Re: 1180 Main Street, Redwood City

Dear Gail:

Please find enclosed the workplan for the above mentioned property.

Mr. Chubick is in a bit of a hurry to get this completed, so any help in expediting this workplan would be appreciated.

If you have any questions, please give me a call.

Sincerely,

Chuck Kiper

DRAFT

WORK PLAN FOR OVER-EXCAVATION
AT 1180 MAIN STREET, REDWOOD CITY
FEBRUARY 2, 1994

1.0 BACKGROUND

SEMCO was contracted by Larry Chubick, property owner of 1180 Main Street, Redwood City, to remove one underground waste oil storage tank at the referenced addressed (see site map for location)

2.0 SITE HISTORY

The site is a commercial property and is the process of change of ownership. Mr. Chubick has also contracted with SEMCO for the required remedial work.

2.1 During excavation and removal of the known waste oil tank, an additional gasoline underground storage tank was discovered. Both tanks were removed on January 14, 1994. The tanks were transported to Erickson, Inc. by RHT, under manifest # 92885656. Tank # 12816 and 12817 were assigned to these two UST's. Please see enclosed sample map for location of samples collected from each tank excavation. Samples were collected and observed in the presence of Teresa Belasco of San Mateo County Environmental Health.

2.2 The condition of the tanks were noted by SEMCO and Teresa Belasco as follows:
Tank # 12816 (waste oil) had several surface holes with several hole at the end seam at the 11:00 position and no apparent holes in the tank bottom.
Tank # 12883 (regular gasoline tank) had pitting, but no holes were observed.

3.0 ANALYTICAL PROTOCOLS AND RESULTS

Tank # 12816- TPH GAS/DIESEL, BTXE, TOG CLHC, ICAP 5 METALS
Tank # 12883- TPH AS GAS, BTXE, TOTAL LEAD

4.0 CONCLUSIONS AND RECOMMENDATIONS

Upon receipt of the analytical, it appears the regular gasoline tank excavation is non detected on all three samples. However, the waste oil tank has elevated levels at the West end (fill end) of diesel as does the excavated material. All other analysis except metals were non-detected.

SEMCO proposes to overexcavate the fill end approximately 10 cubic yards or 2' in all directions. All previously excavated materials will be excavated. graded, transported and disposed of a Certified State Recycle Center. After excavation, a confirmation sample will be collected and requested to be analyzed for TPH as diesel.

The Excavation will be backfilled with approved material and compacted grade for resurfacing.

This is to certify that I have personally determined that this tank is in accordance with the American Petroleum Institute and have found the condition to be in accordance with its assigned designation. This certificate is based on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

TANK SIZE 1000 Gallon Tank CONDITION SAFE FOR FIRE

REMARKS: OXYGEN 20.9%
LOWER EXPLOSIVE LIMIT LESS THAN 0.1%

"ERICKSON INC. HEREBY CERTIFIES THAT THE ABOVE NUMBERED TANK HAS BEEN CUT OPEN, PROCESSED, AND THEREFORE DESTROYED AT OUR PERMITTED HAZARDOUS WASTE FACILITY."

DRAFT

In the event of any physical or atmospheric changes affecting the gas-free conditions of the above tanks, or if in any doubt, immediately stop all hot work and contact the undersigned. This permit is valid for 24 hours if no physical or atmospheric changes occur.

STANDARD SAFETY DESIGNATION

SAFE FOR MEN: Means that in the compartment or space so designated (a) The oxygen content of the atmosphere is at least 19.5 percent by volume; and that (b) Toxic materials in the atmosphere are within permissable concentrations; and (c) In the judgment of the Inspector, the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Inspector's certificate.

SAFE FOR FIRE: Means that in the compartment so designated (a) The concentration of flammable materials in the atmosphere is below 10 percent of the lower explosive limit; and that (b) In the judgment of the Inspector, the residues are not capable of producing a higher concentration that permitted under existing atmospheric conditions in the presence of fire and while maintained as directed on the Inspector's certificate, and further, (c) All adjacent spaces have either been cleaned sufficiently to prevent the spread of fire, are satisfactorily inerted, or in the case of fuel tanks, have been treated as deemed necessary by the Inspector.

The undersigned representative acknowledges receipt of this certificate and understands the conditions and limitations under which it was issued.

RECEIVED

SUBJECT: Monitor Well Construction Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the following report documenting construction of a monitor well with associated development and groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The investigation was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Soil and Groundwater Remediation Guidelines.

DRAFT

Introduction

Reportedly, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11:00 position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons (Table 1). Water present in the pit was sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline,

benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2). The pit was pumped dry and no water recharged. Not true * See inspector notes for more details. Basically, pump didn't work well, took sample then re-pumped pit and re-sampled. Contractor over-pumped pit. MJ 5/31/94

Regardless, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. This report describes the construction and sampling of the monitor well that was requested.

Drilling and Soil Sampling

Prior to mobilization ASE secured a drilling permit from SMCDHS and notified Underground Service Alert (USA) of the planned drilling. A monitor well, MW-1, was constructed about 9 feet from the former UST in the assumed downgradient direction of the former UST, towards the San Francisco Bay (Figure 2). The gradient direction was also verified by a file review of the nearby RMC Lonestar site.

The approximately 8-inch diameter boring was drilled by HEW Drilling using hollow stem augers on May 4, 1994. The boring was advanced to a total depth of 20 feet, with soil samples collected every 5 feet in a 2-inch diameter modified California sampler outfitted with brass liners. The sampler used to collect soil samples was triple rinsed between uses in tap water containing soap, tap water, and a final rinse of distilled water. Sample tubes were cleaned prior to arrival at the site.

Visual and olfactory observations of the soils, including observations of petroleum hydrocarbons, were made and recorded on the boring log (see attached). No petroleum odors were noted emanating from any of the MW-1 soil samples. In general, the subsurface consisted of black silty clays to a depth of 14 feet underlain by black and grey fine gravel and sand. Groundwater was first encountered at approximately 14 feet below ground surface. Drilling was halted at a depth of 20 feet, about 5 feet below the initial detection of water.

One soil sample from the vadose zone at a depth of 10.5 to 11 feet was retained for subsequent laboratory analyses. This soil sample was preserved for subsequent laboratory analysis by covering the ends of the brass liner with teflon tape followed by plastic caps, labelling, and placing with blue-ice in a cooler. The label was pre-printed with an identifying number that corresponds to a page in a bound sampling booklet. On this page the location, date, and sampler's name were recorded.

Soils from drilling activities were stored on-site in a 55 gallon drum pending laboratory results.

DRAFT

Monitor Well Construction

A monitor well, MW-1, was constructed in the boring by HEW Drilling, a licenced well driller in the State of California. A sketch of the well construction details is presented in Figure 3. The monitor well was constructed by inserting approximately 20 feet of two-inch diameter, flush threaded, schedule 40 PVC pipe inside the hollow stem auger. The lower 15 feet was comprised of 0.020 inch machine slotted screen with a threaded cap on the bottom, while the upper 5 feet was constructed of blank casing.

A filter pack of #3 sand was placed in the annulus between the well casing and the boring wall using the hollow stem auger as a tremie pipe. The annulus was filled with sand to about 4 feet below ground surface. Then, an approximately 1 foot thick bridge of bentonite pellets was placed in the annulus and hydrated with clean, distilled water. The bentonite was allowed to swell for about 20 minutes prior to placement of a well seal comprised of a cement grout containing approximately 3% bentonite. The grout was placed in the annulus from a depth of 3 feet to the ground surface.

The well was completed with a watertight, circular valve box, set at the grade of the pavement. Excess casing was cut off to bring the top down to an elevation just below existing ground surface. A locking water tight plug was inserted in the well and secured with a padlock.

Monitor Well Development and Sampling

On the May 5, 1994, the day following well construction, MW-1 was developed by bailing and a groundwater sample was collected. Field notes documenting well development are attached.

Prior to development, depth to water (DTW) was measured at 7.74 feet below TOC. A pressure change was noted upon unsealing the well. An initial volume of water was removed from the well using a clean teflon bailer and examined. The water was turbid, with no petroleum odor. No petroleum odor was noted during development. A total of 10.5 gallons were purged from the well, equivalent to greater than 5 casing volumes.

Purge water was discharged into 5-gallon buckets calibrated for volume measurement. Temperature, pH, and electrical conductivity were measured periodically during development (Table 3). Temperature was measured by placing water from the bailer into a 1-liter cylinder containing an alcohol thermometer. pH was measured with 0-11 range Hydrion pH paper. Electrical conductivity was measured using a calibrated Myron L Company

DRAFT

EP11/pH meter.

At the end of development the DTW was measured at 9.85 feet. The well was allowed to recover for four hours at which time DTW was measured at 9.76 feet. With approval from Ms. Michele Shoemaker of SMCDHS, a sample was then collected.

A new clean, polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product or petroleum odor. Three volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in a 55 gallon drum pending analytical results. The well was capped, locked, and covered.

Laboratory Analyses

Both the soil and groundwater samples were transported under chain of custody (attached) to Coast to Coast Analytical Services (CCAS), a state certified laboratory, for analyses.

The soil sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D), benzene, toluene, ethylbenzene, and xylenes (BTEX); extracted by EPA Method 5030 and analyzed by EPA Methods 8020, and 8015 modified.

The water sample was analyzed for TPH as gas (TPH-G), TPH-D, and volatile organics including BTEX; extracted by EPA Method 5030 and analyzed by EPA Method 8240.

Laboratory reports are attached. Table 1 summarizes the laboratory results for soil, and Table 2 for the groundwater. The soil from MW-1 did not contain any detectable TPH or BTEX. The groundwater sample from MW-1 did not contain any TPH-G, TPH-D, BTEX, or volatile organics.

Quality Control

Laboratory quality control for both soil and water, consisting of method blanks and matrix spikes are attached.

DRAFT

Summary and Conclusions

This report has been prepared to document construction, development, and sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

A boring was advanced at a location within 10 feet of the former UST (Figure 2). The boring was located in the apparent downgradient direction from the former UST location. No petroleum odors were encountered in the soil from the boring.

A two-inch diameter, 20 feet deep monitor well was constructed in the boring (Figure 3). The monitor well was developed and a groundwater a sample collected on the day after construction. No free product or petroleum odor was noted in the groundwater.

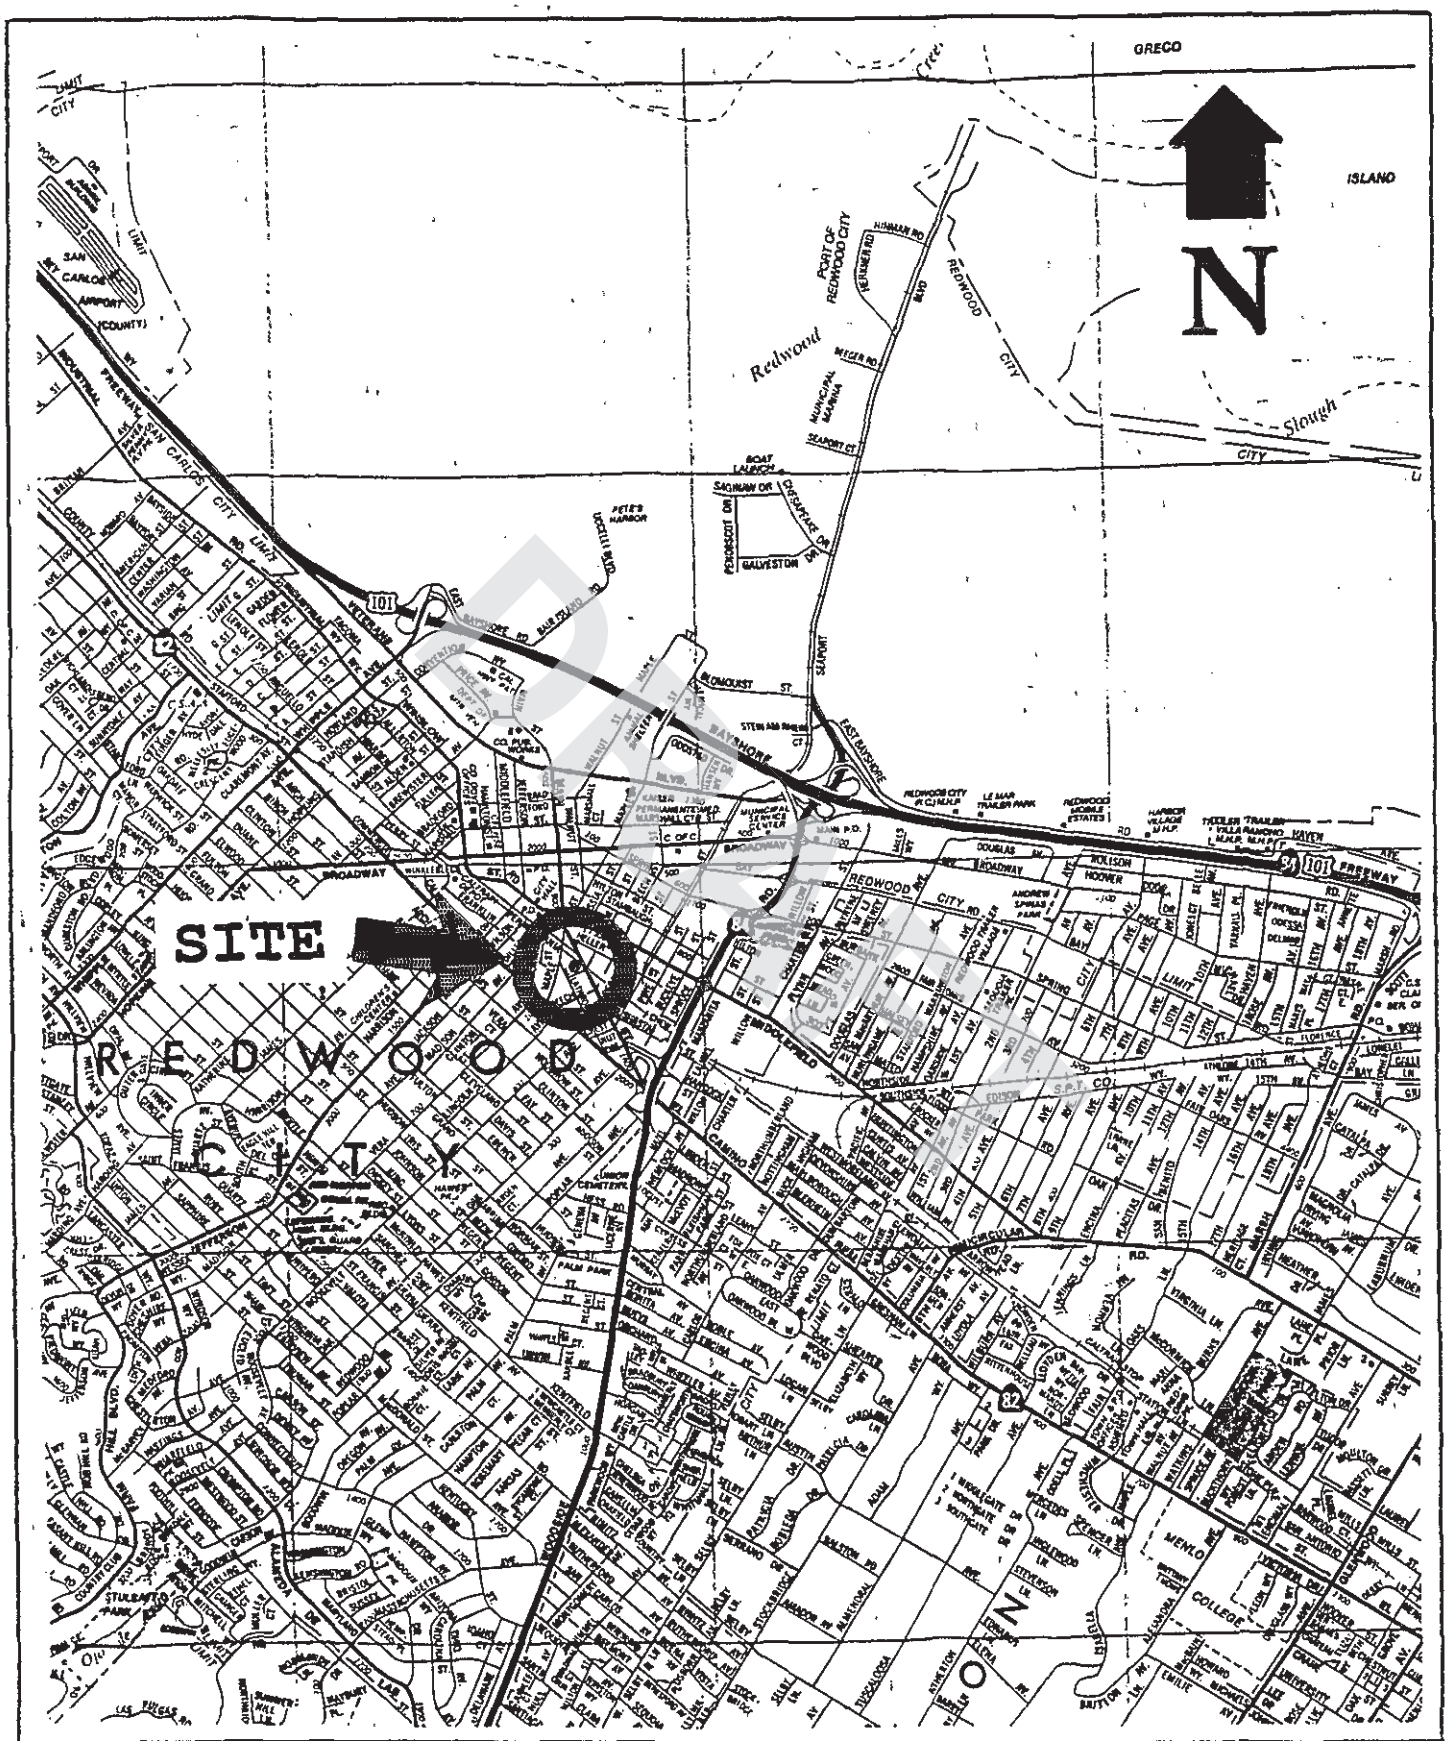
Laboratory analytical results show no detectable TPH-D, or BTEX in the soil (Table 1), and no TPH-D, TPH-G, BTEX, or volatile organics in the groundwater (Table 2) from MW-1.

Recommendations

ASE recommends collection of a groundwater sample from the monitor well, MW-1, at the next regularly scheduled quarterly date, on or about August 5, 1994 to check the veracity of the initial analytical results that show no detectable hydrocarbons in the groundwater. ASE also recommends analysis only for TPH-D and BTEX due to the absence of volatile organics in the initial sample.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,



Frederick A. Yukic, MS, PE

1.0 INTRODUCTION

In this report, we are presenting a detailed account of the tank removal activities at Chub's Auto Repair, located at 1180 Main Street, Redwood City, California. All work was performed by SEMCO, San Mateo and was done in compliance with the County of San Mateo and the Redwood City Fire Department. Tank preparation, excavation and removal occurred on January 14, 1994. Re-excavation activities occurred on February 9, 1994.

2.0 EXCAVATION AND TANK REMOVAL

On January 14, 1994, SEMCO excavated the site for the removal of one 1000 gallon Waste Oil tank. Upon arrival to the site and preparation for the removal, another tank was discovered, which was determined to be a 1000 gallon gasoline tank.

Both tanks were voided of their residual product, which was placed into barrels for disposal. It was later disposed of by Allied Petroleum on Manifest # 93267128. The tanks were then inerted by washing them with a hot water detergent wash, followed by solid carbon dioxide (dry Ice) until acceptable levels of oxygen and lower explosive limits were reached..

The tanks condition were noted as follows:

1) 1000 gallon waste oil was unwrapped steel with several 1/8" holes in surface and 2-3 1/4" holes at the East end. The piping had many holes.
2) 1000 gallon gasoline tank was unwrapped steel with pitting, but no holes were observed.

The inerted tanks were hauled by Rich Hamilton Trucking on Manifest # 92885656.

After the tanks were removed, it was noted that the soil beneath the waste oil tank was discolored, with a slight solvent odor. The soil in both excavations had a clayey/sandy consistency. The soil beneath the gas tank had no discoloration or odor.
At this time, soil samples were collected.

3.0 SOIL SAMPLING

Soil samples were retrieved out of the excavation by use of the backhoe bucket. Clean brass sample tubes were used by pushing them into the soil until a full sample was obtained. All samples were sealed with teflon tape, plastic end caps and sealed with masking tape, labeled and entered onto a chain of custody form. Samples taken to Superior Precision Analytical, a State certified laboratory.
Samples were collected from the waste oil excavation from the East end of the excavation at 8 feet and the West end at 8.5 feet. A four tube composite sample was collected from the excavated waste oil soil.

These samples were to be analyzed for TPH as Gasoline, Diesel, BTXE, Oil and Grease, 8010, 8240 and ICAP 5 Metals.

Samples were collected from the gasoline tank excavation from the North end at 8 feet and the South end at 9.5 feet. A four tube composite was also collected from the excavated soil. These samples were to be analyzed for TPH as Gas, BTXE and Total Lead.

Analytical results demonstrated that the gasoline excavation had no detectable traces of the analyzed constituents, except for 8ppm lead in the North sample, 7ppm lead in the South sample and 30 ppm Lead in the Excavated spoils. The analytical for the waste oil tank demonstrated Non detectable levels in the East end of the excavation. The West end however, had 810 ppm Diesel with non detectable levels in Gasoline, BTXE and Oil and Grease. The excavated soil had 4 ppm TPH as gas, 1100 ppm Diesel, No Benzene, 0.048 ppm Toluene, 0.036 ppm Ethyl Benzene, 0.28 ppm Xylenes and no Oil and Grease.

Based on the analytical, it was determined that additional excavation work would be necessary for the Waste Oil tank excavation.

5.0 RE-EXCAVATION ACTIVITIES

After assessing the analytical results, it was decided in conjunction with the various lead agencies to re-excavate the site down to a level in which there would be no detectable traces of contaminants.

A workplan was submitted to San Mateo County on February 2, 1994, to over excavate the West end (fill end) by approximately 10 cubic yards. Upon approval of the workplan, the job was scheduled for February 9, 1994 with San Mateo County Environmental Health inspector Michelle Shomarker.

SEMCO arrived on site and excavated the West end laterally approximately 5 feet and removed the soil to the 8 foot level. The water table was reached at the 9 foot level. The water in the excavation was pumped and allowed to recharge. (This water was placed in barrels to be disposed of at a later date) A soil sample was collected at the 8 foot level, and a water sample was collected. The soil sample was analyzed for TPH as gas and diesel, BTXE and TOG. A water sample was also collected with analysis request for TPH as gas and diesel, BTEX, TOG and 8010. However only one liter and three VOA's were collected on this date. Superior Precision Analytical informed SEMCO only one analysis could be run due to the inadequate amount. (please see enclosed correspondence from Superior).

DRAFT

Conversations on site was to request this sample not be analyzed, and allowing the pit water to be pumped and allowed to recharge. San Mateo County later requested this sample to be analyzed. SEMCO requested Superior to run TOG analysis only, due to the inadequate amount. Analytical results indicated levels of 9 ppm Oil and Grease. SEMCO at this time requested that the pit be allowed to be pumped and recharge. Permission was given for this task, so an appointment was scheduled for February 17, 1994 with San Mateo County Environmental Health Department.

A water storage tank (swing tank) was delivered to the site for the receiving of water from the excavation. The water was pumped and allowed to recharge. Three (3) amber liters and three (3) voas of water were collected and analyzed for TPH as gasoline, diesel, BTXE, TOG and 8240.

Analytical results demonstrated non detected levels in TPH as gas, BTXE, TOG and 8240. The analysis for TPH as Diesel had a level of 530 ppb, but was noted as not matching the typical diesel pattern.

The excavation was backfilled and compacted to prepare for resurfacing. The water from the original pumping of the excavation, was pumped from the barrels and was placed into the holding tank for disposal.

The water in the holding tank was then sampled on March 9, 1994 for TPH as gasoline, Diesel,BTXE, TOG and 8240, to determine how the disposal would be handled. The analysis demonstrated only 110 ppb diesel, while all other analysis were non detected.

Based on this information, the analytical was presented to South Bay Sewer Authority for pumping the water into the Sewer. On March 16, 1994, SBSA approved the discharge of the water into the sewer. (see attached permit) On March 17, 1994, the water was pumped from the tank into sewer.

The concrete was replaced on March 28, 1994

This report is for your files. If you have any questions, please give me a call.

Dear Chuck,

This letter is in regards to our conversation about SEMCO's project 93-3496 (Chub's Auto). As reflected by Superior Precision Analytical's records, only one container (one liter amber glass bottle) was received for SEMCO's sample #1 Pit Water on Febuary 10, 1994.

Chuck, if you have any questions please give me a call at (415) 647-2081.

Best Regards,

5/31/94

SUBJECT: Monitor Well Sampling Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the second quarterly report documenting groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Guidelines.

DRAFT

Introduction

Reportedly, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11 O'clock position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons. Water present in the pit was sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline, benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2).

Subsequently, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. This report describes the second quarterly sampling of the monitor well.

Monitor Well Development and Sampling

On August 4, 1994, monitor well MW-1 was purged by bailing and a groundwater sample was collected. Field notes documenting well sampling are attached.

Prior to purging, depth to water (DTW) was measured at 10.32 feet below the top of the well casing (TOC). An initial volume of water was removed from the well using a new clean polyethylene bailer and examined. The water was clear, with no petroleum odor. No petroleum odor was noted during purging. A total of 5 gallons were purged from the well, equivalent to greater than 3 casing volumes. Purge water was discharged into 5-gallon buckets calibrated for volume measurement.

At the end of purging the DTW was measured at 10.25 feet, indicating instant recovery. With approval from Ms. Michele Shoemaker of SMCDHS, a sample was collected in her absence.

A new clean, polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product. Two volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in a 55 gallon drum pending analytical results. The well was capped, locked, and covered.

Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to PACE (formally Coast to Coast Analytical Services), a state certified laboratory, for analyses.

The groundwater sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D), by EPA methods 3510/8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-1 did not contain any TPH-D or BTEX.

Quality Control

Laboratory quality control for water, consisting of method blanks and spikes, are attached.

Summary and Conclusions

This report has been prepared to document sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

The monitor well was purged and a groundwater sample collected. No free product or petroleum odor was noted in the groundwater.

Laboratory analytical results show no detectable TPH-D or BTEX in the groundwater from MW-1 (Table 2).

Recommendations

ASE recommends collection of a groundwater sample from the monitor well, MW-1, at the next regularly scheduled quarterly date, on or about November 4, 1994 to check the veracity of the analytical results that show no detectable hydrocarbons in the groundwater for two quarters.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,

Frederick A. Yukic, MS, PE

SUBJECT: Monitor Well Sampling Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the third quarterly report documenting groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Guidelines.

DRAFT

Introduction

Reportedly, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11 O'clock position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons. Water present in the pit was sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline, benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2).

Subsequently, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. The monitor well was constructed at the site on May 4, 1994. This report describes the third quarterly sampling of the monitor well.

Monitor Well Development and Sampling

On November 3, 1994, monitor well MW-1 was purged by bailing and a groundwater sample was collected. Field notes documenting the well sampling are attached.

Prior to purging, depth to water (DTW) was measured at 10.35 feet below the top of the well casing (TOC). An initial volume of water was removed from the well using a clean teflon bailer and examined. The water was clear, with no petroleum odor. No petroleum odor was noted during purging. A total of 5 gallons were purged from the well, equivalent to greater than 3 casing volumes. Purge water was discharged into 5-gallon buckets calibrated for volume measurement.

At the end of purging the DTW was measured at 10.22 feet, indicating instant recovery. With approval from Ms. Michele Shoemaker of SMCDHS, a sample was collected in her absence.

A new clean, polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product. Three volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. Two 1 liter amber bottles with preservative were also filled with ground water. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in labeled buckets pending analytical results. The well was capped, locked, and covered.

Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses.

The groundwater sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D) by EPA methods 3510/8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-1 did not contain any detectable TPH-D or BTEX.

DRAFT

Quality Control

Laboratory quality control for water, consisting of method blanks and spikes, are attached.

Summary and Conclusions

This report has been prepared to document sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

The monitor well was purged and a groundwater sample collected. No free product or petroleum odor was noted in the groundwater.

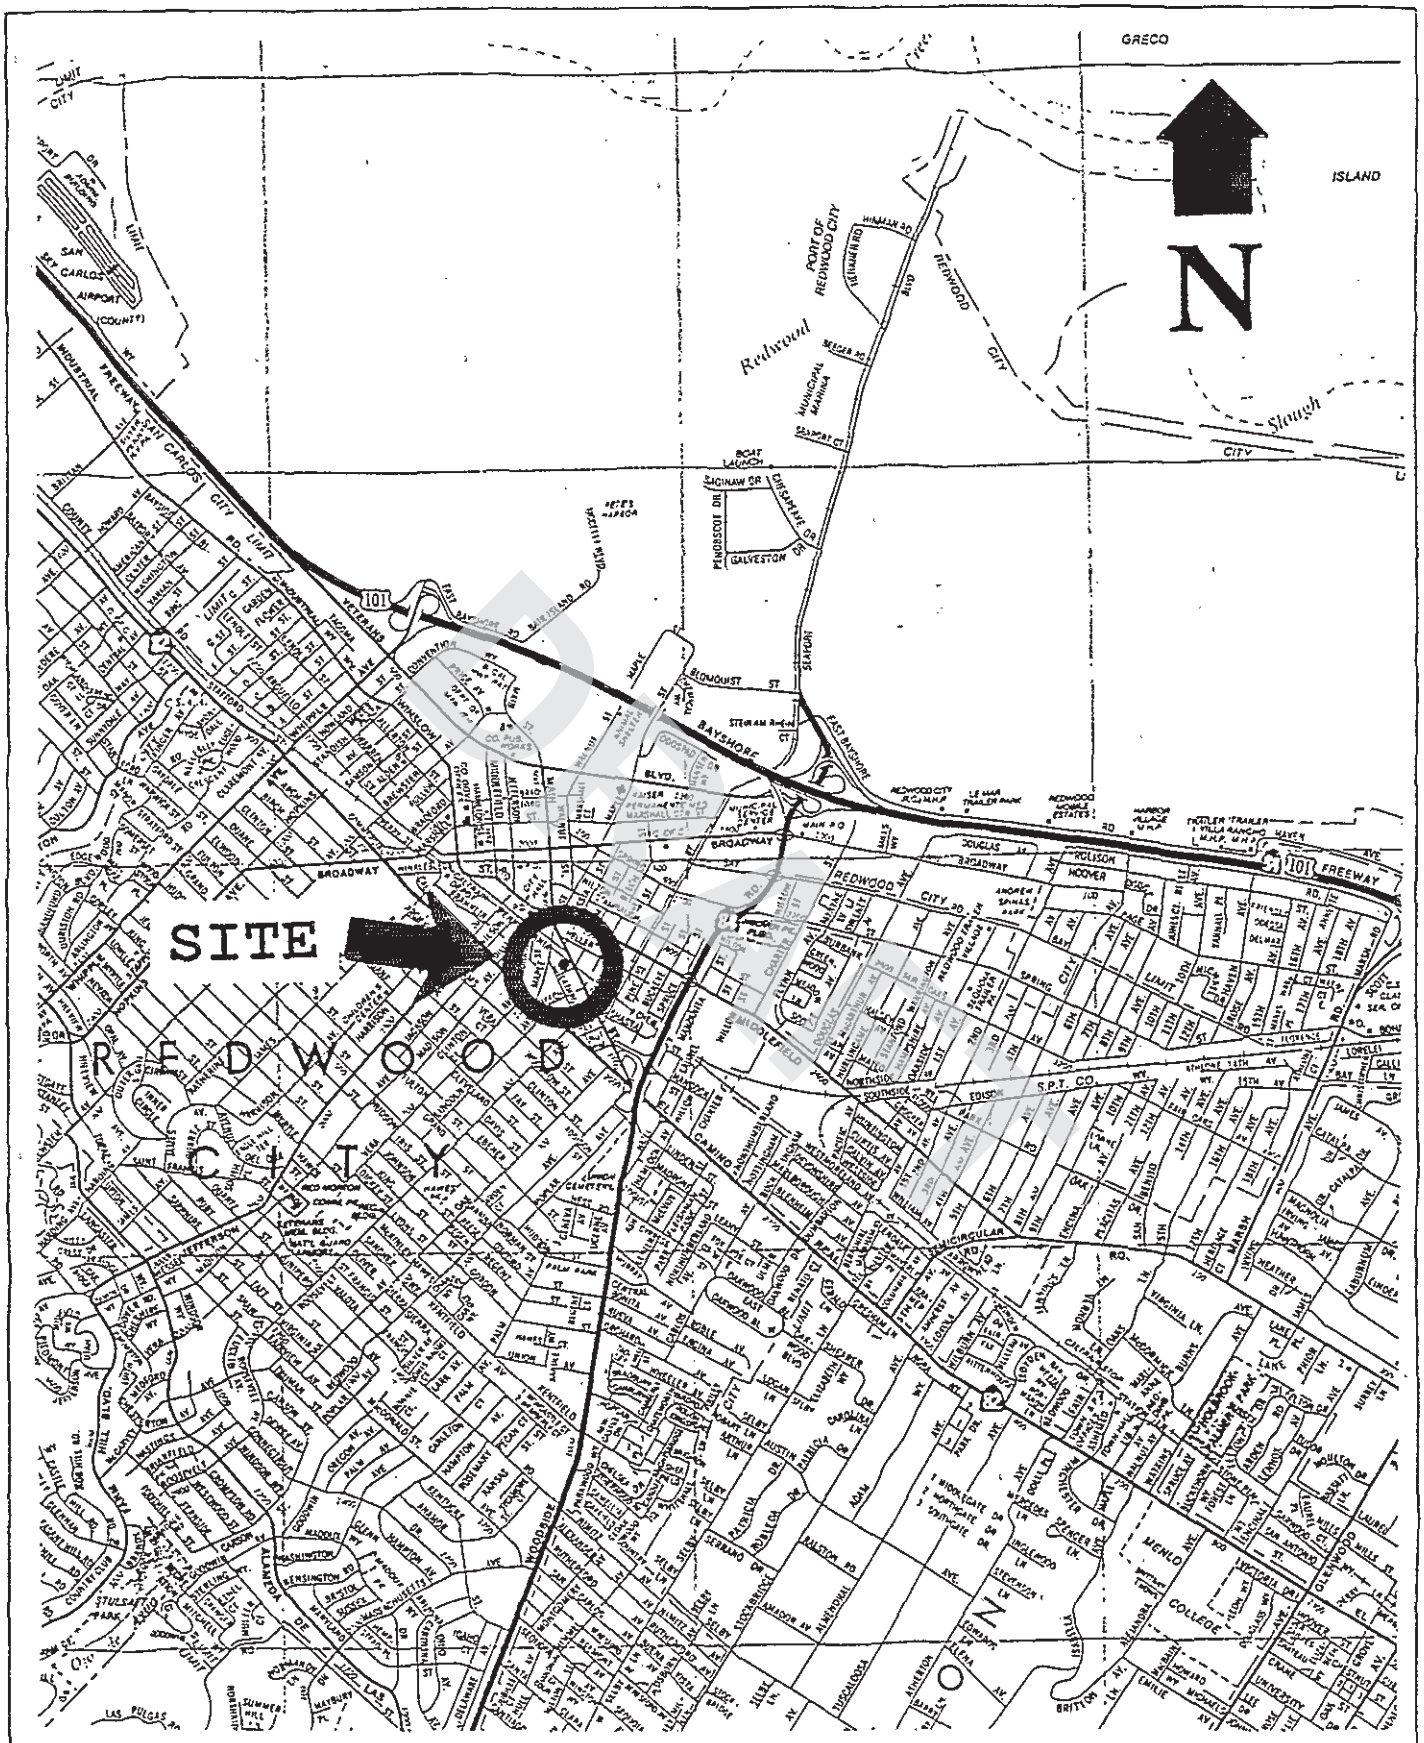
Laboratory analytical results show no detectable TPH-D or BTEX in the groundwater from MW-1 (Table 2).

Recommendations

ASE recommends collection of a groundwater sample from the monitor well, MW-1, at the next regularly scheduled quarterly date, on or about February 3, 1994 to check the veracity of the analytical results that show no detectable hydrocarbons in the groundwater for three quarters.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,



Frederick A. Yukic, MS, PE

SUBJECT: Hydraulic Lift Sampling Results
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed hydraulic lift sampling results for Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted by ASE following San Mateo County LUFT Enforcement Program (CLEP) Guidelines. In addition to the sampling results, this report describes activities conducted by contractors at the site related to the hydraulic lift removal.

Introduction

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was installed approximately 10 years ago. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil Sampling

August 16, 1994

At the request of Mr. Larry Chubick, ASE visited the site on August 16, 1994 to collect soil samples from the stockpile and from the bottom of the hydraulic lift excavation (see attached field notes). When ASE arrived at the site an excavation was present inside the building which was approximately 8 feet long by 4 feet wide (Figure 2). The approximately six-inch thick concrete floor had been cut and/or jackhammered to facilitate excavation. The excavation was approximately 7 feet deep at its deepest. The sidewalls were inspected and found to be composed of fill soils to a depth of 2.5 feet, followed by a black silty clay to 7 feet, underlain by a gray, mottled black silty clay which appeared moist. No groundwater was present in the pit.

~~A soil sample was collected from the center of the south end~~

DRAFT

A soil sample was collected from the center of the south end of the excavation (the reported location of the hoist cylinder) by hand augering to a depth of 8 feet, about 2 feet beneath the reported bottom of the hoist cylinder. At this depth the soil is a moist, grey, mottled black silty clay.

The auger contents were transferred into a clean, six-inch long, two-inch diameter brass liner. The ends of the liner were covered with teflon tape followed by plastic caps. A label with a pre-printed number was attached to the liner prior to placement in an ice chest containing blue ice. The label number corresponds to a page in a booklet on which was written the sampler, date, project, sample location, and sample description.

A second soil sample was collected from the stockpile generated by the excavation using the sample handling procedure described above. The sample was comprised of a brown to black silty clay. Only one sample was collected from the approximately 3 cubic yards of stockpile, in accordance with San Mateo County Department of Health Services (SMCDHS) guidelines for re-use of contaminated soils.

September 12, 1994

After receipt of the laboratory results for the initial soil samples showing the presence of Oil and Grease (O&G), the excavation was deepened by BCM. ASE was not present during excavation.

ASE returned to the site on September 12, 1994 to collect additional bottom samples. At this time the areal extent of the excavation was about the same, but the depth had increased to 8 feet. ASE collected two additional samples, at depth of 9.5 and 10 feet, while hand augering to a total depth of 10 feet. Both samples were tan grey mottled red-orange silty clay. The samples were collected, handled, and preserved as described above for previous samples. The stockpile volume was estimated to have increased to about 7 cubic yards as a result of the additional excavation.

September 26, 1994

After receipt of the laboratory results for the September 12, 1994 soil samples showing the presence of O&G in the 10 foot deep sample, ASE returned to the site on September 26, 1994 to collect additional soil samples. ASE collected three additional samples while hand augering to a total depth of 12 feet. All samples were red brown and grey silty clay. The samples were collected, handled, and preserved as described above for previous samples.

DRAFT

October 4, 1994

After receipt of the laboratory data for the September 26, 1994 soil sample showing O&G as 520 ppm in the sample from 12.5 feet, ASE returned to the site on October 4, 1994 to collect additional soil samples. However, ASE found water in the hand boring at a depth of 11 feet. Thus, no soil samples were collected because of the presence of groundwater.

October 28, 1994

On October 28, 1994 two additional soil samples were collected from the stockpile by ASE for use in characterizing the soil for offsite disposal. The samples were collected according to the procedures described above for previous samples. One sample was a black silty clay, while the other was a tan grey silty clay.

Additional Excavation

On December 12, 1994 the hydraulic lift excavation was deepened using a low overhead backhoe which fit inside the building. ASE observed the excavation which was performed by a contractor employed by Chub's Auto Repair. The maximum depth that could be reached by the backhoe was 12 feet.

Prior to digging the excavation walls were inspected visually. The south wall of the excavation was stained by fluid, a condition that had not been previously noted. The fluid appeared to have originated in the fill soils at 2 feet and had flowed down the southern sidewall to total depth of 8 feet. On explanation for the staining is that rainwater had infiltrated beneath the pavement outside the building, flowed through the shallow backfill into the building, and then into the excavation during rainfall. On the other walls a white powdery deposit was noted (perhaps precipitates of calcium).

As the excavation was deepened groundwater was observed entering the excavation below a depth of about 11 feet. After about one hour the water level rose to a depth of about 10.9 feet.

ASE used a hand auger to bore into the bottom of the middle of the excavation to a depth of approximately 15.5 feet where a silty sand was encountered. The boring was terminated at this depth based on data contained in the boring log for nearby well MW-1 (associated with a former UST) which showed the first water bearing zone at about 15 feet.

As allowed by the LUFT Guidelines, water was pumped from the excavation. A total of about 100 gallons of water was removed

DRAFT

from the excavation by skimming the surface with a 5-gallon bucket and pumping with a sump pump from the water surface. The 5-gallon bucket was noted to be oily when removed from the excavation. Water pumped was stored in 55-gallon drums pending analytical results. At the end of pumping the water level in the excavation had lowered to 11.3 feet deep.

A 4-inch diameter PVC pipe with a bottom cap attached by screws was placed into the boring to make a backfill well (MW-2). The purpose of this well was to allow the excavation to be backfilled immediately for safety reasons, and to provide for future groundwater extraction and/or monitoring, if necessary. The bottom 6 feet of the pipe was sawcut with 6 rows of vertical slots approximately 6 inches long to allow water to flow into the pipe (Figure 3). This resulted in slots between depths of 9.5 and 15.5 feet, above the reported depth to water of about 10 feet in nearby MW-1. A locking plug was inserted into the top of the pipe.

The excavation was backfilled with clean, washed pea gravel. The pea gravel was placed around the 4-inch diameter well to the ground surface.

Soils excavated were stockpiled onsite on asphalt in the fenced parking area and were covered with plastic. ASE estimated the final volume of stockpile at approximately 11 cubic yards (see attached field notes).

Groundwater Sampling

On December 12, 1994 two days following the additional excavation a groundwater sample was collected from the backfill well (MW-2). ASE did not collect the groundwater sample immediately after pumping because a previously scheduled appointment required the technician to leave the site. ASE waited two days to collect the sample because the additional excavation was conducted on a Saturday, and offices are closed on Sunday, so the following Monday was the first opportunity to sample.

No purging of the backfill well was undertaken at the time of sampling because the excavation had previously been pumped prior to backfilling (see above). A grab groundwater sample was collected by lowering a clean teflon bailer into the backfill well and removing a volume of water. The water was clear, with no free product. The contents of the bailer was emptied into a one-liter amber bottle containing preservative. The bottle was labelled and then placed in an ice chest containing blue ice for preservation during shipment to the analytical laboratory under chain of custody.

DRAFT

Laboratory Methods

The soil and groundwater samples were transported under chain of custody (attached) to state certified analytical laboratories, either Priority Environmental Labs (PEL) or PACE, Incorporated. Laboratory reports are attached along with quality control. Laboratory results are summarized in Table 1.

The soil and groundwater samples were analyzed for O&G by EPA method 418.1.

To facilitate disposal, two stockpile soil samples collected on October 28, 1994 were composited in the laboratory and analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Method 8020. The stockpile composite was also analyzed for soluble cadmium, chromium, lead, nickel, and zinc by EPA Methods 1310/7130/7190/7420/7520/7950. Finally, the stockpile composite was analyzed for reactivity, corrosivity, and ignitability by Title 22 of the California Code of Regulations.

Laboratory Results

Laboratory reports are attached and the results are summarized in Table 1.

The results show that O&G was present in soil beneath the former hydraulic lift cylinder at concentrations of 12,000 ppm at 8.5 feet below ground surface (bgs), 1,600 ppm at 9.5 feet, 1,700 ppm at 10 feet, and 520 ppm at 12.5 feet.

The groundwater sample from the backfill well (MW-2) was analyzed and found to contain 1.7 ppm of O&G.

The stockpile soil sample results show O&G at 4,100 ppm. The stockpile composite lab results show soluble cadmium at 0.53 ppm, soluble lead at 0.73 ppm, soluble zinc at 0.67 ppm. Soluble chromium, soluble nickel and BTEX were not detected in the stockpile composite sample. Finally, the stockpile composite was not reactive of ignitable, and the pH was measured at 7.6 ppm.

Stockpile Disposal

The approximately 11 cubic yards of stockpiled soils were transported to the BFI Vasco Road Landfill for disposal. A gate ticket showing a total weight of 12.32 tons is attached.

DRAFT

Summary and Conclusions

This report has been prepared to document sampling beneath a former hydraulic lift cylinder removed from the subsurface at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

Soil samples were collected from beneath the hydraulic lift by hand boring into the bottom of the excavation created by removal (Figure 2). Laboratory results showed O&G in soils beneath the former hydraulic lift to a depth of 12.5 feet. Groundwater was encountered at 12.5 feet, so no deeper soil samples were collected. The soil sample from between 12 to 12.5 feet deep, the final depth of the excavation, was found to contain O&G at 520 ppm.

Subsequently, the excavation was deepened to approximately 12 feet, the maximum depth attainable with a backhoe that could fit inside the building. Water entered the excavation, filling it to 10.9 feet below ground surface. In accordance with LUFT guidelines the excavation was pumped once, with about 100 gallons of groundwater removed into 55-gallon drums. As a result of pumping the water level declined to about 11.3 feet. A hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet where the first water bearing zone was encountered. A backfill well (MW-2) was constructed in the boring and excavation of 4-inch diameter PVC pipe with sawcut slots. Pea gravel backfill was placed around the well from the bottom of the excavation to ground surface.

Two days after excavation pumping, ASE returned to the site and collected a grab groundwater sample from the backfill well. Because the excavation had been previously pumped, the well was not purged. Lab results show that the groundwater sample contained 1.7 ppm of O&G, which is below the required practical quantitation reporting limit for leaking underground fuel tanks.

Laboratory analytical results also showed that the stockpiled soil excavated contained O&G at 4,100 ppm and soluble metals at apparently non-hazardous concentrations. In addition, lab results showed that the soil was not reactive, corrosive, or ignitable. The stockpile soil was transported to BFI Vasco Road Landfill for disposal.

RECEIVED

SUBJECT: Monitor Well Sampling Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the fourth quarterly report documenting groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Guidelines.

DRAFT

Introduction

~~Reportedly~~, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11 O'clock position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons. Water present in the pit was eventually sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline, benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2).

Subsequently, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. The monitor well was constructed at the site on May 4, 1994 in the assumed downgradient direction from the former UST, towards the San Francisco Bay. This report describes the fourth quarterly sampling of the monitor well.

Observations

On February 2, 1995, one day prior to sampling, water levels were measured in MW-1 and tidal water levels in Redwood Creek were observed. No tidal influence on MW-1 water levels observed on February 2. However, on February 3, water levels were noted to be 0.15 feet lower (see attached field notes).

Monitor Well Development and Sampling

On February 3, 1995, monitor well MW-1 was purged by bailing and a groundwater sample was collected. Field notes documenting the well sampling are attached.

Prior to purging, depth to water (DTW) was measured at 8.56 feet below the top of the well casing (TOC). An initial volume of water was removed from the well using a new clean polyethylene bailer and examined. The water was clear, with no petroleum odor. No petroleum odor was noted during purging. A total of 6 gallons were purged from the well, equivalent to greater than 3 casing volumes. Purge water was discharged into 5-gallon buckets calibrated for volume measurement.

At the end of purging the DTW was measured at 8.57 feet, indicating instant recovery. A sample was then collected in presence of Ms. Michele Shoemaker of SMCDHS.

The same polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product. Three volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. Two 1 liter amber bottles with preservative were also filled with ground water. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in labeled buckets pending analytical results. The well was capped, locked, and covered.

DRAFT

Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses.

The groundwater sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D) by EPA methods 3510/8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-1 did not contain any detectable TPH-D or BTEX.

Quality Control

Laboratory quality control for water, consisting of method blanks and spikes, are attached.

Summary and Conclusions

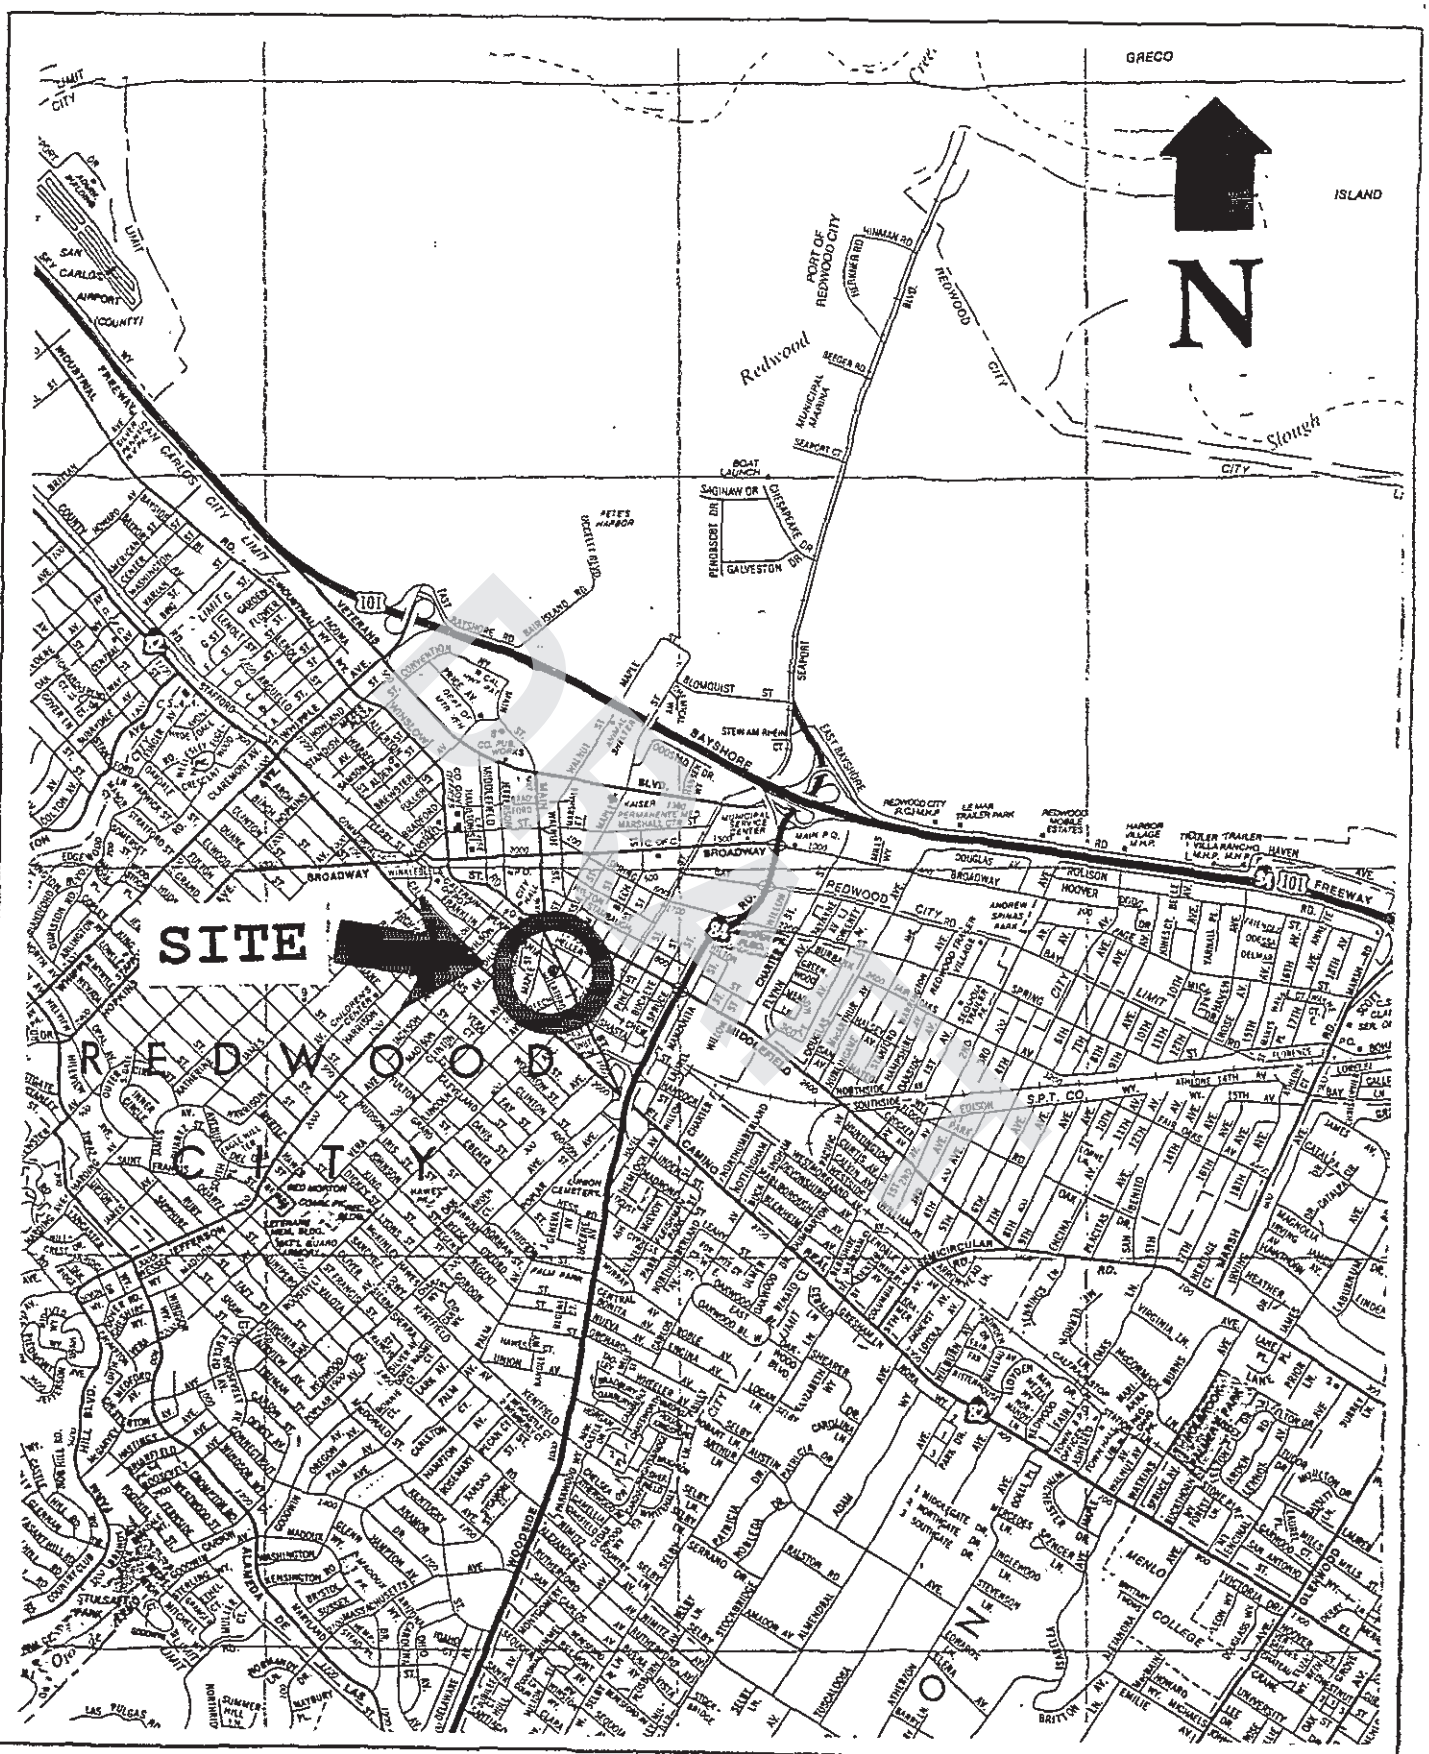
This report has been prepared to document sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1). The monitor well was purged and a groundwater sample collected. No free product or petroleum odor was noted in the groundwater. Laboratory results show no detectable TPH-D or BTEX in the groundwater from MW-1 (Table 2).

Recommendations

Laboratory results for groundwater samples collected from MW-1 for the past four quarters show no detectable TPH-D or BTEX. Based on these results there does not appear to be significant contamination of the site groundwater. Thus, ASE recommends site closure.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,



Frederick A. Yukic, MS, PE

SUBJECT: Monitor Well Sampling Report For MW-2
Hydraulic Lift Excavation
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits this sampling report for monitor well MW-2 associated with a former hydraulic lift at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted by ASE following San Mateo County LUFT Enforcement Program (CLEP) Guidelines.

DRAFT

Introduction

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was approximately 10 years old. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil samples were collected from beneath the hydraulic lift by hand boring into the bottom of the excavation created by removal (Figure 2). Laboratory results showed O&G in soils beneath the former hydraulic lift (Table 1). The excavation was deepened to approximately 12 feet, the maximum depth attainable with a backhoe that could fit inside the building. Water entered the excavation, filling it to 10.9 feet below ground surface. In accordance with LUFT guidelines the excavation was pumped once, with about 100 gallons of groundwater removed. A hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet where the first water bearing zone was encountered. A well (MW-2) was constructed in the excavation boring of 4-inch diameter PVC pipe with sawcut slots surrounded by pea gravel. A grab groundwater sample from the backfill well after excavation pumping was found to contain 1.7 ppm of O&G, which is below the required practical quantitation reporting limit of 5 mg/l required by the Tri-regional Recommendations for leaking underground fuel tanks.

This report describes the second sampling of MW-2.

did what type of soils???

Monitor Well Purging and Sampling

On March 13, 1995, monitor well MW-2 was purged by bailing and a groundwater sample was collected. Field notes documenting the well sampling are attached.

Prior to purging, depth to water (DTW) was measured at 7.65 feet below the top of the well casing (TOC). A new clean polyethylene bailer was used for purging and sampling. No petroleum odors were noted during purging. Spots of sheen were noted during purging. A total of 16 gallons were purged from the well, equivalent to greater than 3 casing volumes. Purge water was discharged into 5-gallon buckets calibrated for volume measurement.

At the end of purging the DTW was measured at 7.80 feet. MW-2 was allowed to recover for 25 minutes, until DTW equaled 7.70 feet, about 80% recovery. Ms. Michele Shoemaker of SMCDHS gave permission to collect a sample in her absence.

The polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product. Two 1 liter amber bottles with preservative were filled with ground water. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in a labeled drum pending analytical results. The well was capped, locked, and covered.

Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses.

The groundwater sample was analyzed for oil and grease (O&G) by EPA method 418.1.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-2 shows 1.5 mg/L of O&G.

Quality Control

Laboratory quality control for water, consisting of method blanks and spikes, are attached.

DRAFT

Summary and Conclusions

This report has been prepared to document sampling of the monitor located at the former hydraulic lift cylinder removed from the subsurface at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1). The monitor well was purged and a groundwater sample collected. No free product or petroleum odor was noted in the groundwater. Spots of sheen were noted in the groundwater.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-2 shows 1.5 mg/L of O&G (Table 1). This is about the same as for the previous sample.

Recommendations

Based on two quarters of laboratory results for groundwater from MW-2 which show less than 5 mg/L of O&G, the practical quantitation reporting limit listed in the Tri-Regional Recommendations for O&G, ASE recommends site closure.

SUBJECT: Horizontal Hydraulic Gradient
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

This letter is in response to your request for determination of the horizontal hydraulic gradient at the above-referenced site (Figure 1). The gradient was estimated using the two existing monitor wells at the site and a temporary piezometer that was constructed in a hole from which a hydraulic lift was removed.

Temporary Piezometer Construction

Reportedly, three hydraulic lifts were removed from the site on April 8, 1995. On April 10, 1995 an ASE representative visited the site for collection of soil samples from beneath the lifts as part of their closure (see attached field notes). The hole from lift #4 was approximately 1.5 feet in diameter and 5.5 feet deep. ASE drilled to a depth of 9.5 feet using a 2-inch diameter hand auger before collecting a sample from between 9.5 and 10 feet for laboratory analysis. ASE left the site after collecting samples from each of the other two hydraulic lift holes.

On April 20, 1995 an ASE representative returned to the site to deepen the hole at lift #4 for construction of the temporary piezometer TPZ-1 (Figure 2). ASE hand augered to a depth of about 16 feet where a brown, clayey sand was encountered which contained groundwater (see attached field notes). This depth was roughly equivalent to the depth of MW-2 and the first water-bearing zone in MW-1.

The temporary piezometer was constructed by inserting about 15 feet of 1-inch diameter, schedule 40 PVC into the boring. The bottom 10 feet was machine slotted screen with a bottom plug, while the upper five feet was blank casing. A cap was placed on top of the casing prior to leaving the site.

DRAFT

Horizontal Hydraulic Gradient

On the following day, April 21, 1995, ASE conducted an engineering survey of the top of casing (TOC) of the two monitor wells and one temporary piezometer (see attached field notes). In addition, water levels were collected from the two monitor wells and one temporary piezometer (see attached field notes). Using this data the water surface elevations were calculated (Table 1). As can be seen from the data, the variation in WSE of 0.01 feet is smaller than the accuracy of the measurements, so there is no perceptible gradient at the site.

Conclusions and Recommendations

Based on the measurements collected on April 21, 1995 there is no perceptible gradient at the site. As such, the location of MW-1, which is within 10 feet of the former UST, is adequate to detect any groundwater contamination dispersing/diffusing from beneath the former UST. Since no hydrocarbons were detected in MW-1 groundwater for four quarters, and recalling that a sample collected from the excavation after three pumping episodes was found to contain no detectable hydrocarbons, ASE recommends site closure.

SUBJECT: MW-2 Groundwater Extraction and Sampling Report
Hydraulic Lift Excavation
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits this groundwater extraction and sampling report for monitor well MW-2 associated with a former hydraulic lift at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1).

Introduction

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was approximately 10 years old. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil samples were collected from beneath the hydraulic lift contained oil and grease (O&G) at progressively lower concentrations (Table 1). The excavation was deepened to approximately 12 feet, the maximum depth attainable with a backhoe that could fit inside the building. Water entered the excavation, filling it to 10.9 feet below ground surface. The excavation was pumped once, with about 100 gallons of groundwater removed. Then, a hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet, into the first water bearing zone. A monitor well (MW-2) was constructed in the excavation boring of 4-inch diameter PVC pipe with sawcut slots surrounded by pea gravel (Figure 2). A grab groundwater sample from the well contained 1.7 ppm of O&G (Table 1).

Subsequently, the monitor well was sampled on March 13, 1995 after purging 3 casing volumes and allowing the water level to recover. Laboratory results for the sample collected showed 1.5 ppm of O&G (Table 1).

This report describes groundwater extraction of MW-2 followed by sampling of the monitor well for the third time.

DRAFT

Groundwater Extraction

On Saturday May 13, 1995, groundwater was extracted from monitor well MW-2 using a submersible pump. Field notes documenting the groundwater extraction are attached. The pump was placed about one foot above the well bottom.

Prior to purging, depth to water (DTW) was measured at 9.58 feet below the top of the well casing (TOC). In the course of pumping, the pump was stopped three times due to entrained air, and was restarted three times after allowing the well to recover. A flowmeter used to measure total volume showed that approximately 779 gallons were pumped. At the beginning of pumping the flow rate was estimated at 12 gallons per minute (gpm). Pumped water was disposed into the sanitary sewer under temporary permit from SBSA.

Upon removal of thee submersible pump it was observed to be coated with a white foam that felt oily. The foam did not have the appearance of a petroleum product in that it was white. A polyethylene bailer was used to purge an additional 2.5 gallons and inspect the foam.

Monitor Well Purging and Sampling

On May 15, 1995 ASE returned to the site to sample monitor well MW-2. Field notes documenting the well sampling are attached.

Prior to purging, DTW was measured at 9.13 feet below TOC. A new clean polyethylene bailer was used for purging and sampling. No petroleum odors were noted during purging. Purge water was discharged into 5-gallon buckets calibrated for volume measurement. A total of 13 gallons were purged from the well, equivalent to greater than 3 casing volumes. White globules and a sheen without color was noted on the water in the bucket during purging.

At the end of purging the DTW was measured at 9.26 feet. MW-2 was allowed to recover for about one-half hour, until DTW reached 9.15 feet, equal to 80% recovery. Ms. Michele Shoemaker of SMCDHS gave permission to collect a sample in her absence.

The polyethylene bailer used for purging was then used for collection of a sample. Two 1 liter amber bottles with preservative were filled with groundwater. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was disposed to the sanitary sewer under temporary permit from SBSA. The well was capped, locked, and covered.

DRAFT

MW-2 Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses for oil and grease (O&G) by EPA method 418.1. Laboratory reports are attached which include quality control. Table 1 summarizes the laboratory results. The MW-2 groundwater sample was found to contain 1.6 mg/L of O&G.

Re-inspection of MW-1 Laboratory Analyses

In response to a request from Ms. Michele Shoemaker for additional sampling of nearby monitor well MW-1 associated with a former UST (Figure 2), ASE asked Priority Environmental Labs to re-inspect the results for samples collected from MW-1. The chromatograms for groundwater samples collected on November 3, 1994 and February 3, 1995 were re-examined for the presence of motor oil by the laboratory, with none detected. Modified laboratory reports for these samples are attached.

Summary and Conclusions

This report has been prepared to document groundwater extraction and sampling at MW-2, located in the excavation of a former hydraulic lift at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

On Saturday 13 March 1995 a total of 779 gallons were pumped from MW-2 using a submersible pump with discharge to the sanitary sewer under permit. The pump was stopped and restarted three times due to entrained air. A white foam with an oily feel was noted on the submersible pump when it was removed from the well. The foam did not have the appearance of a petroleum product in that it was white.

On 15 March 1995, Two days following pumping the monitor well was purged and a groundwater sample collected using standard procedures (3 casing volumes, 80% recovery). No free product or petroleum odors were noted in the groundwater. White globules and a sheen were noted on the water by the sampler.

Laboratory reports for the groundwater sample collected on March 15, 1995 are attached. The groundwater sample from MW-2 was found to contain 1.6 mg/L of O&G (Table 1), about the same as for the two previous samples. The concentration suggests that the white foam/globules are not a petroleum product, but rather are a food or plant oil that is not detected by EPA Method 418.1. Regardless, the concentrations of O&G that have been detected in MW-2 are below the practical quantitation reporting limit of 5 mg/L required by the Tri-Regional Recommendations for O&G.

DRAFT

For comparison, a study conducted by ABAG of urban run-off into the San Francisco Bay showed mean concentrations of 3 mg/L during dry periods and 8 mg/L during wet periods. In addition, a study conducted in Fresno, California by the USGS measured O&G in urban run-off at an average concentration of 3 mg/L for a residential catchment and 11 mg/L for an industrial catchment. Thus, the concentration of O&G detected in MW-2 is lower than the average concentration measured in urban run-off flowing into San Francisco Bay.

Finally, analytical results for MW-1, a nearby monitor well, were re-inspected for the presence of motor oil with none detected. The lack of motor oil in MW-1 suggests that O&G in groundwater is localized to an area around MW-2.

Recommendations

Based on three quarters of laboratory results for groundwater from MW-2 which show less than 5 mg/L of O&G, the practical quantitation reporting limit required by the Tri-Regional Recommendations for O&G, ASE recommends site closure.

SUBJECT: MW-1 Groundwater Sampling Report
Hydraulic Lift Excavation
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits this groundwater sampling report for monitor well MW-1 as part of a groundwater investigation associated with a former hydraulic lift at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). At the request of Michele Shoemaker of SMCDHS a sample was collected from MW-1 and analyzed for oil and grease (O&G) be EPA Method 418.1 as described in detail below. Attached to this report are copies of field notes, chain of custody forms, and laboratory reports for your records.

DRAFT

History

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was approximately 10 years old. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil samples were collected from beneath the hydraulic lift contained oil and grease (O&G) at progressively lower concentrations (Table 1). The excavation was deepened to the maximum depth attainable with a backhoe that could fit inside the building, approximately 12 feet, where the concentration of O&G was measured at 520 ppm. Water entered the excavation, filling it to 10.9 feet below ground surface. The excavation was pumped once, with about 100 gallons of groundwater removed. Then, a hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet, into the first water bearing zone. A monitor well (MW-2) was constructed in the excavation boring. A grab groundwater sample from the well contained 1.7 ppm of O&G (Table 1).

Subsequently, MW-2 was sampled on March 13, 1995. Laboratory results for the sample collected showed 1.5 ppm of O&G (Table 1). On May 13, 1995 approximately 779 gallons were extracted from MW-2 with discharge to the sanitary sewer under permit. A groundwater sample collected on May 15, 1995 was found to contain 1.6 ppm of O&G.

Previous to removal of the hydraulic lift, a monitor well (MW-1) had been constructed at the location of two former USTs for gasoline and waste oil (Figure 2). MW-1 is located about 30 feet south of MW-1. MW-1 was sampled for four quarters for Total Petroleum Hydrocarbons (TPH) as diesel, with results showing no detectable hydrocarbons. Recently, the lab data for the last two samples from MW-1 were re-inspected by the laboratory for the presence of motor oil, with none detected.

In April 1995 additional hydraulic lifts were removed from the site. A temporary piezometer was constructed in one of these lifts and an engineering survey was conducted at the site. Water level measurements taken on April 21, 1995 showed that the horizontal hydraulic gradient between the monitor wells at the site is imperceptible.

Monitor Well Purging and Sampling

On June 1, 1995 ASE returned to the site to sample monitor well MW-1. Field notes documenting the well sampling are attached.

Prior to purging, the depth to water (DTW) was measured at 9.67 feet below the top of the well casing (TOC). A new clean polyethylene bailer was used for purging. No petroleum odors or visual presence of petroleum were noted during purging. Purge water was discharged into 5-gallon buckets calibrated for volume measurement. A total of 6 gallons were purged from the well, equivalent to greater than 3 casing volumes.

At the end of purging the DTW was measured at 9.68 feet, indicating instant recovery. Ms. Michele Shoemaker of SMCDHS gave permission to collect a sample in her absence.

A new clean polyethylene bailer was used for collection of a sample. Two 1 liter amber bottles with preservative were filled with groundwater. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was placed in labeled buckets pending analytical results. The well was capped, locked, and covered.

DRAFT

MW-1 Laboratory Analyses

The groundwater sample was transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses for oil and grease (O&G) by EPA method 418.1. Laboratory reports are attached which include quality control. Table 1 summarizes the laboratory results. The MW-1 groundwater sample did not contain any detectable O&G.

Summary

This report has been prepared to document groundwater sampling on June 1, 1995 of MW-1 at Chub's Auto Repair, 1180 Main Street, Redwood City, California. Laboratory results for the groundwater sample collected from MW-1 show no detectable O&G.

Conclusions and Recommendations

ASE recommends site closure based on the following observations and conclusions:

1. O&G has been detected in MW-2 at concentrations below the published practical quantitation reporting limit required by the Tri-Regional Recommendations of 5 mg/L.

2. Studies of urban run-off into San Francisco Bay found a mean O&G concentration of 3 mg/L in water, higher than the concentration of O&G detected in MW-2 which is located in close proximity to Redwood Creek.

3. There is no published State of California drinking water standard for O&G.

4. There is no perceptible gradient between MW-1 and MW-2, suggesting little potential for lateral migration of the viscous O&G. The O&G should biodegrade with time.

5. Analytical results for MW-1, located about 30 feet from the former hydraulic lift, show no detectable O&G, suggesting that O&G in groundwater is limited to a localized area around MW-2.

6. The benefit realized by a reduction in O&G concentrations in groundwater over such a limited area from present levels (1.5 mg/L) to less than the detection limit (0.5 mg/L) can not be justified considering the economic cost that would be required.

June 21, 1995

Mr. Larry Chubbick
1180 Main Street
Redwood City, CA 94063

Dear Mr. Chubbick:

UNDERGROUND STORAGE TANK (UST), CASE CLOSURE FOR A 1,000 GALLON WASTE OIL UST AND A 1,000 GALLON GASOLINE UST AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

CASE NO. 330120

This letter confirms the completion of site investigation and remedial action for the underground storage tanks formerly located at the above described location.

Based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in the Title 23, Californian Code of Regulations, Division 3, Chapter 16, Section 2721(e).

Please telephone Michele Shoemaker at (415) 599-1679 if you have any questions regarding this matter.

Sincerely,

Brian J. Zamora, MPH, REHS
Director, Environmental Health

SAN MATEO COUNTY REMEDIAL OVERSIGHT PROGRAM
CASE CLOSURE
M E M O R A N D U M

TO: SAN MATEO COUNTY REMEDIAL OVERSIGHT PROGRAM

FROM: Michele Shoemaker **DATE:** June 13, 1995

SUBJECT: Case Closure for San Mateo County Site #330120, Chub's Auto Repair, 1180 Main Street, Redwood City, California.

BACKGROUND

On January 14, 1994, a 1,000 gallon waste oil underground storage tank (UST) were removed from the subject site. During the process of excavating, a second 1,000 gallon tank was discovered. It was determined to have held gasoline. Both tanks were single walled steel tanks. The waste oil tank had holes, a solvent odor was noted in the air, and the soil beneath the tank was stained. The gasoline tank did not have any holes, odors, or staining. The two tanks were in separate excavations. One soil sample was taken from each end of the tank in both excavations.

INVESTIGATION

Four soil samples were taken from the two UST excavations. Analytical results indicated:

	TPH-g	TPH-d	O&G	B	T	E	X
E-8' wot	<1	<10	<50	<0.005	<0.005	<0.005	<0.005
W-8.5' wot	<1	810	<50	<0.005	<0.005	<0.005	<0.005
N-8' gas	<1	- -	- -	<0.005	<0.005	<0.005	<0.005
S-9.5' gas	<1	- -	- -	<0.005	<0.005	<0.005	<0.005

On 2/3/94 overexcavation of the waste oil tank pit occurred to approximately 10' below ground surface (bgs). A soil sample was obtained at approximately 8' bgs on the west wall. Analytical results were as follows: <1 ppm TPH-g, <10 ppm TPH-d, <50 ppm oil & grease, non detect for 8010 compounds, <0.005 ppm for BTEX constituents. Groundwater was encountered at approximately 9.5' bgs; the pit was partially pumped due to pump failure and a water sample was obtained. Due to contractor error, the pit water sample was only analyzed for oil and grease. The result was 9,000 ppb oil and grease.

The pump was fixed and the pit was pumped at least two more times prior to the sampling the re-charge. The groundwater was sampled again on 02/17/94. Analytical results were: <50 ppb TPH-g, <0.5 ppb BTEX, 530 ppb TPH-d, <5000 ppb oil & grease, and non-detect for 8010 compounds. The diesel was noted by the lab as non-typical diesel.

On 05/04/94 groundwater monitoring well MW-1 was installed within ten (10) feet of the former tanks at the subject site (groundwater gradient was deterimined at the site using two groundwater

monitoirng wells and a temporary piezometer. Based on the data, there is no perceptible gradient). A soil sample was obtained from 10.5-11' below ground surface (bgs). No odors were noted on the boring log. The depth to water was 14' bgs. The soil sample was analyzed for TPH-mo, TPH-d, and BTEX compounds. All analytes were below detection limits: 0.005 ppm for BTEX, 5 ppm TPH-d, and 10 ppm TPH-mo.

The groundwater monitoring well has been monitored four consecutive quarters; no contaminants have been detected. Analytical results are attached.

In early August, 1994 a hydraulic lift was removed from the subject site. The pit was excavated to groundwater at 12' bgs. Soil samples were collected from the excavation and analyzed for oil and grease by 418.1 (see table below). A grab water sample was obtained from the pit. A saw-cut PVC pipe was installed in the excavation and backfilled with pea gravel. The consultant named the PVC pipe as MW-2. Soil and groundwater results from the hoist removal are seen below:

Hydraulic Hoist Analytical Results

Soil sample depth	oil & grease
8-8.5'	12,000 ppm
9-9.5'	1,600 ppm
9.5-10'	1,700 ppm
12-12.5'	520 ppm
pit water 12/12/94	1700 ppb
MW-2 water 3/13/95	1500 ppb
MW-2 water 5/15/95	1600 ppb

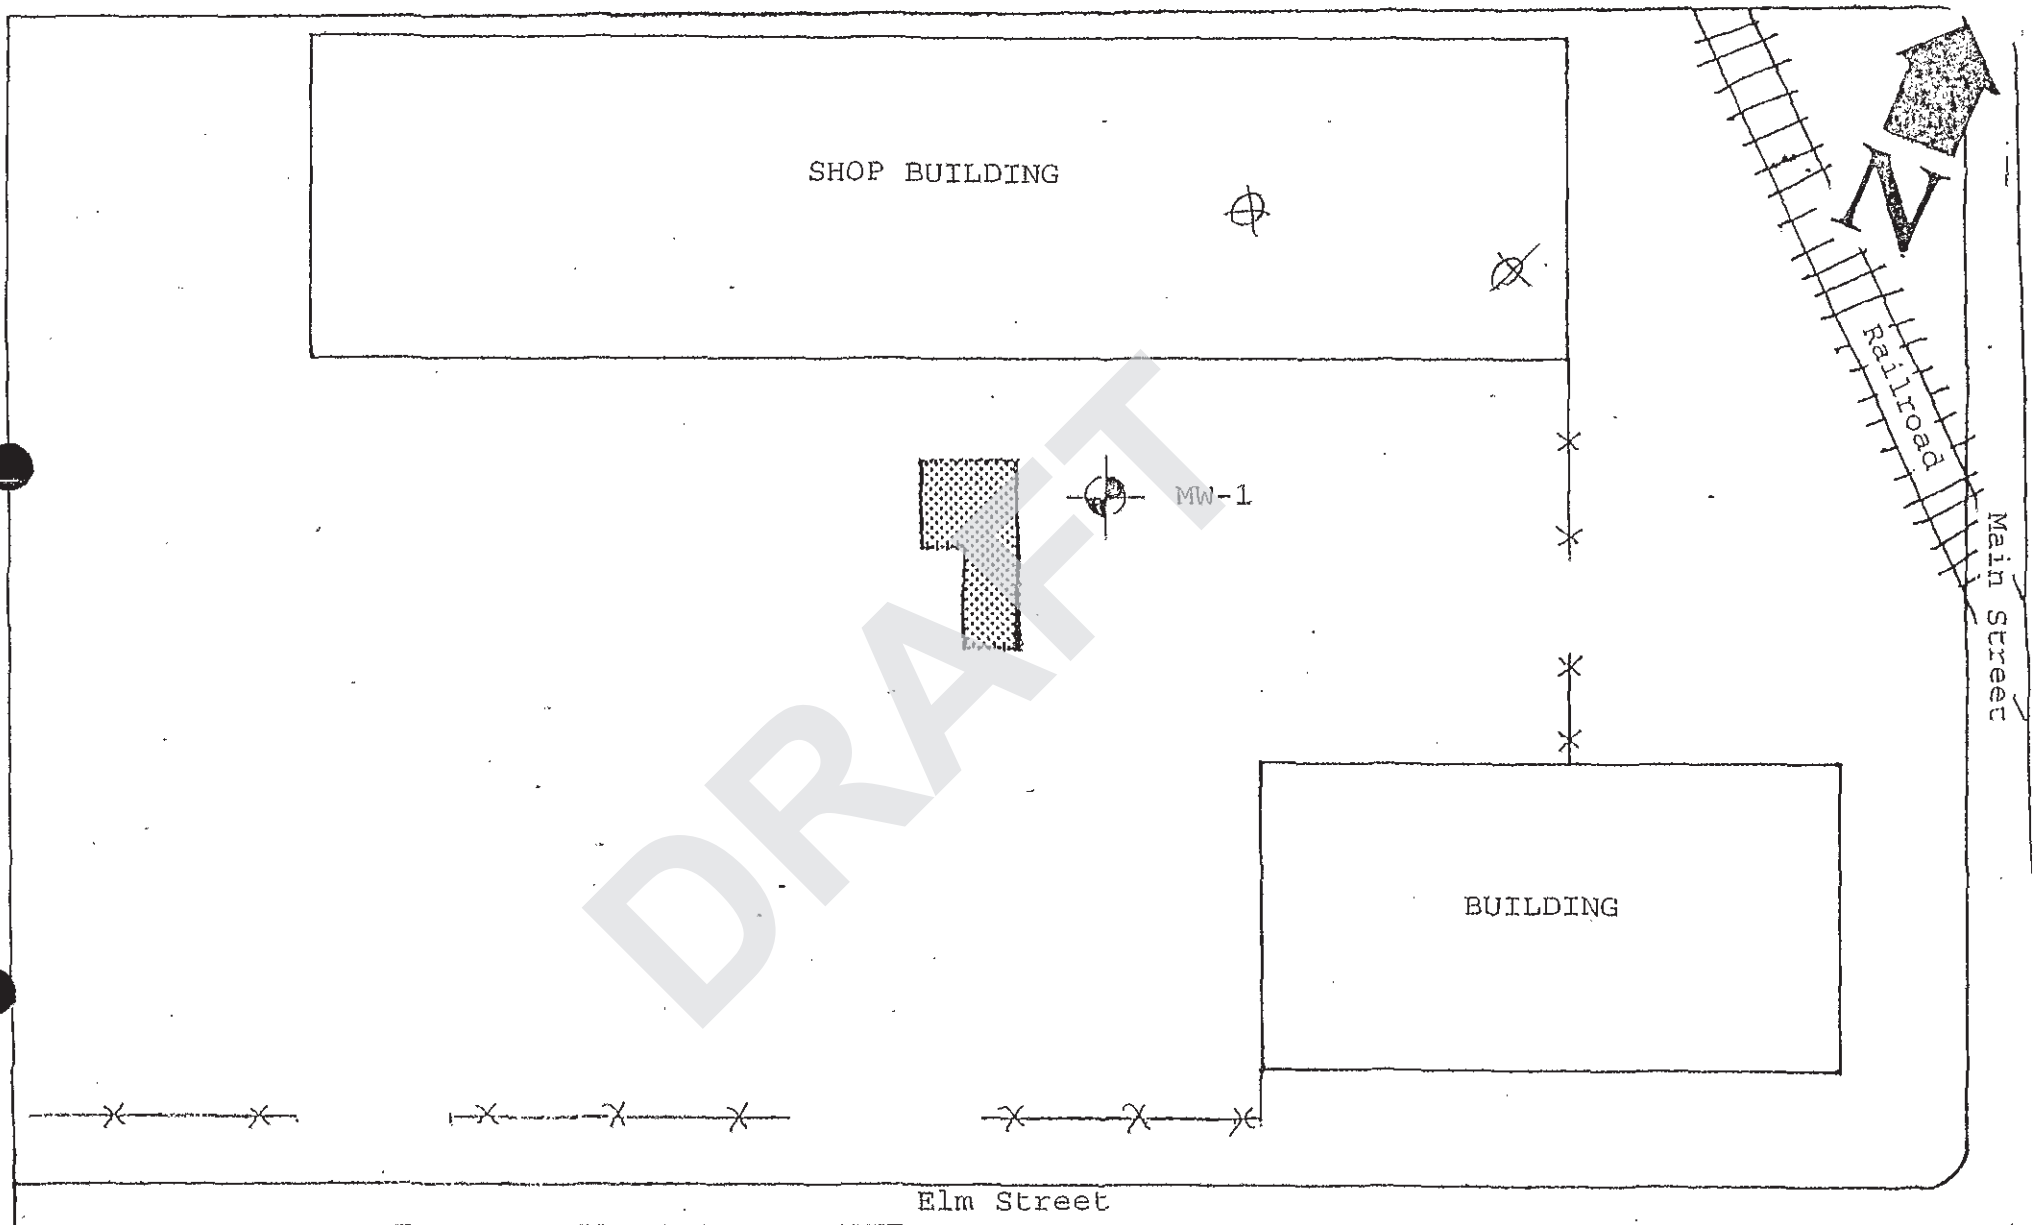
DRAFT

An estimated 2.5 cubic yards of soil contaminated with approximately one (1) gallon of hydraulic oil remains in place at the site.

Approximately 800 gallons were purged from MW-2 and the well was re-sampled for oil and grease. The analytical results are shown above. The samples were analyzed by EPA Method 418.1. On 02/03/95, MW-1 was analyzed for kerosene, diesel, and motor oil with detection limits of 50, 50, and 0.5 ppb. No kerosene, diesel, or motor oil was detected in the groundwater.

On May 29, 1995 MW-1 was sampled for oil and grease. None was detected at detection of 0.5 ppm. The low levels of oil and grease in MW-2 do not pose a threat to human health or the environment. There is not a perceptible gradient between MW-1 and MW-2. Since there is no oil and grease in MW-1, this indicates there is little potential for lateral migration of the oil and grease found in MW-2. Further, the economic cost of remediating such low levels of oil and grease does not warrant additional investigation. According to the consultant, "a study conducted by ABAG of urban run-off into the San Francisco Bay showed mean concentrations of 3 mg/L (oil and grease) during dry periods and 8 mg/L during wet periods. In addition, a study conducted in Fresno, California by the USGS measured oil and grease in urban run-off at an average concentration of 3 mg/L for a residential catchment and 11 mg/L for an industrial

catchment. Thus, the concentration of O&G in MW-2 is lower than the average concentration measured in urban run-off flowing into San Francisco Bay" and therefore the site should be closed.



GEOLOGY

Black silty clays are present to approximately 14' bgs. Black and gray fine gravel and sand underlie the silty clays to at least 20' bgs, the total depth explored.

RECOMMENDATIONS:

Based on the investigation, monitoring results, and other information which is currently and actually known to this agency, we have determined that all appropriate response actions have been completed, all acceptable or remedial practice were implemented, and no further investigation, remedial/removal action, or monitoring is required at the site with regard to a release of hazardous waste or substance from the underground storage tank located at the site. We have determined that a significant release of gasoline fuel has not occurred and the shallow waters have not been significantly impacted. San Mateo County Remedial Oversight Program staff have determined that the water quality objectives of the San Francisco Bay Regional Water Quality Control Board have been satisfied.

SUBJECT: Estimated Volume of Contaminated Soil and Hydraulic Oil Hydraulic Lift Excavation (MW-2)
Chub's Auto Repair
1180 Main Street
Redwood City, California

DRAFT

Dear Ms. Shoemaker,

At your request Applied Science and Engineering, Inc. (ASE) respectfully submits this estimate of the volume of contaminated soil and hydraulic oil that is present in the subsurface in the vicinity of a former hydraulic lift at Chub's Auto Repair, 1180 Main Street in Redwood City, California.

Introduction

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was installed approximately 10 years ago. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994. An excavation 4 feet wide by 8 feet long was created.

Soil samples were collected from beneath the hydraulic lift by hand boring into the bottom of the excavation created by removal (Figure 2). Laboratory results showed O&G in soils beneath the former hydraulic lift to a depth of 12.5 feet. Groundwater was encountered at 12.5 feet, so no deeper soil samples were collected. The soil sample from between 12 to 12.5 feet deep, the final depth of the excavation, was found to contain O&G at 520 ppm. Subsequently, the excavation was deepened to approximately 12 feet, the maximum depth attainable with a backhoe that could fit inside the building.

Subsequent sampling of a monitor well constructed in the excavation revealed only small concentrations of O&G in groundwater beneath the former hydraulic lift (MW-2) and no detectable O&G in a nearby monitor well (MW-1). In anticipation of closing the site you asked for an estimate of the quantities of contaminated soil and hydraulic oil remaining in the ground. This report provides those estimates.

ASE
APPLIED SCIENCE AND ENGINEERING INC.

Estimated Volume of Contaminated Soil and Hydraulic Oil

The volume of contaminated soil remaining in the subsurface was estimated by assuming that hydraulic oil leaked from the bottom of the cavity which contained the hydraulic cylinder and backfill sand. This cavity was approximately 2 feet in diameter and 8 feet deep. Thus, the hydraulic oil is assumed to have leaked from the circular bottom of the cylinder at a depth of 8 feet. Due the lack of perceptible horizontal hydraulic gradient at the site, the radial distribution of the leak was probably symmetrical.

The hydraulic oil is also assumed to have impacted soils between the bottom of the cylinder and the reported depth of first water; between 8 and 12 feet deep. In addition, For the purposes of the volume estimate, the infiltration profile was assumed to be a 45 degree angle extending from the bottom of the cylinder. Based on this assumption the profile extends laterally a distance equal to the vertical distance, 4 feet. This assumption is probably valid for the relatively uniform soil profile present at the site. The volume of soil described by this surface is then reduced by considering that contaminated soils were excavated to a depth of 12 feet over a 4 foot by 8 foot area.

Using the above model of the leak geometry, it is estimated that about 2.5 cubic yards of soil has been impacted by the leak. This soil is beneath the site structure, making it inaccessible.

Assuming an average concentration of O&G in soil of 520 mg/kg yields an estimated volume of hydraulic oil in the ground of about 1 gallon.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,

Frederick A. Yukic, MS, PE
Principal Engineer

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

This office has recently reviewed the case file for closure regarding the investigation associated with the former leaking underground storage tanks at the subject site. This office has forwarded a closure recommendation to the Regional Water Quality Control Board (RWQCB) for concurrence. The RWQCB has approved the closure. This letter is not a case closure letter; however, this office will issue a final case closure letter once the existing groundwater monitoring wells at the subject site have been properly abandoned and all drums containing soil and groundwater have been removed. A draft copy is enclosed. Please have your consultant submit a subsurface drilling application and schedule well abandonment with this office. Please provide seventy-two (72) hour notice to this office of the well abandonment. Should you have any questions, I may be reached at (415) 599-1679. Thank you.

Sincerely,

Michele Shoemaker

Congratulations on the issuance of the Letter of Commitment you recently received from the State Water Resources Control Board. As you are aware, the monies promised by the program is contingent upon continued compliance with site investigation and cleanup requirements. In order to remain in compliance, the following is expected to begin within ninety (90) days from issuance of the Letter of Commitment:

- Sample groundwater monitoring well MW-1 for oil and grease.

This site is being considered for closure. After the results of the MW-1 sampling for oil and grease are received, this office will review the case for closure. If you have questions, I may be reached at (415) 599-1679. Thank you.

Sincerely,

Michele Shoemaker

UNDERGROUND STORAGE TANK CLEANUP FUND, CLAIM NO. 009200, FOR SITE ADDRESS: 1180 Main St., Redwood City 94063

The State Water Resources Control Board (State Board) takes pleasure in issuing the attached Letter of Commitment in an amount not to exceed $20,000. This Letter of Commitment is based upon our review of the corrective action costs incurred to date and your application received on October 20, 1994 and may be modified by the State Board in writing by an amended Letter of Commitment.

Read the terms and conditions listed in the Letter of Commitment. The State Board will take steps to withdraw this Letter of Commitment after 90 calendar days from the date of this transmittal letter unless you proceed with due diligence with your cleanup effort. *This means that you must take positive, concrete steps to ensure that corrective action is proceeding with all due speed. For example, if you have not started your cleanup effort, you must obtain three bids and sign a contract with one of these bidders within 90 calendar days. If your cleanup effort has already started and was delayed, you must resume the expenditure of funds to ensure that your cleanup is proceeding in an expeditious manner. You are reminded that you must comply with all regulatory agency time schedules and requirements.*

This package includes the following:

- *A "Reimbursement Request Instructions" package. Retain this package for future reimbursement requests. These instructions must be followed when seeking reimbursement for corrective action costs incurred after January 1, 1988. Included in the instruction package are: - Samples of completed Reimbursement Request forms and Spreadsheets.*
  - Recommended Minimum Invoice Cost Breakdown
- *A "Bid Summary-Sheet to list information on bids received.*
- *A "Certification of Non-Recovery From Other Sources" which must be returned before any reimbursements can be made.*
- *"Reimbursement Request" forms which you must use to request reimbursement of costs incurred.*
- *"Spreadsheet" forms which you must use in conjunction with your Reimbursement Request.*
- *"Claimant Data Record" (Std. Form 204) which must be completed and returned with your first Reimbursement Request.*

YOU MUST SUBMIT A REIMBURSEMENT REQUEST PACKAGE BY July 24, 1995, OR SEND A WRITTEN UPDATE EXPLAINING:

1. ***Status of cleanup to date.***
2. ***Reason(s) why a reimbursement request has not been submitted.***
3. ***Costs incurred to date for corrective action.***
4. ***Projected date for submitting a reimbursement request.***

We constantly review the status of all active claims. If you do not submit a reimbursement request or a written update by the date above, or fail to proceed with due diligence with the cleanup, we will take steps to withdraw your Letter of Commitment.

If you have any questions regarding the Letter of Commitment or the Reimbursement Request package, please contact Donna L. Turcotte at (916) 227-4532.

Sincerely,

Doug Wilson for

LETTER OF COMMITMENT FOR REIMBURSEMENT OF COSTS

CLAIM NO: 009200

AMENDMENT NO: 0

CLAIMANT: Chub's Auto Repair

BALANCE FORWARD: $0

CO-PAYEE: None

JOINT CLAIMAINT: None

THIS AMOUNT: $20,000

NEW BALANCE: $20,000

CLAIMANT ADDRESS: 543 Sunset Way
Redwood City, CA 94062

TAX ID/SSA NO: 94-2787556

Subject to availability of funds, the State Water Resources Control Board (SWRCB) agrees to reimburse Chub's Auto Repair (Claimant) for eligible corrective action costs at 1180 Main St., Redwood City 94063 (Site). The commitment reflected by this Letter is subject to all of the following terms and conditions:

1. Reimbursement shall not exceed $20,000 unless this amount is subsequently modified in writing by an amended Letter of Commitment.

2. The obligation to pay any sum under this Letter of Commitment is contingent upon availability of funds. In the event that sufficient funds are not available for reasons beyond the reasonable control of the SWRCB, the SWRCB shall not be obligated to make any disbursements hereunder. If any disbursements otherwise due under this Letter of Commitment are deferred because of unavailability of funds, such disbursements will promptly be made when sufficient funds do become available. Nothing herein shall be construed to provide the Claimant with a right of priority for disbursement over any other claimant who has a similar Letter of Commitment.

3. All costs for which reimbursement is sought must be eligible for reimbursement and the Claimant must be the person entitled to reimbursement thereof.

4. Claimant must at all times be in compliance with all applicable state laws, rules and regulations and with all terms, conditions, and commitments contained in the Claimant's Application and any supporting documents or in any payment requests submitted by the Claimant.

5. No disbursement under this Letter of Commitment will be made except upon receipt of acceptable Standard Form Payment Requests duly executed by or on behalf of the Claimant. All Payment Requests must be executed by the Claimant or a duly authorized representative who has been approved by the Division of Clean Water Programs.

6. Any and all disbursements payable under this Letter of Commitment may be withheld if the Claimant is not in compliance with the provisions of Paragraph 5 above.

7. Neither this Letter of Commitment nor any right thereunder is assignable by the Claimant without the written consent of the SWRCB. In the event of any such assignment, the rights of the assignee shall be subject to all terms and conditions set forth in this Letter of Commitment and the SWRCB's consent.

8. This Letter of Commitment may be withdrawn at any time by the SWRCB if completion of corrective action is not performed with reasonable diligence.

IN WITNESS WHEREOF, this Letter of Commitment has been issued by the SWRCB this 6th day of April, 1995.

SMCo# 330120

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

I have recently reviewed the March 30, 1995 Applied Science and Engineering Monitor Well Sampling Report for MW-2 at the subject site. The report recommends closure of the site. There are two issues at the site that need to be resolved before closure can be granted.

First, the report requests case closure based on the level of less than 5,000 parts per billion (ppb) of oil and grease, per the Tri-Regional Recommendations. I have spoken with the Regional Water Quality Control Board regarding oil and grease in water. The detection limit of oil and grease in water is 1,000 ppb and it is the Board's decision that sites with oil and grease levels above 1,000 ppb will not be closed. Currently, the level of oil and grease in the water exceeds 1,000 ppb.

The second issue is the direction of groundwater gradient. Before a case can be closed, the direction of the groundwater gradient at the subject site must be determined. Typically, it is common to install three groundwater monitoring wells in a triangular configuration to determine gradient. In conversations with your consultant, I have stated that if no other groundwater monitoring wells are available, historical data may be used to establish the gradient. To date, no data has been provided to this office regarding the gradient. Please submit the direction of the groundwater flow at the subject site.

Should you have any questions, you may reach me at (415) 599-1679.

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

Thank you for the February 16, 1995 Applied Science and Engineering Monitor Well Sampling Report for the subject site. The report completes this office's request to monitor the groundwater for four consecutive quarters. The report requests case closure at the site. There are two issues at the site that prevent closure review at this time. First, the site specific groundwater gradient needs to be calculated using the on-site well, MW-1. Second, the removal of a hydraulic hoist indicated oil and grease impact to the soil at the subject site. I discussed the oil and grease issue with the Regional Water Quality Control Board to determine if additional investigation was required. Based on the levels of oil and grease in the soil, I was informed that an investigation was required. Before the site can be closed, the investigation will be required. I have stated in previous letters that the existing well MW-1 may be able to be used for this investigation. After the gradient has been determined, it should be evident whether or not MW-1 will be able to be used for the hydraulic hoist investigation.

Should you have any questions, you may reach me at (415) 599-1679.

Sincerely,

Michele Shoemaker

Solvent cementing of thermoplastic pipe should not be used in the construction of ground-water monitoring wells. In solvent cementing, a solvent primer is generally used to clean the two pieces of casing to be joined and a solvent cement is then spread over the cleaned surface areas. The two sections are assembled while the cement is wet. This allows the active solvent agent(s) to penetrate and soften the two casing surfaces that are joined. As the cement cures, the two pieces of casing are fused together; a residue of chemicals from the solvent cement remains at the joint. The cements used in solvent welding, which are themselves organic chemicals, have been show to adversely affect the integrity of ground-water samples. (See Aller et al., 1989 for a summary of relevant research.)

2.5 Well Intake Design

The RP should design and construct the intakes of monitoring wells to (1) accurately sample the aquifer zone the well is intended to sample; (2) minimize the passage of formation materials (turbidity) into the well; and (3) ensure sufficient structural integrity to prevent the collapse of the intake structure.

2.5.1 Well Screen

The goal of a properly completed monitoring well is to provide low turbidity water that is representative of ground-water quality in the vicinity of the well. Monitoring wells completed in rock often do not require screens, though wells completed in unconsolidated sediments do require screens.

Screen Length

The selection of screen length usually depends on the objective of the well. Piezometers, for example, are generally completed using short screens (2 feet or less), as are wells where only a discrete flow path, such as thin gravel interbedded with clays, is monitored. To avoid dilution, well screens should be kept to the minimum length appropriate for intercepting a contaminant plume, especially in a high-yielding aquifer. The screen length should generally not exceed 10 feet. If construction of a water table well is the objective, either for defining flow gradient or detecting the presence of floating non-aqueous phase liquid (NAPL), then a longer screen spanning the water table is acceptable, to account for NAPL's or seasonal water table fluctuations. The RP should not use screen lengths that create a conduit for contaminant transport across hydraulically separated geologic units.

Screen Slot Size

Well screen slot size should be selected to retain at least 90% of the filter pack material (discussed below) in artificially filter packed wells, or a minimum of 50% of the formation material in naturally packed wells, unless the RP can demonstrate that turbidity-free water (<5 nephelometric turbidity units) can be obtained using a larger slot size. Although this is a higher percentage than is usually required in a production well, the low withdrawal rates and the infrequent use of a monitoring well necessitate the higher

DRAFT

percentage exclusion. Cal EPA emphasizes that filtering a sample subsequent to its collection is not the solution for dealing with turbidity in an improperly designed well. Furthermore, well screens should be factory-slotted. Manually slotting casing as a substitute for screens should not be accepted under any conditions.

2.5.2 Filter Packs/Pack Material

The annular space between the borehole wall and the screen or slotted casing should be filled in a manner that minimizes the passage of formation materials into the well. The driller should generally install an artificial filter pack around each well intake. As discussed above, wells in rock often do not require screens, and thus do not require filter packs. However, they are the exception; most wells will require filter packs and a screened length of casing. Aller et al. (1989) provide a comprehensive discussion of the purpose and selection of filter pack materials.

An artificial filter pack is appropriate in most geologic settings. In particular, an artificial filter pack should be used when: 1) the natural formation is poorly sorted; 2) a long screened interval is required and/or the intake spans highly stratified geologic materials of widely varying grain sizes; 3) the natural formation is a uniform fine sand, silt, or clay, 4) the natural formation is thin-bedded, 5) the natural formation is poorly cemented sandstone, 6) the natural formation is highly fractured or characterized by relatively large solution channels; 6) the natural formation is shales or coals that will act as a constant source of turbidity to ground-water samples; and 7) the diameter of the borehole is significantly greater than the diameter of the screen (Aller et al., 1989). Using natural formation material as filter pack is recommended only when the natural formation materials are well sorted and relatively coarse-grained.

Filter pack material should be chemically inert. The best filter packs are made from industrial grade quartz (Barcelona, 1985a). Any other type of sand should be analyzed for cation exchange capacity and volatile organic compounds (VOCs) to determine whether it will interact with analytes of concern in the ground water. Commercially available pea gravel may be acceptable for use in gravel aquifers; however, because the filter pack should be chemically inert, the pea gravel itself should not be chemically active or coated with a chemically active metal oxide. Filters constructed from fabric should not be allowed, as they tend to plug and may be chemically reactive.

Aller et al. (1989) provide the following summary of methods for selecting the size of filter pack materials:

> "Although design techniques vary, all use the filter pack ratio to establish size differential between the formation materials and filter pack materials. Generally this ratio refers to either the average (50 percent retained) grain size of the formation material or the 70 percent retained size of the formation material. For example, Walker (1974) and Barcelona et al. (1985a [1985b in this document])

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

This letter is in response to Mr. Fred Yukic's January 12, 1995 letter to this office. Mr. Yukic poses two questions which I will answer: 1.) Why is there a need to investigate groundwater? 2.) Why isn't the "piping" considered a well?

1.) I have contacted the Regional Water Quality Control Board regarding this site. Because of the oil and grease detected in the soil, an investigation is required. Mr. Yukic refers to the Practical Quantitation Reporting Limit of 5 ppm listed in the Tri-Regional Recommendations. According to the RWQCB, detection of oil and grease above 1,000 ppb requires an investigation. The level of oil and grease detected in the groundwater sample obtained from the site was 1,700 ppb.

2.) The PVC piping installed at the site certainly meets the definition enclosed by Mr. Yukic from the Department of Water Resources California Well Standards, but the definition does not include a complete description of how a well is constructed. Please see the attached figure 2, typical monitoring well. The piping allows for qualitative water samples to be obtained, but not for water samples representative of the aquifer to be obtained.

The piping at the site may be used for groundwater extraction purposes. As was stated previously, the existing well at the site may be able to be used to investigate the groundwater. Please refer to my letter to you dated December 23, 1994. Thank you. Should you have any questions, you may reach me at (415) 599-1679.

Sincerely,

Michele Shoemaker
Hazardous Materials Specialist
County Remedial Oversight Program

SUBJECT: Response to Comments - Former Hydraulic Lift
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

This letter is in response to a 23 December 1994 letter from you to Mr. Larry Chubick concerning a subsurface investigation at Chub's Auto Repair, 1180 Main Street in Redwood City, California. There are currently two separate investigations at the site; a former UST excavation and a former hydraulic lift excavation. This letter responds only to issues concerning the former hydraulic lift and the associated monitor well (MW-2).

DRAFT

Background

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Soil samples collected from beneath the hydraulic lift by hand boring into the bottom of the excavation showed O&G in soils beneath the former hydraulic lift to a depth of 12.5 feet. A soil sample from between 12 to 12.5 feet deep, the final depth of the excavation, was found to contain O&G at 520 ppm.

Subsequently, the excavation was deepened to approximately 12 feet, the maximum depth attainable. Water entered this excavation, filling it to 10.9 feet below ground surface. In accordance with the Tri-Regional Recommendations (see attached Case B) and the SMCDHS CLEP Guidelines by incorporation, the excavation was pumped once, allowed to recharge, and then was sampled. Lab results show that the groundwater sample contained 1.7 ppm of O&G, which is below the required practical quantitation reporting limit for leaking underground fuel tanks of 5.0 ppm (see attached).

A hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet where the first water bearing zone was encountered. A monitor well (MW-2) was constructed in the boring and excavation of 4-inch diameter PVC pipe with saw cut slots. Pea gravel backfill was placed around the well from the bottom of the excavation to ground surface.

Issue #1 - Why is there a need to investigate groundwater?

You letter states that "... it appears that the hydraulic oil from the lift has impacted soil and groundwater at the site." As evidenced by the soil sample from 12.5 feet it does appear that soil beneath the former hydraulic lift has been impacted. However, based on the groundwater sample collected from the pit which contained O&G at a concentration below the required Practical Quantitation Reporting Limit of 5 ppm listed in the Tri-Regional Recommendations, it does not appear that groundwater has been significantly impacted. As such, continued monitoring does not appear to be required by the regulations.

Issue #2 - Why isn't the "piping" a monitor well?

According to the definition contained in the California Water Code (see attached DWR Monitor Well standard) MW-2 is a monitor well. Our review of the Monitor Well Standards does not show any deficiencies in the construction of MW-2. In addition, MW-2 is located in the excavation backfill, where any potential impacts to groundwater can be monitored. There are numerous other sites in the County where wells were constructed in the backfill and were accepted by your office. Therefore, ASE believes that MW-2 is a satisfactorily constructed monitor well.

Please state your reasons and authority in refusing to recognize MW-2 as a monitor well. Construction of another monitor well in lieu of MW-2 would not provide any additional benefit, and would be an economic hardship on the client, a small businessperson.

Please call me at (415) 363-2445 if you have any questions or require additional information. Please respond in writing to the issues raised above.

Sincerely,

Frederick A. Yukic, MS, PE
Principal Engineer

DRAFT

EXPLANATION FOR TABLE #2: MINIMUM VERIFICATION ANALYSIS

1. OTHER METHODOLOGIES are continually being developed, and as methods are accepted by EPA or DHS, they also can be used.

2. For DRINKING WATER SOURCES, EPA recommends that the 500 series for volatile organics be used in preference to the 600 series because the detection limits are lower and the QA/QC is better.

3. APPROPRIATE STANDARDS for the material stored in the tank are to be used for all analyses on Table #2. For instance, seasonally, there may be five different jet fuel mixtures to be considered.

4. TO AVOID FALSE POSITIVE detection of benzene, benzene-free solvents are to be used.

5. TOTAL PETROLEUM HYDROCARBONS (TPH) as gasoline (G) and diesel (D) ranges (volatile and extractible, respectively) are to be analyzed and characterized by GCFID with a fused capillary column and prepared by EPA method 5030 (purge and trap) for volatile hydrocarbons, or extracted by sonication using 3550 methodology for extractible hydrocarbons. Fused capillary columns are preferred to packed columns; a packed column may be used as a "first cut" with "dirty" samples or once the hydrocarbons have been characterized and proper QA/QC is followed.

6. TETRAETHYLLEAD (TEL) analysis may be required if total lead is detected unless the determination is made that the total lead concentration is geogenic (naturally occurring).

7. CHLORINATED HYDROCARBONS (CL HC) and BENZENE, TOLUENE, XYLENE AND ETHYLBENZENE (BTX&E) are analyzed in soil by EPA methods 8010 and 8020, respectively, (or 8240) and for water 601 and 602, respectively, (or 624).

8. OIL AND GREASE (O & G) may be used when heavy, straight chain hydrocarbons may be present. Infrared analysis by method 418.1 may also be acceptable for O & G if proper standards are used. "Standard Methods" 17th Edition, 1989, has changed the 503 series to 5520.

9. PRACTICAL QUANTITATION REPORTING LIMITS are influenced by matrix problems and laboratory QA/QC procedures. Following are the Practical Quantitation Reporting Limits:

	SOIL PPM	WATER PPB
TPH G	1.0	50.0
TPH D	1.0	50.0
BTX&E	0.005	0.5
O & G	50.0	5,000.0

DRAFT

STANDARDS

Part I. General

Section 1. Definitions*.

A. Monitoring Well. The term "monitoring well" is defined in Section 13712 of the California Water Code as:

> ". . . any artificial excavation by any method for the purpose of monitoring fluctuations in ground water levels, quality of underground waters, or the concentration of contaminants in underground water."

B. Exploration Hole (or Boring). For the purpose of these standards, an exploration hole or boring is an uncased excavation whose purpose is the immediate determination of hydrologic conditions at a site.

C. Enforcing Agency. An agency designated by duly authorized local, regional, or state government to administer laws or ordinances pertaining to the construction, maintenance, and destruction of monitoring wells.

Section 2. Application to Well Type.

These standards apply to all types of monitoring wells, except as prescribed in Sections 3 and 4, that follow. Before a change in use of a well is made, standards for the new use shall be complied with.

Section 3. Exemptions for Unusual Conditions.

Under certain circumstances the enforcing agency may waive compliance with these standards and prescribe alternate requirements. These standards may be waived only where they are impractical or ineffective because of unusual conditions, or would result in an unsatisfactory well condition or function. In waiving these standards the enforcing agency shall, if at all possible, require that measures be implemented to provide the same or greater level of water quality protection than would otherwise be provided by these standards.

---

*Technical terms are also defined in Appendix A.

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

Thank you for the Applied Science and Engineering Inc. (ASE) Hydraulic Lift Sampling Results report dated December 21, 1994 for the subject site. Based on the results presented in the report, it appears that the hydraulic oil from the lift has impacted soil and groundwater at the site.

A PVC pipe was installed in the excavation area. This office does not consider the piping a groundwater monitoring well, which is required to be installed to investigate the groundwater conditions at the site, but do feel that if necessary, groundwater can be extracted from it. Groundwater extraction is a commonly used remediation method. It is my understanding that you have been waiting to concrete the excavated area based on this office's decision on the piping; please be advised that you may cement the piping in place.

As I mentioned above, a groundwater monitoring well will need to be installed at the site to investigate the groundwater at the site in relation to the hydraulic hoist. I have mentioned in previous letters that the direction of the groundwater flow needs to be determined. It would be prudent to determine the gradient at the site before installing another well as the existing well might be able to be used for the hydraulic hoist investigation. Two conditions would enable the existing well to be used: 1.) the hydraulic hoist area is upgradient from the existing well or 2.) the gradient at the site is flat.

Should you have any questions, you may reach me at (415) 599-1679.

Sincerely,

Michele Shoemaker

SUBJECT: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

Thank you for the Applied Science and Engineering Inc. (ASE) Monitor Well Sampling Report dated November 14, 1994. One more quarter of groundwater monitoring is required at the subject site in relation to the removal of underground storage tanks.

It is my understanding that a hydraulic hoist was removed from inside the building at the subject site on October 5, 1994 and that oil and grease was found at depths up to twelve feet below ground surface. This office has no further information about the hoist removal. Please update this office as to the status of the hoist removal.

After the fourth quarter of groundwater monitoring has occurred and the gradient has been determined using the on-site well, this office will review the case for closure regarding the removal of the underground storage tanks.

Please notify this office seventy-two hours prior to any site activities. Should you have any questions, you may reach me at (415) 599-1679.

Thank you for the Applied Science and Engineering Inc. (ASE) Monitoring Well Construction Report dated May 24, 1994. The report states that the water in the tank pit from the underground storage tank excavation was pumped dry and did not recharge. For clarification purposes, the pit was pumped at least three times, with full recharge each time. The contractor that submitted the tank removal report has been instructed to clarify this information in a revised tank removal report. I have discussed the situation with Mr. Yukic of ASE and it is this office's understanding that future groundwater monitoring reports will reflect the actual events that occurred.

Your consultant has requested that on the basis of the analytical results to date, the well only be sampled for TPH-diesel and BTEX compounds. This office concurs with this request. As you are aware, the monitoring well will need to be monitored three more times (August and November of 1994 and February of 1995) to be considered for case closure. If the well shows no contamination for four consecutive quarters, this office will process a request for case closure. This office requires seventy-two hour notification before sampling events. Should you have any questions, you may reach me at (415) 599-1679. Thank you.

Sincerely,

Michele Shoemaker
Hazardous Materials Specialist

RE: SUBSURFACE INVESTIGATION AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

I received and reviewed the SEMCO Tank Removal Report for the subject site. The report has several statements that contradict what this office believes occurred at the site. These statements and my concerns are listed below.

- Page 2 states, "The water sample was to be analyzed for the same constituents (TPH-gasoline, TPH-diesel, oil and grease, BTEX), but not enough water was collected, so oil and grease was the only analysis run".

I witnessed three 40 milliliter VOAs and three amber liter bottles filled. This is sufficient sample to run the above analyses.

- Page 2 states, "Initially, San Mateo County Environmental Health Department had stated that this water sample, due to the inadequate amount, and obvious floating product, would not need to be analyzed. But it was later decided by San Mateo County to run the analysis."

This office did not state that a because of a lack of sample and obvious floating product, the water would not need to be analyzed. As mentioned above, sufficient sample amounts were witnessed by this office to run the required analyses. Additionally, after the pit was pumped, floating product was not visible.

- Page 3 states, "Another water sample still needed to be collected, so an appointment was scheduled for February 17, 1994".

This office was expecting analytical results for the groundwater sample taken on February 9, 1994. On February 14, 1994 I was on another County Remedial Oversite Program site in the city of San Mateo when Mr. Chuck Kiper of your office requested that another water sample be taken since when the pit was originally pumped, the pump was malfunctioning.

DRAFT

SAN MATEO COUNTY BOARD OF SUPERVISORS

HEALTH SERVICES AGENCY DIRECTOR
MARGARET TAYLOR

ENVIRONMENTAL HEALTH SERVICES DIVISION DIRECTOR
BRIAN ZAMORA, MPH, REHS

590 HAMILTON STREET, REDWOOD CITY, CALIFORNIA 94063
PHONE (415) 363-4305 • TDD (415) 573-3206 • FAX [415] 363-7882

I agreed that the pit could be pumped one more time. I called your office on February 16, 1994 to make an appointment and you stated that the pit was being pumped as we spoke. An appointment was scheduled for February 17, 1994. When I arrived on site on February 17, 1994, the pit was being pumped for the second time in two days. San Mateo County policy is to pump the pit one time and sample within twenty-four hours. SEMCO was informed that this overpumping of the pit was in violation of County policy but that a sample should be taken.

Once again, three amber liter bottles and three 40 milliliter VOAs were filled. After a discussion with Dean Peterson of this office, a decision was made to analyze both pit water samples (2/9/94 and 2/17/94).

On February 22, 1994 I called Mr. Kiper of your office and told him that both samples should be run for all analyses. He stated that he would make sure that they were.

The Tank Removal Report submitted to this office directly contradicts the events that actually occurred. Please submit a revised report to this office by **May 17, 1994.** If you should have any questions, please contact me at (415) 599-1679.

Sincerely,

Michele Shoemaker

SUBJECT: SUBSURFACE INVESTIGATION AT 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

Thank you for the Applied Science and Engineering Inc. Workplan dated March 30, 1994 for the subject site. The workplan proposes installing one groundwater monitoring well. The direction of groundwater flow must be determined at the subject site. Typically, three monitoring wells are measured and a gradient is calculated. Existing monitoring wells at 25 Maple Street and 1501 El Camino Real, Redwood City, California may be used to determine gradient. Have your consultant contact the well owners to gain access to the wells.

In addition, groundwater ~~and soil~~ samples taken during the monitoring well installation and groundwater samples taken after well development at the subject site must be analyzed for: TPH-gasoline, TPH-diesel, BTEX, oil and grease, and EPA 8240.

Once the above items are addressed, subsurface drilling permits will be issued and the work may proceede.

Should you have any questions, you may reach me at (415) 599-1679. Thank you.

Sincerely,

Michele Shoemaker

DRAFT

SUBJECT: CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

Our files identify your company as a discharger, or potential discharger, of waste to waters and/or soil of the State as the result of petroleum product leaks from underground tanks at facilities it owns, operates, or for which it is liable. This letter is intended to clarify your responsibilities for reporting, investigating, and conducting cleanup of such discharges.

The San Francisco Bay Regional Water Quality Control Board (RWQCB) is responsible for oversight of soil and ground water pollution cases which threaten or impact waters of the State. However, due to the large number of fuel leak cases reported, the RWQCB Staff is not able to respond to each incident. Therefore, the San Mateo County Leaking Underground Fuel Tank (LUFT) Enforcement Program (CLEP) is working with the RWQCB and is taking the lead role for case-handling. Regardless of the level of oversight from agencies, you are responsible for the timely reporting, investigation, and cleanup of soil and ground water pollution such that the beneficial uses of waters of the State are protected, and in compliance with appropriate policies.

As described in enclosure (1), you are responsible to reimburse the State of California for up to 150 percent of the site specific oversight costs incurred by the County while overseeing the cleanup of your site.

Investigations and Cleanup Responsibilities:

The subject underground tank leak case has been reported as your responsibility. The following steps are the minimum required for addressing your site:

1. Determine the lateral and vertical extent of soil and ground water pollution.

2. Assess the local and regional hydrogeology as appropriate to evaluate actual or potential impacts of contamination to beneficial uses of surface and/or ground water.

3. Evaluate and implement appropriate remedial action alternatives.

4. *Remove all floating or free product. Dissolved constituents and contaminated soil* should be remediated consistent with State Water Resources Control Board Resolution No. 68-16.

DRAFT

Reporting Responsibilities

1. Submittal of individual technical reports, for the site, detailing all investigative and remedial actions associated with the site. These reports shall be submitted on a quarterly basis, unless more frequent reports are requested by this office or the RWQCB. These reports shall be submitted until such time as the case is closed by CLEP and the RWQCB.

2. A summary report shall be submitted on a quarterly basis and include the following information, at a minimum:

   a. Site name, address, city and county site number.

   b. A brief background history of the investigation and remedial actions.

   c. A chronological listing of actions that were taken regarding investigation and remediation during the previous quarter.

   d. A listing, with scheduled dates, of actions planned for the next quarter.

   e. Status on the characterization of soil pollution, free product, and dissolved constituents.

   f. Status on remediation of soil pollution, free product, and dissolved constituents. This shall include a report of the gallons of product recovered, and a calculation for the amount of product recovered from dissolved phase removal and/or vapor extraction.

The first quarterly summary report shall be submitted thirty (30) calendar days from the date of this letter, and quarterly thereafter.

All proposals and reports which contain engineering or geological information, interpretations, or other opinions as specified by The Business and Professions Code, must be signed AND STAMPED by an appropriately registered professional. In general, all reports on investigation and remediation require this type of signature.

All proposals and reports submitted to us must be accompanied by a cover letter signed by an officer or legally authorized representative of your company which states at a minimum:

> "I declare under penalty of perjury, that the information and/or recommendations contained in the attached proposal or report is true and correct."

You are required to submit the above reports pursuant to Section 13267(b) of the California Water Code. Failure to comply may subject you to the imposition of administrative civil liabilities by the Regional Board of up to one thousand dollars ($1,000) per day of non-compliance.

Two (2) additional enclosures include:

- A partial resource list of consultants that may assist you in meeting the above requirements.

and

- A brief informational packet discussing possible state monies available to you.

Thank you for your cooperation in this matter. Please contact me within 15 days at (415) 599-1679 to further discuss your case and answer any questions.

Sincerely,

Michele Shoemaker

Standard Stormwater Facility Inspection Report Form

Inspection conducted by: San Mateo County, Environmental Health Division, 590 Hamilton St., Redwood City, CA 94063

Reason for Inspection: ☐ First Inspection ☑ Routine Inspection ☐ Complaint ☐ Other | Facility location: Incorporated ☑ Unincorporated ☐

NAME OF FACILITY: FIVE STAR DEVELOPMENT | SITE ADDRESS: 134 MAPLE

CONTACT NAME	PHONE	BUSINESS TYPE/ACTIVITY	SIC

Is the facility covered under any other programs or permits?

☐ None ☐ Sanitary sewer
☐ Air quality ☐ Hazmat business plan ☐ Underground storage tanks ☐ Aboveground storage tanks
☐ Fire department(hazmat storage) ☐ Hazmat waste generator ☐ Retail food facility ☐ Other

Is the facility covered under a storm water permit? ☐ Does not need Coverage ☐ No, but may need to be (Refer to Regional Board)
☐ Individual ☐ General: Does the facility have a SWPPP? ☐ yes ☐ no

N/A = Not Applicable; POTENTIAL for Pollutant Exposure without BMPs: 1 = low potential, 2 = medium potential, 3 = high potential
ACTUAL Type of Discharge: BMP: 0 = BMPs are effective, 1 = BMPs are fairly/almost effective, 2 = BMPs are not effective, 3 = No BMPs are implemented
PEX = Pollutant Exposure, NSW = Non-Stormwater Discharge

AREAS OF ACTIVITY	N/A	POTENTIAL	ACTUAL BMP	ACTUAL PEX	ACTUAL NSW	REMARKS: Describe recommendations, requirements, and time to implement. Check box if remark is a *requirement.*
A. Outdoor Process/Manufacturing Areas	/					☐
B. Outdoor Material Storage Areas	/					☐
C. Outdoor Waste Storage/Disposal Areas	/					☐
D. Outdoor Vehicle and Heavy Equipment Storage, Maintenance Areas	/					☐
E. Outdoor Parking Areas and Access Roads	/					☐
F. Outdoor Wash Areas	/					☐
G. Rooftop Equipment	/					☐
H. Outdoor Drainage from Indoor Areas	/					☐
I. Other (describe):						☐

Outreach material distributed: STOPPP Brochure ☑ Industrial Brochure ☐ BMP Information ☐

The existing operational practices of the facility ☑ Do / ☐ Do Not reduce pollutant discharge to the storm drain system to the maximum extent practicable.

ADDITIONAL COMMENTS/REMARKS

☐ Facility map available ☐ See attached for more comments

PRIORITY FOR RE-INSPECTION: ☐ First ☐ Second ☐ Third

ENFORCEMENT: ☐ None ☐ Verbal Notice ☐ Warning Notice ☐ Informal Violation ☐ Formal Violation ☐ Legal Action

Inspector Luisa Blasco Date 6/1/94

DRAFT

PROCEDURE FOR THE REMOVAL OF UNDERGROUND STORAGE TANKS

1. Complete the "Application for Permit to Close Underground Hazardous Materials Storage Tank" (pages 1&2). Please complete one application per tank.

2. Contact the Local Fire and Building Agency for their policy regarding closure of underground storage tanks.

3. Submit the completed application, designated fee, written workmen's compensation insurance verification and plot plan drawing to the San Mateo County Environmental Health Services Division. The drawing should consist of an aerial view of the facility at which the tank(s) are located and should include the following information:

    a. Scale
    b. North arrow
    c. Property line
    d. Location of structures near the tank(s)
    e. Location of relevant existing equipment, including the tank(s) to be removed, associated piping, and fuel dispensers.
    f. Area roadways

    Also, submit State Water resources Control Board Part A form for the facility, and Part B form for each tank closed. These forms are available from the Environmental Health Services Division.

4. In order to determine the extent of any contamination, soil and/or water samples must be taken from the excavation pit after the tank(s) are removed. Soil samples must also be taken every twenty (20) feet along piping runs at the interface of backfill material and native soil. Soil samples will be required to be taken from the excavation spoils pile (approximately one discrete sample per 20 cubic yards). The samples must be collected by a qualified, independent third party. All samples shall be protected against contamination and/or degradation during their collection, transport, and analysis. A written analysis report, including chain of custody documentation, and sample location map with measurements including depth, must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s). This report is subject to review and must be approved in order to be recognized as valid.

5. A groundwater investigation will be required if any of the following conditions exist or if a representative of the Environmental Health Services Division deems one necessary to assure that the public health and safety is protected:

    a. Soil contamination concentrations exceeding 100 ppm total petroleum hydrocarbons (TPH) or total oil and grease (TOG) within two feet of native soil beneath the tank.

    b. Detectable concentrations of petroleum hydrocarbon are found in soil at or below the seasonable high groundwater level.

    c. Detectable levels of any petroleum hydrocarbon in soil below the tank and the soil contains layers of sand, gravel and/or other high permeability material.

    d. Ground water in excavation pit has detectable levels of any petroleum hydrocarbon. (Pit may be pumped and allowed to recharge).

    e. Site has history of leaks or tanks are in poor condition upon removal.

DRAFT

6. It must be demonstrated to a representative of the Environmental Health Services Division that residual product and any associated waste (i.e.sludge) have been removed from the interior of the tank(s) prior to purging. Documentation of proper disposal of residual product and associated waste using an Uniform Hazardous Waste Manifest (UHWM) must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

7. It must be demonstrated to a representative of the Environmental Health Services Division that tank(s) have been adequately pruged and that no explosive hazard exists at the time of tank(s) removal i.e. 10% of lower Explosive Limit (% LEL) or 5% oxygen.

8. Underground tank(s) and associated piping removed from excavations must be shipped under UHWM to a permitted treatment, storage and disposal (TSD) facility or Class I landfill Underground tanks may be cleaned using a high-pressure washer to reduce the % LEL. This process does not render these tank(s) non-hazardous and these tank(s) must be hauled under a hazardous waste manifest. Only tank(s) cleaned by a State Department of Health Services (DOHS) permitted tank cleaner may be disposed of as non-hazardous waste. Copies of all UHWM must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

9. Any piping associated with the tank(s) which is to remain underground must be flushed of all residual product and capped or sealed to the satisfaction of the Environemental Health Services Division.

10. Transported tanks must have all opening sealed, except for opening atop the tank fitted for ventilation with "T" or other device which will preclude rain entering a stored tank.

11. The Environmental Health Services Division must be notified a minimum of seven days(7) prior to commencement of work to schedule an inspection. Please note that the inspection must be confirmed with the district inspector. A representative of this office must be present at the time of removal.

12. An additional hourly fee will be charged for inspection time exceeding three hours.

13. Site safety plan must be available for review at job site.

THE ABOVE ARE GENERAL PROCEDURES-MODIFICATIONS MAY BE NECESSARY IN CERTAIN CASES. IF YOU HAVE ANY QUESTIONS, OR OTHERWISE NEED ASSISTANCE, PLEASE CALL THE SAN MATEO COUNTY ENVIRONMENTAL HEALTH SERVICES DIVISION AT (415) 363-4305.

I hereby certify that I have read and will follow the "Procedures for the Removal of Underground Storage Tanks"

FORM A (9-90) FOR0003A-R2

DRAFT

INSTRUCTIONS FOR COMPLETING FORM "A"

GENERAL INSTRUCTIONS:

1. One FORM "A" shall be completed for all NEW PERMITS, PERMIT CHANGES or any FACILITY/SITE INFORMATION CHANGES.
2. SUBMIT ONLY ONE (1) FORM "A" for a Facility/Site, regardless of the number of tanks located at the site.
3. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
4. Please type or print clearly all requested information.
5. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Record name and address (physical location) of the underground tank(s).
   NOTE: Address MUST have a valid physical location including city, state, and zip code.
   P.O. BOX NUMBER ARE NOT ACCEPTABLE.
   Include nearest cross street and name of the operator.
2. Phone number must have an area code. If the night number is the same, write "SAME" in proper location.
3. Check the appropriate box for TYPE OF BUSINESS OWNERSHIP (ex. CORPORATION, INDIVIDUAL, etc.)
4. Check the appropriate box for TYPE OF BUSINESS.
5. If Facility/Site is located on land within an indian reservation or other indian trust lands, check the box marked "YES".
6. Indicate the NUMBER of TANKS at this SITE.
7. Record the E.P.A. ID # or write "NONE" in the space provided.

II. PROPERTY OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; if the same, write "SAME AS SITE" across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; If the same, write "SAME AS SITE" across this section. Be sure to check TANK OWNERSHIP TYPE box.

IV BOARD OF EQUALIZATION UST STORAGE FEE ACCOUNT NUMBER (MUST BE COMPLETED)

Enter your Board of Equalization (BOE) UST storage fee account number which is required before your permit application can be processed. Registration with the BOE will ensure that you will receive a quarterly storage fee return requesting the $0.0025 (6 mills) per gallon fee due on the number of gallons placed in your USTs. The BOE will code persons exempt from paying the storage fee so returns will not be sent. If you do not have an account number with the BOE or if you have any questions regarding the fee or exemptions, please call the BOE at 916-739-2582 or write to the BOE at the following address: Board of Equalization, Environmental Fees Unit, P.O. Box 942879, Sacramento, CA 94279-0001.

V. LOCAL NOTIFICATION AND BILLING ADDRESS

1. Check ONE BOX for the address that will be used for BOTH LOCAL AND BILLING NOTIFICATIONS.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the facility number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THIS APPLICATION CANNOT BE PROCESSED IF THE BOE ACCOUNT NUMBER IS NOT FILLED IN. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all NEW PERMITS, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.
2. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987).
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle A if above ground; circle U if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

GENERAL INSTRUCTIONS

1. One COPY of "B" shall be completed for each tank for all NEW PERMITS, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.
2. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
3. Please type or print clearly all requested information.
4. Use a ball point pen writing instrument, you are making 3 copies.

TOP OF FORM: MARK ONLY ONE ITEM

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID #. - If there is a tank number that is used by the owner to identify the tank (ex. AB 0/69).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987)
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. IF MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle A if above ground; circle U if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1983 or 01/88).
2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check "Yes" or "NO".

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

Dear Ms. Belasco:

This is to inform you that Interstate Grading and Paving, Inc. will be the contractor removing the underground tank at the above referenced location.

Interstate's California Contractors License Number is 366020 with classifications "A" and "HAZ". Copies are attached.

Workers Compensation insurance is with Republic Indemnity, Policy No. PC 943307. A copy of certificate is also attached.

If you will need any additional information, please give me a call.

Very truly yours,

INTERSTATE GRADING AND PAVING, INC.

RECEIVED

TRANSMITTAL: Laboratory Results
Stockpile Re-Sampling
134 Maple Street
Redwood City, California

Dear Mr. Marcelli,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed laboratory results for stockpile re-sampling conducted at 134 Maple Street in Redwood City, California on November 9, 1994. The stockpile was generated during removal of two underground storage tanks (USTs). Also attached are a copy of my field notes which include a sketch of the site, a table summarizing the laboratory reports, and a copy of the chain of custody form.

DRAFT

Introduction

ASE was present during removal of a 1,000 gallon diesel UST and 580 gallon gasoline UST on September 9, 1994. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which led to the dispenser location. Soils excavated from above the USTs and along the pipeline trench were placed in a stockpile and covered with plastic. Soils excavated from beneath the USTs were stockpiled separately and covered with plastic. A total of about 30 cubic yards of soil were stockpiled.

Soil samples were collected from the bottom of the UST excavation using the backhoe bucket, as previously reported in a September 28, 1994 letter. Ms. Teresa Belasco of the San Mateo County Department of Health Services (SMCDHS) observed the soil sampling. One soil sample was collected from beneath the fill end of the gasoline UST. Two soil samples were collected from beneath former diesel UST, one from beneath each end. These samples were collected at depths of approximately 8 feet, one foot below the bottom of the UST pits. A soil sample was also collected from the location of the fuel dispenser at a depth of about 3 feet. Finally, ASE collected two soil samples, one from each stockpile, for laboratory analysis. Laboratory results for these samples are shown in Table 1. Upon receipt of the laboratory analyses Ms. Belasco closed the site.

Because low concentrations of petroleum hydrocarbons were detected in the stockpile soil samples, the soil could not be used to backfill the excavation according to SMCDHS guidelines (see attached). Thus, you spread out the stockpile soils and passively aerated them at the site for two months. This report transmits the results of re-sampling of the stockpile after aeration.

Soil Sampling

Two soil samples were collected from the approximately 30 cubic yards of stockpile, in accordance with SMCDHS guidelines requiring one discrete sample for every 20 cubic yards. The sample locations were chosen randomly. Soil samples were collected by scraping away about 6 inches of soil from the surface, then pushing a 2-inch diameter, six inch long brass liner into the exposed soil. The ends of the liner were covered with teflon tape, followed by plastic caps, and then a label was attached to the liner for identification purposes. The liner was placed into an ice chest containing blue ice for preservation during shipment to the laboratory.

Laboratory Analyses

The soil samples were transported under chain of custody (see attached) to Priority Environmental Laboratories (PEL), a state certified laboratory, for analysis. The laboratory report is attached. Laboratory methods used are listed on the reports. Analyses were conducted only for compounds that were detected in the initial stockpile samples.

No benzene, toluene, ethylbenzene, or xylenes (BTEX) were detected in the two soil samples collected as re-sampling of the stockpiles.

Conclusion

Laboratory results for two discrete soil samples collected from a stockpile of approximately 30 cubic yards show no detectable BTEX. Based on these results the stockpile soils have been successfully remediated by passive aeration at the site.

In accordance with SMCDHS guidelines which require no detectable hydrocarbons in the stockpile (see attached), the stockpiled soil can now be used as site backfill.

DRAFT

Please call me at (415) 363-2445 if you have any questions or require additional information. Thank you for the opportunity to work on this project.

Sincerely,

Frederick A. Yukic, MS, PE

SAN MATEO COUNTY POLICY STATEMENT: HANDLING AND DISPOSAL OF REMEDIATED SOIL

APRIL, 1990

BACKGROUND The San Francisco Bay Regional Water Quality Control Board (RWQCB) has recently created policy addressing the fate of soils being excavated at underground tank sites. The RWQCB's policy reads to the effect that soils being tested below detection levels of all contaminants may be used for general fill needs. Any soils tested with levels above the detection limit must be either 1) remediated to below detection limits, 2) disposed of at a properly rated landfill or 3) obtain a variance from the RWQCB to place the soil back into the excavation.

GOAL The goal of this policy statement is to clarify the options available of disposing of soils and to establish a protocol for sampling the soils.

DISCUSSION As discussed in the Tri-regional Guidelines of June 1988, the 100 ppm level is not a cleanup level but is merely used as a tool to prioritize sites and indicate the severity of the original release. Whenever soil contaminated at any level is introduced to the ground the risk of groundwater degradation exists. Such degradation would require additional remedial activities. Offered below is a list of concentration levels and the handling option associated with each concentration.

TPH and BTXE

All Contaminants Non-Detectable	-Reuse for general site fill needs -Dispose of at Class III
10-100 ppm	-Remediate to N.D. -Dispose of at Class III -Obtain variance from RWQCB
100-1000 ppm	-Remediate further -Dispose of at Class II or I
1000 or greater	-Remediate further -Dispose of at Class I

POLICY It shall be the policy of San Mateo County to allow reuse of remediated soils only when laboratory analysis show that the soils contain a nondetectable amount of contaminant. All other soils shall be handled as outlined above.

To characterize the soil in order to determine the levels of contamination present the sampling protocol below has been established. This protocol must be followed whenever the responsible party is attempting to dispose of the soils within San Mateo County.

TTLC = 1000
STLC = 5

* In addition to site specific contaminants, i.e. TPH-G, TPH-D and BTXE etc., all soils being hauled to Ox Mountain Landfill must include testing for total and soluble lead (TTLC/STLC). Approval to haul the soils to Ox Mountain must first be received from San Mateo County.

* Any nonhazardous soils being disposed of outside of San Mateo County must be documented with a Bill of Laden submitted to this office within fifteen (15) days of disposal

All sampling techniques, handling procedures and analytical methodologies as described in both the LUFT guidance and the Tri-regional guidelines shall apply.

A representative of San Mateo County must be notified a minimum of forty-eight (48) hours prior to sampling and shall be present at the time of sampling.

One discrete sample for every 20 cubic yards of soil must be collected and analyzed via the appropriate methods. Composite sampling will no longer be accepted for disposal of soils. The Bay Area Air Quality Management District still requires that their sampling protocol be followed before any aeration begins.

Piles of soil should be spread out to a maximum thickness of two (2) feet and the requisite number of samples are to be obtained one (1) foot into the soil.

If the pile cannot be spread, then the appropriate number of samples shall be taken with a hand auger in a way to best characterize the pile. A grid system should be utilized in conjunction with a random sampling protocol.

TRANSMITTAL: Laboratory Results
Soil Sampling
134 Maple Street
Redwood City, California

DRAFT

Dear Mr. Marcelli,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed laboratory results for soil sampling conducted at 134 Maple Street in Redwood City, California on September 9, 1994 as part of removal of two underground storage tanks (USTs). Also attached are a copy of my field notes which include a sketch of the site, a table summarizing the laboratory reports, and a copy of the chain of custody form.

Observations

ASE was present during removal of both the approximately 1,088 gallon diesel UST and the approximately 580 gallon gasoline UST. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which led to the dispenser location.

Soils excavated from above the USTs and along the pipeline trench were placed in a stockpile and covered with plastic. Soils excavated from beneath the USTs were stockpiled separately and covered with plastic. A total of about 30 cubic yards of soil were stockpiled.

Soil Samples

Soil samples were collected from the backhoe bucket in the presence of Ms. Teresa Belasco of the San Mateo County Department of Health Services (SMCDHS). Soil samples were collected by scraping away about 3 inches of soil from the backhoe bucket, then driving a 2-inch diameter, six inch long brass liner into the exposed soil surface. The ends of the liner were covered with teflon tape, followed by plastic caps, and then a label was attached to the liner for identification purposes. The liner was placed into an ice chest containing blue ice for preservation during shipment to the laboratory.

One soil sample was collected from beneath the fill end of the gasoline UST. Two soil samples were collected from beneath former diesel UST, one from beneath each end. These samples were collected at depths of approximately 8 feet, one foot below the bottom of the UST pits.

A soil sample was also collected from the location of the fuel dispenser at a depth of about 3 feet. Finally, ASE collected two soil samples, one from each stockpile, for laboratory analysis. Ms. Teresa Belasco of SMCDHS was present during this sampling.

Laboratory Analyses

The soil samples were transported under chain of custody (see attached) to Priority Environmental Laboratories (PEL), a state certified laboratory, for analysis. The laboratory report is attached. Laboratory methods used are listed on the reports.

No petroleum hydrocarbons were detected in the three soil samples collected from beneath the USTs.

The soil sample from beneath the dispenser was found to contain 30 ppm of total petroleum hydrocarbons (TPH) as diesel but no detectable TPH as gasoline, benzene, toluene, ethylbenzene, or xylenes (BTEX).

The soil sample from stockpile #1 was found to contain 8.8 ppb of toluene, 5.8 ppb of ethylbenzene, and 27 ppb of xylenes. No TPH as gasoline, TPH as diesel, or benzene were detected in the sample.

The soil sample from stockpile #2 was found to contain 5.6 ppb of xylenes. No TPH as gasoline, TPH as diesel, benzene, toluene, or ethylbenzene were detected in the sample.

Conclusion

On September 15, 1994 the laboratory data was FAXed to Ms. Teresa Belasco at SMCDHS. Subsequently, ASE called her by telephone to discuss the results.

When asked if the excavation could be backfilled with the stockpiled soil Ms. Belasco stated that the lab results must be no petroleum hydrocarbons detected prior to backfilling. Therefore, the stockpiled soils must be aerated and resampled (with results showing no hydrocarbons) prior to re-use in backfilling the excavation.

When asked about the need for further excavation at the fuel dispenser, Ms. Belasco stated that no additional excavation was required because the concentrations were relatively low and the piping and USTs looked in good shape.

DRAFT

Please call me at (415) 363-2445 if you have any questions or require additional information. Thank you for the opportunity to work on this project.

Sincerely,

Frederick A. Yukic, MS, PE

Redwood City, CA 94063

SUBJECT: Closure of Underground Storage Tank, 134 Maple Street, Redwood City, CA

Dear Mr. Marcelli:

This letter confirms the closure of two underground storage tanks under San Mateo County permit number HM 063 94 at the subject site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is our position that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional, or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

Thank you for your cooperation in this matter. I may be reached at (415) 363-4565.

Sincerely,

Teresa Belasco, REHS, MPH

OFFICIAL INSPECTION REPORT / FIELD OBSERVATIONS

Site Name: Chubb's Auto Repair
Site Address: 1180 Main St., PVC

Page 1 of
Date: 6/21/95
Program: CROP
Site Computer #
APN:

On site for scheduled well abandonment by pressure grouting. MW-2 in gravel, took 55 gal grout in pit, then concrete & cement in PVC piping.

MW-1 took approximately 20 gal grout & held pressure.

Larry Chubbuck to finish top 3" of seal to match his pavement / concrete floor.

DRAFT

Inspector: M Schemah
Received By: the file

1180 Main St., RWC Club's Auto

4/26/95 Fred Yukic called. He wanted to know if Chubb could pump water from well in lift pit. I said ok. xns

5/2/95 Reviewed report on gradient & called Fred. Asked to sample MW-1 for O+G also. Fred said "MW-2" will be pumped extensively on 5/13/95 which is a Saturday - it won't interrupt business. Will sample for O+G. xns. Turn close

5/24/95 Submitted for closure.
5/25/95 Gail Lee rejected for closure. If no gradient, then shouldn't conclude the source of oil & grease is from the Redwood Creek. I called Fred & asked him to sample MW-1 for oil & grease. He said the lab quantified a sample from MW-1 for motor oil, diesel, & kerosene (0.5/50/50 ppb detection) & all were non-detect. Spoke w/ Gail she said sample MW-1 for O+G.

5/30/95 Called Larry, asked to sample well (MW-1) for O+G.
6/2/95 Fred Yukic called. MW-1 was non-detect for O+G.
6/13/95 Ken Horowitz 415-328-4500 ext. 14 - Attny handling sale of property. Would like to know when send closure request to state.

DRAFT

Chubs Auto, 1180 Main St., RWC #330120

2/(17)/95 Sent fax to Fred Yukic about well construction.

2/21/95 Rec'd quarterly report. Requests case closure. KMS
Performed partial closure review, but need gradient at site and also need to resolve oil and grease issue. Sent letter. KMS

date not recorded (before 4/20/95)
Spoke with Fred Yukic regarding gradient at the site. Told him it is necessary to know it before can close. Use other wells, or provide rationale. KMS

4/20/95 Fred Yukic called. Put piezometer into one of the hydraulic hoist ~~rep~~ holes. Determined that gradient is flat. KMS

OFFICIAL INSPECTION REPORT / FIELD OBSERVATIONS

Site Name: Chub's Auto
Site Address: 1180 Main St., RWC

Page 1 of 1
Date: 3FEB95
Program: 330120
Site Computer #:
APN:

2/3/95 On site for scheduled groundwater sampling. No odor/sheen. David O. w/ ASE = sampler TPH-d, BTEX. Water is brownish. ASE questioning tidal influence had done some monitoring of depth yesterday. 2x amber l ~~VOA~~ bottle, x40 ml VOA

Piping in the hoist excavation present but not concreted. Recommend that cover-cement the pea gravel. Mr Chubbuck wondered if needed well in that area & I said yes, based on conversation w/ RWQCB & levels detected in the soil. xms

Inspector: Michele Shoemaker
Received By: File

DRAFT

1180 Main St. RWC chubs #330120

JANUARY 31, 1995 - David of ASF called to say he's sampling at 11 on 2/3/95. xms

DRAFT

Chubb's Auto, 1180 Main St. RWC #330120

12/9/94 Spoke w/ Fred Yukic. He wanted to remind me that the overexcavation would be occurring tomorrow at the site. I told Fred I may not go, but that Fred should go, if possible. Fred said he didn't know if he was going to be there so he would talk with Mr. Chubbick today and call me back.

Need grab water sample if hit water (probably will). Stockpile going to Vasco Rd. What is going to be used as fill? Fred will find out. tmg

12/12/14 (on Saturday) Fred called. He said he put in a saw cut (6"screen") PVC pipe in the hole @ Chubbs to act as a well. He pumped out approximately 100 gallons & then sampled Monday. The water appeared oily. The pit was dug out to 12' bgs.

Question: is the pipe considered a well??

12/20/94 - Spoke with Fred Yukic - the water sample from the pit came back at 2 ppm O+G.

1/12/95 Fred Y. called. Wanted to know why a well was needed if O+G are at detection. I called back 1/13/95 and left message for him to call me. tmg

DRAFT

Chubbs Auto, 1180 main St., RWC #330120

8/4/94 On-site for scheduled gw sampling. Did not stay to witness sampling. Brought student intern Barry Buy. XMS

9/1/94 Rec'd quarterly. Still non-detect. Need gradients wrote letter XMS

10/5/94 Fred Yukic called. A hydraulic hoist was removed from the site. Soil samples have been taken and they had hits so dug deeper and still have 500 ppm oil and grease at the water level. I told Fred that I would be the main contact person for this cleanup. I asked him to forward all analytical to me and a brief workplan for the work that he's proposing. We'll probably have to take a water sample and take it from there - XMS

10/7/94
Received fax of analytical to date. Called Fred to see when work is occurring. Left message.

11/16/94 Rec'd quarterly report. Send letter.

11/28/94 Fred Yukic called. He'll be sending a letter to update me on the site. RP is hiring someone to overdig if it may happen on a weekend. I told Fred to have RP call me for notifications regardless of the day XMS

DRAFT

Chub's Auto Repair, 1180 Main St., RWC #330120

5/4/94 On site to witness monitoring well installation. Showed up just as ready to pour seal. Well is 20' deep, water at 10' took soil samples at 5½', 10½ feet. Will analyze one of them, depending on water level tomorrow when the well is developed. Dave of Applied Science + Engineering will be on site tomorrow from 10-1 to develop the well.

Soils were clayey to 14' and then gravel/course sand encountered.

Soil sample to run for TPH-d, BTEX, water sample for the whole scan, without oil and grease as this was low in the original water sample. TPH-gd, BTEX, volatiles. xMshoemaker.

5/5/94 On site for well sampling. Well hadn't fully recovered so I didn't wait for sampling. Water was very silty. No odors. xMshoemaker

5/31/94 Received well monitoring report. All ND. I called Fred because his report states the ~~well~~ pit (MS) was pumped dry and didn't re-charge but SMCo. asked for well anyway. I told him I would send him a copy of my notes. Also, Fred asked if volatiles could be eliminated from sampling requirements.

6/2/94 called SMCo. Revised report should be out soon. xMS

DRAFT

1180 Main Street, Redwood City, CA # 330120 CHUB'S AUTO REPAIR

4/8/94 (continued) submitted, then maybe I won't require so many analyses. Soil does not need to be analyzed for everything, just TPH-d and BTEX, as workplan proposes. x MShoemaker

4/18/94 Fred Called. He said the pit sample on 2/9/94 was only analyzed for oil and grease and was at 9 ppm. He said the tank was analyzed for volatiles before disposal, but results were low. I said the well needs to be analyzed for volatiles, but can hold oil and grease. MShoemaker

4/19/94 received drilling application. I approved it. MShoemaker

4/29/94 Received Tank Removal Report from SEMCO dated 4/26/94. x MShoemaker. Sent letter 5/4/94.

DRAFT

1180 Main St, PWC CHUB'S AUTO REPAIR SM # 330120

2/17 called Chuck w/ SEMCO. Asked him why pumped pit more than one time. He said thought it was ok to do three times. SM Co. Guidelines state one time only. I faxed him copy of Guidelines page iii. x MSroemaker

3/3/94 Randy w/ SEMCO called. Wants to pump pit again. I asked for results from previous water sampling before I make a decision. Told Randy that more purging and sampling is not going to preclude Chub's from putting in a well.

3/15/94 Called Chuck w/ Semco because I received a call from a prospective consultant at the site (Fred Yukic 363-2445). Fred had talked with Mr. Chubbick and was told the water had some weird chemicals in it. I don't have the pit water results yet so I requested them from Chucks. K MSroemaker

3/18/94 Received analytical results from SEMCO, from second sampling. Have not received sample results for original pit water sampling (2/9/94) x MSroemaker

3/31/94 Redd workplan for the installation of one monitoring well. Consultant is Applied Science and Engineering. x MSroemaker

4/8/94 - Fred Yukic called abt. the letter from this office 4/4/94. I want gradient determined once the well is in place, just for confirmation. I want water sampled for parameters listed because SEMCO overpumped the pit, invalidating results. If 2/9/94 water sample results are

continued

DRAFT

Chubs Auto Repair

1180 Main St., RWC

2/16/94 - Semco pumped pit, set appt for sampling 1 pm. [(2) of 5000 gal tanks]

2/17/94 arrived on site. Pit was being pumped when I arrived. Pit had been pumped dry yesterday & re-filled partially.

It rained last night, not covered, but bermed. (water level unchanged per Pat of Semco). Berming material was soil but not covered with plastic.

There was sheen on water seen.

~100 gal was pumped today.

Worker @ Chub's said the water level had varied, he thought due to tidal influence. Redwood Creek very close to pit - approx. 60' to the west. The paved ditch was running quickly

- Sample #: Pit H_2O #1 to be submitted to laboratory. Sampler didn't know which lab, nor which were the proper containers. Suggested he call lab to check.

x Michele Stromski

DRAFT

1180 Main St., RWC - Chubs Auto Repair
2/3/94 - Rec'd and approved brief workplan
2/9/94 - on site for over excavation

- Arrived on site, had already began digging and hit groundwater. were pumping the pit (having problems w/ pump) but were pumping slower than re-charge so got no. where. There was a sheen on the water - Took a water sample. Samples to be submitted for TPH-g, TPH-d, BTEX, CL hydrocarbons, GTO. Soil Sample was taken at ~8' on the west wall. Depth to groundwater was approximately 9½ feet.

x Michele Sholund

2/14/94 Chuck w/ SEMCO wanted to know if could re-pump pit because of pump difficulties. The samples are on hold that were submitted 2/9/94. He has a tank on site to pump into. OK by me.

SUBSURFACE DRILLING APPLICATION

Upon review of the information on this application and submitted workplan and subject to approval noted below, a permit will be issued allowing owner/agent driller/agent to construct the described well. Permission to mobilize may be withheld until a field check verifies all statements made on application by Permittee and is also subject to the "General" and "Special" Conditions stated below.

In addition to the well location map included in the workplan, attach a copy to the permit. The well location map shall include the following:

1. Sketch well location to scale, show dimension to nearest foot
2. Show a minimum of two dimensions at right angles. Dimensions shall be from the centerline of the closest named street and or property lines. These dimensions may be estimated and subsequently finalized in the report of findings.
3. North Arrow, existing site features, existing wells and any other pertinent information.

GENERAL CONDITIONS:

A. Construction under this permit is subject to any instructions by a Health Department representative relative to the "Standards for the Construction of Wells in San Mateo County" and the State Water Well Standards.

B. Permit may be voided before work begins if field check reveals any misrepresentation under "well location" of the submitted workplan.

C. The permit is valid only for the purpose specified herein. No change in construction procedure as prescribed in the workplan and in the special conditions below will be allowed except upon written permission of the County.

D. Permittee shall assume entire responsibility for all activities and uses under the permit and shall indemnify, defend and save the County of San Mateo, its' officers, agents and employees free and harmless from any and all expense, cost or liability in connection with or resulting from the exercise of the permit including, but not limited to property damage, personal injury and wrongful death.

E. The wells may not be used for domestic water supplies unless separately approved by the Office of Environmental Health.

F. Permit will be automatically canceled if not exercised or if an extension is not requested by Permittee with 90 calendar days of above date.

G. Driller is to complete State DWR Form 188 and mail original to San Mateo County Environmental Health within 30 days of completion of well construction.

H. For the construction of water producing wells a Permittee must be a licensed water well drilling contractor unless the work is to be done by the landowner or employees of the landowner. (See Business & Professions Code 7026.3, 7028).

I. Dry holes and/or soil borings must be grouted within one week of drilling.

J. Well destruction shall be done in accordance with State and County Standards.

K. All workplans and reports need to conform to County LUFT Enforcement guidelines as well as Regional Water Quality Control Board guidelines and the State Water Well Standards.

L. If contamination is discovered, verbal notification to the county is required within 48 hours. A written report is required within 30 days.

SPECIAL CONDITIONS:

~~ALL MONITORING WELLS ARE TO BE SURVEYED TO MEAN SEA LEVEL DATUM.~~

DRAFT

The Department of Toxics Substances Control (DTSC) takes every precaution to ensure the accuracy of data in the Hazardous Waste Tracking System (HWTS). However, because of the large number of manifests handled, inaccuracies in the submitted data, limitations of the manifest system and the technical limitations of the database, DTSC cannot guarantee that the data accurately reflect what was actually transported or produced.

The Department of Toxics Substances Control (DTSC) takes every precaution to ensure the accuracy of data in the Hazardous Waste Tracking System (HWTS). However, because of the large number of manifests handled, inaccuracies in the submitted data, limitations of the manifest system and the technical limitations of the database, DTSC cannot guarantee that the data accurately reflect what was actually transported or produced.

The AFX Research, LLC Environmental Lien & AUL Search Report, provides results from available current land title records for environmental cleanup liens and other activities and use limitations, such as engineering and institutional controls.

A network of trained, professional researchers, following established industry protocols, use client supplied property information to search for:

- Parcel information and / or legal description
- Ownership information
- Official land title documents recorded at jurisdictional agencies such as recorder's' office, registries of deeds, county clerks' offices, etc.
- Access a copy of the deed
- Environmental encumbrance(s) associate with the deed
- Provide a copy of any environmental encumbrance(s) based upon a review of keywords in the instrument(s) (title, parties involved and description)
- Provide a copy of the deed or cite documents reviewed

NESHAP ASBESTOS SURVEY and LEAD-BASED PAINT INSPECTION

134 Maple Street & 1180 Main Street
Redwood City, California 94063

DRAFT

Project No. 292738

Prepared For

Lathrop PARC Redwood City, LLC
101 Seminary Drive
Menlo Park, CA 94025

Prepared By

AEI Consultants
2500 Camino Diablo, Suite 200
Walnut Creek, CA 94597
(925) 746-6000

EXECUTIVE SUMMARY

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. The purpose of the survey was to locate, identify, sample and assess the condition of interior and exterior building materials suspected of containing greater than one percent (1%) asbestos and to perform a lead paint inspection. The survey included the assessment and characterization of suspect friable and non-friable ACM and lead content in painted surfaces. Asbestos containing construction material (ACCM) will also be identified, if applicable.

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation.

The subject property at 1180 Main Street is located on the south side of Main Street in a mixed residential and commercial area of Redwood City, California. The property is improved with two structures: a stand-alone office building at the southeast corner of the property, as well as a warehouse/retail facility along the north side of the property; both properties were occupied at the time of this investigation. The warehouse/retail facility is the only structure involved under the scope of this survey.

DRAFT

NESHAP Asbestos Summary

A total of thirty-two (32) samples of suspect ACM were collected from the subject property buildings during the survey.

- RACM was detected in the materials collected from 134 Maple Street, and is listed in the table below:

RACM identified at 134 Maple Street

Material	Location	NESHAP Category	Quantity	% Asbestos
Tan Vinyl Floor Sheet	**Hallway and Bathroom**	**RACM**	**~ 200 ft^2**	**60% Chrysotile**

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

- No asbestos-containing materials were detected from the sampling conducted at 1180 Main Street.

See attached asbestos analytical results in Appendix A.

Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings. The United States Department of

Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

See attached analytical results with details and locations of areas inspected in Appendix B.

DRAFT

1.0 INTRODUCTION

This report documents the methods and findings of a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. AEI Consultants (AEI) inspected all readily accessible areas of the buildings.

The Code of Federal Regulations (CFR), 40 CFR 61, Subpart M, National Emissions Standards for Hazardous Air Pollutants (NESHAP), classifies Asbestos Containing Materials (ACM) as any material or product that contains *greater than* 1% asbestos. As suspect ACM is identified, it is classified as either friable or non-friable.

Non-friable ACM is classified as either Category 1 or Category 2 material as follows:

- **Category 1** – Asbestos containing packings, gaskets, resilient floor coverings and asphalt roofing products; and

- **Category 2** – All remaining types of non-friable asbestos containing material not included in Category 1 that when dry, cannot be crumbled, pulverized or reduced to powder by hand pressure.

Friable materials are more hazardous than non-friable materials since they are more likely to release fibers into the air. Friable is defined as any ACM that when dry, can be crumbled, pulverized or reduced to powder by hand pressure.

- **Regulated Asbestos containing materials (RACM) –** A hazardous waste when friable, is classified as any manufactured material that contains *greater than* 1% asbestos and is:

    1. Friable – The material can be crumbled, pulverized or reduced to powder by hand pressure;

    2. Category 1 that are subjected to sanding, grinding, cutting or abrading;

    3. Category 1 material that has become friable during renovation activities; or

    4. Category 2 material that has become friable during renovation activities.

Materials containing *greater than* 1% asbestos are subject to the NESHAP regulations (40 CFR Part 61, Subpart M). RACM (friable ACM and non-friable ACM that will become friable during renovation/demolition operations) must be removed from structures prior to renovations or demolitions. Certain non-friable ACM and materials containing 1% or less asbestos may remain in structures during renovations/demolitions; however, there are waste handling/disposal issues and Cal/OSHA work requirements that may make it cost ineffective to do so. Contractors are responsible for segregating and characterizing waste streams prior to disposal.

With respect to potential worker exposure, notification, and registration requirements, Cal/OSHA regulations (Title 8, California Code of Regulations (CCR) Section 1529) define asbestos-containing construction material (ACCM) as any material with an asbestos content of >0.1% (Title 8, CCR §341.6). Removal or disturbance of more than 100 ft^2 of ACCM must be performed by a DOSH registered contractor utilizing asbestos-trained workers. It is important to

DRAFT

note the associated EPA waste labeling is not required if the material contains 1% or less asbestos, however, Cal/OSHA labeling is still required at concentrations $\leq$1%. Furthermore, at concentrations >1% all requirements of the standards become effective.

Construction activities (including demolition) that disturb materials or paints containing any amount of lead (both LCP and LBP) are subject to certain requirements of the Cal/OSHA lead standard contained in Title 8, CCR, §1532.1. Deteriorated paint is defined be Title 17, CCR, Division 1, Chapter 8, §35022 as a surface coating that is cracking, chalking, flaking, chipping, peeling, non-intact, failed or otherwise separating from a component. Demolition of a deteriorated Lead Containing Paint (LCP) component would require waste characterization and appropriate disposal. Intact LCP on a component is currently accepted by most landfill facilities; however, contractors are responsible for segregating and characterizing waste streams prior to disposal.

Potential hazards exist to workers who remove or cut through LCP coatings during demolition. Dust containing hazardous concentrations of lead may be generated during scraping or cutting materials coated with LCP. Torching of these materials may produce lead oxide fumes. Therefore, air monitoring and/or respiratory protection may be required during the demolition of materials coated with LCP. Guidelines regarding regulatory provisions for construction work where workers by be exposed to lead are presented in Title 8, CCR, §1532.1.

DRAFT

1.1 Scope of Work

The purpose of the survey was to locate, identify, sample and assess the condition of random building materials suspected of containing greater than one percent (1%) asbestos, as well as perform a lead-based paint inspection.

The survey was performed on November 5, 2010, by Alain Grissette of AEI, a Certified Asbestos Consultant (CAC #07-4300) and a Cal/DOSH Certified Lead-Paint Inspector/Assessor (#18206). The asbestos inspection was performed in conformance with modified protocols set forth by the Environmental Protection Agency (EPA) Asbestos Hazard Emergency Response Act (AHERA), the National Emission Standards for Hazardous Air Pollutants (NESHAP) and Cal/OSHA. The lead inspection was performed in conformance with modified protocols set forth by the Housing for Urban Development (HUD) Lead-Based Paint Inspection Guidelines.

1.2 Limitations

The data presented and the opinions expressed in this report are qualified as follows:

- The sole purpose of the investigation and of this report is to assess the Site with respect to asbestos materials as defined in AEI's Scope of Work and the applicable State, Federal and local environmental laws and regulations.

- AEI derived the data in this report primarily from visual inspections, interviews with individuals with information about the Site and a limited number of environmental samples. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, conclusions, and recommendations expressed in the report.

- In preparing this report, AEI has relied upon and presumed accurate certain information (or absence thereof) about the Site provided by the Client, and others identified herein. Except as otherwise stated in the report, AEI has not attempted to verify the accuracy or completeness of such information.

- The data reported and the findings, observations, conclusions, and recommendations expressed in the report are limited by the Scope of Services, including the extent of environmental sampling and other tests. The Scope of Services was defined by the requests of the Client, the time and budgetary constraints imposed by the Client, and the availability of access to the Site.

- The collection of bulk building material samples for analysis is a destructive procedure and may cause damage to the integrity of building systems. AEI will take normal state-of-the-art precautions to minimize damage, however, AEI will not be held responsible for damage to the building systems as a result of sample collection.

- Suspect ACMs may be present in the building in inaccessible areas such as hidden or concealed wall cavities or ceiling; the discovery of hidden or concealed materials is a destructive process, not in the scope of work for this survey.

- Because of the limitations stated above, the findings, observations, conclusions and recommendations expressed by AEI in this report are limited to the information obtained and the surface and subsurface investigation undertaken and should not be considered an opinion concerning the compliance of any past or current owner(s) or operator(s) of the Site with any Federal, State or local laws or regulations. No warranty or guarantee, whether express or implied, is made with respect to the data reported or findings, observations, conclusions, or recommendations expressed in this report. Furthermore, such data, findings, observations, conclusions and recommendations are based solely upon Site conditions in existence at the time of investigation.

- This report has been prepared on behalf of and for the exclusive use of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

DRAFT

2.0 SITE DESCRIPTION

2.1 Site Description

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation.

The subject property at 1180 Main Street is located on the south side of Main Street in a mixed residential and commercial area of Redwood City, California. The property is improved with two structures: a stand-alone office building at the southeast corner of the property, as well as a warehouse/retail facility along the north side of the property; both properties were occupied at the time of this investigation. The warehouse/retail facility is the only structure involved under the scope of this survey.

Suspect building materials that may contain asbestos include: gypsum drywall panel with associated joint compound, vinyl floor sheet, and roofing materials.

Suspect painted surfaces include paint on interior drywall/plaster walls and associated trim, as well as paint on exterior brick and stucco walls and associated trim.

DRAFT

3.0 METHODOLOGY

3.1 Material Sampling

3.1.1 Asbestos Sampling Procedures

During the survey, AEI visually inspected all readily accessible areas of the subject buildings, identified homogeneous areas of suspect material (materials that share the same texture, color, use, and appear to have been applied at approximately the same time) and collected representative samples of suspect material for laboratory analysis. The samples collected were placed in plastic bags, sealed, labeled and transported under chain of custody documentation to an accredited laboratory.

3.1.2 Lead Sampling Procedures

An RMD XRF Lead Paint Analyzer was utilized. The XRF works by exposing a paint surface to radiation emitted from a sealed source inside the instrument. The source of the radiation in all the XRF analyzers currently used is the cobalt-57 (^{57}C0) or the cadmium-109 (^{109}Cd) isotopes. Both of these radioactive materials spontaneously emit energy in the form of X-rays and gamma rays. When these rays are released from an XRF analyzer and hit a painted surface, the elements in the paint matrix – which include lead – are "excited" and respond by emitting energy in the form of X-rays characteristic of each of the elements. This response is known as fluorescence. The detector in the analyzer then reports the concentration, if any, of lead in the surface. In addition to the XRF analysis, each painted area was evaluated for evidence of deterioration (i.e., flaking or cracking).

3.2 Analytical Methods

All asbestos samples collected were transported under chain of custody documentation to EMSL Analytical Inc. (EMSL) in San Leandro, California for analysis. EMSL is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP #101208-0) and the California Environmental Laboratory Accreditation Program (CA-ELAP # 1620).

All paint samples from the survey were analyzed using a RMD XRF Lead Paint Analyzer.

3.2.1 Asbestos Analysis

All bulk suspect asbestos samples were analyzed using polarized light microscopy (PLM) in accordance with the Environmental Protection Agency's (EPA) "Method of Determination of Asbestos in Bulk Samples" (EPA 600/R-93/116, July, 1993). This method is referred to as the "Improved Method" and is recommended by EPA as a preferred substitute to the Interim Method EPA 600/M4-82-020, 1982.

The EPA regulations define ACM as any material with an asbestos content greater than one percent (>1%). However, Cal/OSHA regulations define ACCM as any material with an asbestos content of >0.1%; Cal/OSHA and EPA regulations regarding the proper handling of ACMs and ACCMs must be followed.

DRAFT

If based on the results of the initial sampling, a 400-Point Count Reanalysis may be necessary for asbestos results of 1% or less to confirm the material is 1% or less by NESHAP rule. A 1000- Point Count Reanalysis would be necessary to confirm the material is 0.1% or less by Cal/OSHA rule. If point count reanalysis is not performed on these materials, then the material is covered by NESHAP and Cal/OSHA as ACM.

3.2.2 Lead Analysis

All LCP samples from the survey were analyzed using a RMD XRF Lead Paint Analyzer.

3.3 Limiting Conditions

AEI was granted access to all areas of the subject property.

Suspect ACMs and LBP may be present in the building in inaccessible areas such as hidden or concealed wall cavities or ceiling. Upon exposure of the inaccessible areas, AEI recommends sampling and analysis of any newly discovered suspect materials.

This report was prepared for the sole use and benefit of Lathrop PARC Redwood City, LLC. Neither this report, nor any of the information contained herein shall be used or relied upon for any purpose by any person or entity other than Lathrop PARC Redwood City, LLC.

DRAFT

4.0 SAMPLING AND ANALYSIS

4.1 Asbestos Survey

A total of thirty-two (32) bulk suspect asbestos-containing building material samples were collected from the structures throughout the subject property. In addition, two (2) additional 1000 point count analyses were conducted to better characterize materials with trace amounts of asbestos for the establishing proper work practices during renovation or demolition.

The sample descriptions and results are listed in the tables below:

Sample Analytical Results for 1180 Main Street, Redwood City, CA

Sample #	Material (Layer) Description	Location of Materials	NESHAP Category	% Asbestos
A-101	A. Acoustic Ceiling Tile	Rear Storage Area	n/a	None Detect
A-102	A. Drywall	Rear Storage Area	n/a	None Detect
	B. Joint Compound		n/a	None Detect
A-103	A. Drywall	Main Storage Area	n/a	None Detect
	B. Joint Compound		n/a	None Detect
A-104	A. Grey Base Cove	Rear Storage Area	n/a	None Detect
	B. White Mastic		n/a	None Detect
A-105	A. Drywall	Office	n/a	None Detect
A-106	A. Black Roofing Mastic	Roof – Penetrations & Edges	n/a	None Detect
A-107	A. Roof Core	Roof – Near Main Street	n/a	None Detect
A-108	A. Roof Core	Roof – Rear of Building	n/a	<0.1 Chrysotile*
A-109	A. Window Putty	Exterior Windows North Side	n/a	0.1 Chrysotile*

** Reanalyzed utilizing 1000 Point Count Method*

See attached analytical results and chain of custody documentation in Appendix A.

- No asbestos-containing materials were detected in the samples collected.

While trace amounts of asbestos was detected in samples A-108 & A-109, further point count analysis reduced the asbestos percentage to below the threshold both EPA and Cal/OSHA require for ACM or ACCM categorization.

	B. Paint		n/a	None Detect

DRAFT

See attached analytical results and chain of custody documentation in Appendix A.

The following materials were determined to be asbestos-containing materials (>1% Asbestos):

- Tan Vinyl Floor Sheet & Paper Backing – Front Room, Hallway & Bathroom *~ 200 sq. ft.*

The ACMs were observed in poor condition and do pose a health and safety concern to occupants of the subject property in their current state.

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

DRAFT

4.2 Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings.

The United States Department of Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

OSHA and Cal/OSHA standards require protection for all workers when working with paint containing lead, regardless of the concentration. A contractor performing paint removal work should follow the OSHA lead standard for the construction industry. The lead content of the paint should be considered when choosing a method to remove the paint, as proper waste disposal requirements and worker protection measures must be taken.

Lead Containing Paint Compliance Summary

Construction activities that disturb materials or paints containing *any* amount of lead are subject to certain requirements of the Cal/OSHA lead standard contained in Title 8, CCR, §1532.1. Deteriorated paint is defined be Title 17, CCR, Division 1, Chapter 8, §35022 as a surface coating that is cracking, chalking, flaking, chipping, peeling, non-intact, failed or otherwise separating from a component. Demolition of a deteriorated Lead Containing Paint (LCP) component would require waste characterization and appropriate disposal. Intact LCP on a component is currently accepted by most landfill facilities; however, contractors are responsible for segregating and characterizing waste streams prior to disposal.

Potential hazards exist to workers who remove or cut through LCP coatings during demolition. Dust containing hazardous concentrations of lead may be generated during scraping or cutting materials coated with LCP. Torching of these materials may produce lead oxide fumes. Therefore, air monitoring and/or respiratory protection may be required during the demolition of materials coated with LCP. Guidelines regarding regulatory provisions for construction work where workers by be exposed to lead are presented in Title 8, CCR, §1532.1.

DRAFT

5.0 SUMMARY

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. The purpose of the survey was to locate, identify, sample and assess the condition of interior and exterior building materials suspected of containing greater than one percent (1%) asbestos and to perform a lead paint inspection. The survey included the assessment and characterization of suspect friable and non-friable ACM and lead content in painted surfaces. Asbestos containing construction material (ACCM) will also be identified, if applicable.

NESHAP Asbestos Summary

A total of thirty-two (32) samples of suspect ACM were collected from the subject property buildings during the survey.

- RACM was detected in the materials collected from 134 Maple Street, and is listed in the table below:

RACM identified at 134 Maple Street

Material	Location	NESHAP Category	Quantity	% Asbestos
Tan Vinyl Floor Sheet	**Hallway and Bathroom**	**RACM**	**~ 200 ft^2**	**60% Chrysotile**

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

- No asbestos-containing materials were detected from the sampling conducted at 1180 Main Street.

See attached asbestos analytical results in Appendix A.

Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings. The United States Department of Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

See attached analytical results with details and locations of areas inspected in Appendix B.

DRAFT

6.0 RECOMMENDATIONS

AEI recommends the following:

- Written notification to contractors (that will be conducting renovation, demolition, relocation, or related activities) of the presence and location of asbestos and lead-based paint;

- Prepare bid documents and specifications for the demolition project to control the project and ensure lawful removal techniques are used;

- Remove and dispose of ACM prior to demolition using licensed abatement contractors in accordance with Federal, State, and Local regulations and ordinances, and

- Follow Federal, State, and Local regulations and ordinances for proper disposal of ACM.

DRAFT

7.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. Any exceptions to, or deletions from, this practice are described in Sections 1.2 and 3.3 of this report.

Due to magnification limitations inherent in PLM, asbestos fibers in dimensions below the resolution capability of PLM may not be detected. Samples reported as <1% or none detected may require additional testing by TEM to confirm asbestos quantities. The above test report relates only to the items tested and may not be reproduced in any form without the express written approval of EMSL Analytical, Inc. EMSL's liability is limited to the cost of analysis. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client.Samples received in good condition unless otherwise noted.

Disclaimer:Some samples may contain asbestos fibers present in dimensions below PLM resolution limits.The limit of detection as stated in the method is 0.1%. EMSL Analytical Inc suggests that samples reported as <0.1% or none detected undergo additional analysis via TEM. The above test report relates only to the items tested. This report may not be reproduced, except in full, without written approval EMSL Analytical Inc. This test report must not be used by the client to claim product endorsement by NVLAP or any agency of the United States Government. EMSL Analytical Inc. bears no responsibility for sample collection activities, analytical method limitations, or the accuracy of results when requested to separate layered samples. EMSL Analytical Inc liability is limited to the cost of sample analysis.The test results contained within this report meet the requirements of NELAC unless otherwise noted.Samples received in good condition unless otherwise noted. Samples received in good condition unless otherwise noted.

EXECUTIVE PROPERTY DESCRIPTION

Property: Proposed Lathrop Post-Acute Recovery Center
134 Maple Street
Redwood City, San Mateo County, California

Site Description: The subject property consists of three (3) parcels totaling approximately 1.313 acres of land. The subject property is currently developed with one (1) two-story vacant office/showroom/warehouse building (formerly Marcelli Lighting) constructed circa 1974, one (1) one-story auto repair building (formerly Chubs Auto Repair) constructed circa 1955, and one (1) one-story vacant office building constructed circa 1950-1962. In addition, the subject property is improved upon by the Redwood Creek (a concrete-lined culvert), an exterior storage yard, landscaped regions and asphalt parking areas. The vacant two-story office/showroom/warehouse building and auto repair building will be demolished and a five-story, 114-bed skilled nursing facility will be constructed. The vacant office building will remain at the subject property (the building's future use has not been determined). The subject property is serviced by electricity, natural gas, and municipally supplied water and sewer.

1.0 EXECUTIVE SUMMARY

The following table summarizes the conclusions and opinions representing Dominion Due Diligence Group's (D3G's) best professional judgment based on information accessed during the course of this investigation. D3G performed a Phase I Environmental Site Assessment that included subject property observations of the Proposed Lathrop Post-Acute Recovery Center on December 21, 2010 located at 134 Maple Street in Redwood City, San Mateo County, California (subject property).

OBSERVED CONDITIONS	SECTION REFERENCE	ACCEPTABLE	RECOMMENDED RESPONSE ACTION
STANDARD ENVIRONMENTAL RECORDS REVIEW	5.1	√	
UNREGULATED UNDERGROUND STORAGE TANK(S) (UST)	6.3	√	
PAST INDUSTRIAL/DETRIMENTAL OPERATIONS	5.4 5.5	√	
VAPOR ENCROACHMENT CONDITION	5.6	√	
STORED HAZARDOUS MATERIALS	6.3 6.4	√	
POLYCHLORINATED BIPHENYLS (PCBS)	6.3 6.4	√	
ABOVEGROUND STORAGE TANK(S) (AST)	6.3 6.4	√	
DUMPING, LANDFILLS	6.3	√	
HAZARDOUS RUN-OFF	6.3	√	
ASBESTOS-CONTAINING MATERIALS	8.1		(1)
LEAD-BASED PAINT	8.2		(2)
FLOOD ZONE	8.4		(3)
NOISE	8.10		(4)

(√) = there are no environmental concerns associated with the observed condition

(1) If PACMs are to be impacted during any proposed renovation activities, they should be sampled by an appropriately licensed asbestos inspector prior to impaction and treated accordingly. Identified friable or damaged ACMs and ACMs which are to be impacted by renovation activities should be removed by a licensed asbestos abatement contractor in accordance with applicable regulations. Any remaining ACMs should be managed under a site-specific Operations and Maintenance (O&M) Program. In addition, compliance with 40 CFR 61 Subpart M is recommended prior to any renovation or demolition activities at the subject property.

(2) D3G recommends that if presumed LBP is to be impacted during any future renovation or demolition activities, the contractor must adhere to the OSHA Lead in Construction Standard (29 CFR 1926.62) and all generated debris containing lead-based paint is to be

DRAFT

appropriately characterized and disposed of in accordance with applicable EPA RCRA requirements.

(3) If the proposed development directly or indirectly impacts the identified floodplain areas, compliance with Executive Order 11988, "Floodplain Management," is required by either obtaining a Conditional Letter of Map Amendment (CLOMA) or Conditional Letter of Map Revision (CLOMR) or by implementing procedures contained in 24 CFR Part 55.20 (8-step Process). This 8-Step Process is intended to address the requirements of Executive Order (EO) 11988, Floodplain Management, as well as the requirements of Federal Register 24 CFR Parts 50, 55 and 58.

In addition, per HUD Chapter 9 Guidelines, all "critical actions" as defined in 24 CFR 55.2(b)(2), must comply with the requirements of 24 CFR 55.20(e) – "…All critical actions in the 500-year floodplain shall be designed and built at or above the 100-year floodplain (in the case of new construction) and modified to include: 1. Preparation of and participation in an early warning system; 2. An emergency evacuation and relocation plan; 3. Identification of evacuation route(s) out of the 500-year floodplain; and 4. Identification marks of past or estimated flood levels on all structures."

(4) The projected DNL value for all noise sources is 87.8 dB. Pursuant to 24 CFR 51.101(a)(3), the composite DNL 87.8 dB is "unacceptable". The requirements set out in Section 51.104(a) are designated to ensure that interior levels do not exceed the established 45 dB level. D3G recommends that appropriate noise mitigation measures be undertaken.

DRAFT

2.0 INTRODUCTION

2.1 Purpose

Wells Fargo Bank, N.A. contracted Dominion Due Diligence Group (D3G) to perform a Phase I Environmental Site Assessment (ESA) of the Proposed Lathrop Post-Acute Recovery Center located at 134 Maple Street in Redwood City, San Mateo County, California (subject property). As such, Wells Fargo Bank, N.A. is considered the "User" of this report as defined under ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process Designation: E 1527-05 (ASTM E 1527 05).

The purpose of the Phase I ESA is to provide appropriate inquiry into the previous ownership and uses of the subject property and to identify recognized environmental conditions (RECs), which are the presence or likely presence of any hazardous substances or petroleum products at the subject property under conditions that indicate an existing release, a past release, or a material threat of a release into structures, the ground, groundwater or surface water of the subject property. In addition, this report assesses non-scope considerations as directed by the client. Factual information regarding on-site business operations, conditions, and historical data provided to D3G is assumed to be correct and complete.

This investigation was conducted in accordance with ASTM E 1527-05 published guidelines, 40 CFR Part 312, Standards and Practices for All Appropriate Inquiries: Final Rule, U.S. Housing and Urban Development (HUD) Multifamily Housing Accelerated Processing Guide, and accepted Phase I ESA industry standards.

2.2 Detailed Scope of Services

The ASTM E 1527-05 scope of work for this Phase I ESA consisted of the following:

- site reconnaissance of the subject property and a visual survey of the adjacent properties to evaluate the potential for RECs;
- review of applicable and reasonably ascertainable information about the subject property, including aerial photography, USGS topographic map, state and federal databases, Sanborn maps, property assessment information and other governmental sources that are publically available, practically reviewable, and obtainable within reasonable time and cost constraints;
- interviews with selected individuals knowledgeable about the subject property and vicinity properties; and
- if provided, a review of existing environmental reports documenting previous assessment and remediation efforts completed at the subject property.

D3G also evaluated the following ASTM Non-Scope Considerations in accordance with the 2009 U.S. HUD Multifamily Housing Accelerated Processing (MAP) Guide: Tier 1 Vapor Encroachment Screening in general compliance with ASTM Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions Designation: E 2600-10, asbestos-containing materials, lead-based paint, floodplain hazards, wetlands, coastal barrier resources area, coastal zone management, historic properties, threatened and endangered species, sole source aquifers, noise, airport clear zones, air emissions and additional nuisances and hazards. See the completed HUD Environmental Questionnaire provided in Appendix M and the HUD Form 4128 and Environmental Field Data Sheets in Appendix N for the remaining HUD report protocols.

This Phase I ESA did not include the collection or analysis of soil or groundwater samples.

2.3 Significant Assumptions

Factual information regarding on-site business operations, conditions, and historical data provided to D3G is assumed to be correct and complete. D3G assumes no responsibility for hidden or latent conditions or misrepresentation by the property owner, its representatives, public information officials or any authority consulted in connection with the compilation of this report.

D3G assumes that all information provided by Environmental FirstSearch regarding the regulatory status of facilities within the approximate minimum search distance is complete, accurate and current.

2.4 Limitations and Exceptions

D3G encountered the following limitations, exceptions, and/or data gaps during the performance of this Phase I ESA:

- Our on-site observations pertain only to specific locations at specific times on specific dates. This report and conclusions herein are based upon data collection between December 21, 2010 and January 12, 2011. Our observations and conclusions do not reflect variations in conditions that may exist, in unexplored areas of the subject property, or at times other than those represented by our observations.
- In order for the prospective purchaser to claim protection from CERCLA liability as an innocent landowner, bona fide prospective purchaser, or contiguous property owner, the acquisition of the subject property should be completed within 180 days after the subject property inspection date.
- According to 40 CFR Part 312, Standards and Practices for All Appropriate Inquiries: Final Rule, CERCLA liability rests with the owner or operator of a property and not with an environmental professional hired by the prospective landowner and who is not involved with the ownership or operation of the property.
- This report meets the requirements set forth in 40 CFR Part 312 Standards and Practices for All Appropriate Inquiries: Final Rule. However, in order to qualify for certain landowner liability protections under CERCLA, Bona Fide Prospective Purchasers, Contiguous Property Owners, and/or Innocent Landowners must meet additional requirements in 101(35)(B) of CERCLA (42 U.S.C. 9601(35)) of the Federal Register.
- No significant data gaps in historical information were identified that would impact D3G's ability to identify RECs. Collectively the sources considered and consulted during the course of this assessment allowed D3G to adequately determine the subject property history. Therefore, these data gaps are not considered to be significant.
- In regards to the Tier 1 Vapor Encroachment Screening, D3G has reduced the approximate minimum search distance for up-gradient and cross-gradient off-site contaminated properties based on actual plume data collected for dry cleaners, state hazardous waste sites, and evaluation of actual gas station LUST data as outlined in the article, *A Smaller Intrusion,* by Anthony J. Buonicore, P.E. published in the May 2009 Issue of Pollution Engineering magazine.
- During the subject property reconnaissance, areas of the property were covered in dense vegetation. Therefore, D3G was unable to identify items including, but not limited to, stained areas, stressed vegetation, monitoring wells, vent pipes, fill ports, or manhole covers.

DRAFT

- Historical information was not reasonably ascertainable to the subject property's first developed use. D3G obtained historical information to 1891 at which time the subject property was developed with the Bunn's Feed Mill, an elevated grain tank/silo and a dwelling. Due to the age of any development activities previous to 1891, this limitation is not significant.
- At the time this report was issued, D3G had not received the completed user, current landowner, previous landowner, or key site manager questionnaires.

2.5 Special Terms and Conditions

This investigation was conducted in accordance with ASTM E 1527-05 published guidelines and 40 CFR Part 312, Standards and Practices for All Appropriate Inquiries: Final Rule. In addition, Non-Scope items are addressed in accordance with the 2009 U.S. HUD Multifamily Housing Accelerated Processing (MAP) Guide.

2.6 User Reliance

This report has been prepared for, and can be relied upon by the Client, Wells Fargo Bank, N.A., and the United States Department of Housing and Urban Development (HUD). This report is not to be relied upon or reproduced, either in whole or in part, without written consent from D3G.

3.0 SUBJECT PROPERTY DESCRIPTION

3.1 Location and Legal Description

The subject property is located at 134 Maple Street in Redwood City, San Mateo County, California and contains a total of 1.313 acres of land. The subject property is situated at an elevation of approximately fifteen (15) feet above mean sea level and is located at Latitude, 37.481191 and Longitude, -122.225172.

SUBJECT PROPERTY MUNICIPAL IDENTIFICATION	
ASSESSOR PARCEL NUMBERS	053147010, 053147020 and 053147050
SOURCE - San Mateo County assessment documents	

A copy of the tax cards and map illustrating the legal property boundary is included in Appendix A of this report.

DRAFT

3.2 Site and Vicinity General Characteristics

The subject property is located in an area of residential and commercial development.

3.3 Current Use of the Subject Property

The subject property is currently utilized as a vacant office/showroom/warehouse building (formerly Marcelli Lighting), an auto repair building (formerly Chubs Auto Repair), and a vacant office building.

3.4 Description of Structures, Roads, and Other Improvements

The following section describes general conditions and features as noted during D3G's inspection:

GENERAL SUBJECT PROPERTY DESCRIPTION AND IMPROVEMENTS	
SUBJECT PROPERTY ACREAGE	1.313 acres
BUILDING(S) DESCRIPTION	One (1) two-story vacant office/showroom/warehouse building, one (1) one-story auto repair building, and one (1) one-story vacant office building
ADJOINING ROADS	Maple Street, Lathrop Street, Main Street, and Elm Street
CONSTRUCTION DATE(S)	Circa 1974, circa 1955 and between 1950 and 1962
EXTERIOR IMPROVEMENTS	Redwood Creek (a concrete-lined culvert), an exterior storage yard, landscaped regions and asphalt parking areas
UNIMPROVED AREAS	None

D3G reviewed the Preliminary Lot Line Adjustment via Parcel Map plans produced by BKF Engineers in May 2010. Subject property acreage was obtained from the plans. A copy of the Preliminary Lot Line Adjustment via Parcel Map plans is included in Appendix B of this report.

D3G reviewed the proposed Site Plan maps produced by Fong & Chan Architects on April 16, 2010. Information regarding the proposed structure was obtained from the maps. A copy of the proposed Site Plan maps is included in Appendix B of this report.

DRAFT

3.4.1 Subject Property Utilities

SUBJECT PROPERTY UTILITIES	
ELECTRICITY	Pacific Gas & Electric Company
NATURAL GAS	Pacific Gas & Electric Company
WATER	Redwood City Public Works Water Services
SANITARY SEWER	Redwood City Public Works Water Services
INDUSTRIAL WASTEWATER	NA
SOLID WASTE	Not provided

HEATING SOURCE	AGE
Electricity (Marcelli Lighting) and natural gas (office building)	Circa 1974 and circa 1950-1962 - current

COOLING SOURCE	AGE
Electricity (Marcelli Lighting and the office building)	Circa 1974 and circa 1950-1962 - current

The auto repair structure did not appear to be constructed with a permanent heating or cooling system.

3.5 Current Uses of Adjoining Properties

DIRECTION	LAND USAGE
NORTH	Southern Pacific railroad and Cook's Collision
SOUTH	Elm Street and ATA Reprographics, Main Street Coffee Roasting Company, California Auto Detailers and Hopkins Acura Dealership
EAST	Southern Pacific railroad, Main Street, RPH (commercial plumbing) and a church
WEST	Maple Street, Lathrop Street and Franklin Street Apartments

Cook's Collision, which is listed in the Environmental FirstSearch Report as Cook's Auto Body/Repair, is discussed further in Sections 5.1.1 and 5.1.2. RPH, which is listed in the FirstSearch Report as Baker Graphics or BPS Baker Graphics Redwood City, is discussed further in Section 5.1.2.

The Franklin Street Apartments are are further discussed in Section 5.1.1 and 5.6.

See Appendix B for a copy of the Site Plan, which identifies subject property structure(s) and general vicinity characteristics.

DRAFT

4.0 USER PROVIDED INFORMATION

4.1 Title Records

Assessor Parcel Number (APN) 053147010		
OWNER	**PURCHASE DATE**	**DEED BOOK/PAGE**
Lathrop PARC Redwood City, LLC	2006	Unknown
Nicolas and Barbara Marcelli	1976	Unknown
SOURCE - Interview with Mr. Louis Deziel, Jr., current landowner representative		

Assessor Parcel Number (APN) 053147020 & 053147050		
OWNER	**PURCHASE DATE**	**DEED BOOK/PAGE**
Butler Realty, LLC	2002 and 2007	Unknown
SOURCE - Interview with Mr. Kevin Flaherty, Leasing Agent and current landowner representative		

Due to the nature of the tax assessment documents and deed records, a thorough chain-of-title was not reasonably ascertainable.

4.2 Environmental Liens or Activity and Use Limitations (AULs)

D3G has not been provided information regarding environmental liens and activity use limitations by the User.

4.3 Specialized Knowledge

D3G has not been provided information regarding specialized knowledge or experience that is material to recognized environmental conditions in connection with the subject property by the User.

4.4 Commonly Known or Reasonably Ascertainable Information

D3G has not been provided information regarding commonly known or reasonably ascertainable information within the local community about the property that is material to recognized environmental conditions in connection with the property by the User.

4.5 Valuation Reduction for Environmental Issues

D3G has not been provided any knowledge of valuation reduction for environmental issues pertaining to the subject property by the User or Current Landowner Representative.

DRAFT

4.6 Owner, Property Manager, and Occupant Information

The subject property is currently owned by Lathrop PARC Redwood City, LLC and Butler Realty, LLC and the Current Landowner questionnaire is discussed further in Section 7.2. Mr. Kevin Flaherty is the current Key Site Manager and the questionnaire is discussed further in Section 7.4.

4.7 Reason for Performing Phase I ESA

The user informed D3G that the Phase I ESA is being performed because the subject property is being purchased and developed with a five-story, 114-bed, skilled nursing facility.

4.8 Previous Environmental Reports

D3G reviewed a previous Phase I ESA produced by TRC on July 23, 2007 for the northwestern portion of the subject property identified as Assessor Parcel Number (APN) 053147010 (formerly Marcelli Lighting). TRC reviewed reports associated with two (2) previous underground storage tanks (USTs). TRC wrote, "In September 1994, a 580-gallon gasoline UST and a 1,000-gallon diesel UST, as well as a fuel dispenser and below ground piping, were removed from a location near the southern corner of the on-site building. The USTs were reported to be in good condition. Soil samples were collected from beneath the USTs and dispenser, and from stockpiled soil. The samples were analyzed for total gasoline and diesel range petroleum hydrocarbons (TPHg and TPHd, respectively), and benzene, toluene, ethylbenzene and xylenes (BTEX). TPHd at 30 parts per million (ppm) was detected in the sample collected beneath the dispenser, which was below applicable clean up levels. Toluene, ethylbenzene and xylenes were additionally detected in the stockpile soil samples at up to 0.0088, 0.0058 and 0.27 ppm, respectively, which is above regulatory standards. The stockpiled soil was subsequently aerated on-site and re-sampled; no BTEX compounds were detected in the samples collected after aeration. The soil was subsequently used on-site to backfill the excavation. The reports indicate that the work was performed under oversight from the County of San Mateo Department of Health Service (CSMDHS) and that the CSMDHS closed the site after reviewing the laboratory results." TRC concluded that, "the planned use appears compatible with the known on-site environmental conditions. No further work appears required". No RECs were identified. See Appendix P for a copy of the previous Phase I ESA.

DRAFT

D3G reviewed the Laboratory Results Soil Sampling report produced by Applied Science and Engineering, Inc. (ASE) on September 28, 1994, which confirmed TRC's findings. In addition, D3G reviewed the Laboratory Results Stockpile Re-Sampling report produced by ASE on November 21, 1994. These reports describe the removal of the 1,088-gallon diesel UST, the 580-gallon gasoline UST and the associated piping and equipment located at the Marcelli Lighting location. Based on the condition of the removed USTs, the analytical data, remediation of the soils from the UST tank pit, and regulatory status, D3G does not believe that the previous USTs are an environmental concern to the subject property. Based on the fact that the above-listed reports identify USTs removed in September 1994 and the highly unlikely probability that four (4) USTs were located at Marcelli Lighting, D3G believes that there were only two (2) previous USTs at the subject property even though the UST size is different but similar in the reports. See Appendix Q for a copy of the Laboratory Results Soil Sampling report. See Section 7.6 for San Mateo County Department of Health Services-Environmental Health information regarding the previous on-site USTs. The former USTs located at the former Marcelli Lighting building are discussed further in Section 5.6.

D3G reviewed a previous Phase I ESA produced by Odic Environmental (Odic) on January 17, 2007 for the eastern portion of the subject property identified as APN 053147020 and 053147050 occupied by Chubs Auto Repair. Odic concluded that, "Historic RECs were found. The subject site had a release of petroleum hydrocarbons to soil and groundwater, with case closure achieved. While closure was granted for the release from the former UST, impact to groundwater from petroleum hydrocarbons has been documented. However, the reported levels are considered to be a low risk for impact to the groundwater beyond the property boundaries, and are not expect to affect any nearby sensitive receptors. Odic hereby recommends no further action based on the current site condition and available public records due to a minimal risk of regulatory action related to the existing contamination at the subject property." See Section 5.6 for additional information regarding the previous subject property LUST incident and UST facility. See Appendix R for a copy of the body of the Odic previous Phase I ESA.

DRAFT

5.0 RECORDS REVIEW

5.1 Standard Environmental Record Sources

5.1.1 State Regulatory Records

According to ASTM E 1527-05, Section 8.1.2.1, the search radius may be reduced due to the urban nature of the subject property and surrounding area. Therefore, the concern attributed to leaking underground storage tank (LUST) sites and State Hazardous Waste Sites (SHWS) is minimized to within 0.33 miles of the subject property.

DATABASE	FINDINGS	
STATE AND TRIBAL LEAKING UNDERGROUND STORAGE TANK DATA (LUST)	On-Site: Adjacent: 0.33 Mile Radius:	Two (2) Two (2) Fifty-three (53)
STATE AND TRIBAL UNDERGROUND STORAGE TANK DATA (UST)	On-Site: Adjacent: 0.25 Mile Radius:	One (1) None Twenty-six (26)
STATE AND TRIBAL VOLUNTARY CLEANUP PROGRAM SITES (VCP)	On-Site: Adjacent: 0.50 Mile Radius:	None None Three (3)
STATE AND TRIBAL BROWNFIELD SITES (BROWNFIELDS)	On-Site: Adjacent: 0.50 Mile Radius:	None None None
STATE AND TRIBAL HAZARDOUS WASTE SITES (SHWS)	On-Site: Adjacent: 0.33 Mile Radius:	None None None
STATE AND TRIBAL INSTITUTIONAL/ENGINEERING CONTROLS (IC/EC)	On-Site: Adjacent: 0.15 Mile Radius:	None None None
STATE AND TRIBAL REGISTERED SOLID WASTE LANDFILLS (SWL)	On-Site: Adjacent: 0.75 Mile Radius:	None None One (1)
STATE SPILLS SITES (SPILLS)	On-Site: Adjacent: 0.15 Mile Radius:	None None Two (2)
Source - State of California governmental records accessed by Environmental FirstSearch		

According to ASTM E 1527.05 Section 3.2.39, an historical recognized environmental condition (HREC) which in the past may have been a REC, but may or may not be considered a REC currently. The on-site LUST listings for the subject property are considered an HREC.

DRAFT

The subject property, identified as Chub's Auto Repair, is listed in the Environmental FirstSearch Report twice (a duplicate record) as a Closed LUST facility and once as a UST facility. D3G reviewed available files from the San Mateo County Department of Health Services-Environmental Health regarding the Closed LUST cases. According to the Revised Tank Removal Report produced by SEMCO on June 8, 1994, a 1,000 gallon waste oil tank and a 1,000 gallon gasoline tank were removed on January 14, 1994. Soil samples from the gasoline tank pit indicated that no detectable traces of analyzed constituents were present except for de minimis amounts of lead. Soil samples from the waste oil tank pit indicated that diesel impacted the soil at 1,100 parts per million (ppm). The tank pit was over-excavated and the subsequent sample indicated diesel at 530 parts per billion (ppb) in the soil, which was above the regulatory levels. See Appendix U for a copy of the Revised Tank Removal Report.

According to the Monitoring Well Construction Report produced by Applied Science and Engineering, Inc. (ASE) on May 24, 1994, in compliance with regulatory requests, a monitoring well (MW-1) was constructed adjacent to the former waste oil UST tank pit to 20 feet below ground surface (bgs). Soil samples were also collected during drilling activities. MW-1 was completed, developed and sampled. Collected soil and groundwater samples were analyzed for petroleum hydrocarbons. Laboratory analysis indicated that soil and groundwater samples were non-detect for petroleum hydrocarbons during the sampling events. ASE recommended collecting groundwater samples quarterly for one year. See Appendix V for a copy of the Monitoring Well Construction Report.

D3G reviewed the Monitor Well Sampling Report produced by ASE on February 16, 1995. The Report states that four (4) quarters of groundwater monitoring were conducted and that analyzed groundwater was non-detect for petroleum hydrocarbons. ASE recommended site closure. See Appendix W for a copy of the Monitor Well Sampling Report.

According to field notes from the San Mateo County Department of Health Services-Environmental Health dated June 21, 1995, MW-1 was abandoned. According to the June 21, 1995 correspondence from the San Mateo County Department of Health Services-Environmental Health, the investigation of the site and remediation of the previous USTs is complete. Based upon available information, no further action (NFA) related to the USTs is required. Additionally, based on the absence of contamination in the subsurface, after the final sampling of MW-1, related to the previous USTs and the regulatory status, D3G does not believe that the previous USTs are an environmental concern to the subject property. See Appendix X for a copy of the NFA letter. The former UST/LUST facility is discussed in Section 5.6.

Cook's Auto Body, which is located across the railroad tracks adjacent to the north and topographically down-gradient, is listed in the Environmental FirstSearch Report as an open LUST facility. According to the Environmental FirstSearch Report, the facility is under site cleanup. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site accessed at

DRAFT

http://geotracker.waterboard.ca.gov/. The LUST incident occurred on the northern portion of the Cook's Auto Body property at an actual distance of approximately 0.04 miles from the subject property. Based on distance and topographic relationship, the Cook's Auto Body is not suspected to present an environmental concern to the subject property. Refer to Section 5.6 for further discussion.

The Hudson Property which is located at 135 Maple Street is located on the western adjacent and topographically cross-gradient property is listed in the Environmental FirstSearch Report as a closed LUST facility. Additionally, according to historical research performed by D3G the property was previously utilized as a Carburetor and Auto Repair facility starting in 1962 through at least 1968. According to the Environmental FirstSearch Report, the facility is a closed LUST incident. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site assessed at http://geotracker.waterboard.ca.gov/. According to the reviewed documentation and the Environmental FirstSearch Report, the release was reported on November 2, 1999 and involved solvents and the contaminated media was "other groundwater – not drinking water". Additionally, the LUST incident was closed on October 30, 2002. Finally the property was redeveloped between 1998 and 2005 with the present multi-family apartment complex. Based on the topographic relationship, and current regulatory status, the western adjacent LUST incident is not considered to be of environmental concern to the subject property. Refer to Section 5.6 for further discussion.

The remaining state-regulated facilities are not located on-site or adjacent and are not of environmental concern to the subject property. The closest record is approximately 0.07 miles southwest of the subject property. Based on the listed distances, topographic relationships, and/or current regulatory statuses, the vicinity state-regulated facilities are not suspected to present environmental concerns to the subject property.

DRAFT

5.1.2 Federal Regulatory Records

DATABASE	FINDINGS	
EPA NATIONAL PRIORITIES LISTING (NPL – SUPERFUND)	On-Site: Adjacent: 1.00 Mile Radius:	None None None
EPA NATIONAL PRIORITIES LISTING (NPL – DELISTED SITES)	On-Site: Adjacent: 0.50 Mile Radius:	None None None
EPA COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT (CERCLIS)	On-Site: Adjacent: 0.50 Mile Radius:	None None One (1)
EPA COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT (CERCLIS) NO FURTHER REMEDIAL ACTION PLANNED (NFRAP)	On-Site: Adjacent: 0.50 Mile Radius:	None None Three (3)

EPA EMERGENCY RESPONSE NOTIFICATION-SITES (ERNS)	On-Site: Adjacent: 0.15 Mile Radius:	None One (1) One (1)
EPA RCRA CORRECTIVE ACTION REPORT (CORRACTS)	On-Site: Adjacent: 1.00 Mile Radius:	None None One (1)
SOURCE - Environmental Protection Agency records accessed by Environmental FirstSearch		

The subject property is listed as Chub's Auto Repair in the Environmental FirstSearch Report as a RCRA small quantity generator of hazardous waste. According to the Environmental FirstSearch Report, no violations are listed. The Chub's Auto Repair is no longer in business and should no longer be classified as a RCRA generator. Based on the regulatory status, the RCRA small quantity generator listing is not an environmental concern to the subject property.

Baker Graphics located at 1201 Main Street, adjacent to the east and topographically cross-gradient of the subject property, is currently known as RPH and is listed in the Environmental FirstSearch Report as a RCRA generator of hazardous waste and an ERNS site. According to the Environmental FirstSearch Report, no violations are listed for the facility. D3G contacted Ms. Mary Misemer, Regulatory Assistance Officer with the California Department of Environmental Protection (CA EPA) (1-800-728-6942) on January 10, 2010 to obtain information pertaining to the ERNS site. However, Ms. Misemer's review of online regulatory database documents found no information available on the adjacent ERNS site. In addition, D3G

DRAFT

reviewed the California Department of Toxic Substances EnviroStor website accessed at http://www.envirostor.dtsc.ca.gov/public/ for a listing of cleanup sites and hazardous waste permitted facilities, and the National Response Center (NRC) website accessed at http://www.nrc.uscg.mil/nrchp.html for a review of federally-regulated oil and chemical spills. However, the eastern adjacent ERNS site was not listed in either the EnviroStor or the NRC database. Based on the topographic relationship and lack of reported handling violations, the adjacent RCRA generator of hazardous waste and ERNS site are not suspected to be of environmental concern to the subject property.

Cook's Auto Body, which is located across the railroad tracks adjacent to the north and topographically down-gradient, is listed twice in the Environmental FirstSearch Report as a RCRA generator of hazardous waste. According to the Environmental FirstSearch Report, no violations are listed. Based on the listed distance, topographic relationship and current regulatory status, the Cook's Auto Body is not suspected to present an environmental concern to the subject property.

The remaining federally-regulated facilities are not located on-site or adjacent and are not of environmental concern to the subject property. The closest remaining record is located approximately 0.07 miles to the northeast of the subject property. Based on the listed distances, topographical relationships and/or current regulatory statuses, the remaining federally-regulated facilities are not suspected to have negatively impacted the environmental integrity of the subject property.

5.1.3 Database Non-Geocoded/Un-Mapable Sites

No non-geocoded sites were determined to be located within the applicable search radius for ASTM E 1527-05.

5.2 Additional Environmental Record Sources

There were no other sources for environmental records that were reviewed for this study.

5.3 Physical Setting Sources

5.3.1 Topography and Regional Surface Water

TOPOGRAPHY AND REGIONAL SURFACE WATER	
ELEVATION (feet above mean sea level)	15
SLOPE	North
APPROXIMATE GROUNDWATER FLOW	North
REGIONAL SURFACE WATER	Redwood Creek, a concrete-lined culvert, is located on-site and flows north
SOURCE - USGS Topographic Quadrangle – *Palo Alto, California* 1991	

DRAFT

Located in the Appendix A is a topographic map depicting subject property elevations and drainage patterns. Depth to groundwater fluctuates depending on hydrological and weather conditions.

On-site drainage at the subject property is suspected to consist of flow along the asphalt parking areas to strategically located storm drains and surface percolation in the unpaved areas.

5.3.2 Soil Characteristics

SOIL CHARACTERISTICS	
SOIL TYPE	*Urban land (131):* This map unit consists of soils that have been so altered by man-made activities, that classification is not feasible.

5.4 Historical Use Information on the Subject Property

5.4.1 Review of Aerial Photographs

YEAR	SUBJECT PROPERTY
1948	The northern portion is developed with structures used as a feed and fuel (wood and coal) facility. The southern portion is partially wooded and undeveloped.
1965	The northern portion is developed with structures used as a feed and fuel (wood and coal) facility. The southern portion is developed with the current auto repair and office structures.
1974	Current subject property structures
1982	Same as 1974
1993	Same as 1974
1998	Same as 1974
2005	Same as 1974
2009	Same as 1974
SOURCES - Google Earth and Environmental Data Resources, Inc.	

A copy of the aerial photography is included in Appendix D of this report.

DRAFT

5.4.2 Fire Insurance Maps

YEAR	SUBJECT PROPERTY
1891	Bunn's Feed Mill, an elevated grain tank/silo, and a dwelling [PD]
1897	W.J. Bunn's Feed Mill, grain warehouse, engine shop, stable, one (1) unidentified building, an elevated grain tank, and a dwelling
1907	Cullen Co's Grain Warehouse, grain warehouse, one (1) unidentified building, dwellings, sheds and a hen house
1919	"Feed and Fuel" building, dwellings, sheds, and an automobile garage
1950	Ridgeway Feed and Fuel (wood and coal), a feed and grain warehouse, an office, and vacant lots
1962	Palmer Supply Company Feed and Fuel (wood and coal), a feed and grain warehouse, and an office on the northern portion and the current auto repair/spray painting, a store building, and a parking lot on the southern portion
1968	Vacant land on the northern portion and the southern portion is the same as 1962
SOURCE - Environmental Data Resources, Inc. - Certified Sanborn Map Report	

PD = partially depicted

Based on the fact that the fuel that was sold during the historical use of the subject property was wood and coal, D3G does not believe that the historical uses of the subject property as a Feed and Fuel company are considered environmental concerns to the subject property.

The Auto Repair Facility is further discussed in Section 5.1.1 and 5.6.

A copy of the Sanborn Fire Insurance Maps is included in Appendix D.

5.4.3 Other Historical Sources

No additional historical sources were reasonably ascertainable.

5.4.4 Summary of Subject Property History

According to the reviewed subject property historical information, the northern portion of the subject property consisted of a grain mill from at least 1891 through the mid-1960s. An engine shop and stable were associated with the grain mill circa 1897. In addition, the northern portion of the subject property was utilized as a Feed and Fuel (wood and coal) facility from approximately 1919 through 1962. The subject property is believed to have been vacant from at least 1968 until the current northern subject property lighting warehouse/storage/office structure (formerly Marcelli Lighting) was constructed in approximately 1974.

According to the reviewed subject property historical information, the southern portion of the subject property consisted of an elevated grain tank and a dwelling from at least 1891 through 1907 when it was developed with dwellings, sheds and a hen house. The subject property was utilized for residential purposes from approximately 1907 until 1955 when the

DRAFT

auto repair building was constructed. The vacant office building was constructed between 1950 and 1962 and was used as a store and office building.

None of the accessed data depicts underground storage tanks (USTs) at the former structures; however, there exists the possibility that the former structures utilized underground or aboveground storage tanks (USTs/ASTs). No visual evidence of USTs (fill ports/vent pipes) or ASTs was observed during the site inspection. If additional ASTs or USTs were formerly located at the subject property, they should have been removed during the demolition of the structure. Information regarding previous on-site USTs is located in Section 5.1.1 and 5.6.

DRAFT

YEAR	NORTH	SOUTH	EAST	WEST
1968	Pennsylvania Railroad, stores, an automobile service and produce warehouse building, and a gas and oil facility	Same as 1962	Not depicted	Same as 1962
SOURCE - Environmental Data Resources, Inc. - Certified Sanborn Map Report				

The western adjacent Carburetor and Automotive Repair facility is further discussed in Section 5.1.1 and 5.6.

The southern adjacent H. Beeger Tanning facility is depicted on the 1891 through 1948 Sanborn Fire Insurance Maps. However, it is not depicted in the 1950 Sanborn Fire Insurance Map, instead where the Beeger Tanning facility was located is a storage building, stores and a vacant lot. Additionally, the facility is located topographically cross-gradient from the subject property and has since been redeveloped as a car dealership with associated structures. Based on the amount of time, approximately 60 years since the properties last use as a tannery, redevelopment of the property and topographic relationship, the southern adjacent tannery is not suspected to be of environmental concern to the subject property.

The adjacent properties have been occupied by a tannery, automobile service facilities and a gas and oil facility and are down to cross-gradient to the subject property. Based on the regulatory review and site inspection, the adjacent facilities are not considered an environmental concern to the subject property.

A copy of the Sanborn Fire Insurance Maps is included in Appendix D.

5.5.3 Other Historical Sources

No additional historical sources were reasonably ascertainable.

DRAFT

5.6 Tier 1 Vapor Encroachment Screening

D3G performed a Tier 1 Vapor Encroachment Screening in compliance with ASTM E 2600-10 "ASTM Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions" as amended. The purpose of the Tier 1 Vapor Encroachment Screening is to conduct an initial screen to determine if a Vapor Encroachment Condition (VEC) exists in connection with the subject property. A VEC is defined as the presence or likely presence of chemical of concern (COC) vapors in the subsurface of the subject property caused by the release of vapors from contaminated soil or groundwater either on or near the subject property.

D3G reviewed standard environmental record sources to identify if there are known or suspected sources of contamination within the area of concern (AOC). According to ASTM E 2600-10, the area of concern is defined by the approximate minimum search distance which is based upon the chemical of concern (i.e. petroleum hydrocarbons vs. non-petroleum hydrocarbons) and the location of a known or suspected source of contamination with respect to the subject property.

According to ASTM E 2600-10 8.2.1 *"The area of concern is one third of a mile around the subject property, unless the use of a shorter distance is appropriate."* In addition, according to ASTM E 2600-10 8.3.1, *"The approximate minimum search distance may be expanded or reduced in the up-gradient, down-gradient, and/or cross-gradient directions by the environmental professional conducting the Vapor Encroachment Screening based upon experience in the local area."* Therefore, D3G has reduced the approximate minimum search distance for up-gradient and cross-gradient contaminated properties based on actual plume data collected for dry cleaners, state hazardous waste sites, and evaluation of actual gas station LUST data as outlined in the article, *A Smaller Intrusion*, by Anthony J. Buonicore, P.E. published in the May 2009 Issue of Pollution Engineering magazine. A copy of the article is provided in Appendix E. The revised approximate minimum search distances are provided in the table below. Unless otherwise stated, groundwater flow/gradient is approximated based on surface topography.

D3G was not provided information from the User, Current Landowner, or Key Site Manager, regarding specialized knowledge or experience or commonly known or reasonably ascertainable information within the local community about the subject property that is material to the assessment of a VEC in connection with the subject property.

Subject Property

Based on a review of the Environmental FirstSearch Report, the subject property is identified in the State and Federal Records Search. The subject property, identified as Chub's Auto Repair, is listed in the LUST/UST State Records Search. According to the Environmental FirstSearch Report, the subject property is listed twice as a Closed LUST facility and once as a UST facility. A review of available documentation indicates that two (2) USTs were present at the subject property. In addition, the final sampling analysis indicated that soil and

DRAFT

groundwater were not contaminated by the previous USTs and the case was closed. Based on the absence of contamination in the subsurface related to the previous USTs and the regulatory status, a VEC does not exist or is not likely to exist at the subject property from the previous on-site USTs. The USTs are discussed further in Section 5.1.1.

D3G contacted the San Mateo County Department of Health Services-Environmental Health for a review of their environmental records including regional environmental health issues, on-site wells and/or septic system records for the subject property. D3G reviewed San Mateo County Department of Health Services-Environmental Health documents related to the previous USTs located at the Marcelli Lighting location. The application for the permit to close two (2) on-site USTs (500-gallon gasoline and 1,000-gallon diesel USTs installed in 1979) was filed on May 26, 1994. D3G reviewed a letter from the San Mateo County Department of Health Services-Environmental Health dated October 4, 1994 which stated, "it is our position that no further action is required at this time." See Section 4.8 for the previous Phase I ESA report regarding the previous on-site USTs. Although there is a slight discrepancy in the size of the USTs between the previous reports discussed in Section 4.8 and the health department documentation, there were only two (2) USTs reported to be located on this portion of the subject property. Based on the condition of the removed USTs, the analytical data, remediation of the soils from the UST tank pit, and regulatory status, D3G believes that a VEC does not exist or is not likely to exist at the subject property from the previous USTs.

D3G reviewed the Hydraulic Lift Sampling Results produced by ASE on December 21, 1994. ASE stated that a hydraulic lift was removed from the automobile repair shop in August 1994 because the cylinder was leaking. The hydraulic pit was over-excavated to twelve (12) feet bgs and a monitoring well (MW-2) was placed in the washed pea gravel backfilled pit. Soil and groundwater samples were collected from the bottom of the pit and MW-2 and analyzed for oil & grease (O&G) by EPA method 418.1. Analytical data indicated that O&G was present in the soil sample at 520 ppm at 12.5 feet bgs and that O&G was present in groundwater at 1.7 ppm, which is below regulatory levels. D3G reviewed the San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum dated June 13, 1995. The memorandum outlined the history of the hydraulic lift removal, prior sampling events and analytical information. In addition, the memorandum stated that it is estimated that approximately 2.5 cubic yards of soil contaminated with approximately one (1) gallon of hydraulic oil remains in place at the site. Based on the de minimis amount (approximately one gallon) of hydraulic oil in the subsurface and the fact that the former hydraulic lift has been previously investigated, D3G does not suspect that the hydraulic oil negatively impacted the environmental integrity of the subject property. Additionally, the objectives of the San Francisco Bay Regional Water Quality Control Board have been satisfied and that the case has been closed, D3G believes that a VEC does not exist or is not likely to exist at the subject property from the previous hydraulic lift. If contamination is discovered during the subject property demolition and/or construction, the contamination should be disposed of in accordance with local, state and federal regulations.

The subject property is listed as Chub's Auto Repair in the Environmental FirstSearch Report as a RCRA small quantity generator of hazardous waste. According to the Environmental FirstSearch Report, no violations are listed. The Chub's Auto Repair is no longer in business and should no longer be classified as a RCRA generator. Based on the regulatory status, the RCRA small quantity generator listing is not an environmental concern to the subject property. Therefore, a VEC does not exist or is not likely to exist at the subject property from the previous RCRA small quantity generator of hazardous waste.

Contaminated Properties within the Area of Concern

The following table identifies contaminated properties within the revised approximate minimum search distances, based on a review of the Environmental FirstSearch Report and a review of adjacent historical use information that is reasonably ascertainable.

	UP-GRADIENT SOURCES: NUMBER OF IDENTIFIED RECORDS		DOWN-GRADIENT SOURCES: NUMBER OF IDENTIFIED RECORDS		CROSS-GRADIENT SOURCES: NUMBER OF IDENTIFIED RECORDS	
Search Distance	**COC : 1/3 mile**	**Petroleum: 1/10 mile**	**COC : 0.02 mile (100 ft)**	**Petroleum: 0.02 mile (100 ft)**	**COC: 0.07 mile (365 ft)**	**Petroleum: 0.03 mile (165 ft)**

*A review of the state and federal environmental records sources obtained from the Environmental FirstSearch Report is provided in Appendix E.

Cook's Auto Body, which is located across the railroad tracks adjacent to the north and topographically down-gradient, is listed in the Environmental FirstSearch Report as an open LUST facility. According to the Environmental FirstSearch Report, the facility is under site cleanup. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site accessed at http://geotracker.waterboard.ca.gov/. The LUST incident occurred on the northern portion of the Cook's Auto Body property at an actual distance of approximately 0.04 miles from the subject property. Based on distance and topographic relationship, the Cook's Auto Body is

not suspected to present an environmental concern to the subject property. Therefore, a VEC does not exist or is not likely to exist at the subject property from the previous LUST incident.

The Hudson Property which is located at 135 Maple Street is located on the western adjacent and topographically cross-gradient property is listed in the Environmental FirstSearch Report as a closed LUST facility. Additionally, according to historical research performed by D3G the property was previously utilized as a Carburetor and Auto Repair facility starting in 1962 through at least 1968. According to the Environmental FirstSearch Report, the facility is a closed LUST incident. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site assessed at http://geotracker.waterboard.ca.gov/. According to the reviewed documentation and the Environmental FirstSearch Report, the release was reported on November 2, 1999 and involved solvents and the contaminated media was "other groundwater – not drinking water". Additionally, the LUST incident was closed on October 30, 2002. Finally the property was redeveloped between 1998 and 2005 with the present multi-family apartment complex. Located on the western adjacent property is a portion of Redwood Creek, which is a preferential pathway for contaminates as well as acting as a hydraulic barrier to prevent contamination from reaching the residential structure of the subject property. Based on the topographic relationship, current regulatory status and presence of a hydraulic barrier between the subject property and the western adjacent LUST, the LUST incident is not considered to be of environmental concern to the subject property. Therefore, a VEC does not exist or is not likely to exist at the subject property from the previous LUST incident.

6.0 SITE RECONNAISSANCE

6.1 Methodology and Limiting Conditions

D3G's site inspection consisted of visual observations along boundaries and various transects throughout the subject property. On the interior lobbies, hallways, utility rooms, maintenance and repair areas and offices were observed. The adjacent properties were observed from the subject property and the boundaries of the subject property and public right-of-ways.

6.2 General Site Setting

The subject property consists of three (3) parcels totaling approximately 1.313 acres of land. The subject property is currently developed with one (1) two-story vacant office/showroom/warehouse building (formerly Marcelli Lighting) constructed circa 1974, one (1) one-story auto repair building (formerly Chubs Auto Repair) constructed circa 1955, and one (1) one-story vacant office building constructed circa 1950-1962. In addition, the subject property is improved upon by the Redwood Creek (a concrete-lined culvert), an exterior storage yard, landscaped regions and asphalt parking areas. The vacant two-story office/showroom/warehouse building and auto repair building will be demolished and a five-story, 114-bed skilled nursing facility will be constructed. The vacant office building will remain

DRAFT

at the subject property (the building's future use has not been determined). The subject property is serviced by electricity, natural gas, and municipally supplied water and sewer.

6.3 Exterior Observations

EXTERIOR OBSERVATIONS	OBSERVED	NOT OBSERVED
HAZARDOUS MATERIALS AND PETROLEUM PRODUCTS	(1)	
POLYCHLORINATED BIPHENYLS (PCBS)		√
SUBJECT PROPERTY DUMPED MATERIALS/LANDFILLS		√
SOLID WASTE DISPOSAL		√
SPILLS/STAINED SOILS/STAINED PAVEMENT/STRESSED VEGETATION		√
STORAGE TANKS NOT PREVIOUSLY LISTED		√
WELLS NOT PREVIOUSLY LISTED		√
HAZARDOUS RUNOFF		√
PITS, PONDS, OR LAGOONS*		√
ODORS		√

*Excludes stormwater drainage features

(1) No bulk storage of hazardous materials or petroleum products was observed on the exterior of the subject property. However, D3G observed the following materials on the portion of the property utilized as a storage yard: three (3) empty 55-gallon drums, small quantity (one (1) to five (5) gallon) gasoline containers, automobile batteries, tires, small containers of motor oil and cleaning products. Leakage was not visually observed in the vicinity of the stored materials. The on-site chemicals are commercially available, stored in limited quantities, and are not believed to present an environmental concern to the subject property. D3G recommends that the hazardous materials and petroleum products be proper disposed of during demolition activities.

6.4 Interior Observations

INTERIOR OBSERVATIONS	OBSERVED	NOT OBSERVED
HAZARDOUS MATERIALS AND PETROLEUM PRODUCTS	(1)	
POLYCHLORINATED BIPHENYLS (PCBS)		√
STORAGE TANKS NOT PREVIOUSLY LISTED		√
ODORS		√
DRAINS AND/OR SUMPS		√
POOLS OF LIQUID		√

DRAFT

(1) No bulk storage of hazardous materials or petroleum products was identified on the interior at the subject property. However, paints, cleaning products, small containers (one (1) to five (5) gallons) of gasoline and small containers of motor oil are stored in the maintenance areas. None of the stored materials were observed to be leaking or to have had signs of major spillage. No floor drains or other potential receptors for the release of hazardous materials were observed within the areas of material storage. The on-site chemicals are commercially available, stored in limited quantities, and are not believed to present an environmental concern to the subject property. D3G recommends that hazardous material or petroleum products be properly disposed of during demolition activities.

7.0 INTERVIEWS

7.1 Prospective Landowner/User Questionnaire

A Property Questionnaire was provided to Wells Fargo Bank, N.A., the User; however, it was not returned to D3G. According to HUD MAP 9.3.A.2, the sponsor/developer is responsible for completing the User Questionnaire. This is noted in Section 2.4.

7.2 Current Landowner Questionnaire

A Property Questionnaire was provided to Mr. Louis Deziel, the Current Landowner Representative; however, it was not returned to D3G. This is noted in Section 2.4.

7.3 Previous Landowner Questionnaire

A Property Questionnaire was provided to Mr. Louis Deziel to forward to Mr. Kevin Flaherty, the Previous Landowner; however, it was not returned to D3G. This is noted in Section 2.4.

7.4 Key Site Manager Questionnaire

A Property Questionnaire was provided to Mr. Louis Deziel, the Key Site Manager; however, it was not returned to D3G. This is noted in Section 2.4.

7.5 Occupant Questionnaire

The subject property consists of two (2) vacant buildings and an auto repair facility; therefore, an Occupant Questionnaire is not necessary for this investigation pursuant to ASTM E 1527 05 Section 10.5.2.1.

DRAFT

7.6 Local Agencies Contacted

D3G contacted Mr. Bernel Mershon, Fire Prevention Secretary for the City of Redwood City Fire Department, on December 22, 2010 for a review of their environmental records (i.e. USTs, hazardous materials storage, and spills) for the subject property. However, a response has not yet been received. D3G previously contacted the Fire Prevention Secretary on August 16, 2010 and according to Mr. Mershon, records for the subject property at that time included a permit issued on August 24, 1994 for the removal of two (2) USTs. A copy of the correspondence is located in Appendix F of this report.

D3G contacted the San Mateo County Department of Health Services-Environmental Health for a review of their environmental records including regional environmental health issues, on-site wells and/or septic system records for the subject property. D3G reviewed San Mateo County Department of Health Services-Environmental Health documents related to the previous USTs located at the Marcelli Lighting location. The application for the permit to close two on-site USTs (500-gallon gasoline and 1,000-gallon diesel USTs installed in 1979) was filed on May 26, 1994. D3G reviewed a letter from the San Mateo County Department of Health Services-Environmental Health dated October 4, 1994 which stated, "it is our position that no further action is required at this time." See Section 4.8 for the previous Phase I ESA report regarding the previous on-site USTs. Based on the condition of the removed USTs, the analytical data, remediation of the soils from the UST tank pit, and regulatory status, D3G does not believe that the previous USTs are an environmental concern to the subject property. A copy of the County of San Mateo Environmental Health UST information and closure letter can be found in Appendix S.

In addition, according to the San Mateo County Department of Health Services-Environmental Health reviewed files, the subject property at the Marcelli Lighting location was listed as a Hazardous Waste Generator of waste thinner, sludge and waste oil. Based on the fact that no violations are listed in the reviewed records, D3G does not believe that the Hazardous Waste Generator status is an environmental concern. A copy of the County of San Mateo Environmental Health hazardous waste information can be found in Appendix T.

D3G additionally reviewed files from the San Mateo County Department of Health Services-Environmental Health regarding the parcel at the auto repair facility (formerly Chub's Auto Repair). The files identify two (2) previous USTs at the subject property. See Sections 5.1.1 and 5.1.2 for additional information regarding the previous USTs.

Additional files from the San Mateo County Department of Health Services-Environmental Health regarding the parcel at the auto repair facility (formerly Chub's Auto Repair) reference contamination associated with a previous hydraulic lift.

DRAFT

According to ASTM E 1527.05 Section 3.2.39, an historical recognized environmental condition (HREC) which in the past may have been a REC, but may or may not be considered a REC currently. The contamination from the previous on-site hydraulic lift is considered an HREC.

D.

D3G reviewed the Hydraulic Lift Sampling Results produced by ASE on December 21, 1994. ASE stated that a hydraulic lift was removed from the automobile repair shop in August 1994 because the cylinder was leaking. The hydraulic pit was over-excavated to twelve feet bgs and a monitoring well (MW-2) was placed in the washed pea gravel backfilled pit. Soil and groundwater samples were collected from the bottom of the pit and MW-2 and analyzed for oil & grease (O&G) by EPA method 418.1. Analytical data indicated that O&G was present in the soil sample at 520 ppm at 12.5 feet bgs and that O&G was present in groundwater at 1.7 ppm. A copy of the Hydraulic Lift Sampling Results report can be found in Appendix Y.

D3G reviewed the MW-1 Groundwater Sampling Report Hydraulic Lift Excavation report produced by ASE on June 2, 1995. ASE summarized the previous sampling events at MW-2 which identified O&G in the groundwater at 1.5-1.7 ppm over three quarterly sampling events. Based on the fact that the concentration of O&G at MW-2 is below the reporting limit required by the Tri-Regional of 5 ppm, that urban run-off into San Francisco Bay has a mean concentration of 3 ppm and that reducing the O&G to the detection limit of 0.5 ppm is cost prohibitive, ASE recommended closing the site. A copy of the MW-2 Groundwater Sampling Report Hydraulic Lift Excavation report produced by ASE report can be found in Appendix Z.

D3G reviewed the San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum dated June 13, 1995. The memorandum outlined the history of the hydraulic lift removal, prior sampling events and analytical information. In addition, the memorandum stated that it is estimated that approximately 2.5 cubic yards of soil contaminated with approximately one (1) gallon of hydraulic oil remains in place at the site. Based on the investigation, monitoring results and other information, no further investigation is required at the site. Therefore, the case is closed. A copy of the San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum can be found in Appendix ZZ.

Based on the de minimis amount (approximately one gallon) of hydraulic oil in the subsurface and the fact that the former hydraulic lift has been previously investigated, D3G does not suspect that the hydraulic oil negatively impacted the environmental integrity of the subject property. Additionally, the objectives of the San Francisco Bay Regional Water Quality Control Board have been satisfied and that the case has been closed. D3G does not believe that the previous hydraulic lift is an environmental concern and it is considered an HREC at the subject property. If contamination is discovered during the subject property demolition and/or construction, the contamination should be disposed of in accordance with local, state and federal regulations.

7.7 Additional Persons Interviewed

INTERVIEWED PERSON	POSITION/RELATION TO PROPERTY	INTERVIEW DATE	CONTENT OF DISCUSSION
Louis Deziel	Current Landowner representative	12/21/2010	Discussed subject property operations, property history, toured the property and accessed the interior.

8.0 INVESTIGATION FOR NON-SCOPE CONSIDERATIONS

8.1 Asbestos-Containing Materials

The current subject property structures were constructed in approximately 1955, 1950-1962 and 1974, during a time of asbestos-containing building material usage; therefore, ACMs are suspected to be present at the subject property. According to a NESHAP Asbestos Survey and Lead-Based Paint Inspection Report prepared by AEI Consultants (AEI) dated November 11, 2010, Mr. Alain Grissette, a State of California licensed Asbestos Consultant (CAC #07-4300) with AEI, conducted an NESHAP Asbestos Survey at the subject property on November 5, 2010. However, the office building located at 1180 Main Street was not included as part of the survey. Sampled materials included acoustic ceiling tiles, drywall/joint compound, window putty, covebase and associated mastics, vinyl flooring materials and associated mastics, and roofing materials. An asbestos-containing material (ACM) is defined by the Federal OSHA, the State of California OSHA and EPA as materials with an asbestos concentration of greater than 1.0%. Asbestos-containing construction materials (ACCMs) are defined by the State of California OSHA as materials with an asbestos concentration between 0.1% and 1.0%. The following table itemizes the sampled materials and their respective asbestos contents:

SAMPLE NUMBER	SAMPLED MATERIAL	LOCATION	% ASBESTOS
A-101	Acoustic ceiling tile	Rear Storage Area	None detected
A-102 (layer 1)	Drywall	Rear Storage Area	None detected
A-102 (layer 2)	Joint compound	Rear Storage Area	None detected
A-103 (layer 1)	Drywall	Main Storage Area	None detected
A-103 (layer 2)	Joint compound	Main Storage Area	None detected
A-104 (layer 1)	Grey base cove	Rear Storage Area	None detected
A-104 (layer 2)	White mastic a/w grey base cove	Rear Storage Area	None detected
A-105	Drywall	Office	None detected
A-106	Black roofing mastic	Roof – Penetrations and Edges	None detected
A-107	Roof core	Roof – Near Main Street	None detected

SAMPLE NUMBER	SAMPLED MATERIAL	LOCATION	% ASBESTOS
A-108	Roof core	Roof – Rear of building	< 0.1% chrysotile*
A-109	Window putty	Exterior Windows North Side	0.1% chrysotile*
B-101 (layer 1)	Drywall	Front Room, Front Wall	None detected
B-101 (layer 2)	Joint compound	Front Room, Front Wall	None detected
B-102 (layer 1)	Drywall	Front Room, Side Wall	None detected
B-102 (layer 2)	Joint compound	Front Room, Side Wall	None detected
B-103 (layer 1)	Drywall	Front Room, Wall Behind Counter	None detected
B-103 (layer 2)	Joint compound	Front Room, Wall Behind Counter	None detected
B-104 (layer 1)	Tan vinyl floor sheet	Front Room, Hallways and Bathroom	None detected
B-104 (layer 2)	**Paper backing a/w tan vinyl floor sheet**	**Front Room, Hallways and Bathroom**	**60% chrysotile**
B-105 (layer 1)	Drywall	Rear Storage, Ceiling	None detected
B-105 (layer 2)	Joint compound	Rear Storage, Ceiling	None detected
B-106 (layer 1)	Drywall	Rear Storage, Wall next to stairs	None detected
B-106 (layer 2)	Joint compound	Rear Storage, Wall next to stairs	None detected
B-107 (layer 1)	Roof core	Roof – Front of Building	None detected
B-107 (layer 2)	Paint a/w roof core	Roof – Front of Building	None detected
B-108 (layer 1)	Roof core	Roof – Rear of Building	None detected
B-108 (layer 2)	Paint a/w roof core	Roof – Rear of Building	None detected
B-109 (layer 1)	Roof felt	Roof - Parapet	None detected
B-109 (layer 2)	Paint a/w roof felt	Roof - Parapet	None detected
B-110 (layer 1)	Grey/black roof mastic	Roof - Penetrations	None detected
B-110 (layer 2)	Paint a/w roof mastic	Roof - Penetrations	None detected

* = analyzed via more precise EPA 1,000 Point Count Method; a/w = associated with

The identified ACMs and ACCMs are denoted in bold type. While trace amount of asbestos was detected in samples A-108 and A-109, further point count analysis reduced the asbestos percentage to below the threshold both EPA and Cal/OsHA require for ACM or ACCM categorization. The identified vinyl floor sheeting paper backing are friable (able to be crushed via hand pressure) and were observed to be in poor physical condition at the time of the survey. However, according to an invoice and Certificate of Completion dated December 30, 2010, 200 square feet of the tan vinyl sheet flooring and scrape mastic were removed from the subject property.

According to a Post-Abatement Clearance Survey Report prepared by AEI Consultants (AEI) dated December 23, 2010, the abatement was performed at the subject property on December 22, 2010 by PW Stevens, a California DOSH registered abatement contractor. Following the abatement procedures, Mr. Alain Grissette with AEI performed a Post-

DRAFT

Abatement Clearance Survey at the property. Mr. Grissette performed a visual survey of the property to ensure complete removal of the vinyl floor sheet from the containment area and that the containment area of was left free of dust and debris. The results of the visual inspection indicated the all of the vinyl sheet floor had been removed and no dust or debris was observed. In addition, Mr. Grissette performed air sampling clearance using phase contrast microscopy (PCM) air samples to ensure safe work practices were utilized during abatement. The PCM air samples were analyzed using NIOSH 7400 methodology and compared to the clearance level of 0.01 fibers per cubic centimeter (f/cc^2). AEI collected two (2) PCM air samples from within the containment area, one (1) from the hallway and one (1) from the bathroom. In addition, two (2) PCM samples were submitted for quality assurance purposes. The analytical results indicated levels of 0.0025 f/cc^2 and 0.0031 f/cc^2 in the hallway and bathroom, respectively. Based on the results, the asbestos abatement procedures passed both the visual and air sampling clearance requirements.

The office building located at 1180 Main Street was not included as part of the NESHAP Asbestos Survey and Lead-Based Paint Inspection survey. Presumed asbestos containing materials (PACMs) observed at the structure include, but are not limited to: wall and ceiling materials, caulking, vinyl flooring materials, mastics, and roofing materials. Recommendations are listed in Section 11.0.

8.2 Lead-Based Paint

The current subject property structures were constructed in approximately 1955, 1950-1962 and 1974, prior to the 1978 ban on lead-based paint (LBP); therefore, LBP may be present. No peeling or flaking paint was observed at the subject property at the time of the site inspection. According to a NESHAP Asbestos Survey and Lead-Based Paint Inspection Report prepared by AEI Consultants (AEI) dated November 11, 2010, Mr. Alain Grissette, a Cal/DOSH Certified Lead-Paint Inspector/Assessor (license #18206) with AEI, conducted a Lead-Based Paint Inspection at the subject property on November 5, 2010. However, the office building located at 1180 Main Street was not included as part of the survey. Ninety-seven (97) samples were collected from the painted surfaces of components through the subject property structures. The lead paint inspection was completed utilizing an X-ray fluorescence (XRF) lead paint analyzer, which quickly, accurately, and non-destructively measures the concentration of lead-based paint on surfaces. Sampled surfaces consisted of walls, doors, and associated framework, windows and associated framework, ceilings, baseboards, and miscellaneous components. The XRF readings were compared to the EPA and United States Department of Housing and Urban Development lead in paint standard of 1.0 mg/cm^2. The results of this inspection indicate that none of the sampled components contained lead-based paint. Components identified as containing lead in *any concentration* are required be handled in accordance with 29 CFR 1926.62, the OSHA "Lead Exposure in Construction" Standard (OSHA does not define LBP).

A copy of the NESHAP Asbestos Survey and Lead-Based Paint Inspection Report is included in Appendix ZZZZ.

DRAFT

The office building located at 1180 Main Street was not included as part of the NESHAP Asbestos Survey and Lead-Based Paint Inspection survey. Therefore, LBP is presumed to have been used on interior and exterior surfaces of that structure. No peeling or flaking paint was observed at the subject property at the time of the site inspection. Recommendations are listed in Section 11.0.

8.3 Radon Gas

U.S. EPA RADON DATA	
ZONE	2
ZONE DEFINITION	Average reading between 2 and 4 picocuries/liter (pCi/L)
SOURCE - U.S. EPA Radon Map	

The property does not contain subgrade living areas, which reduces the potential for radon gas. In addition, HUD guidelines do not regulate radon gas.

8.4 Flood Zone

According to FEMA Flood Insurance Rate Map (FIRM) #060325-0011B, dated May 17, 1982, the subject property drainage ditch is located within in Zone A, designated as an area within the 100-year flood zone and the remaining portion of the subject property is located in Zone B, designated as an area within the 500-year flood zone.

Recommendations are listed in Section 11.0 of this report.

8.5 Wetlands

A wetland delineation/determination has not been performed at the subject property; however, according to the National Wetlands Inventory map accessed at http://www.fws.gov/wetlands/Data/Mapper.html and visual observations, there are not suspected to be any wetland areas on the subject property.

8.6 Coastal Barrier Resource Area/Coastal Zone Management

According to Coastal Barrier Resource Area information accessed at http://www.fema.gov/business/nfip/cbrs/cbrs.shtm, the subject property is not located within a coastal barrier. According to the California Coastal Commission, San Mateo County is not located within a Coastal Management Zone.

DRAFT

8.7 Historic Properties

The structures were constructed in approximately 1955, 1950-1962 and 1974 and are not suspected to qualify as historic properties. The subject property is not listed, and is not suspected to be eligible to be listed, in the National Register of Historic Places. In addition, the subject property is not located within a historic district of the City of Redwood City or San Mateo County. The State of California Office of Historic Preservation requires that SHPO determination correspondence originate from the local HUD office.

A copy of The National Register of Historic Places for Redwood City is provided in Appendix J.

8.8 Threatened and Endangered Species

The U.S. Department of the Interior Endangered Species list was reviewed. Based on the developed nature of the subject property, none of the listed species are suspected to inhabit the subject property.

A copy of The U.S. Department of the Interior Threatened and Endangered Species System for California is provided in Appendix K.

8.9 Sole Source Aquifer

According to an EPA Groundwater and Drinking Water publication, the subject property is not serviced or supplied by a protected aquifer system. A copy of the EPA Groundwater and Drinking Water publication is provided in Appendix L.

8.10 Noise

The subject property is located in the vicinity of the Caltrain and Union Pacific railroad and the San Carlos Airport and Moffett Field. There are no major roadways within 1,000 feet of the subject property. The projected DNL value for all noise sources is 87.8 dB, which is considered "unacceptable."

Recommendations are listed in Section 11.0 of this report. A copy of the completed noise survey is provided in Appendix O.

8.11 Nuisances and Hazards

No "nuisances" or "hazards" were observed at the subject property or surrounding properties during the subject property inspection.

DRAFT

9.0 FINDINGS

This Phase I ESA was prepared in accordance with ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process Designation: E 1527-05, 40 CFR Part 312 Standards and Practices for All Appropriate Inquiries: Final Rule, U.S. Housing and Urban Development (HUD) Multifamily Housing Accelerated Processing Guide, and accepted Phase I ESA industry standards. This assessment has revealed the following findings based on the subject property inspection, interviews, and review of available records:

OBSERVED CONDITIONS	ON-SITE	ADJACENT
STANDARD ENVIRONMENTAL RECORDS REVIEW	Yes	Yes
UNREGULATED UNDERGROUND STORAGE TANK(S) (UST)	Yes (Former)	No
PAST INDUSTRIAL/DETRIMENTAL OPERATIONS	Yes	No
VAPOR ENCROACHMENT CONDITION	Yes	No
STORED HAZARDOUS MATERIALS	Yes	NA
POLYCHLORINATED BIPHENYLS (PCBS)	No	NA
ABOVEGROUND STORAGE TANK(S) (AST)	No	No
DUMPING, LANDFILLS	No	No
HAZARDOUS RUN-OFF	No	No
ASBESTOS-CONTAINING MATERIALS	Yes	NA
LEAD-BASED PAINT	No	NA
FLOOD ZONE	Yes	NA
NOISE	Yes	NA

NA = Not Applicable

10.0 OPINION

Based on the findings of this Phase I ESA, the following historical recognized environmental conditions (HRECs) were identified in connection with the subject property:

- Previous On-site Underground Storage Tanks at APN 053147020/VEC
  According to ASTM E 1527.05 Section 3.2.39, an historical recognized environmental condition (HREC) which in the past may have been a REC, but may or may not be considered a REC currently. The on-site LUST listing for the subject property is considered an HREC.

  The subject property, identified as Chub's Auto Repair, is listed in the Environmental FirstSearch Report twice (a duplicate record) as a Closed LUST facility and once as a UST facility. D3G reviewed available files from the San Mateo County Department of Health Services-Environmental Health regarding the Closed LUST cases. According to the Revised Tank Removal Report produced by SEMCO on June 8, 1994, a 1,000 gallon waste oil tank and a 1,000 gallon gasoline tank were removed on January 14, 1994. Soil samples

DRAFT

from the gasoline tank pit indicated that no detectable traces of analyzed constituents were present except for de minimis amounts of lead. Soil samples from the waste oil tank pit indicated that diesel impacted the soil at 1,100 parts per million (ppm). The tank pit was over-excavated and the subsequent sample indicated diesel at 530 parts per billion (ppb) in the soil, which was above the regulatory levels. See Appendix U for a copy of the Revised Tank Removal Report.

According to the Monitoring Well Construction Report produced by Applied Science and Engineering, Inc. (ASE) on May 24, 1994, in compliance with regulatory requests, a monitoring well (MW-1) was constructed adjacent to the former waste oil UST tank pit to 20 feet below ground surface (bgs). Soil samples were also collected during drilling activities. MW-1 was completed, developed and sampled. Collected soil and groundwater samples were analyzed for petroleum hydrocarbons. Laboratory analysis indicated that soil and groundwater samples were non-detect for petroleum hydrocarbons during the sampling events. ASE recommended collecting groundwater samples quarterly for one year. See Appendix V for a copy of the Monitoring Well Construction Report.

D3G reviewed the Monitor Well Sampling Report produced by ASE on February 16, 1995. The Report states that four (4) quarters of groundwater monitoring were conducted and that analyzed groundwater was non-detect for petroleum hydrocarbons. ASE recommended site closure. See Appendix W for a copy of the Monitor Well Sampling Report.

According to field notes from the San Mateo County Department of Health Services-Environmental Health dated June 21, 1995, MW-1 was abandoned. According to the June 21, 1995 correspondence from the San Mateo County Department of Health Services-Environmental Health, the investigation of the site and remediation of the previous USTs is complete. Based upon available information, no further action (NFA) related to the USTs is required. Based on the absence of contamination in the subsurface related to the previous USTs and the regulatory status, D3G does not believe that the previous USTs are an environmental concern to the subject property. Therefore, a VEC does not exist or is not likely to exist at the subject property. See Appendix X for a copy of the NFA letter.

- Previous On-site Hydraulic Lift at APN 053147020/VEC

  According to ASTM E 1527.05 Section 3.2.39, an historical recognized environmental condition (HREC) which in the past may have been a REC, but may or may not be considered a REC currently. The contamination from the previous on-site hydraulic lift is considered an HREC.

  D3G reviewed the Hydraulic Lift Sampling Results produced by ASE on December 21, 1994. ASE stated that a hydraulic lift was removed from the automobile repair shop in August 1994 because the cylinder was leaking. The hydraulic pit was over-excavated to twelve (12) feet bgs and a monitoring well (MW-2) was placed in the washed pea gravel

DRAFT

backfilled pit. Soil and groundwater samples were collected from the bottom of the pit and MW-2 and analyzed for oil & grease (O&G) by EPA method 418.1. Analytical data indicated that O&G was present in the soil sample at 520 ppm at 12.5 feet bgs and that O&G was present in groundwater at 1.7 ppm. A copy of the Hydraulic Lift Sampling Results report can be found in Appendix Y.

D3G reviewed the MW-1 Groundwater Sampling Report Hydraulic Lift Excavation report produced by ASE on June 2, 1995. ASE summarized the previous sampling events at MW-2 which identified O&G in the groundwater at 1.5-1.7 ppm over three quarterly sampling events. Based on the fact that the concentration of O&G at MW-2 is below the reporting limit required by the Tri-Regional of 5 ppm, that urban run-off into San Francisco Bay has a mean concentration of 3 ppm and that reducing the O&G to the detection limit of 0.5 ppm is cost prohibitive, ASE recommended closing the site. A copy of the MW-1 Groundwater Sampling Report Hydraulic Lift Excavation report produced by ASE report can be found in Appendix Z.

D3G reviewed the San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum dated June 13, 1995. The memorandum outlined the history of the hydraulic lift removal, prior sampling events and analytical information. In addition, the memorandum stated that it is estimated that approximately 2.5 cubic yards of soil contaminated with approximately one (1) gallon of hydraulic oil remains in place at the site. Based on the investigation, monitoring results and other information, no further investigation is required at the site. Therefore, the case is closed. A copy of the San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum can be found in Appendix ZZ.

Based on the de minimis amount (approximately one gallon) of hydraulic oil in the subsurface and the fact that the former hydraulic lift has been previously investigated, D3G does not suspect that the hydraulic oil negatively impacted the environmental integrity of the subject property. Additionally, the objectives of the San Francisco Bay Regional Water Quality Control Board have been satisfied and that the case has been closed, D3G believes that a VEC does not exist or is not likely to exist at the subject property from the previous hydraulic lift. If contamination is discovered during the subject property demolition and/or construction, the contamination should be disposed of in accordance with local, state and federal regulations.

Based on the findings of this Phase I ESA, the following environmental concerns were identified in connection with the subject property:

- Asbestos-Containing Materials (ACMs)
  The office building located at 1180 Main Street was not included as part of the NESHAP Asbestos Survey and Lead-Based Paint Inspection survey. Presumed asbestos containing materials (PACMs) observed at the structure include, but are not limited to: wall and ceiling materials, caulking, vinyl flooring materials, mastics, and roofing materials.

- Lead-Based Paint (LBP)
  The office building located at 1180 Main Street was not included as part of the NESHAP Asbestos Survey and Lead-Based Paint Inspection survey. Therefore, LBP is presumed to have been used on interior and exterior surfaces of that structure. No peeling or flaking paint was observed at the subject property at the time of the site inspection.

- FEMA 100 and 500-year Floodplain
  According to FEMA Flood Insurance Rate Map (FIRM) #060325-0011B, dated May 17, 1982, the subject property drainage ditch is located within in Zone A, designated as an area within the 100-year flood zone and the remaining portion of the subject property is located in Zone B, designated as an area within the 500-year flood zone.

- Unacceptable Noise Level
  The subject property is located in the vicinity of the Caltrain and Union Pacific railroad and the San Carlos Airport and Moffett Field. There are no major roadways within 1,000 feet of the subject property. The projected DNL value for all noise sources is 87.8 dB, which is considered "unacceptable."

Based on the findings of this Phase I ESA, the following observed conditions are not considered a REC or an environmental concern to the subject property:

- Previous On-site Underground Storage Tanks at APN 053147010
  D3G reviewed a previous Phase I ESA produced by TRC on July 23, 2007 for the western portion of the subject property located at APN 053147010. TRC reviewed reports associated with two (2) previous underground storage tanks (USTs). TRC wrote, "In September 1994, a 580-gallon gasoline UST and a 1,000-gallon diesel UST, as well as a fuel dispenser and below ground piping, were removed from a location near the southern corner of the on-site building. The USTs were reported to be in good condition. Soil samples were collected from beneath the USTs and dispenser, and from stockpiled soil. The samples were analyzed for total gasoline and diesel range petroleum hydrocarbons (TPHg and TPHd, respectively), and benzene, toluene, ethylbenzene and xylenes (BTEX). TPHd at 30 parts per million (ppm) was detected in the sample collected beneath the dispenser, which was below applicable clean up levels. Toluene, ethylbenzene and xylenes were additionally detected in the stockpile soil samples at up to 0.0088, 0.0058 and 0.27 ppm, respectively, which is above regulatory levels. The stockpiled soil was subsequently aerated on-site and re-sampled; no BTEX compounds were detected in the samples collected after aeration. The soil was subsequently used on-site to backfill the excavation. The reports indicate that the work was performed under oversight from the County of San Mateo Department of Health Service (CSMDHS) and that the CSMDHS closed the site after reviewing the laboratory results." TRC concluded that, "the planned use appears compatible with the known on-site environmental conditions. No further work appears required". No RECs were identified.

DRAFT

D3G reviewed the Laboratory Results Soil Sampling report produced by Applied Science and Engineering, Inc. (ASE) on September 28, 1994, which confirmed TRC's findings. In addition, D3G reviewed the Laboratory Results Stockpile Re-Sampling report produced by ASE on November 21, 1994. These reports describe the removal of the 1,088-gallon diesel UST, the 580-gallon gasoline UST and the associated piping and equipment located at the Marcelli Lighting location. Based on the fact that the above-listed reports identify USTs removed in September 1994 and the highly unlikely probability that four (4) USTs were located at Marcelli Lighting, D3G believes that there were only two (2) previous USTs at the subject property even though the UST size is different but similar in the reports.

D3G contacted the San Mateo County Department of Health Services-Environmental Health for a review of their environmental records including regional environmental health issues, on-site wells and/or septic system records for the subject property. D3G reviewed San Mateo County Department of Health Services-Environmental Health documents related to the previous USTs located at the Marcelli Lighting location. The application for the permit to close two on-site USTs (500-gallon gasoline and 1,000-gallon diesel USTs installed in 1979) was filed on May 26, 1994. D3G reviewed a letter from the San Mateo County Department of Health Services-Environmental Health dated October 4, 1994 which stated, "it is our position that no further action is required at this time." See Section 4.8 for the previous Phase I ESA report regarding the previous on-site USTs. Although there is a slight discrepancy in the size of the USTs between the previous reports discussed in Section 4.8 and the health department documentation, there were only two (2) USTs reported to be located on this portion of the subject property. Based on the condition of the removed USTs, the analytical data, remediation of the soils from the UST tank pit, and regulatory status, D3G believes that a VEC does not exist or is not likely to exist at the subject property from the previous USTs.

- <u>On-Site RCRA Facility</u>
  The subject property is listed as Chub's Auto Repair in the Environmental FirstSearch Report as a RCRA small quantity generator of hazardous waste. According to the Environmental FirstSearch Report, no violations are listed. The Chub's Auto Repair is no longer in business and should no longer be classified as a RCRA generator. Based on the regulatory status, the RCRA small quantity generator listing is not an environmental concern to the subject property.

- <u>Adjacent State- and Federally-Regulated Facilities</u>
  Cook's Auto Body, which is located across the railroad tracks adjacent to the north and topographically down-gradient, is listed in the Environmental FirstSearch Report as an open LUST facility. According to the Environmental FirstSearch Report, the facility is under site cleanup. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site accessed at http://geotracker.waterboard.ca.gov/. The LUST incident occurred on the northern portion of the Cook's Auto Body property at an actual distance of approximately 0.04 miles from the subject property. Based on distance and topographic relationship, the

Cook's Auto Body is not suspected to present an environmental concern to the subject property.

Baker Graphics located at 1201 Main Street, adjacent to the east and topographically cross-gradient of the subject property, is currently known as RPH and is listed in the Environmental FirstSearch Report as a RCRA generator of hazardous waste and an ERNS site. According to the Environmental FirstSearch Report, no violations are listed for the facility. D3G contacted Ms. Mary Misemer, Regulatory Assistance Officer with the California Department of Environmental Protection (CA EPA) (1-800-728-6942) on January 10, 2010 to obtain information pertaining to the ERNS site. However, Ms. Misemer's review of online regulatory database documents found no information available on the adjacent ERNS site. In addition, D3G reviewed the California Department of Toxic Substances EnviroStor website accessed at http://www.envirostor.dtsc.ca.gov/public/ for a listing of cleanup sites and hazardous waste permitted facilities, and the National Response Center (NRC) website accessed at http://www.nrc.uscg.mil/nrchp.html for a review of federally-regulated oil and chemical spills. However, the eastern adjacent ERNS site was not listed in either the EnviroStor or the NRC database. Based on the topographic relationship and lack of reported handling violations, the adjacent RCRA generator of hazardous waste and ERNS site are not suspected to be of environmental concern to the subject property.

Cook's Auto Body, which is located across the railroad tracks adjacent to the north and topographically down-gradient, is listed twice in the Environmental FirstSearch Report as a RCRA generator of hazardous waste. According to the Environmental FirstSearch Report, no violations are listed. Based on the listed distance, topographic relationship and current regulatory status, the Cook's Auto Body is not suspected to present an environmental concern to the subject property.

The Hudson Property which is located at 135 Maple Street is located on the western adjacent and topographically cross-gradient property is listed in the Environmental FirstSearch Report as a closed LUST facility. Additionally, according to historical research performed by D3G the property was previously utilized as a Carburetor and Auto Repair facility starting in 1962 through at least 1968. According to the Environmental FirstSearch Report, the facility is a closed LUST incident. D3G reviewed documentation related to the adjacent LUST incident on the California State Water Resources Control Board GeoTracker GIS site assessed at http://geotracker.waterboard.ca.gov/. According to the reviewed documentation and the Environmental FirstSearch Report, the release was reported on November 2, 1999 and involved solvents and the contaminated media was "other groundwater – not drinking water". Additionally, the LUST incident was closed on October 30, 2002. Finally the property was redeveloped between 1998 and 2005 with the present multi-family apartment complex. Located on the western adjacent property is a portion of Redwood Creek, which is a preferential pathway for contaminates as well as acting as a hydraulic barrier to prevent contamination from reaching the residential structure of the subject property. Based on the topographic relationship, current regulatory status and presence of a hydraulic barrier between the subject property and the western adjacent

DRAFT

LUST, the LUST incident is not considered to be of environmental concern to the subject property. Therefore, a VEC does not exist or is not likely to exist at the subject property from the previous LUST incident.

- Stored Hazardous Materials

  No bulk storage of hazardous materials or petroleum products was observed on the exterior of the subject property. However, D3G observed the following materials on the portion of the property utilized as a storage yard: three (3) empty 55-gallon drums, small quantity (one (1) to five (5) gallon) gasoline containers, automobile batteries, tires, small containers of motor oil and cleaning products. Leakage was not visually observed in the vicinity of the stored materials. The on-site chemicals are commercially available, stored in limited quantities, and are not believed to present an environmental concern to the subject property. D3G recommends that the hazardous materials and petroleum products be proper disposed of during demolition activities.

  No bulk storage of hazardous materials or petroleum products was identified on the interior at the subject property. However, paints, cleaning products, small containers (one (1) to five (5) gallons) of gasoline and small containers of motor oil are stored in the maintenance areas. None of the stored materials were observed to be leaking or to have had signs of major spillage. No floor drains or other potential receptors for the release of hazardous materials were observed within the areas of material storage. The on-site chemicals are commercially available, stored in limited quantities, and are not believed to present an environmental concern to the subject property. D3G recommends that hazardous material or petroleum products be properly disposed of during demolition activities.

- Asbestos-Containing Materials (ACMs)

  The current subject property structures were constructed in approximately 1955, 1950-1962 and 1974, during a time of asbestos-containing building material usage; therefore, ACMs are suspected to be present at the subject property. Presumed asbestos containing materials (PACMs) observed at the subject property include, but are not limited to: wall and ceiling materials, caulking, vinyl flooring materials, mastics, and roofing materials. D3G did not sample for ACMs. However, according to a NESHAP Asbestos Survey and Lead-Based Paint Inspection Report prepared by AEI Consultants (AEI) dated November 11, 2010, Mr. Alain Grissette, a State of California licensed Asbestos Consultant (CAC #07-4300) with AEI, conducted an NESHAP Asbestos Survey at the subject property on November 5, 2010. Sampled materials included acoustic ceiling tiles, drywall/joint compound, window putty, covebase and associated mastics, vinyl flooring materials and associated mastics, and roofing materials. An asbestos-containing material (ACM) is defined by the Federal OSHA, the State of California OSHA and EPA as materials with an asbestos concentration of greater than 1.0%. Asbestos-containing construction materials (ACCMs) are defined by the State of California OSHA as materials with an asbestos concentration between 0.1% and 1.0%. ACMs were identified during the NESHAP Asbestos Survey and the results are detailed in Section 8.1.

DRAFT

- Lead-Based Paint (LBP)
  The current subject property structures were constructed in approximately 1955, 1950-1962 and 1974, prior to the 1978 ban on lead-based paint (LBP); therefore, LBP may be present. No peeling or flaking paint was observed at the subject property at the time of the site inspection. According to a NESHAP Asbestos Survey and Lead-Based Paint Inspection Report prepared by AEI Consultants (AEI) dated November 11, 2010, Mr. Alain Grissette, a Cal/DOSH Certified Lead-Paint Inspector/Assessor (license #18206) with AEI, conducted a Lead-Based Paint Inspection at the subject property on November 5, 2010. LBP was identified during the Lead-Based Paint Inspection and the results are detailed in Section 8.2.

11.0 CONCLUSIONS

Dominion Due Diligence Group performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Practice E 1527-05 of the Proposed Lathrop Post-Acute Recovery Center located at 134 Maple Street in Redwood City, San Mateo County, California (subject property). Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report. This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the subject property.

D3G has performed a Phase I ESA at the subject property. Based on the identified environmental concerns discussed in Section 10.0, D3G recommends the following:

- Asbestos-Containing Materials (ACMs)
  If PACMs are to be impacted during any proposed renovation activities, they should be sampled by an appropriately licensed asbestos inspector prior to impaction and treated accordingly. Identified friable or damaged ACMs and ACMs which are to be impacted by renovation activities should be removed by a licensed asbestos abatement contractor in accordance with applicable regulations. Any remaining ACMs should be managed under a site-specific Operations and Maintenance (O&M) Program. In addition, compliance with 40 CFR 61 Subpart M is recommended prior to any renovation or demolition activities at the subject property.

- Lead-Based Paint (LBP)
  D3G recommends that if presumed LBP is to be impacted during any future renovation or demolition activities, the contractor must adhere to the OSHA Lead in Construction Standard (29 CFR 1926.62) and all generated debris containing lead-based paint is to be appropriately characterized and disposed of in accordance with applicable EPA RCRA requirements.

- FEMA 100 and 500-year Floodplain
  If the proposed development directly or indirectly impacts the identified floodplain areas, compliance with Executive Order 11988, "Floodplain Management," is required by either obtaining a Conditional Letter of Map Amendment (CLOMA) or Conditional Letter of Map Revision (CLOMR) or by implementing procedures contained in 24 CFR Part 55.20 (8-step Process). This 8-Step Process is intended to address the requirements of Executive Order (EO) 11988, Floodplain Management, as well as the requirements of Federal Register 24 CFR Parts 50, 55 and 58.

  In addition, per HUD Chapter 9 Guidelines, all "critical actions" as defined in 24 CFR 55.2(b)(2), must comply with the requirements of 24 CFR 55.20(e) – "…All critical actions in the 500-year floodplain shall be designed and built at or above the 100-year floodplain (in the case of new construction) and modified to include: 1. Preparation of and participation in an early warning system; 2. An emergency evacuation and relocation plan; 3. Identification of evacuation route(s) out of the 500-year floodplain; and 4. Identification marks of past or estimated flood levels on all structures."

- Unacceptable Noise Level
  The projected DNL value for all noise sources is 87.8 dB. Pursuant to 24 CFR 51.101(a)(3), the composite DNL 87.8 dB is "unacceptable". The requirements set out in Section 51.104(a) are designated to ensure that interior levels do not exceed the established 45 dB level. D3G recommends that appropriate noise mitigation measures be undertaken.

12.0 DEVIATIONS

There are no deviations from the ASTM standard Phase I ESA except for those outlined in Section 2.4 of this report.

13.0 ADDITIONAL SERVICES

No additional services were contracted between the User and D3G.

15.0 SIGNATURE OF ENVIRONMENTAL PERSONNEL

Data presented in this report is factual to the best of our knowledge. Available sources of data were comprehensively researched to provide a complete Phase I ESA of the subject property. The Phase I ESA was prepared in accordance with ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (Designation E 1527-05), 40 CFR Part 312 Standards and Practices for All Appropriate Inquiry: Final Rule, and portions of the 2009 U.S. Department of HUD MAP Guide protocols. See D3G's HUD Form 4128 and Environmental Field Data Sheets for the remaining HUD MAP report protocols.

D3G understands that this Phase I ESA will be used by the User to document to the U.S. Department of HUD that the MAP Lender's application for FHA multifamily mortgage insurance was prepared and reviewed in accordance with HUD MAP requirements. D3G certifies that the review was in accordance with the HUD MAP requirements applicable on the date of the review and that D3G has no financial interest or family relationship with the officers, directors, stockholders or partners of the Borrower, the general contractor, any subcontractors, the buyer or seller of the proposed property or engage in any business that might present a conflict of interest.

D3G is employed under contract for this specific assignment and has no other side deals, agreements, or financial considerations with the MAP Lender or others in connection with this transaction.

16.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Warning: Title 18 U.S.C. 1001, provides in part that whoever knowingly and willfully makes or uses a document containing any false, fictitious, or fraudulent statement or entry, in any manner in the jurisdiction of any department of agency of the United States, shall be fined not more than $ 10,000 or imprisoned for not more than five years or both.

OWNER'S STATEMENT

WE HEREBY STATE THAT WE ARE THE OWNERS OF, OR HAVE SOME RIGHT, TITLE, OR INTEREST IN AND TO THE REAL PROPERTY INCLUDED WITHIN THE SUBDIVISION SHOWN UPON THE HEREIN MAP; THAT WE ARE THE ONLY PERSONS WHOSE CONSENT IS NECESSARY TO PASS CLEAR TITLE TO SAID REAL PROPERTY; AND THAT WE HEREBY CONSENT TO THE MAKING AND RECORDING OF SAID MAP AND SUBDIVISION AS SHOWN WITHIN THE DISTINCTIVE BORDER LINE.

WE ALSO HEREBY RESERVE EASEMENTS FOR STORM DRAIN OVER THOSE CERTAIN STRIPS OF LAND DESIGNATED AND DELINEATED AS "P.S.D.E." (PRIVATE STORM DRAIN EASEMENT). THE MAINTENANCE, REPAIR, AND/OR REPLACEMENT OF FACILITIES WITHIN SAID EASEMENTS SHALL BE THE SOLE RESPONSIBILITY OF THE PROPERTY OWNER.

WE HEREBY DECLARE THAT THE AREAS DESIGNATED ON THIS MAP AS "P.A.E." (PRIVATE ACCESS EASEMENT), ARE TO BE RESERVED AS PRIVATE ACCESS EASEMENTS FOR THE PRIVATE USE OF THE OWNERS OF ALL LOTS SHOWN ON THIS MAP AND THEIR LICENSEES, INVITEES, VISITORS, GUESTS AND TENANTS. THESE EASEMENTS ARE NOT OFFERED NOR ACCEPTED FOR DEDICATION TO THE PUBLIC.

DRAFT

A Smaller Intrusion

by Anthony J. Buonicore, P.E.

Posted: May 1, 2009

Reducing the area of concern in the ASTM vapor intrusion standard could make the screening process much more efficient.

Based upon feedback from the marketplace since the ASTM E 2600-08 vapor intrusion standard was published in March 2008,[1] the standard is currently undergoing revision. There are two proposed technical revisions that will enable the area of concern (AOC) for vapor intrusion screening in real estate transactions to be significantly reduced and save considerable time.

A former industrial site located near a residential area which caused a vapor intrusion issue.

The first technical revision is directed at differentiating in Tier 1 between what steps to take when groundwater flow direction cannot be estimated (in the Phase I investigation) and when it can. The second revision would eliminate the secondary area of concern (AOC) in Tier 1 as field experience to-date has shown it not to be necessary. Moreover, it can waste valuable time and money investigating sites a considerable distance from the target property (TP) that are highly unlikely to result in a vapor intrusion problem.

DRAFT

Starting with the basics

These proposed revisions in the standard have the potential to significantly reduce the AOC, and thus the time and cost of investigations. The existing standard identifies a primary and secondary AOC in the Tier 1 search distance test, distinguished by whether the record search is done within the area completely around a target property (primary AOC), or whether the up-gradient direction beyond the primary AOC (secondary AOC) is included as well.

An old waste dump area located near a residential area that created a vapor intrusion issue.

Also, the search distances are different for sites contaminated with volatile and semi-volatile chemicals of concern (COC) – such as many chlorinated solvents – versus sites contaminated with petroleum hydrocarbon COC – such as BTEX. The search distances are shorter for petroleum hydrocarbons because they are known to undergo significant bio-degradation in the presence of oxygen. The primary AOC search distances were determined based upon conservative consideration of both plume length and

the distance vapors might travel along a path of least resistance from a source (such as contaminated groundwater) through the vadose zone directly to a structure on a TP. The secondary AOC was included to keep the search distances in the E 2600-08 standard consistent with those in the E 1527-05 Phase I standard.[2]

There is sound technical basis for establishing the primary AOC. Plume length research was conducted for both volatile chemical plumes (such as chlorinated solvent plumes from dry cleaners) and volatile petroleum hydrocarbon plumes from leaking underground storage tank sites. In order to be conservative, the plume length selected to determine the primary AOC was based upon the 90th percentile distance.[3-6] For (non-petroleum hydrocarbon) COC plumes – such as may be associated with dry cleaners – 90 percent of the time the plume length was less than approximately 1,590 feet. For volatile petroleum hydrocarbon COC plumes, 90 percent of the time it was less than approximately 390 feet.

Using experience from vapor intrusion sites in the U.S. on the distances vapors may migrate through the vadose zone, and adding them to the 90th percentile plume length, the primary AOC search radii were determined, i.e., 1/3 mile (1,760 feet) for non-petroleum hydrocarbon COC, and 1/10 mile (520 feet) for petroleum hydrocarbon COC.

Under the proposed technical revisions, if it is not possible to estimate groundwater flow direction in the Phase I investigation, then the Tier 1 screen must consider all known or suspect COC-contaminated property surrounding the TP within the search radii of the primary AOC, as defined in the existing standard. However, if it is possible to estimate groundwater flow direction (and assuming four quadrants can be distinguished around a TP: an up-gradient, two cross-gradient, and a down-gradient), then the AOC can be further reduced. This is important because each known or suspect contaminated property within the AOC may need to be investigated further, and may even require a file review at state regulatory offices (in accordance with Tier 2 of the standard). The key consideration is where the known or suspected contaminated property is located with respect to the TP.

Contaminated sources located up-gradient of the TP

For contaminated sources – such as a drycleaner with a PERC release or a gas station with a release from a leaking underground storage tank – located up-gradient of the TP, the focus would continue to be those contaminated properties within the primary AOC distances (i.e., 1,760 feet for COC sources and 520 feet for petroleum hydrocarbon COC sources).

For contaminated sources located cross-gradient of the TP

DRAFT

A former gas station site.

When a contaminated property (such as a drycleaner with a PERC release or a gas station with a release from a leaking underground storage tank) is located cross gradient from the TP, the length of the plume associated with the cross-gradient source is not really relevant. However, its width is relevant. According to the E 2600-08 standard, what matters for cross-gradient sources is whether the nearest edge of the contaminated plume is within the critical distance from the nearest structure on the TP. The critical distance as defined in E 2600-08 effectively is the maximum distance a vapor can reasonably be expected to migrate in relatively permeable soil, assuming the path of least resistance is directly from the nearest edge of the contaminated media (such as groundwater) to the nearest structure on the TP. The distance of concern from the structure on the TP to the property that created the contamination (e.g., a dry cleaner), would be the critical distance plus a distance to account for the plume width at that point. While the critical distance numbers are specifically identified in E 2600-08 for petroleum hydrocarbon and non-petroleum hydrocarbon contamination, nothing prescriptive is mentioned in the standard about how to deal with plume width if such information is not available. A suggested approach is described later.

DRAFT

For contaminant sources located down-gradient of the TP

For contaminated sites – such as a dry cleaner with a PERC release or a gas station with a release from a leaking underground storage tank – located down-gradient of the TP, plume length and width matter little and the focus would only be on the critical distance. Hence, the AOC can be reduced from 1,760 feet to 100 feet for COC contamination, except for petroleum hydrocarbon COC contamination where the AOC can be reduced from 520 feet to either 100 feet (when LNAPL or free product is presumed to be present), or 30 feet (when only dissolved petroleum hydrocarbons are presumed to be present in the groundwater).

Suggested methodology for dealing with plume width at cross-gradient sources

A former drycleaners. Such sites present high potential risk in any vapor intrusion

For contaminated properties located cross-gradient from the TP, plume width must be taken into consideration in selecting an appropriate distance of concern ($D_{concern}$). The question is, what would be a reasonably conservative estimate for plume width (a default value) to use in the screening process assuming no actual plume information is available?

One approach is to base the default plume width on 1/3rd of the plume length[7,8] and, to be conservative, use the 90th percentile plume length (PL90) discussed previously, regardless of where the contaminated property is located in the cross-gradient quadrant. Plume width, for example, would matter little if the contaminated property is located close to the boundary separating the cross-gradient quadrant from the down-gradient quadrant. On the other hand, it would be of much greater concern if the contaminated property is located close to the boundary separating the cross-gradient quadrant from the up-gradient quadrant.

screen.

Assuming symmetry of the plume on both sides of the source, one-half of the plume width (PW) would be added to the critical distance ($D_{critical}$) to establish the distance of concern. This can be expressed as:

$$\mathbf{D_{concern} = D_{critical} + 1/2\ PW = D_{critical} + 1/2\ (PL90/3)}$$

Comparing this approach for default plume width with actual plume data[3-6] suggests the approach is reasonable. For non-petroleum hydrocarbon COC contamination sources (such as a dry cleaner) located cross-gradient from the TP:

$$\mathbf{D_{critical} = 100\ ft.}$$
$$\mathbf{PL90 = 1{,}590\ ft.}$$

Therefore:

$$\mathbf{D_{concern} = 100 + 1/2\ (1{,}590/3) = 365\ feet}$$

The default E 2600-08 search radius in the cross-gradient quadrant can then be reduced from 1,760 feet to 365 feet for non-petroleum hydrocarbon COC.

For LNAPL or free product petroleum hydrocarbon sources (such as a gas station with a release from a leaking underground storage tank) located cross gradient from the TP:

$$\mathbf{D_{critical} = 100\ ft.}$$
$$\mathbf{PL90 = 390\ ft.}$$

Therefore:

DRAFT

$$D_{concern} = 100 + 1/2\ (390/3) = 165\ ft.$$

Using this approach, the default E 2600-08 search radius in the cross-gradient quadrant could then be reduced from 520 feet to 165 feet for LNAPL petroleum hydrocarbon sources. If only dissolved petroleum hydrocarbons (in groundwater) are presumed to be present:

$$D_{critical} = 30\ ft.$$
$$PL90 = 390\ ft.$$

Therefore:

$$D_{concern} = 30 + 1/2\ (390/3) = 95\ ft.$$

Using this approach, the default E 2600-08 search radius in the cross-gradient quadrant could then be reduced from 520 feet to 95 feet for dissolved petroleum hydrocarbon sources.

DRAFT

Status of E 2600-08

Several changes are planned for the ASTM E 2600-08 standard that should improve its practicality, clarity and consistency. These changes were balloted in April 2009. After discussion of these changes and any further revisions, there will be another ballot in summer 2009. If all goes well, it is anticipated that the revised standard could be approved at the October 2009 ASTM meeting in Atlanta and published by the end of the year.

Furthermore, using reasonable assumptions, it may be possible to reduce significantly the default distances of concern, which could significantly reduce the investigation effort in many cases with minimal reduction to the protectiveness of the screening process. ***PE***

Interview Documentation

Prospective Landowner and/or User Questionnaire

SUBJECT PROPERTY NAME:	
SUBJECT PROPERTY ADDRESS:	

QUESTION	YES	NO	UNK?
1. Are you aware of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property?			
2. Are you aware of any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the subject property?			
3. Are you aware of any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products?			
4. Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law?			
5. Are you aware of any activity use limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?			
6. As the user of this ESA do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants?			
7. Are you aware of commonly known or reasonably ascertainable information about the property? For example: Do you know the past uses of the property?			
8. Do you know specific chemicals that are present or once were present at the property?			
9. Do you know of spills or other chemical releases that have taken place at the property?			
10. Do you know of environmental cleanups that have taken place at the property?			
11. Based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?			
12. Has a title search been performed? If yes, please attach.			
13. Is the property or has the property been used as a gasoline station, motor repair facility, commercial printing, dry cleaners, photo developing, landfill, industrial use, waste treatment or disposal facility?			
14. Are there currently any damaged or discarded automotive or industrial batteries, pesticides, paints, or other chemicals at the subject property?			
15. Are there currently any industrial drums or chemicals at the subject property?			
16. Are you aware of contaminated fill dirt at the subject property? (i.e. Fill dirt from off-site.)

To: 'FD-Bernel Mershon'
Subject: RE: Request for information

Good Afternoon,
Our company is updating a report for Wells Fargo Bank, N.A in regards to the property at 134 Maple Street. I wanted to make sure there is no new information on file for this address or for 1180 Main Street and 1612 El Camino Real. We are interested in UST permit files and any hazmat spills responses. We do already have a copy of the 1994 permit.

Thank you for your time,

Lucy Scarberry – Research Manager

Subject: RE: Request for information

Dear Ms. Scarberry,

I have reviewed the records for the properties requested in your email. I have no records for 1180 Main Street and 1612 El Camino Real. I show, however, a permit was issued for 134 Maple Street on August 24, 1994 allowing the removal of two underground tanks.

I hope this will assist you.

Sent: Tuesday, January 11, 2011 1:29 PM
To: 'bmershon@redwoodcity.org'
Cc: 'm.ayers@d3g.biz'
Subject: Hazardous Material Spill information request

Ms. Mershon,

Our company, Dominion Due Diligence Group, is conducting a Phase I Environmental Site Assessment Report for the Proposed Lanthrop Post-Acute Recovery Center, to be located at 134 Maple Street in Redwood City and financed by the Department of Housing and Urban Development (HUD).

A review of CA state-regulated facilities found a spill in the vicinity of the property, listed as Baker Graphics and located at 1201 Main Street, Redwood City, CA 94063.

I contacted the CA EPA regional regulatory assistance officer yesterday to see if they had any information on the spill because the site was assigned an EPA facility number of 181553. However, a review of their records and of the EnviroStor database found no information on the site.

I was hoping you could access the Redwood City Fire Department's records for any response to a hazardous materials spill at 1201 Main Street. Please fax any information you find on the incident to 804-358-3003 (Attn: Marta) or email to m.tomic@d3g.biz.

I greatly appreciate your time and assistance. Please do not hesitate to contact me directly if you have any questions or require any additional information.

Thank you,

Marta Tomic – Environmental Project Manager
Dominion Due Diligence Group (D3G)

ASTM Phase I Environmental Site Assessment Training
40-Hour OSHA Hazwoper Training
8-Hour OSHA Supervisor Certification
Nuclear Density Testing Gauge Operation Certification

EXPERIENCE

Mr. Prevatte is responsible for operations at D3G's western regional office in Denver, Colorado. Mr. Prevatte has over 15 years experience performing investigations of surface and subsurface environmental conditions. Mr. Prevatte has worked on numerous projects involving the identification of hazardous wastes and other site contaminants. In addition, Mr. Prevatte has worked on site characterizations, writing groundwater monitoring plans, quality assurance audits, hazardous waste landfill construction and operation. Specific projects have included:

Phase I Environmental Site Assessments

Conducted environmental assessments in accordance with ASTM E 1527-05 published guidelines, 40 CFR Part 312, Standards and Practices for All Appropriate Inquiry: Final Rule of numerous properties ranging from undeveloped land to contaminated sites such as gasoline stations and manufacturing/industrial facilities. Managed 1000's of Phase I Environmental Site Assessments from project procurement to company staffing to report writing and submittal delivery.

Phase II Environmental Site Assessments

Conducted and managed numerous subsurface sampling investigations and site characterization projects. Duties included the installation of borings and monitoring wells and the collection of potentially contaminated media, including soil and groundwater. Produced corrective action plans and initial site characterization reports for submittal to government regulatory authorities.

Appendix K

The U.S. Department of the Interior Threatened and Endangered Species System

California – 309 species

Animal – 129 species

Status	Species
E	Abalone, White North America (West Coast from Point Conception, CA, U.S.A., to Punta Abreojos, Baja California, Mexico) (*Haliotis sorenseni*)
E	Albatross, short-tailed (*Phoebastria (=Diomedea) albatrus*)
T	Beetle, delta green ground (*Elaphrus viridis*)
E	Beetle, Mount Hermon June (*Polyphylla barbata*)
T	Beetle, valley elderberry longhorn (*Desmocerus californicus dimorphus*)
T	Butterfly, bay checkerspot (*Euphydryas editha bayensis*)
E	Butterfly, Behren's silverspot (*Speyeria zerene behrensii*)
E	Butterfly, callippe silverspot (*Speyeria callippe callippe*)
E	Butterfly, El Segundo blue (*Euphilotes battoides allyni*)
E	Butterfly, Lange's metalmark (*Apodemia mormo langei*)
E	Butterfly, lotis blue (*Lycaeides argyrognomon lotis*)
E	Butterfly, mission blue (*Icaricia icarioides missionensis*)
E	Butterfly, Myrtle's silverspot (*Speyeria zerene myrtleae*)
T	Butterfly, Oregon silverspot (*Speyeria zerene hippolyta*)
E	Butterfly, Palos Verdes blue (*Glaucopsyche lygdamus palosverdesensis*)
E	Butterfly, Quino checkerspot (*Euphydryas editha quino (=E. e. wrighti)*)
E	Butterfly, San Bruno elfin (*Callophrys mossii bayensis*)
E	Butterfly, Smith's blue (*Euphilotes enoptes smithi*)
E	Chub, bonytail entire (*Gila elegans*)
E	Chub, Mohave tui (*Gila bicolor mohavensis*)
E	Chub, Owens tui (*Gila bicolor snyderi*)
E	Condor, California U.S.A. only (*Gymnogyps californianus*)
E	Crayfish, Shasta (*Pacifastacus fortis*)
E	Fairy shrimp, Conservancy (*Branchinecta conservatio*)
E	Fairy shrimp, longhorn (*Branchinecta longiantenna*)
E	Fairy shrimp, Riverside (*Streptocephalus woottoni*)
E	Fairy shrimp, San Diego (*Branchinecta sandiegonensis*)
T	Fairy shrimp, vernal pool (*Branchinecta lynchi*)
E	Fly, Delhi Sands flower-loving (*Rhaphiomidas terminatus abdominalis*)
E	Flycatcher, southwestern willow (*Empidonax traillii extimus*)
E	Fox, San Joaquin kit (*Vulpes macrotis mutica*)
E	Fox, San Miguel Island (*Urocyon littoralis littoralis*)
E	Fox, Santa Catalina Island (*Urocyon littoralis catalinae*)
E	Fox, Santa Cruz Island (*Urocyon littoralis santacruzae*)

DRAFT

Status	Species
E	Fox, Santa Rosa Island (*Urocyon littoralis santarosae*)
T	Frog, California red-legged Entire (*Rana draytonii*)
E	Frog, mountain yellow-legged southern California DPS (*Rana muscosa*)
T	Gnatcatcher, coastal California (*Polioptila californica californica*)
E	Goby, tidewater Entire (*Eucyclogobius newberryi*)
E	Grasshopper, Zayante band-winged (*Trimerotropis infantilis*)
E	Kangaroo rat, Fresno (*Dipodomys nitratoides exilis*)
E	Kangaroo rat, giant (*Dipodomys ingens*)
E	Kangaroo rat, Morro Bay (*Dipodomys heermanni morroensis*)
E	Kangaroo rat, San Bernardino Merriam's (*Dipodomys merriami parvus*)
E	Kangaroo rat, Stephens' (*Dipodomys stephensi (incl. D. cascus)*)
E	Kangaroo rat, Tipton (*Dipodomys nitratoides nitratoides*)
E	Lizard, blunt-nosed leopard (*Gambelia silus*)
T	Lizard, Coachella Valley fringe-toed (*Uma inornata*)
T	Lizard, Island night (*Xantusia riversiana*)
T	Moth, Kern primrose sphinx (*Euproserpinus euterpe*)
E	Mountain beaver, Point Arena (*Aplodontia rufa nigra*)
E	Mouse, Pacific pocket (*Perognathus longimembris pacificus*)
E	Mouse, salt marsh harvest (*Reithrodontomys raviventris*)
T	Murrelet, marbled CA, OR, WA (*Brachyramphus marmoratus*)
T	Otter, southern sea except where EXPN (*Enhydra lutris nereis*)
T	Owl, northern spotted (*Strix occidentalis caurina*)
E	Pikeminnow (=squawfish), Colorado except Salt and Verde R. drainages, AZ (*Ptychocheilus lucius*)
T	Plover, western snowy Pacific coastal pop. (*Charadrius alexandrinus nivosus*)
E	Pupfish, desert (*Cyprinodon macularius*)
E	Pupfish, Owens (*Cyprinodon radiosus*)
E	Rabbit, riparian brush (*Sylvilagus bachmani riparius*)
E	Rail, California clapper (*Rallus longirostris obsoletus*)
E	Rail, light-footed clapper U.S.A. only (*Rallus longirostris levipes*)
E	Rail, Yuma clapper U.S.A. only (*Rallus longirostris yumanensis*)
E	Salamander, California tiger U.S.A. (CA - Santa Barbara County) (*Ambystoma californiense*)
E	Salamander, California tiger U.S.A. (CA - Sonoma County) (*Ambystoma californiense*)
T	Salamander, California tiger U.S.A. (Central CA DPS) (*Ambystoma californiense*)
E	Salamander, desert slender (*Batrachoseps aridus*)
E	Salamander, Santa Cruz long-toed (*Ambystoma macrodactylum croceum*)

Status	Species
T	Salmon, chinook CA Central Valley spring-run (*Oncorhynchus (=Salmo) tshawytscha*)
T	Salmon, chinook CA coastal (*Oncorhynchus (=Salmo) tshawytscha*)
E	Salmon, chinook winter Sacramento R. (*Oncorhynchus (=Salmo) tshawytscha*)
T	Salmon, coho OR, CA pop. (*Oncorhynchus (=Salmo) kisutch*)
E	Salmon, coho central CA coast (*Oncorhynchus (=Salmo) kisutch*)
T	Sea turtle, green except where endangered (*Chelonia mydas*)
E	Sea turtle, leatherback (*Dermochelys coriacea*)
T	Sea turtle, loggerhead (*Caretta caretta*)
T	Sea turtle, olive ridley except where endangered (*Lepidochelys olivacea*)
T	Sea-lion, Steller eastern pop. (*Eumetopias jubatus*)
T	Seal, Guadalupe fur (*Arctocephalus townsendi*)
E	Sheep, Peninsular bighorn Peninsular CA pop. (*Ovis canadensis nelsoni*)
E	Sheep, Sierra Nevada bighorn Sierra Nevada (*Ovis canadensis sierrae*)
E	Shrew, Buena Vista Lake ornate (*Sorex ornatus relictus*)
E	Shrike, San Clemente loggerhead (*Lanius ludovicianus mearnsi*)
E	Shrimp, California freshwater (*Syncaris pacifica*)
E	Skipper, Carson wandering (*Pseudocopaeodes eunus obscurus*)
E	Skipper, Laguna Mountains (*Pyrgus ruralis lagunae*)
T	Smelt, delta (*Hypomesus transpacificus*)
E	Snail, Morro shoulderband (=Banded dune) (*Helminthoglypta walkeriana*)
T	Snake, giant garter (*Thamnophis gigas*)
E	Snake, San Francisco garter (*Thamnophis sirtalis tetrataenia*)
T	Sparrow, San Clemente sage (*Amphispiza belli clementeae*)
T	Steelhead Central Valley CA (*Oncorhynchus (=Salmo) mykiss*)
T	Steelhead central CA coast (*Oncorhynchus (=Salmo) mykiss*)
T	Steelhead northern CA (*Oncorhynchus (=Salmo) mykiss*)
T	Steelhead south central CA coast (*Oncorhynchus (=Salmo) mykiss*)
E	Steelhead southern CA coast (*Oncorhynchus (=Salmo) mykiss*)
E	Stickleback, unarmored threespine (*Gasterosteus aculeatus williamsoni*)
T	Sturgeon, North American green U.S.A. (CA) Southern Distinct Population Segment (*Acipenser medirostris*)
E	Sucker, Lost River (*Deltistes luxatus*)
E	Sucker, Modoc (*Catostomus microps*)
E	Sucker, razorback entire (*Xyrauchen texanus*)
T	Sucker, Santa Ana 3 CA river basins (*Catostomus santaanae*)
E	Sucker, shortnose (*Chasmistes brevirostris*)
E	Tadpole shrimp, vernal pool (*Lepidurus packardi*)
E	Tern, California least (*Sterna antillarum browni*)

DRAFT

Status	Species
E	Tiger beetle, Ohlone (*Cicindela ohlone*)
E	Toad, arroyo (=arroyo southwestern) (*Bufo californicus (=microscaphus)*)
T	Tortoise, desert U.S.A., except in Sonoran Desert (*Gopherus agassizii*)
T	Towhee, Inyo California (*Pipilo crissalis eremophilus*)
T	Trout, Lahontan cutthroat (*Oncorhynchus clarki henshawi*)
T	Trout, Little Kern golden (*Oncorhynchus aguabonita whitei*)
T	Trout, Paiute cutthroat (*Oncorhynchus clarki seleniris*)
E	Vireo, least Bell's (*Vireo bellii pusillus*)
E	Vole, Amargosa (*Microtus californicus scirpensis*)
E	Whale, blue (*Balaenoptera musculus*)
E	Whale, finback (*Balaenoptera physalus*)
E	Whale, humpback (*Megaptera novaeangliae*)
E	Whale, killer Southern Resident DPS (*Orcinus orca*)
E	Whale, Sei (*Balaenoptera borealis*)
E	Whale, sperm (*Physeter catodon (=macrocephalus)*)
T	Whipsnake (=striped racer), Alameda (*Masticophis lateralis euryxanthus*)
E	Woodrat, riparian (=San Joaquin Valley) (*Neotoma fuscipes riparia*)
T	Bear, grizzly lower 48 States, except where listed as an experimental population or delisted (Ursus arctos horribilis)
E	Jaguar (Panthera onca)
E	Sea-lion, Steller western pop. (Eumetopias jubatus)
T	Trout, bull U.S.A., conterminous, lower 48 states (Salvelinus confluentus)
E	Wolf, gray Lower 48 States, except MN and where EXPN. Mexico. (Canis lupus)
T	Lynx, Canada (Contiguous U.S. DPS) (Lynx canadensis)

Plant- 180 species

Status	Species
E	Allocarya, Calistoga (*Plagiobothrys strictus*)
E	Alopecurus, Sonoma (*Alopecurus aequalis var. sonomensis*)
E	Ambrosia, San Diego (*Ambrosia pumila*)
T	Amole, purple (*Chlorogalum purpureum*)
T	Baccharis, Encinitas (*Baccharis vanessae*)
E	Barberry, island (*Berberis pinnata ssp. insularis*)
E	Barberry, Nevin's (*Berberis nevinii*)
E	Bedstraw, El Dorado (*Galium californicum ssp. sierrae*)
E	Bedstraw, island (*Galium buxifolium*)
E	Bird's beak, palmate-bracted (*Cordylanthus palmatus*)

DRAFT

Status	Species
E	Bird's-beak, Pennell's (*Cordylanthus tenuis ssp. capillaris*)
E	Bird's-beak, salt marsh (*Cordylanthus maritimus ssp. maritimus*)
E	Bird's-beak, soft (*Cordylanthus mollis ssp. mollis*)
E	Bladderpod, San Bernardino Mountains (*Lesquerella kingii ssp. bernardina*)
T	Bluecurls, Hidden Lake (*Trichostema austromontanum ssp. compactum*)
E	Bluegrass, Napa (*Poa napensis*)
E	Bluegrass, San Bernardino (*Poa atropurpurea*)
T	Brodiaea, Chinese Camp (*Brodiaea pallida*)
T	Brodiaea, thread-leaved (*Brodiaea filifolia*)
E	Broom, San Clemente Island (*Lotus dendroideus ssp. traskiae*)
E	Buckwheat, cushenbury (*Eriogonum ovalifolium var. vineum*)
E	Buckwheat, Ione (incl. Irish Hill) (*Eriogonum apricum (incl. var. prostratum)*)
E	Bush-mallow, San Clemente Island (*Malacothamnus clementinus*)
E	Bush-mallow, Santa Cruz Island (*Malacothamnus fasciculatus var. nesioticus*)
T	Butterweed, Layne's (*Senecio layneae*)
E	Button-celery, San Diego (*Eryngium aristulatum var. parishii*)
E	Cactus, Bakersfield (*Opuntia treleasei*)
E	Ceanothus, coyote (*Ceanothus ferrisae*)
E	Ceanothus, Pine Hill (*Ceanothus roderickii*)
T	Ceanothus, Vail Lake (*Ceanothus ophiochilus*)
E	Checker-mallow, Keck's (*Sidalcea keckii*)
E	Checker-mallow, Kenwood Marsh (*Sidalcea oregana ssp. valida*)
E	Checker-mallow, pedate (*Sidalcea pedata*)
E	Clarkia, Pismo (*Clarkia speciosa ssp. immaculata*)
E	Clarkia, Presidio (*Clarkia franciscana*)
T	Clarkia, Springville (*Clarkia springvillensis*)
E	Clarkia, Vine Hill (*Clarkia imbricata*)
E	Clover, Monterey (*Trifolium trichocalyx*)
E	Clover, showy Indian (*Trifolium amoenum*)
T	Crownbeard, big-leaved (*Verbesina dissita*)
E	Crownscale, San Jacinto Valley (*Atriplex coronata var. notatior*)
T	Cypress, Gowen (*Cupressus goveniana ssp. goveniana*)
E	Cypress, Santa Cruz (*Cupressus abramsiana*)
T	Daisy, Parish's (*Erigeron parishii*)
T	Dudleya, Conejo (*Dudleya abramsii ssp. parva*)
T	Dudleya, marcescent (*Dudleya cymosa ssp. marcescens*)
E	Dudleya, Santa Clara Valley (*Dudleya setchellii*)
T	Dudleya, Santa Cruz Island (*Dudleya nesiotica*)
T	Dudleya, Verity's (*Dudleya verityi*)

DRAFT

Status	Species
T	Dudleyea, Santa Monica Mountains (*Dudleya cymosa ssp. ovatifolia*)
T	Dwarf-flax, Marin (*Hesperolinon congestum*)
E	Evening-primrose, Antioch Dunes (*Oenothera deltoides ssp. howellii*)
E	Evening-primrose, Eureka Valley (*Oenothera avita ssp. eurekensis*)
T	Evening-primrose, San Benito (*Camissonia benitensis*)
E	Fiddleneck, large-flowered (*Amsinckia grandiflora*)
E	Flannelbush, Mexican (*Fremontodendron mexicanum*)
E	Flannelbush, Pine Hill (*Fremontodendron californicum ssp. decumbens*)
E	Fringepod, Santa Cruz Island (*Thysanocarpus conchuliferus*)
E	Gilia, Hoffmann's slender-flowered (*Gilia tenuiflora ssp. hoffmannii*)
E	Gilia, Monterey (*Gilia tenuiflora ssp. arenaria*)
E	Goldfields, Burke's (*Lasthenia burkei*)
E	Goldfields, Contra Costa (*Lasthenia conjugens*)
T	Grass, Colusa (*Neostapfia colusana*)
E	Grass, Eureka Dune (*Swallenia alexandrae*)
E	Grass, Solano (*Tuctoria mucronata*)
T	Gumplant, Ash Meadows (*Grindelia fraxino-pratensis*)
T	Howellia, water (*Howellia aquatilis*)
E	Indian paintbrush, San Clemente Island (*Castilleja grisea*)
E	Jewelflower, California (*Caulanthus californicus*)
E	Jewelflower, Metcalf Canyon (*Streptanthus albidus ssp. albidus*)
E	Jewelflower, Tiburon (*Streptanthus niger*)
E	Larkspur, Baker's (*Delphinium bakeri*)
E	Larkspur, San Clemente Island (*Delphinium variegatum ssp. kinkiense*)
E	Larkspur, yellow (*Delphinium luteum*)
E	Layia, beach (*Layia carnosa*)
E	Lessingia, San Francisco (*Lessingia germanorum (=L.g. var. germanorum)*)
E	Lily, Pitkin Marsh (*Lilium pardalinum ssp. pitkinense*)
E	Lily, Western (*Lilium occidentale*)
T	Liveforever, Laguna Beach (*Dudleya stolonifera*)
E	Liveforever, Santa Barbara Island (*Dudleya traskiae*)
E	Lupine, clover (*Lupinus tidestromii*)
E	Lupine, Nipomo Mesa (*Lupinus nipomensis*)
E	Malacothrix, island (*Malacothrix squalida*)
E	Malacothrix, Santa Cruz Island (*Malacothrix indecora*)
E	Mallow, Kern (*Eremalche kernensis*)
E	Manzanita, Del Mar (*Arctostaphylos glandulosa ssp. crassifolia*)
T	Manzanita, Ione (*Arctostaphylos myrtifolia*)
T	Manzanita, Morro (*Arctostaphylos morroensis*)

DRAFT

Status	Species
T	Manzanita, pallid (*Arctostaphylos pallida*)
E	Manzanita, Presidio (*Arctostaphylos hookeri var. ravenii*)
E	Manzanita, Santa Rosa Island (*Arctostaphylos confertiflora*)
T	Mariposa lily, Tiburon (*Calochortus tiburonensis*)
E	Meadowfoam, Butte County (*Limnanthes floccosa ssp. californica*)
E	Meadowfoam, Sebastopol (*Limnanthes vinculans*)
E	Mesa-mint, Otay (*Pogogyne nudiuscula*)
E	Mesa-mint, San Diego (*Pogogyne abramsii*)
E	Milk-vetch, Braunton's (*Astragalus brauntonii*)
E	Milk-vetch, Clara Hunt's (*Astragalus clarianus*)
E	Milk-vetch, Coachella Valley (*Astragalus lentiginosus var. coachellae*)
E	Milk-vetch, coastal dunes (*Astragalus tener var. titi*)
E	Milk-vetch, Cushenbury (*Astragalus albens*)
T	Milk-vetch, Fish Slough (*Astragalus lentiginosus var. piscinensis*)
E	Milk-vetch, Lane Mountain (*Astragalus jaegerianus*)
T	Milk-vetch, Peirson's (*Astragalus magdalenae var. peirsonii*)
E	Milk-vetch, triple-ribbed (*Astragalus tricarinatus*)
E	Milk-vetch, Ventura Marsh (*Astragalus pycnostachyus var. lanosissimus*)
E	Monardella, willowy (*Monardella linoides ssp. viminea*)
E	Morning-glory, Stebbins' (*Calystegia stebbinsii*)
E	Mountain balm, Indian Knob (*Eriodictyon altissimum*)
E	Mountain-mahogany, Catalina Island (*Cercocarpus traskiae*)
E	Mustard, slender-petaled (*Thelypodium stenopetalum*)
E	Navarretia, few-flowered (*Navarretia leucocephala ssp. pauciflora (=N. pauciflora)*)
E	Navarretia, many-flowered (*Navarretia leucocephala ssp. plieantha*)
T	Navarretia, spreading (*Navarretia fossalis*)
E	Niterwort, Amargosa (*Nitrophila mohavensis*)
E	Onion, Munz's (*Allium munzii*)
E	Orcutt grass, California (*Orcuttia californica*)
E	Orcutt grass, hairy (*Orcuttia pilosa*)
E	Orcutt grass, Sacramento (*Orcuttia viscida*)
T	Orcutt grass, San Joaquin (*Orcuttia inaequalis*)
T	Orcutt grass, slender (*Orcuttia tenuis*)
T	Owl's-clover, fleshy (*Castilleja campestris ssp. succulenta*)
E	Oxytheca, cushenbury (*Oxytheca parishii var. goodmaniana*)
T	Paintbrush, ash-grey (*Castilleja cinerea*)
E	Paintbrush, soft-leaved (*Castilleja mollis*)
E	Paintbrush, Tiburon (*Castilleja affinis ssp. neglecta*)

DRAFT

Status	Species
E	Penny-cress, Kneeland Prairie (*Thlaspi californicum*)
E	Pentachaeta, Lyon's (*Pentachaeta lyonii*)
E	Pentachaeta, white-rayed (*Pentachaeta bellidiflora*)
E	Phacelia, island (*Phacelia insularis ssp. insularis*)
E	Phlox, Yreka (*Phlox hirsuta*)
E	Piperia, Yadon's (*Piperia yadonii*)
E	Polygonum, Scotts Valley (*Polygonum hickmanii*)
E	Potentilla, Hickman's (*Potentilla hickmanii*)
T	Pussypaws, Mariposa (*Calyptridium pulchellum*)
E	Rock-cress, Hoffmann's (*Arabis hoffmannii*)
E	Rock-cress, McDonald's (*Arabis macdonaldiana*)
E	Rockcress, Santa Cruz Island (*Sibara filifolia*)
T	Rush-rose, island (*Helianthemum greenei*)
T	Sandwort, Bear Valley (*Arenaria ursina*)
E	Sandwort, Marsh (*Arenaria paludicola*)
E	Seablite, California (*Suaeda californica*)
E	Sedge, white (*Carex albida*)
E	Spineflower, Ben Lomond (*Chorizanthe pungens var. hartwegiana*)
E	Spineflower, Howell's (*Chorizanthe howellii*)
T	Spineflower, Monterey (*Chorizanthe pungens var. pungens*)
E	Spineflower, Orcutt's (*Chorizanthe orcuttiana*)
E	Spineflower, Robust (incl. Scotts Valley) (*Chorizanthe robusta (incl. vars. robusta and hartwegii)*)
E	Spineflower, slender-horned (*Dodecahema leptoceras*)
E	Spineflower, Sonoma (*Chorizanthe valida*)
T	Spurge, Hoover's (*Chamaesyce hooveri*)
E	Stonecrop, Lake County (*Parvisedum leiocarpum*)
E	Sunburst, Hartweg's golden (*Pseudobahia bahiifolia*)
T	Sunburst, San Joaquin adobe (*Pseudobahia peirsonii*)
E	Sunflower, San Mateo woolly (*Eriophyllum latilobum*)
E	Sunshine, Sonoma (*Blennosperma bakeri*)
E	Taraxacum, California (*Taraxacum californicum*)
E	Tarplant, Gaviota (*Deinandra increscens ssp. villosa*)
T	Tarplant, Otay (*Deinandra (=Hemizonia) conjugens*)
T	Tarplant, Santa Cruz (*Holocarpha macradenia*)
E	Thistle, Chorro Creek bog (*Cirsium fontinale var. obispoense*)
E	Thistle, fountain (*Cirsium fontinale var. fontinale*)
E	Thistle, La Graciosa (*Cirsium loncholepis*)
E	Thistle, Loch Lomond coyote (*Eryngium constancei*)

DRAFT

Status	Species
E	Thistle, Suisun (*Cirsium hydrophilum var. hydrophilum*)
T	Thornmint, San Diego (*Acanthomintha ilicifolia*)
E	Thornmint, San Mateo (*Acanthomintha obovata ssp. duttonii*)
E	Tuctoria, Greene's (*Tuctoria greenei*)
T	Vervain, Red Hills (*Verbena californica*)
E	Wallflower, Ben Lomond (*Erysimum teretifolium*)
E	Wallflower, Contra Costa (*Erysimum capitatum var. angustatum*)
E	Wallflower, Menzies' (*Erysimum menziesii*)
E	Watercress, Gambel's (*Rorippa gambellii*)
T	Wild-buckwheat, southern mountain (*Eriogonum kennedyi var. austromontanum*)
E	Woodland-star, San Clemente Island (*Lithophragma maximum*)
E	Woolly-star, Santa Ana River (*Eriastrum densifolium ssp. sanctorum*)
E	Wooly-threads, San Joaquin (*Monolopia (=Lembertia) congdonii*)
E	Yerba santa, Lompoc (*Eriodictyon capitatum*)
T	Centaury, spring-loving (Centaurium namophilum)
E	Fritillary, Gentner's (Fritillaria gentneri)

APPENDIX M

HUD Environmental Questionnaire

HUD Environmental Questionnaire

	Yes	No
1. Is the subject property located within a designated coastal barrier resource area?		✓
2. Is the subject property located within the 100- or 500-year floodplain?	✓	
3. Are there any known historic preservation issues related to the subject?		✓
4. Is the subject property located within 5 miles of a civil airport or within 15 miles of a military airfield?	✓	
5. Is the project located within 1,000 feet of major highways or busy roads?		✓
6. Is the project located within 3,000 feet of a railroad?	✓	
7. Are industrial facilities handling explosive or fire-prone materials such as liquid propane, gasoline or other storage tanks adjacent to or visible from the project site?		✓
8. Are there any wetlands on the subject site?		✓
9. Are any repairs or modifications to the project likely to affect any listed or proposed endangered or threatened species or critical habitats?		✓
10. Is the subject property located on a sole source aquifer?		✓
11. Are there any known landfills within ½-mile of the site?		✓
12. Are any buildings located in the fall zone of any high voltage power transmission or other towers?		✓
13. Do any of the required or proposed repairs change the foot print of the building(s)?	✓	

	Yes	No
Does the community participate in the National Flood Insurance Program (NFIP)?	✓	
Is Flood Insurance required for this property?	✓	

NFIP Map Panel #: 060325-0011B Date: 5/17/1982

Flood Zone: Zone A and Zone B

Appendix N

HUD Form 4128 and Environmental Field Data Sheets

Environmental Assessment and Compliance Findings for the Related Laws

U.S. Department of Housing and Urban Development

1. Project Number
HUD Program **LEAN 232 NC**
2. Date Received

RMS: HI-00487R

Findings and Recommendations are to be prepared **after** the environmental analysis is completed. Complete items 1 through 15 as appropriate for all projects. For projects requiring an environmental assessment, also complete Parts A and B. For projects categorically excluded under 24 CFR 50.20, complete Part A. Attach notes and source documentation that support the findings.

3. Project Name and Location (Street, City, County, State)

Proposed Lathrop Post-Acute Recovery Center
134 Maple Street
Redwood City, San Mateo County, California

4. Applicant Name and Address (Street, City, State, Zip Code), and Phone

Wells Fargo Bank, N.A.
13115 NE 4th Street, Suite 250
Vancouver, WA 98684 360-253-5275

5. ☐ Multifamily ☑ Elderly ☐ Other
If Other, explain:
Skilled nursing facility

6. Number of
114 beds Dwelling Units **1+1** Buildings
5+1 Stories **1.313** Acres

7. Displacement ☑ No ☐ Yes
If Yes, explain:

8. ☑ New Construction ☐ Rehabilitation ☐ Refinance ☐ Other
If Other, explain:

9. Has an environmental report (Federal, State, or local) been used in completing this form? ☐ No ☑ Yes
If Yes, identify: **A Phase 1 ESA was completed by Dominion Due Diligence Group and Federal and State databases were compiled by Environmental FirstSearch.**

10. Planning Findings. Is the project in compliance or conformance with the following plans?

Local Zoning	☑ Yes	☐ No	☐ Not Applicable
Coastal Zone	☐ Yes	☐ No	☑ Not Applicable
Air Quality (SIP)	☑ Yes	☐ No	☐ Not Applicable

Explain any "No" answer:

11. Environmental Finding (check one)
☐ Categorical exclusion is made in accordance with § 50.20 **or**
☐ Environmental Assessment and a **Finding of No Significant Impact** (FONSI) is made in accordance with § 50.33 or
☐ Environmental Assessment and a **Finding of Significant Impact** is made, and an Environmental Impact Statement is required in accordance with §§ 50.33(d) and 50.41.

Are there any unresolved conflicts concerning the use of the site?
☐ No ☑ Yes (explain): **On-site FEMA 100- and 500-year floodplain**
Unacceptable noise

☐ Project is recommended for approval (List any conditions and requirements) ☐ Project is recommended for rejection (State reasons)

Part A. Compliance Findings for §50.4 Related Laws and Authorities

§ 50.4 Laws and Authorities	Project is in Compliance Yes	Project is in Compliance No	Source Documentation and Requirements for Approval
16. Coastal Barrier Resources	✓		According to information accessed at http://www.fema.gov/business/nfip/cbrs/cbrs.shtm the subject property is not located within a coastal barrier.
17. Floodplain Management (24 CFR Part 55)		✓	According to FEMA Flood Insurance Rate Map (FIRM) #060325-0011B, dated May 17, 1982, the subject property drainage ditch is located within in Zone A, designated as an area within the 100-year flood zone and the remaining portion of the subject property is located in Zone B, designated as an area within the 500-year flood zone. Continued on page 8 of 8.
18. Historic Preservation (36 CFR Part 800)	✓		See Appendix J regarding correspondence with the State Historic Preservation Office.
19. Noise Abatement (24 CFR Part 51 Subpart B)		✓	See Appendix O for the completed HUD Noise Worksheets.
20. Hazardous Operations (24 CFR Part 51 Subpart C)	✓		Site observations and the Environmental FirstSearch Report of state and federally regulated properties.
21. Airport Hazards (24 CFR Part 51 Subpart D)	✓		There are no military airports within 2 ½ miles of the subject property or civil airports within 3,000 feet of the subject property.
22. Protection of Wetlands (E. O. 11990)	✓		A wetland delineation/determination has not been performed at the subject property; however, according to the National Wetlands Inventory map accessed at http://www.fws.gov/wetlands/Data/Mapper.html and visual observations, there are not suspected to be any wetland areas on the subject property.
23. Toxic Chemicals & Radioactive Materials(§ 50.3(i))	✓		Site observations and the Environmental FirstSearch Report of state and federally regulated properties.
24. Other § 50.4 authorities (e.g., endangered species, sole source aquifers, farmlands protection, flood, insurance, environmental justice)	✓		See HUD Worksheets

Part B. Environmental/Program Factors

Factors	Anticipated Impact/Deficiencies None	Minor	Major	Source Documentation and Requirements for Approval
25 Unique Natural Features and Areas	✓			Visual Observations - See HUD worksheets
26. Site Suitability, Access, and Compatibility with Surrounding Development	✓			Visual Observations - See HUD worksheets
27. Soil Stability, Erosion, and Drainage	✓			Visual Observations - See HUD worksheets
28. Nuisances and Hazards (natural and built)	✓			Visual Observations - See HUD worksheets
29. Water Supply / Sanitary Sewers	✓			The current site structures are connected to municipally supplied water and sewer.
30. Solid Waste Disposal	✓			Based on visual observations of vicinity properties, the subject property will be sufficiently serviced in regards to solid waste disposal.
31. Schools, Parks, Recreation, and Social Services	✓			According to Beverly Johnson, Director at the San Mateo County Human Services Agency, social services will be available for future residents.
32. Emergency Health Care, Fire and Police Services	✓			According to Chief Louis A. Cavarruviaz at the Redwood City Police Department, police services will be available for future residents. According to Susan Nemes at the Redwood City Fire Department, fire and emergency services will be available for future residents.
33. Commercial / Retail and Transportation	✓			Visual Observations - See HUD worksheets
34. Other	✓			No other property concerns were identified during the site inspection.

DRAFT

Sample Field Notes Checklist

Project Number	HUD Program
	LEAN 232 - New Construction

Project Name: **Proposed Lathrop Post-Acute Recovery Center**

Location (street, city, county/State, & zip code)

134 Maple Street, Redwood City, San Mateo County, California 94063

Number of Dwelling Units	Project site is in a location described as
114 beds	☑ Central city ☐ Suburban ☐ Infill urban development
☐ Refinance ☑ New construction ☐ Rehabilitation	☐ In developing rural area ☐ In undeveloped area

Note to Reader: An Environmental Assessment (EA) is a concise public document that a Federal agency must prepare in order to comply with the National Environmental Policy Act (NEPA) and the related Federal environmental laws and authorities. The EA must support decision making process and provide a clear rationale, justification, and documentation for ratings assigned.

Instructions

It is recommended that this checklist be used by HUD staff who prepare the Environmental Assessment (EA; form HUD-4128). It will constitute full documentation for many factors on the EA, and partial documentation for others. It will avoid narrative reports and expedite the environmental review process. This checklist, which is a slightly revised version of Appendix C of Handbook 1390.2, should be used pending revision of Handbook 1390.2.

The number for each checksheet topic is the number that appears on form HUD-4128. Also, each checklist title/heading is followed by a reference to where the topic appears in the current Handbook 1390.2.

Before the site visit, review the Phase I and all background information submitted with the application (if applicable). During the site visit, the preparers of form HUD-4128 are to: (i) answer all relevant questions on this checklist; (ii) use the spaces provided for comments to include supplemental information as well as to record any recommended mitigation measures or requirements for project approval; (iii) key your answers to the relevant questions (using additional sheets of paper to provide more detailed information); and (iv) use the spaces provided for source documentation to cite the information source used (e.g., title of a technical report, map, or special study; site inspection/field observation; name and location of the qualified data source(s) that provided the information, for example, the local planning agency, the local housing and/or community development agency, the State environmental protection agency, the State Historic Preservation Officer, or other qualified data source.)

Preparers are to obtain and use, as appropriate, any environmental report (Federal, State, or local) that may have already been prepared for the property or area in which the property is located.

Several different types of maps will be useful in completing the review, such as the project plan or plot map, a location map showing major features and facilities in the vicinity, the USGS topographic map and FEMA flood map for the site area, and zoning/land use maps. ***Many of the conditions can and should be recorded directly on the project plan.*** Distances to major features and facilities (e.g., schools and fire stations) and a description of the surrounding area are examples. The plan can then be referenced as "source documentation" on form HUD-4128.

DRAFT

9. Environmental Report

List the Federal, State, or local agencies contacted to obtain their existing environmental reports and other data for the HUD environmental review for the proposed project.

A database of Federal and State agencies was compiled by Environmental FirstSearch for this investigation. The federal listings searched included NPL, NPL De-listed, RCRA-TSD, RCRA, CERCLIS, CORRACTS, Brownfields and ERNS. The state listings searched included UST, LUST, SHWS, Brownfields, VCP, and SWL.

List the major reports obtained. (attach the report(s) or otherwise list the title, author, publication date)

The Environmental FirstSearch Report is included as Appendix E.

10. Planning Findings

Is the project in compliance or conformance with the local zoning?

☑ Yes ☐ No ☐ Not Applicable If No or Not Applicable, explain.

According to the San Mateo County Planning and Building Department, the subject property is zoned IBT (Industrial Business Transition) District and the proposed structure will be in compliance with the local zoning ordinance.

Is the project located within a coastal management zone (CZM)?

☐ Yes ☑ No ☐ Not Applicable

If your answer is Yes, the State Coastal Zone Management (CZM) Agency must make a finding that the project is consistent with the approved State CZM program.

Is the State's finding attached to this checksheet?

☐ Yes ☐ No ☑ Not Applicable

Is the project in compliance with the air quality State Implementation Plan (SIP)?

☑ Yes ☐ No ☐ Not Applicable

Comments:
According to the California Coastal Commission, San Mateo County is not located within a Coastal Management Zone. Based on the nature of the proposed development at the subject property, the site is not suspected to affect the air quality of the surrounding areas.

Source documentation:
Visual observations and http://www.coastal.ca.gov/

Are there any unresolved conflicts concerning the use of the site?
☐ Yes ☑ No If your answer is Yes, briefly explain:

16. Coastal Barrier Resources
Is the project located within a coastal barrier designated on a current FEMA flood map or Department of Interior coastal barrier resources map?
☐ Yes ☑ No If your answer is Yes, the law prohibits Federal funding of projects in designated coastal barriers.

17. Flood Management (24 CFR Part 55) (see CF 3 and 4 of Handbook 1390.2)
Is the project located within a floodplain designated on a current FEMA flood map?
☑ Yes ☐ No Identify FEMA flood map used to make this finding:
Community Name and Number: **City of Redwood, #060325**
Map Panel Number and Date of Map Panel: **0011B, dated May 17, 1982**
If your answer is Yes, use § 55.12 and the floodplain management decisionmaking process (§ 55.20) to comply with 24 CFR Part 55.
Comments:
According to FEMA Flood Insurance Rate Map (FIRM) #060325-0011B, dated May 17, 1982, the subject property drainage ditch is located within in Zone A, designated as an area within the 100-year flood zone and the remaining portion of the subject property is located in Zone B, designated as an area within the 500-year flood zone. Continued on page 8 of 8.
Source documentation: (attach § 55.20 analysis)
FEMA Flood Insurance Rate Maps (FIRM) #060325-0011B, dated May 17, 1982

18. Historic Preservation (see CF 2 of Handbook 1390.2)
Has the SHPO been notified of the project and requested to provide comments?
☐ Yes ☑ No ☐ Not Applicable
Is the property listed on or eligible for listing on the National Register of Historic Places?
☐ Yes ☑ No
Is the property located within or directly adjacent to an historic district?
☐ Yes ☑ No
Does the property's area of potential effects include an historic district or property?
☐ Yes ☑ No
If your answer is Yes to any of the above questions, consult with the State Historic Preservation Officer (SHPO) and comply with 36 CFR part 800.
Has the SHPO been or is being advised of HUD's finding?
☐ Yes ☑ No ☐ Not Applicable
Comments:
The structures were constructed in approximately 1955, 1950-1962 and 1974 and are not suspected to qualify as historic properties. The subject property is not listed, and is not suspected to be eligible to be listed, in the National Register of Historic Places. In addition, the subject property is not located within a historic district of the City of Redwood City or San Mateo County. The State of California Office of Historic Preservation requires that SHPO determination correspondence originate from the local HUD office.

Source documentation:
The National Register of Historic Places for Redwood City, California are located in Appendix J.

19. Noise Abatement (see CF 1 of Handbook 1390.2)
Is the project located near a major noise source, i.e., civil airports (within 5 miles), military airfields (15 miles), major highways or busy roads (within 1000 feet), or railroads (within 3000 feet)?
☑ Yes ☐ No If your answer is Yes, comply with 24 CFR 51, Subpart B which requires a noise assessment for proposed new construction. Use adopted DNL contours if the noise source is an airport.
Comments:
The subject property is located in the vicinity of the Caltrain and Union Pacific railroad and the San Carlos Airport and Moffett Field. There are no major roadways within 1,000 feet of the subject property. The projected DNL value for all noise sources is 87.8 dB, which is considered "unacceptable." Continued on page 8 of 8.

Source documentation: (attach NAG worksheets)
See Appendix O for the completed HUD Noise Worksheets

DRAFT

20. Hazardous Industrial Operations (see CF 5 of Handbook 1390.2)

Are industrial facilities handling explosive or fire-prone materials such as liquid propane, gasoline or other storage tanks adjacent to or visible from the project site?

☐ Yes ☑ No If your answer is Yes, use HUD Hazards Guide and comply with 24 CFR Part 51, Subpart C.

Comments:

21. Airport Hazards (see CF 5 of Handbook 1390.2)

Is the project within 3,000 feet from the end of a runway at a civil airport?

☐ Yes ☑ No

Is the project within 2-1/2 miles from the end of a runway at a military airfield?

☐ Yes ☑ No If your answer is Yes to either of the above questions, comply with 24 CFR Part 51, Subpart D.

Comments: **There are no military airports within 2 ½ miles of the subject property or civil airports within 3,000 feet of the subject property.**

Source documentation:
www.aeroplanner.com was accessed for information on vicinity airports.

22. Protection of Wetlands (E.O. 11990) (see CF 3 and 4 of Handbook 1390.2)

Are there drainage ways, streams, rivers, or coastlines on or near the site?

☐ Yes ☑ No

Are there ponds, marshes, bogs, swamps or other wetlands on or near the site?

☐ Yes ☑ No

For projects proposing new construction and/or filling, the following applies:

Is the project located within a wetland designated on a National Wetlands Inventory map of the Department of the Interior (DOI)?

☐ Yes ☑ No If your answer is Yes, E.O. 11990, Protection of Wetlands, discourages Federal funding of new construction or filling in wetlands and compliance is required with the wetlands decisionmaking process (§ 55.20 of 24 CFR Part 55. Use proposed Part 55 published in the Federal Register on January 1, 1990 for wetland procedures).

Comments: **A wetland delineation/determination has not been performed at the subject property; however, according to the National Wetlands Inventory map accessed at http://www.fws.gov/wetlands/Data/Mapper.html and visual observations, there are not suspected to be any wetland areas on the subject property.**

Source documentation: (attach § 55.20 analysis for new construction and/or filling)
USFWS National Wetlands Inventory (NWI) map accessed at http://www.fws.gov/wetlands/Data/Mapper.html and visual observations

23. Toxic Chemicals and Radioactive Materials (see CF 5 of Handbook 1390.2)

Has a Phase I (ASTM) Report been submitted and reviewed?

☑ Yes ☐ No If your answer is No, is a Phase I (ASTM) report needed? ☐ Yes ☐ No ☑ Not Applicable

Are there issues that require a special/specific Phase II report before completing the environmental assessment?

☐ Yes ☑ No

Is the project site near an industry disposing of chemicals or hazardous wastes?

☐ Yes ☑ No

Is the site listed on an EPA Superfund National Priorities or CERCLA, or equivalent State list?

☐ Yes ☑ No

Is the site located within 3,000 feet of a toxic or solid waste landfill site?

☐ Yes ☑ No

Does the site have an underground storage tank?

☐ Yes ☑ No

If your answer is Yes to any of the above questions, use current techniques by qualified professionals to undertake investigations determined necessary and comply with § 50.3(i).

Are there any unresolved concerns that could lead to HUD being determined to be a Potential Responsible Party (PRP)?

☐ Yes ☑ No

Comments:
The subject property, identified as Chub's Auto Repair, is listed in the Environmental FirstSearch Report twice (a duplicate record) as a Closed LUST facility and once as a UST facility. D3G reviewed the Hydraulic Lift Sampling Results produced by ASE on December 21, 1994. ASE stated that a hydraulic lift was removed from the automobile repair shop in August 1994 because the cylinder was leaking. D3G reviewed a previous Phase I ESA produced by TRC on July 23, 2007 for the western portion of the subject property located at APN 053147010. TRC reviewed reports associated with two (2) previous underground storage tanks (USTs). Chub's Auto Report is further discussed in Sections 5.1.1 and 5.6, the ASE Hydraulic Lift Sampling Result Report is further discussed in Section 5.6 and the previously removed USTs are further discussed in Sections 4.8, 5.1.1 and 5.6.

Source documentation: (attach Phase I (ASTM) Report)
The Phase 1 Environmental Site Assessment was completed by D3G in accordance with ASTM E 1527-05 guidelines and HUD protocols.

DRAFT

24. Other

a. Endangered Species (see EF 3.4 of Handbook 1390.2)

Has the Department of Interior list of Endangered Species and Critical Habitats been reviewed?

☑ Yes ☐ No

Is the project likely to affect any listed or proposed endangered or threatened species or critical habitats?

☐ Yes ☑ No ☐ Not Applicable If your answer is Yes, compliance is required with Section 7 of the Endangered Species Act, which mandates consultation with the Fish and Wildlife Service in order to preserve the species.

Comments:

The U.S. Department of the Interior Endangered Species list was reviewed. Based on the developed nature of the subject property, none of the listed species are suspected to inhabit the subject property.

Source documentation:

The U.S. Department of the Interior Threatened and Endangered Species System for California is located in Appendix K of this report.

b. Sole Source aquifers

Will the proposed project affect a sole source or other aquifer?

☐ Yes ☑ No

Comments

According to an EPA Groundwater and Drinking Water publication, the subject property is not serviced or supplied by a protected aquifer system. A copy of the EPA Groundwater and Drinking Water publication is provided in Appendix L.

Source documentation:

Environmental Protection Agency Office of Water, Office of Groundwater and Drinking Water National Summary of Sole Source Aquifer Designations. This document is accessible at http://www.epa.gov.

c. Farmlands Protection (see EF 3.3 of Handbook 1390.2)

If the site or area is presently being farmed, does the project conform with the Farmland Protection Policy Act and HUD policy memo?

☐ Yes ☑ No If your answer is Yes, compliance is required with 7 CFR Part 658, Department of Agriculture regulations implementing the Act.

Comments:

The subject property consists of commercially developed land.

Source documentation:

According to visual observations

d. Flood Insurance

Is the building located or to be located within a Special Flood Hazard Area identified on a current Flood Insurance Rate Map (FIRM)?

☑ Yes ☐ No If your answer is Yes, flood insurance protection is required for buildings located or to be located within a Special Flood Hazard Area as a condition of approval of the project. In addition, compliance with § 55.12 and the floodplain management decisionmaking process (§ 55.20) is required (refer to item #17 above). Document the map used to determine Special Flood Hazard Area in above item #17 pertaining to community name and number, map panel number and date of map panel.

e. Environmental Justice

Is the project located in a predominantly minority and low-income neighborhood?

☐ Yes ☑ No

Does the project site or neighborhood suffer from disproportionately adverse environmental effects on minority and low-income populations relative to the community-at-large?

☐ Yes ☑ No If your answer is Yes, compliance is required with E.O. 12898, Federal Actions to Address Environmental Justice.

Comments:

Based on visual observations, the subject property is not located in a minority or low-income neighborhood.

Source documentation: **Visual observations**

25. Unique Natural Features and Areas (see EF 3.2 of Handbook 1390.2)

Is the site near natural features (i.e., bluffs or cliffs) or near public or private scenic areas?

☐ Yes ☑ No

Are other natural resources visible on site or in vicinity? Will any such resources be adversely affected or will they adversely affect the project?

☐ Yes ☑ No

Comments:

The subject property is not located near natural features or near public or private scenic areas. In addition, no other natural resources are visible on-site or in the vicinity.

DRAFT

26. Site Suitability, Access, and Compatibility with Surrounding Development (see EF 1.1 and 1.3 of Handbook 1390.2)

Has the site been used as a dump, sanitary landfill or mine waste disposal area? ☐ Yes ☑ No
Is there paved access to the site? ☑ Yes ☐ No
Are there other unusual conditions on site? ☐ Yes ☑ No

Is there indication of:	Yes	No		Yes	No
distressed vegetation	☐	☑	oil/chemical spills	☐	☑
waste material/containers	☐	☑	abandoned machinery, cars, refrigerators, etc.	☐	☑
soil staining, pools of liquid	☐	☑	transformers, fill/vent pipes, pipelines, drainage structures	☐	☑
loose/empty drums, barrels	☐	☑			

Is the project compatible with surrounding area in terms of:

	Yes	No		Yes	No
Land use	☑	☐	Building type (low/high-rise)	☑	☐
Height, bulk, mass	☑	☐	Building density	☑	☐

Will the project be unduly influenced by:

	Yes	No		Yes	No
Building deterioration	☐	☑	Transition of land uses	☐	☑
Postponed maintenance	☐	☑	Incompatible land uses	☐	☑
Obsolete public facilities	☐	☑	Inadequate off-street parking	☐	☑

Are there air pollution generators nearby which would adversely affect the site:

	Yes	No		Yes	No
Heavy industry	☐	☑	Large parking facilities (1000 or more cars)	☐	☑
Incinerators	☐	☑	Heavy travelled highway (6 or more lanes)	☐	☑
Power generating plants	☐	☑	Oil refineries	☐	☑
Cement plants	☐	☑	Other(specify)	☐	☑

Comments:

Source documentation:
Visual observations

27. Soil Stability, Erosion, and Drainage (see EF 1.2 of Handbook 1390.2)

Slopes: ☐ Not Applicable ☐ Steep ☐ Moderate ☑ Slight

	Yes	No	
Is there evidence of slope erosion or unstable slope conditions on or near the site?	☐	☑	
Is there evidence of ground subsidence, high water table, or other unusual conditions on the site?	☐	☑	
Is there any visible evidence of soil problems (foundations cracking or settling, basement flooding, etc.) in the neighborhood of the site?	☐	☑	
Have soil studies or borings been made for the project site or the area?	☐	☐	☑ Unknown
Do the soil studies or borings indicate marginal or unsatisfactory soil conditions?	☐	☐	☑ Unknown
Is there indication of cross-lot runoff, swales, drainage flows on the property?	☐	☑	
Are there visual indications of filled ground?	☐	☑	
If your answer is Yes, was a 79(g) report/analysis submitted?	☐	☐	☑ Not Applicable
Are there active rills and gullies on site?	☐	☑	
If the site is not to be served by a municipal waste water disposal system, has a report of the soil conditions suitable for on-site septic systems been submitted?	☐	☐	☑ Not Applicable
Is a soils report (other than structural) needed?	☐	☑	
Are structural borings or a dynamic soil analysis/geological study needed?	☐	☑	

Comments:
There is no evidence of soil problems or unstable conditions on the subject property. The topography of the site slopes to the north.

Source documentation:
Visual observations

DRAFT

28. Nuisances and Hazards (see EF 1.3 and 1.4 of Handbook 1390.2)

Will the project be affected by natural hazards:

	Yes	No		Yes	No
Faults, fracture	☐	☑	Fire hazard materials	☐	☑
Cliffs, bluffs, crevices	☐	☑	Wind/sand storm concerns	☐	☑
Slope-failures from rains	☐	☑	Poisonous plants, insects, animals	☐	☑
Unprotected water bodies	☐	☑	Hazardous terrain features	☐	☑

Will the project be affected by built hazards and nuisances:

	Yes	No		Yes	No
Hazardous street	☐	☑	Inadequate screened drainage catchments	☐	☑
Dangerous intersection	☐	☑	Hazards in vacant lots	☐	☑
Through traffic	☐	☑	Chemical tank-car terminals	☐	☑
Inadequate separation of pedestrian/vehicle traffic	☐	☑	Other hazardous chemical storage	☐	☑
Children's play areas located next to freeway or other high traffic way	☐	☑	High-pressure gas or liquid petroleum transmission lines on site	☐	☑
Inadequate street lighting	☐	☑	Overhead transmission lines	☐	☑
Quarries or other excavations	☐	☑	Hazardous cargo transportation routes	☐	☑
Dumps/sanitary landfills or mining	☐	☑	Oil or gas wells	☐	☑
Railroad crossing	☐	☑	Industrial operations	☐	☑

Will the project be affected by nuisances:

	Yes	No		Yes	No
Gas, smoke, fumes	☐	☑	Unsightly land uses	☐	☑
Odors	☐	☑	Front-lawn parking	☐	☑
Vibration	☐	☑	Abandoned vehicle	☐	☑
Glare from parking area	☐	☑	Vermin infestation	☐	☑
Vacant/boarded-up buildings	☐	☑	Industrial nuisances	☐	☑
			Other (specify)	☐	☑

Comments:
No "nuisances" or "hazards" were observed at the subject property or surrounding properties during the subject property inspection.

Source documentation:
Visual observations

29. Water, Supply, Sanitary Sewers, and Solid Waste Disposal (see EF 2.1, 2.2, and 2.4 of Handbook 1390.2)

Is the site served by an adequate and acceptable:

water supply
☑ Yes ☐ No ☑ Municipal ☐ Private

sanitary sewers and waste water disposal systems
☑ Yes ☐ No ☑ Municipal ☐ Private

trash collection and solid waste disposal
☑ Yes ☐ No ☐ Municipal ☑ Private

If the water supply is non-municipal, has an acceptable "system" been approved by appropriate authorities and agencies?
☐ Yes ☐ No ☑ Not Applicable

If the sanitary sewers and waste water disposal systems are non-municipal, has an acceptable "system" been approved by appropriate authorities and agencies?
☐ Yes ☐ No ☑ Not Applicable

Comments:
The current site structures are connected to municipally supplied water and sewer. In addition, the subject property is sufficiently serviced in regards to solid waste disposal.

Source documentation:
Visual observations

DRAFT

31. Schools, Parks, Recreation, and Social Services (see U/EF 4, 5, and 6 of Handbook 1390.2)

Will the local school system have the capability to service the potential school age children from the project?

☑ Yes ☐ No

Are parks and play spaces available on site or nearby?

☑ Yes ☐ No

Will social services be available on site or nearby for residents of the proposed project?

☑ Yes ☐ No

Comments:

According to Beverly Johnson, Director at the San Mateo County Human Services Agency, social services will be available for future residents.

Source documentation:

Beverly Johnson, Director at the San Mateo County Human Services Agency - 650-802-7555

32. Emergency Health Care, Fire and Police Services (see U/EF 7, 8, and 9 of Handbook 1390.2)

Are emergency health care providers located within reasonable proximity to the proposed project?

☑ Yes ☐ No Approximate response time: **< 10 minutes**

Are police services located within reasonable proximity to the proposed project?

☑ Yes ☐ No Approximate response time: **< 10 minutes**

Is fire fighting protection ☑ municipal ☐ volunteer adequate and equipped to service the project?

☑ Yes ☐ No Approximate/estimated response time: **4 minutes**

Comments:

According to Chief Louis A. Cavarruviaz at the Redwood City Police Department, police services will be available for future residents.
According to Susan Nemes at the Redwood City Fire Department, fire and emergency services will be available for future residents.

Source documentation:

Chief Louis A. Cavarruviaz at the Redwood City Police Department - 650-780-7122
Susan Nemes at the Redwood City Fire Department - 650-780-7402

33. Commercial/Retail and Transportation (see U/EF 10 and 11 of Handbook 1390.2)

Are commercial/retail shopping services nearby?

☑ Yes ☐ No

Is the project accessible to employment, shopping and services by

☑ public transportation or ☐ private vehicle?

Is adequate public transportation available from the project to these facilities?

☑ Yes ☐ No

Are the approaches to the project convenient, safe and attractive?

☑ Yes ☐ No

DRAFT

11. Conditions and Requirements for Approval

Are mitigation measures required?

☑ Yes ☐ No

If your answer is Yes, list and describe:

#17 Continued From Page 2 of 8:

If the proposed development directly or indirectly impacts the identified floodplain areas, compliance with Executive Order 11988, "Floodplain Management," is required by either obtaining a Conditional Letter of Map Amendment (CLOMA) or Conditional Letter of Map Revision (CLOMR) or by implementing procedures contained in 24 CFR Part 55.20 (8-step Process). This 8-Step Process is intended to address the requirements of Executive Order (EO) 11988, Floodplain Management, as well as the requirements of Federal Register 24 CFR Parts 50, 55 and 58.

In addition, per HUD Chapter 9 Guidelines, all "critical actions" as defined in 24 CFR 55.2(b)(2), must comply with the requirements of 24 CFR 55.20(e) – "…All critical actions in the 500-year floodplain shall be designed and built at or above the 100-year floodplain (in the case of new construction) and modified to include: 1. Preparation of and participation in an early warning system; 2. An emergency evacuation and relo

#19 Continued From Page 2 of 8:

The projected DNL value for all noise sources is 87.8 dB. Pursuant to 24 CFR 51.101(a)(3), the composite DNL 87.8 dB is "unacceptable". The requirements set out in Section 51.104(a) are designated to ensure that interior levels do not exceed the established 45 dB level. D3G recommends that appropriate noise mitigation measures be undertaken.

DRAFT

Brief Description of the Project:

The subject property consists of three (3) parcels totaling approximately 1.313 acres of land. The subject property is currently developed with one (1) two-story vacant office/showroom/warehouse building (formerly Marcelli Lighting) constructed circa 1974, one (1) one-story auto repair building (formerly Chubs Auto Repair) constructed circa 1955, and one (1) one-story vacant office building constructed circa 1950-1962. In addition, the subject property is improved upon by the Redwood Creek (a concrete-lined culvert), an exterior storage yard, landscaped regions and asphalt parking areas. The vacant two-story office/showroom/warehouse building and auto repair building will be demolished and a five-story, 114-bed skilled nursing facility will be constructed. The vacant office building will remain at the subject property (the building's future use has not been determined). The subject property is serviced by electricity, natural gas, and municipally supplied water and sewer.

HUD Noise Worksheets

RE: Noise Issues at the Proposed Lathrop Post-Acute Recovery Center
134 Maple Street
Redwood City, San Mateo County, California

Dominion Due Diligence Group has calculated the estimated noise characteristics of the Proposed Lathrop Post-Acute Recovery Center located at 134 Maple Street in Redwood City, San Mateo County, California.

The San Carlos Airport and Moffett Field are located 2.2 and 10.0 miles, respectively, from the subject site. The subject property is located well outside of the noise contour lines for these airports. Therefore, these airports are not suspected to significantly affect the noise characteristics of the subject property.

There are no major roads (4 lanes or more) within 1,000 feet of the subject property.

Caltrain and Union Pacific railroad lines are located within 3,000 feet of the subject property. The noise value was calculated for the railroads and the DNL value for railroads is 87.8 decibels (dB).

The projected DNL value for all noise sources is 87.8 dB. Pursuant to 24 CFR 51.101(a)(3), the composite DNL 87.8 dB is "unacceptable". The requirements set out in Section 51.104(a) are designated to ensure that interior levels do not exceed the established 45 dB level. D3G recommends that appropriate noise mitigation measures be undertaken.

DRAFT

**Train count information for Caltrain and Union Pacific were obtained from Rick Degman, Manager of Rail Operations for Caltrain (degmanr@samtrans.com, 650-508-7722) and Stephen Coleman with Caltrain Engineering (colemans@samtrans.com). According to Mr. Degman, Amtrak operates Caltrain service on their behalf and Union Pacific operates freight trains at variable times during the night. Train speeds ranged from 5-79 miles per hour (mph), so a speed of 30 mph was utilized.
*Train counts for Union Pacific were obtained from the Federal Railroad Administration's Office of Safety Analysis website accessed at http://safetydata.fra.dot.gov/officeofsafety/. Distances were obtained using Google Earth and site plan provided by Fong and Chan Architects dated April 16, 2010.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

134 MAPLE STREET

REDWOOD CITY, CALIFORNIA

1.0 INTRODUCTION

1.1 Purpose

This Phase I environmental site assessment was performed for Mr. Louis Deziel, who we understand is considering the purchase and redevelopment of the site shown on Figures 1 and 2. The development of a 5-story, skilled nursing facility is planned.

The purpose of this study was to strive to document recognized environmental conditions at the site related to current and historic use of hazardous substances and petroleum products. The term "recognized environmental conditions" means the presence or likely presence of hazardous substances or petroleum products on a property under conditions that indicate a significant release or significant threat of a release into the ground, ground water, or surface water.

1.2 Scope of Work

As requested, the scope of work for this study was performed in general accordance with the American Society for Testing and Materials (ASTM) Designation E 1527-05 as outlined in our agreement dated January 10, 2007. The scope of work included the following tasks.

- Reconnaissance of the site and limited drive-by survey of adjacent properties for readily observable indications of current or historic activities that have or could significantly impact the site.
- Review of readily available topographic maps and reports to evaluate local hydrogeologic conditions including anticipated ground water depth and flow direction.
- Review of readily available documents, maps, and aerial photographs, and interviews with knowledgeable persons to evaluate past land uses.
- Acquisition and review of a regulatory agency database report to evaluate potential impacts to the site from reported contamination incidents at nearby facilities.
- Review of available regulatory agency files to obtain information about the use and storage of hazardous materials at the site.

Our scope of services did not include sampling or analysis of on-site building materials, air, soil, or ground water. The limitations of this Phase I environmental site assessment are presented in Section 7; the terms and conditions of our agreement are presented in Appendix A. This work was performed under the oversight of Leonardo Alvarez, P.G., C.E.G., who meets the ASTM E 1527-05 qualifications.

2.0 SITE RECONNAISSANCE

2.1 Site Location and Ownership

The site is located at 134 Maple Street in Redwood City, in a mixed commercial and residential area. It is bounded by Maple Street to the west, railroad tracks and commercial businesses to the northeast, and a commercial property to the southeast. Redwood Creek, an open concrete-lined channel, bisects the southwestern portion of the site. The site location and ownership information is shown in Table 1.

Table 1. Site Information

Site Address	APN	Approximate Parcel Size	Site Owner	Approximate Square Footage of Building (s)
134 Maple Street	053-147-010	29,000 sq. ft.	Nicholas Marcelli	3,000

2.2 Topographic Features and Hydrogeology

Based on U.S. Geological Survey (USGS) topographic maps, the site's elevation is approximately 15 feet above mean sea level. Topography in the vicinity of the site slopes gently to the north toward the San Francisco Bay. Although we have not reviewed site-specific ground water data, based on our experience in the area, the shallow water-bearing zone likely is encountered at depths of approximately 10 to 15 feet; ground water beneath the site likely flows to the north.

2.3 Site Visit

To observe current site conditions, our representative, environmental engineer Stason I. Foster, P.E., visited the site on July 17, 2007 and was accompanied by Mr. Louis Deziel, who plans to purchase the site.

At the time of our visit, the site was developed with an unoccupied, single-story commercial building. Based on a conversation with Mr. Deziel, as well as signs on the building, the building was most recently occupied by Marcelli Lighting. The interior was mostly vacant and consisted of a former lighting fixture showroom and sales counter, an office area, a restroom and a warehouse area with a loft. An automobile was stored in the warehouse. Empty shelving was present within the warehouse and loft areas.

Exterior areas of the site consisted of an asphalt paved parking area on the northern portion of the site and a mostly unpaved, fenced storage yard on the southern portion of the site. A semi-truck trailer and steel shipping container (both empty), a truck and car, and a few pieces of miscellaneous equipment were present within the storage yard. Small stockpiles of gravel, soil, and brick (a few cubic yards in size) also were present.

Redwood Creek (an open, concrete-lined channel) was observed to bisect the southwestern portion of the site. The portion of the site on the southwestern side of the creek was observed to be landscaped with small shrubs and trees.

Additional observed site features are listed in Table 2.

Table 2. Additional Readily Observable Site Features

Site Features			Comments
Heating/Ventilation/Air Conditioning System	☒ Natural Gas and/or Electrical ☐ Fuel Oil		
Potable Water Supply	☒ Municipal	☐ On-Site Well	
Sewage Disposal Syst.	☒ POTW	☐ On-Site Septic	
Transformers	☐ Present ☒ PG&E	☐ Not Observed ☐ Privately Owned	Pad Mounted. No indications of leakage noted.
Other Features	☐ Aboveground Storage Tanks ☐ Agricultural Wells ☐ Air Emission Control Systems ☐ Boilers ☐ Burning Areas ☐ Chemical Mixing Areas ☐ Chemical/HazMat Storage Areas ☐ Clean Rooms ☐ Drainage Ditches ☐ Dry Wells ☐ Elevators ☐ Emergency Generators ☐ Equipment Maintenance Areas ☐ Garbage Disposal Areas ☐ High Power Transmission Lines ☐ Hoods and Ducting ☐ Hydraulic Lifts ☐ Odors ☐ Petroleum Pipelines ☐ Petroleum Wells ☐ Pits, Ponds or Lagoons ☐ Pools of Liquid ☐ Railroad Lines ☐ Row Crops or Orchards ☐ Stains or Corrosion ☒ Stockpiles of Soil or Debris ☐ Stressed Vegetation ☐ Sumps, Floor Drains or Clarifiers ☐ Surface Water Features ☐ Underground Storage Tanks ☐ Vehicle Maintenance Areas ☐ Vehicle Wash Areas ☐ Waste Water Generation or Treatment Systems ☐ Other Wells		As discussed above

Note: An unchecked box does not warrant that these features are not present on-site; it only states that these features were not readily observed during our site visit.

2.4 Site Vicinity Drive-By Survey

To evaluate adjacent land use, we performed a limited drive-by survey. Our observations are presented in Table 3.

Table 3. Adjacent Properties

Property Use	Direction from Site	Observations
Commercial	Northeast	Cook's Auto Repair and Rountree Plumbing and Heating (RPH)
Commercial	Southeast	Chub's Auto Repair (unoccupied)
Residential	West/Northwest	Franklin Street Apartments

2.5 Interviews with Site Owner and Occupants

During our study, we contacted Mr. Don Wright, the site owner's representative and real estate broker. To obtain general information regarding past and current site usage, an environmental questionnaire was provided to Mr. Wright and he was asked to forward it to the site owner for completion. The questionnaire was not returned to us, as of the date of this report.

3.0 USER PROVIDED INFORMATION

3.1 Environmental Liens, Specialized Knowledge, Commonly Known Information and Purchase Price

The ASTM standard defines the User as the party seeking to use a Phase I environmental site assessment to evaluate the environmental condition of the site. For the purpose of this Phase I environmental site assessment, the User is Mr. Louis Deziel. Per the ASTM standard, it is the User's responsibility to communicate certain information to the environmental professional (TRC). This information consists of the following:

- Specialized knowledge or experience that is material to recognized environmental conditions in connection with the site.
- Commonly known or reasonably ascertainable information within the local community about the property that is material to recognized environmental conditions in connection with the property.
- Knowledge of any environmental liens or activity and use limitations (AULs) filed under federal, tribal, state, or local law.
- In a transaction involving the purchase of real estate, the User must consider the relationship of the purchase price of the property to the fair market value of the property if the property were not affected by hazardous substances. If there is a discrepancy between the purchase price and fair market value, this information should be provided.

It is our understanding that Mr. Louis Deziel is not aware of any of the above items.

3.2 Previous Environmental Reports

To further evaluate the site history, we reviewed and relied upon the information presented in the following reports that were obtained from Mr. Louis Deziel. Copies of the reports are attached in Appendix E.

Applied Science and Engineering, Inc. September 28, 1994. *Laboratory Results, Soil Sampling, 134 Maple Street, Redwood City California.*

Applied Science and Engineering, Inc. November 21, 1994. *Laboratory Results, Stockpile Re-Sampling, 134 Maple Street, Redwood City California.*

The above reports document activities and present laboratory results associated with the removal of two underground storage tanks (USTs) from the site. In September 1994, a 580-gallon gasoline UST and a 1,000-gallon diesel UST, as well as a fuel dispense and below ground piping, were removed from a location near the southern corner of the on-site building. The USTs were reported to be in good condition. Soil samples were collected from beneath the USTs and dispenser, and from stockpiled soil. The samples were analyzed for total gasoline and diesel range petroleum hydrocarbons (TPHg and TPHd, respectively), and benzene, toluene, ethylbenzene and xylenes (BTEX). TPHd at 30 parts per million [ppm] was detected in the sample collected beneath the dispenser. Toluene, ethylbenzene and xylenes were additionally detected in the stockpile soil samples at up to 0.0088, 0.0058 and 0.027 ppm, respectively. The stockpiled soil was subsequently aerated on-site and re-sampled; no BTEX compounds were detected in the samples collected after aeration. The soil was subsequently used on-site to backfill the excavation. The reports indicate that the work was performed under oversight from the County of San Mateo Department of Health Services (CSMDHS) and that the CSMDHS closed the site after reviewing the laboratory results.

4.0 HISTORICAL REVIEW

The ASTM standard requires that all obvious uses of the subject property be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. Review of historical sources at less than approximately 5-year intervals is not required by this standard.

4.1 Photograph and Map Review

To evaluate the site history, we reviewed:

- Aaerial photographs (dated 1946, 1956, 1965, 1974, 1982, 1993 and 1998) from Environmental Data Resources, Inc. (EDR) in Milford, Connecticut.
- USGS 15-minute and 7.5-minute topographic maps (dated 1899, 1902, 1943, 1947, 1948, 1953 and 1961).
- Historic Sanborn fire insurance maps (dated 1884, 1888, 1891, 1897, 1907, 1919, 1950, 1962 and 1968) obtained from EDR

The above maps and photographs commonly provide historical information regarding a site including land uses and changes in development over time. Copies of these maps and photographs are presented in Appendix B. The following is a summary of our observations for the site and site vicinity. Note that each of the topographic maps show the site to be located within a developed area of Redwood City. No specific on-site features are depicted; thus, these maps are not discussed below.

4.1.1 Site

1884 though 1907: The 1884 Sanborn map shows the site to be developed with a commercial building occupied by the Redwood City Flour Mill. The 1888, 1891 and 1897 Sanborn maps show the building to be occupied by the W.J. Bunns Feed Mill; office and grain warehouse uses are depicted. Cullen Company Grain Warehouse is depicted as the building occupant on the 1907 Sanborn map. A steam boiler is shown within the building on each of the maps.

1919 though 1965: On the 1919 Sanborn map, the on-site building is noted to be used for feed and fuel storage. The 1950 Sanborn map shows the building to have been expanded to include wood, coal and hay storage areas and a store; Ridgeway Feed & Fuel is noted as the building occupant. Similar site use is depicted on the 1962 Sanborn map; Palmer Supply Company is noted as the occupant. The aerial photographs dated from 1943 to 1965 appear to show similar on-site development.

1968 through 1974: On the 1968 Sanborn map, the site is shown to be vacant. The 1974 aerial photograph appears to show a portion of the original flour mill/grain warehouse building (or its foundation) to remain on-site; the wood, coal and hay storage structures appear to have been removed.

1982 through 1998: On the aerial photographs dated from 1982 to 1998, the current on-site building appears to be present. Miscellaneous, unidentifiable objects appear to be present within the storage yard area on the southern portion of the site.

4.1.2 Site Vicinity

Based on the Sanborn maps and aerial photographs, the immediate site vicinity appears to have consisted mainly of widely spaced dwellings and undeveloped land during the late 1800s and early 1900s. Railroad tracks are shown to border the site to the northeast and a few commercial buildings are shown to the north. An increase in commercial development and corresponding decrease in residential and undeveloped property are apparent by the 1940s. Subsequent maps and photographs show further increases in mainly commercial development.

4.2 City Directories

To provide additional information pertaining to past site occupants, a city directory search report was obtained from Environmental Data Resources, Inc. City directories dated between 1981 and 2000 were reviewed and indicate that Marcelli Lighting occupied the site during that period. A copy of the city directory report is attached in Appendix C.

5.0 REGULATORY RECORDS

5.1 City and County Agencies File Review

To obtain information regarding past site uses and hazardous materials usage and storage, we reviewed readily available information at the Redwood City Building Department (RCBD) and the County of San Mateo Health Services Agency (CSMHSA) pertaining to the site address. Some of the information reviewed for the site (APN 053-147-010) at the RCBD was listed under the address of 160 Maple Street, which appears to have been a former site address. The information made available to us is summarized in Table 4.

Table 4. Available File Review Information

Agency	Date	Entity	Remarks
RCBD	1966	Owner: J.M. Ridgeway	Letter from fire marshal noting dilapidated condition of on-site building. Demolition was recommended.
RCBD	1966	Owner: J.M. Ridgeway	Permit to demolish a warehouse building.
RCBD	1978 and 1979	Marcelli Electric	Building plans, permits and other correspondence associated with the construction of a showroom and warehouse building for Marcelli Electric. The current site use was listed as being a vacant lot.
RCBD	1986	Marcelli Electric	Plans and other documents associated with a proposed wall along the adjacent railroad tracks. General construction yard and storage of equipment and materials is noted. A site plan shows the current on-site building as being occupied by the Marcelli Lighting store. The UST area and dispenser (as discussed in Section 3.2) also are depicted.
CSMHSA	1994	Nick Marcelli/Marcelli Lighting	Permit and other documents associated with the removal of two USTs that were reportedly installed in 1979.
CSMHSA	1994	Nick Marcelli	Closure letter from the CSMHSA indicating that no further action associated with the USTs is required.
CSMHSA	1996 and 1997	Five Star Development	Hazardous waste generator inspection reports indicating the generation of waste oil (~2 gal/month) and "small amounts" of thinner and sludge. The business type is listed as "construction".
CSMHSA	1996 and 2004	Nick Marcelli dba Five Star Development	Facility information sheets indicating occupancy by Five Star Development. A 2004 inspection report indicates that the facility closed.

In addition to the items listed above, Building Department files contained various documents, applications and correspondence dated between 1973 and 1974 associated with a proposal by Robert Pierce of Waterproof Chemicals, Inc., to construct a building on-site. The building was to be used by Waterproof Chemicals for blending and bottling of solvents and detergents. Based on the information reviewed, the Planning Department application was withdrawn and the building does not appear to have been constructed.

5.2 Regulatory Agency Database Report

During this study, a regulatory agency database report was obtained and reviewed to help establish whether contamination incidents have been reported in the site vicinity. A list of the database sources reviewed, a detailed description of the sources, and a radius map indicating the location of the reported facilities relative to the project site are presented in Appendix D. Nick Marcelli is listed at the site address on the HAZNET and San Mateo County Business Inventory databases. The HAZNET data is extracted from the copies of hazardous waste

manifests received each year by the Department of Toxic Substances Control; this listing indicates that empty containers and unspecified oil-containing wastes were disposed from the site. The San Mateo County Business Inventory database lists the site as an underground storage tank (UST) facility and indicates that less than 27 gallons per year of hazardous waste is generated.

There were no reported nearby hazardous materials spills or releases with a potential to significantly impact the site. The potential for site impact was evaluated based on information in the database records regarding the type of release, current case status, and distance and direction from the site.

6.0 CONCLUSIONS

6.1 Historical Summary

Based on the information reviewed during this study, the site was developed by 1884 with a flour mill. Historic Sanborn maps noted feed mill and grain warehouse uses between 1888 and 1907. From about 1919 to the mid-1960s, the site was used as a feed and fuel supply facility; storage areas for wood, coal and hay were present. The on-site structures appear to have been demolished in 1966. During the late 1970s, the current on-site building was constructed and occupied by Marcelli Electric until about 2004. Marcelli Electric (aka Marcelli Lighting) used the building for lighting showroom and warehouse purposes. The fenced area on the southern portion of the site appears to have been used as contractor (Nick Marcelli dba Five Star Development) storage yard for equipment and materials. The building is currently unoccupied.

6.2 Chemical Storage and Use

Except for gasoline and diesel fuel, no information was found indicating that significant quantities of hazardous materials historically have been used or stored at the site. Information from the CSMHSA noted that hazardous wastes generated at the site included waste oil (approximately 2 gallons per month) and "small amounts" of thinner and sludge. No indication of spills was noted.

As discussed in Section 3.2, gasoline and diesel were previously stored in two USTs that were removed in 1994. A low concentration of TPHd (30 ppm) was detected in soil beneath the fuel dispenser. This concentration does not appear to pose a significant threat to human health or the environment. A closure letter dated October 4, 1994 was issued by CSMHSA indicating that no further action associated with the USTs is required.

The historic Sanborn maps dated from 1884 to 1907 depict a steam boiler within an on-site building. More modern boilers were sometimes powered by fuel oil stored in USTs; however, during the late-1800/early-1900 time period, coal was the most likely fuel source.

6.3 Rail Lines

Railroad tracks are present adjacent to the site. Assorted chemicals historically have been used for dust suppression and weed control along rail lines, and impacted soil near railroad tracks is sometimes present. The tracks are not located on-site; thus, the potential for on-site soil to have been significantly impacted appears low. If a higher degree of confidence is desired, consideration should be given to evaluating on-site soil quality.

6.4 Asbestos

Due to the age of the on-site building, asbestos-containing materials (ACMs) may be present. If demolition, renovation, or re-roofing of the building is under consideration, an asbestos survey must be conducted under National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines. In addition, NESHAP guidelines require that all potentially friable ACM be removed prior to building demolition or renovation that may disturb the ACM.

6.5 Lead-Based Paint

In 1978, the Consumer Product Safety Commission banned the use of lead as an additive in paint. Currently, the U.S. EPA and U.S. Department of Housing and Urban Development are proposing additional lead-based paint regulations. Based on the age of the building, lead-based paint may be present. If lead-based paint is still bonded to the building materials, its removal is not required prior to demolition. It will be necessary, however, to follow the requirements outlined by Cal/OSHA Lead in Construction Standard, Title 8, California Code of Regulations (CCR) 1532.1 during demolition activities; these requirements include employee training, employee air monitoring, and dust control. If lead based paint is peeling, flaking or blistered, it should be removed prior to demolition. It is assumed that such paint will become separated from the building components during demolition activities; thus, it must be managed and disposed as a separate waste steam. Any debris or soil containing lead paint or coating must be disposed at landfills that are permitted to accept the waste being disposed.

6.6 Potential Environmental Concerns Within the Site Vicinity

Based on the information obtained during this study, no hazardous material incidents have been reported in the site vicinity that would be likely to significantly impact the site. As is typical to many commercial areas, several facilities in the vicinity, however, were reported as hazardous materials users. If leaks or spills occur at these facilities, contamination could impact the site, depending upon the effectiveness of cleanup efforts.

6.7 Data Failures and Gaps

Data failure occurs when the readily available standard historical sources that are likely to be useful have been reviewed and yet the objectives have not been met. For example, data failure is not uncommon in trying to identify the use of a property back to the first developed use or 1940 (whichever is earlier). The following data failures were identified:

- The historical information reviewed did not include information dating back prior to 1884. Based on our experience in this area, the site likely was undeveloped prior to construction of the flour mill depicted on the 1884 Sanborn map. This data failure does not appear significant.

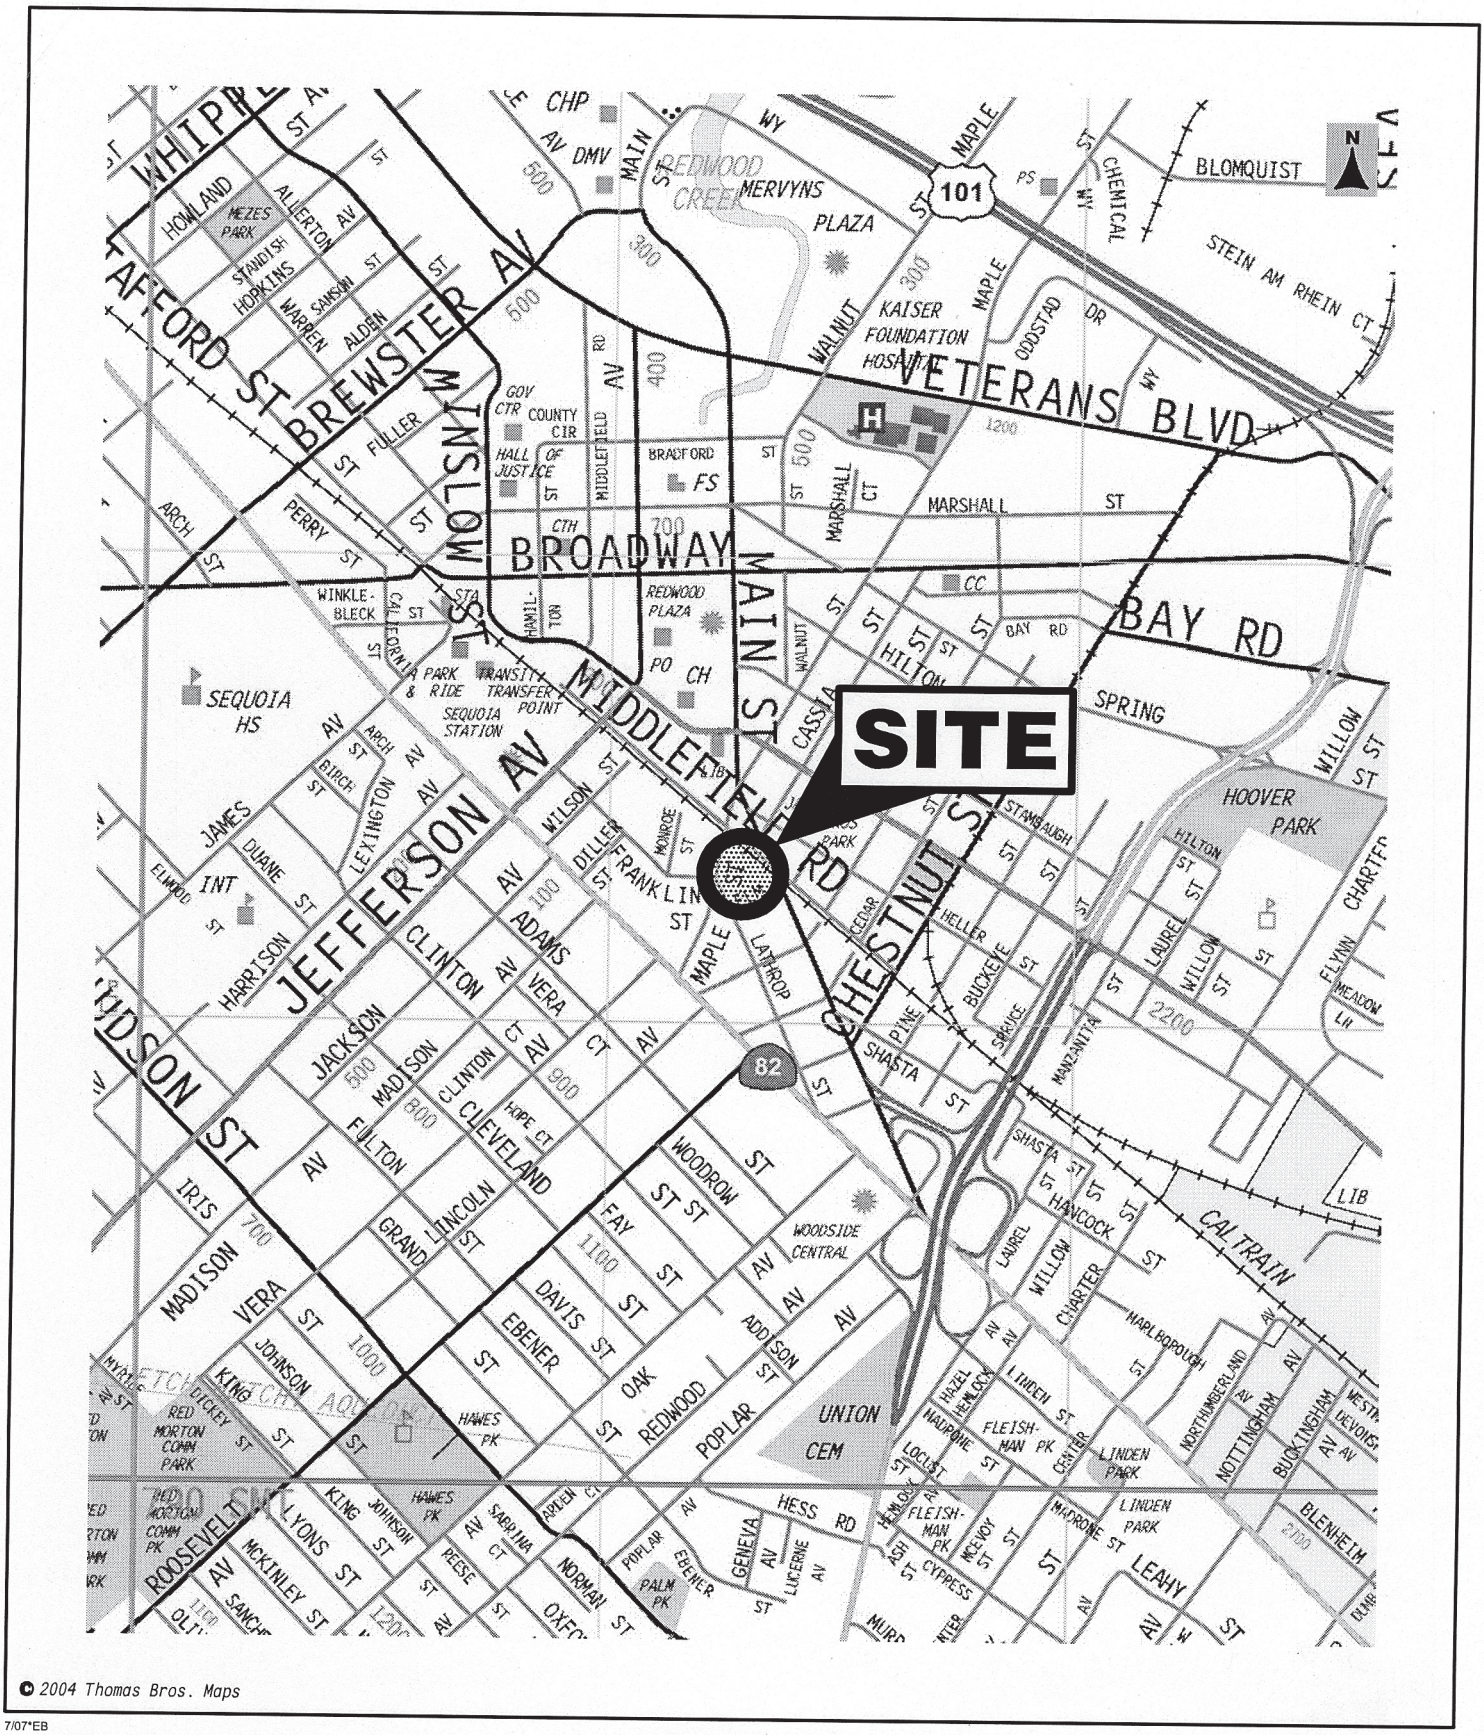
A data gap is the lack of or inability to obtain information regarding the site that adversely impacts the ability of an environmental professional to identify recognized environmental conditions. The following data gaps were identified:

- The environmental questionnaire sent to the owner was not returned to us. Based on the reasonably ascertainable information reviewed during this assessment, the lack of a completed questionnaire does not appear significant.

- Contact information for former property owners and occupants was not provided to us. We understand that this information is not reasonably ascertainable.

6.8 General Conclusions

We understand that Mr. Louis Deziel is considering purchasing the site for development of a skilled nursing facility. Based on the information obtained during this survey, the planned use appears compatible with the known on-site environmental conditions. No further work appears required.



7.0 LIMITATIONS

As with all site assessments, the extent of information obtained is a function of client demands, time limitations, and budgetary constraints. Our conclusions and recommendations regarding the site are based on readily observable site conditions, review of readily available documents, maps, aerial photographs, and data collected and/or reported by others. Due to poor or inadequate address information, the regulatory agency database report listed several sites that may be inaccurately mapped or could not be mapped; leaks or spills from these or other facilities, if nearby, could impact the site. As directed by you, we are relying on information presented in reports provided to us by you or your representative. We are not responsible for the accuracy of information or data presented by others.

Because publicly available information often cannot affirm the presence of recognized environmental conditions, there is the possibility that such conditions exist. Our conclusions and recommendations in this site assessment are qualified in that no soil, ground water, air, or building material analyses were performed. Sampling and analysis lead to a more reliable assessment of environmental conditions, conditions that often cannot be noted from typical Phase I activities. Should you desire a greater degree of confidence, these samples should be obtained and analyzed to further evaluate environmental conditions. Our recommendation that no further work appears required is not a guarantee of site cleanliness; it is only a statement that there is no affirmative representation that the site has been significantly impacted.

This report was prepared for the sole use of Mr. Louis Deziel. It is valid for 180 days. We make no warranty, expressed or implied, except that our services have been performed in accordance with environmental principles generally accepted at this time and location.

Laboratory Results Soil Sampling Report by ASE

ASE
APPLIED SCIENCE AND ENGINEERING INC.

September 28, 1994

Mr. Nick Marcelli
Five Star Development
9 Cerritos Place
Redwood City, CA 94061

TRANSMITTAL: Laboratory Results
Soil Sampling
134 Maple Street
Redwood City, California

Dear Mr. Marcelli,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed laboratory results for soil sampling conducted at 134 Maple Street in Redwood City, California on September 9, 1994 as part of removal of two underground storage tanks (USTs). Also attached are a copy of my field notes which include a sketch of the site, a table summarizing the laboratory reports, and a copy of the chain of custody form.

DRAFT

Observations

ASE was present during removal of both the approximately 1,088 gallon diesel UST and the approximately 580 gallon gasoline UST. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which led to the dispenser location.

Soils excavated from above the USTs and along the pipeline trench were placed in a stockpile and covered with plastic. Soils excavated from beneath the USTs were stockpiled separately and covered with plastic. A total of about 30 cubic yards of soil were stockpiled.

Soil Samples

Soil samples were collected from the backhoe bucket in the presence of Ms. Teresa Belasco of the San Mateo County Department of Health Services (SMCDHS). Soil samples were collected by scraping away about 3 inches of soil from the backhoe bucket, then driving a 2-inch diameter, six inch long brass liner into the exposed soil surface. The ends of the liner were covered with teflon tape, followed by plastic caps, and then a label was attached to the liner for identification purposes. The liner was placed into an ice chest containing blue ice for preservation during shipment to the laboratory.

One soil sample was collected from beneath the fill end of the gasoline UST. Two soil samples were collected from beneath former diesel UST, one from beneath each end. These samples were collected at depths of approximately 8 feet, one foot below the bottom of the UST pits.

A soil sample was also collected from the location of the fuel dispenser at a depth of about 3 feet. Finally, ASE collected two soil samples, one from each stockpile, for laboratory analysis. Ms. Teresa Belasco of SMCDHS was present during this sampling.

Laboratory Analyses

The soil samples were transported under chain of custody (see attached) to Priority Environmental Laboratories (PEL), a state certified laboratory, for analysis. The laboratory report is attached. Laboratory methods used are listed on the reports.

No petroleum hydrocarbons were detected in the three soil samples collected from beneath the USTs.

The soil sample from beneath the dispenser was found to contain 30 ppm of total petroleum hydrocarbons (TPH) as diesel but no detectable TPH as gasoline, benzene, toluene, ethylbenzene, or xylenes (BTEX).

The soil sample from stockpile #1 was found to contain 8.8 ppb of toluene, 5.8 ppb of ethylbenzene, and 27 ppb of xylenes. No TPH as gasoline, TPH as diesel, or benzene were detected in the sample.

The soil sample from stockpile #2 was found to contain 5.6 ppb of xylenes. No TPH as gasoline, TPH as diesel, benzene, toluene, or ethylbenzene were detected in the sample.

Conclusion

On September 15, 1994 the laboratory data was FAXed to Ms. Teresa Belasco at SMCDHS. Subsequently, ASE called her by telephone to discuss the results.

When asked if the excavation could be backfilled with the stockpiled soil Ms. Belasco stated that the lab results must be no petroleum hydrocarbons detected prior to backfilling. Therefore, the stockpiled soils must be aerated and resampled (with results showing no hydrocarbons) prior to re-use in backfilling the excavation.

When asked about the need for further excavation at the fuel dispenser, Ms. Belasco stated that no additional excavation was required because the concentrations were relatively low and the piping and USTs looked in good shape.

TRANSMITTAL: Laboratory Results
Stockpile Re-Sampling
134 Maple Street
Redwood City, California

Dear Mr. Marcelli,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed laboratory results for stockpile re-sampling conducted at 134 Maple Street in Redwood City, California on November 9, 1994. The stockpile was generated during removal of two underground storage tanks (USTs). Also attached are a copy of my field notes which include a sketch of the site, a table summarizing the laboratory reports, and a copy of the chain of custody form.

DRAFT

Introduction

ASE was present during removal of a 1,000 gallon diesel UST and 580 gallon gasoline UST on September 9, 1994. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which led to the dispenser location. Soils excavated from above the USTs and along the pipeline trench were placed in a stockpile and covered with plastic. Soils excavated from beneath the USTs were stockpiled separately and covered with plastic. A total of about 30 cubic yards of soil were stockpiled.

Soil samples were collected from the bottom of the UST excavation using the backhoe bucket, as previously reported in a September 28, 1994 letter. Ms. Teresa Belasco of the San Mateo County Department of Health Services (SMCDHS) observed the soil sampling. One soil sample was collected from beneath the fill end of the gasoline UST. Two soil samples were collected from beneath former diesel UST, one from beneath each end. These samples were collected at depths of approximately 8 feet, one foot below the bottom of the UST pits. A soil sample was also collected from the location of the fuel dispenser at a depth of about 3 feet. Finally, ASE collected two soil samples, one from each stockpile, for laboratory analysis. Laboratory results for these samples are shown in Table 1. Upon receipt of the laboratory analyses Ms. Belasco closed the site.

Because low concentrations of petroleum hydrocarbons were detected in the stockpile soil samples, the soil could not be used to backfill the excavation according to SMCDHS guidelines (see attached). Thus, you spread out the stockpile soils and passively aerated them at the site for two months. This report transmits the results of re-sampling of the stockpile after aeration.

Soil Sampling

Two soil samples were collected from the approximately 30 cubic yards of stockpile, in accordance with SMCDHS guidelines requiring one discrete sample for every 20 cubic yards. The sample locations were chosen randomly. Soil samples were collected by scraping away about 6 inches of soil from the surface, then pushing a 2-inch diameter, six inch long brass liner into the exposed soil. The ends of the liner were covered with teflon tape, followed by plastic caps, and then a label was attached to the liner for identification purposes. The liner was placed into an ice chest containing blue ice for preservation during shipment to the laboratory.

Laboratory Analyses

The soil samples were transported under chain of custody (see attached) to Priority Environmental Laboratories (PEL), a state certified laboratory, for analysis. The laboratory report is attached. Laboratory methods used are listed on the reports. Analyses were conducted only for compounds that were detected in the initial stockpile samples.

No benzene, toluene, ethylbenzene, or xylenes (BTEX) were detected in the two soil samples collected as re-sampling of the stockpiles.

Conclusion

Laboratory results for two discrete soil samples collected from a stockpile of approximately 30 cubic yards show no detectable BTEX. Based on these results the stockpile soils have been successfully remediated by passive aeration at the site.

In accordance with SMCDHS guidelines which require no detectable hydrocarbons in the stockpile (see attached), the stockpiled soil can now be used as site backfill.

SAN MATEO COUNTY POLICY STATEMENT: HANDLING AND DISPOSAL OF REMEDIATED SOIL

APRIL, 1990

BACKGROUND The San Francisco Bay Regional Water Quality Control Board (RWQCB) has recently created policy addressing the fate of soils being excavated at underground tank sites. The RWQCB's policy reads to the effect that soils being tested below detection levels of all contaminants may be used for general fill needs. Any soils tested with levels above the detection limit must be either 1) remediated to below detection limits, 2) disposed of at a properly rated landfill or 3) obtain a variance from the RWQCB to place the soil back into the excavation.

GOAL The goal of this policy statement is to clarify the options available of disposing of soils and to establish a protocol for sampling the soils.

DISCUSSION As discussed in the Tri-regional Guidelines of June 1988, the 100 ppm level is not a cleanup level but is merely used as a tool to prioritize sites and indicate the severity of the original release. Whenever soil contaminated at any level is introduced to the ground the risk of groundwater degradation exists. Such degradation would require additional remedial activities. Offered below is a list of concentration levels and the handling option associated with each concentration.

TPH and BTXE

All Contaminants Non-Detectable	-Reuse for general site fill needs -Dispose of at Class III
10-100 ppm	-Remediate to N.D. -Dispose of at Class III -Obtain variance from RWQCB
100-1000 ppm	-Remediate further -Dispose of at Class II or I
1000 or greater	-Remediate further -Dispose of at Class I

LICY It shall be the policy of San Mateo County to allow reuse of remediated soils only when laboratory analysis show that the soils contain a nondetectable amount of contaminant. All other soils shall be handled as outlined above.

To characterize the soil in order to determine the levels of contamination present the sampling protocol below has been established. This protocol must be followed whenever the responsible party is attempting to dispose of the soils within San Mateo County.

TLC = 1000
STLC = 5

* In addition to site specific contaminants, i.e. TPH-G, TPH-D and BTXE etc., all soils being hauled to Ox Mountain Landfill must include testing for total and soluble lead (TTLC/STLC). Approval to haul the soils to Ox Mountain must first be received from San Mateo County.

* Any nonhazardous soils being disposed of outside of San Mateo County must be documented with a Bill of Laden submitted to this office within fifteen (15) days of disposal

All sampling techniques, handling procedures and analytical methodologies as described in both the LUFT guidance and the Tri-regional guidelines shall apply.

A representative of San Mateo County must be notified a minimum of forty-eight (48) hours prior to sampling and shall be present at the time of sampling.

One discrete sample for every 20 cubic yards of soil must be collected and analyzed via the appropriate methods. Composite sampling will no longer be accepted for disposal of soils. The Bay Area Air Quality Management District still requires that their sampling protocol be followed before any aeration begins.

Piles of soil should be spread out to a maximum thickness of two (2) feet and the requisite number of samples are to be obtained one (1) foot into the soil.

If the pile cannot be spread, then the appropriate number of samples shall be taken with a hand auger in a way to best characterize the pile. A grid system should be utilized in conjunction with a random sampling protocol.

Attached please find our PHASE I ENVIRONMENTAL SITE ASSESSMENT, ("the Report") for the above-mentioned Subject Property. This report has been prepared by Odic for the Client under the professional supervision of the principal and/or senior staff whose seal(s) and signatures appear hereon. Neither Odic, nor any staff member assigned to this investigation has any interest or contemplated interest, financial or otherwise, in the subject or surrounding properties, or in any entity which owns, leases, or occupies the subject or surrounding properties or which may be responsible for environmental issues identified during the course of this investigation, and has no personal bias with respect to the parties involved. The purpose of this Report is to assist Client, in its underwriting of a proposed mortgage loan on the Subject Property described herein.

The assessment was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession, and in accordance with generally accepted practices of other consultants currently practicing in the same locality under similar conditions. No other representation, expressed or implied, and no warranty or guarantee is included or intended. The Report speaks only as of its date, in the absence of a specific written update of the Report, signed and delivered by Odic.

There are no intended or unintended third party beneficiaries to this Report, unless specifically named. Odic is an independent contractor, not an employee of either the issuer or the borrower, and its compensation was not based on the findings or recommendations made in the Report or on the closing of any business transaction. Thank you for the opportunity to prepare this Report, and assist you with this project. Please call us if you have any questions or if we may be of further assistance.

Respectfully Submitted,

EXECUTIVE SUMMARY

ODIC performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-05 of the Subject Property. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this Report.

REPORT COMPONENT	SUMMARY OF CONCLUSION
Subject Property Characteristics (Current Tenant or Property Use Concerns)	The subject property is situated on the northwest corner of Main St. and Elm St. in the City of Redwood City, CA. The property is an irregularly-shaped parcel of commercially-zoned land improved with two rectangular single-story buildings, with one building situated in the northwest portion and the other in the southeast portion of the property. A parking lot occupying the remainder of the property. Access to the property is achieved via Main Street to the northeast and Elm Street to the northwest.
Subject Property Reconnaissance	No RECs (Recognized Environmental Conditions) were found during site reconnaissance.
Historical Use of Subject Property and Vicinity	According to Sanborn Fire Insurance Maps the property appeared improved with dwellings in 1891, 1907, 1919. In 1950 no structures were depicted on site, while in 1968 the property was occupied by several buildings labeled as spray painting and auto repair. According to building records obtained from the City of Redwood City, permits for a garage building in 1952 with an addition to the office building in 1955 and various other permits through 1986. Mr. Steve Brugman, owner, stated that he has occupied and operated an auto repair facility on the property since 1995 and that the property was previously used as an auto repair facility. City directories showed listings as Chub's Auto repair from 1996 through 2006. Aerial photographs showed improvements on the property as early as 1943 with buildings similar to the current buildings in 1974.
Federal, State and Local Agency Concerns	The subject property is not listed on the following environmental regulatory database record research: NPL, CORRACTS, RCRA-TSD, CALSITES, and SWF. The property is listed as RCRA-SQG, FINDS, HAZNET, LUST, CORTESE, SWEEPS UST and San Mateo County BI. According to the EDR Radius Map report, the RCRA-SQG listing show no violations found. The HAZNET listing shows various chemical disposed of off-site by manifest and a closure letter was issued by SMCDHS for the LUST and UST related listings.
Potential Off-site Sources	No RECs (Recognized Environmental Conditions) were found during site reconnaissance.
Non-CERCLA Items	No RECs (Recognized Environmental Conditions) were found during site reconnaissance. Due to the age the building (constructed prior to 1978), interior/exterior portions of the building may contain asbestos and lead base paints. Those areas suspected of having any asbestos containing materials and lead base paints appeared to be in good condition with no fraying or deterioration. It should be noted that this assessment did not include any sampling and testing to determine if any asbestos containing materials and lead base paints are present.
Other RECs	Historic RECs were found. The subject site had a release of petroleum hydrocarbons to soil and groundwater, with case closure achieved.
Inaccessible or Un-surveyed Portions of Subject Property	Full access to the entire property was provided to ODIC, and there were no notable portions of the Subject Property excluded from the survey and field inspection.

REPORT COMPONENT	SUMMARY OF CONCLUSION
Data Gap	The User failed to provide any information requested in the AUL environmental questionnaire. Such is considered a data gap. The absence of this information may not be considered enough to warrant further investigation due to a low risk of environmental contamination at the site, however absence of research into any existing environmental liens recorded for the subject property may disqualify the user for CERCLA landowner liability protection. The largest data gap in this research was from 1919 to 1943. Other gaps ranged from two to sixteen years. However, ODIC does not believe that any gaps in the information reviewed would affect our ability to identify recognized environmental concerns.

Historic RECs were found. The subject site had a release of petroleum hydrocarbons to soil and groundwater, with case closure achieved. While closure was granted for the release from the former UST, impact to groundwater from petroleum hydrocarbons has been documented. However, the reported levels are low, such that there is a low risk for impact to the groundwater beyond the property boundaries, and is not expected to affect any nearby sensitive receptors.

ODIC hereby recommends no further action based on the current site condition and available public records due to a minimal risk of regulatory action related to the existing contamination at the subject property.

DRAFT

1.0 SCOPE OF WORK & LIMITATIONS

The primary purpose of this *Phase I Environmental Site Assessment Report* (the *Report*) is to assist *Client,* in its underwriting of a proposed mortgage loan on the Subject Property, and to identify *recognized environmental conditions* in connection with the Subject Property described in this *Report*. The investigation is prepared in accordance with the Client's Environmental Site Assessment scope of work for the use and benefit of the Client, it's successors, and assignees and US SBA if financing is to be authorized by US SBA. It is based, in part, upon documents, writings, and information owned, possessed, or secured by the Client. Neither this report, nor any information contained herein shall be used or relied upon for any purpose by any other person or entity without the express written permission of the Client.

This report has been prepared by ODIC for the Client under the professional supervision of the principal and/or senior staff whose seal(s) and signatures appear hereon. Neither ODIC, nor any staff member assigned to this investigation has any interest or contemplated interest, financial or otherwise, in the subject or surrounding properties, or in any entity which owns, leases, or occupies the subject or surrounding properties or which may be responsible for environmental issues identified during the course of this investigation, and has no personal bias with respect to the parties involved.

The purpose of this practice is to define good commercial and customary practice for conducting an *environmental site assessment*2 of a parcel(s) of *commercial real estate* with respect to the range of contaminants within the scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) and *petroleum products*. As such, this practice is intended to permit a *user (Client, Purchaser, Lender, Owner)* to satisfy one of the requirements to qualify for the *innocent landowner, contiguous property owner,* or *bona fide prospective purchaser* limitations on CERCLA liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"): that is, the practice that constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

Controlled substances are not included within the scope of this standard. Persons conducting an *environmental site assessment* as part of an EPA Brownfields Assessment and Characterization Grant awarded under CERCLA 42 U.S.C. §9604(k)(2)(B) must include controlled substances as defined in the Controlled Substances Act (21 U.S.C. §802) within the scope of the assessment investigations to the extent directed in the terms and conditions of the specific grant or cooperative agreement. Additionally, an evaluation of *business environmental risk* associated with a parcel of *commercial real estate* may necessitate investigation beyond that identified in this practice.

In defining a standard of good commercial and customary practice for conducting an *environmental site assessment* of a parcel of *property*, the goal of the processes established by this practice is to identify *recognized environmental conditions*. The term *recognized environmental conditions (RECs)* means the presence or likely presence of any *hazardous substances* or *petroleum products* on a *property* under conditions that indicate an existing release, a past release, or a material threat of a release of any *hazardous substances* or *petroleum products* into structures on the *property* or into the ground, ground water, or surface water of the *property*. The term includes *hazardous substances* or *petroleum products* even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not *RECs*.

ODIC has performed this *Phase I Environmental Site Assessment* in conformance with the scope and limitations of ASTM Practice E 1527-05.

SCOPE OF WORK

This *Report* was prepared for the exclusive use of *Client*. This *Report* has been prepared in accordance with our *Standard Conditions For Engagement* and *Authorization Letter* and *Agreement for Environmental Services* approved and signed by *Client*, and with the limitations described below, all of which are integral parts of this *Report*. A copy of the signed *Standard Conditions For Engagement* and *Authorization Letter* and *Agreement for Environmental Services* is maintained at the Odic Environmental, Los Angeles, California office.

The information reported was obtained through sources deemed reasonably ascertainable, as defined in ASTM E1527-05; a visual site survey of areas readily observable, easily accessible or made accessible by the property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property. Municipal information was obtained through file reviews of reasonably ascertainable standard government record sources, and interviews with the authorities having jurisdiction over the property. Findings, conclusions and recommendations included in the *Report* are based on our visual observations in the field, the municipal information reasonably obtained, information provided by the Client, and/or a review of readily available and supplied documents.

ODIC renders no opinion as to the property condition at un-surveyed and/or inaccessible portions of the Subject Property, which are described below. ODIC relies completely on the information, whether written, graphic or verbal, provided by the property contact or as shown on any documents reviewed or received from the property contact, owner or agent, or municipal source, and assumes that information to be true and correct. The observations in this *Report* are valid on the date of the survey. Where access to portions of the Subject Property or to structures on the Subject Property was unavailable or limited, ODIC renders no opinion as to the presence of petroleum products or hazardous substances in that portion of the Subject Property or structure. In addition, ODIC renders no opinion as to the presence of, or indirect evidence relating to, petroleum products or hazardous substances where direct observation of the interior walls, floor, or ceiling of a structure was obstructed by objects or coverings on or over these surfaces.

The conclusions provided by ODIC are based on the information obtained by visual survey of the Subject Property, and information provided by agents representing the Subject Property, or agents of the owner. In addition, ODIC has relied on certain information provided by state and other referenced parties, and on information contained in the files of federal, state and/or local agencies available to ODIC at the time of the assessment. Although there may have been some degree of overlap in the information provided by these various sources, ODIC did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of these *Environmental Services*.

CERCLA Requirements Other Than Appropriate Inquiry (ASTM E1527-05 1.1.3) - This practice does not address whether requirements in addition to *all appropriate inquiry* have been met in order to qualify for the *LLPs* (specified in 42 U.S.C. §9607(b)(3)(a) and (b) including the continuing obligation not to impede the integrity and effectiveness of *activity and use limitations* (AULs), or the duty to take reasonable steps to prevent releases, or the duty to comply with legally required release reporting obligations).

It is acknowledged that ODIC judgments shall not be based on scientific or technical tests or procedures beyond the scope of the Services or beyond the time and budgetary constraints imposed by the Client. It is acknowledged further that ODIC conclusions shall not rest on pure science but on such considerations as economic feasibility and available alternatives. Client also acknowledges that, because geologic and soil formations are inherently random, variable, and indeterminate in nature, the Services and opinions provided under this Agreement with respect to such Services, are not guaranteed to be a representation of actual conditions on the Subject Property, which are also subject to change with time as a result of natural or man-made processes, including water permeation. In performing the Services, ODIC shall use that degree of care and skill ordinarily exercised by environmental consultants or engineers performing similar services in the same or similar locality. The standard of care shall be determined solely at the time the Services are rendered and not according to standards utilized at a later date. The Services shall be rendered without any other warranty, expressed or implied, including, without limitation, the warranty of merchantability and the warranty of fitness for a particular purpose.

The ASTM Standard E1527-05 does not encompass analytical testing to evaluate Asbestos Containing Materials (ACM), radon, lead-based paint (LBP), drinking water quality, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, biological agents, mold, stored chemicals, debris, fill materials, surface water, or subsurface samples (soil and groundwater) as part of a Phase I ESA. Such additional information of non-ASTM 1527 is merely extra contents, and cannot be used to bind this report as a whole to the compliance and conformance to ASTM guideline. *No disassembly of systems or building components or physical or invasive testing is to be performed unless Contract Engagement specifically called for such testing as an additional scope of work.* ODIC has performed this *Phase I Environmental Site Assessment* in conformance with the scope and limitations of ASTM

Practice E 1527-05. *This Report* may not include all environmental conditions which can materially impact the subject property other than those defined as REC in ASTM E1527-05.

As our standard procedure and scope of work defined by ASTM E1527-05, ODIC is not contracted to perform AUL and environmental lien search via title records, since such is beyond the scope of the service included in this report.

The assessment was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession, and in accordance with generally accepted practices of other consultants currently practicing in the same locality under similar conditions. No other representation, expressed or implied, and no warranty or guarantee is included or intended. The *Report* speaks only as of its date, in the absence of a specific written update of the Report, signed and delivered by ODIC.

Additional information that becomes available after our survey and draft submission concerning the Subject Property should be provided to ODIC so that our conclusions may be revised and modified if necessary, at additional cost. This *Report* has been prepared in accordance with our *Standard Conditions for Engagement*, which is an integral part of this *Report.*

Adjoining sites, neighboring sites or surrounding properties mentioned in this report are defined only up to one parcel immediately next to the subject property, and ODIC will only check immediately adjoining properties to identify historical use of the surrounding areas via historical source or data on such adjoining properties, and/or walk-through along subject property's perimeters to find obvious signs of environmental concerns.

It is often not possible (under "reasonably ascertainable" clause of ASTM guideline) to identify every single historical business tenants or occupants on the subject property. ODIC cannot be liable for not identifying all such past tenants or occupants of the project site.

INDEPENDANT CONTRACTOR STATUS / PROFESSIONAL RESPONSIBILITY

In performing Services under the mutually agreed contractual agreement and verbal engagement, ODIC operates as, and have the status of, an independent contractor. Subject to any limitations established by the Client as to the degree of care and amount of time and expenses to be incurred and any other limitations contained in the mutually agreed contractual agreement and verbal engagement, ODIC performs the Services consistent with that level of care and skill ordinarily exercised by other professional consultants under similar circumstances at the time the Services are performed. Client hereby acknowledges that whenever a Project involves hazardous or toxic materials there are certain inherent risk factors involved (such as limitations on laboratory analytical methods, variations in subsurface conditions, economic loss to Client or property owner, a potential obligation for disclosure to regulatory agencies, a potential for a decrease in market value of real property, and the like) that may adversely affect the results of the Project, even though the Services are performed with such skill and care. No other representation, warranty, or guarantee, express or implied, is included or intended by the mutually agreed contractual agreement and verbal engagement.

QUALIFICATION STATEMENT OF ENVIRONMENTAL PROFESSIONAL

Odic states that this Phase I Environmental Assessment was performed under Environmental Professional (EP)'s direct supervision, that he/she has prepared and/or reviewed and approved the report, and that the methods and procedures utilized in the development of this report conforms to minimum industry standards using both the American Society for Testing Methods (ASTM) Standard E1527-05 and the United States – Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) as guidelines. Odic certifies that Odic's Environmental Professionals and Subcontractors are properly licensed and/or certified to conduct Phase I Environmental Site Assessments.

Odic's EP declares that, to the best of his/her professional knowledge and belief, he/she meets the definition of Environmental Professional as defined in 40 CFR Part 312. Odic's EP who prepared this assessment possesses the specific qualifications based upon education, training and experience to assess a property of the nature, history, and

setting of the subject site. Odic Environmental has developed and performed the "All Appropriate Inquiries" in accordance with the standards and practices as defined in 40 CFR Part 312.

ABBREVIATIONS

ODIC may use various abbreviations to describe various site, building or system components or legal descriptions. Not all abbreviations may be applicable to all reports. The abbreviations most often utilized are defined below.

ACM	Asbestos-containing material
ACT	Acoustic Ceiling Tile
ADA	Americans with Disabilities Act
AHU	Air Handling Unit
APA	American Plywood Association
APCD	Air Pollution Control District
AQMD	Air Quality Management District
AS	Air Sparging
AST	Aboveground storage tank
ASTM	American Society for Testing and Materials
bgs	Below Ground Surface
BOD	Biochemical oxygen demand
BTEX	Benzene-toluene-ethylbenzene-xylene
BTU	British Thermal Unit (a measurement of heat)
BTUH	British Thermal Units per Hour
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
CFR	Code of Federal Regulations
CMU	Concrete Masonry Unit
COCs	Chemicals of Concern
DEP	Department for Environmental Protection
DEQ	Department of Environmental Quality
DOE	Department of Ecology (WA)
DTSC	Department of Toxic Substance Control (CA)
EIFS	Exterior Insulating Finishing System
EP	Extraction procedure
EPA	Environmental Protection Agency
EPDM	Ethylene Propylene Diene Monomer (rubber membrane roof)
EUL	Expected Useful Life, Effective Useful Life
FCU	Fan Coil Unit
FEMA	Federal Emergency Management Agency
FHA	Forced Hot Air
FHW	Forced Hot Water
FID	Flame ionization detector
FIRM	Flood Insurance Rate Map
FOIA	Freedom Of Information Act
FRT	Fire retardant treated plywood
GC/MS	Gas chromatography/mass spectrometry
GFI	Ground Fault Interrupt (circuit)
GPR	Ground-penetrating radar
GWB	Gypsum Wall Board
HCP	Handicapped Person
HID	High Intensity Discharge (lighting)
HVAC	Heating, Ventilating and Air Conditioning
HWH	Hot Water heater
LBP	Lead-based paint
LDL	Laboratory Detection Limit
LEL	Lower explosive limit
LUST	Leaking underground storage tank
MCL	Maximum contaminant level
MDP	Main Distribution Panel
mg/L	Milligrams per Liter
MSDS	Material safety data sheet
MSSL	Maximum Soil Concentration Limit
MTBE	Methyl Tertiary Butyl Ether
NFA	No Further Action (letter)

VCT	Vinyl Composition Tile
VOC	Volatile organic compound
VWC	Vinyl Wall Covering

DRAFT

1.1 AUL SEARCH AND REVIEW OF LAND TITLE RECORDS

The information reported herein was obtained through sources deemed reliable, a visual site survey of areas readily observable, easily accessible or made accessible by the property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property.

Under ASTM E1527-05, Section 6 – User Responsibilities – User ("Client, Lender, Purchaser, Owner") has to search for environmental liens in the Land Title Records. This is a mandatory requirement in order to get the CERLCA protections under ASTM E1527-05 and All Appropriate Inquiries.

According to ASTM E1527-05, search for environmental liens and AULs from review of Land Title Records shall be performed by the *user ("Client, Lender, Purchaser")* that will help identify the possibility of *recognized environmental conditions* in connection with the *property*. These tasks do not require the technical expertise of an *environmental professional* and are generally not performed by *environmental professionals* performing a *Phase I Environmental Site Assessment*. We understand that as our standard procedure, customer has completed *User* Questionnaire to assist the *user* and Odic Environmental in gathering information from the *user* that may be material to identifying *recognized environmental conditions*.

Review Title and Judicial Records for Environmental Liens or Activity and Use Limitations (AULs)—Reasonably ascertainable recorded land title records and lien records that are filed under federal, tribal, state, or local law should be reviewed to identify *environmental liens* or *activity and use limitations*, if any, that are currently recorded against the *property*. *Environmental liens* and *activity and use limitations* that are imposed by judicial authorities may be recorded or filed in judicial records, and, where applicable, such records should be reviewed. Any *environmental liens* or *activity and use limitations* so identified shall be reported to Odic Environmental conducting a *Phase I Environmental Site Assessment*.

Unless added by a change in the scope of work to be performed by Odic Environmental, this practice does not impose on Odic the responsibility to undertake a review of *recorded land title records* and judicial records for *environmental liens* or *activity and use limitations*. The *user* should either *(1)* engage a title company or title professional to undertake a review of *reasonably ascertainable recorded land title records* and lien records for *environmental liens* or *activity and use limitations* currently recorded against or relating to the *property*, or *(2)* negotiate such an engagement of a title company or title professional as an addition to the scope of work to be performed by Odic.

CLIENT-PROVIDED INFORMATION

According to ASTM Standards E-1527-05 and the USEAP AAIs, in order to qualify for the Land-owner Liability Protection (LLPs) offered by the Small Business Liability Relief and Brownfield's Revitalizations Act of 2001, User must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

USER QUESTIONNAIRE for AUL

In order to qualify for one of the *Landowner Liability Protections (Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the *user* must provide the following information (if available) to the *environmental professional*. Failure to provide this information could result in a determination that "*all appropriate inquiry*" is not complete.

USER/CUSTOMER QUESTIONNAIRE	
QUESTION	CUSTOMER TO ANSWER
(1.) Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25). Are you aware of any environmental cleanup liens against the *property* that are filed or recorded under federal, tribal, state or local law?	No response
(2.) Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26). Are you aware of any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?	No response
(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28). As the *user* of this *ESA* do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an adjoining *property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?	No response
(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29). Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?	No response
(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30). Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as *user*, (a.) Do you know the past uses of the *property*? (b.) Do you know of specific chemicals that are present or once were present at the *property*? (c.) Do you know of spills or other chemical releases that have taken place at the *property*? (d.) Do you know of any environmental cleanups that have taken place at the *property*?	No response
(6.) The degree of obviousness of the presence of likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31). As the *user* of this *ESA*, based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property*?	No response

The User failed to provide any information requested in the AUL environmental questionnaire. Such is considered a data gap. The absence of this information may not be considered enough to warrant further investigation due to a low risk of environmental contamination at the site, however absence of research into any existing environmental liens recorded for the subject property may disqualify the user for CERCLA landowner liability protection.

ADDITIONAL USER QUESTIONNAIRE

In addition, certain information should be collected by the User, if available, and provided to the *environmental professional* selected to conduct the Phase I. This information is intended to assist the *environmental professional* but is not necessarily required to qualify for one of the *LLPs*. The information includes:

USER QUESTIONNAIRE	
QUESTION	ANSWER
(a) the reason why the Phase I is required	No response
(b) the type of *property* and type of *property* transaction	No response
(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful)	No response
(d) the scope of services desired for the Phase I (including whether any parties to the *property* transaction may have a required standard scope of services on whether any considerations beyond the requirements of Practice E 1527 are to be considered)	No response
(e) identification of all parties who will rely on the Phase I *report*	No response
(f) identification of the site contact and how the contact can be reached	No response
(g) any special terms and conditions which must be agreed upon by the *environmental professional*	No response
(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition)	No response

DRAFT

2.0 SUBJECT PROPERTY CHARACTERISTICS

2.1 PROJECT INFORMATION & PROPERTY LOCATION

Project Information	
ITEM	
ODIC Project Number	6343476-ESAI
Client Project Number	N/A
Subject Property Address	1180 Main St., Redwood City, CA
Subject Property Name	Chubs Auto Repair
Property Inspection Date	December 23, 2006
Weather Condition	Fair
ODIC's Field Assessor	Jonathan Maraccini, Field Assessor
ODIC's Environmental Consultant / QAQC Officer	Hyung Kim, Principal Consultant, REA, CHMM, M.S. John Winkler, CA Professional Geologist, REA
Property Location	The subject property is situated on the northwest corner of Main St. and Elm St. in the City of Redwood City, CA.

2.2 PROPERTY IMPROVEMENT & BUILDING/LAND DESCRIPTION

Property Improvement & Building/Land Description	
ITEM	
General Layout of Property	The property is an irregularly-shaped parcel of commercially-zoned land improved with two rectangular single-story buildings, with one building situated in the northwest portion and the other in the southeast portion of the property. A parking lot occupies the remainder of the property.
Access to Property	Access to the property is achieved via Main Street to the northeast and Elm Street to the northwest.
Lot Size & Shape	Irregularly-shaped, exact size not measured (according to property profile)
Building Size & Shape	Rectangular, exact sizes not measured
Number of Buildings	Two
Year of Construction	Circa 1974 for the present buildings (according to aerial photographs)
Percent Coverage by Building	Approximately 45%
Number of Stories	One
Foundation	Concrete slab-on-grade
Frames/Exterior Walls	Concrete tilt-up
Roof Type	Not inspected
Interior Description	The interior of the northwest building consists of an office area followed by multiple auto body repair bays, with each bay occupied by multiple work related equipment, supplies and multiple vehicles, some of which were situated on electric vehicle lifts. The north portion of the southwest building consisted of multiple vehicles, body parts and auto repair related equipment. The interior materials of the subject buildings consisted of exposed concrete, painted walls, beams and exposed ceiling.
Other Improvements & Features	N/A
Description of Unimproved Areas	The subject property is 100% improved.

DRAFT

2.3 CURRENT OCCUPANTS & USE OF THE PROPERTY

Current Occupants & Use of the Property	
ITEM	
Present Occupant/Business Operation	Chubs Auto Repair/ Auto repair facility
Number of Occupants/Units	One occupant, two units

2.4 MUNICIPAL SERVICES & UTILITIES

Municipal Service & Utilities	
ITEM	
Portable Water	City of Redwood City
Gas/Oil Source for Heating	PG&E
Electrical	PG&E
Sewage Disposal System	City of Redwood City
Solid Waste Disposal	Allied Waste

DRAFT

3.0 SUBJECT PROPERTY RECONNAISSANCE

3.1 LIMITING CONDITIONS

The information reported herein was obtained through sources deemed reliable, a visual site survey of areas readily observable, easily accessible or made accessible by the property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property.

No disassembly of systems or building components or physical or invasive testing was performed. ODIC renders no opinion as to the property condition at un-surveyed and/or inaccessible portions of the Subject Property. ODIC relies completely on the information, whether written, graphic or verbal, provided by the property contact or as shown on any documents reviewed or received from the property contact, owner or agent, or municipal source, and assumes that information to be true and correct. The observations in this Report are valid on the date of the survey.

3.2 SUBJECT PROPERTY RECONNAISSANCE

Subject property reconnaissance	
ITEM	LOCATION AND DESCRIPTION
Processes that generate or handle Petroleum Products or Hazardous Substances	Yes
Underground Storage Tank	Yes
Aboveground Storage Tank	None observed
Fuel Islands / Dispensers	None observed
Any type of fueling systems	None observed
Containers of Hazardous Material & Petroleum Products related to subject operation/process	Yes
Other containers of suspicious hazardous materials in drums, barrels, or other storage or unlabeled/unidentified containers on site	None observed
Containers not attributed to current use of the Subject Property	None observed
Surface staining either on unpaved or paved land	Yes
Areas of asphalt patch or surface depressions	None observed
Stockpiled Soils with visual contamination	None observed
Fill material of questionable origin/ Piles	None observed
Stressed vegetation	None observed
Any type of heavy equipments or machinery of environmental concern on site	None observed
Hydraulic equipment or machine of environmental concern (potential PCB-oil / hydraulic oil) such as hydraulic lift, compactor, etc.	Yes
Drains for Machinery/Equipment Cleaning or Flushing	None observed
Wastewater Treatment Units & Clarifiers	None observed
Pools of liquid	None observed
Other Drains and Sumps	None observed
Any regulated surface wastewater discharges	None observed

DRAFT

Subject property reconnaissance	
ITEM	LOCATION AND DESCRIPTION
Storm water or surface-water drainage system having any abnormal accumulation of petroleum or chemical run-off or foreign materials, any unusual blockage of the storm-water control system	None observed
Any stained catch basins, drip pads, or sumps	None observed
Visual indication of Herbicides & Pesticides use to pose environmental concern	None observed
Visual evidence of leak or contamination from septic systems or Cesspools	None observed
Wells (any irrigation wells, injection wells, abandoned wells, groundwater-monitoring wells, dry wells, septic wells, oil wells, gas wells, domestic water wells, vapor wells or other-monitoring wells)	Yes
Railroad tracks or spurs	None observed
Visual evidence of improper handling/disposal or solid wastes	None observed
Other visual evidence of spills, leakage, staining, corrosion, soil/groundwater contamination	None observed
Dry-cleaning operation on site	None observed

3.3 *Detailed Description of Any Reconnaissance Items of Concern*

The subject property operates an auto repair facility which was found to have containers of new motor oil and coolant. The subject site also generates used motor oil and coolant. Located on the southwest corner of the subject property was evidence of a previous underground storage tank (UST). The site has historically had two USTs in the subsurface (see Section 5.4, Local Agency Records for further explanation). During the site inspection the property owner indicated multiple groundwater monitoring wells were advanced during a previous Phase II investigation. After extensive field reconnaissance, ODIC did not observe any previous monitoring wells.

Aboveground automotive waste fluids (waste oil, lubricants, motor oil) containers were observed inside the subject building's service area. Secondary containments were not present. Additionally, minor oil staining was observed on the concrete surfaces but the staining appeared to be limited to the surfaces in nature. Overall, housekeeping practices appeared to be sound and no direct conduits to the surface were observed in the vicinity of the containers. Most of the area is paved with asphalt and concrete surfaces, and there is visual evidence of minor staining sporadically, and historical use of auto body-work on the subject property was found according to historical records.

There are five hydraulic hoists and three hoists presently inside the service garage and associated underground holding containers for hydraulic fluid. ODIC observed no significant cracks or deterioration on the floor around the lift cylinders, and there was no evidence of spill or release of suspected hydraulic oil.

No RECs (Recognized Environmental Conditions) were found during site reconnaissance.

3.4 BUSINESS ENVIRONMENTAL RISK

Business Environmental Risk is defined as a risk, which can have material environmental impact, or environmentally driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to the issues requiring investigation. Activity and Use Restriction arising from Business Environmental Risk or Compliance Violation is defined as restrictions on the use of, or access to, a site/facility to (1) reduce or eliminate exposure to hazardous substance onsite, or (2) prevent activities that could interfere with a response action either as Engineering Controls or Institutional Controls. ODIC also searched for compliance records, permits and plans, etc. in relation to the subject business operation in the past and presence, which includes but not limited to, Environmental Permits, Equipment Operation Permits, NPDES, Hazardous Material/Waste Inventory or Management Plans, etc., Non-Compliance, Violation, Notices, Correspondences, Community Right-to-Know Plan, Health & Safety Plan, IIPP, SPCC, MSDS, Waste Ticket, Generator ID, etc.

Waste manifests, waste recycling receipts and business licenses were observed and reviewed at the subject property. All documents appear to be up to date and accurate.

3.5 NON-CERCLA ITEMS

The following table summarizes issues on which the survey of interior areas of the Subject Property focused:

NON-CERCLA ITEMS	
ITEM	LOCATION AND DESCRIPTION
Suspicious asbestos-containing materials in damaged condition if the structure is built prior to 1978	Given the age of the subject building (pre-1978), it is possible that asbestos-containing construction materials exist on-site. While none of these materials were observed in damaged condition, any renovation or demolition activities on-site should be accompanied by an asbestos abatement program by a licensed contractor to reduce the risks posed by exposure to asbestos.
Suspicious lead-based paint in damaged condition if the structure is built prior to 1978	Given the age of the subject building (pre-1978), it is possible that lead-based paint exists on-site. However, no flaking or peeling of paint was observed during site reconnaissance.
Lead in drinking water	Not applicable
Radon gas concern	Not applicable
Visual evidence of Urea Formaldehyde	Not applicable
Suspicious potential PCB-oil concern with hydraulic equipment, ballasts, transformers, etc.	N/A
Wetland, creeks, swale, pits, ponds, lagoons, or any other water bodies	Not applicable
Visual evidence of mold problems from wet areas, roof leaks, moisture around air conditioning or plumbing units	No staining or obvious indications of mold or significant water intrusion were noted.
Air quality problems (unusual smells, obnoxious odors, or visual emissions, air emission stacks)	Not applicable
Is the property under flood zone (Federal Emergency Management Agency Flood Insurance Rate Map)	Not applicable

DRAFT

NON-CERCLA ITEMS	
ITEM	LOCATION AND DESCRIPTION
Regulatory compliance, Cultural and historical resources, Industrial hygiene, Health and safety, Ecological resources, Endangered species,	Not applicable No implication is intended as to the relative importance of inquiry into such non-scope considerations, and this list of non-scope considerations is not intended to be all-inclusive.

3.5.1 Asbestos-Containing Material (ACM)

The use of asbestos in many building products was banned by the U.S. Environmental Protection Agency (EPA) by the late 1970s. In 1989, EPA issued a ruling prohibiting the manufacturing, importation, processing, and distribution of most asbestos containing products. This rule, known as the Ban & Phase-Out Rule, would have effectively banned the use of nearly 95% of all asbestos products used in the United States. However, the U.S. 5th Circuit Court of Appeals vacated and remanded most of the Ban and Phase Out Rule in October 1991. Due to this court decision, many asbestos containing product categories not previously banned (prior to 1989) may still be in use today.

Asbestos-containing material (ACM) represents a concern when it is subject to damage that results in the release of fibers. Friable ACM, which can be crumbled by hand pressure and is therefore susceptible to damage, is of particular concern. Non-friable ACM is a potential concern if it is damaged by maintenance work, demolition or other activities.

Asbestos for commercial use was banned by federal government in 1978. In general, although asbestos-containing materials may be present in the building materials, so long as they would be in an undisturbed state without disturbances or dismantlement, such ACM's do not pose an immediate health risk to building occupants. Local Building & Safety Department and appropriate Air Quality Management District (AQMD) require all possible asbestos-containing materials (ACM's) to be identified and removed in the case of renovation or construction of existing structure which might disturb or dismantle the suspicious ACM's.

If it is found that asbestos is contained within subject building materials through comprehensive asbestos survey, the implementation of an Asbestos Operations and Maintenance Program shall be developed, in order to ensure the safety of occupants who may be exposed to potential asbestos hazards.

An AHERA Certified Inspector or a State Certified Asbestos Consultant can perform the asbestos survey involving bulk sampling and analysis at NIST/NVLAP accredited laboratory using Polarized Light Microscopy with Dispersion Station (PLM/DS) in accordance with the Environmental Protection Agency (EPA) "Interim Method of the Determination of Asbestos in Bulk Insulation Samples" (EPA-600-M4-82-020).

Asbestos-containing material (ACM) represents a concern when it is subject to damage that results in the release of fibers. Friable ACM, which can be crumbled by hand pressure and is therefore susceptible to damage, is of particular concern. Non-friable ACM is a potential concern if it is damaged by maintenance work, demolition or other activities.

Prior to demolition of the subject building, asbestos survey and abatement of identified ACMs prior to demolition shall be conducted in accordance with AQMD Rule 1403 and demolition codes of regulation.

Based upon non-residential use of the Subject Property, ODIC is not contracted to perform ACM survey at the subject property, thus it is beyond the scope of the service included in this report

DRAFT

3.5.2 Lead-Based Paint (LBP)

In 1978, the federal government banned the use of lead-based paint in residential applications; however, usage in general industry continued at a decreased rate to the present. Due to the dangers of lead poisoning, the Consumer Product Safety Commission banned the sale of lead-based paint (LBP), defined as containing more than 0.06% lead by weight, to consumers, and the use of LBP in residences and other areas where consumers have direct access to painted surfaces. Effective June 3, 1993, the Lead in Construction Standard codified in 29 CFR (Code of Federal Regulations) 1926.62 applies to sources or potential sources of lead exposure present in an "employment-related" context. Federal regulations specify that lead paint hazards must be abated in residential buildings occupied by children under the age six.

The trigger mechanism for application of the standard is an activity that, by its inherent nature, may cause exposure to lead. Therefore, within the context of regulatory compliance for OSHA (Occupation Safety and Health Agency), the subject property did not appear to require further response to suspect lead-based paint as no on-site activity by its inherent nature would cause exposure to lead.

Lead-based paint presents a hazard through inhalation or ingestion of paint chips or vapor fumes. The greatest cumulative health threat is to young children, and for this reason the Department of Housing and Urban Development (HUD) has promulgated lead standards and survey requirements for buildings affected by HUD funding. This HUD regulation represents the only federal requirement for lead-based paint, hazard management applicable to privately owned structures. Based upon non-residential use of the Subject Property, ODIC is not contracted to perform LBP survey at the subject property, thus it is beyond the scope of the service included in this report

3.5.3 Lead in Drinking Water

Lead has historically been used in pipes, solder, and brass fixtures used in water distribution systems and plumbing material. In 1986, EPA banned the use of lead at concentrations exceeding 0.2% lead in solder and 8% lead in other plumbing material. Based upon non-residential use of the Subject Property, ODIC is not contracted to perform the testing of lead content in water at the subject property, this it is beyond the scope of the service included in this report.

3.5.4 Radon

Radon is a naturally occurring, colorless and odorless radioactive gas that is generated primarily in granitic rocks. The United States Surgeon General has published information that radon is a major cause of lung cancer. Radon usually enters a building through openings in the foundation, and therefore is a potential health concern to occupants of the lowest level of a building with inadequate ventilation. Radon sources can be found from earth and rock beneath building structures, well water, and building materials themselves. Though there is no immediate health effect, it is believed to account for approximately 10% of lung cancer deaths in the United States. Estimated national average is 1.5 picocuries per liter of air, however, levels as high as 200 picocuries per liter in some commercial buildings can be found. USEPA and State Department of Health Services' Radon Survey Interim Results report shows different U.S. regions according to general geological and climate information.

If a property region reportedly has radon concentration below 4 picocuries per liter of air in 99.5% of homes within the region, then, it is not likely impacted by the presence of radon gas, considering EPA action limit of 4 picocuries per liter of air volume. However, when your premises are tested for radon level and have high level of radon reading, seek proper measures such as increase in ventilation, installation of heat exchanger or heat recovery ventilator, or sealing of cracks and other openings in basement floor. Usual methods of radon testing involve charcoal canisters at HVAC systems or lowest livable level of the subject buildings. Based upon non-residential use of the Subject Property, ODIC is not contracted to perform Radon testing at the subject property, this it is beyond the scope of the service included in this report.

3.5.5 Potential Impact of Urea Formaldehyde

Formaldehyde, by itself, or in combination with other chemicals, serves a number of purposes in manufactured products. It had been widely used to add permanent press qualities to clothing and draperies, as a component of glues and adhesives, and as a preservative in some paints and coating products. In commercial buildings, the most significant sources of formaldehyde are pressed wood products made using adhesives that contain urea-formaldehyde (UF) resins, such as particleboard, hardwood plywood paneling, medium density fiberboard. As a colorless, pungent-smelling gas, Formaldehydes can cause sensations in the mucous membrane and difficulty in breathing which could lead to asthmatic attack.

Newly installed UF foam insulation often releases the gas-phase UF for six to twelve months. Such volatilized gases can concentrate in the internal air of a building. No evidence of UF foam insulation was observed during the subject property reconnaissance. The potential for UF on the site is presumed low. ODIC is not contracted to perform the testing of formaldehyde level on the subject property, thus the delineation of its level is beyond the scope of the service included in this report.

3.5.6 Polychlorinated Biphenyls (PCBs) Equipment

Prior to 1978, PCBs were commonly used in dielectric fluids in transformers, capacitors, and light ballasts due to their desirable thermal characteristics, and hydraulic fluid compactor. Due to their demonstrated toxicity and persistence in the environment, PCB manufacturing in the United States was discontinued. By 1985, the US EPA required that commercial property owners with transformers containing more than 500 ppm PCBs must register the transformer with the local fire department, provide exterior labeling, and remove combustible materials within 5 meters (40 CFR 760.30). The US EPA has three different categories for PCB-containing transformers such as non-PCB containing transformer, if less than 50 ppm PCB, PCB-contaminated transformer, if between 50 and 499 ppm of PCB, and it must conform to the US EPA Fire Rule for disposal, and PCB-transformer, if greater than 500 ppm of PCB.

No PCB-containing light ballasts were inspected, which operate fluorescent light fixtures. Separate survey of PCB's on existing light ballasts can only determine the content, unless such ballasts contained in the fluorescent light fixtures are labeled with "no PCB". Prior to construction or any disturbances to the existing light fixtures, PCB-ballasts survey has to be performed for any building structure constructed prior to 1978, and identified PCB-ballasts shall properly be disposed of by incineration or recycled within authorized facilities. ODIC is not contracted to perform the testing of PCB contents in suspicious fixtures and equipments on the subject property, thus the delineation of its level is beyond the scope of the service included in this report.

3.5.7 Pits, Ponds, Lagoons

No visible evidence of wetlands such as pits, ponds, lagoons, or any other water bodies were observed within the subject property's boundary lines.

Wetlands identification of the property is not part of an ASTM 1527-05 Phase I. ODIC is not contracted to perform the identification of wetlands on the subject property, thus the delineation of its level is beyond the scope of the service included in this report. However, wetlands on the property may reduce the allowable footprint that could be developed, which significantly changes the economics of the project. Wetlands are lands where saturation with water is the dominant factor determining the nature of soil development and the types of plants and animal communities living in the soil and on its surface. Wetlands can be further defined through classification according to the length of time that an area is inundated or saturated by water, and the type of plants and animals an area supports. There are five major wetland classifications: marine, estuarine, lacustrine, riverine, and plaustrine. Marine and estuarine wetlands are associated with the ocean and include coastal wetlands, such as tidal marshes. Lacustrine wetlands are associated with lakes, while riverine wetlands are found along rivers and streams. Plaustrine wetlands may be isolated or connected wet areas and include marshes, swamps, vernal pools, and bogs.

Pits, ponds and lagoons are often associated with the disposal of solid and liquid wastes, which may include hazardous materials. The Clean Water Act (1972), Section 404, establishes federal authority to regulate activities in

wetlands, and US Department of Fish and Game mapping resources are often used for geographic wetland identification.

3.5.8 Mold (Fungi, Bacteria)

The presence of mold and mildew in residential and commercial buildings is causing a surge of interest amongst building owners, architects, engineers and contractors regarding its source and consequences. In general, mold is a subset of the fungi family. Fungi are common and found in most ecosystems. Fungi is needed to help recycle organic material to sustain plant and animal life. In order to reproduce, mold release tiny spores into the air, which eventually attach onto surfaces favorable for growth. A class of fungi, molds have been found to cause a variety of health problems in humans, including allergic, toxicological, and infectious responses. Molds are decomposers of organic materials, and thrive in humid environments, and produce spores to reproduce as plants produce seeds. When mold spores land on a damp spot indoor, they may begin growing and digesting whatever they are growing on in order to survive. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problems remain undiscovered or not addressed.

Interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation and carpeting often play host to such growth. Moisture control is often the key to mold control, since molds need both food and water to survive.

Molds need three things to grow and thrive: Organic materials (food) such as wood, cloth, leather, carpets, or dust, Temperatures between 40 degrees and 100 degrees F. Moisture. If any of these three conditions are not present, a mold colony will become dormant. A dormant colony will become reactivated if favorable conditions return. Often molds release compound gases that create the common "musty" smell associated with mold.

Moisture is the one criterion that must be controlled in order to prevent, or stop, mold growth in interior or living environments. Aside from roof and drainage leaks, and leaky plumbing, there are numerous sources of moisture related to water vapor already in the air (relative humidity). Tubs/showers, cooking, plants, dishwashing, humidifiers and outdoor humid air all contribute moisture that can lead to condensation on, or within, wall surfaces, at windows or at air supply registers. If a must door exists within an area, there is a good chance that mold is present.

As mold becomes a more prevalent issue, building owners will need to stay informed on the subject. There are dozens of Internet websites geared to the topic, and increased litigation in this area is also fueling increased interest. With any new trend there often is misinformation, incorrect conclusions, and conflicting information. Those involved in the building industry should consider the source and weight of information carefully before drawing conclusions and making decisions.

Laboratory test and sampling by qualified industrial hygienist for air & wipe testing can only determine the environmental site conditions for various species of fungi such as Aspergillus, Cladosporium, Stachybotris and other mycotoxyns, and bacteria families such as Legionella, etc. Mold assessment or sampling of the property is not part of an ASTM 1527-05 Phase I. ODIC is not contracted to perform the identification of mold hazards on the subject property, thus the delineation of its level is beyond the scope of the service included in this report.

3.5.9 Flood Zone

ODIC is not contracted to search flood map to identify whether the subject property is located within 50-year, 100-year flood zone, within the scope of this environmental assessment.

3.5.10 Other Non-Scope Considerations

ODIC is not contracted to research the following non-scope considerations, within the scope of this environmental assessment. No implication is intended as to the relative importance of inquiry into such non-scope considerations, and this list of non-scope considerations is not intended to be all-inclusive:

Regulatory compliance, Cultural and historical resources, Industrial hygiene, Health and safety, Ecological resources, Endangered species.

3.6 ADJACENT PROPERTIES

For the scope of this assessment, properties are defined and categorized based upon their physical proximity to the subject property. An adjoining property is any real estate property whose border is contiguous or partially contiguous with the subject properties, or that would be if the properties were not separated by a roadway, street, public thoroughfare, river, or stream.

Adjacent Properties	
ITEM	
Northwest	Commercial building, followed by Pennsylvania Ave.
Southwest	Immediately by Lathrop St., followed by parking lot and commercial building
Northeast	Immediately by Main St., followed by residential
Southeast	Immediately by Elm St., followed by auto repair facility

Visual reconnaissance of the adjacent properties did not reveal evidence of Recognized Environmental Conditions (RECs). No large quantities of hazardous materials were observed being stored in an improper manner or otherwise impacting the ground surface. No equipment or machinery of environmental concern, i.e. wastewater treatment units/systems or underground storage tanks were observed in a dysfunctional state and no heavy manufacturing processes were taking place. Beyond visual reconnaissance, ODIC relies on a search of governmental agency files and databases for warning of any potential concerns related to adjoining and semi-adjoining properties. Please see Section 5.0, Regulatory Agency Search, for further information.

3.7 PHYSICAL SETTING

TOPOGRAPHY & HYDROGEOLOGY

The subject property's physical location was researched employing a United States Geological Survey (USGS) 7.5 Minute Topographic Quadrangle (Quad) Map relevant to the subject property. The USGS 7.5 Minute Quad Map has an approximate scale of 1 inch to 2,000 feet, and shows physical features with environmental significance such as wetlands, water bodies, roadways, mines, and buildings.

The physical and natural features illustrated on the Quad Map served as areas of visual emphasis when conducting the site inspection of the subject property. The USGS 7.5 Minute Quad Map was used as the only Standard Physical Setting Source, and is sufficient as a single reference.

The Subject Quad Map shows no physical features that may have environmentally impacted the subject property. The subject property and general area are identified as urban developed. No mines, wells, wetlands, or aboveground tanks were mapped in the general area of the subject property. The elevation of the site is approximately 16 feet above mean sea level with a gradual down-slope toward the north north-east.

Dominant soil composition in the general area of the subject property is characterized as soil component name Urban Land with a variable soil surface texture, Class D, very slow infiltration rates.

According to records reviewed from SMCDHS, groundwater on site was measured at depths of 7.74 to 10.37 feet bgs during subsurface investigation activities conducted at the site in 1994 and 1995. Groundwater flow direction data was not available for the subject site, however, is suspected to flow to the north. A site located at 1700 Middlefield (approximately xx feet to the northwest, reports groundwater flow direction to the northeast.

DRAFT

While groundwater flow direction at the subject property cannot be confirmed without survey measurement of static groundwater level at triangular points, it is expected to flow in the direction of surface topographical contour, or toward the wetland or nearest water body or discharge basin (percolation channel). It is important to note that groundwater flow direction can be influenced locally and regionally by the present of local wetland features, surface topography, recharge and discharge areas, horizontal and vertical inconsistencies in the types and location of subsurface soils, and proximity to water pumping wells. Depth and gradient of the water table can change seasonally in response to variation in precipitation and recharge, and over time, in response to urban development such as storm water controls, impervious surfaces, pumping wells, cleanup activities, dewatering, seawater intrusion barrier projects near the coast, etc.

4.0 SUBJECT PROPERTY AND VICINITY HISTORY

4.1 HISTORICAL RECORD SEARCH RESOURCES

Historical Records Search in conformance with the scope and limitations of ASTM Standard Practice E 1527-05 was conducted for the Property. All *obvious* uses of the *property* shall be identified from the present, back to the *property's* first developed use, or back to 1940, whichever is earlier.

HISTORICAL RECORD SEARCH RESOURCES	
ITEM	REFERENCE SOURCE
Previous Environmental Reports	Various reports from SEMCO Environmental Contractors & General Engineering with dates ranging from 2/2/94 through 6/10/94, several reports from Applied Science & Engineering with dates ranging from March 30, 1994 through June 2, 1995, Superior Precision Analytical on 2/24/94 and Priority Environmental Labs on 4/12/95.
Sanborn Fire Insurance Maps	1884 through 1968
Historical Aerial Photographs	The EDR Aerial Photo Decade Package
Historical City Directories	1991 through 2006
Building/Planning Department Zoning/Land Use Records	Redwood City Building and Safety Department
Recorded Land Title Records	N/A
Historical Topographical Maps	TerraServer via USGS
Oil & Gas Maps	Department of Conservation, Oil, Gas & Geothermal Resources, corresponding Wildcat and District Maps for the subject and immediate vicinity
Interviews	Mr. Steve Brugman, Owner/Operator, December 23, 2006
Property Tax Files	N/A
Other Historical Records	N/A

4.2 PREVIOUS ENVIRONMENTAL REPORTS

ODIC review of records obtained from the County of San Mateo Department of Health Services (SMCDHS) indicated that on January 14, 1994, a 1,000-gallon waste oil UST was removed from the site. During the excavation process, a second 1,000-gallon UST was discovered and determined to have contained gasoline. Both tanks were single walled with the waste oil tank exhibiting holes. A solvent odor was noted in the air and the soil beneath the tank was stained. The gasoline tank did not have any holes, odors or staining. The two tanks were in separate excavations and one soil sample was taken from each end of the tank in both excavations. Samples were returned as non detect for THP-g, O&G and BTEX with the exception of one sample from the waste oil UST returning with a result of 810 ppm of TPH-d.

In February of 1994, the waste oil tank pit was over excavated to approximately 10 feet bgs. One soil sample was taken at 8 feet bgs on the west wall with results of less than 1 ppm of TPH-g, less than 10 ppm of TPH-g, less than 50 ppm of oil & grease (O&G), non-detect for halogenated volatile organic compounds and less than 0.005ppm for BTEX. Groundwater was encountered at 9.5 feet bgs; the pit was partially pumped and a water sample was obtained. Due to contractor error, the pit water sample was only analyzed for oil & grease with a concentration of 9,000 ppb. The pump was repaired, and the pit was pumped at least two more times prior to sampling the re-charge with results of less than 50 ppb TPH-g, less than 0.5 ppb BTEX, 530 ppb TPH-d , less than 5,000 ppb O&G, and non-detect for halogenated volatile organic compounds. The diesel was noted by the lab as non-typical diesel.

In May of 1994, a groundwater monitoring well (MW-1) was installed in the area of the former waste oil UST, and monitored for four consecutive quarters with no contaminants detected.

In August of 1994, a hydraulic lift was removed from the site. The pit was excavated to groundwater at 12 feet bgs. Soil samples were collected and analyzed for O&G by method 418.1, with a grab water sample also taken. A saw-cut PVC pipe was installed in the excavation, backfilled with pea gravel and named as MW-2. O&G were detected at levels ranging from 520 ppm to 12,000 ppm in soils with water samples ranging from 1,500 to 1,700 ppb. An estimated 2.5 cubic yards of excavated soil contaminated with approximately 1 gallon of hydraulic oil remained in place at the site.

In February of 1995, MW-1 was analyzed for kerosene, diesel and motor oil with detection limits of 50, 50, and 0.5 ppb with a non detect result. In May of 1995, MW-1 was sampled for O&G with a non-detect result. The low levels of O&G in MW-2 were deemed not to pose a threat to human health or the environment. As there is not a perceptible gradient between MW-1 and MW-2, and since no O&G was found in MW-1, little potential for lateral migration from MW-2 was noted, and the consultant recommended closure. A letter from SMCDHS, dated June 21, 1995, stating formal closure for the subject property was granted.

4.3 *Fire Insurance Maps*

Historical Sanborn Fire Insurance Maps

Date	Description
1884	The property was not depicted on this map.
1891	The property appeared improved with an irregularly shaped dwelling in the southeastern portion with an unlabeled building to the northwest. A dwelling, wood shed and water tank occupied the adjacent property to the south. Other adjacent parcels were not depicted on this map.
1907	The property appeared divided into four parcels, three of which were rectangular and one L-shaped rectangular parcels. The westerly parcel was improved with a rectangular dwelling and outbuilding, followed by an irregularly-shaped dwelling and outbuilding on the second parcel followed by and outbuilding on the L-shaped parcel and an irregularly-shaped dwelling on the easternmost parcel. The northerly adjacent parcel was occupied by an irregularly-shaped building labeled as Cullen Company Grain Warehouse. Other adjacent parcels were not depicted on this map.
1919	The property was divided into four rectangular parcels. A rectangular dwelling and outbuilding occupied the easterly portion, followed by an irregularly-shaped dwelling and outbuilding, a dwelling on the southerly portion of the westerly parcel with an outbuilding to the north of it. The adjacent parcel to the north was labeled feed and fuel, while the parcels to the south were vacant and occupied by a dwelling with detached garage. Other adjacent parcels were not depicted on this map.
1950	No structures were depicted on the property. The parcels to the south were vacant and improved with a dwelling, detached garage and out building. of a different configuration than the previous map. The northerly adjacent parcel was labeled as Ridgeway Feed and Fuel with a feed and grain warehouse and wood and coal storage area. Redwood Creek was to the west of the site.
1968	The property was occupied by several structures labeled as spray painting, auto repair, parking and store. Several stores occupied the adjacent parcel to the south, while the parcel to the north was unoccupied.

4.4 HISTORIC AERIAL PHOTOGRAPHS

Historical Aerial Photographs		
DATE	SOURCE	DESCRIPTION
1943	EDR	The property appeared improved with several rectangular buildings with a rectangular building to the north, several buildings to the south and vacant land to the east and west. Outlying areas appeared improved with a mix of commercial and residential development.
1956	EDR	Remained unchanged in general.
1965	EDR	The property appeared improved with a large rectangular building in the southeast corner, followed by several other buildings to the west. The northerly and easterly adjacent parcels appeared as vacant and undeveloped. Outlying areas remained unchanged in general.
1974	EDR	The property appeared improved with two rectangular structures similar to the current buildings on-site. Outlying and adjacent parcels remained unchanged in general with the exception of a rectangular building adjacent to the north.
1982	EDR	Remained unchanged in general.
1993	EDR	Remained unchanged in general.
1998	EDR	Remained unchanged in general.

4.5 CITY DIRECTORIES

Business directories including city, cross-reference and telephone directories were reviewed, if available, at approximately five-year intervals for the years spanning 1991 through 2006. These years are not necessarily inclusive. A summary of the information obtained is provided in the text below.

Subject Property		
YEAR	BUSINESS LISTING	SOURCE
1991	No Return	Haines Criss-Cross Directory
1996-2006	Chub's Auto Repair	Haines Criss-Cross Directory

ODIC review of city directory listings for adjoining properties showed no listings likely to have any adverse affect to the environmental subsurface at the subject property.

4.6 BUILDING RECORDS / PROPERTY PROFILE

Building & Planning Department Records		
DATE	DESCRIPTION	OWNER
07/21/52	Garage Building	Russ Denny
03/15/55	Addition to office building	R. Denny
01/06/59	Addition and alteration to existing commercial building	H. H. Wadler
N/A	Application to architectural committee, City of Redwood City	Cambridge Auto Repair & Sales
07/20/73	Letter to Mr. Burke regarding business license application	N/A
07/08/86	Re-roof	Chub's Auto Repair

4.7 CHAIN OF TITLE / PRELIMINARY TITLE REPORT

No Preliminary Title Reports or Historical Chain of Title were reviewed for this assessment. ODIC's scope of investigation as well as contractual agreement between ODIC and the Client excludes obtaining and reviewing a Preliminary Title Reports or Historical Chain of Title.

4.8 HISTORICAL TOPOGRAPHICAL MAPS

ODIC did not use the extensive series of Historical USGS 7.5 Topographical Maps in this site assessment because other records were obtained, which are considered sufficient to meet ASTM E1527-05 standard guidelines. However, the most recently photo-revised USGS Topographical Map (via USGS / Terra Server) for the subject property did not show any features of environmental concern.

4.9 OIL & GAS MAPS

ODIC used California Department of Conservation, Oil, Gas & Geothermal Resources, corresponding Wildcat and District Maps for the subject and immediate vicinity, but found no active or abandoned oil & gas well on the subject property or immediate vicinity.

4.10 INTERVIEWS

Mr. Steve Brugman was interviewed on December 23rd 2006. He stated that he has operated an auto repair facility at the property since approximately 1995, and that it was previously used as an auto repair facility before he purchased it. Additionally, he said that he is aware of a previous Phase II conducted after a standard underground fuel tank removal, however he does not have this report and does not know where it is. Mr. Brugman concluded the interview by stating that he was not aware of any environmental concerns pertaining to the subject property.

4.11 OTHER HISTORICAL RECORDS

No other historical records were used.

4.12 SUMMARY OF HISTORICAL PROPERTY USE AND DATA GAP

Summary of Historical Property Use

According to Sanborn Fire Insurance Maps the property appeared improved with dwellings in 1891, 1907, 1919. In 1950 no structures were depicted on site, while in 1968 the property was occupied by several buildings labeled as spray painting and auto repair. According to building records obtained from the City of Redwood City, permits for a garage building were issued in 1952 with an addition to the office building in 1955 and various other permits through 1986. Mr. Steve Brugman, owner, stated that he has occupied and operated an auto repair facility on the property since 1995 and that the property was previously used as an auto repair facility. City directories showed listings as Chub's Auto repair from 1996 through 2006. Aerial photographs showed improvements on the property as early as 1943 with buildings similar to the current buildings in 1974.

Data Gap

ASTM E1527-05 and the US-EPA AAIs requires that the report identify and comment on significant data gaps that affect the ability of the environmental professional to identify recognized environmental concerns.

DRAFT

The largest data gap in this research was from 1919 to 1943. Other gaps ranged from two to sixteen years. However, ODIC does not believe that any gaps in the information reviewed would affect our ability to identify recognized environmental concerns.

DRAFT

5.0 REGULATORY RECORD SEARCH

5.1 PROCEDURE

The most current databases sources maintained by state and federal offices were searched and provided by governmental record search database suppliers. Such databases were searched for properties with reported environmental issues within radii specified by ASTM Standard E 1527-05, either by using geocoding information that identified the coordinates of the properties in the databases or by checking the street addresses of practically reviewable non-geocoded "orphan" properties within the same zip code. The database report is included as an appendix to this *Report*. The database report may identify a certain "orphan sites" which are those facilities that could not be mapped or geocoded due to inadequate address information. We attempted to locate the facilities via various mapping programs, but cannot be held liable for not correctly locating these orphan sites to determine their impact to the subject property.

5.2 FEDERAL AGENCY RECORDS

FEDERAL AGENCY RECORDS		
SOURCE	CRITERIA FOR MAXIMUM SEARCH DISTANCE (MILES)	NO. OF PROPERTIES WITHIN SEARCH DISTANCE
NPL	1.0	0
De-listed NPL	0.5	0
CERCLIS	0.5	1
CERCLIS-NFRAP	0.5	3
RCRA-CORRACTS	1.0	1
RCRA-TSDF	0.5	0
RCRA-Generator	Subject Property and Adjoining Properties	1
ERNS	Subject Property Only	0
Federal IC/EC Registries	Subject Property Only	0
Other Federal List	Subject Property Only	0

National Priority List (NPL) Facilities
The NPL Report, also known as the Superfund List, is an EPA listing of the nation's worst uncontrolled or abandoned hazardous waste facilities. Listing as a Superfund Site is primarily based on a score that the facility receives from the EPA's Hazard Ranking System. These facilities are targeted for possible long-term remedial action under the Superfund Act. Such prioritized sites with significant risk to human health and the environment receive remedial funding under the Comprehensive Environmental Response Conservation and Liability Act (CERCLA). The *NPL* or *National Priorities List* is a list compiled by EPA pursuant to CERCLA, 42 U.S.C. §9605(a)(8)(B), of properties with the highest priority for cleanup pursuant to EPA's Hazard Ranking System. 40 C.F.R. Part 300 can be referenced. (*http://www.epa.gov/superfund/sites/npl/npl.htm*)

De-Listed NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Comprehensive Environmental Response, Compensation & Liability Information System (CERCLIS) and CERCLIS - No Further Remedial Action Planned (CERCLIS-NFRAP) Sites
The CERCLIS is the EPA compilation of sites for which the EPA has evidence of, or is investigating, a release or threatened release, of hazardous substances which may be subject to review in accordance with the terms and

conditions of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (Superfund Act). Sites to be included are identified primarily by the reporting requirements of hazardous substances including degreasing solvents, oily waste, acid solutions, alkaline solutions, and heavy metal solutions, Treatment, Storage and Disposal (TSD) facilities and releases larger than specific Reportable Quantities (RQ), established by EPA. There is one CERCLIS site within 0.5 miles of the subject property.

Lower Elevation	Address	Dist / Dir	Map ID	Page
DUOLITE INTERNATIONAL	*800 CHESTNUT ST*	*1/4 - 1/2ENE*	*AF120*	*151*

There are 3 CERC-NFRAP sites within 0.5 miles of the subject property,

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
PRICE COMPANY	2110 MIDDLEFIELD RD	1/4 - 1/2ESE	122	160
REDWOOD FOOD PACKING CO	2200 MIDDLEFIELD RD	1/4 - 1/2ESE	AI128	169
Lower Elevation	**Address**	**Dist / Dir**	**Map ID**	**Page**
REDWOOD GENERAL TIRE SERVICE	*1630 BROADWAY*	*1/4 - 1/2NE*	*AJ132*	*174*

The property at 800 Chestnut had a release of volatile organic compounds to groundwater, with containment of groundwater under control. None of the sites listed above in researched database are suspected to have an adverse environmental impact on the Subject Property based on one or more of the following rationale: a) their horizontal distance from the Subject Property; b) their down/cross-gradient location with respect to the assumed shallow groundwater flow direction; c) the nature of the reported release (e.g., contamination confined only within soil media, absence of groundwater impact, lack of transporting media such as groundwater); and/or d) their regulatory status (e.g., case closed, remediation action underway).

RCRA-CORRACTS: Corrective Action Tracking System (CORRACTS)
CORRACTS is a list of facilities that are found to have had hazardous waste releases and require Resource Conservation and Recovery Act (RCRA) corrective action activity, which can range from site investigations to remediation. This database is also known as RCRA Violators or Corrective Action Report (CORRACTS). There is 1 CORRACTS site within 1 mile of the subject property.

Lower Elevation	Address	Dist / Dir	Map ID	Page
DUOLITE INTERNATIONAL	*800 CHESTNUT ST*	*1/4 - 1/2ENE*	*AF120*	*151*

The property at 800 Chestnut had a release of volatile organic compounds to groundwater, with containment of groundwater under control. None of the sites listed above in researched database are suspected to have an adverse environmental impact on the Subject Property based on one or more of the following rationale: a) their horizontal distance from the Subject Property; b) their down/cross-gradient location with respect to the assumed shallow groundwater flow direction; c) the nature of the reported release (e.g., contamination confined only within soil media, absence of groundwater impact, lack of transporting media such as groundwater); and/or d) their regulatory status (e.g., case closed, remediation action underway).

RCRA-TSDF: Resource Conservation and Recovery Act (RCRA) Treatment Storage Disposal Facility (TSDF)
The RCRIS report of hazardous waste generators, treatment, storage, and disposal (TSD) facilities contains information pertaining to facilities that are required to register their hazardous waste activity under the Resource Conservation and Recovery Act (RCRA).

Resource Conservation and Recovery Act (RCRA) Generator
RCRA hazardous waste generators are identified as Large Quantity Generators (LQGs), Small Quantity Generators (SQGs), or Conditionally Exempt Small Quantity Generators (CESQG). RCRA LQGs are identified as those facilities, which generate at least 1,000 kilograms (2,200 pounds) of non-acutely hazardous waste (or 1 kilogram of

acutely hazardous waste) monthly. RCRA SQGs are identified as those facilities that generate less than 1,000 kilograms of non-acutely hazardous waste monthly. The subject property is listed as RCRA-SQG.

Site	Database(s)	EPA ID
CHUBS AUTO REPAIR 1180 MAIN ST REDWOOD CITY, CA 94063	RCRA-SQG FINDS HAZNET	CAR000004721

The property is listed as RCRA-SQG, however with no violations found and is therefore unlikely to have any adverse affect to the environmental subsurface at the subject property.

Emergency Response Notification System (ERNS)
The ERNS is a national database used to collect information on reported releases of petroleum products or hazardous substances. The database contains information from spill reports made to federal authorities including the EPA, the U.S. Coast Guard, the National Response Center and the U.S. Department of Transportation. The program is a cooperative effort of the Environmental Protection Agency, the Department of Transportation Research and Special Program Administration's National Transportation System Center and the National Response Center. There are primarily five Federal statues that requires release reporting: CERCLA Section 103; the Superfund Amendments and Reauthorization Act (SARA) Title III Section 304; the Clean Water Act of 1972 (CWA) Section 311(b)(3); and the Hazardous Material Transportation Act of 1974 (HMTA) Section 1808 (b).

US Engineering Controls: Engineering Controls Sites List - A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.
Source: Environmental Protection Agency
Telephone: 703-603-8905

US Institutional Controls: Sites with Institutional Controls - A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.
Source: Environmental Protection Agency

US Brownfields: A Listing of Brownfields Sites - Included in the listing are brownfields properties addresses by Cooperative Agreement recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

State/Tribal Equivalent NPL
California AWP (Annual Work Plan previously known as Bond Expenditure Plan): The California Health & Safety code requires the California EPA to develop a site-specific expenditure plan as the basis for an appropriation of California Hazardous Substance Cleanup Bond Act of 1984 funds. The Agency is also required to update annually and report any significant adjustments to the Legislature on an ongoing basis. The plan identifies California hazardous waste sites targeted for cleanup by responsible parties, the California and the Federal Environmental Protection Agency over the next coming years.

California Bond Expenditure Plan
Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

State/Tribal Equivalent CERCLIS
State of California Office of Planning and Research (CORTESE) This database is a consolidation of information from various sources. It is maintained by the State Office of Planning and Research and lists potential and confirmed hazardous waste or substances sites. Many of the CORTESE sites are also listed as LUST due to nature of release and jurisdictional overlap of local oversight regulatory agencies. The subject property is listed as CORTESE.

Many of the CORTESE sites are also listed as LUST due to nature of release and jurisdictional overlap of local oversight regulatory agencies. Refer to The Leaking Underground Storage Tank section, unless such CORTESE sites are not addressed in LUST sections.

California Historical Abandoned Site Survey Program (CALSITES): The Historical Abandoned Site Survey (HASS) Program, formerly the California Abandoned Sites Program Information System – ASPIS, identified certain potential hazardous waste sites. The identification of these sites were generally not made via sampling and site characterization, but as a result of file searches and windshield surveys. No Further Action sites are also on the CALSITE list which have been marked for no further action by the California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) in accordance with California Health & Safety Code.

State/Tribal SWLF

SWIS (Solid Waste Information System) / SWLF (Solid Waste Landfill): Active, Closed and Inactive Landfills. SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites. As legislated under Solid Waste Management and Resource Recovery Act of 1972, each state maintains list of

certain facilities, i.e. Active solid waste disposal sites, Inactive or Closed solid waste disposal sites and Transfer facilities.

State/Tribal LUST

LEAKING UNDERGROUND STORAGE TANKS (LUSTS)

The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data comes from the California State Water Resources Control Board Leaking Underground Storage Tank Information System, pursuant to California Health & Safety Code. The subject property is listed as LUST.

According to Geotracker database research, the Hudson Property LUST site at 135 Maple St., approximately 396 feet to the west southwest of the subject, reported a release of solvents on an unspecified date which affected other groundwater. This site was reviewed by regulatory agencies and granted case closure status in October of 2002. Given this status and its cross-gradient location from the subject property with respect to assumed shallow groundwater flow, it is unlikely to have any adverse affect to the environmental subsurface at the subject property.

According to Geotracker database research, the Cooks Auto Body LUST site at 1104 Main St., approximately 468 feet to the north northwest southwest of the subject, reported a release of gasoline on an unspecified date which affected other groundwater. This site is currently undergoing assessment with regulatory agencies. However, given its cross-gradient location from the subject property with respect to assumed shallow groundwater flow, it is unlikely to have any adverse affect to the environmental subsurface at the subject property.

None of the sites listed above, other than ones described separately if environmental concern is posed, are suspected to have an adverse environmental impact on the Subject Property based on one or more of the following rationale: a) their horizontal distance from the Subject Property; b) their down/cross-gradient location with respect to the

DRAFT

assumed shallow groundwater flow direction; c) the nature of the reported release (e.g., contamination confined only within soil media, absence of groundwater impact, lack of transporting media such as groundwater); and/or d) their regulatory status (e.g., case closed, remediation action underway).

If sites are listed on the Leaking Underground Storage Tank (LUST) database with a "case closed (no further remedial actions required)" status, it shall be interpreted as "the identified contamination at such sites was mitigated to a degree that the governing agency believed that these sites do not pose apparent concern/threat to the subsurface environment of the neighboring area".

State/Tribal UST
UST: The Underground Storage Tank database contains registered USTs which are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data comes from the California State Water Resources Control Board's Hazardous Substance Storage Container Database. The subject property is listed as SWEEPS UST.

Site	Database(s)	EPA ID
CHUBS AUTO REPAIR 1180 MAIN ST REDWOOD CITY, CA 94063	RCRA-SQG FINDS HAZNET LUST Facility Status: Case Closed Cortese San Mateo Co. BI SWEEPS UST	CAR000004721

See section 5.4, Local Agency Records, for further information.

State/Tribal IC/EC Registries
California Department of Toxic Substance Control (DTSC) Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

State/Tribal Voluntary Cleanup Sites
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that California Department of Toxic Substance Control (DTSC) oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

State/Tribal Brownfield Sites
California Department of Toxic Substance Control (DTSC) Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

California State – Supplementary ASTM Database

CHMIRS (California Hazardous Materials Information Reporting System) contains information on reported hazardous material incidents, i.e., accidental releases or spills. The source is the California Office of Emergency Services.

HAZNET (HAZARDOUS WASTE INFORMATION SYSTEM)
The California Environmental Protection Agency maintains a list of facilities that issue hazardous waste manifests which are submitted without correction, and therefore may contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source of the manifest records is the California Department of Toxic Substance Control (DTSC). This database is a supplemental listing to the current ASTM standards. The subject property is listed as HAZNET.

Site	Database(s)	EPA ID
CHUBS AUTO REPAIR 1180 MAIN ST REDWOOD CITY, CA 94063	RCRA-SQG FINDS HAZNET	CAR000004721

According to EDR Radius Map Report, the subject property is listed as HAZNET for 0.65, 0.85 and 0.81 tons of unspecified organic liquid mixture for disposal by a recycler, 1 ton of other empty containers 30 gallons or more, .4170 tons of unspecified oil-containing waste for disposal by a recycler. Given off-site disposal of the above, it is unlikely to have any adverse affect to the environmental subsurface at the subject property.

CLEANERS
The California Department of Toxic Substance Control (DTSC) maintains a list of dry cleaning facilities in California. A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services. This database is a supplemental listing to the current ASTM standards.

NT (Toxic Releases): The California Regional Water Quality Control Boards or local Department of Health & Safety Services keeps track of toxic releases to the environment. These lists are known as Unauthorized Releases, Spill, Leaks, Investigation and Cleanups, Non-Tank Releases, Toxic List or similar, depending on the local agency

TPC (Toxic Pits): The Toxic Pits Cleanup Act places strict limitations on the discharge of liquid hazardous wastes into surface impoundment, toxic ponds, pits and lagoons. Regional Water Quality Control Boards are required to inspect all surface impoundments annually, in addition, every facility was required to file a Hydro-geological Assessment Report. Recent legislation allows the Department of Health Services to exempt facilities that closed on or before December 31, 1985, if no significant environmental risk is shown to remain.

SWAT (Solid Waste Assessment Test): This program requires that disposal sites with more than 50,000 cubic yards of waste provide sufficient information to the regional water quality control board to determine whether or not the site has discharged hazardous substances which will impact the environment. Site operators are required to file Solid Waste Assessment Test reports on a staggered basis. Operators submit water quality tests to the Regional Water Quality Control Board, describing surface and groundwater quality and supply; and the geology within 1 mile of the site. Air quality tests are submitted to the local Air Quality Management District or Air Pollution Control District.

Water Wells: The Groundwater Site Inventory (GWSI) database was provided by the United States Geological Survey (USGS), which contains information on over 1,000,000 wells and other groundwater which the USGS has studied, used or otherwise had reason to document through the course of research.

CA FID: The Facility Inventory Database contains active and inactive underground storage tank locations. The source is the State Water Resource Control Board.

COUNTY HMS County Department of Public Works maintains a list of facilities that generate industrial waste or have underground storage tanks (USTs). The data comes from the San Mateo County Environmental Health Services Division. The subject property is listed as San Mateo County BI: Business Inventory

Site	Database(s)	EPA ID
CHUBS AUTO REPAIR 1180 MAIN ST REDWOOD CITY, CA 94063	RCRA-SQG FINDS HAZNET LUST Facility Status: Case Closed Cortese San Mateo Co. BI SWEEPS UST	CAR000004721

According to EDR Radius Map report, the subject property is listed as San Mateo County BI for the storage of less than 500 tires, motor vehicle fuels or waste, generator and recycler of waste oil/solvent, and underground tank – general.

5.4 LOCAL AGENCY RECORDS

ODIC review of records obtained from the County of San Mateo Department of Health Services (SMCDHS) indicated that on January 14, 1994, a 1,000-gallon waste oil UST was removed from the site. During the excavation process, a second 1,000-gallon UST was discovered and determined to have contained gasoline. Both tanks were single walled with the waste oil tank exhibiting holes, a solvent odor was noted in the air and the soil beneath the tank was stained. The gasoline tank did not have any holes, odors or staining. The two tanks were in separate excavations and one soil sample was taken from each end of the tank in both excavations. Samples were returned as non detect for THP-g, O&G and BTEX with the exception of one sample from the waste oil UST returning with a result of 810 ppm of TPH-d.

In February of 1994, the waste oil tank pit was over excavated to approximately 10 feet bgs. One soil sample was taken at 8 feet bgs on the west wall with results of less than 1 ppm of TPH-g, less than 10 ppm of TPH-g, less than 50 ppm of oil & grease (O&G), non detect for halogenated volatile organic compounds and less than 0.005ppm for BTEX. Groundwater was encountered at 9.5 feet bgs; the pit was partially pumped due to pump failure and a water sample was obtained. Due to contractor error, the pit water sample was only analyzed for oil & grease with a concentration of 9,000 ppb. The pump was repaired, and the pit was pumped at least two more times prior to sampling the re-charge with results of less than 50 ppb TPH-g, less than 0.5 ppb BTEX, 530 ppb TPH-d , less than 5,000 ppb O&G, and non-detect for 8010 compounds. The diesel was noted by the lab as non-typical diesel. In May of 1994, a groundwater monitoring well (MW-1) was installed in the area of the former waste oil UST, and monitored for four consecutive quarters with no contaminants detected.

In August of 1994, a hydraulic lift was removed from the site. The pit was excavated to groundwater at 12 feet bgs. Soil samples were collected and analyzed for O&G by method 418.1, with a grab water sample also taken. A saw-cut PVC pipe was installed in the excavation, backfilled with pea gravel and named as MW-2. O&G were detected at levels ranging from 520 ppm to 12,000 ppm in soils with water samples ranging from 1,500 to 1,700 ppb. An estimated 2.5 cubic yards of soil contaminated with approximately 1 gallon of hydraulic oil remains in place at the site.

In February of 1995, MW-1 was analyzed for kerosene, diesel and motor oil with detection limits of 50, 50, and 0.5 ppb with a non detect result. In May of 1995, MW-1 was sampled for O&G with a non-detect result. The low levels

of O&G in MW-2 do not pose a threat to human health or the environment. As there is not a perceptible gradient between MW-1 and MW-2 and since no O&G was found in MW-1, little potential for lateral migration from MW-2 was noted, and the consultant recommended closure. A letter from SMCDHS, dated June 21, 1995, stating formal closure for the subject property was observed.

DRAFT

6.0 FINDINGS AND CONCLUSIONS

ODIC performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-05 of the Subject Property. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this Report.

REPORT COMPONENT	SUMMARY OF CONCLUSION
Subject Property Characteristics (Current Tenant or Property Use Concerns)	The subject property is situated on the northwest corner of Main St. and Elm St. in the City of Redwood City, CA. The property is an irregularly-shaped parcel of commercially-zoned land improved with two rectangular single-story buildings, with one building situated in the northwest portion and the other in the southeast portion of the property. A parking lot occupying the remainder of the property. Access to the property is achieved via Main Street to the northeast and Elm Street to the northwest.
Subject Property Reconnaissance	No RECs (Recognized Environmental Conditions) were found during site reconnaissance.
Historical Use of Subject Property and Vicinity	According to Sanborn Fire Insurance Maps the property appeared improved with dwellings in 1891, 1907, 1919. In 1950 no structures were depicted on site, while in 1968 the property was occupied by several buildings labeled as spray painting and auto repair. According to building records obtained from the City of Redwood City, permits for a garage building in 1952 with an addition to the office building in 1955 and various other permits through 1986. Mr. Steve Brugman, owner, stated that he has occupied and operated an auto repair facility on the property since 1995 and that the property was previously used as an auto repair facility. City directories showed listings as Chub's Auto repair from 1996 through 2006. Aerial photographs showed improvements on the property as early as 1943 with buildings similar to the current buildings in 1974.
Federal, State and Local Agency Concerns	The subject property is not listed on the following environmental regulatory database record research: NPL, CORRACTS, RCRA-TSD, CALSITES, and SWF. The property is listed as RCRA-SQG, FINDS, HAZNET, LUST, CORTESE, SWEEPS UST and San Mateo County BI. According to the EDR Radius Map report, the RCRA-SQG listing show no violations found. The HAZNET listing shows various chemical disposed of off-site by manifest and a closure letter was issued by SMCDHS for the LUST and UST related listings.
Potential Off-site Sources	No RECs (Recognized Environmental Conditions) were found during site reconnaissance.
Non-CERCLA Items	No RECs (Recognized Environmental Conditions) were found during site reconnaissance. Due to the age the building (constructed prior to 1978), interior/exterior portions of the building may contain asbestos and lead base paints. Those areas suspected of having any asbestos containing materials and lead base paints appeared to be in good condition with no fraying or deterioration. It should be noted that this assessment did not include any sampling and testing to determine if any asbestos containing materials and lead base paints are present.
Other RECs	Historic RECs were found. The subject site had a release of petroleum hydrocarbons to soil and groundwater, with case closure achieved.
Inaccessible or Un-surveyed Portions of Subject Property	Full access to the entire property was provided to ODIC, and there were no notable portions of the Subject Property excluded from the survey and field inspection.

REPORT COMPONENT	SUMMARY OF CONCLUSION
Data Gap	The User failed to provide any information requested in the AUL environmental questionnaire. Such is considered a data gap. The absence of this information may not be considered enough to warrant further investigation due to a low risk of environmental contamination at the site, however absence of research into any existing environmental liens recorded for the subject property may disqualify the user for CERCLA landowner liability protection. The largest data gap in this research was from 1919 to 1943. Other gaps ranged from two to sixteen years. However, ODIC does not believe that any gaps in the information reviewed would affect our ability to identify recognized environmental concerns.

DRAFT

7.0 RECOMMENDATIONS AND OPINIONS

Historic RECs were found. The subject site had a release of petroleum hydrocarbons to soil and groundwater, with case closure achieved. While closure was granted for the release from the former UST, impact to groundwater from petroleum hydrocarbons has been documented. However, the reported levels are low, such that there is a low risk for impact to the groundwater beyond the property boundaries, and is not expected to affect any nearby sensitive receptors.

ODIC hereby recommends no further action based on the current site condition and available public records due to a minimal risk of regulatory action related to the existing contamination at the subject property.

DRAFT

8.0 REFERENCES

During the preparation of this Report, a number of sources were contacted, many individuals interviewed, and various state, county or local municipal agencies consulted. Documentation applicable to the Subject Property in those departments and agencies was requested and reviewed when and where reasonably ascertainable, as detailed in ASTM E1527-05. Individuals listed without phone numbers were contacted in person or by e-mail. Reference sources for site-specific information, hydro-geologic setting, technical data, historical research data, environmental reports and other records used are identified throughout this Report in corresponding sections. Any additional reference sources not cited in the preceding sections in this report are to be disclosed in this section.

County of San Mateo Environmental Health UST Closure Information

DRAFT

HEALTH SERVICES AGENCY

ENVIRONMENTAL HEALTH SERVICES DIVISION

October 4, 1994

Mr. Nick Marcelli
9 Cerrito Place
Redwood City, CA 94063

SUBJECT: Closure of Underground Storage Tank, 134 Maple Street, Redwood City, CA

Dear Mr. Marcelli:

This letter confirms the closure of two underground storage tanks under San Mateo County permit number HM 063 94 at the subject site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is our position that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional, or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

Thank you for your cooperation in this matter. I may be reached at (415) 363-4565.

Sincerely,

Teresa Belasco, REHS, MPH
Hazardous Materials Specialist IV

cc: Dean Peterson, Hazardous Materials Program Manager

Tank #	Year Tank Installed	Volume of Tank (Gallons)	
1	79	1000	☒ Cathodic Protection?

☒ Single-wall or ☐ Double-wall?

Primary Containment — ☒ Steel ☐ Fiberglass ☐ Concrete ☐ Other? _____

7. Chemical Composition of Materials Currently or Previously Stored in Tank.

☒ Unleaded ☐ Super Unleaded ☐ Regular ☐ Premium ☒ Diesel ☐ Waste Oil

☐ Other? _____

8. Reason for Removal

☐ Tank leak ☐ System Upgrade ☒ Discontinued use ☐ Other? _____

9. Certification by Applicant

I hereby certify that I have read and will follow the "Procedure for the Removal of Underground Storage Tanks" printed on the attached page.

10. Name of Applicant (Owner or Owner's Representative)

Signature _____ Date 4-26-94

11. Approved Permit # _____ **Returned for Correction** _____

Inspector Luisa Blasco Date 6/1/94

DRAFT

PROCEDURE FOR THE REMOVAL OF UNDERGROUND STORAGE TANKS

1. Complete the "Application for Permit to Close Underground Hazardous Materials Storage Tank" (pages 1&2). Please complete one application per tank.

2. Contact the Local Fire and Building Agency for their policy regarding closure of underground storage tanks.

3. Submit the completed application, designated fee, written workmen's compensation insurance verification and plot plan drawing to the San Mateo County Environmental Health Services Division. The drawing should consist of an aerial view of the facility at which the tank(s) are located and should include the following information:

    a. Scale
    b. North arrow
    c. Property line
    d. Location of structures near the tank(s)
    e. Location of relevant existing equipment, including the tank(s) to be removed, associated piping, and fuel dispensers.
    f. Area roadways

    Also, submit State Water resources Control Board Part A form for the facility, and Part B form for each tank closed. These forms are available from the Environmental Health Services Division.

4. In order to determine the extent of any contamination, soil and/or water samples must be taken from the excavation pit after the tank(s) are removed. Soil samples must also be taken every twenty (20) feet along piping runs at the interface of backfill material and native soil. Soil samples will be required to be taken from the excavation spoils pile (approximately one discrete sample per 20 cubic yards). The samples must be collected by a qualified, independent third party. All samples shall be protected against contamination and/or degradation during their collection, transport, and analysis. A written analysis report, including chain of custody documentation, and sample location map with measurements including depth, must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s). This report is subject to review and must be approved in order to be recognized as valid.

5. A groundwater investigation will be required if any of the following conditions exist or if a representative of the Environmental Health Services Division deems one necessary to assure that the public health and safety is protected:

    a. Soil contamination concentrations exceeding 100 ppm total petroleum hydrocarbons (TPH) or total oil and grease (TOG) within two feet of native soil beneath the tank.

    b. Detectable concentrations of petroleum hydrocarbon are found in soil at or below the seasonable high groundwater level.

    c. Detectable levels of any petroleum hydrocarbon in soil below the tank and the soil contains layers of sand, gravel and/or other high permeability material.

    d. Ground water in excavation pit has detectable levels of any petroleum hydrocarbon. (Pit may be pumped and allowed to recharge).

    e. Site has history of leaks or tanks are in poor condition upon removal.

DRAFT

6. It must be demonstrated to a representative of the Environmental Health Services Division that residual product and any associated waste (i.e.sludge) have been removed from the interior of the tank(s) prior to purging. Documentation of proper disposal of residual product and associated waste using an Uniform Hazardous Waste Manifest (UHWM) must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

7. It must be demonstrated to a representative of the Environmental Health Services Division that tank(s) have been adequately pruged and that no explosive hazard exists at the time of tank(s) removal i.e. 10% of lower Explosive Limit (% LEL) or 5% oxygen.

8. Underground tank(s) and associated piping removed from excavations must be shipped under UHWM to a permitted treatment, storage and disposal (TSD) facility or Class I landfill Underground tanks may be cleaned using a high-pressure washer to reduce the % LEL. This process does not render these tank(s) non-hazardous and these tank(s) must be hauled under a hazardous waste manifest. Only tank(s) cleaned by a State Department of Health Services (DOHS) permitted tank cleaner may be disposed of as non-hazardous waste. Copies of all UHWM must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

9. Any piping associated with the tank(s) which is to remain underground must be flushed of all residual product and capped or sealed to the satisfaction of the Environemental Health Services Division.

10. Transported tanks must have all opening sealed, except for opening atop the tank fitted for ventilation with "T" or other device which will preclude rain entering a stored tank.

11. The Environmental Health Services Division must be notified a minimum of seven days(7) prior to commencement of work to schedule an inspection. Please note that the inspection must be confirmed with the district inspector. A representative of this office must be present at the time of removal.

12. An additional hourly fee will be charged for inspection time exceeding three hours.

13. Site safety plan must be available for review at job site.

THE ABOVE ARE GENERAL PROCEDURES-MODIFICATIONS MAY BE NECESSARY IN CERTAIN CASES. IF YOU HAVE ANY QUESTIONS, OR OTHERWISE NEED ASSISTANCE, PLEASE CALL THE SAN MATEO COUNTY ENVIRONMENTAL HEALTH SERVICES DIVISION AT (415) 363-4305.

I hereby certify that I have read and will follow the "Procedures for the Removal of Underground Storage Tanks"

THIS FORM MUST BE ACCOMPANIED BY AT LEAST (1) OR MORE PERMIT APPLICATION - FORM B, UNLESS THIS IS A CHANGE OF SITE INFORMATION ONLY.

FORM A (9-90) FOR0033A R2

DRAFT

INSTRUCTIONS FOR COMPLETING FORM "A"

GENERAL INSTRUCTIONS:

1. One FORM "A" shall be completed for all NEW PERMITS, PERMIT CHANGES or any FACILITY/SITE INFORMATION CHANGES.
2. SUBMIT ONLY ONE (1) FORM "A" for a Facility/Site, regardless of the number of tanks located at the site.
3. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
4. Please type or print clearly all requested information.
5. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Record name and address (physical location) of the underground tank(s).
   NOTE: Address MUST have a valid physical location including city, state, and zip code.
   P.O. BOX NUMBER ARE NOT ACCEPTABLE.
   Include nearest cross street and name of the operator.
2. Phone number must have an area code. If the night number is the same, write "SAME" in proper location.
3. Check the appropriate box for TYPE OF BUSINESS OWNERSHIP (ex. CORPORATION, INDIVIDUAL, etc.)
4. Check the appropriate box for TYPE OF BUSINESS.
5. If Facility/Site is located on land within an indian reservation or other indian trust lands, check the box marked "YES".
6. Indicate the NUMBER of TANKS at this SITE.
7. Record the E.P.A. ID # or write "NONE" in the space provided.

II. PROPERTY OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; if the same, write "SAME AS SITE" across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; If the same, write "SAME AS SITE" across this section. Be sure to check TANK OWNERSHIP TYPE box.

IV BOARD OF EQUALIZATION UST STORAGE FEE ACCOUNT NUMBER (MUST BE COMPLETED)

Enter your Board of Equalization (BOE) UST storage fee account number which is required before your permit application can be processed. Registration with the BOE will ensure that you will receive a quarterly storage fee return requesting the $0.0025 (6 mills) per gallon fee due on the number of gallons placed in your USTs. The BOE will code persons exempt from paying the storage fee so returns will not be sent. If you do not have an account number with the BOE or if you have any questions regarding the fee or exemptions, please call the BOE at 916-739-2582 or write to the BOE at the following address: Board of Equalization, Environmental Fees Unit, P.O. Box 942879, Sacramento, CA 94279-0001.

V. LEGAL NOTIFICATION AND BILLING ADDRESS

1. Check ONE BOX for the address that will be used for BOTH LEGAL AND BILLING NOTIFICATIONS.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the facility number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THIS APPLICATION CANNOT BE PROCESSED IF THE BOE ACCOUNT NUMBER IS NOT FILLED IN. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

A. SYSTEM TYPE: (A) (U) 1 SUCTION; A U 2 PRESSURE; A U 3 GRAVITY; A U 99 OTHER
B. CONSTRUCTION: A (U) 1 SINGLE WALL; A U 2 DOUBLE WALL; A U 3 LINED TRENCH; A U 95 UNKNOWN; A U 99 OTHER
C. MATERIAL AND CORROSION PROTECTION: A U 1 BARE STEEL; A U 2 STAINLESS STEEL; A U 3 POLYVINYL CHLORIDE (PVC); A U 4 FIBERGLASS PIPE; A U 5 ALUMINUM; A U 6 CONCRETE; A (U) 7 STEEL W/ COATING; A U 8 100% METHANOL COMPATIBLE W/FRP; A (U) 9 GALVANIZED STEEL; A (U) 10 CATHODIC PROTECTION; A U 95 UNKNOWN; A U 99 OTHER
D. LEAK DETECTION: ☐ 1 AUTOMATIC LINE LEAK DETECTOR ☐ 2 LINE TIGHTNESS TESTING ☐ 3 INTERSTITIAL MONITORING ☐ 99 OTHER None

V. TANK LEAK DETECTION

☐ 1 VISUAL CHECK ☐ 2 INVENTORY RECONCILIATION ☐ 3 VADOZE MONITORING ☐ 4 AUTOMATIC TANK GAUGING ☐ 5 GROUND WATER MONITORING ☐ 6 TANK TESTING ☐ 7 INTERSTITIAL MONITORING ☒ 91 NONE ☐ 95 UNKNOWN ☐ 99 OTHER

VI. TANK CLOSURE INFORMATION

1. ESTIMATED DATE LAST USED (MO/DAY/YR) 1990
2. ESTIMATED QUANTITY OF SUBSTANCE REMAINING None GALLONS
3. WAS TANK FILLED WITH INERT MATERIAL? YES ☐ NO ☒

THIS FORM HAS BEEN COMPLETED UNDER PENALTY OF PERJURY, AND TO THE BEST OF MY KNOWLEDGE, IS TRUE AND CORRECT

APPLICANT'S NAME (PRINTED & SIGNATURE): Nick Marcello
DATE: 5-26-94

LOCAL AGENCY USE ONLY

THE STATE I.D. NUMBER IS COMPOSED OF THE FOUR NUMBERS BELOW

STATE I.D.#	COUNTY #	JURISDICTION #	FACILITY #	TANK #
	41	000	330211	2

PERMIT NUMBER | PERMIT APPROVED BY/DATE | PERMIT EXPIRATION DATE

THIS FORM MUST BE ACCOMPANIED BY A PERMIT APPLICATION - FORM A, UNLESS A CURRENT FORM A HAS BEEN FILED.
FILE THIS FORM WITH THE LOCAL AGENCY IMPLEMENTING THE UNDERGROUND STORAGE TANK REGULATIONS

DRAFT

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all NEW PERMITS, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.
2. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987).
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle A if above ground; circle U if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. . Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

1.0 INTRODUCTION

In this report, we are presenting a detailed account of the tank removal activities at Chub's Auto Repair, located at 1180 Main Street, Redwood City, California. All work was performed by SEMCO, San Mateo and was done in compliance with the County of San Mateo and the Redwood City Fire Department. Tank preparation, excavation and removal occurred on January 14, 1994. Re-excavation activities occurred on February 9, 1994.

2.0 EXCAVATION AND TANK REMOVAL

On January 14, 1994, SEMCO excavated the site for the removal of one 1000 gallon Waste Oil tank. Upon arrival to the site and preparation for the removal, another tank was discovered, which was determined to be a 1000 gallon gasoline tank.

Both tanks were voided of their residual product, which was placed into barrels for disposal. It was later disposed of by Allied Petroleum on Manifest # 93267128. The tanks were then inerted by washing them with a hot water detergent wash, followed by solid carbon dioxide (dry Ice) until acceptable levels of oxygen and lower explosive limits were reached..

The tanks condition were noted as follows:

1) 1000 gallon waste oil was unwrapped steel with several 1/8" holes in surface and 2-3 1/4" holes at the East end. The piping had many holes.
2) 1000 gallon gasoline tank was unwrapped steel with pitting, but no holes were observed.

The inerted tanks were hauled by Rich Hamilton Trucking on Manifest # 92885656.

After the tanks were removed, it was noted that the soil beneath the waste oil tank was discolored, with a slight solvent odor. The soil in both excavations had a clayey/sandy consistency. The soil beneath the gas tank had no discoloration or odor.
At this time, soil samples were collected.

3.0 SOIL SAMPLING

Soil samples were retrieved out of the excavation by use of the backhoe bucket. Clean brass sample tubes were used by pushing them into the soil until a full sample was obtained. All samples were sealed with teflon tape, plastic end caps and sealed with masking tape, labeled and entered onto a chain of custody form. Samples taken to Superior Precision Analytical, a State certified laboratory.
Samples were collected from the waste oil excavation from the East end of the excavation at 8 feet and the West end at 8.5 feet. A four tube composite sample was collected from the excavated waste oil soil.

These samples were to be analyzed for TPH as Gasoline, Diesel, BTXE, Oil and Grease, 8010, 8240 and ICAP 5 Metals.

Samples were collected from the gasoline tank excavation from the North end at 8 feet and the South end at 9.5 feet. A four tube composite was also collected from the excavated soil. These samples were to be analyzed for TPH as Gas, BTXE and Total Lead.

Analytical results demonstrated that the gasoline excavation had no detectable traces of the analyzed constituents, except for 8ppm lead in the North sample, 7ppm lead in the South sample and 30 ppm Lead in the Excavated spoils. The analytical for the waste oil tank demonstrated Non detectable levels in the East end of the excavation. The West end however, had 810 ppm Diesel with non detectable levels in Gasoline, BTXE and Oil and Grease. The excavated soil had 4 ppm TPH as gas, 1100 ppm Diesel, No Benzene, 0.048 ppm Toluene, 0.036 ppm Ethyl Benzene, 0.28 ppm Xylenes and no Oil and Grease.

Based on the analytical, it was determined that additional excavation work would be necessary for the Waste Oil tank excavation.

5.0 RE-EXCAVATION ACTIVITIES

After assessing the analytical results, it was decided in conjunction with the various lead agencies to re-excavate the site down to a level in which there would be no detectable traces of contaminants.

A workplan was submitted to San Mateo County on February 2, 1994, to over excavate the West end (fill end) by approximately 10 cubic yards. Upon approval of the workplan, the job was scheduled for February 9, 1994 with San Mateo County Environmental Health inspector Michelle Shomarker.

SEMCO arrived on site and excavated the West end laterally approximately 5 feet and removed the soil to the 8 foot level. The water table was reached at the 9 foot level. The water in the excavation was pumped and allowed to recharge. (This water was placed in barrels to be disposed of at a later date) A soil sample was collected at the 8 foot level, and a water sample was collected. The soil sample was analyzed for TPH as gas and diesel, BTXE and TOG. A water sample was also collected with analysis request for TPH as gas and diesel, BTEX, TOG and 8010. However only one liter and three VOA's were collected on this date. Superior Precision Analytical informed SEMCO only one analysis could be run due to the inadequate amount. (please see enclosed correspondence from Superior).

DRAFT

Conversations on site was to request this sample not be analyzed, and allowing the pit water to be pumped and allowed to recharge. San Mateo County later requested this sample to be analyzed. SEMCO requested Superior to run TOG analysis only, due to the inadequate amount. Analytical results indicated levels of 9 ppm Oil and Grease. SEMCO at this time requested that the pit be allowed to be pumped and recharge. Permission was given for this task, so an appointment was scheduled for February 17, 1994 with San Mateo County Environmental Health Department.

A water storage tank (swing tank) was delivered to the site for the receiving of water from the excavation. The water was pumped and allowed to recharge. Three (3) amber liters and three (3) voas of water were collected and analyzed for TPH as gasoline, diesel, BTXE, TOG and 8240.

Analytical results demonstrated non detected levels in TPH as gas, BTXE, TOG and 8240. The analysis for TPH as Diesel had a level of 530 ppb, but was noted as not matching the typical diesel pattern.

The excavation was backfilled and compacted to prepare for resurfacing. The water from the original pumping of the excavation, was pumped from the barrels and was placed into the holding tank for disposal.

The water in the holding tank was then sampled on March 9, 1994 for TPH as gasoline, Diesel,BTXE, TOG and 8240, to determine how the disposal would be handled. The analysis demonstrated only 110 ppb diesel, while all other analysis were non detected.

Based on this information, the analytical was presented to South Bay Sewer Authority for pumping the water into the Sewer. On March 16, 1994, SBSA approved the discharge of the water into the sewer. (see attached permit) On March 17, 1994, the water was pumped from the tank into sewer.

The concrete was replaced on March 28, 1994

This report is for your files. If you have any questions, please give me a call.

RECEIVED

SUBJECT: Monitor Well Construction Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the following report documenting construction of a monitor well with associated development and groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The investigation was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Soil and Groundwater Remediation Guidelines.

DRAFT

Introduction

Reportedly, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11:00 position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons (Table 1). Water present in the pit was sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline,

benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2). The pit was pumped dry and no water recharged. Not true * See inspector notes for more details. Basically, pump didn't work well, took sample then re-pumped pit and re-sampled. Contractor over-pumped pit. MJ 5/31/94

Regardless, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. This report describes the construction and sampling of the monitor well that was requested.

Drilling and Soil Sampling

Prior to mobilization ASE secured a drilling permit from SMCDHS and notified Underground Service Alert (USA) of the planned drilling. A monitor well, MW-1, was constructed about 9 feet from the former UST in the assumed downgradient direction of the former UST, towards the San Francisco Bay (Figure 2). The gradient direction was also verified by a file review of the nearby RMC Lonestar site.

The approximately 8-inch diameter boring was drilled by HEW Drilling using hollow stem augers on May 4, 1994. The boring was advanced to a total depth of 20 feet, with soil samples collected every 5 feet in a 2-inch diameter modified California sampler outfitted with brass liners. The sampler used to collect soil samples was triple rinsed between uses in tap water containing soap, tap water, and a final rinse of distilled water. Sample tubes were cleaned prior to arrival at the site.

Visual and olfactory observations of the soils, including observations of petroleum hydrocarbons, were made and recorded on the boring log (see attached). No petroleum odors were noted emanating from any of the MW-1 soil samples. In general, the subsurface consisted of black silty clays to a depth of 14 feet underlain by black and grey fine gravel and sand. Groundwater was first encountered at approximately 14 feet below ground surface. Drilling was halted at a depth of 20 feet, about 5 feet below the initial detection of water.

One soil sample from the vadose zone at a depth of 10.5 to 11 feet was retained for subsequent laboratory analyses. This soil sample was preserved for subsequent laboratory analysis by covering the ends of the brass liner with teflon tape followed by plastic caps, labelling, and placing with blue-ice in a cooler. The label was pre-printed with an identifying number that corresponds to a page in a bound sampling booklet. On this page the location, date, and sampler's name were recorded.

Soils from drilling activities were stored on-site in a 55 gallon drum pending laboratory results.

DRAFT

Monitor Well Construction

A monitor well, MW-1, was constructed in the boring by HEW Drilling, a licenced well driller in the State of California. A sketch of the well construction details is presented in Figure 3. The monitor well was constructed by inserting approximately 20 feet of two-inch diameter, flush threaded, schedule 40 PVC pipe inside the hollow stem auger. The lower 15 feet was comprised of 0.020 inch machine slotted screen with a threaded cap on the bottom, while the upper 5 feet was constructed of blank casing.

A filter pack of #3 sand was placed in the annulus between the well casing and the boring wall using the hollow stem auger as a tremie pipe. The annulus was filled with sand to about 4 feet below ground surface. Then, an approximately 1 foot thick bridge of bentonite pellets was placed in the annulus and hydrated with clean, distilled water. The bentonite was allowed to swell for about 20 minutes prior to placement of a well seal comprised of a cement grout containing approximately 3% bentonite. The grout was placed in the annulus from a depth of 3 feet to the ground surface.

The well was completed with a watertight, circular valve box, set at the grade of the pavement. Excess casing was cut off to bring the top down to an elevation just below existing ground surface. A locking water tight plug was inserted in the well and secured with a padlock.

Monitor Well Development and Sampling

On the May 5, 1994, the day following well construction, MW-1 was developed by bailing and a groundwater sample was collected. Field notes documenting well development are attached.

Prior to development, depth to water (DTW) was measured at 7.74 feet below TOC. A pressure change was noted upon unsealing the well. An initial volume of water was removed from the well using a clean teflon bailer and examined. The water was turbid, with no petroleum odor. No petroleum odor was noted during development. A total of 10.5 gallons were purged from the well, equivalent to greater than 5 casing volumes.

Purge water was discharged into 5-gallon buckets calibrated for volume measurement. Temperature, pH, and electrical conductivity were measured periodically during development (Table 3). Temperature was measured by placing water from the bailer into a 1-liter cylinder containing an alcohol thermometer. pH was measured with 0-11 range Hydrion pH paper. Electrical conductivity was measured using a calibrated Myron L Company

DRAFT

EP11/pH meter.

At the end of development the DTW was measured at 9.85 feet. The well was allowed to recover for four hours at which time DTW was measured at 9.76 feet. With approval from Ms. Michele Shoemaker of SMCDHS, a sample was then collected.

A new clean, polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product or petroleum odor. Three volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in a 55 gallon drum pending analytical results. The well was capped, locked, and covered.

Laboratory Analyses

Both the soil and groundwater samples were transported under chain of custody (attached) to Coast to Coast Analytical Services (CCAS), a state certified laboratory, for analyses.

The soil sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D), benzene, toluene, ethylbenzene, and xylenes (BTEX); extracted by EPA Method 5030 and analyzed by EPA Methods 8020, and 8015 modified.

The water sample was analyzed for TPH as gas (TPH-G), TPH-D, and volatile organics including BTEX; extracted by EPA Method 5030 and analyzed by EPA Method 8240.

Laboratory reports are attached. Table 1 summarizes the laboratory results for soil, and Table 2 for the groundwater. The soil from MW-1 did not contain any detectable TPH or BTEX. The groundwater sample from MW-1 did not contain any TPH-G, TPH-D, BTEX, or volatile organics.

Quality Control

Laboratory quality control for both soil and water, consisting of method blanks and matrix spikes are attached.

DRAFT

Summary and Conclusions

This report has been prepared to document construction, development, and sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

A boring was advanced at a location within 10 feet of the former UST (Figure 2). The boring was located in the apparent downgradient direction from the former UST location. No petroleum odors were encountered in the soil from the boring.

A two-inch diameter, 20 feet deep monitor well was constructed in the boring (Figure 3). The monitor well was developed and a groundwater a sample collected on the day after construction. No free product or petroleum odor was noted in the groundwater.

Laboratory analytical results show no detectable TPH-D, or BTEX in the soil (Table 1), and no TPH-D, TPH-G, BTEX, or volatile organics in the groundwater (Table 2) from MW-1.

Recommendations

ASE recommends collection of a groundwater sample from the monitor well, MW-1, at the next regularly scheduled quarterly date, on or about August 5, 1994 to check the veracity of the initial analytical results that show no detectable hydrocarbons in the groundwater. ASE also recommends analysis only for TPH-D and BTEX due to the absence of volatile organics in the initial sample.

Please call me at (415) 363-2445 if you have any questions or require additional information.

DATA SHEET FOR SAMPLING WELL MW-1
& DEVELOPING

JOB NAME CHUB
SAMPLED BY DAVID OLKOWSKI

DATE 5/5/1994
SHEET 1 OF 1

USE POSITIVE VALUES
WELL DEPTH (WD) 20 ft
INITIAL DEPTH TO WATER (DTWI) 7.74 ft
(WD - DTWI) (X GAL/FT) = CASING VOLUME (CV)
(20 - 7.74) (0.17 GAL/FT) = 2.08 GALLONS/CV
(3CV) (GAL/CV) = 3 CASING VOLUMES
(5) (2.08) = 10.42 GALLONS NEED TO BE PURGED

DIA.	X
2"	0.17
4"	0.66
6"	1.5

TIME	DTW	GALS	MICR S	pH	TEMP C	NOTES
10:13						ARRIVE SITE
10:19						UNPLUG WELL, UNDER VAC/PRESSURE?
PIT WATER IS ALLEGED TO HAVE BEEN TIDAL.						
10:36	7.74 ft					
10:45		0	2200	7.6	19.3	TURBID, NO ODOR
10:57		3	1750	7.6	19.3°	
11:08		6	1700	7.6	19°	VERY SILTY
11:20		9	1790	7.6	19°	
11:29		10.5	1820	7.6	19°	
11:33	9.85					
11:44	9.83					
11:57	9.80					
12:10	COVER MW-1, PLACE WATER IN DRUM, LEAVE SITE					
15:28	[illegible]					RETURN TO SITE
15:33	9.76 ft					WATER LEVEL IN CREEK STILL [illegible] LOW.
15:43						FILL 3 VOA's
15:57	PLACE WATER IN DRUM; PLUG, LOCK (KEY #3204) & COVER MW-1					
16:00						LEAVE SITE

FINAL DEPTH TO WATER (DTWF) 9.85
0.2(DTWF) + 0.8(DTWI) = DTW FOR 80% RECOVERY (DTW80%R)
0.2(9.85) + 0.8(7.74) = 8.16 FT MAX. BEFORE SAMPLING

RECEIVED

SUBJECT: Monitor Well Sampling Report
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the fourth quarterly report documenting groundwater sampling at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted in accordance with the requirements of the State of California Leaking Underground Fuel Tank (LUFT) Manual, the Tri-Regional Recommendations of the San Francisco Bay Regional Water Quality Control Board (SFRWQCB), and the San Mateo County LUFT Enforcement Program (CLEP) Guidelines.

DRAFT

Introduction

~~Reportedly~~, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11 O'clock position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons. Water present in the pit was eventually sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline, benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample (Table 2).

Subsequently, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. The monitor well was constructed at the site on May 4, 1994 in the assumed downgradient direction from the former UST, towards the San Francisco Bay. This report describes the fourth quarterly sampling of the monitor well.

Observations

On February 2, 1995, one day prior to sampling, water levels were measured in MW-1 and tidal water levels in Redwood Creek were observed. No tidal influence on MW-1 water levels observed on February 2. However, on February 3, water levels were noted to be 0.15 feet lower (see attached field notes).

Monitor Well Development and Sampling

On February 3, 1995, monitor well MW-1 was purged by bailing and a groundwater sample was collected. Field notes documenting the well sampling are attached.

Prior to purging, depth to water (DTW) was measured at 8.56 feet below the top of the well casing (TOC). An initial volume of water was removed from the well using a new clean polyethylene bailer and examined. The water was clear, with no petroleum odor. No petroleum odor was noted during purging. A total of 6 gallons were purged from the well, equivalent to greater than 3 casing volumes. Purge water was discharged into 5-gallon buckets calibrated for volume measurement.

At the end of purging the DTW was measured at 8.57 feet, indicating instant recovery. A sample was then collected in presence of Ms. Michele Shoemaker of SMCDHS.

The same polyethylene bailer was used to remove a volume of water from the well. The water in the bailer had no free product. Three volatile analysis vials (VOAs) containing preservative were filled with groundwater from the bailer using an attachment that allowed the vials to be filled from the bottom so as to minimize exposure to air. Two 1 liter amber bottles with preservative were also filled with ground water. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was stored in labeled buckets pending analytical results. The well was capped, locked, and covered.

DRAFT

Laboratory Analyses

The groundwater samples were transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses.

The groundwater sample was analyzed for total petroleum hydrocarbons as diesel (TPH-D) by EPA methods 3510/8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020.

Laboratory reports are attached. Table 2 summarizes the laboratory results for the groundwater. The groundwater sample from MW-1 did not contain any detectable TPH-D or BTEX.

Quality Control

Laboratory quality control for water, consisting of method blanks and spikes, are attached.

Summary and Conclusions

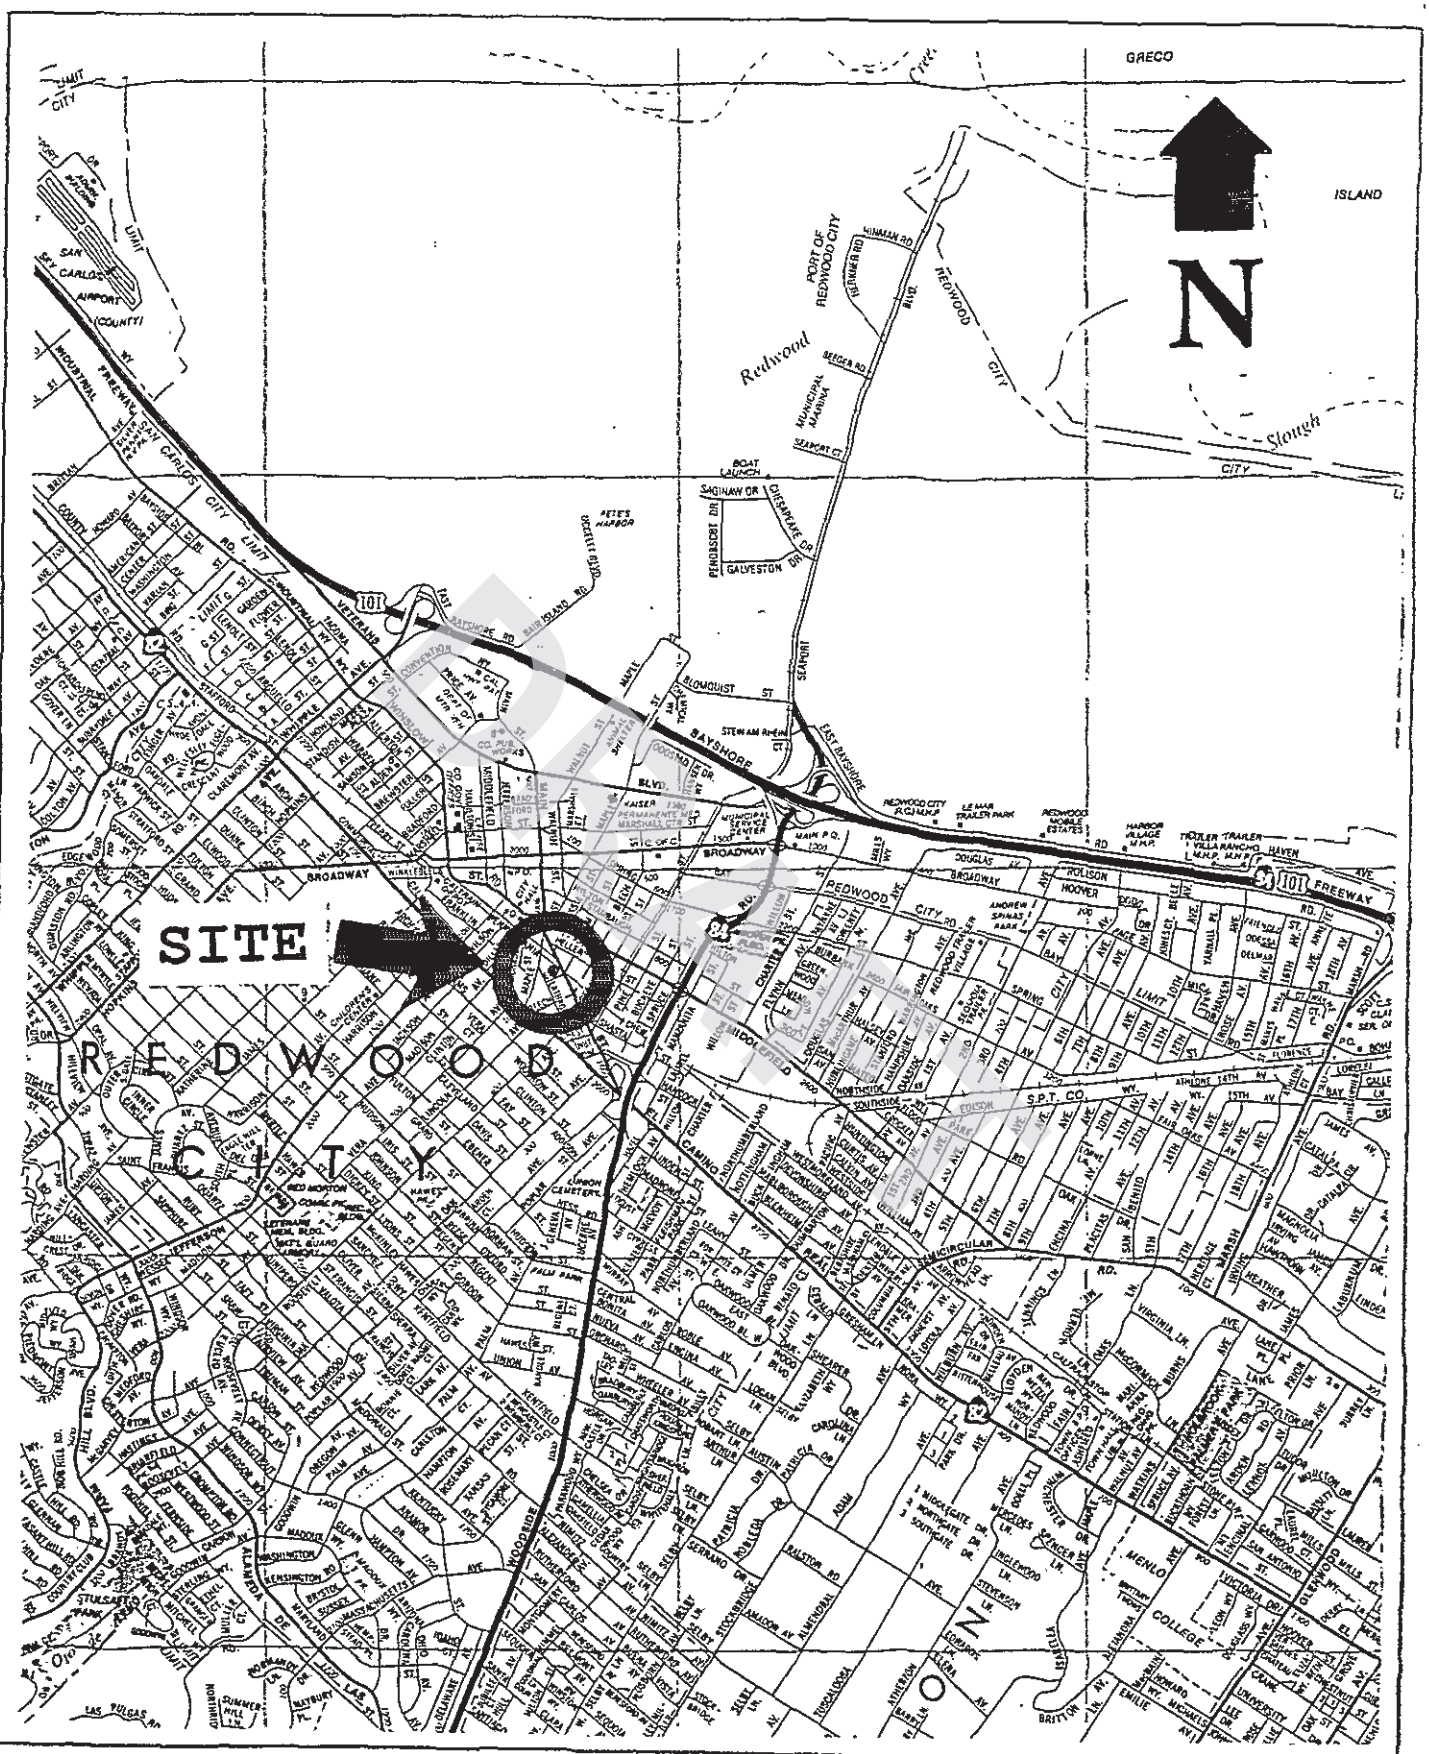
This report has been prepared to document sampling of a monitor well at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1). The monitor well was purged and a groundwater sample collected. No free product or petroleum odor was noted in the groundwater. Laboratory results show no detectable TPH-D or BTEX in the groundwater from MW-1 (Table 2).

Recommendations

Laboratory results for groundwater samples collected from MW-1 for the past four quarters show no detectable TPH-D or BTEX. Based on these results there does not appear to be significant contamination of the site groundwater. Thus, ASE recommends site closure.

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,



Frederick A. Yukic, MS, PE

HEALTH SERVICES AGENCY

ENVIRONMENTAL HEALTH SERVICES DIVISION

June 21, 1995

Mr. Larry Chubbick
1180 Main Street
Redwood City, CA 94063

Dear Mr. Chubbick:

UNDERGROUND STORAGE TANK (UST), CASE CLOSURE FOR A 1,000 GALLON WASTE OIL UST AND A 1,000 GALLON GASOLINE UST AT CHUB'S AUTO REPAIR, 1180 MAIN STREET, REDWOOD CITY, CALIFORNIA

CASE NO. 330120

This letter confirms the completion of site investigation and remedial action for the underground storage tanks formerly located at the above described location.

Based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in the Title 23, Californian Code of Regulations, Division 3, Chapter 16, Section 2721(e).

Please telephone Michele Shoemaker at (415) 599-1679 if you have any questions regarding this matter.

Sincerely,

Brian J. Zamora, MPH, REHS
Director, Environmental Health

RECEIVED

SUBJECT: Hydraulic Lift Sampling Results
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the enclosed hydraulic lift sampling results for Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The sampling was conducted by ASE following San Mateo County LUFT Enforcement Program (CLEP) Guidelines. In addition to the sampling results, this report describes activities conducted by contractors at the site related to the hydraulic lift removal.

Introduction

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was installed approximately 10 years ago. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil Sampling

August 16, 1994

At the request of Mr. Larry Chubick, ASE visited the site on August 16, 1994 to collect soil samples from the stockpile and from the bottom of the hydraulic lift excavation (see attached field notes). When ASE arrived at the site an excavation was present inside the building which was approximately 8 feet long by 4 feet wide (Figure 2). The approximately six-inch thick concrete floor had been cut and/or jackhammered to facilitate excavation. The excavation was approximately 7 feet deep at its deepest. The sidewalls were inspected and found to be composed of fill soils to a depth of 2.5 feet, followed by a black silty clay to 7 feet, underlain by a gray, mottled black silty clay which appeared moist. No groundwater was present in the pit.

~~A soil sample was collected from the center of the south end~~

DRAFT

A soil sample was collected from the center of the south end of the excavation (the reported location of the hoist cylinder) by hand augering to a depth of 8 feet, about 2 feet beneath the reported bottom of the hoist cylinder. At this depth the soil is a moist, grey, mottled black silty clay.

The auger contents were transferred into a clean, six-inch long, two-inch diameter brass liner. The ends of the liner were covered with teflon tape followed by plastic caps. A label with a pre-printed number was attached to the liner prior to placement in an ice chest containing blue ice. The label number corresponds to a page in a booklet on which was written the sampler, date, project, sample location, and sample description.

A second soil sample was collected from the stockpile generated by the excavation using the sample handling procedure described above. The sample was comprised of a brown to black silty clay. Only one sample was collected from the approximately 3 cubic yards of stockpile, in accordance with San Mateo County Department of Health Services (SMCDHS) guidelines for re-use of contaminated soils.

September 12, 1994

After receipt of the laboratory results for the initial soil samples showing the presence of Oil and Grease (O&G), the excavation was deepened by BCM. ASE was not present during excavation.

ASE returned to the site on September 12, 1994 to collect additional bottom samples. At this time the areal extent of the excavation was about the same, but the depth had increased to 8 feet. ASE collected two additional samples, at depth of 9.5 and 10 feet, while hand augering to a total depth of 10 feet. Both samples were tan grey mottled red-orange silty clay. The samples were collected, handled, and preserved as described above for previous samples. The stockpile volume was estimated to have increased to about 7 cubic yards as a result of the additional excavation.

September 26, 1994

After receipt of the laboratory results for the September 12, 1994 soil samples showing the presence of O&G in the 10 foot deep sample, ASE returned to the site on September 26, 1994 to collect additional soil samples. ASE collected three additional samples while hand augering to a total depth of 12 feet. All samples were red brown and grey silty clay. The samples were collected, handled, and preserved as described above for previous samples.

DRAFT

October 4, 1994

After receipt of the laboratory data for the September 26, 1994 soil sample showing O&G as 520 ppm in the sample from 12.5 feet, ASE returned to the site on October 4, 1994 to collect additional soil samples. However, ASE found water in the hand boring at a depth of 11 feet. Thus, no soil samples were collected because of the presence of groundwater.

October 28, 1994

On October 28, 1994 two additional soil samples were collected from the stockpile by ASE for use in characterizing the soil for offsite disposal. The samples were collected according to the procedures described above for previous samples. One sample was a black silty clay, while the other was a tan grey silty clay.

Additional Excavation

On December 12, 1994 the hydraulic lift excavation was deepened using a low overhead backhoe which fit inside the building. ASE observed the excavation which was performed by a contractor employed by Chub's Auto Repair. The maximum depth that could be reached by the backhoe was 12 feet.

Prior to digging the excavation walls were inspected visually. The south wall of the excavation was stained by fluid, a condition that had not been previously noted. The fluid appeared to have originated in the fill soils at 2 feet and had flowed down the southern sidewall to total depth of 8 feet. On explanation for the staining is that rainwater had infiltrated beneath the pavement outside the building, flowed through the shallow backfill into the building, and then into the excavation during rainfall. On the other walls a white powdery deposit was noted (perhaps precipitates of calcium).

As the excavation was deepened groundwater was observed entering the excavation below a depth of about 11 feet. After about one hour the water level rose to a depth of about 10.9 feet.

ASE used a hand auger to bore into the bottom of the middle of the excavation to a depth of approximately 15.5 feet where a silty sand was encountered. The boring was terminated at this depth based on data contained in the boring log for nearby well MW-1 (associated with a former UST) which showed the first water bearing zone at about 15 feet.

As allowed by the LUFT Guidelines, water was pumped from the excavation. A total of about 100 gallons of water was removed

DRAFT

from the excavation by skimming the surface with a 5-gallon bucket and pumping with a sump pump from the water surface. The 5-gallon bucket was noted to be oily when removed from the excavation. Water pumped was stored in 55-gallon drums pending analytical results. At the end of pumping the water level in the excavation had lowered to 11.3 feet deep.

A 4-inch diameter PVC pipe with a bottom cap attached by screws was placed into the boring to make a backfill well (MW-2). The purpose of this well was to allow the excavation to be backfilled immediately for safety reasons, and to provide for future groundwater extraction and/or monitoring, if necessary. The bottom 6 feet of the pipe was sawcut with 6 rows of vertical slots approximately 6 inches long to allow water to flow into the pipe (Figure 3). This resulted in slots between depths of 9.5 and 15.5 feet, above the reported depth to water of about 10 feet in nearby MW-1. A locking plug was inserted into the top of the pipe.

The excavation was backfilled with clean, washed pea gravel. The pea gravel was placed around the 4-inch diameter well to the ground surface.

Soils excavated were stockpiled onsite on asphalt in the fenced parking area and were covered with plastic. ASE estimated the final volume of stockpile at approximately 11 cubic yards (see attached field notes).

Groundwater Sampling

On December 12, 1994 two days following the additional excavation a groundwater sample was collected from the backfill well (MW-2). ASE did not collect the groundwater sample immediately after pumping because a previously scheduled appointment required the technician to leave the site. ASE waited two days to collect the sample because the additional excavation was conducted on a Saturday, and offices are closed on Sunday, so the following Monday was the first opportunity to sample.

No purging of the backfill well was undertaken at the time of sampling because the excavation had previously been pumped prior to backfilling (see above). A grab groundwater sample was collected by lowering a clean teflon bailer into the backfill well and removing a volume of water. The water was clear, with no free product. The contents of the bailer was emptied into a one-liter amber bottle containing preservative. The bottle was labelled and then placed in an ice chest containing blue ice for preservation during shipment to the analytical laboratory under chain of custody.

DRAFT

Laboratory Methods

The soil and groundwater samples were transported under chain of custody (attached) to state certified analytical laboratories, either Priority Environmental Labs (PEL) or PACE, Incorporated. Laboratory reports are attached along with quality control. Laboratory results are summarized in Table 1.

The soil and groundwater samples were analyzed for O&G by EPA method 418.1.

To facilitate disposal, two stockpile soil samples collected on October 28, 1994 were composited in the laboratory and analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Method 8020. The stockpile composite was also analyzed for soluble cadmium, chromium, lead, nickel, and zinc by EPA Methods 1310/7130/7190/7420/7520/7950. Finally, the stockpile composite was analyzed for reactivity, corrosivity, and ignitability by Title 22 of the California Code of Regulations.

Laboratory Results

Laboratory reports are attached and the results are summarized in Table 1.

The results show that O&G was present in soil beneath the former hydraulic lift cylinder at concentrations of 12,000 ppm at 8.5 feet below ground surface (bgs), 1,600 ppm at 9.5 feet, 1,700 ppm at 10 feet, and 520 ppm at 12.5 feet.

The groundwater sample from the backfill well (MW-2) was analyzed and found to contain 1.7 ppm of O&G.

The stockpile soil sample results show O&G at 4,100 ppm. The stockpile composite lab results show soluble cadmium at 0.53 ppm, soluble lead at 0.73 ppm, soluble zinc at 0.67 ppm. Soluble chromium, soluble nickel and BTEX were not detected in the stockpile composite sample. Finally, the stockpile composite was not reactive of ignitable, and the pH was measured at 7.6 ppm.

Stockpile Disposal

The approximately 11 cubic yards of stockpiled soils were transported to the BFI Vasco Road Landfill for disposal. A gate ticket showing a total weight of 12.32 tons is attached.

DRAFT

Summary and Conclusions

This report has been prepared to document sampling beneath a former hydraulic lift cylinder removed from the subsurface at Chub's Auto Repair at, 1180 Main Street, Redwood City, California (Figure 1).

Soil samples were collected from beneath the hydraulic lift by hand boring into the bottom of the excavation created by removal (Figure 2). Laboratory results showed O&G in soils beneath the former hydraulic lift to a depth of 12.5 feet. Groundwater was encountered at 12.5 feet, so no deeper soil samples were collected. The soil sample from between 12 to 12.5 feet deep, the final depth of the excavation, was found to contain O&G at 520 ppm.

Subsequently, the excavation was deepened to approximately 12 feet, the maximum depth attainable with a backhoe that could fit inside the building. Water entered the excavation, filling it to 10.9 feet below ground surface. In accordance with LUFT guidelines the excavation was pumped once, with about 100 gallons of groundwater removed into 55-gallon drums. As a result of pumping the water level declined to about 11.3 feet. A hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet where the first water bearing zone was encountered. A backfill well (MW-2) was constructed in the boring and excavation of 4-inch diameter PVC pipe with sawcut slots. Pea gravel backfill was placed around the well from the bottom of the excavation to ground surface.

Two days after excavation pumping, ASE returned to the site and collected a grab groundwater sample from the backfill well. Because the excavation had been previously pumped, the well was not purged. Lab results show that the groundwater sample contained 1.7 ppm of O&G, which is below the required practical quantitation reporting limit for leaking underground fuel tanks.

Laboratory analytical results also showed that the stockpiled soil excavated contained O&G at 4,100 ppm and soluble metals at apparently non-hazardous concentrations. In addition, lab results showed that the soil was not reactive, corrosive, or ignitable. The stockpile soil was transported to BFI Vasco Road Landfill for disposal.

Redwood City, CA 94063

SAN MATEO COUNTY
ENVIRONMENTAL HEALTH
JUN 5 1995
RECEIVED

SUBJECT: MW-1 Groundwater Sampling Report
Hydraulic Lift Excavation
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits this groundwater sampling report for monitor well MW-1 as part of a groundwater investigation associated with a former hydraulic lift at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). At the request of Michele Shoemaker of SMCDHS a sample was collected from MW-1 and analyzed for oil and grease (O&G) be EPA Method 418.1 as described in detail below. Attached to this report are copies of field notes, chain of custody forms, and laboratory reports for your records.

DRAFT

History

A hydraulic lift was removed from the above-referenced site, an automobile repair shop, in early August 1994. Reportedly, the lift was approximately 10 years old. The lift was removed because the cylinder was leaking by BCM Services and Engineering prior to August 16, 1994.

Soil samples were collected from beneath the hydraulic lift contained oil and grease (O&G) at progressively lower concentrations (Table 1). The excavation was deepened to the maximum depth attainable with a backhoe that could fit inside the building, approximately 12 feet, where the concentration of O&G was measured at 520 ppm. Water entered the excavation, filling it to 10.9 feet below ground surface. The excavation was pumped once, with about 100 gallons of groundwater removed. Then, a hand boring was advanced 3.5 feet below the bottom of the excavation, to a total depth of 15.5 feet, into the first water bearing zone. A monitor well (MW-2) was constructed in the excavation boring. A grab groundwater sample from the well contained 1.7 ppm of O&G (Table 1).

Subsequently, MW-2 was sampled on March 13, 1995. Laboratory results for the sample collected showed 1.5 ppm of O&G (Table 1). On May 13, 1995 approximately 779 gallons were extracted from MW-2 with discharge to the sanitary sewer under permit. A groundwater sample collected on May 15, 1995 was found to contain 1.6 ppm of O&G.

Previous to removal of the hydraulic lift, a monitor well (MW-1) had been constructed at the location of two former USTs for gasoline and waste oil (Figure 2). MW-1 is located about 30 feet south of MW-1. MW-1 was sampled for four quarters for Total Petroleum Hydrocarbons (TPH) as diesel, with results showing no detectable hydrocarbons. Recently, the lab data for the last two samples from MW-1 were re-inspected by the laboratory for the presence of motor oil, with none detected.

In April 1995 additional hydraulic lifts were removed from the site. A temporary piezometer was constructed in one of these lifts and an engineering survey was conducted at the site. Water level measurements taken on April 21, 1995 showed that the horizontal hydraulic gradient between the monitor wells at the site is imperceptible.

Monitor Well Purging and Sampling

On June 1, 1995 ASE returned to the site to sample monitor well MW-1. Field notes documenting the well sampling are attached.

Prior to purging, the depth to water (DTW) was measured at 9.67 feet below the top of the well casing (TOC). A new clean polyethylene bailer was used for purging. No petroleum odors or visual presence of petroleum were noted during purging. Purge water was discharged into 5-gallon buckets calibrated for volume measurement. A total of 6 gallons were purged from the well, equivalent to greater than 3 casing volumes.

At the end of purging the DTW was measured at 9.68 feet, indicating instant recovery. Ms. Michele Shoemaker of SMCDHS gave permission to collect a sample in her absence.

A new clean polyethylene bailer was used for collection of a sample. Two 1 liter amber bottles with preservative were filled with groundwater. The samples were labelled with the time, date, location, and sampler's name prior to storage in a cooler with blue ice.

All purge water was placed in labeled buckets pending analytical results. The well was capped, locked, and covered.

DRAFT

MW-1 Laboratory Analyses

The groundwater sample was transported under chain of custody (attached) to Priority Environmental Labs, a state certified laboratory, for analyses for oil and grease (O&G) by EPA method 418.1. Laboratory reports are attached which include quality control. Table 1 summarizes the laboratory results. The MW-1 groundwater sample did not contain any detectable O&G.

Summary

This report has been prepared to document groundwater sampling on June 1, 1995 of MW-1 at Chub's Auto Repair, 1180 Main Street, Redwood City, California. Laboratory results for the groundwater sample collected from MW-1 show no detectable O&G.

Conclusions and Recommendations

ASE recommends site closure based on the following observations and conclusions:

1. O&G has been detected in MW-2 at concentrations below the published practical quantitation reporting limit required by the Tri-Regional Recommendations of 5 mg/L.

2. Studies of urban run-off into San Francisco Bay found a mean O&G concentration of 3 mg/L in water, higher than the concentration of O&G detected in MW-2 which is located in close proximity to Redwood Creek.

3. There is no published State of California drinking water standard for O&G.

4. There is no perceptible gradient between MW-1 and MW-2, suggesting little potential for lateral migration of the viscous O&G. The O&G should biodegrade with time.

5. Analytical results for MW-1, located about 30 feet from the former hydraulic lift, show no detectable O&G, suggesting that O&G in groundwater is limited to a localized area around MW-2.

6. The benefit realized by a reduction in O&G concentrations in groundwater over such a limited area from present levels (1.5 mg/L) to less than the detection limit (0.5 mg/L) can not be justified considering the economic cost that would be required.

DRAFT

Please call me at (415) 363-2445 if you have any questions or require additional information.

Sincerely,

Frederick A. Yukic, MS, PE

San Mateo County Department of Health Services-Environmental Health Case Closure Memorandum

SAN MATEO COUNTY REMEDIAL OVERSIGHT PROGRAM
CASE CLOSURE
M E M O R A N D U M

TO: SAN MATEO COUNTY REMEDIAL OVERSIGHT PROGRAM

FROM: Michele Shoemaker **DATE:** June 13, 1995

SUBJECT: Case Closure for San Mateo County Site #330120, Chub's Auto Repair, 1180 Main Street, Redwood City, California.

BACKGROUND

On January 14, 1994, a 1,000 gallon waste oil underground storage tank (UST) were removed from the subject site. During the process of excavating, a second 1,000 gallon tank was discovered. It was determined to have held gasoline. Both tanks were single walled steel tanks. The waste oil tank had holes, a solvent odor was noted in the air, and the soil beneath the tank was stained. The gasoline tank did not have any holes, odors, or staining. The two tanks were in separate excavations. One soil sample was taken from each end of the tank in both excavations.

INVESTIGATION

Four soil samples were taken from the two UST excavations. Analytical results indicated:

	TPH-g	TPH-d	O&G	B	T	E	X
E-8' wot	<1	<10	<50	<0.005	<0.005	<0.005	<0.005
W-8.5' wot	<1	810	<50	<0.005	<0.005	<0.005	<0.005
N-8' gas	<1	- -	- -	<0.005	<0.005	<0.005	<0.005
S-9.5' gas	<1	- -	- -	<0.005	<0.005	<0.005	<0.005

On 2/3/94 overexcavation of the waste oil tank pit occurred to approximately 10' below ground surface (bgs). A soil sample was obtained at approximately 8' bgs on the west wall. Analytical results were as follows: <1 ppm TPH-g, <10 ppm TPH-d, <50 ppm oil & grease, non detect for 8010 compounds, <0.005 ppm for BTEX constituents. Groundwater was encountered at approximately 9.5' bgs; the pit was partially pumped due to pump failure and a water sample was obtained. Due to contractor error, the pit water sample was only analyzed for oil and grease. The result was 9,000 ppb oil and grease.

The pump was fixed and the pit was pumped at least two more times prior to the sampling the re-charge. The groundwater was sampled again on 02/17/94. Analytical results were: <50 ppb TPH-g, <0.5 ppb BTEX, 530 ppb TPH-d, <5000 ppb oil & grease, and non-detect for 8010 compounds. The diesel was noted by the lab as non-typical diesel.

On 05/04/94 groundwater monitoring well MW-1 was installed within ten (10) feet of the former tanks at the subject site (groundwater gradient was deterimined at the site using two groundwater

monitoirng wells and a temporary piezometer. Based on the data, there is no perceptible gradient). A soil sample was obtained from 10.5-11' below ground surface (bgs). No odors were noted on the boring log. The depth to water was 14' bgs. The soil sample was analyzed for TPH-mo, TPH-d, and BTEX compounds. All analytes were below detection limits: 0.005 ppm for BTEX, 5 ppm TPH-d, and 10 ppm TPH-mo.

The groundwater monitoring well has been monitored four consecutive quarters; no contaminants have been detected. Analytical results are attached.

In early August, 1994 a hydraulic lift was removed from the subject site. The pit was excavated to groundwater at 12' bgs. Soil samples were collected from the excavation and analyzed for oil and grease by 418.1 (see table below). A grab water sample was obtained from the pit. A saw-cut PVC pipe was installed in the excavation and backfilled with pea gravel. The consultant named the PVC pipe as MW-2. Soil and groundwater results from the hoist removal are seen below:

Hydraulic Hoist Analytical Results

Soil sample depth	oil & grease
8-8.5'	12,000 ppm
9-9.5'	1,600 ppm
9.5-10'	1,700 ppm
12-12.5'	520 ppm
pit water 12/12/94	1700 ppb
MW-2 water 3/13/95	1500 ppb
MW-2 water 5/15/95	1600 ppb

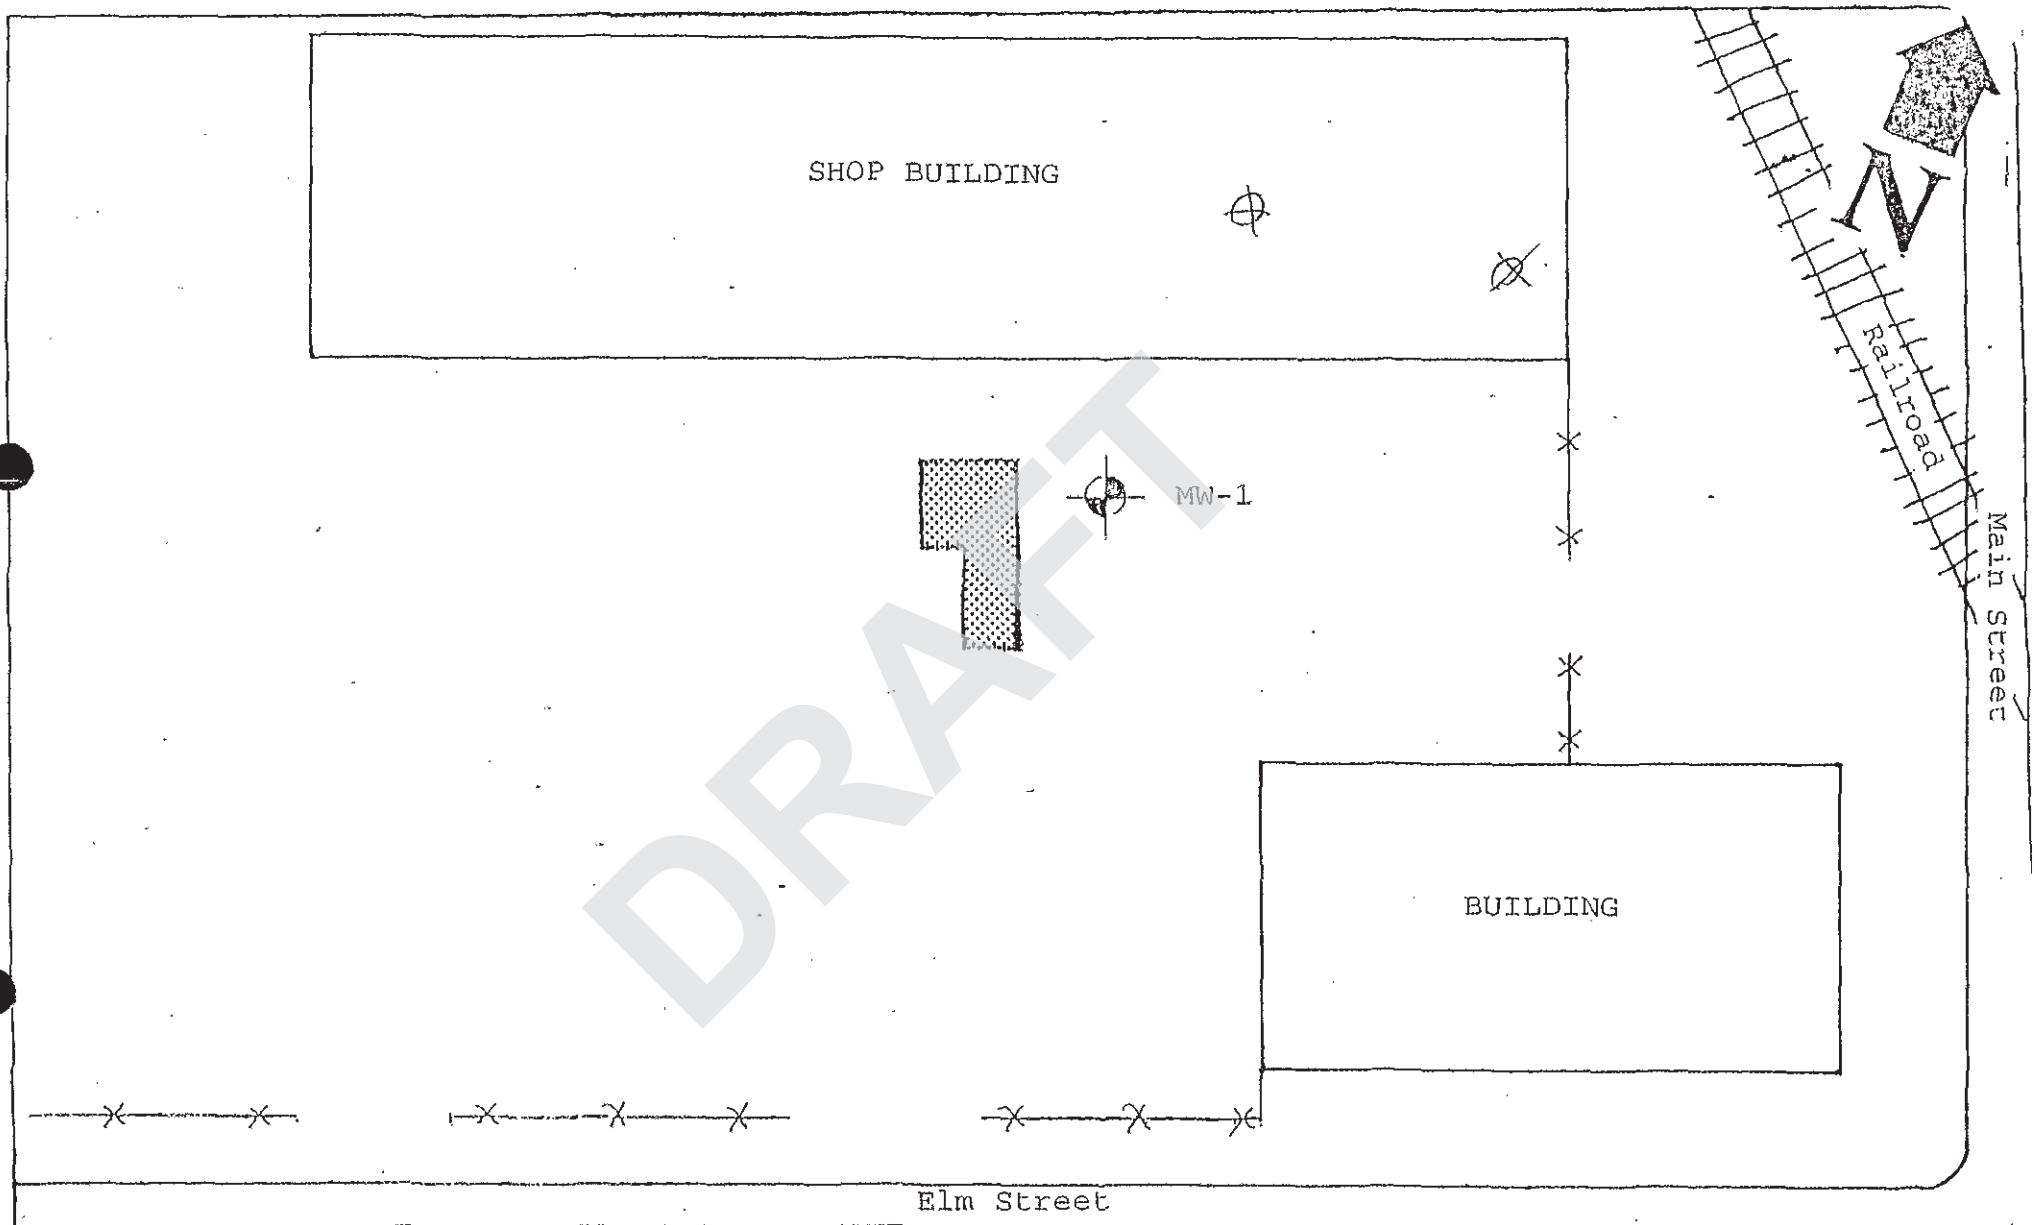
DRAFT

An estimated 2.5 cubic yards of soil contaminated with approximately one (1) gallon of hydraulic oil remains in place at the site.

Approximately 800 gallons were purged from MW-2 and the well was re-sampled for oil and grease. The analytical results are shown above. The samples were analyzed by EPA Method 418.1. On 02/03/95, MW-1 was analyzed for kerosene, diesel, and motor oil with detection limits of 50, 50, and 0.5 ppb. No kerosene, diesel, or motor oil was detected in the groundwater.

On May 29, 1995 MW-1 was sampled for oil and grease. None was detected at detection of 0.5 ppm. The low levels of oil and grease in MW-2 do not pose a threat to human health or the environment. There is not a perceptible gradient between MW-1 and MW-2. Since there is no oil and grease in MW-1, this indicates there is little potential for lateral migration of the oil and grease found in MW-2. Further, the economic cost of remediating such low levels of oil and grease does not warrant additional investigation. According to the consultant, "a study conducted by ABAG of urban run-off into the San Francisco Bay showed mean concentrations of 3 mg/L (oil and grease) during dry periods and 8 mg/L during wet periods. In addition, a study conducted in Fresno, California by the USGS measured oil and grease in urban run-off at an average concentration of 3 mg/L for a residential catchment and 11 mg/L for an industrial

catchment. Thus, the concentration of O&G in MW-2 is lower than the average concentration measured in urban run-off flowing into San Francisco Bay" and therefore the site should be closed.



GEOLOGY

Black silty clays are present to approximately 14' bgs. Black and gray fine gravel and sand underlie the silty clays to at least 20' bgs, the total depth explored.

RECOMMENDATIONS:

Based on the investigation, monitoring results, and other information which is currently and actually known to this agency, we have determined that all appropriate response actions have been completed, all acceptable or remedial practice were implemented, and no further investigation, remedial/removal action, or monitoring is required at the site with regard to a release of hazardous waste or substance from the underground storage tank located at the site. We have determined that a significant release of gasoline fuel has not occurred and the shallow waters have not been significantly impacted. San Mateo County Remedial Oversight Program staff have determined that the water quality objectives of the San Francisco Bay Regional Water Quality Control Board have been satisfied.

1180 Main St. RWC chubs #330120

JANUARY 31, 1995 - David of ASF called to say he's sampling at 11 on 2/3/95. xms

DRAFT

Chubb's Auto, 1180 Main St. RWC #330120

12/9/94 Spoke w/ Fred Yukic. He wanted to remind me that the overexcavation would be occurring tomorrow at the site. I told Fred I may not go, but that Fred should go, if possible. Fred said he didn't know if he was going to be there so he would talk with Mr. Chubbick today and call me back.

Need grab water sample if hit water (probably will). Stockpile going to Vasco Rd. What is going to be used as fill? Fred will find out. tmg

12/12/14 (on Saturday) Fred called. He said he put in a saw cut (6"screen") PVC pipe in the hole @ Chubbs to act as a well. He pumped out approximately 100 gallons & then sampled Monday. The water appeared oily. The pit was dug out to 12' bgs.

Question: is the pipe considered a well??

12/20/94 - Spoke with Fred Yukic - the water sample from the pit came back at 2 ppm O+G.

1/12/95 Fred Y. called. Wanted to know why a well was needed if O+G are at detection. I called back 1/13/95 and left message for him to call me. tmg

DRAFT

Chubbs Auto, 1180 main St., RWC #330120

8/4/94 On-site for scheduled gw sampling. Did not stay to witness sampling. Brought student intern Barry Buy. XMS

9/1/94 Rec'd quarterly. Still non-detect. Need gradients wrote letter XMS

10/5/94 Fred Yukic called. A hydraulic hoist was removed from the site. Soil samples have been taken and they had hits so dug deeper and still have 500 ppm oil and grease at the water level. I told Fred that I would be the main contact person for this cleanup. I asked him to forward all analytical to me and a brief workplan for the work that he's proposing. We'll probably have to take a water sample and take it from there - XMS

10/7/94
Received fax of analytical to date. Called Fred to see when work is occurring. Left message.

11/16/94 Rec'd quarterly report. Send letter.

11/28/94 Fred Yukic called. He'll be sending a letter to update me on the site. RP is hiring someone to overdig if it may happen on a weekend. I told Fred to have RP call me for notifications regardless of the day XMS

DRAFT

Chub's Auto Repair, 1180 Main St., RWC #330120

5/4/94 On site to witness monitoring well installation. Showed up just as ready to pour seal. Well is 20' deep, water at 10' took soil samples at 5½', 10½ feet. Will analyze one of them, depending on water level tomorrow when the well is developed. Dave of Applied Science + Engineering will be on site tomorrow from 10-1 to develop the well.

Soils were clayey to 14' and then gravel/course sand encountered.

Soil sample to run for TPH-d, BTEX, water sample for the whole scan, without oil and grease as this was low in the original water sample. TPH-gd, BTEX, volatiles. xMshoemaker.

5/5/94 On site for well sampling. Well hadn't fully recovered so I didn't wait for sampling. Water was very silty. No odors. xMshoemaker

5/31/94 Received well monitoring report. All ND. I called Fred because his report states the ~~well~~ pit (MS) was pumped dry and didn't re-charge but SMCo. asked for well anyway. I told him I would send him a copy of my notes. Also, Fred asked if volatiles could be eliminated from sampling requirements.

6/2/94 called SMCo. Revised report should be out soon. xMS

DRAFT

1180 Main Street, Redwood City, CA # 330120 CHUB'S AUTO REPAIR

4/8/94 (continued) submitted, then maybe I won't require so many analyses. Soil does not need to be analyzed for everything, just TPH-d and BTEX, as workplan proposes. x MShoemaker

4/18/94 Fred Called. He said the pit sample on 2/9/94 was only analyzed for oil and grease and was at 9 ppm. He said the tank was analyzed for volatiles before disposal, but results were low. I said the well needs to be analyzed for volatiles, but can hold oil and grease. MShoemaker

4/19/94 received drilling application. I approved it. MShoemaker

4/29/94 Received Tank Removal Report from SEMCO dated 4/26/94. x MShoemaker. Sent letter 5/4/94.

DRAFT

1180 Main St, PWC CHUB'S AUTO REPAIR SM # 330120

2/17 called Chuck w/ SEMCO. Asked him why pumped pit more than one time. He said thought it was ok to do three times. SM Co. Guidelines state one time only. I faxed him copy of Guidelines page iii. x MSroemaker

3/3/94 Randy w/ SEMCO called. Wants to pump pit again. I asked for results from previous water sampling before I make a decision. Told Randy that more purging and sampling is not going to preclude Chub's from putting in a well.

3/15/94 Called Chuck w/ Semco because I received a call from a prospective consultant at the site (Fred Yukic 363-2445). Fred had talked with Mr. Chubbick and was told the water had some weird chemicals in it. I don't have the pit water results yet so I requested them from Chucks. K MSroemaker

3/18/94 Received analytical results from SEMCO, from second sampling. Have not received sample results for original pit water sampling (2/9/94) x MSroemaker

3/31/94 Redd workplan for the installation of one monitoring well. Consultant is Applied Science and Engineering. x MSroemaker

4/8/94 - Fred Yukic called abt. the letter from this office 4/4/94. I want gradient determined once the well is in place, just for confirmation. I want water sampled for parameters listed because SEMCO overpumped the pit, invalidating results. If 2/9/94 water sample results are

continued

DRAFT

(415) 368-2224

Chubs Auto Repair

1180 Main St., RWC

2/16/94 - Semco pumped pit, set appt for sampling 1 pm. [(2) of 5000 gal tanks]

2/17/94 arrived on site. Pit was being pumped when I arrived. Pit had been pumped dry yesterday & re-filled partially.

It rained last night, not covered, but bermed. (water level unchanged per Pat of Semco). Berming material was soil but not covered with plastic.

There was sheen on water seen.

~100 gal was pumped today.

Worker @ Chub's said the water level had varied, he thought due to tidal influence. Redwood Creek very close to pit - approx. 60' to the west. The paved ditch was running quickly

- Sample #: Pit H_2O #1 to be submitted to laboratory. Sampler didn't know which lab, nor which were the proper containers. Suggested he call lab to check.

x Michele Stromski

DRAFT

1180 Main St., RWC - Chubs Auto Repair
2/3/94 - Rec'd and approved brief workplan
2/9/94 - on site for over excavation

- Arrived on site, had already began digging and hit groundwater. were pumping the pit (having problems w/ pump) but were pumping slower than re-charge so got no. where. There was a sheen on the water - Took a water sample. Samples to be submitted for TPH-g, TPH-d, BTEX, CL hydrocarbons, GTO. Soil Sample was taken at ~8' on the west wall. Depth to groundwater was approximately 9½ feet.

x Michele Sholund

2/14/94 Chuck w/ SEMCO wanted to know if could re-pump pit because of pump difficulties. The samples are on hold that were submitted 2/9/94. He has a tank on site to pump into. OK by me.

(925) 746-6000

EXECUTIVE SUMMARY

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. The purpose of the survey was to locate, identify, sample and assess the condition of interior and exterior building materials suspected of containing greater than one percent (1%) asbestos and to perform a lead paint inspection. The survey included the assessment and characterization of suspect friable and non-friable ACM and lead content in painted surfaces. Asbestos containing construction material (ACCM) will also be identified, if applicable.

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation.

The subject property at 1180 Main Street is located on the south side of Main Street in a mixed residential and commercial area of Redwood City, California. The property is improved with two structures: a stand-alone office building at the southeast corner of the property, as well as a warehouse/retail facility along the north side of the property; both properties were occupied at the time of this investigation. The warehouse/retail facility is the only structure involved under the scope of this survey.

DRAFT

NESHAP Asbestos Summary

A total of thirty-two (32) samples of suspect ACM were collected from the subject property buildings during the survey.

- RACM was detected in the materials collected from 134 Maple Street, and is listed in the table below:

RACM identified at 134 Maple Street

Material	Location	NESHAP Category	Quantity	% Asbestos
Tan Vinyl Floor Sheet	**Hallway and Bathroom**	**RACM**	**~ 200 ft^2**	**60% Chrysotile**

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

- No asbestos-containing materials were detected from the sampling conducted at 1180 Main Street.

See attached asbestos analytical results in Appendix A.

Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings. The United States Department of

Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

See attached analytical results with details and locations of areas inspected in Appendix B.

1.0 INTRODUCTION

This report documents the methods and findings of a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. AEI Consultants (AEI) inspected all readily accessible areas of the buildings.

The Code of Federal Regulations (CFR), 40 CFR 61, Subpart M, National Emissions Standards for Hazardous Air Pollutants (NESHAP), classifies Asbestos Containing Materials (ACM) as any material or product that contains *greater than* 1% asbestos. As suspect ACM is identified, it is classified as either friable or non-friable.

Non-friable ACM is classified as either Category 1 or Category 2 material as follows:

- **Category 1** – Asbestos containing packings, gaskets, resilient floor coverings and asphalt roofing products; and

- **Category 2** – All remaining types of non-friable asbestos containing material not included in Category 1 that when dry, cannot be crumbled, pulverized or reduced to powder by hand pressure.

Friable materials are more hazardous than non-friable materials since they are more likely to release fibers into the air. Friable is defined as any ACM that when dry, can be crumbled, pulverized or reduced to powder by hand pressure.

- **Regulated Asbestos containing materials (RACM) –** A hazardous waste when friable, is classified as any manufactured material that contains *greater than* 1% asbestos and is:

    1. Friable – The material can be crumbled, pulverized or reduced to powder by hand pressure;

    2. Category 1 that are subjected to sanding, grinding, cutting or abrading;

    3. Category 1 material that has become friable during renovation activities; or

    4. Category 2 material that has become friable during renovation activities.

Materials containing *greater than* 1% asbestos are subject to the NESHAP regulations (40 CFR Part 61, Subpart M). RACM (friable ACM and non-friable ACM that will become friable during renovation/demolition operations) must be removed from structures prior to renovations or demolitions. Certain non-friable ACM and materials containing 1% or less asbestos may remain in structures during renovations/demolitions; however, there are waste handling/disposal issues and Cal/OSHA work requirements that may make it cost ineffective to do so. Contractors are responsible for segregating and characterizing waste streams prior to disposal.

With respect to potential worker exposure, notification, and registration requirements, Cal/OSHA regulations (Title 8, California Code of Regulations (CCR) Section 1529) define asbestos-containing construction material (ACCM) as any material with an asbestos content of >0.1% (Title 8, CCR §341.6). Removal or disturbance of more than 100 ft^2 of ACCM must be performed by a DOSH registered contractor utilizing asbestos-trained workers. It is important to

DRAFT

note the associated EPA waste labeling is not required if the material contains 1% or less asbestos, however, Cal/OSHA labeling is still required at concentrations $\leq$1%. Furthermore, at concentrations >1% all requirements of the standards become effective.

Construction activities (including demolition) that disturb materials or paints containing any amount of lead (both LCP and LBP) are subject to certain requirements of the Cal/OSHA lead standard contained in Title 8, CCR, §1532.1. Deteriorated paint is defined be Title 17, CCR, Division 1, Chapter 8, §35022 as a surface coating that is cracking, chalking, flaking, chipping, peeling, non-intact, failed or otherwise separating from a component. Demolition of a deteriorated Lead Containing Paint (LCP) component would require waste characterization and appropriate disposal. Intact LCP on a component is currently accepted by most landfill facilities; however, contractors are responsible for segregating and characterizing waste streams prior to disposal.

Potential hazards exist to workers who remove or cut through LCP coatings during demolition. Dust containing hazardous concentrations of lead may be generated during scraping or cutting materials coated with LCP. Torching of these materials may produce lead oxide fumes. Therefore, air monitoring and/or respiratory protection may be required during the demolition of materials coated with LCP. Guidelines regarding regulatory provisions for construction work where workers by be exposed to lead are presented in Title 8, CCR, §1532.1.

DRAFT

1.1 Scope of Work

The purpose of the survey was to locate, identify, sample and assess the condition of random building materials suspected of containing greater than one percent (1%) asbestos, as well as perform a lead-based paint inspection.

The survey was performed on November 5, 2010, by Alain Grissette of AEI, a Certified Asbestos Consultant (CAC #07-4300) and a Cal/DOSH Certified Lead-Paint Inspector/Assessor (#18206). The asbestos inspection was performed in conformance with modified protocols set forth by the Environmental Protection Agency (EPA) Asbestos Hazard Emergency Response Act (AHERA), the National Emission Standards for Hazardous Air Pollutants (NESHAP) and Cal/OSHA. The lead inspection was performed in conformance with modified protocols set forth by the Housing for Urban Development (HUD) Lead-Based Paint Inspection Guidelines.

1.2 Limitations

The data presented and the opinions expressed in this report are qualified as follows:

- The sole purpose of the investigation and of this report is to assess the Site with respect to asbestos materials as defined in AEI's Scope of Work and the applicable State, Federal and local environmental laws and regulations.

- AEI derived the data in this report primarily from visual inspections, interviews with individuals with information about the Site and a limited number of environmental samples. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, conclusions, and recommendations expressed in the report.

- In preparing this report, AEI has relied upon and presumed accurate certain information (or absence thereof) about the Site provided by the Client, and others identified herein. Except as otherwise stated in the report, AEI has not attempted to verify the accuracy or completeness of such information.

- The data reported and the findings, observations, conclusions, and recommendations expressed in the report are limited by the Scope of Services, including the extent of environmental sampling and other tests. The Scope of Services was defined by the requests of the Client, the time and budgetary constraints imposed by the Client, and the availability of access to the Site.

- The collection of bulk building material samples for analysis is a destructive procedure and may cause damage to the integrity of building systems. AEI will take normal state-of-the-art precautions to minimize damage, however, AEI will not be held responsible for damage to the building systems as a result of sample collection.

- Suspect ACMs may be present in the building in inaccessible areas such as hidden or concealed wall cavities or ceiling; the discovery of hidden or concealed materials is a destructive process, not in the scope of work for this survey.

- Because of the limitations stated above, the findings, observations, conclusions and recommendations expressed by AEI in this report are limited to the information obtained and the surface and subsurface investigation undertaken and should not be considered an opinion concerning the compliance of any past or current owner(s) or operator(s) of the Site with any Federal, State or local laws or regulations. No warranty or guarantee, whether express or implied, is made with respect to the data reported or findings, observations, conclusions, or recommendations expressed in this report. Furthermore, such data, findings, observations, conclusions and recommendations are based solely upon Site conditions in existence at the time of investigation.

- This report has been prepared on behalf of and for the exclusive use of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

DRAFT

2.0 SITE DESCRIPTION

2.1 Site Description

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation.

The subject property at 1180 Main Street is located on the south side of Main Street in a mixed residential and commercial area of Redwood City, California. The property is improved with two structures: a stand-alone office building at the southeast corner of the property, as well as a warehouse/retail facility along the north side of the property; both properties were occupied at the time of this investigation. The warehouse/retail facility is the only structure involved under the scope of this survey.

Suspect building materials that may contain asbestos include: gypsum drywall panel with associated joint compound, vinyl floor sheet, and roofing materials.

Suspect painted surfaces include paint on interior drywall/plaster walls and associated trim, as well as paint on exterior brick and stucco walls and associated trim.

DRAFT

3.0 METHODOLOGY

3.1 Material Sampling

3.1.1 Asbestos Sampling Procedures

During the survey, AEI visually inspected all readily accessible areas of the subject buildings, identified homogeneous areas of suspect material (materials that share the same texture, color, use, and appear to have been applied at approximately the same time) and collected representative samples of suspect material for laboratory analysis. The samples collected were placed in plastic bags, sealed, labeled and transported under chain of custody documentation to an accredited laboratory.

3.1.2 Lead Sampling Procedures

An RMD XRF Lead Paint Analyzer was utilized. The XRF works by exposing a paint surface to radiation emitted from a sealed source inside the instrument. The source of the radiation in all the XRF analyzers currently used is the cobalt-57 (^{57}C0) or the cadmium-109 (^{109}Cd) isotopes. Both of these radioactive materials spontaneously emit energy in the form of X-rays and gamma rays. When these rays are released from an XRF analyzer and hit a painted surface, the elements in the paint matrix – which include lead – are "excited" and respond by emitting energy in the form of X-rays characteristic of each of the elements. This response is known as fluorescence. The detector in the analyzer then reports the concentration, if any, of lead in the surface. In addition to the XRF analysis, each painted area was evaluated for evidence of deterioration (i.e., flaking or cracking).

3.2 Analytical Methods

All asbestos samples collected were transported under chain of custody documentation to EMSL Analytical Inc. (EMSL) in San Leandro, California for analysis. EMSL is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP #101208-0) and the California Environmental Laboratory Accreditation Program (CA-ELAP # 1620).

All paint samples from the survey were analyzed using a RMD XRF Lead Paint Analyzer.

3.2.1 Asbestos Analysis

All bulk suspect asbestos samples were analyzed using polarized light microscopy (PLM) in accordance with the Environmental Protection Agency's (EPA) "Method of Determination of Asbestos in Bulk Samples" (EPA 600/R-93/116, July, 1993). This method is referred to as the "Improved Method" and is recommended by EPA as a preferred substitute to the Interim Method EPA 600/M4-82-020, 1982.

The EPA regulations define ACM as any material with an asbestos content greater than one percent (>1%). However, Cal/OSHA regulations define ACCM as any material with an asbestos content of >0.1%; Cal/OSHA and EPA regulations regarding the proper handling of ACMs and ACCMs must be followed.

DRAFT

If based on the results of the initial sampling, a 400-Point Count Reanalysis may be necessary for asbestos results of 1% or less to confirm the material is 1% or less by NESHAP rule. A 1000- Point Count Reanalysis would be necessary to confirm the material is 0.1% or less by Cal/OSHA rule. If point count reanalysis is not performed on these materials, then the material is covered by NESHAP and Cal/OSHA as ACM.

3.2.2 Lead Analysis

All LCP samples from the survey were analyzed using a RMD XRF Lead Paint Analyzer.

3.3 Limiting Conditions

AEI was granted access to all areas of the subject property.

Suspect ACMs and LBP may be present in the building in inaccessible areas such as hidden or concealed wall cavities or ceiling. Upon exposure of the inaccessible areas, AEI recommends sampling and analysis of any newly discovered suspect materials.

This report was prepared for the sole use and benefit of Lathrop PARC Redwood City, LLC. Neither this report, nor any of the information contained herein shall be used or relied upon for any purpose by any person or entity other than Lathrop PARC Redwood City, LLC.

DRAFT

4.0 SAMPLING AND ANALYSIS

4.1 Asbestos Survey

A total of thirty-two (32) bulk suspect asbestos-containing building material samples were collected from the structures throughout the subject property. In addition, two (2) additional 1000 point count analyses were conducted to better characterize materials with trace amounts of asbestos for the establishing proper work practices during renovation or demolition.

The sample descriptions and results are listed in the tables below:

Sample Analytical Results for 1180 Main Street, Redwood City, CA

Sample #	Material (Layer) Description	Location of Materials	NESHAP Category	% Asbestos
A-101	A. Acoustic Ceiling Tile	Rear Storage Area	n/a	None Detect
A-102	A. Drywall	Rear Storage Area	n/a	None Detect
	B. Joint Compound		n/a	None Detect
A-103	A. Drywall	Main Storage Area	n/a	None Detect
	B. Joint Compound		n/a	None Detect
A-104	A. Grey Base Cove	Rear Storage Area	n/a	None Detect
	B. White Mastic		n/a	None Detect
A-105	A. Drywall	Office	n/a	None Detect
A-106	A. Black Roofing Mastic	Roof – Penetrations & Edges	n/a	None Detect
A-107	A. Roof Core	Roof – Near Main Street	n/a	None Detect
A-108	A. Roof Core	Roof – Rear of Building	n/a	<0.1 Chrysotile*
A-109	A. Window Putty	Exterior Windows North Side	n/a	0.1 Chrysotile*

** Reanalyzed utilizing 1000 Point Count Method*

See attached analytical results and chain of custody documentation in Appendix A.

- No asbestos-containing materials were detected in the samples collected.

While trace amounts of asbestos was detected in samples A-108 & A-109, further point count analysis reduced the asbestos percentage to below the threshold both EPA and Cal/OSHA require for ACM or ACCM categorization.

DRAFT

See attached analytical results and chain of custody documentation in Appendix A.

The following materials were determined to be asbestos-containing materials (>1% Asbestos):

- Tan Vinyl Floor Sheet & Paper Backing – Front Room, Hallway & Bathroom *~ 200 sq. ft.*

The ACMs were observed in poor condition and do pose a health and safety concern to occupants of the subject property in their current state.

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

DRAFT

4.2 Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings.

The United States Department of Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

OSHA and Cal/OSHA standards require protection for all workers when working with paint containing lead, regardless of the concentration. A contractor performing paint removal work should follow the OSHA lead standard for the construction industry. The lead content of the paint should be considered when choosing a method to remove the paint, as proper waste disposal requirements and worker protection measures must be taken.

Lead Containing Paint Compliance Summary

Construction activities that disturb materials or paints containing *any* amount of lead are subject to certain requirements of the Cal/OSHA lead standard contained in Title 8, CCR, §1532.1. Deteriorated paint is defined be Title 17, CCR, Division 1, Chapter 8, §35022 as a surface coating that is cracking, chalking, flaking, chipping, peeling, non-intact, failed or otherwise separating from a component. Demolition of a deteriorated Lead Containing Paint (LCP) component would require waste characterization and appropriate disposal. Intact LCP on a component is currently accepted by most landfill facilities; however, contractors are responsible for segregating and characterizing waste streams prior to disposal.

Potential hazards exist to workers who remove or cut through LCP coatings during demolition. Dust containing hazardous concentrations of lead may be generated during scraping or cutting materials coated with LCP. Torching of these materials may produce lead oxide fumes. Therefore, air monitoring and/or respiratory protection may be required during the demolition of materials coated with LCP. Guidelines regarding regulatory provisions for construction work where workers by be exposed to lead are presented in Title 8, CCR, §1532.1.

DRAFT

5.0 SUMMARY

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. The purpose of the survey was to locate, identify, sample and assess the condition of interior and exterior building materials suspected of containing greater than one percent (1%) asbestos and to perform a lead paint inspection. The survey included the assessment and characterization of suspect friable and non-friable ACM and lead content in painted surfaces. Asbestos containing construction material (ACCM) will also be identified, if applicable.

NESHAP Asbestos Summary

A total of thirty-two (32) samples of suspect ACM were collected from the subject property buildings during the survey.

- RACM was detected in the materials collected from 134 Maple Street, and is listed in the table below:

RACM identified at 134 Maple Street

Material	Location	NESHAP Category	Quantity	% Asbestos
Tan Vinyl Floor Sheet	Hallway and Bathroom	RACM	~ 200 ft^2	60% Chrysotile

Any repairs or renovations to the ACMs should be performed by a licensed asbestos contractor. Proper safety procedures for the removal or repair of ACMs should always be followed in order to protect the occupants of the building and the abatement workers.

- No asbestos-containing materials were detected from the sampling conducted at 1180 Main Street.

See attached asbestos analytical results in Appendix A.

Lead-based Paint Inspection

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings. The United States Department of Housing and Urban Development (HUD) standard for 'lead-based paint' (LBP) is ≥1.0 mg/cm² (0.50% by weight).

- None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

See attached analytical results with details and locations of areas inspected in Appendix B.

DRAFT

6.0 RECOMMENDATIONS

AEI recommends the following:

- Written notification to contractors (that will be conducting renovation, demolition, relocation, or related activities) of the presence and location of asbestos and lead-based paint;

- Prepare bid documents and specifications for the demolition project to control the project and ensure lawful removal techniques are used;

- Remove and dispose of ACM prior to demolition using licensed abatement contractors in accordance with Federal, State, and Local regulations and ordinances, and

- Follow Federal, State, and Local regulations and ordinances for proper disposal of ACM.

DRAFT

7.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. Any exceptions to, or deletions from, this practice are described in Sections 1.2 and 3.3 of this report.

Due to magnification limitations inherent in PLM, asbestos fibers in dimensions below the resolution capability of PLM may not be detected. Samples reported as <1% or none detected may require additional testing by TEM to confirm asbestos quantities. The above test report relates only to the items tested and may not be reproduced in any form without the express written approval of EMSL Analytical, Inc. EMSL's liability is limited to the cost of analysis. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client.Samples received in good condition unless otherwise noted.

Disclaimer:Some samples may contain asbestos fibers present in dimensions below PLM resolution limits.The limit of detection as stated in the method is 0.1%. EMSL Analytical Inc suggests that samples reported as <0.1% or none detected undergo additional analysis via TEM. The above test report relates only to the items tested. This report may not be reproduced, except in full, without written approval EMSL Analytical Inc. This test report must not be used by the client to claim product endorsement by NVLAP or any agency of the United States Government. EMSL Analytical Inc. bears no responsibility for sample collection activities, analytical method limitations, or the accuracy of results when requested to separate layered samples. EMSL Analytical Inc liability is limited to the cost of sample analysis.The test results contained within this report meet the requirements of NELAC unless otherwise noted.Samples received in good condition unless otherwise noted. Samples received in good condition unless otherwise noted.

Subject: Post-Abatement Clearance Survey
134 Maple Street
Redwood City, California 94063

This letter summarizes Post-Abatement Clearance Survey performed by AEI Consultants (AEI) at the above referenced property. The survey was performed on December 22, 2010, by Alain Grissette of AEI. Mr. Grissette is a Certified Asbestos Consultant (#07-4300). This Post-Abatement Clearance Survey was performed in response to a request by the Client for visual and air sampling verification of the successful abatement of asbestos-containing vinyl floor sheet from the subject property.

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation. An initial survey conducted by AEI on November 11, 2010 revealed the presence of asbestos-containing vinyl floor sheet. Abatement was conducted on December 22, 2010 by PW Stephens, a California DOSH registered asbestos abatement contractor.

VISUAL CLEARANCE

A visual assessment of the property was conducted by Mr. Grissette of AEI to ensure the removal of all vinyl floor sheet from the containment area (bathroom and hallway) and that the containment area was left free of debris and dust. Containment was installed around the areas to be abated, with warning signs posted outside the work area.

The following is a summary of AEI's observations:

- All vinyl floor sheet had been removed from the bathroom and hallway, with no dust or debris observed.

AIR SAMPLING CLEARANCE

Clearance of the abatement of the vinyl floor sheeting was conducted by PCM air samples to ensure safe work practices were utilized during abatement. PCM air samples were analyzed using NIOSH 7400 methodology in accordance with the Environmental

Protection Agency's (EPA) regulations. PCM analysis determines the presence or absence of any type of fibers on the sample cassette filter. The clearance level for using the PCM method is 0.01 fibers per cubic centimeter. If any samples collected contain fiber concentrations above the PCM clearance level, the sample will be reanalyzed using Transmission Electron Microscopy (TEM) analysis according to AHERA methodology to determine the actual concentration of asbestos fibers present on the sample cassette filter.

All samples collected were transported under Chain of Custody documentation (Appendix A) to EMSL Analytical Inc. (EMSL) in San Leandro, California for analysis. EMSL is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP No.101208-0) and the California Environmental Laboratory Accreditation Program (CA/ELAP No.1620). Copies of the analytical results provided by EMSL are attached.

AEI collected a total of two (2) PCM air samples from within the containment areas and submitted for analysis by NIOSH 7400 methodology. In addition, two (2) PCM samples were submitted for quality assurance purposes (one field blank sample and one sealed lab sample); these samples are only to be analyzed if the initial containment samples exceeded clearance levels.

The samples, descriptions and results are listed in the following table:

PCM Air Clearance Sample Results

Sample #	Sample Locations	Analytical Results (f/cc^2)
PA-1	Hallway	0.0025
PA-2	Bathroom	0.0031
PA-Field	Field Blank	*Not Analyzed*
PA-Lab	Lab Blank	*Not Analyzed*

Results given in Fibers per cubic centimeter (F/cc^2)
Acceptable limit = 0.01 f/cc^2

Based on the results of the air samples collected, airborne fibers have not been released during the abatement activities onsite.

The asbestos abatement has passed both visual and air sampling clearance requirements.

The recommendations and conclusions presented as a result of this study apply strictly to the environmental regulations and property conditions existing at the time the study was performed. The sample analytical results are only valid for the time and place of collection and AEI does not warrant that these results will be repeatable or are representative of past or future conditions.

Please call me at (925) 746-6000, x151 if you have any questions.

Limit of detection is 7 fibers/mm². Interlaboratory Sr values: 5-20 fibers = 0.35, 21-50 fibers = 0.30, 51-100 fibers = 0.20. The laboratory is not responsible for data reported in fibers/cc, which is dependent on volume collected by non-laboratory personnel. Results have been blank corrected as applicable. EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears not responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples received in good condition unless otherwise noted.

RE: SOIL SAMPLING SERVICES
LATHROP PARC
REDWOOD CITY, CALIFORNIA

DRAFT

Dear Mr. Denziel:

We are pleased to present this letter summarizing the results of soil sampling services performed at the Lathrop Park site located in Redwood City, California.

THE PROJECT
TRC evaluated the current soil conditions at the site for potential reuse or landfill disposal. It is our understanding that approximately 4,500 Cubic Yards of soil will be excavated during construction activities at the site.

SOIL SAMPLING
As requested, to evaluate disposal options for soil generated during construction activities at the site, we collected five four-point composite samples from the subject soil. It is anticipated that approximately 4,500 cubic yards of soil will be excavated for off-site disposal or potential reuse. The soil samples were collected from the in-place soil using a backhoe provided by Lathrop Park LLC. Using our standard sampling protocols the samples were collected at various depths from the exploratory pits located within the foot-print of the planned excavation. The samples were collected in stainless steel liners, the ends covered in Teflon tape, taped, and capped with plastic end caps. The samples were then placed in an ice cooled chest for transport to a state-certified laboratory under chain of custody documentation. All soil sampling equipment were cleaned in a solution of laboratory grade detergent and distilled water before use and between sample points.

LABORATORY ANALYSIS
Based on information obtained from various Phase I Environmental Assessment Report (TRC, July, 2007; Dominion, 2011) the site was historically used for commercial purposes, including a fee mill and grain warehouse, a feed and fuel supply facility, car services and gas station, and in more recent times site-use included an electrical equipment store and contractor equipment storage. The underground storage tanks of the former gas station were removed in 1984 and the site received closure form the San Mateo County of Department of Environmental Health.

Based on the site history, the five composite soil samples were analyzed for total petroleum hydrocarbons in the diesel and motor oil range (EPA Method 8015B), 17 California Assessment Manual (CAM) metals (EPA Test Method 6010/7000); (EPA Test Method 8270), and organochlorine pesticides (EPA Test Method 8081). Additionally, the soil samples were analyzed for volatile organic compounds (VOCs) including gasoline range petroleum hydrocarbons (TPHg) (EPA Test Method 8015); benzene, toluene, ethylbenzene, and xylenes (BTEX) (EPA Test Method 8260).

RESULTS

As shown on the attached laboratory reports, the analyses performed did not detect pesticides, VOC's, including gasoline-range hydrocarbons, BTEX nor MTBE in any of the samples analyzed. The metal concentrations detected appear typical of naturally occurring background concentrations and are below Total Threshold Level Concentrations (TTLC), except for chromium, nickel and lead. Of these only lead in the near-surface sample with a detected concentration of 54 mg/kg appeared anomalous and above the hazardous waste TTLC level of 50 mg/kg.

The detected chromium concentrations in samples collected at a depth of 1.5, 3.0, 4.5 and 6.0 feet, although above the hazardous waste TTLC level of 50 mg/kg, appear consistent with naturally occurring levels for soils known from the area. Nickel concentrations are also elevated, but exceeded the hazardous waste TTLC concentration only in soil sample ABCD-1.5.

As with chromium, the detected nickel levels appear consistent with natural occurring background concentrations. Elevated chromium and nickel concentrations are typical of ultramafic bedrock, naturally occurring and common in the area of the investigation. However, since the concentrations were above the hazardous waste levels, additional solubility tests (STLC) were completed on all soil samples with TTLC exceedances. Results of the solubility tests demonstrated that none of the samples exceeded the hazardous STLC waste levels and therefore the soil can be safely disposed off as non-hazardous waste.

Furthermore, laboratory analysis detected motor oil, diesel and low-level pesticide concentrations in samples collected from the upper 4.5 feet. But only the near-surface sample produced motor oil concentrations that exceeded the ecology risk-based environmental screening level (ESL) established by the State Regional Water Quality Control Board for residential site use and beneficial use of groundwater.

RECOMMENDATIONS

Based on the chemical analytical data, the soil appears non-hazardous and should be acceptable for off-site disposal at any Class II landfill. Furthermore, if selective excavation and disposal is considered, based on the analytical results, soil below a depth of 1.0 ft, did not exceed established ESLs for residential site use, and therefore this soil does not appear to pose a risk to human health or the environment. Consequently, the soil below 1.0 foot can be considered for residential reuse, or alternatively, for appropriate disposal at a Class III landfill.

The near-surface soil (0-1.0 ft), due to the detected above ESL motor oil concentrations is not recommended for re-use and should be disposed off at an appropriate Class II landfill. We recommend submitting this report and the laboratory results to your selected landfill for their review and acceptance of the soil.

LIMITATIONS

This report was prepared for the use of Lathrop Park LLC in evaluating soil quality at the referenced Site at the time of this study. The accuracy and reliability of geo- or hydrochemical studies are a reflection of the number

DRAFT

and type of samples taken and extent of the analyses conducted, and are thus inherently limited and dependent upon the resources expended. We make no warranty, expressed or implied, except that our services have been performed in accordance with environmental principles generally accepted at this time and location. The chemical and other data presented in this report can change over time and are applicable only to the time this study was performed.

Thank you for choosing us to assist you with this project. If you have any questions, please call and we shall be glad to discuss them with you.

Very truly yours,

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
F	RPD of the MS and MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
Samples A(B,C,D)- SURF on COC have IDs as A(B,C,D)-0.5 on containers. Logged in as on COC.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: Internal standard responses were outside of acceptance limits for the following samples 720-37686-5, 10, 15. The samples show evidence of matrix interference; confirmed by re-analysis.

No other analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: A,B,C,D-SURF (720-37686-25).

Method 8081A: The matrix spike / matrix spike duplicate (MS/MSD) precision for batch 99844 was outside control limits. Non-homogeneity of the sample matrix is suspected. The associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) precision met acceptance criteria.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	False	SEE NCM
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Sent: Wednesday, October 05, 2011 7:31 PM
To: Sharma, Dimple
Subject: STLC analysis

Hi Dimple:

We had some high hits in the results of our Lathrop PRAC project. Test America ID # 720-37686-1

Please perform STLC on the following samples:

Composite Sample for the 1.5 set: STLC analysis for Cr and Nickel

Composite Sample for the 3.0 set: STLC analysis for Cr

Composite Sample for the 4.5 set: STLC analysis for Cr

Composite Sample for the 6.0 set: STLC analysis for Cr

Composite Sample for the Surf set: STLC analysis for Pb

Charles has authorized a 4 day TAT.

I you have any questions please contact Charles Mettler at 408-690-0557 or cmettler@trcsolutions.com.

Thanks

Nathan Berube

RE: SOIL SAMPLING SERVICES
LATHROP PARC
REDWOOD CITY, CALIFORNIA

DRAFT

Dear Mr. Deziel:

We are pleased to present this letter summarizing the results of soil sampling services performed at the Lathrop Park site located in Redwood City, California.

THE PROJECT
On October 25, 2011, TRC collected soil samples for laboratory evaluation of the in-place soil at the Area II of the site. The top 1-foot of soil in this area is being considered for potential reuse or landfill disposal. It is our understanding that approximately 200 Cubic Yards of soil will be excavated during construction activities at the site.

SOIL SAMPLING
As requested, to evaluate disposal options for soil generated during construction activities at the site, we collected one four-point composite sample from the subject soil. It is anticipated that approximately 200 cubic yards of soil will be excavated for off-site disposal or potential reuse. The soil samples were collected from the in-place soil using hand tools. Using our standard sampling protocols the samples were collected from various locations within the Second Area at depths from the surface to 1-foot below the existing ground surface. The samples were collected in clean glass jars provided by a state certified laboratory. The samples were then placed in an ice cooled chest for transport to a state-certified laboratory under chain of custody documentation. All soil sampling equipment was cleaned in a solution of laboratory grade detergent and distilled water before use and between sample points.

LABORATORY ANALYSIS

The composite sample collected from Area II was analyzed for total petroleum hydrocarbons in the motor oil range and total lead for the following reasons: Phase I Site history (see below), the results of the laboratory analysis from the top 1-foot of the adjacent site (Area I), and your intention that only the top 1-foot of the Second Area (Area II) will be excavated for off-haul.

Based on information obtained from various Phase I Environmental Assessment Reports (TRC, July, 2007; Dominion, 2011) the site (covering both, Area I and II) was historically used for commercial purposes,

including a fee mill and grain warehouse, a feed and fuel supply facility, car services and gas station, and in more recent times site-use included an electrical equipment store and contractor equipment storage. The underground storage tanks of the former gas station were removed in 1984 and the site received closure form the San Mateo County of Department of Environmental Health.

Since the site history was the same for both Area I and II and the only detected impact to the near-surface soil in Area I consisted of lead and motor oil range hydrocarbons, laboratory analysis of the near-surface soil samples collected in Area II was therefore limited to those two chemical compounds.

RESULTS

As shown on the attached laboratory report, the analyses performed detected Motor Oil Range Organics ranging from 59 to 1100 mg/Kg. Total Threshold Level Concentrations (TTLC) for lead was detected from 9.3 to 50 mg/Kg. The lead concentration of 50 mg/Kg detect in sample S-6-1.0 was equal to the minimum hazardous waste TTLC level.

Furthermore, none of the constituents detected in the sample exceeded concentrations of the ecology risk-based environmental screening level (ESL) established by the State Regional Water Quality Control Board for residential site use and beneficial use of groundwater. Also, none of the results exceeded the California Human Health Screening Levels (CHHSLs), which are human-exposure based screening levels.

RECOMMENDATIONS

Due to the exceedances of lead, the soil appears hazardous and a Class II landfill will likely require STLC analysis prior to acceptance. Because the concentrations did not exceed ESLs or CHHSLs the top 1.0-foot of soil can be considered for ONSITE residential or commercial reuse.

LIMITATIONS

This report was prepared for the use of Lathrop Park LLC in evaluating soil quality at the referenced Site at the time of this study. The accuracy and reliability of geo- or hydrochemical studies are a reflection of the number and type of samples taken and extent of the analyses conducted, and are thus inherently limited and dependent upon the resources expended. We make no warranty, expressed or implied, except that our services have been performed in accordance with environmental principles generally accepted at this time and location. The chemical and other data presented in this report can change over time and are applicable only to the time this study was performed.

Thank you for choosing us to assist you with this project. If you have any questions, please call and we shall be glad to discuss them with you.

Very truly yours,

TRC ENGINEERS, INC.

Charles Mettler, P.G.
Principal Geologist

RE: ADDITIONAL SOIL SAMPLING SERVICES, LATHROP PARC REDWOOD CITY, CALIFORNIA

DRAFT

Dear Mr. Deziel:

Thank you for requesting additional environmental services at the Lathrop PARC project site located at 134 Maple Street in Redwood City, California. This change order is being issued to address the additional services request by you to continue the soil management activities at the project site.

ORIGINAL SCOPE OF WORK

In accordance with our agreement dated September 23, 2011, TRC evaluated soil conditions at the site for potential reuse or landfill disposal. On September 27, 2011 we collected representative soil samples at the northern portion of the site where the foundation elements of the proposed building were to be excavated. The samples were analyzed at a California State certified laboratory and results were used to determine suitability for reuse onsite or disposal at various landfills. On October 05, 2011 an STLC analysis was performed on select samples as required by the landfill to determine the appropriate disposal facility.

ADDITIONAL SOIL SAMPLING

Subsequently the site was divided into three soil sampling Areas. Area I was located at the northernmost portion of the site where the foundation excavations were conducted, with Area II in the center and Area III at the southern portion of the site. The sampling locations are shown on the site plan (Figure 1). At your request, on October 25, 2011, TRC collected 1 four-point composite sample from the top 1-foot of Area II. On December 02, 2011 TRC collected 1 four-point composite sample on the top 1-foot of the Area III. All samples were analyzed at a State Certified laboratory.

ADDITIONAL LABORATORY ANALYSIS

The two 4-point composite soil samples mentioned above were analyzed at a State Certified Laboratory. Each sample was analyzed further to determine STLC parameters. On December 07, 2011 an STLC analysis was

performed on the Area II sample for lead. On December 16, 2011 an STLC analysis was performed on the Area III sample for lead and on December 19, 2011 an STLC analysis was requested for chromium.

LETTER REPORTS

At your request we provided two letters and various e-mail communications presenting the analytical results of the soil quality evaluation summarizing our conclusions and recommendations. Our conclusions and recommendations were based on readily available information, observations of existing conditions, and our interpretation of the analytical data.

FEES AND TERMS

The following table lists the billable tasks performed by TRC since the issue date of TRC's original proposal in September 2011. The additional work has been completed in accordance with the terms and conditions of this agreement. Payment for work shall be due and payable upon receipt of TRC's statement. To be recognized, any dispute over charges must be claimed in writing within 30 days of the billing date. Disputes or questions about a statement shall not be cause for withholding payment for remaining portions due. A service charge of 1 percent per month shall be assessed on balances unpaid 30 days after the issue date of TRC's statement to compensate TRC for the cost and burden of administering the account and collecting fees owed. Requested changes to this contract must be approved in writing before we proceed.

Additional services that are not outlined in this agreement, such as attendance at project meetings, preparation of additional draft reports, and review of environmental reports will be charged on a time-and-expense basis.

Louis;

Attached is the result of the STLC analysis for lead on sample S-6.0-1.0 taken from Area II. The analysis resulted in an STLC lead concentration of 2.1 mg/L which is below California Title 22 level (5.0 mg/L) for disposal in a Class II landfill.

Yes, I spoke to Joe Griffith regarding the required analysis for the soil samples collected at section two, on 10/25/11 and he says we need to do STLC on the one sample that returned 50 ppm for lead. I had the lab start the STLC today.
Joe says the soil will go to Vasco.

RE: SOIL SAMPLING SERVICES
LATHROP PARC
REDWOOD CITY, CALIFORNIA

DRAFT

Dear Mr. Deziel:

We are pleased to present this letter summarizing the results of soil sampling services performed at the Lathrop Park site located in Redwood City, California.

THE PROJECT
On December 2, 2011, TRC collected soil samples for laboratory evaluation of the in-place soil at the Section 3 Area of the site. The top 1-foot of soil in this area is being considered for potential reuse or landfill disposal. It is our understanding that approximately 200 Cubic Yards of soil will be excavated during construction activities at the site.

SOIL SAMPLING
As requested, to evaluate disposal options for soil generated during construction activities at the site, we collected one four-point composite samples from the subject soil. It is anticipated that approximately 200 cubic yards of soil will be excavated for off-site disposal or potential reuse. The soil samples were collected from the in-place soil using a backhoe provided by Lathrop Park LLC. Using our standard sampling protocols the samples were collected at various depths from the surface to 1-foot below the existing ground surface. The samples were collected in clean glass jars provided by a state certified laboratory. The samples were then placed in an ice cooled chest for transport to a state-certified laboratory under chain of custody documentation. All soil sampling equipment was cleaned in a solution of laboratory grade detergent and distilled water before use and between sample points.

LABORATORY ANALYSIS
Based on information obtained from various Phase I Environmental Assessment Report (TRC, July, 2007; Dominion, 2011) the site was historically used for commercial purposes, including a fee mill and grain warehouse, a feed and fuel supply facility, car services and gas station, and in more recent times site-use included an electrical equipment store and contractor equipment storage. The underground storage tanks of the former gas station were removed in 1984 and the site received closure form the San Mateo County of Department of Environmental Health.

Based on the site history, the four-point composite soil sample was analyzed for total petroleum hydrocarbons in the diesel and motor oil range (EPA Method 8015B), 17 California Assessment Manual (CAM) metals (EPA Test Method 6010/7000); (EPA Test Method 8270), and organochlorine pesticides (EPA Test Method 8081). Additionally, the soil samples were analyzed for volatile organic compounds (VOCs) including gasoline range petroleum hydrocarbons (TPHg) (EPA Test Method 8015); benzene, toluene, ethylbenzene, and xylenes (BTEX) (EPA Test Method 8260).

RESULTS

As shown on the attached laboratory reports, the analyses performed did not detect pesticides, VOC's, including gasoline-range hydrocarbons, BTEX nor MTBE in the composite sample analyzed. Detected diesel and motor oil concentrations (190 mg/kg and 670 mg/kg respectively) exceeded the concentrations of the ecology risk-based environmental screening levels (ESL) established by the State Regional Water Quality Control Board for residential site use and beneficial use of groundwater. Therefore this soil is not suitable for residential on-site use unless it is capped by low permeable pavement (roadways, vehicle parking areas) reducing the risk of direct exposure. However in areas of surface exposure (landscaped areas) this soil needs to be removed and appropriately disposed off site.

The metal concentrations detected appear typical of naturally occurring background concentrations and are below Total Threshold Level Concentrations (TTLC), except for chromium and lead. The chromium and lead concentrations were reported at 130 mg/kg and 52 mg/kg respectively, which are above the hazardous waste TTLC level of 50 mg/kg for both. However chromium concentration appears consistent with naturally occurring levels for soils from the area. Subsequent STLC analysis detected a soluble lead concentration of 1.4 mg/L which is significantly below the hazardous waste level and therefore appears acceptable at either a Class II or possibly, a Class III landfill.

Based on field observations during sampling, it appears that the soil of Section 3 is similar to the Section 2 soil. Also site history and hence, the detected anomalous compounds and concentrations, are similar between the two site development sections and no additional soil quality characterization appears required.

RECOMMENDATIONS

Due to the exceedances of diesel and motor oil concentrations, the upper 1 foot of soil in Section 3 of the site cannot be reused in planned future landscaped areas and needs to be disposed off at an appropriate landfill. The soil may be reused in areas onsite where the soil will be capped in paved road ways or paved parking lot areas. Since chromium appears consistent with natural occurring levels and since previous and current STLC results indicate that neither lead nor chromium appears to exceed hazardous waste criteria levels, the soil from both site sections should be acceptable at a and a Class II or possibly at a Class III landfill. We recommend forwarding the analytical results to your selected landfill for their review and acceptance of the soil.

LIMITATIONS

This report was prepared for the use of Lathrop Park LLC in evaluating soil quality at the referenced Site at the time of this study. The accuracy and reliability of geo- or hydrochemical studies are a reflection of the number and type of samples taken and extent of the analyses conducted, and are thus inherently limited and dependent upon the resources expended. We make no warranty, expressed or implied, except that our services have been performed in accordance with environmental principles generally accepted at this time and location. The chemical and other data presented in this report can change over time and are applicable only to the time this study was performed.

DRAFT

Thank you for choosing us to assist you with this project. If you have any questions, please call and we shall be glad to discuss them with you.

Very truly yours,

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
F	RPD of the MS and MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Sharma, Dimple

From: Berube, Nathan (SanFrancisco,CA-US) [NBerube@trcsolutions.com]
Sent: Friday, December 16, 2011 1:45 PM
To: Sharma, Dimple
Subject: Additional Lathrop PARC analysis

Hi Dimple,

Regarding your report # 720-39020-1: We got a high result for Lead on the latest composite soil sample from Lathrop PARC.

Please start an STLC analysis for sample A,B,C,D-1.0 Composite for Lead.

The client didn't mention the high Chromium concentration. Will the STLC results automatically reveal STLC concentrations for everything above the detection limit (like Chromium)? Or do you only look for the one specified contaminant (Lead in this case)?

Thanks,

Nate

Sent: Monday, December 19, 2011 6:55 PM
To: Sharma, Dimple
Subject: FW: Additional Lathrop PARC analysis

HI Dimple;

The client would now like to include STLC analysis for Chromium from the same sample as below.

Thanks,

Nate

Previous Owner(s), Operators and/or Occupants:	Nicholas Marcelli / Don Wright agent; Butler Realty	Wright: 650-465-0437 Butler: 650-361-1270	
PROPERTY USE AND SPECIFICATIONS			
☐ Single-Family Residential		☒ Vacant or undeveloped	
☐ Multi-Family Residential		☐ Agricultural *specify type:*	
☐ Commercial Office		☐ Industrial *specify type:*	
☒ Commercial Retail		☒ Other *specify type:*	
Provide a general site description: Lot 1 is currently vacant, entitled and permitted for healthcare facility development; Lot 2 has an older 1,920 sf general office. Previous uses were lighting contractor store and auto repair shop.			
Provide all known current/former addresses and/or parcel numbers: 134 Maple St. was 053-147-010; 1180/1190 Main St. were 053-147-020 and 053-147-050. The block was reconfigured as two different parcels with a Parcel map that was filed (~2010).			
Total Property Size: approx. 1.312 acres total		Original Construction Date: UNK, pre-1970	
Total Number of Buildings: 1		Was Construction Phased? ☐Yes ☐No ☒Unk	
Total Sq. Ft. of Buildings: 1,920		Dates of Renovations/Phases: 2012	
Are there any plans for site redevelopment or change in use? ☒Yes ☐No If yes, please describe: Property is being sold to a developer to develop a mixed use project (unknown mix of office, residential, retail).			
Are there any bodies of water on or immediately adjacent to the site? ☒Yes ☐No If yes, please describe: Redwood Creek currently serves as a concrete lined City storm water channel running along and across the western edge of property.			
Electricity Provider: PG&E		Gas Provider: PG&E	
Heating System Fuel Source(s): gas		Cooling System Power Source: electricity	
Potable Water Source/Provider: City of Redwood City			
Any waste water discharge at the site? ☐ Septic Tank/Leachfield ☒ Sanitary Sewer ☐ Other		Sanitary Sewer Provider (if applicable): City of Redwood City	

DRAFT

OCCUPANTS/TENANTS		
Current Occupant(s)/Tenant(s)	*Length of occupancy*	*Brief description of on-site operations*
Lathrop PARC Redwood City, LLC	7 years	Construction office, now idle

Previous Occupant(s)/Tenant(s)	*Length of occupancy*	*Brief description of on-site operations*
Auto storage (-020, -050)	+/- 4 years	Truck and auto storage on asphalt pavement since demolished
Pet kennel (-020)	+/- 4 years	Pet kennel
Marcelli Lighting (-010)	+/- 35 years	Lighting store and contractor office/yard
Chubbs Auto repair (-020)	decades	Auto repair

Has the subject site ever been occupied by the following:
☐ Dry Cleaner ☐ Gas Station ☐ Printing Facility ☐ Manufacturing Facility
If yes, provide length of occupancy:

Marcelli had an underground gas tank for use by his business according to our previous Phase I. I do not know if Chubbs sold gasoline, they sold motor oil.

Have any previous investigations been performed at the subject property? ☒Yes ☐No If Yes, are copies available? 2007 (PhsI) and 2010-2011 (phase II) by TRC Solutions, and 2011 (Phase I) by Dominion Due Diligence. Inspection and remediation of existing 1,920sf building was done by several consultants in 2010-2012 for lead/asbestos/etc. LUST remediation by previous owners of both -010 and -020 in 1970s, Chubbs and Marcelli. See reports provided.

If Yes, note type and describe: ☒ Phase I ESA ☒ Phase II ☒ Asbestos ☒ Lead Paint ☐ Radon

ON-SITE ENVIRONMENTAL CONDITIONS

Are you aware of any of the following environmental conditions, **either current or former**, on the subject site? **NOTE:** If applicable, please provide inventory records, inspection records and material safety data sheets to site inspector during site inspection.

Environmental Condition/Issue	*Response*	*Notes on Yes Responses*
Aboveground Storage Tanks	☐ Yes ☒ No	
Underground Storage Tanks	☒ Yes ☐ No	See Phase I report for work in ~1970s
Hazardous/Toxic Substances	☒ Yes ☒ No	Presumed materials used by former lighting / general contractor (Marcelli on -010) and auto storage and repair businesses at Chubbs on (-020). Lathop PARC's Phase II report from TRC states that top one foot of soil has (slightly) excessive concentrations of hydrocarbons and

DRAFT

		certain elements/metals (chromium and nickel??); see report.
Stored Chemicals	☐ Yes ☒ No	Presumed materials used by former lighting / general contractor (Marcelli on -010) and auto storage and repair businesses at Chubbs on (-020).
Chemical Spills/Releases	☐ Yes ☒ No	
Dump Areas/Landfills	☐ Yes ☒ No	But note Archeology report shows general area was infilled with fill dirt about 2' deep.
Waste Treatment Systems	☐ Yes ☒ No	
Wastewater Discharges	☒ Yes ☐ No	Bathroom sewer pipe to Elm St. at Chubbs was leaking before demolition
Floor Drains/Sumps/Clarifiers	☒ Yes ☐ No	Chubbs Auto repair had pits for hydraulic lifts.
Pits, Ponds, Lagoons	☐ Yes ☒ No	
Stained Soil/Vegetation	☒ Yes ☐ No	See TRC soil lab reports; slightly elevated hydrocarbons present in top 1 foot; perhaps from CalTrain exhaust.
Pesticide/Herbicide Use	☐ Yes ☒ No	
Polychlorinated Biphenyls (PCBs)	☐ Yes ☒ No	I am not aware of any. But Marcelli was an Electrical contractor; also check TRC lab reports.
Electrical Transformers	☐ Yes ☒ No	
Hydraulic Lifts	☒ Yes ☐ No	Chubbs auto repair had lifts, see Phase 1.
Elevators	☐ Yes ☒ No	
Asbestos	☒ Yes ☐ No	Roof and ceiling tiles (?) of existing building. Tiles were removed. Some asbestos may still remain encapsulated in the roof of the existing building. See abatement reports.
Environmental Condition/Issue	*Response*	*Notes on Yes Responses*
Lead-based paint	☒ Yes ☐ No	Lead paint was detected in existing building prior to its remodel in 2011. See abatement reports.
Oil/Gas Wells	☐ Yes ☒ No	
Environmental Clean-ups	☒ Yes ☐ No	Two LUSTS in the 1970s. Asbestos/Lead/etc. in 2010-2012. Removal of slightly contaminated soil to Class II dump (Vasco) by current owner per TRC direction.
Environmental Permits	☒ Yes ☐ No	I have an old, possibly usable, permit to dump remaining top 1' of soil at Vasco.
OTHER ENVIRONMENTAL CONDITIONS		
Are you aware of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property?		

DRAFT

☐ Yes ☒ No
If yes, provide brief explanation.

Are you aware of any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property?
☒ Yes ☐ No
If yes, provide brief explanation:
There was remediation of LUSTs and hydraulic pits approximately during the 1970s that received clearances.

During entitlement of the SNF we identified certain soils that when excavated had to be dumped a class II dump (top 1 foot plus certain deeper soil that was at the side wall of the LUST at Marcelli).

During excavation for our foundation we discovered an abandoned length of pipe buried in the soil near the creek channel that may have had asbestos and we abated it.

Our plans did not require excavating more than a couple feet deep on the Chubbs site, so nothing other than the top 1 foot needed to be removed to a Class II dump. However, our project was not going to disturb the soil at the side walls of the Chubbs Hydraulic lifts, and, similar to Marcelli, the soil at the side wall of the hydraulic pits may need to be dumped at a classed dump if excavated.

Are you aware of any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products?
☐ Yes ☒ No
If yes, provide brief explanation.

Are you aware of any incidents of flooding, leaks, or other water intrusion, and/or complaints related to indoor air quality?
☐ Yes ☒ No
If yes, provide brief explanation.

However, the existing building does have cracks in exterior walls that allow air and dust to pass to the interior.

Are you aware of any cases of extreme water damage or mold throughout the building(s)?
☐ Yes ☒ No
If yes, provide brief explanation.

However, the existing building exterior windows at the corner of Elm St. and Main St. are temporary replacements installed after a vandal broke them. All windows in the room facing the railroad were installed improperly (inside out) and have a tendency to leak water onto the window sill and cause the sill wood to swell and the sill paint to bubble.

Person completing questionnaire: Louis Deziel, Jr.

Title/Affiliation to the subject property: Manager for current Owner

Number of years associated with the subject property: 6 - 7

Tuolumne River — SFPUC Website

DRAFT

OUR DRINKING WATER SOURCES AND TREATMENT

Supplied by the San Francisco Regional Water System (SFRWS), which is owned and operated by the San Francisco Public Utilities Commission (SFPUC), our major water source originates from spring snowmelt flowing down the Tuolumne River to storage in the Hetch Hetchy Reservoir. This well protected Sierra water source is exempt from filtration requirements by the United States Environmental Protection Agency (USEPA) and State Water Resources Control Board's Division of Drinking Water (SWRCB-DDW). Water from the Hetch Hetchy reservoir receives the following treatments to meet appropriate drinking water standards: disinfection by ultraviolet light and chlorine, corrosion control by adjustment of the water pH value, fluoridation for dental health protection, and chloramination for maintaining disinfectant residual and minimizing disinfection byproduct formation.

Hetch Hetchy water is supplemented with surface water from two local watersheds. Rainfall and runoff from the 35,000 acre Alameda Watershed in Alameda and Santa Clara counties are collected in the Calaveras and San Antonio reservoirs, and delivered to the Sunol Valley Water Treatment Plant (SVWTP). Rainfall and runoff from the 23,000 acre Peninsula Watershed in San Mateo County are stored in the Crystal Springs, San Andreas and Pilarcitos reservoirs, and are delivered to the Harry Tracy Water Treatment Plant. In addition to these local sources, the SWRCB-DDW approved the SFPUC to use the surface water in Lake Eleanor, Lake Cherry and the associated creeks all conveyed via the Lower Cherry Aqueduct, Early Intake Reservoir and Tuolumne River (collectively known as Upcountry Non-Hetch Hetchy Sources, or UNHHS) as additional drinking water sources to the SFRWS. The UNHHS water, if used, will be treated at the SVWTP prior to service to customers. In 2016, the SFRWS did not use UNHHS. Water at the two local treatment plants is subject to filtration, disinfection, fluoridation, and pH adjustment for corrosion control optimization. Redwood City receives water from Hetch Hetchy reservoir and Alameda Watershed.

The SFPUC conducts watershed sanitary surveys for the Hetch Hetchy source annually and local water sources every five years. The last local sanitary survey was done in 2016. The SFPUC conducted a special watershed sanitary survey for UNHHS in 2015 as part of its drought response plan efforts. These surveys evaluate the sanitary condition, water quality, potential contamination sources and the results of watershed management activities, and were completed with support from partner agencies including National Park Service and US Forest Service.

These surveys identified wildlife, stock, and human activities as potential contamination sources. You may contact the San Francisco District office of the SWRCB-DDW at 510-620-3474 to review these reports.

LAWN BE GONE!

Save water by removing your grass! Redwood City residents and businesses are eligible to receive rebates of $1 per square foot for replacing lawn with a beautiful, drought tolerant landscape.

How do I receive a rebate?

To receive the rebate, you must submit an application and receive a Notice to Proceed from your water provider before removing your lawn. Visit www.redwoodcity.org/conservation for more information and program requirements.

Get Paid to Transform Your Landscaping!

DRAFT

CONTAMINANTS AND REGULATIONS

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and herbicides**, that may come from a variety of sources such as agriculture, urban stormwater runoff and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application and septic systems.
- **Radioactive contaminants**, that can be naturally-occurring or be the result of oil and gas production and mining activities.

More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline 800-426-4791, or at ***www.epa.gov/safewater***.

WATER QUALITY

The SFPUC's Water Quality Division (WQD) regularly collects and tests water samples from reservoirs and designated sampling points throughout the system to ensure the water delivered to you meets or exceeds federal and state drinking water standards. In 2016, WQD staff conducted more than 50,200 drinking water tests in the transmission and distribution systems. This is in addition to the extensive treatment process control monitoring performed by the SFPUC's certified operators and online instruments.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. In order to ensure that tap water is safe to drink, the USEPA and SWRCB-DDW prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

TO LEARN MORE

Additional water quality data may be obtained by contacting Justin Chapel at Redwood City Public Works Services (650) 780-7464.

Want to learn more about drinking water regulations? Visit the SWRCB Division of Drinking Water at www.swrcb.ca.gov/drinkingwater or the U.S. Environmental Protection Agency at www.epa.gov.

Water quality policies are decided at public hearings held at regularly scheduled City Council meetings. For more information visit www.redwoodcity.org.

Key Water Quality Terms
Following are definitions of key terms referring to water quality standards and goals noted on the adjacent data table.
Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.
Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the USEPA.
Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs or MCLGs as is economically and technologically feasible. Secondary MCLs (SMCLs) are set to protect the odor, taste, and appearance of drinking water.
Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
Primary Drinking Water Standard (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.
Regulatory Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.
Turbidity: A water clarity indicator that measures cloudiness of the water, and is also used to indicate the effectiveness of the filtration system. High turbidity can hinder the effectiveness of disinfectants.
Cryptosporidium is a parasitic microbe found in most surface water. The SFPUC regularly tests for this waterborne pathogen, and found it at very low levels in source water and treated water in 2015. However, current test methods approved by the USEPA do not distinguish between dead organisms and those capable of causing disease. Ingestion of *Cryptosporidium* may produce symptoms of nausea, abdominal cramps, diarrhea, and associated headaches. *Cryptosporidium* must be ingested to cause disease, and it may be spread through means other than drinking water.

Color	unit	15	N/A	<5 –11	<5	Naturally-occurring organic materials
Specific Conductance	µS/cm	1600	N/A	31 - 218	146	Substances that form ions when in water
Sulfate	ppm	500	N/A	1 - 30	16	Runoff / leaching from natural deposits
Total Dissolved Solids	ppm	1000	N/A	<20 - 95	63	Runoff / leaching from natural deposits
Turbidity	NTU	5	N/A	0ND - 0.5	0.2	Soil runoff
Lead and Copper	**Unit**	**AL**	**PHG**	**Range**	**90th Percentile**	**Major Sources in Drinking Water**
Copper	ppb	1300	300	< 1 - 107 [10]	27.4	Internal corrosion of household water plumbing systems
Lead	ppb	15	0.2	<1 - 6.9 [11]	3.8	Internal corrosion of household water plumbing systems

City of Redwood City—Water Quality Data for Year 2016

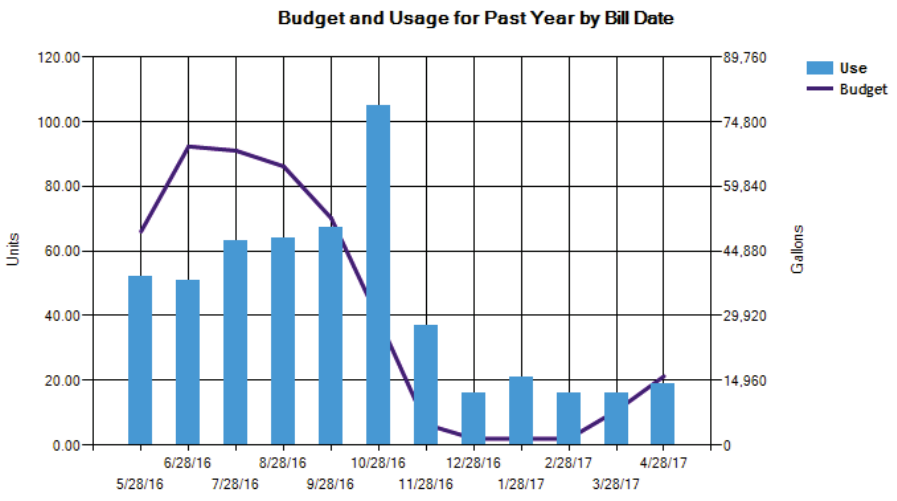
Other Water Quality Parameters	Unit	ORL	Range	Average
Alkalinity (as $CaCO_3$)	ppm	N/A	7 - 112	39
Boron	ppb	1000 (NL)	ND-123	ND
Bromide	ppb	N/A	<5-19	8
Calcium (as Ca)	ppm	N/A	2 - 18	10
Chlorate(12)	ppb	800 (NL)	47 - 250	143
Hardness (as $CaCO_3$)	ppm	N/A	8 - 76	44
Magnesium	ppm	N/A	0.2 - 6	3.6
pH	-	N/A	8.2 - 9.8	9.4
Phosphate (Ortho)	ppm	N/A	<0.03-0.11	0.04
Potassium	ppm	N/A	0.2 - 1	0.6
Silica	ppm	N/A	5.1 - 5.7	5.3
Sodium	Ppm	N/A	2.6 - 17	11
Strontium	ppb	N/A	13 - 204	13

Footnotes:

(1) All results met State and Federal drinking water health standards.
(2) These are monthly average turbidity values measured every 4 hours daily.
(3) There is no turbidity MCL for filtered water. The limits are based on the TT requirements for filtration systems.
(4) This is the highest locational running annual average value.
(5) Total organic carbon is a precursor for disinfection byproduct formation. The TT requirement applies to the filtered water from the SVWTP only.
(6) In May 2015, the SWRCB recommended an optimal fluoride level of 0.7 ppm be maintained in the treated water. In 2016, the range and average of the fluoride levels were 0.5 ppm - 0.8 ppm and 0.6 ppm, respectively.
(7) The natural fluoride levels in the upcountry sources were ND. Elevated fluoride levels in the SVWTP and HTWTP raw water are attributed to the transfer of fluoridated Hetch Hetchy water into the local reservoirs.
(8) This is the highest running annual average value.
(9) Aluminum also has a primary MCL of 1,000 ppb
(10) The most recent Lead and Copper Rule monitoring was in 2015. 0 of 31 site samples collected at consumer taps had copper concentrations above the AL.
(11) The most recent Lead and Copper Rule monitoring was in 2015. 0 of 31 site samples collected at consumer taps had lead concentrations above the AL.
(12) The detected chlorate in the treated water is a degradation product of sodium hypochlorite used by the SFPUC for water disinfection.

DRAFT

WATER USE PROGRAM - "MYWATER"



Conserving water can be a difficult task, but by using the tools in the MyWater Program, you will find it much easier. View water use compared to your water budget, sign up for leak alerts, water use reports and much more.

MyWater is a useful tool provided to you by Redwood City's Water Utility Services Division. MyWater allows you to view your water budget and consumption information on an hourly, daily, or monthly basis.

MyWater's purpose is to empower the customer through better customer service so that we may use water more wisely, and in turn, save money and help the environment.

MyWater allows you to:

- View hourly water use
- Sign up for leak alerts
- View water use reports
- View water use compared to a customized water budget

DRINGKING WATER AND LEAD

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. There are no known lead service lines in the SFRWS. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. It is possible that lead levels at your home may be higher than at others because of plumbing materials used in your property.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. You can minimize the potential for lead exposure, when your water has been sitting for several hours, by flushing your tap for 30 seconds to 2 minutes (or until the water temperature has changed) before using water for drinking or cooking. If you are concerned about lead levels in your water, you may wish to have your water tested. Additional information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the USEPA's Safe Drinking Water Hotline 800-426-4791, or at ***www.epa.gov/lead.***

SPECIAL HEALTH NEEDS

Some people may be more vulnerable to contaminants in drinking water than the general population.

Immuno-compromised persons, such as:

* Those with cancer undergoing chemotherapy,
* Persons who have undergone organ transplants,
* People with HIV/AIDS or other immune system disorders
* Some elderly people and infants,

can be particularly at risk from infections.

These people should seek advice about drinking water from their health care providers. USEPA and Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the USEPA's Safe Drinking Water Hotline 800-426-4791 or at ***www.epa.gov/safewater***.

FLUORIDATION AND DENTAL FLUOROSIS

Mandated by State law, water fluoridation is a widely accepted practice proven to be safe and effective for preventing and controlling tooth decay. The SFPUC's fluoride target level in the water is 0.7 milligram per liter, consistent with the May 2015 State regulatory guidance on optimal fluoride level.

Infants fed formula mixed with water containing fluoride at this level may still have a chance of developing tiny white lines or streaks in their teeth. These marks are referred to as mild to very mild fluorosis, and are often only visible under a microscope. Even in cases where the marks are visible, they do not pose any health risk. The CDC considers it safe to use optimally fluoridated water for preparing infant formula.

To lessen this chance of dental fluorosis, you may choose to use low-fluoride bottled water to prepare infant formula. Nevertheless, children may still develop dental fluorosis due to fluoride intake from other sources such as food, toothpaste and dental products.

Contact your health provider or SWRCB-DDW if you have concerns about dental fluorosis. For additional information about fluoridation or oral health, visit the CDC website ***www.cdc.gov/fluoridation*** or SWRCB-DDW website ***www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/Fluoridation.shtml***.

DRAFT

Megan Nolet – Project Manager, Due Diligence

BA- Environmental Studies, Brown University, Providence, RI

Ms. Nolet provides project management to ensure ASTM compliance and satisfaction of client requirements for Phase I Environmental Assessments, Environmental Transaction Screens, Regulatory Database Review, and Historical Records Review.

Project experience for Ms. Nolet includes:

- Phase I Environmental Site Assessments (PHI ESA)
- Environmental Transaction Screens (ETS)
- Regulatory Database Review
- Historical Records Review

In addition, prior to joining the environmental consulting industry, Ms. Nolet spent four years studying a diverse range of environmental disciplines including: environmental health, coastal ecology and conservation, environmental statistics, ecology, conservation biology, environmental law and policy, and science communications.

DRAFT

Steven H. Yekich – National Client Manager

B.S. – Earth Science, State University of New York at Brockport

AHERA Asbestos Inspector – The Environmental Institute

Annual 40 Hour HAZWOPER

Mr. Yekich has over 16 years of experience in the environmental consulting field and has performed ASTM Phase I-II Environmental Site Assessments (ESAs) and subsequent phases of investigation/cleanups for banks, Certified Development Companies (CDCs), private investment groups, private landowners and large commercial/industrial facilities throughout the United States. This work has included dozens of subsurface investigations of contaminated soil and/or groundwater and vapor intrusion, involving underground storage tanks, manufacturing facilities, and dry-cleaning facilities. Mr. Yekich worked for an in/ex-site chemical oxidation/reduction company which designed and implemented injections throughout the Southeast which involved the use of several chemical agents. In addition, Mr. Yekich has been a Senior Author for over 1500 ASTM Phase I's, Phase II's, Environmental Transaction Screens (ETS), and SBA Record Search's (RSRA).

Project experience for Mr. Yekich includes:

- **WOOD TREATING FACILITY, EAST POINT, GEORGIA**

  Mr. Yekich provided technical and field support associated with semi-annual monitoring of existing well network which included clustered shallow, intermediate, and deep wells along with assistance of RCRA Part B permitting for an operating wood treatment facility contaminated with pentachlorophenol (PCP), cresol, naphthalene, chlorinated solvents, and petroleum-type constituents. The facility was documented to contain several Solid Waste Management Units (SWMUs) along with Hazardous Waste Management Units (HWMUs), consisting of a former waste disposal pit and pressure vessel areas utilizing PCP. In addition, Mr. Yekich developed a sampling protocol following US EPA guidance documentation and implemented the sampling event using field staff, which was overseen by the Georgia Environmental Protection Division (GA EPD) personnel during sampling events. A semi-annual Corrective Action Report (CAR) was prepared and submitted to the Georgia Environmental Protection Division (GA EPD) using the data collected.

- **FORMER COTTON MILL, BUILDING RENOVATION & BROWNFIELD SITE, MONROE, GEORGIA**

  Mr. Yekich performed an extensive Phase I/II assessment followed by preparation of a Prospective Purchaser Corrective Action Plan (PPCAP) at a late-1800's cotton mill. Environmental concerns were identified through a review of historic Sanborn maps, aerials, and interviews and included former diesel ASTs, USTs, ruptured transformers, a cooling pit, and a dry pond previously used to dispose of coal ash. The assessment also identified the presence of asbestos

DRAFT

containing piping throughout the facility. Mr. Yekich oversaw the abatement of damaged areas of the piping and prepared an Operation & Maintenance Plan for addressing materials left in-place. Extensive Phase II Site Investigations were performed on a "rush" basis to investigate the subsurface RECs. The results indicated the presence of several RCRA metals and PAHs in soils exceeding regulatory limits, particularly in the pond area due to coal ash layer. A Brownfield CAP was prepared and approved by the Georgia EPD along with a plan for additional assessment and eventual remedial action.

- **FORMER COMMERCIAL PRINTER, OAKWOOD, GEORGIA**

  Mr. Yekich provided technical and field support associated with a Phase I/II ESA prior to redevelopment into a Wal-Mart Supercenter. The Phase I ESA identified the mixing of paint along with raw materials located in underground storage tanks (USTs), which included both hazardous and petroleum-type substances. In addition, the facility was identified to have utilized two septic tank systems. Mr. Yekich installed 12 monitoring wells, which included Type II and II wells in order to delineate the horizontal and vertical extent of dissolved phase petroleum hydrocarbons, hazardous solvents, and RCRA Metals, associated with past printing operations, USTs, hazardous storage room, and septic tank systems. Contamination was confirmed resulted from the former operations released in soil and groundwater. Mr. Yekich also established site specific metal background concentration and also assisted in preparation of the Prospective Purchaser Corrective Action Plan (PPCAP) report which recommended Dig and Haul to remove the constituents of concern (COCs) to below the applicable Risk Reduction Standard (RRS).

- **FORMER SERVICE STATION, ATLANTA, GEORGIA**

  Mr. Yekich provided technical and field support associated with a Corrective Action Plan – Part "B", which included the installation of 5 monitoring well to further delineate the horizontal and vertical extent of Free Product and dissolved phase petroleum hydrocarbons in soil and groundwater. Mr. Yekich assisted in preparation of the CAP-B report which recommended In-site Chemical Oxidation (ISCO) to treat petroleum hydrocarbons.

- **MISCELLANEOUS ASSESSMENT/REMEDIATION PROJECTS**

  Mr. Yekich has extensive experience in subsurface soil and groundwater assessments and remediation in a variety of geologic/hydrogeologic provinces (Piedmont, Coast, Valley & Ridge, and Blue Ridge). His drilling assessment experience includes: direct-push technology (DPT), NQ rock coring, air-rotary, hollow-stem auger, and rotosonic drilling methods. Remediation methods utilized have included Chemical Oxidation/Reduction (ISCO/ISCR), both in-situ or ex-situ, Enhanced Bioremediation, Soil Vapor Extraction (SVE), Air-Sparging (AS), Dual-Phase Extraction (DPE) and other related technologies.

Technical reports prepared by Mr. Yekich have included Phase I/II/III property assessments, CAP/CSRs, PPCAPs, Quarterly/Semi-Annual monitoring reports for UST/RCRA facilities, SPCC Plans, Storm Water Plans, Asbestos Survey Reports, and U.S. Army Corps of Engineers (USACE) Wetland Delineation/Permitting reports and permits.

- **AEROSPACE PARTS MANUFACTURER PORTFOLIO, THROUGHOUT THE U.S.**

  Mr. Yekich provided technical review support associated with eight (8) aerospace manufacturing facilities located throughout the United States for a large regional banking client. Several of the facilities dated back into the 1940s and 50s. The facilities manufactured aerospace parts which involved shaping, bending, grinding, sandblasting, and chemical etching. Several of the facilities utilized vapor degreasers, wastewater lagoons, vats/pits, and numerous hazardous solvents as part of their operations, which included trichloroethene (TCE), 1,1,1-trichloroethane (1,1,1-TCA).

- **MISCELLANEOUS CHEMICAL INJECTION PROJECTS**

  Mr. Yekich provided technical design of chemical oxidation/reduction along with implementation of sodium persulfate (Klozur), sodium permanganate, Fenton's reagent, surfactants, and chemical reduction using Zero Valent Iron (ZVI) to various environmental consulting companies throughout the United States, and worked closely with manufacturers of these chemicals which included FMC Corporation, Carus Corporation, Adventus Group, and VeruTek Technologies. Mr. Yekich attended Battelle Symposium, AIGP events, and gave numerous PowerPoint presentations to consulting companies and their clients. Mr. Yekich also presented at the Alabama Department of Environmental Management (ADEM), groundwater conference in Montgomery, Alabama, in addition to hosting a large presentation for environmental consultants in Alabama, which included the presentation of all the chemical manufacturers listed above, discussion of their products, case studies, and audience participation. Mr. Yekich also prepared case studies using activated persulfate (Klozur), which are posted on the FMC Corporation website.

- **FORMER INDUSTRIAL MANUFACTURER, OPELIKA, AL**

  Mr. Yekich assisted in the design and implementation of a former large manufacturing plant which manufactured exercise equipment. This facility was contaminated with chlorinated ethene's and ethane's, in addition to petroleum related constituents. Over 1,000 injections points were installed throughout the interior and exterior portions of the subject buildings, which received various concentrations of activated persulfate using sodium hydroxide, over the course of several injections.

DRAFT

- **FORMER TRUCKING FACILITY, ATLANTA, GA**

  Mr. Yekich helped design and implement a large ex-situ soil blending project on behalf of the GEPD and their client, in order to reduce Free Product and dissolved petroleum-impacted groundwater. This project involved the excavation of petroleum-impacted soils; transportation of soil via front end loaders into industrial sieves, placement of sieved soils into a modified soil blending machine, which applied activated persulfate with iron and hydrogen peroxide as the activators. The material was stockpiles pending laboratory analysis, and placed back into the excavation. Monitoring wells were installed within the excavation area to document the decreasing concentrations. Dewatering of petroleum-impacted groundwater was placed inside aboveground storage tanks (ASTs), pending transportation to an off-site waste facility.

GEOTECHNICAL INVESTIGATION
1180 Main Street
Redwood City, California

1.0 INTRODUCTION

This report presents the results of a geotechnical investigation performed by Langan Engineering and Environmental Services, Inc. (Langan) for the proposed development at 1180 Main Street in Redwood City, California. The site is bound by Pennsylvania Avenue and railroad tracks (Caltrain) to the northeast, Main Street to the east, Elm Street to the south, Lathrop Street to the southwest, and Maple Street to the northwest; the approximate site location is shown on Figure 1. The site is irregularly shaped with long dimensions of about 300 feet by 400 feet and a total area of about 1.3 acres.

Previously, the site appears to have been occupied by buildings, concrete slabs and paved parking lots, which were demolished in mid- to late-2011. The majority of the site is currently a vacant lot with scattered vegetation, with the exception of the southeast corner of the site, which is currently occupied by a one-story commercial building, and the northwest portion of the site, which contains an open, concrete-lined channel for Redwood Creek and an associated concrete stormwater detention area.

We understand the proposed project consists of an approximately 112,000 square foot four-story office building above two levels of underground parking[1], with the lowest basement level located approximately 21½ feet below the existing ground surface (bgs). The project also includes the development of a public park to be located along the western side of the proposed office building and a pedestrian bridge within the park that will span across the existing culvert that runs through the southwest portion of the property.

We previously performed a preliminary geotechnical study of the site based on available geotechnical data in the vicinity and presented our findings in a letter dated 18 August 2017.

2.0 SCOPE OF SERVICES

Our services were performed in general conformance with our scope of services outlined in our proposal dated 1 December 2017, and included drilling two borings at the project site to

[1] Based on plans titled "1180-90 Main Street Planning Application, Office Building by Premia Capital" by brick architects, dated 26 February 2018.

supplement the available data and collect physical soil samples. We used the results of our field exploration and findings from our preliminary geotechnical study to develop conclusions and design-level recommendations regarding:

- soil and groundwater conditions;
- most appropriate foundation type(s) for the proposed building;
- design criteria for the appropriate foundation types, including final vertical and lateral capacities;
- estimates of total and differential settlement of new foundations;
- site seismicity and seismic hazards, including liquefaction and associated hazards;
- 2016 California Building Code (CBC) seismic design criteria, including site classification, mapped values S_S and S_1, modification factors F_a and F_v and S_{MS} and S_{M1};
- site grading, including criteria for fill quality and compaction;
- soil subgrade preparation;
- excavation, dewatering, and temporary cut slopes;
- design of below-grade walls;
- temporary shoring
- concrete flatwork; and
- construction considerations.

3.0 FIELD EXPLORATION

3.1 Previous Investigations

Geotechnical investigations[2],[3] of the site were performed by others for a proposed development that was not constructed; data from those reports was reviewed by us and used as part of this study. During those investigations, five borings were drilled and four Cone Penetration Tests (CPTs) were advanced in the northern and central portions of the site. Logs

[2] Report by TRC titled "Preliminary Geotechnical Investigation, Lathrop Post-Acute Recovery Center, 134 Maple Street, Redwood City, California," dated 12 June 2008

[3] Report by TRC titled "Geotechnical Investigation and Geologic Hazards Review, Lathrop Post-Acute Recovery Center, 134 Maple Street, Redwood City, California," dated 31 August 2009

of the borings and CPTs and laboratory test results are presented in Appendix A and the locations are presented on Figure 2.

As part of our preliminary investigation we advanced three Cone Penetration Tests (CPTs). The CPTs, designated as CPT-1 through CPT-3, were performed at the approximate locations shown on Figure 2. The CPTs were advanced to depths of about 52 feet below ground surface (bgs). The CPTs were performed by hydraulically pushing a 1.7-inch-diameter, cone-tipped probe, with a projected area of 15 square centimeters, into the ground. The cone tip measures tip resistance, and the friction sleeve behind the cone tip measures frictional resistance. Electrical strain gauges or load cells within the cone continuously measured the cone tip resistance and frictional resistance during the entire depth of each probing. Accumulated data was processed by computer to provide engineering information, such as the types and approximate strength characteristics of the soil encountered. The CPT logs, showing tip resistance, side friction and friction ratio by depth, pore pressures, and interpreted soil classification, are presented in Appendix B. Soil types were estimated using the classification chart included in Appendix B.

Pore-pressure dissipation tests (PPDTs) were performed during each of the CPTs. PPDTs are conducted at various depths to measure hydrostatic water pressures and to determine the approximate depth of the groundwater level. The variation of pore pressure with time is measured behind the tip of the cone and recorded. For this investigation, the duration of the tests was about 5 minutes. The results of the three PPDTs are presented Appendix B.

3.2 Current Field Exploration

To further evaluate the subsurface conditions at the site, we performed a field exploration on 8 February 2018, which consisted of drilling two borings, designated B-1 and B-2, respectively. The approximate locations of the borings are presented on Figure 2.

Prior to commencing our field work, we obtained the necessary soil boring permit from the San Mateo County Health System's Environmental Health Division (SMCHSEHD). We also retained a private utility locating subcontractor to check for underground utilities at each boring location and, as required by law, we notified Underground Service Alert (USA) at least 72 hours prior to the start of work.

The borings were drilled by Pitcher Drilling of Palo Alto using a truck-mounted rig equipped with rotary wash drilling equipment. Both borings were drilled to depths of approximately 41½ feet

bgs. During drilling, our field engineers logged the borings and obtained representative samples of soil encountered for classification and laboratory testing. The boring logs are presented in Appendix C on Figures C-1 and C-2. The soil was logged in accordance with the soil classification system described on Figure C-3.

Soil samples were obtained using the following sampler types.

- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch-outside diameter and a 1.38-inch-inside diameter, without liners
- Sprague and Henwood (S&H) split-barrel sampler with a 3.0-inch-outside diameter, 2.5 inch-inside diameter, lined with 2.43-inch inside diameter stainless steel tubes
- Shelby Tube (ST) sampler with a 3-inch outside diameter and a 2.93-inch inside diameter

The sampler types were chosen on the basis of soil type and desired sample quality for laboratory testing. In general, the SPT sampler was used to evaluate the relative density of sandy soil and the S&H sampler was used to obtain samples in medium stiff to very stiff cohesive soil. The ST sampler was used to obtain relatively undisturbed samples of soft to medium stiff cohesive soils.

The SPT and S&H samplers were driven with a 140-pound, above-ground, automatic safety hammer falling 30 inches. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers every six inches of penetration were recorded and are presented on the boring logs. A "blow count" is defined as the number of hammer blows per six inches of penetration. The blow counts required to drive the S&H and SPT samplers were converted to approximate SPT N-values to account for sampler type and hammer energy using factors of 0.7 and 1.2, respectively. The blow counts used for this conversion were the last two blow counts of an 18-inch drive. The final converted blow counts for each sample are shown on the boring logs.

The ST samplers were pushed hydraulically into the soil; the piston pressures, measured in pounds per square inch (psi), required to advance the samplers are shown on the logs.

Upon completion, both borings were backfilled with grout consisting of cement and water in accordance with the requirements of the SMCHSEHD. The soil cuttings generated from the borings were placed in 55-gallon drums, stored temporarily at the site, and later transported off-site for disposal.

3.3 Laboratory Testing

The soil samples from the field exploration program were re-examined in the office by our engineer for soil classifications, and representative samples were selected for laboratory testing. Samples were tested to measure moisture content, dry density, fines contents, plasticity (Atterberg Limits), shear strength, and compressibility. Results of the laboratory tests are included on the boring logs and in Appendix D.

4.0 SITE AND SUBSURFACE CONDITIONS

4.1 Site Conditions

A one-story commercial building exists in the southeast corner of the site. In the northwest portion of the site exists an open, concrete-lined channel for Redwood Creek and an associated concrete stormwater detention area, located immediately adjacent to the channel. The remaining majority of the site is currently a vacant lot occupied by scattered vegetation. Site elevations outside of the creek channel and stormwater detention areas generally vary between about 15½ feet[4] and 17 feet. Within the stormwater detention area, the ground slopes down from about Elevation 16 to approximately Elevation 11 feet; within the existing Redwood Creek channel area, the ground slopes down to a minimum elevation of approximately 6 feet.

Previously, the site appears to have been occupied by buildings, concrete slabs, and paved parking lots, which were demolished in mid- to late-2011.

4.2 Subsurface Conditions

The results of previous investigations and our field investigation indicate that the project site is blanketed by up to 4½ feet of fill consisting of sand with clay, sandy clay, and clay with varying amounts of asphalt, concrete and brick debris; in addition along the northeast boundary railroad ballast rock was encountered in the fill. The fill is underlain by a layer of medium stiff to very stiff clay that extends to depths of about 15 to 22 feet bgs, except at CPT-2 where medium dense sand was encountered to depths of about 12 feet overlying the clay layer. Atterberg limits tests indicate the upper few feet of the clay has high expansion potential. Below the clay is an approximately 7 to 23 foot thick layer of loose to dense sand with varying fines content.

[4] Elevations based on plan titled "1180/1190 Main Street Planning Submittal Existing Conditions Plan" by BKF Engineers, Surveyors, Planners, dated 11/20/17. All elevations provided herein reference Redwood City Datum (RCD), unless otherwise noted.

These sand layers were found to extend to depths ranging from about 22 to 39 feet bgs, roughly corresponding to Elevations -6 and -23 feet, respectively. Underlying these sand layers is stiff to very stiff clay, to the maximum explored depth of 50 feet bgs.

Due to the use of rotary wash drilling methods, the groundwater level was obscured during drilling operations. PPDTs performed as part of our preliminary investigation indicate groundwater is at depths of about 10 to 12 feet bgs, roughly corresponding to Elevations 6 and 4 feet, respectively. This matches with groundwater measurements taken during drilling of borings by others, where groundwater was encountered at depths of 12 to 15 feet bgs. However, all groundwater levels were measured at the time of the respective investigations and likely do not represent the stabilized groundwater level. Seasonal fluctuations in rainfall influence groundwater levels and may cause several feet of variation. The California Geological Survey, as part of their Seismic Hazards Zone Report (Palo Alto Quadrangle) reported the historic high groundwater level in this area on the order of 5 feet bgs, roughly corresponding to Elevation 11 feet.

5.0 REGIONAL SEISMICITY

The major active faults in the area include the San Andreas, Monte Vista-Shannon, San Gregorio, Hayward, and Calaveras faults. These and other active faults in the region are shown on Figure 3. For each of the active faults within 50 kilometers of the site, the distance from the site and estimated mean characteristic Moment magnitude[5] are summarized in Table 1 [2007 Working Group on California Earthquake Probabilities (WGCEP) (2008) and Cao et al. (2003)].

[5] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude
Monte Vista-Shannon	5.4	Southwest	6.50
N. San Andreas - Peninsula	6.9	West	7.23
N. San Andreas (1906 event)	6.9	West	8.05
San Gregorio Connected	21	West	7.50
Total Hayward	24	Northeast	7.00
Total Hayward-Rodgers Creek	24	Northeast	7.33
Total Calaveras	33	East	7.03
N. San Andreas - Santa Cruz	39	Southeast	7.12
Mount Diablo Thrust	44	Northeast	6.70
N. San Andreas - North Coast	46	Northwest	7.51
Zayante-Vergeles	49	Southeast	7.00

Figure 3 also shows the earthquake epicenters for events with magnitude greater than 5.0 from January 1800 through August 2014. Since 1800, four major earthquakes have been recorded on the San Andreas Fault. In 1836 an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale (Figure 4) occurred east of Monterey Bay on the San Andreas Fault (Toppozada and Borchardt 1998). The estimated Moment magnitude, $M_{w,}$ for this earthquake is about 6.25. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), an M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The Loma Prieta Earthquake occurred on 17 October 1989, in the Santa Cruz Mountains with an M_w of 6.9, approximately 35 kilometers from the site.

In 1868 an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward Fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras Fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake (M_w = 6.2). The most recent earthquake to be felt in the Bay Area occurred on 24 August 2014 south of Napa, with an M_w

of 6.0; the fault responsible for this quake is still being determined, but is believed to have occurred within the Napa fault system, with the epicenter located approximately 103 km from the site.

The 2014 WGCEP (2015 report) at the U.S. Geologic Survey (USGS) predicted a 72 percent chance of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area in 30 years. More specific estimates of the probabilities for different faults in the Bay Area are presented in Table 2.

TABLE 2
WGCEP (2015) Estimates of 30-Year Probability of a Magnitude 6.7 or Greater Earthquake

Fault	Probability (percent)
Hayward-Rodgers Creek	32
N. San Andreas	33
Calaveras	25
Green Valley	7
San Gregorio	6
Mount Diablo Thrust	4

6.0 SEISMIC HAZARDS

During a major earthquake, strong to violent ground shaking is expected to occur at the project site. Strong ground shaking during an earthquake can result in ground failure such as that associated with soil liquefaction[6], lateral spreading[7], cyclic densification[8], and fault rupture. Each of these conditions has been evaluated based on our literature review, field investigation, and analysis and are discussed in this section.

[6] Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits.

[7] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[8] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground-surface settlement.

6.1 Liquefaction

When saturated soil with little to no cohesion liquefies during a major earthquake, it experiences a temporary loss of shear strength as a result of a transient rise in excess pore water pressure generated by strong ground motion. Flow failure, lateral spreading, differential settlement, loss of bearing, ground fissures, and sand boils are evidence of excess pore pressure generation and liquefaction.

As noted in our preliminary geotechnical study, the site is within a zone designated with the potential for liquefaction, as identified by the California Geologic Survey in a map titled, "State of California Seismic Hazard Zones, Palo Alto 7.5-Minute Quadrangle," prepared by the California Geologic Survey (2006)." Specifically, the map shows the site is in an area "where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693 (c) would be required."

We generally followed the procedures presented in the 1996 NCEER and the 1998 NCEER/NSF workshops on the Evaluation of Liquefaction Resistance of Soils (Youd and Idriss 2001) for the evaluation of liquefaction triggering for the soils at the site. The level of ground shaking used in our liquefaction evaluation was based on the Maximum Considered Earthquake (MCE) mapped values. A modified peak geometric mean ground acceleration (PGA_M) of 0.68 times gravity was used in our analyses. This PGA was calculated using the procedures specified in the 2016 CBC, using site class D. A depth to groundwater of 5 feet bgs was used in our analyses.

As noted in Section 4.2, approximately 7 to 23 feet of loose to dense sand with varying fines content was encountered during our field investigation. Within this layer, loose to medium dense granular deposits up to four feet thick were encountered in several borings and CPTs. Based on the representative blow counts within these layers and low to moderate plasticity of the fines, we judge excess pore water pressure could be generated in these layers during a Maximum Considered Earthquake (MCE_R) event, causing them to liquefy.

We used the Tokimatsu and Seed (1987) method for evaluating earthquake-induced liquefaction settlement in the borings that could be expected during a major earthquake. Based on the results of our analyses, we estimate the layers that are potentially susceptible to liquefaction described above could experience post-earthquake settlements of up to about 2½ inches, where the layers are not removed as part of the excavation for the basement. Therefore we

estimate liquefaction-induced settlement of up to 2½ inches could occur outside of the building footprint, within the park and bridge areas. This settlement is expected to be erratic.

We anticipate the approximately 22 to 25 feet of soil will be excavated within the proposed building footprint to construct the planned basement levels, which will partially remove some of the soil susceptible to liquefaction. We estimate up to approximately one inch of settlement may occur in the soil that will remain beneath the proposed building footprint.

6.2 Lateral Spreading

Lateral spreading is a phenomenon in which a surficial soil displaces along a shear zone that has formed within a continuous underlying liquefied layer. The surficial blocks are transported downslope or in the direction of a free face, such as a channel, by earthquake and gravitational forces. Lateral spreading is generally the most pervasive and damaging type of liquefaction-induced ground failure generated by earthquakes.

The loose to medium dense sandy layers encountered at the site that are susceptible to liquefaction appear to be discontinuous. Additionally, the planned excavation will remove a portion of the soils within the building footprint that are susceptible to liquefaction. As a result, we conclude that the potential for lateral spreading to impact the proposed building foundation is low.

6.3 Cyclic Densification

Cyclic densification (also referred to as seismic densification and differential compaction) can occur during strong ground shaking in loose, granular deposits above the water table, resulting in ground surface settlement. The degree of susceptibility to cyclic densification is directly related to the relative density of the existing granular soils.

In general, the subsurface soils encountered at the site above the groundwater level are sufficiently dense and/or cohesive to resist significant cyclic densification. However, as noted in our preliminary geotechnical study, within the vicinity of CPT-2, approximately five feet of loose sand was encountered at a depth of about 5 feet. However, since CPT-2 is within the proposed building footprint, we anticipate that these soils will be removed as part of the excavation, and that no significant settlement from seismic densification during a major earthquake is anticipated.

6.4 Fault Rupture

Historically, ground surface displacements closely follow the traces of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. Therefore, we judge the risk of surface faulting at the site is low. However, in a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure is low.

7.0 DISCUSSION AND CONCLUSIONS

We conclude that the proposed development is feasible from a geotechnical standpoint, provided the recommendations presented in this report are incorporated into the project plans and specifications, and implemented during construction.

Based on the subsurface conditions at the site, assumed building loads, and planned basement depth of about 24½ feet bgs, we conclude the primary geotechnical issues for this project include:

- selection of an appropriate foundation system to support the building loads and accommodate estimated static and seismic settlements;
- design criteria for foundations and basement walls, including hydrostatic pressures;
- dewatering and support for proposed excavations and adjacent improvements during construction
- providing a stable subgrade and adequate working surface at the base of the excavation, and
- potential for seismically induced ground settlement.

These and other geotechnical issues are discussed in the remainder of this section.

7.1 Foundations and Settlement

At the time this report was prepared, structural loads for the building were not available. Therefore, we have assumed a load of 250 pounds per square foot (psf) per floor for sustained gravity loading based on past experience. As a result, we anticipate an average total bearing pressure on the order of 2,000 psf including the weight of foundations. We conclude that the

building can be supported on a mat foundation provided the estimated long-term total and differential settlements from the building loads are acceptable.

Due to the anticipated depth of the excavation, rebound of soil at the bottom of the excavation is expected. Once the building is constructed, these soils will recompress under new building loads, resulting in settlement of the building. Because the weight of the soil removed for the proposed basement excavation is about equal to the weight of the building and will not result in a significant net change in overburden pressure, the vast majority of this settlement is expected to be from recompression. For a sustained bearing pressure of 2,000 psf applied at approximately at the bottom of the excavation, we estimate long-term total consolidation settlement of up to about 1½ inches and differential settlement of up to about half of the total settlement between the center and edges of the proposed building. As a result, no significant settlements are expected to occur outside of the building footprint. However, the above estimated settlements should be recalculated once the actual building loads and final planned excavation depth are available. As previously discussed, we anticipate that the excavation for the basement will remove some of the soil layers that are susceptible to seismically-induced settlement during a major earthquake. However, about 1-inch of liquefaction induced settlement could occur beneath the building. This settlement should be added in addition to the static settlement under the weight of the proposed building.

The soil at the bottom of the proposed excavation varies across the site and is anticipated to consist of medium dense to dense sand and stiff to very stiff moderately compressible clays. The soil exposed at the foundation level will be susceptible to disturbance under construction equipment loads. To help protect the soil subgrade a working pad could be constructed. The pad should consist of open graded crushed rock and should be underlain by a geotextile fabric. This layer of crushed rock can also be used as part of the dewatering system. A 3- to 4-inch thick mud slab can be placed on the crushed rock and then the waterproofing can be installed and the mat constructed. The need for the working pad should be evaluated during when the bottom of the excavation is reached; however, for budgeting purposes an allowance for the working pad should be included.

7.2 Excavation and Shoring Considerations

We anticipate soil to be excavated from the site can be removed with conventional earthmoving equipment such as excavators and backhoes; debris may be encountered within the fill layer. Currently the southeast corner of the site is occupied by a one-story building; the site was also previously occupied other structures that were demolished. Buried foundations

from previous structures and the existing one-story building may require the use of jackhammers or hoe-rams to break apart and remove.

We anticipate that an excavation on the order of 25 feet will be needed to construct the planned basement levels and will require the excavation to be shored to protect the surrounding improvements. There are several key considerations in selecting a suitable shoring system. Those we consider of primary concern are:

- protection of surrounding improvements, including roadways, utilities, and the nearby railroad tracks
- control of groundwater inflow
- the ability of the shoring system to reduce potential for ground movement
- penetration of shoring system into the dense/stiff soils below the bottom of the excavation
- cost

We judge the most economical shoring system for the project would consist of soldier piles, timber lagging, and tiebacks. Internal braces may be required if there are obstructions precluding the use of tiebacks or if extending them beyond property lines is not permitted. For a soldier beam-and-lagging system, steel soldier piles would be placed in predrilled holes and backfilled with lean and/or full-strength concrete prior to site excavation. Wood lagging would be placed between the soldier beams as the excavation proceeds. However, if sand with a low fines content is encountered within the zone of excavation, installation of lagging in the sand could be difficult. Drilling of the holes for the soldier piles will likely require casing and/or the use of drilling mud to prevent caving of sand and gravel layers. Alternatively, soldier piles may be installed by vibrating them, if they are not adjacent to existing improvements that are susceptible to vibration induced damage. If soldier piles are installed by vibration, vibration monitoring should be performed to evaluate the potential impact to adjacent improvements.

The shoring system is likely to deform during excavation of the basement, which could cause settlement of the adjacent railroad tracks. Furthermore, lowering the groundwater table outside of the excavation could also cause settlement to the tracks. This will need to be evaluated by the shoring designer. If the estimated ground movements near the tracks are unacceptable, it may be necessary to use a soil cement cutoff wall near the railroad tracks. Soil cement cutoff walls are stiffer than conventional soil pile and lagging systems and would reduce the potential for lowering the groundwater outside the excavation. However, a soil

cement cutoff wall is more expensive and also could impact the design of the basement since it is thicker than a conventional soil pile and lagging system. The need for a soil cement cutoff wall should be evaluated by the shoring designer. We can provide recommendations for a soil cement cutoff wall, if it is determined that they are needed.

7.3 Deflection and Settlement Monitoring

Shoring systems are expected to deflect during excavation. This lateral displacement could manifest itself as settlement or lateral movement of adjacent improvements. The magnitude of these movements is difficult to estimate because it depends on many factors, including the type of shoring system used and the contractor's skill in installing it. Clough and O'Rourke (1990) analyzed measured lateral displacements and associated ground settlements behind actual excavations in sand and concluded that both the lateral movements and settlements varied from 0.1 to 0.3 percent of the excavation depth. Therefore, for the anticipated excavation depths of about 25 feet, these empirical relationships would suggest the shoring will likely displace about ½ to 1 inch. The associated settlements predicted from the empirical data suggest ground surface settlements behind the shoring will have a similar magnitude as the lateral movement. This typically manifests itself as a settlement trough, with the greatest settlement occurring at a horizontal distance behind the shoring between ½ and 1 times the height of the excavation. Beyond this distance, settlement should decrease with distance from the wall, and should be very small at a distance twice the excavation depth. Therefore, we anticipate lateral displacements and associated settlements near the shoring will likely be about ½ to 1 inch. These estimates assume the quality of construction will meet or exceed that considered standard in the construction industry. Control of ground movement will depend as much on the timeliness of installation of lateral restraint as on the design. The shoring contactor should implement means and methods that will achieve the lower bound of the estimated range.

A monitoring program should be established prior to installing the shoring system to monitor and evaluate the effects of the construction on the adjacent improvements. The contractor should install survey points to monitor the movement of shoring and settlement of the adjacent building during excavation. The monitoring should provide timely data which can be used to modify the shoring system if needed. In addition, geotechnical instrumentation including inclinometers and piezometers should be installed to monitor movement of the shoring system and groundwater levels during excavation and construction.

As discussed in section 7.2, movements associated with a soldier pile and lagging system could adversely impact the adjacent improvements. Therefore, a stiffer shoring system may be required, such as a soil-cement mix wall or concrete diaphragm wall, where movements may adversely impact adjacent improvements. These systems are stiffer than a conventional soldier pile and lagging system and consequently, will deflect less. Recommendations for these types of shoring systems can be provided, if it is determined that the deflections from a tied-back soldier-pile-and-lagging system are not tolerable.

7.4 Groundwater Considerations

As noted in Section 4.2, groundwater was encountered during our site investigation between depths of about 10 to 12 feet, roughly corresponding to Elevations 6 and 4 feet, respectively. However, the reported historic high groundwater level in this area is at approximately 5 feet bgs, which corresponds to Elevation 11 feet. Therefore, we conclude that a groundwater depth of about 5 feet, roughly corresponding to Elevation 11 feet, is appropriate for design of the building. The building should be designed to resist hydrostatic uplift pressures resulting from this groundwater elevation.

The excavation to install the mat foundation for the building is anticipated to extend about 20 feet below the design groundwater table. To facilitate excavation and construction of the foundation, groundwater should be lowered to at least 3 feet below the bottom of the deepest planned excavation level, including excavation for waterproofing or subgrade stabilization.

If a soldier-pile-and-lagging shoring wall is installed, dewatering the excavation area will likely lower the groundwater near the railroad tracks. A performance specification should be provided as part of the shoring and dewatering bid documents to evaluate dewatering restrictions that may be imposed on the project due to the presence of the nearby railroad tracks.

Variables that will influence the performance of the dewatering system and the quantity of water produced include the shoring type installed, the number of wells, the depth and positioning of the wells, the interval over which each well is screened, and the rate at which each well is pumped. Different combinations of these variables can be used to successfully dewater the site. Selection of the shoring and dewatering systems should be coordinated to minimize overall costs. Groundwater testing and discharge fees should be anticipated.

8.0 RECOMMENDATIONS

Recommendations for site preparation, temporary shoring, dewatering, foundations, utilities, seismic design, permanent wall design, and other geotechnical aspects are presented in the following sections of this report.

8.1 Site Preparation

We understand the existing one-story commercial building in the southeast corner of the site and the existing concrete stormwater detention area will be demolished. In addition, existing pavements, abandoned utilities, and other obstructions including any buried foundations and slabs from previous structures, should be removed from areas to receive improvements. Where utilities to be removed extend off site, they should be capped or plugged with grout at the property line. It may be feasible to abandon utilities in-place, outside the proposed building footprint provided they will not interfere with future utilities, or building foundations or walls. If utilities are abandoned in-place, they should be completely filled with flowable cement grout over their entire length within the property limits. Existing utility lines, where encountered, should be addressed on a case-by-case basis. Voids resulting from the demolition activities should be properly backfilled with lean concrete or engineered fill as described below.

8.2 Temporary Shoring

The selection, design, construction, and performance of the shoring system should be the responsibility of the contractor. In particular, the shoring contractor should develop their own conclusions regarding the applicability of the selected shoring system, and provide alternative shoring types, if they deem necessary; however, any system should be reviewed and approved by the project design team. A registered civil engineer knowledgeable in this type of construction should be retained to design the shoring. We should review the final shoring plans and calculations to check that they are consistent with the recommendations presented in this report. In addition, a representative from our office should observe the installation and/or testing of the geotechnical aspects of the shoring.

If sand with a low fines content is encountered within the zone of excavation, lagging boards should be placed with every three feet of new excavation depth. If caving occurs, the lagging should be placed with every one foot of new excavation depth. Voids that result from caving soil behind wood lagging should be grouted before proceeding to the next row of lagging.

Where traffic occurs within 10 feet of the shoring depth, a uniform surcharge load of 100 psf acting over the top 10 feet should be included in the design. In addition, surcharge from existing buildings should be evaluated and accounted for in the design of the shoring walls as necessary. An increase in lateral design pressure for the shoring will also be required where heavy construction equipment or stockpiled materials are within a distance equal to the shoring depth. Construction equipment should not be allowed within five feet from the edge of the excavation unless the shoring is specifically designed for the appropriate surcharge. If cranes are planned outside of the proposed excavations, their foundations should be designed so as not to surcharge the shoring, or the shoring should be designed for the imposed surcharge. The increase in pressure should be computed after the surcharge loads are known. The anticipated deflections of the shoring system should be estimated by the shoring designer and provided to the design team and owner to check if they are acceptable.

8.2.1 Soldier-Pile and Lagging Walls

Tied-back soldier piles and lagging shoring should be designed using the lateral earth pressures presented on Figure 5. In developing the pressures shown on Figure 5, we assumed that groundwater will be lowered to a depth of at least three feet below the bottom of the excavation and not impose loads on the shoring system. The pressures presented on Figure 5 are for a level ground condition behind the shoring. Traffic or surcharge loads should be added to the active pressures. Both the passive resistance and active pressure are shown below the bottom of the excavation.

The shoring designer should evaluate the required penetration depth of the soldier piles. The soldier piles should have sufficient axial capacity to support the vertical load acting on the piles, if any. Vertical loads can be resisted by skin friction along the soldier piles. We recommend using an allowable skin friction of 1,000 psf in the soil on the perimeter of the piles below the excavation level. To compute the allowable skin friction (against the back side of the soldier piles) above the excavation level, we recommend an allowable friction coefficient of 0.3 times the horizontal component of the tieback force. End bearing of the soldier piles should be neglected.

8.2.2 Tiebacks

Temporary tiebacks may be used to restrain the shoring if encroachment agreements can be made with neighbors, if required, and there are no obstructions that cannot be avoided. Design criteria for tiebacks are presented on Figure 5.

Tiebacks should derive their load-carrying capacity from the soil behind an imaginary line sloping upward from a point H/5 feet away from the bottom of the excavation and sloping upwards at 60 degrees from the horizontal, where H is the wall height in feet. Tiebacks with bar and strand tendons should have a minimum unbonded length of 10 and 15 feet, respectively. The unbonded length should be created by placing an oversized rigid smooth plastic casing (i.e. PVC pipe) over the bars or strands; flexible plastic over the bars does not provide adequate bond-break for the unbonded zone. Clear spacing between tiebacks should be at least six times the grouted diameter of the bonded zone or four feet, whichever is greater. During installation of the shoring system, the bottom of the excavation should not extend more than two feet below a row of unsecured tiebacks.

Tieback allowable capacity will depend upon the drilling method, hole diameter, grout pressure, post-grouting, and workmanship. The use of solid-flight augers to install tiebacks in material susceptible to caving can result in loss of soil and settlement of existing improvements or the ground surface located above the tiebacks. Therefore, solid flight augers or Titan-type anchors should not be used for tieback installation. We recommend a smooth-cased tieback installation method (such as a Klemm type rig) be used. For estimating purposes, we recommend using the allowable skin friction value for post-grouted tiebacks shown on Figure 5, which includes a factor of safety of 1.5.

The contractor should be responsible for determining the actual length of tiebacks required to resist the lateral earth and water pressures imposed on the temporary retaining systems. Determination of the tieback length should be based on the contractor's familiarity with the chosen installation method. The computed bond length should be confirmed by a performance- and proof-testing program under our observation. Replacement tiebacks should be installed for tiebacks that fail the load tests.

8.2.3 Tieback Testing

Each tieback should be tested. The first two production tiebacks and two percent of the remaining tiebacks should be performance-tested to at least 1.25 times the design load. All other temporary tiebacks should be proof-tested to at least 1.25 times the design load. The performance tests will be used to determine the load carrying capacity of the tiebacks and the residual movement. The performance-tested tiebacks should be checked no sooner than 24 hours after initial lock off to confirm stress relaxation has not occurred. As the geotechnical engineer of record, we should evaluate the results of the performance tests and determine if creep testing is required and select the tiebacks that should be creep tested. If any tiebacks

fail to meet the proof-testing requirements, additional tiebacks should be added to compensate for the deficiency, as determined by the shoring designer.

During testing the maximum test load should not exceed 80 percent of the yield strength of the tendons or bars. The movement of each tieback should be monitored with a free-standing, tripod-mounted dial gauge during performance and proof testing.

8.2.3.1 Performance Tests

Performance tests will be used to determine the load carrying capacity and the load-deformation behavior of the tiebacks. They are also used to check that the designed unbonded length has been established. In the performance test, the load applied to the tieback and its corresponding movement is measured during several cycles of incremental loading and unloading. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 1, 2, 3, 4, 5, 6 and 10 minutes. If the difference between the 1- and 10-minute readings is less than 0.04 inch during the loading, the test is discontinued. If the difference is more than 0.04 inch, the holding period is extended to 60 minutes, and the movements should be recorded at 15, 20, 25, 30, 45, and 60 minutes.

As the geotechnical engineer of record, we should evaluate the results of the performance tests and determine if creep testing is required and select the tiebacks that should be creep tested. Creep tests should be performed in accordance with provision of "Recommendations for Prestressed Rock and Soil Anchors" of Post-Tensioning Institute.

8.2.3.2 Proof Tests

A proof test is a simple test used to measure the total movement of the tiebacks during one cycle of incremental loading. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 1, 2, 3, 4, 5, 6, and 10 minutes. If the difference between the 1- and 10-minute readings is less than 0.04 inch, the test is discontinued. If the difference is more than 0.04 inch, the load should be maintained and the observation is continued until the creep rate can be determined. The proof test results should be compared to the performance test results. Any significant variation from the performance test results will require performance testing on the tieback.

We should evaluate the results of performance and proof tests to check that the tiebacks can resist the design load. For any tiebacks that fail to meet the performance and proof testing requirements, additional tiebacks should be installed to compensate for the deficiency, as required by the shoring designer.

8.2.3.3 Acceptance Criteria

As the geotechnical engineer of record, we should evaluate the tieback test results and determine whether the tiebacks are acceptable. A performance- or proof-tested tieback with a ten-minute hold is acceptable if the tieback carries the maximum test load with less than 0.04 inch movement between one and ten minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length.

A performance- or proof-tested tieback with a 60-minute hold is acceptable if the tieback carries the maximum test load with a creep rate that does not exceed 0.08 inch/log cycle of time, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length.

If the total movement of the tiebacks at the maximum test load does not exceed 80 percent of the theoretical elastic elongation of the unbonded length, the tieback should be replaced by the contractor.

8.3 Dewatering

The groundwater should be drawn down within the limits of the excavation so that the groundwater level is at least three feet below the bottom of the excavation. This level should be maintained until sufficient building weight and/or uplift capacity is available to resist the design hydrostatic uplift pressure. Elevator and sump pits can be locally dewatered. Drawdown is expected to occur outside of the excavation; adjacent site improvements should be monitored for vertical movement that could be caused by the dewatering. Recharge wells should be installed and used to restore groundwater to preconstruction levels should unacceptable settlement of adjacent structures be observed.

The structural engineer should evaluate and provide recommendations for when the dewatering system can be turned off. The number and depth of dewatering wells should be determined by a specialty dewatering contractor using the design groundwater level presented herein. The volume of water discharged should be monitored and a record of the amount should be submitted to the owner. The design of the dewatering system should be coordinated with the temporary shoring design and also provided for review by the design team.

The site dewatering system should be designed and implemented by an experienced dewatering contractor and its designer in conjunction with the shoring designer and contractor, who should be responsible for the success of their system.

8.4 Excavation, Subgrade Preparation, and Backfill

The majority of the site grading for the project will consist of excavation for the building. Prior to site grading, existing building foundations and the concrete stormwater detention area in the northwest portion of the site, as well as other obstructions, should be removed. Obstructions, if encountered, may have to be partially removed before the shoring can be installed. Such removal may require the use of a hoe-ram or other demolition or coring equipment to break up the material for disposal off-site; care should be taken to minimize vibrations when removing obstructions from the site.

If space permits, temporary excavations for localized, shallow excavations such as elevator pits can be sloped no steeper than 1.5 to 1 (horizontal to vertical).

8.4.1 Mat Foundation Preparation

As noted in Section 7.1, the subgrade exposed at the bottom of the proposed building excavation is anticipated to consist of medium dense to dense sand and stiff to very stiff moderately compressible clay. We conclude the mat foundation may bear on this material, provided any potentially liquefiable material encountered at the subgrade is over-excavated to suitable material and replaced with either lean concrete or engineered fill.

Because the excavation for the basement level will be below the groundwater level, the soil at subgrade level will be near saturation even after dewatering. To protect the subgrade, we recommend heavy construction equipment not be allowed within 3 feet of subgrade elevation and that final excavation be made with excavators or backhoes with smooth buckets. Without an extended period for drying, we judge the subgrade may not support even light equipment and foot traffic without experiencing excessive disturbance.

To help protect the subgrade if it is soft and/or saturated, we recommend overexcavating the site and constructing a working pad on which to construct the mat. The need for the working pad should be evaluated once the bottom of the excavation is reached. If needed, we anticipate an overexcavation of about 12 inches will suffice, if used in conjunction with a woven reinforcing fabric (geotextile), such as Mirafi 500x. After placing the reinforcing fabric on the

exposed subgrade, the overexcavation should be backfilled with clean one-inch minus crushed rock.

Because the proposed basement foundation will be below the design groundwater level, waterproofing the base of the mat is recommended. We recommend the waterproofing be placed directly on the crushed rock or on a mud slab (thin layer of lean concrete) and be covered by a mud slab. The mud slab covering should reduce the potential for damage to the waterproofing and provide a firm, smooth surface on which to place the reinforcing steel for the mat. We recommend the waterproofing be placed in accordance with the manufacturer's specifications. If they differ from our recommendations, the manufacturer's specification should be followed to preserve their warranty.

As discussed in Section 7.1, depending on the amount of water at the subgrade elevation, it may be desirable to use a crushed rock working pad as a temporary drainage blanket. To drain the crushed rock, four-inch diameter perforated PVC pipe should be placed near the bottom of the rock, spaced every 30 feet, to direct water trapped in the rock to a sump. The sump should be properly abandoned before the completion of construction. In addition, a perimeter drain within or below the working pad may be needed to control and redirect infiltrating and perched water away from the mat subgrade. Typically, the perimeter drain extends 12 to 24 inches below the subgrade and slopes down to a low point where the water can be pumped.

The subgrade should be free of standing water, debris, and disturbed materials prior to placing the working pad or mud slab. We should check the exposed subgrade after cleaning, but prior to placement of the working pad, mud slab or waterproofing.

8.4.2 At-Grade Improvements

Other areas that will receive improvements (e.g. sidewalks and exterior slabs and concrete flatwork) should be stripped of existing improvements. The surface exposed by stripping should be scarified to a depth of at least eight inches, moisture-conditioned to at least three percent above optimum moisture content and compacted to between 88 and 93 percent relative compaction[9]. If soft or loose soil is encountered, the unsuitable material should be removed and be replaced with suitable fill material that is properly compacted and moisture conditioned. The exposed ground surface should be kept moist during subgrade preparation.

[9] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557-07 laboratory compaction procedure.

We recommend new sidewalks and concrete flatwork (in non-vehicular traffic area) be underlain by at least four inches of Class 2 aggregate base material that has been compacted to at least 90 percent relative compaction.

8.4.3 Backfill Requirements

On-site soils, are generally suitable for reuse as backfill provided they are non-corrosive, acceptable from an environmental standpoint, and meet the requirements given below for general fill. Soil below the groundwater table will require drying by aeration prior to its reuse as compacted fill. All materials to be used as fill, including on-site soil, should have a low corrosion potential, be non-hazardous, free of organic material, contain no rocks or lumps larger than three inches in greatest dimension, and have a low to moderate expansion potential (defined by a liquid limit of less than 40 and a plasticity index lower than 12). On-site soil that does not meet these criteria should not be used as fill.

Fill should be moisture conditioned to above optimum moisture content, placed in lifts not exceeding eight inches in loose thickness, and compacted to at least 90 percent relative compaction. However, if the fill is thicker than 5 feet or contains less than 10 percent fines (percent passing the No. 200 sieve) the fill should be compacted to at least 95 percent relative compaction. Aggregate base used beneath vehicular pavements should be compacted to 95 percent relative compaction. During construction, we should check that the on-site and any proposed import material is suitable for use as fill. A flowable cement grout, lean concrete, or lightweight cell-crete may be used to backfill areas not accessible to compaction equipment.

Langan should approve all sources of fill at least three days before use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed import material. A bulk sample of approved fill should be provided to the geotechnical engineer at least three working days before being imported or used at the site.

8.5 Mat Foundation

We conclude the proposed building can be supported on a mat foundation bottomed on firm native soil. As discussed in Section 7.1, we estimate total static settlement under the anticipated building loads will be up to about 1½ inches. Differential settlement of up to about

half of the total settlement is anticipated between the center and edges of the proposed building, although the actual differential settlement will depend on the rigidity of the mat.

To design the mat using the modulus of subgrade reaction method, we recommend a modulus of subgrade reaction of 15 kips per cubic foot. The modulus value is representative of the anticipated settlement under the building loads. After the mat analysis is completed, we should review the computed settlement and bearing pressure profiles to check that the modulus value is appropriate. The modulus value is applicable for allowable dead plus live loads up to about 4 kips per square foot.

In addition, the mat should be designed to accommodate the predicted seismic settlements discussed in Section 6. To account for potential liquefaction induced settlements we recommend the mat span an unsupported area of 5 feet in diameter in any location within the interior. The evaluation for areas of non-support is empirical and is not meant to model actual site performance; the purpose is to establish mat stiffness to control differential settlement.

Lateral forces can be resisted by a combination of passive resistance against the vertical face of the mat foundation and friction along the base of the mat. Passive resistance along the vertical face of the mat may be calculated using an equivalent fluid weight of 150 pounds per cubic foot (pcf). Friction along the bottom of the foundation will be affected by the type of waterproofing system used. The waterproofing manufacturer should provide a recommended friction coefficient based on testing of their product. For initial estimating, frictional resistance can be computed using a base friction coefficient of 0.2, which assumes a waterproofing membrane is placed below the mat. These values include a factor of safety of about 1.5 and may be used in combination without reduction.

The mat should be designed to resist hydrostatic pressure based on the design groundwater level.

8.6 Waterproofing

Because the building will extend below the groundwater level, waterproofing of the mat foundation and basement walls is recommended. Water stops should be placed across all construction joints. The waterproofing should be placed directly against the backside of the basement walls.

Waterproofing should be designed by an experienced waterproofing consultant and placed in accordance with the manufacturer's specifications. The use of a mud slab above and below

the waterproofing will reduce the potential for subgrade disturbance and protect the waterproofing from damage during mat construction, as discussed in Section 8.4.1. The mud slab should also provide a firm, smooth working surface for placement of reinforcing steel.

8.7 Tiedown Anchors

If the weight of the proposed building is not sufficient to overcome the hydrostatic uplift loads or if additional seismic uplift resistance is needed, the net upward pressure can be resisted by tiedowns. Tiedowns consist of relatively small-diameter, drilled, grout-filled shafts with steel bars or tendons embedded in the grout. The tiedowns develop their uplift resistance from friction between the perimeter of the shaft and the surrounding soil.

Tiedowns should be spaced at least four shaft diameters apart, with a minimum spacing of four feet. Because specialty contractors who install tiedowns use different installation procedures, the uplift capacity of the tiedowns will vary with the procedure. For planning purposes however, we recommend using an allowable friction of 1,000 psf for permanent uplift loads. For temporary/transient uplift loads, that value may be increased by one-third. Higher values can be obtained depending upon the installation techniques employed by the contractor and the results of pullout tests; anchors should be designed with factors of safety of at least 2.0 for permanent loads or 1.5 for transient loads.

Tiedowns will extend significantly below the bottom of the excavations and planned dewatering. Therefore, it is very likely the tiedowns will be subjected to a significant upgradient of groundwater pressure. The tiedown contractor should anticipate this condition and take the necessary precautions to reduce water flow along the tiedown interface, which can significantly impact tiedown installation, grout cover, and ultimate capacity of the tiedown.

Special attention should be given to waterproofing the connections between the tiedowns and the mat. If tiedowns are used they will be permanent and therefore we recommend they be double corrosion protected. Corrosion protection requirements for the bonded and unbonded length, and stressing anchorage are outlined below:

- encapsulations used to provide a corrosion protection layer over the tendon bond length should consist of a grout-filled, corrugated plastic sleeve, or grout-filled deformed steel tube; the prestressing steel can be grouted inside the encapsulation prior to inserting the tendon into the drill hole or after the tendon has been placed; centralizers or grouting techniques should provide a minimum of ½ inch of grout cover over the encapsulation

- a sheath filled with corrosion inhibiting compound or grout, or a heat shrinkable tube internally coated with a mastic compound should be used to provide corrosion protection of the unbonded length

- the trumpet should be sealed to the bearing plate and overlap the unbonded length corrosion protection by at least four inches; it should be completely filled with a corrosion inhibiting compound or grout

The tiedowns will be installed below the water table; therefore, the contractor should use an augercast system or be prepared to case the holes to prevent caving. High strength bars or strands may be used as tensile reinforcement in the anchors. For stressing, the steel bars and strands should have at least 10 and 15 feet of free length, respectively. If strands are used, a higher lock-off load will likely be required than if a steel bar is used. The lock-off load should be determined by the project structural engineer to limit elongation of the tiedown under the hydrostatic and/or transient loading.

The bond length should be at least 15 feet. The design capacity of the tiedowns should be confirmed by a performance- and proof-test program conducted under our observation. We recommend the first two production tiedowns and five percent of the remaining tiedowns be performance tested to two times the design load. The remainder should be proof tested to two times the design load. The test procedure and acceptance criteria described in Section 8.2.4 for tieback testing should also be used for tiedowns. Replacement tiedowns should be provided, as directed by the structural engineer, for tiedowns that fail the test. All tiedowns should be prestressed and locked off. The allowable amount of deformation after the tiedown is locked off should be determined by the structural engineer. The actual lock-off load should be determined after initial testing of the first few tiedowns.

8.8 Utilities and Utility Backfill

Underground utilities connecting to the proposed building should be designed to accommodate the predicted static settlements at the building perimeter. In addition, if it is desired to preserve utility connections during a major earthquake where they enter the building, the anticipated seismic settlements of the surrounding ground surface (up to about 2½ inches) should be considered. Where utilities enter and exit the buildings these settlements would need to be accommodated over a relatively short span using flexible connections. The decision to protect utility connections at the building perimeter during a major earthquake should consider that the utilities away from the site may experience significant movement and therefore not remain operational.

Utility trenches should conform to current OSHA requirements for slopes, shoring, and other safety concerns. The thickness and type of bedding material required for utility conduits will depend on the soil conditions at the utility trench bottom. Bedding and backfill material should follow the pipe manufacturer's recommendations. As a minimum, bedding should extend at least D/4 (with D equal to the outside pipe diameter) below the bottom of the pipe and should be at least four inches thick. After the pipes and conduits are tested, inspected (if required), and approved, they should be covered to a depth of at least six inches with sand or fine gravel, which should be mechanically tamped to at least 90 percent relative compaction. If backfill material with less than 10 percent fines is used, or if the trench is greater than 5 feet deep, the entire depth of the fill should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements resulting in damage to the pavement section. Utilities should be designed for potentially corrosive soil conditions.

8.9 Seismic Design

For seismic design in accordance with the provisions of 2016 California Building Code (CBC) we recommend the following:

- Risk-Targeted Maximum Considered Earthquake (MCE_R) S_s and S_1 of 1.712g and 0.79g, respectively;
- Site Class D;
- Site Coefficients F_a and F_v of 1.0 and 1.5;
- MCER spectral response acceleration parameters at short periods, S_{MS}, and at one-second period, S_{M1}, of 1.712g and 1.186g, respectively;
- Design Earthquake (DE) spectral response acceleration parameters at short period, S_{DS}, and at one-second period, S_{D1}, of 1.141g and 0.790g, respectively;
- PGAM of 0.68g.

8.10 Permanent Basement Walls

We recommend that basement walls be designed using the parameters presented in Table 3. Walls that are within 10 feet of the streets should be designed for an additional lateral pressure of 100 psf in the upper 10 feet. We should evaluate the magnitude of surcharge loads from adjacent buildings and the pressures should be accounted for in the basement wall design.

Because the site is in a seismically active area, the design of basement walls should be checked for static and seismic conditions to evaluate the governing condition. Under earthquake loading conditions, there will be a seismic increment that should be added to the active earth pressures. We used the procedures outlined in Sitar, et al. (2012) to compute the seismic increment. The more critical condition of either at-rest pressure or the active pressure plus seismic pressure increment should be used. The seismic increments for a Design Earthquake (DE) level for level backfill, are presented in Table 3.

TABLE 3
Basement Wall Design Earth Pressures

Elevation (feet)	Equivalent Fluid Weights for Static Conditions		Seismic Conditions[1]
	Unrestrained Walls (Active)	Restrained Walls (At rest)	Total Active Plus Seismic Pressure Increment[3]
Above Elevation 11 feet[2]	35 pcf	60 pcf	70 pcf
Below Elevation 11 feet	80 pcf	95 pcf	100 pcf

Notes:
1. The more critical condition of either at-rest pressure for static conditions or active pressure plus a seismic pressure increment for seismic conditions should be checked.
2. Based on the design groundwater level
3. Based on a design-level earthquake (PGA = 0.46g)

The lateral equivalent fluid weights given assume the walls are properly backdrained above the design groundwater table to prevent the buildup of hydrostatic pressure. If the walls are not drained above Elevation 11 feet, the full height of the wall should be designed for the equivalent fluid weights presented for below the ground water table. One acceptable method for backdraining the wall is to place a prefabricated drainage panel against the back of the wall. The drainage panel should extend down to a flat collector pipe at the design groundwater elevation. The pipe should be wrapped in filter fabric (Mirafi 140N or equivalent). We should check the manufacturer's specifications regarding the proposed prefabricated drainage panel material to verify it is appropriate for its intended use. The pipe should be connected to a suitable discharge point.

If backfill is required behind basement walls, the walls should be braced or hand-compaction equipment used to prevent unwanted surcharges on the walls.

8.11 Construction Monitoring

A monitoring program should be established to evaluate the effects of the construction on nearby buildings and improvements adjacent to the excavation. The contractor should install surveying points to monitor the movement of shoring and settlement of nearby structures and the ground surface during excavation. The monitoring should provide timely data which can be used to modify the shoring system if needed. In addition, geotechnical instrumentation including inclinometers and piezometers should be installed to monitor the effects of the dewatering and movement of the shoring system during excavation and construction. We recommend installing the instrumentation listed below:

Slope inclinometers: We recommend installing a minimum of three slope inclinometers adjacent to or within the proposed shoring system. Where possible, slope inclinometers should be installed behind the three shoring walls closest to the railroad tracks and extend to a depth of about two times the estimated excavation depth.

Piezometers: We recommend installing at least three piezometers along the walls closest to the railroad tracks. The upper five feet of the piezometers should be properly sealed with cement-bentonite mix to reduce surface water infiltration.

Survey points: Survey points should be installed on the shoring and on the streets and improvements adjacent to the proposed excavation. These points should be used to monitor the vertical and horizontal movements of the shoring and these improvements. These points should be selected with the help of the geotechnical engineer, so they can provide the most value to the project.

We should obtain inclinometer and piezometer readings regularly. Initially, depending upon the speed of excavation, the instrumentation should be read about every one to two weeks. The frequency of readings may, in the later stage of construction, be modified as appropriate. Results of survey monitoring should be submitted to us and the construction team in a timely manner for review.

In addition, the conditions of the existing railroad tracks adjacent to the site should be photographed and surveyed prior to the start of construction and monitored periodically during construction.

8.12 Site Drainage

Drainage control design should take into account the settlement of the building and surrounding improvements. It should include provisions for positive surface gradients so that surface runoff is not permitted to pond, particularly adjacent to structures, or on roadways or pavements. Surface runoff should be directed away from foundations to properly designed and installed drop inlets.

9.0 ADDITIONAL SERVICES DURING DESIGN, CONSTRUCTION DOCUMENTS, AND CONSTRUCTION QUALITY ASSURANCE

Prior to construction, we should review the project plans and specifications to check their conformance with the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing during site preparation, grading, placement and compaction of fill, and installation of shoring and building foundations. These observations will allow us to compare actual with anticipated soil conditions and to check that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

10.0 LIMITATIONS

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings and CPTs as well as information provided by Premia LLC. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others. Any proposed changes in structures or their locations should be brought to Langan’s attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan’s attention for evaluation, as they may affect our recommendations.

This report has been prepared to assist the Owner, architect, and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities on adjacent properties which are beyond the limits of that which is the specific subject of this report.

MAP OF MAJOR FAULTS AND EARTHQUAKE EPICENTERS IN THE SAN FRANCISCO BAY AREA

Date 03/12/18	Project No. 770643401	Figure 3

I **Not felt by people, except under especially favorable circumstances. However, dizziness or nausea may be experienced.**
Sometimes birds and animals are uneasy or disturbed. Trees, structures, liquids, bodies of water may sway gently, and doors may swing very slowly.

II **Felt indoors by a few people, especially on upper floors of multi-story buildings, and by sensitive or nervous persons.**
As in Grade I, birds and animals are disturbed, and trees, structures, liquids and bodies of water may sway. Hanging objects swing, especially if they are delicately suspended.

III **Felt indoors by several people, usually as a rapid vibration that may not be recognized as an earthquake at first. Vibration is similar to that of a light, or lightly loaded trucks, or heavy trucks some distance away. Duration may be estimated in some cases.**
Movements may be appreciable on upper levels of tall structures. Standing motor cars may rock slightly.

IV **Felt indoors by many, outdoors by a few. Awakens a few individuals, particularly light sleepers, but frightens no one except those apprehensive from previous experience. Vibration like that due to passing of heavy, or heavily loaded trucks. Sensation like a heavy body striking building, or the falling of heavy objects inside.**
Dishes, windows and doors rattle; glassware and crockery clink and clash. Walls and house frames creak, especially if intensity is in the upper range of this grade. Hanging objects often swing. Liquids in open vessels are disturbed slightly. Stationary automobiles rock noticeably.

V **Felt indoors by practically everyone, outdoors by most people. Direction can often be estimated by those outdoors. Awakens many, or most sleepers. Frightens a few people, with slight excitement; some persons run outdoors.**
Buildings tremble throughout. Dishes and glassware break to some extent. Windows crack in some cases, but not generally. Vases and small or unstable objects overturn in many instances, and a few fall. Hanging objects and doors swing generally or considerably. Pictures knock against walls, or swing out of place. Doors and shutters open or close abruptly. Pendulum clocks stop, or run fast or slow. Small objects move, and furnishings may shift to a slight extent. Small amounts of liquids spill from well-filled open containers. Trees and bushes shake slightly.

VI **Felt by everyone, indoors and outdoors. Awakens all sleepers. Frightens many people; general excitement, and some persons run outdoors.**
Persons move unsteadily. Trees and bushes shake slightly to moderately. Liquids are set in strong motion. Small bells in churches and schools ring. Poorly built buildings may be damaged. Plaster falls in small amounts. Other plaster cracks somewhat. Many dishes and glasses, and a few windows break. Knickknacks, books and pictures fall. Furniture overturns in many instances. Heavy furnishings move.

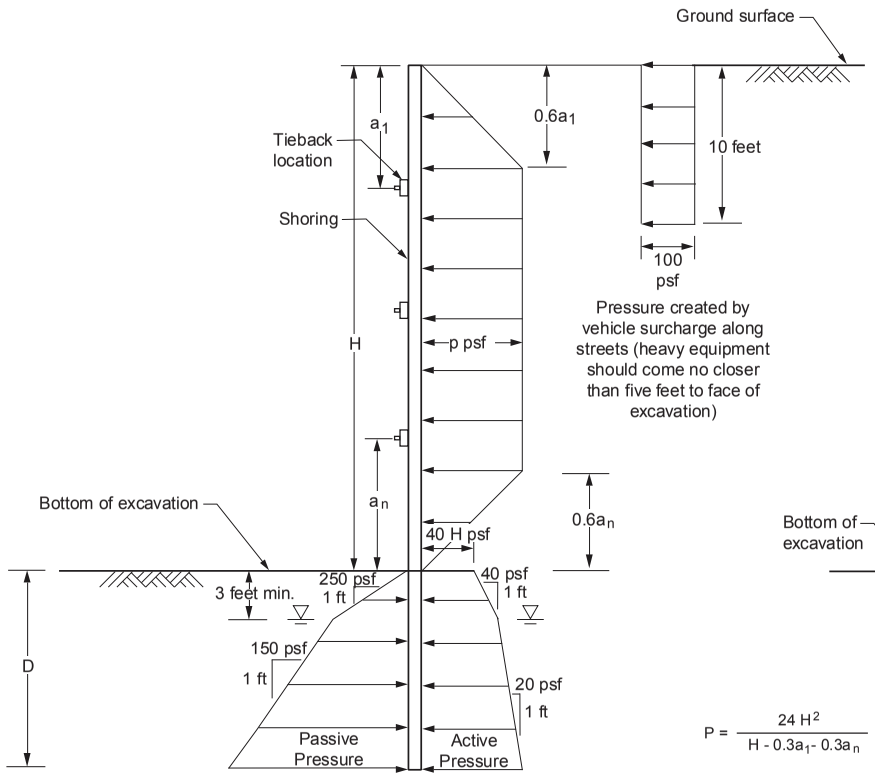
VII **Frightens everyone. General alarm, and everyone runs outdoors.**
People find it difficult to stand. Persons driving cars notice shaking. Trees and bushes shake moderately to strongly. Waves form on ponds, lakes and streams. Water is muddied. Gravel or sand stream banks cave in. Large church bells ring. Suspended objects quiver. Damage is negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in poorly built or badly designed buildings, adobe houses, old walls (especially where laid up without mortar), spires, etc. Plaster and some stucco fall. Many windows and some furniture break. Loosened brickwork and tiles shake down. Weak chimneys break at the roofline. Cornices fall from towers and high buildings. Bricks and stones are dislodged. Heavy furniture overturns. Concrete irrigation ditches are considerably damaged.

VIII **General fright, and alarm approaches panic.**
Persons driving cars are disturbed. Trees shake strongly, and branches and trunks break off (especially palm trees). Sand and mud erupts in small amounts. Flow of springs and wells is temporarily and sometimes permanently changed. Dry wells renew flow. Temperatures of spring and well waters varies. Damage slight in brick structures built especially to withstand earthquakes; considerable in ordinary substantial buildings, with some partial collapse; heavy in some wooden houses, with some tumbling down. Panel walls break away in frame structures. Decayed pilings break off. Walls fall. Solid stone walls crack and break seriously. Wet grounds and steep slopes crack to some extent. Chimneys, columns, monuments and factory stacks and towers twist and fall. Very heavy furniture moves conspicuously or overturns.

IX **Panic is general.**
Ground cracks conspicuously. Damage is considerable in masonry structures built especially to withstand earthquakes; great in other masonry buildings - some collapse in large part. Some wood frame houses built especially to withstand earthquakes are thrown out of plumb, others are shifted wholly off foundations. Reservoirs are seriously damaged and underground pipes sometimes break.

X **Panic is general.**
Ground, especially when loose and wet, cracks up to widths of several inches; fissures up to a yard in width run parallel to canal and stream banks. Landsliding is considerable from river banks and steep coasts. Sand and mud shifts horizontally on beaches and flat land. Water level changes in wells. Water is thrown on banks of canals, lakes, rivers, etc. Dams, dikes, embankments are seriously damaged. Well-built wooden structures and bridges are severely damaged, and some collapse. Dangerous cracks develop in excellent brick walls. Most masonry and frame structures, and their foundations are destroyed. Railroad rails bend slightly. Pipe lines buried in earth tear apart or are crushed endwise. Open cracks and broad wavy folds open in cement pavements and asphalt road surfaces.

XI **Panic is general.**
Disturbances in ground are many and widespread, varying with the ground material. Broad fissures, earth slumps, and land slips develop in soft, wet ground. Water charged with sand and mud is ejected in large amounts. Sea waves of significant magnitude may develop. Damage is severe to wood frame structures, especially near shock centers, great to dams, dikes and embankments, even at long distances. Few if any masonry structures remain standing. Supporting piers or pillars of large, well-built bridges are wrecked. Wooden bridges that "give" are less affected. Railroad rails bend greatly and some thrust endwise. Pipe lines buried in earth are put completely out of service.



XII **Panic is general.**
Damage is total, and practically all works of construction are damaged greatly or destroyed. Disturbances in the ground are great and varied, and numerous shearing cracks develop. Landslides, rock falls, and slumps in river banks are numerous and extensive. Large rock masses are wrenched loose and torn off. Fault slips develop in firm rock, and horizontal and vertical offset displacements are notable. Water channels, both surface and underground, are disturbed and modified greatly. Lakes are dammed, new waterfalls are produced, rivers are deflected, etc. Surface waves are seen on ground surfaces. Lines of sight and level are distorted. Objects are thrown upward into the air.

MODIFIED MERCALLI INTENSITY SCALE

Date 03/12/18	Project No. 770643401	Figure 4

$$P = \frac{24\,H^2}{H - 0.3a_1 - 0.3a_n}$$

Notes:
1. Passive pressure includes a factor of safety of about 1.5.
2. Pressures assume site and surrounding ground are successfully dewatered at least 3 feet below the bottom of the excavation.
3. Passive pressure should be assumed to act over the pile spacing or three pile diameters, whichever is smaller.
4. Surcharge pressure due to construction equipment, if any, should be added to the above shoring pressure.
5. Penetration depth (D) required should be determined by the shoring designer.
6. Active pressure below the excavation should be assumed to act over one pile diameter
7. Actual number of tieback rows to be determined by shoring designer.

APPENDIX A

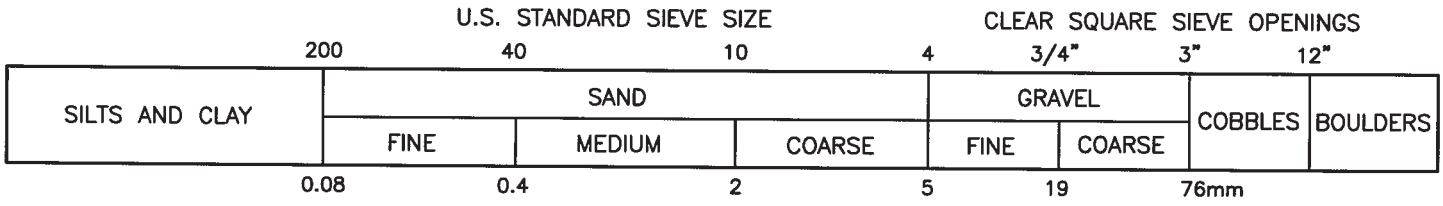
DATA FROM PREVIOUS INVESTIGATIONS

APPENDIX A

FIELD INVESTIGATION

The field investigation consisted of a surface reconnaissance and a subsurface exploration program using truck-mounted, hollow-stem auger drilling and cone penetration test (CPT) equipment. Three 8-inch-diameter exploratory borings were drilled on February 25, 2009 to a maximum depth of 45 feet; Four CPTs were hydraulically-pushed on February 20, 2009 to a maximum depth of 90 feet. CPT data was obtained at 0.16 feet (5 centimeter) intervals and consisted of cone tip resistance, sleeve friction, dynamic pore pressure and other parameters. The approximate locations of the exploratory borings and CPTs are shown on Figure 2. Figure 2 also shows our two previous exploratory borings. The soils encountered were continuously logged in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D2488). The logs of the borings and CPTs, as well as a key to the classification of the soil, are included as part of this appendix.

The locations of borings and CPTs were approximately determined by pacing from existing site boundaries. Elevations of the borings were not determined. The locations of the borings and CPTs should be considered accurate only to the degree implied by the method used.



Representative soil samples were obtained from the borings at selected depths. All samples were returned to our laboratory for evaluation and appropriate testing. Penetration resistance blow counts were obtained by dropping a 140-pound hammer 30 inches. Modified California 3.0-inch outside diameter (O.D.) samples and Standard Penetration Test (SPT) 2-inch O.D. samples were obtained by driving the samplers 18 inches and recording the number of hammer blows for each 6 inches of penetration. Unless otherwise indicated, the blows per foot recorded on the boring logs represent the accumulated number of blows required to drive the samplers the last two 6-inch increments. When using the SPT sampler, the last two 6-inch increments is the uncorrected SPT measured blow count. Relatively undisturbed samples were also obtained with 2.875-inch inside diameter Shelby Tube sampler, which were hydraulically pushed. The various samplers are denoted at the appropriate depth on the boring logs and symbolized as shown on Figure A-1.

The attached boring and CPT logs and related information depict subsurface conditions at the locations indicated and on the date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these boring and CPT locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition, any stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

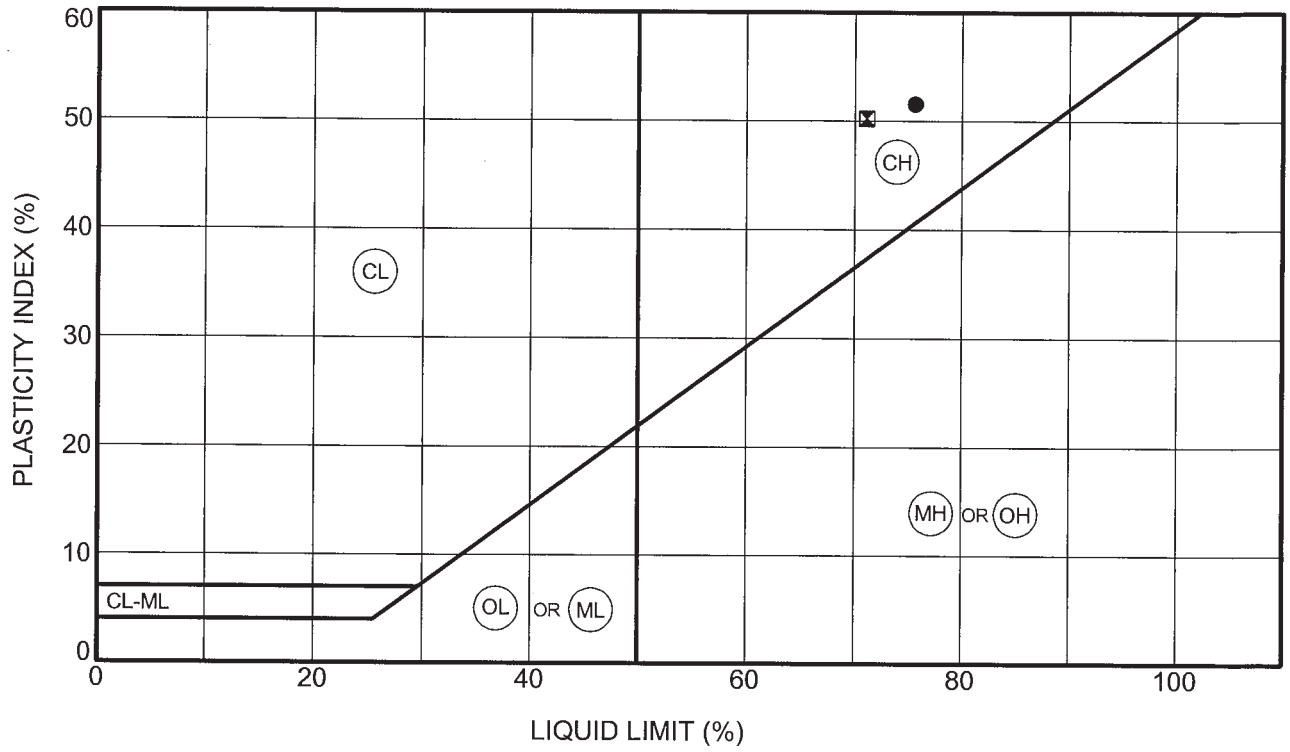
APPENDIX B
LABORATORY PROGRAM

The laboratory testing program was directed toward a quantitative and qualitative evaluation of the physical and mechanical properties of the soils underlying the site and to aid in verifying soil classification.

Moisture Content: The natural water content was measured (ASTM D2216) on 44 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.

Dry Densities: In place dry density tests (ASTM D2937) were performed on 28 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Plasticity Index: Plasticity Index (PI) tests (ASTM D4318) were performed on two samples of the subsurface soils to measure the range of water contents over which these materials exhibit plasticity. The PI was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are presented on Figure B-1 and on the logs of the borings at the appropriate sample depths.



Washed Sieve Analyses: The percent soil fraction passing the No. 200 sieve (ASTM D1140) was performed on nine samples of the subsurface soils to aid in the classification of these soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Unconfined Compression: Unconfined compression tests (ASTM D2166) were performed on two undisturbed samples of the clayey subsurface soils to evaluate the undrained shear strengths of these materials. Samples tested had a diameter of 2.5 inches and a height-to-diameter ratio of at least 2. Failure was taken as the peak normal stress. Results of these tests are presented on the boring logs at the appropriate sample depths.

Consolidation: One consolidation test (ASTM D2435) was performed on a relatively undisturbed sample of the subsurface clayey soils to assist in evaluating the compressibility property of this soil. Results of the consolidation test are presented graphically on Figure B-2.

R-Value: An R-value resistance test (California Test Method No. 301) was performed on a representative sample of the near surface soils at the site to provide data for the pavement design. The test indicated an R-value of less than 5. The results of the test are presented on Figure B-3.

Email: cpt@cptinc.com
www.cptinc.com

CALIFORNIA PUSH TECHNOLOGIES INCORPORATED

Introduction

The enclosed report presents the results of the site investigation program conducted by CPT Inc. for Langan Engineering at 1180 Main St in Redwood City, CA. The program consisted of three cone penetration tests (CPT) performed on July 26, 2017.

Project Information

Project	
Client	Langan Engineering
Project	1180 Main St
CPT Inc. project number	17-56073

A map from Google Earth including the CPT test locations is presented below.

Rig Description	Deployment System	Test Type
CPT truck rig (C15)	30 ton rig cylinder	CPT

Coordinates		
Test Type	Collection Method	EPSG Reference
CPT	Consumer grade GPS	32610

Cone Penetration Test (CPT)	
Depth reference	Depths are referenced to the existing ground surface at the time of each test.
Tip and sleeve data offset	0.1 meter This has been accounted for in the CPT data files.
Additional plots	Standard – expanded range and advanced CPT plots are provided in the data release package.

Cone Penetrometers Used for this Project						
Cone Description	Cone Number	Cross Sectional Area (cm^2)	Sleeve Area (cm^2)	Tip Capacity (bar)	Sleeve Capacity (bar)	Pore Pressure Capacity (psi)
447:T1500F15U500	447	15	225	1500	15	500
Cone AD447 was used for all CPT soundings.						

CPT Calculated Parameters	
Additional information	The Normalized Soil Behavior Type (SBT Q_{tn}) classification chart (Robertson, 2009) was used to classify the soil for this project. A detailed set of calculated CPT parameters have been generated and are provided in Excel format files in the release folder. The CPT parameter calculations are based on values of corrected tip resistance (q_t), sleeve friction (f_s) and pore pressure (u_2). Soils were classified as either drained or undrained based on the Normalized Soil Behavior Type (SBT Q_{tn}) classification chart (Robertson, 2009). Calculations for both drained and undrained parameters were included for materials that classified as silt mixtures (zone 4).

Limitations

This report has been prepared for the exclusive use of Langan Engineering (Client) for the project titled "1180 Main St". The report's contents may not be relied upon by any other party without the express written permission of CPT Inc. CPT Inc. has provided site investigation services, prepared the factual data reporting, and provided geotechnical parameter calculations consistent with current best practices. No other warranty, expressed or implied, is made.

The information presented in the report document and the accompanying data set pertain to the specific project, site conditions and objectives described to CPT Inc. by the Client. In order to properly understand the factual data, assumptions and calculations, reference must be made to the documents provided and their accompanying data sets, in their entirety.

The cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd. of Richmond, British Columbia, Canada.

CPT Inc.'s piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and a geophone sensor for recording seismic signals. All signals are amplified down hole within the cone body and the analog signals are sent to the surface through a shielded cable.

The penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm^2 and 15 cm^2 tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table presented in the first appendix. The 15 cm^2 penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm^2 piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 mm diameter over a length of 32 mm with tapered leading and trailing edges) located at a distance of 585 mm above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u_2" position (ASTM Type 2). The filter is 6 mm thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current ASTM D5778 standard. Our calibration criteria also meet or exceed those of the current ASTM D5778 standard. An illustration of the piezocone penetrometer is presented in Figure CPTu.

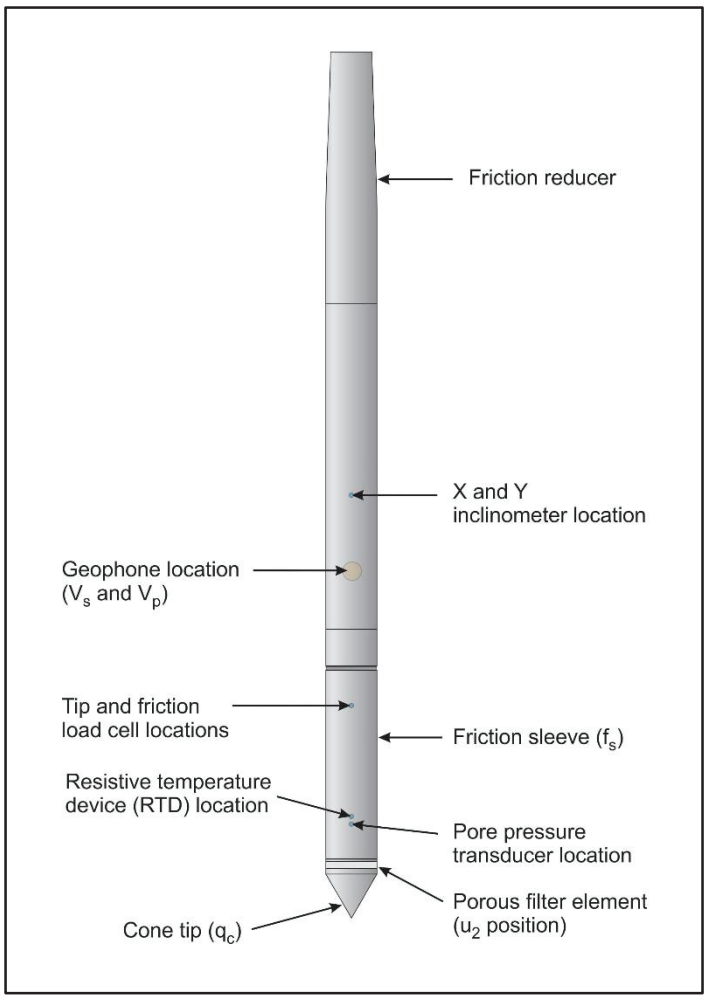

Figure CPTu. Piezocone Penetrometer (15 cm^2)

The data acquisition systems consist of a Windows based computer and a signal conditioner and power supply interface box with a 16 bit (or greater) analog to digital (A/D) converter. The data is recorded at fixed depth increments using a depth wheel attached to the push cylinders or by using a spring loaded rubber depth wheel that is held against the cone rods. The typical recording intervals are either 2.5 cm or 5.0 cm depending on project requirements; custom recording intervals are possible. The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to CPT Inc.'s CPT operating procedures which are in general accordance with the current ASTM D5778 standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with either glycerin or silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of 2 cm/s, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to CPT Inc.'s cone penetration testing procedures:

- Each filter is saturated in silicone oil or glycerin under vacuum pressure prior to use
- Recorded baselines are checked with an independent multi-meter
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with ASTM standards

The interpretation of the piezocone data and associated calculated parameters for this report are based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by Robertson (1990) and Robertson (2009). It should be noted that it is not always possible to accurately identify a soil type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in Robertson et al, 1986:

$$q_t = q_c + (1\text{-}a) \bullet u_2$$

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the piezocone (0.8 for CPT Inc. probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all CPT Inc. piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (Rf) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

A summary of the CPTu soundings along with test details and individual plots are provided in the appendices. A set of files with calculated geotechnical parameters were generated for each sounding based on published correlations and are provided in Excel format in the data release folder. Information regarding the methods used is also included in the data release folder.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to Robertson et al. (1986), Lunne et al. (1997), Robertson (2009), Mayne (2013, 2014) and Mayne and Peuchen (2012).

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in Figure PPD-1. For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

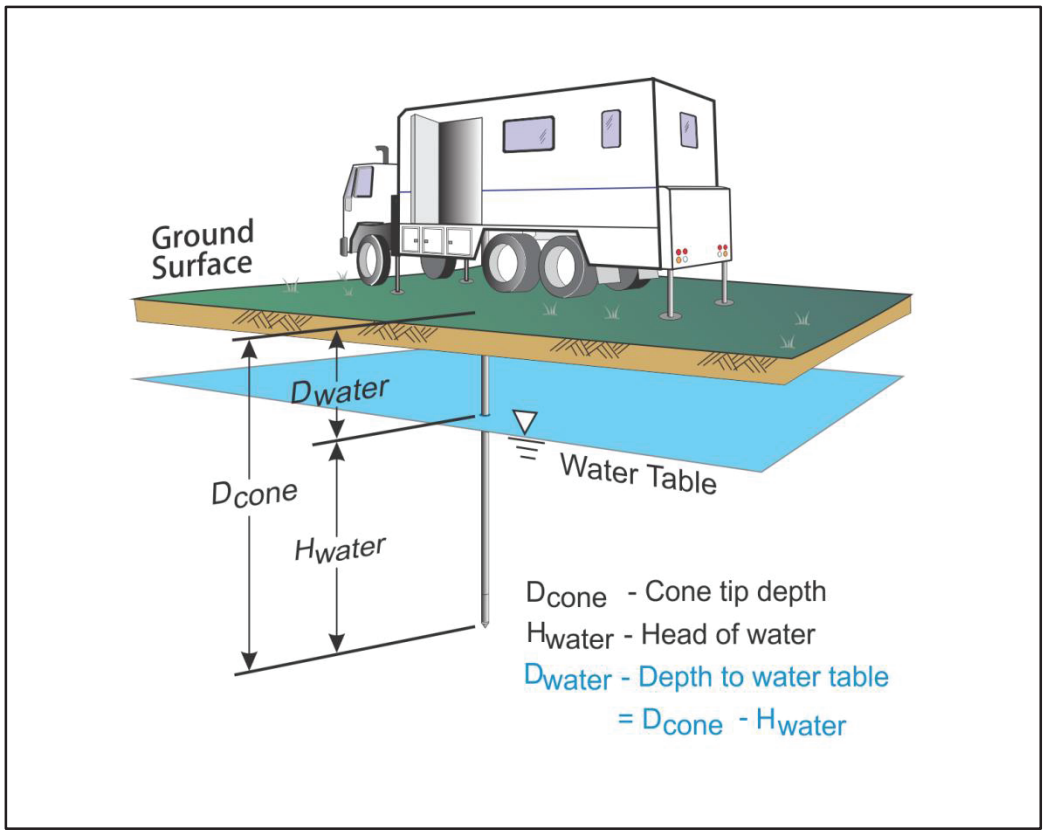

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in Figure PPD-2 are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

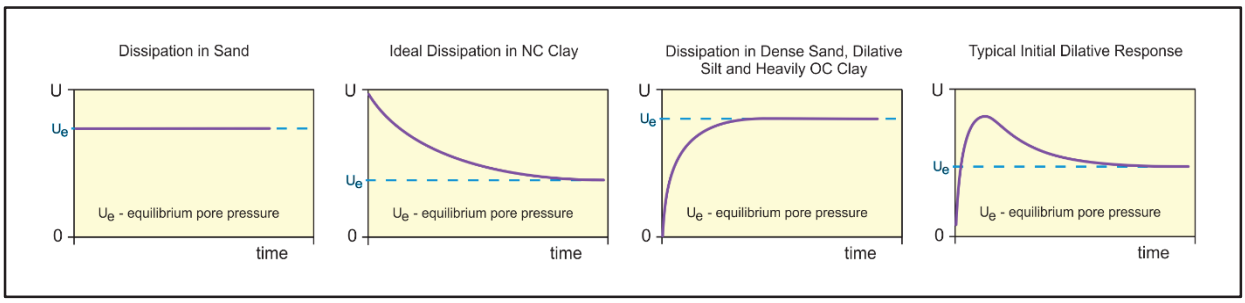

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve of Figure PPD-2.

In fine grained deposits the point at which 100% of the excess pore pressure has dissipated is known as t_{100}. In some cases this can take an excessive amount of time and it may be impractical to take the dissipation to t_{100}. A theoretical analysis of pore pressure dissipations by Teh and Houlsby (1991) showed that a single curve relating degree of dissipation versus theoretical time factor (T*) may be used to calculate the coefficient of consolidation (c_h) at various degrees of dissipation resulting in the expression for c_h shown below.

$$c_h = \frac{T^* \cdot a^2 \cdot \sqrt{I_r}}{t}$$

Where:

T* is the dimensionless time factor (Table Time Factor)
a is the radius of the cone
I_r is the rigidity index
t is the time at the degree of consolidation

Table Time Factor. T* versus degree of dissipation (Teh and Houlsby, 1991)

Degree of Dissipation (%)	20	30	40	50	60	70	80
T* (u_2)	0.038	0.078	0.142	0.245	0.439	0.804	1.60

The coefficient of consolidation is typically analyzed using the time (t_{50}) corresponding to a degree of dissipation of 50% (u_{50}). In order to determine t_{50}, dissipation tests must be taken to a pressure less than u_{50}. The u_{50} value is half way between the initial maximum pore pressure and the equilibrium pore pressure value, known as u_{100}. To estimate u_{50}, both the initial maximum pore pressure and u_{100} must be known or estimated. Other degrees of dissipations may be considered, particularly for extremely long dissipations.

At any specific degree of dissipation the equilibrium pore pressure (u at t_{100}) must be estimated at the depth of interest. The equilibrium value may be determined from one or more sources such as measuring the value directly (u_{100}), estimating it from other dissipations in the same profile, estimating the phreatic surface and assuming hydrostatic conditions, from nearby soundings, from client provided information, from site observations and/or past experience, or from other site instrumentation.

For calculations of c_h (Teh and Houlsby, 1991), t_{50} values are estimated from the corresponding pore pressure dissipation curve and a rigidity index (I_r) is assumed. For curves having an initial dilatory response in which an initial rise in pore pressure occurs before reaching a peak, the relative time from the peak value is used in determining t_{50}. In cases where the time to peak is excessive, t_{50} values are not calculated.

Due to possible inherent uncertainties in estimating I_r, the equilibrium pore pressure and the effect of an initial dilatory response on calculating t_{50}, other methods should be applied to confirm the results for c_h.

Additional published methods for estimating the coefficient of consolidation from a piezocone test are described in Burns and Mayne (1998, 2002), Jones and Van Zyl (1981), Robertson et al. (1992) and Sully et al. (1999).

A summary of the pore pressure dissipation tests and dissipation plots are presented in the relevant appendix.

1. Assumed phreatic surface was based on pore pressure dissipation tests. Hydrostatic conditions were assumed for calculated parameters.
2. Coordinates were acquired using consumer grade GPS equipment with datum: WGS 1984 / UTM Zone 10 North.

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

GRAIN SIZE CHART

Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel	3" to No. 4	76.2 to 4.76
coarse	3" to 3/4"	76.2 to 19.1
fine	3/4" to No. 4	19.1 to 4.76
Sand	No. 4 to No. 200	4.76 to 0.075
coarse	No. 4 to No. 10	4.76 to 2.00
medium	No. 10 to No. 40	2.00 to 0.420
fine	No. 40 to No. 200	0.420 to 0.075
Silt and Clay	Below No. 200	Below 0.075

INTRODUCTION

NOISE TECHNICAL MEMO PURPOSE

The purpose of this Noise Technical Memo is to support the 1180 Main Street Project (proposed project) Initial Study Mitigated Negative Declaration (ISMND). This memo provides analyses of potential project-related impacts for exposure to excessive noise during construction and operation. This memo has been prepared to analyze the potential construction-related noise impacts generated form the proposed projects and estimate the potential operational noise conditions located at the project site. This memo will be used as a supplementary analysis to the ISMND.

Specifically, the purpose of this memo is to assess the existing ambient noise conditions at the nearest sensitive receptors and within the proposed project area. This memo includes an evaluation of the proposed noise-generating uses that could affect offsite noise-sensitive receptors as well as assessing the potential indoor noise conditions affecting occupants of the proposed project site.

One source of noise generation associated with commercial development projects is project construction activities. This includes site grading, construction of the building, and increased traffic related to worker trips and material delivery. Operational noise from a commercial development can be attributed to an increase of traffic count from employees as well as from fixed mechanical equipment used to operate the building.

PROJECT DESCRIPTION AND LOCATION

The 1.31-acre project site is located at 1180 and 1190 Main Street near the City's downtown area. The project site is adjacent to Elm Street, Lathrop Street, Maple Street, Main Street, and the Caltrain corridor. The project site is approximately 0.5 mile west of the Redwood City Caltrain station on James Avenue. Regional access is provided to by U.S. Highway 101, approximately 1 mile north, and Highway 84 located approximately 0.5 mile east of the project site.

The proposed project would demolish the existing vacant one-story commercial building and a concrete foundation totaling approximately 7,623 square feet and redevelop the site with a three-story commercial office building of 109,375 square feet with a two-level underground parking garage of 70,619 square feet. In addition, the proposed project would complete the existing bridge crossing with the construction of a 64-foot wide bridge over the drainage channel. The proposed bridge would provide access to the building's main entrance and include a public park of 10,000 square feet. The proposed project would also include an onsite shipping container café of 325 square feet.

NOISE FUNDAMENTALS AND TERMINOLOGY

Noise is generally defined as unwanted sound that annoys or disturbs people and potentially causes an adverse psychological or physiological effect on human health. Because noise is an environmental pollutant that can interfere with human activities, evaluation of noise is necessary when considering the environmental impacts of a proposed project.

Sound is mechanical energy transmitted by pressure waves over a medium such as air or water. Sound is characterized by various parameters that include the rate of oscillation of sound waves (frequency), the speed of propagation, and the pressure level or energy content (amplitude). In particular, the sound pressure level is the most common descriptor used to characterize the loudness of an ambient (existing) sound level. Although the decibel (dB) scale, a logarithmic scale, is used to quantify sound intensity, it does not accurately describe how sound intensity is perceived by human hearing. The perceived loudness of sound is dependent upon many factors, including sound pressure level and frequency content. The human ear is not equally sensitive to all frequencies in the entire spectrum, so noise measurements are weighted more heavily for frequencies to which humans are sensitive in a process called A-weighting, written as dB(A) and referred to as A-weighted decibels. There is a strong correlation between A-weighted sound levels and community response to noise. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. Table 1 defines sound measurements and other terminology used in this memo, and Table 2 summarizes typical A-weighted sound levels for different noise sources.

With respect to how humans perceive and react to changes in noise levels, a 1dB(A) increase is imperceptible, a 3 dB(A) increase is barely perceptible, a 6 dB(A) increase is clearly noticeable, and a 10 dB(A) increase is subjectively perceived as approximately twice as loud (Egan 2007). These subjective reactions to changes in noise levels were developed on the basis of test subjects' reactions to changes in the levels of steady-state pure tones or broad-band noise and to changes in levels of a given noise source. These statistical indicators are thought to be most applicable to noise levels in the range of 50 to 70 dBA, as this is the usual range of voice and interior noise levels. The number of agencies and municipalities have developed or adopted noise level standards, consistent with these and other similar studies, to help prevent annoyance and to protect against the degradation of the existing noise environment.

Different types of measurements are used to characterize the time-varying nature of sound. These measurements include the equivalent sound level (Leq), the minimum and maximum sound levels (Lmin and Lmax), percentile-exceeded sound levels (such as L10, L20), the day-night sound level (Ldn), and the community noise equivalent level (CNEL). Ldn and CNEL values typically differ by less than 1 dB. As a matter of practice, Ldn and CNEL values are considered to be equivalent and are treated as such in this assessment.

For a point source such as a stationary compressor or construction equipment, sound attenuates based on geometry at rate of 6 dB per doubling of distance. For a line source such as free flowing traffic on a freeway, sound attenuates at a rate of 3 dB per doubling of distance (Federal Highway Administration 2011). Atmospheric conditions including wind, temperature gradients, and humidity can change how sound propagates over distance and can affect the level of sound received at a given location. The degree to which the ground surface absorbs acoustical energy also affects sound propagation. Sound that travels over an acoustically absorptive surface, such as grass, attenuates at a greater rate than sound that travels over a hard surface, such as pavement. The increased attenuation is typically in the range of 1–2 dB per doubling of distance. Barriers such as buildings and topography that block the line of sight between a source and receiver also increase the attenuation of sound over distance.

Table 1: Definition of Sound Measurement

Sound Measurements	Sample Heading
Decibel (dB)	A unit-less measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micro-pascals.
A-Weighted Decibel (dB(A))	An overall frequency-weighted sound level in decibels that approximates the frequency response of the human ear.
C-Weighted Decibel (dB(C))	The sound pressure level in decibels as measured using the C- weighting filter network. The C-weighting is very close to an unweighted or flat response. C-weighting is only used in special cases when low-frequency noise is of particular importance. A comparison of measured A- and C-weighted level gives an indication of low frequency content.
Maximum Sound Level (Lmax)	The maximum sound level measured during the measurement period.
Minimum Sound Level (Lmin)	The minimum sound level measured during the measurement period.
Equivalent Sound Level (Leq)	The equivalent steady state sound level that in a stated period of time would contain the same acoustical energy.
Percentile-Exceeded Sound Level (Lxx)	The sound level exceeded xx % of a specific time period. L10 is the sound level exceeded 10% of the time. L90 is the sound level exceeded 90% of the time. L90 is often considered to be representative of the background noise level in a given area.
Day-Night Level (Ldn)	The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring during the period from 10:00 p.m. to 7:00 a.m.
Community Noise Equivalent Level (CNEL)	The energy average of the A-weighted sound levels occurring during a 24-hour period with 5 dB added to the A-weighted sound levels occurring during the period from 7:00 p.m. to 10:00 p.m. and 10 dB added to the A-weighted sound levels occurring during the period from 10:00 p.m. to 7:00 a.m.
Peak Particle Velocity (Peak Velocity or PPV)	A measurement of ground vibration defined as the maximum speed (measured in inches per second) at which a particle in the ground is moving relative to its inactive state. PPV is usually expressed in inches/second.
Frequency: Hertz (Hz)	The number of complete pressure fluctuations per second above and below atmospheric pressure.
Source: Federal Highway Administration 2006a

Quiet suburban nighttime	-40-	Theater, large conference room (Background)
Quiet rural nighttime	-30-	Library
	-20-	Bedroom at night, concert hall (Background)
	-10-	Broadcast/recording studio
	-0-	

Decibel Addition

Because decibels are logarithmic units, sound pressure levels cannot be added or subtracted through ordinary arithmetic. On the dB scale, a doubling of sound energy corresponds to a 3-dB increase. In other words, when two identical sources are each producing sound of the same loudness, their combined sound level at a given distance would be 3 dB higher than one source under the same conditions. For example, if one source produces a sound pressure level of 70 dB(A), two identical sources would not produce 140 dB(A)—rather, they would combine to produce 73 dB(A). The cumulative sound level of any number of sources can be determined using decibel addition.

Vibration

Operation of heavy construction equipment, particularly pile driving and other impact devices such as pavement breakers, create seismic waves that radiate along the surface of the earth and downward into the earth. These surface waves can be felt as ground vibration. Vibration from operation of this equipment can result in effects ranging from annoyance of people to damage of structures. Varying geology and distance will result in different vibration levels containing different frequencies and displacements. In all cases, vibration amplitudes will decrease with increasing distance.

Reference: **Noise Technical Memo for 1180 Main Street Project**

Perceptible groundborne vibration is generally limited to areas within a few hundred feet of construction activities. As seismic waves travel outward from a vibration source, they excite the particles of rock and soil through which they pass and cause them to oscillate. The actual distance that these particles move is usually only a few ten-thousandths to a few thousandths of an inch. The rate or velocity (in inches per second) at which these particles move is the commonly accepted descriptor of the vibration amplitude, referred to as the peak particle velocity (PPV). Table 3 summarizes typical vibration levels generated by construction equipment (Federal Transit Administration 2006b).

Table 3: Vibration Source Levels for Construction Equipment

Equipment	PPV at 25 Feet
Pile driver (impact)	0.644 to 1.518
Pile drive (sonic/vibratory)	0.170 to 0.734
Vibratory roller	0.210
Hoe ram	0.089
Large bulldozer	0.089
Caisson drilling	0.089
Loaded trucks	0.076
Jackhammer	0.035
Small bulldozer	0.003
Source: Federal Transit Administration 2006b	

Vibration amplitude attenuates over distance and is a complex function of how energy is imparted into the ground and the soil conditions through which the vibration is traveling. The following equation can be used to estimate the vibration level at a given distance for typical soil conditions (Federal Transit Administration 2006b). PPVref is the reference PPV from Table 3.

PPV = PPVref x (25/Distance) 1.5

Table 4 summarizes guidelines vibration annoyance potential criteria suggested by Caltrans (California Department of Transportation 2004).

Table 4: Guideline Vibration Annoyance Potential Criteria

Human Response	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Sources
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.9	0.10

Human Response	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Sources
Severe	2.0	0.4
Notes: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment. Source: California Department of Transportation 2004.		

Table 5 summarizes guideline vibration damage potential criteria suggested by Caltrans (California Department of Transportation 2004).

Table 5: Guideline Vibration Damage Potential Criteria

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structure	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5
Notes: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment. Source: California Department of Transportation 2004.		

REGULATORY SETTING

CALIFORNIA GREEN BUILDING STANDARDS (CALGREEN)

The 2016 California Green Building Standards Code (CalGreen), Section 5.507 “Environmental Comfort”, states the following:

5.507.4.1 Exterior noise transmission. Wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall meet a composite STC rating of at least 50 or a composite OITC rating of no less than 40, with exterior windows of a minimum STC of 40 or OITC of 30 in the following locations:

1. Within the 65 CNEL noise contour of an airport

Exceptions:

1. Ldn or CNEL for military airports shall be determined by the facility Air Installation Compatible Land Use Zone (AICUZ) plan.

2. Ldn or CNEL for other airports and heliports for which a land use plan that has not been developed shall be determined by the local general plan noise element.

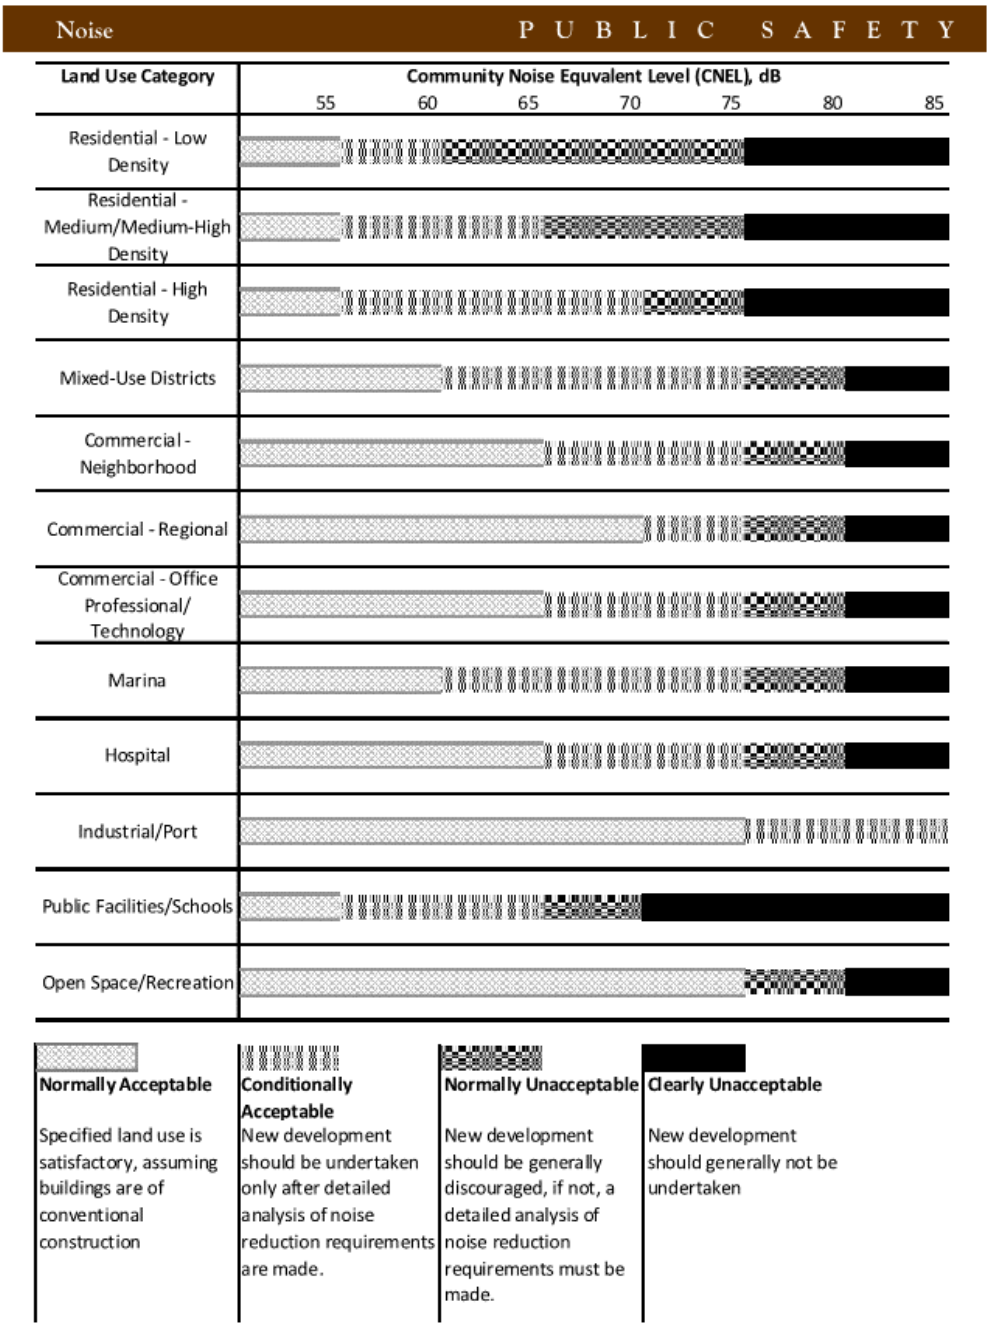
3. Within the 65 CNEL or Ldn noise contour of a freeway or expressway, railroad, industrial source or fxed-guideway notice source as determined by the Noise Element of the General Plan.

5.507.4.1.1 Noise exposure where noise contours are not readily available. Buildings exposed to a noise level of 65 dB Leq-1-hr during any hour of operation shall have building, addition or alteration exterior wall and roof-ceiling assemblies exposed to the noise source meeting a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30).

5.507.4.2 Performance method. For buildings located as defined in Section 5.507.4.1 or 5.507.4.1.1, wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall be constructed to provide an interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations

5.507.4.2.1 Site features. Exterior features such as sound walls or earth berms may be utilized as appropriate to the building, addition or alteration project to mitigate sound migration to the interior.

5.507.4.2.2 Documentation of compliance. An acoustical analysis documenting complying interior sound levels shall be prepared by personnel approved by the architect or engineer of record.



5.507.4.3 Interior sound transmission. Wall and floor-ceiling assemblies separating tenant spaces and tenant spaces and public places shall have an STC of at least 40.

REDWOOD CITY GENERAL PLAN

The Public Safety Element within the Redwood City General Plan addresses those public safety issues that affect Redwood City, including noise concerns. The Noise Element aims to “partner with and embrace neighborhoods to improve health, safety, and well-being for all”. The Element identifies land use compatibility noise standards for noise-sensitive land uses affected by transportation and non-transportation noise sources. As shown in Figure 1, for commercial office buildings that are affected by transportation noise sources, the “normally acceptable” exterior noise level is 50-65 dB(A) CNEL. Exterior noise levels up to 75 dB(A) CNEL are considered “conditionally acceptable” and should be undertaken only after a detailed analysis of the noise reduction requirements are made. Exterior noise levels between 75 dB(A) and 80 dB(A) CNEL are considered “normally unacceptable” and those above 80 dB(A) are “clearly unacceptable”. New construction with exterior noise levels in this range would require a detailed analysis of the noise reduction requirements and noise insulation features to be incorporated in the project to maintain “normally acceptable” interior noise levels.

Reference: **Noise Technical Memo for 1180 Main Street Project**

Figure 1: Redwood City Noise Guidelines for Land Use Planning

Specific Policies with the Noise Element include the following:

- Policy PS-13.6: Require all exterior noise sources (construction operations, air compressors, pumps, fans, and leaf blowers) to use available noise suppressions devices and techniques to bring exterior noise down to acceptable levels that are compatible with land uses.
- Policy PS-13.8: Implement appropriate standard construction noise controls for all construction projects.
- Policy PS-13.9: Require noise created by new non-transportation noise sources to be mitigated so as not to exceed acceptable interior and exterior noise level standards.
- Policy PS-14.1: Consult with responsible federal and State agencies to minimize the impact of transportation-related noise, including noise associated with freeways, major arterials, rail lines, and airports.
- Policy PS-14.4: Require development that is or will be affected by railroad noise and/or vibration to include appropriate measures to minimize adverse noise effects on residents and business persons.

REDWOOD CITY MUNICIPAL CODE

Chapter 24 “Noise Regulation” of the Redwood City Municipal Code states the following:

Sec. 24.30. - EXCESSIVE AND UNREASONABLE NOISES:

The following are deemed to be excessive and unreasonable noises:

A. Noise levels generated by construction activities, including demolition, alteration, repair or remodeling of or to existing structures and construction of new structures on property within the City, at more than 110 dB measured at any point within a residential district of the City and outside of the plane of said property;

B. Noise levels generated by an individual item of machinery, equipment or device used during construction activities, including demolition, alteration, repair or remodeling of or to existing structures and construction of new structures on property within the City, at more than 110 dB measured within a residential district of the City at a distance of twenty-five feet (25′) from said machinery, equipment or device. If said machinery, equipment or device is housed within a structure on the property, then the measurement shall be made at a distance as near to twenty-five feet (25′) from said machinery, equipment or device as possible.

Sec. 24.31. - PROHIBITED NOISE LEVELS:

It shall be unlawful for any person to suffer or allow noise levels to be generated by:

A. Construction activities, including demolition, alteration, repair or remodeling of or to existing structures and construction of new structures on property within the City, at more than 110 dB measured at any point within a residential district of the City and outside of the plane of said property;

B. An individual item of machinery, equipment or device used during construction activities, including demolition, alteration, repair or remodeling of or to existing structures and construction of new

structures on property within the City, at more than 110 dB measured within a residential district of the City at a distance of twenty-five feet (25′) from said machinery, equipment or device. If said machinery, equipment or device is housed within a structure on the property, then the measurement shall be made at a distance as near to twenty-five feet (25′) from said machinery, equipment or device as possible.

Sec. 24.32. - TIME LIMITATIONS:

Notwithstanding the provisions in this Division to the contrary, it shall be unlawful for any person to engage in construction activities, including demolition, alteration, repair or remodeling of or to existing structures and the construction of new structures on property in a residential district or within five hundred feet (500′) of a residential district in the City, between the hours of eight o'clock (8:00) P.M. and seven o'clock (7:00) A.M. the following day, Monday through Friday of any week or at any time on Saturdays, Sundays or holidays if the noise level generated by any such activity exceeds the local ambient measured at any point within the residential district and outside of the plane of said property.

Sec. 24.33. - CONSTRUCTION SITE NOTICE:

A. Generally: The owner of any property in a residential district of the City or of any property located within five hundred feet (500′) of any such district upon which construction activities, including demolition, alteration, repair or remodeling of or to existing structures, and construction of new structures are proposed to occur, shall post a sign at all entrances to the work site prior to commencement of the work for the purpose of informing all contractors and subcontractors, their employees, agents, materialmen and all other persons at the property of the basic limitations upon noise and construction activities provided in this Division. Said sign(s) shall be posted at least five feet (5′) above ground level and shall be on a white background with black lettering, which lettering shall be a minimum of one and one-half inches (1 ½″) in height.

B. Sign Text: Said sign(s) shall read as follows:

   NOISE LIMITATIONS UPON WORK ON PROPERTIES IN OR NEAR RESIDENTIAL DISTRICTS

   (Includes any and all deliveries)

   NOISE PROHIBITED

   MONDAYS through FRIDAYS ..... 8:00 p.m. to 7:00 a.m.

   SATURDAYS, SUNDAYS and HOLIDAYS ..... ALL DAY

   During the foregoing periods, no noise above the local ambient level in Residential Districts shall be generated by construction work or activities.

   WORK NOISE LIMITS AT ALL OTHER TIMES:

   1. No individual item of machinery, equipment, or device used in or near a residential district shall produce sound in excess of 110 dBA, measured twenty-five feet (25′) from such machinery, equipment, or device; 2. Work noise level at any point outside of the construction site property plane shall not exceed 110 dBA within any part of a residential district.

2. The foregoing provisions are requirements of the Noise Regulations of the City, violations of which are punishable pursuant to the provisions of this Chapter.

Sec. 24.34. - EXCEPTIONS; PERMITS:

Upon a showing by a property owner to the enforcement officer that a diligent investigation of available noise abatement techniques indicates that compliance with the requirements of this Division would be impracticable or unreasonable, the enforcement officer may issue a permit allowing an exception to the provisions contained in all or any portion of this Division subject to such reasonable and appropriate conditions as the enforcement officer may impose, including, but not limited to, a compliance schedule, restrictions upon construction methods or use of machinery, equipment or devices, permission to engage in construction activities on Saturdays, Sundays, and holidays only between the hours of nine o'clock (9:00) A.M. and eight o'clock (8:00) P.M., or implementation of such other practices as the enforcement officer deems appropriate. Any such permit shall be effective for a period not to exceed six (6) months and shall be of such reasonably short duration as the enforcement officer shall determine giving due regard to the extent and the complexity of the construction to which it pertains.

Any person aggrieved by the decision of the enforcement officer in issuing or denying the issuance of a permit pursuant to this Section may appeal the enforcement officer's decision to the Community Development Director. Such appeal shall be filed, processed and heard in accordance with the provisions of Chapter 1 of this Municipal Code.

Sec. 24.35. - EXEMPTIONS:

Noise levels generated by construction activities, including demolition, alteration, repair or remodeling of or to existing structures and the construction of new structures on property within the City: a) in the course or within the scope of emergency work; and b) in the course of work performed personally by the owner or resident of a dwelling unit with respect to said unit on Mondays through Fridays between the hours of seven o'clock (7:00) A.M. and eight o'clock (8:00) P.M. and on Saturdays, Sundays, and holidays between the hours of nine o'clock (9:00) A.M. and eight o'clock (8:00) P.M., are exempt from the provisions of this Division.

EXISTING AMBIENT NOISE LEVELS

The existing noise environment in a project area is characterized by the area's general level of development due to the high correlation between the level of development and ambient noise levels. Areas which are not urbanized are relatively quiet, while areas which are more urbanized are noisier as a result of roadway traffic, industrial activities, and other human activities.

The City of Redwood City is exposed to several sources of noise, including traffic on major highways, such as US-101, California Route 84 (Woodside Road), and California Route 82 (El Camino Real), and noise from railways, such as the Caltrain tracks. Traffic noise depends primarily on traffic speed (tire noise increases with speed), proportion of medium and large truck traffic (trucks generate engine, exhaust, and wind noise in addition to tire noise), and number of speed control devices, such as traffic lights (accelerating and decelerating vehicles and trucks can generate more noise).

Changes in traffic volumes can also have an impact on overall traffic noise levels. For example, it takes 25 percent more traffic volume to produce an increase of only 1 dB(A) in the ambient noise level. For roads already heavy with traffic volume, an increase in traffic numbers could even reduce noise because the heavier

volumes could slow down the average speed of the vehicles. A doubling of traffic volume results in a 3 dB(A) increase in noise levels.

The loudest source of noise at the site is the Caltrain tracks which border the northeast edge of the site (along Pennsylvania Avenue). The total number of trains passing the site is approximately two (2) per hour, except for morning and evening rush hour times, when the total train count can be up to four (4) per hour. Noise from the trains includes general noise from the interaction of the train wheels on the tracks, warning horns from the train engine, and alarms from the traffic control bars.

Traffic noise in the area is sparse with Main Street being the busiest street. The traffic on Main Street is comprised of primarily vehicles, but also contains medium trucks, company trucks, and construction vehicles. There is very little traffic on Elm and Maple Streets. Other sources of noise at the project site include intermittent construction activity on Lathrop Street, including one (1) backhoe, one (1) truck, and two (2) workers, sidewalk activity, and nature-based noises.

A noise survey was conducted between Tuesday, November 20 and Wednesday, November 21, 2018 to establish the existing baseline condition for the project. The survey involved securing a calibrated Larson Davis LxT sound level meter to the fence near the corner of Maple and Main Streets (within the red circle in Photo 1 and shown as a blue pin in Figure 3.12-2). The microphone was extended approximately 6' above the ground and directly faced the Caltrain tracks. The microphone was located about 23' from the edge of the closest railroad track.

Photo 1: Microphone at Long-Term Measurement Location

The unattended meter collected data continuously between Tuesday and Wednesday for a minimum of 24-hours. The highest one-hour Leq sound pressure level measured at this location during anticipated business hours (8:00 AM to 6:00 PM) was 82.1 dB(A). The average one-hour Leq sound pressure level measured during anticipated business hours was 77.7 dB(A). Average one-hour sound pressure levels measured at the site are shown in Chart 1. The 24-hour measurement location is shown as a blue pin in Figure 2. Both Chart 1 and Figure 2 are attached to the end of this memo.

Based on the June 27, 2018 Planning Application Drawing Set, the edge of the project building will be located approximately 32'-3" from the edge of the closes railroad tracks. Using typical line source attenuation, an additional 2 dB(A) of attenuation is expected between the measurement location and the project building façade. Therefore, the highest one-hour Leq sound pressure level expected at the project building façade during anticipated business hours is 80.1 dB(A).

SENSITIVE RECEPTORS

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are considered to be more sensitive to noise intrusion than are commercial or industrial activities. Ambient noise levels can also affect the perceived desirability or livability of a development.

The project site is surrounded by a mix of land uses, including commercial spaces and a church to the north, apartments to the west, and commercial spaces to the southeast. The sensitive receivers (in red pins in

Figure 2) are considered to be the San Jose Obrero Catholic Church across Pennsylvania Avenue and the Franklin Street Apartments across Maple Street.

METHODOLOGY

Results from the long-term site measurements were used to provide baseline noise conditions at nearby sensitive receptors and within the project site vicinity. For the purpose of this analysis, potential sensitive receptors were determined by reviewing current aerial photography and by walking the project site.

Impacts from future project-related traffic were estimated using predicted traffic counts from the October 2018 1180 and 1190 Main Street Transportation Impact Analysis report prepared by Kimley Horn.

Short-term site noise data were used as an input to the Federal Highway Administration Roadway Construction Noise Model (RCNM) as the existing ambient noise level input. The RCNM is used as the Federal Highway Administration's national standard for predicting noise generated from construction activities. The RCNM analysis includes the calculation of noise levels (Lmax and Leq) at incremental distances for a variety of construction equipment. The spreadsheet inputs include acoustical use factors, Lmax values, and Leq values at various distances depending on the ambient noise measurement location. For this analysis, it was assumed that a worst-case noise scenario for construction activity would entail the operation of three noisiest pieces of equipment (grader, dozer, and compactor) simultaneously.

ENVIRONMENTAL IMPACT ANALYSIS

EXTERIOR TRAFFIC NOISE LEVEL IMPACTS

To describe future noise levels due to traffic added from the peak hour project, a.m. and p.m. peak hour traffic counts with and without the project provided by Kimley Horn were used to determine the percentage increase of traffic on the roads adjacent to the project site and adjacent sensitive receivers.

Table 6 shows the cumulative peak hour counts associated with traffic on the local roadway network both with and without the project. The last columns in the table show the overall percentage change and the estimated difference in peak hour noise level.

Table 6 Traffic Peak Hour Counts and Estimated Noise Increase

Roadway	Cumulative Peak Hour Traffic Count	Cumulative Peak Hour Traffic Count with Project	Percentage Change	Estimated dB(A) Change
Maple Street	386 (519)	433 (572)	12% (10%)	0.5 (0.4) dB(A)
Lathrop Street	145 (250)	204 (314)	41% (26%)	Still 1 dB(A) or Less
Main Street	475 (703)	506 (727)	7% (3%)	0.3 (0.1) dB(A)
Elm Street	58 (76)	89 (98)	53% (29%)	Still 1 dB(A) or Less

Notes:

1. Numbers in parenthesis are p.m. peak hour traffic volumes.

The project is expected to minimally increase traffic counts along the busiest roads surrounding the project site; Maple Street and Main Street. There will be essentially no change in traffic noise expected along these streets and there will be no impact.

Reference: **Noise Technical Memo for 1180 Main Street Project**

Peak hour traffic counts are expected to significantly increase with the project along Lathrop and Elm Streets. Even though the percentage of traffic is expected to increase, the overall traffic counts are still very low. The peak hour traffic counts along Lathrop and Elm Streets will still be substantially less than the existing traffic counts (without the project) on both Maple and Main Streets. Therefore, future noise levels on Lathrop and Elm Streets with the project are not expected to significantly increase over the current conditions.

Therefore, the project should not cause increased traffic noise levels over the baseline conditions at the neighboring sensitive receivers and this would be a less than significant impact relative to this topic.

INTERIOR TRAFFIC AND TRAIN NOISE LEVEL IMPACTS

The June 27, 2018 Planning Application drawing set indicates the project will involve a new three-story office building with two (2) levels of below-grade parking. 2016 CalGreen states if the building is exposed to a noise level of 65 dB(A) Leq-1-hr during any hour of operation, the exterior façade design shall incorporate noise reduction features. Exterior ambient noise measurements indicate the façades of the building facing the rail lines would be exposed to 1-hr Leq noise levels up to 78.7 dB(A) and would be subject to this requirement.

In particular, exterior wall and roof-ceiling assemblies exposed to the noise source meeting a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30) shall be used in all affected areas or wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall be constructed to provide an interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations.

Therefore, the exterior façade design of the building would incorporate Mitigation Measure MM NOI-1 and be designed with incorporating measures, such as laminated windows systems, as necessary to reduce noise levels on the interior of the building to a maximum of 50 dB(A) Leq during normal operating hours.

- **MM-NOI-1: Interior Traffic Noise.** All facades of the building which have exposure to the rail lines shall be constructed to meet the requirements of the 2016 California Green Building Standards Code (CalGreen), Section 5.507 “Environmental Comfort”. In particular, exterior wall and roof-ceiling assemblies exposed to the rail line shall meet a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30). Or, the services of a qualified acoustical consultant may be obtained to conduct a detailed noise study to help design the exterior façade such that the interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations.

PROJECT FIXED-SOURCE NOISE IMPACTS

Typical commercial building construction will involve new rooftop mechanical equipment, air handling units, exhaust fans, and potentially chillers and cooling towers. This equipment will generate noise that will radiate to the neighboring properties. Chapter 24 “Noise Regulation” does not currently have any specific noise restrictions for exterior mechanical equipment to neighboring properties. The code section only addresses noise from an assembly of three (3) or more people between the hours of 8:00 PM and 7:00 PM on weekdays or anytime on weekends and holidays and noise from construction. Therefore, the impact of fixed-source noise to the neighboring properties would be less than significant.

Reference: **Noise Technical Memo for 1180 Main Street Project**

SHORT-TERM CONSTRUCTION NOISE IMPACTS

Two types of short-term noise impacts could occur during construction of the proposed project. First, construction crew commutes and the transport of construction equipment and materials to the project site would incrementally increase noise levels on access roads leading to the project site. This increased traffic would be composed of vehicles, medium trucks, and heavy trucks.

Existing traffic on Main Street and Maple Street already includes a component of construction vehicles and trucks to service the existing commercial facilities, such as PRENAV, Inc. and Cooks Collision. Noise levels along these streets are not expected to increase due to project-related construction traffic.

The second type of short-term noise impact is related to noise generated during construction. Construction activities would include excavation activities and grading, foundation work, building construction, and paving. Each construction stage has its own mix of equipment and, consequently, its own noise characteristics. These various construction operations would change the character of the noise generated at the project site and, therefore, the ambient noise level as construction progresses. The loudest phases of construction include excavation, building construction, and grading phases, as the noisiest construction equipment is earthmoving and grading equipment. Table 3.12-2 below lists types of construction equipment that may be used throughout construction and the maximum and average operational noise level as measured at 100 feet from the operating equipment. The 100-foot distance represents the distance between the northwest edge of the project site and the existing Franklin Street Apartment buildings across Maple Street.

Table 7: Summary of Federal Highway Administration Roadway Construction Noise Model at Existing Apartment Receiver

Source	Distance to Nearest Sensitive Receptor	Sound Level at Apartments		
		Lmax, dB(A)	Acoustical Use Factor (%)	Leq, dB(A)
Backhoe	100 feet	71.5	40	67.6
Compactor (ground)	100 feet	77.2	20	70.2
Crane	100 feet	74.5	16	66.6
Concrete Mixer Truck	100 feet	72.8	40	68.8
Compressor (air)	100 feet	71.6	40	67.7
Bulldozer	100 feet	75.6	40	71.7
Excavator	100 feet	74.7	40	70.7
Front End Loader	100 feet	73.1	40	69.1
Flat Bed Truck	100 feet	68.2	40	64.3
Generator	100 feet	74.6	50	71.6
Grader	100 feet	79.0	40	75.0
Paver	100 feet	71.2	50	68.2

Reference: **Noise Technical Memo for 1180 Main Street Project**

Source	Distance to Nearest Sensitive Receptor	Sound Level at Apartments		
		Lmax, dB(A)	Acoustical Use Factor (%)	Leq, dB(A)
Pickup Truck	100 feet	69.0	40	65.0
Pneumatic Tools	100 feet	79.2	50	76.1
Welder / Torch	100 feet	68.0	40	64.0
Tractor	100 feet	78.0	40	74.0

Source: FHWA 2006, AQ/GHG assumptions (Appendix A)

A reasonable worst-case noise condition for general construction activity is that a grader, pneumatic tools, and a tractor would operate simultaneously at the same location. This represents a conservative scenario, as it assumes that all three pieces of equipment would be operating at the same time and same place. Construction would occur in sequential phases, thus in reality, it is not likely the three loudest pieces of equipment would be operating simultaneously at the exact location of the project site closest to the nearest noise-sensitive receiver. Nevertheless, the RCNM calculated that this scenario would result in a combined noise level of 83.5 dB(A) Lmax and 79.9 dB(A) Leq at the existing apartments 100 feet from the project site. The construction noise modeling output results are attached to this memo in Figure 3.

Although noise levels could range into the "clearly unacceptable" ranges, as defined in the City of Redwood City General Plan, construction activities and increases in noise levels from construction activities would be temporary and construction activities would be limited to the restrictions set by Chapter 24 "Noise Regulation", Division 3 "Construction" of the Redwood City Municipal Code.

In addition to the restrictions listed in the Redwood City Municipal Code, Program PS-63 in the Redwood City General Plan and the Federal Transit Administration offers construction mitigation measures listed in Section 12.1.3 "Mitigation of Construction Noise" in the Transit Noise and Vibration Impact Assessment document (FTA-VA-90-1003-06 May 2006). In conclusion, construction noise would be short-term and intermittent. Furthermore, implementation of Mitigation Measure NOI-2 would ensure compliance with the City's construction noise standards; therefore, impacts would be less than significant with mitigation incorporated.

- **MM NOI-2: Construction Noise Reduction.** Implementation of the following multi-part mitigation plan is required to reduce the potential construction period noise impacts.
    - Follow all construction noise requirements listed Section 24, Division 3 "Construction" of the Redwood City Municipal Code and Program PS-63 "Enforcing Construction and Maintenance Noise Regulations" in the Redwood City General Plan.
    - Minimize noise from construction activities by enforcing construction hours, including vehicle start-up and preparation.
    - Limit construction to the hours of 8:00 AM to 5:00 PM on weekdays and 9:00 AM to 5:00 PM on Saturdays, with no noise-generating construction on Sundays or holidays.
    - Control noise from construction worker's radios to the point where they are not audible at existing residences that border the project site.
    - Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

- Locate stationary noise-generating equipment as far as possible from sensitive receptors when sensitive receptors adjoin or are near a construction area.
- Utilize "quiet" air compressors and other stationary noise sources where technology exists.
- The construction contractor would prohibit unnecessary idling of internal combustion engines.
- Notify residents adjacent to the project site of the construction schedule in writing.

SHORT-TERM CONSTRUCTION VIBRATION IMPACTS

During construction of the project, equipment such as cranes, excavators, graders, loaders, backhoes, and bulldozers may be used as close as 100 feet from the nearest sensitive receptor. Construction equipment that would be used during project construction would generate vibration levels between 0.003 PPV and 0.089 PPV at 25 feet, as shown below in Table 8. All the groundborne vibration levels are below the Federal Transit Administration vibration threshold at which human annoyance could occur of 0.10 PPV. Additionally, construction activities would be temporary in nature and would likely occur during normal daytime working hours as per the Redwood City General Plan. Therefore, construction vibrations are not predicted to cause damage to existing buildings or cause annoyance to sensitive receptors. As such, implementation of the project would have a less than significant impact related to vibration.

Table 8: Vibration Source Levels for Construction Equipment

Type of Equipment	Peak Particle Velocity at 25 Feet	Peak Particle Velocity at 50 Feet	Peak Particle Velocity at 100 Feet	Threshold at which Human Annoyance Could Occur	Potential for Project to Exceed Threshold
Large Bulldozer	0.089	0.031	0.011	0.10	None
Loaded Trucks	0.076	0.027	0.010	0.10	None
Small Bulldozer	0.003	0.001	0.000	0.10	None
Auger/Drill Rigs	0.089	0.031	0.011	0.10	None
Jackhammer	0.035	0.012	0.004	0.10	None
Vibratory Hammer	0.070	0.025	0.009	0.10	None

Source: FTA 2006

RAIL LINE VIBRATION IMPACTS

Impacts due to vibration from the adjacent Caltrain railroad lines are addressed in the February 23, 2018 "1180 Main St, Redwood City Vibration Study" report prepared by Mei Wu Acoustics. The study measured ground vibration levels on the foundation of the existing building on the eastern corner of the site; approximately 41' from the centerline of the nearest railroad track, for a minimum of 24 hours. All measurements were then compared to the limits in the Federal Transit Administration (FTA) "Transit Noise and Vibration Impact Assessment" document FTA-VA-90-1003-06, Table 8.1 as a guideline to assess

vibration impacts. The Mei Wu Study concluded all measured events were considered acceptable by the FTA guidelines, except for two very short intermittent events that exceeded 83 VdB and only one of these events occurred during the day when the building would be occupied. Therefore, the impact from rail line vibration would be less than significant and no further mitigation measures were recommended.

Please refer to the report for further discussion of the vibration measurements and results.

AIRPORT NOISE IMPACTS

The nearest public airport to the project site is the San Carlos Airport, located approximately 2.21 miles northwest of the project site. The project site falls well outside the 55 dBA CNEL contour line for the San Carlos Airport as shown in Figure PS-9 in the Redwood City General Plan. Therefore, this would be a less than significant impact.

CONCLUSION

Noise generation associated with the proposed development is typically attributed to the project construction activities. These include site grading, construction of the building and apparatuses, and the increase traffic related to facility use. Operational noise generation can be attributed to the slight increase in traffic counts from employees as well as from typical commercial fixed mechanical equipment.

Based on the FHWA RCNM the proposed project can generate, high levels of construction noise, which are temporary and will not result in long-term impacts from construction. While the noise level impacts presented for each phase of construction are a “worst-case” scenario and may at times be audible over traffic-related noise level impacts surrounding the area, these high levels are not expected to be continuous. Moreover, these noise levels will occur only during the hours allowed by the City's Municipal Code and will be reduced by the application of noise control techniques affecting and controlling the construction noise at the source. Noise control techniques would be implemented to ensure that noise generated from temporary construction activities would not exceed the Redwood City guidelines at nearby sensitive receptors. Furthermore, the exterior façade of the project building would be designed to reduce noise from existing roadways and railways to achieve Code requirements.

Subject:	**1180 Main St, Redwood City Vibration Study**		
	MWA Project - 18008		

Mei Wu Acoustics (MWA) is pleased to submit this report regarding the ground vibration study conducted for 1180 Main St in Redwood City.

This project proposes a multi-level mixed-use (office/retail) building in downtown redwood city. This site-specific vibration study was conducted to measure the ground-borne vibration levels generated by train pass-by events on the nearby Caltrain Railroad line.

MWA personnel measured ground vibration levels at the project site for a period of 24 hours. The measured ground-borne vibration levels exceeded the FTA guideline of 83 VdB for infrequent events during two events.

1. Project Overview

The project site is located adjacent to the Caltrain Railroad line in redwood city. The project proposes the development of a three-story office building with two levels of subterranean parking. The future façade of the building is to be located approximately 41’ from the centerline of the nearest railroad track.

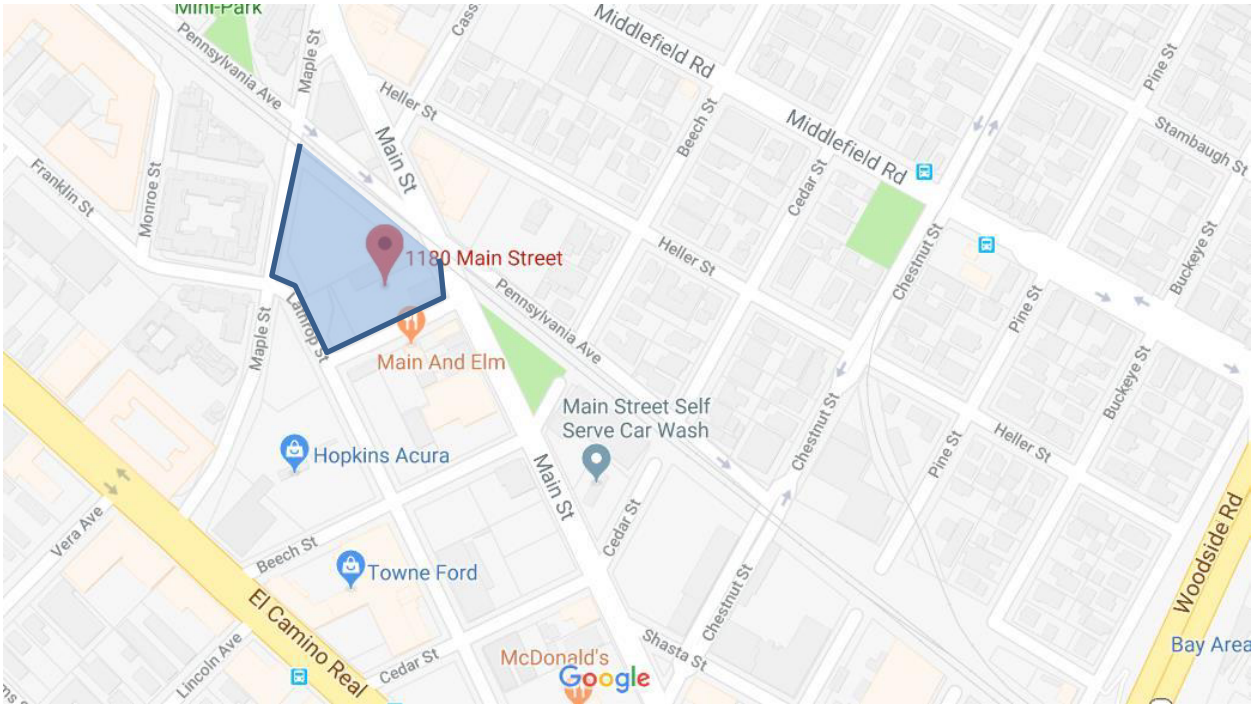

Figure 1: Project Site Overview - 1180 Main St

2. Vibration Criteria

As stated in the Redwood City General Plan Environmental Impact Report (Figure 2), there are no code requirements regarding ground vibration levels. Rather, guidelines developed by the Federal Transit Administration (FTA) are used to assess potential vibration impacts.

> **Vibration Criteria**
>
> **Presently, the City does not have any established vibration criteria or vibration limitations that can be used to evaluate the compatibility of sensitive land uses with respect to groundborne vibration related to railroads. While there are no City established vibration standards, both the U.S. Department of Transportation's Federal Railroad Administration (FRA) and the U.S. Department of Transportation's Federal Transit Administration (FTA) have developed vibration impact assessment criteria for evaluating vibration impacts associated with transit projects, which are based on maximum overall levels for a single event (i.e., a train passing by).**

Figure 2: Redwood City General Plan Environmental Impact Report - Excerpt from Section 4.10-13

The FTA guidelines for vibration levels are based on the building type (occupancy usage) and the number of vibration events per day. The guidelines are reproduced below as Table 1.

Table 8-1. Ground-Borne Vibration (GBV) and Ground-Borne Noise (GBN) Impact Criteria for General Assessment

Land Use Category	GBV Impact Levels (VdB re 1 micro-inch /sec)			GBN Impact Levels (dB re 20 micro Pascals)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB[4]	65 VdB[4]	65 VdB[4]	N/A[4]	N/A[4]	N/A[4]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

Notes:

1. "Frequent Events" is defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.
2. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.
3. "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.
4. This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.
5. Vibration-sensitive equipment is generally not sensitive to ground-borne noise.

Table 1: FTA Ground-borne Vibrations Guidelines[1]

The criteria are specified in vibration decibels (VdB) with respect to one-micro-inch per second (µin/s); the vibration velocities are specified as the one-second root-mean-square (RMS) averages. This project is a Category 3 type building; the applicable guidelines (highlighted in the table above) are 75 VdB for frequent events (more than 70 per day), 78 VdB for occasional events (30 to 70 events per day), and 83 VdB for infrequent events (less than 30 per day).

[1] FTA-VA-90-1003-06 - Transit Noise and Vibration Impact Assessment - Table 8-1, Page 8-3.

3. Vibration Measurement Description

MWA personnel visited the site on February 20th to measure ground vibration levels. The major source of ground-borne vibrations at the site is train pass-by events on the adjacent Caltrain Railroad line.

Measurements were conducted using a National Instruments NI-9234 DAQ equipped with PCB Piezotronics 393B12 ICP accelerometers. The acceleration data was captured and stored on a HP Pavilion DM4 laptop computer running National Instruments LabVIEW SignalExpress with the Sound and Vibration Assistant software.

The ground vibration levels were measured by an accelerometer on the foundation of the existing building at the eastern corner of the site. The accelerometer was located approximately 41' from the centerline of the nearest railroad track (southbound CalTrain), which is the proposed distance of the future building façade from the railroad track (Figure 3).

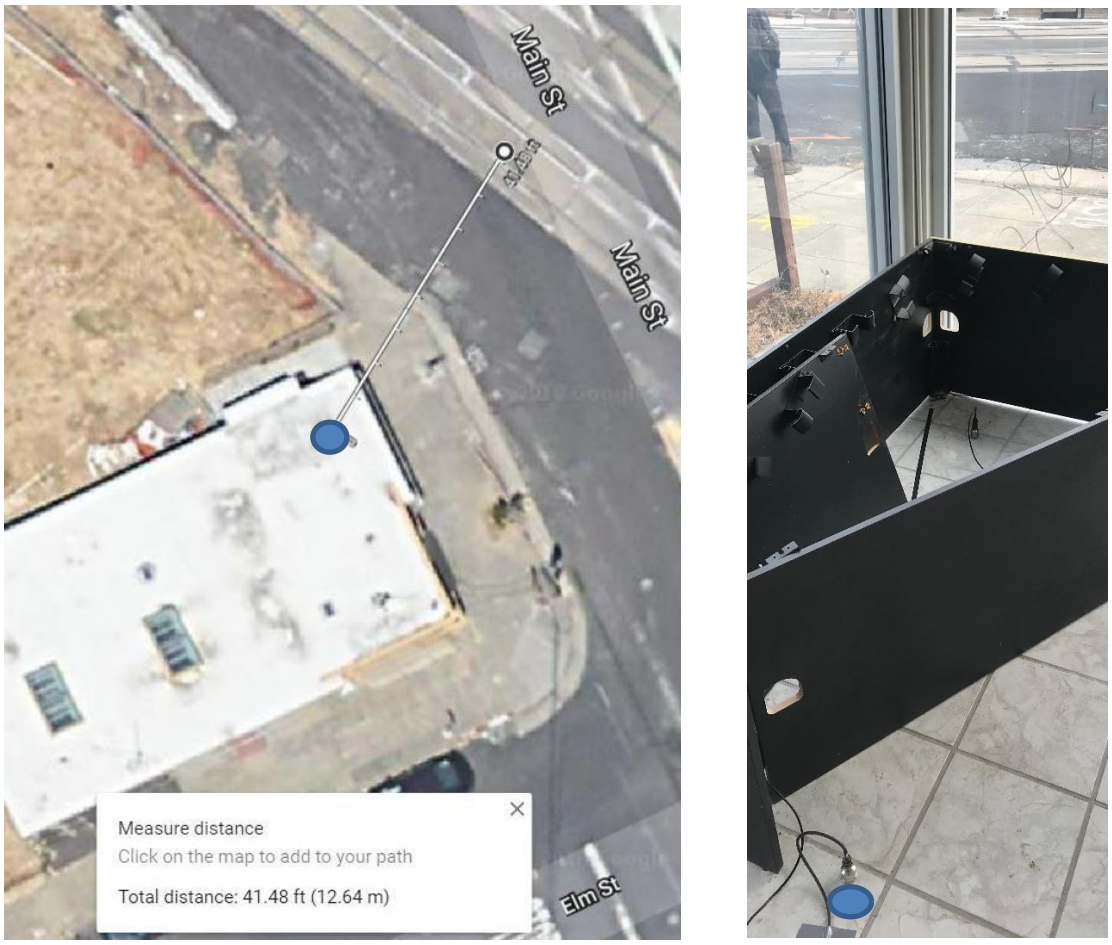

Figure 3: Vibration Measurement Location and Distance to the Railroad Track

As the vibration levels were measured on a building foundation slab, we expect that vibration levels on a similar foundation 41 ft away from the railroad track would also be similar to the measured levels. The measured vibration levels are representative of vibration levels on the ground floor only; vibration levels on floors of different elevations may vary.

4. Measurement Results

Vibration levels were measured at the site for a 24-hour period; shown in 8 hour periods in the three graphs below. The vibration acceleration was converted to vibration velocity with a one-second RMS average. All vibration levels are compared to vibration decibels (VdB) with respect to 1 micro-inch per second, per the FTA guidelines.

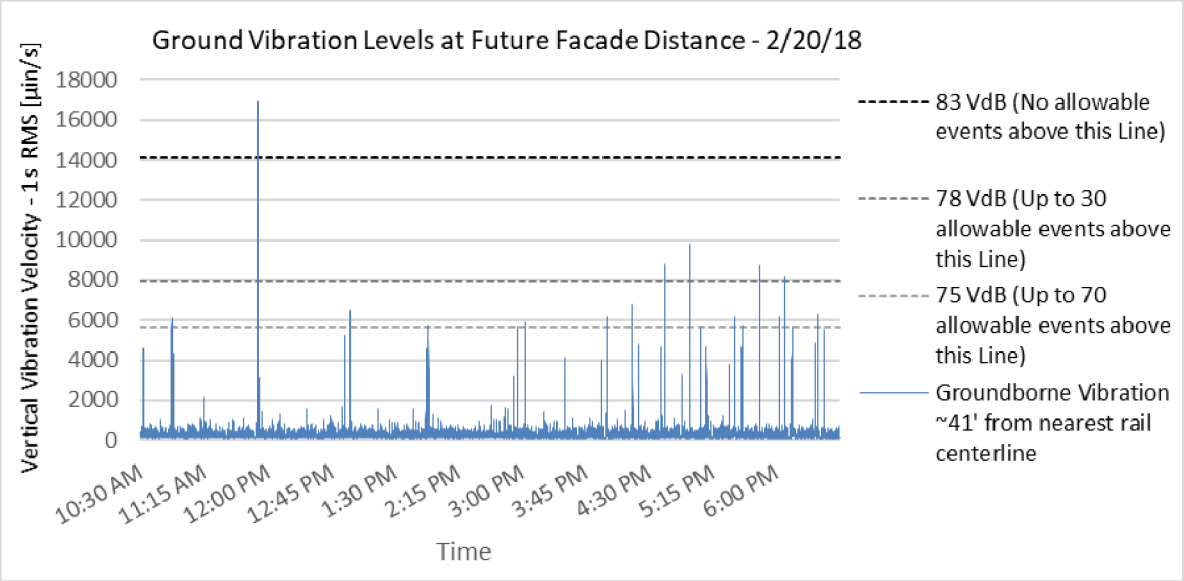

Figure 4: Ground Vibration Levels - 2/20/18 Daytime

There was an event at 11:53AM that exceeded the FTA guidelines of 83 VdB (or 14,125 µin/s); the level measured was 85 VdB (~17,000 µin/s) as seen on Figure 4.

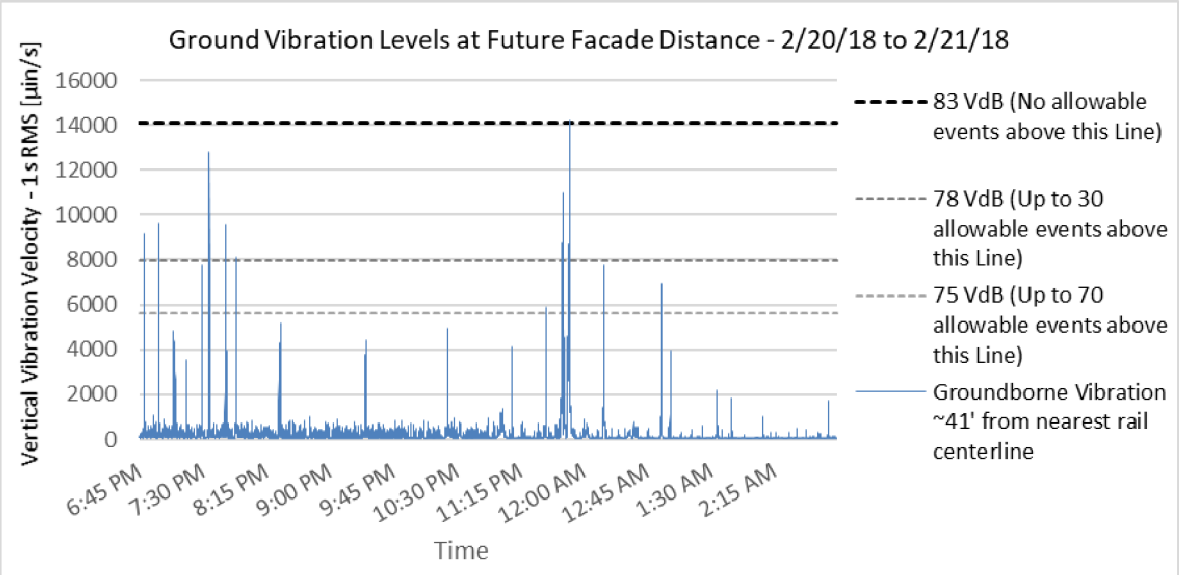

Figure 5: Ground Vibration Levels - 2/20/18 to 2/21/18 Nighttime

There was an event at 11:50PM that was equivalent to the FTA guideline of 83 VdB (or 14,125 µin/s); the level measured was 83 VdB (~14,200 µin/s) (Figure 5).

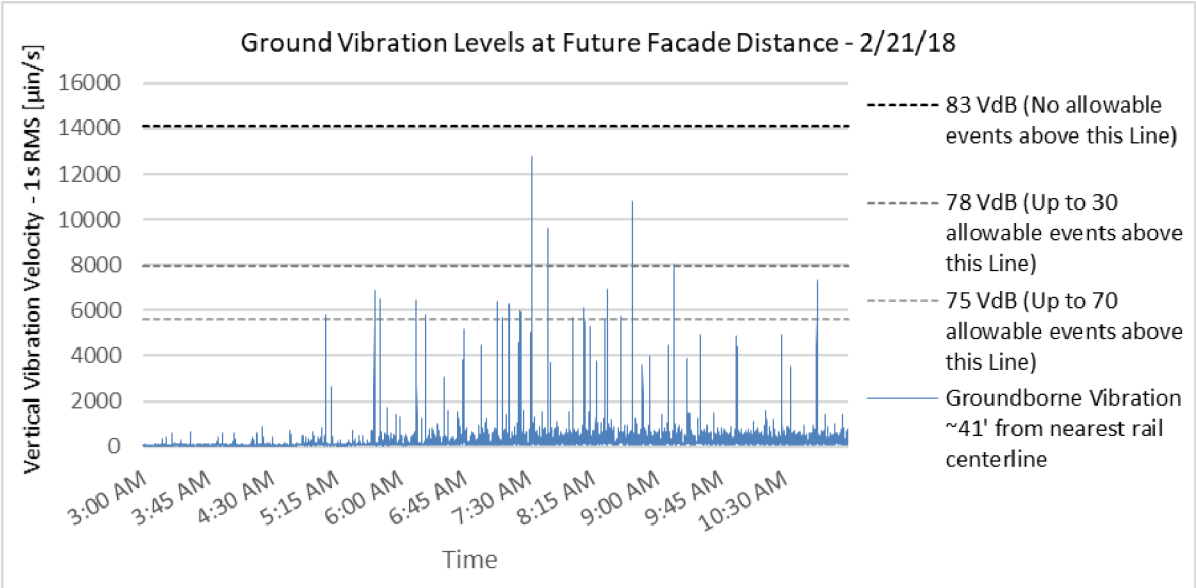

Figure 6: Ground Vibration Levels - 2/21/18 Morning

There were no events measured during the morning hours on 2/21/18 that exceeded 83 VdB.

Over the 24-hour period, there were two (2) events that exceeded 83 VdB, fifteen (15) events that exceeded 78 VdB, and forty-three (43) events that exceeded 75 VdB.

All of the measured events are considered acceptable by the FTA guidelines, except for the two events that exceeded 83 VdB. Only one of these events occurred during the day when the building would be occupied.

* * *

This concludes our report regarding the ground vibration measurements for 1180 Main St in Redwood City. Please contact Mei Wu Acoustics if you have any questions or comments.

Appendix H TRAFFIC IMPACT ANALYSIS REPORT

TRANSPORTATION IMPACT ANALYSIS

1180 & 1190 Main Street

PREPARED FOR:

CITY OF REDWOOD CITY

EXECUTIVE SUMMARY

The 1180 and 1190 Main Street Project ("Project"), is a development which will merge two parcels at 1180 and 1190 Main Street and construct a 112,113-square foot office building.

This traffic study was prepared to determine potential impacts related to the project based on standards and methodologies set forth by the City of Redwood City (City) and the San Mateo City/Council Association of Governments (C/CAG). This study includes evaluations during the AM and PM peak hour traffic conditions for 19 intersections. This study also addresses the potential transportation effects of the proposed project to assist the City with project planning and the identification of potential conditions of approval for the project.

PROJECT TRIP ESTIMATES

Trips generated by the proposed project were based on the average rates for ITE Land Use 710 (General Office Building) from the Institute of Transportation Engineer's (ITE) publication, Trip Generation, 10th Edition. Due to the project's proximity to the Redwood City Caltrain's station and downtown area, transit and mixed-use reductions were applied. The proposed project will generate a 105 vehicle trips in the AM peak hour and a 97 vehicle trips in the PM peak hour.

It should be noted that the C/CAG's 2014 *Guidelines for Implementing the Land Use Component of the Congestion Management Program* requires development that generates 100 or more net new peak hours trips to implement a Transportation Demand Management (TDM) plan to reduce vehicle trips. However, to be conservative, no TDM reductions were assumed.

PROJECT IMPACTS AND RECOMMENDED MITIGATION

Project impacts were determined by comparing conditions with the proposed project to those without the proposed project. Potential significant impacts for study intersection are created when LOS criteria are met. Additional potential significant impacted are created if the proposed project would conflict with existing City's plans and policies. **Table E1** summaries impacts and mitigations associated with the proposed project.

LATHROP CLOSURE ANALYSIS

A supplemental analysis was conducted to evaluate the potential effects of closing a segment of Lathrop Street between Maple Street and Elm Street to vehicle access, except for emergency medical services. Project impacts were determined for this scenario. **Table E2** summaries impacts and mitigations associated with the proposed project.

Table E1 - Summary of Project Impact and Mitigation

Impact #	Location	Scenarios	Mitigation	Impact Significance
TRANS-1	El Camino Real / Beech Street	Cumulative Plus Project PM Peak Hour	Restrict Left-Turns	Mitigated to Less than Significant
TRANS-2	Main Street / Chestnut Street	Cumulative Plus Project PM Peak Hour	Optimize Signal Timing	Mitigated to Less than Significant
TRANS-3	Main Street / Pine Street-SR 84 Ramps	Cumulative Plus Project PM Peak Hour	Install All-way Stop Control	Mitigated to Less than Significant
TRANS-4	Project Site	All	Construct following pedestrian improvements: • Install marked crosswalks at Maple Street/ Franklin Street-Lathrop Street • Install LOOK (R15-8) sign for pedestrian railroad crossing at Maple Street and Main Street. • Install two-stage crosswalk at Maple Street / Main Street and sidewalk improves along the east side of Maple street between Main Street and railroad tracks	Mitigated to Less than Significant
TRAN-5	Project Site	All	Install Class III “Sharrows” along Lathrop Street and pay fair share towards other bicycle improvements within the area	Mitigated to Less than Significant

Table E2 - Summary of Project Impact and Mitigation for Lathrop Closure Analysis

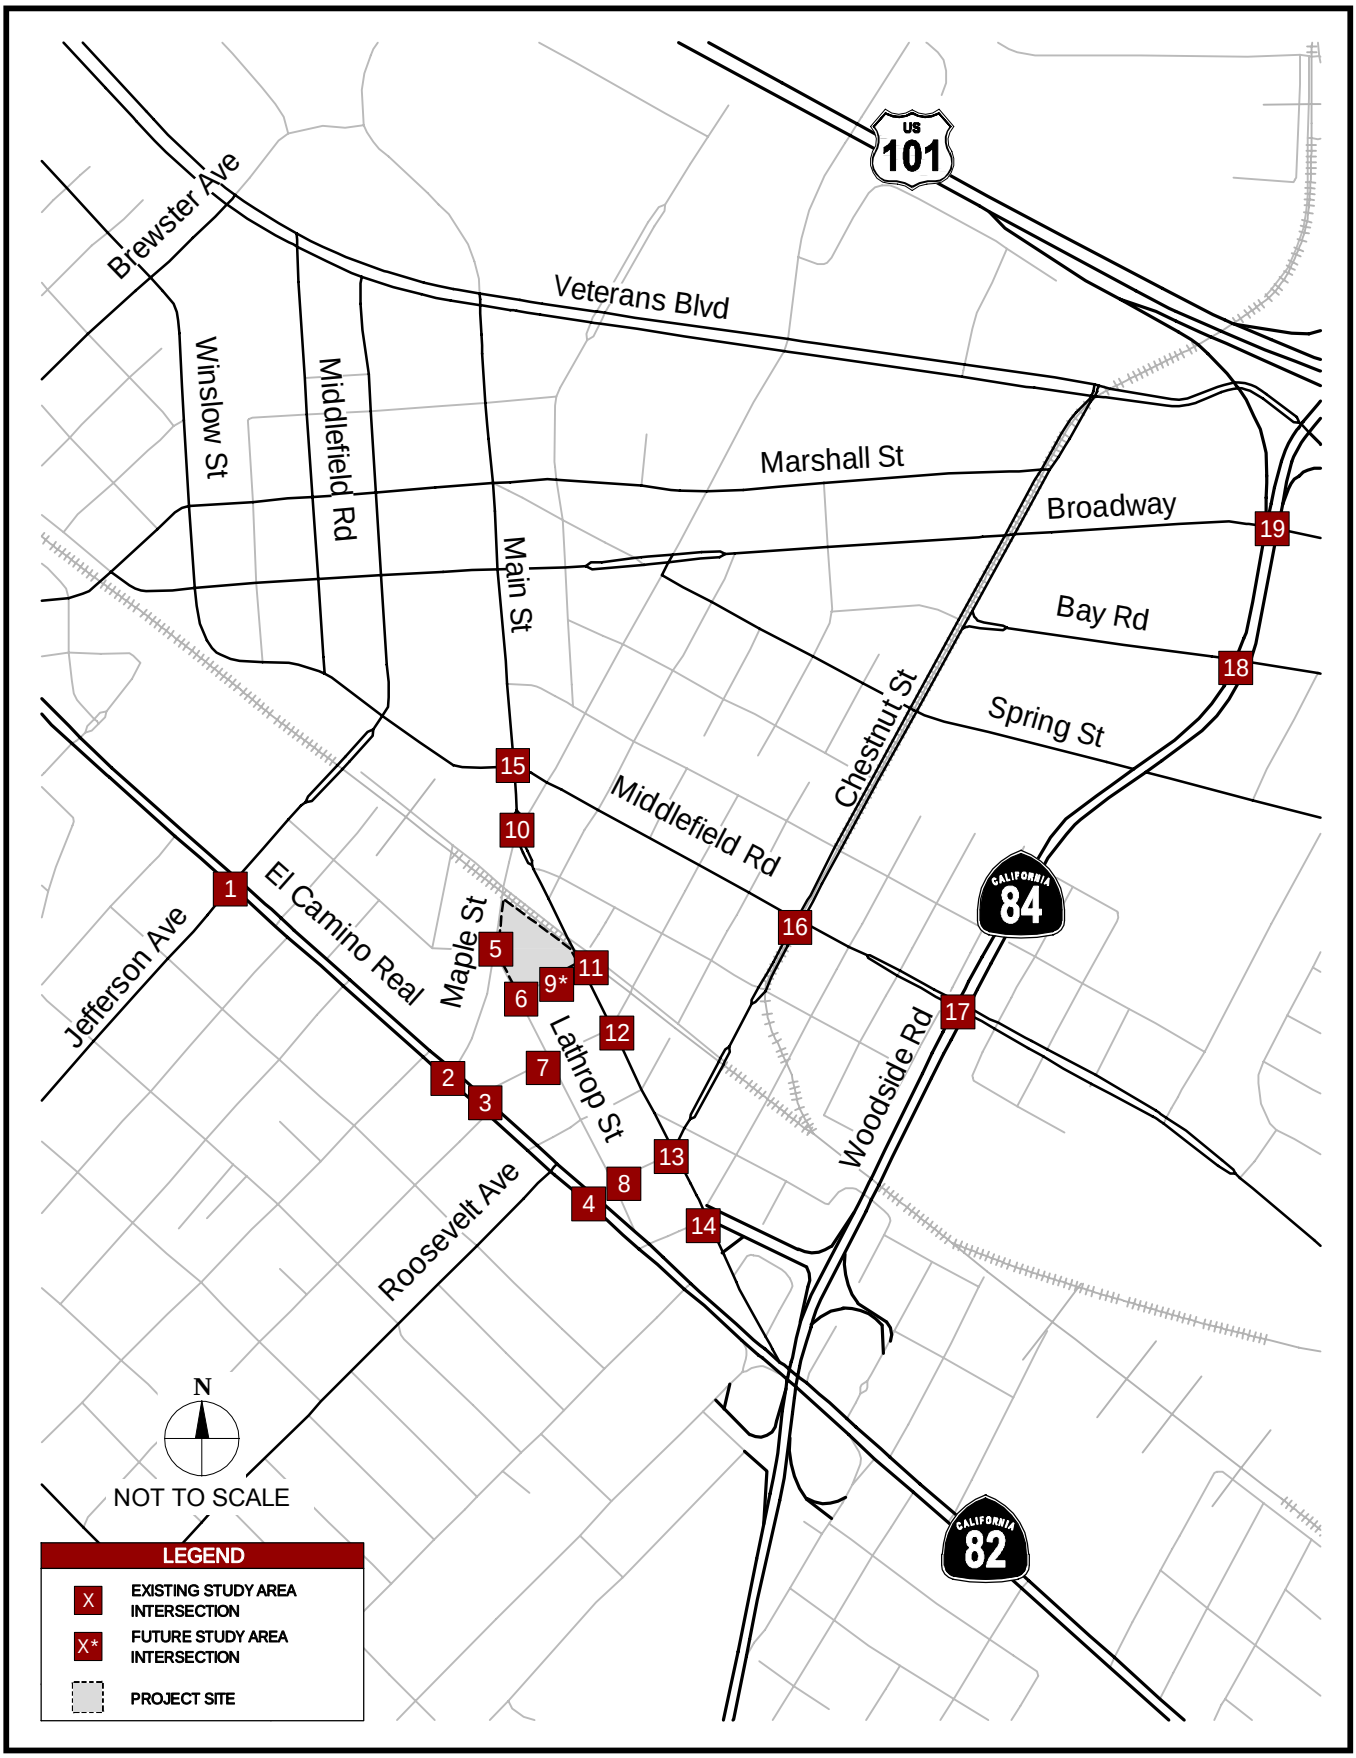
Impact #	Location	Scenarios	Mitigation	Impact Significance
TRANS-S1	El Camino Real / Beech Street	Cumulative Plus Project AM Peak Hour Cumulative Plus Project PM Peak Hour	Restrict Left-Turns	Mitigated to Less than Significant
TRANS-S2	Main Street / Chestnut Street	Cumulative Plus Project PM Peak Hour	Optimize Signal Timing	Mitigated to Less than Significant
TRANS-S3	Main Street / Pine Street-SR 84 Ramps	Cumulative Plus Project PM Peak Hour	Install All-way Stop Control	Mitigated to Less than Significant
TRANS-S4	Project Site	All	Construct following pedestrian improvements: • Install marked crosswalks at Maple Street/ Franklin Street-Lathrop Street • Install LOOK (R15-8) sign for pedestrian railroad crossing at Maple Street and Main Street. Install two-stage crosswalk at Maple Street / Main Street and sidewalk improves along the east side of Maple street between Main Street and railroad tracks	Mitigated to Less than Significant
TRAN-S5	Project Site	All	Install Class III “Sharrows” along Lathrop Street and pay fair share towards other bicycle improvements within the area	Mitigated to Less than Significant

1. INTRODUCTION

This report presents the results of the transportation impact analysis (TIA) for a proposed 3-story office building located in the City of Redwood City, California. The proposed project ("Project") will merge two parcels at 1180 and 1190 Main Street and construct a 112,113-square foot office building.

Figure 1 illustrates the location of the project site in relation to the adjacent roadway network. Pedestrians may access the building at entrances on Main Street and Lathrop Street. Vehicles may enter the underground parking off Elm Street.

This traffic study was prepared to determine potential impacts related to the project based on standards and methodologies set forth by the City of Redwood City (City) and the San Mateo City/Council Association of Governments (C/CAG). This study includes evaluations during the AM and PM peak hour traffic conditions for 19 intersections. This study also addresses the potential transportation effects of the proposed project to assist the City with project planning and the identification of potential conditions of approval for the project.



STUDY AREA

The proposed project will generate new vehicular trips that will increase traffic volumes on the nearby street network. To assess changes in traffic conditions associated with the proposed project, the following intersections were studied, as shown in **Table 1**. Study intersections were selected in adherence with the City/Council Association of Governments of San Mateo County (C/CAG) threshold of 50 or more net new peak hour trips per intersection generated by the project. **Figure 1** illustrates the intersection locations.

TRAFFIC CONDITIONS

This TIA evaluates the following traffic scenarios:

- Existing Conditions – Based on traffic counts taken in March 2016, April 2017, and May 2018 and existing roadway geometry and traffic control in 2018.
- Existing Plus Project Conditions – Based on traffic generated by the proposed project added to existing traffic volumes. Existing roadway geometry with proposed project roadway improvements and traffic controls are assumed for this scenario.
- Background Condition – Based on traffic from approved projects in the study area (provided by City staff and dated June 2018) added to existing traffic volumes.
- Background Plus Project Conditions – Based on traffic from approved projects in the study area and traffic generated by the proposed project added to existing traffic volumes.
- Cumulative Conditions – Based on traffic from approved and pending projects in the study area (provided by City staff and dated June 2018) added to existing traffic volumes.
- Cumulative Plus Project Conditions – Based on future cumulative year traffic projections and traffic generated by the proposed project.

STUDY METHODOLOGY

Analysis of significant environmental impacts at intersections and freeway segments was based on the methodology of level of service (LOS). The LOS of an intersection is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. Levels of service for this study were determined using methods defined in the *Highway Capacity Manual, 2000* (HCM) for signalized intersections and *Highway Capacity Manual, 2010* (HCM 2010) for unsignalized intersections.

INTERSECTION LEVEL OF SERVICE

The HCM includes procedures for analyzing side-street stop-controlled (SSSC) and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for each minor street approach movement and major street left-turns. **Table 2** relates the operational characteristics associated with each LOS category for signalized and unsignalized intersections[1].

[1] Transportation Research Board, *Highway Capacity Manual 2010*, National Research Council, 2000

Table 2 - Intersection Level of Service Definitions

Level of Service	Description	Signalized (Avg. control delay per vehicle sec/veh.)	Unsignalized (Avg. control delay per vehicle sec/veh.)
A	Free flow with no delays. Users are virtually unaffected by others in the traffic stream	delay ≤ 10.0	delay ≤ 10.0
B	Stable traffic. Traffic flows smoothly with few delays.	10.0 < delay ≤ 20.0	10.0 < delay ≤ 15.0
C	Stable flow but the operation of individual users becomes affected by other vehicles. Modest delays.	20.0 < delay ≤ 35.0	15.0 < delay ≤ 25.0
D	Approaching unstable flow. Operation of individual users becomes significantly affected by other vehicles. Delays may be more than one cycle during peak hours.	35.0 < delay ≤ 55.0	25.0 < delay ≤ 35.0
E	Unstable flow with operating conditions at or near the capacity level. Long delays and vehicle queuing.	55.0 < delay ≤ 80.0	35.0 < delay ≤ 50.0
F	Forced or breakdown flow that causes reduced capacity. Stop and go traffic conditions. Excessive long delays and vehicle queuing.	delay > 80	delay > 50

THRESHOLD OF SIGNIFICANCE

Project impacts were determined by comparing conditions with the proposed project to those without the proposed project. Significant impacts for unsignalized and signalized intersections are created when traffic from the proposed project causes the LOS to fall below a specific threshold.

City of Redwood City

The LOS standard for City of Redwood City intersections is LOS D except for C/CAG designated Congestion Management Program (CMP) intersections, which allows for a minimum level of service of LOS E. Project impacts at City of Redwood City signalized intersections would be considered significant if one of the following criteria is met:

1. If the intersection operates at an acceptable LOS (i.e. LOS A, B, C, or D for City intersections and LOS A, B, C, D or E for CMP intersections) without the project and degrades to an unacceptable LOS (i.e. LOS E, or F) with the project; or
2. If the intersection operates at an unacceptable LOS (i.e. LOS E, or F for City intersections or LOS F for CMP intersections) without the project and the project increases the delay by five (5) or more seconds.

Project impacts at City of Redwood City unsignalized intersections would be considered significant if one of the following criteria is met:

1. If the intersection operates at an acceptable LOS (i.e. LOS A, B, C, or D) without the project and degrades to an unacceptable LOS (i.e. LOS E, or F) with the project and the traffic volumes at the intersection satisfy the California Manual of Uniform Traffic Control Devices (CA MUTCD) Peak Hour Volume warrant for traffic signal installation; or
2. If the intersection operates at an unacceptable LOS (i.e. LOS E, or F) without the project and the project increases the delay by five (5) or more seconds and the traffic volumes at the intersection satisfy the California Manual of Uniform Traffic Control Devices (CA MUTCD) Peak Hour Volume warrant for traffic signal installation.

Mitigation for intersections with a significant impact must improve the LOS back to without Project conditions or better.

SIGNAL WARRANTS

Traffic signals may be justified when traffic operations fall below acceptable LOS standards and when one or more signal warrants are satisfied. Traffic volumes at the unsignalized study intersections were compared against the peak hour warrant in the 2014 California Manual on Uniform Traffic Control Devices (CA MUTCD)[2]. *Traffic Signal Warrant #3 – Peak Hour Volume Warrant* is satisfied when traffic volumes on the major and minor approaches exceed thresholds for one hour of the day. The Peak Hour Warrant is generally the first warrant to be satisfied. Other warrants such as those for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied.

QUEUING

The effects of vehicle queuing were analyzed and the 95th percentile queue is reported for all study intersections. The 95th percentile queue length represents a condition where 95 percent of the time during the peak hour, traffic volumes will be less than or equal to the queue length determined by the analysis. This is referred to as the "95th percentile queue."

Queues that exceed the turn pocket length can create potentially hazardous conditions by blocking or disrupting through traffic in adjacent travel lanes. However, these potentially hazardous queues are generally associated with left-turn movements. Locations where the right turn pocket storage is exceeded are not considered potentially hazardous because the right turn movement typically goes at the same time as the through movement and the additional vehicles that spill out of the turn pocket will likely not hinder nor disrupt the adjacent through traffic, as would be the case in most left turn pockets.

The City of Redwood City does not have specified standards for queuing in its policy guidelines. Thus, for purposes of this analysis, queuing deficiencies were considered to occur under conditions where project traffic causes the queue in a left turn pocket to extend beyond the turn pocket by 25 feet or more (i.e., the length of one vehicle) into adjacent traffic lanes that operate (i.e., move) separately from the left turn lane. Where the vehicle queue already exceeds that turn pocket length under pre-project conditions, a queuing deficiency would occur if project traffic lengthens the queue by 25 feet or more.

REPORT ORGANIZATION

The remainder of the report is divided into the following chapters:

- Chapter 2: Existing Conditions – describes existing conditions on the roadway network, transit system, pedestrian facilities, and bicycle facilities.
- Chapter 3: Existing Plus Project Conditions – describes the proposed project, trip generation, and estimated impact on the transportation system under Existing Plus Project Conditions.
- Chapter 4: Background Traffic Conditions – describes the traffic conditions under Background Conditions with and without the proposed project.
- Chapter 5: Cumulative Traffic Conditions – describes the traffic conditions under Cumulative Conditions with and without the proposed project.
- Chapter 6: Intersection Vehicle Queuing and Site Access and Circulation - describes vehicle queuing analysis at the study intersections and site access and circulation for the proposed Project. This chapters also includes potential effects the proposed project may have on the transit system, pedestrian facilities, and bicycle facilities.
- Chapter 7: Summary of Impacts and Recommended Mitigation – summarizes potential impacts of the proposed project and mitigations, if necessary.
- Chapter 8: Supplemental Analysis - Lathrop Street Closure – summarizes supplemental analysis conducted to evaluate the potential impacts associated with the closure of Lathrop Street between Maple Street and Elm Street.

2. EXISTING CONDITIONS

This chapter describes the existing conditions of the roadway network, transit service, pedestrian facilities, and bicycle facilities within the vicinity of the project site. The chapter also presents existing turning movement volumes and intersection levels of service.

EXISTING ROADWAY NETWORK

This section provides a description of the specific roadways included in this study.

EL CAMINO REAL (STATE ROUTE 82)

El Camino Real, State Route 82 (SR 82), is a four-lane north-south boulevard. El Camino Real runs parallel to US 101 and connects multiple cities in the Bay Area from Daly City to the north and Santa Clara to the south. The posted speed limit on El Camino Real within the study area is 35 mph.

BAY ROAD

Bay Road begins as a residential two-lane roadway in the west at Beech Street and continues east as a four-lane industrial street, serving commercial and industrial land uses within the study area. The speed limit on Bay Road is 30 miles per hour.

BEECH STREET

Beech Street is a two-lane local road with on-street parking. Within the study area, Beech Street begins at El Camino Real and terminates just south of the railroad tracks serving industrial land uses. Beech Street continues north of the railroad tracks and serves residential land uses. Within the study area, the speed limit on Beech Street is 25 miles per hour.

BROADWAY

Broadway is an east-west industrial street, which runs between Hopkins Avenue and Fifth Avenue. Between Hopkins Avenue and El Camino Real, Broadway is a two-lane roadway with bicycle lanes that serves residential land uses. Within the downtown area, between El Camino Real and Woodside Road, there are two to four lanes along Broadway with either on-street parking or bicycle lanes. East of Woodside Road, Broadway is a four-lane road with a two-way left-turn lane (TWLTL) and shared bicycle lanes (sharrows) or bicycle lanes. West of Woodside Road, the posted speed limit on Broadway is 25 miles per hour and 30 miles per hour east of Woodside Road.

CHESTNUT STREET

Chestnut Street is a two-lane, local street with on-street parking. There is an at-grade crossing with the railroad tracks near the Pennsylvania Avenue. Within the study area, Chestnut Street, serves industrial land uses and serves residential and commercial land uses north of the railroad tracks. Chestnut Street connects with Veterans Boulevard to the north and El Camino Real to the south. Within the study area the speed limit on Chestnut Street is 25 miles per hour.

ELM STREET

Elm Street is a two-lane local street with on-street parking. Elm Street runs between Lathrop Street and Main Street. Left turns from Elm Street onto Main Street are prohibited. Entrance to the Project's garage is located off Elm Street. The speed limit on Elm Street is 25 miles per hour.

FRANKLIN STREET

Franklin Street is a two-lane local street with on-street parking that serves residential uses. Franklin Street begins at Jefferson Avenue and becomes Lathrop Street at Maple Street. The speed limit on Franklin Street is 25 miles per hour.

JEFFERSON AVENUE

Jefferson Avenue is a connector street that connects the residential and downtown area in Redwood City. West of Middlefield Road, Jefferson Avenue is a four-lane roadway with on-street parking and shared bicycle lanes and a speed limit of 30 miles per hour. East of Middlefield Road, Jefferson Avenue becomes a two-lane roadway with on-street parking and a speed limit of 25 miles per hour.

LATHROP STREET

Lathrop Street is a two-lane local roadway with on-street parking, that serves industrial land uses. Lathrop Street connects with El Camino Real and turns into Franklin Street at Maple Street. The speed limit on Lathrop Street is 25 miles per hour.

MAIN STREET

Main Street is a two-way roadway that runs between El Camino Real and Veterans Boulevard. Within the study area Main Street is designated as a local street with on-street parking and serves industrial land uses. North of Middlefield Road, Main Street is designated as a pedestrian street with on-street parking and a TWLTL in some segments. There is a median island on Main Street from the railroad tracks towards Elm Street to prevent cars heading downtown from accessing the tracks when the gate arms are down. Within the study area the speed limit on Main Street is 30 miles per hour. There is an at-grade crosswalk with the railroad tracks, just north of Elm Street.

MAPLE STREET

Maple Street is north-south roadway that runs from Redwood Creek to El Camino Real. Within the study area south of Main Street, it is designated in the General Plan as a two-lane pedestrian street and as a Neighborhood Main Street in RWCmoves. Maple Street has Class II bike lanes and a speed limit of 25 miles per hour that serves residential purposes. North of Main Street, Maple Street is predominantly a two-lane street with on-street parking, and a speed limit of 25 miles per hour. From Main Street to Middlefield Road, Maple Street is one-way in the southbound direction with on-street parking. North of Marshall Street, there is no on-street parking and the posted speed limit is 30 miles per hour.

MIDDLEFIELD ROAD

Middlefield Road is an east-west connector street which connects the residential and downtown areas. East of Maple Street, Middlefield Road is a two-lane roadway with a two-way left-turn lane, on street parking,

and Class II bicycle lanes with a speed limit of 30 miles per hour. West of Maple Street, Middlefield Road is primarily a two-lane roadway with on-street parking and a speed limit of 25 miles per hour.

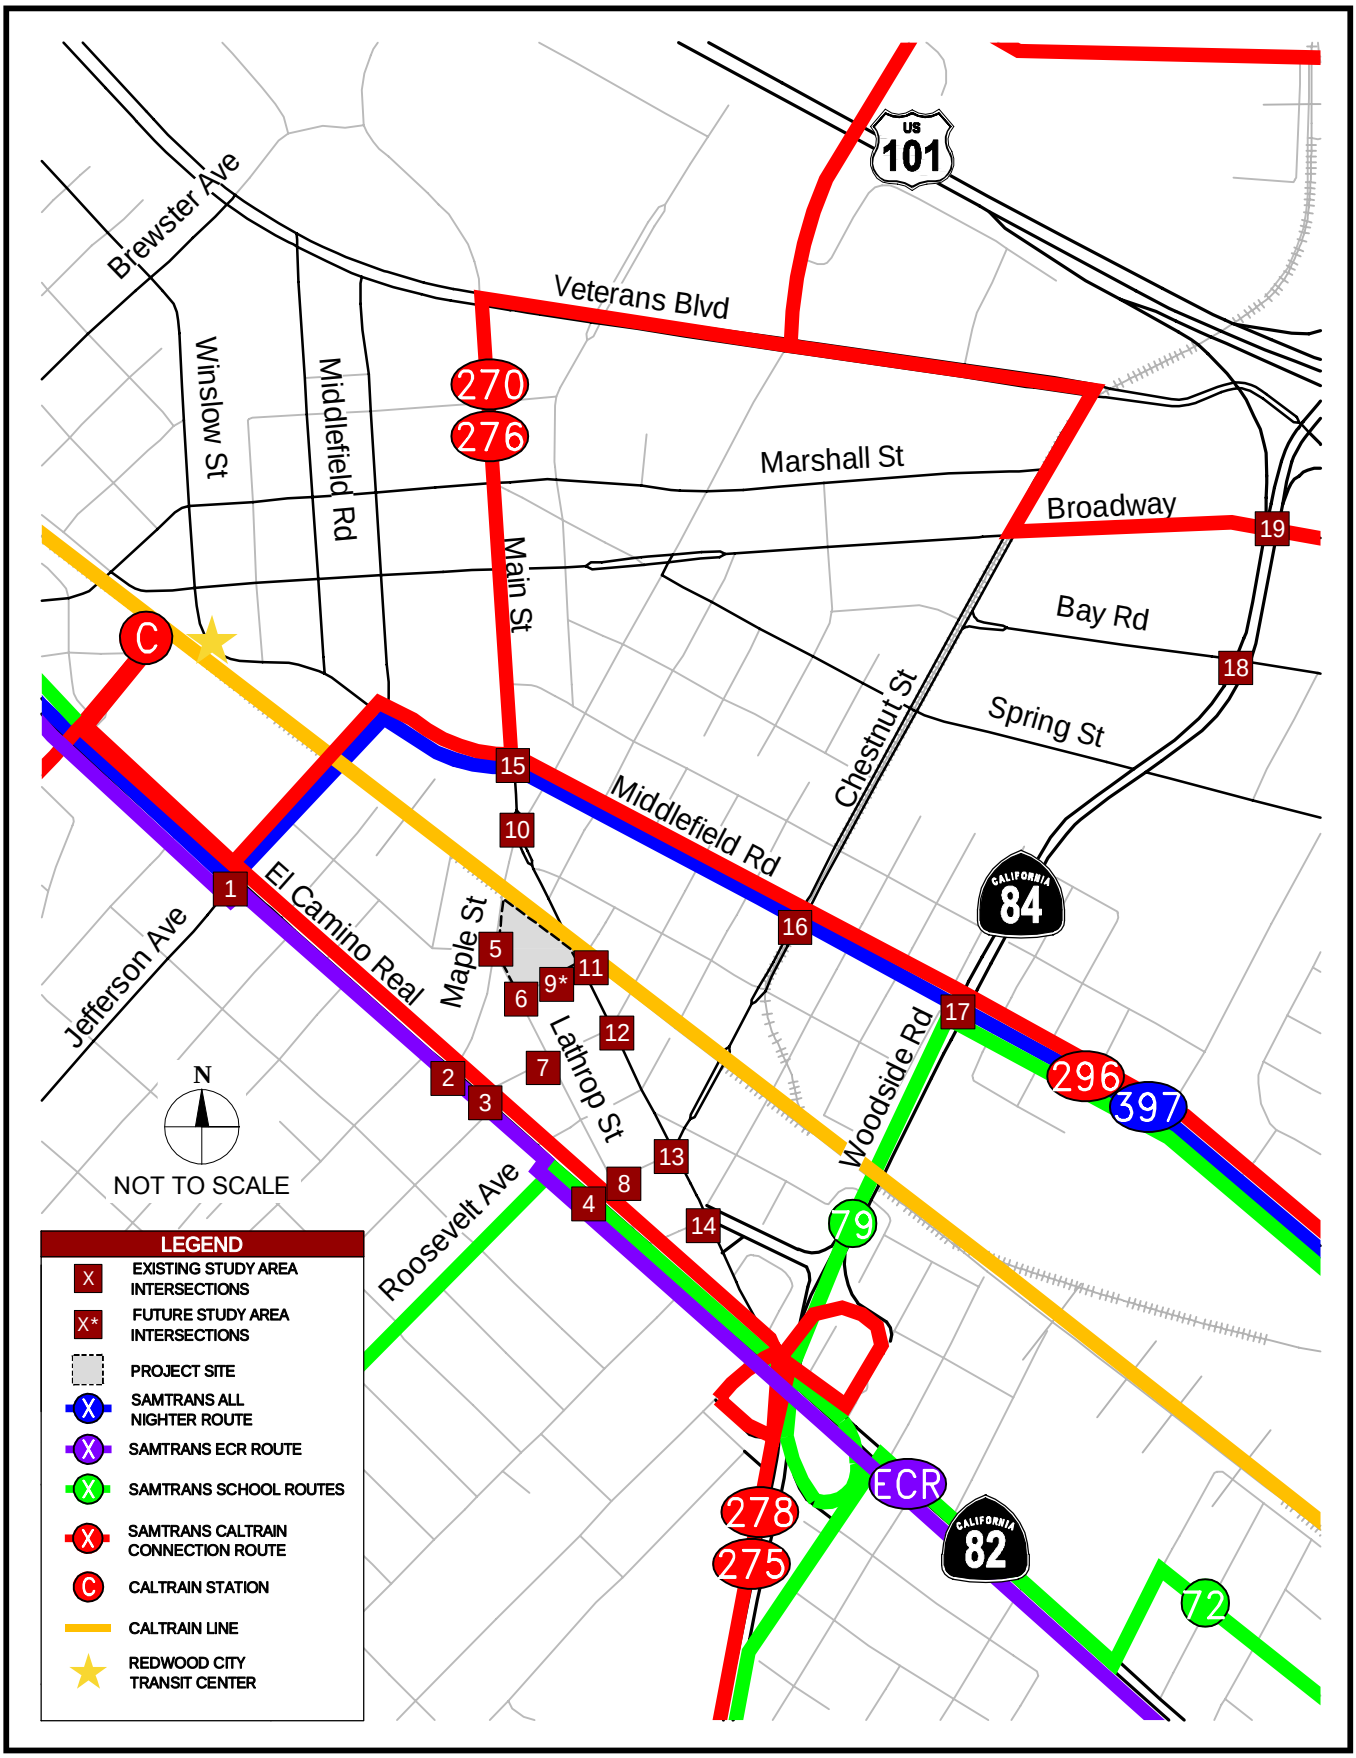
WOODSIDE ROAD

Woodside Road, is a north-south, designated boulevard that connects to I-280 and US-101. Within the study area, Woodside Road is a four to five-lane roadway. South of US-101, Woodside Road is designated as State Route 84 (SR 84). The posted speed limit is 35 miles per hour.

EXISTING TRANSIT FACILITIES

SamTrans and Caltrain provide transit services within Redwood City and other cities in San Mateo County. The existing transit services within the study area are shown in **Figure 2** and described in this section. **Table 3** provides of a summary of the existing transit service in the study area.

SAMTRANS BUS SERVICES



SamTrans has multiple bus routes near the project site and in the vicinity of Redwood City. Many routes (such as Routes 73, 78, 87, 296, 398, etc.) operate within the study area, but do not run near the proposed site; therefore, only routes that service the nearby area of the proposed project are described in this section.

Route 79 is a limited local bus service for that operates between Kennedy Middle School and the intersection of Florence Street and 17th Avenue only on school days. During the AM peak, there are three buses that run between 7:03 AM to 8:08 AM on approximately 5- to 30-minute headways. During the afternoon dismissal period, there are three buses that depart Kennedy Middle School between 3:14 PM and 4:15 PM. On Thursday afternoons, there are two buses that depart the middle school at 2:00 PM and 2:03 PM. In the vicinity of the project site, Route 79 runs on Roosevelt Avenue, El Camino Real, Woodside Road, and Middlefield Road with the nearest bus stop at El Camino Real and Roosevelt Avenue.

Route 274 is a local bus service that operates between Cañada College and the Redwood City Transit Center. Route 274 operates during the weekdays between 6:05 AM and 10:45 PM on 30- to 60-minute headways. In the vicinity of the project site, Route 274 runs on El Camino Real and Woodside Road. There is no weekend service, and the nearest bus stop is at El Camino Real and Oak Avenue.

Route 275 is a local bus service that operates on weekdays between the Redwood City Transit Center and the intersection of Woodside Road and Alameda de las Pulgas. It operates from 6:00 AM to 7:14 PM on 30-minute headways. In the vicinity of the project site, the route runs along Woodside Road and El Camino Real, with the nearest bus stop at El Camino Real and Cedar Street.

Route 278 is a local bus service that operates between Cañada College and the Redwood City Transit Center. Route 278 only operates on Saturday between 7:30 AM and 7:29 PM on 60-minute headways. In the vicinity of the project site, Route 278 runs on El Camino Real and Woodside Road, with the nearest bus stop at El Camino Real and Cedar Street.

FIGURE 2
EXISTING TRANSIT FACILITIES

Table 3 - Existing Transit Service

Route	From	To	Weekdays			Weekends	
			Operating Hours[1]	Headway[2] (minutes)		Operating Hours[1,3]	Headway[2] (minutes)
				Peak	Off-Peak		
SamTrans							
79	Kennedy Middle School	Florence St. and 17th Ave.	7:05 AM to 4:40 PM[4]	5-35	-	No weekend service	-
274	Redwood City Transit Center	Cañada College	6:05 AM to 10:25 PM	30	60	No weekend service	-
275	Redwood City Transit Center	Woodside Road and Alameda de las Pulgas	6:00 AM to 7:15 PM	30	30	No weekend service	-
278	Redwood City Transit Center	Cañada College	No weekday service	-	-	7:30 AM to 7:30 PM	60
296	Redwood City Transit Center	Palo Alto Transit Center	All hours[5]	15	60	All hours[6]	30-90
397	San Francisco	Palo Alto Transit Center	12:45 AM to 6:25 AM	-	60	12:45 AM to 6:25 AM	60
ECR	Daly City BART station	Palo Alto Transit Center	4:20AM to 1:44 AM	10	20-60	5:00 AM to 2:05 AM	15

Notes:
[1] Operating Hours rounded to the nearest 5 minutes for weekdays and weekends.
[2] Headways are defined as the time between transit vehicles on the same route. Listed headways are the modes of the headways and rounded to the nearest 5 minutes.
[3] Operating hours for Sundays may have different schedule or flexible schedule compared to Saturdays.
[4] Route 79 operates on school days only. Buses heads towards Kennedy Middle School between 7:05 AM and 8:10 AM and departs from Kennedy Middle School between 3:15 PM and 4:40 PM (2:00 PM and 4:40 PM on Thursdays).
[5] Route 296 operates from 6:05 AM to 2:45 AM the next day for the eastbound direction and from 3:45 AM to 12:25 AM the next day for the westbound direction.

Route 296 is a local bus service that runs between the Redwood City Transit Center and the Palo Alto Transit Center. On weekdays, the route operates from 6:05 AM to 2:44 AM the next day for the eastbound direction and 3:46 AM to 12:23 AM the next day for the westbound direction on approximately 15- to 60-minute headways. On weekends, the route operates from 6:43 AM to 2:20 AM the next day for the eastbound direction and from 3:45 AM to 12:26 PM the next day for the westbound direction on approximately 30- to 60-minute headways. In the vicinity of the project side, Route 296 runs on Middlefield Road, Jefferson Avenue, and El Camino Real, with the nearest bus stop at Middlefield Road and Cassia Street.

Route 397 is an all-nighter bus service that operates between downtown San Francisco and the Palo Alto Transit Center. On weekdays and weekends, there are three buses that operate to San Francisco at 12:46 AM, 1:46 AM, and 2:46 AM and four buses that operate to Palo Alto Transit Center at 1:06 AM, 2:06 AM, 3:06 AM, and 4:06 AM. In the vicinity of the project site, Route 397 runs along Middlefield Road and El Camino Real, with the nearest bus stop at Middlefield Road and Cassia Street.

Route ECR RAPID is a rapid bus service that runs along El Camino Real from the Daly City BART station to the Palo Alto Transit Center. This route only has twelve stops, many are either Caltrain stations or transit centers, along provides riders, which faster travel times along El Camino Real. The route operates within Redwood City between 4:22 AM and 1:44 AM the next day on the weekdays with headways approximately 20 minutes during peak hours, 60 minutes during late night service. On Saturdays, the route operates

within Redwood City between 5:02 AM and 2:06 AM the next day with headways between 10 to 30 minutes throughout the day and 60 minutes during late night service. On Sundays, the route operates within Redwood City between 5:05 AM and 2:02 AM the next day with headways approximately 30 minutes. In the vicinity of the project site, Route ECR RAPID runs on El Camino Real along Jefferson Avenue and Woodside Road, with the nearest bus stop at Redwood City Transit Center.

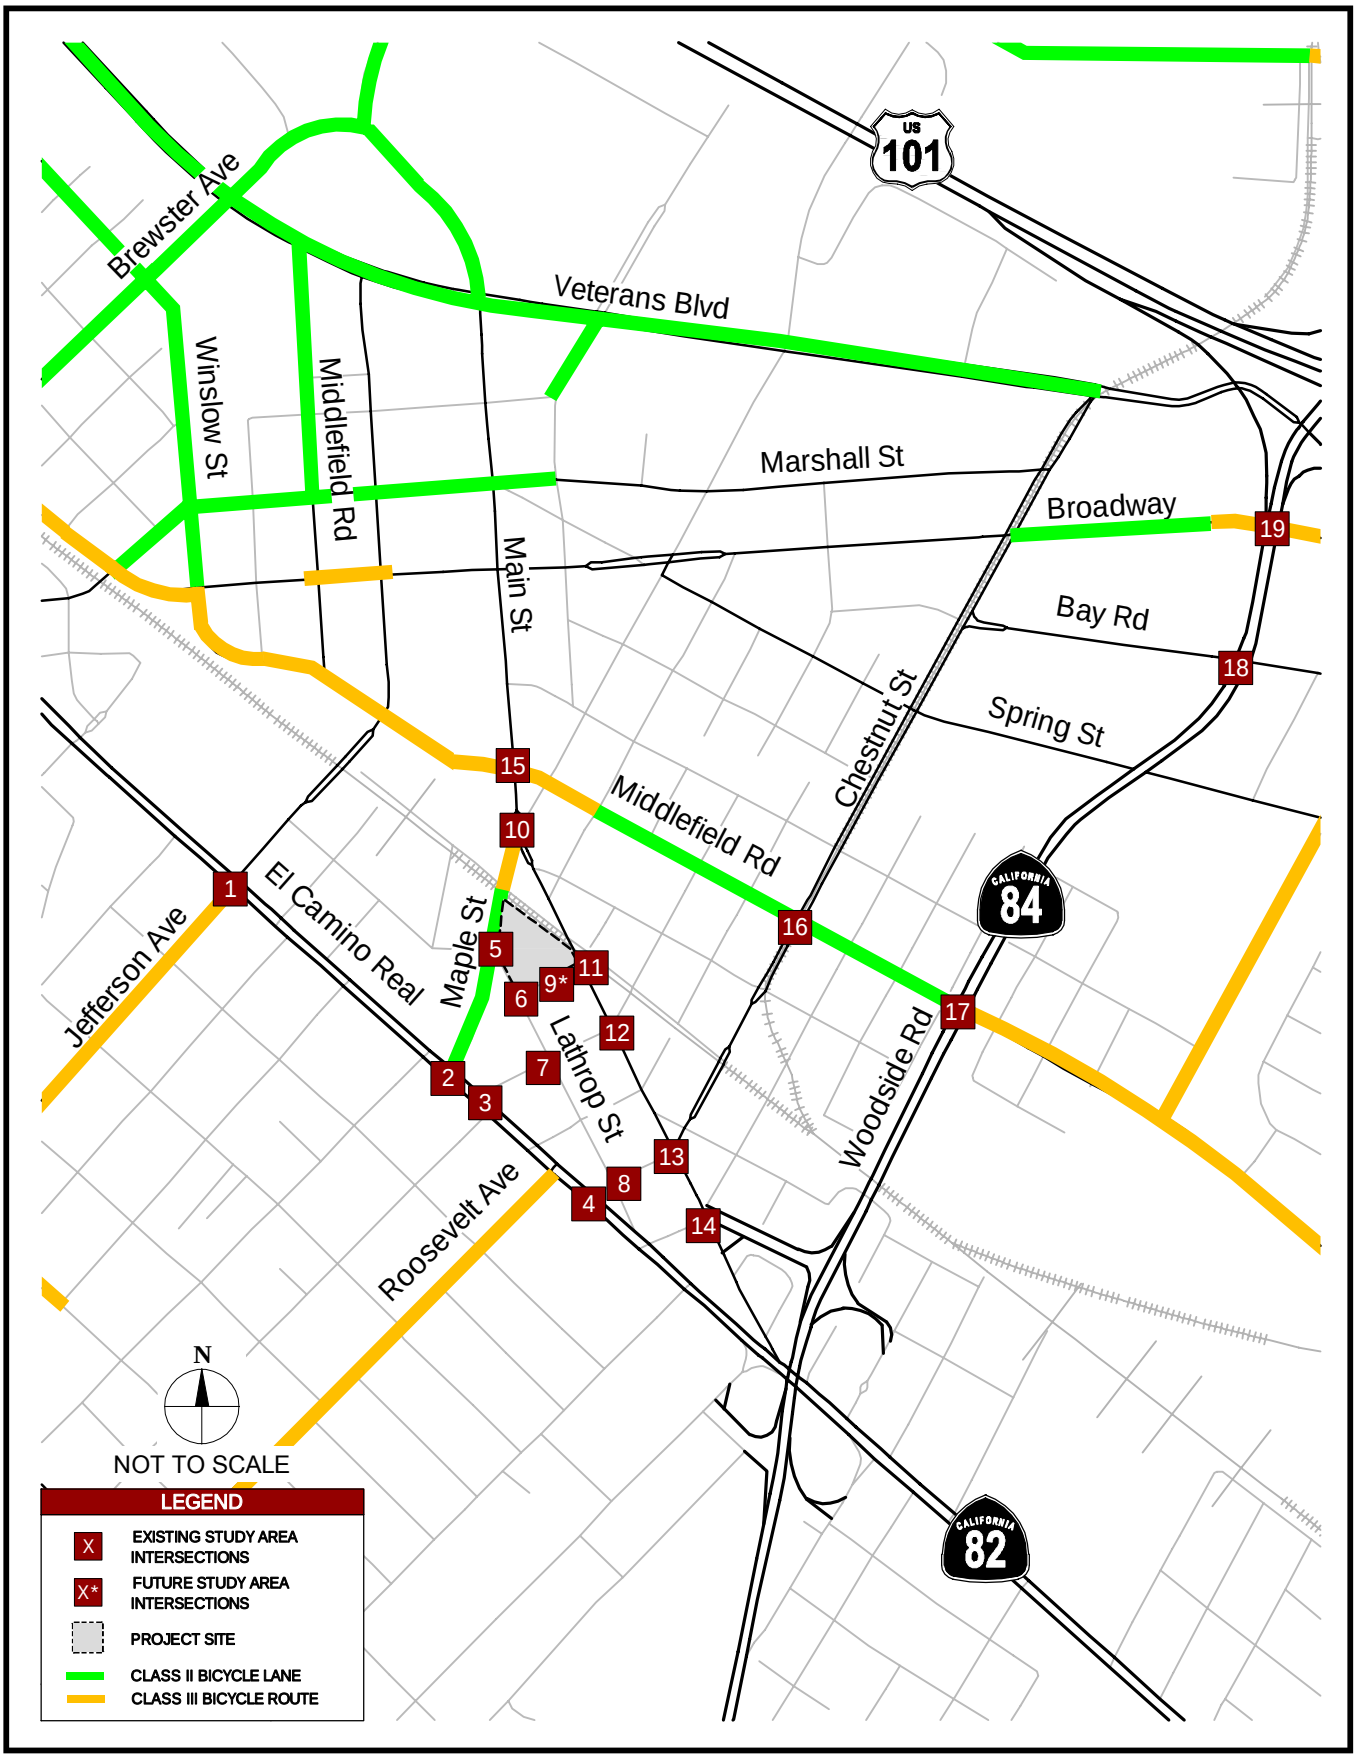
CALTRAIN

Caltrain provides commuter-heavy rail services between San Francisco County and Santa Clara County.

The Redwood City Caltrain station is located on James Avenue, approximately 2,000 feet west of the project site. During the weekday AM peak, the station is served by three northbound limited-stop trains, two northbound baby bullet trains, six southbound limited-stop trains, and two southbound baby bullet trains. During the weekday PM peak, the station is served by four northbound limited-stop trains, three northbound baby bullet trains, three southbound limited-stop trains, and two southbound baby bullet train. Those taking Caltrain may transfer to SamTrans bus routes ECR, 95, 274, 275, 276, 278, 295, 296, 397, 398 and RAPID.

EXISTING PEDESTRIAN FACILITIES

Sidewalks and crosswalks are mostly provided throughout the study area in Redwood City to allow pedestrians to access nearby transit stops, residential uses, and commercial uses. There are existing sidewalks present for the majority of the area surrounding the project site, except adjacent to the project site along Lathrop Street and Maple Street. There are no marked crosswalks directly adjacent to the project site.



Caltrain tracks are located immediately north of the project site. Pedestrians may cross the Caltrain railroad tracks on the east side of Main Street or on either side of Maple Street. A project is currently under construction that will install an at-grade pedestrian crossing on the west side of Main Street.

EXISTING BICYCLE FACILITIES

Figure 3 shows existing bicycle facilities within the study area.

Class II bicycle lanes are located throughout the City of Redwood City. The following is a list of the Class II bicycle lanes near the study area:

- Brewster Avenue between Perry Street and Main Street
- Broadway between Chestnut Street and Woodside Road
- Main Street between Convention Way and Veterans Boulevard
- Maple Street between El Camino Real and Pennsylvania Avenue
- Marshall Street between Arguello Street and Walnut Street
- Middlefield Road between Marshall Street and Veterans Boulevard and between Cassia Street and Woodside Road
- Veterans Boulevard between Whipple Avenue and Chestnut Street
- Walnut Street from Bradford Street to Veterans Boulevard
- Winslow Street from Broadway and Howland Street

Kimley»Horn

FIGURE 3
EXISTING BICYCLE FACILITES

097596108 DECEMBER 2018

1180 & 1190 MAIN STREET TIA

Class III bicycle routes are located throughout the City of Redwood City. The following is a list of the Class III bicycle routes near the study area:

- Arguello Street between Brewster Avenue and Broadway
- Broadway between Winslow Street and Marshall Street and between Woodside Road and Charter Street
- Charter Street between Broadway and Middlefield Road
- Jefferson Avenue between Alameda de las Pulgas and El Camino Real
- Maple Street between Pennsylvania Avenue and Main Street
- Middlefield Road/Winslow Street between Broadway and Cassia Street
- Middlefield Road between Woodside Road and Douglas Avenue
- Roosevelt Avenue between Upton Street and El Camino Real

EXISTING PLANS AND POLICES

The City of Redwood City has many plans and policies which provides guidance, direction, and recommendation on transportation-related issues within the City. Some of these plans and polices include the City's General Plan, Redwood City Moves (RWCMoves), El Camino Real Corridor Study, and Grade Separate Footprint Study.

REDWOOD CITY GENERAL PLAN

In 2010, the City adopted its most recent General Plan which includes goals, policies, and actions for developing the transportation network in Redwood City. Resulting from the goals, policies, and actions from the General Plan are transportation improvement projects that will help mitigate the increased vehicular demand on the network. The following is a list of relevant goals, policies, and implementation programs regulating development in the City of Redwood City:

- **Goal BE-25:** Maintain a local transportation system that balances the needs of bicyclist, pedestrian, and public transit with those of private cars.
- **Policy BE-25.6**: Ensure that the City's transportation impact fee program provides adequate funding for necessary transportation improvements that will benefit all travel modes, while also incentivizing development that is less dependent on expensive new transportation infrastructure.
- **Policy BE-26.6:** Require new development projects to provide pedestrian, bicycle, and electric bicycle/scooter facilities that connect to existing and planned pedestrian and bicycle facilities; and require large parking facilities to accommodate pedestrian, bicycle and electric bicycle/scooter circulation.
- **Implementation Program BE-38: Transportation Impact Fee.** Review and, if necessary, update the City's transportation impact fee program to ensure that funding is provided for necessary transportation improvements that will benefit all travel modes.

REDWOOD CITY MOVES (RWCMOVES)

In 2016, the City recognized substantial changes within Redwood City that would affect transportation and began developing a citywide transportation plan, Redwood City Moves (RWCMoves). The plan presents existing transportation trends and data for the City as well as serving as a guiding document by identifying and prioritizing transportation projects and programs. RWCMoves was adopted on July 23, 2018.

The vision of the RWCMoves is to "Promote the best experience possible for everyone in Redwood City by creating and maintaining a safe, multimodal, and accessible transportation network." The plan also consists of the following six goals:

1. Eliminate traffic fatalities and severe injuries for all modes by 2030
2. Create a walking and bicycling-friendly community that provides a safe, balanced, and convenient transportation system
3. Provide seamless connection and improve street access to all areas within the City, but especially along mixed-use corridors designated in the General Plan and Citywide Transportation Plan
4. Embrace innovation in all forms of emerging technologies especially in ways to creatively manage congestion and the transportation system
5. Reach over 50% of all trips being by non-driving modes by 2040, remaining automobile trips should be zero emission trips
6. Invest in projects that support a resilient, equitable and sustainable transportation system.

RWCMoves identifies and prioritizes many transportation projects for the City. **Table 4** presents improvement projects within the study area. The following projects are under construction:

- Bicycle lanes on Middlefield Road between Maple Street and Woodside Road
- Pedestrian safety improvements at Middlefield Road and Woodside Road
- Railroad safety improvements at Main Street

EL CAMINO REAL CORRIDOR PLAN

The El Camino Real Corridor Plan is a policy document that was adopted by City Council on December 4, 2017. The plan includes visions, goals, and strategies for street improvements along the El Camino Real within Redwood City to make the corridor more pedestrian-, bicycle-, and transit-friendly and support uses along the corridor. The plan focuses on four main topics: 1) Mobility, 2) Economic Vitality, 3) Housing, and 4) Place-Making.

The El Camino Real Corridor Plan identifies transportation improvements within the study area, which includes:

- Intersection improvements at Jefferson Avenue, Roosevelt Avenue, Redwood Road, and Main Street
- Installing Class IV protected bicycle facilities
- Restrict left-turn during peak commute hours to improve traffic flow along El Camino Real

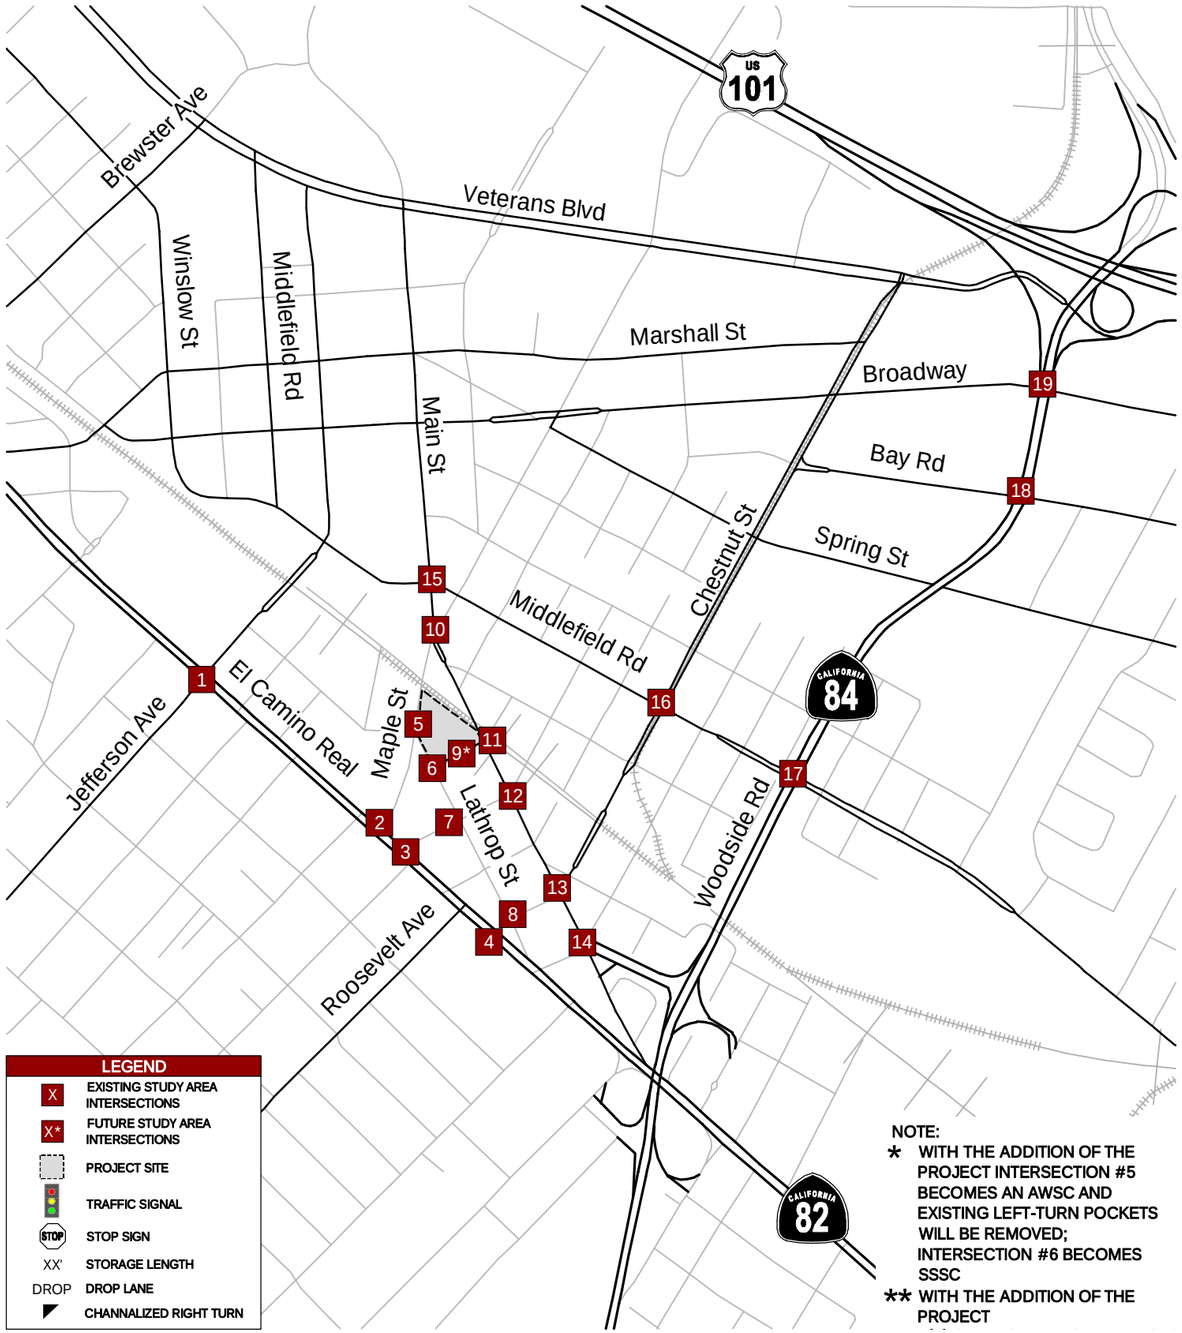
GRADE SEPARATION FOOTPRINT STUDY PROGRAM

In 2009, the Grade Separation Footprint Study was conducted to identify the impacts and alternatives to grade separations at several Caltrain grade crossings within the City of Redwood City. The Footprint Study Program assists with other studies in identifying which alternatives are the most feasible based on the impacts and cost of each alternative.

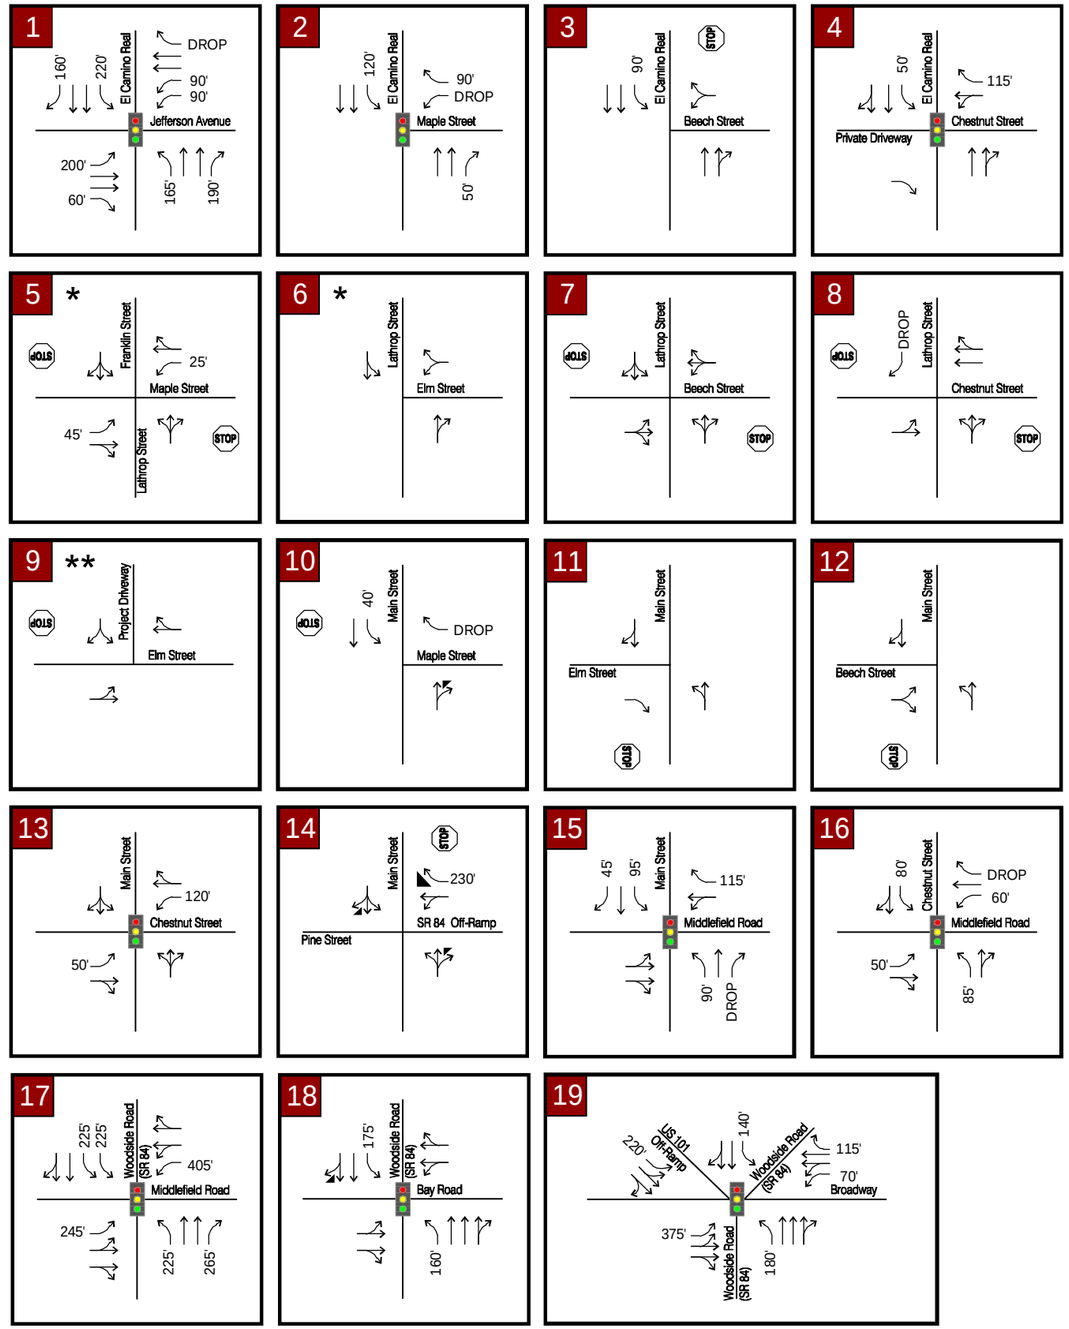
The plan found that the feasible alternatives for grade-separated crossings at the rail tracks at both Maple Street and Main Street would consist of the railroad remaining at grade, with Maple Street or Main Street going over or under the tracks. The plan also found that if all crossings were grade separated via elevated railroad tracks, both Maple Street and Main Street would have to be depressed under the partially elevated tracks.

Table 4 - RWCMoves Improvements Projects within the Study Area

#	Title	Project Description
2	El Camino Real Bike Facilities	Design and pilot protected bike lanes (Class IV) along the entire length of El Camino Real
6	Main Street and Maple Street Cycle Track	Design and install cycle track (Class IV) along Main Street and Maple Street between Convention Way and El Camino Real
9	Lathrop Street Bicycle Boulevard	Design and install bicycle boulevard (Class III) along Lathrop Street between Maple Street and El Camino Real
24	Wayfinding Signage	Develop and install citywide wayfinding signage network to popular destinations, such as Redwood City Transit Center & Station, Downtown, SR 84, parking area, etc.
27	Pedestrian Countdown Signals	Retrofit existing traffic signals to ensure that all are equipped with countdown pedestrian signals
29	El Camino Real Corridor Plan Implementation – Short and Long Term Projects	Implement of short and long-term transportation improvement project identified in the El Camino Real Corridor Plan
35	Middlefield Road (between Main Street and Woodside Road) Corridor Improvements	Consider transit service improvement along Middlefield Road
40	Jefferson Avenue Complete Street Corridor Design	Develop complete street corridor design for Jefferson Avenue to better accommodate bike, pedestrian, and transit facilities
41	Maple Street Corridor Improvements	Construct improvements along Maple which include: - Add crosswalks at Maple Street / Franklin Street - Install sidewalks to bridge over creek on Lathrop Street - Sign Maple as Class III bicycle facility between Middlefield to Marshall Street - Enhance multimodal connection over US 101 between Veterans Boulevard and Blomquist Street
71	US 101 and Woodside Road Interchange Improvement	Construct US 101 and Woodside interchange improvements.
72	El Camino Real Adaptive Signal Coordination	Evaluated and install adaptive signal coordination along El Camino Real
73	Middlefield Road Adaptive Signal Coordination	Evaluated and install adaptive signal coordination along Middlefield Road
77	El Camino Real Traffic Flow Improvements	Prioritize design and install timed signal and restrict some left-turn movements during commute hours to manage congestion and improve traffic flow along El Camino Real
80	El Camino Real Signal Relocations	Evaluate and consider relocation existing traffic signals along El Camino Real
95	Main Street Railroad Grade Separation	Support construction of Main Street and railroad grade separation
97	Chestnut Street Railroad Grade Separation	Support construction of Chestnut Street and railroad grade separation
98	Maple Street Railroad Grade Separation	Support construction of Maple Street and railroad grade separation



EXISTING LANE CONFIGURATION AND TRAFFIC CONTROL



Existing intersection lane configuration and traffic controls are illustrated in **Figure 4**. **Table 5** lists the existing traffic control for each study intersection. With the addition of the project, the existing-left turn pockets are removed at Intersection #5 – Franklin Street-Lathrop Street / Maple Street and the intersection becomes an all-way stop control intersection. Also with the addition of the project, Intersection #6 – Lathrop Street / Elm Street becomes a side-street stop control intersection.

Table 5 - Study Intersection and Traffic Control

#	Intersection	Existing or Future Intersection	Traffic control
1	El Camino Real / Jefferson Avenue	Existing	Signal
2	El Camino Real / Maple Street	Existing	Signal
3	El Camino Real / Beech Street	Existing	SSSC
4	El Camino Real / Chestnut Street	Existing	Signal
5	Franklin Street-Lathrop Street / Maple Street	Existing	SSSC/AWSC[1]
6	Lathrop Street / Elm Street	Existing	Uncontrolled/ SSSC[2]
7	Lathrop Street / Beech Street	Existing	SSSC
8	Lathrop Street / Chestnut Street	Existing	SSSC
9	Elm Street / Project Driveway	Future	SSSC
10	Main Street / Maple Street	Existing	SSSC
11	Main Street / Elm Street	Existing	SSSC
12	Main Street / Beech Street	Existing	SSSC
13	Main Street / Chestnut Street	Existing	Signal
14	Main Street / Pine Street-SR 84 Ramp	Existing	SSSC
15	Middlefield Road / Main Street	Existing	Signal
16	Middlefield Road / Chestnut Street	Existing	Signal
17	Woodside Road (SR 84) / Middlefield Road	Existing	Signal
18	Woodside Road (SR 84) / Bay Road	Existing	Signal
19	Woodside Road (SR 83) / Broadway	Existing	Signal

Note:
SSSC – Side-Street Stop Control
AWSC – All-Way Stop Control
[1] With the addition of the project, the existing left-turn pockets at **Intersection #5** are removed and the intersection **becomes an AWSC.**
[2] With the addition of the project, Intersection #6 becomes a SSSC.

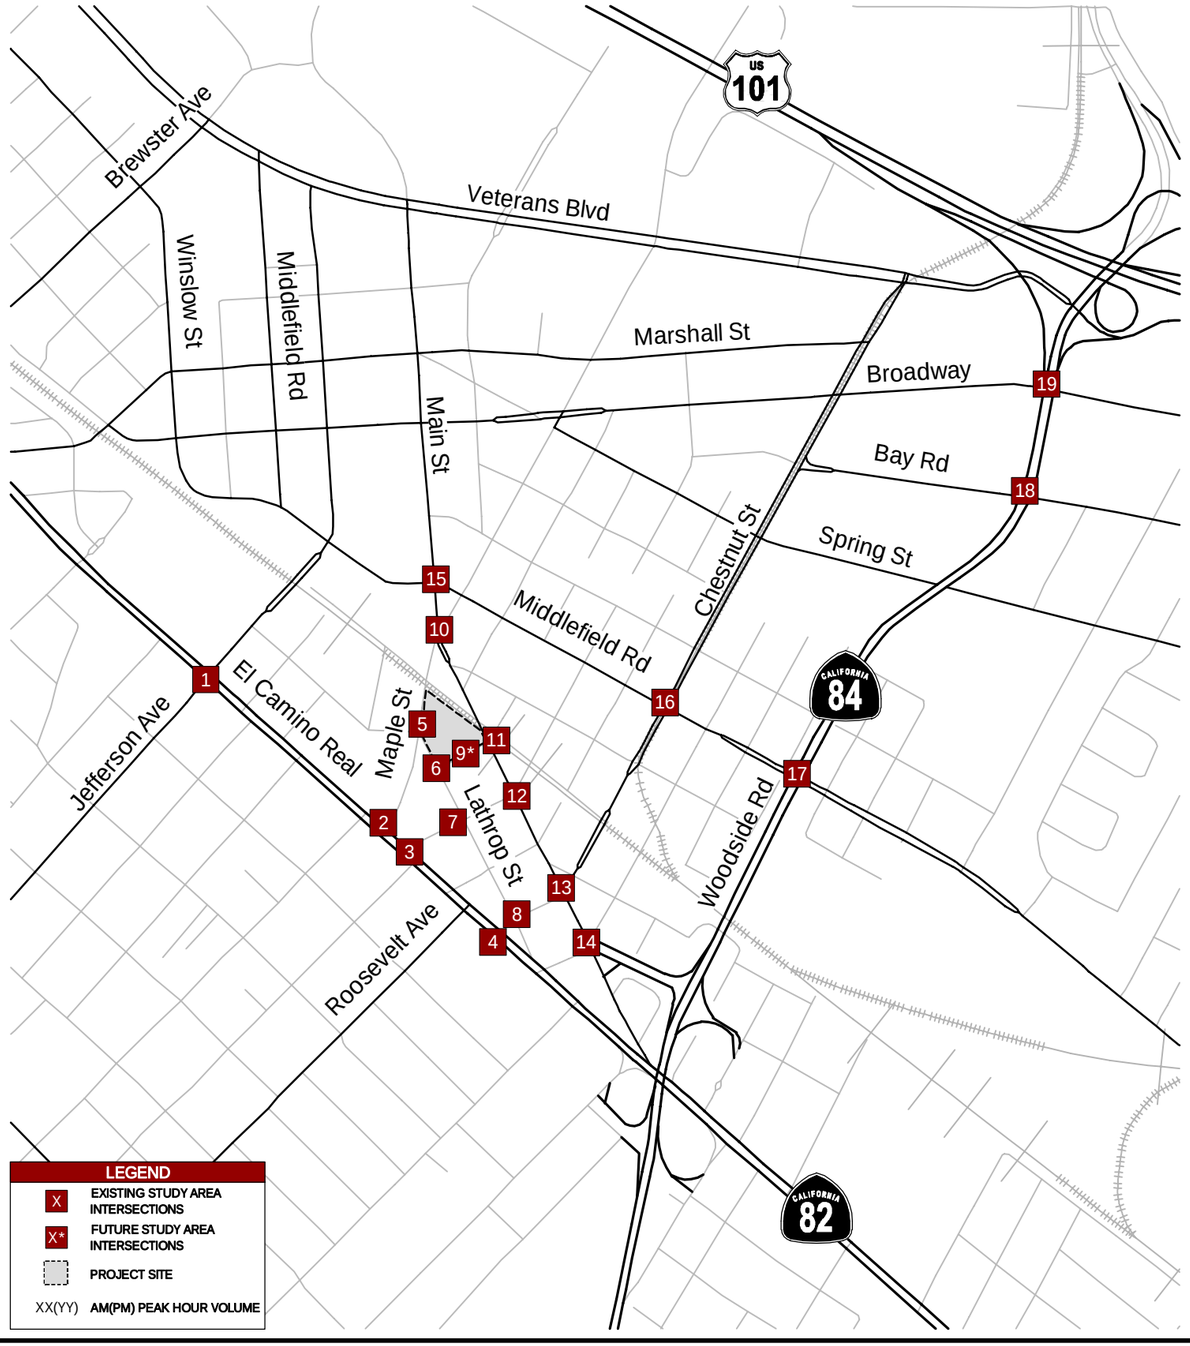
FIGURE 4
EXISTING LANE GEOMETRY AND TRAFFIC CONTROL

1180 & 1190 MAIN STREET TIA

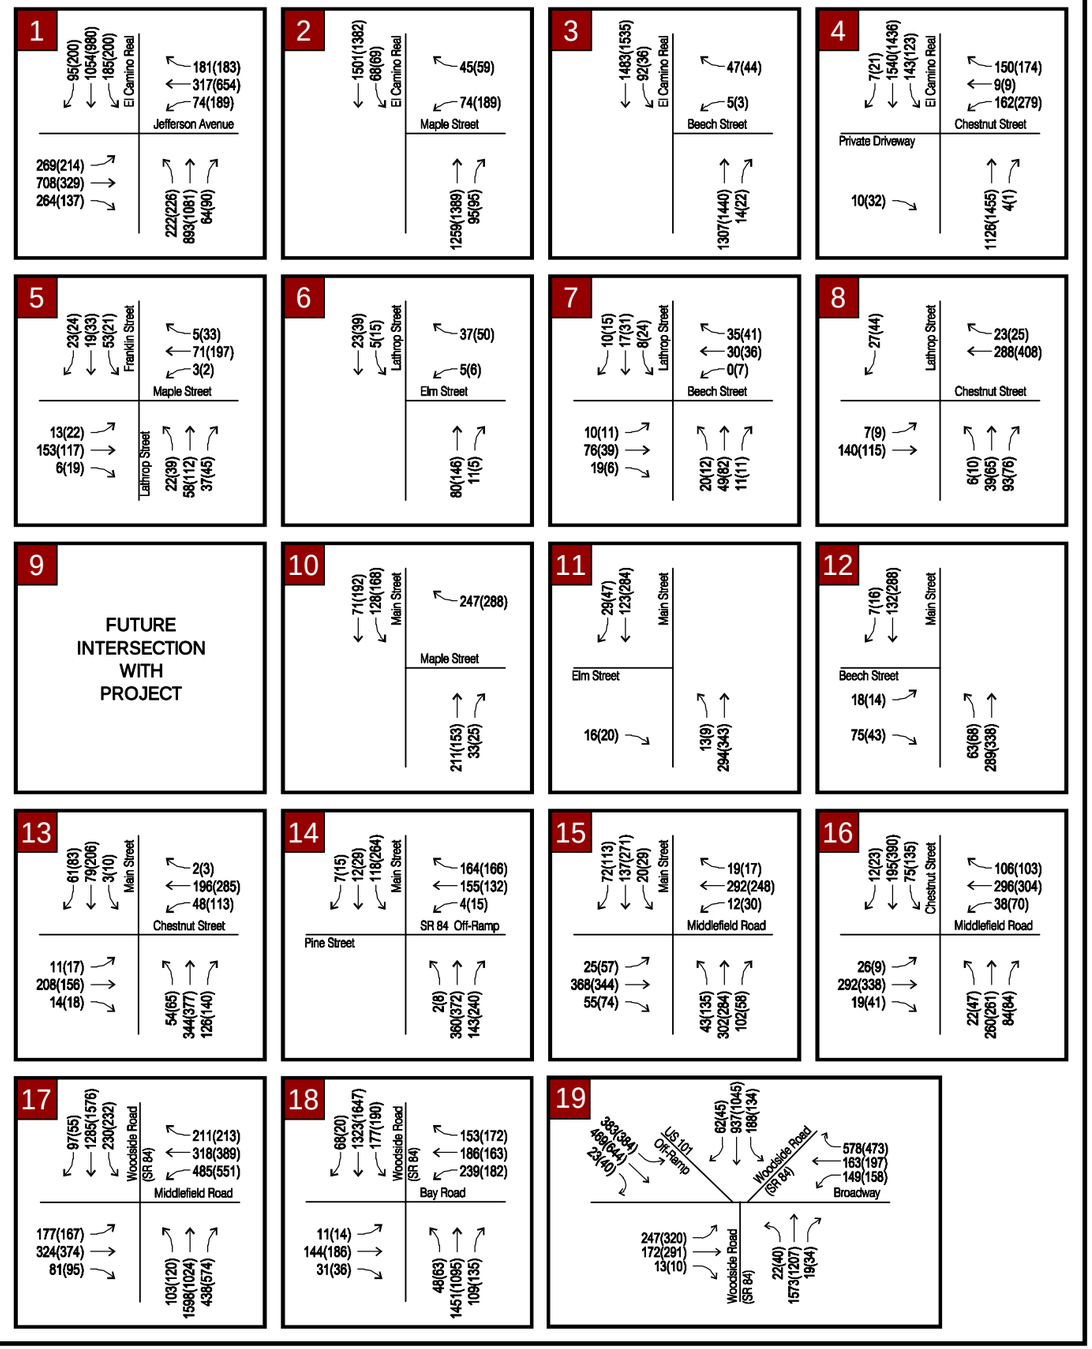
EXISTING PEAK-HOUR TURNING MOVEMENT VOLUMES

Weekday intersection turning movement volumes for study intersections were collected in March 2016, April 2017 and May 2018. Volumes were collected during the AM (7:00-10:00 AM) peak period and PM (4:00-7:00 PM) peak period on a weekday when local schools were in session.

Volumes at adjacent study intersections with no mid-block driveways were balanced. The volume adjustments from the volume balancing were conservatively completed by increasing the lower volume to match the higher volume. The hand calculations and intersection volume data sheets for all traffic counts are provided in the **Appendix**. Peak hour turning movement volumes are shown in **Figure 5**.



EXISTING SIGNAL WARRANT



Signal warrants were evaluated at the unsignalized study intersections under Existing Conditions. Below are the results of the signal warrants analysis for the nine (9) unsignalized intersections under existing conditions:

Did not meet peak hour signal warrant:

- #3 – El Camino Real / Beech Street
- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street
- #14 – Main Street / Pine Street – SR 84

Analysis sheets are provided in the **Appendix**.

EXISTING INTERSECTION LEVEL OF SERVICE

Traffic operations were evaluated at the study intersections under existing traffic conditions. Results of the analysis are presented in **Table 6**. **Table 6** lists the municipal jurisdiction, LOS criteria, intersection control, and LOS/delay for each intersection. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #3 – El Camino Real / Beech Street (AM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 Ramps (PM Peak Hour)
- #17 – Woodside Road (SR 84) / Middlefield Road (AM and PM Peak Hours)
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)

Analysis sheets are provided in the **Appendix**.

Table 6 - Existing Intersection Level of Service Summary

#	Intersection	LOS Criteria	Jurisdiction	Control	Existing			
					AM Peak		PM Peak	
					LOS	Delay (sec)[1]	LOS	Delay (sec)[1]
1	El Camino Real / Jefferson Avenue	D	City / Caltrans	Signal	D	51.8	D	48.5
2	El Camino Real / Maple Street	D	City / Caltrans	Signal	A	6.1	A	9.5
3	El Camino Real / Beech Street	D	City / Caltrans	SSSC	**E**	**35.3**	D	28.0
4	El Camino Real / Chestnut Street	D	City / Caltrans	Signal	B	14.7	B	19.5
5	Franklin Street-Lathrop Street / Maple Street	D	City	SSSC	B	11.9	C	15.6
6	Lathrop Street / Elm Street[2]	D	City	-	Uncontrolled Intersection			
7	Lathrop Street / Beech Street	D	City	SSSC	B	10.4	B	10.7
8	Lathrop Street. Chestnut Street	D	City	SSSC	B	11.6	B	13.9
9	Elm Street / Project Driveway (Future)	D	City	SSSC	Future Intersection			
10	Main Street / Maple Street	D	City	SSSC	B	10.8	B	10.6
11	Main Street / Elm Street	D	City	SSSC	A	9.1	B	10.4
12	Main Street / Beech Street	D	City	SSSC	B	10.5	B	12.4
13	Main Street / Chestnut Street	D	City	Signal	B	16.3	B	19.6
14	Main Street / Pine Street-SR 84 Ramps	D	City	SSSC	C	21.0	**F**	**62.3**
15	Middlefield Road / Main Street	D	City	Signal	C	29.2	C	34.9
16	Middlefield Road / Chestnut	D	City	Signal	B	15.3	B	19.0
17	Woodside Road (SR 84) / Middlefield Road[3]	E	City / Caltrans	Signal	**F**	**99.2**	**F**	**112.9**
18	Woodside Road (SR 84) / Bay Road	D	City / Caltrans	Signal	D	37.7	D	39.0
19	Woodside Road (SR 84) / Broadway	D	City / Caltrans	Signal	**E**	**74.6**	**F**	**81.6**

Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #6 - Lathrop Street / Elm Street is an uncontrolled intersection and removed from analysis.

3 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

FIELD OBSERVATIONS

Field observations were conducted in May 2018 to qualitatively confirm existing intersection LOS results with conditions in the field to identify any existing problems. Overall, the study intersections were observed to operate similarly to the calculated LOS.

It should be noted that construction was observed at the following locations:

Main Street / Elm Street: Construction work consisting of installing curb ramps on the west side of the intersection of Main Street / Elm Street and the at-grade railroad crossing just north of the intersection. It was observed that all roadway lanes were open to traffic and construction did not affect the operation at this intersection.

Woodside Road (SR 84) / Middlefield Road: Construction associated with the City's Middlefield Road and Woodside Road Intersection Improvement Project were going on. The improvement project consists of reconstructing roadway intersection, upgrading traffic signal system, and constructing new pedestrian facilities elements such as curb ramps, crosswalks, and pedestrian signals. It is anticipated that construction will be completed in October 2018.

Although construction was observed during field observations, it should be noted that existing traffic counts were collected before construction began. It was observed that only the elements of the pedestrian facilities such as curb ramps and sidewalks were removed. All roadway lanes were open to traffic and construction did not appear to affect the operation at the intersection.

3. EXISTING PLUS PROJECT CONDITIONS

This chapter presents a description of the proposed site use, trip generation, trip distribution, and trip assignment, as well as potential impacts of the proposed project on the transportation system.

PROPOSED SITE USE

The proposed project will merge two parcels at 1180 and 1190 Main Street that are vacant or have been unoccupied for an extended period of time and construct a 112,113-quare foot office building. **Figure 6** illustrates the site plan for the proposed project. Pedestrians may access the building at entrances on Main Street and Lathrop Street. Vehicles may enter the underground parking off Elm Street. Railroad tracks run adjacent to the site on the northeast side of the project from Maple Street to Main Street.

TRIP GENERATION

Trip generation for projects are typically calculated based on information contained in the Institute of Transportation Engineer's (ITE) publication, *Trip Generation Manual, 10th Edition*.[3] The manual is a standard reference used by jurisdictions throughout the country for the estimation of trip generation potential of proposed projects.

A trip is defined in the *Trip Generation Manual* as a single or one-directional vehicle movement with either the origin or destination at the project site. In other words, a trip can be either "to" or "from" the site and therefore, a single visitor to a site is counted as two.

For purposes of determining the worst-case impacts of traffic on the surrounding street network, the trips generated by a proposed project are estimated for the AM peak hour (between the hours of 7:00 AM and 9:00 AM), and for the PM peak hour (between 4:00 PM and 6:00 PM) on a typical weekday.

Trips generated by the proposed project were based on the average rates for ITE Land Use 710 (General Office Building). Since the proposed project is within 0.5 mile from the Redwood City Caltrain station a transit reduction was applied. The proposed project is also located within proximity to downtown and mixed land uses, therefore a MXD (mixed-use development) reduction was also applied. **Table 7** presents the trip generation for the proposed project. The proposed project will generate 105 vehicle trips in the AM peak hour and a 97 vehicle trips in the PM peak hour. Trip generation calculation sheets are provided in the **Appendix**.

Table 7 - Project Trip Generation

ITE Land Use Code	Land Use	Size	Units	Daily Trips	AM Peak Total	AM Peak In	AM Peak Out	PM Peak Total	PM Peak In	PM Peak Out
710	General Office Building	112.113	KSF	1,092	130	112	18	129	21	108
	Transit Reduction[1]			-73	-9	-8	-1	-7	-1	-6
	Mixed Use Reduction[2]			-229	-16	-14	-2	-25	-4	-21
Total External Project Trips				**1,019**	**105**	**90**	**15**	**97**	**16**	**81**

[1] Utilized transit reduction rate from Redwood City Downtown Precise Plan of 7.3% for the AM peak and 6.0% for the PM peak. Transit reduction rate for daily trips 6.66% (average of AM and PM reduction).
[2] Utilized mixed-used reduction rate from Redwood City Downtown Precise Plan of 12.3% for the AM and 19.1% for the PM

It should be noted that the C/CAG's 2014 *Guidelines for Implementing the Land Use Component of the Congestion Management Program* requires development that generated 100 or more net new peak hours trips to implement a Transportation Demand Management (TDM) plan to reduce demand. However, a TDM reduction was not used in the trip generation calculations to be conservative.

PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

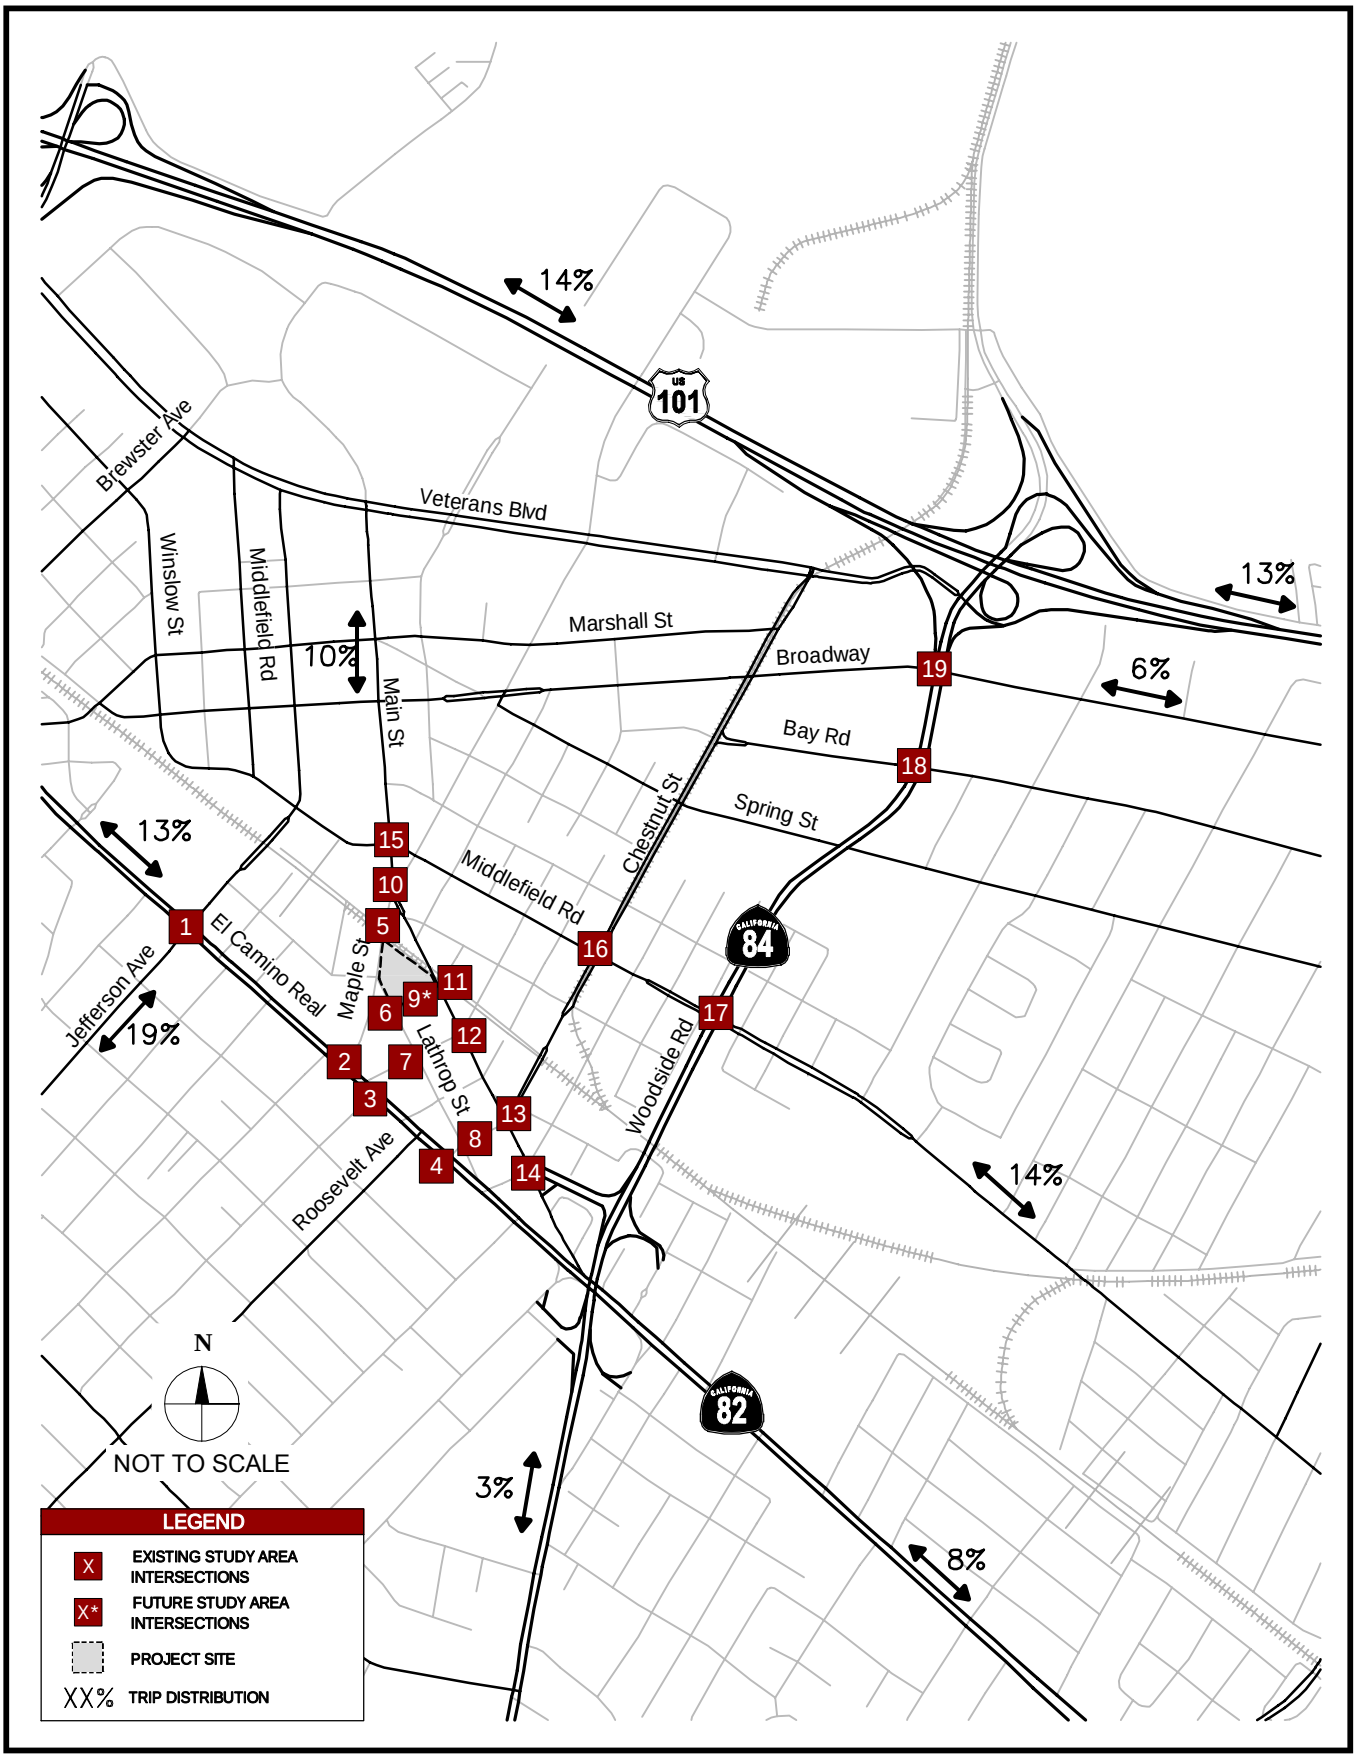
Project trip distribution was based on existing traffic count information, general orientation of population sources to the site, and trip distribution from RWCMoves. **Figure 7** presents the traffic distribution assumed for this analysis. The project vehicle trip assignment is shown in **Figure 8.**

EXISTING PLUS PROJECT SIGNAL WARRANT

Signal warrants were evaluated at the unsignalized study intersections under Existing Plus Project Conditions. Below are the results of the signal warrants analysis for the ten (10) unsignalized intersections under existing conditions:

Did not meet peak hour signal warrant:

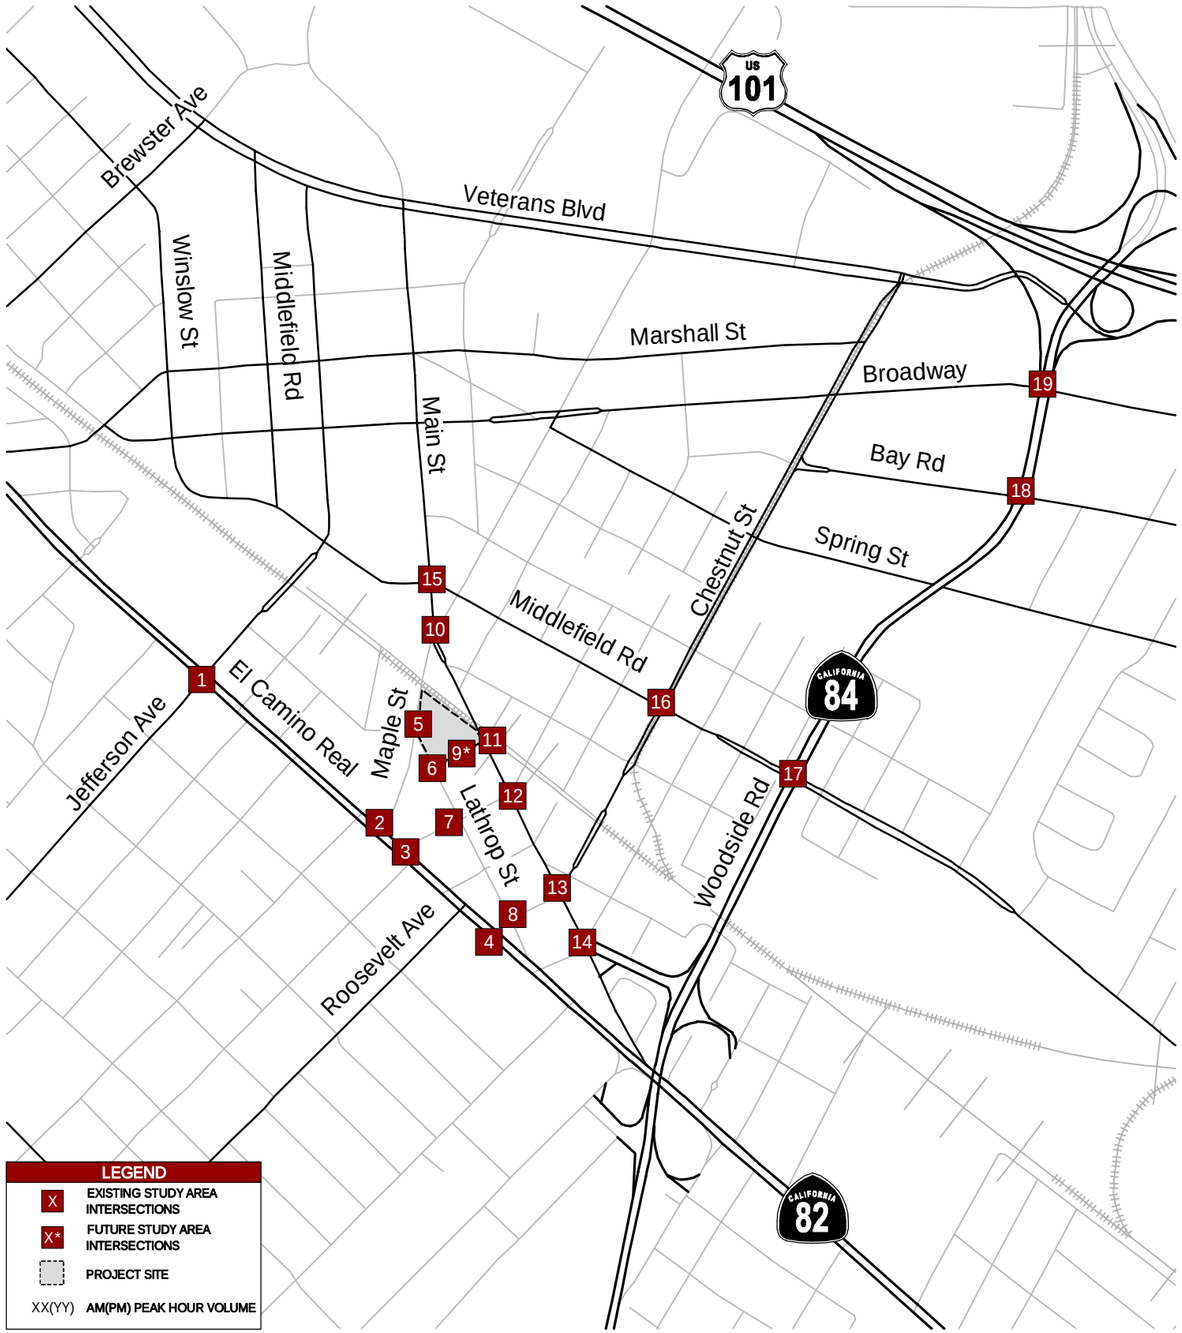
- #3 – El Camino Real / Beech Street
- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #9 – Elm Street / Project Driveway
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street
- #14 – Main Street / Pine Street – SR 84



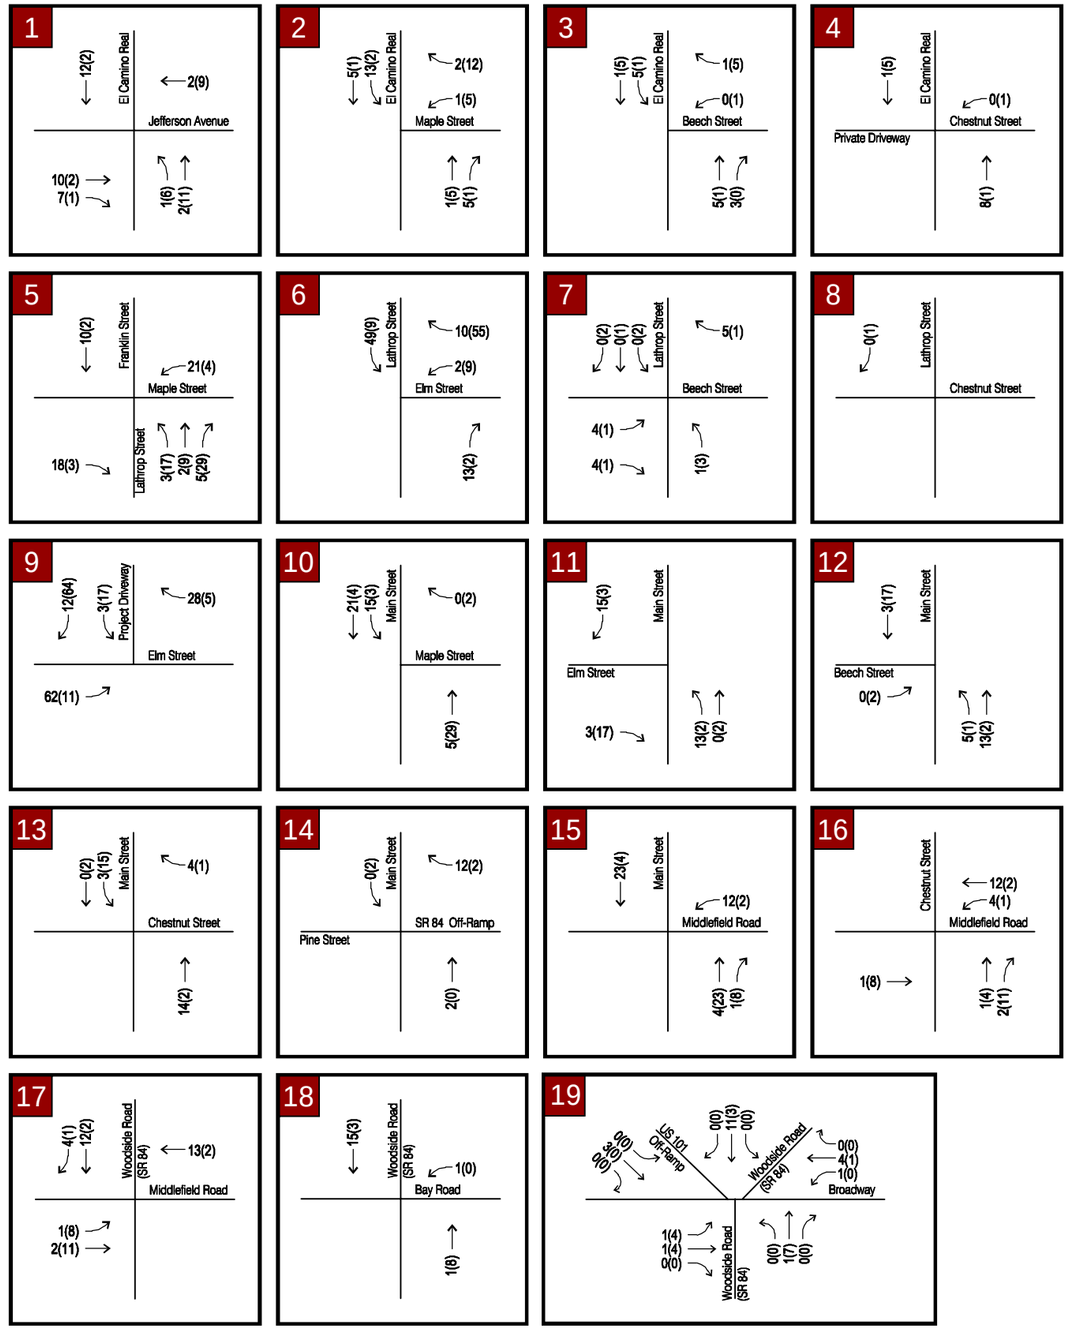
Analysis sheets are provided in the **Appendix**.

EXISTING PLUS PROJECT INTERSECTION LEVEL OF SERVICE

Traffic operations were evaluated at the study intersections under existing conditions plus traffic generated by the project, as seen on **Figure 9**. Results of the analysis are presented in **Table 8**. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:



- #3 – El Camino Real / Beech Street (AM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #14 – Main Street / Pine Street – SR 84 Ramps (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #17 – Woodside Road (SR 84) / Middlefield Road (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**



Analysis sheets are provided in the **Appendix**.

19	Woodside Road (SR 84) / Broadway	D	City / Caltrans	Signal	**E**	**74.6**	**F**	**81.6**	**E**	**75.2**	**0.6**	**F**	**82.4**	**0.8**

Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized and AWSC intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #5 - Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the Project.

3 Intersection #6 - Lathrop Street / Elm Street becomes a side-street stop control intersection with the Project.

4 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

4. BACKGROUND TRAFFIC CONDITIONS

This chapter will discuss the traffic conditions under the Background and Background Plus Proposed Project scenarios.

BACKGROUND TRANSPORTATION IMPROVEMENTS

Under Background conditions, the following lane geometry improvements were assumed:

- Intersection #17 – Woodside Road (SR 84) / Middlefield Road: During field work it was observed that the City's Middlefield Road and Woodside Road Intersection Improvement Project is being constructed. The improvement project will reconfigure the following approaches:
    - Eastbound approach will consist of one exclusive left-turn, one through, and one shared through/right-turn lanes.
    - Southbound approach will consist of two exclusive left-turn, two through, and one right-turn lanes.
    - Westbound approach will consist of two exclusive left-turn, one through, and one exclusive right-turn lanes.

Figure 10 illustrates the intersection geometry and traffic control assumed for the Background analysis.

BACKGROUND TRAFFIC VOLUMES

To achieve Background traffic conditions, traffic volumes from approved, but not yet constructed projects were incorporated according to information provided by City staff and added to existing volumes. **Table 9** lists the projects that were included in the background traffic.

Table 9 - Projects to Assume for Background Conditions

Project	Project Description	Status
550 Allerton Street	69,486 sf office	Under Construction
2075 Broadway	80,000 sf office; 13,515 sf retail	Under Construction
150 El Camino Real	12 townhomes	Under Construction
1305 El Camino Real	137-unit multi-family residential	Under Construction
815 Hamilton	60,241 sf office; 7,176 sf retail	Under Construction
1629 Main Street	24,700 sf office; 2 residential units	Under Construction
1175 Marshall Street (Kaiser Hospital Phase II)	196,100 sf medical	Under Construction
849 Veterans Boulevard	90-unit multi-family residential	Under Construction
103 Wilson Street	175-unit multi-family residential	Under Construction
Stanford in Redwood City	570,000 sf office; 31,159 sf recreation; 14,000 sf childcare; 5,053 sf storage	Under Construction
707 Bradford Street	117-unit multi-family residential	Approved
1690 Broadway	92-room hotel	Approved
1409 El Camino Real	350-unit multi-family residential	Approved
433 Harrison Avenue	17 townhomes	Approved
353 Main Street	125-unit multi-family residential	Approved
929 Main Street	8,002 sf retail	Approved
1548 Maple Street	131-unit multi-family residential	Approved
612 Jefferson Avenue	20-unit multi-family residential	Approved
910 Woodside Road	10 condominium units	Approved

BACKGROUND SIGNAL WARRANT

Signal warrants were evaluated at the unsignalized study intersections under Background Conditions. Below are the results of the signal warrants analysis for the nine (9) unsignalized intersections under Background conditions:

Did not meet peak hour signal warrant:

- #3 – El Camino Real / Beech Street
- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street

Met peak hour signal warrant:

- #14 – Main Street / Pine Street – SR 84 (PM Peak Hour)

While Intersection #14 satisfies peak hour signal warrant, other considerations such as other signal warrants and its proximity to the existing signal at Intersection # 13 – Main Street / Maple Street should be evaluated before installing a signal. Analysis sheets are provided in the **Appendix**.

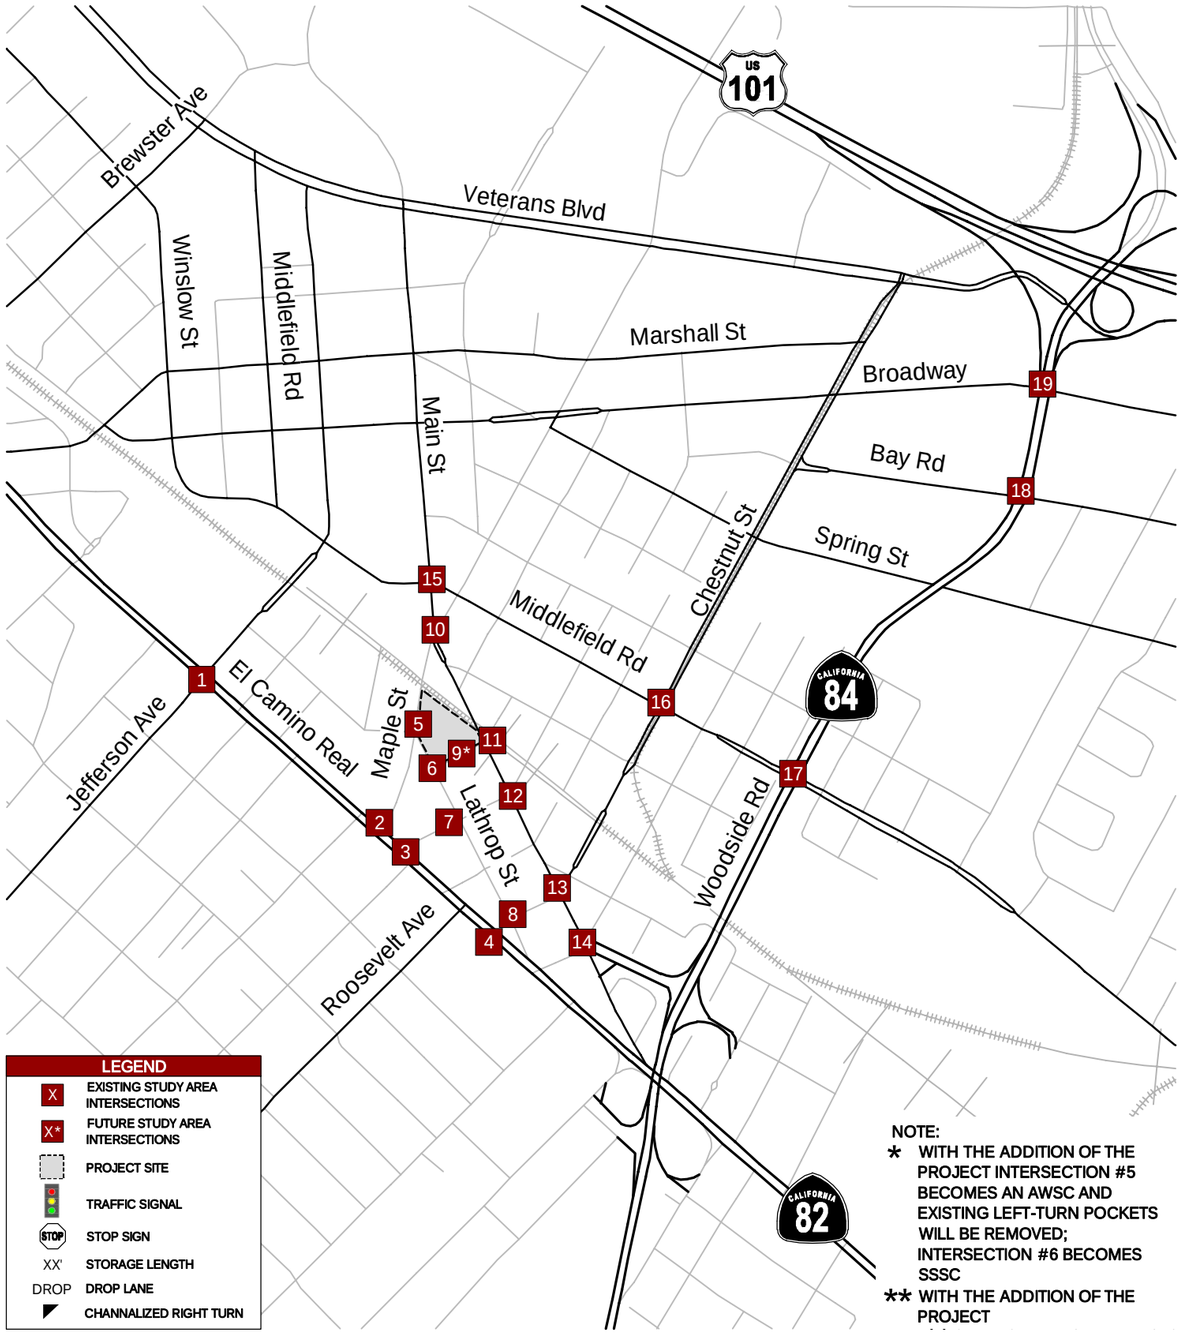
BACKGROUND INTERSECTIONS LEVEL OF SERVICE

Background volumes were evaluated at the study intersections and are presented in **Figure 11**. Results are presented in **Table 10**. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #3 – El Camino Real / Beech Street (AM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 Ramps (PM Peak Hour)
- #17 – Woodside Road (SR 84) / Middlefield Road (PM Peak Hour)
- #18 – Woodside Road (SR 84) / Bay Road (PM Peak Hour)
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)

Analysis sheets are provided in the **Appendix**.

Table 10 - Background Intersection Level of Service Summary



#	Intersection	LOS Criteria	Jurisdiction	Control	Background			
					AM Peak		PM Peak	
					LOS	Delay (sec)[1]	LOS	Delay (sec)[1]

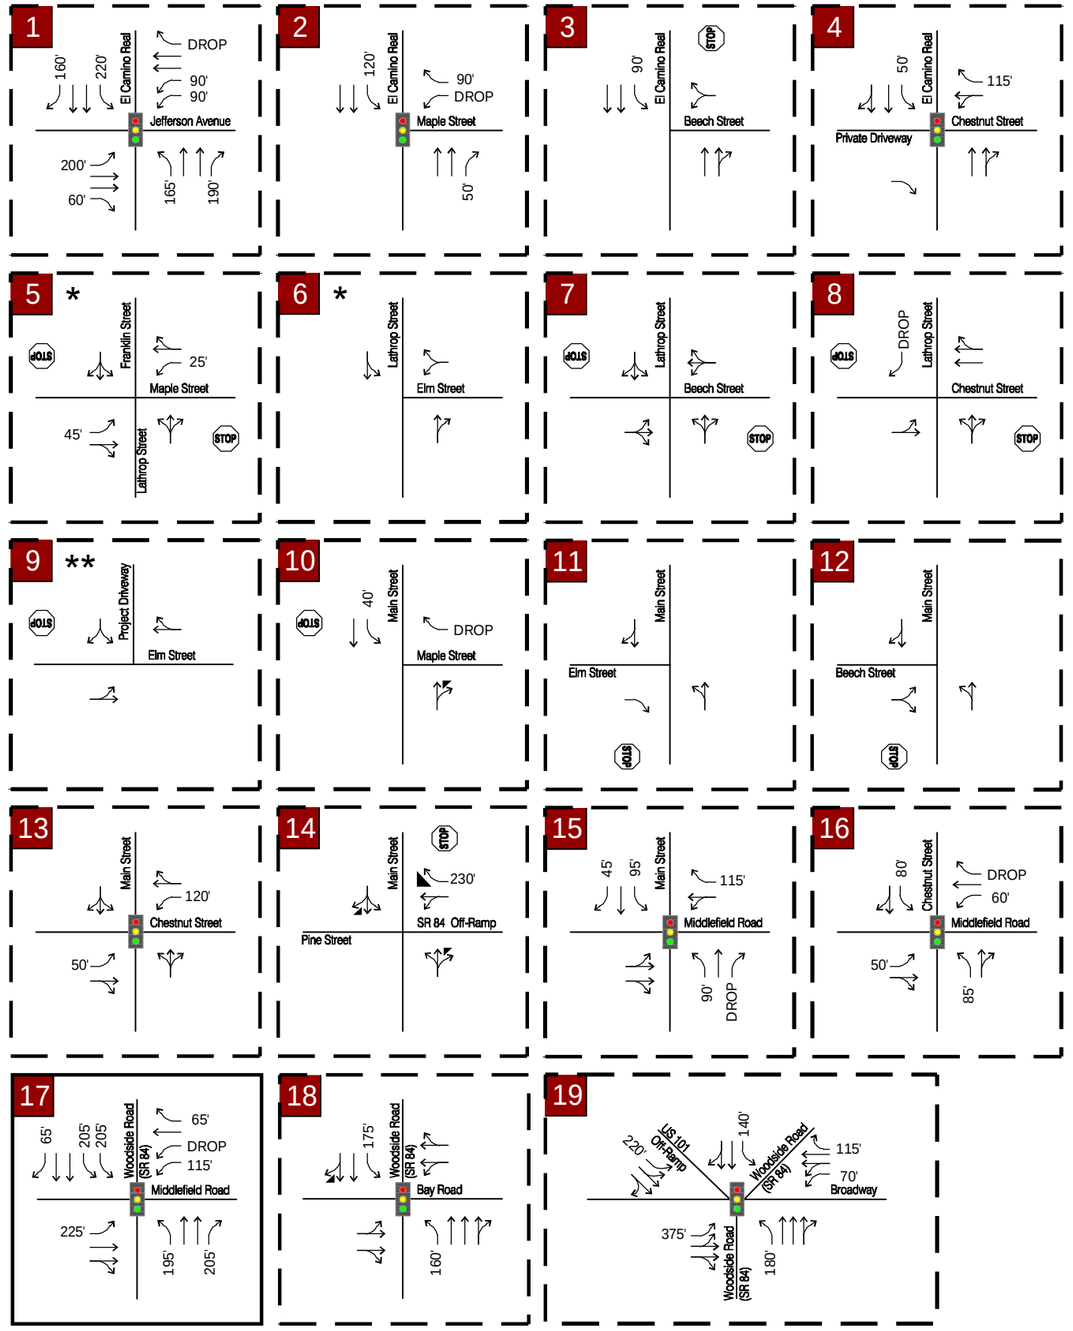
15	Middlefield Road / Main Street	D	City	Signal	C	33.4	D	29.9
16	Middlefield Road / Chestnut	D	City	Signal	B	18.2	C	22.0
17	Woodside Road (SR 84) / Middlefield Road[3]	E	City / Caltrans	Signal	E	67.7	**F**	**89.2**
18	Woodside Road (SR 84) / Bay Road	D	City / Caltrans	Signal	D	53.0	**E**	**67.0**
19	Woodside Road (SR 84) / Broadway	D	City / Caltrans	Signal	**F**	**148.5**	**F**	**162.6**



Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #6 - Lathrop Street / Elm Street is an uncontrolled intersection and removed from analysis.

3 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

BACKGROUND PLUS PROJECT SIGNAL WARRANT

Signal warrants were evaluated at the unsignalized study intersections under Background Plus Project Conditions. Below are the results of the signal warrants analysis for the ten (10) unsignalized intersections under Background Plus Project conditions:

Did not meet peak hour signal warrant:

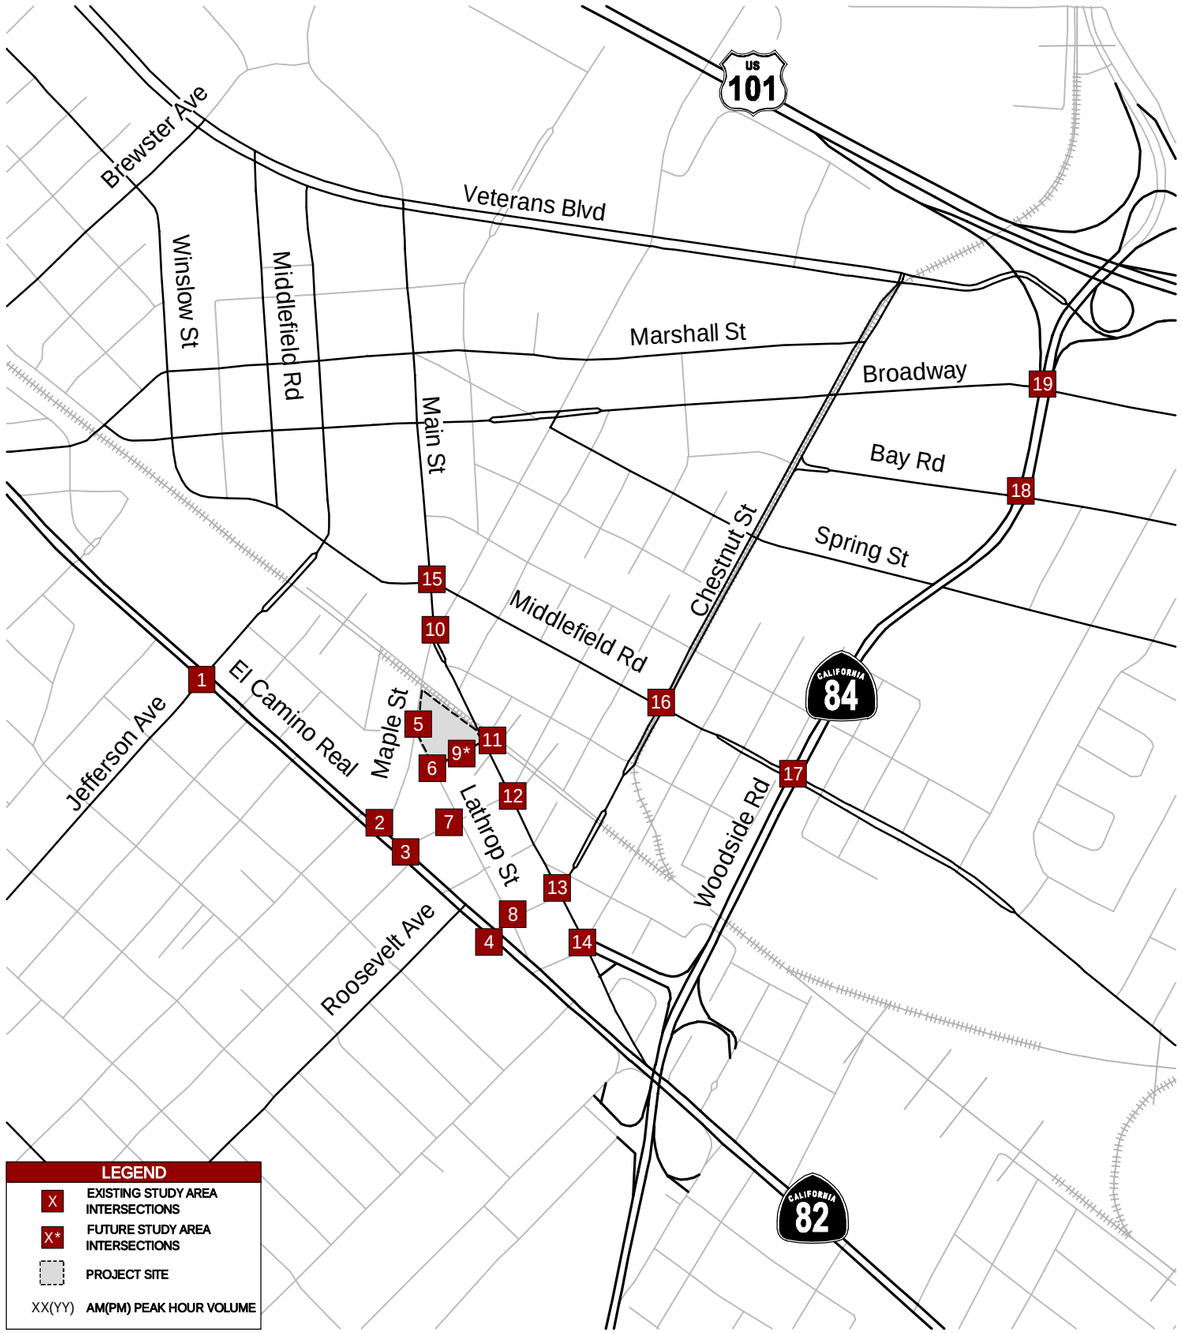
- #3 – El Camino Real / Beech Street
- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #9 – Elm Street / Project Driveway
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street

Met peak hour signal warrant:

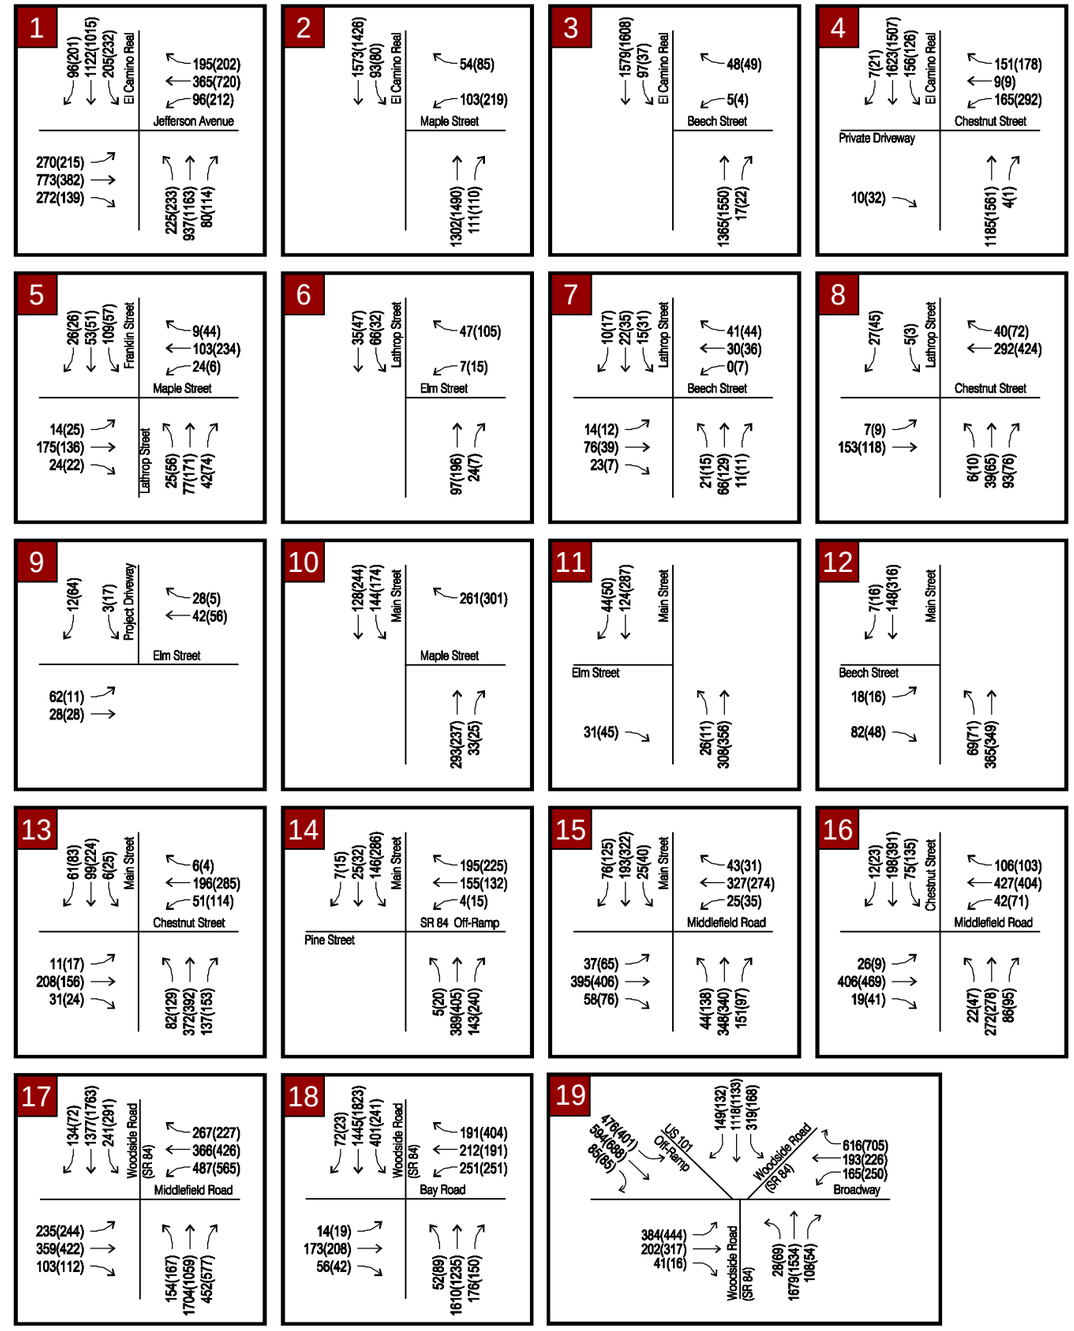
- #14 – Main Street / Pine Street – SR 84 (PM Peak Hour)

While Intersection #14 satisfies peak hour signal warrant, other considerations such as other signal warrants and its proximity to the existing signal at Intersection # 13 – Main Street / Maple Street should be evaluated before installing a signal.

Analysis sheets are provided in the **Appendix**.



BACKGROUND PLUS PROJECT INTERSECTION LEVEL OF SERVICE



Background Plus Project traffic conditions were evaluated at the study intersections and are shown in **Figure 12**. Results are presented in **Table 11**. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #3 – El Camino Real / Beech Street (AM and PM Peak Hours)
  - AM peak hour: Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds and volumes do not satisfy Peak Hour Volume signal warrant – **Not a significant Impact**
  - PM peak hour: Intersection operating acceptably without the project and project causes intersection to operate at an unacceptable LOS, but volumes do not satisfy Peak Hour Volume signal warrant – **Not a significant Impact**
- #14 – Main Street / Pine Street – SR 84 Ramps (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #17 – Woodside Road (SR 84) / Middlefield Road (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**

- #18 – Woodside Road (SR 84) / Bay Road (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**

Analysis sheets are provided in the **Appendix**.

Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized and AWSC intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #5 - Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the Project.

3 Intersection #6 - Lathrop Street / Elm Street becomes a side-street stop control intersection with the Project.

4 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

5. CUMULATIVE TRAFFIC CONDITIONS

This chapter will discuss the traffic conditions under the Cumulative and Cumulative Plus Project Conditions.

CUMULATIVE TRANSPORTATION IMPROVEMENTS

Under Cumulative conditions, the following lane geometry improvements were assumed:

- Intersection #9 – Elm Street/ Project Driveway: Northbound approach as the driveway for Block D of the proposed 1601 El Camino Real project.

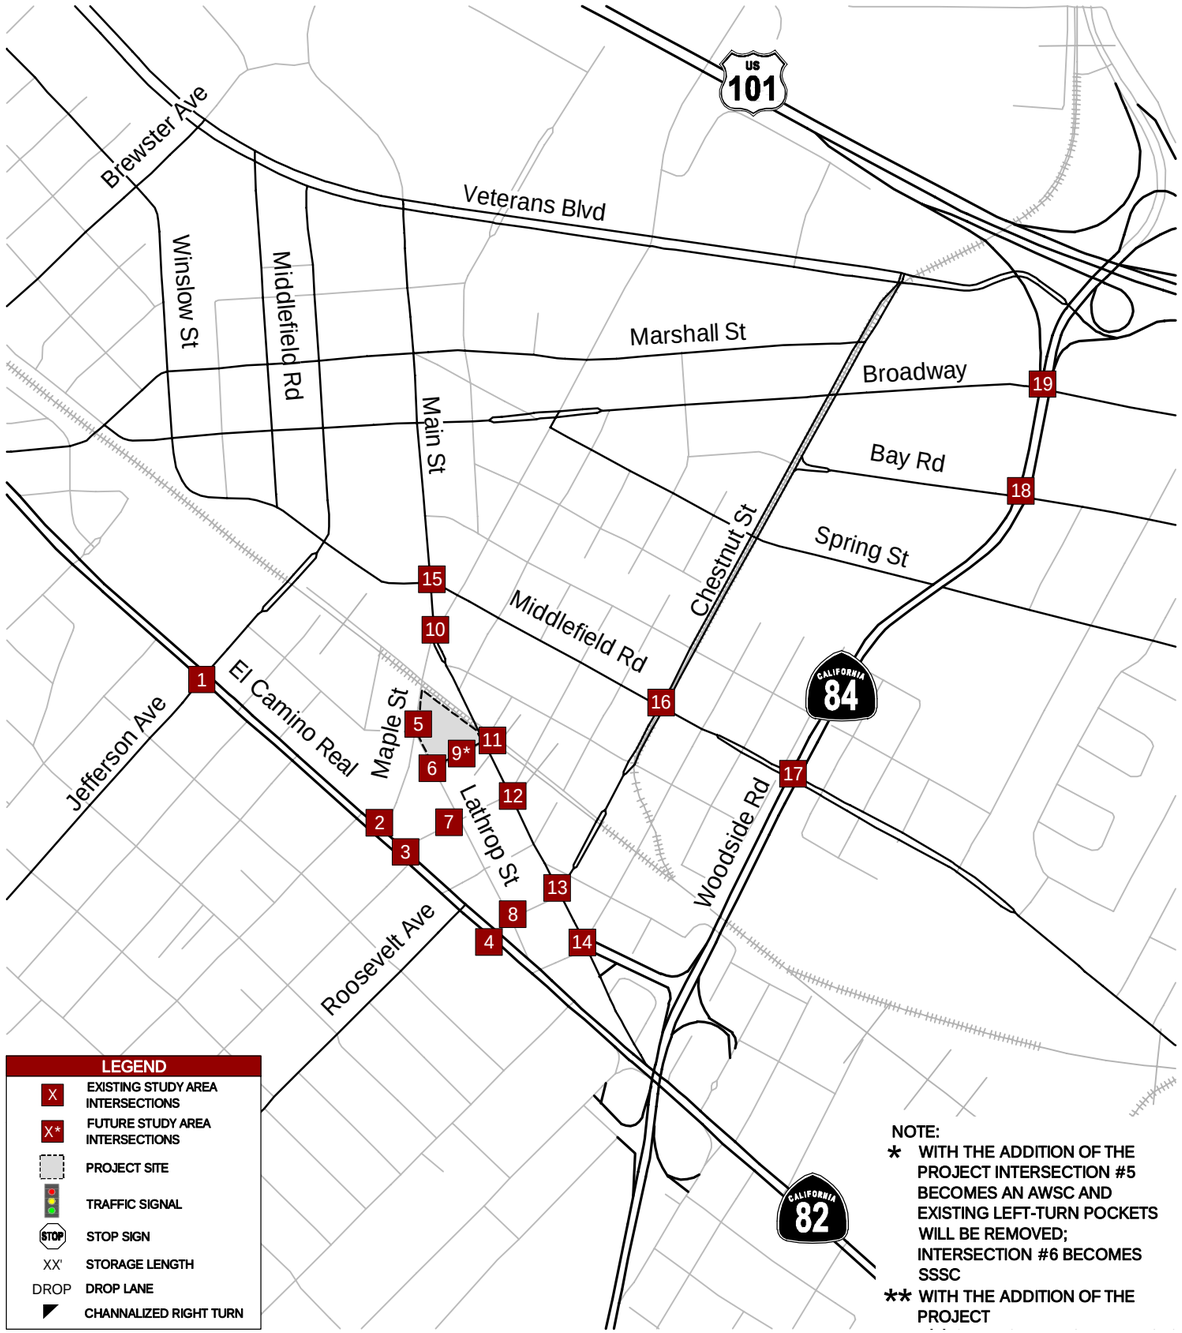

Figure 13 illustrates the intersection geometry and traffic control assumed for the Cumulative analysis.

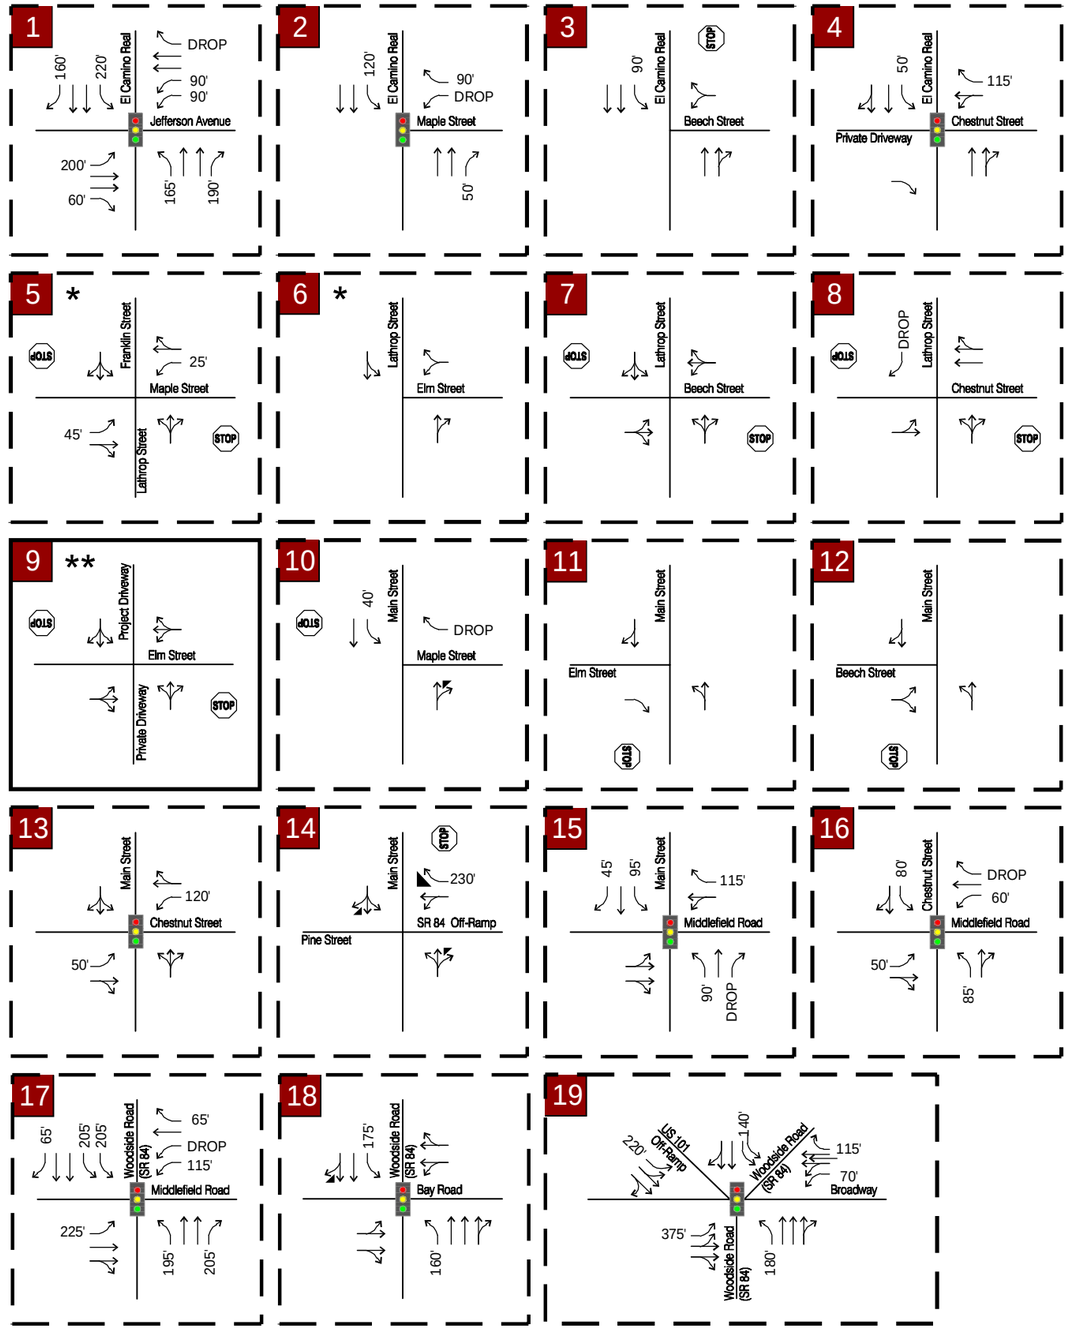

CUMULATIVE TRAFFIC VOLUME

To achieve Cumulative traffic conditions, traffic volumes from approved and pending projects were incorporated according to information provided by City staff. In addition to projects listed in **Table 9**, Cumulative volumes include projects listed in **Table 12**.

Table 12 - Additional Projects to Assume for Cumulative Conditions

Project	Project Description	Status
525 E Bayshore Road	201,000 sf auto-dealership	Proposed
557 E Bayshore Road	550-unit multi-family residential; 100,000 sf sport club	Proposed
320-350 Blomquist Street	1,296,556 SF high-tech office campus	Proposed
1401 Broadway	520-unit multi-family residential; 420,00 sf office; 18,800 sf retail; 6,860 sf commercial	Proposed
31 Center Street	7 residential units	Proposed

CUMULATIVE SIGNAL WARRANT

Signal warrants were evaluated at the unsignalized study intersections under Cumulative Conditions. Below are the results of the signal warrants analysis for the nine (9) unsignalized intersections under Cumulative conditions:

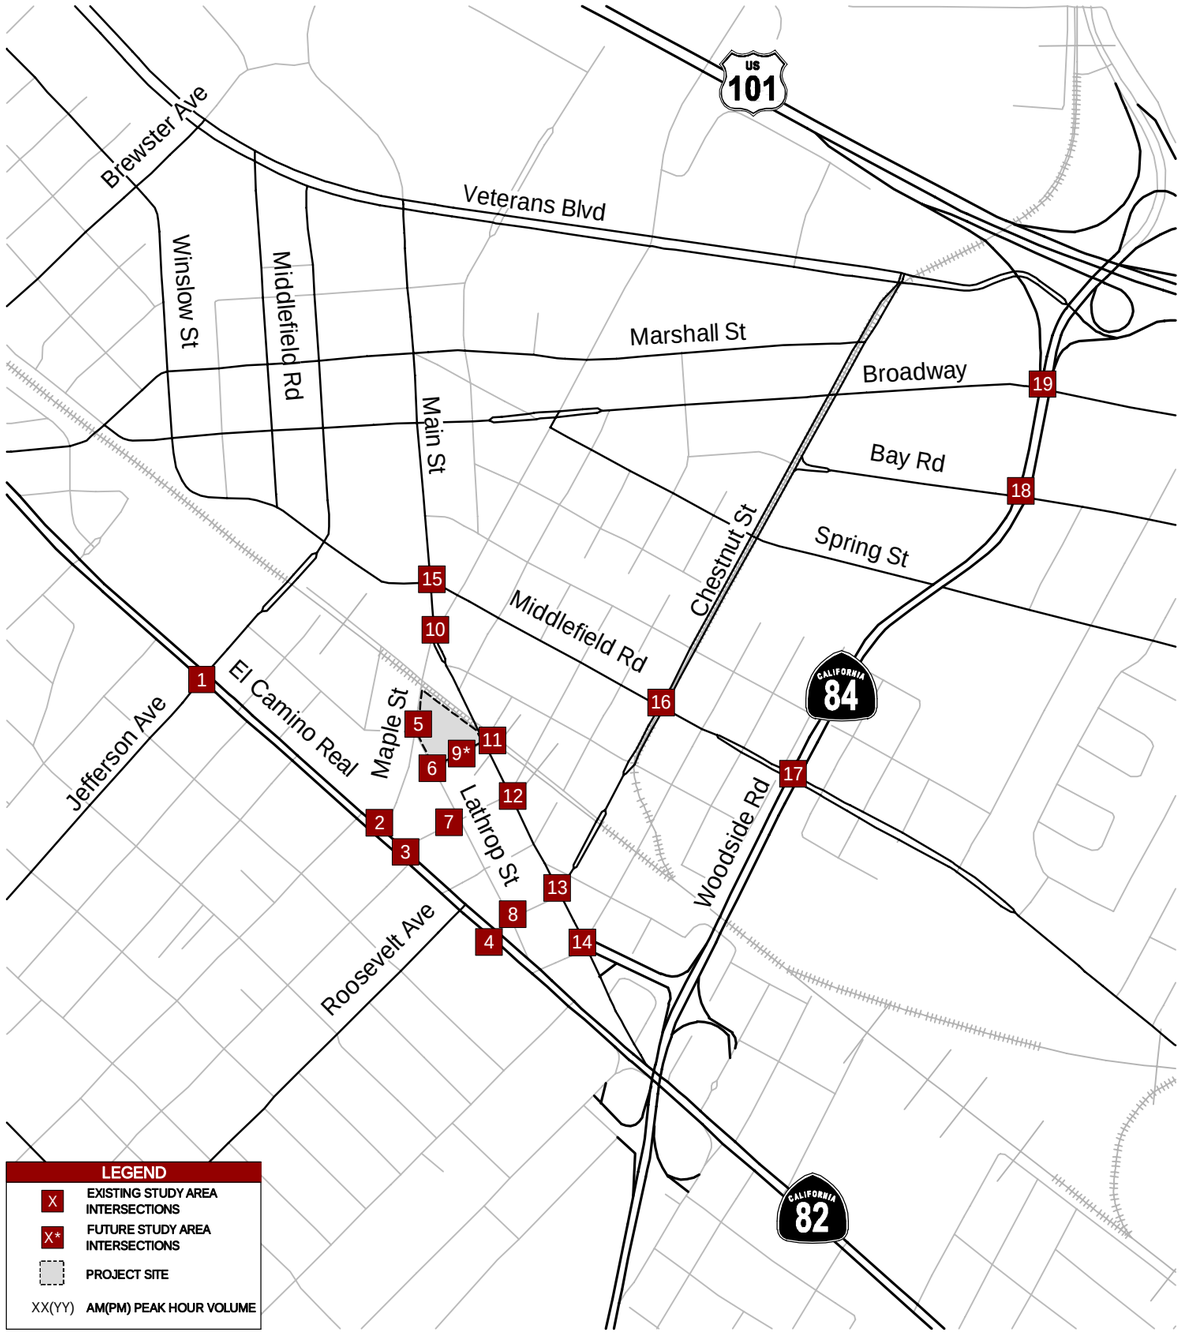
Did not meet peak hour signal warrant:

- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street

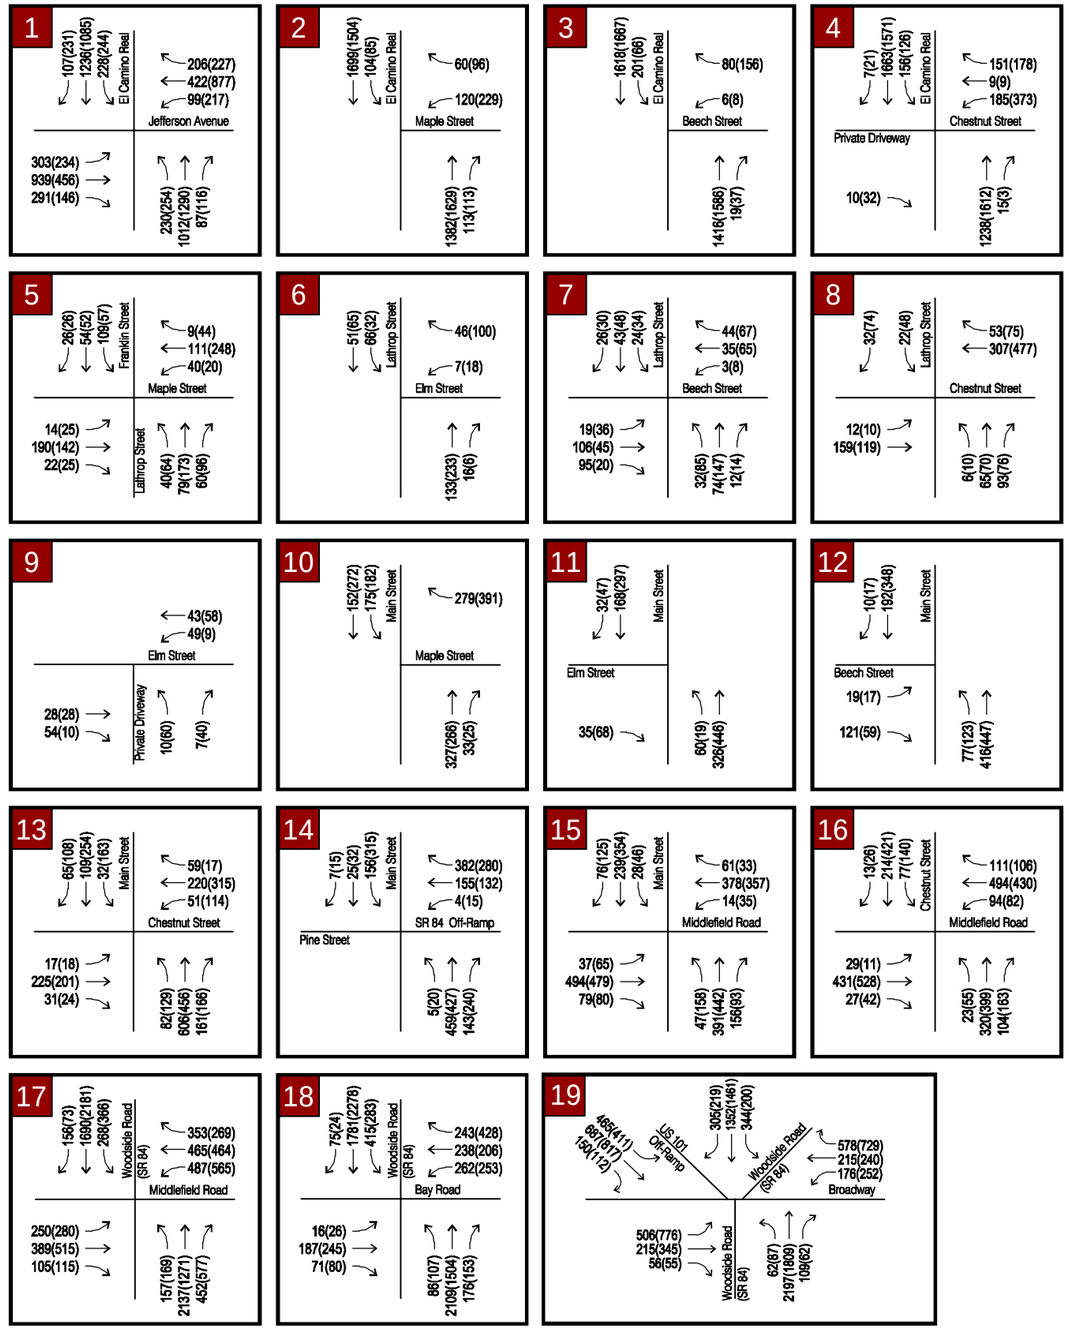
Met peak hour signal warrant:

- #3 – El Camino Real / Beech Street (PM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 (AM and PM Peak Hours)

While both Intersections #3 and #14 satisfy the peak hour signal warrant, other considerations such as other signal warrants and its proximity to existing signals at Intersection #2 – El Camino Real / Maple Street (for Intersection #3) and at Intersection # 13 – Main Street / Chestnut Street (for Intersection #14) should be evaluated before installing a signal.



Analysis sheets are provided in the **Appendix**.



CUMULATIVE INTERSECTIONS LEVEL OF SERVICE

Cumulative volumes were evaluated at the study intersections and are presented in **Figure 14**. Results are presented in **Table 13.** All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #1 – El Camino Real / Jefferson Avenue (AM and PM Peak Hours)
- #3 – El Camino Real / Beech Street (AM and PM Peak Hours)
- #5 – Franklin Street-Lathrop Street / Maple Street (PM Peak Hour)
- #13 – Main Street / Chestnut Street (PM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 Ramps (AM and PM Peak Hours)
- #17 – Woodside Road (SR 84) / Middlefield Road (AM and PM Peak Hours)
- #18 – Woodside Road (SR 84) / Bay Road (AM and PM Peak Hours)
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)

Analysis sheets are provided in the **Appendix**.

Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #6 - Lathrop Street / Elm Street is an uncontrolled intersection and removed from analysis.

3 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

CUMULATIVE PLUS PROJECT SIGNAL WARRANT

Signal warrants were evaluated at the unsignalized study intersections under Cumulative Plus Project Conditions. Below are the results of the signal warrants analysis for the ten (10) unsignalized intersections under Cumulative Plus Project conditions:

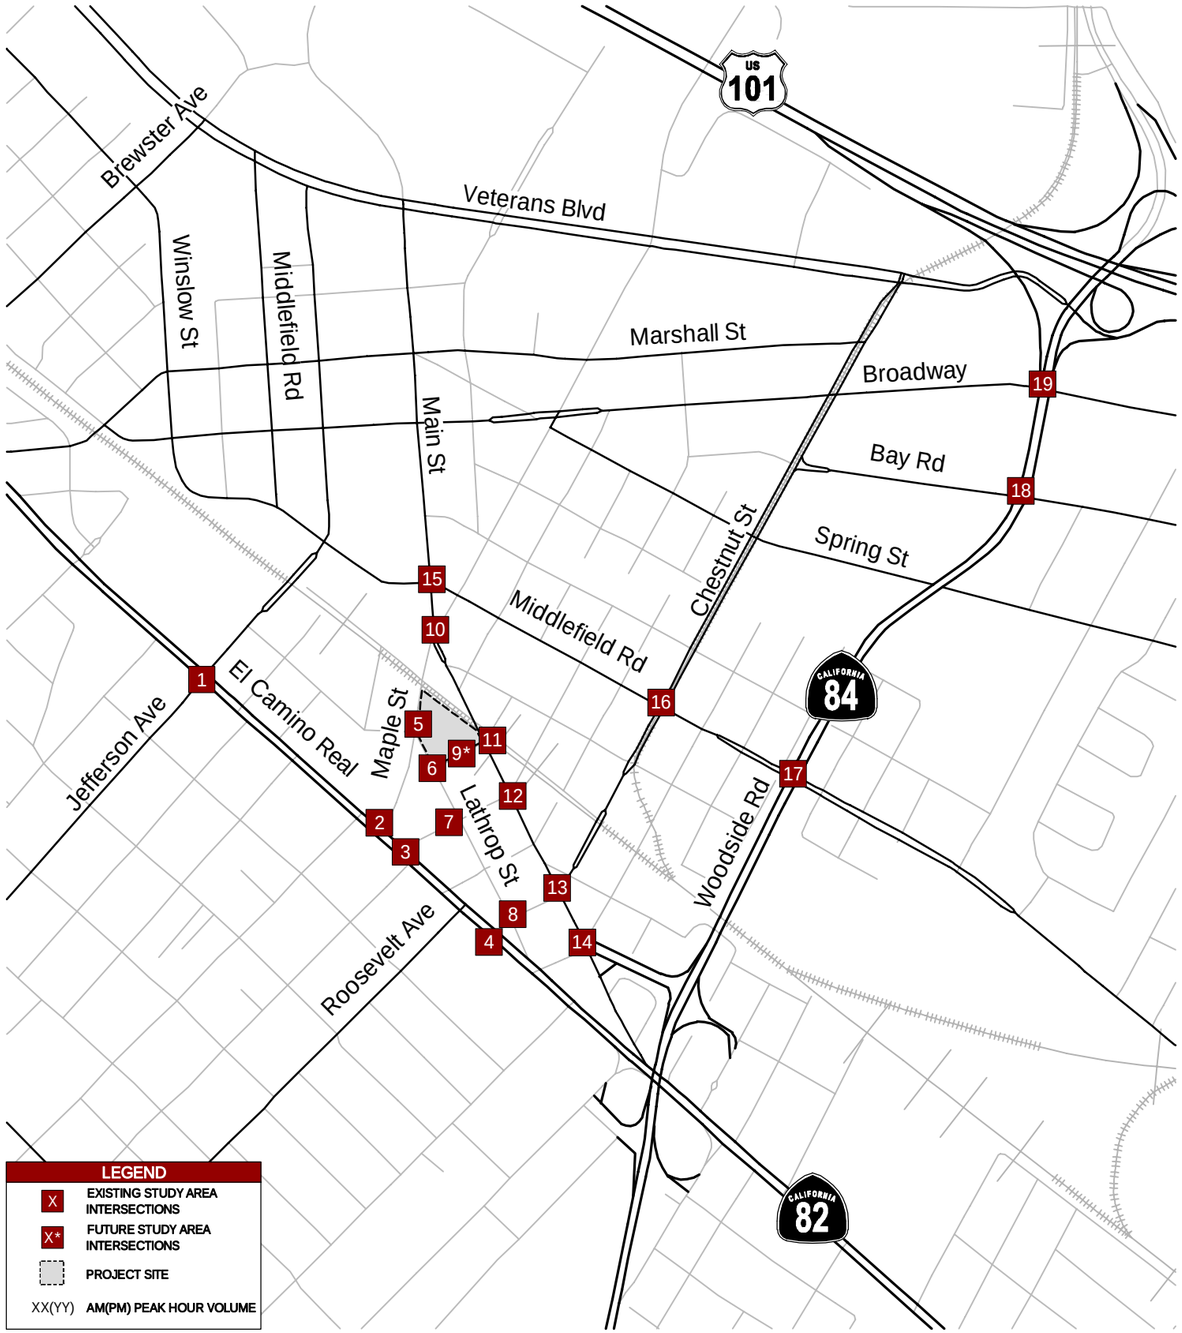
Did not meet peak hour signal warrant:

- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #9 – Elm Street / Project Driveway
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street

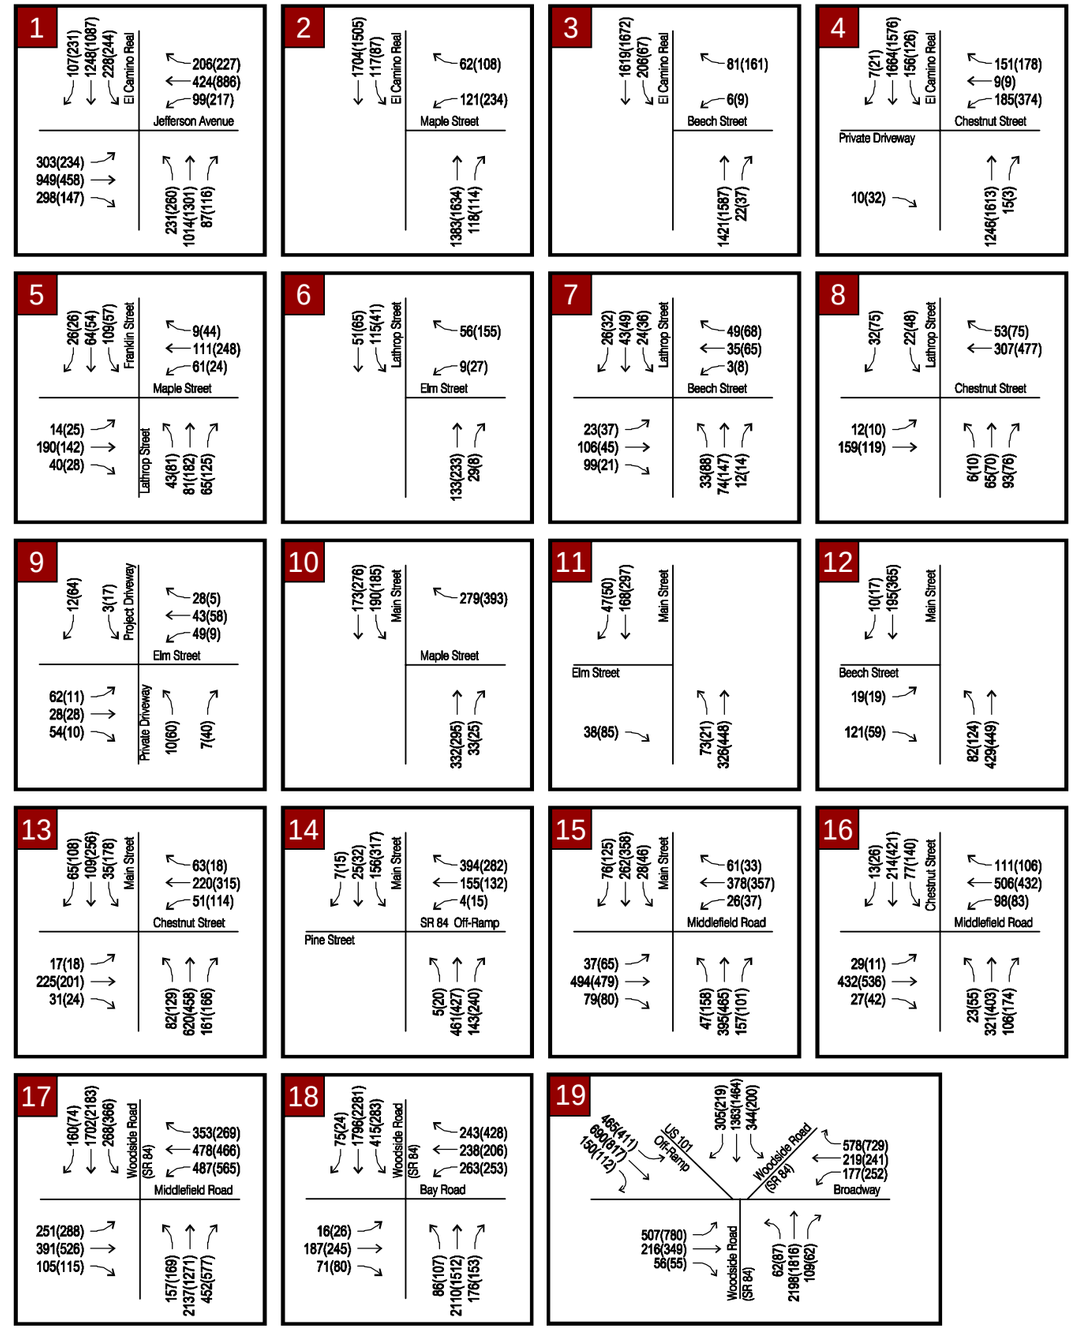
Met peak hour signal warrant:

- #3 – El Camino Real / Beech Street (PM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 (AM and PM Peak Hours)

While both Intersections #3 and #14 satisfy peak hour signal warrant, other consideration such as other signal warrants and its proximity to existing signals at Intersection #2 – El Camino Real / Maple Street (for Intersection #3) and at Intersection # 13 – Main Street / Chestnut Street (for Intersection #14) should be evaluated before installing a signal.



Analysis sheets are provided in the **Appendix**.



CUMULATIVE PLUS PROJECT INTERSECTION LEVEL OF SERVICE

Cumulative Plus Project traffic conditions were evaluated at the study intersections and are shown in **Figure 15**. Results of the analysis are presented in **Table 14**. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #1 – El Camino Real / Jefferson Avenue (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #3 – El Camino Real / Beech Street (AM and PM Peak Hours)
  - AM peak hour: Intersection operating unacceptably without the project with increase in delay less than five (5) seconds – **Not a significant Impact**
  - PM peak hour: Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds and volumes satisfy Peak Hour Volume signal warrant – **Significant Impact**
- #13 – Main Street / Chestnut Street (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds – **Significant Impact**
- #14 – Main Street / Pine Street – SR 84 Ramps (AM and PM Peak Hours)
  - AM peak hour: Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
  - PM peak hour: Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds and volumes satisfy Peak Hour Volume signal warrant – **Significant Impact**
- #17 – Woodside Road (SR 84) / Middlefield Road (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #18 – Woodside Road (SR 84) / Bay Road (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**

Analysis sheets are provided in the **Appendix**.

Note: Intersections that are operating below acceptable levels are shown in **BOLD** and significant impacts highlighted.

1 The average control delay is reported for signalized and AWSC intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #5 - Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the Project.

3 Intersection #6 - Lathrop Street / Elm Street becomes a side-street stop control intersection with the Project.

4 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

6. INTERSECTION VEHICLE QUEUING AND SITE ACCESS AND CIRCULATION

This chapter presents the results from the vehicle queuing analysis completed for each of the study intersections, as well as site access and circulation for the proposed project site.

INTERSECTION VEHICLE QUEUING

As congestion increases, it is common for traffic at intersections to form lines of stopped (or queued) vehicles. Queue lengths were determined for each turn lane and measured the distance that vehicles will back up in each direction approaching an intersection. *Synchro* software calculates the 95th percentile queues based on *HCM 2000* methodology. The 95th percentile queue is used to account for fluctuations in traffic and represents a condition where 95 percent of the time during the peak period, traffic volumes will be less than or equal to the queue determined by the analysis. It is used as a benchmark for determining deficiencies as a standard transportation engineering practice. A typical vehicle length of 25 feet was used in the queuing analysis. An operational deficiency was assumed to occur if the queue increases by one or more vehicles and the vehicle queue exceeds the turn pocket length. A summary of the queuing results is included in the **Appendix**.

The analysis showed that several existing turn bay storage lengths are exceeded by future traffic volumes. In all cases, the exceeded queue lengths are not solely due to the project, but are a result of pre-existing deficiencies. For example, the 95th percentile northbound left turn queue length at the intersection of El Camino Real and Jefferson Avenue is 302 feet during the AM peak in the Existing Conditions and 303 feet during the AM peak in the Existing Plus Project Conditions. The turn pocket length is 165 feet long and the queue spills out of the turn pocket, the result is a pre-existing deficiency. The analysis found that there are no queuing deficiencies due to the addition of the project.

SITE ACCESS AND CIRCULATION

The proposed project was evaluated to determine if the project will provide adequate access to the site and if the project would potentially conflict with adopted policies, plans, or programs supporting alternative transportation or generate pedestrian and bicycle demand that would not be accommodated by existing pedestrian or bicycle facilities and plans including RWCMoves.

SITE ACCESS

As shown in **Figure 6**, pedestrians may access the site at entrances along Main Street and Lathrop Street. Vehicles may access the underground parking garage on Elm Street. It should be noted that there is a median on the southbound approach at the intersection of Main Street / Elm Street which restricts vehicles from making an eastbound left turn from Elm Street onto Main Street. Vehicles traveling from the project site to downtown will need to utilize the Maple Street / Franklin Street-Lathrop Street intersection to the west or head south towards the Main Street / Beech Street intersection. This median at Main Street / Elm Street also extends into the intersection, making the northbound left from Main Street onto Elm Street a more difficult maneuver, however existing counts show that vehicles (13 trips in the AM peak hour and 9 trips in the PM peak hour) still make this maneuver. It is anticipated that some project trips (13 trips in the AM peak hour and 2 trips in the PM peak hour) will make this maneuver, which will result in less than 10 seconds of delay for the northbound left-turn movement and less than 5 feet of queuing during the peak hours.

The driveway was determined to operate at an acceptable LOS at the completion of the proposed project (see Intersection #9 in **Tables 8, 11, and 14** for LOS results). There were also no queuing deficiencies identified for the southbound approach at Intersection #9.

PARKING REQUIREMENTS

The City parking requirements are stated in Article 30 of Redwood City Municipal Code. The parking requirements for professional, business or administrative offices are dependent on whether the site is within the downtown core (radius distance less than 1,500 feet from the northerly-most corner of the Sequoia Station building adjacent to the Caltrain station). The proposed project has a radius distance of approximately 2,000 feet and is outside the downtown core and will need to provide one (1) space for every 300 square feet of gross floor area[4], which equates to 374 parking spaces. In addition, the project is within a Mixed-Use Live/Work (MULW) zoning district which requires that at least 8 percent of the parking spaces to be designated for any combination of low-emitting fuel-efficient, electric, and carpool/vanpool vehicles[5] or 30 spaces.

The February 2018 site plans indicate that the project will provide a total of 341 spaces, of which 26 spaces are designated for low-emitting and carpool vehicles. Both space counts are lower than the City's requirement and a formal assessment should be conducted to evaluate the adequacy of the proposed parking supply. The project is proposing the use of valet to meet parking requirements which may help increase parking supply; however, reduced parking demand and overall vehicles trips is better achieved through implementation of elements from the required TDM plan. These elements would include parking management and encourage employees to walk, bike, or take transit to work.

PEDESTRIAN ACCESS AND CIRCULATION

The project site is located within walking distance to the Redwood City Caltrain Station as well as the downtown area. Pedestrians traveling to and from the Redwood City Caltrain station would utilize sidewalks on roadways parallel to the north or south of the tracks. For those walking north of the tracks, they will walk along Winslow Street, Middlefield Road, Main Street and would need to cross the Caltrain tracks at either Maple Street or Main Street. For those traveling south of the tracks, they will walk through Sequoia Station shopping center and walk along Franklin Street-Lathrop Street and will need to cross Maple Street. Currently there are no marked crosswalks at Maple Street. Pedestrians walking to or from the downtown area will need to cross the tracks at either side of Maple Street or Main Street.

The Caltrain tracks run along the northeast side of the building. The project is proposing an entrance on Main Street near the train tracks, which might lead to potential train conflicts. While conducting field observation, it was observed that a pedestrian crossing was being constructed on the west side of Main Street, which will involve pedestrian gates and barriers, however the project should provide signage and sight clearance to warn pedestrians of the railroad crossing.

According to Article 55.3.C of the Redwood City Municipal Code, developments within MULW zoning districts shall promote walkability and connectivity. There are existing sidewalks adjacent to the proposed site along Main Street and Elm Street where pedestrians can access the site from the other places within the City. However, there are currently no sidewalks adjacent to the site where the main entrance is located on Lathrop Street, as well as along the site on Maple Street. The February 2018 site plan indicated that the

[4] Redwood City Municipal Code. Article 30.5.B

[5] Redwood City Municipal Code. Article 30.4.D

proposed project will construct sidewalks to connect to the existing pedestrian facilities near the project site. The project also proposes other pedestrian-oriented designs such as enhanced streetscapes which includes benches, lighting, and multiple locations for public art installations.

RWCMoves identifies improvements along Maple Street which include adding crosswalks at Maple Street / Franklin Street-Lathrop Street and constructing sidewalk to bridge over the creek on Lathrop Street. The February 2018 site plan indicates sidewalks over the creek, but no marked crosswalks at Maple Street / Franklin Street-Lathrop Street.

While the project site does include many elements to promote walkability and connectivity, there are still missing pedestrian facilities surrounding the site such as no marked crosswalks at the intersection of Maple Street / Franklin Street-Lathrop Street or signage for the pedestrian crossing at Maple Street and Main Street. Therefore, the project will result in potential **significant impact**.

BICYCLE ACCESS AND CIRCULATION

From the proposed site, bicyclists may utilize the bicycle lanes and bicycle route along Maple Street to connect to bicycle facilities to the north such as Middlefield Road. The bicycle lanes extend south to El Camino Real, where cyclist may use the bicycle routes along Jefferson Avenue and Roosevelt Avenue. However, there are gaps in the existing bicycle network, for example along El Camino Real and Maple street between Main Street and Middlefield Road.

Article 55.6.D of the Redwood City Municipal Code requires developments within MULW zoning district to provide the following bicycle parking:

- Non-live/work Bicycle Parking (Tenant): secure bicycle parking for five (5) percent of motorized vehicle parking capacity
- Non-live/work Bicycle Parking (Visitor): permanently anchored bicycle racks within 100 feet of the primary entrance for five (5) percent of motorized vehicle parking capacity

The project is proposing a total of 341 motorized vehicle parking spaces; therefore, the project is required to 17 secure bicycle parking for tenants and 17 bicycle spaces for visitors. The site plans indicate that the project will be providing 72 vertical mount wall racks for tenant parking and 26 bicycle racks for visitor parking, which meets the City's requirements. The February 2018 site plan indicates the visitor bicycle racks would be located near the entrances of the building for visitors. The site plans did not indicate the location for the tenant vertical mount wall racks, but these racks should be placed in a secure location.

RWCMoves identifies several bicycle improvement projects along El Camino Real, Main Street, Maple Street, and Lathrop Street to encourage more bicycle usage in the area. However, the project site plan only includes sharrows on Lathrop Street between Maple Street and Elm Street as improvements to the bicycle facilities, which conflicts with City's plans and policies, which results in a **potential significant impact**.

TRANSIT

The proposed project was evaluated to determine if it would potentially conflict with adopted policies, plans, or programs supporting relating to transit or generate transit demand that would not be accommodated by existing transit facilities and plans including RWCMoves.

For those taking transit, SamTrans bus routes ECR, 79, 270, 276, 278, 296, and 397 operate within the vicinity of the proposed project. There are no bus stops located adjacent to the site. The nearest bus stops are along El Camino Real near Cedar Street or along Middlefield Road near Cassia Street.

The Redwood City Caltrain station is also within ½ mile and Caltrain riders may walk to the proposed project. Those walking north of the tracks may walk along Winslow Street, Middlefield Street, and Maple Street and cross tracks at the crossing along Maple Street. Those traveling south of the track may walk through Sequoia Station and along Franklin Street. Caltrain provides three northbound limited-stop trains, two northbound baby bullet trains, six southbound limited-stop trains, and two southbound baby bullet trains during the weekday AM peak and four northbound limited-stop trains, three northbound baby bullet trains, three southbound limited-stop trains, and two southbound baby bullet train during the weekday PM peak.

According to RWCMoves, approximately 30 percent and 36 percent of downtown office employees use transit to travel to work, during the AM and PM peak, respectively. If it is conservatively assumed (from the standpoint of transit demand) that 30 and 36 percent of the project employees and visitors will use transit during the peak hours, it represents approximately 39 passengers in the AM peak period and 46 passengers in the PM peak period. The project should consider accommodating transit riders such as provide pedestrian and bicycle facilities to connect the project site to the Caltrain station and SamTrans bus stops.

RAILROAD TRACK GRADE SEPARATION

As identified in the 2009 Grade Separation Footprint Study and RWCMoves, it is proposed that the railroad crossings at Maple Street and Main Street become grade separated.

Maple Street

The Grade Separation Footprint Study identified three feasible alternatives for crossing at Maple Street: 1) full street overpass, 2) full street underpass, or 3) partially depressed roadway.

Based on conceptual designs, either the full street overpass or full street underpass alternative would involve adjusting the roadway elevation near the project site along Maple Street between Middlefield Road and approximately 200 feet south of Franklin Street-Lathrop Street and Franklin Street-Lathrop Street between Monroe Street and Elm Street. Both of these alternatives also involve closing Main Street at the rail crossing. For the overpass, the roadway elevation along Maple Street would change between 0 and 36 feet above existing. Along Franklin Street-Lathrop Street, the roadway elevation would change between 0 and 10 feet above existing. For the underpass, roadway elevation along Maple Street would change between 0 and 22 feet below existing. Along Franklin Street-Lathrop Street, the roadway elevation would change between 0 and 5 feet below existing.

The partially depressed roadway would only be implemented if all the rail crossings from Whipple Avenue to Chestnut Street were grade separated via elevated railroad tracks. This alternative would consist of adjusting the roadway elevation along Maple Street by approximately 100-150 feet north and south of the tracks. The elevation change would be between 0 to 2 feet below existing.

The grade separation at Maple Street will result in design of a pedestrian undercrossing or overcrossing near the intersection of Maple Street / Franklin Street-Lathrop Street.

Main Street

The Grade Separation Footprint Study identified three feasible alternatives for the crossing at Main Street: 1) full street overpass, 2) full street underpass, or 3) partially depressed roadway.

Based on conceptual designs, either the full street overpass or full street underpass alternative would involve adjusting the roadway elevation near the project site along Main Street between Maple Street and Beech Street, Elm Street between Lathrop Street and Main Street, and Lathrop Street between Maple Street and Beech Street. For the overpass, the roadway elevation along Main Street would change between 0 and 30 feet above existing. Elm Street would have a change in elevation between 8 and 28 feet above existing. Lathrop Street would have a change in elevation between 0 and 8 feet above existing. For the underpass, the roadway elevation along Main Street would change between 0 and 22 feet below existing. Elm Street would have a change in elevation between 4 and 21 feet below existing. Lathrop Street would have a change in elevation between 0 and 4 feet below existing.

The partially depressed roadway would only be implemented if all the rail crossings from Whipple Avenue to Chestnut Street were grade separated via elevated railroad tracks. This alternative would consist of adjusting the roadway elevation along Main Street between Heller Street and Beech Street and along Elm Street between Lathrop Street and Main Street. The elevation change along Main Street would be between 0 to 6 feet below existing and between 0 and 4 feet below existing along Elm Street.

The grade separation at Main Street would greatly affect the project since the improvement along Elm Street would affect the Project's only vehicle access driveway.

As proposed, the project would limit the City's ability to construct a grade separation in the future. An additional 150 – 250 feet of clear space from the railroad tracks, would be required to facilitate grade separations.

7. SUMMARY OF IMPACTS AND RECOMMENDED MITIGATIONS

Based on the results of the traffic analysis and evaluation of the proposed site plan, the following project impacts are noted in **Table 15**. The impacts are identified as being significant unless mitigated.

Table 15 - Impact Summary

Impact Type	Location	Scenarios	Impact Significance
LOS	#3 - El Camino Real / Beech Road	Cumulative Plus Project PM Peak Hour	Mitigated to Less than Significant
LOS	#13 - Main Street / Chestnut Street	Cumulative Plus Project PM Peak Hour	Mitigated to Less than Significant
LOS	#14 - Main Street / Pine Street-SR 84 Ramps	Cumulative Plus Project PM Peak Hour	Mitigated to Less than Significant
Pedestrian	Project Site	All	Mitigated to Less than Significant
Bicycle	Project Site	All	Mitigated to Less than Significant

SIGNIFICANT UNLESS MITIGATED

The following significant impacts are listed by study intersection:

IMPACT TRANS – 1: EL CAMINO REAL / BEECH ROAD (INTERSECTION #3)

The intersection of El Camino Real / Beech Road will have an LOS impact in the following scenario due to the proposed project:

- Cumulative Plus Project PM Peak Hour

Cumulative Plus Project

In the Cumulative Plus Project scenario, the intersection of El Camino Real / Beech Road will operate at an unacceptable LOS F with a worst movement delay of 158.2 seconds in the PM peak hour. Although the intersection operates at an unacceptable LOS F with a delay of 129.9 seconds without the project, the project increases the delay by more than five (5) seconds and the volumes satisfy the Peak Hour Volume signal warrant. This is a significant impact.

The intersection satisfies the Peak Hour Volumes signal warrant and installing a signal would result in the intersection operating at LOS B with an average intersection delay of 11.0 seconds. However, other considerations such as other signal warrants and its proximity to an existing signal at Intersection #2 – El Camino Real / Maple Street should be evaluated before installing a signal.

The high delay for the westbound approach can be attributed to high volumes on El Camino Real and vehicles waiting to make a westbound left turn from Beech Street onto El Camino Real. As an alternative mitigation, the westbound left-turn movement should be prohibited at least during the peak times when there are high volumes on El Camino Real. This would result in the intersection operating at LOS D with a worst movement delay of 28.4 seconds. It should be noted that 9 vehicles would be redistributed throughout the network because of this mitigation. This redistribution of traffic was evaluated and was found not to degrade the operation of adjacent intersections to unacceptable levels.

Installing a signal would require approval from Caltrans, while restricting left-turns would involve installing signage on Beech Street, which is under the City's jurisdiction. The restriction of left-turns at this intersection is consistent with the El Camino Real Corridor Plan. Therefore, restricting left-turns from Beech Street is the most feasible mitigation. This mitigation would result in the intersection operating acceptably and therefore the impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – 2: MAIN STREET / CHESTNUT STREET (INTERSECTION #13)

The intersection of Main Street / Chestnut Street will have an LOS impact in the following scenario due to the proposed project:

- Cumulative Plus Project PM Peak Hour

Cumulative Plus Project

In the Cumulative Plus Project scenario, the intersection of Main Street / Chestnut Street will operate at an unacceptable LOS F with a worst movement delay of 84.4 seconds in the PM peak hour. Although the intersection operated at an unacceptable LOS E with a delay of 73.0 seconds without the project, the project increases the delay by more than five (5) seconds. This is a significant impact.

To mitigate the impact, the signal timing should be optimized. This would result in the intersection operating at LOS D with an average intersection delay of 50.8 seconds. The project should pay its fair share to this improvement. This mitigation would result in the intersection operating acceptably and therefore the impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – 3: MAIN STREET / PINE STREET – SR 84 RAMPS (INTERSECTION #14)

The intersection of Main Street / Pine Street-SR 84 Ramps will have an LOS impact in the following scenario due to the proposed project:

- Cumulative Plus Project PM Peak Hour

Cumulative Plus Project

In the Cumulative Plus Project scenario, the intersection of Main Street / Pine Street-SR 84 Ramps will operate at an unacceptable LOS F with a worst movement delay of 169.9 seconds in the PM peak hour. Although the intersection operated at an unacceptable LOS F with a delay of 163.8 seconds without the project, the project increases the delay by more than five (5) seconds and volumes satisfy the Peak Hour Volume signal warrant. This is a significant impact.

The intersection satisfies the Peak Hour Volumes signal warrants and installing a signal would result in the intersection operating at LOS B with an average intersection delay of 14.0 seconds. However, other considerations such as other signal warrants and its proximity to an existing signal at Intersection #13 – Main Street / Chestnut Street should be evaluated before installing a signal.

An alternative mitigation would install stop signs along Main Street to convert the intersection control to an all-way stop control (AWSC). This mitigation would result in the intersection operating at LOS F with an average intersection delay of 63.3 seconds.

Installing a signal would require approval from Caltrans, while converting the intersection to an AWSC would require installing stop signs along Main Street, which is under the City's jurisdiction. Therefore, converting the intersection to an AWSC is the most feasible mitigation. This mitigation would result in the intersection operating better than before project conditions and therefore the impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – 4: PEDESTRIAN FACILITIES

While the project site does include many elements to promote walkability and connectivity, there are still missing pedestrian facilities surrounding the site such as no marked crosswalks at the intersection of Maple Street / Franklin Street-Lathrop Street or signage for the pedestrian railroad crossings at Maple and Main Street. This is a significant impact.

To mitigate the impact, the project should construct the following pedestrian improvements:

- Update the site plan to include marked crosswalks and install accessible curb ramps on all legs of the intersection of Maple Street / Franklin Street-Lathrop Street.
- Add signage (i.e. R15-8 LOOK) for the pedestrian railroad crossing at Maple Street and Main Street.
- Install two-stage pedestrian crossing at Maple Street / Main and improve sidewalks on the east side of Maple Street between Main street and the railroad

The impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – 5: BICYCLE FACILITIES

RWCMoves identifies several bicycle improvement projects along El Camino Real, Main Street, Maple Street, and Lathrop Street to encourage more bicycle usage in the area. It is proposed that Class IV protected bicycle lanes be installed along El Camino Real along the entire corridor within Redwood City, as well as along Main Street and Maple Street between Convention Way and El Camino Real. Along Lathrop Street, it is proposed that Class III bicycle route be installed. While there are many proposed City bicycle projects near the Project, project site plan does not indicate any improvements to the bicycle facility, which conflicts with City's plans and policies. This is a significant impact.

To mitigate the impact, the project would construct some these improvements adjacent to the site such as the Class III bicycle route signage and "sharrows" along Lathrop Street. The project should maintain 35.5 feet of space in the traveled way on Maple Street to accommodate the planned cycle tracks and required fire access. The project should also pay its fair share towards bicycle cycle tracks on Maple Street and improvements projects near the project site. The impact is **less than significant** with the proposed mitigation.

8. SUPPLEMENTAL ANALYSIS – LATHROP STREET CLOSURE

A supplemental analysis was conducted to evaluate the potential effects of closing a segment of Lathrop Street. This chapter discussed the assumptions and results of this proposed closure.

LATHROP STREET CLOSURE

Under Cumulative conditions, there are considerations as part of the proposed project to close Lathrop Street between Maple Street and Elm Street to vehicle access, except for emergency medical services, to allow for more park spaces.

This supplemental analysis evaluated the Lathrop Street Closure between Maple Street and Elm Street. Due to the combined size of the proposed project and 1601 El Camino Block D project (110,778 sf office), as well as good access management practices, it is necessary to allow vehicle access at Intersection #6 to remain.

LANE GEOMETRY AND CONTROL

For the Lathrop Street Closure analysis the lane geometry and traffic control was assumed to be the same as for the Cumulative analysis, except with the following changes:

- Intersection #5 – Franklin Street-Lathrop Street / Maple Street: removal of northbound approach, westbound left turn movement, and eastbound right turn movement
- Intersection #6 – Lathrop Street / Elm Street: removal of southbound approach, northbound through, and westbound right turn

Figure 16 illustrates the intersection geometry and traffic control assumed for the Lathrop Street Closure analysis.

LATHROP STREET CLOSURE VOLUMES

Volumes at Intersection #5 – Franklin Street-Lathrop Street / Maple Street and Intersection #6 – Lathrop Street and Elm Street, as well as trip assignment for background traffic assumed in the Cumulative conditions were redistributed to account for the street closure, as seen on **Figure 17**.

Project trips were also redistributed for the street closure and the Cumulative Plus Project (Lathrop closure) volumes are shown in **Figure 18**.

SIGNAL WARRANTS

Signal warrants were evaluated at the unsignalized study intersections under both without and with project conditions. Below are the results of the signal warrants analysis for the ten (10) unsignalized intersections under Cumulative Plus Project (Lathrop closure) conditions:

Did not meet peak hour signal warrant:

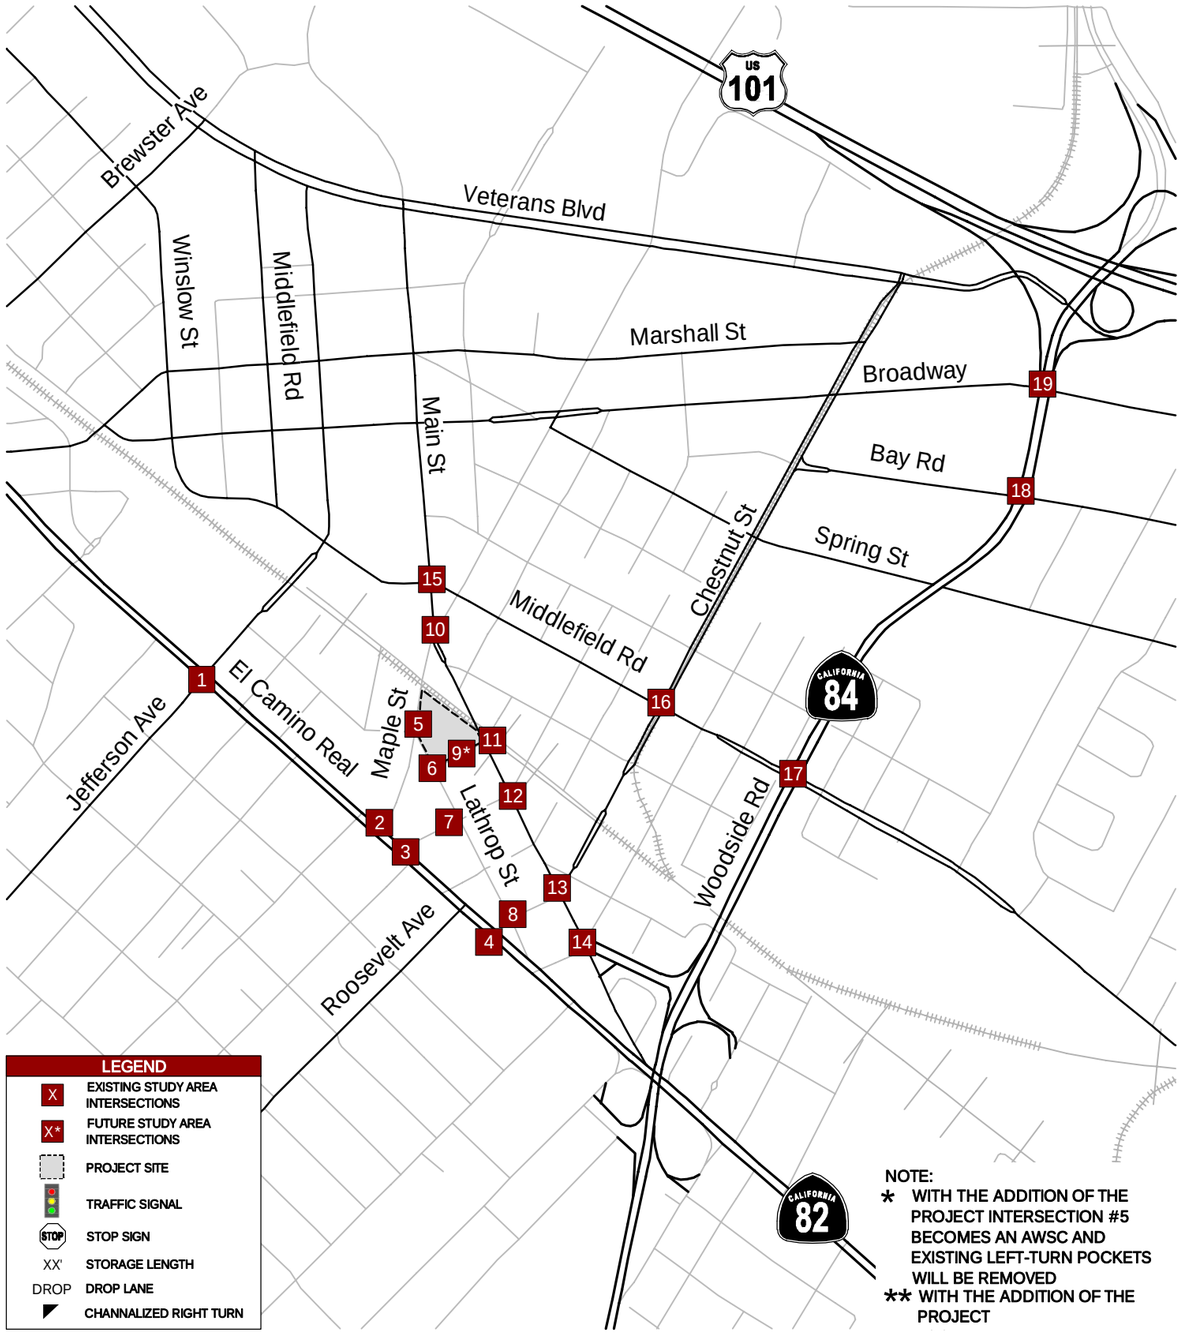
- #5 – Franklin Street - Lathrop Street / Maple Street
- #6 – Lathrop Street / Elm Street
- #7 – Lathrop Street / Beech Street
- #8 – Lathrop Street / Chestnut Street
- #9 – Elm Street / Project Driveway
- #10 – Main Street / Maple Street
- #11 – Main Street / Elm Street
- #12 – Main Street / Beech Street

Met peak hour signal warrant:

- #3 – El Camino Real / Beech Street (PM Peak Hour)
- #14 – Main Street / Pine Street – SR 84 (AM and PM Peak Hours)

While both Intersections #3 and #14 satisfy the peak hour signal warrant, other considerations such as other signal warrants and its proximity to existing signals at Intersection #2 – El Camino Real / Maple Street (for Intersection #3) and at Intersection # 13 – Main Street / Chestnut Street (for Intersection #14) should be evaluated before installing a signal.

Analysis sheets are provided in the **Appendix**.



LEVEL OF SERVICE ANALYSIS

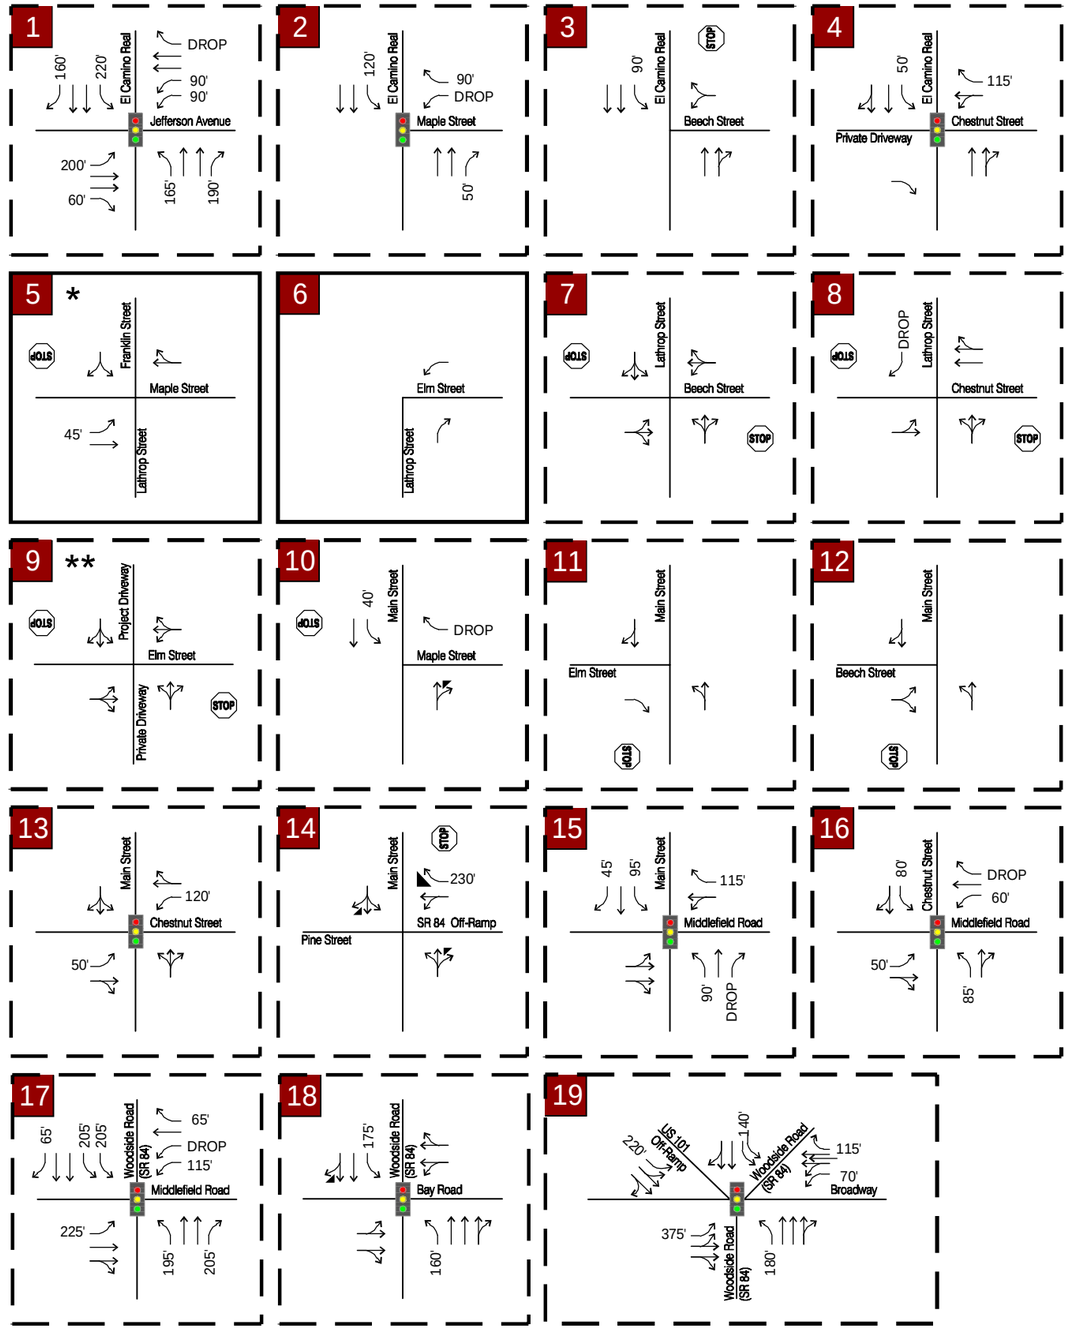


Table 16 presents the results of the LOS analysis. All study intersections function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #1 – El Camino Real / Jefferson Avenue (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #3 – El Camino Real / Beech Street (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds and volumes satisfy Peak Hour Volume signal warrant – **Significant Impact**
- #12 – Main Street / Beech Street (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds, but volumes do not satisfy Peak Hour Volume signal warrant – **Not a significant Impact**
- #13 – Main Street / Chestnut Street (PM Peak Hour)
  - Intersection operating acceptably without the project and project causes intersection to operate at an unacceptable LOS– **Significant Impact**

- #14 – Main Street / Pine Street – SR 84 Ramps (PM Peak Hour)
  - Intersection operating unacceptably without the project with increase in delay greater than five (5) seconds and volumes satisfy Peak Hour Volume signal warrant – **Significant Impact**
- #17 – Woodside Road (SR 84) / Middlefield Road (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #18 – Woodside Road (SR 84) / Bay Road (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**
- #19 – Woodside Road (SR 84) / Broadway (AM and PM Peak Hours)
  - Intersection operating unacceptably without the project with increase in delay by less than five (5) seconds – **Not a significant Impact**

Analysis sheets are provided in the **Appendix**.

Note: Intersections that are operating below acceptable levels are shown in **BOLD**.

1 The average control delay is reported for signalized and AWSC intersections. The delay for the worst movement is reported for SSSC intersections.

2 Intersection #5 - Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the Project.

3 With the Lathop Closure Intersection #6 - Lathrop Street / Elm Street is an uncontrolled intersection with no conflicting movements. Without the closure, Intersection #6 is side-street stop control intersection.

4 Intersection #17 - Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

INTERSECTION QUEUING

With the Lathrop Street Closure, it is anticipated that the following queuing deficiency in **Table 17** would occur with the project.

Table 17 - Intersection with Queuing Deficiency with the Project and Lathrop Street Closure

#	Intersection	Peak Period	Turning Movement	Storage Length (feet)	Queue Length (feet)		Variance
					Without Project	With Project	
1	El Camino Real / Jefferson Ave	PM Peak	NBL	165	400	428	28 feet (1 veh)
17	Woodside Road (SR 84) / Middlefield Road	PM Peak	EBL	225	528	565	37 feet (1 veh)

For both these impacts, optimizing signal timing would improve these queuing deficiencies.

SUMMARY OF IMPACTS AND RECOMMENDED MITIGATIONS

Based on the results of the supplemental traffic analysis, the following intersection level of service impacts are noted in **Table 18**. The impacts are identified as being significant unless mitigated.

Table 18 - Lathrop Street Closure Project Impact Summary

Impact Type	Location	Peak Hour	Impact Significance
LOS	#3 - El Camino Real / Beech Road	AM Peak Hour PM Peak Hour	Mitigated to Less than Significant
LOS	#13 - Main Street / Chestnut Street	PM Peak Hour	Mitigated to Less than Significant
LOS	#14 - Main Street / Pine Street-SR 84 Ramps	PM Peak Hour	Mitigated to Less than Significant
Pedestrian	Project Site	N/A	Mitigated to Less than Significant
Bicycle	Project Site	N/A	Mitigated to Less than Significant

IMPACT TRANS – S1: EL CAMINO REAL / BEECH ROAD (INTERSECTION #3)

During the AM peak hour, the intersection of El Camino Real / Beech Road would operate at an unacceptable LOS F with a worst movement delay of 594.6 seconds. Although the intersection operates at an unacceptable LOS F with a worst movement delay of 459.5 seconds without the project, the project increases the delay by more than five (5) seconds and the volumes satisfy the Peak Hour Volume signal warrant. This is a significant impact.

In addition, during the PM Peak hour, the intersection will operate at an unacceptable LOS F with a delay of 841.4 seconds. Although the intersection operates at an unacceptable LOS F with a delay of 761.3 seconds without the project, the project increases the delay by more than five (5) seconds and the volumes satisfy the Peak Hour Volume signal warrant. This is a significant impact.

Similar to IMPACT TRANS-1, signalizing the intersection or restricting westbound left-turn movements during the peak periods would mitigate the impact. Signalizing will result in the intersection operating acceptably at LOS B or better during the AM and PM peak hours. This mitigation would require approval from Caltrans.

Restricting westbound left-turns would result in the intersection operating acceptably at LOS C during the AM peak hour and at LOS F with a worst movement delay of 59.1 seconds, which is better than without project condition. This mitigation would also result in the redistribution of 16 trips throughout the network. This redistribution of traffic was evaluated and was found not to degrade operation of adjacent intersection to unacceptable levels. The restriction of left-turns at this intersection is consistent with the El Camino Real Corridor Plan. Therefore, restricting left-turns from Beech Street is the most feasible mitigation. This mitigation would result in the intersection operating acceptably and therefore the impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – S2: MAIN STREET / CHESTNUT STREET (INTERSECTION #13)

During the PM peak hour, the intersection of Main Street / Chestnut Street will operate at an unacceptable LOS E with a delay of 77.9 seconds. Without the project, the intersection operated at an acceptable LOS D. Since the addition of the project causes the intersection to operate unacceptably, this is a significant impact.

Similar to IMPACT TRANS-2, signal timing should be optimized. This would result in the intersection operating acceptably at LOS D with 43.0 seconds of delay. The project should pay for this improvement. This mitigation would result in the intersection operating acceptable and therefore the impact is **less than significant** with the propose mitigation.

IMPACT TRANS – S3: MAIN STREET / PINE STREET – SR 84 RAMPS (INTERSECTION #14)

During the PM peak hour, the intersection of Main Street / Pine Street-SR 84 Ramps will operate at an unacceptable LOS F with a delay of 149.7 seconds. Although the intersection operated at an unacceptable LOS F with a delay of 144.4 seconds without the project, the project increases the delay by more than five (5) seconds and volumes satisfy the Peak Hour Volume signal warrant. This is a significant impact.

Similar to IMPACT TRANS-3, a signal should be installed or the intersection should be converted to an all-way stop control. Signalizing will result in the intersection operating acceptably at LOS B. This mitigation would require approval from Caltrans.

Converting intersection control to an all-way stop control would result in the intersection operating at LOS F with an average intersection delay of 57.2 seconds. Converting the intersection to an AWSC would involve installing stop signs along Main Street which is under the City's jurisdiction. Therefore, converting the intersection to an AWSC is the most feasible mitigation. This mitigation would result in the intersection operating better than before project conditions and therefore the impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – S4: PEDESTRIAN FACILITIES

While the project site does include many elements to promote walkability and connectivity, there are still missing pedestrian facilities surrounding the site such as no marked crosswalks at the intersection of Maple Street / Franklin Street-Lathrop Street or signage for the pedestrian crossings at Maple and Main Street. This is a significant impact.

Similar to IMPACT TRANS-4, the project should construct the following pedestrian improvements:

- Update the site plan to include marked crosswalks and install accessible curb ramps on all legs of the intersection of Maple Street / Franklin Street-Lathrop Street.
- Add signage (i.e. R15-8 LOOK) for the pedestrian railroad crossing at Maple Street and Main Street.
- Install two-stage pedestrian crossing at Maple Street / Main and improve sidewalks on the east side of Maple Street between Main street and the railroad

The impact is **less than significant** with the proposed mitigation.

at the intersection of Maple Street / Franklin Street-Lathrop Street and install signage (R15-8 LOOK) for the pedestrian crossing at Maple Street and Main Street. The impact is **less than significant** with the proposed mitigation.

IMPACT TRANS – S5: BICYCLE FACILITIES

RWCMoves identifies several bicycle improvement projects along El Camino Real, Main Street, Maple Street, and Lathrop Street to encourage more bicycle usage in the area. It is proposed that Class IV protected bicycle lanes be installed along El Camino Real along the entire corridor within Redwood City, as well along Main Street and Maple Street between Convention Way and El Camino Real. Along Lathrop Street, it is proposed that Class III bicycle route be installed. While there are many proposed City bicycle projects near the Project, project site plan does not indicate any improvements to the bicycle facility, which conflicts with City's plans and policies. This is a significant impact.

Similar to IMPACT TRANS-5, the project should install Class III bicycle route "sharrows" along Lathrop Street and maintain 35.5 feet of space in the travel way on Maple to accommodate the planed cycle tracks and required fire access. The project will pay its fair share towards bicycle improvements projects near the project site. The impact is **less than significant** with the proposed mitigation.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Section 1 – Introduction and Project Description

This report introduces the Transportation Demand Management (TDM) plan for the commercial development located at 1180/1190 Main Street. A vicinity map can be found on Figure 1.

The proposed project site includes a 1.312 Acre (57,111 Square Feet) lot with no existing uses. The proposed development will consists of a new three story building purposed for general office space with 110,000 Gross Square Feet (GSF) of floor area . A site plan can be found on Figure 2A and the ground floor plan on Figure 2B.

Trip Generation Estimates

Vehicle trip generation estimates are calculated to provide the number of anticipated vehicle trips (employees, deliveries, visitors, etc.) that are produced by the project site's specific land use during a specified time period. The number of vehicle trips generated by the project site was estimated using trip generation rates for a general office use facility (ITE Land Use 710 – General Office) published in the Institute of Transportation Engineers' (ITE), *Trip Generation, 9th Edition (2012).*

The estimated number of vehicle trips for the proposed project site after a transit credit is applied is forecast to be 191 AM peak hour trips and 190 PM peak hour trips. The complete details of the trip generation calculation can be found in Table 1.

Trip Reduction Goals

The goal of this TDM plan is to identify trip reduction methods to be implemented in order to reduce the number of new AM and PM peak hour single occupant vehicle (SOV) trips by shifting at least 60% of the total project trips to alternative modes of transportation.

Table 1 - Trip Generation Table

Use	Size/ Unit	AM Peak Hour			PM Peak Hour		
		Factor	Trips In/Out	Total Trips	Factor	Trips In/Out	Total Trips
Proposed Project							
General Office Building (710)	110 ksf	(1)	181/25	206	(1)	34/168	202

Section 2 – Existing Transportation Facilities and Services

The following transportation facilities provide alternate modes of transportation to the conventional single-occupant vehicle (SOV):

- Commuter Rail
- SamTrans
- Pedestrian Facilities

This section discusses the existing and planned facilities located in proximity to 1180 Main Street. Schedules for transit systems in the area are subject to change and can be found at: http://www.samtrans.com/schedulesandmaps.html

A local transit map and the surrounding networks can be found on Figure 3.

Commuter Rail – CALTRAIN

Caltrain provides intercity commuter rail service between Santa Clara County, San Mateo County and San Francisco County. Currently, there is one Caltrain Stations located in proximity to 1180 Main Street — the Redwood City Station.

The Redwood City station is located approximately 0.27 miles from the project site. This close proximity provides convenient transit access to and from the project site for users. The station is also equipped with 18 bike racks and 50 bike lockers which are available through a rental agreement.

Redwood City Caltrain Station Schedule

Northbound Weekdays

5:09,
5:44, 6:30, 6:45, 6:51*, 7:30, 7:45*, 7:51*, 8:33, 8:45*, 8:51*, 9:23, 9:54, 10:29, 10:54, 11:49,* **12:49, 1:49, 2:54, 3:19, 3:46, 4:25*, 4:31*, 4:52, 5:25*, 5:33*, 5:53, 6:25*, 6:31*, 6:52, 7:19, 7:29, 8:09, 9:09, 10:09, 11:09**

Southbound Weekdays

5:45,
6:15, 6:51, 7:14, 7:20*, 7:30, 8:14, 8:20, 8:30, 9:14, 9:20, 9:30, 9:57, 10:19, 10:57, 11:57,* **12:57, 1:57, 2:57, 3:19, 3:57, 4:19, 5:08, 5:24*, 5:30*, 6:08, 6:24*, 6:30*, 7:08, 7:24*, 7:30*, 8:20, 9:30, 10:30, 11:30,** *12:51*

Samtrans Bus Routes

The project site area is serviced by San Mateo County Transit District (SamTrans) with provides access through San Mateo County and to San Francisco County as well as Santa Clara county. Detailed information on services and routes can be found at: http://www.samtrans.com/schedulesandmaps.html

Pedestrian Facilities

The nearby pedestrian facilities are comprised of sidewalks, warning devices and signals, crosswalks, and trails. The area has an extensive pedestrian facility network that provide access to local transit facilities as well as local commercial areas. However, currently no sidewalk exists along the project frontage on Maple St and Lathrop St. This project will install new sidewalks along Maple St and Lathrop St frontage

to encourage walking trips over vehicle trips and improve pedestrian connectivity for the area as a whole.

Bicycle Facilities

The nearby bicycle infrastructure is comprised of Class II bike facilities. Currently, there are Class II bicycle lanes located on Middlefield Rd and Maple St. These existing facilities provide access to local transit facilities as well as local commercial areas. The existing bicycle facilities are shown on figure 4.

Section 3 – Potential TDM Design Measures and Programs

The San Mateo County Association of Governments (C/CAG) has developed a list of TDM design measures that are defined in the "Guidelines for Implementing the Land Use Component of the Congestion Management Program". Table 2 provides a summary of potential measures as defined in the TDM Guidelines. The TDM plan for 1180/1190 Main Street includes applicable measures from the above mentioned list, as well as other current state of the practice approaches. Section 4 of this TDM lists the specific measures that will be implemented at 1180/1190 Main Street.

Table 2 - C/CAG TDM Design Measures

C/CAG TDM Measures		
Transportation Demand Management Measure	**Number of Trips Credited**	**Rationale**
Secure bicycle storage	One peak hour trip will be credited for every 3 new bike lockers/racks installed and maintained. Lockers/racks must be installed within 100 feet of the building.	Experience has shown that bicycle commuters will average using this mode onethird of the time, especially during warmer summer months.
Showers and changing rooms.	Ten peak hour trips will be credited for each new combination shower and changing room installed. An additional 5 peak hour trips will be credited when installed in combination with at least 5 bike lockers	10 to 1 ratio based on cost to build and the likelihood that bicycle utilization will increase.
Operation of a dedicated shuttle service during the peak period to a rail station or an urban residential area. Alternatively the development could buy into a shuttle consortium.	One peak hour trip will be credited for each peak-hour round trip seat on the shuttle. Increases to two trips if a Guaranteed Ride Home Program is also in place. Five additional trips will be credited if the shuttle stops at a child-care facility enroute to/from the worksite.	Yields a one-to-one ratio (one seat in a shuttle equals one auto trip reduced); utilization increases when a guaranteed ride home program is also made available.
Charging employees for parking.	Two peak hour trips will be credited for each parking spot charged out at $20 per month for one year. Money shall be used for TDM measures such as shuttles or subsidized transit tickets.	Yields a two-to-one ratio

C/CAG TDM Measures		
Subsidizing transit tickets for employees.	One peak hour trip will be credited for each transit pass that is subsidized at least $20 per month for one year. One additional trip will be credited if the subsidy is increased to $75 for parents using transit to take a child to childcare enroute to work.	Yields a one-to-one ratio (one transit pass equals one auto trip reduced).
Subsidizing pedestrians/bicyclists who commute to work.	One peak hour trip will be credited for each employee that is subsidized at least $20 per month for one year.	Yields a one-to-one ratio (One pedestrian/bicyclist equals one auto trip reduced.
Creation of preferential parking for carpoolers.	Two peak hour trips will be credited for each parking spot reserved.	Yields a two-to-one ratio (one reserved parking spot equals a minimum of two auto trips reduced).
Creation of preferential parking for vanpoolers.	Seven peak hour trips will be credited for each parking spot reserved.	Yields a seven-to-one ratio (one reserved parking spot equals a minimum of seven auto trips reduced).
Implementation of a vanpool program.	Seven peak hour trips will be credited for each vanpool arranged by a specific program operated at the site of the development.Increases to ten trips if a Guaranteed Ride Home Program is also in place.	The average van capacity is seven
Operation of a commute assistance center, offering on site, one stop shopping for transit and commute alternatives information, preferably staffed with a live person to assist building tenants with trip planning.	One peak hour trip will be credited for each feature added to the information center; and an additional one peak hour trip will be credited for each hour the center is staffed with a live person,up to 20 trips per each 200 tenants. Possible features may include: Transit information, brochure rack, Computer kiosk connected to Internet, Telephone (with commute and transit information numbers), Desk and chairs (for personalized trip planning), On-site transit ticket sales, Implementation of flexible work hour schedules that allow transit riders to be 15-30 minutes late or early (due to problems with transit or vanpool), Quarterly educational programs to support commute alternatives.	This is based on staff's best estimate. Short of there being major disincentives to driving, having an on-site TDM program offering commute assistance is fundamental to an effective TDM program.

C/CAG TDM Measures		
Survey Employees to examine use and best practices.	Three peak hour trips will be credited for a survey developed to be administered twice yearly	This is based on staff's best estimate with the goal of finding best practices to achieve the mode shift goal.
Implementation of a parking cash out program.	One peak hour trip will be credited for each parking spot where the employee is offered a cash payment in return for not using parking at the employment site.	Yields a one-to-one ratio (one cashed out parking spot equals one auto trip reduced.
Implementation of ramp metering.	Three hundred peak hour trips will be credited if the local jurisdiction in cooperation with CalTrans, installs and turns on ramp metering lights during the peak hours at the highway entrance ramp closest to the development.	This is a very difficult and costly measure to implement and the reward must be significant.
Installation of high bandwidth connections in employees' homes to the Internet to facilitate home telecommuting	One peak hour trip will be credited for every three connections installed. This measure is not available as credit for a residential development.	Yields a one-to-three ratio.
Installation of video conferencing centers that are available for use by the tenants of the facility.	Five peak hour trips will be credited for a center installed at the facility.	This is based on staff's best estimate.
Implementation of a compressed workweek program.	One peak hour trip will be credited for every 5 employees that are offered the opportunity to work four compressed days per week.	The workweek will be compressed into 4 days; therefore the individual will not be commuting on the 5th day.
Flextime: Implementation of an alternate hours workweek program.	One peak hour trip will be credited for each employee that is offered the opportunity to work staggered work hours. Those hours can be a set shift set by the employer or can be individually determined by the employee.	This is based on staff's best estimate.
Provision of assistance to employees so they can live close to work.	If an employer develops and offers a program to help employees find acceptable residences within five miles of the employment site, a credit of one trip will be given for each slot in the program.	This assumes that a five-mile trip will generally not involve travel on the freeways.

C/CAG TDM Measures		
Implementation of a program that gives preference to hiring local residents at the new development site.	One peak hour trip will be credited for each employment opportunity reserved for employees recruited and hired from within five miles of the employment site.	This assumes that a five-mile trip will generally not involve travel on the freeways.
Provision of on-site amenities/accommodations that encourage people to stay on site during the workday, making it easier for workers to leave their automobiles at home.	Five peak hour trips will be credited for each feature added to the job site. Possible features may include: banking grocery shopping clothes cleaning exercise facilities child care center	This is based on staff's best estimate.
Provide use of motor vehicles to employees who use alternate commute methods so they can have access to vehicles during breaks for personal use.	Five peak hour trips will be credited for each vehicle provided.	This is based on staff's best estimate.
Provide use of bicycles to employees who use alternate commute methods so they can have access to bicycles during breaks for personal use.	One peak hour trip will be credited for every four bicycles provided.	This is based on staff's best estimate.
Provision of child care services as a part of the development	One trip will be credited for every two child care slots at the job site.This amount increases to one trip for each slot if the child care service accepts multiple age groups (infants=0-2yrs, preschool=3&4 yrs, school-age=5 to 13 yrs).	This is based on staff's best estimate.
Developer/property owner may join an employer group to expand available child care within 5 miles of the job site or may provide this service independently	One trip will be credited for each new child care center slot created either directly by an employer group, by the developer/property owner, or by an outside provider if an agreement has been developed with the developer/property owner that makes the child care accessible to the workers at the development.	This is based on staff's best estimate.

C/CAG TDM Measures		
Join the Alliance's guaranteed ride home program.	Two peak hour trips will be credited for every 2 slots purchased in the program.	Experience shows that when a Guaranteed Ride Home Program is added to a TDM program, average ridership increases by about 50%.
Combine any ten of these elements and receive an additional credit for five peak hour trips.	Five peak hour trips will be credited.	Experience has shown that offering multiple and complementary TDM components can magnify the impact of the overall program.
Work with the Alliance to develop/ implement a Transportation Action Plan.	Ten peak hour trips will be credited.	This is based on staff's best estimate.
The developer can provide a cash legacy after the development is complete and designate an entity to implement any (or more than one) of the previous measures before day one of occupancy.	Peak hour trip reduction credits will accrue as if the developer was directly implementing the items.	Credits accrue depending on what the funds are used for.
Encourage infill development.	Two percent of all peak hour trips will be credited for each infill development.	Generally acceptable TDM practices (based on research of TDM practices around the nation and reported on the Internet).
Encourage shared parking.	Five peak hour trips will be credited for an agreement with an existing development to share existing parking.	Generally acceptable TDM practices (based on research of TDM practices around the nation and reported on the Internet).
Participate in/create/sponsor a Transportation Management Association.	Five peak hour trips will be credited.	Generally acceptable TDM practices (based on research of TDM practices around the nation and reported on the Internet).
Coordinate Transportation Demand Management programs with existing developments/employers.	Five peak hour trips will be credited.	This is based on staff's best estimate.
For employers with multiple job sites, institute a proximate commuting program that allows employees at one location to transfer/trade with employees in another location that is closer to their home.	One peak hour trip will be credited for each opportunity created.	Yields a one-to-one ratio.

C/CAG TDM Measures		
Pay for parking at park and ride lots or transit stations.	One peak hour trip will be credited for each spot purchased.	Yields a one-to-one ratio.

Section 4 – Designated TDM Measures and Programs

C/CAG TDM Measures

The following table 3 includes measures that are either incorporated into the project site design by the developer or will be implemented by the tenant(s), and required by the leasing agreement, following occupancy of the new building.

Table 3

TDM Measure	Trip Credit	Party Responsible for Implementation
Secure bicycle storage	The project will provide 72 long term bicycle parking units and 26 short term bicycle parking units. This results in a reduction of 33 peak hour trips	Developer
Showers and Changing room	The project will provide 2 shower/changing room facilities. This results in a reduction of 30 peak hour trips when installed in conjunction with 5 or more in-unit bike storage spaces per shower/changing room facility.	Developer
Subsidizing transit tickets for employees.	The project will provide transit subsidies of $20/month to a minimum of 87 employees. This results in a reduction of 87 peak hour trips.	Tenant
Creation of preferential parking for carpoolers.	The project will provide 16 preferential carpool parking stalls. This results in a reduction of 32 peak hour trips	Developer
Provision of on-site amenities/accommodations that encourage people to stay on site	The project will provide an onsite cafe. This results in a reduction of 5 peak hour trips.	Developer
Infill Development	The project is considered infill development. This results in a reduction of 4 peak hour trips	NA

The number of trip reductions resulting from the implemented measures above totals to 191 peak hour trips.

Additional TDM Measures

In addition to the measures listed in table 3 from the C/CAG design guide, the following measures will also be implemented to help reduce SOV trips.

Loading Area

The site design includes a designated loading area. This will facilitate the efficient pick up and drop off of passengers. This encourages multiple vehicle occupancy and thus has the potential to reduce overall single occupancy vehicle trips.

Bike Share

The project is open to partnering with a local bike share service if such an opportunity arises in the future.

Onsite TDM Information Location

The project will have a designated location onsite where TDM information will be available to the employees/tenants. This will increase TDM awareness and will improve the overall effectiveness of this TDM.

Parking Occupancy Monitoring and Public Access

The project will make a reasonable effort to provide parking occupancy monitoring systems where practical. This may reduce congestion around the parking entrance by alerting drivers when the parking lot is already at capacity. The project will work with the city to identify solutions to maintain effective public access to the parking facility.

Section 5 – Evaluation

The purpose of this TDM plan is to reduce the overall vehicle trips and decrease the traffic impact resulting from the proposed development.

Annual TDM Report and Survey

An annual TDM survey, prepared by the City of Redwood city, shall be distributed to the employees/tenants by the owner/ property manager. A response rate of 51% must be achieved by the

survey in order to be considered compliant. After completing the survey an annual report shall be prepared and submitted to the city of Redwood City. The report shall include results of the survey, driveway counts, parking utilization rates, and discussion of the utilization of the TDM measures and awareness of the TDM programs. This report must be submitted on an annual basis to the City of Redwood City.

Modifications to the TDM Program

The TDM plan should be considered a living document with the primary goal of reducing SOV trips. As techniques and programs change and/or advance, the TDM plan should be revised accordingly.

Participation in Transportation Management Association

The project/tenant will make a reasonable effort to participate in a Transportation Management Association if one is formed for project's region in the future.

Section 6 – Summary

This TDM plan has been produced for the use at 1180/1190 Main Street. Multiple design and program measures were presented to facilitate the use of alternate modes of transportation, including transit, carpooling, bicycling, and walking.

This TDM plan is anticipated to achieve a reduction of 191 peak hour trips resulting in 0 net new AM peak hour trips and -1 net new PM peak hour trips; however, actual trip volumes shall be monitored and TDM measures may be adjusted as a result.
