Control of salinity will continue to be a challenge. Desalinization studies must be funded and additional facilities for brine disposal are needed. From a salinity standpoint, it is preferable for the watershed to use SWP supplies compared to CRA supplies. Shortages of SWP supplies, due to regulatory issues in the Sacramento-San Joaquin Delta or other factors, can significantly impact the TDS concentrations in surface water and groundwater in the watershed. When SWP supplies are decreased, the percentage of the imported supply that comes from the CRA is increased, resulting in increased salinity in the imported supply. As water is used, discharged, and used again downstream, this increase in salinity affects downstream users in addition to the area that first used the water.

### *Nutrient Management*

Elevated nitrogen and phosphorus concentrations come from municipal and industrial wastewater, septic tanks, animal wastes, and agricultural and lawn fertilizers. Nitrogen-containing and phosphorus-containing compounds act as nutrients in streams and rivers. Nitrate in freshwater can cause oxygen depletion. Desalination facilities or desalters, in operation in Chino, San Jacinto, and Orange County basins reduce nutrient concentrations in groundwater. Brine lines also are being used to export high nutrient water to the OCSD for treatment and disposal to the ocean.

## Imported Water Recharge Cooperative Agreement

The Santa Ana Region was the first in the State to develop a comprehensive management plan for nitrogen and total dissolved solids (collectively referred to as "salinity"). The Regional Board adopted the *Total Dissolved Solids/Nitrogen Management Plan* as an amendment to the Santa Ana Region Basin Plan in 2004. The plan was developed in collaboration with stakeholders to address salt management in the watershed.

Concentrations of salinity in some surface water supplies and some groundwater basins are elevated due in part to past agricultural and dairy operations. Besides the historical legacy of salinity contamination, there is an additional salt load to the water basins associated with importing water into the region and recycling and reusing local and imported water supplies. Some of the groundwater basins in the Santa Ana River Watershed have a higher water quality than imported water. As a result, one of the concerns, which emerged from the Regional Board, was that by replenishing groundwater with imported supplies basin quality would deteriorate, violating state anti-degradation policies.

The 2004 Basin Plan amendment provided a framework for regulating recycled water discharges to surface water or groundwater in order to meet groundwater salinity objectives and beneficial uses. However; the Basin Plan did not directly address the potential salinity impacts of using imported water for groundwater recharge. The Regional Board and the State Legislature recognized that conjunctive use of imported water was necessary to facilitate the long-term sustainability of water supplies. Therefore, to avoid the necessity of regulating imported water salinity as a waste, the Regional Board worked with water supply agencies to develop a cooperative means of achieving compliance with salinity objectives without issuing waste discharge requirements.

In January of 2008, the Regional Board and water supply entities in the Santa Ana Region signed a "Cooperative Agreement to Protect Water Quality and Encourage the Conjunctive Uses of Imported Water in the Santa Ana River Basin." It states that:

> *"The Parties that intentionally recharge imported water within the Santa Ana Region (the "Recharging Parties") agree voluntarily to collect, compile and analyze the N/TDS water quality data necessary to determine whether the intentional recharge of imported water in the Region may have a significant adverse impact on compliance with the Salinity Objectives with the Region."*

The Cooperative Agreement was signed by the Regional Board and eight agencies in the watershed that import water to the region, import or export water between basins in the region, recharge groundwater basins with imported water, or treat or recharge wastewater in the region that includes imported water. The Cooperative Agreement directs the eight water agencies to prepare a summary of the amount of imported water recharged in each groundwater management zone, analyze the impact of such recharge on salinity levels in those zones, and compare projected water quality to historical ambient water quality. Specifically the agencies agreed to:

- Prepare a report every three years documenting the amount and quality of imported water recharged in each groundwater management zone during the previous three-year period

- Prepare a report every six years that projects ambient water quality in each groundwater management zone for the subsequent 20 years based on modeling that accounts for salt inputs from surface waters and reflects the effects of all existing and reasonably foreseeable recharge projects

**TDS and Nitrate Management in the Chino Basin**

For many years, the Chino Basin was home to one of the highest concentrations of dairies in the world. Waste discharges from years of dairy operations, as well as discharges from other commercial operations, left the southern portion of Chino Basin with a serious salt-imbalance. While the water quality in the northern portion of the basin remained high, increasing TDS and nitrate levels degraded groundwater in the south, threatening the quality of Chino Basin's groundwater supplies and SAR water that was flowing into Orange County's groundwater recharge basins.

The Regional Board addressed the impacts of salt loads from dairy operations by adopting waste discharges requirements, which included the requirements for dairies to adopt engineered waste management programs and manure control programs. The Chino Basin Desalter Authority, composed of IEUA and other local agencies, operates two desalters to pump out and remove contaminants in the groundwater. OCWD operates wetlands in the Prado Basin to naturally filter out nitrates. In addition, economic changes have led to a decline in number of dairies located in the Chino Basin.

These efforts have begun to reduce levels of TDS and nitrate in the basin. Plans are underway by IEUA and the CBWM as part of their maximum benefit agreement with the Regional Board for construction of an additional desalter and to expand other programs to improve groundwater quality in this area.

Each of the agencies importing water for groundwater recharge has completed these requirements. The first round of monitoring and modeling indicates that water quality impacts are minimal. The second round of the six-year reports is now in progress and will be completed by year 2015. Staffs from the agencies continue to meet regularly to discuss modeling approaches and coordinate the modeling efforts.

## Ocean Water

This section focuses on issues related to ocean water quality. The primary emphasis with ocean water is maintaining water quality in order to protect marine resources and public health. Furthermore, the quality of ocean water may become a concern for drinking water, if seawater desalination facilities are built to create new water supplies.

## Current Condition

Ocean water quality is evaluated using a number of different parameters and constituents related to beneficial uses. In the Basin Plan, one of the key beneficial uses is full body contact recreation, known as REC-1.

The California Health and Safety Code requires ocean waters adjacent to public beaches be tested for indicator bacteria to ensure public safety. This program, created by AB 411, establishes uniform and consistent water quality monitoring, response, and public notification requirements for the entire California coastline. The water quality standards established by AB 411 have been incorporated into the State Board's Ocean Plan and by reference into the Basin Plan. In addition to recreation, the ocean waters also support important habitat areas, including two ASBS and their related onshore Critical Coastal Areas (CCAs).

*Compliance with California Health and Safety Code Standards*

The County of Orange Health Care Agency implements AB 411 for Orange County's beaches, harbors, and bays shown in **Figure 5.5-4**.

Regulatory compliance is determined from the percentage the time standards were met. Beach Mile Days (BMDs) are calculated from the number of days and the linear area of ocean or bay front that is in violation of the AB 411 standards. BMD represents the loss of beneficial use of ocean recreational waters. **Table 5.5-28** lists total number of BMDs posted for beaches due to violation of AB411 standards. Orange County beaches on the CWA 303 (d) list are shown in **Table 5.5-29**.

**Table 5.5-28 Total Number of Beach Mile Days Posted for Open Coastal Ocean Water Areas Due to Violation of AB 411**

| Year | Seal/Surfside/Sunset | Bolsa Chica | Huntington City | Huntington State | Newport Beach | Crystal Cove |
|---|---|---|---|---|---|---|
| 2000 | 3.7 | 5.4 | 10.1 | 67.6 | 2.2 | 1.3 |
| 2001 | 0.4 | 0.1 | 1.4 | 14.8 | 0.7 | 0.3 |
| 2002 | 1.2 | 0.9 | 1.2 | 23.8 | 1.2 | 0.1 |
| 2003 | 0.3 | 0.8 | 0.8 | 41.9 | 1.4 | 0.2 |
| 2004 | 2.4 | 0.1 | 0.5 | 10.6 | 1.2 | 0.1 |

**Table 5.5-29 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs**

| Name | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Balboa Beach | DDT, Dieldrin, PCBs | Source unknown | 2019 |
| Bolsa Chica State Beach | Copper, nickel | Source unknown | 2019 |
| Huntington Beach State Park | PCBs | Source unknown | 2019 |
| Seal Beach | Enterococcus, PCBs | Source unknown | 2019 |

### *Newport Beach Marine Life Refuge (CCA No. 70/ASBS No. 32)*

The Newport Beach Marine Life Refuge is bounded to the west by a line heading oceanward 1,000 feet along Poppy Avenue in Corona Del Mar, and to the east by a line heading oceanward 1,000 feet along the westerly limits of Crystal Cove State Park. It extends from the mean high tide line to 1,000 feet offshore or 100 feet of ocean depth, whichever is nearer. This ASBS is designated to protect dolphin breeding areas and other marine species. Water quality is impacted by the following:

- Stormwater and dry weather runoff from Buck Gully, its major tributary and from over two dozen direct discharge pipes from residential neighborhoods along the coastal edge of the ASBS
- Sediment transported from Buck Gully and coastal bluffs
- Beachgoer scavenging and trampling, despite educational efforts to discourage taking of tide pool species

### *Irvine Coast Marine Life Refuge (CCA No. 71/ASBS No. 33)*

The Irvine Coast Marine Life Refuge is bounded by the Newport Beach Marine Life Refuge to the west and to the east by a line heading oceanward 1,000 feet along the Irvine Cove cliffs at the edge of Laguna Beach. It extends from the mean high tide line to 1,000 feet offshore or 100 feet of ocean depth, whichever is nearer. Like its immediate neighbor, this ASBS is designated to protect dolphin breeding areas and other waterborne species. It is impacted by the following:

- Stormwater and dry weather runoff from the Pelican Hill/Point area and from Los Trancos Canyon and Muddy Creek
- Stormwater and dry weather runoff from direct discharge facilities draining through Crystal Cove State Park, Pacific Coast Highway, and Pelican Point
- Beachgoer scavenging despite educational efforts to discourage taking of tide pool species

**Southern California Coastal Water Research Project (SCCWRP)**

SCCWRP was formed in 1969 as a JPA to conduct research about the effects of wastewater and other discharges to the Southern California coastal marine environment. Its mission is to contribute to the scientific understanding of linkages among human activities, natural events, and the health of the Southern California coastal environment; communicate this understanding to decision makers and other stakeholders; and recommend strategies for protecting the coastal environment for this and future generations.

SCCWRP's 14 member agencies include representatives of city, county, State, and Federal government agencies responsible for monitoring and protecting the marine environment. SCCWRP brings together a multidisciplinary team of scientists to address complex environmental problems; recommend protection strategies; and foster communication and cooperation between scientists, the regulated community, and regulators.

SCCWRP is a recognized leader in environmental research. Accomplishments include developing new environmental monitoring methods, and defining the mechanisms by which biota are potentially affected by anthropogenic stressors. SCCWRP has participated in some of the most significant scientific discoveries, methodology developments, and environmental policy decisions of the past 40 years.

In the 2013-2014 Research Plan, SCCWRP scientists address topics such as, ocean acidification and hypoxia, beach bacteria, nutrients and eutrophication, freshwater and marine bioassessment, emerging contaminants, molecular method development, and regional monitoring, as well as environmental data acquisition, sharing, processing, and visualization technology.

Additional information may be found at www.sccwrp.org.

## Current Management Strategies for Ocean Water

The major goal for ocean water quality improvement is to achieve water quality standards, which includes meeting beneficial uses and WQOs, preventing anti-degradation and meeting California's Ocean Plan and AB 411 standards. Goals, management strategies, and tactics are summarized in **Table 5.5-30**.

**Table 5.5-30 Ocean Water Quality (including Bays, Estuaries, and Tidal Prisms) Goals, Strategies, and Tactics**

| Goals | Strategies | Tactics |
|---|---|---|
| Water Quality Standards attained (includes Ocean Plan and AB 411 standards) | • Protect good quality ocean water<br>• Clean up poor quality ocean water | • Monitoring<br>• Source water protection<br>• POTWs implement source control and treatment<br>• Urban runoff managed through NPDES/DAMP<br>• NPDES permits for other dischargers<br>• Implement State Non-Point Source (NPS) Plan<br>• TMDLs<br>• Constructed wetlands<br>• Localized urban runoff treatment systems<br>• Surface water diversions to POTWs or other treatment systems<br>• Research<br>• Public outreach |

The Newport Coast Watershed Management Program works on water quality issues from Buck Gully in Corona del Mar to El Morro Canyon. These concerns include canyon stability, impacts to sensitive marine life areas, water quality impacts due to dry-weather nuisance flows, and invasive plants. This watershed program, organized by the City of Newport Beach, coordinates efforts between city staff, community members, property owners, jurisdictional agencies, Orange County Coastkeeper and other interested parties.

**Orange County Coastkeeper**

The Orange County Coastkeeper, founded in 1999, is a non-profit organization dedicated to the protection and preservation of the marine habitats and watersheds in Orange County. This is accomplished through programs of education, restoration, enforcement and advocacy. Members work with businesses, developers, cities, elected officials and regulatory agencies to develop solutions to the problems of polluted urban runoff. The long-term goal is to protect and preserve all of Orange County's waterbodies and restore them to healthy, fully functioning systems that will protect recreational uses and aquatic life.

### *Seawater Desalination*

In previous integrated water resource planning, potable water arising from seawater desalination had not appeared to be a viable or economic water supply alternative for the foreseeable future for Southern California. However, on November 29, 2012, this scenario changed. With the approval by the

San Diego County Water Authority (Authority), a 30 year water purchase agreement, with Poseidon Resources, for the purchase of up to 56,000 acre-feet of desalinated seawater per year from a new Carlsbad Desalination Project, which is projected to begin soon. The seawater desalination facility takes advantage of an existing seawater intake operated by the Encina Power Station in Carlsbad. This unique operations and management agreement will result in a purchase price by the Authority of desalted seawater at $1,897-$2,097 per acre-foot in 2012 dollars. The Authority estimates that water produced by the project will account for about one-third of all locally generated water in San Diego County by the Year 2020.

Though the Carlsbad seawater desalination project is outside the Santa Ana River Watershed, planning efforts are underway for a similar type of project to be located at the Huntington Beach. In February 2012 the Santa Ana Regional Board approved a permit for a large-scale desalination plant at Huntington Beach that would turn ocean water into drinking water. Similar to the Carlsbad plant, Poseidon Resources, a private investment firm that specializes in seawater desalination, will develop and manage the proposed Huntington Beach seawater facility on a 12-acre site next to a coastal power plant. According to the company, it would be the largest such facility in the western hemisphere and supply 50 million gallons of drinking water a day, which is enough to supply 300,000 people.

While local water agencies, lawmakers and the business community generally support building the plant, water quality concerns remain. The ocean water intake system would discharge extra salty water, known as “brine”, and would release water tainted with iron and cleaning fluids that could impact or kill fish, plankton larvae and other sea creatures.

A State policy adopted in 2010 will phase out the use of seawater to cool coastal power plants, a process that may harm fish, larvae, eggs, seals, sea lions, turtles and other creatures, when they get trapped against screens or sucked into the plant and are exposed to heated water.

The new policy by the State Board would end seawater cooling by ocean beach power plants similar to the Huntington Beach plant as early as 2020. The Huntington Beach project, which has been in the works for more than 12 years, still needs approval from the State Coastal Commission to move forward. State water regulators are collecting scientific and technical data in order to draft new policies on seawater intake that will be specific to desalination plants that could be adopted in the next year. Environmental groups said they would appeal the decision to the State Board. The earliest the Huntington Beach plant could start operating is 2016.

## CHALLENGE: Identification and Solutions

**Table 5.5-31** identifies current challenges for water quality management. The challenges were identified by members of the Beneficial Use Assurance Pillar. Because of the broad scope of issues, the diversity of challenges is significant. A range of potential solutions for each challenge are identified and categorized by the type of water body affected and the nature of the challenge (institutional/political, financial, regulatory, or insufficient data). Each item listed in the table is discussed in more detail on the following page.

**Table 5.5-31 Water Management Challenges**

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Regional Board's resources insufficient for Basin Planning; priorities in most recent triennial review conducted in 2006 have yet to be completed | • Secure additional resources for Basin Planning | • No new funding for Basin Planning<br>• 2006 Triennial Review issues still incomplete<br>• Revisions needed for Lake Elsinore/Canyon Lake TMDL not being addressed | • Work with Regional Board staff to develop potential options to address funding challenges<br>• Evaluate potential for watershed stakeholder resources to be utilized to supplement work of Regional Board staff<br>• Identify top Basin Plan priorities in need of review<br>• Develop funding mechanism for Regional Board to develop revisions to the Lake Elsinore/Canyon Lake TMDL |
| Lack of prioritization in addressing water quality problems and limited resources make it difficult to solve the most pressing water quality issues in the watershed | • Create process to determine water quality problems presenting greatest human health and environmental risk<br>• Allocate funding and staff resources to identified priorities | • Stormwater Quality Standards Task Force (SWQSTF) developed proposed Basin Plan amendments addressing water quality impacts related to recreational water use and providing method for prioritizing regulatory efforts. Basin Plan was approved by the Regional Board and State Boardas of Jan. 21, 2014. | • Support adoption of SWQSTF proposed Basin Plan amendments<br>• Encourage development of additional programs that prioritize water quality improvements.<br>• Identify top Basin Plan priorities in need of review |
| Solving water quality challenges by developing multi-agency, multi-benefit projects has advantages, but this is difficult to achieve as agencies have traditionally worked independently at the local level | • Increase regional dialogue<br>• Foster pooling of resources and cost sharing<br>• ID areas where regional efforts likely to have greatest impact and chance of success; target those areas for | • State grant programs have facilitated development of multi-agency, multi-benefit projects and have provided funding for such projects | • Continue working toward development of regional solutions for water quality problems |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| | regional projects | | |
| Regulatory barriers make it difficult to develop regional BMPs to manage municipal stormwater discharges | • Work to overcome regulatory barriers | • Stakeholders continue to discuss methods/options to addressing regulatory barriers | • Regulators and stakeholders should address regulatory barriers in next phase of MS4 permits scheduled for adoption in 2014<br>• Permits should allow for regional BMPs as co-equal to infiltration, harvest and reuse, and bio-treatment BMPs<br>• Assign watershed stakeholder task force to develop these options |
| Fecal bacterial contamination in stormwater remains a problem | • Conduct research<br>• Assess health impacts from human vs. nonhuman sources and relationship between fecal indicators and health risks<br>• Develop sanitary survey criteria to assess urban and non-urban environments | • Middle Santa Ana River (MSAR) TMDL Task Force completed development and implementation of Comprehensive Bacteria Reduction Plans for Counties of Riverside and San Bernardino | • Continue work of the MSAR TMDL Task Force |
| Floatable debris in stormwater hard to control | • Financial incentives to develop outreach and source control programs<br>• Develop and implement trash and litter control municipal ordinances<br>• Coordinate with the State Board's Marine Debris Steering Committee | • Control of floatable debris continues to be a problem in the watershed | • Continue efforts to address floatable debris and trash in stormwater<br>• Apportion funding from future stormwater funding and grant programs |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Problems with septic system impacts to groundwater difficult and expensive to solve | • ID lead agency for expanding sewers to areas outside local agency jurisdictions<br>• Extend sewers to areas without them<br>• Amend laws to simplify annexations of areas without sewer providers<br>• Provide source protection to reduce emerging contaminants<br>• Increase minimum lot size for septic systems | • EMWD extended sewer system to community of Enchanted Heights; service extension to Quail Valley in progress.<br>• Diamond Park Mutual Water Company customers in Santa Ana connected to municipal supply<br>• Review of water quality data from small system water providers in Orange County completed<br>• Municipal stormwater permits required permittees to develop septic system inventories by 2012 | • As first step to working on remediating water quality problems from septic systems, produce an inventory map locating areas within the watershed that remain on septic systems<br>• Work to develop plan to extend sewer systems to these areas |
| WUE and conservation increases pollutant concentrations in influent water to wastewater treatment plants challenging discharge permit compliance (i.e. TDS limits) | • Promote use of containers for food waste, pharmaceuticals, and household chemicals disposal<br>• Promote use of detergents and products with low salt levels<br>• Include higher loading levels in new treatment plant design and during CEQA and permit processes for new reclamation projects | | • New section added to OWOW 2.0 discussing challenge of influent water quality<br>• Promote source control efforts throughout watershed |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Salt balance not achieved in watershed | • Regional efforts for reducing salt impacts in runoff<br>• Establish mitigation plans for recycled water projects<br>• Ensure long-term viability of existing brine lines<br>• Expand existing brine lines<br>• Financial incentives for desalination studies and facilities<br>• Encourage regulators to recognize exporting certain brines and constituents as regulatory relief/offsets for wastewater permitting requirements<br>• Support elimination of water softeners<br>• Address long-term need for increased brine disposal capacity | • IEUA's water softener program has removed over 600 salt-based softeners in the Chino Basin since 2008<br>• Water softener ordinances preventing the future installation of salt-based softeners have been passed in the cities of Montclair, Upland, and Fontana<br>• Throughout the Inland Empire, public agencies have joined the "No Drugs Down the Drain" program, installing drop off boxes in public locations and participating in the National Drug Take-Back Day<br>• Mitigation plans are required by Regional Board for recycled water projects where appropriate<br>• Mitigation plans approved for recycled water use by IEUA and EMWD<br>• SAWPA working on plans to ensure viability of and expansion of the Inland Empire Brine Line | • Work toward adoption of the Delta Plan in order to promote reliability of low-TDS imported water supplies for use in the watershed<br>• Consider brine concentration alternatives to reduce discharges to brine line and/or zero discharge projects<br>• Increase outreach, promotion, and awareness of National Drug Take-Back Day and "No Drugs Down the Drain" programs by posting prominently on websites, etc<br>• Implement salt and nutrient management plans consistent with the statewide Recycled Water Policy<br>• Identify regional strategies to support salinity control for imported water sources |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Public agencies must comply with new regulations without ability to increase revenues | • Federal and State funds for infrastructure banks<br>• Amend Proposition 218<br>• Prepare strategies to address legal decisions adverse to public agencies setting/increasing fees for improvements<br>• Increase effectiveness of new regulations by encouraging ID of goals and implementation plans for those regulations<br>• Build public support for funds to address challenging water supply needs | • Public agencies continue to struggle to keep up with rising costs | • Work toward implementation of recommendations from OWOW 1.0 |
| Emerging constituents detected at low levels without understanding of human health and toxicological effects<br><br>Standard lab methods not available for emerging contaminants | • Outreach to agencies and Regional Board on status of studies and research<br>• Evaluate joint opportunities to conduct studies<br>• Encourage development of human health and ecological risk levels for specific compounds<br>• Develop list of appropriate surrogates and indicators of water quality for monitoring constituents<br>• Develop monitoring plan for waterbodies and facilities and test for appropriate set of constituents<br>• Support creation of Blue Ribbon Commission to recommend monitoring of emerging contaminants in recycled water<br>• Collaborate on public information outreach<br>• Create collaborative efforts to develop new analytical methods<br>• Regulators and dischargers coordinate with California Department of Publlic Health (CDPH) to ensure analytical methods developed and approved<br>• Promote collection facilities and programs for unused pharmaceuticals and distribute smaller amounts to patients when possible | • State Blue Ribbon Commission completed report on monitoring of emerging constituents<br>• Emerging Constituents (EC) Program Task Force completed four years of annual EC sampling in watershed<br>• EC Task Force created a Water Quality Program Public Relations Work Group to collaborate on outreach<br>• Standard methodology is under development | • Continue to support work of the Emerging Constituents Work Group<br>• Work with CA Office of Environmental Health Hazard Assessment and CA Department of Public Health on development of Public Health Goals and water quality standards |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Land for new water treatment facilities in urban areas difficult to obtain | • Financial incentives for property owners to make land available for cleanup facilities | • Land availability continues to be a challenge | • Continue working to implement recommendations from OWOW 1.0 |
| Finding parties responsible for groundwater contamination is difficult<br><br>Typical response to well contamination is to shut down well, but pump and treat may be most effective means to cleanup | • Work with State and Federal agencies to obtain grants, including U.S. Dept. of Agriculture for perchlorate cleanup<br>• Set up an orphan share fund<br>• Develop incentives for groundwater producers to treat for wells producing contaminated water<br>• Change existing local rules and regulations that act as barriers to cleaning up water contamination | • Groundwater contamination clean-up efforts continue to be slowed<br>• In some cases potentially responsible parties are using CEQA or other means to delay clean-up | • Support efforts of water districts and other agencies to investigate parties responsible for groundwater contamination and collect funds from those parties to clean up contamination<br>• Evaluate methods to streamline groundwater cleanup projects<br>• Explore arrangements where multiple public agencies with grant funding form an MOU with non-public potential responsible parties to share cost and provide regional water supply solutions |
| Local agencies limited in amount of fines and penalties able to assess and have limited regulatory jurisdiction over some agencies (i.e. school districts) | • Consolidate enforcement authority to the regulating agency<br>• Expand local agencies' enforcement authority<br>• Develop panel to discuss current regulatory environment, interagency impacts, and impacts to business and residents, such as groundwater discharge permitting requirements | • Limitations on local agencies remain a problem | • Continue to work on providing local agencies authority to properly enforce regulations protecting water quality<br>• Utilize part of future stormwater funding to pay for cost of enforcement |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Solving 1 problem may cause new one, i.e. infiltrating runoff improves surface water but may cause ground-water problem | • Increase communication, planning and cooperation among stakeholders<br>• Collect data on infiltration BMPs at selected sites to evaluate potential impacts to groundwater quality | • RCFCWCD LID Testing and Demonstration Facility will collect water quality data on LID BMP performance<br>• County of Orange is implementing Glassell Yard Campus Stormwater LID Retrofit Project<br>• Business Industries of America completed study evaluating cost effectiveness of variety of LID BMPs | • Continue evaluation of LID BMPs to document long-term performance and water quality benefits.<br>• Promote and increase the profile of BMP examples within communities (e.g. RCFCWCD campus) |
| Changing public behavior is difficult | • Develop, pilot, and evaluate effectiveness of strategies to change public behavior<br>• Foster watershed sustainability by encouraging behavior aimed at reducing runoff and preventing pollution<br>• Increase public perception of value of water. | • No Drugs Down the Drain website – http://www.nodrugsdownthedrain.org | • Continue efforts to educate public on water quality issues in the watershed<br>• Expand efforts to change public behavior |
| Planning for complex growth impacts difficult in rapidly urbanizing areas<br><br>Potential water quality impacts hard to ID | • Educate local officials so water quality concerns become core issues<br>• Conduct studies to identify water quality challenges in rapidly developing areas | • Approaches used in Stormwater MS4 permits continue to be evaluated<br>• Managing growth impacts continues to be difficult | • Implement recommendations from OWOW 1.0<br>• Work with Regional Board in development of next Stormwater MS4 permit |

| OWOW 1.0 Challenge | OWOW 1.0 Recommendations | Status of Addressing Challenge | OWOW 2.0 Suggested Implementation Activities |
|---|---|---|---|
| Urbanization and concrete-channelization have seriously reduced groundwater recharge leading to water quality impairments and reduced water supplies | • Promote LID principles<br>• Recognize in regulatory and funding frameworks that using design and retrofit technology to minimize runoff and increase infiltration is beneficial for water quality and TMDL goals | • Chino Basin stakeholders preparing the Recharge Master Plan Update for the basin to monitor MS4 compliance and quantify benefits to basin | • Continue to work toward recognition in regulatory and funding frameworks that using design and retrofit technology to minimize runoff and increase infiltration is beneficial for water quality and TMDL goals |

**Table 5.5-32 OWOW 2.0 Recommendations**

| Challenges | Recommendations |
|---|---|
| Fracking for oil or gas development, if conducted within the watershed, could cause groundwater contamination | • Support development of statewide regulations that protect water quality |
| New statewide regulations setting biological objectives for surface water are being developed and will be compliance challenge for wastewater agencies | • Participate in rule making process to support development of policies and regulations that are effective and efficient and do not place an undue burden on dischargers |
| New statewide regulations setting nutrient objectives for surface water are being developed that will be compliance challenge for wastewater agencies | • Participate in rule making process to support development of policies and regulations that are effective and efficient and do not place an undue burden on dischargers |
| Surface water quality monitoring is not coordinated within the watershed leading to duplicative sampling in some areas and inadequate sampling in others. In some cases this may lead to 303(d) listings that do not reflect real impairments | • Assess surface water quality monitoring in watershed. Work on plan to improve coordination and development of regional approach to monitoring<br>• Use monitoring developed by MSAR Watershed Pathogen TMDL Task Force, SWQSTF, SCCWRP's Regional Bio-assessment program, and SWAMP as models |
| A small number of small water systems may be in operation within the watershed that do not have resources for monitoring and proper operations and maintenance, which may result in drinking water provided to customers that are in violation of drinking water standards. (25 people or more, or 15 or more connections is a public water system in CA; State Small Water Systems are at least 5 connections, but less than 15 and are regulated by county health departments) | • Work with CDPH and county health departments to identify small system water providers, if any, which need assistance with providing safe drinking water<br>• Develop plan to address any small system water providers that need assistance |
| Sediment deposition in some areas creates water quality impairments, reduces aquatic habitat, and reduces water conservation storage. Reduced sediment flow downstream of dams causes armoring of river/creek beds resulting in reduction in percolation capacity, aquatic habitat, and beach replenishment | • Support USACE/OCWD Prado Basin Sediment Management Demonstration Project<br>• Support efforts of Newport Bay Stakeholders to reduce sediment load into Upper Newport Bay |

## Description of Data Collection Process

Greg Woodside of the OCWD and Mark Adelson of the Regional Board co- chaired the Beneficial Use Assurance Pillar Committee and coordinated the preparation of this report. Committee members, listed below, provided direction and assisted in collecting the information contained in this report and reviewed and commented on draft versions. The committee met in person and also held conference calls on a number of occasions.

# 5.5.1 Brine Line to the Salton Sea

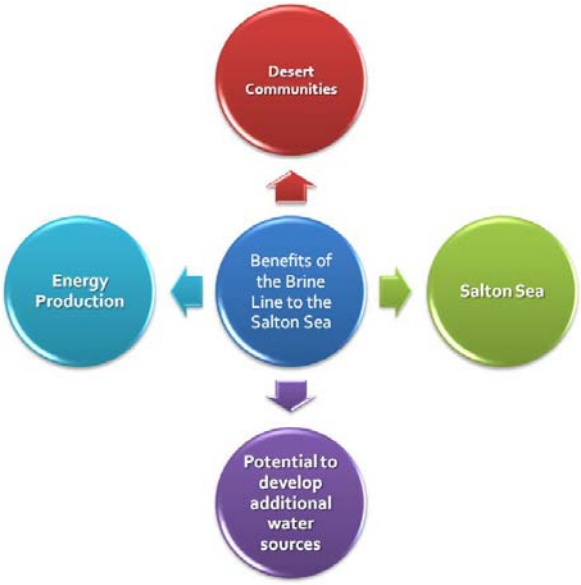
## Introduction

In support of the One Water One Watershed (OWOW) 2.0 Plan, the Bureau of Reclamation (Reclamation) conducted an appraisal-level analysis of the connection of the Inland Empire Brine Line (Brine Line), formerly known as the Santa Ana Regional Interceptor (SARI), to the Salton Sea. It is one of several salt management alternatives involving brine delivery that the Santa Ana Watershed Project Authority (SAWPA) examined within the basin. One alternative option explores direct brine discharge to the Sea. Reclamation's appraisal analysis of the Brine Line are found in a four-volume set of technical memoranda that address the SARI history; engineering, brine and flow data; various options and strategies; projected cost information; and recommendations. Those points are captured in Reclamation's *Inland Empire Interceptor Appraisal: Technical Manuals 1-4* and the associated *Executive Summary*, attached as OWOW 2.0 **Appendix D1-D5**.

The Brine Line was constructed to help manage the basin's water quality by exporting highly saline waters from the Inland Empire to a wastewater plant in Orange County for ocean discharge. Like nearly all watersheds in arid climates, salt management is essential for water resource managers to ensure populations and ecosystems continue to thrive.

SAWPA's Brine Line, an important tool in managing inland groundwater basins, has allowed businesses with industrial processes that produce brine to move into and expand in the Inland Empire. Orange County also benefits from the Brine Line through the removal of salinity from the Santa Ana River, providing a reliable level of protection for its water quality and reducing the area's dependence upon imported water.

A study entitled Santa Ana Watershed Salinity Management Program (Salinity Management Program) was completed in 2010, by a team of consultants led by Camp, Dresser & McKee Smith (CDM Smith), which addressed the Brine Line capacity limitations. The Salinity Management Program identified and evaluated several alternatives for managing flows in the Brine Line system.



Some alternatives have been considered for improved salt management involving the Brine Line within the Santa Ana River Watershed (SARW). The first was a Brine Line flow reduction through a centralized treatment facility. Here the brine would undergo biological treatment, followed by chemical softening, then high recovery reverse osmosis treatment and disinfection concludes the process. The treated water is then available for use while the reject water continues downstream for further treatment and discharge to the ocean. A variation of this option would be to further treat and concentrate brine at individual desalters or facilities, but the benefits of scale for a single facility would be lost. Another salt management alternative includes providing incentives to commercial users to encourage use of the existing Brine Line. Brine disposal can be maximized and the cost can be minimized by directly discharging brine to the ocean. Currently, brine in the Brine Line is several times less salty than ocean water and with sufficient pretreatment at the source stream the brine could be discharged directly to the ocean without any negative impact to the environment, avoiding downstream treatment costs. Pretreatment is only required of system users with high BOD/TSS waste, but the cost of pretreatment may provide an incentive for the highest valued use of the Brine Line, salt disposal. In addition, the permit requirements for direct ocean discharge are onerous and time-consuming, so making use of the existing brine line is advantageous to these industries.

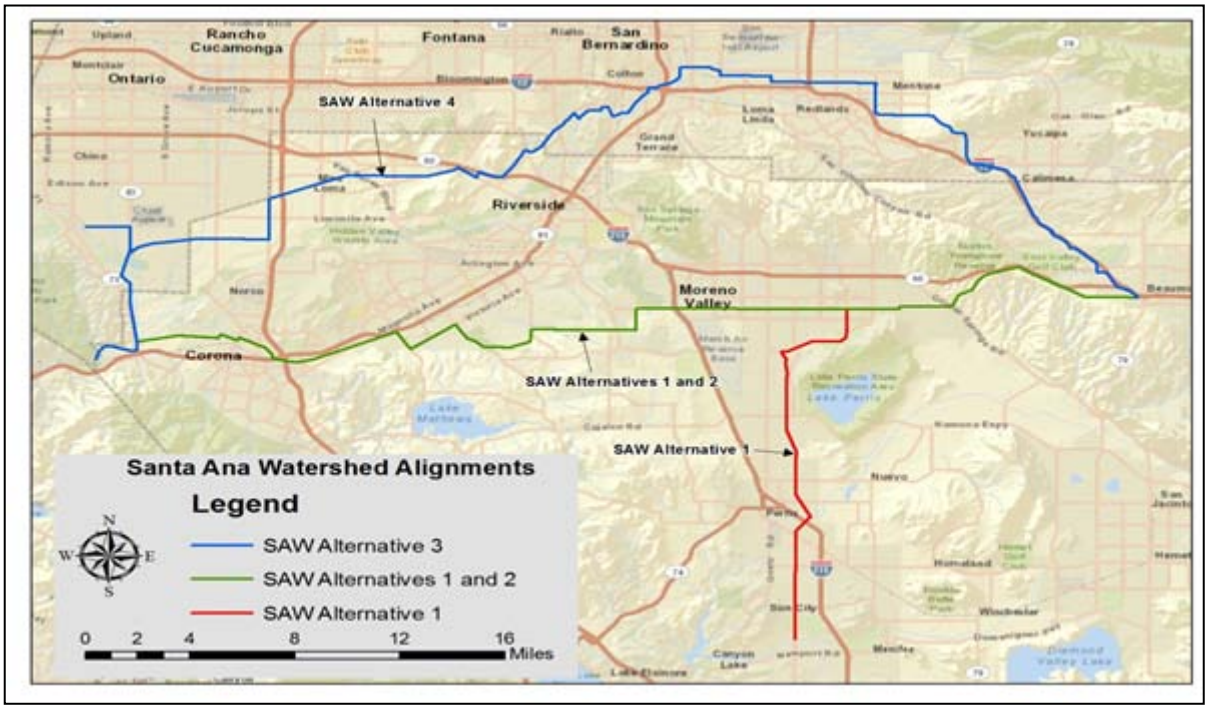
The final salt management alternative assumes all the flows in the Brine Line would be collected just below Prado Dam, the lowest elevation in the upper watershed, and that a separate pipeline would be constructed to transport that flow directly to the Salton Sea. The Salton Sea, California's largest inland lake, is a shallow, highly saline basin with no outfall to external water bodies. It is 14,000 parts per million saltier than ocean water.

After delivery of the Santa Ana Watershed Salinity Management Program report by CDM Smith, SAWPA staff prepared a report entitled *Inland Empire Brine Line Disposal Option Concept Investigation* (SAWPA Investigation) in which four alternative conceptual designs for the Brine Line to the Salton Sea alternative were developed and evaluated. Such a pipeline could accommodate additional saline flows which would be treated to some extent prior to discharge into the Salton Sea. A list of potential benefits including bringing in 30-40 thousand acre -feet of water every year to the Salton Sea were indentified that would significantly assist in the following:

- Dilute salt concentrations
- Help stabilize lake levels
- Enhance water reliability
- Protect fish and wildlife that are dependent on the Salton Sea ecosystem

- Restore the long-term stable aquatic and shoreline habitat for fish and wildlife that depend on the Sea
- Mitigate air quality impacts from exposed playas
- Maintain the Salton Sea as a vital link along the Pacific Flyway
- Minimize noxious odors and other water and air quality problems
- Enhance economic development opportunities that will provide sustainable financial improvements
- Improve the economic quality of life for communities around the Salton Sea
- Improve aquifer water quality
- Increase water production

Reclamation's engineering analysis and recommendations are attached as a separate report, which is an **Appendix D5** in OWOW 2.0. Based on that analysis, SAWPA remains hopeful that as new partnerships are developed with potential brine customers throughout the Basin and other parts of the state, the viability of this salt management alternative will become a truly system-wide solution. An economic analysis was recommended to help examine the potential for this proposed undertaking.



## Appraisal Analysis Objectives

As mentioned above, the Brine Line to the Salton Sea alternative was the subject of the Appraisal Analysis and is identified as the Inland Empire Interceptor (IEI).

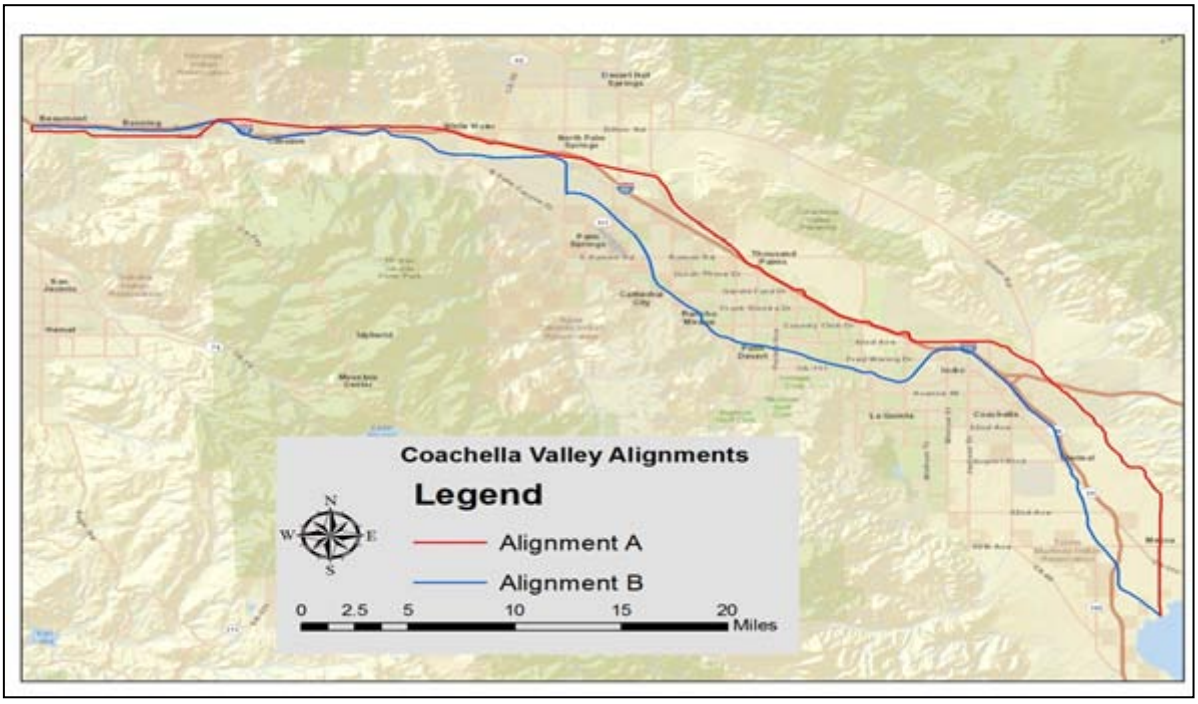
The purpose of this Appraisal Analysis is to help determine whether more detailed investigations of the proposed IEI are justified. Under Reclamation criteria set forth in *Reclamation Manual, Directives and Standards, FAC 09-01: Cost Estimating* (Reclamation Manual), appraisal analyses "are intended to be used as an aid in selecting the most economical plan by comparing alternative features". Several alternative conceptual designs for the proposed IEI will be developed and evaluated in this Appraisal Analysis for the purpose of comparison.

Three of the four alternative conceptual designs for the portion of the proposed IEI in the Santa Ana Watershed addressed in the SAWPA Investigation described above were considered in this Appraisal Analysis.

**Figure 5.5.1-1 Santa Ana Watershed Alignments for the Proposed IEI**

Additionally, two alternative alignments were developed and evaluated in this Appraisal Analysis for the portion in the San Gorgonio Pass and Coachella Valley. The route of the proposed IEI through the San Gorgonio Pass and Coachella Valley areas in eastern Riverside County represents an opportunity for SAWPA to expand the Brine Line service area.

**Figure 5.5.1-2 Coachella Valley Alignments for the Proposed IEI**



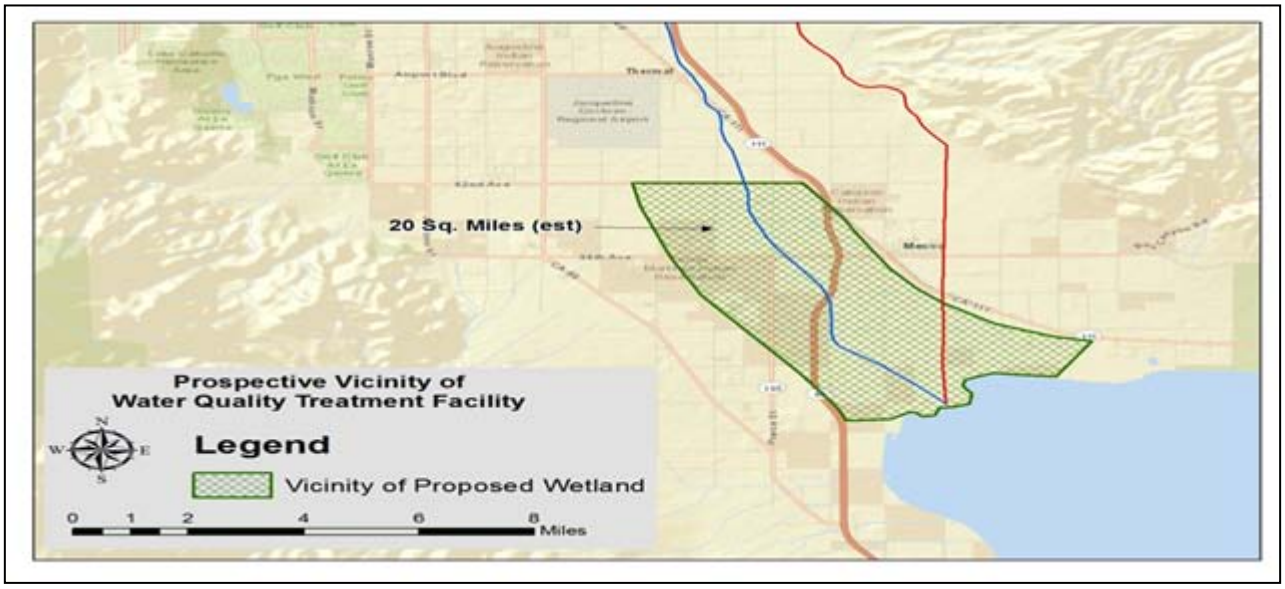


**Figure 5.5.1-3 Water Quality Treatment Facility Location for Proposed IEI**

## Feasibility Analysis and Benefit-Cost Analysis

As discussed above, the purpose of an Appraisal Analysis is to help determine whether more detailed investigations of a proposed project are justified, the criteria for which are set forth in the Reclamation Manual. The *Reclamation Manual* also describes criteria for "a project Feasibility Study and Feasibility-level cost estimate, which are intended to support funding authorization for new construction" and "cannot be conducted without authorization and appropriation of funds by the Congress".

Also, as a Federal agency, Reclamation must perform benefit-cost analyses (BCA) for proposed water resources projects at the appropriate stage of project planning. The main set of guidelines for a BCA is the *Economic and Environmental Principles and Guidelines for Water and Related Land Resources Implementation Studies*, U. S. Water Resources Council, 1983 (P&Gs). For Reclamation projects, BCAs are typically performed at the Feasibility level of study.

The purpose of a BCA is to compare the benefits of a proposed project to its costs. The total costs of the project are subtracted from the total benefits to measure net benefits. If the net benefits are positive (benefits exceed costs), then the project could be considered economically justified. Conversely, if net benefits are negative (costs exceed benefits), then the project would not be economically justified. When multiple alternatives are being considered for a project, the alternative with the greatest positive net benefit would be preferred from an economic perspective.

A BCA is comprised of four "accounts" identified as the National Economic Development (NED) account, the Regional Economic Development (RED) account, the Environmental Quality (EQ) account, and the Social Effects (OSE) account. The NED and RED accounts are used to evaluate the economic effects of proposed alternative plans.

A RED analysis focuses on economic impacts to the region in which the project is located. The RED analysis recognizes the NED benefits accruing to the local region plus the transfers of income into the region.

A NED analysis focuses on economic impacts to the entire Nation. The *P&Gs* require Reclamation to analyze the NED effects so as not to favor one area of the country over another. Economic justification is determined solely by the benefit-cost analysis and must be demonstrated on the basis of NED benefits exceeding NED costs.

## Conclusions and Recommendations

The results of the present worth analyses of the estimated costs for the proposed IEI are presented in Technical Memorandum No.4 (TM4). A simple comparison of those results with the present worth analyses for the other Options presented in the Salinity Management Program indicates that the costs of the proposed IEI are greater than the costs of other Options. However, certain aspects of the proposed IEI distinguish this Option 4 from the other options considered in the Salinity Management Program, and further investigation and analysis of the proposed IEI warrants consideration.

Significant opportunities are available for refinement of the conceptual designs for the proposed IEI presented in this Appraisal Analysis. Further investigation and analysis of these opportunities could help refine the estimated costs, reduce the multiplier applied to estimated costs for contingencies, and evaluate the benefits associated with the project. These refinements could lead to a more favorable present worth comparison of the proposed IEI with the other Options.

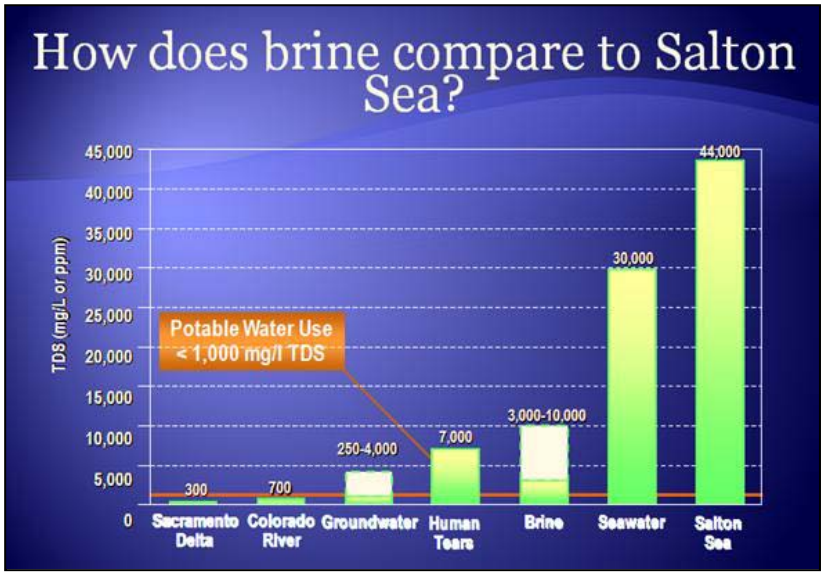
Opportunities to refine the scope, conceptual designs, estimated costs, and benefits associated with the proposed IEI are identified and discussed in TM4. In general, these Opportunities represent the Conclusions of this Appraisal Analysis. Suggested Optimization Strategies for the proposed IEI are also identified and discussed in TM4. These suggested Optimization Strategies describe recommended next steps (or Recommendations) for further investigation and analysis of the proposed IEI.

As discussed above, a Feasibility level of study "cannot be conducted without authorization and appropriation of funds by the Congress" and represents a substantial commitment to a project. These recommendations are suggested as interim stages of investigation and analysis of the proposed IEI. A Feasibility study and benefit-cost analysis of the proposed IEI would be warranted only if these additional investigations and analyses produce favorable results.

## Conclusions

The Conclusions from this Appraisal Analysis are summarized as follows:

C1. Economic Development: The economic development potential associated with the proposed IEI is significant and unique to this option. If implemented, the proposed IEI would make brine management infrastructure available to prospective employers located in the San Gorgonio Pass and Coachella Valley areas.



C2. Net Impact: The proposed IEI would impact the Salton Sea in various ways, some of which may be considered beneficial and others negative. Further investigation and analysis of these aspects would help determine design criteria for associated components of the proposed IEI.

C3. Salton Sea Restoration: Delays to implementation of a restoration plan for the Salton Sea have contributed to uncertainties regarding salinity and water quality aspects of the proposed IEI. Improved understanding of progress toward restoration of the Sea would help determine appropriate project design criteria for the affected components of the proposed IEI.

C4. Basin Plan: Uncertainties regarding Salton Sea salinity and water quality regulatory requirements contribute to uncertainties regarding planning and design of associated components of the proposed IEI and the associated costs.

C5. Stakeholder Partnering: The standards established in the Basin Plan for salinity and water quality in the Salton Sea are a deterrent to potential new sources of water supply to the Sea.

Community and stakeholder support would enhance the likelihood of adoption of changes to those standards.

C6. Salton Sea Salinity: The salts in the IEI flows would add to the existing rate of accumulation of salts in the Sea. Whether those salts would cause total dissolved solids (TDS) concentrations in the Sea to increase will depend on such factors as the magnitude of the Salton Sea water budget imbalance over time and progress toward implementation of a Salton Sea restoration plan.

C7. Salton Sea Water Quality: Similar to salinity, whether the total suspended solids (TSS) and biochemical oxygen demand (BOD) in the IEI flows would cause an adverse impact on the water quality in the Salton Sea will depend on such factors as the magnitude of the Salton Sea water budget imbalance over time and progress toward implementation of a Salton Sea restoration plan. The estimated cost of the proposed Water Quality Treatment Facility (TF) represents a substantial portion of the total estimated costs for the project, which calls for careful scrutiny of the design criteria for this facility.

C8. Brine Pretreatment and Treatment Strategies: The proposed TF could function in place of the Brine Pretreatment and Treatment Strategies presented in the Salinity Management Program, or it could function as part of a hybrid design in combination with a Strategy from the Salinity Management Program.

C9. Management of Surplus Energy: The large estimated costs of the proposed IEI Turbine Generator Stations and associated electric transmission facilities indicate that the time period necessary to recover that investment in would be long. The estimated cost of the proposed IEI could likely be significantly reduced by using an alternative approach to remove surplus energy from flows in the system.

C10. Other Opportunities: Examples of other opportunities to refine, reduce and/or eliminate estimated costs identified in this Appraisal Analysis include but are not limited to the following:

- Synthetic Membrane Liner - The synthetic membrane liner under the TF is the largest single component of the estimated cost of that facility; use of an alternative approach to soil permeability could likely significantly reduce that cost.
- Tunneling – Tunneling in lieu of direct bury of the proposed pipeline through the Badlands west of the City of Beaumont along the Gas Main Alignment may reduce impacts associated with construction of the project.
- Phasing - Phasing of certain project components could allow some project costs to be deferred.

## Recommendations

The results of this Appraisal Analysis and the Conclusions listed above suggest appropriate recommended next steps for further investigation and analysis of the proposed IEI to refine the scope, conceptual designs, estimated costs and anticipated benefits of the proposed IEI. These recommendations are summarized as follows:

R1. Economic Impact Analysis: In response to Conclusion C1 (Economic Development), perform an economic impact analysis for the proposed IEI to quantify the economic development and other benefits of the proposed IEI.

R2. Salton Sea Water Budget: In response to Conclusions C2, C3, C6 and C7, develop water budgets for the Salton Sea and for the planned Salton Sea restoration, or update available existing water budgets.

R3. Salton Sea Salinity and Water Quality Models: In response to Conclusions C2, C3, C6 and C7, develop models for salinity and water quality in the Salton Sea and for the planned Salton Sea restoration, or update available existing models.

R4. IEI Influence on Salton Sea Salinity: In response to Conclusions C2, C3 and C6, use the water budgets and the salinity models for the Salton Sea to evaluate the impact of proposed IEI flows on TDS concentrations in the Salton Sea, to evaluate the influence of those impacts on the IEI design, and to refine estimated costs for the proposed IEI.

R5. IEI Influence on Salton Sea Water Quality: In response to Conclusions C2, C3 and C7, use the water budgets and the water quality models for the Salton Sea to evaluate the impact of the proposed IEI flows on TSS and BOD concentrations in the Salton Sea, to evaluate the influence of those impacts on the IEI design, and to refine estimated costs for associated components of the proposed IEI.

R6. Salton Sea Restoration Influence on IEI Design: In response to Conclusion C2, C3, C6 and C7, use the water budgets and the salinity and water quality models for the Salton Sea restoration to evaluate the impact of the proposed IEI flows on the planned restoration, to evaluate the influence of the planned restoration on the IEI design, and to refine estimated costs for the proposed IEI.

R7. Basin Plan Amendment Process: In response to Conclusion C4 (Basin Plan), evaluate the process and technical requirements for a Basin Plan Amendment to modify Salton Sea salinity and water quality regulatory requirements for the proposed IEI.

R8. Identify, Investigate & Initiate Partnerships: In response to Conclusion C5 (Stakeholder Partnering), seek opportunities to partner with other Salton Sea stakeholders in support of regulatory changes to encourage new sources of water supply to the Salton Sea in support of restoration efforts. This effort may include:

- Establish a dialogue with other organizations serving the San Gorgonio Pass, Coachella Valley areas, and/or other areas adjacent to the Salton Sea,
- Investigate community support for changes to the regulatory approach to Salton Sea salinity and water quality standards to encourage new sources of water supply for the Salton Sea, and
- Develop specific proposals for suggested regulatory changes and identify benefits. Communicate the suggested regulatory changes and associated benefits to the community.

R9. Hybrid Strategies for Brine Treatment: In response to Conclusion C8 (Brine Pretreatment and Treatment Strategies), identify and evaluate alternative strategies for treatment of the IEI flows, which may include hybrid designs incorporating Salinity Management Program brine pretreatment strategies in combination with alternative configurations of the wastewater treatment ponds and/or constructed wetlands that comprise the TF considered in this Appraisal Analysis.

R10. Alternative Designs for Surplus Energy: In response to Conclusion C9 (Management of Surplus Energy), develop and evaluate alternative strategies for management of surplus energy in IEI flows such as low-head in-line turbine generators and pressure reducing valves.

R11. Alternative Liner Materials: In response to Conclusion C10 (Other Opportunities), investigate alternatives to the proposed synthetic membrane liner under the TF, including site-specific soil investigations to determine actual soil permeability to facilitate investigation of alternatives such as soil treatment using clay and suitability of a "leaky wetland".

R12. Tunneling: In response to Conclusion C10 (Other Opportunities), investigate the constructability of and the impacts associated with direct-bury of the proposed pipeline through the Badlands west of the City of Beaumont along the Gas Main Alignment and the feasibility of tunneling in lieu of direct bury in that area.

R13. Phasing of Improvements: In response to Conclusion C10 (Other Opportunities), investigate opportunities for phasing of selected project components (e.g. use of dual pipelines in Coachella Valley) to defer costs until warranted by system flows, including a Present Worth analysis of the phased project costs.

## Summary

The Conclusions (Opportunities) and the associated Recommendations (Optimization Strategies) identified above are summarized in **Table 5.5.1-1**. Priority rankings are assigned the table to those recommendations, which are loosely based on the potential influence on the estimated project costs and/or the value of anticipated benefits.

**Table 5.5.1-1 Summary of Conclusions and Recommendations**

| CONCLUSIONS (OPPORTUNITIES) | | RECOMMENDATIONS (OPTIMIZATION STRATEGIES) | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | R1 - Economic Impact Analysis | R2 - Salton Sea Water Budget | R3 - Salton Sea Salinity & Water Quality Model | R4 - IEI Influence on Salton Sea Salinity | R5 - IEI Influence on Salton Sea Water Quality | R6 - Influence of Salton Sea on IEI Design | R7 - Basin Plan Amendment Process | R8 - Identify, Investigate, & Initiate Partnerships | R9 - Hybrid Strategies for Brine Treatment | R10 - Alternative Designs for Surplus Energy | R11 - Alternative Liner Materials | R12 - Tunneling in Lieu of Direct Bury | R13 - Phasing of Improvements |

# 5.6 Water Use Efficiency

SAWPA's Demonstration Garden
Riverside, CA

## Background

Of the many broad watershed management strategies proposed under One Water One Watershed (OWOW) 2.0, the highest priority strategy to meet future water demands, as well as the most cost efficient, is water use efficiency. The OWOW Pillars and OWOW Governance support the importance of this strategy and need for changing current irrigation behavior and move forward with implementation of water use efficiency measures necessary to meet future water resource needs. The Water Use Efficiency (WUE) Pillar has worked closely with the other OWOW Pillars to recognize WUE is an absolutely necessary and key integration component of the overall watershed portfolio of existing, and planned water supply strategies to ensure a sustainable watershed for future generations.

The WUE element of the Integrated Regional Water Management Plan (IRWMP) is the product of a growing regional effort to diversify our portfolio of water supplies, drought-proof the watershed, and ensure a reliable water supply into 2030. The terminology "water use efficiency" implies and supports efficient use of all water resources at all times. To begin identifying how to support existing water conservation strategies, enhance existing programs and measures, develop new WUE efforts, and be a model for others in this arena, a comprehensive long-term WUE plan needs to be envisioned and developed.

Assessing the current and existing WUE conditions and resources will identify opportunities for agencies in the Santa Ana River Watershed and partnering agencies outside the purview of the watershed to work together to maximize expertise, share resources, apply for various WUE program funding sources, collaborate on regional public awareness initiatives, and expand implementation of WUE programs.

The reader will notice that the term “water use efficiency” has been used in place of “water conservation” in this chapter. In the past, “water conservation” was used in many state and local water planning documents to mean the effective and appropriate use of water by consumers. However, it is the consensus of the WUE pillar that this effective and appropriate use of water is more accurately described by the term “water use efficiency.” Furthermore, the phrase “water conservation” usually is associated with water-saving programs that are implemented when water supplies are compromised due to drought or a water shortage brought on by an emergency situation, thereby implying a water “diet.” By using the phrase “water use efficiency” in future program implementation activities, and in educational and outreach efforts, the WUE team intends to convey and emphasize year-round, long-term improvements in how we use water while maintaining quality of life standards.

## Current Conditions

### Description of Resource Management

With pressures on available local groundwater, and imported water supplies in the watershed increasing due to continuing drought conditions, increasing population, climate change impacts, and mandated cutbacks in imported water, collaborative, and integrated water resource planning, is critical for a sustainable future. A study by the Pacific Institute, “Waste Not, Want Not: The Potential for Urban Water Conservation in California,” concludes that WUE is the most cost-effective way to maximize diminishing water supplies, which makes it one of the most important components for diversifying the region’s water portfolio in the coming years.

Over the past decade, significant WUE measures have been implemented by Southern California water agencies. These programs include the large-scale replacement of old inefficient water fixtures and the upgrade of building and plumbing codes in the State requiring low-flow toilets and showerheads in all new development. It is anticipated that these types of regulatory mandates will continue to be enhanced as emerging technologies become available. Through these programs, the amount of water imported into much of Southern California has remained fairly constant, sufficiently meeting demands despite significant development and population increases. However, with the water supply outlook continuing to worsen, WUE will be a critical resource management strategy that this region will need to embrace.

WUE measures can be categorized as “active” programs, such as rebates, or “passive” programs, such as the incorporation of WUE into standardized plumbing codes. Currently, the majority of WUE water savings is achieved through passive measures. Active WUE measures, however, will provide for a more

holistic approach to watershed planning, and help usher a social transformation in water consumption attitudes and standards among the public and water industry. Through a combination of active and passive measures, it is estimated that over 20% of forecasted water demand in the Santa Ana River Watershed can be met through the implementation of aggressive WUE programs.

This subsection describes the current urban water resources available to the Santa Ana River Watershed. It also describes resource management programs currently implemented or participated in by the Santa Ana Watershed Project Authority (SAWPA) member agencies, and other partners within the watershed. These programs include: the OWOW initiative, programs offered by the California Department of Water Resources (DWR) Office of Water Use Efficiency and Transfers, the California Urban Water Conservation Council's (CUWCC) Memorandum of Understanding Regarding Urban Water Conservation; Metropolitan Water District of Southern California (MWDSC) Conservation Measure Funding, the United States Bureau of Reclamation (USBR) programs, other current resource management programs; and trends in WUE legislation.

### *DWR Office of Water Use Efficiency and Transfers*

The DWR Office of Water Use Efficiency and Transfers offers several WUE programs that are utilized by water agencies in the Santa Ana River Watershed. These programs include funding from the WUE Grant Program that was established by Propositions 50 and 84; The Water Security, Clean Drinking Water, Coastal and Beach Protection Act of 2002; providing and updating the State Model Local Water Efficient Landscape Ordinance; and consulting with the State Energy Commission to develop performance standards and labeling requirements for water-efficient landscape irrigation equipment.

*Courtesy of MWDSC*

The Office of Water Use Efficiency and Transfers also offers an urban planning assistance program to assist urban water suppliers in meeting the requirements of the Urban Water Management Planning (UWMP) Act by preparing comprehensive and useful water management plans, implementing water conservation programs, and understanding the requirements of the Act. DWR is required to evaluate all applications for WUE grant and loan financing on the applicant agency's compliance with, and implementation of, its UWMP.

### *California Urban Water Conservation Council*

The CUWCC is a partnership of water suppliers, environmental groups, and others interested in conserving California's greatest natural resource – Water. The CUWCC was created in 1991 to increase efficient water use statewide through partnerships among urban water agencies, public interest organizations, and private entities. A significant number of agencies within the Santa Ana River Watershed are signatories to their "Memorandum of Understanding Regarding Urban Water Conservation in California" (MOU), which is the foundation of the CUWCC. The MOU created a negotiated framework between water agencies and environmental groups to facilitate expedited implementation of reasonable water conservation measures. The agencies that are signatories to the

MOU have agreed to implement comprehensive urban water conservation best management practices (BMPs) intended to reduce long-term urban water demands, and to consider water conservation on an equal basis with other water resource management options.

The BMPs established in the MOU are listed in **Table 5.6-1** below. Many of these BMPs are significant to the future success of WUE programs and planning efforts in the state of California. However, with close to 400 MOU signatories, differences exist between how each agency implements and tracks the BMPs. For instance, public outreach methods and marketing strategies vary among agencies in the SARW due to differences in each agency's size and resources.

Some of the agencies within the SARW who are signatories to the CUWCC's MOU are pursuing regional and collaborative WUE planning efforts and funding programs, yet because these agencies are geographically located outside of MWDSC's service territory, they are finding it difficult to implement the CUWCC's BMP programs in the same robust fashion as their MWDSC counterparts.

**Table 5.6-1 CUWCC's BMPs**

| | | |
|---|---|---|
| Foundational BMP's | | |
| 1 | Utility Operations Programs | |
| 1.1 | Operations Practices | |
| 1.2 | Water Loss Control | |
| 1.3 | Metering with Commodity Rates | |
| 1.4 | Retail Conservation Pricing | |
| 2 | Education Programs | |
| 2.1 | Public Information Programs | |
| 2.2 | School Education Programs | |
| Programmatic BMP's | | |
| 3 | Residential | |
| 4 | Commercial, Industrial, Institutional | |
| 5 | Landscape | |

In addition to the BMP list, the CUWCC has developed two options: a Flex Track Options and a gallon per capita day Compliance Option. These options can be implemented by participating agencies to help them meet their savings goals for a particular BMP measure. Agencies choosing either of these options are responsible for achieving water savings greater than or equal to that which they would have achieved using only the BMP list items. Through this type of innovative approach, smaller agencies, as well as those that are implementing extraordinary conservation measures will be able to better demonstrate their efforts to achieve water savings.

### *MWDSC WUE Measure Funding*

Through a water conservation commitment to its member agencies, MWDSC provides incentive funding for a wide variety of WUE programs, devices, and measures throughout its service area. These programs are offered to residential, commercial and industrial, agricultural, and public sector entities.

In 2008, MWDSC issued a call for extraordinary conservation measures and outlined some of the tools that they would develop to help their member agencies achieve its call for increased water savings. MWDSC launched a region-wide residential rebate program to help make it simpler for the over 18 million people in their service territory to take advantage of rebates through a one-stop shop concept. The program, known as SoCal Water$mart, is proving to be very effective, and has increased the convenience factor for the average Southern California consumer.

To help defray the criticism of those that would point the finger at public agencies as some of the largest water wasters, MWDSC created the Accelerated Public Sector Program to provide funding opportunities to public agencies to help them implement WUE programs and practices. The program has proved to be a tremendous success, especially with cities and school districts across the southland.

MWDSC hosts a monthly WUE meeting for conservation coordinators to share information and learn about important changes in the field. Certain entities (including Pillar participants, San Bernardino Valley Municipal Water District (Valley District) and the City of Yucaipa), are within the SARW but lie outside of MWDSC's boundaries, and are therefore not eligible to participate in MWDSC's programs. It is crucial that watershed planners find ways to encourage the development of similar WUE programs and funding opportunities for these communities, especially since many of these areas fall within the auspices of the Disadvantaged and Tribal Communities Pillar and are home to disadvantaged stakeholders.

### *Resource Management Programs*

A variety of WUE management programs, pilot programs, and outreach efforts have been implemented by SAWPA member agencies, MWDSC, cities and counties, and other entities from within the watershed. These programs include:

- California Friendly Homes
- Targeted Water Conservation Programs
- Water-wise Ordinances and Design Guidelines for New and Existing Developments
- Green Building and LEED Standards
- Development Mitigation Credits for New WUE Programs
- Weather-Based Irrigation Controller (WBIC) Programs and rebates
- Agricultural and High Water Use Residential and Commercial Audits and Evaluations
- Landscape Irrigation Budgets
- Rotating Sprinkler Nozzles for Sprinkler Heads Rebates
- High-Efficiency Nozzles for Large Landscape Heads
- Turf Reduction Rebate Programs (Cash for Grass)

- Synthetic Turf Rebate Programs
- Residential and Professional Landscape Classes (California Friendly)
- Landscape Audit Programs
- Regional Landscape Alliances
- Variable Flow Pumping Systems for Homeowners Association (HOAs), Municipalities, etc.
- Custom-Sized, Pressure-Specific Pump and WBIC Packages
- US Environmental Protection Agency (EPA) WaterSense Certification Programs
- High-Efficiency Toilet (HET) Rebates, Direct-install and Distribution Programs
- Multi-Family High-Efficiency Toilet – Direct Install
- High-Efficiency Clothes Washer (HECW) Rebates and Added Incentives
- Industrial Water Use Reduction Audits and Incentive Programs
- Swimming Pool Cover and Rain Barrel Rebates
- Public Sector Incentive Programs
- CII Water Use Surveys & Rebate Program
- Hotel and Tourism Industry Programs
- HOA Outreach and Training Programs (Changes to CCRs)
- Industrial Process Performance Improvements Programs
- Allocated Budgeted (Tiered)Water Rates
- University Sponsored Water Institutes
- Fundraising Projects with Water-wise Plant Palettes
- Community Outreach Programs and Water Festivals
- Public Awareness and Communications Campaigns
- School Education Programs
- Water Conservation Demonstration Gardens
- Water-wise Landscape Contests, Gardening Guides and CDs

Various water agencies and other water related organizations in the watershed will implement WUE programs on a regional basis deemed to have a high probability of success and are cost-effective but will not duplicate MWDSC's conservation efforts. SAWPA, on behalf of the OWOW stakeholders and participants, will apply for grant funding to complement and expand on existing efforts.

### *WUE Policy and Legislation*

The California Legislature has been active in creating and passing legislation regarding WUE. Legislation passed by the California Legislature, such as AB566, AB 662, AB 715, AB 1420, AB 1560, and AB 1881, are guiding and shaping the way for WUE. AB 566 requires, rather than permits, the model landscape ordinance (per the Water Conservation Act) to include climate information for irrigation scheduling based on the California Irrigation Management Information System (CIMIS) system. AB 662 requires the minimum standards for operating efficiency of water-using devices/appliances be based on those efficiencies that will reduce the energy and water consumption rates, and that do not result in any added total costs over the designed life of the appliances concerned. AB 715 requires that all toilets sold or installed in California use no more than an average of 1.6 gallons per flush, and that all urinals sold or installed in California use no more than an average of one gallon per flush. It also requires that, on and after January 1, 2014, all toilets and all urinals, other than blow-out urinals, sold or installed in California are high-efficiency toilets (1.28 gallons per flush or less) and urinals. AB 1420 requires eligibility for any

grant or loan to an urban water supplier awarded or administered by DWR, State Water Resources Control Board (State Board) or the Bay-Delta Authority to be conditioned on the implementation of the water demand management measures described in the UWMP. DWR is required to convene an independent panel to provide recommendations to the legislature relating to adoption, implementation, and reporting of demand management measures. The DWR also must identify demand management measures that achieve a standard of excellence. AB 1560 requires the Energy Commission to prescribe, by regulation, water conservation design standards for new residential and new nonresidential buildings. Additionally, the DWR prepared a Water Efficient Landscape Model Ordinance as part of the implementation of AB 1881.

On November 6, 2009, the State Legislature approved Senate Bill X7-7 – Statewide Water Conservation as part of the State Comprehensive Water Package. This legislation establishes one of the most progressive mandates to establish statewide water use efficiency standards in the State's history. The bill includes the following:

SB X7-7 creates a framework for future planning and actions by urban and agricultural water suppliers to reduce California's water use. This bill requires the development of agricultural water management plans and requires urban water agencies to reduce statewide per capita water consumption 20 percent by 2020. Specifically, this bill:

- Establishes multiple pathways for urban water suppliers to achieve the statewide goal of a 20 percent reduction in urban water use
- Specifically, urban water suppliers may:
    - Set a conservation target of 80 percent of their baseline daily per capita water use
    - Utilize performance standards for water uses that are specific to indoor, landscape, and commercial, industrial and institutional uses
    - Meet the per capita water use goal for their specific hydrologic region as identified by DWR and other state agencies in the 20 percent by 2020 Water Conservation Plan
    - Reduce from a 10-year or 15-year baseline daily per capita water use, a specific amount for different water sectors: indoor residential, unmetered uses, commercial, and landscape
- Requires urban water suppliers to set an interim urban water use target and meet that target by December 31, 2015 and meet the overall target by December 31, 2020
- Requires DWR to cooperatively work with the CUWCC to establish a task force that shall identify BMPs to assist the commercial, industrial, and institutional sector in meeting the water conservation goal
- Requires agricultural water suppliers to measure water deliveries and adopt a pricing structure for water customers based at least in part on quantity delivered, and, where technically and economically feasible, implement additional measures to improve efficiency
- Requires agricultural water suppliers to submit Agricultural Water Management Plans beginning December 31, 2012, and include in those plans information relating to the water efficiency measures they have undertaken and are planning to undertake

- Makes ineligible for State grant funding any urban or agricultural water supplier who is not incompliance with the requirements of this bill relating to water conservation and efficient water management
- Requires DWR to report to the Legislature in 2013, 2016 and 2021, on agricultural efficient water management practices being undertaken and reported in agricultural water management plans
- Requires the DWR, the State Board, and other state agencies to develop a standardized water information reporting system to streamline water reporting required under the law

## Regional WUE Strengths, Weaknesses, Opportunities and Threats

As part of the process of evaluating the region's overall WUE performance and future WUE planning efforts, a Strengths, Weaknesses, Opportunities, and Threats (SWOT) analysis was conducted to determine best strategies and the most effective course of action. The identified Strengths, Weaknesses, Opportunities and Threats, which are further categorized as physical, institutional, and customer-related are summarized in the SWOT analysis described below.

### *Strengths*

The regional WUE strengths lie primarily in the activities and experience of the regional water agencies and their sub-agencies. SAWPA consists of five major water and wastewater agencies: Valley District, Inland Empire Utilities Agency, Western Municipal Water District, Eastern Municipal Water District, and Orange County Water District. Many of these agencies also serve as the primary wholesale water agency for sub-agencies within their service area.

Through SAWPA, multi-agency forums or roundtables are held among member agencies to provide interagency communication, communication with the public, and communication with regulating bodies. It is also through these forums that agencies can share their technical and practical expertise in WUE program implementation. By meeting together to discuss issues and concerns, a unified message and response is continually refined and implemented by agencies for important issues such as the water crisis and future policy initiatives. Additionally, other organizations including non-profit entities, coalitions, and environmental interest groups, as well as larger institutions such as MWDSC and USBR, have been instrumental in helping to create and maintain the region's vision for a sustainable watershed.

### *Weaknesses*

The regional WUE weaknesses lie generally in the differences in implementation of WUE programs, available agency resources for those programs, and in customer awareness and attitudes toward WUE.

With so many water agencies participating in regional processes, there are sometimes conflicting goals or priorities that can hinder progress. There also seems to be a gap in the distribution and implementation of conservation programs in various portions of the region. One reason is the ineligibility for conservation funding of those agencies that do not fall within the MWDSC boundaries. Public outreach and marketing methods vary due to the differences in the size and resources of agencies, budgets, and number of agency staff dedicated to WUE programs. This variance translates into

customers within the same region not being similarly informed, and thereby not attuned to local water usage issues and regional water conservation measures.

Additionally, the Santa Ana River Watershed is limited in the number of landscaping professionals, contractors, and other trade staff members who are knowledgeable about WUE, water-efficient techniques, and technologies; and who can serve as resources for water customers looking to implement WUE measures. It will be important to forge partnerships with industry groups and large retailers to help bring about a transformation in the marketplace by making it easier for consumers to purchase new water efficient irrigation devices.

### *Opportunities*

One of the key opportunities that can be implemented is the use and reiteration of the term "water use efficiency" instead of "water conservation" in any education or outreach to the stakeholders and the community. As explained previously, the word "conservation" usually conjures negative image of a water "diet", which is generally associated with times when water supplies are compromised due to drought. By using the phrase "water use efficiency," agencies convey the importance of efficient use of water resources at all times and encourage water-wise behaviors as an integral part of customers' lifestyles.

The weaknesses noted earlier are also opportunities to build new strengths. By using the OWOW WUE Pillar forum, agencies can collaborate on projects that will provide regional benefits by maximizing shared resources and developing new relationships and programs.

Other opportunities available to the regional WUE effort are mainly customer-oriented: changing expectations and behaviors; inspiring and motivating WUE; and providing information, training, and support programs regarding WUE and technologies. The opportunity for increased solution-oriented collaboration among water agencies and professionals is also a key opportunity.

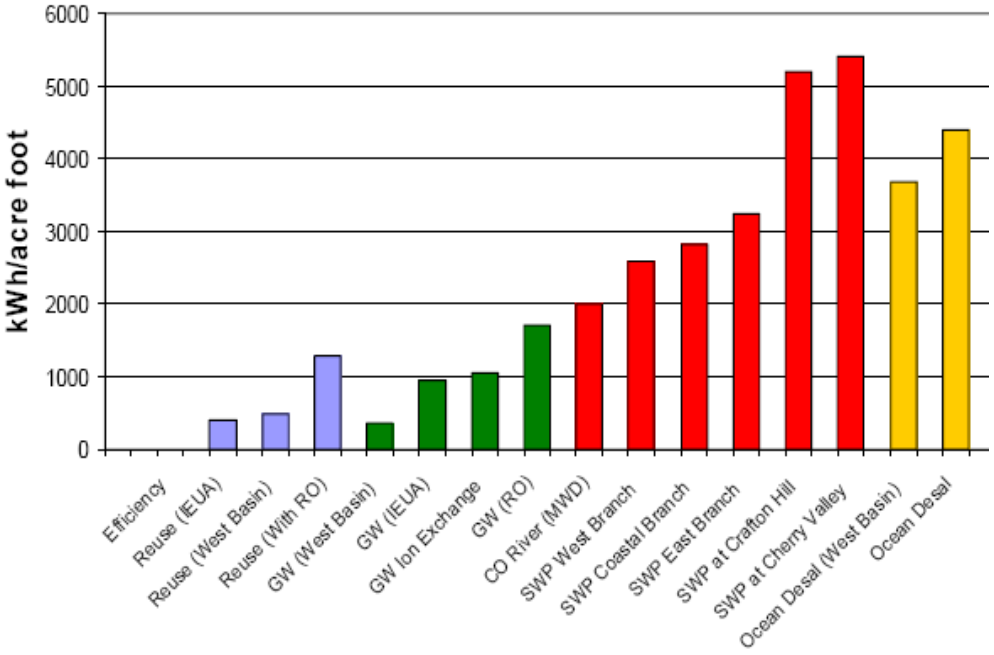
There are many opportunities for WUE measures in the region. With the continuation of regional marketing measures, WUE issues can reach a broader audience throughout the region. SAWPA and local agencies will have an enhanced role to advance WUE by embracing emerging technologies, and creating grant-funded technical assistance for the region. Other WUE opportunities include new programs such as EPA's WaterSense, training classes for landscapers and the public, and the possibility of developing a contractor certification program. Better coordination with water agencies and cities will help promote new WUE ordinances based on AB 1881, the California Model.

Local Water Efficient Landscape Ordinance, such as the Riverside County Water Efficient Landscape Requirements Ordinance, County Ordinance 859; new water-efficient development; and the use of allocated tiered water rates. There also is an opportunity for SAWPA and local agencies to partner with the area's energy utilities on marketing and incentive programs for California's commercial, industrial, and institutional (CII) water users that target water use and water-related energy use. All of these opportunities will be designed to motivate customers to increase their WUE.

As implementation measures are enacted to comply with AB 32, California Global Water Solutions Act of 2006, to control greenhouse emissions, the advantages in reduced energy use of WUE applications become readily apparent. As indicated in **Figure 5.6-1**, on the following page, WUE is ranked as the most

energy efficient of water supply source per kWh/AF in Southern California based on research conducted by Dr. Robert Wilkinson, Director Water Policy Program, University of California, Santa Barbara.

**Figure 5.6-1 Energy Intensity of Selected Water Supply Sources in Southern California**



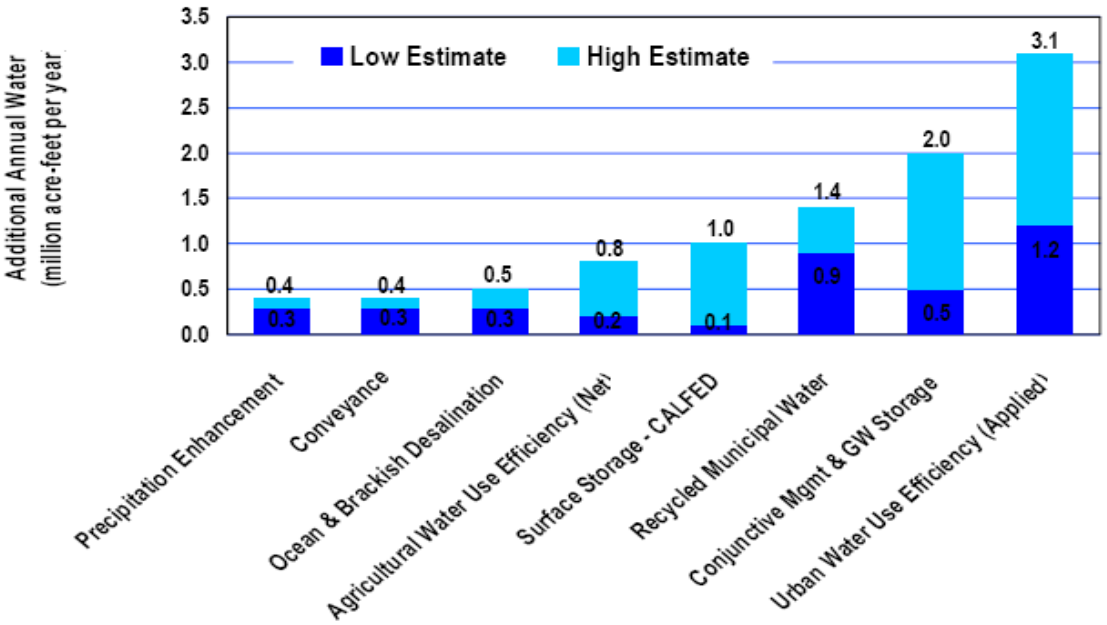


**Figure 5.6-2 California Water Supply**

Further, under **Figure 5.6-2**, of the many California water supply options available, urban WUE offers the largest supply available under low and high estimates statewide.

*Threats*

Funding, population growth, water infrastructure maintenance, and legislation are several main issues that could inhibit the regional WUE programs. The region is in need of programs to promote efficient use of its water supply, while facing a possible cutback on grant funding. Other issues include political pressures, the need for agencies to remain cost-effective and recent legislation requiring compliance with UWMPs.

Several of these threats are embodied in AB 1420, a bill signed by Governor Schwarzenegger in October 2007 regarding water demand management measures and water management grant or loan funds. This legislation states that eligibility for any grant or loan to an urban water supplier awarded or administered by DWR, the State Board, or the Bay-Delta Authority is to be conditioned on the implementation of the water demand management measures (DMMs) described in the supplier's UWMP. If the supplier is not in compliance with any of the DMMs in its UWMP, it will not be eligible for state funding grants or loans.

Agencies will have to work together to examine these potential threats and create a plan for moving forward if faced with any of these challenges.

## Identification & Implementation of Strategies to Improve Resources

With their key goal to reduce demand for imported supplies received from the State Water Project and Colorado River, SAWPA, its member agencies, and other retail agencies in the watershed are developing water-efficient strategies to become more self-reliant and sustainable. To identify opportunities for using water more efficiently, existing conditions and regional resources were identified and analyzed by the Pillar members.

### Water Use Efficiency Measures

The WUE Pillar meetings gathered information and ideas on potential new conservation opportunities, programs, and emerging technologies that could be implemented in the SARW. The WUE team developed two primary points of agreement: 1) the main focus of WUE's current and future efforts should shift from indoor residential water use to landscape and CII water use, and 2) regionally standardized WUE programs should be implemented throughout the watershed.

To develop a plan and outline strategies to accomplish these items, the WUE Pillar members held quarterly meetings to exchange information and ideas, partner and support each other's efforts, and coordinate with SAWPA staff. Through these meetings, a comprehensive list was created to summarize existing and potential new opportunities for WUE efforts. The WUE list was created by the Pillar. It lists several conservation measures by the following categories: Regional Programs and Incentives,

Landscape, CII, Financial and Policy Initiatives (also refer to *Current Conditions* section), and Partnerships and Outreach. Pillar members were invited to check off the WUE measures they currently were implementing, and measures they wanted to pursue. Using this information, the Pillar was able to review everyone's efforts and validate their agreed vision to focus on landscape and CII water use, and regionally standardized WUE programs.

The following is the list of the WUE Pillar's list of programs determined to be the most effective in the categories listed above:

*Regional Programs and Incentives*

- ***Promulgate HETs and High Efficiency Clothes Washer (HECWs)***
  Toilets and clothes washers typically account for 27% and 22%, respectively of residential indoor use, representing the most significant remaining savings potential for indoor use. (Note: Aggressive showerhead replacement programs in the early 1990's, in addition to plumbing code changes, have resulted in high saturation levels for low-flow showerheads). By replacing a toilet that uses 3.0 gallons or more per flush with one that uses 1.28 gallons per flush or less, a resident may receive $100, depending on the toilet selected and the incentive offered by the local water provider.

  Incentives also exist for residents who want to buy a new HECW that uses less water and energy than conventional washers. These incentives encourage residents to invest in and install WUE devices that will be used frequently in their households.

  Building upon the success of indoor WUE programs provides the groundwork to now shift the focus to outdoor and landscape water conservation measures. Out of all of the topics in the WUE matrix, the landscape category had the most conservation measures identified by the Pillar. The irrigation system improvements (audits and equipment) and the CII large-scale and key account audits and Implementation measures were the ones that were ranked the highest in the landscape category, which reinforces the Pillar's focus on landscape and CII water use.

- ***Utilize MWD's Regional Support for WUE Rebate Incentive Programs***
  MWDSC has implemented a program that allows water agencies to customize their rebates by adding additional incentives. The program also allows agencies to target markets, analyze data, and implement new approaches. MWDSC rolled out SoCal Water$mart, a regional residential rebate program where any resident within MWDSC's general service area will be eligible to apply for rebates on water efficient purchases for the home directly from MWDSC, thereby eliminating the ineligibility of customers who live in non-participating MWDSC areas. The landscape water use efficiency statewide market survey conducted by the Water Resources Institute at California State University, San Bernardino, shows that rebates would provide motivation for a significant percentage of decision-makers for residential and managed properties to invest in landscape water efficiency technologies.

*Landscape*

- ***Irrigation System Improvements (Audits and Equipment)***

Irrigation of residential and certain types of commercial landscapes currently is one of the largest uses of water. Landscape water use can be reduced by up to 30% by simply repairing broken or damaged irrigation components, adjusting pressure, retrofitting with more efficient components, and scheduling irrigation properly. A simple system improvement is retrofitting spray head sprinkler nozzles with rotating sprinkler nozzles. The rotating sprinkler nozzles apply water at one-third the rate of spray heads, thereby allowing the sprinklers to run for longer periods of time before runoff occurs.

A significant system improvement that can be accomplished in combination with other irrigation improvements to reduce landscape water use by 20% or more is the installation of a "smart" irrigation controller. It estimates or measures depletion of available plant and soil moisture, and replenishes water as needed while minimizing excess water use. It adjusts water application throughout the irrigation season without human intervention. There are two types of smart controllers: 1) sensor-based controllers, which use historical weather data, plus temperature and precipitation monitoring, or information provided by an on-site weather station; and 2) signal-based controllers that use localized weather data provided by the California Irrigation Management Information System or an equivalent. The benefits of encouraging and promoting the use of smart controllers include reduction of outdoor water use, healthy and attractive landscaping, reduction of runoff and non-point source pollution, and improved water quality.

*Commercial, Industrial, Institutional*

- ***CII Large Scale and Key Account Audits and Implementation***
  Large-scale CII customers use water in unique ways that must be examined for opportunities to save water on an industry-wide or individual basis. To assist with this, MWDSC has the Water Savings Performance Program that provides audits and retrofits to large industrial water users. Financial assistance is provided for documented water savings derived from projects implemented under the program that meet the qualifying criteria.

  Equipment for the proposed improvements may be purchased or leased. Typical process improvements that qualify include installation of equipment to capture, treat, and reuse water that otherwise would be discharged to the sewer, and replacement of existing equipment with more efficient process improvements resulting in reduced water demand.

  On a smaller scale, many local water agencies have obtained grant funding to implement local programs to assist commercial users in retrofitting to more efficient devices.

- ***SoCal WaterSmart Program***
  MWDSC's SoCal WaterSmart Rebate Program, in which three of the four eligible SAWPA member agencies participate, is tailored specifically for the CII and residential sectors. Rebates are available for numerous water efficient devices and technologies to help lower water and sewer bills, reduce energy costs, and address environmental impacts. The program also allows regional marketing to key strategic partners, including device vendors. The lifetime water savings for devices and

technologies installed to date in Southern California through the SoCal WaterSmart program is anticipated to be over 20 billion gallons.

The growing population in this semi-arid region puts an ever-increasing strain on the limited water supply. The dramatic anticipated water savings resulting from the SoCal WaterSmart program show that one of the best ways to meet this demand is for Metropolitan and its member agencies to help customers become more aware of water-saving technologies, and to provide the necessary financial incentives to encourage their implementation.

## Other Inferences from the WUE Matrix

The other categories of financial and policy initiatives, and partnerships and outreach, are important in strategizing, designing, and implementing WUE efforts. Each is a category that directly affects and influences the direction and development of future WUE programs.

### *Financial and Policy Initiatives*

Water budgets and allocated tiered water rates offers individualized allocated water budgets for each water customer. This creates a structure that encourages people to stay within their water budget, and may be used at the discretion of local retail water agencies to penalize those who are careless or excessive with their water use. The money generated from overuse penalties is used as a funding source to implement new local WUE programs. AB 2882 supports this strategy by allowing wholesale and retail water suppliers to adopt allocation-based conservation water pricing.

### *Partnerships and Outreach*

Partnering and outreach is an integral part in building consensus, sharing resources, and unifying the message for WUE efforts. There were numerous responses from WUE Pillar members on the ideas for how to partner with Resource Conservation Districts and Pollution Prevention/Water Quality efforts.

- ***Partner with Resource Conservation Districts***
  Conservation districts emerged during the 1930s as a way to prevent the soil erosion problems of the Dust Bowl from recurring. Formed as independent local liaisons between the Federal government and landowners, conservation districts have worked closely with the USDA Natural Resources Conservation Service (formerly the Soil Conservation Service).

  In California, conservation districts are called Resource Conservation Districts (RCD), and are independent "special districts" organized under the state Public Resources Code, Division 9. Each RCD has a volunteer Board of Directors made up of five to nine district landowners who are elected locally or appointed. Currently, 103 RCDs in California work to address a wide variety of conservation issues including forest fuel management, water and air quality, wildlife habitat restoration, soil erosion control, and conservation education.

  Because RCDs are grassroots, nongovernmental organizations, they have no regulatory power and must meet their goals for the natural resources in their community through voluntary approaches, i.e., neighbors asking neighbors to cooperate. Opportunities exist for agencies in the watershed to

work with local RCDs on cooperative efforts to improve the natural environment, in this case, through WUE.

- ***Partner with Pollution Prevention/Water Quality Efforts and Vector Control***
  A major source of water pollution is "non-point source" pollution, or pollution that comes from an indirect source. Storm runoff and excess irrigation are primary sources of non-point source water pollution. Irrigation runoff can contain fertilizers and pesticides that can harm habitat, flora, and fauna. Contamination of streams and rivers, as well as groundwater can result from storm and irrigation runoff if they carry pollution loads that are high. Reduction of non-point source water pollution is especially critical in areas that drain directly into the watershed. Reducing the use of irrigation and scheduling irrigation correctly to avoid runoff can accomplish this. Similarly, the majority of mosquito and vector activity is in and around storm drains, so reducing runoff will help alleviate this problem and reduce the threat of vector-based diseases such as West Nile Virus. There also are opportunities to share public outreach messaging among the various regulating agencies.

- ***Partnership and Collaboration***
  Many agencies on their own have contributed to the current WUE programs and these efforts do not go unnoted. The existing programs are the foundation for our next steps, which include maintaining as well as expanding existing partnerships and collaborations with water wholesalers, sub-wholesalers, retailers, and municipalities.

  Another potential opportunity is to create new and innovative partnerships with customers that are large water users, such as schools, parks, businesses, irrigation companies, HOAs/property managers, gardeners, landscape architects, and contractors. Some of these partnerships could correspond with other CII programs.

  Collaborations with energy utilities could lead to improved outreach, cost-savings and opportunities for increased (combined) financial incentives that will further motivate participation. Energy utilities already are partnering with key water agencies, including MWDSC, on the pilot water-energy programs outlined in the California Public Utilities Commission’s ruling regarding water-related energy use.

  Other possible partnerships and collaboration efforts include co-marketing between water agencies and product vendors. Examples include the WUE device certification with the EPA’s “WaterSense” certification and labeling program, or WUE device training sessions sponsored by water agencies and led by a representative from the device’s manufacturer.

  The WUE Pillar also can support partnerships and collaboration among water agencies by serving as a forum to share ideas on what works or does not work for an agency. Collaboration between SAWPA member agencies in and outside of the MWDSC service area on WUE programs will allow those agencies and their customers outside of the MWDSC Metropolitan area to participate.

- ***Public Outreach: Emphasis on Outdoor Landscaping and Irrigation Efficiency***

With up to 70% percent of household water consumption going toward outdoor use, there is a growing need to provide water efficient programs targeting outdoor landscaping. There are various ways to increase water efficiency of outdoor landscaping. The outdoor efficiency program topics identified by the WUE team include:

*Marketing programs:*

- Changing landscape design elements: increase pervious hard surfaces, pavers and bioswales
- Creating sample landscape plan templates
- Using captured rainwater, recycled wastewater, gray water, or treated water for non-potable uses including irrigation
- Positioning water-efficient gardens as in style and "hip"
- Utilizing marketing suggestions from the Water Resource Institute (WRI) Landscape Water Use Efficiency statewide market survey: positives of water smart landscapes, the cost of doing nothing, children's involvement, and responsibility for the environment
- Targeting marketing efforts to various demographic communities

*Technology/training programs:*

- Advancing emerging technologies such as, smart irrigation controllers, high-efficiency nozzles, and new irrigation device technology
- Creating a comprehensive package for consumers to promote use of smart irrigation controllers (e.g. rebates, stores, installers, training, and check-ups)
- Advocating use of climate-appropriate plants and functional warm season turf throughout the region
- Developing a "one-stop shop" that offers accessible and comprehensive water-efficient landscape planning programs

- ***Public Outreach: Community-Based Social Marketing***

  Community-based social marketing is a behavior-change tool that can supplement traditional information-intensive marketing campaigns. Previously utilized as a strategy in health care initiatives such as smoking cessation, it now is being utilized for other causes, including natural resource management, to achieve the adoption of environmentally sustainable behaviors by the members of our communities.

  Community-based social marketing involves four steps: 1) identifying the barriers and benefits to a sustainable behavior through a combination of literature reviews, focus groups, and survey research; 2) developing a strategy to promote the sustainable behavior that utilizes "tools" that have been shown to be effective in removing barriers and changing behavior; 3) piloting the strategy; and 4) evaluating the strategy once it has been implemented across a community. These steps result in a community outreach campaign that will successfully foster the desired sustainable behavior, which in the WUE Pillar's case, is water-efficient behavior.

  There are several typical reasons why people do not engage in a particular sustainable behavior. One reason is that people are unaware of the activity and/or its benefits. Another reason is that the

activity may be perceived as having significant difficulties and barriers associated with adopting it. For example, people may believe that switching their traditional garden to a California-friendly landscape is a daunting task that requires expertise and money. A third reason why people do not engage in a sustainable activity is that they feel that there are no significant barriers that discourage their current behavior. For example, irrigation schedules are left the same throughout the entire year because it is easier to leave it alone rather than have to adjust it due to weather conditions or the time of year.

To better influence what people do, community-based social marketing helps public outreach campaigns to identify perceived barriers and benefits to an action, and promote specific changes to overcome those obstacles. People naturally tend to gravitate to actions that have the most benefit and that have the fewest barriers to overcome. Additionally, perceived barriers and benefits vary from individuals and groups. What may work for one neighborhood may not work for another, or what may work for residents may not work for businesses. Behaviors also compete with each other; as one adopts a new behavior, the previous behavior is being rejected. For example, the behavior of capturing cold water in a bucket before the shower water gets warm replaces the behavior of letting the unused water run down the drain.

Because of this diversity of motivations, the perceived barriers and benefits to the desired sustainable behavior have to be understood so that the available behavior change tools can be prioritized by the benefits they offer and barriers they remove. From this analysis, effective community-based social marketing strategies can be developed. For future community-based social marketing efforts by the WUE Pillar, the WRI Landscape Water Use Efficiency Statewide Market Survey will be a good starting point as it identifies several residential and managed properties incentives and barriers to increased landscape WUE.

Once a sustainable behavior-specific marketing strategy has been developed, the piloting and post-pilot evaluation of the behavior change strategy ensure that a project is effective at achieving the desired result before it is implemented on a large scale. By careful research and planning, pilot testing, and pilot results evaluation, community-based social marketing strategies that promote sustainable behaviors, can successfully become and remain a part of people's lifestyles.

## Other WUE Strategies Discussed in WUE Meetings

The following is a brief summary of additional measures prioritized by the WUE Pillar that were not included in the Table of WUE Measures, but highly discussed in WUE meetings.

- ***UWMP***

  In the area of WUE planning, water agencies in California must perform certain minimum planning processes required by the California Water Code. The most informative of these planning tools is the UWMP. Agencies that either have more than 3,000 service connections or deliver more than 3,000 acre-feet annually must complete a UWMP, at least every five years. The UWMP incorporates requirements for describing how the agency will implement WUE demand management measures, which are equivalent to the CUWCC BMPs. In the Santa Ana River Watershed, there are many

overlapping water agency jurisdictions and their respective UWMPs, creating a large amount of information about WUE. BMP implementation information is also available, much of it from the CUWCC.

- ***20 x 2020***
  The Water Conservation Bill of 2009 (SB X7-7) provides the regulatory framework to support the statewide reduction in urban per capita water use described in the *20 by 2020 Water Conservation Plan*. Consistent with the Bill, each urban water supplier must determine and report its existing baseline water consumption and establish future water use targets in gallons per capita per day. The first report began with the 2010 UWMP.

  An urban water supplier must set a 2020 water use target and an interim target for 2015. There are four methods or options for compliance: 1.) establish a conservation target of 80% of their baseline daily per capita water use; 2.) utilize performance standards for water uses that are specific to indoor, landscape, commercial, industrial and institutional uses; 3.) meet the per capita water use goal for the appropriate hydrologic region; 4.) reduce from a 10 year or 15-year baseline daily per capita water use, a specific amount for different water sectors. Option 4 is subject to revision by the DWR prior to 2015.

- ***Evaporation and Transpiration Correlation***
  Significant water loss can be attributed to evaporation and transpiration. Evaporation accounts for surface water that enters the air as vapor due to the heat of the sun. Transpiration accounts for the use of water by plants. By promoting climate-appropriate plant species instead of turf grass, transpiration is reduced. By planting more trees, the amount of shade area is increased, which reduces evaporation and the heat island effect.

  There will be opportunities for water agencies within a watershed to partner with other public and private entities that share the same goal of increasing the amount of climate-appropriate plants in the watershed. The goal of reducing evaporation and transpiration should be incorporated into the plant palette idea, where landscape contractors can recommend a palette of plants that are climate-appropriate to a resident, business, or industry. Additional evaporation reductions can be accomplished by providing incentives or voucher programs for swimming pool and spa covers, and banning outdoor misting systems.

## Collaboration and Integration with other OWOW Pillars

The nine other OWOW Pillars are developing programs, resources, and strategies for addressing challenges in their areas of expertise, similar to the WUE Pillar. By integrating strategies from multiple OWOW Pillars into planned water resource management programs, and by increasing program planning and implementation coordination among Pillars, efficiencies and benefits are generated that yield program results greater than those achieved through the efforts of a single agency or Pillar. Additionally, collaboration that produces consensus among the OWOW Pillars creates a stronger, more unified voice to communicate regional water management goals, strategies, and messages to stakeholders. Described

below are the three reasons that collaboration and planning integration with other OWOW Pillars is crucial to the fulfillment of the WUE vision.

## Leveraging Expertise

The WUE Pillar aims to maximize the benefits of the work of the other Pillars and water agencies by incorporating their expertise in future WUE programs. Among others, the Water Resource Optimization, Stormwater: Resource and Risk Management, Energy and Environmental Impact Response, and Land Use and Water Planning Pillars share common ground with the WUE Pillar. For example, WUE is a response to the region's dependence on imported water supplies, which is a water supply reliability and climate change concern, and WUE targets behaviors that create dry weather run-off that carries non-point source pollution. Collaboration and information sharing between these Pillars and the WUE Pillar will create consistency among programs and services, establishing a norm that is recognized within and beyond the region.

The more connections that can be made between Pillars in the design of a project, the more the project can be deemed valuable and successfully prioritized for funding and implementation due to its ability to provide multiple benefits. On another level, publicity and marketing strategies can be maximized through the dissemination and repetition of the message across different Pillars and diverse audiences.

Additionally, as WUE is a watershed-wide goal shared by many Pillar areas, the potential exists for the WUE Pillar to become a clearinghouse for WUE programs and resources, which could be made available through a Website for easy access. The WUE Pillar also could take on the role of a regional coordination planning body for WUE experts, including irrigation repair services, landscape design firms, and landscape contractors. Putting the public in touch with these experts through the clearinghouse would demonstrate a grassroots and social marketing approach to the implementation of WUE measures.

## Leveraging Resources

Water resources are vital to the Santa Ana River Watershed, and resources including time and funding are vital to the successful implementation of WUE projects and programs. As the Santa Ana River Watershed's water resources cannot meet unlimited demands, and the WUE Pillar members' time and funding do not allow an unlimited number of WUE programs to be implemented, leveraging available resources to achieve the most benefit is critical.

In terms of water resources, the water agencies in the Santa Ana River Watershed currently rely on varying degrees of imported water supply to meet customer needs. Through the identification of existing local resources such as groundwater and recycled water, water agencies will be able to better leverage water supply resources. One of those available local water supply resources is water saved through WUE measures.

Especially now, as the State Water Plan and the SB X7-7- Statewide Water Conservation is in full swing along with current legislative initiatives of AB 1420 (access to water conservation funding), AB 1881 (water efficient landscapes and land use planning), focus on water efficiency, increased engagement by, and resources from, the WUE Pillar will be necessary to meet these new requirements.

One way to leverage time and funding resources is to group together WUE projects and programs by similar geographic areas. By collaborating on work activities, timelines, and stakeholder outreach, the sponsors of these projects and programs can reduce project costs, lessen community impact by decreasing completion time for capital projects, and achieve greater success in community outreach and stakeholder behavior change for education and marketing programs.

Having multiple Pillars come together to combine various water management strategies within a single project or program, is another way to leverage time and funding resources. For example, the Water Resource Optimization, Stormwater: Resource and Risk Management, Energy and Environmental Impact Response, Disadvantaged and Tribal Communities, and Land Use and Water Planning Pillars could integrate WUE into all resource-based planning efforts (*i.e.*, treating WUE as a supply source and as a means to offset climate change impacts, while mitigating land use impacts). WUE provides opportunities to increase demand for recycled water use. Landscape water conservation programs have a secondary benefit of reducing runoff and non-point source water pollution, as well as reducing the proliferation of vector-based diseases.

As available staff and funding resources are not uniform among member agencies, leveraging resources and programs across geographical areas and Pillars can address equity and fair distribution of resources while maximizing results. WUE programs and WUE ads can be spread across geographic areas and Pillars to leverage resources and maximize benefits. Using region-wide communications outlets obtains the greatest benefit for the funding resources available by allowing the ads' messages to reach the widest audience possible, and can result in earned media, better ad rates, and extra airtime.

Employing WUE staff expertise and funding resources on a regional basis using the IRWMP process ensures that smaller agencies and agencies outside of the MWDSC service area have access to the available resources. Pursuing regional implementation of programs will help to both leverage and balance resources, as agencies already implementing WUE will impart their expertise in the design and implementation of new regional WUE programs. These programs will then be available to the customers of smaller agencies, and regional programs will be able to employ new implementation formats and access new funding. The region's water agencies will benefit from more consistent messaging and improved reliability of regional WUE programs.

Leveraging the available resources to implement WUE programs that benefit those with sufficient means and those in need of resources is a proactive approach that will maximize the WUE benefits throughout the region.

### Leveraging Funds

Integration of water management strategies across geographies, within the project implementation process, and through partnerships between agencies can result in significant financial efficiencies. Collaborative projects that are widely supported can be more far-reaching and implemented more quickly, effectively, and efficiently than could be accomplished by one agency focused on a single water management strategy.

Spreading WUE funding throughout a watershed results in cost benefits through the integration of multiple strategies or messages and through regional marketing efficiencies. For example, Valley District and the Yucaipa Valley Water District (YVWD) are within the SARW, but are not MWDSC member agencies, making them ineligible for MWDSC efficiency funding. However, collaborative projects with regional benefits facilitated by the OWOW effort, such as a regional conservation incentive funding program that would overlap with efforts by MWDSC Metropolitan member agencies, SAWPA agencies, and Pillars, would be a way to enable Valley District, YVWD, and other agencies outside of MWDSC's boundaries to receive funding and to maximize WUE benefits and results.

Funds also can be leveraged to achieve goals through regional partnerships and projects that use matching funds, such as MWDSC's conservation credits program. Created in 1988 and regularly updated, this conservation credits program provides funds to MWDSC's Metropolitan's member agencies to advance their individual demand management strategies. Additionally, Federal government funds could be used to leverage State and local funding.

Focusing in particular on the Water Resource Optimization, Energy and Environmental Impact Response, and Disadvantaged and Tribal Communities Pillars, Santa Ana River Watershed water agencies should incorporate WUE funding into their planning portfolios to ensure a constant funding stream for WUE programs and efficiency measure implementation.

## Description of Data Collection and Compilation Process

### Stakeholder Identification

The WUE Pillar is comprised of over 40 stakeholders from all three counties (Orange, Riverside, and San Bernardino), consisting of WUE experts, consultants, business leaders, and other industry leaders. Members were solicited during several outreach events held by SAWPA in the early stages of the planning process. A fish bowl type public involvement approach (participants placed their business card in a "fish bowl" for each Pillar group of interest to them) was used to gather interest and collect contact information from potential participants. SAWPA also sent numerous email outreach blasts that invited and encouraged involvement and participation. Some members volunteered and others were assigned by their respective agencies.

### Strategies Deployed to Involve and Motivate Stakeholders

Strategies used to involve and motivate the WUE members were establishing meeting dates early, creating an advisory committee within the larger pillar group, structuring meetings to constructively

gather input, committing attendance for half-day brainstorming sessions, providing refreshments and lunch at workshops, making chapter drafts available electronically for review and comment, and continually reaching out to potential new participants.

## Event Coordination

A chapter outline was developed by compiling input from a total of three large-scale meetings, PowerPoint presentations, and other resources, and organizing them into the categories developed by SAWPA. An interactive workshop was developed as a way to review the outline and gather more information. Participants were assigned to a group that worked on a particular section of this chapter. Within these groups, participants discussed and refined the key message of the section. Each group answered the question: "What should be the key message of this section of the WUE Chapter?" Participants were asked to develop key messages that relate to the mission statement of WUE discussed in the last meeting, and to determine if keywords, such as "future vision" and "proactive" needed to be part of the mission statement.

Another assignment for each group was to review a section of the WUE chapter. Participants read through their chapter section outline and discussed what information was missing or needed to be further developed. Each group thought about:

- What information is missing that is needed to support the section's key message?
- Can this section be organized or structured differently?
- Are there examples that can be placed in this section?
- Is there a program or resource that needs to be described in more detail in this section?
- What resources can be researched and cited?
- What supporting graphics/photos can communicate ideas in this chapter section?
- Are there statistics that need to be included in this chapter section? If so, where can this information be extrapolated?

Each group then presented their ideas of their key message and chapter section to the rest of the team. Afterwards, each participant was able to comment and add information to other sections of the chapter. Additionally, two matrices were provided to the stakeholders: Table of WUE Measures, and Table of BMPs. These matrices will serve as comprehensive databases to summarize efforts in the SAWPA OWOW region. Participants were asked to fill out these matrices marking the existing and future efforts of their organization in terms of WUE and the CUWCC's BMPs. With over 100 agencies listed in the matrix,

these working databases identify and track areas of overlap, areas of collaboration, areas in need of development or improvement, and levels of prioritization.

## Data Collection Methodology

Some of the SAWPA member agencies serve disadvantaged communities that have not yet had the opportunity to access grant funding to implement WUE programs. Other agencies have been promoting WUE for years, or have not begun at all. Thus, within the Santa Ana River Watershed, there are varying levels of familiarity with, and implementation of, WUE programs. It is this "uneven playing field" that the WUE Pillar has attempted to address by devising mechanisms to allow the Santa Ana River Watershed as a whole to achieve water demand reduction. Key questions regarding implementation of WUE programs in the Santa Ana River Watershed include:

- Should an approach to WUE be broad and non-specific so that agencies within the region have local flexibility, or should there be a list of specific measures and projects that have high potential for multiple regional benefits that are to be implemented by all agencies?
- If a conservation measure or project is locally cost-effective, should it be implemented regardless of the availability of grant funding?

Because each agency has its own set of ongoing circumstances, customers, and funding, agencies have differing preferences about the answers to these questions.

As a way to envision the greater picture of how to design a plan of action, the WUE Pillar members have expressed a desire to hold quarterly meetings to exchange information and ideas, partner by supporting each other's efforts, and coordinate with SAWPA staff. By coming together regularly, members can prioritize next steps, coordinate grant funding opportunities, and continually evaluate each WUE strategy to confirm its cost-effectiveness and benefits to the region.

Under the OWOW Plan, comprehensive databases were compiled to summarize two large efforts in the SAWPA OWOW region: 1) List of WUE measures: existing and potential new opportunities for WUE efforts, and 2) Table of BMPs: implementation coverage of the CUWCC BMP. With over 100 agencies listed, these working databases identify and track:

- Areas of overlap
- Areas of collaboration
- Areas in need of development or improvement
- Levels of prioritization

The WUE "opportunities" matrix was developed under this Plan that identifies existing and potential new programs as a result of a Pillar brainstorming effort. The programs are categorized as Regional Programs and Incentives, Landscape, CII, Financial and Policy Initiatives, and Partnerships and Outreach. Each SAWPA member agency has indicated which programs are of most interest to their service area.

This Plan demonstrated that water efficiency measures could have significant beneficial impacts on future water supplies in the region and how they are managed. As the major regional wholesalers, MWDSC and Valley District have compiled water demand and supply data. MWDSC also has provided water conservation savings data. The data is based on the 2005 UWMPs and the OWOW 1.0 plan, as well as MWDSC's internal planning processes with data gathered from its member agencies. These datasets were discussed and analyzed in the WUE Pillar to determine the potential level of savings that will be targeted in the IRWMP.

One challenge is obtaining conservation savings data from those retail water suppliers within the Santa Ana River Watershed that are not MWDSC member agencies or sub-agencies, or that have not signed the urban CUWCC MOU. Most of them will likely have supply and demand data, but they may not necessarily have conservation savings data. Agencies that have this full set of information should be contacted to make sure the data is integrated into the data set.

## The Future of Water Use Efficiency

Agencies and their partnerships with each other and private industry will continue to collaborate and develop new programs promoting water use efficiency. The ultimate goal will be to get water customers to automatically base decisions on what is the most water efficient way to plan, implement, and maintain devices and landscapes. This will require customer education and continued incentives to promote water use efficiency. The sector that demonstrates the greatest potential for water savings is the landscape. Therefore, the WUE Pillar will move forward with collaborative projects that primarily emphasize outdoor efficient use of water.

### Customer Handbook for Using Water Efficiently Outdoors

When it comes to using water outdoors, particularly when using water to irrigate, most water customers do not know how to be efficient. The WUE pillar plans to create and promote an engaging customer handbook to promote the use of, and assist customers with, using landscape water efficiently. The handbook will be specific to the SARW, authored by University of California Cooperative Extension researchers and others, and will be available to anyone in the watershed. The handbook will inform the public about the importance of knowing some basic soil science, as well as landscape and irrigation design, implementation, and maintenance to prevent inefficient water use. Up to 30% of a landscape's water use can be eliminated by simply repairing and adjusting irrigation, and using an appropriate plant palette. However, most people do not know how to fix irrigation problems, properly schedule their irrigation, or select appropriate plants. This guide will entice people to educate themselves on specific methods and materials that will assist them in becoming water-efficient in their landscape.

### Inland Empire Garden Friendly

Most of the Santa Ana River Watershed lies within what is locally known as the Inland Empire. This area consists of the greater basin that lies within western San Bernardino and Riverside counties. Public agencies, California State University, San Bernardino, and Rancho Santa Ana Botanic Garden formed the Inland Empire Garden Friendly Program to expose the public to a recognizable branding that identifies with using water efficiently in the landscape. Agencies have partnered with The Home Depot and local nurseries to successfully promote climate-appropriate plants. The program has a website that contains information on local workshops, plant sales, botanical gardens, a plant list, and other related resources (http://www.iegardenfriendly.com/). Increased promotion, events, and a greatly expanded plant database are planned for the future.

## Agricultural Water Use

Within the watershed, there are over 157 million acres in production consisting of nursery stock, fruit and nut crops, field crops, and vegetable crops with a value of over $388 million dollars. Almost all of these crops would not be possible without irrigation.

Resource conservation districts and water districts are expanding their role in conducting irrigation audits. MWDSC recently opened its water saving performance program to include agricultural customers. This program provides financial incentives, up to 50% of eligible project costs, for customized water efficiency improvements. The WUE Pillar will be working on irrigation management strategies, and making new technologies available to farmers.

# 5.7 Land Use and Water Planning

The Shops at Dos Lagos
Corona, CA

## Introduction

The Land Use and Water Planning Pillar for One Water One Watershed 2.0 (OWOW) was re-formed in early 2012 and was co-chaired by Jerry Blum, City of Ontario Planning Director and Susan Lien-Longville, Santa Ana Regional Water Quality Control Board (RWQCB) Board Member (formerly Water Resources Institute: CSU, San Bernardino). The Pillar conducted ten meetings at the Santa Ana Watershed Project Authority (SAWPA) between July 2012 and August 2013, which were regularly attended by staff from water and utility agencies, Caltrans, the development community, resource conservation groups, and interested consultants.

Land use decisions are arguably the primary underlying cause of, and potential solution for, the existing water supply, water quality, and natural resource challenges in the Santa Ana River (SAR) Watershed. Similarly, relative energy use and greenhouse gas emission levels result from the level of efficiency produced by land use patterns. Land use designations and development through time have resulted in areas of economic vitality and comfortable living, while leaving other areas in blighted conditions, with inequitable exposure to environmental hazards and poorly maintained infrastructure. To improve conditions and create a sustainable watershed, land use decisions must provide net watershed benefits. We must avoid land use decisions that allow net degradation of watershed conditions.

The Land Use and Water Planning Pillar reviewed the guidance of the Department of Water Resources (DWR) Integrated Regional Water Management (IRWM) Guidelines, Relation to Land Use Planning Standard to assist the development of this chapter and actions to support their efforts. This section encouraged an exchange of knowledge and expertise between land use and water resource managers;

examining how Regional Watershed Management Groups (RWMG) and land use planning agencies currently communicate; and identifying how to improve planning efforts between the RWMGs and land use planning agencies.

This Chapter: 1) describes the history of development and watershed planning efforts in the Santa Ana River Watershed; 2) identifies key watershed sustainability needs; 3) evaluates how watershed priorities can be addressed by improved collaboration between water and land use agencies; and 4) recommends the strategies and implementation actions expected to be effective to ensure watershed sustainability priorities are a primary consideration in the land use decision process. Finally, this OWOW 2.0 Plan (Plan) updates and revises the OWOW 1.0 Plan.

Chapter 1.2 of the OWOW 1.0 Plan, Moving Towards Sustainability, summarized the history of land use patterns and practices in the Santa Ana River Watershed and some of the impacts of land use decisions on water resources and lessons learned. An objective analysis of the strengths, threats and weaknesses of land use patterns and practices is followed by strategies that address land use and water management producing mutually beneficial and cost effective results. The chapter closes with suggestions of collaborative partnerships between regional water management agencies and local governments, and private sector developers and environmental organizations to address the sustainability of prior and future land use decisions. The authors of this chapter are confident that solutions to the challenges we face in the watershed are limited only by our determination to solve complex land use and watershed sustainability problems by working together.

The way in which we manage water resources is inextricably linked to our land use patterns. Our current land use planning and practices have damaged and threaten to further damage our water-supply reliability, and are costly in many other ways, including loss of historic watershed functionality, habitat deterioration and high energy consumption for transport. This problem can be stopped and even reversed if local governments and their planning and water agencies, real estate developers, and the environmental community work together to fully incorporate water in the development process. No one agency can be successful working alone.

Working together, the watershed can increase the understanding that unavoidable impacts do result from previous long-standing standard building practices. Embracing a sustainable development ethic steers the Watershed in a direction to meet human needs, while preserving the environment so that these needs can be met now, as well as in the indefinite future. Furthermore, ignoring the opportunities to curb the impacts of land use will result in only greater impacts tomorrow.

## Implementation Principles[1]

1. Water supply agencies should be consulted early in the land use decision-making process regarding technology, demographics and growth projections
2. City and county officials, the watershed stakeholders, Local Agency Formation Commission (LAFCO), special districts and other stakeholders sharing watersheds should collaborate to take advantage of the benefits and synergies of water resource planning at a watershed level
3. The best, multi-benefit and integrated strategies and projects should be identified and implemented before less integrated proposals, unless urgency demands otherwise
4. From start to finish, projects and programs should involve the public, build relationships, and increase the sharing of and access to information. The participatory process should focus on ensuring that all residents have access to clean, reliable and affordable water for drinking and recreation
5. Plans, programs, projects and policies should be monitored and evaluated to determine if the expected results are achieved and to improve future practices
6. Limited, accessible, low-cost, outdoor recreational opportunities

## Current Priorities and Approaches for Watershed Sustainability—OWOW 2.0

### Main objectives for the Land Use and Water Planning Pillar:

- Identify implementation actions to conduct collaboration between water and land use communities
- Prepare (as appropriate): updates to conditions of land use and resource management; implementation measures to support water savings through land use practices including low impact development; implementation of Ahwahnee Water Principles for Resource Efficient Land Use, new green building programs and onsite and offsite conservation land use practices
- Determine new opportunities to improve collaboration between water managers and land use decision makers and interaction with the land use community
- Determine what forums, policies and projects could be instituted to improve water management efforts with the land use community
- Describe how improved interaction between water managers and land use planners could advance the Plan implementation and the planning process

Despite over a decade of Integrated Regional Watershed Management planning within the SAR Watershed and numerous similar plans designed to address watershed challenges from the watershed perspective, the core challenges of population growth and expanding urbanization remain. Innovative ideas and projects have been implemented and water quality and water supplies are better managed as a result. However, key challenges remain—the integration of watershed stakeholders and an

[1] Local Government Commission, 2005. Ahwahnee Water Principles. http://www.lgc.org/ahwahnee/h2o_principles.html

overwhelming need to develop unbiased cooperative watershed implementation processes. Competing individual agency priorities can limit the level of cooperation and the resulting assemblage of feasible projects. Watershed sustainability priorities should be given greater weighting in the project conceptualization and implementation process.

### Relationship to other OWOW Pillars

#### *Land Use Links All Pillars*

Water use is dictated by land use. Likewise, water supply is a function of location, and groundwater recharge is impacted by land uses—agriculture uses water and adds nutrients, urbanization demands water for residents and businesses, and historically reduces groundwater recharge by the use of impervious cover. Wastewater treatment is designed to accommodate the needs of the watershed, which are largely a function of population and resulting development. Water quality is also directly impacted by land uses. Natural hazard risks are exacerbated by development in fault zones, flood plains, and fire-prone areas—these scenarios are made better or worse by land use decisions. Natural resources and habitat are exploited, managed, or preserved based on the allowed development, which is controlled by land use decisions. Energy use is a function of land use characteristics and the infrastructure required to support the developed areas—suburban sprawl leads to more land used for roadways and imported water requires transport systems. These choices lead to relative levels of energy use, limit energy efficiency for the watershed, and determine greenhouse gas emissions from the watershed that drive climate change. Finally, government oversight tries to reduce undue environmental degradation and minimize health risks, but works within a context of existing land uses and ongoing land use demands. Economically disadvantaged communities are a consequence of ongoing land use decisions and policies.

## Current Land Development Planning, Design, and Approval Processes

### Historical and Current Conditions of Land Use

Historical documents describe years of sustainable land use practices in the SAR Watershed by native tribes, followed by the California missions that established the first significant rangelands and the first agricultural production in the region. A steady wave of migration from other regions of the country and abroad continued, and accelerated during the construction of the railroads in the years between 1861 and 1900, following the path of available water supplies needed to operate the steam engines. From the top to the bottom of the watershed, the history of small towns that became respectably sized cities is linked to the arrival of thousands of permanent railroad jobs. Readily available water supplies then fueled the development of a vibrant agricultural community, including a large citrus industry, dependent on irrigation.

Growth throughout the watershed stagnated during the Great Depression, but World War II caused military installations and industrial war suppliers to move further inland, along with a major wave of migration. Residential and commercial development were greatly expanded in the watershed by the soldiers returning from the Pacific Theater of World War II-they relocated throughout the nation including Southern California where they had trained or been stationed at military bases.

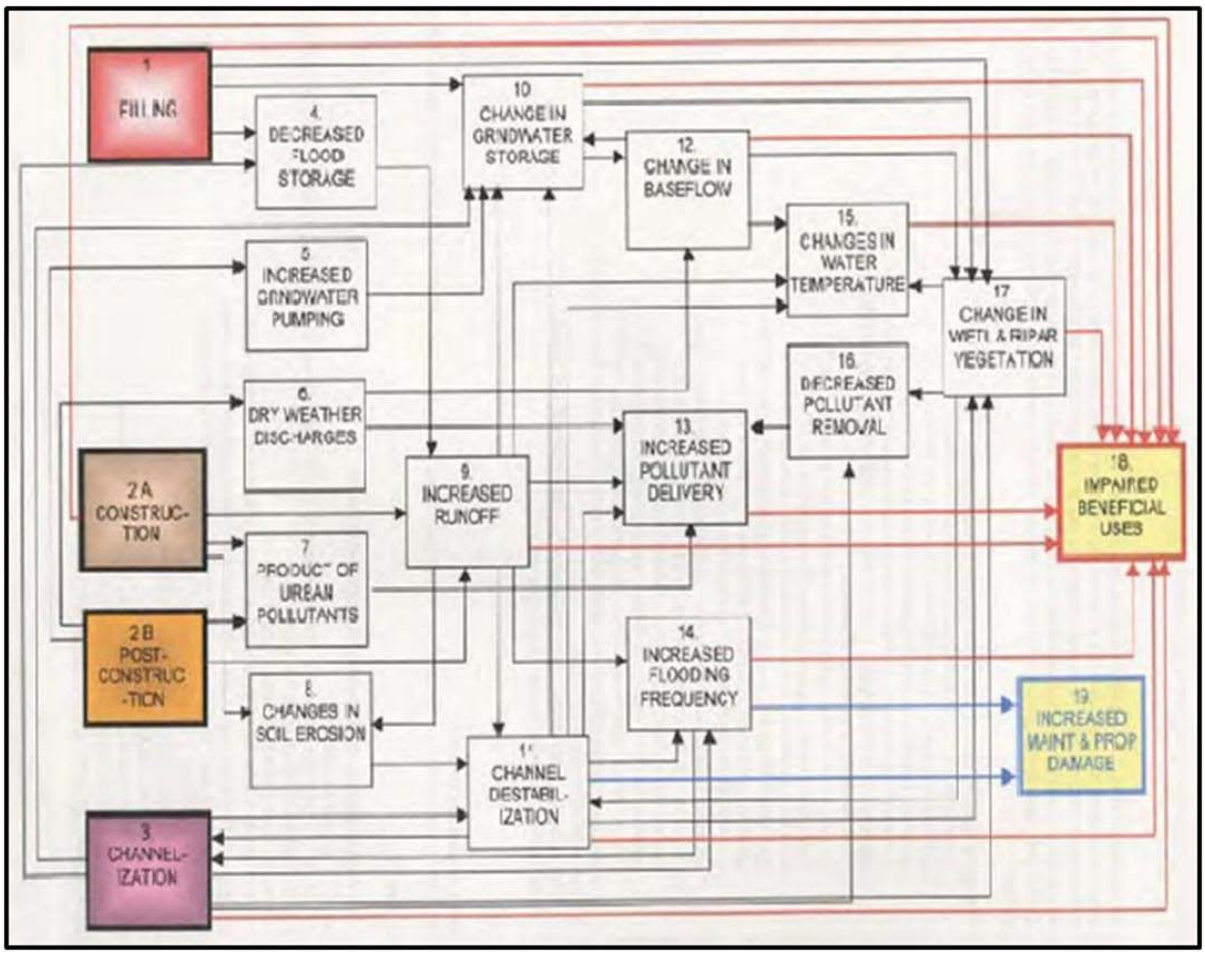
Demographic patterns clearly reflect an internal migration pattern from west to east in the Watershed that began when coastal property become too expensive for many prospective buyers, driving population further inland in search of affordable homes and land. The construction of the freeway system was enthusiastically welcomed in Riverside and San Bernardino Counties where the new link to robust job markets on the coast and in Los Angeles triggered the growth of suburbs that primarily served as bedroom communities for commuters.

Land use patterns show the expansion from locations with direct access to surface water to places that could be served by gravity-fed irrigation ditches and canals. Land use intensified in areas where drilling a private well was affordable until the critical mass of urban and agriculture water users prompted the establishment of private water companies, irrigation districts, and municipal water districts that could tap the groundwater and build systems to deliver the water directly to customers.

Concerns over reliable water supplies to sustain future land uses led to decades of water rights disputes in the courts between downstream and upstream water agencies in the watershed. By the time the State and Federal environmental protection regulations were established in the 1970's, consumptive land use patterns in the Watershed had dramatically decreased the quality and quantity of open space, and surface waters and groundwater had been severely impaired by practices of the time.

## Management of Land Resource

The sole authority of cities and counties to regulate land use in their own jurisdiction is deeply anchored in California history and cherished by local communities. Local governments have focused on sustaining a robust economy through land use decisions that contribute to construction of infrastructure, and generating local government revenues that cover the costs of city and county services that protect the lives and property of their constituents.



## Regional Strengths, Threats, and Weaknesses of Land Use

The increase in hard surfacing and flood control over decades of land use practices in the watershed has changed stormwater runoff patterns resulting in a threat to the sustainability of regional groundwater basins losing historical recharge capacity. For example, the Chino Basin Watermaster estimates that over 40,000 acre-feet/year (AFY) of groundwater recharge have been lost on average since land use practices began increasing impervious surfaces.

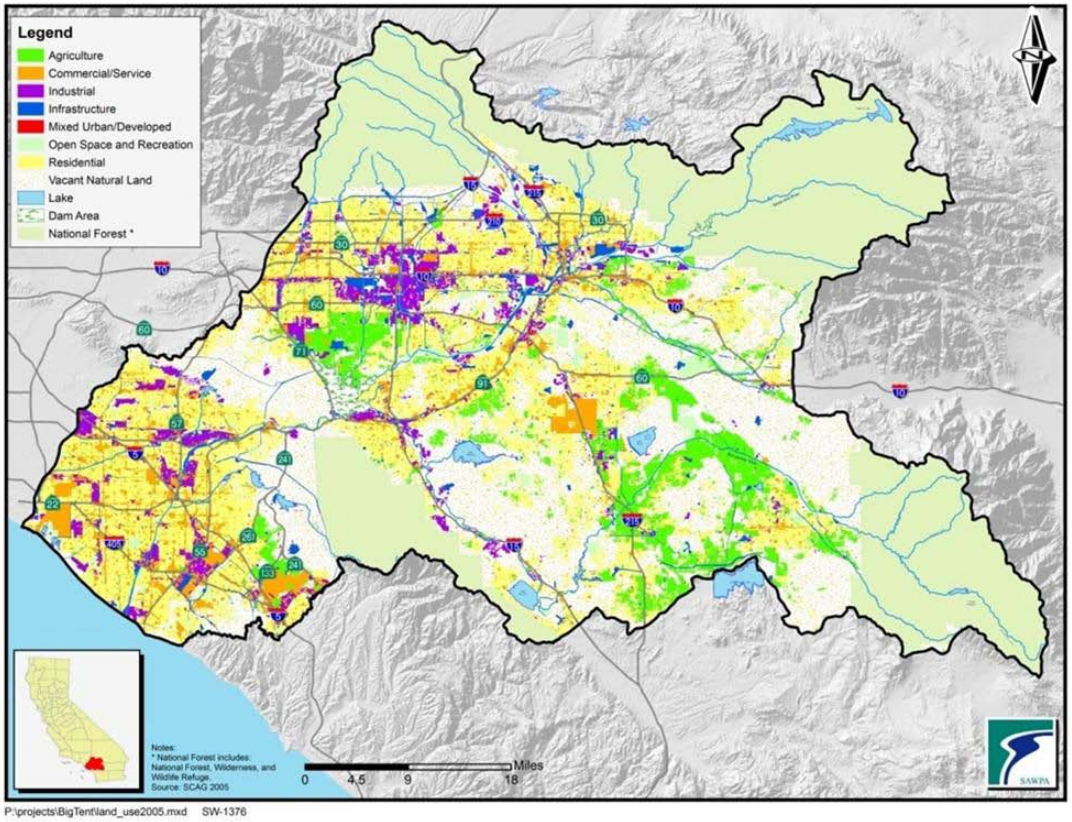
Various studies have demonstrated a strong correlation between the impervious cover in a watershed and reductions in water supply sustainability. When impervious cover exceeds 10% of total watershed area, there is typically a decrease in groundwater recharge and an increase in 1-2 year frequency flood events, decreased baseflow, and increased pollutant discharges into surface waters.

**Figure 5.7-1,** developed by the State Water Resources Control Board (SWRCB), illustrates the potential effects of development on the beneficial uses of water from a science-based perspective. All of these effects are present in varying degrees throughout the developed watershed.

**Figure 5.7-1 Potential Effects of Development of Beneficial Uses**
**(Source: State Water Resources Control Board)**

Drawing on the most recent land use maps available from the Southern California Association of Governments (SCAG), **Figure 5.7-2** reflects the collective outcome of land use planning and decisions in the Watershed that, over time, has shrunk the footprint of agriculture, open space and recreation, while the areas consumed by new residential, commercial, and industrial developments have expanded. **Figure 5.7-3** projects specific areas of population increase from 2008 to 2035 and pinpoints locations where future land use decisions will need to address a robust economy with new jobs and housing for residents, as well as a sustainable water supply over a long-term planning horizon.

**Figure 5.7-2 Land Uses in the Santa Ana River**



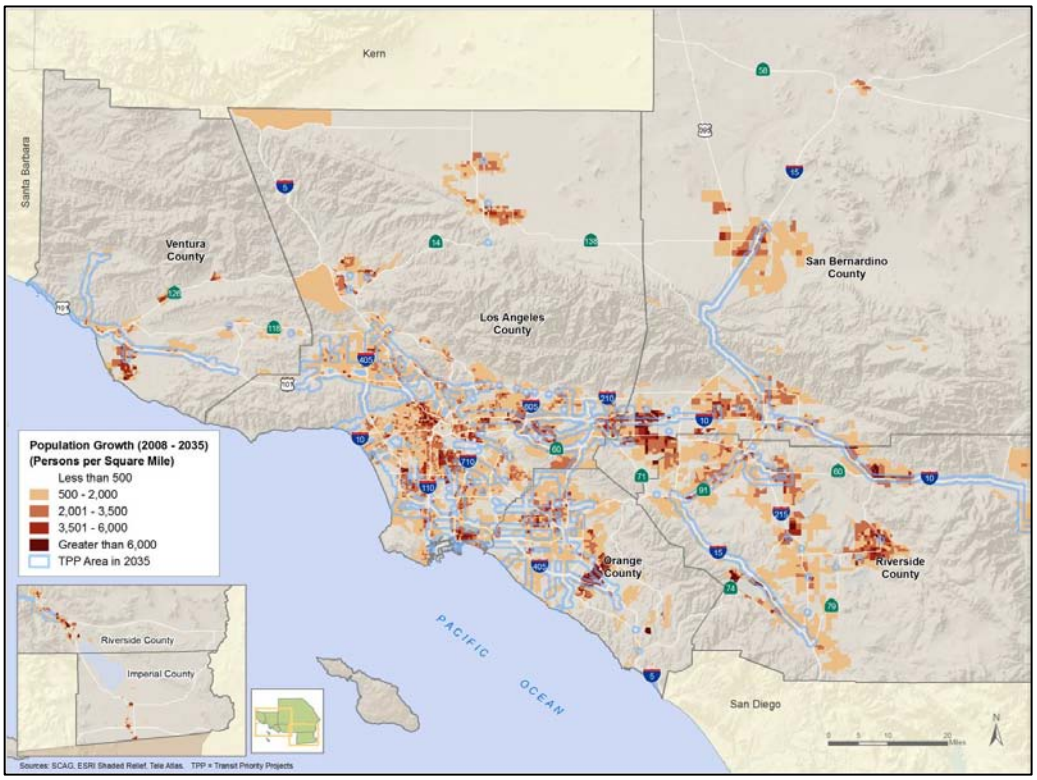


**Figure 5.7-3 Projected Population Growth 2008-2035 (SCAG RTP 2012)**

## Regional Planning and Implementation of Land Use Strategies

### *Compass Blueprint*

The Compass Blueprint was developed by SCAG in companionship with the 2003 Regional Transportation Plan (RTP) and it continued as a companion to the 2008 RTP. The 2008 RTP recognized "The centrifugal force of growth that continues to push the development footprint of the urbanized area outward. At the same time, pushing back on dispersed development are natural barriers, financial constraints to pay for outward expansion, and public resistance to unsustainable 'leap frog' growth into green fields and sensitive habitat areas. Nearly all natural locations for urban development have been consumed, leaving us with hard choices about how we are to grow and change to meet the demands of the future."

The Compass Blueprint recommended implementation of integrated land use and transportation planning in the local communities of the Southern California region to accommodate the growth forecasted over the next 25 years in an environmentally sustainable manner.

Working with stakeholders in each county, the regional planning agencies that serve as Council of Governments for Orange, Riverside, and San Bernardino Counties developed the Compass Blueprint. The Compass Blueprint 2% strategy envisions the direction of future development in strategic opportunity areas (SACs) that do not exceed 2% of the region's land resources. The Compass effort also educated stakeholders regarding alternative development that is more compact and more sustainable. A series of maps identified SACs in each county (**Figure 5.7-4A** to **Figure 5.7-4C**). The Opportunity Areas are shown as colored areas within a blue perimeter line. Substantial future development is anticipated to happen around transit hubs, railway stations, major bus stations, and along transit corridors. The maps point to modest changes in current land use and transportation trends on only 2% of the land area of the region. Efforts already are underway to reduce the quantity of low-density development in a number of the Opportunity Areas.

**Figure 5.7-4a SCAG Compass Blueprint Strategic Opportunity Areas – SANBAG**

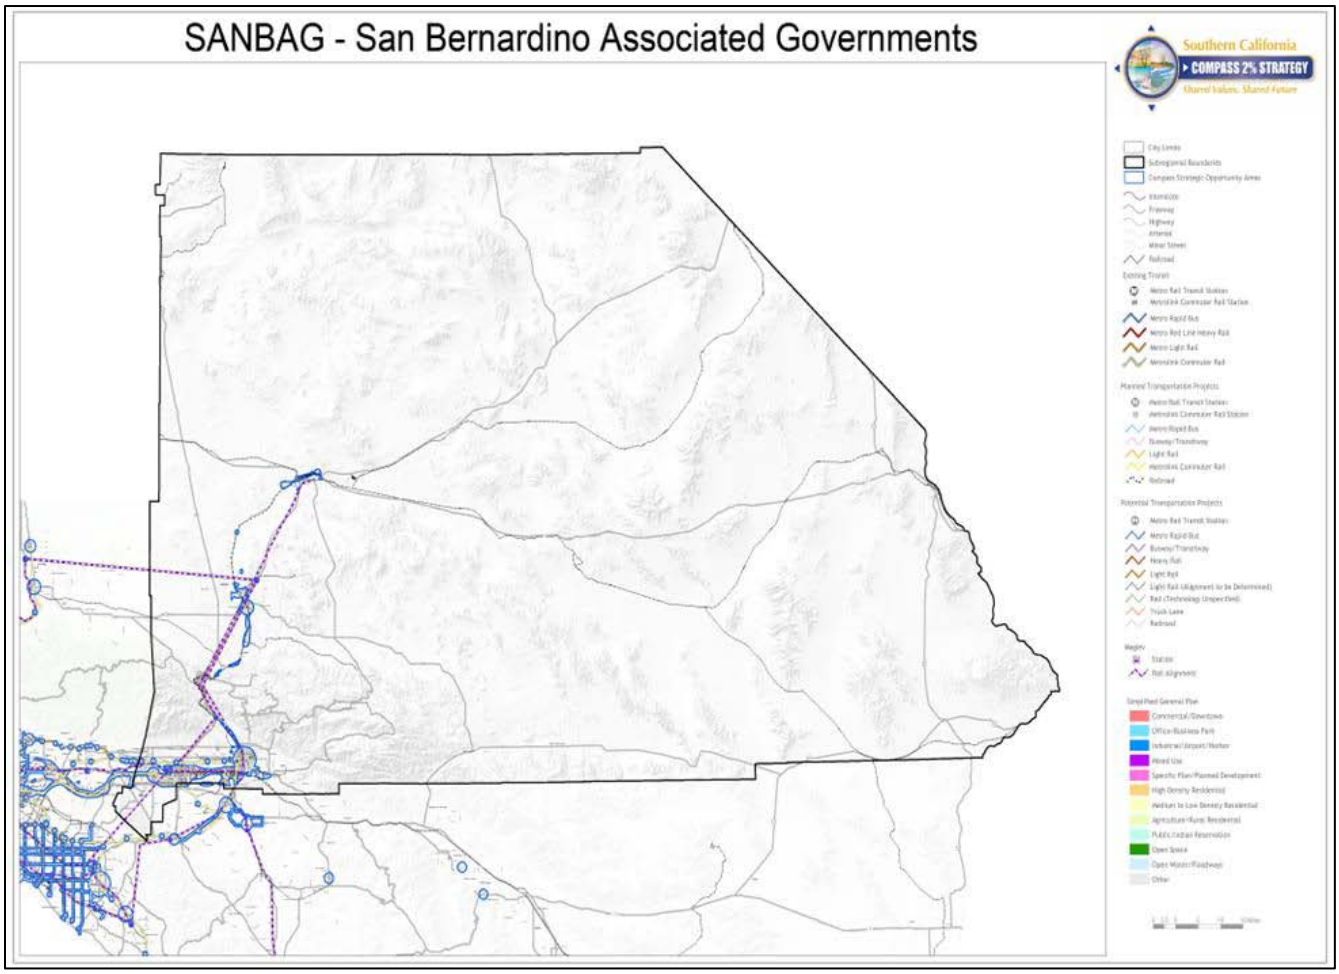

**Figure 5.7-4b SCAG Compass Blueprint Strategic Opportunity Areas - OCCOG**

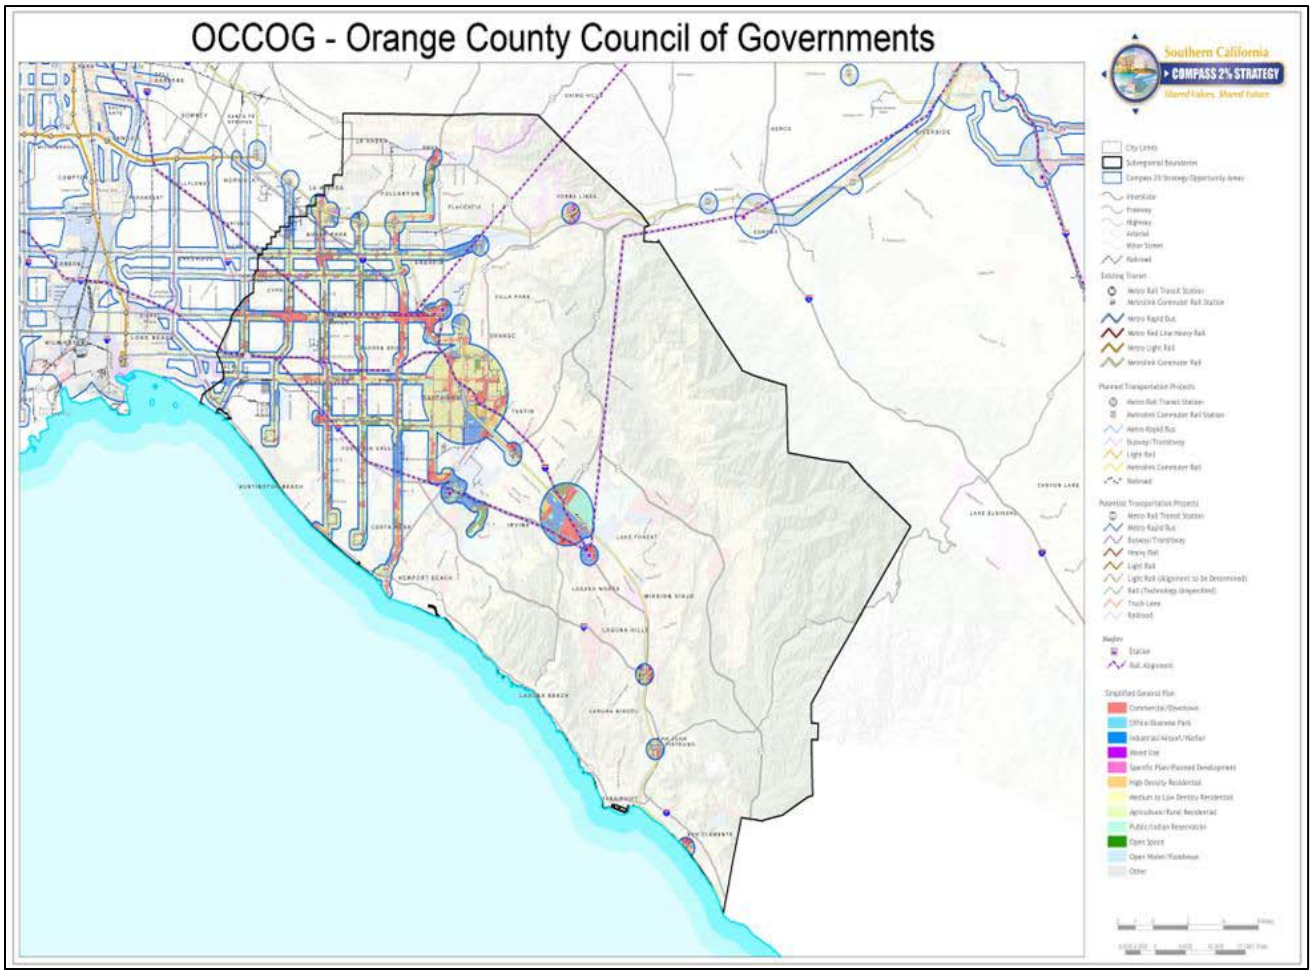

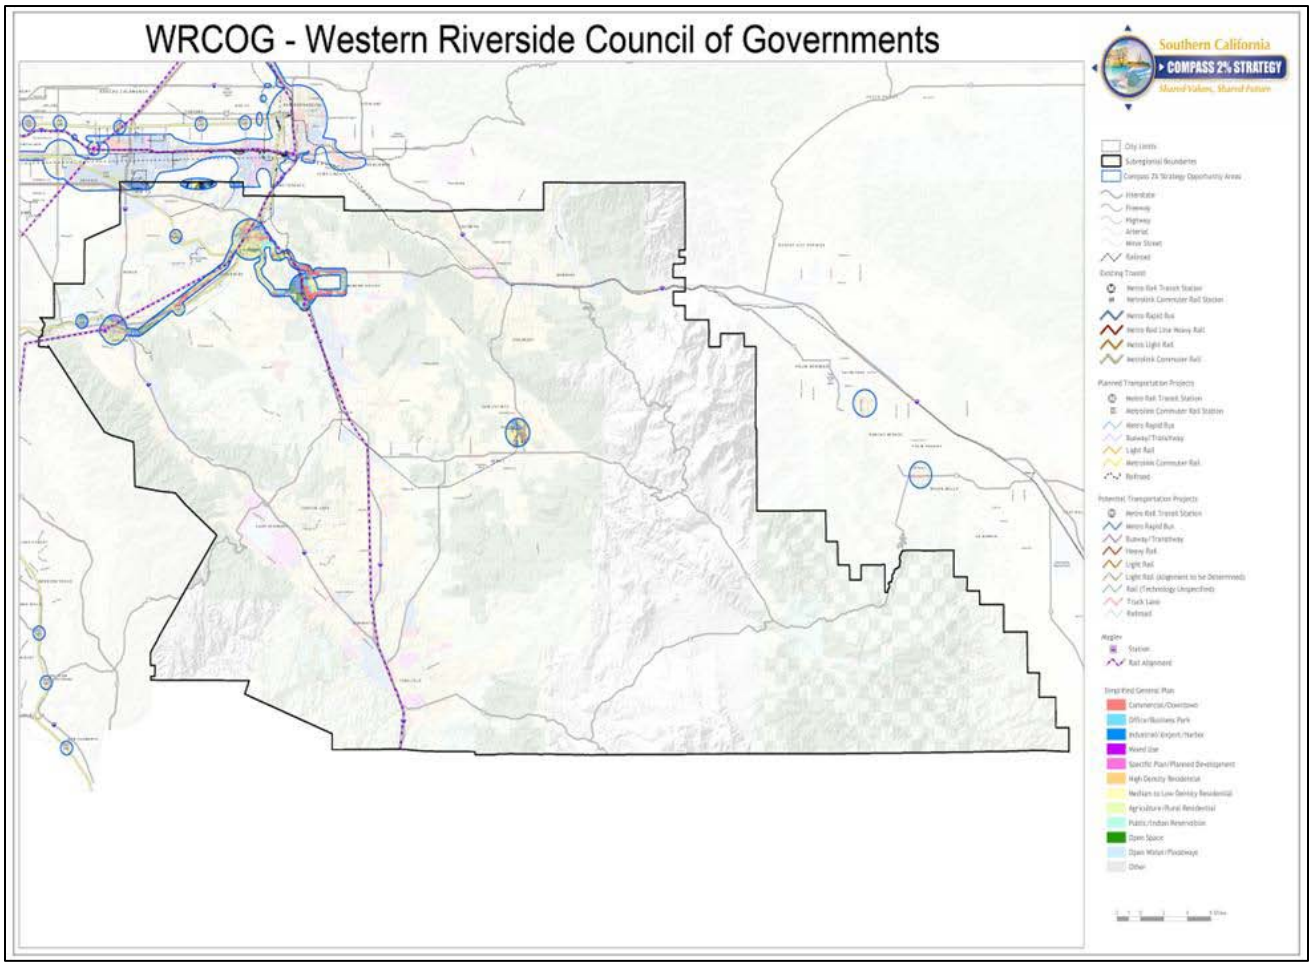

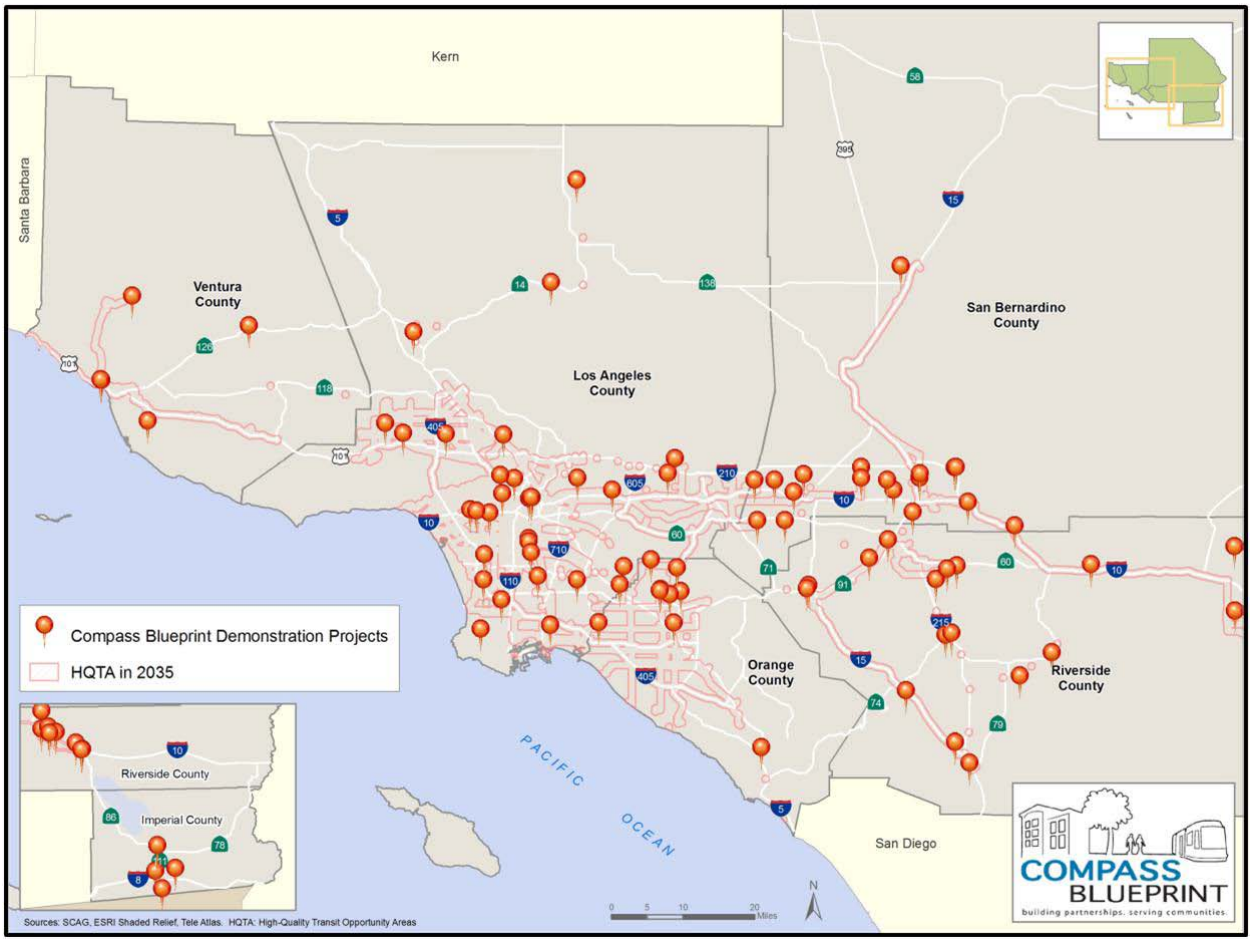

**Figure 5.7-4c SCAG Compass Blueprint Strategic Opportunity Areas – WRCOG**

Higher density development that is compact, mixed use, walkable, and transit-oriented not only preserves open lands that absorb water to the maximum extent possible, but minimizes automobile generated urban runoff pollutants that degrade both surface and ground water quality.

The Compass Blueprint used four (4) guiding principles: "Mobility, Livability, Prosperity and Sustainability." Since 2004, Compass Blueprint has supported integrated land use and transportation planning through incentive funding of over $10.5 million for 132 demonstration projects in the SCAG Region. These are voluntary SCAG/local government partnerships that use innovative approaches to work with local plans and implement regional priorities. Projects include transit-oriented development plans, downtown revitalization efforts, low-income community visioning, and other projects that support local and regional goals. **Figure 5.7-5** shows all completed Compass Blueprint Demonstration Projects, including thirty projects located within the SAR Watershed. (See 2012 SCAG RTP, Appendix: SCS Background Documentation for project list. Also see interactive project map at: http://maps.scag.ca.gov/cbp/

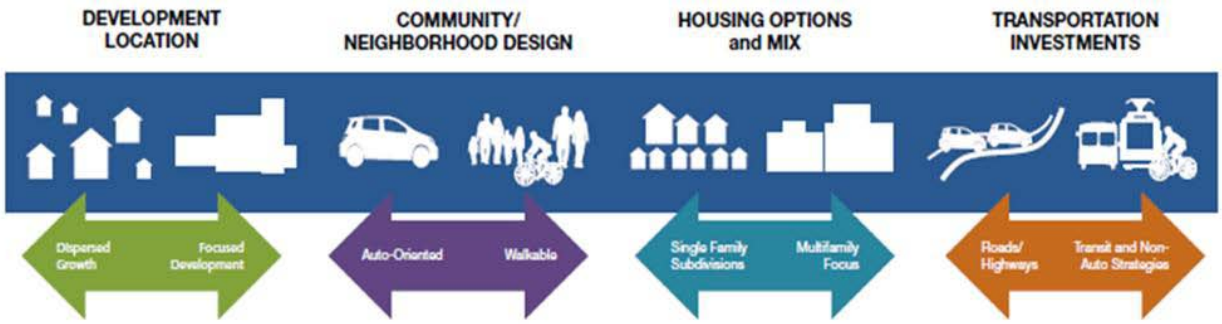
**Figure 5.7-5 SCAG Compass Blueprint Demonstration Projects and HQTA Projected for 2035**

Future Demonstration Projects throughout the region will encourage implementation of sustainability principles by focusing on regionally-significant local plans that directly implement the Sustainable Communities Strategy (SCS) and its goal of translating policy to on-the-ground land use changes and multi-modal transportation improvements. Concurrently, Compass Blueprint will further incentivize local implementation of the SCS through the Compass Blueprint Awards Program, and through the "Toolbox Tuesdays" program offering free, monthly, professional training events for local planners.

### *Local Sustainability Planning Tool*

The SCAG 2012 RTP was developed with support from the Local Sustainability Planning Tool (LSPT), a GIS tool that allows users to evaluate various development scenarios and potential impacts **(Figure 5.7-6A and 6B).** The LSPT is a sketch planning tool that can be used by local jurisdictions and members of the public to analyze the impact of different land use scenarios on vehicle ownership, vehicle miles traveled, mode-use, and their associated effects on GHG emissions. (See http://rtpscs.scag.ca.gov/Pages/Local-Sustainability-Planning-Tool.aspx for more information or to access the LSPT.)

**Figure 5.7-6a SCAG RTP Workshop Scenario Elements**



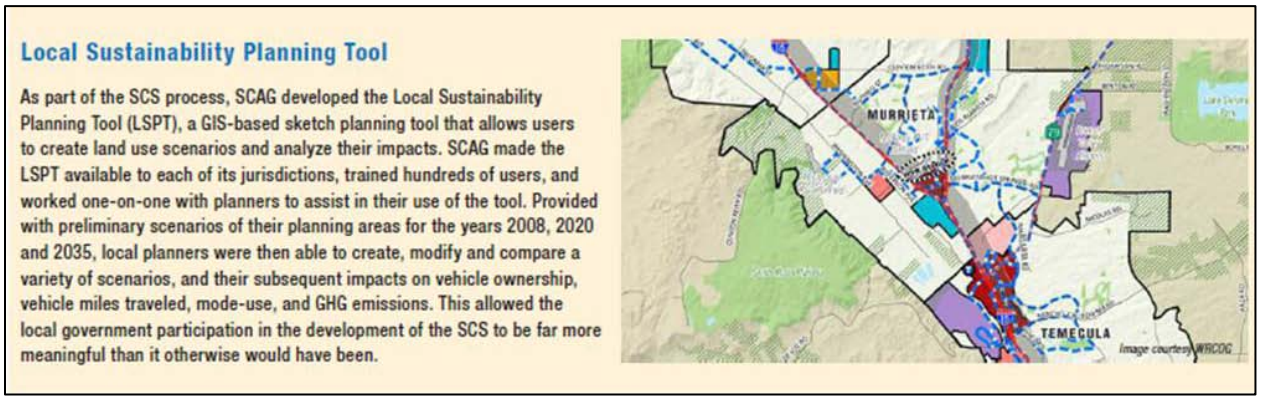


**Figure 5.7-6b SCAG Local Sustainability Planning Tool ( SCAG 21012 RTP)**

The implementation of land planning relies on three primary tools authorized in California Government Code (CA Code): the General Plan (Section 65300 et seq.) and Specific Plans; the zoning ordinance (Section 65850 et seq.); and the Subdivision Map Act (Section 66410 et seq.)[2].

### *General Plans*

General Plans include development goals and policies and lay the foundation for land use decisions made by planning commissions, city councils, or board of supervisors. General Plans must contain text sections and maps or diagrams illustrating the general distribution of land uses, circulation systems,

[2] Fulton, William, 1999. Guide to California Planning, Second Edition. Point Arena, California, Solano Press Books.

open space, environmental hazard areas, and other policy statements that can be illustrated. General Plans must contain seven mandatory elements: circulation, conservation, housing, land use, noise, open-space, and safety. Cities and counties could adopt an optional water element in their general plans, but few have done so. Instead, water has typically been addressed in the mandatory conservation element or in optional natural resources or public facilities elements. Commonly, water is addressed only in terms of water supply and/or water conservation.[3] CA Code (65302.2) requires General Plans adopted or revised after January 1, 1996, to consider any applicable Urban Water Management Plans.

General Plans can be amended four times per year, and multiple individual changes can comprise each amendment. Although not required, guidance is available for preparing a Water Element[4]. Few jurisdictions in California have prepared Water Elements for their general plan (see Merced County for one example).[5] Also, "The Department of Water Resources or the Central Valley Flood Protection Board, as appropriate, and the Department of Fish and Game may develop site design and planning policies to assist local agencies which request help in implementing the general plan guidelines for meeting flood control objectives and other land management needs." (CA Code 65303.4)

Discussions with the Land Use and Water Planning Pillar noted that there are contrary attitudes about the effectiveness of General Plans among the watershed stakeholders. Local governments, who approve the plans, tend to view them favorably as dynamic tools for planning land use because city councils or board of supervisors have the capacity to approve General Plan Amendments as deemed appropriate. On the other hand, local residents and environmental organizations voice frustration with General Plans that in practice are not routinely "implemented over time for the physical development of the communities", but rather serve as convenient placeholder planning documents for processing routine General Plan Amendments that expand land use.

### *Specific Plans*[6]

Specific plans are flexible and scalable by design and can be used in different ways to implement LID and watershed protection priorities. If adopted by resolution, a specific plan is a policy document. If adopted by ordinance, a specific plan can be a regulatory document. An overlay specific plan could be adopted either by resolution or ordinance to address only the watershed protection issues. Alternatively, a specific plan could be adopted to address the comprehensive development or redevelopment of a defined area and include watershed protection requirements among the standards

[5] Merced County Water Element draft: June 2011: http://www.co.merced.ca.us/pdfs/planning/generalplan/2030sections/mcgpu_2030gp_part_ii_12_water_pcrd_2011_06_14.pdf

[6] Appendix B: California Planning and Regulatory Framework for LID. Low Impact Development Manual for Southern California, 2010. Low Impact Development Center; https://www.casqa.org/LinkClick.aspx?fileticket=zA3DaxiwHtE%3d&tabid=242

and implementation measures applicable to the area. The Land Use and Water Planning Pillar stakeholders support the expanded use of Specific Plans as Watershed Planning Tools.

### *Zoning Ordinances*

CA Code Section 65850 authorizes zoning as a regulatory mechanism to implement general plans. Zoning is adopted by ordinances and must be consistent with general plans. Zoning requires compliance on a lot-by-lot basis with specific enforceable standards. Zoning ordinances specify categories of land use and associated standards such as minimum lot size, maximum building heights, and minimum building setbacks. Zoning ordinances can include overlay zones that provide additional standards for specified areas such as historic districts, wetlands, and other areas deemed to require extra protection. [2] AB 1881 required California cities to adopt landscaping ordinances to improve water conservation through drought-tolerant landscaping and effective irrigation control systems.

### *Subdivision Map Act*

Any subdivision of land for sale or financing requires local government approval through adopted subdivision regulations required by state law. Subdivision approvals can be granted by local Planning Commissions or may also require approval by local government councils or boards. Such approvals offer an opportunity for local government to require conditions of approval for land development, including water supply, water quality, habitat conservation, or other watershed-based requirements.

### *CEQA*

The California Environmental Quality Act (CEQA), is not a planning law as such, but has significantly influenced land use since it was passed in 1970. "By law CEQA has four functions:

1. To inform decision-makers about significant environmental impacts;
2. To identify ways environmental damage can be avoided;
3. To prevent avoidable environmental damage;
4. To disclose to the public why a project is approved even if it leads to environmental damage."[7]

The ideal timeframe for CEQA implementation is as early in the planning process as possible to "enable environmental considerations to influence project program and design and yet late enough to provide meaningful information for environmental assessment" [CA Code §15004(b)]. Since the earliest planning stage is the development of the applicable General Plan, Water and Land Use considerations should be incorporated into general plans in California. Any subsequent municipal planning must be consistent with a municipality's general plan. Therefore, incorporation of water and land use issues into general plans would provide support at the foundational level of development planning, and would serve to link LID with CEQA Guidelines.[2] The requirements of the National Environmental Policy Act (NEPA) were patterned after CEQA, and only apply to projects with federal involvement. Therefore, compliance with CEQA is typically sufficient in substance to comply with NEPA, although NEPA compliance may require a longer timeline.

[7] Fulton, William, 1999. Guide to California Planning, Second Edition. Point Arena, California, Solano Press Books. Chapter 9.

### CEQA Incentive[8]

SB 375 provides incentives in the form of CEQA streamlining to encourage community design that supports reduction in per capita GHG emissions. Generally, two types of projects are eligible for streamlined CEQA review once a compliant RTP/SCS has been adopted: (1) residential/mixed use projects (consistent with the SCS) or (2) a Transit Priority Project (TPP). See Appendix: SCS Background Documentation for more information on CEQA streamlining incentives through SB 375.

#### *Development codes*

Development codes typically combine zoning ordinances, subdivision regulations, design review guidelines, and related planning requirements.[1] Recently developed CalGreen building codes are now required.

As of January 1, 2011, "California requires new buildings to reduce water consumption, employ building commissioning to increase building system efficiencies, divert construction waste from landfills, and install low pollutant emitting finish materials. CALGreen's mandatory measures establish a minimum for green construction practices, and incorporate environmentally responsible buildings into California cities without significantly driving up construction costs in a slow economy.

CALGreen has approximately 52 nonresidential mandatory measures and an additional 130 provisions that have been placed in the appendix for optional use. Some key mandatory measures for commercial occupancies include specified parking for clean air vehicles, a 20% reduction of potable water use within buildings, a 50% construction waste diversion from landfills, use of building finish materials that emit low levels of volatile organic compounds, and commissioning for new, nonresidential buildings over 10,000 square feet."[9]

## OWOW and Land Use Planning Interaction

There are a variety of innovative collaborations that already exist between water supply agencies and other public agencies that are producing mutually-beneficial and cost-effective results, as demonstrated in the Plan. However, opportunities remain for water agencies to develop more effective partnerships with local governments, developers and environmental organizations that will leverage funds, resources and expertise.

As previously described, the OWOW Plan was developed in an open, multi-jurisdictional and multidisciplinary process in which the interests of all stakeholders in the watershed were considered. The Steering Committee and the Pillars included representatives not only from water agencies, but from cities and counties, the development community, and a host of non-governmental organizations. The resulting Plan: (1) links the need for sufficient and clean water with land use, environmental protection, and the need for economic development; (2) and increases understanding of the link between water resources and land use for both land use planning and water agencies. More comprehensive

[8] SCAG 2012. Regional Transportation Plan 2012-2035: Sustainable Communities Strategy. http://www.scagrtp.net/

[9] The 2010 California Green Building Standards Code. http://www.bsc.ca.gov/Home/CALGreen.aspx

understanding creates a perspective of land use planning that includes new development, open space for parks, recreation and environmental services, such as habitat and water filtration and natural treatment. Furthermore, the OWOW process strengthens interactions between water agencies and land use planning entities into the future.

Incorporating water use considerations into land use planning will be required to meet the requirements on Senate Bill (SB) 7, which requires urban water agencies to reduce per capita consumption 20% by 2020. Considering that outdoor use (i.e. landscaping) accounts for at least half of typical water use, land use decisions will have tremendous impact on future water conservation efforts.

The following sections describe ongoing efforts in the region to simultaneously address land use and water planning:

### *Working with Residential, Commercial and Industrial Developers*

Water supply agencies, including the Metropolitan Water District of Southern California (MWDSC), have been investing in landscape water use efficiency projects with homebuilders for several years.

As of January 2010, Assembly Bill (AB) 1881 required local governments to adopt the State's Model Water Efficient Landscape Ordinance or equivalent ordinance, and required public and private development projects to submit water efficient landscape plans for areas equal or greater than 2,500 square feet. AB1881 institutionalizes the incorporation of water efficient landscaping into new development at the State level. Stakeholders in the Chino Basin developed an AB1881-equivalent landscape ordinance prior to the 2010 deadline as a locally-tailored alternative.

In addition to the accomplishments to be provided by AB1881, residential, commercial, and industrial developers have been working to support critical aspects of integrated regional water management, such as:

- Supporting LID site designs that reverse the conventional concept of stormwater runoff as a waste needed to be conveyed offsite as rapidly as possible, to recognizing stormwater as an essential resource to be captured for groundwater recharge or other use. Implementation of LID techniques also reduces pollutants in stormwater, including metals, nutrients, pesticides, total dissolved solids, petroleum hydrocarbons, and bacterial contaminants.
- Reducing the proportion of impervious surfaces in new developments by installing green roofs or rainfall-capturing roofs, and pervious pavement for parking lots, sidewalks, plazas and other similar uses.

### *Working with Local Governments*

Water supply agencies, such as MWDSC, continue to expand investment of resources in water-efficient, highly visible public landscaping projects in cooperation with local governments in the watershed. Unfortunately, investments to date have yet to create the critical mass of water-use efficient landscapes necessary to prompt the public toward a dramatic paradigm shift. Considerable additional investment is

necessary to reduce unreasonable water waste and meet SB 7 requirement of 20% reduction in per capita water use by 2020.

Obsolete land use practices present in visible public places that employ wasteful water use practices should be prioritized for investment to be retrofitted and transformed into examples of water use efficiency and livability.

The outcome of investing resources in this manner offers the benefits of:

- Increasing the conservation of potable water supplies that are currently dedicated to irrigating public landscapes that lack water use efficiencies
- Reducing the portfolio of negative images of public agencies wasting water
- Educating the public using visible public places with signage that explains the smart controllers and irrigation systems that are supporting attractive water-use-efficient landscape designs that the public would find desirable in their own homes and businesses
- Replacing impervious surfaces in public projects where flashy urban runoff is a chronic problem with attractive permeable paving illustrated with signage for the public
- Natural resources, such as wetlands, floodplains, recharge zones, riparian area preservation and restoration, open space, and native habitats, should be identified, preserved and restored as valued assets for flood protection, water quality improvement, groundwater recharge, habitat, and overall long-term water resource sustainability
- Reducing development in high risk areas prone to wildfires and post-fire debris flows that reduce the efficiency of water supply programs when foreseeable disasters do occur
- Sewering disadvantaged communities with failing septic systems that are proximate to available sewer lines where residents lack financial resources and political will

### *Working with Environmental Organizations*

Agencies and stakeholders in the Watershed have partnered with the environmental community in restoring over 3,000 acres of riparian habitat**.** These projects have increased surface water flow, replacing water hungry invasive species with native plants, and increased habitat suitability for endangered riparian species. However, water supply agencies have insufficiently invested resources working with environmental organizations in low-income communities that disproportionately lack sufficient land surfaces for the capture of stormwater from urban runoff that also can serve as open space for recreation.

The outcome of investing resources in this manner reduces stormwater pollutant loads, and serves the needs of Disadvantaged Communities.

## Regional and Watershed Examples

### University of California, Irvine Cooperative Extension LID Test Site[10]

The University of California, Irvine Cooperative Extension (UCCE) Low Impact Development (LID) Test Facility (UCCE Facility), located in Irvine, California, consists of three model residential landscapes each with a mock residence, and a fourth, undisturbed landscape **(Figure 5.7-7).** The residential landscapes were constructed with various levels of LID BMP implementation. The volume and pollutant concentration of discharges, and the percentage of runoff from various BMPs and LID systems have been monitored, and the soil type reviewed.

**Figure 5.7-7 UCCE LID Site**

The mock residences are used for equipment storage and occasionally as meeting rooms or classrooms during demonstrations of the facility. Pesticides and fertilizers were applied according to package directions, and irrigation was applied as needed to maintain the residential landscapes. The plots are each 90 feet by 45 feet, totaling 4,050 square feet. The mock residences have footprints of 576 square feet. The LID features at the four sites are described below.

[10] San Bernardino County Flood Control District Lid Guidance Manual and Training Program Monitoring Technical Memorandum Revised July 2011. Prepared by Mactec Engineering, Inc.

- Landscape A: Typical Landscape – The typical landscape was designed to represent a single-family residence in a modern development with no LID techniques implemented. This landscape was developed with a concrete driveway, landscaped grass and flowers, concrete walkways, standard roof drains, and landscape drains running to the street. Landscape A is approximately 37 percent impervious.
- Landscape B: Retrofit Landscape – The retrofit landscape consists of LID techniques that a homeowner could install on an existing residential development such as Landscape A. The driveway and walkway were constructed with pervious stone pavers, and a positive sub-drain/infiltration system was installed under the driveway. A dry-well infiltration pit, rain gutter cisterns, and minor landscaping modifications including native plant materials are additional features of the retrofit landscape. Landscape B is approximately 14-percent impervious and 23-percent semi-pervious (stone pavers).
- Landscape C: Full Implementation or Sustainable Landscape – The full implementation landscape consists of LID features such as interlocking pavers for the driveway and walkways, landscape infiltration trenches, and landscaping with low water use and native plants. Roof drains are directly connected to dry wells. This landscape was designed with the goal of minimizing runoff from irrigation and storms. Landscape C is approximately 14-percent impervious and 23-percent semipervious (stone pavers).
- Landscape D: Undisturbed Landscape – The graded lot consists of an empty, undeveloped landscape adjacent to the three residential landscape sites. This area is surrounded by a berm and is absent a driveway, walkways, a housing structure, landscape vegetation, and any LID features of the residential sites. This site was established in March 2009 and is used to represent the characteristics of pre-development land.

Drainage for the four landscapes has been designed to direct all runoff into concrete collection boxes located at the west corner of each lot. Each of the collection boxes has a sump pump connected to a flow meter. A data logger inside each mock residence records the volume of all discharges. Grab samples have been collected from the three residential landscapes and analyzed for pesticides during both dry weather and wet weather events between early 2007, late 2008, and in early 2010 for a separate perimeter study.

## Multi-Objective Stormwater Management Projects in the Chino Creek Watershed[11]

### *Chino Creek Wetlands and Educational Park*

This project, conceptually modeled after the Sepulveda Basin in Los Angeles, where a public park is a part of the flood control system, had two main objectives. The first objective was to detain, infiltrate and treat stormwater from the upper, off-site watershed and tributary areas; and the second was to be a demonstration site for different types of constructed wetlands so that developers in the area would understand the most cost-effective wetland type for their projects. Developers were very interested to learn whether there was a wetland type that had a small footprint, reasonable capital and O&M cost,

[11] SCWC, 2012. Stormwater Capture: Opportunities to Increase Water Supplies in Southern California. http://socalwater.org/images/SCWC_Stormwater_White_Paper__Case_Studies.Smaller.pdf

and was reliable over time so that regulations were met consistently. Different types of wetlands operating in parallel provided comparable treatment data.

The 22-acre wetlands and educational park serves as a demonstration area and has incorporated educational features for improving water supply, stormwater treatment and water efficiency. Educational tours are provided through a partnership between IEUA and the Santa Ana Watershed Association (SAWA) (see: http://www.ieua.org/education/docs/ChinoCreekParkBrochure.pdf) **(Figure 5.7-8).**

**Figure 5.7-8 Chino Creek Wetlands**

The park was designed to capture and infiltrate flows generated from up to a 25-year frequency design storm as well as to attenuate flows from the 100-year storm event (395 cubic feet per second (cfs)) from the upper tributary area of 700 acres.

Stormwater flow from the upper tributary area enters the Park from two reinforced concrete boxes on the north and northwest of the site. Currently, a 3 ft. x 10 ft. box culvert transports this flow under Kimball Avenue in the north location into an unlined channel and then a detention pond before entering the park for treatment.

The detention basin was designed to divide the flow into three types of wetlands:

- Subsurface flow
- Surface emergent marsh/pond habitat
- Cottonwood/Native Willow riparian channel

The park design also included small surface bioswales, in order to provide further water quality improvement and create habitat for native flora and fauna.

Both the subsurface flow and surface type of wetlands were expected to provide water quality improvement and to retain storm flows on-site. The subsurface wetlands were designed based on a pilot project that was completed at a local dairy previous to the design of the park. The Cottonwood/Native Willow riparian channel was designed to mimic natural wetlands typically found in Southern California and in this region.

The wetland basins were all designed so that grab sampling could occur and to provide electrical outlets for automatic sampling if desired. Key operations and maintenance personnel were involved in the design to promote ease of maintenance. While the site looks very organic, the entire site allows easy re-routing of flow from one basin and/or wetland to another, to facilitate maintenance.

The upland park areas have trails, habitat and open space, and were designed for detention and sheet flow of stormwater. Open areas were planted with native vegetation and mulched with compost. After traversing through the wetlands and the habitat, flow is discharged under El Prado Road and discharges as surface flow in an existing flow pattern to Chino Creek.

### *Inland Empire Utilities Agency (IEUA) Headquarters*

The IEUA Headquarters (HQ), a Leadership Energy & Environmental Design (LEED) Platinum facility, was designed to meet all LEED requirements for both site and water, including stormwater, and became a demonstration of on-site BMPs. This site is aesthetically pleasing, with outdoor opportunities for staff, including picnicking. It has provided extensive opportunities for education and public outreach, including numerous tours and demonstration visits.

The four main goals of the HQ site were determined by IEUA and by LEED Platinum certification criteria, and included:

- Maximize open space, native plants, and habitat
- Reduce stormwater
- Treat stormwater
- Use of recycled water

Maximizing open space involved conserving existing natural areas, restoring damaged areas (dairy farm activities), providing habitat and promoting biodiversity within the vicinity. The Agency reduced the

development of its footprint (site area, building footprint, future building expansion, parking lot, water feature and pavement) to exceed the local zoning open space requirement for the site by 25%. Reducing stormwater flow involved eliminating runoff and contamination and increasing on-site infiltration by limiting the disruption of natural water flows. The site was graded in such a way as to create an on-site retention basin with a capacity of 75.9 acre-feet. This was in addition to the infiltration capacity of the site itself and the parking lot. Reuse of stormwater was not done at the site, as it was seen as not cost-effective and potentially maintenance intensive.

The treatment of stormwater was accomplished by focusing on both suspended solids and phosphorus by limiting disruption of natural water flows by eliminating stormwater runoff, increasing on-site infiltration and using vegetation and the natural biota in soil to treat stormwater contaminants.

Infiltration and retention basins were used to estimate the removal of pollutants (Total Suspended Solids [TSS] and Total Phosphorus [TP]) from on-site storm runoff produced from an 85th percentile 24-hour storm event ("first flush" storm runoff). Bio-filters and bio-swales are included as pre-treatment for the infiltration/retention basins. The large wet pond is also used as a BMP facility. The majority of the parking areas have permeable surfaces which provide additional stormwater treatment, thus improving water quality.

Recycled water from the adjacent Regional Wastewater Treatment Plant No. 5 (RP-5) was considered to be a critical component for reducing water consumption and demonstrating water conservation practices. Recycled water is an important product of the Agency. Demonstrating the use of this water on grass lawns and native and California adaptive plants is still seen today as important in overcoming barriers to its use.

### *Cucamonga Creek Watershed Regional Water Quality Project*[12]

This is a unique multi-jurisdictional project to create and restore the region's native ecosystems while enhancing recreational and educational uses as part of a regional watershed management plan. Spearheaded by the City of Ontario and supported by the City of Chino, the County of San Bernardino, the Inland Empire Utilities Agencies (IEUA), the Orange County Water District (OCWD), and the United States Army Corps of Engineers (USACE), the project transforms a fallow and underutilized area within the Prado Basin to provide regional environmental and recreational benefits. The project's unique regional approach is also supported by the State Water Resources Control Board through grant funding and is an integral part of the Santa Ana Watershed Project Authority's (SAWPA) Integrated Regional Water Management Plan, "One Water, One Watershed" (OWOW).

Prado Dam was originally constructed as a flood protection project and was completed in 1941 (see Chapter 5.8, Pages 10-11 for more complete description). Although there are many benefits associated with having the dam in place and valuable habitat being developed behind the dam, it is a physical

[12] Text from City of Ontario 2013.

barrier in the Santa Ana River Channel. As such, the dam creates habitat blockage for a variety of species that rely, now or historically, on the Santa Ana River as a migratory corridor[13].

Water Quality Benefits

The Prado Basin contains some of the best and largest riparian habitat in all of Southern California. Included are threatened and endangered species such as the least Bell's vireo, arroyo chub, and Santa Ana sucker. In addition, groundwater pumped from the basin is the primary source of drinking water consumed and used in Orange County. The Santa Ana Regional Water Quality Control Board (RWQCB) has designated Cucamonga Creek/Mill Creek as impaired pursuant to Section 303(d) of the Clean Water Act. The project provides a regional approach to enhancing water quality in Prado Basin, protecting the viability of native habitat while improving groundwater quality for downstream water users.

The Cucamonga Creek Watershed encompasses approximately 77 square miles, comprised of portions of the cities of Ontario, Chino, Rancho Cucamonga, and Upland. Pollutants such as pathogens, nutrients, salinity/total dissolved solids/chlorides, and suspended solids are known to occur in these water bodies. Active and former agricultural uses and urban runoff from developed areas represent the primary contributors to the pollutants found in the watershed.

The project, proposed for completion in 2014, diverts flows from Cucamonga Creek into a series of natural water quality treatment ponds that include areas of open water and wetland vegetation. The system is designed to first remove trash and debris as water flows through a de-silting basin, then remove pollutants through natural settlement, ultraviolet light treatment, and biological activity as it travels through native wetland vegetation. The system is designed to be entirely gravity fed, requiring no manmade energy sources, thus promoting progressive water quality alternatives that advance the use of renewable, sustainable, and environmentally sensitive designs, materials and practices **(Figure 5.7-9).**

[13] Source: Comments from Anthony Spina, National Marine Fisheries Service, West Coast Region.

**Figure 5.7-9 Cucamonga Creek Wetlands**

The project is a regional natural treatment facility designed to hold and treat 160 acre-feet of water. This volume translates into treatment of 10 – 18% of all wet-weather runoff in the Cucamonga Channel watershed. In contrast, a single-function water quality project of the same size in an upstream tributary could effectively capture approximately 6% of the total wet-weather runoff from the watershed. Thus, the project is an effective means of leveraging water quality benefits for the region.

Recreational Benefits

The project's recreational plan provides for additional passive recreation opportunities in the Prado Basin by incorporating approximately 3.5 miles of hiking and equestrian trails, forming a looped trail system around vegetated and open water ponds **(Figure 5.7-10).** The proposed trail system includes benches in locations that offer vistas of the wetland ponds and the surrounding environment, providing wildlife viewing opportunities with interpretative signage. Planting will be coordinated around the benches to provide shade and increase the aesthetic character of the views. The surrounding native plantings and open water wetlands will attract numerous wildlife species, offering excellent wildlife viewing opportunities.

**Figure 5.7-10 Cucamonga Creek Time Series**

Interpretive signage is proposed at the trailheads as well as throughout the trail system to provide park users with a better understanding of the history of the area; local wildlife that might be viewed; information on native vegetation, including plant communities and individual species; and an explanation on water quality and natural treatment systems.

Consistent with the needs identified by the USACE Prado Basin Master Plan and the San Bernardino County Parks Department, the trail system will provide future trail connections for the inter-county trail system as well as the Coast to Crest Trail System intended to connect the Santa Ana River Trail from its outfall in Orange County to the mountains in San Bernardino. The new trail system will also connect to the City of Chino Urban Buffer linear park/open space (The Preserve Specific Plan, City of Chino – March 2003, Amended – January 2008).

Native Habitat Creation and Restoration Benefits

The Prado Basin currently protects 4,400 acres of native habitat. The Prado Basin also contains some of the best and largest riparian habitat in all of Southern California with more than 300 species of plants, 13 species of reptiles, 47 species of breeding birds, 11 raptor species, and 23 mammal species. Included

are threatened and endangered species such as the least Bell's vireo, arroyo chub, and Santa Ana sucker.

The Project will create 32 acres of native habitat through the use of native planting in the wetland ponds and slopes in addition to replacing non-native vegetation, agricultural lands, and disturbed areas with high quality native vegetation. The Native Habitat Plan creates several habitat types that will benefit local wildlife, including endangered species, by utilizing species that promote nesting, breeding and foraging. The Native Habitat Plan also supports the Recreation Plan by providing shade, wildlife viewing opportunities, and aesthetics.

## Low Impact Development Guidance and Training for Southern California

This project, funded under Proposition 40 and cooperatively conducted with local governments and regulatory agencies from six counties (Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura; and RWQCBs from Los Angeles, Santa Ana, and San Diego regions), began in 2006. It was led by the San Bernardino County Flood Control District with guidance from the Southern California Stormwater Monitoring Coalition (SMC), and a stakeholder-comprised Technical Advisory Committee (TAC). The project developed the Low Impact Development Manual for Southern California, which facilitates the implementation of LID techniques for projects in Southern California. It also provides guidance for municipalities, land developers, consultants and other design professionals who prepare stormwater engineering plans and specifications in Regional Water Quality Control Board Districts 4, 8 and 9 of Southern California.

The LID GTPSC also conducted several training workshops in 2007 and 2008, and transferred the final LID Manual to the California Stormwater Quality Association (CASQA) for statewide access via the World Wide Web and to steward updates and revisions to the manual over time. CASQA now hosts an LID web portal and will be developing this portal under a 2012 Proposition 84 Stormwater Grant.

Finally, the project included a monitoring element designed to evaluate the effectiveness of LID BMPs in reducing stormwater impacts. Monitoring has been underway at selected sites, although precipitation has generally been less than average, so few events have been captured. The monitoring program is currently under review by the SMC, and is expected to be refined and continued. The objective is to adaptively update the LID Manual based on actual performance of LID in the field.

## Riverside County Flood Control & Water Conservation District LID Retrofit Project

The RCFCWCD retrofitted their 15-acre headquarters near downtown Riverside with LID BMPs from their LID BMP Design Manual to showcase, learn, and gather local, real-world data of constructible LID BMPs. The Project was supported through a partnership with SAWPA and funded in part by Proposition 13 Water Bond funding administered by the SWRCB. The Project entailed construction and installation of selected LID BMPs, including porous pavers, porous concrete pavement, porous asphalt pavement, biofiltration basins, and a vegetated infiltration swale. The Project also replaced turfed landscaped areas with drought tolerant and California-friendly landscaping **(Figure 5.7-11).** The total construction cost of the Project was $ 2,557,634.36.

**Figure 5.7-11 Riverside County FC and WCD LID Testing and Demonstration Facility**

A dedicated website was developed during the project to educate the public about LID practices. The website also served as an avenue to show construction progression of the different LID BMPs. Since construction completion in 2012, the facility has welcomed and educated visitors through signs, markers, and a walking guide. The facility has also garnered several awards, including the ASCE's (Region 9, Los Angeles Section) 2012 Civil Engineering Project Improvement Award, ASCE Region 9 2012 Outstanding Stormwater Management Project, and the Southern California APWA 2012 Project of the Year in Stormwater Quality.

The project also constructed and installed a monitoring center which will allow future water quality monitoring of LID BMP influent and effluent that aims to enumerate LID BMP performance in the semi-arid Southern California climate.

## San Bernardino County Vision Water Element[14, 15]

This project is an effort to "improve countywide efforts to plan and manage water resources in San Bernardino County." The Vision: "Develop a Countywide strategy that encourages collaboration among business, residents, and water agencies that will:

- Address multiple watersheds and water agencies
- Build institutional and organizational capacity for future countywide networking efforts
- Create mutually beneficial investment opportunities to ensure adequate water supplies and quality for the future"

"Leaders from public and private water agencies, regulators, planners, education and business formed the Countywide Vision Water Element group in January 2012 and have been meeting regularly to discuss the challenges faced by the county community as it strives to meet the water needs of an ever -growing region."

"The Water Element Group recognized the need for a high-level, comprehensive look at countywide water management. With participation from water agencies throughout the County, the Water Element Group prepared an inventory of current and planned water needs and available water resources. The inventory found that more than ***enough water will exist to meet the needs of San Bernardino County residents and businesses through 2035 only if water users step-up conservation efforts and the public and local government leaders are willing to invest in projects that will store and protect additional water supplies***."

"The County Vision Water Element group will use the information contained in the inventory to promote partnerships among water agencies and other stakeholders within the county, improve water management and efficiency, protect and conserve water resources, and identify the most important next steps the group should take to further these goals."

## City of Ontario New Model Colony General Plan[16]

Since 1998, the City of Ontario has been developing a bold vision for its future growth, including the adoption of its general plan and adding 3,303 acres of former agricultural land into its sphere of influence. The City's recent plans call for 13,000 new housing units across a broad range of housing types and a mix of business spaces oriented towards three mixed-use centers that are served by pedestrian-friendly roadways and a large central park. Emphasizing connections to corridors and transit, the City is creating a major regional center for Southern California.

---

[16] SCAG 2012. Regional Transportation Plan 2012-2035: Sustainable Communities Strategy, Page 149. http://www.scagrtp.net/

## Existing Forums to Address Watershed Planning

SCAG is the Regional Transportation Planning Authority. As such, SCAG has been evaluating regional growth problems and developing guidance and approaches to implement community sustainability principles in collaboration with local governments and County Transportation Commissions (CTCs). Water quality and water supply are key sustainability considerations and are given high priority in the SCAG efforts. The Water Chapter of SCAG's 2008 Regional Comprehensive Plan (RCP)[17] (Pages 48-63) evaluates water priorities and climate change, and provides comprehensive recommendations for addressing these issues in the immediate future as related to regional growth needs.

The SCAG recommendations are entirely consistent with the OWOW Mission to develop a sustainable and adaptable watershed. For example the 2008 RCP provides the following Water Goals:

- "Develop sufficient water supplies through environmentally sustainable imports, local conservation and conjunctive use, reclamation and reuse to meet the water demands created by continuing regional growth
- Achieve water quality improvements through implementation of land use and transportation policies and programs that promote water stewardship and eliminate water impairments and waste in the region
- Foster comprehensive and collaborative watershed planning within the region that produces waterwise programs and projects with multiple benefits and ecosystem protections, integrating local government planning efforts with those of special districts, environmental advocate and other watershed stakeholders"

### *Transportation Planning[18]*

Since 2000, SCAG has worked with Southern California stakeholders to create a dynamic regional growth vision. "Charged by federal law with preparing a Regional Transportation Plan every four years, SCAG has traditionally focused most on the mobility aspects of the region's growth. Under state law, SCAG is also charged with working with its member local governments on planning for an adequate regional housing supply."

The 2012 RTP land use mitigation program includes the following types of measures:

- Encourage cities and counties to update their general plans and provide the most recent plans to SCAG
- Work with member cities to ensure that transportation projects are consistent with the RTP and general plans
- Work with cities and counties to ensure general plans reflect RTP policies

### *Water Resources in the RTP*

[17] SCAG 2008. Regional Comprehensive Plan. http://www.scag.ca.gov/rcp/pdf/finalrcp/f2008RCP_Water.pdf

[18] SCAG 2012. Regional Transportation Plan 2012-2035: Sustainable Communities Strategy. http://www.scagrtp.net/

Cumulative impacts to water resources from the growth projected in the 2012 RTP include potential water quality impairment from increased impervious surfaces; increased development in alluvial fan floodplains; and increased water demand and associated impacts. Increased greenhouse gas emissions from the transportation system impact the security and reliability of the imported water supply.
The water resources mitigation program from the 2012 RTP includes the following types of measures:

- Utilizing advanced water capture and filtration techniques, showing a preference for naturalized systems and designs, to control stormwater at the source
- Avoiding any new construction of impervious surfaces in non-urbanized areas, such as wetlands, habitat areas, parks, and near river systems
- Avoiding any new construction that provides access to flood-prone areas, such as in alluvial fans and slide zones
- Protection and preservation of existing natural flood control systems, such as wetlands and riparian buffers, and expansion of such systems in areas where they do not currently exist
- Constructing projects according to Best Management Practices for water quality protection and water conservation, including low-impact development and green building standards
- Coordinating project development and construction efforts across jurisdictional, agency, and departmental boundaries, to increase project benefits

### *Orange County Sustainable Communities Strategy (SCS)*[19]

The Orange County Council of Governments (OCCOG) developed their own SCS and entered into a *Memorandum of Understanding with SCAG specifying submission* schedules and standards for each component of the subregional SCS. While OCCOG conducted their own research and outreach to develop their SCS, they worked closely with SCAG through workshop preparation **(Figure 5.7-6a),** data and information sharing, and regular meetings. SCAG's Local Sustainability Planning Tool was also made available along with trainings and one-on-one working sessions to assist in the review and revision of the preliminary scenarios.

### *Riverside County and City Arroyo-Watershed Project*

The Riverside Arroyo/Watershed Policy Study, completed in November 2006, was a joint effort between the City of Riverside and the County of Riverside to establish a broad plan for the protection of the arroyos and other watercourses that traverse the boundary between the City and County. The study also made recommendations intended to facilitate the protection of water quality, and the augmentation of water supply for the City-County area. The study applies to a large portion of the Santa Ana Watershed area, offers a comprehensive program of water protective policies and land use/riparian and water interface design concepts, and involves two closely coordinated neighboring jurisdictions, and thus can provide a model for other jurisdictions within the OWOW Plan area, both in terms of policies and design concepts, as well as inter-jurisdictional cooperation in implementing them. The study was prepared by the County-City Arroyo/Watershed Committee (CCAC), an interdisciplinary group whose members were appointed by the Riverside City Council and the Riverside County Board of Supervisors.

[19] Orange County Sustainable Communities Strategy, June 2011. http://www.occog.com/pdf/OCSCS20110614.PDF

Many organizations contributed to the work of the CCAC, especially SAWPA, the California Department of Fish and Game, the Riverside-Corona Resource Conservation District, the Riverside County Flood Control and Water Conservation District, SAWA, Riverside Land Conservancy, UCR (logistical research), and Mt. San Jacinto College.

The recommendations of the CCAC in the Riverside Arroyo/Watershed Policy Study were intended to result in implementing amendments to both the City's and County's General Plans, their zoning ordinances, grading ordinances, and other ordinances and policies under the charge of the those jurisdictions' Planning, Transportation, Flood Control, Health, Agricultural Commissioner, and Parks offices/departments. Study recommendations have been incorporated into the City's General Plan and ordinances, and are in the process of being similarly adopted by the County as part of a major, comprehensive General Plan update.

The Study's policies address a wide variety of land use and watershed issues, including (but not limited to): building/graded area setbacks from arroyos; illegal grading policies; a GIS tool for mapping watercourse features requiring protection; golf course setbacks from arroyos; a model policy associating slope, setbacks from arroyos, and lot size; requirements for septic tanks; policies for bridging, rather than grading road (with culverts) arroyo crossings; water quality protection policies that emphasize multiple, compatible uses, using storm water management and runoff as design elements; requirements for domestic and farm animals and livestock grazing in and near arroyos; restrictions on nurseries in and near arroyos; and restrictions on the location of utility facilities in and near arroyos. The CCAC GIS Watercourse Layer Map of arroyos and watercourses in the project area was accompanied by 19 specific recommendations for proactive and sensitive development that occurs near watercourses and arroyos[20].

The Study identifies several "next" steps to carry forth the benefits of its approach, including:

- Ensure the incorporation of the study's concepts on a long-term basis into local general plans and zoning ordinances
- Thorough, adequate assessments of at-risk land use conversions in and near arroyos;
- The establishment of various levels of governance and coordination on a watershed-wide basis; and public education about the study and the public's role in assisting in its implementation
- Conduct an objective evaluation of the effectiveness of existing protection measures and their implementation

[20] Riverside Arroyo Watershed Policy Study: Recommendations, 2006. Prepared by the County/City Arroyo-Watershed Committee. http://www.rctlma.org/planning/content/geninfo/ccacpolicystudy.pdf

Benefits to implementing the recommended actions included:

1. ***Create dynamic scenarios*** for protecting watercourses and other watershed values described in General Plan vision statements by applying policy recommendations in combination with the new GIS Watercourse Protection Map
2. ***Reduce the occurrence of code violations*** due to consistent and clear rules across boundaries for developers, land owners, staff, and land use decision-makers
3. ***Lessen potential for citizen complaints, litigation, and development delays*** over code violations due to consistent and clear rules across boundaries and an approach that is integrative in nature
4. ***Enhance public safety*** through incorporation of BMPs that reduce downstream flooding, landslides and erosion, and water quality impacts from new and existing development
5. ***Lower flood management and water quality management costs*** through controlling runoff and water quality at the source while providing multiple benefits that include habitat protection, recreation enhancement, aesthetic improvements, and high quality development
6. ***Improve neighborhood and community quality of life*** through increased opportunities for recreation, significant protection and enhancement of the aesthetic quality of Riverside, and high quality development
7. ***Enhance funding opportunities*** for acquiring State and Federal funds, including the recently passed Proposition 84 water bond funds, to make flood management and water quality protection improvements that are consistent with the CCAC policy recommendations and design guidelines

### *Newport Bay Conservancy*

The Newport Bay Conservancy is developing a Concept Book for the Newport Bay Watershed that is intended to inform land use planning in the region and inform how it could be used to support water resource restoration goals. The project will first identify the ecological and water resource infrastructure goals that enable cross-agency buy in. It will then look for land use design opportunities throughout the watershed for implementing those goals in their entirety. The idea is to paint a picture for what complete resource integration and restoration would look like in the urban landscape and demonstrate how it could be integrated into other urban planning objectives such as transportation planning, community beautification and economic development. In this way, water resource restoration can become a part of the bigger picture of creating and enhancing community identity while also achieving technical environmental goals.

### *OWOW Influence on Planning Commissions*

The OWOW Plan can influence local Planning Commissions indirectly, through project consideration and selection for funding and outreach from OWOW Pillar participants. Projects identified and recommended by the Plan could be communicated to local Planning agencies for consideration through brochures or other outreach. The SAWPA Commission and OWOW Steering Committee include local decision makers and elevate the level of awareness of watershed priorities.

### *General Plan Water Element*

Current CA Code does not require General Plans to include a "water element." A water element has been strongly recommended as a fundamental approach to incorporate water issues into the planning process. Therefore, the 2003 General Plan Guidelines from the California Office of Planning Research the included guidelines for an optional water element (Page 128) and a flood management element (Page 116) (OPR General Plan Guideline are currently in the process of being updated. See: http://opr.ca.gov/docs/GPG_2013_One_Pager.pdf).

### *Model Ordinance Governing Planning for Watershed Sustainability*

Local government ordinances and implementing codes are more directly implemented than higher-level planning documents. Many local governments have adopted ordinances to address specific environmental concerns, including water supply and conservation, water quality, and sustainable development practices. MS4 Permits in the watershed require all Permittees to "maintain adequate legal authority to control the discharge of pollutants to their MS4s through ordinance… and enforce these authorities." MS4 Permittees in the watershed have complied by adopting ordinances based on regionally developed model stormwater ordinances. All watershed cities were required by AB1881 to adopt a landscape ordinance by January 2010—most cities complied through the use of the DWR model ordinance or regional model ordinances.

### *Los Angeles County Ordinance Example*[21]

"The County of Los Angeles added a chapter to the Title 12 Environmental Protection of the Los Angeles County Code. This chapter is entitled Low Impact Development Standards; its stated purpose is to require the use of LID principles in development projects. The chapter states, *"LID builds on conventional design strategies by utilizing every softscape and hardscape surface in the development to perform a beneficial hydrologic function by retaining, detaining, storing, changing the timing of, or filtering stormwater and urban runoff."* The ordinance requires comprehensive LID plans that demonstrate compliance with an LID Standards Manual to be submitted for review and approval by the Department of Public Works. It also specifies that urban and stormwater runoff quantity and quality control standards will be established in the LID Standards Manual that is to be updated and maintained by the Department of Public Works. For subdivisions, the LID plans must be approved prior to tentative map approval. For all other development, an LID plan must be approved prior to issuance of a grading permit or, where a grading permit is not required, prior to issuance of a building permit.

The Subdivision and Planning Zoning Titles of the Los Angeles County Code were amended to add reference to the Low Impact Development Title. In addition, the County adopted ordinances for green building and drought-tolerant landscaping. All three ordinances apply to all administrative and all discretionary projects."

[21] Low Impact Development Manual for Southern California, 2010. Low Impact Development Center, Appendix B, Page 203.; https://www.casqa.org/LinkClick.aspx?fileticket=zA3DaxiwHtE%3d&tabid=242

Therefore, the Land Use and Water Pillar recommends the development of a model ordinance that would facilitate the consistent implementation of Watershed Sustainability Planning Procedures. Such a model ordinance could be readily adapted from existing ordinance examples, such as the "Model Ordinance Governing Planning and Development on Alluvial Fans" that was recommended by stakeholders appointed to DWR's Alluvial Fan Task Force (AFTF). (See: http://aftf.csusb.edu/documents/DRAFT_MODEL_ORDINANCE.pdf).

The AFTF Model Ordinance was designed to provide a platform for pre-project level discussion and evaluation of sustainability issues related to individual development projects being proposed in alluvial fan areas. The sole purpose of the Model Ordinance was to facilitate better informed land use decisions. The Model Ordinance procedures are intended provide project proponents with as much information about sustainability issues before any project planning expenditures take place.

It is important that OWOW 2.0 stakeholders also note that AFTF Model Ordinance (MO), crafted by attorneys and vetted by legal stakeholders, **was designed specifically not expand or conflict with any existing land use regulatory processes in any way**. To that end, the MO merely sets forth procedures to be followed, and substantive factors to be considered, for these particular types local land use decisions. The ultimate goal is for local communities to utilize the best available scientific information to ensure that land use planning and development adequately consider watershed sustainability issues.

### *OWOW Governance and OWOW Project Selection*

The OWOW 2.0 Plan will guide the selection of projects to be awarded California Proposition 84 funds and other future water resource implementation funding in the SAR Watershed. However, to maximize project benefits and ultimately optimize watershed sustainability, project concepts and designs need to be influenced before project selection process begins. Projects created to serve single or very limited entity interests may not have considered the cumulative watershed impact and demand close scrutiny. Comprehensive watershed planning should include project conceptualization that maximizes benefits from the holistic watershed perspective.

To further more holistic project concepts, the plan binds watershed stakeholders through trust and relationship building. The plan will be most effective if successfully communicated to the local and regional agency decision-makers.

### *Relevant policies*

- General Plans have conservation elements that can serve watershed sustainability requirements
- Local Ordinances—such as AB 1881 Landscape Ordinance
- Master Drainage Plans
- MS4 Permit Requirements for development, redevelopment, and roads
- MS4 Permits require Permittees to review the watershed protection principles and policies, specifically addressing urban and stormwater runoff, in its planning procedures, including CEQA preparation, review and approval processes; General Plan and related documents

including, but not limited to its Development Standards, Zoning Codes, Conditions of Approval, Development Project Guidance; and WQMP development and approval processes[22]

## Drivers for Land Use and Water Planning Collaboration

### *Implementation of land development provisions of MS4 Permits*

The U.S. Environmental Protection Agency (EPA) requires Municipal Separate Storm Sewer Systems (MS4) permits to address new development and significant redevelopment projects through implementation of post-construction controls to reduce pollutants in stormwater discharges, and ensure long-term operation and maintenance of these controls.[23]

Hydrologic modifications from urbanization increase the quantity of stormwater discharges, and cause excessive erosion and stream channel degradation. Frequently the volume, duration, and velocity of stormwater discharges cause degradation to aquatic systems. Protecting and restoring the physical, chemical and biological integrity of receiving waters must be a central issue in stormwater permits. The National Research Council[24] recommends that the NPDES stormwater program examine the impacts of stormwater flow, treat flow as a surrogate for other pollutants, and includes recommended control requirements in stormwater permits. The report recommends that the volume retention practices of infiltration, evapotranspiration and rainwater harvesting be used as primary stormwater management mechanisms. For this reason, EPA recommends use of a permit condition that is based on maintaining or restoring predevelopment hydrology although other forms of this permit condition maybe appropriate as well.

### *MS4 Tasks (WQMPs, LID, General Plan, Codes, CEQA, hydromodification, habitat)*

As part of the development program, the MS4 Permits include several requirements aimed at linking water quality and watershed protection with land use planning processes. These requirements include the "consideration of watershed protection principles in…CEQA and planning processes" (San Bernardino County MS4 Permit, Section XI.B.3.b.4; Page 77). These principles include specific consideration of the impacts of stormwater runoff, discharge of pollutants, and physical impacts which could affect downstream receiving waters and beneficial uses. The permittees must also coordinate with the Santa Ana RWQCB when projects require a Clean Water Act Section 401 Water Quality Certification. The MS4 Permit also specifies development of "common principles and policies necessary for watershed protection," which must include seven specific considerations (SB County MS4; Section XI.C.3.a – g; Page 78). These required considerations are very similar to the Ahwahnee Water Principles. The three

[22] CRWQCB, Santa Ana Region, January 29, 2010. Waste Discharge Requirements for the County of San Bernardino and the Incorporated Cities of San Bernardino County, Order No. R8-2010-0036, NPDES No. Cas618036, Areawide Urban Storm Water Runoff.

[23] USEPA, 2010. MS4 Permit Improvement Guide. **EPA 833-R-10-001**

[24] *Urban Stormwater Management in the United States*, National Academies Press, 2008 www.epa.gov/npdes/pubs/nrc_stormwaterreport.pdf

county MS4 Programs are each developing watershed geodatabases intended to integrate watershed data and facilitate better planning. These are being developed within Watershed Action Plans (WAPs) (San Bernardino and Riverside County MS4s) and Watershed Infiltration and Hydromodification Master Plans (WIHMPs) (in Orange County). These are described in more detail in the **Chapter 5.8 Stormwater: Resource and Risk Management** "MS4 Permits as a driver for Plan implementation," and table 5.8-1.

Water Quality Management Plans (WQMPs) contain the requirements for implementation of post-construction BMPs for development projects subject to approval by the Permittees. The most recent WQMPs require the implementation of LID principles at all sites, with infiltration BMPs preferred wherever feasible. WQMPs are required for most projects that disturb 5,000 square feet or more, all auto repair facility projects, and projects 2,500 square feet or more that discharging environmentally sensitive areas (SB County MS4 Permit, Section XI.D.4; Page 79).

The WQMPs include specific requirements for projects that have a downstream Hydrologic Condition of Concern (HCOC). HCOCs are locations where water quality or habitat will be adversely affected by increased flow volumes, velocities, or by changes in the timing or duration of stormwater runoff. Protection of areas with HCOCs is a developing science and the MS4 Permits encourage watershed and stream-specific evaluations and require monitoring to ensure appropriate protection is devised and implemented.

The MS4 Permits require the development and/or revision of Local Implementation Plans (LIPs) for each Permittee. The LIPs describe each individual Permittee's detailed processes and identifies departments responsible for implementing all MS4 Permit requirements as specified in the Drainage Area Management Plans (DAMPs) and Municipal Storm Water Management Plans (MSWMPs). LIPs are an enforceable extension of the MS4 Permit. Individual LIPs are reviewable by the Regional Board and lack of implementation of LID provisions constitutes non-compliance with the MS4 Permit.

The MS4 Permits also require the implementation of LID or "greenstreet" techniques for applicable road construction projects. These requirements have been incorporated into the WQMPs and Technical Guidance Documents (TGDs).

### *Alternative compliance approaches*

Alternative approaches for compliance with the MS4 Permit development requirements are described in **Chapter 5.8 Stormwater: Resource and Risk Management** in this plan. However, additional description and project applications are included below from the land use perspective.

### *Alternative land development compliance under MS4 Permits*

Urban Runoff Fund, Water Quality Credit System, Regional Treatment BMPs

(These are described in more detail in the **Chapter 5.8 Stormwater: Resource and Risk Management** "MS4 Permits as a driver for Plan implementation," pages 26-27 and Table 5.8-1**)** Alternative stormwater compliance elements for development projects in the Santa Ana Region MS4 Permits.)

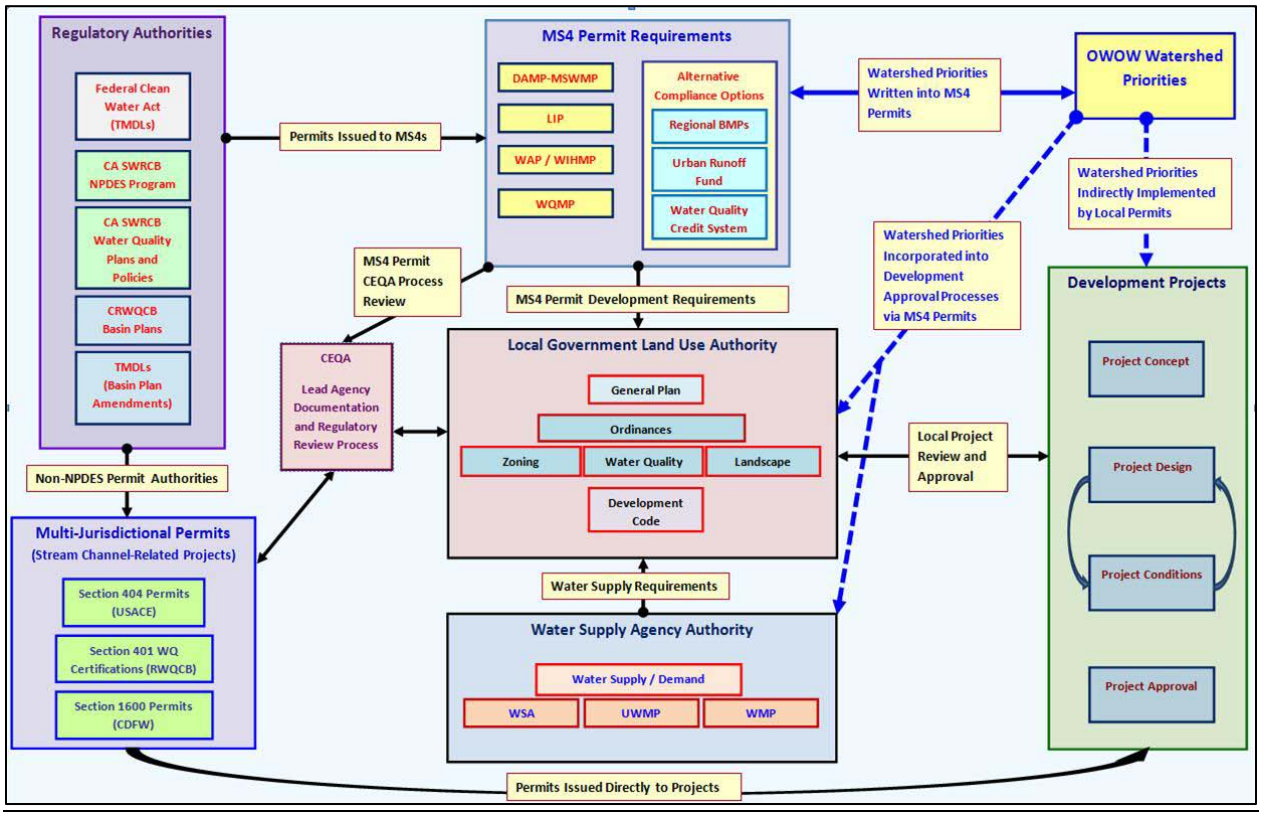
The MS4 Permits allow the development and significant redevelopment requirements of the WQMPs to be met through the use of: regional treatment BMPs, and urban runoff fund, or a water quality credit system. Regional treatment BMPs include sediment basins, infiltration basins or water quality wetlands that would receive storm runoff from upstream project sites. Potentially, regional facilities could be funded in part by contributing development projects, and be maintained by a public agency. Properly implemented regional BMPs could protect water quality and provide groundwater recharge, while providing a cost-effective means for MS4 WQMP compliance.

An urban runoff fund (URF) would be established to develop water quality projects using contributions from development projects where LID and infiltration are not feasible, or where greater benefits could be derived from off-site project implementation. Challenges to use of the URF include administration of the fund, assessing the value of projects and appropriate fund contributions, and scheduling constraints written into the MS4 Permits.

A water quality credit system would be established to allow projects to trade water quality or LID/infiltration credits. Projects unable to provide adequate runoff BMPs onsite could purchase credits for BMPs implemented elsewhere. Sites that are able to provide water quality or infiltration BMPs that exceed the required design standards would be allowed to sell credits for the net additional treatment capacity.

Design and approval of development project occurs within a complicated process involving regulations, permits, water supply determinations, and guidance. Regulatory agencies technically do not have land use authority, but influence land use through permit requirements. **Figure 5.7-12** shows schematically the linkages between regulations, permits, local government authority, water agency responsibilities, and where watershed protection priorities are incorporated. State and federal authorities are imposed by state and federal agencies on projects through permits. MS4 Permits specifically require incorporation of watershed protection "principles and policies" into local government General Plans, CEQA documents and the overall development process. Stream channel dredge and fill (USACE Section 404 Permits) RWQCB and SWRCB 401 Water Quality Certifications, and stream alteration permits (CDFW Section 1600 Permits) are typically issued directly to individual projects. Local jurisdictions must verify and facilitate these permits before approving project plans. Water suppliers are responsible to provide water supply assurance before projects can be approved by the local government **(See Figure 5.7-13**). Finally, OWOW Plan priorities inform the permitting process and are indirectly incorporated into local development approval processes and into individual projects.

**Figure 5.7-12 Local Land Use Authority, Regulatory Authority and Permitting Requirements**



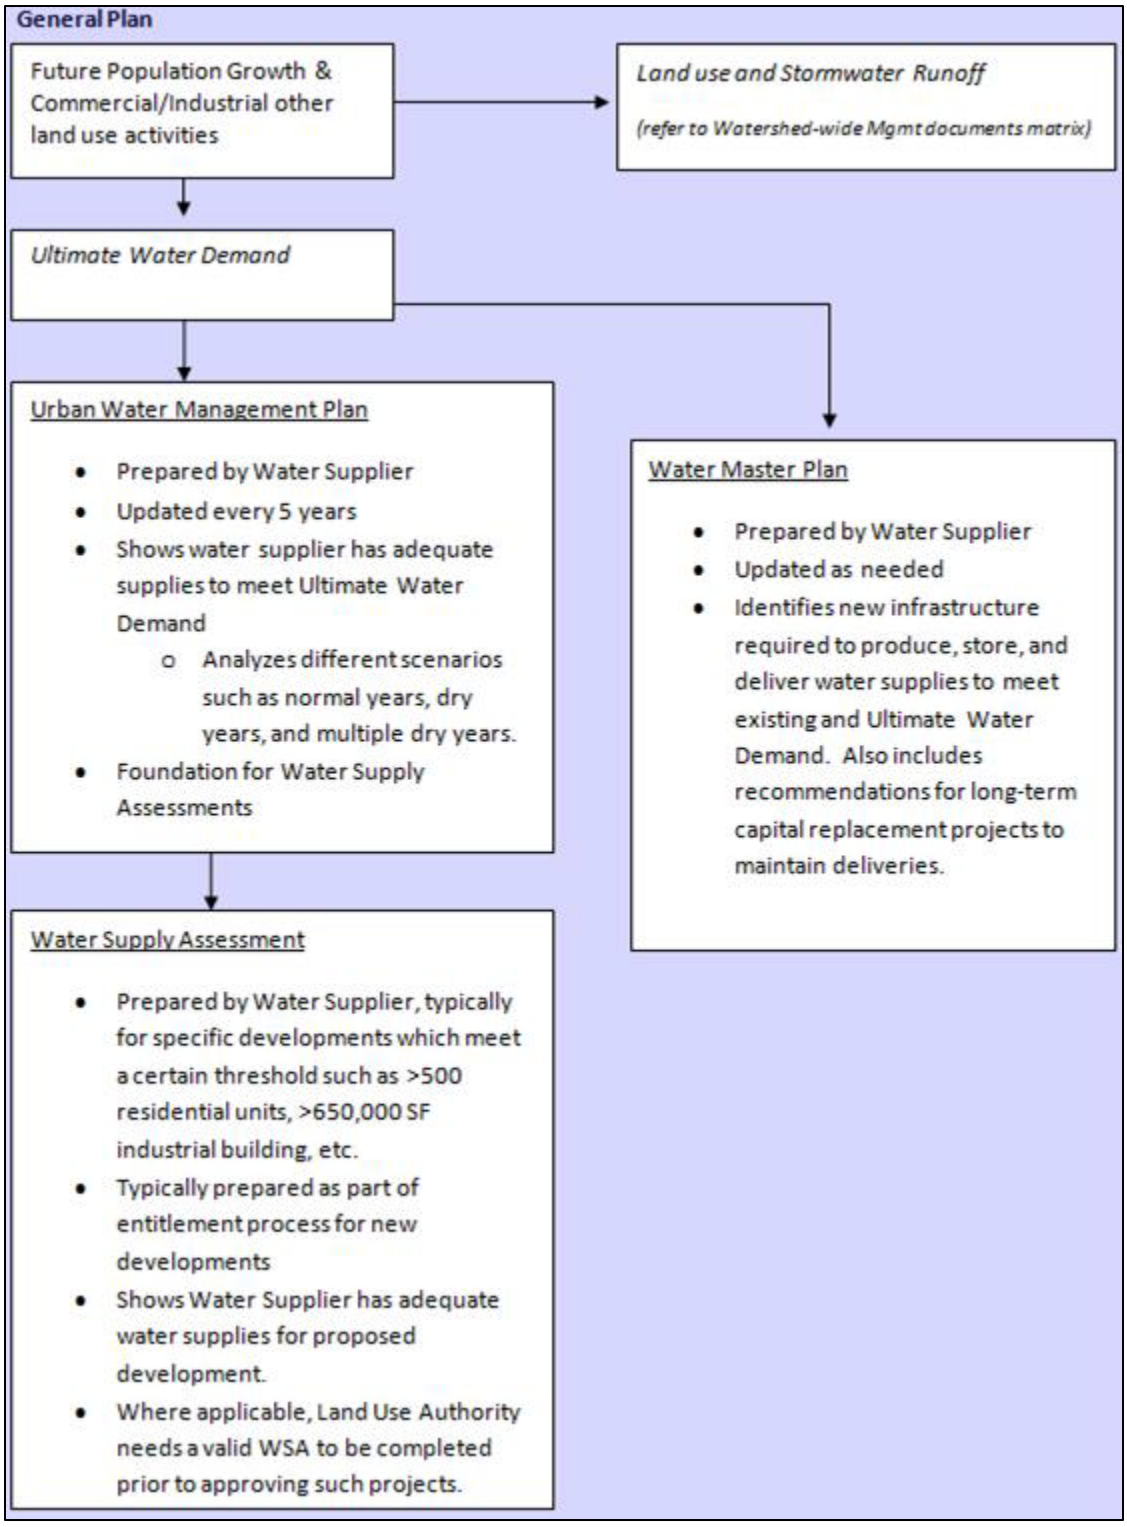


**Figure 5.7-13 General Plan-Water Supply Requirements**

### *Incentives for OWOW stakeholders to partner on MS4 Development projects*

Ground water yield increase from LID implementation

A primary goal of LID implementation is to maintain or restore natural hydrologic conditions at project sites. A key aspect of hydrology is enhancing infiltration to compensate for installation of impervious surfaces. LID implementation can incrementally increase the recharge of groundwater basins, whether at individual, distributed sites in the watershed, or at larger scale catchment or regional infiltration sites. This increases the local groundwater supply and improves watershed sustainability.

### *Quantification (estimates) of groundwater recharge from site-based or regional LID—value of water supply*

As stated by the Southern California Water Committee (SCWC): "Not all development will occur in areas where on-site capture and infiltration results in augmentation of groundwater basins used as drinking water supplies…"[25] Although LID techniques will increase groundwater recharge, it is difficult to determine the actual quantity of new available supply due to variable soil and subsurface characteristics. Larger scale infiltration facilities are more quantifiable and more likely to be maintained and monitored. Valuation of increased recharge and new supply is needed to understand cost benefit factors and to incentivize such projects to encourage broader project support. The Chino Basin Water Master has evaluated the volume of recharged and potentially accessible water from LID implementation in the Chino Basin. The challenge is to demonstrate cost-benefits for the stakeholders under various implementation scenarios, especially distributed, individual site based infiltration BMPs v. larger scale catchment or subwatershed regional infiltration basins. Larger scale basins would most likely be maintained by water agencies and their effectiveness would be monitored and maximized, whereas individual privately maintained BMPs will have less scrutiny and less effective maintenance on average. Water agencies will need demonstrated long-term supply increases to justify cost sharing on such projects, while MS4 partners need to show pollutant reduction and mitigation of hydromodification.

### *Development community perspective and partnering*

The development community in the SAR Watershed has demonstrated a willingness to adapt projects to meet watershed needs and to lead innovative projects (See examples in the **Chapter 5.8 Stormwater: Resource and Risk Management,** "Stormwater as an Essential Resource for the SAR Watershed" and "Regional and Watershed Examples" described earlier in this chapter) Building Industry Association and the Construction Industry Coalition on Water Quality have partnered in research and implementation projects to advance understanding of costs and benefits of LID and sustainable community designs. Developers will design and build the projects that serve watershed priorities as a result of ongoing collaboration.

## Legislated Water Supply or Conservation Goals

### *Water Supply Legislation*

In 1983, the State legislature enacted the Urban Water Management Planning Act which requires urban water suppliers that provide water to 3,000 or more customers, or that provides over 3,000 acre-feet of

[25] SCWC, 2012. Stormwater Capture: Opportunities to Increase Water Supplies in Southern California.

water annually, to prepare an Urban Water Management Plan (UWMP) and update it every 5 years. The UWMP describes the supplier's efforts to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its customers during normal, single dry, and multiple dry years. UWMPs and General Plans are linked and interdependent as the assumptions for land use, population growth, etc., must be consistent. UWMPs are a critical source document for cities and counties as they update General Plans. Similarly, General Plans are a source document as water suppliers update their UWMPs. Continuing land use changes and population growth have resulted in additional water demand on water systems. In 2002, the State legislature enacted Senate Bills 610 and 221 as companion measures, to further promote more collaborative planning between local water suppliers and land use authorities and to ensure the increased demands are adequately addressed, and a firm source of water supply is available prior to approval of certain developments. *Water Supply Assessments* pursuant to SB 610 and *Written Verifications of Water Supply* pursuant to SB 221 are prepared by the water supplier for applicable projects and typically rely on UWMPs as a foundational document.

SB 610 (Water Supply Assessment) requires an urban water supplier to include a description of all water supply projects and programs that may be undertaken to meet total projected water use over the next 20 years. SB 221 (Written Verification of Water Supply) prohibits approval of a tentative map, or a parcel map for which a tentative map was not required, or a development agreement for a subdivision of property of more than 500 dwelling units, including the design of the subdivision or the type of improvement, unless the legislative body of a city or county provides written verification from the applicable water supplier that sufficient water supplies are, or will be available prior to completion of the project.

In 2009, the State legislature enacted Senate Bill 7x-7 (20x2020 Plan) to set forth a statewide road map to maximize urban water use efficiency and conservation and establish a requirement to reduce per capita water consumption by 20% by 2020. To ensure progress in meeting the goal, water suppliers were mandated to develop water use targets and document such compliance in their UWMPs.

Water supply, needed for population growth, is a significant limiting factor for development projects. UWMPs and Water Supply Assessments link water resource constraints with local project planning, design and approval process. Water supply is a critical sustainability factor and should be recognized as a high priority feasibility factor in project concept development. Projects that enhance water supply, such as LID capture and use BMPs and infiltration BMPs on various scales (that recharge supply aquifers) should merit stronger acceptance with the regulatory programs.

### *Sustainable Communities Legislation*[26]

The purpose of SB 375 (Sustainable Communities and Climate Protection Act of 2008) is to implement the state's greenhouse gas emissions (GHG) reduction goals in the sector of cars and light trucks. This mandate requires the California Air Resources Board to determine per-capita GHG emission reduction

[26] SCAG 2012. Regional Transportation Plan 2012-2035: Sustainable Communities Strategy. http://www.scagrtp.net/

targets for each Metropolitan Planning Organization (MPO) in the state for years 2020 and 2035. SCAG and California's 17 other MPOs must address GHG reduction in a "Sustainable Communities Strategy" that is part of the respective MPO's Regional Transportation Plan. In accordance with Govt. Code section 65080(b)(2)(B)(vii), the 2012 Regional Transportation Plan (RTP) and incorporated SCS are expected to achieve GHG emission reductions of 8 percent per capita in 2020 and 16 percent per capita in 2035.

Transportation strategies contained in the RTP—managing transportation demand and making key transportation system improvements – are major components of the SCS. However, the SCS also focuses on the general land use growth pattern for the region, because geographical relationships between land uses—including density and intensity—help determine the need for travel in the first place. Therefore, SCAG's SCS includes not only projections about the transportation network but also about land use. Under SB 375, a SCS must, in summary:

- Identify existing and future land use patterns
- Consider statutory housing goals and objectives
- Identify areas to accommodate long-term housing need
- Identify areas to accommodate 8-year housing need
- Consider resource areas and farmland
- Identify transportation needs and the planned transportation network
- Set forth a future land use pattern to meet GHG emission reduction targets
- Comply with federal law for developing an RTP

The SCS does not create a mandate for land use policies at the local level. In fact, SB 375 specifically states that the SCS cannot dictate local General Plan policies (see, Government Code Section 65080(b) (2) (J)). However, the SCS is intended to provide a regional policy foundation for local governments to build upon and includes quantitative growth projections from each city and county in the region. In addition, some projects consistent with the SCS are eligible for streamlined environmental review.

One aspect of SB 375 unique to the SCAG region is that subregions within SCAG have the option of creating their own subregional SCS. Of SCAG's 15 subregions, two accepted this option: the Gateway Cities Council of Governments (Gateway COG) and the Orange County Council of Governments (OCCOG). These subregional SCS documents are incorporated into the regional SCS.

## Optimize Watershed Supply and Quality

The Ahwahnee Water Principles for Resource Efficient Land Use describe values that a community should consider to maximize the sustainability of a watershed or region. These are grouped into nine basic principles that link community development with sustainable approaches for land use, water supply, water quality protection, flooding, and natural resource conservation.

The plan describes opportunities and constraints in the SAR Watershed that must be managed to ensure increased sustainability while accommodating population growth. The goal is to achieve optimal resource use and to adapt to changing conditions over time.

### *Constraints that limit Land Use & Water Planning Collaboration*

Collaboration pros and cons:

Pros:

- Collaboration can pool or leverage resources of multiple agencies
- Provides a more multi-disciplinary, multi-agency perspective, and increased experience and expertise
- Avoids unnecessary duplication of efforts
- Helps ensure all related priorities and projects are considered
- Collaborative projects can be more competitive for grant funding

Cons:

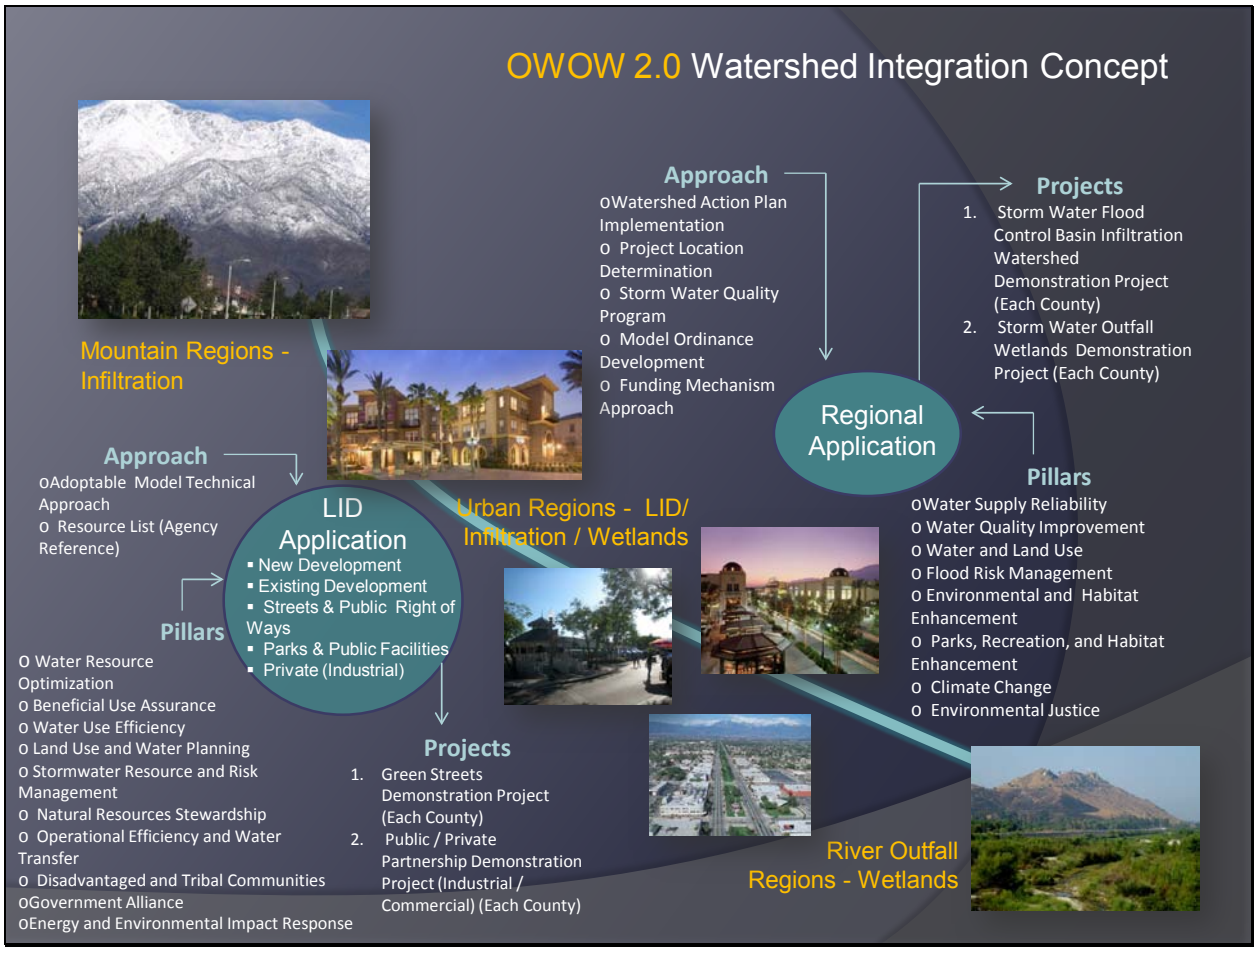
- Differing multi-jurisdictional priorities may be difficult to address adequately
- Collaborative projects may be slower to develop and implement
- Multi-jurisdictional permitting requires more effort

Process and regulatory constraints

- Existing plans and codes may preclude LID designs (e.g. curb requirements)
- Right-of-way, safety and design requirements may limit adaptability of road retrofit or improvement projects
- Regional BMPs are generally favored by stakeholders, including regulators. However, regulations and permits contain potentially conflicting limitations such as the transport of waste in waters of the US and habitat protection requirements that limit BMP maintenance opportunities
- MS4 Permit WQMPs require BMP selection and implementation based on a strict hierarchy that limits the possible configurations that can be approved

Relevant constraints identified by other Pillars

- Watershed locations with non-infiltrating soils and geology
- Areas with groundwater contaminant plumes
- Concern regarding infiltration of stormwater from industrial land uses, or from BMPs that are poorly designed, installed, and/or maintained
- Project site may not be the most effective location to recharge a water-supply aquifer
- Watershed priorities are not part of the WQMP site feasibility analysis



Funding options to support collaboration

- OWOW supports collaborative projects
- An URF or Water Quality Credit System could become a funding source based on cooperation
- Seek state/federal funding to develop regional funding mechanisms for collaborative projects
- Partner with SCAG or Councils of Government for incentive funding for demonstration projects
- USDA Grants to partner with agricultural stakeholders

## Strategies for Improved Interaction Between Water Managers and Land Use Planners

The OWOW Plan and process has significantly expanded the breadth and level of stakeholder involvement in understanding watershed problems and in developing strategies to address these problems and improve the watershed over previous IRWMP efforts. However, to effectively integrate watershed sustainability into the land use planning and development concept, design, and approval process, additional stakeholders and higher management and executive level staff within stakeholder organizations must become fully participating members of the OWOW effort. Watershed sustainability priorities must be integrated into decisions driven by the priorities of economic development. An alternative is to have OWOW integrated into economic development processes. A diagram of the OWOW land use and water planning process is shown in **Figure 5.7-14** below.

**Figure 5.7-14 OWOW 2.0 Watershed Integration Concept**

## OWOW Outreach Committee

The OWOW Pillars held several Pillar Integration meetings during the development of the Plan. These meetings provided a unique forum to develop and evaluate potential watershed priorities and projects to address watershed sustainability. We recommend a continued series of periodic meetings to further the ideas and continue to develop new ideas. Outreach efforts should also be periodically held to update other stakeholder forums, such as Regional Board meetings, Boards of Supervisors, and other watershed groups.

## OWOW /FCD Partnership Development or Enhancement

Stakeholders in the Chino Basin have successfully completed several multi-stakeholder projects that address stormwater, water supply and habitat. One of the most significant is the Chino Basin Facility Improvement Project. This project is a partnership between the Chino Basin Watermaster, the Inland Empire Utilities Agency, The San Bernardino County Flood Control District and the Chino Basin Water Conservation District. This project has retrofitted approximately two-dozen offline flood control basins with remotely operable control valves to allow capture and recharge of stormwater and dry weather flows. The project is supported by a four-party Agreement and received funding support from Proposition 13 Water Bond through SAWPA. Although this project has increased the capture and recharge of stormwater in the basin, it has not been coordinated with the MS4 Program and does not provide any MS4 compliance benefits.

## Revisions to the Land Planning Process to Address Constraints

Basic land planning tools can be revised or amended to incorporate watershed sustainability priorities. General Plans can incorporate a specific water element, or can include watershed requirements in the conservation element. Specific Plans can also be used to implement watershed and/or sustainability considerations. Different local governments will have specific preferences and concerns regarding general plan revisions.

Model sustainability ordinances (LID implementation, alluvial fans, water conservation, or sustainable communities) can be used to implement watershed priorities. Model ordinances have been developed for such purposes, such as the Model Ordinance Governing Planning and Development on Alluvial Fans[27], and the LID, Green Streets, and Drought-Tolerant Landscaping Ordinance adopted by the County of Los Angeles.

## Early Consideration of Project Concepts and Designs

Planning processes should encourage the earliest possible consideration or watershed priorities. Project concepts should serve watershed needs and be designed and implemented to optimize watershed sustainability. Once a project has been conceived, it is subject only to process-based modifications. Fundamental choices regarding allowable projects should be informed by the plan.

[27] Alluvial Fan Task Force: Findings and Recommendations Report, July 2010. Appendix D: Model Ordinance Governing Planning and Development on Alluvial Fans.
http://aftf.csusb.edu/documents/FINDINGS_Final_Oct2010_10-29-10_web.pdf

## General Plan, Specific Plan, and Ordinance Changes

General Plans and Specific Plans could be revised to require projects to demonstrate early consideration of Plan priorities and recommendations. Ordinances can specify the process to implement early project planning practices.

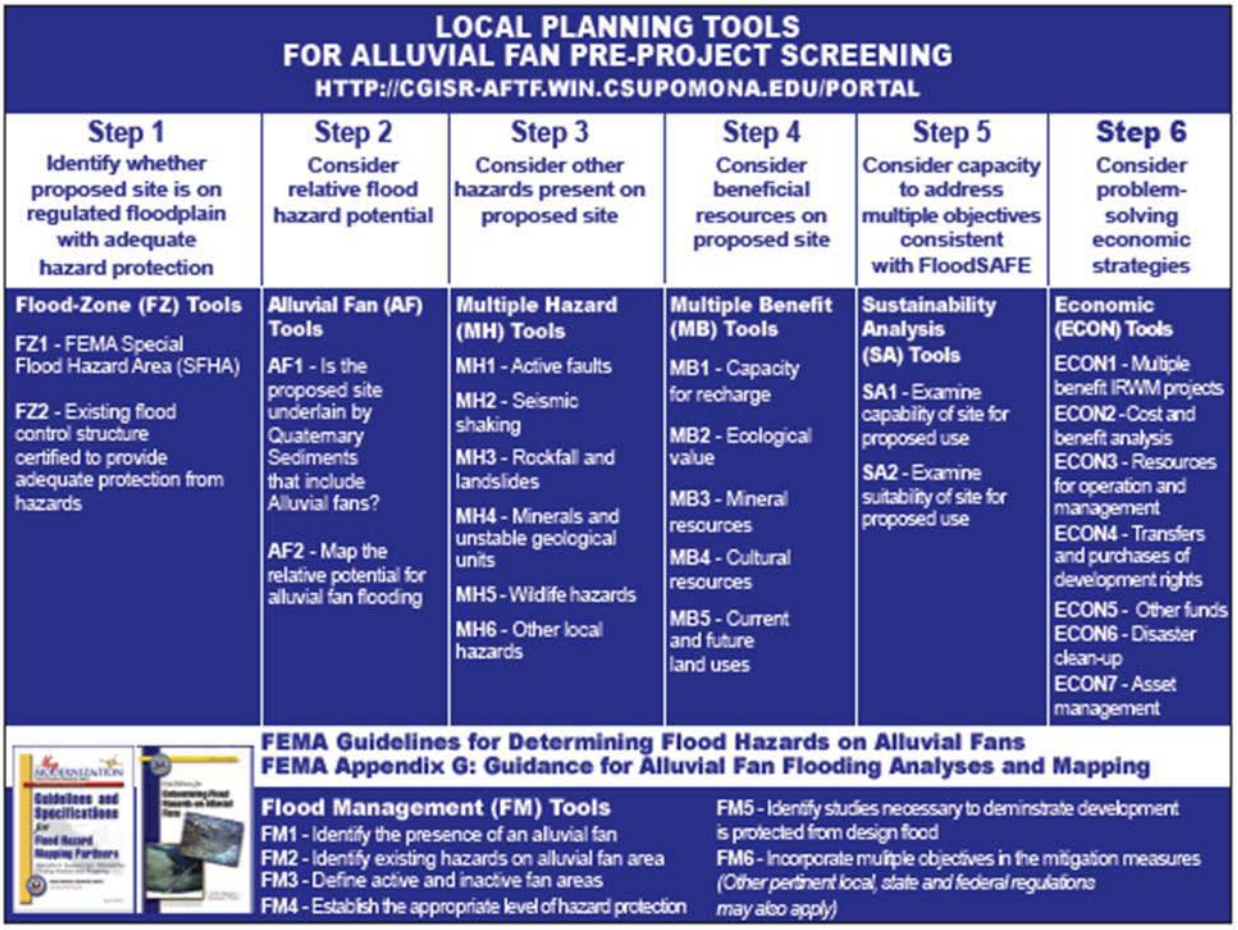
## Training Needs—Various Target Audiences

Implementation of the cooperative and multi-benefit project concepts will be supported by education. Training and outreach have been a part of the OWOW process, and should be enhanced for OWOW 2.0. It is especially important to provide education for the high-level decision makers, including elected officials, the RWQCB, and other local and regional stakeholders. Outreach can build trust and acceptance of new approaches.

## Consider How Water Agency "Will Serve" Letters May Be Used to Support Land Use Planning

Current requirements for water supply assessments limit their applicability to relatively large-scale projects. Requiring water supply assurances for all projects could help ensure implementation of water conservation measures (landscaping, water recycling, stormwater capture and use) for a wider range of projects. A watershed scale supply assessment could provide an incentive for water agencies to collaborate—and develop guidelines for water supply requirements.

## Incorporate Recommendations of Alluvial Fan Task Force in Land Use Planning[28]



Alluvial fans are gently sloping fan-shaped landforms commonly seen at the base of semi-arid mountain ranges in the SAR Watershed and serve as natural buffers between fire-prone mountain ranges and flooding. Paths of flooding and debris flows on alluvial fans may be uncertain, making development challenging.

The Integrated Approach (IA) for development on alluvial fans consists of a suite of local planning tools for preproject screening designed to assist local communities that need to plan for and evaluate future development proposals on alluvial fans **(Figure 5.7-15)**[29].

[28] Alluvial Fan Task Force Fact Sheet 2010.
http://aftf.csusb.edu/documents/AFTF_FACTS_Final_Oct2010_web[1].pdf

[29] AFTF, 2010. Integrated Approach for Sustainable Development On Alluvial Fans.
http://aftf.csusb.edu/documents/IA_Final_Oct2010_web.pdf

**Figure 5.7-15 Local Planning Tools and FEMA**

The tools provide a method for planners to evaluate hazards, resources, and site-specific issues in alluvial fan areas that are proposed for development. This evaluation helps determine, in the pre-project phase, whether new development can be designed to promote flood management sustainability, by avoiding the most hazardous areas and conserving the most valuable resources. Flood management tools are included that are consistent with FEMA guidelines to analyze alluvial fan flood hazards and to formulate flood hazard protection.

As directed by Assembly Bill 2141, the findings and recommendations of the Task Force will be submitted to DWR and the State legislature for possible future action.

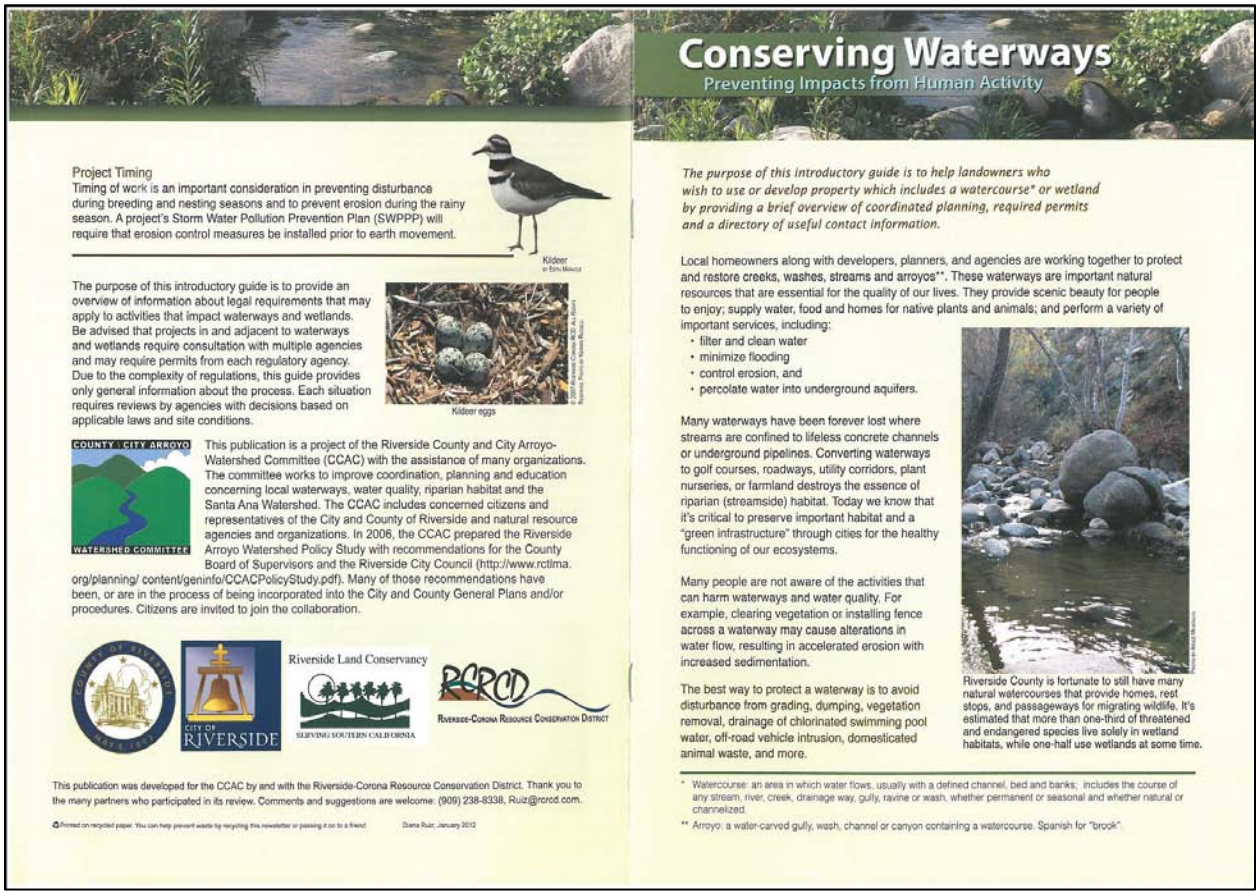
# Implementation Recommendations to Support Water and Land Use Planning Collaboration

## Watershed Integration: Watershed Identity Development and Implementation Project

This comprehensive project includes an assemblage of component projects designed to overcome existing limitations on watershed-based planning and project development to accelerate progress toward a sustainable watershed. SAWPA OWOW would lead and steer this project assemblage, including:

### *Local land use authority process enhancement*

This element will provide education, guidance, and ready-to-use tools for local jurisdictions to align all aspects of their land planning and approval processes to reinvent communities over time, based on watershed sustainability priorities. This effort can benefit from coordination with the ongoing San Bernardino County Vision Water Element, and should incorporate innovative methods and findings. The approach should start with efforts to engage the Councils of Government in the watershed, and work to influence and integrate the elected officials, Boards, and other high-level decision makers. This project would provide workshops, training materials, case examples, and focused outreach and training. Products of this project would include:



- Watershed-wide land use planning guidelines manual(s)
- Model ordinance governing planning for watershed sustainability
- Model general plan water element for the SAR Watershed
- Watershed coordination forums and training workshops
- Planning Commission education and outreach

Three pilot programs can implement these enhancements:

<u>The Riverside City/County Arroyo-Watershed Program</u>

This program provides the initial concepts and tools, and has experience working through local jurisdictions and building cooperation. The Riverside City-County Arroyo/Watershed Policy study and subsequent coordination efforts developed a methodology to achieve local government implementation of General Plan, ordinance, and policy amendments that address watershed protection priorities. This methodology can be implemented throughout the SAR Watershed to align local government plans and procedures with OWOW Plan priorities. The original project focused on preserving stream and arroyo areas and habitat, and needs to more fully incorporate water supply and overall sustainability principles. These can be readily incorporated into the method.

**Figure 5.7-16 Riverside City/County Arroyo-Watershed Program**

Conserving Waterways

Preventing Impacts from Human Activity

Project Timing

Timing of work is an important consideration in preventing disturbance during breeding and nesting seasons and to prevent erosion during the rainy season. A project's Storm Water Pollution Prevention Plan (SWPPP) will require that erosion control measures be installed prior to earth movement.

Killdeer

The purpose of this introductory guide is to provide an overview of information about legal requirements that may apply to activities that impact waterways and wetlands. Be advised that projects in and adjacent to waterways and wetlands require consultation with multiple agencies and may require permits from each regulatory agency. Due to the complexity of regulations, this guide provides only general information about the process. Each situation requires reviews by agencies with decisions based on applicable laws and site conditions.

Killdeer eggs

COUNTY CITY ARROYO WATERSHED COMMITTEE

This publication is a project of the Riverside County and City Arroyo-Watershed Committee (CCAC) with the assistance of many organizations. The committee works to improve coordination, planning and education concerning local waterways, water quality, riparian habitat and the Santa Ana Watershed. The CCAC includes concerned citizens and representatives of the City and County of Riverside and natural resource agencies and organizations. In 2006, the CCAC prepared the Riverside Arroyo Watershed Policy Study with recommendations for the County Board of Supervisors and the Riverside City Council (http://www.rctlma.org/planning/ content/geninfo/CCACPolicyStudy.pdf). Many of those recommendations have been, or are in the process of being incorporated into the City and County General Plans and/or procedures. Citizens are invited to join the collaboration.

SERVING SOUTHERN CALIFORNIA

RCRCD

RIVERSIDE-CORONA RESOURCE CONSERVATION DISTRICT

This publication was developed for the CCAC by and with the Riverside-Corona Resource Conservation District. Thank you to the many partners who participated in its review. Comments and suggestions are welcome: (909) 238-8338, Ruiz@rcrcd.com.

Printed on recycled paper. You can help prevent waste by recycling this newsletter or passing it on to a friend. Diana Ruiz, January 2012

*The purpose of this introductory guide is to help landowners who wish to use or develop property which includes a watercourse* or wetland by providing a brief overview of coordinated planning, required permits and a directory of useful contact information.*

Local homeowners along with developers, planners, and agencies are working together to protect and restore creeks, washes, streams and arroyos**. These waterways are important natural resources that are essential for the quality of our lives. They provide scenic beauty for people to enjoy; supply water, food and homes for native plants and animals; and perform a variety of important services, including:

- filter and clean water
- minimize flooding
- control erosion, and
- percolate water into underground aquifers.

Many waterways have been forever lost where streams are confined to lifeless concrete channels or underground pipelines. Converting waterways to golf courses, roadways, utility corridors, plant nurseries, or farmland destroys the essence of riparian (streamside) habitat. Today we know that it's critical to preserve important habitat and a "green infrastructure" through cities for the healthy functioning of our ecosystems.

Many people are not aware of the activities that can harm waterways and water quality. For example, clearing vegetation or installing fence across a waterway may cause alterations in water flow, resulting in accelerated erosion with increased sedimentation.

The best way to protect a waterway is to avoid disturbance from grading, dumping, vegetation removal, drainage of chlorinated swimming pool water, off-road vehicle intrusion, domesticated animal waste, and more.

Riverside County is fortunate to still have many natural watercourses that provide homes, rest stops, and passageways for migrating wildlife. It's estimated that more than one-third of threatened and endangered species live solely in wetland habitats, while one-half use wetlands at some time.

* Watercourse: an area in which water flows, usually with a defined channel, bed and banks; includes the course of any stream, river, creek, drainage way, gully, ravine or wash, whether permanent or seasonal and whether natural or channelized.

** Arroyo: a water-carved gully, wash, channel or canyon containing a watercourse. Spanish for "brook".

<u>The Newport Bay Conservancy Concept Book</u>

The Newport Bay Conservancy Concept Book for the Newport Bay Watershed is intended to inform land use planning in the region and inform how it could be used to support water resource restoration goals. This project can pilot the local government enhancement approach within the Newport Bay Watershed and influence adjacent jurisdictions.

<u>City of Ontario – New Model Colony</u>

The City of Ontario has implemented innovative land use planning approaches and can provide a pilot project area for local government enhancement in urbanized San Bernardino County. The City's recent plans call for 13,000 new housing units across a broad range of housing types and a mix of business spaces oriented towards three mixed-use centers that are served by pedestrian-friendly roadways and a large central park. Emphasizing connections to corridors and transit, the City is creating a major regional center for Southern California.

*Coordinate and integrate with other regional planning efforts to build-in key watershed sustainability priorities into plans that apply to the SAR Watershed.*

This element would engage the regional transportation planning agencies (SCAG, SANBAG, WRCOG, RCTC, and OCCOG) and other planning agencies as partners in OWOW. This would coordinate closely with (1) above.

Regional transportation planning efforts have successfully reached local, regional, and state decision-makers, and enlisted significant stakeholder participation and support. The OWOW Plan should integrate, or be integrated into the transportation planning world. Transportation planning should incorporate the OWOW watershed sustainability priorities as co-equal with the other RTP elements. Although sustainability is a key consideration, mandated by legislation, water quality and water supply are inadequately weighted in the RTPs. Reinvent these elements into a comprehensive sustainability effort, including all stakeholders and decision-makers and a plan for the watershed. Partner with the SCWC, ASCE, Urban Land Institute, and other groups for technical support.

SCAG has funded transportation demonstration projects in the Region and at least 30 projects in the SAR Watershed. Conduct an evaluation of these projects and their linkages to water and sustainability.

Coordinate and host a symposium to describe the ecology, hydrology, and natural history of the SAR Watershed. This is needed to inform stakeholders regarding how the watershed is naturally integrated, and how urbanization has disrupted the integration and how to reintegrate to maximize functions and sustainability.

*Watershed-wide geodatabase alignment and connection, access portal, and planning and evaluation tool development.*

County-based geodatabases have been recently prepared by San Bernardino and Riverside County Watershed Action Plans, and Orange County hydromodification mapping and Watershed Master Plans. This includes evaluation of existing watershed planning tools and a search for other existing applicable tools.

- Develop GIS layer of “community improvement areas” based on local government economic development needs—street rebuilding, drainage improvements, utility rehabilitation in conjunction with streets
- Workshop with planners
    - Layer of transportation opportunity areas
    - overlay with WQ project sites
    - Economic development areas
    - Failed street areas
    - DAC layer
- Identify project types—example
- DAC Greenstreets
- FCD Recharge Basins

- Transportation Agency Data (Rail/Caltrans)
    - Locate joint project areas (Trans/Water)
    - Locate joint Ag/water project areas
- Integrate Land Use Decision Support Tools Developed Elsewhere
- Coordinate geodatabase development with the development of applicable tools that include areas outside the SAR Watershed to enhance functionality. Several relevant tools and mapping efforts are of particular interest.
    - EcoAtlas
    - The San Francisco Estuary Institute developed a statewide geodatabase designed to track riparian and wetland resources under the State Wetland and Riparian Monitoring Program. The EcoAtlas includes interactive base layers, including streams, wetlands, riparian areas, and special habitats, and provides maps and other spatial information. This tool was developed by the Wetland and Riparian Monitoring Workgroup and provides detailed statewide information on wetland and riparian restoration projects. This is an active online tool and is viewable at http://www.ecoatlas.org/. The project team continues to maintain and improve the EcoAtlas.
    - DWR Integrated Water and Land Smart Planning Tool
    - DWR, in partnership with Sonoma State University Center for Sustainable Communities, is developing a decision support tool that integrates land use with water supply, water quality, energy and water/energy use and impacts including GHGs, and project cost factors. The tool was "designed for local decision makers who are considering land use and project design decisions, based on economic development needs and consistency with general and specific plans."[30] This tool can be customized with local condition inputs and will soon be tested by local governments in California. The tool will quantify costs associated with different development and design scenarios, and is intended to:
        - "Create an open, locally-modifiable and user-friendly tool to help guide land use and land cover decisions
        - Quantify relationships between land use alternatives and key water supply benefits, including water supply reliability, flood management, water quality, habitat value, Climate Action Mitigation
        - Quantify the monetary costs of implementing LID and traditional development strategies, including long term costs
        - Compare and contrast different development styles exemplified in four case study sites."
- USBR online climate change model for the SAR Watershed.
- Water/Energy use and impact data and resources (see **Chapter 5.13 Energy and Environmental Impact Response**, "Water-Energy Projects" and the Energy Network)

[30] Draft Report, April 2013: Integrating Land and Water Management: A Suburban Case Study and User-Friendly, Locally Adaptable Tool. California Department of Water Resources and Sonoma State University. (http://www.waterplan.water.ca.gov/docs/meeting_materials/caucus/2013.05.09/DRAFT_DWR-Report_4_30_13.pdf)

*Regulatory assessment and integration to support watershed sustainability project concepts and implementation.*

Regulatory Boards and staff support the OWOW Plan. However, varying interpretations of regulations and permit requirements may impede the development of concepts and projects that provide overall cumulative and long-term watershed sustainability improvements. This project element would engage the regulators (RWQCB and SWRCB, DWR, CDFW, USACE, etc.) and proactive stakeholders (including NGOs) to develop approaches to implement projects and ensure compliance with relevant regulations and permits.

*Demonstration project site identification, project design, coordinated planning, construction and maintenance.*

These are multi-benefit, multi-jurisdictional projects that address watershed sustainability priorities. Projects should Identify project partners and costs/benefits, and develop incentives to encourage continued implementation. The project should consider developing model implementation tools such as a model MOU or Agreement for multi-agency projects or watershed-wide projects.

Two proposed project categories:

<u>Green street/parking lot projects</u>

Retrofits or new projects that create new functions of stormwater treatment and capture, groundwater recharge if feasible, flood risk reduction, enhanced aesthetics and/or walkable/recreation spaces, and incrementally improve water quality and maximize water use efficiency. Projects can integrate with other projects or include elements such as public parks.

This project would coordinate the three SAR Watershed county Public Works Departments, interested cities, water agencies, and other stakeholders to identify locations and designs for multi-use green street or parking lot related projects that address stormwater runoff and improve existing developed areas. The project would also develop funding strategies for maintenance and additional projects, will include water quality credit and regulatory compliance evaluation, and recommend provisions for permit compliance credit. Completed projects will serve as models to increase understanding and acceptance of similar projects in the watershed.

Specific considerations should include:

- Commercial and “clean” industrial areas for parking lot retrofit
- Street use safety and design constraints
- Existing design manuals (e.g. San Mateo Street Design Manual)
- Needs to link economic development, Planning, and Public Works departments of local government
    - Locate and prioritize streets already in need of upgrade or replacement
        - Such as ”failed” streets in City of LA

- coordinate with utility infrastructure replacement—in street corridors
- sell as a community redevelopment project

Example Projects:

- Monte Vista Avenue Grade Separation
  **(**http://www.cityofmontclair.org/depts/pw/engineering/projects/upcoming_projects.asp

A railroad grade separation project in the City of Montclair on Monte Vista Avenue at the Union Pacific Railroad tracks is planned over the next few years. Rail traffic has been increasing on this stretch of busy rail line known as the Alameda Corridor East. The traffic is expected to increase significantly as trade traffic continues to grow at the ports of Los Angeles and Long Beach. Montclair has begun acquiring a right-of-way for the project. Funding for this project is coming from a variety of sources. The 30 million dollar project is expected to begin construction in 2014.

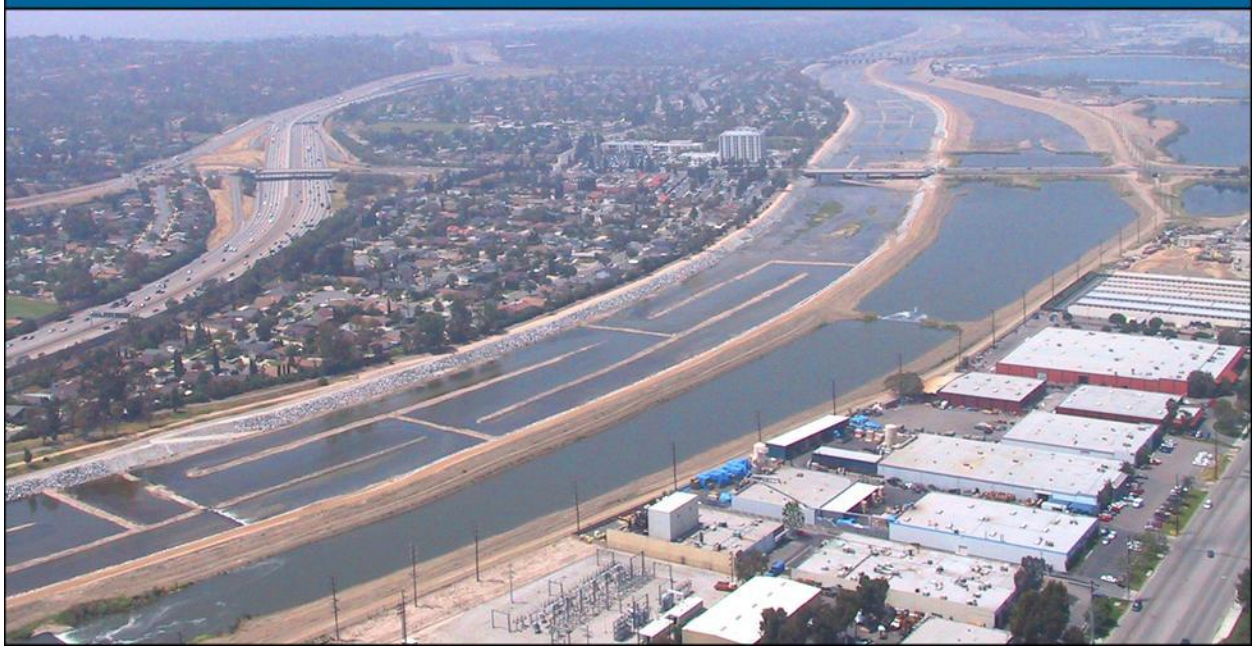
- City of Riverside “parklets" policy projects and small street retrofits by private entities
- Elmer Ave Neighborhood Retrofit – Council for Watershed Health

http://www.watershedhealth.org/programsandprojects/was.aspx?search=elmer

**Figure 5.7 -17 Elmer Avenue Neighborhood Retrofit**

Regional treatment for surface and stormwater runoff

Sites to be selected, optimally one per county, that can accept and treat/infiltrate stormwater, nuisance runoff, and other surface flows. Projects will be multi-benefit and multi-agency collaborations. These sites can be identified based on previous evaluations of opportunities within the county flood control systems and the geodatabases, combined with evaluation and recommendations from other watershed stakeholders, especially the water and regulatory agencies. Water supply, habitat conservation, creation or mitigation, and long-term maintenance must be addressed. These sites would develop mechanisms to account for water quality benefits and provide MS4 Permit compliance capacity. This project element would collaborate with the regulatory assessment effort (No. 4, above) to develop a model regional treatment/retention BMP implementation guidance document.



Potential project locations:

- The City and County of Riverside are partnering to develop increased groundwater recharge in the Kansas, Marlborough, and Columbia basins
- Geodatabases provide initial list of project sites, collaborate with Water Agencies to prioritize sites
- Evaluate existing multi-use projects to determine their effectiveness in achieving stated benefits (e.g. Big League Dreams—Cucamonga-Mill Creek Wetlands)

# 5.8 Stormwater: Resource and Risk Management

## Chapter Findings and Recommendations Summary

The purpose of this Chapter is to 1) describe the mission, facilities, and operations of Flood Control Management agencies in the Santa Ana River Watershed; 2) identify past, current, and emerging key watershed priorities; 3) evaluate how key priorities have been, and potentially can be, addressed by Flood Control Districts/Divisions (FCDs) using a range of strategies; and 4) recommend the strategies and projects most likely to be effective to ensure watershed sustainability over a range of timescales. Finally, this OWOW 2.0 Plan (Plan) updates and revises the 2010 Plan.

### Priority Issues

- Water supply is challenged by increased demand due to population growth in the watershed; reductions in imported water supplies; reduced groundwater recharge from expansion of urbanization and impervious surfaces placed over viable recharge areas; loss of riparian habitat; losses to the ocean due to concrete channelization and lost recharge in the channels themselves, seawater intrusion due to decreased groundwater recharge in coastal areas, and uncertain, but expected, long-term reductions in average annual precipitation due to climate change.
- High priority water quality problems include maintaining the salt balance in the watershed (see **Chapter 5.5 Beneficial Use Assurance**), reducing anthropogenic pollutants in surface water runoff to optimize beneficial uses, preventing pollutants from contaminating groundwater; and cleanup and management of existing contaminated groundwater sites (**Chapter 5.5 Beneficial Use Assurance**).

- Watershed management efforts of past decades were driven largely by individual entity priorities or programs. However, more comprehensive and integrated projects driven by a multi-stakeholder project paradigm can more effectively and more efficiently address watershed needs. Such projects can assist stakeholders to achieve compliance with the increasingly complex Municipal Stormwater NPDES Permits (MS4 Permits), while providing increased stormwater capture and groundwater recharge using favorable cost benefit approaches. Cooperative projects also unite various watershed jurisdictions and information, and more readily adapt to future conditions—and adaptability will be essential to effectively manage uncertain future conditions such as climate change.
- Reducing the risk of loss of life and property damage due to flooding remains a high priority within the Santa Ana River Watershed. The completion of the Santa Ana River Mainstem Project will reduce the risk of a catastrophic flood event in the Santa Ana River Watershed. However, there remains significant flood risk related to tributary watercourses within the watershed, compounded by potential impacts of wildfires and earthquakes.

## Policy and Procedure Recommendations

1. Describe a process to link public and private project development processes among stakeholders that promotes consideration of watershed priorities and stakeholder priorities very early in the planning process;
2. Preserve floodplain functions through stricter management of development in floodplains—limit project construction in areas subject to flooding, preserve and restore riparian habitat functions, and enhance groundwater recharge;
3. Where appropriate, FCDs, and all watershed stakeholders, should develop procedures and guidelines to ensure consideration of IRWM goals and watershed protection principles and priorities, consistent with the MS4 Permits, when planning and designing CIP or other projects, and during development or revisions of Master Drainage Plans (MDPs) and planning of projects that implement the MDPs;
4. Create a lead watershed-wide Plan coordinating advisory and facilitation group that brings stakeholders together for decision making, partnership formation, and resource allocation to achieve Plan goals;
5. Create a source of funds targeted at multi-agency Plan projects.

## Implementation Recommendations

1. Develop a water conservation-recharge optimization plan for existing and potential future flood control facilities, using the example work of the Chino Basin Recharge Master Plan and implementation projects as a template.
2. Connect existing county or program-specific geodatabases to create a comprehensive watershed geodatabase that provides access to appropriate stakeholders, and set up a data quality control and maintenance program. The main component County MS4 geodatabases are well under way as described under “Map-Based Watershed Plans” in Section 6.

3. Develop adaptable mechanisms to implement regional BMPs and alternative compliance options (see **Table 5.8-1**) under the MS4 Permits where appropriate (see example concept project in **Appendix F2**).
4. Describe role of a lead watershed-wide Plan coordinating advisory group with facilitation to ensure coordination of project partners.
5. Preserving and restoring riparian habitat areas in conjunction with the comprehensive and integrated project recommendations within the 2.0 Plan.

**Table 5.8-1 Alternative Stormwater Compliance Elements for Development Projects in the Santa Ana Region MS4 Permits**

| Alternative Compliance Options (MS4 Permits: San Bernardino Co.--Section XI.G; Riverside Co.—Section XII.G; Orange Co.—Section XII.E) | |
|---|---|
| **1** | If a preferred BMP is not technically feasible, other BMPs should be implemented to mitigate the project impacts, or if the cost of BMP implementation greatly outweighs the pollution control benefits, the Permittees may grant a waiver of the BMPs. All waivers, along with waiver justification documentation, must be submitted to the Executive Officer at least 30 days prior to Permittee approval of the WQMP. Only those projects that have completed a feasibility analysis as specified in the WQMP Guidance and Template (see Section XI.E.7) and approved by the Executive Officer shall be considered for alternatives and in-lieu programs. If a waiver is granted, the Permittees shall ensure that project proponents participate in one of the in-lieu programs discussed in this section. |
| **2** | The permittees may collectively or individually propose to establish an urban runoff fund to be used for urban water quality improvement projects within the same watershed that is funded by contributions from developers granted waivers.<br><br>The contributions should be at least equivalent to the cost savings for waived projects and the urban runoff fund shall be expended for water quality improvement or other related projects approved by the Executive Officer within two years of receipt of the funds. If a waiver is granted and an urban runoff fund is established, the annual report for the year should include the following information with respect to the urban runoff fund:<br>• Total amount deposited into the funds and the party responsible for managing the urban runoff fund;<br>• Projects funded or proposed to be funded with monies from the urban runoff fund;<br>• Party or parties responsible for design, construction, operation and maintenance of urban runoff funded projects; and<br>• Current status and a schedule for project completion. |

| | |
|---|---|
| **3** | The obligation to install structural treatment control BMPs at a new development is met if, for a common plan of development, BMPs are constructed with the requisite capacity to serve the entire common project, even if certain phases of the common project may not have BMP capacity located on that phase in accordance with the requirements specified above.<br><br>This goal may be achieved through watershed-based structural treatment controls, in combination with site-specific BMPs. All treatment control BMPs should be located as close as possible to the pollutant sources, should not be located within waters of the US, and pollutant removal should be accomplished prior to discharge to waters of the US. Regional treatment control BMPs shall be operational prior to occupation of any of the priority project sites tributary to the regional treatment BMP. |
| **4** | The permittees may establish a water quality credit system for alternatives to infiltration, harvesting and reuse, evapotranspiration, and other LID BMPs and hydromodification requirements specified above.<br><br>Any credit system that the permittees establish should be submitted to the Executive Officer for review and approval. The following types of projects may be considered for the credit system:<br>• Redevelopment projects that reduce the overall impervious footprint<br>• Brownfield redevelopment<br>• High density developments (>7 units per acre)<br>• Mixed use and transit-oriented development (within ½ mile of transit)<br>• Dedication of undeveloped portions of the project to parks, preservation areas and other pervious uses<br>• Regional treatment systems with a capacity to treat flows from all upstream developments<br>• **Contribution to an urban runoff fund (see 2, above)**<br>• Offsite mitigation or dedications within the same watershed<br>• City Center area<br>• Historic Districts and Historic Preservation areas<br>• Live-work developments<br>• In-fill projects<br><br>**Riverside County Only**<br>• Projects that enhance the transport of coarse sediment to the coast for beach replenishment. |
| **5*** | The water quality credit system should not result in a net impact on water quality. |
| **6*** | A summary of waivers of LID (along with a short description of the Section XII.G.2 through XII.G4 In-Lieu program selected), Hydromodification and Treatment Control BMPs along with any water quality credit granted, in-lieu projects, or urban runoff fund contribution required by each Co-Permittee shall be included in the Annual Report. |
| *Not specified in the Orange County MS4 Permit. | |

## Evolution of OWOW Plan Flood Risk Management Pillar from 1.0 to 2.0

The Plan has evolved in the past few years as water supply and water quality problems, and flood, fire, and earthquake risks have been further evaluated and better understood. The linkage to FCD agency activities, as described in the Plan, version 1.0 and 2.0, are summarized below.

### OWOW 1.0

1. Evaluate how to achieve the goal to "manage rainfall as a resource," thereby maximizing beneficial use of rainwater and providing adequate flood control capacity and other community benefits; and,
2. Develop potential improved metrics for the expression of risk that are more understandable and more universal, to facilitate the establishment of better flood protection standards.
3. The 1.0 Plan objectives are reflected in its "vision of flood risk management in 2030":
4. Each person in the watershed feels secure that there is a less than one in one hundred chance in any given year that their home will be flooded.
5. There is no loss of life and no uninsured property damage in the watershed due to flooding.
6. Stormwater is managed with the understanding that it is both a potential risk and a valuable resource.
7. The 1.0 Plan, Chapter 5.6, describes the watershed's physical geography, basic hydrology, land uses, and the history of the region's floods and flood response. Regional flood response culminated in the ongoing Santa Ana River Project, and management strategies focused on hardening and straightening stream channels to maximize drainage efficiency, and buffering peak flows by providing large flood storage facilities.

### Chapter Findings

1. Very early land use decisions have preceded implementation of flood management strategies, severely limiting feasible flood control alternatives. Significant urban encroachment has occurred in most regional floodplain areas, where regional storage and hardened, straightened, and levied channels may be the only feasible and effective flood protection approaches.
2. If flood management strategies were developed during the original (earliest) planning for development of the region, and implemented in a proactive, rather than reactive, manner, flood risk management could be balanced with other watershed priorities, and overall benefits could be optimized.
3. To address the current regional priorities, given the existing systems, the Flood Risk Management Pillar and the Water and Land Use Pillar will need to collaborate to develop more effective new approaches going forward.

### Challenges for the Future

1. Watershed Coordination: To improve upon the results of traditional approaches to flood risk management, more collaborative and comprehensive planning and implementation needs to be coordinated at the watershed scale.
2. Water Conservation: Develop additional ways to modify our infrastructure, or build new infrastructure components with more effective designs, to maximize the capture of local water while maintaining the required level of flood protection. Water conservation is part of the missions of the watershed FCDs (see Section 5.b, below). Probably the greatest opportunities for increased

capture and recharge of stormwater are in the Inland Empire (generally San Bernardino and Riverside Counties and the incorporated cities in the SAR Watershed), where geology and open space allow enhanced recharge to reduce downstream flood magnitudes.

3. Stormwater Quality Management and Flood Risk Management: MS4 Permits adopted in 2009 and 2010 for the watershed include explicit requirements to limit changes in runoff volume and velocity of runoff from new development and significant redevelopment projects using "low impact development" (LID) design concepts. These include minimizing impervious surface area, including pervious areas to interrupt flows across impervious areas, and maximizing stormwater infiltration. However, LID concepts and other methods used to avoid changes to the hydrograph will not address flood management issues. The LID requirements apply predominantly to new development projects so will not provide short-term solutions for existing developed areas, and a large proportion of the suitable watershed areas are already mostly built-out.
4. Ecological Impacts: Construction of flood control conveyance facilities and dams for flood detention have a direct effect on riparian and wetland habitats. New projects of this type have become increasingly unacceptable to the public and environmental groups, and when approved, incur major costs for environmental mitigation. This Plan should develop a regional consensus on how to balance habitat protection and restoration priorities with flood protection and regulatory requirements.
5. Money and Advocacy: Flood control projects and water supply projects are expensive. Public investment for such projects has typically been spread over a large population, and required as a condition of project approvals, leading to the expectation that infrastructure improvements depended on growth to be affordable. The Watershed needs to find alternatives to relying on future development to fund infrastructure.

Flood control infrastructure project construction often depends on State and Federal subsidies. This approach necessitates a sustained commitment to advocacy in Sacramento and Washington, DC, that is expensive and has not always been well coordinated. A comprehensive, watershed-wide plan for flood management, integrated with other water resources programs, would be the foundation for focused advocacy efforts of all stakeholders and the entire delegation of legislators in the Watershed.

1. Decision Making: Historical land development and land planning decisions have occurred before flood protection planning and implementation. Therefore, land development has pre-empted flood control and constrained the available flood management approaches, thus limiting the ability of FCDs to fully achieve their flood control missions and address the economic and environmental impacts of those actions.
2. Quantification of Risk (to prioritize): Flood risk needs to be clearly communicated to elected officials, and to compare that risk to other priority community needs, including water resources. It is important for the public to understand what 100-year flood protection means. Currently, the average citizen is concerned mainly whether flood insurance premiums are required, and whether the local FCD is doing its job.

### Conclusions (OWOW 1.0)

1. Environmental Review requirements have increased the complexity of FCD infrastructure management.
2. FCD Management priorities should be integrated into the earliest stages of land use planning and decision/approval processes.

### OWOW 2.0

1. Build on the work of OWOW 1.0 to identify implementation actions to address strategies for flood risk and stormwater management.
2. Define any new opportunities to address flood protection and integrate storm water management and water conservation with reduction of risk to property from flood events.
3. Explore feasibility of automated rainwater harvesting systems and networks that could provide water conservation and flood control, as well as water quality benefits.
4. Examine the framework and potential development of regional mitigation banks.
5. Evaluate "alternative compliance," options provided by MS4 Permits include regional BMPs, retention credits, in lieu BMP implementation, and an urban runoff fund.
6. Identify approaches and processes to partner with FCDs on projects.

These objectives and recommendations for the 2.0 Plan are discussed further in the following sections.

## Relation to other OWOW Pillars

FCD Jurisdictions cross virtually all other jurisdictional areas in the watershed, and almost all surface water infrastructures are managed by the FCDs, some in partnership with the U.S. Army Corps of Engineers (USACE), the U.S. Bureau of Reclamation USBR, the California Department of Water Resources (DWR), water districts, cities, or other agencies. Projects requiring surface water conveyance or storage will typically require permits from the FCDs and other agencies. Therefore, FCDs are mandatory project stakeholders and partners in the vast majority of existing and potential projects to enhance stormwater capture and groundwater recharge. FCD legislative authorities included water conservation, but the highest mission priority is flood protection. Any cooperative project with a FCD as a partner must ensure that project design and operation does not compromise flood protection priorities.

In California, most MS4 Permits designate FCDs as Principal Permittees. In the Santa Ana River (SAR) Watershed, the Principal Permittees are the San Bernardino County Flood Control District (SBCFCD), the Riverside County Flood Control & Water Conservation District (RCFCWCD), and the County of Orange. SBCFCD, RCFCWCD, and OCFCD (OC/OCFCD)[1] are collectively referred to herein as the FCDs. Principal Permittees lead the development of required implementation documents and programs and coordinate

[1]The Orange County Flood Control District, administered by the Orange County OC Public Works (OC Public Works), is governed by the Orange County Board of Supervisors. OCFCD is a political entity that has no employees, but owns land, and assesses an annual benefit on all taxable real property in Orange County. Because OCFCD has no specific employees, the District and its property are administered, maintained, and operated by OC Public Works staff, who are in turn employed by the County of Orange. (http://ocflood.com/about/history)

implementation of the MS4 Permits among all of their co-permittees (cities and counties). Therefore, the Principal Permittees and FCDs are a primary source of information and guidance for the co-permittees and other stakeholders in the watershed. These MS4 Permit requirements include:

1. WQMPs—Water Quality Management Plans are enforceable guidance that specifies the requirements for stormwater quality and hydromodification mitigation project designs and BMPs.
2. Watershed Plans—Detailed plans to address watershed management within specific subwatersheds with the SAR Watershed and within specified jurisdictional or hydrologically defined areas. These include plans to address specific water quality problems (such as TMDLs), and/or hydromodification management, specific habitats, or other subwatershed-specific concerns.
3. Tools: MS4 programs are required to develop a variety of tools to address urban runoff impacts, including public outreach materials and programs, technical guidance for development project design and conditioning, mapping and GIS, hydrology manuals, water quality and biological monitoring programs, and various special studies to address specific concerns.

Therefore, the Principal Permittees and FCDs (and their co-permittees) are the direct link to compliance with the MS4 Permits. These permits require consideration of water quality, changes in runoff hydrology, integration of runoff water quality issues into land use planning and development project approval, preservation and improvement of habitat, and compliance with all related state and federal regulations (USACE 404 Dredge and Fill permits; CDFW stream alteration agreements; USFW species and habitat concerns; RWQCB Section 401 Water Quality Certifications, and others) as well as local ordinances and codes. The broad scope of the MS4 Permits and the watershed-wide jurisdiction of the Principal Permittees link the FCDs to all the other OWOW Pillars.

# Background

## Santa Ana Watershed Physical Characteristics[2]

The Santa Ana River watershed covers about 2,650 square miles. Maximum elevations in the Watershed exceed 11,000 feet, and more than one-third of the watershed area lies within three steep mountain ranges. Most of the rest occurs in lower-sloped valleys formed by a series of broad alluvial fans that extend from the base of the mountain front. The SBCFCD has jurisdiction over the largest and most upgradient areas in the watershed, RCFCWCD manages the intermediate and lower eastern section, and OC/OCFCD manages the lower, more coastal portion.

The watershed comprises three main sub-watersheds: 1) The Santa Ana River above Prado Dam (upper SAR Watershed) which drains of about 62% of the watershed, 2) the San Jacinto River which drains about 30% of the watershed into Lake Elsinore--flows from the San Jacinto River only reach Prado Dam when Lake Elsinore spills over into Temescal Wash (last spillover occurred in 1980), and 3) the S A R Watershed below Prado Dam which drains about 8% of the watershed and includes the Santa Ana Mountains, Chino Hills and the broad coastal plain.

[2] This section follows very closely with only some ammendation (and where elsewhere referenced) the hydrology section of the *Review Report on the Santa Ana River Main Stem---including Santiago Creek and Oak Street Drain for flood control and allied purposes*, US Army Corps of Engineers, Los Angeles District, December 1975

Physiographic differences between the three areas result in significant differences in the design and operation of FCD facilities. The upper SAR Watershed includes three significant tributaries, Mill Creek, Bear Creek, and Lytle Creek. The Upper SAR Watershed has areas of extreme slopes and elevations, the average gradient of the Mountain reaches of the upper SAR average 240 ft. /mile, and 30 ft. /mile near Prado Dam. The gradients of the main tributaries average 700 ft. /mile in the mountains and 30 ft. /mi in the valley reaches[3]. Storm and runoff events in the upper SAR Watershed can be extremely dynamic and subject to high levels of sediment and debris delivery in very short timelines. One large rainfall season, or event (or fire) can cause impacts to the FCD system that takes all available resources to recover from—thus delaying work on other planned projects for up to several years.

The San Jacinto River flows from headwaters in the San Jacinto Mountains. Mountains and foothills account for 471 square miles while 288 square miles are considered valley floor (SWRB, 1955). Elevations range from less than 1,250 feet above sea level at Lake Elsinore to approximately 1,400 to 1,700 feet on the valley floor to 10,834 feet at Mt. San Jacinto in the San Jacinto Mountains[4]. More than 90 percent of the San Jacinto River Watershed drains to Lake Elsinore (McKibbin, Stuart 2013). Runoff from as far as Moreno Valley, San Jacinto, Hemet, and Perris contribute to surface flows that reach Lake Elsinore during rainfall events. During normal to dry periods, when the San Jacinto River and the surrounding tributaries are essentially dry, little or no flow enters Lake Elsinore.[3]

Approximately 60% of the drainage area for the SAR Watershed below Prado Dam lies within the Santa Ana Mountains and the Chino Hills. Most of the remaining area lies within the broad coastal plain that extends southwestward to the Pacific Ocean. Numerous tributaries contribute to the Santa Ana River within this reach. The principal tributary is Santiago Creek with a drainage area of approximately 102 square miles. Lesser tributaries include Wardlow Canyon, Aliso Canyon, Gypsum Canyon, Blue Mud Canyon, Walnut Canyon, and Carbon Canyon Creek. The average gradient of these tributaries is about 300 feet/mile, while the average slope of the Santa Ana River from Prado Dam to the ocean is about 15 feet/mile[2].

The climate is generally mild, but both temperature and precipitation vary considerably with distance from the ocean, elevation, and topography. Most precipitation occurs as rain from December through March, although some falls as snow at higher elevations. The average annual rainfall varies from ten inches per year south of Riverside, to about 45 inches per year in the higher mountains.

Winter storms usually move in from the Pacific Ocean bringing widespread rain, and snow at the higher elevations. Such storms often last several days. More localized episodic storms associated with frontal systems can occur at any time of the year, and can produce high-intensity precipitation over a comparatively small area for up to six hours.

---

[3] USACE, 1988. Design Memorandum No. 1 **PHASE II GDM ON THE SANTA ANA RIVER MAINSTEM including Santiago Creek**

[4] Tetra Tech, WRIME, Inc., for the San Jacinto Watershed Council, 2007. **San Jacinto River Integrated Regional Watershed Management Plan**

Stream flow is perennial in the canyons of the Santa Ana River and in the headwaters of most of its tributaries, but is generally ephemeral in most valley segments. Stream flow increases rapidly in response to precipitation. High-intensity precipitation, especially following wildfire, may result in intense sediment-laden floods, with some debris load in the form of shrubs and trees.

There are several large lakes and reservoirs within the watershed that help regulate flood flows; the largest being Prado Dam, Seven Oaks Dam, Lake Elsinore, Big Bear Lake, Lake Hemet Reservoir, and Santiago Reservoir.

### Historical Flooding

The SAR Watershed has experienced flooding on numerous occasions in the American era, including floods in 1825, 1862, 1884, 1914, 1916, 1927, 1938, 1965, 1969, 1980, 1983, 1995, 2005 and 2010. The critical event in flood management in the SAR Watershed was the 1938 flood. In that event, Orange County experienced California's worst flooding of the 20th century. The City of Anaheim experienced 15 feet of water in some places, and 182,000 total acres were inundated. Dozens of deaths occurred. In Riverside and San Bernardino Counties, the 1938 flood made it painfully clear that the County governments did not have an adequate program of flood protection. The Orange County FCD was formed in 1927, San Bernardino County created its flood control district in 1939, and Riverside County followed the same course in 1944.

### Missions

The FCDs' highest priority is to ensure flood protection of life and property and comes directly from legislative authority (CWC Section 8100). However, FCDs also have parallel missions to provide water conservation, and recreational and irrigation use of impounded waters within their jurisdictions, while preserving flood protection effectiveness (see Section 5.a, below).[5]

## Flood Control Improvements

### Santa Ana River

The Santa Ana River has been the focus of USACE of Engineers projects starting with the authorization of Prado Dam in 1936. The dam was completed in 1941. Levees were constructed in Riverside in 1955. Prado Dam was built primarily for downstream flood protection, and 92 percent of the watershed lies above it. More recently, the dam also has become a vital component of the water supply management program in the region, and has allowed the creation of ecologically important habitat areas behind it.

Prado Dam originally was designed to provide protection against flooding in a 200-year event, but as the watershed urbanized, the protection had decreased to a 70-year event with the downstream channel having capacity for only a 50-year event. To address these deficiencies the USACE initiated study of the Santa Ana River Main Stem Project (SARP) in 1964. Construction of the SARP was initiated in 1989. The SARP is located along a 75-mile reach of the Santa Ana River in Orange, Riverside and San Bernardino Counties. The project's objective is to provide the developed and developing areas in the

[5] Public Law 534, 78th Congress, 1944, and specific projects referenced therein and as updated since.

watershed with approximately 100-year flood protection through the end of the project life. The plan for flood control improvements included three principal features:

1. Lower river channel modification for flood control along the 30.5 miles of the Santa Ana River from Prado Dam to the Pacific Ocean. Construction of a retarding basin and channel improvements on Santiago Creek are also planned. (Ongoing, estimated completion date: 2016)[6]
2. Enlargement of Prado Dam to increase reservoir storage capacity from 217,000 acre-feet to 362,000 acre-feet. (Ongoing, projected completion date 2024.)
3. Construction of Seven Oaks Dam (about 35 miles upstream of the existing Prado Dam) with gross reservoir storage of 145,600 acre-feet. (Completed in 1999.)
4. The drainage area behind Seven Oaks Dam comprises 177 square miles, excluding 32 square miles that drains internally to Baldwin Lake. The principal tributary is Bear Creek, which drains 55 square miles, and has an average gradient of 460 feet/ mile. The only existing structure that would affect flood flows in this sub-watershed is Big Bear Lake, which is a water conservation reservoir. It collects water from a 38-square-mile drainage area, and has a surcharge storage capacity of about 8600 AF between the top of the conservation pool and the top of the dam.

## San Jacinto River

The San Jacinto River Watershed Council (SJRWC) developed an Integrated Regional Water Management Plan (IRWMP) for that 770-square-mile sub-watershed (now incorporated into the Plan). The San Jacinto IRWMP, addressed water supply, water quality, drought-proofing, and critical habitat protection. The plan also addresses flood risk concerns, and recognizing that the issue is risk management and not purely a matter of engineering, the SJRWC approach frames the issue as "providing]flood protection to existing disadvantaged communities." The plan acknowledges a number of flood risk management strategies as alternatives to channelization.

In 1960 the USACE constructed the San Jacinto River Levee to protect the city of San Jacinto. The levee was rehabilitated by the USACE in 1980 after the levee was breached by a 30-year return frequency flood event. Another major USACE project was the Lake Elsinore Management Project constructed in 1995; the project allows for better management of the lake water levels and provides a safe outlet for the lake when it spills.

## Improvements to Tributaries

Other flood control improvements exist along some of the smaller tributaries: San Antonio, Chino, Cucamonga, Deer, Lytle, San Sevaine, Day, San Timoteo, City, and Cajon Creeks, above Prado Dam; Carbon Canyon Dam and Villa Park Dam in Orange County; and Perris Valley Storm Drain and Salt Creek above Lake Elsinore. These improvements include channelization, debris basins, storm drains, levees, stone and wire-mesh fencing, stone walls or rip-rap along the banks of stream channels, concrete side slope protection, and drop structures.

[6] Orange County Public Works, Flood Control Division: http://ocflood.com/sarp/lower

Other improvements not aimed mainly at flood control include spreading grounds, recharge basins, and water conservation reservoirs. There are more than 100 water conservation and recreational reservoirs in the watershed, with storage volumes ranging from 5 AF to 182,000 AF in Lake Mathews. These improvements affect the regimen of lesser flood flows, but do not appreciably affect major flood flows. Below Prado Dam in Orange County, local and tributary projects include: improvements to Fullerton Creek Channel, Greenville-Banning Channel, Bolsa Chica Channel, East Garden Grove-Wintersburg Channel, Huntington Beach Channel, Talbert Channel, Peters Canyon Channel, Aliso Creek Channel, Serrano Creek Channel, San Juan Creek Channel, Westminster Channel, and Atwood Channel.

## Flood Risk

Risk is the product of the likelihood of the flood control facility failing, the amount of damage that might occur for given depths of flooding and the likelihood of a flood discharge. For example, a levee made from sand is much more likely to fail than one made of concrete and the risk for residents behind it is higher. Or if an area is flooded to a depth of 1-foot but all the buildings in the area are elevated 2-feet above the ground the risk from flooding is dramatically reduced.

Flood discharges can be estimated. One way to estimate flood discharges is the Probable Maximum Flood (PMF) which is the most severe combination of critical meteorological and hydrological conditions that are reasonably *possible* in the region. Application of PMF is mostly confined to determination of spillway requirements of high dams in order to give virtually complete security against potential floods catastrophes.

The USACE has chosen to design many flood control structures in the region to the Standard Project Flood (SPF), which represents the discharge that may be expected from the most severe combination of meteorological and hydrological conditions that are considered reasonably *characteristic* of the geographical region involved, including extremely rare combinations. SPF is selected where some small degree of risk can be accepted but an unusually high degree of protection is justified by hazards to life and high property values within the area to be protected. It is estimated that the SPF discharges are generally equal to 40-60 percent of the MPF discharges for the same basin. For example the Prado Dam and Seven Oaks Dam storage areas and the Santa Ana levees were designed for the SP F.

Today, the discharge most commonly used by local jurisdictions for planning and design is the 100-year flood, a hypothetical event that is defined as having a 1 in 100 (1%) chance of occurring in any given year. This standard came about through the National Flood Insurance Act of 1968 which created the National Flood Insurance Program (NFIP). At the outset of the program, a national standard was needed to enable all properties to be treated similarly. The 100-year or base flood was selected as a trade-off between two possible extremes. At one end of the spectrum, the program could have sought to protect everyone from almost all floods, no matter how large or rare, which would have placed economic improvement restrictions on very large areas. At the other end, the program could have provided

protection only for the smaller floods, which would have left many buildings exposed to damage. The 100-year standard was the balance point between the pros and cons of both extremes.[7]

In order to take advantage of the federal government's offer of affordable flood insurance, communities that participate in the NFIP must manage their floodplains by applying land use regulation and construction standards in an effort to reduce future flood losses. Local communities adopted the 100-year standard to be consistent with the NFIP, although some critical flood facilities are designed to higher standards. For example, the California State Legislature adopted SB5 in 2005 which established that levees and floodwalls in the Sacramento-San Joaquin Valley provide protection against a flood that has a 1-in-200 chance of occurring any given year.

The California Department of Water Resources and the USACE have developed a program called "California's Flood Future."[8] They found that millions of Californians live in areas exposed to flood risk, and believe there is an unacceptable level of flood threat to public safety and the economy. They evaluated risk in 100-yr and 500-yr flood zones as defined by FEMA and statewide county sources. They found an expectedly larger population would be affected by a 500-yr flood with concomitant economic losses. They also found that the South Coast Region has the greatest population exposed to floods, with the majority in the Orange and Los Angeles Counties: 250,000 in the 100-yr floodplain, and over 3 million in the 500-yr flood plain. The results of this work will influence flood risk management approaches in the future, and explicitly suggests use of integrated water management and IRWMs to address this challenge.

The NFIP has mapped 100-year floodplains for the major tributaries throughout the watershed. The Table below shows the scope of the existing flood hazard within the Santa Ana River Watershed.

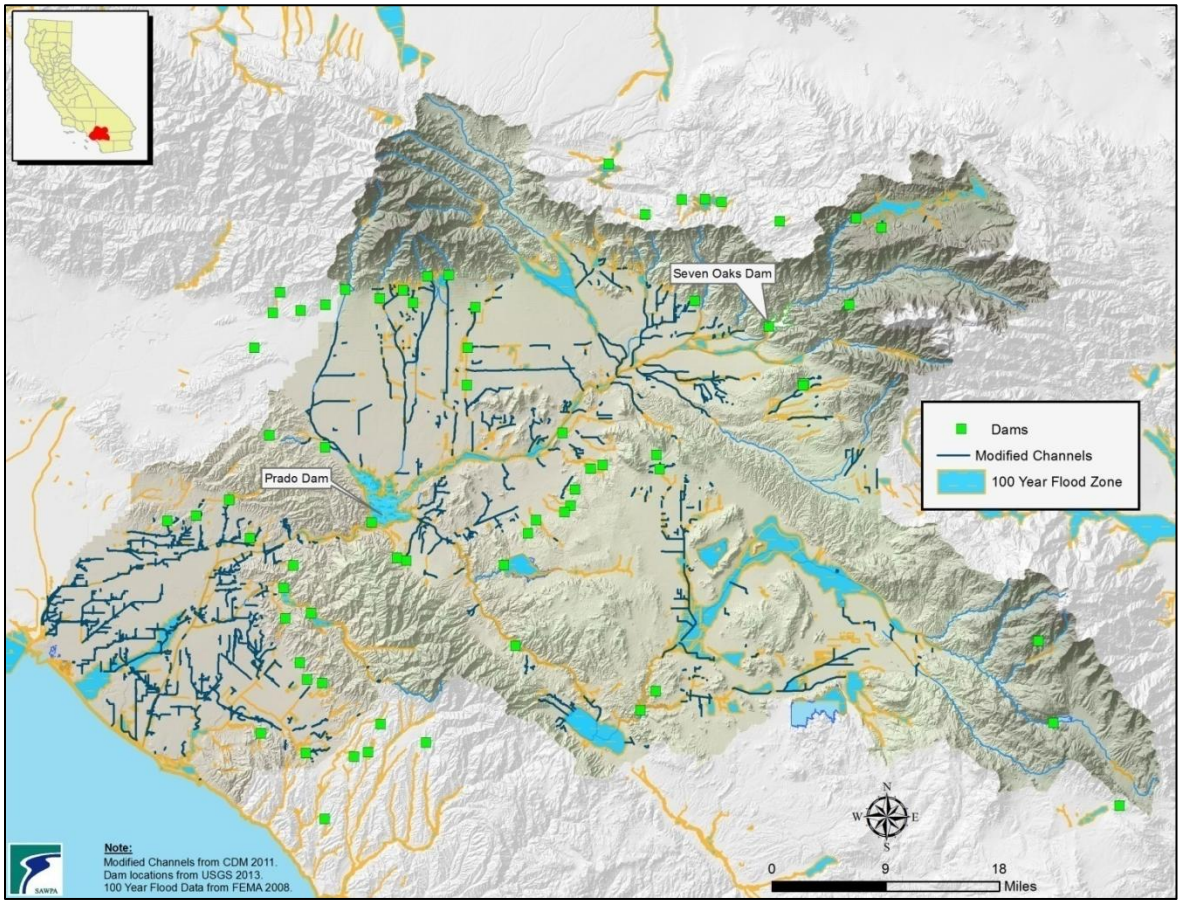

**Table 5.8-2 Square Mileage of 100-Year Floodplain**

| County | 100-year floodplain (sq. mi) | Number of structures | Value of structures |
|---|---|---|---|
| Orange | 46 | | |
| Riverside | 90 | 7200 | $2.4 Billion |
| San Bernardino | 191 | | |

**Figure 5.8-1 Flood Channels and 100-Year Flood Zones in the Santa Ana River**

## Sediment management (sediment as a resource)[9]

1. There are many benefits associated with managing sediment within the Watershed. With Seven Oaks and Prado Dams, sediment transfer could provide a longer usable life of the dams for flood control purposes. The costs of raising the elevation of a dam in the future have large economic and social implications. Some of the impacts include the cost of construction, purchase of property that will lie within the new flood zone and the relocation of infrastructure. Sediment-filled reservoirs behind dams have been addressed elsewhere by plans to remove the dams (e.g. Matilija Dam in Ventura County: http://www.matilijadam.org/).
2. Removing sediment from behind our dams would also preserve and create valuable storage volume for water conservation efforts. Water conservation is limited based on storing water at elevations that minimally impact flood control efforts and natural resources. As sediment accumulates behind a dam it reduces the available volume for water conservation. Active management of sediment at the Prado Dam is being investigated by the USACE's Prado Basin, California Feasibility Study and the

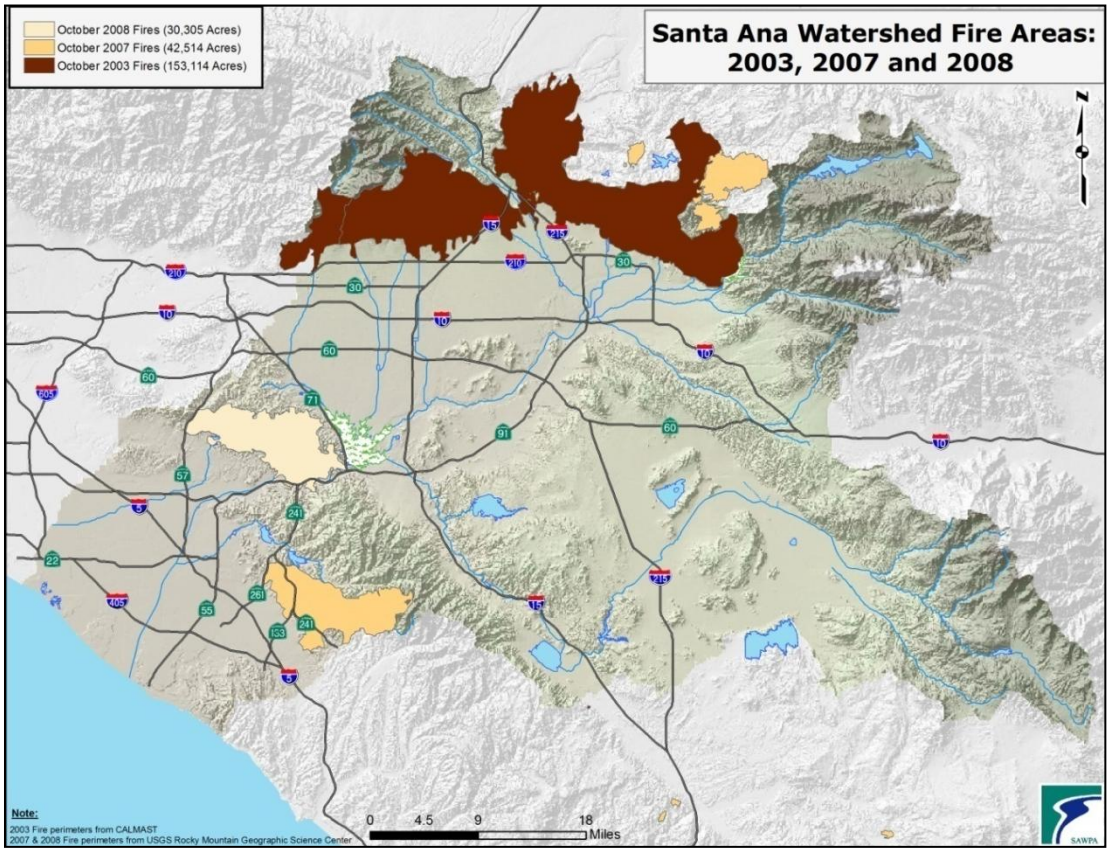
[9] Sediment management section adapted from the OWOW Santa Ana River Watershed Planning Framework white paper, Sediment Transfer Section, p. 10-11, April 17, 2012.

Proposition 84-funded Prado Basin Sediment Management Demonstration Project (Project ID #2098, Table SW-2a and b).

3. Sediment released below a dam is carried further downstream and provides replenishment sediment that could replace eroded areas that have compromised critical infrastructure. Two examples in the SAR Watershed include the CA 91 Freeway and the current location of the Inland Empire Brine Line. This replenishment sediment would also preserve stream embankments and critical flood control levees. As the river incises due to reduced sediment loads, it erodes the embankments and adversely impacts wildlife habitat for protected riparian species. This adverse impact is termed "hydromodification" in the MS4 Permits.
4. Sediment is needed in the Santa Ana River for groundwater recharge operations between Imperial Highway and the CA 57 Freeway. Coarsening, and subsequent armoring, occurs when the natural sands in the river are washed downstream and not replaced by new sediment deposition. Over time the accumulation of these fine sediments create an impermeable layer in the river bottom thereby reducing percolation rates.
5. The Santa Ana River is also a major source of sediment for beach sand. While anthropogenic beach replenishment is a regular activity, the full effects of sediment impoundment by Prado Dam have yet to be felt by Orange County coastal communities. Consequences of reduced sediment at the coast will affect private and public properties, infrastructure, and adverse environmental impacts.
6. Effective sediment management requires a watershed-wide approach. Sediment originates from erosion in the local mountains and foothills and is transported through and stored within the jurisdictions of numerous agencies on its way to the ocean.

## Floating Debris

Floating debris and trash can cause clogging and slow drainage of flood facilities and water quality BMPs. If such facilities are not adequately maintained, these materials can become a source for mosquitos, and other disease vectors and nuisance pests. Accumulated trash and debris are also remobilized to downstream areas with successive storm events, and blown by strong winds.



## Fire

Episodic wildfires are natural occurring events in southern California landscapes. However, fire suppression practices in the past decades have altered the character of natural landscapes and plant communities, and urban expansion and encroachment into natural areas has resulted in an increased frequency of wildfires (**Figure 5.8-2**).[10] Increases in runoff, erosion, and sediment loading during storm events have been well documented. Flood facilities can be overwhelmed and uncontrolled debris flows and floods can occur. Long-term slope stability is compromised by intense wildfire events, and post-fire runoff contains increased levels of pollutants that can cause severe impacts to receiving waters. These impacts are not fully understood, but may be best managed by prevention. Anthropogenically-intensified wildfires also cause longer-lasting landscape impacts, and habitat recovery may be delayed.

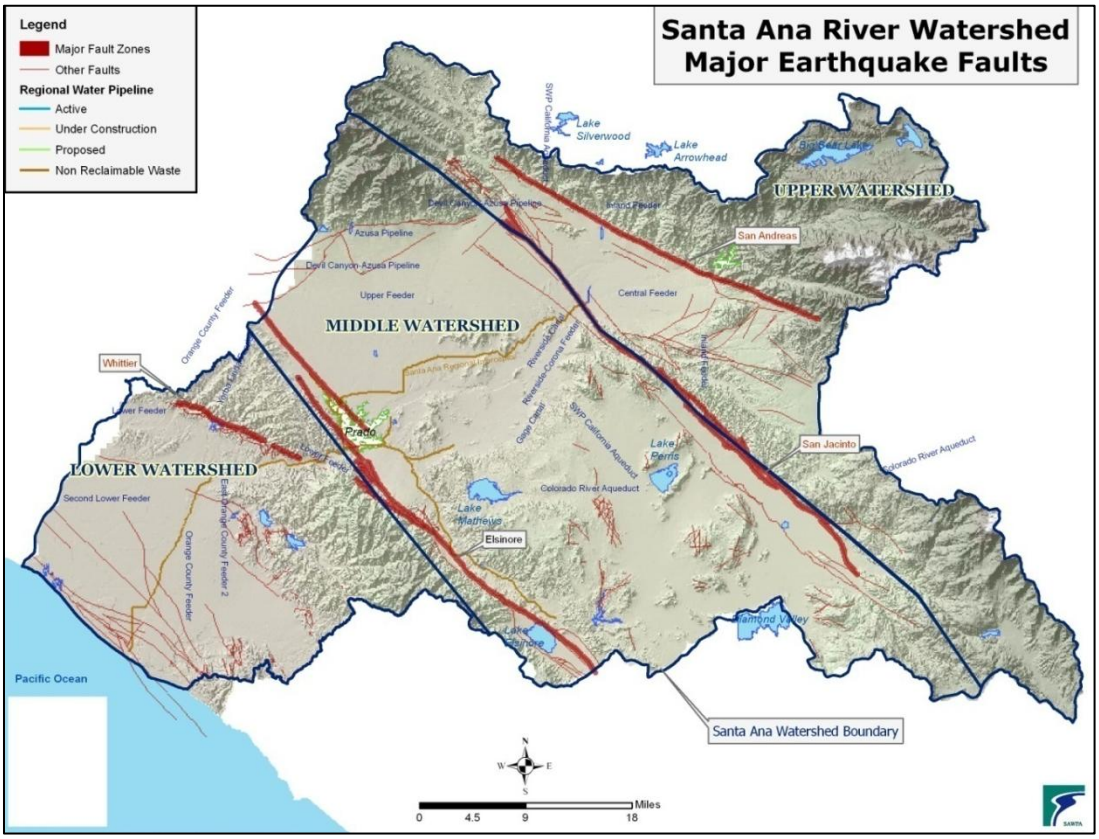
[10] Stein and Brown, 2009. Effects of post-fire runoff on surface water quality: Development of a southern California regional monitoring program with management questions and implementation recommendations. Southern California Coastal Water Research Project, Technical Report 598.

The "Forest-First" programs under development between SAWPA and the USFS should provide proactive management actions to reduce wildfire impacts over time.[11]

**Figure 5.8-2 Major Wildfire Areas in the Santa Ana River Watershed in 2003, 2007, and 2008**

## Earthquake

The Santa Ana River Watershed very seismically active, being affected by three major fault systems, the San Andreas, San Jacinto, and Elsinore faults (**Figure 5.8-3**). Although FCD facilities and dams have been engineered and constructed to meet all applicable seismic hazard requirements (e.g. Seven Oaks dam is designed to withstand an 8.0 magnitude earthquake), actual infrastructure damage from earthquakes remains uncertain.



The USGS has developed a theoretical, yet plausible, San Andreas Fault earthquake scenario called The Great California Shakeout[12]. The Great California Shakeout scenario depicts the impacts from a 7.8 magnitude earthquake on the San Andreas Fault in Southern California. On average, such an earthquake occurs south of the San Gabriel Mountains every 150 years; the most recent was 300 years ago. A 7.8 magnitude earthquake is expected to affect 7.5 million people. An estimated 200,000 people commute over the San Andreas Fault for work and would potentially be separated from their homes. Ground

[11] OWOW Santa Ana River Watershed Planning Framework white paper, Forest First Program Projects Section, p. 11-13, April 17, 2012.
[12] USGS, Great Shake Out, updated 2013. http://earthquake.usgs.gov/regional/nca/simulations/shakeout/

shaking would last as long as 2 minutes and some areas will experience ground level displacement of up to 10 feet. Thousands of aftershocks would be expected in the following months. There would be an estimated 1,800 deaths and 53,000 injuries in the first minutes of the event. As many as 1,500 buildings would collapse and 300,000 structures would be severely damaged causing $213 billion in damages. 255,000 people would be homeless. In the minutes following the earthquake Southern California would expect up to 1,600 fires due to severely reduced fire-fighting capability from damaged infrastructure, and a lack of running water and/or electricity for weeks or months.

The SAR Watershed would be significantly affected, especially by interruptions in the supply of imported water. Such an earthquake event could cause extensive levee failure along the State Water Project, resulting in significant imported water loss and flooding of surrounding areas.

**Figure 5.8-3 Major Geologic Fault Zones in the Santa Ana River Watershed**

## Climate Change

The OWOW Plan includes evaluation of climate change impacts and recommendations to the watershed through mitigation and adaptation to a changing climate. Details of the watershed's evaluation can be found in the Bureau of Reclamation's Technical Memorandum: 86-68210-2013-02: Climate Change Analysis for the Santa Ana River Watershed, dated August 2013. It is located at **[Appendix F2]** in the OWOW 2.0 Plan. Some of the highlights of the watershed's climate change analysis reveal that in the next 50-years and beyond, average annual temperatures will increase, total annual precipitation will

probably decrease, and winter snowpack will melt sooner, causing more runoff in the winter rather than in the spring.

In the Santa Ana River Watershed, nearly 95% of the average annual rainfall occurs in about a 4.5 day period. Collecting a substantial portion of large runoff volumes in the short timeframes characteristic of intense, short duration events in such a short timeframe in detention or recharge basins is difficult. Given the same average annual rainfall, runoff from more frequent and less intense storms could be captured more effectively by typical basins. However, changing weather conditions resulting from climate change are expected to increase the intensity of storms in the SAR Watershed while decreasing their frequency, which would decrease the expected volume captured by existing approaches.
FCDs are not expected to make significant changes to facilities in the near future, but should evaluate their systems to address variable runoff scenarios in partnership with other stakeholders. It may be possible to modify the runoff capture facilities to optimize groundwater recharge for shorter duration, larger magnitude, and higher intensity storm events. Collaborative projects with water supply and groundwater management agencies as partners would provide a multi-perspective approach, and higher likelihood for success for climate change adaptation projects, than FCDs conducting such projects in isolation. Successful flood control and stormwater capture/groundwater recharge projects will likely require adaptive management approaches for long-term optimization.

## Intersection of IRWM (OWOW) and Flood Control District Missions

California's Flood Future (2013)[13] identified the following problems currently facing FCDs:

- Land use decisions may not adequately prioritize public safety;
- Differing methodologies and inadequate data make risk assessment complex and costly;
- Flood management projects are not prioritized from a system wide perspective;
- Emergency preparedness may not receive necessary funding;
- Delayed permit approvals and complex permit requirements are obstacles to flood risk reduction; and,
- Lack of reliable, sustained funding puts Californians at significant risk.
- This section links these and other problems, from the perspective of FCDs, with the purpose of the Plan and efforts to improve compatibility and how to partner with FCDs.

### FCD Missions

The missions of FCDs hold flood protection as their highest priority. FCDs are natural partners for many projects due to their broad jurisdictional areas, and parallel missions of water conservation and water quality improvement. However, FCD funding is generated from property assessments which may limit the applicability of FCD funds to the areas from which fees are derived (FCD Zone areas). Mission statements for the SAR Watershed FCDs:

[13] California's Flood Future Highlights: Recommendations for managing the State's Flood Risk. Public Review Draft March 2013, California Department of Water Resources and the USACE.

### *RFCWCD*

"The objects and purposes of this act are to provide for the control of the flood and storm waters of the district and the flood and storm waters of streams that have their source outside of the district, but which streams and the waters thereof flow into the district, and to conserve the waters for beneficial and useful purposes by retarding, spreading, storing, retaining and causing to percolate into the soil within the district, these waters, or to save or conserve in any manner all or any of these waters and protect from these flood or storm waters, the watercourses, watersheds, public highways, life and property in the district, and to prevent waste of water or diminution of the water supply in, or unlawful exportation of water from the district, and to obtain, retain and reclaim drainage, storm, flood and other waters for beneficial use in the district.[14]

### *SBCFCD*

"To provide for the control of flood and storm waters of the District in order to protect watercourses, watersheds, public highways, life and property; to conserve such waters for beneficial purposes by spreading, storing and causing to percolate in the soil."[15]

### *OCFCD*

The purposes of this act are to provide for the control of the flood and storm waters of the district, and the flood and storm waters of streams that have their source outside of the district, but which flow into the district, and to conserve those waters for beneficial and useful purposes by spreading, storing, retaining, and causing them to percolate into the soil within the district, or outside the district, or to save or conserve in any manner all or any of those waters and protect from damage from those flood or storm waters, the harbors, waterways, public highways, and property in the district."[16]

## Right of Way

FCDs are also constrained by right-of-way and easements. Master Plans of Drainage (MPDs) typically develop a conceptual conveyance system for a plan area, with the intention to preserve adequate right-of-way for FCD facilities to be built when needed. However, many MPDs were developed without due consideration for enhanced stormwater capture, or for soft-bottom or more ecological alternatives to standard hardened and concrete facilities. Therefore, existing right-of-way for FCD facilities may be inadequate to accommodate multi-use facility designs.

## Environmental permitting requirements

Construction of most FCD facilities requires environmental permitting, including CEQA documents and permits from the USACE (404 Dredge and Fill Permits), RWQCBs (401 Water Quality Certifications), and CDFW (1601 Streambed Alteration Agreements). Increasing concern over the environmental impacts of the construction of hardened and concrete-lined facilities has resulted in increased environmental mitigation requirements for such facilities. Permitting for more ecologically benign designs and multi-

[14] Riverside County Flood Control Act, 1944.
[15] SBCFCD Flood Control Act of 1938.
[16] Orange County Flood Control Act, Chapter 723 of the State of California Statutes of 1927

benefit facilities can be less costly and more streamlined. This provides an incentive for FCDs to incorporate such project concepts and designs into their CIP plans, and enhances their benefits as partners in cooperative projects.

## Challenges for collaboration

The FCDs have been implementing CIP projects and maintaining these facilities in the watershed for approximately 80 years, acting with legislative authority to protect life, property, and navigation. This includes debris basins in the steep foothills, engineered conveyance and storage facilities in the inland valleys, and dams and channel protection measures to allow flood runoff to flow to the ocean with a minimum of uncontrolled floodwaters. On a parallel track, the FCDs have implemented water conservation elements within their facilities, particularly as an aid to flood protection, and to remove sediment and improve water quality as it moves downstream in the watershed. These facilities were built and maintained to protect large pre-existing urban areas, and to serve constantly growing urban and suburban areas in the watershed. These works were completed with local, state and federal funding, and were constructed in part by the USACE.

Each FCD (SBCFCD, RCFCWCD, and OC/OCFCD) has differing challenges based on their physiography (as described in Section 4), on their proportion of existing urbanized area and remaining developable areas, and on economic factors. Orange County has the lowest gradient topography and conveyance system overall, has the greatest population and economic resources, yet probably has the biggest challenge to find new space for recharge basins or to enlarge FCD facilities to meet greater flood flows. Riverside County has high gradient and lower gradient areas, a smaller population and less economic resources than OC/OCFCD, and has added constraints associated with a large existing Multi-Species Habitat Conservation Plan. San Bernardino County has the highest gradient areas and the Seven Oaks Dam, has significant sediment and debris removal needs, and has several large groundwater basins and potential for increased storage, somewhat more developable area, yet fewer economic resources than the other counties. Each county has existing sites of groundwater contamination, but only Orange County has the issue of seawater intrusion.

With the adoption of the environmental regulations in the late 1960s and early 1970s (Porter-Cologne Water Quality Act; reauthorized and amended Federal CWA; CEQA; NEPA; and the ESA), regulatory permitting has impacted the planning, design operations, and maintenance activities of the FCDs. In more recent decades, the environmental impacts of FCD facilities and activities have been observed and criticized by environmental protection advocacy groups. FCD facility planning, design, and permitting, and maintenance has become more complex and costly as a result of this layer of regulation and scrutiny, while the flood protection and water conservation directives have continued as highest priorities.

There appears to be great benefit for significantly increasing the degree of project planning, design, implementation, and maintenance conducted collaboratively among the FCDs; with watershed partners including water suppliers, groundwater management agencies, Watermasters, sewering agencies, local land development authorities, and the USACE and the USFS. Each of these entities brings experience,

design ideas, and potentially funding and maintenance resources to the project. A collaborative project development team also fulfills the objectives of IRWMP implementation and is more competitive in the quest for grant funding. This was recognized by the Board of Supervisors of the RCFCWCD when they approved Resolution Number F2004-18 in June 2004. This resolution directs RCFCWCD and Western Municipal Water District (WMWD) to jointly plan and develop water conservation projects in western Riverside County, including a conjunctive use program for Colton and Riverside groundwater basins; the Riverside-Corona Feeder Project; and joint participation in new conservation at Seven Oaks Dam. RCFC also investigated with WMWD whether an existing detention basin in the City of Riverside would function for water conservation. However, high groundwater in the area precluded an increase in infiltration at the site.

In San Bernardino County, the SBCFCD and the San Bernardino Valley Municipal Water District first entered into a cooperative agreement to recharge groundwater using SBCFCD basins in 1972. Several projects have been developed since this first agreement. Most recently, the SBCFCD and the SBVMWD have approved a MOU for the purpose of evaluating SBCFCD facilities for dual purposing to provide increased groundwater recharge while maintaining flood protection as the highest priority. Current work is focused on the Cactus FC/Recharge Basins in Rialto. Here, the SBCFCD, in cooperation with SBVMWD, obtained $1 million from a Proposition 84 Grant to enhance Cactus Basins 3/3A for flood control and groundwater recharge purposes.

However, collaborative projects using FCD facilities must acknowledge the overarching priority for flood protection. Projects must be designed to allow FCD facilities to function unimpeded and dynamically during and in preparation for potential flood conditions. In addition, FCD facilities may have other constraints regarding design and maintenance that support their flood protection function, and these must be accommodated by the design and operation of the project. FCDs are willing partners to accomplish watershed-based objectives, but must fulfill their legislative mandate when conditions demand it.

Compliance with the MS4 Permits may provide significantly increased incentives for FCDs to collaborate on watershed projects that address MS4 Permit requirements (see discussions in Sections 3 and 6).

## Stormwater as an Essential Resource for the SAR Watershed

This section builds on the work of OWOW 1.0 to provide examples of three projects successfully implemented in the SAR Watershed to achieve IRWM goals. Each project includes multiple component projects, and are either ongoing or are planning future implementation actions. This is, or course, not an exhaustive project list. These particular projects are presented as examples of how several of the "challenges for the future" (as listed in Section 2, above) can and have already been met in parts of the SAR Watershed—some were achieved decades earlier. The approaches, tools, and partnerships developed during these projects will help guide and improve future implementation projects for flood risk and stormwater management.

### Successful Implementation Projects

#### *The Santa Ana River Mainstem Project (SARP)*[17]

This ongoing project is designed to provide flood protection to the growing urban communities in Orange, Riverside and San Bernardino Counties. The proposed improvements to the system cover 75 miles, from the headwaters of Santa Ana River east of the city of San Bernardino to the mouth of the river at the Pacific Ocean between the cities of Newport Beach and Huntington Beach. This project is perhaps the most significant successful project in the SAR Watershed. Although it began with a flood protection priority as a driver that leveraged state and federal funding, it has incorporated a wide range of water quality and water conservation components over several decades—and is managed by a multi-agency entity. It is a model for adaptive infrastructure management with changing priorities.

All three counties, collectively, work closely with the USACE to design and construct the project elements. The project approach has been significantly improved through use of facilities on the SAR to increase groundwater recharge, especially in the lower SAR. The project pioneered the reoperation of Prado Dam and the use of Seven Oaks Dam to allow more use of storage capacity for water conservation, without unacceptably diminishing flood protection.
Project success factors:

1. Overriding flood threat mitigation priority initiated the project.
2. Legislative mandates drove project implementation and funding.
3. Strong and long-term ongoing cooperation among federal, state, and local project partners with a multi-party Agreement.
4. Demonstrable short and long-term benefits.

#### *Chino Basin Facility Improvement Project*

In the Chino Basin, over 25 flood control retention basins were retrofitted to allow infiltration of stormwater, and to infiltrate imported water and recycled water when seasonal storm control functions were not needed. Funding for these improvements was provided by SAWPA under the Year 2000 Proposition 13 Water Bond, Southern California Integrated Watershed Program.

[17] Santa Ana River Project Website: http://cms.ocgov.com/gov/pw/flood/sarp/default.asp

Enhanced imported and stormwater infiltration in the Chino Basin has been studied and implemented since the adjudicated basin yield was defined by the Court in 1978 (Case No. 164237). The adjudication found that the "safe yield" of 145,000 AFY (acre-feet/year) had been routinely exceeded in previous years. Corrective action was identified as augmenting the recharge of imported and natural flows by the use of offline recharge basins.[18] Following the adjudication, the Chino Basin Watermaster began replenishing groundwater with imported water. This plan recognized that impervious surfaces of flood control facilities and urbanization reduced groundwater recharge and that offline recharge basins should compensate by additional recharge to the extent feasible. It also recognized the advantage of infiltration of natural runoff due to the higher relative concentration of total dissolved solids present in imported water. So, the CBWM and the SBCFCD began a water conservation and stormwater capture project in the early 1980's that continues to the current day. Improvements include monitoring wells and SCADA (computer controlled operating system) for the basins.

The project determined that flood control facilities can be successfully augmented for stormwater recharge, that stormwater infiltration/ recharge and flood protection objectives are often compatible, and that communication among project partners was critically important.[19]
Project success factors:

1. Hydrologic studies were ongoing to develop groundwater and surface water data acceptable by all parties—estimated conservable runoff were almost 11,000 AFY (acre-feet/year) for Day Creek, and 31,000 AFY for San Sevaine; The most efficient recharge areas were identified based on soils and geology; The Inland Empire Utilities Agency reported that these improvements have captured approximately 100,000 AFY each year of operation;
2. Flood protection must be the highest priority and has been incorporated into the operating plans for the system by all parties;
3. Facility operation and maintenance responsibilities were to be shared among the parties;
4. Stakeholder trust, backed up by formal Four-Party Agreement for the project (Agreement for Operation and Maintenance of Facilities to Implement the Chino Basin Recharge Master Plan). See related update report on these efforts.[20]
5. SAWPA/State grant funding assistance (Proposition 13) for construction.

### *The Hemet-San Jacinto Integrated Recharge and Recovery Program.*[21]

The Hemet-San Jacinto Basins are located within the San Jacinto River Watershed in Western Riverside County, and consist of the Hemet South, Hemet North, Canyon, and San Jacinto Upper Pressure sub basins or management zones. These sub basins underlie Eastern Municipal Water District's (Eastern

[18] Bill Mann and Associates, 1983. Day, Etiwanda, and San Sevaine Creeks Drainage Plan, Water Conservation Report
[19] Campbell, 2011. Planning and Operations Experiences with the Chino Basin Groundwater Recharge Program. Managed Aquifer Recharge Symposium January 25-26, 2011 Irvine, California. www.nwri-usa.org/rechargesymposium2011.htm
[20] Wildermuth Environmental, 2008.Chino Basin Optimum Basin Management Program, 2008 State of the Basin Report.
[21] Eastern Municipal Water District 2000.State of the Hemet/San Jacinto basins. http://www.emwd.org/modules/showdocument.aspx?documentid=93

MWD) service area and are utilized for groundwater supply for the cities of San Jacinto and Hemet, as well as unincorporated areas of Riverside County.

This project involves 100 acres of ponds, eight recovery wells, and a 60-inch diameter pipeline from Eastern MWD's EM-14 connection to the ponds. The objectives of the project include: providing Tribal Settlement Water (long-term average of 7,500 AFY), elimination of groundwater overdraft (10,000 AFY) and additional long-term supply (15,000 AFY). The project includes 20 acres of wet pond recharge area in the San Jacinto River channel, and has captured and recharged over 10,000 acre-feet since June 2012. A Stipulated Judgment (including the Soboba Tribe, EMWD, MWD, and LHMWD) has been filed as a collaborative solution to promote the efficient and coordinated management of surface water and groundwater, to avoid problems from overdraft, to assist in protecting the rights of the Tribe, to sustain and enhance water resources, and to resolve competing claims to surface water and groundwater[22]. Project success factors:

1. Currently, Eastern MWD has a Planning Department that pursues efforts to work with other agencies and private groundwater producers to establish cooperative groundwater management programs including groundwater storage and conjunctive use programs[23].
2. The project was guided by a unique committee that included construction oversight staff, attorneys, and managers (the CAM committee). Although impetus to initiate the project came from a water rights decision, the project has been a successful multi-agency recharge project.
3. The project team recommends that future projects should conduct thorough early planning, identify and secure funding from multiple sources, and involve regulatory permitting agencies early in the project development process. The San Jacinto Upper Pressure Groundwater Basin has a large remaining capacity for storage.[20]

### *Riverside City/FCD/WVMWD basin retrofit projects*

These are in various stages of implementation—planning, design, and contract procurement.

### *Key Project Success Factors*

1. Partnering with FCDs requires adoption of flood protection as the highest priority.
2. Thorough early planning and feasibility studies will streamline project design and implementation.
3. Long-term strong project leadership and management.
4. Strong and long-term ongoing trust and cooperation among all project partners, supported by a multi-party Agreement.
5. Adequate funding sources to plan, design, construct, and maintain the project must be identified, and be available.
6. Collaborative projects benefit from multiple stakeholder expertise and resources, and improve the cost-benefit balance.

[22] EVWD 2013. Hemet/San Jacinto Groundwater Basin Management: The Stipulated Judgment—PowerPoint Presentation. **http://www.emwd.org/modules/showdocument.aspx?documentid=5593**
[23] Daverin, John. Personal communication May 30, 2013.

7. Regulatory, judicial, or legislative mandates can rapidly initiate project development and implementation.
8. Participation in the OWOW Plan.

### *Stormwater Recharge Projects awarded under OWOW 1.0 and 2.0*

**Tables 5.8-3a and 3b** list the projects recently funded and currently under varying phases of implementation, which were awarded funding under Phases 1.0 and 2.0 of Proposition 84 per the Plan. The FCDs expect to have further discussions with all stakeholders to Identify potential site-specific opportunities for flood damage reduction and stormwater capture projects in partnership with stakeholders, using the map-based Watershed Geodatabase tools .

**Table 5.8-3a Implementation Projects Funded by Proposition 84 Round 1**

| Agency | Project | Benefits |
|---|---|---|
| City of Ontario | Cucamonga Creek Watershed Regional Water Quality Project (Mill Creek Wetlands) | • New storage of 160 AF<br>• 14 acres of preservation restored |
| Western Municipal Water District | Arlington Basin Water Quality Improvement Project | • Stormwater capture storage increase of 1,300 AFY<br>• 16 acres of preservation restored |

**Table 5.8-3b Implementation Projects Funded by Proposition 84 Round 2**

| Agency | Project | Benefits |
|---|---|---|
| San Bernardino Valley Municipal Water District | Enhanced Stormwater Capture and Recharge along the Santa Ana River | • Stormwater capture storage increase of 14,600 AFY |
| Inland Empire Utilities Agency | San Sevaine Ground Water Recharge Basin | • Stormwater capture storage increase of 2,000 AFY<br>• 26 acres of preservation restored |
| City of Fontana | Vulcan Pit Flood Control and Aquifer Recharge Project | • Stormwater capture storage increase of 2,000 AFY<br>• 60 acres of preservation restored |
| City of Yucaipa | Wilson III Basins Project and Wilson Basins/Spreading Grounds | • Stormwater capture storage increase of 1,300 AFY<br>• |
| San Bernardino Valley Water Conservation District | Plunge Creek Water Recharge and Habitat Improvement | • Stormwater capture storage increase of 1,250 AFY<br>• 50 acres of preservation restored |
| Orange County Water District | Prado Basin Sediment Management Demonstration Project | • Stormwater capture storage increase of 450 AFY |

### *Planned Project Site*[24]

The City of Santa Ana in association with the Cities of Newport Beach and Costa Mesa, is developing conceptual engineering for a proposed urban discharge diversion facility. The proposed facility will be located in the downstream portions of the Santa Ana Delhi Channel near the intersection of Mesa Drive and Irvine Avenue. The proposed project is intended to capture and divert urban discharge low-flow into the sanitary sewer system to address urban surface water quality in accordance with the Orange County MS4 Permit and the Total Maximum Daily Load (TMDL) for selenium discharge to the Upper Newport Bay. The Selenium TMDL includes waste load allocations for MS4 Dischargers in the Upper Newport Bay watershed, including discharges from the Santa Ana Delhi Channel watershed and facilities owned and operated by the Cities of Santa Ana, Costa Mesa and Newport Beach and the Orange County Flood Control District. The primary impetus of developing the proposed Urban Discharge Diversion System is to address the current Selenium TMDL, but also to address potential future TMDL's including bacteria, trash, toxics, metals and nutrients. The proposed diversion system has the ability to essentially eliminate discharges to the Upper Newport Bay and, therefore, eliminate the threat of pollutants entering the Backbay.

Three design concepts have been developed for discharging the treated flows. One concept would allow the treated water to be harvested for irrigation by the Newport Beach Golf Course.

## MS4 Permits as a driver for Plan implementation

Renewed MS4 Permits for Orange, Riverside, and San Bernardino Counties in the Santa Ana River Watershed were adopted in 2009 and 2010. These permits contain broad and specific requirements to implement programs and conduct projects that are consistent with the objectives of the Plan and this Chapter. The requirements for New Development and Significant Redevelopment emphasize the implementation of LID principles. The default requirement is for development projects to be designed and built so that stormwater is infiltrated to the extent feasible. Infiltration of stormwater from these projects should benefit groundwater recharge in areas suitable for recharge. However, the water quality volume to be captured is the runoff from the 24-hour 85$^{th}$ percentile storm event (generally varying from 0.5 – 1.25 inches per 24 hours). This capture volume is small compared to flood protection design storms (10-yr, 50-yr, or 100-yr frequency event) so flood protection infrastructure will likely still be required for the foreseeable future, in spite of LID implementation.

The MS4 Permits also require projects to implement BMPs to maintain the predevelopment hydrograph for the 2-yr 24-hour storm event. Similarly, the control of runoff from this small storm event size will not provide the required flood protection.

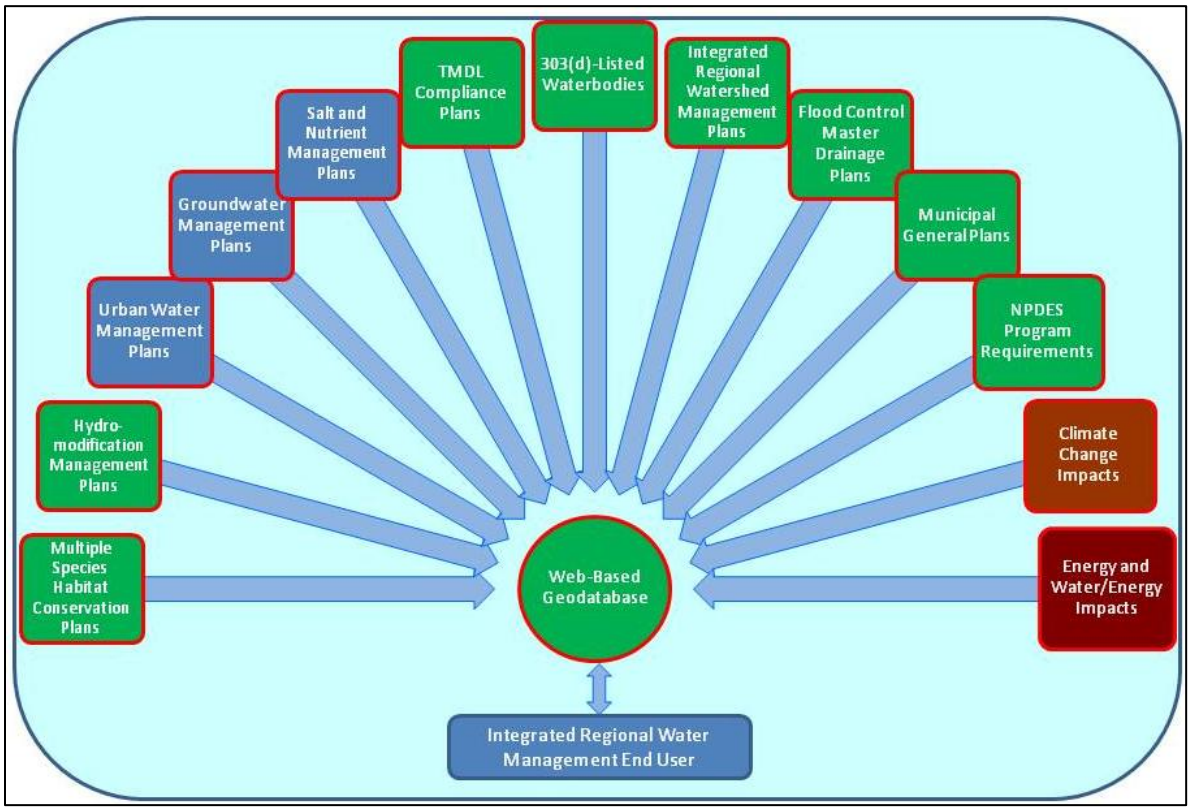
However, the MS4 Permits provide several requirements to incentivize the development of watershed-based compliance alternatives to meet MS4 Permit requirements for sites where LID implementation is not feasible. **Table 5.8-4** excerpts the specific requirements from the MS4 Permits. Despite the

[24] Excerpted and paraphrased from Santa Ana Delhi Channel Diversion Project: Preliminary Design Report. September 2012 Revision.

potential benefits, the MS4 Permit alternative compliance options have been proposed and evaluated to some degree, but have yet to be widely implemented in the SAR Watershed. Note that the successful projects summarized earlier were initiated without specific intent to comply with MS4 Permits, and some component projects predate the MS4 Permits.

Another study that has been proposed by the Inland Empire Utilities Agency[25] will evaluate the feasibility to increase stormwater capture and improve water quality by diverting and recharging up to 100% of the urban dry weather flow, and first-flush wet weather flow from a 303-d listed waterbody segment with a TMDL for pathogens. The project will investigate the feasibility of retrofitting existing recharge basins as part of the regional strategy to augment groundwater resources, and comply with urban stream TMDLs and MS4 permits.

Examples of recent projects that were developed with MS4 Permit compliance in mind include: the New Model Colonies offline treatment wetlands in the Chino Basin (see **Chapter 5.7 Land Use and Water Planning** ). These wetlands are being construction downstream and are separate from the development project site. However, it has not been designed or approved as an acceptable alternative BMP for any other development projects to exploit; and the County of Orange is conducting a feasibility study for the creation of a retention credit system using an existing site where a basin has been filled in. This project was submitted for funding under Proposition 84, but was not funded (see project description in **Appendix K**).



## Alternative watershed-or sub-watershed based compliance options include:

- Establishment of an urban runoff fund—development projects could contribute funding that would be pooled with funds from other projects and used to fund water quality projects elsewhere in the watershed.
- Off-site or Regional BMPs—BMPs may be implemented downstream from the project site, or are watershed-based structural BMPs.
- Establish a water quality credit system—certain project types can comply with water quality BMPs requirements through credits produced by alternative environmentally beneficial actions (brownfields, in-fill projects, redevelopment and transit –oriented projects, credit for urban runoff fund contribution, etc.).

[25] Urban Runoff Capture Retrofits at Recharge Sites--Feasibility and Case Study. Inland Empire Utilities Agency, January 2012 Proposition 84 Concept Proposal, PIN 24000.

## Map Based Watershed Plans (GIS-based or geodatabase development)

**Figure 5.8-4 Web-Enabled Watershed Geodatabase Components (adapted from RCFC&WCD slide)**

### *Planning Tools*

The geodatabases described below were designed as a resource for long-term land planning as well as for project siting and design evaluations. The planning aspects are described in the **Chapter 5.7 Land use and Water Planning**. Development of planning tools is recommended to include significant outreach to and participation from Planning Departments and Commissions.

### *Development tools*

San Bernardino County (Watershed Action Plan)

MS4 Permittees (cities and counties) must develop an integrated watershed approach to integrate planning and approvals for water quality and water quantity control measures. The requirements include revising the General Plan and CEQA documents to incorporate the water quality and watershed management principles. The Watershed Action Plan (WAP) is required to "improve integration of water quality, stream protection, storm water management, water conservation and re-use, and flood protection, with land use planning and development processes."

Phase 2 of the WAP requires the development and implementation of a Hydromodification Monitoring Plan, and a Hydromodification Management Plan. It also requires the development of "recommendations for streamlining regulatory approval of Regional Treatment Control BMPs."
In support of the San Bernardino MS4 Permit Watershed Geodatabase and the Watershed Action Plan, SAWPA participated in monthly meetings led by the San Bernardino MS4 Permit staff and other interested agencies from Jan. 2010 through Jan. 2011. Outreach meetings in conformance with watershed linkages to the OWOW process and SAWPA task forces were conducted on Dec. 15, 2010. San Bernardino Flood Control District hired RBF to develop the Watershed Geodatabase and provided demonstrations of the tool periodically throughout its development with input provided by stakeholders. The tool was submitted to the Regional Board as part of the Phase I deliverables under the MS4 Permit in Jan. 2011.

Status: WAP Phase 1 has been submitted and approved, Phase 2 tasks are ongoing.

Riverside County (Watershed Action Plan)
The Permittees must develop a Watershed Action Plan that describes and implements the Permittees' stated approach to coordinated watershed management. The WAP should address watershed scale water quality impacts of urbanization in the Permit Area associated with Urban TMDL WLAs, stream system vulnerability to Hydromodification from Urban Runoff, cumulative impacts of development on vulnerable streams, preservation of Beneficial Uses of streams in the Permit Area, and protection of water resources, including groundwater recharge areas.

Within two years from Permit adoption, the Permittees shall identify existing unarmored or soft-armored stream channels in the Permit Area that are vulnerable to Hydromodification.
Within three years the Permittees must submit the WAP that includes proposed regional approaches to meet urban TMDL WLAs, recommendations for retrofit studies of public facilities to address TMDLs, hydromodification, and LID implementation. They must also describe regional collaborative efforts (e.g. Task Forces) that benefit water quality and how the Permittees should link these to their Urban Runoff Programs.

Further requirements include developing a hydromodification management plan and a schedule to develop a watershed geodatabase available via the World Wide Web, and to provide training regarding implementation of the WAP and associated tools to all appropriate personnel.

In support of the Riverside MS4 Permit Watershed Geodatabase development, SAWPA held a joint meeting of the Stormwater: Resource and Risk Management Pillar and the Land Use and Water Planning Pillar on October 5, 2012. The Riverside County Flood Control and Water Conservation District provided an overview of the Watershed Geodatabase tool purpose and future use. Data for the tool was requested from the audience. SAWPA received a formal request for specific data from the RCFCWD in Sept. 2012 and available data was provided to them in Oct. 2012.

Status: Draft WAP was submitted for review January 29, 2013; the RWQCB provided comments on March 26, 2013; the revised draft WAP is due for submittal by June 24, 2013. RCFCWCD made a formal request for GIS and other data to water districts in their county area in January 2013.

Orange County (Watershed Master Plan)

The Permittees are allowed a compliance approach for mitigating impacts from hydromodification using mapping, modeling and reconnaissance methods. These tools are to be integrated into Watershed Master Plans (WMPs) that are an alternative means to comply with site-by-site implementation of hydromodification BMPs. WMPs are limited in scope by the MS4 Permit to apply only for alternative hydromodification compliance. The WMPs are similar in approach to the WAPs, but less comprehensive.

In the Orange County MS4 permit, though not specifically required, a geodatabase tool has been developed to support the MS4 compliance described as the Watershed Characteristic/ Mapping Tools under the Watershed Infiltration and Hydromodification Management Plan (WIHMP). This work was prepared by PACE Advanced Water Engineering Inc. under contract with the Orange County Watershed and Coastal Resources Division.

Status: The County of Orange is currently developing WIHMPs for the regional drainage areas in the SAR Watershed. The WIHMPs incorporate more comprehensive watershed data.

Since the three county MS4 permits were not approved at the same time, the schedule to implement the tools is staggered with the first efforts in the development of a support tool having occurred in Orange County with approval of their permit on May 22, 2009 and the San Bernardino permit and the Riverside County permit approval in Jan. 29, 2010.

## Policy and Procedure Opportunities and Recommendations

- Develop procedures and guidelines to ensure consideration of IRWM goals at project concept, planning, and design stages
- Collaborate with Land Use and Water Planning Pillar on development of geodatabase and other planning tools.
- Create a lead watershed advisory and facilitation group as forum for stakeholder planning and project development
- Preserve floodplain functions through stricter management of development in floodplains. Consider development of Model General Plan Language to implement this priority.
- Where appropriate, FCDs, and all watershed stakeholders, should develop procedures and guidelines to ensure consideration of IRWM goals and watershed protection principles and priorities, consistent with the MS4 Permits, when planning and designing CIP or other projects, and during development or revisions of Master Drainage Plans (MDPs) and planning of projects that implement the MDPs.
- Create a watershed-wide IRWM coordinating advisory group that continues the work of the OWOW Stormwater: Resource and Risk Management Pillar that brings FCDs, groundwater managers, and

other stakeholders together for decision making, partnership formation, and resource allocation to achieve IRWM goals.

- Water Agencies and Flood Control Districts should partner together via site specific agreements and general memorandums of understanding to develop multi-use facilities and optimize existing facilities for flood control, water conservation and water quality purposes. These agencies should work together to develop funding mechanisms to compensate the constituencies of the FCDs for the use of the facilities in re-charge activities, and preserve existing water rights.
- Evaluate impacts of 500 year flood management standard.

## Implementation Recommendations

### Develop Watershed Geodatabase Tools

Align and connect the San Bernardino, Riverside, and Orange County Watershed Geodatabase tools to create a system-wide or true watershed-wide tool supporting the entire Santa Ana River Watershed, coinciding with the Santa Ana Regional Board jurisdiction. This would enhance development and implementation of system-wide and watershed-wide solutions under the next round of MS4 Permits, due for renewal in 2014 and 2015. Connecting these geodatabase tools would greatly aid the development of an optimization and prioritization plan for the capture and recharge of stormwater, imported water, and low flow urban runoff to enhance water availability and reliability for the future of the watershed. Some additional data layers will be needed, particularly consideration of the impacts of climate change and energy, and energy/water use in watershed evaluations and planning. See integration of multiple watershed inputs in [**Figure 5.8-4.**]Coordinate and host geodatabase for the SAR Watershed (from WAPs and HCOC Maps): compile, coordinate, and provide hosting/access to GIS/geodatabase resources for the entire SAR Watershed. The comprehensive tool would achieve the following:

- Accessible by all stakeholders, with data quality assurance and maintenance program
- Maps developed to support development project conditions and acceptable BMPs
- Infiltration emphasized in MS4s
- Connecting 3 county geodatabase layers will support watershed project concepts, and identify likely project partners
- Includes FCD facility analyses for retrofit opportunities
- Have been and will be reviewed by regulatory agencies
- Set up a data quality control and long-term maintenance program
- Provide user-friendly access to these tools from a single portal
- Geodatabase tools provide preliminary project sites and priorities
- Site lists have been developed by FCDs
- Must prioritize flood protection
- Ideally, must address MS4 Permit compliance
- Ensure full participation of FCDs in early planning and project siting and design
- Costs/benefits need to be spread over FCD constituency
- Identify top three sites for demonstration project

*Develop tools for analysis and pre-populated standard form templates related to development projects:*

Map layers will include the following (and many others as are relevant):

- Recharge areas
- Preservation areas
- Multi-jurisdictional contacts for project sites
- Water supply areas by agency; imported water dependent sites, imported water infrastructure
- Water sources—groundwater wells, recycling plants, desalters
- Links to on-line climate change models
- Links to energy use and water/energy use data
- Include Regional Transportation Plan data and project concepts and potential partnering on transportation/water resource projects
- Include Utility data and evaluate coordination and cooperation with Utility Company sites and right-of-way

Coordinate/collaborate with EcoAtlas and/or other relevant map or model efforts, such as the DWR Integrated Water and Land Smart Planning Tool [See **Chapter 5.7 Land Use and Water Planning**]

Implementation-Specific Tools

- WQMP Templates
- Regional BMP sites
- Feasibility determinations—e.g. does the site provide more benefit as a regional BMP?
- Pollutants of concern

Identify top three sites for multi-benefit regional BMP demonstration projects, initiate partner relationships, and develop background needed to prepare funding applications:

Riverside County potential project example sites:

- Kansas Basin
- Marlborough Basin
- Columbia Basin
- Arlington Basin Projects (depending on status)

## Develop ground water recharge optimization and prioritization

Develop optimization and prioritization plan for existing and potential future flood control facilities for the capture and recharge of stormwater, imported water, and low flows in the SAR Watershed. Use Geodatabases and facility evaluation lists and prioritize top three basins for each County for feasibility study and further work as warranted. Identify pilot/demonstration projects for FCD Basin retrofits in partnership with Water Agencies and other stakeholders.

*Considerations to Include:*

- Groundwater basin recharge area optimization and prioritization: FCDs collaborate with groundwater management agencies to develop GIS/geodatabase of groundwater basin recharge potential; develop and execute an optimization methodology and prioritize watershed areas for stormwater capture recharge project planning.
- Consider where and how to maximize water supply and minimize waste.
- Existing FCD basin and facility retrofit evaluation and implementation studies (MS4 Permit requirement): Determine stormwater capture and groundwater recharge potential, concomitant with continued flood protection requirements, for FCD facilities throughout the SAR Watershed. Develop list of priorities for implementation, and consult with potential project partners.
- Use existing county or program-specific geodatabases, and/or the recommended comprehensive watershed geodatabase (Recommendation (a), above) that provides access to appropriate stakeholders.
- Develop guidance for development of WQMPs for Flood Control CIPs that recognizes the flexibility in the MS4 Permits and goals of the Plan.

## Develop Watershed-Based Tools for Alternative MS4 Stormwater Compliance the Serves Regional Priorities

This project involves creating a Task Force that includes the county FCDs, the water agencies, regulators, environmental NGOs, and interested stakeholders in parallel with demonstration projects and upcoming MS4 Permit renewals. Watershed-based and optimized BMPs also will provide compliance with MS4 Permit compliance where applicable. Alternative compliance approaches (see **Table 5.8-4**) will include:

- Identification of regional water quality and/or infiltration sites for watershed-based compliance
  - Pilot sites for off-site or Regional BMPs—BMPs will typically be implemented downstream from the project site. Identify 3 pilot sites for watershed-wide applicability
- Water quality and/or water quantity credit system, and/or an Urban Runoff Fund
  - Build on Orange County's retention credit pilot project [see **Appendix E**]
  - Development projects contribute funds used for water quality/recharge/habitat projects elsewhere in the watershed.
  - Current MS4 permits list project types which can comply via credits produced by alternative environmentally beneficial actions.
- Assessment of regulatory constraints and flexibility regarding alternative compliance approaches.

**Table 5.8-4 Watershed Action Plan, Watershed Master Plan, and Hydromodification Requirements in the Santa Ana River Watershed MS4 Permits.**

## Watershed Action Plan and Watershed Master Plan Requirements

(Excerpted from the San Bernardino County MS4 Permit Section XI.B; similar requirements excerpted from the Riverside County MS4 Section XII.B. The WAPs in the Orange County MS4 Section XVIII are focused on TMDL implementation; relevant OC MS4 requirements for Watershed Master Plans excerpted from Hydromodification Requirements Section XII.D.5)

## San Bernardino County MS4 Section XI.B

B. **Watershed Action Plan**

1. The Permittees shall develop an integrated watershed management approach to improve integration of planning and approval processes with water quality and quantity control measures. Management of the water quality and hydrologic impacts of urbanization will be more effective whether managed on a per site, sub-regional or regional basis, if coordinated within the Watershed Action Plan. Pending completion of a Watershed Action Plan, management of the impacts of urbanization shall be accomplished using existing programs.
2. Within twelve months of adoption of this Order, each Permittee shall review the watershed protection principles and policies, specifically addressing urban and stormwater runoff, in its planning procedures, including CEQA preparation, review and approval processes; General Plan and related documents including, but not limited to its Development Standards, Zoning Codes, Conditions of Approval, Development Project Guidance; and WQMP development and approval processes.
3. The Principal Permittee, in collaboration with the Co-Permittees, shall develop a Watershed Action Plan (WAP) that describes and implements the Permittees' approach to coordinated watershed management. The WAP shall improve coordination of existing programs and identify new and/or enhanced program elements as applicable. The objective of the WAP is to improve integration of water quality, stream protection, storm water management, water conservation and re-use, and flood protection, with land use planning and development processes. The WAP shall be developed in two phases:

a. Phase 1: within 12 months of adoption of this Order, the Principal Permittee, in coordination with the Co-Permittees shall:

i. Identify program-specific objectives for the WAP; the objectives will include consideration of:

1. The watershed protection principles specified in Section XI.C.3.a - g, below;

2. The Permittee's planning and procedure review required in XI.B.2, above;

3. Potential impediments to implementing watershed protection principles during the planning and development processes, including but not limited to LID principles and management of the impacts of hydromodification;

4. Impaired waters [CWA § 303(d) listed] with and without approved TMDLs, pollutants causing impairment, monitoring programs for these pollutants, control measures, including any BMPs that the Permittees are currently implementing, and any BMPs the Permittees are proposing to implement. In addition, if a TMDL has been developed and an implementation plan is yet to be developed, the WAP shall specify that the responsible Permittees should develop constituent-specific source control measures, conduct additional monitoring and/or cooperate with the development of an implementation plan, where feasible, and consistent with the MEP standard.

ii. Develop a structure for the WAP that emphasizes coordination of watershed priorities with the

Permittees' LIPs via the areawide model LIP;

iii. Identify linkages between the WAP and the SWQSTF, MSWMP, WQMP, the implementation of LID, and the TMDL Implementation Plans;

iv. Identify other relevant existing watershed efforts (Chino Basin Master Plan, SAWPA's IRWMP, etc., and their role in the WAP;

v. Ensure that the HCOC Map/Watershed Geodatabase is available to watershed stakeholders via the World Wide Web, and has incorporated the following information:

1. Delineation of existing unarmored or soft-armored drainages in the permitted area that are vulnerable to geomorphological changes due to hydromodification and those channels and streams that are engineered, hardened, and maintained.

2. GIS layers for known sensitive species, protected habitat areas, drainage boundaries, and potential storm water recharge areas and/or reservoirs;

3. 303(d)-listed waterbodies and associated pollutants;

4. Available and relevant regulatory and technical documents accessible via hyperlinks;

b. Phase 2: within 12 months of the approval by the Executive Officer of the Report from Phase 1, above, the Principal Permittee, in coordination with the CoPermittees, shall:

i. Contingent upon consensus with Regional Board staff and other resource agencies as described in XI.B.3.a.vii, above, specify procedures and a schedule to integrate the use of the Watershed Geodatabase into the implementation of the MSWMP, WQMP, and TMDLs;

ii. Develop and implement a Hydromodification Monitoring Plan (HMP) to evaluate hydromodification impacts for the drainage channels deemed most susceptible to degradation. The HMP will Identify sites to be monitored, include an assessment methodology, and required follow-up actions based on monitoring results. Where applicable, monitoring sites may be used to evaluate the effectiveness of BMPs in preventing or reducing impacts from hydromodification.

iii. Develop and implement a Hydromodification Management Plan prioritized based on drainage feature/susceptibilitylrisk assessments and opportunities for restoration.

iv. Conduct training workshops in the use of the Watershed Geodatabase. Each Permittee must ensure that their planning and engineering staffs attend a workshop.

v. Conduct demonstration workshops for the Watershed Geodatabase to be attended by appropriate upper-level managers and directors from each Permittee.

vi. Develop recommendations for streamlining regulatory agency approval of regional treatment control BMPs. The recommendations should include information needed to be submitted to the Regional Board for approval of regional treatment control BMPs. At a minimum, this information should include: BMP location; type and effectiveness in removing pollutants of concern; projects tributary to the regional treatment system; engineering design details; funding sources for construction, operation and maintenance; and parties responsible for monitoring effectiveness, operation and maintenance. The Permittees are encouraged to collaborate and work with other counties to facilitate and coordinate these recommendations.

vii. Implement applicable retrofit or regional treatment recommendations from the evaluation conducted in Section B.3.a.ix, above.

viii. Submit the Phase 2 components in a report to the Executive Officer. The submitted report shall be deemed acceptable to the Regional Board if the Executive Officer raises no written objections within 30 days of submittal.

XI.B.3.a.

ix: Conduct a system-wide evaluation to identify opportunities to retrofit existing storm water conveyance systems, parks, and other recreational areas with water quality protection measures, and

develop recommendations for specific retrofit studies that incorporates opportunities for addressing applicable TMDL implementation plans, hydromodification management, and/or LID implementation within the permitted area. (Orange County Section XIV.10)

x. Conduct a system wide evaluation to identify opportunities for joint or coordinated development planning to address stream segments vulnerable to hydromodification and coordinated re-development planning to identify restoration opportunities for hardened and engineered streams and channels. The WAP shall identify contributing jurisdictions and the stream segments that will benefit from this coordination.

XI.B.3.a.xi: Invite participation and comments from resource conservation districts, water and utility agencies, state and federal agencies, non-governmental agencies and other interested parties in the development and use of the Watershed Geodatabase;

## Riverside County MS4 Section XII.B.

**B. WATERSHED ACTION PLAN**

1. An integrated watershed management approach may facilitate integration of planning and project approval processes with water quality and quantity control measures. Management of the impacts of Permit Area urbanization on water quality and stream stability is more effectively done on a per-site, neighborhood and municipal basis based on an overall watershed plan. Pending completion of the Watershed Action Plan consistent with this section, management of the impacts of urbanization shall be accomplished using existing programs. The Permittees shall develop a Watershed Action Plan to address the entire Permit Area. The Permittees may choose to develop sub-watershed action plans based on the overall Watershed Action Plan in the future based on new 303(d) impairments, TMDL requirements, or other factors.

2. The Permittees shall develop and submit to the Executive Officer for approval a Watershed Action Plan that describes and implements the Permittees' approach to coordinated watershed management. The objective of the Watershed Action Plan is to address watershed scale water quality impacts of urbanization in the Permit Area associated with Urban TMDL WLAs, stream system vulnerability to Hydromodification from Urban Runoff, cumulative impacts of development on vulnerable streams, preservation of Beneficial Uses of streams in the Permit Area, and protection of water resources, including groundwater recharge areas.

3. Within three years of Permit adoption, the Co-Permittees shall develop the Watershed Action Plan and implementation tools to address impacts of urbanization in a holistic manner. At a minimum, the Watershed Action Plan shall include the following:

a. Describe proposed Regional BMP approaches that will be used to address Urban TMDL WLAs.

b. Develop recommendations for specific retrofit studies of MS4, parks and recreational areas that incorporate opportunities for addressing TMDL Implementation Plans, Hydromodification from Urban Runoff and LID implementation.

c. Description of regional efforts that benefit water quality (e.g. Western Riverside County Multiple Species Habitat Conservation Plan, TMDL Task Forces, Water Conservation Task Forces, Integrated Regional Watershed Management Plans) and their role in the Watershed Action Plan. The Permittees shall describe how these efforts link to their Urban Runoff Programs and identify any further coordination that should be promoted to address Urban WLA or Hydromodification from Urban Runoff to the MEP.

4. Within two years of adoption of this Order, the Permittees shall delineate existing unarmored or soft-armored stream channels in the Permit Area that are vulnerable to Hydromodification from New Development and Significant Redevelopment projects.

5. Within two years of completion of the delineation in Section XII,B.4 above, develop a

Hydromodification management plan (HMP) describing how the delineation will be used on a per project, sub-watershed, and watershed basis to manage Hydromodification caused by urban runoff. The HMP shall prioritize actions based on drainage feature/susceptibility/risk assessments and opportunities for restoration.

a. The HMP shall identify potential causes of identified stream degradation including a consideration of sediment yield and balance on a watershed or subwatershed basis.

b. Develop and implement a HMP to evaluate Hydromodification impacts for the drainage channels deemed most susceptible to degradation. The HMP will identify sites to be monitored, include an assessment methodology, and required follow-up actions based on monitoring results. Where applicable, monitoring sites may be used to evaluate the effectiveness of BMPs in preventing or reducing impacts from Hydromodification.

6. Identify Impaired Waters [CWA § 303(d) listed] with identified Urban Runoff Pollutant sources causing impairment, existing monitoring programs addressing those Pollutants, any BMPs that the Permittees are currently implementing, and any BMPs the Permittees are proposing to implement consistent with the other requirements of this Order. Upon completion of XII.B.4, develop a schedule to implement an integrated, world-wide-web available, regional geodatabase of the impaired waters [CWA § 303(d) listed], MS4 facilities, critical habitat preserves defined in the Multiple Species Habitat Conservation Plan and stream channels in the Permit Area that are vulnerable to Hydromodification from Urban Runoff.

7. Develop a schedule to maintain the geodatabase required in Section XII.B.4 and other available and relevant regulatory and technical documents associated with the Watershed Action Plan.

8. Within three years of adoption of this Order, the Watershed Action Plan shall be submitted to the Executive Officer for approval and incorporation into the DAMP. Within six months of approval, each Permittee shall implement applicable provisions of the approved revised DAMP and incorporate applicable provisions of the revised DAMP into the LIPs for watershed wide coordination of the Watershed Action Plan.

9. The Permittees shall also incorporate Watershed Action Plan training, as appropriate, including training for upper-level managers and directors into the training programs described in Section XV. The Co-Permittees shall also provide outreach and education to the development community regarding the availability and function of appropriate web-enabled components of the Watershed Action Plan.

10. Invite participation and comments from resource conservation districts, water and utility agencies, state and federal agencies, non-governmental agencies and other interested parties in the development and use of the Watershed Geodatabase;

## Orange County MS4 Section XII.D.

Section XII.D.5 provides a compliance approach for mitigating impacts from hydromodification using mapping and reconnaissance methods.

5. The permittees shall address the hydrologic conditions of concern on a watershed basis by preparing a Watershed Master Plan as described below:

The Watershed Master Plans shall integrate water quality, hydromodification, water supply, and habitat for the following watersheds: Coyote Creek-San Gabriel River; Anaheim Bay-Huntington Harbour; Santa Ana River; and Newport Bay-Newport Coast. Components of the Plan shall include: (1) maps to identify areas susceptible to hydromodification including downstream erosion, impacts on physical structure, impacts on riparian and aquatic habitats and areas where storm water and urban runoff infiltration is possible and appropriate; and, (2) a hydromodification model to make available as a tool to enable proponents of land development projects to readily select storm water preventive and mitigative site BMP measures.

The maps and a model Plan for one watershed shall be prepared by May 22, 2011. The model Plan should specify hydromodification management standards for each sub-watershed and provide assessment tools. In the preparation of the model Plan, the permittees are encouraged to use currently available information from other sources such as: (1) Orange County Flood Control Master Plan; (2) Irvine Ranch Water District's Natural Treatment System Master Plan; (3) Orange County Watershed Plans; (4) Nutrient and Selenium Management Program; (5) TMDL and 303(d) Listing information from the U.S. EPA and/or the Regional Board, and (6) and water districts.
The model Watershed Master Plan shall be submitted to the Executive Officer for approval. Watershed Master Plans shall be completed for all watersheds 24 months after approval of the model Watershed Master Plan.
The Watershed Master Plans shall be designed to meet applicable water quality standards and the Federal Clean Water Act.

### Possible Approaches and Products of the Task Force:

- Develop approaches for streamlined regulatory approval of off-site, regional BMPs, or other alternative compliance options.
    - Develop a draft Regional Board Resolution regarding alternative compliance options
- Develop a model administration program for a water quality/quantity credit system
- Clarify MS4 permit language, applicable to permit renewals coming up
- Identify lead agency (involve Southern California Monitoring Coalition)
- Develop model for mechanism to initiate and manage a Regional Urban Runoff Management Fund in a pilot area of the watershed.

## Development Process and Watershed Planning Coordination Group

To support important coordination and collaboration among the development and planners, it is recommended that the OWOW Steering Committee, supported by SAWPA staff, serve as the lead organization to ensure coordination of project partners (e.g. Chino Basin Groundwater Recharge Coordinating Committee) tasked with coordinating and persuading through coordinated meetings to cooperatively discuss mission and goals of the agencies, resources available among agencies, understand economic and technical constraints, and discuss opportunities for cooperative efforts to promote watershed sustainability priorities. The OWOW Steering Committee is uniquely situated to perform this function with representation on the Committee by cities, counties, environment, Regional Board and sustainable land development interests.

- Needs to transcend Proposition 84 or other funding decisions
- Should include the Regional Board
- Evaluates project ideas using the geodatabase
- Recommends necessary elements of training programs

### Specific Agency/Committee Tasks:

- Develop a process to link project development processes for various watershed stakeholders with each other, and align project plans and designs with watershed sustainability priorities
- Develop an approach to coordinate agencies' processes for project planning and design
    - Increased flood control system and management capacity and reliability
    - Projects and efforts that attenuate peak storm flows resulting from urbanization
    - Projects and efforts that increase recharge of stormwater
    - Projects that allow the region to meet nonpoint pollution control goals
    - Projects and efforts for groundwater clean-up by infiltrating high quality water into the groundwater basins
    - Improved habitat and facility maintainability.
- Proposed Participants:
    - US Army Corps of Engineers
    - Santa Ana Regional Water Quality Control Board
    - San Bernardino County Public Facilities and Flood Control District
    - Riverside County Flood Control and Water Conservation District
    - Orange County Flood Control District, OC Public Works
    - Eastern Municipal Water District
    - Inland Empire Utilities Agency
    - Orange County Water District
    - San Bernardino Valley Municipal Water District
    - Western Municipal Water District
    - Chino Basin Watermaster
    - San Bernardino Valley Water Conservation District
    - Santa Ana Watershed Project Authority
    - Cucamonga Valley Water District
    - Other parties of interest and affected agencies
- Outline project development and implementation processes of watershed stakeholders
- Identify decision/influence points in each process
    - Determine approach to incorporate watershed optimization priorities into project concepts and designs
    - Develop mechanisms or procedures to ensure watershed priorities are adequately incorporated or considered
- Identify and coordinate with regulatory project permitting processes
    a. Watershed optimization priorities inform permit processes and qualifiers
    b. Evaluate the role of CEQA

## Conduct further study of the 500-year flood impacts

Develop recommendations regarding appropriate changes to local policies based on the 500-year storm frequency standard for flood protection.

# 5.9 Natural Resources Stewardship

## Introduction

The Santa Ana River Watershed historically contained an abundance of natural resources, including water captured from snowmelt in the local mountains, diverse wildlife populations, abundant aquatic life in streams and coastal waters, geological resources for building materials, and a wide range of plant communities from coastal sage, to wetlands, to evergreen forests. These assets were first utilized by Native Americans and then by European settlers, who began to change the land use in the watershed with irrigation and farming.

Over the past 200 years, human population has increased greatly in the Santa Ana River Watershed. Since the 1930s, controlling floods and providing a reliable water supply have taken precedence over other critical watershed issues. These priorities have changed the natural hydrology of the Santa Ana Watershed, diminishing the once abundant natural water resources in the region. This strain on water resources and associated urbanization has left only remnants of isolated habitat in highly populated areas. Other factors including invasive plant species, frequent local fires and rogue recreational uses also have contributed to a reduction or complete loss of available habitat in some areas.

The natural resources and habitat in the Santa Ana River Watershed are now a fraction of their historical values. Therefore, efforts must be made to sustain and conserve the remaining resources for the benefit of future generations of life in the ecosystems of the watershed, and even expand them where possible. The purpose of this chapter is to detail the current status of these natural resources, including their benefits as both habitat and recreational assets, and to identify opportunities to promote and

implement sustainability followed by recommendations for solutions that maintain ecological balance and economic health.

## Resources of the Santa Ana River

### *Surface Water*

Water is the key life-sustaining resource within the Santa Ana River Watershed. The river begins high in the San Bernardino Mountains, where it flows westward for approximately 18 miles and then picks up additional flows from Bear Creek, a major tributary. The river then runs southward and meets up with Seven Oaks Dam, which provides capacity for flood control and also serves as a reservoir, with a total capacity of 145,600 acre-feet. The released flows from the Seven Oaks Dam continue westward with additional flows into the river contributed by Mill Creek, City Creek, San Timoteo Creek, Warm Creek, Twin Creek, Cajon Creek, and Lytle Creek before reaching the reservoir at Prado Dam. The Prado Basin also is fed by Chino Creek and another stream named Mill Creek, and occasionally by Temescal Creek in wetter years.

Water released from Prado Dam continues westward into Orange County, where the river then is diverted into spreading grounds for groundwater recharge in the north Orange County aquifer. Any remaining flows are confined to concrete channels between earthen levees, and additional flows are received from Santiago Creek, located near the city of Anaheim. The flows continue in a concrete flood control channel until crossing Interstate 5 near the city of Santa Ana, where the river again flows through a soft-bottom channel before reaching its mouth between Huntington Beach and Newport Beach.

Much of the river's historical flows have been diverted for local use along its path. The majority of water that currently flows in the Santa Ana River during the non-rainy season now comes from effluent from wastewater treatment plants.

The Santa Ana River Watershed has one natural and several manmade lakes that retain water for use as drinking water, irrigation, recreation, and habitat for aquatic species. Big Bear Lake is manmade and resulted from the construction of a dam along Bear Creek to hold back the runoff and snowmelt for the purpose of providing a reliable source of irrigation water for citrus growers near Redlands. Recreational boating and fishing are also beneficial uses of Big Bear Lake. Lake Perris, located in the eastern side of the Santa Ana River Watershed, is also manmade. Completed in 1973, Lake Perris is the terminus of the State Water Project and is used as a recreational amenity for the region. Lake Mathews, also manmade, is located in the foothills of the Santa Ana Mountains and functions strictly as a drinking water reservoir. It is the terminus of the Colorado River Aqueduct.

Lake Elsinore is a natural lake that offers recreational boating and fishing. In recent years, the lake has been replenished with recycled water. Mystic Lake, in the San Jacinto Basin, is an ephemeral lake that appears in wetter years, receiving waters from overflows from the San Jacinto River.

### *Minerals*

The geological composition in the Santa Ana Watershed has developed over a long period of time by the forces of natural seismic events and climate changes that affected the course and volume of the Santa Ana River. As flows from tributaries carried and deposited sediment along its varied alignments, areas referred to as alluvial fans were created. Most of the watershed from the base of the San Bernardino Mountains and north of the Santa Ana River are comprised of marine and non-marine sedimentary rocks. On the south, in the area of the Cleveland National Forest, shale, sandstone, limestone and slate dominate the geology. The San Bernardino Mountains' geology consists largely of a composite of Precambrian igneous and metamorphic rocks and Mesozoic granite.

The greatest mineral economic resource in the region is in aggregate, which can be in the form of natural sand and gravel, or produced by crushing rock. It is valued for its many uses in construction such as in Portland cement concrete, asphaltic concrete, road base, railroad ballast, and rip-rap. The California Geological Survey estimates that current permitted mining for this resource in the Santa Ana River Watershed region will meet only 25 percent of the estimated local demand. Importing this resource from other than local sources will result in higher project costs for all types of construction and have negative environmental impacts. Mining, however, also has been associated with negative environmental impacts including noise, dust, and habitat destruction. Mitigation of these impacts results in a lengthy process of five to ten years to acquire permits, which has greatly reduced the amount of aggregate mined in the region despite its abundance.

### *Vegetation in Habitat Areas*

Habitat classifications can be very complex, and while complex information is available for interested parties, this document will refer to several generalized groups, including alluvial fan, riparian, wetland, coastal, chaparral, and forested habitats.

Alluvial fans are located where stream flows that originate in mountainous areas flatten and spread out. Fan-shaped deposits of sand and gravel sediment, brought down from higher elevations, are left in the wake of storm and flood events, building up over time. They also can be found in desert areas that are prone to flash floods. Alluvial fan areas create a unique habitat in the Santa Ana River Watershed, but most significantly, they are home to both endangered and threatened plants and animals. They also are in areas where historical groundwater recharge has occurred, increasing the importance for conservation of alluvial fan areas.

Riparian habitats are those areas that transition between land and rivers or streams, and sometimes are referred to as buffer zones. These riparian zones provide valuable wildlife habitat and serve as wildlife corridors, allowing for increased biodiversity by enabling wildlife, including aquatic life, to move freely along river systems. Keeping this connectivity intact is vital in avoiding development of isolated communities.

According to the Clean Water Act, wetlands are defined as: "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal

circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." Wetlands serve as vital habitats for a wide range of birds and aquatic creatures. Coastal habitats consist of a combination of beaches and intertidal wetlands, which meet the definition of wetlands above.

Chaparral is comprised of hard-leafed evergreen shrubs that grow two to four meters tall with deep roots. An understory layer rarely exists. Chaparral habitat occurs in different types of terrain including plains, rocky hills, and mountain slopes. Forested habitats exist mainly in the higher elevations of the watershed.

## *Wildlife*

*Birds*

Riparian ecosystems harbor the highest number of bird species in the watershed. Riparian habitat provides productive breeding grounds and offers vital over-wintering and migration stop-over areas for migrating birds. Loss and degradation of riparian habitat have negatively impacted bird populations throughout the watershed. Other factors affecting bird populations are brood parasitism by the brown-headed cowbird, and disruption of natural hydrological regimes from dams and levees.

The federally endangered least Bell's vireo has experienced recent population growth within the watershed due to aggressive management activities that started within Prado Basin and spread to other riparian areas throughout the watershed. In 1986 there were only 16 pairs of vireos reported breeding in the Prado Basin. With the management and restoration provided by the Santa Ana Watershed Association (SAWA) and its constituent agencies, there were more than 1,200 vireo territories throughout the Santa Ana River Watershed in 2012.

This stunning recovery is due to the provision of a high quality habitat for the bird species, in part, due to invasive species removal, a project in place to control populations of the predatory cowbird, and other efforts on the part of the U.S. Fish and Wildlife Service (USFWS), Orange County Water District (OCWD), several resource conservation districts (RCDs), and SAWA. The Coastal California Gnatcatcher (*Polioptila californica*) is a focal species under California's Natural Communities Conservation Planning (NCCP) program and is listed as a Species of Special Concern in California. The USFWS listed it as threatened in 1993. Critical Habitat for the species was designated in 2000, but court-ordered review of the economic effects of this designation is under way. *(Mock 2004)*

Both the least Bell's vireo and the federally endangered southwestern willow flycatcher are affected by cowbird brood parasitism. The implementation of cowbird management programs, in addition to preservation and restoration of riparian deciduous shrub habitat are needed to reduce current populations. The bald eagle, listed by the USFWS as endangered in 1978, has experienced population growth over the past two decades. The bald eagle could be considered a USFWS success story: reclassified as "threatened" in 1995 and first proposed for delisting in 2000. Delisting of a species is the USFWS's ultimate goal and only happens when specific recovery goals have been met for a species. Unfortunately, delisting is an infrequent occurrence. In the case of the bald eagle, delisting has been

delayed while the USFWS determines how the species would be managed once it is no longer classified as threatened.

### *Aquatic Life*

*Fishes*

The Santa Ana River and its tributaries historically provided habitat for eight species of native fish (species have multiple forms). Only four native non-game freshwater fishes currently are found in non-estuarine waters: arroyo chub, Santa Ana speckled dace, Santa Ana sucker, and threespine stickleback. All of these remaining fishes have limited distributions and face possible extirpation.

As previously mentioned, the Santa Ana sucker is listed by the federal government as a "threatened" species pursuant to the Endangered Species Act. Currently, the western brook lamprey is known to be extirpated from the watershed. The Pacific lamprey has been observed once in the past 47 years and it likely is extirpated as well. Introduced forms of the rainbow trout have been extensively stocked in the watershed for sport fishing for over 100 years, and it is unknown if any genetically pure rainbow trout stocks endemic to the watershed remain. The partially armored threespine stickleback was widely planted in the watershed for mosquito control in the early 1900s and now is found out of its natural historical range, e.g., Big Bear Lake. There are three current known occurrences of threespine stickleback: in Shay Pond, Juniper Springs Pond, and Sugarloaf Meadow Pond. During high water conditions, Shay Creek and Baldwin Lake also are occupied. Historically, they extended up Caribou Creek (Van Dusen Canyon), but water diversions and re-routing of drainages currently have made that unlikely. Juniper Springs drains to Arrastre Creek, which drains to the Mojave Desert. Shay Pond and Shay Creek drain to Baldwin Lake. Baldwin is considered a mountain playa lake and historically didn't have an outlet. The connection to Big Bear Lake is an artificial man-made connection for flood control purposes, so now Baldwin Lake will drain to Big Bear Lake in an extreme flood event.

In contrast, at least 33 fishes have been introduced into the watershed and currently are present. New species can be expected to be found at any time due to inter-basin water transfers, ship ballast water hitchhikers, bait bucket introductions, and hobbyists disposing of unwanted fishes. Many of the introduced fishes are widespread, while a few are restricted to specific locations or habitats. Of the current inventory of introduced fishes, most were introduced by government agencies to serve as a food resource, for insect control, for sport fishing, or to serve as forage for sport fishes. A smaller number of fish have become established after arriving inadvertently via inter-basin water transfers or in ships' ballast water. For a detailed discussion of the introduction of fishes to California, the reader is directed to Dill and Cordone (1997). Additional information about introductions of fishes to Southern California is presented by Swift *et al*. (1993). Supplemental records can be found in Moyle (2002).

*Oncorhynchus mykiss* is one of six Pacific salmon in the genus *Oncorhynchus* that are native to the North American coast. O*. mykiss*, along with other species of Pacific salmon exhibit an anadromous life history, which means that juveniles of the species undergo a change that allows them to migrate from freshwater to mature in salt water before returning to their natal rivers or streams (*i.e.,* streams where they were spawned) to reproduce.

Historically, these fish were the only abundant salmonid species that occurred naturally within the coast ranges of Southern California. Steelhead entered the rivers and streams draining the Coast Ranges from Point Sal to the U.S. Mexican Border during the winter and spring, when storms produced sufficient runoff to breach the sandbars at the rivers' mouths, and provided fish passage to upstream spawning and rearing habitats. These fish and their progeny were sought out by recreational anglers during the winter, spring and summer fishing seasons.

Steelhead are a highly migratory species. Adult steelhead spawn in coastal watersheds; their progeny rear in freshwater or estuarine habitats prior to migrating to the sea. Within this basic life history pattern, the species exhibits a greater variation in the time and location spent at each life history stage than other Pacific salmon within the genus *Oncorhynchus.*

The life cycle of steelhead generally involves rearing in freshwater for one to three years before migrating to the ocean, and spending from one to four years maturing in the marine environment before returning to spawn in freshwater. Adult steelhead do not necessarily die after spawning and may return to the ocean, sometimes repeating their spawning migration one or more times. It is rare for steelhead to spawn more than twice before dying, and most that do so are females.

This species may also display a non-anadromous life history pattern (*i.e.*, a "freshwater-resident" strategy); non-anadromous individuals that complete their entire life history cycle (incubating, hatching, rearing, maturing, reproducing, and dying) in freshwater commonly are referred to as rainbow trout. However, this terminology does not capture the complexity of the life history cycles exhibited by native *O. mykiss*. "Rainbow trout", which have completed their life history cycle entirely in freshwater, sometimes produce progeny that become anadromous and emigrate to the ocean and return as adults to spawn in freshwater. Conversely, it has also been shown that steelhead may produce progeny that complete their entire life cycle in freshwater.

There is a third type of life history strategy displayed by *O. mykiss* fish that is referred to as "lagoonanadromous", which may spend a majority of the freshwater phase of their life moving back and forth between the estuary or lagoon at a river's mouth and upstream freshwater habitats before emigrating to the ocean. Steelhead populations in Southern California have not been investigated to determine whether or to what extent they may exhibit this life history strategy; however, steelhead smolts have been documented rearing in Southern California estuaries.

Within each of the three basic life history strategies (fluvial-anadromous, freshwater-resident, and lagoon-anadromous), there is additional variation, including examples of finer-scale habitat switching, such as multiple movements between lagoon and freshwater habitats in the course of a single summer in response to fluctuating habitat conditions; and also so-called "adfluvial" populations that inhabit freshwater reservoirs but spawn in tributary creeks.

Closely related to these various life history strategies is the use by steelhead of a wide variety of habitats over their lifespan, including river mainstems, small montane tributaries, estuaries, and the ocean. Steelhead move between these habitats because each habitat supports only certain aspects of what the fish require to complete their life cycle. Different populations frequently differ in the details of the times

and habitats that they utilize while pursuing the general pattern of the anadromous life cycle. These differences can reflect the evolutionary response of populations to environmental opportunities, subject to a variety of biological constraints that are also a product of evolution.

See the National Marine Fisheries Services Southern California Steelhead Recovery Plan (2012) for more details, and supporting references, particularly Chapter 1 “Introduction”, and Chapter 2 “Steelhead Biology and Ecology”.

For the other native fish species, see C. C. Swift, T. R. Haglund, M. Ruiz, and R. N. Fisher “The Status and Distribution of Freshwater Fishes of Southern California” (1993).

The decline of indigenous steelhead/rainbow trout (*Oncorhynchus mykiss*) populations in the Santa Ana River watershed is the result of a multitude of anthropogenic activities that have degraded riverine and estuarine habitats, and fragmented riverine habitats through the construction of instream barriers such as dams, diversions, road-crossing, and flood control structures. The threats analysis conducted by NMFS as part of the recovery planning for the Southern California steelhead populations, identified “Dams and Surface Water Diversions”, “Flood Control”, “Groundwater Extraction”, “Levees and Channelization”, and “Urban Development” as the highest threats to the native trout/steelhead populations in the Santa Ana River Watershed.

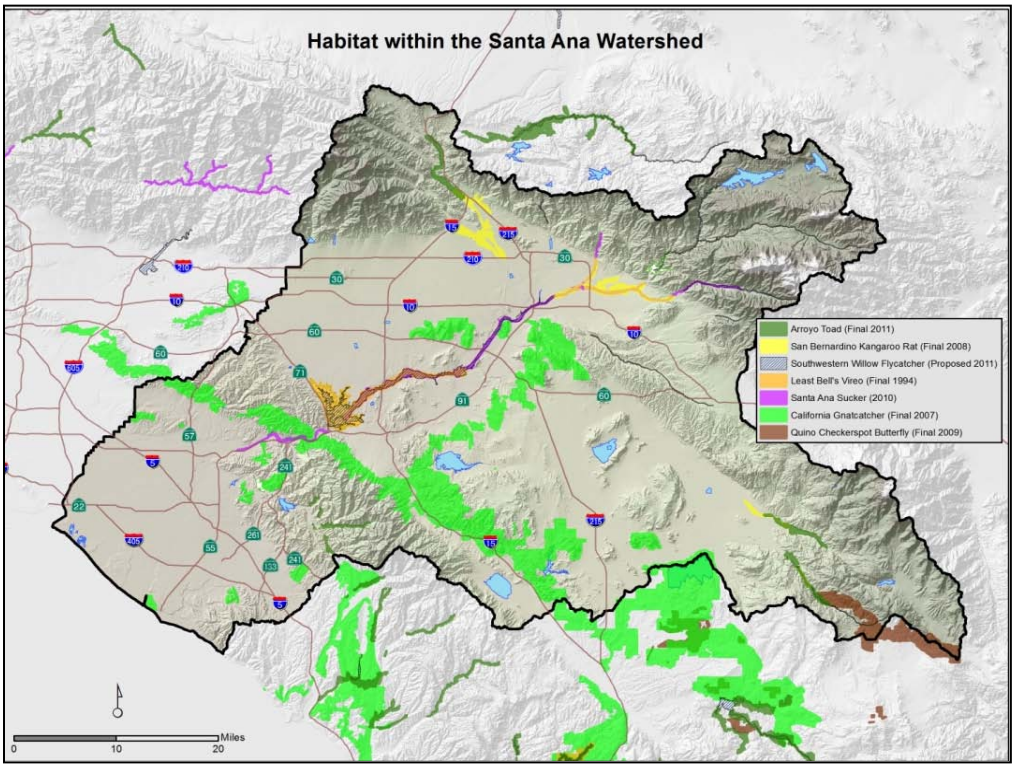
Over-exploitation of rainbow trout/steelhead by recreational angling was not identified as a principal factor for the decline of this species in the Santa Ana River, or in Southern California generally. Stocking of *O. mykiss* to supplement an existing native freshwater recreational fishery was initiated and subsequently increased over the years in response to a variety of factors, including human population growth, increased accessibility to angling areas, expansion of leisure time, and to support expanding outdoor recreational activities as an important component in a developing tourist industry. The reported catches of large number of trout by anglers in local media (*e.g.,* the July 17, 1982 report in the *Citrograph*, a Redlands newspaper, of three individuals taking 592 trout in three hours from Bear Creek, a tributary to the Santa Ana River in San Bernardino County) provide an indication of the natural productivity of the native fishery of the watershed.

The California Legislature began regulating recreational angling (along with other forms of angling) in 1861, when the Southern California human population was a small fraction of its current levels. The increasing restrictions on recreational angling were prompted by the increasing human pressures on the indigenous fishery resources, but were not intended to address the underlying cause of the decline of the populations, nor to safeguard native fish populations or maintain natural ecosystem functions. While both the anadromous form and the freshwater resident forms of *O. mykiss* now have been reduced to critically low levels, residualized populations persist in the headwater tributaries above and below impassible barriers, and the lower reaches remain accessible to the anadromous form when hydrologic conditions permit upstream migration from the ocean.

In February 2012, the City of Riverside, showing community support for steelhead restoration, adopted Resolution 22351, “A Resolution of the City Council …Supporting Restoration Efforts for the Southern California Steelhead in the Santa Ana River.” This resolution supports recommendations for restoring

the Santa Ana River steelhead population through mitigation actions identified in the U.S. National Marine Fisheries Service Southern California Steelhead Recover Plan.

See the National Marine Fisheries Services Southern California Steelhead Recovery Plan (2012) for more details, and supporting references, particularly Chapter 2 “Steelhead Biology and Ecology”, and Chapter 12 “Mojave Rim Biogeographic Population Group”.



### *Amphibians*

During the past 50 years, population growth and urban development in Southern California have displaced many amphibian species, and encroached upon much of the former amphibian habitat. These include the federally listed endangered arroyo toad (*Bufo californicus*) and mountain yellow-legged frog, (Rana muscosa), and the federally-listed threatened California red-legged frog (Rana aurora draytonii). Several species are thought to be extinct, and many others have fragmented populations that are at risk of extirpation. Amphibians are especially sensitive to environmental changes that alter the hydrology, ecology, and geology of a region because they have evolved, highly specialized adaptations that have allowed them to exist in these relatively arid regions. Introduced species also have been a major contributor to the decline in amphibian populations in Southern California. These non-native species increase competition for food sources, as well as prey upon many of the native amphibians.

### *Reptiles*

The California Department of Fish and Wildlife (CDFW) considers the Southwestern pond turtle (*Clemmys marmorata*) a species of “special concern”. Recent reports on *C. marmorata* in Southern California indicate that a few viable populations remain in the regions (see also Brattstrom 1988). Approximately six to eight viable populations of the turtle remain south of the Santa Clara River system in California. Droughts have exacerbated the negative effects of habitat alteration accumulated over many years in much of this region from changes in land and water use, and abusive grazing practices. In particular, most western pond turtle populations examined in this region appear to show an age structure increasingly biased toward adults, indicating little or no recruitment is taking place. Recent surveys indicate that the southwestern pond turtle also is seriously threatened throughout most of its range outside of California.

**Figure 5.9-1 Map of Critical Habitat within the Santa Ana River Watershed**

## Current Status of Resources

### *Water Quality and Quantity*

Water quality in the mountain portion of the watershed is good overall, with low concentrations of total dissolved solids, nitrates, and other pollutants. Although elevated levels of total coliform and silt have been identified with storm flows, water quality exceeds the State standards set for the identified beneficial uses of the water. The water quality generally decreases, and turbidity increases with distance from the mountains. Multiple water reuse becomes a more dominant factor. The river courses through a large dairy preserve. Treated municipal wastewater is discharged into the river at many points between Riverside and the Prado Basin.

Fortunately, water quality in the SAR has improved in recent years due to technological developments and water quality planning. Most of the native fishes of the watershed are adapted to clear, unpolluted water that can support food resources and provide the various habitat conditions necessary to complete their respective life cycles. While fish kills that are due to the spill of toxic substances into streams are dramatic examples of the effects of pollution, these instances are acute, or short-term, rather than chronic. More insidious, however, are the chronic effects on aquatic resources of non-lethal forms of pollution that decrease growth, inhibit reproduction, or impair movement. Chronic elevated water temperatures or high sediment loads are examples of this type of pollution, even though toxic chemicals are not involved. Other examples include elevated but non-toxic levels of ammonia, increases in salinity, and low levels of dissolved oxygen (DO). Because most of the remaining native freshwater fishes live, at

some time, in treated wastewater, the issue of chronic, low-level pollution is of great concern, although the quality of wastewater has increased markedly in past years.
The base flow of the Santa Ana River continues to increase because of continuing urbanization. A minimum base flow of 42,000 acre-feet per year was adjudicated in 1969 as a result of litigation between OCWD and Chino. This flow rate is measured at Prado Dam and was based upon historical averages. However, rapid urbanization has resulted in increasing discharges of high-quality tertiary treated water from the many treatment plants located along the river. In 1999, the base flow had increased to 140,000 acre-feet and was once projected to rise to 230,000 acre-feet by 2020. However, increasing conservation measures and re-use, along with development standards that require water to be retained on site, put the future base flow of the river in question. Decreases in flow would result in diminishing supplies of water to maintain habitat restoration, especially along the river mainstem and its tributaries.

The flow through the alluvial scrub is seasonal. Between the cities of San Bernardino and Riverside, the river picks up enough urban discharge to support perennial flow and productive riparian habitat dominated by willows. The quality of the fish habitat also increases greatly and there are recent records for the occurrence of native fishes including the federally listed, threatened Santa Ana River sucker (*Catostomus santaanae*). The other native species recorded from several, scattered localities are the arroyo chub (*Gila orcutti*) and more rarely, the speckled dace (*Rhinichthys osculus*). Fish habitat will be particularly affected if flows are reduced because of less runoff and less water being discharged from treatment facilities.

### *Spotty Conservation Areas*

Without a comprehensive, regional plan for water-oriented habitat conservation, independent efforts by various planners, regulators, and landowners can lead to fragmented habitat areas and fragmented management of those areas. In addition, a parcel-by-parcel, or piecemeal planning approach can lead to inconsistent, inequitable regulation of land development and unnecessary costs and delays. Broader planning and management approaches would benefit both the environment and development.

In general, the larger a habitat area, the healthier it is, with ample breeding, feeding and shelter opportunities for its inhabitants. Fragmented, small habitat areas can pose a threat to species diversity and the overall health of ecosystems.

Habitat fragmentation frequently is caused when native vegetation is cleared for activities such as agriculture or urbanization. Habitats, which were once continuous, become divided into separate fragments or islands. When habitat is fragmented, plants and animals lose their protective buffers around the fringes and access to each other, food, and water. Eventually the fragments become unable to support their natural diversity and species disappear.

The Army Corps of Engineers promotes a watershed approach to placement of compensatory mitigation in implementing its 2008 Mitigation Rule. The following is its definition of that approach: “Watershed Approach means an analytical process for making compensatory mitigation decisions that support the sustainability or improvement of aquatic resources in a watershed. It involves consideration of

watershed needs, and how locations and types of compensatory mitigation projects address those needs. A landscape perspective is used to identify the types and location of compensatory mitigation projects that will benefit the watershed and offset losses of aquatic resource conditions, past and projected aquatic resource impacts in the watershed, and terrestrial connections between aquatic resources when determining compensatory mitigation requirements for Corps permits."

However, compensatory mitigation and its restrictions can result in fragmented management, especially when mitigation providers are required by regulatory agencies to assign long-term real estate instruments, conservation easements, or other restrictive covenants to land before funding for compensatory mitigation can be directed to the mitigation provider. In many areas of the Santa Ana Watershed where habitat has been significantly degraded, especially along the mainstem where most of the invasive plants thrive, providing long-term protection through such instruments is not feasible. Much of this land is owned by cities, counties, flood control districts, water districts, park districts and by the Army Corps itself. These entities historically have not been willing to grant easements or other restrictive covenants to third parties, such as non-profit environmental organizations and resource conservation districts.

Fragmented management refers to piecemeal approaches to conservation and restoration of water-oriented habitat. When management is approached in a collective, comprehensive manner, overall costs can be reduced, funding can be pooled, and wasteful or harmful practices can be minimized or eliminated. When management is fragmented, there is a potential for duplication of effort, conflicting practices, and excessive costs.

### *Special Status Species*

Second only to Hawaii, the State of California is home to the highest number of endangered species in the United States. As defined within the Federal Endangered Species Act of 1973, an endangered species is any animal or plant listed by regulation as being in danger of extinction throughout all or a significant portion of its geographical range. A threatened species is any animal or plant that is likely to become endangered within the foreseeable future throughout all or a significant portion of its geographical range. Federal law prohibits the "take" of any individuals or habitat of federally-listed species without a special permit.

In addition to Federal laws, the State of California has its own California Endangered Species Act, with a separate listing of species and separate laws governing take of listed species. Enforcement of the Federal Endangered Species Act is administered by the USFWS and the National Marine Fisheries Service, while the CDFW enforces the California Endangered Species Act. Refer to **Figure 5.9-1** above for a map of critical habitat within the watershed.

The varied geography and natural features of the watershed provide habitat for a number of Federal and/or State-listed species. As the Santa Ana Integrated Regional Watershed Plan focuses on the resources in and around the Santa Ana River, listed species of concern herein are those that occupy aquatic, wetland, riparian, or riparian-adjacent areas. Of these, two are plants – the Santa Ana River woolly star (*Eriastrum densifolium*) and the slender-horned spine flower (*Dodecahema leptoceras*); one

fish – the Santa Ana River sucker (*Catostomus santaanae*); three amphibians – the arroyo toad (*Bufo californicus*), Mountain Yellow-legged frog, (Rana muscosa), and the California red-legged frog (Rana aurora draytonii); three birds – the least Bell's vireo (*Vireo bellii pusillus*), the southwestern willow flycatcher (*Empidonax traillii*), and the bald eagle (*Haliaeetus leucocephalus*); two mammals – the San Bernardino kangaroo rat (*Dipodomys merriami parvus*) and Stephen's kangaroo rat (*Dipodomys panamintinus*); one insect – the Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*) and one invertebrate - Riverside Fairy shrimp, (Streptocephalus woottoni). Reaches 4 and 5 of the Santa Ana River are federally-designated critical habitat for the Santa Ana sucker. Reach 5 also is federally-designated critical habitat for the San Bernardino kangaroo rat. Any project or policy recommended by the Santa Ana Integrated Watershed Plan will need to assess potential impacts to listed species, and incorporate measures to avoid impacts to these species.

### *Coastal Conditions*

Essential Fish Habitat areas exist in the coastal waters off Orange County. The Magnusen Stevens Act defines Essential Fish Habitat as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." To clarify this definition, "waters" is defined as aquatic areas and their associated physical, chemical, and biological properties that are used by fish, and may include areas historically used by fish. Substrate means "sediment, hard bottom, structures underlying the waters, and associated biological communities"; necessary means "the habitat required to support a sustainable fishery and the managed species' contribution to a healthy ecosystem"; and spawning, breeding, feeding, or growth to maturity covers the full life cycle of a species.

An additional coastal resource is in the form of sea-grasses, including eelgrass. They have great economic benefits by providing habitat, nursery grounds, and refuge that is essential for the continued replenishment of fish, a vital economic resource in the form of food. The economic value of sea-grass also is seen in its ability to filter nutrients such as phosphates and nitrates that come from fertilizers used in gardens and lawns. According to a recent study, a value in the form of global nutrient cycling by the world's sea-grasses is an estimated $1.9 trillion per year. (Waycott 2009) Documented decline in the amount of sea-grass areas globally has made their preservation a priority. Sea-grasses are now federally-protected under the Clean Water Act.

Marine habitat, in the form of eelgrass habitat, also is affected by human activity because of its location in the shallow sub-tidal zones of coastal areas. Coastal development, boating, aquaculture and fishing, and urban runoff are all contributing factors that have the potential for causing damage due to pollution. The health of this habitat is important as nursery grounds and refuge from predation for many species of fish and invertebrates including juvenile halibut, lobster, sharks, scallops, and oysters. It also provides protective shade to prevent overheating, and there are many species that actually lay eggs on the blades for protection until they hatch. Eelgrass is also a food source to both aquatic and waterfowl species.

## Agriculture and Dairies: Water Quality Protection

Regulatory agencies in the watershed have taken a number of regulatory actions to address water quality impacts related to agricultural and dairy practices in the region, including impacts to both surface

water and groundwater due to runoff from manure in dairy farm corrals, spreading of manure for fertilizer in agricultural fields, and use of pesticides.
In 2007, the Santa Ana Regional Water Quality Control Board (RWQCB) issued R8-2007-0001 (NPDES No. CAG018001): General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) within the Santa Ana Region (Santa Ana RWQCB, 2007), prohibiting all dairies in the watershed from discharging process wastewater or stormwater runoff up to a 25-year, 24-hour rainfall event, and requiring each facility to develop an Engineered Waste Management Plan. This permit was amended with adoption of R8-2013-0001, which directed dairies in the San Jacinto Watershed to collaborate with Eastern Municipal Water District's Salinity Management Program.

The Riverside County Ordinance 427.2 passed by the Riverside Board of Supervisors in 2001, regulates safe transportation and application of manure in certain county districts by requiring operators and/or landowners to report manure application. The purpose of the ordinance is to minimize impacts to neighboring properties, local waterways, underground water supplies, and soil resources.

The San Jacinto Basin Resource Conservation District (SJBRCD) and the Western Riverside County Agriculture Coalition (WRCAC) developed a multi-phased process for establishing and running a Manure Manifest System (MMS). The MMS addresses nutrient and salt loadings by specifying that manure be applied to land at rates consistent with cropping practices and groundwater conditions. This will prohibit over-application at sites where potential impacts to groundwater basins are a concern.

### *Santa Ana Watershed Agricultural Report*

The objective of this report is to provide an overview of agriculture in the Santa Ana Watershed. This report includes information on types of commodities produced in the watershed, value of these commodities, information on whether agriculture is shrinking, percentage of irrigated land and percentage of region covered by Confined Animal Feeding Operations (CAFO). The focus of this report is especially on regions in San Bernardino, Riverside, and Orange County, which is a part of the Santa Ana Watershed. One of the other objectives of this report also is to shed some light on the impacts of agricultural pattern or CAFO in the Santa Ana Watershed on the overall water quality of the region.

### *San Bernardino County*

Livestock and poultry contribute to the highest value in the San Bernardino County region; this is followed by nursery and miscellaneous crops. Next, vegetables, fruit and nuts constitute the third and fourth most valuable crops within the region. Livestock and poultry cover the most amounts of acres compared to the any other type of crop that is produced in the region. Nursery and miscellaneous crops utilize the least amount of land compared to all other crop types, although it is of the second highest value in the region. All of the agriculture in the Santa Ana Watershed is irrigated and CAFO operations in the watershed include numerous dairies and chicken farms.

### *Riverside County*

In Riverside County, nursery is the highest value crop followed by vegetable crop; the third most valuable crop is fruit and nuts. According to the Riverside County Agricultural Commissioner, everything in the Riverside area of the Santa Ana Watershed is irrigated with the exception of "Range" and "Grain" acreage. Although there are dairies in Riverside and San Jacinto districts, the Riverside County

Agricultural Commissioner could not provide any statistics on the CAFO as they do not regulate CAFO in the region.

### *Orange County*

In Orange County the highest value crops are nursery and miscellaneous, followed by fruit and nut crops, and then by vegetable crops. As suggested by the County Agricultural Commissioner, agriculture is shrinking and operators are moving to high value crops in this region. The field crops in this region are grown without irrigation without any CAFO.

## The Value of Understanding

The urban watersheds of the California coast provide a unique opportunity to explore the value of historical ecology research for developing contemporary wetland and riparian restoration plans. Studies have demonstrated that restoration and mitigation planning would be greatly improved if done within the context of ecosystem function (Kentula 1997, 2007; Kershner 1997; National Research Council [NRC] 2001; White and Fennessy 2005). Unfortunately, in the urban environments of California, much of the current understanding of wetland and riparian ecology is derived from systems highly modified by human activities. Thus, identifying appropriate functional reference conditions or distinguishing natural processes from anthropogenic effects can be difficult. Recent historical ecology studies in California have provided new and surprising evidence of wetland resources previously not recognized, particularly in Southern California where evidence suggests wetland ecosystems were larger and more diverse than previously thought (Stein et al. 2010; Grossinger et al. 2011; San Dieguito River Park 2010). This suggests that historical ecology not only provides important information about functional reference conditions but also sheds light on previous misconceptions about the historical environment.

The value of historical ecology has been questioned in the urban coastal regions of Southern California where natural hydrologic processes are unlikely to be fully recoverable. Arguably, historical ecology may provide confusion in the face of a systematic incapability to return wetland ecosystems to their pre-development condition, often due to the permanent loss of natural hydrodynamic processes that were present prior to human contact. Understanding the historical template is as important as understanding the contemporary condition. Knowledge of historical ecosystem components is key to creating management and restoration plans that make sense relative to the contemporary landscape. The historical perspective provides an understanding of the relationship between physical settings that support natural wetland functions, the driving forces behind ecosystem degradation, and perhaps most important, the value of wetland ecosystems that remain intact (Stein et al. 2010). Considerable evidence supporting the importance of historical ecology in contemporary wetland management, even in highly urbanized areas, now exists (Kentula 1997; White & Fennessy 2005; Stein et al. 2010). In addition, new technical tools provide shared access to data collected for historical ecology projects, creating an opportunity for cross-disciplinary collaboration and ongoing discovery of historical reference conditions beyond traditional reports.

## Current Threats to Resources

Primary threats to aquatic resources within the Santa Ana River Watershed include past and ongoing loss and degradation of native habitat—approximately 90 percent of the wetland habitat in the Santa Ana River Watershed has been lost. Non-native invasive plants have taken over approximately half of the remaining wetlands, resulting in greatly increased threat of fire, greatly reduced wildlife values, and increased flooding issues, particularly from the arundo breaking off and forming huge debris dams. Non-native vertebrate and invertebrate species are wreaking havoc as competitors and predators of native species. There has been a historical lack of coordinated natural resources management to counteract some of the effects of human-induced impacts on the wetlands, along with a lack of public awareness and stewardship of wetland resource. The future availability of water is also a significant issue in habitat restoration and ongoing maintenance.

### *Unnatural Hydrology*

The Santa Ana River and its tributaries have been largely channelized and dammed to provide flood protection for the growing human population. There are many lakes, reservoirs, and dams on the tributaries including Santiago Dam, Villa Park Reservoir, Brea Dam, Fullerton Dam, Prado Dam, Carbon Canyon Dam, San Antonio Dam, Lake Hemet, Railroad Canyon Lake, Lake Elsinore, Lake Mathews, Big Bear Lake, and Baldwin Lake. Seven Oaks Dam is situated on the mainstem near its emergence from the San Bernardino Mountains, and captures about 7.2 percent of the total watershed. Prado Dam is located near the middle of the mainstem, capturing 52 percent of the watershed.

As noted by Moyle (2002), most of California's inland waterways today bear little resemblance to the streams and lakes encountered by the first European explorers and settlers. In the watershed, this observation is certainly true as flood control and channelization activities have left portions of streams channelized and concrete-lined where once riparian forests grew along a meandering stream. Fortunately, today only 20 percent of the Santa Ana River is concrete-lined. Dam construction and flood control activities were not the only factors influencing the watershed in ways that adversely impact habitat critical for aquatic resources. The following factors also have played a role:

- Stream channel alteration
- Draining of streams and lakes, especially adjacent wetlands
- Livestock grazing and the impact on aquatic and riparian vegetation, sedimentation, and water pollution
- Historical logging practices
- Invasive plant infestations
- Invasive and feral animal populations
- Bark Beetle infestation
- Mining, particularly in-stream aggregate mining
- Watershed changes resulting in cumulative effects to aquatic resources

### *Invasive Species*

Human development and activities in the watershed have greatly reduced the floodplain and associated habitats, and deleteriously affected the river's natural function and processes. One of the most

challenging agents of deleterious change has been a multitude of non-native, invasive species, primarily, but not exclusively, plants. One major problematic species, *Arundo donax,* at one point was reported to have taken over approximately 10,000 acres of river bottom, replacing native wetland habitats. The Santa Ana River has been transformed by giant reed. Other weedy species are major local issues including perennial pepperweed (*Lepidium latifolium*), tamarisk (*Tamarix* spp.), castor bean (*Ricinus molle*), and tree of heaven (*Ailanthus* altissima), among others, but Arundo is pervasive. Giant reed provides no redeeming wildlife value— it carries fire, causes obstruction to flood flows and results in damages to bridges and other structures, and results in expensive beach clean-ups. Compared to native habitat, Arundo consumes nearly three times the water, and it provides poor stream shading, impacting water quality. Arundo consumes an estimated 56,200 acre-feet of water annually from the Santa Ana River alone—enough for more than 100,000 households.

Achieving total eradication of Arundo in some parts of the Santa Ana River Watershed will take decades. Arundo control started in the upper watershed and continues downstream because Arundo invades by pieces that wash down and sprout in moist soil. Arundo seeds are sterile in our area, so the spread of Arundo has been entirely by vegetative means in the watershed.

Arundo on the Santa Ana River mainstem has been nearly completely eradicated in an area that stretches upstream from the Mission Bridge in Riverside, through San Bernardino and Redlands, and through the major tributaries of Mill Creek and San Timoteo Canyon. The San Bernardino National Forest also has projects focused on Arundo removal. Arundo has been nearly eliminated also in the Riverside County areas of Mystic Lake, the San Jacinto River, and Mockingbird Canyon/Woodcrest. In Orange County, it has been nearly eradicated in Carbon Canyon, Modjeska Canyon, Santiago Creek and Blackstar Canyon areas. All of these areas are being kept under control. This leaves the mainstem areas from Mission Bridge downstream, and then through the Prado Basin and the lower reaches in the Santa Ana Canyon. There are still thousands of acres of Arundo in these areas. Mitigation providers need to be given access to these lands and develop long-term agreements with the public and private landowners to complete the task of eradicating Arundo from the Santa Ana Watershed.

Certain species of non-native vertebrates like the brown-headed cowbird are extremely harmful to native species and are managed in association with endangered species monitoring to ensure no harmful effects to listed species. More than 100,000 cowbirds have been removed from the Santa Ana River Watershed since 1986.

In coastal regions, an invasive algae nicknamed “killer algae” or the alien seaweed *Caulerpa taxifolia* was found, according to NOAA, in Southern California’s coastal waters located in Huntington Harbour in Orange County. It is actually the result of a clone developed for aquarium foliage that “escaped” into the coastal waters. It originally was discovered in the Mediterranean where it has had devastating consequences. In areas where the species has become well established, it has caused ecological devastation by overgrowing and eliminating native seaweeds, sea grasses, reefs, and other communities, and economic devastation by harming tourism, pleasure boating, and recreational diving, and had a costly impact on commercial fishing. The dense carpet that this species can form on the bottom could inhibit the establishment of juveniles of many reef species, and its establishment offshore

could seriously impact commercial fisheries and navigation through quarantine restrictions to prevent the spread of this species. This alga poses a substantial threat to marine ecosystems in Southern California, particularly to the extensive eelgrass meadows and other benthic environments that make coastal waters such a rich and productive environment for fish and birds. The eelgrass beds and other coastal resources that could be directly impacted by an invasion of *Caulerpa* are part of a food web that is critical to the survival of numerous native marine species including the commercially and recreationally important spiny lobster, California halibut, and sand basses. Eradication methods have been undertaken in Huntington Harbour, however, constant monitoring is necessary to insure that this threat is eliminated. (NOAA)

### *Invasive Fishes*

Introduced fishes have a great impact on the aquatic resources of the watershed. The 33 species of introduced fishes greatly outnumber the four remaining native fish species. The number of species, *per se*, is not the problem but, rather, the impact that introduced fishes and other aquatic organisms, have on the native fishes of the Watershed. Introduced fishes have dramatically changed the composition of the watershed's fish community and now act as a deterrent to the restoration and enhancement of the native fishes that remain. Some of the aquatic species that continue to be destructive include: carp, bass, African clawed frogs, and red-eared sliders.

The manner in which introduced fishes can affect the aquatic resources of the Watershed include:

- Competition between native and introduced fishes for food and space
- Predation by introduced species on native fishes
- Habitat interference by introduced fishes that change habitat characteristics
- Introduction of diseases that may infect native fish or other aquatic animals
- Hybridization between closely related species

Each of the aforementioned factors has acted in concert over a long period of time to reduce the native fish community of the watershed to that which remains today. The Santa Ana Integrated Regional Watershed Management Plan recognizes that history cannot be undone and the aquatic community cannot be restored to its pre-settlement condition; however, a conservation strategy can be implemented that will ensure the long-term viability of the watershed's aquatic communities

### *Other invasive species*

Destruction to habitat also can be caused by animals such as feral dogs, cats, and pigs. With no natural predators, the numbers of these animals have greatly increased in recent years. The feral pigs are the most destructive. They root, trample and eat their way through sensitive plant and animal species' habitats. On National Forest managed lands, they have harmed the riparian habitat and oak grasslands by wallowing and turning over the soil in search of grubs, tubers and bulbs. The eggs of ground-nesting birds also are on their menu as they compete for vegetative food sources with other native animals. Their consumption of seeds such as acorns affects the ability for a habitat to regenerate naturally, potentially leaving areas they frequent in a desolate state.

### *Diminished Habitat Areas and Wildlife Linkages*

Development, especially during the past 50 years, has destroyed hundreds of thousands of acres of habitat. The result is now that much of the remaining habitat is fragmented, and connections among some remaining habitat areas have been irretrievably lost. The challenge to watershed stakeholders is to find innovative ways of preserving those connections that remain and creating new ones.

Transportation infrastructure—including roads, bridges and rail lines—presents significant obstacles to wildlife movement, especially for large mammals that are accustomed to roaming extensive territories. Commercial and residential developments, unlike roads, create many other issues along with being a barrier. These issues include introduction of non-native plants and non-native, predatory animals into the surrounding habitat areas.

Wildlife movement and habitat connectivity should be important considerations in any residential or commercial development. Community planners should make it a priority.

Current major efforts to preserve habitat connections in the Santa Ana River Watershed focus on the high country ringing the watershed and facilitating movement in and out of the watershed from outside areas, including the San Gabriel River Watershed, the Santa Barbara Mountains, San Diego County and the eastern and northern desert areas of San Diego, and Riverside and San Bernardino Counties. One example is an effort to preserve the linkage between the Palomar Mountains and the inland ranges of San Diego County through the southern Riverside County area to the Santa Ana Mountains.

While efforts to keep our watershed linked with surrounding natural areas are vital to species diversity and abundance, it is also important that intra-watershed linkages be preserved and created. Within the watershed, many conservation efforts are conducted with a focus on preserving habitat areas with linkages for wildlife (see Current Conservation Measures below).

Several efforts in the Santa Ana River Watershed are focused on road and freeway barriers. Many critical former wildlife movement corridors have been significantly disrupted by major freeways.

Riparian areas of the Santa Ana River and subwatersheds and drainages provide opportunities to preserve linkages for wildlife movement, especially for larger wildlife. Studies have shown that large mammals prefer to move through areas that are less confined and contain quality habitat on both sides of the obstruction and in the crossing area itself over areas that lack one or more of these characteristics.

Alluvial fan areas—such as those found along the lower elevations of the front ranges of the San Gabriel, Santa Ana, San Bernardino and San Jacinto Mountains—should be considered valuable not only for their aquifer-recharge abilities, but also for use as wildlife linkages. According to the California Alluvial Fan Task Force's *Planning Manual for Development on Alluvial Fans*, "Alluvial fan areas can provide connectivity between lowland and highland areas and provide critical habitat for sensitive plant and animal species downstream and downwind of the fans themselves." For this reason, preservation of sensitive alluvial fan areas should be considered in all development plans.

Population increases in the Santa Ana Watershed have resulted in the need for additional commercial and residential development, making the remaining open space areas attractive for these purposes.

Developmental goals often conflict with conservation efforts to preserve habitat and the region would benefit from collaborative land use planning to ensure that continuous wildlife corridors are preserved to promote biological diversity and prevent isolated conservation areas that diminish species viability.

### *Climate Change and Natural Factors*

The habitat within the Santa Ana Watershed is affected by natural occurring droughts, seasonal floods and fires resulting from both natural occurring lightning and human activities. Climate change is an additional uncertain variable that can influence the intensity of these natural events and the resulting damage to habitat.

### *Unsanctioned Recreational Uses*

It is recognized that the Santa Ana River, in areas where stream flow is substantial, is a destination for recreation and relief from the heat of hot summer days. There are, however, no designated areas for such uses along the mainstem (except in the San Bernardino National Forest) and efforts to restrict access have had limited success. Sensitive habitat is vulnerable to damage in the form of pollution as there are no trash receptacles or restroom facilities, as well as foot traffic. In some cases, people have constructed dams out of plastic bags in order to make a larger pool of water for swimming. This type of activity can damage the native aquatic habitat and natural hydrology of the stream flow.

Sensitive habitat also is at risk from all terrain vehicle recreation. Continued use can result in the development of ruts in which rainfall can find its way into, exacerbating the problem by increasing erosion and runoff debris, as well as forming new channels that change the natural hydrology of the area.

Other restricted activities specifically along the Santa Ana River Trail are as follows:

- Discharge of firearms and hunting is prohibited along the Trail
- Motor vehicles are prohibited
- Possession of alcoholic beverages is prohibited
- No overnight camping is allowed along the Trail, although it may be allowed in some adjoining park areas
- Fireworks, grills and campfires are prohibited
- Geocaches are allowed where they do not affect natural, cultural and historical resources, visitor safety, or other park users.

Implemented policies such as these are submitted and then reviewed by the Policy Advisory Group (PAG) and Technical Advisory Committee (TAC) for the Trail. Comprised of eight elected representatives from county and city government, these groups are responsible for policy creation and modification.

## Recreational Opportunities of Natural Resources

Most park and open space areas are local amenities, so the implementation of projects to develop them becomes a local decision intended to serve a focused, local population often residing within a few miles of a given developed park or open space area.

On the other hand, regional parks and open space areas tend to be larger, and provide more diverse amenities than those found in locally operated park facilities, and are managed to attract visitors from a wider area. Visitors come from within the Santa Ana River Watershed or from adjoining areas. The diversity of available facilities may enhance the region's attractiveness to visitors, and thereby provide economic growth through increased tourism. Most notably, parkland containing exceptional natural resources may attract eco-tourists looking for an opportunity to experience outdoor activities unavailable in their own areas. The wide variety of topography and natural resources within the watershed provide excellent opportunities for the development of this type of tourism.

Regional park facilities also may serve an important role in the continued economic development of the region. Businesses interested in attracting highly-skilled workers often use the proximity to well-developed recreational resources in attracting and retaining talent. Among the amenities often considered by skilled professionals are culture and the arts, nightlife, and the availability of outdoor recreation opportunities. From the ocean to the mountains, the watershed provides numerous opportunities for such a population.

Running through the watershed is the Santa Ana River Trail and Parkway (SART), a regional recreational amenity linking open space areas throughout the watershed. Models, such as the SART, could be developed in other parts of the watershed, such as in San Timoteo Canyon, along Lytle Creek, and within the San Jacinto Watershed. Completion of these linear park amenities and their connection with the existing trail backbone could create a world-class recreation system available to millions of residents and visitors.

Funding for recreational projects vary on location and type of project. Typically, projects are funded by various grants from agencies within the benefiting area. Other sources of funding include the California Department of Parks and Recreation, and additional grants available through the federal government.

### *Anaheim Park Projects*

OCWD and the City of Anaheim have forged a creative partnership to address the lack of open space and resources. On November 15, 2011, Anaheim opened a 14-acre nature park and a 1-½ mile bike path on public lands owned by OCWD near the City's urban core.

In the early 2000s, it was apparent that the City of Anaheim needed to find open space to provide an opportunity for nature and exercise. However, due to the built-out environment, lack of land, and high land prices, the City had few opportunities for large-scale nature parks. So The City forged a relationship with the largest landowner in Anaheim, the OCWD. The OCWD's Burris Basin is a 116-acre ground water replenishment facility on the west bank of the Santa Ana River. It is located only one-half mile north of the Platinum Triangle, Honda Center, Angel Stadium, and the Anaheim Regional Intermodal Transportation Center (ARTIC) that currently is under construction.

In 2005, the OCWD granted a 25-year lease to the City of Anaheim to open 14 acres of land for a public trail and nature park for an annual payment of $1. The agreement required the City to pay for the

construction, maintenance, and security of the public park area. The City immediately began an intense public input process and funding campaign. The City of Anaheim received $6.3 million in grants from the Rivers and Mountains Conservancy, California River Parkway Grant, and the Recreational Trails Program.

Anaheim Coves at Burris Basin offers a resting spot for Santa Ana River Trail users and nearby neighborhoods. There are two parking lots and restrooms, along with ample seating and opportunities for bird watching. Integrated public art interprets the natural environment with bird images embedded in the concrete seating, and metal pelican shapes in the gates that welcome patrons. This is a place for people (including the elderly and young children) to exercise, socialize, commute, and enjoy nature at the same time. There also has been a drastic reduction in calls for service and crime within the area.

The signage interprets OCWD's mission of groundwater recharge and the importance of water conservation; it also presents local history and the native flora and fauna. All landscaping is comprised of plants and trees indigenous to the Santa Ana River Watershed.

On April 30, 2013, a Memorandum of Understanding was ratified between OCWD and the City for the extension of the bike path almost one mile north and an eleven-acre nature park on the OCWD 5 Coves facility. Anaheim Coves at Burris Basin represents a great example of how cities and local water agencies can partner to further meet the needs of the community.

### *Parks, Recreation and Open Space*

The former Parks, Recreation and Open Space Pillar (now integrated in to the Natural Resources Stewardship Pillar) brought together park, recreation, and open space advocates from the three counties, including cities, other governmental agencies, and citizens who are interested in public access relative to water resources in the watershed. This group focused attention on the larger "picture" of opportunities. However, they consider the SART as a model for the development of additional regional amenities where close cooperation across many areas and jurisdictions is necessary.

The general findings included a survey of current Regional Park and open space offerings and conditions. While there have been many accomplishments, especially with regard to river access, more planning, management and coordination are needed. Urban development patterns, high land prices, and low availability of land for recreation make expansion of opportunities difficult. Also, new parks or trails may impact habitat with limited land remaining for public access and recreation.

Possible future threats include availability of funding for new trails and parks within the watershed, a shortage of ongoing maintenance funds, and the ability to maintain a high level of security and care for the parks and trails.

Strategies for addressing existing threats include: 1) seeking more stable funding through assessments; 2) increasing public awareness of park, recreation and open space issues; 3) developing a plan to leverage existing resources and expertise; 4) forging and maintaining partnerships; 5) improving resource mapping; 6) curtailing vandalism by increased patrol presence; and 7) ensuring regional park master plans include proper trail and open space protections. One of the most important regional

strategies is to fund and complete the SART. It also is imperative to help local agencies find support for their recreation needs radiating from the SART backbone. The model developed on the mainstem of the Santa Ana River (SAR) to develop the SART can be adapted to tributaries such as San Timoteo Creek and the San Jacinto River.

Current recreation opportunities in the watershed include bicycling, hiking, walking, skiing, snowboarding, rock climbing, geocaching, bird watching, swimming, horseback riding, and organized team and individual sports. The availability and level of participation in such activities is dictated by terrain, the location within the watershed, and degree of urbanization. For example, approximately 18 percent of the Watershed is within the San Bernardino National Forest. Recreational opportunities in this area are much different than in highly urbanized areas such as the cities of San Bernardino and Huntington Beach. In the upper watershed, hiking, rock climbing, and mountain biking are very popular on national forest lands. In the lower, more urbanized areas in the watershed, jogging and cycling are more common, as well as organized sports such as soccer and baseball. Sports fields are located adjacent to the river along its length.

The centerpiece of recreation in the watershed is the SART, a 100-mile trail currently under development, extending from the crest of the San Bernardino Mountains to the coast of the Pacific Ocean. The trail runs through three counties, 15 cities, and multiple jurisdictions. The trail is approximately 65-percent complete with plans to complete the remaining portions over the next five years (**Table 5.9-1**).

**Table 5.9-1 Status of Santa Ana River Trail and Parkway**

| County | Completed (miles) | In Construction (miles*) | Planned (miles*) |
|---|---|---|---|
| San Bernardino | 7 | 0 | 14.0 |
| Riverside | 12 | 0 | 21.0 |
| Orange | 24 | 0 | 4.5 |
| **Total Miles** | **43** | **0** | **39.5** |
| *Mileages are approximate and do not include earthen trail in San Bernardino National Forest. | | | |

The SART, shown in **Figure 5.9-2**, is a common thread through each county, and **Figure 5.9-3** lists the recreational opportunities available in the Watershed. **Table 5.9-2** describes each county's unique set of recreational resources.

**Figure 5.9-2 Santa Ana River Trail Parkway**

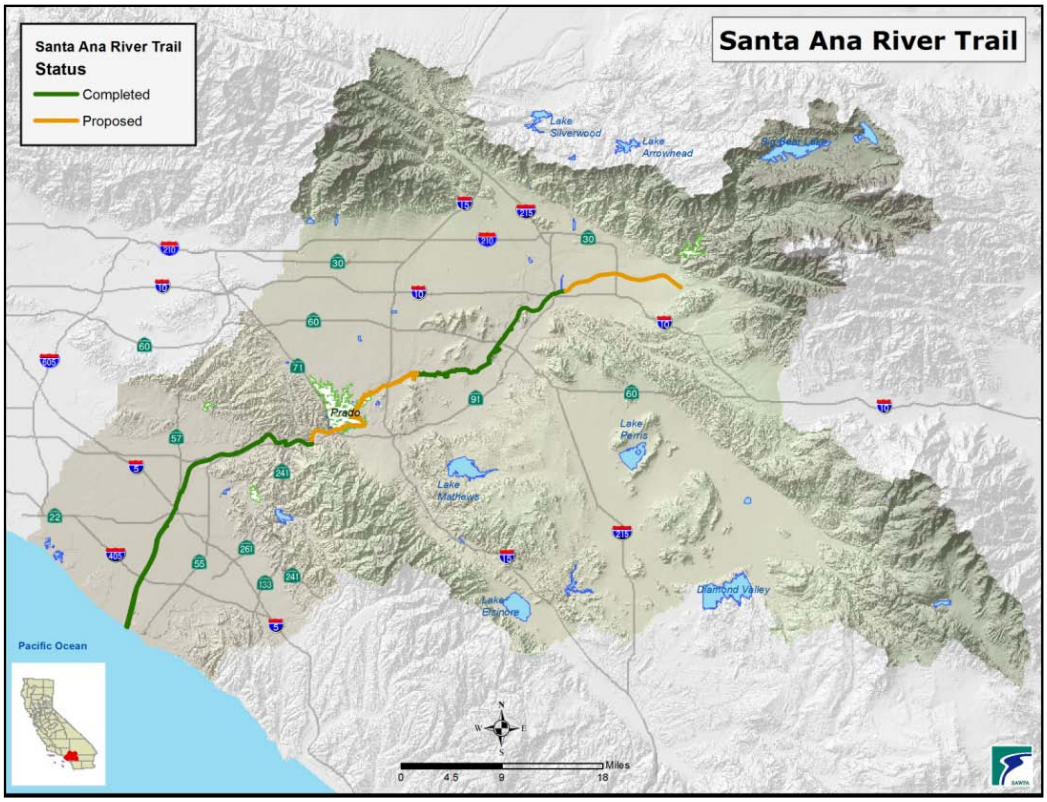


**Figure 5.9-3 Recreational Opportunities within the Watershed**

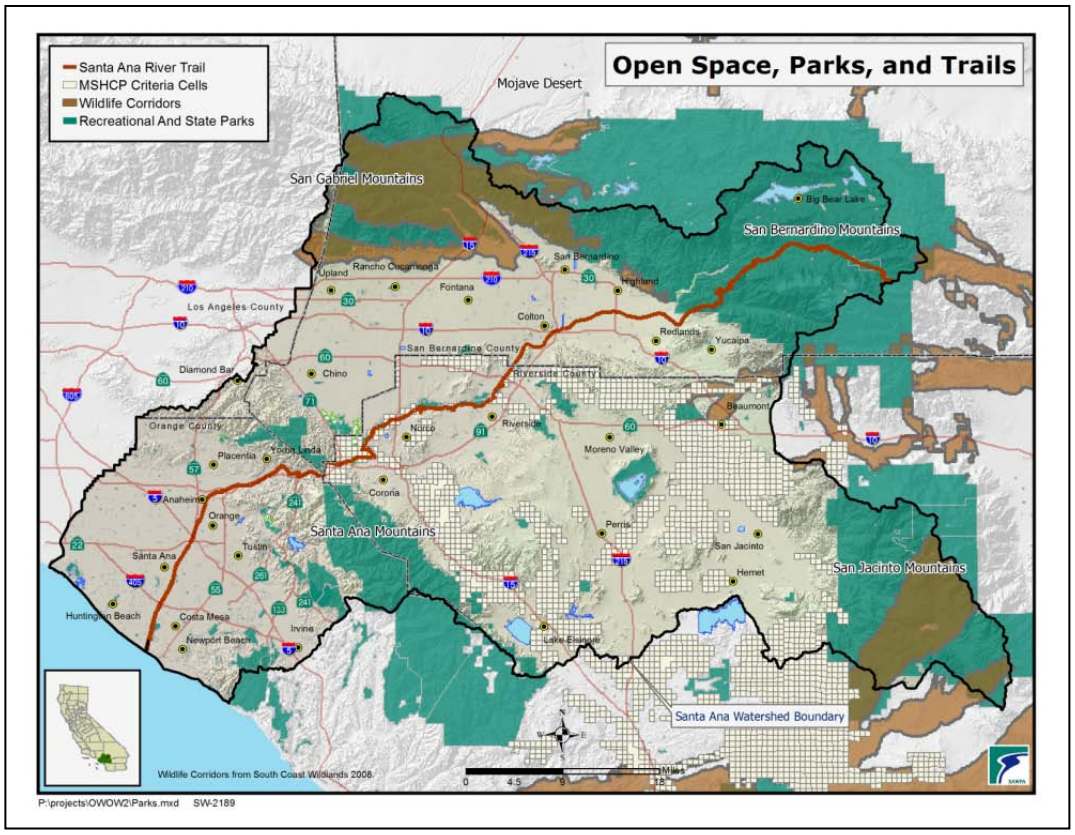

**Table 5.9-2 Regional Recreational Resources by County**

| County | Name and Location of Recreational Resource | Description of Resource and Available Activities |
|---|---|---|
| **San Bernardino County** | San Bernardino National Forest | Approximately 672,000 acres<br>352 miles of trails<br>Camping, fishing, hiking, equestrian, skiing, outdoor education, biking, target shooting and motorized sports |
| | Chino Hills State Park<br>Chino Hills | 6,000 acre park<br>Mostly open space<br>Hiking, bird watching, mountain biking |
| | Wildwood Canyon State Park<br>Yucaipa | Under development<br>1,200 acres currently; plans to expand to 5,000 acres and to develop trails and campgrounds |
| | County Parks: Glen Helen, Prado Basin, Cucamonga Guasti, and Yucaipa | Approximately 4,500 acres total<br>Camping, fishing, swimming and general day use |
| | City Parks: Cities of Chino, Chino Hills, Redlands, San Bernardino, Colton, Highland and Loma Linda | Various locations, facilities and acreages with mostly urban uses |
| | Rails to Trails<br>Upland and Fontana | |
| | Wildlands Conservancy Los Rios Rancho, Oak Glen | 6,000 acres of open space with hiking and outdoor educational facilities |
| **Riverside County** | County Parks: Hidden Valley Wildlife Area, Martha McLean-Anza Narrows, Rancho Jurupa, and Louis Rubidoux Nature Center | Hiking, bird watching, equestrian, camping, and outdoor education |
| | City Parks: City of Riverside, Norco River Trails, Mt. Rubidoux Park, Fairmount Park, and Butterfield | Various locations, facilities and acreages with mostly urban uses |

**Table 5.9-2 Regional Recreational Resources by County (continued…)**

| County | Name and Location of Recreational Resource | Description of Resource and Available Activities |
|---|---|---|
| **Orange County** | County Parks: 3 regional parks along SART | |
| | City Parks: 9 City parks along SART | |
| | Burris Basin currently under development | |
| | Existing equestrian facilities: Rancho Del Rio and Singletree Farms | |
| | SART bikeway: 27 miles complete<br>Riding and hiking trail: 23 miles complete | |
| | Talbert Marsh | Multi-purpose trail on 25 acres.<br>Bird watching |
| | Upper Newport Bay State Ecological Reserve/Interpretive Center | Bird watching, outdoor education, biking, and walking |
| | Irvine Ranch Wildlands and Parks | Hiking, equestrian, outdoor education, and mountain biking |
| | Bolsa Chica Ecological Reserve<br>Bolsa Chica State Beach | 300 acres<br>Outdoor education, hiking, biking, bird watching, and camping |

## Regional Strengths, Threats and Weaknesses in Recreation

### *Physical*

One of the great strengths of the region is that each county is geographically distinct, providing a variety of recreational opportunities. However, this diversity in topography also creates some threats and challenges. The biggest threat to recreation in the region is arguably patterns of urban development. The upper portion of the watershed, in San Bernardino County, is mountainous and relatively less populated than other areas in the watershed. The lower valleys are more urban with a discernible pattern of higher density near the coast. However, recently, relatively lower land values inland have resulted in increasing urbanization in these areas. Open space is being converted at a rapid pace, reducing opportunities to establish large parks and natural recreational amenities. The result most likely will be the development of more urban parks, which will support more urban recreational activities.

The upper portion of the watershed, being mountainous, results in a diversity of activities associated with forested environments. These include skiing, camping, hiking, rock climbing, and fishing. The middle portion of the watershed is relatively flat, valley terrain and is more densely urbanized. Activities in these areas include walking, jogging, bike riding, and horseback riding. Also, activities associated with more urban environments such as organized team sports played on developed fields, are more common in these areas.

The proximity of the ocean in the lower parts of the watershed is a draw for outdoor recreation in Orange County. The beach provides recreational opportunities found nowhere else in the watershed.

This is a strength, in that unique activities are available, but also a weakness in that the area is heavily used and requires additional maintenance and management. Facilities require greater upkeep and the potential for conflicts among users is higher here than elsewhere.

The presence of the Prado Dam in the center of the watershed also creates some unique challenges and opportunities. The area behind the dam is a largely undisturbed wetland, habitat to a number of threatened and endangered bird species. Bird watching is popular in this area, but access is challenging. Additionally, the river below the dam has water year round, providing recreational opportunities such as boating and fishing. The river upstream of the dam is more intermittent and does not offer these same opportunities in the same way.

The presence of the SART and various State and regional parks adjacent to the river along its course provide a ready-made infrastructure on which to build future trail linkages. There are few recreational trails adjacent to water in Riverside and San Bernardino counties, but opportunities exist to develop recreational amenities at flood control facilities.

### *Institutional*

All counties and cities in the watershed have some type of park and recreation management agency in place. These agencies provide an existing framework from which to plan and implement future projects. Several working groups currently exist to address specific issues that also provide forums from which to collaborate. Additionally, many agencies have developed management plans for various parks and resources under their purview. For example, most cities have master plans that reference recreation along the river. A major institutional strength is that most of the agencies currently cooperate and maintain good working relationships with one another as they endeavor to build trails. Most cities in the watershed have completed or are in the process of completing some type of vision document for the Santa Ana River Trail within their jurisdictions. Sponsored mainly by the Wildlands Conservancy, these "blue ribbon" committees have assembled stakeholders in each city to craft a vision for recreation adjacent to the river. Each city will have a document that can be used to guide future recreational development.

Private institutions, such as the Wildlands Conservancy, located in San Bernardino County, provide key private support and involvement. The Wildlands Conservancy has provided critical and substantial funding and works effectively with government agencies to further outdoor recreational and educational programs. Other groups, such as the Crafton Hills, Yucaipa Valley, San Bernardino Mountains, and Riverside land conservancies are working with their own contacts and partners to acquire lands, build connecting trails, and encourage elected officials to make recreation and open space a priority. The SART Partnership, a relatively new collaboration between public and private entities in the watershed also has been effective in bringing about funding and planning in the watershed. In 2006, the three counties, SAWPA, and the Wildlands Conservancy signed a Memorandum of Understanding to form the SART Collaborative Partnership. This group brings political will to bear, and directs the agencies under its umbrella to coordinate, seek funding, and leverage resources to finish building the SART. This group has developed the first regionally adopted plan for completing the unfinished segments of the trail.

Many of the group's participants felt that lack of funding to implement management plans was a widespread problem. Much of the funding focused on non-native species removal, such as Arundo donax (giant cane). The group also expressed that funding was available for new park development, but not for maintenance and operations. Many expressed the need for acquiring lands to expand or build new facilities.

## Current Conservation Measures

There are several active, proposed and inactive conservation plans in the Santa Ana River Watershed. The following is a list of some of the current plans. There are large gaps between these plans in the watershed, including in Western Orange County and in San Bernardino County.

### Upper Santa Ana River Wash Land Management and Habitat Conservation Plan

The project is located in the eastern valley portion of San Bernardino County, mostly within the cities of Highland and Redlands, but also partially within county jurisdiction. The plan area is bounded by Greenspot Road to the north and east, Alabama street to the west, and the SAR Wash to the south. The purpose of the proposed project is to allow the continued use of land and mineral resources while maintaining the biological and hydrological resources of the planning area in an environmentally sensitive manner. The Wash Plan is intended to coordinate and manage the present and future activities in the wash that are part of multiple jurisdictions, each with different needs. The goal of the project is to balance the ground-disturbing activities of aggregate mining, recreational activities, water conservation, and other public services with quality, natural habitat for endangered, threatened and sensitive species (San Bernardino Valley, 2007).

### Western Riverside County Multiple Species Habitat Conservation Plan

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional Habitat Conservation Plan (HCP) focusing on the conservation of species and their associated habitats in Western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat-planning efforts in Southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. Large-scale HCP planning efforts have been completed in San Diego and Orange Counties, and a similar effort is under way in the Coachella Valley. The MSHCP will allow Riverside County and its cities to better control local land use decisions and maintain a strong economic climate in the region, while addressing the requirements of the State and Federal Endangered Species Acts.

Riverside County's population in 2000 was approximately 1.5 million people. Its population is expected to double by 2020, to reach approximately 3.5 million by 2030, and be approximately 4.5 million by 2040, according to forecasts by SCAG. This is nearly a 400% increase over the next 40 years. Most of Southern California's growth over the next 40 years is expected to occur in the Inland Empire (San Bernardino and Riverside Counties) (SCAG 2001).

Accommodating an increase in population of this magnitude will involve urbanizing thousands of acres of undeveloped land and result in significant conflicts with regulations protecting species and their habitats. Conflicts and delays will escalate costs for all development projects, uncoordinated mitigation efforts will fragment habitats, the region will miss opportunities to improve the quality of life, and economic development opportunities for the current and future residents of Riverside County also will not be realized.

The MSHCP plan area encompasses approximately 1.26 million acres (1,966 square miles). It includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. This HCP is one of the largest plans ever attempted. It covers multiple species and multiple habitats within a diverse landscape, from urban centers to undeveloped foothills and montane forests, all under multiple jurisdictions. It extends across many bioregions as well, including the Santa Ana Mountains, Riverside Lowlands, San Jacinto Foothills, San Jacinto Mountains, Agua Tibia Mountains, Desert Transition, and San Bernardino Mountains. It will provide a coordinated MSHCP Conservation Area and implementation program to preserve biological diversity and maintain the region's quality of life.

**Existing Reserves within the Western Riverside County MSHCP**

- Box Springs Reserve
- Bureau of Land Management Lands
- Cleveland National Forest
- Emerson Oaks Reserve
- Harford Springs Reserve
- Kabian Park
- Lake Mathews-Estelle Mountain Reserve
- Lake Perris Recreation Area
- Lake Skinner Recreation Area
- March Air Reserve Base Reserve Lands
- Metropolitan Water District Lands
- Mount San Jacinto Wilderness State Park
- Norton Younglove Reserve
- Orange County Water District Lands
- Prado Basin
- Riverside County Flood Control and Water
- Conservation District Lands
- San Bernardino National Forest
- San Diego Gas and Electric Lands
- San Jacinto Wildlife Refuge
- San Timoteo Creek State Park
- Santa Margarita Ecological Reserve
- Santa Rosa Plateau Nature Reserve
- Southern California Edison Lands
- Southwestern Riverside County Multi Species Reserve
- Sycamore Canyon Wilderness Park
- UC James San Jacinto Mountain Reserve

## Orange County Natural Communities Conservation Plan

The purpose of this project is to create a sub-regional multi-habitat-based HCP that balances resource protection with reasonable economic growth. This effort provided an opportunity to preserve coastal sage scrub and oak woodland habitats that have nearly disappeared from Southern California. The remote canyons of the 13,000-acre northern boundary, east of the City of Orange, are notable for "The

Sinks" area of Limestone Canyon, a huge, steep-walled sandstone ravine that resembles a mini-Grand Canyon. The land harbors some of Orange County's richest oak and sycamore woodlands, as well as

streams and springs laced with blackberries and monkey flowers and shared by animals of all sizes – from mountain lions to rare lizards. The ranch's 12,000-acre Weir, Gypsum and Fremont Canyons, adjacent to the Cleveland National Forest, are home to many native animals and plants. These include the rare Tecate cypress, found only in three other areas of California. The 14,000-acre southern boundary, with its hills, meadows, wooded canyons and sweeping views of the Pacific, connects Crystal Cove State Park and the Laguna Coast Wilderness Park. The Irvine Ranch Wildlands and Parks are home to bobcats, red-tailed hawks, coyotes, mule deer, meadowlarks, and an abundance of other wildlife (Nature Conservancy, 2008).

The Irvine Ranch Conservancy was established in 2005. It is a non-profit, non-advocacy organization, created to help care for the 50,000 acres of permanently protected wildlands and parks on the historic Irvine Ranch. The organization works with its partners to enhance the public's appreciation, understanding and connection to the land, while helping other landowners and managers with all aspects of stewardship. The Irvine Ranch Conservancy contributes its resources, expertise and energy to achieve the best possible balance of preservation and public participation. Nearly 50,000 acres of wildlands and parks have been designated as permanent open space on The Irvine Ranch. However, protecting the land is only the first step. Mediterranean ecosystems like these need extremely attentive stewardship. The rare plants, animals, and habitats found here are adapted to specialized conditions and need our long-term management to survive. The mission of the Irvine Ranch Conservancy is to make sure that these lands are cared for and enjoyed to the highest possible standards.

The wildlands of the North Ranch are connected to the Cleveland National Forest and are one of the few places where natural habitat ranges relatively unbroken from lowland scrub, grassland and oak woodlands up to higher altitude montane chaparral and conifers. The Venturan and Diegan associations of coastal sage scrub and native grasslands of Southern California are all critically endangered, and the Irvine Ranch Wildlands and Parks and adjacent wildlands offer one of the last, best places to protect these ecosystems and many of the species associated with them.

This area also is sufficiently large and continuous to support native ecosystems that still benefit from the presence of large predators such as mountain lion, coyote, golden eagle and bobcat. Their ecological role as top carnivores helps maintain a healthy and resilient ecosystem. The wildlands are some of the last and most extensive lower elevation habitat for these important predators. For all of these reasons, The Irvine Ranch Wildlands and Parks have been identified by The Nature Conservancy as one of the top 50 priority conservation landscapes in California.

Not only are these natural areas a globally important conservation priority, they are remarkably close to one of the world's largest urban regions. This offers an unparalleled opportunity for people to experience and enjoy these extraordinary native ecosystems in their own backyard, while enhancing understanding and support for their protection and stewardship (Irvine Ranch Conservancy, 2008).

*Existing Conservation Plans Western Riverside County MSHCP*

| Plan | Agency | Acres | Status |
|---|---|---|---|
| WRC MSHCP | WRC RCA | | Underway |
| Cleveland NF | USFS | | Completed |

| | **Total Acres:** | 54,000 | |

### *Innovative Conservation Arrangements*

Restoring the river requires many partners, agencies and landowners. Some of the key agencies include the following. The Corps has provided major funding through mitigation requirements and permits the wetland activities under Section 404 of the Clean Water Act. EPA receives, administers, and has distributed funds earmarked for this program through the efforts of Congressman Calvert and others. The CDFW permits the wetland activities under Section 1601 of the Fish and Game Code, has directed mitigation funds to SAWA, and contributes expertise to deal with some of the resource issues. The USFWS oversees and must approve activities that could affect wetland resources and endangered species. The RWQCB approves activities that could affect water quality and provides oversight of the recognized beneficial uses of the wetland resources. OCWD, which is responsible for managing water resources and providing water to more than two million Orange County residents, has provided major funding, provides personnel to manage wetlands and endangered species, and manages 2,400 acres near the middle of the river in the Prado Basin, attempting to maximize wildlife resources. The county flood control agencies maintain sections of the river for flood conveyance, cooperate toward achieving mutual goals, and issue entry permits.

Other programs include the Federal Safe Harbor Policy, which protects the ability of landowners to use their land responsibly in exchange for the setting aside of large land parcels for conservation of specific threatened or endangered species.

## Opportunities for Improvement

As the watershed has been developed over the past two centuries, many water-oriented habitats have been altered by man. Where water-oriented habitats have been reduced, the flora and fauna have adapted, moved or disappeared. Through the OWOW process, stakeholders will investigate how to successfully manage water-oriented habitats while ensuring adequate public water supply, protecting water quality, and providing housing and commerce for a growing population.

The following is a list of issues/challenges, followed by a brief discussion of potential approaches that take advantage of opportunities for improvement.

### *Create managed system and restoration targets*

A plan for sustainable management of conservation areas with targeted restoration efforts is essential for preventing further deterioration of habitat. Consideration for characteristics of each of the main

habitat types:  alluvial fan; riparian, wetland and coastal and their specific ecosystems, will require habitat specific management plans and restoration criteria.

Potential Approaches:

- Develop a map of the watershed reflecting all the water-oriented habitat areas as described in this chapter
- Develop a landownership database along riparian corridors
- Work with landowners to manage habitat more effectively and provide "assistance agreements"
- Develop an urban habitat management model that softens/blurs the transition from urban development to surrounding habitat areas, and allows urban gardens and green space to be used safely/responsibly by wildlife based in the habitat areas
- Partner with transportation agencies to minimize fragmentation and incorporate wildlife crossings
- Incorporate vector control efforts into habitat management efforts to avoid conflicting activities
- Consolidate the various "vision plans" by various agencies regarding water-oriented habitat conservation

The region's favorable climate and historically high employment rate make the region prime for development and urban growth, and it is expected to remain so in the future. This produces a great deal of pressure on water-oriented habitat. To address these pressures, this Plan recommends that the development community consider water-oriented habitats early in the development planning process.
Potential Approaches:

- Analyze the economic value of environmental and habitat enhancement to new and existing communities
- Identify early what general and specific areas should be preserved at full build-out of the Watershed rather than identifying them after landowners have prepared development plans (the latter approach can result in inequitable, piecemeal conservation efforts)
- Incorporate water-oriented habitat conservation into land use planning in a manner that provides a return on investment while protecting the environment
- Modify the State tax structure to encourage conservation
- Facilitate cooperation among regulators and private landowners to prioritize lands that could be purchased and set aside as public lands
- Identify funding sources for such purchases or facilitate development agreements that transfer such lands to public agencies for future management
- Consider the natural configuration of water-oriented habitat that does not recognize political jurisdictional boundaries. A regional coordination effort is needed to provide consistent planning and regulation across multiple jurisdictions

### *Create Sustainable wildlife corridors and expansion of restored areas*

Creating sustainable wildlife corridors will require land use planning coordinated across jurisdictional boundaries.  Cooperation also must take place among all of the current regional conservation plans, mitigation providers, resource conservation districts, and non-profit conservation organizations.

Potential Approaches:

- Facilitate legislation to simplify landowner habitat conservation programs
- Develop an inventory of existing mitigation lands
- Develop a Watershed-wide, water-oriented habitat conservation program
- Create mitigation banks to "pool" smaller mitigation requirements to enable the creation of larger, more beneficial habitat mitigation projects
- Work with private landowners to manage habitat more effectively, provide "assistance agreements" that help those landowners manage their lands partnership, and management education
- Build on successes of the Western Riverside County MSHCP and other similar efforts to expand conservation opportunities

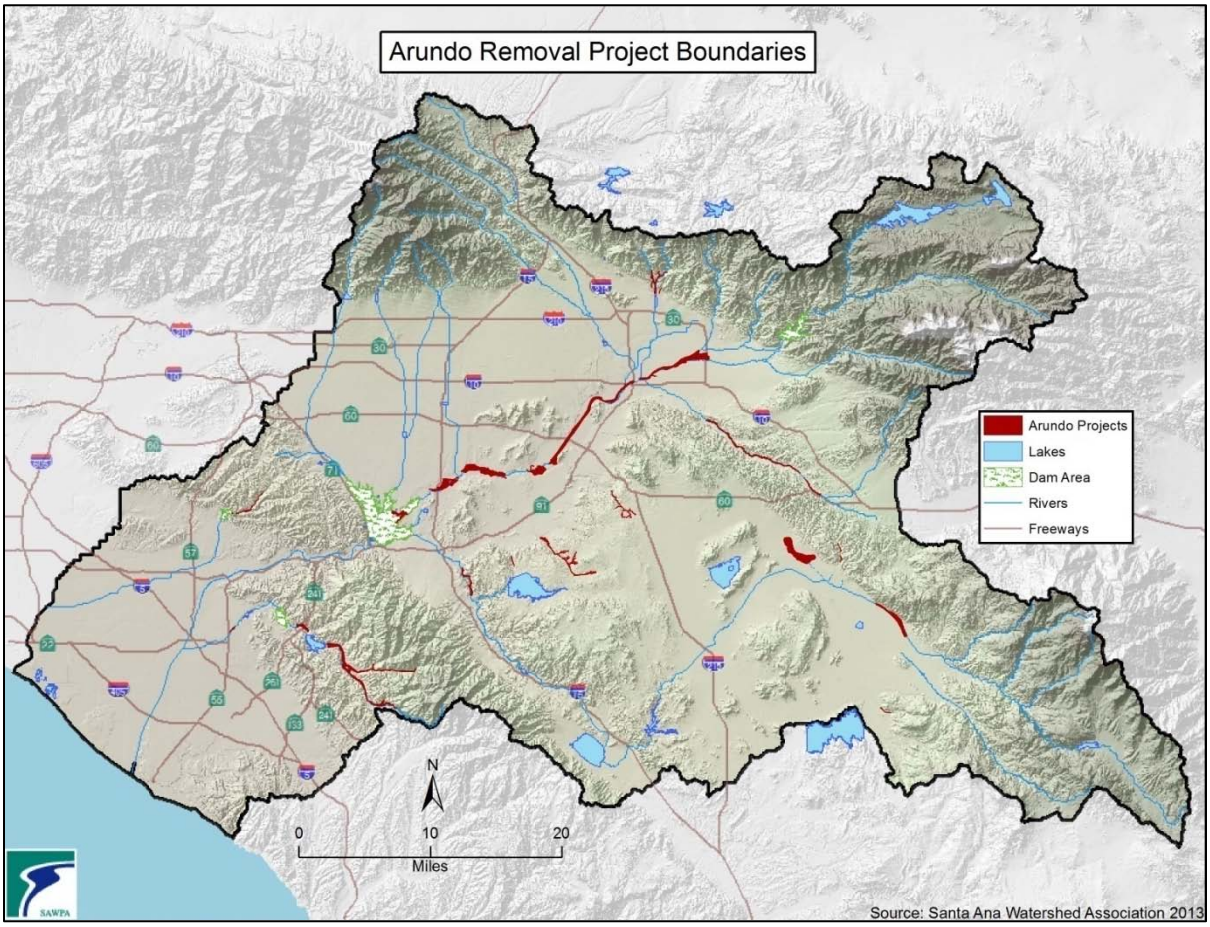
### *Provide sustainable funding sources for ongoing maintenance of conservation areas*

Over the past few decades, development interests, regulators and environmental groups have worked together to encourage habitat conservation and enhancement while allowing for reasonable land development. Such efforts include Natural Community Conservation Plans and HCPs. These programs have provided large conservation areas to accommodate large developments, but have taken years and large financial commitments to develop and implement. Despite significant bond funding in recent years, there still is a shortage of funding available in both the private and public sectors to purchase, operate, and maintain valuable habitat areas.

Challenges to the effort to restore areas of the mainstem include an in-lieu fee program and other mitigation program regulations that insist on long-term protections such as conservation easements, fee-title ownership, and real estate instruments over all areas where removal and restoration occur. This is not feasible in many places along the Santa Ana River because these lands are controlled by flood control agencies, parks districts, cities, counties, and the Army Corps itself. However, other long-term agreements need to be made among these agencies and organizations whose missions include invasive removal and native habitat restoration. Public and private landowners with ownership and jurisdiction over these areas need to work with mitigation providers, such as non-profit organizations, conservation authorities and resource conservation districts to develop long-term protection agreements that will satisfy the requirements of the Army Corps of Engineers, the California Department of Fish and Wildlife, the US Fish and Wildlife Service, and the Regional Water Quality Control Board.

The Integrated Regional Watershed Management Plan should include consensus among all agencies and organizations with ownership/stewardship over areas of the Santa Ana River mainstem and tributaries that provide for long-term protection of areas where habitat restoration efforts are occurring or need to occur. This kind of cooperative agreement will be critical to the ability of governmental and non-profit organizations to secure mitigation funding to do the necessary habitat restoration work needed in the watershed. Without such agreements, the fragmentation of restored habitat in the watershed will continue to be a problem.

Potential Approaches:



- Research and develop innovative funding arrangements to buy high priority, water-oriented conservation lands, construct needed improvements for appropriate public access, and fund on-going operation and maintenance of those lands
- Create cooperative agreements among public landowners and organizations that conduct long-term maintenance of habitat areas that provide reasonable protections in perpetuity for ongoing restoration

### *Invasive species eradication and maintenance funding*

Restoring the river requires many partners, agencies and landowners. Some of the key agencies include the following. The Army Corps of engineers has provided major funding through mitigation requirements and permits the wetland activities under Section 404 of the Clean Water Act. EPA receives, administers, and has distributed funds earmarked for habitat program. The CDFW permits the wetland activities under Section 1601 of the Fish and Game Code, and has directed mitigation funds to mitigation providers, and contributes expertise to deal with some of the resource issues. The USFWS oversees and must approve activities that could affect wetland resources and endangered species. The RWQCB approves activities that could affect water quality and provides oversight of the recognized beneficial uses of the wetland resources. The county flood control agencies maintain sections of the river for flood conveyance, cooperate toward achieving mutual goals, and issue entry permits. OCWD, which is responsible for managing water resources and providing water to more than two million Orange County residents, has provided major funding for habitat restoration throughout the watershed, provides personnel to manage wetlands and endangered species, and manages 2,400 acres near the middle of the river in the Prado Basin, attempting to maximize wildlife resources.

The historical and current sources of habitat restoration funding include developer fees directed by the Army Corps to in-lieu fee mitigation providers. Outside of in-lieu fee mitigation, the CDFW and the RWQCB order mitigation measures that result in developer fees that that are directed to non-profit and governmental mitigation providers and conservation organizations. Grant and bond funding in the watershed also have funded the removal of thousands of acres of invasive plants, initial and ongoing restoration of habitat areas, biological monitoring of sensitive species, and conservation of habitat areas. The image below, **Figure 5.9-4,** illustrates the multiple areas affected by the Arundo Donax.

**Figure 5.9-4 Arundo Donax Removal Areas**

All of these sources and more should continue to support restoration and ongoing maintenance. Access to such funding should be expanded to benefit the watershed. New, innovative partnerships should be developed to direct funding to habitat issues.

Potential Approaches:

- Create and update watershed-wide, public contact list of mitigation and conservation organization organizations, their capabilities and areas of expertise
- Create a regional grant opportunities network and clearinghouse to direct more funding to the watershed for restoration and public education
- Develop a wider range of in-lieu funding programs, habitat banks for water-oriented habitats throughout the watershed
- Create and encourage innovative public/private/non-profit partnerships and collaboration to improve opportunities for bringing grant funding to the watershed.

### *Habitat Restoration Projects*

Much of the remaining invasive plant biomass and areas that could benefit from Re-establishment activities (removal of invasive species followed by long-term, active planting and biological monitoring) in the watershed is on land owned by Federal, State, and local governments for purposes other than water-oriented habitat conservation. In many cases, these lands currently are left unmanaged or are managed in a manner that discourages the development of habitat. There are many unused portions of public lands that could be set aside for habitat enhancement without impacting the landowner's primary purpose. An example may be flood control channels and basins that could provide habitat while still providing critical flood protection.

Potential Approaches:

- Develop a public land database as a first step toward a more comprehensive, coordinated management plan
- Develop a regional plan for public land use
- Develop regional "safe harbor" type agreements that allow for long-term management of public lands for multiple uses including habitat conservation
- Coordinate wildlife management with local parks departments
- Provide expert assistance to public agency landowners to help them better understand how they can manage their lands for multiple purposes, especially short- or long-term habitat enhancement
- Partner with public utilities in utility corridors

### *Pollutant Trading Programs*

Constructed wetlands can be used to remove pollutants from surface runoff using natural processes. Formal pollutant trading programs provide the mechanism to pool funding from multiple, smaller sources to construct wetlands that would create habitat and increase the pollutant removal benefit.
Potential Approach:

- Develop formal pollutant trading programs that facilitate pooling of funds to construct wetlands

### *Create community involvement in habitat conservation and restoration*

As development moves into the arroyos and hillsides of the watershed, more people are living closer to valuable habitat. Unfortunately, not enough emphasis has been placed on developing a land ethic across the watershed, even among those residents who live directly adjacent to some of the watershed's richest habitats. There is a great deal of potential to improve the connection between people and local habitats. For instance, along the northeastern slope of the Santa Ana Mountains, stewardship groups could be formed among residents to care for the habitat and wildlife in the local canyons and forest water courses.

Some of the watershed's high quality, water-oriented habitats are near disadvantaged communities, where little attention has been paid to stewardship of the local resources. Developing local "ownership" of these habitats could benefit both the habitat and the community.
Potential Approaches:

- Develop a social marketing campaign, including opinion surveys to determine how to best enhance the people/habitat connection
- Develop community "ownership" of local water courses and wetlands by forming wetland societies or stewardship/"friend" groups
- Create educational centers near water-oriented habitat areas
- Provide educational tours of both local and regional water-oriented habitat areas
- Sponsor conferences that include outdoor seminars
- Produce/distribute wildlife habitat maps and make them available on-location and on the Internet
- Increase citizen science opportunities/involvement
- Increase access to high-quality habitat
- Provide field trips to elementary and high school students to increase watershed awareness

### *Sediment restored downstream of dams*

Sediment buildup behind Prado Dam is a problem for this Army Corps flood control and water retention facility because its capacity to store water is being continuously degraded by upstream sediment that has nowhere to go once it reaches the dam.

Water that is discharged from Prado Dam picks up existing sand and sediment below the dam and transports the material to the coast. Because Prado Dam is cutting off the replacement source of sediment, the River below Prado Dam is "sand starved." The lack of replenishment sand to the lower Santa Ana River will have significant negative impacts to groundwater recharge efforts in Orange County. Because sands are unable to get past Prado Dam, areas of the River below Prado Dam have started to armor. Riverbed armoring occurs when replenish sediments are restricted allowing the particle size distribution to change and the remaining sediment to become more densely packed, resulting in reduced permeability. This process severely impedes the recharge capacity of the river. The decreased flow of sediments downstream of Prado Dam also has affected natural habitats and decreased replenishment of beach sands. Multiple studies and field surveys have been performed to quantify the degradation of the Santa Ana River Channel below Prado Dam.

OCWD has proposed its "Prado Basin Sediment Management Demonstration Project." The purpose of this project is to demonstrate the feasibility of taking on a long-term sediment management plan for the basin. The Corps is also currently engaged in development in a feasibility study for ecosystem restoration throughout the Prado Basin.

### *Creating MSHCPs and RCDs in areas that are currently not covered*

There are several areas of the watershed where special conservation districts and formal habitat conservation plans do not exist that could benefit from their establishment.

A regional multi-species habitat conservation plan is needed for the more populated areas of San Bernardino County. There have been several efforts in specific places, but there is no MSHCP covering the quickly growing southwestern San Bernardino County region. Western Orange County also has not been covered by an MSHCP.

In addition to the positive effects of habitat conservation plans, resource conservation districts (RCDs) provide valuable services that preserve and restore habitat, and help landowners protect and enhance habitat on their properties. There currently is no Resource Conservation District in Orange County. Other resource conservation districts (including Inland Empire RCD, in conjunction with SAWA) in the watershed have conducted habitat restoration work in Orange County, but this requires special permission from the Local Agency Formation Commission (LAFCO) to allow them to work outside of their district boundaries. Orange County has a unique mix of habitat that includes forest, chaparral, riparian, coastal sage scrub, marsh and open ocean, and could benefit greatly from the formation of an RCD to serve the area.

## Project Proposals

Two of the most immediate needs in the Santa Ana River watershed in natural resources preservation and protection are Arundo removal and wildlife connections. **Table 5.9-3** shows two concepts from the Natural Resources Stewardship Pillar Implementation Concept Projects table.

**Table 5.9-3 Natural Resources Stewardship Pillar Implementation Concept Project**

| Project Title | | Project Concept |
|---|---|---|
| NR2 | Establish sustainable wildlife corridors and expansion of restored areas | Creating sustainable wildlife corridors will require land use planning coordinated across jurisdictional boundaries. Cooperation also must take place among all of the current regional conservation plans, mitigation providers, resource conservation districts and non-profit conservation organizations. |
| NR4 | Project that provides invasive species eradication and maintenance funding | All of these sources and more should continue to support restoration and ongoing maintenance. Access to such funding should be expanded to benefit the watershed. New, innovative partnerships should be developed to direct funding to habitat issues. |

These two projects would occur along the mainstem of the Santa Ana River, but would have far-reaching positive effects for habitat restoration, recreation, wildlife movement, disadvantaged communities and water retention.

### *NR2—Project to Create Sustainable Wildlife Linkages and Expand Restored Areas*

There are several areas in the Santa Ana River Watershed that have been identified by regulatory agencies and conservation groups as vital linkages that need to be preserved for movement of wildlife and species diversity. Most of these areas preserve a link among natural habitats from the San Diego County Mountains and deserts, through southwestern Riverside County, through the Santa Ana Mountains and Cleveland National Forest, and then n across the Santa Ana Canyon through to Chino Hills State Park and the Prado Basin, and the rest of the Santa Ana River upstream. Of course the linkages work in the other direction as well.

Significant chokepoints in these wildlife movement linkages are created in the watershed by roadways, especially Interstate 15 in the Temecula area, the 241 Toll Road in Orange County, and the 91 Freeway in the Santa Ana Canyon adjacent to the river.

The biggest challenge to such a project is providing a large enough crossing with the right characteristics to encourage crossings by everything from the smallest insects to the largest mammals. In a study published in *Biological Conservation* titled, "Use of highway undercrossings by wildlife in Southern California," the authors wrote the following regarding wildlife crossings: "Our results show that while many native animals used passages beneath highways, the presence of suitable habitat on either side of the passage was a particularly important factor for predicting use." The study also found that size of the passage was important especially with large carnivores and deer. The study authors recommended the following: "To increase the likelihood of utilization and to help prevent animals from crossing road surfaces, we suggest that simple improvements, such as habitat restoration near crossing points and animal-proof fencing that serves to funnel wildlife to passages, can facilitate animal movement between fragmented habitats that are bisected by roads." (Ng, et al 2003)

The 91 Freeway in the Santa Ana Canyon provides a significant barrier to wildlife movement, especially large mammals, including carnivores such as bobcats, coyotes and mountain lions. At B Canyon in Riverside County adjacent to the upstream edge of the Green Valley Golf Club, the freeway creates a barrier between two of the Riverside County MSCHP's major habitat areas—Existing Core A (Prado Basin/Santa Ana River) and Existing Core B (Cleveland National Forest). In the Plan, this is known as Constrained Linkage 1. The Plan recommends creating an adequate wildlife underpass or overpass at this location. Plans have been submitted by the Riverside County Transportation Commission to enlarge a culvert under the freeway to improve movement of wildlife. However, further measures are needed to improve this linkage for the future.

In the Santa Ana Canyon outside of the MSHCP area, the 91 Freeway also constrains the linkage between the Cleveland National Forest and Chino Hills State Park, most notably at Coal Canyon. The corridor under the freeway was never vegetated and mountain lions are no longer using it, although historical use of this linkage is well documented. Currently, there is a considerable amount of construction taking place in this area, which also is hampering animal movement

Suggested solutions include re-vegetating the Coal Canyon ramp undercrossing and improving oak-riparian structure coming down the drainage that leads to the large culvert there to enhance the likelihood that certain wildlife, including mountain lions, would even approach the crossing. Other solutions include keeping the culvert clear of heavy sediment but with a sandy or dirt floor, cutting light and noise impacts at the crossing with sound walls or other measures, moving Caltrans and other equipment and construction-related activities to other locations, and improving some of the fencing around this area.

We recommend a project that would begin with a study of the current mitigation and construction measures taking place in these areas, determine what is lacking in planning and funding, and then

develop a plan to create crossings that meet criteria for successful crossing sites. Implementation would include crossing construction, funnel fencing construction, initial and ongoing habitat restoration, mitigation of lighting and noise effects, and landscaping and monitoring. Partners could include the Western Riverside Regional Conservation Authority, the Army Corps of Engineers, Caltrans, Riverside County Transportation Commission, Santa Ana Watershed Association, Riverside-Corona Resource Conservation District, and the counties of Orange and Riverside.

### *NR4—Project to Eradicate Invasive Species and Provide Native Habitat*

As noted earlier, Arundo has been nearly completely eradicated in the upper Santa Ana River watershed upstream from Riverside, and the San Bernardino National Forest also has projects focused on Arundo removal. There are also several ongoing invasive-removal and maintenance operations in Norco, Eastvale, and in the Prado Basin. These downstream projects are in constant danger of re-infestation because of scattered, large Arundo infestations on the Riverside area of the mainstem in the area between the Mission Bridge and the Goose Creek Golf Course.

Within this stretch of the mainstem, there are significant "gaps" where Arundo is present and presents a threat of re-infesting downstream areas that have been cleared by the Army Corps, SAWA, the resource conservation districts and OCWD. However, the area also contains several large eradication and restoration projects managed by the Santa Ana Watershed Association and Riverside County Parks and Open Space District totaling nearly 1,500 acres. In the middle of this stretch of the river is Hidden Valley Wildlife Area, where SAWA has been eradicating approximately 775 acres of invasive plants over an approximately 1,000-acre project area since 2008 with Proposition 50 funding. In 2013, active planting and restoration has occurred on some of the more bare areas of the project. In 2014, the Proposition 50 grant will expire and other funding will be needed to keep this area under control and in active restoration. Riverside County Parks also is working to remove Arundo on its own property.

Funding for removal and restoration of these "Arundo gaps" in the Riverside area of the Santa Ana River mainstem will result in a more systematic removal of Arundo from the watershed, and remediate some of the problems mentioned earlier in this chapter of spotty conservation areas and fragmented management of natural resources. Removing these large areas of Arundo also returns a significant amount of water to the river every year because of the plant's rapid growth and heavy water use compared to native vegetation. The removal of Arundo and restoration of native habitat also provide benefits to sensitive species including the least Bell's vireo, the southwestern willow flycatcher, and the Santa Ana sucker.

Potential partners in this project could include Riverside County Flood Control and Water Conservation District, Riverside County Parks and Open Space District, California Department of Fish and Wildlife, the Inland Empire Resource Conservation District, Riverside-Corona Resource Conservation District, the City of Riverside, and the City of Jurupa Valley.

## Summary

One of the greatest questions for the future of habitat restoration in the Santa Ana River Watershed is future hydrology. As conservation and reclamation efforts grow within water and sanitation districts

and the Regional Water Quality Control Board seeks to eliminate urban runoff, areas that currently experience year-round flows may become dry. This will have an adverse effect on native vegetation and native fishes, birds and other wildlife. In addition, the effects of climate change on watershed hydrology are uncertain. In the face of these challenges, maintaining current flows or restoring natural stream flows may be problematic and expensive.

There are many opportunities for improving habitat in the Santa Ana Watershed, and there are numerous benefits for wildlife and people. However, the current fragmented management of habitat is one of the greatest barriers to success. Restoring and maintaining valuable habitat throughout the watershed will require a "big tent" approach that involves all of the stakeholders in the watershed. One Water, One Watershed is an example of the kind of effort that is needed to bring all of the elements and organizations together.

# 5.10 Operational Efficiency and Water Transfer

## Introduction

The water management in California has always been a critical element for the State's economic growth over the last two decades. California Department of Water Resources (DWR) has worked extensively on the concept of Integrated Regional Water Management (IRWM) planning to encourage the development of comprehensive water resources management plans throughout the state. Using water efficiently, improving water quality and reliability, and integrating environmental stewardship are not new concepts to the regional water agencies within the Santa Ana River (SAR) Watershed and the Santa Ana Watershed Project Authority (SAWPA). Within the SAR Watershed there are over 100 large and small water districts: local, regional, state and federal agencies, and public/private stakeholders. These agencies have developed strategies such as water use efficiency, water recycling, groundwater storage and conjunctive use, urban runoff management, and water budget based rate billing structures to enhance their comprehensive water resources management plans. Through One Water One Watershed (OWOW) planning process, the Operational Efficiency and Water Transfers Pillar worked together to discuss the integrated regional projects that could be implemented for the future.

The purpose of this report is to explore the strategies that have already been defined within the SAR watershed, and ascertain potential region-wide operational efficiency and water transfer concepts that can be developed by cooperative strategic planning effort among different agencies. Such concepts can benefit from integration of different resources, facilities, and capabilities that currently exist to achieve a higher operational efficiency within the SAR Watershed. The goal of the report is to provide operational efficiency and water transfer concepts that can be developed utilizing elements within

different water resources plans prepared by various agencies and others in support of the OWOW program. To achieve this goal, the report provides an overview of water resources conditions at the State and regional level and offers assessment matrixes based on different strategic documents prepared by stakeholders within different geographical regions of the SAR Watershed. In addition, the report provides preliminary water transfer concepts, and potential implementation procedures that can be used to enhance the water resources reliability and operational efficiency within the SAR Watershed.

The report provides a common foundation that frames the potential imbalances that may be faced in the future and potential concepts that may be considered to resolve those imbalances.

## Water Resources Management Activities at the State Level

This section reviews major planning activities and goals that are being implemented and/or considered at the state level. These goals play an important role in the objectives set by the regional and local water resources leaders in the SAR Watershed area.

### California Water Plan

The California Water Plan (CWP) has always been a valuable source of information for water planners since 1957. In the early years, these plans were primarily produced by DWR. However, for the 2009 CWP Update the DWR formed an interagency steering committee representing over 20 agencies and a 45-member advisory committee to better integrate regional water management activities into the State water and flood management planning.

By law, the CWP documents are required to be published every five years. The purpose of the CWP is to provide regional, local, tribal, state, and federal governments and organizations a strategic planning forum to collaboratively identify short-term and long-term actions that would help sustain California's water resources, and to prepare response plans for catastrophic events that would threaten the livelihood of the people of California.

These reports have evolved from statistical summaries of water supply and demand to expert analyses of complex hydrology, water use, conservation, and emerging trends issues in water resource management, flood safety and climate change adaptation. The CWP provides strategic recommendations to guide future state investments and the direction of resource management policies.

The 2009 Water Plan Update implementation plan identifies 13 objectives that could provide more sustainable water and flood systems given the changing climate and other uncertainties and risks throughout the state. Some of these objectives such as setting co-equal goals for the ecosystem and reliable water supply by managing a sustainable California Delta are site specific, but many of the objectives mentioned requiring regional implementation for their success. The following implementation objectives mentioned by the CWP are also considered by several regional agencies within the SAR watershed as part of their strategy for a more adaptive and resilient water resources management system.

- Integrated Regional Water Management – improve and expand IRWM to create and build on partnerships that are essential for sustainable watershed management, and would increase regional self-sufficiency
- Use Water More Efficiently – use greater water conservation, recycling, and reuse to help meet future water demands and adapt to climate change
- Expand Conjunctive Management of Multiple Supplies –use existing and new surface and import water with groundwater storage to prepare for droughts, and climate change
- Protect Surface Water and Groundwater Quality – protect and restore water quality for public health and beneficial use of state's water supplies
- Reduce Energy Consumption of Water Systems and Uses – reduce the energy consumption of water and wastewater systems by implementing water related strategies

The 2009 CP Update was published in March 2009 right before passage of a historic water legislation package by the California State Legislature in November of 2009. The SAWPA member agencies strategies focusing on the above mentioned objectives are reviewed in Section 4 of this report.

## Climate Change

In December 2009, the U.S. Environmental Protection Agency (EPA) issued findings that greenhouse gas (GHG) emissions is a threat to public health. As a result, responding to climate change remains a priority in both Houses and Senate; and increases the likelihood of federal regulatory action. Legislative and regulatory actions will exacerbate the existing water management challenges confronting regional agencies in the watershed. Possible consequences of climate change include:

- More frequent drought periods
- Changes in runoff patterns from the Sierra Nevada
- Increased flooding intensity, as well as impacts to the operations of the State's surface water storage facilities

Higher temperatures in the Sierras will result in earlier and more rapid runoff of snowmelt and less storage ability. The DWR is projecting that the California snowpack will decline by 25 to 40 percent by 2050 and significantly reduce the amount of water that is stored for use during the summer and fall. Decreased energy production through hydropower is also a concern. In addition, population growth will result in an increased demand for water in California. Inadequate storage and increased growth will significantly impact water supply reliability within the State, and the Santa Ana River Watershed.

Regional temperature increases and precipitation variability would likely reduce flows in local streams which would reduce groundwater recharge and impact sources of water supply; increase storm intensity and flooding; increase erosion and related water quality problems; and impact on wildlife habitat. Furthermore, the implications of global sea level rise would increase sea-water intrusion into groundwater supplies and infrastructure damage in the coastal communities. In general, the watershed

should plan for reduced water supply availability, higher costs for water, and lower environmental quality.

While climate change projections at regional scale are undergoing constant refinement, the science, the causes, and extent of climate change will continue to be debated, water agencies within the watershed must position themselves to protect and promote their constituents' interests. SAWPA highlighted the water supply reliability challenges by state droughts, droughts on the Colorado River, and the threat of climate change in its OWOW planning process and helped the regional agencies to work together to address these challenges.

## Bay-Delta Conservation Plan

The Bay-Delta Conservation Plan (BDCP) is being prepared through a collaboration of state, federal, and local water agencies, environmental organizations, and other interested parties. These organizations have formed the BDCP Steering Committee. The BDCP will identify a set of water flow reliability and habitat restoration actions that could contribute to the recovery of endangered and sensitive species and their habitats. The goal of the BDCP is to provide for the Sacramento-San Joaquin River Bay-Delta (Delta) species/habitat protection and to improve reliability of water supplies.

As the BDCP evaluates habitat, physical and operational alternatives necessary to restore the Delta ecosystem while providing water supply reliability, state and federal agencies are developing a joint Environmental Impact Report/Statement (EIR/EIS) under the Delta Habitat Conservation and Conveyance Program (DHCCP). The EIR/EIS will determine the potential environmental impacts of the proposed BDCP.

Lead agencies for the EIR/EIS are the California Department of Water Resources, the Bureau of Reclamation, the U.S. Fish and Wildlife Service, and National Oceanic and Atmospheric Administration's National Marine Fisheries Service, in cooperation with the California Department of Fish and Game, the EPA and the U.S. Army Corps of Engineers (ACoE).

The BDCP is being developed in compliance with the Federal Endangered Species Act (ESA) and the California Natural Communities Conservation Planning Act (NCCPA). When completed, the BDCP would provide the basis for the issuance of endangered species permits for the operation of the state and federal water projects. The BDCP would be implemented over the next 50 years.

The OWOW planning effort highlighted the vulnerability of the Delta and helped the regional agencies to address some of the challenges related to this threat.

## Urban Water Management Planning

The State of California requires urban water suppliers that either provide over 3,000 acre-feet of water annually or have more than 3,000 connections to prepare Urban Water Management Plans (UWMP) in support of their long-term resource planning. The UWMP identifies different water supply sources that are available to meet existing and future water demands over a 20-year planning horizon considering

normal, dry, and multiple dry years. The UWMPs are prepared every 5 years and submitted to DWR to make sure the plans meet the requirements identified in the Urban Water Management Planning Act (Division 6 Part 2.6 of the Water Code §10610 - 10656). The Act requires the urban water supply agencies to describe their Demand Management Measures (DMM) in their UWMPs. These DMMs are the same as the California Urban Water Conservation Council (CUWCC) Best Management Practices (described in Section 2.5).

The requirement that all urban retail water suppliers quantify per capita baseline water use, set water use targets, and then show actual reductions in 2015 and 2020 has caused suppliers throughout the watershed to pay particularly close attention to the effectiveness of their water conservation programs.

The water suppliers within the Santa Ana River Watershed prepare UWMPs in support of long-term resource planning in their respective geographic area. Also, as part of the OWOW process, SAWPA took the initiative to highlight the challenges of population growth in the watershed and how this growth can be sustained based on the UWMPs prepared by the water suppliers in the region.

## Water Use Efficiency

The CCUWCC was created to increase efficient water use throughout the state by forming partnerships among urban water agencies, public interest organizations, and private industry. Some 400 water agencies and environmental groups have signed a Memorandum of Understanding (MOU) voluntarily pledging to implement a series of Best Management Practices (BMP) within a reasonable time frame. Water agencies that became signatories to the CUWCC MOU pledge to implement the BMPs to specified levels and to report progress on their BMP implementation biannually to the CUWCC.

In order to be eligible for grant or loan funding from the State of California, an urban water supplier, whether a signatory to the CUWCC MOU or not, must demonstrate that it's efforts in implementing each DMM or BMP will be implemented at the coverage level determined by the CUWCC MOU.

Only the BMPs that are cost-effective for the water supplier need to be implemented; and successful implementation of all BMPs and credit for actively participating in the CUWCC process need not be a "complete" implementation of all BMPs.

The CUWCC maintains a self-reporting database on the status of BMP implementation by MOU participants. This information includes results of each BMP, the money invested in each BMP, and the estimated water savings for each of those measures by each participant.

The Water Conservation Act of 2009 (Senate Bill Number 7 of the 7th Extraordinary session - SBX 7-7) was enacted by the California legislature in November 2009. This Act sets an overall goal of reducing per capita urban water use statewide by 20 percent by December 31, 2020 and requires the urban water suppliers to report the 20 percent by 2020 water use reduction goals in their UWMPs. The UWMP documents were one of the most pertinent documents reviewed and used to develop the matrix in Section 5.

The SBX 7-7 legislation also directed DWR to address the following urban water use efficiency issues:

- Convene a task force to investigate alternative best management practices for the commercial, industrial and institutional sectors
- Establish a standardized water use reporting form
- Promote regional water resource management through increased incentives and decreased barriers
- Develop statewide targets for regional water management practices like recycled water, brackish groundwater, desalination and urban stormwater infiltration and direct use

Increasing the supply of water has the same effect on water availability as decreasing the demand for water (through increased efficiency). However, engineered methods for increasing supply, such as building new dams for surface storage, or increasing water exports from the Delta, are becoming less certain as California moves into the future. Many water suppliers are turning to other strategies, such as improving efficiency, to meet increasing demand. As the costs for engineered water supply options go up, even the most expensive conservation strategies are becoming economically viable.

The 2020 state population is expected to be in the range of 44 million people and a decrease in per capita water use of 20 percent will equate to an annual demand reduction of 2 million acre-feet of water.

Many of the water suppliers within the Santa Ana River Watershed are signatories to the CUWCC MOU and evaluate their BMPs when developing their water resources strategies. Need for a collaborative approach amongst the watershed stakeholders to help meet long term goals of water use efficiency is part of the OWOW process.

## Regional Water Resources Management Activities

This section reviews major operational efficiencies and water transfer activities in support of the state goals that are being implemented and/or considered at the regional level by Metropolitan Water District of Southern California (MWD), and SAWPA. These integrated activities play an important role in the objectives set by SAWPA member agencies in their respective region, and local water resources leaders in their respective regions/areas.

### MWD Integrated Resources Plan

The MWD Integrated Resources Plan (IRP) is the long-term water resources strategy for MWD's six-county service area. The MWD IRP is the blueprint that guides MWD's efforts to increase water supplies and lower demands through 2035. MWD's first IRP was developed in 1996 and updated in 2004.

The MWD's 2009 IRP was prepared as part of MWD's normal five-year planning cycle. The major update on this IRP is addressing changing water supply conditions and the unprecedented series of challenges and uncertainties facing the Southern California region. These uncertainties include Delta and Colorado River water supply restrictions, climate change, continued population growth, emerging water quality

issues and rising energy costs. These challenges require new approaches by MWD, its member agencies, and other regional stakeholders.

MWD member agencies, including the regional stakeholders in the SAR Watershed actively participated in the preparation of the 2009 IRP through Regional Workshops, Technical Oversight Committee and Technical Workgroups. The MWD IRP provided recommendations with respect to six resource areas: groundwater, recycled water, conservation, stormwater/urban runoff, graywater and seawater desalination.

## MWD Water Supply Allocation Plan

In 2007, MWD was concerned about many water supply challenges in its service area as a result of:

- Critically dry conditions in the State Water Project (SWP) systems
- A ruling in the Federal Courts in August 2007 provided protective measures for the Delta Smelt in the Sacramento-San Joaquin River Delta

These challenges brought uncertainty about future pumping operations from the SWP and raised the possibility that MWD would not have access to the supplies necessary to meet total demands in Southern California, and would have to allocate shortages in supplies to its member agencies. It is important to note that MWD's SWP supply contract with DWR prohibits importing SWP water into MWD's service area without MWD's consent; therefore, transfers of SWP water originating outside of MWD's service area are subject to approval and agreement with MWD.

In preparing for any potential shortages, MWD developed a Water Supply Allocation Plan (WSAP). The WSAP calculates each of the MWD's member agency supply allocations and identifies the key implementation elements needed for administering an allocation should a shortage occur. The WSAP is used by the MWD's member agencies for the urban water shortage contingency analysis that is required under Water Code Section 10632 and is incorporated into MWD's Regional Urban Water Management Plan (RUWMP).

In February of 2009 Governor Schwarzenegger proclaimed a statewide water shortage emergency when California was in its third consecutive year of drought. At the time, the SWP Table A allocation was at 20 percent and the MWD Board saw it appropriate to implement the WSAP and allocated water to its member agencies effective July 1, 2009. Because of the supply impacts from the recent drought conditions and Bay-Delta operational constraints, deliveries of the discounted water at the replenishment rate were suspended in 2007. MWD is currently working with its member agencies on potential long-term revisions of the Replenishment Water Program. The biggest issue causing MWD's rate increases is the loss of sales. Water sales are at record low as a result of many factors, including unemployment, foreclosures, extraordinary conservation, and the response to water rate increases. MWD water sales are at 1.73 MAF, compared to the usual sale of 2.3 MAF. Since 2007, MWD Tier 1 and Tier 2 rates have increased 69 percent and 86 percent, respectively. The Tier 2 water rate in 2013 is $997/AF.

The proclamation of the water shortage emergency by the Governor, the WSAP, discontinuation of the replenishment water program, and increased MWD water rates, were catalysts for the regional agencies within the SAR Watershed to take a closer look at their water supply reliability.

## Planning Work Group Effort within the Santa Ana Watershed

Since the early 1970's, SAWPA has played a key role in the development and update of the Basin Plan for the SAR Watershed. Several task forces have been formed to address complex technical and regulatory issues and resolve inter-Agency conflicts. These task forces generally include staff of the Santa Ana Regional Water Quality Control Board (RWQCB) as active members or advisors and other stakeholders.

SAWPA's Nitrogen/Total Dissolved Solids Task Force, which met between 1996 and 2003,included some 22 water supply and wastewater management agencies and RWQCB. SAWPA has led different Task Force activities and has completed multi-million dollar studies to review groundwater quality, groundwater sub-basin boundaries, waste load allocations, and other related studies within the SAR Watershed. Different Task Force efforts usually include development of more scientifically defensible data and acceptable projects for a sustainable Watershed.

SAWPA's Basin Monitoring Program Task Force (BMPTF) is another effort tasked with executing some of the monitoring and reporting commitments within the Watershed, such as a triennial compilation of ambient groundwater quality data and an annual report of Santa Ana River water quality. The BMPTF also updates the Santa Ana River Wasteload Allocation model used to evaluate different discharge scenarios and the impacts of the Santa Ana River flows on the Orange County groundwater.

Another SAWPA work group is the Emerging Constituents (EC) Task Force. In 2007, a workgroup of water agencies and Publicly Owned Treatment Works (POTWs) was formed to develop a characterization program for emerging constituents. In the early years of its formation, the work group evaluated water quality monitoring programs, regulatory issues, stakeholder concerns, analytical methods, and potential public health and environmental impacts. Later, the workgroup developed an EC Investigative Work Plan based on ongoing characterization studies and other related evaluations. This Work Plan was submitted to and approved by the RWQCB in December 2009 (Resolution No. R8-2009-0071). Thereafter, the workgroup was formalized as a task force of multiple agencies under a task force agreement and renamed the EC Program Task Force.

The Work Plan originally had identified nine ECs, increasing to 13 ECs in 2012 to be sampled, and required each participating POTW agency to sample and pay for its own analyses of these constituents. In 2013, the list was reduced to just the ECs mandated by the SWRCB Water Recycled Water Policy and transitioned to a triennial sampling program.

## Integrated Watershed Programming in the Santa Ana Watershed

Since its formation in 1968, SAWPA has been a leader in water resource planning for the SAR Watershed. SAWPA coordinated development of the first Santa Ana Integrated Watershed Program (IWP) document in 2002. This planning document identified seven major elements for a sustainable Watershed:

- Drought-proofing of the watershed by storing up to 1.3 million acre-feet (MAF) of new water
- Mitigating water quality impacts from the past activities
- Use water recycling as a major supply to reduce the area's overall need for imported water
- Develop flood protection along the main stem of the Santa Ana River
- Enhance wetlands and habitat to restore the Pacific Flyway
- Bring additional recreational opportunities and increase public awareness of the environmental needs
- Protect the long-term beneficial uses of the groundwater basins by using the Inland Empire Brine Line (IEBL) to carry saline wastes to the ocean

SAWPA has pursued the above elements based on the needs of its member agencies and other stakeholders within the watershed. The success of the SAWPA's planning efforts have provided the watershed with $389 million of different grant funding, including $250 million of Proposition 13, $25 million of Proposition 50, and $114 million of Proposition 84 grant funding. In 2005, SAWPA updated the IWP to include a summary of the many planning processes underway and priority projects of the stakeholders within the watershed. In early 2009, SAWPA completed a new integrated water management plan for the region known as OWOW. The vision of the OWOW Plan is a sustainable drought proofed and salt-balanced watershed with economic and environmental viability.

As part of OWOW process, SAWPA placed emphasis on building a collaborative approach amongst stakeholders to help meet long-term goals and objectives of the watershed in an integrated and multi-beneficial manner. Hence, the OWOW process includes a ten-member Steering Committee representing different interests throughout the Watershed. The Committee includes two representatives from the SAWPA Commission; three County Supervisors (one from each county); three mayors (one from each county); a business representative from the development community, and a representative from the environmental community. The Steering Committee developed the following working goals and objectives:

- Provide Reliable Water Supply
- Preserve and Enhance the Environment
- Promote Sustainable Water Solutions
- Ensure High Quality Water
- Provide Economically Effective Solutions
- Improve Regional Integration and Coordination
- Use Rainfall as a Resource
- Provide Recreational Opportunities

- Maintain Quality of Life

During the OWOW process, it was recognized that additional projects implemented as a result of different grant funding has closed the gap between supply and demand and increasing emphasis should be placed on water use efficiency and development of local supplies.

With as much as 60 percent of household water consumption going toward outdoor usage, there is a growing need to provide effective programs targeting outdoor landscaping.

While water recycling is an important local supply for the watershed's sustainable future, challenges related to recycled water projects are varied and range from regulatory issues, ability to handle storage/seasonal variability, water quality impacts, salinity management to public acceptance, perception, and other policy issues.

The OWOW planning process has created greater partnerships, funding opportunities, connectivity, and increased awareness of planning projects in all the communities within the watershed. A collaborative process that results in multifunction, multi-benefit projects will ultimately reduce the cost to the taxpayer and increase the efficiency of local agencies. The idea of meeting a number of community needs with a single project is not new; however, specialization within regional agencies has often moved these project types to the backburner. Hence, efforts primarily have focused on a single purpose projects, and efforts required to develop multi-objective solutions have made true multi-benefit projects relatively uncommon.

SAWPA recognizes that the OWOW process is not complete. All solid plans require constant refinement, and the OWOW Plan is no different.

## Water Resources Management Activities within the Santa Ana Watershed Regions

This section reviews major planning activities being implemented and/or considered within the SAR Watershed. These planning activities were evaluated as part of the OWOW process and did set the basis for the integrated resources planning objectives set by the OWOW Steering Committee. The water resources management activities are evaluated within five geographic areas of the SAR Watershed, starting from Big Bear Lake to the Pacific Ocean. The watershed is divided into five geographical areas. These management activities, concepts, and concerns are based on a summary of existing conditions as observed by the SAWPA member agencies.

### Management Activities in the Upper Santa Ana River Portion of the Watershed

The main regional agency in this area is San Bernardino Valley Municipal Water District (SBVMWD) covers about 353 square miles of southwestern San Bernardino County. The projected demand in the Upper SAR region is expected to increase by about 50 percent from 349,200 AF in 2005 to 519,700 AF in 2030 (2007 Upper Santa Ana River Watershed Integrated Regional Management Plan).

SBVMWD is the fifth largest of the 29 water contractors in the state with an annual maximum Table A entitlement of 102,600 AFY. SBVMWD imports SWP water into its service area and manages groundwater storage within the San Bernardino Valley area. Based on the Department of Water Resources State Water Project Delivery Reliability Report, the long-term average supply for SBVMWD by 2030 is estimated to be 60 percent of their Table A allocation unless the pumping restrictions in the Delta are lifted. To optimize its imported water supply, SBVMWD is attempting to increase the amount of water it imports during wet years for direct delivery and artificial recharge. This stored wet year water can then be pumped during the dry years.

SBVMWD is developing a storage program to help meet direct delivery demands during SWP shortages. The current storage program includes the DWR Carryover Storage Program, the Yuba Accord, the DWR Dry Year Water Transfer Program, storage in the Kern-Delta water bank, and storage in Big Bear Lake.

Development and reuse of recycled water is at its infancy in this region and is projected to increase steadily over the next two decades (2010 Regional UWMP - SBVMWD).

The Cities of San Bernardino and Colton joined together and developed the 41 MGD Rapid Infiltration/Extraction (RIX) process to treat un-chlorinated secondary effluent prior to ultraviolet (UV) light disinfection for tertiary treatment and discharge to SAR. Currently, RIX discharges all of its product water (approximately 33 MGD) to the SAR. RIX is obligated to provide 16,000 AFY for downstream purposes to meet the 15,250 AFY SAR "base flow" obligations. However, there is local interest to use RIX discharge for direct groundwater recharge and non-potable demands.

Yucaipa Valley Water District (YVWD) has an 8 MGD recycled water plant which has microfiltration filters and ultraviolet (UV) light for disinfection. YWVD Regional Water Recycling Facility discharges about 1,000 AFY of recycled water into the San Timoteo Creek. YVWD is considering construction of reverse osmosis membrane treatment at its Yucaipa Valley Regional Water Filtration Facility for the treatment of imported water supplies in compliance with the basin plan objectives set by the RWQCB. In order to dispose of the brine flow, YVWD constructed a 15-mile brineline to connect to the existing IEBL pipeline in San Bernardino. YVWD has adopted planning guidelines requiring the use of recycled water for front and rear yard irrigation of new development in its service area, and has developed a dual distribution system of potable and recycled water to convey recycled water (2010 Regional UWMP - SBVMWD).

The City of Redlands supplies recycled water to Southern California Edison’s Mountain View Power Plant for its cooling water. City of Redlands expects to produce 8,015 AFY of recycled water by 2030 and is evaluating the potential of providing recycled water to the City of Loma Linda (2010 Regional UWMP - SBVMWD). Recycled water facilities are not currently available in the City of Colton's service area; construction of such facilities is cost prohibitive and the City has no plans to reuse recycled water in the area at this time (2010 Regional UWMP - SBVMWD). The City of Rialto is updating its Recycled Water Master Plan and is investigating the expansion of its existing tertiary treatment plant and reclaimed water system as a way to supplement the City's water supply. Beaumont-Cherry Valley Water District is upgrading its Waste Water Treatment Plant from 2 MGD to 4 MGD. The District is currently discharging

this water to Cooper Creek, but is planning to use a portion of its recycled water in the future. Fontana Water Company and City of Fontana are planning the construction of a facility that will produce 5,000 AFY of recycled water for distribution; while Big Bear Valley Recycled Water Master Plan emphasizes on groundwater recharge (2007 Upper Santa Ana River Watershed Integrated Regional Management Plan).

Approximately 60 percent of this region's supply is from groundwater, 70 percent of which is from the San Bernardino Basin Area (SBBA). The SBBA was adjudicated by the 1969 Judgment. This Judgment established a natural safe yield of 232,100 AFY; SBVMWD agencies are allowed 167,238 AFY and Riverside County agencies receive 64,862 AFY of the safe yield (2010 Regional UWMP - SBVMWD).

SBVMWD and WMWD share a long history of working together on water supply issues; both agencies are members of the Watermaster Committee for the OC Judgment and they are the two-member Watermaster Committee for the 1969 Judgment.

Liquefaction in the Pressure Zone remains a major threat. The City of San Bernardino has a very high water table and experiences high pressure; at times wells have become artesian and damaged property in the area. An agreement among groundwater producers in the Pressure Zone to maximize production from this area during high groundwater level conditions is desirable. Additional facilities may be required to produce and convey large quantities of groundwater from the Pressure Zone for use outside of this area (2007 Upper Santa Ana River Watershed Integrated Regional Management Plan).

SBVMWD and San Bernardino Valley Water Conservation District (SBVWCD) are primarily the agencies in charge of groundwater recharge. Conjunctive use projects may be feasible with construction of additional recharge basins, wells, pipeline facilities; so long as the projects comply with terms and conditions of the 1969 Judgments, and various decrees and agreements (2010 Regional UWMP - SBVMWD).

Bunker Hill groundwater basin is estimated to have 6 million AF of storage capacity; with a recharge efficiency rate of 95 percent (2007 Upper Santa Ana River Watershed Integrated Regional Management Plan).

In 2010, SBVMWD and Western Municipal Water District (WMWD) received two permits from the State Water Resources Control Board (SWRCB) to divert Santa Ana River water downstream from Seven Oaks Dam. The yield from these two permits is estimated to be up to 200,000 AF in wet years, with an average annual yield of 10,800-27,000 AF. Additional infrastructure for capturing and utilizing this local stormwater is required. SBVMWD has completed CEQA and 60 percent design for the first phase of these facilities.

The City of Redlands has surface water rights to approximately 15,000 AFY from the Mill Creek and SAR. The current use of this water by the City is limited to its treatment capacity. Fontana Water Company as an agent for Fontana Union Water Company diverts water from Lytle Creek. During normal years, West Valley Water District (WVWD) uses up to 5,500 AFY from Lytle Creek surface flows and projects using a minimum of 2,130 AFY during extended drought periods. East Valley Water District (EVWD) has water

rights for 4,500 AFY of SAR water, with the ability to expand to 7,300 AFY through the conversion of remaining agricultural properties and water shares of stock through the North Fork Mutual Water Company (2010 Regional UWMP - SBVMWD).

Nine agencies in the area have an "exchange agreement" that allows them to exchange SWP, SAR, and Mill Creek water through simultaneous and deferred exchanges for the benefit of each party (2010 Regional UWMP - SBVMWD).

The San Gorgonio Pass Water Agency (SGPWA) may have a shortage of about 17,500 AFY by 2030. During multi-year drought periods, this shortage could increase to 26,700 AFY. This shortfall can be overcome by reducing demands and/or purchasing additional water supplies (2007 Upper Santa Ana River Watershed Integrated Regional Management Plan).

The agencies in the San Bernardino County have difficulty achieving adequate local funding. A major constraint in implementing many of the projects in this region is lack of financial capacity and funding availability. Many of the local communities are economically disadvantaged and may not be able to finance costly projects.

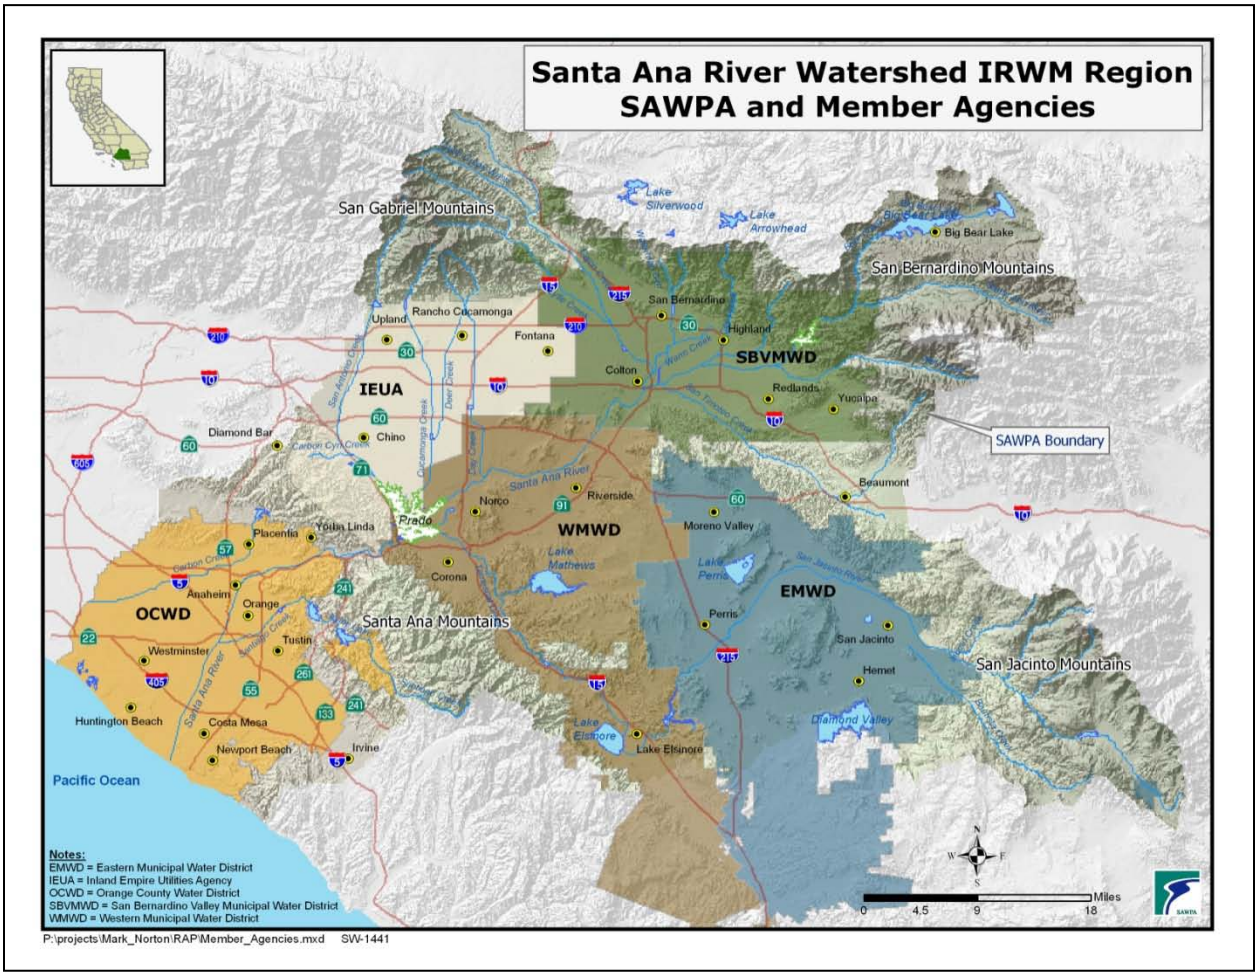
The water agencies in this region are concerned about expansion of the critical habitat area for the Santa Ana Sucker fish, which could impact water allocation, water use, and recharge efforts along the SAR. In October 2012, several water agencies in this region lost a court battle when the federal district judge allowed for the expansion of the critical habitat of the Santa Ana Sucker in upstream areas of the SAR. The agencies are appealing this court decision.

## Management Activities Between Colton and Prado Dam

The main stem of the SAR extends between the cities of Colton and Corona. Temescal Creek also flows into the Prado dam in Corona. The main regional water agency in this area is Western Municipal Water District (WMWD) serves the western portion of Riverside County (**Figure 5.10-1**) including nine water purveyors in its jurisdiction 1) Box Springs Mutual Water Company, 2) City of Corona, 3) City of Norco, 4) City of Riverside, 5) Eagle Valley Mutual Water Company, 6) Elsinore Valley Municipal Water District, 7) Lee Lake Water District, 8) Rancho California Water District, and 9) Jurupa Community Services District.

WMWD receives treated imported water through MWD's Mills and Skinner Water Filtration Plants (WFPs); the untreated imported water is delivered through MWD's Lower Feeder. Demand for imported water within the WMWD area is expected to increase from 104,000 AFY in 2010 to 208,000 AFY by the year 2040 (2008 Updated IRWM Plan - WMWD).

Imported water from MWD accounts for 33 percent of total water demands in the WMWD area and is expected to comprise 35 percent of total water demand by 2030 (2008 Updated IRWM Plan - WMWD). WMWD recognizes the importance of a collaborative relationship with MWD and expects to receive 100 percent of its imported water needs from MWD. Even though WMWD is counting on the imported water from MWD, there are concerns over salinity, bromide, and organic carbon concentration levels of the imported water (2008 Updated IRWM Plan - WMWD).



WMWD's Ordinance 377 requires customers to use recycled water where this resource is available and can be properly used (2010 UWMP Update - WMWD). Recycled water use in 2005 accounted for 9,100 AFY (3 percent of total water demands in 2005) within the WMWD area. The use of recycled water is expected to increase to 59,600 AFY by 2030, which represents about 12 percent of the total demands in 2030 (2008 Updated IRWM Plan - WMWD). WMWD is interested in expanding the current recycled water treatment capacities and reuse this resource for recharge into the groundwater basins (2010 UWMP Update - WMWD).

Groundwater continues to be the primary water supply source available to WMWD and agencies within its jurisdiction. The largest city in this region is the City of Riverside, which receives less than 5 percent of its supply from WMWD (2010 UWMP Update - WMWD), and its remaining supply from Bunker Hill, Riverside North, and Riverside South groundwater basins (2010 UWMP - City of Riverside). Groundwater is expected to meet 252,000 AFY of demands by 2025 which is approximately 54 percent of the 2025 total water supply (2008 Updated IRWM Plan - WMWD). WMWD is interested in expanding its groundwater production capacity in the vicinity of the March Air Reserve Base (2010 UWMP Update - WMWD). WMWD is a member of the Chino Desalter Authority, and this membership gives WMWD access to treated Chino Basin groundwater (2010 UWMP Update - WMWD). Future expansion and use of the groundwater resources may require additional treatment and/or desalination which are subject to availability of brine disposal facilities (2008 Updated IRWM Plan - WMWD).

In 2010, WMWD and SBVMWD received two permits from SWRCB to withdraw water from the SAR. These permits are issued based on the surface water that can be made available from the Seven Oaks Dam facilities (2010 UWMP Update - WMWD). WMWD is interested in storing excess stormwater runoff, SAR water, and SWP water in the San Bernardino Groundwater basin (2010 UWMP Update - WMWD).

WMWD has been proactive in developing its regional water shortage contingency plan and has a Water Conservation and Supply Shortage Program. WMWD has implemented a tiered-rate billing system and Staff is focused on reducing land use irrigation water consumption through the District's Water Use Efficiency Master Plan (2010 UWMP Update - WMWD).

**Figure 5.10-1 Different Geographical Regions within the Santa Ana River Watershed**

## Management Activities within the San Jacinto Watershed

San Jacinto Watershed extends from San Jacinto Mountains to Canyon Lake. The water from San Jacinto River flows into Canyon Lake and to Temescal Creek. The main regional agency serving the San Jacinto Watershed is Eastern Municipal Water District (EMWD). This region includes four water purveyors 1) Lake Hemet Municipal Water District, 2) City of Hemet, 3) City of San Jacinto, and 4) City of Perris. Population in the EMWD service area is expected to grow by 75 percent in the next 25 years (2011 IRP - EMWD).

EMWD receives treated imported water through MWD's Mills and Skinner WFPs; the untreated imported water is delivered though several MWD connections with EMWD. EMWD receives approximately 80 percent of its potable water supply from MWD (2011 IRP - EMWD). EMWD is concerned about its imported water supply because MWD's reliability buffer for retailers is predicated on finding a solution to the Delta issues within the next ten to fifteen years. Other imported water concerns include persistence of drought in the Colorado River system, and water quality issues such as salinity, uranium, perchlorate, chromium VI, nutrients, N-Nitrosodimethylamine, and pharmaceuticals in the water supply from the Colorado River Aqueduct. MWD is making significant investments to its

infrastructure to improve supply and system reliability, and EMWD is concerned about the cost increases to the MWD member agencies as a result of these improvements (2011 IRP - EMWD).

MWD is facing regional treatment capacity shortages in the future. In 2007, MWD in cooperation with EMWD and WMWD completed an Integrated Area Study (IAS) and identified the need for a new filtration plant in the area. In addition, Mills WFP conveyance capacity for delivery of treated water to EMWD is limited, which requires significant transmission infrastructure upgrades (2011 IRP - EMWD).

To address some of the imported water concerns, EMWD has expanded local treatment of untreated MWD water, and with the cooperation of three of its purveyors has developed a groundwater replenishment program to reduce reliance on treated MWD water in its area (2011 IRP - EMWD)/ (2010 UWMP - EMWD).

EMWD is responsible for all wastewater collection and treatment in its service area and treated 46,500 AF of water in 2010. All of the wastewater collected in the EMWD service area is treated to tertiary standards, and EMWD has an extensive recycled water system for the use of its recycled water. EMWD's recycled water system includes four Regional Water Reclamation Facilities (RWRF), several recycled water unlined surface storage ponds, above ground storage tanks, and a distribution system that connects all of its RWRF's. EMWD has a mandatory recycled water use ordinance, which requires new and existing customers to use recycled water for appropriate permitted uses when available (2010 UWMP - EMWD).

EMWD reuses all of its produced recycled water during peak demand months (June-September). The demand during these months is higher than the recycled water that is produced, and supply is supplemented by recycled water that is stored during cooler, wetter parts of the year (October –May). During these months surplus recycled water is stored in unlined surface storage ponds, resulting in extensive groundwater recharge. Any surplus water that cannot be stored due to storage limitations is disposed through a regional outfall pipeline to Temescal Creek and Santa Ana River (2010 UWMP - EMWD).

EMWD intends to capture and reuse all of its future growth generated recycled water by constructing an Advanced Water Treatment Facility (AWTF) and recharging the product water into the San Jacinto groundwater basin (2011 IRP - EMWD). Such a project requires significant capital investment, a significant outreach program to overcome regulatory and local acceptance hurdles, and additional capacity in the brine disposal facilities.

EMWD produces potable groundwater from two management plan areas in the San Jacinto Watershed, the West San Jacinto Groundwater Basin Management (WSJGM) area, and the Hemet/San Jacinto Water Management (HSJWM) area. The groundwater produced from the WSJGM area is brackish and requires treatment. EMWD operates two desalination plants in the WSJGM area to convert brackish groundwater into potable water (2010 UWMP - EMWD).

The groundwater from the HSJWM area is of potable quality, but the basins are overdrafted. The overdrafted conditions caused a prolonged litigation against EMWD and MWD, by the Soboba Band of Luiseño Indians, and a settlement that was signed in 2006. Under this settlement, the local purveyors in the HSJWM area are required to develop a management plan for the HSJWM area; and for thirty years MWD is obligated to deliver 7,500 AFY for groundwater replenishment. The HSJWM Plan activities will be coordinated by a Watermaster who is responsible to overcome the chronic groundwater overdrafts in the HSJWM area (2010 UWMP - EMWD). The Watermaster in collaboration with EMWD will be responsible for operating the HSJWM groundwater basins within their safe yield limits; recharge groundwater basins with imported water; and use EMWD's San Jacinto River flow diversion rights of 5,760 AFY for recharge of the HSJWM groundwater basins.

As part of compliance with SBX7-7 legislation, EMWD implemented a budget based tiered rate program for its retail residential and landscape customers. Each customer account has a monthly budget based on the number of persons in the household and the irrigation landscape area. The conservation programs being implemented by EMWD are expected to conserve 19,200 AFY of water by 2035 (2010 UWMP - EMWD).

High reliance on imported water and its associated challenges have caused EMWD to pay particular attention to improving water supply reliability within its service area. EMWD is continuously looking at programs such as conservation, desalination, budget based tiered rate billing structure, recycled water use, urban stormwater runoff harvesting, groundwater recharge, and water transfers to improve its water supply reliability.

## Management Activities within the Chino Basin Area

This region extends from San Gabriel Mountains to Prado Dam. The two main regional agencies serving this area are Chino Basin Watermaster (CBWM) and Inland Empire Utility Agency (IEUA).

### *Activities Within The Chino Basin Watermaster Area*

The Optimum Basin Management Plan (OBMP) for the Chino Basin is a major strategic planning in the CBWM area which was prepared by the IEUA and CBWM to address groundwater quality problems and identify groundwater management opportunities. The OBMP objective is to develop cost-effective, reliable, potable water supplies, enhance and protect the yield and quality of the Chino groundwater basins; while minimizing demand for imported water and encouraging the use of the large available storage space in the aquifer system. The OBMP provides the framework for cooperative groundwater management program development among agencies in the Chino groundwater basins. To facilitate implementation of the OBMP, an agreement (the "Peace Agreement") was signed by Watermaster, Inland Empire Utility Agency (IEUA), Western Municipal Water District (WMWD), and various other stakeholders in June of 2000. The OBMP does address the urban water management planning needs within the Chino groundwater basins through water quality treatment, groundwater recharge, groundwater desalination, and water recycling programs. In 2007, the original Peace Agreement was updated (Peace II Agreement) to redefine the future programs and actions required to implement the OBMP. In 2010, IEUA completed a Peace II subsequent Environmental Impact Report (SEIR) for the OBMP update.

The Peace II Agreement includes groundwater desalination which creates "Hydraulic Control" in the Chino groundwater basin. The Hydraulic Control ensures that the water management activities in the Chino groundwater basins will not impair the beneficial uses of the Santa Ana River downstream of Prado Dam.

### *Activities Within the Inland Empire Utility Agency Area*

IEUA was originally formed in 1950 as the Chino Basin Municipal Water District and officially changed its name to IEUA on July 1, 1998, to reflect the change in the District's mission. IEUA provides imported water, wastewater management, and energy recovery/production services to a 242 square mile area in the southwest corner of San Bernardino County (see **Figure 5.10-1**). IEUA provides water and wastewater services to ten contracting agencies in its jurisdiction 1) City of Chino, 2) City of Chino Hills, 3) Cucamonga Valley Water District (CVWD), 4) City of Fontana, 5) San Antonio Water Company, 6) City of Ontario, 7) City of Upland, 8) Monte Vista Water District, 9) Fontana Water Company, and 10) City of Montclair. The IEUA service area population is expected to grow from 830,000 to 1,200,000 by 2035.

MWD has invested $2.7 million in a 100,000 AF Chino Basin groundwater conjunctive use program. MWD and IEUA are working together to expand this program by a minimum of 50,000 AF. This strategy will provide dry year water supplies for the Chino Basin and the SAR watershed (2010 UWMP - IEUA). In December 2012, the MWD Board eliminated their groundwater replenishment program.

Although IEUA has worked to reduce its reliance on imported water, due to increased demand, in six of the past ten years IEUA was required to purchase imported water at a higher cost (MWD's Tier 2 rate) (2010 UWMP - IEUA).

Since 2007, MWD Tier 1 and Tier 2 rates have increased 69 percent and 86 percent, respectively. Increasing rates in conjunction with the elimination of the replenishment program has caused IEUA and its member agencies to re-evaluate how the Chino Basin is operating. As a result, it is no longer economical for the groundwater users to overproduce the basin during dry years, and it is less expensive to purchase MWD's imported water at the Tier 1 rate as a direct import (2012-13 Operating and Capital Budget - IEUA).

Currently, IEUA produces about 60,000 AFY of recycled water from four recycled water plants IEUA reuses about 54 percent of its recycled water and discharges the remaining 36 percent of its recycled water into the SAR.

The Inland Empire Regional Composting Facility is a joint venture between IEUA and Los Angeles County Sanitation District. This facility uses biosolids from IEUA's anaerobic digesters (2010 UWMP - IEUA). IEUA's ultimate recycled water plan is for delivery of 93,000 AFY of recycled water from all four of its plants. As of 2012, the recycled water distribution pipeline network has been constructed at a cost of $250 million, and is expected to deliver 62,000 AFY for direct use and replenishment by 2035 (2010 UWMP - IEUA). Currently IEUA recharges 10,000 AFY into the Chino Basin; with plans to double the recycled water recharge within the next ten years.

Available recycled water supplies are projected to reach 83,000 AFY by 2035. The SAR judgment requires IEUA to discharge 17,000 AFY into the SAR. This leaves approximately 66,000 AFY of recycled water available for beneficial use within the IEUA service area by 2035 (2010 UWMP - IEUA).

The Chino Basin is the largest groundwater basin in the Upper Santa Ana Watershed. In 2010, Chino Basin groundwater provided the IEUA service area with 105,000 AFY of supply (60-70 percent of its water supply). Development and maintenance of the Chino Basin are critical for the supply reliability in the region. Chino Basin groundwater production is expected to reach 170,000 AFY by 2035(2010 UWMP - IEUA).

The 1978 Chino Basin Judgment adjudicated water rights in the Chino Basin and formed the Chino Basin Watermaster (CBWM). The Judgment set the safe-yield at 145,000 AFY, but an additional 40,000 AFY of desalted groundwater can be produced via three desalters under the CBWM's OBMP. These desalters use a combination of reverse osmosis and ion exchange technology to treat the pumped groundwater. Salt balance is a major issue for the Chino Basin and the SAR Watershed as a whole. Depletion of groundwater reserves, undesired water quality, contravention of existing water rights, excessive increases in production costs, streamflow depletion, and subsidence are other factors that affect the Chino Basin water supplies. In 2005, CBWM, IEUA, OCWD, and the RWQCB developed a hydraulic control monitoring program to characterize the relationship of the SAR and the Chino Basin. Information from this program is used to adaptively manage the Chino Basin's storage and recovery activities (2010 UWMP - IEUA). The Chino Basin is a valuable resource for water transfers in the SAR Basin because of its ability to store vast quantities of water, and has storage capability of up to 6 million AF (2010 UWMP - IEUA).

In 2002, CBWM, Chino Basin Water Conservation District (CBWCD), San Bernardino County Flood Control District (SBCFCD), and IEUA formed a joint committee to implement the Chino Basin Facilities Improvement Project (CBFIP). Improvements to the Chino Basin groundwater recharge will substantially increase the replenishment of the groundwater basin through a combination of storm water, recycled water, and imported water. This project is designed to maximize the use of uninterruptible supplies when available (2010 UWMP - IEUA). IEUA is the lead agency for implementation of the CBFIP which has constructed and improved 19 recharge sites with a total potential recharge capacity of 110,000 AFY(2012-13 Operating and Capital Budget - IEUA).

Changes in the environmental regulations, the GHG emission legislation, and other legislations can significantly impact energy programs and costs. As a result, IEUA has adopted a "Gridless by 2020" campaign, in which IEUA will meet 100 percent of its2020 energy needs with renewable energy sources (2012-13 Operating and Capital Budget - IEUA).

Population increase, combined with uncertain effects from climate change, have prompted IEUA management to alert its Board of Directors to the significant water management challenges that the area will be facing in the future (2010 UWMP - IEUA).

## Management Activities within the Orange County Area

The SAR below Prado dam flows through Orange County and discharges into the Pacific Ocean. The main regional groundwater agency serving this area of the SAR Watershed is Orange County Water District (OCWD). The OCWD was formed in 1933 to manage and protect the Orange County groundwater basin (**Figure 5.10-1**). OCWD encompasses 350 square miles in the lower SAR Watershed serving more than 2.4 million people and providing water supply to thirteen cities and six water districts.

Total water demand within OCWD's boundary is about 480,000 AFY (2009 Update GWM Plan - OCWD). Total demand includes the use of groundwater, surface water from Santiago Creek and Irvine Lake, recycled water, and imported water (2009 Long-Term Facilities Plan - OCWD). The groundwater basin managed by OCWD provides up to 75 percent of the water needed within OCWD's boundary. Municipal Water District of Orange County (MWDOC) has estimated total water demands within OCWD's boundary in 2035 to be 558,000 AFY (2010 UWMP - MWDOC).

MWDOC and the cities of Anaheim, Fullerton, and Santa Ana are members of MWD and can import water directly from MWD. Since 2004, OCWD, MWDOC, and participating producers in the region have participated in MWD's Conjunctive Use Program. The existing MWD storage program provides for MWD to store up to 66,000 AF of water in the basin in exchange of MWD's contribution to improvements in basin management facilities (2010 UWMP - MWDOC).

Water managers in Orange County are very concerned about the increasing cost of the imported water due to endangered/threatened species in the Delta, drought along the Colorado River, and reduced water sales by MWD.

The Orange County Sanitation District (OCSD) is the regional wastewater management agency for 21 cities, three special districts, and a portion of the unincorporated county areas. The OCSD treats 210 MGD of wastewater at its two treatment facilities in Huntington Beach and Fountain Valley. OCWD receives secondary treated wastewater from OCSD and treats it to a pristine level at the Groundwater Replenishment System (GWRS) before recharging it into the groundwater basin. GWRS can currently produce up to 72,000 AFY (2009 Update GWM Plan - OCWD). The system can be expanded to a total of 120,000 AFY in two phases (2009 Long-Term Facilities Plan - OCWD).

Since 1965, Los Angeles County Flood Control District (LACFCD) and OCWD have been jointly operating injection wells in the Alamitos and Talbert Barriers to control the seawater intrusion into the Orange and Los Angeles Counties. Controlling seawater intrusion into the groundwater basin is critical to protecting the water quality of groundwater in the region. GWRS provides water for the Talbert Barrier injection wells in addition to recharge water for the Anaheim surface water recharge facilities. Approximately 34,000 AFY (30 MGD) of injection is used at the Talbert Barrier to substantially raise water levels, an amount sufficient to fully prevent seawater intrusion. Talbert Barrier may require up to 45 MGD of injection to meet the projected 2020 conditions (2009 Update GWM Plan - OCWD).

OCWD owns and operates a network of recharge facilities that cover over 1,500 acres in addition to the 2,150 acres that it owns above Prado Dam (used for conservation and water quality improvement).

OCWD has two diversion permits from the SWRCB for diversion and use of up to 362,000 of SAR water, and collection and storage of 33,560 AFY from Santiago Creek. OCWD utilizes the permitted diversions from the SAR and Santiago Creek to maximize recharge of the groundwater basin. SWRCB has also agreed to hold an additional 143,000 AFY in abeyance for OCWD for possible future projects. This provides an opportunity for OCWD to pursue long-term projects and complete environmental analysis and planning of those projects by 2023.In its Long-Term Facilities Plan (2009 Long-Term Facilities Plan - OCWD) OCWD identified potential projects for recharge enhancement, including sediment removal from SAR; new injection wells to recharge GWRS water in the basin; subsurface recharge galleries to recharge more GWRS water; and cooperation with the County of Orange to recharge at Fletcher Basin-area.

The groundwater basin's primary source of water is the OCWD recharge activities in and adjacent to the SAR and Santiago Creek. The SAR bed percolation rate has been declining by approximately one percent per year for the last 20 years due to the coarsening of the riverbed. In addition, invasive and pervasive plant species, such as Arundo Donax, prohibit maximize flow in the SAR and Prado dam areas. OCWD is able to recharge essentially all non-storm flow in the SAR that enters the OC through Prado Dam; however, stormflows exceed the diversion capacity during years of heavy precipitation. During wet years, there is a significant loss of water to the ocean. Maximum percolation at the recharge facilities is estimated at 500 cubic-feet per second (cfs), while the rate of stormflow can reach 3,000 cfs. In 1997-98 alone, approximately 270,000 AF of SAR stormflow were lost to the ocean (2009 Update GWM Plan - OCWD).

OCWD has legal rights to a minimum of 42,000 AFY of SAR baseflow (defined as “perennial flows from the upper watershed” in SAR which is predominantly treated wastewater). Over the last 10 years, the SAR provided approximately 200,000 AFY of water to Orange County (150,000 AFY of baseflow and 50,000 AFY of stormflow) to recharge the groundwater basin (2009 Long-Term Facilities Plan - OCWD).

OCWD has developed an extensive groundwater modeling, monitoring, and tracking system; and has comprehensive sub-surface geology, and water quality data for the region. OCWD estimates the entire groundwater storage capacity in the region to be 66,000,000 AF. In 2009, OCWD estimated the inflows to the groundwater to be approximately 341,000 AF (with 235,000 AF at the Forebay recharge facility, 35,000 AF at Talbert Gap, 2,500 AF at Alamitos Gap, and 69,000 AF of other recharge). This inflow is balanced with groundwater production of 335,000 AF and subsurface outflow of 8,000 AF (2009 Update GWM Plan - OCWD).

The GWRS provides a dependable supply of water and is expected to remove approximately 47,000 tons of salt per year. In addition, Tustin and Irvine desalters remove and treat impaired groundwater in the region (2009 Update GWM Plan - OCWD). MWDOC has identified several projects in the area that would double impaired groundwater production. However, these projects will require additional replenishment water for their implementation (2010 UWMP - MWDOC).

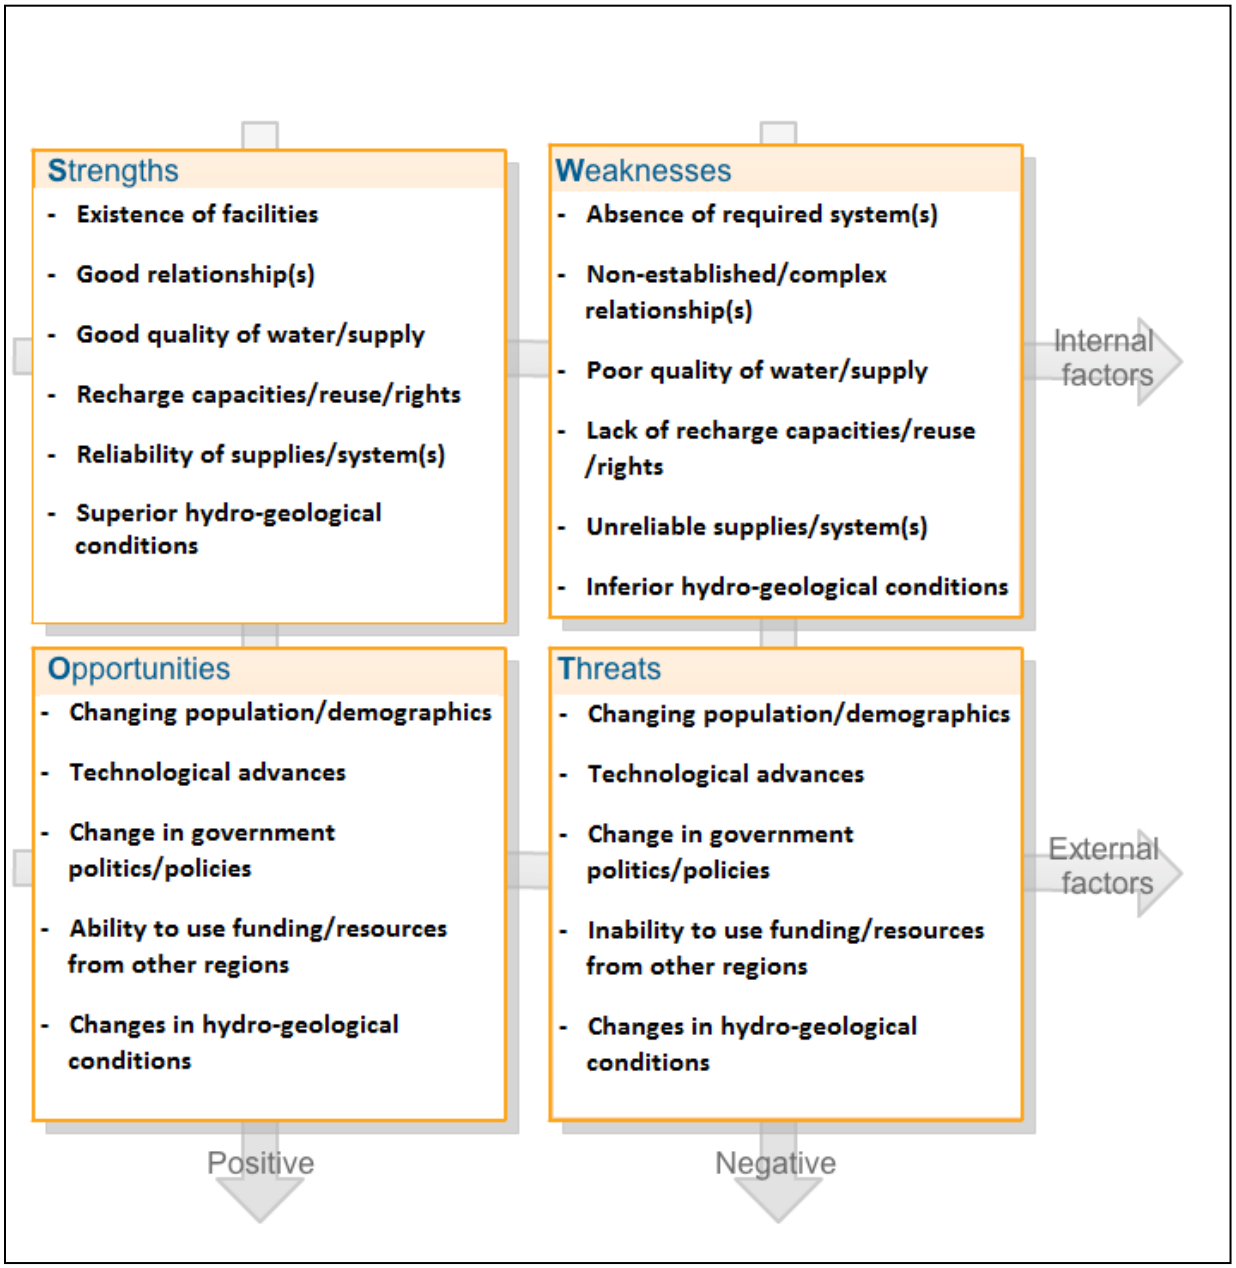
To control nitrate levels, OCWD operates 350 acres of wetlands in the Prado Basin to naturally remove nitrates before they enter recharge facilities. In addition, OCWD is interested in developing more wetlands above the Prado Dam at Chino Creek (Prado Basin area), River Road (to treat SAR baseflow

that is not diverted to the existing Prado wetlands), Temescal Creek, and Mill Creek (proposed by the City of Ontario) (2009 Long-Term Facilities Plan - OCWD).

Development and implementation of water use efficiency programs to assure 20 x 2020 compliance and establishing water use efficiency is considered as a main source for water resources mix in Orange County by the MWDOC Strategic plan. One of the key strategies identified by MWDOC is increasing Orange County's water supply from non-local sources. MWDOC plans to assist member agencies with water transfers and exchanges and would like to be proactive in identifying and screening innovative, non-local water supply. Irvine Ranch Water District (IRWD) worked with MWD and MWDOC to develop the IRWD Strand Ranch Integrated Banking Project that allows for recharge, storage and recovery of 50,000 AF of SWP water in Kern County. Another MWDOC objective is to build coalitions in support of developing ocean desalination as a component of the water resources strategy for Orange County.

Concerns within this region includes:

- Decreases in baseflows reaching Prado Dam caused by several factors including increased recycling in the upper SAR basin
- Protecting groundwater quality from industrial contamination and other potential sources of contamination
- Declining flows in the SAR and tributaries to the SAR impacting natural resources in the watershed
- Changes in the amount of inflow to OCSD that could affect supplies for the GWRS
- Continuation of drought conditions impacting the MWD supply reliability
- Availability of imported water to replenish the groundwater basin
- Maintaining the quality of water in the SAR that is the source water for recharging the Orange County groundwater basin



Water agencies within the Orange County recognize the importance of a collaborative relationship with the agencies in the upper SAR watershed and have historically entered into agreements with these agencies for excess water that the agencies pump into the SAR and reaches Prado dam (2009 Update GWM Plan - OCWD).

## Watershed Integration Nexus Analysis

By definition, Strengths (S) and Weaknesses (W) in a geographic area are considered to be internal factors over which water supply agencies have some measure of control. Also, by definition, Opportunities (O) and Threats (T) are considered to be external factors over which the agencies in a geographic region have essentially no control. SWOT is an acronym for Strengths, Weaknesses, Opportunities and Threats, and SWOT Analysis is the most renowned tool for analysis of the overall strategic position of a business and its environment. The key purpose of a SWOT analysis is to identify the strategies that will create a specific business model that will best align resources and capabilities to the requirements of the environment in which the business operates. Basic guidelines were set to categorize Strengths, Weaknesses, Opportunities, and Threats for each geographical area. These

guidelines (shown in **Figure 5.10-2**) provide a standardized approach in preparation of SWOT analysis for the entire watershed. A SWOT analysis, also called situational analysis, is usually used to evaluate the internal strengths and weaknesses of an organization and the external opportunities and threats to that organization.

**Figure 5.10-2 SWOT Analysis Guidelines**

However, in this report, a SWOT analysis is conducted to explore the strategies that have already been defined by SAR watershed stakeholders, in particular SAWPA member agencies, and identify the strengths and opportunities that can be developed by a cooperative planning effort amongst SAWPA member agencies. Such cooperative concepts can benefit from the integration of different resources,

facilities, and capabilities that currently exist within the watershed. The SWOT analysis used for this WIN study began with an examination of strengths and concerns identified in different geographical areas by SAR watershed agencies in their strategic documents, and the opportunities and threats are based on information gathered from the regional planning documents. The goal of the report is to provide a Watershed Integration Nexus (WIN) concept by utilizing SWOT analysis elements within different geographical regions of the SAR watershed in support of the OWOW program.

Using the SWOT analysis presented in this report, water managers can help the SAR watershed increase its internal strengths and reduce its internal weaknesses while augmenting external opportunities and reducing external threats.

The accuracy of a SWOT analysis is dependent upon the amount and source of data that are available. Any analysis with a lack of data may suffer from a biased viewpoint, and an incorrect hypothesis may be formulated that would corrupt the sole purpose of the analysis. In order to validate the accuracy of data and information related to a particular geographical area, several meetings with the SAWPA member agencies' strategic planners were conducted. **Table 5.10-1** through **Table 5.10-5** summarizes the SWOT analysis results for different geographical areas. These summary tables were prepared based on information provided in Section 4 of the report, which were validated by SAWPA member agencies' strategic planners.

The SWOT analysis is instrumental in strategy formulation and is a strong tool, but it involves a great subjective element. The analysis provided in this report is intended as a guideline and not as a prescription. Regional water managers in different geographical regions can use the SWOT analysis summaries in **Table 5.10-1** through **Table 5.10-5** capitalize on their regional strengths, and collaborate with agencies in other geographical regions to overcome weakness and external threats to their specific region.

**Table 5.10-1 SWOT Analysis Summary for the Upper Santa Ana River Portion of the Watershed**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| SBVMWD permits to divert Santa Ana River Water | Lack of a mature recycled water reuse program in the region | Construct additional recharge facilities to capture recently permitted diversions | Liquefaction threat if groundwater levels rise within 50 feet of land surface |
| Most of the watershed's runoff flows through this region | Conjunctive use opportunities limited to around 40,000 acre-feet due to potential for high groundwater in San Bernardino | Increase stormwater capture through "Active Recharge" and "Rubber Dam" projects | Many of the local communities are economically disadvantaged and unattractive to potential companies for economic growth |
| Stored water in Kern-Delta and Big Bear Lake to supplement direct delivery needs in dry years | Good quality groundwater preservation requires expensive AWTF of recycled water for groundwater recharge | Optimize the effectiveness of existing recharge operations and build additional recharge facilities so that SBVMWD can import SWP in wet years | Expansion of the critical habitat area for the Santa Ana Sucker, and its interference with regional water management efforts |
| The region has an estimated groundwater capacity of 5 million acre-feet | Projected supply shortage in the SGPWA area | Regional access to the Inland Empire Brine Line (IEBL) | Environmental needs in the Delta impacting imported supplies to the SAR watershed |
| SBVMWD is the fifth largest of the 29 water contractors in the state | | Dewatering plan should high groundwater return | Meeting demands during droughts |
| Maximizing imported water during wet years through Cooperative Recharge Program | | Improve the local economy by attracting pharmaceutical and other businesses that need a brine line | |
| Collaborative water management through the Basin Technical Advisory Committee (BTAC) | | | |
| Having the Rapid Infiltration/Extraction (RIX) project permits/process. | | | |

**Table 5.10-2 SWOT Analysis Summary for Area Between City of Colton and Prado Dam**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| WMWD collaborative relationship with MWD and its involvement in the IRP Process | Expansion and use of the groundwater requires additional treatment and/or desalination | Planning for expansion of recycled water use in the area | Significant future demand increase in the region due to rapid population growth and urban development |
| Participation in different Task Force activities to resolve regulatory issues with RWQCB | | Ability to store excess stormwater runoff, SAR water, and SWP water, in the San Bernardino Groundwater basin | Climate change altering hydrologic conditions impacting imported supplies to the SAR watershed |
| Ability to address concerns within the SAR Watershed through collaborative approach amongst stakeholders (Members of SAWPA) | | WMWD has a temporary permit from SWRCB to receive surface water from Seven Oaks Dam | Concerns over salinity, bromide, and organic carbon concentration levels of the imported water |
| Ability to receive treated imported water from two WFP (MWD's Mills and Skinner WFP) | | Access to the IEBL for brine disposal | Restrictions on SWP and Colorado River operation |
| Reliance on imported water limited to 33 percent of total water demand in the WMWD area | | | Extensive MWD imported water rate increases in recent years |
| WMWD is a member of the Chino Desalter Authority with access to treated Chino Basin groundwater | | | |
| Long history of working relationship between WMWD and SBVMWD on water supply issues | | | |
| WMWD has implemented a tiered-rate water rate structure to improve water use efficiency in the area | | | |

**Table 5.10-3 SWOT Analysis Summary for the San Jacinto River Sub-watershed Area**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| Collaborative relationship with MWD and its involvement in the IRP Process | Reliance on imported water exceeds 80 percent of total potable water demand in the EMWD area | Development of a stipulated judgment to address the over drafted groundwater issues | Climate change altering hydrologic conditions impacting imported supplies to the SAR watershed |
| Participation in different Task Force activities to resolve regulatory issues with RWQCB | Reuse all of future generated recycled water requires construction of AWTF | Existence of a comprehensive conservation program in the area | Significant future demand increase in the region due to rapid population growth and urban development |
| Ability to address concerns within the SAR Watershed through collaborative approach amongst stakeholders | Need for significant transmission infrastructure upgrades, and future regional treatment capacity shortages at the Mills WFP | Regional access to the Inland Empire Brine Line (IEBL) | Restrictions on SWP (finding a solution to the Delta issues within the next ten to fifteen years) and persistence of drought in the Colorado River system |
| Ability to receive treated imported water from two WFP (MWD's Mills and Skinner WFP) | Over drafted groundwater basins in the area | | Extensive MWD imported water rate increases in recent years |
| Existence of a groundwater replenishment program to reduce reliance on treated MWD water | | | |
| Having a budget based tiered rate program | | | |
| Existence of an extensive recycled water system in the area | | | |
| Existence of desalination plants to treat and use the brackish groundwater in the area | | | |
| Expanded local treatment of untreated MWD water | | | |
| Availability of tertiary treated recycled water in the area | | | |

**Table 5.10-4 SWOT Analysis Summary for the Chino Basin Area**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| Collaborative relationship with MWD and its involvement in the IRP Process | Operational, capacity and permitting limitations to the recycled water recharge program | The SAR judgment requiring discharge of 17,000 AFY into the SAR (another 66,000 AFY of recycled water is available by 2035) | Climate change altering hydrologic conditions impacting imported supplies to the SAR watershed |
| Participation in different Task Force activities to resolve regulatory issues with RWQCB | Groundwater contamination | Regional access to the Inland Empire Brine Line (IEBL) | Extensive MWD imported water rate increases in recent years |
| Ability to address concerns within the SAR Watershed through collaborative approach amongst stakeholders | Procedural and legal constraints due to the Adjudication | Having CBWM and a framework (OBMP) for cooperative groundwater management development | Significant future demand increase in the region due to rapid population growth and urban development |
| Implementing the OBMP to ensure the water management activities will not impair the beneficial uses downstream of Prado Dam | | IEUA's "Gridless by 2020" campaign to meet 100 percent of its2020 energy needs with renewable energy sources | No longer economical for the groundwater users to overproduce the Chino Basin during dry years after the elimination of MWD's replenishment rates |
| Ability to use recycled water for irrigation, agriculture, commercial/industrial and groundwater recharge instead of imported water | | Further expansion of conjunctive use type programs, to further manage imported and groundwater resources during wet and dry periods | Increase in groundwater production costs, streamflow depletion, groundwater contamination, and subsidence effect on the Chino Basin |
| Extensive investment in a major conjunctive use program | | | Restrictions on SWP and droughts in the Colorado River system |
| Chino Basin having up to 6 million AF of storage capability | | | Changes in the environmental regulations, the GHG Emission legislation, and other legislations |

**Table 5.10-5 SWOT Analysis Summary for the Orange County Area**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| Having good collaborative relationships with agencies in the upper SAR region | Need to control seawater intrusion into the groundwater basin, and using GWRS water for the Talbert Barrier | Groundwater production in 2035 will only be 7.5 percent more than the current production | Future demand increase in the region due to population growth and urban development |
| Ability to address concerns within the SAR Watershed through collaborative approach amongst stakeholders | Diversion capacity along the SAR is less than wet year stormflows (flow rates up to 3,000 cfs) | GWRS can be expanded to a total of 120,000 AFY | Restrictions on SWP and drought in the Colorado River system |
| Participation in different Task Force activities to resolve regulatory issues with RWQCB | Lack of sufficient replenishment water | OCWD has two diversion permits from the SWRCB (up to 362,000 of SAR water, and 33,560 AFY from Santiago Creek) | Climate change altering hydrologic conditions impacting imported supplies to the SAR watershed |
| OCWD has legal rights to 42,000 AFY of perennial flows from the upper watershed (this is predominantly treated wastewater) | | Extensive increase of recycled water reuse in the region from current 85,000 AFY to 135,000AFY by 2035 | Increased use of recycled water in the upper SAR basin (decreases base flows reaching Prado Dam) |
| GWRS provides a dependable supply of water and treats up to 72,000 AFY for recharge into the groundwater basin | | SWRCB has agreed to hold 143,000 AFY in abeyance for OCWD for possible future projects | Decline in baseflow due to upper basin recycling projects and other factors |
| 450 acres of wetlands naturally remove nitrates before SAR flows enter OC | | Developing additional recharge capability (recharge basins; new injection wells; and recharge galleries) | SAR bed percolation declining one percent per year for the last 20 years |
| OCWD owns and operates a network of recharge facilities that cover over 1,500 acre | | Ability to develop ocean desalination as a component of the water resources strategy in the region | Arundo Donax prohibits maximum flows in the SAR to reach OC |

**(Continuation of Table 5.10-5 SWOT Analysis Summary for the Orange County Area)**

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| GWRS removes up to 47,000 tons of salt per year | | Potential for USACE/OCWD agreement to increase water conservation behind Prado Dam | Increased water demands within the region due to population growth |
| Cooperative relationship with other agencies in the region | | Ability to recharge all non-storm SAR flows (max. percolation capacity is at 500 cfs) | USACE Prado stormwater releases at rates exceeding the region recharge capacity |
| Ability to use groundwater for more than 2/3 of the water needs in the area | | | The increasing cost of the imported water |
| IRWD Strand Ranch Integrated Banking Project allows for recharge, storage and recovery of 50,000 AF of SWP water in Kern County | | | Sediment accumulation behind Prado Dam reducing storage capacity |
| SAR provides approximately160,000 AFY (to groundwater basin in the region(110,000 AFY of baseflow and 50,000 AFY of stormflow) | | | Legal constraints affecting groundwater contamination remediation |
| OCWD has extensive knowledge of the groundwater basins in the region (groundwater modeling, monitoring, and tracking system; comprehensive sub-surface geology, and water quality data) | | | |
| The groundwater storage capacity in the region is estimated to be 66,000,000 AF | | | |

## Conclusions and Recommendations

The stakeholders within the Santa Ana River Watershed were asked how they would distribute future strategic planning funds in their geographical area using a standardized questionnaire. **Table 5.10-6** shows the different funding categories that were listed on the questionnaire, and **Figure 5.10-3** shows the responses received for four out of the five agencies participating in the process. The numbers shown on **Figure 5.10-3** correspond to categories list on **Table 5.10-6**.

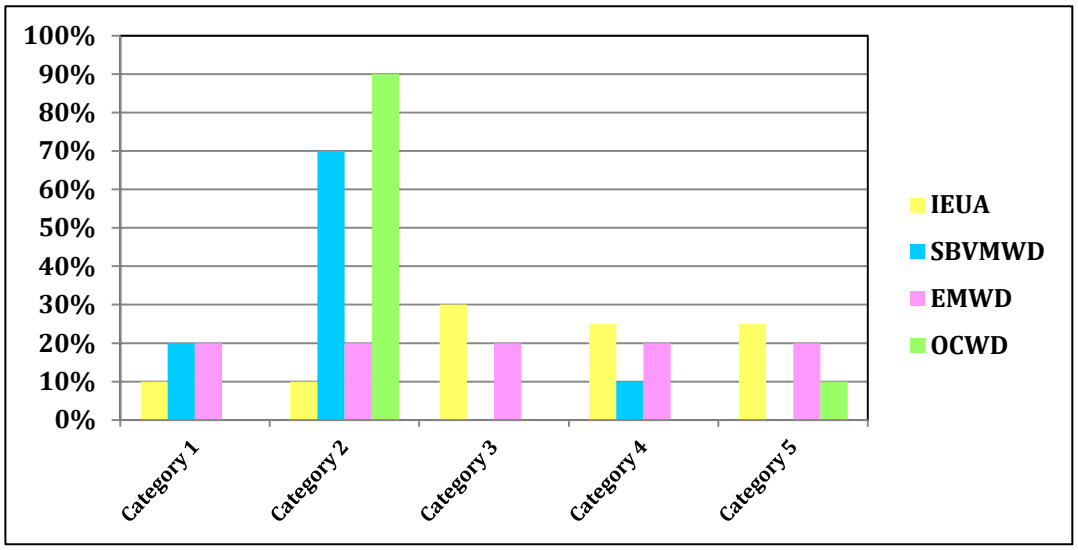


**Table 5.10-6 Questionnaire Identifying Different Strategic Planning Funding Categories**

| Strategic Funding Categories | Category Nos. Used on Figure 5.10-3 |
|---|---|
| Expand compliance with the SBx7-7 and implement projects that reduce per capita water usage by more than 20 percent by the year 2020. | **1** |
| Create/ Expand supply and system reliability during drought, emergency, and peak demand situations. | **2** |
| Create/Expand coordination with other agencies in the area and develop regional water management strategies that would increase conservation and local water supplies. | **3** |
| Create/Expand local recycled water reuse program(s) in the area. | **4** |
| Develop/Implement projects that protect groundwater resources and the environment. | **5** |

It is interesting to note that the agencies at the most upstream and most downstream geographical areas of the watershed are more focused on creating and expanding supply and system reliability during drought, emergency, and peak demand situations (Category 2), whereas the interest of the agencies in the middle of the watershed is more distributed amongst the other categories listed on **Table 5.10-6**. The conceptual recommendations offered in this report are based on information presented.

The sections below provide brief discussion for these recommendations.

**Figure 5.10-3 Future Strategic Planning Funding Priorities within Different Santa Ana River Watershed Geographic Area**

## Recommended Water Transfer Concepts

Based on the feedback received from strategic planners in different geographical regions, it is concluded that Watershed Integration Nexus (WIN) can be developed for two different water transfer concepts to improve operational efficiency in the watershed:

- Imported Water Transfer
- Recycled Water Transfer

### *Imported Water Transfer Concept*

This concept allows an agency to take MWD imported water during wet years and store it in the groundwater basins within (or outside) its own geographic area. This concept requires an agency with groundwater storage rights (Storing Agency) to work with another agency looking at improving its water supply reliability (Consuming Agency) and coordinate their supply and demand activities within their respective geographical areas.

During the years that MWD stores water in its storage accounts such as the Semitropic Water Storage District and Kern County Water Bank, the Storing Agency receives imported water from MWD in-lieu of groundwater production; and the Consuming Agency pays MWD for the water delivered to the Storing Agency at the time of delivery.

During the years that MWD Board implements the Water Supply Allocation Plan (see section 3.2 for more detail on MWD's WSAP) and MWD withdraws water from its storage accounts, the Consuming Agency will receive additional imported water from MWD above its WSAP allotment while the Storing Agency receives a reduced WSAP allotment and increases its groundwater production to offset the reduced WSAP allotment. In addition, during the Dry Year period the Consuming Agency pays the Storing Agency a storage fee for the additional water it receives above its WSAP allotment from MWD.

At the present time, MWD staff is working with its member agencies to develop a Local Storage Program that is complementary with other storage programs and provide:

- Regional water management benefits
- Equity for MWD member agencies
- Financial integrity (program should not reduce the full service purchases in the year when the water is stored)
- Operational flexibility for MWD

Therefore, it is important for MWD to participate in further development of the imported water transfer concept in the SAR watershed, and MWD's willingness to allow for allotment exchange between the Storing and Consuming Agencies at a revenue neutral price to MWD.

This section quantifies a proposed imported water transfer project based on the imported water transfer concept.

### *Recycled Water Transfer Concept*

This concept allows a geographical region to receive revenue for discharge of recycled water into SAR in-lieu of developing costly AWTF for treatment and use of recycled water in the same geographical region that the recycled water is generated. This concept requires the agency that discharges recycled water into the SAR (Discharging Agency) to coordinate with an agency with existing water purification facilities downstream of the discharge point (Consuming Agency). A good Consuming Agency candidate would be OCWD with its existing GWRS.

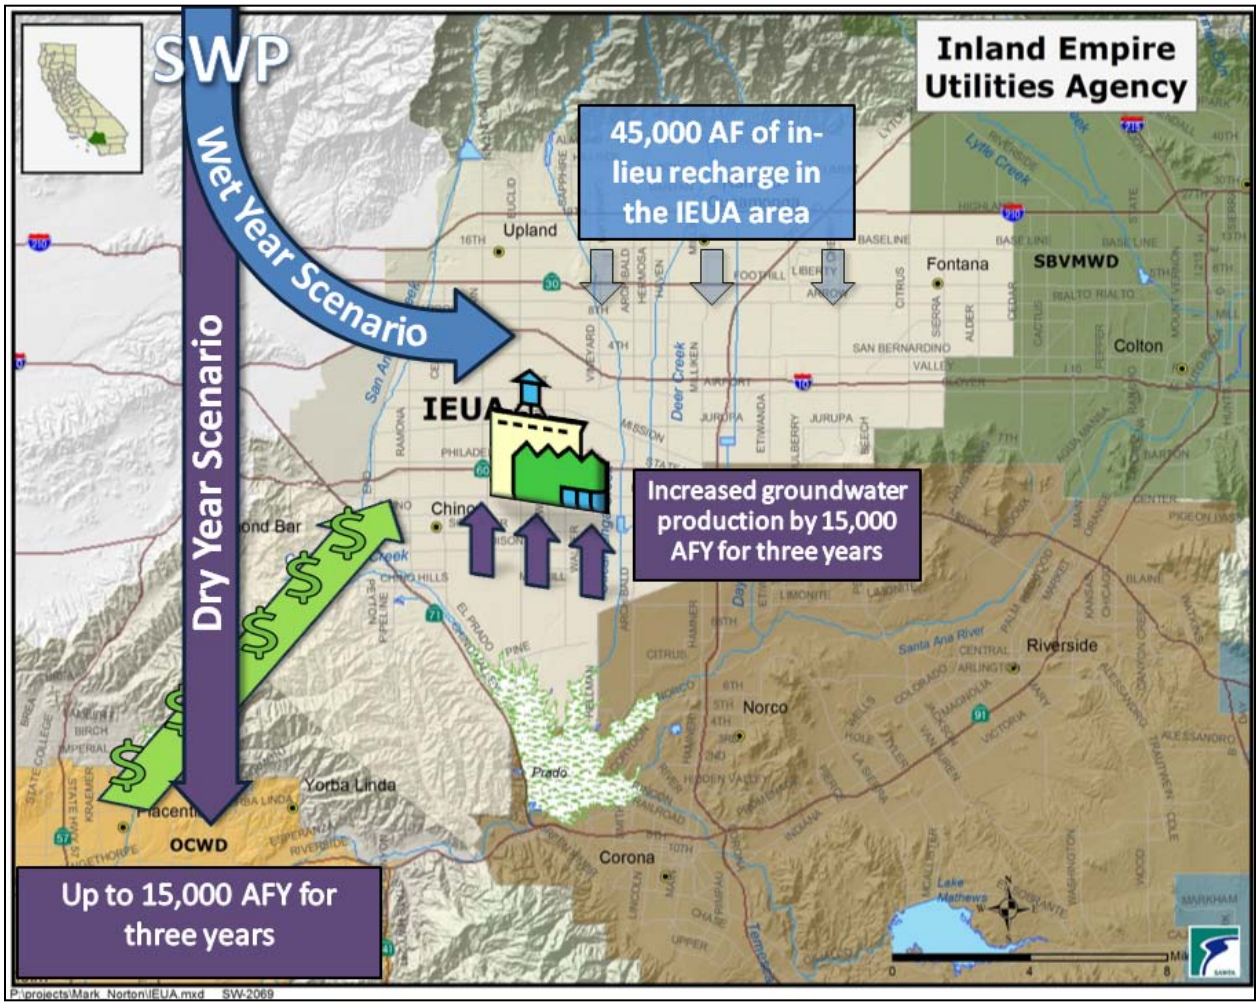
In this concept, the Discharging Agency will handle any salinity management regulatory requirements through mitigation at the Consuming Agency's geographical area. This would require the Discharging Agency to pay the Consuming Agency for the cost of any salinity mitigation at the point of treatment. In return, the Consuming Agency will pay for the water provided by the Discharging Agency. The revenues received by the Discharging Agency can be used to purchase imported water from MWD during Wet Years for recharge in the Discharging Agency's groundwater basins. This concept will improve operational efficiency and water supply reliability at both Discharging and Consuming Agencies' geographical areas. It is important for the SAR Watermaster to be involved in the development of this concept.

The section below quantifies a proposed recycled water transfer project based on the above described concept.

## Recommended Water Transfer Projects

Defining the institutional, technical, legal, and financial aspects of the concepts outlined the sections below can be very complex and would require close coordination between different stakeholders involved in a particular project benefiting from a particular concept.

The implementation of such projects requires economic studies to define benefits for specific agencies that can participate in each concept, and cooperation between agencies in different geographical areas to jointly prepare project specific implementation plans.



The sections below provide basic quantification for two potential projects that can be implemented based on the concepts outlined in this section.

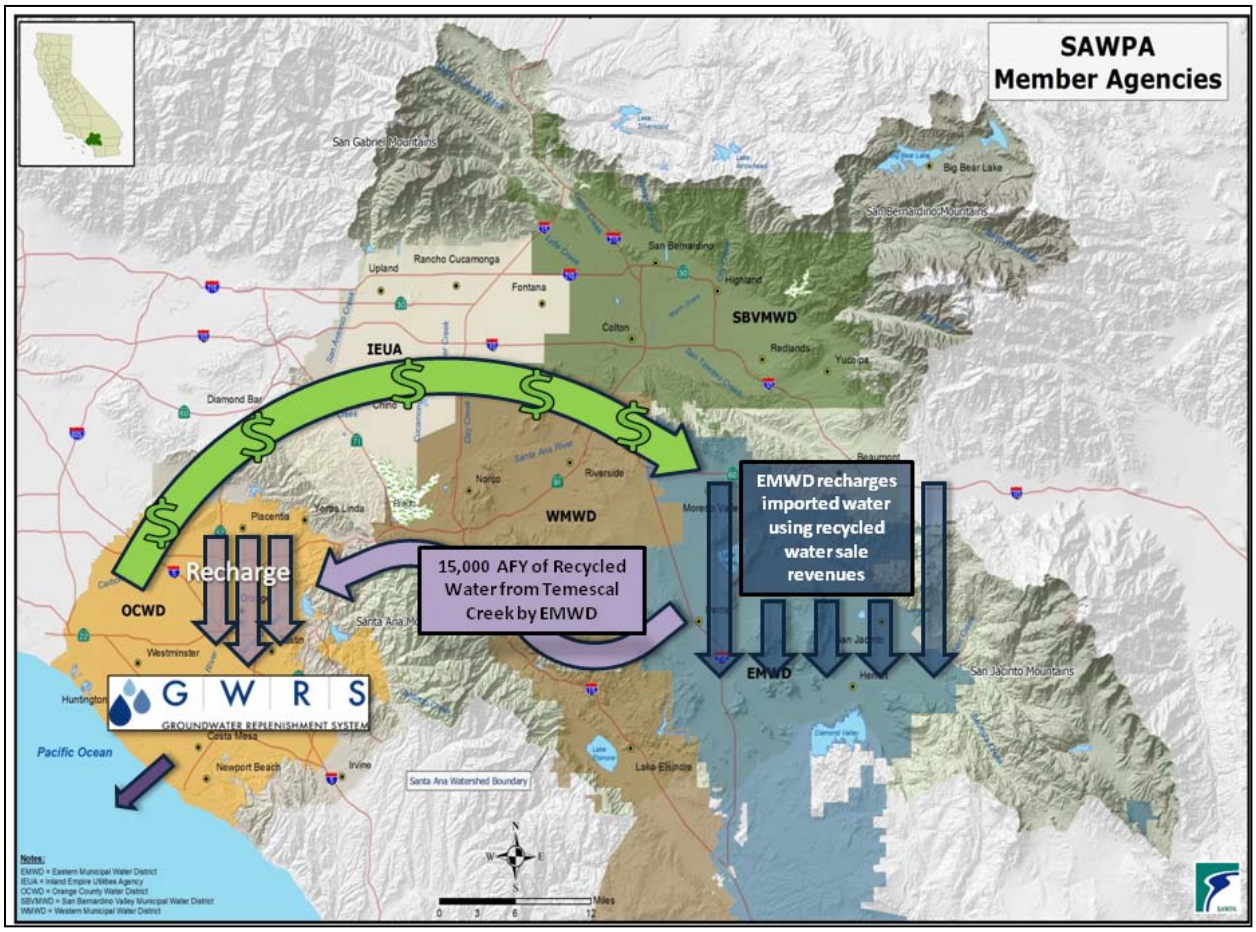
### *Recommended Imported Water Transfer Project*

Using Chino Basin storage capabilities as a resource to improve water supply reliability in Orange County is the basis for this recommended project. Inland Empire Utility Agency (IEUA) staff has indicated ability to use 45,000 AF of the Chino Basin storage during wet years, and groundwater production capacity of agencies within the Chino Basin to extract up to 15,000 AFY of additional groundwater during dry years. In addition, Orange County Water District (OCWD) is willing to discuss this potential project in more detail with IEUA.

This project concept would require OCWD member agencies to provide some (or all) funding for the purchase of up to 45,000 AF of imported water by the IEUA member agencies during wet years. It is important for MWD to provide the imported water at a rate that recognizes the benefits of MWD not storing the SWP water at one of MWD's own storage programs such as the Semitropic Water Storage District and/or Kern County Water Bank. During dry years, OCWD member agencies can request IEUA member agencies to increase their groundwater production for three years by up to 15,000 AF per year in-lieu of direct deliveries from MWD, while MWD increases deliveries in the Orange County area by an equal amount. Under this scenario, the net MWD deliveries during dry years (years that Water Supply Allocation Plan is implemented) will remain unchanged, without the need for MWD to produce water from its own storage accounts. At the same time, having the imported water stored in the SAR watershed will increase local supply reliability, and provide some financial incentive to both IEUA and OCWD member agencies. **Figure 5.10-4** shows the schematics for this project. Institutional, technical, legal, and financial details for this project need to be developed by interested agencies within the Chino Basin and Orange County areas.

**Figure 5.10-4 Recommended Imported Water Transfer Project**

### *Recommended Recycled Water Transfer Project*



EMWD has the capability to discharge 15,000 AFY of recycled water into Temescal Creek. The discharge will be mostly in the winter months of the year for the benefit of OCWD member agencies. With the approval of the SAR Watermaster, this flow can be contractually added to OCWD's SAR base flow allocation at Prado.

The water quality of EMWD's discharged recycled water may require some salinity mitigation by OCWD to meet the RWQCB Basin Plan Objective in basins downstream of Temescal Creek and Orange County. The details of the required mitigation shall be defined and negotiated with the RWQCB. There is a potential to use GWRS for the required mitigation. EMWD will be responsible to pay for the cost of that mitigation.

As part of this project, OCWD will credit EMWD for the purified water that is recharged into the Orange County groundwater basin, and compensate EMWD when that water is produced by OCWD member

agencies. To increase water supply reliability in the SAR Watershed, it is important for EMWD to use the revenues from this water transfer project for imported water banking during wet years in the San Jacinto Watershed groundwater basins. **Figure 5.10-5** shows the schematics for this project. Institutional, technical, legal, and financial details for this project need to be developed by EMWD and OCWD.

**Figure 5.10-5 Recommended Recycled Water Transfer Project**

## Acknowledgments

Special thanks to Charlie Bachmann, Joe Grindstaff, John Kennedy, Andrew Kenzler, Craig Miller, Brian Powell, P. Ravishanker, Jack Safely, Ryan Shaw, Bob Tincher, Marsha Westropp, and Greg Woodside who provided information and feedback on the strategic planning activities within their geographic region. We also thank Mark Norton and Jeff Beehler for reviewing a draft version of this report, Lindsey Stuvick for researching and reviewing planning documents published by different stakeholders within the Santa Ana River Watershed, and Irma Verino for editorial support.

# 5.11 Disadvantaged and Tribal Communities

Soboba Band of Luiseño Indians
Indian Water Rights Signing Ceremony

## Introduction

This Chapter provides a brief description of Disadvantaged Communities (DACs) and Native American Indian Tribes (Tribes) located in or near the Santa Ana River Watershed (SARW). A summary of water and related resource opportunities and challenges facing these entities can be found in the Bureau of Reclamation (Reclamation) report *Overview of Disadvantaged Communities & Native American Indian Tribes in the Santa Ana River Watershed*, located at **Appendix G**. This Chapter of the OWOW 2.0 Plan updates the OWOW 1.0 report's **Chapter 5.10: Environmental Justice**.

Environmental Justice, as defined by the U.S. Environmental Protection Agency (EPA), is "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies." With coordinated efforts by local, state and federal governments, such justice can be achieved in communities throughout the SARW, ensuring that all residents can enjoy the same degree of protection from environmental and health hazards and equal access to the decision-making process to have a healthy environment in which to live, learn, and work.

Information for Reclamation's report was gathered from several sources including personal interviews, web research, documentation review, and publically available information. This report addresses DACs and Tribes separately, as they each have very different and distinctive demographics and economic bases. The report is not meant to be an exhaustive analysis of their unique factors, but rather an introduction and, in some cases, an overview of these populations and their unique water resources requirements.

There are legitimate water quality issues that impact low income and Tribal communities throughout the SARW, but some perceptions of unsafe water where water supplies are clearly safe for public consumption identify another problem. The solution to these issues is to ensure that all communities have the information, financial and technical resources, and administrative and regulatory policies they need to make informed decisions that can result in benefits to all members of communities within the Watershed.

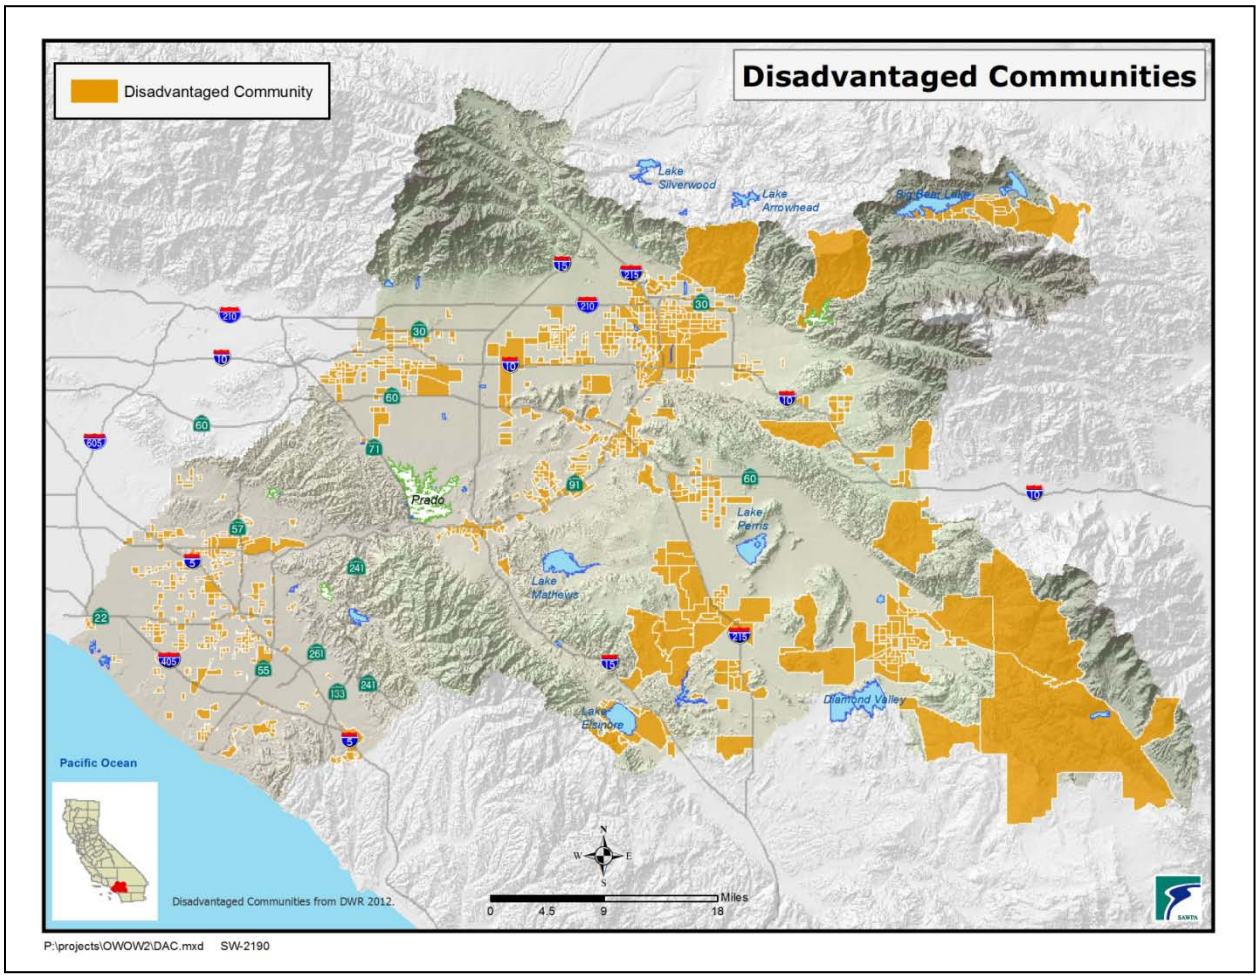
One of the key provisions found through the research that could assist DACs is the 1996 Safe Drinking Water Act (SDWA) Amendments and the 2006 Safe Drinking Water State Revolving Fund (DWSRF) program. Through the DWSRF, states can provide below-market interest rate loans to publicly and privately owned community water systems and nonprofit non-community water systems for necessary infrastructure improvements. States may also establish separate eligibility criteria and special funding options for economically disadvantaged communities through this program.

Section 1452 of the SDWA defines a disadvantaged community as "the service area of a public water system that meets affordability criteria established after public review and comment by the State in which the public water system is located." Under this section, states may provide additional subsidies (including forgiveness of principal) to communities that meet the established criteria, or that are expected to meet these criteria as a result of a proposed project.

Though no special provision was found related to Tribes, the EPA supports "Tribal Assumption of Federal Environmental Laws" under federal statutes, stating, among other things, that "[t]he Agency will recognize tribal governments as the primary parties for setting standards, making environmental policy decisions, and managing programs for reservations, consistent with Agency standards and regulations." Three Federal environmental statutes - the SDWA, the Clean Water Act, and the Clean Air Act - explicitly authorize EPA to "treat tribes in the same manner as states" for purposes of implementing various EPA environmental programs that may be of benefit to these communities.

## Background

This Chapter and the Reclamation report address DACs and Tribes separately. The water and related resources opportunities and challenges for these entities vary widely based on their locations and community compositions. This diversity is captured in compilation tables are found in Table 1 (for DACs), and Table 3 (for Tribes) in Reclamation's report.



The conclusion in the report summarizes the information to offer SAWPA water resources planners a means to examine future opportunities, and topics for consideration as the OWOW plan is updated. It also provides recommendations to engage DACs and Tribes in future Proposition 84 grant programs and others grant programs as they arise. Though SARW was considered on the fastest growing regions in California prior to the 2008 recession, it still has some of the poorest residents in the state.

## Disadvantaged Communities

The California Department of Water Resources defines a DAC as "a community with a median household income less than 80% of the state-wide average. A Medium Household Income (MHI) of $48,706 is the DAC threshold (80% of the statewide MHI). " **Figure 5.11-1** notes the general area of the DACs located in SARW (provided by Proposition 84 and 1E Integrated Regional Water Management Guidelines, dated August 2010).

During the OWOW 1.0 planning process, DAC outreach was conducted in strategic areas throughout the watershed, including the following communities: Lake Elsinore and Pedley in Riverside County, Rialto and Colton in San Bernardino County, and Santa Ana in Orange County. OWOW 2.0 DAC outreach expanded on that initial effort and also classified DACs into regions. Each region has distinct characteristics and roughly follows the Santa Ana River as it flows from its headwaters in the San Bernardino Mountains to the outfall/estuary at Huntington Beach, a journey of 96 miles. These regions are not "officially" recognized, but they serve as a tool in guiding future DAC/Tribal outreach in the watershed.

**Figure 5.11-1 Disadvantaged Communities in SARW**

## Methodology for Assessing the DACs

The SARW covers approximately 2,650 square miles and is home to 5.4 million residents. Approximately 69 percent of the cities/communities within the watershed are considered disadvantaged or contain disadvantaged communities. In terms of population, approximately 26 percent (1.4 million residents) of the total watershed population is considered disadvantaged.

As previously noted above, the watershed was separated into regions for investigation. To assist in identifying DACs in each region, meetings were held with the California Department of Public Health and the Santa Ana Regional Water Quality Control Board. Once a DAC was identified, meetings were held with local public agencies to gain detailed knowledge about the unique characteristics of each region. Meetings were also held with the residents of these communities to help gain an understanding of their water quality and supply concerns. **Figure 5.11-2** lists known Disadvantaged Communities or Partially Disadvantaged Communities in the SARW.

**Figure 5.11-2 Disadvantaged or Partially Disadvantaged Communities in SARW**

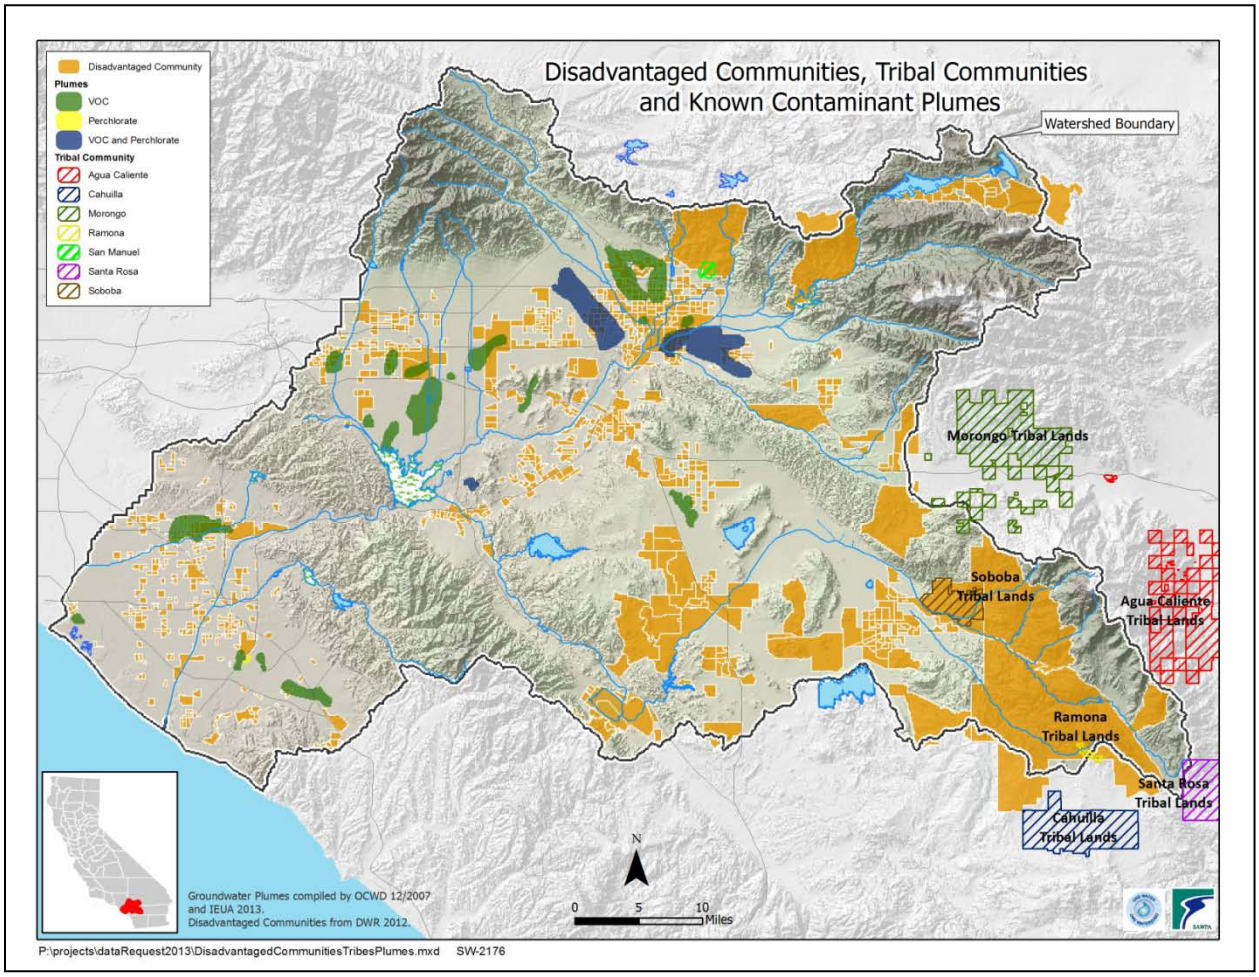
## DAC Challenges and Opportunities

The SARW is rich in diversity and, as like many arid regions in the West, faces numerous water and related resources challenges. There are distinct regional differences throughout the watershed with much variability due to economic factors. Numerous economic resources are concentrated along the Orange County coast, and many natural resources are concentrated in the San Bernardino Mountains and its headwaters. The Santa Ana River is the watershed's unifying element.



Through the OWOW planning process, significant outreach has been conducted to communicate with DACs within its service area; however, more needs to be done. These small and/or disadvantaged communities are often located in sparsely populated, rural areas and cannot provide the economies of scale necessary to build and maintain adequate water and wastewater systems. Also, many of these communities lack the resources and in-house expertise necessary to apply for grants and loans to help make wastewater projects more feasible, and often do not have the technical expertise to determine the best project alternative to appropriately plan and manage long-term operations and maintenance needs. Thus, as SAWPA moves forward with its Integrated Regional Watershed Management Planning, best practices to help with DAC assessments and stakeholder engagement will be critical.

DACs also face many of the same challenges as their neighboring communities, including:

- Limited funding/funding sources
- High infrastructure costs
- Poor water quality
- Limited water supplies
- Failing septic systems/undersized treatment facilities
- Increasing demands on existing water resources
- Flooding or drought
- Inadequate community support
- Limited project communication

Groundwater is highly used throughout the state of California and in SARW. DACs in particular tap this vital resource as their primary drinking water source. **Figure 5.11-3** depicts the various groundwater contaminant plumes (volatile organic compounds (VOC), perchlorate, and VOC and perchlorate) in or near these disadvantaged or Tribal communities within the SARW.

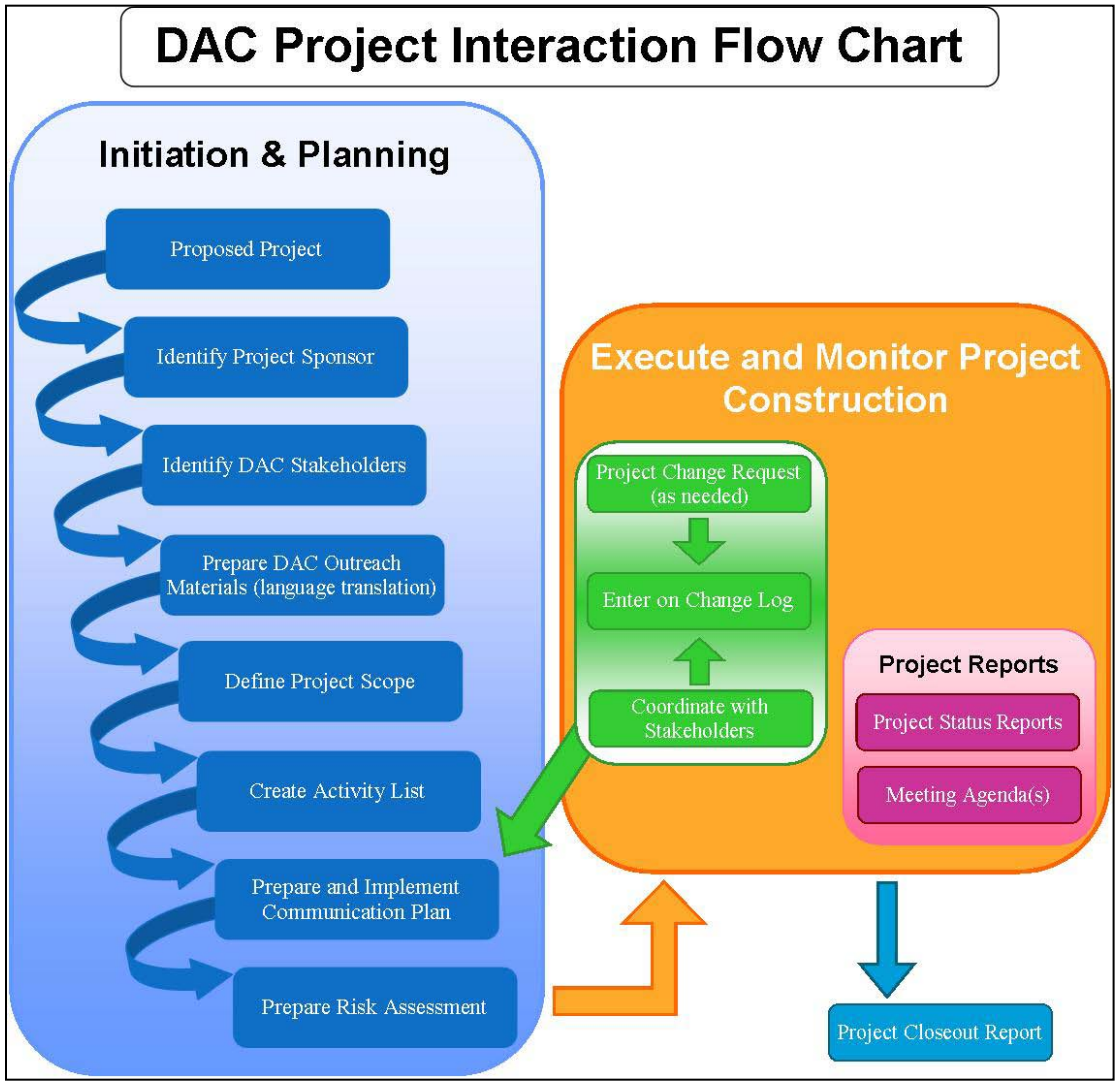
**Figure 5.11-3 DACs, Tribal Communities and Known Groundwater Contaminant Plumes**

## Future DAC Support and Implementation

The 'Quail Valley Subarea 9, Phase 1 Sewer System Project' and 'Home Gardens Well Rehabilitation, Corona - Multi-jurisdictional Transmission Line Project' were approved for Round 2 Proposition 84 funding and will have significant value-added benefits not only for the DAC areas involved, but for the surrounding communities and water agencies that work with these entities. The early engagement process with DACs can't be overstated.

These proposed projects were scored, ranked and proposed for funding under OWOW Proposition 84 Round 2 Implementation. OWOW 2.0 calls for all of SARW to see the links between stormwater management and local water supply, land use and water quality, and accommodation of a growing population with finite water resources. It is only through a view of the watershed as an integrated system that SAWPA and its member agencies can successfully develop operational efficiencies system-wide. These DAC projects as well as future ones will help achieve that objective.

## Best Practices for DAC Engagement and Participation



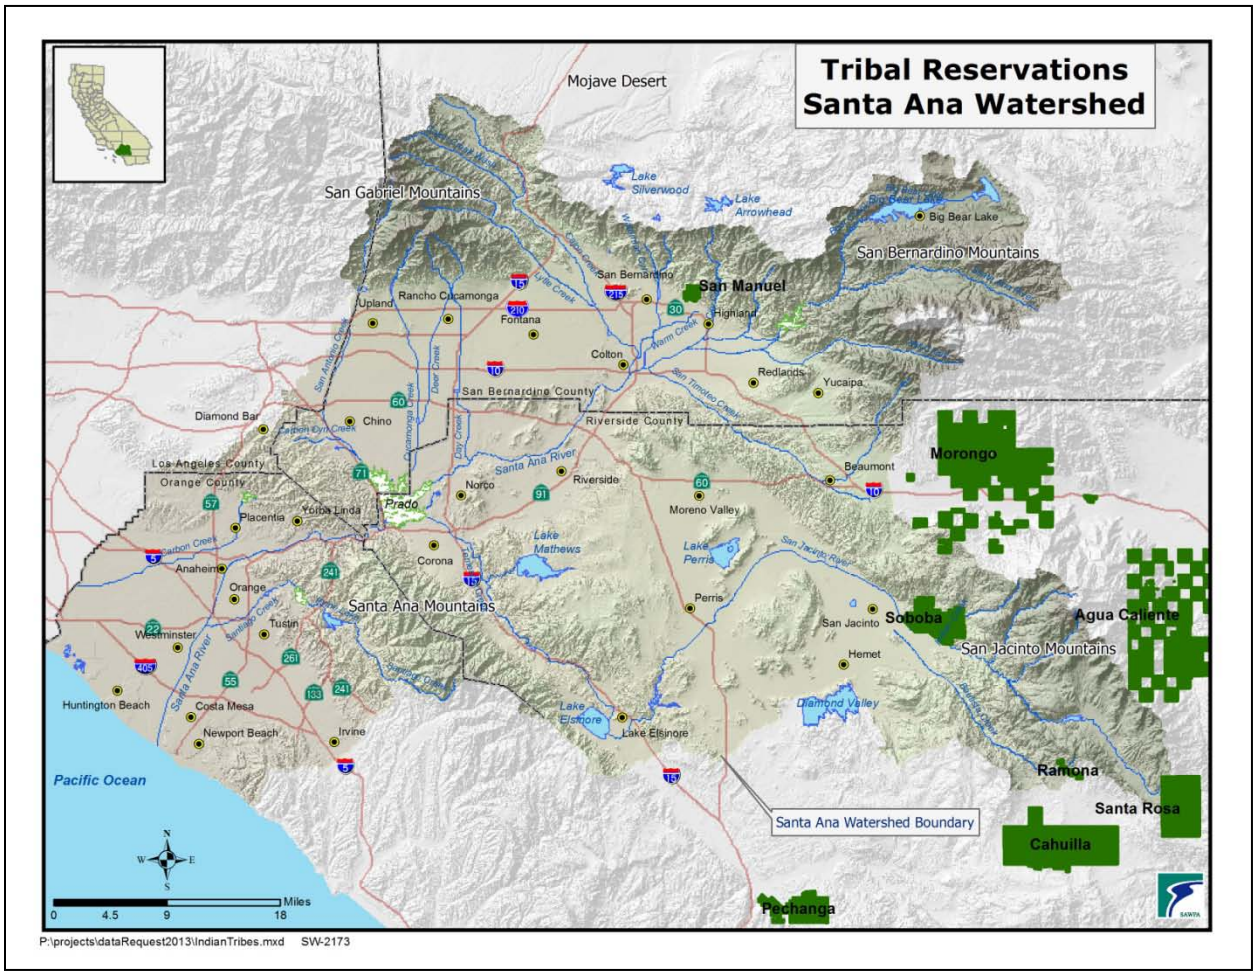
At times, community outreach is seen as a cursory notification for an upcoming event. For many water agencies, it may be conducted by sending a billing notice with an insert, or using an email blast or a website posting. However, these outreach methods should be modified to effectively work with DACs. It may be possible that English is not a DAC population's first language, and substantial cultural differences may also affect message reception. To effectively communicate the impact of a potential project, water and other public service agencies should create diverse lines of communication with their stakeholders and customers.

A participatory planning process - one in which all the stakeholders are involved - is often the most effective and inclusive way to work with DAC residents. This process provides community ownership and support; information about community history, politics, and past mistakes; and respect and a voice for everyone. It also takes time, care, mutual respect, and commitment. To conduct such a process well, stakeholders must be identified, and communication techniques must be used that are specifically designed to reach them. Also, the process must be maintained over time, so momentum will not be lost. By implementing a planning process that meets all these requirements, it is likely that SAWPA can conduct successful community interactions that truly work and meet DACs' unique needs.

Through direct assistance to DAC drinking water and wastewater treatment facility managers, many systems can begin to achieve compliance with health and safety regulations. Or the solution may lie in consolidating with adjacent systems so as to gain an economy of scale that assures fiscal sustainability. Either way, the goal of a safe, reliable, and sustainable water system is essential to securing protection to the public health, economy, and environment of California's rural and economically disadvantaged communities.

**Figure 5.11-4** lists some of the activities that should be considered and/or implemented when conducting outreach with DACs.

**Figure 5.11-4 SARW Disadvantaged Communities Engagement Flow Chart**



## Native American Indian Tribes

### Definitions

**Federally Recognized Tribe:** As identified in CFR Section 900.6 an Indian Tribe "means any Indian tribe, band, nation or other organized group or community, including pueblos, Rancherias, colonies and any Alaska Native Village, or regional or village corporation as defined in or established pursuant to the Alaska Native Claims Settlement Act, which recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians."

**Non-Federally Recognized Tribe:** According to the U.S. Department of the Interior, a non-recognized tribe has no relationship with the United States. Congress, not the Department of the Interior, has the final word as to whether a tribe should be federally recognized and whether a non-recognized tribe may nevertheless receive certain federal benefits. All of this information is represented in **Figure 5.11-5.**

**Figure 5.11-5 SARW Native American Tribal Communities**

## Methodology for Assessing the Tribes

The OWOW 2.0 update process ensures Tribes have a voice and provides a means for these cultures to be equal and active participants with other stakeholders, encouraging early participation in the actions taken within the watershed that could impact them. The region's Tribes believe that the past is the foundation of their future. To ensure the culture and traditions of these Tribes are embraced in the process, it is important to provide a means to educate the stakeholders early on, as well. As part of the outreach process, the four Santa Ana Watershed Tribes were contacted, although not all provided input to this document. Outreach was extended to neighboring Tribes, as well.

## Santa Ana River Watershed Tribes

The Soboba Band of Luiseno Indians, the San Manuel Band of Serrano Mission Indians, the Morongo Band of Mission Indians, and the Santa Rosa Band of Cahuilla Indians reside within the SARW boundary. Just outside the communities of the Agua Caliente Band of Cahuilla Indians, the Cahuilla Band of Mission Indians, the Ramona Band of Cahuilla Mission Indians, and the Pechanga Band of Luiseno Indians. For purposes of this Chapter and the Reclamation report, contact was made with all these Tribes.

## Tribal Challenges and Opportunities

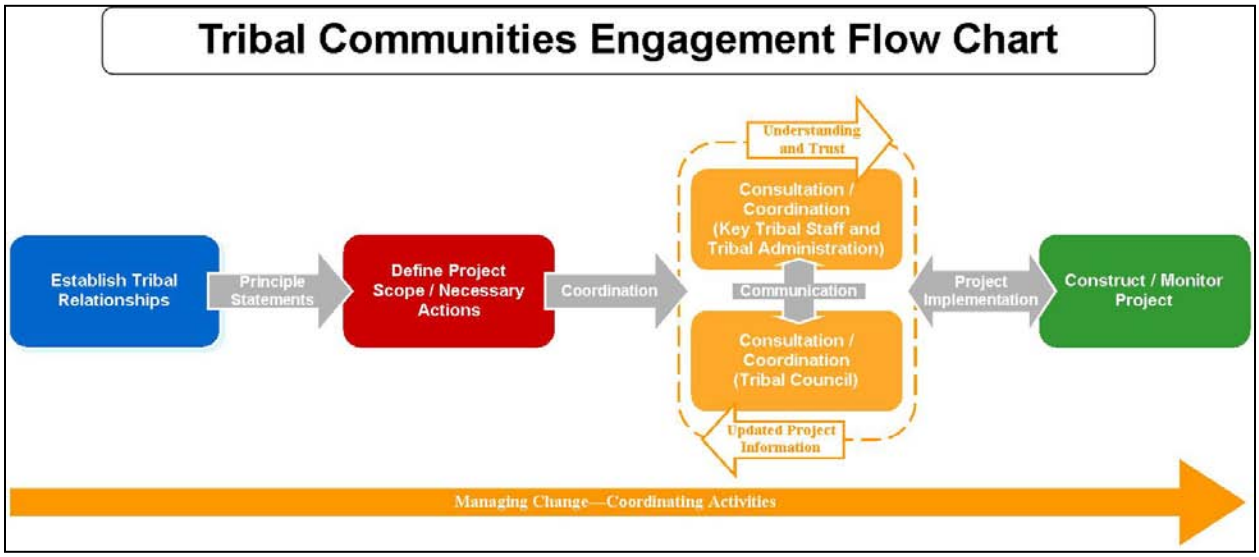
Water resources in the Santa Ana River Watershed consist of local surface water and groundwater, imported surface water, and reclaimed water. In many cases, the water challenges Tribes encounter are no different than local, state, or federal challenges. A decision to use water for a particular purpose can have far-reaching impacts which can affect not only state and local communities, but the Tribal communities as well. Early in the planning process, it is particularly important to include Tribes to ensure their possibly unique requirements may be recognized.

Listed below are potential water management issues on tribal lands:

- Groundwater overdraft
- Insufficient groundwater supply
- Growing water demands
- Habitat conservation planning requirements
- County groundwater ordinances (if applicable)
- Impact of neighboring communities
- Inadequate water recycling facilities
- Adverse impact of groundwater depletion on water quality
- Increased runoff from newly developed impervious surfaces
- High cost of imported water
- Chlorine sediments
- Inadequate flood protection infrastructure
- Tribal lands in flood inundation areas
- California Environmental Quality Act compliance

## Future Tribal Support and Implementation

Similar to approaches with DACs, the importance of an early engagement and effective outreach with Tribes cannot be overstated. Though only four Tribes are within the SARW, they have important roles in their neighboring communities as well as the region's economy. Additionally, more work and coordination is needed to isolate water and related resources issues in these communities, and make SAWPA and its member agencies aware of requirements for unique Tribal activities. Consultation protocols with Tribes should be used by senior Santa Ana Watershed Project Authority and District staff. Improving coordination with regulating agencies like the Santa Ana Regional Water Quality Control Board and EPA will also help characterize issues and solutions.



### *Soboba Band of Luiseño Indians Wastewater Treatment Project*

One success story is already in the making. The Soboba Band of Luiseño Indians joined forces with Eastern Municipal Water District, Lake Hemet Municipal Water District, and the federal Bureau of Indian Affairs to propose a Wastewater Treatment Plan project for Round 2 Proposition 84 funding. After review by the Project Selection Committee, it was ranked and prioritized and recommended for funding. This $15 million wastewater treatment plant on the Soboba Indian Reservation will improve the health and welfare of Soboba tribal members, and extend local water supplies by reclaiming previously unused low-quality water. Also, under an historic agreement among the Tribe and two local water agencies – Eastern and Lake Hemet Municipal Water Districts – the partners will cooperatively restore and protect the health of the San Jacinto River groundwater basin, part of the SARW that provides valuable water resources to the region. The Soboba wastewater treatment plant will address much needed water and sewer improvements on the reservation, positively impacting tribal members for generations to come, and will improve the quality of life for non-Tribal citizens residing near the reservation.

## Best Practices for Tribal Engagement and Participation

A variety of goals and actions for tribal involvement are in the Reclamation report, but **Figure 5.11-6** offers a step-by-step process to successfully engage Tribes in decision-making related to water resources programs.

**Figure 5.11-6 Tribal Engagement Process**

# Conclusion

Engaging DACs and Tribes in water and related resources planning through effective outreach is good for both the community and the water sector itself. There are distinct differences due to cultural and

historic context; however, the two groups have more in common. Both need their voices heard during proposed project development.

Today, DACs and Tribes face critical and serious water and related resources challenges, such as failing septic systems, isolation, language barriers, flood risk, and lack of funding and or resources to name a few. It is imperative that the water sector and its key stakeholders recognize proposed DAC and Tribe water project needs, and engage these communities early in the process. The OWOW 2.0 process recognizes the various funding needs for DACs and Tribes, and the Federal and State funding programs available to them.

Water sector outreach and engagement should include speaking with DAC residents, listening to their issues, attending Tribal Council meetings, participating on DAC and or Tribal-related committees, and conducting continuous networking. These actions could lead to consensus-based development and implementation project solutions for these groups, and the sooner that approach is under taken by the water sector, the better for everyone within the SARW.

# 5.12 Government Alliance

## Introduction

The One Water One Watershed (OWOW) Government Alliance Pillar (Pillar) was established under the Santa Ana Watershed Project Authority's (SAWPA) update of their Integrated Regional Water Management (IRWM) Plan, also known as the OWOW 2.0 Plan.

From May 2011 through June 2013, the Pillar met 14 times. Collectively, it had 29 active participants from 10 Federal agencies, two Tribal Nations, eight State agencies, and four local government agencies which are listed below.

**Federal Agencies**
- Department of the Defense
  - Army Corps of Engineers
- Department of the Interior
  - Bureau of Indian Affairs
  - Bureau of Reclamation
  - U.S. Fish and Wildlife Service
  - U.S. Geological Survey
  - National Park Service
- Department of Commerce
  - National Marine Fisheries Service
- U.S. Department of Agriculture
  - Natural Resources and Conservation Service
  - Rural Development
  - U.S. Forest Service

**Tribal Nations**
- San Manuel Band of Mission Indians Tribe
- Soboba Band of Luiseño Indians Tribe

**State Agencies**
- Natural Resources Agency
- Department of Water Resources
- State Parks
- Department of Public Health
- Department of Fish and Wildlife
- Department of Transportation
- Department of Forestry and Fire Protection
- Santa Ana Regional Water Quality Control Board

**Local Government Agencies**
- Santa Ana Watershed Project Authority
- Riverside County Emergency Services
- Riverside County Flood Control and Water Conservation District
- Santa Ana Regional Water Quality Control Board

It's noteworthy to also point out that the U.S. Federal Emergency Management Agency and the U.S. Environmental Protection Agency both requested ongoing information updates on the Pillar's activities; meeting notes and notices were provided to those designated agency representatives.

In the beginning of the OWOW 2.0 water resource planning process, the Pillar met for a brainstorming session. SAWPA staff provided planning guidance, while group discussions focused on regional and integrated projects and programs concepts that could benefit the watershed as a whole. The Pillar also forged potential long-term alliances, and addressed each agency's involvement in existing or planned programs throughout the watershed. Proposed projects and programs that resulted from past proposals submitted by watershed stakeholders were also addressed.

Two key goals of this Pillar are: 1) leverage watershed information and potential resources from governmental agencies and seek out synergistic opportunities; and 2) consider large-scale ideas for implementation.

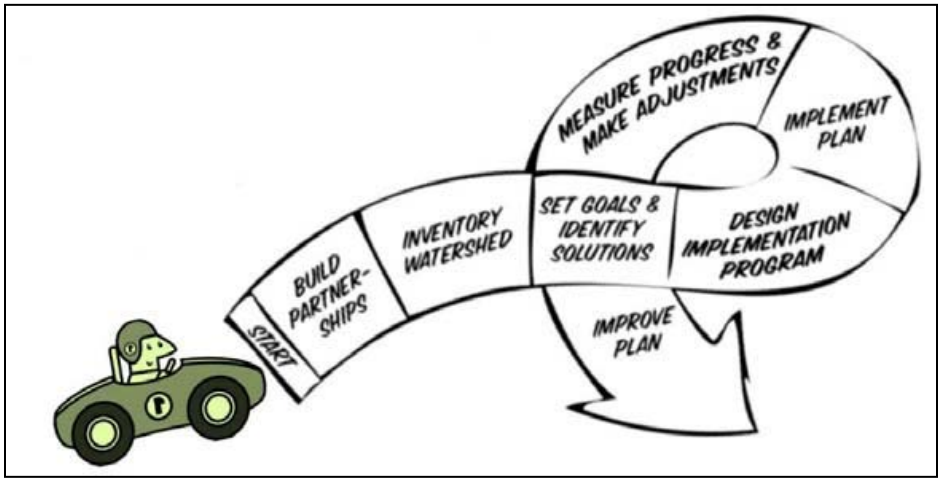
As part of the Government Partnerships Pillar planning process, a *Resource Guide* (**Appendix H**) was developed that lists contact information for governmental agencies within and outside the watershed that support the OWOW efforts. It provides a compilation of all the governmental organization contacts with ties to the Watershed including Federal, Tribal, and State agencies, and the local water agencies from the three counties within the Watershed's boundary. The Guide also contains key resources from documents like the *California Climate Adaptation Strategy* and the *California Water Plan Update*; tools for users like the *Water Energy Relationship Report and Water Equivalents Table*; key websites; applicable Federal and State laws for the water sector; and an A-to-Z list of key terms, acronyms and concepts. The *Resource Guide* contains valuable information that the Pillar members hope that SAWPA and its member agencies and stakeholders will find useful in promoting collaboration with agencies on future regional integrated projects and programs.

Luna Leopold, an early pioneer of water science, proclaimed: "The health of our waters is the principal measure how we live on the land." The Pillar hopes that the *Resource Guide's* useful information is measured by its frequent use and will ensure that periodic updates are conducted to help maintain its value.

## A Pillar's Path to Success

Every plan and the supporting processes to help enhance or refine a strategy must connect with its key components. But identifying these components can be challenging. This Pillar's path to develop a "planned" approach for OWOW 2.0 process success began with a simple seven step outline (**Table 5.12-1**) to document all the steps necessary for an "integrated planning" blueprint.

**Table 5.12-1 Seven Step Outline for Integrated Planning**



| | |
|---|---|
| 1 | Build Partnerships |
| 2 | Characterize the Watershed |
| 3 | Set Goals and Identify Solutions |
| 4 | Design an Implementation Program |
| 5 | Develop Watershed Plan Outline |
| 6 | Implement the Watershed Plan |
| 7 | Measure Progress and Make Adjustments |

Through Pillar meetings, relationships were built and partnerships were formed as the participants shared critical information and developed collaborative ideas. Over time, a new outline was created which reflected the increasing sophistication of the process.

## The Road Less Traveled

A roadmap metaphor (**Figure 5.12-1**) helped the Pillar further address the planning process and approach, and reflected both short and long-term Pillar goals to complement OWOW 2.0 goals. It also helped the Pillar reach consensus about the priorities of Pillar members, and recognized that a mechanism was needed to help forecast proposed projects for development. The roadmap, as a framework, helped the Pillar plan and coordinate information on the development of a proposed project or activity.

**Figure 5.12-1 Pillar Roadmap**

## OWOW 1.0 Phase…and Beyond

The Government Partnerships Pillar was established in 2011 as part of SAWPA's initial OWOW planning effort. It was formed based on a desire to forge improved working relationships among the various

governmental agencies in the watershed, and support interaction among watershed stakeholders and governmental agencies as new integrated projects and programs were advanced.

The two Pillar co-leads were selected from the U.S. Army Corps of Engineers and the Bureau of Reclamation. Several additional Federal, Tribal, State, and Local governmental agency representatives helped forge several key alliances to foster collaboration within the watershed. The multi-agency engagement in this Pillar's activities helped pave the way to enhance communications among the agencies and close any coordination gaps that may have existed.

Today, the OWOW 2.0 vision is for a sustainable watershed that is drought-proof, salt-balanced, and supports economic and environmental viability. SAWPA and its member agencies and stakeholders will be able to achieve that mission with continued coordination and communication with the various Federal, Tribal, State, and local government agencies that support and/or regulate planning and proposed project development in the watershed. Long-term collaboration among the many participating agencies, new synergies, and multi-beneficial projects must be developed to help maintain the Watershed's sustainability, now and into the future.

## Key Pillar Success Stories

### Fourteen meetings over two years

*Nine 'Themed' Presentations:*

- EPA's Web-based Watershed Planning Tools
- Community Collaborative Rain, Hail, & Snow Network
- Riverside County's Water & Dam Emergency Response and Army Corps of Engineers Dam Emergency Management Program Overview
- Caltrans Planning
- Regional Advanced Mitigation Planning
- Riparian Habitat Joint Venture
- Forest First
- EPA Climate Change Indicators

*Seven 'Big Ideas' Brainstormed:*

- Group Purchasing: leveraging member agencies' buying power for supplies and services
- Energy Savings: engaging member agencies in collaborative partnerships to reduce carbon footprints and save energy
- Site/Facility Security: sharing security expertise among the member agencies to protect personnel, equipment and facilities
- Climate Change/Adaptation: exploring improved joint agency planning through adaptive development and implementation strategies

- Water Conservation: collaborating and partnering among member agencies and other entities to save water through outreach and education
- Sustainability: promoting the goals of OWOW through member agencies promoting wise use of water and energy
- Right-of-Way Dual-Use: working with Caltrans and local governments to use land right-of-ways to collect and store more water in the watershed

*Four Video Reviews:*

- **Watershed** - http://www.youtube.com/watch?v=3mcHrzOImoY – a James Redford production that explores creating a water ethic in the West
- **Last Call at the Oasis** - http://www.youtube.com/watch?v=fLE3i92LkQk – a Jessica Yu production that addresses our world's growing water crisis
- **Climate change video series** - http://www.water.ca.gov/climatechange/video.cfm – a California Department of Water Resources series that addresses planning and adapting to effects of climate change
- **The Next Frontier: Engineering the Golden Age of Green** - http://www.thenextfrontiermovie.com/ – an award-winning documentary that addresses the use of fossil fuels and their impacts on our growing greenhouse gas emissions and possible mitigation strategies

## Next Steps for the Pillar

The Government Alliance Pillar will continue to ensure that Federal and State agencies effectively partner in the management of water and other resources within the watershed, and consider other Pillar's perspectives in their support of OWOW 2.0 goals and objectives. The Pillar will:

- Periodically publish updates of the *Resource Guide* and post them on SAWPA's website
- Conduct an email blast to continue contact with Pillar members
- Encourage active networking with SAWPA's planning team
- Ensure reminders are sent out well in advance of proposed future meetings

The Pillar should continue to meet at a minimum annually and preferably bi-annually. There are many dynamic regulatory and governmental activities in the watershed, so the need to continue and maintain vital program and activity communication is critical. To maintain these lines of communication, the Pillar will:

- Periodically develop agendas and host Pillar meetings to keep lines of communication open and relationships strong
- Leverage the *Resource Guide's* agency contacts, and assure that steps are taken to keep all information current

- Continue coordination with various governmental agencies, as appropriate, for all proposed projects, initiatives, and integrated water and related resources activities to help identify necessary environmental compliance requirements and or potential areas of conflict

**Prepared by:**

Bureau of Reclamation, Santa Ana Watershed Project Authority

**Project Contacts:**

Jack Simes, Bureau of Reclamation Project Manager
Eileen Takata, Army Corps of Engineers, Los Angeles District
Mark Norton, Santa Ana Watershed Project Authority Project Manager

Other Government Contacts are included in Resource Guide shown in the **Appendix H**.

# 5.13 Energy and Environmental Impact Response

Inland Empire Utilities Agency

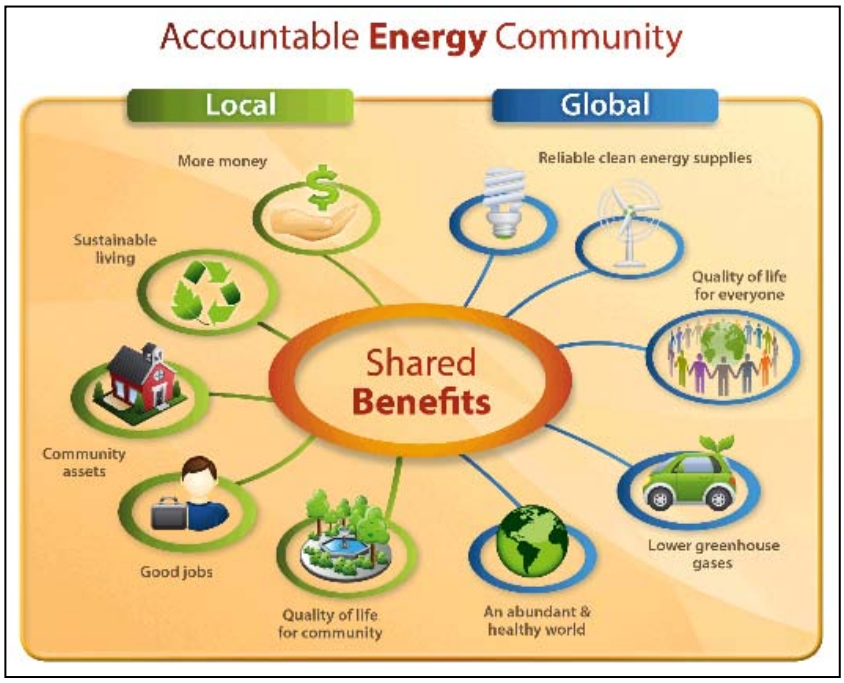
In 2005, the California Energy Commission investigated statewide energy use and found that water-related energy uses account for about 19 percent of all electricity and 30 percent of non-powerplant natural gas used within California. Since that finding, some progress has been made in identifying strategies for achieving benefits found at the nexus of water, energy and climate. In 2006, the California Public Utilities Commission (CPUC) conducted a number of workshops to explore whether – and how – the water-energy nexus should be included in the state's regulated energy programs. Concurrently, the California Department of Water Resources (DWR) began investigating how the linkages among water, energy and climate should be included in the state's water planning processes. Since that time, DWR has required consideration of the water-energy nexus in competition for Integrated Regional Water Management (IRWM) planning grants, and has also included elements of the state's water-energy-climate nexus in the California Water Plan.

In examining the water-energy nexus in greater detail, an important white paper was published in September 2012 by GEI Consultants entitled "California's Water Energy Nexus: Pathways to Implementation." The white paper was funded by the Water-Energy Team of the Governor's Climate Action Team (WET-CAT) for the purpose of facilitating the on-going dialogue among policymakers and regulators as to the types of actions that can be taken by California's water sector to help achieve the state's aggressive resource efficiency, economic and environmental goals.

GEI summarized key findings and recommendations that suggest that water and wastewater agencies have unique characteristics that could be leveraged through appropriate partnerships to provide significant benefits to the state's electric system. As a result of the sizeable energy impact by water and wastewater agencies, the GEI report indicates that Santa Ana Watershed Project Authority (SAWPA), as a water resources management agency, is uniquely positioned to collaborate with and help California attain its energy efficiency, renewable energy and greenhouse gas reduction goals. Many areas of the state, water and wastewater agencies may have the capacity through their lands, facilities and professional staff to generate significant new amounts of renewable energy through solar, biogas, wind and other sources. Other agencies have the flexibility to consider feasible changes for when and how they use energy that are consistent with maintaining reliable water deliveries and public safety.

The two overarching conclusions from GEI's white paper are:

- *The choices that the water and wastewater agency sector make to invest in energy efficiency and renewable energy generation, matter to California*
- *It is rare to have so much opportunity for making such a positive and powerful impact – improvements in energy efficiency, renewable energy generation and reduction in greenhouse gases – concentrated into one sector. It is an opportunity that cannot be ignored*



Under OWOW 1.0, a chapter was prepared by the Climate Change Pillar describing the impacts of climate change on the water resources-related projects. That chapter described the climate change impacts and various broad-based implementation strategies that the watershed should take to mitigate and adapt to these impacts. Under the OWOW 2.0 Plan, SAWPA reformed the Pillar as the "Energy and Environmental Impact Response" Pillar recognizing that each IRWM region needs to not only address climate change, but must also recognize and mobilize implementation actions to reduce energy demand and improve energy efficiencies in the water and wastewater industries in their areas. Craig Perkins, executive director of The Energy Coalition, a non-profit organization based in Irvine, California was named Co-chair of the new Energy and Environmental Response Pillar. Roy Herndon from Orange County Water District (OCWD) was named co-chair. The Pillar's work focused on: 1) energy outreach to the water and wastewater industries, and 2) development of new and updated climate change models and forecasting tools as supported by the U.S. Department of the Interior's Bureau of Reclamation (Reclamation).

# Water-Energy Projects

## The Energy Coalition

The Energy Coalition is a non-profit organization formed to develop and implement energy blueprints – the plans and strategies that integrate these energy efficiency practices to help schools, businesses, and governments. The Energy Coalition created The Energy Network, a program funded by the CPUC to provide a suite of services that increase participation in energy efficiency projects. The Energy Network's services are available to public agencies in the Southern California Edison and Southern California Gas service territories. A team of professionals is working through The Energy Network to develop a regional model for local government collaboration statewide to support accountable energy communities.

**Figure 5.13-1 Shared Benefits of an Accountable Energy Community**
(source: The Energy Coalition)

One specific area of focus for The Network is engaging water and wastewater agencies in energy efficiency projects through the development of aggressive energy management programs. While including the retrofit of aging infrastructure equipment, an ideal efficiency project will complete a system-wide optimization designed to reduce energy inputs throughout facility operations (see **Table 5.13-1**). With funding through the CPUC, the services offered to water districts and other public agencies are free of charge, and utilize an expedited project delivery model, cutting the time to construct in half for many projects and significantly reducing the completion costs. Technical, engineering, and project management services are also available to public agencies enrolled in The Energy Network program.

**Table 5.13-1 Energy Efficiency Measures for Water Management Facilities**

| Wastewater Facility Sample Measures | |
|---|---|
| Design and Control of Aeration Systems | Peak flow storage and/or intermittent aeration |
| | Dual impeller aerator (mechanical mixing) |
| | Integrated airflow control |
| | Automated SRT/DO Control (Solids Retention Time and Dissolved Oxygen) |
| | Respirometry for aeration control |
| | Off-gas monitoring and control |
| | Online monitoring and control of nitrification using nicotinamide adenine dinucleotide (NADH) |
| | Proprietary control systems |
| Blower and Diffuser Technology for Aeration Systems | High-speed gearless (turbo) blowers |
| | Single-stage centrifugal blowers with inlet guide vanes and variable diffuser vanes |
| | Ultra-fine bubble diffusers |
| | New diffuser cleaning technology |
| Innovative and Emerging Energy Conservation Measures for Selected Treatment Processes | Low-pressure high-output lamps for UV disinfection |
| | Automated channel routing for UV disinfection |
| | Membrane air scour alternatives |
| | Hyperbolic mixers |
| | Pulsed large bubble mixing |
| Energy Conservation Measures for Solids Processing | Vertical linear motion mixer |
| | Upgrade of multiple hearth furnaces to incorporate waste heat recovery/combustion air pre-heating |
| | Solar drying |
| **Water Distribution System Sample Measures** | |
| Supply and Conveyance | Install high efficiency pumps |
| | Shift distribution pumping to off-peak hours and utilize reservoirs when possible |
| | Shift water pumping from the summer months to other months |
| Water Treatment | Install high efficiency pumps |
| | Develop lower energy intensity water treatment methods |
| | Shift water treatment to off-peak and partial peak times |
| Distribution | Install high efficiency pumps |
| | Shift water pumping to off-peak and partial peak times |
| End-Use | Increase energy efficiency of water heating and pumping devices |
| | Reduce the use of once-through cooling, thereby slowing reliance on treated water supplies |
| | Save energy by conserving water |

By providing unbiased expertise and premium engineering services, The Energy Network addresses the common barriers that prevent many local governments and public agencies with limited resources from adopting energy saving measures. These new services will complement and support services provided by existing programs offered by the electric and gas utilities.

Under the first phase of a program specifically designed to work with water and wastewater agencies, The Energy Network is providing free technical, project management, financing and rebate information to cities, municipalities, and water agencies looking to pursue energy efficiency projects to improve facilities' performance and streamline capital improvement processes. The Network's technical staff, in

close collaboration with SAWPA, is conducting a number of outreach meetings to explain the program and engage water and wastewater agencies throughout the Santa Ana River Watershed (SARW).

The Energy Network will provide energy resources, expertise and technical assistance to multiple water and wastewater agencies to develop strategic energy management plans for municipal energy efficiency projects. The Network also offers assistance with securing an energy project master lease option to help agencies pay for projects that are beyond their current budget capacities. This private sector financing will enable participating agencies to pay for retrofits without up-front funding. The Energy Network will serve as a model for energy efficiency retrofit implementation and financing statewide. The following resources to the water and wastewater agencies in the SARW are being made available:

- Technical and project management support
- Competitive private sector funding
- Construction management support, including procurement and contractor coordination
- Aggregated procurement of equipment and construction services
- A data management platform that supports energy management and permitting
- Evaluation and assessment of energy efficiency opportunities to reduce operating costs

Multiple meetings among water and wastewater agencies throughout the SARW SARW were held with The Energy Network Project Manager James Ferro, with support of SAWPA staff, to explain these services and to explore opportunities to reduce energy consumption by water agencies within the watershed.

## Water-Energy Innovation Projects

A majority of public utility departments in the SARW encourage the implementation of projects that capture renewable sources of energy. These renewable energy projects are often recommended to businesses and homeowners through the use of financial incentives. However, water and wastewater agencies, both public and private, share the same benefits of renewable energy. Due to energy-intensive water infrastructure, such as pump stations and treatment facilities, water agencies implementing renewable energy collection systems benefit from considerable cost savings. These collection systems also assist in stabilizing the California Energy Grid by “giving back” to the grid.

Of those water agencies implementing a form of renewable energy, the most common water-energy innovation projects currently envisioned and being implemented are forms of solar and wind energy collection systems. These projects often range from modifications of wastewater treatment plant processes to installing windmills to utilizing solar panels that also provide shaded parking spaces. A few agencies are also exploring innovative, less conventional sources of renewable energy such as using food-waste to create energy to power their wastewater treatment plants, or mini-turbines installed in their water pipelines to create electricity. These renewable water-energy innovation projects not only

cut energy costs for municipal agencies, but are better for the environment. An overview of water-energy projects within the SARW are described in detail below.

### *Inland Empire Utilities Agency 'Go Gridless by 2020'*

The Inland Empire Utilities Agency (IEUA) is committed to building a better environment through better business practices. In addition to its LEED Platinum-level design administrative headquarters, IEUA is pursuing a progressive energy management strategy to be self-sufficient or 'gridless' by the year 2020. In 2008, IEUA installed 3.5 megawatts of solar power at its water recycling facilities and at the Inland Empire Regional Composting Facility. The solar energy saves IEUA hundreds of thousands of dollars a year on energy costs. In 2010 IEUA signed a 20-year Power Purchase Agreement with Anaergia Services to install, operate and maintain a 2.8-megawatt (MW) fuel cell system at the IEUA RP-1 Water Recycling Facility. Under the agreement, Anaergia is responsible for funding, design, construction, operation and maintenance of the system. IEUA will purchase power generated from the fuel cell plant at the agreed-upon price over the next 20 years, and use the heat generated from the process to heat the anaerobic digesters. The fuel cell plant will be fueled primarily with renewable biogas, making it the largest unit of its kind in the world. In 2012, IEUA installed 1 MW of wind energy at its northern water recycling plant. The treatment plant is located where a persistent wind source is available to drive a wind turbine, generating enough electricity to power the plant and provide an annual savings of more than $100,000 in electricity costs. Together, the existing and planned projects will generate 10+ megawatts of renewable energy for the agency.

### *Western Municipal Water District - Solar Power System*

The Western Riverside County Regional Wastewater Authority (WRCRWA), which is managed by Western Municipal Water District (WMWD), has more than 5,000 solar panels covering nine acres at the WRCRWA's wastewater treatment plant. This system can provide up to 1 MW of energy during peak energy use hours. WRCRWA is committed to utilizing renewable energy sources to help lower the amount of greenhouse gases released into the atmosphere.

The solar panels track the sun, increasing sunlight capture by up to 30 percent more than conventional fixed-tilt systems. At its peak, the solar panels provide 25 percent of the power needed to operate the wastewater treatment plant.

This will help reduce WRCRWA's energy costs as the price of electricity increases in the years to come. It also increases the reliability of the plant and protects the region against power outages by reducing the burden on the California electrical grid during peak demand.

### *The Metropolitan Water District of Southern California – Skinner Solar Array*

As part of an ongoing district-wide sustainability initiative, The Metropolitan Water District of Southern California activated a 10-acre solar power facility at its Robert A. Skinner Water Treatment Plant in Riverside County. The one-megawatt solar installation generates about 2.4 million kilowatt-hours (kWh) of clean, renewable energy a year.

### *Eastern Municipal Water District Solar Photovoltaic Renewable Energy Project*

A 500-kilowatt (kW) solar photovoltaic renewable energy facility was constructed at Eastern Municipal Water District's (EMWD) Administrative Campus to provide approximately 1 to 1.2 MWs for its Administrative Campus in the City of Perris. The site, adjacent to the I-215 freeway, provides high visibility for the project to the public. The panels are ground-mounted, with underground electrical transmission conduits, instrumentation conduits, and other related appurtenances.

### *EMWD Digester Gas Driven Fuel Cells*

These fuel cells allow EMWD to run some of its Moreno Valley and Perris Valley Regional Water Reclamation facilities during peak hours virtually free of charge, with no toxic emissions, cutting greenhouse gases by more than 10,600 tons annually—the equivalent of taking approximately 1,000 cars off the road for one year. The fuel cells use an electrochemical process that generates significantly less pollution than combustion technologies by converting the chemical energy in fuel (hydrogen) into electricity through a non-combustion process that is virtually emissions free. The conversion produces heat that can be used for cogeneration (cogen) or other processes and operates on a variety of fuels – including digester gas. The cogen process in a wastewater treatment plant is the simultaneous generation of electricity and recovery of usable heat from engines, fuel cells, microturbines, or other generation technologies. Recovered heat is often used to heat anaerobic digesters, which enhance the production of digester gas. This may then be used as a renewable fuel source within an EMWD wastewater treatment plant to power equipment or to generate electricity.

### *Elsinore Valley Municipal Water District Solar Project*

With increasing energy costs and California's requirement to become more reliant on renewable energy sources, Elsinore Valley Municipal Water District's (EVMWD) solar power project supplies enough energy – more than 1 million kWh of electricity a year – to run the District's Administration building, saving money, resources, and reducing carbon emissions. This project is part of the District's long-term plan to reduce overhead costs and, in turn, reduce costs for EVMWD customers.

### *Riverside Public Utilities Spherical and Steam-Powered Turbines*

Riverside Public Utilities (RPU) was selected by the California-Nevada Section of the American Water Works Association to receive its 2011 Outstanding Energy Management Award, for its in-system study of a water pipe that generates electricity. The award recognizes top water utilities whose energy management in operation of potable water supplies provides cost savings attributed to innovative, significant, and transferable techniques.

Developed through a partnership with Lucid Energy Technologies of Portland, Oregon, and Northwest Pipe Company of Vancouver, Washington, a portion of a gravity-fed water pipe is fitted with a vertical axis spherical turbine, which spins as water passes it, generating electricity. The world's first prototype unit was installed inside a 48-inch water pipe in Riverside in February 2010. Riverside was chosen as the pilot project city for this new technology based on RPU's progressive quest to find new renewable energy resources and the City's ongoing commitments to create a more sustainable and environmentally stable community.

The first generation system of the in-line power pipe produced a maximum of 7 kW of electricity at full flow on a continuous basis. Through monitoring, redesign, and installing prototypes, Northwest Pipe Co. and Lucid Energy have been able to increase that output to 20 kW with the third generation turbine that is currently in place. The third generation unit alone has already produced more than 23 megawatt-hours of energy.

RPU's newly acquired Clearwater Cogeneration Power Plant (Clearwater) was purchased from the City of Corona in 2010. Clearwater produces approximately 22 MWs from a natural gas-fired single combustion turbine generator, which is similar to those that RPU operates at its facilities. Additionally, Clearwater cogenerates an additional 8 MW of power by utilizing the heat produced by the gas-fired generator in boilers, which in turn create the steam that is needed to power a steam turbine generator on site. In addition to producing environmentally friendly power, Clearwater helps reduce energy procurement

costs for RPU, which helps the agency provide high quality, reliable power to its customers at the lowest rates possible.

The City Council authorized RPU to move forward with an agreement with Shoshone Renaissance LLC that provides 64 MW of renewable geothermal power resources for the city, increasing its renewable resources portfolio to 33 percent in 2011. Geothermal power plants utilize super-heated fluid from the Earth to create pressurized steam, which is used to turn the blades of a turbine that creates electricity. Compared to solar or wind generation sources (which don't produce energy at night or when there is no wind), geothermal plants provide reliable sources of energy for utilities to use for baseload needs. At full capacity, the 64 MW received through the new facility will provide 20 percent of Riverside's baseload.

### *San Bernardino Municipal Water District Methane Gas Generators*

The San Bernardino Municipal Water Reclamation Plant (WRP) reuses resources generated during the wastewater treatment processes. Since 2000, methane gas has been used as a renewable energy source to power two pump stations operated by San Bernardino Municipal Water District. In 2010, a co-generation facility was installed at the WRP which uses the methane gas produced during the treatment processes as a source of energy. This highly valuable energy source is used to fuel two 750-watt generators, which supply electricity to the WRP, minimizing the amount of electricity required to be purchased for WRP operations.

### *Irvine Ranch Water District Food Waste to Energy / Solar Project*

The Irvine Ranch Water District (IRWD) is evaluating several potential projects for renewable energy sources to be implemented as early as 2014. The IRWD Food Waste Energy Project evaluates the collection and use of pre-processed and liquefied food waste to increase digester gas production to be used to generate electricity. Equipment would include a food waste receiving station and microturbine generators. The IRWD Solar Program evaluates the potential for future solar projects, and various purchase structures including: IRWD-owned and -operated, a power purchase agreement, and a land lease to a solar developer at Jackson Ranch.

### *Cucamonga Valley Water District Solar Project*

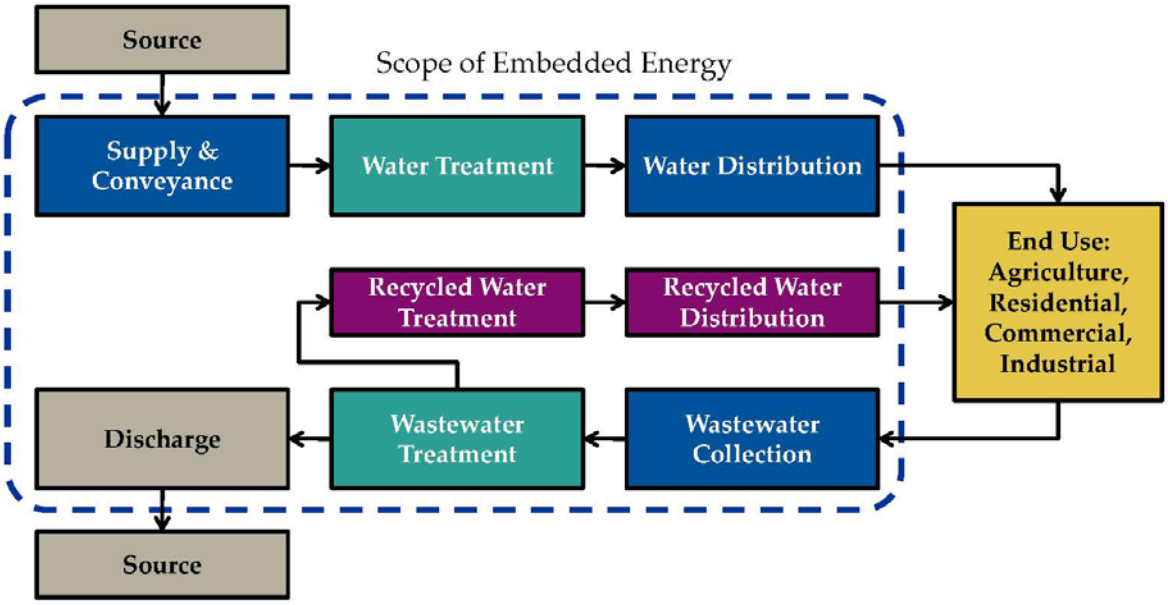
The Cucamonga Valley Water District (CVWD) joined with SolarWorld California to construct a new ground-mounted solar energy system and Environmental Learning Center in 2006. Designed to augment the energy needs of CVWD particularly during peak summer demand periods, the system also serves as an on-site example of clean energy production for the students who visit the Environmental Learning Center. It is innovatively designed to teach children from grades K-12 about their role in preserving the environment.

The solar system was designed in response to CVWD’s visionary approach to satisfy long-term energy needs, provide a hedge against rising electricity rates, and proactively preserve and protect the environment. Consisting of 1,416 modules, the 274 kW system annually generates 380,000 kWh. The system also eliminates the production of 240 metric tons of carbon dioxide per year, or the pollution an average car emits over 10,132 days. SolarWorld's proprietary panelization process, consisting of a factory-assembled design, allows for more efficient installation and virtually eliminates packaging.

CVWD has indicated that the project will ultimately reduce the required power load by 27 percent. As part of the Self-Gen Program, Southern California Edison defrayed a significant portion of the installation cost with a $720,000 rebate to CVWD.

### *City of Redlands Wastewater Treatment Plant Photovoltaic Array*

In 2011, the City of Redlands implemented a project to install a photovoltaic array on property located at the city's wastewater treatment plant (WWTP). The WWTP is a city-owned facility that operates 24 hours per day, 365 days per the year. It is a high-energy user, and can use as much as 239,000 kWh during a 32-day billing cycle. An Energy Efficiency and Conservation Block Grant project will contribute to other efforts designed to make this high-energy-use facility into a greener, leaner operation. Under this renewable energy project, the city would develop a scope of work and construction documents for competitive bid. The scope of work includes installation of a photovoltaic array on a piece of property referred to as the brine pond, which has a surface area of roughly 42,124 square feet on which to perform the installation. Project components of this installation are: 627 solar panels at 175 watts each; a 100-kW power inverter with AC/DC current disconnects; and other integration parts such as combiner boxes and MC connectors. The solar panel installation will yield an estimated system size of 113 kilowatts with an estimated output of 14,416 kWh per month. The city estimates the cost of the project to be $678,400 for the equipment and installation. This project will contribute to an overall improvement in energy efficiency of the WWTP.



## Future Opportunities

The Energy Network is also leading a water/energy nexus pilot project designed to facilitate the implementation of water efficiency projects that capture embedded energy savings. Many discussions on how to quantify embedded energy in water savings have occurred at the statewide level, yet little has been done to move forward on identifying the lost opportunities of doing nothing. The pilot project has brought together a team of experts from academia, the private sector, and the government throughout California to apply a scientifically robust energy intensity factor to a portfolio of water supplies at the watershed level. Using historical data collected from SAWPA member agencies, this metric will be applied to completed water efficiency measures and rebates issued within the watershed from SAWPA member agencies from 2010-2012. This data will be compiled and presented in the form of a report to the CPUC and other interested state agencies to support the inclusion of embedded energy rebates for water efficiency projects in the next program cycle.

The second phase of this project will integrate high energy intensity water efficiency measures into The Energy Network's offerings for public agencies to implement as part of their energy efficiency strategies through the Network's comprehensive project delivery method. The third and final phase of the pilot will result in the publication of a 'how-to guide' for public agencies looking to broaden their energy and water efficiency programs, including the identification of high energy intensity water efficiency projects that can result in significant energy savings for the state.

The Energy Coalition, in coordination with SAWPA, is also developing a white paper describing the increased opportunities that are available by capturing the embedded energy in the water use cycle.

**Figure 5.13-2 Scope of Embedded Energy** (Source: Navigant Consulting, Inc.)

In June 2013, the importance of this program came to light as news was announced that one of the major power generating facilities serving Southern California, the San Onofre Nuclear Generating Site (SONGS), would be decommissioned due to safety concerns. In late June 2013, SAWPA conducted an outreach and education program for retail water agency public information officers in SARW. With the assistance of the Governor's Office of Research, public message points and outreach graphics on the water-energy nexus were prepared, which focused on the message of "saving energy could be accomplished by saving water." The outcome of the meetings was the understanding that, while most Californians know about the importance of conserving water, many require a greater awareness of the importance of saving energy, and few know about the direct connection between saving both.

Saving water could help water and wastewater providers save energy which, in turn, saves consumers money. As a result, message points and graphics for outreach material were shared among the water retail agencies in SARW to mobilize for important summer requirements associated with the SONGS shutdown. This timely messaging by the water retail agencies in the watershed reflects an excellent example of collaboration and integration of water-energy nexus outreach messaging.

Also, in the past decade renewable energy projects have become increasingly efficient and popular sources of energy. Many wastewater treatment plants in the SARW are using fuel cells as a way to store energy and recycle the heat produced. Solar panels are being considered to provide energy to reduce operations costs have now become the norm. Windmills have not become as popular as solar or fuel cell technology, but have been implemented at a limited scale. This is primarily due to the limited reliable wind patterns in developed areas and possible concern with aesthetics. With several agencies researching and developing innovative sources of renewable energy, such as the mini-turbines placed in water pipelines and collecting energy produced during the wastewater treatment process, as well as

local energy rebates being offered by federal and state government, the probability of increased levels of reliable and renewable sources of energy is very likely. In the near future, one can expect to see more water agencies moving to be "gridless" through renewable energy projects.

# Climate Change Assessment

## Introduction

In 2009, the newly published OWOW Plan addressed the impacts of climate change on the SARW on a very broad scale based on the available science at the time. Climate change science has and continues to evolve; however, incontrovertible evidence suggests that changing weather patterns can have a profound impact on California and within the SARW. To help assess possible long-term effects, SAWPA and the Reclamation entered into a partnership in the Spring of 2011 under the SECURE Water Act (Title IX, Subtitle F of Public Law 111-11) through the U.S. Department of the Interior's WaterSMART (Sustain and Manage America's Resources for Tomorrow) program and used Reclamation's West-wide Climate Risk Assessment to help conduct a thorough climate change analysis for SARW.

In updating OWOW 1.0, SAWPA identified several tasks related to climate change that could benefit from Reclamation technical assistance. Results from Reclamation's climate change analysis addressed SARW's water supply and demand projections and can help identify necessary adaptation strategies in light of projected effects from climate change. Key findings in Reclamation's *Technical Memorandum (TM) No. 86-68210-2013-02: Climate Change Analysis for the Santa Ana River Watershed* (**Appendix F2**) were used to update OWOW 1.0's Chapter 5.9: Climate Change, and to evaluate new research information on climate change implications for SARW. That information was also used to help assess increased energy demand to comply with the state's mandated Assembly Bill (AB) 32, Global Warming Solutions Act, and to help ensure SARW's future water supply and demand needs are met.

SAWPA, its five member agencies, and key water sector stakeholders know that warmer temperatures, altered patterns of precipitation and runoff, and rising sea levels are, in all likelihood, going to continue to increase and may potentially compromise local and imported water supplies and SARW's environmental resources, and challenge sustainability of SARW communities. SARW's water sector awareness to these unfolding events and development of associated adaptation strategies will help water agencies assess impacts on local water supply, infrastructure, and imported water sources, including the State Water Project (SWP).

Responding to climate change within the SARW presents significant challenges. Climate change impacts and vulnerabilities will vary in each SARW sub-region, and the resources available to each water agency to effectively respond to climate change will also vary.

Regional solutions and integrated projects, such as those proposed through the OWOW 1.0 and 2.0 Call for Projects, are vital to SARW's future and key to addressing and developing necessary adaptation strategies to help combat effects of climate change.

The basis for this Chapter update is **Appendix F2**, as noted above, and the key findings extracted to help frame this update. Reclamation's TM explains the methods used to analyze potential implications of

changing climate, and how those implications might affect issues of importance to SAWPA and the SARW.

Chapter 1 of **Appendix F2** provides an introduction to the project and the study area, along with a summary of relevant previous studies. The development of climate projections and hydrology models can be found in Chapter 2. Chapter 3 provides projections for SARW's water supply and demand for water years 1951- 2009. These projections are summarized and highlighted below. An impact analysis was also conducted that focused on key areas of importance in SARW, and these results can be found in Chapter 4 of **Appendix F2**. Also, a tool to help SAWPA evaluate its water demand management is presented in Chapter 5, along with a case study of potential adaptation strategies. Finally in Chapter 6, uncertainties are addressed relative to SARW's climate change analysis. A SARW vulnerability assessment is included.

In light of climate change, prolonged drought conditions, potential economic growth, and population projections, a strong concern exists to ensure an adequate water supply will be available to meet SARW's future water demands. The goals from this analysis include: incorporating existing regional and local planning studies within the watershed; sustaining the innovative "bottom up" approach to regional water resources management planning; ensuring an integrated, collaborative approach; using science and technology to assess climate change and greenhouse emissions effects; facilitating watershed adaptation planning; and expanding outreach to all major water uses and stakeholders.

## Projections for the Watershed

Global climate models (GCMs) used in this **Appendix F2** were downscaled to 12-kilometer grids to make them relevant for regional analysis. The downscaled GCM projections are produced by internationally recognized climate modeling centers around the world and make use of greenhouse gas (GHG) emissions scenarios, which include assumptions of projected population growth and economic activity.

Future water supply was analyzed for the SARW using the downscaled GCMs and a hydrologic model to project streamflow using 112 different projections of future climate. Projected climate variables, including daily precipitation, minimum temperature, maximum temperature, and wind speed were included, as well as historical model simulations over the period 1950-1999. Final products include data sets at key locations for precipitation, temperature, evapotranspiration, April 1 Snow Water Equivalent (SWE), and streamflow.

These data sets were used to answer the following frequently asked questions regarding impacts of climate change on the watershed:

### *Will surface water supply decrease?*

- Annual surface water is likely to decrease over future periods.
- Precipitation shows somewhat long-term decreasing trends.
- Temperature will increase, which is likely to cause increased water demand and reservoir evaporation.
- April 1$^{st}$ SWE will decrease.

*Will groundwater availability be reduced?*

- Groundwater currently provides approximately 54 percent of total water supply in an average year, and groundwater use is projected to increase over the next 20 years.
- Projected decreases in precipitation and increases in temperature will decrease natural recharge throughout the basin.
- Management actions such as reducing municipal and industrial water demands or increasing trans-basin water imports and recharge will be required to maintain current groundwater levels.
- A basin-scale groundwater screening tool was developed to facilitate analysis of basin-scale effects of conservation, increasing imported supply, changing agricultural land use, and other factors on basin-scale groundwater conditions.

*Is Lake Elsinore in danger of drying up?*

- Lake Elsinore has less than a 10 percent chance of drying up by 2099.
- In the 2000-2049 period, Lake Elsinore has a greater than 75 percent chance of meeting the minimum elevation goal of 1,240 feet (ft).
- In the future period 2050-2099, Lake Elsinore has less than a 50 percent chance of meeting the minimum elevation goal of 1,240 ft.
- There is less than a 25 percent chance that Lake Elsinore will drop below low lake levels (1,234 ft) in either period.
- The EVMWD project does aid in stabilizing lake levels; however, for the period 2050-2099, additional measures will likely be required to help meet the minimum elevation goal of 1,240 ft.

*Will the region continue to support an alpine climate and how will the Jeffrey Pine ecosystem be impacted?*

- Warmer temperatures will likely cause Jeffrey pines to move to higher elevations and may decrease their total habitat.
- Forest health may also be influenced by changes in the magnitude and frequency of wildfires or infestations.
- Alpine ecosystems are vulnerable to climate change because they have little ability to expand to higher elevations.
- Across the State, it is projected that alpine forests will decrease in area by 50 to 70 percent by 2100.

*Will skiing at Big Bear Mountain Resorts be sustained?*

- Simulations indicate significant decreases in April 1$^{st}$ snowpack that amplify throughout the 21$^{st}$ century.
- Warmer temperatures will also result in a delayed onset and shortened ski season.

- Lower elevations are most vulnerable to increasing temperatures.
- Both Big Bear Mountain Resorts lie below 3,000 meters and are projected to experience declining snowpack that could exceed 70 percent by 2070.

*How many additional days over 95°F are expected in Anaheim, Riverside and Big Bear City?*

- All the climate projections demonstrate clear increasing temperature trends.
- Increasing temperatures will result in a greater number of days above 95°F in the future.
- The number of days above 95°F gets progressively larger for all cities advancing into the future.
- By 2070 it is projected that the number of days above 95°F will quadruple in Anaheim (4 to 16 days) and nearly double in Riverside (43 to 82 days). The number of days above 95°F at Big Bear City is projected to increase from 0 days historically to 4 days in 2070.

*Will floods become more severe and threaten flood infrastructure?*

- Simulations indicate a significant increase in flow for 200-year storm events in the future.
- The likelihood of experiencing what was historically a 200-year event will nearly double (i.e. the 200-year historical event is likely to be closer to a 100-year event in the future).
- Findings indicate an increased risk of severe floods in the future, though there is large variability between climate simulations.

*How will climate change and sea level rise affect coastal communities and beaches?*

- Climate change will contribute to global sea level rise (SLR) through melting of glaciers and ice caps and thermal expansion of ocean waters, both of which increase the volume of ocean water.
- Regional SLR may be higher or lower than global SLR due to effects of regional ocean and atmospheric circulation.
- Average sea levels along the Southern California coast are projected to rise by 5 to 24 inches by 2050 and 16 to 66 inches by 2100.
- SLR is likely to inundate beaches and coastal wetlands and may increase coastal erosion. Effects on local beaches depend on changes in coastal ocean currents and storm intensity, which are highly uncertain at this time.
- SLR will increase the area at risk of inundation due to a 100-year flood event.
- Existing barriers are sufficient to deter seawater intrusion at Talbert and Alamitos gaps under a 3-foot rise in sea levels. However, operation of barriers under SLR may be constrained by shallow groundwater concerns.

All these Frequently Asked Questions and their answers were documented in a series of fact sheets that supplement this analysis; they are presented as **Appendix F1** to this chapter.

## Climate Change Analysis Methodology

Reclamation conducted an extensive literature review relevant to SARW, and also consulted with IEUA about their 2006 work with the RAND Corporation and the National Science Foundation that was used to prepare the Climate Change chapter for the SARW's 2010 OWOW 1.0 Plan. The RAND report evaluated case studies addressing water management decision-making under conditions of abrupt climate change.

Under the OWOW 1.0 Plan's Climate Change chapter, the IEUA's 2005 Urban Water Management Plan (UWMP) was used to create a baseline case for water management. That plan emphasized development of local supplies and a reduced dependence on imported water supplies.

Under base-year conditions, approximately 70 percent of the water supplies come from local sources (e.g., groundwater, recycled water, and desalted groundwater supplies). These ratios of potential water supply sources are relatively common throughout SARW, but in some regions are less so, and some are more dependent on imported water. The UWMP projected that IEUA would be able meet nearly 80 percent of its service area water demand by 2025.

The RAND study showed that IEUA's 2005 UWMP performed well under many potential climate change scenarios. Still, after four years of research, SARW faces significant risk to its water supply sources if nothing more is done now or in the future, especially to develop additional local supplies.

The core vulnerability identified from the UWMP model run was the region's continued reliance on imported water supply; climate change scenarios show that imported supply is likely to be severely impacted by declines in statewide precipitation. The most cost-effective scenarios were those which included significant improvements in local water use efficiency along with the development of additional conjunctive use and recycled water programs.

For the OWOW 2.0 Plan Climate Change evaluation, **Appendix F2**, Reclamation reviewed a large body of research that has been conducted over the past ten or more years on climate change and how the western United States might be affected. Most of this research has focused on large-scale implications (for example, over the western United States), while providing limited regional scale information. The following section summarizes research that is relevant to the SARW, and shows that although these results are applicable, additional research was required – through this Basin Study – to evaluate smaller scale, site specific, climate change impacts.

Reclamation also used a combined physical and statistical modeling approach for the climate change research. Specific details on these approaches can be found in the report.

Observed trends in hydroclimatology over the western United States will likely have significant impacts on water resources planning and management. There have been preliminary efforts by agencies managing California's water resources to incorporate climate change research into their planning and management tools, including preliminary modeling studies of potential impacts of climate change to operations of the SWP and Central Valley Project, Delta water quality and water levels, flood forecasting and evapotranspiration rates.

Weather projections for SARW, reflective of climate changes predicted by the scientific community's global climate models, were developed. That data was used with a water management model to evaluate how various water management scenarios for the region would perform under different scenarios of climate and other management options.

The probable scenarios affecting water supplies in SARW included increased temperature but variable precipitation levels. It also was recognized and confirmed by Reclamation's analysis that the statewide climate trends would likely result in reduced snowpack and runoff amounts, which would, in turn, reduce the amount of water that is likely to be available for water imports to the region.

## Water Supply and Demand Summary

**Table 5.13-2** shows a summary of the projected effects of climate change on a variety of hydroclimate metrics for three future periods (above the most downstream location, Santa Ana River at Adams St. Bridge). **Table 5.13-3** shows a summary of projected water demands out to 2050.

**Table 5.13-2 Summary of Effects of Climate Change on Supply**

| Hydroclimate Metric (change from 1990's) | 2020's | 2050's | 2070's |
|---|---|---|---|
| Precipitation (%) | 0.67 | -5.41 | - 8.09 |
| Mean Temperature (%) | 1.22 | 3.11 | 4.1 |
| April 1st SWE (%) | -39.93 | -80.4 | -93.07 |
| Annual Runoff (%) | 2.6 | - 10.08 | -14.61 |
| December-March Runoff (%) | 9.82 | - 3.01 | -6.38 |
| April-July Runoff (%) | -6.35 | - 25.24 | -31.39 |

**Table 5.13-3 Summary of Water Demand for the Santa Ana River Watershed**

| | 1990 | 2000 | 2010 | Present | 2020 | 2030 | 2040 | 2050 |
|---|---|---|---|---|---|---|---|---|
| **Demand (MAFY)** | **.0924** | **1.121** | **1.298** | **1.339** | **1.503** | **1.723** | **1.958** | **2.178** |

Imported water for the SARW will also likely be affected by the changing climate. The 2011 SWP Reliability report projects a temperature increase of 1.3° to 4.0° F by mid-century and 2.7° to 8.1° F by the end of the 21st century. It predicts that increased temperatures will lead to less snowfall at lower elevations and decreased snowpack. By mid-century it predicts that Sierra Nevada snowpack will reduce

by 25 to 40 percent of its historical average. Decreased snowpack is projected to be greater in the northern Sierra Nevada, closer to the origin of SWP water, than in the southern Sierra Nevada. Furthermore, an increase in "rain on snow" events may lead to earlier runoff.

Given these changes, a water shortage worse than the 1977 drought could occur one out of every six to eight years by the middle of the 21st century and one out of every two to four years by the end of 21st century. Also, warmer temperatures might lead to increased demand. This factor, combined with declining flows, will likely lead to decreased carryover storage from year to year. Alternative water supply options, such as recycled water, rainwater harvesting, and desalination may need to be relied upon in order to meet the continually growing demand.

## Sea Level Rise Impacts

Climate change will contribute to global SLR through melting of glaciers and ice caps and thermal expansion of ocean waters, both of which increase the volume of water in the oceans. Regional SLR may be higher or lower than global SLR due to effects of regional ocean and atmospheric circulation.

California's 2,000 miles of coastline has experienced just under eight inches of sea level rise over the past decade, a number that is likely to increase drastically as the climate continues to change. Critical infrastructure, such as roads, hospitals, schools, emergency facilities, wastewater treatment plants, power plants, and more will also be at increased risk of inundation, as would vast areas of wetlands and other natural ecosystems.

Flooding and erosion already pose a threat to communities along the California coast and there is compelling evidence that these risks will increase in the future. In areas where the coast erodes easily, SLR will likely accelerate shoreline recession due to erosion. Erosion of some barrier dunes may expose previously protected areas to flooding.

OCWD conducted a study to evaluate the potential effects of projected sea level rise on coastal Orange County groundwater conditions. Two locations were selected near the Talbert and Alamitos seawater intrusion injection barriers for analysis. The model for the analysis used data from well logs, aquifer pump tests, groundwater elevation measurements, hand-drawn contour maps, geologic cross sections, water budget spreadsheets, and other data stored in OCWD's Water Resources Management System database.

The results showed that increasing temperatures will melt ice sheets and glaciers and cause thermal expansion of ocean water, both of which will increase the volume of water in the oceans and thus contribute to global mean SLR. Regional SLR may be higher or lower than global mean SLR due to regional changes in atmospheric and ocean circulation patterns. Regional mean sea level along the Southern California coast is projected to rise by 1.5 to 12 inches by 2030, 5 to 24 inches by 2050, and 16 to 66 inches by 2100.

Inundation due to SLR is likely to reduce the area of beaches and wetlands along the Southern California coast. In addition, SLR is likely to increase erosion of sea cliffs, bluffs, sand bars, dunes, and beaches

along the California coast. However, the overall effects of climate change on local beaches will depend on changes in coastal ocean currents and storm intensities, which are less certain at this time.

SLR is likely to increase the coastal area vulnerable to flooding during storm events. Also, detailed analysis carried out by OCWD found that the Talbert Barrier would be effective at preventing seawater intrusions through the Talbert Gap under a 3-foot sea level rise. In the case of the Alamitos Barrier, seawater intrusion through the Alamitos Gap would likely be prevented once current plans to construct additional injection wells are implemented. At both barriers, however, shallow groundwater concerns could limit injection rates and thus reduce the effectiveness of the barriers in preventing seawater intrusion under rising sea levels.

## Addressing Climate Change

Addressing climate change in OWOW 2.0 provides SAWPA staff, the OWOW Steering Committee, OWOW Pillars, and SARW's water sector stakeholders with specific information necessary to plan, assess, and rank proposed IRWM projects. These proposed projects must address reductions to greenhouse gas (GHG) emissions within their water management activities. Projects are given a performance measure to help determine how effectively criteria are addressed, which helps with the ranking process.

Proposed projects that could be funded under the DWR IRWM Proposition 84 grant program and other funding programs can help adapt or mitigate effects from climate change, as they are required to track the effectiveness and performance of GHG emissions during and after implementation and construction.

SAWPA is a member in good standing with the California Climate Action Registry, and encourages SAWPA's member agencies and water sector partners to also do the same. SAWPA also continuously tracks legislative developments at the Federal and State level that deal with climate change, especially as it relates to IRWM planning.

SAWPA and key watershed stakeholders continuously analyze current, past, and or proposed legislation and policies relative to the water sector, and the context of Executive Orders (EO), such as EO S-3-05, the California Global Warming Solutions Act of 2006 (AB 32); Senate Bill 97, the California Environmental Quality Act (CEQA) and GHG Emissions; and EO S-13-18, Climate Adaptation Strategy. The following list of publications, updates, and presentations, relative to California and climate change, have been reviewed and are continuously being monitored.

- Update to the Climate Change Scoping Plan, California Air Resources Board (2013)
- California Climate Adaptation Strategy, California Natural Resources Agency (2013 Update)
- Preparing for New Risks: Addressing Climate Change in California's Urban Water Management Plans, University of California - Berkeley and DWR (June 2013)
- Sea-Level Rise for Coasts of California, Oregon, and Washington: Past, Present, and Future, The National Academies Press (June 2012)
- Atmospheric Rivers, Floods, and Climate Change, DWR (January 2012)

- Climate Change and Integrated Regional Water Management in California, University of California - Berkeley and DWR (June 2012)
- Climate Change, Extreme Weather, and Southern California Floods, DWR (January 2012)
- Draft Climate Action Plan Phase 1: Greenhouse Gas Emissions Reduction Plan, DWR (March 2012)
- Proposition 84 and 1E Guidelines Update, DWR (November 2012)
- California Adaptation Planning Guide, California Emergency Management Agency and Natural Resources Agency (July 2012)
- Climate Change Handbook for Regional Water Planning, DWR (November 2011)
- Water & Climate Change Adaptation Symposium: From the Sierra to the Ocean, DWR (October 2011)
- Annual Climate Change Reports, DWR (2008, 2009, 2010, & 2011).

The following table shows additional portions of the OWOW 2.0 planning efforts that address climate change.

**Table 5.13-4 Climate Change Information Included in OWOW Plan**

| OWOW Plan Section | Climate Change Information Included |
|---|---|
| SARW Description | Describes likely climate change impacts in SARW, determined by a vulnerability assessment. |
| OWOW Objectives | Adaptation to climate change:<br>• Addresses adapting to changes in the amount, intensity, timing, quality and variability of precipitation, runoff, and recharge.<br>• Considers SLR effects on water supply and other water resource conditions (e.g., recreation, habitat) and identify suitable adaptation measures. Consider the Ocean Protection Council's SLR Policy.<br><br>Reducing emissions (mitigation of GHG):<br>• Reduces carbon consumption, embedded energy in water, and GHG emissions.<br>• Strategies adopted by California Air Resources Board in its AB32 Scoping Plan, including innovative applications.<br>• Options for carbon sequestration where options are integrally (directly or indirectly) tied to OWOW objectives. |
| Resource Management Strategies | Identifies and implements adaptation strategies that address SARW specific or local climate change contributions or impacts. |

| | |
|---|---|
| Project Review Process | Includes these factors:<br>• Contributes to adapting to climate change; and<br>• Contribution to reducing GHGs, compared to the alternative. |
| Local Water Planning to OWOW | Considers and incorporates water management issues and climate change adaptation and mitigation strategies from local plans into OWOW. |
| Relation to Local Land Use Planning | Demonstrates information sharing and collaboration, with regional land use planning in order to manage multiple water demands through the state (as described in CWP Update 2009), adapts water management systems to climate change, and potentially offsets climate change impacts to water supply. |
| Plan Performance and Monitoring | Contains policies and procedures that promote adaptive management. |
| Coordination | Considers the following:<br>• Stay involved in the Natural Resources Agency's California Adaptation Strategy process, and<br>• Join The California Registry (www.theclimateregistry.org) |

## Greenhouse Gas Reduction

Climate change threatens California's natural environment, economic prosperity, public health, and quality of life. Recognizing the need for action, California has put in place ambitious emission reduction goals in the form of AB 32. By requiring in law a reduction in GHG emissions, California has set the stage to transition to a sustainable, clean energy future, and has put climate change mitigation on the national agenda, spurring action by many other states. AB 32 directly links anthropogenic GHG emissions and climate change, provides a timeline for statewide GHG emissions reduction, requires quantitative accounting of GHG emissions, and enforces disclosure of GHG emissions from every major sector in the state.

AB 32 requires that every major sector in California reduce its GHG emissions to the 1990 levels by 2020, and to 80 percent below the 1990 levels by 2050, shown in **Figure 5.13-3**. These targets were developed from the levels of reduction climate scientists agree is required to stabilize our climate. The red line represents the projected GHG emissions out to 2050, if no action is taken. In order to reach the GHG emissions target set by AB 32 for 2020, a reduction of approximately 30 percent is required from the 'no action' scenario.

**Figure 5.13-3 AB 32 GHG Emission Reduction Targets**

Each water agency must address its carbon footprint to help the region meet the compliance requirements spelled out in AB 32. GHG emissions related to water consumption in the region must be continually measured and reported. A GHG Emissions Calculator developed by Reclamation will help the water sector meet these mandated requirements that drive compliance with projected GHG targets out to 2050. The Calculator allows users within the SARW to easily and quickly evaluate how their water management decisions affect their water demand, energy use, and GHG emissions. A TM on the GHG Emissions Calculator is included as an **Appendix J** to this report.

The TM explains the methods used to develop the calculator and provides instructions on how to use it by introducing examples. The examples focus on the SARW and demonstrate how to develop a GHG emissions baseline, evaluate what actions are required to meet specific GHG emission reduction goals, and illustrate how the GHG Emissions Calculator can be used to analyze projects.

The GHG analysis was designed to take advantage of best available datasets and modeling tools and to follow methodologies documented in peer-reviewed literature. However, there are a number of analytical uncertainties that are not reflected in Reclamation's study results, including uncertainties associated with analytical areas that can be grouped under two categories—climate projection information, and assessing hydrologic impacts that inform many of the Basin Study FAQs.

OWOW 2.0 has taken steps in planning for climate change by examining current climate change projections to determine potential impacts, assessing water resource vulnerabilities, and developing a series of strategies that can be used in projects to adapt to climate change and mitigate GHGs.

The table below lists suggested implementation actions for SARW stakeholders to apply that can help reduce energy consumption and ensure AB 32 Global Warming Solutions Act compliance.

**Table 5.13-5 Implementation Actions to Reduce Energy Consumption**

| Action | Ways and Means |
|---|---|
| Inventory the Water Sector | Calculate the watershed's carbon footprint |
| Promote Energy Conservation | Use appliances and vehicles that are efficient; weatherization; implement temperature controls (on A/C and heating units); turn off lights; install CFP bulbs; install LCD computer screens; and use natural light. |
| Promote Water Conservation | Reduce urban and ag water demands; build resilient communities; and integrate water resources management practices; and promote project collaboration and partnerships. |
| Promote Alternative Energy Use | Install solar, wind, geothermal, tidal, and biomass fuel capacity; and implement any hydropower capabilities. |
| Implement Offsets | Purchase carbon offsets; plant trees; promote innovative approaches and solutions that foster community vitality, environmental quality, and economic prosperity. |
| Review or Implement Effective Policies | Conduct a gap analysis on the watershed's policies on dealing with GHG emissions; create an energy solutions campaign - save energy, reduce carbon footprint; review applicable laws and ordinances; and promote and implement energy efficiencies and sound conservation practices. |

## Vulnerabilities

To help determine potential watershed vulnerabilities, the Energy and Environmental Impact Response Pillar assessed the Reclamation Climate Change Analysis and all applicable climate change technical data compiled about the SARW and its projected outlook through the year 2099. Reclamation used existing or new climate change models and other resources to help look beyond what was described in OWOW

1.0 and evaluate the amount, intensity, quality, variability of runoff, recharge, and imported water deliveries to the watershed that will potentially result from climate change.

Climate change is projected to affect many aspects of water resources management in the SARW. A critical first step to help prevent and/or mitigate those impacts is identifying key water sector vulnerabilities. Below is a summary of key vulnerabilities relative to the SARW:

**Water Supply**

- Insufficient local water supply
- Increased dependence on imported supply
- Inability to meet water demand during droughts
- Shortage in long-term operational water storage capacity

**Water Quality**

- Poor water quality
- Increased water treatment needs

**Flooding**

- Increased flash flooding and inland flooding damage
- Increased coastal flooding and inundation of coastal community storm drains
- Damage to coastal community sewer systems from sea level rise

**Ecosystem and Habitat**

- Damage to coastal ecosystems and habitats
- Adverse impacts to threatened and sensitive species from reduced terrestrial flows and SLR

Direct coordination with OCWD on SLR modeling in Orange County was also conducted to help assess potential impacts to their seawater intrusion barrier infrastructure and groundwater basins. Another part of critical criteria in addressing SARW's vulnerabilities is dealing with GHG emissions from operations of construction equipment, passenger vehicle trips during construction and operation, transportation of construction materials and equipment, transportation of material inputs and output for operations and maintenance activities, generation of electricity used for project operations, and waste generation and disposal of materials during construction and operations.

## Climate Change Adaptation Strategies

### *OWOW Implementation Activities*

Identifying SARW's vulnerabilities helps establish a foundation for SAWPA staff, its member agencies and key stakeholders to implement actions and employ resource management strategies necessary to address, adapt to, and mitigate the projected effects of climate change. OWOW's Resource Management Strategies, as identified in the OWOW 1.0 Plan and the follow-up implementation activities under the OWOW 2.0 Plan, are detailed in the two tables below.

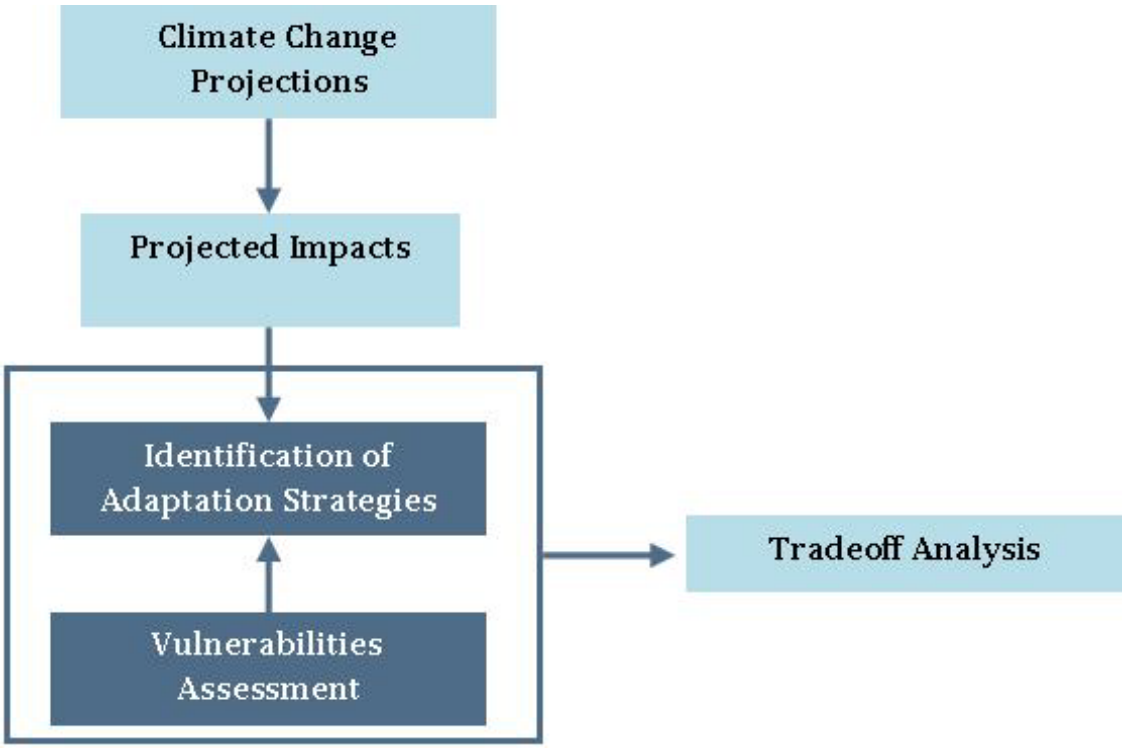
**Table 5.13-6 OWOW 1.0 Resource Management Strategies**

| OWOW 1.0 Strategy | Description |
|---|---|
| Understand that the past is not the future | Planning within the SARW must include consideration of the potential impacts of climate change, such as reduced precipitation, more intense storm patterns, increased flooding, reduced snow pack decreasing the reliability of imported water, great evaporation of surface water, sea level rise and associated impacts of coastal groundwater basins, and increased stress on natural habitats. |
| Develop watershed-wide programs | Time, money and water can be saved though coordinated program implementation with the SARW. |
| Incorporate climate considerations into land use planning | The development of SmartGrowth Communities, the implementation of Low Impact Development, and improved water efficiency standards will play a significant role in helping the watershed adapt to climate change impacts. |
| Factor in flood and fire management in planning decisions | The steep mountains and alluvial flood plans of the watershed, combined with its historical proclivity towards intense storm events, makes the region more vulnerable to climate change induced flooding and fires, as the intensity of flood and fire events may increase further. |
| Protect and restore aquatic ecosystems | The watershed has a rich array of biological resources that are critical to the quality of life in the region, Healthy ecosystems are more resistant to climate impacts, and enhancement of these systems provide other benefits including water quality, recreation, and flood protection. |
| Make water use efficiency and local water supply development a top priority | Increase investment in water use efficiency, recycled water, stormwater capture, and groundwater storage are vital to the long-term reliability of water supplies for the Watershed. |
| Promote investment in renewable energy, building efficiency, and vehicle efficiency | Transportation, power generation, and heating are primary sources of controllable carbon emissions, and constitute early implementation opportunities for the reduction of greenhouse gases. Wind and solar energy implementation could become significant sources of renewable energy. |

| | |
|---|---|
| Recognize the energy intensity of water supplies | Development of local supplies is acknowledged by the California Air Resources Board as a core adaptation strategy, as well as a way to reduce greenhouse gas emissions under California's AB 32 Scoping Plan. |

The following climate adaptation strategies were developed through a consultative process among Reclamation, SAWPA staff, and three members of the Energy and Environmental Impact Response Pillar. By identifying SARW's vulnerabilities (listed as a 'checklist' in **Appendix F3**), SAWPA staff, its member agencies, and key water sector stakeholders developed the adaptation strategies listed below that will be addressed in OWOW 2.0 Plan activities.

**Table 5.13-7 OWOW 2.0 Implementation Activities**



| OWOW 2.0 Implementation Activities | Description |
|---|---|
| Reduce demand | Promote the State's 20 x 2020 Water Conservation Plan in the watershed. |
| Improve operational efficiency | Promote systems reoperations, water transfers, improved local and regional water conveyance projects, reduction in energy consumption, and water transfers. |
| Increase water supply | Promote conjunctive management and groundwater storage; consider brackish and ocean desalination opportunities and more recycled water use, and local and regional surface storage opportunities. Identify watershed supply sources and increase storage capacity, and improve surface water operating efficiencies. |
| Land fallowing | Implement land-use policies that address and reduce agriculture and urban water use; improve flood and fire risk management; identify ecosystems vulnerabilities, and ways/means to improve water quality. Reduce agriculture and landscape water demand, promote xeriscape, and improve water supply reliability. |
| Reduce coastal infrastructure threats | Plan for SLR; optimize coastal infrastructure operations; maintain and improve infrastructure; and reduce flooding impacts on habitat and water quality. |
| Resource stewardship | Improve management of watershed lands, wildlife, and water resources |

| | |
|---|---|
| | through conservation, preservation, and ecosystem restoration. |
| Improve water quality | Improve drinking water treatment, distribution, and groundwater use. Improve stormwater capture practices; address urban landscape improvements and urban runoff management; improve salinity management practices; implement groundwater remediation and pollution prevention practices. |
| AB 32 compliance | Develop methodology for quantifying energy intensity of SARW water supplies and uses. Perform carbon footprint assessment and use the GHG Calculator Tool to identify additional opportunities for reducing carbon emissions. |
| Public education | Increase public outreach and education through the OWOW process |

### *Tradeoff Analysis*

Based on the OWOW 2.0 Plan Energy and Environmental Impact Response Pillar's review and analysis of Reclamation's Climate Change Analysis TM, the SARW is potentially highly sensitive to climate change, with a particular vulnerability to changes in precipitation, temperature, evapotranspiration, snow water equivalent, and streamflow. A Tradeoff Analysis (seen below) was employed to assess the various climate change adaptation strategies noted in the OWOW 2.0 Plan update.

**Figure 5.13-4 Tradeoff Analysis Methodology**

Adaptation strategies (listed in **Table 5.13-8**) were cross-referenced with the vulnerability issues, discussed above, to determine the number and type of climate change vulnerabilities that can be addressed. This interaction is shown in the table below.

**Table 5.13-8 Adaptation Strategies to Address Climate Change Vulnerabilities**

| | | Vulnerability | | | |
|---|---|---|---|---|---|
| | | **Water Supply** | **Water Quality** | **Flood** | **Ecosystem** |
| **Adaptation Strategies** | Reduce Demand | ✓ | ✓ | - | ✓ |
| | Improve Operational Efficiency | ✓ | ✓ | ✓ | ✓ |
| | Increase Water Supply | ✓ | ✓ | - | ✓ |
| | Land Fallowing | ✓ | ✓ | - | ✓ |
| | Reduce Coastal Infrastructure Threat | - | ✓ | ✓ | ✓ |
| | Resource Stewardship | ✓ | ✓ | ✓ | ✓ |
| | Improve Water Quality | ✓ | ✓ | - | ✓ |
| | AB32 Compliance | ✓ | ✓ | ✓ | ✓ |
| | Public Education | ✓ | ✓ | ✓ | ✓ |

In this table, the adaptation strategy addresses vulnerability by marking with a checkmark '✓ '. Analysis of this table demonstrates that four adaptation strategies – improve operational efficiency, resource stewardship, AB32 compliance, and public education – would address the four key vulnerabilities in the watershed.

These four adaptation strategies collectively form what is referred to as the 'no regrets strategy,' a strategy which argues that energy-saving measures should be undertaken immediately to help reduce climate change impacts. Such a strategy is one that would provide benefits in the present while also reducing vulnerability to future climate change impacts. If immediately implemented, such a strategy may provide some benefit even under the uncertainty of climate change projections. Specific actions under the 'no regrets strategy' are listed below.

**Table 5.13-9 Proposed Actions Under a 'No Regrets Strategy'**

| | Proposed Action | | | |
|---|---|---|---|---|
| | Improve Operational Efficiency | Resource Stewardship | AB32 Compliance | Public Education |
| Urban Water Use Efficiency | ✓ | ✓ | ✓ | ✓ |
| Improved Conveyance System | ✓ | ✓ | ✓ | ✓ |
| GW Management | ✓ | ✓ | ✓ | ✓ |
| Pollution Prevention | ✓ | ✓ | ✓ | ✓ |
| Stormwater BMP | ✓ | ✓ | ✓ | ✓ |
| Forestry Management | ✓ | ✓ | ✓ | ✓ |

Description of individual proposed actions under the 'no regrets strategy' is given below.

### *Urban Water Use Efficiency*

Conservation of existing water supplies is of utmost importance to a growing population in the SARW. A representative analysis from Orange County shows that per capita water use will need to be reduced from the current value of about 175 gallons per day (gpd) to about 98 gpd by 2030.

### *Improved Conveyance Systems*

By increasing the efficiency of local and regional conveyance systems, water can be moved at a decreased cost. This is particularly important in the context of being compliant with the AB32 legislation, and is related to urban water use efficiency. With reduced per capita water use, GHG emissions can be

reduced from the current level of about 120,000 GHG emissions to about 75,000 GHG emissions by 2030.

### *Groundwater Management*

By taking into account the balance between groundwater and surface water, managers can improve long-term viability of each resource. Reclamation's Groundwater Screening Tool evaluates impacts to groundwater from a changing climate, and evaluates effective conjunctive surface water groundwater management. The groundwater screening tool was applied to four groundwater basins (Orange County, Upper Santa Ana Valley, San Jacinto, and Elsinore) within the watershed. As an example, potential actions to avoid projected water level declines in Orange County are listed below. Each alternative listed will protect against groundwater declines through 2060.

- Reduce municipal and industrial demand with a gradual reduction of approximately 15 percent by 2020 (i.e., reduce per capita use from ~175 gpd in 2010 to ~150 gpd by 2020 to ~98 gpd by 2030).
- Increase local water supplies by ~75,000 acre-feet (af) per year through recycled water treatment capacity and development of seawater desalination capacity, and increase stormwater capture efficiency.
- Increase imports from the Colorado River Aqueduct and SWP gradually from ~30,000 af per year to ~105,000 af per year (this may not be feasible due to cost, greenhouse gas emissions, or availability).
- Reduce summertime groundwater pumping.

### *Pollution Prevention*

Preventing and remediating polluted water resources improves quality for users and improves long-term viability of local resources. This includes improved salt management in brackish desalinization and water reuse systems in the SARW. Specific alternatives analyzed include:

- Modify the existing Brine Line system.
- Salton Sea considerations including, restoration plans, salt load and increased water supply to the sea.
- Brine pre-treatment strategies.
- Alternative pipeline alignments including easement, right of way, and designs.
- Remediate polluted groundwater to reduce treatment of larger quantities of migrating water (future avoided costs).

### *Stormwater Best Management Practices*

Implementing stormwater best management practices (BMP) reduces storm runoff and pollution, improves groundwater recharge, improves air quality, reduces heat island effect, and decreases sun exposure to asphalt. BMPs will continue to be required in the SARW. SAWPA member agencies, flood control districts, and the Regional Water Quality Control Board will continue to enforce BMPs.

### *Forestry Management*

Create plans to restore, sustain and enhance forest health and watershed functions within forests. As part of forest management, SAWPA has initiated a Forest First initiative in collaboration with the U.S. Forest Service. As home to the headwaters of the Santa Ana River, the National Forests encompass approximately 30 percent of the SARW's land mass. These forest areas also receive 90 percent of the SARW annual precipitation. Forest management practices have direct effects on both water quality and quantity, particularly relative to forest fires and the consequential effects of soil erosion and water storage.

The collaborative efforts in the Forest First initiative include four main watershed restoration strategies that would provide significant benefits to downstream water supply and quality. The first of these strategies includes forest fuels management, which would focus on reducing understory growth that can contribute to the intensity of fires, making them more devastating and difficult to fight. The second strategy involves restoration of chaparral plant communities in areas that have not recovered due to repeated fires, and where native vegetation has been replaced by grasses that increase runoff, instead of the chaparral capturing and dispersing rainfall, and allowing moisture to percolate and recharge groundwater basins. The third strategy is meadow restoration that would involve returning water that had been converted to conveyance back to a meadow sheet flow so that the meadow can function in a natural groundwater recharge capacity. The last strategy involves retrofitting roads in order to reduce water conveyance, reduce fire risk, and increase the number of fire breaks. Further details on this initiative are available at: http://www.sawpa.org/collaboration/projects/forest-first/.

This analysis of the 'no regrets strategy' allows SAWPA, its member agencies, and key stakeholders an opportunity to assess proposed Proposition 84 projects and specific adaptation strategies, and the associated costs and benefits in terms of productivity, mitigation potential, resilience, and sustainability. The most promising projects and strategies can then become part of SAWPA's toolbox of climate change adaptation strategies. SAWPA's 'no regret strategies' will, however, tend to encourage incremental adaptation responses as opposed to more expansive adaptation responses.

### *Additional Strategies*

Beyond 'no regrets strategies', a group of actions, under what could be referred to as 'low regrets strategies,' can be formulated. 'Low regrets strategies' are designed to facilitate adaptation with respect to climate change predictions. These strategies are marginally more costly than 'no regrets strategies' and have a stronger reliance upon climate change predictions, especially for more severe scenario predictions. As such, they provide a scientifically conservative approach to public health and safety in terms of water supply.

'Low regret strategies' are important to consider in terms of a planning horizon. For example, such strategies for SAWPA might include changing the design of infrastructure that is intended to last many years to a design that, despite an incremental cost increase, will serve its intended purpose even under an increased risk climate change model.

**Table 5.13-10 Summary of Actions Under 'Low Regrets' Strategies**

| Low Regrets Strategy | Description |
|---|---|
| Emissions targets | Conduct a survey of emissions generated from all water-related operations and plan for a specific reduction in carbon emissions. |
| Expanded flood control infrastructure | Climate change projections call for an increase in the intensity of storms, and existing infrastructure may not be effective. |
| Solar projects for water conveyance systems | Using solar power as part of a renewable energy portfolio helps water districts control variable costs, as well as decrease carbon emissions. |
| Consider high SLR<br><br>Model predictions and build new infrastructure accordingly | When in the planning process for building new water-related infrastructure, deliberately plan for SLR and design the project accordingly. |
| Expansion of wetlands | By expanding natural wetlands project areas, SLR will not inundate existing wetlands. In addition, wetlands provide carbon reduction benefits, water filtration benefits, heat island reduction and habitat benefits. |

## System Reliability and Risk Assessment

The impetus for integrated water and related resources management is the recognition that the following factors threaten the future of water resources in the SARW:

- Drought conditions in the Colorado River Watershed, a primary source of imported water to the SARW
- Unpredictability of future water imports from the San Joaquin-Bay Delta and Colorado River Watershed due to uncertainties in water availability, and changing water management requirements

- Continued population growth and development, which puts further stress on the natural hydrology of the watershed and increases the need for additional assured water supplies
- Uncertainties of climate change and its associated hydrologic variability

OWOW 2.0 is this watershed's preliminary answer to these threats. The OWOW 2.0 Plan envisions a region where its stakeholders take an active role in creating a watershed that:

- Is sustainable, drought-proofed, and salt balanced by 2035
- Protects its water resources and uses water efficiently
- Supports economic and environmental viability
- Mitigates and adapts to a changing climate
- Corrects environmental justice deficiencies
- Minimizes interruptions to natural hydrology
- Creates a water ethic at both institutional and personal levels

## Next Steps

Several tools are available for SAWPA, its member agencies, and key water sector stakeholders to help address the effects of climate change and plan ways to adapt to or mitigate those potential impacts. Adaptation is the key component in the toolbox to help water resources planners and water sector decision-makers thoroughly understand and evaluate potential vulnerabilities from climate change impacts.

Research on climate change impacts is still evolving and as new findings are developed, they are shared throughout the SARW and California. SAWPA will continue to explore innovative quantitative tools to help assess vulnerabilities and conduct decision support analysis to help progress toward addressing climate change impacts in SARW. Actions that have been productive, and will continue to be in working toward this goal include:

- Aggregation of climate change knowledge from State and Federal research
- Further assess No and Low Regret strategies
- Develop a centralized and clearinghouse of information and lessons-learned for member agencies
- Offer web-based and workshop-delivered information on climate change impacts for the SARW
- Create adaptation strategies and share that information with the water sector

- Conduct webinars to further collaboration among water agencies
- Develop regional case studies to discuss implementation actions
- Bring additional agencies and officials into the discussion
- Encourage innovative projects and search for flexibility
- Seek to use evaluation studies/economic analysis as part of the message
- Examine co-benefits to gain more support
- Ensure disadvantaged and tribal communities have roles in the planning
- Continue to involve key watershed stakeholders
- Explore supportive resources/connections: Water Research Foundation, Water Environment Federation, Climate Ready Estuaries
- Collaborate whenever possible

## Implications of Climate Change

The SARW and its water sector leaders are preparing to meet the uncertainty associated with climate change, tackling its challenges head-on with various adaptation strategies and decision support tools from the latest climate science available. The region continues to see population and business growth and development. With unreliable imported water supply sources from the SWP and Colorado River, which could help sustain this growth and development, addressing the region's water supply and demand management balance within finite water resources, will be equally challenging.

Additionally, the region's increased construction and development patterns invite more hardscape surfaces, reduce natural water infiltration into groundwater basins, and impede groundwater recharge opportunities. The call for urban communities to employ more "green" development standards should be increased region-wide for all new and existing homes. These communities and the water sector should also embrace the Ahwahnee Water Principles (Principles) developed by California's Local Government Commission. The Principles provide the communities of California a broader, more coordinated and more flexible water management system that tackles water quality, supply and flood risks together. In support of the Principles, several proposed Proposition 84 projects will help address potential water shortfalls once they are complete. They are: WMWD's Customer Handbook for Using Water Efficiently in the Landscape, and its commercial, industrial, and institutional performance-based Water Use Efficiency Program; and the Inland Empire Utility Agency's (IEUA) Regional Residential Landscape Retrofit Program.

Coupled with all this uncertainty is a growing concern of the basin's water quality and the cost of water from various (imported and local) supply sources. SAWPA, its member agencies, and watershed stakeholders, continue to explore alternative means to augment and convey imported water supplies, especially if they were to be interrupted on a large-scale from a major earthquake. Some additional options being addressed include developing more brackish desalination, increasing water recycling with advanced water treatment technologies, and cleaning up contaminated water plumes with advanced water treatment in SARW's groundwater basins. None of these options are inexpensive, but investing in today's technology may prove to be less costly in comparison to the future price of water. Investing in local resources now buys down risk to future key water vulnerabilities. Some projects that are proposed for funding under OWOW and DWR's Proposition 84 Round 2 IRWM Implementation grant program include EMWD's Perris Desalination Program - Brackish Water Wells 94, 95, & 96; the City of Irvine's Peters Canyon Channel Water Capture and Reuse Pipeline; WMWD's Arlington Basin Water Quality Improvement Program; and Lake Elsinore and San Jacinto Watersheds Authority's Canyon Lake Hybrid Treatment Process.

Projected increases in the region's temperature over time will increase water demand (and increase evapotranspiration) in urban communities and the environment. The heat island effect will also become more prominent, especially during summer months, as will the impacts to the region's wildlife habitat and air quality. Heat islands can affect communities by increasing summertime peak energy demand, air conditioning costs, air pollution and GHG emissions, heat-related illness and mortality.

Less snowpack, which feeds SARW's creeks, streams, and rivers, is projected in the future. Less runoff from snowmelt will negatively impact local water supply. Potential increases in storm intensity or extreme weather events will also increase the likelihood of impact and effects from flooding. Some of the proposed projects supported by OWOW will help abate that impact through more stormwater capture that would otherwise be lost to the sea. Stormwater runoff helps groundwater replenishment, and smarter management practices of that precious resource will help further basin-wide recharge efforts. Proposed projects supported by OWOW and DWR's Proposition 84 IRWM Implementation program include the City of Yucaipa's Wilson III Basin Project and Wilson Basins/Spreading Grounds; the City of Fontana's Vulcan Pit Flood Control and Aquifer Recharge Project; the City of Ontario's Francis Street Storm Drain and Ely Basin Flood Control and Aquifer Recharge Project; San Bernardino Valley Municipal Water District's Enhanced Stormwater Capture and Recharge along the Santa Ana River project; and the IEUA's San Sevaine Groundwater Recharge Basin.

SLR will impact Orange County coastal communities and some of their essential infrastructure and coastal habitat. SLR leads to flooding of low-lying areas, loss of coastal wetlands, erosion of coastal beaches, saltwater contamination of groundwater aquifers and impacts on roads, sewage treatment plants and other coastal infrastructure. It also increases sea water intrusion opportunities to coastal groundwater basins and impairs the available fresh water supplies, which, if affected, would require the use of advanced water treatment systems. That would raise the cost of water produced and delivered to the end-user. Orange County Water District's Alamitos Barrier Improvement Project recommended by OWOW for funding under DWR's Proposition 84 Round 2 IRWM Implementation grant program would help curtail potential seawater intrusion of their freshwater aquifer.

All these implications of climate change have a direct result on SARW's socio-economics. Future predictions of development affect estimates of future climate change impacts. In some instances, different estimates of development trends can lead to a reversal from a predicted positive to a predicted negative impact, or vice versa. Climate change in the region will create inequalities between the counties that make up SARW, its communities, and within the watershed as a whole. The future level of adaptive capacity of SARW's residents, businesses, and the natural systems to climate change will affect how our society will be impacted by climate change.

## Future Considerations

The SARW and our world, as we know it, will change over time, requiring that the strategies implemented to avoid, adapt, or mitigate the most severe impacts of climate change must be flexible enough to change too. The imminence and severity of the problems posed by the accelerating changes in the global climate are becoming increasingly evident: global surface temperatures are rising, heat waves and droughts are becoming more severe, storm events are becoming more frequent and more intense, land and sea ice cover is shrinking, sea level is rising, and the pH of the ocean is changing with the potential to disrupt healthy and functional ocean ecosystems. Our environment and the communities dependent on it are facing a global crisis with real, local impacts.

What is needed in these ever-changing times are ways to help identify research needs that can support scientifically-based regulations to minimize effects of climate change on our forests, aquatic resources, and fish and wildlife populations. Much of the most innovative work on climate change is occurring at the State and local levels, but this work must be coordinated with efforts around the globe to ensure reliability and consistency of approaches. Wherever you look in the SARW, it is not difficult to find at a city council, county board, or planning and zoning meeting where a concerned citizen is raising an energy policy or climate change concern and demanding action from their leaders.

SARW's water sector leaders are also engaged in those discussions and, with respect to climate change and implementing an adaptation strategy, they are committed to helping reduce agency carbon footprint by reaching the mandated AB 32 compliance by 2020. SAWPA, its member agencies, and key watershed stakeholders, recognize that the reality of climate change is that human activity is contributing significantly to altering or damaging our environment, and that it has the potential to create significant social and economic impacts. Hence, climate change management strategies can help reduce the significance of the projected impacts.

The impacts of climate change span many issues, including: combined sewer overflows, inundation of treatment water and wastewater facilities, and shifts in the timing of the rainfall that recharges groundwater basins and provides much needed surface water supply to sustain the region's drinking water supply and prevents saltwater intrusion in coastal aquifers. The new climate reality in SARW must incorporate land-use decisions across the watershed into regional water management strategies. This will be challenging because land-use decisions are often made at the local level, and the role for State or Federal agency engagement is not very clear.

Preserving the function of valuable ecosystem services is critical in the battle to combat the impacts of climate change in the region. One of the best things that can be done to prevent flooding is to preserve wetlands. Regulators and planners need to consider adaptation strategies when making decisions about preserving or filling local wetlands. Another land-use concern is building structures in the water or up to the water's edge. Based on past data and the intensity of storms, such structures are vulnerable to damage and are unlikely to be rebuilt quickly given today's economic situation. This type of thinking brings the conversation about building resilience to a watershed level.

Some of the greatest impacts related to local effects of climate change are highly variable and uncertain. SLR is the only factor in the climate equation that has durability and simplicity, and the observation that more frequent extreme events likely will occur at the local level is among the few that can be made with confidence. The need for resilience—that is, flexibility in thinking about a potential change and the ability to learn and adjust with the realities of that change—is very clear.

In developing management strategies that address climate change, SAWPA can serve as a catalyst throughout the watershed to help address human activity and instigate the necessary behavior changes to bring about meaningful desired effects. A plan of action detailing how SARW stakeholders can make a difference must be developed and periodically updated. External factors, such as weather changes, will prompt the need for watershed stakeholders to consider changes in technology, human behavior, and water sector investments to help address the uncertainty associated with climate change.

To that end, the SARW's climate change analysis helps identify necessary adaptation strategies. These strategies focus on flood risk, stormwater management, and water use efficiency optimization. In this arid region of the state, every drop of water counts, and SAWPA and its member agencies and stakeholders need to nurture the resilience of the watershed.

Regional water resources planners must continue to address the watershed's flood protection and stormwater capture opportunities, and must also promote more project integration with regional benefits. By implementing adaptation strategies that help optimize our finite water resources, realize greater water and energy conservation practices, and identify rain harvesting opportunities while implementing flood control measures, managers of SARW water resources can help reduce risk to property and lives.

To manage unavoidable impacts from a changing climate, water managers should consider changes to their infrastructure and storage reservoir operations, funding tools and incentives, and flood control approaches. Traditional approaches of the past are not adequate because they underestimate the severity and speed of climate change and overestimate the ability of natural systems to respond. Moreover, the impacts of climate change will have greater variability across our region than has been seen before. The water and energy resource management strategies described throughout this chapter should be implemented on a regional scale to harness process efficiencies and conservation savings.

OWOW 2.0 addresses this by developing an IRWM plan that is flexible, forward looking, and integrates environmental and societal constraints, considerations, and opportunities across stakeholder groups.

The science is available to water managers and decision makers and is relevant to the choices that policymakers must make. Decision-making inherently relies on forecasting, and accepts a certain amount of risk that the decision being made is less than optimal. Economists explain that risk equals probability multiplied by impact. However, risk is difficult to conceptualize when the probabilities and impacts are uncertain or unknown. Serious thought also is needed to consider the advantages of different decision-making models.

SARW's stakeholders need to create a climate risk management team that will ensure integration of proposed Proposition 84 projects and build a bridge to include climate change adaptation strategies within member agency water management practices. Those practices should include risk and disaster management response, and any current and future land-use planning exercises and decisions that can promote sustainable watershed development and reduce vulnerabilities associated with climate risk. The team's central focus should be on maximizing the positive and minimizing the negative outcomes in SARW's communities with respect to climate change and agricultural and water and related resources interests.

## List of Contributors

Contributors to the Chapter include:

**Bureau of Reclamation**

|---|---|
| James Ferro | The Energy Coalition |
| Craig Perkins | The Energy Coalition |
| Roy Herndon | Orange County Water District |

# 5.14 Integration and Implementation

## Integration and Implementation

Concurrent with the preparation and development of integrated regional implementation actions conducted by the Pillars, SAWPA conducted several integration workshops throughout the OWOW 2.0 plan development to encourage collaboration and integration between the Pillars. These workshops served to promote further integration held among the Pillars with discussions of the linkages and integration. A shared vision for the watershed was discussed as described below:

1. A Watershed that is sustainable, drought-proofed and salt-balanced by 2030, and in which water resources are protected and water is used efficiently.
2. A Watershed that supports economic and environmental viability.
3. A Watershed that is adaptable to climate change.
4. A Watershed in which environmental justice deficiencies are corrected.
5. A Watershed in which interruptions to natural hydrology are minimized.
6. A water ethic is created at the institutional and personal level.

The integration of projects considered partnerships among different organizations, employing multiple water resource management strategies, supporting multiple beneficial uses, considering system-wide regional or watershed wide scales, and addressing different components of the hydrologic cycle.

The workshop meetings sought to promote integration, to investigate linkages and consider additional synergistic solutions. The workshops were facilitated by SAWPA and were held with the Pillar Co-chairs and several additional Pillar members. The goals of the workshop were shared with the group as follows:

- Inform – Increase awareness of proposed pillar implementation
- Evaluate – Linkages among proposed projects/programs
- Develop – Identify synergy and refine existing projects/programs to create anew

In discussion of integration, the benefits of an integrated system approach were reviewed with all participants. One of the advantages of the OWOW 2.0 planning process is the ability to address similar project objectives by local interests with a larger scale, integrated regional project. Resources devoted to implementing multiple smaller projects such as staffing, funding, and equipment may benefit from economies of scale when project proponents can work together on a regional project. All IRWM plans must contain provisions for reviewing project objectives and considering new, expanded, or even different solutions that meet multiple local needs.

SAWPA has stressed this strategy of a system's approach to all stakeholders in outreach material, workshops and conferences associated with OWOW 2.0. Examples are shown below in **Figure 5.14-1**.

**Figure 5.14-1 Strategy of a Systems Approach Examples**

## Traditional Silo Approach

- Single purpose, single problem project
- Little collaboration
- Unintended downstream environmental consequences
- Sectoral isolation of water resources
- Lack of coordination of resources:
  - ◊ Stormwater shunted out of the watershed
  - ◊ Wastewater treated to increasingly high standards is dumped
  - ◊ Clean water imported from faraway

## 21st Century Approach

**Integrated Regional Water Management (IRWM)**

- Multi-beneficial projects and programs linked together for improved synergy
- Provides "Biggest Bang for the Buck"
- Proactive innovative, and sustainable solutions
- Watershed systems based approach
- Promotes collaboration cross-sectoral integration among diverse water related agencies
- Focuses on integrated regional solutions supporting local reliability and local prioritization
- Integrates water supply, water quality, recycled water, stormwater management, water use efficiency, land use, energy, climate change, habitat, and disadvantage communities and tribes
- Coordinates resources so that water is used multiple times
  - ◊ Manages stormwater for drinking water
  - ◊ Treats wastewater for irrigation and groundwater replenishment
  - ◊ Builds or modify parks to support water efficiency, ecosystem habitat, and stormwater capture
  - ◊ Improves water quality pollution prevention
  - ◊ Addresses energy and water nexus

## Pillar Recommended Implementation Actions

The OWOW 2.0 Plan reflects the interconnected needs of the Region, examines linkages and develops synergy and does not limit solutions to just the needs of specific entities in the watershed. Opportunities for examining true integration were regular topics of discussion at OWOW pillar integration meetings. As the draft OWOW 2.0 plan was nearing completion, an increased focus was placed on sharing the pillar recommended implementation actions by each pillar and integration of these actions. This process of supporting implementation will continue even after the adoption of the OWOW 2.0 Plan as a new "Call for Projects" approach is contemplated in mid- 2014 in anticipation of Round 3 Prop 84 IRWM Implementation funding.

Shown below is the list of benefit elements that support a multi-benefit approach. The benefit acronym is listed alongside each of the recommended pillar implementation actions described further below.

1. WUE - Water supply reliability, water conservation, and water use efficiency
2. SCT - Stormwater capture, storage, clean-up, treatment, and management
3. RWE- Removal of invasive non-native species, the creation and enhancement of wetlands, and the acquisition, protection, and restoration of open space and watershed lands
4. NPS -Non-point source pollution reduction, management, and monitoring
5. GWR -Groundwater recharge and management projects
6. CRR- Contaminant and salt removal through reclamation, desalting, and other treatment technologies and conveyance of reclaimed water for distribution to users
7. WQB-Water banking, exchange, reclamation, and improvement of water quality
8. FMP -Planning and implementation of multipurpose flood management programs
9. WPM-Watershed protection and management
10. DWT -Drinking water treatment and distribution
11. EFR- Ecosystem and fisheries restoration and protection
12. DAC – Disadvantaged community critical water supply and/or water quality improvements
13. CC – Climate change adaptation and mitigation

Details of each implementation actions are described in each pillar chapter and in **Table 5.14-1** through **Table 5.14-10**.

**Table 5.14-1 Water Resource Optimization Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Water Rates that Encourage Conservation | Create incentive programs for retail water agencies in the watershed to reduce water demand and help meet SBX7-7 required demand reductions. | WUE |
| Water Conservation Public Education | Promote more public education of water use efficiency practices both indoor and outdoor. | WUE |
| Outdoor Conservation | Promote increased California friendly outdoor landscaping through incentives to reduce irrigation, currently at 60%-80%. | WUE |
| Reduce Evapotranspiration | Evapotranspiration might be reduced by developing and implementing programs to increase the amount of shaded area such as planting trees or constructing shade structures watershed-wide or strategic locations in the watershed. | WUE |
| Watershed Exchange Program | Upper Watershed foregoes development of more water recycling and provides future treated wastewater to the Lower Watershed via SAR. Lower watershed provides "replacement" water to upper/middle watershed | GWR, WUE, WQB |
| Wet Year Imported Water Storage Program | Upper watershed and MWDSC would implement this strategy.<br>Goal: Change MWDSC place of storage from Central Valley to Santa Ana River Watershed<br>Develop: MWDSC pricing structure to encourage more storage in watershed.<br>Concept: Water stored in wet years for a reduced price. Water pumped in dry years for remaining Tier 1 price. | GWR, WUE, WQB |
| Enhanced Water Conservation at Prado Dam | - Corps & OCWD currently studying 505 ft year-round<br>- Enhanced Project<br>- Cannot start until Mainstem project complete<br>- Would increase water storage elevation to:<br>510 ft or 514 ft<br>- Benefit: ~10,000 AF | SCT, WUE |
| Enhanced Santa Ana River Stormwater Capture below Seven Oaks Dam | Additional stormwater detained by Seven Oaks Dam could enable the diversion of up to 500 cfs and up to 80,000 acre-feet per year. This may require execution of new water rights agreement among SAR Watermaster parties. | SCT, FMP, GWR |
| Enhanced Stormwater Capture from the Tributaries of the Santa Ana River | Additional stormwater capture along the SAR tributaries could enhance capture of 28,000 AFY Specific locations in the watershed would need to be defined. | SCT, GWR |

**Table 5.14-1 Water Resource Optimization Pillar Implementation Actions (Continued)**

| Title | Summary Description | Benefits |
|---|---|---|
| Riverside Basin Aquifer Storage and Recovery Project | Riverside Public Utilities, is in partnership with Valley District and others are developing a design for a rubber dam that would cross the Santa Ana River and be used to divert flows, 12,800 AFY into off-stream recharge basins. | SCT, GWR |
| MS4 Credits | Under MS4, increase the amount of stormwater captured and recharged in the watershed by allowing owners to purchase "MS4 Credits" that could be applied to recharge projects in the watershed. | SCT, NPS |
| Re-Operate Flood Control Facilities | Working with flood control agencies re-operate flood control facilities with the goal of increasing stormwater capture increasing flood get away capacity and revising decades old storage curves. Without any impending storms, the flood control agencies may be able to release stormwater at a slower rate. This relatively minor operational change would make stormwater flows easier to capture and put to use. It also would result in impounding the water longer, which would increase artificial recharge during the "holding period". This strategy has already been successfully implemented in some portions of the watershed | SCT, FMP |
| Size Flood Control Facilities for Stormwater Capture | Increase the size of existing, or new, detention basins. Larger detention basins would slow the flow and increase the recharge area, which would increase the amount of stormwater that is artificially recharged. In addition to this increased recharge, the larger basins also would provide greater flood protection. | SCT, FMP |

**Table 5.14-1 Water Resource Optimization Pillar Implementation Actions (Continued)**

| Title | Summary Description | Benefits |
|---|---|---|
| Increase Surface Water Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. This project would supplement but not replace existing or proposed groundwater storage. | WUE, WQB |
| Increase Groundwater Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. | WUE, WQB |

**Table 5.14-2 Beneficial Use Assurance Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Develop Regional BMPs to Manage Municipal Stormwater Discharges | Develop regional BMPs, infiltration and harvest & reuse projects to support efficiency and effective stormwater quality improvement. | SCT, NPS |
| Salt Removal Projects to Achieve Salt Balance | • Expand groundwater desalination to key groundwater basins where TDS and Nitrate concentrations are approaching discharge limits. Locations may include Elsinore Basin, Perris Basins in EMWD and Riverside Basins.<br>• Support adoption of the Bay Delta Conservation Plan in order to promote reliability of low-TDS imported water supplies for use in the watershed. | CRR, WUE |
| Coordinate Surface Water Quality Monitoring Program | Assess surface water quality monitoring in watershed for overlap. Align proposed SAR Watershed stormwater regional monitoring program, MS4 stormwater monitoring, TMDL monitoring, and POTW monitoring for cost efficiencies and reduction of redundancies. | WQB |
| Support Small Water Systems that do not have Resources for Monitoring and Proper Operations and Maintenance | Work with CDPH and county health departments to identify small system water providers which need assistance with providing safe drinking water. Preliminary investigations indicate needs and support for both San Bernardino and Riverside Counties. | DAC, DWT |

**Table 5.14-3 Water Use Efficiency Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Educational and Marketing Programs for Water Use Efficiency | • Video modules of simplified demonstrations and instructions<br>• Contractor education programs<br>• Alliances with private industry (Professional orgs, manufacturers, distributors)<br>• Expanded marketing of Customer Handbook<br>• Regional information and marketing such as Inland Empire Garden Friendly and similar<br>• A truly simple irrigation scheduling tool | WUE, CC |
| Technology and Training Programs for Water Use Efficiency | • Advancing emerging technologies such as smart irrigation controllers, high-efficiency nozzles, and new irrigation device technology<br>• Creating a comprehensive package for consumers to promote use of smart irrigation controllers (e.g. rebates, stores, installers, training, and check-ups)<br>• Advocating use of climate-appropriate plants and functional warm season turf throughout the region<br>• Developing a "one-stop shop" that offers accessible and comprehensive water-efficient landscape planning programs | WUE, CC |
| Incentive Programs for Water Use Efficiency | Implement programs that allow water agencies to customize their rebates by adding additional incentives like MWDSC's programs. Support programs that allow agencies to target markets, analyze data, and implement new approaches. Rebates have been proven to motivate residential and managed properties decision makers to invest in landscape water efficiency technologies. | WUE, CC |
| Market Transformation for Water Use Efficiency | • Changing landscape design elements: increase pervious hard surfaces, pavers, and bioswales<br>• Creating sample landscape plan templates<br>• Using captured rainwater, recycled wastewater, graywater, or treated water for non-potable uses including irrigation<br>• Positioning water-efficient gardens as in style and "hip"<br>• Utilizing marketing suggestions from the WRI Landscape Water Use Efficiency statewide market survey: positives of water smart landscapes, the cost of doing nothing, children's involvement, and responsibility for the environment | WUE, CC |

**Table 5.14-4 Land Use and Water Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Programs to Integrate Water Resource Management into Land Use Planning | • Improve Interaction Between Water Resource Managers and Land Use Planners<br>  o Effectively incorporate proposed water supply protection and use factors into land use planning<br>• OWOW /FCD partnership development or enhancement (links to Stormwater Pillar)<br>• Land planning process enhancements<br>  o Early consideration of project concepts and designs<br>• Focused training for Land Use Planners and Land Development Engineering Community<br>• Incorporate recommendations of Alluvial Fan Task Force in land use planning | WPM, NPS |
| Programs that Support Watershed Integration, Identity Development and Implementation | • Local land use authority process enhancement<br>• Coordinate regional transportation planning to build-in key watershed sustainability priorities into plans that apply to the SAR Watershed.<br>• Watershed-wide geodatabase integration, access portal, and planning and evaluation tool development.<br>• Regulatory assessment and integration to support watershed sustainability project concepts and implementation.<br>• Demonstration project site identification, project design, coordinated planning, construction, and maintenance.<br>• Develop alternative compliance programs for MS4 Permit land development requirements | WPM, NPS |
| Program to Enhance Local Land Use Authority Process | • In each SAR Watershed County<br>  o The Riverside City/County Arroyo-Watershed Program<br>  o The Newport Bay Conservancy Pilot Project<br>  o City of Ontario--New Model Colonies<br>• Products of this project would include:<br>  o Watershed-Wide Land Use/ Water Resource Planning Guidelines Manual(s)<br>  o Model General Plan Water Element for the SAR Watershed<br>  o Watershed Coordination Forums and Training Workshops<br>  o Planning Commission Education and Outreach | WPM, NPS |
| Connect Watershed-wide Geodatabase Integration, Access Portal, and Planning and Evaluation Tools | • Develop “Community Improvement Area” layer<br>• Groundwater recharge areas (optimization with FCDs and Water Agencies)<br>• Overlay with Water Quality/Resource/Habitat characteristics<br>• Transportation Planning collaboration potential | WPM, NPS |

**Table 5.14-4 Land Use and Water Pillar Implementation Actions (Continued)**

| Title | Summary Description | Benefits |
|---|---|---|
| Demonstration Projects Including Site Identification, Design, Coordinated Planning, Construction, and Maintenance | • One in each county<br>• Green street/parking lot projects<br>  o Possible: Monte Vista Ave in the City of Montclair<br>• Regional treatment/recharge for surface and stormwater runoff (follow example of Chino Basin)—Possible locations include Gibson, Victoria, and Metrolink Basins projects with City and County of Riverside and Western MWD<br>  o Joint projects with SBCFCD and SBVMWD<br>  o Additional SBFCD/IEUA projects in Chino Basin | WPM, NPS, CC |

**Table 5.14-5 Stormwater: Resource and Risk Management Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Stormwater Policy/Procedure Recommendations | • Develop procedures and guidelines to ensure consideration of IRWM goals at project concept, planning, and design stages using OWOW Stormwater Resource and Risk Management Pillar to implement<br>• Provide stricter land management in floodplains<br>  o Evaluate impacts of 500 year flood management standard | WPM, NPS, |
| Align County Geodatabases Into a Comprehensive Watershed Geodatabase | • Accessible by all stakeholders, with data quality assurance and maintenance program<br>• Maps developed to support development project conditions and acceptable BMPs<br>  o Infiltration emphasized in MS4s<br>• Maps include all watershed data parameters<br>• Aligning or connecting the three county geodatabase layers will support watershed project concepts, and identify likely project partners even across county lines<br>  o Includes FCD facility analyses for retrofit opportunities<br>  o Have been and will be reviewed by regulatory agencies<br>  o Provide access and develop user tools<br>  o Planning Tools<br>  o Outreach to Planning Departments<br>• Implementation Tools<br>  o WQMP Templates<br>  o Regional BMP sites<br>  o Feasibility issues<br>  o Prioritize top three basins for potential recharge retrofit demonstration projects for each county in partnership with stakeholders | SCT, GWR |

**Table 5.14-5 Stormwater Resource and Risk Management Pillar Implementation Actions (Continued)**

| Title | Summary Description | Benefits |
|---|---|---|
| Develop a Groundwater Recharge Optimization Plan for Existing and Potential Future Flood Control Facilities | • Chino Basin Watermaster Optimization Plan as a guide<br>• Geodatabase tools provide preliminary project sites and priorities<br>  o Site lists have been developed by FCDs<br>• Supports multi-benefits approach of recharge and flood protection while addressing MS4 Permit requirements<br>• Costs/benefits need to be spread over FCD constituency<br>• Identify top three sites for demonstration projects | GWR, FMP |
| Develop Watershed-Based Tools for MS4 Stormwater Compliance | • Task Force approach with regulators in parallel with demonstration projects and MS4 Permit renewals<br>• Regional water quality and/or infiltration sites<br>  o Off-site or Regional BMPs—BMPs will typically be implemented downstream from the project site<br>• Water quality and/or water quantity credit system<br>• Build on Orange County's retention credit pilot project<br>  o Development projects contribute funds used for water quality/recharge/ habitat projects elsewhere in the watershed.<br>  o Current MS4 permits list project types which can comply via credits produced by alternative environmentally beneficial actions.<br>• Identify pilot sites for watershed-based compliance | SCT, GWR, WPM |

**Table 5.14-6 Natural Resources Stewardship Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Create Managed System and Restoration Targets | A plan for sustainable management of conservation areas with targeted restoration efforts is essential for preventing further deterioration of habitat. Consideration for characteristics of each of the main habitat types: Alluvial fan; Riparian, Wetland and Coastal and their specific ecosystems, will require habitat specific management plans and restoration criteria. | EFR, RWE |
| Establish Sustainable Wildlife Corridors and Expansion of Restored Areas | Using Riverside County Multi-Species Habitat Plan as a template, create sustainable wildlife corridors conduct across jurisdictional boundaries in San Bernardino and Orange County for watershed connectivity Coordinate among all of the current regional conservation plans, mitigation providers, resource conservation districts and non-profit conservation organizations. | EFR, RWE |
| Provide Sustainable Funding Sources for Ongoing Maintenance of Conservation Areas | Create a permanent funding program to assure funding for long-term protection of areas where habitat restoration efforts are occurring or need to occur. This kind of cooperative agreement will be critical to the ability of governmental and non-profit organizations to secure mitigation funding to do the necessary habitat restoration work needed in the watershed. | EFR |
| Project that Provides Invasive Vegetative Species Eradication and Maintenance Funding | Establish watershed wide non-native vegetation removal program to support habitat restoration and water savings. Removal program would address arundo removal of areas not currently addressed in the watershed as well as tamarisk removal. | EFR, WUE, CC, FMP |
| Pollutant Trading Programs | Constructed wetlands can be used to remove pollutants from surface runoff using natural processes. Formal pollutant trading programs provide the mechanism to pool funding from multiple, smaller sources to construct wetlands that would create habitat and increase the pollutant removal benefit. | WPM, EFR |
| Create Programs for Community Involvement in Habitat Conservation and Restoration | Some of the watershed's high quality, water-oriented habitats are near disadvantaged communities, where little attention has been paid to stewardship of the local resources. Developing local "stewardship" of these habitats could benefit both the habitat and the community. | EFR, RWE |

**Table 5.14-7 Operational Efficiency and Water Transfers Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Water Transfer Project between IEUA and OCWD: Wet Year and Dry Year Allocation | This project concept proposes a purchase by OCWD of up to 45,000 AF of imported water to be recharged by the IEUA member agencies during wet years. Water would be purchased at a reduced imported water rate from MWD reflecting the savings of not storing the SWP water at one of MWD's own storage programs such as the Semitropic Water Storage District and/or Kern County Water Bank. During dry years, OCWD member agencies could request IEUA member agencies to increase their groundwater production for three years by up to 15,000 AF per year in-lieu of direct deliveries from MWD, while MWD increases deliveries in the Orange County area by an equal amount. Under this scenario, the net MWD deliveries during dry years (years that Water Supply Allocation Plan is implemented) will remain unchanged, without the need for MWD to produce water from its own storage accounts. At the same time, having the imported water stored in the SAR watershed will increase local supply reliability, and provide some financial incentive to both IEUA and OCWD member agencies. | WQB, WUE, GWR, CC |
| Water Recycling Project between EMWD and OCWD | EMWD has the capability to discharge 15,000 AFY of recycled water into Temescal Creek. The discharge will be provided in wet years when local use cannot occur for the benefit of OCWD member agencies. With the approval of the SAR Watermaster, this flow can be contractually added to OCWD's SAR base flow allocation at Prado. The water quality of EMWD's discharged recycled water may require some salinity mitigation by OCWD to meet the RWQCB Basin Plan Objective in Orange County. The GWRS will be used to provide the required mitigation for the discharged water, and EMWD will pay OCWD for the cost of that mitigation. As part of this project, OCWD will credit EMWD for the purified water that is recharged into the Orange County groundwater basin, and compensate EMWD when that water is produced by OCWD member agencies. To increase water supply reliability in the SAR Watershed, EMWD could use the revenues from this water transfer project for imported water banking during wet years in the San Jacinto Watershed groundwater basins. | WQB, WUE, GWR, CRR, CC |

**Table 5.14-8 Disadvantaged and Tribal Communities Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| DAC Water Supply or Water Quality Improvement Projects | • Address poor water quality for the Edgemont Water District and County Water of Riverside District.<br>• Construct new sewer systems to address failing septic systems/undersized treatment facilities in Beaumont Cherry Valley. | DAC, DWT |
| Tribal Water Management Projects | • Provide funding support to water recycling facilities; that share mutual benefit to tribes and surrounding regions. Based on cooperative efforts among tribes and adjoining water agencies. | DWT |

**Table 5.14-9 Government Alliance Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| Government Alliance Coordination: | • Provide resource guide to all government entities and publish updates of the Resource Guide and post them on SAWPA's website. | WPM |

**Table 5.14-10 Energy and Environmental Impact Response Pillar Implementation Actions**

| Title | Summary Description | Benefits |
|---|---|---|
| GHG Inventory of the Water Sector | Calculate the Watershed's Carbon Footprint | CC |
| Promote Water Use Efficiency | Reduce Urban and Ag water demands; Build Resilient Communities; and Integrate water resources management practices; and Promote project collaboration and partnerships. | WUE, CC |
| Promote Alternative Energy Use to Reduce Embedded Water Use | Install Solar; Wind, Geothermal, Tidal, and Biomass Fuel capacity; and Implement any hydropower capabilities. | WUE, CC |
| Implement GHG Emission Offsets | Purchase Carbon Offsets; Plant Trees; Promote innovative approaches and solutions that foster community vitality, environmental quality, and economic prosperity. | WUE, CC, EFR |
| Review or Implement Effective Energy Efficiency Policies | Conduct a gap analysis on the watershed's policies on dealing with Greenhouse Gas Emissions; Create an energy solutions campaign - save energy, reduce your carbon footprint; Review applicable laws and ordinances; and Promote and implement energy efficiencies and sound conservation practices. | CC, WPM |
| Inventory the Water Sector | Calculate the Watershed's Carbon Footprint | WPM |
| Promote Electricity Conservation to Address Embedded Water Use | Region-wide Use Appliances and Vehicles that are efficient; Weatherization; Implement Temperature Controls (on A/C and Heating units; Install CFP Bulbs; Install LCD computer screens; and Use natural light. | CC, WPM |

## Regional Implementation Action Linkages

Upon review of the recommended pillar implementation actions, the participants in the workshops were asked to discuss linkages, overlaps and similarities among the actions.

The following questions were proposed:

1. Are any actions that are similar to one another overlap?
2. Is the action better if we combine overlapping aspects?
3. Are any actions dependent on another action, recommended here or separately, to be implemented?
4. Can we link or integrate any of the actions proposed?
5. Any new synergistic ideas for regional implementation actions?
6. Any areas of the watershed that need more attention where a regional implementation action would be desirable?

These questions were posed particularly mindful of DWR IRWM Implementation requirements to develop work plans that identify linkages between and among actions that are critical to the success of the regional effort. From the discussions, a list of Pillar recommended implementation actions that best represent watershed-wide and system-wide solutions was defined. These are discussed in the next section. However, the Pillar Integration Workshop also covered a number of suggestions that would assist and support implementation as well as shown below.

- Support PUC rebates to implement for sustainability and water conservation in outreach to customers (PUC rebates for water conservation).
- Geodatabase concept affects a number of the Pillars so that it could be part of the Basin Plan.
- Add layers to the Geodatabase that shows the following:
    - Utility company information
    - Climate change scenarios
    - Layers of natural resources areas
    - Layers of Potential restoration areas
    - Layer of highly economical land to stay away from and BMP opportunities
    - Status of ongoing planning activities by agencies
- Promote Geographical integration
    - Scale up ideas for watershed wide basis
    - Example: Water softener ordinance IEUA
    - Program could scale up to stormwater capture
    - Increase rate of return in recycled water if this program would be watershed wide
- Tool that allows everyone to see what agencies are working on beneficial use and water quality
    - If a project will transfer water or use less water, using the new GHG emission calculation tools to save water and reduce GHG
        - San Bernardino County has a GHG emission calculation tool for developers, for water and energy reduction
    - Sea Level Rise can effect water quality – coordination between agencies must be done
- LID should be looking at a regional perspective (streets and landscape areas)
- The impacts of recharge to groundwater basins with contaminant plumes must be considered. IEUA did ordinance on controlling water softeners and everyone in the watershed can benefit from it

- Creating sustainable jobs should not be excluded from the discussion – (Habitat for Birds and Bees).
- WMWD has surf and turf program though it's very labor intensive and they help subsidize retrofit to residential properties, up to 6,000 sq ft
- Sea level rise is an issue that will affect other types of land use and costs
- Pillar meetings should keep going on a monthly basis
- The key to unwind the 303 (d) impaired water body listing dilemmas is to address problems at a sub-watershed scale
- A regional monitoring plan could save time and money
- Climate change is relevant to beneficial use (habitat and water quality)
- How do we go back and recapture conservation and industrial commercial? Innovative Mitigation!
- Work with regulatory agencies from the beginning of a project
    - Need to incorporate a forward vision
    - Begin a plan by integrating all water resource issues first
    - Bring in all agencies and other regional project proponents for innovative mitigation
- Legislation
    - Consider needs for changing legislation
    - Stormwater should not considered wastewater
        - Change "Water used" to "Water consumed"
        - Upstream water user and downstream water user – how do we give them credit for keeping water in the river?
        - Assimilative capacity with salt – How to get credit?

## OWOW 2.0 Plan – Future Implementation

In preparing the OWOW 2.0 Plan, a series of Broad Planning/Management Guidance Strategies were distilled from that work and will serve to guide future planning and management in the watershed. The Strategies reflect a change in thinking about water resource management. Historically, water activities were organized into different silos and managers worked to achieve separate and individual goals that were thought to be unrelated. The water supplier's goal was to divert water for a growing population and economy without regard its impact on the environment. The flood control manager's goal was to channelize stormwater to get it out of the community before it could harm people and property or sink into the ground. The waste water manager's goal was to highly treat and dump waste into the river or ocean to be carried away. The environmentalists were isolated and recreation was left to its own devises. Managing the watershed and water resources as done in the past realized narrow singular goals but did so with tremendous unintended consequences. The list of endangered species only grew longer, as did the list of impaired water bodies. Societal values have changed, water and funds are scarcer, and together we have realized that the old way is no longer viable. SAWPA adopted its first Integrated Water Plan in 1998 and has been committed to this kind of watershed or system thinking ever since. **Figure 5.14-2** shows this relationship.

**Figure 5.14-2 Depiction of Planning/Management Strategies**

These Broad Planning/Management Guidance Strategies are not projects or programs themselves and are separate and distinct from priorities assigned to evaluate projects for funding that are often dependent on the grant sponsoring agency criteria. These Planning/Management Strategies are meant to guide planning efforts and are listed *in no particular ranked order or priority as shown below*.

### *Demand Reduction and Water Use Efficiency*

Water use efficiency practices remain a key resource management priority for the watershed and a cost effective tool for reducing the gap between available supplies and projected demand. This is reflected through a reduced per capita water use as well as potentially reduced commercial and industrial water use. Though significant progress is anticipated with mandated reductions through 20% by 2020 legislation, more can be done. Many water use efficiency actions have been implemented locally but these can be scaled watershed-wide. These include water conservation rates that encourage budged based rates, Garden Friendly landscaping and landscape ordinance application, smart controllers and irrigation nozzles, and turf buy-back programs, to name a few. The last acre foot of water is often the most expensive, reducing that cost goes far to keep water rates stable.

Monitoring data shows wasteful irrigation runs off yards down streets and culverts collecting pet waste and pollution until it hits the receiving water with a toxic slug causing beach closures and fish kills. At great expense cities have been tasked to clean up this dry weather urban runoff pollution. This cost can be avoided with successful water use efficiency.

It is understood too that there is a direct link of water use efficiency with energy efficiency and GHG emission reduction.

*Watershed Hydrology and Ecosystem Protection and Restoration*

Implement cost-effective programs that will protect and restore our watershed's ecosystem and hydrologic system so that it will sustainably produce the array of services including water resources. Recognizing that the SAR Watershed has multiple interrelated parts, a holistic approach to solving issues of supply, quality, flood and ecosystem management is necessary. This approach recognizes that in order to achieve a healthy productive watershed, improvements starting at the top of the watershed with a healthy and managed forest effectively support downstream stormwater attenuation and runoff capture and water quality improvement. The emphasis is on source control rather than end-of-pipe treatment as a best management practice. Implementation actions under this priority include forest management, pollution prevention, low impact development, stormwater capture and flood management, and MS4 stormwater implementation.

*Operational Efficiency and Transfers*

Cooperative agreements that result in water transfers, exchanges, and banking have resulted in better use of water resources. With the rich groundwater storage opportunities available in the SAR Watershed, expanding the groundwater storage with a variety of available water sources can be more much more cost effective than new surface storage. Such agreements will result in our ability to stretch available supplies and replace the storage lost by a shrinking snowpack. Projects under this category occur by collaboration and cooperation among the multitude of agencies and entities in the watershed, and agencies that import water into the watershed. New banking agreements can represent both habitat mitigation banking as well as groundwater banking. These agreements can only occur by entities working together and opening doors to improved efficiency and increased water supply reliance.

*Innovative Supply Alternatives*

This strategy recognizes the need for more progress in a portfolio approach with expansion of innovative and effective 21st Century technology for water production, recycling, pumping, and desalinization. Traditionally, these projects serve as an important component to achieving water supply reliability. Moving forward, a broader range of tools are now available to us to serve both economic and environmental objectives. Projects under this category provide multiple benefits and thus can be mutually reinforcing. Brackish desalination and salinity management are necessary to sustain local supplies. Salinity management is essential for groundwater basin health in the watershed.

*Remediation and Clean up.*

Another strategy is implementing TMDLs and pollution remediation. Projects under this category must reflect projects that have region wide benefit, are integrated and have multiple benefits without a focus only on local or single purpose needs. Under this strategy, the focus is on preventing pollution and also dealing with the pollution that has already occurred. This reflects a desire to duplicate the success already established in the watershed to prevent pollution and then to remediate pollution. If we continue operating in ways that cause pollution, degrading the watershed, the list of TMDLs will continue to grow.

The Broad Planning/Management Guidance Strategies were presented and discussed with the Pillars and other stakeholders to possibly prioritize the five (5) strategies. The feedback received is that all five (5) strategies are a priority to the watershed. Depending on locality and progress made by entities within the watershed. However, each local entity should evaluate the water resources strategies that make the most sense at the higher watershed level over multiple decades as opposed to immediate or

parochial needs. It is true that factors such as of cost effectiveness, water supplies generated versus demand, environmental benefit, feasibility, and practicality must be considered. But as stakeholder of the watershed, entities are encouraged to consider the long term watershed planning approach as they consider competing alternatives to meet needs and give more merit or attention to strategies such as water use efficiency that has been traditionally found to be more cost effective in reducing water demands and generating water supply with additional benefits of dry weather urban runoff pollution reduction before other alternatives. Further projects should consider system wide benefits before other alternatives that can have multiple benefits downstream. This applies particularly to pollution prevention at the source rather than having to address a chain of unintended and possibly negative consequences downstream for future generations.

Shown below is a list of Pillar Recommended Implementation Actions that were prepared based on the Pillar work, Master Craftsmen work, and other stakeholder input. These regional implementation actions are not listed in priority or are in any particular order. They represent the integrated work of the Pillars that resulted from their collaboration internally and with other Pillars and are the solutions to the challenges that they identified in each of their Pillar chapters. This list does not represent a list of projects that been rated and ranked projects under the more formal Project Review Process defined under the OWOW 2.0 Plan. However, they are recommended implementation actions that reflect an emphasis on integration and system-wide solutions to the watershed challenges and include the 13 watershed-wide framework concepts previously discuss.

Each of the Pillars recommended watershed-wide implementation actions that could eventually become projects once they are more fully investigated and analyzed. Multi-agency project proponents for these implementation actions have not been identified yet. It is anticipated that these recommended actions may best help fulfill the vision of OWOW 2.0 Plan.

**Appendix K** shows projects submitted to SAWPA under the Round 2 "Call for Projects" conducted in 2012, and are rated and ranked based on the project criteria defined for OWOW Round 2. The process undertaken for project review for the OWOW Round 2 projects is discussed in **Chapter 6 Project/Program Review, Evaluation and Prioritization**.

Each of the pillars recommended implementation actions shown below, and must be further investigated and analyzed to fulfill future grant funding requirements. Further, multi-agency project proponents for these actions may not have been identified yet. It is anticipated that this list of Pillar recommended actions, shown in **Table 5.14-11**, will serve as planning guidance for possible watershed-wide implementation projects to be encouraged for funding under Proposition 84 Round 3, and can best help fulfill the vision of OWOW 2.0 Plan.

**Table 5.14-11 Pillar Recommended Implementation Actions**
**(In no particular order)**

| Title | Summary Description |
|---|---|
| Water Budget Based Tiered Water Rates | Create incentive programs for retail water agencies in the watershed to adopt water budget-based tiered water rates. |
| Water Use Efficiency Incentive Program | Create an incentive program for expanded water use efficiency programs including cash for grass, landscape retrofit support, and California-friendly plant discounts. Utilize IEUA Residential Landscape Transformation Program and MWDOC Comprehensive Landscape Water Use Efficiency Programs as template. |
| Watershed Exchange Program | • Upper Watershed foregoes development of more water recycling and provides future treated wastewater to their Lower Watershed via SAR<br>• Lower watershed provides "replacement" water to upper/middle watershed |
| Wet Year Imported Water Storage Program | • Upper watershed and MWDSC would implement this strategy<br>• Goal: change MWDSC place of storage from Central Valley to Santa Ana River Watershed<br>• Develop MWDSC pricing structure to encourage more storage in the watershed<br>• Water stored in wet years for a reduced price. Water pumped in dry years for remaining Tier 1 price |
| Enhanced Water Conservation at Prado Dam | • Corps & OCWD currently studying 505 ft year-round<br>• Enhanced Project<br>o Cannot start until Mainstem project complete<br>o Would increase water storage elevation to:<br>510 ft or 514 ft<br>Benefit: ~10,000 AF |
| Enhanced Santa Ana River Stormwater Capture Below Seven Oaks Dam | Additional stormwater detained by Seven Oaks Dam could enable the diversion of up to 500 cfs and up to 80,000 acre-feet per year. This may require execution of new water rights agreement among SAR Watermaster parties. |
| Off River Storage and Supply Credits | Additional stormwater capture along the SAR tributaries could enhance capture/ recharge. Specific locations in the watershed would need to be defined. New recharge projects could allow for purchase of "MS4 Credits" by cities and counties as part of new development as a regional MS4 compliant recharge project. |

| Title | Summary Description |
|---|---|
| Re-Operate Flood Control Facilities | Working with flood control agencies re-operate flood control facilities with the goal of increasing stormwater capture increasing flood get away capacity and revising decades old storage curves. Without any impending storms, the flood control agencies may be able to release stormwater at a slower rate. This relatively minor operational change would make stormwater flows easier to capture and put to use. It also would result in impounding the water longer, which would increase artificial recharge during the "holding period". This strategy has already been successfully implemented in some portions of the watershed. |
| Increase Surface Water Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. This project would supplement but not replace existing or proposed groundwater storage. |
| Increase Groundwater Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. |
| Inland Empire Garden Friendly Demonstration and LID Project | Using the Inland Empire Garden Friendly Program as a template, a demonstration project is proposed to quantify the benefits of installing Inland Empire garden friendly products and further demonstrate Low Impact Development features in a DAC neighborhood. The project would be modeled in part after the successful City of Santa Monica Garden-Friendly Project, as well as the Elmer Avenue Neighborhood Retrofit project in the LA Basin. |
| DAC Water Supply or Water Quality Improvement Projects | Provide funding support to assure drinking water standards are met such as in the County Water Company of Riverside near Wildomar. Construct new sewer system for the areas that have failing septic systems/undersized treatment facilities like Beaumont Cherry Valley. |
| Wetlands Expansion Watershed wide | Create new wetlands along the tributaries of Santa Ana River to provide for natural water quality improvement, ecosystem restoration and recreational opportunities. Water supply for such wetlands would be dry weather urban runoff and available recycled water and would be patterned after the Mill Creek Wetlands in Chino Basin. |
| **Title** | **Summary Description** |
| Watershed-wide Multi-Use Corridor Program | Create multi-use corridors along SAR and its tributaries and Upper Newport Bay tributaries in all three counties in the watershed to provide for sustainable wildlife corridors, stormwater attenuation and capture, flood control, sediment reduction and erosion restoration, enhanced NPS pollution treatment, removal of non-native species, and creation of recreational trails,. In Riverside County, along Temescal Wash, San Bernardino, San Timoteo Wash, Orange County along Borrego Canyon Wash between Irvine Blvd., and Town Center Drive. |

| | |
|---|---|
| Multi-Species Habitat Plan for Gap Areas of Watershed | Create multi-species habitat plan for San Bernardino County and portions of Orange County. Though work is underway on the Upper Santa Ana Wash Land Management and Habitat Conservation Plan, there is no MSHCP covering the growing areas of southwestern San Bernardino County. Western Orange County is also not covered by an MSHCP. |
| Water Conservation Recharge Optimization Program | Establish a water conservation-recharge optimization plan for existing and potential future flood control facilities, using the example work of the Chino Basin Recharge Master Plan and implementation projects as a template. |
| Watershed-wide Geodatabase Access | Connect existing county or program-specific geodatabases to create a comprehensive watershed geodatabase that provides access to appropriate stakeholders, and set up a data quality control and maintenance program. The main component County MS4 geodatabases are well under way. |
| Forest Restoration Projects | Expand forest restoration through fuels reduction, meadow and chaparral restoration projects to strategic areas above major stormwater recharge basins for flood control, water supply and water quality benefits. |
| Residential Self-Regenerating Water Softener Removal Rebate Program | Removal of self regenerating water softeners has been proven as an effective strategy to reduce TDS levels at WWTP and assure future salt discharge requirements. The project provides watershed-wide rebates and would be a joint program among water agencies in the watershed. |
| Salt Removal Projects to Achieve Salt Balance | Expand groundwater desalination to key groundwater basins where TDS and Nitrate concentrations are approaching discharge limits. Locations may include Elsinore Basin, Perris Basins in EMWD and Riverside Basins. |
| Enhanced Stormwater Capture from the Tributaries of the Santa Ana River | Develop additional stormwater capture projects along the SAR tributaries that support key groundwater management zones identified by San Bernardino, Riverside, and Orange County Geodatabases. Early estimates indicated a capture potential of 12,000 AFY. |
| **Title** | **Summary Description** |
| Conjunctive Use Storage and Water Transfer Project using Wet Year and Dry Year Allocation | This project concept proposes a purchase by OCWD of up to 45,000 AF of imported water to be recharged by the IEUA member agencies during wet years. Water would be purchased at a reduced imported water rate from MWD reflecting the savings of not storing the SWP water at one of MWD's own storage programs such as the Semi-Tropic Water Storage District and/or Kern County Water Bank. In dry years, OCWD member agencies could request IEUA member agencies to increase their groundwater production for three years by up to 15,000 AF per year in-lieu of direct deliveries from MWD, while MWD increases deliveries in the Orange County area by an equal amount. Under this scenario, the net MWD deliveries during dry years (years that Water Supply Allocation Plan is |

| | |
|---|---|
| | implemented) will remain unchanged, without the need for MWD to produce water from its storage accounts. At the same time, having the imported water stored in the SAR watershed will increase local supply reliability, and provide some financial incentive to both IEUA and OCWD member agencies. |
| Salt Assimilative Capacity Building and Recycled Water Transfer Project | EMWD has the capability to discharge 15,000 AFY of recycled water into Temescal Creek. The recycled water discharge will be dependent on surplus recycled water available and not used within EMWD particularly during wet seasons. With the approval of the SAR Watermaster, this flow can be contractually added to OCWD's SAR base flow allocation at Prado. The water quality of EMWD's discharged recycled water may require some salinity mitigation by OCWD to meet the RWQCB Basin Plan Objective in Orange County. The GWRS will be used to provide the required mitigation for the discharged water, and EMWD will pay OCWD for the cost of that mitigation. As part of this project, OCWD will credit EMWD for the purified water that is recharged into the Orange County groundwater basin, and compensate EMWD when that water is produced by OCWD member agencies. To increase water supply reliability in the SAR Watershed, EMWD could use the revenues from this water transfer project for imported water banking during wet years in the San Jacinto Watershed groundwater basins. |
| Riverside Basin Aquifer Storage and Recovery Project | Riverside Public Utilities, in partnership with Valley District and others, are developing a design for a rubber dam that would cross the Santa Ana River and be used to divert flows while mitigating environment impacts. Creates, 28,000 AFY into off-stream recharge basins. |
| Watershed Invasive Plant Removal Project | The Santa Ana Watershed Association, the Front Country District Ranger on the San Bernardino National Forest and Southern California Edison had proposed a major an invasive plant eradication project for the Mill Creek Watershed. This project area covers the front (southern slopes) of the San Bernardino Mountains from Highway 18 through Waterman Canyon on the west to Highway 38 from the Mill Creek Ranger Station to Angelus Oaks, an area of approximately 172,773 acres. The proposed future 3-year work area in this proposal covers the Mill Creek Watershed from the Forest boundary to the headwaters. This project proposes to expand the San Bernardino Mountains Front Range Invasive Plant Removal Project to an invasive plant removal and restoration project in the Santa Ana River Watershed that has many partners and stakeholders extending from the coast to the headwaters. |
| **Title** | **Summary Description** |
| Regional BMPs to Manage Municipal Stormwater Discharges | Develop regional BMPs including infiltration, harvest & reuse, and biotreatment as proposed under current MS4 Permits. Initial phase would be located in MSAR Pathogen TMDL area and expand into other areas of the watershed under future phases to address pathogen treatment. |
| Watershed-wide coordinated surface water monitoring program | Surface water quality monitoring is not coordinated within the watershed leading to duplicative sampling in some areas and inadequate sampling in others. In some cases this may lead to 303(d) listings that do not reflect real impairments. A new program to coordinate surface water quality monitoring to enhance efficiency and reduce costs is proposed. Sources of monitoring |

| | |
|---|---|
| | data would come from MSAR Watershed TMDL, SWQSTF, MS4 Stormwater Permits, and SCCWRP Bio-assessment Program. |
| Watershed Urban Runoff Management Fund | Establishing a Watershed Based Urban Runoff Management Fund to support the implementation of stormwater management programs. Components of this program could include the regulatory basis for a watershed based program, the legal basis and authority for the fund, the agreements, and programmatic elements. |
| Santa Ana River Sediment Transport | Building upon an OCWD demonstration project, implementation of a full scale project that allows for the appropriate transfer of sediment to maximize recharge operations, restore habitat, and reduce operation costs. |
| Transportation Corridor Stormwater Capture and Treatment | New uses of the current transportation right-of-ways can be expanded for capturing rain runoff and replenishing groundwater basins. |
| Modified Watershed Brine Management System | Optimizing the water used to transport brine so that less water is lost to the ocean through increased concentrating of brine or delivery to the Salton Sea for beneficial use. |
| Water Industry Energy Use Reduction Incentive Program | Supporting regional purchase and installation programs of water resource related greener energy projects that reduce capital costs and green house gas emissions. |
| Watershed Land Use Planning Tool Kit | Developing a tool kit that translates water principles to support watershed planning decisions and implements a jurisdictional outreach effort for relevant regional, county and city planning agencies that encourages adoption of the guidance ideology into General Plans and zoning codes at the local level. |

## From Concept to Reality – Next Steps for OWOW Implementation

Implementation of the Watershed-based Implementation Concepts just described requires a collaborative multi-jurisdictional effort to be successful. Two types of efforts are envisioned: (1) implementation of Water Resources Infrastructural Conceptual Projects; and (2) Watershed Sustainability Guidance and Programs. Implementation of infrastructural conceptual projects have both institutional (regulatory, jurisdictional, economic) and technical (planning, design and construction) elements. The biggest challenge to successful implementation is not the technical issues; it is the institutional issues that will be associated with any project. We have the technical skills to build the infrastructure; however, developing the institutional support across the watershed, which is required to actually build the infrastructure, requires substantial work. Developments of Watershed-based Guidance and Programs have similar challenges. From a technical standpoint, we have numerous experts throughout the watershed that have the skills and knowledge to develop the projects and programs. On the ground, implementation of the guidance will require a significant focus on the institutional issues.

With these distinctions (technical vs. institutional) in mind, the following recommendations are made to move forward particularly as the future grant funding opportunities arise:

- Identify a champion(s) for each conceptual implementation action or project, one who has the time and resources to commit to the effort.

- Form teams that are responsible for the various project elements, but led by the project champion(s). Recommended teams and examples of their potential responsibilities could include:

    - Financial – This team develops either the means to finance a project (including state/federal grant development) or develops economically sound programs to support watershed management activities, e.g., establishment and operation of an Urban Mitigation Fund to support regional stormwater treatment.
    - Regulatory – This team's job is to eliminate or minimize regulatory barriers or steer projects in a manner to work around such barriers. They would identify regulatory issues associated with implementation of an infrastructure project or implementation of elements of a guidance document. This team would work directly with the regulatory agencies to resolve conflicts and overcome barriers; they would also lead the effort to develop regulatory documents, e.g., prepare permit applications or complete CEQA requirements for the implementation of an infrastructure project.
    - Legal – Experts can provide critical information regarding legal issues such as making sure existing legally binding agreements, e.g., water rights, are not impacted by a project. If they are impacted, they would develop options and provide means for working around such barriers.
    - Marketing – Outreach is a key to success of any watershed project. The marketing team would be responsible for developing stakeholder support, preparing outreach materials, and coordinating outreach activities, including arranging for experts from the other teams to attend outreach events to share their knowledge.
    - Technical – The technical team includes the skill sets needed to design the project or develop the technical aspects of a guidance document. For infrastructure projects, the team would begin with a 10% planning level design, which then would be used by the other teams to initiate their efforts. Once agreement is reached on the planning level concept, the various financial, regulatory, legal and marketing needs can be defined,

and the other teams can go to work while the technical team moves forward with design. Similarly, for guidance development, the technical team would first develop the technical framework, methods, or ideas that will comprise the guidance. With that understanding developed, the other teams would go to work to lay the groundwork, where needed, to increase the likelihood of implementation across the watershed.

- Empower the teams to work autonomously with oversight by the champion. The project champion(s) would ensure the work of the various teams is shared as needed.

- Decision makers need to be at the table leading the teams. The staff of the decision makers can certainly do the heavy lifting, but decision makers are needed to drive the process forward, especially when the inevitable speed bumps arise. A commitment to work to the 30% design level will develop project and program concepts that can engage and encourage the input from other potential partners and encourage project development beyond the single purpose project.

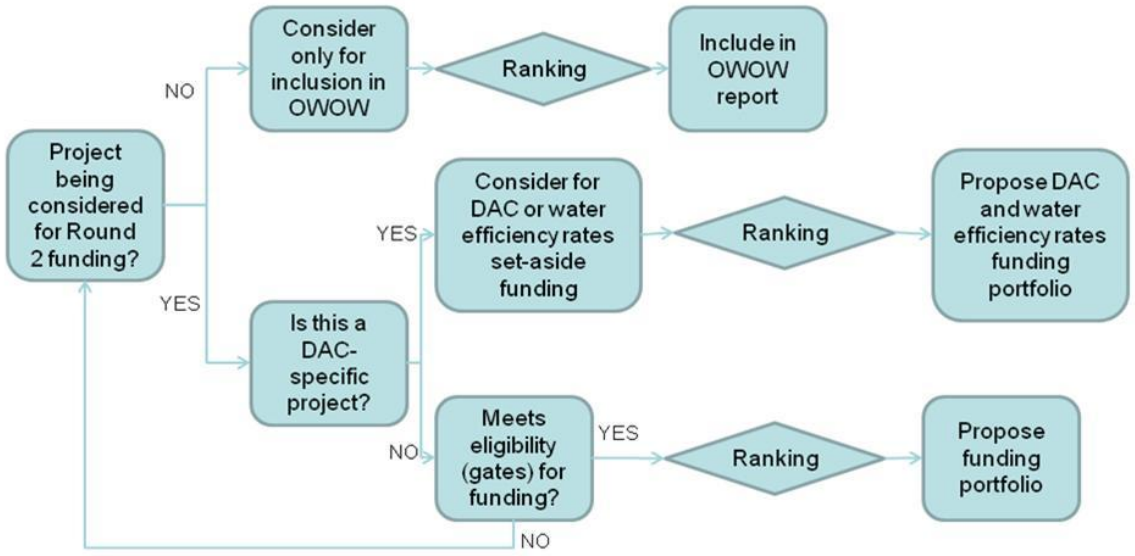
- Investing in 30% level design (preliminary design) is helpful to the permitting process as the 10-15% design concepts sometimes leave many unanswered questions for regulators resulting in lower commitment to the project initially due to uncertainty.

Preliminary design and feasibility analysis of the projects will improve eligibility for future IRWM grant funding rounds. As project development occurs and regional multi-benefits are more clearly defined, it is likely such projects will be highly rated under future funding rounds through Prop 84 IRWM grant program. With the lion's share of Prop 84 **Chapter 2 Governance, Outreach, and Integration** called out for the Santa Ana River Watershed occurring under the next and final round of Prop 84 amounting to $73.5 million; greater funding support will be available to support regional implementation projects and projects that benefit larger geographic areas of the watershed. Disadvantaged communities and Native American Tribes will be provided special consideration and attention particularly to find adjoining agencies, cities, counties or NGOs that may serve as the sponsoring entity for new water supply or water quality improvement projects.

Eligibility Gates

## Project Prioritization

The Santa Ana Watershed Project Authority (SAWPA), as the regional watershed planning group for the Santa Ana River Watershed, has been facilitating efforts to implement a watershed planning framework to guide water resource managers for the immediate future through the year 2035. To date, this has resulted in the development of the *One Water One Watershed 2.0 Plan* (OWOW Plan). The goal of this process is to develop the tools and strategies necessary to define an integrated water resource plan where all types of water (local surface and groundwater, imported water, stormwater and treated wastewater effluent) are viewed in a comprehensive, integrated manner as a single water resource with water use efficiency as the number one goal.



To assure that the OWOW plan included a list of prioritized implementation projects sufficiently developed and demonstrating appropriate needs that can be funded through the Integrated Regional Water Management (IRWM) Grant programs or other funding opportunities. Under OWOW 1.0, SAWPA issued its first Call for Projects to be included in the OWOW Plan from any public agency or non-profit organization in the Santa Ana River Watershed. The period for the preparation of project application was from May 17 to June 30, 2010. During this initial Call for Projects, project applications were evaluated in a two-step process to: 1) determine their eligibility to be included in the OWOW Plan, and, 2) prioritize projects for potential Proposition 84 funding based on their merits to address the watershed goals and objectives. The selection process was developed with goal of transparency, objectivity and deliberation. With the first round of project funding made available from the Department of Water Resource's (DWR) Proposition 84 Integrated Regional Water Management (IRWM) grant program,

agencies in the watershed were asked to collaborate ensuring that their constituencies received multiple benefits that were regional in nature

Under Round 1 of Proposition 84 IRWM program, SAWPA awarded $12 million to 13 integrated projects in the Santa Ana River Watershed in 2011 using a project evaluation and rating and ranking process that incentivized integration and collaboration for watershed management,

In the second round of Proposition 84 project funding conducted in 2012, SAWPA sought to further expand the power of multi-agency cooperation as a means for more holistic, integrated program/project implementation. The primary difference and focus for this second funding round was to encourage projects that reflect a watershed approach that that could create opportunities for local agencies to help shape the implementation of actions that restore hydraulic functionality, solve problems, and provide long-term sustainability. To achieve this end, a new project solicitation was conducted by SAWPA in the summer of 2012. In this project/program solicitation, there were 136 projects submitted for rating and ranking. The adopted rating and ranking process used in OWOW 2.0 is depicted in **Figure 6-1**. Of these projects, 52 requested funding in this round. Others provided project information for planning/ partnership development purposes and to be eligible for other funding sources, such as Proposition 1E.

**Figure 6-1 Adopted Rating and Ranking Process**

## Project Prioritization Criteria

Candidate projects included in the OWOW Plan were evaluated and prioritized based on the degree to which they comply with Evaluation Criteria developed by SAWPA staff. These were based on the goals and objectives, strategies and targets established by the Steering Committee and the Pillars. The achievement of goals and objectives by a project is directly related to the projects ability to obtain Proposition 84, Chapter 2 funding. Chapter 6 Project/Program Review, Evaluation and Prioritization describes the process followed to develop and weight the criteria.

Evaluation criteria were the basis for ranking projects in a reproducible way, using numerical scores for quantitative and qualitative criteria, and applying a consistent scoring and ranking process, described below. A performance measure was created for each criterion to numerically establish the degree to which a project meets each criterion. In some cases, more than one performance measure was used for a given criterion.

The evaluation criteria and performance measures for project prioritization had the following attributes:

**Non-redundant:** each criterion needs to measure something not measured by others to avoid a bias decision.

**Specific:** each criterion is described in detail, clearly specifying what is being measured and the rationale for it.

**Relevant:** criteria and, particularly, performance measures need to help discriminate between "better" and "worse" projects in terms of matching with goals and objectives. If a performance measure value does not vary between projects (if the score for all projects is the same for a given performance measure) the performance measure is unnecessary or inadequate.

Evaluation criteria and their respective performance measures employed in OWOW 2.0 are presented below in **Table 6-1 Ranking Criteria and Performance Measures**.

**Table 6-1 Ranking Criteria and Performance Measures**

| Project Evaluation Criteria | Criteria Weights | Performance Measures | Performance Measure Weights | Performance Measure Units |
|---|---|---|---|---|
| 1. Improve Water Reliability | 20% | Water Use Efficiency | 20% | AFY |
| | | Stormwater Capture/Storage | 20% | AFY |
| | | Recycling/Reuse | 20% | AFY |
| | | Groundwater Desalination | 20% | AFY |
| | | Other | 20% | AFY |
| 2. Improve Water Quality and Salt Balance in the Watershed | 20% | Non-Point Source Reduction | 33% | MGD |
| | | Reduction of TMDLs and Other | 33% | kg/year |
| | | Salt Removal | 33% | tons/year |
| 3. Manage Flood Waters Through Preservation and | 20% | Acres of habitat created | 60% | acres |
| | | Natural hydrology restoration and connectivity | 20% | -na- |

| Project Evaluation Criteria | Criteria Weights | Performance Measures | Performance Measure Weights | Performance Measure Units |
|---|---|---|---|---|
| Restoration of Natural Hydrology | | LID or resource efficient land use practices | 20% | -na- |
| 4. Reduce Greenhouse Gas Emissions from Water Management Activities | 20% | GHG Reduction (CO2 equivalent) | 100% | metric tons |
| 5. Cost Effectiveness | 20% | Cost per AFY | 20% | -na- |
| | | Cost per Acre of Habitat | 20% | -na- |
| | | Cost per Tons of Salt Removed | 20% | -na- |
| | | Cost per MGD of Water Treated | 20% | -na- |
| | | Cost per kg of TMDL or Other Pollutants Removed | 20% | -na- |

## Call for Projects

After the criteria was established by the OWOW governance, SAWPA conducted a Call For Projects to all stakeholders in the watershed and solicited candidate projects from agencies and non-profit organizations in the watershed for inclusion in the OWOW 2.0 plan. The on-line form required specific information that assured that all the Project Review Process requirements could be met (**Appendix L**). These included the following:

- Description of how project contributes to OWOW Goals and Objectives
- Description of how project relates to Resource Management Strategies
- Description of how project is technical feasible
- Description of specific benefits to Disadvantaged Community issues
- Description of Environmental Justice considerations
- Description of project cost and financing
- Description of economic feasibility and economic analysis
- Description of project status
- Description of project merit, benefits and application to OWOW plan
- Description of climate change impacts in region
- Description of how project will reduce greenhouse gas emission compared to project alternatives

Multiple outreach flyers, email notices and workshops were implemented by SAWPA prior to and during the Call for Project Application period of two months. Procedures for submitting projects online and in hard copy for those who were unable to submit online were also made available to stakeholders.

## Project Eligibility Requirements

The first step of the prioritization process was to determine those projects specifically eligible for funding from full OWOW Project List that included conceptual projects and projects seeking grant funding. For the OWOW Round 2 Call for Projects, the Steering Committee established a number of eligibility gates as minimum requirements to compete for available Proposition 84 Implementation grant funding. The eligibility gates were not limited just to the Proposition 84 statutory requirements but also include eligibility gates that would emphasize the need for integration, collaboration and meeting the OWOW Plan Goals and Objectives. These included Proposition 84 Statutory Requirements, Multi-jurisdictional Collaboration, Cost-Match Commitment and Completion Commitment.

### Proposition 84 Statutory Requirements – Project Eligibility for Proposition 84 Funding:

Through this eligibility gate project proponents are required to address Proposition 84 eligibility requirements in relation to the DWR Prop 84 IRWM Proposal Solicitation Package (PSP) requirements including funding match, urban water suppliers, groundwater projects, agricultural water suppliers, and surface water diverters.

### Multi-jurisdictional Collaboration – Number of Partners, Partners Role and Level of Participation:

This eligibility gate requires that project proponents have local partners and to identify each partner identify the role(s) of the partnership (e.g., planning coordination, funding partner, etc). A mere letter of support was considered insufficient to reflect multi-jurisdictional collaboration.

### Cost-Match Commitment – Minimum Percent of Project Cost Funded Locally:

This eligibility gate requires that project proponents provide a minimum 25% match.

### Completion Commitment - Secured Funding:

This eligibility gate requires that project proponents provide documentation of the availability of local funds to complete the project.

## Initial Review

After the deadline for the Call for Projects was reached, all projects were evaluated by SAWPA staff to determine their eligibility to be part of the OWOW Plan. Since the projects received were in different stages of development, projects beyond the conceptual level, largely with feasibility studies in place, were parsed out to be considered for possible Proposition 84 IRWM Implementation funding. It is important to reiterate that initial ranking was based on self-reported project data.

The first review step occurred internally by SAWPA staff to assure quality control and catch any data input errors. With so many project information forms representing over a hundred projects from across the watershed, QA/QC was important to confirm any data outliers and verify with the project proponents whether the data was accurate. The process was conducted to ensure a sense of fairness and completeness before commencing the prioritization process. If errors based on SAWPA's review

were encountered largely based on unrealistic data entry errors, the project proponent was contacted and encouraged to correct the error by re-submittal of the corrected project information form.

Thereafter, review by SAWPA included more in depth evaluation and confirmation of the costs, benefits and overall economic feasibility analysis. Quantification and accuracy of claimed benefits were also double checked.

## Project Scoring

The next step of the prioritization process was to score each project. Scoring is the process by which the information provided by the project sponsors is converted to a numerical value for each sub-criterion using the performance measures presented in **Table 6-1** above. In many instances, the information provided in the nomination forms need to be processed or combined to establish the numerical value of each performance measure. Relevant methodological notes on the scoring of each performance measures are presented above. The Project Form is located in **Appendix L**.

Each project submitted to SAWPA for inclusion in the OWOW 2.0 ranking process was scored and evaluated using the five criteria established by the OWOW Steering Committee. Each criteria was equally weighted at 20%. Each project was scored based on the effective benefit that would be realized at the conclusion of the project as described within the scope in the application. For each criterion, a scale was developed such that it would be used as the basis for analysis utilizing a commercially available software package developed by Infoharvest, Inc., called Criterium DecisionPlus (CDP).

### Criterion 1 – Improve Water Reliability and Reduce Reliance on Imported Water

Scores were developed for Criterion 1 by using the acre-foot per year (AFY) yields provided by applicants for the water use efficiency, stormwater capture and storage, recycled reuse, groundwater desalination, and other categories. The score for this criterion was developed using the following steps:

- The total AFY were summed up for each project for all the categories
- A scale was developed to account for the full range of benefits
- The projects were scored based on this scale
- The values were entered into CDP

### Criterion 2 – Improve Water Quality and Salt Balance

Scores were developed for Criterion 2 for each of three categories: Non-Point Source Reduction (mgd), Reduction of Total Maximum Daily Loads (TMDL) Listed Pollutants and other Pollutants (KG/year), and Salt Removal (tons/year). To develop the scores, the following steps were taken:

- Data for each category was normalized on a scale of 1 to 5, 1 being the worst and 5 the best
    - To develop the normalization, the data for each category with a value greater than 0 was divided into quartiles to facilitate developing ranges. Scores were assigned using the scale.

- Normalized data was then summed together for the three categories for each project to value the multi-benefit of multiple categories.
- Summed data was adjusted to display a 1 to 5 scoring.
- The values were entered into CDP.

### Criterion 3 – Manage Flood Waters through Preservation and Restoration of Natural Hydrology

Criterion 3 was evaluated using three performance measures: Acres of Habitat Created (3a), Natural Hydrology Restoration and Connectivity (3b), and Low Impact Development or Resources Efficient Land Use Practices (3c). The performance measures were weighted with the following percentages 60%, 20%, and 20%, respectively. Performance measure 3a was weighted higher as it provides the greatest benefit to the criteria.

#### *Performance Measure 3a*

Scores were developed for performance measure 3a using the following steps:
Develop a scale that would best convey the benefit for each project.

- Each project was scored
- Scores were entered into CDP

#### *Performance Measures 3b and 3c*

Performance measures 3b and 3c consist of 2 components: a yes/no answer to whether the project provides the applicable benefit and a description of the benefit. Values for each component were developed based on the following factors:

- Project had no applicable benefit
- Project had benefits but had little or no quantification of such benefits
- Project had quantified and clear benefits
- Values were then entered into CDP

### Criterion 4 – Reduce Greenhouse Gas Emissions from Water Management Activities

Scores were developed for Criteria 4 using the following steps:

- Data was normalized on a scale of 1 to 5, 1 being the worst and 5 the best (any project that provided more than 10,000 metric tons of $CO_2e$ reduction were scored a 5)
- The values were entered into CDP

### Criterion 5 – Cost Effectiveness

Criteria 5 is composed of five components evaluating the cost-effectiveness on a per unit basis per year for each benefit identified by the applicant: Cost per AFY of Water (5a), Cost per Acre of Habitat (5b), Cost per Tons of Salt Removed (5c), Cost per MGD of Water Treated (5d), Cost per KG of TMDL listed or Other Pollutants Removed (5e). Values for each component were calculated using the following steps:

- Data was normalized on a scale of 1 to 5, 1 being the worst and 5 the best
- The normalized values for each project and for all components were summed together and averaged to arrive at the cost effectiveness value
- The values were entered into CDP

## OWOW Project Ranking

The project scores for each performance measure were used for the ranking of the projects using a multi-criteria ranking method. The method is known as Multi-Attribute Rating Technique (MART). The method consists of applying the weights for each criterion to the criteria scores, and adding the weighted criteria scores to obtain an overall weighted and final score to use in ranking. For the ranking process, the commercial software used was CDP. CDP uses MART for ranking projects or planning alternatives.

One of the steps in the MART consists of normalizing the scores. The *normalization* of a score is necessary to eliminate the units of the scores and to be able to add, average, or compare scores from different performance measures. *Normalization* basically means converting any dimensional or dimensionless quantity to a common scale.

*Normalization* of scores was done at two levels in this prioritization process. The first level of normalization was done within the scoring (i.e., before the application of CDP) where a criterion required addition or averaging of performance measures. In OWOW 2.0 the following performance measures were normalized to a scale of 1-5:

For the criterion “Improve Water Quality and Salt Balance in the Watershed” the performance measures:

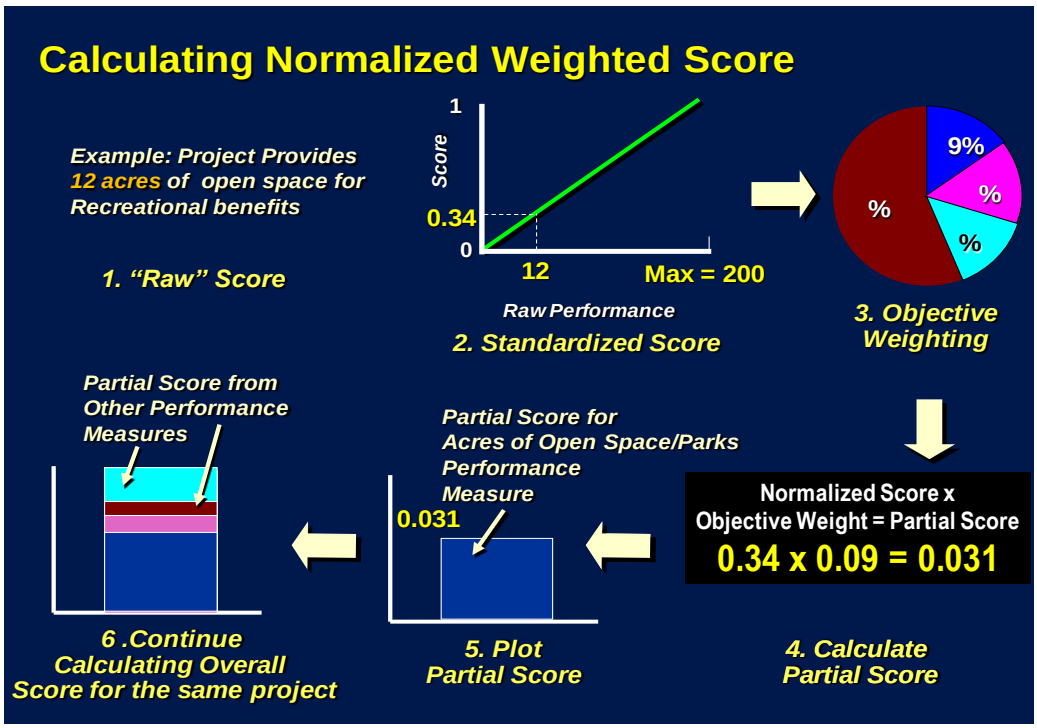
- Non-Point Source Reduction [MGD]
- Reduction of TMDLs and Other [KG/year]
- Salt Removal [tons/year]

Once these three performance measures were normalized, they were combined in a composite score of 1-5 to be used for prioritization. For the criterion “Reduce Greenhouse Gas Emissions from Water Management Activities” the Data normalized to 1-5 scale for CO2equivalent.

- Data > 10,000 co2e metric tons capped at 5
- Data with value less 10,000 co2e divided into quartiles to develop ranges for scale

For the criterion “Cost effectiveness” the performance measures:

- Cost per AFY of Water [$/AFY]



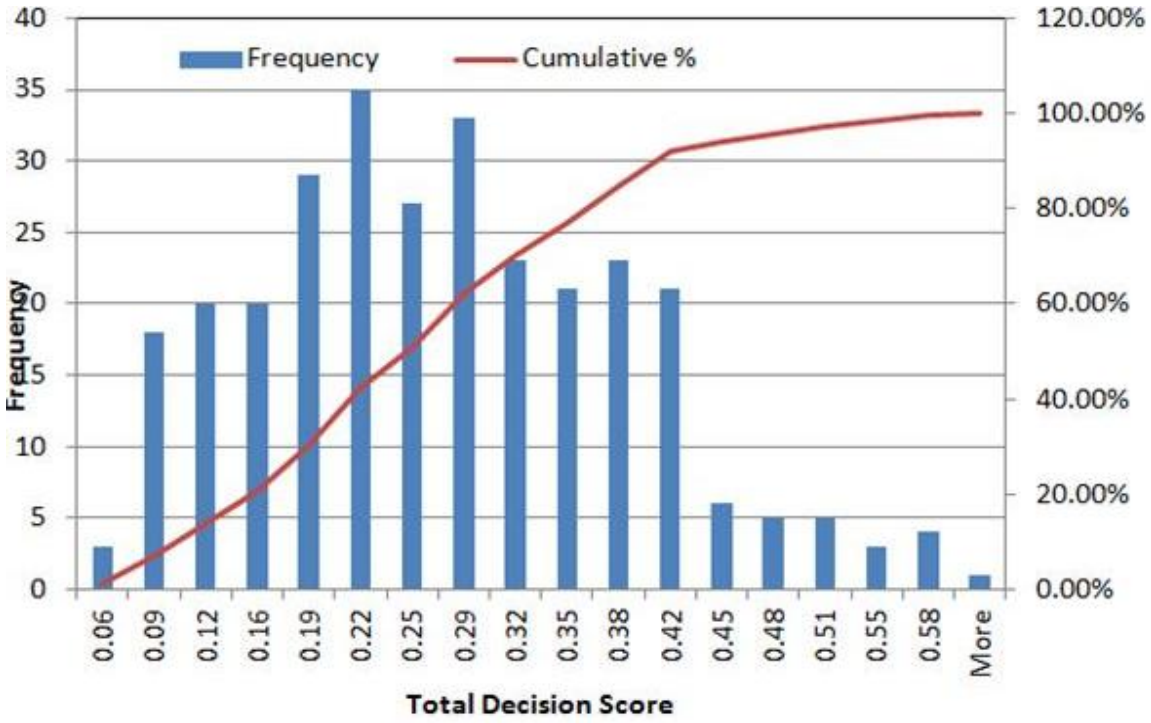
- Cost per Acre of Habitat [$/acre]
- Cost per Tons of Salt Removed [$/(tons/year)]
- Cost per MGD of Water Treated [$/MGD]
- Cost per Kg of TMDL listed or Other Pollutants Removed [$/(KG/year)]

The normalized scores in the scale of 1 to 5 then were combined in an average as a composite score of cost effectiveness to be used in prioritization.

The second case in which *normalization* was conducted was within the ranking process, for all of the scores. This step always is performed in MART and it's a step performed within CDP. CDP normalizes all scores using a scale of 0 to 1.

In addition to the normalization score in CDP, there are five other basic steps in MART (**Figure 6-2**). The first step is the scoring of the project against each sub-criteria as described in the earlier sections. In the example described in **Figure 6-2**, the project has a score of 12 acres (raw performance measure) for recreational benefits. As different criteria have different units of measurement (for example salt removal is measured in tons/year, water treatment benefits are measured in MGD, etc.) normalization is used, as mentioned above. In the example depicted in **Figure 6-2**, the recreational benefits score is converted with a scale between 0 and 1, using a linear scale. The raw performance of 12 acres translates into a normalized score of 0.34 (where the score of 0 indicates the worst performance, i.e. no acres for open space, and the score of 1.0 indicates the best performance, i.e. largest recreational and open space area provided by any project).

**Figure 6-2 Multi-Attribute Rating Technique to Rank Any Type of Alternatives or Projects**



Step 3 on **Figure 6-2** shows the weighting of the criteria. In OWOW 2.0 all criteria were weighted equally. In Step 4 in **Figure 6-2**, the normalized score is multiplied by the weight of the criterion. In the example in **Figure 6-2**, the open space criterion received a weight of 9 percent (out of a possible 100 percent). The normalized score (0.34) is multiplied by its weight of 9 percent in order to get a partial score of 0.031 for the project.

The partial score of 0.031 then is plotted on a graph for that project [Step 5 in **Figure 6-2**]. This procedure is repeated for all of the other criteria (or performance measures) for the same project until a total decision score for the alternative is calculated [Step 6 in **Figure 6-2**]. Finally, after all projects receive a total score, they can be compared to the rest of the projects and ranked according to the overall CDP score, also called *decision score*.

**Figure 6-3** shows the example of a linear scale for normalization of scores in Step 2. In the process of normalizing scores for the OWOW projects, however, some of the normalization scales were defined as non-linear scales. This was necessary to avoid an effect called "shadowing" by which a few projects with significantly higher raw scores can generate low scores for the rest of the projects when a linear scale is used. For example, in a situation in which 95 percent of projects have benefits under 100 acres, but one or two percent of projects have benefits over 5,000 acres, a linear scale could result in the lowest score for the 95 percent of projects under 100 acres. The shadowing of those high performing projects could render the performance measure irrelevant since the normalized score would not serve as a discriminator for 95 percent of projects.

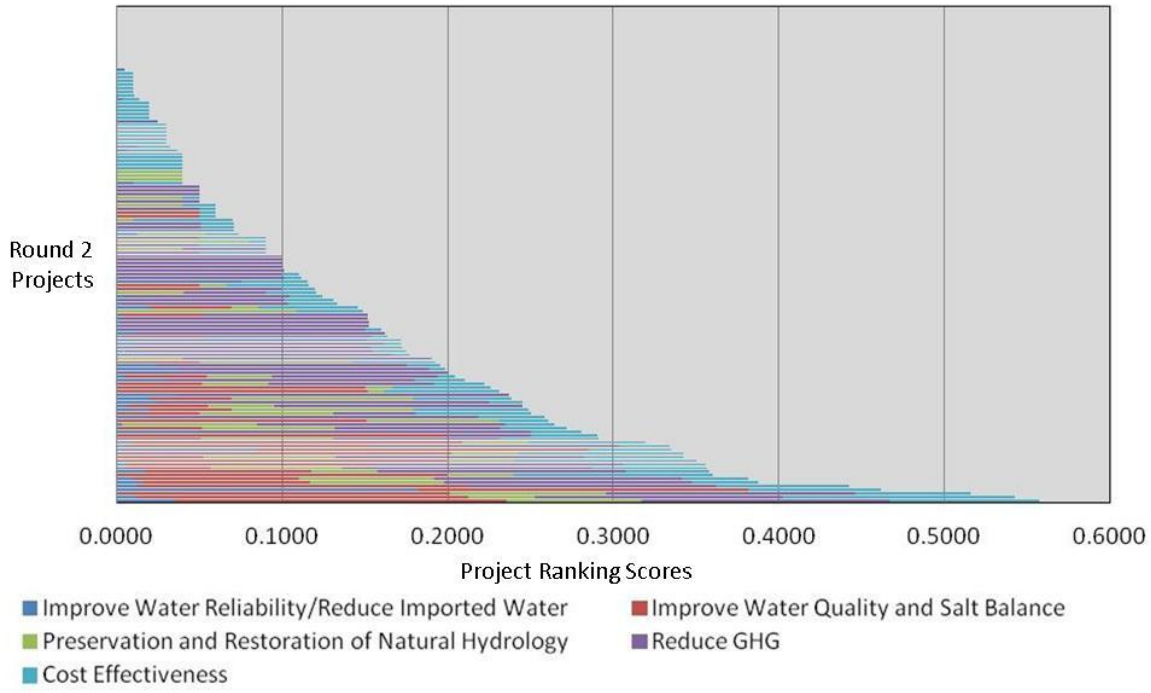
**Figure 6-3 Distribution of Total Decision Scores for all OWOW**

In the OWOW ranking process, the scales for "Improve Water Reliability and Reduce Reliance on Imported Water", "Improve Water Quality and Salt Balance", "Manage Flood Waters through Preservation and Restoration of Natural Hydrology" and "Cost Effectiveness" scales for these benefits each required non-linear normalization scales.

## Project Prioritizations Results

All 136 projects included in the OWOW 2.0 plan were ranked using MART. The complete ranked list of projects is presented in **Appendix K**.

**Figure 6-4** presents the spread of decision scores (ranking scores) in a horizontal bar chart. The figure shows an inflection point around 90 percent of projects. This means that about ten percent of the projects (between 25 and 20 projects) distinguish from the rest obtaining scores that would indicate that they provide more benefits and/or perform significantly better than the rest of the projects for most of the criteria.



In order to test the robustness of the ranking method used (including the qualitative scales and the non-linear normalization scales), a series of sensitivity analyses were run on the model.

Additionally the sensitivity of the ranking to the weights of the sub criteria also was tested. Results of the sensitivity analysis showed that the ranking is not sensitive to the qualitative scales (such as the

greenhouse gas scale of 1 to 5). The model is not sensitive to the actual shape of the non-linear scales used for normalization of some criteria, as long as the scale remains non linear (to avoid the "shadowing" effect). Similarly, the ranking generally is not sensitive to reasonable changes in the weights of the criteria (changes of ten percentage points). The ranking, however, does show a sensitivity to the actual raw scores (numbers reported in the project nomination forms) mainly for water supply and water quality benefits. For a ranking of projects to determine the actual Proposition 84 funding, the information provided in the nomination form would have to be vetted to avoid biases in decision scores due to inaccurate information.

The final prioritized OWOW project implementation list is presented in **Appendix K**. Projects are ranked from highest CDP decision score to lowest CDP decision score. Scores range from about 0.06 for the lowest ranked projects to above 0.60 for the highest ranked projects (shown in **Figure 6-4**). The "perfect" theoretical score is 1.0. The results of the ranking with the highest ranked project around 0.61 are not unexpected given the great number and diversity of sub-criteria. Generally, in any multi-criteria ranking process, the greater the number of criteria the lower the decision scores tend to be, as it becomes increasingly less likely that the best project will score well for all criteria.

**Figure 6-4 Distribution and Magnitude of Total Decisions Scores for all OWOW 2.0 Projects**

Based on project numeric score from established criteria approved by the OWOW Steering Committee, projects were assigned to one of three tiers to reflect natural breaks in the results on the project rankings. Identification of these breaks and placement in a specific tier was based on an analysis of

score distributions by an independent consultant for all ranked projects. The tiers represent how well a specific project meets the OWOW benefit criteria.

## Project Review Committee

The next step in this process was to assure the veracity of information submitted by project proponents. To evaluate projects, SAWPA formed a three person Project Review Committee (PRC) to provide an independent and expert review of the top ranked submissions including disadvantaged community assistance and water use efficiency rate funding. The three committee members were selected for their knowledge of water, both technically and at a policy level, their understanding and leadership in developing integrated approaches to problem solving and their knowledge of the Santa Ana River Watershed. The PRC included Joe Grindstaff, former Executive Officer of the Delta Stewardship Council and former SAWPA General Manager; Pete Silva, former State Water Resources Control Board member and former US EPA's Assistant Administrator for the Office of Water; and Gerry Thibeault, former Executive Officer of the California Regional Water Quality Control Board, Santa Ana Region. Over the last week of November of 2012, the PRC interviewed project proponents from the top 32 projects.

Prior to the interview process, the PRC were asked to focus on finding projects that were not only technologically feasible, but projects that were integrated and provided regional benefit. In the review process, the PRC first vetted the claims made by the project proponents on their on-line application. Secondly, they focused on the projects in the context of the goals and objectives of OWOW. Projects that provided single benefits, were not regional in scope and impact or were not representative of significant collaboration were not considered for funding. The PRC sought to identify and move projects forward that exemplified the integrated planning concept and provided the most benefit to the OWOW planning region.

A portfolio of 22 projects and programs was recommended by the PRC, two of which were subsequently accelerated into Round 1, due to the availability of additional Round 1 funding. These projects combined provide water use efficiency, enhanced groundwater recharge, integrated flood control/ habitat benefits, non-point source pollution reduction, salt removal from local aquifers, and assistance to disadvantaged communities. Funding from Round 2 is expected to provide about $17 million to support the 22 projects. In addition to the grant funding, local funding in the amount of $193 million has also been committed by project proponents to implement the projects.

The recommended projects were approved by OWOW Steering Committee and SAWPA Commission in December 2012. Thereafter, the approved Round 2 project proponents from the Santa Ana Region were asked to prepare the DWR application with compilation of the project solicitation package by SAWPA staff and submittal to the State by March 29, 2013. DWR announced their recommended projects under Round 2 released on Sept. 25, 2013. The implementation of Round 2 IRWM Implementation projects will serve to augment the important initial implementation of OWOW projects from Round 1 in moving the watershed closer to meeting the OWOW vision of a Watershed that is sustainable, drought proofed and salt balanced by 2030, and in which water resources are protected and water is used efficiently.

**OWOW Prop 84 Round 2 Recommended Project list is as follows:**

| Project Name | Lead Agency | Recommended Grant |
|---|---|---|
| Wineville Recycled Water | Inland Empire Utilities Agency (IEUA) | $1,000,000 |
| San Sevaine Recharge | IEUA | $750,000 |
| Vulcan Pit Flood Control | City of Fontana | $1,000,000 |
| Wilson Basins Project | City of Yucaipa | $750,000 |
| Francis St/Ely Basin Project | City of Ontario | $750,000 |
| Plunge Creek Recharge | San Bernardino Valley Municipal Water District (SBVMWD) | $500,000 |
| Enhanced SAR Recharge | SBVWCD | $1,000,000 |
| 14th St. Recharge | City of Upland | $500,000 |
| Arlington-Central Ave. Phase I | City of Riverside | $1,000,000 |
| Perris Desalter Wells | Eastern Municipal Water District (EMWD) | $1,000,000 |
| Alamitos Barrier Project | Orange County Water District (OCWD) | $500,000^ |
| Peters Canyon Capture | City of Irvine | $1,000,000 |
| Corona/Home Gardens Well | City of Corona Department of Water and Power | $1,300,000 |
| Prado Basin Sediment Demo | OCWD | $750,000 |
| Wastewater Project | Soboba Tribe | $150,000 |
| Canyon Lake Hybrid Project | Lake Elsinore and San Jacinto Watersheds Authority | $500,000 |
| Arlington Basin WQ Project | Western Municipal Water District (WMWD) | $500,000^ |
| Forest First Project | US Forest Service | $1,000,000 |
| Com/Ind/Inst. Water Efficiency | Municipal Water District of Orange County | $500,000 |
| Regional Landscape Retrofit | IEUA | $500,000 |
| Customer WUE Handbook | WMWD | $120,000 |
| Quail Valley Sewer System | EMWD | $1,930,000 |

SAWPA staff worked closely with each project proponent to ensure that their Proposition 84 IRWM Implementation Grant applications were completed appropriately. Upon announcement and approval of the recommended Round 2 project list by SAWPA Governance, weekly workshops were held with the 20 project proponents to support application preparation and submittal to SAWPA to compilation.

As part of this process, each project proponent had to adopt the OWOW 1.0 plan. Additionally, due to new State legislation, a description of how the projects would reduce dependence on the Delta Supply was included as part of the overall application submitted by SAWPA to DWR.

## Future Review Processes

It is anticipated that the project review and prioritization process will be reviewed and refined to support greater integration and collaboration, to comply with any new DWR IRWM Guidelines and PSP requirements, and improve the streamlining and efficiency of project submittal. Further, based on public workshop feedback the process will be refined to better serve the stakeholders and support the overall goals and objectives of the OWOW plan.

# 7.0 Impacts and Benefits Of Sustainable Integrated Solutions

With the development of integrated watershed planning, multi-benefit and multi-purpose projects have moved to the forefront and have become one of the primary goals of the One Water One Watershed (OWOW) process. The idea of meeting a number of community needs with a multi-benefit project is not new; however, specialization within agencies that deal with water has often moved these project types to the backburner. Past efforts primarily have focused on single purpose projects, and the additional effort required to develop multi-objective solutions has made true multi-benefit projects relatively uncommon. In California, there has been an effort to incentivize collaborative planning through Integrated Regional Watershed Management (IRWM) Planning and associated funding sources.

This reliance on single-purpose projects is not unique to water. An interesting analogy can be drawn with the field of public health. Infectious diseases that plague much of the world can be treated by eliminating the infectious agent or interrupting the transmission of the pathogen. Public health programs traditionally focus on both approaches and use a team of physicians, sanitary engineers, and others professionals to address problems, often with great results. The development of more specialization in public health practice, in many cases, has been correlated with the resurgence of some diseases, such as malaria. Recently, scientists have become concerned that the "Balkanization of Science" has resulted in specialists with narrow training focusing only on a single aspect of a broader problem. Effective solutions often are missed by this approach (Moore, 2008). Similar statements could be made about water management. If water is considered in the broadest sense as a resource that benefits a wide group of interests, including those represented by the ten Pillar groups of the OWOW process, the projects that address as many of those interests as possible should be encouraged.

Some of the earliest multi-benefit water projects were done through a partnership between those interested in flood and groundwater management. Spreading grounds along the front slopes of local mountains have attenuated flood flows and recharged groundwater basins for nearly 100 years. OCWD partnered early with Orange County Flood Control District to provide recharge basins within flood control basins. More recently, Inland Empire Utilities Agency (IEUA) has worked with San Bernardino County Flood Control to modify the operation of the flood control system to maximize recharge opportunities. IRWD has partnered with the Orange County Flood Control District to store recycled water in some flood control basins. All of these projects primarily were facilitated by operational changes rather than the construction of new infrastructure, although in some cases the flood system was upgraded. Operational changes could occur only when both parties understood the needs and assets of the other.

The development of multi-benefit projects will remain challenging and require sustained effort by agencies that manage water. In the watershed alone, there are approximately 100 agencies that manage water in some way. This situation is not unique to this watershed. The Federal government has 12 agencies and eight separate committees all doing water-related work (Udall and Averyt, 2009). Agencies need to prioritize collaborative projects and provide the staff resources to ensure that such projects are developed.

The purpose of integrated watershed planning is to consider other disciplines or functional areas when planning and implementing projects. Benefits of this approach far exceed the immediate benefit of reducing controversy surrounding a particular project. The Pillars developed a list of potential benefits in a workshop to identify incentives associated with the development of multi-benefit programs and projects. They are listed below:

**Solving Problems using a multi-benefit approach prevents the creation of other problems.** Often when a single-function project is developed, it has an impact on other water-related areas, often unanticipated. The truth of this statement is often born out in a CEQA or NEPA analysis, where numerous problem areas can be identified.

**Mult-benefit problem solving results in no missed opportunities.** In a multi-benefit type of approach, a careful exploration of all aspects of a particular project often results in the identification of incremental project changes that can result in large benefits in other areas.

**Cost and resource savings for the public can be achieved.** When a multi-benefit project is developed, the cost of providing each benefit is often less than providing similar benefits to the public using two or more separate projects. As land and other public resources become scarce, these types of projects are more likely to be undertaken and provide more public benefit.

**Developing projects that provide multiple benefits develops trust.** As groups develop multi-benefit projects, trust is developed among different constituencies, each interested in a different aspect of water. These groups are more likely to work toward similar solutions in the future if they have successfully developed multi-benefit projects.

**Multi-benefit projects are focused on building successful projects, not dispute resolutions.** Groups focused on problem solving rather than dispute resolution or litigation save public resources and implement solutions to regional problems faster than they would had they disputed each other's single-function project.

**Development of multi-purpose projects can develop better communication.** Through the development of a project, groups that span geography or area of interest develop better communication and trust.

**Multi-purpose projects often have diverse sources of funding.** As multi-benefit projects are developed, multiple State and Federal funding sources become available providing cost share opportunities, and increasing the probability that a specific project would move forward.

**Development of multi-function projects allows sharing of human resources.** Each agency or constituency interested in developing a project has access to individuals with unique abilities and perspectives. Teams formed from diverse groups often develop unique solutions to problems.

Pillar Co-chairs met several times to develop matrices that demonstrated the potential benefits of multi-benefit projects undertaken between Pillar groups. In other words, how would a multi-benefit project conducted by one Pillar group benefit another group? The purpose of this exercise was to encourage the Pillars to begin to focus on how implementing projects to benefit their constituency can be designed to benefit others.

Drafts of these matrices were taken to three public workshops held in Orange, Riverside, and San Bernardino Counties. At these sessions, stakeholders were invited to comment on the work of the Pillars, as well as suggest their own benefits. Again, the primary purpose of these workshops was to encourage discussion around the concept of designing projects for more than one purpose. As the Pillar leaders completed their final drafts, they developed a list of project types that would benefit more than one Pillar and were worthy of further consideration and implementation.

Under OWOW 2.0 Plan, as some Pillars were folded into others and new ones arose as compared to the OWOW 1.0 Plan, new tables were developed that catalog the potential impacts and benefits at the region level and inter-region levels. A project that fulfills a particular watershed need can be designed to provide other benefits to several other Pillars and to surrounding regions. Maximizing these benefits provides for better projects and better use of public money.

## Implementation Benefits of Prop 84 Round 1 and Round 2

Since the development of the OWOW Plan, there have been many multi-beneficial projects proposed and funded for the improvement of communities and water agencies alike. These projects have been financed by Proposition 84 Chapter 2 Round 1, and Proposition 84 Round 2, implementation of these developments has provided both regional and inter-regional benefits. Shown below in **Table 7-1** is a list of all the projects and their associated benefits. These projects were able to target key improvement areas within the watershed such as:

- Water Use Efficiency
- Stormwater Capture Storage
- Groundwater Desalination
- Recycling Reuse
- New Storage
- Non-point Source Reduction
- Salt Removal
- Preservation Restoration
- Reduction of TMDL's and other Pollutants

Also part of Round 2, another sequence of proposed and funded projects proved to be multi-beneficial to the watershed. Listed below on **Table 7-2** is a record of all the funded projects and their respective benefits. These follow the same key target improvement areas as shown above. Development and implementation of projects such as these contribute to the overall goal in creating a sustainable watershed.

**Table 7-1 Implementation Projects Funded by Proposition 84 Chapter 2 Round 1**

| Project | Benefits |
|---|---|
| Santa Ana Watershed Vireo Monitoring and Breeding Bird Surveys | • Restored 300 acres of endangered bird species habitat |
| Arlington Desalter Connection Project No. 27 – 1208 & Western Municipal Water District Promenade Connection | • Water use efficiency increase of 11,200 AFY |
| Groundwater Replenishment System – Flow Equalizer | • Recycling reuse increase of 12,000 AFY<br>• |
| Perris II Desalination Facility | • Groundwater desalination of 6,050 AFY<br>• Non-point source reduction of 7 MGD<br>• 21,000 tons of salt removed<br>• Two acres of preservation restored |
| Cactus Basins No. 3 and No. 3A | • Stormwater capture storage increase of 15,000 AFY<br>• 700 acres of preservation restored |
| Sludge Dewatering, Odor Control, and Preliminary Sludge Thickness at Plant No. 1, Project No. P1 – 101 | • Recycling reuse increase of 78,400 AFY |
| Perchlorate Wellhead Treatment System Pipelines | • 101 tons of salt removed |
| Chino Creek Well-field, Wells 1,2, and 3 | • Groundwater desalination of 2,900 AFY<br>• One ton of salt removed |
| Cucamonga Creek Watershed Regional Water Quality Project (Mill Creek Wetlands) | • New storage of 160 AF<br>• 14 acres of preservation restored |
| Repairs to the Unlined RCP Reach IVA and Reach IV-B Santa Ana Regional Interceptor (SARI) | • Supports continued brine disposal |
| Well 21 and 22 Project | • Groundwater desalination of 6,300 AFY |
| Alamitos Barrier Improvement Project | • 520 tons of salt removed |
| Arlington Basin Water Quality Improvement Project | • Stormwater capture storage increase of 1,300 AFY<br>• 16 acres of preservation restored |

**Table 7-2 Implementation Projects funded by Proposition 84 Chapter 2 Round 2**

| Project | Benefits |
|---|---|
| Wineville Regional Recycled Water Pipeline and Groundwater Recharge Systems Upgrades | • Stormwater capture storage increase of 4,600 AFY<br>• 46 acres of preservation restored |

| | |
|---|---|
| Forest First – Increase Stormwater Capture and Decrease Sediment Loading through Forest Ecological Restoration | • 1,750 acres of preservation restored |
| Perris Desalination Program – Brackish Water Wells 94, 95 and 96 | • Groundwater desalination of 2,900 AFY<br>• 4,060 tons of salt removed |
| San Sevaine Ground Water Recharge Basin | • Stormwater capture storage increase of 2,000 AFY<br>• 26 acres of preservation restored |
| Vulcan Pit Flood Control and Aquifer Recharge Project | • Stormwater capture storage increase of 2,000 AFY<br>• 60 acres of preservation restored |
| Wilson III Basins Project and Wilson Basins/Spreading Grounds | • Stormwater capture storage increase of 1,300 AFY<br>• |
| Peters Canyon Channel Water Capture and Reuse Pipeline | • Reduction of TMDL and other pollutants |
| Corona/Home Gardens Well Rehabilitation and Multi-Jurisdictional Water Transmission Line Project | • Restoration of water service |
| Commercial/Industrial/Institutional Performance-Based Water Use Efficiency Program | • Water use efficiency increase of 400 AFY |
| Quail Valley Subarea 9 Phase 1 Sewer System Project | • Septic tank to sewer conversion |
| Francis Street Storm Drain and Ely Basin Flood Control and Aquifer Recharge Project | • Stormwater capture storage increase of 622 AFY |
| Customer Handbook to Using Water Efficiently in the Landscape | • Water use efficiency increase of 7,240 AFY |
| Plunge Creek Water Recharge and Habitat Improvement | • Stormwater capture storage increase of 1,250 AFY<br>• 50 acres of preservation restored |
| Prado Basin Sediment Management Demonstration Project | • Stormwater capture storage increase of 450 AFY |
| Enhanced Stormwater Capture and Recharge along the Santa Ana River | • Stormwater capture storage increase of 14,600 AFY |
| 14th Street Groundwater Recharge and Storm Water Quality Treatment Integration Facility | • Stormwater capture storage increase of 400 AFY |
| Soboba Band of Luiseño Indians Wastewater Project | • Feasibility Study |
| Canyon Lake Hybrid Treatment Process | • 525 acres of preservation restored<br>• 50% reduction in total Phosphorus concentration |
| Recycled Water Project Phase I (Arlington-Central Avenue Pipeline) | • Recycling reuse increase of 6,000 AFY |
| Regional Residential Landscape Retrofit Program | • Water use efficiency increase of 1,000 AFY |

**Table 7-3 Impacts and Benefits of Water Resource Optimization**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | Potential Impacts | Potential Benefits | Potential Impacts | Potential Benefits |
| **Water Resource Optimization** | • Increased expenses<br>• Surface water loss<br>• Ocean habitat loss<br>• New discharge issues associated with brine line disposal | • Quantifies environmental and habitat needs<br>• Allows cost sharing partnerships to enhance and improve the capability of flood control infrastructure to capture and infiltrate storm flows<br>• Allows sustainable growth<br>• Provide high quality supply to clean up contaminated ground water basins<br>• Promotes appropriate use of recycled water<br>• Promotes change in water usage strategies<br>• Encourages transition of landscaping to native plant types<br>• Reduced water demands<br>• Increases water supply<br>• Improve water quality<br>• Lowers the concentrations of imported salt in local surface and groundwater supplies<br>• Surface storage provides opportunities for local recreation<br>• Expands and enhances opportunities for recreational boating and sport fishing<br>• Water utility easements provide trail opportunities<br>• Enhances property value | • New outflow locations<br>• New discharge locations<br>• Additional storage/ infrastructure construction will increase Green House Gas (GHG) emissions | • Incentive for high quality industrial and commercial development<br>• Supports smart growth, enhancing quality of life<br>• Reduces the total carbon footprint associated with importing water<br>• Provides mechanism to lower the concentration of industrial pollutants<br>• Support less reliance on imported water supplies<br>• Additional storage/ Infrastructure which help prepare for inter-regional drought, natural disaster, or terriost attack |

**Table 7-4 Impacts and Benefits of Beneficial Use Assurance**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | **Potential Impacts** | **Potential Benefits** | **Potential Impacts** | **Potential Benefits** |
| **Beneficial Use Assurance** | • Increase of Green House Gas (GHG) emissions<br>• Increased energy use for water quality treatment<br>• Increased machinery maintenance | • Reduced the input of nutrients which promote eutrophication<br>• Promote greater biodiversity<br>• Use of natural treatment systems provides incentive for restoration and construction of habitats<br>• Supports and protects areas of biological significance including habitats for threatened and endangered species<br>• Provides high quality drinking water for disadvantaged communities<br>• Reduces the perceived need for bottled water<br>• Expands and enhances recreational opportunities<br>• Strategies that promote infiltration, such as LID (Low Impact Development) help reduce peak flows and flooding<br>• Extends the life of existing infrastructure<br>• Reduces risk to public health<br>• Attracts high quality industrial developments<br>• Expands opportunities for water recycling<br>• Improves the efficiency of membranes and filters<br>• Expands the range of available technologies<br>• Extends the life of fixtures and appliances<br>• Reduces the perceived need for water softeners. | • Possible damage to habitats<br>• Increased energy consumption in association with pumping<br>• Intrusion opportunity for invasive species | • Offsets climate changes stress on water supply by improving water quality overall<br>• Improve the overall perception of the surrounding regions<br>• Enhances value of property which encourages larger population growth<br>• Incentive for high quality industrial and commercial development<br>• Supports less reliance on imported water supplies<br>• Preparedness to aid surrounding regions from inter-regional drought, natural disaster, or terriost attacks via the conservation of water supplies<br>• Promotes new and innovative water treatment methods |

**Table 7-5 Impacts and Benefits of Water Use Efficiency**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | **Potential Impacts** | **Potential Benefits** | **Potential Impacts** | **Potential Benefits** |
| **Water Use Efficiency** | • Increased short term construction and site-specific impacts<br>• Reduced flow downstream<br>• Negative habitat impacts<br>• Negative water quality impacts | • Reduce carbon footprint associated with transporting and processing water<br>• Reduce carbon footprint associated with water use and consumption<br>• Encourage planting of native plant species<br>• Reduced standing plant biomass associated with fire threat in the riverbed<br>• Promotes water efficient programs through water budget based rate funds<br>• Encourage maintenance of open spaces and corridors for trails<br>• Reduce salt importation<br>• Encourage water recycling and opportunities for alternate technologies (i.e., gray water systems, cisterns for roof runoff)<br>• Reduced stress on existing infrastructure<br>• Provides opportunity for conservation of local surface and ground water flows | • Long term financial impact on local water retailers<br>• As water use efficiency programs become more effective, the funds supporting them decline<br>• Increased concentration of runoff due to decreased frequency of runoff<br>• As water becomes more efficient it may cause a possible reduction of jobs | • Reduce the volume of poor quality runoff from reaching natural systems<br>• Provide increased funding for reduced water demand government programs<br>• Provide support to CA constitutional obligations and 20% by Year 2020 compliance<br>• Provide inter-regional education opportunities through signage and multi-benefit/multi-purpose demonstration projects<br>• Supports less reliance on imported water supplies.<br>• Promote water wise methods<br>• Less water requires less overall energy used for transportation (i.e., pumping) |

**Table 7-6 Impacts and Benefits of Land Use and Water Planning**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | Potential Impacts | Potential Benefits | Potential Impacts | Potential Benefits |
| **Land Use and Water Planning** | • Increased short term construction and site-specific impacts<br>• Possible long term construction projects to meet Low Impact Development standards<br>• Possible long term construction through urban areas, which may be detrimental to surrounding businesses | • Increased water supply<br>• Improved water quality<br>• Practice resource stewardship<br>• Smart growth through higher density development reduces the carbon footprint associated with transporting and processing water<br>• Helps improve watershed functionality<br>• Preserve and integrate habitat into a built environment<br>• Enhanced habitat connectivity and quality of life<br>• Redevelopment and retrofitting provide opportunities for habitat restoration<br>• Sewer systems protect groundwater quality, reducing the risk of contamination associated with septic system failure<br>• Promotes natural groundwater recharge to reduce storm flow<br>• Improved quality of stormwater runoff<br>• Avoid flood control infrastructure costs<br>• Provides opportunities for public-private partnerships<br>• Reduced cost of regulatory compliance<br>• Integration of recycled water into new development promotes sustainable growth<br>• Higher density development reduces the cost of recycled water infrastructure<br>• Sustainable development provides market for recycled water<br>• Provides prescriptive measures for the efficient use of water and recycled water for irrigation and other non-potables uses<br>• More open space promotes gw recharge<br>• Promotes the efficient use of water<br>• Provide market for green products and water saving devices | • Increased short term construction and site-specific impacts<br>• Projects prove to be very expensive and continued maintenance could create government budget cuts elsewhere | • Supports less reliance on imported water supplies.<br>• Creates opportunity for multi-agency projects that are adopted by other regions<br>• Reduced nuisance flow from urban development into surface waters<br>• Provides better local job to housing ratio reducing the carbon footprint associated with commuting<br>• Encourages inter-regional innovative, low-impact designs and practices<br>• Creates future ideas that prove to be more innovative energy-efficient designs |

**Table 7-7 Impacts and Benefits of Stormwater: Resource and Risk Management**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | Potential Impacts | Potential Benefits | Potential Impacts | Potential Benefits |
| **Stormwater: Resource and Risk Management** | • Increased short term construction and site-specific impacts<br>• Possible damage to habitat areas used as flood zones<br>• Loss of riparian and/or wetland acreage | • Improved flood management<br>• Non-structural flood control channels help preserve natural habitats<br>• Serves as a multi-purpose source for funding habitat related projects<br>• Prevent channel erosion<br>• Easements provide fire breaks and emergency access<br>• Protect lives and properties<br>• Reduced flood insurance costs<br>• Provide improved water quality for recreational use<br>• Integrated flood strategies enhance the value of developed properties<br>• Reduced risk to infrastructure from debris dams associated with entering flood control systems<br>• Integrated flood strategies improve the quality of surface, ocean, and groundwater<br>• Support regulatory compliance and reduce compliance cost<br>• Provides additional conveyance opportunities<br>• Provides facilities to recharge recycled water<br>• High quality stormwater dilutes the salt of recycled water and imported water recharge<br>• Increased opportunities for groundwater recharge<br>• Provides temporary storage for other uses<br>• Increased available local water supply<br>• Expanded local recharge reduces the need for irrigation | • Could result in a missed allocation of funding due to infrequent flows within the regions | • Large recharge basins help reduce the heat island effect, reducing all surrounding temperatures<br>• Increased groundwater recharge that reduces the need for more energy intensive imported water<br>• Connects neighboring biological communities<br>• Better understanding of risk improves overall safety for state agencies and surrounding regions<br>• Promotes multi-agency projects which provide opportunities to expand high quality development<br>• Increased emergency flows that create inter-regional disaster planning |

**Table 7-8 Impacts and Benefits of Natural Resource Stewardship**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | **Potential Impacts** | **Potential Benefits** | **Potential Impacts** | **Potential Benefits** |
| **Natural Resources Stewardship** | • Increased short term construction and site-specific impacts<br>• Loss of any potential urban future development<br>• Possible long term construction near urban areas, which may be detrimental to surrounding businesses | • Protects natural habitats<br>• Resource stewardship<br>• Environmental services are an important link to public health – clean air, natural treatment of water<br>• Improved stormwater quality<br>• Provides additional flood control system capacity<br>• Promotes groundwater recharge<br>• Protects property from local flood impacts<br>• Redevelopment strategy for blighted areas<br>• Promotes consistency with general strategic plans<br>• Provides large permeable area for storm water infiltration<br>• Wetlands provide enhance water quality<br>• Provides erosion control and reduce accompanying sediment load<br>• Treatment wetlands reduce recycling costs | • Loss of land use and associated inter-regional revenue | • Provides a market for recycled water, decreasing reliance on imported water supplies<br>• Provides environmental education outreach programs with inter-regional agencies<br>• Improved overall aesthetics of surrounding regions<br>• Promotes inter-regional economic growth through tourism |

**Table 7-9 Impacts and Benefits of Operational Efficiency and Water Transfers**

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | Potential Impacts | Potential Benefits | Potential Impacts | Potential Benefits |
| **Operational Efficiency and Water Transfer** | • Increased short term construction and site-specific impacts | • Improved efficiency of water transfers<br>• Improved infrastructure<br>• Reduced green house gas<br>• Maximizes water transportation strategies<br>• Cuts down on inefficient water transfer strategies<br>• Increased longevity of tools, machinery, and transportation vehicles<br>• Less maintenance on transportation vehicles and pipelines<br>• Decreased water waste<br>• Reduced energy use<br>• Creates more localized water availability<br>• Cuts down overall maintenance costs<br>• Decreased operational spending (i.e., fuel)<br>• Decreased energy consumption | • Long term financial impact of inter-regional water retailers and wholesalers<br>• Retrofitting programs requires copious funding from various government entities | • Supports less reliance on imported water supplies.<br>• Minimizes emission of Green House Gases (GHG)<br>• Reduces overall energy costs associated with pumping/wheeling<br>• Aids emergency flow strategies that support inter-regional disaster planning |

| Pillar | Within IRWM Region | | Inter-Regional | |
|---|---|---|---|---|
| | Potential Impacts | Potential Benefits | Potential Impacts | Potential Benefits |
| **Energy and Environmental Impact Response** | • Increased short term construction and site-specific impacts<br>• Potential long term operating cost | • Decreases carbon footprint<br>• Benefits to public health<br>• Increases funding opportunities for community enhancement<br>• Reduction of greenhouse gas emissions<br>• Reduction of the heat island effect<br>• Trail usage encourages non-gasoline modes of transportation<br>• Promotes efficient energy use<br>• Provides cheaper, natural treatment for surface water and groundwater recharge<br>• Provides more green rebate program opportunities<br>• Improvements to infrastructure are more energy efficient<br>• Promotes a sense of well being for the community<br>• Improved surrounding habitats<br>• Lower use of limited resources | • Increased long term construction may have an economic impact on surrounding areas<br>• Expensive future repair and/or retrofitting costs | • Increase of government green programs<br>• Reduced inter expense of resources<br>• Reduced unnecessary waste<br>• Reduction of Green House Gases (GHG) emissions<br>• Protects interconnecting natural forests<br>• Maximized energy efficiency<br>• May spur more projects/ideas of reducing carbon footprint |

## Conclusion

Implementation of these projects found in the OWOW 2.0 Plan proves to be critical in creating a sustainable watershed. We must understand that the development of ideas and methods not only have a direct impact within the region, but also inter-regionally. The information above is a list of potential impacts and benefits relatable to the Pillars found in the OWOW 2.0 Plan. These benefits and impacts are separated into two different categories that give a brief analysis of the strategic implementation. It is important that these potential impacts are realized so that if they do occur, the watershed is prepared. Also it is important to see the potential benefits these outcomes could have on the region and inter-regions. The development and implementation of multi-benefit projects will remain challenging and require sustained effort by agencies that manage water.

# 8.0 Finance

The Santa Ana Watershed Project Authority ("SAWPA") has engaged David Taussig and Associates, Inc. ("DTA") to investigate financing alternatives for public facilities and regional planning to be included as part of SAWPA's Integrated Regional Water Management Plan ("IRWMP"), also known as One Water One Watershed ("OWOW") 2.0.

Even with uncertainty in the economy, agencies are unable to wait around for funding. Financing and design efficiencies can and will be improved with regional/inter-agency coordination and transparency.

The primary objective of this chapter is to present feasible and realistic funding alternatives for regional water projects and integrated water infrastructure planning, with an emphasis on new and innovative approaches. A secondary objective of this chapter is to ensure that public financing policies are appropriately addressed, and that the integrated planning required to construct regional water and water quality improvements is adequately funded.

Specific financing objectives are:

- Public facilities and programs developed through the OWOW 2.0 process will be adequately financed and constructed in a timely manner, and the planning and coordination for these types of integrated projects also will be adequately funded.
- The OWOW 2.0 program, through SAWPA or through the actions of its Steering Committee, is able to maximize the availability of public debt financing (and the use of Federal and State grants and loans) for regional infrastructure or programmatic needs, while minimizing the financial burden on the individual agencies and/or property owners.

- Public financing for regional programs or infrastructure is equitable, financially feasible, efficiently utilized and consistent with each agency's goals and, when necessary, meets all relevant nexus and benefit criteria.
- Public financing mechanisms avoid creating a financial and administrative burden to the public agency, and develop cost savings through increased efficiency in the public arena.
- The certainty and sustainability of identified options for funding regional water projects and integrated planning will be discussed.

SAWPA, as the leading watershed wide water resource agency for the Santa Ana River Watershed (the "Watershed") and region, plays a major role in administering, participating, coordinating, and facilitating efforts to address regional water management issues. To date, these efforts have been funded primarily by the SAWPA member agencies. SAWPA's governance structure is a Joint Powers Authority ("JPA") involving five member agencies: Eastern Municipal Water District ("EMWD"), Inland Empire Utilities Agency ("IEUA"), Orange County Water District ("OCWD"), San Bernardino Valley Municipal Water District ("SBVMWD") and Western Municipal Water District ("WMWD"). It is particularly noteworthy that SAWPA's activities benefit multiple stakeholders throughout the Santa Ana River Watershed, many of whom are not SAWPA member agencies and do not share in supporting SAWPA's annual IRWM expenses budget, which are estimated at between $250,000 and $800,000 – depending on whether an IRWMP update is necessary during the year. These stakeholders include over 97 water related agencies, 3 counties, 59 cities and various State water, environmental and regulatory agencies, federal agencies, other special districts and groups.

California voters approved Propositions 84, 1E, and 1C in 2006. Under Proposition 84, $114 million has been allocated to the watershed subject to an adoption of an Integrated Regional Water Management Plan. Using a decentralized, comprehensive stakeholder involvement process, as well as involving experts from all fields and areas within the watershed, an extraordinarily collaborative and visionary plan was developed. The Santa Ana Watershed Integrated Regional Water Management Plan, called the OWOW Plan, was adopted in November 2010 with a goal of addressing the major water challenges over the next two decades. Highly respected industry-wide as the leading IRWM region in California, SAWPA is expected to receive funding in each round of the Proposition 84 IRWM program. Through the OWOW effort, SAWPA secured $12.0 million in funding for Round I implementation with a DWR-SAWPA contract executed in June 2012. Round II funding for 20 projects in the Santa Ana IRWM Region is projected to be $16 million with contracts among DWR/SAWPA and project proponents expected in the fall of 2013. According to a recent statement by the DWR, Round III IRWM implementation grant applications will not be available until early 2015.

## Funding Options for Integrated Regional Planning Efforts

SAWPA and its regional planning efforts are critical for the future of the watershed. Yet SAWPA's bottom-up, broad-based approach requires that SAWPA expend valuable resources for coordination, support, and facilitation. To date, SAWPA's efforts have been largely funded by the SAWPA member agencies and grant funded administration funds. With California's uncertain future economic climate, grant funding through water bonds is no longer a secure funding source. In addition, SAWPA's member agencies tightened their financial belts during the Great Recession which threatens SAWPA's largest funding source. Finally, many parties benefit from SAWPA's leadership and value creation, but do not contribute to SAWPA's OWOW Plan development and Plan update expenses.

It is imperative that SAWPA review its funding options and develop plans today to ensure a long-term stable funding source for the future. In June 2012, SAWPA completed a detailed evaluation of its funding challenges and summarized its findings in a document titled, "2012 OWOW Funding Options" ("Study"). DTA found the Study to be comprehensive, creative, and reasonable in its recommendations and conclusions.

SAWPA is not the only agency struggling to find a way to fund the coordination and facilitation of regional planning efforts. As part of this Report, we have investigated funding sources used by other IRWM regions. While the California Department of Water Resources ("DWR") and others encourage an integrated approach to infrastructure planning, until a long term stable funding source is identified, it will be difficult to fully achieve the desired benefits.

### SAWPA Study of Funding Alternatives

The Study identifies seven funding mechanisms that may be used to fund all or a portion of SAWPA's ongoing operating expenses. Each of these mechanisms is discussed briefly below. While individually, these mechanisms may not be an ideal source of stable, long term funding, taken in combination, one or more of these mechanisms could provide a revenue stream to offset or reduce the current contributions from SAWPA members.

- Grant Funding
- Voluntary Contributions
- Project Application Fee
- Fee on Projects Funded
- Public Private Funding Partnerships
- Form an IRWP Planning Committee
- Continue Status Quo

#### *Grant Funding*

SAWPA has been successful in receiving planning grants in the past and will continue to pursue all grant funds that are available in the future. However, planning grant funds may not always be available and should be thought of as supplemental funding, rather than a permanent source of funding.

Grant funding typically is tied to State bond funds, which are uncertain at best. While there is an

expectation that a water bond will appear on the November 2014 ballot, past attempts to put the measure on the ballot did not succeed; and even if on the ballot, approval by the voters is not guaranteed.

### *Voluntary Contributions*

Voluntary contributions of money and staff time are appreciated by SAWPA. However, SAWPA member agencies have contributed a disproportionately large share of SAWPA's funding requirements. In addition, by their nature, this type of funding is voluntary, and therefore is not a reliable source of long term funding. Voluntary contributions are a significant component of the funding for this conference.

A segregated fund administered within the SAWPA Planning Department, known as the One Water One Watershed Fund ("OWOW Fund"), was created to provide a means for other agencies or groups to participate financially in the development of the OWOW process and to help offset costs borne by SAWPA and its member agencies. The OWOW Fund collects and manages funds provided to SAWPA for development and implementation of the OWOW program.

The following is SAWPA's official policy for the administration of the OWOW Fund:

"Upon receipt of funds from agencies or other groups provided for the purpose of supporting the One Water One Watershed Program, SAWPA shall deposit such funds into a segregated account (Fund No. 392 - OWOW). This account will accrue interest. The segregated account will be included in the SAWPA budget during the annual budget cycle. SAWPA administrative and project costs will be deducted from the account.

All project-related expenditures from this account shall be reviewed by the SAWPA Commission to ensure consistency with the purpose of the One Water One Watershed Program and regional integrated watershed planning. Activities undertaken under this fund include:

- Collection, collation and analysis of data for One Water One Watershed plans
- Development of written materials, including maps and diagrams, to support the One Water One Watershed Program
- Development and implementation of stakeholder outreach and education activities in support of One Water One Watershed planning
- Provision of technical assistance and facilitation in the development of specific sub-regional plans in support of broader One Water One Watershed objectives

Participation and funding of activities undertaken as part of this fund does not imply an endorsement of specific projects developed under the One Water One Watershed Program."

### *Application Fee for Project Grant Submittals*

A new funding option would be for SAWPA to charge an application fee for each project an agency submits for funding. For the first round of Proposition 84 funding, 297 project applications were submitted to SAWPA for inclusion in the OWOW plan and for consideration of possible funding. By charging a modest application fee of $500 or $1,000 per project, SAWPA could have generated $148,500 to $297,000. However, it is unknown if the number of projects submitted would have been reduced as a result of such a fee.

In addition, charging a fee for each project generates a one-time funding source that is linked to future grant funding, rather than an ongoing permanent source.

### *Fee for Project Successful In Obtaining Grant*

A slightly different funding option would be to charge an administrative fee on each project selected to receive grant funding. By charging the successful project applicants, those who benefit most from the IRWMP process would help pay a portion of SAWPA's ongoing costs.

For Round I of Proposition 84, 13 projects in the watershed received $12.7 million in grant funding. If SAWPA charged a 10% fee for each project, this would have generated $1.3 million for planning and facilitation.

As mentioned above, charging a fee for successful projects generates a one-time funding source that is linked to future grant funding, rather than an ongoing permanent source. SAWPA's legal counsel is reviewing the legality of charging such a fee.

### *Public Private Partnerships*

Many businesses and business coalitions benefit from the work done by SAWPA to develop and implement OWOW and OWOW 2.0. A new funding option would be for SAWPA to identify these businesses and try to form beneficial relationships such that the businesses would be willing to contribute funds in support of the OWOW effort. Like voluntary contributions, this type of funding is optional, and therefore is not a stable source of long term funding.

### *IRWMP Planning Committee Memberships*

Development of an IRWMP Planning Committee could create a permanent source of funding for SAWPA's ongoing efforts. If such a task force included all stakeholders within the watershed and required a minimal annual contribution from each, this would result in a permanent funding source for the OWOW program at a minimal cost to each stakeholder (currently estimated at less than $5,000 per agency annually).

To get agencies to agree to be part of the task force and make contributions annually, there needs to be a compelling and beneficial reason for them to join. Task force membership would need to offer agencies more benefit than just receiving grant funding. Demonstrating the direct benefit of regional planning to each agency and organization sufficiently to assure regular and ongoing budgeted funding in the task force would be the most difficult hurdle to implementation. SAWPA has used the task force model to successfully fund projects in the past.

### *Status Quo*

Another option to secure funding for SAWPA's ongoing planning and collaboration efforts is to continue the current model of relying upon contributions from the SAWPA member agencies.

In many ways, funding from the five SAWPA member agencies reflects a broad based multi-agency approach for funding regional integrated planning. With most of the SAWPA member agencies serving as a wholesale water agency or water supplier role for a large area in the watershed, their sub-agencies provide funding to the SAWPA member agencies through water connection fees and rates. Funding received by water fees and rates by each of the SAWPA member agencies from sub-agencies and the general public is funneled in part to support SAWPA in its ongoing regional planning efforts.

## SAWPA Funding Versus Other Funding Approaches

### *Survey of Leading IRWM Regions*

As a part of this Report, DTA has investigated the funding approached used by other IWRM regions. In the course of DTA's research, DTA interviewed DWR staff regarding the myriad of methodologies that IRWM regions are using to fund their respective ongoing operational expenses. DWR staff provided DTA with a list of several the most highly respected and innovative IRWM regions and suggested that DTA contact them and catalogue their approaches to funding. The following are DTA's observations after conducting interviews with staff at the following agencies.

The survey participants (in no particular order) were:

- Sacramento River Sub Region Funding Area – IRWM Region No. 1, American River Basin; Regional Water Authority staff
- North Coast Sub Region Funding Area – IRWM Region No. 21, North Coast; Humboldt County Planning Department
- San Diego Sub Region Funding Area – IRWM Region No. 26, San Diego; San Diego County Water Authority
- Tulare/Kern Sub Region Funding Area – IRWM Region No. 38, Upper Kings Basin Integrated Regional Water Management Authority; Kings River Conservation District

DTA's interviews with the IRWMs revealed that all of the funding methodologies in use by the survey participants were either already implemented by SAWPA or are under consideration in SAWPA's "2012 OWOW Funding Options" Study. The most notable area of possible improvement for SAWPA is that other IRWMs have been able to develop higher percentages and a broader array of stakeholders contributing funds to support their respective operations.

The Kings Basin IRWM Authority in the Tulare/Kern Funding is funded primarily through a broad coalition of regional agricultural, municipal and community interests with a membership of 50+/- members each paying $7,000 in annual fees plus a one-time $30,000 fee to fund the original IRWMP. Further, grant applicants must be "sponsored" by a member in good standing to qualify for grant consideration.

The San Diego IRWM is funded through fiscal year 2016 with a MOU documenting combined support from San Diego County, the City of San Diego and the San Diego Water Authority to fund IRWM operations up to a total of $1,470,000; San Diego's funding sources are more vertically diverse and are a closer reflection the type of organizations (i.e. governmental, public utility, private water purveyors) submitting projects for grant funding. The San Diego IRWM region is studying the use of an application fee for grant submittals to fund its operations.

Similar to SAWPA, the American Basin IRWM governance structure is a Joint Powers Agreement ("JPA"). The American Basin IRWM is funded by a consortium of similar type organizations, water purveyors plus wastewater organizations; there are a total of 25 water and wastewater agencies operating within the IRWM boundaries. 18 of the 25 share the IRWM's ongoing administration expenses. In this case the funding source is horizontal; however, the cost sharing has greater breadth.

### *Voluntary Subscriber Fees*

In addition to reviewing the Study and surveying other IRWM regions, SAWPA recommended that DTA investigate voluntary subscriber fees, similar to those proposed by the Murrieta Fire Department.

### Murrieta Fire Department Case Study

With funding decreasing over the past few years the Murrieta Fire Department ("MFD") searched for ways to maintain its current level of service without raising taxes. To help offset the costs of providing Emergency Medical Service ("EMS"), the MFD has proposed a program that would help compensate for the cost of emergency calls. The Murrieta EMS Subscription Program would be an annual, voluntary membership fee designed to shield Murrieta residents and businesses from out-of-pocket expenses related to EMS.

MFD's proposed cost recovery program will charge $350 per response, per person for each medical aid response that is performed. As an alternative to paying this charge, the MDF EMS Subscription Program ("Subscription Program") allows residents and business owners the option of paying a small annual fee rather than being charged the response fee. For single-family homes, the cost is $48 per year. For businesses the cost of this membership depends on the size of the business measured by the number of employees. The Subscription Program membership covers all response fees for services rendered.

Similar to MFD's model, SAWPA could use a combination of committee membership with grant application fees where committee members pay lower grant application fees than non-members.

## Conclusions

In one form or another, all of the funding mechanisms described above are available to SAWPA. Further study and vetting by SAWPA leadership and legal counsel are required for implementation. With California's uncertain future economic climate, grant funding through water bonds is unreliable at best. At the same time, due to the Great Recession, SAWPA member agencies have had to tighten their financial belts fueling funding uncertainty. In addition, concerns about equity require that SAWPA investigate methods to spread its costs over a broader group of stakeholders.

## Facility Funding Options

The One Water One Watershed Plan 2.0 contains a wide variety of public improvements to be constructed by multiple public agencies, including water supply and water quality projects, as well as projects that address the habitat restoration, flood control, recreational, and open space needs of the watershed. This section summarizes financing methods which may provide funding beyond Proposition 84 Chapter 2 grant funding.

### State and Federal Funding

In the past, SAWPA, its member agencies, and other local agencies in the watershed have been successful in obtaining State and Federal funding to build projects. However, the primary emphasis of this Report is on local funding sources.

While State and Federal grants and loans can be useful in funding one-time projects or coping with shortfalls, the consistent availability of such funding cannot be ensured and is often beyond the control of local public agencies. In addition, such grant programs typically require local matching funds, while loan programs require a local revenue source for repayment. DTA strongly recommends that public agencies continue to search and apply for available grants and loans; to the extent that projects are able to receive such funding, the need to undertake the local mechanisms cited below is diminished. However, local sources of revenue are recommended because they are under the control of each agency and are more predictable for long-term planning purposes.

#### *State Funding*

##### 2014 Bond Measure

A California Water Bond is currently slated for the November 4, 2014 ballot, as a legislatively-referred bond act. The measure is known by its supporters as the Safe, Clean, and Reliable Drinking Water Supply Act and in its current configuration would authorize the State to borrow $11.1 billion to overhaul the state's water system.

A water bond measure was originally certified to be on the State's 2010 ballot. It was removed and placed on the 2012 ballot. The California State Legislature, on July 5, 2012 approved a bill to take the measure off the 2012 ballot and put it on the 2014 ballot, purportedly to increase the likelihood of the approval of the Jerry Brown Tax Hike Initiative in 2012. Although there will be plenty of hot-button issues on the 2014 ballot in California, some observers predict that "the biggest fight, the sharpest split, may come over water. Specific spending proposals currently under consideration include:

- $455 million for drought relief projects, disadvantaged communities, small community wastewater treatment improvements and safe drinking water revolving fund
- $1.4 billion for "integrated regional water management projects"
- $2.25 billion for projects that "support delta sustainability options"
- $3 billion for water storage projects
- $1.7 billion for ecosystem and watershed protection and restoration projects in 21 watersheds
- $1 billion for groundwater protection and cleanup
- $1.25 billion for "water recycling and advanced treatment technology projects"

## Prior Bond Measures

Recent successful State Bond measures that funded water quality and water supply improvements include Proposition 13, Proposition 50 and Proposition 84.

### Proposition 13

In March 2000, California voters approved Proposition 13 (2000 Water Bond), which authorized the State of California to sell $1.97 billion in general obligation bonds to support safe drinking, water quality, flood protection and water reliability projects throughout the state. SAWPA successfully implemented Proposition 13 funding to construct $1 billion in infrastructure projects.

### Proposition 50

Passed by voters in 2002, Proposition 50 authorized $3,440,000,000 general obligation bonds to fund a variety of water projects, including:

- Specified CALFED Bay-Delta Program projects including urban and agricultural water use efficiency projects;
- Grants and loans to reduce Colorado River water use;
- Purchasing, protecting and restoring coastal wetlands near urban areas;
- Competitive grants for water management and quality improvement projects; Development of river parkways;
- Improved security for state, local and regional water systems; and
- Grants for desalination and drinking water disinfection.

### Proposition 84

Passed by voters in 2006, The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84) authorized $5.388 billion in general obligation bonds to fund safe drinking water, water quality and supply, flood control, waterway and natural resource protection, water pollution and contamination control, State and local park improvements, public access to natural resources, and water conservation efforts.

## State Revolving Funds

The State of California has established two State Revolving Funds ("SRF") which allow local agencies to have access to low interest loans to finance projects. The Clean Water SRF is a loan program that provides low-cost financing to eligible entities within State and tribal lands for water quality projects including: all types of nonpoint source, watershed protection or restoration, estuary management projects, and more traditional municipal wastewater treatment projects. The Drinking Water SRF is a loan program that provides low-cost financing to eligible entities within the State and tribal lands for public and private water systems infrastructure projects needed to achieve or to maintain compliance with safe drinking water requirements and to protect public health. Small water systems and disadvantaged communities are given higher funding priority. Both SRFs are managed by the State and funded by the federal Environmental Protection Agency.

***Other State Funding***
Shown below is a list of other State funding programs:

• California Department of Fish and Game Pacific Coast Salmon Restoration Fund (Fisheries Restoration Grant Program)
• California Coastal Conservancy Proposition 84 Funds
• California Coastal Conservancy Southern California Wetlands Recovery Project
Community Wetland Restoration Grants
• California Wildlife Conservation Board
• California State and Regional Water Quality Control Board Clean Water Grant Program
• California Integrated Watershed Management Grant Program Proposition 50 Funds
• California Department of Parks and Recreation Habitat Conservation Fund
• CalTrans Environmental Enhancement and Mitigation Program
• U.C. California/NOAA California Sea Grant College Program

## *Federal Funding*

### 2013 Water Resources Development Act

On March 20, 2013 the Senate Environment and Public Works (EPW) Committee unanimously approved S.601, the Water Resources Development Act of 2013. The bill provides critical flood protection for communities across the country, maintains the flow of commerce, and will create up to 500,000 new jobs. The bill seeks to further leverage government funds for water infrastructure projects through an innovative financing pilot project program—referred to as the Water Infrastructure Finance and Innovation Act (WIFIA)—which can help our nation meet its infrastructure improvement needs. The WIFIA, based on a popular program in the transportation sector, takes the dollars appropriated to it, leverages them in the market and takes that total available assistance and loans it from the federal government directly to a project.

Title X of WRDA has $250 million authorized for the WIFIA program ($50 million per year for five years 2014-2018) with eligibility for both water resources projects (flood control, levees, dams, etc.) and water/wastewater infrastructure. Projects that are eligible for SRF funding are eligible for funding from this WIFIA, as are energy efficiency upgrades, desalination, and acquisition of real property. Projects carried out by a non-public entity are eligible, provided that they have a public sponsor. There is a $20 million minimum for eligibility, and repayment of the loan must be from a dedicated revenue source.

### Other Federal Options

Shown below is a list of other federal funding programs and options:

NOAA/NMFS Restoration Center Community-Based Restoration Program
• NOAA/NMFS Restoration Center Open Rivers Initiative
• NOAA/NMFS Proactive Species of Concern Grant Program
• NOAA National Sea Grant College Program
• NOAA Coastal and Estuarine Land Conservation Program
• NOAA/ACOE/USFWS/EPA/NRCS Estuary Habitat Restoration Program
• EPA Wetlands Protection Grants and Near Coastal Waters Programs

• US. Department of Transportation Highway Bridge Rehabilitation and Replacement Program
• U.S. Fish and Wildlife Service National Coastal Wetlands Conservation Grant Program
• U.S. Fish and Wildlife Service Coastal Program
• U.S. Fish and Wildlife Service Partners for Fish and Wildlife Program
• U.S. Fish and Wildlife Service North American Wetland Conservation Act
• National Resource Conservation Service
• Federal Highway Administration – Road Aquatic Species Passage Funding

In 2012, the Congressional Research Service prepared a report entitled "Legislative Options for Financing Water Infrastructure" that describes several water infrastructure financing alternatives under consideration at the Federal level. The following six key actions are under consideration, some of which may benefit SAWPA and other local agencies.

- Increase funding for State Revolving Fund Programs
- Create a Federal infrastructure trust fund
- Create a Water Infrastructure Finance Innovation Act (WIFIA)
- Create a National Infrastructure Bank
- Modify Private Activity Bond Restrictions
- Reinstate Build America Bonds

### Increase Funding for State Revolving Fund Programs

Typical State Revolving Fund ("SRF") programs are funded by an initial (and periodic) capital injection(s) by the Federal government and managed by individual states. Annual capital appropriations by the Federal government fund the SRFs. The SRF essentially functions as a bank, lending at low interest rates for specific water projects. Loan repayments are then recycled back to individual SRF programs. SRF programs are governed by eligible project rules in addition to funding management constraints. States only make loans, purchase local debt, or issue financial guarantees and are not allowed to deplete the capital of the fund. Thus, the fund operates as a "revolving" source of financing.

According to the Congressional Research Service, Congress is considering expanding the funding for SRF programs.

### Federal Infrastructure Trust Fund

Federal trust funds currently exist to provide financing for airport and highway infrastructure but do not exist for water infrastructure. In contrast to an SRF, a Federal trust fund is supported by a fixed annual revenue stream (for example Federal fuel taxes). The revenues are then collected by the Federal Government and are dedicated or "earmarked" for expenditure on specific purposes.

Public focus on the Federal deficit decreases the likelihood that a water trust fund could be established. However, some members of Congress propose to increase infrastructure spending with a water trust fund.

### Water Infrastructure Finance Innovation Act ("WIFIA")

In 1998, Congress created the Transportation Infrastructure Finance Innovation Act ("TIFIA"). TIFIA provides Federal credit assistance of up to one-third of project costs, with a minimum project cost-eligibility requirement of $50 million. Eligible projects must have a dedicated revenue stream (typically tolls). TIFIA is supported by $122 million in Federal money annually, administered by the Department of Transportation.

A WIFIA program would be similar to the TIFIA and potentially administered by the Environmental Protection Agency. The Water Resources and Environment Subcommittee has circulated a draft WIFIA bill (H.R. 3145) and held two hearings on the topic in 2012. One of the main benefits of the proposed program would be to provide low-cost capital to infrastructure projects. Under the TIFIA program, loan repayment does not begin until 5 years after "substantial completion" of the project, with payments ending after 35 years. This structure allows projects to be built and benefits to be realized before loan repayment starts, a significant benefit to water management projects. However, a drawback is that the program requires a revenue stream. For water infrastructure projects, this would limit eligible projects to those that collect user fees based on water use.

WIFIA is a part of the Water Resources Development Act . In a rare display of bipartisanship on major legislation, the U.S. Senate passed Sen. Barbara Boxer's water resources bill on Wednesday, May 15, 2013. The $12.5 billion bill, which includes a long-sought authorization for levee improvements in Sacramento, drew overwhelming support from both Democrats and Republicans. The Water Resources Development Act would authorize a variety of U.S. Army Corps of Engineers projects across the country, including flood control efforts, port improvements, wetlands restoration and coastal storm protection. The bill includes language that would expedite the environmental review process that many critics say leads to unnecessary delays and added costs in such projects. The bill next moves to the House of Representatives for their consideration.

### National Infrastructure Bank

In general, an infrastructure bank is an entity that manages capital and provides loans for infrastructure development. Both current Federal and State administrations ran on a political platform that includes increased infrastructure funding, and an infrastructure bank has been considered by Congress on several occasions. An infrastructure bank could provide funding for a range of infrastructure projects, with water projects as just a single component.

### Modify Private Activity Bond Restrictions

Private Activity Bonds are tax-exempt bonds that are available for privately owned water facilities that are either operated by a government unit or charge water rates that are approved by a political subdivision of a community. Most private activity bonds, including those for water furnishing and water treatment facilities are subject to a state volume limit. Congress is considering changing requirements to allow more access to tax-exempt bonds for water infrastructure.

### Reinstate Build America Bonds

As part of the American Recovery and Reinvestment Act, Congress created Build America Bonds to encourage job creation through infrastructure projects. These bonds could be issued for any

governmental purpose for which tax-exempt governmental bonds (excluding private activity bonds) can be issued, including capital expenditures and working capital. The authority to issue Build America Bonds expired in December 2010. Congress is considering reinstating Build America Bonds to target water infrastructure projects.

### *Private National, Regional and Local Funding*

In addition to Federal and State funding sources, there are also numerous private national, regional and local funding sources for southern California habitat restoration projects, such as National Fish and Wildlife Foundation.

## Proposition 218

One of the key funding considerations of this Report is Proposition 218 which was approved by the voters in California in 1996. This constitutional amendment, which is also called the "Right to Vote on Taxes Act," is arguably the most significant impediment to arise against adequate local infrastructure funding since the adoption of Proposition 13 in 1978. Proposition 218 was a successful effort by the State's voters to ensure that local governments could not levy any taxes, assessments or user fees on property owners without the express consent of the voters in the community where such charges would be levied. Specifically, all general taxes need to be approved by at least one-half of the electorate, all special taxes need to be approved by at least two-thirds of the electorate, and all special assessments and property-related fees must be approved by at least one-half of the impacted property owners submitting mailed ballots prior to the public hearing at which such special assessments or fees are to be approved by a local legislative body (or, at the option of the legislative body, by at least two-thirds of the registered voters). Any fee that is property-related, or that arises as a consequence of property ownership, falls under the scrutiny of Proposition 218. Furthermore, the initiative power of the electorate was confirmed by Proposition 218 to ensure that local taxes, assessments, and fees can be reduced at any time by the electorate, with the only exception being when such revenues are required to satisfy an existing contractual obligation (e.g., the payment of debt service on outstanding bond issuances). The only exceptions to these voter requirements are fees for sewer, water, and refuse collection. However, based on the California Supreme Court's decision in *Bighorn-Desert View Water Agency v. Verjil* these types of fees are subject to Proposition 218 noticing and hearing requirements.

Although the distinction between fees, taxes and assessments may sometimes seem blurred and overlapping, the following discussion provides the general definition of the various local governments "charges" . A fee is a charge imposed to recover the costs of a government service or to mitigate the impacts of the fee payer's activity on the community. User fees recover the costs of service and include, for example, utility rates (enterprise fees) and facility usage (park fees). Regulatory fees are related not only to mitigation (development impact fees, capacity fees), but also to the recovery of costs to regulate fee payer activities (plan check fees, building permit fees).

A tax is a charge imposed by government to pay for general governmental purposes ("general tax") or specific governmental purposes ("special tax"). Assessments are charges related to special benefits that a property or business derives from the improvements or services paid for by these charges.

The significance of Proposition 218 to the funding of the local infrastructure cannot be overstated. Most sources of local funding, with the exception of sewer, water, and refuse collection fees, are now effectively off-limits without an election. The ability for general funds to pay for public infrastructure is also limited due to competition for such funds from other uses, and the requirement that any additional bond funds must be approved by two-thirds of the electorate. Unless the electorate or the property owners in an area vote in favor of a general tax, special tax, assessment or fee, none of these funding sources can be implemented.

### *Salinas Decision*

The far-reaching impacts of Proposition 218 are probably most clearly evidenced by the case of the *Howard Jarvis Taxpayers Association v. City of Salinas.* In that case, the City of Salinas went to great efforts to design a stormwater management utility fee that it thought was not property related, in order to avoid the necessity of holding an election. The proposed fee was not put to a vote of the property owners or the registered voters, but instead was enacted by the City Council through the adoption of two ordinances. The first ordinance imposed a Stormwater Management Utility Fee within the City, while the second established fee levels. Fee levels were assigned to assessor's parcels according to the land use types located on each parcel, with the fees themselves based on the relative amounts of impervious area typically associated with each land use type. To avoid being considered a property-related fee, the City exempted undeveloped parcels and those developed parcels that were not expected to access the City's storm management system. The Howard Jarvis Taxpayers Association challenged the fee, and the trial court ruled in favor of the City because it concluded that (a) the fee was not property-related, and (b) the fee was exempt from the voter requirement as a result of the sewer and water fee exemptions under Proposition 218.

The Howard Jarvis Taxpayers Association appealed to the Sixth Appellate District of the State Court of Appeals, which overturned the trial court's finding by a 3-0 vote. The basis for the Appeal Court's decision was an emphasis on Proposition 218's fundamental premise that "the provisions of this act shall be liberally construed to effectuate its purposes of limiting local government revenue and enhancing taxpayer consent." As a result, the Appeals Court determined that a fee based on land use was not a charge directly based on use (such as the metered use of water for a water fee), and that it was in fact a fee based on ownership of property because a property owner could not escape the fee by declining to accept the service. The Appeals Court went on to declare that stormwater management activities are separate from sewer and water services, and therefore would not be eligible for the voter exemption permitted under Proposition 218 for sewer and water fees. The State Supreme Court denied the City's petition to review the Appeals Court's decision.

### *Santa Clara County Decision*

On July 14, 2008, the State Supreme Court, in the case of *Silicon Valley Taxpayers Association v. Santa Clara County Open Space Authority*, decided two key points relating to Proposition 218. First, the State Supreme Court held that legal challenges to special assessments are subject to independent judicial review, reversing a number of pre-Proposition 218 cases which gave more deference to the public agency that established the assessment district. Second the State Supreme Court held that the assessments in the Santa Clara case did not meet the substantive requirements of Proposition 218 because the Santa Clara County Open Space Authority did not demonstrate the special benefit to the assessed property and the amounts assessed were not proportional to the benefit received by each parcel.

In 2001, the Santa Clara County Open Space Authority conducted proceedings to establish a countywide assessment district to acquire, improve and maintain regional open space. As a part of the proceedings, an Engineer's Report was prepared and a ballot protest procedure was conducted. The Engineer's Report claimed that all property within the district received special benefit from the proposed land acquisitions and set the assessment at $20 per single family parcel (and provided a formula to determine the rates for other types of property). However, the land proposed to be acquired was not identified. Following a mailed ballot procedure, the assessment passed by more than 50% of the ballots returned (weighted by level of assessment). The assessments were later challenged on the basis that the Santa Clara County Open Space Authority failed to satisfy the special benefit and proportionality requirements of Proposition 218.

Although this case involves an open space assessment and many of the court's comments are related to assessments rather than fees, this case needs to be carefully reviewed and considered for its implications for any proposed assessment or property related fee. In its decision, the State Supreme Court stated that Proposition 218 requires courts to make an independent review of local agency decisions regarding assessments and property-related fees and charges. In addition, while property-related fees do not have the same special benefit restrictions (see Section III.C.3 for further discussion) that apply to assessments, Proposition 218 states that a fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to that parcel. The State Supreme Court found that the Santa Clara County Open Space Authority failed to meet the proportionality tests because the Engineer's Report did not (1) identify the improvements to be funded, (2) estimate the cost of such improvements, and (3) connect the proportionate costs of the benefits received from the public improvements to the assessed parcels.

Subsequent to the Santa Clara County decision, there have been additional court cases that continue to scrutinize assessments as they pertain to the requirements of Proposition 218.

### *Summary of Proposition 218 Nexus Requirements*

Under Proposition 218 a fee or a charge shall not be imposed unless it meets all of the following requirements:

- Revenues derived from the fee or charge shall not exceed the funds required to provide the property related service;
- Revenues derived from the fee or charge shall not be used for any purpose other than that for which the fee or charge was imposed;
- The amount of fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to that parcel;
- No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question. Fees or charges based on potential or future use of a service are not permitted; and
- No fee or charge may be imposed for general governmental services including, but not limited to police, fire, ambulance or library services where the service is available to the public at large in substantially the same manner as it is to property owners.

## Local Revenue Sources

This section contains brief summaries of a number of mechanisms that may provide funding for local agencies. The findings in these sections are based on a review of relevant literature and DTA infrastructure public financing experience.

This section is focused on possible local revenue sources. Federal and State funding are discussed in earlier sections and can be very useful in funding one-time projects or coping with shortfalls, but consistent availability of such funding cannot be assured and is often beyond the control of local public agencies. In addition, Federal and State programs often involve loans that require some type of collateral and a local stream of revenue to repay them. Local agencies should search and apply for any available grants and loans; to the extent that projects are able to receive such funding, the need to undertake the local mechanisms cited below is diminished. This section summarizes financing mechanisms that may be utilized by local agencies in place of general fund revenues. **Table 8-1** and **Table 8-2** located at the end of this Chaptersummarize financing alternatives that should be considered, as well as brief descriptions their advantages and disadvantages.

### *Longevity and Certainty of Funding*

In an effort to clarify the California Department of Water Resources requirement for an explanation of the certainty and longevity of known or potential funding for an IRWM plan and projects that implement the plan, DTA contacted Ms. Tracie Billington, the Branch Chief for DWR's IRWM Grants and Funding. Ms. Billington explained DWR's perspective in great detail. While a matrix showing the specific funding sources and their certainty and longevity is appropriate for individual projects when such information is available, a more qualitative approach is acceptable when identifying potential funding mechanisms.

As explained by Ms. Billington, an analysis of the "Certainty" and "Longevity" of known or potential funding sources is most appropriately addressed when looking at specific infrastructure projects. For

example, the IRWM projects that were submitted to SAWPA as part of the OWOW 2.0 process have been ranked, and in general the higher ranking projects having a greater "Certainty" or probability of being financed than the lower ranked submittals.

In addition, those financing mechanisms which have been approved and are included in current Federal, State, or local budgets have a greater level of certainty than those which require future voter or legislative approvals.

The "Longevity" of a funding source is customarily stated in the law creating or approving the mechanism. For example, many bonds are issued for 30 year terms, while certain tax measures may sunset after 5 or 10 years. In addition, pay as you go programs may not generate sufficient revenues up front, and may require interim revenue sources to build facilities in a timely manner. Therefore, it is important to match the time constraints of various funding programs to specific projects to ensure project completion.

In addition to funding for new infrastructure projects, local agencies are also concerned funding the ongoing operations and maintenance of such facilities. Therefore as a part of the discussion of local funding options in the sections below, we have indicated where such funds can also be used to pay for ongoing operations and maintenance.

The local financing methodologies described below have been grouped into (1) traditional, customarily used approaches, and (2) new, creative and innovative financing structures.

### *Traditional Public Finance Measures*

#### Sales Tax Measure

A sales tax is a funding option that places a consumption tax on certain goods and services. Most sales taxes are collected by the seller, who pays the tax to the public entity that is charging the tax. Under state law, a local agency may only increase the sales tax within its jurisdiction in increments of 0.125%. According to Section 7251.1 of California Transactions and Use Tax Law, the combined rate of all sales taxes imposed shall not exceed 200 basis points above the base tax rate for the State (as of January 1, 2013, the rate shall not exceed 9.5% based on a base rate of 7.5%).

Sales tax revenues may be used to fund any facilities or services specified in the ballot materials. Therefore, this type of funding could be used to fund a broad array of capital, O&M and planning costs. The legislative body of a local government or district must place the sales tax increase on a special, primary, or general election ballot. As a special purpose tax, it would require a 2/3 majority vote.

Statewide, only 35 out of 68 special purpose tax measures (those requiring a 2/3 vote) were approved by the relevant electorate in the November 2012 election. School parcel taxes had the highest passing rate of 64%, County special taxes had a passing rate of 58%, and Special Districts had a passing rate of 44%. City special taxes had a passing rate of only 33%. To be successful, a local would need to undertake an effective public outreach effort to demonstrate to voters the benefits to that will be achieved through this additional tax.

As a result of California Proposition 30, the State's base sales tax rate was increased by 0.25% (from 7.25% to 7.5%) on January 1, 2013. The 0.25% tax rate increase will expire on December 31, 2016. Local agencies will find it extremely difficult to pass an additional sales tax increase to fund regional water projects until after the State 0.25% tax increase expires.

### *Stormwater Utility Fee*

A municipal stormwater utility fee ("Stormwater Utility Fee") can be adopted under Health and Safety Code Section 5471 ("Section 5471"). Section 5471 allows certain public agencies to collect fees or charges from property owners (including standby charges from owners of undeveloped properties) to pay for capital improvements, operations, and maintenance for their storm drainage, water and sewerage systems. The public agencies authorized to levy these charges include counties, cities, sanitary districts, sewer maintenance districts, and other districts authorized to acquire, construct, maintain and operate sanitary sewers and sewerage systems.

Revenues derived from the fees levied under Section 5471 can be used for the acquisition, construction, reconstruction, maintenance, and operation of storm drainage, water and sewerage systems, as well as the repayment of principal and interest on bonds issued for the construction or reconstruction of these storm drainage, water and sewerage systems.

As a parcel-related fee, a Stormwater Utility Fee must be calculated according to Proposition 218 guidelines for fees set forth in Section III.C.3.

### *Los Angeles County Case Study*

The County of Los Angeles has been considering how best to implement a dedicated funding mechanism for surface water quality since at least 2005. Waterways throughout the county have been found to be polluted above acceptable levels under the federal Clean Water Act and other state and federal laws. The Los Angeles County Flood Control District has recently proposed to adopt a Clean Water, Clean Beaches Measure, which would establish an annual fee to pay for clean water programs. The proposed clean water fee would be imposed on property within the Los Angeles County Flood Control District, which includes most of Los Angeles County (with the exception of portions of the Antelope Valley), for the purpose of improving water quality and reducing pollution from stormwater and urban runoff.

The proposed clean water fee would provide dedicated funding for local and regional projects and programs to help keep pollution out of stormwater and runoff, clean up pollution that flows into waterways, and use stormwater and runoff to recharge groundwater supplies. The proposed fee for each parcel is based on impervious area, which is determined based on land use, zoning, and lot size.

On January 15, 2013, the Board of Supervisors opened a public hearing to listen to public testimony regarding the proposed measure. Due to significant community and agency concerns at the hearing, the Board of Supervisors kept the protest period open for an additional 60 days. On March 12, 2013 the Board again listened to public testimony. At the conclusion of public testimony the Board of Supervisors voted to not proceed with the Clean Water, Clean Beaches Measure at this time and then directed Public Works to continue working towards consensus with stakeholders on key elements of the proposed measure and to report back on progress in 90 days. If consensus is reached among the

stakeholders, the Board of Supervisors may consider placing the proposed fee on the general ballot in June or November of 2014.

### *Water, Sewer, Trash Fees*

While Proposition 218 does not require voter approval for sewer, water and refuse collection user fees, it does require a clear nexus between costs and benefits, as well as a clear separation between existing development and future development. Therefore, to implement fees of this nature, a nexus must be demonstrated between the public facilities and services being funded and the demand of a household or business for water, sewer and refuse collection services. Since most local utilities already charge these types of fees to pay for their costs of service, rates would need to be increased to cover the cost of additional public facilities.

The exemptions for water, sewer and refuse collection user fees from the restrictions of Proposition 218 apply only to the voter approval requirements. As parcel-related fees, these user fees must still be calculated according to Proposition 218 guidelines for fees (discussed in Section C above). Written notice must still be provided to property owners of record. Also, the proposed fees are subject to a public hearing prior to receiving legislative approval. The submittal of written protests prior to the public hearing by a majority of the property owners impacted by a user fee is sufficient to prevent the imposition of that fee. However, it is DTA's experience that on a large-scale financing program (e.g., an entire city or water district); the protest provision has little impact because it is so difficult to contact at least 50% of a large area's property owners and persuade them to mail in their protest ballots. The only exception to this rule is when a few landowners own 50% of the acreage.

### *Public Enterprise Revenue Bonds*

Public enterprise revenue bonds are debt instruments payable from a special fund - a limited source pledge which secures debt service payments of the bonds. As such, these bonds usually finance facilities related to revenue generating enterprise and are payable from the revenues of that enterprise. There are a number of State statutes authorizing the issuance of revenue bonds. The most commonly used statute is the Revenue Bond Law of 1941.

The Revenue Bond Law of 1941 allows cities, counties, and certain special districts to issue revenue bonds to finance, among other things, water and sewer collection, supply, and treatment facilities. The law requires a majority vote to authorize the size and purpose of the bond issue. Because these bonds are secured by a pledge of revenues and not an agency's general fund, they typically carry a higher interest rate than general obligation bonds, but a lower rate than the land-secured bonds (CFD or AD). In addition, there is usually a requirement that revenues generated from an enterprise exceed debt service on bonds by twenty-five percent (25%). This "coverage" protects the bond holders from minor delinquencies and defaults that may occur.

### *Development Impact Fee*

Development Impact Fees ("DIFs") are monetary exactions (other than taxes or special assessments) that are charged by local agencies in conjunction with approval of a development project and are usually collected at the time building permits or occupancy permits are issued. DIFs are levied for the purpose

of defraying all or a portion of the costs of any public facility, improvement or amenity that benefits the development required to pay the fee. However, DIFs cannot be used to pay for public services. Most cities and counties currently impose DIFs for a broad range of public facilities.

AB 1600, which promulgated Section 66000 and other sections of the Government Code, was enacted by the State of California in 1987 to regulate the imposition of DIFs within the State. AB 1600 requires that all public agencies satisfy a number of requirements when establishing, increasing or imposing a fee as a condition of approval for a development project. These requirements include identifying the facilities to which the collected fee would be applied and determining that there is a reasonable relationship between the facilities to be financed, the benefit received by the development paying the fees, and the amount of the fees being imposed. Water and sewer agencies can impose connection fees or capacity charges, which are similar to DIFs, as specified in Government Code section 66013.

While DIFs and connection fees cannot typically be leveraged (i.e., provide security for bonds or other debt instruments), they can be used in conjunction with debt financing to help retire bonds secured by other means (e.g., a CFD or AD). Development fees can also be used to generate reimbursement revenues to property owners or public agencies that have previously paid more than their fair share of public improvement costs. To the extent that regional water improvements are required of future development, DIFs could be utilized to cover these costs for such development. However, DIFs cannot finance any improvements required by existing development, nor can they fund O&M costs for either new or existing development.

### *General Obligation Bonds*

The issuance of general obligation ("G.O.") bonds by a public agency issuer represents a pledge on the issuer's part to levy a uniform ad valorem property tax on all taxable properties within the issuer's jurisdiction in order to annually repay principal and interest due. The bonds are a "general obligation" of the issuer; that is, bondholders have recourse to the "full faith and credit" of the issuer (i.e., unlimited property taxation) to ensure that annual debt service requirements are met. G.O. Bonds may be used to acquire, construct, and improve real property. However, they may not be used to purchase furniture or equipment, or to pay for operations or maintenance.

Prior to 1978, G.O. bonds were, by far, the most popular vehicle for debt financing of infrastructure and public facilities in California. The approval of State Proposition 13 in 1978 quickly brought that era to a close. It was not until 1986, with the passage of State Proposition 46, that resurgence in G.O. bond authorization was seen. This latter proposition reinstated the ability of local public agencies to incur new bonded indebtedness and secure it through the imposition of an ad valorem property tax. Consistent with Proposition 13, however, it was required that two-thirds of the registered voters in the affected territory approve any such measure. In some cases, particularly with certain types of water districts, Improvement Districts may be established which limit the tax levying capability of the issuer and the election regarding the bond issuances to only those properties located within the Improvement District.

Because G.O. Bonds are one of the most secure debt financing instruments available to local public agencies, they generally carry lower interest rates than the other local financing mechanisms being

reviewed in this Report. In addition, the dispersion of debt service costs throughout a jurisdiction helps minimize the taxes to each property owner, as opposed to levying a tax on a special district consisting of a much smaller area. However, the requirement of a two-thirds approval by voters throughout the issuer's jurisdiction makes it difficult to obtain authorization to sell G.O. bonds.

### *Special Assessment District*

There are a number of types of Assessment Districts ("ADs") that can be utilized to fund water supply improvements and maintenance services. Public works improvements are eligible for AD financing to the extent that properties within the AD receive a special, measurable, local and direct benefit from such improvements. Traditionally, improvements to be financed using an AD under the Municipal Improvement Act of 1913 and the Improvement Bond Act of 1915 include, but are not limited to, streets and roads, water, sewer, flood control facilities, utility lines and landscaping. Other types of public improvements which have a "regional" significance (e.g., major roads, bridges, flood control facilities, etc.) are only partially eligible, based on the proportion of benefit from the improvements that can be assigned to parcels within the AD. Traditionally, items of general benefit to a community, such as schools, fire stations and parks, have not been eligible for Assessment District financing. An AD can also provide funding to operate and maintain improvements financed by the AD itself.

The Benefit Assessment Act of 1982 provides more flexibility in providing public services, as road, drainage, flood control and street lighting maintenance services can be funded under this Act, whether not the improvements themselves are funded through the AD. ADs are subject to specific benefit requirements as a result of both their enabling legislation and Proposition 218. As discussed above, under their enabling legislation, public works improvements and services are eligible for AD financing to the extent that properties within the AD receive a special, measurable, local, and direct benefit from such improvements and services. Proposition 218 further emphasized this benefit requirement by requiring that:

*"An agency which proposes to levy an assessment shall identify all parcels which will have a special benefit conferred upon them and upon which an assessment will be imposed. The proportionate special benefit derived by each identified parcel shall be determined in relationship to the entirety of the capital cost of a public improvement or for the cost of the property related service being provided. No assessment shall be imposed on any parcel which exceeds the reasonable cost of the proportional special benefit conferred on that parcel. Only special benefits are assessable, and an agency must separate the general benefits from the special benefits conferred on a parcel. Parcels within a district that are owned or used by any agency, the State of California or the United States shall not be exempt from assessment unless the agency can demonstrate by clear and convincing evidence that such publicly owned parcels in fact receive no special benefit."*

Proposition 218 defines "special benefit" as the following:

*"Special benefit means a particular and distinct benefit over and above general benefits conferred on real property located in the district or to the public at large. General enhancement of property value does not constitute special benefit."*

It also places the burden of proof on the public agency in any legal action challenging the validity of an assessment:

*"In any legal action contesting the validity of any assessment, the burden shall be on the agency to demonstrate that the property or properties in question receive a special benefit over and above the benefits conferred on the public at large and that the amount of any contested assessment is proportional to, and no greater than, the benefits conferred on the property or properties in question."*

Recent court cases discussed in Section C reinforce the special benefit requirements of Proposition 218, making an AD less attractive for funding regional water supply and water quality improvements than many other funding mechanisms.

### *Mello-Roos Community Facilities District*

A Community Facilities District ("CFD") is a funding option that can be used to pay for public infrastructure and services for future development. While a two-thirds vote of the "qualified electors" is required to establish a CFD, the boundaries of a potential CFD could be set so that fewer than twelve registered voters initially reside within the CFD. In this case, the "qualified electors" would be the property owners (not the registered voters), and if a property owner were conditioned to form or annex to a CFD in order to develop his or her property, he would need to agree to include his property in the CFD. While this type of financing would not generate funds to pay for public infrastructure and services for existing development, it could cover a substantial portion of the cost of such facilities and services related to future development and redevelopment.

The Mello-Roos Community Facilities Act ("Act") was enacted by the California State Legislature in 1982 (Section 53311 et. seq. of the Government Code) to provide an alternate means of financing public infrastructure and services subsequent to the passage of Proposition 13 in 1978. The Act complies with Proposition 13, which permits cities, counties and special districts to create defined areas within their jurisdiction and, by a two-thirds vote within the defined area, impose special taxes to pay for the public improvements and services needed to serve that area. The Act defines the area subject to a special tax as a CFD. If fewer than twelve registered voters reside within a proposed CFD, the property owners within the CFD are defined as the qualified electors. Therefore, if new development and significant redevelopment are required to join a CFD in order to gain entitlements, pull building permits or record a final map or parcel map, the cooperation of a property owner who wishes to develop a parcel can be assured. The Act provides a simple and inexpensive annexation process whereby vacant parcels can annex to a CFD on a parcel-by-parcel basis, as they become developed.

A CFD may provide for the purchase, construction, expansion or rehabilitation of any real or other tangible property (including land) with an estimated useful life of at least five years. It may also finance the costs of planning, design, engineering and consultants involved in the construction of improvements or formation of the CFD. The facilities or real property financed by the CFD do not have to be physically located within the CFD. Any facilities that will be publicly owned, and will have a useful life of five years or more, would qualify for this financing.

Furthermore, a CFD may also pay for certain types of public services, including police, fire, and ambulance services, landscape and park maintenance, street and road maintenance, flood and storm protection services, library and recreational services, and school facilities maintenance. However, a CFD may only finance these services to the extent that they are in addition to those provided within the area of the CFD before the CFD was created, and may not supplant services already available within that area.

Formation of a CFD authorizes the public agency establishing the CFD to levy a special tax on all taxable property within the CFD, as defined in the formation documents. Property owned or irrevocably offered to a public agency may be exempted from the special tax. Mello-Roos special taxes are collected at the same time and in the same manner as regular ad valorem property taxes, unless otherwise specified by the agency. Special tax revenues may be used to pay the debt service on bonds that have been sold to fund the construction or acquisition of public capital facilities, or to pay directly for facilities or public services.

### *Certificates of Participation or Lease Revenue Bonds*

Two long-term funding alternatives that could potentially be used to fund regional water supply and water quality improvements are Certificates of Participation ("COPs") and Lease-Revenue Bonds ("LRBs"). These funding mechanisms provide long-term financing for public improvements via a lease or installment sales structure, as opposed to requiring debt service payments. By establishing a lease obligation, COPs and LRBs avoid being designated as debt, and therefore avoid the election requirement (and the two-thirds vote requirement) mandated by Proposition 13 for all bond sales. As no voter election is required to sell these instruments, a county board of supervisors or a city council could approve a bond sale with a simple majority vote of the legislative body.

In brief, the principal parties to a COPs or LRB financing include a public agency, a non-profit corporation and a trustee. The non-profit corporation may be formed specifically to construct and own the necessary improvements, the funds for which are generated from the proceeds of the COPs or LRB sale. The non-profit corporation may also be an existing agency, such as a joint powers authority or an economic development corporation. However, the actual responsibilities for managing the construction are generally delegated to the public agency. The non-profit corporation then leases or sells the land and facilities back to the public agency in return for lease or installment sales payments.

The investors who purchase the COPs or LRBs receive a specified portion of the public agency's payments to cover the principal and interest due on their COPs. The certificates or bonds are secured by the public agency's pledge to make payments to cover its lease or installment sales payments, although there is no requirement that the public agency commit its general fund to making these payments. The trustee is responsible for accepting these payments and then disbursing them to the certificate or bond holders.

There are two major problems associated with COPs or LRBs. First, these instruments can only be used to fund public improvements, not O&M costs. Second, and more significantly, a source of revenues is required to repay the COPs or LRBs, so these mechanisms could not be utilized without monies being

generated by some other source. COPs are generally secured by the covenant of the public agency to make annual appropriations in an amount sufficient to service the certificates. The appropriations may come from the public agency general fund or from a designated special fund, such as the enterprise fund user fees or a CFD. Due to Gann Amendment limitations on general fund spending, the use of general fund monies to make payments on COPs or LRBs would be detrimental to other recipients of general fund monies. However, to the extent that one or a combination of the available funding mechanisms provide a reliable and secure ongoing revenue stream, a public agency can issue COPs or LRBs that are non-recourse to its general fund.

Sewer and water improvements, parking facilities and other revenue-generating public uses can be financed with revenue bonds. Debt service on these bonds may be paid through monthly utility bills, parking fees, and other revenues, etc. Bonds are not sold until sufficient revenues are available to provide a level of bond debt service coverage which is acceptable to the municipal bond market. As water rates are already used to fund the ongoing cost of providing water, financing new water facilities through the use of public enterprise revenue bonds will often require an increase in water rates.

**Table 8-1 Traditional Finance Measures**

| Financing Mechanism | Advantages | Disadvantages |
|---|---|---|
| Sales Tax Measure | • Can provide a fairly consistent source of funding<br>• Can fund any facilities or services specified in ballot materials | • Requires a 2/3 vote; Can be regressive in nature when calculated as a function of income<br>• Currently preempted by State 0.25% sales tax increase |
| Stormwater Utility Fee | • Can apply to every parcel in the area adopting the fee<br>• Can pay O&M or capital costs<br>• Can be implemented on municipality, watershed, or WMA basis | • Will require property owner or registered voter election |
| Water User Fee | • No election requirement under Proposition 218; but ballot protest process is recommended<br>• No legal constraints on raising funds other than nexus<br>• Can pay O&M or capital costs | |
| Sewer User Fee | • No election requirement under Proposition 218; but ballot protest process is recommended<br>• No legal constraints on raising funds other than nexus<br>• Can pay O&M or capital costs | |

**(Continuation of Table 8-1 Traditional Finance Measures Table)**

| Financing Mechanism | Advantages | Disadvantages |
|---|---|---|
| Refuse Collection Fee | • No election requirement under Proposition 218; but ballot protest process is recommended<br>• No legal constraints on raising funds other than nexus<br>• Can pay O&M or capital costs | • Public agencies can only control rates charged to users through negotiation with private entities |
| Public Enterprise Revenue Bonds | • Customarily finance water and sewer systems.<br>• Lower interest rate than land-secured bonds | • Requires stable revenue stream which exceeds debt service by 25% |
| Development Impact Fees | • No voter approval required<br>• Can be used to reimburse public agencies and developers for over sizing capital improvements | • Can only pay for capital improvements needed for new development |
| General Obligation Bonds | • Carry lower interest rates than the other local financing alternatives<br>• Greater dispersion of debt service costs throughout a jurisdiction helps minimize the taxes to each property owner, as opposed to levying a tax on a special district consisting of a much smaller area | |
| Special Assessment Districts | • Spreads costs equitably<br>• Can finance certain facility and O&M costs | • Public agencies can only control rates charged to users through negotiation with private entities |
| Mello Roos Community Facilities District | • Can pay O&M or capital costs<br>• Can pay capital costs anywhere within the jurisdiction forming the CFD | • Requires 2/3 vote of qualified electors so would probably only apply to new development and redevelopment<br>• Can only be used to fund increased services (not existing services) that benefit the parcels within the CFD |
| Certificates of Participation and Lease Revenue Bonds | • Can be adopted by legislative body, as no voter approval required<br>• Can be used to pay for capital improvements | • Need to find source of reliable revenues to pay interest and principal. Interest rates charged tend to be higher if repayment revenues aren't predictable<br>• Statutory and constitutional limitations on the size of municipal debt may apply |

## *Creative Funding Mechanisms*

### Local Infrastructure Bank

In general, an infrastructure bank is an entity that manages capital and provides loans for infrastructure development. Similar to a State or Federal infrastructure bank, a local infrastructure bank run by SAWPA could potentially provide funding for a range of water supply and water quality projects. In theory, SAWPA member agencies and other stakeholders could invest funds in a pool managed by SAWPA. SAWPA could then loan these funds back to certain local agencies to fund regional infrastructure. Further investigation of this option is needed.

### Water/Energy Nexus

Since the California Energy Commission ("CEC") issued its landmark finding in 2005 – that water-related energy uses account for about 19% of all electricity and 30% of non-power plant natural gas used within the state – California's water and energy sectors have been collaborating on strategies for achieving the incremental resource, economic and environmental benefits that can be found at the intersection of water, energy and climate. In 2006, a multi-agency Water-Energy Team was established to assist the Governor's Climate Action Team in identifying and promulgating statewide strategies for reducing water- sector greenhouse gases ("GHGs"). About the same time, the CEC commenced development of its first water-energy research program. The California Public Utilities Commission ("CPUC") conducted workshops to explore whether and how the water-energy nexus should be included in the state's regulated energy programs. Concurrently, the DWR commenced investigations as to how the linkages among water, energy and climate should be included in the state's water planning processes. In addition, the Federal Environmental Protection Agency has a Sustainable Infrastructure program which is intended to help water and wastewater utilities to conserve water, be more energy efficient, and adapt to the impacts of climate change.

The water sector has unique capabilities for substantially changing the amount, time and place of its consumption of electricity. Since energy is the single largest ongoing expense for water system operations and maintenance; if energy usage is made more efficient, water agencies will see significant savings. These savings will free up money that can be used for water supply and water quality improvements.

### Public Private Partnerships

A Public Private Partnership ("PPP") customarily involves a contract between a public sector organization and a private party, in which the private party provides a public service or project and assumes substantial financial, technical and operational risk in the project. In some types of PPP, the cost of using the service is borne exclusively by the users of the service and not by the taxpayer. In other types (notably the private finance initiative), capital investment is made by the private sector on the basis of a contract with government to provide agreed services and the cost of providing the service is borne wholly or in part by the government. Government contributions to a PPP may also be in kind (notably the transfer of existing assets). In projects that are aimed at creating public improvements like in the infrastructure sector, the government may provide a capital subsidy in the form of a one-time grant, so as to make it more attractive to the private investors. In some other cases, the government may support the project by providing revenue subsidies, including tax breaks or by removing guaranteed

annual revenues for a fixed time period.

Typically, a public sector consortium forms a special company called a "special purpose vehicle" (“SPV”) to develop, build, maintain and operate the asset for the contracted period. In cases where the government has invested in the project, it is typically (but not always) allotted an equity share in the SPV. It is the SPV that signs the contract with the government and with subcontractors to build the facility and then maintain it. In the infrastructure sector, complex arrangements and contracts that guarantee and secure the cash flows make PPP projects prime candidates for project financing. Two examples of PPPs are discussed on the next page.

### *West Coast Infrastructure Exchange*

Funded by two Rockefeller Foundation grants totaling $750,000, the West Coast Infrastructure Exchange (“Exchange”) is a start-up non-profit entity that was established to tap into the expertise of development and finance leaders to save money, find innovative financing methods and achieve cost savings via collaboration in order to make projects more feasible. Participating jurisdictions include the states of California, Oregon and Washington, as well as, British Columbia. The goal of the exchange is to explore ideas together, to share best practices and technical expertise, to help identify infrastructure projects that might help benefit from some private involvement, and to work together to find out what projects might be bundled to make them more appealing to the private sector. Target infrastructure investment opportunities include, but are not limited to energy transmission and efficiency, water storage capacity, municipal water systems and wastewater management.

During the start-up phase, through 2013, the Exchange will operate with an interim management team representing each partner office, coordinated by the Oregon State Treasury. Committees will begin to establish a framework for evaluating projects. The Exchange will seek a director with experience in public infrastructure management. After those steps have been completed, the Exchange will begin serving as an information source and develop a process for connecting projects to financing, potentially including private capital.

By establishing a center of expertise to provide technical assistance, setting standards and providing investment information, and simultaneously advancing new mechanisms for project finance the Exchange has the potential to attract large private institutional investors.

The following table (**Table 8-2**) compares traditional project operations to the Exchange’s performance-based methodology.

**Table 8-2 Comparison between Traditional Projects**

## Assessing the WCX

The West Coast Infrastructure Exchange is employing a performance-based infrastrucure, which approaches project management differently than traditional models, the ways in which are detailed in the chart below (click to enlarge).

**Types of Projects**

| Traditional | Performance-Based Infrastructure |
|---|---|
| Limited analysis of alternatives, focus on capacity additions | Thorough analysis of alternatives, consider demand and supply side solutions equally, benefit-cost analysis drives decision-making |
| Project planning doesn't consider impact of climate change | Project planning accounts for predicted changes in sea level, precipitation and extreme weather events |
| Each jurisdiction finances and delivers projects on their own | Jurisdictions plan together and pool resources to lower project costs and deliver better regional outcomes |
| Projects funded through general taxes, gas taxes, and federal grants | Projects funded with user fees such as variable tolls for highways and bridges |
| Design-Bid-Build: One group designs the project and an entirely separate group with the low bid builds the project | Design-Build-Operate-Maintain: Public owner contracts with one entity for best value on delivered infrastructure services over life of project<br><br>Design-Build-Finance-Maintain: Public owner contracts with one entity which delivers financing and project with best value for public owner |
| Tax-exempt debt offers lowest cost of capital for public projects | Taxable debt in context of public-private partnership delivers more value to public |

*Chart courtesy of westcoastx.com*

### *Pace Program*

Property Assessed Clean Energy ("PACE") programs enable property owners to finance private "green" improvements including water conservation improvements, as well as, solar panels, heating and air conditioning systems, pool filtration equipment, windows and doors, water conservation improvements, fuel cells and other types of energy saving improvements. The funding for the improvements is repaid through an annual assessment on the property tax bill. DTA currently serves as the Assessment Engineer for Western Riverside Council of Government's ("WRCOG") HERO Program for Western Riverside County as well as WRCOG's statewide California HERO Program. The HERO Program is WRCOG's version of a PACE Program, which offers qualified property the opportunity to finance energy

efficiency and water conservation improvements for their properties.

Since the HERO Program was launched in early 2012, 7,897 applications have been received, with 5,157 approved for energy improvements totaling $146.15 million. Approximately $36.1 million in bonds have been closed to date to fund eligible improvements.

To the extent that local property owners reduce their water and/or energy usage through a PACE program, the demand for new water and other infrastructure may be reduced.

### *Government Legislation*

Government Code Section 5956 et seq. allows local governmental agencies (including cities, counties and special districts) to use design-build to construct "fee producing infrastructure facilities." The legislation expressly allows facilities that provide water supply, treatment and distribution. This authority is limited to privatization transactions where the private entity will operate and maintain facility.

## Crowd Sourcing

Crowd funding, also referred to as crowd financing or crowd sourced capital, is the practice of developing an online group-based investment campaign to generate financing for a specific project. This practice leverages dedicated internet fundraising websites to spur community support and financing for an assortment of ventures, including architectural, through numerous small dollar investors. The campaign owner is provided the opportunity to petition a wide variety of potential investors as opposed to solely relying on angel investors or venture capitalists. The investing public is protected from outsized loses through the nature of the small dollar contributions with the risk spread across a larger population.

Crowdfunding refers to any kind of capital formation where both funding needs and funding purposes are communicated broadly via an open call in a forum where the call can be evaluated by a large group of individuals, the crowd. The outreach is referred to as a crowdfunding campaign and the person or company in charge of the campaign is referred to as the campaign owner.

### *Donation-Based Crowdfunding*

The type of crowd funding that comes closest to our traditional understanding of online fundraising is donation-based crowdfunding. With this model, tangible returns are not the reason for individual contributions, and thus the success of the campaign is solely determined by the crowd's identification with or emotional attachment to the campaign's cause. A common example is a community project that would otherwise require municipal or other government funding. In a report released in May 2012, Massolution's Crowdfunding Industry Report estimated the aggregate crowdfunding volume throughout 2011 was close to $1.5 billion, of which almost half was raised via donation-based crowdfunding as described above. The main benefit of donation-based crowdfunding is that the campaign owner does not need to compensate the crowd once the funding is secured. The challenge, however, is that the crowd needs to identify or have an emotional connection with the campaign cause itself. Donation-based crowdfunding is ideal for projects that do not have something tangible to offer in return for the funds raised. In order to activate the accessible crowd it is important to communicate why no other

means of funding is available. On top of that, the project itself needs to appeal either via identification or emotion in order to get individuals to contribute but also to get them to spread the word of the project on to likeminded crowdfunders. In a crowdfunding ecosystem it is crucial to make the purpose of the call for capital as clear as possible as raising funds for vague purposes can make it difficult for the individual crowdfunders to truly identify themselves with the campaign. Donation-based crowdfunding is therefore the model that will require the most carefully thoughtful communications strategy, and the most persistent communications effort.

While donations are granted due to either identification or an emotional attachment to the project's cause and/or urgency, rewards have to be interesting themselves, meaning the campaign has to offer a set of rewards that are economically sound or in some way relevant to the campaign.

Recreational walking/biking trails along river trails (which actually are stormwater flood control channels) are potential candidates for crowdsourcing. Similar to the signs along freeways acknowledging contributions for maintenance, SAWPA may use a similar signage program to reward donors with advertising. This concept appears to work best in funding operations and maintenance.

The concept may also be applied to infrastructure funding. The most familiar application is school and universities establishing building fund campaigns for a new sports facility. Religious organizations often have campaigns to raise funding to build new churches. However, public appetite for funding water infrastructure through crowdsourcing may be limited.

### Energy Service Company ("ESCO") And Energy Saving Performance Contract ("ESPC")

An Energy Service Company ("ESCO") is a business that develops, installs, and arranges financing for projects designed to improve the energy efficiency and maintenance costs for facilities over a seven to twenty year time period. ESCOs generally act as project developers for a wide range of tasks and assume the technical and performance risk associated with the project. Typically, they offer the following services:

- develop, design, and arrange financing for energy efficiency projects
- install and maintain the energy efficient equipment involved
- measure, monitor, and verify the project's energy savings
- assume the risk that the project will save the amount of energy guaranteed

These services are bundled into the project's cost and are repaid through the dollar savings generated.

What sets ESCOs apart from other firms that offer energy efficiency, like consulting firms and equipment contractors, is the concept of performance-based contracting. When an ESCO undertakes a project, the company's compensation, and often the project's financing, is directly linked to the amount of energy that is actually saved.

Typically, the comprehensive energy efficiency retrofits inherent in ESCO projects require a large initial capital investment and offer a relatively long payback period. The customer's debt payments are tied to

the energy savings offered under the project so that the customer pays for the capital improvement with the money that comes out of the difference between pre-installation and post-installation energy use and other costs. For this reason, ESCOs have led the effort to verify, rather than estimate energy savings. One of the most accurate means of measurement is the relatively new practice of metering, which is direct tracking of energy savings according to sanctioned engineering protocols.

Most performance-based energy efficiency projects include the maintenance of all or some portion of the new high-energy equipment over the life of the contract. The cost of this ongoing maintenance is folded into the overall cost of the project. Therefore, during the life of the contract, the customer receives the benefit of reduced maintenance costs, in addition to reduced energy costs. As an additional service in most contracts, the ESCO provides any specialized training needed so that the customer's maintenance staff can take over at the end of the contract period.

Energy Savings Performance Contracts ("ESPCs"), also known as Energy Performance Contracts ("EPCs"), are an alternative financing mechanism authorized by the United States Congress designed to accelerate investment in cost effective energy conservation measures in existing Federal buildings.

ESPCs allow Federal agencies to accomplish energy savings projects without up-front capital costs and without special Congressional appropriations. The Energy Policy Act of 1992 (EPACT 1992) authorized Federal agencies to use private sector financing to implement energy conservation methods and energy efficiency technologies. An ESPC is a partnership between a Federal agency and an ESCO. The ESCO conducts a comprehensive energy audit for the Federal facility and identifies improvements to save energy. In consultation with the Federal agency, the ESCO designs and constructs a project that meets the agency's needs and arranges the necessary financing. The ESCO guarantees that the improvements will generate energy cost savings sufficient to pay for the project over the term of the contract. After the contract ends, all additional cost savings accrue to the agency.

The savings must be guaranteed and the Federal agencies may enter into a multiyear contract for a period not to exceed 25 years. ESPCs are regulations created by the Federal Energy Management Program ("FEMP") of the United States Department of Energy ("DOE") as required by the Energy Policy Act of 1992. The final DOE ruling came into effect on May 10, 1995. The use of ESPCs by Federal agencies was reauthorized in the Energy Policy Act of 2005 ("EPACT 2005") through the end of Fiscal Year (FY) 2016 and permanently reauthorized in The Energy Independence and Security Act of 2007 ("EISA").

### Regional General Obligation Bond

With a traditional General Obligation bond, as discussed in Section III.D.1.(f), bonds are issued by a public agency, based on a pledge of the ad valorem property taxes for all (or a portion) of the properties within the issuer's jurisdiction. Recently, Joseph Zoba, General Manger at Yucaipa Valley Water District, has proposed the use of regional general obligation bonds to raise funds regionally to be used for regional projects. This would avoid the time consuming and expensive Federal and State processes to compete for funds. A regional general obligation bond program would be administered locally for

greater local control, and would require regional partners to work together closely in developing regional solutions.

It is unclear whether a regional general obligation bond could be implemented without modifications to the existing enabling legislation. In addition, there would be many challenges for such a program including defining boundaries and achieving the 2/3 vote necessary to establish such a program.

## Conclusions

As stated in the Introduction, SAWPA engaged David Taussig and Associates, Inc. ("DTA") to investigate financing alternatives for public facilities and regional planning. In addition to its many years of successes regarding all facets of financing public infrastructure, DTA has furthered its expertise by recently working with other significant public agencies, including the California Department of Water Resources, to research current state-of-the-art financing methodologies.

The following are DTA's general observations, recommendations and conclusions regarding this review of financing methodologies for SAWPA (specific recommendations are described in detail in the body of the report):

- Throughout the prosecution of this assignment, DTA conducted many interviews with recognized leading public finance experts and reviewed the body of current, available industry documents and communications. Consistent throughout DTA's research, SAWPA is universally regarded as one of, if not the most highly regarded IRWMs in California. SAWPA has outstanding leadership, is staffed by practitioners who are recognized industry-wide for their expertise in their assigned specialties, and most noteworthy, SAWPA has a dynamic organizational structure that is focused on continual improvement, flexibility and creativity in seeking solutions to both SAWPA's and the water industry's challenges.
- This document presents feasible and realistic funding alternatives for regional water projects and integrated water infrastructure planning highlighting innovative new approaches, the effect of current public financing policies and summarizing industry "best practices" to fund the integrated planning required to construct regional water and water quality improvements.
- There exists a structural incongruity between current legislation, watersheds and the systemic structure in which watersheds are managed. Watersheds are rarely, if ever, regulated, served or are the responsibility of a single governmental entity. Literally dependent entirely on the lay of the land, the topography of a broad region determines a watershed's boundaries. In most, if not all cases, watersheds span multiple counties. Current legislation does not provide a means of assigning the functional and financial responsibility for managing this valuable natural resource as a complete integrated system. This piecemeal management system engenders philosophical conflicts, inconsistent management protocols and is inherently inefficient.
- Even though a few progressive and thoughtful ad hoc cooperative alliances exist between some counties, regional governmental entities with responsibility, authority and funding to manage significant watersheds do not currently exist. With the current funding alternatives and their respective requirements (voter approval thresholds, etc.) regional funding is not feasible. Without

funding, responsible administration with backbone is impossible.

## Limitations of Report

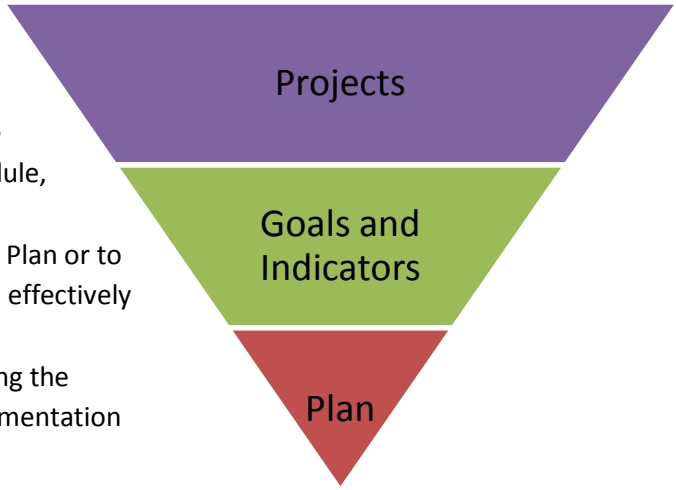
The conclusions and recommendations in this report rely on the information provided to DTA at the time of the writing of the Report by the following parties was true, correct, and complete:

1. The Santa Ana Watershed Project Authority
2. The California State Department of Water Resources

# 9.0 Data Management and Plan Performance/Monitoring

Managing water resources data at a watershed-wide level in a centralized and consistent manner, and providing access to this information to key stakeholders and the public at large is critical to the successful implementation of the Santa Ana Watershed Project Authority (SAWPA) One Water One Watershed (OWOW) 2.0 Plan. This chapter reports on the various methods and tools developed by SAWPA and others to monitor performance, manage data and provide new tools to support the implementation of the OWOW Plan. This includes a watershed assessment of how effectively progress is being made in achieving the OWOW 2.0 goals, objectives, and planning targets.

The results of the watershed assessment tool and reporting provides users with the status and trends in water resources, as well as the economic, ecologic and social systems that make up the watershed. This scientific, data-driven watershed assessment benefits local, regional, state and federal agencies and organizations by conveying a systematic, scientific evaluation of conditions developed for and presented to a wide-ranging audience. Integrated assessment and reporting of environmental and community conditions promote cooperative management and decision-making by increasing the public's awareness of regional conditions.



In addition, this report describes the mechanism for future plan evaluation and implementation and is designed to meet the Integrated Regional Water Management (IRWM) requirements for Plan Performance and Monitoring while also providing OWOW 2.0 with a mechanism for celebrating successes, drawing resources to challenges, and improving the health of the Santa Ana River Watershed (SARW). Properly managed data helps SAWPA, other agencies and stakeholders in the watershed

identify water quantity and quality issues, assess and develop potential solutions, quantify the anticipated impacts of these solutions, and measure the extent to which anticipated impacts materialize. In addition, having a single depository of data with a consistent format allows the sharing of information among stakeholders, and the integration of watershed data with other databases at the State level.

## OWOW Plan Performance and Monitoring

Through OWOW 2.0, SAWPA has developed a process to evaluate and implement the OWOW 2.0 Plan. The intent of which is to:

- Ensure progress is being made toward meeting the objectives of the Plan
- Ensure specific projects identified in the Plan are being implemented as planned in terms of schedule, budget, and technical specifications
- Identify potential necessary modifications to the Plan or to specific projects, in order to more efficiently and effectively accomplish the goals and objectives of the Plan
- Provide transparency and accountability regarding the disbursement and use of funds for project implementation

This process includes performance measures (indicators) and monitoring to document progress toward meeting the OWOW 2.0 Plan goals. Monitoring will take place at two levels, the plan and individual implementation project. Linking the two are a set goals, each made up of a number of specific indicators.

It is anticipated that plan performance will be evaluated every three to five years. This is based upon a number of limiting factors including:

- The scale and complexity of the Santa Ana River Watershed
- Availability of data updates
- Window of time required to complete projects

Results of this, as well as future evaluations will be published by SAWPA in the OWOW Webpage, and will include the use of visual tools (i.e. dashboards) to show progress to date in achieving the plan goals.

## Project Monitoring

The evaluation (rating and ranking) of projects, detailed in **Chapter 6 Project/Program Review, Evaluation and Prioritization**, is conducted through a multi-step process under the direction of the OWOW governance structure. Through this process projects of high value in achieving OWOW goals are identified to move forward for implementation and monitoring. The frequency of which this process for updating project ratings and rankings is conducted is based upon the availability of funding for projects. Projects implemented through OWOW are monitored through a Data Management System (DMS) maintained by SAWPA. This DMS is designed to ensure "lessons learned" from project-specific monitoring efforts will be used to improve SAWPA's ability to implement future projects in the OWOW Plan. SAWPA has established a "datamart" with the State to link directly to the California Environmental Data Exchange Network (CEDEN) database to down load data available for the SARW on a regular basis, and intends to expand this capability of other State databases as the opportunity becomes available. Additional tools to support the SAWPA DMS are described in detail in the Data Management section of this chapter.

SAWPA provides oversight on projects that are implemented through the Department of Water Resources (DWR) funding programs and require that project performance monitoring be developed and results reported as part of project implementation. The project's proponents are responsible for data that is collected and provided to SAWPA and DWR as part of the regular reporting process. The project monitoring plans developed by the project proponents must include information on the following information.

- Parameter or constituent being monitored
- Measures to remedy or react to problems encountered during monitoring
- Location of monitoring
- Monitoring frequency
- Monitoring protocols and methodologies and responsible parties
- Data management process for tracking what is monitored
- Procedures to ensure monitoring schedule and processes can be maintained

## Data Management Approach

The Santa Ana River Watershed (SARW) includes over a hundred municipalities and public agencies, and each municipality and agency is responsible for monitoring a wide range of parameters for many varied programs. SAWPA has directed each of these agencies to submit data to state agencies where appropriate and project performance data to SAWPA. The SARW Region has, therefore, determined that the focus should be on collecting the data already being provided by project proponents funded through the IRWM Program (and therefore already meeting DWR data requirements) and use of that data for the purposes of determining Plan Performance as described previously. Projects funded through the IRWM implementation funding programs are required to provide data from approved project performance monitoring programs in formats already consistent with the list of state agency databases

called out in DWR guidance. Therefore, the Region can ensure that the data provided can be effectively shared and used by the State and the Region's stakeholders.

SAWPA recognizes that a great deal of valuable data is collected from studies and projects not funded through the IRWM Program but which could benefit the Region and the State if made accessible. Therefore, SAWPA is working to expand the capabilities of a number of in-house tools to assist Regional stakeholders and agencies who wish to provide datasets to the Region through the IRWM Program, these datasets will be uploaded to the SAWPA database, but SAWPA would not be responsible for determining if these datasets meet DWR requirements nor for including the data into the Plan Performance assessment process. The region may, in the future, pursue additional funding to further enhance and grow the Region's DMS to fully include datasets from projects and programs not funded through the IRWM program.

Stakeholders contribute data through the projects funded by the IRWMP and are directed to input data into the appropriate state database. Additionally, stakeholders also contribute data through task force efforts such as the Lake Elsinore and Canyon Lake Nutrient Total Maximum Daily Load (TMDL) Task Force and the Middle Santa Ana River Pathogen TMDL Task Force.

Data that were not required to be submitted to state database but are deemed important are placed in SAWPA database and are made accessible through web tools, maps and tables. This database is reviewed by SAWPA staff and routinely backed up. Data quality is corrected through the use of spatial queries and then displayed through maps and tables. Anomalies are easily spotted and corrected by data submitters and SAWPA staff. Outside consultants, often added for their expertise on a particular project, add another set of eyes to the data.

The data that are submitted to the State through databases such as CEDEN as well as the SAWPA database, are available through web tools and data requests. These web tools combine tabular data with spatial data and allow the user to view the information on a map of the watershed. Many of the tools provide a quick method of analysis by providing a map with features that may be colored by a value or a chart on top of the map showing a value over time. Data that has been uploaded to the State per contract is available through a number of tools that use a weekly connection to CEDEN database which provides a very up-to-date view of the data. Data compatibility with State databases is exceptionally high due the feedback loop caused by using web based tools displayed near real time submitted data.

## OWOW Plan Monitoring

There are a number of ongoing monitoring programs that are collecting data in the Region to support the OWOW Program. Current pertinent monitoring activities in the Region are described briefly below.

### *Lake Elsinore and Canyon lake Nutrient TMDL*

The Lake Elsinore and Canyon Lake Nutrient TMDL Task Force is comprised of local stakeholders seeking to address the nutrient TMDLs defined by the Regional Board for two impaired water bodies in the San Jacinto River Watershed – Canyon Lake and Lake Elsinore. This Task Force was organized and formed by

SAWPA and LESJWA to address water quality targets in a cost effective manner among over 20 agencies and coalitions, including Federal, State, and local agencies. The Task Force meets monthly and includes representatives from local cities, Riverside County, agriculture and dairy, environmental groups, as well as the regulatory community. At the request of the Regional Board, SAWPA served as a neutral facilitator for the early TMDL development process for Lake Elsinore and Canyon Lake.

### *Middle Santa Ana River Pathogen TMDL*

The Middle SAR Pathogen TMDL Task Force is a collaborative effort of public and private sector agencies and interests focused on the development of pathogen TMDLs for SAR Reach 3, its tributaries, and other water bodies in the Chino Basin area. Formed in 2007, the Task Force has been working on several pathogen-related activities and studies for the Chino Basin. The objectives of this Task Force are to implement a number of tasks identified by the Regional Water Quality Control Board (RWQCB) in their 2005 Amendment to the Basin Plan. These include the implementation of a watershed-wide monitoring program to assess compliance with REC-1 beneficial use water quality objectives for fecal coliform, evaluate numeric targets established for *E. coli*, and identify and implement measures to control sources of impairment. The Task Force works with the Regional Board in the formulation of pathogen TMDL allocation and implementation strategies. SAWPA serves as the neutral facilitator and administrator of the Task Force.

### *Urban Water Management Plans*

The Urban Water Management Planning Act (UWMP Act) requires that planning projections be evaluated over at least a 20 year period. Most of the agencies within the watershed projected their demands for a 25 year period ending in 2030. This report provides the actual water demands for 2005 along with the water demand projections through 2030. Water demands within the watershed are met through a combination of both local and imported water supplies. Local resources include precipitation in the form of snow pack, surface flow and groundwater. Imported resources for the Watershed are primarily from the Colorado River Aqueduct (CRA) and the State Water Project (SWP). UWMP's evaluate scenarios that help prepare for water supply reliability the Watershed assuming a multi-year drought.

## Technical Analysis

In addition, there a vast amount of data utilized in the creation of the OWOW 2.0 Plan, which are not directly reported to the State. This data and technical information is used to develop the water management needs in the OWOW 2.0 Plan. The data collected is considered adequate for the needs of developing the OWOW plan in representing current conditions, the scope of historical highs and lows and future forecasts and projections. **Table 9.1** identifies the studies, models and other data sets used to create tables, charts and graphics throughout the OWOW Plan.

**Table 9-1 Source Material Used for OWOW 2.0 Technical Analyses**

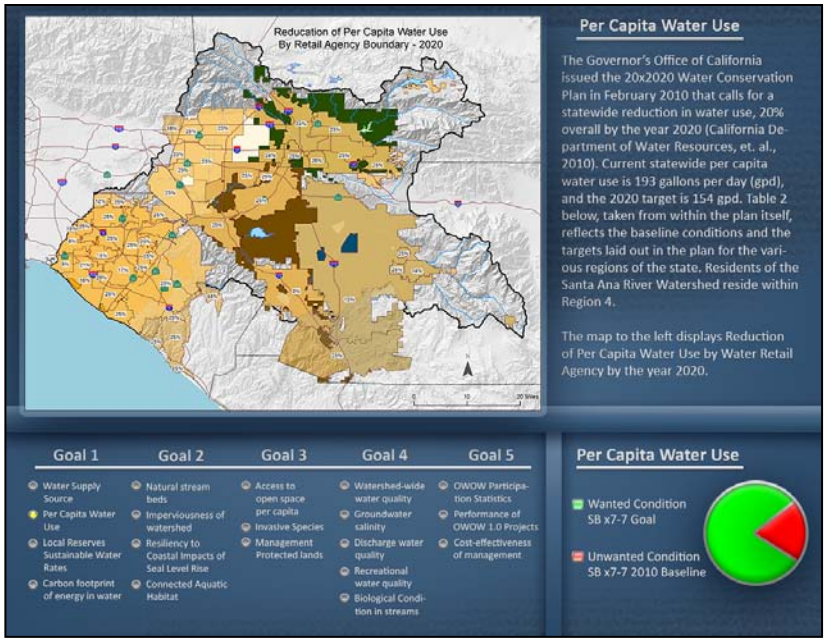
| Data or Study | Analysis Method | Results | Use in IRWM Plan | Source |
|---|---|---|---|---|
| Tribal Communities | Spatial Analysis | Percent of Tribal Communities in the Watershed | Map of Tribal Communities | Southern California Association of Governments (SCAG) |
| Disadvantaged Communities | Spatial Analysis | Percent of Disadvantaged Communities in the Watershed | Map of Disadvantaged Communities | SCAG |
| Groundwater Management Zones | Groundwater Supply/Quality/Storage | GW Management Zone, Water Quality and available storage mapping | Map of GW management zones | RWQCB, Santa Ana Basin Plan |
| Watershed Land Use | Spatial Analysis/Land Use Trends | Spatial representation of available regions for groundwater recharge | Map of land use in the SARW | SCAG |
| Critical Habitat | Habitat/Spatial Analysis | Spatial representation of critical habitat | Map of critical habitat in the SARW | Various Agencies |
| Population | Population Projections | Projected Populations for the watershed until 2035 | Map of population density in the SARW | SCAG |
| Flood Control Facilities | Spatial/Stormwater Capture Analysis | Stormwater Capture mapping | Map of flood control infrastructure in the SARW | Various Agencies |
| Groundwater Recharge Facilities | Recharge Opportunities/Spatial Analysis | GW recharge mapping | Map of GW recharge facilities and opportunities in the SARW | Various Agencies |
| Constructed Wetlands | Habitat/Stormwater Recharge Analysis | Habitat Area/Stormwater | Map of Constructed | Various Agencies |

| Data or Study | Analysis Method | Results | Use in IRWM Plan | Source |
|---|---|---|---|---|
| | | Recharge Opportunities | Wetlands in the SARW | |
| Recycled Water Facilities | Spatial/Water Quality/Water Supply Analysis | Locations and dischargers along the SAR | Map of recycled water facilities in the SARW | Various Agencies |
| Agency Service Area | Spatial Analysis/Population Projections | Mapping of Agency Service Areas and Boundaries | Map of Agency Service Areas in the SARW and surrounding areas | UWMP/Retail Agencies |
| Watershed Delineations | Spatial Analysis | Sub-Watershed delineations within the SAR | Used in evaluation of more focused planning | Various Agencies |
| Desalination Plants | Spatial Analysis/Desalination Capacities/Quality | Mapping of Desalination Plants | Map of Desalination Plants in the SARW | Various Agencies |
| Regional Infrastructure | Spatial Analysis/Water Supply Analysis | Mapping of Regional Water Infrastructure and Supply Opportunities | Map of Regional Infrastructure and the outlets in the SARW | Member Agencies |
| Surface Water | Water Quality/Spatial Analysis | Mapping of Surface Water | Mapping of surface water sources in the SARW | RWQCB, Santa Ana Basin Plan |
| Imported Water Infrastructure | Spatial Analysis/Economic Impacts | Mapping of Metropolitan Water District (MWDSC) Imported Water Infrastructure | Mapping of MWDSC Imported Water Infrastructure in the SARW | MWDSC Regional Plans |
| Fault Lines | Spatial Analysis/Infrastructure Risk Analysis | Mapping of fault lines with water infrastructure | Mapping of fault lines and water infrastructure | US Geological Survey (USGS) |
| Delta Smelt Impacts | Water Supply Projections | Projections of water supply affected by the | Water import projections for Chapter 5.4 | MWDSC |

| Data or Study | Analysis Method | Results | Use in IRWM Plan | Source |
|---|---|---|---|---|
| | | Delta Smelt impacts | | |
| Impaired Water Bodies (303-D List) | Water Quality Analysis | Mapping of impaired water bodies in the SARW | Mapping the impaired water bodies in the SARW | 303-D List |
| TMDL Projects | Water Quality Analysis | Mapping of TMDL projects in the SARW | Map of TMDL Projects in the SARW | Various Agencies |
| Invasive Species | Habitat/Spatial Analysis | Mapping of areas affected by Invasive Species | Map and analysis of the effects of invasive species | Santa Ana Watershed Association (SAWA) |
| Water Quality Objectives | Water Quality Analysis | Mapping of water quality objectives in the SARW | Map and analysis of water quality objectives. | RWQCB, Santa Ana Basin Plan |
| Seawater Intrusion Zones | Water Quality/Spatial/Water Supply /Projections | Mapping of basins in danger of Saltwater Intrusion and the effects on supply | Map and analysis of potential seawater intrusion zones | Orange County Water District (OCWD) |
| Dam Locations | Spatial Analysis | Mapping of dams and weirs | Maps and sediment loading potential regarding dams | Various Agencies |
| Santa Ana River Trail | Habitat/Recreational Spatial Analysis | Mapping of recreation opportunities along the SAR | Map of the Santa Ana River Trail | Various Agencies |
| Temperature | Climate Analysis | Mapping of temperature zones throughout the SARW | Map and analysis of temperature data throughout the SARW | U.S. Bureau of Reclamation (Reclamation) |
| Groundwater Plume Maps | Spatial Analysis/Water Quality Analysis | Mapping of contaminated GW due contamination plumes | Map and analysis of contaminated groundwater basins/plumes | Various Agencies |

## Plan Performance and Project Support Tools

SAWPA has developed a number of tools to facilitate the evaluation, dissemination and integration of data to track plan performance as well as new tools to support project proponents in collaboration and evaluating multiple resources necessary to develop new regional projects. The emphasis of tool development is to support the achievement of the OWOW plan objectives at both the plan and project implementation levels. Most of these tools were developed in-house by SAWPA staff. However, several tools also reflect the collaborative work of SAWPA and others. The watershed assessment tool was developed by SAWPA working closely with the Council for Watershed Health and Dr. Fraser Shilling, UC Davis. New project support tools to support climate change adaptation and mitigation were developed by the Reclamation, based on a funding partnership with SAWPA for the OWOW 2.0 Plan. The Reclamation tools were designed such that project proponents as well as the general public could evaluate the projected climate change impacts in the Santa Ana River Watershed as well as adaptation and mitigation measures to deal these changing conditions. It is anticipated that these tools can be effectively adapted to other IRWM regions and users across the State.



Many of the tools were designed to provide the user access to forms or data through graphical user interface (GUI) supported by Graphical information System (GIS) map layers and rely on the use of electronic reporting linked to a sequel database. It is intended that these tools will be further enhanced and expanded in the context of the OWOW Plan, as more and better data becomes available. With this information, SAWPA will be able to track the watershed's progress in meeting OWOW 2.0 goals, as well as, be responsive to opportunities to expand regional planning.

## Watershed Assessment Framework and Tool

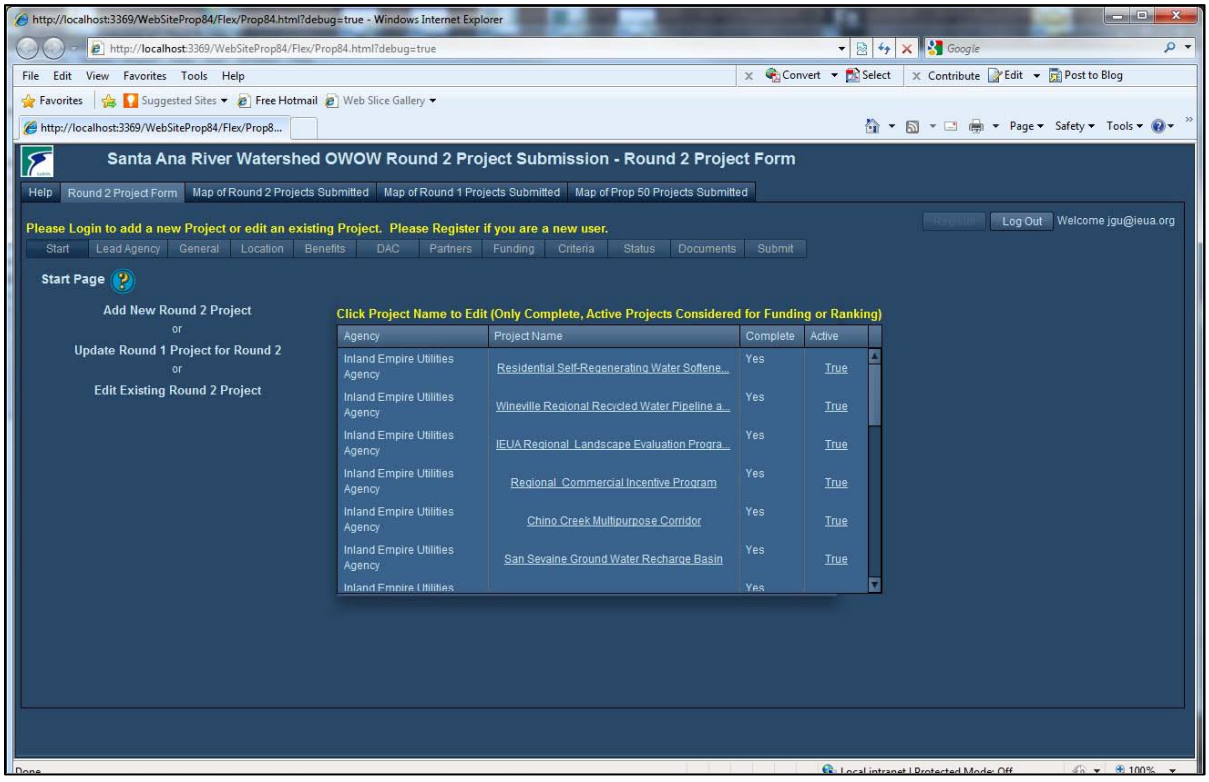
With the implementation of integrated projects and programs seeking to achieve a sustainable watershed, SAWPA early in the OWOW 2.0 planning scoping recognized the need for a common method of measuring progress on meeting the goals and objectives as well as the health of the Santa Ana River Watershed. SAWPA engaged the services of the Council for Watershed Health, a nonprofit organization, and Dr. Fraser Shilling of UC Davis to develop a watershed assessment framework for the Santa Ana River Watershed. Based on their experience with developing methodology for a Watershed Assessment Framework (WAF) using the Arroyo Seco watershed in the Los Angeles County and their work on developing a similar project for the State on the California Water Plan 2013 Update, the Council and Dr. Shilling were able to work with the Pillar workgroups to update the watershed management goals, establish planning targets or wanted conditions for the watershed and utilize data indicators or metrics from existing datasets or data collection efforts to track progress. With the input of SAWPA staff, a new tracking computer tool was created incorporating this work that will allow managers to evaluate and assess progress and assure actionable results for implementation.

SAWPA, working with their stakeholders, developed an interface to display the goals, indicators and results for SAWPA's OWOW 2.0 watershed assessment tool.

**Figure 9-1 Watershed Assessment Tool**

This interface provides the user a menu of watershed management goals and related indicators established for SAWPA's OWOW 2.0 watershed assessment. The user can select from this menu indicators that were used in the watershed assessment. When an indicator is selected, the screen updates to provide an in depth evaluation of the indicator, data employed and watershed score.

The tool includes the following features:



- Indicator narrative describing: What is it, Why it is important, Target or desired condition, Stress condition, Basis of calculation and use, What did we find out/How are we doing, How sure are we about our findings, Technical Information and Analysts
- Thematic map displaying the available spatial data
- Watershed assessment score

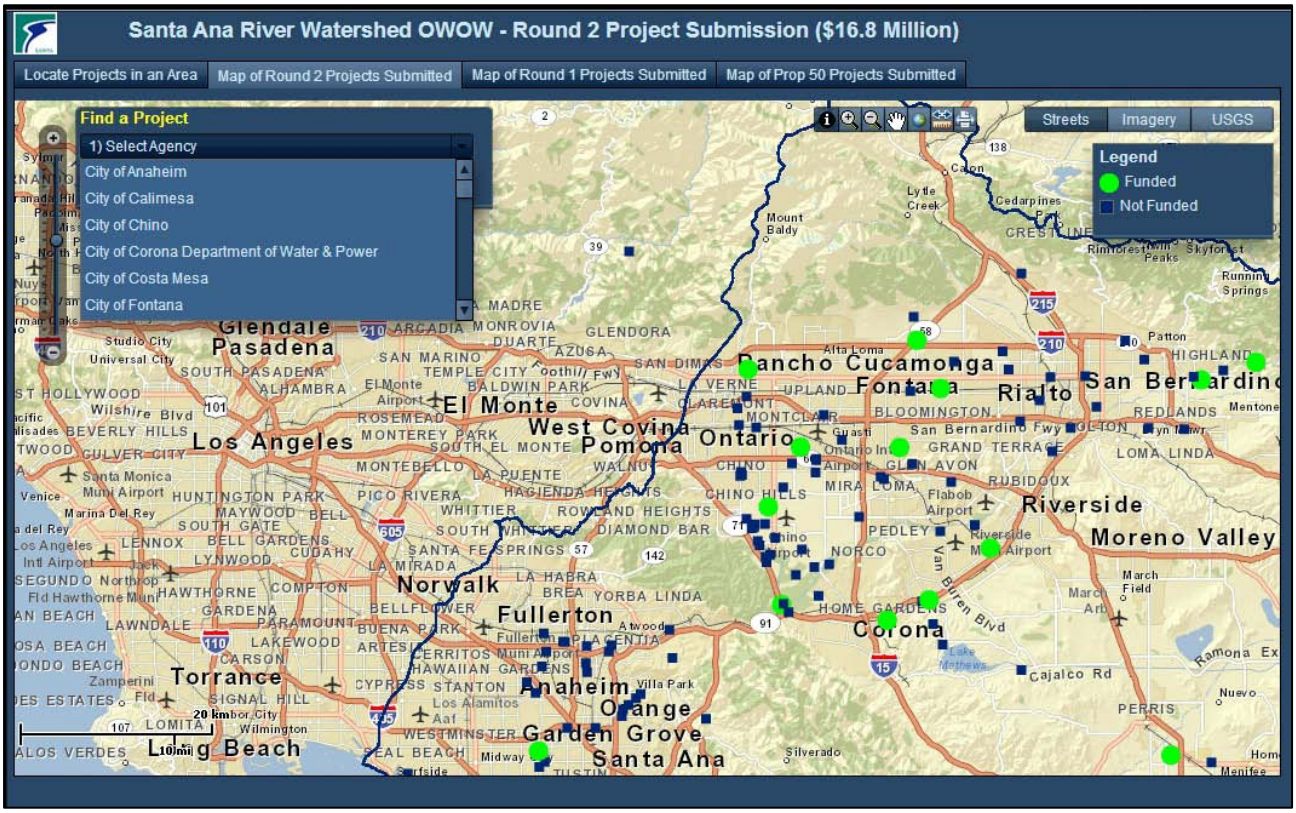
Using this assessment tool, SAWPA now has an effective, efficient and responsive ongoing monitoring program for the watershed. A report synopsis of the indicators selected for each goal, and what the analysis told us about the watershed is included in the **Appendix A**.

## OWOW 2.0 Project Application Form

OWOW 2.0 Project Application Form was developed by SAWPA staff to provide stakeholders an on-line form for the submittal of project proposals for Proposition 84 Round 2 funding.

**Figure 9-2 Project Application Form**

The OWOW 2.0 Project Application Form includes key information required to address the goals of SAWPA's OWOW 2.0 IRWM Program, as well as DWR's Proposition 84 Round 2 grant program. Access to the form requires the user to register and the account is password protected.
Key information included in the form includes:



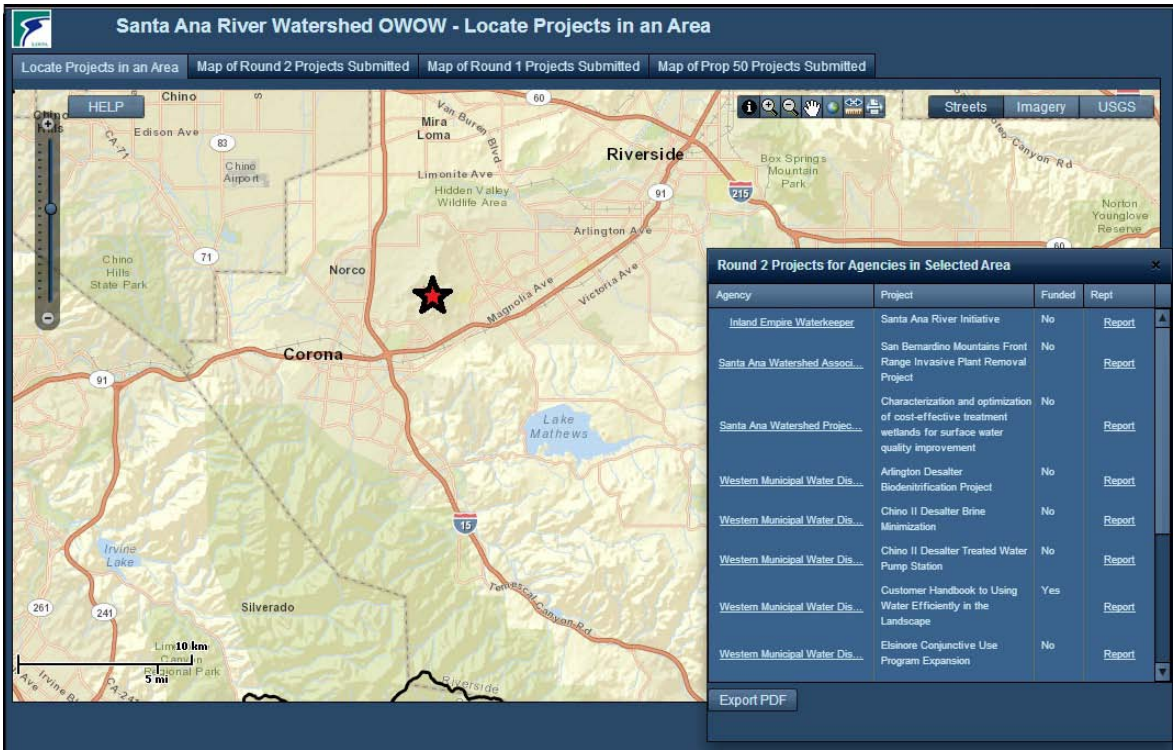
- Lead Agency Contact Information
- Project Location
- Project Benefits
- Disadvantaged Community and Tribal Support
- Project Funding
- Project Partners
- Project Status
- Attachments

Additionally, this on-line form provides the user the ability to import information from earlier proposal submissions.

## OWOW 2.0 Submitted Project Map

OWOW 2.0 Submitted Project Map was developed by SAWPA staff to provide stakeholders a tool to identify and review other project proposals submitted for Proposition 84 Round 2 funding. In addition, the tool serves as a tool to assist project proponents with a tool identify potential project partners.

**Figure 9-3 Submitted Project Map**



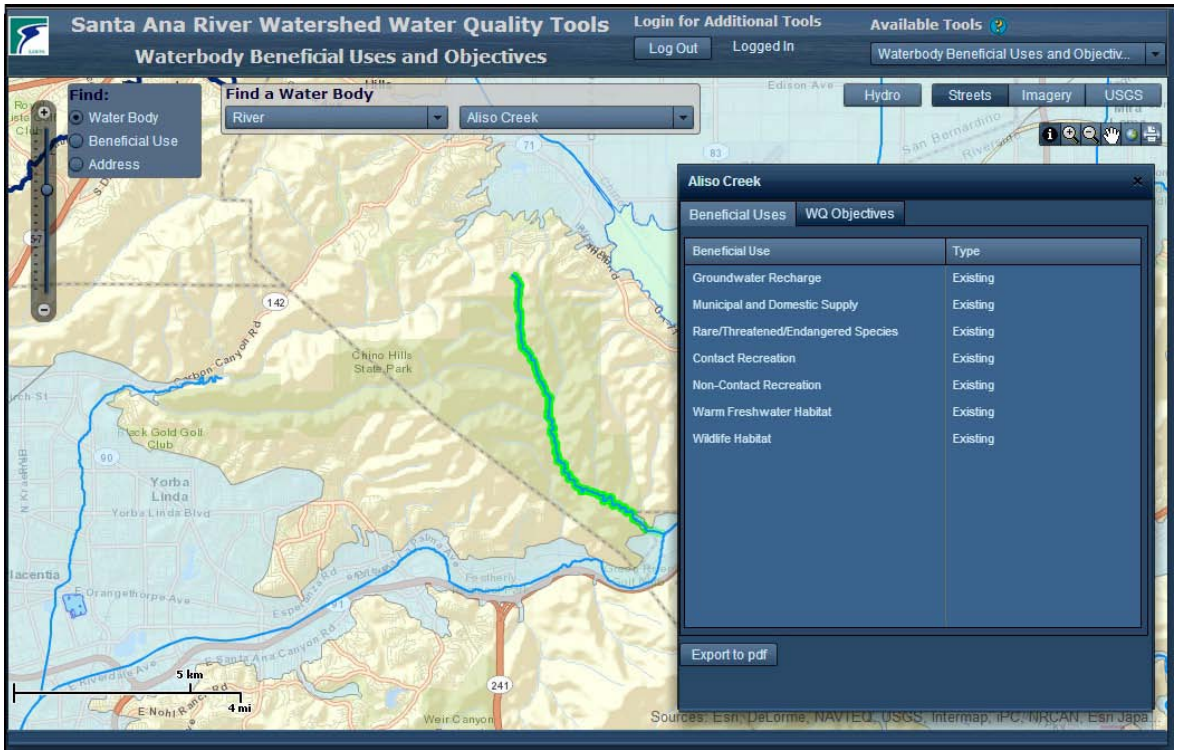
The Project Map identifies the location of each project submitted for Proposition 84 Round 2 funding. The user simply clicks on a project marker and a pop-up window is activated displaying a PDF copy of the completed OWOW 2.0 Project Application Form. Additionally, by hovering over a project marker, the user will be able to view the name of the project applicant.

## OWOW 2.0 Project Partner Locator

OWOW 2.0 Project Partner Locator was developed by SAWPA staff to provide stakeholders a tool to identify potential project partners for the development of regional integrated watershed projects.

**Figure 9-4 Project Partner Locator**

The user simply clicks on the map and a pop-up window is activated displaying agencies whose service area overlaps the proposed project area.



## Santa Ana River Watershed Water Quality Tools

SAWPA partnering with the Santa Ana RWQCB and local stakeholders have developed a suite of tools to provide water planners and the public access to Basin Plan information relating to designated beneficial uses, water quality objectives and water quality data for waterbodies within the Santa Ana Watershed.

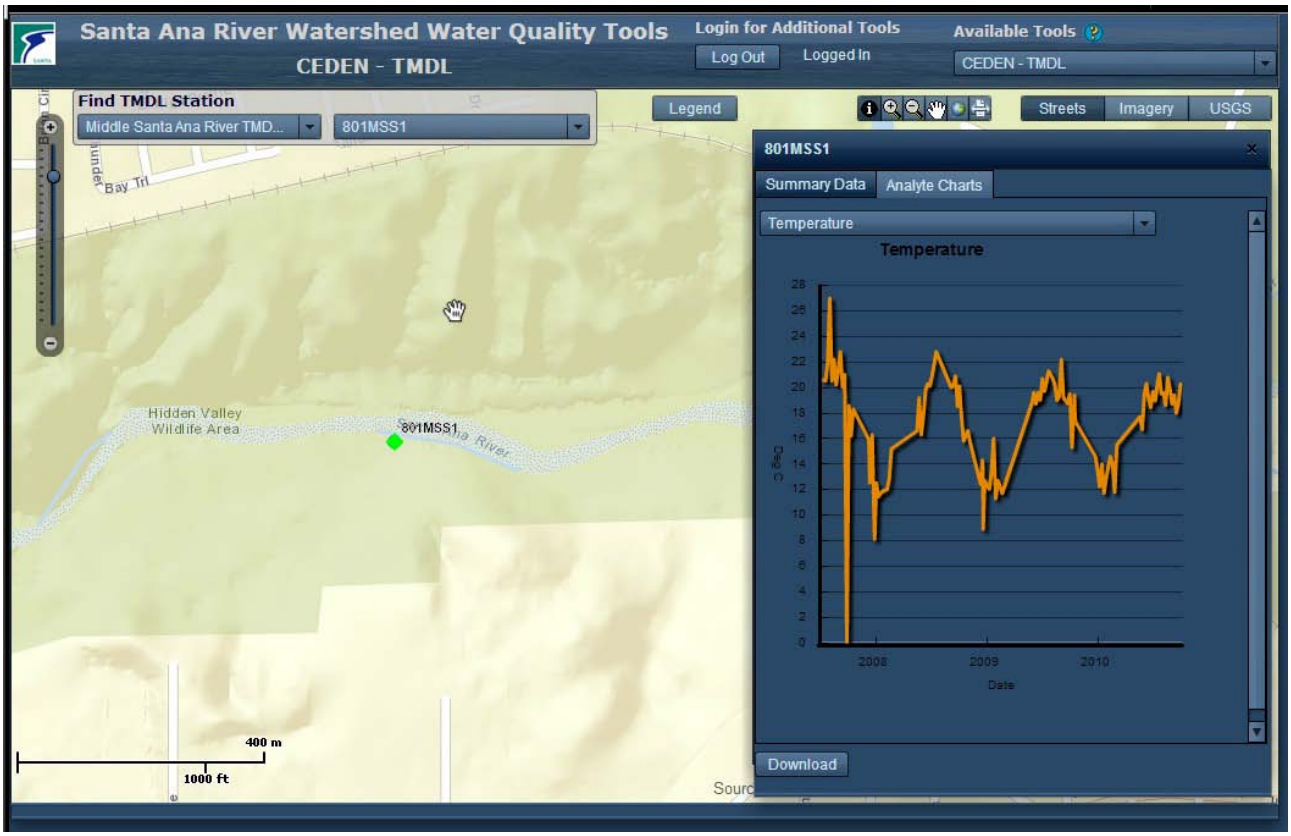
## Waterbody Beneficial Uses and Water Quality Objectives

SAWPA partnering with the Santa Ana RWQCB has developed an interactive web application to explore hydrologic features and regulatory criteria established for waterbodies within the Santa Ana Watershed Basin Plan.

**Figure 9-5 Waterbody Beneficial Uses and Objectives**

This tool provides the user the ability to search a map of the Santa Ana River Watershed to identify a particular hydrologic feature, waterbody beneficial use or street address through a series of searchable menus or by simply clicking on a particular map feature.

Searching by waterbody type activates a set of pull-down menus. The first pull-down menu lists waterbody types including: bays, lakes, rivers, wetlands and groundwater management zones. The second includes a list of each named waterbody of that type identified in the Santa Ana River Watershed Basin Plan. When the user selects a waterbody, a pop-up window is activated displaying applicable beneficial uses and water quality objectives.



Searching by beneficial use activates a of pull-down menu of beneficial uses types identified in the Santa Ana River Watershed Basin Plan. When the user selects a beneficial use, each waterbody with that particular beneficial use is activated throughout the watershed. Selecting a waterbody activates a pop-up window displaying applicable beneficial uses and water quality objectives.

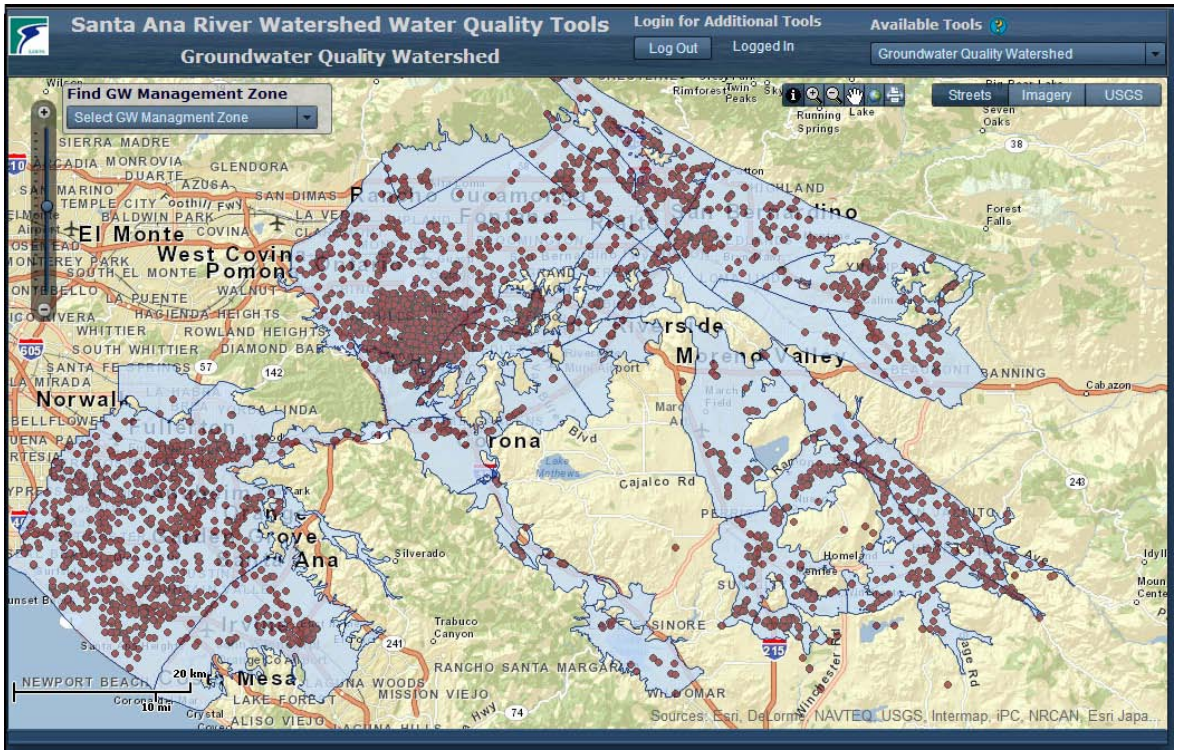
Additional features of this application include the ability to turn on/off waterbody features, export waterbody data to a PDF file, capture information from the screen and print to a PDF file, and multiple map backgrounds including: street map, satellite imagery and USGS quad.

## Water Quality Monitoring Data Tool

SAWPA partnering with the Santa Ana Regional Water Quality Control Board has developed an interactive web application to examine surface water quality data for TMDL monitoring locations within the Santa Ana Watershed Basin Plan.

**Figure 9-6 Watershed  Water Quality Tools**

This tool provides the user the ability to search monitoring locations by regulatory program through a series of searchable menus or by simply clicking on a particular monitoring location within the Santa Ana River Watershed.  Current data available includes watershed-wide monitoring data collected through the Lake Elsinore and Canyon Lake nutrient and the Middle Santa Ana River pathogen TMDL programs. Data available in this application is updated on a weekly basis and served through a datamart connection established with CEDEN, managed by the California State Water Resources Control Board (SWRCB).



Searching by project activates a of pull-down menu listing regularly monitored stations. Selecting a particular monitoring station zooms the map to the selected location and activates a pop-up window with a series of tabs.  The first tab includes a summary of available data collected at that monitoring location including: list of analytes, average result, unit of measure, number of samples and date range. A second tab includes a chart tool, which provides the user the ability to select an analyte from a pull-down menu to view available time series data graphically.

Additional features of this application include the ability to turn export waterbody data to a PDF file, capture information from the screen and print to a PDF file, and multiple map backgrounds including: street map, satellite imagery and USGS quad.

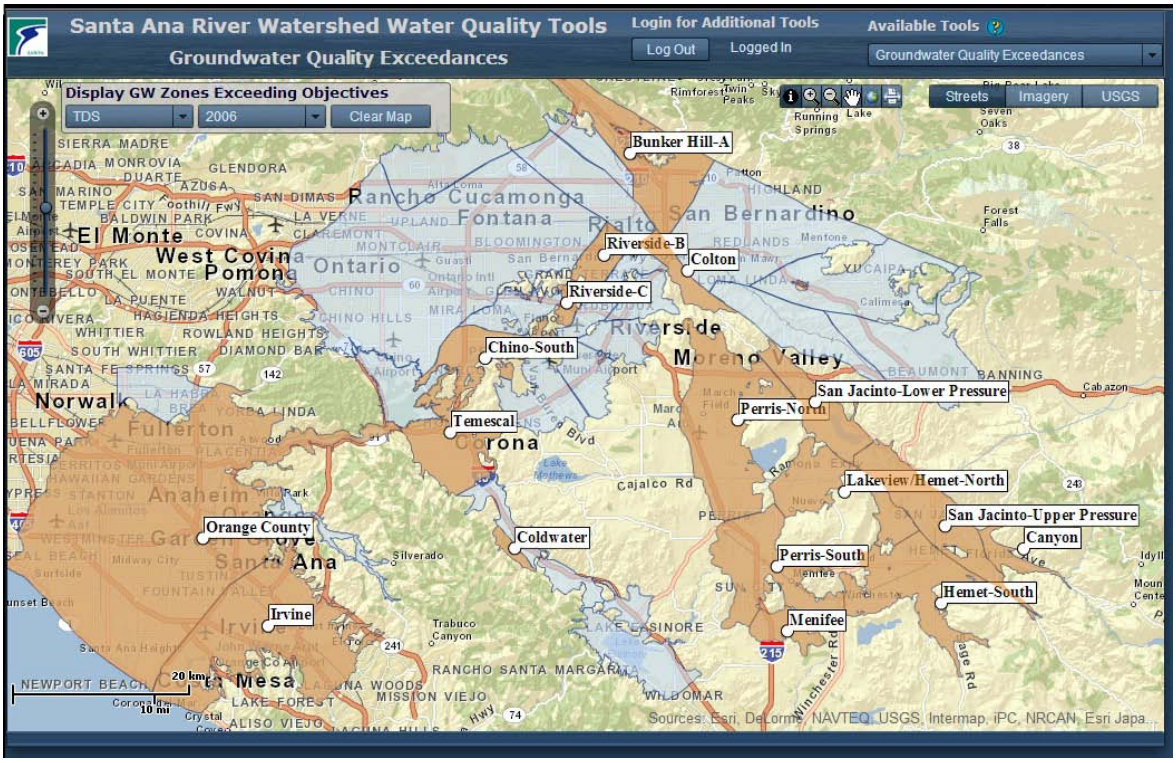
## Ambient Groundwater Quality Tool

SAWPA partnering with the Santa Ana RWQCB has developed an interactive web application to examine summary groundwater quality data by groundwater management zones within the Santa Ana Watershed Basin Plan.

**Figure 9-7 Groundwater Quality**

This tool provides the user the ability to view groundwater quality data summarized by groundwater management zone as reported in the Recomputation of Ambient Water Quality in the Santa Ana River Watershed for TDS and NO3-N for the past 20 year well data collection period. The user can examine summary groundwater management zone data through a searchable menu or by simply clicking on a particular Santa Ana River Watershed groundwater management zone. Selecting a particular groundwater management zone "zooms" the map to the selected location and activates a pop-up window with a series of tabs.

The first tab includes a summary of available data collected at that monitoring location including: list of analytes, average result, unit of measure, number of samples and date range. A second tab includes a graph of available TDS time series data plotted against its water quality objective. A third tab includes a



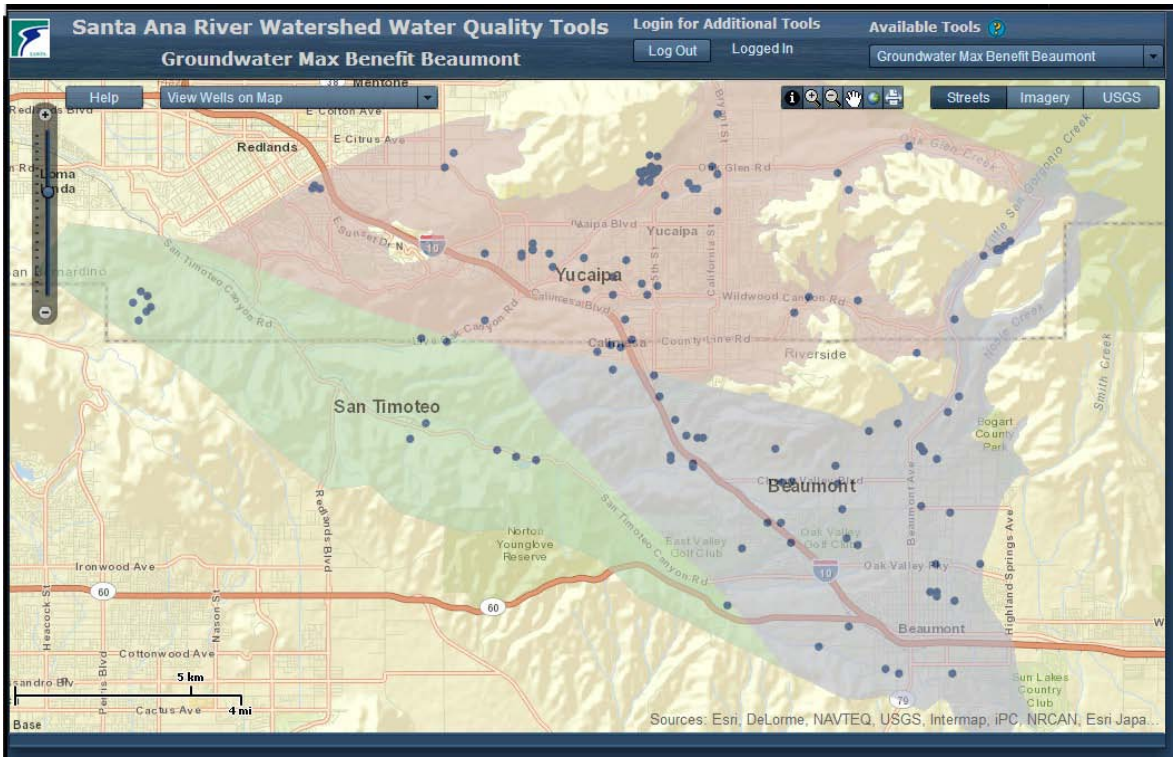
graph of available NO3-N time series data plotted against its water quality objective. A fourth tab includes a chart tool, which provides the user the ability to select an analyte from a pull-down menu to view available time series data graphically.

Additional features of this application include the ability to turn export waterbody data to a PDF file, capture information from the screen and print to a PDF file, and multiple map backgrounds including: street map, satellite imagery and USGS quad.

## Groundwater Basins Water Quality Modeling Tool

SAWPA partnering with the SWRCB has developed an interactive web application to examine exceedences to groundwater quality objectives for TDS and NO3-N by groundwater management zone within the Santa Ana Watershed Basin Plan.

**Figure 9-8 Groundwater Quality Exceedances**



This tool provides the user the ability to view exceedences to groundwater quality objectives for TDS and NO3-N as reported by the Triennial Recomputation of Ambient Water Quality in the Santa Ana Watershed Reports. The user can identify groundwater management zones exceeding groundwater quality objectives for TDS and NO3-N through a series of pull-down menus by selecting between TDS and NO3-N and then selecting a year. After the selections are made, the map refreshes highlighting and naming the groundwater management zones with exceeding the selected groundwater quality objective for the selected year.

Additional features of this application include the ability to turn export waterbody data to a PDF file, capture information from the screen and print to a PDF file, and multiple map backgrounds including: street map, satellite imagery and USGS quad.

## Groundwater Basins Maximum Benefit Water Quality Modeling Tool (DRAFT)

SAWPA partnering with the Santa Ana RWQCB is working to develop an interactive web application to examine exceedences to the max benefit groundwater quality objectives for TDS and NO3-N in the Beaumont groundwater management zone within the Santa Ana River Watershed.

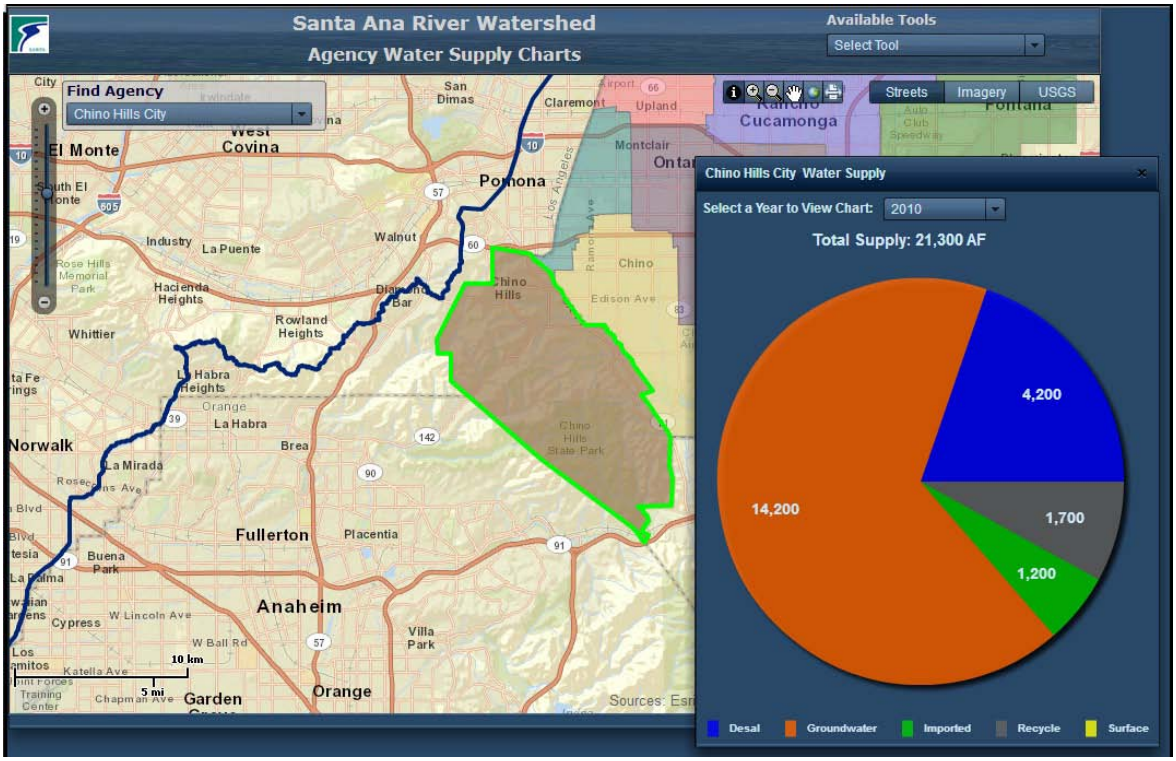
**Figure 9-9 Groundwater Maximum Benefit**

This tool provides the user the ability to examine water quality relating to max benefit groundwater quality objectives for TDS and NO3-N for the Beaumont groundwater management zone as reported in the 2011, Recomputation of Ambient Water Quality in the Santa Ana Watershed for the Period 1990 to 2009. A pull-down menu provides the user the following options to evaluate well data in the Beaumont groundwater management zone.

**NO3-N Exceeding BU Objective** – highlights wells exceeding the max benefit groundwater quality objective NO3-N in the Beaumont groundwater management zone

**NO3-N Concentration Range** – view provides a color ramp of NO3-N water quality for all wells

**TDS Exceeding BU Objective** – highlights wells exceeding the max benefit groundwater quality objective TDS in the Beaumont groundwater management zone



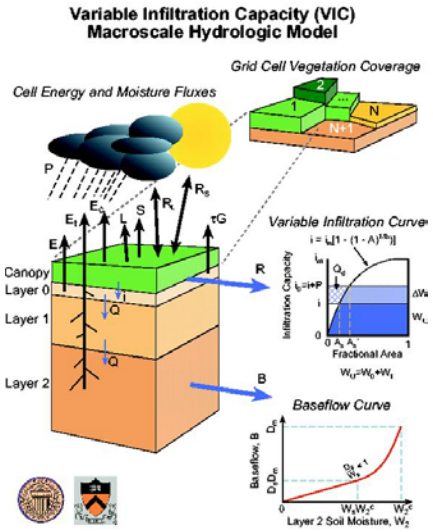
From any of these views, the user can select a highlighted well. This zooms the map to the selected location and activates a pop-up window displaying a summary of TDS and NO3-N water quality data.

Additional features of this application include the ability to turn export waterbody data to a PDF file, capture information from the screen and print to a PDF file, and multiple map backgrounds including: street map, satellite imagery and USGS quad.

## Pilot - Water Resource Management Tool

SAWPA partnering with DWR and Esri is working to develop an interactive web application to review and analyze water resources data for water purveyors operating in the Santa Ana River Watershed.

**Figure 9-10 Agency Water Supply Charts**

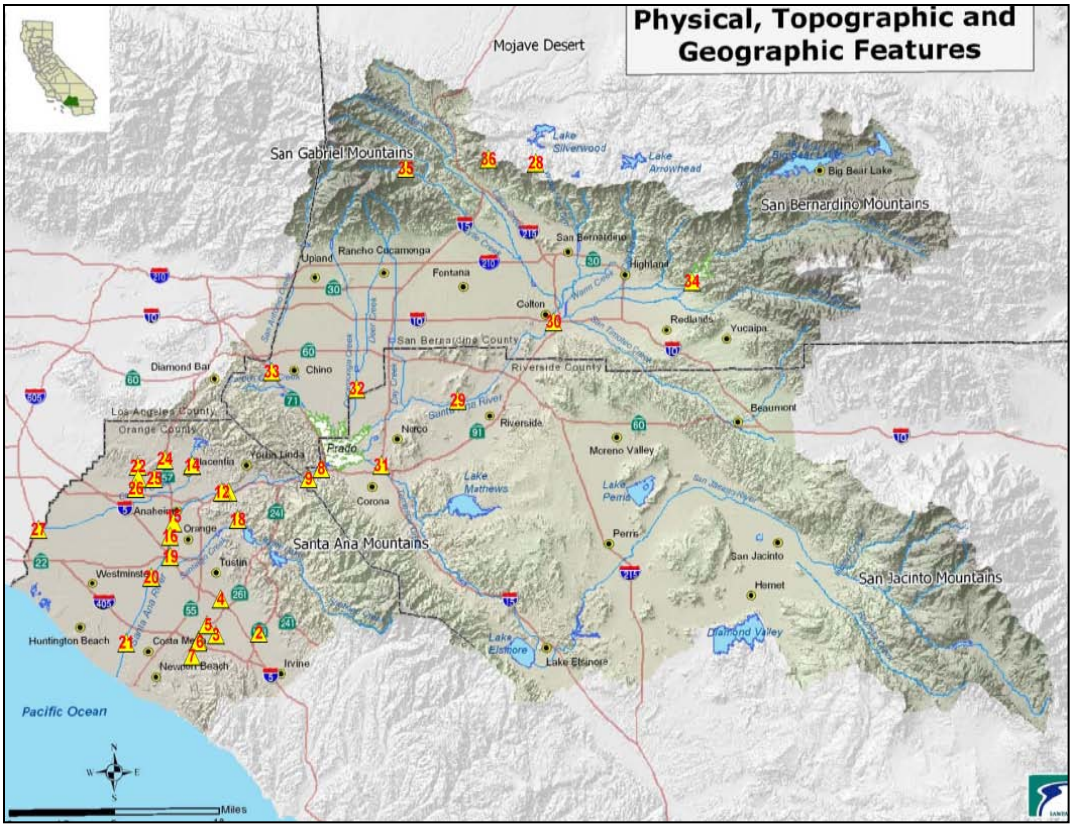


This tool will provide water planners a tool to assess data related to various sources of water supply, and water use, as well as, a number of other related water resource information for the Santa Ana River Watershed. This includes the ability to display, explore and analyze water resources data at a number of levels (agency, basin, watershed) and management scenarios projected over a 20-year planning horizon. The tool is anticipated to be on-line in 2014.

The completed tool will consider the following components:

- Water Retailers and Wholesalers

- Imported Water
- Groundwater withdrawals and recharge
- Water recycling
- Wastewater flows
- Conservation
- Surface withdrawals
- Water Use
- Planned Water Resource projects



## Climate Change Model

A partnership between SAWPA and Reclamation has produced an interactive climate change modeling tool to provide water planners with information on potential impacts of climate change within the Santa Ana River Watershed. The main objective of this particular tool is to develop a simplified modeling framework for evaluating climate change impacts on surface flows, temperature, snow melt, storm flow and groundwater levels and to apply this framework to evaluate potential impacts of climate change as well as mitigation/adaptation alternatives. The Climate Change tool enables the user to explore, identify and download custom climate change data for various scenarios modeled for the Santa Ana River Watershed. Recognizing the importance of potential impacts of climate change in the future, the tool will allow planners to foresee possible issues avoiding misallocation of resources and funds.

While this tool proves to be very useful to agencies within the Santa Ana River Watershed there are still some steps that Reclamation and SAWPA are taking in order to make it even more effective. This includes data refinement, model refinement, cross validation, and sea level rise information. All of these steps target any future issue or potential impact that climate change might have within the Santa Ana River Watershed.

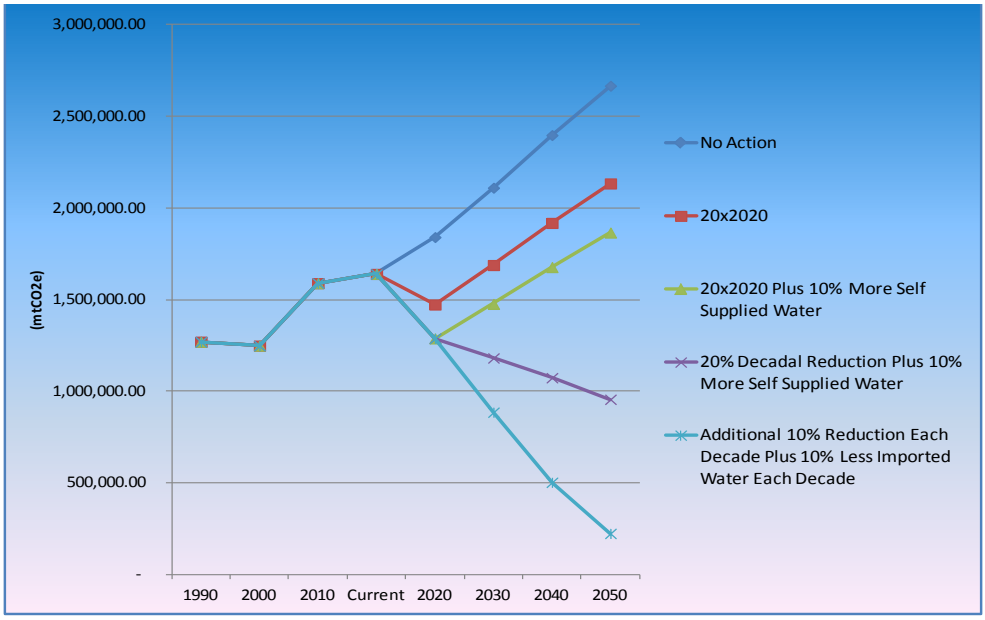


**Figure 9-11 Physical, Topographic and Geographic Features within the SARW**

## Green House Gas Modeling Tool

Reclamation, working with SAWPA, developed an interactive green house gas emissions modeling tool to provide water planners and the public information about the impacts of green house gases on water resources within the Santa Ana Watershed. This tool enables the user to explore, identify and download custom green house gas data for a suite of water technologies modeled for the Santa Ana River Watershed. It will also exhibit energy consumption in the delivery and treatment process with relation to water. In accordance with AB – 32 (Assembly Bill) which requires regions within California to reduce their overall GHG emission, the tool also evaluates both the supply and demand of water in the Santa Ana River Watershed. This tool will prove to be very useful within the watershed because it allows agencies and SAWPA alike to use the calculator for different types of scenarios which can be used to compare each outcome and result. Further, the tool can be adapted to individual projects and is anticipated for use in future GHG emissions calculations by project proponents

**Figure 9-12 GHG Emissions Scenario Comparison**

### Groundwater Basins Water Quality Modeling Tool

In partnership with SAWPA and Reclamation, an interactive groundwater modeling tool was developed to allow planner and other entities to identify potential impacts of climate change on groundwater resources within the Santa Ana River Watershed. The tool will enable the user to explore, identify and download groundwater data for various climate change scenarios modeled for the Santa Ana River Watershed. This data includes but is not limited to groundwater elevation, basin-average precipitation and potential ET, stream flows, M&I demand, agricultural demand, and augmented supplies. Utilization of this tool provides many different types benefits, the user is able to apply information the project might need in order to account for any future climate change scenarios. This is an important part of the project process, since an agency/public is able to identify problematic situations now they will be able to avoid or deal with them in the future. This tool at this time reflects four general groundwater management regions as defined by DWR for the watershed and is currently still under development.

## OWOW Watershed Outreach Tools

SAWPA's technical approach for public outreach required a broad application of current technologies due to the difference in skill sets of the watershed audience. The demographics of this audience ranged from users who relied on the telephone (land line) for information to mobile users comfortable with Twitter. The middle ground in regards to user's technology comfort zone was the web itself. SAWPA's approach relied on three distinct technologies, the Web, Email, and Telephony, to best meet the user's abilities to receive information.

The Web provided SAWPA with several avenues of outreach. The first avenue being SAWPA's own website and SAWPA's ability to quickly modify and create pages dedicated to the OWOW process. Even the home page provided immediate announcements and directions for further information. The second avenue was a Water Blog linked to the SAWPA home page that provided additional information on a wide range of water topics, often supporting current issues or related projects. The third avenue was allowing users access through the web to project forms, project reports, and interactive GIS Tools. This

provided users with additional information on all projects and water issues thru these reports and the use of the GIS Tools. The fourth avenue was providing profile sites for users to locate SAWPA and the OWOW planning process on Facebook and LinkedIn.

Telephony provided watershed users with the ability to dial in and provide input to many of the OWOW meetings that occurred at SAWPA. The use of a free audio bridge along with web enabled presentation tool allowed users to call in anywhere in the watershed and participate in the planning process. On the mobile side, the use of Twitter provided users with quick announcements and links to recently published documents, invitations to events, and current projects in the watershed.

These methods of outreach provided the multifaceted audience with up-to-date information while using technology they were comfortable with. Technology use and its methods are constantly being reviewed during the OWOW process and will be updated to further increase the watershed audience.

SAWPA's social media tool kit could include:

- Home base (Water Blog)
- Social conversation site (Twitter)
- Social profile site (Facebook) (B2C)
- Business profile (LinkedIn) (B2B)
- Search Tools (i.e., Google Blogs search or Technorati)

As efforts in a particular area grow, additional tools may need to be added (i.e., listening, social bookmarking, and photo sharing tools).

## Other Social Outreach Tools

### Watershed-Wide Master Calendar

The Watershed-wide master calendar was launched on January 15, 2012. Information about the watershed-wide calendar was sent out to the entire OWOW Constant Contacts data base announcing the new watershed-wide calendar and inviting outside agencies to post their agency's events onto this interactive master regional calendar. Participants may obtain passwords to input their events by contacting the IT Department.

As further refinements are made, the calendar will contain links to the respective agencies' websites (i.e., download registration information etc.) thus creating a helpful resource tool to all stakeholders. It is intended that the calendar will be a "go-to" place to check out watershed-wide events. Event postings will be promoted through in Linked In, Twitter, and Facebook posts every time an announcement or significant event is added.

In the early stages of development and implementation, most likely SAWPA staff will need to add and monitor the events on this calendar until outside interest and momentum are deemed acceptable and the calendar becomes self-sufficient. If this step is overlooked, the calendar's possible fate could be jeopardized immediately after launching. It is important to designate a staff member to monitor and remove outdated events that outside event planners do not remove. This staff member should monitor on a weekly basis posted events and remove any outdated events.

This tool will be in addition to the normal SAWPA in-house events/meetings calendar already posted on the SAWPA website.

## Mass Emails

Mass emails are authorized by the General Manager prior to release. Every time a mass email is sent, Constant Contact provides an opportunity to send out that same message as a social media message concurrently to Linked In, Twitter and Facebook by utilizing Constant Contact's "Simple Task" option. This additional option should be incorporated as "normal" procedure when sending out future mass emails. By sending social media messages when sending out mass emails, SAWPA's social media presence could be further enhanced.

| CHINO BASIN MUNICIPAL WATER DISTRICT,<br><br>Plaintiff,<br><br>v.<br><br>CITY OF CHINO, et al.<br><br>Defendants | No. RCV 51010[2]<br><br><br><br><br><br>JUDGMENT |

## I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction. The complaint herein was filed on January 2, 1975, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. A first amended complaint was filed on July 16, 1976. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. By answers and order of this Court,

[2] Original Judgment signed January 27, 1978, Case # 164327 by Judge Howard B. Weiner. File transferred August 1989, by order of the Court and assigned new case number RCV 51010.

the issues have been made those of a full inter se adjudication between the parties. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation For Judgment. Stipulation for entry of judgment has been filed by and on behalf of a majority of the parties, representing a majority of the quantitative rights herein adjudicated.

3. Trial; Findings and Conclusions. Trial was commenced on December 16, 1977, as to the non-stipulating parties, and findings of fact and conclusions of law have been entered disposing of the issues in the case.

4. Definitions. As used in this Judgment, the following terms shall have the meanings herein set forth:

(a) Active Parties. All parties other than those who have filed with Watermaster a written waiver of service of notices, pursuant to Paragraph 58.

(b) Annual or Year –- A fiscal year, July 1 through June 30, following, unless the context shall clearly indicate a contrary meaning.

(c) Appropriative Right –- The annual production right of a producer from the Chino Basin other than pursuant to an overlying right.

(d) Basin Water –- Ground water within Chino Basin which is part of the Safe Yield, Operating Safe Yield, or replenishment water in the Basin as a result of operations under the Physical Solution decreed herein. Said term does not include Stored Water.

(e) CBMWD –- Plaintiff Chino Basin Municipal Water District.

(f) Chino Basin or Basin –- The ground water basin underlying the area shown as such on Exhibit “B” and within the boundaries described in Exhibit “K”.

(g) Chino Basin Watershed –- The surface drainage area tributary to and overlying Chino Basin.

(h) Ground Water –- Water beneath the surface of the ground and within the zone of saturation, i.e., below the existing water table.

(i) Ground Water Basin –- An area underlain by one or more permeable formations capable of furnishing substantial water storage.

(j) Minimal Producer –- Any producer whose production does not exceed **ten** acre-feet per year. [3]

(k) MWD –- The Metropolitan Water District of Southern California.

(l) Operating Safe Yield –- The annual amount of ground water which Watermaster shall determine, pursuant to criteria specified in Exhibit "I", can be produced from Chino Basin by the Appropriative Pool parties free of replenishment obligation under the Physical Solution herein.

(m) Overdraft –- A condition wherein the total annual production from the Basin exceeds the Safe Yield thereof.

(n) Overlying Right –- The appurtenant right of an owner of lands overlying Chino Basin to produce water from the Basin for overlying beneficial use on such lands.

(o) Person. -- Any individual, partnership, association, corporation, governmental entity or agency, or other organization.

(p) PVMWD –- Defendant Pomona Valley Municipal Water District.

(q) Produce or Produced –- To pump or extract ground water from Chino Basin.

(r) Producer –- Any person who produces water from Chino Basin.

(s) Production –- Annual quantity, stated in acre feet, of water produced.

(t) Public Hearing –- A hearing after notice to all parties and to any other person legally entitled to notice.

(u) Reclaimed Water – Water which, as a result of processing of waste water, is suitable for a controlled use.

(v) Replenishment Water –- Supplemental water used to recharge the Basin pursuant to the Physical Solution, either directly by percolating the water into the Basin or

[3] Order dated September 27, 2001.

indirectly by delivering the water for use in lieu of production and use of safe yield or Operating Safe Yield.

(w) Responsible Party –- The owner, co-owner, lessee or other person designated by multiple parties interested in a well as the person responsible for purposes of filing reports hereunder.

(x) Safe Yield –- The long-term average annual quantity of ground water (excluding replenishment or stored water but including return flow to the Basin from use of replenishment or stored water) which can be produced from the Basin under cultural conditions of a particular year without causing an undesirable result.

(y) SBVMWD –- San Bernardino Valley Municipal Water District.

(z) State Water –- Supplemental Water imported through the State Water Resources Development System, pursuant to Chapter 8, Division 6, Part 6 of the Water Code.

(aa) Stored Water –- Supplemental water held in storage, as a result of direct spreading, in lieu delivery, or otherwise, for subsequent withdrawal and use pursuant to agreement with Watermaster.

(bb) Supplemental Water –- Includes both water imported to Chino Basin from outside Chino Basin Watershed, and reclaimed water.

(cc) WMWD –-Defendant Western Municipal Water District of Riverside County.

5. List of Exhibits. The following exhibits are attached to this Judgment and made a part hereof:

"A" -- "Location Map of Chino Basin" showing boundaries of Chino Basin Municipal Water District, and other geographic and political features of Chino Basin.

"B" -- "Hydrologic Map of Chino Basin" showing hydrologic features of Chino Basin.

"C" – Table Showing Parties in Overlying (Agricultural) Pool.

"D" – Table Showing Parties in Overlying (Non-agricultural Pool and Their Rights.

"E" – Table Showing Appropriators and Their Rights.

"F" -- Overlying (Agricultural) Pool Pooling Plan.

"G" -- Overlying (Non-agricultural) Pool Pooling Plan.

"H" -- Appropriative Pool Pooling Plan.

"I" -- Engineering Appendix.

"J" -- Map of In Lieu Area No. 1.

"K" -- Legal Description of Chino Basin.

## II. DECLARATION OF RIGHTS

### A. HYDROLOGY

6. Safe Yield. The Safe Yield of Chino Basin is 140,000 acre feet per year.

7. Overdraft and Prescriptive Circumstances. In each year for a period in excess of five years prior to filing of the First Amended Complaint herein, the Safe Yield of the Basin has been exceeded by the annual production therefrom, and Chino Basin is and has been for more than five years in a continuous state of over draft. The production constituting said overdraft has been open, notorious, continuous, adverse, hostile and under claim of right. The circumstances of said overdraft have given notice to all parties of the adverse nature of such aggregate over-production.

### B. WATER RIGHTS IN SAFE YIELD

8. Overlying Rights. The parties listed in Exhibits "C" and "D", are the owners or in possession of lands which overlie Chino Basin. As such, said parties have exercised overlying water rights in Chino Basin. All overlying rights owned or exercised by parties listed in Exhibits "C" and "D", have, in the aggregate, been limited by prescription except to the extent such rights have been preserved by self-help by said parties. Aggregate preserved overlying rights in the Safe Yield for agricultural pool use, including the rights of the State of California, total 82,800 acre feet per year. Overlying rights for non-agricultural pool use total 7,366 acre feet per year and are individually decreed for each affected

party in Exhibit "D". No portion of the Safe Yield of Chino Basin exists to satisfy unexercised overlying rights, and such rights have all been lost by prescription. However, uses may be made of Basin Water on overlying lands which have no preserved overlying rights pursuant to the Physical Solution herein. All overlying rights are appurtenant to the land and cannot be assigned or conveyed separate or apart therefrom ***for the term of the Peace Agreement except that the members of the Overlying (Non-Agricultural) Pool shall have the right to Transfer or lease their quantified Production rights (i) within the Overlying (Non-Agricultural) Pool; (ii) to Watermaster in conformance with the procedures described in the Peace Agreement between the Parties therein, dated June 29, 2000; or (iii) in accordance with the Overlying (Non-Agricultural) Pool Pooling Plan set forth in Exhibit "G."***[4]

9. Appropriative Rights. The parties listed in Exhibit "E" are the owners of appropriative rights, including rights by prescription, in the unadjusted amounts therein set forth, and by reason thereof are entitled under the Physical Solution to share in the remaining Safe Yield, after satisfaction of overlying rights and rights of the State of California, and in the Operating Safe Yield in Chino Basin, in the annual shares set forth in Exhibit "E".

(a) Loss of Priorities. By reason of the long continued overdraft in Chino Basin, and in light of the complexity of determining appropriative priorities and the need for conserving and making maximum beneficial use of the water resources of the State, each and all of the parties listed in Exhibit "E" are estopped and barred from asserting special priorities or preferences, inter se. All of said appropriative rights are accordingly deemed and considered of equal priority.

(b) Nature and Quantity. All rights listed in Exhibit "E" are appropriative and prescriptive in nature. By reason of the status of the parties, and the provisions of Section 1007 of the Civil Code, said rights are immune from reduction or limitation by prescription.

[4] Order dated September 28, 2000 and Order dated April 19, 2001 further modified by Order dated December 21, 2007.

10. Rights of the State of California. The State of California, by and through its Department of Corrections, Youth Authority and Department of Fish and Game, is a significant producer of ground water from and the State is the largest owner of land overlying Chino Basin. The precise nature and scope of the claims and rights of the State need not be, and are not, defined herein. The State, through said departments, has accepted the Physical Solution herein decreed, in the interests of implementing the mandate of Section 2 of Article X of the California Constitution. For all purposes of this Judgment, all future production by the State or its departments or agencies for overlying use on State-owned lands shall be considered as agricultural pool use.

C. RIGHTS TO AVAILABLE GROUND WATER STORAGE CAPACITY

11. Available Ground Water Storage Capacity. There exists in Chino Basin a substantial amount of available ground water storage capacity which is not utilized for storage or regulation of Basin Waters. Said reservoir capacity can appropriately be utilized for storage and conjunctive use of supplemental water with Basin Waters. It is essential that said reservoir capacity utilization for storage and conjunctive use of supplemental water be undertaken only under Watermaster control and regulation, in order to protect the integrity of both such Stored Water and Basin Water in storage and the Safe Yield of Chino Basin.

12. Utilization of Available Ground Water Capacity. Any person or public entity, whether a party to this action or not, may make reasonable beneficial use of the available ground water storage capacity of Chino Basin for storage of supplemental water; provided that no such use shall be made except pursuant to written agreement with Watermaster, as authorized by Paragraph 28. In the allocation of such storage capacity, the needs and requirements of lands overlying Chino Basin and the owners of rights in the Safe Yield or Operating Safe Yield of the Basin shall have priority and preference over storage for export.

## III. INJUNCTION

13. Injunction Against Unauthorized Production of Basin Water. Each party in each of the respective pools is enjoined, as follows:

(a) Overlying Agricultural Pool. Each party in the Overlying (Agricultural) Pool, its officers, agents, employees, successors and assigns, is and they each are ENJOINED AND RESTRAINED from producing ground water from Chino Basin in any year hereafter in excess of such party's correlative share of the aggregate of 82,800 acre feet allocated to said Pool, except pursuant to the Physical Solution or a storage water agreement.

(b) Overlying Non-Agricultural Pool. Each party in the Overlying Non-Agricultural Pool, its officers, agents, employees, successors and assigns, is and they each are ENJOINED AND RESTRAINED from producing ground water of Chino Basin in any year hereafter in excess of such party's decreed rights in the Safe Yield, except pursuant to the provisions of the Physical Solution or a storage water agreement.

(c) Appropriative Pool. Each party in the Appropriative Pool, its officers, agents, employees, successors and assigns, is and they are each ENJOINED AND RESTRAINED from producing ground water of Chino Basin in any year hereafter in excess of such party's decreed share of Operating Safe Yield, except pursuant to the provisions of the Physical Solution or a storage water agreement.

14. Injunction Against Unauthorized Storage or Withdrawal of Stored Water. Each party, its officers, agents, employees, successors and assigns is and they each are ENJOINED AND RESTRAINED from storing supplemental water in Chino Basin for withdrawal, or causing withdrawal of, water stored by that party, except pursuant to the terms of a written agreement with Watermaster and in accordance with Watermaster regulations. Any supplemental water stored or recharged in the Basin, except pursuant to such a Watermaster agreement, shall be deemed abandoned and not classified as Stored Water. This paragraph has no application, as such, to supplemental water spread or provided in lieu by Watermaster pursuant to the Physical Solution.

## IV. CONTINUING JURISDICTION

15. Continuing Jurisdiction. Full jurisdiction, power and authority are retained and reserved to the Court as to all matters contained in this judgment, except:

(a) The redetermination of Safe Yield, as set forth in Paragraph 6, during the first ten (10) years of operation of the Physical Solution;

(b) The allocation of Safe Yield as between the several pools as set forth in Paragraph 44 of the Physical Solution;

(c) The determination of specific quantitative rights and shares in the declared Safe Yield or Operating Safe Yield herein declared in Exhibits "D" and "E"; and

(d) The amendment or modification of Paragraphs 7 (a) and (b) of Exhibit "H", during the first ten (10) years of operation of the Physical Solution, and thereafter only upon affirmative recommendation of at least 67% of the voting power (determined pursuant to the formula described in Paragraph 3 of Exhibit "H"), but not less than one-third of the members of the Appropriative Pool Committee representatives of parties who produce water within IEUA or WMWD; after said tenth year the formula set forth in said Paragraph 7 (a) and 7 (b) of Exhibit "H" for payment of the costs of replenishment water may be changed to 100% gross or net, or any percentage split thereof, but only in response to recommendation to the Court by affirmative vote of at least 67% of said voting power of the Appropriative Pool representatives of parties who produce ground water within IEUA or WMWD, but not less than one-third of their number. In such event, the Court shall act in conformance with such recommendation unless there are compelling reasons to the contrary; and provided, further, that the fact that the allocation of Safe Yield or Operating Safe Yield shares may be rendered moot by a recommended change in the formula for replenishment assessments shall not be deemed to be such a "compelling reason."

Said continuing jurisdiction is provided for the purpose of enabling the Court, upon application of any party, the Watermaster, the Advisory Committee or any Pool Committee, by motion and, upon at least 30 days' notice thereof, and after hearing thereon, to make such further or supplemental orders or directions as may be necessary or appropriate for interpretation, enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment.

## V. WATERMASTER

### A. APPOINTMENT

16. Watermaster Appointment. CBMWD, acting by and through a majority of its board of directors, is hereby appointed Watermaster, to administer and enforce the provisions of this Judgment and any subsequent instructions or orders of the Court hereunder. The term of appointment of Watermaster shall be for five (5) years. The Court will by subsequent orders provide for successive terms or for a successor Watermaster. Watermaster may be changed at any time by subsequent order of the Court, on its own motion, or on the motion of any party after notice and hearing. Unless there are compelling reasons to the contrary, the Court shall act in conformance with a motion requesting the Watermaster be changed if such motion is supported by a majority of the voting power of the Advisory Committee.

### B. POWERS AND DUTIES

17. Powers and Duties. Subject to the continuing supervision and control of the Court, Watermaster shall have and may exercise the express powers, and shall perform the duties, as provided in this Judgment or hereafter ordered or authorized by the Court in the exercise of the Court's continuing jurisdiction.

18. Rules and Regulations.[5]

**(a) Upon recommendation by the Advisory Committee, Watermaster shall make and adopt, after public hearing, appropriate rules and regulations for conduct of Watermaster affairs, including, meeting schedules and procedures, and compensation of members of Watermaster. Thereafter, Watermaster may amend the rules from time to time upon recommendation, or with approval of the Advisory Committee after hearing noticed to active parties, except that compensation of Watermaster members shall be subject to Court Approval. A copy of the rules and regulations, and of amendments, shall be mailed to each active party.**

**(b) Under the rules, Watermaster members shall be paid up to $125 for each day's attendance at meetings at the direction of the board, not to exceed eight meetings in each month. Compensation shall not be paid for junkets or attendance at conferences, seminars, or retreats at locations other than Watermaster headquarters. Members shall not be compensated for more than one meeting each day.**

**(c) Under the rules, Watermaster members may be reimbursed for reasonable and necessary travel, meals, lodging and registration expenses incurred on Watermaster business. Mileage shall not be paid for travel to or from Watermaster meetings unless the individual must travel more than 50 miles per month. The Watermaster's budget shall include an appropriation for expense reimbursement. The Watermaster shall file a report on the expense reimbursement with the court as part of the Annual Report. The Report shall disclose total expense reimbursements and single expenditures for items of $125.00 or more.**

19. Acquisition of Facilities. Watermaster may purchase, lease, acquire and hold all necessary facilities and equipment; provided, that it is not the intent of the Court that Watermaster acquire any interest in real property or substantial capital assets.

[5] Order dated March 31, 1999.

20. Employment of Experts and Agents. Watermaster may employ or retain such administrative, engineering, geologic, accounting, legal or other specialized personnel and consultants as may be deemed appropriate in the carrying out of its powers and shall require appropriate bonds from all officers and employees handling Watermaster funds. Watermaster shall maintain records for purposes of allocation of costs of such services as well as of all other expenses of Watermaster administration as between the several pools established by the Physical Solution.

21. Measuring Devices. Watermaster shall cause parties, pursuant to uniform rules, to install and maintain in good operating condition, at the cost of each party, such necessary measuring devices or meters as Watermaster may deem appropriate. Such measuring devices shall be inspected and tested as deemed necessary by Watermaster, and the cost thereof shall constitute an expense of Watermaster.

22. Assessments. Watermaster is empowered to levy and collect all assessments provided for in the pooling plans and Physical Solution.

23. Investment of Funds. Watermaster may hold and invest any and all Watermaster funds in investments authorized from time to time for public agencies of the State of California.

24. Borrowing. Watermaster may borrow from time to time amounts not exceeding the annual anticipated receipts of Watermaster during such year.

25. Contracts. Watermaster may enter into contracts for the performance of any powers herein granted; provided, however, that Watermaster may not contract with or purchase materials, supplies or services from IEUA, except upon the prior recommendation and approval of the Advisory Committee and pursuant to written order of the Court.

26. Cooperation With Other Agencies. Subject to prior recommendation or approval of the Advisory Committee, Watermaster may act jointly or cooperate with agencies of the United States and the State of California or any political subdivisions, municipalities or districts or any person to the end that the purpose of the Physical Solution may be fully and economically carried out.

27. Studies. Watermaster may, with concurrence of the Advisory Committee or affected Pool Committee and in accordance with Paragraph 54 (b), undertake relevant studies of hydrologic conditions, both quantitative and qualitative, and operating aspects of implementation of the management program for Chino Basin.

28. Ground Water Storage Agreements. Watermaster shall adopt, with the approval of the Advisory Committee, uniformly applicable rules and a standard form of agreement for storage of supplemental water, pursuant to criteria therefore set forth in Exhibit "I". Upon appropriate application by any person, Watermaster shall enter into such a storage agreement; provided that all such storage agreements shall first be approved by written order of the Court, and shall by their terms preclude operations which will have a substantial adverse impact on other producers.

29. Accounting for Stored Water. Watermaster shall calculate additions, extractions and losses and maintain an annual account of all Stored Water in Chino Basin, and any losses of water supplies or Safe Yield of Chino Basin resulting from such Stored Water.

30. Annual Administrative Budget. Watermaster shall submit to Advisory Committee an administrative budget and recommendation for each fiscal year on or before March 1. The Advisory Committee shall review and submit said budget and their recommendations to Watermaster on or before April 1, following. Watermaster shall hold a public hearing on said budget at its April quarterly meeting and adopt the annual administrative budget which shall include the administrative items for each pool committee. The administrative budget shall set forth budgeted items in sufficient detail as necessary to make a proper allocation of the expense among the several pools, together with Watermaster's proposed allocation. The budget shall contain such additional comparative information or explanation as the Advisory Committee may recommend from time to time. Expenditures within budgeted items may thereafter be made by Watermaster in the exercise of powers herein granted, as a matter of course. Any budget transfer in excess of 20% of a budget category during any budget year or modification of such administrative budget during any year shall be first submitted to the Advisory Committee for review and recommendation.

31. Review Procedures. All actions, decisions or rules of Watermaster shall be subject to review by the Court on its own motion or on timely motion by any party, the Watermaster (in the case of a mandated action), the Advisory Committee, or any Pool Committee, as follows:

(a) Effective Date of Watermaster Action. Any action, decision or rule of Watermaster shall be deemed to have occurred or been enacted on the date on which written notice thereof is mailed. Mailing of copies of approved Watermaster minutes to the active parties shall constitute such notice to all parties.

(b) Noticed Motion. Any party, the Watermaster (as to any mandated action), the Advisory Committee, or any Pool Committee may, by a regularly noticed motion, apply to the Court for review of any Watermaster's action, decision or rule. Notice of such motion shall be served personally or mailed to Watermaster and to all active parties. Unless otherwise ordered by the Court, such motion shall not operate to stay the effect of such Watermaster action, decision or rule.

(c) Time for Motion. Notice of motion to review any Watermaster action, decision or rule shall be served and filed within ninety (90) days after such Watermaster action, decision or rule, except for budget actions, in which event said notice period shall be sixty (60) days.

(d) De Novo Nature of Proceedings. Upon the filing of any such motion, the Court shall require the moving party to notify the active parties, the Watermaster, the Advisory Committee, and each Pool Committee, of a date for taking evidence and argument, and on the date so designated shall review de novo the question at issue. Watermaster's findings or decision, if any, may be received in evidence at said hearing, but shall not constitute presumptive or prima facie proof of any fact in issue.

(e) Decision. The decision of the Court in such proceeding shall be an appealable supplemental order in this case. When the same is final, it shall be binding upon the Watermaster and all parties.

C. ADVISORY AND POOL COMMITTEES

32. Authorization. Watermaster is authorized and directed to cause committees of producer representatives to be organized to act as Pool Committees for each of the several pools created under the Physical solution. Said Pool Committees shall, in turn, jointly form an Advisory Committee to assist Watermaster in performance of its functions under this judgment. Pool Committees shall be composed as specified in the respective pooling plans, and the Advisory Committee shall be composed of ten (10) voting representatives from each pool, as designated by the respective Pool Committee[6] ***in accordance with each pool's pooling plan.*** WMWD***, Three Valleys Municipal Water District (Successor to PVMWD)*** and SBVMWD shall each be entitled to one non-voting representative on said Advisory Committee.

33. Term and Vacancies. Members of any Pool Committee, shall serve for the term, and vacancies shall be filled, as specified in the respective pooling plan. Members of the Advisory Committee shall serve at the will of their respective Pool Committee.

34. Voting Power. The voting power on each Pool Committee shall be allocated as provided in the respective pooling plan. The voting power on the Advisory Committee shall be one hundred (100) votes allocated among the three pools in proportion to the total assessments paid to Watermaster during the preceding year; provided, that the minimum voting power of each pool shall be

| (c) | Appropriative Pool | 20. |

[6] Order dated September 18, 1996.

In the event any pool is reduced to its said minimum vote, the remaining votes shall be allocated between the remaining pools on said basis of assessments paid to Watermaster by each such remaining pool during the preceding year. The method of exercise of each pool's voting power on the Advisory Committee shall be as determined by the respective pool committees.

35. Quorum. A majority of the voting power of the Advisory Committee or any Pool Committee shall constitute a quorum for the transaction of affairs of such Advisory or Pool Committee; provided, that at least one representative of each Pool Committee shall be required to constitute a quorum of the Advisory Committee. No Pool Committee representative may purposely absent himself or herself, without good cause, from an Advisory Committee meeting to deprive it of a quorum. Action by affirmative vote of a majority of the entire voting power of any Pool Committee or the Advisory Committee shall constitute action by such committee. Any action or recommendation of a Pool Committee or the Advisory Committee shall be transmitted to Watermaster in writing, together with a report of any dissenting vote or opinion.

36. Compensation. Pool or Advisory Committee members may receive compensation, to be established by the respective pooling plan, but not to exceed twenty-five dollars ($25.00) for each meeting of such Pool or Advisory Committee attended, and provided that no member of a Pool or Advisory Committee shall receive compensation of more than three hundred ($300.00) dollars for service on any such committee during any one year. All such compensation shall be a part of Watermaster administrative expense. No member of any Pool or Advisory Committee shall be employed by Watermaster or compensated by Watermaster for professional or other services rendered to such Pool or Advisory Committee or to Watermaster, other than the fee for attendance at meetings herein provided, plus reimbursement of reasonable expenses related to activities within the Basin.

37. Organization.

(a) Organizational Meeting. At its first meeting in each year, each Pool Committee and the Advisory Committee shall elect a chairperson and a vice chairperson from its

membership. It shall also select a secretary, a treasurer and such assistant secretaries and treasurers as may be appropriate, any of whom may, but need not, be members of such Pool or Advisory Committee.

(b) Regular Meetings. All Pool Committees and the Advisory Committee shall hold regular meetings at a place and time to be specified in the rules to be adopted by each Pool and Advisory Committee. Notice of regular meetings of any Pool or Advisory Committee, and of any change in time or place thereof, shall be mailed to all active parties in said pool or pools.

(c) Special Meetings. Special meetings of any Pool or Advisory Committee may be called at any time by the Chairperson or by any three (3) members of such Pool or Advisory Committee by delivering notice personally or by mail to each member of such Pool or Advisory Committee and to each active party at least 24 hours before the time of each such meeting in the case of personal delivery, and 96 hours in the case of mail. The calling notice shall specify the time and place of the special meeting and the business to be transacted. No other business shall be considered at such meeting.

(d) Minutes. Minutes of all Pool Committee, Advisory Committee and Watermaster meetings shall be kept at Watermaster's offices. Copies thereof shall be mailed or otherwise furnished to all active parties in the pool or pools concerned. Said copies of minutes shall constitute notice of any Pool or Advisory Committee action therein reported, and shall be available for inspection by any party.

(e) Adjournments. Any meeting of any Pool or Advisory Committee may be adjourned to a time and place specified in the order of adjournment. Less than a quorum may so adjourn from time to time. A copy of the order or notice of adjournment shall be conspicuously posted forthwith on or near the door of the place where the meeting was held.

38. Powers and Functions. The powers and functions of the respective Pool Committees and the Advisory Committee shall be as follows:

(a) Pool Committees. Each Pool Committee shall have the power and responsibility for developing policy recommendations for administration of its particular pool, as created under the Physical Solution. All actions and recommendations of any Pool Committee which require Watermaster implementation shall first be noticed to the other two pools. If no objection is received in writing within thirty (30) days, such action or recommendation shall be transmitted directly to Watermaster for action. If any such objection is received, such action or recommendation shall be reported to the Advisory Committee before being transmitted to Watermaster.

(b) Advisory Committee. The Advisory Committee shall have the duty to study, and the power to recommend, review and act upon all discretionary determinations made or to be made hereunder by Watermaster.

[1] Committee Initiative. When any recommendation or advice of the Advisory Committee is received by Watermaster, action consistent therewith may be taken by Watermaster; provided, that any recommendation approved by 80 votes or more in the Advisory Committee shall constitute a mandate for action by Watermaster consistent therewith. If Watermaster is unwilling or unable to act pursuant to recommendation or advice from the Advisory Committee (other than such mandatory recommendations), Watermaster shall hold a public hearing, which shall be followed by written findings and decision. Thereafter, Watermaster may act in accordance with said decision, whether consistent with or contrary to said Advisory Committee recommendation. Such action shall be subject to review by the Court, as in the case of all other Watermaster determinations.

[2] Committee Review. In the event Watermaster proposes to take discretionary action, other than approval or disapproval of a Pool Committee action or recommendation properly transmitted, or execute any agreement not theretofore within the scope of an Advisory Committee recommendation, notice of such intended action

shall be served on the Advisory Committee and its members at least thirty (30) days before the Watermaster meeting at which such action is finally authorized.

(c) Review of Watermaster Actions. Watermaster (as to mandated action), the Advisory Committee or any Pool Committee shall be entitled to employ counsel and expert assistance in the event Watermaster or such Pool or Advisory Committee seeks Court review of any Watermaster action or failure to act. The cost of such counsel and expert assistance shall be Watermaster expense to be allocated to the affected pool or pools.

## VI. PHYSICAL SOLUTION

### A. GENERAL

39. Purpose and Objective. Pursuant to the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts and orders the parties to comply with a Physical Solution. The purpose of these provisions is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Chino Basin by providing the optimum economic, long-term, conjunctive utilization of surface waters, ground waters and supplemental water, to meet the requirements of water users having rights in or dependent upon Chino Basin.

40. Need for Flexibility. It is essential that this Physical solution provide maximum flexibility and adaptability in order that Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options, in order to maximize beneficial use of the waters of Chino Basin. To that end, the Court's retained jurisdiction will be utilized, where appropriate, to supplement the discretion herein granted to the Watermaster.

41. Watermaster Control. Watermaster, with the advice of the Advisory and Pool Committees, is granted discretionary powers in order to develop an optimum basin management program for Chino Basin, including both water quantity and quality considerations. Withdrawals and supplemental water replenishment of Basin Water, and the full utilization of the water resources of Chino Basin, must

be subject to procedures established by and administered through Watermaster with the advice and assistance of the Advisory and Pool Committees composed of the affected producers. Both the quantity and quality of said water resources may thereby be preserved and the beneficial utilization of the Basin maximized.

42. General Pattern of Operations. It is contemplated that the rights herein decreed will be divided into three (3) operating pools for purposes of Watermaster administration. A fundamental premise of the Physical Solution is that all water users dependent upon Chino Basin will be allowed to pump sufficient waters from the Basin to meet their requirements. To the extent that pumping exceeds the share of the Safe Yield assigned to the Overlying Pools, or the Operating Safe Yield in the case of the Appropriative Pool, each pool will provide funds to enable Watermaster to replace such overproduction. The method of assessment in each pool shall be as set forth in the applicable pooling plan.

B. POOLING

43. Multiple Pools Established. There are hereby established three (3) pools for Watermaster administration of, and for the allocation of responsibility for, and payment of, costs of replenishment water and other aspects of this Physical Solution.

(a) Overlying (Agricultural) Pool. The first pool shall consist of the State of California and all overlying producers who produce water for other than industrial or commercial purposes. The initial members of the pool are listed in Exhibit "C".

(b) Overlying (Non-agricultural) Pool The second pool shall consist of overlying producers who produce water for industrial or commercial purposes. The initial members of this pool are listed in Exhibit "D".

(c) Appropriative Pool. A third and separate pool shall consist of owners of appropriative rights. The initial members of the pool are listed in Exhibit "E".

Any party who changes the character of his use may, by subsequent order of the Court, be reassigned to the proper pool; but the allocation of Safe Yield under Paragraph 44 hereof shall not be changed. Any non-party producer or any person who may hereafter commence production of water from Chino Basin, and who may become a party to this physical solution by intervention, shall be assigned to the proper pool by the order of the Court authorizing such intervention.

44. Determination and Allocation of Rights to Safe Yield of Chino Basin. The declared Safe Yield of Chino Basin is hereby allocated as follows:

| Pool | Allocation |
|---|---|
| Overlying (Agricultural) Pool | 414,000 acre-feet in any five (5) consecutive years. |
| Overlying (Non-agricultural) Pool | 7,366 acre-feet per year. |
| Appropriative Pool | 49,834 acre-feet per year. |

The foregoing acre foot allocations to the overlying pools are fixed. Any subsequent change in the Safe Yield shall be debited or credited to the Appropriative Pool. Basin Water available to the Appropriative Pool without replenishment obligation may vary from year to year as the Operating Safe Yield is determined by Watermaster pursuant to the criteria set forth in Exhibit "I".

45. Annual Replenishment. Watermaster shall levy and collect assessments in each year, pursuant to the respective pooling plans, in amounts sufficient to purchase replenishment water to replace production by any pool during the preceding year which exceeds that pool's allocated share of Safe Yield in the case of the overlying pools, or Operating Safe Yield in the case of the Appropriative Pool. It is anticipated that supplemental water for replenishment of Chino Basin may be available at different rates to the various pools to meet their replenishment obligations. If such is the case, each pool will be assessed only that amount necessary for the cost of replenishment water to that pool, at the rate available to the pool, to meet its replenishment obligation.

46. Initial Pooling Plans. The initial pooling plans, which are hereby adopted, are set forth in Exhibits "F", "G" and "H", respectively. Unless and until modified by amendment of the judgment pursuant to the Court's continuing jurisdiction, each such plan shall control operation of the subject pool.

C. REPORTS AND ACCOUNTING

47. Production Reports. Each party or responsible party shall file periodically with Watermaster, pursuant to Watermaster rules, a report on a form to be prescribed by Watermaster showing the total production of such party during the preceding reportage period, and such additional information as Watermaster may require, including any information specified by the affected Pool Committee.

48. Watermaster Report and Accounting. **Watermaster's Annual Report shall be filed by *January 31* of each year. The Report shall apply to the preceding fiscal years' operation. The Report shall contain details as to operation of the Pools. A certified audit of assessments and expenditures pursuant to this Physical Solution, and a review of Watermaster activity.** [7]

D. REPLENISHMENT

49. Sources of Supplemental Water. Supplemental water may be obtained by Watermaster from any available source. Watermaster shall seek to obtain the best available quality of supplemental water at the most reasonable cost for recharge in the Basin. To the extent that costs of replenishment water may vary between pools, each pool shall be liable only for the costs attributable to its required replenishment. Available sources may include, but are not limited to:

(a) Reclaimed Water. There exist a series of agreements generally denominated the Regional Waste Water Agreements between IEUA and owners of the major municipal sewer

[7] Order dated March 31, 1999.

systems within the basin. Under those agreements, which are recognized hereby but shall be unaffected and unimpaired by this judgment, substantial quantities of reclaimed water may be made available for replenishment purposes. There are additional sources of reclaimed water which are, or may become, available to Watermaster for said purposes. Maximum beneficial use of reclaimed water shall be given high priority by Watermaster.

(b) State Water. State water constitutes a major available supply of supplemental water. In the case of State Water, Watermaster purchases shall comply with the water service provisions of the State's water service contracts. More specifically, Watermaster shall purchase State Water from MWD for replenishment of excess production within IEUA, WMWD and TVMWD, and from SBVMWD to replenish excess production within SBVMWD's boundaries in Chino Basin, except to the extent that MWD and SBVMWD give their consent as required by such State water service contracts.

(c) Local Import. There exist facilities and methods for importation of surface and ground water supplies from adjacent basins and watersheds.

(d) Colorado River Supplies. MWD has water supplies available from its Colorado River Aqueduct.

50. Methods of Replenishment. Watermaster may accomplish replenishment of overproduction from the Basin by any reasonable method, including:

(a) Spreading and percolation or Injection of water in existing or new facilities, subject to the provisions of Paragraphs 19, 25 and 26 hereof.

(b) In Lieu Procedures. Watermaster may make, or cause to be made, deliveries of water for direct surface use, in lieu of ground water production.

E. REVENUES

51. Production Assessment. Production assessments, on whatever basis, may be levied by Watermaster pursuant to the pooling plan adopted for the applicable pool.

52. Minimal Producers. Minimal Producers shall be exempted from payment of production assessments, upon filing of production reports as provided in Paragraph 47 of this Judgment, and payment of an annual five dollar ($5.00) administrative fee as specified by Watermaster rules.

53. Assessment Proceeds –- Purposes. Watermaster shall have the power to levy assessments against the parties (other than minimal pumpers) based upon production during the preceding period of assessable production, whether quarterly, semi-annually or annually, as may be determined most practical by Watermaster or the affected Pool Committee.

54. Administrative Expenses. The expenses of administration of this Physical Solution shall be categorized as either (a) general Watermaster administrative expense, or (b) special project expense.

(a) General Watermaster Administrative Expense shall include office rental, general personnel expense, supplies and office equipment, and related incidental expense and general overhead.

(b) Special Project Expense shall consist of special engineering, economic or other studies, litigation expense, meter testing or other major operating expenses. Each such project shall be assigned a Task Order number and shall be separately budgeted and accounted for. General Watermaster administrative expense shall be allocated and assessed against the respective pools based upon allocations made by the Watermaster, who shall make such allocations based upon generally accepted cost accounting methods. Special Project Expense shall be allocated to a specific pool, or any portion thereof, only upon the basis of prior express assent and finding of benefit by the Pool Committee, or pursuant to written order of the Court.

55. Assessments -- Procedure. Assessments herein provided for shall be levied and collected as follows:

(a) Notice of Assessment. Watermaster shall give written notice of all applicable assessments to each party on or before ninety (90) days after the end of the production period to which such assessment is applicable.

(b) Payment. Each assessment shall be payable on or before thirty (30) days after notice, and shall be the obligation of the party or successor owning the water production facility at the time written notice of assessment is given, unless prior arrangement for payment by others has been made in writing and filed with Watermaster.

(c) Delinquency. Any delinquent assessment shall bear interest at 10% per annum (or such greater rate as shall equal the average current cost of borrowed funds to the Watermaster) from the due date thereof. Such delinquent assessment and interest may be collected in a show-cause proceeding herein instituted by the Watermaster, in which case the Court may allow Watermaster its reasonable costs of collection, including attorney's fees.

56. Accumulation of Replenishment Water Assessment Proceeds. In order to minimize fluctuation in assessment and to give Watermaster flexibility in purchase and spreading of replenishment water, Watermaster may make reasonable accumulations of replenishment water assessment proceeds. Interest earned on such retained funds shall be added to the account of the pool from which the funds were collected and shall be applied only to the purchase of replenishment water.

57. Effective Date. The effective date for accounting and operation under this Physical Solution shall be July 1, 1977, and the first production assessments hereunder shall be due after July 1, 1978. Watermaster shall, however, require installation of meters or measuring devices and establish operating procedures immediately, and the cost of such Watermaster activity (not including the cost of such meters and measuring devices) may be recovered in the first administrative assessment in 1978.

## VII. MISCELLANEOUS PROVISIONS

58. Designation of Address for Notice and Service. Each party shall designate the name and address to be used for purposes of all subsequent notices and service herein, either by its endorsement on the Stipulation for Judgment or by a separate designation to be filed within thirty (30) days after Judgment has been served. Said designation may be changed from time to time by filing a written notice of such change with the Watermaster. Any party desiring to be relieved of receiving notices of Watermaster or committee activity may file a waiver of notice on a form to be provided by Watermaster. Thereafter such party shall be removed from the Active Party list. Watermaster shall maintain at all times a current list of all active parties and their addresses for purposes of service. Watermaster shall also maintain a full current list of names and addresses of all parties or their successors, as filed herein. Copies of such lists shall be available, without cost, to any party, the Advisory Committee or any Pool Committee upon written request therefor.

59. Service of Documents. Delivery to or service upon any party or active party by the Watermaster, by any other party, or by the Court, of any item required to be served upon or delivered to such party or active party under or pursuant to the Judgment shall be made personally or by deposit in the United States mail, first class, postage prepaid, addressed to the designee and at the address in the latest designation filed by such party or active party.

60. Intervention After Judgment. Any non-party assignee of the adjudicated appropriative rights of any appropriator, or any other person newly proposing to produce water from Chino Basin, may become a party to this Judgment upon filing a petition in intervention. Said intervention must be confirmed by order of this Court. Such intervenor shall thereafter be a party bound by this judgment and entitled to the rights and privileges accorded under the Physical Solution herein, through the pool to which the Court shall assign such intervenor.

61. Loss of Rights. Loss, whether by abandonment, forfeiture or otherwise, of any right herein adjudicated shall be accomplished only (1) by a written election by the owner of the right filed with Watermaster, or (2) by order of the Court upon noticed motion and after hearing.

62. Scope of Judgment. Nothing in this Judgment shall be deemed to preclude or limit any party in the assertion against a neighboring party of any cause of action now existing or hereafter arising based upon injury, damage or depletion of water supply available to such party, proximately caused by nearby pumping which constitutes an unreasonable interference with such complaining party's ability to extract ground water.

63. Judgment Binding on Successors. This Judgment and all provisions thereof are applicable to and binding upon not only the parties to this action, but also upon their respective heirs, executors, administrators, successors, assigns, lessees and licensees and upon the agents, employees and attorneys in fact of all such persons.

64. Costs. No party shall recover any costs in this proceeding from any other party.

**EXHIBIT "F"**

**OVERLYING (AGRICULTURAL) POOL**

POOLING PLAN

1. Membership in Pool. The State of California and all producers listed in Exhibit "C" shall be the initial members of this pool, which shall include all producers of water for overlying uses other than industrial or commercial purposes.

2. Pool Meetings. The members of the pool shall meet annually, in person or by proxy, at a place and time to be designated by Watermaster for purposes of electing members of the Pool Committee and conducting any other business of the pool. Special meetings of the membership of the pool may be called and held as provided in the rules of the pool.

3. Voting. All voting at meetings of pool members shall be on the basis of one vote for each 100 acre feet or any portion thereof of production from Chino Basin during the preceding year, as shown by the records of Watermaster.

4. Pool Committee. The Pool Committee for this pool shall consist of not less than nine (9) representatives selected at large by members of the pool. The exact number of members of the Pool Committee in any year shall be as determined by majority vote of the voting power of members of the pool in attendance at the annual pool meeting. Each member of the Pool Committee shall have one vote and shall serve for a two-year term. The members first elected shall classify themselves by lot so that approximately one-half serve an initial one-year term. Vacancies during any term shall be filled by a majority of the remaining members of the Pool Committee.

5. Advisory Committee Representatives. The number of representatives of the Pool Committee on the Advisory Committee shall be as provided in the rules of the pool from time to time but not exceeding ten (10). The voting power of the pool on the Advisory Committee shall be apportioned and exercised as determined from time to time by the Pool Committee.

6. Replenishment Obligation. The pool shall provide funds for replenishment of any production by persons other than members of the Overlying Non-Agricultural Pool or Appropriator Pool,

in excess of the pool's share of Safe Yield. During the first five (5) years of operations of the Physical Solution, reasonable efforts shall be made by the Pool Committee to equalize annual assessments.

7. Assessments. All assessments in this pool (whether for replenishment water cost or for pool administration or the allocated share of Watermaster administration) shall be in an amount uniformly applicable to all production in the pool during the preceding year or calendar quarter. Provided, however, that the Agricultural Pool Committee, may recommend to the Court modification of the method of assessing pool members, inter se, if the same is necessary to attain legitimate basin management objectives, including water conservation and avoidance of undesirable socio-economic consequences. Any such modification shall be initiated and ratified by one of the following methods:

(a) Excess Production. - In the event total pool production exceeds 100,000 acre feet in any year, the Pool Committee shall call and hold a meeting, after notice to all pool members, to consider remedial modification of the assessment formula.

(b) Producer Petition. - At any time after the fifth full year of operation under the Physical Solution, a petition by ten percent (10%) of the voting power or membership of the Pool shall compel the holding of a noticed meeting to consider revision of said formula of assessment for replenishment water.

In either event, a majority action of the voting power in attendance at such pool members' meeting shall be binding on the Pool Committee.

8. Rules. - The Pool Committee shall adopt rules for conducting meetings and affairs of the committee and for administering its program and in amplification of the provisions, but not inconsistent with, this pooling plan.

//

//

//

**EXHIBIT "G"**

**OVERLYING (NON-AGRICULTURAL) POOL**

POOLING PLAN

1. Membership in Pool. The initial members of the pool, together with the decreed share of the Safe Yield of each, are listed in Exhibit "D". Said pool includes producers of water for overlying industrial or commercial non-agricultural purposes, or such producers within the Pool who may hereafter take water pursuant to Paragraph 8 hereof.

2. Pool Committee. The Pool Committee for this pool shall consist of one representative designated by each member of the pool. Voting on the committee shall be on the basis of one vote for each member, unless a volume vote is demanded, in which case votes shall be allocated as follows:

The volume voting power on the Pool Committee shall be 1,484 votes. Of these, 742 votes shall be allocated on the basis of one vote for each ten (10) acre feet or fraction thereof of decreed shares in Safe Yield. (See Exhibit "D"). The remaining 742 votes shall be allocated proportionally on the basis of assessments paid to Watermaster during the preceding year.[8]

**Affirmative action of the Committee shall require a majority of the voting power of the members in attendance, provided that it includes concurrence by at least one-third of its total members.[9]**

3. Advisory Committee Representatives. At least three (3) members of the Pool Committee shall be designated by said committee to serve on the Advisory Committee. The exact number of such representatives at any time shall be as determined by the Pool Committee. The voting power of the pool shall be exercised in the Advisory Committee as a unit, based upon the vote of a majority of said representatives.

[8] Or production assessments paid under Water Code Section 72140 et seq., as to years prior to the second year of operation under the Physical Solution hereunder.
[9] Order dated October 8, 2010.

4. Replenishment Obligation. The pool shall provide funds for replenishment of any production in excess of the pool's share of Safe Yield in the preceding year.

5. Assessments.[10]

**(a) Replenishment Assessments. Each member of this pool shall pay an assessment equal to the cost of replenishment water times the number of acre feet of production by such producer during the preceding year in excess of (a) his decreed share of the Safe Yield, plus (b) any carry-over credit under Paragraph 7 hereof.**

**(b) Administrative Assessments. In addition, the cost of the allocated share of Watermaster administration expense shall be recovered on an equal assessment against each acre foot of production in the pool during such preceding fiscal year or calendar quarter; and in the case of Pool members who take substitute ground water as set forth in Paragraph 8 hereof, such producer shall be liable for its share of administration assessment, as if the water so taken were produced, up to the limit of its decreed share of Safe Yield.**

**(c) Special Project OBMP Assessment. Each year, every member of this Pool will dedicate ten (10) percent of their annual share of Operating Safe Yield to Watermaster or in lieu thereof Watermaster will levy a Special Project OBMP Assessment in an amount equal to ten percent of the Pool member's respective share of Safe Yield times the then-prevailing MWD Replenishment Rate.**

6. Assignment. Rights herein decreed are appurtenant to ***that*** land and are only assignable with the land for overlying use thereon; provided, however, **(a)** that any appropriator who may, directly or indirectly, undertake to provide water service to such overlying lands may, by an appropriate agency agreement on a form approved by Watermaster, exercise said overlying right to the extent, but only to the extent necessary to provide water service to said overlying lands***,*** and ***(b) the members of the pool shall have the right to Transfer or lease their quantified production rights within the pool or to***

[10] Order dated December 21, 2007.

***Watermaster in conformance with the procedures described in the Peace Agreement between the Parties therein, dated June 29, 2000 for the term of the Peace Agreement.*** [11]

7. Carry-over. Any member of the pool who produces less than its assigned water share of Safe Yield may carry such unexercised right forward for exercise in subsequent years. The first water produced during any such subsequent year shall be deemed to be an exercise of such carry-over right. In the event the aggregate carry-over by any pool member exceeds its share of Safe Yield, such member shall, as a condition of preserving such surplus carryover, execute a storage agreement with Watermaster.

8. Substitute Supplies. To the extent that any Pool member, at the request of Watermaster and with the consent of the Advisory Committee, takes substitute surface water in lieu of producing ground water otherwise subject to production as an allocated share of Safe Yield, said party shall nonetheless remain a member of this Pool.

**9. Physical Solution Transfers. All overlying rights are appurtenant to the land and cannot be assigned or conveyed separate or apart therefrom except that for the term of the Peace Agreement the members of the Overlying (Non-Agricultural) Pool shall have the discretionary right to Transfer or lease their quantified Production rights and carry-over water held in storage accounts in quantities that each member may from time to time individually determine as Transfers in furtherance of the Physical Solution: (i) within the Overlying (Non-Agricultural) Pool; (ii) to Watermaster in conformance with the procedures described in the Peace Agreement between the Parties therein, dated June 29, 2000; (iii) in conformance with the procedures described in Paragraph I of the Purchase and Sale Agreement for the Purchase of Water by Watermaster from Overlying (Non-Agricultural Pool dated June 30, 2007; or (iv) to Watermaster and thence to members of the Appropriative Pool in accordance with the following guidelines and those procedures Watermaster may further provide in Watermaster's Rules and Regulations:**

[11] Order dated September 28, 2000 and Order dated April 19, 2001.

**(a) By December 31 of each year, the members of the Overlying (Non-Agricultural) Pool shall notify Watermaster of the amount of water each member shall make available in their individual discretion for purchase by the Appropriators. By January 31 of each year, Watermaster shall provide a Notice of Availability of each Appropriator's pro-rata share of such water;**

**(b) Except as they may be limited by paragraph 9(e) below, each member of the Appropriative Pool will have, in their discretion, a right to purchase its pro-rata share of the supply made available from the Overlying (Non-Agricultural) Pool at the price established in 9(d) below. Each Appropriative Pool member's pro-rata share of the available supply will be based on each Producer's combined total share of Operating Safe Yield and the previous year's actual Production by each party;**

**(c) If any member of the Appropriative Pool fails to irrevocably commit to their allocated share by March 1 of each year, its share of the Overlying (Non-Agricultural) Pool water will be made available to all other members of the Appropriative Pool according to the same proportions as described in 9(b) above and at the price established in Paragraph 9(d) below. Each member of the Appropriative Pool shall complete its payment for its share of water made available by June 30 of each year.**

**(d) Commensurate with the cumulative commitments by members of the Appropriative Pool pursuant to (b) and (c) above, Watermaster will purchase the surplus water made available by the Overlying (Non-Agricultural) Pool water on behalf of the members of the Appropriative Pool on an annual basis at 92% of the then-prevailing "MWD Replenishment Rate" and each member of the Appropriative Pool shall complete its payment for its determined share of water made available by June 30 of each year.**

**(e) Any surplus water cumulatively made available by all members of the Overlying (Non-Agricultural) Pool that is not purchased by Watermaster after completion of the process set forth herein will be pro-rated among the members of the Pool in proportion to the total quantity offered for transfer in accordance with this provision and may be retained by the**

**Overlying (Non-Agricultural) Pool member without prejudice to the rights of the members of the Pool to make further beneficial us or transfer of the available surplus.**

**(f) Each Appropriator shall only be eligible to purchase their pro-rata share under this procedure if the party is: (i) current on all their assessments; and (ii) in compliance with the OBMP.**

**(g) The right of any member of the Overlying (Non-Agricultural) Pool to transfer water in accordance with this Paragraph 9(a)-(c) in any year is dependent upon Watermaster making a finding that the member of the Overlying (Non-Agricultural) Pool is using recycled water where it is both physically available and appropriate for the designated end use in lieu of pumping groundwater.**

**(h) Nothing herein shall be construed to affect or limit the rights of any Party to offer or accept an assignment as authorized by the Judgment Exhibit "G" paragraph 6 above, or to affect the rights of any Party under a valid assignment.**

~~9~~**10**. Rules. The Pool Committee shall adopt rules for administering its program and in amplification of the provisions, but not inconsistent with, this pooling plan.

**EXHIBIT "H"**

**APPROPRIATIVE POOL**

POOLING PLAN

1. Qualification for Pool. Any city, district or other public entity and public utility -- either regulated under Public Utilities Commission jurisdiction, or exempt therefrom as a non-profit mutual water company (other than those assigned to the Overlying (Agricultural) Pool) -- shall be a member of this pool. All initial members of the pool are listed in Exhibit "E", together with their respective appropriative rights and acre foot allocation and percentage shares of the initial and subsequent Operating Safe Yield.

2. Pool Committee. The Pool Committee shall consist of one (1) representative appointed by each member of the Pool.

3. Voting. The total voting power on the Pool Committee shall be 1,000 votes. Of these, 500 votes shall be allocated in proportion to decreed percentage shares in Operating Safe Yield. The remaining 500 votes shall be allocated proportionally on the basis of assessments paid to Watermaster during the preceding year. Routine business of the Pool Committee may be conducted on the basis of one vote per member, but upon demand of any member a weighted vote shall be taken. Affirmative action of the Committee shall require a majority of the voting power of members in attendance, provided that it includes concurrence by at least one-third of its total members.

4. Advisory Committee Representatives. **Members of the Pool Committee shall be designated to represent this pool on the Advisory Committee *on the following basis*: Each major appropriator, i.e., the owner of an adjudicated appropriative right in excess of 3,000 acre feet, *or each appropriator that produces in excess of 3,000 acre feet based upon the prior year's production,* shall be entitled to one representative. *Two additional representatives* of the Appropriative Pool on the Advisory Committee shall be elected at large by the remaining members of the pool. The voting power of the Appropriative Pool on the Advisory Committee shall be apportioned between the major appropriator representatives in proportion to their respective voting power in the Pool Committee. The two representatives of the remaining appropriators shall exercise equally the voting power proportional to the Pool Committee voting power of said**

**remaining appropriators; provided, however, that if any representative fails to attend an Advisory Committee meeting, the voting power of that representative shall be allocated among the representatives of the Appropriative Pool in attendance in the same proportion as their respective voting powers.** [12]

5. Replenishment Obligation. The pool shall provide funds for purchase of replenishment water to replace any production by the pool in excess of Operating Safe Yield during the preceding year.

6. Administrative Assessment. Costs of administration of this pool and its share of general Watermaster expense shall be recovered by a uniform assessment applicable to all production during the preceding year.

7. Replenishment Assessment. The cost of replenishment water required to replace production from Chino Basin in excess of Operating Safe Yield in the preceding year shall be allocated and recovered as follows:

(a) For production, other than for increased export, within CBMWD or WMWD:

(1) Gross Assessment. 15% of such replenishment water costs shall be recovered by a uniform assessment against all production of each appropriator producing in said area during the preceding year.

(2) Net Assessment. The remaining 85% of said costs shall be recovered by a uniform assessment on each acre foot of production from said area by each such appropriator in excess of his allocated share of Operating Safe Yield during said preceding year.

(b) For production which is exported for use outside Chino Basin in excess of maximum export in any year through 1976, such increased export production shall be assessed against the exporting appropriator in an amount sufficient to purchase replenishment water from CBMWD or WMWD in the amount of such excess.

[12] Order dated September 18, 1996.

(c) For production within SBVMWD or PVMWD:

By an assessment on all production in excess of an appropriator's share of Operating Safe Yield in an amount sufficient to purchase replenishment water through SBVMWD or MWD in the amount of such excess.

8. Socio-Economic Impact Review. The parties have conducted certain preliminary socio-economic impact studies. Further and more detailed socio-economic impact studies of the assessment formula and its possible modification shall be undertaken for the Appropriator Pool by Watermaster no later than ten (10) years from the effective date of this Physical Solution, or whenever total production by this pool has increased by 30% or more over the decreed appropriative rights, whichever is first.

9. Facilities Equity Assessment. Watermaster may, upon recommendation of the Pool Committee, institute proceedings for levy and collection of a Facilities Equity Assessment for the purposes and in accordance with the procedures which follow:

(a) Implementing Circumstances. - There exist several sources of supplemental water available to Chino Basin, each of which has a differential cost and quantity available. The optimum management of the entire Chino Basin water resource favors the maximum use of the lowest cost supplemental water to balance the supplies of the Basin, in accordance with the Physical Solution. The varying sources of supplemental water include importations from MWD and SBVMWD, importation of surface and ground water supplies from other basins in the immediate vicinity of Chino Basin, and utilization of reclaimed water. In order to fully utilize any of such alternate sources of supply, it will be essential for particular appropriators having access to one or more of such supplies to have invested, or in the future to invest, directly or indirectly, substantial funds in facilities to obtain and deliver such water to an appropriate point of use. To the extent that the use of less expensive alternative sources of supplemental water can be maximized by the inducement of a Facilities Equity Assessment, as herein provided, it is to the long-term benefit of the entire basin that such assessment be authorized and levied by Watermaster.

(b) Study and Report. - At the request of the Pool Committee, Watermaster shall undertake a survey study of the utilization of alternate supplemental supplies by

members of the Appropriative Pool which would not otherwise be utilized and shall prepare a report setting forth the amount of such alternative supplies being currently utilized, the amount of such supplies which could be generated by activity within the pool, and the level of cost required to increase such uses and to optimize the total supplies available to the basin. Said report shall contain an analysis and recommendation for the levy of a necessary Facilities Equity Assessment to accomplish said purpose.

(c) Hearing. - If the said report by Watermaster contains a recommendation for imposition of a Facilities Equity Assessment, and the Pool Committee so requests, Watermaster shall notice and hold a hearing not less than 60 days after distribution of a copy of said report to each member of the pool, together with a notice of the hearing date. At such hearing, evidence shall be taken with regard to the necessity and propriety of the levy of a Facilities Equity Assessment and full findings and decision shall be issued by Watermaster.

(d) Operation of Assessment. - If Watermaster determines that it is appropriate that a Facilities Equity Assessment be levied in a particular year, the amount of additional supplemental supplies which should be generated by such assessment shall be estimated. The cost of obtaining such supplies, taking into consideration the investment in necessary facilities shall then be determined and spread equitably among the producers within the pool in a manner so that those producers not providing such additional lower cost supplemental water, and to whom a financial benefit will result, may bear a proportionate share of said costs, not exceeding said benefit; provided that any producer furnishing such supplemental water shall not thereby have its average cost of water in such year reduced below such producer's average cost of pumping from the Basin. In so doing, Watermaster shall establish a percentage of the total production by each party which may be produced without imposition of a Facilities Equity Assessment. Any member of the pool producing more water than said percentage shall pay such Facilities Equity Assessment on any such excess production. Watermaster is authorized to transmit and pay the proceeds of such Facilities Equity Assessment to those producers who take less than their share of Basin water by reason of furnishing a higher percentage of their requirements through use of supplemental water.

10. Unallocated Safe Yield Water. To the extent that, in any five years, any portion of the share of Safe Yield allocated to the Overlying (Agricultural) Pool is not produced, such water shall be available for reallocation to members of the Appropriative Pool, as follows:

(a) Priorities. - Such allocation shall be made in the following sequence:

(1) to supplement, in the particular year, water available from Operating Safe Yield to compensate for any reduction in the Safe Yield by reason of recalculation thereof after the tenth year of operation hereunder.

(2) pursuant to conversion claims as defined in Subparagraph (b) hereof.

(3) as a supplement to Operating Safe Yield, without regard to reductions in Safe Yield.

(b) Conversion Claims.[13] The following procedures may be utilized by any appropriator:

***1) Record of Unconverted Agricultural Acreage. Watermaster shall maintain on an ongoing basis a record with appropriate related maps of all agricultural acreage within the Chino Basin subject to being converted to appropriative water use pursuant to the provisions of this subparagraph. An initial identification of such acreage as of June 30, 1995 is attached hereto as Appendix 1.***

**(2) Record of *Water Service Conversion*. Any appropriator who undertakes to permanently provide water service to lands *subject to conversion* may report such intent to change water service to Watermaster. Watermaster *should* thereupon verify such change in water service and shall maintain a record and account for each appropriator of the total acreage involved. *Should, at any time, converted acreage return to water service from the Overlying (Agricultural) Pool, Watermaster shall return such acreage to unconverted status***

[13] Order dated November 17, 1995.

***and correspondingly reduce or eliminate any allocation accorded to the appropriator involved.***

**(*3*) Allocation *of Safe Yield Rights***

**(i) *For the term of the Peace Agreement in* any year in which *sufficient* unallocated Safe Yield from the Overlying (Agricultural) Pool is available for such conversion claims, Watermaster shall allocat*e to* each appropriator with a conversion claim *2.0* acre feet of unallocated Safe Yield water for each converted *acre for which conversion has been approved and recorded by the Watermaster.* [14]**

***(ii) In any year in which the unallocated Safe Yield water from the Overlying (Agricultural) Pool is not sufficient to satisfy all outstanding conversion claims pursuant to subparagraph (i) herein above, Watermaster shall establish allocation percentages for each appropriator with conversion claims. The percentages shall be based upon the ratio of the total of such converted acreage approved and recorded for each appropriators's account in comparison to the total of converted acreage approved and recorded for all appropriators. Watermaster shall apply such allocation percentage for each appropriator to the total unallocated Safe Yield water available for conversion claims to derive the amount allocable to each appropriator.***

**(*4*) Notice *and Allocation*. Notice of *the* special allocation of Safe Yield water pursuant to conversion claims shall be given to each appropriator and shall be treated for purposes of this Physical Solution as an addition to such appropriator's share of the Operating Safe Yield for the particular year only.**

[14] Order dated September 28, 2000 and Order dated April 19, 2001.

***(5) Administrative Costs. Any costs of Watermaster attributable to the administration of such special allocations and conversion claims shall be assessed against the appropriators participating in such reporting, apportioned in accordance with the total amount of converted acreage held by each appropriator participating in the conversion program.***

11. In Lieu Procedures. There are, or may develop, certain areas within Chino Basin where good management practices dictate that recharge of the basin be accomplished, to the extent practical, by taking surface supplies of supplemental water in lieu of ground water otherwise subject to production as an allocated share of Operating Safe Yield.

(a) Method of Operation. - An appropriator producing water within such designated in lieu area who is willing to abstain for any reason from producing any portion of such producer's share of Operating Safe Yield in any year may offer such unpumped water to Watermaster. In such event, Watermaster shall purchase said water in place,in lieu of spreading replenishment water, which is otherwise required to make up for over production. The purchase price for in lieu water shall be the lesser of:

(1) Watermaster's current cost of replenishment water, whether or not replenishment water is currently then obtainable, plus the cost of spreading; or

(2) The cost of supplemental surface supplies to the appropriator, less

a. said appropriator's average cost of ground water production, and

b. the applicable production assessment were the water produced.

Where supplemental surface supplies consist of MWD or SBVMWD supplies, the cost of treated, filtered State water from such source shall be deemed the cost of supplemental surface supplies to the appropriator for purposes of such calculation.

In any given year in which payments may be made pursuant to a Facilities Equity Assessment, as to any given quantity of water the party will be entitled to payment under this section or pursuant to the Facilities Equity Assessment, as the party elects, but not under both.

(b) Designation of In Lieu Areas. - The first in lieu area is designated as the "In Lieu Area No. 1" and consists of an area wherein nitrate levels in the ground water generally exceed 45 mg/l, and is shown on Exhibit "J" hereto. Other in lieu areas may be designated by subsequent order of Watermaster upon recommendation or approval by Advisory Committee. Said in lieu areas may be enlarged, reduced or eliminated by subsequent orders; provided, however, that designation of In Lieu Areas shall be for a minimum fixed term sufficient to justify necessary capital investment. In Lieu Area No. 1 may be enlarged, reduced or eliminated in the same manner, except that any reduction of its original size or elimination thereof shall require the prior order of Court.

12. Carry-over. Any appropriator who produces less than his assigned share of Operating Safe Yield may carry such unexercised right forward for exercise in subsequent years. The first water produced during any such subsequent year shall be deemed to be an exercise of such carry-over right. In the event the aggregate carry-over by any appropriator exceeds its share of Operating Safe Yield, such appropriator shall, as a condition of preserving such surplus carry-over, execute a storage agreement with Watermaster. Such appropriator shall have the option to pay the gross assessment applicable to such carry-over in the year in which it accrued.

13. Assignment, Transfer and Lease. Appropriative rights, and corresponding shares of Operating Safe Yield, may be assigned or may be leased or licensed to another appropriator for exercise in a given year. Any transfer, lease or license shall be ineffective until written notice thereof is furnished to and approved as to form by Watermaster, in compliance with applicable Watermaster rules. Watermaster shall not approve transfer, lease or license of a right for exercise in an area or under conditions where such production would be contrary to sound basin management or detrimental to the rights or operations of other producers.

14. Rules. The Pool Committee shall adopt rules for administering its program and in amplification of the provisions, but not inconsistent with, this pooling plan.

//

//

//

**EXHIBIT "I"**

**ENGINEERING APPENDIX**

1. Basin Management Parameters. In the process of implementing the physical solution for Chino Basin, Watermaster shall consider the following parameters:

(a) Pumping Patterns. - Chino Basin is a common supply for all persons and agencies utilizing its waters. It is an objective in management of the Basin's waters that no producer be deprived of access to said waters by reason of unreasonable pumping patterns, nor by regional or localized recharge of replenishment water, insofar as such result may be practically avoided.

(b) Water Quality. - Maintenance and improvement of water quality is a prime consideration and function of management decisions by Watermaster.

(c) Economic Considerations. - Financial feasibility, economic impact and the cost and optimum utilization of the Basin's resources and the physical facilities of the parties are objectives and concerns equal in importance to water quantity and quality parameters.

**2. Hydraulic Control and Re-Operation. In accordance with the purpose and objective of the Physical Solution to "establish a legal and practical means for making the maximum reasonable beneficial use of the waters of the Chino Basin" (paragraph 39) including but not limited to the use and recapture of reclaimed water (paragraph 49(a) ) and the identified Basin Management Parameters set forth above, Watermaster will manage the Basin to secure and maintain Hydraulic Control through controlled overdraft.**

**(a) Hydraulic Control. "Hydraulic Control" means the reduction of groundwater discharge from the Chino North Management Zone to the Santa Ana River to de minimus quantities. The Chino North Management Zone is more fully described and set forth in Attachment I-1 to this Engineering Appendix. By obtaining Hydraulic Control, Watermaster will ensure that the water management activities in the Chino North Management Zone do not cause**

**materially adverse impacts to the beneficial uses of the Santa Ana River downstream of Prado Dam.**

**(b) Re-Operation. "Re-Operation" means the controlled overdraft of the Basin by the managed withdrawal of groundwater for the Desalters and the potential increase in the cumulative un-replenished Production from 200,000 acre-feet authorized by paragraph 3 below, to 600,000 acre feet for the express purpose of securing and maintaining Hydraulic Control as a component of the Physical Solution.**

**[1] The increase in the controlled overdraft herein is separate from and in addition to the 200,000 acre-feet of accumulated overdraft authorized in paragraph 3(a) and 3(b) below over the period of 1978 through 2017.**

**[2] "Desalters" means the Chino I Desalter, the Chino I Expansion, the Chino II Desalter and Future Desalters, consisting of all the capital facilities and processes that remove salt from Basin water, including extraction wells and transmission facilities for delivery of groundwater to the Desalter. Desalter treatment and delivery facilities for the desalted water include pumping and storage facilities and treatment and disposal capacity in the Santa Ana Regional Interceptor.**

**[3] The groundwater Produced through controlled overdraft pursuant to Re-Operation does not constitute New Yield or Operating Safe Yield and it is made available under the Physical Solution for the express purpose of satisfying some or all of the groundwater Production by the Desalters until December 31, 2030. ("Period of Re-Operation").**

**[4] The operation of the Desalters, the Production of groundwater for the Desalters and the use of water produced by the Desalters pursuant to Re-Operation are**

**subject to the limitations that may be set forth in Watermaster Rules and Regulations for the Desalters.**

**(5) Watermaster will update its Recharge Master Plan and obtain Court approval of its update, to address how the Basin will be contemporaneously managed to secure and maintain Hydraulic Control and operated at a new equilibrium at the conclusion of the period of Re-Operation. The Recharge Master Plan shall contain recharge projections and summaries of the projected water supply availability as well as the physical means to accomplish recharge projections. The Recharge Master Plan may be amended from time to time with Court approval.**

**(6) Re-Operation and Watermaster's apportionment of controlled overdraft in accordance with the Physical Solution will not be suspended in the event that Hydraulic Control is secured in any year before the full 400,000 acre-feet has been Produced without Replenishment, so long as: (i) Watermaster has prepared, adopted and the Court has approved a contingency plan that establishes conditions and protective measures that will avoid unreasonable and unmitigated material physical harm to a party or to the Basin and that equitably distributes the cost of any mitigation attributable to the identified contingencies; and (ii) Watermaster is in substantial compliance with a Court approved Recharge Master Plan.[15]**

**3**. Operating Safe Yield. Operating Safe Yield in any year shall consist of the Appropriative Pool's share of Safe Yield of the Basin, plus any controlled overdraft of the Basin which Watermaster may authorize. In adopting the Operating Safe Yield for any year, Watermaster shall be limited as follows:

(a) Accumulated Overdraft. - During the operation of this Judgment and Physical Solution, the overdraft accumulated from and after the effective date of the Physical Solution and

[15] Order dated December 21, 2007.

resulting from an excess of Operating Safe Yield over Safe Yield shall not exceed 200,000 acre feet.

(b) Quantitative Limits. - In no event shall Operating Safe Yield in any year be less than the Appropriative Pool's share of Safe Yield, nor shall it exceed such share of Safe Yield by more than 10,000 acre feet. The initial Operating Safe Yield is hereby set at 54,834 acre feet per year. Operating Safe Yield shall not be changed upon less than five (5) years' notice by Watermaster. Nothing contained in this paragraph shall be deemed to authorize, directly or indirectly, any modification of the allocation of shares in Safe Yield to the overlying pools, as set forth in Paragraph 44 of the Judgment.

**4**. Ground Water Storage Agreements. Any agreements authorized by Watermaster for storage of supplemental water in the available ground water storage capacity of Chino Basin shall include, but not be limited to:

(a) The quantities and term of the storage right.

(b) A statement of the priority or relation of said right, as against overlying or Safe Yield uses, and other storage rights.

(c) The procedure for establishing delivery rates, schedules and procedures which may include:

[1] spreading or injection, or

[2] in lieu deliveries of supplemental water for direct use.

(d) The procedures for calculation of losses and annual accounting for water in storage by Watermaster.

(e) The procedures for establishment and administration of withdrawal schedules, locations and methods.

# CHINO BASIN

## IN LIEU AREA NO. 1

## EXHIBIT "J"

**EXHIBIT "K"**
**LEGAL DESCRIPTION**

**OF CHINO BASIN**

Preamble

All of the townships and ranges referred to in the following legal description are the San Bernardino Base and Meridian. Certain designated sections are implied as the System of Government Surveys may be extended where not established. Said sections are identified as follows:

Section 20, T1N, R8W is extended across Rancho Cucamonga;

Section 36, T1N, R8W is extended across the City of Upland;

Sections 2,3, and 4, T1S, R7W are extended across Rancho Cucamonga;

Section 10, T1S, R8W is extended across the City of Claremont;

Sections 19, 20, 21, 30, 31 and 32, T1S, R8W are extended across the City of Pomona;

Sections 4, 5, and 28, T2S, R8W are extended across Rancho Santa Ana Del Chino;

Sections 15 and 16, T3S, R7W are extended across Rancho La Sierra; and

Sections 17 and 20, T3S, R7W are extended across Rancho El Rincon.

Description

Chino Basin is included within portions of the Counties of San Bernardino, Riverside and Los Angeles, State of California, bounded by a continuous line described as follows:

EXHIBIT “K”

BEGINNING at the Southwest corner of Lot 241 as shown on Map of Ontario Colony Lands, recorded in Map Book 11, page 6, Office of the County Recorder of San Bernardino County, said corner being the Point of Beginning;

1. Thence Southeasterly to the Southeast corner of Lot 419 of said Ontario Colony Lands;

2. Thence Southeasterly to a point 1300 feet North of the South line and 1300 feet East of the West line of Section 4, T1S, R7W;

3. Thence Easterly to a point on the East line of Section 4, 1800 feet North of the Southeast corner of said Section 4;

4. Thence Easterly to the Southeast corner of the Southwest quarter of the Northeast quarter of Section 3, T1S, R7W;

5. Thence Northeasterly to a point on the North line of Section 2, T1S, R7W, 1400 feet East of the West line of said Section 2;

6. Thence Northeasterly to the Southwest corner of Section 18, T1N, R6W;

7. Thence Northerly to the Northwest corner of said Section 18;

8. Thence Easterly to the Northeast corner of said Section 18;

9. Thence Northerly to the Northwest corner of the Southwest Quarter of Section 8, T1N, R6W;

10. Thence Easterly to the Northeast corner of said Southwest quarter of said Section 8;

11. Thence Southerly to the Southeast corner of said Southwest Quarter of said Section 8;

12. Thence Easterly to the Northeast corner of Section 17, T1N, R6W;

13. Thence Easterly to the Northeast corner of Section 16, T1N, R6W;

14. Thence Southeasterly to the Northwest corner of the Southeast quarter of Section 15, T1N, R6W;

15. Thence Easterly to the Northeast corner of said Southeast quarter of said Section 15;

16. Thence Southeasterly to the Northwest corner of the Northeast quarter of Section 23, T1N, R6W;

17. Thence Southeasterly to the Northwest corner of Section 25, T1N, R6W;

18. Thence Southeasterly to the Northwest corner of the Northeast quarter of Section 31, T1N, R5W;

19. Thence Southeasterly to the Northeast corner of the Northwest quarter of Section 5, T1S, R5W;

20. Thence Southeasterly to the Southeast corner of Section 4, T1S, R5W;

21. Thence Southeasterly to the Southeast corner of the Southwest quarter of Section 11, T1S, R5W;

22. Thence Southwesterly to the Southwest corner of Section 14, T1S, R5W;

23. Thence Southwest to the Southwest corner of Section 22, T1S, R5W;

24. Thence Southwesterly to the Southwest corner of the Northeast quarter of Section 6, T2S, R5W;

25. Thence Southeasterly to the Northeast corner of Section 18, T2S, R5W;

26. Thence Southwesterly to the Southwest corner of the Southeast quarter of Section 13, T2S, R6W;

27. Thence Southwesterly to the Southwest corner of the Northeast quarter of Section 26, T2S, R6W;

28. Thence Westerly to the Southwest corner of the Northwest quarter of said Section 26;

29. Thence Northerly to the Northwest corner of said Section 26;

30. Thence Westerly to the Southwest corner of Section 21, T2S, R6W;

31. Thence Southerly to the Southeast corner of Section 29, T2S, R6W;

32. Thence Westerly to the Southeast corner of Section 30, T2S, R6W;

33. Thence Southwesterly to the Southwest corner of Section 36, T2S, R7W;

34. Thence Southwesterly to the Southeast corner of Section 3, T3S, R7W;

35. Thence Southwesterly to the Southwest corner of the Northeast quarter of Section 10, T3S, R7W;

36. Thence Southerly to the Northeast corner of the Northwest quarter of Section 15, T3S, R7W;

37. Thence Southwesterly to the Southeast corner of the Northeast quarter of Section 16, T3S, R7W;

38. Thence Southwesterly to the Southwest corner of said Section 16;

39. Thence Southwesterly to the Southwest corner of the Northeast quarter of Section 20, T3S, R7W;

40. Thence Westerly to the Southwest corner of the Northwest quarter of said Section 20;

41. Thence Northerly to the Northwest corner of Section 17, T3S, R7W;

42. Thence Westerly to the Southwest corner of Section 7, T3S, R7W;

43. Thence Northerly to the Southwest corner of Section 6, T3S, R7W;

44. Thence Westerly to the Southwest corner of Section 1, T3S, R8W;

45. Thence Northerly to the Southeast corner of Section 35, T2S, R8W;

46. Thence Northwesterly to the Northwest corner of said Section 35;

47. Thence Northerly to the Southeast corner of Lot 33, as shown on Map of Tract 3193, recorded in Map Book 43, pages 46 and 47, Office of the County Recorder of San Bernardino County;

48. Thence Westerly to the Northwest corner of the Southwest quarter of Section 28, T2S, R8W;

49. Thence Northerly to the Southwest corner of Section 4, T2S, R8W;

50. Thence Westerly to the Southwest corner of Section 5, T2S, R8W;

51. Thence Northerly to the Southwest corner of Section 32, T1S, R8W;

52. Thence Westerly to the Southwest corner of Section 31, T1S, R8W;

53. Thence Northerly to the Southwest corner of Section 30, T1S, R8W;

54. Thence Northeasterly to the Southwest corner of Section 20, T1S, R8W;

55. Thence Northerly to the Northwest corner of the Southwest quarter of the Southwest quarter of said Section 20;

56. Thence Northwesterly to the Northeast corner of the Southeast quarter of the Southeast quarter of the Northwest quarter of Section 19, T1S, R8W;

57. Thence Easterly to the Northwest corner of Section 21, T1S, R8W;

58. Thence Northeasterly to the Southeast corner of the Southwest quarter of the Southwest quarter of Section 10, T1S, R8W;

59. Thence Northeasterly to the Southwest corner of Section 2, T1S, R8W;

60. Thence Northeasterly to the Southeast corner of the Northwest quarter of the Northwest quarter of Section 1, T1S, R8W;

61. Thence Northerly to the Northeast corner of the Northwest quarter of the Northeast quarter of Section 36, T1N, R8W;

62. Thence Northerly to the Southeast corner of Section 24, T1N, R8W;

63. Thence Northeasterly to the Southeast corner of the Northwest quarter of the Northwest quarter of Section 20, T1N, R7W; and

64. Thence Southerly to the Point of Beginning.

Sections Included

Said perimeter description includes all or portions of the following Townships, Ranges and Sections of San Bernardino Base and Meridian:

T1N, R5W - Sections: 30, 31 and 32

T1N, R6W - Sections: 8, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35 and 36

T1N, R7W - Sections: 19, 20, 24, 25, 26, 29, 30, 31, 32, 35 and 36

T1N, R8W - Sections: 25 and 36

T1S, R5W - Sections: 4, 5, 6, 7, 8, 9, 10, 11, 14, 15,16, 17, 18, 19, 20, 21, 22, 28, 29,30, 31 and 32

T1S, R6W - Sections: 1 through 36, inclusive

T1S, R7W - Sections: 1 through 36, inclusive

T1S, R8W - Sections: 1, 2, 10, 11, 12, 13, 14, 15, 16, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35 and 36

T2S, R5W - Sections: 6, 7 and 18

T2S, R6W - Sections: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 26, 29, 30 and 31

T2S, R7W - Sections: 1 through 36, inclusive

T2S, R8W - Sections: 1, 2, 3, 4, 5, 9, 10, 11, 12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26, 27, 28, 35 and 36

T3S, R7W - Sections: 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 16, 17 and 20

T3S, R8W - Sections: 1.
