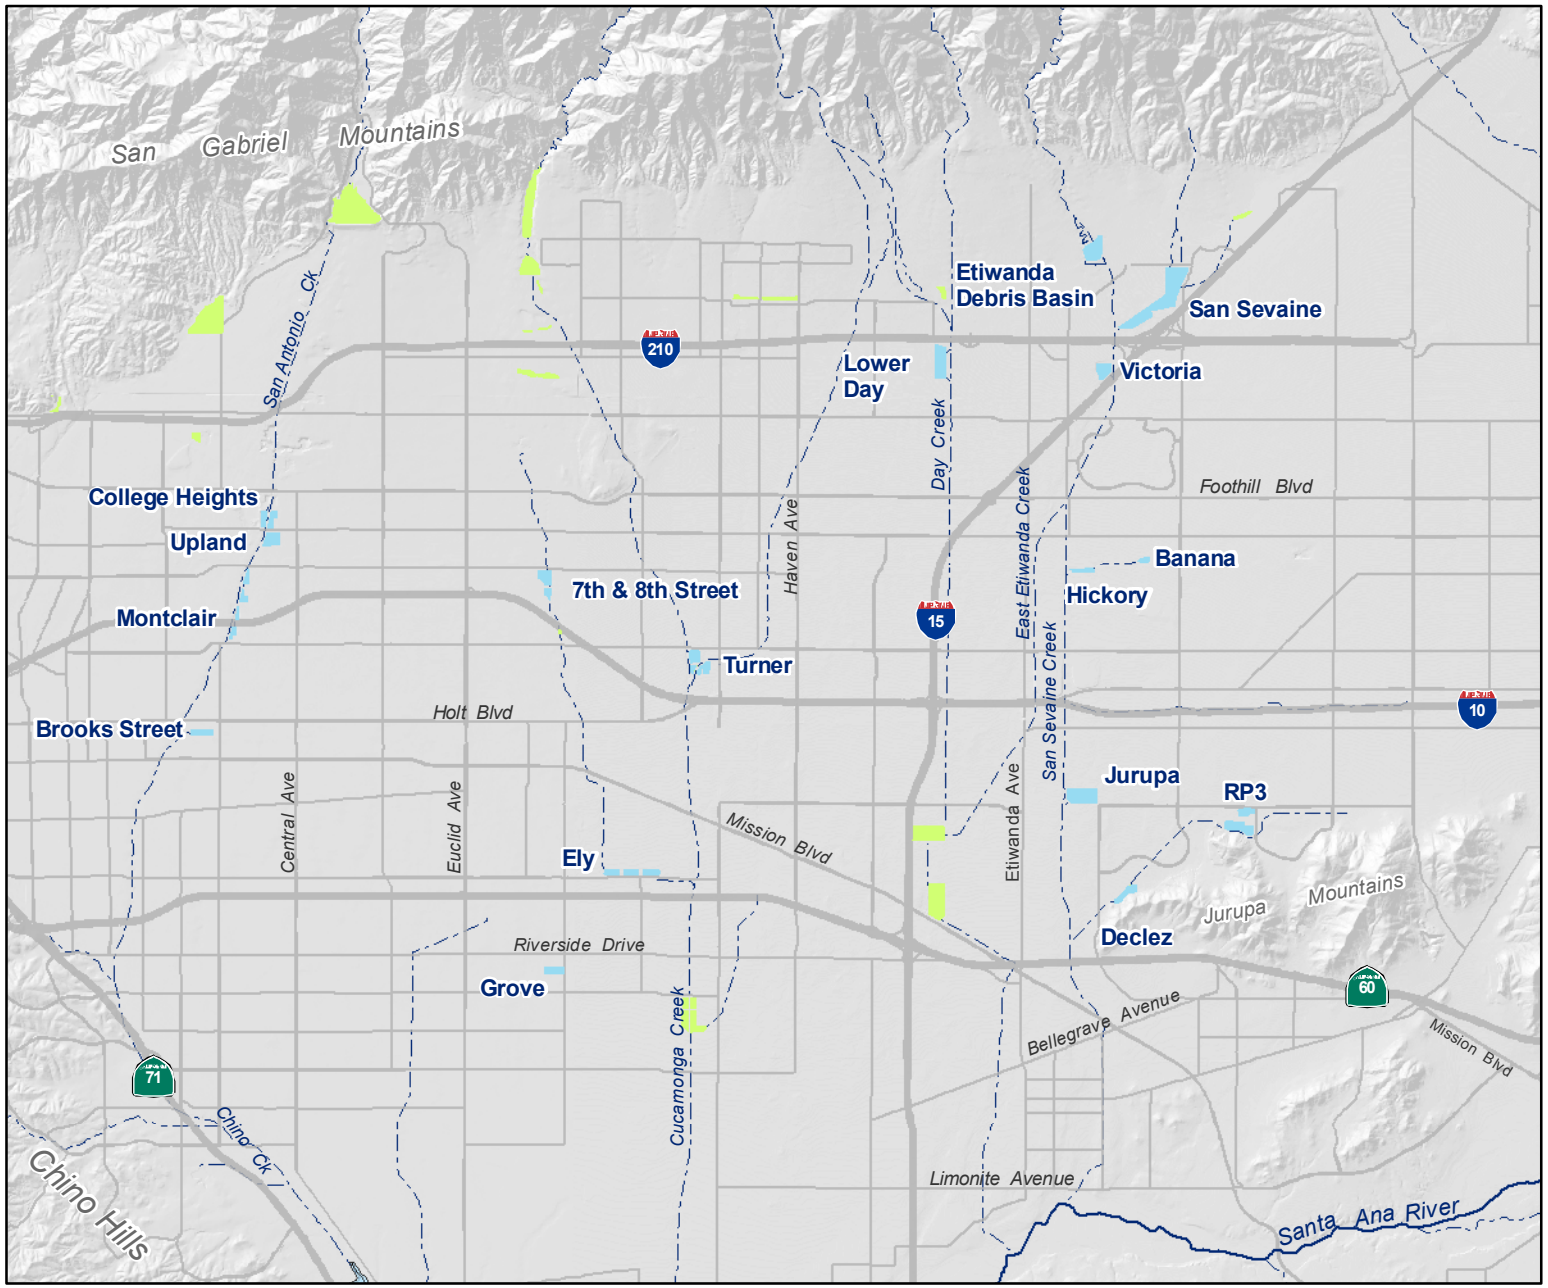
The injected water is WFA-treated water, which meets CCR Title 22 drinking water standards.



Cells shaded in grey reflect most recent lab values.

## Bulletin 132-16

# Management of the California

# State Water Project

*Covers Calendar Year 2015 Activities*

***Published June 2017***

**Edmund G. Brown Jr.** *Governor*
*State of California*

**John Laird** *Secretary for Natural Resources*
*California Natural Resources Agency*

**William A. Croyle** *Acting Director*
*Department of Water Resources*

# Foreword

Bulletin 132-16, Management of the California State Water Project, continues the Bulletin 132 annual series begun in 1963. Bulletin 132-16 reports water supply planning, construction, financing, management, and operation activities of the State Water Project (SWP). Appendix B contains data and computations used to determine the SWP water contractors' Statements of Charges for 2017. Appendix B was previously printed and distributed to SWP water contractors to document and support calculation of contractors' annual charges.

The Bulletin discusses significant events and issues that affected SWP management and operations from January 1, 2015, through December 31, 2015.

Bulletin 132-16 also discusses water supply and delivery, Delta resources and environmental issues, local assistance programs, power resources, recreation, and financial analysis of the SWP.

Please note that the water delivery figures listed are accurate at the time of this publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than were available at the time of publication, please consult the most recent edition of Bulletin 132, or contact Department of Water Resources staff in the State Water Project Analysis Office.

William A. Croyle
*Acting Director*

# California Water Commission

The California Water Commission consists of nine members appointed by the Governor and confirmed by the Senate. Seven members are chosen for their expertise related to the control, storage, and beneficial use of water, and two are chosen for their knowledge of the environment. The commission advises the Director of the Department of Water Resources (DWR) on matters within DWR's jurisdiction, approves rules and regulations, and monitors and reports on the construction and operation of the State Water Project (SWP).

The roles and responsibilities of the California Water Commission are defined in the Water Code, Government Code, and Code of Civil Procedure.

The commission's SWP-specific responsibilities are to:

- conduct an annual review of the construction and operation of the SWP and report to DWR and the Legislature with any recommendations (Water Code Section 165);
- hold public hearings on all additional facilities proposed to be added to the SWP and name any new facilities (Water Code Sections 161.5 and 166); and
- adopt a resolution of necessity, and give each affected person a venue to be heard, before DWR may commence an eminent domain proceeding (Code of Civil Procedure Section 1245.210).

The California Water Commission's Executive Officer is Joseph Yun, and the Commission members at the time of publication are:

Carol Baker, Vice-Chair

Andrew Ball

Joseph Byrne

Daniel Curtin

Joe Del Bosque

Maria Herrera

Catherine Keig

David Orth

Armando Quintero, Chair

# SWP Long-term Water Contractors

The State Water Project long-term water supply contractors are listed below, followed by shortened forms of their names that are used in Bulletin 132.

| | |
|---|---|
| Alameda County Flood Control and Water Conservation District, Zone 7 | Alameda-Zone 7 |
| Alameda County Water District | Alameda County |
| Antelope Valley-East Kern Water Agency | AVEK |
| Castaic Lake Water Agency | Castaic Lake |
| City of Yuba City | Yuba City |
| Coachella Valley Water District | Coachella |
| County of Butte | Butte |
| County of Kings | Kings |
| Crestline-Lake Arrowhead Water Agency | Crestline |
| Desert Water Agency | Desert |
| Dudley Ridge Water District | Dudley Ridge |
| Empire West Side Irrigation District | Empire |
| Kern County Water Agency | Kern |
| Littlerock Creek Irrigation District | Littlerock |
| The Metropolitan Water District of Southern California | Metropolitan |
| Mojave Water Agency | Mojave |
| Napa County Flood Control and Water Conservation District | Napa |
| Oak Flat Water District | Oak Flat |
| Palmdale Water District | Palmdale |
| Plumas County Flood Control and Water Conservation District | Plumas |
| San Bernardino Valley Municipal Water District | San Bernardino |
| San Gabriel Valley Municipal Water District | San Gabriel |
| San Gorgonio Pass Water Agency | San Gorgonio |
| San Luis Obispo County Flood Control and Water Conservation District | San Luis Obispo |
| Santa Barbara County Flood Control and Water Conservation District | Santa Barbara |
| Santa Clara Valley Water District | Santa Clara |
| Solano County Water Agency | Solano |
| Tulare Lake Basin Water Storage District | Tulare |
| Ventura County Watershed Protection District | Ventura |

# State Water Project Highlights

*The Cordelia Pumping Plant Forebay, part of the North Bay Aqueduct.*

The annual Bulletin 132 series began in 1963 and reported the first deliveries of water by the new State Water Project (SWP). Bulletin 132-16, *Management of the California State Water Project*, continues this series as the fifty-fourth edition. It reports on SWP planning, construction, finance, management, and operations during calendar year 2015. The SWP is operated and maintained by the California Department of Water Resources (DWR).

The SWP is one of the world's largest water, power, and conveyance systems. In the past decade it has conveyed an annual average of 2.9 million acre-feet (maf) of water. SWP facilities—pumping and power plants; reservoirs, lakes, and storage tanks; canals, tunnels, and pipelines—capture, store, and convey water to public water agencies and local water districts.

## Drought

In January 2014, the Governor declared a state of emergency due to severe drought conditions and directed State and local agencies to take all necessary actions to conserve water, enhance and protect water supplies, and reduce harmful effects of the drought. Subsequent proclamations and executive orders extended provisions and added new provisions. On November 13, 2015, the Governor issued Executive Order B-36-15, which requires the orders and provisions contained in the January 17, 2014 Proclamation; the April 25, 2014 Proclamation; and Executive Orders B-28-14 (December 22, 2014) and B-29-15 (April 1, 2015) to remain in full force and effect.

To address the effects of the historic drought in 2015, the Bureau of Reclamation (Reclamation), DWR, U.S. Fish and Wildlife Service, National Marine Fisheries Service, Department of Fish and Wildlife, and State Water Resources Control Board (SWRCB) continued coordinated and extensive water operations and regulatory adjustments. The adjustments to existing water quality and federal Endangered Species Act requirements of SWRCB's Water Right Decision 1641 and the U.S. Fish and Wildlife Service and National Marine Fisheries Service biological opinions allowed the Central Valley Project (CVP) and SWP to support water deliveries and transfers and to maximize upstream water storage while minimizing adverse effects on listed fish species and protecting water quality.

DWR and Reclamation continued to work in close coordination with the fish and wildlife agencies and the SWRCB to produce and update a 2015 drought contingency plan for CVP and SWP operations.

During 2015, DWR and Reclamation submitted a number of temporary urgency change petitions to the SWRCB requesting modification of requirements to meet Water Right Decision 1641 objectives. The SWRCB issued orders allowing temporary changes to some of the water quality and flow objectives.

For more information about SWRCB drought-related actions, see Chapter 4, Water Quality.

### Emergency Drought Barrier

In 2015, in response to drought conditions, a temporary, emergency salinity/drought barrier was constructed in the Delta on West False River between Jersey and Bradford islands and just east of the confluence with the San Joaquin River. The purpose of the barrier was to limit the tidal push of saltwater from San Francisco Bay into the Central and South Delta, allowing Delta

water quality to be maintained and water in upstream reservoirs to be conserved. The barrier successfully allowed the SWP and the CVP to operate with reduced Sacramento River/Delta outflow, as approved by the SWRCB, while maintaining control of salinity in the Central Delta.

## SWP Allocations

DWR approved delivery of 0.42 maf on December 1, 2014, resulting in initial Table A amounts of 10 percent of SWP water contractor requests. On March 2, 2015, DWR increased the 2015 Table A amounts to 0.83 maf, for a final allocation of 20 percent.

## Water Supply Contract Extension Program

In May 2013, DWR and the SWP contractors began negotiations in a public forum to develop contract amendments to extend the term and change certain financial provisions of the water supply contracts. In June 2014, the negotiators for DWR and the SWP contractors reached a general agreement on principles for such an amendment. In 2015, DWR continued preparing a draft environmental impact report for the proposed contract extension amendment. For more information see Chapter 9, Water Contracts and Deliveries.

## Yearly Activities Summary

### 2015 Precipitation and Water Storage

#### *Precipitation and Mountain Snowpack in Water Year 2014–2015*

Water year 2014–2015 proved to be another dry year, the fourth consecutive year with less than average precipitation and mountain snowpack. The State received precipitation at 74 percent of average in water year 2014–2015 compared to 56 and 79 percent of average in water years 2013–2014 and 2012–2013, respectively. Though a below-average water year, the Northern Sierra 8-Station Precipitation Index had 37.2 inches of precipitation, which was 74 percent of average. The San Joaquin 5-Station Precipitation Index was 19 inches (47 percent of average), and the Tulare Basin 6-Station Precipitation Index was 13.6 inches (47 percent of average). The statewide mountain snowpack on April 1 was only 5 percent of average.

#### *River Runoff*

Statewide river runoff totaled 46 percent of average in the 2014–2015 water year. Runoff in the Sacramento River Region, the San Joaquin 4 Rivers, and the Tulare Lake Region was 51, 24, and 19 percent of average, respectively.

#### *Water Supply Indices*

The Sacramento Valley Water Year Hydrologic Classification and the San Joaquin Valley Water Year Hydrologic Classification were both "critical," based on observed data for water year 2014–2015.

#### *Water Year 2014–2015 Statewide Storage Totals*

Monthly storage totals for the major Sierra Nevada reservoirs began at 56 percent of average reservoir storage following a dry 2013–2014 water year. The percent of average storage dipped slightly in the fall and then rose through the winter, peaking at 71 percent of average at the end of February. During the next 5 months, storage dropped gradually to 54 percent of average in July where it remained through September.

#### *2015 Storage Totals in Major SWP Reservoirs*

End-of-year storage on December 31, 2015, in major SWP reservoirs and the State's share of joint-use reservoirs was 1.6 maf or 30 percent of maximum storage, compared to 2.3 maf or 43 percent of maximum storage

at the end of 2014. The average end-of-month total storage in major SWP reservoirs for 2015 was 2.2 maf.

## Diversions from the Delta

In 2015, the SWP diverted 837,421 acre-feet (af) at Banks Pumping Plant. There was no pumping for the Cross Valley Canal, and 8,380 af of CVP water was wheeled at Banks Pumping Plant by DWR during 2015.

Maximum daily Delta exports occurred on February 12 at 13,797 af. Combined SWP and CVP monthly Delta exports in 2015 varied from a high of 318,941 af in January to a low of 42,300 af in July. Delta exports totaled approximately 1.6 maf in 2015.

For more information, see Chapter 8, Water Supply.

## 2015 Water Supplies, Contracts, and Deliveries

### *2015 Water Deliveries*

In 2015, a total of 2,104,264 af of SWP and non-SWP water was delivered to 29 long-term SWP water contractors and 20 non-SWP agencies. The SWP portion totaled 1,336,889 af, and the non-SWP portion totaled 767,375 af.

The 1,336,889 af delivered to SWP water contractors was categorized as follows:

- 640,444 af of Table A water;
- 37,011 af of transfers and exchanges of Table A water;
- 3,000 af of Turn-Back or Multiyear Water Pool Program water;
- 131,990 af of carryover water;
- 690 af of Article 21 water;
- 347,852 af of water bank recovery;
- 128,871 af of delivery of backup water;
- 728 af of settlement water;
- 2 af of SWP water for parks and recreation;
- 12,025 af of 2013 Yuba Accord Dry Year Purchase Program water;
- 7,716 af of local water;
- 4,870 af of permit water; and
- 21,690 af of other non-SWP programs.

The 767,375 af portion delivered to 19 non-SWP agencies was categorized accordingly:

- 39,058 af of SWP contracted supply;
- 26,181 af of water bank recovery;
- 689,930 af of regulated delivery of local supply;
- 211 af for parks and recreation;
- 877 af for fish and wildlife;
- 10,455 af for Kern National Wildlife Refuge; and
- 663 af for annual contracts.

For more information, see Chapter 9, Water Contracts and Deliveries.

## Power Resources

SWP generation totaled 1,274,706 megawatt hours of energy in 2015. The SWP received a total of 2,780,640 megawatt hours of energy from other power resources and firm purchases under agreements and exchanges. There were no bilateral sales of energy in 2015. For detailed information, see Chapter 10, Power Resources.

The sidebar, State Water Project Power Generation and Consumption in 2015, summarizes amounts of power generated and consumed by the SWP.

### *Greenhouse Gas Management*

In 2015, DWR reported its pump load, sulfur hexafluoride emissions, and generation for 2014 to the California Air Resources Board. DWR's sulfur hexafluoride emissions were below the maximum allowable limit; however, because the allowable limit will be lower in future years, DWR is developing plans to reduce its sulfur hexafluoride emissions. DWR also reported its greenhouse

## State Water Project Power Generation and Consumption in 2015

| Power Generation and Consumption | Megawatt Hours |
|---|---|
| Energy generation by SWP facilities | 1,274,706 |
| Energy sources and firm purchases under agreements and exchanges | 2,780,640 |
| **Total Energy Available to the SWP** | 4,055,346 |
| Energy sales[a] | (566,888) |
| **Net SWP Power Consumption[b]** | 3,488,457 |

[a] Received under the Lodi Energy Center Power Sales Agreement as a purchase credit.
[b] Totals may not sum as expected due to rounding.

gas emissions for 2014 to The Climate Registry and submitted its fossil fuel report for 2014 to the Governor's Office.

For more information regarding DWR's management of greenhouse gas emissions, and its efforts to add renewable, greenhouse gas emission-free energy to the SWP's energy portfolio, see Chapter 10, Power Resources.

## Hydropower License Planning and Compliance

DWR holds three hydropower licenses and two conduit exemptions issued by the Federal Energy Regulatory Commission (FERC): Oroville Facilities, FERC Project No. 2100; South SWP Hydropower, FERC Project No. 2426; Pine Flat Transmission Line, FERC Project No. 2876; Alamo Powerplant Project, FERC Project No. 14579; and Mojave Siphon Powerplant Project, FERC Project No. 14580.

### *Oroville Facilities Relicensing*

On January 26, 2005, DWR filed an application with FERC requesting a new license for the Oroville Facilities (FERC Project No. 2100). The existing 50-year hydropower license expired January 31, 2007; FERC is issuing annual licenses under the same terms and conditions as the expired license until the new license is issued. Issuance of the new license has been delayed pending issuance of the National Marine Fisheries Service biological opinion.

For more information regarding events associated with Oroville Facilities relicensing in 2015, see Chapter 3, Environmental Programs; Chapter 6, Legislation and Litigation; Chapter 10, Power Resources; and Chapter 13, Recreation.

### *South SWP Hydropower*

In 2015, DWR initiated an extensive information gathering effort for the

pre-application document for the FERC relicensing of South SWP Hydropower. As a part of this effort, DWR mailed a notice and a questionnaire to agencies and potential stakeholders who may have an interest in the relicensing process. The questionnaire solicited information pertaining to the existing environment and potential effects of continued operation and maintenance of the South SWP Hydropower facilities. This information will be included in the pre-application document. The pre-application document and notice of intent for relicensing are due to FERC by January 31, 2017.

For more information about hydropower relicensing activities, see Chapter 10, Power Resources.

## Financial Analysis

In 2015, DWR continued to pay bondholders as scheduled. The SWP was financially viable and was indirectly paid for by the approximately 25 million water users served by the project. Direct payment was through the 29 long-term water contractors. In 2015, the SWP handled approximately $993 million in revenues and $993 million in expenses. The 2015 Income Statement for the State Water Project sidebar presents a summary of the year's revenues and expenses. For detailed information, see Chapter 14, Financial Analysis.

### 2015 Income Statement for the State Water Project

| **Revenues** | **Thousands of Dollars** |
|---|---|
| Water Contract Payments | 1,077,327 |
| Revenue Bond Cover Adjustments | (58,832) |
| Rate Management Adjustments | (40,470) |
| Other Revenues | 15,093 |
| **Total Operating Revenues** | **993,118** |
| **Expenses** | |
| Project Operations, Maintenance, Power, and Replacement | 637,202 |
| Deposits to Reserves | 53,047 |
| Water Bond Principal | 186,252 |
| Water Bond Interest | 116,616 |
| **Total Operating Expenses and Debt Service** | **993,118** |
| **Net System Revenues** | **0** |

## Engineering, Construction, and Real Estate

In 2015, engineering, construction, and real estate work to enhance, expand, repair, and protect the SWP and other facilities within the State continued. Significant projects included the Perris Dam remediation, the East Branch Extension Phase I Improvements and Phase II projects, Clifton Court Forebay radial gate repairs, the Emergency Drought Barriers Project, and the seismic retrofit of 23 bridges in the San Luis, San Joaquin, and Southern field divisions.

DWR worked on 65 construction contracts in various SWP construction divisions in 2015. Projects included pipeline repair, control system upgrades, fire systems modernization, equipment refurbishments and upgrades, seismic upgrades of bridges, maintenance facility improvements at dam and reservoir sites, and the addition of new pumping units and a reservoir.

DWR processed a net total of $7.02 million in payments in 2015 in support of right-of-way activities required for the construction, operation, and maintenance of the SWP. DWR also conducted real estate activities related to SWP acquisitions, temporary permits, property management, and appraisals.

For more information, see Chapter 12, Engineering, Construction, and Real Estate.

## Delta Resources and Environmental Issues

### *California WaterFix and California EcoRestore*

In April, DWR announced a new alternative that would replace the proposed Bay Delta Conservation Plan as the State's proposed project. The conveyance facility and habitat restoration measures proposed in the Bay Delta Conservation Plan would be separated into two distinct efforts—California WaterFix and California EcoRestore. Throughout the rest of the year, a number of regulatory processes were underway for California WaterFix.

### *Fish Restoration Program*

Pursuant to the U.S. Fish and Wildlife Service and National Marine Fisheries Service biological opinions and the Department of Fish and Wildlife Longfin Smelt incidental take permit, the Fish Restoration Program continued to make progress towards fulfilling its restoration requirements.

For more information about Delta resources and environmental issues, see Chapter 2, Delta Resources; Chapter 3, Environmental Programs; and Chapter 4, Water Quality Programs.

## Recreation

In 2015, SWP facilities supported an estimated 4.4 million recreation days of use, up 12.9 percent from the 3.9 million recorded in 2014. Most of the SWP recreation use was concentrated at the major reservoirs, with approximately 47 percent occurring in the Oroville Field Division and 38 percent occurring in the Southern Field Division. For more information, see Chapter 13, Recreation.

# SWP Security Measures

Security and protection of the SWP remain primary goals for DWR. SWP facilities are closely monitored, and DWR staff are vigilant in maintaining a secure environment. Security patrols of SWP facilities are frequent and ongoing, and plans are in place to address potential or actual acts of terrorism. Security system improvements continue in conjunction with Reclamation and other federal and State agencies.

# SWP Milestones through the Decades

## 50 Years Ago—1965

Construction began on Little Panoche Detention Dam and Reservoir.

Construction of Los Banos Detention Dam and Reservoir was completed.

Construction of the South Bay Aqueduct was completed in June and water deliveries began to Santa Clara County.

## 40 Years Ago—1975

An earthquake of magnitude 5.8 occurred in the Oroville area on August 1, 1975. A thorough earthquake safety investigation of the Oroville facilities was conducted, and the results were eventually published in Bulletin 203, "The August 1, 1975 Oroville Earthquake Investigations."

## 30 Years Ago—1985

Water deliveries to SWP long-term water contractors totaled 2,001,053 acre-feet, the largest amount delivered since the SWP began operating.

Construction of Alamo Powerplant was completed.

In March, a groundbreaking ceremony was held for the North Bay Aqueduct, Phase II.

## 20 Years Ago—1995

DWR relocated operational headquarters for the SWP from the Resources Building in downtown Sacramento to a renovated building north of downtown. The new Joint Operations Center would be shared with Reclamation, operators of the CVP, and the National Weather Service.

DWR began fishery studies on the lower Feather River to support the renewal of DWR's FERC license to operate the Oroville Facilities.

## 10 Years Ago—2005

On January 26, 2005, DWR submitted its application to FERC to renew the license for the Oroville Facilities.

# Chapter 1
# The State Water Project

*The California Aqueduct near Palmdale, California.*

This chapter primarily provides background on the State Water Project (SWP), including brief descriptions of SWP facilities, planning, construction, power operations, financing, contracting agencies, water deliveries, and the project's many uses and functions. It also provides a glimpse of California history, with a look at the processes and decisions that went into the creation of the largest state-built water project in the country.

Chapters 2 through 15 provide more detail on significant events and specific topics related to management of the SWP in calendar year 2015. At the end of the bulletin, Appendix B presents data and computations used to determine the SWP water contractors' Statements of Charges for 2017.

*Information in this chapter was contributed by the Division of Operations and Maintenance and the State Water Project Analysis Office.*

California's diverse geography contains both the highest and lowest elevations in the coterminous United States, with a resulting diversity of climate that ranges from desert to alpine to subtropical. In a typical year, some areas receive as little as 2 inches of rain, while others receive more than 100 inches. This diversity of geography and climate creates an intricate and constantly changing pattern of water supplies, which, in turn, creates enormous challenges in managing this vital resource.

## The State Water Project

Like present-day Californians, the earliest settlers faced the problem of how best to conserve, control, and deliver water. Remains of aqueducts, canals, and dams are still found near some of California's original missions. The first recorded aqueduct, built in 1770 to serve the San Diego mission, was 6 miles long. In the early twentieth century, several cities, including San Francisco and Los Angeles, built aqueducts to convey water from the Sierra Nevada to other parts of the State.

In 1951, after many years of discussion and study, the Legislature authorized construction of a water storage and supply system to capture and store rainfall and snowmelt runoff in Northern California and deliver it to areas of need throughout the State. Eight years later, the Legislature passed the Burns-Porter Act, which provided the mechanism for obtaining funds necessary to construct the initial State Water Project (SWP) facilities. In 1960, California voters approved issuance of $1.75 billion in general obligation bonds, as authorized in the act, thereby securing funds to build the SWP. In 1962, the first water was delivered through a portion of the South Bay Aqueduct to two long-term contracting agencies in Alameda County.

Today the SWP, built, operated, and managed by the Department of Water Resources (DWR), is the largest state-built, multipurpose, user-financed water project in the country. It was designed and built to deliver water, control flooding, generate power, provide recreational opportunities, and enhance habitat for fish and wildlife. SWP water irrigates about 750,000 acres of farmland, mainly in the southern San Joaquin Valley. Approximately 25 million of California's estimated 39 million residents benefit from SWP water.

## Precipitation and Runoff

The water stored and delivered by the SWP originates as rainfall and snowmelt runoff in Northern and Central California's watersheds, where most of the State's precipitation occurs. The precipitation, snowpack, and the rate and amount of snowmelt help determine how much water the SWP can deliver in any given year.

Since 1968, DWR has monitored and recorded annual precipitation and runoff for each water year, which begins on October 1 and ends on the following September 30.

## Water Delivery Facilities

The SWP depends on a complex system of dams, reservoirs, power plants, pumping plants, canals, and aqueducts to deliver water. Although initial water transportation facilities were essentially completed in 1973, other facilities have since been built, and still others are either under construction or are planned to be built, as needed.

The SWP facilities include 30 dams (29 of which impound water), 20 reservoirs, 29 pumping and generating plants, and approximately 700 miles of aqueducts and pipelines. Figure 1-1 shows the names and locations of primary water delivery facilities. For more information about existing long-term SWP water supply contracts and annual water deliveries, see Table 1-6 (at the end of this chapter) and Chapter 9, Water Contracts and Deliveries.

Changes have occurred since the long-term SWP water supply contracts were signed in the 1960s, including population growth, differences in local water use, local water conservation programs, conjunctive-use programs, and environmental issues. Demands for SWP water are expected to increase and change as California's population continues to grow and as the potentially serious effects of climate change impact the State's water resources.

## Project Design

Water from rainfall and snowmelt runoff is stored in SWP conservation facilities and delivered via SWP transportation facilities to water agencies and districts in the Upper Feather River, North Bay, South Bay, San Joaquin, Central Coastal, and Southern California areas.

Three small reservoirs—Antelope Lake, Lake Davis, and Frenchman Lake—are the northernmost SWP facilities. Situated on Feather River tributaries in Plumas County, these lakes are used primarily for recreation. They also provide water to the City of Portola and local agencies that have water rights agreements with DWR.

Downstream from these lakes lies Lake Oroville, which conserves water from the Feather River watershed. Created by Oroville Dam, the tallest earthfill dam in the Western Hemisphere, Lake Oroville is the project's largest storage facility with a capacity of approximately 3.5 million acre-feet (af).

Releases from Lake Oroville flow down the Feather River into the Sacramento River, which drains the northern portion of California's great Central Valley. The Sacramento River flows into the Sacramento-San Joaquin Delta, comprising 738,000 acres of land interlaced with channels that receive runoff from 40 percent of the State's land area. The SWP, federal Central Valley Project (CVP), and local agencies all divert water from the Delta.

From the northern Delta, Barker Slough Pumping Plant diverts water for delivery to Napa and Solano counties through the North Bay Aqueduct, which was completed in 1988. Near Byron, in the southern Delta, the SWP diverts water into Clifton Court Forebay for delivery south of the Delta. Banks Pumping Plant lifts water from Clifton Court Forebay into the California Aqueduct, which flows to Bethany Reservoir. From Bethany Reservoir, the South Bay Pumping Plant lifts water into the South Bay Aqueduct to supply Alameda and Santa Clara counties. The South Bay Aqueduct provided initial deliveries in 1962 and has been fully operational since 1965.

Most of the water delivered to Bethany Reservoir from Banks Pumping Plant flows into the California Aqueduct. This 443-mile-long main aqueduct conveys water to the agricultural lands of the San Joaquin Valley and to the urban regions of Southern California.

The California Aqueduct winds along the west side of the San Joaquin Valley. It transports water to O'Neill Forebay, Gianelli Pumping-Generating Plant, and San Luis Reservoir. San Luis Reservoir has a storage capacity of more than 2 million af and is jointly owned by DWR and the Bureau of Reclamation (Reclamation). DWR's share of gross storage in the reservoir is 1,062,183 af. Generally, water is pumped into San Luis

**Figure 1-1** **Names and Locations of Primary Water Delivery Facilities, December 31, 2015**

Reservoir from late fall through early spring, where it is temporarily stored for release back to the California Aqueduct to meet summertime peaking demands of SWP and CVP water contractors.

SWP water not stored in San Luis Reservoir and water released from San Luis flows south through the San Luis Canal, a portion of the California Aqueduct jointly owned by DWR and Reclamation.

As the water flows through the San Joaquin Valley, numerous turnouts convey it to farmlands within the service areas of the SWP and CVP. Along its journey, this water is lifted more than 1,000 feet by four pumping plants—Dos Amigos, Buena Vista, Teerink, and Chrisman—before reaching the foot of the Tehachapi Mountains.

In the southern San Joaquin Valley, near Kettleman City, Phase I of the Coastal Branch Aqueduct serves agricultural areas west of the California Aqueduct. In August 1997, completion of Phase II extended the Coastal Branch Aqueduct to serve municipal and industrial water users in San Luis Obispo and Santa Barbara counties.

The remaining water conveyed by the California Aqueduct is delivered to Southern California, home to roughly two-thirds of California's population. Before it can be delivered, the water must first cross the Tehachapi Mountains. Fourteen 80,000-horsepower pumps at Edmonston Pumping Plant, situated at the foot of the mountains, raise the water 1,926 feet—the highest single lift of any pumping plant in the world. The water enters 8.5 miles of tunnels and siphons as it flows into Antelope Valley, where the California Aqueduct divides into two branches: the East Branch and the West Branch.

The East Branch carries water through Alamo Powerplant, Pearblossom Pumping Plant, and Mojave Siphon Powerplant into Silverwood Lake in the San Bernardino Mountains. From Silverwood Lake, water flows through the San Bernardino Tunnel to Devil Canyon Powerplant. Water continues down the East Branch through the Santa Ana Pipeline to Lake Perris, the southernmost SWP reservoir.

The East Branch Extension is a nearly 33-mile pipeline linking parts of service areas for San Bernardino Valley Municipal Water District and San Gorgonio Pass Water Agency to the California Aqueduct. The East Branch Extension, Phase I, carries water from Devil Canyon Powerplant Afterbay to Cherry Valley, bringing water to Yucaipa, Calimesa, Beaumont, Banning, and other communities. Phase II, when completed, will assist with this delivery.

Water in the West Branch flows through Oso Pumping Plant, Quail Lake, and then from the Peace Valley Pipeline through Warne Powerplant into Pyramid Lake in Los Angeles County. From there it flows through the Angeles Tunnel, Castaic Powerplant, Elderberry Forebay, and into Castaic Lake, terminus of the West Branch. Castaic Powerplant is operated by the Los Angeles Department of Water and Power.

The energy needed to operate the SWP, the largest single user of electrical power in California, comes from a combination of its own hydroelectric generating plants and power purchased from and exchanged with other utilities. The project's eight hydroelectric power plants, including four pumping-generating plants, produce enough electricity in a normal year to supply about two-thirds of the SWP's necessary operating power.

Tables 1-1 through 1-5, on the following pages, present statistical information about primary storage facilities, primary dams, pumping plants, power plants, and aqueducts.

## Future Planning and Construction

The planning, design, and construction of SWP facilities were based on studies and analyses that projected SWP water contractor annual water delivery needs. To meet these projected needs, water conservation reservoirs, storage facilities, and delivery facilities were planned to be constructed in stages as demands for water increased. Lake Oroville and San Luis Reservoir were the first SWP conservation reservoir facilities constructed. Additional facilities were scheduled to meet increased demands. It was anticipated that population growth in delivery service areas and water supply areas of origin would influence the final schedule for SWP facilities. Increasingly, issues such as escalating costs, environmental concerns, and increased non-SWP demand for limited water supplies have become important factors affecting the planning and construction of new facilities.

In response to changes in water management policy, DWR continues to reassess plans for additional facilities that will incorporate increased environmental safeguards, while also increasing SWP delivery yield. Developing these plans involves the time-consuming process of finding technically suitable projects and satisfying many complex and dynamic environmental procedures, laws, and regulations.

For more information about current SWP planning and construction, see Chapter 12, Engineering, Construction, and Real Estate. Information about prior construction activities can be found in previous issues of Bulletin 132.

**Table 1-1 Physical Characteristics of Primary Storage Facilities**

| Facility | Gross Capacity (acre-feet) | Surface Area (acres) | Shoreline (miles) |
|---|---|---|---|
| Antelope Lake | 22,600 | 930 | 15 |
| Frenchman Lake | 55,500 | 1,580 | 21 |
| Lake Davis | 84,400 | 4,030 | 32 |
| Lake Oroville | 3,537,600 | 15,810 | 167 |
| Thermalito Forebay | 11,800 | 630 | 10 |
| Thermalito Afterbay | 57,000 | 4,300 | 26 |
| Thermalito Diversion Pool | 13,400 | 320 | 10 |
| Clifton Court Forebay | 31,300 | 2,180 | 8 |
| Bethany Reservoir | 5,100 | 180 | 6 |
| Lake del Valle | 77,100 | 1,060 | 16 |
| San Luis Reservoir[a] | 2,027,800 | 12,520 | 65 |
| O'Neill Forebay[b] | 56,400 | 2,700 | 12 |
| Los Banos Reservoir | 34,600 | 620 | 12 |
| Little Panoche Reservoir | 5,600 | 190 | 6 |
| Quail Lake | 7,600 | 290 | 3 |
| Pyramid Lake | 171,200 | 1,300 | 21 |
| Elderberry Forebay | 32,500 | 500 | 7 |
| Castaic Lake | 323,700 | 2,240 | 29 |
| Silverwood Lake | 75,000 | 980 | 13 |
| Lake Perris | 131,500 | 2,320 | 10 |

[a] DWR's share of storage in San Luis Reservoir, jointly owned with Reclamation, is 1,062,183 af.
[b] DWR's share of storage in O'Neill Forebay is 29,500 af.

## Climate Change

Planners are also concerned about climate change and its potentially serious effects on water resources. Temperature increases may affect water demand and aquatic ecosystems. Projected increases in air temperature may lead to changes in the amount, timing, and form of precipitation—rain or snow; changes in the volume and timing of runoff; Delta water quality changes due to sea-level rise; and changes in the amount of irrigation water needed due to modified evapotranspiration rates.

The ability of the SWP and CVP to meet the water demands of their customers and the environment depends on the accumulation of mountain snowpack and subsequent spring and summer snowmelt runoff. A warming climate may reduce this natural water storage mechanism.

## Table 1-2 Physical Characteristics of Primary Dams

| Facility | Crest Elevation (feet) | Structural Height (feet) | Crest Length (feet) | Structural Volume (thousand cubic yards) |
|---|---|---|---|---|
| Antelope | 5,025 | 120 | 1,320 | 380 |
| Frenchman | 5,607 | 139 | 720 | 537 |
| Grizzly Valley | 5,785 | 132 | 800 | 253 |
| Oroville | 922 | 770 | 6,920 | 80,000 |
| Thermalito Diversion | 233 | 143 | 1,300 | 154 |
| Thermalito Forebay | 231 | 91 | 15,900 | 1,840 |
| Thermalito Afterbay | 142 | 39 | 42,000 | 5,020 |
| Clifton Court Forebay | 14 | 30 | 36,500 | 2,440 |
| Bethany | 250 | 121 | 3,940 | 1,400 |
| Del Valle | 773 | 235 | 880 | 4,150 |
| Sisk | 544 | 385 | 18,600 | 77,664 |
| O'Neill Forebay | 233 | 88 | 14,300 | 2,877 |
| Los Banos Detention | 384 | 167 | 1,370 | 2,100 |
| Little Panoche Detention | 676 | 152 | 1,440 | 1,210 |
| Pyramid | 2,606 | 400 | 1,090 | 6,860 |
| Elderberry Forebay | 1,550 | 200 | 1,990 | 6,000 |
| Castaic | 1,535 | 425 | 4,900 | 46,000 |
| Cedar Springs | 3,378 | 249 | 2,230 | 7,600 |
| Perris | 1,600 | 128 | 11,600 | 20,000 |
| Crafton Hills | 2,932 | 95 | 500 | 144 |

## Table 1-3 Pumping Plant Characteristics

| Facility | Number of Units | Normal Static Head (ft)[a] | Total Flow at Design Head (cfs)[a] | Total Motor Rating (hp)[a] |
|---|---|---|---|---|
| Robie Thermalito | 3 (p-g)[b] | 85-102 | 9,120 | 120,000 |
| Hyatt | 3 (p-g)[b] | 500-625 | 5,610 | 519,000 |
| Barker Slough | 9 | 95-120 | 228 | 4,800 |
| Cordelia | 11 | 138 | | |
| Banks | 11 | 236-252 | 10,670 | 333,000 |
| South Bay | 9 | 566 | 330 | 27,750 |
| Del Valle | 4 | 0-38 | 120 | 1,000 |
| Gianelli | 8 (p-g)[b] | 99-327 | 11,000 | 504,000 |
| Dos Amigos | 6 | 107-125 | 15,450 | 240,000 |
| Las Perillas | 6 | 55 | 461 | 4,050 |
| Badger Hill | 6 | 151 | 454 | 11,750 |
| Devil's Den[c] | 6 | 521 | 134 | 10,500 |
| Bluestone[c] | 6 | 484 | 134 | 10,500 |
| Polonio Pass[c] | 6 | 533 | 134 | 10,500 |
| Buena Vista[c] | 10 | 205 | 5,405 | 144,500 |
| Teerink[c] | 9 | 233 | 5,445 | 150,000 |
| Chrisman[c] | 9 | 518 | 4,995 | 330,000 |
| Edmonston[c] | 14 | 1,926 | 4,480 | 1,120,000 |
| Oso | 8 | 231 | 3,252 | 93,800 |
| Pearblossom | 9 | 540 | 2,575 | 203,200 |
| Greenspot | 4 | 382 | 50 | 3,900 |
| Crafton Hills | 3 | 613 | 40 | 4,000 |
| Cherry Valley | 2 | 130 | 75 | 300 |

[a] Feet=ft; cubic feet per second=cfs; horse power=hp.
[b] The term p-g indicates pumping-generating units.
[c] These plants have one unit in reserve.

## Table 1-4 Power Plant Characteristics, by Facility

| Hydroelectric Facility | Number of Units | Normal Static Head (ft)[a] | Total Flow at Design Head (cfs)[a] | Net Dependable Capacity (MW)[a] | Nameplate Capacity (MW)[a] |
|---|---|---|---|---|---|
| Thermalito Diversion Dam | 1 | 63-77 | 615 | 3 | 3 |
| Robie Thermalito | 4 (3 p-g)[b] | 85-102 | 17,400 | 114 | 114 |
| Hyatt | 6 (3 p-g)[b] | 410-676 | 16,950 | 645 | 645 |
| Gianelli (total) | 8 p-g[b] | 99-327 | 16,960 | 363 | 424 |
| Warne | 2 | 719-739 | 1,600 | 67 | 74 |
| Castaic[c] | 7 (6 p-g)[b] | 900-1,050 | 20,820 | 1,128 | 1,254 |
| Alamo | 1 | 115-141 | 1,740 | 15 | 17 |
| Mojave Siphon | 3 | 81-136 | 2,880 | 29 | 30 |
| Devil Canyon | 4 | 1,406 | 2,940 | 235 | 276 |

[a] Feet=ft; cubic feet per second=cfs; megawatts=MW.
[b] The term p-g indicates pumping-generating units.
[c] Castaic Pumping-Generating Plant is owned and operated by the Los Angeles Department of Water and Power.

## Table 1-5 Total Miles of Aqueducts

| Facility | Channel and Reservoir | Canal and Siphon | Pipeline and Discharge Line | Tunnel | Total |
|---|---|---|---|---|---|
| Grizzly Valley Pipeline | 0.0 | 0.0 | 6.0 | 0.0 | 6.0 |
| Thermalito Power Canal and Tail Channel | 1.5 | 1.9 | 0.0 | 0.0 | 3.4 |
| North Bay Aqueduct | 0.0 | 0.0 | 27.6 | 0.0 | 27.6 |
| South Bay Aqueduct (including Del Valle Branch) | 0.3 | 10.7 | 31.9 | 1.7 | 44.6 |
| *Subtotal* | *1.8* | *12.6* | *65.5* | *1.7* | *81.6* |
| California Aqueduct | | | | | |
| Clifton Court Forebay to O'Neill Forebay | 4.5 | 61.9 | 0.3 | 0.0 | 66.7 |
| O'Neill Forebay to Kettleman City | 4.1 | 101.4 | 0.2 | 0.0 | 105.7 |
| Kettleman City to Edmonston Pumping Plant | 0.0 | 120.1 | 0.9 | 0.0 | 121.0 |
| Edmonston Pumping Plant to Tehachapi Afterbay | 0.0 | 0.2 | 1.9 | 7.9 | 10.0 |
| Tehachapi Afterbay to Lake Perris | 4.0 | 97.8 | 34.3 | 3.9 | 140.0 |
| *Subtotal* | *12.6* | *381.4* | *37.6* | *11.8* | *443.4* |
| California Aqueduct Branches | | | | | |
| Coastal Branch | 0.0 | 14.1 | 98.7 | 2.7 | 115.5 |
| West Branch | 9.7 | 9.3 | 5.8 | 7.1 | 31.9 |
| East Branch Extension | | | | | |
| Devil Canyon Powerplant to Greenspot Pump Station | 0.0 | 0.0 | 16.2 | 0.0 | 16.2 |
| Greenspot Pump Station to Noble Creek Terminus | 0.0 | 0.0 | 16.4 | 0.0 | 16.4 |
| *Subtotal* | *9.7* | *23.4* | *137.1* | *9.8* | *180.0* |
| **Total** | **24.1** | **417.4** | **240.2** | **23.3** | **705.0** |

To address these concerns, DWR and Reclamation are coordinating with federal, State, and local agencies and nongovernmental organizations to provide qualitative and quantitative assessments of the potential risks and effects of climate change on California's water resources and update decision makers on climate change impacts, the ability of existing facilities to accommodate these impacts, and available mitigation measures.

In response to changes brought about by population growth, environmental concerns, climate change, and other factors, DWR continues to plan, design, and construct transportation and power-producing facilities for the SWP.

For more information on climate change, see Chapter 3, Environmental Programs.

## Methods of Financing

Project facilities have been constructed with several general types of financing: general obligation bonds and tideland oil revenues (under the Burns-Porter Act, which was approved by the Legislature in 1959, and the bond issue approved by voters in 1960); revenue bonds; and capital resources revenues. Repayment of these funds, and the operations, maintenance, power, and replacement costs associated with water supply, are paid by the 29 agencies and districts that have long-term contracts with DWR for the delivery of SWP water.

## Long-term Contracting Agencies

From 1963 through 1967, 32 agencies or districts signed long-term water supply contracts with DWR. However, in 1965, the City of West Covina was annexed to The Metropolitan Water District of Southern California, and in 1981, Hacienda Water District was assigned to Tulare Lake Basin Water Storage District. On January 1, 1992, Castaic Lake Water Agency assumed all rights and obligations granted to Devil's Den Water District in accordance with its long-term water supply contract. Therefore, only 29 agencies and districts have long-term contracts with DWR as of December 31, 2015.

The contracts initially provided for a combined maximum annual Table A amount of 4,230,000 af of water supply. As a result of contract amendments in the 1980s and the Monterey Amendment, the current combined maximum annual Table A amount by 2016 totals 4,172,786 af (see Appendix B, Table B-4 for details). The contracts are in effect for the longest of the following periods:

- the project repayment period, which extends to the year 2035;
- 75 years from the date of the contract; or
- the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

Figure 1-2 shows the name and location of each contracting agency and district and lists the first year of SWP delivery service for each. Table 1-6 presents more detailed information about each contracting agency.

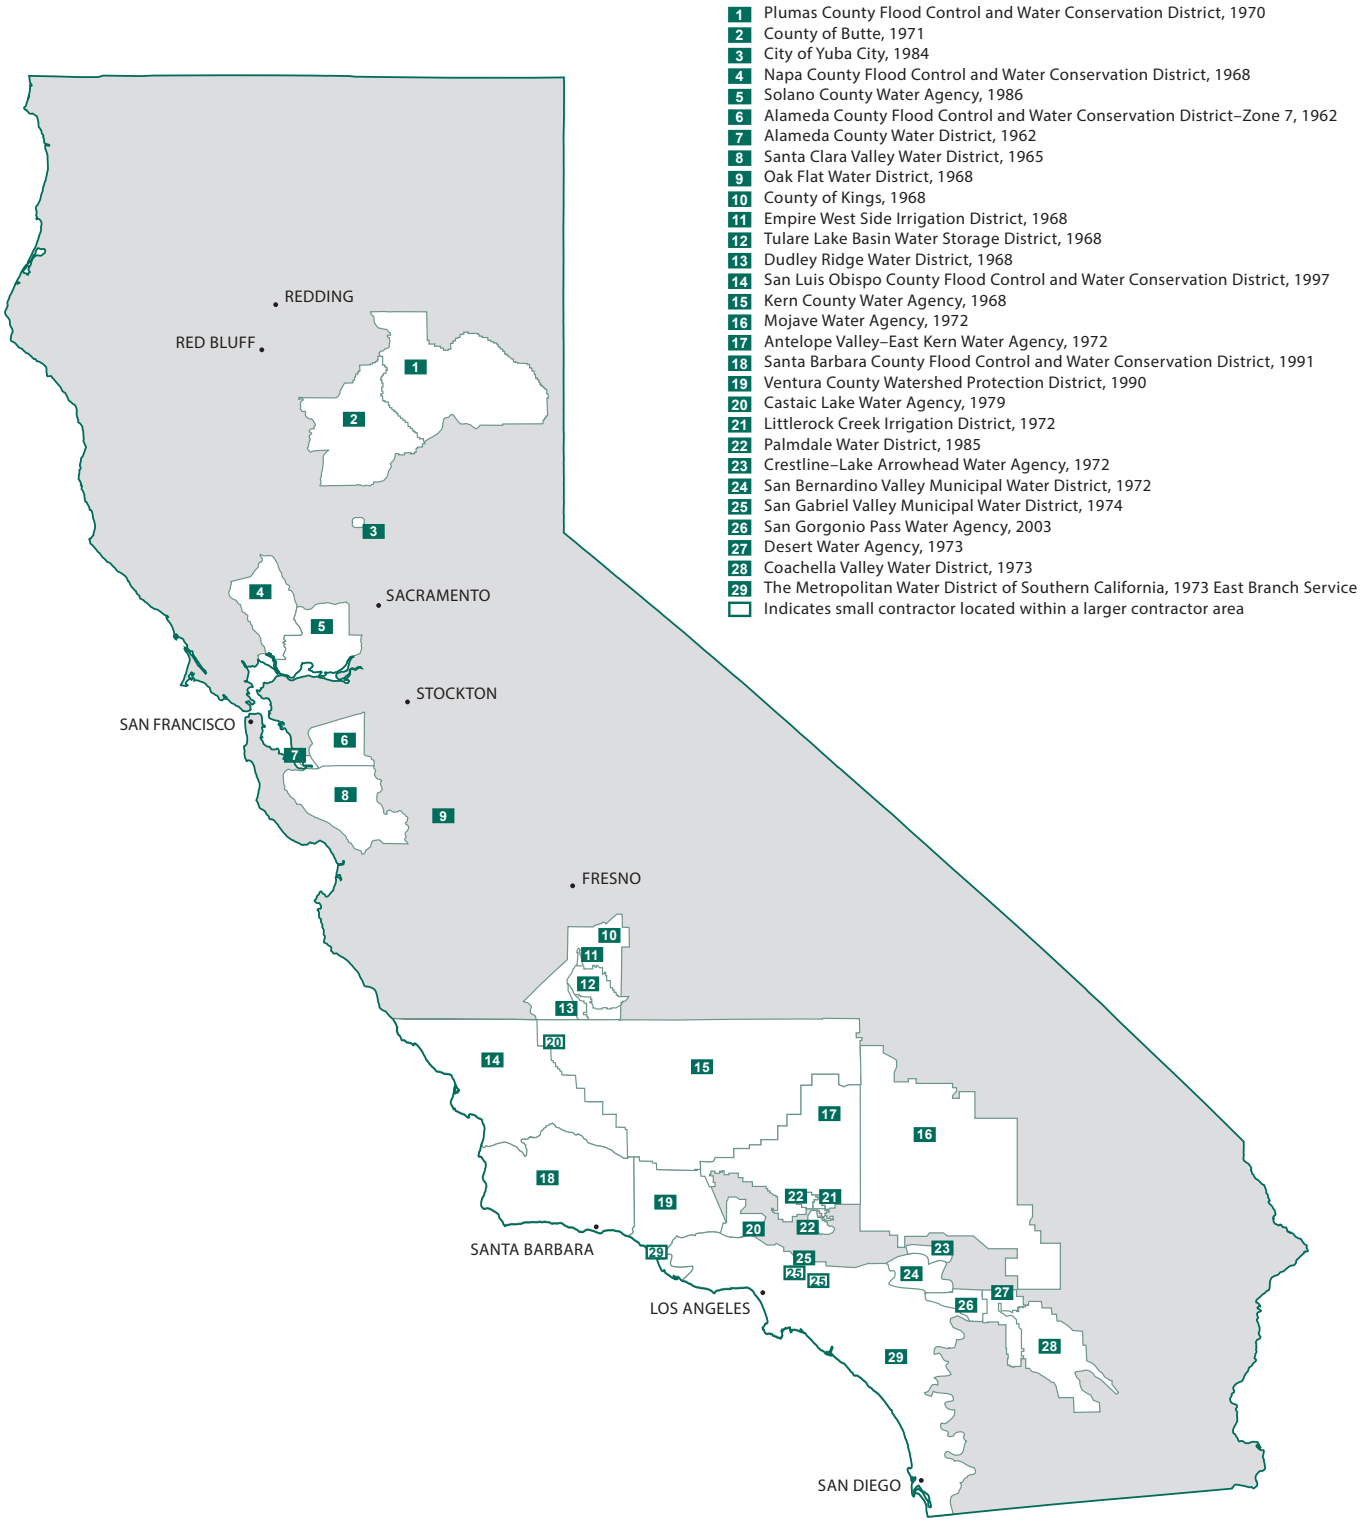

**Figure 1-2 Names, Locations, and First Year of Service of SWP Long-term Contracting Agencies, December 31, 2015**

## Table 1-6 Long-term Water Supply Contracting Agencies, by Area, as of December 31, 2015

| Contracting Agency | Cumulative Deliveries (acre-feet)[a] | Annual Table A (acre-feet) | Payments (in dollars)[h] | Gross Area (acres) | Assessed Valuation (in dollars)[b] | Estimated Population |
|---|---|---|---|---|---|---|
| **Upper Feather River Area** | | | | | | |
| City of Yuba City | 48,278 | 9,600 | 7,873,848 | 9,813 | 4,644,427,541 | 68,379 |

[a] All water delivered to long-term SWP water contractors, including carryover, Article 21, surplus, unscheduled, exchange, permit, purchased, local, and non-SWP water.
[b] Statutes of 1978, Chapter 1207, added Section 135 to the Revenue and Taxation Code, requiring assessment at 100 percent of full value for the 1981–1982 fiscal year and fiscal years thereafter.
[c] Total of all Plumas County Flood Control and Water Conservation District, including Last Chance Creek Water District.
[d] Assessed valuation not available on an agency area breakdown.
[e] Castaic Lake Water Agency (Southern California Area) includes land in the San Joaquin Valley Area formerly known as Devil's Den Water District.
[f] Total for Metropolitan, including Calleguas Municipal Water District, which is common to Metropolitan and Ventura County Watershed Protection District.
[g] Includes duplicate values. Some areas that are within two or more agencies are included in each agency's total.
[h] Includes all payments pursuant to the repayment provisions of the Water Supply Contracts. Transportation and Conservation Replacement Accounting System payments are also included in this table.
WD = Water District; WCD = Water Conservation District

# Chapter 2
# Delta Resources

*Waterways and wetlands of the Sacramento-San Joaquin Delta at Sherman Island.*

## Significant Events in 2015

In April, the Governor announced a major change for the project known as the Bay Delta Conservation Plan (BDCP). A new preferred alternative (Alternative 4A) proposed to construct water conveyance facilities through an initiative called California WaterFix.

In response to drought conditions, a temporary, emergency salinity/drought barrier was constructed in the Delta on West False River between Jersey and Bradford islands to limit saltwater intrusion into the Central and South Delta from San Francisco Bay.

The West Delta Program completed construction of the Sherman Island Whale's Mouth Wetland Restoration Project, a 650-acre wetland on the lower southwest side of Sherman Island.

*Information for this chapter was contributed by the FloodSAFE Environmental Stewardship and Statewide Resources Office, the Bay-Delta Office, and the Division of Flood Management.*

The Sacramento-San Joaquin Delta (Delta) is a unique environmental resource and a major source of water for millions of Californians. Since the 1950s, the Department of Water Resources (DWR) and other State and federal agencies have developed and implemented numerous programs to manage the Delta.

## Delta Water Management Programs

Future water deliveries to millions of Californians throughout the State will be affected by many factors, including two significant changes: Delta pumping restrictions and climate change. Ongoing planning activities and regulatory actions continue to influence DWR activities in the Delta. As a result of the efforts associated with the California Water Fix and California EcoRestore (these two programs replaced the Bay Delta Conservation Plan [BDCP]), and the Delta Stewardship Council's (DSC) *Delta Plan*, many of DWR's proposed projects were suspended as staff continued to work on the State Water Project (SWP) Delta Compliance Program.

## BDCP/California WaterFix

In April 2015, the Governor announced a major change for the project known as the BDCP. A new preferred alternative (Alternative 4A) to the BDCP would not complete BDCP as a Natural Community Conservation Plan, but instead construct water conveyance facilities through an initiative called California WaterFix. A parallel effort called California EcoRestore proposes to implement habitat restoration actions in the Delta. California WaterFix is being developed in compliance with the federal Endangered Species Act.

For more information regarding BDCP/California WaterFix, see Chapter 3, Environmental Programs.

## Emergency Drought Barrier

In 2015, in response to drought conditions, a temporary, emergency salinity/drought barrier was constructed in the Delta on West False River between Jersey and Bradford islands and just east of the confluence with the San Joaquin River. The barrier would limit saltwater intrusion into the Central and South Delta from San Francisco Bay, allowing Delta water quality to be maintained and water in upstream reservoirs to be conserved. The barrier, built with large rocks, measured approximately 750 feet long and 12 feet wide at the top. Installation started in May and was completed in June, and removal started in September and was completed in November. The barrier successfully allowed the SWP and CVP to operate with reduced Sacramento River/ Delta outflow, as approved by the SWRCB, while maintaining control of salinity in the Central Delta. A comprehensive efficacy report is being prepared by DWR and is planned to be completed by January 2017.

For more information see Chapter 4, Water Quality Programs, and Chapter 7, Water Supply Development & Reliability.

## Delta Plan

The *Delta Plan*, adopted by the DSC in May 2013 in compliance with the Delta Reform Act of 2009, is a comprehensive, long-term management plan for the Delta. It became effective with legally enforceable regulations in September 2013. (For more information, see the sidebar, Delta Stewardship Council.)

## Delta Stewardship Council

Created by the Legislature under the Sacramento-San Joaquin Delta Reform Act of 2009 (Delta Reform Act), the Delta Stewardship Council (DSC) is an independent agency of the State of California composed of members who represent different parts of the State and offer diverse expertise in fields such as agriculture, science, the environment, and public service. Of the seven members, four are appointed by the Governor, one each is appointed by the Senate and by the Assembly, and the seventh is the Chair of the Delta Protection Commission. The council is the successor to the California Bay-Delta Authority and assumes all of its administrative rights, abilities, obligations, and duties.

The *Delta Plan* was adopted by the DSC on May 16, 2013. It became effective with legally enforceable regulations on September 1, 2013. The *Delta Plan* is a comprehensive, long-term management plan for the Sacramento-San Joaquin Delta. It establishes a set of integrated policies, strategies, and actions to guide State and local agencies to help achieve the coequal goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. It will also guide protection and enhancement of the unique resources, culture, and values of the Delta as an evolving place (California Water Code Section 85054).

The Delta Reform Act specifies eight policy objectives that are "inherent" in the coequal goals (see California Water Code Section 85020). It also specifies a statewide policy to reduce reliance on the Delta in meeting the State's future water supply needs through improved regional water self-reliance (California Water Code Section 85021) and identifies specific subjects and strategies that must be included in the *Delta Plan* (see generally, California Water Code Sections 85301–85309).

The Delta Reform Act also established the Delta Science Program and Delta Independent Science Board (ISB) to provide the scientific support and oversight the DSC needs to make decisions based on sound science. The Delta Science Program replaces the CALFED Bay-Delta Program Science Program, and the Delta ISB replaces the CALFED Bay-Delta Program ISB.

The Delta Science Program will develop scientific information and synthesis on issues critical to managing the Bay-Delta system. That body of knowledge must be unbiased, relevant, authoritative, integrated across State and federal agencies, and communicated to Bay-Delta decision makers, agency managers, stakeholders, the scientific community, and the public. The *Delta Science Plan* released by the DSC in December 2013, provides a guide for organizing, conducting, and integrating science in the Delta. A Science Action Agenda will be a key component of implementing the *Delta Science Plan.*

The Delta ISB is a standing board of nationally and internationally prominent scientists with appropriate expertise to evaluate the broad range of scientific programs that support adaptive management of the Delta. The Delta ISB will provide oversight of the scientific research, monitoring, and assessment programs that support adaptive management of the Delta through periodic reviews of each of those programs. The overall objective of Delta ISB oversight is to ensure that the science supporting Bay-Delta programs, the application of that science, and the technical aspects of the Bay-Delta programs are optimally developed and implemented.

More information about the *Delta Plan* is available on the DSC's website.

## State Water Project Delta Compliance Program

The SWP and Central Valley Project (CVP) obtained take authorization for the federal Endangered Species Act and California Endangered Species Act listed fish species for coordinated operations in the Delta through a U.S. Fish and Wildlife Service biological opinion (BiOp) for Delta Smelt in December 2008, a Department of Fish and Wildlife incidental take permit for Longfin Smelt in February 2009, and a National Marine Fisheries Service (NOAA Fisheries) BiOp for salmon, steelhead, and Green Sturgeon in June 2009. Some of the requirements in these documents were implemented right away, while others needed development of studies and projects before being implemented.

In 2015, efforts continued under the SWP Delta Compliance Program to develop studies and construct projects to address regulatory requirements under the NOAA Fisheries and U.S. Fish and Wildlife Service BiOps and the Department of Fish and Wildlife incidental take permit.

### Predation, Release, and Efficiency Program

The predation, release, and efficiency program includes improving existing fish salvage release sites, developing additional fish salvage release sites, assessing predation reduction alternatives, continuing the associated predation study for Clifton Court Forebay, and evaluating the screening efficiency of the Skinner Fish Facility to comply with the requirements under the BiOps and incidental take permit. These requirements include:

- reducing prescreen loss of federal Endangered Species Act-protected salmon and steelhead in Clifton Court Forebay to no more than 40 percent (Prescreen loss is the loss of fish as they move across the forebay that results from predation by fish and birds.);
- reducing predation by 50 percent at the fish release sites;
- implementing fish release site studies to develop methods to reduce predation following release of salvaged fish; and
- identifying salvage deficiencies and recommending actions to improve salvage efficiency in order to meet a required efficiency goal of 75 percent for salmonids.

#### *Fish Science Building*

The addition of the Fish Science Building at the Skinner Fish Facility was essential to improve DWR's ability to conduct fish studies to meet regulatory requirements for operation of the SWP. The existing collection, handling, transport, and release building was too small and lacked the necessary equipment to hold and rear fish to carry out various studies and projects. The new building includes a small laboratory, fish rearing tanks, an office, and an area to store study gear and equipment. Construction of the Fish Science Building was initiated in 2013 and completed in 2014. It became fully operational in 2015, supporting numerous fishery studies related to the BiOps.

#### *Fish Salvage Release Sites*

The predation reduction strategy for the release sites includes designing and constructing the Curtis Landing fish release site with minimal in-water structure to reduce predation and improve survival of released salvaged fish. Two new fish release sites will be built on Sherman Island so that more time can be allowed between releases at each site. Coordinated interagency use will occur at a total of six release sites.

Construction of the major components of the Curtis Landing fish release site was

completed in 2014, and the facility became fully operational in 2015. Design of the two new Sherman Island sites was completed in 2014, all permits were obtained, and construction was initiated in fall 2015. A cost-sharing agreement with DWR's Delta Levees Program for these two sites was also implemented for the levee construction portion of this project.

### *Clifton Court Forebay Fishing Facility*

The predation reduction strategy for Clifton Court Forebay was to increase public fishing opportunities in the forebay, with the intention of reducing the number of predatory fish and the prescreen loss of federal Endangered Species Act-protected salmon and steelhead. This strategy involved constructing a fishing pier to provide improved access to anglers.

During 2014, changes were made to Conservation Measure 1 of the BDCP that conflicted with the fishing pier project and would have effectively prevented public access to the fishing pier. The project was indefinitely suspended, and DWR, in close coordination with NOAA Fisheries, analyzed other predator reduction alternatives in 2015 (as described in the Ad Hoc Studies section below).

The predator study continued in 2015. The study is designed to gather as much information as possible, pre- and post-installation of the proposed fishing facility, to document the behavior and population demographics of predatory fish and birds, as well as salmonid survival. Full-scale predator sampling and acoustic tagging, avian surveys, creel surveys, and releases of marked salmon were conducted. Pilot-level genetic analysis of predator stomach contents also continued in 2015.

### *Ad Hoc Studies*

Subsequent to the suspension of the fishing facility project, and as a result of numerous meetings with NOAA Fisheries and DWR's ongoing responsibility to reduce prescreen loss of listed fish species, DWR embarked on a study of more than 21 alternatives to reduce predation in the forebay. NOAA Fisheries identified six preferred alternatives and provided a ranking of these alternatives. In addition, NOAA Fisheries approved an extension for compliance with the BiOp requirement conditioned on DWR completing four interim measures to reduce predation in the forebay. DWR immediately initiated planning of the four interim measures:

- electrofishing the forebay;
- controlling aquatic weeds;
- establishing a fishing incentive program; and
- implementing operational changes to limit take.

DWR also initiated an in-depth study of various dredging proposals for the forebay that could contribute to the survival of listed fish species.

Additional information about CVP/SWP operations related to the BiOps can be found in Chapter 3, Environmental Programs.

### *Skinner Fish Facility*

The strategy for determining the screening efficiency of the Skinner Fish Facility includes evaluating:

- fish losses through primary louvers, secondary louvers, and holding tanks;
- hydraulics within the facility;
- relative abundance of predators within the primary louver channels; and
- fish behavior and movement patterns as they are entrained and guided through the facility.

During 2015, the technical team continued to evaluate and recommend revisions to the SWP and CVP fish loss equations used at the

respective facilities. Other efforts included construction and installation of new stainless steel fish transport and count buckets and initiation of a contract with the University of California, Davis, to conduct studies relative to Green Sturgeon behavior near structures similar to the louvers.

### Fish Screen Evaluations

Fish screens at Barker Slough Pumping Plant, Roaring River Slough Distribution System, and diversions around Sherman Island continued to be evaluated to comply with the requirements of the BiOps and the incidental take permit. The evaluations consisted of three components:

- fish screen cleanliness;
- fish screen hydraulics; and
- fish entrainment.

The evaluations were used to determine whether facility structural components are in sufficient condition to perform as designed; the effectiveness of fish screen cleaning practices; water approach velocities for various screen cleanliness conditions; and entrainment for various combinations of fish presence, pumping rates, times of day, and times of year.

During 2015, a number of evaluations were conducted for each facility. Final reports were prepared for the November 2013 through June 2014 evaluation period, and draft reports were prepared for the November 2014 through June 2015 evaluation period. In addition, some screens were repaired or replaced based on the results of these evaluations.

## Delta Knowledge Improvement Program

In response to Assembly Bill 1200 (Laird; Chapter 573, Statutes of 2005), which required DWR to provide a risk analysis of the Delta and Suisun Marsh and to develop a set of improvement strategies to manage those risks, DWR created the Delta Risk Management Strategy to look at the sustainability of the Delta and assess major risks to Delta resources from floods, seepage, subsidence, and earthquakes (see Bulletins 132-08 through 132-13).

During the course of the Delta Risk Management Strategy project, a number of information gaps and information quality issues were identified. The limited amount of quality information prompted the creation of the Delta Knowledge Improvement Program, as a means to actively fund specific studies to fill the data gaps identified in the Delta Risk Management Strategy.

In 2015, the Delta Knowledge Improvement Program focused on studies to improve State levee investment decisions in the Delta. These studies included:

- an ongoing economic study to assist the DSC in developing a comprehensive investment strategy for the Delta levees;
- a feasibility study to assist the Delta Protection Commission with making recommendations on how to implement a Delta Flood Risk Management Assessment District; and
- an investigation to determine how Delta levees on peat soils respond under seismic loading.

As part of an effort to update determination of the 100-year water levels in the Delta, the Delta Knowledge Improvement Program funded a data quality analysis of historical water levels reported by gauge stations in the Delta.

More information about the Delta Knowledge Improvement Program is available on DWR's website.

# North Delta Flood Control and Ecosystem Restoration Project

The North Delta Flood Control and Ecosystem Restoration Project will provide flood control improvements and ecosystem restoration in the North Delta. The project will implement important flood control improvements in the area of the North Delta where the Mokelumne River, Cosumnes River, Dry Creek, and Morrison Creek converge (see Figure 2-1). Flood flows in the area threaten levees, bridges, and roadways when levees on McCormack-Williamson Tract (MWT) are overtopped and a flood surge occurs. The proposed project will help regulate peak flood flows and prevent flood surges. It will also provide substantial aquatic and terrestrial habitat benefits.

The final North Delta Flood Control and Ecosystem Restoration Project environmental impact report was certified in November 2010 and recommended the implementation of a preferred alternative (Alternative 1-A for the Group I actions and the No Action Alternative for the Group II actions [for details see Bulletin 132-11]). The project will create tidal, subtidal, aquatic, and terrestrial habitats benefiting a number of special status species such as Sacramento Splittail and Chinook Salmon. The project, as proposed, will provide contiguous habitat and a riparian corridor from the downstream portion of the Cosumnes River Preserve to the Delta.

Two project elements are proposed for implementation: the MWT element combines North Delta flood surge reduction measures with the construction of habitat-friendly levees, floodplain restoration, and the creation of freshwater tidal habitat on MWT. The MWT property, purchased using a CALFED Bay-Delta Program grant, is currently owned and managed by The Nature Conservancy. (For background on the CALFED Bay-Delta Program, see Bulletins 132-95 through 132-11.) When completed, the MWT element will result in nearly 1,500 acres of tidal marsh and floodplain restoration. The Grizzly Slough element consists of breaching the Grizzly Slough and Bear Slough levees upstream of MWT to help attenuate peak flood flows and maximize nearly 500 acres of floodplain habitat on the DWR-owned property. These projects are consistent with the objectives put forth in the *California Water Action Plan*, the *Delta Plan*, and the California EcoRestore initiative.

## Project Status

The MWT project planning, permitting, and implementation was divided into two phases, due to the size and complexity of the multibenefit project. Phase A entails constructing a protective tower levee and resloping the landside levee to strengthen levees and minimize the effect of wave-wash erosion when the land receives flood water as designed. Phase B is proposed to include weir construction, levee breaching, and floodplain and tidal marsh restoration.

In 2015, the MWT Project Team completed studies, regulatory requirements (e.g., permits under Clean Water Act Sections 401 and 404 and a biological assessment), and planning work for Phase A. Construction is planned for 2017. Considerable progress was made on Phase B (real estate activities, permitting strategies, and updated hydrologic models), which is proposed to be implemented in 2018 and 2019. As part of Phase B, DWR is working with the California Natural Resources Agency/California EcoRestore to evaluate long-term ownership, management/monitoring options, and potential funding sources. Concurrent with MWT project work, a separate team under Reclamation District 348 (New Hope Reclamation District) is beginning the project design work for Grizzly Slough, including the real estate analyses and wetland delineation.

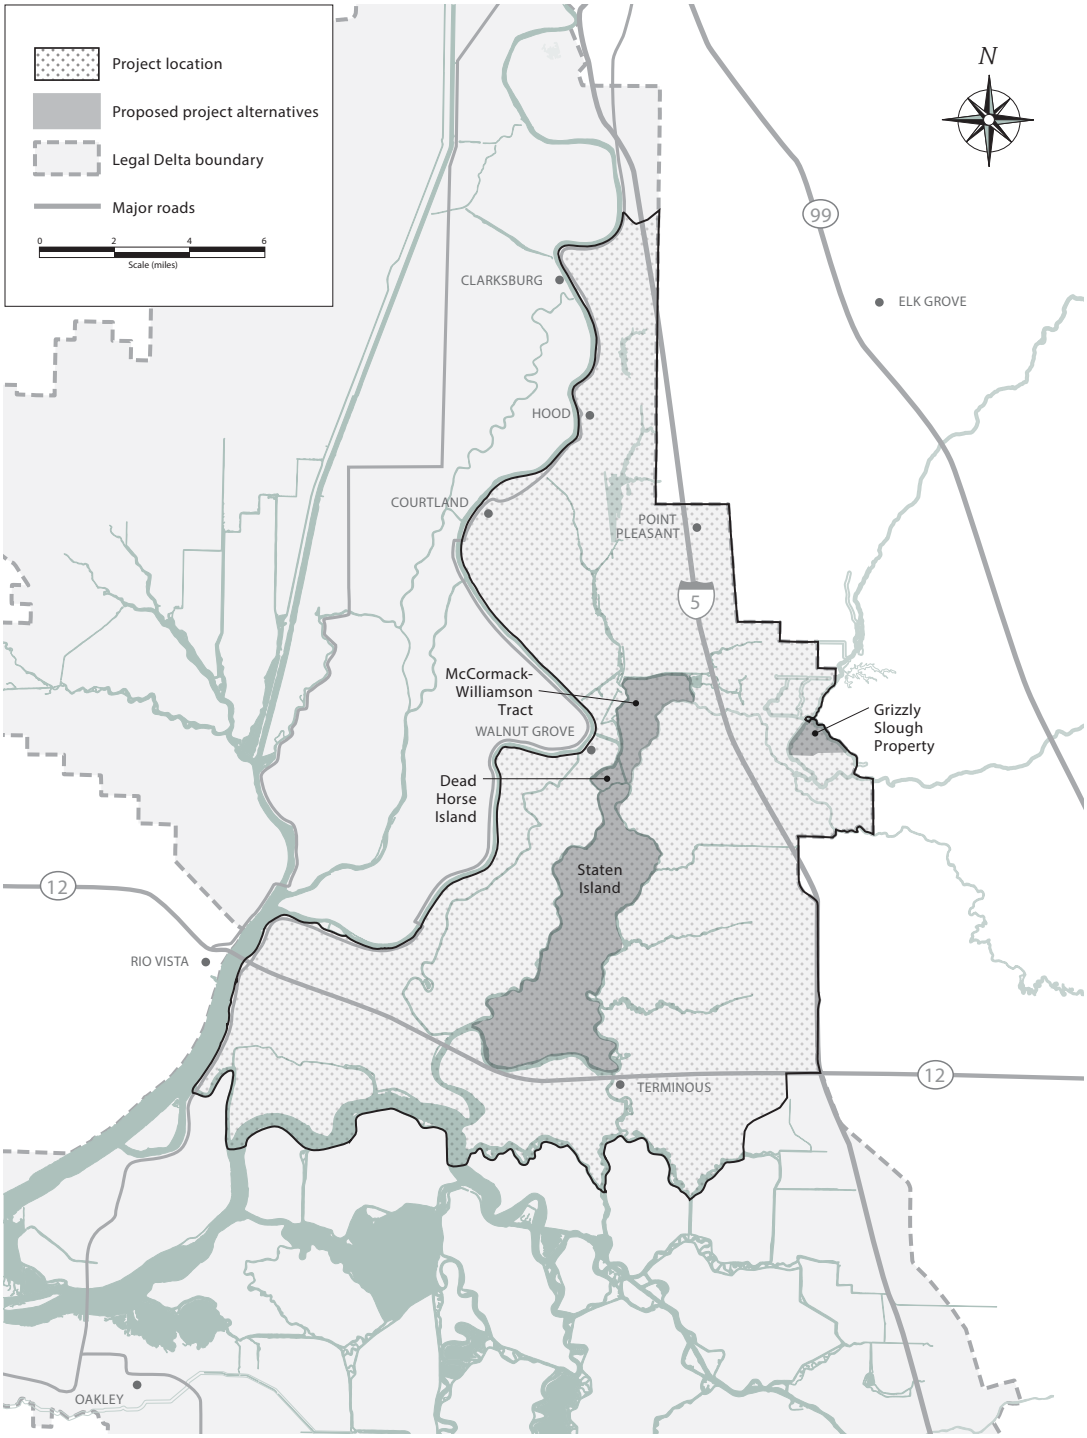

**Figure 2-1** **North Delta Flood Control and Ecosystem Restoration Project**

## South Delta Improvements Program

In 1999, the South Delta facilities became a key component of the CALFED Bay-Delta Program.

South Delta Improvements Program (SDIP) elements in the CALFED Bay-Delta Program record of decision included increasing diversions through Clifton Court Forebay (first to 8,500 cubic feet per second [cfs] and then to 10,300 cfs), dredging and installing operable tidal barriers in the South Delta, installing a fish barrier at the Head of Old River, and constructing the first phase of a new intake and fish screen in Clifton Court Forebay. SDIP is proposed to be implemented in two component stages.

DWR and the Bureau of Reclamation (Reclamation) identified the following SDIP project objectives and purposes:

- reducing movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via Old River (SDIP Stage 1);
- maintaining adequate water levels and water quality through improved circulation for agricultural diversions in the South Delta, downstream of the Head of Old River (SDIP Stage 1);
- increasing water deliveries and delivery reliability to SWP and CVP water contractors south of the Delta (SDIP Stage 2); and
- providing opportunities to convey water for fish and wildlife purposes by increasing the maximum permitted level of diversion through the existing intake gates at Clifton Court Forebay to 8,500 cfs (SDIP Stage 2).

The SDIP Stage 1 physical/structural component includes the following elements:

- constructing and operating a fish-control gate at the Head of Old River to reduce downstream movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via the Head of Old River;
- constructing and operating up to three flow-control structures (gates) at Middle River (near the confluence of Middle River with Victoria Canal); Grant Line Canal (near the confluence of Grant Line Canal and Old River); and Old River (just east of the Delta-Mendota Canal intake) to improve existing water levels and circulation patterns in South Delta water channels;
- dredging various channels in the South Delta, including Middle and Old rivers, to improve conveyance; and dredging areas surrounding agricultural diversions to improve their function; and
- extending up to 24 agricultural diversion intake facilities to improve their function.

The SDIP final environmental impact report/environmental impact statement (2006) determined the preferred alternative for SDIP Stage 1, which entails installation of permanent control gates to replace the temporary rock barriers currently installed and removed each year under the DWR South Delta Temporary Barriers Project. The preferred alternative also includes the elements of dredging and extending agricultural diversions.

### Preferred Plan

The preferred plan for SDIP is to construct the Stage 1 physical/structural component as soon as permits are obtained and defer the operational component until more is known about the project's potential effects on Delta Smelt and other protected fish species.

DWR deferred both the increase in diversions of up to 10,300 cfs and the associated new fish screens as components of the SDIP due to major funding issues and significant technical uncertainties associated with the design and construction of the new fish screens.

## Program Status

DWR and Reclamation continued to suspend most SDIP planning and permitting activities during 2015. Some activities were undertaken to address requirements of the 2009 NOAA Fisheries BiOp for the CVP and SWP Long-term Operations Criteria and Plan.

Discussions between DWR and NOAA Fisheries revealed NOAA Fisheries' concern for potential barrier hydraulic disturbances that could promote increased predation on juvenile salmon. DWR conducted a hydrodynamic study focusing on barrier design features to minimize these disturbances. A study report was submitted to NOAA Fisheries in April 2010, which identified several features that could be incorporated into the design.

NOAA Fisheries stated an interest in delaying further discussions on the SDIP until completion of an ongoing, multiyear South Delta Temporary Barriers Project predation study. The study is being conducted to satisfy requirements of the project's 2008 NOAA Fisheries BiOp and is examining the occurrence of predation associated with the project. The study's field data collection was completed in 2011, and data analysis is in progress. A final predation study report is expected in 2017. Data from the study will be useful in considering permanent barrier design options and operation strategies to minimize predation.

For additional information about SDIP, see Chapter 7, Water Supply Development and Reliability.

## Temporary Barriers Project Facilities

The South Delta Temporary Barriers Project is an ongoing project that installs up to four rock barriers in channels located in the southern portion of the Delta near the cities of Tracy and Lathrop in San Joaquin County. The barriers are usually installed during the irrigation season from April to November at four sites (see Figure 2-2), as follows:

(1) Head of Old River, in Old River where it splits from the San Joaquin River;
(2) Old River near Tracy, one-half mile east of the Jones Pumping Plant intake and about 8 miles northwest of Tracy;
(3) Middle River near Victoria Canal, just southeast of the confluence of Middle River, Trapper Slough, and North Canal; and
(4) Grant Line Canal, 420 feet east of the Tracy Boulevard Bridge.

The Old River near Tracy, Middle River near Victoria Canal, and Grant Line Canal rock barriers are designed to act as flow-control structures to improve water levels and circulation within the South Delta. The Head of Old River barrier is designed to improve migration conditions for Central Valley fall-run Chinook Salmon in the spring and fall. In the spring, the barrier blocks migratory movements of juvenile salmon into Old River from the San Joaquin River. In the fall, the barrier increases the volume of San Joaquin River flow passing downstream through the Port of Stockton and improves dissolved oxygen levels in the San Joaquin River. As a result, it improves the low dissolved oxygen sag that occurs near that area and aids upstream migration of adult salmon in the San Joaquin River basin.

In 2015, the three flow-control agricultural barriers at Middle River near Victoria Canal, Grant Line Canal, and Old River near Tracy were installed and operated as planned. Installation started in March, and the barriers were removed in November. Additionally,

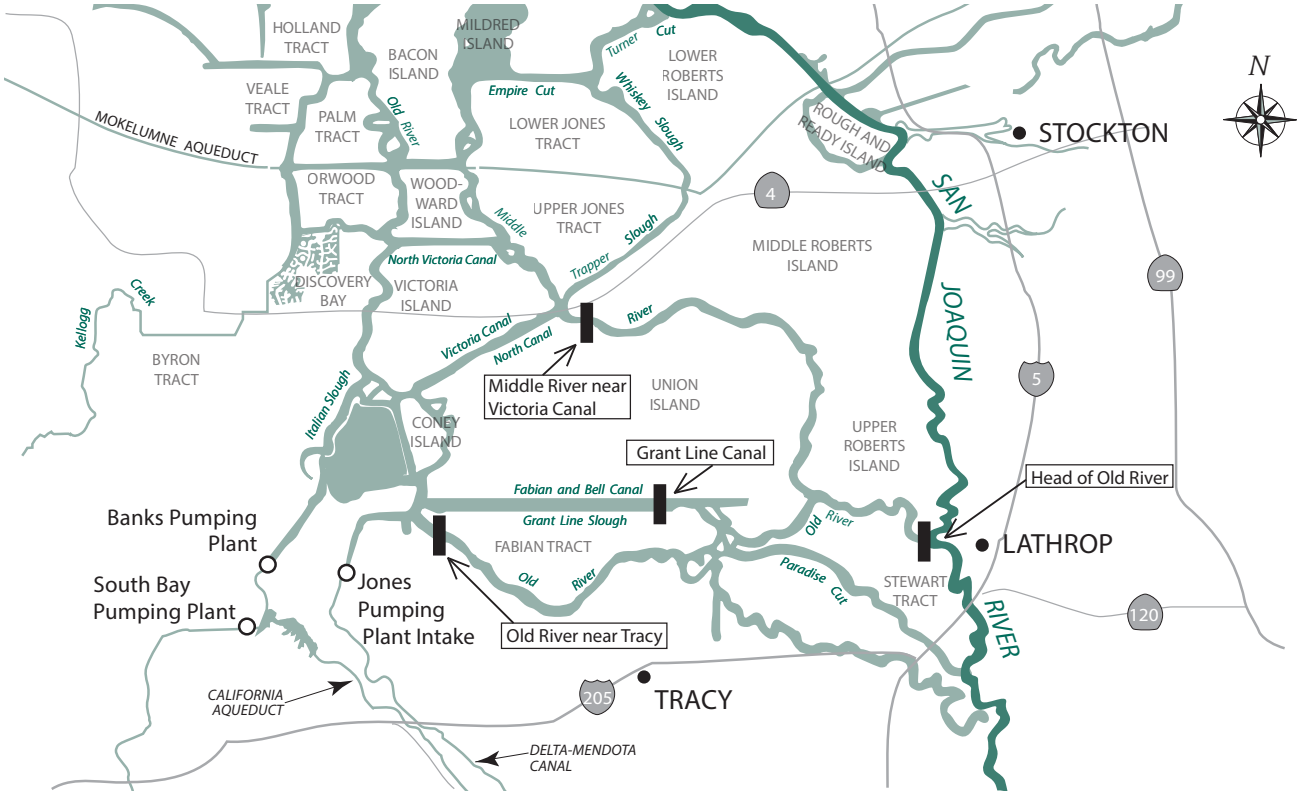

**Figure 2-2 Temporary Barrier Locations in the South Delta**

the option of raising the Middle River barrier by 1 foot to increase the water level and improve circulation was exercised on June 8, 2015.

The spring Head of Old River rock barrier was installed in 2015 with construction beginning in early March and full closure achieved by April 3. Eight culverts with slide gates remained in the open position for the duration of the installation. The barrier was breached on June 1, 2015, and it was completely removed by June 8, 2015.

In 2015, the Head of Old River Predator Manipulation Study was implemented to study predatory fish distribution and abundance in the San Joaquin River in the vicinity of the Head of Old River. The coordinated acoustic telemetry studies were conducted by Reclamation, NOAA Fisheries, and the U.S. Fish and Wildlife Service to track the movements of salmon smolts, steelhead, and predatory fish to determine the outmigrating salmon smolt survival in the Delta and to learn more about the predatory fish impact on the salmon population. In the Predator Manipulation Study, NOAA Fisheries used genetic analysis to determine predator diet and tested the hypothesis that salmon smolt survival can be improved in one reach of the San Joaquin River by removing and relocating predatory fish to another reach.

In 2015, the fall Head of Old River rock barrier was installed and operated from September 13 until November 12, when the barrier was breached. Removal was completed on November 18.

Data collected in 2015 are being analyzed, and the findings of the studies will be published in reports and peer-reviewed

journal articles by the respective agency for each individual study.

Information on the temporary barriers, including details about barrier operations, can be found on DWR's website.

## Delta Flood Control

Levees in the Delta protect valuable wildlife habitat, farms, homes, urban areas, recreational developments, highways, railroads, natural gas infrastructure, utility lines, a major aqueduct, and other public developments. Delta levees influence and protect critical water quality parameters in Delta waterways. Some levees also protect water quality for approximately 25 million Californians who receive a portion of their water from the Delta. The State Legislature recognized the importance of the Delta and enacted the Delta Flood Protection Act of 1988, declaring that ". . . the Delta is endowed with many invaluable and unique resources and that these resources are of major statewide significance" (California Water Code Sections 12300 et seq.).

Since 1988, the Delta Levees Program has provided more than $310 million in State-appropriated funds. These monies are combined with local cost-share funding to provide flood protection and environmental benefits in the Delta.

In Senate Bill 34 (Boatwright; Chapter 28, Statutes of 1988), the Legislature declared its intent to appropriate $6 million for local assistance under the Delta Levee Maintenance Subventions Program and $6 million for Delta Levees Special Flood Control Projects, including subsidence studies and monitoring on Bethel, Bradford, Jersey, Sherman, and Twitchell islands; Holland, Hotchkiss, and Webb tracts; and the towns of Thornton and Walnut Grove.

In 1996, Assembly Bill 360 (Hannigan; Chapter 601, Statutes of 1996) expanded the area covered by the Delta Levees Program to include the remainder of the legal Delta and northern Suisun Bay.

Additional funding sources for the Delta Levees Program include:

- Proposition 204 enacted in 1996 ($25 million);
- Proposition 13 enacted in 2000 ($30 million);
- Proposition 50 enacted in 2002 ($70 million);
- Proposition 84 enacted in 2006 ($275 million);
- Proposition 1E enacted in 2006; and
- Proposition 1 enacted in 2014.

### Delta Flood Emergency Preparedness, Response, and Recovery Program

The Delta Flood Emergency Preparedness, Response, and Recovery Program was initiated within the Division of Flood Management in response to the passing of the Disaster Preparedness and Flood Prevention Bond Act of 2006 (Proposition 1E). The program is designed to enhance emergency preparedness and enable DWR to better coordinate with its local partners to respond to and recover from a large-scale Delta flood emergency.

The *Delta Flood Emergency Management Plan* presents DWR's concept of operations for flood emergency response in the Delta. The plan describes the roles and responsibilities of DWR's emergency response organizations, including the Flood Operations Center, the Project Operations Center, and the Department Operations Center, and lists DWR's actions during flood emergency response. It also supports DWR's emergency preparedness efforts in the Delta and guides DWR management in making critical decisions during recovery.

A tabletop exercise was held in April 2015 in support of the Delta Flood Emergency Preparedness, Response, and Recovery Program. The exercise included staff from each of DWR's emergency response organizations.

For more information, visit DWR's website.

## Delta Levees Maintenance Subventions Program

The Delta Levees Maintenance Subventions Program (Subventions Program) is a cost-share program that provides technical and financial assistance to local levee-maintaining agencies in the Delta for the maintenance and rehabilitation of levees. The Subventions Program is authorized by California Water Code Sections 12980 through 12995 and is managed by DWR. The Central Valley Flood Protection Board reviews and approves DWR's recommendations and enters into agreements with local agencies to reimburse eligible costs for levee maintenance and rehabilitation.

The Subventions Program provides reimbursement funding to local levee-maintaining agencies for improving, maintaining, and enhancing nearly 700 miles of project and nonproject levees. Since its inception in 1973, the Subventions Program has provided more than $180 million of State funding to more than 70 islands in the Delta. In fiscal year 2015–2016, the program expects to reimburse approximately $8 million to local agencies for eligible levee maintenance and rehabilitation activities. (In fiscal year 2014–2015, the program reimbursed $8 million.) These activities help minimize the risk of Delta levee failure, which in turn protects the Delta's ecosystem, communities, and agriculture; State and private infrastructure; and the State's water supply.

## Delta Levees Special Flood Control Projects Program

The Delta Levees Special Flood Control Projects Program assists eligible local agencies in the Delta with flood protection and levee stability repairs. In 1990, the California Water Commission approved actions and priorities that serve as guides for DWR to determine the best use of appropriations to protect Delta islands. Long-term actions and priorities include:

- rehabilitating threatened levees through the beneficial reuse of dredged material;
- improving water supply reliability, levee integrity, and habitat enhancement by soliciting multibenefit projects through the projects solicitation process;
- upgrading levees to the standards included in Bulletin 192-82 (*Delta Levees Investigation*); and
- considering projects that will help achieve net long-term habitat improvement for fish and wildlife.

While DWR seeks cost sharing for all projects, the actual reimbursement depends on each local agency's ability to pay. In some cases, DWR may provide up to 100 percent of the cost. Districts receiving these funds are required to participate in a habitat improvement program to ensure net long-term habitat enhancement.

Levee restoration projects, habitat projects, and other special projects were conducted on various Delta islands and tracts in 2015–2016.

## Bulk Credit Program

In 2012, the Delta Levees Subventions Program and the Special Flood Control Projects Program established a model Bulk Credit Program allowing reclamation districts to more effectively meet habitat mitigation obligations.

Under the Bulk Credit Program, reclamation districts are able to utilize mitigation credits purchased in advance from an existing mitigation bank. These credits provide more biologically effective mitigation than past practices of establishing less formal, smaller mitigation sites, and are a much more efficient way of meeting mitigation obligations. The bulk purchase of credits from the mitigation bank is made at a substantial discount.

In 2015, the Bulk Credit Program continued to be the principal tool for participating reclamation districts to meet their habitat mitigation obligations resulting from Delta levee maintenance and improvement work. The program also continued planning for an 80-acre habitat mitigation site on Twitchell Island to support future mitigation obligations of the program. The mitigation site will be bordered by an 80-acre habitat enhancement site that will provide riparian forest and scrub shrub habitats.

### Reuse of Dredged Material for Delta Levees

As local sources of fill material for levee repair are depleted, new economical sources must be located. DWR has worked to find opportunities to reuse clean, dredged material in the Delta.

As part of this effort, a charter for the multiagency Delta Long-Term Management Strategy (LTMS) for the beneficial reuse of dredged material became effective in February 2007. The Delta LTMS is designed to improve operational efficiency and coordination of collective and individual agency decision-making responsibilities, resulting in approved dredging and dredged material management actions in the Delta, including the beneficial reuse of such material. Regular Delta LTMS meetings have included representatives from DWR, the U.S. Army Corps of Engineers, the U.S. Environmental Protection Agency, the Regional Water Quality Control Board, the Ports of Stockton and West Sacramento, and other interested parties.

Delta LTMS long-term goals include:

- developing a streamlined permitting process for dredging and dredged material reuse;
- developing a consolidated guidance document addressing sampling, tests, protocols, and methods for assessing sediment and dredged material characterization;
- developing a sediment management plan of methodologies for assessing and characterizing sediments and determining appropriate disposal options;
- developing a programmatic biological assessment for sensitive Delta species;
- drafting a programmatic environmental impact report/environmental impact statement for the Delta LTMS; and
- identifying and permitting additional sediment placement and beneficial reuse sites in the Delta.

The Delta LTMS program conducted a technical review of the program in July 2015 and concluded there was a need for continued effort. Progress has been slowed due to funding issues.

## West Delta Program

The West Delta Program is tasked with land management on Sherman and Twitchell islands to achieve DWR's goals and objectives, including understanding and managing methods that will mitigate subsidence. The West Delta Program objectives are supported by active research and application of land management activities used for subsidence reversal, carbon sequestration, and habitat development.

Since 2008, DWR has constructed approximately 1,700 acres of subsidence mitigation projects on Sherman and Twitchell islands and constructed approximately 6,000 lineal feet of "fish friendly" habitat setback levees. In 2015, the West Delta Program continued a partnership with the University of California, Berkeley, to collect greenhouse gas data on both newly constructed wetland sites, and typical Delta farmed crops such as corn and alfalfa, and irrigated pasture. Data collected since 2010 has shown that there is a net greenhouse gas benefit of approximately 10 metric tons of carbon dioxide equivalent by planting wetland crops on previously farmed Delta peatland soils.

Building upon subsidence mitigation work, DWR, in partnership with the Sherman Island Reclamation District, was awarded a $10.5 million grant from the California Department of Fish and Wildlife's fiscal year 2014–2015 Wetlands Restoration for Greenhouse Gas Reduction Program. The grant provided funding for another 2,200 acres of wetlands on Sherman Island; construction of the Sherman Island Whale's Mouth Wetland Restoration Project; and all planning, design, permitting, and construction for the Belly Wetland (see Figure 2-3). Matching funds from both DWR and the University of California, Berkeley, will provide for additional greenhouse gas monitoring throughout the Delta, resulting in a data set from a more robust variation of conditions.

In 2015, the West Delta Program completed construction of the Sherman Island Whale's Mouth Wetland Restoration Project, a 650-acre wetland on the lower southwest side of Sherman Island. Project features include more than 9 miles of berms needed to terrace the land into cells for appropriate water depth, approximately 23 water control

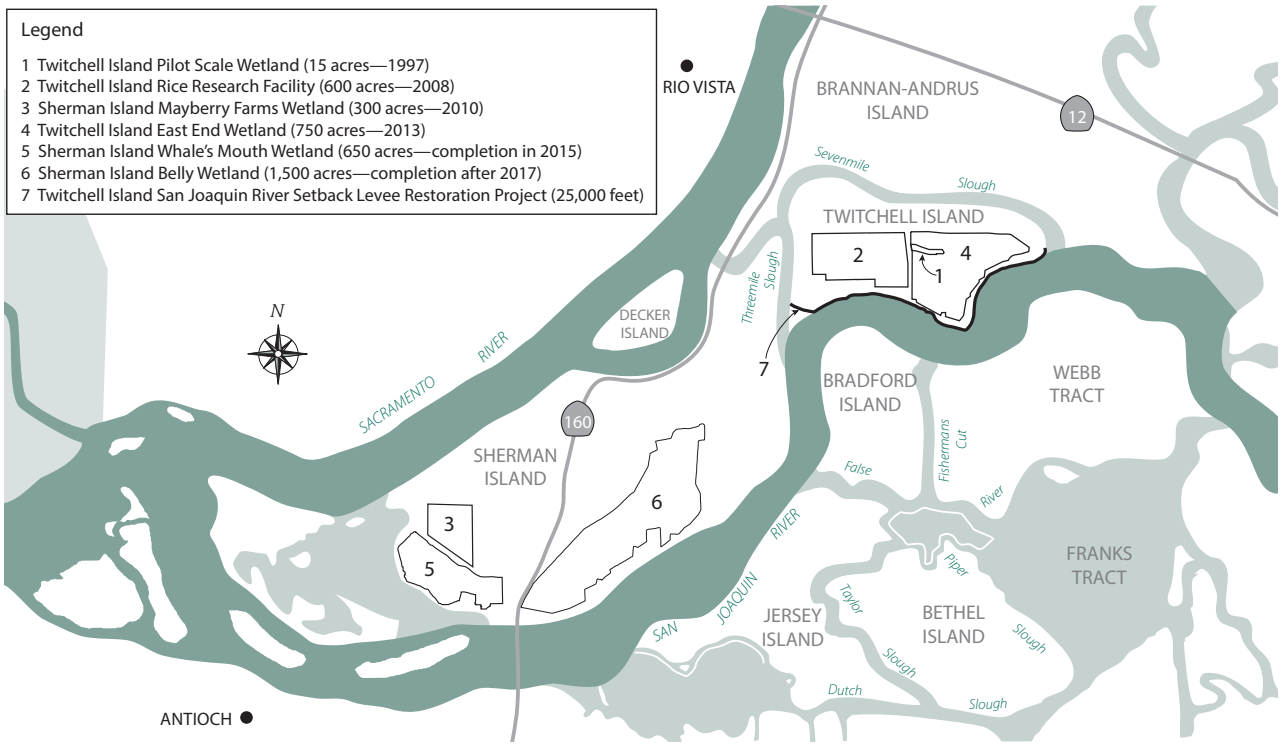

**Figure 2-3 Selected West Delta Program Projects**

structures, and approximately 75 acres of new upland habitat, including 13 acres that had been a scour pond created during the 1969 Sherman Island flood.

Continued efforts for 2015 included carbon protocol development, a multiagency effort to develop a draft greenhouse gas protocol that will allow for quantification of a project's net increase in carbon sequestration, which could be considered for adoption by the California Air Resources Board in late 2016 or early 2017.

The West Delta Program continued working with Twitchell Island Reclamation District to develop construction plans and environmental permits for the Twitchell Island San Joaquin River Setback Levee Restoration Project. This project will construct approximately 25,000 lineal feet of setback levee along the San Joaquin River, allowing for habitat features to be developed on the water side.

# Chapter 3
# Environmental Programs

*The restored Cookhouse Meadow in the Sierra Nevada.*

## Significant Events in 2015

In February, DWR received the Climate Leadership Award for Excellence in Greenhouse Gas Management (Goal Setting) for its work on the DWR *Greenhouse Gas Emissions Reduction Plan*. The award, given by the U.S. Environmental Protection Agency, the Association of Climate Change Officers, The Climate Registry, and the Center for Climate and Energy Solutions, is the highest national award given for greenhouse gas (GHG) management. DWR is the first public agency to be honored with the award.

In April, the Department of Water Resources (DWR) announced a new alternative that would replace the proposed Bay Delta Conservation Plan (BDCP) as the State's proposed project. The conveyance facility and habitat restoration measures proposed in the BDCP would be separated into two distinct efforts—California WaterFix and California EcoRestore.

*Information in this chapter was contributed by the Division of Environmental Services, the Division of Operations and Maintenance, the Division of Integrated Regional Water Management, and the State Water Project Analysis Office.*

The Department of Water Resources (DWR) has developed and implemented several programs to avoid, minimize, and/or offset adverse environmental impacts resulting from construction and operation of State Water Project (SWP) facilities. DWR has also established other environmental programs and partnered with other agencies to restore and enhance the natural environment.

## Operations for Species of Concern

A primary consideration in the operation of the SWP is avoiding, minimizing, and/or offsetting adverse impacts to species of concern, species listed as threatened or endangered by a State or federal agency, or species proposed for listing. The SWP is operated pursuant to biological opinions (BiOps) issued under the federal Endangered Species Act (ESA), and consistency determinations or incidental take permits issued under the California Endangered Species Act (CESA). A key to avoiding and minimizing adverse impacts to these species is maintaining flexibility in SWP operations. Operational responses can include Delta Cross Channel gate closure, export curtailments, changes in delivery schedules, increased reservoir releases, preferential use of certain facilities, or a combination of these actions.

Additional information can be found in Chapter 7, Water Supply Development and Reliability.

### San Joaquin River Restoration Program

The San Joaquin River Restoration Program is a comprehensive long-term effort to restore flows to the San Joaquin River from Friant Dam to the confluence of the Merced River and to restore a self-sustaining Chinook Salmon (*Oncorhynchus tshawytscha*) fishery in the river, while reducing or avoiding adverse water supply impacts from restoration flows. The San Joaquin River Restoration Program worked through several challenges in 2015 related to water availability, levee stability, project implementation, and fish reintroduction.

Restoration flows continued to be hindered due to another critical water year in the San Joaquin River basin. The amount of water the San Joaquin River Restoration Program receives each year is based on the water year classification, and with water year 2014–2015 being one of the driest years on record, no restoration flows were released for a second consecutive year.

The San Joaquin River Restoration Program updated its Framework for Implementation that describes how the program will be implemented over the next 15 years. The framework seeks to sequence projects in a logical order to achieve program goals, based on realistic funding and resources, and includes schedules, budgets, and priorities of the five implementing agencies, including DWR. An initial milestone in the framework is to reconnect the San Joaquin River to the ocean by releasing 1,300 cubic feet per second restoration flows and by implementing channel and structural projects.

DWR continued to perform levee evaluations along the river and flood bypasses in the restoration area to ensure that the restoration flows will not significantly increase flood risk. Levee evaluations in 2015 focused on the Eastside Bypass where data show flows over 580 cubic feet per second would exceed criteria set by the U.S. Army Corps of Engineers (Corps) for levee

seepage and stability. DWR is developing plans to investigate this critical reach and develop alternatives to improve these levees to achieve the framework's restoration flow release goal of 1,300 cubic feet per second.

The framework identifies the Mendota Pool Bypass and Reach 2B Improvements Project as one of the first major structural improvement projects to be implemented. A public draft environmental impact statement (EIS)/environmental impact report (EIR) was released in June 2015 and is expected to be finalized in 2016.

Planning for the Reach 4B, Eastside Bypass and the Mariposa Bypass Channel and Structural Improvements Project also continued. A consensus-based alternative development process was initiated in 2015 with landowner and agency stakeholders to identify a preferred alternative for routing fish and flows through Reach 4B and the flood bypass area. DWR is the California Environmental Quality Act (CEQA) lead agency for the project and plans to implement flow and fish passage components of the project by 2019 to correspond with the framework schedule.

In April 2015, the Department of Fish and Wildlife (DFW) and the U.S. Fish and Wildlife Service (USFWS) released approximately 54,000 hatchery-produced juvenile spring-run Chinook Salmon into the San Joaquin River near its confluence with the Merced River. This release follows a similar release made in 2014 and contributes to the San Joaquin River Restoration Program's plan for long-term reintroduction of spring-run salmon to the San Joaquin River.

More information is available on the San Joaquin River Restoration Program's website.

## Lower Yuba River Accord

The Lower Yuba River Accord's purpose is to resolve instream flow issues and protect and enhance lower Yuba River fisheries and local water supply reliability. The Lower Yuba River Accord provides revenues for local flood control and water supply projects; water to enhance SWP and Central Valley Project (CVP) water supply reliability by offsetting Sacramento-San Joaquin Delta (Delta) export reductions for protection and restoration of Delta fisheries; and improvements in statewide water supply management, including dry year supplies for participating SWP and CVP contractors.

Water contracted by DWR under the Lower Yuba River Accord Water Purchase Agreement (Component 1 water) continues to be used to help offset Delta export reductions to benefit fish. In 2015, Yuba County Water Agency delivered 59,131 acre-feet of Component 1 water from surface releases, shared equally between DWR and the Bureau of Reclamation (Reclamation). This water was used to offset Delta pumping curtailments equally at Banks Pumping Plant and Jones Pumping Plant made pursuant to the BiOps on Delta Smelt and salmonids issued by the USFWS and the National Marine Fisheries Service (NOAA Fisheries) as modified by subsequent court orders. Under an agreement signed in 2012, DWR and Reclamation equally share Component 1 water made available from 2012 through 2015. Because 60,000 af of Component 1 water was due to be delivered in 2015, Yuba owes the remaining 869 af in a future year. In addition, Yuba County Water Agency provided 30,000 acre-feet of Component 4 groundwater substitution water through agreements with seven of its member units to enhance lower Yuba River flows. The water was then made available for transfer to many of the participating contractors through a letter agreement between DWR and Yuba County Water Agency.

For more information about the Lower Yuba River Accord, see Chapter 9, Water Contracts and Deliveries.

# Oroville Facilities

## Existing Federal Energy Regulatory Commission License Activities for 2015

### *Invasive Plant Management*

During 2015, DWR removed all the red sesbania (*Sesbania punicea*) along the Thermalito Power Canal, Thermalito Forebay, and Thermalito Diversion Pool as part of the annual maintenance that started in 2007. The Thermalito Power Canal, Thermalito Forebay, and Thermalito Diversion Pool are the upstream extent of the red sesbania population on the Feather River and are considered a high priority management area.

DWR also continued to partner with the Butte County Agricultural Commissioner to remove several invasive plants within areas of joint management. The Butte County Agricultural Commissioner treated several stands of red sesbania that are adjacent to the upstream extents managed by DWR, but are not on DWR property, and several locations of skeleton weed (*Chondrilla juncea*) near McCabe Creek and Ponderosa Reservoir.

### *Feather River Fish Hatchery*

**Fall-run Chinook Salmon.** A total of 7,075,242 juvenile fall-run Chinook Salmon were released into the Delta, Sacramento River, and San Francisco and San Pablo bays.

**Spring-run Chinook Salmon.** A total of 2,183,570 spring-run Chinook Salmon were released in the Feather River.

**Steelhead.** A total of 331,805 steelhead were planted in the Feather River at Boyd's Pump Boat Launch.

### *Lake Oroville and Thermalito Afterbay*

In October, 139,388 Chinook Salmon were planted in Lake Oroville.

Due to a surplus egg supply at the Feather River Fish Hatchery (FRFH), 17,200 steelhead were stocked in the Thermalito Afterbay.

For additional information about fish stocking in the SWP, see Chapter 13, Recreation.

Habitat improvement continued in 2015 in the fluctuation zone of the lake. Approximately 1,600 Christmas trees were recycled with the help of the Boy Scouts and the California Conservation Corps. The recycled trees were used to construct structures for juvenile fish habitat at the Spillway Boat Launch area, Loafer Creek, and Thermalito Afterbay.

### *Oroville Wildlife Area*

Monitoring and weed removal activities continued during 2015 at the wetland ponds that were constructed in 2011 in the Oroville Wildlife Area. These wetland ponds were created as a mitigation requirement in the 1995 Corps Clean Water Act Section 404 permit for a project that constructed two waterfowl brood ponds at Thermalito Afterbay. The wetland ponds project converted a 20-acre area of low-quality, disturbed, upland habitat into 10 acres of emergent wetland and 10 acres of riparian habitat. The waterfowl brood ponds were a requirement of the revised recreation plan that was part of the Federal Energy Regulatory Commission's September 22, 1994, order.

## Lake Oroville Elevation

A number of aspects of the Oroville Facilities can be affected by lake surface elevation including:

- habitat;
- flora and fauna of the lakeshore area and upstream tributaries;
- recreation;
- water quality;

- water temperature;
- shoreline and lakebed stability and erosion;
- flood storage capacity;
- power generation; and
- streamflow requirements (downstream of the lake).

The 2015 low point for the Lake Oroville reservoir surface elevation was reached on December 9 at 649.5 feet, and the annual high point of 764.1 feet was reached on April 17. The full pool elevation of Lake Oroville is approximately 900 feet.

## Federal Energy Regulatory Commission Relicensing Activities

### *USFWS Biological Opinion for the Oroville Facilities Relicensing*

Various conservation measures for the species identified in the USFWS 2007 BiOp for the Oroville Facilities relicensing project continued to be implemented on SWP lands. Monitoring associated with these measures includes an annual vernal pool survey (645 mapped vernal pools and/or features); protective measures for elderberry shrubs (*Sambucus* species, host plant for the valley elderberry longhorn beetle [*Desmocerus californicus dimorphus*]); and annual monitoring of nesting Bald Eagles (*Haliaeetus leucocephalus*) in the area (five currently active nests). In addition, habitat management activities within the Oroville Wildlife Area are coordinated through DFW. These activities include providing nest and forage habitat for waterfowl and upland bird species, monitoring and maintaining Thermalito Afterbay brood pond water surface elevations, and protecting and conserving Giant Garter Snake (*Thamnophis gigas*) habitat. An annual compliance report for 2015 was compiled by DWR and submitted to USFWS.

For more information about Oroville Facilities relicensing, see Chapter 10, Power Resources.

# Invasive Species

## Quagga and Zebra Mussel Monitoring and Assessment

The quagga mussel, *Dreissena rostriformis* (previously classified as *Dreissena rostriformis bugensis*), and the zebra mussel, *D. polymorpha*, are invasive freshwater mussels that pose a significant threat to the SWP. Both species attach to hard substrates, including other mussels, with strong byssal threads, forming dense colonies and causing significant biofouling impacts to raw water infrastructure by clogging small diameter piping and filters and encrusting trash racks and fish screens.

In early 2007, the quagga mussel was detected in the lower Colorado River and spread throughout connected water diversion systems (see Bulletin 132-08). The following year, the zebra mussel was detected in San Justo Reservoir in San Benito County, adding to the existing threat. In response, DWR formed the Aquatic Nuisance Species Program within the Division of Operations and Maintenance. The program includes applied studies, early detection monitoring, vector management, rapid response planning, long-term mussel management, and public outreach.

### *Applied Studies*

**Assessment of Habitat Suitability.** DWR's consultant (see Bulletin 132-11), examined the suitability of the SWP to support long-term populations of quagga and zebra mussels (dreissenids) if unintentionally introduced. Based on the results, SWP locations were classified into one of three groups: unable to support, potentially able to support, or able to support long-term populations of dreissenid mussels (see Bulletin 132-12). Understanding

where dreissenid mussels may survive in the SWP will be used to prioritize management efforts.

**Early Detection Monitoring.** DWR routinely monitors the California Aqueduct, SWP reservoirs, and the Delta for the presence of quagga and zebra mussels. DWR uses three different methods to monitor for mussels: zooplankton tows (with DNA analysis) for veligers (the free floating larval stage); settlement plates (see Bulletin 132-10); and bioboxes for adults (attached/settled stage).

In 2015, DWR and two collaborating water agencies, Santa Clara Valley Water District and The Metropolitan Water District of Southern California, collected veliger samples at 16 locations (see Bulletin 132-10). In addition, DWR staff are trained in quagga and zebra mussel identification and are instructed to look for mussels during regular field work and during routine facility maintenance activities. No mussels were detected in the SWP, the Delta, or other SWP source water during 2015.

## *Prevention and Response Planning*

To protect against and prepare for mussels in the SWP, the Aquatic Nuisance Species Program developed several planning documents to guide actions and identify vulnerabilities. The *Quagga and Zebra Mussel Vector Management Plan for the State Water Project* identifies potential mussel points-of-entry and vectors and outlines mechanisms to reduce the risk of introduction. The two primary vectors of mussels are downstream transport of planktonic veligers in natural and constructed waterways and overland transport of veligers and attached adults on watercraft. A critical component of the vector management plan is reducing the risk posed by watercraft. To accomplish this, DWR contracted with the California Department of Parks and Recreation and the Los Angeles County Department of Parks and Recreation to implement vessel inspection and outreach programs at San Luis State Recreation Area (San Luis Reservoir, O'Neill Forebay, and Los Banos Creek Reservoir) and Pyramid and Castaic lakes (see Bulletin 132-12).

At San Luis State Recreation Area, 11,349 vessels were inspected during 2015. Of those vessels, 328 failed the inspection due to the presence of wet equipment or standing water and were not allowed to launch. At Castaic Lake, 22,123 vessels were inspected, and 678 failed the inspection. At Pyramid Lake, 19,169 vessels were inspected, with 931 failures. No mussels were found during the inspections.

In December 2013, quagga mussels were discovered in Lake Piru, operated by United Water Conservation District, in Ventura County (see Bulletin 132-14). Lake Piru is in close proximity to Pyramid and Castaic lakes.

Sampling for veligers had been routinely conducted at Pyramid and Castaic lakes since 2008, and all samples had been negative. Due to the possibility that mussels were introduced in Pyramid and Castaic lakes from Lake Piru, monitoring efforts were immediately increased, additional settlement plates were deployed in 2013, and additional sampling for veligers was conducted during 2013, 2014, and 2015. All additional samples were negative for quagga mussels.

If mussels are detected in the SWP, the *Quagga and Zebra Mussel Rapid Response Plan for the State Water Project* outlines a course of action to confirm the sighting; delineate the population; implement containment and eradication measures; and notify State and federal partner agencies, the SWP water contractors, and any potentially impacted entities.

With uncontrolled watercraft access to and from infested bodies of water, such as the Colorado River, the SWP and the Delta remain vulnerable to mussel infestation.

Therefore, DWR has prepared a long-term mussel management plan that identifies facility vulnerabilities and outlines both short-term and long-term options to prevent or mitigate mussel biofouling impacts for all at-risk SWP facilities. The short-term control strategies are those that can be implemented within a few weeks to a few months time and may be temporary in nature, such as shutdowns for power washing and shell removal. The long-term control strategies have longer implementation times (6 months to multiple years) and are permanent in nature (alterations to infrastructure).

DWR's consultant assisted DWR with plan preparation (see Bulletin 132-14). As a follow-up to the management plan reports, the consultant will develop cost estimates for facility retrofit implementation.

## The Bay Delta Conservation Plan

The Bay Delta Conservation Plan (BDCP) was initiated in 2006 with the goal of providing a plan to restore and protect water supply, water quality, and Delta ecosystem health within a stable regulatory framework. The BDCP was being developed through collaboration, scientific analysis, policy review, and public input. Participants included state, federal, and local water agencies, state and federal fish and wildlife agencies, environmental organizations, agricultural organizations, and other interested parties. The BDCP would have served as a natural community conservation plan under the State's Natural Community Conservation Planning Act and a habitat conservation plan under Section 10 of the ESA, providing long-term take authorization for SWP and CVP operations under the CESA and ESA while providing for the conservation and management of species in the Delta. The draft BDCP and its associated environmental review documents were available for public review and comment from December 13, 2013 through July 29, 2014. In response to comments received during the public comment period, State and federal agencies decided to change the approach and would no longer pursue completion of the BDCP.

On April 30, 2015, DWR announced a new alternative that would replace the proposed BDCP as the State's proposed project. The conveyance facility and habitat restoration measures proposed in the BDCP would be separated into two distinct efforts—California WaterFix and California EcoRestore.

## California WaterFix and California EcoRestore

The California WaterFix will construct new Delta conveyance facilities in compliance with the ESA and CESA. The conveyance facilities would allow greater flexibility in water diversions and better balancing of the associated water quality and hydrodynamic benefits for fish, drinking water, agriculture, and other beneficial uses.

California EcoRestore was announced as an initiative to help coordinate and advance at least 30,000 acres of critical habitat restoration in the Delta over the next 4 years. California EcoRestore is unassociated with any habitat restoration that may be required as part of the construction and operation of the new Delta water conveyance (California Waterfix).

### Endangered Species Act Consultation Initiated

In early 2015, DWR and Reclamation initiated ESA Section 7 (informal) consultation with NOAA Fisheries and the USFWS and began to develop the biological assessment for construction and operation of California WaterFix. Species under the jurisdiction of the USFWS and NOAA Fisheries were confirmed by the agencies in May and July, respectively. DWR also engaged with DFW to begin the incidental take analysis for State-listed species, as required during the CESA

Section 2081(b) permitting process. The BiOp and 2081(b) permit are expected to be completed in 2016.

### Recirculated Draft Environmental Document Released

On July 10, 2015, DWR and Reclamation released the partially recirculated draft EIR/supplemental draft EIS for the BDCP/California WaterFix. The public comment period that began July 10, 2015, was originally scheduled to end August 31, 2015, but was extended to October 30, 2015. Public meetings were held in Sacramento on July 28 and in Walnut Grove on July 29.

The primary purposes of the partially recirculated draft EIR/supplemental draft EIS were to provide the public and interested agencies with updated environmental analysis to address certain revisions to the previously issued documents related to the BDCP and its draft EIR/EIS, to introduce new alternatives (Alternatives 4A, 2D, and 5A), and to address certain issues raised in comments received on the draft EIR/EIS. The partially recirculated draft EIR/supplemental draft EIS included evaluation of Alternative 4A, California WaterFix.

### Change Petition Submitted

On August 25, 2015, DWR and Reclamation submitted a petition for a change to the water rights necessary for the implementation of key components of California WaterFix. The petition requests the State Water Resources Control Board approval to add points of diversion and rediversion to the existing water right permits (and existing diversion authorization) held by the SWP and the CVP.

### Corps Permit Application Submitted

On August 26, 2015, DWR submitted a permit application to the Corps for California WaterFix. This application started a Corps environmental review process, which runs parallel to the environmental review process required by CEQA and National Environmental Policy Act. The Corps' process will consider whether to issue a permit for California WaterFix project activities, such as construction, that will occur in or affect waters of the United States, triggering the Corps' regulatory authority under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act of 1899.

### Final EIR/EIS

In late 2015, DWR began preparing the final BDCP/California WaterFix EIR/EIS, including updating analyses and modeling, drafting the executive summary, drafting the mitigation monitoring and reporting program, and responding to public comments. The final EIR/EIS is expected to be released in 2017.

## Biological Opinions Issued on CVP/SWP Operations

The NOAA Fisheries and USFWS have both issued BiOps on CVP and SWP operations that include reasonable and prudent alternatives to avoid jeopardy of federally listed species. Both the 2008 USFWS and 2009 NOAA Fisheries BiOps were challenged in federal court but were eventually upheld and are the basis for ESA compliance for the SWP and CVP. As required by the court order, Reclamation completed an EIS in November 2015. For more information about the federal litigation, see Chapter 6, Legislation and Litigation.

The remand process allowed DWR, DFW, Reclamation, USFWS, and NOAA Fisheries to undertake a collaborative adaptive management approach to interim operations under the existing BiOps.

The Collaborative Science and Adaptive Management Program was formed in May 2013 to produce information developed through a collaborative science process that

is directly relevant to management actions in the Delta and can be used to manage operations in a way that protects fish while providing for greater water supply reliability.

The Collaborative Science and Adaptive Management Program is comprised of a Policy Group and a Collaborative Adaptive Management Team. The Policy Group includes State and federal agency directors, regional directors, general managers of water agencies, and executive directors of nongovernmental organizations. The Collaborative Adaptive Management Team includes managers and scientists working under the direction of the Policy Group to facilitate collaborative science and adaptive management.

DWR, Reclamation, and the regulatory agencies have recently created multiple cooperative real-time management teams to provide a way to rapidly disseminate information, develop recommendations, and make decisions on fisheries-related issues to minimize adverse effects on listed species while meeting permit requirements and contractual obligations for water deliveries. These interagency teams meet regularly, up to weekly during critical periods, to review the latest available information on species status, environmental conditions, and

## Endangered Species and Biological Opinions

An endangered species is one in danger of extinction in all or a significant portion of its range; a threatened species is one likely to become endangered. The Endangered Species Act (ESA) and the California Endangered Species Act (CESA) are designed to protect threatened and endangered species by ensuring federal and State agencies adopt measures to protect the species during the design, construction, and operation of projects, or for other forms of agency action, and prohibit the unauthorized take of endangered species. Biological opinions and incidental take permits are issued to protect ESA- and CESA-listed species.

ESA Section 7 requires federal agencies to ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of listed species or modify their critical habitat, otherwise formal consultation is required. Federal agencies must consult with the U.S. Fish and Wildlife Service and/or the National Marine Fisheries Service (the wildlife agencies). As part of the consultation process, the wildlife agency issues a biological opinion which states the agency's determination of whether the action is likely to jeopardize a species or adversely modify critical habitat. If the wildlife agency determines an action will jeopardize or adversely modify, it will suggest reasonable and prudent alternatives that the "action agency" may take to avoid the likely jeopardy or adverse modification (Title 16, United States Code Sections 1531–1544 [1973]).

CESA is substantially similar to ESA in all aspects (California Fish and Game Code Sections 2050–2098 [1984]). Under CESA, an incidental take permit issued by the Department of Fish and Wildlife can allow for the take of State-listed species if specific criteria are met, including measures to minimize and mitigate the impacts of authorized take (California Code of Regulations, Title 14, Sections 783.0–783.8).

projected project operations and to develop recommendations for actions to protect listed species. A list of the interagency teams and their agency participants, descriptions of the teams, and the process for real-time decision making is in the EIS for the coordinated long-term operation of the CVP and SWP.

The Delta Science Program conducted the 2015 Long-term Operations Biological Opinions Annual Science Review in November. Background information, review materials, and the review report are available on the Delta Stewardship Council's website.

## Delta Operations for Delta Smelt and Longfin Smelt

The Smelt Working Group (an interagency team of experts on Delta Smelt and Longfin Smelt [*Spirinchus thaleichthys*] biology) meets regularly from December through June to assess the risk to Delta Smelt and Longfin Smelt from CVP and SWP export facilities. Based on near real-time technical information, such as fish distribution, salvage, and physical water conditions, the Smelt Working Group makes recommendations on export operations to the USFWS and DFW with the goal of reducing entrainment of the two species.

Recommendations are based on guidelines outlined in the 2008 USFWS BiOp and the 2009 DFW Longfin Smelt incidental take permit (see Bulletin 132-10).

During the 2014–2015 water year, the USFWS made no determinations that altered export operations. Several factors throughout the time period indicated that additional restrictions to pumping operations were not necessary to protect Delta Smelt or Longfin Smelt. These were: (1) low Delta Smelt salvage and no Longfin Smelt salvage at the export facilities, largely due to extremely low densities of both species in the system, and (2) severely restricted export levels to meet flow and water quality objectives during the critically dry conditions.

## Fish Restoration Program

Pursuant to the USFWS and NOAA Fisheries BiOps and the DFW Longfin Smelt incidental take permit (see Bulletin 132-11), the Fish Restoration Program (FRP) continued to make progress towards fulfilling its restoration requirements.

In 2015, the FRP continued its outreach efforts, primarily by sending out eNews updates and updating the website with new documents. The FRP website provides an overview of the program and serves as a publicly accessible repository for documents that are relevant to the program's efforts, including links to project-specific documents for each separate restoration project under the FRP. The website also provides a means by which the public can contact the program.

Interim land management of Prospect Island continued in 2015. A small levee repair was done in January after several small diameter pipes extending from Miner Slough to the land side of the levee were found conveying water and causing erosion damage. Vegetation on the crown and slopes of the Miner Slough levee along Prospect Island was cleared, using a combination of boom mowers and goat herds, to facilitate inspection and monitoring of the priority levee repair sites. Due to delays in obtaining permits, larger-scale levee repairs were not done in 2015. DWR continues to pursue obtaining the necessary permits to complete this work. After acquiring the southern portion of Prospect Island from the Port of West Sacramento in September, DWR had the California Conservation Corps clear vegetation from the Miner Slough levee. A portion of the levee was cleared in 2015; the remainder will be completed in 2016.

DWR's North Central Region Office continues to monitor the 20 groundwater wells and one surface water gauge installed on Prospect Island, and nine groundwater wells and three surface water gauges on Ryer Island. Groundwater and surface water levels are monitored to characterize the subsurface hydrogeological conditions to further evaluate the potential for seepage to occur on Ryer Island as a result of tidal restoration on Prospect Island.

The preferred alternative project description and conceptual restoration plan for Prospect Island habitat restoration was developed in 2014. Work on the administrative draft EIR continued in 2015. A public draft is scheduled to be released in 2016.

FRP monitoring activities in 2015 focused on the refinement of a standardized framework for tidal wetland monitoring in the Delta. The intent in using a common framework is to increase data comparability across projects and provide more power to detect effects of restoration. The FRP monitoring team revised the preliminary monitoring plan for the Prospect Island project to reflect the hypotheses and metrics included in the framework. Additionally, the team developed databases, and metadata standards that will be applied to all future monitoring.

DWR acquired the Port of West Sacramento's 140-acre portion of Decker Island. Restoration planning for Decker Island progressed with the development of goals and objectives, initial topography, and cultural resources, and the completion of vegetation surveys. Several conceptual designs were selected and evaluated; a single project design will be chosen in early 2016.

DWR purchased the 245-acre Property 322 in February 2013 for tidal habitat restoration. At the end of 2015, DWR was in escrow to purchase Property 329. The two properties are located on Bradmoor Island within the Suisun Marsh. Initial restoration planning includes alternatives to restore the whole island or only the portion already purchased.

The FRP continues efforts to acquire more restoration properties. In an effort to reach its BiOp restoration requirements, DWR is developing a process to solicit proposals for restoration projects in which private and nonprofit entities would acquire property and develop and implement tidal habitat restoration projects that meet DWR criteria. DWR began discussions with Reclamation to develop a joint, cost-shared process for soliciting proposals and awarding contracts. DWR expects to complete preparation of the full solicitation package to begin solicitation in 2016 and award contracts in late 2016.

## Decisions on Endangered Species

Table 3-1 lists fish species of concern found in the Delta. No status changes were made in 2015.

## Trends in Fish Abundance

Abundance indices for Longfin Smelt and Delta Smelt are based on DFW fall midwater trawl sampling conducted every year from September through December. Index calculations are based on average catch per trawl for 100 core index stations, which are partitioned into 14 geographic areas. The average monthly catch per tow in each area is multiplied by a weighting factor that is based on the estimated volume of water in each area. The resulting values are then summed over all areas and months to obtain the annual index. This fall abundance index serves as an indicator for adult Longfin and Delta Smelt populations over a relatively long period of time.

The abundance index for Longfin Smelt is shown on Figure 3-1. The index for 2015 declined from the previous year to the lowest value on record.

**Table 3-1 Special Status Delta Fish Species**

| Common Name | Scientific Name | Listing or Action | |
|---|---|---|---|
| | | ESA | CESA |
| Delta Smelt | *Hypomesus transpacificus* | threatened[a] (4/5/1993) | endangered (1/20/2010) |
| Longfin Smelt | *Spirinchus thaleichthys* | candidate[b] (4/2/2012) | threatened (4/9/2010) |
| Chinook Salmon (winter-run) | *Oncorhynchus tshawytscha* | endangered (2/3/1994) | endangered (9/22/1989) |
| Chinook Salmon (spring-run) | *Oncorhynchus tshawytscha* | threatened (11/15/1999) | threatened (2/5/1999) |
| Chinook Salmon (fall-/late fall-run) | *Oncorhynchus tshawytscha* | species of concern (4/15/2004) | none |
| Steelhead (Central Valley DPS) | *Oncorhynchus mykiss* | threatened (5/18/1998) | none |
| Green Sturgeon (Southern DPS) | *Acipenser medirostris* | threatened (6/6/2006) | none |
| Sacramento Splittail | *Pogonichthys macrolepidotus* | none | species of concern |
| Pacific Lamprey | *Entosphenus tridentata* | species of concern | none |
| River Lamprey | *Lampetra ayresii* | none | species of concern |

ESA = federal Endangered Species Act; CESA = California Endangered Species Act; DPS = distinct population segment

[a] In April 2010, the USFWS found that reclassification of Delta Smelt from threatened to endangered was warranted but precluded by other higher priority listing actions.

[b] On April 2, 2012, the USFWS found that listing the San Francisco Bay-Delta DPS as threatened or endangered was warranted but precluded by other higher priority listing actions and has added the San Francisco Bay-Delta DPS of Longfin Smelt to its list of candidate species.

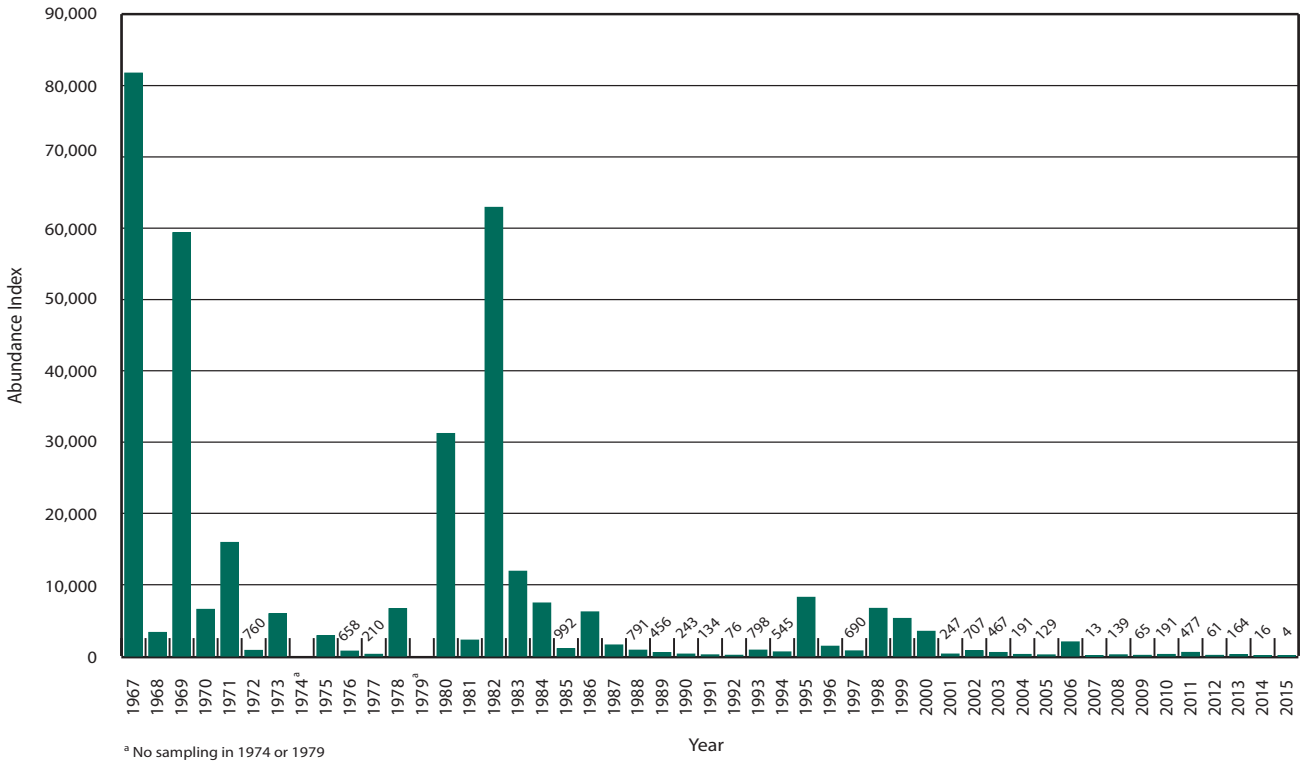

**Figure 3-1 Longfin Smelt Fall Midwater Trawl Abundance Index, 1967–2015**

Figure 3-2 shows the fall midwater trawl abundance index for Delta Smelt. In 2015, the index dropped to a value of 7, the lowest value observed since the inception of the survey.

Figure 3-3 shows estimates of returning adult winter-run Chinook Salmon from 1970 through 2015. These estimates, referred to as escapement estimates, are the number of adults that escape mortality and return to spawn. The Sacramento River winter-run Chinook Salmon escapement estimates are generated from the DFW carcass survey. DFW has been using the carcass survey data to generate escapement estimates since 2001, prior to which Red Bluff Diversion Dam counts were used. The estimated winter-run Chinook Salmon escapement for 2015 was 3,440, which was 14 percent higher than the 2014 escapement estimate.

Figure 3-4 shows estimates of returning adult spring-run Chinook Salmon from 1985 through 2015. Individual estimates are shown for the FRFH and the principal spring-run spawning streams: Battle Creek, Clear Creek, Mill Creek, Deer Creek, and Butte Creek. The escapement estimates are shown separately for each stream because the Feather River estimate is based on returns to the FRFH, where the genetic integrity of spring-run Chinook Salmon is uncertain. The estimated escapement for 2015 was 4,440 for the FRFH and 1,190 for the other streams combined. The 2015 escapement estimate was 1.2 times higher than the 2012 parent stock estimate for the FRFH, but 15.7 times lower than the 2012 parent stock estimate for naturally spawned fish in Battle, Clear, Mill, Deer, and Butte creeks.

Due to the lack of comprehensive monitoring programs, there are no reliable escapement estimates for wild Central Valley steelhead.

## Pelagic Organism Decline in the Upper San Francisco Estuary

By the early 2000s, long-term monitoring by the Interagency Ecological Program revealed marked declines in numerous pelagic (open water) fish species in the upper San Francisco Estuary (the Delta and Suisun Bay). This decline has collectively become known as pelagic organism decline.

Pelagic fish species in decline include Delta Smelt, Longfin Smelt, Striped Bass (*Morone saxatilis*), and Threadfin Shad (*Dorosoma petenense*). These declines resulted in significant management consequences, including limits on SWP and CVP pumping operations for the protection of Delta Smelt (listed as threatened under ESA and endangered under CESA) and Longfin Smelt (listed as threatened under CESA).

Since 2005, Interagency Ecological Program scientists have been coordinating studies investigating potential causes of pelagic organism decline. In 2010, an "ecosystem regime shift" conceptual model was put forward, hypothesizing that pelagic organism decline was caused by changes to multiple and interacting environmental variables, such as outflow, turbidity, and salinity, which led to fundamental changes to the Delta ecosystem. This conceptual model has served as a working hypothesis for continuing pelagic organism decline investigations since 2011. In early 2012, the Interagency Ecological Program formed the Management, Analysis, and Synthesis Team to synthesize scientific datasets with the goal of addressing pressing management information needs.

During 2015, the team conducted a synthesis on how recent drought conditions have influenced Delta fishes, including Delta Smelt and Longfin Smelt, and their habitats. The abundance of both species dropped

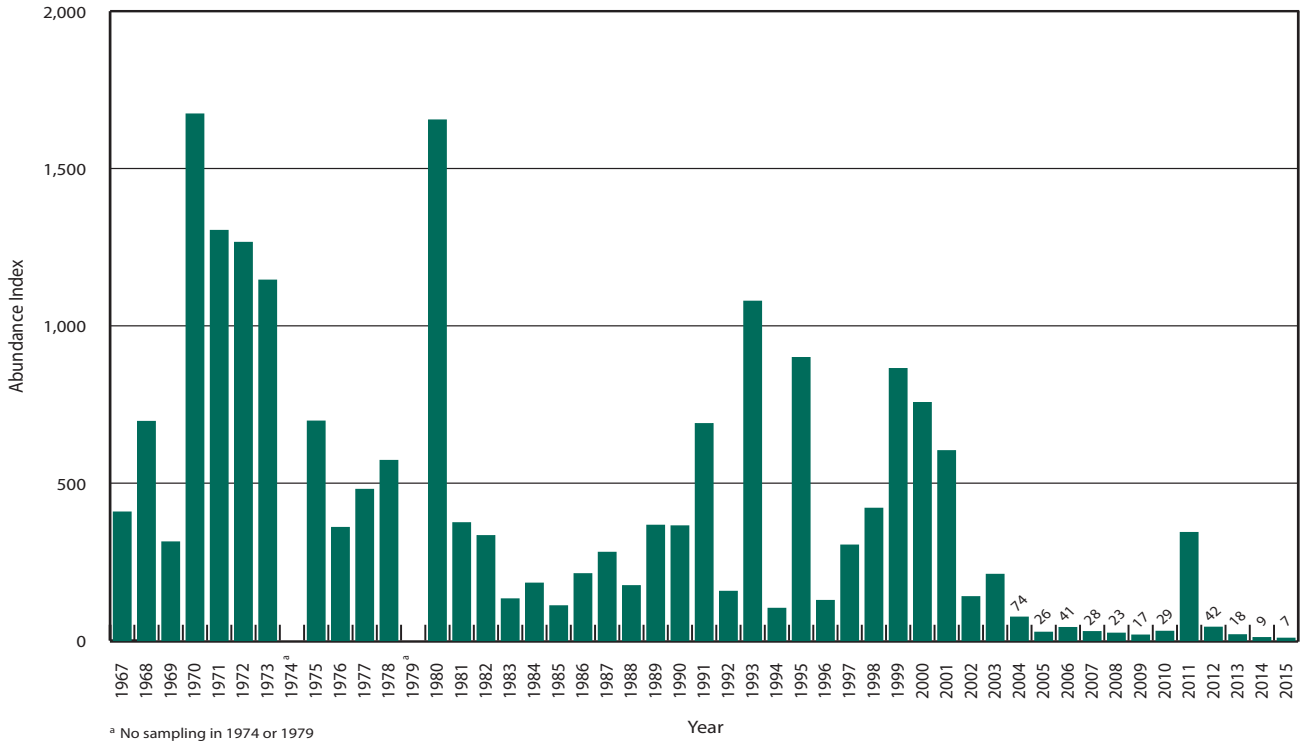

**Figure 3-2** **Delta Smelt Fall Midwater Trawl Abundance Index, 1967–2015**

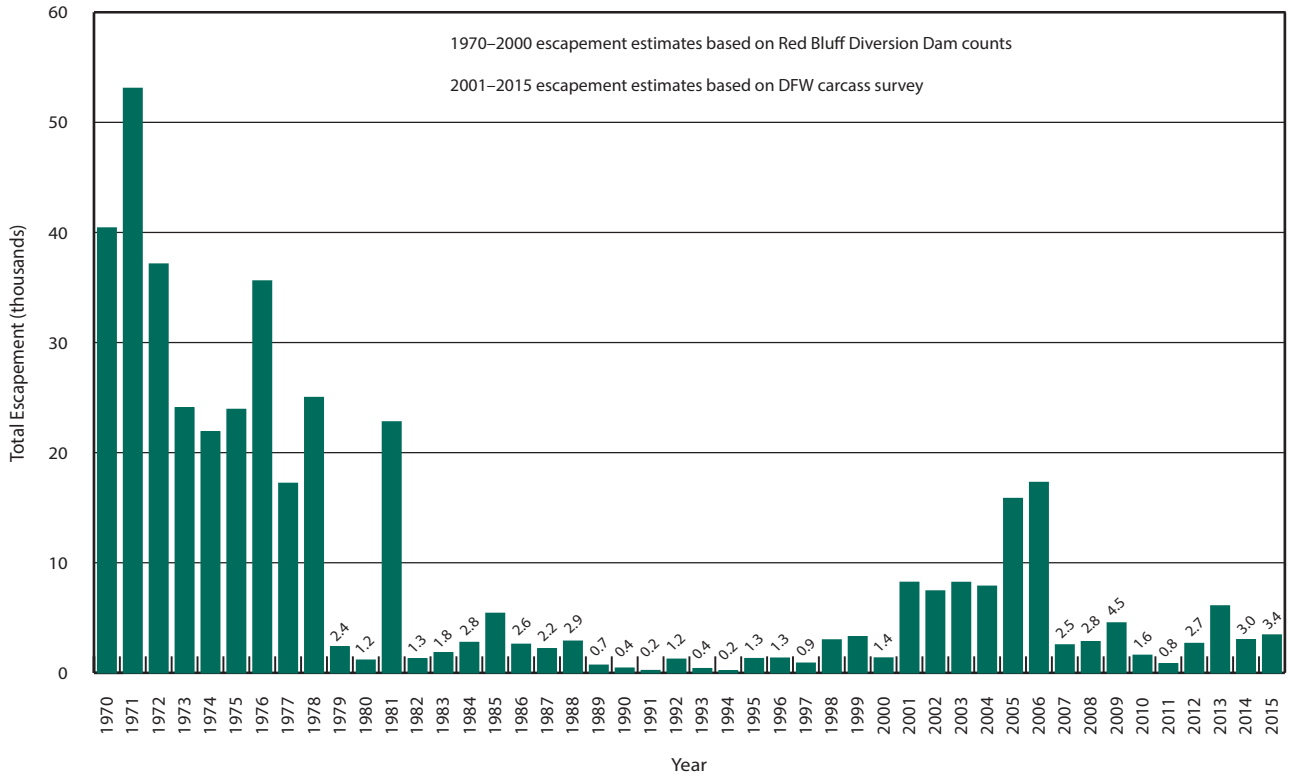

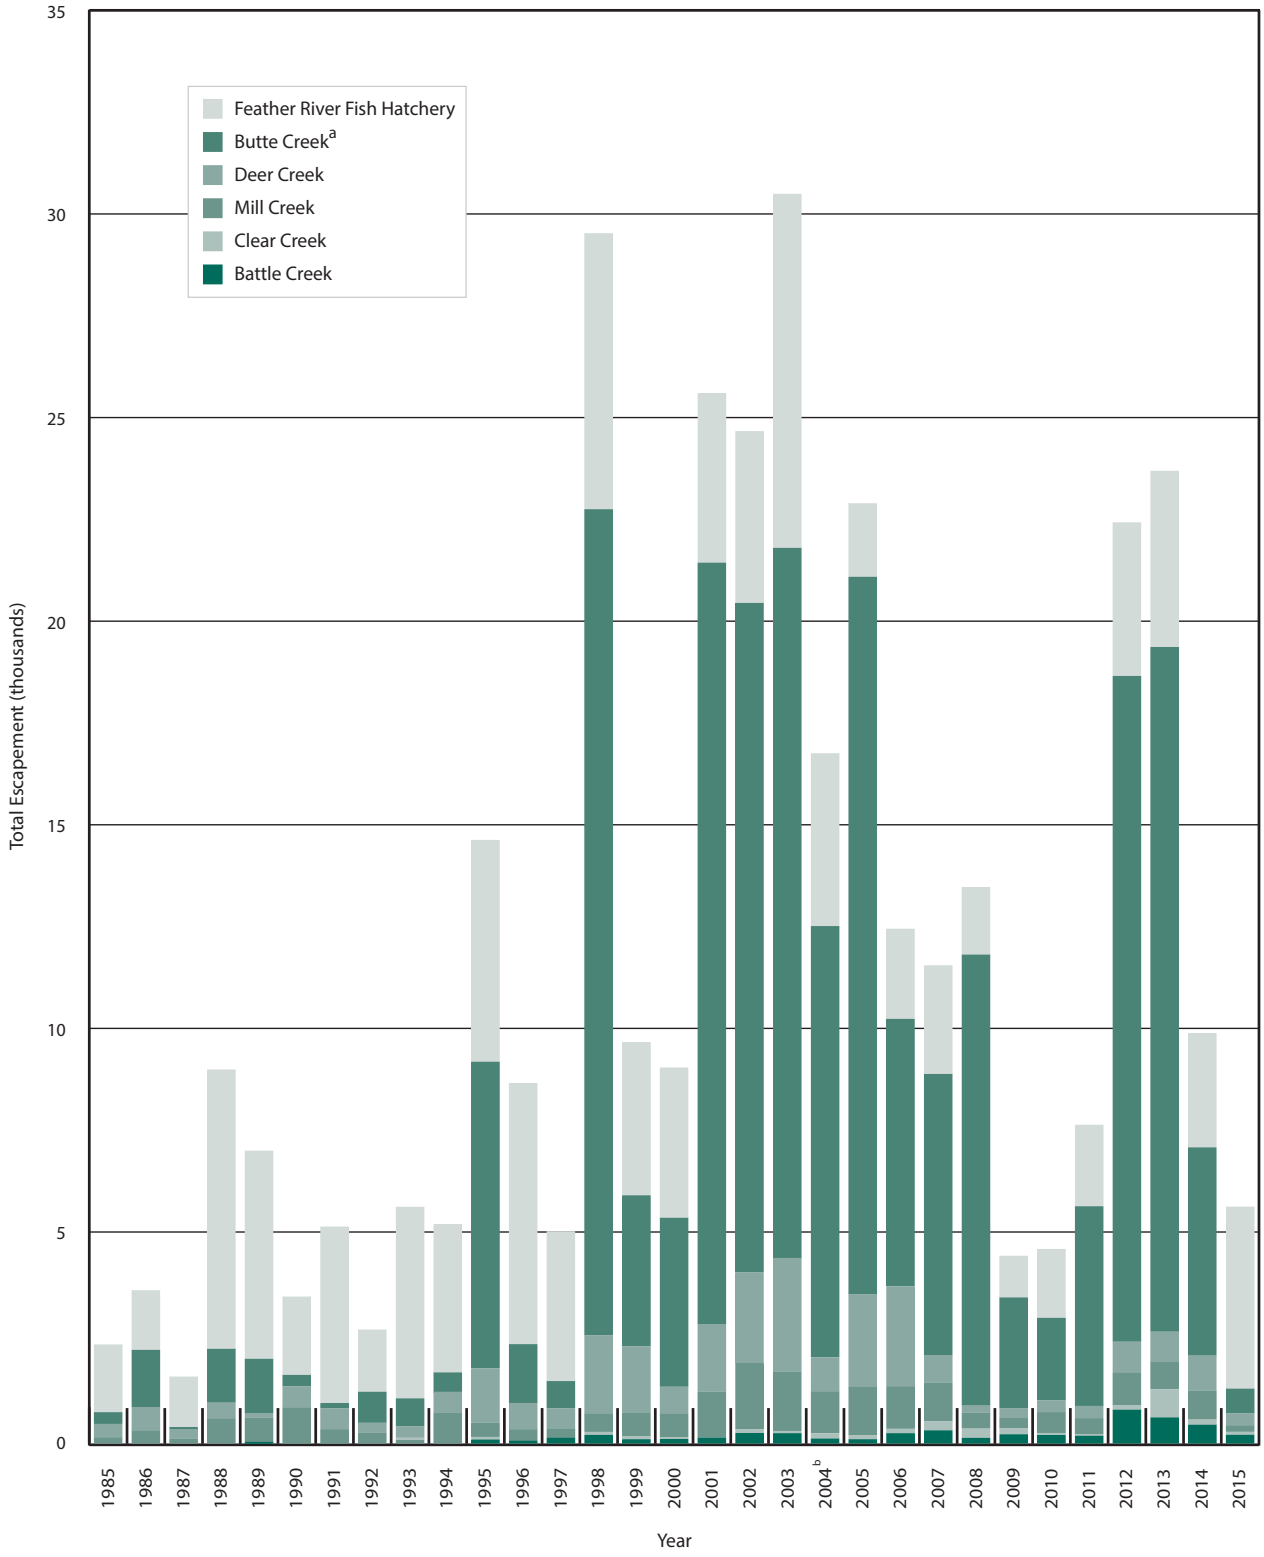

**Figure 3-3** **Estimated Total Adult Winter-run Chinook Salmon Escapement, 1970–2015**

[a] From 1985–2000, Butte Creek estimates were based on snorkel surveys.
From 2001–2015, Butte Creek estimates were based on carcass surveys.
[b] In 2004, the Feather River Fish Hatchery ladder was only open September 15–30 instead of the typical 30 days.

**Figure 3-4 Estimated Total Adult Spring-run Chinook Salmon Escapement, 1985–2015**

to record low levels during the current multiyear drought that extended into 2015. A manuscript detailing the Management, Analysis, and Synthesis Team's synthesis will be submitted to a peer-reviewed journal in 2016.

## Feather River Fish Studies

In the early 1990s, the Feather River fish studies were initiated to document and monitor fish populations in the lower Feather River. Early efforts focused on studies to identify flow requirements for Chinook Salmon and steelhead. The program has progressively expanded since the mid-1990s, first, to prepare for the Federal Energy Regulatory Commission relicensing of the Oroville Facilities and then to satisfy the 2004 NOAA Fisheries BiOp for the CVP and SWP long-term Operations Criteria and Plan. Recently, efforts have been made to satisfy the NOAA Fisheries BiOp with the Oroville Facilities license issuance in mind. Baseline information will be developed that satisfies current requirements and will directly benefit planning and implementation of license requirements. Field program elements have included operation of rotary screw traps (RSTs), acoustic and radio telemetry, salmon and steelhead spawning surveys, salmon escapement surveys, spring-run Chinook Salmon tagging, otolith thermal marking studies, snorkel and beach seining surveys, Green Sturgeon studies, steelhead acoustic tagging, and hatchery juvenile Chinook Salmon movement and survival studies.

The study area is generally divided into the low-flow channel, from the Fish Barrier Dam downstream to the Thermalito Afterbay Outlet, and the high-flow channel, from the Thermalito Afterbay Outlet downstream to the confluence with the Sacramento River at Verona (see Figure 3-5).

### Rotary Screw Traps

RSTs capture juvenile salmon and steelhead as they emigrate from the Feather River. Over the last 18 years, DWR has used RSTs as the primary method to assess the general abundance and timing of emigrating juvenile salmon and steelhead in the lower Feather River. In addition, large numbers of naturally produced (wild) salmon have been coded wire tagged to examine their return success. Although adult returns have been too small to evaluate, a 5-year tagging effort has led to estimates of fry survival through the upper reaches of the high-flow channel—the first time this has ever been achieved. This data will be presented in an upcoming report.

Emigration timing and travel times confirm that most wild juvenile Chinook Salmon move rapidly through the upper reaches of the lower Feather River as fry. However, little information exists regarding rearing behavior in the lower Feather River downstream of the town of Live Oak (see the Beach Seining section, later in the chapter). Additionally, trapping larger individuals that may be exhibiting alternative life-history strategies is difficult and not likely to be well documented without targeted trapping efforts (which are not currently employed).

In 2015, the RSTs fished throughout the majority of the emigration period, with salmon emigration observed from December through May, with the greatest abundance occurring in January and February. In 2015, trapping locations included both the low-flow and high-flow channels. Within the low-flow channel, approximately 19,500,000 juvenile salmon were estimated to have passed the RSTs. Within the high-flow channel, approximately 7,500,000 were estimated to have passed the Herringer Riffle trap at River Mile (RM) 46.

Although Chinook Salmon and steelhead were the primary targets of trapping efforts, records were kept on all fish species caught.

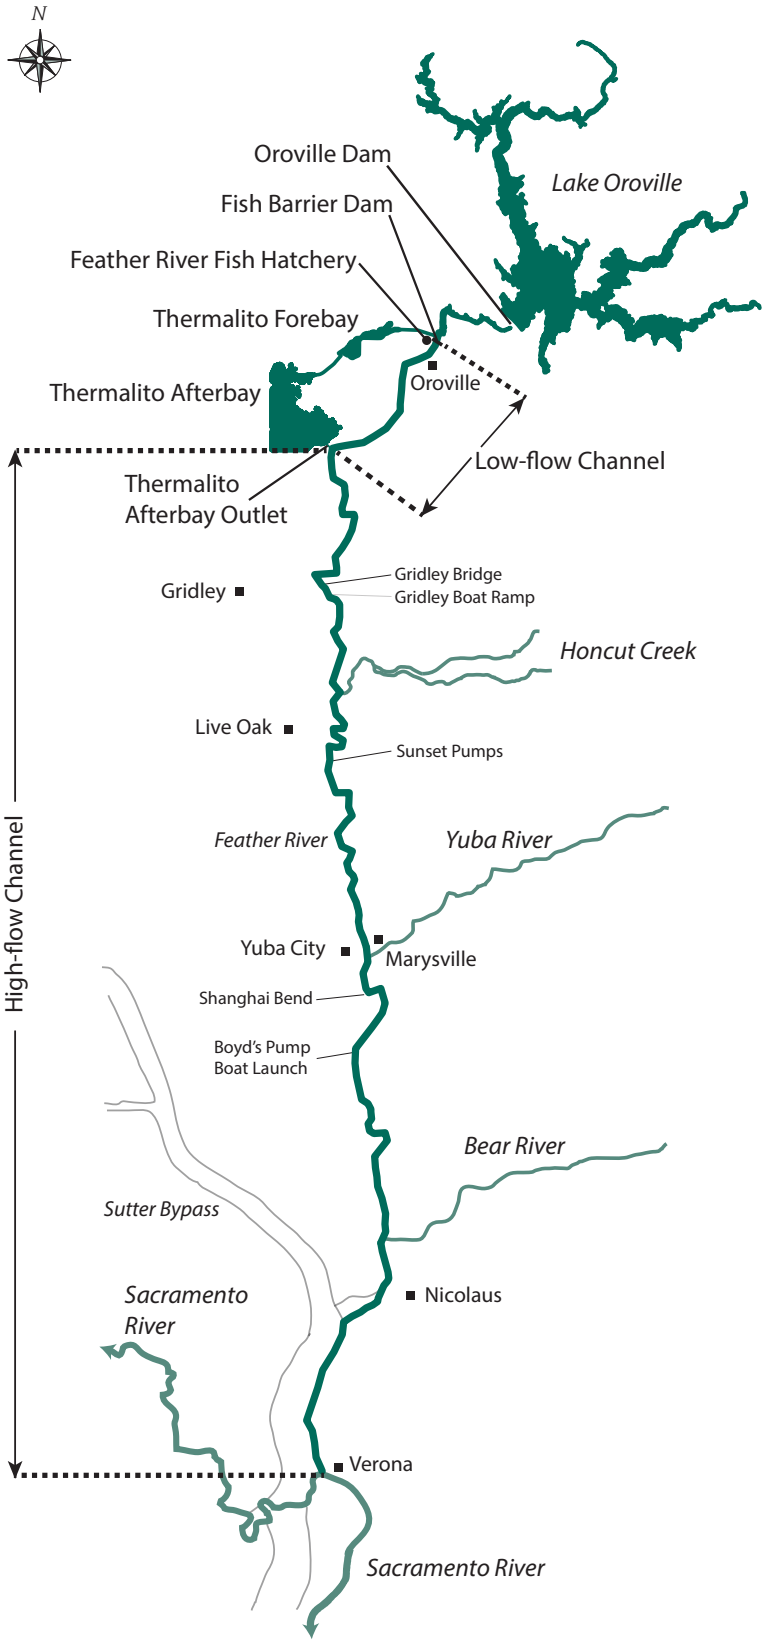

**Figure 3-5 The Lower Feather River**

Twenty-three species, including three races of Chinook Salmon (fall-run, spring-run, and late fall-run), were caught during the 2015 season. Chinook Salmon was the dominant species, comprising 95 percent of the catch. A total of 465,019 Chinook Salmon were caught in the RSTs with 319,221 (69 percent) of those captured in the low-flow channel and 145,798 (31 percent) caught in the high-flow channel.

## Acoustic Telemetry

Acoustic telemetry gathers baseline information on the migration and holding patterns of adult spring-run Chinook Salmon in the lower Feather River. In 2015, a telemetry study was conducted to collect additional data to better understand migration of prespawning adult Chinook Salmon.

Chinook Salmon with a spring-run life history enter freshwater in spring and hold in the river up to several months before spawning. In order to collect additional data to evaluate straying, migration patterns, and potential passage barriers for spring-run Chinook Salmon, adults were captured and tagged with acoustic tags.

Between April 28 and June 25, 2015, nine adult spring-run Chinook Salmon were captured at Shanghai Bend (downstream of the Yuba River confluence) using hook-and-line sampling and implanted with acoustic tags. These fish were monitored along the 67-mile stretch of river from the Fish Barrier Dam near the FRFH to the confluence with the Sacramento River at Verona. Twenty-six submersible hydrophone receivers positioned at various locations along this stretch picked up the signals from the implanted tags as fish passed the receivers. All salmon tagged at Shanghai Bend in 2015 swam to the upper reaches of the Feather River. Seven out of nine Chinook Salmon were observed to reach the uppermost extent near the FRFH (RM 67). Two fish demonstrated upstream movement to River Bend Park (RM 65.7) with no evidence of movement upstream of this point.

## Spawning Surveys

To better understand Feather River salmon and steelhead spawning distribution and response to restoration actions, redd surveys (a redd is a shallow depression in a streambed, excavated by a salmonid and containing deposited fish eggs) are performed to identify the location, timing, magnitude, and physical characteristics of natural spawning sites in the lower Feather River. The surveys are generally performed weekly, and, depending on the survey type, much of the available spawning area between the Fish Barrier Dam and Gridley Bridge is searched.

### *Salmon*

In June and July 2014, DWR implemented a project to strategically place 8,300 cubic yards of salmon and steelhead spawning gravel in the lower Feather River near the FRFH. The spawning gravel used was in the ideal size range for salmon and steelhead, and the project was designed to optimize depth, flow, and velocity for immediate use. In selected areas with significant armoring and large cobble, the riverbed was also scarified to increase permeability and to break up the armoring that had occurred over the past 50 years. Redd mapping and hydraulic modeling occurred before the project to document existing use and to inform the design of each new feature. Post-project redd mapping and modeling were performed to document use of the newly restored sites and to validate predictions.

In 2015, Chinook salmon redd surveys were conducted within the gravel augmentation project boundary to monitor the response to the restored areas. Redd surveys were also performed in the high-flow channel to record redds that could be dewatered when flows decrease in the fall.

Ground surveys for the 2015 Chinook Salmon redd survey began on September 16 and continued until December 4. The redd survey consisted of a total of 37 days over 13 survey weeks. The surveys were concentrated in lower, middle, and upper Auditorium Riffle as well as the section between upper Cottonwood Riffle and upper Moe's Side Channel. Hatchery Riffle and upper Hatchery Riffle (RM 66.6) were also sampled. The high-flow channel was surveyed four times in 2015. The first survey was conducted on October 15 and the last survey took place on December 3.

During the 13 weekly surveys, 2,023 redds were found within the spawning area between upper Hatchery Riffle and lower Auditorium Riffle (RM 66.4). This area included all of the newly restored spawning sites as well as Cottonwood Riffle and Moe's Side Channel. Since 2014, the restored areas continue to see significant spawning activity, indicating that the project was successful. Another 147 redds were discovered in the high-flow channel from the Thermalito Afterbay Outlet to the Gridley Bridge.

The week 4 survey (October 5, 6, 8, and 9) covering the area between upper Hatchery Riffle and lower Auditorium Riffle revealed the highest number of redds with 377. The second highest total was 350 redds for the survey conducted the week of October 19 in the same areas. The locations with the largest number of redds were the lower Auditorium Riffle area with 651 (32 percent) and Hatchery Riffle with 257 (13 percent). The average depth for all salmon redds was 0.45 meters (m) (1.48 feet [ft]), and the average water velocity was 0.46 m (1.51 ft) per second. The average redd length and width was 2.1 m (6.89 ft) by 1.4 m (4.59 ft), respectively.

### *Steelhead*

In 2015, a total of 56 steelhead redds were identified during 8 weekly surveys. Forty of the 56 redds (71 percent) were observed in Moe's Side Channel and Hatchery Side Channel, two side channels in the uppermost section (RM 66.5) of the lower Feather River. Steelhead redds were first observed on January 15, with newly constructed redds continuously observed through March 5. Fifty redds (89 percent) were observed between mid-January and mid-February.

The average depth for all recorded redds was 0.33 m (1.08 ft) with an average water velocity of 0.67 m (2.20 ft) per second. The average redd length and width was 1.17 m (3.84 ft) by 0.76 m (2.49 ft). Small gravel and pebbles were the dominant substrate types used by steelhead for redd construction, and overhead cover was present at 59 percent of observed redds. Instream cover was present at 55 percent of observed steelhead redds.

## Salmon Escapement Survey

The survey provides information crucial to monitoring, managing, and conserving Feather River salmon populations. The primary purpose of the salmon escapement survey is to evaluate the abundance of Chinook Salmon spawning in the lower Feather River. Other important objectives include: (1) understanding the distribution and success of spawning, (2) estimating the number of hatchery salmon spawning in the river, and (3) identifying trends in population and age structure.

The Chinook Salmon spawning escapement survey began September 8 and continued through December 23, 2015. The survey was conducted in the low-flow channel and the high-flow channel from the Table Mountain Bridge downstream to the Gridley Bridge. Due to the low numbers of returning fish in the high-flow channel, the data were pooled with the low-flow channel data to generate one estimate for the entire lower Feather River.

The carcass mark-recapture study resulted in a spawning population estimate of

18,069 adult Chinook Salmon for the lower Feather River. There were an estimated 2,497 grilse (2-year-old fish less than 65 centimeters in fork length). These estimates include both fall-run and spring-run Chinook Salmon since their spawning is currently not fully segregated on the Feather River.

Approximately 95.2 percent of the spawning population utilized the low-flow channel. Since 2000, the long-term average for the low-flow channel's spawning population is 82.8 percent. In the low-flow channel, survey section 8 (RM 66.5) had the highest carcass concentration followed by section 12 (RM 63.0). The highest concentrations of carcasses in the high-flow channel were found in sections 24 and 28 (RM 57 and 56, respectively).

## Feather River Fish Hatchery Spring-run Chinook Salmon Tagging

To better manage broodstock selection at the FRFH, a program was developed to mark spring-run Chinook Salmon entering the FRFH in the spring. The spring-run Chinook Salmon tagging program allows DFW to segregate the spawning of spring- and fall-run Chinook Salmon in the hatchery in the fall when the populations are mixed together in the fish ladder. The program also investigates potential differences in spawning distribution and timing of the early arriving spring-run Chinook Salmon in the river.

Early arriving spring-run Chinook Salmon entering the hatchery in May and June were marked with individually numbered Hallprint dart tags for identification. Once marked, the fish were released back into the river. During the hatchery spawning season, the tags enabled hatchery staff to distinguish the early arriving spring-run fish from the fall-run fish, allowing segregated spawning for each run. The tags also enabled the escapement survey crew to differentiate spring- and fall-run salmon, so that any potential differences in spawning success, distribution, or behavior of the two runs can be analyzed.

In 2015, 5,355 Central Valley spring-run Chinook Salmon were tagged at the FRFH. Tagging began on May 21 and ended on July 2. When spawning commenced in the fall, a total of 4,940 tagged fish were recaptured: 4,440 at the FRFH and 500 in the river escapement survey.

## Snorkel Surveys

From 1999 to 2001, DWR conducted snorkel surveys focused on juvenile steelhead, but included observations of other species and life stages. In 2010, DWR reinstituted the lower Feather River snorkeling surveys with the following objectives:

(1) determine the relative abundance and distribution of juvenile spring-run Chinook Salmon and steelhead prior to habitat improvements;
(2) identify habitat conditions (depth, substrate, velocity, and cover) where juvenile Chinook Salmon and steelhead occur; and
(3) identify potential sites for channel improvement and structural habitat restoration.

In 2015, the Feather River Program continued to collect data to determine the relative abundance and distribution of age-0 steelhead and salmon prior to habitat improvements. Nonsalmonid species were also identified and enumerated. The program also succeeded in quantifying habitat characteristics where juvenile steelhead and salmon occur as well as identifying other high-use areas of the low-flow channel that may benefit from habitat improvements.

Snorkel surveys were conducted during July, August, and September 2015 at 21 permanent sites, 12 in the low-flow

channel and 9 in the high-flow channel. Of the 116 Chinook Salmon identified during the snorkel surveys, 113 were adults. A total of 365 steelhead were identified and enumerated; 283 were considered to be juveniles (≤200 mm fork length).

## Beach Seining

DWR conducted beach seining surveys in the lower Feather River between January 1997 and August 2001 to document fish distribution. Since then, beach seining has occurred intermittently since 2008 to further document the distribution and condition of steelhead and salmon in both the low-flow and high-flow channels during the primary emigration and rearing period (roughly December through July).

Although targeted at steelhead and salmon, beach seining is useful to augment screw trapping for the purpose of documenting the distribution and relative abundance of all fish species found in the Feather River. In 2015, the objectives for beach seining included two relatively new components: capturing spring-run smolts released from the FRFH to augment survival study and emigration rate data collected via acoustic tagging, and collecting random samples of juvenile Chinook Salmon for an ongoing *Ceratonova shasta* study. This study is looking at the rate of infection and disease from the parasite *C. shasta* experienced by juvenile Chinook Salmon rearing or emigrating in the lower Feather River.

Beach seining surveys were conducted from April through August 2015. A total of 83 seine hauls and 6,076 individual fishes were sampled during the 2015 surveys. Native fishes dominated the beach seine catch and represented 88 percent of the overall catch. The most abundant groups captured were juvenile minnows (1,880), Sacramento Sucker (1,693), and juvenile Chinook Salmon (794). A total of 23 steelhead were captured by beach seine in 2015.

## Green Sturgeon Studies

The primary objective of the sturgeon study is to provide DWR with data to make long-term management decisions concerning future monitoring programs, operational changes to the facilities, and/or habitat enhancement within the lower Feather River. Specific studies focus on the following components of Green Sturgeon life-history in the lower Feather River:

- potential adult migration barriers;
- migration patterns;
- distribution and habitat preferences;
- annual abundance of adults; and
- identification of spawning grounds.

In 2015, 73 sonar surveys were completed from January 12 to December 23. The number of surveys conducted at six locations was as follows:

- Lower Shanghai (RM 24.7), 25;
- Upper Shanghai (RM 25.5), 1;
- Sunset Pumps (RM 38.5), 23;
- Lower McFarland (RM 52.0), 2;
- Big Hole (RM 57.9), 1; and
- Thermalito Afterbay Outlet (RM 59), 21.

A total of 29 sturgeon detections were made during the survey season. Since individuals are detected multiple times, analysis of the 29 detections suggests that at least 3 to 5 individuals were within the study area. Sturgeon at Shanghai accounted for 89 percent of the detections and were 1.5 to 1.9 m (4.9 to 6.2 ft) in length at depths of 1.1 m (3.6 ft) to 4.7 m (15.4 ft). The only sturgeon detected at Sunset Pumps rock dam was 1.5 m (4.9 ft) long at 1.1 m (3.6 ft) depth. The two other detections occurred at Upper Shanghai (1.4 m (4.6 ft) long; 1.2 m (3.9 ft) deep) and Lower McFarland (1.3 m (4.3 ft) long; 2.5 m (8.2 ft) deep). It

is not clear whether these were Green or White Sturgeon.

One adult Green Sturgeon was captured via angling and tagged on October 22 below Shanghai where it remained until it began outmigrating on December 23. One adult Green Sturgeon was visually identified repeatedly below Sunset Pumps between June 29 and August 1 at 1 to 2 m (3.3 to 6.6 ft) depth. A Green Sturgeon was also visually confirmed by multiple biologists at Lower McFarland (above the Sunset Pumps rock dam) on multiple occasions.

No egg or larval sampling occurred in 2015 since adults were not detected until after the spawning season was over.

### *Ceratonova shasta* Sampling

*Ceratonova* (previously known as *Ceratomyxa*) *shasta* is a parasite that infects freshwater salmonid fishes throughout tributaries of the Pacific coast of North America, including the Feather River. *C. shasta* has a complex life cycle involving an invertebrate polychaete worm host (*Manayunkia speciosa*) in addition to the salmon host. Infected worms release actinospores into the water that infect fish by attaching to the gills.

A high prevalence of severe *C. shasta* infection (68–83 percent) was observed in natural Feather River juvenile Chinook Salmon sampled in the high-flow channel between 2012–2014. Juveniles collected in the low-flow channel were far less likely to be infected (<10 percent prevalence of infection). In 2015, DWR partnered with the USFWS Coleman National Fish Health Laboratory to better understand the problem observed in the lower Feather River. The objectives of this study were to:

(1) compare prevalence and severity of infection by *C. shasta* and the myxozoan kidney parasite, *Parvicapsula minibicornis*, in natural Chinook Salmon juveniles in the low- and high-flow channel reaches of the Feather River from late January until outmigration ends in late spring;
(2) collect juvenile Chinook Salmon by beach seine in the lower Feather River below the confluence of the Yuba River during the prime infectivity period of March and April (the lower river sample may provide information on tributary input and prognosis of infections acquired up-river); and
(3) collect environmental DNA samples from the Feather River at several different locations to better determine the locations where actinospores are of highest density.

Results of the 2015 *C. shasta* sampling show both a high prevalence (58 percent) and disease severity in natural Chinook Salmon juveniles collected in the high-flow channel of the Feather River. Infection was detected as early as February when the water temperature was 11–12°C (51.8–53.6°F). These fish had concurrent infections by *P. minibicornis*. Salmon sampled from the low-flow channel of the Feather River and Lake Oroville showed little to no *C. shasta* infection. Infection data for natural Chinook Salmon and sentinel fish along with the *C. shasta* environmental DNA concentration in river water demonstrates a zone of high infectivity for both pathogens in the high-flow channel, from approximately the Thermalito Afterbay Outlet (RM 59) to at least the Herringer RST site (RM 45.8). Actinospore concentrations declined downstream of the Herringer site.

## Fish-related Mitigation Projects

In 1986, DWR and DFW signed the Delta Pumping Plant Fish Protection Agreement (Delta Fish Agreement) to annually provide funds to offset direct losses of Chinook Salmon, steelhead, and Striped Bass at

Banks Pumping Plant. The Delta Fish Agreement is commonly referred to as the Four Pumps Agreement because it was adopted as part of the mitigation for four additional pumps at Banks Pumping Plant. Direct losses are defined as losses of fish that occur from the time fish are drawn into Clifton Court Forebay until the surviving fish are returned to the Delta. In principle, DFW and DWR intended this agreement to offset direct losses of all fish caused by the diversion of water by the pumping plant starting in 1986. However, at that time, information on impacts and measures to offset those impacts was sufficient only to deal with Chinook Salmon, steelhead, and Striped Bass. The agreement allowed for addressing impacts on other fish species once impacts could be identified and measures could be developed that would offset such impacts.

The agreement formalized the Delta Pumping Plant Fish Advisory Committee consisting of representatives from interest groups concerned with fish resources affected by the SWP, including, but not limited to, representatives of the SWP water contractors, sport and commercial fishing groups, and environmental groups. DWR and DFW work with the Delta Pumping Plant Fish Advisory Committee to review the success of the agreement in offsetting the direct effects of diversions at Banks Pumping Plant.

To mitigate fish loss, mitigation projects are selected and funded by the Delta Fish Agreement. The agreement outlines how project proposals are reviewed and selected for funding and gives priority to mitigation measures for habitat restoration and other nonhatchery measures. Under the agreement, DWR calculates fish loss as prescribed in the agreement, and approved mitigation projects earn fish mitigation credits to satisfy the fish loss mitigation provisions in the agreement. Mitigation is on a fish-for-fish basis.

The agreement provides for two funding components. One component is the Annual Mitigation Account for compensating the annual fish loss. It has no expiration date. The second is a $15 million Lump Sum Account provided by DWR for additional projects to compensate for post-1986 fish loss.

Since 1986, DWR has spent $71 million on mitigation projects developed under the Delta Fish Agreement. Mitigation fund expenditures through December 31, 2015, were $57 million for the Annual Mitigation Account and $14 million for the $15 million Lump Sum Account. Funds approved but unexpended from each account were $7 million and $1 million, respectively. Funds for the Delta Fish Agreement's Lump Sum Account will be available for expenditure through December 31, 2016.

For more information, see DWR's website.

## Climate Change

Impacts on California under a changing climate include rising seas, longer, more frequent droughts, reduced snowpack, higher temperatures, and earlier snowmelt are already occurring and are projected to continue. These hydrologic changes will challenge current and future operation of the SWP.

California experienced a fourth consecutive year of drought in 2015. The extreme heat that accompanied this dry period was unprecedented. All four years ranked in the top 10 hottest years on record for the state, with 2014 being the hottest year ever recorded in California.

California's hydrology is a snowmelt-dominated system. Warmer temperatures are already shifting peak snowmelt runoff to earlier in the year. Projections show the trend of warming and earlier runoff will continue through the 21st century,

increasingly overlapping with winter storms and flood protection operations. Because flood control is a high priority for California's multipurpose reservoirs (like Lake Oroville) this shift in runoff timing will result in runoff being released to maintain flood protection storage space in reservoirs. Reduced late season runoff will result in less runoff captured for storage, increasing the potential for shortages when demand is high. Additionally, estimates of historical precipitation indicate that over time, there has been a trend toward more rain than snow in the total amount of precipitation in the Sierra Nevada. For more information, see *California Climate Science and Data*, published by DWR in June 2015 and available on DWR's website.

To address these challenges, DWR remains committed to contributing to statewide, national, and international efforts to mitigate the future impacts of climate change by reducing greenhouse gas (GHG) emissions from its activities and adapting to unavoidable climate change impacts. DWR's efforts throughout 2015 represent the continuation of its multipronged approach to addressing these issues by conducting research to better understand potential future impacts; monitoring and reporting GHG emissions; developing plans, strategies, and actions to improve the resiliency of DWR/SWP facilities and operations; reviewing and consulting with outside experts; and developing and managing climate data.

## Completed in 2015

### *Review and Consultation*

**DWR Climate Change Technical Advisory Group.** To improve the scientific basis for decisions and enhance the consistency of climate change approaches, DWR empaneled a Climate Change Technical Advisory Group. The group provides guidance on the scientific aspects of climate change, the impacts of climate change on water resources, the use and creation of planning approaches and analytical tools, and the development of adaptation responses.

The advisory group's work concluded with the release of the report, *Perspectives and Guidance for Climate Change Analysis* in August 2015. The group processes and outcomes were also presented at the American Geophysical Union 2015 Fall Meeting in a poster titled, "Producing Scientific and Strategic Guidance for California's Department of Water Resources: The Climate Change Technical Advisory Group."

Additional information on the Climate Change Technical Advisory Group can be found in previous editions of Bulletin 132, and Climate Change Technical Advisory Group materials and meeting notes can be found on DWR's climate change website.

### *Research*

**Climate Change Impacts on California Water Rights.** The project goal was to evaluate future nonproject water rights reliability in the Sacramento, Feather, and American river watersheds. The final report, published in 2015, gives projections of future water rights curtailments showing that water rights are likely to be curtailed much more frequently and for significantly longer durations in the future. Further, many more water rights holders will be affected by curtailment actions in the future. As curtailments last longer and become more common, more water users will have to access other supplies, such as groundwater or water transfers, or will have to fallow land or conserve water in other ways to meet their demands. The report also provides information about the amount of stored SWP and CVP water that is released each year in excess of the releases that would be necessary to meet SWP and CVP deliveries and how this amount of water is likely to change in the future. The report

is available on the University of California eScholarship website.

**Evaluation of Benefits of Meadow Restoration on Sierra Nevada Water Supply.** DWR provided funding to the U.S. Forest Service for a 5-year investigation of the hydrologic effects of meadow restoration and how restored meadows can contribute to improved system operation and ecosystem functioning.

In a natural, undegraded condition, mountain meadow communities have deep soils, dense herbaceous vegetation, and a naturally developed drainage pattern. Water infiltrates the soil, and shallow meandering channels then carry water downstream. Meadows typically remain fully saturated for most of each year and can store substantial quantities of groundwater in their soils, acting as natural reservoirs of water at high elevations. Slow release of water stored in meadow sediments can provide base flow to downstream drainages long after surface runoff has stopped for the season. In addition, the water storage capacity of meadows can buffer the rate of water runoff during snowmelt and reduce peak flows that cause flooding downstream. Degraded meadows that have been exposed to poor land-use practices drain rapidly into stream channels rather than across meadow surfaces.

The project culminated with the release of the final report, *Effects of Meadow Erosion and Restoration on Groundwater Storage and Baseflow in National Forests in the Sierra Nevada, California*. The report is available on the Sierra Nevada Meadows Data Clearinghouse website.

### *Data Development and Distribution*

**Formation of Regional Energy Intensity of Water Supplies Website.** As a follow up to the SWP water-energy intensity work completed in the *California Water Plan Update 2013*, an interactive website has been created. Regionally based energy intensity data is listed by source, including the SWP. SWP water-energy intensity is a measure of the amount of energy required to extract one unit of water from its origin on the Feather River or other tributary source water and convey it to a particular turnout point. Within California, the SWP water-energy intensity of water varies greatly depending on geography. Information about energy intensity and its associated GHG impacts is designed to help inform the public and SWP water contractors about the energy requirements of their SWP water supplies. Energy usage and GHG emissions information can support measures to reduce GHG emissions, as mandated by the State.

## Ongoing during 2015

### *Planning*

**Data Collection and Climate Services.** Since 2011, DWR has continued developing the Flood Emergency Response Information Exchange. Information in the exchange has been linked to the climate data in the California Climate Data Archive, and seasonal forecasting tools and a storms database have been developed. The exchange will also house a new server for providing depth-duration-frequency curves and annual extremes data sets that make up Bulletin 195 (*Rainfall Analysis for Drainage Design*) in a map-based format. Beta testing is currently underway in DWR's Hydrology and Flood Operations Office.

For observing data systems, DWR is continuing its partnership with the Earth System Research Laboratory of the National Oceanic and Atmospheric Administration and Scripps Institution of Oceanography to deploy new monitoring equipment for extreme precipitation events. For this network, water vapor measurements, wind profilers, soil moisture sensors, and freezing-level radar are being deployed across the State. The data from this network are currently served through

the National Oceanic and Atmospheric Administration's Hydrometeorology Testbed website and the Center for Western Weather and Water Extremes website. Other observing opportunities include elements of the Forecast-Coordinated Operations program, the Forecast Informed Reservoir Operations Project at Lake Mendocino in the Russian River watershed, and the University of California, Merced/University of California, Berkeley, observing system in the American River and Feather River watersheds. A remote sensing monitoring effort using airborne LIDAR (light detection and ranging) measurements of the snowpack is continuing under a joint project between DWR, the California Cooperative Snow Survey Program, and the National Aeronautics and Space Administration's Jet Propulsion Laboratory. In the San Francisco Bay Area, new observations for precipitation will be part of the Advanced Quantitative Precipitation Information System, a regional project funded through the Integrated Water Resources Management Program.

## *Research*

**Reoperation of Water Supply and Flood Protection Systems.** The system reoperation study is being conducted in cooperation with stakeholders to identify strategies for reoperation of flood protection and water supply systems to improve water supply reliability, ecosystem protection, and flood management. In 2015, DWR completed assessments of reoperation of Shasta Lake, Lake Oroville, and Lake McClure, and integrated operation of the SWP and CVP, completing Phase 3 of the study.

Development of the system reoperation study is a multiphased effort that includes:

- Phase 1, Plan of Study (completed in 2011);
- Phase 2, Strategy Formulation and Refinement (completed in 2014);
- Phase 3, Preliminary Assessments of Strategies (completed in 2015); and
- Phase 4, Reconnaissance Level Assessments of Strategies (planned to be completed in 2016).

More information about this project can be found on the System Reoperation Program webpage on DWR's website.

## *Data Development and Curation*

**DWR Climate Change Basic Data Group.** DWR's Climate Change Basic Data group consists of representatives from the Division of Statewide Integrated Water Management, the Division of Flood Management, and DWR's regional offices. The project goals are to assess current climate data acquisition efforts at DWR; promote cooperation and coordination across programs; and strategize on issues of data storage, management, and dissemination. A partnership with the Western Regional Climate Center continued for coordinating statewide climate data collection, storage, and dissemination.

During 2015, the group began researching potential partnerships for assistance with managing in-house historical climate data. Future goals include digitizing historical climate data and providing access for academic research.

## *Policy*

**Development of Internal DWR Policies on Climate Change Mitigation, Analysis, and Adaptation.** In 2010, the DWR CEQA Climate Change Committee began a three-phase process to develop a comprehensive DWR Climate Action Plan that will contain internal policies to address climate change mitigation, effects analysis, and adaptation.

***Climate Action Plan Phase I.*** Completed in 2012, Climate Action Plan Phase I is the comprehensive DWR-wide *Greenhouse Gas Emissions Reduction Plan* that covers mitigation of GHG emissions. The plan lays

out steps to cut DWR's GHG emissions by 50 percent below 1990 levels by 2020 and 80 percent below 1990 levels by 2050.

In 2015, DWR's GHG emissions fell to their lowest levels since records have been kept (1988). The SWP produces more than 97 percent of DWR's GHG emissions. Since the implementation of the *Greenhouse Gas Emissions Reduction Plan* in 2012, DWR has realized a 30 percent reduction in overall GHG emissions.

***Climate Action Plan Phase II.*** Started in 2012, Phase II is a framework and data toolbox to guide analysis of the effects of climate change on DWR projects and activities. Phase II will ensure that all DWR projects meet standards for consistency, quality, and adequacy in climate change analysis for planning activities. This guidance may also provide assistance to local water managers. Phase II is expected to be completed in 2018.

***Climate Action Plan Phase III.*** Phase III of the Climate Action Plan evaluates the vulnerability of DWR facilities and operations to key climate change impacts and develops adaptation strategies to improve DWR's resiliency to climate change. The DWR Climate Change Vulnerability Assessment builds on studies of global, regional, and SWP-specific climate change impacts to evaluate, describe, and where possible, quantify DWR's vulnerabilities to expected changes in temperature, precipitation, and humidity. Specifically, this assessment looks at how changes in hydrology (precipitation, snowpack runoff, and flooding), extreme heat, wildfire, and sea-level rise will threaten DWR's infrastructure, maintenance activities, and operations. This comprehensive assessment is highly analytical using an array of geographic information system and modeling tools that goes beyond what any resource agency has previously employed for climate change vulnerability assessment. DWR-owned facilities and properties are considered, including those associated with the SWP, flood facilities, regional offices, and managed lands. It is intended that the climate change vulnerability assessment will serve as a foundation for the development of a climate change adaptation plan for impacted operations, infrastructure, and staff work. Together the climate change vulnerability assessment and climate change adaptation plan will help prioritize DWR's adaptation and resiliency efforts such as additional water storage projects, infrastructure improvements, enhanced maintenance and operation procedures, and improved habitat management. The vulnerability assessment portion of Phase III is expected to be completed in 2016, with the adaptation plan following in 2017.

## *Reporting*

**Emissions Reports to The Climate Registry.** DWR's emissions are primarily the result of electricity generation at DWR-owned power plants and power purchase transactions to provide power for operation of the SWP.

In May 2015, DWR reported its GHG emissions for the 2014 emission year to the California Air Resources Board pursuant to California mandatory GHG emissions reporting regulations (California Code of Regulations, Title 17, Sections 95100–95158). The report included energy generated and consumed by the SWP and sulfur hexafluoride emissions associated with the SWP's switchyard circuit breakers. The report did not include emissions from the Reid Gardner coal-fired power plant, which previously supplied DWR with up to 235 megawatts of power. (DWR's purchasing contract with Reid Gardner expired in 2013 and was not renewed in an effort to reduce GHG emissions from DWR activities.) In addition, to meet its compliance obligation for the Cap and Trade Program, DWR participated in GHG allowance auctions conducted by the California Air Resources Board.

## Environmental Document Review

Some environmental documents handled by the State Clearinghouse (a division in the Governor's Office of Planning and Research) concern proposed activities that could affect the SWP. Such documents are regularly reviewed to identify any public safety or liability issues arising from the proposed activities.

During 2015, the Division of Environmental Services, Environmental Document Review Section tracked documents related to development along the California Aqueduct, levee encroachment, dam safety issues, water transfers and other water supply issues, wastewater treatment, quarry development, solar and wind power facilities, and climate change issues. The number of environmental documents addressing significant climate change issues increased from 2, in 2010, to 26 in 2013 (after the CEQA guidelines were amended to address GHG emissions pursuant to Senate Bill 97 [Dutton; Chapter 185, Statutes of 2007]). However, in 2014, climate change issues began to be addressed in the general plan process, resulting in only 10 documents clearly dealing with climate change being processed that year. In 2015, 13 documents primarily related to climate change issues were processed.

DWR comments submitted through the CEQA and/or National Environmental Policy Act processes addressed a number of issues, including safety and water supply; encroachment on physical facilities; impacts to cross-drainage facilities; potential damage to SWP pipelines and aqueducts; wildlife issues, including migration, setbacks, and habitat conservation lands; DWR's status as a cooperating or responsible agency; development and operation of small-scale and utility-scale wind and solar projects; and jurisdictional dams.

In 2015, the Environmental Document Review Section screened 2,766 State Clearinghouse documents. After screening, 1,131 documents were referred for information, including notices of preparation and various final documents. Additionally, 129 formal referrals were made for negative declarations, notices of preparation, EIRs, and National Environmental Policy Act documents.

Seventy-six formal referrals plus one requested document were sent to the Division of Operations and Maintenance, and 17 referrals and two requested documents were sent to the State Water Project Analysis Office.

The total number of referrals and requests sent to the Division of Operations and Maintenance and the State Water Project Analysis Office remained the same as in 2014.

In 2015, formal referrals to all other DWR reviewers, including the Central Valley Flood Protection Board and the Division of Safety of Dams, decreased by about 25 percent from 2014. This decrease is relatively insignificant since the total number of referrals was small when compared to the total number of documents (41 were referred in 2014 and 31 in 2015). In addition, Central Valley Flood Protection Board referrals by the Environmental Document Review Section are made only if the State Clearinghouse does not directly assign an appropriate document to the board.

# Chapter 4
# Water Quality Programs

*An emergency drought barrier was built on West False River between Jersey and Bradford islands to block salt water from pushing into the central Delta from San Francisco Bay.*

## Significant Events in 2015

Due to a fourth year of drought conditions, an emergency drought barrier on West False River between Jersey and Bradford islands was erected in May in an effort to maintain good water quality in the central Sacramento-San Joaquin Delta.

Pyramid Lake in Los Angeles experienced a potentially harmful algal bloom in the summer. On June 26, the Department of Water Resources (DWR) issued a public advisory to avoid body contact with algal scum or visible blooms and to take precautions during recreation at the lake. The bloom subsided and the advisory was lifted on July 24.

In mid-October, mudflows clogged the East Branch Aqueduct and caused a shutdown of the normal aqueduct flows to Antelope Valley-East Kern Water Agency. DWR's Southern Field Division and contractors cleaned up and replaced parts of the aqueduct liner by early November.

*Information in this chapter was contributed by the Division of Environmental Services, the Division of Operations and Maintenance, and the State Water Project Analysis Office.*

The Department of Water Resources (DWR), Division of Operations and Maintenance currently maintains 16 automated water quality monitoring stations at key locations along the SWP. This network of automated stations continuously monitors a variety of water quality parameters throughout the system and provides real-time data to SWP water contractors. In addition, field grab samples collected weekly, monthly, quarterly, or annually from more than 30 SWP locations are routinely analyzed for a broad range of constituents at the State's Bryte Chemical Laboratory.

## Delta Water Quality

Maintaining adequate water quality to support multiple beneficial uses of water from the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta) is of concern to DWR as well as other resource agencies. The State Water Resources Control Board (SWRCB) establishes water quality objectives to protect a variety of beneficial uses of water within the Bay-Delta. The objectives are contained within the water quality control plans (WQCPs) adopted by the SWRCB. Water quality objectives are also contained in Article 19 of the long-term SWP water supply contracts. In July 2014, the Drinking Water Program was transitioned from the California Department of Public Health (CDPH) to the SWRCB. The SWRCB is now the primary enforcement authority for federal and State safe drinking water acts and is responsible for the regulatory oversight of public water systems throughout the State.

The SWRCB adopted the current *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (Bay-Delta Plan) on December 13, 2006 (Resolution No. 2006-0098).

The SWRCB adopted Water Right Decision 1641 (D-1641) in December 1999 (amended March 15, 2000). D-1641 implements the objectives of the Bay-Delta Plan. D-1641 amends the water rights of a number of water rights holders—primarily those for the SWP and Central Valley Project (CVP)—to help achieve the Bay-Delta Plan objectives.

For additional background information about the SWRCB's activities and the Bay-Delta Plan, see the sidebar, State Water Resources Control Board, and Chapter 7, Water Supply Development and Reliability.

### 2015 Drought Conditions

In January 2014, the Governor declared a state of emergency due to severe drought conditions and directed State and local agencies to take all necessary actions to conserve water, enhance and protect water supplies, and reduce harmful effects of the drought. Subsequent proclamations and executive orders extended provisions and added new provisions. On November 13, 2015, the Governor issued Executive Order B-36-15, which requires the orders and provisions contained in the January 17, 2014 Proclamation; the April 25, 2014 Proclamation; and Executive Orders B-28-14 (December 22, 2014) and B-29-15 (April 1, 2015) to remain in full force and effect.

To address the effects of the historic drought in 2015, the Bureau of Reclamation (Reclamation), DWR, U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NOAA Fisheries), Department of Fish and Wildlife (DFW), and SWRCB continued coordinated and extensive water operations and regulatory adjustments. The adjustments to existing water quality and federal Endangered Species Act requirements of D-1641 and the USFWS and NOAA Fisheries

## State Water Resources Control Board

The State Water Resources Control Board (SWRCB), established by the California Legislature in 1967, oversees water rights and protects water quality by setting and implementing statewide policy, administering appropriative water rights, coordinating with and supporting Regional Water Quality Control Board (RWQCB) efforts, and reviewing petitions that contest RWQCB actions. The five SWRCB members are appointed by the Governor and confirmed by the Senate. The SWRCB is responsible for four major programs.

Water quality: to preserve, protect, enhance, and restore water quality.

Water rights: to issue permits for water rights specifying amounts, conditions, and construction timetables for diversion and storage.

Financial assistance: to assist local agencies and individuals with pollution prevention or clean-up.

Enforcement: to enforce water rights and water quality laws and regulations.

Under their water quality authority, the SWRCB and RWQCBs adopt water quality control plans (WQCPs) for each of the planning basins in the State. The WQCPs contain water quality objectives for flow, salinity, dissolved oxygen levels, and other parameters necessary for the protection of various beneficial uses, such as municipal and industrial, agricultural, and fish and wildlife. The SWRCB implements these objectives in a number of ways, depending on the circumstances, including imposing conditions on water rights permits and licenses.

Current water quality objectives for the Sacramento-San Joaquin Delta and Suisun Marsh are contained in the *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (Bay-Delta Plan), adopted December 13, 2006. The SWRCB is required to conduct periodic updates of the Bay-Delta Plan. As part of the update process, the SWRCB conducts proceedings to gather information, receive recommendations, consider public comments, and facilitate detailed discussions to evaluate new information relevant to potential changes to the water quality objectives. Recent issues of concern related to the WQCP include the ongoing drought, pelagic organism decline, special status fish species, Delta inflow, San Joaquin River flows, and southern Delta salinity.

Water Right Decision 1641 (D-1641), adopted by the SWRCB in December 1999 and amended in March 2000, implemented the objectives in the 1995 Bay-Delta Plan and continues to implement the objectives in the 2006 Bay-Delta Plan. D-1641 places terms and conditions on a number of water rights, primarily those for the State Water Project (SWP) and Central Valley Project (CVP). The Department of Water Resources and the Bureau of Reclamation operate the SWP and CVP in coordination to meet the terms in D-1641 and other applicable regulatory requirements relevant to each project.

biological opinions (BiOps) allowed the CVP and SWP to support water deliveries and transfers and to maximize upstream water storage while minimizing adverse effects on listed fish species and protecting water quality.

### *Emergency Drought Barrier*

Since early 2014, emergency drought barriers had been part of drought planning for CVP/SWP operations. If there was insufficient water in upstream reservoirs for release to minimize saline intrusion into the Sacramento-San Joaquin Delta Estuary (Delta), salinity intrusion could occur to the extent that interior portions of the Delta would exceed water quality objectives. Increased salinity in the Delta could compromise municipal and irrigation water supplies and have an adverse effect on the sensitive aquatic resources in the Delta. A 750-foot-wide barrier was installed in May 2015 on West False River between Jersey and Bradford islands near the confluence of the West False and San Joaquin rivers. The purpose of the barrier was to limit the tidal push of saltwater from San Francisco Bay into the Central Delta to protect Delta water quality and to minimize the amount of fresh water released from upstream reservoirs to repel the saltwater. Approximately 150,000 tons of rock were used to build the barrier. The barrier was removed by mid-November. To monitor effectiveness of the barrier, DWR installed 10 new monitoring stations to augment the existing network of monitoring stations in the Delta. DWR used emergency drought barriers to reduce salinity intrusion during the 1976–1977 drought.

For more information, see Chapter 2, Delta Resources, and Chapter 7, Water Supply Development and Reliability.

## SWRCB Drought Year Actions

As the State experienced one of the driest periods on record, the SWRCB took a number of drought-related actions pertaining to emergency rulemaking by issuing new or modifying existing orders; considering and/or approving temporary urgency change petitions (TUCPs) and water transfer requests; coordinating cooperative efforts with State and federal agencies; gathering information; and performing outreach, expanded monitoring, and field investigations.

On January 23, 2015, DWR and Reclamation filed a joint TUCP to temporarily change SWP and CVP water right permit and license conditions imposed pursuant to D-1641. On February 3, 2015, SWRCB issued an order approving parts of the TUCP, subject to conditions. Throughout the year, DWR and Reclamation submitted additional TUCPs and requests to modify the TUCP order, and SWRCB modified the order several times in response. Issues included Delta outflow requirements, export limits, Delta Cross Channel gate operations, Sacramento River and San Joaquin River flow requirements, western Delta agricultural salinity requirements, and adjusted operations to conserve water in upstream storage to ensure water supply.

DWR and Reclamation submitted the Drought Contingency Plan for the period January 15 through September 30, 2015, to SWRCB as required in SWRCB's TUCP order dated October 7, 2014, and water right order 2014-0029. The plan was developed in coordination with the fish and wildlife agencies and addressed projected water operations based on various hydrologic scenarios and potential adjustments to regulatory requirements. Proposed operations in the Drought Contingency Plan consider water quality, fish protection, and water supply. The Drought Contingency Plan serves as the framework to develop proposed modifications to D-1641 requirements during the drought. Reclamation and DWR will continue to work closely with the fish and wildlife agencies

to update the Drought Contingency Plan as necessary based on changing circumstances.

More information about the TUCP process is available on SWRCB's website.

### California WaterFix

In April 2015, DWR and Reclamation announced plans to split the proposed Bay Delta Conservation Plan into two separate efforts—one for water conveyance facilities and the other for habitat restoration. The water conveyance effort, identified as the California WaterFix, is Alternative 4a (the preferred alternative) of the Bay Delta Conservation Plan/California WaterFix partially recirculated draft environmental impact report/supplemental draft environmental impact statement released in July 2015. California WaterFix would construct new Delta conveyance facilities in compliance with the federal Endangered Species Act and California Endangered Species Act. The conveyance facilities would allow greater flexibility in water diversions and better balancing of the associated water quality and hydrodynamic benefits for fish, drinking water, agriculture, and other beneficial uses.

For additional information about California WaterFix, see Chapter 3, Environmental Programs and Chapter 7, Water Supply Development and Reliability.

## Water Quality Standards

Water quality objectives in the Bay-Delta Plan are categorized by the beneficial uses they are intended to protect, including municipal and industrial, agricultural, and fish and wildlife. DWR operators adjust upstream releases and Delta exports to meet D-1641 operational requirements for meeting water quality and flow standards.

### 2014–2015 Water Year Hydrologic Classifications

The Bay-Delta Plan contains water quality and flow standards that are conditioned by water year type and generally become less stringent in years with less precipitation. The water year classification system provides relative estimates of a basin's available water supply based on the amounts of rainfall and snowmelt runoff and rates of groundwater accretion. Water year types are classified as "wet," "above normal," "below normal," "dry," or "critical."

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) forecast on May 1 of each year determines the water year type for the implementation of flow and water quality criteria contained in the Bay-Delta Plan.

The Sacramento Valley 40-30-30 Index and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) were both critical, based on observed data for water year 2014–2015.

For a detailed discussion of water year 2014–2015, see Chapter 8, Water Supply.

### 2006 Bay-Delta Plan Review

California Water Code Section 13240 requires that the WQCP be periodically reviewed. Federal Clean Water Act Section 303(c) (33 U.S.C. Section 1313(c)) requires a triennial review of State water quality "standards," as defined in the act.

The WQCP review and amendment process consists of review of the Bay-Delta Plan to identify elements that may need amendment or new elements that may need to be added, staff preparation of any amendments or revision of the entire WQCP, and SWRCB adoption of some or all of the amendments or revisions. SWRCB information-gathering activities may affect the scope of the

WQCP review and may include a series of evidentiary hearings on critical issues concerning the Delta's ecology. The review includes both the review and update of water quality objectives (including flow objectives) and the program of implementation in the Bay-Delta Plan, as well as changes to water rights and water quality regulation consistent with the program of implementation.

The SWRCB is conducting the WQCP review in four phases:

- Phase 1 involves updating San Joaquin River flow and southern Delta water quality requirements.
- Phase 2 involves other comprehensive changes to the Bay-Delta Plan to protect beneficial uses not addressed in Phase 1 (e.g., objectives for Delta outflows, Sacramento River inflows, export constraints, Delta Cross Channel gate closure requirements, and Suisun Marsh protection).
- Phase 3 will involve changes to water rights and other measures to implement changes to the Bay-Delta Plan in Phases 1 and 2.
- Phase 4 involves developing and implementing flow criteria and flow objectives for priority Delta tributaries with a focus on the Sacramento River watershed.

The formal review and amendment process for the 2006 Bay-Delta Plan that began in October 2008 continued in 2015. Phase 1 began in 2009, Phase 2 began in 2012, and Phase 4 began in 2013.

## SWP Operations to Meet Water Quality Requirements

In 2015, DWR and Reclamation jointly operated the SWP and CVP in accordance with D-1641, which includes water quality, flow, and operational criteria for the SWP and CVP Delta operations. SWP and CVP operations were coordinated to meet the various objectives of the Bay-Delta Plan, Central Valley Project Improvement Act, and BiOps for listed species, as well as other regulatory requirements. Fish species currently listed under the Endangered Species Act and the California Endangered Species Act include the winter and spring runs of Chinook Salmon, Delta Smelt, steelhead, and Green Sturgeon.

Real-time monitoring of fish movement and conditions in the estuary aids daily water management and provides timely protection of targeted fish species from entrainment at the Delta pumping facilities.

The Bay-Delta Plan includes the requirement to monitor a number of stations within the Delta for specific water quality constituents. DWR conducts extensive monitoring in the Delta and the Suisun Marsh. Figure 4-1 shows water quality compliance and monitoring stations throughout the Delta specified in the Bay-Delta Plan.

In January 2015, the SWP and CVP submitted a TUCP to the SWRCB requesting modification of D-1641 requirements due to drought conditions. The SWRCB approved the TUCP and issued an order allowing temporary changes to some of the water quality and flow objectives. For additional information, see the 2015 Drought Conditions and SWRCB Drought Year Actions sections earlier in this chapter.

For a discussion of other environmental issues, see Chapter 3, Environmental Programs.

### Delta Cross Channel Gates

The Delta Cross Channel gates are operated in accordance with the Bay-Delta Plan/D-1641 and other regulatory requirements. In 2015, the gates were open for 178 days to allow fresher Sacramento River water to flow into interior Delta channels toward the SWP and CVP export

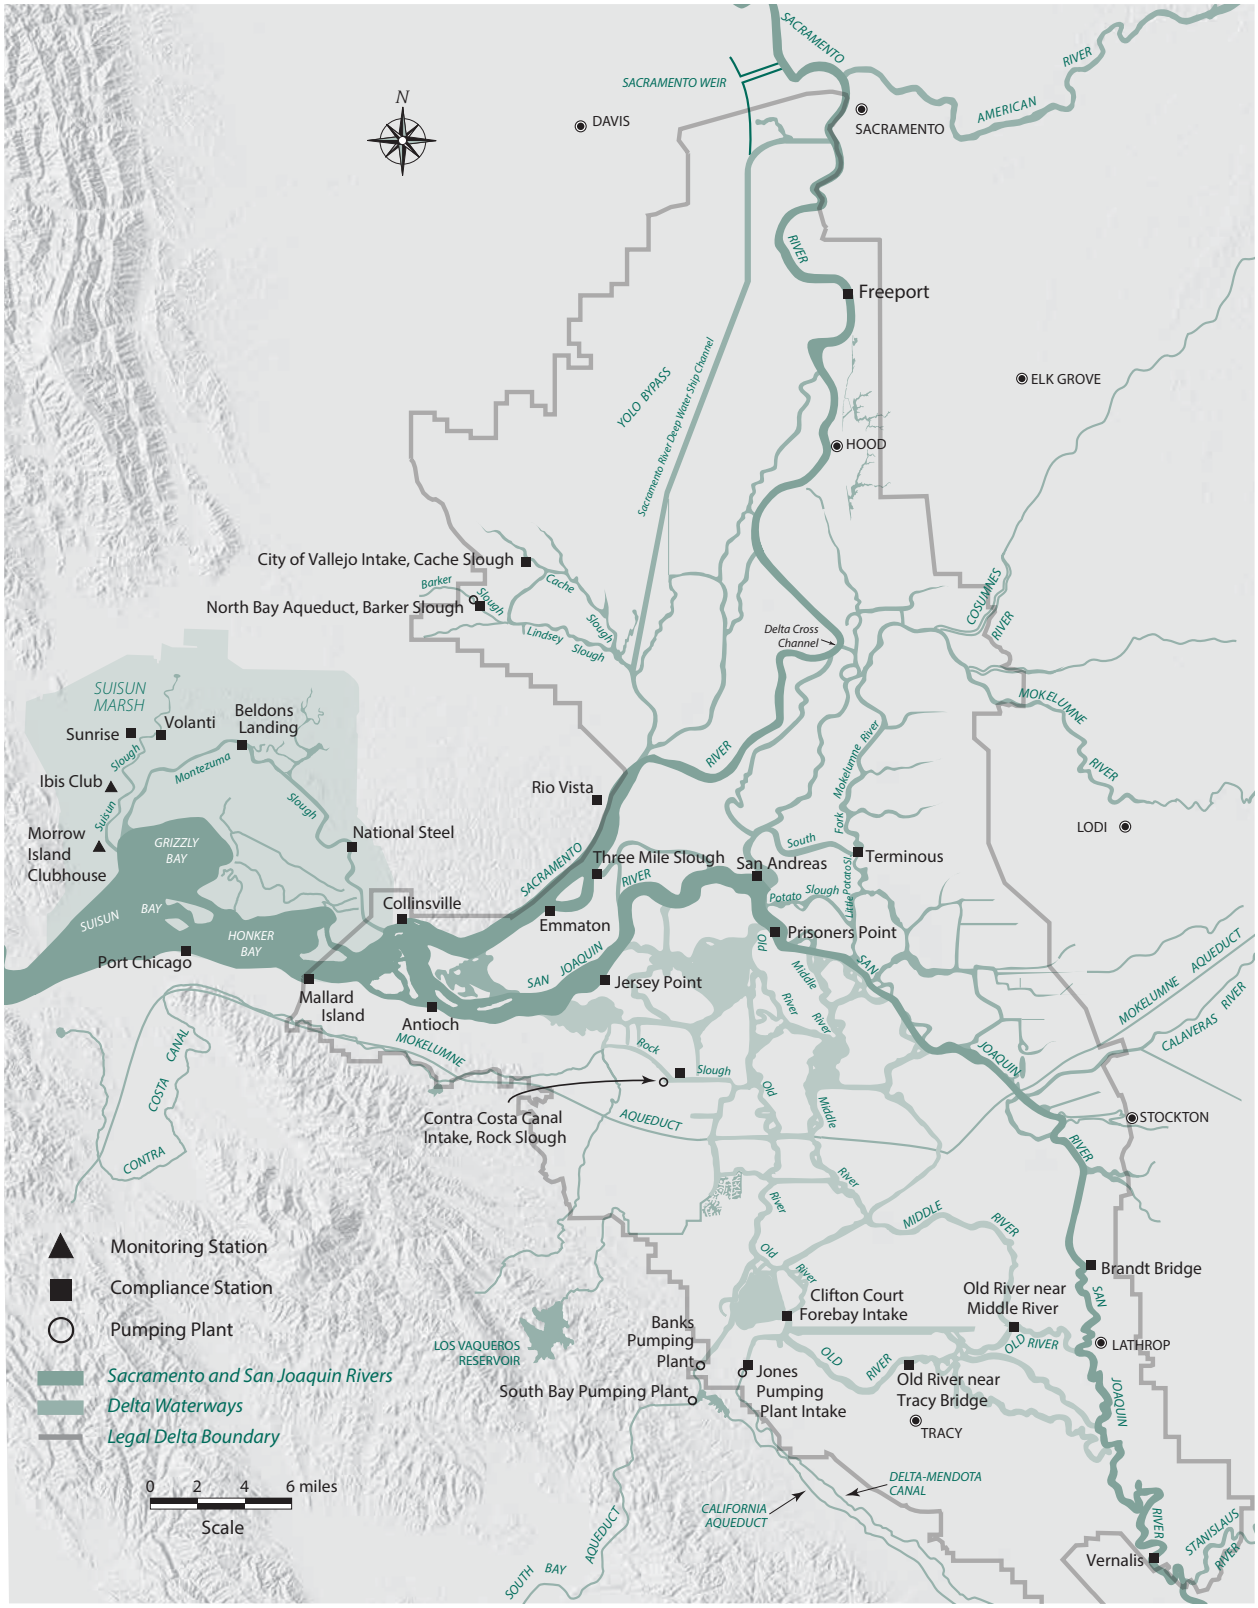

**Figure 4-1 D-1641 Water Quality Compliance and Monitoring Stations in the Sacramento-San Joaquin Delta**

facilities. Reclamation's standard operating procedures call for gate closure when flow on the Sacramento River at Freeport reaches between 20,000 cubic feet per second (cfs) and 25,000 cfs to reduce flooding potential on the Mokelumne River and to prevent scouring on the downstream side of the gate structure. D-1641 contains measures that require gate closure under certain conditions from November 1 through May 20 for fisheries protection as requested by the USFWS, NOAA Fisheries, and DFW. SWRCB's order for the 2015 TUCP allowed for opening the Delta Cross Channel Gates to reduce infiltration of high salinity water during the winter and spring. Under this TUCP order, the gates were opened from May 14 to May 18.

## Municipal and Industrial Objectives

The Bay-Delta Plan includes a year-round 250 milligrams per liter (mg/L) (maximum mean daily) chloride objective that is in effect at Delta export locations (Contra Costa Canal Pumping Plant No. 1, Clifton Court Forebay, Jones Pumping Plant, and Barker Slough). Chloride levels remained below the objective for all days in 2015.

An additional municipal and industrial water quality objective for chloride at the Contra Costa Canal Intake, near Rock Slough, specifies that the chloride level must be below 150 mg/L (maximum daily mean) for a minimum number of days during the year, dependent upon the water year forecast. For calendar year 2015, the objective of 155 days was met.

## Agricultural Salinity Objectives

The Bay-Delta Plan contains agricultural salinity objectives, which vary by location. The salinity objectives, recorded as electrical conductivity (EC), are based on both water year type and a 14-day running average during the irrigation season, from April to mid-August, at Emmaton, Jersey Point, Terminous, and San Andreas in the West and Central Delta. The agricultural salinity objectives at these Delta locations become less stringent under dryer conditions. The Terminous and San Andreas critical water year objectives were met for calendar year 2015. However, the Emmaton critical water year objective of 2.78 millisiemens per centimeter (mS/cm) was moved, under the SWRCB's TUCP order, to the Sacramento River at Three Mile Slough. The objective was not met at Jersey Point for 8 days and Three Mile Slough for 15 days for calendar year 2015.

In the South Delta, salinity may be influenced by San Joaquin River flows, in-Delta diversions, and SWP exports, and water circulation may be influenced by the annual placement of South Delta barriers. South Delta salinity objectives are based on a 30-day running average. The 1.0 mS/cm objective for the South Delta was met at Vernalis. The objective was not met at Old River near Tracy Road Bridge for 97 days, Old River near Middle River for 83 days, and San Joaquin River at Brandt Bridge for 39 days. The 0.7 mS/cm objective for the South Delta was met at Vernalis. The objective was not met at Old River near Tracy Road Bridge for 110 days, Old River near Middle River for 83 days, and San Joaquin River at Brandt Bridge for 82 days. The SWP and CVP share responsibility for meeting the agricultural EC objectives imposed at these South Delta compliance locations.

## Estuarine Habitat Protection Standard

The estuarine habitat protection standard incorporates modified X2 criteria (geographic isohaline) first established in the 1994 Delta Smelt BiOp. The upstream movement of 2 parts per thousand isohaline (2 parts per thousand of salt in the water), measured as 2.64 mS/cm at the surface, is maintained within a certain range of positions in the estuary by adequate Delta outflow. These positions (Collinsville, Chipps Island, Port

Chicago, or Martinez) are associated with an abundance of fish and biota.

The requirement for meeting X2 criteria at Collinsville applies to all days from February through June. The number of days per month when the daily average EC maximum (2.64 mS/cm) is in effect at Chipps Island or Port Chicago is conditioned by the previous month's Eight River Index. (The Eight River Index is the sum of the estimated unimpaired runoff from eight rivers—four in the Sacramento Valley [Sacramento River Region runoff] and four in the San Joaquin Valley [San Joaquin 4 Rivers runoff]. For more about runoff estimates, see Chapter 8, Water Supply.) This requirement may alternately be met with a maximum 14-day running average EC of 2.64 mS/cm or with specific Delta outflow, set as a 3-day average Net Delta Outflow Index (NDOI) of 7,100 cfs, 11,400 cfs, or 29,200 cfs, when the X2 position is at Collinsville, Chipps Island, or Port Chicago, respectively. As allowed by D-1641, the May and June X2 flow objective is reduced to a 14-day running average flow of 4,000 cfs when the best available estimate for the Sacramento River Index is less than 8.1 million acre-feet (af) at the 90 percent exceedance level. The Port Chicago standard becomes effective when the Port Chicago 14-day EC average, immediately prior to the first day of the month, is less than or equal to 2.64 mS/cm.

The Eight River Index for the months of January through May 2015, in million af, was 0.81, 2.23, 0.84, 0.77, and 0.83, respectively. The X2 habitat protection objective at Chipps Island was 1 day in February, 31 days in March, 1 day in April, and 0 days in May and June. The X2 habitat protection objective at Port Chicago was not in effect in 2015. Since the May estimate for the Sacramento River Index was 8.6 at the 90 percent exceedance level, the May and June NDOI objectives were reduced to 4,000 cfs on a 14-day running average. Starting February 3, 2015, the SWRCB TUCP order allowed for a relaxation of the X2 objectives, where an NDOI of 4,000 cfs objective temporarily replaced the X2 objectives for February, March, April, May, and June.

These objectives were met in calendar year 2015.

## Net Delta Outflow Index Standard

Delta outflow cannot be measured directly due to the tidal influence in the Delta. Instead, an approximation of Delta outflow is calculated using measured inflows, exports, and estimated Delta water use. The NDOI was introduced in the 1995 Bay-Delta Plan/D-1641 and remains the same in the 2006 Bay-Delta Plan. NDOI calculates Delta outflow using inflows of the Sacramento River, the Yolo Bypass system, the eastside stream system (consisting of the Mokelumne, Cosumnes, and Calaveras rivers), the Sacramento Regional Treatment Plant, and a measurement of San Joaquin River flow at Vernalis.

Excess outflow conditions, as defined by the Coordinated Operations Agreement, allow for greater flexibility in project operations.

Specific minimum monthly NDOI standards for the protection of fish and wildlife are based on water year type. The SWRCB TUCP order reduced the July NDOI objective from 4,000 cfs to 3,000 cfs. In 2015, the monthly mean NDOI was highest in February, averaging 15,835 cfs. The lowest monthly mean NDOI occurred in August with 3,030 cfs, which was above the objective of 3,000 cfs. All other monthly NDOI objectives were met in 2015.

## River Flow Standards

Water quality objectives include minimum flow requirements measured in the Sacramento River at Rio Vista. These flow standards, incorporated from the winter-run salmon BiOp, set flow requirements based on the Sacramento Valley water year

classification. Water year 2014–2015 was critical, requiring mean monthly flows of 3,000 cfs for September and October and 3,500 cfs for November and December. During these periods, the 7-day running average could not be more than 1,000 cfs below the monthly standard. The SWRCB TUCP order reduced the Rio Vista flow objective to a mean monthly flow of 2,500 cfs and a 7-day running average of 2,000 cfs for September, October, and November. The actual mean monthly flows were 2,954 cfs in September; 2,747 cfs in October; 2,676 cfs in November; and 7,524 cfs in December. The 7-day average Rio Vista flow was less than 2,000 cfs from November 27 to November 30.

Water quality objectives also specify minimum flow requirements measured in the San Joaquin River at Vernalis. These flow standards are based on the San Joaquin Valley 60-20-20 Index, which was critical for water year 2014–2015. If the X2 objective is required to be at or west of the Chipps Island location, critical year base Vernalis flows are set at 710 cfs in February; 710 cfs or 1,140 cfs from March to April 15; and 710 cfs or 1,140 cfs from May 15 to June. The base-flow objective is relaxed to 710 cfs when X2 is required to be east of Chipps Island.

A San Joaquin River spring pulse flow (a short-term increase in stream flow) is required from April 15 to May 15 at Vernalis. This spring pulse flow requirement varies based on the location of X2 during April. However, the CALFED Operations Group may vary the actual timing and duration of the pulse attraction flow based on real-time monitoring data. (For background on the CALFED Bay-Delta Program, see Bulletins 132-95 through 132-11.) The 2015 SWRCB TUCP order allowed the total volume of the pulse flow to be no less than 710 cfs at Vernalis during the pulse flow period from March 25 through April 25. It also reduced the average minimum flow rate to 300 cfs to the end of May, and then to 200 cfs to the end of June.

Additional information about San Joaquin River water quality can be found in Chapter 5, Local Assistance.

## Export Standards

Water quality objectives and D-1641 include an export limitation for the SWP and CVP. It limits Delta exports to a ratio of Delta inflow to combined water project exports and is expressed as a maximum export rate in percentage of Delta inflow.

The SWRCB TUCP order added an additional export limitation for those times when the obligations under D-1641 were not being met. Under these conditions, the maximum combined exports were 1,500 cfs.

The actual export amount is calculated using the 3-day average that combines the inflow rate for Clifton Court Forebay (excluding Byron Bethany Irrigation District diversions from Clifton Court Forebay) added to the Jones Pumping Plant diversion. The export-to-inflow ratio limit is reported as either a 3-day or 14-day running average. A 14-day running average of inflows is used unless storage withdrawals from upstream reservoirs are being made for export, in which case a 3-day average of inflows is used. For all water year types, the maximum combined export rate from February through June is 35 percent of Delta inflow. This rate may be relaxed in February during years with less precipitation to between 35 and 45 percent. From July through January, the export-to-inflow ratio rises to 65 percent.

The 2008 USFWS and the 2009 NOAA Fisheries BiOps typically control the export rate for most of the winter and spring. Under these conditions, the Delta can be pushed into excess conditions more often. Additional information about the BiOps can be found in Chapter 3, Environmental Programs.

During 2015, the Delta was in excess conditions from January 1 to January 14, and

February 7 to March 15, for a total of 51 days. Within this period, combined SWP and CVP exports averaged about 27 percent of Delta inflow, meeting the 65 percent limitation in January and also meeting the 35 percent limitation for February to March.

The Delta was in balanced conditions from January 15 to February 6, and March 16 to December 3, for a total of 314 days. Within this period, combined SWP and CVP exports averaged about 29 percent of Delta inflow, meeting both the 35 percent and 65 percent limitations.

## South Delta Temporary Barriers Project

The South Delta Temporary Barriers Project, initiated as a test project in 1991, was extended for 5 years in 1996, and extended again for 7 years in 2001. The project was created partially in response to a 1982 lawsuit filed by the South Delta Water Agency and consists of rock barriers across four South Delta channels.

These temporary seasonal barriers are designed to improve local water levels and circulation patterns, protect fishery resources, and improve water quality. They are placed across Middle River, Old River near Tracy, Grant Line Canal, and at the Head of Old River.

For more information about the temporary barriers, see Chapter 2, Delta Resources, and Chapter 3, Environmental Programs.

## Delta Mercury Control Program and Mercury Monitoring and Evaluation

DWR's Mercury Monitoring and Evaluation (MME) Section was established in 2012 in the Division of Environmental Services to ensure DWR meets its Delta Mercury Control Program regulatory compliance responsibilities for wetlands, open water, dredging, and educational outreach.

The Delta Mercury Control Program was adopted by the Central Valley RWQCB in 2010 to address mercury and methylmercury (MeHg) water quality impairments in the Delta. For more background information about the program, see Bulletin 132-14.

In 2015, continuing work included:

- completion of one tidal wetland control study and the initiation of a second study to characterize mercury dynamics in tidal wetlands;
- ongoing open water control studies to create mercury models for the Delta and Yolo Bypass;
- data collection from field and laboratory studies to provide information for the modeling work;
- development of brochures for the Mercury Exposure Reduction Program; and
- work on the Statewide Mercury Control Policy and Mercury Control Program for Reservoirs.

### Tidal Wetlands

The Yolo Bypass Wildlife Area tidal wetland study was completed in May 2015. Preliminary analysis of the data indicated that the tidal wetland was a sink for water as well as a sink for organic carbon and MeHg. The total mercury (THg) loads tended to show more seasonality with the tidal wetland being a small source of THg during the warmer months and a small sink during the cooler months.

The second wetland chosen for the tidal wetland studies was the Blacklock tidal wetland, located in the Suisun Marsh and owned by DWR. Sampling began in late spring 2015. To calculate loads and determine if the wetland was a net source or sink for THg or MeHg, two acoustic doppler

current profilers were installed in each of the two breaches to collect stage and velocity data for calculating flow. In October 2015, the acoustic doppler current profilers were removed due to biofouling and are expected to be redeployed in early 2016. The flow data were entered into the Hydstra database, where it was uploaded to DWR's Water Data Library. The study at Blacklock tidal wetland is expected to be completed in 2016.

In addition to flow data, the MME Section collected monthly samples using an autosampler. Composited water samples were analyzed for particulate and dissolved THg and MeHg, total suspended solids, total and dissolved organic carbon, and nutrients. Bryte Chemical Laboratory analyzed all samples except MeHg, which was analyzed by Moss Landing Marine Laboratories. The data collected during these events were entered by Bryte Chemical Laboratory into their Field and Laboratory Information Management System database, which was uploaded to DWR's Water Data Library.

A progress report was submitted to the Central Valley Regional Water Quality Control Board (RWQCB) in October 2015. The report included a preliminary analysis of the data collected at the Yolo Bypass Wildlife Area tidal wetland, plans for study of the Blacklock tidal wetland, and small changes in study design already approved by the RWQCB. The report is available on the Central Valley RWQCB's website.

## Open Water

In 2015, analytical data from the inlet/outlet sampling conducted during the miniflood event of December 2014 were reviewed. Preliminary results suggested that the Yolo Bypass was a net source for unfiltered THg as well as unfiltered and filtered MeHg and total suspended solids. Of the inlet sites, the Cache Creek Settling Basin was the highest contributor to THg loads, while the Knight's Landing Ridge Cut was the largest contributor to MeHg loads. Between the Toe Drain at Interstate 80 and the Toe Drain at Lisbon Weir, total MeHg loads increased by 40 percent. The source of this increase was unknown, and several hypotheses have been considered.

By the end of calendar year 2015, no flooding had occurred in the Yolo Bypass, therefore, no samples were collected for the inlet/outlet study of mass balances and partitioning between the solid and dissolved phases of mercury and MeHg in the Yolo Bypass. However, the U.S. Geological Survey and Moss Landing Marine Laboratories studies to provide data for the modeling effort continued. These studies are not dependent on flood flows for the analyses.

In 2015, the U.S. Geological Survey conducted sediment mesocosm experiments to quantify erosion characteristics associated with different land uses in the Yolo Bypass. Assessment of erosion characteristics was completed for 4 of the 10 land uses in the Yolo Bypass modeling grid. Land uses analyzed were wild rice, white rice, and disked and undisked seasonal wetlands. Preliminary results suggested that erosion characteristics varied between wetlands and rice fields. It is anticipated that assessment of erosion characteristics will be conducted on the remaining land uses in 2016.

In 2015, Moss Landing Marine Laboratories collected sediment cores from 2 of the 10 land uses used in the Yolo Bypass modeling grid (wild rice and undisked seasonal wetland) to analyze for fluxes of mercury and MeHg between sediment and overlying water. Moss Landing Marine Laboratories began a vegetation senescence study to examine the potential MeHg contribution of vegetation submerged by flood flows. It is anticipated that both sediment flux and vegetation senescence studies will continue in 2016. Bale chamber experiments were discontinued because pilot studies indicated this approach did not provide reliable erosion values.

As part of the Delta Mercury Control Program Phase 1 reporting requirements, DWR submitted a progress report in October 2015 to the Central Valley RWQCB documenting modeling progress and preliminary results associated with field and pilot studies. The report is available on the Central Valley RWQCB's website.

Modeling work and field/laboratory studies to collect data for the models will continue in 2016.

## Dredging

DWR is required to submit study workplans to the RWQCB to evaluate management practices to minimize increases in MeHg and mercury discharges from dredging and dredge material reuse.

As discussed in Bulletin 132-14, no dredging activity was identified during the Phase I period of the regulation. Therefore, DWR was not required to submit control study workplans for dredging. In 2015, the MME Section continued to provide mercury guidance to DWR staff for proposed projects involving dredging or spoils usage.

## Delta Mercury Exposure Reduction Program

Elevated concentrations of mercury in fish pose a human health threat. The objective of the Delta Mercury Exposure Reduction Program is to provide educational outreach to reduce human exposure to mercury from consumption of contaminated Delta fish. All entities regulated under the Delta Mercury Control Program are required to participate in a mercury exposure reduction program. DWR is providing up to $20,000 per year through 2019 of in-kind support for brochure and sign production, and associated costs.

Brochures are required for the Sacramento River/Northern Delta, the Central/Southern Delta, and the San Joaquin River regions. DWR's Public Affairs Office worked with the Office of State Publishing to translate fish consumption warning brochures into eight languages: Cambodian, Chinese, Hmong, Lao, Russian, Spanish, Tagalog, and Vietnamese. Brochure production and distribution at local educational outreach meetings will begin in 2016. It is also anticipated that sign production will begin in 2016.

## Statewide Mercury Control Policy and Mercury Control Program for Reservoirs

The SWRCB is developing a statewide mercury policy to control mercury in California's waters. It is anticipated that the policy and its regulations will be presented to the SWRCB for adoption in 2016.

In 2015, the MME Section continued to track developments associated with the Statewide Mercury Control Program for Reservoirs and attended all reservoir owner/operator meetings convened by the SWRCB.

Stakeholder meetings have focused on gathering information about individual reservoirs, determining what reservoir water quality improvement projects are already underway, and soliciting reservoir owner/operator feedback on reservoirs that might be suitable for pilot studies. In addition to attending meetings, the MME Section has provided written feedback on the technical and economic feasibility of the SWRCB's suggested management approaches to reducing MeHg in DWR reservoirs.

The MME Section also continued to collaborate with Reclamation, providing technical advice on the development of a reservoir mercury model.

# Special Studies and Biological Surveys

DWR conducts several special studies and biological surveys each year. This includes a special study in the Stockton Deep Water Ship Channel during the late summer and early fall to monitor the occurrence of low dissolved oxygen (DO) levels. Low DO levels potentially cause physiological stress to fish and block the migration of salmon into the San Joaquin River. DWR also conducts biological surveys of benthic organism density and diversity and of phytoplankton biomass and community composition in the Delta, Suisun Bay, and San Pablo Bay.

## Fall Dissolved Oxygen Study in the Stockton Deep Water Ship Channel

Historically, during the late summer and early fall, DO levels in the eastern and central portions of the Stockton Deep Water Ship Channel have dropped below both the 5.0 mg/L and 6.0 mg/L water quality objectives set by SWRCB and the RWQCB, respectively. These low DO levels are a result of several factors, including low San Joaquin River inflows, high water temperatures, high biochemical oxygen demand, reduced tidal circulation, and intermittent reverse flow conditions in the San Joaquin River at Stockton.

To help reduce the severity of these low DO conditions, DWR normally installs a temporary rock barrier across the Head of Old River during periods of projected low fall flows in the San Joaquin River.

In 2015, installation of the spring barrier began on March 16. Removal of the spring barrier was completed by June 8. Installation of the fall barrier began on September 3, and removal of the fall barrier was completed on November 18.

### *Methods*

In 2015, DO concentration monitoring in the Stockton Deep Water Ship Channel was conducted by boat on 12 monitoring runs, from June 15 to November 24. During each run, 14 sites were sampled at low-water slack tide from Prisoners Point in the Central Delta to the Stockton Turning Basin at the terminus of the ship channel. Because monitoring results differ within the channel, sampling stations were grouped into western, central, and eastern regions. The western region of the channel begins at Prisoners Point and ends at Columbia Cut. The central region of the channel begins one-half mile east of Columbia Cut and ends at Fourteen Mile Slough. Finally, the eastern region of the channel begins at Buckley Cove and ends at Rough and Ready Island. The turning basin is unique within the channel because it is east of the entry point of the San Joaquin River into the channel and isolated from down-channel flows.

### *Results*

During the period of this study, DO levels varied by season and exhibited similar ranges between regions within the channel excluding the turning basin. The overall study period range was 6.10 to 11.80 mg/L at the surface and 5.47 to 10.67 mg/L at the bottom. In the western portion of the channel, DO concentrations ranged from 6.70 to 10.60 mg/L at the surface and 6.66 to 10.67 mg/L at the bottom. In the central portion of the channel, DO concentrations were variable, ranging from 6.35 to 10.30 mg/L at the surface and 5.86 to 10.43 mg/L at the bottom. In the eastern portion of the channel, DO levels were similar to the other regions, ranging from 6.10 to 11.80 mg/L at the surface and 5.47 to 9.22 mg/L at the bottom. In 2015, bottom DO concentrations never fell below the objectives.

Higher San Joaquin River inflows, as well as the absence of intermittent reverse flows

near Stockton, coincided with improved DO conditions. Monitoring operations for the fall 2015 special study were suspended after November 24.

## Benthic Survey

The operation of the SWP can impact flow characteristics of the upper San Francisco Estuary and subsequently influence the density and distribution of benthic biota. Benthic biota are relatively long-lived and can respond to changes in physical factors within the estuary, such as fresh water inflows, salinity, and substrate composition. The benthic monitoring program documents changes in the composition, abundance, density, and distribution of the benthic biota within the estuary. Biological surveys conducted under the benthic monitoring program provide an indication of physical changes occurring within the upper estuary. In addition, benthic monitoring data are also used to detect and document the presence of newly introduced species within the upper estuary.

Benthic monitoring was conducted at 10 sampling sites distributed throughout the major habitat types within the estuary:

- Clifton Court Forebay Intake;
- San Joaquin River at Buckley Cove and at Twitchell Island;
- Old River opposite Rancho del Rio;
- Sacramento River below the Rio Vista Bridge and above Point Sacramento;
- Suisun Bay at Bulls Head Point;
- Grizzly Bay at Dolphin near Suisun Slough; and
- San Pablo Bay near Pinole Point and near the mouth of the Petaluma River.

Four bottom grab samples for benthic analysis and one sample for sediment analysis were collected monthly at each site during 2015. Samples were analyzed to identify organisms to the lowest possible identifiable taxon and to count all organisms collected.

DWR maintains a database of benthic organisms located within the upper estuary. The benthic database is dynamic and regularly undergoes peer review and update. When a new organism is identified at any of the sampling stations it is added to the database. In addition, the taxonomic names of organisms on the list are updated when sufficient evidence is produced to warrant such changes.

The benthic monitoring program collects a large number of organisms, but a relatively small number of species. A total of 198 species of benthic macrofauna were collected in 2015 at the 10 sampling sites. Of the 198 species, 10 represented 78.1 percent of all organisms collected:

- amphipods: *Ampelisca abdita*, *Corophium alienense*, and *Gammarus daiberi*;
- Asian clam: *Potamocorbula amurensis*;
- sabellid polychaetes: *Manayunkia speciosa* and *Laonome calida*;
- tubificid worms: *Limnodrilus hoffmeisteri*, *Varichaetadrilus angustipenis*, and *Aulodrilus pigueti*; and
- ostracod: *Cyprideis sp. A*.

Of the 10 dominant species, *Potamocorbula amurensis*, *Laonome calida*, and *Ampelisca abdita* represent macrofauna that inhabit a typically high saline environment and were found in San Pablo Bay, Suisun Bay, and Grizzly Bay. *Corophium alienense* tolerates a wider range of salinity. It was collected both in the higher saline western sites and the more brackish to fresh water eastern sites such as the San Joaquin River at Twitchell Island and the Sacramento River above Point Sacramento. The remaining six species, *Gammarus daiberi*, *Manayunkia speciosa*, *Limnodrilus hoffmeisteri*, *Varichaetadrilus angustipenis*, *Aulodrilus pigueti,* and *Cyprideis sp. A* are predominantly fresh water

species and were collected at sites east of Suisun Bay.

## Phytoplankton and Chlorophyll *a* Survey

Phytoplankton are small, free-floating or attached algae that can be tiny, single-celled organisms (less than 5 micrometers in diameter) or larger colonial organisms. Phytoplankton are an important source of food in the estuary for zooplankton, invertebrates, and some species of fish. Phytoplankton biomass is an indicator of the status of primary productivity in the estuary. Chlorophyll *a* is one of the main groups of pigments contained in the algal species that make up phytoplankton.

Monthly sampling of chlorophyll *a* concentrations and phytoplankton was conducted in 2015 by DWR's Bay-Delta Monitoring Branch at 13 stations throughout the upper San Francisco Estuary:

- Sacramento River at Greene's Landing/ Hood and above Point Sacramento;
- San Joaquin River at Vernalis, Buckley Cove, and Potato Point;
- Old River opposite Rancho del Rio;
- Disappointment Slough near Bishop Cut;
- Frank's Tract near Russo's Landing;
- Suisun Bay at Bulls Head Point near Martinez and off Middle Point near Nichols;
- Grizzly Bay at Dolphin near Suisun Slough; and
- San Pablo Bay near Pinole Point and near the mouth of the Petaluma River.

Chlorophyll *a* concentration was measured at the 13 monitoring stations to estimate overall phytoplankton biomass in the estuary. Phytoplankton samples were collected and analyzed separately to determine which species were present in the estuary.

Monthly chlorophyll *a* concentrations throughout much of the estuary were relatively low. Of the 155 samples taken in 2015, 94.8 percent (147 samples) had chlorophyll *a* levels below 10 micrograms per liter (µg/L). Chlorophyll *a* levels below 10 µg/L are considered limiting for zooplankton growth. Of the 8 samples with chlorophyll *a* concentrations above 10 µg/L, three were from the San Joaquin River at Vernalis in February, March, and June; two were from Franks Tract near Russo's Landing in April and December; two were from the San Joaquin River at Potato Point in April and December; and one was from Disappointment Slough near Bishop Cut in April. The mean chlorophyll *a* concentration for all samples in 2015 was 3.86 µg/L; the median value was 2.16 µg/L. In 2014, the mean and median were similar (3.41 µg/L and 2.03 µg/L, respectively). The maximum chlorophyll *a* concentration in 2015 was 94.09 µg/L, recorded in June on the San Joaquin River at Vernalis. It was much higher than the maximum in 2014 (34.18 µg/L). The minimum chlorophyll *a* concentration was 0.26 µg/L, recorded in January in Suisun Bay off Middle Point near Nichols.

Phytoplankton biomass and resulting chlorophyll *a* concentrations in some areas of the estuary may be influenced by extensive filtration of the water column by the introduced Asian clam, *Potamocorbula amurensis*. Well-established benthic populations of *P. amurensis* in Suisun and San Pablo bays are thought to have contributed to the low chlorophyll *a* concentrations (and increased water clarity) measured in these westerly bays since the mid-1980s.

In addition to monitoring for chlorophyll *a*, water samples were analyzed for pheophytin *a*.

Pheophytin *a* is a primary degradation product of chlorophyll *a*, and its relative concentration is useful for estimating the

general physiological state of phytoplankton populations. When phytoplankton are actively growing, the concentrations of pheophytin *a* are normally expected to be low in relation to chlorophyll *a*. The mean pheophytin *a* concentration for all samples in 2015 was 1.38 µg/L, and the median value was 1.02 µg/L. The maximum pheophytin *a* concentration was 12.78 µg/L, recorded on the San Joaquin River at Vernalis in June. The minimum pheophytin *a* concentration was 0.43 µg/L, recorded in San Pablo Bay near the mouth of the Petaluma River in February.

Cyanobacteria, cryptomonad flagellates, and green algae constituted 98.5 percent of the organisms collected in 2015. Cyanobacteria alone constituted 97.0 percent due to the presence of small-celled but numerically dominant genera such as *Chroococcus* and *Synechococcus*.

All organisms collected fell into these 11 categories (in order of abundance):

(1) cyanobacteria (class Cyanophyceae);
(2) centric diatoms (class Coscinodiscophyceae);
(3) pennate diatoms (classes Bacillariophyceae and Fragilariophyceae);
(4) cryptomonad flagellates (class Cryptophyceae);
(5) green algae (classes Chlorophyceae and Prasinophyceae);
(6) chrysophyte flagellates (class Chrysophyceae);
(7) euglenoid flagellates (class Euglenophyceae);
(8) dinoflagellates (class Dinophyceae);
(9) charophytes (class Klebsormidiophyceae);
(10) synurophyte flagellates (class Synurophyceae); and
(11) xanthophyte flagellates (class Xanthophyceae).

The 10 most common genera collected were:

(1) *Chroococcus* (cyanobacterium);
(2) *Synechococcus* (cyanobacterium);
(3) *Chlorella* (green alga);
(4) *Plagioselmis* (cryptomonad flagellate);
(5) *Aulacoseira* (centric diatom);
(6) *Cyclotella* (centric diatom);
(7) *Rhodomonas* (cryptomonad flagellate);
(8) *Thalassiosira* (centric diatom);
(9) *Monoraphidium* (green alga); and
(10) *Nitzschia* (pennate diatom).

The cyanobacterium genus *Chroococcus* dominated samples throughout the year, and cyanobacteria numbers overall were high compared to other phytoplankton. Overall numbers of all phytoplankton, however, were low compared with previous years. The low flows and long residence time associated with prolonged drought conditions likely contributed to the higher numbers of cyanobacteria seen in 2015, and cyanobacteria are likely to continue dominating the phytoplankton community during the drought.

## Activities Outside the Delta

Routine SWP water quality monitoring activities and special studies are conducted outside the Delta. The special studies are in response to increasingly stringent regulations facing water purveyors who rely on DWR to deliver high-quality raw water.

### Water Quality Monitoring in the SWP

DWR's Division of Operations and Maintenance monitors water quality throughout the SWP. This monitoring program has more than 30 sampling stations and analyzes more than 200 chemical, biological, and physical constituents. DWR operates monitoring stations at SWP storage and conveyance facilities located throughout the State, from the Feather

River watershed in the north to Lake Perris in the south. Conveyance facilities include the Oroville Facilities, California Aqueduct with the East and West Branches, North Bay Aqueduct, South Bay Aqueduct, Coastal Branch Aqueduct, and the San Luis Joint-Use Complex. DWR collects and analyzes samples monthly at most stations, although the frequency can vary from weekly to annually depending on location, time of year, or special events. DWR sends the water samples to its Bryte Chemical Laboratory in West Sacramento for analysis. Constituents analyzed include dissolved solids; nutrients; minerals such as chloride, sulfate, and sodium; trace metals; herbicides; pesticides; and organic substances.

DWR's water quality monitoring program also uses a network of 16 automated monitoring stations at key locations along the SWP. This network provides real-time data by continuously monitoring a variety of physicochemical parameters such as specific conductance (also referred to as specific conductivity or EC), turbidity (a measurement of suspended particles), pH (a measurement of how acidic or basic water is), $UV_{254}$ (254 nanometer ultraviolet absorbance; a measurement of dissolved organic carbon), and fluorometry (a measurement of algal biomass). SWP water contractors rely on this essential data to assess the quality of water delivered by the SWP.

The water quality monitoring program is an important operational component of the SWP. DWR uses the program's data to evaluate water quality changes in the SWP, short- and long-term trends, and impacts from emergencies such as spills and pipe ruptures. DWR also utilizes the data to influence operations and to determine the quality of drinking water as defined by the SWRCB's Division of Drinking Water. DWR periodically conducts special studies to investigate the impacts of specific incidents affecting SWP water quality. The special studies include non-SWP water turn-ins, floodwater inflows, hydrology, and Delta hydrodynamics. The Division of Operations and Maintenance posts a number of water quality reports on DWR's website.

During 2015, water quality was assessed monthly at eight SWP facilities and at the CVP's Delta-Mendota Canal. Table 4-1 provides mean concentrations for 27 water quality parameters.

EC is an important water quality measurement that estimates the amount of total dissolved salts in a water body. Examples of typical specific conductivity concentrations include a range of 30 to 1,500 microsiemens per centimeter (µS/cm) for potable water and over 50,000 µS/cm for sea water. Mean annual EC of SWP water was 104 µS/cm at Thermalito Afterbay; 385 µS/cm at the North Bay Aqueduct, Barker Slough Pumping Plant; and 776 µS/cm at the Delta-Mendota Canal. EC ranged from 558 to 716 µS/cm in the California Aqueduct.

Dissolved organic carbon measures the amount of organic matter in water. Monitoring of dissolved organic carbon is important to water treatment facility operators as dissolved organic carbon has the potential to facilitate the formation of trihalomethanes (potential toxins) during the chlorination process. Dissolved organic carbon was highest at the North Bay Aqueduct at 6.2 mg/L, while concentrations in the California Aqueduct ranged from 2.6 to 5.2 mg/L.

Turbidity monitoring is important because of the potential of increased turbidity to increase the cost of water treatment. The North Bay Aqueduct, Barker Slough Pumping Plant and Tehachapi Afterbay (Check 41) exhibited higher levels of turbidity (12 NTU [nephelometric turbidity units] and 15 NTU, respectively) compared with other locations, which had mean turbidity ranging from 1 to 4 NTU.

## Table 4-1 Mean Water Quality at Selected SWP Grab Sample[a] Locations in 2015

| Constituent | Units[b] | Reporting Limit | Thermalito Afterbay at Outlet | North Bay Aqueduct, Barker Slough Pumping Plant | Delta-Mendota Canal Upstream of McCabe Road | California Aqueduct | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Banks Pumping Plant | O'Neill Forebay Outlet (Check 13) | Kettleman City (Check 21) | Near Highway 119 (Check 29) | Tehachapi Afterbay (Check 41) | Devil Canyon Second Afterbay |

[a] A grab sample is a single sample chosen to represent the conditions in a given matrix (usually natural water) at a specific location, depth, and time. All reported constituents are the annual mean of laboratory analytical values sampled monthly from January through December. The annual mean for a constituent may be based upon analytical results of 1 to 12 months. When one or more analytical results for a constituent are a "non-detect," the mean is calculated using "0" for the non-detect results.

[b] mg/L = milligrams per liter; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity unit; NR = No data recorded at this location.

Mean arsenic concentrations ranged from less than 0.001 mg/L at Thermalito Afterbay to 0.007 mg/L at Check 29. These surface water values fall below the 0.010 mg/L maximum contaminant level (MCL) for arsenic in drinking water. (The MCL is the maximum level of a contaminant in drinking water at which no known or anticipated adverse effect on human health would occur.)

Bromide, another parameter that, when present in the water, has the potential to form trihalomethanes during water treatment. Bromide concentrations ranged from less than 0.01 mg/L at Thermalito Afterbay to 0.39 mg/L at the Delta-Mendota Canal.

In 2015, DWR sampled for pesticides, herbicides, and other organic compounds in March, June, and September at several SWP facilities and at the CVP's Delta-Mendota Canal (see Table 4-2). The concentrations of the detected herbicides ranged from 0.02 to 0.29 µg/L. No pesticides, herbicides, or other organic compounds were detected in March. In June, the herbicide metolachlor was detected at the Delta-Mendota Canal at a concentration of 0.29 µg/L and at Banks Pumping Plant at a concentration of 0.11 µg/L. The herbicides atrazine and simazine were also detected in June. In September, the detected herbicides were 2,4-D, atrazine, Dacthal (dimethyl tetrachloroterephthalate or DCPA), and simazine. The detected amounts of pesticides in 2015 were well below established MCLs.

DWR routinely monitors taste and odor compounds produced by algae. Chemical substances in water that are often associated with earthy, musty smelling or tasting water include geosmin and 2-methylisoborneol (MIB), which are produced in water bodies by cyanobacteria. Geosmin and MIB are natural by-products of algal chlorophyll production.

DWR's evaluation of a taste and odor event is based on microscopic examination of samples, and most importantly, the chemical analysis of MIB and geosmin. When sampling results indicate that concentrations of these compounds in SWP waters are increasing within the 10 nanograms per liter range, DWR responds by searching for the location of the source of the geosmin or MIB. To do this, water quality samples are collected and analyzed to ascertain the presence of possible algal sources. If an algal source is identified, DWR develops an aquatic herbicide application plan to control the specific algae that are associated with the elevated geosmin and/or MIB concentrations. In 2015, aquatic herbicide applications targeting taste- and odor-producing cyanobacteria occurred in the South Bay Aqueduct, Patterson Reservoir, Coastal Branch Aqueduct, and Castaic Lake.

Additional SWP water quality data are available on DWR's Water Data Library website.

## Non-SWP Turn-ins

Non-SWP water can be admitted to the California Aqueduct for conveyance and redistribution. Non-SWP water is considered to be any input to the SWP for conveyance that is not directly diverted from the Delta. According to California Water Code Section 1810, no agency may deny a transferor of water the use of a water conveyance facility which has unused capacity, for the period of time for which that capacity is available, if fair compensation is paid. Inputs to the California Aqueduct from these sources are called turn-ins.

Turn-in water may be used for local redistribution or transfer to other water contractors. Participants of an approved turn-in program can use available aqueduct capacity to move candidate waters from a point of availability to a point of need. Groundwater substitutions can also be

**Table 4-2 Pesticides, Herbicides, and Other Organic Substances Detected in the SWP in 2015**

| Sampling Location[a] | Sampling Station ID Number | Sample Date | Chemical Detected[b] | Concentration (µg/L)[c] |
|---|---|---|---|---|

| | | 6/17/15 | Simazine | 0.02 |

[a] Water at these locations is normally sampled during March, June, and September; however, no samples were collected in March 2015 at Delta-Mendota Canal, O'Neill Forebay Outlet (Check 13), or California Aqueduct near Kettleman City (Check 21). No samples were collected at Devil Canyon Second Afterbay in September 2015.
[b] Only chemicals found in detectable amounts at the sampling stations are included in this table. Refer to the document entitled *Analytical Methods for Organic Chemicals* for a complete listing of all organic chemicals included in the laboratory analysis. The document is available on DWR's website.
[c] µg/L = micrograms per liter
[d] 2,4-D = 2,4-dichlorophenoxyacetic acid
[e] Dacthal (DCPA) = dimethyl tetrachloroterephthalate

made whereby surface water diversions are reduced by replacing that water with a like amount of groundwater. In this manner, more surface water is made available for transfer to other users. These voluntary water transfers aid in supplying water to areas experiencing shortages, usually during periods of drought or years with below-normal runoff.

Participants of turn-in programs include both SWP and non-SWP contractors that bank groundwater and routinely convey it into the California Aqueduct at various locations. Although most non-SWP turn-ins to the California Aqueduct originate as groundwater from Kern and Kings counties, other waters include excess surface flows or floodwaters typically from southern Sierra Nevada watersheds. Surface water turn-ins have included excess floodwaters from the Kings River redirected through the Mendota Pool and pumped into the California Aqueduct.

Certain conditions must be met before a turn-in proponent can be given approval to convey water into the California Aqueduct. In accordance with California Water Code Section 1810, water may be conveyed or transferred via any unused capacity of the California Aqueduct provided that the commingled water does not result in degradation of water quality. The transfer must also be made without unreasonably affecting fish, wildlife, or other instream beneficial uses.

DWR, therefore, established interim procedures and criteria to review turn-in proposals and determine their approval for acceptance into the California Aqueduct using a two-tiered approach. According to the policy, the proponent of any turn-in proposal shall demonstrate that the water is of consistent, predictable, and acceptable quality. Prospective turn-in entities are required to submit proposals describing their turn-ins, including information such as detailed water quality monitoring and analyses, source water description, identification of wells, inflow rates, and duration. Tier 1 programs have "no adverse impacts" based on historical water quality in the California Aqueduct. Tier 2 programs are those with constituent concentrations higher than historical California Aqueduct conditions and has the potential to cause adverse impacts. Tier 2 programs are referred to the State Water Contractor Facilitation Group for review. The facilitation group consists of DWR staff and representatives from each water contractor that chooses to participate. The group reviews Tier 2 proposals based on merits, impacts, mitigation, water quality monitoring, cost, benefits, and other issues. The group then provides recommendations to DWR regarding proposal approval. DWR considers all factors before making a decision on any turn-in proposal. Programs meeting Tier 1 criteria are approved by DWR without referral to the State Water Contractor Facilitation Group.

A total of 482,825 af of non-SWP turn-in water was admitted to the California Aqueduct during 2015. Most of it (94 percent) originated from groundwater pumping in the San Joaquin Field Division; the remainder came from pumping in the San Luis and Southern field divisions (see Table 4-3). Monitoring showed water quality in the California Aqueduct was affected, both positively and negatively, but the effects were sometimes inconsistent and depended on a variety of factors such as water quality parameter, upstream concentration, turn-in source, and relative flows.

Both the California Department of Public Health (CDPH) Title 22 parameters and a short list of constituents of concern, as determined via the DWR *Water Quality Policy and Implementation process for Acceptance of Non-Project Water into the State Water Project* (October 2012), are regularly monitored. Data are compared to MCLs. Since MCLs apply to drinking water and not surface water, they are used for turn-ins as a tangible goal for concentrations of constituents of concern in the aqueduct.

In the San Luis Field Division, 26,835 af of groundwater was pumped into the California Aqueduct from Westlands Water District. Sulfate and salinity consistently increased between upstream and downstream stations.

These parameters can cause taste and odor problems in drinking water but are not considered human health threats. No consistent increases or decreases were observed for arsenic, bromide, chromium, nitrate, or organic carbon. Manganese samples both upstream and downstream of turn-ins exceeded the secondary MCL of 0.05 mg/L; no other constituents of concern exceeded the MCL in California Aqueduct sampling.

In the San Joaquin Field Division, 454,385 af of groundwater was admitted to the aqueduct from Kern Water Bank Authority, Kern County Water Agency, Semitropic Water Storage District, Arvin-Edison Water Storage District, Wheeler Ridge-Maricopa Water Storage District, and West Kern Water District (see Table 4-3). These turn-ins comprised 44 percent of the total volume of water entering the aqueduct (turn-ins plus Check 21)—slightly less than the amount in 2014 (46 percent).

**Table 4-3 Turn-ins to the California Aqueduct in 2015**

| Groundwater Source | Amount (acre-feet) |
|---|---|
| Antelope Valley-East Kern Water Agency | 1,605 |
| Arvin-Edison Water Storage District | 70,200 |
| Cross Valley Canal | 89,886 |
| Kern Water Bank Canal | 155,394 |
| Semitropic Water Storage District | 109,580 |
| West Kern Water District | 2,103 |
| Westlands Water District | 26,835 |
| Wheeler Ridge-Maricopa Water Storage District | 27,222 |
| **Total** | **482,825** |

Arsenic, total chromium, and nitrate consistently increased in the aqueduct due to San Joaquin Field Division turn-ins. These are undesirable parameters in drinking water because of their potential threat to human health. Drinking water MCLs were exceeded once each for arsenic and chromium. Rising concentrations of constituents like arsenic and other co-occurring contaminants are a concern because they can accumulate in biosolids as a byproduct of drinking water production, potentially increasing disposal costs. Sulfate concentrations varied throughout the San Joaquin Field Division, with slightly more occurrences of increasing concentrations overall. This result is undesirable because sulfate can cause taste and odor problems in drinking water, however, it is not considered a human health threat.

Bromide and organic carbon decreased in the aqueduct downstream of the San Joaquin Field Division turn-ins. This provided a net benefit to SWP contractors because these parameters can increase both the cost of producing drinking water and the potential for creating harmful trihalomethanes during the treatment process.

Chloride and salinity also decreased downstream of the turn-ins, providing a benefit to aqueduct water quality as these parameters have the potential to cause taste and odor problems in drinking water. There are other benefits of lower concentrations of salt and salt-related parameters not necessarily associated with drinking water. Salinity in treated or reclaimed wastewater must meet regulatory limits upon discharge and can become a limiting factor for groundwater recharge. Salinity can also affect some crops, and it remains an ongoing concern for agricultural users of aqueduct water.

In the Southern Field Division, 1,605 af of groundwater was pumped into the aqueduct from Antelope Valley-East Kern Water Agency. This turn-in had very little influence on aqueduct water quality due to small relative inflows and good water quality.

## San Joaquin Valley Agricultural Water Quality Programs

There are a number of programs that conduct or support monitoring, research, training, or demonstration projects related to San Joaquin Valley agricultural water quality. For information about these programs, see Chapter 5, Local Assistance.

# Municipal Water Quality Program Branch

## Municipal Water Quality Investigations Program

The Municipal Water Quality Program (MWQP) Branch includes the Municipal Water Quality Investigations (MWQI) Program, which conducts water quality monitoring (both real time and discrete) in the Delta for municipal and industrial uses. The MWQI Program is the most comprehensive drinking water quality monitoring program in the Delta. Since its inception in 1983, information derived from this program has been supplied to the SWP water contractors and other agencies supplying drinking water taken from the Delta. This information is used extensively by federal, State, and local agencies and the public in water supply planning studies. Data from this program are used to identify longer-term trends in water quality changes in the Delta and the SWP. Monitoring data also help MWQI and other agencies develop research and mitigation measures to reduce drinking water contaminants in Delta waters. In collaboration with the Division of Operations and Maintenance, and through modeling, monitoring data derived from this program are used as an "early warning" system of changing conditions in source water, which can be used to provide advance notice to Delta water users of possible drinking water quality problems. Additionally, the MWQI Program provides technical water quality expertise to other units within DWR, local municipal water agencies, the SWRCB, and the RWQCBs. The program contributes water quality expertise while participating in regulatory, planning, and data sharing efforts.

## Real Time Data and Forecasting Comprehensive Program

The Real Time Data and Forecasting Comprehensive Program has become a central element of the MWQP. The goal of the program is to further develop the capability of real-time data collection and to forecast short- and long-term source drinking water quality conditions in the Delta and SWP. Within the MWQP, the Real Time Data and Forecasting Comprehensive Program entails the following elements:

- real-time water quality monitoring at key locations, providing stakeholders and interested parties with timely data;
- field operations that ensure proper operation of all automated sampling equipment;
- consistent modeling with continuous updates providing the best forecasts possible;
- quality assurance/quality control of the instruments and data; and
- centralized information management and dissemination.

The real-time monitoring network includes stations located at Banks Pumping Plant, Jones Pumping Plant, the Sacramento River at Hood, the San Joaquin River near Vernalis (McCune Station), and the Gianelli Pumping-Generating Plant at San Luis Reservoir.

## Quality Assurance/Quality Control Program

The Quality Assurance/Quality Control Program (Quality Assurance Program) was established in 1992 to ensure that data generated by DWR's environmental monitoring programs meet high quality standards and are scientifically defensible.

Monitoring programs are encouraged to follow standardized procedures including quality control measurements in their sampling protocols.

The Quality Assurance Program integrates planned quality control activities at all levels of environmental monitoring programs through standardized project design and organization; the establishment of data quality objectives; defined sampling, analysis, and quality control procedures; practices for data reduction and validation; guidelines for report preparation; and means to assess progress, feedback, and process improvement.

In 2015, the Quality Assurance Program worked closely with various environmental monitoring programs and provided technical support in the development and review of quality assurance project plans, field manuals, and standard operating procedures. The program also provided assistance with statistical analysis and review of data to ensure compliance with quality assurance objectives and with review of field and laboratory activities to ensure comparable and consistent sample handling and quality control procedures.

## Water Quality Special Studies

Special studies focus on specific aspects of source waters, contaminant loading, measurement methods and instrumentation, and climate and hydrology. They are conducted to:

- investigate the origins, fate, transport, and, in some cases, loads of current and emerging contaminants of concern;
- investigate seasonal patterns and trends of constituents and examine circulation patterns of contaminants;
- refine modeling assumptions; and
- assess the impacts of increasing urbanization on levels of water quality constituents of concern.

The following studies were in progress during 2015:

- Urban Sources and Loads Investigation of Lathrop, California;
- investigation of O'Neill Forebay water circulation;
- spectrofluorometer study;
- feasibility study for a portable water quality monitoring station;
- nutrient budget of the SWP;
- in-situ fluorometer measurements of dissolved organic matter;
- San Joaquin River watershed sanitary survey;
- fluoresence of dissolved organic matter proof of concept study;
- tidal marsh restoration literature review;
- Eastside Watershed Analysis Risk Management Framework and Yolo Delta Simulation Model 2 (DSM2) model monitoring;
- DSM2 nutrient monitoring study;
- Cache Slough Complex prerestoration baseline monitoring; and
- SWP limnology studies.

## Accomplishments for the 2014–2015 MWQI Work Plan

During 2015, the MWQI accomplished the following goals:

- continuous operation of five real-time water quality stations;
- continuous data dissemination of water quality reports;
- weekly distribution of short-term water quality forecasts;
- monthly distribution of volumetric, EC, and organic carbon source fingerprints;
- initialization of version 2 of the Field Station Real Time Monitoring Standard Operating Procedures; and
- production of several projects to develop data for historical conditions for the Delta and aqueduct models (DSM2 and DSM2 Aqueduct Extension Model of the SWP).

The special study reports and other MWQP publications can be found on DWR's website.

## Bryte Chemical Laboratory

Established in 1951, Bryte Chemical Laboratory is DWR's primary analytical laboratory. Its main function is to analyze drinking, surface, waste, and groundwater for the various water quality programs within DWR. Since 1990, the laboratory has been certified biennially by the SWRCB's Environmental Laboratory Accreditation Program to perform water quality analyses following U.S. Environmental Protection Agency or American Water Works Association procedures and analytical methods. This certification allows the laboratory to perform analyses that generate legally defensible data that can be used for regulatory or compliance purposes. The laboratory continues to perform the majority of chemical and other related analyses required to support DWR's water quality programs. Each year, thousands of water samples are routinely analyzed for inorganic and organic constituents such as standard minerals, cations, anions, nutrients, metals, chlorophyll, pesticides, herbicides, and volatile organic compounds.

In 2015, the laboratory upgraded its capability and capacity to detect and analyze anions (fluoride, chloride, bromide, nitrate, and sulfate) with the purchase of two ion chromatographs. The chromatographs are fully automated and computer-controlled electrochemical instruments that generate data that are highly stable, accurate, and reproducible. Each instrument's detection limit has been established at 1.0 part per million.

The laboratory has continued to manage a variety of analytical contracts with other State agencies and several outside laboratories in accordance with the master contract policy approved in fiscal year 1994–1995. These contracts are used to perform analyses that are beyond the capability and capacity of the laboratory, such as analyses of solids and fish tissues. The laboratory works in conjunction with the MWQP Quality Assurance Program to replace these contracts as they expire each fiscal year. On July 1, 2015, Weck Laboratories, Inc. was awarded the contract for water and solids analyses worth $1.5 million over 3 years.

Bryte Laboratory continues to be an active member of a group of laboratories called the California Association of Mutual Aid Laboratories Network headed by CDPH. The laboratory network's main objective is to voluntarily assist CDPH with analyzing chemical agents in water quality samples should a natural disaster or biochemical or chemical event occur in California. The assistance is only required should the analytical capacity of CDPH be exceeded or to confirm the presence or absence of chemical agents in water quality samples provided by CDPH. In 2007, Bryte Chemical Laboratory was classified as a Level II participating laboratory in the California Association of Mutual Aid Laboratories Network organization. Level II only allows the laboratory to receive samples that are prescreened and determined nonhazardous to laboratory personnel.

## Suisun Marsh Program Activities

Suisun Marsh consists of approximately 59,000 acres of tidal and managed brackish water wetlands and 30,000 acres of bays and sloughs. It is the largest contiguous brackish marsh remaining in the United States. Situated in southern Solano County, west of the Delta and north of Suisun Bay, the marsh encompasses more than 10 percent of California's remaining natural wetlands. The marsh is the resting and feeding ground for thousands of waterfowl and shorebirds migrating on the Pacific Flyway. It provides important habitat for more than 221 bird

species, 45 mammal species, 16 reptile and amphibian species, and more than 40 fish species.

DWR became involved in the Suisun Marsh in response to SWRCB Water Right Decision 1485, which required DWR and Reclamation to operate the SWP and CVP to meet salinity standards as specified in the SWRCB's 1978 *Water Quality Control Plan for the Delta and Suisun Marsh*, which established revised water quality objectives for flow and salinity in the Delta and Suisun Marsh. Water Right Decision 1485 also required DWR and Reclamation, in cooperation with other agencies, to develop a plan for Suisun Marsh that would ensure that the long-term standards for full protection of Suisun Marsh would be met. The 1984 *Plan of Protection for Suisun Marsh*, completed by DWR, included construction of a series of facilities to distribute lower-salinity water to managed wetlands and monitoring in relation to these facilities. Today, DWR operates and maintains these water management facilities, including the Roaring River Slough Distribution System, Morrow Island Distribution System (MIDS), Goodyear Slough Outfall, and the Suisun Marsh Salinity Control Gates (SMSCG). Figure 4-2 shows the water quality compliance and monitoring sampling locations and the water management facilities.

Through agreements and plans, DWR has been working in coordination with Reclamation, DFW, Suisun Resource Conservation District, USFWS, and other agencies, on habitat management, preservation, and restoration of the Suisun Marsh.

## Revised Suisun Marsh Preservation Agreement

In 1987, DWR, Reclamation, DFW, and the Suisun Resource Conservation District signed the *Suisun Marsh Preservation Agreement* (SMPA), a contractual framework for implementation of the *Plan of Protection for Suisun Marsh*. It required Reclamation and DWR to meet salinity standards as specified in the SWRCB's 1978 WQCP, set a timeline for implementing the *Plan of Protection for the Suisun Marsh*, and delineated monitoring and mitigation requirements. A revised SMPA and *Revised Mitigation and Monitoring Agreement* were signed in 2005 to include actions to meet channel water salinity standards consistent with D-1641 and to implement landowner-based management activities in lieu of the western marsh facilities proposed in the plan of protection.

The revised SMPA included the following actions: operate facilities to meet channel water salinity standards consistent with D-1641; implement a Water Manager Program; provide portable pumps; update Individual Ownership Adaptive Management Habitat Plans; establish a Drought Response Fund; and replace turnouts on the Roaring River Slough Distribution System. The monitoring agreement included monitoring for the Salt Marsh Harvest Mouse (*Reithrodontomys raviventris*) and Ridgway's Rail (*Rallus obsoletus*; formerly known as the California Clapper Rail), fish, vegetation, and other biological monitoring.

### *SMPA 2015*

SMPA 2015 is the newest revision of the SMPA, which includes new provisions, including September SMSCG operation and the preservation agreement implementation funding. Preservation agreement implementation funds are provided by DWR and Reclamation to improve managed wetlands infrastructure for flooding and draining and joint-use facilities infrastructure.

## Facility Operations, Maintenance, and Related Activities

### *Morrow Island Distribution System*

MIDS is an interior ditch bordered by levees that was created to distribute water to managed wetlands on the western edge of Suisun Marsh. Water with relatively lower salinity is taken from Goodyear Slough in the west through water control structures that transport the water into MIDS. Water is then distributed to managed wetlands through private landowner water control structures along the ditch. Water not used by the landowners exits into Grizzly Bay through water control structures in the east (see Figure 4-2). Routine maintenance during 2015 included mowing, spraying, and levee road regrading and winterizing. Trees were trimmed and invasive trees were removed along 3 miles of the MIDS levee to reestablish access and to prepare for the ditch cleaning maintenance project in 2016.

**Fish Screen and Alternatives.** Based on previous study results, a fish screen

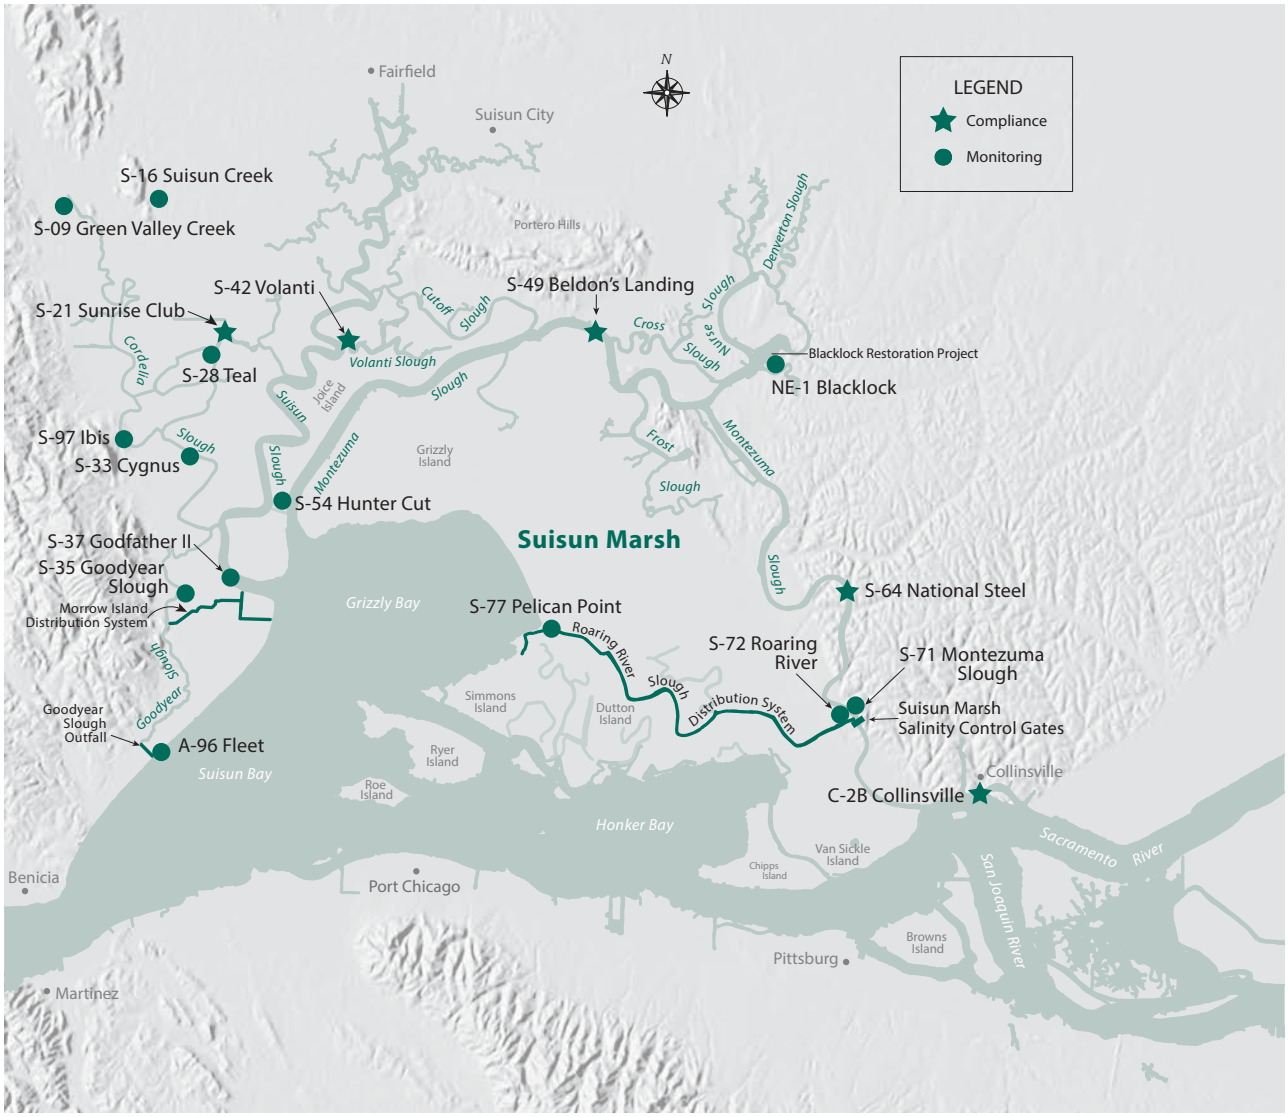

**Figure 4-2 Compliance and Monitoring Stations and Water Management Facilities in the Suisun Marsh**

at MIDS would likely have negligible benefits to sensitive fish populations (see Bulletin 132-07, Chapter 4, Water Quality). DWR and Reclamation are proposing to fulfill the outstanding terms and conditions of the USFWS 1997 BiOp for the MIDS maintenance project by acquiring and protecting, in perpetuity, aquatic habitat in Suisun Marsh. (For additional information about the BiOp, see Bulletin 132-08.) This proposal is ongoing.

**Longfin Smelt Incidental Take Permit.** On February 23, 2009, DFW issued an incidental take permit for the ongoing and long-term operation of existing SWP facilities in the Delta for the protection of Longfin Smelt. MIDS is included as one of these facilities.

To minimize the take of Longfin Smelt at the MIDS diversion, DFW specifies the average intake velocities each year to adequately protect these fish.

Also, as a requirement of the incidental take permit, DWR is developing a study to confirm that the aforementioned operation prevents or substantially reduces the entrainment of Longfin Smelt at MIDS.

**Morrow Lane Bridge Repair.** In July 2012, the Division of Engineering inspected the Morrow Lane Bridge over Goodyear Slough and found the bridge was severely deteriorated. As a result, access and maintenance of MIDS was suspended.

DWR worked with a landowner and consultant to determine how to proceed with bridge repairs. The landowner decided to address the deficiency in two phases. The first was a repair to extend the life of the bridge one to two years, and the second is a full replacement of the bridge (anticipated in 2017).

## *Suisun Marsh Salinity Control Gates*

The SMSCG are operated as needed to meet salinity standards. When they are not in operation, they are placed in an open position to minimize fish concerns related to predation and impedance. Installation or removal of the flashboards and operation of the gates vary depending on salinity conditions, fisheries agencies' requests for sensitive species concerns, or repairs.

**Status of SMSCG in 2014–2015.** The control season started September 2014, a month earlier than usual, due to salinity concerns. The flashboards were installed and the boat locks became operational on September 3, 2014. The SMSCG were tidally operated between September 3, 2014, and June 2, 2015, due to salinity concerns in the marsh. The boat lock was partially closed during the control season due to safety concerns. The gates were tidally operated from September 3 until October 6 to meet the 7-day running average EC of 17 mS/cm for the revised SMPA. Gate operations stopped on October 7 to allow the interior Delta to meet water quality standards. The gates began operating again on October 22 to bring salinity down for November standards. On November 19 there was an electrical control system failure. Gates were set to an open position while repairs were done. Operations resumed on December 4. On December 15, operations stopped for technical work and resumed on January 1, 2015. Operations continued until June 2, 2015. The flashboards were then removed, and the boat locks were set to the open position.

## *Other Facility Operation and Maintenance*

The Roaring River Slough Distribution System and Goodyear Slough Outfall are operated and maintained as needed to provide lower-salinity water to managed wetland properties. Roaring River Slough Distribution System 2015 maintenance

activities included levee mowing and spraying. Goodyear Slough Outfall 2015 maintenance activities included ditch cleaning and levee raising.

### *Water Quality and Compliance*

A deficiency period began in January 2014, which was triggered by a dry water year in 2013, followed by a critical water year in 2014. The deficiency period allows higher salinity conditions at the western marsh compliance stations (S-21 Sunrise Club and S-42 Volanti) from December through May. The deficiency period continued during 2015. Salinity levels in November 2014 at Beldon's Landing (S-49) exceeded the D-1641 standard of a progressive daily mean salinity of 15.5 mS/cm. The salinity standard of 11.0 mS/cm was exceeded for Collinsville (C-2) during May 2015. All other salinity levels for the 2014–2015 control season were below monthly standards for the compliance stations.

Details about salinity levels in the marsh are available in the monthly report entitled *Suisun Marsh Monitoring Program Channel Water Salinity Report* available on DWR's website.

## Blacklock Restoration Project

DWR received CALFED Ecosystem Restoration Program grant funds in 2001 to acquire the 70-acre Blacklock property in December 2003. DWR, in cooperation with Reclamation, DFW, USFWS, and Suisun Resource Conservation District, implemented the Blacklock Restoration Project (location shown on Figure 4-2). This project restored diked, managed wetlands to tidal wetlands. Although a natural breach in the levee occurred in July 2006, it was determined that the planned breach should still be constructed to allow for full tidal flow and optimum sediment transportation. The planned breach construction occurred on October 3 and 4, 2006.

The project goals and objectives are to:

- restore the area to a fully functioning, self-sustaining marsh ecosystem created through restoration of natural hydrologic, sedimentation, and biological processes;
- increase the area and contiguity of emergent wetlands providing habitat for tidal marsh species; and
- assist the recovery of at-risk species.

The final restoration plan for the project was published in June 2007.

In 2015, DWR continued implementing the 10-year monitoring program at the Blacklock site. Monitoring is performed in cooperation with State and federal agencies. There are 15 parameters being monitored, including sediment accretion, channel network evolution, vegetation development, water quality, methylmercury concentrations, and avian use.

In 2013, Wetlands and Water Resources, Inc. worked on the monitoring report for years one through five. The report is being finalized by DWR.

For more information about the Blacklock Restoration Project, visit the Suisun Marsh Program webpage on DWR's website.

## Suisun Marsh Habitat Management, Preservation, and Restoration Plan

The *Suisun Marsh Habitat Management, Preservation, and Restoration Plan*, referred to as the Suisun Marsh Plan, was developed by the Principal Agencies (or Principals), a group of agencies with primary responsibility for Suisun Marsh management. The Suisun Marsh Plan is intended to balance the benefits of tidal wetland restoration with other habitat uses in the marsh by evaluating alternatives that provide a politically acceptable change in marshwide land uses, such as Salt Marsh Harvest Mouse habitat, managed wetlands public use, and upland

habitat. It relies on the incorporation of existing science and information developed through adaptive management.

The principals include USFWS, Reclamation, DFW, DWR, NOAA Fisheries, and Suisun Resource Conservation District. The Principals have consulted with other participating agencies, such as the U.S. Army Corps of Engineers, the San Francisco Bay Conservation and Development Commission, the RWQCBs, and SWRCB, to develop this plan.

On April 21, 2014, Reclamation and USFWS signed the record of decision for the Suisun Marsh Plan. The principals will implement or approve activities in the marsh consistent with the plan over a 30-year period of implementation. The Suisun Marsh Plan is available on Reclamation's website.

## Suisun Marsh Expenditure History

Suisun Marsh expenditures and reimbursements administered by DWR for calendar years 1968 through 2015 are summarized in Table 4-4. From 1968 through December 31, 2015, DWR disbursed more than $162.1 million of SWP funds for planning, design, environmental documentation, construction, maintenance, monitoring, mitigation, and permit compliance in support of implementing the *Plan of Protection for the Suisun Marsh* through the SMPA and for meeting standards set by SWRCB. Reclamation has reimbursed DWR approximately $61.2 million (38 percent), and the State's General Fund has reimbursed approximately $9.5 million (5.9 percent). These figures do not include up-front payments made by Reclamation for staff and other direct costs, as well as approximately $5.7 million in Reclamation interest payments during 1988 and 1989.

Annual figures are reported in Table 4-4 for DWR's up-front payments, Reclamation's reimbursements, General Fund reimbursements, and DWR's cumulative expenditure balance.

## Table 4-4 Suisun Marsh Expenditures and Reimbursements Administered by DWR, Calendar Years 1968–2015 (in dollars)

| Year [1] | Reach 305 Costs [2] | General Fund Payment [3] | Adjustment for General Fund Payment[a] [4] | Reclamation Invoice Payment[d] [5] | Interest Payment Credited Back to Contractors [6] | Net SWP Costs [2] through [6] [7] | Recreation Costs[c] [8] | SWP Water Contractors' Costs [7] minus [8] [9] |

| 2015 | 6,306,506 | | | (6,538,766) | | (232,260) | 182,515 | (414,776) |
| **Total** | **162,059,342** | **(9,478,000)** | **6,634,600** | **(61,239,007)** | **(2,323,609)** | **95,653,326** | **5,413,540** | **90,239,786** |

[a] Under Assembly Bill 1442, the General Fund paid 20 percent of the Suisun Marsh costs through June 1988, which totaled $9,478,000. This payment included $2,843,400, which represents 5.9 percent of the costs through June 1988 paid by the General Fund. This amount has reduced the costs billed to the SWP water contractors. The remaining $6,634,600 received from the General Fund represents DWR's recreation project purpose share of 14 percent.

[b] Excludes interest payments made by Reclamation.

[c] Allocation factors for capital recreation costs have changed from 14 percent to 3.4 percent, and operations and maintenance recreation costs from 14 percent to 3.3 percent.

[d] No payments were made by Reclamation in 2013 and 2014 due to disputed invoices. All disputed charges were resolved and paid in July 2015.

# Chapter 5
# Local Assistance

*California Irrigation Management Information System weather station buoy.*

## Significant Events in 2015

The program unit within the Department of Water Resources (DWR) that manages the California Irrigation Management Information System (CIMIS) conducted several outreach activities at farm shows and conferences to promote the use of CIMIS data to mitigate the impacts of drought. As a result, the CIMIS system received more data requests in 2015 than in any prior year.

DWR's Urban Water Use Efficiency Unit continued to review urban water management plans submitted for the 2010 cycle, and 242 reviews were finalized.

DWR's Water Use Efficiency Grant Program continued to manage approximately 170 grant agreements from previous proposal solicitations funded by Proposition 50.

DWR developed and released the application package for agricultural water management plan 2015 grants in October 2015. The grant program implements the Governor's Executive Order (EO) B-29-15, which directs DWR to prioritize grant funding for agricultural water management plans (AWMP) for midsized agricultural water suppliers.

*Information in this chapter was contributed by the Division of Statewide Integrated Water Management, the Division of Environmental Services, and the Division of Integrated Regional Water Management.*

The Department of Water Resources (DWR) manages the Davis-Grunsky Act program, water use efficiency, agricultural drainage, and Water Conservation Bond Law programs, and participates in several other programs that assist local agencies and benefit State Water Project (SWP) water contractors.

## Davis-Grunsky Act Program

The Davis-Grunsky Act, authorized in 1960 as part of the Burns-Porter Act, provides construction loans for local domestic water projects and agricultural water supply. It also provides grants for recreation and fish and wildlife enhancement. Additionally, loans and grants may be given to rehabilitate dams and reservoirs.

DWR's ongoing administration of Davis-Grunsky Act program loans and grants includes management and oversight of recreation projects and contracts. Administration costs are recovered from revenues generated by repayment of Davis-Grunsky Act loans. Recreation grant contracts are amended to reflect modification of DWR's fee oversight functions and actual construction of recreation facilities.

The Davis-Grunsky Act requires participating State agencies to operate and maintain the recreation projects, while DWR inspects the recreation facilities, monitors the recreation contracts, and maintains a list of the recreation projects.

## Water Use Efficiency

Activities of the Water Use and Efficiency Branch in the Division of Statewide Integrated Water Management include providing technical assistance to local agencies; managing water use efficiency financial assistance programs; managing the California Irrigation Management Information System (CIMIS); reviewing, tracking, and reporting on urban and agricultural water management plans; and promoting water recycling/desalination projects.

### California Irrigation Management Information System

CIMIS is a network of automated weather stations that collects weather data and transmits it to a central repository in Sacramento. After performing quality control and calculations, data are made available to the public for such diverse purposes as irrigation scheduling, resource planning, research, and modeling.

In 2015, DWR's CIMIS network collected data from 146 stations, with approximately 50 percent of the stations on the network belonging to local cooperators. The demand for CIMIS data has been increasing steadily since its establishment in 1982. The number of registered data users has grown from 661 in 1989, to more than 55,000 in 2015.

Approximately 2.5 million reports were generated from the database using the CIMIS website in 2015. An additional 6 million reports were also retrieved from the CIMIS File Transfer Protocol site and CIMIS web services. The ongoing drought mitigation efforts may have led to the high demand for CIMIS data. Users can register online, access archived data, download data files, and peruse content about the CIMIS program and other helpful information. A separate but concurrently operating database and web application is maintained for redundancy to protect the data.

CIMIS continued providing the spatially distributed reference evapotranspiration ($ET_0$) data, known as Spatial CIMIS, and expanded its user base through outreach activities. Spatial CIMIS is produced by coupling remotely sensed data from the National Oceanic and Atmospheric Administration's Geostationary Operational Environmental Satellite with point measurements from CIMIS stations to estimate $ET_0$ data at 2-kilometer grids.

In addition to increasing the number of its stations, CIMIS made significant improvements to data quality and availability in support of California Water Code (CWC) requirements pertaining to conservation, development, and utilization of State water resources and the Model Water Efficient Landscape Ordinance (California Code of Regulations, Title 23, Sections 490–494), which requires all water suppliers to increase water use efficiency. It also requires, among other things, the development of agricultural water management plans and a 20 percent reduction in urban water consumption by the year 2020.

In 2015, DWR conducted several outreach activities at farm shows and conferences to promote the use of CIMIS data to mitigate the impacts of drought. As a result, the CIMIS system received more data requests in 2015 than in any prior year. In anticipation of increased future demand, the CIMIS program is in the process of exploring new technologies and methods to efficiently address CIMIS demand. In one such effort to quantify evaporation from water surfaces, in January 2015 a buoy was deployed to collect data for accurately estimating the amount of evaporated water and developing methodologies to use on other water bodies. This information will be significant for the public in general and for water managers in particular.

## Recycling and Water Desalination

The goal of the Division of Statewide Integrated Water Management's Recycling and Water Desalination Section is to improve water management by promoting the increased use of nonconventional water sources—namely recycled water and desalinated brackish and ocean waters—through planning, technical, and financial assistance. As part of a balanced water portfolio, nonconventional water sources will help meet existing and future water supply and environmental needs. The section's mission consists of increasing safe and beneficial reuse of treated municipal wastewater, advancing energy-efficient treatment and desalination technologies, and encouraging economically and environmentally acceptable use of desalinated brackish and ocean waters.

A primary activity of this section is to manage the Water Desalination Grant Program, funded by voter-approved bond issues: Proposition 50 in 2002 and Proposition 1 in 2014. There have been three rounds of Proposition 50 funding for 51 projects (completed and ongoing), which were awarded $47.7 million for planning, construction, pilot studies, and research. All Proposition 50 funds have been obligated. Proposition 1 will provide $93.1 million in local assistance, for which the first round of funding is planned for 2017.

## Water Use Efficiency Grants and Loans Program

Proposition 50 has provided approximately $105 million for the Water Use Efficiency Grant Program since 2005. The grant program provided funds for implementation of all urban best management practices and agricultural efficient water management practices that would result in local, regional, and statewide benefits. The State benefits are water conservation, flow and timing, water quality, and energy efficiency, among others.

A competitive proposal solicitation package (PSP) was developed for all grant cycles, along with a comprehensive review and evaluation of the project proposals. The PSP defined project benefits, eligible projects, eligible applicants, funding caps, reporting, and other contract requirements.

In 2015, DWR's Water Use Efficiency Grant Program continued to manage close to 170 grant agreements from previous proposal solicitations funded by Proposition 50, pursuant to CWC Section 79550(g).

### *Proposition 1 CalConserve Water Use Efficiency Revolving Fund 2015 Loan Program*

The CalConserve Water Use Efficiency Revolving Fund is intended to be a sustainable funding source for water use efficiency projects. One of the purposes of this fund is to provide measurable reductions in urban per capita potable water use.

In late 2015, DWR developed and released the *CalConserve Water Use Efficiency Revolving Fund Proposition 1 Draft 2015 Loan Guidelines and Proposal Solicitation Package.*

This loan program implements CWC Section 79746, added by Proposition 1, that authorizes DWR to provide funding to assist water suppliers and regions to implement conservation programs and measures that are not locally cost effective. The CalConserve Water Use Efficiency Revolving Fund, established by legislation in 2014 (CWC Section 81000–81046), provides funding available to DWR for the purpose of water use efficiency projects. Assembly Bill 92 (Chapter 2, Statutes of 2015; CWC Section 81023 ) further defines that $10 million be established in the fund for water conservation and water use efficiency projects and programs to achieve urban water use targets. The loan program will provide local agencies with zero-interest loans of up to $3 million.

Of the $10 million in the CalConserve fund, $5 million will be for a pilot project for local agencies to provide water efficiency upgrades to eligible residents, and $5 million will be loaned to customers to finance the installation of onsite improvements to repair or replace, as necessary, cracked or leaking water pipes to conserve water. The final CalConserve guidelines and PSP are expected to be released in 2016.

### *Proposition 1 Agricultural Water Use Efficiency 2015 Grants Program*

This grant program implements CWC Section 79746, added by Proposition 1 that authorizes DWR to provide funding for agricultural water management planning and agricultural water use efficiency projects and programs developed pursuant to CWC Section 10800–10802.

DWR prepared and released the *Draft Agricultural Water Use Efficiency 2015 Grants Proposition 1 Guidelines and Proposal Solicitation Package* in August 2015.

The grant program funds agricultural water use efficiency projects that produce State benefits. Benefits to the State include: water savings, improved in-stream flow, improved water quality, increased energy conservation, reduction of greenhouse gas emissions, and increased local water supply reliability. Thirty million dollars of the $33 million of Proposition 1 funding allocated for agricultural water use efficiency grants in the Governor's budget are available through this PSP. The remaining $3 million are allocated to fund a joint request for proposal with the California Department of Food and Agriculture for a pilot project that will encourage partnerships between an agricultural water supplier and its growers to save water and reduce greenhouse gas emissions through on-farm and districts' conveyance water use efficiency improvements. A separate PSP and guidelines are being developed jointly

with the California Department of Food and Agriculture, and a draft is expected to be released in 2016.

The $30 million agricultural water use efficiency PSP gives priority to projects that are not locally cost-effective, employ a regional scope of activities, provide direct benefits to disadvantaged communities or economically distressed areas, produce multiple benefits, conserve energy and help the greenhouse gas emission reduction or carbon sequestration goals, and employ new or innovative technology or practices. Per the Governor's April 1, 2015, Executive Order (EO) B-29-15, priority in this solicitation will also be given to projects that implement agricultural water management plan (AWMP) actions for agricultural water suppliers serving 10,000 to 25,000 acres of irrigated land.

In accordance with legislative requirements, the draft PSP was posted on DWR's website in October 2015 to accept public comments. Three public workshops were conducted on November 3, 4, and 5, 2015, in Glendale, Sacramento, and Oroville, respectively.

The final Agricultural Water Use Efficiency PSP and guidelines are expected to be released in January 2016.

### *Agricultural Water Management Planning Grants*

DWR developed and released the application package for agricultural water management plan 2015 grants in October 2015. The grant program implements the Governor's EO B-29-15, which directs DWR to prioritize grant funding for AWMPs for midsized agricultural water suppliers (agricultural water suppliers that provide water to 10,000 to 25,000 irrigated acres of land). The grant program is a noncompetitive program to fund AWMPs that meet the requirements of the Governor's EO B-29-15, and to provide sufficient funds to prepare plans in order to meet the original intent of the CWC. One million dollars in grant funding was made available with a $50,000 cap for suppliers preparing new plans, a $10,000 cap for suppliers updating plans, and a $5,000 cap for suppliers who must already submit plans to the Bureau of Reclamation. Grant applications are accepted and reviewed for approval on a continuous basis until all available funding has been awarded, or by May 31, 2016, whichever occurs first.

### *Turf Replacement and High-Efficiency Toilet Rebate Programs*

In August 2015, DWR announced two rebate programs to help Californians further conserve water during the State's historic drought. The rebate programs are financed by the Proposition 1 water bond, approved by voters in 2014. The programs help carry out the Governor's April 1, 2015, EO B-29-15 on drought to further reduce water use in homes by replacing more than 10 million square feet of lawns and upgrading more than 60,000 water-wasting toilets. DWR oversees the rebate programs.

With $24 million in Proposition 1 funding, the turf replacement program will rebate $2 per square foot of turf replaced, up to $2,000 per household, through State or local turf replacement programs. Consumers are eligible to replace turf that is living or dead at the time of the rebate application. The turf rebate program is estimated to benefit more than 10,000 homes, with a focus on disadvantaged communities hardest hit by the drought. Twelve million dollars of the lawn removal funds is targeted for residents in disadvantaged communities with areas of depleted groundwater basins. The turf rebate program is monitored by DWR and administered by the Electric & Gas Industries Association. Approximately $1 million is targeted for lawn removal in institutional properties, such as schools, through an interagency agreement with the California Conservation Corps.

The $6 million toilet rebate program, also funded by Proposition 1, will help Californians replace approximately 60,000 inefficient toilets by offering a $100 customer rebate, per household, to replace them with high-efficiency toilets. Approximately $6 million is being used to fund the direct installation of high-efficiency toilets in disadvantaged communities through an interagency agreement with the Department of Community Services and Development.

## Agricultural Water Management Plans

The CWC requires all water suppliers to increase water use efficiency. Agricultural water suppliers are responsible for preparing, implementing, and updating AWMPs, measuring the volume of water delivered to customers, adopting a pricing structure, and implementing efficient water management practices. Agricultural water suppliers that fail to meet the specified water management planning requirements are not eligible for water grants or loans awarded or administered by the State.

The Agricultural Water Management Planning Act (CWC Section 10800, et seq.) requires an agricultural water supplier to prepare and adopt an AWMP on or before December 31, 2012, and to update its AWMP on December 31, 2015, and every 5 years thereafter. Updated AWMPs have to be submitted to DWR within 30 days of adoption.

"Agricultural water supplier" is defined as a publicly or privately owned water supplier that provides water to 10,000 or more irrigated acres, excluding acreage that receives recycled water. An agricultural water supplier is a supplier of or contractor for water that distributes or sells water for resale. Every water supplier that becomes an agricultural water supplier after December 31, 2012, and provides water to 25,000 or more irrigated acres, excluding recycled water, is responsible for preparing and adopting an AWMP within one year of becoming an agricultural water supplier. Agricultural water suppliers that provide water to less than 25,000 irrigated acres, excluding recycled water, are not required to adopt and implement AWMPs unless sufficient funding has specifically been provided for that purpose.

Agricultural water management and water use efficiency received major attention in the *California Water Action Plan Update 2013* as well as the Governor's EO B-29-15. Under the Emergency Services Act, and in response to the declared Drought Emergency, the Governor issued EO B-29-15, which required all midsized agricultural water suppliers to develop AWMPs. Under EO B-29-15, these agricultural water suppliers must develop AWMPs and shall include a detailed drought management plan and quantification of water supplies and demands for 2013, 2014, and 2015, to the extent data is available. These AWMPs must be submitted to DWR by July 1, 2016.

In 2015, DWR conducted workshops, targeted phone conferences, and Agricultural Stakeholder Committee public meetings as part of updating the AWMP guidebook and developing guidance related to the new agricultural water management requirements in EO B-29-15.

After updating and releasing *A Guidebook to Assist Agricultural Water Suppliers to Prepare a 2015 Agricultural Water Management Plan*, DWR conducted workshops statewide to provide technical assistance and help agricultural water suppliers effectively use the provided guidebook while preparing and implementing their AWMPs. DWR also employed a new web-based tool to make it easier for suppliers to submit AWMP data and tables in a format that will allow DWR to better track and analyze information. DWR continued to provide technical assistance and answer inquiries on the development and implementation of AWMPs.

DWR received AWMPs from 64 agricultural water suppliers for the 2012 submittal cycle. Those plans represent approximately 3.6 million acres, or roughly 44 percent, of the 8.13 million acres of irrigated lands estimated in the *California Water Plan Update 2013*. Some of the 2012 AWMPs were submitted as late as the summer of 2015 because the suppliers needed more time to develop and adopt their first AWMPs. Out of 54 agricultural water suppliers identified as having more than 25,000 acres of irrigated land that were required to submit plans, 44 agricultural water suppliers submitted plans, representing 81 percent compliance.

DWR expects to start receiving the 2015 AWMPs from the agricultural water suppliers after January 2016.

## Urban Water Management Plans

In accordance with the Urban Water Management Planning Act (CWC Section 10610 et seq.), California urban water suppliers are required to adopt and submit urban water management plans to DWR every 5 years on or before December 31 in years ending in five and zero.

CWC Section 10617 defines "urban water supplier" as a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. Assembly Bill 2067 (Chapter 463, Statutes of 2014) amended CWC Sections 10608.42, 10621, 10631, and 10632 to require each urban water supplier to submit its 2015 plan to DWR by July 1, 2016. In addition, the bill extended the date by which DWR is required to review the plans and report to the Legislature to July 1, 2017. Senate Bill 1036 (Chapter 285, Statues of 2014) and Senate Bill 1420 (Chapter 490, Statutes of 2014) amended CWC Sections 10631 and 10644 regarding voluntary reporting of energy intensity, electronic submittal, standardized forms, water loss, and estimating future water savings.

In 2015, DWR continued to review urban water management plans submitted for the 2010 cycle, and 242 reviews were finalized.

DWR also collected the information reported in urban water management plans into a database and provided reports on urban water use data to the Governor, legislators, the media, and interested members of the public. These reports were posted online.

### *20 Percent Urban Water Use Reduction by 2020*

The CWC directs DWR to be the lead agency in implementing a number of separate actions that would guide the State to a targeted reduction of 20 percent of urban water use by 2020. To implement these actions through a public process, DWR convened and continues to work with an Urban Stakeholder Committee to provide guidance and input.

Many of these actions required the development of methodologies, for use by urban water agencies, to calculate agency-level targets and progress toward meeting their water use reduction targets by 2020.

DWR is required to report to the Legislature by the end of 2016 and make recommendations on needed changes if the State is not on track to meet per capita targets. Data analysis is ongoing in preparation for this report.

## Integrated Regional Water Management Grant Program

The Integrated Regional Water Management (IRWM) Grant Program program provides funding for planning, disadvantaged community involvement, implementation, and companion grant programs that support sustainable groundwater planning and

water-energy programs and projects. The program is funded in part by Proposition 84.

### *Proposition 84*

In 2015, draft recommendations were made for the final round of Proposition 84 implementation grants. IRWM will award $231.6 million to 27 grant recipients for projects totaling more than $1 billion in improvements to water supply reliability projects.

## Agricultural Drainage Program

The Agricultural Drainage Program's mission is to seek in-valley solutions to surface and subsurface agricultural drainage water problems, particularly in the San Joaquin Valley, and to improve water quality in the San Joaquin River.

This program consists of several activities, including drainage monitoring and evaluation, drainage treatment, integrated on-farm drainage management, drainage reduction and reuse, environmental services, and the San Joaquin River Water Quality Improvement Program.

In 2015 the following activities were conducted:

- monitoring shallow groundwater levels and flows and collecting water quality data for drainage water from west side San Joaquin Valley tile drain sumps;
- measuring groundwater levels quarterly for approximately 200 wells in Kern County;
- preparing shallow groundwater and irrigation methods maps of drainage-impaired areas using drainage monitoring data in conjunction with land use and irrigation methods data;
- providing assistance for collecting groundwater, soil, and operational data for the integrated on-farm drainage management project at Red Rock Ranch in western Fresno County;
- collecting flow, electrical conductivity, and temperature data from several satellite-linked and web-accessible stations on the mainstem of the San Joaquin River for the Real-time Water Quality Monitoring Program;
- producing weekly forecasts of salinity and flow conditions on the San Joaquin River near Vernalis and other upstream stations using the San Joaquin River Input-Output Day model, and publishing them on DWR's website;
- testing the Watershed Analysis Risk Management Framework model (developed by the University of California, Merced, and the Bureau of Reclamation) and working with the Bureau of Reclamation to refine it for use to replace the current San Joaquin River Input-Output Day model;
- collaborating with the Central Valley Regional Water Quality Control Board and State Water Resources Control Board's initiative, the Central Valley Salinity Alternatives for Long-term Sustainability, by providing data, attending committee meetings, and reviewing program documents; and
- maintaining a DWR website that includes information on drainage programs and activities, salinity and shallow groundwater maps, grants, and links related to other agricultural drainage programs.

## San Joaquin River Water Quality Grant Program

The program provides funding to support projects that will result in direct, measurable water quality improvements to the San Joaquin River by reducing or eliminating discharges of subsurface agricultural drainage, a significant water quality concern for the San Joaquin River. The guidelines and PSP for the program were

released in November 2015. The amount of funding available was $36.6 million from Proposition 84. The due date for applications is March 4, 2016.

## Water Conservation Bond Laws

To help local agencies obtain financing for their water management programs, California voters have approved a number of bond laws authorizing DWR to provide grants and low-interest loans to fund project feasibility studies or construction activities. Recent bond laws are summarized below, with focus on funds administered by DWR.

- The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84; Public Resources Code Sections 75001–75130) authorized $1 billion to continue the IRWM Grant Program. Under this program, grants and construction loans are available with repayment periods of up to 20 years at reduced interest rates for most programs.
- The Water Quality, Supply, and Infrastructure Improvement Act of 2014 (Proposition 1; CWC Sections 79700–79798) authorized the appropriation of $510 million in IRWM funding for implementation and planning efforts. Funds for water use efficiency and desalination projects are also authorized.

Please see previous bulletins for historical authorizations.

# Chapter 6
# Legislation and Litigation

*Canada Geese at Lake Oroville.*

## Significant Events in 2015

Legislation related to drought response and planning; water management and infrastructure projects; urban water management plans; groundwater management; atmospheric rivers; and water supply, reliability, and flood control passed in 2015.

*Information for this chapter was provided by the Legislative Affairs Office and the Office of the Chief Counsel.*

The Department of Water Resources (DWR) monitors State and federal legislation that affects management of the State Water Project (SWP). Legislative bill tracking involves reviewing legislation at its introduction, evaluating amendments in State Assembly and Senate committee hearings, and monitoring its enactment into law. The DWR Assistant Director for Legislation monitors proposed legislation. The Office of the Chief Counsel tracks State and federal litigation that impacts management of the SWP. The DWR Chief Counsel also manages legal cases that involve SWP operations.

# Legislation

## State Legislation

### *AB 91 (Committee on Budget; Chapter 1, Budget Act of 2014)*

Assembly Bill (AB) 91, an amendment to the Budget Act of 2014, expedited General Fund, Proposition 1E bond fund, and Greenhouse Gas Reduction Fund monies for activities related to drought response and planning, as well as other water management and infrastructure projects.

### *AB 92 (Committee on Budget; Chapter 2, Budget Act of 2014)—Water: Drought*

This bill made changes to various provisions of law to address immediate actions associated with the State's drought conditions. Specifically, it granted new authorities to the State Water Resources Control Board (SWRCB), expedited drought response through exemption of certain actions from the California Environmental Quality Act (CEQA), and authorized funding for the removal of a salinity barrier installed in the Sacramento-San Joaquin Delta.

### *AB 149 (Chavez; Chapter 49, Statutes of 2015)—Urban water management plans*

AB 149 extends the date for urban water suppliers to submit their 2020 Urban Water Management Plans by 6 months, which allows DWR extra time to submit its consolidated report to the Legislature. This bill also allows for the most current census population data to be used in planning efforts.

### *AB 617 (Perea; Chapter 666, Statutes of 2015)—Groundwater*

This bill made various changes to the Sustainable Groundwater Management Act of 2014. Specifically, it created a pathway for compelling State agencies to comply with a groundwater plan, and it allowed for an extension to implement a groundwater sustainability plan if litigation had prevented implementation.

### *AB 1390 (Alejo; Chapter 672, Statutes of 2015)—Groundwater: comprehensive adjudication*

This bill establishes a special procedure for a comprehensive adjudication, defined as an action filed in superior court to determine the rights to extract groundwater in a basin. It authorizes the court to determine all rights to groundwater in a basin whether based on appropriation, overlying right, or other rights.

### *SB 13 (Pavley; Chapter 255, Statutes of 2015)—Groundwater*

Senate Bill (SB) 13 made technical changes to the Sustainable Groundwater Management Act of 2014 to improve groundwater management in California.

### *SB 208 (Lara; Chapter 675, Statutes of 2015)—Integrated regional water management plans: grants: advanced payment*

This bill established a requirement for DWR, within 60 days of receiving project information for projects that satisfy specified criteria, to provide advanced payment of 50 percent of the grant awards. It also requires that the advanced funds be handled as prescribed in the bill.

### *SB 226 (Pavley; Chapter 676, Statutes of 2015)—Sustainable Groundwater Management Act: adjudication*

SB 226 provides for expedited groundwater basin adjudication with the intent of encouraging early settlement and avoiding lengthy adjudication processes. The bill makes provisions to integrate and streamline the adjudication process for groundwater basins subject to the Sustainable Groundwater Management Act so that future adjudication furthers the objectives of the act.

### *SB 664 (Hertzberg; Chapter 681, Statutes of 2015)—Water: urban water management planning*

This bill establishes a requirement that an urban water supplier include within its plan, beginning January 1, 2020, a seismic risk assessment and mitigation plan to assess the vulnerability of each of the various facilities of a water system and mitigate those vulnerabilities. The bill authorizes an urban water supplier to comply with this requirement by submitting a copy of the most recently adopted local hazard mitigation plan or multihazard mitigation plan under specified federal law that addresses seismic risk.

### *SB 758 (Block; Chapter 682, Statutes of 2015)—Atmospheric Rivers: Research, Mitigation, and Climate Forecasting Program*

SB 758 established the Atmospheric Rivers: Research, Mitigation, and Climate Forecasting Program in DWR to, upon appropriation of special fund monies, research the causes and effects of atmospheric rivers; take actions to capture water generated by atmospheric rivers to increase the water supply and reliability of water resources in the State; and operate reservoirs in a manner that improves flood protection in the State.

## Federal Legislation

There was no significant federal legislation in 2015 affecting management of the SWP.

# Litigation

As of December 31, 2015, DWR was involved in, or closely monitored, a number of court cases and other actions related to the management of the SWP.

## Sacramento-San Joaquin Delta

### *Delta Smelt*

***Delta Smelt Consolidated Cases. San Luis & Delta-Mendota Water Authority v. Jewell* (9th Cir. 2014 747 F.3d 581).** Litigation stemming from a coalition of environmental groups' challenge to the 2005 biological opinion (BiOp) on Delta Smelt issued by the U.S. Fish and Wildlife Service (USFWS) continued. After judicial review, the 2005 BiOp was found to be unlawful, and USFWS was ordered to prepare a new one. On December 15, 2008, USFWS issued a new BiOp, which required sufficient quantities of fresh water be allowed to flow through the Delta to promote the survival and recovery of Delta Smelt. State and federal water contractors, along with DWR, challenged the BiOp in court alleging that the BiOp violated the National Environmental Policy Act (NEPA), the federal Endangered Species

Act (ESA), and the Administrative Procedure Act (APA.) (For details about this litigation prior to 2015, see Bulletin 132-15 and earlier bulletins.)

On May 12, 2014, DWR, along with State and federal water contractors, filed a petition for rehearing, arguing that the Ninth Circuit Court of Appeals decision did not apply the standard of review that has been established by the U.S. Supreme Court and Ninth Circuit precedent. DWR's petition for rehearing was denied on July 23, 2014. In September and October, State and federal water contractors filed petitions for writ of certiorari seeking review of the Ninth Circuit's decision by the U.S. Supreme Court. The Supreme Court did not rule on the petitions in 2014.

On January 12, 2015, without hearing oral arguments and without ruling on the merits of the case, the Supreme Court denied the petitions of the farmers and water districts seeking review of the March 2014 decision by the Ninth Circuit, thus upholding the 2008 BiOp.

## Salmon

***The Consolidated Salmon Cases* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053).** *San Luis & Delta-Mendota Water Authority, et al. v. Gary F. Lock, as Secretary of the United States Department of Commerce, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053); *Stockton East Water District, et al. v. National Oceanic and Atmospheric Administration, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1090); *State Water Contractors v. Gary F. Locke, Secretary, etc., et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053); *Kern County Water Agency, et al. v. United States Department of Commerce, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1520); *Oakdale Irrigation District, et al. v. United States Department of Commerce, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1580); *The Metropolitan Water District of Southern California v. National Marine Fisheries Service, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1625).

Litigation stemming from a challenge to the 2004 BiOp issued by the National Marine Fisheries Service (NOAA Fisheries) continued. In August 2005, a coalition of environmental groups challenged the 2004 BiOp in federal district court. On April 16, 2008, the court held that the 2004 BiOp violated the ESA and APA and ordered NOAA Fisheries to prepare a new BiOp. NOAA Fisheries issued a new BiOp in June 2009. In September 2009, federal and State water contractors challenged the issuance and adoption of the BiOp on the grounds that the federal defendants failed to comply with NEPA, the ESA, and the APA. DWR joined the litigation in January 2010. (For earlier information about this litigation, see Bulletin 132-15 and prior bulletins.)

On December 22, 2014, a panel for the Ninth Circuit Court of Appeals issued its opinion, overturning in part and upholding in part the district court's ruling.

The panel held that the district court did not give NOAA Fisheries the substantial deference it was due under the APA. The panel found that the components of the BiOp invalidated by the district court were reasonable and supported by the record and therefore the panel upheld the BiOp in its entirety. Given that the U.S. Supreme Court denied review of the Delta Smelt case, parties did not file for Supreme Court review of the consolidated salmon cases.

## State Water Resources Control Board

***California Sportfishing Protection Alliance, et al. v. California State Water Resources Control Board, et al., California Department of Water Resources and United States Bureau of Reclamation, Real Parties in Interest* (Case No. RG15-780498).** The California Sportfishing Protection Alliance filed a petition for writ of mandate challenging the SWRCB's orders granting Temporary Urgency Change Petitions to DWR and the Bureau of Reclamation (Reclamation) in 2014 and 2015. DWR and Reclamation are named as

real parties in interest. On September 16, 2015, the California Sportfishing Protection Alliance filed a first amended complaint claiming that the SWRCB's orders violate the federal Clean Water Act, the Central Valley Basin Plan, and the Public Trust Doctrine. On October 21, the SWRCB filed a demurrer to dismiss the action. A hearing on the matter was set for December 14, 2015.

***California Water Impact Network, California Sportfishing Protection Alliance, and AquAlliance v. California State Water Resources Control Board and California Department of Water Resources* (Super. Ct. Sacramento County, No. 34-2010-80000653).** These conservation groups allege that permit approvals and enforcement failure by the SWRCB has allowed DWR to cause extensive damage to the San Francisco Bay/Sacramento-San Joaquin Delta Estuary and the fish and wildlife that live there. The administrative record was prepared.

There was no new activity in this case in 2015.

## Bay Delta Conservation Plan

***Property Reserve, Inc. v. The Superior Court of San Joaquin County;* Department of Water Resources, real party in interest: *The Carolyn Nichols Revocable Living Trust v. The Superior Court of San Joaquin County;* Department of Water Resources, real party in interest (C067765) Coordinated Proceedings Special Title (Rule 3.550) (C067758, writ denied).** Twenty-four Delta property owners declined DWR's request to gain temporary entry onto their properties to perform environmental and geological surveys. DWR sought orders for temporary entry onto the respondents' properties under Code of Civil Procedure Section 1245.010 et seq. (More information about this litigation is available in Bulletin 132-14 and earlier bulletins.)

On March 13, 2014, the Third District Court of Appeal determined that the precondemnation entry order process was not sufficient to give DWR access to private properties to conduct the surveys. The court ruled that both the geotechnical studies and less disruptive environmental surveys would constitute takings, and therefore, DWR would need to bring condemnation actions to get the access it sought. By the end of 2014, an appeal had been filed with the Supreme Court of California, where briefing was completed in early 2015.

## Jones Tract

***Armando P. Vanni, et al. v. Rindge Land Reclamation District #2039* (Super. Ct. San Joaquin County, No. C072383, app. pending).** Three consolidated lawsuits alleging damages arising out of the levee breach on Upper Jones Tract in 2004 went to trial from August 22 to December 29, 2011.

In April 2012, the court entered judgment in favor of DWR. The court found that the plaintiffs failed to show a causal connection between the levee failure and SWP operations. The plaintiffs appealed.

On December 30, 2014, the Third District Court of Appeal rejected the plaintiffs' contention that the judgment was based on a factual premise not supported by evidence and affirmed the judgment. On January 21, 2015, the Supreme Court of California denied the Petition for Review.

## State Water Resources Control Board Hearing

SWRCB Water Right Decision 1641 contains a water quality objective requiring DWR to annually maintain 0.7 millimhos per centimeter electrical conductivity at three compliance points within the South Delta, from April 1 through August 31, beginning in 2005. In response to allegations that the water quality objective was not being met and would not be met, the SWRCB issued a cease and desist order, which was final on May 16, 2006, requiring DWR and Reclamation to take corrective actions to eliminate the threat of noncompliance.

After a period of negotiations, the SWRCB issued a final order in 2010, modifying its 2006 order, which extended the schedule to implement measures to meet the water quality objectives pending completion of the SWRCB's review and potential modification of the salinity objectives. The order also required DWR, along with Reclamation, to undertake studies to assess the feasibility of implementing various measures to meet the salinity objectives.

Through continued coordination with the Delta Watermaster, additional studies began in 2012 to determine the sources of this local salinity and to explore options for reducing those sources. Preliminary results of these studies indicated significant local sources of salinity. Coordination with the Delta Watermaster continued in 2015.

## Hydropower

### *Oroville Relicensing—Federal Energy Regulatory Commission Project No. 2100*

***Butte County et al. v. Department of Water Resources* (C071785, app. pending).** DWR is seeking renewal of the Federal Energy Regulatory Commission (FERC) license for its hydroelectric generation facilities at Oroville (Project No. 2100). DWR filed its relicensing application in 2005. The original 50-year FERC license expired on January 31, 2007. In February 2008, FERC authorized continued operation by issuing an annual license—under the same terms and conditions—that renews each year until FERC issues a new license. (Details of the license renewal negotiations and earlier litigation are described in previous bulletins.)

In January 2012, the court denied the petitioner's requests to set aside the EIR prepared by DWR and upheld the award to DWR of $675,087 in charges for the administrative record required to proceed with the suit. The court found that the EIR was legally adequate and noted that the record preparation complied with the California Environmental Quality Act (CEQA) and was reasonable and necessary. The petitioners, Butte and Plumas counties, appealed the judgment, and the appellate briefs were filed in 2013.

Oral argument on the appeal was pending through 2015.

## Other Cases

### *The Monterey Amendment*

***Central Delta Water Agency et al. v. California Department of Water Resources* (Super. Ct. Sacramento County, No. 34-2010-80000561) (Central Delta I); *Central Delta Water Agency et al. v. Kern County Water Agency et al., DWR et al., real parties in interest* (Super. Ct. Kern County, No. S-1500-CV-270965) (Central Delta II); *Rosedale-Rio Bravo Water Storage District and Buena Vista Water Storage District v. DWR* (Super. Ct. Kern County, No. S-1500-CV-270635-KCT) (Rosedale-Rio Bravo) (C098249, app. pending).** Legal challenges were brought against the 1995 Monterey Amendment and the EIR adopted by DWR in 2010. (The Monterey Amendment, litigation challenging the amendment and the first EIR, the settlement of that litigation, development of the second EIR (Monterey Plus EIR), and litigation prior to consolidation of the cases in Sacramento County Superior Court are described in earlier bulletins.)

After holding a hearing on the CEQA challenges in the remaining two cases, the trial court ruled that most of the EIR was adequate under CEQA, but that the EIR's discussion of the impacts on continued use and operation of the Kern Water Bank was insufficient. The court issued a decision in favor of the plaintiffs in the two cases finding that the EIR failed to analyze impacts associated with the use and operation of the Kern Water Bank, particularly as to potential groundwater and water quality impacts. On October 2, 2014, the court ordered DWR, as the remedy for the deficiency, to provide additional environmental analysis on the

future impacts of the continued use and operation of the Kern Water Bank and, upon completion of the EIR process, to determine whether to continue use and operation of the Kern Water Bank. On November 24, 2014, the court ordered DWR to set aside the certification of the Monterey Plus EIR and set a deadline of December 31, 2015, for DWR to correct deficiencies in and recertify the Monterey Plus EIR. In December 2014, one set of plaintiffs filed a notice of appeal with the court of appeal. The plaintiffs are appealing the lower court's final CEQA and validation decisions.

On August 10, 2015, the court granted DWR's request for an extension and set a new deadline of June 30, 2016, for completion of a revised Monterey Plus EIR.

## Construction Arbitration

***D.A. McCosker Construction Co., dba Independent Construction Company v. Department of Water Resources* (OAH/PWCA No. A-0021-2013).** This dispute arose out of the construction of Dyer Reservoir under a contract for $11 million. The work concluded in 2012, nearly 2 years behind schedule. In September 2013, the contractor brought a binding arbitration action seeking additional compensation in the amount of $12 million due to alleged defective specifications, differing site conditions, and owner-caused delay. DWR withheld over $1 million in liquidated damages for late completion. Limited discovery was conducted in 2014, and a mediation that took place in December 2014 was unsuccessful. The arbitration hearing is scheduled to commence in January 2016.

## Colorado River

***Quantification Settlement Agreement Cases* ((2015) 237 Cal.App.4th 72; (2014) 767 F.3d 781).** These nine claims (which have been coordinated into a single proceeding before the Sacramento County Superior Court) and federal litigation challenge the Quantification Settlement Agreement (QSA) and associated actions taken to implement the QSA—a collection of 38 agreements that resolve disputes among water users in Southern California regarding their rights to California's shrinking share of Colorado River water. (The QSA and earlier litigation activities are described in Bulletins 132-04 and 132-06 through 132-13.)

In State litigation, after the Sacramento County Superior Court issued a final judgment in July 2013 upholding the QSA's validity, another appeal was filed. In April 2015, the parties agreed to a settlement, and on May 26, 2015, the 3rd District Court of Appeal dismissed all remaining appeals.

On May 19, 2014, the Ninth Circuit Court of Appeals affirmed the judgment of the district court ruling that the Secretary of the Interior did not violate the NEPA or the Clean Air Act in approving the Colorado River Water Delivery Agreement. All remaining appeals were dismissed.

## Clean Water Act

***Catskill Mountains Chapter of Trout Unlimited, Inc., et al. v. United States Environmental Protection Agency, et al.* (N.Y.Dist.Ct., No. 7:08-CV-05606-KMK, app. pending).** A number of environmental groups, private entities, and governmental agencies controlling or utilizing water filed an action challenging the application of the Environmental Protection Agency's (EPA) Water Transfer Rule under the Clean Water Act (CWA). The CWA provides that the discharge of any pollutant by any person without a National Pollution Discharge Elimination System Permit is unlawful. (33 U.S.C. Section 1311(a)). The federal statute defines a discharge of a pollutant to mean any addition of any pollutant to navigable water from any point source. The EPA has applied the CWA provisions to transfers of water between navigable bodies of water and not to "water transfers."

According to the CWA, "water transfers" are "an activity that conveys or connects waters of the United States without subjecting the transferred water to intervening industrial, municipal, or commercial use."

On March 28, 2014, the court found the EPA Water Transfer Rule to be inconsistent with the CWA. The case has been appealed. As the outcome of the case will have a direct and material effect on the operations of the SWP, in June 2014, DWR filed a friend of the court brief (an amicus curiae brief) to advise the court of relevant information and arguments the court might wish to consider. Oral argument was scheduled for December 1, 2015.

***Oregon Natural Resources Council, Inc., et al. v. Bureau of Reclamation, et al.* (798 F.3d 933 (2015)).** The CWA prohibits discharge of any pollutant into navigable waters from any source. However, the CWA allows for the EPA to issue a permit authorizing the discharge of a pollutant in certain instances. If an activity conveys or connects waters of the United States without subjecting the transferred water to intervening industrial, municipal, or commercial use it is excluded from the permit requirement.

Oregon Natural Resources Council, Inc. filed suit against Reclamation alleging that Reclamation violated the CWA by discharging pollutants into the Klamath River from the Klamath Straights Drain without the necessary permit. After initiation of the suit, the EPA adopted a rule that provides an additional exemption from permitting under the CWA for an activity that moves water between two navigable waters without an intervening use. The court held that the rule was a valid regulation because it was a reasonable interpretation of the CWA. This ruling means that the water transfer activities by DWR in California (e.g., routing water through tunnels, channels, or natural streams and directing it to use for irrigation, municipal, or power purposes) are not subject to the permitting process under the national pollutant discharge elimination system program.

In June 2014, DWR filed a friend of the court brief (an amicus curiae brief) to advise the court of relevant information and arguments the court might wish to consider. Oral arguments for the appeal were heard on November 21, 2014.

On August 21, 2015, the Ninth Circuit Court of Appeals issued its determination that a permit is not required under the CWA for waters flowing from the Klamath Straits Drain into the Klamath River.

## Environmental Review Acts

The National Environmental Policy Act (NEPA) (Title 42 United States Code Sections 4321 et seq.) and the California Environmental Quality Act (CEQA) (California Public Resources Code Sections 21000 et seq.) require government agencies to document and consider environmental consequences of their actions in their decision-making processes. NEPA states that it is the goal of the federal government to use all practicable means consistent with other considerations of national policy to protect and enhance the quality of the environment. All federal agencies must prepare an environmental impact statement (EIS), including a discussion of mitigation measures and alternatives, for federal actions that could significantly affect environmental quality.

CEQA is patterned after NEPA. Under CEQA, State and local agencies are required to (1) disclose, through an environmental impact report (EIR), the significant impacts a proposed project would have on the environment, and (2) identify ways to reduce or avoid environmental damage.

CEQA applies to projects directly undertaken, funded, or approved by State or local agencies. NEPA applies to projects directly undertaken, funded, or approved by federal agencies. The Department of Water Resources (DWR) conducts many projects in cooperation with federal agencies. In these cases, both CEQA and NEPA must be followed.

NEPA requires that mitigation measures and alternatives be disclosed to the public in the EIS, but it does not generally require federal agencies to adopt such mitigation measures or alternatives. CEQA does impose substantive duties on all California government agencies approving projects with significant environmental impacts to adopt alternatives or mitigation measures that they find to be feasible to substantially lessen these impacts, unless there are overriding reasons they cannot. When a project is subject to both CEQA and NEPA, both laws encourage agencies to cooperate in planning the project and preparing joint environmental documents.

The environmental review process allows citizens to learn about a proposed project and its potential significant effects and to participate in the decision-making process by providing feedback on agency information. The review process requires agencies to:

- describe the proposed project and the purpose or need for it;
- identify the lead and cooperating agencies involved in the project;
- invite interested parties to participate in the process;
- determine the scope of study with input from responsible agencies and the public;
- prepare and distribute a draft EIS or EIR;
- respond to comments received on the draft;
- prepare the final EIS or EIR;
- make findings and adopt feasible alternatives or mitigation measures to avoid significant effects, if applicable;

## Environmental Review Acts

- adopt a monitoring plan to ensure compliance with mitigation measures; and
- prepare a list of permits required to implement the project if it is approved.

The scoping phase, which occurs early in the review process, is particularly important because it enables government agencies to identify issues and topics to be considered or addressed in the EIS or EIR.

Information gathered in the scoping phase helps agencies identify and evaluate reasonable alternatives, identify potential environmental impacts of the project, determine data and information needed, develop a work schedule, and allocate resources for preparing and distributing the draft environmental document for public review and comment.

NEPA requires a lead agency to involve the public during scoping, while CEQA does not. CEQA, however, does encourage public involvement, and agencies often opt to conduct activities that provide for wide public involvement. Members of the public may raise issues and identify additional alternatives, environmental effects, methods of assessment, and mitigation measures during the scoping phase and continue to participate in the review process for the draft environmental document. Thus, the CEQA process may lead to changes in a project through the development, consideration, and adoption of alternatives or enforceable mitigation measures to avoid or reduce any potential significant adverse effects on the environment.

If the project is approved, the lead agency publishes a document discussing all the factors considered in reaching its decision to proceed with the proposed action. It also discusses whether all practical means to avoid or minimize environmental harm have been adopted, and if not, the reasons they were not.

# Chapter 7
# Water Supply Development and Reliability

*Emergency drought barrier construction nears completion on the West False River in the Sacramento-San Joaquin Delta.*

## Significant Events in 2015

As the State continued to experience one of the driest periods on record, the State Water Resources Control Board (SWRCB) convened several workshops and approved a number of temporary urgency change petitions (TUCPs) from the Department of Water Resources (DWR) and the Bureau of Reclamation (Reclamation) to modify their water right permits for the State Water Project (SWP) and Central Valley Project (CVP).

In May, due to severe drought conditions, a temporary emergency drought barrier was installed on West False River between Jersey and Bradford islands to deter saltwater intrusion from the San Francisco Bay and to conserve water in upstream reservoirs needed to protect Delta water quality. The barrier was removed in November.

In July, *The State Water Project Final Delivery Reliability Report 2015* was released.

*Information in this chapter was contributed by the State Water Project Analysis Office, the Division of Integrated Regional Water Management, the Division of Statewide Integrated Water Management, and the Bay-Delta Office.*

The Department of Water Resources (DWR) works to improve the reliability of State Water Project (SWP) water supplies and the long-term water contract annual Table A water allocations delivered to SWP water contractors. DWR is engaged in planning activities to develop additional water supplies and storage capacity.

Developing new water supplies and storage projects that are economically, environmentally, and technically sound, while satisfying institutional requirements and political concerns, presents significant challenges. Many concerns center on possible adverse effects that additional storage and delivery facilities may have locally and on the Sacramento-San Joaquin Delta (Delta). In the SWP conveyance system, the Delta is the critical link between water supplies in the Sacramento Valley and deliveries to the rest of the Central Valley and Southern California.

DWR works with the State and federal governments, local agencies, and public interest stakeholder groups to ensure water supply reliability now and in the future. To meet SWP water contractors' needs for sufficient water supplies, DWR is engaged in planning, developing, and providing local assistance with the objective of augmenting future SWP water supplies.

## Supply Development and Reliability

Activities DWR is engaged in to augment future SWP supplies include:

- facilitating transfers between SWP long-term water contractors and other agencies, including Central Valley Project (CVP) contractors;
- funding studies on the Giant Garter Snake, a protected species known to inhabit rice growing regions of the Sacramento Valley, and on rice evapotranspiration, to better understand issues related to the transfer of water made available by crop idling;
- supporting the planning and implementation of local and regional conjunctive-use projects in the Sacramento Valley;
- constructing, operating, and maintaining groundwater and land subsidence monitoring networks to detect potential impacts caused by groundwater substitution transfers and other groundwater management activities in the Sacramento Valley;
- assisting with the development and implementation of restoration projects in the Feather River watershed to reduce sedimentation in Lake Oroville and preserve watershed storage capacity; and
- investigating and evaluating storage projects.

### Water Conveyance Through the SWP

DWR encourages and facilitates temporary transfers of water using SWP conveyance facilities for SWP water contractors and other agencies to help meet local, State, and environmental water supply needs. As a practical matter, SWP facilities are often needed to convey transfer water from the existing place of use to the place of use of the transferee. State law requires DWR to make unused SWP capacity available for transfers upon payment of fair compensation, provided that (1) no legal user of water will be injured; (2) there will be no unreasonable effect on fish, wildlife, or

other instream beneficial uses; and (3) there will be no unreasonable effect on the overall economy or the environment of the county from which the water is being transferred (California Water Code [CWC] Section 1810). Water transfers can involve transfers and exchanges among SWP water contractors, between SWP water contractors and non-SWP entities, or between two or more non-SWP entities.

### *Transfer and Exchange Evaluations*

An important element of any water transfer is to determine what quantity of water, if any, is transferable.

The transferability of water depends on many factors including the source of the water being transferred, what is being done to make water available, when the water can be made available, and the type of water right the existing user holds. Several CWC provisions authorize temporary transfers of water rights issued by the State Water Resources Control Board (SWRCB) (appropriative water rights issued after 1914) and placed conditions on the transfers to protect those not involved in them.

Short-term transfers, of less than one year, are authorized under CWC Sections 1725–1732. Long-term transfers, for periods greater than one year, are authorized by CWC Sections 1735–1737. Other CWC sections specify conditions under which water can be transferred and legal protections for those transferring water.

Transfers based on water rights obtained before 1914 are not under SWRCB jurisdiction but must comply with the requirements of the California Environmental Quality Act (CEQA) and possibly the National Environmental Policy Act (NEPA).

The CWC sections noted above contain provisions intended to protect other legal users of water and fish and wildlife from the possible adverse effects of a water transfer. These provisions reflect the concept that changes can be made to the authorized place and purpose of use or point of diversion of a water supply as long as there is no injury to others as a result of the change (the "no injury rule"). The no injury rule in State water law is intended to protect other legal users from the potential expansion of water use beyond what would have been consumed by the original users in the absence of the transfer. Hence, under the no injury rule, only "new water" is transferable (i.e., water added to the downstream water supply only as a result of the transfer). To protect other users, a transfer would not be authorized to the extent that it would reduce the amount or timing of water that would otherwise be available to downstream users, regardless of the water right priority of those users.

CWC Section 1810(d) requires DWR to consider potential impacts of a transfer on legal users, instream uses, and the economy of the area from which the water would be transferred. DWR must determine whether to allow the use of any unused available water conveyance capacity for a transfer under this section. DWR reviews each request to transfer water through SWP facilities to assure that only new water will be transferred. This requirement applies to transfers based on both pre-1914 and post-1914 water rights.

Transfer water is most commonly developed through one of four methods: surplus water release from storage facilities, substituting groundwater for transferred surface water, idling agricultural land, and undertaking conservation activities that develop new water. Because transfers may result in direct impacts and third-party impacts (impacts to parties not involved in the transfer), certain CWC provisions were enacted to limit potential impacts. For example, since additional groundwater pumping from a groundwater substitution project may

potentially affect other groundwater users in the area, CWC Section 1745.10 requires that the groundwater substitution project: (1) be consistent with a groundwater management plan adopted pursuant to State law for the affected area or (2) if a management plan has not been adopted, the transfer project proponent determines the transfer would not create or contribute to conditions of long-term overdraft in the affected groundwater basin.

Injury can also occur due to streamflow depletion induced by increased pumping from wells for groundwater substitution transfers. Consequently, to mitigate possible impacts from groundwater substitution transfers, DWR assesses a streamflow depletion factor, which represents an estimate of the potential effects of the additional groundwater pumping on the surface water system. Each type of transfer has its own set of potential impacts that must be evaluated to protect parties not involved in the transfer.

With the exception of short-term transfers under CWC Section 1725 et seq. (which provides for an expedited process for water rights issued by the SWRCB), water transfers are subject to compliance with CEQA and, possibly, NEPA. The CEQA/NEPA and SWRCB processes provide opportunities for public review and comment on water transfer proposals. The Governor's January 17, 2014, Drought Emergency Proclamation directed DWR and the SWRCB to expedite the review and approval of water transfer proposals and suspended the provisions of CEQA for actions taken by DWR related to transfers. The proclamation did not suspend CEQA for local agencies.

Staff in DWR's State Water Project Analysis Office, Division of Operations and Maintenance, Division of Integrated Regional Water Management, and the Office of the Chief Counsel evaluate proposed water transfers to determine whether the transfers will impact the SWP, other water users, the environment, or the area from which the water will be transferred.

## SWP Delivery Capability Report

*The State Water Project Final Delivery Capability Report 2015* was released in July 2015. The next update of this report is expected in March 2017.

Delivery capability depends on three factors:

(1) the availability of water at the source;
(2) the ability to convey water from the source to the desired point of delivery; and
(3) the level of demand.

To assist local agencies with assessing their overall water supply needs, and the amount of deliveries that they can expect from the SWP, the 2015 report and its appendices provide information on the annual SWP deliveries in the 10-year historical sequence preceding the publication date (2005–2014); the status of DWR activities in the Office of Water Use Efficiency; the results of a simulation model on the current (2015) level of development; and a range of future conditions (2035 level of development and climate change with varying regulations and facilities).

In order to provide a conservative estimate of water delivery capability for current conditions, no planned facility improvements to the SWP infrastructure were assumed, and the analysis of the ability to convey water from the source to the points of delivery assumes only current SWP facilities, regulations, and water rights permits existing in 2015. Lastly, the level of demand for SWP water assumed the maximum Table A delivery amount was requested and reflected current trends in demand from SWP water contractors.

Detailed information on the assumptions, data, and simulation results of existing and

future conditions for annual Table A water deliveries can be found in the final 2015 capability report available on DWR's website.

## SWP Future Water Supply Program

The Future Water Supply Program's goal is to improve and protect the water supply reliability of the SWP while protecting the environment and other legal users of water. The program consists of two main components; Sacramento Valley Groundwater (SVG) and Upper Feather River Watershed Management (UFRWM). The SVG component provides technical support for the Lower Yuba River Accord (Yuba Accord) and to monitor other groundwater and conjunctive-use projects and assess conditions of the Sacramento Valley Groundwater Basin that may affect SWP yield. The four primary objectives of the SVG are to: (1) collect, analyze, and report data to determine the effects of groundwater substitution transfers on the SWP; (2) analyze and report on groundwater substitution transfers that use SWP facilities; (3) monitor groundwater management planning and implementation activities that may affect SWP yield; and (4) develop and utilize analytical tools to support and enhance sustainable groundwater management in the Sacramento Valley.

The UFRWM component of the program evaluates the Feather River watershed above Lake Oroville with respect to watershed management and restoration actions being planned or implemented. These actions are intended to improve the ecological and hydrologic functions of watersheds, thus affecting base flow, improving flood attenuation, and reducing erosion and sedimentation. DWR continued collaborative efforts with local stakeholders in 2015 to implement and enhance monitoring activities for assessing the immediate and long-term hydrologic effects of these actions.

## SWP Water Rights Activities

### Water Right Permits

SWP operations are governed by the terms and conditions contained in DWR's water right permits and licenses along with other State and federal regulatory restrictions, including biological opinions (BiOps) for the protection of endangered species. DWR holds water right permits authorizing SWP operations at each of the SWP facilities, including the Oroville and Delta facilities (which include the North Bay Aqueduct), for water supply purposes. Each permit specifies the authorized quantities of direct diversion and diversion to storage, place of use, purpose of use, and time within which the permitted quantities must be put to beneficial use. A change in any of the terms and conditions contained in the water right permits and licenses, including a change in the place or purpose of use or point of diversion, requires SWRCB approval.

Diversion and use of SWP water throughout the SWP service area has increased since initial operations in the 1960s. However, due to a number of factors, including operational and regulatory constraints, water deliveries have not yet reached the maximum quantities anticipated for full development of the SWP.

#### *2015 Temporary Urgency Change Petition*

Water conditions continued to be critically dry in 2015. These conditions created severe challenges for the SWP and CVP to meet the regulatory objectives both within the Delta and in upstream areas. The SWRCB convened several workshops and approved a number of temporary urgency change petitions (TUCPs) received from DWR and the Bureau of Reclamation (Reclamation )to modify their water right permits for the SWP and CVP.

DWR estimated water balances, performed extensive water supply and salinity

modeling, coordinated with fish and wildlife agencies, and prepared drought contingency plans and operational forecasts, as required by the SWRCB.

On January 23, 2015, DWR and Reclamation filed a joint TUCP to temporarily change SWP and CVP water right permits and license conditions in SWRCB Water Right Decision 1641.

On February 3, 2015, SWRCB issued an order approving parts of the TUCP, subject to conditions. Throughout 2015, DWR and Reclamation submitted additional TUCPs and requests to modify the TUCP order, and SWRCB modified the order several times in response. Issues included Delta outflow requirements, export limits, Delta Cross Channel gate operations, Sacramento River and San Joaquin River flow requirements, western Delta agricultural salinity requirements, and adjusted operations to conserve water in upstream reservoirs.

### *Drought Contingency Plan*

SWRCB's Water Right Order 2014-0029, issued on September 24, 2014, and final TUCP order, dated October 7, 2014, required DWR and Reclamation to develop a drought contingency plan (DCP) for operations in the Delta and the associated project reservoirs in the event that water supplies remain inadequate to satisfy the projects' water right permits and license requirements and other uses. A DCP covering the beginning of water year 2014–2015 through January 15, 2015, was submitted to the SWRCB October 15, 2014. DWR and Reclamation submitted a DCP for the remainder of the 2014–2015 water year (January 15 through September 30, 2015) by January 15, 2015, as required by the 2014 water right and TUCP orders. The DCP included an interagency 2015 drought strategy describing the anticipated coordination, process, planning, and potential drought response actions for 2015.

The DCP was prepared by Reclamation and DWR, working with the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NOAA Fisheries), and the Department of Fish and Wildlife. The DCP addressed projected water operations based on various hydrologic scenarios and potential adjustments to regulatory requirements. Reclamation and DWR continued to work closely with the fish and wildlife agencies to develop operational and contingency plans, as well as real-time coordinated operations and monitoring, in order to responsibly manage the State's limited water supplies. The DCP will be continually updated as necessary based on changing circumstances.

### *Emergency Drought Barrier*

In response to drought conditions in the State and potentially insufficient water supplies to repel salinity in the central and southern Sacramento-San Joaquin Delta, State and federal water and wildlife agencies, working together since 2014 as the Real-time Drought Operations Management Team, determined that installing an emergency drought barrier would help reduce tidally-driven saltwater intrusion into the Central and South Delta. DWR implemented the 2015 emergency drought barrier project constructing a temporary physical (rock) barrier across West False River to help protect Delta water quality and minimize the amount of water released from upstream reservoirs to repel salinity, allowing more water to be conserved in upstream areas. Ongoing coordination with regulatory agencies since 2014 and the Governor's April 1, 2015, Executive Order provided for an expedited permitting process.

Barrier installation started on May 5, 2015. The barrier was hydraulically closed May 28, and completed June 12, installation construction, including the installation of 10 new real-time water quality and flow monitoring stations, was completed July 2, 2015. Barrier removal

started on September 1, 2015, the barrier was breached on October 1, and barrier removal was completed on November 15, and demobilization was completed on November 16, 2015. Removal, including removal of the steel abutment structure, was slow-going and completed on the last day of permitted in-water work. Geologic explorations were also completed during removal thus allowing a future barrier to not require steel abutments. Levee improvements including buttress rock of steel sheet-pile cutoff walls remain in place.

Installation and operation of the 2015 emergency drought barrier successfully allowed the SWP and CVP to operate with reduced Sacramento River/Delta outflow while maintaining salinity control in the Central and South Delta. A comprehensive report is being drafted by DWR and is planned to be completed by March 2017.

### *Water Right Change Petition for California WaterFix*

In April 2015, DWR and Reclamation announced plans to split the proposed Bay Delta Conservation Plan (BDCP) into two separate efforts—one for water conveyance facilities and the other for habitat restoration. The water conveyance effort, identified as the California WaterFix, is Alternative 4a (the preferred alternative) of the BDCP/California WaterFix partially recirculated draft environmental impact report/supplemental draft environmental impact statement released in July 2015. California WaterFix would construct new Delta conveyance facilities consisting of three new water diversion intakes along the Sacramento River and two 30-mile long, 40-foot diameter tunnels to convey water to the existing SWP and CVP pumping facilities in the South Delta. The proposed conveyance facilities would allow greater flexibility in water diversions and better balancing of the associated water quality and hydrodynamic benefits for fish, drinking water, agriculture, and other beneficial uses.

On August 26, 2015, DWR and Reclamation submitted a joint petition to the SWRCB requesting changes in SWP and CVP water right permit conditions. The petition proposes adding points of diversion of water for the SWP and CVP associated with California WaterFix. In October, the SWRCB issued a public notice for the petition and the hearing for the petition. The hearing is scheduled to begin in April 2016 and is expected to be conducted in two parts.

For additional information about California WaterFix, see Chapter 3, Environmental Programs.

## Water Quality Control Plan for the San Francisco Bay/ Sacramento-San Joaquin Delta Estuary

The Delta and Suisun Marsh are located where California's two major river systems, the Sacramento and the San Joaquin, converge and flow westward to meet incoming seawater tides flowing through the San Francisco Bay. The watershed of the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta Estuary) is a critical source of water supply for much of California. The watershed is a source of drinking water for two-thirds of the State's population; it supplies some of the State's most productive agricultural areas; and it provides water for fish, wildlife, and other public trust uses of water within and upstream of the estuary.

Water originating in the Bay-Delta watershed is delivered to areas within the watershed and to areas south and west of the estuary. The largest water distribution systems that release stored water into the Delta and directly divert water from the Delta are the SWP, operated by DWR, and the

federal CVP, operated by Reclamation. Numerous other water storage and diversion projects also influence Bay-Delta Estuary inflows, outflows, water quality, and other hydrologic characteristics.

The SWRCB regulates both the quality of water in the Bay-Delta Estuary and the diversions and uses of water released into and diverted from the estuary for water supply. The SWRCB coordinates its regulatory authorities under State laws governing water quality and water rights, ensuring that water quality is protected for all beneficial uses when water is diverted from the estuary.

In 1999, the SWRCB adopted Water Right Decision 1641 (later modified by Order WR 2000-02) modifying the terms and conditions of a number of water right permits and licenses, primarily those for the SWP and CVP, to implement the objectives of the 1995 water quality control plan.

Under its authority to protect beneficial uses of water, the SWRCB adopted the *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (Bay-Delta Plan) on December 13, 2006 (Resolution No. 2006-0098). The Bay-Delta Plan contains objectives for flow, salinity, dissolved oxygen levels, and other parameters necessary for protection of various beneficial uses such as municipal and industrial, agricultural, and fish and wildlife. The SWRCB implements these objectives in part or in whole, depending on the circumstances, through conditions on water right permits and licenses.

## 2006 Bay-Delta Plan Review

CWC Section 13240 requires that the water quality control plan be periodically reviewed. Federal Clean Water Act Section 303(c) (33 U.S.C. Section 1313(c)) requires a triennial review of State water quality "standards," as defined in the act. Formal review of the 2006 Bay-Delta Plan began in October 2008.

The review and amendment process for the 2006 Bay-Delta Plan consists of:

- identifying elements that may need amendment or new elements that may need to be added;
- preparing any amendments to or revisions of the entire water quality control plan; and
- SWRCB's adoption of some or all of the amendments or revisions.

SWRCB information-gathering activities may affect the scope of the 2006 Bay-Delta Plan review and may include evidentiary hearings on critical issues concerning the Delta's ecology.

In 2015, SWRCB continued its review and update of the 2006 Bay-Delta Plan. The work consists of a four-phased process to develop and implement updates to the Bay-Delta Plan and flow objectives for priority tributaries to the Delta to protect beneficial uses in the Bay-Delta watershed. Phase 1 includes review and potential modification of the San Joaquin River flow objectives for the protection of fish and wildlife beneficial uses, the southern Delta water quality objectives for the protection of agricultural beneficial uses, and the program of implementation for those objectives. Phase 2, initiated in 2012, focuses on issues such as: (1) Delta flow objectives, (2) export/inflow objectives, (3) Delta Cross Channel gate closure objectives, (4) Suisun Marsh objectives, (5) potential new reverse flow objectives for Old and Middle rivers, (6) potential new flood plain habitat flow objectives, (7) potential changes to the monitoring and special studies program, and (8) other potential changes to the program of implementation. Phase 3 involves changes to water rights and other measures to implement changes to the Bay-Delta Plan from Phases 1 and 2. Phase 4 involves developing and implementing flow

objectives for priority Delta tributaries outside of the Bay-Delta Plan updates.

For more information about water quality objectives and compliance monitoring in the South Delta, see Chapter 4, Water Quality Programs.

### 2015 SWRCB Bay-Delta Proceedings

In 2015, SWRCB proceedings examined a number of issues in the Bay-Delta Estuary relating to water quality, conservation, availability, and rights, which have the potential to affect Delta water supply and reliability. The drought was the main issue of concern in 2015. The SWRCB proposed or adopted a number of emergency regulations related to the drought.

## Storage Program

DWR is the State lead agency for the Storage Program, which consists of surface storage studies and groundwater programs and projects. The Storage Program began under the CALFED Bay-Delta Program. (For background on the CALFED Bay-Delta Program, see Bulletins 132-95 through 132-11.)

The Storage Program is a comprehensive program with potential benefit for the SWP consisting of actions related to surface and groundwater storage. DWR's Division of Statewide Integrated Water Management and Division of Integrated Regional Water Management have been working with State and federal agencies to enhance storage and conjunctive-use programs that support local project development via loans and grants. The Storage Program is part of an ongoing evaluation of how storage, both groundwater conjunctive use and surface storage, can help meet California's urban, agricultural, and environmental water supply reliability, ecosystem restoration, and water quality needs.

### Surface Storage Investigations

Surface storage investigations are developing environmental documentation and feasibility studies for four of the five surface storage projects identified for further study in the CALFED record of decision. The four projects are discussed below.

#### *Los Vaqueros Reservoir Expansion Project*

Contra Costa Water District owns and operates the 160,000 acre-foot (af) Los Vaqueros Reservoir just southwest of the Sacramento-San Joaquin Delta. The Los Vaqueros Reservoir Expansion Project involves analysis of increasing reservoir storage up to 275,000 af.

The project objectives are: (1) to develop water supplies for environmental water management; (2) to increase water supply reliability within the San Francisco Bay Area; and (3) to the extent possible, improve the quality of water deliveries to municipal and industrial customers without impairing the project's ability to meet the first two objectives.

The Contra Costa Water District Board certified a final environmental impact report and approved an expansion from 100,000 af to 160,000 af in March 2010. The expansion was completed and dedicated in July 2012.

Contra Costa Water District and local, State, and federal partners continue to study the feasibility of a 275,000 af expansion alternative in the context of other Delta initiatives to improve Delta conveyance and Delta fisheries protection, including long-term programs being explored in California WaterFix and California EcoRestore.

#### *Shasta Lake Water Resources Investigation*

Reclamation, in coordination with other agencies, is studying the feasibility of expanding Shasta Dam and Lake,

primarily to promote increased survival of anadromous fish populations in the upper Sacramento River and to increase water supply reliability. An enlargement of Shasta Dam would inundate additional lands around the existing reservoir and affect a portion of the McCloud River. California Public Resources Code Section 5093.542(c), the Wild and Scenic Rivers Act, states that, "except for participation by the Department of Water Resources in studies involving the technical and economic feasibility of enlargement of Shasta Dam, no department or agency of the state shall assist or cooperate with, whether by loan, grant, license, or otherwise, any agency of the federal, state, or local government in the planning or construction of any dam, reservoir, diversion, or other water impoundment facility that could have an adverse effect on the free-flowing condition of the McCloud River, or on its wild trout fishery."

The State budget does not include funding for DWR to continue participating in this study. However, Reclamation's planning is ongoing.

In 2015, Reclamation completed the final feasibility study report and EIS for the Shasta Lake Water Resources Investigation.

### *North-of-the-Delta Offstream Storage Investigation*

DWR and Reclamation are working in partnership with local, State, and federal agencies to further study north-of-the-Delta offstream storage opportunities. The North-of-the-Delta Offstream Storage Investigation focuses on potential projects on the west side of the Sacramento Valley, including Sites Reservoir.

Storing water in offstream reservoirs during excess flow periods could provide opportunities to increase water storage in an environmentally sensitive manner. The stored water can then be made available to enhance water management flexibility in the Sacramento Valley and the Bay-Delta Estuary, reducing water diversions on the Sacramento River during critical fish migration periods, increasing the reliability of supplies for the Sacramento Valley and statewide, and providing storage and operational flexibility to support environmental enhancement actions and adapt to climate change.

DWR, Reclamation, and the Sites Project Joint Powers Authority continued to work on completing the draft feasibility study report and environmental documentation in 2015.

### *Upper San Joaquin River Basin Storage Investigation*

Reclamation, in coordination with other State and federal agencies, is evaluating opportunities for increased storage in the upper San Joaquin River watershed. The objectives of the Upper San Joaquin River Basin Storage Investigation are to: (1) increase water supply reliability and operational flexibility in the CVP's Friant Division, other San Joaquin Valley areas, and other regions, and (2) enhance water temperature and flow conditions in the San Joaquin River in support of San Joaquin River restoration efforts. Other opportunities include additional hydropower generation, reduction of flood damages, water quality improvements, and recreation site development.

In 2015, Reclamation continued working to complete the final feasibility study report and environmental impact statement. The feasibility report examines potential construction of a new dam and reservoir on the San Joaquin River. The environmental impact statement documents the potential environmental effects of alternatives to increased storage of water from the upper San Joaquin River watershed.

# Delta Conveyance Program

The Delta Conveyance Program previously consisted of projects proposed in the North and South Delta. As a result of the efforts associated with the BDCP and the Delta Stewardship Council's *Delta Plan*, many of these efforts were suspended as staff was redirected to work on the SWP Delta Compliance Program. The remaining projects are discussed briefly below; more detailed information about the Delta can be found in Chapter 2, Delta Resources.

## SWP Delta Compliance Program

The SWP obtained take authorization for federal and California Endangered Species Act listed species through the December 2008 USFWS BiOp for Delta Smelt; the February 2009 Department of Fish and Wildlife incidental take permit for Longfin Smelt; and the June 2009 NOAA Fisheries BiOp for salmon, steelhead, and Green Sturgeon. Many of the regulatory requirements require studies and projects, which are currently underway.

## North Delta

With the North Delta Flood Control and Ecosystem Restoration Project, solutions to improve flood management and the ecosystem are being considered, including setback levees, detention basins, dredging, and levee degradation for floodplain expansion. For more information about this project, see Chapter 2, Delta Resources.

## South Delta

Actions in the South Delta include monitoring and assessment of the South Delta Improvements Program (SDIP), implementing flood control and ecosystem improvements in the lower San Joaquin River, and continuation of DWR's Temporary Barriers Project.

SDIP is a two-stage project. Stage 1 proposes to reduce the movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via Old River and to maintain adequate water levels and water quality for agricultural diversions in the South Delta. Stage 2 would increase water deliveries and delivery reliability to SWP and CVP contractors south of the Delta and increase the maximum permitted level of diversion through the existing intake gates at Clifton Court Forebay.

DWR deferred both the increase in diversions and the associated new fish screens as components of the SDIP due to funding issues and technical uncertainties associated with the design and construction of the new fish screens.

The SDIP final environmental impact report/environmental impact statement (2006) evaluated alternatives and proposed continuing with SDIP Stage 1. This component involves constructing permanent operable gates and channel dredging in the South Delta. DWR is proposing installation of these permanent gates to replace temporary rock barriers currently installed and removed each year under DWR's Temporary Barriers Project.

Reclamation and DWR's 2008 biological assessment for the SWP and CVP Long-term Operations Criteria and Plan included operation of the SDIP permanent operable gates.

The USFWS BiOp, issued in December 2008, concluded that coordinated operations of the CVP and SWP would jeopardize Delta Smelt. The USFWS provided a reasonable and prudent alternative under which SDIP could move forward.

The NOAA Fisheries BiOp, issued in June 2009, concluded that CVP and SWP operations would jeopardize a number of

anadromous species, in particular Chinook Salmon. NOAA Fisheries provided no reasonable and prudent alternative for SDIP. DWR initiated discussion with NOAA Fisheries in late 2009 to establish what actions could lead to a reasonable and prudent alternative under which SDIP could move forward; however, NOAA Fisheries stated an interest in holding off on further discussion until completion of an on-going multiyear South Delta Temporary Barriers Project salmonid survival and predation study. The study field data collection has been completed, data analysis is in progress, and the final predation study report is expected in 2017. Data from the study will be useful in considering permanent barrier design options and operation strategies to minimize predation. Other than the on-going temporary barriers project Predation and Survival study, no work on Stage 1 of SDIP took place in 2015.

Any action regarding SDIP Stage 2 will require further study and public input. Stage 2 planning continued to be suspended in 2015.

For additional information about the South Delta Temporary Barriers Project, see Chapter 2, Delta Resources.

## Lower Yuba River Accord

The Lower Yuba River Accord's (Yuba Accord) purpose is to resolve instream flow issues and protect and enhance lower Yuba River fisheries and local water supply reliability. The Yuba Accord provides revenues for local flood control and water supply projects; water to enhance SWP and CVP water supply reliability by offsetting Delta export reductions for protection and restoration of Delta fisheries; and improvements in statewide water supply management, including dry year supplies for participating SWP and CVP contractors.

The Yuba Accord is based on three agreements, as follows:

- a water purchase agreement between DWR and Yuba County Water Agency (Yuba);
- conjunctive use agreements with Yuba member units; and
- a fisheries agreement.

Three amendments to the water purchase agreement were executed in 2009 and 2010 to address a technical refill accounting issue and groundwater substitution pricing issues.

DWR and Yuba executed Amendment 4 to the Water Purchase Agreement in 2012 to streamline the process for addressing groundwater substitution pricing issues. Conforming amendments were also executed to the participation agreements between DWR and 22 participating contractors in the Yuba Accord.

On December 5, 2014, DWR executed Amendment 5 between DWR and Yuba. The key new terms included: increased pricing for the four components of transfer water to be delivered by Yuba from 2016 through 2020; a $20 million deposit to be paid to Yuba to lock in the new pricing for 5 years, and that will be credited to surface water purchases; allowing for third-party sales by Yuba to nonparticipants in the program under certain circumstances; and continued annual negotiations of groundwater substitution pricing when available. All 22 participating contractors continued their participation from 2016 through 2020 by executing the conforming Amendment 5 to their participation agreements.

On January 8, 2015, DWR executed a Participation Agreement, Amendment 1, and Amendment 5 with two additional contractors, Mojave Water Agency and Santa Barbara County Flood Control and Water

Conservation District, increasing the number of participating contractors from 22 to 24.

Yuba released 59,131 af of Component 1 surface water in 2015 that was shared equally between the SWP and the CVP for project purposes to offset Delta export pumping reductions to benefit fish. Because 60,000 af of Component 1 water was due to be delivered in 2015, Yuba owes the remaining 869 af in a future year. In addition, Yuba provided 30,000 af of Component 4 groundwater substitution water to enhance lower Yuba River flows through agreements with seven of its Member Units. This Component 4 water was made available to many of the Participating Contractors through a letter agreement between DWR and Yuba executed on March 26, 2015, at an effective price of $665 per af.

The water purchase agreement transfers water to help offset Delta export reductions annually and provides dry-year transfer water for SWP and CVP contractors from surface and groundwater substitution sources.

For additional details about the Yuba Accord, see Chapter 9, Water Contracts and Deliveries.

# Chapter 8
# Water Supply

*There was no snow to measure when the April 1, 2015, manual snow survey was conducted at the Phillips snow course.*

## Significant Events in 2015

Water year 2014–2015 proved to be another dry year, the fourth consecutive year with less than average precipitation and mountain snowpack. The State received precipitation at 74 percent of average in water year 2014–2015 compared to 56 and 79 percent of average in water years 2013–2014 and 2012–2013, respectively. Though a below-average water year, the Northern Sierra 8-Station Precipitation Index had 37.2 inches of precipitation. Of this total, 22.8 inches fell during December and February. This accounted for 61 percent of the water year total. The statewide mountain snowpack on April 1 was only 5 percent of average.

Statewide river runoff totaled 46 percent of average in the 2014–2015 water year, which is well below average but 11 percent higher than the previous water year. The Feather River runoff totaled 45 percent of average. Water year runoff totals for the Sacramento River Region (SRR), San Joaquin 4 Rivers (SJR), and Tulare Lake Region (TLR) were well below average at 51, 24, and 19 percent of average, respectively.

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) were both "critical," based on observed data for water year 2014–2015.

*Information in this chapter was contributed by the Division of Flood Management and the Division of Operations and Maintenance.*

The Department of Water Resources (DWR) monitors precipitation, estimates mountain snowpack, calculates river runoff, and operates storage facilities during each water year. The official California water year runs from October 1 through September 30.

## California's Hydrology

DWR divides California into 10 hydrologic regions. Each hydrologic region corresponds to the State's major water drainage basins. Annual precipitation, mountain snowpack, and runoff data are collected and analyzed for the hydrologic regions and used to determine water year type classifications and forecasts for the State's water supply outlook.

The State's precipitation is measured using three primary indices, the Northern Sierra 8-Station Precipitation Index, the San Joaquin 5-Station Precipitation Index, and the Tulare Basin 6-Station Precipitation Index. For more information, see the sidebar, Precipitation Estimates.

Runoff estimates are determined for the Sacramento River Region (SRR), the San Joaquin 4 Rivers (SJR), and the Tulare Lake Region (TLR). For more information, see the sidebar, Runoff Estimates.

The Eight River Index is used to determine the duration of fish and wildlife salinity and flow standards at Chipps Island or Port Chicago from February through June (see Chapter 4, Water Quality Programs). This index is the sum of the unimpaired runoff from the eight rivers in the SRR and SJR.

Two water supply indices, the Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index), are used to derive the water year classification for the Sacramento Valley and the San Joaquin Valley, respectively.

Water year classification is used by various water agencies to formulate water supply decisions. For more information, see the sidebar, Water Supply Indices.

DWR continually updates hydrologic data and information. If your research requires more current data than was available at the time of publication of this bulletin, please consult the most recent edition of Bulletin 120, and/or contact DWR staff in the Hydrology and Flood Operations Office.

## Water Year 2014–2015

### Precipitation

California experienced below average rainfall (74 percent of average) for the water year, and regionally, precipitation varied widely. Figure 8-1 presents water year precipitation for the various regions of the State.

Table 8-1 presents monthly precipitation totals for water year 2014–2015 at various gauges located throughout the State, listed north to south. Statewide, the wettest month, as measured by inches of precipitation, was December when most stations in the list received well above average precipitation. San Francisco measured nearly 290 percent of average.

December started with a strong precipitation event that resulted when a cut-off low drifted south offshore and entrained a pulse of tropical moisture. While not a traditional atmospheric river event, the high precipitation totals across the State reflected the high moisture content pushed into the State by the low. The warm temperatures that accompanied the storm also limited

[a] Water Year = October 1–September 30

[b] AP = Airport; NWS = National Weather Service; WB = Weather Bureau; WSO = Weather Service Office

[c] During September 2015, a fire prevented the measurement of precipitation at Grant Grove.

the amount of snowpack that accumulated during this event. The second week included a strong Pacific storm that brought more rain and more snow to the high country. This event was focused more on the northern half of the State and included high winds—more than 100 miles per hour in the Sierra Nevada. In contrast, January was extremely dry with only one of the ten selected stations receiving more than 25 percent of average precipitation.

Eureka Woodley Island on the north coast of California received 31.4 inches of precipitation for a water year total that was 82 percent of average. For the 2014–2015 water year, precipitation for the station was above normal for October, December, July, and August. Totals for October, December, and August were greater than 150 percent of average.

Blue Canyon experienced above normal precipitation for 2 months of water year 2014–2015. The station totals for the water year were 46.4 inches and 74 percent of average. The largest amount of precipitation and highest percent of normal for the water year occurred in December with 17.0 inches and 163 percent of average, respectively.

Areas of the Central Valley also received their largest amounts of precipitation in December. Precipitation totals were 8.6 inches (270 percent of average) for Sacramento and 2.3 inches (130 percent of average) for Fresno. For the water year, Sacramento received 83 percent of its annual

## Precipitation Estimates

### Northern Sierra 8-Station Precipitation Index (8SI)

In the northern Sierra Nevada, precipitation is indexed by averaging rain gauge totals at eight representative stations, creating what is known as the Northern Sierra 8-Station Precipitation Index. The index provides a representative sample of the major watersheds (upper Sacramento, Feather, Yuba, and American rivers) and serves as a wetness index for the Sacramento River hydrologic region.

The rain gauge stations are:

(1) Mount Shasta City
(2) Shasta Dam
(3) Mineral
(4) Quincy
(5) Brush Creek
(6) Sierraville Ranger Station
(7) Blue Canyon
(8) Pacific House

### San Joaquin 5-Station Precipitation Index (5SI)

In the central Sierra Nevada, precipitation is indexed by averaging rain gauge totals at five representative stations, creating what is known as the San Joaquin 5-Station Precipitation Index. The index provides a representative sample of the major watersheds (Stanislaus, Tuolumne, Merced, and San Joaquin rivers) and serves as a wetness index for the San Joaquin River hydrologic region.

The rain gauge stations are:

(1) Calaveras Big Trees
(2) Hetch Hetchy Reservoir
(3) Yosemite Headquarters
(4) North Fork Ranger Station
(5) Huntington Lake

### Tulare Basin 6-Station Precipitation Index (6SI)

In the southern Sierra Nevada, precipitation is indexed by averaging rain gauge totals at six representative stations, creating what is known as the Tulare Basin 6-Station Precipitation Index. The index provides a representative sample of the Kings, Kaweah, Tule, and Kern river watersheds.

The rain gauge stations are:

(1) Balch Power House
(2) Springville
(3) Giant Forest
(4) Pascoes
(5) Ash Mountain
(6) Isabella

precipitation average, while Fresno received 64 percent of its annual average.

In the San Joaquin and Tulare Lake watersheds, water year total precipitation was also well below average. The largest amounts of precipitation fell in these watersheds during the month of December, which is similar to what transpired in Northern California. Approximately one-fourth of the water year precipitation fell during December for Yosemite Headquarters and Grant Grove. Water year precipitation totals at those two sites were 50 and 48 percent of their respective annual averages.

Further south, Los Angeles was below average, totaling 74 percent of its annual average, whereas San Diego was above average totaling 115 percent of its annual average. San Diego received 4.5 inches of precipitation in December, which is 236 percent of the monthly average. San Diego received 2.4 inches of precipitation in May, which is 1,138 percent of the monthly average. Los Angeles received 4.0 inches of precipitation in December, which is 192 percent of the monthly average.

The monthly totals for the water year for the Northern Sierra 8-Station, the San Joaquin 5-Station, and the Tulare Basin 6-Station precipitation indices are presented in Table 8-2. Precipitation for the three indices totaled 37.2 inches (74 percent of average), 19.0 inches (47 percent of average), and 13.6 inches (47 percent of average), respectively.

For the Northern Sierra 8-Station Precipitation Index, December was wet, registering 15.2 inches, 181 percent of the monthly average. During the 3-month period of December through February, typically the wettest period in the Sierra Nevada, 23.1 inches of precipitation accumulated, which is 91 percent of the average (25.4 inches) for the index for those 3 months. January precipitation was only 3 percent of the monthly average.

For the San Joaquin 5-Station Precipitation Index, the total accumulated precipitation during December through February was 10.1 inches, which represents 53 percent of the water year total for the index and 49 percent of the average for those months for the index.

**Table 8-2 Regional Monthly Precipitation for Water Year 2014–2015**

| | | Northern Sierra 8-Station Precipitation Index | | San Joaquin 5-Station Precipitation Index | | Tulare Basin 6-Station Precipitation Index | |
|---|---|---|---|---|---|---|---|
| | Month | Precipitation (inches) | Percent of Monthly Average | Precipitation (inches) | Percent of Monthly Average | Precipitation (inches) | Percent of Monthly Average |
| 2014 | October | 3.70 | 123 | 0.10 | 5 | 0.80 | 67 |
| | November | 3.90 | 62 | 3.10 | 66 | 0.90 | 29 |
| | December | 15.20 | 181 | 5.90 | 95 | 4.70 | 107 |
| 2015 | January | 0.30 | 3 | 0.20 | 3 | 0.50 | 9 |
| | February | 7.60 | 95 | 4.00 | 58 | 3.20 | 62 |
| | March | 1.00 | 14 | 0.40 | 7 | 0.20 | 4 |
| | April | 2.30 | 59 | 2.30 | 64 | 1.00 | 38 |
| | May | 1.20 | 57 | 1.40 | 78 | 0.90 | 82 |
| | June | 0.80 | 80 | 0.30 | 50 | 0.50 | 125 |
| | July | 0.70 | 350 | 1.10 | 367 | 0.80 | 400 |
| | August | 0.10 | 33 | 0.00 | 0 | 0.00 | 0 |
| | September | 0.40 | 44 | 0.20 | 29 | 0.10 | 17 |
| **Total** | | **37.20** | **74** | **19.00** | **47** | **13.60** | **47** |

For the Tulare Basin 6-Station Precipitation Index, a total of 8.4 inches accumulated during December through February, which represents 62 percent of the water year total for the index and 56 percent of the average for those months for the index.

## Mountain Snowpack

Precipitation that fell during water year 2014–2015 consisted mostly of rain; snow accumulation was quite small, setting record lows throughout the State's mountainous regions. Monthly statewide snowpack for the water year is shown in Table 8-3. Snow water equivalents shown in the table were obtained from daily snow sensor reports corresponding to the first day of each month. The statewide average snow water equivalent reported for April 1 was 1.4 inches or 5 percent of average, lower than the previous record low snowpack of 25 percent in 1977 and 2014. April 1 is typically the average annual date of peak snow accumulation. In 2015, the mountain snowpack peaked during the second week of February at approximately 5.6 inches of snow water content or 19 percent of its April 1 average.

**Table 8-3 Statewide Mountain Snowpack for Water Year 2014–2015**

| | Date | Snow Water Equivalent (inches) | Percent of Average | Percent of April 1 Average[a] |
|---|---|---|---|---|
| 2014 | October 1 | 0.0 | 0 | 0 |
| | November 1 | 0.0 | 0 | 0 |
| | December 1 | 1.0 | 24 | 4 |
| 2015 | January 1 | 4.8 | 47 | 17 |
| | February 1 | 4.2 | 23 | 14 |
| | March 1 | 5.0 | 19 | 17 |
| | April 1 | 1.4 | 5 | 5 |
| | May 1 | 0.4 | 3 | 2 |
| | June 1 | 0.0 | 0 | 0 |
| | July 1 | 0.0 | 0 | 0 |
| | August 1 | 0.0 | 0 | 0 |
| | September 1 | 0.0 | 0 | 0 |

[a] April 1 is the average date of peak statewide mountain snowpack.
This table is based on snow pillow (a device for measuring mountain snowpack at automated reporting stations) data.

## River Runoff

Statewide river runoff totaled 46 percent of average in the 2014–2015 water year. The monthly runoff totals for the SRR, the SJR, the TLR, and the Feather River are shown in Table 8-4. As shown, the water year runoff totals for all of these areas were well below average, with the TLR the lowest at 19 percent of average.

**Table 8-4 Unimpaired Runoff for Water Year 2014–2015 (million acre-feet)**

| | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | WY |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SRR runoff | 0.35 | 0.43 | 2.75 | 0.74 | 1.95 | 0.69 | 0.57 | 0.5 | 0.38 | 0.31 | 0.27 | 0.28 | 9.23 |
| percent of average | *68* | *49* | *161* | *29* | *78* | *24* | *24* | *22* | *31* | *53* | *66* | *69* | *51* |

SRR: Sacramento River Region
Sacramento River above Bend Bridge, Feather River at Oroville, Yuba River near Smartville, American River below Folsom Lake

SJR: San Joaquin 4 Rivers
Stanislaus River below Goodwin Dam, Tuolumne River below La Grange, Merced River below Merced Falls, San Joaquin River below Millerton Lake

TLR: Tulare Lake Region
Kings River below Pine Flat Reservoir, Kaweah River below Terminus Reservoir, Tule River below Lake Success, Kern River below Lake Isabella

WY: Water Year (October 1–September 30)

## Runoff Estimates

Unimpaired runoff represents the natural water production in a river basin, unaltered by upstream diversions, storage, or export of water to or import of water from other basins.

**Sacramento River Region (SRR)**

The runoff estimate for the SRR is the sum of unimpaired flow in million acre-feet (maf) at the following gauging stations:

(1) Sacramento River above Bend Bridge
(2) Feather River at Oroville (inflow to Lake Oroville)
(3) Yuba River near Smartville
(4) American River below Folsom Lake

**San Joaquin 4 Rivers (SJR)**

The runoff estimate for the SJR is the sum of unimpaired flow in maf at the following gauging stations:

(1) Stanislaus River below Goodwin Dam (inflow to New Melones Reservoir)
(2) Tuolumne River below La Grange (inflow to New Don Pedro Reservoir)
(3) Merced River below Merced Falls (inflow to Lake McClure)
(4) San Joaquin River below Millerton Lake (inflow to Millerton Lake)

**Tulare Lake Region (TLR)**

The runoff estimate for the TLR is the sum of unimpaired flow in maf at the following gauging stations:

(1) Kings River below Pine Flat Reservoir
(2) Kaweah River below Terminus Reservoir
(3) Tule River below Lake Success
(4) Kern River below Lake Isabella

**Eight River Index**

The Eight River Index is the sum of the unimpaired runoff from the eight rivers in the SRR and the SJR.

From a water supply perspective, the most closely monitored period is April through July. By the end of July, the April–July runoff was 27, 19, and 15 percent of average, for the three respective regions.

## Water Supply Indices

The Sacramento Valley 40-30-30 Index and the San Joaquin Valley 60-20-20 Index were both "critical," based on observed data for water year 2014–2015.

For more information, see the sidebar, Water Supply Indices.

## Water Supply Indices

### Sacramento Valley 40-30-30 Index

State Water Resources Control Board, Water Right Decision 1641 (D-1641) defines the Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index), a water supply forecasting tool used to derive the water year type for the Sacramento Valley. The State Water Resources Control Board first introduced the Sacramento Valley 40-30-30 Index in the 1991 Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta Plan), and continued using it with the 1995 and 2006 Bay-Delta Plans. D-1641 implements portions of the 2006 Bay-Delta Plan with respect to the operation of the State Water Project and the Central Valley Project.

The Sacramento Valley 40-30-30 Index is used to determine the Sacramento Valley water year type for the purpose of implementing water quality objectives defined in D-1641. It also provides an estimate of the potential water supply originating in the basin from rainfall and snowmelt runoff, groundwater accretion, and reservoir carryover storage. The index incorporates seasonal differences in water contribution for the year and includes the prior year's conditions in order to establish a more reliable index of water availability. The 40-30-30 factors represent the percentage weight given to the following:

(1) 40%—the current year's April through July Sacramento Valley unimpaired runoff;

(2) 30%—the current year's October through March Sacramento Valley unimpaired runoff; and

(3) 30%—the previous year's index with a cap of 10 million acre-feet (to account for required flood control reservoir releases during wet years).

The water year type is determined by the index value on a scale specific to the Sacramento Valley (as defined in D-1641).

| Classification | Index (million acre-feet) |
|---|---|
| Wet | Equal to or greater than 9.2 |
| Above Normal | Greater than 7.8 and less than 9.2 |
| Below Normal | Equal to or less than 7.8 and greater than 6.5 |
| Dry | Equal to or less than 6.5 and greater than 5.4 |
| Critical | Equal to or less than 5.4 |

Water year type forecasts are made beginning in December. The Sacramento Valley 40-30-30 Index May 1 forecast (at the 50 percent exceedance level) determines the "official" water year type for implementing water quality and flow requirements contained in D-1641. The D-1641 objectives are conditioned by water year type and generally become less stringent during dryer years.

## Water Supply Indices

**San Joaquin Valley 60-20-20 Index**

D-1641 uses a similar method in the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) to determine the water year type for the San Joaquin Valley. The 60-20-20 factors represent the percentage weight given to the following:

(1) 60%—the current year's April through July San Joaquin Valley unimpaired runoff;

(2) 20%—the current year's October through March San Joaquin Valley unimpaired runoff; and

(3) 20%—the previous year's index with a cap of 4 million acre-feet (to account for required flood control reservoir releases during wet years).

The water year type is determined by the index value on a scale specific to the San Joaquin Valley (as defined in D-1641).

| Classification | Index (million acre-feet) |
|---|---|
| Wet | Equal to or greater than 3.8 |
| Above Normal | Greater than 3.1 and less than 3.8 |
| Below Normal | Equal to or less than 3.1 and greater than 2.5 |
| Dry | Equal to or less than 2.5 and greater than 2.1 |
| Critical | Equal to or less than 2.1 |

The San Joaquin Valley 60-20-20 Index May 1 forecast (at the 75 percent exceedance level) determines the "official" water year type for implementing D-1641 San Joaquin River Vernalis flow standards.

# Water Year 2015–2016 October through December Water Conditions

The last 3 months of calendar year 2015 mark the beginning of a new water year, 2015–2016. October was a warm, dry month.

Statewide, the average precipitation for October was 66 percent of average according to the Western Regional Climate Center. November was cool and dry with below normal precipitation. Statewide, November precipitation was 66 percent of average. December was cool and wet with 111 percent of average statewide precipitation. Preliminary records, reported in the National Weather Service Record Event Report, show that statewide there were 36 temperature records tied or broken and 7 precipitation records set for December. Of the 36 temperature records set, 16 were for new high maximum temperatures and 11 were for new low minimum temperatures.

At the end of December, water year runoff totals were 55 percent of average for the SRR, 73 percent of average for the SJR, and 49 percent of average for the TLR.

# Storage

## Statewide Storage

Monthly storage totals for the major Sierra Nevada reservoirs are shown in Table 8-5. Water year 2014–2015 began at 56 percent of average reservoir storage following a dry 2013–2014 water year. The percent of average storage dipped slightly in the fall and then rose through the winter, peaking at 71 percent of average at the end of February. During the next 5 months, storage dropped gradually to 54 percent of average in July where it remained through September.

## State Water Project Storage

The State Water Project (SWP) operates a complex system of dams, canals, and reservoirs to collect and store water for future deliveries. Lake Oroville is the first of two primary SWP conservation facilities. Lake Oroville inflow comes from tributaries of the Feather River.

San Luis Reservoir is the second primary SWP conservation facility. This Central California joint-use facility derives its inflow from pumping at the Gianelli Pumping-Generating Plant. San Luis is an off-stream storage reservoir. Most of the water is pumped into the reservoir from late fall to early spring. This water is temporarily

**Table 8-5 Monthly Reservoir Storage for Water Year 2014–2015 (thousand acre-feet)**

| Reservoir | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Shasta | 1,109 | 1,048 | 1,867 | 2,001 | 2,613 | 2,689 | 2,662 | 2,404 | 2,198 | 1,990 | 1,789 | 1,603 |

stored, then released into the California Aqueduct to meet SWP water contractor peaking demands in the summer months. The remaining SWP dams and reservoirs regulate the stored water supply with delivery patterns that are designed to fit local water demands.

## *2015 Storage Totals in Major SWP Reservoirs*

End-of-year storage on December 31, 2015, in major SWP reservoirs and the State's share of joint-use reservoirs was 1.6 million acre-feet (maf) or 30 percent of maximum storage, compared to 2.3 maf or 43 percent of maximum storage at the end of 2014. The average end-of-month total storage in major SWP reservoirs for 2015 was 2.2 maf.

## *Lake Oroville*

Lake Oroville has a maximum water storage capacity of 3,537,580 acre-feet (af). Runoff from the upper Feather River drainage is collected and stored in this reservoir and released to the Sacramento-San Joaquin Delta through Oroville Dam, Thermalito Diversion Dam, and Thermalito Afterbay.

**2015 Inflow.** Total Lake Oroville inflow for 2015 was 1,295,451 af, which was 35 percent of the average (3.69 maf) over the last 30 years. Maximum daily inflow occurred on February 9 at 55,407 af. Minimum daily inflow occurred on November 16 at 26 af. Peak monthly total inflow occurred in February at 329,201 af, 25 percent of the 2015 total. The highest total inflow in the last 30 years (1986–2015) was in 1995 at 8,996,242 af. The lowest total inflow for the same period was in 2015 at 1,295,451 af.

Figure 8-2 shows monthly Lake Oroville inflow for 2013, 2014, and 2015.

Figure 8-3 shows historical maximum and minimum cumulative Lake Oroville inflow and the current cumulative inflow for 2015.

**2015 Storage.** Minimum storage occurred on December 9 at 909,041 af, 26 percent of lake capacity. Maximum storage occurred on April 17 at 1,812,641 af, 51 percent of lake capacity. End-of-year Lake Oroville storage was 1,016,767 af. Figure 8-4 shows storage in Lake Oroville for 2014 and 2015.

## *2015 San Luis Reservoir Operations*

San Luis Reservoir is operated jointly by DWR and the Bureau of Reclamation pursuant to operating procedures adopted in June 1981. San Luis Reservoir has a normal operating capacity of 2,027,840 af. The SWP share of this capacity is 1,062,183 af.

San Luis Reservoir reached its maximum storage on March 16 at 1,382,623 af, 68 percent of its normal maximum operating capacity. At the beginning of 2015, San Luis Reservoir contained 820,209 af, 40 percent of its capacity. The SWP storage share was 535,326 af. The highest end-of-month SWP share of water storage occurred in March at 958,679 af. Figure 8-5 shows the SWP share of storage and total storage in San Luis Reservoir for 2014 and 2015.

## *2015 Lake del Valle Operations*

Lake del Valle, located off the South Bay Aqueduct, functions primarily as a storage facility for water delivery to Santa Clara and Alameda counties. At the beginning of 2015, Lake del Valle held 34,663 af, which was about 45 percent of its maximum capacity of 77,111 af. Its highest storage occurred on April 28 at 40,733 af. Its lowest storage occurred on December 21 at 26,161 af.

On December 31, storage in Lake del Valle was 26,181 af, 34 percent of its maximum capacity. There was 3,509 af of natural inflow into Lake del Valle, and 4,377 af of inflow from the South Bay Aqueduct. There were no releases to Arroyo Valle, and releases for 2015 to the South Bay Aqueduct from Lake del Valle totaled 13,353 af.

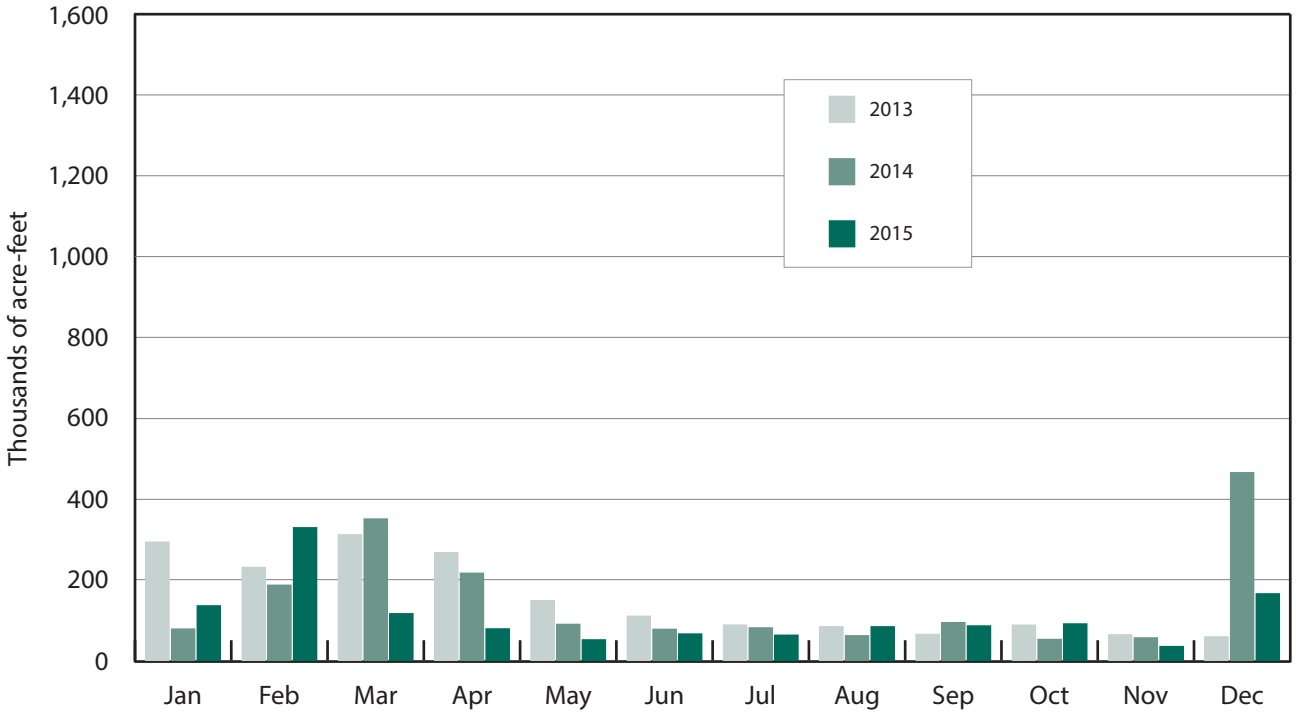

**Figure 8-2 Monthly Inflow into Lake Oroville from the Feather River, 2013–2015**

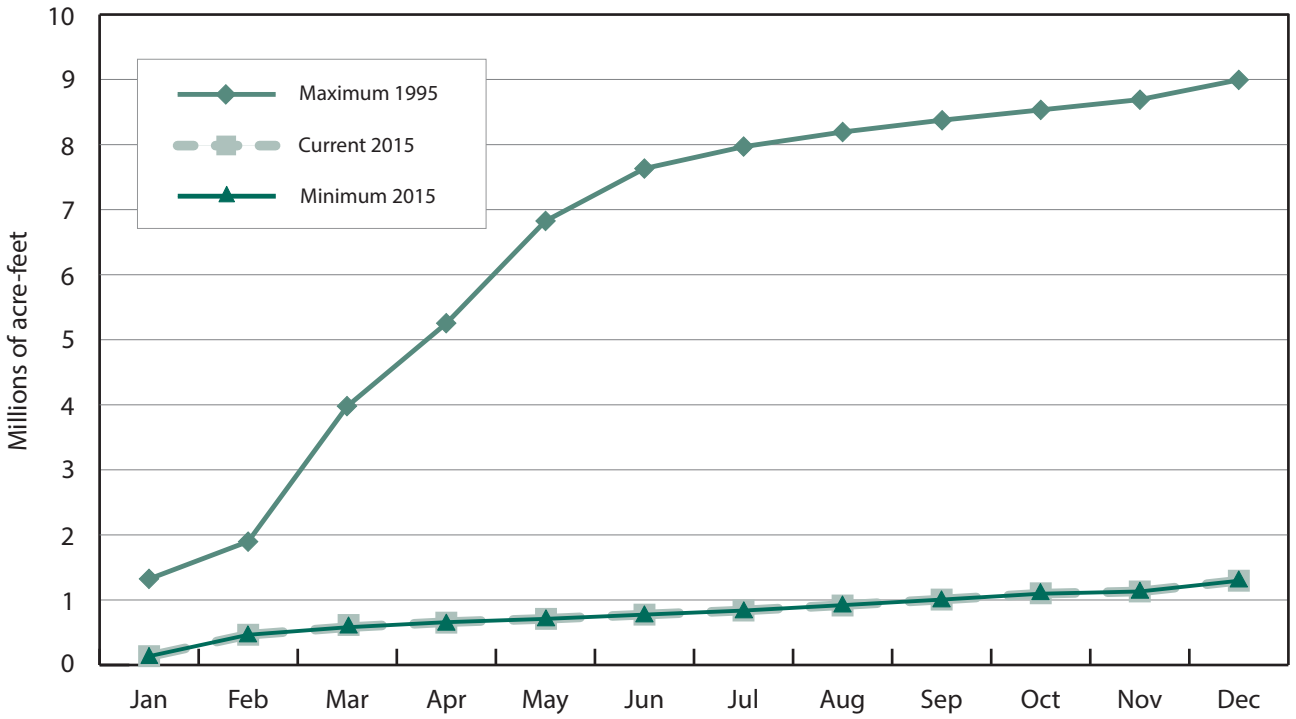

**Figure 8-3 Lake Oroville Cumulative Inflow over the Last 30 Years—Current and Historical Maximum and Minimum**

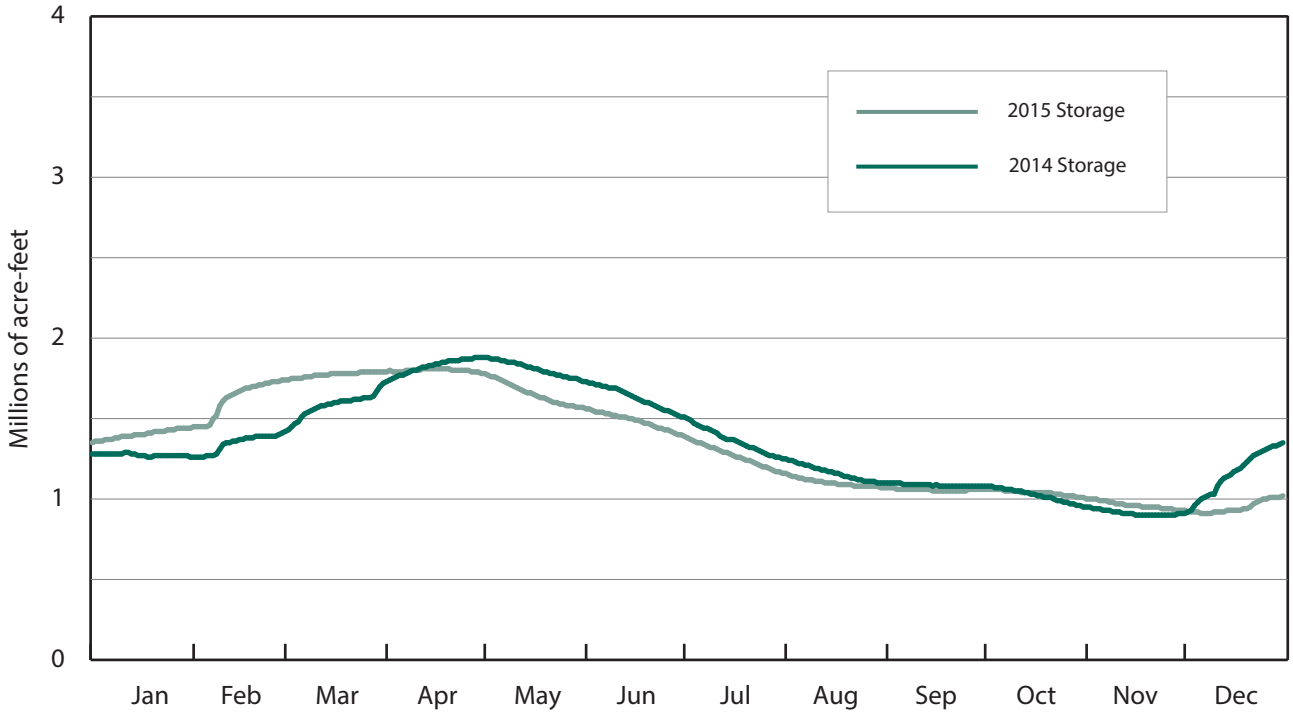

**Figure 8-4** **Storage in Lake Oroville, 2014 and 2015**

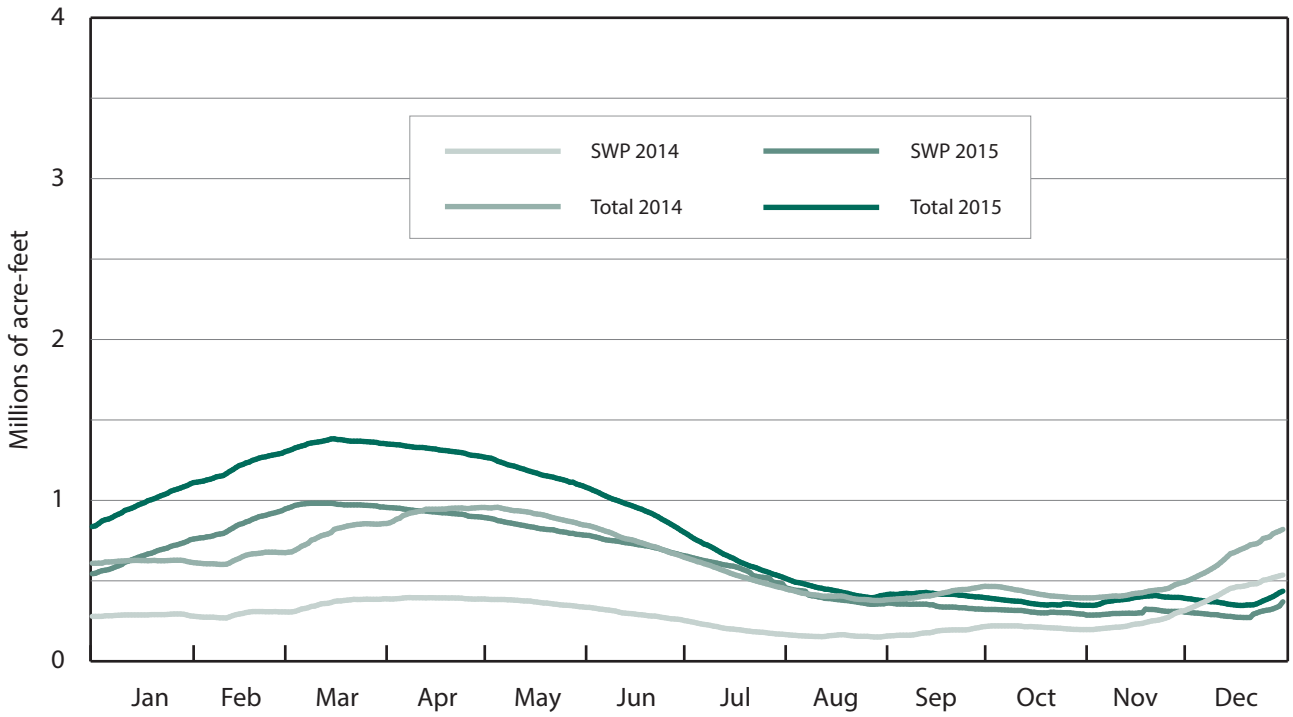

**Figure 8-5** **SWP Share of Storage and Total Storage in San Luis Reservoir, 2014 and 2015**

### *2015 Southern Reservoir Operations*

During normal operating conditions, DWR maintains its four southern reservoirs—Pyramid, Castaic, Silverwood, and Perris—at or near full operating capacity to ensure uninterrupted delivery of water to Southern California SWP water contractors.

At the beginning of 2015, these reservoirs held 406,879 af, which is 59 percent of their combined normal maximum operating capacity of 689,021 af. At the end of 2015, the reservoirs held 409,546 af, 59 percent of combined normal maximum operating capacity.

## Diversions from the Delta

The SWP diverts water from the Sacramento-San Joaquin Delta, through the Barker Slough and Banks pumping plants, for delivery to SWP water contractors' storage facilities. The SWP diverts water from Barker Slough Pumping Plant to the North Bay Aqueduct. Water is delivered from Banks Pumping Plant to the South Bay Area through the South Bay Aqueduct, and to the San Joaquin Valley, Central Coastal, and Southern California areas through the California Aqueduct. The Central Valley Project (CVP) diverts water to similar areas from the Delta through Jones Pumping Plant and Contra Costa Pumping Plant.

In 2015, the North Bay Aqueduct received 35,179 af of water from the Barker Slough Pumping Plant.

Figure 8-6 shows the amounts of water pumped each month for 2015 at Banks Pumping Plant, totaling 845,801 af. Of this amount, the SWP diverted 837,421 af. There was no pumping for the Cross Valley Canal, and 8,380 af was wheeled for the CVP. All CVP pumping at Banks Pumping Plant occurred in May and August.

The CVP diverted 688,723 af at Jones Pumping Plant and 71,621 af at Contra Costa Pumping Plant in 2015.

The combined Delta exports include all of these plants. Figure 8-7 shows the monthly amounts of water diverted from the Delta in 2015 by the SWP and CVP. Maximum daily Delta exports occurred on February 12 at 13,797 af. Combined SWP and CVP monthly Delta exports in 2015 varied from a low of 42,300 af in July, to a high of 318,941 af in January. Delta exports totaled approximately 1.6 maf in 2015.

Figure 8-8 shows monthly total amounts pumped at Dos Amigos Pumping Plant for 2015. Dos Amigos Pumping Plant diverts water from O'Neill Forebay to the California Aqueduct. Dos Amigos pumped the largest amount in July at 190,325 af.

Figure 8-9 shows the amount of water pumped each month in 2015 at Edmonston Pumping Plant. Water pumped through the Edmonston Pumping Plant for delivery to Southern California totaled 735,381 af.

Additional water supply information can be found on DWR's website.

# Chapter 9
# Water Contracts and Deliveries

*Dyer Reservoir.*

## Significant Events in 2015

A total of 2,104,264 acre-feet (af) of State Water Project (SWP) and non-SWP water was delivered to 29 long-term SWP water contractors and 19 other agencies. The portion delivered to SWP water contractors was 1,336,889 af; the portion delivered to non-SWP agencies was 767,375 af.

The hydrologic conditions in the Sacramento and San Joaquin river watersheds were both classified as "critically dry." As a result, the Department of Water Resources (DWR) approved only 20 percent of the SWP water contractors' Table A allocation requests.

Eight SWP water contractors recovered approximately 347,852 af of water from water banks.

*Information for this chapter was provided by the State Water Project Analysis Office.*

Long-term water supply contracts between the Department of Water Resources (DWR) and 29 public agencies and local water districts provide for water service from the State Water Project (SWP) and are the basis for the SWP's construction and on-going operations. The State provides SWP financing, capital construction, improvements, and all operations and maintenance of SWP facilities, and the agencies and local districts have contractually agreed to repay all associated costs.

## Long-term Water Supply Contracts

The long-term water supply contracts also set forth the maximum amount of water a contractor may request each year from the SWP, and these water amounts are written within the contracts in a list format known as Table A. "Table A" or "Table A water" represents a portion or all of the annual Table A amount requested by SWP water contractors and approved for delivery by DWR based on hydrologic conditions, current reservoir storage, and combined requests from the SWP water contractors. Under certain water year conditions, DWR is not able to deliver the quantity of water requested by SWP water contractors. In those years, a proportional amount is allocated and delivered according to the long-term water supply contracts by prorating the amount in proportion to each SWP water contractor's annual Table A amount. Table A amounts may also be used as a factor to allocate other available water supplies to each contractor. Approved Table A amounts may also be referred to in this chapter as "approved amounts," "approved water," or "allocated water."

SWP water provided under the long-term water supply contracts include current year Table A amounts, transfer and exchange of Table A water, carryover water, Turn-Back Pools A and B water, Multiyear Water Pool Program water, and Article 21 water.

DWR enters into agreements with SWP water contractors and non-SWP agencies, which may be amended periodically, to convey SWP and non-SWP water through the California Aqueduct. Using SWP facilities, DWR conveys non-SWP water for various agencies according to the terms of water rights and water transfer and exchange agreements. DWR also enters into agreements to approve construction, operation, and maintenance of SWP facilities, including turnouts and turn-ins.

The State Water Project Analysis Office (SWPAO) uses a numbering system for contracts, amendments, and agreements executed by DWR. These numbers, referred to as SWPAO numbers, are designated in Chapter 9 text as "SWPAO #XXXXX" and are located in parentheses in descending order, after each contract, amendment, or agreement description. These numbers can be used as identifiers to contact DWR staff for more detailed information on a particular document.

### Contract Extension Negotiations

In May 2013, DWR and the SWP water contractors began negotiations in a public forum to develop contract amendments to extend the term and change certain financial provisions of the long-term water supply contracts. In June 2014, the negotiators for DWR and the SWP water contractors reached a general agreement on principles for such an amendment (the "Agreement in Principle").

## State Water Project Long-term Water Supply Contracts

The first long-term water supply contract was signed with The Metropolitan Water District of Southern California (Metropolitan) on November 4, 1960. The contract was negotiated by the Department of Water Resources (DWR) and Metropolitan according to terms of the contracting principles for water service contracts announced by the Governor on January 20, 1960.

The Metropolitan contract became the prototype for all long-term water supply contracts; by the end of 1967, 31 agencies had contracted for water. In addition, a long-term water supply contract was executed with the City of West Covina in December 1963, but it was terminated in August 1965, and the city's Table A amount was transferred to Metropolitan through an amendment to its long-term contract with DWR. Long-term contracts with Hacienda Water District and Devil's Den Water District were also terminated when those districts transferred their Table A amounts, through contract amendments, to Tulare Lake Basin Water Storage District (1981) and Castaic Lake Water Agency (1992), respectively. Today the State Water Project (SWP) has long-term water supply contracts with 29 SWP water contracting agencies. Those contracts have been amended periodically, and as needed, to incorporate mutually agreed upon modifications.

All water contracts signed in the 1960s included an estimated date for initial water deliveries and a schedule of the water delivery amount the SWP water contractor could expect annually (annual Table A amounts). That amount was designed to increase gradually until the maximum amount of annual Table A was reached. The total combined maximum annual Table A amount for all SWP water contracting agencies was initially 4,230,000 acre-feet (af), assuming full development of the SWP.

The contracts were executed for 75 years or until all bonds sold as part of the California Water Resources Development Bond Act were repaid, whichever period was longer. As a result of amendments to contracts in the 1990s, the current combined maximum annual Table A amount totals 4,172,786 af, and the contracts are in effect for the longest of the following periods: (1) the project repayment period, which extends to December 31, 2035; (2) 75 years from the date of the contract; or (3) the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

Currently, the long-term water supply contracts remain in effect for whichever period is longest, the project repayment period, which extends to December 31, 2035, 75 years from the effective date of the contract, or until all bonds issued to finance construction costs of SWP facilities are repaid. Each SWP water contractor may elect to receive continued service under its long-term water supply contract contingent upon certain specified terms and conditions and other reasonable and equitable terms mutually agreed upon by DWR and the SWP water contractors.

The 75-year long-term water supply contract term results in the contracts having varying termination dates that range between

December 31, 2035, and December 31, 2042. Under the Agreement in Principle, each SWP water contractor that signs an amendment would extend its contract term to December 31, 2085.

Also under the Agreement in Principle, payment provisions for capital costs and certain other costs will be amended from an amortized basis to an annual "pay as you go" basis. The "pay as you go" provisions will provide revenues needed by DWR to operate the SWP in a fiscally sound manner. The long-term water supply contracts' current provisions authorizing DWR to charge the SWP water contractors annually for the full amount of required annual debt service and coverage on the bonds will continue in any extended long-term water supply contract.

The Agreement in Principle also provides for, among other things, the following:

- an increase in DWR's operating reserves—a mechanism for financing capital projects with interest from the SWP water contractors;
- the establishment of accounts to fund for certain State Water Resources Development System expenses not chargeable to the SWP water contractors; and
- the establishment of a finance committee consisting of DWR and contractor representatives to serve as a forum for discussions and to provide a channel for recommendations concerning SWP financial policies.

Before any long-term water supply contract amendment is adopted, DWR must accomplish the following as part of the contract amendment process: (1) complete an environmental review pursuant to the California Environmental Quality Act and (2) deliver a presentation in an informational hearing to the California Legislature. In 2015, DWR continued preparing a draft environmental impact report (EIR) for the proposed contract extension amendment.

# Amendments to Long-term SWP Water Supply Contracts

All of the original long-term water supply contracts signed by DWR and the 29 long-term SWP water contractors have been amended to incorporate mutually desired changes. Most amendments fall under the following general categories:

(1) permanent transfers of Table A amounts from one SWP water contractor to another;
(2) allocation of costs and benefits for the addition or enlargement of SWP facilities;
(3) purchase of excess capacity in the California Aqueduct; and
(4) provisions to implement Monterey Agreement principles.

## 2015 Amendments to Long-term SWP Water Supply Contracts

There were no amendments to the long-term water supply contracts in 2015.

## Monterey Amendments

The Monterey Amendments increased the reliability of existing water supplies and water management flexibility, providing more tools for the 29 long-term SWP water contractors to maximize use of existing facilities.

The Monterey Amendments included changes in allocation of Table A water, the transfer of Table A amounts and land, financial restructuring, and increased operational flexibility. The Monterey Amendments are discussed in detail in Bulletin 132-95, Chapter 1, Summary of Significant Events, available on the DWR website.

In 2015, DWR continued to operate the SWP according to the long-term water supply contracts, the Monterey Amendments, and the May 5, 2003, settlement agreement for the Planning and Conservation League v. DWR (1995) lawsuit. The May 2003 settlement agreement is discussed in detail in Bulletin 132-04, Chapter 9, Water Contracts and Deliveries, available on DWR's website. As required by the settlement agreement, the Monterey Plus EIR was prepared and eventually certified by DWR in 2010. The adequacy of the Monterey Plus EIR was challenged, and the court found that the Monterey Plus EIR complied with the California Environmental Quality Act in all respects except with regard to its discussion/analysis of the development, use, and operation of the Kern Water Bank. In November 2014, the court ordered DWR to correct the deficiencies in a revised Monterey Plus EIR and to recertify the revised Monterey Plus EIR by December 31, 2015. In July 2015, the court granted DWR's request for a 6-month extension, changing the deadline to June 30, 2016.

See Chapter 6, Legislation and Litigation, for the current status of the Monterey Amendment litigation.

# Miscellaneous Agreements with Long-term SWP Water Contractors

## 2015 Water Conveyance and Exchange Agreements

Water conveyance and exchange agreements that were executed or pending execution with SWP water contractors during 2015 are described below.

### *AVEK/Littlerock*

A letter agreement among DWR, AVEK, and Littlerock, dated December 29, 2015, and executed on December 31, 2015, approved the delivery of up to 460 acre-feet (af) of Littlerock's 2015 SWP Table A water to AVEK by December 31, 2015. In exchange, AVEK will return an equal amount, up to 460 af, of its future approved SWP Table A water to Littlerock by December 31, 2025. There will be no monetary payments between AVEK and Littlerock for this 1:1 exchange. During 2015, a total of 460 af was delivered to AVEK under this agreement. (SWPAO #15026)

### *Alameda County/Alameda-Zone 7/ Contra Costa*

A letter agreement among DWR, Alameda County, Alameda-Zone 7, and Contra Costa Water District (Contra Costa), dated December 18, 2015, was executed December 21, 2015. The agreement approved the exchange of up to 5,000 acre-feet (af) of SWP water supplies for an equal amount of Contra Costa's Central Valley Project (CVP) water supplies.

This CVP-SWP water exchange is to facilitate the return of up to 5,000 af of Alameda County's and Alameda-Zone 7's previously stored water in Kern County. Contra Costa can divert up to 5,000 af of SWP water supplies at its intakes for use in its service area before January 20, 2016. In exchange, the Bureau of Reclamation (Reclamation) will make available an equal amount, up to 5,000 af, of Contra Costa's CVP water supplies at Banks Pumping Plant for subsequent delivery by DWR to Alameda County and Alameda-Zone 7 turnouts located on the South Bay Aqueduct under Article 55 of Alameda County's and Alameda Zone 7's respective long-term water supply contracts with DWR. DWR filed a petition with the State Water Resources Control Board (SWRCB) and received a 1-year approval, effective January 20, 2015, for a temporary change in point of diversion to allow the diversion of SWP water at Contra Costa's intakes. Reclamation filed a separate petition and received a 1-year approval, effective September 28, 2015, for a change in point of diversion to allow the diversion

of CVP water at Banks Pumping Plant to complete the water exchange. In 2015, no water was moved under this agreement. (SWPAO #15025)

### *Santa Clara*

An agreement between DWR and Santa Clara, executed September 21, 2015, provides additional temporary points of delivery for the return of a portion of Santa Clara's previously stored SWP water supplies in the Semitropic Water Banking and Exchange Program. DWR and Santa Clara have previously entered into separate change in point of delivery agreements that allow for the storage and future return of Santa Clara's approved SWP water supplies under the Semitropic Water Banking and Exchange Program. Under the executed point of delivery agreements, Santa Clara's stored water can be returned to Santa Clara through the South Bay Aqueduct. This agreement allows for temporary additional points of delivery of a portion of Santa Clara's stored water in the Semitropic Water Banking and Exchange Program at O'Neill Forebay and/or San Luis Reservoir through December 31, 2017. Santa Clara's water delivered to San Luis Reservoir and/or O'Neill Forebay under this agreement will be used within the SWP place of use. (SWPAO #15017)

An agreement between DWR and Santa Clara Valley Water District (Santa Clara), executed September 21, 2015, allows for additional temporary points of delivery of a portion of Santa Clara's SWP water supplies at San Luis Reservoir and/or O'Neill Forebay through December 31, 2017. Santa Clara's water delivered to San Luis Reservoir and/or O'Neill Forebay under this agreement will be used within the SWP place of use. (SWPAO #15016)

### *Dudley Ridge/Westlands*

A change in point of delivery agreement among DWR, Dudley Ridge, and Westlands Water District (Westlands), executed August 4, 2015, approved the delivery of up to 850 af of Dudley Ridge's approved 2015 SWP Table A water to Westlands through August 31, 2015. This is to facilitate an exchange between Sandridge Partners and a landowner in Westlands' service area. The landowner acquired 850 af of water from Shafter-Wasco Irrigation District, a CVP Friant Division contractor. This water was made available to Sandridge Partners for use in Kern County. In exchange, an equivalent amount, up to 850 af, of Dudley Ridge's approved 2015 SWP Table A water was delivered to Westlands in Reach 7 of the California Aqueduct for use on lands in the Kings County portion of Westlands' service area, which is within the SWP place of use. In 2015, 850 af of Dudley Ridge's Table A water was delivered to Westlands under this agreement. (SWPAO #15015)

### *San Bernardino/Santa Clara*

A letter agreement among DWR, San Bernardino, and Santa Clara, dated July 16, 2015, and executed August 4, 2015, approved the delivery of up to 2,500 af of San Bernardino's approved 2015 SWP Table A water to Santa Clara by December 31, 2015. In exchange, Santa Clara will return up to 5,000 af, based on an exchange ratio of 1:2, of its future approved SWP water supplies. Santa Clara will return to San Bernardino up to 2,500 af by December 31, 2018, and up to 2,500 af by December 31, 2023. During 2015, a total of 2,500 af of San Bernardino's Table A water was delivered to Santa Clara under this agreement. (SWPAO #15014)

### *Tulare/San Luis Water District/Westlands*

A change in point of delivery agreement among DWR, Tulare, San Luis Water District (San Luis), and Westlands, executed August 4, 2015, approved the delivery of up to a total of 14,000 af of Tulare's approved SWP water supplies to Westlands and San Luis by April 30, 2016. This agreement facilitates delivery of Kings River pre-1914 water rights water from J.G. Boswell

Company, a landowner in Tulare, to Westlands' and San Luis' service areas. In exchange, up to 14,000 af of J.G. Boswell Company's Kings River pre-1914 water rights water will be delivered to Tulare for use in its service area. DWR filed a petition with the SWRCB and received a 1-year approval effective May 1, 2015, for consolidation of SWP and CVP places of use. During 2015, a total of 14,000 af of Tulare's Table A water was delivered to Westlands and San Luis, of which 10,500 af was delivered to Westlands and 3,500 af was delivered to San Luis under this agreement. (SWPAO #15013)

### *Kern/Westlands*

A change in point of delivery agreement among DWR, Kern, and Westlands, executed August 12, 2015, provided for a same landowner transfer by Paramount Farming Company that owns land in both Kern's and Westlands' service areas. This agreement approved the delivery of up to 3,000 af of Kern's approved 2015 and/or 2016 SWP Table A water to Westlands. In exchange, Kern will retain a like amount of Paramount Farming Company's CVP water previously stored in Kern's service area. DWR filed a petition with the SWRCB and received a 1-year approval order, effective May 1, 2015, for the consolidation of SWP and CVP places of use. During 2015, no water was delivered to Westlands under this agreement. (SWPAO #15012)

### *Kern*

A change in point of delivery agreement between DWR and Kern, executed July 9, 2015, approved the delivery of up to 16,705 af of Kern's approved 2015 and/or 2016 SWP Table A water at O'Neill Forebay to Reclamation for subsequent delivery by Reclamation to the San Joaquin River Exchange Contractors (Exchange Contractors) through April 30, 2016. This is to facilitate the return of Kern-Tulare Water District's (Kern-Tulare) and Delano-Earlimart Irrigation District's (Delano-Earlimart) previously stored CVP water supplies in Kern's service area. The return and delivery of Kern-Tulare's and Delano-Earlimart's previously stored water was accomplished through a series of exchanges. First, DWR made available up to 16,705 af of Kern's approved Table A water at O'Neill Forebay to Reclamation for subsequent delivery by Reclamation to the Exchange Contractors for use on lands outside the SWP place of use. In exchange, Kern will retain a like amount of Kern-Tulare's and Delano-Earlimart's previously stored water in Kern's service area. Kern-Tulare and Delano-Earlimart will in turn receive a like amount of San Joaquin River water, normally delivered to the Exchange Contractors, which will instead be released by Reclamation from Millerton Lake for delivery to Kern-Tulare and Delano-Earlimart. DWR filed a petition with the SWRCB on May 11, 2015, and received approval on May 22, 2015, for an additional exchange of water under SWRCB's April 27, 2015, order for approval of consolidation of SWP and CVP places of use. During 2015, a total of 16,705 af of Kern's Table A water was made available to Reclamation at O'Neill Forebay under this agreement. (SWPAO #15011)

### *AVEK/Kern*

A letter agreement among DWR, AVEK, and Kern, dated May 28, 2015, and executed October 20, 2015, approved the transfer of up to 861 af of approved AVEK's SWP water supplies to Kern on behalf of Tejon Ranch Company that farms in both AVEK's and Kern's service areas. During 2015, no water was delivered to Kern under this agreement. (SWPAO #15008)

### *Kern/Westlands*

A change in point of delivery agreement among DWR, Kern, and Westlands, executed August 12, 2015, provided for a same landowner transfer by Poso Creek Water Company that has farming operations in both Kern's and Westlands' service areas.

This agreement approved the delivery of up to 12,819 af of Kern's approved 2015 and/or 2016 SWP Table A water to Westlands. In exchange, Kern will retain a like amount of Poso Creek Water Company's CVP water previously stored in Kern's service area. DWR filed a petition with the SWRCB and received a 1-year approval order, effective May 1, 2015, for the consolidation of SWP and CVP places of use. During 2015, no water was delivered to Westlands under this agreement. (SWPAO #15007)

### *AVEK/Santa Barbara*

A letter agreement (SWPAO #15005) among DWR, AVEK, and Santa Barbara, dated March 26, 2015, and executed April 10, 2015, approved the delivery of up to 7,500 af of AVEK's approved SWP water supplies to Santa Barbara by December 31, 2015. In exchange, Santa Barbara will return up to 7,500 af, based on an even exchange ratio of 1:1, of its future approved SWP water supplies to AVEK by December 31, 2025. A subsequent amendment (SWPAO #15005-A), dated July 27, 2015, and executed August 31, 2015, allows storage of a portion of AVEK's SWP water supplies in San Luis Reservoir. The water supplies are identified as carryover water for later delivery to Santa Barbara by December 31, 2017. During 2015, 4,847 af of AVEK's Table A water was delivered to Santa Barbara under this agreement. (SWPAO #15005 and #15005-A)

### *AVEK/Santa Clara*

A letter agreement among DWR, AVEK, and Santa Clara, dated March 18, 2015, and executed April 23, 2015, approved the delivery of up to 15,000 af of AVEK's approved SWP water supplies to Santa Barbara by December 31, 2015. In exchange, Santa Clara will return up to 15,000 af, based on an even exchange ratio of 1:1, of its future approved SWP water supplies to AVEK by December 31, 2025. During 2015, a total of 7,500 af of AVEK's Table A water was delivered to Santa Clara under this agreement. (SWPAO #15004)

### *Tulare/Westlands*

A letter agreement among DWR, Tulare, and Westlands, dated March 5, 2015, and executed March 16, 2015, approved the transfer of up to 4,000 af of Tulare's 2015 SWP Table A water to Westlands on behalf of Westlake Farms Incorporated, which has farms in both Tulare's and Westlands' service areas. During 2015, no water was delivered to Westlands under this agreement. (SWPAO #15003)

### *Kern/Tulare*

A letter agreement among DWR, Kern, and Tulare, dated March 5, 2015, and executed April 24, 2015, approved the transfer of up to 10,000 af of Tulare's 2015 SWP Table A water to Kern on behalf of J.G. Boswell Company, which has farms in both Tulare's and Kern's service areas. During 2015, no water was delivered to Kern under this agreement. (SWPAO #15002)

### *AVEK/Littlerock*

A letter agreement among DWR, AVEK, and Littlerock, dated December 23, 2014, and executed September 3, 2015, approved the delivery of up to 115 af of Littlerock's 2014 SWP Table A water to AVEK. In exchange, AVEK will return an equal amount, up to 115 af, of its future approved SWP Table A water to Littlerock by December 31, 2024. There will be no monetary payments between AVEK and Littlerock for this 1:1 exchange. During 2015, no water was moved under this agreement. (SWPAO #14021)

### *Kern/Westlands*

A change in point of delivery agreement among DWR, Kern, and Westlands was executed February 24, 2015, to facilitate a water exchange between Harris Farms, LLC and Semitropic Water Storage District, a member unit of Kern. This agreement

approved the delivery of up to 4,627 af of Kern's approved 2014 and/or 2015 SWP Table A water to Westlands through April 30, 2015. In exchange, Kern will retain a like amount of Harris Farm, LLC's CVP water previously stored in Kern's service area. DWR filed a petition with the SWRCB on October 20, 2014, and received approval on October 24, 2014, for additional exchange of water under SWRCB's March 28, 2014, order for the approval of the consolidation of SWP and CVP places of use. An amendment (SWPAO #14020-A) dated July 9, 2015, and executed July 14, 2015, extends the term of the agreement to allow the delivery of up to 3,055 af of Kern's approved 2015 and/or 2016 Table A water to Westlands through April 30, 2016. DWR filed a petition with the SWRCB and received a 1-year approval order, effective May 1, 2015, for the consolidation of SWP and CVP places of use. During 2015, a total of 4,627 af of Kern's Table A water was delivered to Westlands under this agreement. (SWPAO #14020 and SWPAO #14020-A)

### *Kern*

An amendment between DWR and Kern, dated July 6, 2015, and executed July 15, 2015, approved the delivery of up to 5,182 af of Kern's Table A water to Westlands' service area outside of Kings County for 2015 and 2016. The original agreement (SWPAO #06013), executed April 26, 2007, allowed the return water to be delivered only in the Kings County portion of Westlands' service area, which is within the SWP place of use. DWR filed a petition with the SWRCB and received a 1-year approval order, effective May 1, 2015, for the consolidation of SWP and CVP places of use. During 2015, a total of 1,341 af of Kern's Table A water was delivered to Westlands under this agreement. (SWPAO #06013 and SWPAO #06013-D)

### *Kern/Metropolitan*

An amendment among DWR, Kern, and Metropolitan, executed August 31, 2015, approved the delivery of up to 20,000 af of Metropolitan's approved SWP water supplies to O'Neill Forebay by March 1, 2015, facilitating an exchange among the Exchange Contractors. Under this amendment, up to 20,000 af of Metropolitan's approved SWP water supplies would be made available at O'Neill Forebay and subsequently delivered by Reclamation to the Exchange Contractors. In exchange, Reclamation will deliver an equal amount of CVP water to Arvin-Edison Water Storage District (Arvin-Edison) on behalf of Metropolitan. DWR filed a petition with the SWRCB and received a 1-year approval order, effective May 1, 2014, for the consolidation of SWP and CVP places of use. The original long-term point of delivery agreement (SWPAO #01013), executed March 18, 2004, approved the delivery of a portion of Metropolitan's approved SWP water supplies for storage and later recovery from groundwater basins within Arvin-Edison through December 31, 2035. No water was moved under this amendment in 2015. (SWPAO #01013 and SWPAO #01013-A)

### *AVEK/Mojave*

An amendment (SWPAO #97003-B) among DWR, Mojave, and AVEK, executed April 30, 2015, approved an additional point of delivery of Mojave's approved SWP Table A water to AVEK's turnout in Reach 20A of the California Aqueduct. The 1997 agreement (SWPAO #97003) executed on November 13, 1997, and the amendment (SWPAO #97003-A) executed on January 12, 2012, approved the delivery of up to 1,800 af per year of Mojave's approved Table A water for use by a solar power generating plant operated by Luz Solar Partners, Ltd. III–VII. The amendment approved the delivery of up to 3,000 af of Mojave's approved Table A water in AVEK's groundwater basin as a

backup water supply to the solar plant in the event of an SWP outage through December 31, 2035. During 2015, a total of 1,023 af of Mojave's Table A water was delivered to AVEK under this agreement. (SWPAO #97003, SWPAO #97003-A, and SWPAO #97003-B)

## Water Conveyance and Exchange Agreements Prior to 2015

### *Palmdale/San Bernardino*

A letter agreement among DWR, Palmdale, and San Bernardino, dated August 1, 2014, and executed August 14, 2014, approved the delivery of up to 2,500 af of San Bernardino's approved SWP water supplies to Palmdale by December 31, 2014. In exchange, Palmdale will return up to 5,625 af, based on an unbalanced exchange ratio of 1:2.25, of its future SWP water supplies to San Bernardino by December 31, 2018. During 2015, a total of 500 af of Palmdale's Table A water was delivered to San Bernardino under this agreement. (SWPAO #14013)

### *Butte*

A letter agreement between DWR and Butte, dated July 7, 2014, and executed July 29, 2014, approved the conveyance of up to 3,000 af per year of non-SWP water to California Water Service Company, a member agency of Butte, through December 31, 2017. This non-SWP water is made available by Pacific Gas & Electric Company for DWR to convey to California Water Service Company's turnouts at the Thermalito Power Canal, under Article 55 of Butte's long-term water supply contract. During 2015, a total of 2,558 af of non-SWP water was conveyed under this agreement. (SWPAO #14011)

### *Dudley Ridge/Santa Clara*

A letter agreement among DWR, Dudley Ridge, and Santa Clara, dated June 28, 2013, and executed July 12, 2013, approved the conveyance of up to 3,100 af per year, minus Sacramento-San Joaquin Delta carriage water losses, on a 50/50 equal basis of non-SWP water to Dudley Ridge and Santa Clara through December 31, 2024. This non-SWP water is made available by Browns Valley Irrigation District. During 2015, 1,240 af was delivered to Dudley Ridge and 1,240 af was delivered to Santa Clara under this agreement. (SWPAO #13020)

### *Butte*

Three multiyear agreements (SWPAO #13013, SWPAO #13014, and SWPAO #13015) were executed in 2014 among DWR, Butte, and several participating SWP contractors. Butte's long-term water supply contract with DWR provides for Butte to have a maximum Table A amount of 27,500 af per year. Butte determined that 24,000 af per year of its Table A amount is not needed to meet its in-county demands for 2014 through 2021 and requested a transfer of up to 24,000 af per year of its Table A water to Palmdale, Dudley Ridge, and Kern. Up to 10,000 af of Butte's allocated Table A water is made available to transfer to Palmdale. Up to 14,000 af of Butte's allocated Table A water is shared on a percentage basis of 85.66 and 14.34 percent for transfer to Kern and Dudley Ridge, respectively. Butte also determined that the difference of 3,500 af per year (27,500 af minus 24,000 af) may not be fully utilized by Butte for its in-county needs and requested a transfer of a portion of the 3,500 af per year on a percentage basis to Palmdale, Dudley Ridge, and Kern when it becomes available (Butte's Additional Water). In 2015, Butte's allocated Table A water was transferred as follows.

**Butte/Kern.** A multiyear agreement among DWR, Butte, and Kern, executed August 5, 2014, approved the annual delivery of a portion of Butte's allocated Table A water plus a portion of Butte's Additional Water when it becomes available to four of Kern's member units (Belridge Water Storage District, Berrenda Mesa Water Storage District, Lost Hills Water District, and

Wheeler Ridge-Maricopa Water Storage District) in years 2014 through 2021. During 2015, a total of 1,554 af of Butte's Table A water was delivered to Kern under this agreement. (SWPAO #13015)

**Butte/Dudley Ridge.** A multiyear agreement among DWR, Butte, and Dudley Ridge, executed August 5, 2014, approved the annual delivery of a portion of Butte's allocated Table A water plus a portion of Butte's Additional Water when it becomes available to Dudley Ridge in years 2014 through 2021. During 2015, a total of 260 af of Butte's Table A water was delivered to Dudley Ridge under this agreement. (SWPAO #13014)

**Butte/Palmdale.** A multiyear agreement among DWR, Butte, and Palmdale, executed August 5, 2014, approved the annual delivery of a portion of Butte's allocated Table A water plus a portion of Butte's Additional Water when it becomes available to Palmdale in years 2014 through 2021. During 2015, a total of 1,296 af of Butte's Table A water was delivered to Palmdale under this agreement. (SWPAO #13013)

### *Dudley Ridge/Kern/Metropolitan*

A multiyear exchange and change in point of delivery agreement among DWR, Dudley Ridge, Kern, and Metropolitan, executed December 16, 2013, approved the delivery of up to 8,700 af of Dudley Ridge's approved SWP water supplies to Metropolitan by December 31, 2017. In exchange, Metropolitan will return up to 4,350 af, based on an unbalanced exchange ratio of 2:1, of its future approved SWP water supplies to Dudley Ridge by December 31, 2022. This agreement allows for the delivery of a portion of Dudley Ridge's approved SWP water supplies to either Metropolitan's service area and/or Kern's turnouts for storage in Rosedale-Rio Bravo Water District (Rosedale-Rio Bravo), a member unit of Kern, for later use by Metropolitan within its own service area. During 2015, a total of 452 af of Dudley Ridge's Table A water was delivered to Metropolitan under this agreement. (SWPAO #13012)

### *Coachella/Kern*

A multiyear change in point of delivery and conveyance agreement among DWR, Coachella, and Kern, executed July 30, 2013, approved the annual delivery of up to 16,500 af of water acquired by Coachella back to Coachella through December 31, 2035. Glorious Land Company (GLC) and Rosedale-Rio Bravo executed an agreement in 2005 to provide a water supply from Rosedale-Rio Bravo to GLC's development project in Riverside County. GLC was not yet ready to receive the water to which it was entitled under the 2005 Rosedale-Rio Bravo/GLC agreement. In 2012, GLC and Coachella executed an assignment agreement that allowed Coachella to annually acquire up to 16,500 af of Rosedale-Rio Bravo's water under the 2005 Rosedale-Rio Bravo/GLC Agreement (Assigned Water). This agreement allows for the delivery of the Assigned Water to Coachella by (1) a change in point of delivery of a portion of Rosedale-Rio Bravo's allocation of Kern's Table A water as an exchange for a like amount of Assigned Water and (2) conveyance of the Assigned Water to Coachella under Article 55 of Coachella's long-term water supply contract by direct pump-in of the water into the California Aqueduct. In 2015, a total of 9,500 af was delivered to Coachella under this agreement. (SWPAO #12023)

### *Dudley Ridge/Tulare*

A same landowner agreement among DWR, Dudley Ridge, and Tulare, executed September 7, 2012, approved multiyear transfers between Dudley Ridge and Tulare through December 31, 2035. This agreement allows for the delivery of up to 15,000 af per year of a portion of Dudley Ridge's and/or a portion of Tulare's approved Table A water for same landowner transfers to the other party without any expected return. During

2015, a total of 617 af of Tulare's Table A water was delivered to Dudley Ridge's turnouts. (SWPAO #12011)

### *Kern/Metropolitan/Santa Barbara*

A letter agreement among DWR, Kern, Metropolitan, and Santa Barbara, dated April 18, 2012, and executed June 28, 2012, approved the exchange of up to 1,500 af of Santa Barbara's approved SWP water supplies with Metropolitan's future SWP water supplies equal to one-half, less losses, of the total amount delivered to Metropolitan. Metropolitan will provide the return water to Santa Barbara by December 31, 2017. A separate change in point of delivery agreement (SWPAO #11022) among DWR, Kern, and Metropolitan, executed August 3, 2012, allowed for Santa Barbara's approved SWP water supplies to be delivered to Kern's turnouts for storage in Kern County, as described in Bulletin 132-13. During 2015, a total of 410 af of Metropolitan's Table A water was delivered to Santa Barbara. (SWPAO #11021)

### *AVEK/Palmdale*

A letter agreement among DWR, AVEK, and Palmdale, dated May 1, 2012, and executed November 13, 2012, approved the delivery of up to 10,000 af of Palmdale's 2011 SWP water supplies to AVEK. In exchange, AVEK will return 50 percent, up to 5,000 af, of its future SWP water supplies to Palmdale by December 31, 2021. During 2015, a total of 2,465 af of AVEK's water was delivered to Palmdale, of which 653 af was Article 56(c) carryover water and 1,812 af was Table A water. (SWPAO #11020)

### *Dudley Ridge/Kern*

A multiyear same landowner transfer agreement among DWR, Dudley Ridge, and Kern, executed June 13, 2011, provided for the delivery of a portion of Dudley Ridge's approved Table A water for same landowner transfers to Kern through December 31, 2020, without any expected return. During 2015, a total of 16,950 af of Dudley Ridge's water was delivered to Kern under this agreement. (SWPAO #10030)

### *Empire/Westlands*

A long-term change in place of use agreement among DWR, Empire, and Westlands, executed March 3, 2011, approved the annual delivery of up to 2,000 af of Empire's approved Table A water to Westlands through April 1, 2027. This transfer was made on behalf of two landowners, Brooks Farms and Newton Brothers Farms, that farm in both Empire's and Westlands' service areas. DWR filed a petition with the SWRCB and received approval for a temporary change in place of use. The SWRCB subsequently issued an order authorizing the long-term change in place of use on November 21, 2011. During 2015, a total of 262 af of Empire's Table A water was delivered to Westlands under this agreement. (SWPAO #10008)

### *Tulare/Westlands*

A long-term change in place of use agreement among DWR, Tulare, and Westlands, executed January 7, 2011, approved the annual delivery of up to 8,000 af of Tulare's approved Table A water to Westlands' turnouts through April 1, 2027. The transfer was made on behalf of two landowners, Hansen Ranches and Newton Brothers Farms, that farm in both Tulare's and Westlands' service areas. DWR filed a petition with the SWRCB and received approval for a temporary change in place of use. The SWRCB issued an order authorizing the long-term change in place of use on November 21, 2011. In 2015, a total of 1,742 af of Tulare's Table A water was delivered to Westlands. (SWPAO #10006)

### *Napa/Solano*

A long-term change in point of delivery agreement among DWR, Napa, and Solano, executed October 11, 2010, approved the conveyance of up to 500 af per year of

the City of Vallejo's non-SWP water from Solano's service area to Napa's turnouts located on the North Bay Aqueduct under Article 55 of Napa's long-term water supply contract. The City of Vallejo, a member agency of Solano, has water rights to this non-SWP water originating from Cache Slough and Lindsay Slough (tributaries of the Sacramento River). This agreement provides for the delivery of the City of Vallejo's non-SWP water through Reach 3B of the North Bay Aqueduct. This agreement is effective through December 31, 2035. During 2015, a total of 500 af of non-SWP water was conveyed under this agreement. (SWPAO #10005)

### *Crestline/San Bernardino*

A letter agreement (SWPAO #08063) among DWR, Crestline, and San Bernardino, dated December 17, 2008, and executed December 22, 2008, approved the delivery of up to 1,000 af of Crestline's approved SWP Table A water to San Bernardino by December 31, 2008. In exchange, San Bernardino returned an equal amount of its future approved Table A water to Crestline by December 31, 2011. There was no monetary payment between Crestline and San Bernardino for this 1:1 exchange. An amendment (SWPAO #08063-A) dated December 14, 2009, and executed February 16, 2010, among DWR, Crestline, and San Bernardino, extended the term for the delivery of San Bernardino's approved Table A water to Crestline to December 31, 2018. During 2015, a total of 850 af of San Bernardino's Table A water was delivered to Crestline under this agreement. (SWPAO #08063 and SWPAO #08063-A)

### *Castaic Lake/Kern*

A long-term agreement among DWR, Castaic Lake, and Kern, executed February 5, 2008, approves the annual conveyance of up to 11,000 af of non-SWP Kern River water from Buena Vista Water Storage District, a member unit of Kern, to Castaic Lake. The Kern River water was delivered to Castaic Lake either by a change in point of delivery of a portion of Kern's Table A water to Castaic Lake in exchange for a like amount of Buena Vista Water Storage District's water, or by direct pump-in to the California Aqueduct and conveyed to Castaic Lake under Article 55 of Castaic Lake's long-term water supply contract. During 2015, a total of 10,995 af was delivered to Castaic Lake under this agreement. (SWPAO #07008)

### *Mojave/Solano*

A letter agreement among DWR, Mojave, and Solano, dated December 7, 2007, and executed March 10, 2008, approved the delivery of up to 2,000 af of Solano's 2005 approved SWP water supplies to Mojave by December 31, 2005. In exchange, Mojave will return up to 1,000 af, based on an exchange ratio of 2:1, of its SWP water supplies to Solano by December 31, 2015. During 2015, a total of 1,000 af of Mojave's Table A water was delivered to Solano, thereby completing this agreement. (SWPAO #05019)

### *Kings/Westlands*

A long-term change in point of delivery agreement among DWR, Kings, and Westlands, executed March 24, 2004, provides for the delivery of up to 5,000 af of Kings' annual Table A water through Westlands' turnouts for use at Lemoore Naval Air Station. This agreement is effective through December 31, 2035. During 2015, a total of 190 af of Kings' Article 56(c) carryover water was delivered to Westlands' turnouts under this agreement. (SWPAO #04005)

### *Solano/Cities of Fairfield, Vacaville, and Benicia*

A settlement agreement among DWR, Solano, and the cities of Fairfield, Vacaville, and Benicia, which includes conveyance service by Solano, was executed on May 19, 2003. The agreement provides for delivery through December 31, 2035, of up to

31,620 af per year of settlement water to Solano for delivery through the North Bay Aqueduct to the three cities to help meet their current and future municipal and industrial water needs. During 2015, a total of 728 af of settlement water was delivered to Solano for conveyance to the three cities. (SWPAO #03017)

### *Kings/Tulare*

A long-term change in point of delivery agreement among DWR, Kings, and Tulare, executed March 10, 2006, provides for the delivery of up to 200 af of Kings' annual Table A water to Westlands' turnouts. The water is conveyed to GWF Energy LLC for use within Kings' service area. This agreement is effective through December 31, 2035. During 2015, a total of 22 af of Kings' Table A water was delivered to Westlands' turnouts. (SWPAO #02031)

### *Kern*

A long-term change in point of delivery agreement between DWR and Kern, executed June 8, 2000, approved the delivery of a portion of Kern's annual Table A water to Western Hills Water District (Western Hills). In exchange, Kern will receive a like amount of local water acquired by Western Hills in the Pioneer Groundwater Bank. The SWRCB approved Western Hills' service area to be included within the authorized SWP place of use on April 21, 2000. During 2015, a total 718 af of Kern's water was delivered to Western Hills, of which 133 af was Table A water and 585 af was Article 56(c) carryover water. (SWPAO #01001)

### *Napa/Solano*

A change in point of delivery agreement among DWR, Napa, and Solano, executed December 26, 2001, approved the delivery of up to 628 af of Napa's annual Table A water to the City of Vallejo's Water Treatment Plant in Solano's service area. This water is further conveyed to the city of American Canyon, a member agency of Napa. The agreement is effective through December 31, 2035. During 2015, a total of 66 af of Napa's Table A water was delivered to Solano's turnouts. (SWPAO #00029)

## Introduction of Local Water Agreement

### *AVEK*

An agreement between DWR and AVEK, executed April 7, 2015, approved the introduction and conveyance of up to 27,000 af of AVEK's local groundwater into the California Aqueduct within AVEK's service area. During 2015, AVEK introduced a total of 1,516 af of its local water into the California Aqueduct; DWR conveyed and delivered 1,516 af to AVEK's turnouts under this agreement. (SWPAO #14016)

## Turnout Agreements

### *Alameda-Zone 7*

On September 30, 2015, DWR executed an agreement with Alameda-Zone 7 for construction, operation and maintenance of the Olivina Turnout. The turnout, located at Station 37+50 of the South Bay Aqueduct's Del Valle Branch Pipeline, has a maximum design capacity of 0.7 cubic feet per second (cfs).

### *AVEK*

On June 24, 2015, DWR executed an agreement with AVEK for a temporary water diversion at Milepost 366.53 of the California Aqueduct's East Branch. Deliveries from this turnout, up to 100 af and not exceeding 4 cfs, were for agricultural purposes. The agreement expired on December 24, 2015.

On November 25, 2015, DWR executed an agreement with AVEK for operation and maintenance of the existing Quartz Hill Turnout. The turnout, located at Milepost 366.73 of the California Aqueduct's East Branch, has a maximum design capacity of 144 cfs.

### Byron Bethany Irrigation District

On August 25, 2015, DWR executed an agreement with Byron Bethany Irrigation District (Byron Bethany) and Musco Family Olive Company (Musco) for modification, operation and maintenance of the Musco Olive Turnout. Modifications included the installation of a magnetic flow meter and chart recorder on Musco property. The turnout, located at Milepost 12.47 of the California Aqueduct, has a maximum design capacity of 1 cfs.

### Kings

On November 20, 2015, DWR executed an agreement with Kings and Kettleman City Community Services District (Kettleman City) for construction, operation and maintenance of the Kettleman City Turnout. The turnout, located at Milepost 173.12 of the California Aqueduct, has a maximum design capacity of 2.67 cfs.

### Dudley Ridge/Kern

On August 6, 2015, DWR executed an amendment to the December 9, 2014, agreement with Dudley Ridge, Kern, Lost Hills Water District, Berrenda Mesa Water District, Semitropic Water Storage District, and Belridge Water Storage District for the 2014–2015 California Aqueduct Pump-Back Program. The amendment renamed the program from 2014–2015 California Aqueduct Pump-Back Program to 2014–2016 California Aqueduct Pump-Back Program and extended the termination date of the original agreement from April 30, 2015, to May 31, 2016.

### Kern

On July 20, 2015, DWR executed an amendment to the May 23, 1994, agreement with Kern and Buena Vista Water Storage District (Buena Vista) for construction, operation and maintenance of Buena Vista Turnout No. 7. The amendment specified the requirements for decommissioning the Buena Vista Turnout.

On July 20, 2015, DWR executed an agreement with Kern and Henry Miller Water District (Henry Miller) for operation and maintenance of Henry Miller Turnouts No. 1 and 2. Henry Miller Turnout No. 1, previously known as Buena Vista Turnout No. 3, is located at Milepost 243.09 of the California Aqueduct and has a design flow of 125 cfs. Henry Miller Turnout No. 2, previously known as Buena Vista Turnout No. 4, is located at Milepost 249.85 and has a design flow of 120 cfs.

## Activities Related to the Monterey Amendments

### Storage of Water Outside SWP Contractor Service Areas

Pursuant to Article 56(c) of the Monterey Amendments, seven SWP water contractors have separate agreements with DWR to convey approved water supplies outside their service areas for storage in existing and operational groundwater storage programs and for future recovery of water to use within their service areas. These change in point of delivery agreements are listed in Table 9-1. These agreements include provisions for conveyance to and from storage, and recovery methods by exchange and/or pump-in to the California Aqueduct. During 2015, a total of 239,100 af was recovered from storage.

### Turn-Back Water Pool Program

Pursuant to Article 56(d) of the Monterey Amendments, SWP water contractors who signed the Monterey Amendments are permitted to participate annually in the Turn-Back Water Pool Program. In 2015, SWP water contractors did not buy or sell water under Pool A or Pool B of the Turn-Back Water Pool Program due to their participation in the Multiyear Water Pool Program.

**Table 9-1 Storage of Water Outside SWP Contractor Service Areas in 2015 (acre-feet)[a]**

| Contractor | Contract Status | Storage Provider | To Storage (includes losses, if any) | From Storage | Return By |

[a] Storage amounts in this table may differ from the amounts in Table 9-8 due to water-type reclassification.
[b] Indicates amendments to agreement.
[c] Total acre-feet indicates all water recovered from various water banks. Some of the recovered water may be temporarily stored in SWP facilities. Amounts include losses, if any.

## Multiyear Water Pool Program

The 2015–2016 Multiyear Water Pool was initiated through a program letter sent to all SWP water contractors dated February 2, 2015. All SWP water contractors were permitted to participate in the program as either buyers or sellers in 2015 and/or 2016. The program allowed SWP water contractors to offer portions of their approved 2015 Table A water for sale in a water pool for use by interested SWP water contractors.

Based on Table A supply and demand, the pool water was allocated among the purchasing SWP water contractors into one of the two buyer pools. The "69 Percent Pool" consisted of water purchased by Metropolitan and Kern, which together take up 69.37 percent of the total SWP Table A amount. The remaining 30.63 percent of the SWP Table A amount was available for the other SWP water contractors to purchase in the "31 Percent Pool."

The Multiyear Water Pool Program participation occurred in June 2015, with 3,000 af purchased under this program. Multiyear Water Pool Program water was sold for $322.00 per af, for a Table A allocation of 20 percent on June 1, 2015. The 2015 Multiyear Water Pool Program closed on June 15, 2015.

Table 9-2 lists SWP water contractors that participated in the 2015 Multiyear Water Pool Program.

**Table 9-2 2015 Multiyear Water Pool Program (acre-feet)**

| Contractor | Sold | Purchased |

## Article 21 Water Program

Pursuant to the Monterey Amendments, Article 21 water replaces surplus, wet weather, and Article 12(d) water. The Article 21 Water Program allows an SWP water contractor to take delivery of water over the approved and scheduled Table A amounts for the current year. Article 21 water is only available for delivery on a short-term basis as determined by DWR when water is still available after operational requirements for SWP water deliveries, water quality, and Sacramento-San Joaquin Delta (Delta) requirements are met. During 2015, 690 af of Article 21 water was delivered.

## Flexible Storage Program

Pursuant to Article 54 of the Monterey Amendments, the Flexible Storage Program provides the option to SWP water contractors participating in the repayment of the capital costs of Castaic Lake and Lake Perris to withdraw water in excess of approved deliveries. The program objective is to provide additional flexibility to benefit local water management activities. Participating SWP water contractors are given 5 years to replace withdrawn stored water with approved SWP or non-SWP water.

Flexible storage allows for withdrawal of up to 160,000 af at Castaic Lake and 65,000 af at Lake Perris. SWP water contractors participating in the Castaic Lake Flexible Storage Program include Metropolitan,

Ventura, and Castaic. These contractors are allowed to withdraw up to a maximum of 153,940 af, 1,377 af, and 4,683 af, respectively. Metropolitan is the only SWP water contractor allowed to withdraw water from Lake Perris, up to a maximum of 65,000 af.

In 2015, Metropolitan started with a balance of -218,940 af in flexible storage. Metropolitan did not withdraw flexible storage water, leaving them with an end-of-year balance of -218,940 af. Castaic started the year with a balance of -4,424 af in flexible storage. Castaic did not withdraw flexible storage water, but replaced 4,339 af of withdrawn storage water using their water bank recovery water, leaving them with an end-of-year balance of -85 af.

### *Extended Carryover Program*

Pursuant to Article 56 of the Monterey Amendments, SWP water contractors can elect to store SWP water outside of their service areas and carry it over to the following year for use within their service areas. Qualified SWP water contractors can request the carryover of Table A water for delivery in the following year to the extent that such deliveries do not adversely affect current or future project operations. Factors that influence how much extended carryover water can be delivered include operational constraints of project facilities, filling of SWP conservation storage facilities, flood control releases, and water quality restrictions.

If storage requests exceed the available storage capacity, the amount available is allocated among the SWP water contractors requesting storage in proportion to their annual Table A amount for that year.

Twenty SWP water contractors took delivery of Article 56(c) water in the amount of 131,990 af of previously approved Table A water carried over into 2015. A total of 265 af of SWP water contractors' carryover water was delivered to non-SWP contractors for a total of 132,255 af of water delivered.

## 2015 Water Transfers

Due to the critically dry hydrologic conditions in 2015, a number of SWP water contractors experienced significant water supply shortages. Nine SWP water contractors executed water transfer conveyance agreements with DWR and six non-SWP agencies on the Feather, Yuba, Sacramento, and American rivers, and within the Delta.

A total of 21,586 af of water was made available to the SWP buyers from a combination of reservoir releases and groundwater substitution. See Table 9-3 for a list of sellers that provided water for transfer in 2015. A total of 17,286 af of transfer water was delivered to the SWP buyers after conveyance losses, including Delta carriage water losses of 20 percent, except to Napa, which was assessed a zero percent carriage water loss. See Table 9-4 for a list of the SWP buyers and the quantities delivered.

## Lower Yuba River Accord

The Lower Yuba River Accord (Yuba Accord) was announced in 2005 to settle long-standing litigation over instream flows in the Yuba River in relation to fisheries. The purpose of the Yuba Accord is to resolve instream flow issues associated with the operation of the Yuba River Development Project in a way that protects and enhances lower Yuba River fisheries and local water supply reliability. The Yuba River Development Project provides revenues for local flood control and water supply projects, water to enhance SWP and CVP water supply reliability by offsetting Delta export reductions for the protection and restoration of Delta fisheries, and improvements in statewide water supply management, including dry year water

**Table 9-3 2015 Water Transfers Seller Activities (acre-feet)**

| Sellers | Buyers | SWPAO # | Transfer Action | Transfer Water Available |
|---|---|---|---|---|
| Garden Highway Mutual Water Company | Dudley Ridge | 15702 | Groundwater Substitution | 140 |
| | Kern | | | 241 |
| | Oak Flat | | | 17 |
| | Metropolitan | | | 468 |
| Sutter Extension Water District | Kern | 15704 | Groundwater Substitution | 510 |
| | Metropolitan | | | 990 |
| Plumas Mutual Water Company | Kern | 15724 | Groundwater Substitution | 591 |
| | Metropolitan | | | 1,149 |
| Sutter South Water District | Kern | 15725 | Reservoir Releases | 1,679 |
| | Kings | | | 29 |
| | Metropolitan | | | 3,269 |
| | Napa | | | 89 |
| | Palmdale | | | 66 |
| | Santa Barbara | | | 140 |
| | Santa Clara | | | 308 |
| Foresthill Public Utility District | Santa Clara | 15740 | Reservoir Releases | 1,900 |
| South Feather Water and Power Agency | Dudley Ridge | 15750 | Reservoir Releases | 154 |
| | Kings | | | 32 |
| | Kern | | | 3,333 |
| | Metropolitan | | | 6,481 |
| **Total** | | | | **21,586** |

**Table 9-4 2015 Water Transfers Buyer Activities (acre-feet)**

| Buyers | Water Available to Buyer | Carriage Water Losses[a] | Net Water Delivered |
|---|---|---|---|
| Dudley Ridge | 294 | 59 | 235 |
| Kern | 6,354 | 1,271 | 5,083 |
| Kings | 61 | 12 | 49 |
| Metropolitan | 12,357 | 2,472 | 9,885 |
| Napa | 89 | 0 | 89 |
| Oak Flat | 17 | 3 | 14 |
| Palmdale | 66 | 13 | 53 |
| Santa Barbara | 140 | 28 | 112 |
| Santa Clara | 2,208 | 442 | 1,766 |
| **Total[b]** | **21,586** | **4,300** | **17,286** |

[a] Carriage water losses of 20 percent were applied to all transfers except to Napa. Napa (located north of the Delta) was assigned with zero carriage water loss.
[b] Totals may not sum as expected due to rounding.

supplies for participating SWP and CVP water contractors.

## Agreements

The Yuba Accord is based on three sets of agreements: a water purchase agreement with DWR, that includes water to help offset Delta export reductions and dry year water for participating SWP and CVP water contractors; conjunctive use agreements with Yuba County Water Agency (Yuba) member units; and a fisheries agreement resolving minimum flows. The Yuba Accord provides for higher releases into the Yuba River to benefit Chinook Salmon and steelhead, transfer water to help offset Delta export reductions annually, and provide dry year transfer water for SWP and CVP water contractors from both surface and groundwater substitution sources.

The required agreements were executed in late 2007 and early 2008, and the SWRCB approved the Yuba Accord on March 25, 2008, setting the flow schedules for the river and authorizing accord-based water transfers through 2025. During that same period, DWR completed executing 22 agreements for dry year supplies for participating SWP and CVP water contractors under the accord.

## Amendments

In April 2009, two amendments to the Yuba Accord's water purchase agreement were executed. Amendment Number 1 resolved a technical issue related to refill accounting, and Amendment Number 2 addressed pricing issues for groundwater substitution water.

Amendment Number 3 was executed April 22, 2010, and addressed market pricing issues for groundwater substitution water.

On January 6, 2012, Amendment Number 4 was executed between DWR and Yuba, and between DWR and 22 participating contractors. Amendment Number 4 provides for annual negotiations of groundwater substitution water pricing, prioritizing SWP water contractors' Delta export transfer supplies, and optionally suspending certain accounting rules to permit all groundwater substitution water to be classified as Component 4 water.

Under Amendment Number 4, all accrued groundwater substitution water is payable even if it cannot be exported. The single exception is that DWR and Yuba Accord water contractors will not be required to pay for the portion (if any) of groundwater substitution component water that is released in accordance with the provisions of the Yuba Accord Fisheries Agreement, Section 5.1.8, Supplemental Flows for Groundwater Substitution Programs, unless it can be exported

On December 5, 2014, DWR executed Amendment Number 5 to the Yuba Accord Water Purchase Agreement with Yuba. The key new terms included: increased pricing for the four components of transfer water to be delivered by Yuba from 2016 through 2020; a $20 million deposit to be paid to Yuba to lock in the new pricing for 5 years and will be credited to surface water purchases; an allowance for third-party sales by Yuba to nonparticipants in the program under certain circumstances; and continued annual negotiations of groundwater substitution pricing when available. All 22 participating contractors agreed to continue their participation in the Yuba Accord from 2016 through 2020 by executing the conforming Amendment Number 5 to their participation agreements. On January 8, 2015, DWR executed a Participation Agreement, Amendment 1, and Amendment 5 with Mojave and Santa Barbara, increasing the number of participating contractors to from 22 to 24.

## Component 1 and Component 4 Water Deliveries

In 2015, Yuba delivered 59,131 af of Component 1 water from surface releases, shared equally between DWR and Reclamation. Because 60,000 af of Component 1 water was due to be delivered in 2015, Yuba owes the remaining 869 af in a future year. There were no water deliveries for Component 2 or Component 3 water.

A letter agreement was executed between DWR and Yuba on March 26, 2015. The agreement provided for 30,000 af of Component 4 groundwater substitution water at an effective price of $665 per af.

The 59,131 af of Component 1 water was used to offset Delta pumping curtailments equally at the Banks Pumping Plant and Jones Pumping Plant. The curtailments were made pursuant to the biological opinions on Delta Smelt and salmonids issued by the U.S. Fish and Wildlife Service and the National Marine Fisheries Service as modified by subsequent court orders. Yuba delivered 30,000 af of Component 4 groundwater substitutions water.

Component 4 water was shared 50 percent among 13 participating SWP water contractors, and 50 percent among CVP contractor members of the San Luis & Delta-Mendota Water Authority, a federal CVP water contractor. The 2015 transfers by Yuba pursuant to the 2007 DWR/ Yuba Water Purchase Agreement totaled 89,131 af. The 30,000 af of Component 4 water was used by the 14 State and federal participating contractors to help offset low water allocations.

### *Carriage Water Losses*

The 13 SWP water contractors shared the Yuba River water based on their relative requests for the various components in proportion to their Table A contract amounts. The SWP water contractors that purchased the water are responsible for applicable carriage water costs and conveyance charges based on Article 55 of their long-term water supply contracts. Carriage costs reduced actual deliveries of Yuba River water through Banks Pumping Plant and Jones Pumping for all participating contractors in 2015. The Yuba water for DWR and the SWP water contractors was exported through the Banks Pumping Plant, and the Yuba water for Reclamation and the San Luis & Delta-Mendota Water Authority was exported through the Jones Pumping Plant in 2015 with applicable carriage water costs.

Table 9-5 shows Lower Yuba River Accord Component 4 water deliveries.

# Agreements with Non-SWP Agencies

In addition to negotiating agreements with SWP water contractors to provide for specified water deliveries, DWR also enters into agreements with non-SWP agencies to provide water conveyance service.

## San Luis & Delta-Mendota Water Authority

An agreement among DWR, San Luis & Delta-Mendota Water Authority, Oakdale Irrigation District, and South San Joaquin Irrigation District was executed on September 29, 2015. DWR and San Luis & Delta-Mendota Water Authority purchased 23,000 af of pulse flow releases from Oakdale Irrigation District and South San Joaquin Irrigation District to benefit migratory fish on the Stanislaus River below Goodwin Dam during October and November 2015. The pulse flow releases provided water supply benefits in the Delta that were shared equally between the SWP and the CVP. DWR paid $500 per af for the pulse flow water. (SWPAO #15022)

**Table 9-5 Lower Yuba River Accord Component 4 Water Deliveries, 2015 (acre-feet)**

| Participating Contractor | Component 4 | Carriage Water Losses (20%) | Water Delivered |
|---|---|---|---|
| | [1] | [2] | [1] - [2] |
| **SWP Contractor** | | | |
| Alameda-Zone 7 | 345 | 69 | 276 |
| Coachella | 533 | 107 | 426 |
| Crestline | 2 | 1 | 1 |
| Dudley Ridge | 194 | 39 | 155 |
| Kern | 4,211 | 843 | 3,368 |
| Kings | 40 | 8 | 32 |
| Metropolitan | 8,192 | 1,639 | 6,553 |
| Napa[a] | 124 | 0 | 124 |
| Oak Flat | 24 | 5 | 19 |
| Palmdale | 91 | 19 | 72 |
| San Bernardino | 440 | 88 | 352 |
| Santa Clara | 429 | 86 | 343 |
| Tulare | 375 | 75 | 300 |
| *SWP Contractor Total* | *15,000* | *2,979* | *12,021* |
| **Non-SWP Contractor** | | | |
| San Luis & Delta-Mendota Water Authority | 15,000 | 5,250[b] | 9,750 |
| **Grand Total** | **30,000** | **8,229** | **21,771** |

[a] Carriage loss does not apply to Napa because these contractors are north of the Delta.
[b] San Luis & Delta-Mendota Water Authority's water was pumped through Jones Pumping Plant by Reclamation with deliveries reduced by 35 percent carriage water losses.

## Westlands Water District

An agreement between DWR and Westlands, executed June 29, 2015, allowed for the introduction of up to 30,000 af of Westlands' local groundwater within Westlands' service area in Reaches 4 through 7 of the California Aqueduct through October 30, 2015. During 2015, a total of 26,835 af of Westlands' water was pumped into the California Aqueduct under this agreement. (SWPAO #15019)

An amendment was executed February 10, 2015, to extend the term of an agreement between DWR and Westlands. The original agreement (SWPAO #14010) executed July 15, 2014, approved the introduction of up to 30,000 af of Westlands' local groundwater into the California Aqueduct, and provided for the conveyance and delivery by DWR to Westland's turnouts in Reaches 4 through 7 of the California Aqueduct through October 31, 2014. This amendment (SWPAO #14010-B) extends the term of the agreement to February 28, 2015. In 2015, Westlands introduced 4,297 af of local water into the California Aqueduct; DWR conveyed and delivered to Westlands a total of 3,641 af within the San Luis Canal portion (Reaches 4–7) of the California Aqueduct. Westlands made available, as mitigation to the SWP, 568 af for allocation to the SWP water contractors. (SWPAO #14010 and SWPAO #14010-B)

## Del Puerto Water District

An exchange agreement among DWR, Reclamation, Del Puerto Water District, and Oak Flat, executed May 14, 2014, approved the exchange of up to 2,000 af of Del Puerto Water District's CVP water supplies for an equivalent amount of Oak Flat's approved SWP water supplies through April 30, 2015. DWR will deliver up to 2,000 af of approved SWP water supplies to Del Puerto Water District using Oak Flat's turnouts in the California Aqueduct. In exchange, Reclamation will make an equivalent amount of Del Puerto Water District's CVP water supplies available to DWR at O'Neill Forebay. DWR filed a petition with the SWRCB, and received a 1-year approval order, effective May 1, 2014, for the consolidation of SWP and CVP places of use. During 2015, a total of 19 af was delivered to Oak Flat's turnouts under this agreement. (SWPAO #13022)

## Reclamation and Kern National Wildlife Refuge—U.S. Fish and Wildlife Service

A letter agreement sent by DWR on September 17, 2012, and accepted by Reclamation on September 21, 2012, provided for DWR to deliver up to 30,500 af of CVP water to the Kern National Wildlife Refuge from June 1, 2012, through September 30, 2028. Under this agreement, DWR conveys CVP water from the end of Reach 7 of the California Aqueduct to Buena Vista Water Storage District's turnouts in Reaches 10A and 12E. DWR conveyed a total of 10,455 af during 2015. (SWPAO #12309)

## Reclamation—Joint Point of Diversion

In 2012, DWR renewed the joint point of diversion agreement with Reclamation. Under this agreement, DWR makes excess SWP conveyance capacity available to Reclamation for the conveyance of water from the Delta at Banks Pumping Plant. This includes: (1) making up for curtailed water exports from Jones Pumping Plant associated with improving conditions for fish in the Delta; (2) replacing water exports foregone during maintenance and repair of CVP facilities between the Delta and O'Neill Forebay; and (3) conveying Reclamation's share of Component 1 water provided under the Yuba Accord. As part of the joint point of diversion agreement, the first 21,000 af conveyed through Banks Pumping Plant for July, August, and September of each year include a charge for the temporary barriers in the Delta. In 2015, DWR conveyed 8,380 af of water. (SWPAO #12300)

## Reclamation and San Joaquin Valley National Cemetery—U.S. Department of Veterans Affairs

A pending letter agreement among DWR, Reclamation, and the U.S. Department of Veterans Affairs provides for the conveyance of up to 850 af of CVP water to Reach 2B of the California Aqueduct for the U.S. Department of Veterans Affairs' San Joaquin Valley National Cemetery. DWR delivered a total of 210 af to the national cemetery through Reach 2B of the California Aqueduct in 2015 under this pending agreement. (SWPAO #10310)

## Reclamation and Byron Bethany Irrigation District—Musco Family Olive Company

A pending agreement among DWR, Byron Bethany, and Reclamation provides for the conveyance of up to 800 af of Byron Bethany's CVP water to repayment Reach 2A of the California Aqueduct for use by Musco Family Olive Company. DWR delivered a total of 453 af in 2015 under this pending agreement. (SWPAO #04300)

## Reclamation and Cross Valley Canal Contractors

Through eight, 3-party contracts, and the corresponding changes in points of delivery associated with Cross Valley Canal (CVC) contracts with Reclamation and CVC water contractors, DWR conveys CVP water for CVC water contractors. The following eight CVP water contractors are defined as CVC water contractors: the County of Fresno, County of Tulare, Hills Valley Irrigation District, Kern-Tulare Water District, Lower Tule River Irrigation District, Pixley Irrigation District, Rag Gulch Water District, and the Tri-Valley Water District.

During 2015, DWR did not convey any water for the CVC water contractors.

## Delta Settlement Agreements

DWR negotiated contracts with various Delta agencies to settle adverse impact claims by the agencies against DWR due to operation of the SWP. Water deliveries to these agencies in 2015 are reported in the sections covering deliveries to non-SWP agencies later in this chapter.

### *Byron Bethany Irrigation District*

Byron Bethany executed an agreement with DWR on May 28, 2003, that describes the nature and extent of Byron Bethany's right for the diversion of water from the Delta for agricultural, municipal, and industrial uses within the district. This agreement terminated a 1993 exchange agreement.

### *City of Antioch*

DWR and the City of Antioch executed an agreement on April 11, 1968, that requires DWR to reimburse the City of Antioch for decreases in usable San Joaquin River water availability caused by operation of the SWP. The agreement was amended October 29, 2013 to update boundaries and clarify measurement definitions. DWR reimburses the City of Antioch for the purchase of substitute water when the number of usable days, as defined by the contract, is below 208. Credits for the number of usable days above 208 in this same period accrue to offset the water-day deficiencies in future years.

In 2015, DWR determined that 45 usable days were available to the City of Antioch, and there were no credits to offset the deficiency of 163 days. DWR reimbursed the City of Antioch $1,386,287 for the purchase of substitute untreated water.

### *Contra Costa Water District*

DWR and Contra Costa Water District (Contra Costa) executed an agreement on April 21, 1967, that requires DWR to reimburse Contra Costa for decreases in availability of usable river water in Mallard Slough caused by operation of the SWP. DWR reimburses Contra Costa for the purchase of substitute water when the number of usable days, as defined by the contract, is below 142. Credits for the number of usable days above 142 in this same period accrue to offset the water-day deficiencies in future years.

In 2015, DWR determined that 10 usable days were available to Contra Costa, and there were no credits to offset the deficiency of 132 days. DWR reimbursed Contra Costa $337,499 for the purchase of substitute untreated water. The reimbursement included energy costs for pumping water into Los Vaqueros Reservoir for later release as substitute water.

### *East Contra Costa Irrigation District*

East Contra Costa Irrigation District (East Contra Costa) executed an agreement with DWR on January 7, 1981, that requires East Contra Costa to make payments to DWR for the assurance of adequate water supply and specific water quality from Delta channels. An agreement executed April 11, 1991, with DWR, East Contra Costa, and Contra Costa

allows for intake at Rock Slough on Contra Costa Canal by Contra Costa to treat water for municipal and industrial users within East Contra Costa's service area. It was amended February 7, 2000, to allow diversions under both contracts at the Rock Slough intake of the Contra Costa Canal and the Los Vaqueros Reservoir intake at Old River.

East Contra Costa paid DWR $38,145 for the assurance of adequate water supply and specific water quality in 2015.

### *North Delta Water Agency*

North Delta Water Agency's (North Delta) agreement with DWR, executed January 28, 1981, requires North Delta to make payments to DWR for the assurance of adequate water supply and specific water quality from Delta channels. An amendment signed on January 21, 1997, changed the monitoring station at Emmaton to Three Mile Slough and reduced North Delta's payments in lieu of assessments on land DWR owns within North Delta's jurisdiction. A memorandum of understanding was executed on May 26, 1998, to establish the joint position with respect to implementation of water quality objectives contained in the 1995 Bay-Delta water quality control plan.

An agreement executed on May 21, 2008, resolved a lawsuit regarding the Department of Fish and Wildlife's land within North Delta boundaries. The 2008 agreement expired May 4, 2011. DWR is negotiating with the Department of Fish and Wildlife and North Delta on a new agreement to replicate the functionality of the 2008 agreement.

North Delta paid DWR $368,711.96 for the assurance of adequate water supply and specific water quality in 2015.

In 2015, North Delta experienced a drought emergency as defined by the 1981 contract. DWR developed an expedited claims procedure and provided it to North Delta for its review.

### *South Delta Water Agency*

In September 1990, DWR completed negotiations for a long-term agreement with South Delta Water Agency and Reclamation. The parties agreed to proceed with the design, construction, and operation of certain barrier facilities in South Delta channels. These facilities resolved portions of the lawsuit that South Delta Water Agency filed in 1982 regarding the alleged effects of export pumping by the SWP and CVP on water levels, quality, and circulation in the South Delta.

DWR has installed and operated temporary barrier facilities in the South Delta to improve area conditions and collect data needed to design and operate permanent barrier facilities. Ongoing efforts are being made to improve water levels, circulation, and quality in South Delta channels. These efforts have included modifying and dredging around local diverters' intakes, conducting a series of computer modeling studies, and modifying barrier flap gate operations.

# Water Deliveries

## Table A Deliveries

Each year, by October 1, the SWP water contractors submit initial requests for Table A deliveries allocated to them for use in the subsequent calendar year. Initial Table A allocation amounts for the coming year are made by DWR in December. The Table A allocations are based on operations studies that assume 90 percent exceedance of historical water supply (where exceedance refers to the possibility that water supply in the coming year will be less than the historical average annual water supply), current reservoir storage, and total requests by the SWP water contractors. Forecasts for the year are updated as hydrologic conditions change. Table A amounts are

increased or decreased depending on both actual and projected hydrologic conditions, though decreases are rare as the 90 percent exceedance criterion is fairly conservative.

On October 1, 2014, SWP water contractors submitted initial requests for 2015 totaling 4.17 million acre-feet (maf).

DWR approved delivery of 0.42 maf on December 1, 2014, resulting in initial Table A amounts of 10 percent of SWP water contractor requests. DWR increased the 2015 Table A amounts to 0.83 maf, for a final allocation of 20 percent, on March 2, 2015.

Table 9-6 lists the changes in Table A amounts that were approved by DWR based on updated hydrologic conditions.

**Table 9-6 2015 Allocated Table A Amounts**

| Notice to SWP Contractors No. | Allocation Amount (maf) | Percentage of Requested Water |
|---|---|---|
| 14-10 | 0.42 | 10 |
| 15-01 | 0.63 | 15 |
| 15-03 | 0.83 | 20 |

## 2015 Water Deliveries

In 2015, a total of 2,104,264 af of SWP and non-SWP water was delivered to 29 long-term SWP water contractors and 19 non-SWP agencies. The SWP portion totaled 1,336,889 af, and the non-SWP portion totaled 767,375 af.

The 1,336,889 af delivered to SWP water contractors was categorized as follows:

- 640,444 af of Table A water;
- 37,011 af of transfers and exchanges of Table A water;
- 3,000 af of Turn-Back or Multiyear Water Pool Program water;
- 131,990 af of carryover water;
- 690 af of Article 21 water;
- 347 852 af of water bank recovery;
- 128 871 af of delivery of backup water;
- 728 af of settlement water;
- 2 af of SWP water for parks and recreation;
- 12,025 af of 2015 Yuba Accord Dry Year Purchase Program water;
- 7,716 af of local water;
- 4,870 af of permit water; and
- 21,690 af of other non-SWP programs.

The 767,375 af portion delivered to 19 non-SWP agencies was categorized accordingly:

- 39,058 af of SWP contracted supply;
- 26,181 af of water bank recovery;
- 689,930 af of regulated delivery of local supply;
- 211 af for parks and recreation;
- 877 af for fish and wildlife;
- 10,455 af for Kern National Wildlife Refuge; and
- 663 af for annual contracts.

Figure 9-1 shows amounts of water delivered to various locations during 2015.

Specific information about water deliveries made to SWP water contractors and other agencies during 2015, and historical deliveries from 1962 through 2015, is presented in the following four sections, each with a corresponding table located at the end of the chapter:

- Water Delivered to Long-term SWP Water Contractors in 2015, by Service Area (Table 9-7);
- Total Amounts of Water Delivered in 2015, by Month (Table 9-8);
- Total Amounts of Annual Table A Water and Water Conveyed, by Type, 1962–2015 (Table 9-9); and
- SWP Water Delivered by Category, 1962–2015 (Table 9-10).

**Figure 9-1 Water Delivered in 2015 and Delivery Locations of Long-term SWP Water Supply Contractors and Feather River Area Districts with Water Rights Agreements with DWR**

Please note that the water delivery figures listed are accurate at the time of this Bulletin 132 publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than was available at the time of publication, please consult the most recent edition of Bulletin 132 and/or contact DWR staff in the State Water Project Analysis Office.

## 2015 Water Deliveries to Long-term SWP Water Contractors

Table 9-7 shows amounts delivered in 2015 by service area. The following information is arranged by column number.

### *Table A Water Delivered*

Columns 1 through 5 show a detailed breakdown of Table A water delivered for SWP water contractors in 2015.

### *Multiyear Water Pool Program*

Column 3 shows 3,000 af of Multiyear Water Pool Program water delivered to SWP water contractors in 2015.

### *Carryover Table A Water Delivered in 2015*

Column 4 shows a total of 132,255 af was carried over from previous years for delivery in 2015, which includes deliveries to non-SWP agencies.

The carryover program was designed to encourage the most effective and beneficial use of water and to avoid obligating the SWP water contractors to use or lose water by December 31 of each year. The SWP water contractors' long-term water supply contracts and amendments state the criteria for carrying over Table A water from one year to the next under Articles 12(e), 14(b), and 56(c).

### *Total Table A Water Delivered*

Column 5 shows all Table A water delivered in 2015—a total of 851,503 af.

### *Article 21*

Column 6 shows Article 21 water delivered to SWP water contractors. In 2015, 690 af of Article 21 water was delivered.

### *Other SWP Water*

Column 7 shows 728 af of other SWP water. Other SWP water consists of settlement water delivered to Solano.

### *Total SWP Water Delivered*

Column 8 shows a total of 852,921 af of SWP water was delivered in 2015. This includes total Table A water, Table A carryover water, Multiyear Water Pool Program water, and other SWP water consisting of settlement water.

### *Non-SWP Water Deliveries*

Columns 9, 10, and 11 include deliveries of non-SWP water to long-term water contractors. Column 9 shows delivery of 128,871 af of backup water, Column 10 shows 347,852 af of water bank recovery, and Column 11 shows 46,303 af of other non-SWP water. Other non-SWP water is local and permit water that an SWP water contractor has a water right to, or has purchased from, exchanged with, or transferred from non-SWP agencies.

### *Total Deliveries*

Column 12 shows total amounts of water delivered to SWP water contractors. In 2015, the SWP delivered 1,375,947 af of water to the 29 SWP water contractors.

## Water Delivered in 2015 by Month

During 2015, the SWP provided water service to 48 agencies, including 29 SWP water contractors. The amounts of water delivered by month to all agencies are listed in

Table 9-8 and are summarized below as SWP water and non-SWP water.

## SWP Water

SWP water, as defined in the long-term water supply contracts, includes current year Table A amounts, transfer and exchange of Table A water, carryover of Table A water, Turn-Back Pools A and B water, Multiyear Water Pool Program water, and Article 21 water. Detailed information concerning those conveyances for 2015 is found under the "Miscellaneous Agreements with Long-term SWP Water Contractors" section in this chapter's preceding pages or is listed below.

## Non-SWP Water

In 2015, DWR used SWP facilities to convey non-SWP water for various non-SWP agencies according to the terms of water rights and water transfer and exchange agreements. Detailed information concerning those deliveries is in this chapter's preceding pages or is listed below.

**Last Chance Creek Water District.** Under the water supply agreement between DWR and Last Chance Creek Water District, dated April 29, 2013, a total of 4,542 af was supplied from Frenchman Lake to Last Chance Creek Water District.

**Water Rights Water.** Water in this category is transported through SWP facilities to agencies with settlement agreements with DWR. Some water passes through SWP transportation facilities; some is stored in SWP reservoirs for release later. In 2015, the following water was delivered to the Feather River, North Bay, South Bay, Delta, and Southern California areas, as summarized below.

***Feather River Area.*** Seven non-SWP agencies received 664,207 af, under their water right settlement agreements, as follows:

- Garden Highway Mutual Water Company, 10,481 af;
- Joint Water Districts Board, 402,934 af;
- Oswald Water District, 1,501 af;
- Plumas Mutual Water Company, 7,882 af;
- Tudor Mutual Water Company, 2,622 af;
- Western Canal Water District, 238,781 af; and
- Valberde and Ramelli, 6 af.

DWR conveyed local water totaling 6,331 af through SWP facilities on behalf of two non-SWP agencies:

- South Feather Water and Power Agency (formerly Oroville-Wyandotte Irrigation District), 4,740 af; and
- Thermalito Water and Sewer District (formerly Thermalito Irrigation District), 1,591 af.

***North Bay Area.*** Deliveries in the North Bay area included 500 af of Vallejo permit water delivered to Napa, and 728 af of settlement water delivered pursuant to the May 19, 2003, *Settlement Agreement among DWR, Solano County Water Agency, and the Cities of Fairfield, Vacaville, and Benicia*.

***South Bay Area.*** In the South Bay area, a total of 7,690 af of local water was delivered to Alameda-Zone 7 and Alameda County. These two South Bay Aqueduct SWP water contractors hold water rights to runoff from the Lake del Valle watershed.

***Delta.*** In the Delta, 19,392 af of water was delivered to Byron Bethany pursuant to the May 28, 2003, *Agreement Between the Department of Water Resources of the State of California and the Byron-Bethany Irrigation District Regarding the Diversion of Water from the Delta*.

East Contra Costa Irrigation District diverted 18,982 af of water pursuant to the January 7,1981, *Contract Between the State of California Department of Water*

*Resources and the East Contra Costa Irrigation District for the Assurance of a Dependable Water Supply of Suitable Quality*.

***Southern California Area.*** In the Southern California area, 26 af of local runoff from the Houston Creek watershed was stored and delivered to Crestline under water rights held by DWR on Houston Creek. The authorized place of use is limited to the Crestline area.

## Annual Table A Water and Water Delivered Since 1962

Information about 2015 annual Table A water and water conveyed, by type, for the previous 50 years is contained in Table 9-9. The following discussion of conveyed Table A water is arranged according to column numbers.

### *Annual Table A Water*

Columns 1 through 7 of Table 9-9 show the amount of SWP water contractors' annual maximum Table A water by area for years 1962 through 2015 as specified in the Table A schedules of the long-term water supply contracts.

In some instances, Table A schedules—projections of each contractor's need for water to 2035—have been amended to meet the needs of individual contractors. The amounts of annual Table A water each SWP water contractor may request for years 1962 through 2035 can be found in Table B-4 of Appendix B in the back of this bulletin.

### *Water Delivered*

Columns 8 through 16 show water delivered or conveyed, including initial fill water and operational losses and storage changes.

**Table A Water.** Column 8 shows amounts of Table A water delivered each year from 1962 through 2015. In 2015, a total of 851,503 af of Table A water was delivered.

**Article 21 and Unscheduled Water.** Column 9 shows amounts of Article 21 water, as defined under SWP deliveries, and unscheduled water delivered from 1962 through 2015. Article 21 and unscheduled water are water in excess of that required to meet all demands for the year's Table A water and water to be stored in SWP reservoirs. In 2015, 690 af of Article 21 or unscheduled water was delivered.

**Other Water.** Column 10 includes amounts of water classified as other water delivered in 2015, including non-SWP water conveyed through SWP facilities and regulated delivery of local supply. In 2015, a total of 580,841 af of other water was delivered.

**Feather River Diversions.** Column 11 includes amounts of water from the Feather River delivered according to agreements with non-SWP agencies on the Feather River, including Last Chance Creek Water District. In 2015, a total of 670,538 af in this category was delivered to agencies in the Feather River area.

**Recreation and Fish and Wildlife Water.** Column 12 shows water conveyed for recreational use or to improve water quality for fish and wildlife. In 2015, a total of 692 af of SWP water was conveyed for this purpose.

**Initial Fill Water.** The quantities listed in Column 14 represent the amounts used to initially fill the aqueducts and reservoirs south of the Delta to maximum operating capacities. Initial filling began in 1962, with the filling of the South Bay Aqueduct, and was completed in 1979, when Lake Perris reached its maximum operating capacity of 127,000 af. In 1996 and 1997, the Coastal Aqueduct was initially filled.

**Operational Losses.** Column 15 includes the total amounts of water lost through evaporation and seepage, net storage changes in reservoirs south of the Delta, and amounts of inflow from local drainage areas,

including inflows into San Luis Canal and from the Kern River Intertie. Negative values are indicated for years when withdrawals and evaporation from reservoirs south of the Delta exceed the amounts of water added to the reservoirs.

## Historical Water Delivered

Table 9-10 shows SWP water delivered by category from 1962 to 2015.

## Table 9-7 Water Delivered to Long-term SWP Water Contractors in 2015, by Service Area (acre-feet)[a, b]

| Service Area and SWP Contractor | Table A Water Deliveries | | | | | SWP Water | | | Non-SWP Water | | | Total Water Delivered [12] |

[a] Please note that the water delivery figures listed are accurate at the time of this Bulletin 132 publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than was available at the time of publication, please consult the most recent publication of Bulletin 132 and/or contact DWR staff in the State Water Project Analysis Office.

[b] This table includes SWP water that was delivered to non-SWP agencies.

[a] Values include amounts of deliveries to short-term contractors (Mustang Water District, 1970–1972; Tracy Golf and Country Club, 1974, 1979, and 1980; Green Valley Water District, 1974, 1975, 1978, 1979, 1980, and 1985; and Granite Construction Company, 1980).
[b] Includes amounts of SWP and non-SWP water conveyed for SWP and non-SWP water contractors.
[c] Includes amounts of water diverted under various water rights agreements.
[d] Amounts reflect net effect of (1) operational losses from SWP transportation facilities; (2) changes in reservoir storage south of the Delta; (3) storable local inflows to SWP reservoirs; (4) side inflow to San Luis Canal; and (5) inflow into the California Aqueduct from the Kern River Intertie.

## Table 9-10 SWP Water Delivered by Category, 1962–2015 (acre-feet)

[b] Includes water conveyed for SWP and non-SWP water contractors.
[c] Includes amounts of water diverted according to various water rights agreements.

# Chapter 10
# Power Resources

*Power lines near Victor Valley in the Mojave Desert.*

## Significant Events in 2015

Energy used at the 29 State Water Project (SWP) pumping and generating plants totaled 3.49 million megawatt hours (MWh). To meet SWP energy needs, the Department of Water Resources (DWR) purchased 2.59 million MWh of energy at a cost of $81.33 million. This included: (1) 1.95 million MWh of WSPP short-term energy from four marketers (referred to as bilaterals) and two renewable-energy electric utilities at a combined cost of $64.75 million; and (2) 0.64 million MWh of long-term energy at a cost of $16.58 million. Additional energy-associated costs totaled $117.87 million.

Pursuant to WSPP bilateral trades, transactions made under the Lodi Energy Center Power Sales Agreement, transactions under the California Independent System Operator (CAISO), and revenues from other long-term contracts, DWR received a total of $83.35 million.

On November 5, 2015, DWR executed a power purchase agreement with sPower to provide solar power from the Solverde 1 Solar Facility, a solar photovoltaic renewable energy generation facility.

*Information for this chapter was provided by the State Water Project Analysis Office, the SWP Power and Risk Office, the Hydropower License Planning and Compliance Office, and the SWP Operations Control Office.*

Long-term State Water Project (SWP) water contractors depend on the SWP to obtain economical sources of power in order to deliver affordable water. Consequently, the Department of Water Resources (DWR) administers a comprehensive power resources program. Key elements of the program include studies of power resources for future needs, acquisition of long-term power resources and transmission services, short-term purchases or sales of power, and the strategic operation of generation and pumping facilities.

## Power Resources Program

The goals of the SWP power resources program are to:

- obtain reliable, environmentally sensitive, and competitively priced power resources and transmission services sufficient to operate the SWP;
- develop and manage power resources to minimize the cost of water deliveries to SWP water contractors;
- meet responsibilities and criteria of the Western Electricity Coordinating Council (WECC); and
- conform to regulations of the Federal Energy Regulatory Commission (FERC).

To achieve these goals, DWR constructed its own power facilities. Additionally, DWR enters into long-term contracts and short-term arrangements with other electric utilities and with the California Independent System Operator (CAISO) for transmission access and for power purchases and sales. DWR's generators and pumps provide a mix of regulation, spinning, and nonspinning reserves to the CAISO's ancillary services market. DWR's power resources program also takes advantage of SWP water storage and conveyance capacities, which cost-effectively control pump loads and generation.

### Major Electric Utility Industry Developments

In 2015, CAISO continued to address the impact of increasing renewable energy generation and the need for greater ramping capability to maintain grid reliability.

In April 2015, CAISO and PacifiCorp entered into a memorandum of understanding to explore the feasibility, costs, and benefits of PacifiCorp joining CAISO as a Participating Transmission Owner. In October 2015, the Governor signed Senate Bill 350, the Clean Energy and Pollution Reduction Act of 2015, which requires that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by 2030 and for CAISO to study the impacts of becoming a regional grid operator.

Throughout 2015, CAISO continued to work on governance of and enhancements to the Energy Imbalance Market (EIM), which allows other balancing area authorities to participate in CAISO's real-time market. The purpose of the EIM is to provide market efficiency by allowing other regions to share resources that are intended to be more economic. At the end of 2015, PacifiCorp, Puget Sound Energy, Arizona Public Service, and Portland General Electric had committed to CAISO EIM participation. The participation of these regional utilities with resources in California, Oregon, Washington, Utah, Wyoming, Idaho, Nevada, and Arizona

expanded the pool of generating resources bidding energy into the CAISO real-time market.

On April 29, 2015, FERC waived CAISO's requirement to reinstate convergence bidding at interties due to CAISO's findings related to potential market inefficiencies that could allow market gaming opportunities.

In June 2015, Peak Reliability completed its separation from WECC. Peak Reliability was formed as an independent company to perform the reliability coordinator services previously performed by WECC.

In July 2015, CAISO kicked off its stakeholder initiative on the Flexible Resource Adequacy Criteria and Must-Offer Obligation (Phase 2) as a continuation to the flexible capacity stakeholder process that was initiated in January 2012. Phase 2 is meant to enhance the Phase 1 processes, including flexible capacity from external resources through interties and from storage resources. It also kicked off its Reliability Services Initiative (Phase 2) to enhance resource adequacy provisions such as substitution of forced outages and Local Regulatory Authority interaction and process alignment.

In order to comply with the interregional planning requirements established by FERC Order 1000, the four planning regions—CAISO, ColumbiaGrid, Northern Tier Transmission Group, and WestConnect—agreed to hold at least one coordination meeting a year to inform stakeholders about each region's current planning activities and coordination efforts. During 2015, significant events included the completion of required regional planning processes by the four regional entities and ongoing dialog among the planning regions to develop a process for coordinating transmission planning information.

On October 23, 2015, CAISO released an issue paper to evaluate whether revisions to its existing Transmission Access Charge rate structure are appropriate when adding a new large utility with a load service territory (e.g., PacifiCorp) to the CAISO's existing Balancing Authority Area, creating an expanded Balancing Authority Area footprint. This initiative's focus is on high-voltage transmission rate recovery only. The various alternatives presented in the issue paper are meant to initiate discussion of potential Transmission Access Charge structures for consideration as alternatives to the existing structure.

Also in 2015, CAISO, along with the California Energy Commission and California Public Utilities Commission, introduced the Renewable Energy Transmission Initiative 2.0 to facilitate electric transmission coordination and planning as the State looks to increase to a 50 percent renewable portfolio standard.

## DWR Participation in Electric Utility Industry Activities

DWR continued to participate in CAISO's stakeholder processes to help ensure that tariff and business practice manuals are compatible with SWP operations. DWR's participation in CAISO stakeholder processes focused on the following primary elements in 2015:

- Market Initiatives Roadmap;
- Stakeholder Initiatives Catalog;
- Intertie Convergence Bidding;
- 2-Tier Real-time Bid Cost Recovery;
- Energy Storage and Distributed Energy Resources, Phase 1;
- Grid Management Charge rate structure for 2016;
- Pay for Performance;
- Bidding Rules Enhancements FERC Order 809;
- Load Granularity Refinements;
- Barriers to demand response;
- FERC Order 764 compliance;

- Commitment Cost Enhancements, Phases 2 and 3;
- Pricing Enhancements;
- Flexible Ramping Product;
- EIM Enhancements;
- Generator Interconnection Process Enhancements;
- Reactive Power Requirements;
- Transmission planning;
- FERC Order 1000 compliance, Phase 2;
- Local capacity procurement for 2016 requirements;
- Annual Resource Adequacy processes including the Path 26 allocation, import allocation, and net qualifying capacity; and
- Flexible Capacity Procurement process for 2017—Capacity Procurement Mechanism tariff language.

In addition, DWR participated in the California Energy Commission's planning processes by submitting a demand forecast to the commission.

Besides CAISO and the California Energy Commission stakeholder processes, DWR participated in FERC proceedings to help ensure that various market requirements or cost allocation mechanisms were appropriately structured. This included the following major processes and litigations (with FERC docket numbers given in parenthesis, if applicable):

- CAISO's Multi-stage Generation enhancements (ER14-93, ER14-1004, ER15-1875);
- CAISO's Demand Response Report (ER06-615);
- CAISO's EIM (ER13-1372, ER14-1729, EL15-53, ER15-1196, ER15-1919);
- CAISO's Amendment to Participating Load Agreement (ER15-1805);
- CAISO's Two-tier Real-time Bid Cost Recovery (ER06-615);
- CAISO's Commitment Cost Enhancements (ER15-15);
- CAISO's Convergence Bidding at Interties (ER14-480, ER15-1451);
- CAISO's Order 1000 Compliance (ER13-1470);
- Pacific Gas & Electric Company's (PG&E) TO17 proposal to increase transmission revenue requirement rates for retail and wholesale customers of CAISO (ER15-2294);
- San Diego Gas & Electric's TO4—Cycle 3 proposal to increase transmission revenue requirement rates for retail and wholesale customers of CAISO (ER16-445);
- Southern California Edison's (SCE) fourth annual update to its approved formula rate (ER11-3697);
- SCE's proposed annual update to its Transmission Revenue Balancing Account (ER16-175) and Reliability Services tariff (ER16-174);
- San Diego Gas & Electric's proposed annual update to its Transmission Revenue Balancing Account Adjustment and Transmission Access Charge Balancing Account Adjustment (ER16-550);
- PG&E's proposed annual update to its Transmission Revenue Balancing Account (ER16-42);
- TransCanyon's initial transmission owner tariff, which includes a formula rate designed to calculate annual transmission revenue requirement (ER15-1682);
- NextEra Energy Transmission West's initial transmission owner tariff, which includes a formula rate designed to calculate annual transmission revenue requirement (ER15-2239); and
- PG&E's notice of termination of the Comprehensive Agreement between PG&E and the State of California Department of Water Resources State Water Project (Comprehensive Agreement) (ER15-223) and PG&E's filing of new load and generator interconnection agreements with DWR (ER15-227).

In April 2015, DWR submitted a motion to intervene in Cases No. 15-1057 and 15-1241 (consolidated) before the U.S. Court of Appeals for the District of Columbia Circuit, which were petitioned by the Transmission Agency of Northern California, Modesto Irrigation District, the City of Santa Clara, and the City of Redding. The petitioners are seeking to appeal FERC orders (EL14-44 and ER15-223) relating to a complaint versus PG&E, alleging a breach of PG&E's contractual obligations to them under the operating agreement for the California-Oregon Intertie resulting from the loss of DWR participation in PG&E's Pacific AC Intertie remedial action schemes with termination of the Comprehensive Agreement. Briefs will be due beginning in February 2016.

## Bulk Electric System Reliability Standards

### *Background*

The Energy Policy Act of 2005 assigned FERC the responsibility for bulk electric system reliability and required the creation of an Electric Reliability Organization. The North American Electric Reliability Corporation (NERC) was named the Electric Reliability Organization by FERC in July 2006 and was tasked with establishing reliability standards for the bulk electric system. Compliance with NERC reliability standards is mandatory.

WECC was named by NERC and approved by FERC as the regional entity responsible for enforcing a reliable bulk electric system in the Western Interconnection, which includes both western Canada and the western United States. WECC oversees implementation of standards and validation of compliance, including assessment of penalties and/or sanctions. Details of the NERC standards and the attributes of the compliance program appear in Bulletin 132-11.

### *NERC Reliability Compliance—Internal Compliance Program Improvements*

In March 2015, DWR executed a settlement agreement with WECC regarding possible violations of NERC's reliability standards. As a result of this settlement agreement, DWR improved its internal compliance program (ICP) to foster a culture of partnership with WECC by committing to:

- encourage communication and collaboration with WECC;
- provide all relevant information, as well as mitigating factors, when making self-reports to WECC if DWR discovers possible violations of NERC reliability standards;
- respond timely to WECC data requests, and promptly escalate unresolved issues to higher-level employees;
- ensure knowledgeable staff is readily available to respond to WECC by assigning properly trained owners to each applicable NERC standard and instituting advanced internal deadlines to reduce the need for extension requests.

Additionally, to ensure that DWR is adhering to NERC's reliability standards and DWR's own internal procedures, DWR modified existing policies and processes to incorporate annual internal spot-check/audits on 20 percent of applicable NERC reliability standards and on DWR's internal procedures that relate to compliance.

Pursuant to its ICP, DWR's Compliance and Regulatory Office conducted an internal audit of DWR's compliance to its nine existing ICP policies and associated processes and twelve NERC reliability standards, which is 20 percent of the standards applicable to DWR. DWR used the audit results to improve and strengthen the ICP.

In 2015, NERC implemented its Risk-Based Compliance Monitoring and Enforcement Program to replace its previous

zero-tolerance program. Under this new program, entities that have effective internal controls and low reliability risks may receive fewer audits from NERC and WECC, reduced audit scope, and reduced penalties for noncompliance.

NERC also continued to help the industry transition to Version 5 of the Critical Infrastructure Protection Reliability Standards (CIP Version 5) to further mitigate cyber risks to the bulk power system. In response, DWR developed its CIP Version 5 transition plan to ensure that DWR is in compliance by the implementation date.

In compliance with the requirements of the reliability standards, DWR also submitted its annual self-certification to WECC in February 2015. This was done to certify DWR's compliance with the requirements of a WECC-determined subset of standards or to provide a violation report supported by a mitigation plan to resolve outstanding items. Violations can lead to financial penalties or reduced operating flexibility.

In addition, NERC annually creates a 3-year plan to address reliability standards development and revision. DWR's Division of Operations and Maintenance monitors this plan to ensure compliance with standards as they change.

## Greenhouse Gas Management

In 2015, DWR reported its pump load, sulfur hexafluoride emissions, and generation for 2014 to the California Air Resources Board. DWR's sulfur hexafluoride emissions were below the maximum allowable limit; however, because the allowable limit will be lower in future years, DWR is developing plans to reduce its sulfur hexafluoride emissions. DWR also reported its greenhouse gas (GHG) emissions for 2014 to The Climate Registry and submitted its fossil fuel report for 2014 to the Governor's Office.

To meet its contractual obligation for the Lodi Energy Center's cap and trade compliance cost, DWR continued participating in allowance auctions conducted jointly by the California Air Resources Board and Québec's Ministry of Sustainable Development, Environment and the Fight against Climate Change.

## Hydropower License Planning and Compliance

DWR holds three hydropower licenses and two conduit exemptions issued by FERC: Oroville Facilities, FERC Project No. 2100; South SWP Hydropower, FERC Project No. 2426 (P-2426); Pine Flat Transmission Line, FERC Project No. 2876; Alamo Powerplant Project, FERC Project No. 14579; and Mojave Siphon Powerplant Project, FERC Project No. 14580. FERC licenses and conduit exemptions may contain terms and conditions related to operations, maintenance, engineering, dam safety, security, environmental and cultural resources, recreation, and public safety. FERC also conducts safety, security, and environmental inspections, and DWR is required to comply with all findings of the inspections. Compliance with FERC requirements is an important function of DWR organizations since FERC has the authority to levy fines for noncompliance. FERC also considers the record of compliance when considering the term of license renewals.

### *Oroville Facilities Relicensing*

On January 26, 2005, DWR filed an application with FERC requesting a new license for the Oroville Facilities. (More detailed information about the relicensing process is available in previous editions of Bulletin 132.) The existing 50-year license expired January 31, 2007; FERC is issuing annual licenses under the same terms and conditions as the expired license until the new license is issued. Issuance of the new

license has been delayed pending issuance of the National Marine Fisheries Service (NOAA Fisheries) biological opinion.

DWR certified the final environmental impact report on July 22, 2008. One month later, Butte and Plumas counties filed a lawsuit challenging the adequacy of the environmental impact report. The case was heard in January 2012, and the court ruled in DWR's favor. (More detailed information about the original lawsuit is available in previous editions of Bulletin 132). However, Butte and Plumas counties filed an appeal of the decision on August 6, 2012. Opening and responding briefs were filed on February 14, 2013, and June, 24, 2013, respectively. In addition, *State Water Contractors Inc., et al.* filed a respondent's brief on June 10, 2013, and Butte and Plumas counties filed an appellant's reply brief on July 31, 2013. In 2014 and 2015, the parties filed supplemental briefs in response to the court's request. A trial date to hear arguments has not yet been set.

The Habitat Expansion Agreement (HEA) submitted by DWR and PG&E to NOAA Fisheries for Central Valley salmon and steelhead in 2010 required preparation of a Habitat Expansion Plan (completed in 2010 with NOAA Fisheries consultation initiated in 2012) and annual reporting of activities undertaken to implement the HEA. On January 9, 2014, NOAA Fisheries provided DWR and PG&E with a letter explaining the bases for its determination that the measures contained in the Habitat Expansion Plan would not fulfill the fish enhancement goals of the HEA. On August 24, 2015, DWR submitted an annual report describing the activities of the previous 12 months toward implementing the HEA.

### *South SWP Hydropower*

In 2015, DWR initiated an extensive information gathering effort for the pre-application document for the FERC relicensing of South SWP Hydropower. As a part of this effort, on July 8, 2015, DWR mailed a notice and a questionnaire to agencies and potential stakeholders who may have an interest in the relicensing process. The questionnaire solicited information pertaining to the existing environment and potential effects of continued operation and maintenance of the South SWP Hydropower facilities. This information will be included in the pre-application document. The pre-application document and notice of intent for relicensing are due to FERC by January 31, 2017.

On December 11, 2015, FERC issued an order approving DWR's request to permanently close Hardluck Campground and remove it as a requirement of the South SWP Hydropower license. Hardluck Campground has been closed to public use periodically since 2001, and to all camping use since 2008, to protect habitat for the Arroyo Toad (*Anaxyrus californicus*), which is listed as endangered under the federal Endangered Species Act. In the order, FERC also required DWR to file a demand analysis report by April 30, 2016, clearly specifying whether or not there is sufficient demand to replace Hardluck Campground with a similar camping facility.

## Existing SWP Power Facilities

Figure 10-1 shows the names, locations, and nameplate capacities of DWR's primary power facilities.

### *Hydroelectric*

Hydroelectric generation provides the largest share of SWP power resources. The combined Hyatt Pumping-Generating Plant and Robie Thermalito Pumping-Generating Plant (Hyatt-Thermalito) generate about 2.2 billion kilowatt hours (kWh) of energy in a median water year, while the 3 megawatts (MW) from the Thermalito Diversion Dam Powerplant adds another 24 million kWh per year.

*CVP* = Central Valley Project
*KRCD* = Kings River Conservation District
*LADWP* = Los Angeles Department of Water and Power
*MWD* = The Metropolitan Water District of Southern California
*NCPA* = Northern California Power Agency

**Figure 10-1 Names, Locations, and Nameplate Capacities of Primary Long-term Power Facilities**

Generation at California Aqueduct recovery plants—Alamo, Devil Canyon, Gianelli, Mojave Siphon, and Warne—varies with the amount of water conveyed. These five plants generate about one-sixth of the total energy used by the SWP.

### *Renewables*

Dominion's RE Camelot solar photovoltaic project near Mojave, California in southeastern Kern County began full commercial operation December 23, 2014, and began delivering renewable, GHG emission-free energy to the CAISO grid to meet a portion of the energy needs for operation of SWP pump loads. The facility's single-axis photovoltaic panels directionally track the sun's movement to maximize the panels' efficiency. The 45 MW plant is expected to deliver approximately 124,000 MWh of annual generation.

SunPower will design, build, operate, and maintain a 9.5 MW single-axis solar photovoltaic facility adjacent to the Pearblossom Pumping Plant. This solar facility is expected to begin commercial operation in December 2016. DWR will receive all of the energy and associated renewable credits from the facility. The plant is expected to deliver approximately 27,400 MWh of annual generation.

Solverde 1, a solar photovoltaic renewable energy generation facility, is expected to commence commercial operation on December 31, 2016. The 85 MW plant is expected to deliver approximately 230,000 MWh of annual generation.

## DWR Power Planning Activities

DWR does long-term power planning for the SWP through periodic development of an Integrated Resource Plan (IRP). The IRP concludes with plans for long-term and mid-term power procurements necessary to provide power to operate the SWP and ensure rate stability through energy market disruptions. IRP 2013 will be succeeded by IRP 2016; development of the new IRP began in the fall of 2015. IRP 2016 will look at current and future SWP operational scenarios and the corresponding power portfolio needs and uncertainties. Findings and recommendations of previous plans will be updated based on current market developments and constraints.

DWR had completed a power planning study in 2011 of the economic viability of a second unit at the Alamo Powerplant, which would be a qualified renewable small hydroelectric facility. The project was shown to provide substantial energy and GHG reduction benefits to DWR. Following the power planning study, DWR initiated a design study in 2012 to determine whether a surge chamber would be required and to finalize the project cost estimates. A project implementation decision will be made following completion of the design and cost studies.

In May 2012, DWR's California Environmental Quality Act Climate Change Committee oversaw the completion of DWR's Climate Action Plan (CAP) Phase I: GHG Emissions Reduction Plan that established DWR's overall GHG emissions strategy. CAP Phase I assesses GHG emissions from on-going activities, sets goals for GHG reductions that will exceed State GHG mandates, and presents plans for how emissions reductions will be achieved. It memorialized the previously approved SWP Renewable Energy Procurement Plan, which had been completed in February 2010, as the method to achieve the SWP's CAP Phase I emission reduction goals. DWR initiated renewable energy procurements in late 2012 and 2013 in accordance with the CAP Phase I and Renewable Energy Procurement Plan.

In 2015, DWR procured GHG compliance instruments to meet its compliance and contractual obligations under the Cap

and Trade Program administered by the California Air Resources Board.

## Contractual Resource Arrangements

Through joint development, DWR obtains a significant amount of capacity and energy for SWP operations from other utilities throughout California and the Southwest. However, with the implementation of the CAISO Market Redesign and Technology Upgrade (MRTU) in April 2009, and implementation of CAISO's power markets that provide access to affordable day-ahead and real-time energy, DWR is less reliant on marketers and other utilities to meet its net energy needs.

### *Joint Developments*

In 1966, DWR entered into a contract with the Los Angeles Department of Water and Power (LADWP) for joint development of the West Branch of the California Aqueduct. LADWP constructed and operates Castaic Powerplant, which is a pumped-storage facility connected to the LADWP transmission system at the Sylmar Substation. DWR receives capacity and energy at the Sylmar Substation based on weekly water schedules through the West Branch.

Gianelli Pumping-Generating Plant is a joint-use facility owned and operated by DWR and the Bureau of Reclamation. DWR's share is 222 MW, and the Bureau of Reclamation's share is 202 MW.

### *Long-term Purchase Agreements*

In 1979, DWR entered into a contract with Kings River Conservation District to receive the output of the 165 MW hydroelectric Pine Flat Powerplant. The power plant supplies the SWP with about 400 million kWh of energy in median water years.

DWR also contracts for the energy output of five hydroelectric plants totaling 30 MW owned and operated by The Metropolitan Water District of Southern California (Metropolitan).

In May 2010, DWR entered into an agreement with the Northern California Power Agency (NCPA) and various public agencies to finance, construct, operate, and maintain the Lodi Energy Center—a 280 MW natural gas combined cycle combustion turbine generation facility that NCPA would own and operate, and from which DWR would receive 33.5 percent of the output. The facility achieved its commercial operation date on November 27, 2012.

In an effort to add "green" generating resources to the SWP's energy portfolio, DWR entered into a renewable Power Purchase Agreement with Alameda Municipal Power that started in 2012. The contract provides certified renewable energy, with 28.3 MW from an existing geothermal project and 5.3 MW from landfill gas energy. Under this agreement, DWR receives an estimated 183,000 MWh of annual generation. The geothermal plants are owned and operated by NCPA and are located at The Geysers geothermal field in Middletown, California. The landfill gas energy under the new contract will come from the Republic Services Ox Mountain Landfill gas-to-energy plant in Half Moon Bay, California. The plant is owned and operated by a subsidiary of Ameresco, Inc. Landfill gas is created when organic waste decomposes, producing methane—the primary ingredient in natural gas and a GHG. The contract with Alameda Municipal Power helps DWR meet its goal of reducing emissions by 50 percent below 1990 levels by 2020. The agreement term is October 15, 2012, through December 31, 2016.

On March 13, 2014, DWR executed a consent and amendment agreement with RE Columbia and RE Camelot transferring the RE Columbia generation facility to RE Camelot. Under a 20-year power purchase

agreement through 2034, the 45 MW plant is expected to deliver approximately 124,000 MW of annual generation.

On October 5, 2015, a 20-year power purchase agreement, with an optional 10-year extension, was executed between DWR and SunPower Corporation to provide solar photovoltaic renewable energy to the SWP. The solar facility will be located adjacent to the SWP Pearblossom pumping facility.

On November 5, 2015, DWR executed a 20-year power purchase agreement, through 2036, with Solverde 1 for solar photovoltaic renewable energy.

On December 16, 2015, DWR executed a WSPP agreement with Metropolitan for the purchase of 51.4 MW of capacity and renewable energy credits bundled with energy. The contract provides certified renewable energy from five small hydro plants, owned and operated by Metropolitan. Under this agreement, DWR will receive an estimated 54,574 MWh of annual energy and renewable energy credits. The agreement term is January 1, 2016, through December 31, 2020.

The renewable energy procured under these agreements will further increase the amount of renewable and zero GHG emission energy used by the SWP and will help DWR meet its 2020 GHG emission reduction goals.

### *Short-term Purchase Agreements*

DWR typically transacts with member utilities and energy marketers of the WSPP. In 2015, these transactions included energy and capacity to meet the requirements of resource adequacy, which is a planning and procurement process to ensure adequate resources.

In addition to transactions under the WSPP master agreement, DWR can purchase surplus energy from Metropolitan's Colorado River Aqueduct system according to the terms of the 1988 coordination agreement between DWR and Metropolitan. This agreement also provides for monthly surplus firm and economy energy sales from DWR to Metropolitan and energy exchanges between DWR and Metropolitan.

## Load Management

DWR operates its pumps through an extensive computerized network. This control system, coupled with the operating flexibility of DWR's pumping and generating plants provided by storage reservoirs, allows DWR to maximize pumping during off-peak periods when power costs are lower—usually at night—and maximize power generation during on-peak periods when power costs are higher. By taking advantage of this scheduling flexibility, when not restricted by operating requirements, SWP pump load and generation are optimized to reduce the net cost of power needed for SWP water deliveries.

### *Demand Response*

DWR is the largest single supplier of demand response in the CAISO market via a participating load agreement under which DWR bids SWP load to be curtailed by CAISO when the price of energy in the CAISO market reaches DWR's bid price. Due to DWR's water delivery priority, these bids are normally restricted to contingency events.

## Contractual Transmission Agreements

DWR has contracts with CAISO, PG&E, and SCE for both transmission interconnections and network transmission service for SWP power resources and pumping loads.

The Comprehensive Agreement—a bilateral transmission agreement with PG&E, entered into in 1983, that covered transmission service, interconnection service, and other services—expired on December 31, 2014.

With the termination of the Comprehensive Agreement, all transmission service for DWR facilities in Northern and Central California transitioned to open-access transmission service under the CAISO tariff. For continuation of interconnection service, DWR entered into a successor load interconnection agreement, generation interconnection agreements, and transmission facilities agreements, effective January 1, 2015. The interconnection services for Pine Flat Powerplant are managed under a separate letter agreement with PG&E that does not expire until 2029. The letter agreement was revised, effective January 1, 2015, to remove references to the Comprehensive Agreement and other outdated provisions for consistency with current accepted practices. The DWR/PG&E Midway-Wheeler Ridge Transmission System agreement was revised in November 2015 to remove references to the Comprehensive Agreement and to reflect that transmission service is provided under CAISO.

With the termination of the Comprehensive Agreement on December 31, 2014, DWR's historic participation in PG&E's remedial action system, which allowed PG&E to shed DWR load under certain conditions, was also terminated. Under the new load interconnection agreement, DWR agreed to continue using the remedial action system equipment for an interim period at a limited group of facilities to provide load shed only in the event of a triple line outage of the California-Oregon Intertie 500 kV transmission lines. DWR load shed in this scenario supports the Southern Island Load Tripping plan and is in exchange for PG&E covering underfrequency load shedding requirements associated with SWP load under the WECC coordinated plan.

In Southern California, DWR receives transmission service for SWP loads and resources through CAISO, and DWR has interconnection agreements with SCE. Additionally, DWR has wholesale distribution service agreements with SCE for service over SCE's distribution system from the CAISO interchange points to SWP loads and resources.

In 2015, DWR and SCE continued coordination on the engineering, design, and construction of the new interconnection facilities for Citrus Pump Station, located in San Bernardino County, which is expected to begin start-up in late 2016 and achieve commercial operation in early 2017. In addition, DWR and SCE entered into negotiations for a new distribution service agreement to cover Citrus Pump Station service over SCE's distribution network.

## SWP Power Operations in 2015

Tables 10-1 through 10-4, at the end of the chapter, present historical information about SWP power operations for calendar year 2015, including energy consumed, generated, purchased, and sold. Note that in some instances, these tables may not sum as expected due to rounding.

### Energy Consumed

In 2015, energy used for SWP operations at the 29 SWP pumping and generating plants totaled 3.49 million MWh. According to the terms and conditions of various water conveyance contracts and exchange agreements, some water belonging to the Central Valley Project is pumped through Banks and Dos Amigos pumping plants and Gianelli Pumping-Generating Plant. The Bureau of Reclamation furnishes additional energy for this purpose.

Table 10-1 shows the amount of energy used each month at SWP pumping and power generating plants to operate the SWP in 2015.

## Energy Generated and Purchased

Table 10-2 shows the amounts of energy generated at SWP facilities in 2015, as well as energy purchased for SWP operations.

### *Hydroelectric and Natural Gas*

The Hyatt-Thermalito power complex in Oroville generated 589,395 MWh of energy in 2015.

Energy generated at SWP aqueduct recovery plants—Gianelli, Alamo, Mojave Siphon, Devil Canyon, and Warne—totaled 685,311 MWh.

The SWP received generation from the Lodi Energy Center. SWP's 33.5 percent share of the Lodi Energy Center's energy output for 2015 was 566,888 MWh.

## Contractual Resource Arrangements in 2015

SWP power operations rely on contractual arrangements as well as SWP facilities. These contractual arrangements include joint development projects and energy purchases.

### *Joint Developments*

Through the *West Branch Cooperative Development Agreement* with LADWP, DWR receives energy based on the amount of water scheduled through the West Branch. In 2015, LADWP provided 424,024 MWh for DWR's share of energy generated at Castaic Powerplant.

DWR's share of Gianelli Pumping-Generating Plant used 156,027 MWh and generated 115,210 MWh of energy in 2015.

### *Purchases and Costs*

Table 10-3 shows the amounts of energy, transmission, and other services purchased in 2015. Amounts include contractual short-term and long-term energy trades and associated transactions of energy, transmission, capacity, and ancillary services with CAISO, and miscellaneous energy-related costs.

DWR transacted 2.59 million MWh of energy at a cost of $81.33 million. Other SWP-related costs include $4.98 million for transmission service outside CAISO and $112.90 million for operation, maintenance, and miscellaneous CAISO charges, among other things. Key costs associated with the latter amount are (1) $4.35 million for debt service and $3.84 million for operations and maintenance, both related to Pine Flat Powerplant; (2) $9.42 million for debt service and $7.93 million for capital improvement, management, operations, and maintenance, all connected to the Lodi Energy Center Project. The $4.98 million for transmission service outside CAISO includes $0.42 million for PG&E; $2.72 million for SCE; and a total of $1.84 million related to LADWP and NCPA.

**Long-term Purchase Agreements.** According to terms of the Kings River Conservation District contract, DWR receives the total output of the 165 MW Pine Flat Powerplant. In 2015, the power plant provided 20,951 MWh of energy to the SWP at an energy component cost of $159,227.

Under the Metropolitan Small Hydro contract, DWR purchased 56,452 MWh of energy in 2015 from three small hydroelectric power plants on the Metropolitan system at a cost of $3.23 million.

Also, under the Lodi Energy Center Power Sales Agreement with NCPA, DWR received a purchase credit of $21.31 million based on 566,888 MWh generated at the Lodi Energy Center plant during 2015 and conveyed to the CAISO power grid. This amount is shown in Table 10-4.

Lastly, under renewable energy long-term contracts with Alameda Municipal Power

and RE Camelot, LLC, DWR received a total of 310,544 MWh at a cost of $13.11 million.

**Short-term Energy Purchase Agreements.** Existing resources and long-term power and transmission contracts ensure that the SWP has enough power to meet long-term needs.

When SWP power requirements exceed resources during daily operations, short-term purchases make up the difference. In 2015, the SWP purchased 1.64 million MWh of short-term energy under the WSPP agreement from four WSPP marketers at a cost of $51.64 million. These purchases are reflected in Table 10-3.

## Contractual Sales of Excess Power

In 2015, DWR received $83.35 million in energy revenues. This includes (1) $46.33 million connected to bilateral trades and $14.90 million for ancillary service transactions, both made through CAISO; (2) $11,563 in short-term sales; and (3) $22.10 million associated with long-term contracts. This third item includes, among other things, $21.31 million related to the Lodi Energy Center Power Sales Agreement with NCPA. It also includes $134,221 for CAISO pass-through costs collected from the U.S. Department of Energy, Western Area Power Administration, in accordance with a contract executed June 27, 2012, with DWR for CAISO scheduling coordinator services. Under the terms of this contract, DWR acts as a scheduling coordinator for the joint-use facilities of the San Luis Unit and certain DWR pumping facilities occasionally used to pump federal water. See Table 10-4 for information about energy and other services sold and revenue received.

# Forecasting Power Operations

Each year, after reviewing the SWP water contractors' water delivery requests and the construction schedule for future facilities, DWR forecasts the associated energy consumption and generation through 2035. Short-term power requirements, based on actual water supply and reservoir storage levels, are determined for the current and two ensuing years of operation. Long-term operational studies for the remaining years are based on median-year water supply conditions and optimal reservoir storage levels. The forecast also includes losses in reservoirs and aqueducts, recreation water, and water to replace storage in reservoirs south of the Delta.

Actual SWP power requirements may vary significantly from the forecast amounts. Those variations are due to the amount of water available and delivered in a given year. For example, dry conditions in Northern California could result in a reduction in the amount of water available for delivery and for generation. If full deliveries could not be made, less power would be used. Power requirements could also decrease during a wet year because of the availability of local water in the San Joaquin Valley or Southern California.

Conversely, power requirements could exceed the amount originally forecast if actual water deliveries are greater than the amounts estimated. For example, if additional pumping is needed to refill reservoirs south of the Delta after an unexpectedly dry year, more power would be used.

## Table 10-1 Energy Used at Pumping Plants and Power Plants in 2015, by Month (megawatt-hours)

| Pumping Plants and Power Plants | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Hyatt-Thermalito Power Complex (station service) | 0 | 2 | 0 | 1 | 1 | 0 | 0 | 0 | 7 | 1 | 4 | 3 | 19 |
| North Bay Interim Pumping Plant | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Cordelia Pumping Plant | 557 | 658 | 476 | 832 | 1,022 | 1,131 | 1,063 | 930 | 892 | 809 | 856 | 477 | 9,703 |
| Barker Slough Pumping Plant | 211 | 277 | 295 | 613 | 655 | 609 | 590 | 816 | 769 | 783 | 613 | 218 | 6,448 |
| South Bay Pumping Plant | 5,021 | 4,370 | 5,384 | 10,276 | 9,468 | 10,129 | 11,990 | 9,352 | 8,026 | 8,508 | 5,088 | 4,427 | 92,040 |
| Del Valle Pumping Plant | 13 | 12 | 13 | 358 | 11 | 6 | 6 | 8 | 8 | 6 | 12 | 14 | 466 |
| Banks Pumping Plant | 67,278 | 62,038 | 20,462 | 8,825 | 6,878 | 5,344 | 5,148 | 11,999 | 12,672 | 4,610 | 11,583 | 21,898 | 238,736 |
| Gianelli Pumping-Generating Plant (SWP share) | 64,313 | 56,311 | 15,397 | 154 | 75 | 113 | 0 | 1,254 | 1,373 | 1,018 | 3,913 | 12,106 | 156,027 |
| Dos Amigos Pumping Plant (SWP share) | 2,430 | 2,851 | 6,587 | 10,279 | 16,298 | 18,058 | 16,480 | 14,833 | 9,953 | 4,562 | 4,446 | 6,249 | 113,025 |
| Buena Vista Pumping Plant | 7,621 | 6,231 | 15,944 | 20,309 | 21,729 | 18,363 | 20,830 | 17,557 | 13,434 | 8,863 | 15,187 | 19,941 | 186,010 |

# Chapter 11
# Facilities Maintenance

*Many features along the California Aqueduct were inspected in 2015.*

## Significant Events in 2015

Potential Failure Mode Analyses (PFMAs) were conducted for Bidwell Bar Canyon Saddle, Parish Camp Saddle, Thermalito Diversion, Thermalito Forebay, and Thermalito Afterbay dams in January.

Sisk and O'Neill dams had Comprehensive Facility Review (CFR) inspections by the Bureau of Reclamation (Reclamation) in March 2015.

At the Castaic Dam outlet works, valves on the high intake tower were refurbished.

Reclamation inspected the spillway and intake structures at Little Panoche Detention Dam.

In June, Thermalito Afterbay Outlet Gate No. 3 was returned to service.

Oroville Dam Flood Control Outlet Gates No. 7 and No. 8 seal refurbishment was completed. This completed the refurbishment effort for all eight flood control outlet gates

Hyatt Penstock No. 1 was dewatered and inspected.

*Information for this chapter was provided by the Division of Operations and Maintenance, the Division of Safety of Dams, the Division of Integrated Regional Water Management, and the State Water Project Analysis Office.*

The Department of Water Resources (DWR), through the Division of Operations and Maintenance (O&M), monitors all State Water Project (SWP) facilities to ensure safety and reliability. DWR is required, by federal and State law, to contract periodically with independent consultants to review the safety of SWP dams and power facilities.

## Inspecting and Maintaining Project Dams

DWR conducts several types of inspections on SWP facilities to ensure that each dam is safe for continued operation. The Dam Safety Branch (DSB), Division of Safety of Dams (DSOD), Federal Energy Regulatory Commission (FERC), and the Bureau of Reclamation conduct various inspections and safety analyses to ensure the safety of SWP dams.

O&M staff, through the DSB and field divisions, inspect, collect, and analyze data for all SWP dams and appurtenant structures. DSB also conducts performance and instrumentation analyses and prepares annual reports that are distributed to the field divisions for scheduling and maintenance. The reports are also sent to FERC and to DSOD for their review.

In accordance with Division 3 of the California Water Code, DSOD has regulatory authority over dams owned and operated by DWR.

DSOD is responsible for overseeing all design modifications and construction activities on jurisdictional SWP dams. In accordance with the California Code of Regulations (Title 23, Division 2, Chapter 1, Article 5), DSOD participates in the Director's Safety Review Board (DSRB) events and presents their findings to the DSRB.

Additionally, DSOD engineers inspect SWP dams annually, on a fiscal year basis, to ensure they remain safe, are performing as intended, and are not developing problems. These annual inspections also include in-depth instrumentation review of dam surveillance data. DSOD engineers and geologists evaluate proposed modifications to existing dams, as well as designs for any proposed new jurisdictional dams. DSOD also oversees construction activities to ensure work is performed in accordance with approved plans and specifications.

FERC inspects all FERC-licensed SWP facilities annually. These inspections include a review of significant events, instrumentation data, and the visual appearance of each dam, penstock, or power plant. Under FERC's requirements, consulting engineers and geologists are retained to evaluate SWP dam facilities every 5 years.

DWR contracts periodically with independent consultants to review the safety of SWP dams and power facilities, except for Pearblossom Spill Basin. Pearblossom Spill Basin Dam was originally designed to be used during misoperation at the Pearblossom Pumping Plant; the spill basin was never fully completed and has never been used.

### Routine Inspections

During 2015, DSOD along with O&M staff conducted routine periodic inspections for all of the dams in the SWP. These inspections included Antelope, Frenchman, Grizzly Valley, Oroville, Bidwell Canyon Saddle, Parish Camp Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Fish Barrier dams in the Oroville Field Division; Bethany, Clifton Court Forebay, Del Valle, Dyer, and Patterson dams in the Delta Field Division; and Castaic, Crafton Hills, Crafton Hills Reservoir Enlargement, Pyramid, Quail, Cedar Springs,

Devil Canyon Second Afterbay, and Perris dams in the Southern Field Division. Table 11-1 shows SWP dam inspections conducted in 2015.

## Joint-use Facility Inspection

The four dams in the San Luis Field Division (Sisk Dam, O'Neill Dam, Los Banos Detention Dam, and Little Panoche Detention Dam) are used jointly with the Bureau of Reclamation (Reclamation) and are not under DSOD jurisdiction.

Every 6 years, Reclamation conducts a Comprehensive Facility Review (CFR) of these joint-use facility dams. The CFRs for Sisk Dam, O'Neill Dam, Los Banos Detention Dam, and Little Panoche Detention Dam occurred in 2015.

Periodic Facility Reviews (PFRs) are also conducted by Reclamation every 6 years using an alternate schedule spaced between the CFRs. PFRs were conducted for the joint-use facilities in 2012. A joint annual inspection of the facilities with Reclamation, DSB, and San Luis Field Division was conducted in March 2015.

## Independent Reviews

### *Director's Safety Review Board*

Under California Water Code, Section 6056, DWR is required to retain a consulting board to review: (1) the adequacy of the design of any dam or reservoir DWR proposes to construct; and (2) the safety of the completed construction, including the terms and conditions for the Certificate of Approval. In accordance with this California Water Code requirement, DWR formed the DSRB.

The DSRB is a board of three independent consultants that meet at least once every 5 years to review the operational performance of DWR-owned dams and more frequently when consulting on new dams. The DSRB independently reviews and assesses safety conditions of SWP dams.

DSRB consultants are selected based on their knowledge of geotechnical, structural, and civil engineering, including their experience evaluating dam performance. Their independent assessments include the review of dam performance during earthquakes, evaluation of instrumentation data, inspection of each dam, and evaluation of studies performed by DWR. The DSRB then prepares reports on each dam, approving dams as safe for continued operation and making recommendations. Based on DSRB recommendations, DWR prepares action plans. No DSRB inspections occurred on the SWP in 2015.

## FERC Reviews

FERC conducts dam safety inspections in conjunction with O&M on an annual basis for SWP dams under its jurisdiction. Every 5 years, a FERC Part 12D inspection is also conducted. The last Part 12D inspections occurred in 2014. SWP dams under FERC jurisdiction are reviewed under FERC-defined northern section, Project 2100 (P-2100) and southern section, Project 2426 (P-2426). P-2100 consists of dams associated with Oroville Field Division facilities, and P-2426 dams are associated with Pyramid, Quail, Cedar Springs, and Devil Canyon Second Afterbay facilities.

As a supplement to the FERC Part 12D safety inspection, FERC's Dam Safety Performance Monitoring Program requires that a Potential Failure Mode Analysis (PFMA) be performed for FERC-licensed dams. The PFMA involves document review and site visits to develop a comprehensive list of potential failure modes at each dam. From the FERC review process, two documents are generated: the FERC Part 12D Safety Inspection Report and the PFMA Report. FERC-licensed facilities are also inspected annually by DSB and FERC's Dam Safety engineer.

## Table 11-1 State Water Project Dam Inspections in 2015

| Field Division | Facility | Type of Inspection | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | Operations & Maintenance-Dam Safety Branch | Division of Safety of Dams | Federal Energy Regulatory Commission | Bureau of Reclamation Annual Inspection | Bureau of Reclamation 6-Year Comprehensive Facility Review | Director's Safety Review Board | Part 12D 5-Year Review |

### Supporting Technical Information

The Supporting Technical Information Document is a separate report that summarizes SWP project elements and details that do not change significantly over time. The document is updated as required but is not generated as part of any of the dam safety inspections.

## Arroyo Pasajero Program

The Arroyo Pasajero and its tributaries drain approximately 530 square miles of the Diablo Range of the coastal mountains west of the California Aqueduct in Fresno County. Its downstream juncture with the San Luis Canal segment of the California Aqueduct, between Highway 198 and Avenal Cutoff Road, poses a particularly difficult operational and maintenance problem for the SWP. Reclamation designed and constructed the San Luis Canal segment of the California Aqueduct, while DWR operates and maintains it, with all costs shared 45 percent and 55 percent, respectively.

During periods of heavy rainfall, high flows in the Arroyo Pasajero and its tributaries transport heavy sediment loads eroded from the Arroyo Pasajero watershed. Over a vast amount of time, sediment transported by arroyo floods formed a 450-square-mile alluvial fan extending from its apex at the eastern margin of Pleasant Valley (Anticline Ridge) to the San Joaquin Valley trough. The California Aqueduct traverses the arroyo's alluvial fan and forms a barrier to arroyo flood flows. Flood control facilities, designed to accommodate Arroyo Pasajero floodwater, include the West Side Detention Basin (designed to store floodwater and sediment west of the California Aqueduct), an evacuation culvert to release floodwater east of the California Aqueduct, and drain inlets to release floodwater into the California Aqueduct.

Since the floods of 1969, when nearly all of the detention basin's planned 50-year sediment storage capacity was filled by deposition, DWR and Reclamation have worked to mitigate the effects of heavy flooding and the diminished storage capacity of the detention basin. In 1980, asbestos discovered in The Metropolitan Water District of Southern California's water supply was traced to runoff from the Arroyo Pasajero and other Diablo Range streams. This discovery, in conjunction with the high cost of removing sediment from the California Aqueduct, led DWR to adjust operating procedures to minimize runoff entering the California Aqueduct. The volume of runoff and sediment transported by the Arroyo Pasajero is roughly 400 percent greater than was originally estimated during the design of the detention basin in the mid-1960s.

### DWR and DWR/Reclamation Alternative Long-term Solution

Construction to restore the storage capacity of the West Side Detention Basin started in August 2004, and many of the designed improvements were completed by the summer of 2005. These improvements restored the storage capacity to the detention basin and added control over releases of floodwater into the California Aqueduct and onto private farmland. The intended 50-year level of protection was achieved by raising levees, adding a control structure equipped with an inflatable rubber dam, installing flood gates, and acquiring flood easements. As of 2015, the basin's flood control features continued to function as expected.

Rating curve updates for the three aqueduct flood water inlet control structures (the evacuation culvert, flood gates, and rubber dam) were completed. Near the end of the year, construction was initiated on staff gages to allow field crews to better estimate aqueduct inflows.

In 2009, DWR signed the certificate of acceptance for the deeds for easements and lands acquired via litigation. The deeds were recorded, and the process to transfer the rights to Reclamation, as required by the joint-use agreement, was initiated. Work to address the transfer documents continued in 2015.

The West Side Detention Basin is an area of interest in the U.S. Environmental Protection Agency (EPA) Atlas Mine Area Operable Unit Record of Decision issued by the EPA in 1991. Five-year reviews of the Atlas Mine Area Operable Unit began in 2001 and have continued every 5 years since. In fall 2010, as a part of the upcoming 2011 review cycle, DWR toured the basin with representatives from the EPA and inspected all of the basin flood control features as well as soil berms, gates, locks, and signs used to deter soil disturbing activities. The EPA released its Five-Year Review Report in August 2011. The report contained various recommendations for DWR to take into consideration while operating the basin. As of 2015, DWR continued its standard operating procedures within the basin to comply with the EPA's Comprehensive Environmental Response Compensation and Liability Act (Superfund law).

## Related Activities

In September 2011, the California Department of Transportation (Caltrans) informed DWR that it had funding through final design on the proposed bridge project at Lassen Avenue (State Route 269) over Arroyo Pasajero. DWR provided comments on the current project study report in October 2011, which focused on flood control and the ongoing operations and maintenance needs of DWR's field division staff to properly maintain the channel. Throughout 2015, Caltrans continued to advance the California Environmental Quality Act/National Environmental Policy Act process and design of the project.

## Cantua Creek Stream Group

Planning for a restoration project similar to the West Side Detention Basin restoration project began in 2006 for the Cantua Creek Stream Group detention basins. The project goal is to improve aqueduct flood protection and water quality between Mileposts 128.48 and 141.57.

A feasibility-level study for the Cantua Creek Stream Group Improvements Project, completed in April 2011, identified actions such as raising embankments, making modifications to structures, and acquiring flood easements to provide a 50-year level of protection for the California Aqueduct. Improving water quality in the aqueduct was a significant goal of the study, since currently, several of the existing drain inlets are not gated, and sediment-laden floodwater flows directly into the aqueduct with little detention and decanting. Increasing flood storage and detention of this floodwater prior to releasing it into the California Aqueduct would provide a significant benefit to water quality in the aqueduct.

In 2015, environmental and real estate processes continued to move forward, which resulted in minor changes to the design plans. The project is planned for construction in the late summer and fall of 2016.

Rating curve updates for four aqueduct flood water inlet control structures (Cantua Creek drain inlet at Harlan Avenue, Cantua Creek flume near Mt. Whitney Avenue, Salt Creek weir near Mt. Whitney Avenue, and the Salt Creek drain inlet at Laguna Avenue) were updated. Near the end of 2015, construction began on a series of staff gauges that would allow field crews to better estimate aqueduct inflows.

# Repairs, Modifications, and Inspections

DWR continually monitors all SWP facilities and performs repairs, modifications, and inspections as necessary to ensure safe, reliable water delivery.

## Inspections

Condition Assessment Program inspections are scheduled annually, biennially, or every 5 years. Future inspections will aim to identify trends in maintenance and aging of the SWP.

In 2015, Condition Assessment Program inspections were performed on 31 different reaches of the SWP along more than 258 miles of canals. To aid in maintenance efforts, check structures, control buildings, compound grounds, roads, culverts, drain inlets, overchutes, turn-ins, turnouts, and utility crossings along the canal were inspected and rated.

### *Oroville Field Division*

In the Oroville Field Division, four features along 2 miles of the Thermalito Power Canal were inspected.

Refurbishment efforts continued at Thermalito Powerplant from the damage that occurred during a fire in November 2012.

In June 2015, Thermalito Afterbay Outlet Gate No. 3 was returned to service.

### *Delta Field Division*

In the Delta Field Division, features along 54 miles of the California Aqueduct were inspected. One hundred eighty-one California Aqueduct features were inspected, spanning 5 repayment reaches and 15 aqueduct pools.

The installation of the Clifton Court Forebay intake structure radial Gate No. 2 telemetry equipment was completed on February 19, 2015. The special condition placed on operation of the gate on July 31, 2014, was removed.

### *San Luis Field Division*

In the San Luis Field Division, features along 60 miles of the California Aqueduct were inspected. Two hundred thirty-three California Aqueduct features were inspected, spanning 3 repayment reaches and 6 aqueduct pools.

### *San Joaquin Field Division*

In the San Joaquin Field Division, features along 44 miles of the California Aqueduct were inspected. One hundred thirty-two California Aqueduct features were inspected, spanning 5 repayment reaches and 11 aqueduct pools.

### *Southern Field Division*

In the Southern Field Division, features along 98 miles of the West and East branches of the California Aqueduct were inspected, including Gorman Creek, Beartrap Road culverts in Tejon Ranch, and gauging stations for Castaic Lake inflow. Four hundred twelve California Aqueduct features were inspected, spanning 18 repayment reaches and 34 aqueduct pools.

At the Castaic Dam outlet works, valves on the high intake tower were refurbished. The refurbishment took place from April through August, 2015, and involved the top seven of the nine tiers of valves in the high intake tower. The refurbishment work occurred while the water surface elevation at Castaic Lake was low due to the drought. The water surface elevation reached approximately 100 feet below the normal operating level.

Perris Dam's emergency bulkhead bolts were exercised in the presence of DSOD. The Perris Dam seismic remediation of dam embankment project (Specification No. 14-03) began in September 2014 and continued in 2015.

This work was implemented to upgrade the seismic safety of Perris Dam. The outlet tower and penstock are on a 10-year inspection cycle.

## Other Inspections

In addition to the conveyance facilities, 65 bridges, along with 89 roofs of SWP buildings, were inspected as part of a regularly scheduled maintenance program. SWP access roads are routinely inspected by staff in each field division as they traverse the hundreds of miles of paved and unpaved roadways daily. Staff reports of distressed and problematic areas result in road repair projects.

## Outages for Maintenance and Repair of Facilities

Table 11-2 presents information, arranged chronologically, about significant scheduled and unscheduled outages at SWP pumping and power plants in 2015. The table includes information about incidents resulting in outages of 14 days or more.

**Table 11-2 Outages for Maintenance and Repair of Facilities in 2015, by Month** 1 of 6

| Month | Facility | Unit | Outage Description |
|---|---|---|---|
| January | Banks Pumping Plant | 5 | January 1 to February 4 for lower guide bearing inspection and repair; continued from December 3, 2014 |
| | Banks Pumping Plant | 11 | January 21 to March 1 for loss of synchronization |
| | Barker Slough Pumping Plant | 7 | January 1 to December 31 for excessive vibration |
| | Cordelia Pumping Plant | 3 | January 1 to June 16 for motor pump refurbishment |
| | South Bay Pumping Plant | 3 | January 1 to December 31 for motor pump coupling and alignment |
| | South Bay Pumping Plant | 6 | January 1 to December 31 for vibration testing and balancing; continued from June 2, 2014 |
| | South Bay Pumping Plant | 7 | January 1 to December 31 for excessive vibration |
| | South Bay Pumping Plant | 10 | January 1 to March 27 for cooling water failure |
| | Hyatt Powerplant | 1 | January 1 to July 14 for river valve operation due to water temperature requirements |
| | Hyatt Powerplant | 2 | January 1 to February 26 for river valve operation due to water temperature requirements |
| | Robie Thermalito Pumping-Generating Plant | 1 | January 1 to December 31 for fire damage; continued from November 22, 2012 |
| | Robie Thermalito Pumping-Generating Plant | 2 | January 1 to December 31 for fire damage; continued from November 22, 2012 |
| | Robie Thermalito Pumping-Generating Plant | 3 | January 1 to December 31 for fire damage; continued from November 22, 2012 |
| | Robie Thermalito Pumping-Generating Plant | 4 | January 1 to December 31 for fire damage; continued from November 22, 2012 |
| | Alamo Powerplant | 1 | January 1 to March 5 for Condition Assessment Program inspection, current transformer replacement, and relay upgrade; continued from October 13, 2014 |
| | Oso Pumping Plant | 3 | January 1 to December 31 to refurbish, overhaul, and rewind discharge valve; continued from December 4, 2013 |
| | Oso Pumping Plant | 4 | January 1 to December 31 to refurbish, overhaul, and rewind, discharge valve; continued from December 4, 2013 |
| | Pearblossom Pumping Plant | 1 | January 5 to February 6 for annual Condition Assessment Program inspection |
| | Buena Vista Pumping Plant | 6 | January 2 to May 6 for stator rewind, motor refurbishment, and discharge valve repairs |
| | Edmonston Pumping Plant | 2 | January 2 to April 3 for discharge valve repairs |
| | Edmonston Pumping Plant | 4 | January 2 to April 3 for discharge valve repairs |
| | Edmonston Pumping Plant | 6 | January 2 to April 3 for discharge valve repairs |

**Table 11-2 Outages for Maintenance and Repair of Facilities in 2015, by Month** 2 of 6

| Month | Facility | Unit | Outage Description |
|---|---|---|---|
| | Edmonston Pumping Plant | 8 | January 2 to April 3 for discharge valve repairs |
| | Edmonston Pumping Plant | 10 | January 2 to April 3 for discharge valve repairs |
| | Edmonston Pumping Plant | 12 | January 2 to April 3 for discharge valve repairs |
| | Edmonston Pumping Plant | 14 | January 2 to April 3 for discharge valve repairs |
| | Dos Amigos Pumping Plant | 1 | January 1 to February 6 for field breaker replacement; continued from June 21, 2014 |
| | Giannelli Pumping-Generating Plant | 1 | January 1 to June 18 for generator refurbishment; continued from September 13, 2012 |
| | Giannelli Pumping-Generating Plant | 2 | January 1 to June 9 for butterfly valve installation; continued from October 24, 2014 |
| | Pine Flat Powerplant | 1 | January 1 to February 28 for annual maintenance |
| | Pine Flat Powerplant | 2 | January 1 to February 28 for annual maintenance |
| | Pine Flat Powerplant | 3 | January 1 to February 28 for annual maintenance |
| February | Barker Slough Pumping Plant | 1 | February 16 to March 20 because of an incomplete start |
| | South Bay Pumping Plant | 5 | February 12 to March 30 to repair bearing cooling water leak |
| | Hyatt Powerplant | 3 | February 23 to April 6 for transmission line #2 protective line relay replacement |
| | Hyatt Powerplant | 4 | February 23 to March 30 for transmission line #2 protective line relay replacement |
| | Hyatt Powerplant | 5 | February 26 to March 14 for penstock #2 runner inspection |
| | Hyatt Powerplant | 6 | February 26 to March 14 for penstock #2 runner inspection |
| | Badger Hill Pumping Plant | 1 | February 13 to April 25 for discharge line #1 recoat and flow meter installation |
| | Badger Hill Pumping Plant | 2 | February 13 to April 25 for discharge line #1 recoat and flow meter installation |
| | Badger Hill Pumping Plant | 3 | February 13 to April 25 for discharge line #1 recoat and flow meter installation |
| | Badger Hill Pumping Plant | 4 | February 13 to April 25 for discharge line #1 recoat and flow meter installation |
| | Dos Amigos Pumping Plant | 3 | February 9 to February 24 for Condition Assessment Program inspection and exciter preventative maintenance |
| March | Banks Pumping Plant | 9 | March 2 to July 23 for Condition Assessment Program inspection and preventative maintenance |
| | Hyatt Powerplant | 2 | March 17 to April 4 for penstock #1 for Unit 3 runner inspection and repair |

**Table 11-2 Outages for Maintenance and Repair of Facilities in 2015, by Month** 3 of 6

| Month | Facility | Unit | Outage Description |
|---|---|---|---|
| | Chrisman Pumping Plant | 8 | March 19 to April 9 brakes failed to release |
| | Teerink Pumping Plant | 8 | March 2 to March 23 for replacement of motor bus |
| | Dos Amigos Pumping Plant | 2 | March 9 to November 13 for discharge line inspection |
| | Giannelli Pumping-Generating Plant | 3 | March 3 to March 23 for scroll case inspection |
| | Giannelli Pumping-Generating Plant | 3 | March 23 to May 7 for excessive noise in turbine pit and loss of nose cone |
| April | Banks Pumping Plant | 8 | April 30 to May 17 for upstream seat position indicator oil leak |
| | Hyatt Powerplant | 5 | April 6 to May 19 for Oroville-Thermalito transmission line #3 protective line relay replacement |
| | Hyatt Powerplant | 6 | April 6 to May 15 for Oroville-Thermalito transmission line #3 protective line relay replacement |
| | Mojave Siphon Powerplant | 3 | April 13 to May 1 for annual Condition Assessment Program inspection |
| May | Barker Slough Pumping Plant | 6 | May 21 to June 19 for ground fault |
| | Mojave Siphon Powerplant | 2 | May 7 to May 27 for annual Condition Assessment Program inspection |
| | Oso Pumping Plant | 5 | May 29 to July 14 discharge valve failed to open |
| | Giannelli Pumping-Generating Plant | 3 | May 7 to December 31 for penstock #2 out of service |
| | Giannelli Pumping-Generating Plant | 4 | May 7 to August 25 for penstock #2 out of service |
| June | Devil Canyon Powerplant | 2 | June 8 to October 1 for annual Condition Assessment Program inspection and relay replacement |
| | Mojave Siphon Powerplant | 1 | June 1 to June 19 for annual Condition Assessment Program inspection |
| | Oso Pumping Plant | 6 | June 29 to July 14 for discharge valve refurbishment |
| | Badger Hill Pumping Plant | 6 | June 10 to October 6 for valve malfunction |
| | Chrisman Pumping Plant | 4 | June 8 to October 20 for Condition Assessment Program inspection and suction elbow inspection |
| | Chrisman Pumping Plant | 7 | June 1 to July 7 for Condition Assessment Program inspection, motor brake repair, and replacement of backfill piping |
| | Pine Flat Powerplant | 1 | June 2 to June 17 for penstock #1 work |
| | Pine Flat Powerplant | 2 | June 2 to June 17 for penstock #1 work |
| July | Banks Pumping Plant | 1 | July 27 to August 11 for relay and instrumentation calibration |
| | Banks Pumping Plant | 5 | July 24 to August 20 for motor pole replacement |

**Table 11-2 Outages for Maintenance and Repair of Facilities in 2015, by Month** 4 of 6

| Month | Facility | Unit | Outage Description |

|---|---|---|---|
| | Polonio Pass Pumping Plant | 3 | October 31 to November 22 for annual coastal outage |
| | Polonio Pass Pumping Plant | 4 | October 31 to November 22 for annual coastal outage |
| | Polonio Pass Pumping Plant | 5 | October 31 to November 24 for annual coastal outage |
| | Polonio Pass Pumping Plant | 6 | October 31 to November 22 for annual coastal outage |
| | Teerink Pumping Plant | 1 | October 12 to November 4 to investigate and repair KYA transformer oil leak |
| | Teerink Pumping Plant | 2 | October 12 to October 28 to investigate and repair KYA transformer oil leak |
| | Teerink Pumping Plant | 3 | October 12 to October 27 to investigate and repair KYA transformer oil leak |
| | Teerink Pumping Plant | 9 | October 19 to November 5 to repair suction drain valve |
| November | Banks Pumping Plant | 2 | November 20 to December 11 for overvoltage relay trip |
| | Banks Pumping Plant | 3 | November 16 to December 16 for 59x neutral overvoltage 86m motor lock out |
| | Banks Pumping Plant | 6 | November 9 to November 24 for relay and instrumentation calibration |
| | Banks Pumping Plant | 10 | November 30 to December 15 for headworks gate #5 control and power feed refurbishment |
| | Banks Pumping Plant | 11 | November 30 to December 15 for headworks gate #5 control and power feed refurbishment |
| | South Bay Pumping Plant | 12 | November 17 to December 7 for incomplete start sequence |
| | Hyatt Powerplant | 3 | November 16 to December 12 for runner band drain leak |
| | Devil Canyon Powerplant | 4 | November 30 to December 22 for annual Condition Assessment Program inspection |
| | Teerink Pumping Plant | 7 | November 9 to November 24 to replace pump packing and equalize vent lines |
| | Dos Amigos Pumping Plant | 5 | November 17 to December 29 to replace vane control oil |
| December | Pearblossom Pumping Plant | 6 | December 14 to December 31 for hydraulic oil loss |
| | Pearblossom Pumping Plant | 7 | December 14 to December 31 for head cover bolt failure |
| | Badger Hill Pumping Plant | 3 | December 2 to December 31 for shaft seal leak |

# Chapter 12
# Engineering, Construction, and Real Estate

*Cement deep soil mixing at Perris Dam.*

## Significant Events in 2015

In 2015, engineering, construction, and real estate continued to work to enhance, expand, repair, and protect the State Water Project (SWP) and other facilities within the State. Significant projects included Perris Dam remediation, the East Branch Extension Phase I improvements and Phase II projects, Clifton Court Forebay radial gate repairs, the emergency drought barrier project, and the seismic retrofit of 23 bridges in the San Luis, San Joaquin, and Southern field divisions.

*Information for this chapter was provided by the Division of Engineering.*

Initial construction of the State Water Project (SWP) facilities began in 1957 with the relocation of the Western Pacific Railroad facilities and Highway 70 near the City of Oroville to accommodate the SWP Oroville Facilities. Oroville Dam was constructed between 1961 and 1967. Construction of the South Bay Aqueduct (SBA) facilities started in 1960, and the first SWP water was delivered through the SBA in 1962 to serve Alameda County.

In 1963, work began on the California Aqueduct, and by 1968, the SWP was delivering water to long-term SWP water contractors in the San Joaquin Valley. By 1973, with the completion of Edmonston Pumping Plant at the foot of the Tehachapi Mountains and other East Branch conveyance facilities, the SWP was delivering water to Lake Perris at the southernmost point in Riverside County.

Other water deliveries took place as follows:

- 1968—the first SWP water was delivered through the first phase facilities of the North Bay Aqueduct and through the first phase facilities of the Coastal Branch;
- 1974—the first SWP water was delivered through the West Branch facilities to Los Angeles County;
- 1988—SWP water was delivered through the second phase facilities of the North Bay Aqueduct to Solano County; and
- 1997—SWP water was delivered through the second phase facilities of the Coastal Branch Aqueduct to San Luis Obispo and Santa Barbara counties.

Prior to the completion of the initial facilities in 1973, work began on the Upper Feather River facilities to supply local water, recreation, and fish enhancement. Power plants, additional pumping units, and turbine-generators that had previously been deferred were built to ensure water quality and fish enhancement in the Delta.

From 1974 through 2015, design and construction activities included repairing concrete lining failures or potential failures of the canal system and concrete pipeline sections, replacing equipment components of existing facilities, enlarging or extending aqueduct reaches, refurbishing pump-turbine units, and adding pumps and motors to existing facilities. Specific projects included constructing the Devil Canyon Second Afterbay, constructing Phase II of the Coastal Branch, extending the SWP through the East Branch Extension to the San Gorgonio Pass service area in San Bernardino and Riverside counties with enlargements and expansions in later years, SBA enlargement, Perris Dam seismic remediation, and activities related to habitat restoration and water conveyance options in the Delta.

## Design Activities

In 2015, work to enhance, expand, repair, and protect SWP water delivery facilities continued. Engineering activities supported more efficient water deliveries within the confines of legal and environmental constraints and power availability. Significant projects included the Sisk Dam seismic reevaluation, North Bay Aqueduct alternate intake study, and Perris Dam emergency release facility design. Table 12-1 (at the end of the chapter) provides a list of completed and ongoing design work that was undertaken in 2015.

The Department of Water Resources' (DWR), Division of Engineering (DOE) continued

to design projects for development into the construction phase, including awarding construction contracts. DOE worked with many DWR divisions and offices, as well as local, State, and federal agencies. DOE prepared preliminary designs and estimates; developed and administered construction contract documents and carried out construction projects; and conducted special studies of dams, canal embankments, and other SWP facilities.

Study and design activities continued from previous reporting periods, or initiated in 2015, included the following:

- Oroville, Thermalito Afterbay, and Thermalito Forebay dams radial gate nondestructive examination of tendons—study;
- Lake Oroville reservoir rim inspection—study;
- Oroville Field Division roofing replacement—design;
- Thermalito Afterbay Dam, well replacement, phase II—design;
- Hyatt Powerplant, Thermalito Diversion Dam Powerplant, and Oroville Operations and Maintenance Center fire systems modernization—design;
- North Bay Aqueduct alternate intake—study;
- Clifton Court Forebay Dam stratigraphic model of foundation—study;
- Delta Field Division—Byron Road Bridge replacement—design;
- Delta Field Division embankment and liner repair (Milepost 62)—design;
- Sisk Dam seismic reevaluation—study;
- San Joaquin Field Division bridge hinge retrofits—design;
- Castaic Dam left abutment analysis—study;
- Castaic Dam tower nonlinear structural analysis—study; and
- Perris Dam emergency release facility—design and environmental documents.

In 2015, DOE staff completed the following projects:

- Oroville, Thermalito, and Pyramid dams radial gate structural reevaluation—design;
- Bidwell Canyon stage III boat ramp extension—design;
- Oroville Dam river outlet modification—design;
- Oroville Dam radial gates seal replacement—design;
- Oroville Field Division roofing replacement—design;
- Oroville Field Division fire systems modernization—design review;
- Hyatt and Thermalito power plants fire detection system—design;
- Thermalito Powerplant bypass gate reliability—design;
- Montezuma Slough Control Facility roofing replacement—design;
- Sherman and Twitchell islands new fish screens at existing siphons at 5 sites—final design;
- Del Valle Dam right abutment fault, phase 2 investigation—study;
- Delta Field Division canal repairs (Reaches 1 and 2A)—design;
- San Luis Field Division canal liner and embankment repair—design;
- Devil's Den, Bluestone, and Polonio Pass pumping plants insulated flange repair and vault construction—design;
- Los Robles Bridge—seismic analysis;
- East Branch Enlargement, Phase II—preliminary design and environmental documents; and
- Mojave Division replacement of standby emergency generators—design.

## California WaterFix

In 2008, the Delta Habitat Conservation and Conveyance Program was established to conduct activities related to assessing

potential habitat restoration and water conveyance options in the Delta for the Bay/Delta Conservation Plan. On April 30, 2015, State and federal agencies announced a new sub-alternative, Alternative 4A, to replace Alternative 4 (the proposed Bay Delta Conservation Plan) as the State's proposed project. Alternative 4A reflects the State's proposal to separate the conveyance facility and habitat restoration measures into two separate efforts: California WaterFix (Alternative 4A) and California EcoRestore.

In 2015, activities related to California WaterFix included the following:

- completing the phase 1 of system impact studies for Pacific Gas & Electric Company, Sacramento Municipal Utility District, and Western Area Power Administration regarding potential impacts to their systems to provide transmission service to the California Waterfix project;
- preparing a conceptual engineering report for the Dual Conveyance Facility Modified/Pipeline/Tunnel Option—Clifton Court Forebay Pumping Plant;
- completing initial draft design phase studies for the Clifton Court Pumping Plant;
- completing transmission system modeling for Western Area Power Administration for system impact study purposes;
- completing a draft agreement and exhibits to establish the Design and Construction Enterprise to support collaboration in the design and construction of California WaterFix; and
- completing phase 2 of system impact study for Sacramento Municipal Utility District.

More information can be found in Chapter 3, Environmental Programs, or on the California WaterFix and California EcoRestore websites.

## Construction Activities

DWR divides the California Aqueduct into the following construction divisions: North San Joaquin, San Luis, South San Joaquin, Tehachapi, Mojave, and Santa Ana divisions of the so-called "main line," and the West and Coastal branches.

DOE worked on 65 construction contracts in various SWP construction divisions in 2015. Projects included pipeline repair, control system upgrades, fire systems modernization, equipment refurbishments and upgrades, seismic upgrades of bridges, maintenance facility improvements at dam and reservoir sites, and the addition of new pumping units and a reservoir. Table 12-2 (at the end of the chapter) provides a list of completed and ongoing construction contracts undertaken in 2015. Resolution of contract claims may extend the actual contract closeout beyond the completion or acceptance date.

Since the inception of the SWP, environmental issues have increased in magnitude with the enactment of numerous federal and State laws. DWR has complied with these laws by seeking appropriate permits, preparing environmental compliance documents, and incorporating environmental requirements and conditions into the design and execution of construction projects. Environmental scientists work with design engineers to produce projects that meet SWP objectives while having the least impact possible on the environment.

Construction contract specifications and plans are reviewed and modified with the environmental compliance requirements and sensitive resource protection needs in mind. Ongoing construction activities are monitored to ensure compliance with requirements outlined in environmental permits for each contract.

## SWP—General

### *SWP Supervisory Control and Data Acquisition System*

A contract (Specification No. 08-12) to replace portions of the aging SWP supervisory control and data acquisition system began in May 2009. This contract furnishes and installs 176 controller assemblies for the replacement of remote terminal units located throughout the SWP and furnishes 16 controller assemblies for Devil Canyon Powerplant and DWR's development lab at the Joint Operations Center. The controller assemblies were built from components furnished by the contractor (programmable logic controllers, sequence-of-event recorders, fiber patch panels, modems, and other equipment). Work was completed in October 2015. Acceptance is expected in July 2016.

### *California Aqueduct Copper Communications Cable and Voice and Data Equipment*

Work began on approximately 450 miles of California Aqueduct copper communications cable and voice data equipment monitoring, testing, and repair in March 2014 (Specification No. 13-17). The project includes providing monitoring, testing, leak detection, and routine and nonroutine cable repairs. Work is scheduled to be completed in March 2016. Acceptance is expected in May 2016.

## Oroville Division

### *Robie Thermalito Pumping-Generating Plant*

Initial cleanup of the Robie Thermalito Pumping-Generating Plant (Specification No. 13-16) began in October 2013. The work involves cleaning and repairing all fire-impacted equipment; installing new roll-up doors; procedure testing essential systems; and installing a new heating, ventilation, and air-conditioning system. Work also includes repairing spalled concrete, the roof, and skylights; cleaning electrical components in the switchyard; and other cleanup as deemed necessary by the engineer. Work is scheduled to be completed in May 2016. Acceptance is expected in July 2016.

### *Bidwell Bar Bridge*

The Bidwell Bar Bridge access road repair (Specification No. 14-10) began in September 2014. Work included reinforcing embankment material. Work was completed in January 2015 and accepted in November 2015.

### *Oroville Dam River Outlet Diversion Tunnel No. 2*

Baffle ring installation work (Specification No. 15-11) began in December 2015. This project includes furnishing and installing two water-filled tunnel plugs, providing support work for fixed cone valve replacement, and installing 12 DWR-furnished baffle ring segments at the Oroville Dam River Outlet Diversion Tunnel No. 2. Work is scheduled to be completed in April 2016. Acceptance is expected in June 2016.

### *Bidwell Canyon Boat Ramp*

The stage III boat ramp extension (Specification No. 15-13) began in December 2015. Work includes a concrete paved boat ramp, earthwork, compacted backfill, reinforced concrete, rock slope protection, erosion control, and drill and bond dowels. Work is scheduled to be completed in January 2016. Acceptance is expected in May 2016.

### *Hyatt Powerplant Fire System Modernization Project*

The goals of the fire system modernization project are to increase safety and property protection, while reducing business interruptions and environmental impacts. The project to furnish and install the new

fire detection and evacuation system project (Specification No. 15-06) began in October 2015.

Work includes:

- upgrading transformer, generator, high voltage tunnel, and Area Control Center communication room fire suppression systems;
- replacing Hyatt's oil purification/storage room and high voltage cable oil room carbon dioxide suppression system with a high pressure water mist system;
- installing water sprinkler and clean agent suppression at specific locations within Hyatt and the Area Control Center to meet probable maximum loss criteria;
- providing modifications within the plant and the dam core block that allow a safe outlet for staff during an emergency event and providing additional communications systems throughout the plant; and
- networking all fire detection and suppression systems at all facilities to remote workstations capable of monitoring and controlling the new and existing systems.

DWR assisted the contractor with the design work and are assisting the contractor during the construction phase of the project. Work is scheduled to be completed in June 2017. Acceptance is expected in July 2017.

## *Hyatt Powerplant Diversion Tunnel No. 2*

Emergency repairs (Specification No. 14-07) began in March 2014 involving furnishing, installing, and commissioning video surveillance and telecommunications equipment; refurbishing the existing hydraulic system; and furnishing, installing, and commissioning new hydraulic system components for actuation.

Additional work included:

- furnishing and installing hydraulics and electronic controls to allow backup operation of the 72-inch spherical valve plug from Elevation 252 inside the Hyatt Powerplant;
- furnishing and installing an emergency actuation system for the 72-inch spherical valves;
- removing two 54-inch fixed cone valves for refurbishment and reinstalling them; and
- constructing other appurtenances and hydraulic structures as required.

Work was completed in July 2014 and accepted in September 2015.

## *Feather River Fish Hatchery*

Repair of the raw water supply pipeline (Specification No. 14-01) began in April 2014. Work included removing and providing surface preparation of the delaminated lining area inside the existing 60-inch diameter steel pipe. Surface preparation and removal and replacement of mortar at various pipe joints was also completed for a 54-inch reinforced concrete pipe.

Additional work included:

- removing existing pipe access structures and concrete slabs;
- removing and salvaging existing combination air release valves, stand pipes, and valves;
- constructing two new manholes and concrete encasements;
- installing two new pipe access structures with hatch covers, ladders, and extension safety posts; and
- removing and replacing manhole lid gratings.

The work was completed in September 2014 and accepted in February 2015.

### *Feather River Spawning Gravel Supplementation*

A project (Specification No. 14-04) to enhance fish habitat began in May 2014 and consisted of three parts:

(1) importing 13,300 cubic yards of gravel and stockpiling it adjacent to the fish hatchery;
(2) clearing, grading, shaping, and maintaining an earth access ramp from the stockpile location down to the Feather River; and
(3) constructing an access road in the river channel and placing 8,300 cubic yards of the stockpiled gravel in the river channel to construct riffles, berms, and channels.

This work was completed in September 2014 and accepted in February 2015.

## South Bay Aqueduct

### *SBA Enlargement and Improvement*

The SBA Enlargement and Improvement projects restored the first 16.38 miles of the SBA to the 300 cubic feet per second (cfs) design flow and increased the design capacity by up to 130 cfs. This work enlarged the South Bay Pumping Plant to accommodate four additional 45 cfs units, constructed a third discharge line, constructed Dyer Reservoir, enlarged the canal, and modified associated structures. Projects are described below.

**Canal Modifications.** Various modifications were performed along Dyer Canal, Livermore Canal, Alameda Canal, and Del Valle Pipeline under a contract that began in October 2010 (Specification No. 09-16). Work included raising the canal lining, canal embankment, and operating roads; removing, modifying, installing, and constructing various structures, including overchutes, inlets, pipes, bridges, trash racks, siphons, check structures, water-level measurement systems, radial gates, motors, control systems, flowmeters, and valves; and raising/refurbishing Patterson Reservoir. Work was completed in June 2015. Acceptance is expected in February 2016.

**South Bay Pumping Plant.** The following contracts for the SBA Enlargement project at South Bay Pumping Plant continued throughout 2015.

Specification No. 04-05: furnishing 45 cfs pump and motor units for Unit Nos. 10 through 13 and one spare pump and motor. Work began in November 2004. In February 2015, DWR and the contractor agreed to terms for closing out the contract. Acceptance is expected in January 2016.

Specification No. 04-20: furnishing valves, actuators, and hydraulic power units. Work began in May 2005. The equipment was furnished in June 2007. Repairs to the butterfly valves were added to this contract by change order. Work was completed in October 2015, and acceptance is expected in January 2016.

Specification No. 06-04: enlarging pumping plant initial facilities. Work began in August 2006 and was completed in October 2011. Acceptance is expected in January 2016.

Specification No. 07-18: complete pumping plant enlargement. Work began in December 2007. Added work included repairs to a water system pipeline adjacent to Banks Pumping Plant. Work was completed in April 2014. Acceptance is expected in January 2016.

**Del Valle Dam.** The following contracts for Del Valle Dam continued in 2015.

Specification No. 12-14: bulkhead installation and removal. Work began in October 2012. Original contract work included labor, materials, and construction equipment;

hauling construction equipment for installation and removal of a DWR-furnished bulkhead gate; repairing cracks inside the flood control outlet works tunnel; applying coatings to the bulkhead gate and flood control outlet works tunnel slide gates; painting station markings on the inside of the Del Valle spillway tunnel; and installing a metal walkway.

In addition to the original contract work, additional tasks were performed under change order. These tasks included:

- urgent repair of leaks on the SBA Pipeline at Mileposts 38.90, 33.83, and 35.34;
- Thermalito Powerplant recovery efforts;
- Clifton Court Forebay gate repair;
- open channel flowmeter installation at Dyer Reservoir;
- Del Valle floodgate repair;
- Hyatt Powerplant clean-up; and
- furnishing WEKO-SEALs (internal joint seals).

Work was completed in April 2014. Acceptance is expected in July 2016.

Specification No. 14-17: repair leaks inside tier valve intake structure, conservation outlet works tunnel and access tunnel, Del Valle Branch Pipeline, and gate chamber access tunnel. Work began in October 2014. The contractor repaired damaged coatings of valves and steel pipe, installed pressure transducer conduits on the exterior of the tier valve intake structure, installed a remotely monitored weir for seepage measurement, and painted station markings on the inside of the tier valve intake structure and the conservation outlet works access tunnel. Work was completed in April 2015 and accepted in October 2015.

## North San Joaquin Division

### *Skinner Fish Science Building*

The Delta Fish Survival Improvements Program (Specification No. 12-15) began in December 2012. Work consisted of construction of a cold-formed steel frame building with restroom, office space, and break room facilities. The project included demolishing the following existing items:

- asphalt concrete paving;
- concrete and reinforcing steel;
- concrete curb and gutter;
- chain-link fencing;
- traffic gates;
- metal beam guardrail; and
- cathodic protection.

Work was completed in October 2014. Acceptance is expected in January 2016.

### *Clifton Court Forebay Dam*

On July 8, 2013, radial Gate No. 2 at the Clifton Court Forebay Dam intake structure failed catastrophically. With an advance directive under a contract that began in October 2012 (Specification No. 12-14), a contractor retrieved the gate from the reservoir and made immediate minor repairs to radial Gates No. 1, 3, 4, and 5 to minimize the potential for failure of additional gates. DOE issued and awarded Specification No. 13-15 in July 2013 to repair and reinstall Gate No. 2 and to identify and correct conditions to a level of acceptable operational risk on the four remaining gates. The contract also included removing, cleaning, and repairing five loading gates. Work was completed in February 2015 and accepted in July 2015.

### *Skinner Fish Facility*

**Fish Count and Transport Buckets.** Work began in June 2014 to furnish fish count and transport buckets (Specification No. 14-08) for the Skinner Fish Facility. Work was

completed in June 2015, and acceptance is expected in February 2016.

**Emergency Repair of Louvers.** On September 18, 2014, six louver supports in Bay 5 at the Skinner Fish Facility failed catastrophically. With an advance directive under a contract that began in October 2012 (Specification No. 12-18), a contractor recovered the broken louvers and performed a dive inspection and damage assessment. A contract (Specification No. 14-20) began in November 2014 to temporarily replace the failed aluminum frames in Bay 5 with steel ones, fabricate and install new louvers, perform additional condition assessment dive inspections of Bays 1 through 5, and make necessary temporary repairs based on conditions. In addition, the louver washing system was upgraded with new pumps, valves, and controls, and the flow meters were replaced. Work was completed in May 2015 and accepted in September 2015.

### *Curtis Landing Fish Release Site*

Work for this project (Specification No. 14-02) began in March 2014. It involved two tasks related to the Curtis Landing fish release site. The first included selective demolition of the existing fish release system piping, support framing and piles, electrical system, and other miscellaneous facilities, and relocation of passive integrated transponder antennas, a submersible pump, and articulated mats. The second task included construction of a concrete slab, wall, and foundation; construction of a steel platform with metal grating, piping, valves, flowmeter, and submersible pump; construction of the structural steel framework to support the piping; and electrical work for the fish screen pump, lights, and gates. Work was completed in May 2015. Acceptance is expected in February 2016.

## San Luis Division

### *Canal Milepost 86.69 to Milepost 138.29*

Turnout structure modifications (Specification No. 15-03) began in November 2015. Work includes installation of guide steel and thermoplastic polyolefin single-ply roofing at five locations, and head panel modification. The project is scheduled to be completed in March 2016. Acceptance is expected in July 2016.

### *Delta and San Luis Field Divisions—Roads and Parking Areas*

Work began in July 2013 (Specification No. 13-06) to seal and pave roads and parking areas in Alameda, Contra Costa, Stanislaus, Santa Clara, Merced, Kings, and Fresno counties. Work was completed in January 2014 and accepted in February 2015.

## Tehachapi Division

### *Edmonston Pumping Plant*

A contract to replace pump Units W2, W4, W6, and W8 (Specification No. 02-10) began in June 2003. Work was completed in March 2011. Delivery of additional spare parts was added later to the contract through a change order. Delivery and acceptance were completed in November 2015. Work consisted of:

- designing, fabricating, and testing a four-stage pump model and a single-stage pump model, and furnishing a pump model test program report;
- designing, manufacturing, delivering, storing, and installing four pumps to replace existing pumps;
- furnishing spare parts, auxiliary equipment, tools, and templates;
- applying coatings;
- providing liaison services; and
- furnishing additional spare parts requested via change order.

### *Chrisman and Devil's Den Pumping Plants*

Site improvements (Specification No. 12-12) began in December 2012. The work included:

- repairing and coating water discharge pipe sleeve couplings and expansion joints;
- constructing temporary scaffolds with containment structures for sandblasting and cleaning the joints;
- removing sandblast dust and debris; and
- removing and replacing 160 feet of 12-inch diameter steel pipe.

Work was completed in February 2015 and accepted in December 2015.

### *Antelope Valley-East Kern Water Agency Turnout*

Construction of the Antelope Valley-East Kern turnout (Specification No. 13-11) began in August 2013. The work involved excavation, constructing a temporary coffer dam, erosion control, installing steel pipe and fittings, concrete work, miscellaneous metal work, a trash rack, and backfilling. The contractor performed demolition of the concrete liner and existing drainage ditch and removal of an existing asphalt concrete road. Work was completed in August 2014 and accepted in May 2015.

## Mojave Division

### *Canal Milepost 335.80*

The emergency canal lining repair project (Specification No. 15-16) began in October 2015. Work includes dewatering, removal of the concrete liner and unsuitable material, backfill, and concrete and joint sealant repair. Work is expected to be completed in January 2016. Acceptance is expected in June 2016.

### *Canal Milepost 342.65*

Repair at Milepost 342.65 (Specification No. 13-10) began in July 2013. The work included dewatering of Pool 52, removal and repair of concrete panels, concrete repair and cleaning, replacement of bolt anchors and ladders, and repair of the access road. Work was completed in January 2014 and accepted in January 2015.

### *Pearblossom Pumping Plant*

A contract to construct a new 20,000 square-foot Pearblossom Administration Building near Pearblossom Pumping Plant began in February 2011 (Specification No. 10-23). The new building, which received notification of Leadership in Energy and Environmental Design platinum certification in May 2015, is occupied by Southern Field Division staff and Lancaster Project Headquarters personnel. Work was completed in February 2013. Acceptance is expected in April 2016.

## Santa Ana Division

### *East Branch Extension Phase I Improvements*

#### Crafton Hills Reservoir Enlargement.

A construction contract (Specification No. 11-12) to increase the reservoir's operating storage from 85 acre-feet to approximately 225 acre-feet began in December 2011. The work included an earthen embankment dam with rock slope protection, access roads, grouting, a seepage collection system, geotechnical instrumentation, and mechanical aerators. The reservoir was filled in September 2014. Work was completed in June 2014 and accepted in March 2015.

### *East Branch Extension Phase II*

Phase II of the East Branch Extension will complete the planned capacity increase for the East Branch Extension. Phase II will allow San Gorgonio Pass Water Agency to receive its maximum annual Table A water and allow the San Bernardino Valley Municipal Water District to increase its distribution system capacity to its Redlands and Yucaipa Valley service areas. Principal Phase II features include approximately

6 miles of new 72-inch and 66-inch diameter pipe, a new reservoir (Citrus Reservoir), a new 160 cfs pump station (Citrus Pump Station), expansion of the existing Crafton Hills Pump Station, and installation of an additional pump at Cherry Valley Pump Station.

**Citrus Reservoir.** Construction of Citrus Reservoir (Specification No. 12-02) began in June 2012. The work to construct the reservoir included selective demolition, excavation, compacted soil liner, hydraulic asphalt concrete, inlet works, and environmental protection. Work was completed in February 2014 and accepted in February 2015.

**Mentone Pipeline.** Construction of Mentone Pipeline (Specification No. 12-03) began in July 2012. The work includes installation of approximately 2 miles of 72-inch buried steel pipe from Foothill Pump Station to Citrus Reservoir and approximately 3.5 miles of 66-inch buried steel pipe from Citrus Pump Station to Crafton Hills Pump Station. Work is scheduled to be completed in June 2015. Acceptance is expected in December 2016.

**Valves.** Manufacturing, testing, and delivery of three energy dissipating valve assemblies (including electric actuators) for Citrus Reservoir (Specification No. 10-10) began in September 2010. The valves were delivered to the site in October 2012. Spare parts and special tools were included in the contract work. Work was completed in March 2013. Acceptance is expected in July 2017.

Manufacturing, testing, and delivery of 14 ANSI (American National Standards Institute) butterfly valve assemblies with actuators for Citrus Pump Station, Crafton Hills Pump Station, and Cherry Valley Pump Station (Specification No. 10-16) began in January 2011. Spare parts and special tools were included in the contract work. Work was completed in July 2013. Acceptance is expected in July 2017.

Manufacturing, testing, and delivery of 12 AWWA (American Water Works Association) butterfly valve assemblies with actuators for Crafton Hills Pump Station, Cherry Valley Pump Station, and Mentone Pipeline (Specification No. 10-17) began in February 2011. Spare parts and special tools were included in the contract work. Work was completed in mid-2013. Acceptance is expected in July 2017.

Manufacturing, testing, and delivering 12 ANSI ball valve assemblies with actuators and 4 actuators for Citrus Pump Station, Crafton Hills Pump Station, and Cherry Valley Pump Station (Specification No. 10-18) began in January 2011. The valves were delivered to the site in October 2012. Spare parts and special tools were included in the contract work. Acceptance is expected in July 2017.

**Transformers.** Transformers, accessories, tools, and spare parts were manufactured, tested, and delivered for Citrus Pump Station under a contract (Specification No. 10-20) that began in March 2011. The equipment was delivered to the completion contractor in December 2015. Acceptance is expected in July 2017.

**5 kilovolt Switchgear.** Work includes manufacturing, factory testing, and commissioning equipment (Specification No. 13-12) for a prefabricated control building and associated equipment, accessories, tools, special tools, and spare parts. Also included are 5 kilovolt (kV), 4,000 amperes (A) switchgear motor breaker cubicle assemblies; 5 kV, 4000 A main and tie breaker switchgear cubicle assemblies; 5 kV, 4,000 A station service breaker switchgear cubicle assemblies; and 5 kV-class surge protection equipment in the main incoming bus compartments. Fabrication began in June 2014 and is scheduled to be completed in October 2016. Acceptance is expected in June 2017.

### *Crafton Hills and Citrus Pump Stations*

Construction on the Crafton Hills Pump Station expansion and Citrus Pump Station initial work (Specification No. 12-10) began in October 2012. Work included construction of a prestressed concrete forebay water tank and pump station buildings; earthwork, shoring, and demolition; installation of a hydraulic asphalt concrete liner, steel pipe and appurtenances, DWR-furnished materials, and equipment; application of coatings; and testing. Work was completed in October 2014. Acceptance is expected in July 2016.

### *Citrus, Crafton Hills, and Cherry Valley Pump Stations*

Work to provide pumps, motors, variable frequency drives, and excitation system equipment, and associated hardware, for the pump stations (Specification No. 13-01) began in June 2013. Units were delivered in December 2015. Acceptance is expected in July 2017.

## West Branch

### *Oso Pumping Plant*

Work to construct a 14,400 square-foot civil maintenance and mobile equipment building at Oso Pumping Plant (Specification No. 07-22) began in December 2007. Work was completed in July 2012. Acceptance is expected in October 2016.

### *Perris Dam*

The seismic remediation of Perris Dam (Specification No. 14-03) began in August 2014. The work involves construction of a new compacted berm; extension of the existing blanket drain; construction of a new drain line, a new toe drain, and a relief well system; cement deep soil mixing treatment of the alluvium beneath the footprint of the compacted berm; road work; and other related work. The rock material for the project is being produced on-site by using blasting methods and a rock processing plant. The work is scheduled to be completed in November 2017. Acceptance is expected in March 2018.

**Oak Valley (Perris Dam).** Mitigation work for the Perris Dam seismic remediation project (Specification No. 15-01) began in June 2015. The work involves:

- excavation, grading, and revegetation of a new channel and floodplain system;
- protection of native trees and vegetation;
- monitoring well destruction;
- earthwork, including excavation, transport, stockpile, and placement of fill and rock structures for grade control;
- installing biotechnical structures;
- installing erosion control devices;
- installing a hog exclusion fence and gate; and
- planting, seeding, irrigating, and plant establishment.

The work is scheduled to be completed in January 2017. Acceptance is expected in April 2017.

## Coastal Branch

### *Kern and San Luis Obispo Counties*

The cathodic protection rehabilitation project in Kern and San Luis Obispo counties (Specification No. 13-13) began in September 2013. Work included removing encasement at insulating coupling flanges and installing new insulating sleeve couplings inside new cast-in-place vaults. A portion of the work was completed in January 2014 and accepted in September 2014. The remaining work was completed under Specification No. 15-05. Acceptance is expected in July 2016.

### *Devil's Den, Bluestone, and Polonio Pass Pumping Plants*

Work on cathodic protection rehabilitation and installation of insulated sleeve

couplings (Specification No. 15-05) began in September 2015 and was completed in December 2015. The project is expected to be accepted in July 2016.

## Construction Activities in Multiple Divisions

### *Temporary Rock Barriers 2013, 2014, and 2015*

Two tasks related to the South Delta Temporary Barriers Project (Specification No. 12-18) began in January 2013. The first task included the removal of temporary rock barriers and appurtenances at Middle River, Old River, and Grant Line Canal. Additional work included temporary pumping facilities, dredging in the South Delta, removing of aquatic weeds in Clifton Court Forebay, installing of stone protection in the South Delta, and structural maintenance and repair at the Curtis Landing and Horseshoe Bend release facilities. The second task included furnishing, installing, and removing a nonphysical barrier at the head of Georgiana Slough and at the east side of the Sacramento River (immediately downstream of the Walnut Grove Bridge). Work was completed in December 2015. Acceptance is expected in March 2016.

### *West False River*

The temporary rock barrier for the drought emergency (Specification No. 15-04) began in April 2015. Work included construction of a rock barrier at West False River, which included installing embankment rock to form the embankments of the barrier, aggregate base materials, and whalers and attachments between the king pipe piles and sheet piles. The contractor also installed DWR-furnished materials such as warning signs and buoys, ball floats, and lights. Work was completed in June 2015 and was accepted in September 2015.

### *West False River and Rio Vista Storage Area*

The work (Specification No. 15-08) at West False River began in August 2015 and consists of removal of the drought barrier, including:

- removing of embankment rock and transporting the rock to the Rio Vista storage area;
- removing of warning signs, warning buoys, ball floats, and lights;
- cutting and removal of steel sheet; and
- applying seeding and erosion control methods.

The work at the Rio Vista storage area includes:

- demolition of selected existing features;
- clearing and grubbing, including tree removal, grading, imported backfill, and geotextile fabric;
- installing corrugated metal pipe, aggregate base, hot mix asphalt, pavement markings and signs, woven wire fence and gates, metal beam guardrail, bollards, and applying seeding and erosion control methods,
- installing a hot-tap water connection, piping, valves, backflow device, water meter, and appurtenances.

Work is scheduled to be completed in January 2016. Acceptance is expected in March 2016.

### *San Luis, San Joaquin, and Southern Field Divisions*

The seismic retrofit of bridges addressed existing seismic deficiencies in 23 bridges (9 DWR and 14 Reclamation) located in the San Luis, San Joaquin, and Southern field divisions. There are 22 structures that carry local streets and roads over the California Aqueduct, and one that supports the aqueduct operational road over a local

county road. The work included constructing of shear keys at bridge piers and abutments, replacing some existing reinforced concrete bridge deck, installing hot mix asphalt pavement and dikes, and installing metal beam guard railing. The seismic retrofit was required to prevent potential collapse during an earthquake, and deck replacement work is required due to deterioration of the concrete decks from heavy truck traffic.

**Phase I.** Work on the Duncan Road Bridge, Goss Road (Goodwin Drive) Bridge, Maple Avenue Bridge, Mesquite Street Bridge, and the Ranchero Road Bridge in the Southern Field Division (Specification No. 14-09) began in August 2014. The bridge decks were replaced at the Maple Avenue and the Ranchero Road bridges. Work was completed in September 2015. Acceptance is expected in August 2016.

**Phase II.** Work on the Butts Road Bridge, McCabe Road Bridge, and Mervel Avenue Bridge in the San Luis Field Division (Specification No. 14-14) began in September 2014. Work was completed in February 2015 and accepted in April 2015.

**Phase III.** Work on the 15 bridges located in Fresno, Kings, and Kern counties in the San Luis and San Joaquin field divisions (Specification No. 14-13) began in September 2014. Work was completed in March 2015 and accepted in April 2015.

### *Edmonston, Chrisman, Teerink, and Buena Vista Pumping Plants*

Work at these pumping plants involved the following contracts.

Specification No. 11-10: furnish and install 230 kV SF6 power circuit breakers. Work began in March 2012, was completed in March 2015, and accepted in November 2015.

Specification No. 13-09: replace 57 annunciator panels and the associated hardware for the equipment at the pumping plants. Work began in November 2013, was completed in February 2015, and accepted in August 2015.

Specification No. 11-04: replace the septic tanks, sewage piping, and pumps. Work began in April 2012, was completed in August 2014, and accepted in February 2015.

### *San Joaquin Field Division*

Replacement of the existing standby engine generators with new liquefied petroleum gas and diesel standby engine generators (Specification No. 14-19) began at 21 check sites and 8 pumping plant sites in the San Joaquin Field Division in May 2015. Work also includes installing new fuel tanks, transfer switches, and load banks to support operation of the new standby engine generators. The sites include all of the Coastal Branch pumping plants and check sites; all check sites from Check 22 to 39 on the California Aqueduct; and Teerink, Buena Vista, and Edmonston pumping plants. Work is estimated to be completed in October 2016. Acceptance is expected in November 2016.

### *Badger Hill Pipeline*

Work began in the San Joaquin and Southern field divisions (Specification No. 13-14) in November 2013. Work included removing and replacing the existing lining in manifolds and pipeline, constructing a flow metering vault, removing and replacing a joint at Check 66, and removing and reinstalling pipe spool pieces. Because of emergency work in Specification No. 15-16, work under this contract (Specification No. 13-14) is suspended through October 2016. Work is scheduled to be completed in June 2017. Acceptance is expected in June 2017.

### *Southern Field Division—Seal and Pave Roads and Parking Areas*

This project (Specification No. 14-05) began in July 2014 and covered areas in Los Angeles and San Bernardino counties.

The work included:

- traffic stripes and pavement markings;
- pavement repairs;
- hot mix asphalt paving and overlays;
- earthwork including excavation and compacted backfill;
- wheelstops; and
- miscellaneous metalwork.

The work was completed in September 2015. Acceptance is expected in March 2016.

## Real Estate Activities

DWR processed a net total of $7.02 million in payments in 2015 in support of right-of-way activities required for the construction, operation, and maintenance of the SWP. This amount represents direct payments made for the cost of real property rights, damages, temporary entry permits, licenses, leases, and relocation expenses.

DWR conducted the following real estate activities from January 1 through December 31, 2015.

### SWP Acquisitions

Activities related to SWP acquisitions were as follows:

- recorded two easements and secured one encroachment permit for the 2009 National Marine Fisheries Service biological opinion for the Sherman Island Little Baja and Manzo Ranch fish release sites project;
- secured two agreements with East Bay Regional Park District and the Department of Fish and Wildlife for use of the Bureau of Reclamation fish release site for the 2009 National Marine Fisheries Service biological opinion for the Sherman Island Little Baja and Manzo Ranch fish release sites project;
- processed three payments to the Delta Ferry Authority for costs related to boat repair for the emergency drought barrier project;
- secured two encroachment permits with the city of Tracy for the South Delta salinity study;
- processed six permits for the California Irrigation Management Information System;
- secured one encroachment permit with the city of Rio Vista for the Delta Flood Emergency Preparedness, Response, and Recovery Program;
- recorded one grant deed for DWR Parcel No. SGP-85 as required for the East Branch Extension Phase I Improvements, mitigation project;
- recorded three permanent easement deeds and one Director's quitclaim deed as required for the East Branch Extension Phase II Improvements Project;
- retrieved condemnation deposit monies from the State Treasurer for the East Branch Extension and SBA, Dyer Reservoir Project;
- secured one damage agreement, one lease agreement, one easement deed, and one encroachment permit as required for the 2015 emergency drought barrier project;
- processed two license and hold harmless agreements as required for the emergency drought barrier project;
- processed payment for a landowner claim for damages as related to the emergency drought barrier project;
- secured a damage agreement with the delta ferry authority for the emergency drought barrier project;
- processed agreement for access as required for the Division of

Environmental Services, Interagency Ecology Program, delta compliance monitoring;
- completed property exchange with the Port of West Sacramento for the Decker Island and Prospect Island habitat restoration projects;
- secured the right-of-way contract for spoil site as required for the Milepost 62 canal embankment repair project;
- secured one special use permit and two access agreements as required for the Division of Operation and Maintenance (O&M) earthquake engineering project;
- secured one encroachment permit as required for the San Joaquin Fish Hatchery access and trail project;
- secured one right-of-way contract and one utility modification agreement as required for the SBA Improvement and Enlargement Project; and
- processed three payments for water monitoring compliance related to the Suisun Marsh water monitoring project.

## Temporary Entry Permits

In 2015, DWR obtained 28 temporary entry permits including:

- Bay Delta Office—South Delta salinity study, 1;
- Cantua Creek Stream Group Improvements Project,1;
- Del Valle fault survey project, 2;
- East Porterville emergency well project, 1;
- emergency drought barrier project—water information monitoring station, 1;
- emergency drought barrier project—boundary survey, 1;
- FloodSAFE Environmental Stewardship and Statewide Resources Office Delta ecosystem enhancement—levees project, 1;
- Fish Restoration Program, 1;
- Fish Restoration Program—Decker Island land management project, 2;
- Fish Restoration Program—flood systems repair project, 1;
- Perris Dam Remediation—Oak Valley mitigation project, 1;
- North Central Region Office, O&M delta operation project, 1;
- O&M—Coastal Branch maintenance, 1;
- O&M—earthquake engineering permits, 1;
- Prospect Island Restoration Project, 1;
- San Joaquin River Restoration Program, 1;
- SBA—erosion repair project, 2;
- Suisun Marsh compliance program, 1;
- South Delta Temporary Barriers Project, 2;
- Division of Environmental Services—water quality monitoring stations, 1;
- Yolo Bypass habitat restoration, 4; and
- Yolo Bypass Salmonid Habitat Restoration and Fish Passage Project, 1.

## SWP Property Management

Property management activities during 2015 were as follows:

- managed leasing activities of SWP nonoperating properties, which produced $728,662;
- processed 44 encroachment permit applications and executed 22;
- collected fees of $217,390.50 for review and inspection costs related to encroachment permit applications; and
- coordinated review of 21 tentative tract map developments within 1 mile of the California Aqueduct.

## SWP Appraisals

In 2015, 54 percent of total appraisal assignments (27 of 50) completed by

DWR were exclusively for the SWP. These assignments included the following:

- East Branch Extension Phase I, Crafton Hills Reservoir enlargement project—completed two appraisals and three appraisal reviews;
- Cantua Creek Stream Group Improvements Project—completed five appraisals;
- Fish Restoration Program—completed four appraisals, one agricultural lease rate, and one review;
- West Sacramento Corporation Yard Agreement—completed two appraisals;
- Perris Dam seismic remediation—completed one appraisal review;
- Decker Island acquisition project—completed one appraisal;
- SWP property management—reviewed one appraisal and completed one appraisal and one license rate;
- Dutch Slough Tidal Marsh Restoration Project—completed two appraisals;
- North Bay Aqueduct—completed one review; and
- Winter Island acquisition, tidal habitat restoration—completed one appraisal.

In addition, two Architectural Revolving Fund accounts were established at the Department of General Services to finance appraisals for the Fish Restoration Program and the Perris Dam Emergency Release Facility Project.

## Table 12-1 Design Activities, 2015

| Construction Division and Facility | Design Activity | Date Design Began | Design Actual/ Estimated Completion Date |
|---|---|---|---|
| **Oroville Division** | | | |
| Oroville, Thermalito Afterbay, and Thermalito Forebay dams | Radial gate nondestructive examination of tendons study | July 2015 | December 2017 |
| Lake Oroville | Reservoir rim inspection study | November 2015 | June 2016 |
| Bidwell Canyon | Stage III boat ramp extension | June 2015 | August 2015 |
| Oroville Dam | River outlet modification | December 2013 | December 2015 |
| | Radial gates seals replacement | July 2011 | March 2015 |
| Oroville Field Division | Fire systems modernization (design review) | September 2014 | October 2015 |
| | Roofing replacement | May 2015 | November 2015 |
| Hyatt and Thermalito power plants | Fire detection system | March 2013 | June 2015 |
| Thermalito Powerplant | Bypass gate reliability | October 2013 | November 2015 |
| Thermalito Afterbay Dam | Well replacement, phase II, | June 2013 | January 2016 |
| Hyatt Powerplant, Thermalito Diversion Dam Powerplant, and Oroville Operations & Maintenance Center | Fire systems modernization | August 2013 | October 2015 |
| **Suisun Marsh Facilities** | | | |
| Montezuma Slough Control Facility | Roofing replacement | April 2014 | May 2015 |
| **Delta Facilities** | | | |
| Georgiana Slough | Salmon protection technology (preliminary design) | October 2015 | December 2015 |
| Sherman and Twitchell islands | New fish screens at existing siphons—5 sites | July 2014 | June 2015 |
| Middle River, Old River, Grant Line Canal | Temporary rock barrier | July 2015 | October 2015 |
| **North Bay Aqueduct** | | | |
| North Bay Aqueduct | Alternate intake study | October 2008 | June 2016 |
| **South Bay Aqueduct** | | | |
| Del Valle Dam | Right abutment fault phase 2 investigation study | May 2015 | September 2015 |
| **North San Joaquin Division** | | | |
| Clifton Court Forebay Dam | Stratigraphic model of foundation study | July 2014 | July 2015 |
| Delta Field Division | Byron Road bridge replacement | January 2014 | July 2016 |
| | Canal repairs (Reaches 1 and 2A) | February 2015 | May 2015 |
| | Embankment and liner repair (Milepost 62) | July 2015 | January 2016 |
| **San Luis Division** | | | |
| Sisk Dam | Seismic reevaluation | July 2007 | September 2016 |
| San Luis Field Division | Canal liner and embankment repair | February 2013 | May 2015 |
| **South San Joaquin Division** | | | |
| San Joaquin Field Division | Bridge hinge retrofit | July 2015 | January 2016 |

**Table 12-1 Design Activities, 2015** *(continued)*

| Construction Division and Facility | Design Activity | Date Design Began | Design Actual/ Estimated Completion Date |
|---|---|---|---|
| **Coastal Branch** | | | |
| Devil's Den, Bluestone, Polonio Pass pumping plants | Insulated flange repair and vault construction | December 2014 | March 2015 |
| **West Branch** | | | |
| Castaic Dam | Left abutment analysis study | November 2015 | December 2017 |
| | Tower nonlinear structural analysis study | January 2015 | February 2016 |
| Los Robles Bridge (not part of seismic program) | Seismic analysis | August 2005 | June 2015 |
| **East Branch** | | | |
| Southern Field Division | Pools 47–49 canal repair and restoration design | October 2015 | November 2015 |
| **East Branch Enlargement** | | | |
| East Branch Enlargement Phase II | Preliminary design and environmental documents | March 2007 | June 2015 |
| **Mojave Division** | | | |
| Various Sites | Replace standby emergency generators at 19 check sites, 8 pumping plants, and 2 special locations | April 2012 | May 2015 |
| **Santa Ana Division** | | | |
| Perris Dam | Emergency release facility preliminary design and environmental documents | October 2006 | July 2017 |
| **Miscellaneous** | | | |
| Oroville, Thermalito, Pyramid dams | Radial gate structural reevaluation | July 2011 | March 2015 |

## Table 12-2 Construction Activities, 2015

| Construction Division and Facility | Construction Contract (Specification Number) | Starting Date (Notice to Begin Work) | Acceptance Date (expected or actual) | Estimated Total Contract Costs (in thousands of dollars) |
|---|---|---|---|---|
| **State Water Project—General** | | | | |
| SWP Supervisory Control and Data Acquisition System | Replace remote terminal units (08-12) | May 2009 | July 2016 | 12,112 |
| California Aqueduct | Copper communications cable and voice and data equipment—monitoring, testing, and repair (13-17) | March 2014 | May 2016 | 877 |
| **Oroville Division** | | | | |
| Robie Thermalito Pumping-Generating Plant | Initial cleanup and restoration—clean and repair fire-impacted equipment (13-16) | October 2013 | July 2016 | 1,218 |
| Bidwell Bar Bridge | Repair access road erosion (14-10) | September 2014 | November 2015 | 433 |
| Oroville Dam Outlet Diversion Tunnel No. 2 | Baffle ring installation (15-11) | December 2015 | June 2016 | 2,621 |
| Bidwell Canyon Boat Ramp | Stage III boat ramp extension (15-13) | December 2015 | May 2016 | 319 |
| Hyatt Powerplant | Fire systems modernization (15-06) | October 2015 | July 2017 | 15,000 |
| Hyatt Powerplant Diversion Tunnel No. 2 | Emergency repair—video surveillance and telecommunications equipment, refurbish existing/furnish new hydraulic system components (14-07) | March 2014 | September 2015 | 5,404 |
| Feather River Fish Hatchery | Water supply pipeline repair—remove and provide surface prep to existing steel pipe and associated structures (14-01) | April 2014 | February 2015 | 356 |
| Feather River Spawning Gravel Supplementation | Spawning gravel supplementation for fish habitat enhancement (14-04) | May 2014 | February 2015 | 851 |
| **South Bay Aqueduct** | | | | |
| South Bay Aqueduct Enlargement and Improvement | | | | |
| Dyer Canal, Livermore Canal, Alameda Canal, and Del Valle Pipeline | Perform canal modifications (09-16) | October 2010 | February 2016 | 29,468 |
| South Bay Pumping Plant | Furnish four 45 cfs pump and motor units and one spare pump and motor (04-05) | November 2004 | January 2016 | 5,530 |
| | Furnish valves, actuators, and hydraulic power unit (04-20) | May 2005 | January 2016 | 2,039 |
| | Construct pumping plant enlargement—initial facilities (06-04) | August 2006 | January 2016 | 16,424 |
| | Enlarge pumping plant (07-18) | December 2007 | January 2016 | 24,436 |
| Del Valle Dam | Bulkhead installation and removal (12-14) | October 2012 | July 2016 | 76,658 |
| | Tier valve intake repairs (14-17) | October 2014 | October 2015 | 1,348 |
| **North San Joaquin Division** | | | | |
| Skinner Fish Science Building | Delta Fish Survival Improvements Program (12-15) | December 2012 | January 2016 | 6,104 |
| Clifton Court Forebay Dam | Emergency radial gate repairs (12-14) [Remaining work will finish under 13-15] | October 2012/ July 2013 | July 2015 | 1,241 |

## Table 12-2 Construction Activities, 2015

| Construction Division and Facility | Construction Contract (Specification Number) | Starting Date (Notice to Begin Work) | Acceptance Date (expected or actual) | Estimated Total Contract Costs (in thousands of dollars) |
|---|---|---|---|---|
| **North San Joaquin Division** (continued) | | | | |
| Skinner Fish Facility | Fish count and transport buckets (14-08) | June 2014 | February 2016 | 177 |
| | Emergency louver repair (12-18) [Remaining work will finish under 14-20] | October 2012/ November 2014 | September 2015 | 1,230 |
| Curtis Landing Fish Release Site | Site improvements (14-02) | March 2014 | February 2016 | 1,179 |
| **San Luis Division** | | | | |
| Mileposts 86.69–138.29 | Turnout structure modifications at 15 locations (15-03) | November 2015 | July 2016 | 714 |
| Various counties | Seal and pave roads and parking areas (13-06) | July 2013 | February 2015 | 9,251 |
| **Tehachapi Division** | | | | |
| Edmonston Pumping Plant | Replace pumps, Units W2, W4, W6, and W8 (02-10) | June 2003 | November 2015 | 36,916 |
| Chrisman and Devil's Den pumping plants | Site improvements (12-12) | December 2012 | December 2015 | 3,530 |
| Antelope Valley-East Kern Water Agency Turnout | Construct turnout (13-11) | August 2013 | May 2015 | 969 |
| **Mojave Division** | | | | |
| Milepost 335.80 | Emergency canal lining repair (15-16) | October 2015 | June 2016 | 1,052 |
| Milepost 342.65 | Pool 52 repair (13-10) | July 2013 | January 2015 | 1,333 |
| Pearblossom Pumping Plant | Construct new administration building (10-23) | February 2011 | April 2016 | 13,243 |
| **Santa Ana Division** | | | | |
| East Branch Extension Phase I Improvements | | | | |
| Crafton Hills Reservoir Enlargement | Increase operating storage of the reservoir (11-12) | December 2011 | March 2015 | 10,890 |
| East Branch Extension Phase II | | | | |
| Citrus Reservoir | Construct new reservoir (12-02) | June 2012 | February 2015 | 19,310 |
| Mentone Pipeline | Construct 5.5 miles of pipeline (12-03) | July 2012 | December 2016 | 42,729 |
| Valves | Manufacture, test, and deliver 3 energy dissipating valves for Citrus Reservoir (10-10) | September 2010 | July 2017 | 626 |
| | Manufacture, test, and deliver 14 ANSI butterfly valves for Citrus, Crafton Hills, and Cherry Valley pump stations (10-16) | January 2011 | July 2017 | 1,320 |
| | Manufacture, test, and deliver 12 AWWA butterfly valves for Crafton Hills and Cherry Valley pump stations and Mentone Pipeline (10-17) | February 2011 | July 2017 | 550 |
| | Manufacture, test, and deliver 12 ANSI ball valves for Citrus, Crafton Hills, and Cherry Valley pump stations (10-18) | January 2011 | July 2017 | 3,300 |

## Table 12-2 Construction Activities, 2015

| Construction Division and Facility | Construction Contract (Specification Number) | Starting Date (Notice to Begin Work) | Acceptance Date (expected or actual) | Estimated Total Contract Costs (in thousands of dollars) |
|---|---|---|---|---|
| **Santa Ana Division** (continued) | | | | |
| Transformers | Manufacture, test, and deliver transformers and accessories for Citrus Pump Station (10-20) | March 2011 | July 2017 | 793 |
| 5 kV switchgear | Manufacture, factory test, and commission equipment (13-12) | June 2014 | June 2017 | 5,001 |
| Crafton Hills and Citrus pump stations | Pump station expansion and initial construction (12-10) | October 2012 | July 2016 | 25,566 |
| Citrus, Crafton Hills, and Cherry Valley pump stations | Furnish equipment and hardware (13-01) | June 2013 | July 2017 | 2,144 |
| **West Branch** | | | | |
| Oso Pumping Plant | Construct civil maintenance and mobile equipment building (07-22) | December 2007 | October 2016 | 4,048 |
| Perris Dam | Seismic remediation of dam embankment (14-03) | August 2014 | March 2018 | 75,539 |
| Oak Valley—Perris Dam | Mitigation for Perris Dam seismic remediation impacts (15-01) | June 2015 | April 2017 | 2,357 |
| **Coastal Branch** | | | | |
| Kern and San Luis Obispo counties | Cathodic protection rehabilitation (13-13) [Remaining work will finish under 15-05] | September 2013 | September 2014 | 552 |
| Devil's Den, Bluestone, and Polonio Pass pumping plants | Cathodic protection rehabilitation (15-05) | September 2015 | July 2016 | 180 |
| **Multiple Divisions** | | | | |
| Temporary rock barriers, 2013, 2014, and 2015 | Installation and removal at various Delta locations (12-18) | January 2013 | March 2016 | 11,834 |
| West False River | Emergency drought barrier installation (15-04) | April 2015 | September 2015 | 13,800 |
| West False River and Rio Vista Storage Area | Emergency drought barrier removal and various work in storage area (15-08) | August 2015 | March 2016 | 14,618 |
| San Luis, San Joaquin, and Southern field divisions | Phase I seismic retrofit of bridges (14-09) | August 2014 | August 2016 | 433 |
| | Phase II seismic retrofit of bridges (14-14) | September 2014 | April 2015 | 2,794 |
| | Phase III seismic retrofit of bridges (14-13) | September 2014 | April 2015 | 2,306 |
| Edmonston, Chrisman, Teerink, and Buena Vista pumping plants | Furnish and install circuit breakers (11-10) | March 2012 | November 2015 | 2,306 |
| | Replace annunciator panels and hardware (13-09) | November 2013 | August 2015 | 809 |
| | Replace septic tanks, sewage piping, and pumps (11-04) | April 2012 | February 2015 | 1,634 |
| San Joaquin Field Division | Replace standby engine generators (14-19) | May 2015 | November 2016 | 5,000 |
| Badger Hill Pipeline | Pipeline repair (13-14) | November 2013 | June 2017 | 3,325 |
| Southern Field Division | Seal and pave roads and parking areas (14-05) | July 2014 | March 2016 | 2,715 |

# Chapter 13
# Recreation

*Low water at Lake Oroville during the fourth year of drought.*

## Significant Events in 2015

The fourth year of drought in California continued to negatively impact recreation at many State Water Project (SWP) facilities. Two Catch A Special Thrill (C.A.S.T.) for Kids events and the popular Apple Festival at Silverwood Lake were cancelled in Southern California due of the lack of water.

Despite low water levels, several reservoir draw-downs, and the start of the Perris Dam remediation project, Lake Perris remained open, and the campgrounds remained full throughout the summer. Other regional reservoirs were closed mid-summer due to low water levels.

The Department of Water Resources (DWR), along with the California Department of Parks and Recreation (California State Parks), the California Conservation Corps, and the California Department of Forestry and Fire Protection, held a third annual C.A.S.T. for Kids event at Brannan Island State Recreation Area in the Delta.

DWR supported the 2015 Independence Day celebration and fireworks show on Lake Oroville, which included a "Red, White, and You" party at the upper overlook parking lot at the south end of Oroville Dam. More than 5,000 participants attended the event, and an estimated 10,000 people watched the enhanced fireworks show, the largest in many years.

*Information for this chapter was provided by the Division of Integrated Regional Water Management, the Public Affairs Office, the Division of Environmental Services, the Division of Operations and Maintenance, and the State Water Project Analysis Office.*

The State Water Project (SWP) is a multipurpose project that provides recreational benefits to millions of Californians. In addition to providing water supply, flood control, and habitat for fish and wildlife, the SWP offers extensive and varied recreational opportunities—tours, sightseeing, fishing, hunting, picnicking, camping, boating, water skiing, bicycling, hiking, and swimming. Under the Davis-Dolwig Act (DDA), these recreational opportunities, as well as fish and wildlife enhancements, are not allocable as water and power costs to the SWP water contractors. The DDA, together with the Burns-Porter Act, provide financing for SWP recreational facilities and fish and wildlife enhancement projects, declaring that these projects benefit all the people of California and should be paid for by all Californians. The Department of Water Resources (DWR) coordinates with the California Department of Parks and Recreation (California State Parks) and the Department of Fish and Wildlife (DFW) to assure that the recreation and fish and wildlife enhancement potential at SWP facilities is fully realized.

## Recreation Areas

The SWP has 37 developed recreation areas, or sites, throughout California, including 18 developed fishing access sites. Figure 13-1 shows the name and location of each area.

## Recreation Use

Since the SWP began delivering water in 1962, more than 243 million recreation days have been recorded at SWP recreation facilities. A recreation day is defined as one individual user visiting a recreation site along the SWP within all or part of a 1-day period.

In 2015, SWP facilities supported an estimated 4.4 million recreation days of use, up 12.9 percent from the 3.9 million recorded in 2014. Most of the SWP recreation use was concentrated at the major reservoirs, with approximately 47 percent occurring in the Oroville Field Division and 38 percent occurring in the Southern Field Division.

California experienced a fourth year of significant drought in 2015, negatively impacting recreation throughout the SWP. The major reservoirs in the Southern Field Division were especially hard hit, with both low water levels and cancelled events. Silverwood Lake's popular annual Apple Festival was cancelled due to a lack of apples on the trees of the historic apple orchard. But despite the low water levels and draw-downs during dam repairs, recreation at Lake Perris remained steady throughout the year while other regional reservoirs, such as Diamond Valley Lake, were closed to recreation by mid-summer due to low water levels.

SWP facilities around the Oroville Field Division received 9 percent more recreational use than those around the Southern Field Division, the opposite of previous years when the southern reservoirs have typically received more recreational use. This may have been due to the unusually low drawn-down water levels experienced at two major southern SWP reservoirs—Castaic Lake and Lake Perris.

Visitation at DWR's three SWP educational visitors centers, in recreation days, totaled approximately 356,500. This included:

- 95,900 at Lake Oroville Visitors Center;
- 134,700 at Romero Overlook Visitors Center, San Luis Reservoir; and
- 125,900 at Vista del Lago Visitors Center, Pyramid Lake.

**Figure 13-1 Names and Locations of SWP Recreation Areas**

Overall, recreation usage of more than 4.4 million recreation days at the SWP reservoirs listed in Table 13-1 contributed significantly to the total day-use visitors reported at the 280 units of the California State Park System.

# Facilities

## Planning

### *Lake Oroville State Recreation Area*

In 2015, DWR and California State Parks planned a number of future improvements. One of these was the addition of three new floating campsites designed to accommodate users with disabilities. The new campsites are expected to be available for public use in 2017.

California State Parks plans to install 10 new shade ramadas at the South Thermalito Forebay day-use area. Additionally, installation of 1,300 feet of Class 1 trail and four shade ramadas with concrete picnic tables for visitors with disabilities are planned on the Brad Freeman Trail near North Thermalito Forebay. These improvements will enhance the visitors' experience; they will now have the opportunity to use a picnic site that can be reached by trail or by water.

California State Parks also plans to extend the existing Wyk Island Trail, a trail in the Bidwell Canyon Recreation Area designed for visitors with disabilities, by an additional 2,700 feet. And in the Spillway Recreation Area, there are plans to update the parking lot striping to accommodate users with disabilities.

DWR and California State Parks staff are also in the process of updating and improving the Lake Oroville State Recreation Area Trail Map.

### *San Luis Reservoir State Recreation Area*

The California State Parks Planning, Research and Support Section, along with local district superintendents, develops plans for future park needs and addresses issues such as removing overgrowth and improving visitor access and staff accommodations. The following planned improvements are scheduled to begin in either late 2015 or 2016, depending on funding:

- seal cracks and slurry campground roads at San Luis Creek;
- install a recirculation pump at the Basalt Water Treatment Plant; and
- replace a 30-year-old employee housing trailer.

## New Facilities

### *Lake Oroville State Recreation Area*

A DWR project to extend the Bidwell Canyon Stage 3 Boat Ramp 106 feet farther into Lake Oroville was completed in December 2015. The boat ramp extension project will now allow boat launching and retrieval on a three-lane concrete ramp down to lake elevation 665 feet (235 feet below full pool). Construction crews took advantage of near-record-low lake levels to extend the ramp to elevation 660 feet, which is 16 feet deeper into the lake than the ramp reached after initial construction in 2008–2009. Plans are to eventually extend the ramp to elevation 640 feet as lake levels allow.

The boat ramp project improves safe access to Lake Oroville for emergency responders and law enforcement, marina operators, the public, and California State Parks and DWR operations and maintenance staff during drought conditions. Aquatic habitat and cultural resource mitigation projects were also initiated in compliance with terms of the project's permit.

## Table 13-1 Estimated Recreation Days in 2015, by Field Division and Facility

| Field Division and Facility | Recreation Days (rounded) | |
|---|---|---|
| **Oroville Field Division** | | |
| Frenchman Lake | 21,000 | e |
| Antelope Lake | 35,000 | e |
| Lake Davis | 45,000 | e |
| Lake Oroville, Thermalito Diversion Pool, and Thermalito Forebay | 1,162,000 | e(2) |
| Thermalito Afterbay and Oroville Wildlife Area | 332,000 | e(2) |
| Feather River Fish Hatchery | 226,700 | e(2) |
| Lake Oroville Visitors Center | 95,900 | e(2) |
| ***Subtotal*** | ***1,917,600*** | |
| **Delta Field Division** | | |
| Lake del Valle | 535,500 | |
| Bethany Reservoir | 2,800 | e(1) |
| Fishing Access Site: | | |
| Niels Hansen | 200 | e(1) |
| California Aqueduct: | | |
| Walk-in Fishing | 200 | e(1) |
| Bikeway | 100 | e(1) |
| White Slough Wildlife Area | 13,000 | e(1) |
| ***Subtotal*** | ***551,800*** | |
| **San Luis Field Division** | | |
| San Luis Reservoir SRA: San Luis Reservoir, O'Neill Forebay, and Los Banos Reservoir | 275,300 | |
| Romero Overlook Visitors Center | 134,700 | |
| ***Subtotal*** | ***410,000*** | |
| **San Joaquin Field Division** | | |
| Fishing Access Sites: Kettleman City, Lost Hills, Buttonwillow, and California Aqueduct Walk-in Fishing | 21,800 | e(1) |
| ***Subtotal*** | 21,800 | |
| **Southern Field Division** | | |
| Silverwood Lake | 335,300 | |
| Lake Perris | 535,900 | |

| **Grand Total** | **4,438,800** | |

Note: These values are provided by facility operators and numerous other sources and vary in their degree of accuracy. Recreation days are based on counts, except those marked "e," which are based on partial data. Locations marked "e(1)" are not regularly monitored and are only visually monitored. It is likely that these areas are used significantly more than what is represented in this table, but it is difficult to ascertain a realistic annual use. Rows marked "e(2)" are estimates for locations at Lake Oroville State Recreation Area and Oroville Wildlife Area using trends in preliminary data between years 2014 and 2015. Official attendance data will be published in a March 2017 Technical Information Record, which will be submitted to FERC as part of the 2017 Biennial Record consistent with FERC Order 2100-054 requirements.

## Improvements to Facilities

### *Lake Oroville State Recreation Area*

The Bidwell Canyon Stage 3 Boat Ramp parking lot striping was redesigned to provide safer vehicle and boat-trailer parking and improve traffic flow. Additionally, the California State Parks Division of Boating and Waterways funded a new boarding float for the boat ramp.

DWR continued to work on wildfire fuel load reduction within the Loafer Creek Recreation Area, Lime Saddle Recreation Area, and the Saddle Dam area. The work involves the removal and thinning of trees, shrubs, and grasses to create a shaded fuel break.

DWR improved the swim beach at the Monument Hill Boat Ramp and Day Use Area at Thermalito Afterbay with the addition of 350 tons of sand. A chain-link fence separating the parking lot from the beach was removed to provide easier access to the beach, and picnic tables were moved to enhance access to them. The parking lot striping was also redesigned and wheel stops were added to improve traffic flow and enhance safety.

California State Parks staff rebuilt the bridge at North Thermalito Forebay near the swim beach. They also rebuilt Bidwell Canyon Bridge #1, widening it to accommodate emergency equipment and bringing the railings up to date.

California State Parks also installed a new puncheon on the Roy Rogers Trail.

### *Lake del Valle State Recreation Area*

In 2015, a total of 23 work orders were handled at Lake del Valle State Recreation Area by the East Bay Regional Park District. These included:

- replacing flooring in the camp and marina stores;
- grading the hiking trails around the facilities;
- replacing two manhole concrete collars in the campgrounds;
- repairing irrigation lines and leaking water lines to the kiosk;
- repairing a broken isolation valve for the womens' restroom in Westside Building No. 1;
- performing emergency tree work in Campsite 101 and throughout the park as a result of the drought, which has killed many of the trees that were planted when the reservoir was built; and
- installing rock around the culvert of the campground.

### *Silverwood Lake State Recreation Area*

During 2015, California State Parks completed a project at Cleghorn Day Use Area, which included walkways to picnic tables and to the lake and a new pathway. These facilities were designed and built to accommodate visitors with disablilties.

A project was started in the New Mesa Campground with an emphasis on making the facilities accessible for visitors with disabilities. This included 28 comfort stations, 3 campsites, and several parking spaces. A new fish-cleaning station was also built in the boat lot.

### *Lake Perris State Recreation Area*

California State Parks and DWR made a number of improvements to the Lake Perris State Recreation Area facilities, including:

- crack-sealing and repaving 2 miles of park roads;
- updating kiosks with new carpentry;
- initiating a new contract that added large trash cans and eliminated 1,200 smaller cans. The large cans are less likely to be affected by wind or animals, keeping the park cleaner;

- towing out several sunken boats, removing hazards to vessel navigation;
- adding 20,000 tons of sand to the swim beaches;
- replacing several navigational buoys; and
- converting an old beach snack bar into a new group picnic site.

## Recreation Activities

The SWP, with its many reservoirs and hundreds of miles of aqueducts, offers Californians extensive and varied recreational opportunities. From Antelope Lake in Northern California to Lake Perris in Southern California, the SWP includes facilities for anglers, boaters, campers, hikers, cyclists, and many others. While DWR manages the routing of water through the aqueducts and reservoirs, the recreational facilities are operated variously by federal, State, and local agencies and, in many cases, their private concessionaires. Visitors to SWP recreation facilities can swim, water ski, picnic, and enjoy many other recreational activities. See Figure 13-2 for the various types of recreation available along the SWP.

### Lake Oroville State Recreation Area

DWR, California State Parks, and other agencies sponsored a number of activities at Lake Oroville State Recreation Area in 2015.

DWR and California State Parks helped support, through a contract with the Oroville Chamber of Commerce, the annual Oroville Salmon Festival. This one-day fall event was held at the Feather River Fish Hatchery, downtown Oroville, and the Feather River Nature Center. It was attended by an estimated 22,000 participants.

A Native Ways Celebration, attended by 400 visitors, was held by California State Parks at the Lake Oroville Visitors Center.

California State Parks hosted Bidwell Bar Days at Bidwell Canyon Day Use Area's historic Toll House. The event treats park visitors to a day in the life of the old west.

Kiwanis hosted a "Hooked on Fishing, Not on Drugs" free kids' fishing day at Bedrock Park in the spring with support from DWR staff. Approximately 1,000 people attended the half-day event.

An estimated 22,000 visitors attended the annual 24 Hours of Gold Bicycle Race, which was held on the Lake Oroville trail system and based out of the Loafer Creek Campground.

California State Parks hosted the annual Frontier Christmas at the Lake Oroville Visitors Center. Visitors learned how to make pioneer crafts and pan for gold.

DWR, California State Parks, and the California Department of Forestry and Fire Protection hosted a C.A.S.T. (Catch A Special Thrill) for Kids fishing event for children with special needs. The event, which treated the children to a day of fishing on the lake, had a reported attendance of 135 people including 39 children, experienced fishermen, and volunteers.

### Lake del Valle State Recreation Area

The East Bay Regional Park District sponsored or co-sponsored the following activities at the Lake del Valle State Recreation Area in 2015:

- two Aquatic Adventure Camps, co-sponsored by DWR and the Richmond Police Athletic League, that served 82 children;
- Coastal Cleanup 2015, where 201 volunteers cleaned up the Lake del Valle shoreline by contributing 706 hours removing 1,000 pounds of trash and 3 large bags of recyclable materials;
- 31 Regional in Nature programs led by naturalists serving 348 individuals, and 52 other nature programs serving 571 individuals;

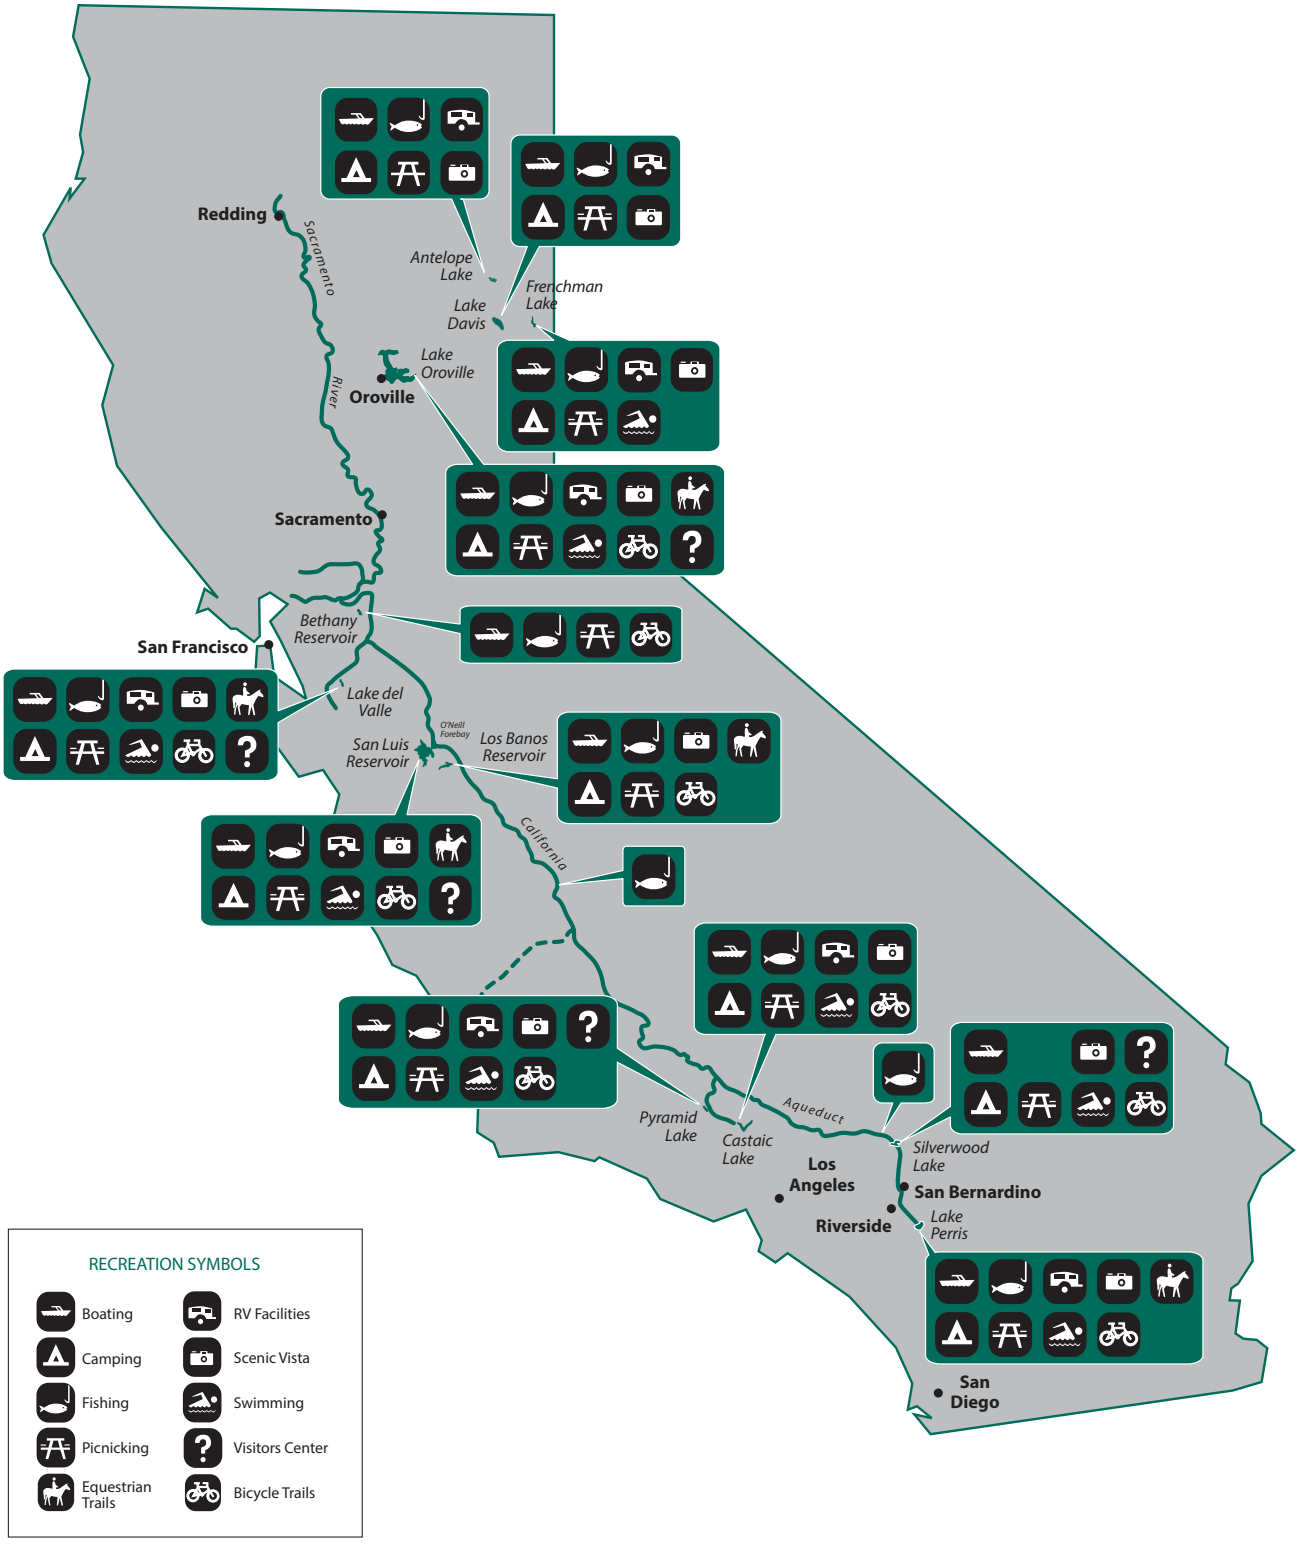

**Figure 13-2** **Types of Recreation along the SWP**

- 16 campfire programs, which served 1,934 attendees;
- 15 boat tours of Lake del Valle serving 571 attendees; and
- 119 Community Outreach Overnight Programs serving eight Youth Employment Programs, co-sponsored by the YMCA and other local agencies.

## San Luis Reservoir State Recreation Area

California State Parks sponsored the "Path of the Padres," hike funded by the Four Rivers Association. During March and April, 700 hikers were exposed to wildflowers, geology, cultural and historical areas, and Native American sites along a 35-mile trail. (As early as 1805, the Mission Padres and accompanying soldiers rested at Los Banos del Padre Arroyo, now known as Los Banos Creek.) Water conservation and the reservoir systems at Los Banos and San Luis reservoirs were discussed on a boat ride to the trailhead.

California State Park employees from San Luis Reservoir State Recreation Area set up interpretative booths and displays and provided the public with information and pamphlets at several local fairs in addition to the California State Fair. In 2015, park employees volunteered at the Merced County Fair and the River Dance Farms Fair, promoting aquatic safety and providing additional water conservation information.

DWR and its partners, including California State Parks, the California Department of Forestry and Fire Protection, the San Joaquin River Exchange Contractors Water Authority, the San Luis & Delta-Mendota Water Authority, and the Bureau of Reclamation, hosted special-needs children at a C.A.S.T. for Kids fishing event at O'Neill Forebay. Fourteen local children were treated to a day of fishing with five of the area's top Delta tournament fishermen.

California State Parks hosted the Central Valley's first Junior Lifeguard Program at San Luis Creek on O'Neill Forebay. The 3-week program provided training, activities, and education for the 16 young people that participated. The Junior Lifeguard Program provides children ages 9 to 14 with entry-level training to become a lifeguard. It promotes aquatic safety and awareness in addition to teaching skills to remain safe while performing aquatic rescues.

## Castaic Lake State Recreation Area

The County of Los Angeles Department of Parks and Recreation sponsored the following activities at Castaic Lake State Recreation Area in 2015:

- 12 "Splash in the Water" events with 875 children ages 7 to 14 who learned about water safety, kayaking, canoeing, standup paddleboarding, and sailing;
- three moonlight kayak classes in which 65 participants ages eight and older learned about the environment at Castaic Lake, the SWP, water safety, and boating safety;
- 52 standup paddleboarding classes to a total of 200 participants;
- two Junior Lifeguard Program sessions, with co-sponsorship from Teague Custom Marine, for a total of 409 participants ages 9 to 17 who learned lifeguarding, first aid, CPR, and water safety skills;
- 11 sessions of FamCamp (formerly Aquatic Adventure Camp) for 576 participants ages 17 and under, which taught boating safety, camping, and team-building principles;
- 64 drop-in kayak clinics provided to 450 participants ages 8 and up; and
- a new program offering early evening paddle sports demonstration activities open to all ages at no charge from May through September, with a total of 450 participants.

## Silverwood Lake State Recreation Area

In 2015, California State Parks sponsored the following activities at Silverwood Lake State Recreation Area:

- Bald Eagle Barge Tours for 600 park visitors on Saturdays and Sundays from January through March, where monthly eagle counts were taken;
- an Adopt-a-School program serving 125 children;
- a Coastal Cleanup Day with 75 volunteers who cleaned up the lake shoreline;
- Earth Day with approximately 100 volunteers who helped park employees install a drip irrigation line in the apple orchard and install a new ramada;
- Veterans Appreciation Day, co-sponsored by the Mojave River Natural History Association, which included a raffle and barbecue and was attended by approximately 200 participants;
- three CAPS Program days (Creative Before and After School Programs for Success, San Bernardino City Unified School District), which served 300 children per day and consisted of lake tours, nature hikes, and making animal tracks;
- 13 Campfire Programs on various park topics, hosted by California State Parks from Memorial Day through Labor Day, which were attended by an estimated 125 visitors per program throughout the summer;
- a group of church volunteers from Victorville cleared brush and repaired and painted various facilities in the Baranca Group Camp; and
- a C.A.S.T. for Kids fishing event, which paired 40 special-needs children with 30 experienced bass fishermen for a day of fishing on the lake, co-hosted by DWR.

## Lake Perris State Recreation Area

California State Parks and other agencies sponsored a number of activities at Lake Perris State Recreation Area in 2015, which included the following:

- 300 children attended outdoor education activities, including geocaching; and
- DFW helped children raise fish, which were later released into the lake.

# Oroville Recreation Plan

The Oroville Facilities, including Lake Oroville State Recreation Area, Oroville Wildlife Area, and adjacent DWR facilities, are operated in conformance with the 1993 Amended Recreation Plan that was approved by the Federal Energy Regulatory Commission (FERC) in its 1994 Order 2100-054. In 2006, DWR and its Settlement Agreement signatories submitted the Settlement Agreement Recreation Management Plan (SARMP, March 2006) for FERC approval. The approved SARMP will be implemented when the new hydropower license is issued by FERC, currently expected sometime in 2017 or later.

Additional recreation improvements identified and proposed in the SARMP are anticipated to be constructed after the new FERC license is issued. The new license terms and conditions are expected to be consistent with the proposed SARMP. In the meantime, DWR, California State Parks, and DFW—Davis-Dolwig Act (DDA) collaborating partners—continue to operate the Oroville Facilities recreation facilities consistent with the existing FERC license (renewed annually) and its associated 1993 Amended Recreation Plan.

## Fish Plantings

In 2015, DFW planted 534,300 fish in SWP reservoirs (see Table 13-2). This was 40.3 percent less fish than the 895,500 planted in 2014 and is the lowest number of fish planted in 10 years. The 4-year average for fish planted from 2012 through 2015 was 714,200. Thermalito Afterbay received 56.4 percent more steelhead trout than it received in 2014, the only SWP location to have more fish planted in 2015 than in the previous year.

## SWP Deliveries for Recreation

DWR has an agreement with California State Parks to provide onshore recreation water at several SWP facilities in an amount prorated to the yearly SWP Table A allocation. Per the 20 percent SWP Table A allocation for 2015, maximum diversion amounts under the onshore recreation agreement were allocated at 20 percent, or a total of 1,356 acre-feet (af), as follows: 550 af at San Luis Reservoir; 80 af at Lake del Valle; 466 af at Castaic Lake and Castaic Lagoon; 250 af at Lake Perris; and 10 af at Bethany Reservoir. Actual deliveries under the agreement totaled 151 af, as follows: 10 af at San Luis Reservoir; 43 af at Lake del Valle; 63 af at Castaic Lake and Castaic Lagoon; 35 af at Lake Perris; and 0 af at Bethany Reservoir. Additional SWP recreation deliveries included 36 af at Silverwood Lake and 17 af at Pyramid Lake. Details about these deliveries are provided in Chapter 9, Water Contracts and Deliveries.

## Recreation Financing

Prior to 2001, DWR reported capital costs allocated to fish and wildlife enhancement and recreation in Bulletin 132, Appendix D, *Costs of Recreation and Fish and Wildlife Enhancement*. With the passage of Senate Bill (SB) 1191 in October 2001, this report was no longer mandated by the Legislature. DWR initially began reporting recreation capital cost information in this bulletin for fiscal year 2000–2001.

The approach to financing recreation and fish and wildlife enhancement (RFWE) in connection with the SWP is provided in the DDA (California Water Code [CWC] Sections 11900–11925) and the Burns-Porter Act (CWC Section 12937). Additionally, as early as 1953, financing for RFWE was addressed in CWC Sections 233, 345, 346, 12581, and 12582. These statutes declare that recreation at the SWP is a benefit to all the people of California and that the associated costs should be borne by all Californians. While this intent is cited in the DDA, no specific appropriation or funding source was defined. Consequently, Assembly Bill (AB) 12 in 1966; SB 1268 in 1970; and the Environmental Water Act—AB 1441 and AB 1442—in 1989 were all enacted to provide the necessary State funding for this SWP purpose. The DDA does, however, explicitly preclude DWR from including RFWE costs in the SWP charges for water and power billed to the public water agencies contracting for SWP water supply.

The Legislature has intermittently appropriated monies to meet State obligations to fund RFWE at the SWP. AB 12 appropriated $5 million per year to DWR from $90 million in tidelands oil and gas revenues. By the early 1980s, DWR had expended the entire $90 million toward funding SWP RFWE obligations. SB 1268 appropriated $55 million to California State Parks and $5 million to DFW specifically for their responsibilities under the DDA at SWP facilities. Finally, AB 1442 appropriated $172 million to reimburse DWR for SWP RFWE costs incurred over the previous 12 years as an offset to DWR's California Water Fund repayment, and an additional $30 million for SWP RFWE through 1994.

In 2012, the DDA was amended to continuously appropriate $10 million per

**Table 13-2 Fish Planted by the Department of Fish and Wildlife in 2015 (thousands)[a]**

| Location and Size | Eagle Lake Trout | Brook Trout | Rainbow Trout | Chinook Salmon | Steelhead Trout | Kokanee Salmon | Total for Lake |

[a] Information provided by DFW, using the following size classes: yearling = a maximum of 20.0 fish per pound; fingerling = 16.1 fish per pound or smaller; subcatchable = between 16.0 and 6.1 fish per pound; catchable = between 6.0 and 1.0 fish per pound; supercatchable = larger than 1.0 fish per pound and up to 0.34 fish per pound; and trophy = 0.33 fish per pound or larger (or greater than 2.99 pounds per fish).

year to DWR. The funding was sourced from the Harbors and Watercraft Revolving Fund that is funded by fuel taxes at marinas statewide; this continuous SWP RFWE funding is essentially a user-funded source. Of the $10 million, $2.5 million per year is for past unreimbursed SWP RFWE costs incurred by DWR through December 31, 2011, and the remaining $7.5 million per year is primarily intended to fund DWR's ongoing annual joint SWP RFWE costs that are generated through DWR's statutory mandate to allocate SWP costs to their respective purposes, including RFWE. These joint costs are those for facilities such as dams, which were constructed to provide multiple benefits such as flood control, water supply, power generation, and RFWE. DWR is required to determine and allocate shares of such facilities to all of the respective purposes. Moreover, the DDA prohibits SWP RFWE purpose costs from being included in charges for water and power to SWP customers, so

the 2012 amendment filled a long-standing shortfall in SWP RFWE funding.

The 2012 DDA amendment was the result of several years of close, cooperative solution development that involved the Natural Resources Agency, the Department of Finance, the Legislative Analyst's Office, legislative staff, DWR, and many of DWR's long-term SWP water contractors.

As another part of the cooperative solution to the long-standing DDA funding difficulties, DWR reexamined the joint RFWE allocation for SWP transportation facilities located south of Dos Amigos Pumping Plant, and beginning January 1, 2013, made revisions to the RFWE allocations described in Table 2 of Appendix B (located at the end of this bulletin).

## Capital Cost Allocations

Table 13-3 shows capital costs allocated to RFWE and overall costs of lands acquired for recreation development through 2015. Total capital costs increased by $11,750,775 over those reported in Bulletin 132-15 due to an increase of $11,342,303 in 2015, and an upward adjustment of $408,472 in years prior to 2015. The increase in 2015 included $10,904,126 in joint costs and $438,177 in specific costs. These costs are budgeted by DWR from funds available for financing project construction costs. Recreation and enhancement costs not reported in this table are budgeted by several State departments and are financed by appropriations from a variety of funds.

## Table 13-3 Recreation and Enhancement Capital Costs of the State Water Project (in dollars)

| Facility | Joint Costs Allocated to Recreation and Enhancement | | | Specific Costs Allocated to Recreation and Enhancement | | | Total |

[a] Percentages are the share of joint costs.

[b] Specific costs for Dos Amigos Pumping Plant to Termini include $2,905,649 for Castaic Dam and Lake, $795,130 for Cedar Springs Dam and Silverwood Lake, $6,348,741 for Perris Dam and Lake Perris, and $898,059 for the California Aqueduct.

# Chapter 14
# Financial Analysis

*Pyramid Lake and Dam.*

## Significant Events in 2015

On September 2, the Department of Water Resources (DWR) delivered $109.275 million of Water System Revenue Bonds, Series AU. The proceeds were presold on August 25 to refinance commercial paper and pay bond financing costs.

*Information for this chapter was provided by the State Water Project Analysis Office in conjunction with the Division of Fiscal Services.*

This chapter presents both a summary and a detailed explanation of the State Water Project's (SWP) current financial analysis, capital costs and requirements, revenues and expenses, and bond activities for years 2015 through 2025.

The Department of Water Resources (DWR) performs a financial analysis annually to ensure the SWP financing program will have sufficient funds to meet construction obligations; project operation, maintenance, power, and replacement costs; and debt service payments for bonds expended for construction. The results of the current financial analysis, dated December 31, 2015, are presented in Tables 14-1 and 14-2, located at the end of this chapter. (Please note that, in some instances, the tables and text figures in this chapter may not sum as expected due to rounding.)

Future contingencies may change the financial analysis, some of which include:

- alterations in schedules of currently planned construction for future facilities;
- changes in economic conditions, including changes in interest rates and in SWP water contractor Table A amounts due to changes in amounts of water needed, conserved, or reclaimed;
- development of additional sources of water not foreseen at this time;
- deviations from the assumptions regarding actual rates of price escalations for future construction from those currently assumed for cost estimates;
- increases in capital costs related to additional conservation facilities; and
- outcome of lawsuits now pending before the courts.

## Capital Requirements and Financing

In conducting the current financial analysis, DWR projected future construction costs through the year 2025 including reimbursement of $123 million interim financing for prior expenditures will total $1.16 billion. Special capital requirements for revenue bond financing of these construction costs are projected at $87 million for a total capital requirement of $1.25 billion. This projection includes construction and financing costs for the following significant SWP projects planned for completion by 2025:

- Perris Dam remediation;
- Phase II enlargement of the East Branch of the California Aqueduct;
- Phase II of the East Branch Extension; and
- a new intake to the North Bay Aqueduct.

Most of these capital requirements will be financed from the projected sale of $1.2 billion of revenue bonds. SWP water contractors will directly be paying $2.6 million. The remaining $45 million of the total capital requirement of $1.25 billion will be financed from capital resources revenues and the transfer of excess revenues not needed for operation costs or debt service.

The analysis of capital requirements and financing presented in Table 14-1 does not include the costs and financing of all facilities needed to develop the remaining yield necessary to meet the

total 4.2 million acre-foot contractual commitment to long-term SWP water contractors. Table 14-1 also excludes the costs of associated facilities financed and constructed by local interests or State agencies other than DWR. Those facilities are essential for realizing full benefits from the SWP and include on-shore recreational developments at SWP facilities and local distribution facilities.

The allocation of capital expenditures for various SWP purposes is detailed in Table 14-3.

## Capital Requirements

Lines 1 through 20 in Table 14-1 show actual and projected SWP capital requirements through 2025. Estimates of future capital expenditures include allowances for construction cost escalation of 5 percent per year from 2016 through 2025. Right-of-way costs are escalated at 4 percent per year from 2016 through 2025. Capital expenditures for the SWP also include requirements other than those for construction, such as disbursements made as part of the Davis-Grunsky Act Program (Line 16) and special capital requirements under revenue bond financing (Line 17). DWR will decide whether to construct facilities only after examining alternatives and completing environmental documentation and other review processes.

*Line 1, Initial Project Facilities*, includes only those facilities completed in the initial construction program, which concluded December 31, 1973 (see Bulletin 132-74, Chapter 2). Additional costs after 1973, and estimated costs of remaining work on the initial SWP facilities, are not included.

*Line 2, North Bay Aqueduct*, consists of the costs for Phase II, improvements, and the Alternate Intake Project. Operational in May 1988, Phase II connected with the Phase I facilities, which were completed in 1968 (Phase I costs are included in the initial project facilities discussed in Line 1). Phase II included costs for pipelines, pumping plants, and a small reservoir necessary to divert water from the western Delta to Napa and Solano counties for urban use. The improvements consist of replacing the existing tank with two 5-million gallon tanks. Construction of the new tanks began in 2007 and was completed in 2010. The Alternate Intake Project includes a new point of diversion along the Sacramento River or its tributaries, a new pumping plant, an in-line storage tank, and an underground pipeline connection to the existing North Bay Aqueduct. The project is expected to be completed in 2025.

*Line 3, Delta and Suisun Marsh Facilities*, shows historical costs that include planning for general Delta facilities and the previously planned peripheral canal and overland water delivery facilities for the western Delta. Also included are historical planning costs for Suisun Marsh as well as construction costs for the Suisun Marsh Salinity Control Gates and an access road. The projected amounts include projected planning costs plus projected costs for fish screens at Sherman and Twitchell islands.

*Line 4, Final Four Units at Banks Pumping Plant*, includes costs of the final four 1,067 cubic feet per second units, which became operational in spring 1992.

*Line 5, Coastal Branch Aqueduct*, includes all costs for the planning, design, and construction of Phase II of the Coastal Branch of the California Aqueduct. Phase II construction began in October 1993 and was completed in 1997. Water deliveries from Phase II facilities began in July 1997.

*Line 6, West Branch Aqueduct*, shows costs for all facilities on the West Branch except Warne Powerplant. Those costs are included in Line 11.

## Table 14-3 Allocation of Capital Expenditures (in thousands of dollars)

| Facilities and Construction Divisions | Expenditures Incurred Through 2015 | Future Expenditures | Total | Preliminary Allocation Among Project Purposes | | | |
|---|---|---|---|---|---|---|---|
| | | | | Water Supply and Power Generation | Flood Control[a] | Recreation and Fish and Wildlife Enhancement | Other[b] |
| **Project Construction Expenditures** | | | | | | | |
| Upper Feather Division | 20,233 | 0 | 20,233 | 1,784 | 0 | 18,449 | 0 |
| Oroville Division (excludes Small Hydro) | 830,317 | 262,830 | 1,093,148 | 994,501 | 71,690 | 26,957 | 0 |
| Delta Facilities Division | 458,926 | 294,769 | 753,695 | 721,752 | 0 | 31,944 | 0 |
| North Bay Aqueduct | 120,069 | 2,630 | 122,700 | 122,700 | 0 | 0 | 0 |
| South Bay Aqueduct | 404,053 | 8,530 | 412,582 | 388,856 | 8,301 | 15,425 | 0 |
| California Aqueduct | | | | | | | |
| North San Joaquin Division | 316,349 | 39,412 | 355,761 | 343,438 | 0 | 12,323 | 0 |
| San Luis Division | 321,709 | 53,115 | 374,824 | 360,318 | 0 | 14,506 | 0 |
| South San Joaquin Division | 342,796 | 35,212 | 378,008 | 360,162 | 0 | 17,845 | 0 |
| Tehachapi Division | 383,022 | 24,997 | 408,019 | 387,132 | 0 | 20,888 | 0 |
| Mojave Division (excludes Small Hydro) | 378,774 | 13,148 | 391,922 | 351,837 | 0 | 40,084 | 0 |
| Santa Ana Division | 357,309 | 93,367 | 450,676 | 378,915 | 0 | 71,761 | 0 |
| West Branch | 568,778 | 25,436 | 594,214 | 559,912 | 0 | 34,302 | 0 |
| Coastal Branch | 499,549 | 12,253 | 511,802 | 511,802 | 0 | 0 | 0 |
| *Subtotal, California Aqueduct* | *3,168,285* | *296,940* | *3,465,225* | *3,253,516* | *0* | *211,709* | *0* |
| Other Project Facilities | | | | | | | |
| Small Hydroelectric Power | | | | | | | |
| Generating Facilities | 100,066 | 0 | 100,066 | 100,066 | 0 | 0 | 0 |

| East Branch Enlargement | 462,031 | 0 | 462,031 | 462,031 | 0 | 0 | 0 |
| East Branch Extension | 360,775 | 49,804 | 410,580 | 410,580 | 0 | 0 | 0 |
| Coastal Power Allocation | 30,708 | 0 | 30,708 | 30,708 | 0 | 0 | 0 |
| Agricultural Drainage Facilities | 86,471 | 18,566 | 105,037 | 0 | 0 | 0 | 105,037 |
| Planning and Pre-operations | 76,542 | 30,000 | 106,542 | 106,542 | 0 | 0 | 0 |
| Unassigned/Miscellaneous | 54,685 | (33,435) | 21,250 | 0 | 0 | 0 | 21,250 |
| *Subtotal, Project Construction Expenditures* | *6,664,737* | *1,041,235* | *7,705,971* | *7,195,210* | *79,990* | *304,484* | *126,287* |
| **Other Capital Requirements** | | | | | | | |
| Davis-Grunsky Act Program | 130,000 | 0 | 130,000 | 0 | 0 | 0 | 130,000 |
| **Total Capital Expenditures** | **6,794,737** | **1,041,235** | **7,835,971** | **7,195,210** | **79,990** | **304,484** | **256,287** |

[a] Reflects DWR's allocation to this purpose irrespective of federal payments.
[b] Includes costs currently unassigned to purpose, planning costs of deleted features of project facilities, initial costs of inventoried items, and costs assigned to the Davis-Grunsky Act Program.

*Line 7, East Branch Enlargement*, includes expenditures for Phases I and II of the East Branch Enlargement. Phase I included the enlargement share of power plant costs at Mojave Siphon and Devil Canyon. (The remaining power plant costs are included in Line 11.) East Branch Enlargement costs for Phase I, by facility, are presented in Table 14-4. Costs for Alamo Powerplant consist of expenditures for Unit 1 facilities allocated to enlargement.

Work on the draft environmental impact report, mapping, and conceptual design for Phase II of the enlargement began in March 2007 and ceased in 2013 at the request of the participating contractors. Project costs include raising the canal embankment and concrete lining, constructing additional siphon barrels, adding bays to check structures, constructing Unit 2 at Alamo Powerplant, and adding two pump/motor units and a discharge line at Pearblossom Pumping Plant. Construction of Unit 2 at Alamo Powerplant is expected to be completed in 2023, all other Phase II construction has been postponed indefinitely.

All costs in Line 7 are allocated to and repaid by the seven Southern California contractors participating in the East Branch Enlargement.

*Line 8, East Branch Improvements*, shows all aqueduct costs on the East Branch not allocated to the enlargement project. Those costs include improvements constructed concurrently with the enlargement work, the reconstruction of the San Bernardino Tunnel Intake, and the construction of the Tehachapi East Afterbay. Costs for power plant construction at Alamo, Mojave Siphon, and Devil Canyon are not included in this line.

*Line 9, East Branch Extension*, shows expenditures for Phases I and II of the extension of the East Branch of the California Aqueduct. The East Branch Extension extends the California Aqueduct east from the Devil Canyon Powerplant to a terminus at Noble Creek near Beaumont in Riverside County. The extension provides water service to the San Gorgonio Pass Water Agency and the San Bernardino Valley Municipal Water District. Construction of Phase I began in February 1999 and was completed in 2003. Phase I improvements include enlargement of the Crafton Hills Reservoir and construction of the Yucaipa Connector Pipeline. Construction of this phase was completed in 2014. Phase II will increase the pumping capacity to 100 percent of design capacity. Construction of Phase II began in 2012 and is scheduled to be completed in 2017. All costs in Line 9 will be allocated to and repaid by the two participating contractors.

*Line 10, South Bay Aqueduct Improvements and Enlargement*, shows expenditures for providing additional capacity required to meet increases in water demands for the service area of Alameda County Flood Control and Water Conservation District, Zone 7, and increasing the existing capacity of the SBA to its original design capacity. Construction began in 2006, and overall project work was completed in 2014.

*Line 11, Power Generation and Transmission Facilities*, does not include the East Branch Enlargement share of costs for Alamo, Mojave Siphon, and Devil Canyon powerplants shown in Line 7 of Table 14-1. The capital costs for facilities included in Line 11 are shown in Table 14-5.

*Line 12, Additional Conservation Facilities*, shows projected costs to plan and study additional conservation facilities. Specific planning activities and projected spending amounts for 2016 through 2025 are shown in Table 14-6. Expenditures for these items are being reviewed. Construction costs of additional conservation facilities are not included in the financial analysis.

Line 12 does not include the Bay Delta Conservation Plan costs. DWR's share of the

**Table 14-4 East Branch Enlargement Phase I Capital Costs by Facility**

| Facility | Amount (in millions of dollars) |
|---|---|

| Midway–Wheeler Ridge | 10.7 |
| Geysers–Lakeville | 6.9 |
| *Subtotal* | *17.6* |
| **Total** | **869.2** |

**Table 14-6 Estimated Future Costs for Planning Additional Conservation Facilities**

| Activity | Amount (in millions of dollars) |
|---|---|
| SWP Future Water Supply | 30.0 |
| Other Planning Costs | 0.0 |
| **Total** | **30.0** |

Bay Delta Conservation Plan expenditures for preliminary planning and environmental impact report preparation are currently financed by participating contractors.

*Line 13, Agricultural Drainage Facilities*, includes projected costs of the Agricultural Drainage Program. The activities in this program are monitoring, evaluating, reducing, and treating drainage, as well as investigating treatment and reuse of drainage water.

DWR assumes that future costs of the drainage program will be financed by revenue transfers (Line 37).

*Line 14, Other Costs*, includes items such as general design and construction costs, costs of completing operation and maintenance facilities, and costs of other completion activities for the initial facilities of the California Aqueduct. Portions of those costs ultimately will be allocated to California Aqueduct units described in the preceding paragraphs.

*Line 15, Total Project Construction Expenditures*, is the total of Lines 1 through 14.

*Line 16, Davis-Grunsky Act Program Costs*, shows costs of the Davis-Grunsky Act Program, a financial assistance program to provide grants and loans to public agencies for constructing local water projects.

As of December 31, 2015, DWR had disbursed $130 million (including $8.5 million for administration) in grants and loans to local agencies throughout the State.

*Line 17, Special Capital Requirements Under Revenue Bond Financing*, presents special capital requirements at the time revenue bonds are sold. The financial analysis assumes that proceeds from any future revenue bonds will be used to pay for bond discounts, bond issuance costs, and debt service reserve requirements.

Information about the application of proceeds to these special requirements for actual and assumed revenue bond sales is presented in Table 14-7.

*Line 18, Total Capital Requirements*, is the total of Lines 15, 16, and 17.

*Line 19, Power Facilities Capital Requirements*, shows the total capital requirements for power facilities included in Line 18.

*Line 20, Water Facilities Capital Requirements*, shows the total capital requirements for water facilities included in Line 18.

## Capital Financing

The SWP was constructed using three general types of financing: Burns-Porter Act, revenue bonds, and capital resources. Lines 21 through 37 of Table 14-1 present specific information about these financing sources.

### *Burns-Porter Act*

Burns-Porter Act financing is derived from the sale of California Water Resources Development Bonds (general obligation bonds) and State tideland oil revenues deposited in the California Water Fund as authorized by the Burns-Porter Act (California Water Code Sections 12930–12944), approved by voters in November 1960. The Burns-Porter Act authorized an issuance of $1.75 billion of general obligation State bonds, which are repaid by revenues received according to the water supply contracts. Of that authorization, $130 million was reserved specifically for the Davis-Grunsky Act Program.

Proceeds from the sale of general obligation bonds were deposited in the California Water Resources Development Bond Fund—Bond Proceeds Account, from which monies were

[a] Actual bond issue for all except future East Branch Enlargement, future East Branch Extension, future South Bay Aqueduct Improvements and Enlargement, and future Water System Facilities bonds.
[b] Bond financing and refunding costs include funds applied to debt service reserve requirements.
[c] Includes $5,911.2 million of refunded principal, leaving a net principal obligation of $4,506.4 million.

expended only for the construction of SWP facilities and for the Davis-Grunsky Act Program. Approximately 24 percent of the expenditures through 2015 for construction and the Davis-Grunsky Act Program were financed with general obligation bonds.

Monies deposited in the California Water Fund were appropriated for purposes outlined in the Burns-Porter Act. Such deposits were derived from a portion of the State tideland oil revenues, in accordance with a continuing authorization. The California Water Fund was used to finance $508 million, or approximately 7 percent, of the construction expenditures through 2015.

## Revenue Bonds

Revenue bond financing is derived from the sale of revenue bonds as authorized by the Central Valley Project Act (California Water Code Sections 11100–11925). DWR's authority to issue revenue bonds was confirmed by a decision of the California Supreme Court in 1963 (*Warne v. Harkness*, 60 Cal. 2d 579).

Proceeds from the sale of revenue bonds are deposited in the Central Valley Water Project Construction Fund, from which money is expended only for purposes specified in the resolution authorizing each bond sale. Those purposes, in addition to paying construction, planning, and right-of-way costs, may include funding the Debt Service Reserve Account, paying interest on bonds, and paying water system operating expenses during a specified period.

As of December 31, 2015, DWR had sold $10.4 billion of revenue bonds. That amount includes $5.9 billion of refunded bonds, leaving a total principal obligation of $4.5 billion.

### *Capital Resources*

Capital resources financing is derived from payments and appropriations (including a portion of the State tideland oil revenues) authorized by a variety of special contracts, cost-sharing agreements, and legislative actions concerning the SWP, plus accrued interest on these funds. Capital resources revenues are deposited in the Central Valley Water Project Construction Fund and may be expended for interest on general obligation bonds and costs of constructing SWP facilities.

According to DWR's financial management policy, the capital resources revenues are used first to cover any general obligation bond debt service that exceeds available revenues.

## Capital Financing Sources

Capital financing sources include power revenue bonds, East Branch Enlargement bonds, East Branch Extension bonds, SBA Enlargement bonds, water system facilities bonds, initial project facilities bonds, bond proceeds from the Davis-Grunsky Act Program, California Water Fund monies, and capital resources revenues.

*Line 21, Power Facilities Revenue Bonds through Series H*, includes the proceeds applied from power revenue bonds for Oroville, Devil Canyon, Castaic, Warne, Reid Gardner, Bottle Rock, Alamo, South Geysers, and small hydro projects.

No future power revenue bond sales are projected for this financial analysis.

*Line 22, East Branch Enlargement, Current Bonds*, shows that $482 million of Water System Revenue Bond proceeds has been applied to the East Branch Enlargement project through December 31, 2015. Of this total, $424 million was used for construction expenditures and $58 million was used for bond discounts, interest costs, and debt service reserve requirements.

*Line 23, East Branch Enlargement, Future Bonds*, shows no projected bond sales for this financial analysis.

*Line 24, East Branch Extension, Current Bonds*, shows that $383 million of Water System Revenue Bond proceeds has been spent through December 31, 2015.

*Line 25, East Branch Extension, Future Bonds*, shows DWR's estimate of $39 million of additional bonds required to complete construction of the East Branch Extension and to pay for bond discounts, capitalized interest, and debt service reserve requirements.

*Line 26, South Bay Aqueduct Enlargement, Current Bonds*, shows that $219 million of Water System Revenue Bond proceeds had been spent through December 31, 2015.

*Line 27, South Bay Aqueduct Enlargement, Future Bonds*, shows DWR's estimate of $5 million of additional bonds required to complete construction of the SBA Enlargement and to pay for bond discounts, capitalized interest, and debt service reserve requirements.

*Line 28, Water System Facilities, Current Bonds*, shows that through December 31, 2015, $2.2 billion of proceeds from Water System Revenue Bonds, Series A through Series AU, was applied to SWP projects other than the East Branch Enlargement, the East Branch Extension, and the SBA Enlargement. Of this total, $2.0 billion was used to pay for construction expenditures and $0.2 billion was used to pay for bond discounts, capitalized interest, and debt service reserve requirements.

*Line 29, Water System Facilities, Future Bonds*, shows that $1.2 billion of future water revenue bonds is needed to provide $1.1 billion for construction of SWP water system facilities and $0.1 billion for bond discounts, interest costs, and debt service reserve requirements.

*Line 30, Subtotal, Water System Revenue Bonds*, is the total of Lines 22 through 29.

*Line 31, Initial Project Facilities Bond Proceeds*, shows the amount of general obligation bonds sold to provide financing costs for initial SWP facilities and for costs of planning certain additional conservation facilities.

Financing initial facilities from general obligation bonds was completed in mid-1972 and totaled $1.444 billion—$1.750 billion Burns-Porter Act authorization less $130 million reserved for the Davis-Grunsky Act Program and $176 million "offset" for additional conservation facilities. (The Burns-Porter Act provides that to the extent California Water Fund monies are expended, an equal amount of general obligation bonds are reserved [offset] for financing the construction of additional conservation facilities in certain watersheds.)

In mid-1972, the reservation of offset bonds was effectively limited to $176 million, the total amount of California Water Fund monies expended up to that time. By mid-1972, all general obligation bonds authorized by the Burns-Porter Act had been offset, reserved for the Davis-Grunsky Act Program, or used for SWP construction.

Approximately $8.5 million of the offset bonds was used to finance planning studies of the Middle Fork Eel River Development. This financial analysis is not based on the use of any offset bond proceeds to meet capital requirements. If, at some time, the State constructs an additional conservation facility, as specified in California Water Code Section 12938, the remaining offset bonds could be sold.

*Line 32, Davis-Grunsky Act Program Bond Proceeds*, shows, for simplification, the entire $130 million of capital expenditures authorized for the Davis-Grunsky Act Program, according to the Burns-Porter Act, as being funded by proceeds from the sale of general obligation bonds. In fact, $102 million originated from bond proceeds while $28 million from the California Water Fund was used for the program in lieu of bond proceeds prior to 1969. Since the final offset in 1994, DWR has accumulated $44.6 million in capital costs through fiscal year 2006–2007.

*Line 33, Application of California Water Fund Monies*, shows the amount of SWP costs financed under the Burns-Porter Act. The act provides that any available money in the California Water Fund must be used for construction in lieu of proceeds from the sale of general obligation bonds.

When the Burns-Porter Act became effective in late 1960, approximately $97 million had been accumulated in the fund. That balance, plus subsequent appropriations, interest earnings, and other miscellaneous income to the fund through December 31, 2015, was used to finance a total of $508 million of SWP costs.

*Line 34, Interim Financing*, shows the net annual amounts of funds flowing into and out of the Water Revenue Commercial Paper Notes program. This program was established in March 1993 to provide an ongoing source of interim financing for water system projects prior to permanent financing from the sale of long-term revenue bonds. DWR has authority to issue up to $150 million of Water Revenue Commercial Paper Notes. A positive number indicates money borrowed from the program to finance construction costs. A negative number indicates money repaid to the program. The financial analysis assumes that all funds borrowed from the program will be repaid before the end of the analysis period.

*Line 35, Direct Pay*, shows the revenues received directly from the contractors rather than financing through bonds for certain SWP project construction expenditures. At this time, the North Bay Aqueduct Alternate Intake is funded this way.

*Line 36, Application of Capital Resources Revenues to Construction*, presents the Capital Resources Revenues applied for capital expenditures.

*Line 37, Revenue Transfers Applied*, shows monies assumed to be transferred to the California Water Fund, according to provisions of the Burns-Porter Act, and subsequently reappropriated to construction (see Line 40 of Table 14-2). Projected amounts for the years 2016 through 2025 include funds to finance expenditures for agricultural drainage facilities, as indicated in Line 13 of Table 14-1, and expenditures for additional conservation facilities, as indicated in Line 12.

*Line 38, Subtotal, Other Capital Financing*, is the total of Lines 31 through 37.

*Line 39, Total Financing of Capital Requirements*, totals Lines 21, 30, and 38.

# Annual Revenues and Expenditures

After financial analysis of SWP operations, DWR concluded that projected payments by contractors and other revenues will be adequate to pay annual operations, maintenance, power, and replacement (OMP&R) costs and meet all repayment obligations on funds used to finance SWP construction and other authorized costs during the period 2016 through 2025. Data on annual revenues and expenditures are presented in Table 14-2. A detailed discussion of each line item follows.

## Project Revenues

Project revenues primarily consist of SWP water contractor payments required under their individual long-term water supply contracts. Those revenues are deposited in two funds: the Central Valley Water Project Revenue Fund, where all revenues pledged to revenue bonds are placed, and the California Water Resources Development Bond Fund—Systems Revenue Account, where all other SWP operating revenues are placed. Use of those funds is limited to paying operating costs and debt service; except that revenues in excess of those costs may be deposited to a reserve for future SWP construction, since the California Water Fund has been repaid (see Line 39).

*Line 1, Capital Resources Revenues*, includes the following:

- federal payments for SWP capital expenditures;
- appropriations for capital costs allocated to recreation;
- appropriations for SWP capital expenditures prior to passage of the Burns-Porter Act and according to Senate Bill 261 (1968);
- payments from Los Angeles Department of Water and Power for Castaic power development;
- advances from contractors for construction of requested work;
- investment earnings on the Capital Resources Account; and
- investment earnings on unexpended revenue bond proceeds.

Historically, appropriations for capital costs allocated to recreation and fish and wildlife enhancement amounted to $5 million per year and were appropriated by the California Legislature from the State tideland oil revenues. There have been no appropriations from this fund since 1985.

Legislation enacted in 1989 offset a portion of the amount owed to the SWP by the State for costs allocated to recreation and fish and wildlife enhancement against the amount the SWP owed to the California Water Fund (see Line 39). Since the final offset in 1994, DWR has accumulated $68.3 million in capital costs through December 31, 2015.

In 2012, the Davis-Dolwig Act was amended to appropriate $10 million per fiscal year from the Harbors and Watercraft Revolving Fund to cover a portion of the OMP&R and capital costs allocated to recreation and fish and wildlife enhancement. Starting in fiscal year 2012–2013, $7.5 million is being appropriated for on-going OMP&R and capital costs and $2.5 million is being appropriated to reimburse for past unreimbursed OMP&R and capital costs.

*Lines 2 through 12, Water Contractor Payments*, show amounts of the separate elements of water contractor payments.

Amounts in Line 4 also include revenues sufficient to cover costs associated with sales of excess power. Appendix B of this bulletin presents a detailed explanation of payments identified in Lines 2 through 12.

OMP&R costs are repaid as they are incurred as part of the Transportation Charge; therefore, no interest charges are included. Construction costs included in the Transportation Charge, and all construction and annual OMP&R costs included in the Delta Water Charge, are to be repaid with interest at the Project Interest Rate.

The Project Interest Rate, as defined in Article 1(r) of the standard provisions of the long-term water supply contracts, is the weighted average of the rates paid on certain securities issued and loans obtained to finance SWP facilities.

According to the original water supply contract provisions, the basis for determining the Project Interest Rate was the weighted average of rates paid on general obligation bond sales only. In 1969, after Oroville Revenue Bonds were issued, the contracts were amended to expand the basis to include rates on all other securities sold and loans obtained thereafter for financing SWP facilities, including revenue bonds (see Bulletin 132-70, page 28).

However, not all proceeds from the sale of revenue bonds are melded into the calculation of the Project Interest Rate. Only those proceeds applied to construction costs (the only application of general obligation bonds permitted by law) and those consumed by the bond discount (a component of the total interest cost of a revenue bond issue) are included in the calculation (see Table 14-8).

Calculations for determining the Project Interest Rate do not include proceeds from the sale of revenue bonds for Off-Aqueduct Power facilities, the East Branch Enlargement facilities, SBA, or water system facilities defined in the Water Revenue Bond Amendment. Table 14-9 lists all bond sales by date and presents basic information used in the calculation of the Project Interest Rate.

Information about contractor water charges in Appendix B, which can be found in the back of this bulletin, is based on known conditions and substantiates DWR's determination of 2017 water charges to be billed on July 1, 2016. However, information about significant differences between the sum of future charges included in Lines 2 through 12 of Table 14-2 and the substantiation of 2016 charges included in Appendix B are as follows.

- Future capital costs in Appendix B are based on the prevailing prices as of December 31, 2015. Those costs presented in the financial analysis include allowances for price escalation.
- Pre-2016 charges in Appendix B represent charges as they should have been, according to currently known conditions. Pre-2016 charges included in Table 14-2 are those actually paid as part of previously determined bills.
- Charges in Appendix B are unadjusted for past overpayments or underpayments. Charges included in Table 14-2 for 2016 and thereafter have been adjusted for any apparent overpayments or underpayments of pre-2016 charges.

## Table 14-8 Revenue Bond Proceeds Affecting Project Interest Rate (in millions of dollars)

| Project | Proceeds Included in Project Interest Rate | | | | Total Principal Amount of Bonds | Percentage of Total Amount Included in Calculating Project Interest Rate [4] / [5] |
|---|---|---|---|---|---|---|
| | Applied to Construction Costs | Less Portion of Proceeds Derived from Interest Earnings Prior to Delivery of Bonds | Plus Bond Financing and Refunding Costs | Subtotal, Proceeds Included in Calculating Project Interest Rate [1] - [2] + [3] | | |
| | [1] | [2] | [3] | [4] | [5] | [6] |

| **Total** | | | **241,343,414** | **13,811,541** | | |
| **Portion allocated to Project Interest Rate** | | | **63,903,487** | **2,945,789** | **4.610** | **4.610** |

[a] A unit equivalent to one dollar of principal amount outstanding for one year.

[b] The total interest rate (without regard to discounts paid or to premiums received) divided by the total dollar-years, expressed as a percent.

[c] Cumulative interest costs divided by cumulative dollar-years, expressed as a percent. (Excluding Oroville Division bonds and revenue bonds for Off-Aqueduct Power Facilities, East Branch Enlargement Facilities, East Branch Extension Facilities, Water System Facilities as defined in the Water Revenue Bond Amendment, Coastal Extension Facilities, or South Bay Aqueduct Enlargement Facilities.)

[d] Variable rate issue. Assumed an interest rate. Actual interest cost and rate will vary.

- Charges in Appendix B for East Branch Enlargement costs include the amounts for debt service and 25 percent cover for the East Branch Enlargement share of the Series A through Series AU bonds. Charges in Table 14-2 apply to Series A through Series AU bonds and also include amounts of the debt service and cover for assumed future bonds.
- The water revenue bond surcharge in Appendix B applies only to the Series B through Series AU bonds. Surcharge values included in Table 14-2 apply to Series B through Series AU bonds and to assumed future issues required to finance SWP construction costs included in Table 14-1.

*Line 13, Subtotal, Water Contractor Payments*, is the total of Lines 2 through 12.

*Line 14, Revenue Bond Cover Adjustments*, represents the credit to contractors resulting from the cover of 25 percent of the annual debt service for Power Facilities Revenue Bonds and Water System Revenue Bonds. Cover is collected as required by the bond resolutions to provide security to the bondholders. If not needed to meet annual bond service, the cover is credited to the contractors in the following year. The annual charges for the following cost components include an amount for bond cover:

- minimum OMP&R component of the Transportation Charge for Off-Aqueduct Power Facilities;
- Water System Revenue Bond Surcharge;
- capital cost component of the Transportation Charge for East Branch Enlargement Facilities;
- capital cost component of the Transportation Charge for Coastal Branch Extension Facilities;
- capital cost component of the Transportation Charge for East Branch Extension Facilities;
- capital cost component of the Transportation Charge for Tehachapi Afterbay; and
- capital cost component of the Transportation Charge for SBA Enlargement.

*Line 15, Rate Management Adjustments*, shows the projected amount of revenue reductions allocated to contractors after repayment of the California Water Fund (see Line 39). Under provisions of the Monterey Amendment, the reduction amount allocated to agricultural contractors is deposited into a trust fund to stabilize payments in water-short years. The urban contractor allocation is applied as a direct reduction in charges.

*Line 16, Federal Payments for Project Operating Costs*, shows federal payments made in accordance with the December 31, 1961, agreement between California and the United States providing for DWR to operate and maintain the San Luis Joint-Use Facilities. According to the January 12, 1972, supplement to the agreement, the Bureau of Reclamation (Reclamation) initially paid 45 percent of operations, maintenance, and replacement (OM&R) costs for those activities. (The percentage does not apply to power costs; Reclamation and DWR each provide their own power to pump water through the joint facilities.)

The percentage paid by Reclamation is periodically reviewed by Reclamation and DWR. A review of the percentage paid by Reclamation was completed in 1987 and resulted in a federal share of 44.09 percent. During the most recent review concluded in August 2015, DWR agreed to reevaluate Reclamation's percentage every five years based on the preceding five years of actual operating expenditures. Operating expenditures for calendar years 2006 through 2010 were reviewed, and the percentage paid by Reclamation for calendar years 2011 through 2015 was retroactively reduced to 39.72 percent. The amounts in

Line 16 are based on the assumption that the federal share will continue at this level for calendar years 2016 through 2025. However, it is anticipated that the percentage paid by Reclamation for calendar years 2016–2020 will be revised once all expenditures through 2015 are known and a new percentage can be determined.

*Line 17, Appropriations for Operating Costs Allocated to Recreation*, shows appropriations made under the Davis-Dolwig Act. In passing the Davis-Dolwig Act, the California Legislature declared its intent that, except for funds provided according to Assembly Bill 12 (1966), DWR's budget will include appropriations of monies from the General Fund necessary for enhancement of fish and wildlife and recreation in connection with State water projects.

Annual OMP&R costs allocated to recreation and fish and wildlife enhancement are to be paid by annual appropriations from the General Fund. Through fiscal year 1982–1983, these appropriations totaled $16.7 million. No additional appropriations have been made from this fund since fiscal year 1982–1983.

Legislation enacted in 1989 offset a portion of the amount owed to the SWP by the State for costs allocated to recreation and to fish and wildlife enhancement against the amount the SWP owed to the California Water Fund (see line 39). Since the final offset in 1994, DWR has accumulated $201.3 million in OMP&R costs through December 31, 2015.

In 2012, the Davis-Dolwig Act was amended to appropriate $10 million per fiscal year from the Harbors and Watercraft Revolving Fund to cover a portion of the OMP&R and capital costs allocated to recreation and fish and wildlife enhancement. Starting in fiscal year 2012–2013, $7.5 million is being appropriated for ongoing OM&R and capital recreation and fish and wildlife enhancement costs and $2.5 million is being appropriated to reimburse DWR for past unreimbursed OMP&R and capital costs.

*Line 18, Davis-Grunsky Loan Repayments*, shows the repayments by local agencies of $76.3 million of loans disbursed as of December 31, 2015. Repayment on any future loans was assumed to be beyond the period covered by the financial analysis.

*Line 19, Revenue Bond Proceeds*, includes bond proceeds classified as special reserves according to the description of revenue bond financing in Line 17 of Table 14-1. Those proceeds, used for capitalized OMP&R costs, revenue bond debt service, and debt service reserves, are not classified as revenue but are included in this line to simplify the financial presentation.

*Line 20, Interest Earnings on Operating Revenues*, includes interest earnings on unexpended proceeds from the sale of general obligation bonds, interest on operating reserves, and other short-term investment earnings on SWP revenues.

*Line 21, Oroville-Thermalito Payments*, shows payments from Pacific Gas & Electric Company, Southern California Edison, and San Diego Gas & Electric Company for power generation at the Oroville facilities. Those utilities purchased all power generation from Hyatt and Thermalito powerplants before April 1, 1983, in accordance with a power sale contract dated November 29, 1967. The historic amount includes the amounts of final settlement of payments made according to the contract.

*Line 22, Miscellaneous Revenues*, includes all other operating revenues not included in Lines 2 through 21.

*Line 23, Subtotal, Other Revenues*, is the total of Lines 16 through 22.

*Line 24, Total Operating Revenues*, is the total of Lines 13, 14, 15, and 23.

*Line 25, Total Operating Revenues and Capital Resources Revenues*, is the total of Lines 1 and 24.

## Project Expenses

Project expenses include the following:

- operations, maintenance, and power costs;
- deposits to replacement reserves;
- deposits to special reserves;
- capital resources expenditures; and
- debt service.

Revenue bond proceeds earmarked for debt service during construction and the first year's operating expenses are deposited in the Central Valley Water Project Construction Fund and disbursed in accordance with resolutions authorizing the issuance of such bonds.

Water contractor revenues associated with operating costs and debt service attributable to projects financed by revenue bonds are deposited in the Central Valley Water Project Revenue Fund for appropriate disbursement. All other operating revenues are deposited in the California Water Resources Development Bond Fund—Systems Revenue Account and are disbursed in accordance with the following four priorities of use, as specified in the Burns-Porter Act:

- SWP OMP&R costs;
- general obligation bond debt service;
- repayment of expenditures from the California Water Fund; and
- deposits to a reserve for future SWP construction.

Project expenses are presented in Lines 26 through 36 of Table 14-2.

*Line 26, Project Operations, Maintenance, Power, and Replacement Costs*, shows the OMP&R portion of the historical and projected costs presented in Table 14-10.

Table 14-10 and Line 26 of Table 14-2 also include the amounts of the operations and maintenance costs for the federal share of joint facilities and those OMP&R costs allocated to recreation, which are intended to be offset by revenues listed in Lines 16 and 17.

Allowances for cost escalations are included in OMP&R costs through 2015. Allowances for additional long-term price escalations in the future are not included in these estimates, because changes in OMP&R costs do not substantially affect the overall results of the financial analysis. (For the most part, changes in OMP&R costs cause direct offsetting changes in operating revenues.)

Power costs make up the largest component of annual operating expenses for the SWP. Assumptions about future power sources and costs are discussed in Chapter 10, Power Resources. Line 26 also includes costs associated with power transactions that result in the sale of power not required for the delivery of water.

*Line 27, Deposits to Replacement Reserves*, shows funds set aside as required by contract for replacing existing SWP facilities. By December 31, 2015, a net deposit (which includes returned deposits) of $98.2 million had been made. $91.7 million had been spent for replacement costs. The balance of the replacement reserve as of that date was $27.9 million.

*Line 28, Deposits to Special Reserves Under Revenue Bond Financing*, includes two significant components: special reserve deposits related to revenue bonds and capital resources revenue carryover from prior years used for construction in the current year. Special reserve deposits are the

## Table 14-10 Operations, Maintenance, Power, and Replacement Costs, by Facility, Composition, and Purpose (in thousands of dollars)

net of several income and expenditure items. Income items related to revenue bonds are:

- proceeds set aside to pay bond interest during construction (capitalized interest);
- proceeds set aside for first year operating costs (capitalized operations and maintenance);
- water contractor payments or bond proceeds set aside for debt service reserves;
- water contractor payments for revenue bond cover requirements; and
- deposits to and withdrawals from operating reserves to meet day-to-day cash flow requirements.

The 1952–2015 column also includes advances to DWR's revolving fund for working funds to purchase mobile equipment and to meet day-to-day operating expenses.

The expenditure items related to revenue bonds include:

- debt service cover payments returned to contractors;
- debt service reserve interest payments returned to contractors;
- surplus account funds returned to contractors or applied to meet expenses;
- total capitalized interest paid out; and
- total capitalized operations and maintenance paid out.

Special reserves, reduced over time as reserved amounts, are used for their respective purposes. The amount indicated each year in Line 28 reflects the change from the previous year. A negative number indicates a withdrawal of special reserves to meet expenses, while a positive number indicates a deposit.

*Line 29, Capital Resources Expenditures*, includes the amount of capital resources revenues applied to construction that is shown in Line 36 of Table 14-1. In Table 14-2, these expenditures are funded out of withdrawals from the reserves in Line 28 and do not affect net revenues shown in Line 38.

*Lines 30 and 31, Payment of Debt Service on Bonds Sold through December 31, 2015*, show the total principal and interest payments, respectively, on bonds sold to date. Table 14-11, at the end of this chapter, summarizes payments on general obligation bonds (Series A through Y water bonds), power revenue bonds by project, and water system revenue bonds (Series A through AU).

*Lines 32 and 33, Payments on Projected Future Water Bonds*, include the projected annual bond debt service amounts for future water revenue bonds included on Lines 23, 25, 27, and 29 of Table 14-1 for the East Branch Enlargement, East Branch Extension, SBA Enlargement, and other water system facilities. Assumptions about the bond debt service on these future bonds are that interest costs for the water revenue bonds average 3.15 percent; and that bonds are to be repaid by the end of the project repayment period (2035) or sooner, with maturities commencing in the year following the date of sale and with equal annual bond debt service for the principal repayment period.

*Lines 34 and 35, Total Payments of Bond Debt Service*, show the total of principal payments indicated on Lines 30 and 32, and the total of interest repayments indicated on Lines 31 and 33.

*Line 36, Subtotal, Bond Debt Service*, is the total of Lines 34 and 35.

*Line 37, Total Operating Expenses and Bond Debt Service*, is the total of Lines 26, 27, 28, 29, and 36.

*Line 38, Net System Revenues*, shows the annual amounts of revenues remaining after the payment of operating costs and bond debt service costs.

*Line 39, California Water Fund Repayment*, shows the total amount of repayments made to the California Water Fund to reimburse the fund for monies expended for construction of the State Water Resources Development System.

Repayment of the California Water Fund was completed in 1998. The $508 million includes the $306 million of repayments shown in Line 39 and the $202 million of reimbursement that was credited to the SWP as offsets for recreation and fish and wildlife enhancement expenditures.

*Line 40, Revenues Used for Capital Expenditures*, includes the amounts required annually for financing scheduled capital expenditures. Revenues not needed for operating costs or bond debt services are available for financing SWP capital expenditures.

## Future Costs of Water Service

Estimates of future water costs are useful to contractors for short-range and long-range planning of water needs, operations, and budgets. Unit water charges shown in Table 14-12 represent estimated costs of water delivery by service area for calendar years 2017 and 2022. The unit rates include costs of existing and future SWP facilities accounted for in Table 14-1 and Table 14-7. The unit water charges are based on the assumption that in 2017 and 2022, the SWP will be able to deliver the entire amount of water requested by each contractor. The unit water charges included in Table 14-12 are listed both as 2017 dollars and as escalated rates reflecting assumed future inflation of 7.5 percent in 2016 and 4.5 percent from 2017 through 2022.

**Table 14-12 Estimated Unit Water Charges for 2017 and 2022, by Service Area (in dollars per acre-foot)**

| Service Area and Charge | 2017 (in 2017 dollars) | 2022 (in 2022 dollars) |

# Chapter 15
# SWP Education and Information

*Visitors at the California State Fair learn water conservation and drought-tolerant landscaping tips at the Department of Water Resources' outdoor exhibit.*

## Significant Events in 2015

On April 1, immediately following the Department of Water Resources' (DWR) fourth manual snow survey of the winter, which found bare ground and historically low water content, the Governor issued Executive Order B-29-15. The order mandated water restrictions statewide and directed DWR, along with other State agencies, to work with cities and counties to implement statewide water saving programs. The order also streamlined the government review process for major drought-related water infrastructure projects and water transfers.

On April 30, the Governor's Office announced a dual approach to improving water conveyance and ecosystem health in the Sacramento-San Joaquin Delta through two projects, California WaterFix and California EcoRestore.

*Save Our Water*, a partnership between DWR and the Association of California Water Agencies (ACWA), launched the *Let it Go* and the *Turn it Off* campaigns in the summer, and the *Fix it for Good* campaign in the fall. These campaigns featured billboard, radio, Internet, theater, and outdoor advertisements urging continued water conservation efforts.

*Information for this chapter was provided by the Public Affairs Office.*

The Department of Water Resources' (DWR) Public Affairs Office (PAO) produces and distributes news and program information describing California's water resources and DWR's mission, programs, and activities. PAO disseminates information by way of news releases, interviews, Internet posts, and both printed and electronic publications. Other avenues include artwork, films, graphics, exhibits, press conferences, photography, public meetings, social media, and special events.

## News Topics

Selected highlights below provide examples of PAO's 2015 outreach efforts and news media responses related to DWR's water policy, programs, and activities.

### Drought

In 2015, PAO observed an increase in public and media interest regarding California water supply and drought-related activities. To address the various interests, PAO increased its public outreach efforts related to the drought.

#### *Executive Order B-29-15*

On April 1, prompted by a fourth consecutive year of drought, the Governor issued Executive Order B-29-15, directing the first-ever statewide, mandatory water use reductions. Key provisions in the order included:

- ordering the State Water Resources Control Board to impose restrictions to achieve a 25 percent reduction in potable urban water usage through February 28, 2016;
- directing DWR to lead a statewide initiative, in partnership with local agencies, to collectively replace 50 million square feet of lawns and ornamental turf with drought-tolerant landscapes; and
- directing the California Energy Commission to implement a statewide appliance rebate program to provide monetary incentives for the replacement of inefficient household devices.

**Model Water Efficient Landscape Ordinance.** On July 15, the California Water Commission approved the updated Model Water Efficient Landscape Ordinance after DWR was directed in the Governor's April 1 Executive Order to revise the existing model landscape ordinance through expedited regulation. DWR developed the revised ordinance, held public workshops on the revisions, and conducted a 15-day public comment period.

The revised ordinance is expected to reduce a new home's water use by 12,000 gallons a year, or 20 percent. Water use on new commercial landscapes will be cut by approximately 35 percent. The ordinance took effect in December 2015.

**Turf and Toilet Rebate Programs.** On August 12, DWR announced two new rebate programs, financed by Proposition 1, which enabled DWR to carry out the Governor's April 1 Executive Order to further reduce water use in homes. DWR oversaw the two rebate programs: one that provided a $100 consumer rebate to replace one inefficient toilet per household; and one that provided up to $2 per square foot to remove lawns and replace them with water-efficient landscaping.

#### *Emergency Drought Barrier*

On February 12, DWR staff organized an informational meeting in Clarksburg about preparations for emergency drought barriers in Delta channels. The overview of the proposal was followed by a question-and-answer period. Several print, television, and radio outlets attended.

In May, installation of the emergency temporary rock barrier began. The barrier was installed on West False River to deter saltwater intrusion from the San Francisco Bay and to conserve water in upstream reservoirs that would be needed for the Delta to protect water quality. Barrier dismantling was completed in November. Project updates were delivered to the public and media via news releases, website updates, and social media.

For more information about the Emergency Drought Barrier, see Chapter 4, Water Quality Programs and Chapter 7, Water Supply Development and Reliability.

### *Save Our Water*

On June 30, *Save Our Water*, a 13-year partnership between DWR and the Association of California Water Agencies, launched a summer campaign with the messages of *Let It Go* and *Turn it Off*, encouraging Californians to continue to conserve water by allowing grass to turn brown and by turning off sprinklers.

The fall campaign, *Fix It for Good,* urged Californians to make permanent changes to save water such as drought-resistant landscapes, water-efficient appliances, and fixture replacements.

The two campaigns included social media messaging, billboards, radio spots, direct mail, theater ads, and outdoor media.

## Snow Surveys

Beginning in late December or early January, DWR conducts five monthly snow surveys to obtain an estimate of snow water content. Data collected in the snow surveys are used to estimate spring and summer snowmelt runoff. The melting snowpack provides much of the State's irrigation and drinking water as demand peaks during the summer months.

In 2015, due to the severity of the drought and lack of snow, DWR conducted only four media-oriented snow surveys in the Sierra Nevada, with the final April 1 survey reporting a record-low measurement at the Phillips Station survey site near Lake Tahoe.

Statewide snowpack water content on April 1 was just 5 percent of the historical average for the date. In 2014, water content was 33 percent of average, and 47 percent of average in 2013.

Media interest was high for all manual snow surveys. PAO distributed news releases on the snow survey findings, historical data, and video and photo links. PAO spoke to many media outlets about the severity of the drought and California's water supply and shared snow survey results on DWR's main website and on social media.

## State Water Project Allocations

On December 1, 2014, DWR announced an initial allocation of 10 percent for the 29 State Water Project (SWP) water contractors that collectively serve more than 25 million Californians and about 750,000 acres of irrigated farmland. On January 15, 2015, DWR announced an increase in the allocation to 15 percent. With the help of mid-December and early February storms, SWP allocations increased to 20 percent on March 2.

The 2014 final allocation of 5 percent was the lowest allocation in SWP history. The final SWP allocation in 2013 was 35 percent of the SWP water contractor requests. In 2012, the first year of the ongoing drought, the final allocation was 65 percent.

## Bay Delta Conservation Plan/ California WaterFix

California WaterFix is a collaborative effort by State and federal agencies to improve California's aging water delivery system.

On April 30, the Governor's Office announced a plan to fix the SWP's aging infrastructure and restore the Delta's ecosystem by splitting the multifaceted Bay Delta Conservation Plan project into two different efforts, California WaterFix and California EcoRestore.

On July, 9, the partially recirculated draft environmental impact report/supplemental draft environmental impact statement for the Bay Delta Conservation Plan/California WaterFix was released. The public comment period that began July 10 was scheduled to end August 31, but was extended an additional 60 days to October 30.

Additional information can be found in Chapter 3, Environmental Programs.

## Solverde I Solar Facility

On December 15, DWR announced a new 20-year power purchase agreement to provide solar power to the SWP from the Solverde I Solar Facility. The facility will be located in Lancaster, and is expected to be fully operational by December 2016. The facility is part of DWR's long-term effort to reduce greenhouse gas emissions.

## SWP Publications

PAO creates and maintains approximately 40 brochures describing the SWP, its mission, and its facilities. The brochures are periodically updated and distributed statewide to educate the public about the SWP.

Brochures distributed to stakeholders, the public, and DWR's Visitors Centers during 2015 included updated versions of the *SWP Visitors Centers* and *History of California Water Development*. Spanish translations were completed for the *Easy Ways to Save Water* brochure and *The Water Cycle* handout. A new *Water Safe for Life with Albert & Einstein Along the California State Water Project* brochure in Spanish was created.

### *E-News*

Each weekday, PAO compiles and electronically distributes news articles, blogs, and commentaries on water-related issues to more than 5,000 subscribers. These news clips inform DWR staff of water issues relevant to DWR and its programs.

Topics highlighted in the weekday news clips include water supply, water quality, drought, watersheds and programs, and agencies and people.

### *Spotlight Stories and Social Media*

On DWR's main website and on DWR's Facebook page, many Spotlight Stories were featured in 2015. Subjects included how California coped with the fourth year of drought, how green power energizes the SWP, snow surveys, emergency groundwater wells, and the salmon passage project at Knights Landing.

DWR increased Facebook and Twitter messaging in 2015. PAO posted four to five messages per week on Facebook and Twitter about various DWR projects, updates, and activities of interest to the public and DWR employees. In 2015, DWR's Facebook followers increased to 5,577.

### *DWR Magazine*

Published three times a year, this news magazine features articles describing DWR programs, staff, and activities.

In 2015, articles covered how Californians were mandated to save water, the Emergency Drought Barrier installation in the Delta, the Clifton Court Forebay predation study, how the Division of Environmental Services monitors turbidity in the Delta, and the installation of a weather buoy at Folsom Lake to study evaporation.

## DWR Tours Program

The DWR tours program regularly attracts foreign and domestic tour groups. The SWP and its water supply mission is the major attraction.

Strong interest in SWP operations among foreign and domestic organizations continued in 2015 as California's historic drought intensified. The DWR tours program arranged visits by academics and water managers from Asia, Europe, the Middle East, and the Americas, who were all interested in how DWR was managing the State's water resources during an extended dry period.

Teachers and students from high school through law school visited DWR as they sought information about the SWP and the drought. The schools included: the University of California, Davis; Humboldt State University; McGeorge School of Law, University of the Pacific; the Urban School of San Francisco; and schools from the Tuolumne County school system.

As a basic component of DWR's Training Program, tours to the Sacramento–San Joaquin Delta and to Oroville Dam and Lake Oroville were provided for recently hired DWR employees.

During 2015, foreign agencies sending visitors to DWR and the SWP included: the Environmental Protection Association and the Ministry of Agriculture and Rural Community Cooperation of South Korea; the Ministries of Energy, Water, and Agriculture from Afghanistan; Taiwan's Ministry of Economic Affairs and Water Resources Agency; the Shanxi Grand Water Network of China; and Singapore's Public Utilities Board, among others.

In 2015, several visits were highlighted among foreign and domestic tour groups.

- The Ministry of Environment, Republic of Korea, sent a delegation seeking information about how DWR and other agencies in California cooperate to protect sources of drinking water.
- Representatives of the Environment Agency-Abu Dhabi visited DWR to compare how environmental programs are designed and implemented, with a focus on groundwater resources management.
- The World Food Center sponsored a visit to Oroville Dam for water experts from private and public sectors who had met at the University of California, Davis to discuss food security from a global perspective.
- The Northern California World Trade Center brought water managers from Afghanistan and Pakistan to DWR to discuss climate change impacts and the drought's effect on SWP hydroelectric power operations.

Figure 15-1 shows the SWP visitors center locations.

## Community Relations and Recreational Safety

In 2015, PAO staff continued to educate the public about the drought, water conservation, and the *Save Our Water* program through DWR's award-winning, water-efficient gardens and exhibits at the California State Fair, which ran from July 10 through July 26.

PAO staff also provided exhibits at the following events:

- San Francisco Flower & Garden Show;
- International Sportsmen's Exposition, Sacramento;
- Healthy Kids Day, Oroville;
- Sacramento Area Creeks Council Creek Week Event;

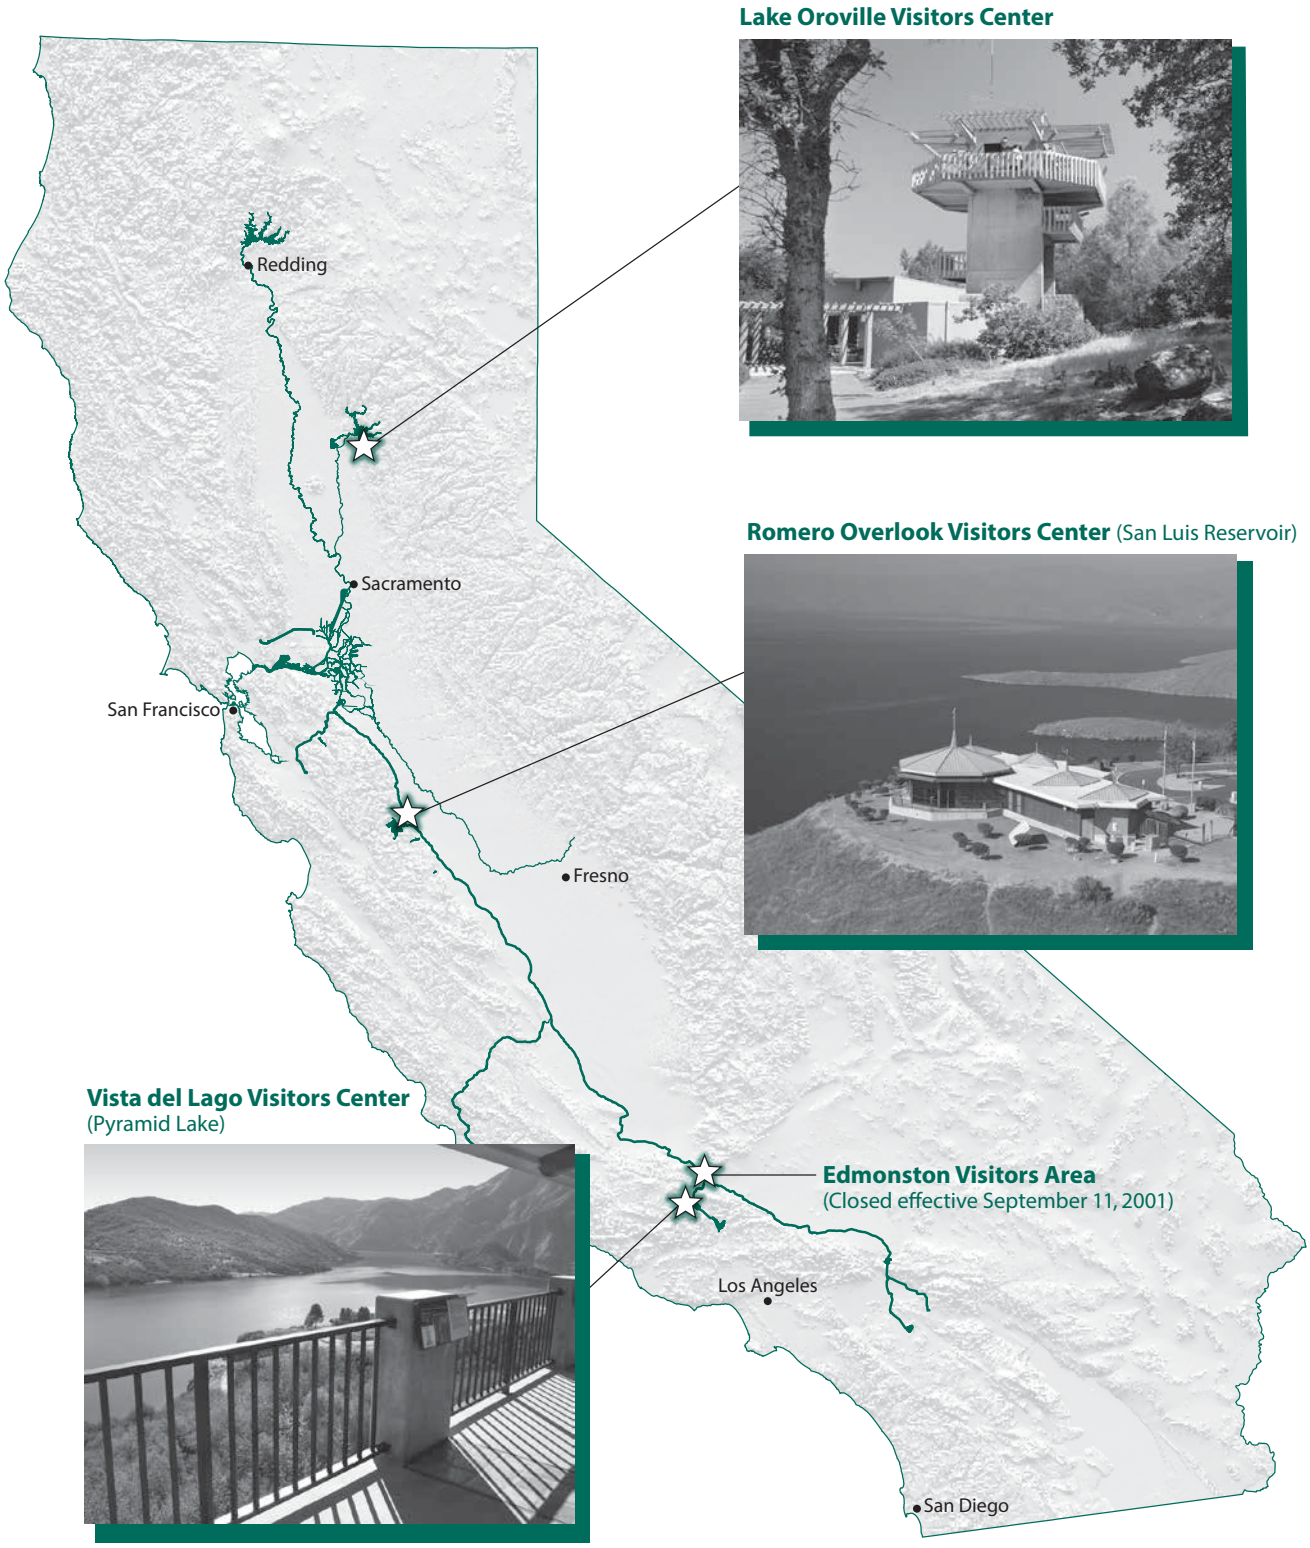

**Figure 15-1** **Visitors Centers on the SWP**

- Feather Fiesta Days, Oroville;
- YMCA Kids Adventure Day, Oroville;
- Sacramento Earth Day;
- World Ag Expo,Tulare;
- CalSTRS Earth Day, West Sacramento;
- CalEPA Earth Day, Sacramento;
- Walk on the Wildside, Sacramento;
- Hooked on Fishing, Not on Drugs, Oroville;
- California State Fair, Sacramento;
- Big Fresno Fair;
- 6th Annual Sacramento Banana Festival;
- Department of Social Services Emergency Preparedness Fair 2015, Sacramento;
- Office of Emergency Services National Preparedness Month, California Day of Preparedness, Sacramento;
- 48th Annual Native American Day, California State Capitol, Sacramento;
- Oroville Salmon Festival; and
- Grape, Raisin & Nut Expo, Fresno.

DWR also co-sponsors and coordinates "Catch A Special Thrill" (C.A.S.T.) fishing events for children with special needs. During 2015, C.A.S.T. events were held at Lake Oroville, Brannan Island State Recreation Area near Rio Vista, O'Neill Forebay at San Luis State Recreation Area, and Silverwood Lake.

DWR continued its partnerships with communities to offer nine Aquatic Adventure Camps throughout the summer months, teaching water safety to young people. In 2015, the camps utilized SWP facilities at Lake del Valle and Castaic Lake.

## SWP Recreation Outreach Program

The goal of the SWP recreation outreach program is to educate the public about the many recreational opportunities available at SWP facilities. PAO staff attends community events; State and county fairs; State and federally sponsored events; and forms partnerships with State, federal, and community groups.

### *SWP Recreation Outreach Events*

DWR, the California Department of Parks and Recreation, and several partner agencies co-sponsored or attended the following recreation outreach events in 2015:

- International Sportsmen's Exposition, Sacramento;
- Jack Splash Club/Oroville YMCA Fit-N-Fun Day;
- Feather Fiesta Days, Oroville;
- Healthy Kids Day, Oroville;
- Hooked on Fishing, Not on Drugs, Oroville; and
- Oroville Salmon Festival.

The Jack Splash Club was created by PAO as a way to interest and educate kids and their families in the Oroville area about safe water recreation. The Oroville YMCA helps manage the club because of its water safety programs, fitness programs, and community standing.

# School Education Program

The School Education Program's goal is to provide students and educators with a statewide perspective on water issues such as conservation, conveyance systems, and the water cycle. PAO staff develops and promotes high-quality materials, providing them free of charge to schools, educators, and water districts. Program achievements for 2015 are described below.

## Public Events and Outreach

In 2015, PAO staff provided displays of DWR's interactive children's exhibits and other educational materials at the:

- 48th Annual Native American Day, California State Capitol, Sacramento;
- Sacramento Area Creeks Council Creek Week Event;
- Water Conservation Presentation, St. Philomene School, Sacramento;

- CalEPA Earth Day, Sacramento; and
- State Scientist Day, Sacramento.

PAO staff organized a team of DWR judges from multiple divisions and provided a special award at the Sacramento Regional Science and Engineering Fair in Sacramento.

PAO staff also assisted at the *Save Our Water* booths at two events in Sacramento: the Office of Emergency Services National Preparedness Month, California Day of Preparedness; and the California State Fair.

## Publications and Materials

Curriculum materials and children's videos were provided to California teachers and water agencies through the *Water Facts & Fun* online catalog and order form and during promotional events. During 2015, the following materials were purchased or reprinted:

- 1,500 *Teacher's Guide for Hands-on Water Activities* booklets;
- 5,000 *Water & Me* color and activity booklets; and
- 5,000 hamburger activity sheets.

## Collaboration and Partnerships

DWR's School Education Program seeks to partner with other entities with similar interests and goals to pool resources in educating California's youth on the importance of water resources. During 2015, PAO staff participated in the following collaborative activities/meetings:

- DWR's Water Education Committee meeting;
- Project Water Education for Teachers (WET) Advisory Committee, the California Environmental Education Interagency Network Committee;
- Creek Week Planning Committee and the Kids' Art Contest Winner Selection Subcommittee; and
- Caring for Our Watersheds contest, sponsored by Agrium Inc. and the Center for Land-Based Learning.

Additional collaborative efforts included PAO staff working with the following:

- California Department of Education's California Regional Environmental Education Community network;
- California Environmental Education Foundation;
- California Project WET program;
- Floodplain and Delta Ecology Institute for teachers, co-sponsored with the San Joaquin County Office of Education;
- Floodplain and Riparian Ecology Institute for teachers, co-sponsored with California State University, Chico;
- Central Valley Floodplain Ecology Institute for Educators, co-sponsored with the SAM Academy and the Central Valley Science Project, California State University, Fresno; and
- Delta Studies Institute for teachers, co-sponsored with the San Joaquin County Office of Education.

# Glossary

This glossary contains terms used in the text of Bulletin 132-16 as well as additional terms related to water resources.

## *A*

**abundance** The number of organisms of a particular kind in a population. (See also, abundance index.)

**abundance index** (fisheries) A relative measure of the weight or number of fish in a stock, a segment of the stock (e.g. the spawners), or an area. Often available in time series, the information is collected through scientific surveys or inferred from fishery data.

**acre-foot** The volume of water that would cover one acre to a depth of one foot; equal to 43,560 cubic feet or 325,851 gallons.

**adaptive management** The process of improving management effectiveness by learning from the results of carefully designed decisions or experiments.

**adipose fin** A small fleshy fin with no rays on the topside of a fish located between the fin on the back and the tail fin.

**afterbay** A storage reservoir downstream of a power plant or large reservoir that regulates fluctuating discharges from a spillway, hydroelectric power plant, or a pumping plant.

**agricultural drainage** (1) The process of directing excess water away from root zones by natural or artificial means, such as by using a system of drains placed below ground surface level (also called subsurface drainage); (2) the water drained away from irrigated farmland.

**alluvium** Unconsolidated soil strata deposited over time by flowing water.

**amphipod** A small crustacean with a flat (laterally compressed) body belonging to the group Amphipoda, found in both marine and freshwater environments.

**anadromous** Fish that live the majority of their life cycle in the sea and return to freshwater streams to spawn.

**anion** An atom or a molecule in which the total number of electrons is greater than the total number of protons, giving it a net negative electrical charge.

**aquifer** A geologic formation that stores water underground (called groundwater), especially one that yields significant quantities of water to wells or springs.

**arid** Describes a climate or region in which precipitation is so deficient in quantity or occurs so infrequently that intensive agricultural production is not possible without irrigation.

**artificial recharge** The addition of surface water to a groundwater basin by human activity, such as putting surface water into spreading basins.

**atmospheric river** A short-lived, narrow stream of high-velocity wind that carries large amounts of water vapor from tropical oceans to mid-latitude land areas resulting in large amounts of precipitation in those areas.

**average annual runoff** The average value of annual runoff volume calculated for a selected period of record, at a specified location, such as a dam or stream gauge.

**average year water demand** Demand for water under average hydrologic conditions for a defined level of development.

## *B*

**balanced water conditions** These exist when upstream reservoir storage releases, plus other inflows, approximately equal the water supply needed to (1) satisfy Sacramento Valley and Sacramento-San Joaquin Delta in-basin needs, including Delta water quality requirements, and (2) meet export needs. DWR and the Bureau of Reclamation jointly decide when balanced or excess water conditions exist.

**beach seine** A rectangular net with poles attached to the ends that is held vertically in the water and dragged through the water a short distance to capture fish.

**beneficial use** Water quality beneficial use categories for water are designated by State law. Beneficial uses of the waters of the State that may be protected against water quality degradation include, but are not limited to, domestic, municipal, agricultural, and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

**benthic organisms** Aquatic animals without backbones that dwell on or in the bottom sediments of fresh or salt water.

**biological assessment** A document prepared as part of the Endangered Species Act, Section 7 process to determine whether a proposed major

construction activity under the authority of a federal action agency is likely to adversely affect listed species, proposed species, or designated critical habitat.

**biological opinion** A scientific assessment issued by the U.S. Fish and Wildlife Service or National Marine Fisheries Service, required by the Endangered Species Act for listed species. Determines the likelihood of a federal action to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.

**biota** Living organisms of a region, as in a stream or other body of water.

**brackish water** Water containing dissolved minerals in amounts that exceed normally acceptable standards for municipal, domestic, and irrigation uses. Considerably less saline than seawater.

**bromide** A salt which naturally occurs in small quantities in seawater; a compound of bromine.

**Burns-Porter Act** (California Water Code Section 12930 et seq.) Formally known as the California Water Resources Development Bond Act, this act passed the Legislature in 1959 and was approved by voters in 1960. It provided initial funding of $1.75 billion in general obligation bonds and authorized construction of the State Water Project facilities.

**bypass** As part of a flood management system, a natural overflow area or channel that allows excessive floodwaters to flow or be diverted from a main river channel to prevent water from overflowing the main river channel.

## C

**CALFED Bay-Delta Program** (CALFED) A federal and State multiagency program established by the 1994 Bay-Delta Accord. CALFED's mission was to develop and implement a long-term comprehensive plan that would restore ecological health and improve water management in the Bay-Delta system. In 2010, all functions and responsibilities of CALFED were assumed by the Delta Stewardship Council.

**California Data Exchange Center** (CDEC) CDEC installs, maintains, and operates an extensive hydrologic data collection network including automatic snow reporting gauges for the DWR Cooperative Snow Surveys Program and precipitation and river stage sensors for flood forecasting. CDEC provides a centralized location to store and process real-time hydrologic information gathered cooperatively throughout the State.

**California Irrigation Management Information System** (CIMIS) A network of automated weather stations that are owned and operated cooperatively between DWR and local agencies. The stations are installed in

most of the agricultural and urban areas of the State and provide farm and large landscape irrigation managers and researchers with "real-time" weather data to estimate crop and landscape evapotranspiration rates and make irrigation management decisions.

**California Water Resources Simulation Model** (CALSIM) A computer model that simulates operations of SWP and Central Valley Project water delivery systems. CALSIM II is a planning tool that was jointly developed by DWR and the Bureau of Reclamation. The model's inputs include hydrologic data for specified study planning years, water demands, infrastructure and regulatory change, and other factors. Outputs include deliveries to water contractors, river flows, reservoir changes, Delta hydrologic parameters, and other data.

**cation** An atom or a molecule in which the total number of protons is greater than the total number of electrons, giving it a net positive electrical charge.

**Central Valley Project deliveries** The volume of water imported to a given area through the Central Valley Project.

**ciliates** Single-celled organisms, characterized by the presence of many hair-like structures called cilia used for locomotion and for feeding.

**climate change** Any significant change in the measures of climate lasting for an extended period of time. This includes major changes in temperature, precipitation, or wind patterns, among other things, that occur over several decades or longer.

**coded wire tag** A small piece of stainless steel wire injected into the snout of juvenile salmon and steelhead. Each tag is etched with a binary code that identifies a fish release group.

**conjunctive use** Application of surface water and groundwater to meet the demand for a beneficial use. Coordinated and planned management of both surface water and groundwater resources to maximize the efficient use of the resources; that is, the planned and managed operation of a groundwater basin and a surface water storage system combined through a coordinated conveyance infrastructure. Water is stored in the groundwater basin for later planned use by intentionally recharging the basin during years of above-average surface water supply.

**conservation facilities** Reservoir facilities that store water and make it available for later use.

**consultation** The process required of a federal agency under Section 7 of the Endangered Species Act when any activity authorized, carried out, or conducted by that agency may affect a listed species or designated critical

habitat; consultation is with the U.S. Fish and Wildlife Service or National Marine Fisheries Service and may be either informal or formal.

**conveyance** Provides for the movement of water and includes the use of natural watercourses and constructed facilities including open channels, pipelines, diversions, fish screens, distribution systems, and pump lifts.

**conveyance facilities** Canals, pipelines, pump lifts, ditches, etc., used to move water from one area to another.

**cryptomonad** A single-celled, photosynthetic organism with two flagella that inhabits both marine and freshwater environments.

**cyanobacteria** Photosynthetic, nitrogen-fixing, colonial bacteria found in a wide variety of terrestrial and aquatic habitats, often referred to as "blue-green algae."

## *D*

**Davis-Grunsky Act** Authorized in 1960 as part of the Burns-Porter Act, this act provides construction loans for local domestic water projects and agricultural water conservation projects.

**Delta outflow** Freshwater outflow from the Sacramento-San Joaquin Delta to protect the beneficial uses within the Delta from the incursion of saline water.

**Delta outflow index** A calculated approximation of the seaward freshwater outflow as it passes Chipps Island near Pittsburg, beyond the confluence of the Sacramento and San Joaquin rivers.

**desalting** A process to reduce the salt concentration of seawater or brackish water.

**diatom** Microscopic marine or freshwater colonial algae that have cell walls made out of silica.

**dinoflagellate** A small, single-celled organism with flagella and an internal skeleton of cellulose-like plates found in both marine and freshwater environments and best known as causers of harmful algal blooms.

**discount rate** The interest rate used to calculate the present value of future benefits and future costs or to convert benefits and costs to a common time basis.

**dissolved organic compounds** Carbon-based substances dissolved in water.

**dissolved oxygen** The amount of oxygen dissolved in water or wastewater, usually expressed in milligrams per liter, parts per million, or percent of saturation.

**distinct population segment** A subdivision of a species that is treated as a species for purposes of listing under the Endangered Species Act. The smallest division of a taxonomic species that can be protected under the Endangered Species Act.

**drainage area** The area of land from which water drains into a river; for example, the Sacramento River Basin, in which all land area drains into the Sacramento River. Also called a watershed, drainage basin, or river basin.

**drought preparedness** The magnitude and probability of economic, social, or environmental consequences that would occur as a result of a sustained drought under a given study plan.

**drought condition** Hydrologic conditions during a defined period, greater than one dry year, when precipitation and runoff are much less than average.

**drought year supply** The average annual supply of a water development system during a defined drought period.

**Delta Simulation Model 2** (DSM2) A hydrodynamic and water quality simulation model used to simulate water flow and quality conditions in the Sacramento-San Joaquin Delta. The model is frequently used to evaluate potential changes in Delta conditions (salinity, flow, and water level) associated with changes in flow patterns in the Delta.

## *E*

**ecosystem restoration** The activity of improving the condition of natural landscapes and biotic communities.

**effluent** Wastewater or other liquid, treated or in its natural state, flowing from a treatment plant or process.

**electrical conductivity** The measure of the ability of water to conduct an electrical current, the magnitude of which depends on the dissolved mineral content of the water.

**endangered species** An animal or plant species in danger of extinction throughout all or a significant portion of its range.

**entrainment** The unintended diversion of fish (or other aquatic organisms) into an unsafe passage route. The incidental trapping of any life stage of fish within waterways or structures that carry water being diverted for use

elsewhere. Fish are considered "entrained" when they enter a diversion point, which for the SWP is Clifton Court Forebay.

**environmental impact report** A report done to analyze project or program impacts on a variety of resources under the California Environmental Quality Act.

**environmental impact statement** A report done to analyze project or program impacts on a variety of resources under the National Environmental Policy Act.

**environmental water** The water for wetlands, for the instream flow in a major river or the Bay-Delta, or for a designated wild and scenic river.

**escapement** The portion of an anadromous fish population that escapes commercial and recreational fisheries and reaches its freshwater spawning grounds.

**estuary** A semi-closed coastal body of water where the lower course of a river enters the sea, influenced by tidal action where the tide meets the river flow, resulting in brackish water.

**evapotranspiration** The amount of water transpired by plants, retained in plant tissues, and evaporated from plant tissues and surrounding soil surfaces. (See also, reference evapotranspiration.)

**excess water conditions** Periods when it is agreed that releases from upstream reservoirs plus unregulated flow exceeds Sacramento Valley in-basin uses plus exports. DWR and the Bureau of Reclamation jointly decide when balanced or excess water conditions exist. During excess water conditions, sufficient water is available to meet all beneficial needs, and the SWP and Central Valley Project are not required to supplement the supply with water from reservoir storage.

**export** An amount of water transported from one source or location to another.

## *F*

**firm yield** The maximum annual supply of a water development project under drought conditions, for some specified level of demand.

**flagellates** Organisms with one or more whip-like structures called flagella, which are used for locomotion or feeding.

**floodplain** A strip of relatively level land bordering a stream or river that is often inundated during times of high water.

**forages** Food for animals, especially crops grown to feed horses, cattle, and other livestock.

**forebay** A reservoir at the intake of a pumping plant or power plant to stabilize water levels; also a storage basin for regulating water for percolation into groundwater basins.

**fork length** A measurement used frequently for fish length when the tail has a fork shape; projected straight distance between the tip of the snout and the fork of the tail.

**freeboard** The height of the physical top of a levee above a specified water surface elevation. This serves as a factor of safety for containing water in the stream or reservoir without overtopping the levee or dam.

**fry** Young, recently hatched fish that are able to swim and catch their own food.

## *G*

**greenhouse gas emissions** Also referred to as carbon intensity or carbon footprint, greenhouse gases trap heat in the atmosphere and contribute to climate change. They include carbon dioxide, methane, nitrous oxide, and fluorinated gases.

**grilse** A term that generally refers to young adult salmonids of a certain length and age. Grilse are often 55–65 centimeters (22–26 inches) in length. They are assumed to be two years old, and adults are assumed to be age three and older.

**groundwater** Water located beneath the land surface that fills the pore spaces of the alluvium, soil, or rock formation in which it is situated. It excludes soil moisture, which refers to water held by capillary action in the upper unsaturated zones of soil or rock.

**groundwater bank** Groundwater banking refers to the practice of recharging specific amounts of water in a groundwater basin during wet or above-average years, which can later be withdrawn and used by the depositing entity.

**groundwater basin** An alluvial aquifer or a stacked series of alluvial aquifers with reasonably well-defined boundaries in a lateral direction and having a definable bottom.

**groundwater recharge** The natural or intentional infiltration of surface water into the zone of saturation of an aquifer (i.e., into groundwater).

**groundwater storage capacity** The volume of void space that can be occupied by water in a given volume of a formation, aquifer, or groundwater basin.

**groundwater table** The upper surface of the zone of saturation in an unconfined aquifer.

## *H*

**habitat** The place or environment where a plant or animal naturally lives and grows with a group of particular environmental conditions.

**habitat conservation plan** A plan that outlines ways of maintaining, enhancing, and protecting a given habitat type needed to protect species; it usually includes measures to minimize impacts, and may include provisions for permanently protecting land, restoring habitat, and relocating plants or animals to another area. Required before a federal Endangered Species Act incidental take permit may be issued.

**halophyte** A plant capable of growing in salty soil.

**haptophyte** A kind of unicellular marine phytoplankton typically covered in tiny scales or plates composed of carbohydrates and calcium deposits.

**hydraulic barrier** (1) A barrier created by injecting fresh water to control seawater intrusion in an aquifer, or created by water injection to control migration of contaminants in an aquifer. (2) A barrier developed in the estuary (the Delta) by release of fresh water from upstream reservoirs to prevent intrusion of seawater into the body of fresh water.

**hydrologic balance** An accounting of all water inflow to, water outflow from, and changes in water storage within a hydrologic unit over a specified period of time.

**hydrologic basin** Where, conceptually, any drop of water that falls in the basin will flow to a stream or groundwater basin within it. It is a larger set of which a subset is the groundwater basin that can be within a hydrologic basin. DWR's hydrologic regions are collections of the larger hydrologic basins.

**hydrologic region** DWR divides California into 10 hydrologic regions, corresponding to the state's major water drainage basins: North Coast, San Francisco Bay, Central Coast, South Coast, Sacramento River, San Joaquin River, Tulare Lake, North Lahontan, South Lahontan, and Colorado River.

**hydrology** The science dealing with the occurrence, circulation, distribution, and properties of the waters of the earth and its atmosphere.

## I

**in-lieu recharge** The practice of providing surplus surface water to historic groundwater users, thereby leaving groundwater in storage for later use.

**ion exchange** Processes of purification, separation, and decontamination of aqueous and other ion-containing solutions with solid ion exchangers (such as sodium carbonate used for water softening).

**instream use** Use of water within its natural watercourse as specified in an agreement, water rights permit, etc. For example, the use of water for navigation, recreation, fish and wildlife, aesthetics, and scenic enjoyment.

**integrated regional water management** A comprehensive approach for determining the appropriate mix of demand and supply management options to provide long-term, reliable water supply at the lowest reasonable cost and with the highest possible benefits to customers, economic development, environmental quality, and other social objectives.

**invertebrate** An animal that lacks a backbone.

## J

**joint points of diversion** The ability of the SWP to use Jones Pumping Plant as a point of diversion and the Central Valley Project to use Banks Pumping Plant as a point of diversion. The SWP and Central Valley Project may use one another's diversion facilities under certain conditions.

**joint powers agreement** An agreement entered into by two or more public agencies that allows them to jointly exercise any power common to the contracting parties. This is defined in Chapter 5 (commencing with Section 6500) of Division 7 of Title 1 of the California Government Code.

**joint-use facilities** Those portions of the SWP that serve both SWP and Central Valley Project functions, and in which both State and federal agencies participate in the construction and use; specifically, the San Luis complex and Reaches 3, 4, 5, 6, and 7 of the California Aqueduct.

**jurisdictional dam** Artificial barriers, together with appurtenant works, which are 25 feet or more in height or have an impounding capacity of 50 acre-feet or more, which are regulated by the DWR Division of Safety of Dams.

## K

**kathablepharid** A specific type of cryptomonad.

## *L*

**land subsidence** The lowering of the natural land surface in response to: earth movements; the lowering of fluid pressure or groundwater level; consolidation of underlying soils; removal of underlying supporting materials by mining (e.g., oil and gas extraction); compaction caused by wetting; or oxidation of organic matter in soils (e.g., peat soil being converted to gas).

**legal Delta** The legal geographical boundaries of the Sacramento-San Joaquin Delta, as established by the Delta Protection Act of 1959, and as defined in California Water Code Section 12220.

**listed species** A species, subspecies, or distinct population segment that has been added to the federal list of endangered and threatened wildlife and plants. The term also applies to a species or subspecies added to the California list of endangered or threatened plants and animals.

## *M*

**maximum contaminant level** The highest drinking water contaminant concentration allowed under federal and State Safe Drinking Water Act regulations.

**mitigation** (1) An action or set of actions designed to avoid, minimize, reduce, eliminate, or compensate for adverse environmental impacts due to an agency activity or program. (2) Reduction of human activities that affect global climate change, including strategies to reduce greenhouse gas emissions.

**Monterey Agreement** An agreement executed in December 1994 among DWR and the SWP water contractors to address fundamental contract issues by amending the long-term water supply contracts.

**Monterey Amendments** Amendments to the long-term water supply contracts for the SWP entered into by DWR and most (27 of 29) of the SWP water contractors in 1995 and 1996 as implementation of the terms of the Monterey Agreement.

**multipurpose project** A project, usually a reservoir, designed to serve more than one purpose, whose costs are normally allocated among the different functions it provides. For example, a project that provides water supply, flood control, and generates hydroelectricity.

## *N*

**natural community conservation planning** (NCCP) A process that promotes multispecies and multihabitat management and conservation through cooperative efforts among public agencies, private landowners, and other interests within a plan area. It provides a framework for minimizing impacts on plant communities and wildlife from proposed development projects.

**natural recharge** Natural replenishment of an aquifer generally from snowmelt and runoff through seepage from the surface.

**net groundwater** The amount of groundwater extraction in excess of deep percolation.

**nonreimbursable costs** The part of project costs allocated to general statewide or national beneficial purposes and funded from general revenues, rather than by water users.

**normalized demand** The process of adjusting actual water use in a given year to account for unusual events such as dry weather conditions, government price support programs for agriculture, rationing programs, or other unusual conditions.

## *O*

**operational yield** An optimal amount of groundwater that should be withdrawn from an aquifer system or a groundwater basin each year. It is a dynamic quantity that must be determined from a set of alternative groundwater management decisions subject to goals, objectives, and constraints of the management plan.

**Operations Criteria and Plan** (OCAP) (1) The document titled, "Long-Term Central Valley Project Operations Criteria and Plan," that serves as a baseline description of the facilities and operating environment of the Central Valley Project and the SWP and identifies factors influencing the physical and institutional conditions and decision-making processes under which the projects currently operate. Regulatory and legal requirements are explained and alternative operating models and strategies described. (2) The document titled, "Central Valley Project Operations Criteria and Plan" (CVP-OCAP, 2004), that describes the laws, regulations, and other criteria applicable to operations of the Central Valley Project that were in effect from 1991 through 2003.

**Operations Criteria and Plan biological opinion** (1) The document titled, "Biological Opinion and Conference Opinion on the Long-Term Operations of the Central Valley Project and the State Water Project" (NOAA Fisheries, 2009).

(2) The December 15, 2008, memorandum from the U.S. Fish and Wildlife Service to the Bureau of Reclamation that comprises the U.S. Fish and Wildlife Service biological opinion on the coordinated operations of the Central Valley Project and the SWP.

**ostracod** A type of bivalve (with a hinged, two-part shell) crustacean, mostly microscopic to small in size, found in aquatic and marine habitats occurring as benthic or planktonic organisms.

**otolith** Ear bone of a fish. Otoliths often show seasonal or annual rings that can be used to determine age.

**outflow** The amount of applied water and conveyance water leaving the service area. Also conveyance outflow.

## *P*

**parr** The developmental life stage of salmon and trout when the young have developed parr marks (vertical bars or spots on the sides of the fish) and are actively feeding in fresh water.

**pelagic** Inhabiting the water column as opposed to being associated with the bottom; generally occurring anywhere from the water's surface down to, but not including, the bottom.

**pelagic fish** Fish that live in open water, often near the surface.

**perched groundwater** Groundwater supported by a zone of material of low permeability located above an underlying main body of groundwater.

**perennial yield** The maximum quantity of water that can be annually withdrawn from a groundwater basin over a long period of time without developing an overdraft condition.

**permeability** The capability of soil or other geologic formations to transmit water.

**phytoplankton** Minute plants, such as algae, that live suspended in bodies of water and drift with the current.

**precipitation** A deposit on the earth of hail, rain, mist, sleet, or snow. It is the common process by which atmospheric water becomes surface or subsurface water.

**project yield** The water supply attributed to all features of a project, including integrated operation.

**proposal solicitation package** (PSP) As part of the formal solicitation for grant applications, a PSP provides detailed instructions on the mechanics of submitting proposals and specific information on submittal requirements.

**public trust doctrine** A legal doctrine recognizing public rights in the beds, banks, and waters of navigable waterways, and the State's power and duty to exercise continued supervision over them as trustee for the benefit of the people.

**pump lift** (1) The vertical distance that a pump will raise water. (2) The distance between the groundwater table and the overlying land surface.

**pumped storage project** A hydroelectric power plant and reservoir system using an arrangement whereby water released for generating energy during peak load periods is stored and pumped back into the upper reservoir, usually during periods of reduced power demand.

**pumping-generating plant** A plant that can either pump water or generate electricity, depending on the direction of water flow.

**punch list** A list of tasks or "to-do" items necessary for the completion of a construction project.

## *Q*

**Quantification Settlement Agreement** A complex package of agreements that defines the rights to a portion of Colorado River water for four water agencies in Southern California, provides for water transfers, and establishes a Joint Powers Authority to oversee restoration of the Salton Sea. The *Colorado River Water Delivery Agreement: Federal Quantification Settlement Agreement* was signed in October 2003 by Coachella Valley Water District, Imperial Irrigation District, The Metropolitan Water District of Southern California, the San Diego County Water Authority, and the federal government.

## *R*

**radial gates** Gates used to control the flow of water into or from a reservoir, canal, or pipeline, or through a channel. Each gate can close under its own weight and is operated independently by remote control.

**radio-telemetry** Automatic measurement and transmission of data from remote sources via radio to a receiving station for recording and analysis.

**rate structure** Designates the rate basis for cost recovery (e.g., flat, uniform, tiered, etc.). Block/tiered rates are assumed to provide cost signals to

consumers. Costs can include capital, operation and maintenance, financing, environmental compliance (documentation, permitting, and mitigation), etc.

**raw water** Water found in the environment, such as rainwater, surface water (e.g., lakes, streams, and the ocean), or groundwater, that has not been treated. Most water is considered raw until it is treated for consumption or used for agriculture or industry.

**reach** On the California Aqueduct, a specific segment of the canal, identified by a number, which is the smallest unit of the SWP identified in water supply contracts for cost allocation and repayment purposes.

**rearing** Refers to the amount of time that juvenile fish spend feeding in nursery areas of rivers, lakes, streams, and estuaries before migration.

**reasonable and prudent alternatives** Alternative actions that can be implemented in a manner consistent with the intended purpose and scope of a project, are economically and technologically feasible, and would avoid the likelihood of jeopardizing the continued existence of listed species or resulting in the destruction or adverse modification of critical habitat.

**recharge** Water added to an aquifer or the process of adding water to an aquifer. Groundwater recharge occurs either naturally as the net gain from precipitation or artificially as the result of human influence.

**recharge basin** A surface facility constructed to infiltrate surface water into a groundwater basin.

**recreation** Water-dependent recreation activities that are consumptive (e.g., parks), flat-water (e.g., boating), or flow-based (e.g., whitewater rafting).

**recycled water** (1) The application of treated water/reclaimed water to meet a beneficial use, supplanting a potable or potentially potable supply. (2) Treated municipal, industrial, or agricultural wastewater to produce water that can be reused.

**redd** A shallow nest of fish eggs covered with gravel in a streambed.

**reference evapotranspiration** ($ET_o$) The evapotranspiration rate from an extended surface of 3 to 6 inch (8 to 15 centimeter) tall green grass cover of uniform height, actively growing, completely shading the ground, and not short on water.

**reliability planning** Water reliability management planning is done by comparing the costs of taking actions to maintain or increase reliability to the costs of accepting less reliability. On this basis, accepting the costs of the adverse effects of less than 100 percent reliability could be a legitimate planning decision. Providing full water supply to meet 100 percent of

projected future water demand is not the planning goal, rather, the goal is to find the justified level of reliability.

**reoperation** See system reoperation.

**repayment reach** California Aqueduct reaches are delineated for the purpose of making project repayment as equitable as possible. The reaches are generally numbered consecutively from the Delta, with Reach 1 being first. Repayment reaches vary greatly in length. (See also, reach.)

**required instream flow** The amount of water required for instream use by agreement, water rights permit, or State/federal acts.

**reused water** The application of previously used water to meet a beneficial use, whether treated or not prior to the subsequent use. (See also, recycled water.)

**return flow** The portion of withdrawn water not consumed by evapotranspiration or system losses which returns to its source or to another body of water.

**reverse osmosis** A method to remove salts and other constituents from water by forcing water through membranes.

**riparian area** The area of land adjacent to a stream, lake, or wetland with vegetation that, due to the presence of water, is distinctly different from the vegetation of adjacent upland areas. Riparian areas provide important fish and wildlife habitat.

**riparian (water) right** A right to use surface water derived from the fact that the land in question abuts the banks of a stream or other water source (lake or pond). These rights are senior to most appropriative water rights.

**riprap** A layer of large uncoursed stones, broken rock, boulders, or precast blocks placed in random fashion on the upstream and downstream faces of embankment dams, stream banks, on a reservoir shore, on the sides of a channel, or other land surfaces to protect them from erosion caused by current, wind, wave, and/or ice action. Very large riprap is sometimes referred to as "armoring."

**run (of fish)** A group of fish of the same species whose upstream spawning migration timing is associated with the seasons, e.g., fall, spring, summer, and winter runs. Members of a run may interbreed with fish of another run.

**runoff** The volume of surface flow from an area during a specified period. Natural runoff is the portion of precipitation that runs off the land and makes up the natural flow in rivers. Incidental runoff is the portion of precipitation that would have been used by natural vegetation but now contributes to

runoff. This is a result of roads, paved areas, building roofs, land drainage systems, fields developed for irrigation, and other changes in land use.

## *S*

**sabellid polychaete** A segmented marine worm that lives in a tube that it builds.

**saline intrusion** The movement of salt water into a body of fresh water. It can occur in either surface water or groundwater bodies.

**salinity** Generally, the concentration of mineral salts dissolved in water. Salinity may be expressed in terms of a concentration, weight (total dissolved solids), electrical conductivity, or osmotic pressure. When describing salinity influenced by seawater, salinity often refers to the concentration of chlorides in the water. (See also, total dissolved solids.)

**salmonid** A fish species belonging to the salmon family, including salmon and trout.

**salt-water barrier** A physical facility or method of operation designed to prevent the intrusion of salt water into a body of fresh water.

**salvage (fish)** At the SWP and Central Valley Project fish protective facilities, fish are removed from export water, transported, and released away from the influence of the water diversion facilities.

**sediment** Soil or mineral material transported by water and deposited in streams or other bodies of water.

**seepage** The gradual movement of water into, through, or from a porous medium. Also, the infiltration of water into the soil from canals, ditches, laterals, watercourses, reservoirs, storage facilities, or other bodies of water, or from a field.

**service area** The geographic area served by a water agency.

**smolt** A juvenile salmonid fish that has assumed the silvery color of the adult and, while migrating toward the ocean, is undergoing physiological changes that will allow it to live in salt water.

**snowpack** The annual accumulation of snow in mountain areas.

**soluble minerals** Naturally occurring substances capable of being dissolved.

**special status species** Plants or animals legally protected under either the federal or California Endangered Species Act or the California Fish and Game Code; those species not currently protected by statute but considered to be rare or endangered under the California Environmental Quality Act; and species considered by the scientific community to be sufficiently rare to qualify for legal protection (e.g., candidate species for listing as threatened or endangered, species of concern to the Department of Fish and Wildlife or U.S. Fish and Wildlife Service, or rare plants identified by the California Native Plant Society).

**species of concern** An informal term referring to a species that might be in need of conservation action.

**spillway** The section of a dam designed to permit water to pass over its crest; a weir or channel taking overflow from the dam. The spillway serves as a safety channel to prevent erosion or overtopping of the dam.

**sprinkler irrigation** A method of irrigation in which the water is sprayed, or sprinkled, through the air to the ground surface.

**stakeholder** Individuals or groups who can affect or be affected by an organization's activities; individuals or groups with an interest or "stake" in what happens as a result of a decision or action.

**State Water Project deliveries** The volume of water imported to a given area through the State Water Project.

**statewide water management systems** These include physical facilities (more than 1,200 State, federal, and local reservoirs, as well as canals, treatment plants, and levees), which make up the backbone of water management in California; and statewide water management programs, which include water-quality standards, monitoring programs, economic incentives, water-pricing policies, and statewide water-efficiency programs such as appliance standards, labeling, and education.

**strategic plan** The long-term goals of an organization or program and an outline of how the goals will be achieved (e.g., adopting specific strategies, approaches, and methodologies).

**stocking** Releasing hatchery-raised fish into a water body for the purposes of supplementing existing populations or creating new ones for fishing (also referred to as "planting").

**streamflow** The rate of water flow past a specified point in a channel.

**subsidence** See land subsidence.

**surface storage** Surface storage uses reservoirs to collect water for later release and use.

**surface supply** Water supply obtained from streams, rivers, lakes, and reservoirs.

**system reoperation** Changes to existing water system operations and management procedures for existing reservoirs and conveyance facilities to increase their water-related benefits.

## *T*

**temporary urgency change petition** A formal request to the State Water Resources Control Board for conditional, temporary changes to the terms and conditions of a water right. Temporary urgency change orders issued by the State Water Resources Control Board allow water right holders to temporarily deviate from the terms of their existing water right.

**threatened species** An animal or plant species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

**tidal wetlands** The margins of an estuary that are periodically inundated by tides; includes all habitats within the elevation range between the lowest and highest tides: intertidal mudflats, regularly inundated tidal marsh plains, tidal channels within the marsh, and infrequently inundated wetland-upland transition zones at the edge of the upland.

**total capital cost** The total monetary cost of options required for "turnkey" implementation, including environmental and third-party impact mitigation, storage, conveyance, energy, capitalized operations and maintenance, administrative costs, planning costs, legal costs, and engineering costs.

**total dissolved solids** The quantity of the residual minerals dissolved in water that remain after evaporation of a solution.

**transpiration** An essential physiological process in which plant tissues give off water vapor into the atmosphere.

**tributary** A stream that flows into a larger stream or other body of water.

**tubificid worm** An aquatic worm with a small, thin, segmented body.

**turbidity** A measure of the cloudiness of water caused by the presence of suspended particles in the water that attenuate or reduce light penetration. Turbidity in natural waters may be composed of organic and/or inorganic constituents and may have direct implications to drinking water treatment.

**turnout** The point at which water is diverted from a main channel or water delivery facility to a distributing facility; a structure through which a water contractor takes delivery of water.

## *U*

**unimpaired flow** The flow past a specified point on a natural stream that is unaffected by stream diversion, storage, import, export, return flow, or change in use caused by modifications in land use.

**unimpaired runoff** A representation of the natural water production of a river basin, unaltered by upstream diversions, storage, or by export or import of water to or from other watersheds.

**Urban Water Management Planning Act** Sections 10610 through 10657 of the California Water Code. The act requires urban water suppliers to prepare urban water management plans that describe and evaluate sources of water supplies, efficient uses of water, demand management measures, implementation strategies and schedules, and other relevant information and programs within their water service areas. Urban water suppliers (Section 10617) are either publicly or privately owned and provide water for municipal purposes, either directly or indirectly, to more than 3,000 customers or supply more than 3,000 acre-feet of water annually.

**urban water use** The use of water for urban purposes, including residential, commercial, industrial, recreation, energy production, military, and institutional classes. The term is applied in the sense that it is a kind of use rather than a place of use.

**urban water use efficiency** Methods or technologies resulting in the same beneficial residential, commercial, industrial, and institutional uses with less water or increased beneficial uses from existing water quantities.

## *V*

**vernal pools** A type of wetland that occurs in shallow foothill and valley depressions. Water remains in pools and swales until it evaporates, usually within a few days to a few months, mainly in late winter and spring.

**volatile organic compound** (VOC) A man-made organic compound that readily vaporizes in the atmosphere. These compounds are often highly mobile in the groundwater system and are generally associated with industrial activities.

## *W*

**wastewater** Domestic or municipal sewage or effluent from an industrial process.

**water demand** The desired quantity of water that would be used if the water were available and if a number of other factors, such as price, did not change. Demand is not static.

**water exchange** Typically, water delivered by one water user to another water user; the receiving water user will return the water at a specified time or when the conditions of the parties' agreement are met. (See also, water transfer.)

**water quality** Description of the chemical, physical, and biological characteristics of water, usually with regard to its suitability for a particular purpose or use.

**water quality objectives** Specific, legally enforced levels of water quality desired for identified uses including drinking, recreation, fish production or propagation of other aquatic life, agriculture, industry, and urban use.

**water recycling** The process of treating wastewater, rendering it suitable for beneficial use.

**water right** In water law, the right of a user to use water from a water source (e.g., a river, stream, pond, or source of groundwater).

**water service reliability** The degree to which a water service system can successfully manage water shortages.

**water supply exports** The amount of water that a region transfers to another to meet needs.

**water table** See groundwater table.

**water transfer** A temporary or long-term change in the point of diversion, place of use, or purpose of use due to a transfer or exchange of water or water rights. A more general definition is that water transfers are a voluntary change in the way water is usually distributed among water users in response to water scarcity.

**water year** A continuous 12-month period for which hydrologic records are compiled and summarized. Different agencies may use different calendar periods for their water years. For DWR, a water year is October 1 through September 30.

**watershed** The land area from which water drains into a stream, river, or reservoir. Also called drainage area, drainage basin, or river basin.

**watershed management** The process of evaluating, planning, managing, restoring, and organizing land and other resource use within an area that has a single common drainage point.

**weir** (1) Any structure across a watercourse used to control, raise, or measure flows. (2) A barrier constructed to catch upstream migrating adult fish.

**wetlands** Lands including swamps, marshes, bogs, and similar areas such as wet meadows, river overflows, mud flats, and natural ponds. An area characterized by periodic inundation or saturation, certain types of soils, and vegetation adapted for life in saturated soil conditions.

**Wild and Scenic River systems** State and federally designated river systems under the 1968 national Wild and Scenic Rivers Act and the 1972 California Wild and Scenic Rivers Act. Seventeen rivers in California, including many forks and tributaries, are designated wild, scenic, or recreational.

**wheel** As applied to water and power, to provide the use of one agency's conveyance facilities for the purpose of transporting another agency's supply.

## *X*

**X2** Delta outflow interaction with tides determines the location of the X2 isohaline salinity gradient. X2 is the location in the Bay-Delta where the tidally averaged bottom salinity is 2 parts per thousand. It is expressed as the distance in kilometers from the Golden Gate Bridge. X2 is used as a primary indicator in managing Delta outflow.

## *Z*

**zooplankton** Small aquatic animals that are suspended or swimming in water.

# Bulletin 132-16

# Appendix B

# Data and Computations Used to Determine 2017 Water Charges

Appendix B, Data and Computations Used to Determine 2017 Water Charges, was previously printed and distributed under an August 2016 cover letter from Pedro Villalobos, Acting Chief of SWPAO, to State Water Project water contractors to document and support DWR's calculation of the contractors' annual charges. Appendix B appears on the following pages as it was published in August 2016. However, Table B-7 was not published in the August 2016 version of Appendix B because the data were not available at the time of publication. Table B-7 now appears in its entirety on page B-78.

# Appendix B
# Data and Computations
# Used to Determine 2017 Water Charges

The Department of Water Resources (DWR) annually furnishes Statements of Charges to the 29 State Water Project (SWP) water supply contractors. Article 29(e) of the *Standard Provisions for Water Supply Contract*, approved August 3, 1962, describes those statements:

> "All such statements shall be accompanied by the latest revised copies of the document amendatory to Article 22 and of Tables B, C, D, E, F, and G of this contract, together with such other data and computations used by the State in determining the amounts of the above charges as the State deems appropriate."

To comply with Article 29(e), DWR performs an annual comprehensive review and redetermination of all water supply and financial aspects of the SWP for the entire project repayment period. This annual redetermination is performed in accordance with Article 22(f) and Article 28 of the water supply contracts, which concern the Delta Water Rate and annual transportation charges, respectively.

Appendix B includes data used to document the redetermination of water charges to be paid by contractors during calendar year 2017. The information is based on established data about the SWP, both known and projected, as of June 2016; however, small volumes of water may be reclassified over time pursuant to water supply contract provisions. If research requires more current data than was available at the time of production of Bulletin 132, please contact the State Water Project Analysis Office. Where applicable, the projected data values shown in this appendix are shaded and the bill year data are in **bold** type.

The computational procedures and interrelationships between tabulations in this appendix are outlined on *Figures B-1* and *B-2*. All tables referenced on Figures B-1 and B-2 follow this text.

## Types of Water Charges

Charges to SWP water supply contractors include the costs of facilities for the conservation and development of a water supply and the conveyance of such supply to SWP service areas. These facilities are classified as "Project Conservation Facilities" and "Project Transportation Facilities" in the *Standard Provisions for Water Supply Contract*. Names of the main facilities in each classification follow.

Project Conservation Facilities

- Frenchman Dam and Lake
- Grizzly Valley Dam and Lake Davis
- Antelope Dam and Lake
- Oroville Dam and Lake Oroville
- Oroville power facilities
- Delta facilities
- Suisun Marsh facilities
- Yolo Bypass
- A portion of the California Aqueduct from the Delta to Dos Amigos Pumping Plant

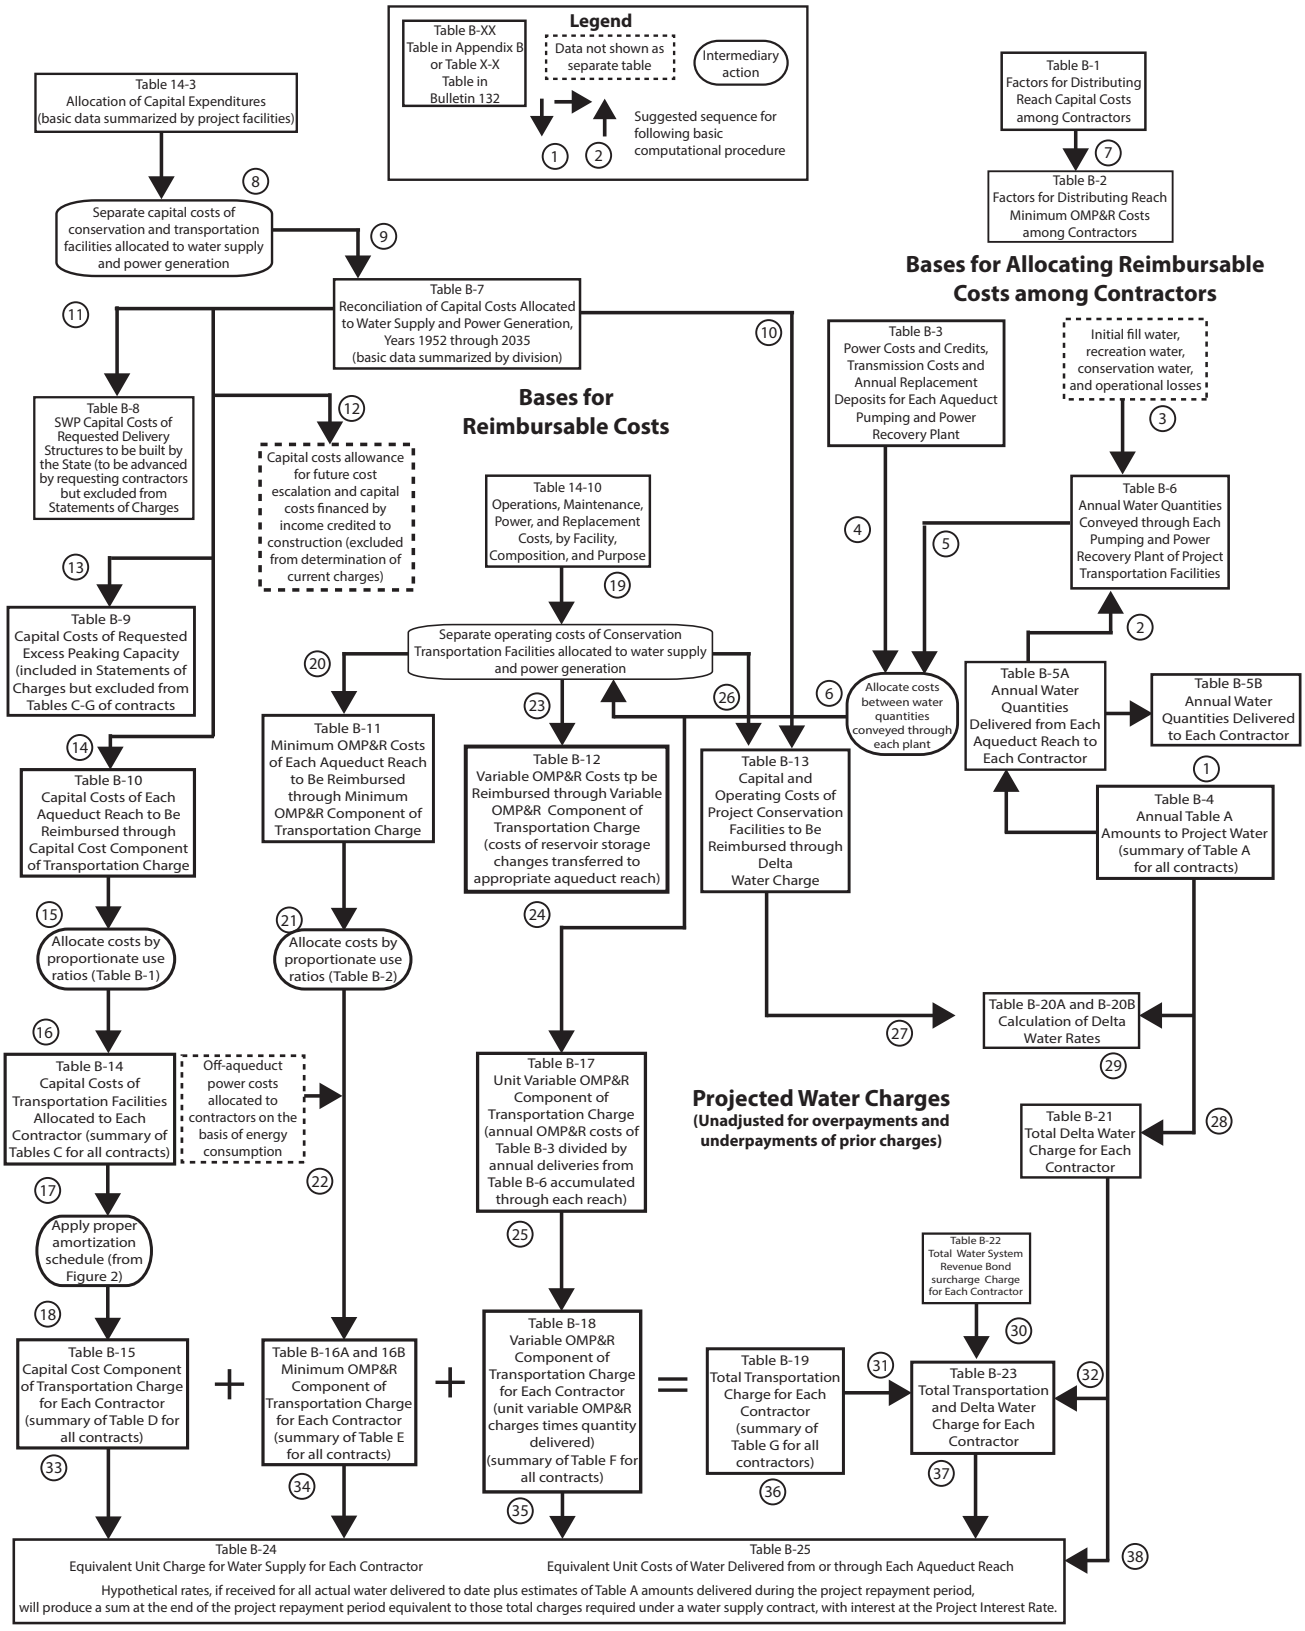

**Figure B-1 Relationships of Data Used to Substantiate Statements of Charges**

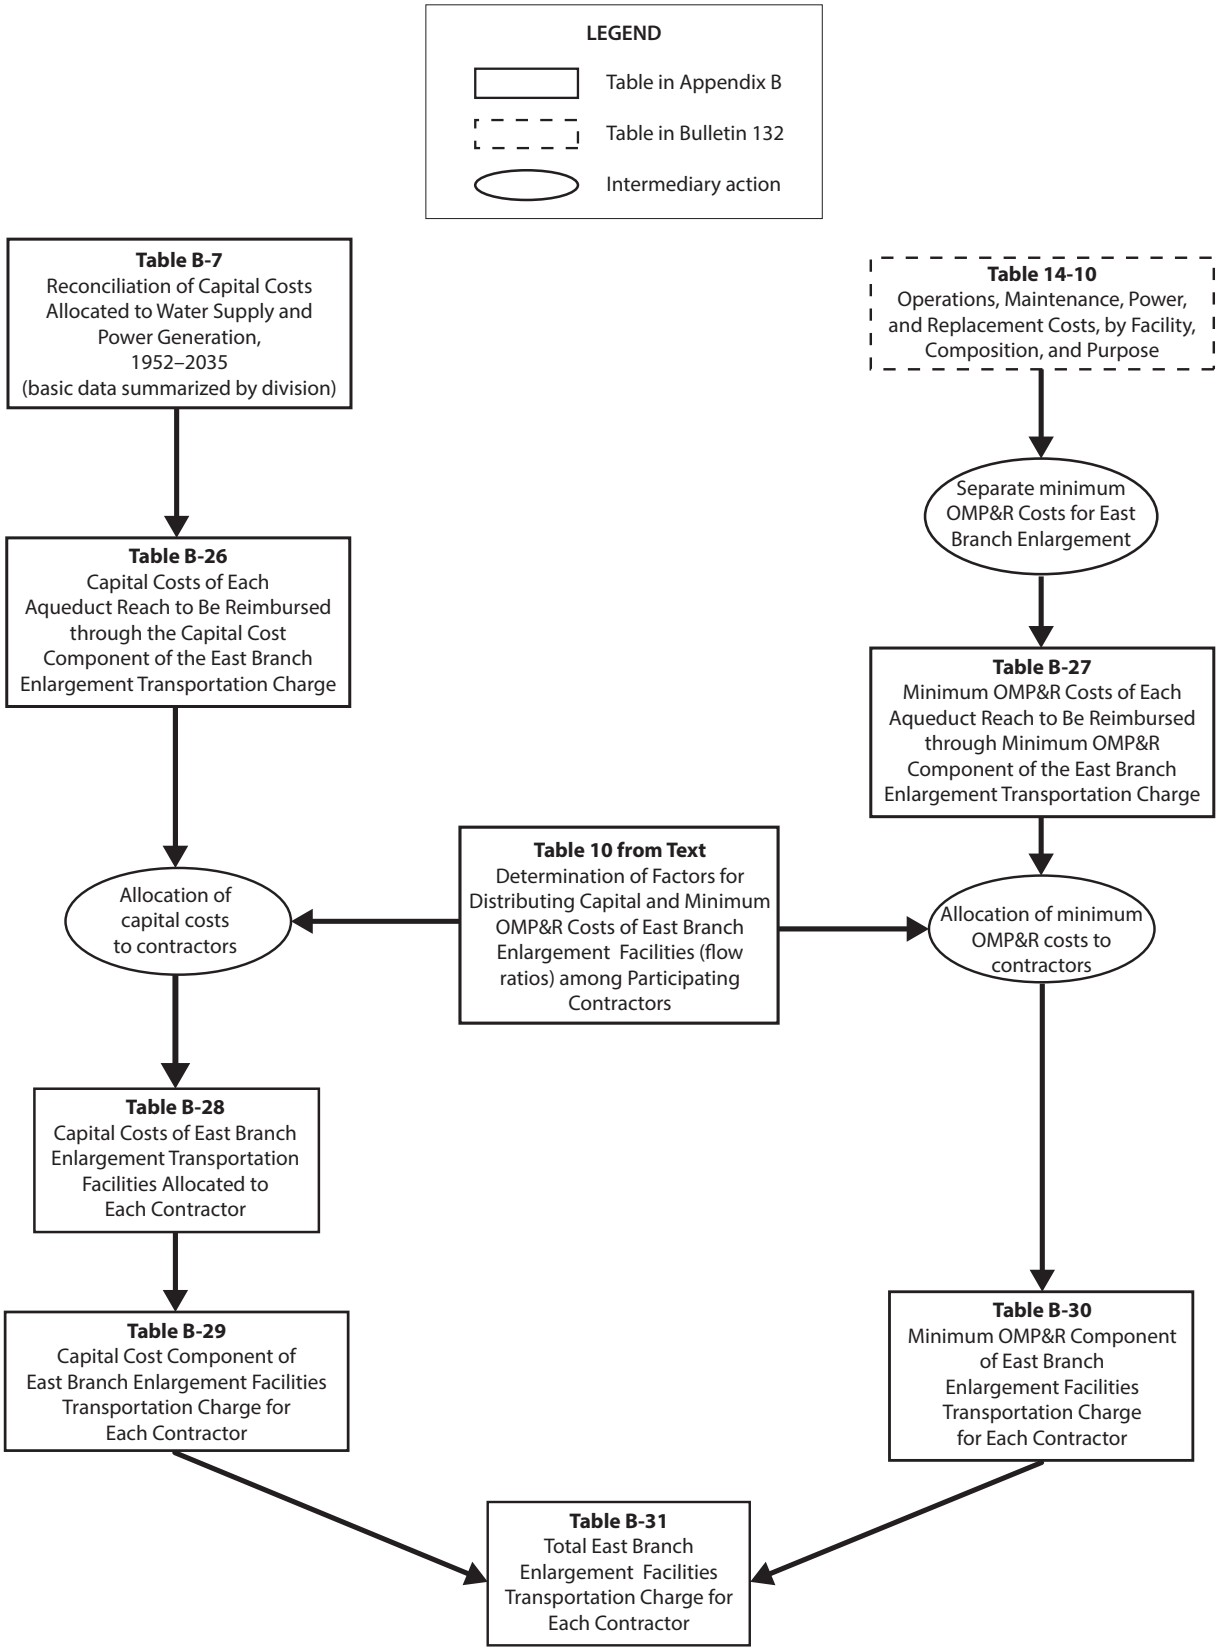

**Figure B-2 Relationships of Data Used to Substantiate East Branch Enlargement Charges**

- Sisk Dam, San Luis Reservoir, and Gianelli Pumping-Generating Plant

Project Transportation Facilities

- Grizzly Valley Pipeline
- North Bay Aqueduct
- South Bay Aqueduct, including Del Valle Dam and Lake del Valle
- the remainder of the California Aqueduct from the Delta to Dos Amigos Pumping Plant and all facilities south, including dams and lakes in Southern California
- Off-Aqueduct Power Facilities (Reid Gardner Unit No. 4, Bottlerock Powerplant, and South Geysers Powerplant)

The standard provisions provide for a Delta Water Charge and a Transportation Charge for project water.

The Delta Water Charge is a unit charge applied to each acre-foot of SWP water the contractors are to receive, in accordance with their contracts. The unit charge, if applied to each acre-foot of all such allocations for the remainder of the project repayment period, is calculated to result in repayment of all outstanding reimbursable costs of the Project Conservation Facilities, with appropriate interest, by the end of the repayment period (2035).

The Transportation Charge is for use of facilities to transport water to the vicinity of each contractor's turnout(s). Generally, the annual charge represents each contractor's proportionate share of the reimbursable capital costs and operating costs of the Project Transportation Facilities.

Each contractor's allocated share of those reimbursable capital costs is amortized for repayment to the State, and certain variations are allowed in the amortization methods. Contractors' shares of reimbursable operating costs are repaid in the year such costs are incurred by the State.

The East Branch Enlargement Transportation Charge is paid by the seven Southern California contractors participating in the enlargement. San Bernardino Valley Municipal Water District advanced funds to pay the district's allocated capital costs for the East Branch Enlargement. The remaining six contractors pay an allocated share of the debt service on revenue bonds sold to finance the enlargement. Each contractor will also pay an allocated share of the minimum operation, maintenance, power, and replacement (OMP&R) costs of the East Branch Enlargement.

Transportation charges for the Coastal Branch Extension, East Branch Extension, and South Bay Enlargement are being repaid by contractors in their respective service areas.

Transportation charges for the Tehachapi Afterbay are repaid by those contractors using electrical power for delivery of their Table A water downstream of the Tehachapi Afterbay.

## Composition and Timing of Water Charges

As shown on *Figure B-3*, the Delta Water Charge and the Transportation Charge consist of the following three components:

(1) conservation and transportation capital cost components, which will return to the State all reimbursable capital costs;
(2) conservation and transportation minimum OMP&R components, which will return to the State all reimbursable operating costs that do not depend on or vary with quantities of water actually delivered to the contractors; and
(3) a transportation variable OMP&R component, which will return to

**Delta Water Charge**

*Capital Cost Component*

1. Planning, design, right-of-way, and construction costs of Conservation Facilities
2. Operations and maintenance (O&M) costs for newly constructed Conservation Facilities prior to initial operations
3. Activation costs for newly constructed Conservation Facilities
4. Power costs allocated to initial filling of San Luis Reservoir
5. Capitalized O&M costs (major repair work and so forth) for Conservation Facilities
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to State Water Project (SWP) pumping prior to 1986 (Department of Water Resources-Department of Fish and Game agreement)

*Minimum Operations, Maintenance, Power, and Replacement (OMP&R) Component*

1. Direct O&M costs of Conservation Facilities
2. General O&M costs allocated to Conservation Facilities
   a. Contractor Accounting Office (portion)
   b. Financial and contract administration (portion)
   c. Water rights
   d. Power planning for SWP facilities (portion)
3. Replacement deposits for SWP control centers (portion)
4. Credits for a portion of Hyatt-Thermalito power generation
5. Power costs and credits related to pumping water to San Luis Reservoir for project operations (storage changes)
6. Value of power used and generated by Gianelli Pumping-Generating Plant
7. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

**Transportation Charge**

*Capital Cost Component*

1. Planning, design, right-of-way, and construction costs of Transportation Facilities
2. Operations and maintenance (O&M) costs for newly constructed Transportation Facilities prior to initial operation
3. Activation costs for newly constructed Transportation Facilities
4. Power costs allocated to initial filling of Southern California reservoirs
5. Capitalized O&M costs (e.g., major repair work) for Transportation Facilities
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to SWP pumping prior to 1986 (Department of Water Resources-Department of Fish and Game agreement)

*Minimum OMP&R Component*

1. Direct O&M costs of Transportation Facilities
   a. Headquarters and field divisions (portion)
   b. Insurance and Federal Energy Regulatory Commission (FERC) costs (portion)
2. General O&M costs related to Transportation Facilities
   a. Contractor Accounting Office (portion)
   b. Financial and contract administration (portion)
   c. Power planning for SWP facilities (portion)
3. Power costs and credits related to pumping water to Southern California reservoirs for project operations (storage changes)
4. Power costs for pumping water to replenish losses from Transportation Facilities (downstream costs)
5. Other power costs
   a. Station service at Transportation Facility power and pumping plants
   b. Certain transmission service costs (transmission access charges, downstream costs, etc.)
6. Replacement deposits for SWP control centers (portion)
7. Off-Aqueduct Power Facility costs—bond service, bond cover costs (25 percent of bond service), bond reserves, transmission service costs, fuel costs, taxes, and O&M—less power sales allocated to Off-Aqueduct Power Facilities
8. Program costs (portion to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

*Variable OMP&R Component*

1. Power purchase costs
   a. Capacity
   b. Energy
   c. Pine Flat Powerplant bond service, O&M, and transmission costs allocated to aqueduct pumping plants
2. Alamo, Devil Canyon, Warne, and Castaic power generation credited at the power plant reach and charged to aqueduct pumping plants
3. Hyatt-Thermalito Diversion Dam Powerplant generation charged to aqueduct pumping plants (credits for this generation are reflected in the Delta Water Rate)
4. Replacement deposits for equipment at pumping plants and power plants
5. Credits from sale of excess SWP system power
6. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

Note: Excludes costs recovered under the East Branch Enlargement Transportation Charge.

**Figure B-3 Composition of Delta Water Charge and Transportation Charge**

the State all reimbursable operating costs that depend on and vary with quantities of water actually delivered to the contractors.

The formula for computing the Delta Water Rate, Article 22(f) of the *Standard Provisions for Water Supply Contract*, was designed to ensure that all adjustments for prior overpayments or underpayments of the Delta Water Charge are accounted for in a redetermination of the rate. Since the redetermined rate applies to all future allocations, such adjustments are amortized during the remainder of the project repayment period. This appendix includes a redetermination of the Delta Water Rate for 2017.

Article 28 of the standard provisions stipulates that Transportation Charges be redetermined each year. The tables in Appendix B include the numerical data used in this redetermination. Transportation Charges for prior years through 2016, included in those tables, are the redetermined amounts and do not equal the amounts actually paid by contractors.

As provided under the Water System Revenue Bond Amendment to the water supply contracts, differences between actual payments under the Transportation capital cost component and amounts computed in this redetermination are accumulated with interest and amortized during the remaining years of the contract repayment period. All computations for adjustments are included in the attachments accompanying each contractor's Statement of Charges and are reflected in revised copies of Table C through Table G of the contract, which are also furnished to each SWP contractor in its annual Statement of Charges.

These redeterminations exclude four charges associated with water service other than the Delta Water Charge and the Transportation Charge. The excluded charges (and the manner in which they are treated in this appendix) are outlined below.

(1) Advances of funds pursuant to Article 24(d) of the standard provisions for excess capacity constructed by the State at the request of contractors.
(2) Advances of funds pursuant to Article 10(d) of the standard provisions for delivery structures (turnouts) constructed by the State at the request of contractors. Partial information concerning actual and projected capital costs of such delivery structures is included in this appendix. Statements concerning these costs and data are furnished to the appropriate contractors at various times and are not part of the annual statements.
(3) Payments for sale and service of surplus water to entities other than contractors, pursuant to Article 21 of the standard provisions, are also excluded. Those payments are generally based on the unit rates shown in Table B-25. Net revenues resulting from noncontractor service are applied as indicated on page 24 of Bulletin 132-71.
(4) Payments under the Devil Canyon-Castaic contract for costs of the Devil Canyon-Castaic facilities allocable to power generation. Charges billed as a result of the contract are billed separately from those billed as a result of the water supply contract. Information about the treatment of such charges in relation to redetermined Transportation Charges is included in special attachments to the bills of the six participating contractors.

Time and method of payment for corresponding components of the Delta Water Charge and the Transportation Charge are as follows:

(1) The capital cost components of the Delta Water Charge and the

Transportation Charge are paid in two semiannual installments, due January 1 and July 1 of each year, based on statements furnished by the State on or before July 1 of the preceding year.

(2) The minimum OMP&R components of the Delta Water Charge and the Transportation Charge are paid in 12 equal installments due the first of each month and based on statements furnished by the State on or before July 1 of the preceding year.

(3) The variable OMP&R component of the Transportation Charge is paid in varying monthly amounts and is due the fifteenth day of the second month following actual water delivery. The charges are projected based on a unit charge per acre-foot established on or before July 1 of the preceding year. Those unit charges may be revised during the year to reflect current power costs and revenues. The unit charges are applied to actual monthly delivery quantities as determined by the State on or before the fifteenth day of the month following actual water delivery.

# Bases for Allocating Reimbursable Costs among Contractors

This section describes procedures for allocating reimbursable costs of Project Transportation Facilities among contractors (see upper right portion of Figure B-1). Those costs do not include annual costs of Off-Aqueduct Power Facilities, which are explained in the "Project Water Charges" section.

## Capital and Minimum OMP&R Costs

*Figure B-4* includes information about the repayment reaches that form the basis for allocating reimbursable costs of the Project Transportation Facilities among contractors. Allocations of reimbursable capital costs and minimum OMP&R costs of each reach are based on the proportionate maximum use of that reach by respective contractors under planned conditions of full development.

The derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors was first reported in Bulletin 132-70. The ratios in Bulletin 132-70 were subsequently revised for the North Bay Aqueduct, the South Bay Aqueduct, the California Aqueduct from the Delta to Castaic Lake, and the Coastal Branch.

All the revisions reported in previous bulletins regarding the derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors were last reported in Tables B-1 and B-2 of Bulletin 132-91. Under Article 53 of the Monterey Amendment, agricultural contractors may sell up to 130,000 acre-feet of aqueduct capacity to municipal and industrial contractors. The first permanent transfer occurred in 1998. Currently, 114,000 acre-feet of the allowable capacity has been transferred. *Table 1* shows the permanent capacity transfers that have taken place since the Monterey Amendment was implemented in 1995.

*Table B-1* presents the reach ratios currently applicable to reimbursable capital costs. These reach ratios do not reflect the permanent capacity transfers.

*Table B-2* presents corresponding ratios for allocating 2016 and after reimbursable minimum OMP&R costs among contractors. Requested excess capacity is omitted when deriving ratios applicable to capital costs because the capital costs for the excess capacity are paid on an incremental-cost basis and not a proportionate-use basis. However, requested excess capacity is accounted for in the ratios applicable to minimum OMP&R costs.

| 29J | Pyramid Lake through Castaic Powerplant |
| 30 | Castaic Dam and Lake |

## Variable OMP&R Costs

Article 26(a) includes provisions to ensure that the variable OMP&R component of the Transportation Charge will result in a return to the State of those costs that depend on and vary with the amount of SWP water deliveries. (The minimum OMP&R component results in a return of those operating costs that do not vary with deliveries.) Under Article 26(a) all such costs for a reach for a given year will be allocated among contractors in proportion to the actual annual use of that reach by the respective contractors.

*Table B-3* summarizes the total power costs, credits, and transmission costs for each aqueduct pumping and power recovery plant. Variable costs are the following:

- Costs of capacity and energy used exclusive of associated power transmission and station service charges (transmission and station service costs that are independent and vary with power usage are classified as minimum OMP&R costs).
- Credits for capacity and energy produced at aqueduct power recovery plants (treated as negative costs).
- Payments for replacement of major plant machinery components having economic lives shorter than the project repayment period. (In 1997, DWR discontinued charging for a sinking fund for replacements. Replacement costs, for 1999 and thereafter, are to be paid on an annual basis as the costs are incurred.)
- Beginning in 2005, a portion of transmission expenditures that will depend on and vary with water and power usage. These costs will be included as part of the variable component.

Table B-3 excludes plant capacity and energy costs associated with surplus and unscheduled water service after May 1, 1973. Prior to that date, surplus water service was charged the same unit variable OMP&R component as allocated water service. An amendment to the water supply contracts in 1973 significantly changed the rate structure for surplus water service. Capacity and energy costs for pumping surplus and unscheduled water were allocated directly to those SWP contractors receiving surplus and unscheduled water service. A contract amendment in 1991 again revised the rate structure to provide for payment of costs through a melded power rate. These revisions to charges for surplus and unscheduled water are effective from the date of the amendments and are not applied to past charges.

An interruptible water program was established in 1994. This program, later renamed as the Article 21 program, is based on individual annual contracts; costs for Article 21 water actually delivered are included in Table B-3.

## Water Conveyance

Tables B-4, B-5A, B-5A-Adj, B-5B, and B-6 present water conveyance quantities that form the basis for allocating costs.

*Table B-4* presents the schedules of annual allocations as set forth in Table A and Article 6(a) of each water supply contract.

*Table B-5A* shows amounts of actual and projected allocated water quantities delivered from each aqueduct reach to each contractor. Projected deliveries for years 2016 through 2035 are based on contractors' requests for future water deliveries. The quantities included in Table B-5A also include nonproject water delivered to contractors, surplus water deliveries prior to May 1, 1973, and actual Article 21 water deliveries in 1994 and thereafter.

**Table 1 Summary of Permanent Aqueduct Capacity Transfers**

| Contractor | | Capacity Transfer | | |
|---|---|---|---|---|
| Seller | Buyer | Amount (acre-feet) | Effective Year | Transfer Description |
| **Transfers under Monterey Amendment** | | | | |
| Kern | Mojave | 25,000 | 1998 | Purchased capacity upstream of Reach 31A |
| Kern | Castaic Lake | 41,000 | 2000 | Purchased capacity upstream of Reach 16A |
| Kern | Palmdale | 4,000 | 2000 | Purchased capacity upstream of Reach 11B |
| Kern | Alameda-Zone 7 | 7,000 | 2000 | Purchased capacity upstream of Reach 10A |
| Kern | Alameda-Zone 7 | 15,000 | 2000 | Purchased capacity upstream of Reach 10A |
| Kern | Alameda-Zone 7 | 10,000 | 2001 | Purchased capacity upstream of Reach 11B |
| Kern | Solano | 5,756 | 2001 | Purchased capacity upstream of Reach 11B and Reach 31A |
| Kern | Napa | 4,025 | 2001 | Purchased capacity upstream of Reach 11B and Reach 31A |
| Kern | Alameda-Zone 7 | 2,219 | 2004 | Purchased capacity upstream of Reach 11B |
| *Subtotal under Article 53* | | *114,000* | | |
| **Transfers outside of Monterey Amendment** | | | | |
| Tulare | Dudley Ridge | 3,973 | 2002 | Purchased capacity upstream of Reach 8D |
| Tulare | AVEK | 3,000 | 2002 | Purchased capacity upstream of Reach 8D |

| *Subtotal outside of Article 53* | | *159,022* | | |

*Table B-5A-Adj* presents a summary of accounting adjustments that result from water deliveries not originating from the Sacramento-San Joaquin Delta. The methodologies used to calculate various components are based on cumulative charges from the Delta through facilities conveying water to a specific repayment reach. When water is introduced to the SWP downstream of the Delta, contractors require an adjustment, or credit, for those facilities not used to convey the water.

*Table B-5B* presents a summary of actual and projected annual allocated water quantities for each contractor. The quantities also include amounts of nonproject water and surplus water delivered prior to May 1, 1973, and actual deliveries of Article 21 water in 1994 and thereafter.

*Table B-6* summarizes the annual allocated water quantities conveyed or to be conveyed through each aqueduct pumping plant or power plant for each of the following functions:

- *Deliveries–Water Supply.* Water made available to contractors at down-aqueduct delivery structures, including certain hypothetical quantities to facilitate cost allocations, for those years when deliveries are made from net annual storage withdrawals. The net annual amounts of storage withdrawals are hypothetically added to the actual amounts conveyed from the Delta to the reservoirs, since deliveries made from storage withdrawals bear the same variable OMP&R costs per acre-foot as they would if the deliveries were actually conveyed from the Delta in that year. The hypothetical increases in the deliveries made from reservoir storage withdrawals are offset by equal credits to the minimum OMP&R costs of the respective reservoirs. Thus, the variable OMP&R components per acre-foot (Table B-17) may be applied to the total annual quantities delivered either from aqueduct reservoir storage or from the Delta.
- *Initial Fill Water.* Water required for initial filling of down-aqueduct reaches and reservoirs or for repayment of pre-consolidation water used during construction.
- *Deliveries–Recreation.* Water delivered to down-aqueduct recreation developments or used for fish and wildlife enhancement.
- *Operational Losses.* Water lost through evaporation and seepage from all down-aqueduct reaches.
- *Reservoir Storage Changes.* Water placed in down-aqueduct reservoir storage after initial filling of the reservoirs, including projected net annual storage accretions (positive values) and withdrawals (negative values) for all down-aqueduct reservoirs of the Project Transportation Facilities.

Variable OMP&R costs (Table B-12) that are allocable to storage accretions are assigned to the minimum OMP&R costs of the respective reservoirs. With the exception of Banks Pumping Plant, "Reservoir Storage Changes" also includes SWP water placed into Southern California groundwater storage from 1978 through 1982 (as positive amounts); and water withdrawn from storage and delivered to contractors in 1979, 1982, 1987, 1988, and 1989 (as negative amounts). At Banks Pumping Plant, groundwater additions and withdrawals are included in "Conservation Water."

Table B-6 also summarizes the following two amounts under the heading *Conservation Water* (Column 25):

(1) Net annual water amounts stored and projected to be stored in San Luis Reservoir.
(2) Water lost and projected to be lost through evaporation and seepage from San Luis Reservoir and from the water conservation portion of the California Aqueduct.

"Conservation Water" includes initial fill water, operational losses, and net annual storage changes associated with San Luis Reservoir and the portion of the California Aqueduct that is allocated to conservation. The same allocation procedure outlined previously for Transportation Facilities also applies to water delivered from storage in Conservation Facilities, except that the hypothetical cost increases are added to the variable OMP&R cost to be reimbursed through the Transportation Charge and deducted from the minimum OMP&R costs to be reimbursed through the Delta Water Charge.

San Luis Reservoir is operated to conserve water for future delivery to downstream

contractors. To account for costs associated with reservoir storage, the power and replacement costs of Banks Pumping Plant (a joint Transportation-Conservation Facility) that are allocated to the conveyance of annual conservation water quantities are transferred to the capital costs of San Luis Reservoir (during initial fill) or to the minimum OMP&R costs of San Luis Reservoir (following initial fill).

In years of net storage withdrawal from San Luis Reservoir, a portion of the minimum OMP&R cost of the reservoir is transferred to the variable OMP&R cost of Banks Pumping Plant. That transfer is equal to the variable OMP&R cost per acre-foot of delivery through Banks Pumping Plant for that year, multiplied by the acre-feet of deliveries derived from San Luis Reservoir storage for that year. Table B-6 also includes amounts of nonproject water and surplus water delivered prior to May 1, 1973, and actual deliveries of Article 21 water in 1994 and thereafter.

## Bases for Reimbursable Costs

This section describes the methods used to derive the costs allocated by the procedures outlined in the preceding section. A diagram of the cost derivation process is shown in the upper-left quadrant of Figure B-1.

First, the capital and minimum OMP&R costs of all SWP facilities are allocated among the various project purposes in accordance with the allocation percentages in *Table 2*. Those percentages may be subject to revision in the future.

The redeterminations in this appendix involve only the SWP costs that are allocated to water supply and power generation.

### Capital Costs

Capital costs used in the redeterminations in this appendix reflect prices prevailing on December 31, 2015; future cost escalation will be reflected in subsequent bulletins.

*Table B-7* presents a reconciliation of estimated total capital costs of each Project Conservation Facility and each Project Transportation Facility. This table shows the relationship of Project Conservation and Transportation costs allocated to contractors (Tables B-8, B-9, B-10, and B-13) to the total SWP capital costs projected by DWR.

*Table B-8* shows costs incurred and projected to be incurred by the State in connection with each contractor's turnouts. Costs incurred by the State for both State-constructed and contractor-constructed delivery structures are paid directly by the contractors for which the structures are built. The State incurs design review and construction inspection costs in connection with contractor-constructed turnouts.

*Table B-9* lists costs and payments for excess capacity built into SWP Transportation Facilities in accordance with amendments to contracts with The Metropolitan Water District of Southern California (Metropolitan), San Gabriel Valley Municipal Water District, and Antelope Valley-East Kern Water Agency, including the following:

- additional costs incurred by the State for requested excess capacity;
- advances by SWP contractors of funds for such costs; and
- credits for advances in excess of costs which were applied to respective contractors' installments of the capital cost component of the Transportation Charge in 1981.

Under Amendment 2 of Metropolitan's contract, 809 cubic feet per second of excess capacity was originally constructed in reaches of the West Branch at Metropolitan's request. That capacity was reclassified as basic capacity of SWP Transportation

**Table 2 Project Purpose Cost Allocation Factors (percentages)[a]**

| PROJECT FACILITIES | Water Supply and Power Generation | | All Other Purposes (Nonreimbursable) | |
|---|---|---|---|---|
| | Capital Costs | Minimum OMP&R Costs | Capital Costs | Minimum OMP&R Costs |
| **Project Conservation Facilities** | | | | |
| Frenchman Dam and Lake | 21.5 | 0.0 | 78.5 | 100.0 |

| Castaic Dam and Lake[e,f] | 94.3 / 91.1 | 96.9 / 91.1 | 5.7 / 8.9 | 3.1 / 8.9 |
| Silverwood Dam and Lake[e,f] | 94.3 / 85.3 | 96.9 / 85.3 | 5.7 / 14.7 | 3.1 / 14.7 |
| Perris Dam and Lake[e,f] | 94.3 / 67.7 | 96.9 / 67.7 | 5.7 / 32.3 | 3.1 / 32.3 |
| Coastal Branch | 100.0 | 100.0 | 0.0 | 0.0 |

[a] Percentages indicated apply to the majority of the facilities with minor exceptions.
[b] Percentages indicated are applicable to the remaining costs of division after excluding costs allocated to flood control that are reimbursed by the federal government (22 percent of capital costs) and excluding specific power costs of Hyatt and Thermalito powerplants and switchyards.
[c] Percentage indicated consists of 48.0 percent of costs allocated to recreation and 26.8 percent to flood control.
[d] Percentage indicated consists of 44.9 percent of costs allocated to recreation and 33.1 percent to flood control.
[e] Percentage indicated is used for 2012 and previous years.
[f] Percentage indicated is used for 2013 and forward.

Facilities under Amendment 7. Metropolitan paid $16.3 million as a prepayment of the capital cost component of the Transportation Charge in lieu of advancing funds for the original requested capacity.

Amendment 5 to Metropolitan's contract requires that additional costs for modifications to the Santa Ana Pipeline (required for enlargement of Lake Perris) will be allocated to Metropolitan and returned to the State through payments of the Transportation Charge. The additional costs to be repaid through Metropolitan's capital cost component for the aqueduct reach from Devil Canyon Powerplant to Barton Road total about $6.7 million (see Bulletin 132-72, page 98).

*Table B-10* presents the actual and projected annual capital costs of each aqueduct reach that will eventually be returned to the

State, with interest, through contractors' payments of the capital cost component of the Transportation Charge and payment of debt service under the Devil Canyon-Castaic contracts.

## Annual Operating Costs

Annual operating costs allocable to water supply and power generation are returned to the State through the minimum OMP&R components of the Delta Water Charge and the Transportation Charge and through a portion of the revenues from energy sales. All reimbursable operating costs of Conservation Facilities are included in the minimum OMP&R component of the Delta Water Charge.

## Transportation and Devil Canyon-Castaic Contract Costs

*Table B-11* shows the amounts of the actual and projected costs to be reimbursed through payments of the minimum OMP&R component of the Transportation Charge and allocated operating costs under the Devil Canyon-Castaic contract. The table includes the following seven types of operating costs incurred annually that do not vary with water quantities delivered to the contractors:

(1) all direct labor charges for field operation and maintenance personnel, including associated indirect costs;
(2) a distributed share of general operating costs that cannot be identified solely with one facility or aqueduct reach;
(3) all of electric power transmission and station service costs up to 2004, and electric power transmission and station service costs for 2005 and after that do not vary with power usage allocable to aqueduct pumping and recovery plants;
(4) all costs for equipment, materials, and supplies;
(5) portions of the power and replacement costs of all pumping plants and power plants that are up-aqueduct from Devil Canyon Powerplant and Castaic Powerplant and that are allocable to the annual conveyance of water lost to evaporation and seepage from respective aqueduct reaches or placed into storage in respective reservoirs of the project transportation facilities (after initial fill);
(6) credits, which offset those costs in (5) above, for deliveries drawn from reservoir storage; and
(7) escalation of certain projected operating costs at 1 percent per year for 2019–2035.

*Table B-12* shows the portions of variable OMP&R costs in Table B-3 that are allocable to the water supply delivery quantities included in Table B-6 and reimbursed through payments of the variable OMP&R component of the Transportation Charge.

To derive Table B-12 costs, the following adjustments are made to Table B-3 costs.

(1) Part of the variable OMP&R costs of each plant is allocated to recreation. The allocation to recreation is in proportion to the quantity of water conveyed through each plant each year for delivery to on-shore recreational developments. That portion of variable plant costs attributable to the initial fill of aqueduct reaches is allocated to the joint capital costs of respective down-aqueduct reaches and reservoirs.
(2) That portion of costs attributable to evaporation and seepage is allocated to the joint minimum OMP&R costs of respective down-aqueduct reaches and reservoirs.
(3) Adjustments are made for additions or withdrawals from storage in aqueduct reservoirs. In years when water is added to storage in aqueduct reservoirs, the cost of conveying this water into storage is charged to the minimum OMP&R costs of the corresponding reservoir. In years when storage in aqueduct reservoirs is decreased for the purpose of making deliveries, a credit

is applied to the minimum OMP&R costs of the reservoir from which the storage is released. This credit is equal to the number of acre-feet of storage reduction times the variable OMP&R unit rate for the year the storage is released. The unit rate is equal to the variable OMP&R unit rate for the year the water is taken from storage.

(4) That portion of costs attributable to pumping water to replace evaporation and seepage losses and for additions or withdrawals from storage in San Luis Reservoir is charged to the minimum OMP&R component of the Delta Water Rate.

The remaining costs are allocated to transportation water supply and repaid by the contractors.

### Conservation Capital and Operating Costs

*Table B-13* is a summary of actual and projected capital and operating costs of the initial Project Conservation Facilities. These costs are reimbursed through payments by contractors under the Delta Water Charge, Oroville power sales, and Gianelli Pumping-Generating Plant credits. Table B-13 also shows credits applied to the reimbursable capital costs of the initial Project Conservation Facilities in accordance with negotiated settlements concerning incurred planning costs for the period from 1952 through 1978.

## Project Water Charges

This section describes the redetermination of past and projected components of the Transportation Charge for annual revision of Tables C through G of each water supply contract. This section also describes the derivation of the unit Delta Water Rates and the Water System Revenue Bond Surcharge.

A summary of equivalent unit charges for each acre-foot of allocated water service is also included for each contractor and each aqueduct reach. A diagram of all calculations may be found on the lower half of Figure B-1.

### Transportation Charges

The accumulation of allocated costs of each aqueduct reach to each contractor is the basis for the Transportation Charge components.

*Table B-14* summarizes each contractor's share of the capital costs of the aqueduct reaches presented in Table B-10. Those amounts are determined by applying proportionate-use ratios set forth in Table B-1 to the costs in Table B-10. The resulting allocated costs are set forth in Table C of the respective water supply contracts.

Prepayments of the capital cost component, required under Metropolitan's Amendment 7, are included as negative capital costs in Table B-14 and Table C of Metropolitan's Statement of Charges. Solano County Water Agency, Empire West Side Irrigation District, and Castaic Lake Water Agency also prepaid capital costs (see Table B-14 footnotes). Table B-14 includes costs of the East Branch Extension to provide water service to San Bernardino Valley Municipal Water District (San Bernardino) and San Gorgonio Pass Water Agency (San Gorgonio).

Both Table B-14 and Table C of the six contractors for project water service below Devil Canyon Powerplant and Castaic Powerplant include the capital costs reimbursable under the Devil Canyon-Castaic contract.

*Table B-15* summarizes capital cost components of the Transportation Charge for each contractor for each year of the project repayment period. By the year 2035, the capital cost components shown in

Table B-15 will recover the costs shown in Table B-14, with interest at the Project Interest Rate of 4.610 percent per annum and based on the amortization schedules included in *Table 3*.

Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table D of the water supply contracts. Costs of excess capacity are billed separately and are not included in Table B-15.

Table B-15 includes the debt service payments due from the six contractors down-aqueduct from Devil Canyon Powerplant and Castaic Powerplant, in accordance with terms of the Devil Canyon-Castaic contract.

*Table B-16A* summarizes the minimum OMP&R components of the Transportation Charge for each year of the project repayment period. Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table E of the respective water supply contracts.

The total amounts included in Table B-16A are determined by applying the proportionate-use ratios in Table B-2 to the reach costs in Table B-11.

Table B-16A excludes Off-Aqueduct Power Facility charges, which are included separately in Table B-16B. Both Table B-16A and Table E include the operating costs payable under the Devil Canyon-Castaic contract for the six contractors down-aqueduct from Devil Canyon Powerplant and Castaic Powerplant.

As part of operating agreements with DWR, Kern County Water Agency was billed from 1963 through 1987 for any additional operating costs caused by early installation of units in Las Perillas and Badger Hill pumping plants by Berrenda Mesa Water

**Table 3 Criteria for Amortizing Capital Costs of Transportation Facilities**

| Contractor | Year of Initial Payment[a] |
|---|---|
| Alameda County Flood Control and Water Conservation District, Zone 7 | 1963[b] |
| Alameda County Water District | 1963 |
| Antelope Valley-East Kern Water Agency | 1963 |
| Castaic Lake Water Agency | 1964 |
| City of Yuba City | [c] |
| Coachella Valley Water District | 1964 |
| County of Butte | [c] |
| County of Kings | 1968 |
| Crestline-Lake Arrowhead Water Agency | 1964 |
| Desert Water Agency | 1963[d] |
| Dudley Ridge Water District | 1968[e] |
| Empire West Side Irrigation District | 1968[e] |
| Kern County Water Agency | |
| Agricultural Use | 1968[e] |
| Municipal and Industrial Use | 1968[e] |
| Littlerock Creek Irrigation District | 1964 |
| The Metropolitan Water District of Southern California | 1963 |
| Mojave Water Agency | 1964 |
| Napa County Flood Control and Water Conservation District | 1966 |
| Oak Flat Water District | 1968 |
| Palmdale Water District | 1964 |
| Plumas County Flood Control and Water Conservation District | 1970 |
| San Bernadino Valley Municipal Water District | 1963 |
| San Gabriel Valley Municipal Water District | 1963[d] |
| San Gorgonio Pass Water Agency | 1963[d] |
| San Luis Obispo County Flood Control and Water Conservation District | 1964[f] |
| Santa Barbara County Flood Control and Water Conservation District | 1964 |
| Santa Clara Valley Water District | 1963 |
| Solano County Water Agency | 1973 |
| Tulare Lake Basin Water Storage District | 1968[e] |
| Ventura County Watershed Protection District | 1964 |

[a] Allocated capital costs of transportation facilities amortized in equal annual installments unless otherwise noted.
[b] Principal payments on each annual capital cost prior to 1971 delayed until calendar year 1972, except payments for 1963.
[c] For City of Yuba City and County of Butte, payments for Delta Water Charge only.
[d] Payment deferred for 1963 and added to 1964 payment with accrued interest.
[e] For Dudley Ridge Water District, Empire West Side Irrigation District, Kern County Water Agency (agricultural use), Oak Flat Water District, and Tulare Lake Basin Water Storage District, according to Article 45 of the contracts for supply of agricultural water, capital costs of transportation facilities allocated to agricultural water supply are amortized by using an equivalent unit rate per acre-foot applied to the annual allocations (Table B-4) through the project repayment period.
[f] For San Luis Obispo and Santa Barbara, all principal and interest payments for costs of the Coastal Stub were deferred until 1976.

Storage District (see Bulletin 132-71, page 7). Under those agreements, a portion of minimum OMP&R costs of Reach 31A were assigned directly to Kern, as shown in *Table 4*, with the remaining reach costs allocated by application of the proportionate-use ratios. DWR purchased the last unit, Unit No. 6, at Las Perillas and Badger Hill pumping plants in early 1997 to provide pumping capacity for deliveries to Coastal Area contractors, which began in 1997.

**Table 4 Minimum OMP&R Costs of Reach 31A Assigned Directly to Kern County Water Agency (in dollars)**

| Year | Direct Charges |
|---|---|
| 1969 | 46,511 |
| 1970 | 46,302 |
| 1971 | 140,074 |

| 1995 | 272,341 |
| 1996 | 322,123 |
| **Total** | **3,997,767** |

As a result of the Monterey Amendment, the costs related to this settlement are to be allocated among all SWP contractors in proportion to their maximum Table A amounts. As costs are incurred, related charges will be included in the contractors' annual Statements of Charges as part of the minimum. Between 2002 and 2010, the Monterey Amendment litigation costs recovered from SWP contractors were $15.8 million.

*Table B-16B* summarizes annual Off-Aqueduct Power Facility charges allocated to each water contractor, adjusted for prior overpayments or underpayments. Those charges are to repay all Off-Aqueduct Power costs, including bond service, deposits for reserves, operation and maintenance costs, fuel costs, taxes, and insurance.

Adopted October 1, 1979, the General Bond Resolution requires that sufficient revenues be collected each year to repay all of those costs. In addition, an amount totaling 25 percent of the annual bond service is collected each year to ensure that sufficient funds are available to cover all annual costs. Any revenues collected and not needed during the year are refunded to the contractors in the next year.

*Table 5* summarizes Off-Aqueduct Power Facility charges and credits related to deliveries for 2015. The ongoing Reid Gardner Powerplant closure costs related to the Reid Gardner Powerplant contract expiration in 2013 are tracked independently from annual Reid Gardner operating costs.

*Table 6* shows projected Off-Aqueduct Power Facility charges and an amount equal to 25 percent of annual bond service for 2016 through 2035. Defeasance of Off-Aqueduct Power facilities bonds occurred in June 2016, so no debt service charges are included in

**Table 5 Summary of 2015 Off-Aqueduct Power Facility Charges and Credits (in dollars)**

| | |
|---|---|
| **Charges by Item** | |
| Reid Gardner Powerplant | 1,630,586 |

| 2035 | 200,000 | - |

future years. Additionally, Reid Gardner, Unit 4 Powerplant remediation costs are projected for 2016, 2017, and 2018 and then only minor operating costs are projected post-2018.

Annual Off-Aqueduct Power Facility charges are allocated among contractors in proportion to the electrical energy required to pump allocated water for the year. The initial allocation for the Statements of Charges is based on estimates of energy to pump requested allocated water deliveries, based on a 60-percent allocation.

An interim adjustment in the allocation of Off-Aqueduct Power costs may be made in May of each year, based on updated cost estimates and April revisions in water delivery schedules. An additional adjustment is made the following year based on actual water deliveries and actual costs for the year.

The energy required to pump each contractor's water is calculated using the kilowatt-hour per acre-foot factors shown in *Table 7* for the pumping plants upstream from the delivery turnouts. The amounts shown include transmission losses.

*Table B-17* presents a summary of actual and projected total variable OMP&R costs for each acre-foot conveyed through each aqueduct pumping plant and power plant for each year of the project. Following are provisions for calculating the variable OMP&R component of the Transportation Charge:

- An annual charge per acre-foot of projected water deliveries to all contractors served from or through each reach is determined so the projected variable OMP&R costs to be incurred for each reach will be returned to the State.

**Table 7 Kilowatt-Hour per Acre-Foot Factors for Allocating Off-Aqueduct Power Facility Costs**

| | kWh per acre-foot[a] | |
|---|---|---|
| **Pumping Plant** | At Plant | Cumulative from Delta |
| Barker Slough | 223 | 223 |
| Cordelia-Benicia | 434 | 657 |
| Cordelia-Vallejo | 178 | 401 |
| Cordelia-Napa | 563 | 786 |
| Banks (Delta) | 296 | 296 |
| South Bay (including Del Valle) | 869 | 1,165 |
| Dos Amigos | 138 | 434 |
| Buena Vista | 242 | 676 |
| Teerink | 295 | 971 |

| Bluestone | 705 | 2,121 |
| Polonio Pass | 705 | 2,826 |

[a] Includes transmission losses.

- The total annual variable OMP&R component for any contractor for a given reach is obtained by multiplying the unit charge associated with that reach by the quantity of water actually delivered from or through the reach to the contractor.

The data summarized in Table B-17 are derived by dividing the costs shown in Table B-3 by the water quantities shown in Table B-6. However, certain costs included in Table B-3 for extra peaking service, which would otherwise constitute variable OMP&R costs, are assigned directly to contractors requesting this type of service (see Bulletin 132-71, page 21, and Water Service Contractors Council Memo No. 593, July 10, 1970). Those costs are excluded from the unit charges shown in Table B-17. Peaking charges based on additional capacity ceased in 1983. Since 1984, costs are based on power market energy rates. The amounts of extra peaking charges for additional power costs are shown in *Tables 8 and 9*.

Unit rates shown in Table B-17 constitute the rates for the pumping plants and power plants listed. The cumulative rates constitute the total rates, cumulative from the Sacramento-San Joaquin Delta, and are applicable to deliveries from or downstream of the pumping plants and power plants. Extra peaking service costs are excluded.

*Table B-18* shows the variable OMP&R components of the Transportation Charge for each contractor for each year of the project repayment period. Table B-18 is developed from the costs per acre-foot included in Table B-17 and the delivery quantities for each contractor from each reach as indicated in Table B-5A and Table B-5A-Adj, plus any costs for extra peaking service. Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table F of the respective water supply contracts.

*Table B-19* summarizes the annual Transportation Charges for each contractor (the sum of the corresponding amounts included in Tables B-15, B-16A, B-16B, and B-18). Those estimated payments, subsequently adjusted for prior overpayments or underpayments, are set forth in Table G of the respective water supply contracts.

In accordance with provisions of the Devil Canyon-Castaic contract, Table B-19 and Table G include amounts of debt service and operating cost payments due from the six contractors located down-aqueduct from Devil Canyon and Castaic powerplants.

## Delta Water Charges

*Table B-20A* presents the calculation of the Delta Water Rate for the initial Conservation Facilities applicable in 2017 in accordance with the amended Article 22(e) and 22(g) of all 29 water supply contracts. The Delta Water Rate was calculated at a Project Interest Rate of 4.610 percent, based on Conservation Facility costs shown in Table B-13. That Delta Water Rate is used to compute projected Delta Water Charges under Article 53(i) for the contractors who have executed the Monterey Amendment. Included in Table B-20A is the Delta Water Rate for the two contractors who have not executed the Monterey Amendment: Plumas County Flood Control and Water Conservation District and Empire West Side Irrigation District.

*Table B-20B* shows each component of the 2017 Delta Water Rate from Table B-20A.

*Table B-21* summarizes the annual Delta Water Charge for each contractor. The projected charges in Table B-21 are developed by multiplying the total rate per acre-foot, as shown in Table B-20A, by the amount of allocated water for each contractor, as shown in Table B-4.

The projected Delta Water Charges from 2016–2035 include the assumption of escalation of projected operating costs at 1.0 percent per year for 2019–2035.

## Water System Revenue Bond Surcharge

*Table B-22* summarizes the Water System Revenue Bond (WSRB) Surcharge to the Delta Water Charge and the transportation capital cost component for each contractor. The surcharge shown in Table B-22 includes the financing costs of the WSRB Surcharge, Series B through Series AT. This surcharge is levied according to an amendment to the water supply contracts, which was signed by all of the water supply contractors.

## Total Water Charges

*Table B-23* summarizes the total annual charges to each contractor (the sum of the Transportation Charge in Table B-19, the Delta Water Charge in Table B-21, and the WSRB Surcharge in Table B-22). The charges do not reflect past payments by contractors and are unadjusted for prior overpayments or underpayments.

## Equivalent Total Water Charges

*Table B-24* presents the Transportation Charge and Delta Water Charge in terms of the equivalent unit charge for each acre-foot of allocated water now projected for delivery to the respective contractors.

These equivalent charges would provide the same principal sum at the end of the project repayment period as annual payments to be made as part of the Delta Water Charge and Transportation Charge, plus interest at the Project Interest Rate, if applied to each acre-foot of allocated water delivered to date; all surplus water delivered prior to May 1, 1973; all Article 21 water deliveries in 1994 and thereafter; and all allocated water now projected to be delivered during the remainder of the project repayment period (Table B-5B).

The equivalent unit Delta Water Charges included in Table B-24 are greater than those presented in Table B-20A because current projections of allocated water service are less for most contractors than the amounts shown in Table A.

## Equivalent Water Costs by Reach

*Table B-25* presents a summary of the equivalent unit transportation cost of conveying allocated water through respective aqueduct reaches of the Project Transportation Facilities.

Those unit costs provide the basis of charges assessed for extra service (such

## Table 8 Extra Peaking Charges for Additional Power, by Pumping Plant (in dollars)

as delivery of allocations down-aqueduct from a contractor's turnout) and for wheeling service to entities other than the SWP contractors.

The cumulative unit conveyance costs indicated for reaches in Table B-25 do not necessarily equal the equivalent unit Transportation Charges to contractors served from such reaches. The unit charges in Table B-24 account for the rate of water demand buildup and cost allocation factors of the individual contractors; however, the unit costs included in Table B-25 reflect the effect of melding the respective buildups and allocation criteria of all contractors whose allocations are conveyed through a given reach. Table B-25 also includes surplus water delivered prior to May 1, 1973, and Article 21 water deliveries in 1994 and thereafter.

## East Branch Enlargement Charges

*Table B-26* reflects DWR's projection of annual capital costs of the East Branch Enlargement for each aqueduct reach. These projections will be redetermined in future bulletins to include the following:

- a reallocation of costs of constructing the present East Branch facilities between Alamo Powerplant and Silverwood Lake;
- a reallocation of costs of Silverwood Lake to reflect additional use as a result of East Branch Enlargement operation;
- a reallocation of costs of San Bernardino Tunnel to reflect redistribution of flow capacities necessary for the East Branch Enlargement facilities; and
- actual enlargement construction costs.

These costs will be recovered with interest from the seven Southern California SWP contractors participating in the enlargement, in accordance with their amended water supply contracts (see *Table 10*).

*Table B-27* lists the projected minimum OMP&R costs for each reach of the enlargement to be repaid by the seven East Branch Enlargement participating contractors. Currently, this table includes only minimum OMP&R costs attributable to the East Branch Enlargement. In accordance with Article 49(e)(1), the contractors participating in the East Branch Enlargement will also share in the remaining minimum OMP&R costs of the affected reaches, in accordance with a formula developed by DWR in consultation with the affected contractors.

*Table B-28* shows each participating contractor's share of the estimated capital costs of the East Branch Enlargement shown in Table B-26.

*Table B-29* shows the amounts of the annual capital cost components of the East Branch Enlargement Transportation Charge for each participating contractor. This component consists of each contractor's allocated share of debt service on bonds sold to finance the enlargement.

*Table B-30* shows the minimum OMP&R components of the East Branch Enlargement Transportation Charge for each participating contractor for each year of the project repayment period. The amounts shown in Table B-30 will recover the minimum OMP&R costs shown in Table B-27.

*Table B-31* shows the annual East Branch Enlargement Transportation charges for each participating contractor (the sum of the corresponding amounts included in Tables B-29 and B-30).

## East Branch Extension Charges

The East Branch Extension charges recover associated costs for East Branch Extension facilities beginning at Devil Canyon Powerplant Afterbay and extending to the terminus at Noble Creek in the vicinity of Beaumont, Riverside County. These costs, separated into 3 phases: Phase 1 Original, Phase 1 Improvements, and Phase 2, will be recovered from two contractors—San Bernardino and San Gorgonio—in

## Table 10 Determination of Factors for Distributing Capital and Minimum OMP&R Costs of East Branch Enlargement Facilities among Participating Contractors

| Reach Number | Description |
|---|---|
| 18A | Junction, West Branch, California Aqueduct through Alamo Powerplant |
| 19 | Alamo Powerplant to Fairmont |
| 20A | Fairmont through 70th Street West |
| 20B | 70th Street West to Palmdale |
| 21 | Palmdale to Littlerock Creek |
| 22A | Littlerock Creek to Pearblossom Pumping Plant |
| 22B | Pearblossom Pumping Plant to West Fork Mojave River |
| 23B | West Fork Mojave River to Silverwood Lake (excluding Mojave Siphon Powerplant facilities) |
| 23C | Mojave Siphon Powerplant facilities |
| 24 | Cedar Springs Dam and Silverwood Lake |
| 25 | Silverwood Lake to South Portal, San Bernardino Tunnel |
| 26A | South Portal, San Bernardino Tunnel through Devil Canyon Powerplant |
| 26B | Devil Canyon Powerplant Bypass |

**Share of Enlargement Capacity (cubic feet per second)**

# Short-term Agreements

DWR and the water supply contractors execute short-term agreements that affect the contractors' charges.

## Municipal Water Quality Investigations

DWR executed a 5-year agreement in 1997 with 16 municipal and industrial contractors, who agreed to pay for allocated shares of DWR's Municipal Water Quality Investigations costs. Additional amendments were executed in 2002, 2006, 2008, 2010, and 2014 to extend the program. The Municipal Water Quality Investigations charges under this agreement are included in the transportation minimum OMP&R components shown in Table B-16A.

## Feasibility Study

Nine contractors executed a short-term agreement (1997 and 1998) to participate in the feasibility study for the American Basin conjunctive-use program. Feasibility study costs are included in Table B-16A.

## Delta Programs

Contractors have agreed to participate in several Delta improvement programs that started in 2007 and that will possibly extend into the future.

The first agreement pertains to the Bay Delta Conservation Plan (BDCP) agreed to in the Memorandum of Agreement (MOA) for Supplemental Funding for Certain Ecosystem Actions and Support for Implementation of Near-Term Water Supply, Water Quality, Ecosystem, and Levee Actions. The BDCP comprises two elements: fishery costs and consultation costs. These costs were added to the contractors' transportation minimum component for bill years 2007 through 2012.

The second agreement pertains to the non-BDCP costs of the MOA, comprising the Delta Vision and pelagic organism decline research costs. These costs were added to the contractors' conservation minimum component for bill years 2007 and 2008.

The third set of agreements pertains to the Delta Habitat Conservation and Conveyance Program (DHCCP). The agreements are between DWR and 20 participating SWP contractors to provide 50 percent of the funding for the preliminary planning phase of an improved Delta water conveyance facility. (The remaining 50 percent is provided by the Bureau of Reclamation.) This program will assess potential habitat restoration and water conveyance options in the Delta. For bill years 2008 through 2011, nearly $70 million in charges associated with the DHCCP were billed directly to the 20 participating SWP contractors as a separate line item in the Statements of Charges and are not reflected in the tables in this appendix.

A fourth set of agreements pertains to both DHCCP and BDCP. For bill years 2012 and 2013, an Agreement for Supplemental Funding for the Costs of Environmental Analysis, Planning and Design of Delta Conservation Measures, Including Delta Conveyance Options, was executed in 2012 between DWR and 16 participating SWP contractors to provide 50 percent of the project funding. In 2012, $22 million was billed and in 2013, $28 million was billed directly to the 16 participating contractors as a separate line item in the Statements of Charges.

During 2013, SWP water supply contractors agreed to participate in the 2013 San Joaquin River Flow Augmentation Program. The costs of the $4 million program were recovered in the 2014 Statements of Charges.

## TABLE B-1 Factors for Distributing Reach Capital Costs Among Contractors[a]

[a] Starting with 2005, transmission costs that vary and depend on power usage are included, therefore recovered through the variable component.

[b] Power costs for the period 1968 through 1987 are for an interim facility.

[c] The costs of Del Valle Pumping Plant are combined with those of South Bay Pumping Plant to simplify the cost allocations.

## TABLE B-3 Power Costs and Credits, Transmission Costs and Annual Replacement Deposits for Each Aqueduct Pumping and Power Recovery Plant[a] (in dollars)

[a] Table A amounts for the South Bay Area were supplied by non-project water for the period June 1962 through November 1967. Actual delivery quantities of project water are shown for 1967.

[b] Napa's Table A quantities exclude amounts during the period 1968 through 1987 that were supplied by non-project water.

[d] 1988 advance allocation.

[e] In accordance with the exchange agreement between the noted agencies, Metropolitan assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert and Coachella for such costs from the Delta through Reach 22B. The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after, the exchange takes place in Reach 26A.

[e] In accordance with the exchange agreement between the noted agencies, Metropolitan assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert and Coachella for such costs from the Delta through Reach 22B. The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after, the exchange takes place in Reach 26A.

[f] Includes 1,650 acre-feet recaptured from groundwater storage in 1982, 10,000 acre-feet in 1987, and 8,749 acre-feet in 1988. This water was stored under DWR's Ground Water Demonstration Program.

[a] Miscellaneous project receipts that are applied for accounting purposes to reduce the capital costs of the particular facilities.
[b] These allowances are included for planning the future financial program, but not for determining current water charges.
[c] See Table B-8.
[d] See Table B-9.
[e] See Table B-13.
[f] See Table B-10. Mojave Division total reduced by $85,971,000 for costs included in "Small Hydro Power Generation Facilities" line.

[a] Approximate only, not to be construed as invoice amounts.

[b] Not a SWP water supply contractor.

[c] 2014 and the majority of 2015 costs were from proposed reverse flow program; to be split among Dudley Ridge, Kern, and four Kern member units.

[a] Overpayment or underpayment for each calendar year—column [1] minus column [2].

[b] Interest rates shown are annual rates. Interest is credited daily at applicable rates on funds deposited in the State's Surplus Money Investment Fund.

[c] Amounts shown are end-of-year balances. Interest on overpayments is credited at applicable Surplus Money Investment Fund interest rates shown in columns [4] and [5]. Interest on underpayments is charged at the 1980 Project Interest Rate of 4.584 percent.

[a] Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

[b] Costs for the period 1968 through 1987 are for an interim facility.

[c] The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedures.

[a] Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

[d] These values represent a proportionate allocation of the total variable OMP&R costs of pumping and recovery plants (Table B-3) associated with net annual withdrawals from storage for Project Transportation Facilities. The allocation is determined annually by applying the following ratio, calculated from the data shown in Table B-6: "Reservoir Storage Changes" (withdrawals, as a positive value) conveyed through each plant, divided by "Total" annual quantity conveyed through each plant, in acre-feet. The costs so determined are accumulated for all upstream plants for each year, for each respective reservoir.

## TABLE B-12 Variable OMP&R Costs to be Reimbursed through Variable OMP&R Component of Transportation Charge[a] (in dollars)

[a] Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

[d] These values represent a proportionate allocation of the total variable OMP&R costs of pumping and recovery plants (Table B-3) associated with net annual withdrawals from storage for Project Transportation Facilities. The allocation is determined annually by applying the following ratio, calculated from the data shown in Table B-6: "Reservoir Storage Changes" (withdrawals, as a positive value) conveyed through each plant, divided by "Total" annual quantity conveyed through each plant, in acre-feet. The costs so determined are accumulated for all upstream plants for each year, for each respective reservoir.

[a] Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

[d] These values represent a proportionate allocation of the total variable OMP&R costs of pumping and recovery plants (Table B-3) associated with net annual withdrawals from storage for Project Transportation Facilities. The allocation is determined annually by applying the following ratio, calculated from the data shown in Table B-6: "Reservoir Storage Changes" (withdrawals, as a positive value) conveyed through each plant, divided by "Total" annual quantity conveyed through each plant, in acre-feet. The costs so determined are accumulated for all upstream plants for each year, for each respective reservoir.

## TABLE B-13 Capital and Operating Costs of Project Conservation Facilities to be Reimbursed through Delta Water Charge (in dollars)

[a] Reimbursed through the capital cost component of the Delta Water Charge.

[b] Negotiated settlements as to the magnitude of SWP planning costs from 1952 through 1978.

[c] Reimbursed through the minimum OMP&R component of the Delta Water Charge. Credits for Gianelli power generation are reflected in these net costs.

[d] Revenues credited through the capital cost component of the Delta Water Charge.

[e] Revenues credited through the minimum OMP&R component of the Delta Water Charge.

[f] Under amendments of Articles 22(e) and 22(g), planning and pre-operating costs of additional Project Conservation Facilities incurred through the previous year reflected in the Delta Water Charge.

# Tables B-14 through B-31

Note: Where applicable, the projected data values shown in this appendix are shaded and the bill year data are in **bold** type.

## TABLE B-14 Capital Costs of Transportation Facilities Allocated to Each Contractor (in dollars)

| Calendar Year | NORTH BAY AREA | | | SOUTH BAY AREA | | | | CENTRAL COASTAL AREA | | |
|---|---|---|---|---|---|---|---|---|---|---|

Note: Allocated capital costs as a result of permanent water transfers under the Monterey Amendment are not reflected in this table.

[a] Costs from Table B-10 allocated to Solano County Water Agency are reduced herein by $2,102,700 in 1986 and $1,823,500 in 1987 under provisions of Amendment 10 to its water supply contract.

## TABLE B-14 Capital Costs of Transportation Facilities Allocated to Each Contractor (in dollars)

[a] Unadjusted for prior overpayments or underpayments of charges.

[b] Determined at the current Project Interest Rate of 4.610 percent per annum.

[c] Reflects the transfers of permanent aqueduct capacity among contractors.

## TABLE B-16A Minimum OMP&R Component of Transportation Charge for Each Contractor (in dollars)

[a] 1983 through 2015 charges are debt service only and do not include bond cover; 2016 charges and after include both debt service and bond cover.

[b] 2009 through 2017 charges include Reid Gardner separation costs that are allocated to contractors based on theoretical energy use over the facility service life, 1983–2013.

## TABLE B-16B Minimum OMP&R Component of Transportation Charge for Each Contractor for Off-Aqueduct Power Facilities[a,b] (in dollars)

[a] 1983 through 2015 charges are debt service only and do not include bond cover; 2016 charges and after include both debt service and bond cover.

[b] 2009 through 2017 charges include Reid Gardner separation costs that are allocated to contractors based on theoretical energy use over the facility service life, 1983–2013.

[c] Costs allocated to contractors in 1989 through 2002 are reduced by credits for Off-Aqueduct Power Facility costs allocated to the pumping of non-SWP water.

[a] For the period 1968 through 1987, rates are for an interim facility.

[b] The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedure.

## TABLE B-17 Unit Variable OMP&R Component of Transportation Charge (in dollars per acre-foot)

[a] Capital charges repaid through bond debt service prior to 2015 exclude bond cover; 2016 and after includes both bond debt service and bond cover.

## TABLE B-20A Calculation of Delta Water Rates

**Calculation in Accordance with Article 53(i) of the Monterey Amendment**
**(Values in millions of dollars [$] or millions of acre-feet [af] discounted to 2016 at 4.610 percent per annum)**

| Procedure | Capital Cost Component | | Minimum Operation, Maintenance, Power and Replacement Component[a] | | Total Delta Water Rate | |
|---|---|---|---|---|---|---|
| | [1] | | [2] | | [3] | |
| **Commencing in 2017** | | | | | | |
| Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Table A Amounts During the Project Repayment Period | $8,606.93[b] | 466.11 af | $7,723.93[c] | 466.11 af | $16,330.86 | 466.11 af |
| Less, Project Power Revenues to be Realized During the Project Repayment Period | ($4,267.49) | | ($3,926.98) | | ($8,194.47) | |
| Less, Delta Water Charges Paid and Project Water Table A Amounts, Prior to 2017 | ($3,229.25)[d] | (414.04) af | ($1,320.64) | (414.04) af | ($4,549.89) | (414.04) af |
| TOTAL | $1,110.19 | 52.07 af | $2,476.31 | 52.07 af | $3,586.50 | 52.07 af |
| Rate Applicable in 2017 | $21.32 per acre-foot | | $47.56 per acre-foot | | $68.88 per acre-foot | |

**Calculation Under Original Provisions, without the Monterey Amendment**
**(for Plumas and Empire)**

| Procedure | Capital Cost Component | | Minimum Operation, Maintenance, Power and Replacement Component[a] | | Total Delta Water Rate | |
|---|---|---|---|---|---|---|
| | [4] | | [5] | | [6] | |
| **Commencing in 2017** | | | | | | |
| Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Table A Amounts during the Project Repayment Period | $8,587.90[b] | 466.11 af | $7,690.03[c] | 466.11 af | $16,277.93 | 466.11 af |
| Less, Project Power Revenues to be Realized During the Project Repayment Period | ($4,267.49) | | ($3,926.98) | | ($8,194.47) | |
| Less, Delta Water Charges Paid and Project Water Table A Amounts, Prior to 2017 | ($3,229.25)[d] | (414.04) af | ($1,320.64) | (414.04) af | ($4,549.89) | (414.04) af |
| TOTAL | $1,091.15 | 52.07 af | $2,442.42 | 52.07 af | $3,533.57 | 52.07 af |
| Rate Applicable in 2017 | $20.95 per acre-foot | | $46.91 per acre-foot | | $67.86 per acre-foot | |

[a] Considering that all operating costs of Project Conservation Facilities will not vary with annual amounts of Project water delivered, and therefore are properly classified as "Minimum" OMP&R Costs. OMP&R costs exclude amounts for Conservation Replacement Accounting System.

[b] Including net credits of $4,850,000 for settlements as to the magnitude of Project Capital costs incurred prior to December 31, 1960, and net credits of $6,678,320 for settlement as to the magnitude of Project Capital costs incurred during the 1961 through 1978 period.

[c] Includes conservation power costs and credits at San Luis Reservoir.

[d] Applying all Delta Water Charges paid prior to 1970 to reimburse Capital costs (the charge was not divided into components until 1970).

**TABLE B-20B Delta Water Rates by Facility (in dollars per acre-foot)**

| Item | Capital Cost Component | Minimum Operation, Maintenance, Power and Replacement Component | Total Delta Water Rate |
|---|---|---|---|
| | [1] | [2] | [3] |
| **Initial Conservation Facilities** | | | |
| Oroville Division | | | |
| Water Supply and Power Costs[a] | 97.42 | 65.90 | 163.32 |
| Less, Oroville Power Revenues | -59.66 | -25.36 | -85.02 |
| *Subtotal* | *37.76* | *40.54* | *78.30* |
| Delta Facilities[b] | 31.70 | 50.83 | 82.53 |
| California Aqueduct portion | | | |
| Reach1 | 5.95 | 11.95 | 17.90 |
| Reach 2A | 3.41 | 1.43 | 4.83 |
| Reach 2B | 1.72 | 1.00 | 2.73 |
| Reach 3 | 1.21 | 0.52 | 1.73 |
| *Subtotal* | *12.29* | *14.90* | *27.19* |
| San Luis Facilities | 18.65 | 16.05 | 34.70 |
| Planning and Preoperating Costs through 2015 | 4.87 | 0.00 | 4.87 |
| 45,000 af Relinquished Costs | 0.37 | 0.65 | 1.02 |
| Less, Capital Cost Credits | -2.35 | 0.00 | -2.35 |
| Less, Delta Water Charges paid prior to 2017 | -81.95 | -75.42 | -157.37 |
| Rate Applicable in 2017 | 21.32 | 47.56 | 68.88 |

[a] Includes revenue received from non-SWP contractors.

[b] Includes: 1. Delta Facility planning costs; 2. Delta Studies costs; and 3. Suisun Marsh Facilities Costs.

## TABLE B-21 Total Delta Water Charge for Each Contractor (in dollars)

| Calendar Year | NORTH BAY AREA | | | SOUTH BAY AREA | | | | CENTRAL COASTAL AREA | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Napa | Solano | Total | Alameda-Zone 7 | Alameda County | Santa Clara | Total | San Luis | Santa Barbara | Total |

[a] Representative of transportation unit costs only; does not include a unit cost of conservation. The Delta Water Rate should be added to these values in order to approximate unit costs at canalside. Includes surplus water prior to May 1, 1973.

[b] Hypothetical charges which, if assessed on all Table A water delivered to date, all surplus water delivered prior to May 1, 1973, and all Table A water estimated to be delivered during the remainder of the project repayment period (Table B-5B), would provide a sum at the end of the period financially equivalent to all Transportation Charges required under the water supply contract considering interest rate at the Project Interest Rate of 4.610 percent per annum.

[c] The Water System Revenue Bond (WSRB) Surcharge equivalent unit rate is calculated by multiplying Column 1 by the ratio of the 2017 WSRB surcharge to the sum of the Transportation Capital and the Capital component of the Delta Water Charge.

**TABLE B-26 Capital Costs of Each Aqueduct Reach to be Reimbursed through the Capital Cost Component of the East Branch Enlargement Transportation Charge Phase 1 and Phase 2 (in dollars)**

[a] 1988 through 2015 charges are debt service only and do not include bond cover; 2016 charges and after include both debt service and bond cover.

[b] East Branch Enlargement Phase 2 debt service schedule starts in 2016, and this table is the sum of East Branch Enlargement Phase 1 and Phase 2 capital charges for each contractor.

[c] Under Article 49(d)(4)(A) of its contract, San Bernardino Valley Municipal Water District elected to pay a portion of its allocated costs of East Branch Enlargement in advance rather than to participate in payment of Water System Revenue Bonds. This election was made via a letter of agreement signed June 1, 1987. As of June 1999, $6,347,938 has been received from the San Bernardino Valley Municipal Water District.

| | thousand acre-feet (taf) | hectare-meters (ha - m)■ | 123.35 | 0.008107 |
| | million acre-feet (maf) | billion cubic meters ($m^3 \times 10^9$)◆ | 1.2335 | 0.8107 |
| | million acre-feet (maf) | cubic kilometers ($km^3$) | 1.2335 | 0.8107 |
| Flow | cubic feet per second ($ft^3/s$) | cubic meters per second ($m^3/s$) | 0.028317 | 35.315 |
| | gallons per minute (gal/min) | liters per minute (L/min) | 3.7854 | 0.26417 |
| | gallons per day (gal/day) | liters per day (L/day) | 3.7854 | 0.26417 |
| | million gallons per day (mgd) | megaliters per day (ML/day) | 3.7854 | 0.26417 |
| | acre-feet per day (af/day) | thousand cubic meters per day ($m^3 \times 10^3$/day) | 1.2335 | 0.8107 |
| Mass | pounds (lb) | kilograms (kg) | 0.45359 | 2.2046 |
| | tons (short, 2,000 lb) | megagrams (Mg) | 0.90718 | 1.1023 |
| Velocity | feet per second (ft/s) | meters per second (m/s) | 0.3048 | 3.2808 |
| Power | horsepower (hp) | kilowatts (kW) | 0.746 | 1.3405 |
| Pressure | pounds per square inch (psi) | kilopascals (kPa) | 6.8948 | 0.14505 |
| | feet head of water | kilopascals (kPa) | 2.989 | 0.32456 |
| Specific capacity | gallons per minute per foot of drawdown | liters per minute per meter of drawdown | 12.419 | 0.08052 |
| Concentration | parts per million (ppm) | milligrams per liter (mg/L) | 1.0 | 1.0 |
| Electrical conductivity | micromhos per centimeter (µmhos/cm) | microsiemens per centimeter (µS/cm) | 1.0 | 1.0 |
| Temperature | degrees Fahrenheit (°F) | degrees Celsius (°C) | (°F - 32)/1.8 | (1.8 x °C) + 32 |

● When using "dual units," inches are normally converted to millimeters (rather than centimeters).

■ Not used often in metric countries, but is offered as a conceptual equivalent of customary western U.S. practice (a standard depth of water over a given area of land).

◆ ASTM Manual E380 discourages the use of billion cubic meters since that magnitude is represented by giga (a thousand million) in other countries. It is shown here for potential use for quantifying large reservoir volumes (similar to million acre-feet).

### OTHER COMMON CONVERSION FACTORS

1 cubic foot=7.48 gallons=62.4 pounds of water
1 cubic foot per second (cfs)=450 gallons per minute (gpm)
1 cfs=646,320 gallons per day=1.98 af a day
1 acre-foot=approximately 325,851 gallons=43,560 cubic feet
1 million gallons=3.07 acre-feet
1 million gallons per day (mgd)=1,120 af a year

Initial State Water Project Allocation Set at 15 Percent

SACRAMENTO – The Department of Water Resources (DWR) today announced an initial water allocation of 15 percent for most State Water Project (SWP) contractors for the 2018 calendar year. That allocation will likely change depending on rain and snowfall received this winter.

“It’s hard to know what mother nature will have in store for us this year, but it’s safe to say California is in a better place than we were during the recent drought,”said DWR Director Grant Davis. “Planning for the year and providing more accurate early estimates for water managers so they can better plan for the year is just one of the many reasons the state needs to improve our forecasting ability.”

percent of its 2.4 million AF capacity and 148 percent of its average for this date. Lake Oroville however, currently holds 59 percent of its historical average this time of year. Water was released beginning in spring to provide adequate flood protection during reconstruction of the main spillway.

Last year, the Department's initial allocation was 20 percent. By the end of Water Year 2017, allocations reached 85 percent due to the abundant rainfall during the year. During the recent drought, the initial allocation was as low as 5 percent in 2014.

Nearly all areas served by the SWP have sources of water other than the allocation, among them streams, groundwater, and local reservoirs. DWR is hopeful that today's SWP allocation, made before the wettest months, will increase as storms bring rain and snow to the state.

Historical December 1 Allocations:

2017: 20 percent

2016: 10 percent

2015: 10 percent

2014: 5 percent

2013: 30 percent

2012: 60 percent

2011: 25 percent

2010: 5 percent

2009: 15 percent

2008: 25 percent

2007: 60 percent

DWR's California Data Exchange Center website shows current water conditions at the state's largest reservoirs and weather stations.
