Demands on the District's water system can be impacted by changes in climate conditions. This is mostly due to shifts in outdoor water use patterns that result from wet or dry weather conditions. Demands can also be impacted by increased drought-messaging and calls for conservation, as has been experienced over the past two years during the Governor's emergency conservation regulations.

The District's 2005 UWMP established water demand patterns for single and multiple dry–year periods based on the most recent five years of production and rainfall data. It found that District customers increased their water use during dry years on average about 5 percent over normal years' usage levels. The District's 2010 UWMP, written at the end of a three-year drought, found that customers responded to significantly expanded customer communications and implementation of water waste restrictions with sizeable reductions in water use during these dry years.

The District is again writing its UWMP at (hopefully) the end of a three-year drought, and has found customers once again responsive to local, regional, and statewide calls for conservation by reducing their water use to historically low levels (see Section 4). Therefore, the District confirms that the minimal demand increases experienced in the past during dry years will be more than be offset by the increased awareness and responsiveness of District customers to the need to conserve, as experienced in the most recent dry-year period. For conservative planning purposes, the District's 2015 UWMP will not adjust customers' demands on its water supply for its dry-year reliability analyses.

### 5.3.2 Climate Change Impacts on Water Supply Reliability

Water resource managers have long strived to meet their goals of system reliability and environmental protection in the face of many uncertainties, including demographic and economic forecasts and intrinsic weather variability. Now water managers also face a new uncertainty—the potential for climate change, which in coming years may significantly affect patterns of water demand and the availability of supplies. However, information about the future impacts of climate change is deeply uncertain and likely to remain so for the foreseeable future.

In March 2016, IEUA published a draft regional Integrated Water Resources Plan (IRP), developed in partnership with its member agencies, which incorporates a comprehensive assessment of regional water supply vulnerabilities to climate change. The IRP identifies general climate change trends for California of increasing temperatures and shifts of precipitation from snow to rain. These trends will impact water supplies in two ways: higher temperatures will cause increased water demands; however, infrastructure to capture rain runoff is limited as water infrastructure in California was designed to capture slow melting snowpack, not rapid stormwater. In addition, droughts are expected to occur more frequently, more intensely, and last longer.

A set of 106 climate scenarios for the IEUA region were derived from downscaled general circulation model results used for the Intergovernmental Panel on Climate Change Assessment Reports 3 & 5. These data suggest that regional temperatures would likely increase between 0.5-3.5 degrees Fahrenheit by 2040. Precipitation was highly variable and showed no clear trend across the scenarios. Using this information, the IRP "stress tested" existing and potential regional water supplies and used the resulting analysis to identify future regional water supply needs and opportunities.

It should be noted that the IRP's analysis is regional and does not apply to individual member agencies such as the District. As stated earlier, the District's past investments in a diverse water supply portfolio provides it with a very reliable water supply. In the coming year, IEUA plans to conduct a "Phase 2" IRP analysis which disaggregates member agencies' water demands and future supply needs due to climate change and other factors.

## 5.4 RELIABILITY ANALYSES – NORMAL, SINGLE, MULTIPLE DRY YEARS

The following tables compare the District's current and projected water supplies and demands in normal, single dry-year and multiple dry-year scenarios for the District.

***Projections presented in Table 5-3 through Table 5-5 indicate the District can expect its available supplies to significantly exceed anticipated demands over the 25-year planning period. As a result of these surplus supplies, the District should not experience any problems in meetings its demands during normal, single, or multiple dry-year scenarios during the next 25 years.***

**Table 5-3:**
**Supply and Demand Comparison – Normal Year (AFY)**

| | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|

# SECTION 6
# WATER DEMAND MANAGEMENT

Monte Vista Water District is a regional leader in developing and implementing proactive demand management programs that protect existing water resources so that adequate water supplies will be available for sustainable future growth. Investments in reliable local resources have been critical to maintaining current and future water supplies. Equally critical is the promotion of water use efficiency as an integral component of current and future water strategy for the service area.

In 1991, the District became one of the first water agencies to sign the California Urban Water Conservation Council's *Memorandum of Understanding Regarding Urban Water Conservation*, accepting its obligation to implement a prescribed set of urban water conservation Best Management Practices (BMPs). The BMPs, which are equivalent to the demand management measures set forth in the Urban Water Management Planning Act, have been a key element in the District's conservation program strategy. The District has maintained its compliance with the BMPs, as demonstrated in its coverage reports included as Appendix M of this Plan.

In addition to the BMPs, the District is required to comply with the Water Conservation Act of 2009's requirements to set and then to meet its urban water use reduction targets of 188 GPCD by 2015 and 167 GPCD by 2020. Section 3.6.2 of this Plan describes how these targets are determined. As many of the District's conservation activities are implemented on a regional basis, the District is an active participant in a regional alliance coordinated by IEUA to achieve regional compliance with the Water Conservation Act of 2009. Both on an individual and regional basis, the District is currently exceeding its urban water use reduction targets.

In the following section, the District will describe its past, current, and future conservation efforts and demonstrate how the District plans to assist its customers in maintaining and enhancing their current water use efficiency practices.

## 6.1 LEGISLATIVE AND REGULATORY REQUIREMENTS

The strategies, programs, and regulations included in this section are designed to meet the following as well as any future statewide compliance requirements:

- CUWCC's BMPs
- Assembly Bill (AB) 1420 – Implementation of Demand Management Measures
- SB X7-7 – The Water Conservation Act of 2009, which requires urban water suppliers to achieve a 20 percent per capita reduction in urban water use by 2020

### 6.1.1 California Urban Water Conservation Council

The California Urban Water Conservation Council (CUWCC) is a voluntary state-wide organization of water agencies, public interest organizations, and private entities tasked with overseeing the BMP reporting process, implementing and revising the *Memorandum of Understanding Regarding Urban Water Conservation* (MOU), and generally promoting urban water use efficiency in California. Membership in CUWCC consists of three groups: Group 1: Urban Water Suppliers; Group 2: Public Advocacy Organizations; and Group 3: Other Interested Parties. Only Groups 1 and 2 have voting rights to alter MOU provisions, and both groups must agree to any alterations. The MOU was last amended in June 2010.

The District became a Group 1 member of CUWCC in 1991, when it was one of 120 water agencies and environmental groups to become charter signatories to the MOU. There are currently over 400 CUWCC members.[23]

In 2010, the District amended its signatory status to become a wholesale as well as a retail water agency signatory to the MOU.

#### *Best Management Practices*

As an MOU signatory, the District is obligated to make "good faith efforts" to meet coverage requirements for the BMPs for efficient urban water usage as set forth in the MOU. Every two years, water agencies that are signatories to the MOU are required to fill out and submit online BMP reports on conservation program activities as they relate to individual BMPs. The District submitted its latest reports for FYE 2013 and FYE 2014 in December 2015.

A BMP is defined by the MOU as a policy, program, practice, rule, regulation or ordinance or the use of devices, equipment or facilities which meets either of the following criteria:

- An established and generally accepted practice among water suppliers that results in more efficient use or conservation of water; or,

- A practice for which sufficient data are available from existing water conservation projects to indicate that significant conservation or conservation-related benefits can be achieved; that the practice is technically and economically reasonable and not environmentally or socially unacceptable; and that the practice is not otherwise unreasonable for most water suppliers to carry out.

The BMPs listed below are incorporated into the MOU:

[23] CUWCC website, www.cuwcc.org.

- BMP 1: Utility Operations
    - BMP 1.1: Conservation Coordinator
    - BMP 1.2: Water Waste Prevention
    - BMP 1.3: Wholesale Agency Assistance Programs
    - BMP 1.4: System Water Audits, Leak Detection and Repair
    - BMP 1.5: Metering with Commodity Rates For All New Connections and Retrofit of Existing Connections
- BMP 2: Education Programs
    - BMP 2.1: Public Information Programs
    - BMP 2.2: School Education
- BMP 3: Residential Programs
    - BMP 3.1: Residential Landscape Water Survey Program
    - BMP 3.2: Residential Leak Assistance Program
    - BMP 3.3: High Efficiency Clothes Washers
    - BMP 3.4: WaterSense Specification Toilets
- BMP 4: Commercial, Institutional, Industrial
- BMP 5: Landscape

BMPs 1 and 2 are considered "Foundational" because they are essential water conservation activities and are adopted for implementation by all signatories to the MOU as ongoing practices with no time limits. The remaining BMPs are considered "Programmatic" and provide minimal levels of activity in order to achieve coverage. Coverage requirements for the current BMPs are meant to achieve conservation-related activity and water savings goals over a ten-year period ending in 2018.

Compliance with the Programmatic BMPs can be accomplished in one of three ways:

1. Accomplishing the specific BMP measures;
2. Accomplish a set of alternative measures which achieves equal or greater water savings, referred to in the MOU as the Flex Track Menu; or
3. Accomplish a GPCD water savings goal.

The latter option is similar but not identical to the GPCD target required in the Water Conservation Act of 2009.

A water agency may also achieve coverage for an individual BMP by doing one of the following:

- File for an exemption from the BMP based on "good faith" efforts, lack of cost-effectiveness, inadequate funds, or lack of legal authority to implement the BMP; or,

- Provide evidence that the agency has implemented an "at least as effective as" conservation activity that would provide equal water savings to implementing the BMP.

Retail agencies are required to achieve coverage for all the BMPs except BMP 1.3. Wholesale agencies are required to achieve coverage for all the Foundational BMPs except BMPs 1.2 and 1.5. Coverage reports are issued by CUWCC upon submittal of annual reports by its Group 1 members. The District's coverage reports for 2013 and 2014 are incorporated as Appendix M.

### 6.1.2 Assembly Bill 1420

Under AB 1420 (2007), effective January 1, 2009, the terms of, and eligibility for, a water management grant or loan made to an urban water supplier and awarded or administered by DWR and the State Board shall be conditioned on the implementation of the Demand Management Measures (DMMs) incorporated into the Urban Water Management Planning Act. Under State Law, achieving compliance under the CUWCC's BMPs is equivalent to implementing the DMMs.

DWR must consider whether an agency is implementing or has scheduled to implement the DMM activities that an agency has identified in its UWMP in evaluating applications for grants and loans financed by specified bond funds. This requirement sunsets on July 1, 2016.

### 6.1.3 The Water Conservation Act of 2009

Enacted in November 2009 as part of an historic package of bills concerning California water management, SBX 7-7 establishes a statewide urban per capita water use reduction of 20 percent by 2020. This initiative applies to all urban retail water suppliers serving a minimum of 3,000 customers or supplying 3,000 AFY or more. Urban retail water suppliers were required to establish a baseline GPCD and report it in their 2010 UWMPs by July 1, 2011.

Beginning in 2010, an urban retail water supplier must establish a baseline and continue to implement required DMMs under AB 1420. On July 1, 2016, compliance with SBX 7-7 will replace compliance with AB 1420 as a condition eligibility of all state water management grants and loans. Awarding of state grants and loans will then be contingent on meeting or exceeding the 20 percent water use reduction target by 2020. An interim reduction target of 10 percent must also be met by December 31, 2015, as certified in each urban agency's 2015 UWMP.

For baseline criteria and establishment of the District compliance's with this legislation, see Section 3.6.1; for District compliance with its 2015 Interim Urban Water Use Target, see Section 3.6.3.

### 6.1.4 Assembly Bill 1881

AB 1881 (Laird 2006), the Water Conservation in Landscaping Act, requires statewide land use agencies to update and adopt local landscaping ordinances by January 1, 2010. The adopted landscaping ordinances must be "at least as effective as" the State Model Water Efficient Landscape Ordinance (MWELO) developed by DWR. In 2015, Governor Brown issued an executive order (B-29-15) requiring significant changes to the MWELO.

Key elements in the updated MWELO include: applying a water budget approach to large new and redeveloped landscapes which require a permit, reducing the ETo adjustment factor used in the calculation of a landscape's budget, increasing the public's awareness of the importance of water use efficiency in landscaping, requiring "smart" (e.g., weather-based) irrigation controllers, and adopting and enforcing statewide prohibitions on overspray and runoff.

The District is not a land use agency and is not required to implement AB 1881. However, the District was directly engaged with its local land use agencies in the process of developing a model landscape ordinance for the Chino Basin region through the Inland Empire Landscape Alliance, convened by IEUA. The District also assisted the City of Montclair in adapting the regional ordinance for adoption into the City Code. The District will continue to work with the City and its other land use agencies in updating and implementing their ordinances for applicable new and rehabilitated developments.

## 6.2 DEMAND MANAGEMENT MEASURE IMPLEMENTATION

As mentioned earlier, the District has maintained its compliance with the BMPs, as demonstrated in its most recent 2013-2014 coverage reports included as Appendix M of this Plan. According to Section 10631(i) of the Urban Water Management Planning Act, submission of CUWCC BMP coverage reports meets the Act's requirement to describe the water supplier's DMM implementation process.

The District has chosen the GPCD compliance option for achieving all of the Programmatic BMP water savings goals. The method of determining GPCD compliance under the MOU differs slightly from that of the Water Conservation Act of 2009, but not enough to be consequential to the District's plans to maintain compliance under both requirements.

## 6.3 DEMAND MANAGEMENT PLANNING

The following is a general description of the District's demand management strategies to maintain compliance with the Water Conservation Act of 2009 and with the DMMs/BMPs under the GPCD compliance option.

### 6.3.1 Regional Conservation Programs

A significant portion of the District's water conservation efforts are conducted through regional programs. The District, through IEUA, has access to MWD's extensive array of conservation programs. In addition, the District is a member of two major regional conservation groups: IEUA's Regional Conservation Workgroup, which facilitates and supplements MWD programs in the IEUA service area; and the Water Education Water Awareness Committee (WEWAC), which manages a number of regional water education and public information programs. The District also has a strong working relationship with CBWCD, which provides conservation and education programs for District customers.

#### *MWD's Regional Conservation Programs*

MWD currently provides financial support for local water projects and water conservation projects implemented by its member agencies that contribute to an increase in the reliable regional water supplies available to the region. The District participates in many MWD regional programs through its MWD member agency, IEUA, as described below.

#### *IEUA's Regional Conservation Workgroup*

IEUA coordinates a comprehensive regional conservation program through its Regional Conservation Workgroup. The Workgroup, comprised of representatives from each of IEUA's eight member retail agencies, advises IEUA on the implementation of conservation and education programs funded through a per-AF surcharge on imported water purchased by the member agencies from IEUA. The program also receives funds through retail meter revenues collected by IEUA. These funds are used to leverage additional funding from MWD, DWR, and the U.S. Bureau of Reclamation, resulting in an annual conservation budget which is consistently over $1 million.[24] The District actively works through the Regional Conservation Workgroup to advocate for conservation and education programs that will be of direct benefit to District customers.

[24] In FYE 2017 IEUA will change this funding structure to a fixed member agency meter equivalent unit charge.

From FYE 2011 through 2015, the IEUA region has achieved 3,630 AF in annual savings and 34,610 AF in lifetime savings, and the District has achieved 169 AF in annual savings and 1,713 AF in lifetime savings from IEUA's regional conservation programs over the same time period.[25] The programs are described below. For District device/rebate numbers and savings by program, please see Appendix N.

- **MWD's SoCal Water$mart Rebate Program**: See above. The Workgroup often supplements MWD's rebate amounts with local funds to increase regional participation in the program.

- **Residential Landscape Transformation Program**: Provides contractor services to replace 500-1,000 square feet of turf with water efficient landscaping. Participants provided nominal co-pay of $0.30 per square foot.

- **Regional Residential Large Landscape Retrofit Program**: Provides outdoor irrigation evaluations and retrofits of landscape devices for ¼-acre and larger sites.

- **FreeSprinklerNozzles.com Voucher Program**: Provides voucher for free high efficiency irrigation spray nozzles through a web-based portal.

- **Turf Rebate**: In FYE 2015, MWD committed an unprecedented $340 million to turf removal incentives for FYE 2015 and 2016.

In addition, IEUA provides the following additional agency support, conservation, and education programs to the District and its customers through the Workgroup process:

- **Regional Landscape Training Workshops**: Residential workshops on the basics of efficient irrigation systems, the benefits of properly watering and fertilizing landscaping, landscape design techniques and plant identification.

- **Water Saving Garden Friendly**: Public-private partnership with Home Depot to promote water efficient plants through decals, plant sales, and workshops.

- **Garden-In-Every School® Program**: Installs water wise gardens in elementary schools.

- **National Theatre for Children**: Live theatre, student curriculum and teacher guides for elementary schools.

- **Shows That Teach**: Educational and motivational school assembly programs that focus on water education.

[25] IEUA Annual Water Use Efficiency Programs Report, FY 2014-2015.

- **Water Discovery Field Trip Program**; Free school field trips to Chino Creek Wetlands and Educational Park to promote the public understanding of the value of natural treatment wetlands, the creation of habitat for endangered/sensitive species and environmental stewardship.

- **Water Conservation Outreach Campaign**: Conservation and drought outreach messaging via monthly ads in local newspaper and movie theaters.

- **BMP Support Grant**: An annual grant of $2,000 to each member agency for a BMP-related program or project.

- **Regional Water and Landscape Conservation Fair**: Held annually in October, the Fair is a community awareness partnering event with CBWCD, IEUA, and its member agencies created to educate the public on the importance of using water efficiently.

IEUA has just developed its third Regional Water Use Efficiency Business Plan to guide its water use efficiency programs through 2020. The plan focuses on assisting retail water agencies in developing budget-based tiered rate structures to incentivize efficient water use. The District developed its budget-based tiered rate structure in 2010 (see Section 6.3.2). Additional identified water use efficiency programs include:

- **Customer Engagement Software and Data Analytics**: Tools for water agencies to identify customers with excess water usage and communicate with customers on how their usage compares against accepted water use efficiency standards. Also offers customers the ability to track usage against a budget through web-based and mobile interfaces.

- **Regional Residential Small Landscape Retrofit Program**: Provides outdoor irrigation evaluations and retrofits of landscape devices for 500-square-foot and larger sites.

- **High Efficiency Nozzle Direct Installations**: Retrofitting pop-up spray heads with high efficiency nozzles. District began program independently in 2015 (see Section 6.3.2).

#### *Water Education Water Awareness Committee*

The Water Education Water Awareness Committee (WEWAC) is a voluntary consortium of 14 local water agencies formed to promote the efficient use of water and to increase public awareness of the importance of water in southern California. WEWAC was founded originally as the "West End Water Awareness Committee" by the District and other local water agencies in the west end of San Bernardino County in 1986 during a severe drought, and it has since grown to include agencies in Los Angeles County (hence the change in the organization's name).

WEWAC implements the following annual education and public outreach programs:

- **EduGrant Program** – Provides $600 grants to local educators for water-related classroom activities. District staff help organize the program and select grant recipients.

- **Project WET Workshops** – Free workshop to introduce local educators to the Project WET ("Water Education for Teachers") *Curriculum & Activity Guide*, a collection of field-tested, innovative, interdisciplinary, water-related lessons and activities aligned with the California Content Standards. The District pays substitute costs for the first five teachers from schools within its service area who register. District staff receive Project WET facilitator training and help organize and run the workshops.

- **Water Awareness Broadcast Media and Digital Art Contest** – Competition among local junior high and high school students to produce a broadcast media or digital art public communication focused on water conservation and awareness.

- **Water Scholar Program** – provides financial support to high school seniors planning to attend a two- or four year college in the following school year.

- **WEWAC Website** – The WEWAC website, www.UseWaterWisely.com, provides education resources in an attractive and engaging way. Includes signup for the monthly *Next Wave* email newsletter, a water quiz, links to other online resources, and information on WEWAC education programs.

- **Quakes Messaging** – Messages on how to use water efficiently posted on the video board during Rancho Cucamonga Quakes minor league baseball games.

As noted above, District staff are actively engaged in assisting in the implementation of WEWAC programs.

#### *Chino Basin Water Conservation District*

CBWCD was established in 1949 to protect and replenish the Chino Groundwater Basin with rainfall and storm water runoff from the San Gabriel Mountains. CBWCD uses an extensive system of percolation ponds and spreading grounds to augment the natural capacity of the region to capture runoff for the recharge of the groundwater basin. CBWCD also promotes water conservation through public education programs, water conservation services, and a newly completed Water Conservation Center – all provided free of charge to residents within its service area. Finally, CBWCD provides funding through its Public Sector Program for onsite retrofits of parks and school yards within its service area to use recycled water.

The District's retail service area lies fully within CBWCD's service area, providing District customers with full access to all CBWCD conservation, education, and funding programs and resources. CBWCD and the District work closely together to promote these programs and communicate their availability to District customers.

The following are brief descriptions of CBWCD's conservation, education, and funding programs and resources which provide direct benefit to the District's conservation programs:

- **Landscape Evaluation and Audit Program (LEAP)** – Certified irrigation system evaluators visit customers' properties, conduct a landscape irrigation evaluation, and provide a comprehensive evaluation report. Partially funded through IEUA.

- **Landscape Design Room** – Resources to assist in retrofitting to water efficient landscaping. Appointments for a free consultation with conservation specialists.

- **Gardening Workshops** – Free gardening workshops for both professionals and homeowners. CBWCD contracts with IEUA to hold workshops exclusively for its member agencies, upon request.

- **Qualified Water Efficient Landscaper (QWEL) Training** – Professional bilingual training on water efficient principles for irrigation systems and landscape design. QWEL is an EPA WaterSense labeled certification.

- **Drought-Tolerant Demonstration Garden** – Showcases a variety of water efficient plants growing in their native environment. Free, open 7 days a week (excluding holidays), guided and unguided tours available.

- **Earth Day Festival** – Annual event for 1,000-1,200 fifth-grade students from local schools. District provides sponsorship funding, hosts water education display booths, and provides educational materials to teachers and students.

- **Education Grants** – Scholarships of up to $5,000 to local students focusing on water related majors.

- **Poster-Art Contest** – Annual themed contest for K-6$^{th}$ grade and 7$^{th}$-12$^{th}$ grade categories. Cash prizes.

- **Recycled Water Conversion Incentive Program** – Funding for conversion of city parks and school yards to recycled water.

- **Mulch Giveaways** – Free mulch, self-help, available twice a week.

#### *Regional Compliance with Water Conservation Act of 2009*

Many of the District's conservation activities are implemented on a regional basis through IEUA's Regional Conservation Workgroup. The Water Conservation Act of 2009 provides a regional compliance option, where a group of agencies that regionally coordinate conservation efforts can set collective urban water use targets and determine regional methods to achieve said targets through a Regional Alliance.

IEUA's eight retail member agencies formed a Regional Alliance, together with IEUA, in 2011. All member agencies within IEUA's service area have agreed to the formation of a Regional Alliance, and will continue to cooperatively participate in developing programs and meeting regional and local water conservation goals. The District is an active participant in regional conservation programs and supports the Regional Alliance's effort to exceed its collective water use reduction goal of 20 percent by 2020 through regional conservation programs and aggressive recycled water development, as described in IEUA's 2015 UWMP.

### 6.3.2 District Conservation Programs

In the late 1980s, faced with a significant drought, the District provided regional leadership in helping to form WEWAC to communicate to the region's water users the need to conserve limited water resources. In 1996, the District initiated its comprehensive conservation incentive programs with free toilet distributions, in partnership with IEUA. Since then, the District has generated over 570 AFY in water savings, or 6,890 AF over the lifetime of the incentivized high efficiency devices. This represents over 6% of the District's current retail water demand. The District has also developed ongoing and effective public information and outreach campaigns.

In addition to the District's leadership, active engagement, and full utilization of regional conservation programs to benefit its customers, the District has also developed District-specific programs to address the particular needs and generate additional water savings and value for its customers.

#### *Budget-Based Tiered Rate Structure*

In August 2010, the District implemented a budget-based tiered rate structure for its single-family residential customers. A budget rate structure relies on a calculation of the indoor and outdoor water needs for each individual customer per billing period which, added together, form the customer's "budget." Customers who stay within their budget will pay lower rates than those who exceed their budget, thus incentivizing efficient use.

The District has revised its budget allocation criteria twice, in 2012 and most recently in 2016, to better align with state efficiency standards. Table 6-1 shows the current default values and formulas that the District uses to determine each customer's water budget. These default values represent a sufficient allocation of water to cover efficient indoor and outdoor water needs. If, due to special circumstances, individual customers require greater amounts of water to meet their indoor or outdoor needs, they may seek a budget variance. In 2016, the District expanded its budget rate structure to include customers with dedicated irrigation meters.

**Table 6-1:**
**Budget-Based Tiered Rate Structure Assumptions – 2016**

| Residential Tier | Residential Formulas |
|---|---|
| **Tier 1** | 4 persons * 55 gallons * 30.4 days / 748 gallons |
| **Tier 2** | Lot Size – Residential Structure Footprint – Hardscape (25% Remaining Lot) * 38 inches |
| **Tier 3** | 50% of Tier 1 + 50% of Tier 2 |
| **Tier 4** | All usage above Tier 3 |
| **Irrigation Tier** | **Irrigation Formulas** |
| **Tier 1** | Lot/Irrigated Size * 45 inches |
| **Tier 2** | All usage above Tier 1 |

Budget-based rate structures are widely considered to be a very effective way to incentivize water customers to use water efficiently. A recent University of California Riverside study of one budget rate structure concluded that it achieved a 15 percent water savings.[26] Additionally, the District dedicates revenues received through its highest penalty tier for conservation program expenses.

***Mandatory Year-Round Water Use Efficiency "Best Practices"***

In May 2010, the District Board of Directors adopted Ordinance 33 (Appendix O), establishing water use efficiency "best practices" and staged water shortage demand management measures (for more information on these stages, see Section 7.2 below). Under Ordinance 33, District customers are required to implement the following water use efficiency "best practices" on a permanent, year-round basis:

- Set automatic irrigation timers to water only before 8:00 a.m. or after 8:00 p.m. and for 15 minutes or less per cycle (exceptions: hand-watering, drip irrigation, weather-based or soil moisture sensing irrigation controllers);

- No runoff from excessive watering;

[26] Kenneth Baerenklau, Kurt Schwabe, and Ariel Dinar, "Allocation-Based Water Pricing Promotes Conservation While Keeping User Costs Low." Agricultural and Resource Economics Update 17(6), 2014.

- No watering during rain;
- Repair leaks within seven days of discovery;
- Use shutoff nozzle to wash vehicles, or use commercial wash that recycles;
- No hosing or washing paved surfaces (except when required for health and safety reasons, and then only with a high-pressure washer);
- Restaurants provide water service only on request;
- Hotels provide option for no daily linen service; and,
- Water recycling systems for conveyer and in-bay automatic vehicle washes, decorative water features, and cooling towers and evaporative cooling systems.

Recycled water customers are exempt from these practices, but they must follow the water use requirements under the District's Ordinance 31 (Appendix L) governing recycled water use within the District's service area.

The District's enforcement of year-round water use efficiency best practices is dictated by established courtesy notice and enforcement procedures, as well as by water supply conditions and staff availability. If violations are reported by customers or witnessed by District staff, the District provides one or more courtesy notices by door hanger, phone call, or letter, informing the customer about the violation and requesting that it be addressed in a timely manner. If the violation is witnessed again by District staff after at least seven (7) days, the District initiates official notifications by letter. If the customer receives two such notifications and the violation is still not addressed after at least seven (7) days from receipt of the last and final notice, the customer is subject to fines and possible flow restriction on the schedule in Table 6-2.

**Table 6-2:**
**Best Practice Notifications and Penalties**

| | First Violation | Second Violation | Third Violation | Fourth Violation | Fifth Violation |
|---|---|---|---|---|---|
| **Best Practices** | Written Notice | Final Written Notice | $50 Fine | $100 Fine | $150 Fine; Flow Restrictor |

Customers have the right to request in writing a waiver for hardship or special circumstances. A staff review board reviews written waivers and grants or revokes waivers. Review board appeals may be heard by the District Board of Directors.

### *Residential Nozzle Retrofit Program*

In 2014, the District contracted with ConServ Construction, Inc. to provide customers with a free irrigation survey and nozzle retrofit program. This program, funded through Tier 4 revenues from its budget-based tiered rate structure (see above), targets customers who exceed their budget or otherwise are identified as high users.

The program provides a site visit, evaluation of the customer's irrigation system, and installation of high-efficiency spray nozzles, as well as a consultation on the many existing regional and local conservation programs would best meet the customer's needs and help reduce water use to within their budget allocation.

### *Enhanced Conservation Program*

In response to Governor Brown's declaration of drought emergency and mandatory conservation order, and in conjunction with a declared Significant Water Supply Shortage under Ordinance 33 (see Section 3.1), the District launched an Enhanced Conservation Program to assist customers in achieving immediate and lasting water savings.

Transferred $250,000 from reserves into its conservation program budget, the District funded the following enhanced programs:

- Enhanced rebates for turf removal, high-efficiency toilets, and weather-based irrigation controllers;
- Enhanced irrigation retrofits to supplement local and regional installations of high-efficiency irrigation technologies;
- A public sector assistance program that provided matching funds to public sector partners in reducing near-term water use while achieving long-term savings; and
- Enhanced promotions through additional customer communications and consultant assistance on developing effective promotional strategy and materials.

### *Drought Response Clinics*

Also in response to the Governor's mandatory conservation actions, the District initiated a series of "clinics" to assist customers with a variety of options to reduce their water use. Customers who attend the clinics receive one-on-one assistance with conservation programs and attend bilingual gardening mini-classes and demonstration garden tours to learn more about water-efficient plants. Customers were able to sign up for free landscape irrigation evaluations, free sprinkler nozzles, free weather-based irrigation controller installations, and free comprehensive landscape retrofits, depending on their qualifications. Customers were also provided with information on available rebates for toilets and clothes washers, as well as tips on how to change water use habits to avoid waste.

***"Water Is Life" Art Poster Contest***

The District has conducted an annual "Water is Life" Art Poster Contest since 2002 for students in Kindergarten through 12th grade that attend schools located within the District's service area. Winners in several grade categories are selected by District staff and members of the Board of Directors. The winning entries of the District's contest are entered into MWD's regional contest which selects 36 posters to feature in a calendar.

***Bruce J. Lance, Jr. Water Scholarship***

In 2013, the District recognized Bruce Lance's 44 years of service as its general counsel by establishing the "Bruce J. Lance, Jr. Water Scholarship" for Montclair High School graduating seniors who plan to attend college. Two $500 scholarships are awarded annually. Applicants are required to write an essay on the importance of water.

***Website and Email Newsletter***

The District's website, www.mvwd.org, has a special conservation section which features conservation programs and resources, a "Watch the Water" news section, rotating water savings tips, a form for reporting water wasters, a garden class signup form, and a full listing of programs and resources for teachers and students. Figure 6-1 shows the website section's current front page. The District has also developed an email newsletter, the e-Waterline, which delivers information from the website conservation section directly to customer inboxes.

### 6.3.3 Potential Customer Sector and Economic Impacts

Conservation has multiple benefits, one of which is the value of conservation to the District's ratepayers, in that it saves them from paying higher rates. The District's conservation strategies are equally targeted to all of its customer sectors, and any economic benefits are expected to be borne equally by all customer sectors. That said, conservation can negatively impact the District through decreased revenues. The District protects itself from such impacts through us of a budget-based tiered rate structure (see Section 6.3.2), which matches the District's revenue needs to efficient water use, as well as through the balanced use of the District's diverse water supply portfolio.

The District expects a long-term reduction in water demands as customers become more efficient. In the future, the District may be required to reduce demands even further by either state regulatory action or other unforeseen situations, resulting in insufficient revenues to meet projected expenses. In order to protect the District financially in such circumstances, the District recently adopted "demand reduction rates" as part of its normal rate adoption process in order to ensure financial stability and high quality water service. These rates are set in four stages representing rate adjustments to address a 10 percent, 20 percent, 30 percent, and 40 percent reduction in demand below baseline levels. Implementation of demand reduction rates would require separate action by the Board of Directors before they take effect, and do not apply to recycled water customers.

**Figure 6-1:**
**District Website Conservation Section**

# SECTION 7
# WATER SHORTAGE CONTINGENCY PLAN

The District's Water Shortage Contingency Plan is District Ordinance 33, which establishes year-round water use efficiency best practices (Section 6.3.2) and staged water supply shortage measures. This Plan addresses emergency shortages, including catastrophic interruptions, and contains mandatory prohibitions, penalties, and consumption reduction methods. Ordinance 33 is incorporated into this UWMP as Appendix O.

The District's stages of action present the measures by which customers are required to implement mandatory water conservation practices during a declared water shortage. The District may declare a shortage due to imported water supply cutbacks by MWD, as well as extended drought, equipment failure, act of terrorism, and/or natural disaster. Although the District will respond to the implementation of MWD's WSDM Plan (Section 5.1.2), the District will focus on implementing its own stages of action with consideration of IEUA's response to a declared water shortage throughout its service area.

## 7.1 WATER SHORTAGE CONTINGENCY ORDINANCE

See Section 6.3.2 for a description of the development of District Ordinance 33.

Ordinance 33 identifies actions to be taken by water consumers within the District's service area during periods of adequate water supply, during "significant" water shortages, "critical" water shortages, and "emergency" water shortages including shortages of up to 50 percent. Each shortage stage includes such actions as limiting outside irrigation, leak repair, avoiding water use during peak demand hours, and reduced overall water usage.

## 7.2 STAGES OF ACTION

Ordinance 33 describes mandatory conservation measures to be implemented during a declared Significant, Critical, and Emergency Water Supply Shortage. Table 7-1 summarizes the expected demand reduction for each declared stage.

Recent experience demonstrates that the District can achieve up to 10 percent reduction in demand through a heightened public awareness campaign without the need of declaring a shortage.

Ordinance 33 establishes water use restrictions based on three phases or shortage conditions: "Significant," "Critical," and "Emergency." Table 7-2 outlines which conservation measures are to be implemented during each stage, as identified in Ordinance 33.

**Table 7-1:**
**Water Shortage Stages and Demand Reductions**

| Stage No. | Water Supply Conditions | % Shortage |
|---|---|---|
| Significant Water Supply Shortage | Current or near-term water supply shortage conditions require a 10 to 25 percent demand reduction | 10-25% |
| Critical Water Supply Shortage | Current or near-term water supply shortage conditions require a 25 to 40 percent demand reduction | 25-40% |
| Emergency Water Supply Shortage | Current or near-term water supply shortage conditions require a 40 percent or higher demand reduction | 40+% |

Aligns with data in DWR Standardized Tables 8-1 R and 8-1 W.

The implementation of the water shortage stages above will result in a significant reduction in water consumption. In the most severe water shortage, the collective implementation of residential and commercial landscape irrigation restrictions may achieve a reduction of up to 50 percent in irrigation water use. Combined with other use restrictions on top of a total customer percentage curtailment of 20 percent, such restrictions are expected to result in an overall water consumption reduction of 50 percent for all water use sectors within the District's service area. The District will measure such reductions relying upon water meters to record the production and consumption of water.

**Table 7-2:**
**Water Shortage Phase Mandatory Prohibitions**

| Prohibitions | Stage When Mandatory |
|---|---|
| Outdoor irrigation except on Tuesday, Thursday and Saturday (exemptions for water-dependent industries, efficient irrigation practices) | Significant |
| Dedicated irrigation use above 75% prior non-shortage year's use | Significant |
| Potable water used for construction, dust control without plan authorization | Significant |
| Fire hydrant use other than approved uses (fire prevention, public welfare) | Significant |
| Outdoor irrigation except on Tuesday and Saturday | Critical |
| Dedicated irrigation use above 50% prior non-shortage year's use | Critical |
| Implementation of local landscape requirements resulting in increased water use | Critical |
| Vehicle washing except at commercial car wash | Critical |
| Refilling swimming pools, spas or ponds for cleaning purposes | Critical |
| Outdoor irrigation except on Saturday | Emergency |
| Dedicated irrigation use above 33% prior non-shortage year's use | Emergency |
| Installation of new landscaping | Emergency |
| Use of potable water for construction and dust control | Emergency |
| Filling swimming pools, spas or ponds | Emergency |
| Wholesale customer demand reduction equal to retail customers | All |

Aligns with data in DWR Standardized Table 8-2 R.

## 7.3 REGIONAL WATER SHORTAGE CONTINGENCY PLANNING

### 7.3.1 MWD's Water Surplus and Drought Management Plan

In 1998, MWD's Board of Directors adopted the Water Surplus and Drought Management (WSDM) Plan. This plan addresses both surplus and shortage operating strategies. The WSDM plan reflects anticipated responses based on the water supplies available to MWD.

The WSDM Plan's guiding principle is to minimize adverse impacts of water shortage and ensure regional reliability. From this guiding principle come the following supporting principles:

- Encourage efficient water use and economical local resource programs.
- Coordinate operations with member agencies to make as much surplus water as possible available for use in dry years.
- Pursue innovative transfers and banking programs to secure more replacement water for use in dry years.
- Increase public awareness about water supply issues.

The WSDM Plan guides the operations of water resources (local resources, Colorado River, SWP, and regional storage) to ensure regional reliability. It identifies the expected sequence of resource management actions MWD will take during surpluses and shortages of water to minimize the probability of severe shortages that require curtailment of full-service demands. Mandatory allocations are avoided to the extent practicable, however, in the event of an extreme shortage an allocation plan will be adopted in accordance with the principles of the WSDM Plan.

The WSDM Plan distinguishes between *Surpluses*, *Shortages*, *Severe Shortages*, and *Extreme Shortages.* Within the WSDM Plan, these terms have specific meaning relating to MWD's capability to deliver water to the IEUA and the District.

- **Surplus:** MWD can meet full-service and interruptible program demands, and it can deliver water to local and regional storage.
- **Shortage:** MWD can meet full-service demands and partially meet or fully meet interruptible demands, using stored water or water transfers as necessary.
- **Severe Shortage:** MWD can meet full-service demands only by using stored water, transfers, and possibly calling for extraordinary conservation. In a Severe Shortage, MWD may have to curtail Interim Agricultural Water Program.
- **Extreme Shortage:** MWD must allocate available supply to full-service customers.

Except in severe or extreme shortages or emergencies, MWD's resource management will allow shortages to be mitigated without impacting municipal and industrial customers.

The equitable allocation of supplies is addressed by the Implementation Goals for the WSDM Plan, with the first goal being to "avoid mandatory import water allocations to the extent practicable." However, the second fundamental goal of the WSDM Plan is to "equitably allocate imported water on the basis of agencies' needs." Factors for consideration in establishing the equitable allocation include retail and economic impacts, recycled water production, conservation levels, growth, local supply production, and participation and investment in MWD's system and programs. In the event of an extreme shortage, an allocation plan is to be adopted in accordance with the principles of the WSDM Plan. Such an allocation plan was adopted by MWD in 2008 and updated in 2015.

### 7.3.2 IEUA's Drought Plan

In response to MWD's WSAP, IEUA developed a Drought Plan for the purpose of implementing the WSAP within the IEUA's service area in a manner that is fair and equitable to IEUA's member agencies. The Drought Plan is consistent with and supplements the WSAP for specific IEUA service area drought planning issues. All WSAP definitions, policies, principals, and program provisions are incorporated into the Drought Plan by reference and are considered to be a part of the Drought Plan. For example, if IEUA is not imposed a penalty from MWD then IEUA would not impose a penalty on a member agency within IEUA's service area. In addition, MWD does not allow resale or "marketing" of WSAP allocation credits and IEUA will not allow IEUA Drought Plan credits to be sold internally within IEUA's service area or externally without IEUA's approval.

IEUA's Drought Plan is consistent with and contributes to the existing IEUA imported water policies and programs. For example, the IEUA's Drought Plan principles encourage development and full utilization of local water resources, such as recycled water and conservation measures. The IEUA Drought Plan also addresses MWD's Chino Groundwater Basin DYY program and the need for best management of DYY program "shift" obligations concurrent with WSAP reductions of imported water supplies to IEUA.

## 7.4 MINIMUM SHORT-TERM SUPPLY AVAILABILITY

The District has evaluated the short-term supply outlook during each of the next three years from 2016 through 2018 and determined the minimum water supplies available for retail and wholesale potable and non-potable demands, as shown in Table 7-3. Local supplies are projected to exceed demand.

**Table 7-3:**
**Minimum Short-Term Retail and Wholesale Supply Availability (AFY)**

| Source | 2016 | 2017 | 2018 |
|---|---|---|---|
| Chino Groundwater Basin[1] | 29,841 | 29,841 | 29,841 |
| Water Facilities Authority[1] | 21,776 | 21,776 | 21,776 |
| San Antonio Water Company[1] | 558 | 558 | 558 |
| Recycled[1] | 1,031 | 1,031 | 1,031 |
| **Total** | **53,205** | **53,205** | **53,205** |

Aligns with data in DWR Standardized Tables 8-4 R and 8-4 W.
[1]Consistent with Table 5-5 , 2020 Year 3 supply estimate (most conservative estimate based on best available information).

## 7.5 CATASTROPHIC SUPPLY INTERRUPTION PLAN

The District's imported water supply source, the SWP, crosses the San Andreas Fault, and many other fault lines bisect major water facilities throughout the region. Experts consider it likely that one or more of these supplies will be disrupted in the event of a major earthquake.

MWD estimates that restoring service on any of its imported water supply facilities following a catastrophic outage could take up to six months. This, in turn, could reduce annual deliveries by roughly up to 50 percent for MWD-supplied water. The Urban Water Management Planning Act requires agencies to consider the effect of a 50 percent cutback in water supplies. This corresponds approximately to the degree of cutback contemplated by MWD's earthquake disruption scenario.

### 7.5.1 Water Shortage Emergency Response

A water shortage emergency could be the result of a catastrophic event such as result of drought, failures of transmission facilities, a regional power outage, earthquake, flooding, supply contamination from chemical spills, or other adverse conditions. In response to such an emergency, the District General Manager is authorized under Ordinance 33, Section 10, to declare the extent of the water supply shortage and implement the appropriate water supply shortage stage as defined by the Ordinance, and then report such water supply shortage condition and level of response to the District Board as soon as possible. Subsequently, the District Board shall be responsible for authorizing and directing implementation of the water conservation stages described in Ordinance 33, as appropriate, to address emergencies.

The District may also activate its Emergency Response Plan, developed and maintained by the District as required under the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (Public Law 107-188). The plan calls for the creation of an Emergency Response Coordinator and Team, emergency conditions staffing plan, a public information and inter-agency communications plan, listing of District facilities, maps and other pertinent information. In addition, the Vulnerability Assessment and Local Hazard Mitigation Plan will assist in meeting emergency needs through operational and facility adjustments.

The District also provides wholesale water supply to the City of Chino Hills through a long-term contractual arrangement. The agreement between the two agencies contains provisions regarding water delivery limitations during emergency situations such as natural or other disasters.

The District will consider such actions as stretching existing water storage and obtaining additional water supplies from neighboring agencies if appropriate. The District has interconnections with four other agencies: Golden State Water Company and the cities of Chino, Chino Hills, and Upland. A supply connection with Golden State can be used for emergencies to serve the City of Claremont. The interconnections with the three cities will allow water to be supplied or received.

The City of Montclair Fire Department houses an emergency command center for Zone 1 of the San Bernardino County and State Office of Emergency Services. The District is currently a member of the Montclair Disaster Group to coordinate disaster preparedness planning for the entire community. Members include the local hospital, the high school, the elementary/middle school district, the major retail mall in the city, police and fire departments, and the Red Cross and related groups. The group assists each other in updating disaster plans and keeps abreast of new information in the area of disaster planning.

The District is a member of the Emergency Response Network of the Inland Empire (ERNIE) and the California Water/Wastewater Agency Response Network (CalWARN), both of which include agreements to facilitate mutual assistance in times of disaster. Construction equipment owned by IEUA is also available to the District to use in disaster recovery for the initial emergency period when danger to life and to property exists.

Public health notifications conforming to state laws will be distributed if District management determines that any damage to the water supply distribution system has compromised water quality, i.e., some level of contamination to the drinking water supply has occurred. Public advisories include directives to use bottled water or to boil tap water prior to consumption. In the case of the absence of natural gas or electricity, instructions on the use of household bleach to disinfect tap water will be provided.

If the imported water supplies are reduced dramatically and power supply is not available for extended periods of time, the District will rely on the implementation of MWD's regional emergency water supply plan in coordination with IEUA.

The District has formed an Emergency Response Committee to coordinate all District emergency and disaster response preparation and implementation. The committee reviews and maintains the District's Emergency Response Plan and provides resources and training for District personnel.

### *Vulnerability Assessment*

In compliance with federal regulations, the District conducted a Vulnerability Assessment to identify areas for security enhancement and to develop a prioritized plan for the mitigation of risks to critical assets. The plan was completed and submitted to the EPA in March 2003, followed by the development of the required revised Emergency Response Plan in September 2003, which complies with Section 1433(b) of the Safe Drinking Water Act as amended by the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (Public Law 107-188, Title IV – Drinking Water Safety and Security).

### *Local Hazard Mitigation Plan*

The purpose of mitigation planning is to recognize hazards, analyze risks, and identify actions, measures, and projects to implement during the pre-disaster period. This District is required by Cal-EMA and FEMA to update its Local Hazard Mitigation Plan every five years.

### *Health and Safety Requirements*

The primary goal of the District's water system is to preserve the health and safety of its personnel and the public. Meeting this goal is a continuous function of the water system—before, during and after a disaster or water shortage. Fire suppression capabilities will continue to be maintained during any water shortage contingency stage. Some water needs are more immediate than others. The following list of public health needs and the allowable time without potable water is a guideline and will depend on the magnitude of the water shortage:

- Hospitals – continuous need
- Emergency shelters – immediate need
- Kidney dialysis – 24 hours
- Drinking water – 72 hours
- Personal hygiene, waste disposal – 72 hours

Based on commonly accepted estimates of interior residential water use in the United States, Table 7-4 indicates per capita health and safety water requirements.

**Table 7-4:**
**Per Capita Health and Safety Water Quantity Calculations**

| | Non-Conserving Fixtures | | Conserving Fixtures[1] | |
|---|---|---|---|---|
| Toilet | 5 flushes x 3.6 gpf | 18.0 | 5 flushes x 1.6 gpf | 8.0 |
| Shower /Bath | 12.7 shower / 2.6 bath | 15.3 | 9.2 shower / 2.6 bath | 11.8 |
| Washer | 1/3 load | 14.7 | 1/3 load | 7.8 |
| Kitchen | Faucets and Dishwasher | 5.0 | Faucets and Dishwasher | 3.0 |
| Other | Faucets etc. | 5.0 | Faucets etc. | 3.7 |
| Total | | 58.0 | | 34.3 |

All data in GPCD.
Source: DWR Urban Drought Guidebook, 2008 Updated Edition.
[1] Fixtures include ULFTs (1.6 gpf), 2.5 gpm showerheads, and efficient clothes washers.

***Priority by Use***

Conditions prevailing in the District area require that the water resources available be put to maximum beneficial use to the extent to which they are capable. The waste of water should be prevented and water conservation, along with water use efficiency, will be encouraged to the maximum reasonable and beneficial use of the District customers and the public welfare. Preservation of health and safety will be a top priority for the District.

## 7.6 PENALTIES AND CONSUMPTION REDUCTION METHODS

District customers who violate the provisions of Ordinance 33 are subject to the procedures and/or penalties described in the Ordinance (Section 11). Table 7-5 outlines the procedures and penalties for violating Ordinance 33 provisions, including year-round best practices and each declared water supply shortage stage, and for subsequent violations which occurs at least 7 days subsequent to the previous violation.

After multiple violations of Ordinance provisions, the District may install a flow restricting device on a customer's water meter. The District may also terminate a customer's landscape meter service upon a prior determination that the customer has repeatedly violated the Ordinance. Any restricted or terminated service may be restored upon showing that the customer is ready, willing, and able to comply with the provision of the Ordinance. Customers may request waivers and appeal staff decisions to the District General Manager and Board of Directors.

**Table 7-5:**
**Penalties and Procedures for Ordinance 33 Violations**

| | First Violation | Second Violation | Third Violation | Fourth Violation | Fifth Violation |
|---|---|---|---|---|---|
| **Best Practices** | Written Notice | Final Written Notice | $50 Fine | $100 Fine | $150 Fine; Flow Restrictor |
| **Significant Water Supply Shortage** | Written Notice | $50 Fine | $100 Fine | $150 Fine | $200 Fine; Flow Restrictor |
| **Critical Water Supply Shortage** | Written Notice | $100 Fine | $200 Fine | $300 Fine; Flow Restrictor | --- |
| **Emergency Water Supply Shortage** | Written Notice | $150 Fine | $300 Fine; Flow Restrictor | --- | --- |

In order to fully implement Ordinance 33 provisions, the District will conduct an expansive public information campaign regarding the declared shortage stage, including newspaper announcements, direct mail, and publicity. The District will also increase its enforcement of water use restrictions through additional water waste patrolling by staff. Typically, in order to reinforce the message of needed reductions in use, the District will also decrease flushing activities to the minimum required to meet water quality objectives. Finally, the District may implement demand reduction rates as described below.

### 7.6.1 Revenue and Expenditure Impacts

As stated in Section 6.3.3, during periods of water supply shortages, state-mandated water use restrictions, or emergency conditions, the District may require its customers to reduce demands below levels projected by the current rate structure. This circumstance may result in insufficient revenues to meet necessary expenses.

The District may rely on its reserves to offset declines in revenues. The District maintains an operating reserve with a target funding level of three months of its annual operating budget, and an emergency reserve with a target funding level of $1 to $4 million, consistent with the District's cash reserve policy (Resolution 612-07).

In order to protect the District financially in such circumstances, the District recently adopted "demand reduction rates" as part of its normal rate adoption process in order to ensure financial stability and high quality water service. The demand reduction rates are set in four stages representing potential rate adjustments to address a 10 percent, 20 percent, 30 percent, and 40 percent reduction in demand below baseline levels. Implementation of demand reduction rates would require separate action by the Board of Directors before they take effect, and do not apply to recycled water customers.

## 7.7 MECHANISMS TO DETERMINE ACTUAL REDUCTIONS IN WATER USE

The District tracks water production through use of the real-time Supervisory Control Data Acquisition System (SCADA) system. Production is monitored through use of the blending station (Plant 17), real time trend screens indicating reservoir storage and monitoring of WFA supply flows. Operations personnel conduct daily rounds and maintenance checks on the groundwater wells. Production reports are prepared monthly and quarterly.

Historically, during a water supply shortage, operations personnel have conducted production facility inspections twice a day with increased monitoring of the SCADA system screens. Reservoir storage trend screens are the key indicators of overall system demand. In addition, field staff has monitored the District service area for signs of system or individual service leaks or excessive landscape watering.

The District will also follow implementation of stages of water shortage declared by MWD through its WSAP and continue to monitor water demand levels. In the event that MWD may call for a Level 5 or 25 percent reduction in demand or higher, the District will coordinate emergency activities with IEUA staff and MWD's Drought Program Officer, and monitor the effectiveness of ongoing conservation programs. Monthly or more frequent reporting on estimated conservation water savings will be provided and reviewed. Water consumption reports, water facility condition, watershed hydrology information, and basin conditions, will all be considered for further appropriate action in response to the water shortage.

# Chapter 1. General Declaration and Policy

SECTION 10610-10610.4

10610. This part shall be known and may be cited as the "Urban Water Management Planning Act."

10610.2. (a) The Legislature finds and declares all of the following:

(1) The waters of the state are a limited and renewable resource subject to ever-increasing demands.

(2) The conservation and efficient use of urban water supplies are of statewide concern; however, the planning for that use and the implementation of those plans can best be accomplished at the local level.

(3) A long-term, reliable supply of water is essential to protect the productivity of California's businesses and economic climate.

(4) As part of its long-range planning activities, every urban water supplier should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry water years.

(5) Public health issues have been raised over a number of contaminants that have been identified in certain local and imported water supplies.

(6) Implementing effective water management strategies, including groundwater storage projects and recycled water projects, may require specific water quality and salinity targets for meeting groundwater basins water quality objectives and promoting beneficial use of recycled water.

(7) Water quality regulations are becoming an increasingly important factor in water agencies' selection of raw water sources, treatment alternatives, and modifications to existing treatment facilities.

(8) Changes in drinking water quality standards may also impact the usefulness of water supplies and may ultimately impact supply reliability.

(9) The quality of source supplies can have a significant impact on water management strategies and supply reliability.

(b) This part is intended to provide assistance to water agencies in carrying out their long-term resource planning responsibilities to ensure adequate water supplies to meet existing and future demands for water.

10610.4. The Legislature finds and declares that it is the policy of the state as follows:

(a) The management of urban water demands and efficient use of water shall be actively pursued to protect both the people of the state and their water resources.

(b) The management of urban water demands and efficient use of urban water supplies shall be a guiding criterion in public decisions.

(c) Urban water suppliers shall be required to develop water management plans to actively pursue the efficient use of available supplies.

## Chapter 2. Definitions

SECTION 10611-10617

10611. Unless the context otherwise requires, the definitions of this chapter govern the construction of this part.

10611.5. “Demand management" means those water conservation measures, programs, and incentives that prevent the waste of water and promote the reasonable and efficient use and reuse of available supplies.

10612. "Customer" means a purchaser of water from a water supplier who uses the water for municipal purposes, including residential, commercial, governmental, and industrial uses.

10613. "Efficient use" means those management measures that result in the most effective use of water so as to prevent its waste or unreasonable use or unreasonable method of use.

10614. "Person" means any individual, firm, association, organization, partnership, business, trust, corporation, company, public agency, or any agency of such an entity.

10615. "Plan" means an urban water management plan prepared pursuant to this part. A plan shall describe and evaluate sources of supply, reasonable and practical efficient uses,

reclamation and demand management activities. The components of the plan may vary according to an individual community or area's characteristics and its capabilities to efficiently use and conserve water. The plan shall address measures for residential, commercial, governmental, and industrial water demand management as set forth in Article 2 (commencing with Section 10630) of Chapter 3. In addition, a strategy and time schedule for implementation shall be included in the plan.

10616. "Public agency" means any board, commission, county, city and county, city, regional agency, district, or other public entity.

10616.5. "Recycled water" means the reclamation and reuse of wastewater for beneficial use.

10617. "Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers. This part applies only to water supplied from public water systems subject to Chapter 4 (commencing with Section 116275) of Part 12 of Division 104 of the Health and Safety Code.

## Chapter 3. Urban Water Management Plans

**Article 1. General Provisions**

SECTION 10620-10621

10620. (a) Every urban water supplier shall prepare and adopt an urban water management plan in the manner set forth in Article 3 (commencing with Section 10640).

(b) Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.

(c) An urban water supplier indirectly providing water shall not include planning elements in its water management plan as provided in Article 2 (commencing with Section 10630) that would be applicable to urban water suppliers or public agencies directly providing water, or to their customers, without the consent of those suppliers or public agencies.

(d) (1) An urban water supplier may satisfy the requirements of this part by participation in areawide, regional, watershed, or basinwide urban water management planning where those plans will reduce preparation costs and contribute to the achievement of conservation and efficient water use.

(2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that

share a common source, water management agencies, and relevant public agencies, to the extent practicable.

(e) The urban water supplier may prepare the plan with its own staff, by contract, or in cooperation with other governmental agencies.

(f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

10621. (a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero, except as provided in subdivision (d).

(b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.

(c) The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).

(d) Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.

**Article 2. Contents of Plan**

SECTION 10630-10634

10630. It is the intention of the Legislature, in enacting this part, to permit levels of water management planning commensurate with the numbers of customers served and the volume of water supplied.

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:

(a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a). If groundwater is identified as an existing or planned source of

water available to the supplier, all of the following information shall be included in the plan:

(1) A copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management.

(2) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater. For basins that a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(c) (1) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following:

(A) An average water year.

(B) A single-dry water year.

(C) Multiple-dry water years.

(2) For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.

(d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

(e) (1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:

(A) Single-family residential.

(B) Multifamily.

(C) Commercial.

(D) Industrial.

(E) Institutional and governmental.

(F) Landscape.

(G) Sales to other agencies.

(H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.

(I) Agricultural.

(J) Distribution system water loss.

(2) The water use projections shall be in the same five-year increments described in subdivision (a).

(3) (A) For the 2015 urban water management plan update, the distribution system water loss shall be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss shall be quantified for each of the five years preceding the plan update.

(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

(4) (A) If available and applicable to an urban water supplier, water use projections may display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following:

(i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.

(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.

(f) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1) (A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(i) Water waste prevention ordinances.

(ii) Metering.

(iii) Conservation pricing.

(iv) Public education and outreach.

(v) Programs to assess and manage distribution system real loss.

(vi) Water conservation program coordination and staffing support.

(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

(2) For an urban wholesale water supplier, as defined in Section 10608.12, a narrative description of the items in clauses (ii), (iv), (vi), and (vii) of subparagraph (B) of paragraph (1), and a narrative description of its distribution system asset management and wholesale supplier assistance programs.

(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water

use, as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.

(h) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

(i) For purposes of this part, urban water suppliers that are members of the California Urban Water Conservation Council shall be deemed in compliance with the requirements of subdivision (f) by complying with all the provisions of the "Memorandum of Understanding Regarding Urban Water Conservation in California," dated December 10, 2008, as it may be amended, and by submitting the annual reports required by Section 6.2 of that memorandum.

(j) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).

10631.1. (a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

(b) It is the intent of the Legislature that the identification of projected water use for single-family and multifamily residential housing for lower income households will assist a supplier in complying with the requirement under Section 65589.7 of the Government Code to grant a priority for the provision of service to housing units affordable to lower income households.

10631.2. (a) In addition to the requirements of Section 10631, an urban water management plan may, but is not required to, include any of the following information:

(1) An estimate of the amount of energy used to extract or divert water supplies.

(2) An estimate of the amount of energy used to convey water supplies to the water treatment plants or distribution systems.

(3) An estimate of the amount of energy used to treat water supplies.

(4) An estimate of the amount of energy used to distribute water supplies through its distribution systems.

(5) An estimate of the amount of energy used for treated water supplies in comparison to the amount used for nontreated water supplies.

(6) An estimate of the amount of energy used to place water into or withdraw from storage.

(7) Any other energy-related information the urban water supplier deems appropriate.

(b) The department shall include in its guidance for the preparation of urban water management plans a methodology for the voluntary calculation or estimation of the energy intensity of urban water systems. The department may consider studies and calculations conducted by the Public Utilities Commission in developing the methodology.

10631.5. (a) (1) Beginning January 1, 2009, the terms of, and eligibility for, a water management grant or loan made to an urban water supplier and awarded or administered by the department, state board, or California Bay-Delta Authority or its successor agency shall be conditioned on the implementation of the water demand management measures described in Section 10631, as determined by the department pursuant to subdivision (b).

(2) For the purposes of this section, water management grants and loans include funding for programs and projects for surface water or groundwater storage, recycling, desalination, water conservation, water supply reliability, and water supply augmentation. This section does not apply to water management projects funded by the federal American Recovery and Reinvestment Act of 2009 (Public Law 111-5).

(3) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if the urban water supplier has

submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the water demand management measures. The supplier may request grant or loan funds to implement the water demand management measures to the extent the request is consistent with the eligibility requirements applicable to the water management funds.

(4) (A) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if an urban water supplier submits to the department for approval documentation demonstrating that a water demand management measure is not locally cost effective. If the department determines that the documentation submitted by the urban water supplier fails to demonstrate that a water demand management measure is not locally cost effective, the department shall notify the urban water supplier and the agency administering the grant or loan program within 120 days that the documentation does not satisfy the requirements for an exemption, and include in that notification a detailed statement to support the determination.

(B) For purposes of this paragraph, "not locally cost effective" means that the present value of the local benefits of implementing a water demand management measure is less than the present value of the local costs of implementing that measure.

(b) (1) The department, in consultation with the state board and the California Bay-Delta Authority or its successor agency, and after soliciting public comment regarding eligibility requirements, shall develop eligibility requirements to implement the requirement of paragraph (1) of subdivision (a). In establishing these eligibility requirements, the department shall do both of the following:

(A) Consider the conservation measures described in the Memorandum of Understanding Regarding Urban Water Conservation in California, and alternative conservation approaches that provide equal or greater water savings.

(B) Recognize the different legal, technical, fiscal, and practical roles and responsibilities of wholesale water suppliers and retail water suppliers.

(2) (A) For the purposes of this section, the department shall determine whether an urban water supplier is implementing all of the water demand management measures described in Section 10631 based on either, or a combination, of the following:

(i) Compliance on an individual basis.

(ii) Compliance on a regional basis. Regional compliance shall require participation in a regional conservation program consisting of two or more urban water suppliers that achieves the level of conservation or water efficiency savings equivalent to the amount of conservation or savings achieved if each of the participating urban water suppliers implemented the water demand management measures. The urban water supplier administering the regional program shall provide participating urban water suppliers and the department with data to demonstrate that the regional program is consistent with this clause. The department shall review the data to determine whether the urban water suppliers in the regional program are meeting the eligibility requirements.

(B) The department may require additional information for any determination pursuant to this section.

(3) The department shall not deny eligibility to an urban water supplier in compliance with the requirements of this section that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the water demand management measures described in Section 10631.

(c) In establishing guidelines pursuant to the specific funding authorization for any water management grant or loan program subject to this section, the agency administering the grant or loan program shall include in the guidelines the eligibility requirements developed by the department pursuant to subdivision (b).

(d) Upon receipt of a water management grant or loan application by an agency administering a grant and loan program subject to this section, the agency shall request an eligibility determination from the department with respect to the requirements of this section. The department shall respond to the request within 60 days of the request.

(e) The urban water supplier may submit to the department copies of its annual reports and other relevant documents to assist the department in determining whether the urban water supplier is implementing or scheduling the implementation of water demand management activities. In addition, for urban water suppliers that are signatories to the Memorandum of Understanding Regarding Urban Water Conservation in California and submit biennial reports to the California Urban Water Conservation Council in accordance with the memorandum, the department may use these reports to assist in tracking the implementation of water demand management measures.

(f) This section shall remain in effect only until July 1, 2016, and as of that date is repealed, unless a later enacted statute, that is enacted before July 1, 2016, deletes or extends that date.

10631.7. The department, in consultation with the California Urban Water Conservation Council, shall convene an independent technical panel to provide information and recommendations to the department and the Legislature on new demand management measures, technologies, and approaches. The panel shall consist of no more than seven members, who shall be selected by the department to reflect a balanced representation of experts. The panel shall have at least one, but no more than two, representatives from each of the following: retail water suppliers, environmental organizations, the business community, wholesale water suppliers, and academia. The panel shall be convened by January 1, 2009, and shall report to the Legislature no later than January 1, 2010, and every five years thereafter. The department shall review the panel report and include in the final report to the Legislature the department's recommendations and comments regarding the panel process and the panel's recommendations.

10632. (a) The plan shall provide an urban water shortage contingency analysis that includes each of the following elements that are within the authority of the urban water supplier:

(1) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions that are applicable to each stage.

(2) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.

(3) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.

(4) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.

(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are

appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.

(6) Penalties or charges for excessive use, where applicable.

(7) An analysis of the impacts of each of the actions and conditions described in paragraphs (1) to (6), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.

(8) A draft water shortage contingency resolution or ordinance.

(9) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.

(b) Commencing with the urban water management plan update due July 1, 2016, for purposes of developing the water shortage contingency analysis pursuant to subdivision (a), the urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.

10633. The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:

(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

(b) A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

(f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

10634. The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.

**Article 2.5. Water Service Reliability**

SECTION 10635

10635. (a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

(b) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.

(c) Nothing in this article is intended to create a right or entitlement to water service or any specific level of water service.

(d) Nothing in this article is intended to change existing law concerning an urban water supplier's obligation to provide water service to its existing customers or to any potential future customers.

**Article 3. Adoption and Implementation of Plans**

SECTION 10640-10645

10640. Every urban water supplier required to prepare a plan pursuant to this part shall prepare its plan pursuant to Article 2 (commencing with Section 10630). The supplier shall likewise periodically review the plan as required by Section 10621, and any amendments or changes required as a result of that review shall be adopted pursuant to this article.

10641. An urban water supplier required to prepare a plan may consult with, and obtain comments from, any public agency or state agency or any person who has special expertise with respect to water demand management methods and techniques.

10642. Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan. Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area.

After the hearing, the plan shall be adopted as prepared or as modified after the hearing.

10643. An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan.

10644. (a) (1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.

(2) The plan, or amendments to the plan, submitted to the department pursuant to paragraph (1) shall be submitted electronically and shall include any standardized forms, tables, or displays specified by the department.

(b) (1) Notwithstanding Section 10231.5 of the Government Code, the department shall prepare and submit to the Legislature, on or before December 31, in the years ending in six and one, a report summarizing the status of the plans adopted pursuant to this part.

The report prepared by the department shall identify the exemplary elements of the individual plans. The department shall provide a copy of the report to each urban water supplier that has submitted its plan to the department. The department shall also prepare reports and provide data for any legislative hearings designed to consider the effectiveness of plans submitted pursuant to this part.

(2) A report to be submitted pursuant to paragraph (1) shall be submitted in compliance with Section 9795 of the Government Code.

(c) (1) For the purpose of identifying the exemplary elements of the individual plans, the department shall identify in the report water demand management measures adopted and implemented by specific urban water suppliers, and identified pursuant to Section 10631, that achieve water savings significantly above the levels established by the department to meet the requirements of Section 10631.5.

(2) The department shall distribute to the panel convened pursuant to Section 10631.7 the results achieved by the implementation of those water demand management measures described in paragraph (1).

(3) The department shall make available to the public the standard the department will use to identify exemplary water demand management measures.

10645. Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

## Chapter 4. Miscellaneous Provisions

### SECTION 10650-10656

10650. Any actions or proceedings to attack, review, set aside, void, or annul the acts or decisions of an urban water supplier on the grounds of noncompliance with this part shall be commenced as follows:

(a) An action or proceeding alleging failure to adopt a plan shall be commenced within 18 months after that adoption is required by this part.

(b) Any action or proceeding alleging that a plan, or action taken pursuant to the plan, does not comply with this part shall be commenced within 90 days after filing of the plan or amendment thereto pursuant to Section 10644 or the taking of that action.

10651. In any action or proceeding to attack, review, set aside, void, or annul a plan, or an action taken pursuant to the plan by an urban water supplier on the grounds of noncompliance with this part, the inquiry shall extend only to whether there was a prejudicial abuse of discretion. Abuse of discretion is established if the supplier has not proceeded in a manner required by law or if the action by the water supplier is not supported by substantial evidence.

10652. The California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of plans pursuant to this part or to the implementation of actions taken pursuant to Section 10632. Nothing in this part shall be interpreted as exempting from the California Environmental Quality Act any project that would significantly affect water supplies for fish and wildlife, or any project for implementation of the plan, other than projects implementing Section 10632, or any project for expanded or additional water supplies.

10653. The adoption of a plan shall satisfy any requirements of state law, regulation, or order, including those of the State Water Resources Control Board and the Public Utilities Commission, for the preparation of water management plans or conservation plans; provided, that if the State Water Resources Control Board or the Public Utilities Commission requires additional information concerning water conservation to implement its existing authority, nothing in this part shall be deemed to limit the board or the commission in obtaining that information. The requirements of this part shall be satisfied by any urban water demand management plan prepared to meet federal laws or regulations after the effective date of this part, and which substantially meets the requirements of this part, or by any existing urban water management plan which includes the contents of a plan required under this part.

10654. An urban water supplier may recover in its rates the costs incurred in preparing its plan and implementing the reasonable water conservation measures included in the plan. Any best water management practice that is included in the plan that is identified in the "Memorandum of Understanding Regarding Urban Water Conservation in California" is deemed to be reasonable for the purposes of this section.

10655. If any provision of this part or the application thereof to any person or circumstances is held invalid, that invalidity shall not affect other provisions or applications of this part which can be given effect without the invalid provision or application thereof, and to this end the provisions of this part are severable.

10656. An urban water supplier that does not prepare, adopt, and submit its urban water management plan to the department in accordance with this part, is ineligible to receive funding pursuant to Division 24 (commencing with Section 78500) or Division 26

(commencing with Section 79000), or receive drought assistance from the state until the urban water management plan is submitted pursuant to this article.

**Chapter 1. General Declarations and Policy** §10608-10608.8
**Chapter 2. Definitions** §10608.12
**Chapter 3. Urban Retail Water Suppliers** §10608.16-10608.44
**Chapter 4. Agricultural Water Suppliers** §10608.48
**Chapter 5. Sustainable Water Management** §10608.50
**Chapter 6 Standardized Data Collection** §10608.52
**Chapter 7 Funding Provisions** §10608.56-10608.60
**Chapter 8 Quantifying Agricultural Water Use Efficiency** §10608.64

# Chapter 1. General Declarations and Policy

SECTION 10608-10608.8

10608. The Legislature finds and declares all of the following:

(a) Water is a public resource that the California Constitution protects against waste and unreasonable use.

(b) Growing population, climate change, and the need to protect and grow California's economy while protecting and restoring our fish and wildlife habitats make it essential that the state manage its water resources as efficiently as possible.

(c) Diverse regional water supply portfolios will increase water supply reliability and reduce dependence on the Delta.

(d) Reduced water use through conservation provides significant energy and environmental benefits, and can help protect water quality, improve streamflows, and reduce greenhouse gas emissions.

(e) The success of state and local water conservation programs to increase efficiency of water use is best determined on the basis of measurable outcomes related to water use or efficiency.

(f) Improvements in technology and management practices offer the potential for increasing water efficiency in California over time, providing an essential water management tool to meet the need for water for urban, agricultural, and environmental uses.

(g) The Governor has called for a 20 percent per capita reduction in urban water use statewide by 2020.

(h) The factors used to formulate water use efficiency targets can vary significantly from location to location based on factors including weather, patterns of urban and suburban development, and past efforts to enhance water use efficiency.

(i) Per capita water use is a valid measure of a water provider's efforts to reduce urban water use within its service area. However, per capita water use is less useful for measuring relative water use efficiency between different water providers. Differences in weather, historical patterns of urban and suburban development, and density of housing in a particular location need to be considered when assessing per capita water use as a measure of efficiency.

10608.4. It is the intent of the Legislature, by the enactment of this part, to do all of the following:

(a) Require all water suppliers to increase the efficiency of use of this essential resource.

(b) Establish a framework to meet the state targets for urban water conservation identified in this part and called for by the Governor.

(c) Measure increased efficiency of urban water use on a per capita basis.

(d) Establish a method or methods for urban retail water suppliers to determine targets for achieving increased water use efficiency by the year 2020, in accordance with the Governor's goal of a 20-percent reduction.

(e) Establish consistent water use efficiency planning and implementation standards for urban water suppliers and agricultural water suppliers.

(f) Promote urban water conservation standards that are consistent with the California Urban Water Conservation Council's adopted best management practices and the requirements for demand management in Section 10631.

(g) Establish standards that recognize and provide credit to water suppliers that made substantial capital investments in urban water conservation since the drought of the early 1990s.

(h) Recognize and account for the investment of urban retail water suppliers in providing recycled water for beneficial uses.

(i) Require implementation of specified efficient water management practices for agricultural water suppliers.

(j) Support the economic productivity of California's agricultural, commercial, and industrial sectors.

(k) Advance regional water resources management.

10608.8. (a) (1) Water use efficiency measures adopted and implemented pursuant to this part or Part 2.8 (commencing with Section 10800) are water conservation measures subject to the protections provided under Section 1011.

(2) Because an urban agency is not required to meet its urban water use target until 2020 pursuant to subdivision (b) of Section 10608.24, an urban retail water supplier's failure to meet those targets shall not establish a violation of law for purposes of any state administrative or judicial proceeding prior to

January 1, 2021. Nothing in this paragraph limits the use of data reported to the department or the board in litigation or an administrative proceeding. This paragraph shall become inoperative on January 1, 2021.

(3) To the extent feasible, the department and the board shall provide for the use of water conservation reports required under this part to meet the requirements of Section 1011 for water conservation reporting.

(b) This part does not limit or otherwise affect the application of Chapter 3.5 (commencing with Section 11340), Chapter 4 (commencing with Section 11370), Chapter 4.5 (commencing with Section 11400), and Chapter 5 (commencing with Section 11500) of Part 1 of Division 3 of Title 2 of the Government Code.

(c) This part does not require a reduction in the total water used in the agricultural or urban sectors, because other factors, including, but not limited to, changes in agricultural economics or population growth may have greater effects on water use. This part does not limit the economic productivity of California's agricultural, commercial, or industrial sectors.

(d) The requirements of this part do not apply to an agricultural water supplier that is a party to the Quantification Settlement Agreement, as defined in subdivision (a) of Section 1 of Chapter 617 of the Statutes of 2002, during the period within which the Quantification Settlement Agreement remains in effect. After the expiration of the Quantification Settlement Agreement, to the extent conservation water projects implemented as part of the Quantification Settlement Agreement remain in effect, the conserved water created as part of those projects shall be credited against the obligations of the agricultural water supplier pursuant to this part.

## Chapter 2 Definitions

SECTION 10608.12

10608.12. Unless the context otherwise requires, the following definitions govern the construction of this part:

(a) "Agricultural water supplier" means a water supplier, either publicly or privately owned, providing water to 10,000 or more irrigated acres, excluding recycled water. "Agricultural water supplier" includes a supplier or contractor for water, regardless of the basis of right, that distributes or sells water for ultimate resale to customers. "Agricultural water supplier" does not include the department.

(b) "Base daily per capita water use" means any of the following:

(1) The urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(2) For an urban retail water supplier that meets at least 10 percent of its 2008 measured retail water demand through recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier, the urban retail water supplier may extend the calculation described in paragraph (1) up to an additional five years to a maximum of a continuous 15-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(3) For the purposes of Section 10608.22, the urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous five-year period ending no earlier than December 31, 2007, and no later than December 31, 2010.

(c) "Baseline commercial, industrial, and institutional water use" means an urban retail water supplier's base daily per capita water use for commercial, industrial, and institutional users.

(d) "Commercial water user" means a water user that provides or distributes a product or service.

(e) "Compliance daily per capita water use" means the gross water use during the final year of the reporting period, reported in gallons per capita per day.

(f) "Disadvantaged community" means a community with an annual median household income that is less than 80 percent of the statewide annual median household income.

(g) "Gross water use" means the total volume of water, whether treated or untreated, entering the distribution system of an urban retail water supplier, excluding all of the following:

(1) Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier.

(2) The net volume of water that the urban retail water supplier places into long-term storage.

(3) The volume of water the urban retail water supplier conveys for use by another urban water supplier.

(4) The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24.

(h) "Industrial water user" means a water user that is primarily a manufacturer or processor of materials as defined by the North American Industry Classification System code sectors 31 to 33, inclusive, or an entity that is a water user primarily engaged in research and development.

(i) "Institutional water user" means a water user dedicated to public service. This type of user includes, among other users, higher education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions.

(j) "Interim urban water use target" means the midpoint between the urban retail water supplier's base daily per capita water use and the urban retail water supplier's urban water use target for 2020.

(k) "Locally cost effective" means that the present value of the local benefits of implementing an agricultural efficiency water management practice is greater than or equal to the present value of the local cost of implementing that measure.

(l) "Process water" means water used for producing a product or product content or water used for research and development, including, but not limited to, continuous manufacturing processes, water used for testing and maintaining equipment used in producing a product or product content, and water used in combined heat and power facilities used in producing a product or product content. Process water does not mean incidental water uses not related to the production of a product or product content, including, but not limited to, water used for restrooms, landscaping, air conditioning, heating, kitchens, and laundry.

(m) "Recycled water" means recycled water, as defined in subdivision (n) of Section 13050, that is used to offset potable demand, including recycled water supplied for direct use and indirect potable reuse, that meets the following requirements, where applicable:

(1) For groundwater recharge, including recharge through spreading basins, water supplies that are all of the following:

(A) Metered.

(B) Developed through planned investment by the urban water supplier or a wastewater treatment agency.

(C) Treated to a minimum tertiary level.

(D) Delivered within the service area of an urban retail water supplier or its urban wholesale water supplier that helps an urban retail water supplier meet its urban water use target.

(2) For reservoir augmentation, water supplies that meet the criteria of paragraph (1) and are conveyed through a distribution system constructed specifically for recycled water.

(n) "Regional water resources management" means sources of supply resulting from watershed-based planning for sustainable local water reliability or any of the following alternative sources of water:

(1) The capture and reuse of stormwater or rainwater.

(2) The use of recycled water.

(3) The desalination of brackish groundwater.

(4) The conjunctive use of surface water and groundwater in a manner that is consistent with the safe yield of the groundwater basin.

(o) "Reporting period" means the years for which an urban retail water supplier reports compliance with the urban water use targets.

(p) "Urban retail water supplier" means a water supplier, either publicly or privately owned, that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes.

(q) "Urban water use target" means the urban retail water supplier's targeted future daily per capita water use.

(r) "Urban wholesale water supplier," means a water supplier, either publicly or privately owned, that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes.

## Chapter 3 Urban Retail Water Suppliers

SECTION 10608.16-10608.44

10608.16.(a) The state shall achieve a 20-percent reduction in urban per capita water use in California on or before December 31, 2020.

(b) The state shall make incremental progress towards the state target specified in subdivision (a) by reducing urban per capita water use by at least 10 percent on or before December 31, 2015.

10608.20.(a) (1) Each urban retail water supplier shall develop urban water use targets and an interim urban water use target by July 1, 2011. Urban retail water suppliers may elect to determine and report progress toward achieving these targets on an individual or regional basis, as provided in subdivision (a) of Section 10608.28, and may determine the targets on a fiscal year or calendar year basis.

(2) It is the intent of the Legislature that the urban water use targets described in paragraph (1) cumulatively result in a 20-percent reduction from the baseline daily per capita water use by December 31, 2020.

(b) An urban retail water supplier shall adopt one of the following methods for determining its urban water use target pursuant to subdivision (a):

(1) Eighty percent of the urban retail water supplier's baseline per capita daily water use.

(2) The per capita daily water use that is estimated using the sum of the following performance standards:

(A) For indoor residential water use, 55 gallons per capita daily water use as a provisional standard. Upon completion of the department's 2016 report to the Legislature pursuant to Section 10608.42, this standard may be adjusted by the Legislature by statute.

(B) For landscape irrigated through dedicated or residential meters or connections, water efficiency equivalent to the standards of the Model Water Efficient Landscape Ordinance set forth in Chapter 2.7 (commencing with Section 490) of Division 2 of Title 23 of the California Code of Regulations, as in effect the later of the year of the landscape's installation or 1992. An urban retail water supplier using the approach specified in this subparagraph shall use satellite imagery, site visits, or other best available technology to develop an accurate estimate of landscaped areas.

(C) For commercial, industrial, and institutional uses, a 10-percent reduction in water use from the baseline commercial, industrial, and institutional water use by 2020.

(3) Ninety-five percent of the applicable state hydrologic region target, as set forth in the state's draft 20x2020 Water Conservation Plan (dated April 30, 2009). If the service area of an urban water supplier includes more than one hydrologic region, the supplier shall apportion its service area to each region based on population or area.

(4) A method that shall be identified and developed by the department, through a public process, and reported to the Legislature no later than December 31, 2010. The method developed by the department shall identify per capita targets that cumulatively result in a statewide 20-percent reduction in urban daily per capita water use by December 31, 2020. In developing urban daily per capita water use targets, the department shall do all of the following:

(A) Consider climatic differences within the state.

(B) Consider population density differences within the state.

(C) Provide flexibility to communities and regions in meeting the targets.

(D) Consider different levels of per capita water use according to plant water needs in different regions.

(E) Consider different levels of commercial, industrial, and institutional water use in different regions of the state.

(F) Avoid placing an undue hardship on communities that have implemented conservation measures or taken actions to keep per capita water use low.

(c) If the department adopts a regulation pursuant to paragraph (4) of subdivision (b) that results in a requirement that an urban retail water supplier achieve a reduction in daily per capita water use that is greater than 20 percent by December 31, 2020, an urban retail water supplier that adopted the method

described in paragraph (4) of subdivision (b) may limit its urban water use target to a reduction of not more than 20 percent by December 31, 2020, by adopting the method described in paragraph (1) of subdivision (b).

(d) The department shall update the method described in paragraph (4) of subdivision (b) and report to the Legislature by December 31, 2014. An urban retail water supplier that adopted the method described in paragraph (4) of subdivision (b) may adopt a new urban daily per capita water use target pursuant to this updated method.

(e) An urban retail water supplier shall include in its urban water management plan due in 2010 pursuant to Part 2.6 (commencing with Section 10610) the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

(f) When calculating per capita values for the purposes of this chapter, an urban retail water supplier shall determine population using federal, state, and local population reports and projections.

(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan required pursuant to Part 2.6 (commencing with Section 10610).

(h) (1) The department, through a public process and in consultation with the California Urban Water Conservation Council, shall develop technical methodologies and criteria for the consistent implementation of this part, including, but not limited to, both of the following:

(A) Methodologies for calculating base daily per capita water use, baseline commercial, industrial, and institutional water use, compliance daily per capita water use, gross water use, service area population, indoor residential water use, and landscaped area water use.

(B) Criteria for adjustments pursuant to subdivisions (d) and (e) of Section 10608.24.

(2) The department shall post the methodologies and criteria developed pursuant to this subdivision on its Internet Web site, and make written copies available, by October 1, 2010. An urban retail water supplier shall use the methods developed by the department in compliance with this part.

(i) (1) The department shall adopt regulations for implementation of the provisions relating to process water in accordance with subdivision (l) of Section 10608.12, subdivision (e) of Section 10608.24, and subdivision (d) of Section 10608.26.

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the

Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

(j) (1) An urban retail water supplier is granted an extension to July 1, 2011, for adoption of an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) due in 2010 to allow the use of technical methodologies developed by the department pursuant to paragraph (4) of subdivision (b) and subdivision (h). An urban retail water supplier that adopts an urban water management plan due in 2010 that does not use the methodologies developed by the department pursuant to subdivision (h) shall amend the plan by July 1, 2011, to comply with this part.

(2) An urban wholesale water supplier whose urban water management plan prepared pursuant to Part 2.6 (commencing with Section 10610) was due and not submitted in 2010 is granted an extension to July 1, 2011, to permit coordination between an urban wholesale water supplier and urban retail water suppliers.

10608.22. Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph(3) of subdivision (b) of Section 10608.12. This section does not apply to an urban retail water supplier with a base daily per capita water use at or below 100 gallons per capita per day.

10608.24.(a) Each urban retail water supplier shall meet its interim urban water use target by December 31, 2015.

(b) Each urban retail water supplier shall meet its urban water use target by December 31, 2020.

(c) An urban retail water supplier's compliance daily per capita water use shall be the measure of progress toward achievement of its urban water use target.

(d) (1) When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:

(A) Differences in evapotranspiration and rainfall in the baseline period compared to the compliance reporting period.
(B) Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period.

(C) Substantial changes to institutional water use resulting from fire suppression services or other extraordinary events, or from new or expanded operations, that have occurred during the reporting period.

(2) If the urban retail water supplier elects to adjust its estimate of compliance daily per capita water use due to one or more of the factors described in

paragraph (1), it shall provide the basis for, and data supporting, the adjustment in the report required by Section 10608.40.

(e) When developing the urban water use target pursuant to Section 10608.20, an urban retail water supplier that has a substantial percentage of industrial water use in its service area may exclude process water from the calculation of gross water use to avoid a disproportionate burden on another customer sector.

(f) (1) An urban retail water supplier that includes agricultural water use in an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) may include the agricultural water use in determining gross water use. An urban retail water supplier that includes agricultural water use in determining gross water use and develops its urban water use target pursuant to paragraph (2) of subdivision (b) of Section 10608.20 shall use a water efficient standard for agricultural irrigation of 100 percent of reference evapotranspiration multiplied by the crop coefficient for irrigated acres.

(2) An urban retail water supplier, that is also an agricultural water supplier, is not subject to the requirements of Chapter 4 (commencing with Section 10608.48), if the agricultural water use is incorporated into its urban water use target pursuant to paragraph (1).

10608.26.(a) In complying with this part, an urban retail water supplier shall conduct at least one public hearing to accomplish all of the following:

(1) Allow community input regarding the urban retail water supplier's implementation plan for complying with this part.

(2) Consider the economic impacts of the urban retail water supplier's implementation plan for complying with this part.

(3) Adopt a method, pursuant to subdivision (b) of Section 10608.20, for determining its urban water use target.

(b) In complying with this part, an urban retail water supplier may meet its urban water use target through efficiency improvements in any combination among its customer sectors. An urban retail water supplier shall avoid placing a disproportionate burden on any customer sector.

(c) For an urban retail water supplier that supplies water to a United States Department of Defense military installation, the urban retail water supplier's implementation plan for complying with this part shall consider the conservation of that military installation under federal Executive Order 13514.

(d) (1) Any ordinance or resolution adopted by an urban retail water supplier after the effective date of this section shall not require existing customers as of the effective date of this section, to undertake changes in product formulation, operations, or equipment that would reduce process water use, but may provide technical assistance and financial incentives to those customers to implement efficiency measures for process water. This section shall not limit

an ordinance or resolution adopted pursuant to a declaration of drought emergency by an urban retail water supplier.

(2) This part shall not be construed or enforced so as to interfere with the requirements of Chapter 4 (commencing with Section 113980) to Chapter 13 (commencing with Section 114380), inclusive, of Part 7 of Division 104 of the Health and Safety Code, or any requirement or standard for the protection of public health, public safety, or worker safety established by federal, state, or local government or recommended by recognized standard setting organizations or trade associations.

10608.28.(a) An urban retail water supplier may meet its urban water use target within its retail service area, or through mutual agreement, by any of the following:

(1) Through an urban wholesale water supplier.

(2) Through a regional agency authorized to plan and implement water conservation, including, but not limited to, an agency established under the Bay Area Water Supply and Conservation Agency Act (Division 31 (commencing with Section 81300)).

(3) Through a regional water management group as defined in Section 10537.

(4) By an integrated regional water management funding area.

(5) By hydrologic region.

(6) Through other appropriate geographic scales for which computation methods have been developed by the department.

(b) A regional water management group, with the written consent of its member agencies, may undertake any or all planning, reporting, and implementation functions under this chapter for the member agencies that consent to those activities. Any data or reports shall provide information both for the regional water management group and separately for each consenting urban retail water supplier and urban wholesale water supplier.

10608.32. All costs incurred pursuant to this part by a water utility regulated by the Public Utilities Commission may be recoverable in rates subject to review and approval by the Public Utilities Commission, and may be recorded in a memorandum account and reviewed for reasonableness by the Public Utilities Commission.

10608.36. Urban wholesale water suppliers shall include in the urban water management plans required pursuant to Part 2.6 (commencing with Section 10610) an assessment of their present and proposed future measures, programs, and policies to help achieve the water use reductions required by this part.

10608.40. Urban water retail suppliers shall report to the department on their progress in meeting their urban water use targets as part of their urban water management plans

submitted pursuant to Section 10631. The data shall be reported using a standardized form developed pursuant to Section 10608.52.

10608.42.(a) The department shall review the 2015 urban water management plans and report to the Legislature by July 1, 2017, on progress towards achieving a 20-percent reduction in urban water use by December 31, 2020. The report shall include recommendations on changes to water efficiency standards or urban water use targets to achieve the 20-percent reduction and to reflect updated efficiency information and technology changes.

(b) A report to be submitted pursuant to subdivision (a) shall be submitted in compliance with Section 9795 of the Government Code.

10608.43. The department, in conjunction with the California Urban Water Conservation Council, by April 1, 2010, shall convene a representative task force consisting of academic experts, urban retail water suppliers, environmental organizations, commercial water users, industrial water users, and institutional water users to develop alternative best management practices for commercial, industrial, and institutional users and an assessment of the potential statewide water use efficiency improvement in the commercial, industrial, and institutional sectors that would result from implementation of these best management practices. The taskforce, in conjunction with the department, shall submit a report to the Legislature by April 1, 2012, that shall include a review of multiple sectors within commercial, industrial, and institutional users and that shall recommend water use efficiency standards for commercial, industrial, and institutional users among various sectors of water use. The report shall include, but not be limited to, the following:

(a) Appropriate metrics for evaluating commercial, industrial, and institutional water use.

(b) Evaluation of water demands for manufacturing processes, goods, and cooling.

(c) Evaluation of public infrastructure necessary for delivery of recycled water to the commercial, industrial, and institutional sectors.

(d) Evaluation of institutional and economic barriers to increased recycled water use within the commercial, industrial, and institutional sectors.

(e) Identification of technical feasibility and cost of the best management practices to achieve more efficient water use statewide in the commercial, industrial, and institutional sectors that is consistent with the public interest and reflects past investments in water use efficiency.

10608.44. Each state agency shall reduce water use at facilities it operates to support urban retail water suppliers in meeting the target identified in Section 10608.16.

# Chapter 4 Agricultural Water Suppliers

SECTION 10608.48

10608.48.(a) On or before July 31, 2012, an agricultural water supplier shall implement efficient water management practices pursuant to subdivisions (b) and (c).

(b) Agricultural water suppliers shall implement all of the following critical efficient management practices:

(1) Measure the volume of water delivered to customers with sufficient accuracy to comply with subdivision (a) of Section 531.10 and to implement paragraph (2).

(2) Adopt a pricing structure for water customers based at least in part on quantity delivered.

(c) Agricultural water suppliers shall implement additional efficient management practices, including, but not limited to, practices to accomplish all of the following, if the measures are locally cost effective and technically feasible:

(1) Facilitate alternative land use for lands with exceptionally high water duties or whose irrigation contributes to significant problems, including drainage.

(2) Facilitate use of available recycled water that otherwise would not be used beneficially, meets all health and safety criteria, and does not harm crops or soils.

(3) Facilitate the financing of capital improvements for on-farm irrigation systems.

(4) Implement an incentive pricing structure that promotes one or more of the following goals:

(A) More efficient water use at the farm level.

(B) Conjunctive use of groundwater.

(C) Appropriate increase of groundwater recharge.

(D) Reduction in problem drainage.

(E) Improved management of environmental resources.

(F) Effective management of all water sources throughout the year by adjusting seasonal pricing structures based on current conditions.

(5) Expand line or pipe distribution systems, and construct regulatory reservoirs to increase distribution system flexibility and capacity, decrease maintenance, and reduce seepage.

(6) Increase flexibility in water ordering by, and delivery to, water customers within operational limits.

(7) Construct and operate supplier spill and tailwater recovery systems.

(8) Increase planned conjunctive use of surface water and groundwater within the supplier service area.

(9) Automate canal control structures.

(10) Facilitate or promote customer pump testing and evaluation.

(11) Designate a water conservation coordinator who will develop and implement the water management plan and prepare progress reports.

(12) Provide for the availability of water management services to water users. These services may include, but are not limited to, all of the following:

(A) On-farm irrigation and drainage system evaluations.

(B) Normal year and real-time irrigation scheduling and crop evapotranspiration information.

(C) Surface water, groundwater, and drainage water quantity and quality data.

(D) Agricultural water management educational programs and materials for farmers, staff, and the public.

(13) Evaluate the policies of agencies that provide the supplier with water to identify the potential for institutional changes to allow more flexible water deliveries and storage.

(14) Evaluate and improve the efficiencies of the supplier's pumps.

(d) Agricultural water suppliers shall include in the agricultural water management plans required pursuant to Part 2.8 (commencing with Section 10800) a report on which efficient water management practices have been implemented and are planned to be implemented, an estimate of the water use efficiency improvements that have occurred since the last report, and an estimate of the water use efficiency improvements estimated to occur five and 10 years in the future. If an agricultural water supplier determines that an efficient water management practice is not locally cost effective or technically feasible, the supplier shall submit information documenting that determination.

(e) The data shall be reported using a standardized form developed pursuant to Section 10608.52.

(f) An agricultural water supplier may meet the requirements of subdivisions (d) and (e) by submitting to the department a water conservation plan submitted to the United States Bureau of Reclamation that meets the requirements described in Section 10828.

(g) On or before December 31, 2013, December 31, 2016, and December 31, 2021, the department, in consultation with the board, shall submit to the Legislature a report on the agricultural efficient water management practices that have been implemented and are planned to be implemented and an assessment of the manner in which the implementation of those efficient water management practices has affected and will affect agricultural operations, including estimated water use efficiency improvements, if any.

(h) The department may update the efficient water management practices required pursuant to subdivision (c), in consultation with the Agricultural Water Management Council, the United States Bureau of Reclamation, and the board. All efficient water management practices for agricultural water use pursuant to this chapter shall be adopted or revised by the department only after the department conducts public hearings to allow participation of the diverse geographical areas and interests of the state.

(i) (1) The department shall adopt regulations that provide for a range of options that agricultural water suppliers may use or implement to comply with the measurement requirement in paragraph (1) of subdivision (b).

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

## Chapter 5 Sustainable Water Management

Section 10608.50

10608.50.(a) The department, in consultation with the board, shall promote implementation of regional water resources management practices through increased incentives and removal of barriers consistent with state and federal law. Potential changes may include, but are not limited to, all of the following:

(1) Revisions to the requirements for urban and agricultural water management plans.

(2) Revisions to the requirements for integrated regional water management plans.

(3) Revisions to the eligibility for state water management grants and loans.

(4) Revisions to state or local permitting requirements that increase water supply opportunities, but do not weaken water quality protection under state and federal law.

(5) Increased funding for research, feasibility studies, and project construction.

(6) Expanding technical and educational support for local land use and water management agencies.

(b) No later than January 1, 2011, and updated as part of the California Water Plan, the department, in consultation with the board, and with public input, shall propose new statewide targets, or review and update existing statewide targets, for regional water resources management practices, including, but not limited to, recycled water, brackish groundwater desalination, and infiltration and direct use of urban stormwater runoff.

## Chapter 6 Standardized Data Collection

SECTION 10608.52

10608.52.(a) The department, in consultation with the board, the California Bay-Delta Authority or its successor agency, the State Department of Public Health, and the Public Utilities Commission, shall develop a single standardized water use reporting form to meet the water use information needs of each agency, including the needs of urban water suppliers that elect to determine and report progress toward achieving targets on a regional basis as provided in subdivision (a) of Section 10608.28.

(b) At a minimum, the form shall be developed to accommodate information sufficient to assess an urban water supplier's compliance with conservation targets pursuant to Section 10608.24 and an agricultural water supplier's compliance with implementation of efficient water management practices pursuant to subdivision (a) of Section 10608.48. The form shall accommodate reporting by urban water suppliers on an individual or regional basis as provided in subdivision (a) of Section 10608.28.

## Chapter 7 Funding Provisions

Section 10608.56-10608.60

10608.56.(a) On and after July 1, 2016, an urban retail water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(b) On and after July 1, 2013, an agricultural water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(c) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for achieving the per capita reductions. The supplier may request grant or loan funds to achieve the per capita reductions to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(d) Notwithstanding subdivision (b), the department shall determine that an agricultural water supplier is eligible for a water grant or loan even though the supplier is not implementing all of the efficient water management practices described in Section 10608.48, if the agricultural water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the efficient water management practices. The supplier may request grant or loan funds to implement the efficient water management practices to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(e) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval documentation demonstrating that its entire service area qualifies as a disadvantaged community.

(f) The department shall not deny eligibility to an urban retail water supplier or agricultural water supplier in compliance with the requirements of this part and Part 2.8 (commencing with Section 10800), that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the requirements of this part or Part 2.8 (commencing with Section 10800).

10608.60.(a) It is the intent of the Legislature that funds made available by Section 75026 of the Public Resources Code should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for grants to implement this part. In the allocation of funding, it is the intent of the Legislature that the department give consideration to disadvantaged communities to assist in implementing the requirements of this part.

(b) It is the intent of the Legislature that funds made available by Section 75041 of the Public Resources Code, should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for direct expenditures to implement this part.

# Chapter 8 Quantifying Agricultural Water Use Efficiency

SECTION 10608.64

10608.64. The department, in consultation with the Agricultural Water Management Council, academic experts, and other stakeholders, shall develop a methodology for quantifying the efficiency of agricultural water use. Alternatives to be assessed shall include, but not be limited to, determination of efficiency levels based on crop type or irrigation system distribution uniformity. On or before December 31, 2011, the department shall report to the Legislature on a proposed methodology and a plan for implementation. The plan shall include the estimated implementation costs and the types of data needed to support the methodology. Nothing in this section authorizes the department to implement a methodology established pursuant to this section.

# Checklist

# Department of Water Resources
# 2015 Urban Water Management Plan
# Checklist

### Arranged by Subject

| CWC Section | UWMP Requirement | Subject | Guidebook Location | UWMP Location |
|---|---|---|---|---|
| **10620(b)** | Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier. | Plan Preparation | Section 2.1 | **Section 1.2.1** |
| **10620(d)(2)** | Coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable. | Plan Preparation | Section 2.5.2 | **Section 1.2.2, Table 1-1** |
| **10642** | Provide supporting documentation that the water supplier has encouraged active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan. | Plan Preparation | Section 2.5.2 | **Section 1.2.2, Appendix F** |
| **10631(a)** | Describe the water supplier service area. | System Description | Section 3.1 | **Section 2.2** |
| **10631(a)** | Describe the climate of the service area of the supplier. | System Description | Section 3.3 | **Section 2.2.2, Table 2-1** |
| **10631(a)** | Provide population projections for 2020, 2025, 2030, and 2035. | System Description | Section 3.4 | **Section 2.2.3, Table 2-2** |
| **10631(a)** | Describe other demographic factors affecting the supplier's water management planning. | System Description | Section 3.4 | **Section 2.2.3, Section 2.2.4** |
| **10631(a)** | Indicate the current population of the service area. | System Description and Baselines and Targets | Sections 3.4 and 5.4 | **Section 2.2.3, Table 2-2** |
| **10631(e)(1)** | Quantify past, current, and projected water use, identifying the uses among water use sectors. | System Water Use | Section 4.2 | **Section 3.3, Table 3-2** |
| **10631(e)(3)(A)** | Report the distribution system water loss for the most recent 12-month period available. | System Water Use | Section 4.3 | **Section 3.4, Table 3-1** |
| **10631.1(a)** | Include projected water use needed for lower income housing projected in the service area of the supplier. | System Water Use | Section 4.5 | **Section 3.5, Table 3-2** |
| **10608.20(b)** | Retail suppliers shall adopt a 2020 water use target using one of four methods. | Baselines and Targets | Section 5.7 and App E | **Section 3.6, Section 3.6.2, Appendix F** |

| | | | | |
|---|---|---|---|---|
| **10608.20(e)** | Retail suppliers shall provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data. | Baselines and Targets | Chapter 5 and App E | **Section 3.6.1, Section 3.6.2, Table 3-3, Table 3-4** |
| **10608.22** | Retail suppliers' per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use of the 5 year baseline. This does not apply if the suppliers base GPCD is at or below 100. | Baselines and Targets | Section 5.7.2 | **Section 3.6.2, Table 3-5** |
| **10608.24(a)** | Retail suppliers shall meet their interim target by December 31, 2015. | Baselines and Targets | Section 5.8 and App E | **Section 3.6.3, Table 3-6** |
| **10608.24(d)(2)** | If the retail supplier adjusts its compliance GPCD using weather normalization, economic adjustment, or extraordinary events, it shall provide the basis for, and data supporting the adjustment. | Baselines and Targets | Section 5.8.2 | **N/A** |
| **10608.36** | Wholesale suppliers shall include an assessment of present and proposed future measures, programs, and policies to help their retail water suppliers achieve targeted water use reductions. | Baselines and Targets | Section 5.1 | **Section 3.6.4** |
| **10608.40** | Retail suppliers shall report on their progress in meeting their water use targets. The data shall be reported using a standardized form. | Baselines and Targets | Section 5.8 and App E | **Section 3.6.3, Appendix D** |
| **10631(b)** | Identify and quantify the existing and planned sources of water available for 2015, 2020, 2025, 2030, and 2035. | System Supplies | Chapter 6 | **Section 4.1, Table 4-1** |
| **10631(b)** | Indicate whether groundwater is an existing or planned source of water available to the supplier. | System Supplies | Section 6.2 | **Section 4.2** |
| **10631(b)(1)** | Indicate whether a groundwater management plan has been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization. | System Supplies | Section 6.2.2 | **Section 4.2.2, Appendix K** |
| **10631(b)(2)** | Describe the groundwater basin. | System Supplies | Section 6.2.1 | **Section 4.2.1** |
| **10631(b)(2)** | Indicate if the basin has been adjudicated and include a copy of the court order or decree and a description of the amount of water the supplier has the legal right to pump. | System Supplies | Section 6.2.2 | **Section 4.2.2, Table 4-3, Appendix K** |
| **10631(b)(2)** | For unadjudicated basins, indicate whether or not the department has identified the basin as overdrafted, or projected to become overdrafted. Describe efforts by the supplier to eliminate the long-term overdraft condition. | System Supplies | Section 6.2.3 | **N/A** |

| | | | | |
|---|---|---|---|---|
| **10631(b)(3)** | Provide a detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years | System Supplies | Section 6.2.4 | **Section 4.2.2, Table 4-4** |
| **10631(b)(4)** | Provide a detailed description and analysis of the amount and location of groundwater that is projected to be pumped. | System Supplies | Sections 6.2 and 6.9 | **Section 4.2.2, Table 4-1** |
| **10631(d)** | Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis. | System Supplies | Section 6.7 | **Section 4.6.4** |
| **10631(g)** | Describe the expected future water supply projects and programs that may be undertaken by the water supplier to address water supply reliability in average, single-dry, and multiple-dry years. | System Supplies | Section 6.8 | **Section 4.6** |
| **10631(h)** | Describe desalinated water project opportunities for long-term supply. | System Supplies | Section 6.6 | **Section 4.6.6** |
| **10631(j)** | Retail suppliers will include documentation that they have provided their wholesale supplier(s) – if any - with water use projections from that source. | System Supplies | Section 2.5.1 | **Section 1.2.2, Appendix F** |
| **10631(j)** | Wholesale suppliers will include documentation that they have provided their urban water suppliers with identification and quantification of the existing and planned sources of water available from the wholesale to the urban supplier during various water year types. | System Supplies | Section 2.5.1 | **Section 1.2.2, Appendix F** |
| **10633** | For wastewater and recycled water, coordinate with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area. | System Supplies (Recycled Water) | Section 6.5.1 | **Section 1.2.2, Appendix F** |
| **10633(a)** | Describe the wastewater collection and treatment systems in the supplier's service area. Include quantification of the amount of wastewater collected and treated and the methods of wastewater disposal. | System Supplies (Recycled Water) | Section 6.5.2 | **Section 4.5.1, Table 4-5, Appendix M** |
| **10633(b)** | Describe the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project. | System Supplies (Recycled Water) | Section 6.5.2.2 | **Section 4.5.1, Section 4.5.2, Section 4.5.3, Section 4.6.5, Table 4-8, Appendix M** |
| **10633(c)** | Describe the recycled water currently being used in the supplier's service area. | System Supplies (Recycled Water) | Section 6.5.3 and 6.5.4 | **Section 4.5.3, Table 4-7** |
| **10633(d)** | Describe and quantify the potential uses of recycled water and provide a determination of the technical and economic feasibility of those uses. | System Supplies (Recycled Water) | Section 6.5.4 | **Section 4.5.2, Section 4.6.5, Table 4-7, Appendix M** |

| | | | | |
|---|---|---|---|---|
| **10633(e)** | Describe the projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected. | System Supplies (Recycled Water) | Section 6.5.4 | **Section 4.5.3, Table 4-6, Table 4-7** |
| **10633(f)** | Describe the actions which may be taken to encourage the use of recycled water and the projected results of these actions in terms of acre-feet of recycled water used per year. | System Supplies (Recycled Water) | Section 6.5.5 | **Section 4.6.5, Appendix M** |
| **10633(g)** | Provide a plan for optimizing the use of recycled water in the supplier's service area. | System Supplies (Recycled Water) | Section 6.5.5 | **Section 4.6.5, Appendix M** |
| **10620(f)** | Describe water management tools and options to maximize resources and minimize the need to import water from other regions. | Water Supply Reliability Assessment | Section 7.4 | **Section 4.1, Section 5.1** |
| **10631(c)(1)** | Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage. | Water Supply Reliability Assessment | Section 7.1 | **Section 5.1, Section 5.1.1, Section 5.1.2, Section 5.1.3, Section 5.1.4, Section 5.3** |
| **10631(c)(1)** | Provide data for an average water year, a single dry water year, and multiple dry water years | Water Supply Reliability Assessment | Section 7.2 | **Section 5.3, Section 5.3.1, Table 5-1, Table 5-2** |
| **10631(c)(2)** | For any water source that may not be available at a consistent level of use, describe plans to supplement or replace that source. | Water Supply Reliability Assessment | Section 7.1 | **N/A** |
| **10634** | Provide information on the quality of existing sources of water available to the supplier and the manner in which water quality affects water management strategies and supply reliability | Water Supply Reliability Assessment | Section 7.1 | **Section 5.2, Section 5.2.1, Section 5.2.2, Section 5.2.3, Section 5.2.4, Section 5.2.5** |
| **10635(a)** | Assess the water supply reliability during normal, dry, and multiple dry water years by comparing the total water supply sources available to the water supplier with the total projected water use over the next 20 years. | Water Supply Reliability Assessment | Section 7.3 | **Section 5.4, Table 5-3, Table 5-4, Table 5-5** |
| **10632(a) and 10632(a)(1)** | Provide an urban water shortage contingency analysis that specifies stages of action and an outline of specific water supply conditions at each stage. | Water Shortage Contingency Planning | Section 8.1 | **Section 7, Section 7.1, Section 7.2, Table 7-1, Appendix P** |
| **10632(a)(2)** | Provide an estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency. | Water Shortage Contingency Planning | Section 8.9 | **Section 7.4, Table 7-3** |

| | | | | |
|---|---|---|---|---|
| **10632(a)(3)** | Identify actions to be undertaken by the urban water supplier in case of a catastrophic interruption of water supplies. | Water Shortage Contingency Planning | Section 8.8 | **Section 7.5, Section 7.5.1, Appendix P** |
| **10632(a)(4)** | Identify mandatory prohibitions against specific water use practices during water shortages. | Water Shortage Contingency Planning | Section 8.2 | **Section 7.2, Section 7.6, Table 7-2, Appendix P** |
| **10632(a)(5)** | Specify consumption reduction methods in the most restrictive stages. | Water Shortage Contingency Planning | Section 8.4 | **Section 7.2, Section 7.6, Table 7-2, Appendix P** |
| **10632(a)(6)** | Indicated penalties or charges for excessive use, where applicable. | Water Shortage Contingency Planning | Section 8.3 | **Section 7.6, Table 7-5, Appendix P** |
| **10632(a)(7)** | Provide an analysis of the impacts of each of the actions and conditions in the water shortage contingency analysis on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts. | Water Shortage Contingency Planning | Section 8.6 | **Section 7.6.1** |
| **10632(a)(8)** | Provide a draft water shortage contingency resolution or ordinance. | Water Shortage Contingency Planning | Section 8.7 | **Section 7.1, Appendix P** |
| **10632(a)(9)** | Indicate a mechanism for determining actual reductions in water use pursuant to the water shortage contingency analysis. | Water Shortage Contingency Planning | Section 8.5 | **Section 7.7** |
| **10631(f)(1)** | Retail suppliers shall provide a description of the nature and extent of each demand management measure implemented over the past five years. The description will address specific measures listed in code. | Demand Management Measures | Sections 9.2 and 9.3 | **See 10631(i)** |
| **10631(f)(2)** | Wholesale suppliers shall describe specific demand management measures listed in code, their distribution system asset management program, and supplier assistance program. | Demand Management Measures | Sections 9.1 and 9.3 | **See 10631(i)** |
| **10631(i)** | CUWCC members may submit their 2013-2014 CUWCC BMP annual reports in lieu of, or in addition to, describing the DMM implementation in their UWMPs. This option is only allowable if the supplier has been found to be in full compliance with the CUWCC MOU. | Demand Management Measures | Section 9.5 | **Section 6.2, Appendix N** |
| **10608.26(a)** | Retail suppliers shall conduct a public hearing to discuss adoption, implementation, and economic impact of water use targets. | Plan Adoption, Submittal, and Implementation | Section 10.3 | **Section 1.2.1, Appendix F** |

| | | | | |
|---|---|---|---|---|
| **10621(b)** | Notify, at least 60 days prior to the public hearing, any city or county within which the supplier provides water that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. | Plan Adoption, Submittal, and Implementation | Section 10.2.1 | **Section 1.2.2, Appendix F** |
| **10621(d)** | Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016. | Plan Adoption, Submittal, and Implementation | Sections 10.3.1 and 10.4 | **Section 1.2.1** |
| **10635(b)** | Provide supporting documentation that Water Shortage Contingency Plan has been, or will be, provided to any city or county within which it provides water, no later than 60 days after the submission of the plan to DWR. | Plan Adoption, Submittal, and Implementation | Section 10.4.4 | **Section 1.2.2, Appendix F** |
| **10642** | Provide supporting documentation that the urban water supplier made the plan available for public inspection, published notice of the public hearing, and held a public hearing about the plan. | Plan Adoption, Submittal, and Implementation | Sections 10.2.2, 10.3, and 10.5 | **Section 1.2.1, Section 1.2.2, Appendix F** |
| **10642** | The water supplier is to provide the time and place of the hearing to any city or county within which the supplier provides water. | Plan Adoption, Submittal, and Implementation | Sections 10.2.1 | **Section 1.2.2, Appendix F** |
| **10642** | Provide supporting documentation that the plan has been adopted as prepared or modified. | Plan Adoption, Submittal, and Implementation | Section 10.3.1 | **Section 1.2.1, Appendix F** |
| **10644(a)** | Provide supporting documentation that the urban water supplier has submitted this UWMP to the California State Library. | Plan Adoption, Submittal, and Implementation | Section 10.4.3 | **Section 1.2.1, Appendix F** |
| **10644(a)(1)** | Provide supporting documentation that the urban water supplier has submitted this UWMP to any city or county within which the supplier provides water no later than 30 days after adoption. | Plan Adoption, Submittal, and Implementation | Section 10.4.4 | **Section 1.2.2, Appendix F** |
| **10644(a)(2)** | The plan, or amendments to the plan, submitted to the department shall be submitted electronically. | Plan Adoption, Submittal, and Implementation | Sections 10.4.1 and 10.4.2 | **Section 1.2.1, Appendix F** |
| **10645** | Provide supporting documentation that, not later than 30 days after filing a copy of its plan with the department, the supplier has or will make the plan available for public review during normal business hours. | Plan Adoption, Submittal, and Implementation | Section 10.5 | **Section 1.2.1, Appendix F** |

| Groundwater recharge | Injection Wells | 400 | 400 | 400 | 400 | 400 |
| | **TOTAL** | 11,519 | 11,756 | 12,060 | 12,361 | 12,645 |

NOTES: First seven categories based on IEUA Land Use Based Demand Model, 2015; see Appendix G for technical memorandum. Water loss and unbilled metered and unmetered uses subtracted out of total demand factor per customer use category. Single-family residential demands include very low, low, and medium (40 percent) model projected residential demands; multi-family residential demands include medium (60 percent) and high density model projected residential demands. Projected landscape demands include all park and school yard landscape demands, some of which are metered under institutional/governmental. All other categories described in footnotes for Table 3-2 in body of report. See District 2015 UWMP Section 3.3, Table 3-2.

**Table 4-2 Wholesale: Demands for Potable and Raw Water - Projected**

| Table 6-1 Retail: Groundwater Volume Pumped | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | Supplier does not pump groundwater. The supplier will not complete the table below. | | | | | |
| Groundwater Type *Drop Down List May use each category multiple times* | Location or Basin Name | 2011 | 2012 | 2013 | 2014 | 2015 |
| *Add additional rows as needed* | | | | | | |
| Alluvial Basin | Chino Groundwater Basin | 9,301 | 6,944 | 6,897 | 7,163 | 5,943 |
| | **TOTAL** | 9,301 | 6,944 | 6,897 | 7,163 | 5,943 |
| NOTES: See District 2015 UWMP Section 4.2, Table 4-4. | | | | | | |

| Table 6-1 Wholesale: Groundwater Volume Pumped | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | Supplier does not pump groundwater. The supplier will not complete the table below. | | | | | |
| Groundwater Type *Drop Down List May use each category multiple times* | Location or Basin Name | 2011 | 2012 | 2013 | 2014 | 2015 |
| Alluvial Basin | Chino Groundwater Basin | 2,732 | 3,594 | 3,428 | 5,359 | 2,462 |
| | **TOTAL** | 2,732 | 3,594 | 3,428 | 5,359 | 2,462 |
| NOTES: See District 2015 UWMP Section 4.2, Table 4-4. | | | | | | |

| Table 6-2 Retail: Wastewater Collected Within Service Area in 2015 | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | There is no wastewater collection system. The supplier will not complete the table below. | | | | | |
| | Percentage of 2015 service area covered by wastewater collection system *(optional)* | | | | | |
| | Percentage of 2015 service area population covered by wastewater collection system *(optional)* | | | | | |
| **Wastewater Collection** | | | **Recipient of Collected Wastewater** | | | |
| Name of Wastewater Collection Agency | Wastewater Volume Metered or Estimated? *Drop Down List* | Volume of Wastewater Collected from UWMP Service Area 2015 | Name of Wastewater Treatment Agency Receiving Collected Wastewater | Treatment Plant Name | Is WWTP Located Within UWMP Area? *Drop Down List* | Is WWTP Operation Contracted to a Third Party? *(optional)* *Drop Down List* |
| *Add additional rows as needed* | | | | | | |
| City of Montclair | Estimated | 2,464 | Inland Empire Utilities Agency | RP-1/RP-4 | No | No |
| **Total Wastewater Collected from Service Area in 2015:** | | 2,464 | | | | |
| NOTES: Estimate based on Montclair's percentage of total IEUA wastewater flows. See District 2015 UWMP Section 4.5.1, Table 4-5. | | | | | | |

**Table 6-3 Retail: Wastewater Treatment and Discharge Within Service Area in 2015**

☑ No wastewater is treated or disposed of within the UWMP service area.
The supplier will not complete the table below.

| Wastewater Treatment Plant Name | Discharge Location Name or Identifier | Discharge Location Description | Wastewater Discharge ID Number *(optional)* | Method of Disposal *Drop down list* | Does This Plant Treat Wastewater Generated Outside the Service Area? | Treatment Level *Drop down list* | 2015 volumes | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Wastewater Treated | Discharged Treated Wastewater | Recycled Within Service Area | Recycled Outside of Service Area |
| *Add additional rows as needed* | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | **Total** | 0 | 0 | 0 | 0 |

NOTES:

**Table 6-3 Wholesale: Wastewater Treatment and Discharge Within Service Area in 2015**

☑ Wholesale supplier neither distributes nor provides supplemental treatment to recycled water.
The supplier will not complete the table below.

| Wastewater Treatment Plant Name | Discharge Location Name or Identifier | Discharge Location Description | Wastewater Discharge ID Number *(optional)* | Method of Disposal *Drop down list* | Does This Plant Treat Wastewater Generated Outside the Service Area? | Treatment Level *Drop down list* | 2015 volumes | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Wastewater Treated | Discharged Treated Wastewater | Recycled Within Service Area | Recycled Outside of Service Area |
| *Add additional rows as needed* | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | | | | | |
| | | | | | | **Total** | 0 | 0 | 0 | 0 |

NOTES:

**Table 6-4 Retail: Current and Projected Recycled Water Direct Beneficial Uses Within Service Area**

☐ Recycled water is not used and is not planned for use within the service area of the supplier. The supplier will not complete the table below.

| | |
|---|---|
| Name of Agency Producing (Treating) the Recycled Water: | Inland Empire Utilities Agency |
| Name of Agency Operating the Recycled Water Distribution System: | Monte Vista Water District |
| Supplemental Water Added in 2015 | N/A |
| Source of 2015 Supplemental Water | N/A |

| Beneficial Use Type | General Description of 2015 Uses | Level of Treatment *Drop down list* | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 (opt) |
|---|---|---|---|---|---|---|---|---|
| Agricultural irrigation | | | | | | | | |
| Landscape irrigation (excludes golf courses) | Parks, school yards, other sites | Tertiary | 308 | 430 | 430 | 430 | 430 | 430 |
| Golf course irrigation | | | | | | | | |
| Commercial use | | | | | | | | |
| Industrial use | | | | | | | | |
| Geothermal and other energy production | | | | | | | | |
| Seawater intrusion barrier | | | | | | | | |
| Recreational impoundment | | | | | | | | |
| Wetlands or wildlife habitat | | | | | | | | |
| Groundwater recharge (IPR)* | Share of regional program | Tertiary | 483 | 601 | 560 | 589 | 639 | 639 |
| Surface water augmentation (IPR)* | | | | | | | | |
| Direct potable reuse | | | | | | | | |
| Other *(Provide General Description)* | | | | | | | | |
| | | **Total:** | 791 | 1,031 | 990 | 1,019 | 1,069 | 1,069 |

**IPR - Indirect Potable Reuse*

NOTES: See District 2015 UWMP Section 4.5.3, Table 4-7.

**Table 6-4 Wholesale: Current and Projected Retailers Provided Recycled Water Within Service Area**

☑ Recycled water is not directly treated or distributed by the supplier. The supplier will not complete the table below.

| Name of Receiving Supplier or Direct Use by Wholesaler | Level of Treatment *Drop down list* | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 *(opt)* |
|---|---|---|---|---|---|---|---|
| *Add additional rows as needed* | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | **Total** | 0 | 0 | 0 | 0 | 0 | 0 |

NOTES:

| Table 6-5 Retail: 2010 UWMP Recycled Water Use Projection Compared to 2015 Actual | | | |
|---|---|---|---|
| ☐ | Recycled water was not used in 2010 nor projected for use in 2015.<br>The supplier will not complete the table below. | | |
| **Use Type** | | **2010 Projection for 2015** | **2015 Actual Use** |
| Agricultural irrigation | | | |
| Landscape irrigation (excludes golf courses) | | 430 | 308 |
| Golf course irrigation | | | |
| Commercial use | | | |
| Industrial use | | | |
| Geothermal and other energy production | | | |
| Seawater intrusion barrier | | | |
| Recreational impoundment | | | |
| Wetlands or wildlife habitat | | | |
| Groundwater recharge (IPR) | | 876 | 483 |
| Surface water augmentation (IPR) | | | |
| Direct potable reuse | | | |
| Other | *Type of Use* | | |
| | **Total** | 1,306 | 791 |
| NOTES: See District 2015 UWMP Section 4.5.2, Table 4-6. | | | |

| Table 6-5 Wholesale: 2010 UWMP Recycled Water Use Projection Compared to 2015 Actual | | |
|---|---|---|
| ☑ | Recycled water was not used or distributed by the supplier in 2010, nor projected for use or distribution in 2015.<br>The wholesale supplier will not complete the table below. | |
| Name of Receiving Supplier or Direct Use by Wholesaler | 2010 Projection for 2015 | 2015 actual use |
| *Add additional rows as needed* | | |
| | | |
| **Total** | 0 | 0 |
| NOTES: | | |

| Table 6-6 Retail: Methods to Expand Future Recycled Water Use | | | |
|---|---|---|---|
| ☐ | Supplier does not plan to expand recycled water use in the future. Supplier will not complete the table below but will provide narrative explanation. | | |
| | Provide page location of narrative in UWMP | | |
| Name of Action | Description | Planned Implementation Year | Expected Increase in Recycled Water Use |
| *Add additional rows as needed* | | | |
| Customer development process; financial incentives; plumbing codes | See UWMP Section 4.6.5; Recycled Water Master Plan, Appendix L | Ongoing | 100 |
| | | **Total** | 100 |
| NOTES: See District 2015 UWMP Section 4.6.5. | | | |

| Table 6-7 Retail: Expected Future Water Supply Projects or Programs | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below. | | | | | |
| ☑ | Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format. | | | | | |
| Section 4.6 | Provide page location of narrative in the UWMP | | | | | |
| Name of Future Projects or Programs | Joint Project with other agencies? | | Description (if needed) | Planned Implementation Year | Planned for Use in Year Type *Drop Down List* | Expected Increase in Water Supply to Agency *This may be a range* |
| | *Drop Down List (y/n)* | *If Yes, Agency Name* | | | | |
| *Add additional rows as needed* | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

NOTES: See District 2015 UWMP Section 4.6 inclusive. District has sufficient water supplies to meet demands for the planning period under all drought conditions; however, the District actively seeks opportunities to further enhance reliability, affordability, and resiliency of its water supply portfolio.

| Table 6-7 Wholesale: Expected Future Water Supply Projects or Programs | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below. | | | | | |
| ☑ | Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format. | | | | | |
| Section 4.6 | Provide page location of narrative in the UWMP | | | | | |
| Name of Future Projects or Programs | Joint Project with other agencies? | | Description *(if needed)* | Planned Implementation Year | Planned for Use in Year Type *Drop Down list* | Expected Increase in Water Supply to Agency |
| | *Drop Down Menu* | *If Yes, Agency Name* | | | | |
| *Add additional rows as needed* | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

NOTES: See District 2015 UWMP Section 4.6 inclusive. District has sufficient water supplies to meet demands for the planning period under all drought conditions; however, the District actively seeks opportunities to further enhance reliability, affordability, and resiliency of its water supply portfolio.

| Purchased or Imported Water | WFA | 9,701 | | 9,701 | | 9,701 | | 9,701 | | 9,701 | |
| **Total** | | 22,650 | 0 | 22,650 | 0 | 22,650 | 0 | 22,650 | 0 | 22,650 | 0 |

NOTES: See District 2015 UWMP Section 4.1, Table 4-1. Groundwater capacity of wells dedicated to wholesale service minus 15% adjustment to account for potential well shutdowns for maintenance/testing. District may use up to its full contractural share (24%) of WFA treatment plant capacity (81 mgd) at any time, subject to Tier 2 and penalty rates; sufficient capacity allocated to meet full wholesale contractural entitlement of up to 20.22 mgd (22,650 AFY). Please note that District supplies are fully integrated and capable of meeting retail and wholesale demands as needed.

**Table 7-1 Retail: Basis of Water Year Data**

| Year Type | Base Year *If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 1999-2000, use 2000* | Available Supplies if Year Type Repeats | |
|---|---|---|---|
| | | ☐ Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location | |
| | | ☑ Quantification of available supplies is provided in this table as either volume only, percent only, or both. | |
| | | **Volume Available** | **% of Average Supply** |
| Average Year | 1893-2015 | | 100% |
| Single-Dry Year | 2013 | | 100% |
| Multiple-Dry Years 1st Year | 2013 | | 100% |
| Multiple-Dry Years 2nd Year | 2014 | | 100% |
| Multiple-Dry Years 3rd Year | 2015 | | 100% |

Agency may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If an agency uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.

NOTES: See District 2015 UWMP Section 5.3, Tables 5-1 and 5-2. Multiple versions of Table 7-1 are being used. This version of Table 7-1 is for Chino Groundwater Basin supply. Based on local hydrologic data.

**Table 7-1 Retail: Basis of Water Year Data**

|---|---|---|---|
| Stage | Restrictions and Prohibitions on End Users<br>***Drop down list***<br>*These are the only categories that will be accepted by the WUEdata online submittal tool* | Additional Explanation or Reference<br>*(optional)* | Penalty, Charge, or Other Enforcement?<br>*Drop Down List* |
| *Add additional rows as needed* | | | |
| Permanent | Landscape - Limit landscape irrigation to specific times | Before 8am or after 8pm; 15 mins per station; exemptions for hand-watering, drip, smart controllers | Yes |
| Permanent | Landscape - Restrict or prohibit runoff from landscape irrigation | | Yes |
| Permanent | Landscape - Other landscape restriction or prohibition | Turn off outdoor irrigation during rain | Yes |
| Permanent | Other - Customers must repair leaks, breaks, and malfunctions in a timely manner | Within 7 days of discovery | Yes |
| Permanent | Other - Require automatic shut of hoses | Or use commercial vehicle wash equipped with recycyling system | Yes |
| Permanent | Other - Prohibit use of potable water for washing hard surfaces | Unless for health and safety purposes and only with a waterbroom or water-efficient pressure washer | Yes |
| Permanent | CII - Restaurants may only serve water upon request | | Yes |
| Permanent | CII - Lodging establishment must offer opt out of linen service | | Yes |
| Permanent | CII - Other CII restriction or prohibition | Require recirculation systems for all cooling towers and evaporative cooling systems, decorative water fountains, and conveyor and in-bay vehicle washes | Yes |

| | | | |
|---|---|---|---|
| Significant | Landscape - Limit landscape irrigation to specific days | Tuesdays, Thursdays, Saturdays; exemptions for water-dependent industries, hand-watering, drip, smart controllers | Yes |
| Significant | Landscape - Other landscape restriction or prohibition | Dedicated irrigation meters limited to 75% pre-shortage use | Yes |
| Significant | Other | Require water use plan for construction/dust control use; make recycled water available | Yes |
| Significant | Other | Restrict use of hydrants | Yes |
| Critical | Landscape - Limit landscape irrigation to specific days | Tuesdays, Saturdays | Yes |
| Critical | Landscape - Other landscape restriction or prohibition | Dedicated irrigation meters limited to 50% pre-shortage use | Yes |
| Critical | Landscape - Other landscape restriction or prohibition | No landscaping requirements that result in increased water use | Yes |
| Critical | Other - Prohibit vehicle washing except at facilities using recycled or recirculating water | | Yes |
| Critical | Other water feature or swimming pool restriction | No emptying/refilling pools; water levels may be maintained | Yes |
| Emergency | Landscape - Limit landscape irrigation to specific days | Saturdays | Yes |
| Emergency | Landscape - Other landscape restriction or prohibition | Dedicated irrigation meters limited to 33% pre-shortage use | Yes |
| Emergency | Landscape - Other landscape restriction or prohibition | No installation of new landscaping | Yes |
| Emergency | Other - Prohibit use of potable water for construction and dust control | | Yes |
| Emergency | Other water feature or swimming pool restriction | No emptying/refilling/maintaining pool | Yes |
| All stages | Other | Wholesale customer demand reduction same percentage as retail customers | Yes |

|---|---|---|
| ☐ | Supplier has notified more than 10 cities or counties in accordance with CWC 10621 (b) and 10642. **Completion of the table below is not required. Provide a separate list of the cities and counties that were notified.** | |
| | Provide the page or location of this list in the UWMP. | |
| ☑ | Supplier has notified 10 or fewer cities or counties. **Complete the table below.** | |
| City Name | 60 Day Notice | Notice of Public Hearing |
| *Add additional rows as needed* | | |
| Chino Hills | ☑ | ☑ |
| NOTES: See District 2015 UWMP Sections 1.2.1 and 1.2.2, Table 1-1. | | |

| SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)* |
|---|
| Acre Feet |
| **The unit of measure must be consistent with Table 2-3* |
| NOTES: |

| SB X7-7 Table-1: Baseline Period Ranges | | | |
|---|---|---|---|
| **Baseline** | **Parameter** | **Value** | **Units** |
| 10- to 15-year baseline period | 2008 total water deliveries | 12,247 | Acre Feet |
| | 2008 total volume of delivered recycled water | - | Acre Feet |
| | 2008 recycled water as a percent of total deliveries | 0.00% | Percent |
| | Number of years in baseline period[1, 2] | 10 | Years |
| | Year beginning baseline period range | 1996 | |
| | Year ending baseline period range[3] | 2005 | |
| 5-year baseline period | Number of years in baseline period | 5 | Years |
| | Year beginning baseline period range | 2003 | |
| | Year ending baseline period range[4] | 2007 | |
| *[1] If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater, the first baseline period is a continuous 10- to 15-year period.* | | | |
| *[2] The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.* | | | |
| *[3] The ending year must be between December 31, 2004 and December 31, 2010.* | | | |
| *[4] The ending year must be between December 31, 2007 and December 31, 2010.* | | | |

Montclair, CA 91763

**Notification of Availability of Public Review Draft – 2015 Urban Water Management Plan**

Dear Mr. Starr,

This letter is an update to Monte Vista Water District's process of developing its 2015 Urban Water Management Plan, in compliance with the California Urban Water Management Planning Act.

A draft of the District's Plan is now available for public review. The plan can be downloaded from the District's website, www.mvwd.org, following the "Public Documents" and "Planning Documents" menu links. A hard copy is also available to review at the District Administrative Office located at 10575 Central Avenue, Montclair. The District will also provide a copy of the Plan electronically or in hard copy upon request.

The District's Board of Directors has set a public hearing for 6:30 p.m., Wednesday, June 22, 2016, to consider adoption of the District's 2015 Urban Water Management Plan. The public hearing will take place at the District Administrative Office, 10575 Central Avenue, Montclair. The District would appreciate receiving comments on the draft plan prior to the public hearing.

This and future announcements concerning progress in updating the District's 2015 Urban Water Management Plan will be posted on the District website, www.mvwd.org, in the "District News" section. Upon adoption, the final Plan will be available on the District website's "Public Documents" section and provided to local cities and counties within which the District provides water service.

For more information, please contact Justin Scott-Coe, public affairs director, at (909) 267-2116 or at jscottcoe@mvwd.org.

**Notification of Availability of Public Review Draft – 2015 Urban Water Management Plan**

Dear Ms. Staats,

This letter is an update to Monte Vista Water District's process of developing its 2015 Urban Water Management Plan, in compliance with the California Urban Water Management Planning Act.

A draft of the District's Plan is now available for public review. The plan can be downloaded from the District's website, www.mvwd.org, following the "Public Documents" and "Planning Documents" menu links. A hard copy is also available to review at the District Administrative Office located at 10575 Central Avenue, Montclair. The District will also provide a copy of the Plan electronically or in hard copy upon request.

The District's Board of Directors has set a public hearing for 6:30 p.m., Wednesday, June 22, 2016, to consider adoption of the District's 2015 Urban Water Management Plan. The public hearing will take place at the District Administrative Office, 10575 Central Avenue, Montclair. The District would appreciate receiving comments on the draft plan prior to the public hearing.

This and future announcements concerning progress in updating the District's 2015 Urban Water Management Plan will be posted on the District website, www.mvwd.org, in the "District News" section. Upon adoption, the final Plan will be available on the District website's "Public Documents" section and provided to local cities and counties within which the District provides water service.

For more information, please contact Justin Scott-Coe, public affairs director, at (909) 267-2116 or at jscottcoe@mvwd.org.

**Notification of Update to Urban Water Management Plan**

Dear Mr. Starr,

Monte Vista Water District is initiating the process of updating its Urban Water Management Plan for 2015, in compliance with the California Urban Water Management Planning Act. Urban water agencies are required to update this planning document every five years.

Water Code Section 10621 states, "Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days prior to the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision."

The District welcomes your agency's assistance and involvement as we update our Urban Water Management Plan. The District's 2010 Urban Water Management Plan is available on our website, www.mvwd.org, following the "Public Documents" and "Planning Documents" menu links. We will post updates to our planning process on the website.

Your agency will receive timely notification on the availability to review the draft Plan and the date and time of the public hearing that will be conducted prior to the official adoption of the Plan. For more information, contact Justin Scott-Coe, public affairs representative, at (909) 267-2116 or at jscottcoe@mvwd.org.

Sincerely,

We will post updates to our planning process on the website.

Your agency will receive timely notification on the availability to review the draft Plan and the date and time of the public hearing that will be conducted prior to the official adoption of the Plan. For more information, contact Justin Scott-Coe, public affairs representative, at (909) 267-2116 or at jscottcoe@mvwd.org.

Sincerely,

***Monte Vista Water District***

**Notification of Update to Urban Water Management Plan**

Dear Mr. Hudson,

Monte Vista Water District is initiating the process of updating its Urban Water Management Plan for 2015, in compliance with the California Urban Water Management Planning Act. Urban water agencies are required to update this planning document every five years.

Water Code Section 10621 states, "Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days prior to the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision."

The District welcomes your agency's assistance and involvement as we update our Urban Water Management Plan. The District's 2010 Urban Water Management Plan is available on our website, www.mvwd.org, following the "Public Documents" and "Planning Documents" menu links. We will post updates to our planning process on the website.

Your agency will receive timely notification on the availability to review the draft Plan and the date and time of the public hearing that will be conducted prior to the official adoption of the Plan. For more information, contact Justin Scott-Coe, public affairs representative, at (909) 267-2116 or at jscottcoe@mvwd.org.

Sincerely,

***Monte Vista Water District***

**RESOLUTION 703-16**

**RESOLUTION OF THE BOARD OF DIRECTORS OF THE MONTE VISTA WATER DISTRICT, COUNTY OF SAN BERNARDINO, STATE OF CALIFORNIA, ADOPTING THE MONTE VISTA WATER DISTRICT'S 2015 URBAN WATER MANAGEMENT PLAN**

---

**WHEREAS,** the California Legislature enacted Assembly Bill 797 (Water Code Section 10610 et seq., known as the Urban Water Management Planning Act) during the 1983-84 Regular Session, and as amended subsequently, mandating that every supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan, the primary objective of which is to plan for the conservation and efficient use of water; and

**WHEREAS,** the Urban Water Management Plan shall be periodically reviewed at least once every five years, and that the District shall make any amendments or changes to its plan which are indicated in the review; and

**WHEREAS,** the California Legislature enacted Senate Bill X7-7 (California Water Code Section 10608 et. seq, known as the Water Conservation Act of 2009) during the 2009 Extraordinary Session, mandating that retail municipal water suppliers establish and include in their 2010 Urban Water Management Plan urban water use reduction targets to assist the state in achieving a 20 percent reduction in urban water use by 2020; and

**WHEREAS,** under California Water Code Section 10608.20, the California Department of Water Resources requires that all water suppliers who filed their 2010 Urban Water Management Plans before 2010 U.S. Census data was available to recalculate their urban water use reduction targets in their 2015 Urban Water Management Plans; and

**WHEREAS,** under California Water Code Section 10608.24, the District is required to determine in its 2015 Urban Water Management Plan whether or not it has met its 2015 urban water use reduction target and to assess its progress toward meeting its 2020 urban water use reduction target; and

**WHEREAS,** Monte Vista Water District is an urban supplier of retail and wholesale water services which, in Fiscal Year Ending 2015, supplied over 16,000 acre-feet of potable and non-potable water to nearly 12,000 retail customers and to its wholesale customer, the City of Chino Hills; and

**WHEREAS,** Monte Vista Water District filed its 2010 Urban Water Management Plan in July 2011, and the full 2010 U.S. Census data set was not available until 2012, thus requiring the District to recalculate its urban water use reduction targets; and

**WHEREAS,** the District's 2015 Urban Water Management Plan demonstrates that the District is currently meeting and exceeding both its 2015 and 2020 urban water use reduction targets; and

**WHEREAS,** the Urban Water Management Plan must be adopted by July 1, 2016, after public review and hearing, and filed with the California Department of Water Resources within thirty days of adoption; and

**WHEREAS,** the District has therefore prepared and circulated for public review a draft 2015 Urban Water Management Plan, including its recalculated urban water use reduction targets; and

**WHEREAS,** a properly noticed public hearing regarding said Urban Water Management Plan, including discussion of the District's method of determining its urban water use targets under the Water Conservation Act of 2009, its compliance with meeting its 2015 interim target, its plan to meet its 2020 target, and the potential economic impacts of meeting these targets, was held by the Board of Directors on June 22, 2016; and

**WHEREAS,** the District did prepare and shall file the said Urban Water Management Plan with the California Department of Resources.

**NOW, THEREFORE BE IT RESOLVED,** the Board of Directors of the Monte Vista Water District does hereby, by this resolution, authorize the adoption of its 2015 Urban Water Management Plan and orders the filing of the plan with the California Department of Water Resources.

ADOPTED this 22nd day of June 2016.

# Appendix F:
# Population Estimate Calculations and Methodologies

# Alternative Methodology to Estimate 2015 Retail Service Area Population

Monte Vista Water District (MVWD) is using the California Department of Water Resources (DWR) online population tool to determine historical population and gallons per capita per day (GPCD) estimates for the purposes of establishing SBX7-7 baselines. The results are attached.

The population tool uses the same methodology for calculating historical MVWD retail service area population to project MVWD's 2015 population as 54,198, which equates to a retail service area population growth of 1.7% since 2010 based on U.S. Census data (54198 - 53284 = 914 / 53284 = 0.017).

However, this rate of growth is inconsistent with the following local knowledge about population growth in the MVWD retail service area:

- At least three multi-family residential complexes with 552 additional residential units have been developed in MVWD's retail service area between 2010 and 2015. Multiplying added multi-family residential units since 2010 (all in Montclair) by the average persons per household and occupancy rate for Montclair in 2015 (California Department of Finance estimates) results in the following calculation: 552 x 3.89 = 2147 x 94.8% = 2036. Added to the 2010 Census service area population provides a 2015 estimated population of 55,320, which equates to a service area population growth of 3.8%.

- The Department of Finance estimates that the population of the City of Montclair, which is served entirely by MVWD and comprises two-thirds of MVWD's retail service area, grew by 4.5% between 2010 and 2015.

- The City of Chino has provided detailed estimates of population growth in the portion of the city served by MVWD, which equates to a 3.3% growth in population.

While the population tool is useful in estimating population between Census years, it appears to have underestimated the growth that has occurred within MVWD's service area since 2010.

MVWD has developed an alternative methodology to calculate its 2015 service area population by using the data from the cities of Montclair and Chino cited above, and applying a melded growth rate since 2010 of 3.9% to the balance of the service area (unincorporated county), resulting in an estimated 2015 population of 55,581 (see attached calculation).

On June 21, 2016, DWR approved the use of the above methodology for estimating MVWD's 2015 retail service area population. MVWD will use the same methodology for estimating population for all other state reporting purposes to maintain consistency of data.

## MVWD 2015 Population Calculation

| Area | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |

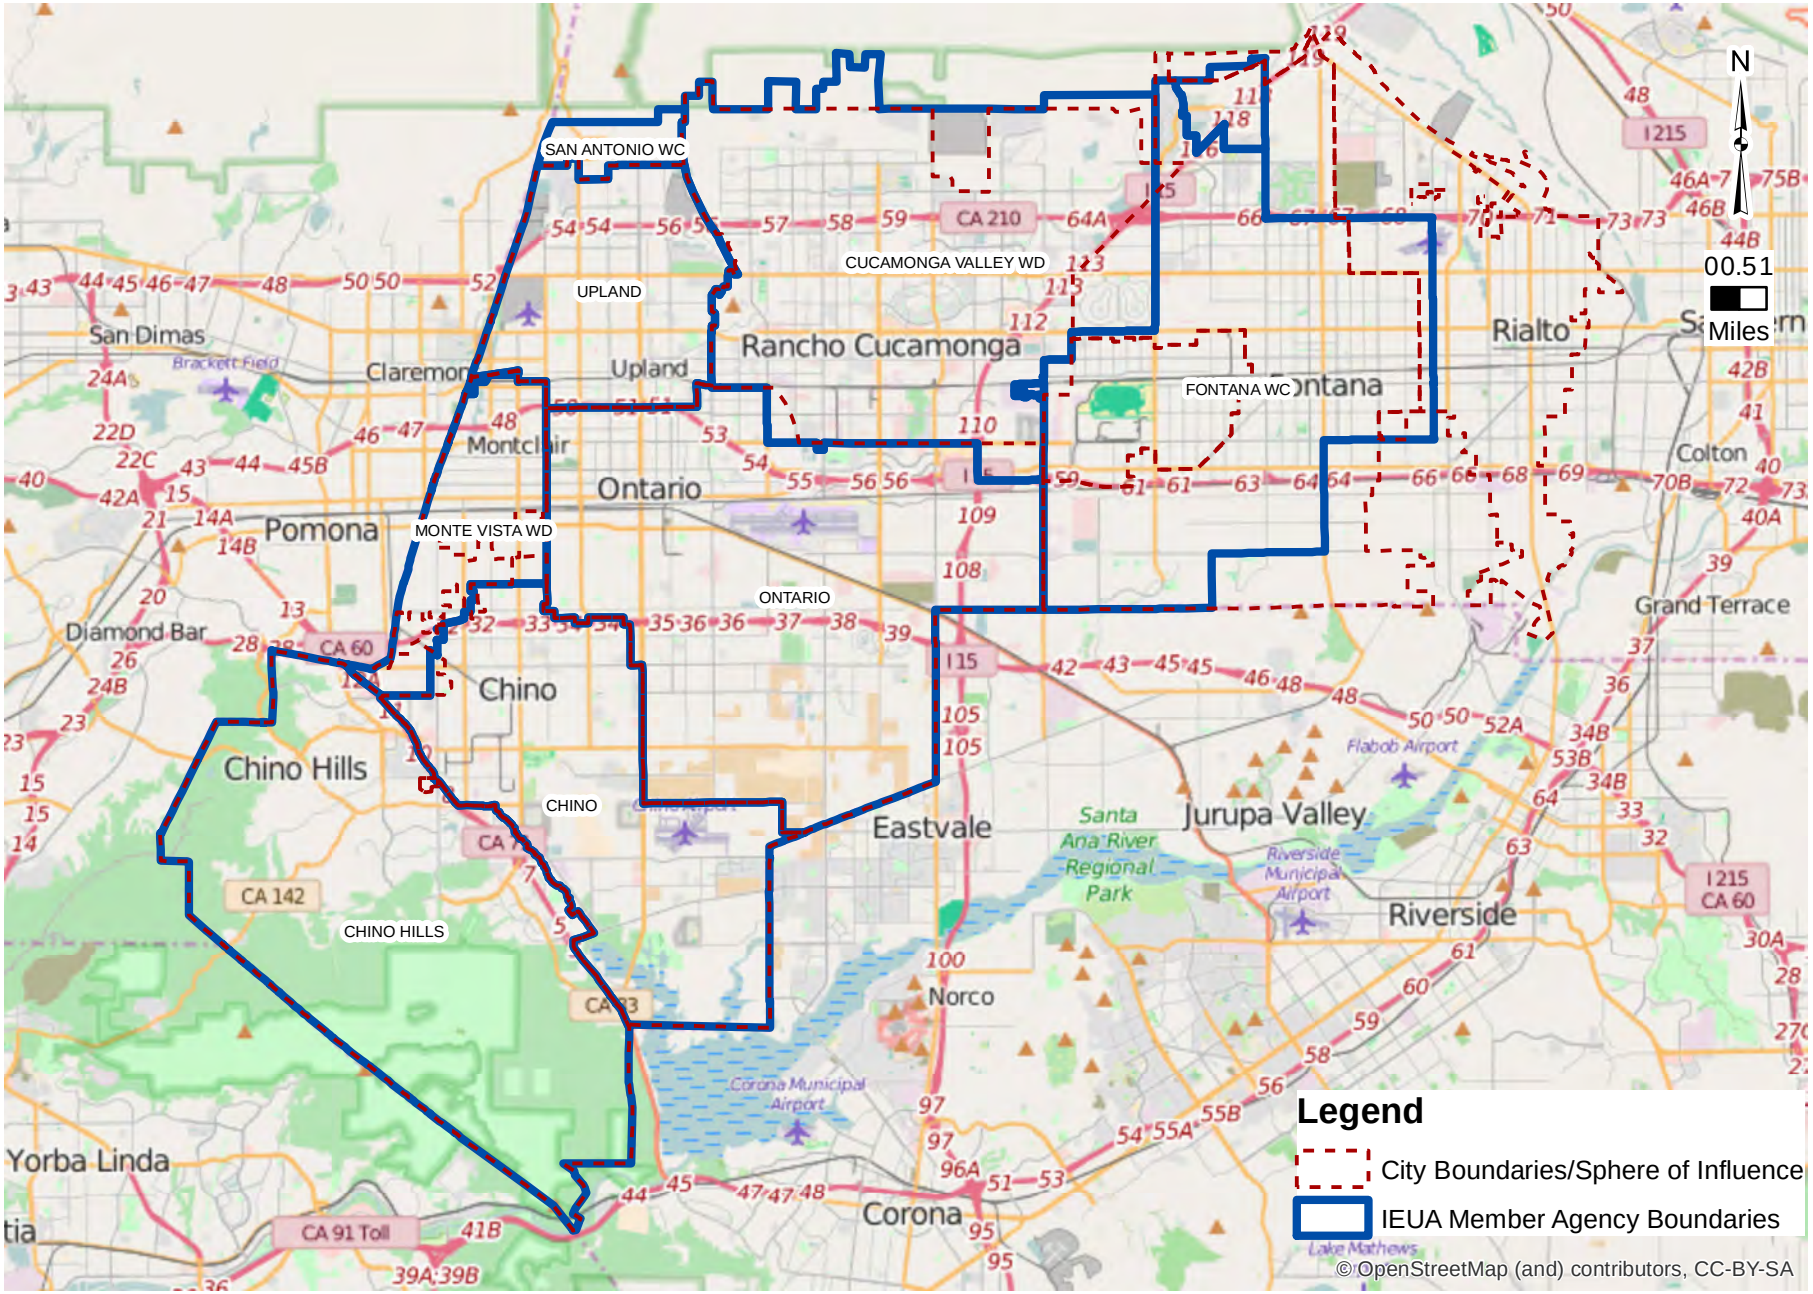
# 1 INTRODUCTION

This Technical Memorandum (TM) summarizes the process used to develop a water demand projection model and identify land use based water demand projections for Inland Empire Utilities Agency (IEUA) and its member agencies. IEUA's member agencies include the cities of Chino, Chino Hills, Ontario, and Upland, Cucamonga Valley Water District (CVWD), Fontana Water Company (FWC), Monte Vista Water District (MVWD), and San Antonio Water Company (SAWCo).

Data development and assumptions are presented in this TM along with a description of the methodologies used to develop the model and projections. The demand projection analysis includes data development and assumptions; and a discussion of the model tool and resulting projections.

# 2 METHODOLOGY

Project objectives are described in this section along with the project study area, an overview of the projection methodology, and a summary of the Demand Model development and use.



## 2.1 Objectives

To support its planning efforts, IEUA developed a Land Use Based Demand Model (Demand Model) to augment its Integrated Regional Plan (IRP) process in order to provide consistently developed member agency demand projections through 2040. The primary objective was to develop a land use based water demand model that disaggregates regional data to the member agency level for IEUA's Urban Water Management Plan (UWMP). The demand projections can be used by IEUA and member agencies for any system or supply planning purpose that requires detailed demand estimates and projections, such as conservation savings analyses.

## 2.2 Study Area and Boundaries

The study area is IEUA's sphere of influence (SOI). This boundary was established by IEUA to define its limit of future annexation to their existing service area. The SOI for IEUA is established by San Bernardino County Local Agency Formation Commission (LAFCO) to represent LAFCO's designation of the spatial extent of IEUA service. The IEUA SOI is the outermost extent of the study area, with demands projected within this boundary. The SOI delineation has undergone public review and California Environmental Quality Act (CEQA) analysis on growth inducing and other impacts.

Within this IEUA SOI boundary, the eight member agencies have boundaries established to prevent overlapping water service and demand projections. The SOIs for public water purveyors are also established by San Bernardino County LAFCO. Private water companies are governed by the State of California Public Utilities Commission, and do not have LAFCO designated SOIs, thus the use of their established member agency boundaries within IEUA is important. These boundaries are presented on Figure 2-1.

Inland Empire Utilities Agency
A MUNICIPAL WATER DISTRICT

INLAND EMPIRE UTILITIES AGENCY, CALIFORNIA
DEMAND MODEL

**Study Area Boundaries**

ARCADIS

May 2016
FIGURE 2-1

Within the study area and underlying each of the member agency boundaries, lie eight cities with land use planning authority. The cities of Chino, Chino Hills, Fontana, Montclair, Ontario, Rancho Cucamonga, Rialto, and Upland, also have SOIs established by San Bernardino County LAFCO. These boundaries were useful in developing demand projections based on future land uses, as discussed in more detail in Section 3.

## 2.3 Overview of Projection Methodology

As presented on Figure 2-2, , the methodology used to create the Demand Model and identify demand projections relied on developing a land use database within a geographic information system (GIS), and determining Land Use Unit Demands (LUDs). LUDs measure water use on a per acre basis. Figure 2-2 presents the primary tasks for: 1) developing a land use database in orange, 2) unit demands in blue, and 3) demand projections in green.

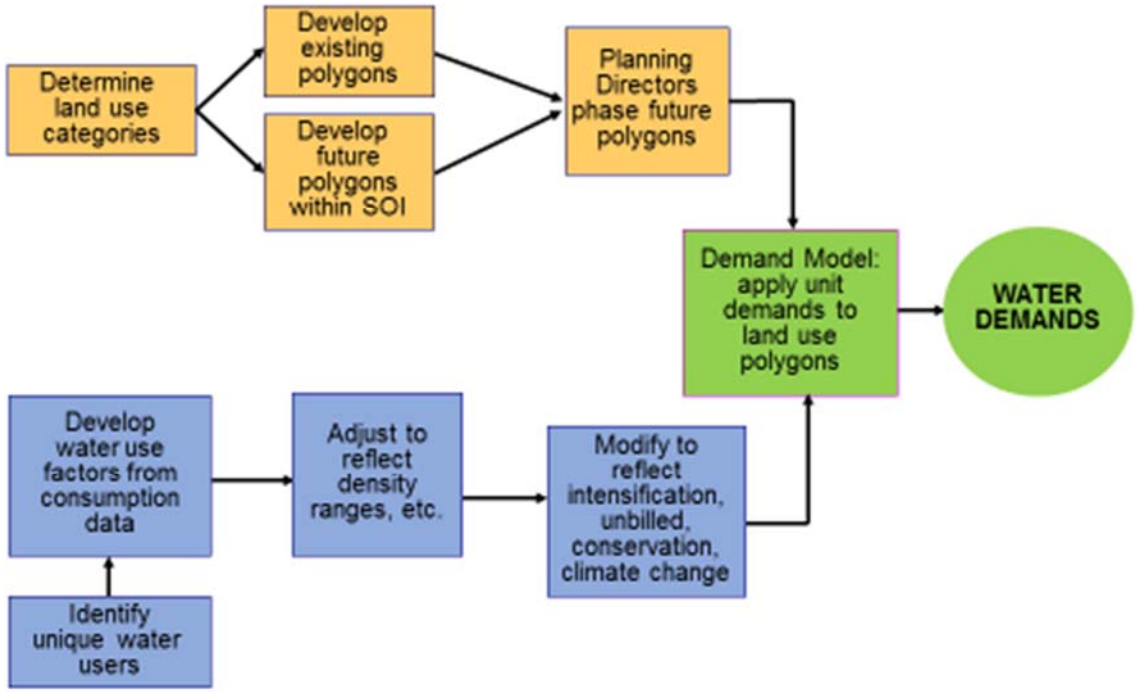


**Figure 2-2: Land Use Based Demand Model Development Process**

The demand projection process relied on the following key assumptions and data development steps.

*Land Use*

- The land use database relied on the SOIs as boundaries for IEUA, public member agencies, and cities.
- Because general plans reflect allowable development, not existing development, actual land uses were mapped by first using city parcel data that was updated as a part of the project to reflect actual land use, thus improving accuracy.
- The projections relied on using approved general plans, specifically the land use element and map for vacant lands identified for future development.
- Planning staff at each land use agency phased development by providing an estimate of potential construction dates for these future land uses.

*Land Use Unit Demands*

- Billing data and unbilled water estimates were provided by member agencies for the previous five years.
- The billing data from 2010 through 2014 were averaged to determine the existing year 2015 "normalized demands", thus smoothing out the annual and seasonal effects of weather and other variables. This approach to normalizing demands was used because of the difficulty separating out the economic complexities of the past eight years (i.e., the Great Recession) and years of drought. The normalized demand became the starting point for the demand projections.
- LUDs were generated for each member agency using existing land use acreage and member agency billing data to ensure that the LUDs reflected the unique demand characteristics of each water purveyor's service area.
- The unbilled water estimate (or unaccounted for water) reflects the percent difference between metered production and consumption; these percentages were provided by each member agency and used as an adjustment factor.
- Climate change impacts on estimated demands in 2040 were obtained from IRP assumptions and used as an adjustment factor.
- Redevelopment, increased densities, repurposing buildings, and other forms of land use intensification as land values increase can have a great effect on future water demands. This was accounted for in the adjustment factors based on an analysis of demand impacts associated with strong market conditions, which was noted in the IRP.
- Conservation savings were obtained from the IRP for plumbing code and efficiency regulation impacts.
- The Demand Model has an adjustment factor category called "Other" that is available to accommodate active conservation savings analyses, by percentage, for each land use, time frame, and member agency.

*Demand Model*

- The Demand Model relied on existing land use and LUDs normalized for 2015 existing demands.
- The Demand Model relied on future land uses and future LUDs, which were existing LUDs adjusted to reflect future changed conditions, to determine water demand projections in five year increments to 2040.
- Demands were identified and projected for each member agency separately which were combined for the IEUA service area in total.

More specific information follows regarding each of these key assumptions and data development steps.

## 2.4 Demand Model Development and Use

The project resulted in a GIS based software application, or tool, to calculate future water demands, called the Demand Model. The Demand Model linked GIS land use polygons and existing land use unit demands (input data) to calculate average annual projections 25 years into the future.

The Demand Model is a Microsoft Access database that contains GIS data collected from IEUA members and land use agencies including parcel data, member agency SOIs, and land use agency boundaries. Additionally, the database also contains layers for future land uses that were developed by the consultant team after consultation with each of the eight land use planning directors (described in Section 3.3 and 3.4). All original data in the individual parcel layer were maintained in this database. A few fields were added to each parcel layer, including the general plan land use, existing land use, year anticipated to be developed, and water purveyor serving the parcel.

The Demand Model can be used to develop demands spatially (by member agency and land use) and temporally (2015 to 2040 in five-year increments). Analysis, such as determining the savings associated with various demand management tools, can be conducted by land use and time frame for member agencies or the entire IEUA service area. The resulting study area Demand Model projections were similar to IRP projections, as described in Section 5.1. The Demand Model projection of approximately 278,000 AF at 2040 were four percent higher than the high range IRP projection.

# 3 LAND USE AND TRENDS

The process of consolidating general plan land use categories for all eight land use planning agencies into one master set of categories is described below, along with how existing and future land use GIS layers and the resulting land use inventories were developed.

## 3.1 Consolidation of Land Use Categories

All cities and counties in California have a general plan to provide and implement the vision for development of each community. All general plans contain a land use element and land use map to describe specific allowable land use and densities for each parcel. City general plans include all lands within their SOI overlapping in some areas with the San Bernardino County general plan that addresses all lands outside of city limits (unincorporated lands).

Each city uses different land use categories in their general plan; therefore, it was important to standardize these categories into a master set for the Demand Model. Appendix A presents the various general plan land use designations and the master set developed for the land use mapping and demand projections. Table 3-1 presents the resulting master set of land use categories and associated residential densities.

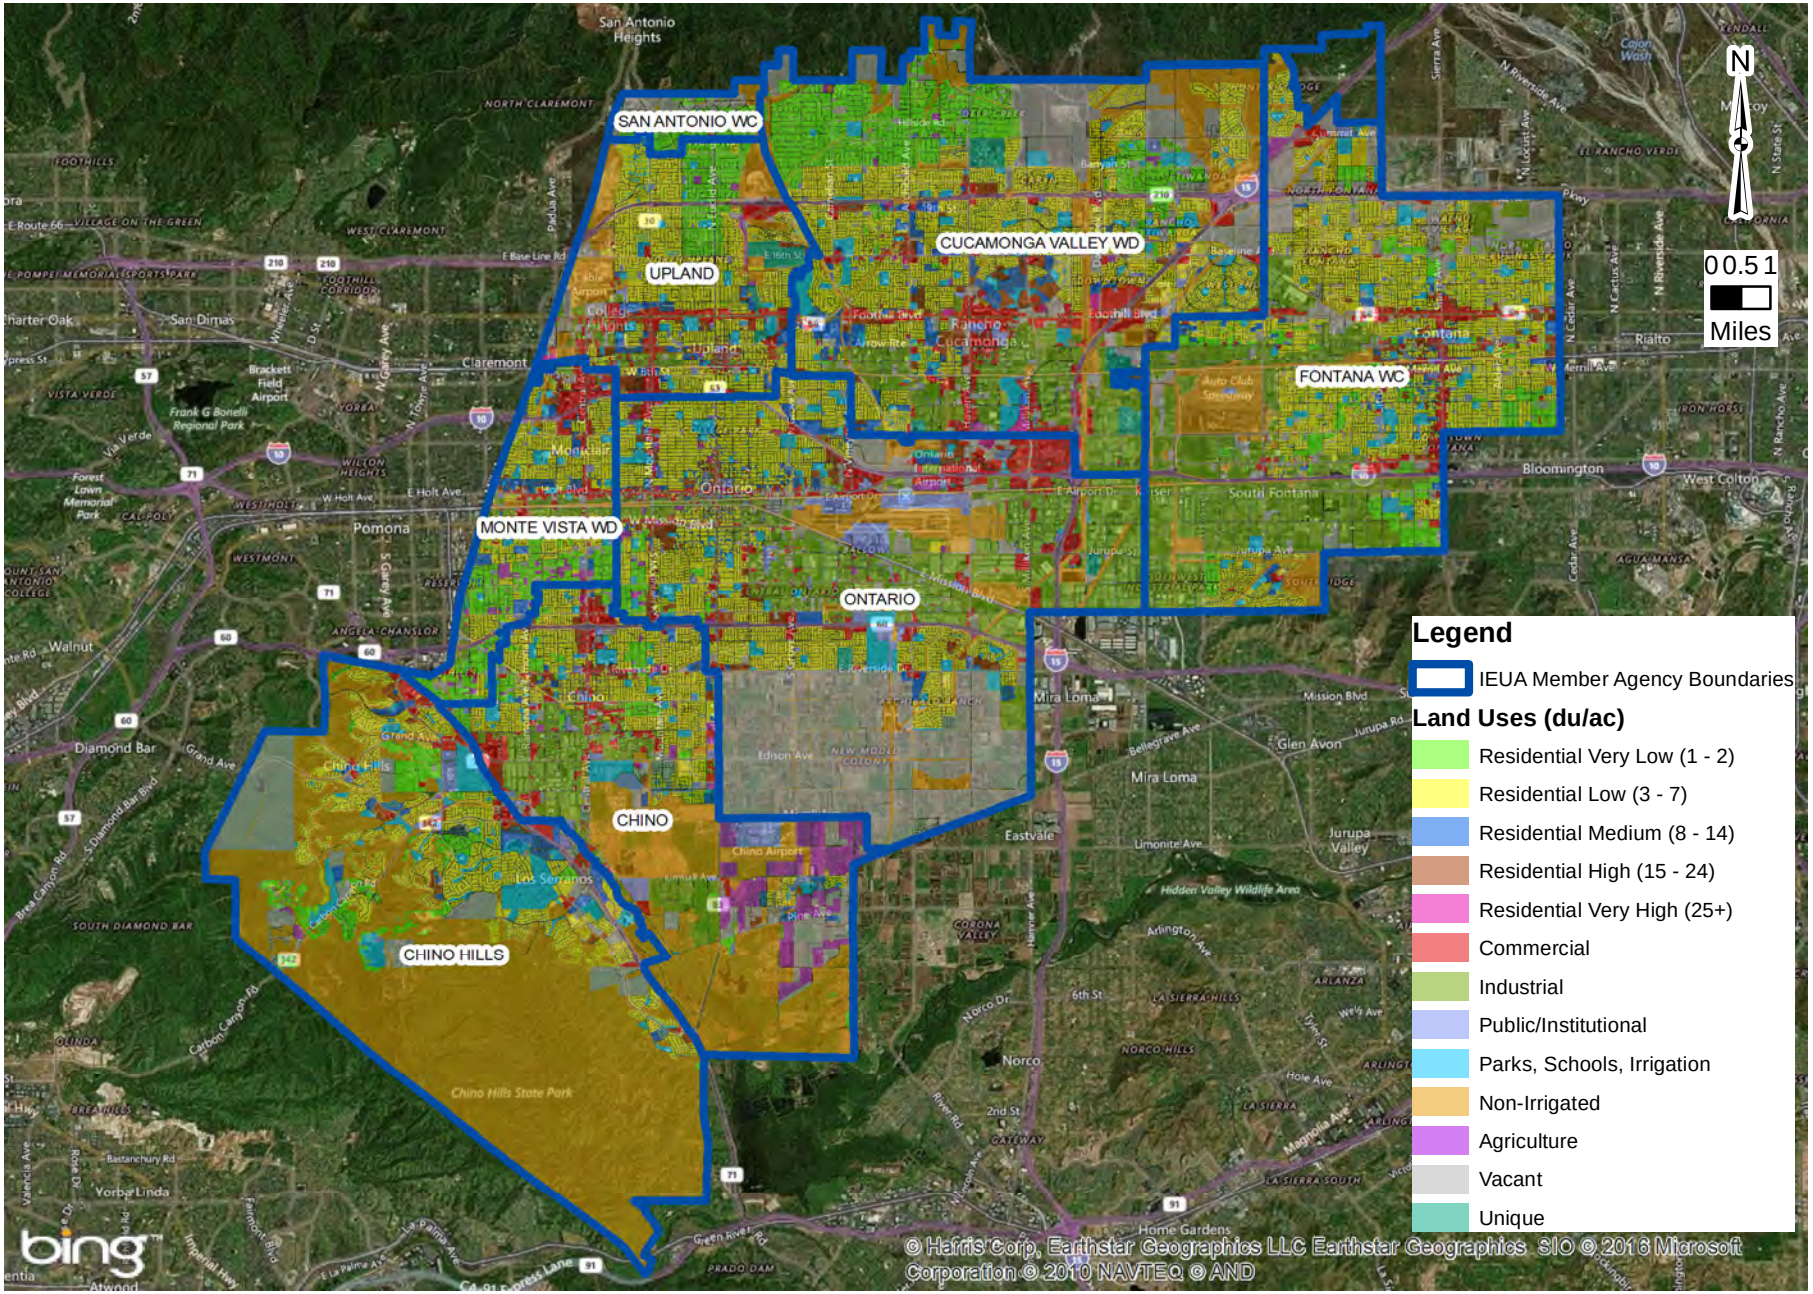
**Table 3-1: Land Use Categories**

| Master Land Use Categories |
|---|
| Very Low Residential (<1-2 dwelling units per acre [du/ac]) |
| Low Residential (3-7 du/ac) |
| Medium Residential (8-14 du/ac) |
| High Residential (15-24 du/ac) |
| Very High Residential (25+ du/ac) |
| Commercial |
| Industrial |
| Public/Institutional |
| Parks, Schools, Irrigation |
| Agriculture |
| Unique Water Users |
| Non-irrigated |
| Vacant |

These land use categories were grouped to reflect similar water demand patterns. For example, parks, and other large turf areas receiving irrigation water (served with potable or recycled water, versus private wells) were identified as Parks, Schools, Irrigation, and retained in the database. Lands that do not receive water service were removed or identified as non-irrigated lands. The parks, schools, and other primarily irrigation uses reflect outdoor irrigation water use that aids in analyzing outdoor water demands. This category includes homeowner association common area irrigation accounts wherever possible.

Residential densities were separated into five categories that reflect new development patterns, density groupings of most general plans, and general customer control over irrigation. For example, residential densities associated with apartment buildings and condominiums typically have no control over outdoor irrigation.

“Mixed use” designations in the general plans reflected different configurations of mixed uses such as different commercial use, or commercial and residential use within the same project boundary but not necessarily on the same parcel. A standard convention for mixed use designations is commercial use on the ground floor with residential above, with a “mixed use” land use category developed. However, since the model needs spatial land use data, and the standard convention was not used for these cities, mixed use lands were delineated to reflect the percentages identified in the general plan or specific plan of planned land uses for each individual development project.



When the Demand Model is updated in the future, a new land use category should be considered to reflect higher densities of residential use. The Very High category in the model reflects densities of 25 du/ac or greater, which is appropriate now. As the region develops “up not out”, it is likely the general plans will be amended to accommodate higher density development.

## 3.2 Existing Land Use Layer Development

Spatially referenced existing land use polygons were created for the entire IEUA service area. Each polygon represents an area of predominant land use identified through parcel data provided by the cities and the county. The parcel data indicating existing land use typically have one category each for single family residential and multi-family residential use. In addition, many of the parcels are labeled “undefined”. For this study, existing land use categories were more specifically defined (e.g., five categories of residential land use and identification of all undefined parcels) using Google Earth maps and street view, windshield surveys, and meetings with community development departments. This extensive effort to improve the classification accuracy of over 70 percent of the existing land use resulted in a detailed database of existing land use that will yield increased accuracy of the LUDs.

The existing land use layer is not an exact replica of land uses but a best estimate. The process started with the use of parcel boundaries used to delineate each land use. But this often resulted in odd shaped polygons in areas such as airport tarmacs or new growth areas in southern Ontario where the ownership boundary does not match the general plan land use boundaries. Areas with parcel shapes that would have a significant impact on the accuracy of the demands, such as New Model Colony in Ontario, were modified to reflect the general plan land use map polygons.

“Unique water users” are identified as customers with consumption patterns determined by the agencies to be unusual, significantly higher (up to 1,240 percent higher) or lower (up to 340 percent lower) than the average customer of that sector. Unique users were separated from general land use categories to prevent a high or low water user from skewing the average unit demand for that particular land use for

each member agency. The unique water users were maintained in the Demand Model as a separate land use.

The result is a GIS layer with existing land use that is presented on Figure 3-1 for the entire study area. Figure 3-2 presents an example of existing land use polygons. Existing land use maps for each member agency can be found in Appendix B.

**Figure 3-2: Detail of Existing Land Uses**

An important land use category in the existing land use database is “Vacant” lands. These vacant lands were defined as not having a current water demand but were designated on the general plans for future urban use having a demand for water. Vacant and agricultural lands that were not identified in the general plan for a future urban use were designated as “Non-irrigated” and include open space, agricultural lands with private water supply, or other lands with private water supplies that will remain private. Although open space lands could include uses with a water demand, each was carefully reviewed to determine if it was natural open space that was not irrigated or was irrigated by private well water. Non-irrigated lands also include significant road and highway rights-of-way and airport tarmacs; supporting airport uses with a water demand were not included in the non-irrigated tarmac polygons; these large land areas are an urban use but typically have minimal demand. The vacant lands with a future urban use were incorporated into a new GIS mapping layer for future land uses.

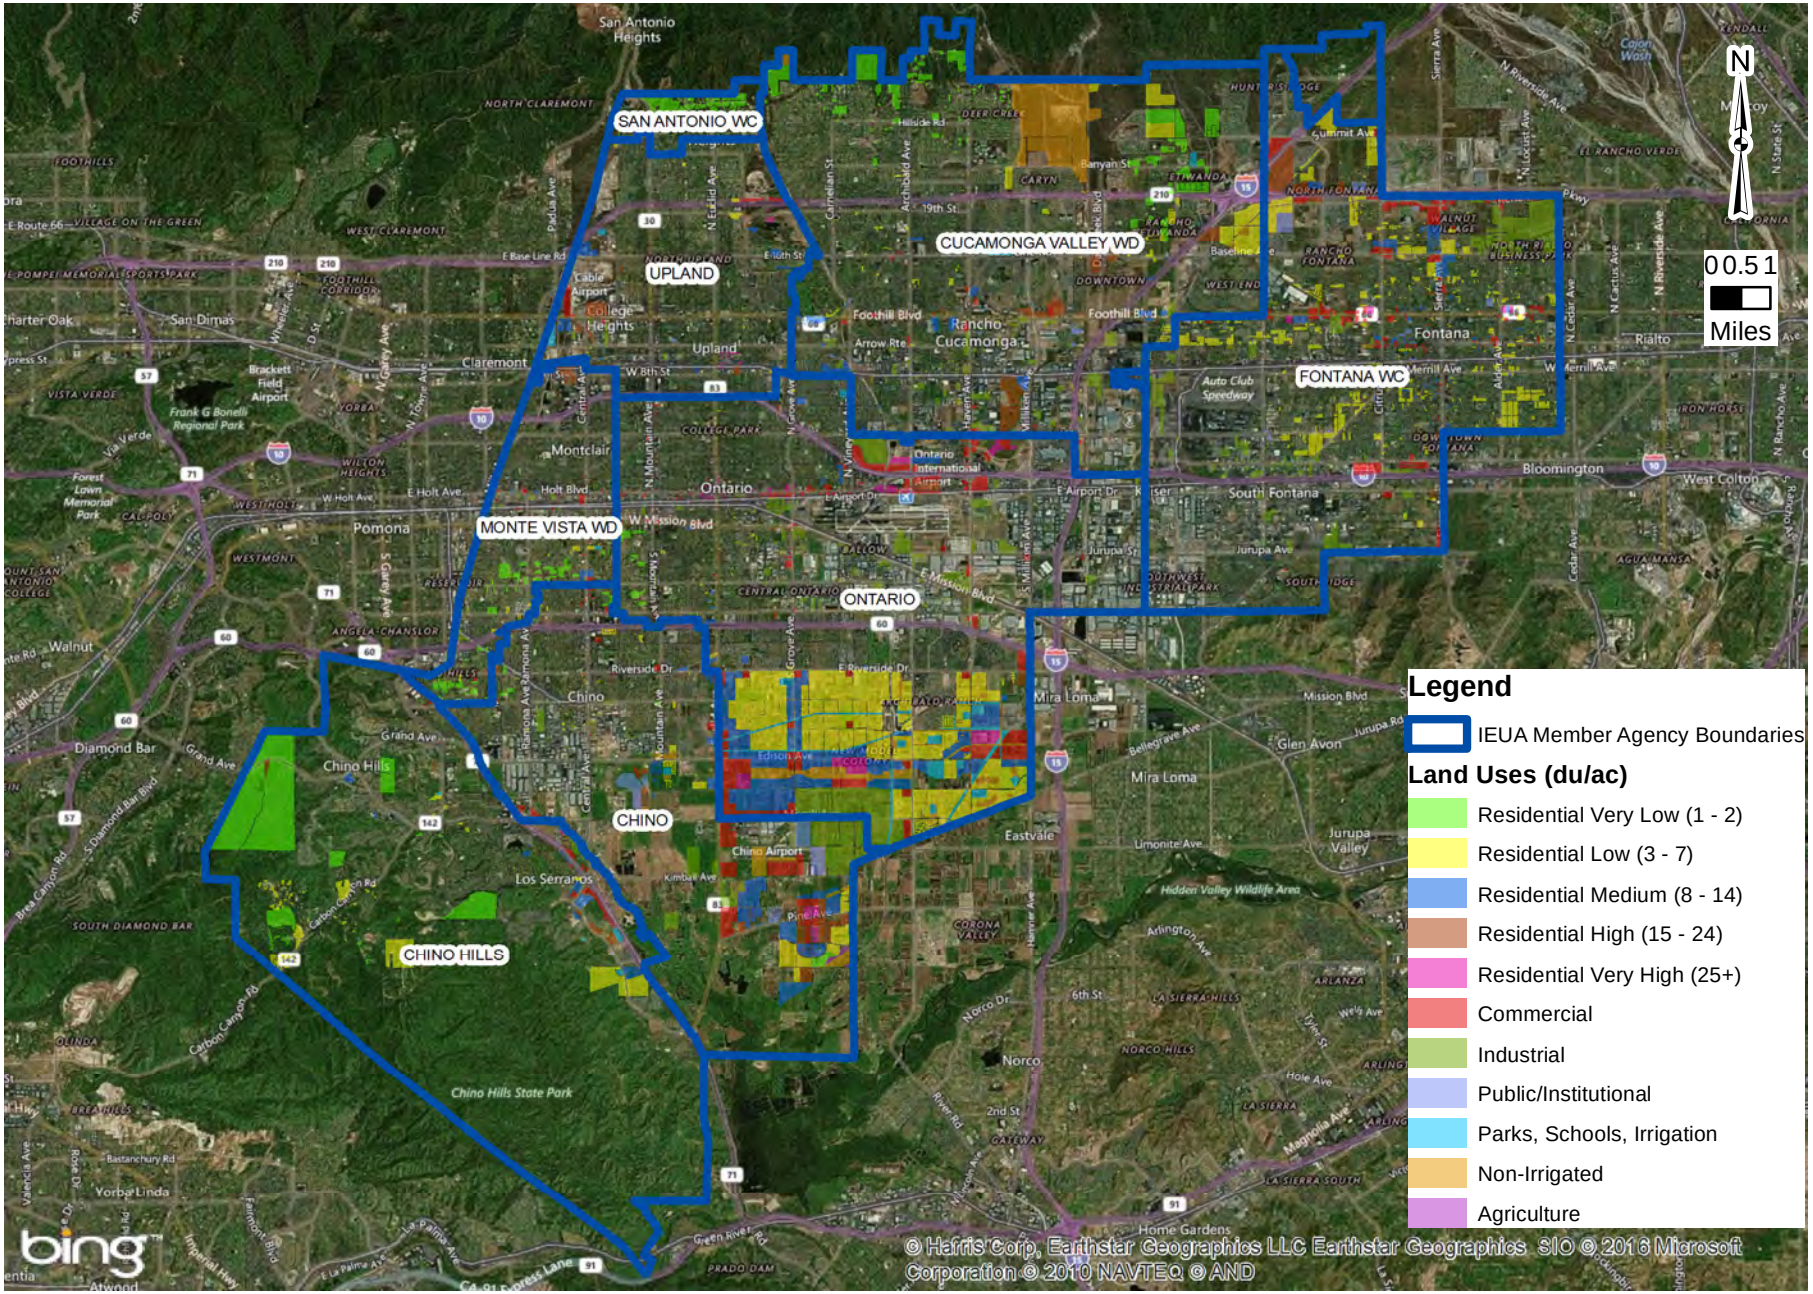
## 3.3 Future Land Use Layer Development

An important part of developing land use based water demand projections, is reliance on locally defined visions of how communities are to grow and change during the planning horizon. Using vacant land use parcels identified during existing GIS land use map development, the city general plan maps were applied to these vacant lands to identify future land uses. Future GIS land use maps were then generated to reflect these future developments. General plans are the most reliable indicators of future development policy because they have been subjected to extensive public review and rigorous environmental documentation prior to adoption. General plans, however, have a single hypothetical buildout date, used for analyses of environmental impacts associated with the full buildout of all lands in accordance with the

land use map. Actual development will occur at varying rates and times, and can extend beyond these general plan dates. Therefore, a more accurate method for identifying the timing of projected water demands based on the general plan was used and is described in the subsequent section.

## 3.4 Land Use Planning Agency Meetings

It is important to have city land use planners identify anticipated timing of development. They are the most knowledgeable of development activities, growth patterns, and trends within their city. The project team held meetings with planning or community development departments of each city (see inset below), with representatives of the applicable water purveyor in attendance, along with IEUA representative(s).



Existing land use maps were provided for each of the eight member agencies using their boundaries to capture service area land use. Future land use maps were also provided for each city within their SOIs. The meetings focused on the confirmation or identification of general plan land use for vacant land that is developable, and the planning representatives' best estimate of development time frame in five year increments through 2040. As 2015 is the year for existing demands, any development under way currently or in the recent past, and not in water billing data, was assigned a 2020 development date for water demand purposes. Also addressed at the meetings were confirmation of boundaries and a general review of existing land uses.

**Land Use Agencies**

- City of Chino
- City of Chino Hills
- City of Fontana
- City of Montclair
- City of Ontario
- City of Rancho Cucamonga
- City of Rialto (partially in Fontana Water Company boundary)

Planning staff provided information on observed land use trends and areas of redevelopment (creating denser development) and reuse (reusing existing buildings for different purposes) in their cities. Trends are discussed later in Section 4.3. Most densification changes are anticipated to not be a change in land use designation, but rather a reuse or repurposing of buildings or redevelopment of lands with higher density buildings within general plan-allowable ranges. These areas reflecting an intensification of use, will result in increased water demands but not necessarily a change in land use designation. The process to accommodate intensification of uses is discussed in Section 4.3.

The existing and future land use maps were edited in the GIS database based on these planning agency meetings. Figure 3-3 presents future land uses within the study area. Appendix B provides future land use maps for each of the member agencies.

## 3.5 Acreage Inventories

Based on the existing and future land use GIS mapping effort as described in previous sections, acreage inventories were generated in the Demand Model for each member agency. Table 3-2 presents the acreage of each land use within the study area to be developed over the planning horizon. The total acreage may not reflect the total IEUA service area because large areas of open space lands that will not have a water demand (e.g., most of Chino Hills State Park) were not included. Table 3-3 presents the net change in acreages for each land use.

**Table 3-2: Study Area Acreage Inventory**

| | Acreage Inventory by Year | | | | | |
|---|---|---|---|---|---|---|
| **Land Use (du/ac)** | **2015** | **2020** | **2025** | **2030** | **2035** | **2040** |
| **Residential Very Low (<1 - 2)** | 9,089 | 9,504 | 10,155 | 10,282 | 10,115 | 11,522 |
| **Residential Low (3 - 7)** | 26,329 | 27,090 | 28,463 | 29,691 | 30,804 | 32,593 |
| **Residential Medium (8 - 14)** | 3,067 | 3,500 | 3,959 | 4,425 | 4,663 | 5,915 |
| **Residential High (15 - 24)** | 2,349 | 2,678 | 3,131 | 3,263 | 3,300 | 3,427 |
| **Residential Very High (25+)** | 231 | 256 | 283 | 408 | 466 | 646 |
| **Commercial** | 6,838 | 6,925 | 7,180 | 7,994 | 8,456 | 9,221 |
| **Industrial** | 16,974 | 18,587 | 19,856 | 20,141 | 20,306 | 20,420 |
| **Public/Institutional** | 2,979 | 2,990 | 3,066 | 3,095 | 3,289 | 3,334 |
| **Parks, Schools, Irrigation** | 5,629 | 5,687 | 5,657 | 5,890 | 5,963 | 6,154 |
| **Agriculture** | 2,026 | 1,534 | 1,175 | 630 | 376 | 68 |
| **Unique Water Users** | 863 | 863 | 852 | 852 | 852 | 852 |
| **Non-Irrigated** | 34,438 | 34,410 | 35,668 | 35,833 | 35,904 | 36,085 |
| **Vacant** | 19,724 | 16,512 | 11,090 | 8,032 | 6,042 | 298 |
| **Total** | **130,537** | **130,537** | **130,537** | **130,537** | **130,537** | **130,537** |

Acreage inventories from the Demand Model for each member agency can be found in Appendix C. As shown in Table 3-2, the largest percent increase in land use in the study area is very high density residential at 180 percent increase. The largest acreage increase by 2040 is low density residential by 6,264 acres. The majority of this new low density residential is attributed to new growth areas in Ontario's New Model Colony and Chino's The Preserve. These lands are currently agricultural lands, but as shown in Table 3-2, most agricultural lands will decline over time as they are converted to urban uses. Medium and high density residential lands are also anticipated to increase at a greater rate (percentage) than very low and low density.

Land use patterns that are unique to each member agency can be identified by studying the maps in Appendix B and the acreage inventories in Appendix C. This is where the agricultural conversions of Ontario and to a lesser extent, Chino, are apparent. And MVWD's service area does not have a lot of

vacant or agricultural land for development but is still growing as infill parcels are developed. Another interesting characteristic in the future acreage inventories in Appendix C is the decrease in acreage for the Parks, Schools, Irrigation land use designation for Rancho Cucamonga and Upland. This decrease in acreage reflects a statewide trend of golf courses replacing some or all of its lands with medium or other density residential uses.

**Table 3-3: Changes in Acreage from 2015 to 2040**

| Land Use (du/ac) | Percent Change |
|---|---|
| **Residential Very Low (1 - 2)** | 27 |
| **Residential Low (3 - 7)** | 24 |
| **Residential Medium (8 - 14)** | 93 |
| **Residential High (15 - 24)** | 46 |
| **Residential Very High (25+)** | 180 |
| **Commercial** | 35 |
| **Industrial** | 20 |
| **Public/Institutional** | 12 |
| **Parks, Schools, Irrigation** | 9 |
| **Agriculture** | -97 |

What is not apparent from the inventories are characteristics such as the extensive underutilized lands in the Fontana Water Company service area that will be consolidated and developed with higher densities. There are currently many acres of very low density (<1 to 2 du/ac) residential lands with a small house on a large unirrigated parcel, and is designated as low density residential. A development pattern has emerged where parcels have been consolidated and homes replaced with a subdivision reflecting a general plan designation of low density (up to 7.6 du/ac in the Fontana General Plan). An example is provided on Figure 3-4.

As discussed in Section 4, acreages have a LUD assigned to them that represents average conditions for that land use within that service area. The LUDs for each land use were adjusted to reflect changing conditions in the study area such as intensification of land uses. An exception to the use of LUD adjustment factors to accommodate intensification can be found with Fontana's very low density land use.

**Fontana Very Low Density Residential**

This is an example of very low density residential land use next to a subdivision of low density residential that was likely built from a consolidation of parcels.

**Figure 3-4: Fontana Very Low Density Residential**

# 4 WATER USE AND ADJUSTMENT FACTORS

Existing water demands are described in this section, along with the development of LUDs, LUD adjustment factors, and the resulting future LUDs.

## 4.1 Existing Demands

### 4.1.1 Establishing Existing Year Demands

Year 2015 was selected at the "existing year" to develop existing demands. To smooth out the effects of weather, and other annual variability, five years of billing data by billing sector were averaged. Averaging of data was used as the methodology to "normalize" demands because of the difficulty teasing out the effects of multiple dry years sandwiching a wet year versus conservation outreach to the public versus the economy partially rebounding from the Great Recession. Water billing data reflects metered consumption. Both the historical five year period of metered consumption and the normalized 2015 demand are presented on Figure 4-1. The existing year (2015) demands are 190,175 acre-feet (AF).

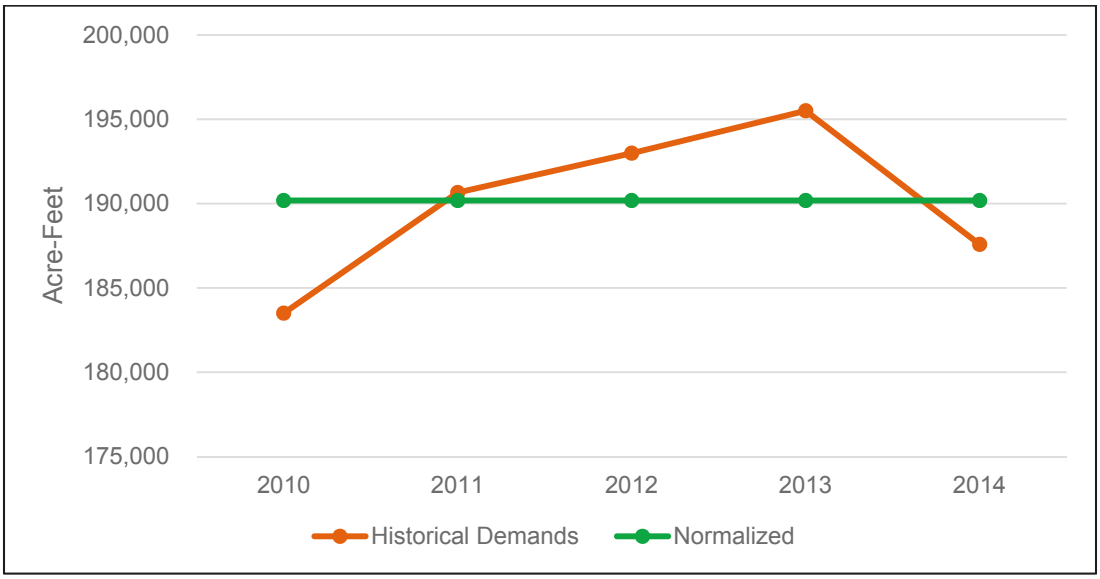

**Figure 4-1: Historical Water Demands**

## 4.2 Existing Land Use Unit Demands

Consumption patterns vary throughout IEUA's service area based on local conditions such as microclimate, demographics, economics, and land use densities. Land Use Unit Demands or LUDs were generated to represent these spatial characteristics of consumption patterns by developing existing LUDs on a per acre basis for each land use within each member agency boundary.

### 4.2.1 Disaggregation of Billing Data

In general, LUDs are calculated by dividing the estimated normalized consumption by the acres for a similar land use. This results in a unit demand of x acre-feet per acre per year (af/ac/yr) for each land use

for each member agency. For example, five years of commercial billing data in CVWD averaged 2,196 acre-feet per year (AFY). The total acreage of commercial use is 1,592 acres. Therefore, 2,196 divided by 1,592 equals an existing CVWD commercial LUD of 1.38 af/ac/yr.

Each member agency tracks and bills metered water consumption differently. The billing data range from 3 to 10 billing sectors or categories for each member agency. Since many of these do not align exactly with the 13 master land uses of the Demand Model, the billing data were disaggregated to apply to the land use categories. For example, data for a "single family residential" billing category were disaggregated into three land use categories: Very Low, Low, and Medium, by determining the prevalent average density of each of the three land use categories multiplied by the total number of existing acres of each land use (based on the Demand Model acreage inventory) to determine the approximate number of dwelling units.

An AFY)/Dwelling Unit (DU) factor was developed using the sum of the dwelling units; this unit factor was then apportioned to each of the three single family land use densities to reflect consumption patterns based on density. For example, approximately 40,600 single family residential dwelling units (i.e., very low, low, and medium densities) in CVWD's service area were calculated from identified densities. Single family residential billing data of 27,790 AFY was divided by 40,600 DUs resulting in 0.68 AFY/DU. Applying 0.68 AFY/DU to approximately 26,140 single family-low density dwelling units resulted in a distribution of Low Density Residential demands of approximately 17,900 AFY. The Very Low category has a higher consumption for the individual home (approximately 1 AF/DU) yet has a lower consumption on a per acre basis (1.85 af/ac/yr), compared with the other categories. Conversely, a Medium density residential dwelling unit has a lower consumption (0.46 AF/DU) than a Very Low and Low density dwelling unit, but has a higher consumption on a per acre basis (4.57 af/ac/yr) because there are more dwelling units per acre.

For multi-family residential billing data, since the majority of water demands are associated with indoor water consumption, the billing data were applied to the estimated total number of dwelling units (based on the prevalent average densities) and the same unit demand per dwelling unit was applied to the average prevalent density to obtain the calculated LUD.

Often the commercial, industrial, and other non-residential uses are combined in the billing data. LUDs from other communities were sometimes used to separate out the demands associated with a specific land use. For example, Fontana Water Company has a Public Authority billing category. The Public/Institutional LUDs from four other member agencies were averaged to obtain an LUD for Public/Institutional for Fontana Water Company with the balance of its Public Authority billing data assigned to Parks, Schools, and Irrigation. This resulted in LUDs for both categories that are within range of the other member agencies.

Another example is the City of Upland. Billing data from its Commercial/Industrial category was separated by applying a typical commercial LUD obtained from Irvine Ranch Water District and East Bay Municipal Utility District LUDs, which were similar, to the data with the balance assigned to Industrial. This resulted in an Industrial LUD for Upland which is higher than the other member agencies for Industrial. Since Upland does not have low water uses associated with warehousing and distribution that other member agencies have, the resulting LUDs are reasonable.

### 4.2.2 Existing LUDs

Table 4-1 presents a comparison of existing LUDs for each member agency by land use. These LUDs represent normalized consumption, but without unbilled water (production) estimates. As shown in Table 4-1, each agency has different service area characteristics represented in their unit demands. These LUDs are calculated outside of the Demand Model using current billing data. They can be easily updated in the future with new billing data and updated existing land use inventories for each agency.

**Table 4-1: Existing Land Use Unit Demands**

| Land Use | Existing Land Use Unit Demands (af/ac/yr) | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Chino | Chino Hills | CVWD | FWC | MVWD | Ontario | SAWCO | Upland |
| **Residential Very Low (<1 - 2)** | 1.73 | 1.40 | 1.85 | 1.25 | 1.27 | 1.20 | 2.34 | 1.90 |
| **Residential Low (3 - 7)** | 2.60 | 2.47 | 2.88 | 2.75 | 2.11 | 2.12 | 0.00 | 2.84 |
| **Residential Medium (8 - 14)** | 4.36 | 4.10 | 4.57 | 6.70 | 4.67 | 5.27 | 4.95[1] | 4.95 |
| **Residential High (15 - 24)** | 4.78 | 4.28 | 6.07 | 11.55 | 9.86 | 7.60 | 6.36 | 8.95 |
| **Residential Very High (25+)** | 6.88 | 6.88[4] | 8.81 | 15.66 | 0.00 | 13.20 | 0.00 | 13.96 |
| **Commercial** | 1.31 | 3.34 | 1.38 | 6.54 | 2.13 | 2.82 | 2.20 | 2.13 |
| **Industrial** | 0.22[3] | 1.07 | 0.51 | 0.33 | 0.65 | 0.38 | 0.00 | 1.07 |
| **Public/Institutional** | 1.31 | 1.17 | 2.73[2] | 2.73[2] | 2.39 | 2.82 | 2.20 | 3.52 |
| **Parks, Schools, Irrigation** | 4.99 | 3.11 | 6.88 | 4.99 | 4.72 | 7.48 | 0.00 | 5.87 |
| **Agriculture** | 0.00 | 0.00 | 0.28 | 0.00 | 0.34 | 15.08 | 0.00 | 0.00 |
| **Unique Water Users #1** | 299[5] | | 3.62 | | 5.59 | 47.57 | | 1.33 |
| **Unique Water Users #2** | 186[5] | | 1.47 | | 43.49 | 18.81 | | 242[5] |
| **Unique Water Users #3** | 81[5] | | 7.43 | | | 10.07 | | 4.57 |
| **Unique Water Users #4** | | | 2.58 | | | | | 3.08 |

Note: Existing LUDs reflect normalized consumption billing data. Unbilled estimate (production) not included here.

[4] Used Chino Very high density residential LUD for future Chino Hills Very high density residential

[5]Chino Unique Water Users and 1 Upland Unique are not located; 1 acre was used with full water demands.

## 4.3 Adjustment Factors

Looking back on Figure 2-2, the LUDs presented in Table 4-1 are applied in the Demand Model to the acreages of land use to determine existing and future demands. The land uses may be undeveloped or

agricultural lands presently to be converted to an urban use in the future – this is a simple calculation of changing the agricultural land use category for each polygon reflecting the City planning staff input on timing resulting in overall increased urban acreage. The next step is to adjust the resulting water demands to reflect more specific existing and future conditions. There are two types of adjustment factors applied to existing LUDs. One, an unbilled water estimate to change the demands from billed consumption to total production demands. The second type are future adjustment factors to approximate how water demands change over time due to climate change, intensification, and conservation. The land use changes over time were discussed in Section 3.3. The adjustment factors described here were applied to the Existing LUDs using the Demand Model to calculate Future LUDs. Each of these adjustment factors are described here along with their correlation to impacts on water demands.

### 4.3.1 Unbilled Water

The existing demand reflects metered consumption data, or billed water use. The Demand Model identified water needs for the quantity of water entering distribution systems, or production requirements. The difference between production and consumption demands has historically been called unaccounted for water or unmetered water. These uses reflect authorized water use that is not billed and other water losses. Authorized uses typically include fire flows, unmetered public facilities, and water main flushing. Other water system losses typically include losses from pipe breaks, storage facilities, and service connections. System losses also can include unauthorized consumption, metering inaccuracies, and other unidentified loss. For the Demand Model, the difference between production and billed consumption is called the unbilled water estimate.

Unbilled water, as provided by each member agency, ranged from two to nine percent of production. The unbilled water estimates were applied to the individual existing LUDs for each member agency. The total production demands are five percent higher than total normalized metered consumption data. It is recommended that as the member agencies conduct water loss analyses, or reduce system losses over time, that their adjustment factor be modified to reflect updated information.

### 4.3.2 Climate Change

The following impacts identified by the Department of Water Resources are associated with climate change that could also impact the study area.

- Increased surface temperature of 5.5 to 10.4 degrees fahrenheit anticipated by the end of the century
- Heat waves will increase in frequency, magnitude, and duration
- Longer, drier, and more frequent periods of droughts are anticipated with up to 2.5 times the number of critically dry years by the end of the century

The IEUA IRP analyzed long term climate change impacts on water demands by reviewing recent predictions of potential increases in temperature. Long term climate change assumptions were based on a National Oceanic and Atmospheric Administration (NOAA) Technical Report (NOAA, 2013), which stated that the anticipated increased temperatures of 3.6 degrees Fahrenheit have the potential to increase water use by as much as 4.3 percent by 2040. However, this number was reduced to 3.2 percent by 2040 for this Demand Model region and applied to four of the residential density demands and outdoor irrigation demands to reflect the trend of new development having less outdoor irrigated landscaping. Using 0

percent at 2015 and 3.2 percent at 2040, an adjustment factor for the intervening years was calculated as a linear interpolation and input to the Demand Model.

### 4.3.3 Intensification

There are many factors that influence water demands associated with land use development patterns, land uses, and activities. Our understanding of these factors is based on discussions during the eight land use planning agency meetings, research on local socioeconomic trends and conditions, analyses of land use patterns observed from the GIS database in the Demand Model, and land use planning trends observed throughout California. The study area is still rebounding from the Great Recession and market conditions for the region are noted by economists to be strong with higher employment and higher occupancy rates anticipated. As agricultural lands develop to urban uses, some communities are reaching "buildout". But the term buildout is a bit of a misnomer as lands are continually evolving over time, resulting in an "up not out" land use pattern shift. In addition, land values are increasing and are anticipated to increase over the 25 year planning horizon which contributes to higher densities and higher utilization of existing buildings or lands. Although difficult to quantify specifically, all of these conditions result in an intensification of land uses and thus higher water demands on a per acre basis. Visual examples are provided in the photos of denser commercial land use patterns (e.g., newer 2-story buildings with high occupancy, smaller floor space but more businesses, more food services, and less parking) reflecting intensification resulting in higher unit water use demands on a per acre basis.

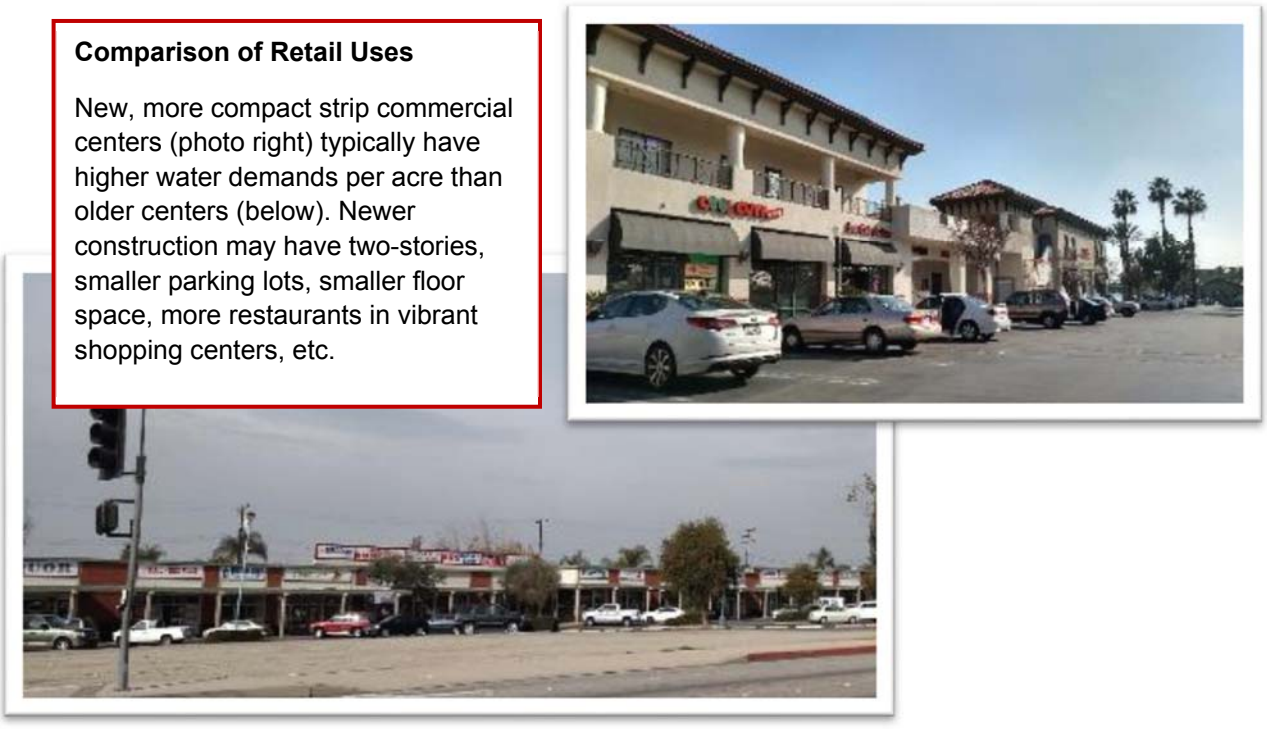

**Figure 4-2: Comparison of Retail Uses**

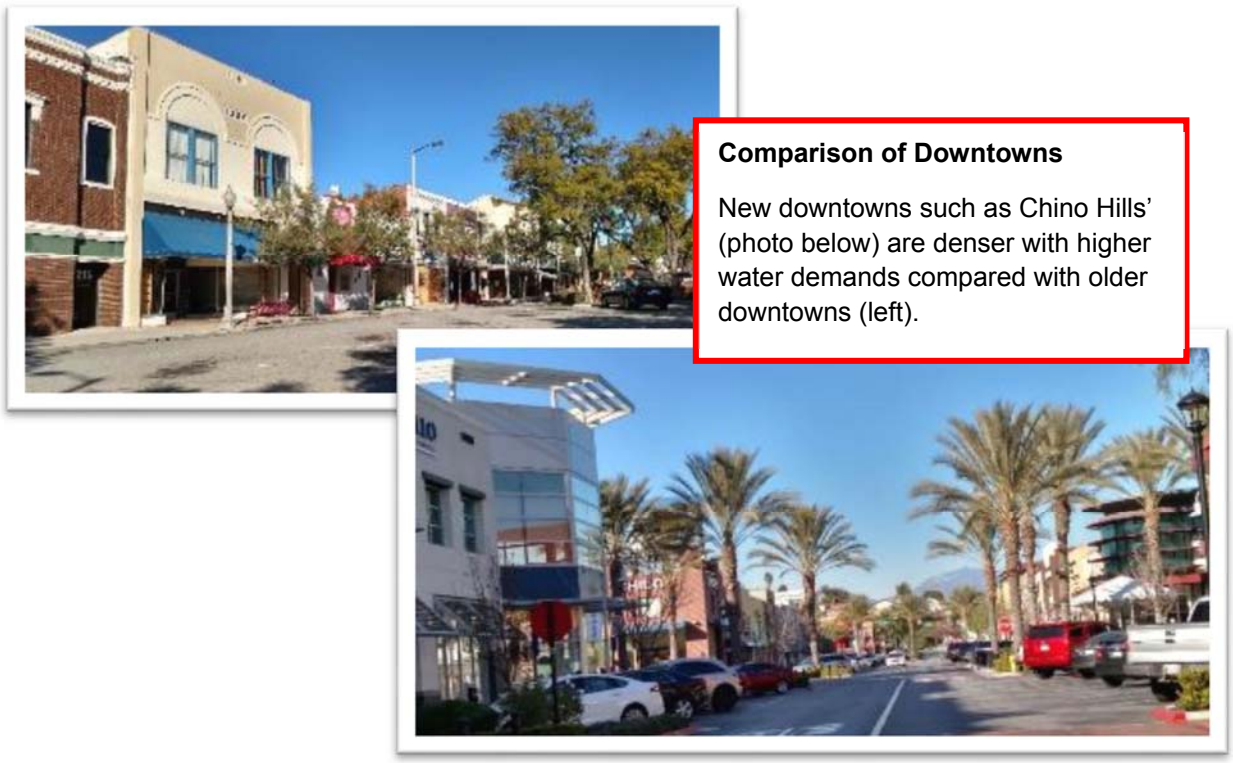

**Figure 4-3: Comparison of Downtowns**

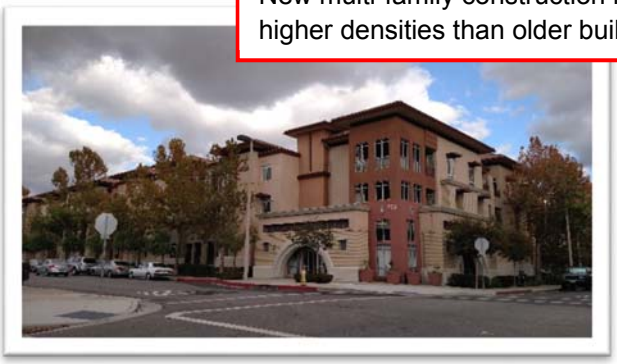
As the member agencies observed during the past eight years, recessions result in reduced water use. Rebound from the Great Recession is still occurring in the study area with gradually increasing demands with strong market conditions anticipated through 2040. Vacant industrial lands are rapidly being developed, and although the predominant industrial use is warehousing and distribution – with low water use – most vacant industrial lands were anticipated by the land use agencies to be built out by 2025 if not sooner. When these large vacant parcels are built out, the region will likely see a consolidation of smaller parcels with currently underutilized uses, replaced with new industrial uses. For example, several city planning staff indicated that older industrial buildings that are vacant or have low occupancy or otherwise underutilized uses are being purchased with adjoining parcels with the intent to consolidate the lands and build larger industrial facilities. Although office commercial vacancy rates are currently very high, with no construction occurring in this sector, the lack of new construction will eventually result in vacancy rates decreasing with more employees per acre, until new commercial office lands are developed.



A "jobs per acre" analysis was conducted to determine the intensification of employment on non-residential lands. The total 2015 employment estimate of 350,460 for the study area (IRP data from Center for Demographic Research using Southern California Association of Governments data) was applied to the 2015 acreage inventory (for commercial, industrial, and public/ institutional land uses) resulting in 13.1 jobs per acre. The 2035 employment estimate of 488,930 was applied to the 2035 acreage, resulting in 15.3 jobs per acre, a 17 percent increase.

There are many acres of underutilized lands which will change in character as land values increase, such as the industrial example described above. Another example is new retail or office construction in shopping center parking lots. Most of the large areas of underutilized lands are in unincorporated areas under San Bernardino County development regulations, although all unincorporated lands in the study area are also within a sphere of influence of a city. Within cities, underutilized lands and buildings also exist, but aren't as prevalent. Land use planners discussed many redevelopment projects where obsolete buildings will be replaced with higher density and intensity of uses, within the same land use designation. This is likely to occur throughout the study area as land values continue to increase and population increases.

Existing residential land use, of which 35,420 acres are low and very low density residential (46 percent of 2015 lands with a water demand), will have changes in water demands associated with unpermitted conversion of garages to living spaces, increased numbers of multiple generational households under one roof, and expansion of homes to accommodate more people per household. A study in the Bay Area comparing water consumption between 1996 and 2005 for low density residential sample areas, found an increase in water demands ranging from 6 to 12 percent due increased intensification of existing land uses (EBMUD, 2009).

Repurposing buildings – for example a train station housing retail stores or restaurants – will likely occur throughout the study area as the economy improves. Another trend is that cities are allowing underutilized industrial buildings to accommodate more customer related functions, such as will-call centers or sports activities, resulting in more employees and customers per acre.

The most prominent trend discussed at the land use agency meetings and observed in the analysis of existing land uses, is the overall increased densities of residential land use occurring and planned in the study area. Increased residential densities have the greatest potential for increasing water demands on a per acre basis, although actual demands decrease on a per dwelling unit and per capita basis due to the reduction of outdoor landscaping associated with compact residential growth.

New multi-family construction has higher densities than older buildings.

Compact development is evident in the land use inventory data that shows the majority of land uses are low density residential but the greatest increase in residential land use is associated with very high density residential use. Each community is planning for higher densities and in general, developers are maximizing allowable densities as cities experience frequent general plan amendment requests. Smart growth is a concept typically associated with compact development along and near transportation corridors, and this trend is being observed in the cities' promoting a revitalization of their downtowns and near Metrolink stations.

Another form of intensification is typically found with the development of small infill parcels that are too small, less than five acres, to be identified on the GIS existing land use layer. However, for this analysis, because much of the existing land use data provided in the GIS parcel files needed clarification, it provided an opportunity to specifically identify many of these small vacant lots. They were therefore included with the land use inventory as vacant, instead of being included as another factor to consider in the development of an intensification adjustment factor.

The intensification adjustment factor was determined using economic data developed for the IRP. The impact to water demands associated with strong market conditions alone, were estimated to increase demands by seven percent. A more conservatively lower estimate of six percent by 2040, with an extrapolation from 2015 for interim demands, was applied in the Demand Model.

In the future when individual customer meters are geocoded and consumption data can be linked and saved in the Demand Model GIS, it is recommended that sample areas be analyzed to compare consumption patterns of older development to newer development of similar land use. This historical comparison data will contribute to quantifying part of the intensification adjustment factor.

### 4.3.4 Conservation

Conservation savings associated with plumbing code changes and water use efficiency programs were determined in IEUA's 2015 Wastewater Facilities Master Plan. Flow monitoring of older residential developments compared with new homes indicated a reduction of indoor flows from an average of 55 gallons per capita per day (GPCD) to 37 GPCD. The proportional share of this indoor reduction on total 2040 residential demands is approximately 2.8 percent. This 2.8 percent at 2040, with an extrapolation from 2015 for interim demands, was used as the conservation adjustment factor and applied to the member agencies' land uses in the Demand Model.

### 4.3.5 Other

The Demand Model has an additional tab in the adjustment factors to allow the user to conduct demand management or other scenarios. The conservation adjustment factor addresses the indoor plumbing code and other efficiency savings, but the "Other" adjustment factor tab could be used by IEUA or its member agencies to study savings potential associated with conservation program scenarios for different land uses.

## 4.4 Future Land Use Unit Demands

There are over 2,000 adjustment factors in the Demand Model. Tables with these adjustment factors can be found in Appendix D. The adjustment factors for each member agency, are applied in the Demand Model to the Existing LUDs to generate Future LUDs, for each land use under each planning period and each member agency. Appendix D Land Use Unit Demands, contains tables of the resulting LUDs after they were adjusted. The LUDs are applied in the Demand Model to the acreage inventories for each member agency to calculate the total production water demands.

# 5 WATER DEMAND PROJECTIONS

Based on the land use GIS layers (existing and future) and the LUDs (existing and future) developed for each member agency, future demands for each land use within each member agency were calculated. This process is summarized in this section along with a discussion of other projection methodologies. Use of the Demand Model is also summarized here with a reference to the User Guide.

## 5.1 Demand Projections through 2040

Future demands were calculated in the Demand Model by applying the Final LUDs (Appendix D) to the acreage inventories of land use for each member agency's service area. This resulted in a total IEUA demand of approximately 278,040 AF at 2040, a 38 percent increase over 2015 normalized production demands (production demands include system losses). Table 5-1 and Figure 5-1 presents the water demands for the IEUA service area for existing normalized 2015, and projected years 2020, 2025, 2030, 2035, and 2040.

**Table 5-1: Demand Projections for IEUA**

| Land Use (du/ac) | Five Year Incremental Demand Projections (AF) | | | | | |
|---|---|---|---|---|---|---|
| | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
| Residential Very Low (<1 - 2) | 15,761 | 16,753 | 18,097 | 18,557 | 18,778 | 21,303 |
| Residential Low (3 - 7) | 73,060 | 75,949 | 80,499 | 84,647 | 88,824 | 94,202 |
| Residential Medium (8 - 14) | 16,012 | 18,376 | 20,967 | 24,117 | 25,806 | 33,264 |
| Residential High (15 - 24) | 18,611 | 21,212 | 25,739 | 27,062 | 27,752 | 28,827 |
| Residential Very High (25+) | 2,634 | 2,904 | 3,300 | 5,105 | 6,009 | 8,292 |
| Commercial | 19,607 | 19,922 | 20,885 | 24,281 | 27,068 | 29,455 |
| Industrial | 6,974 | 7,601 | 8,143 | 8,318 | 8,436 | 8,529 |
| Public/Institutional | 7,285 | 7,354 | 7,627 | 7,746 | 8,138 | 8,257 |
| Parks, Schools, Irrigation | 32,890 | 33,607 | 33,756 | 35,988 | 36,975 | 38,926 |
| Agriculture | 2,274 | 1,466 | 1,188 | 559 | 309 | 23 |
| Unique Water User #1 | 3,848 | 3,872 | 3,878 | 3,903 | 3,926 | 3,949 |
| Unique Water User #2 | 1,487 | 1,498 | 1,507 | 1,515 | 1,523 | 1,533 |
| Unique Water User #3 | 1,068 | 1,074 | 1,082 | 1,088 | 1,095 | 1,101 |
| Unique Water User #4 | 368 | 371 | 373 | 375 | 377 | 379 |
| | **201,879** | **211,959** | **227,041** | **243,261** | **255,016** | **278,040** |

On Figure 5-1, total IEUA demands are shown using the shaded area and values read from the right vertical axis. The individual member agency demands are shown using different lines and values are reads from the left vertical axis.

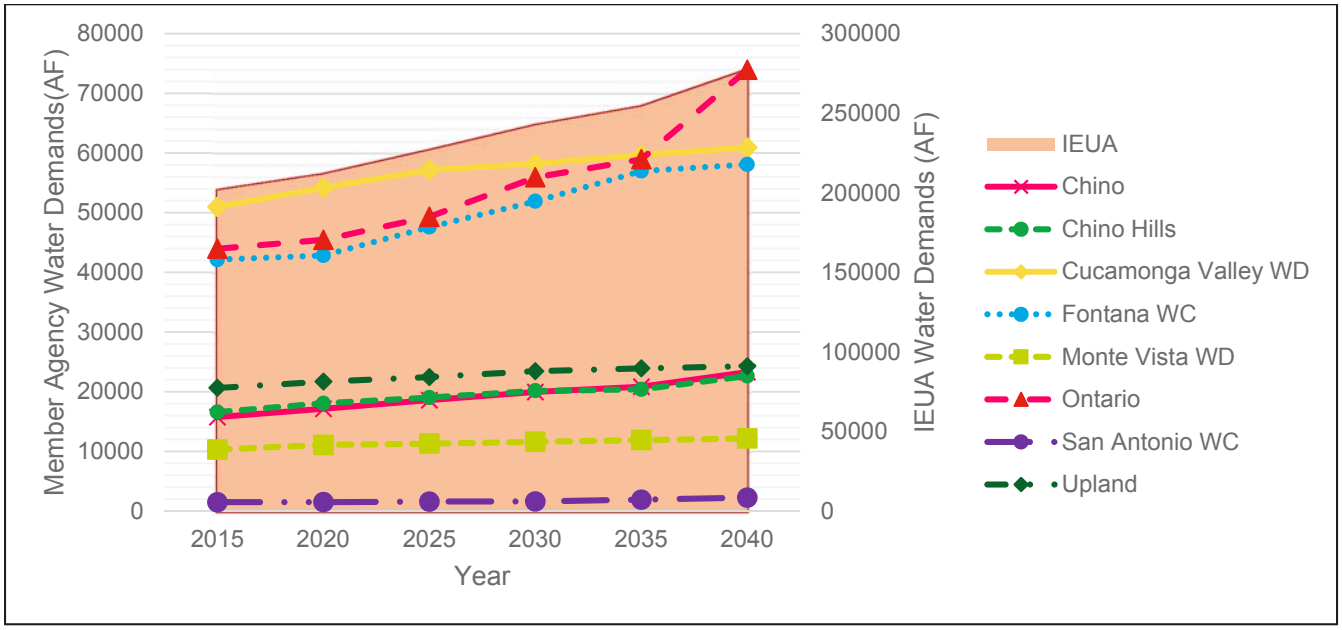


**Figure 5-1: Demand Projections by Member Agency**

As shown on Figure 5-1, total water demands increase gradually between 2015 and 2035 with a slightly steeper curve between 2035 and 2040. The steeper curve in later years is primarily attributed to the large amounts of residential land uses to be developed in Ontario's New Model Colony. Development this land is anticipated to be at the outer end of the study planning horizon. Appendix E contains tables of the resulting projection of water demands by member agency and combined into a total IEUA demand.

Because the projections do not include active conservation efforts, these projections should be considered an upper end. If the City of Ontario's New Model Colony developments are delayed, its projections will likely extend beyond 2040.

There are many methodologies used to project water demands, ranging from simple per capita projections to complex, data-intensive econometric models. The various methodologies rely on different data and assumptions in trying to project future conditions in a changing environment. The land use based demand projections are typically within approximately 10 percent above and 10 percent below actual demands when smoothed to remove annual climatic influences, assuming nothing significant occurs like a great recession. If something significant occurs, since the demands are based on general plan land uses, the later date projections typically remain while interim demands recover.

Different methods can result in slightly or significantly different projections. Per capita projections are inexpensive and simple to develop because they rely on easily available data. However, they are not rigorous, and do not reflect the complexities of water demand patterns or different community characteristics. Therefore, although the results may be consistent with land use based demands for the first few years, as the land use composition (changing percentage of each land use) and characteristics (e.g., higher densities) change over time to reflect that planned for by the community, the per capita demands do not reflect these changing conditions.

Econometric models can be rigorous if socioeconomic data are available and used, as with the IEUA IRP model. These models are typically more cost effective for large service areas, such as Metropolitan Water

District (MWD) or IEUA as a region, to capture regional demographic, economic, and other (e.g., climate change) characteristics and trends that are not site specific to smaller entities. IEUA's econometric model demand projections were similar to the land use based demand projections. Several of its analytical analyses quantifying demand characteristics, such as passive conservation, economic rebound, and climate change, were of particular value to the Demand Model, as presented in this TM.

In summary, different demand projection methodologies will result in different projections. The more rigorous methodologies typically result in projections within a range of plus 20 percent and minus 20 percent of each other. This may be attributable to the use of underlying source data. The similarity in projections of the land use based Demand Model and the IRP econometric model (within four percent) provides a very high level of confidence to use the results as a reliable predictor for future planning projects.

It is recommended that demand projections be updated every ten years or less. This will ensure that changing community characteristics are captured, and that accurate projections are continually relied on for planning purposes.

## 5.2 Use of Demand Model

The land use based Demand Model (welcome menu screenshot presented on Figure 5-2) was developed to perform the calculations described in the previous sections. The major inputs to the model included city general plans, parcel data, city boundaries, IEUA retail agency SOIs in GIS format, and LUDs calculated as described in sections 4.3 and 4.4.

The main purpose of the Demand Model was to provide detailed, rigorously developed demand projections for each member agency. The model does that, as well as test various scenarios to study the effects of conservation, for example, through the use of adjustment factors. The resulting projections described in Section 5.1 were developed using the best available data at a point in time.

As the cities and communities in IEUA's service area develop and change over time, the demand projections can be updated based on new data. For example, if new growth areas in the City of Ontario, which has large land areas converting from agricultural uses to urban over an extended period of time, change land use designations to higher densities than now planned, the acreage inventories can be modified through changes to the GIS files. The model would be re-run to determine the effect on the city's or IEUA's overall demand. Another example is with the intensification of the older commercial areas in the IEUA service area; higher densities are being proposed by developers for underutilized and infill sites. The land use categories can be easily modified in the GIS files to reflect these approved changes and the model re-run. The underlying GIS files and LUDs can also be updated if the development timelines assumed in this study change or updated LUDs are calculated by retail agencies. Appendix F contains a User Guide as a reference document to run these scenarios. The Demand Model, created in Microsoft Access, is completely open and customizable if IEUA or its member agencies choose to add more features in the future.

# APPENDIX F

## Model User Guide

# Land Use Base Water Demand Model User Guide

This Demand Model is built in Microsoft Access which is linked with ArcGIS and provides users with an easy-to-use interface to view and update factor and demands.

## 1 WELCOME

The Welcome page (Figure 1-1 ) is the first interface the user sees when they open the model and is the primary interface for viewing, entering and updating model parameters and inputs like acreages, Land Use Demand Factors (LUD), and adjustment factors.

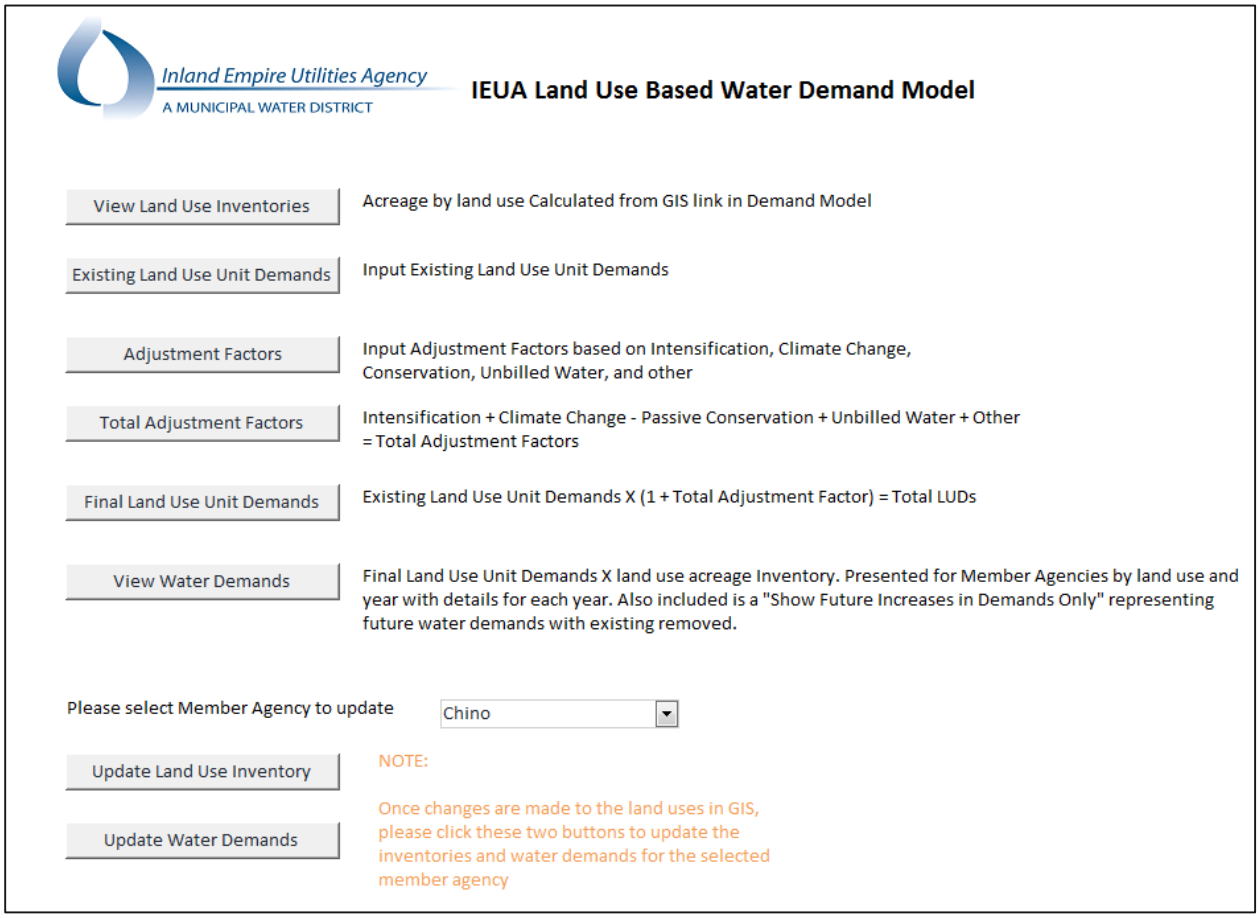

Figure 1-1 Welcome Form

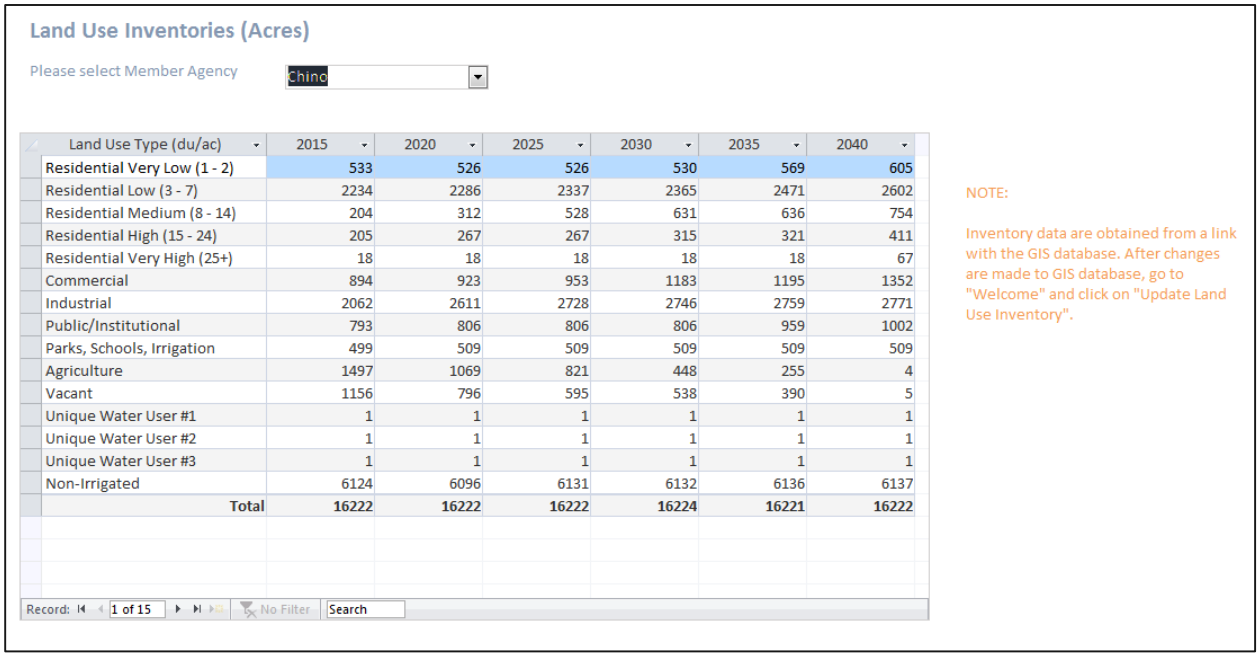
Below list describes the functions for each of the buttons on the Welcome page -



- Click “View Land Use Inventories” to view land use acreages by member agency which are calculated from GIS linked in the Demand Model. Any modification to the acreages and Landuse type must be done using GIS.
- Click “Existing Land Use Unit Demands” to view or update Existing LUD by member agency. LUDs are calculated outside the model as described in the memo. Users can manually update the LUDs when they are updated in the futures. Users can also update the Final Land Use Unit Demands from this form.

- Click “Adjustment Factors” to view or update Adjustment Factors by member agency. Users can also update the Total Adjustment Factors from this form.
- Click “Total Adjustment Factors” to view Total Adjustment Factors by member agency and update the Final Land Use Unit Demands.
- Click “Final Land Use Unit Demands” to view Final Land Use Unit Demands by member agency and update the Water Demands.

If updates are made to the GIS land use layers, users can select the appropriate member agency or all member agencies from the dropdown list and click ”Update Land Use Inventory” and “Update Water Demands” to update acreage inventories and total water demands.

# 2 VIEW LAND USE INVENTORIES

Click on View Land Use Inventories on the Welcome Page to view the acreages by land use. Select a member agency or “All Member Agencies” from the dropdown list to view their land use acreages. The acreages are calculated directly from the GIS database. This table cannot be manually updated without updating the background GIS layers.

| Land Use Type (du/ac) | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| Residential Very Low (1 - 2) | 533 | 526 | 526 | 530 | 569 | 605 |
| Residential Low (3 - 7) | 2234 | 2286 | 2337 | 2365 | 2471 | 2602 |

Figure 2-1 Land Use Inventories Form

# 3 EXISTING LAND USE UNIT DEMANDS

Click on Existing Land Use Unit Demands on the Welcome Page to view and update the Existing land Use Unit Demands manually. The Dropdown menu on the Existing Land Use Unit Demand table can be used view and update LUDs. These Existing LUDs are calculated from the Existing Water Consumption based on the Land Uses (explained in the Technical Memorandum). Updates to LUDS can be made by simply entering the number in the appropriate cell in the table.

After updating the LUD values, Click “Update Final Land Use Unit Demands” to update the final unit demands of all member agencies with the adjustment factors applied.

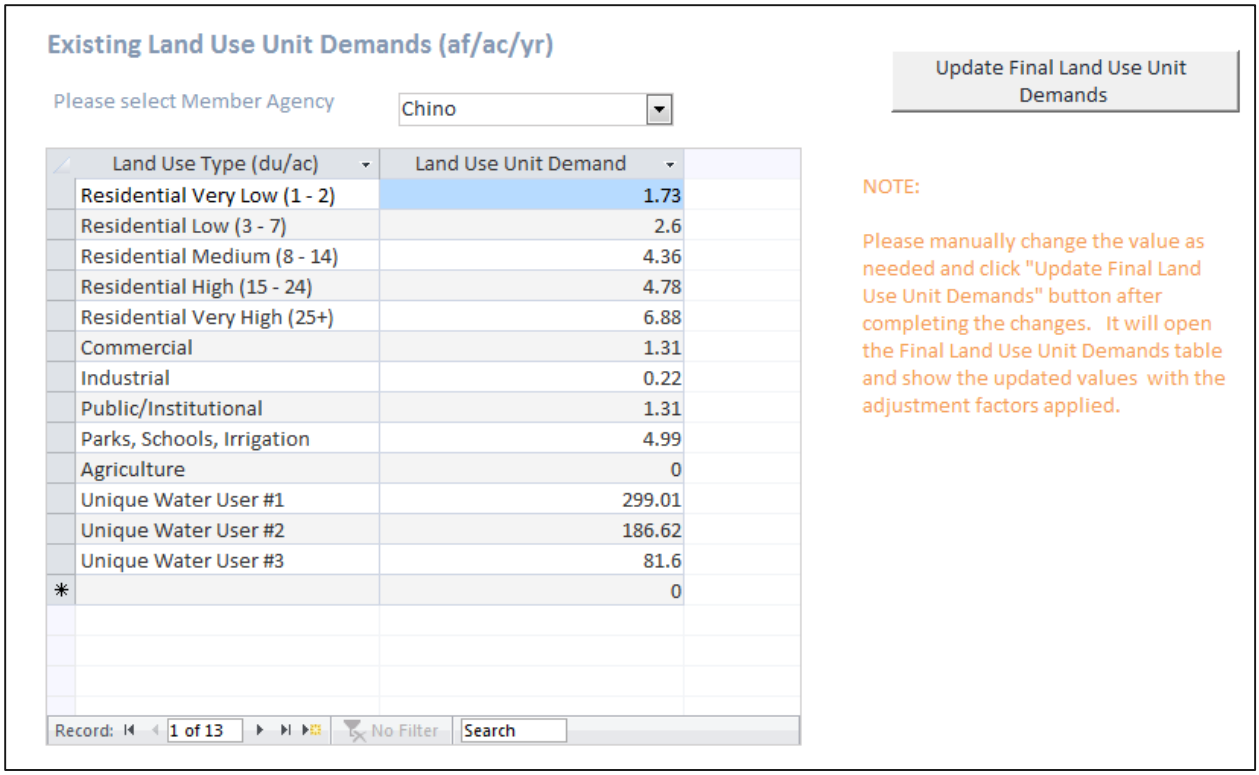

Figure 3-1 Existing land Use Unit Demands Form

# 4 ADJUSTMENT FACTORS

Click on 

on the Welcome Page to view and update the various Adjustment Factors (Figure 4-1). Select a member agency from the drop down menu on the Adjustment Factors table to view and update factor values in each factors. Definition for each Adjustment Factor and how it affects the existing LUDs is provided in the Technical Memorandum.

## 4.1 Intensification

Click on the “Intensification” tab to view the values for each land use by member agency and to update the intensification factors independently. To perform a global update for all land use types, enter a number in the "Update Intensification" box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

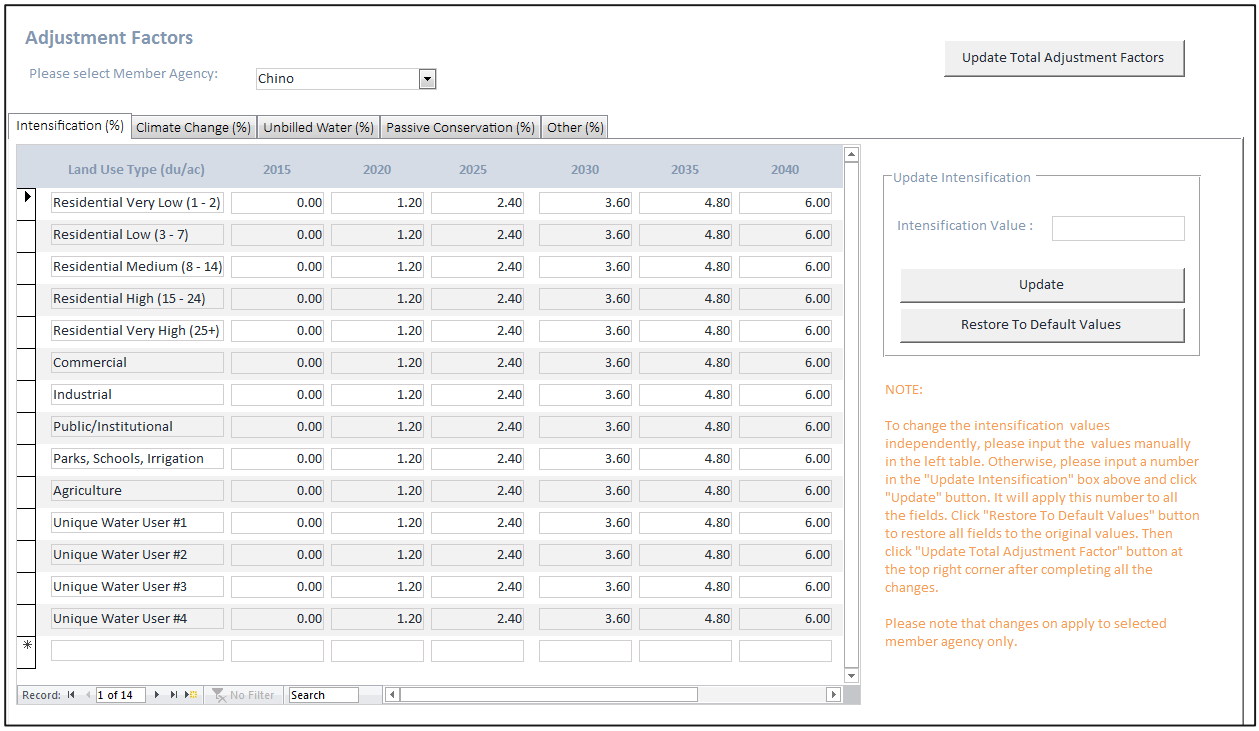

Figure 4-1 Intensification Form

## 4.2 Climate Change

Click on the “Climate Change” tab to view the values for each land use by member agency and to update the factors independently.

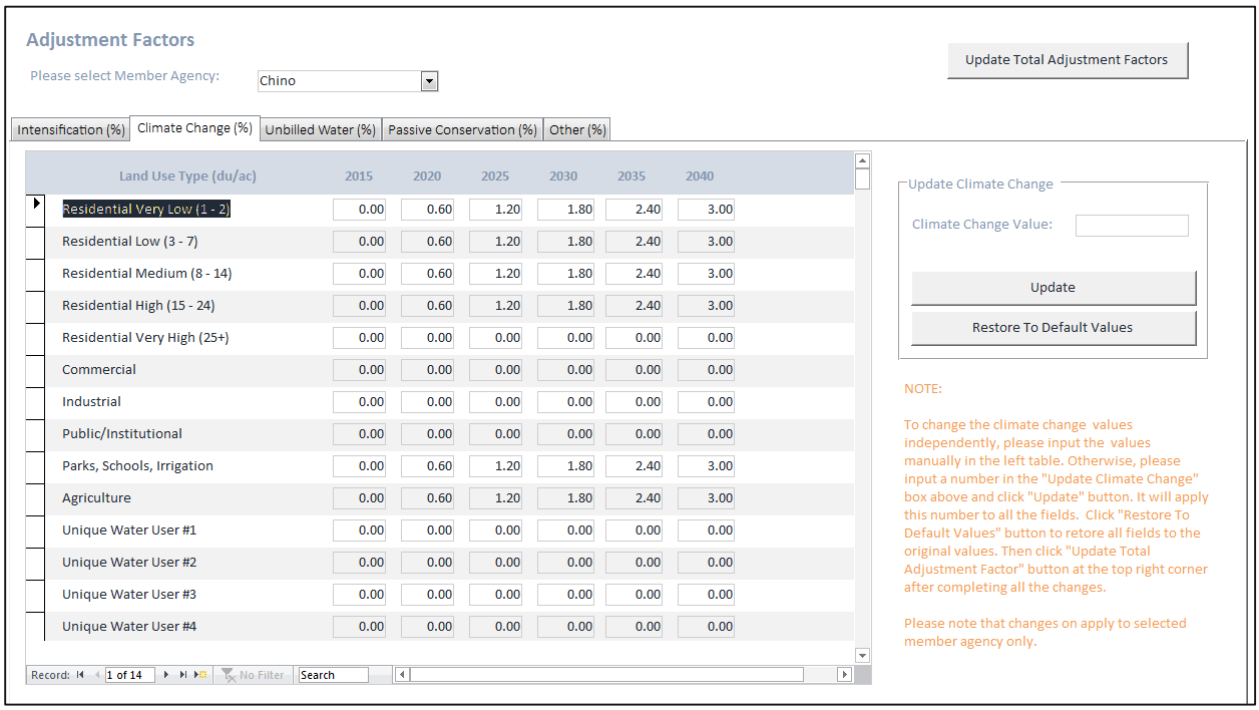

Figure 4-2 Climate Change Form

To perform a global update for all land use types, enter a number in the "Update Climate Change" box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

## 4.3 Unbilled Water

Click on the “Unbilled Water” tab to view the values by member agency and to update the factors. Unbilled Water factors is applied uniformly for all land uses. Click "Restore To Default Values" button to restore it to the original value.

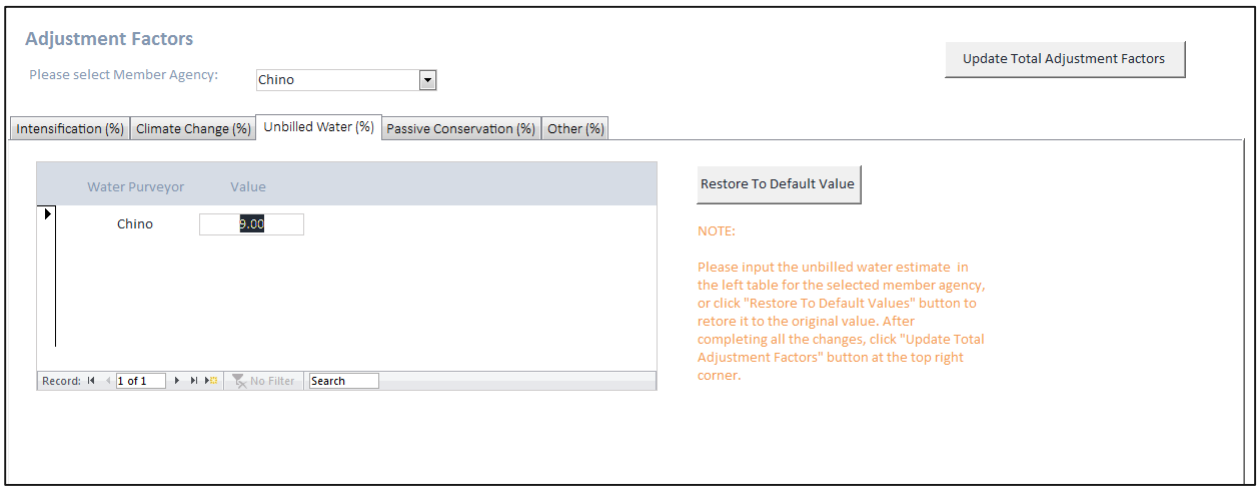

Figure 4-3 Unbilled Water Form

## 4.4 Passive Conservation

Click on the “Passive Conservation” tab to view the values for each land use by member agency and to update the factors independently. To perform a global update for all land use types, enter a number in the "Update Passive Conservation” box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

Entering a positive number for passive conservation to indicate decrease in adjustment factor and demand.

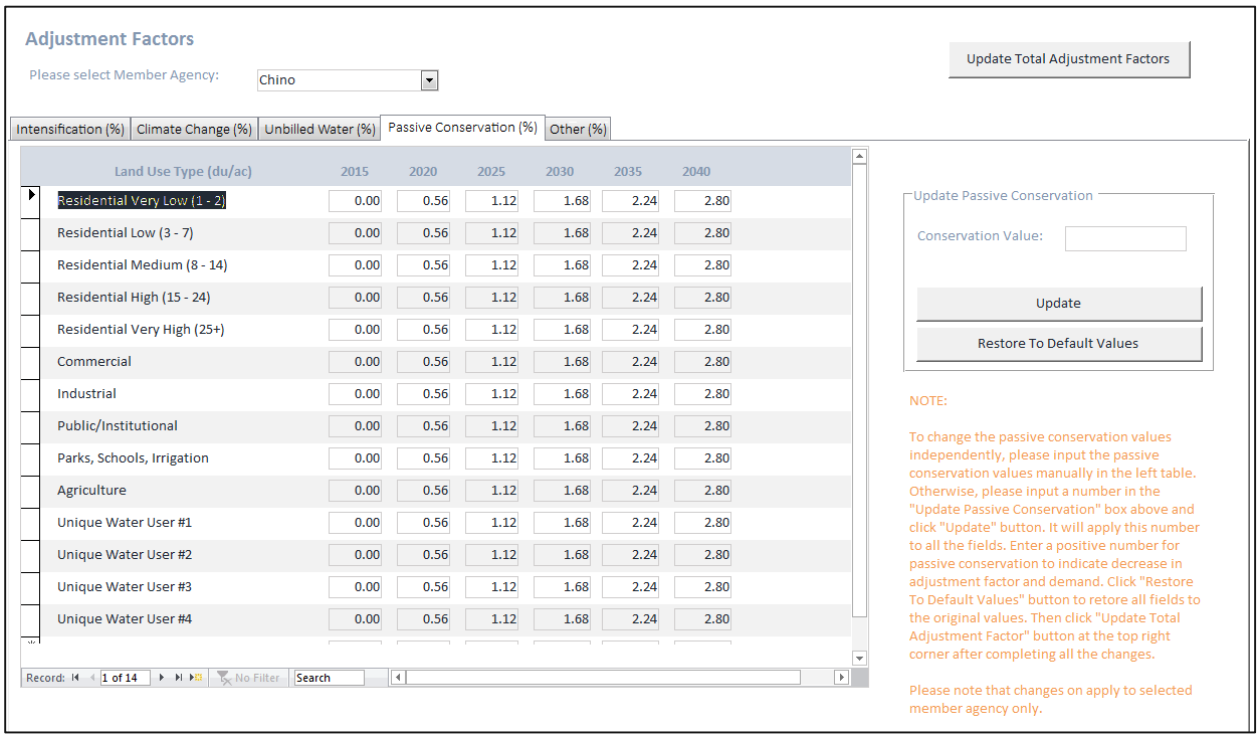

Figure 4-4 Passive Conservation Form

## 4.5 Other

The “Other” tab is an empty form that user can use to capture any additional adjustment factor not captures in the other tabs. The default value is 0 in all cells.

To perform a global update for all land use types, enter a number in the "Update Other Value” box and click "Update" button. Click "Restore To Default Values" button to restore all fields to 0.

A positive value will increase the Existing LUD and hence the total demand. And a negative number will decrease the Existing LUD.

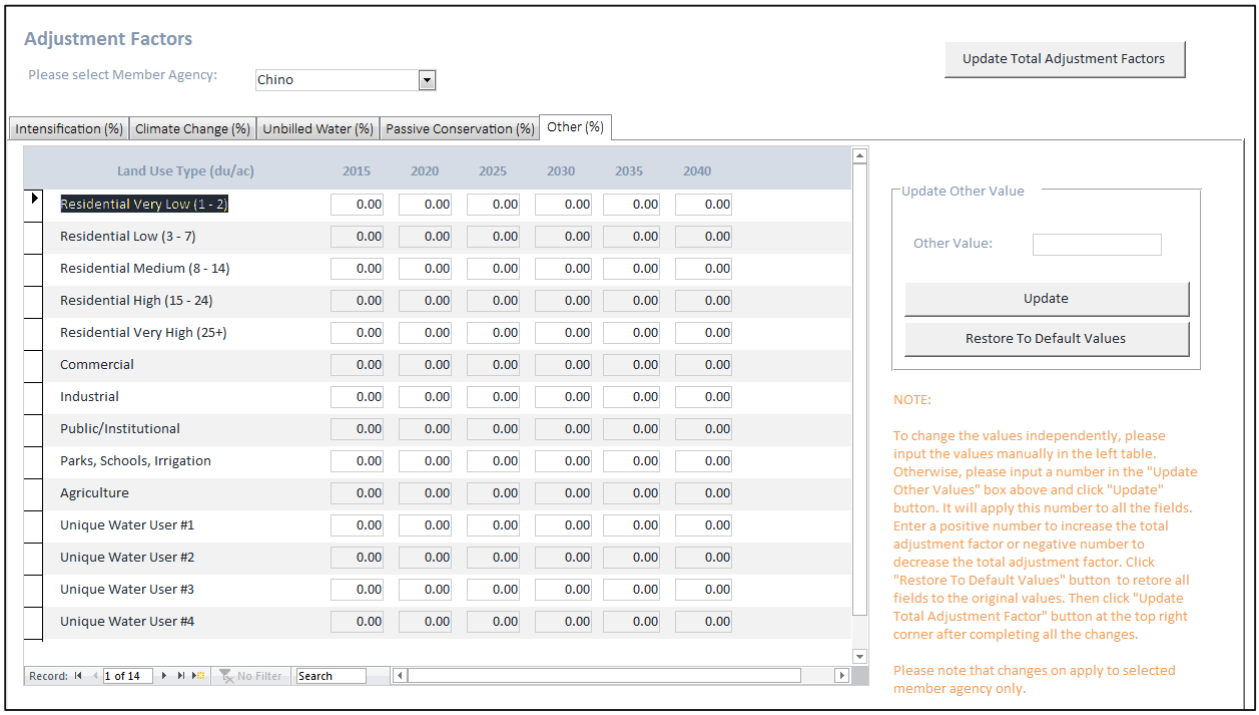

Figure 4-5 Other Form

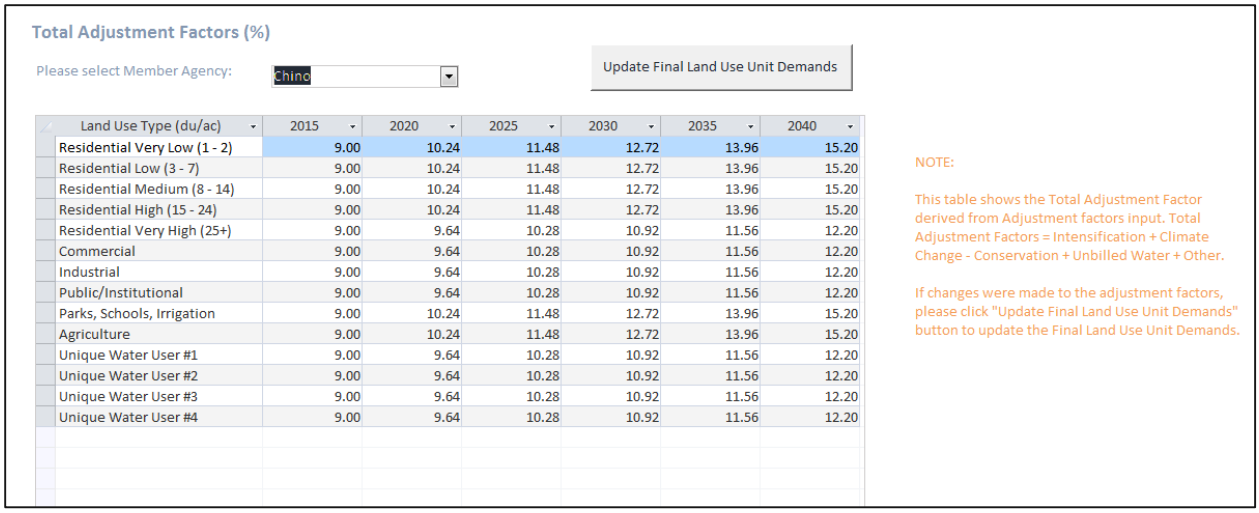

After updating or changing any adjustment factor, click "Update Total Adjustment Factor" button. It will recalculate the Total Adjacent Factors for all member agencies. Then the “Total Adjustment Factors” Form will pop up to show the new Adjustment Factors.

# 5 TOTAL ADJUSTMENT FACTORS

Click on Total Adjustment Factors on the Welcome Page to view the Total Adjustment Factors (Figure 5-1). Use the dropdown box to select the appropriate member agency. These values cannot be changed in this table. These values is calculated using the Adjustment Factors table using below equation

Total Adjustment Factors = Intensification + Climate Change - Conservation + Unbilled Water + Other.

If changes were made to the adjustment factors, please click "Update Final Land Use Unit Demands" button to update the Final Land Use Unit Demands of all member agencies. Then the “Final Land Use Unit Demands” form will pop up to show the results (Figure 6-1)

Total Adjustment Factors (%)

Please select Member Agency: Chino

Update Final Land Use Unit Demands

| Land Use Type (du/ac) | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |

NOTE:

This table shows the Total Adjustment Factor derived from Adjustment factors input. Total Adjustment Factors = Intensification + Climate Change - Conservation + Unbilled Water + Other.

If changes were made to the adjustment factors, please click "Update Final Land Use Unit Demands" button to update the Final Land Use Unit Demands.

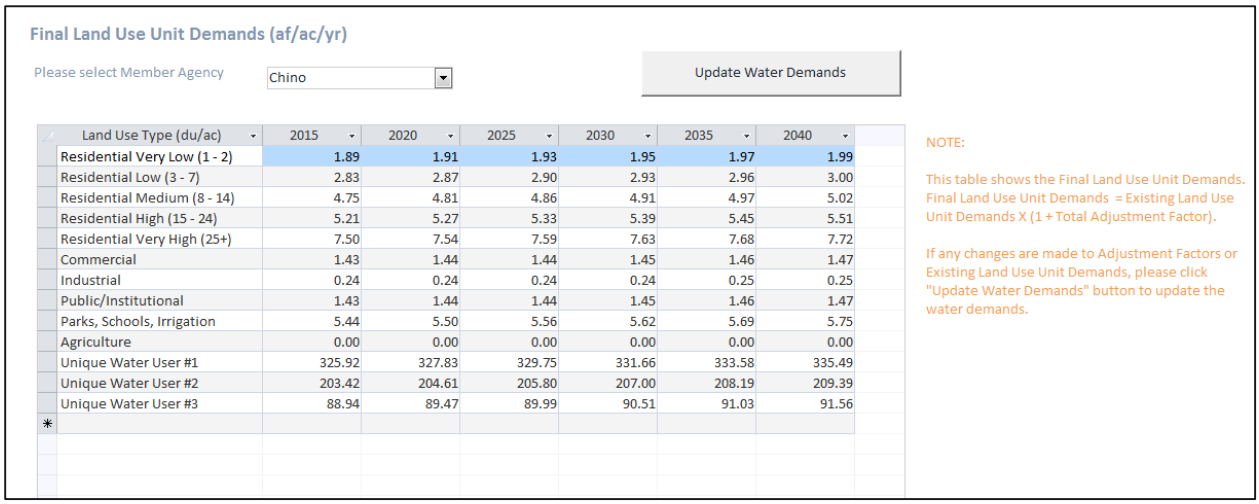

Figure 5-1 Total Adjustment Factors Form

# 6 FINAL LAND UNIT DEMANDS

Click on Final Land Use Unit Demands on the Welcome Page to view the Final LUDs (Figure 6-1) by member agency. Final LUDs is calculated using the below formula

Final Land Use Unit Demands = Existing Land Use Unit Demands X (1 + Total Adjustment Factor)

If changes were made to Adjustment Factors or Existing Land Use Unit Demands, please click "Update Water Demands" button to update the water demands of all member agencies. Then the “Water Demands” Form will pop up to show results.

Figure 7-3 Water Demands by Year

## 7.3 Water Demands Graph

Water Demands table also displays a graph of the water demands of all member agencies throughout the years. Total IEUA demands is shown as default. Click “Not Show IEUA” to show curves of member agencies only.

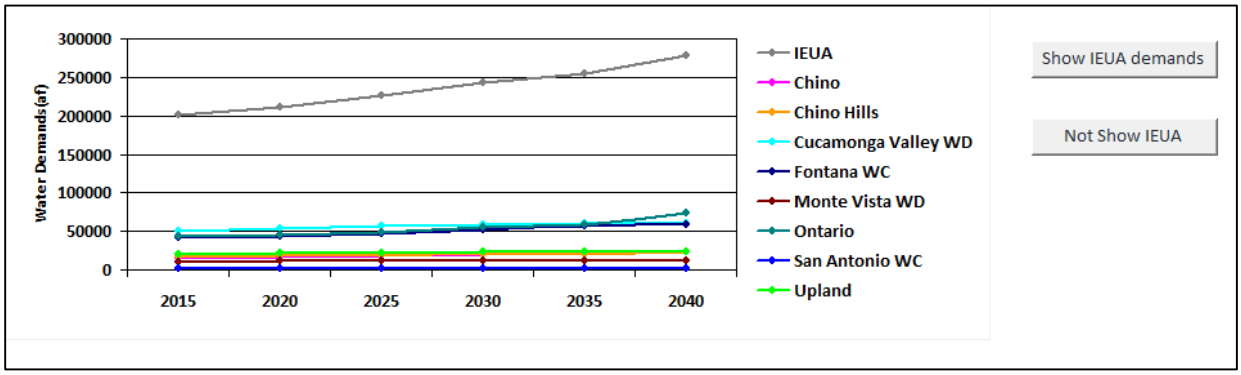

Figure 7-4 Water Demands Graph

# 8 UPDATE LAND USES IN ARCGIS

The model database contain multiple GIS feature classes with land use data which can be updated if changes to land uses occurs or year of development changes. These updates must be done within GIS.

The feature classes in the database is organized based on Cities within IEUA service area. Each city has two data tables: existing data and future data except City of Ontario and City of Upland. These two cities have existing and future data combined in one feature classes.

Since the land uses are mapped to existing parcel data, users only need to update the existing and future land use in the [CityName]_Existing or [CityName]_Existing_GeneralPlan tables. Below table shows which Feature Class is used to calculates acreages in the model. These can be updated within GIS when changes to Land Use type or development year happens.

| City Name | Feature Class Name | Used for Inventory Calculation |
|---|---|---|
| **Chino** | Chino_Existing | Y |
| | Chino_GeneralPlan | Y |
| **Chino Hills** | ChinoHills_Existing | Y |
| | ChinoHills_GeneralPlan | N |
| **Fontana** | Fontana_Existing | Y |
| | Fontana_GeneralPlan | N |
| **Montclair** | Montclair_Existing | Y |
| | Montclair_GeneralPlan | N |
| **Ontario** | Ontario_Existing_GeneralPlan | Y |
| **Rancho Cucamonga** | RanchoCucamonga_Existing | Y |
| | RanchoCucamonga_GeneralPlan | N |
| **Rialto** | Rialto_Existing | Y |
| | Rialto_GeneralPlan | N |
| **Unincorporated area between Montclair and Chino** | UINC_MontClair_Chino_Existing | Y |
| | UINC_MontClair_Chino_GP | N |
| **Upland** | Upland_Existing_GeneralPlan | Y |

In the [CityName]_Existing or [CityName]_Existing_GeneralPlan, besides the geographic information, a few new fields were added (below table).

| Field Name | Description |
|---|---|
| **Master_LU** | Existing land use (in 2015) |
| **GeneralPlan_LU** | Original planned future land use (Not used in inventory calculation) |
| **Future_LU** | Future land use |
| **Year_Developed** | The year the future land use developed |
| **WaterPurveyor** | The member agency belonged to |

To update land use in ArcGIS,

A) Be sure to close the database opened in MS Access
B) Add the needed feature classes to ArcMap and start Editor.
C) Change the land use in Master_LU for existing or change the land use in Future_LU for future and change the Year_Developed as well. Year_Developed value need to be multiples of 5 and starting from 2015 (till 2040). For example, a future land use will be developed in 2023, please input “2020” in Year_Developed field
D) Save the edits and close ArcGIS

Please note, Chino is a special case when editing future land uses. Since the parcels at southeast of Pine Ave & Chino Corona Rd changes significantly in future, the parcels in Chino_GeneralPlan are used for representing the land use in future. If future land uses in the colored area (shown in figure 8-1) needs to be changed, please update the Future_LU and Year_Developed fields in Chino_GeneralPlan feature class. For all other landuse changes, please update these two fields in Chino_Existing feature class.

Figure 8-1 Parcels representing future land uses in Chino

# 9 UPDATE WATER DEMAND MODEL

Once you have completed and saved the changes to the GIS feature classes, use the update features on Welcome page to update land use inventories and water demands.

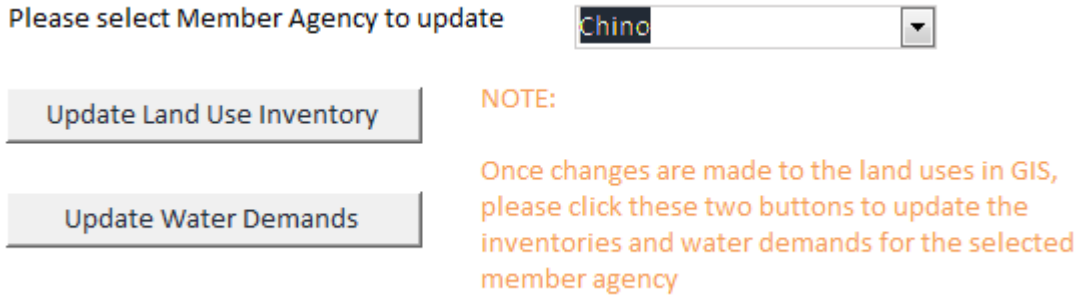

Figure 9-1 Update section in Welcome Form

## 9.1 Update Land Use Inventories

Before making the update, make sure the database is not opened in ArcGIS. Select a member agency or “All Member Agencies” in the dropdown list and click “Update Land Use Inventory” button to run the

calculation. This update procedure can take several minutes, please don't interrupt it. The "Land Use Inventories" window will pop up once the updating finished.

## 9.2 Update Water Demands

Once the inventories update is done, click "Update Water Demands" button to re-calculate the total water demands and the "Water Demands" form will pop up once the updating finished.

**Water Audit Report for:** Monte Vista Water District (3610029)
**Reporting Year:** 2015 | 7/2014 - 6/2015

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

**All volumes to be entered as: ACRE-FEET PER YEAR**

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

<----------- Enter grading in column 'E' and 'J' ---------->

Master Meter and Supply Error Adjustments

### WATER SUPPLIED

| | | | | | Pcnt: | Value: | |
|---|---|---|---|---|---|---|---|
| Volume from own sources: | 8 | 8,408.094 | acre-ft/yr | 8 | | 0.000 | acre-ft/yr |
| Water imported: | 4 | 7,635.200 | acre-ft/yr | 8 | | 0.000 | acre-ft/yr |
| Water exported: | 5 | 6,932.977 | acre-ft/yr | 8 | | 0.000 | acre-ft/yr |

Enter negative % or value for under-registration
Enter positive % or value for over-registration

**WATER SUPPLIED:** 9,110.317 acre-ft/yr

### AUTHORIZED CONSUMPTION

Click here: ? for help using option buttons below

| | | | Pcnt: | Value: | |
|---|---|---|---|---|---|
| Billed metered: | 6 | 8,531.701 | acre-ft/yr | | | |
| Billed unmetered: | n/a | 0.000 | acre-ft/yr | | | |
| Unbilled metered: | 10 | 74.043 | acre-ft/yr | | | |
| Unbilled unmetered: | 8 | 7.488 | acre-ft/yr | | 7.488 | acre-ft/yr |

Use buttons to select percentage of water supplied **OR** value

**AUTHORIZED CONSUMPTION:** ? 8,613.232 acre-ft/yr

**WATER LOSSES (Water Supplied - Authorized Consumption)** 497.085 acre-ft/yr

#### Apparent Losses

| | | | Pcnt: | Value: | |
|---|---|---|---|---|---|
| Unauthorized consumption: | | 22.776 | acre-ft/yr | 0.25% | | acre-ft/yr |

**Default option selected for unauthorized consumption - a grading of 5 is applied but not displayed**

| | | | | | |
|---|---|---|---|---|---|
| Customer metering inaccuracies: | 3 | 175.627 | acre-ft/yr | 2.00% | acre-ft/yr |
| Systematic data handling errors: | 8 | 0.250 | acre-ft/yr | 0.250 | acre-ft/yr |

**Apparent Losses:** ? 198.653 acre-ft/yr

#### Real Losses (Current Annual Real Losses or CARL)

**Real Losses = Water Losses - Apparent Losses:** ? 298.432 acre-ft/yr

**WATER LOSSES:** 497.085 acre-ft/yr

### NON-REVENUE WATER

**NON-REVENUE WATER:** ? 578.617 acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

### SYSTEM DATA

| | | | |
|---|---|---|---|
| Length of mains: | 9 | 198.0 | miles |
| Number of active AND inactive service connections: | 6 | 12,280 | |
| Service connection density: | | 62 | conn./mile main |

Are customer meters typically located at the curbstop or property line? Yes

Average length of customer service line: (length of service line, beyond the property boundary, that is the responsibility of the utility)

**Average length of customer service line has been set to zero and a data grading score of 10 has been applied**

Average operating pressure: 7 85.0 psi

### COST DATA

| | | | |
|---|---|---|---|
| Total annual cost of operating water system: | 10 | $12,957,128 | $/Year |
| Customer retail unit cost (applied to Apparent Losses): | 10 | $2.13 | $/100 cubic feet (ccf) |
| Variable production cost (applied to Real Losses): | 7 | $720.00 | $/acre-ft |

☐ Use Customer Retail Unit Cost to value real losses

### WATER AUDIT DATA VALIDITY SCORE:

*** YOUR SCORE IS: 69 out of 100 ***

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

### PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Water imported
2: Customer metering inaccuracies
3: Water exported

Water Audit Report for: Monte Vista Water District (3610029)
Reporting Year: 2015 7/2014 - 6/2015

*** YOUR WATER AUDIT DATA VALIDITY SCORE IS: 69 out of 100 ***

### System Attributes:

| | | | |
|---|---|---|---|
| | Apparent Losses: | 198.653 | acre-ft/yr |
| + | Real Losses: | 298.432 | acre-ft/yr |
| = | Water Losses: | 497.085 | acre-ft/yr |
| ? | Unavoidable Annual Real Losses (UARL): | 277.37 | acre-ft/yr |
| | Annual cost of Apparent Losses: | $184,143 | |
| | Annual cost of Real Losses: | $214,871 | Valued at Variable Production Cost |

### Performance Indicators:

| | | | |
|---|---|---|---|
| Financial: | Non-revenue water as percent by volume of Water Supplied: | 6.4% | |
| | Non-revenue water as percent by cost of operating system: | 3.5% | Real Losses valued at Variable Production Cost |
| Operational Efficiency: | Apparent Losses per service connection per day: | 14.44 | gallons/connection/day |
| | Real Losses per service connection per day: | 21.70 | gallons/connection/day |
| | Real Losses per length of main per day*: | N/A | |
| | Real Losses per service connection per day per psi pressure: | 0.26 | gallons/connection/day/psi |
| | From Above, Real Losses = Current Annual Real Losses (CARL): | 298.43 | acre-feet/year |
| ? | Infrastructure Leakage Index (ILI) [CARL/UARL]: | 1.08 | |

* This performance indicator applies for systems with a low service connection density of less than 32 service connections/mile of pipeline

# Summary of Chino Groundwater Basin Management

# Summary of Chino Groundwater Basin Management

The 1978 Chino Basin Judgment requires that Watermaster develop a management plan for the Chino Basin that meets water quality and water quantity objectives for the region. Three primary agreements govern the adjudication and management of the basin: 1) the 1978 Chino Basin Judgment; 2) the 2000 Peace Agreement, incorporating the Optimum Basin Management Program Implementation Plan; and 3) the 2007 Peace II Agreement. The following discusses each of these agreements as they pertain to basin management and the District's groundwater supply.

## Chino Basin Judgment Adjudication (1978)

In 1978, the Superior Court of the State of California entered into the Chino Basin Judgment that adjudicated the water rights of the Chino Groundwater Basin and imposed a physical solution.

According to the Judgment, there are significant imported water supplies available to supplement the native safe yield of the basin. Therefore, the purpose of the physical solution was to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of the basin by providing for the optimal economic, long-term, conjunctive utilization of surface waters, ground waters, and supplemental water to meet the requirements of water users having rights in or dependence on the basin. A fundamental premise of the physical solution was that all water users dependent on the basin would be allowed to pump sufficient waters to meet their requirements. To the extent that a water producer's pumping exceeds its share of the safe yield, Watermaster has the obligation to provide for replenishment of the basin for the amount of production exceeding its rights.

Watermaster, as an extension of the Court, manages the basin in accordance with the provisions of the Judgment. An Assessment Package is produced by Watermaster on an annual basis, which describes the rights and abilities to which parties are entitled according to the provisions of the Judgment.

*Water Rights*

Three operating pools were established by the Judgment for Watermaster administration: the Overlying Agricultural Pool, the Overlying Non-Agricultural Pool, and the Appropriative Pool. Rights to the safe yield of the basin were allocated to each pool.

An "overlying" right is defined as the appurtenant right of an owner of lands overlying the basin to produce water from the basin for overlying beneficial use on such lands. An "appropriative" right is defined as the annual production right of a producer from the basin other than pursuant to an overlying right.

According to the 1978 Judgment, the safe yield of the basin is 140,000 AFY. "Safe yield" is defined as the long-term average annual quantity of groundwater (excluding replenishment water or stored water but including return flow to the basin from use of replenishment or storage water) which can be produced from the basin under cultural conditions of a particular year without causing an undesirable result.

Aggregate preserved overlying rights in the safe yield for Agricultural Pool use, including the rights of the State of California, total 82,800 AFY, or 414,000 AF in any five consecutive years. Overlying rights for Non-Agricultural Pool use total 7,366 AFY. In accordance with the provisions of the Judgment, when land converts from agricultural to urban use, the purveyor that will supply water to the converted land may apply for additional groundwater production credit; this process is known as Land Use Conversion.

Appropriative rights allocated by the Judgment include rights by prescription and are entitled under the physical solution to share in the remaining safe yield, after satisfaction of overlying rights. "Operating Safe Yield" (OSY) is defined as the amount of groundwater that Watermaster shall determine can be produced from the basin by the Appropriative Pool parties free of replenishment obligation under the physical solution. Any subsequent change in the OSY would be offset by use of available Overlying Agricultural Pool rights. The District's current share of the OSY is 8.797 percent and the Company's current share is 1.234 percent.

*Reallocation of Unpumped Agricultural Water Rights*

According to the Judgment, in any five years that any portion of the share of safe yield allocated to the Overlying Agricultural Pool is not produced, that water is available for reallocation to the Appropriative Pool. Priority of that water is first to supplement water available from OSY to compensate for any reduction in the safe yield after the tenth year of operation (1988), conversion claims, and then for supplement to the OSY without regard to reductions in safe yield.

Appropriative rights and corresponding shares of OSY may be assigned or may be leased or licensed to another appropriator, as approved by Watermaster.

*Approved Overdraft*

Overdraft is defined as a condition wherein the total annual production from the Basin exceeds the safe yield. The 1978 Judgment stated that the Basin, since at least 1953, was in a condition of overdraft.

In adopting the OSY for any year, Watermaster is limited to 200,000 AF of accumulated overdraft, and in no event shall the OSY in any year be less than the Appropriative Pool's share of safe yield or exceed the Appropriative Pool's share of safe yield by more than 10,000 AF.

*Replenishment for Overproduction*

Watermaster levies an annual Replenishment Assessment in an amount sufficient to purchase replenishment water to replace production during the preceding year which exceeds the safe yield. Assessments are based on the pooling plan for each pool. The Replenishment Assessment for the Appropriative Pool is recovered by a uniform assessment against all production during the preceding year equaling 15 percent of replenishment cost of water, and a uniform assessment on each AF of production by each party in excess of its allocated share of OSY during the preceding year equaling 85 percent of costs.

Supplemental water may be used to recharge the basin either directly by spreading and percolating or injecting the water into the basin, or indirectly by delivering the water for use in lieu of production and use of safe yield or OSY. Supplemental water may be obtained from any available source including recycled water and imported water.

Much of the available natural surface water runoff in the Santa Ana River Watershed is captured and recharged to the groundwater aquifers. A system of flood control channels and percolation basins have been developed to increase the natural recharge capacity of the basin. A limited quantity of excess storm water is captured for recharge; however, the groundwater recharge program is being expanded to include greater quantities of storm water, recycled water, and lesser quantities of imported water.

*Replenishment with Recycled Water*

IEUA assumes responsibility for delivery of recycled water for basin recharge. Recycled recharge water is credited to parties to the Regional Sewer Service Contract, based on relative contributions of wastewater flow delivered to the regional reclamation plants by the respective agencies. This provides additional groundwater pumping rights calculated annually as stored water credits. In FYE 2015, the District received 468 AF of additional production capability as a result of recycled water recharge activity and its Recycled Water Purchase Agreement with the City of Montclair (Section 4.2.4). The Company does not participate in the recharge activity.

*Carryover of Production Rights*

Any Appropriative Pool party who produces less than its assigned share of OSY may carry such unexercised rights forward for use in subsequent years. The first water used in any such subsequent year is to be an exercise of that carryover right. If the aggregate carryover of any Appropriative Pool party exceeds its share of OSY, the water is placed in an excess carryover storage account. Carry-over water has no limit at this time. For the District's latest carryover activity, see Table 4-2.

*Groundwater Storage*

The Judgment states that a substantial amount of available groundwater storage capacity exists in the basin which is not utilized for storage or regulation of basin waters. The basin stores approximately 5 MAF of groundwater and has the capability of storing an additional 1 MAF. Reservoir capacity can be utilized appropriately for storage and conjunctive use of supplemental water with basin waters. Any person or public entity may make reasonable beneficial use of the available groundwater storage capacity for storage of supplemental water, with allocation preference of storage capacity to the needs and requirements of the lands overlying the basin and the owners of rights in the basin.

As of June 30, 2015, the District estimates it has a total of 26,484 AF of water in its excess carryover and local supplemental storage accounts. This quantity represents a significant reserve for use during times of drought and restrictions on other sources of supply.

**Chino Basin Optimum Basin Management Program**

In 1998, Watermaster developed an integrated set of water management goals and actions for the Basin. Known as the Optimum Basin Management Program (OBMP), this document describes nine program elements to meet the water quality and local production objectives in the basin. The OBMP encourages the increased use of local supplies to help "drought proof" the basin.

The OBMP is intended to formulate and implement a groundwater management program that will preserve and enhance the safe yield and the water quality of the basin. Watermaster's goal is to make it possible for all groundwater users to produce water from the basin for beneficial uses at an affordable cost. The OBMP is intended to allow continued reliance on groundwater for beneficial use within the basin while minimizing demand for imported water, and to encourage beneficial use of the large available storage space in the aquifer system. OBMP actions are intended to benefit both local and regional water supply programs.

The effort to complete the OBMP for the basin was divided into two phases. The first phase culminated in the September 1999 submittal of the draft Phase 1 Report to the Court with continuing jurisdiction over the basin groundwater resources. The second phase, including a programmatic Environmental Impact Report, was completed and adopted in July 2000, as the Implementation Plan which was incorporated into the Peace Agreement.

Phase 1 of the OBMP defined the state of the Chino Groundwater Basin, established the goals and objectives concerning major issues identified by stakeholders, and affirmed a management plan for the achievement of the stated goals and objectives. Phase 2 of the OBMP is the Implementation Plan for the installation and operation of OBMP facilities. The major OBMP facilities include pipelines, desalters, possibly an ion exchange facility, recharge basins, pump stations, production wells, and monitoring devices.

The four primary OBMP management goals are to enhance basin water supplies, to protect and enhance water quality, to enhance management of the basin, and to equitably finance the OBMP.

The OBMP includes nine program elements that were developed during the Phase 1 OBMP Report that collectively will meet the goals of the OBMP. The scope of implementation of some of the programs have been combined since they overlap and have synergies between them. The program elements include developing and implementing each of the following:

Element 1 – Comprehensive Monitoring Program

Element 2 – Comprehensive Recharge Program

Element 3 – Water Supply Plan for the Impaired Areas of the Basin

Element 4 – Comprehensive Groundwater Management Plan for MZ 1

Element 5 – Regional Supplemental Water Program

Element 6 – Cooperative Programs With the Regional Water Quality Control Board, Santa Ana Region, and Other Agencies to Improve Basin Management

Element 7 – Salt Management Program

Element 8 – Groundwater Storage Management Program

Element 9 – Storage and Recovery Programs

**Peace Agreements**

In July 2000, Watermaster's planning process culminated with the adoption of a "Peace Agreement" that ended over 15 years of litigation within the basin. The Peace Agreement amended the 1978 Chino Basin Judgment and has a term of 30 years. The Peace Agreement facilitates the implementation of the OBMP.

The Peace Agreement amended the Judgment in three areas:

1. Members of the Overlying Non-Agricultural Pool have the right to transfer or lease their quantified production rights within the same pool or to Watermaster in conformance with specified procedures.

2. Any Appropriative Pool party who provides water service to overlying lands may exercise overlying rights to the extent necessary to provide water service to overlying lands.

3. For the term of the Peace Agreement, in any year in which sufficient unallocated safe yield from Overlying Agricultural Pool is available for conversion claims, Watermaster can allocate each Appropriative Pool party with a conversion claim, 2.0 AF of unallocated safe yield water for each converted acre approved.

The "Peace II" Agreement, signed in 2008, provided improved flexibility in managing the basin's water supply, better utilization of the desalters, and reduced water losses to the Santa Ana River. The Peace II Agreement determined the financial and institutional arrangements needed to implement basin reoperation and hydraulic control, including the following:

Ensures the beneficial use of groundwater in the southern end of the basin by enabling the construction of desalters to produce and treat about 40,000 AFY of groundwater degraded by past agricultural practices;

Maximizes the reuse of recycled water;

Fulfills Watermaster's and IEUA's maximum benefit commitments;

Provides up to 400,000 AF of replenishment water for the desalters;

Creates 400,000 AF of new storage space available for groundwater storage programs; and,

Extends the MZ 1 recharge obligation to be a minimum of 6,500 AFY in perpetuity.

*Supplemental and In-Lieu Recharge*

Watermaster is responsible to conduct recharge and replenishment of the basin. The Peace Agreement directs that during the five years from Fiscal Year Ending (FYE) 2001, Watermaster will conduct physical recharge of supplemental water of 6,500 AFY in MZ 1. If the cumulative total of 32,500 AF of recharge has not been accomplished at the end of the five years, then recharge will continue at the same annual rate until 32,500 AF has been reached.

Recharged supplemental water increases the OSY under the Judgment. Cost and allocation of supplemental water is apportioned pro-rata among members of the Appropriative Pool according to the producer's share of the initial safe yield. Watermaster provides an annual accounting of the amount and location of recharge. Individual producers do not currently have a limit on how much they can over-produce; however, they are assessed an amount to replenish the basin for all overproduction. Producers generally develop annual demand projections that assist in making arrangements with other appropriators for prepurchase of replenishment water through transfers and other agreements. This allows Watermaster to optimize planning within the OBMP.

Any member of the Appropriative Pool who is willing to abstain for any reason from producing any portion of its share of OSY in any year may offer the unproduced water to Watermaster. Watermaster then may purchase water in place of spreading replenishment water.

*Transfers*

Transfers include the assignment, lease, or sale of a right to produce water to another producer within the basin or to another person or entity for use outside the basin whether the transfer is temporary or permanent. Transfers must have the approval of Watermaster. Lease of water rights are also permissible to allow producers to make up for the lessee's over-production. For the District's latest transfer activity, see footnote for Table 4-2.

*Early Transfer and Land Use Conversion*

"Early Transfer" means the reallocation of safe yield not produced by the Overlying Agricultural Pool to the Appropriative Pool on an annual basis rather than according to the five-year increment described in the Judgment. The Early Transfer of not less than 32,800 AFY was the expected approximate amount of water not produced by the Overlying Agricultural Pool. The Early Transfer is to be the greater of 32,800 AF or 32,800 AF plus the actual quantity of water not produced in a given year after all the land use conversions are satisfied. Early transfer water is allocated among members of the Appropriative Pool in accordance with their pro-rata share of the initial safe yield.

With the effective date of the Peace Agreement, the amount of water rights converted from agricultural land to urban use was changed from 2.6 AF per acre with allocation between initial shares of safe yield and service provider to 2.0 AF per acre, all of which is allocated upon conversion of the land to the Appropriative Pool member service provider. Upon conversion of water rights, the purveyor pledges the amount of water needed for the urban land use, and up to 2.0 AFY per acre of land will be made available.

An Overlying Agricultural Pool member has the right to a voluntary agreement with an appropriator, which has a service area contiguous to or inclusive of the agricultural land, to provide the required water to the overlying land on behalf of the pool member. The Appropriative Pool party is then entitled to a credit to off-set production to the extent it is serving the overlying land up to the amount of the historical maximum annual quantity previously used on that property. The credit is debited to the pool's collective production right.

Total required reallocations from Early Transfers and Land Use Conversions are subject to availability. For the District's latest Early Transfers and Land Use Conversions activity, see Table 4-2.

*Local Storage*

Each Appropriative Pool and Overlying Non-Agricultural Pool party has the right to store supplemental water and un-produced carry-over water in the basin. Local storage agreements are approved so long as the total quantity of supplemental water under local storage agreements does not exceed the cumulative total of 100,000 AF. Water held in storage is transferable, but storage capacity is not.

Parties may continue to produce the actual quantity of carry-over water and supplemental water held in its storage account, subject only to the loss provisions. Rate of loss from local storage is currently 2 percent. The 2015 Safe Yield Reset Agreement changes storage losses to 0.07 percent upon achievement of Hydraulic Control; such change is contingent on Court adoption of the agreement. Losses are deducted annually from each storage account.

*Storage and Recovery Program*s

Since the Chino Basin Judgment was implemented in 1978, total groundwater storage in the Basin has stabilized. Current groundwater production from the Basin is 117,000 AFY, well below the current safe yield. By limiting annual water production to a safe yield level, but still allowing agencies to over pump as needed (provided replenishment water is later purchased and restored to the basin), the local agencies have alleviated overdraft concerns. Through improved management such as hydraulic control of the groundwater basin, Watermaster oversees a basin capable of storing 500,000 AF consistent with the OBMP.

Overlying Appropriative and Non-Agricultural Pool members are entitled to the compensation paid for a Storage and Recovery Program paid in any form, including money, revenues, credits, proceeds, programs, facilities, or other contributions. Compensation may also be used to offset the cost of operations, to reduce assessments on the members, and to defray the costs of capital projects at the request of the members.

Under the Peace Agreement, Watermaster is responsible to conduct best efforts to do the following: 1) complete the short-term conjunctive use project conducted by IEUA, Three Valleys Municipal Water District and MWD; 2) develop a seasonal peaking program for in-Basin use and dry year yield to reduce the Basin's demand on MWD water; 3) develop a dry year export program; and 4) develop a seasonal peaking export program. The short-term conjunctive use project includes construction of facilities to store water and later withdraw it for conjunctive use. The program goals are to reduce summertime peaking on MWD, deliver SWP supplies to the Basin, minimize MWD surface water deliveries during future droughts/emergencies, and allow MWD to export storage water for other member agencies.

*Basin Reoperation and Hydraulic Control*

A primary element of the Peace II Agreement is Basin Reoperation. Essentially, Basin Reoperation is the controlled overdraft of the basin by 400,000 AF via forgiveness of the desalter replenishment obligation, resulting in a regional lowering of groundwater levels across the basin, which makes it possible for the desalter pumping to achieve and maintain Hydraulic Control.

The many benefits of Basin Reoperation and Hydraulic Control include improved basin yield by reduced groundwater outflow to (and increased groundwater inflow from) the Santa Ana River, a local and reliable supply of potable water from the desalters, improved salinity management via salt export from the desalters, and the "maximum benefit" groundwater quality objectives which allow for recycled water reuse, among others.

*Conjunctive Use / Dry Year Yield Program*

Conjunctive use describes the coordinated operation of surface water storage and use, groundwater storage and use, and conveyance facilities to meet water management objectives. There are three primary components to a conjunctive management program. The first is to recharge groundwater when surface water is available to increase groundwater in storage. This can be accomplished by reducing groundwater use and substituting it with surface water, allowing natural recharge to increase groundwater (often called in-lieu recharge) or by augmenting recharge with supplemental supplies. The second component is to switch to groundwater use in dry years when surface water is scarce. The third component is to have an ongoing monitoring program to evaluate and allow water managers to respond to changes in groundwater, surface water, or environmental conditions that could exceed management objectives or impact other users.

Chino Basin producers have developed regional conjunctive use programs that store supplemental water for MWD. Under these programs, surplus water during wet periods would be banked and then withdrawn at a later time (either directly or through an in-lieu program). Under the OBMP, Watermaster has identified the potential to store and recover up to 500,000 AF in the Basin.

In 2004, Watermaster, TVMWD, and IEUA executed the Dry Year Yield (DYY) Program with MWD. The eight appropriators participating with MWD in the program are the District, the cities of Chino, Chino Hills, Ontario, Upland and Pomona, CVWD, and Jurupa Community Services District. DYY developed facilities to pump 33,000 AFY during a dry year utilizing the 100,000 AF storage account. The participants are required to reduce (shift) their imported water usage by a predetermined amount during a dry year (see below table). Each participating agency has a specific shift obligation that, when added together, provide MWD with a total of 33,000 AFY of dry year supply.

In exchange for participating in the program, each agency received funding for new groundwater treatment and well facilities that would enable additional groundwater production during dry years. The District received $3.1 million to construct a groundwater production well and an aquifer storage and recovery well with wellhead treatment facilities; the latter project was a joint effort with the City of Chino. Project construction was completed in 2008, the same year the DYY Program went into effect.

**DYY Shift Obligations for Participating Agencies**

| Local Retail Agency | DYY Program Shift Obligation (AFY) |
|---|---|
| City of Chino | 1,159 |
| City of Chino Hills | 1,448 |
| CVWD | 11,353 |
| Jurupa Community Services District | 2,000 |
| Monte Vista Water District | 3,963 |
| City of Ontario | 8,076 |
| City of Pomona | 2,000 |
| City of Upland | 3,001 |
| **Total** | **33,000** |

## BMP 1.2 Water Loss Control **ON TRACK**

**163 Monte Vista Water District - Retail**

| | |
|---|---|
| Completed Standard Water Audit Using AWWA Software? | Yes |
| AWWA File provided to CUWCC? | Yes |
| MVWD Water System Audit - FYE2014.xls | |
| AWWA Water Audit Validity Score? | 69 |
| Complete Training in AWWA Audit Method | Yes |
| Complete Training in Component Analysis Process? | Yes |
| Component Analysis? | Yes |
| Repaired all leaks and breaks to the extent cost effective? | Yes |
| Locate and Repar unreported leaks to the extent cost effective? | Yes |
| Maintain a record keeping system for the repair of reported leaks, including time of report, leak location, type of leaking pipe segment or fitting, and leak running time from report to repair. | Yes |

Provided 7 Types of Water Loss Control Info

| Leaks Repairs | Value Real Losses | Value Apparent Losses | Miles Surveyed | Press Reduction | Cost Of Interventions | Water Saved (AF) |
|---|---|---|---|---|---|---|
| 132 | 300118 | 284885 | 0 | False | 349960.55 | |

# Appendix O:
# Ordinance 33: Establishing Water Use Efficiency Best Practices and Staged Water Supply Shortage Measures

# ORDINANCE 33

## AN ORDINANCE OF THE BOARD OF DIRECTORS OF THE MONTE VISTA WATER DISTRICT, COUNTY OF SAN BERNARDINO, STATE OF CALIFORNIA, TO ESTABLISH WATER USE EFFICIENCY BEST PRACTICES AND STAGED WATER SUPPLY SHORTAGE MEASURES

---

The Board of Directors of the Monte Vista Water District (District) of San Bernardino County, California, does hereby ordain the following:

**Section 1: Purpose**

Monte Vista Water District is responsible for providing reliable water supply for the beneficial use, health, safety and welfare of its customers. The District has worked diligently to educate its customers about the value of water use efficiency and available water supplies to the District. In the unlikely event of a water shortage, the District shall request that its customers make reasonable and necessary reductions in their water use, according to the provisions of this Ordinance.

**Section 2: Policy**

1. The waste or unreasonable use of water by District customers shall be prevented to the greatest extent possible, and the efficient use of water shall be encouraged.

2. The District shall meet its urban water efficiency targets as set forth in California Water Code Sections 10608-10608.60, requiring the District to achieve a 20% reduction in per capita water use or a comparable water use reduction goal by December 31, 2020.

3. The District shall declare respective water supply shortage stages only if the District determines one or more of the following situations has occurred or may occur in the foreseeable future:

   a. The District may be unable to acquire or produce adequate water supplies to meet projected customer demands; or,

   b. The cost to acquire or produce adequate water supplies to meet projected customer demands may rise above the projected revenues generated by currently adopted water rates.

   Such circumstances would most likely occur due to one or more of the following events: imported water supply cutbacks by Metropolitan Water District of Southern California, extended drought, equipment failure, act of terrorism, and/or natural disaster.

4. During a declared water supply shortage, the District shall reduce water deliveries to wholesale water customers equal to the percentage of water demand reduction requested from the District's retail customers. The wholesale customer shall be responsible for managing water demand within its service area to comply with reduced deliveries during the declared water supply shortage.

5. The District shall offer to local agencies within whose boundaries the District provides retail and wholesale water service, upon their request, reasonable levels of assistance in complying with California Government Code Sections 65591-65599 (Water Conservation in Landscaping Act), enacted by Assembly Bill No. 1881 (2006).

**Section 3: Authority and Implementation**

1. The Board of Directors has the statutory power to declare that water supply shortage conditions exist and to implement the various staged provisions of this Ordinance as required to maintain reliable and safe water service to District customers.

2. The General Manager shall request the Board of Directors to declare a water supply shortage at a regular or special meeting of the Board of Directors. The Board shall receive evidence of water supply conditions at a public hearing and shall make findings concerning the adequacy of water supplies for the District and the necessity, if any, of declaring a water supply shortage.

3. The declaration of the Board that a water supply shortage exists or is threatened to exist shall be made by Resolution and public announcement, and shall be published in a newspaper of general circulation within ten (10) calendar days of adoption. The declaration shall become effective immediately upon adoption. The Resolution shall set a time schedule for expiration after review of water supply shortage conditions as reported by the General Manager.

**Section 4: Compliance Responsibility**

The District customer whose name is on the account shall be responsible for compliance with the provisions of this Ordinance.

**Section 5: Water Use Efficiency Best Practices**

1. District customers are required to implement the following water use efficiency best practices at all times:

    a. Set automatic irrigation controllers to water outdoor landscaped areas only between the hours of 8 p.m. and 8 a.m. and for no more than fifteen (15) minutes per day per valve-controlled station. Exempt from this requirement:

        i. Watering by hand.

        ii. Drip irrigation.

        iii. Irrigation systems equipped with weather-based or soil moisture-based irrigation controllers.

    b. Adjust irrigation system so there is no run-off, over-spray or excessive irrigation causing irrigation water to flow off of the customer's property.

    c. Turn off outdoor irrigation during rain.

    d. Repair all plumbing and irrigation system leaks within seven (7) days of discovery.

e. Wash motor vehicles, trailers, boats and other types of mobile equipment with a hand-held bucket or a hand-held hose equipped with a shutoff nozzle, or use a commercial vehicle wash equipped with a water recycling system.

f. Wash paved areas for health and safety purposes only with the use of a waterbroom or water-efficient pressure washer.

g. Restaurants serve water only upon request.

h. Hotels offer guests the option to not launder linen daily.

2. The following technologies shall be equipped with water recycling, recirculation or reuse systems prior to the establishment of new water service:

   a. Cooling towers and evaporative cooling systems.

   b. Decorative water fountains.

   c. Conveyer vehicle washes and in-bay automatic vehicle washes.

3. The District shall offer local agencies and retail and wholesale customers reasonable assistance in complying with State and local water use efficiency guidelines and requirements.

**Section 6: Significant Water Supply Shortage**

If the Board of Directors finds that current or near-term water supply shortage conditions require a 10 to 25 percent demand reduction, the Board may pass a Significant Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Section 5 above:

1. Landscaping and Landscape Irrigation.

   a. All lawns, landscape or turf areas shall be irrigated only on Tuesday, Thursday and Saturday of each week. Exempt from this requirement:

      i. Commercial nurseries, golf courses and other water-dependent industries.

      ii. Watering by hand.

      iii. Drip irrigation.

      iv. Irrigation systems equipped with weather-based or soil moisture-based irrigation controllers.

   b. Water consumption through water meters designed for landscape irrigation shall not exceed 75 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

2. Potable water used on a one-time basis for construction and dust control shall be limited to that quantity identified in the plan submitted by the user which describes water use requirements. The plan shall be submitted to and approved by the General Manager. Upon availability, non-potable recycled water will be made available for these uses.

3. The use of water from fire hydrants shall be limited to fire fighting and related activities, or for municipal activities necessary to maintain the public health, safety and welfare, or for construction use and dust control as approved by the General Manager.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by 10 to 25 percent, effective upon the date of its public announcement of a Significant Water Supply Shortage. The General Manager shall consult with District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 7: Critical Water Supply Shortage**

If the Board of Directors finds that current or near-term water supply shortage conditions require a 25 to 40 percent demand reduction, the Board may pass a Critical Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Sections 5 and 6 above:

1. Landscaping and Landscape Irrigation.

    a. All lawns, landscape or turf areas shall be watered only on Tuesday and Saturday of each week.

    b. Water consumption through water meters designed for landscape irrigation shall not exceed 50 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

    c. No person or entity shall implement any landscaping requirements of any homeowners association, developer or governing agency if it will result in an increase in water consumption from the prior calendar year.

2. No washing of motor vehicles, trailers, boats and other types of mobile equipment shall be permitted, unless done on the premises of a commercial car wash.

3. No one shall empty or refill swimming pools, spas or ponds for cleaning purposes. Water levels may be maintained.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by 25 to 40 percent, effective upon the date of its public announcement of a Critical Water Supply Shortage. The General Manager shall consult with the District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 8: Emergency Water Supply Shortage**

If the Board of Directors finds that, due to emergency circumstances, current or near-term water supply shortage conditions require a 40 percent or higher demand reduction, the Board may pass an Emergency Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Sections 5, 6 and 7 above:

1. Landscaping and Landscape Irrigation.

    a. All lawns, landscape or turf areas shall be watered only on Saturday of each week.

    b. Water consumption through water meters designed for landscape irrigation shall not exceed 33 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

    c. No installation of new landscaping shall be permitted.

2. No potable water for construction and dust control shall be permitted. Upon availability, non-potable recycled water will be made available for these uses.

3. No water shall be used to fill or maintain swimming pools, spas or ponds.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by at least 40 percent, effective upon the date of its public announcement of an Emergency Water Supply Shortage. The General Manager shall consult with District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 9: Exceptions**

No water use requirements described in Sections 5, 6, 7 and 8 above shall apply to the following water uses:

1. The use of recycled water distributed through the District's recycled water distribution system and used for landscape irrigation, construction, dust control or other approved uses, or the use of recycled water produced for direct reuse by commercial car washes, commercial laundries and various industries utilizing industrial water reuse systems.

2. The routine and necessary use of water by a governmental entity in pursuit of its functions for protecting the public health, safety and welfare of its citizens. This exception does not apply to the use of potable water for landscape irrigation by a governmental agency.

3. The necessary use of water for the routine maintenance, testing and/or repair of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems.

4. The use of "gray water". For the purposes of this Ordinance, "gray water" is defined as non-septic domestic wastewater collected from clothes washers, bathtubs, showers, and sinks. This provision shall not be construed to authorize the use of "gray water" if such use is otherwise prohibited by law.

**Section 10: Immediate Water Shortage Response**

In the event that an immediate shortage of water supply occurs due to disaster, the General Manager shall declare the extent of the water supply shortage and shall implement the appropriate water supply shortage stage as defined herein. The General Manager shall report such water supply shortage condition and level of response to the Board of Directors at a time which is reasonable and practicable.

**Section 11: Failure to Comply**

1. Any District customer violating the provisions set forth in this Ordinance shall be subject to the procedures and/or penalties described in this Section.

2. The following table outlines the procedures and penalties for violating the provisions set forth in this Ordinance, and each subsequent violation which occurs at least seven (7) days subsequent to the previous violation:

| | First Violation | Second Violation | Third Violation | Fourth Violation | Fifth Violation |
|---|---|---|---|---|---|
| **Best Practices** | Written Notice | Final Written Notice | $50 Fine | $100 Fine | $150 Fine; Flow Restrictor |
| **Significant Water Supply Shortage** | Written Notice | $50 Fine | $100 Fine | $150 Fine | $200 Fine; Flow Restrictor |
| **Critical Water Supply Shortage** | Written Notice | $100 Fine | $200 Fine | $300 Fine; Flow Restrictor | --- |
| **Emergency Water Supply Shortage** | Written Notice | $150 Fine | $300 Fine; Flow Restrictor | --- | --- |

3. Written Notice

   a. Notice of a violation of Ordinance provisions, as outlined in Subsection 2 above, shall be given in writing by regular mail or personal delivery to the customer at the address on file with the District. If notice is given by mail, the person depositing the notice by mail shall complete a Proof of Service by Mail form indicating the time, date and place the notice was deposited in the U.S. Mail.

   b. If personal delivery is used, any notice of violation of the water use requirements shall be made in the following manner:

i. By handing the notice to the customer personally. The person serving the notice shall complete a Proof of Service form indicating the time, date and place of service.

ii. If the customer is absent from or unavailable at the premises at which the violation occurred, by leaving a copy with some person of suitable age and discretion at the premises and sending a copy through the regular mail to the customer at the address at which the customer is normally billed.

iii. If a person of suitable age or discretion cannot be found, by affixing a copy in a conspicuous place at the premises at which the violation occurred and also sending a copy through the regular mail to the customer at the address at which the customer is normally billed.

c. The notice shall contain a description of the facts of the violation, a statement of the possible penalties for each violation and a statement informing the customer of his or her right to request a waiver due to hardship or special circumstances.

4. After multiple violations of Ordinance provisions, as outlined under Subsection 2 above, the District may install a flow restricting device on a customer's water meter. The District may terminate a customer's landscape meter service upon a prior determination that the customer has repeatedly violated this Ordinance. Such action will only be taken after a hearing held by the Review Board where the customer will have the opportunity to respond to the District's evidence of repeated violation.

5. Any restricted or terminated service may be restored upon request of the customer made not less than forty-eight (48) hours after the implementation of the action restricting or terminating service and only upon a showing by the customer that the customer is ready, willing and able to comply with the provision of this Ordinance. Prior to any restoration of the service, the customer shall pay all District charges for any restriction or termination of service and its restoration.

**Section 12: Review Board**

1. A District customer may request a waiver from any provisions of this Ordinance due to hardship or special circumstances. A Review Board comprised of members of the District staff shall be designated by the General Manager to review such requests. The Review Board shall respond to a waiver request within ten (10) working days of receipt of request.

2. The Review Board shall review customer written requests for a waiver from Ordinance provisions due to hardship or special circumstances, and determine whether or not the case warrants a waiver. No waiver shall be granted unless the water customer shows that he or she has achieved the maximum practical reduction in water consumption other than in the specific area(s) in which a waiver is being sought. No waiver shall be granted to any water customer who, when requested by the District, fails to provide any information necessary for resolution of the customer's request for a waiver.

3. Any customer who is granted a waiver shall provide proof of compliance with said waiver upon demand by any person authorized by the District. If the customer is found to violate any provision of the waiver, the Review Board shall revoke the waiver. The Review Board shall notify the customer in writing of the proposed revocation five (5) working days before taking such action, and the customer shall be given the opportunity to be heard by the Review Board prior to its taking such action.

4. A waiver issued under a particular water supply shortage stage shall not be valid upon passage of a higher water supply shortage stage. A new waiver must be granted by the Review Board for each enacted water supply shortage stage.

5. Appeal of Review Board decisions shall be made in writing to the Board of Directors, whose decision shall be final. The Board of Directors shall consider the appeal within thirty (30) days from the date the appeal was filed. The appealing customer shall be given the opportunity to address the Board of Directors and submit evidence orally and in writing.

**Section 13: Validity**

If any section, sub-section, clause, phrase or portion of this Ordinance is for any reason held to be invalid or unconstitutional by any court of competent jurisdiction, such decision shall not affect the validity of remaining portions of this Ordinance.

**Section 14: Consistency**

1. This Ordinance is consistent with the provision of California Water Code Sections 375-378, inclusive, and Sections 31020-31035.1, inclusive.

2. This Ordinance fulfills the District's water supply shortage planning obligation as required by California Water Code Sections 10610-10656, inclusive (Urban Water Management Planning Act). Subsequent District Urban Water Management Plan updates shall comply with this Ordinance.

**Section 15: Effective Date**

This Ordinance shall be effective immediately upon adoption and shall be published in any newspaper of general circulation and distributed within the District as required by law.

The President of the Board of Directors shall sign this Ordinance and the Secretary shall attest to the same. The Secretary shall cause this Ordinance to be published within ten (10) days after its adoption, at least once in a newspaper of general circulation which is distributed within the boundaries of the Monte Vista Water District.

**Section 16: Repeal and Rescind**

Upon adoption of this Ordinance, Ordinance 32 shall be repealed and rescinded effective on the date of adoption of this Ordinance.

ADOPTED THIS 12th day of May 2010.

Sandra S. Rose
President of the Board of Directors
MONTE VISTA WATER DISTRICT

ATTEST:

Mark N. Kinsey
Secretary to the Board of Directors
MONTE VISTA WATER DISTRICT

California Regional Water Quality Control Board
Santa Ana Region

**RESOLUTION NO. 94-1**

**Resolution Adopting the Updated Water Quality Control Plan for the Santa Ana River Basin (8)**

WHEREAS, the California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. The Water Quality Control Plan for the Santa Ana River Basin (Basin Plan) was adopted by the Regional Board on April 11, 1975 and approved by the State Water Resources Control Board (State Board) on April 17, 1975.

2. An amended Basin Plan was adopted by the Regional Board on May 13, 1983 and approved by the State Board on October 20, 1983. Since that time, specific amendments to the Basin Plan have been adopted by the Regional Board and approved by the State Board. These amendments include the following: revisions of compliance dates for certain waste discharge prohibitions; revisions of the beneficial use designations, in part to conform the Basin Plan to the State Board's Sources of Drinking Water Policy; revision of the total inorganic nitrogen wasteload allocation for discharges to the Santa Ana River system; and the incorporation of minimum lot size requirements and exemption criteria for the use of septic tank-subsurface disposal systems in the Region.

3. Section 303(c) of the Federal Clean Water Act requires that water quality standards be reviewed and revised, if appropriate, on a triennial basis, and Section 13240 of the California Water Code provides that basin plans must be periodically reviewed and may be revised.

4. In 1989, the State Board initiated a statewide program for comprehensive review and update of the basin plans by all regional boards.

5. With extensive public participation and input, the Regional Board has prepared an updated Basin Plan. This Basin Plan update process satisfies federal triennial review requirements under Section 303(c) of the Clean Water Act and the periodic review requirements of the California Water Code under Section 13240.

6. The Regional Board discussed the basin plan update process at its meeting on April 23, 1993. A first draft of the revised Basin Plan was released in June, 1993 and a public workshop to review that draft was conducted on July 16, 1993. The Regional Board released a second draft of the Basin Plan and the relevant staff report in September, 1993 and conducted a public workshop on October 22, 1993. The public workshops were conducted after notice was given to all interested persons in accordance with Section 13244 of the California Water Code. The testimony introduced at those workshops was considered in the preparation of the final revised Basin Plan.

7. Significant additions to the revised Basin Plan include the addition of a new beneficial use designation of "Limited Warm Freshwater Aquatic Habitat" (LWRM) specifically for concrete-lined channels, the creation of wetlands as a waterbody type, designation of RARE beneficial use for a number of waterbodies, revised un-ionized ammonia objectives and corresponding total ammonia effluent limits, water quality objectives for the Big Bear groundwater basin, revised total dissolved solids wasteload allocation and a discussion of water quality and water resource managment projects in the region.

8. In accordance with applicable guidance and regulations, the Regional Board has developed site-specific water quality objectives (SSOs) for cadmium, copper and lead in the Middle Santa Ana River system. The Regional Board reviewed and discussed the issues related to the development and adoption of these SSOs in public meetings and workshops on August 7, 1992, March 5, 1993 and June 4, 1993. The testimony introduced at these workshops was considered in the preparation of final recommendations for SSOs.

9. In accordance with the provisions of California Water Code, Section 13280 *et seq.*, the Regional Board developed a proposed Basin Plan amendment to incorporate the SSOs.

10. At a duly noticed Public Hearing on October 22, 1993, the Regional Board adopted Resolution No. 93-64, adopting the proposed Basin Plan amendment to incorporate the SSOs for cadmium, copper and lead for the middle Santa Ana River system. A staff report regarding this matter was prepared and distributed to all interested parties 30 days prior to the hearing. However, between the time of the transmittal of the staff report and the October 22, 1993 hearing, new information was presented that led to the modification of the SSOs which had been recommended in the staff report. To avoid procedural questions, it is appropriate to rescind Resolution No. 93-64 and to reconsider adoption of the SSOs as part of the final revised Basin Plan. A report concerning the SSOs considered and adopted by the Regional Board on October 22, 1993 is included in the staff report pertaining to the adoption of the revised Basin Plan.

11. Regional Board Resolution No. 92-10, adopted February 14, 1992, found that some of the national water quality criteria, including those for cadmium, copper and lead, are inappropriate for the Middle Santa Ana River because the flows are dominated by reclaimed water, which provides and supports beneficial uses which would not otherwise exist.

12. A Use-Attainability Analysis (UAA) has been conducted for the Santa Ana River. The UAA provided data and analyses which allow the Regional Board to make the following findings regarding the Santa Ana River:
    a. The Site-Specific Water Quality Objectives (SSOs) for cadmium, copper and lead proposed by Regional Board staff will protect the beneficial uses of the Santa Ana River.
    b. The proposed SSOs have been shown to be conservative.

c. The proposed SSOs, which represent higher water quality than presently exists, will not result in degradation of water quality.
d. Existing levels of cadmium, copper and lead in the SAR do not contribute to toxicity in the Santa Ana River.
e. Dischargers to the Santa Ana River are either in compliance with their NPDES permits or are meeting approved compliance schedules.

13. Adoption and implementation of the cadmium, copper and lead SSOs is consistent with the maximum benefit to the people of California, particularly because it encourages water reclamation and will support important social and economic development in the Santa Ana Region.

14. The findings of this Resolution with respect to metals SSOs are specific to the Santa Ana River and to cadmium, copper and lead These findings are not meant to establish precedent or be applicable to other metals or other water bodies.

15. The Regional Board has prepared and distributed a written report (Staff Report) on adoption of the revised Basin Plan, including site-specific objectives for metals, in compliance with applicable state and federal environmental regulations (California Code of Regulations, Section 3775, Title 23 and 40 CFR Parts 25 and 131).

16. The process of basin planning is exempt from the requirements of the California Environmental Quality Act (Public Resources Code Section 21000 *et seq*) to prepare an Environmental Impact Report or Negative Declaration. The updated Basin Plan includes a completed Environmental Checklist, an assessment of the environmental impacts of the adoption of the updated Basin Plan and a discussion of alternatives. The updated Basin Plan, Environmental Checklist, staff report and supporting documentation are functionally equivalent to an Environmental Impact Report or Negative Declaration.

17. Review of potential environmental impacts of adoption and implementation of the reviewed Basin Plan indicated that a substantial increase in energy consumption might be required and that there may be no feasible alternatives or mitigation measures for this impact. However, the only alternatives identified which would not require increase in energy consumption would not ensure protection of the beneficial uses of the waters of the Santa Ana Region and would therefore not comply with state and federal laws. Pursuant to CEQA regulations Section 15093a, Findings of Overriding Considerations, as attached to the Checklist, are therefore appropriate. The benefits of the Basin Plan amendments outweigh the unavoidable adverse environmental effects.

18. The Regional Board has considered federal and state antidegradation policies, the state Sources of Drinking Water Policy and other relevant water quality control policies and finds the updated Basin Plan consistent with those policies.

19. On January 28, 1994, the Regional Board held a Public Hearing to consider the revised Basin Plan, including site-specific objectives for metals. Notice of the Public Hearing was given to all interested persons and published in accordance with Water Code Section 13244.

20. This Basin Plan must be submitted for review and approval by the State Board, the Office of Administrative Law (OAL) and the US Environmental Protection Agency. Once approved by the State Board, the Basin Plan is to be submitted to the Office of Administrative Law. A Notice of Decision will be filed after the State Board and the Office of Administrative Law have acted on this matter. The Basin Plan must then be submitted for review by the U.S. Environmental Protection Agency.

21. The revised Basin Plan will become effective upon approval by the State Water Resources Control Board and the Office of Administrative Law

NOW THEREFORE BE IT RESOLVED THAT:

1. The California Regional Water Quality Control Board, Santa Ana Region, adopts the updated Water Quality Control Plan for the Santa Ana River Basin (8) as set forth in the attached document.

2. The Regional Board hereby adopts the Findings of Overriding Considerations attached to the Environmental Checklist prepared for the updated Water Quality Control Plan.

3. Resolution No. 93-64 adopting site-specific objectives for metals for the middle Santa Ana River system is hereby rescinded.

4. The Regional Board will implement the Inland Surface Waters Plan and Enclosed Bays and Estuaries Plan (Plans), where applicable, as long as they remain in effect. If the Plans are invalidated, the Regional Board will continue to issue National Pollutant Discharge Elimination System permits in compliance with the Porter-Cologne Act and applicable State and federal regulations, including but not limited to, 40 CFR 122.44(d).

5. Within three years after consultation with the Department of Fish and Game on specific waterbodies that support threatened or endangered species, and where scientific evidence indicates that certain existing water quality objectives for these water bodies do not adequately protect such species, the Regional Board will determine whether these objectives are adequately protective. In cases where such existing objectives do not provide adequate protection for threatened and endangered species, the Regional Board will develop and adopt adequately protective site-specific objectives for those constituents.

6. The Executive Officer is directed to forward copies of the updated Water Quality Control Plan for the Santa Ana River Basin (8) to the State Water Resources Control Board in accordance with the requirements of Section 13245 of the California Water Code.

7. The Regional Board requests that the State Water Resources Control Board approve the Water Quality Control Plan in accordance with the requirements of Sections 13245 and 13246 of the California Water Code and forward it to the Office of Administrative Law and the US Environmental Protection Agency-Region IX for approval.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 11, 1994.

Gerard J. Thibeault
Executive Officer

7. The Regional Board requests that the State Water Resources Control Board approve the Water Quality Control Plan in accordance with the requirements of Sections 13245 and 13246 of the California Water Code and forward it to the Office of Administrative Law and the US Environmental Protection Agency-Region IX for approval.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Santa Ana Region, on January 28, 1994.

for Gerard J. Thibeault
Executive Officer

# CHAPTER 1

# INTRODUCTION

## THE WATER QUALITY CONTROL PLAN (BASIN PLAN) FOR THE SANTA ANA RIVER BASIN

The State Water Resources Control Board (SWRCB or State Board) and the nine Regional Water Quality Control Boards (RWQCBs or Regional Boards) are responsible for the protection and, where possible, the enhancement of the quality of California's waters. The SWRCB sets statewide policy, and together with the RWQCBs, implements state and federal laws and regulations. Each of the nine Regional Boards adopts a Water Quality Control Plan, or Basin Plan, which recognizes and reflects regional differences in existing water quality, the beneficial uses of the region's ground and surface waters, and local water quality conditions and problems.

This document is the Basin Plan for the Santa Ana Region. The Santa Ana Regions includes the upper and lower Santa Ana River watersheds, the San Jacinto River watershed, and several other small drainage areas. The Santa Ana Region covers parts of southwestern San Bernardino County, western Riverside County, and northwestern Orange County.

## FUNCTION OF THE BASIN PLAN

The Basin Plan for the Santa Ana Region is more than just a collection of water quality goals and policies, descriptions of conditions, and discussions of solutions. It is also the basis for the Regional Board's regulatory programs. The Basin Plan establishes water quality standards for the ground and surface waters of the region. The term "water quality standards," as used in the federal Clean Water Act, includes both the beneficial uses of specific waterbodies and the levels of quality which must be met and maintained to protect those uses. The Basin Plan includes an implementation plan describing the actions by the Regional Board and others that are necessary to achieve and maintain the water quality standards.

The Regional Board regulates waste discharges to minimize and control their effects on the quality of the region's ground and surface water. Permits are issued under a number of programs and authorities. The terms and conditions of these discharge permits are enforced through a variety of technical, administrative, and legal means.

Water quality problems in the region are listed in the Basin Plan, along with the causes, where they are known. For waterbodies with quality below the levels necessary to allow all the beneficial uses of the water to be met, plans for improving water quality are included.

In some cases, it has been necessary for the Regional Board to completely prohibit the discharge of certain materials. Some types of discharges are prohibited in specific areas. Details on these prohibitions also appear in the Basin Plan.

## LEGAL BASIS AND AUTHORITIES

The Basin Plan reflects, incorporates, and implements applicable portions of a number of national and statewide water quality plans and policies, including the California Water Code and the Clean Water Act.

### California Water Code

California's Porter-Cologne Water Quality Control Act (Section 13000 ["Water Quality"] ***et seq***., of the California Water Code), which established both the State Water Resources Control Board and the present system of nine Regional Water Quality Control Boards, directs in Chapter 4, Article 3, "Regional Water Quality Control Plans," that each Regional Board is to formulate and adopt water quality control plans for all areas within the region and is to periodically review and revise them as necessary. Each Regional Board is to set water quality objectives that will insure the reasonable protection of beneficial uses and the prevention of nuisance, with the understanding that water quality can be changed somewhat without unreasonably affecting beneficial uses.

The California Water Code also lists the specific factors which are to be considered in establishing water quality objectives. A detailed listing appears in Chapter 4 (p. 4-1).

Implementation plans are to include, but not limited to:

(1) a description of the nature of the actions necessary to achieve the objective, including recommendations for appropriate action by any entity, public or private;

(2) a time schedule for the actions to be taken; and

(3) a description of the surveillance to be undertaken to determine compliance with the objectives.

### Clean Water Act

The objective of the federal Clean Water Act is to "***restore and maintain the chemical, physical and biological integrity of the Nation's waters,***" to make waters of the United States "fishable and swimmable." The Clean Water Act includes several sections which relate to Basin Plans and the basin planning process, including sections on Areawide Waste Treatment Management, Basin Planning, and Water Quality Standards and Implementation Plans.

The Clean Water Act requires that states adopt water quality standards, including standards for toxic substances. The states are also required to have a continuing planning process, which includes public hearings at least once every three years to review the water quality standards and revise them if necessary.

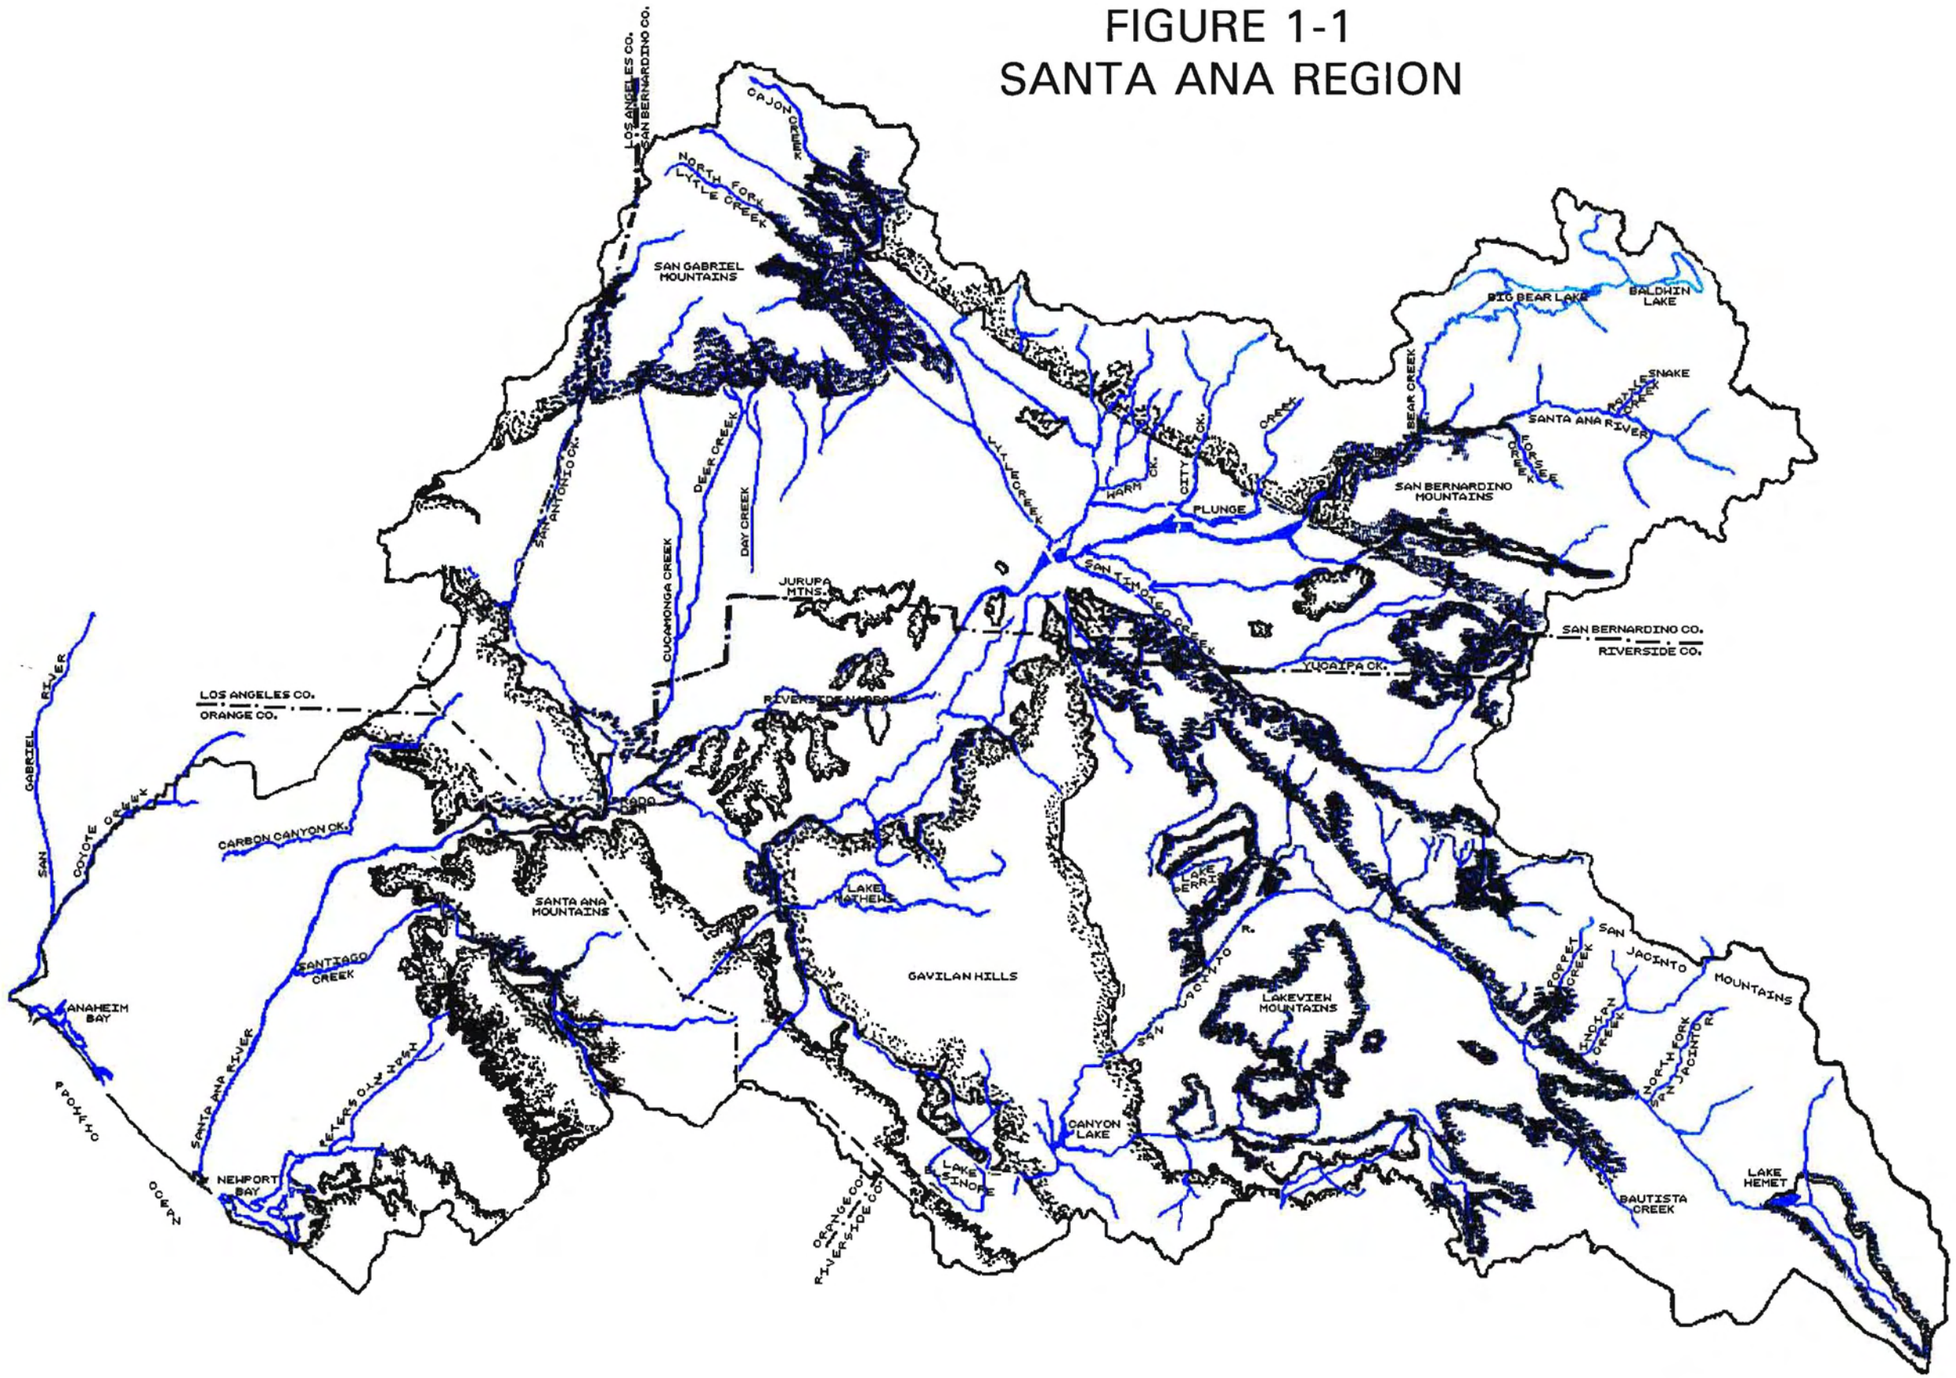
## ENVIRONMENTAL SETTING

The Santa Ana Region is the smallest of the nine regions in the state (2800 square miles) and is located in southern California, roughly between Los Angeles and San Diego. Although small, the region's four million residents (1993 estimate) make it one of the most densely populated regions. People have come to southern California over the years for a wide variety of reasons. Once here, many decide to stay. Snow skiing areas in the mountains are as little as two hours from world-famous broad, sandy ocean beaches.

The climate of the Santa Ana Regions is classified as Mediterranean: generally dry in the summer with mild, wet winters. The average annual rainfall in the region is about fifteen inches, most of it occurring between November and March. Much of the area would be near-desert were it not for the influence of modern civilization.

### Regional Boundaries and Geography

In very broad terms, the Santa Ana Region is a group of connected inland basins and open coastal basins drained by surface streams flowing generally southwestward to the Pacific Ocean (See Figure 1-1).



The boundaries between California's nine regions are usually hydrologic divides that separate watersheds, but the boundary between the Los Angeles and Santa Ana Regions is the Los Angeles County Line. Since that county line only approximates the hydrologic divide, part of the Pomona area drains into the Santa Ana Region, and in Orange County, part of the La Habra drains into the Los Angeles Region.

The east-west alignment of the crest of the San Gabriel and San Bernardino Mountains separates the Santa Ana River basin from the Mojave Desert, which is part of the Lahontan Basin (Region 6).

In the south, the regional boundary divides the Santa Margarita River drainage area from that of the San Jacinto River, which normally terminates in Lake Elsinore.

Near Corona, the Santa Ana River has cut through the Santa Ana Mountains and flows down onto the Orange County coastal plain. The Pacific Ocean coast of the Santa Ana Region extends from just north of Laguna Beach up to Seal Beach and the Los Angeles County line. Other features of the coast include Newport Bay, Anaheim Bay-Huntington Harbour, and the major coastal wetlands areas associated with those bays.

NOTE:

1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 130 Series except as explained below.
2. The numbering system used on this map is an adaptation of the numbering system used in the 130 Series.
3. The boundary between Region 8 and Region 4 follows the boundary between Los Angeles County and Orange or San Bernardino Counties, not the Hydrologic Boundary. The San Bernardino County line splits Hydrologic Unit 1 (Santa Ana River HU) so that Sub-Areas 481.21, 481.22, and 481.23 are legally in Region 4 but drain into Region 8. The Orange County line splits Hydrologic Unit 5 (Los Angeles-San Gabriel River HU) so that Sub-Areas 845.15, 845.61, 845.62 and 845.63 are legally in Region 8 but drain into Region 4. Therefore, a 5 digit number on the map indicates that a regional boundary divides a hydrologic unit, area or subarea. In these cases the second digit is the number of the region from which the hydrologic area has been separated by the regional boundary. All other digits are as described in the legend.
4. The 1986 updated names shown on the map are in accordance with an agreement with DWR and US Geological Survey.

Scale 1:500,000

### Geological Faults

Southern California is a geologically active area. Major earthquake faults in the region include the San Andreas Fault and its large branch, the San Jacinto Fault; the Elsinore-Whittier Fault; and the Newport-Inglewood Fault. The San Andreas Fault divides the San Gabriel Mountains from the San Bernardino Mountains. The San Jacinto Fault, which splits off from the San Andreas Fault near San Bernardino, affects groundwater flows associated both with the Santa Ana and San Jacinto Rivers. The Elsinore-Whittier Fault passes under Prado Dam as it trends, like the others, from the northwest toward the southeast. The Newport-Inglewood Fault enters the region from the Los Angeles basin and passes offshore at Newport Beach. In addition to these major faults, there are many branching, connecting, and parallel faults in the region.

## HISTORY OF WATER DEVELOPMENT

### Early Settlement

Following the Spanish Mission and Rancho Periods, early agriculture centered around horses and cattle. In the early 1800s, the increasing population required more farms and orchards to produce more food. The weather generally supported farming year-round, but the dry summers made irrigation a necessity. Once water supplies became dependable, vast areas of citrus orchard and vineyards also followed. Today, the region still has strong ties to agriculture, including a large dairy industry, but much of what remains is under increasing development pressure. The future probably involves an even larger human population and much less commercial agriculture.

### Original Conditions

Before this area was settled, it is thought that the Santa Ana River flowed from its headwaters in the San Bernardino Mountains to the Pacific Ocean throughout most of the year. The San Jacinto River, also a substantial surface stream, typically would have ended at Lake Elsinore, which acted as an inland sink. Once out of the sycamore-filled mountain canyon, these rivers meandered along in sandy streambeds, shaded by willows, cottonwoods, and live oaks, flows decreasing where water percolated, filling the groundwater basins, increasing where local geological features forced the groundwater to the surface. High groundwater made springs, swampy areas, marshes and bogs common.

Deep alluvial valley deposits made up large groundwater basins, both in the inland valleys and on the coastal plain, basins naturally full of fresh water. Along with its nearby tributaries, the Santa Ana River fed the Bunker Hill groundwater basin, the Colton and Riverside basins, and to a lesser extent, part of the Chino Basin. Streams in the San Gabriel Mountains recharged the Chino Basin. The San Jacinto River recharged a deep (over two thousand feet) graben, the San Jacinto groundwater basin, as it left the mountains, then several other basins in succession on its way to Lake Elsinore. When especially heavy rainfalls or a series of wet winters filled Lake Elsinore, overflows went down Temescal Creek to the Santa Ana River near Corona. The Santa Ana River entered Santa Ana Canyon and passed through the coastal mountains out onto the Orange County Plain, overlying another large, deep groundwater basin largely recharged by river flows. With the diversion of most of this natural surface flow for agricultural and domestic uses, creeks and rivers dried up, carrying only storm flows and runoff. Eventually, treated wastewater replaced some of the flows in some streams.

**Irrigation**

The first irrigation diversions were made directly from the streams, often using crude brush and sand dams and hand-dug ditches to lead the water from the river to the fields. As more and more settlers arrived, the number of diversions increased. Eventually, all the surface flows were taken and groundwater recharge diminished sharply.

Ground water pumping became necessary to provide water for irrigation and for the growing settlements. Windmills were followed by motor-driven pumps, and as groundwater levels fell, deep well turbines became necessary. Artesian areas, such as those near San Bernardino and in Fountain Valley, stopped flowing naturally. The springs, swamps, and other historically wet areas began drying up.

The history of the San Jacinto River and its tributaries parallels that of the Santa Ana. The San Jacinto had historically kept all the groundwater basins in that part of the region full. Now, there is essentially no surface flow beyond the mouth of the canyon, where it exits the mountains; the riverbed is typically dry. Flood flows every five or ten years, however, produce a broad, shallow “Mystic Lake” in the riverbed near the town of Lakeview.

Further downstream, the river is dammed to form Canyon Lake, just upstream from Lake Elsinore. As noted earlier, Lake Elsinore is normally a sink, with no outflow. High annual evaporation rates have historically limited the amount of water in the lake, which has gone dry several times in this century. Only torrential rains or extended wet cycles have produced the rare overflows down Temescal Creek to the Santa Ana River. Several projects to stabilize the level of Lake Elsinore are now being completed.

When local water supplies inevitably ran short, the area’s economy, based on agriculture, was strong enough to help support the construction of large imported water projects. The Metropolitan Water District of Southern California (locally MWD-

SC or “Met”) built and still operates the Colorado River Aqueduct, which has imported millions of acre-feet of water from the Colorado River across the Mojave Desert and into the region. A second, newer system, the California Water Project, pumps comparable volumes of water out of the Sacramento-San Joaquin Delta for delivery to the Santa Ana Region and other parts of Southern California.

### Santa Ana River Stipulated Judgement

Despite the availability of imported water, legal arguments focused on locally available (generally cheaper) water supplies. Overuse of the upstream water by extensive recycling had reduced summer flows in the Santa Ana River to a trickle, and even that trickle was somewhat salty. The largest of these legal arguments pitted Orange County (the downstream users) against all of the upstream users in Riverside and San Bernardino Counties. When the case was settled through an engineered solution the four largest water districts - San Bernardino Valley Municipal Water District (MWD), Chino Basin MWD, Western MWD, and Orange County WD agreed to implement the court’s solution through a Santa Ana River Watermaster.

Minimum average annual flows and guaranteed quality (total dissolved solids, or TDS) from the San Bernardino area to and through the Riverside Narrows were required, as well as flows from the upper basin to the lower basin (Orange County), measured at Prado Dam. The water required to meet the Stipulated Judgement can be made up of wastewater, imported water, dry weather runoff or some combination of these, with TDS the measure of minimum acceptable quality.

Together, the four large water agencies affected by the judgement formed SAWPA, the Santa Ana Watershed Planning (later “Project”) Authority, a forum for discussion of water issues as well as a joint powers agency that can build projects of common interest to two or more members.

## BASIN PLANNING

### History

In the 1950s and ‘60s, the Regional Boards were not actively involved in water quality planning. Water quality problems typically resulted in controls on waste discharges, usually including effluent limits for TDS and perhaps a few other parameters. Beyond that, the only serious restrictions prohibited the creation of a pollution or nuisance. By 1970, however, the Regional Boards were actively involved in the formulation of plans to meet established water quality objectives. The federal Clean Water Act and the Porter-Cologne Act, which required basin-wide planning, plus the National Pollution Discharge Elimination System (NPDES), which empowers the states to set discharge standard, placed new tools in the hands of the Regional Boards and encouraged the development of new approaches to water quality management. With the development of the “1967 Standards,” applicable to interstate waters, came Water Quality Control

Policies for the San Gabriel Tidal Prism, for the Coastal Bays, Marinas and Sloughs, and for Pacific Ocean Coastal Waters.

In the Santa Ana Region, the 1971 Interim Water Quality Control Plan incorporated the 1967 Standards and set water quality objectives for the Santa Ana River at Prado Dam. After the State Board developed the Ocean Plan and the Thermal Plan, the revised Interim Water Quality Control Plan incorporated that information.

Also in the early 1970s, the Santa Ana Regional Water Quality Control Board (Regional Board) was investigating the salt balance situation in the upper basin. An early computer model, primitive and slow by modern standards but providing answers of a kind never available before, had been used to assess the situation. SAWPA was contracted to write the first (1975) essentially complete Basin Plan (Water Quality Control Plan) for the Regional Board, using an improved version of that model.

The 1975 Basin Plan outlined a specific water quality management scheme designed to improve groundwater quality in the upper basin. Unfortunately, the kinds of large-scale actions necessary to maintain the quality of the region's ground and surface waters – basin management facilities, changes in water supply, regional wastewater treatment – were well beyond the regulatory powers of the Regional Board.

One of the region's major problems at that time was salt balance. Salt (TDS) buildup in the water results from excessive reuse of a given volume of water. Each cycle of use, whether in the home, in industry or use by irrigated agriculture, adds salts directly or indirectly, either through partial evaporation (or evapotranspiration) or direct addition of soluble materials. Typically, each use of water adds 200-300 parts per million (ppm) or milligrams per liter (mg/L) of TDS. TDS begins to interfere with the use of water somewhere between 500 and 1000 mg/L TDS; at 2000 mg/L, water is brackish and generally unusable. In order to allow for subsequent use downstream and to keep ground and surface water bodies usable, careful management of water reuse was necessary. Unlimited recycling created water quality problems. "Pumpback" schemes were strongly discouraged.

Part of the 1975 Basin Plan's solution to the salt balance problem, which seemed most acute in the Chino groundwater basin, was to import and recharge large volumes of low-TDS State Water Project (SWP) water. A second feature of the implementation plan was a large wellfield to extract poor quality water from the lower part of the basin. The third component was a pipeline to the sea to export brines from the upper basin. As years have passed, the list of projects has changed, with desalters replacing groundwater flushing projects. Most of the brine line (the Santa Ana River Interceptor or SARI Line) has been built and one groundwater desalter (Arlington) is now in place. Plans for two more desalters (East and West Chino Basin) in this area are still in design; at least one more is proposed in the San Jacinto watershed.

The Santa Ana Regional Water Quality Control Board and SAWPA (now also including Eastern MWD as a member) have continued to work together toward a common goal

– a well-operated basin that meets reasonable standards in an economical manner and provides high-quality water supplies when and where they're needed.

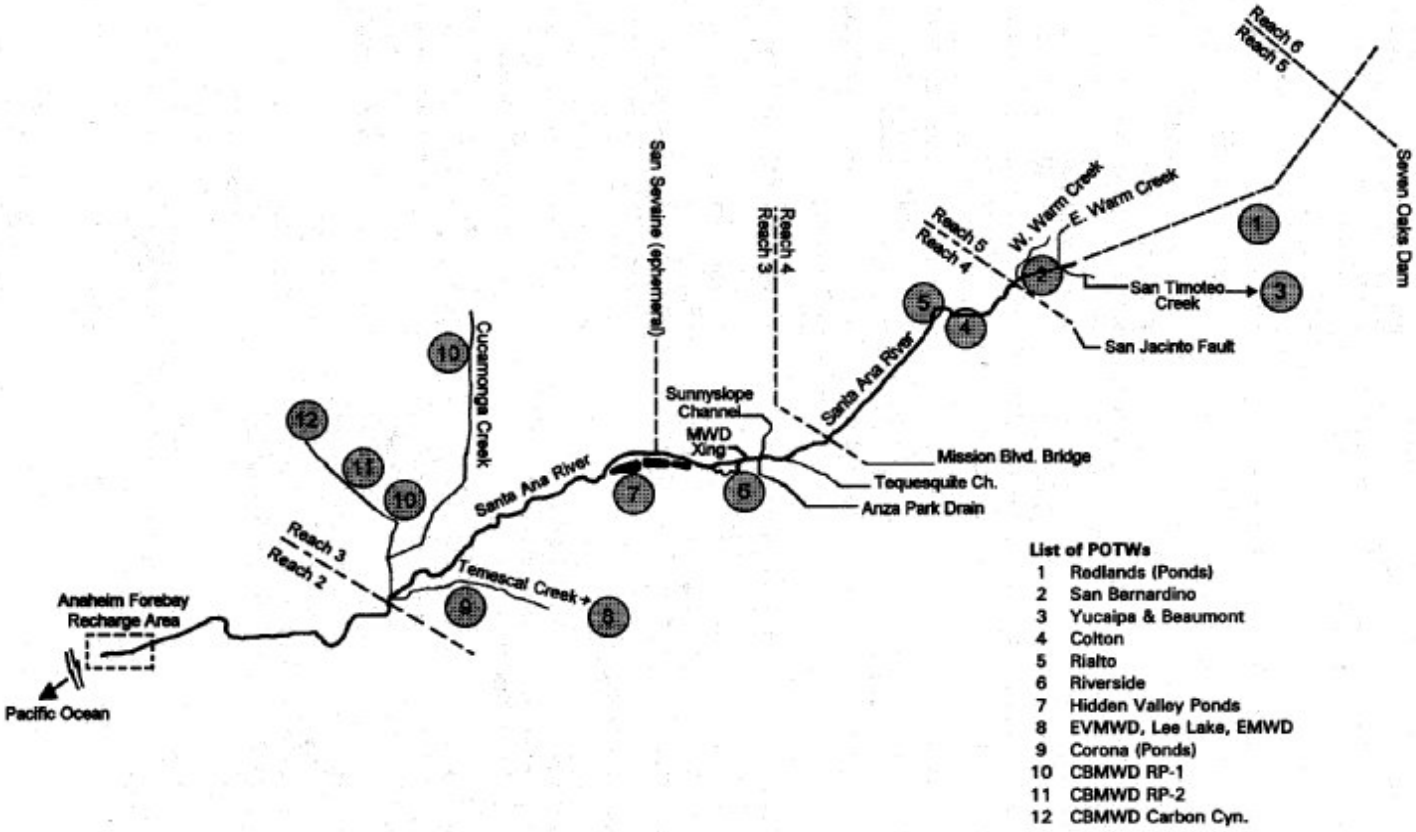
## THE SANTA ANA RIVER

### Reaches

The mainstem of the Santa Ana River is divided into six reaches (Figure 1-2). Each reach is generally a hydrologic and water quality unit.

**Reach 6** includes the river upstream of Seven Oaks Dam, now under construction. Flows consist largely of snowmelt and storm runoff. Water quality tends to be very high.

**Reach 5** extends from Seven Oaks Dam to San Bernardino, to the San Jacinto Fault (Bunker Hill Dike), which marks the downstream edge of the Bunker Hill groundwater basin. Most of this reach tends to be dry, except as a result of storm flows, and the channel is largely operated as a flood control facility. The extreme lower end of this reach includes rising water and intermittently, San Timoteo Creek flows.



**Reach 4** includes the river from the Bunker Hill Dike down to Mission Boulevard Bridge in Riverside. That bridge marks the upstream limit of rising water induced by the flow constriction in the Riverside Narrows. Until about 1985, rising water from upstream and wastewater discharges percolated and the lower part of the reach was dry. Flows are now perennial, but may not remain so as new projects are built. Much of this reach is also operated as a flood control facility.

**Reach 3** includes the river from Mission Bridge to Prado Dam. In the Narrows, rising water feeds several small tributaries (Sunnyslope Channel, Tequesquite Arroyo, and Anza Park Drain) which are important breeding and nursery areas for the native fish. Temescal, Chino, and Mill/Cucamonga Creeks in Prado Basin are also important river tributaries.

**Reach 2** carries all the upstream flows down through Santa Ana Canyon to Orange County where as much of the water as possible is recharged into the Orange County groundwater basin. The downstream end of the forebay/recharge area and, therefore, the ordinary limit of surface flows, is at 17$^{th}$ Street in Santa Ana.

**Reach 1** is a normally dry flood control facility, presently being expanded and improved even further as a part of the US Army Corps of Engineers' Santa Ana River Project. This reach extends from 17$^{th}$ Street to the tidal prism at the ocean.

# FIGURE 1-2
# SANTA ANA RIVER AND TRIBUTARIES

## Flows and Water Quality

When the Santa Ana River Stipulated Judgement was finalized in 1969, surface diversions and groundwater pumping had eliminated most of the dry weather surface flows in the river system between the mountains and Prado Dam. As the inland cities grew, wastewater flows increased. Between 1970 and 1990, the total volume rose from less than 50,000 to over 130,000 acre-feet per year. The river is effluent-dominated, a rare circumstance outside the Southwest. Nevertheless, water quality in the river has improved steadily, due largely to the efforts of the dischargers action in response to the requirements of the Regional Board.

In the 1970s, secondary treatment with disinfection was required in order to protect the health of the people who used it for contact recreation. These treatment requirements were further upgraded to include virus control: in-line coagulation and filtration and improved disinfection (or their equivalents) were then required. In the late 1980s, control of inorganic nitrogen levels was required to protect the aquatic habitat from un-ionized ammonia toxicity and to manage nitrate levels in groundwater for subsequent municipal uses. Further controls on residual chlorine levels were also added.

By 1991, when SAWPA's Use-Attainability Analysis of the middle Santa Ana River was conducted; full compliance with all these requirements had not yet been achieved. The river was posted to warn against water contact recreation, because certain upstream dischargers had not achieved compliance with virus control requirements. Compliance is expected by the end of 1995. Other identifiable water quality problems in the river were restricted to parts of Reach 4 where ammonia and chlorine controls were not yet in place. No water quality impairment due to toxics was seen in other parts of the system. In those other areas, the kinds and numbers of aquatic organisms at any given location tend to be dictated by habitat conditions.

## Aquatic Environment in the Santa Ana River

Because flows are limited or generally absent in several parts of the Santa Ana River, there is no sustained aquatic habitat in those areas. Even where there are perennial flows, the habitat is frequently harsh – warm, shallow water, shifting sand substrate, little or no instream cover, and no riparian vegetation or tree canopy for shade.

There are no dependable flows from the mouth of the canyon, where the river leaves the mountains, for some distance downstream. In the canyon itself, the Corps of Engineers is presently building the Seven Oaks Dam, a large flood control structure. Groundwater recharge basins immediately downstream percolate flows from the river and its nearby tributaries. The river channel is operated as a typically dry flood control facility.

In the San Bernardino area, the San Jacinto Fault (Bunker Hill Dike) forces groundwater to the surface. At present (1993), perennial flows in the middle Santa Ana River begin at the confluence with East Warm Creek, a short distance upstream. The rising water area associated with the fault, now relatively small, was historically a

much larger, swampy area with many large springs. San Timoteo Creek, which the Corps of Engineers plans to line with concrete in the near future, joins the river in this area, its flows predominantly reclaimed wastewater from Yucaipa and other upstream dischargers.

East Warm Creek (near San Bernardino) carries small amounts of water from various non-point sources as well as some rising water. The San Bernardino Publicly-Owned Treatment Works (POTW) currently discharges to this creek just upstream of where it joins the river, but the city plans to move its point of discharge downstream in the near future. The river passes under several major highways and railroads in this area, and parts of the river bottom are lined with concrete. West Warm Creek, fully improved by the Corps for flood control but usually dry, also joins the river in this area.

The Santa Ana River Use-Attainability Analysis (1991) found areas of relatively high habitat value downstream of La Cadena Avenue in Colton, but these areas were largely washed out during the wet 1992-93 winter. Aquatic biota in the stream in this part of Reach 4 were limited, however, because certain POTWs had not yet installed full tertiary treatment and because physical conditions downstream – high temperatures, lack of cover or shelter – strongly discouraged upstream or downstream migration. Recent flood control maintenance practices have included removal of all vegetation and straightening of the river channel, severely reducing the value of the habitat. Surface flows presently continue on down through Reach 4, though conditions are likely to change when San Bernardino and Colton effluents are diverted to the RIX (rapid infiltration and extraction) project further downstream. The City of Rialto may also change its point of discharge to the river.

Near the Mission Boulevard Bridge and the upstream limit of Reach 3, rising water marks the Riverside Narrows area. Groundwater rises in the river channel and to either side as well. This water supports several small tributaries: Sunnyslope Channel, mostly improved for flood control; Tequesquite Arroyo Creek, which also drains Sycamore Canyon; and Anza Park Drain. In addition, the overflow from Lake Evans makes up a perennial tributary to the river in this area. These small streams form the present center of population of the Santa Ana Sucker, one of two remaining native species (in the Santa Ana River).

The City of Riverside's POTW on the south side of the river discharges in the Narrows, diverting all or part of its flows through the Hidden Valley Wildlife Area. Jurupa's Indian Hills POTW on the north side is permitted to discharge under certain conditions as well, but typically reclaims all its flow for golf course landscape irrigation.

From the Riverside Narrows area downstream to Prado Basin, the river is generally natural and unmodified. Even here, however, the water is warm because the mainstem is generally shallow and has a limited canopy. The substrate is dominated by shifting sand, limiting the bottom habitat and available opportunities for attached algae and insects, with only occasional gravel bars and riffles. The Santa Ana River Use-Attainability Analysis demonstrated that these habitat limitations dictate the kinds of numbers of aquatic organisms found here.

The Prado Flood Control Basin is a largely undisturbed, dense riparian wetland. In this area, flows in tributaries from both north and south of the river are again augmented by rising water. Temescal Creek comes in from the south, also carrying Arlington Channel flows and the occasional overflows from Lake Elsinore mentioned previously. A short distance from the river, near the edge of Prado Flood Control Basin, a section of Temescal Creek is the breeding center of the local Arroyo Chub population, the second native fish species still present in the middle river system. All the other species of fish found in the Middle Santa Ana River, including mosquitofish, bass, carp, catfish, etc., are exotics, escaped or introduced species.

All of the creeks draining Chino Basin come into the river on the north side, but the total dry-weather surface flow is negligible. Reclaimed wastewater from Chino Basin MWD's Regional Plant 1 is discharged to Cucamonga Channel, concrete-lined, offers extremely limited aquatic habitat – some attached algae, a few worms and insects, but not resident finfish. The improved channel ends near Prado Basin, and the stream changes names to Mill Creek. Chino Basin MWD's Regional Plant 2 discharges to Chino Creek near Prado Basin, some distance downstream of the discharge from the relatively new Carbon Canyon Plant. The lowest segments of Chino and Mill Creeks, down in Prado Basin, are quite different from most other streams in the watershed, with their muddy bottoms and deeper, slow-flowing water.

Most of the rising Chino Basin groundwater in the Prado area is high in TDS, nitrate, and other constituents, largely reflecting heavy present and historic agricultural water use in the area. Much of the initial water development went to citrus irrigation. That was supplanted first by large-scale vineyards and then by dairies, which are now slowly yielding to urban development.

Temescal Creek also carries reclaimed wastewater from the Lake Elsinore area, but most of that water percolates fairly quickly. Eastern MWD may discharge reclaimed wastewater to Temescal Creek in the future.

Below Prado Dam, the aquatic habitat is again different. The channel is deep in many places, with some rocky substrate and rapid sections. It supports a variety of organisms. In contrast, other stretches are improved for flood control. The river slows as it reaches Anaheim, where Orange County Water District diverts and recharges essentially all the dry weather flows. Downstream from the groundwater recharge areas near Anaheim, the Santa Ana River is normally dry.

## WATER SUPPLY AND WASTEWATER RECLAMATION

The most serious water-related problem in the Santa Ana River Basin at this time is water supply. This region now uses approximately twice as much water as is available from local sources. As a result, the quantity of water imported into this region each year now equals or exceeds the amount of ground and surface water utilized.

As noted earlier, the Colorado River Aqueduct delivers water to Lake Matthews, but the relatively high mineral content of this water limits its reuse in this area. The State Water Project likewise imports water from the Sacramento-San Joaquin Delta, water with lower levels of dissolved minerals. State Water Project water can be used and reused again.

**FLOOD CONTROL**

Most of the annual rainfall in the Santa Ana Region occurs in the winter, as noted earlier. Further, most of it can come in a day or two, resulting in major floods and widespread damage. The last of these was shortly before World War II – much of coastal Orange County was inundated, stimulating the construction of Prado Dam by the US Army Corps of Engineers (Corps). The subsequent further urbanization of Orange County has been accompanied by channelizing essentially all the surface steams in the area.

The Corps is presently increasing the capacity of the main river channel through Orange County, and has begun construction of Seven Oak Dam in the San Bernardino Mountains, upstream of the mouth of Santa Ana River Canyon. Another of the Corps' current projects involves increasing the height of the Prado dam.

Flood control channels are typically designed to move large volumes of water from one place to another rapidly, without property damage. A fully improved channel is usually concrete, severely limiting the aquatic habitat beneficial uses. Partially improved channels may only have levees on either side, but other flood control activities (such as channel straightening, vegetation clearing, and weed control using copper or other toxic materials) can reduce or eliminate the aquatic habitat. Storm flows themselves, not necessarily part of flood events, can and do eliminate streamside habitat in parts of the river through sheer scouring force every few years.

**ADOPTION OF THE BASIN PLAN – AMENDMENTS TO THE BASIN PLAN**

As noted earlier, the California Water Code established the original requirements for the Basin Plan. After the necessary workshops and public hearings, the Regional Board formally adopts the Plan and forwards it to the State Board for their review and approval.

Pursuant to the California Fish and Game Code, Section 2090, Article 4, the Regional Board is required to consult with the Department of Fish and Game with respect to addressing the potential impacts (a) Basin Plan provision(s) may have on rare, threatened or endangered species within the Region. A Basin Plan or amendment is not considered final until that consultation has occurred.

After the State Board approval, the Office of Administrative Law (OAL) must review and approve any new regulatory provisions in the plan to assure that six specific standards are met: necessity (need for the regulation), authority (legislative or legal),

clarity (easily understood), consistency (with other regulations), reference (Water Code or other citation), and non-duplication (of existing regulations).

The plan is also transmitted to EPA for review and approval of those parts of the plan that establish or modify water quality standards as defined in the Clean Water Act (CWA).

## CONTENTS OF THE BASIN PLAN

**Chapter 2** (Plans and Policies) describes some of the many statewide regulatory and guidance documents which apply to the shape and the Regional Board's activities.

**Chapter 3** (Beneficial Uses) discusses the many beneficial uses of the various waters of the Santa Ana Region. Ground and surface waterbodies are identified and tabulated, showing the beneficial uses of each.

**Chapter 4** (Water Quality Objectives) also tabulates the region's waterbodies, and lists the water quality objectives (levels of various water quality parameters which must be met) necessary to protect those beneficial uses.

**Chapter 5** (Implementation) details the Regional Board's water quality regulations and protection programs, lists the region's significant water quality problems and conditions, and describes approaches and solutions to them.

**Chapter 6** (Monitoring and Assessment) contains listings and discussions of the monitoring programs, agencies involved, sampling locations and parameters tested, as well as the programs which collect, manage and maintain the data bases. California's statewide Water Quality Assessment is also described and referenced.

**Chapter 7** (Water Resources and Water Quality Management) covers topics of regional importance not addressed in the other chapters.

# CHAPTER 2

# PLANS AND POLICIES

## INTRODUCTION

In addition to the Santa Ana Region Basin Plan, a number of water quality control plans and policies adopted by the State Water Resources Control Board direct the Regional Board's actions. The State Board Plans and Policies which apply in this region are briefly described below. Copies of the plans and policies are attached in Appendix I.

These plans and policies may be reviewed periodically and may be revised. The Regional Board should be contacted to determine if a particular plan or policy is still current.

## SATE BOARD PLANS

### Thermal Plan (Resolution No. 75-89)

This plan, formally known as the "Water Quality Control Plan for Control for Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California," was developed and adopted in order to minimize the effects of wastes and wastewaters on the temperature of the receiving waters. This plan specifies water quality objectives, effluent quality limits, and discharge prohibitions related to thermal characteristics of interstate waters, enclosed bays estuaries, and waste discharges.

### Ocean Plan (Resolution No. 90-27)

The "Water Quality Control Plan for Ocean Waters of California," amended in 1990, establishes beneficial uses and water quality objectives for waters of the Pacific Ocean along the California coast outside of enclosed bays, estuaries, and coastal lagoons. The Ocean Plan prescribes effluent quality requirements and management principles for waste discharge prohibitions.

The Ocean Plan identifies specific objectives for bacteriological, physical, chemical, and biological characteristics and radioactivity. These objectives are implemented by issuance of waste discharge requirements which include effluent limitations on major wastewater constituents and receiving water limitations for toxic materials. In addition, the Ocean Plan prohibits discharges of specific hazardous substances and waste sludge, bypassing of untreated waste, and impacts to Areas of Special Biological Significance.

### Nonpoint Source Management Plan (Resolution No. 88-123)

In 1988, the State Board adopted the Nonpoint Source Management Plan which established the framework for statewide nonpoint source activities. Six statewide objectives and implementation strategies to manage nonpoint source problems are included in the plan. Chapter 5 provides more detailed information regarding the management plan.

Point sources were the principal focus of water quality control in the 1970s and 1980s. Nonpoint sources are now receiving a larger proportion of planning and regulatory attention.

## STATE BOARD POLICIES

### Policy with Respect to Maintaining High Quality Waters in California (Resolution No. 68-16)

The regulations implementing the Clean Water Act (40 CFR 131.6; 131.12(a)) require that each state develop and adopt a statewide antidegradation policy. In California, this requirement is satisfied by SWRCB Resolution No. 68-16, the "Statement of Policy with Respect to Maintaining High Quality Waters of California." The SWRCB policy requires the continued maintenance of existing high quality waters unless there is a demonstration that: (1) allowing some degradation is consistent with the maximum benefit to the people of the state; and (2) that such degradation would not unreasonably affect existing or potential beneficial use.

Actions which may adversely affect surface water quality must satisfy both Resolution No. 68-16 and the federal antidegradation policy (40 CFR 131.12). The requirements of the two policies are similar: the federal policy requires that existing instream uses and the level of water quality necessary to protect them must be maintained and protected. In addition, a reduction in water quality can be allowed only if there is a demonstration that such a reduction is necessary to accommodate important economic or social development.

### Policy for Water Quality Control (by motion July 6, 1972)

This policy declares the State Board's intent to protect water quality through the implementation of water resources management programs and serves as the general basis for the adoption of subsequent water quality control policies.

### Policy for Enclosed Bays and Estuaries (Resolution No. 74-43)

The Bays and Estuaries Policy recognizes the high environmental and ecological values of the bays and estuaries in the state. Specific direction is given regarding the San Francisco Bay-Delta system. New discharges to other bay and estuarine waters

are prohibited unless enhancement of those waters can be demonstrated. It is also the state's stated policy to phase out or in other ways eliminate existing discharges to bays and estuaries unless such enhancement can de demonstrated.

**Policy on the Use and Disposal of Inland Waters Used for Powerplant Cooling (Resolution No. 75-58)**

This policy provides consistent principles and guidance for supplementary waste discharge requirements or other water control actions for thermal powerplants using inland waters for cooling. The policy specifies that fresh inland waters should be used for cooling only when other alternatives are environmentally undesirable or economically unsound.

**Policy and Action Plan for Water Reclamation (Resolution No. 77-1)**

The Reclamation policy recognizes the present and future need for increased amounts of water in California primarily to support growth. This policy commits both the State Board and Regional Boards to support reclamation in general and reclamation projects which are consistent with sound principles and demonstrated needs.

**Policy on the Disposal of Shredder Waste (Resolution No. 87-22)**

This policy permits the disposal of shredded waste produced by the mechanical destruction of car bodies, old appliances, and similar castoffs, into certain landfills under specific conditions designated and enforced by the Regional Boards.

Supplementary to the state policy, the Santa Ana Regional Board Shredder Waste Policy (Resolution 87-108) designates specific solid waste facilities in the region which are authorized to accept shredder waste. Prior to accepting shredder waste at a facility, a Report of Waste Discharge (ROWD) is required to be submitted to the Regional Board.

**Sources of Drinking Water Policy (Resolution No. 88-63)**

The sources of Drinking Water Policy (Policy) declares that with specified expectations, all waters of the state are to be considers suitable, or potentially suitable, for municipal or domestic supply and should be so designated (**MUN**) by the Regional Boards. Those waters excepted under the Policy include the following: surface and ground waters that are contaminated, either by natural processes or by human activity, to the extent that they cannot reasonably be treated for domestic use; and surface waters in systems designated or modified to carry municipal/industrial/agricultural wastewaters or stormwater runoff. Other exceptions are specified in the Policy.

Adoption of the Policy required that Regional Boards review the beneficial uses of their ground and surface waters and determine where **MUN** designations should be added

and which water bodies should be excepted. Periodic reviews and updates of Regional Basin Plans must conform to this policy.

## STATE BOARD PLANNING ACTIVITES FOR THE BAY/DELTA

The SWRCB is engaged in a comprehensive, multiphase program to protect the waters of the San Francisco Bay/Sacramento-San Joaquin Delta Estuary. While the Santa Ana Regional Board will not be directly involved in implementing the management plans which result from this program, the SWRCBs actions are likely to affect both water quality and quantity in the Regional Board's water quality control programs.

The Bay/Delta water system is a major source of supply to the State, providing more than half of all water used in California. The Bay/Delta is also of extreme ecological significance: it is one of the largest systems for fish and waterfowl habitat and production in the United States.

Two major water distribution systems divert water from the Delta: the Central Valley Project, operated by the United States Bureau of Reclamation; and the State Water Project (SWP), operated by the California Department of Water Resources. The SWP is an important source of high quality, supplemental water supplies for the Santa Ana Region (see Chapter 5 - Salt Balance and Assimilative Capacity). Numerous other water diversion and management efforts influence the inflows into, flows through, and outflows from the Bay/Delta estuary.

In 1978, the SWRCB adopted the "Water Quality Control Plan for the Sacramento-San Joaquin Delta and Suisun Marsh" (the Delta Plan) and Water Rights Decision 1485 (D-1485). The Delta Plan established water quality objectives for salinity and outflow standards and operational constraints necessary to meet the objectives and assure reasonable protection of beneficial uses. These outflow standards and operational constraints are implemented through D-1485.

The Delta Plan proceedings were limited to the current and near term conditions in the Delta. The SWRCB committed to subsequent review of the Delta Plan and is not in that process.

The current Bay/Delta review program has a number of components, including the development and adoption by the SWRCB of the "Water Quality Control Plan for Salinity – San Francisco Bay/Sacramento-San Joaquin Delta Estuary" (Salinity Plan, 19-15 WR, May 1991). This Plan is primarily concerned with salinity and temperature factors. Numerous water quality objectives were established for: salinity at municipal and industrial intakes; salinity levels to protect Delta agriculture; salinity levels to protect export agriculture; and salinity for fish and wildlife resources in the Estuary. Water quality objectives were also established to provide expansion of the period of protection for striped bass spawning, and to address temperature and dissolved oxygen levels for fisheries in the Delta.

This Salinity Plan set the stage for the ongoing Water Rights phase of the proceedings. Determining the flow requirements necessary to meet the Plan objectives and the allocation of responsibility for meeting those objectives will lead to a revised Water Rights Decision.

A draft decision (D-1630) was released in 1992 and revised in 1993. D-1630 called for substantial limits on exports of waters from the Bay/Delta system, including exports to the SWP, during spring. The quality of Bay/Delta waters is generally best during this time of high flows. Limiting exports to other times of the year is likely to mean that poorer quality water will be supplied to users outside the Bay/Delta system, including the Santa Ana Region. High quality SWP water is essential to address the severe mineralization problem in this Region (see Chapter 5).

The SWRCB has determined that it will not adopt an interim water rights decision (D-1630), in part because the above-average rainfall during 1993 eliminated the urgent need to do so to protect fish and wildlife resources. The SWRCB has resumed its proceedings to establish a long-term water right decision to replace D-1485.

# CHAPTER 3
# BENEFICIAL USES

## INTRODUCTION

Basically, a beneficial use is one of the various ways that water can be used for the benefit of people and/or wildlife. Examples include drinking, swimming, industrial and agricultural water supply, and the support of fresh and saline aquatic habitats.

Section 303 of the federal Clean Water Act (33 USC §1313) defines water quality standards as consisting of both the uses of the surface (navigable) waters involved and the water quality criteria which are applied to protect those uses. Under the Porter-Cologne Water Quality Control Act (California Water Code, Division 7, Chapter 2 §13050) these concepts are separately considered as beneficial uses and water quality objectives. Beneficial uses and water quality objectives are to be established for all waters of the state, both surface and subsurface (groundwater).

## BENEFICIAL USES

Beneficial uses were tabulated and discussed in Chapters 1 and 2 of the 1975 Basin Plan and in Chapter 2 of the 1983 Basin Plan. In 1983, twenty-one beneficial uses were defined statewide. Of those, eighteen were identified and recognized in the 1983 Plan: **MUN, AGR, IND, PROC, GWR, NAV, POW, REC1, REC 2, COMM, WARM, COLD, BIOL, WILD, RARE, SPWN, MAR,** and **SHEL.**

In 1988, the State Board adopted the Sources of Drinking Water Policy (SWRCB Resolution No. 88-63) which directed the Regional Boards to add the Municipal and Domestic Supply (**MUN**) Beneficial Use for all waterbodies not already so designated, unless they met certain exception criteria. To implement this Policy, the Regional Board revised the table of Beneficial Uses in the 1983 Basin Plan, adding the **MUN** designation for certain waterbodies and specifically excepting others (RWQCB Resolution No. 89-42). Shortly thereafter, this revised Beneficial Use table was reviewed again and changes were made, including the addition of the Water Contact Recreation (**REC 1**) use for some waterbodies, the revision of some Beneficial Use designations from intermittent (I) to existing (X), and the addition of more waterbodies (RWQCB Resolution No. 89-99).

In this Plan, further changes to the Beneficial Use table have been made. Significant waterbodies not previously identified are included and the beneficial uses are designated. Certain of these waters are excepted from the **MUN** designation. The designation **RARE** has been added where substantial evidence indicates that the waterbody supports rare, threatened or endangered species (Appendix II). Certain known wetlands in the Region are listed in a new waterbody category (see wetlands discussion below). A revised list of Beneficial Uses was developed as part of a comprehensive statewide update of all Basin Plans. Using this revised statewide list as a guide, this Basin Plan updates the list of Beneficial Uses definitions contained in the 1983 Plan.

In all, twenty-three beneficial uses are now defined statewide; of these, nineteen are recognized within the Santa Ana Region. (The four not utilized are Migration of Aquatic Organisms, Freshwater Replenishment, Inland Saline Water Habitat and Aquaculture). One beneficial use specific to the Region, Limited Warm Freshwater Habitat, has been added, bringing the total number of beneficial uses recognized in the Santa Ana Region to twenty. The region's beneficial uses are listed and described below.

<<<<<<<<<<<<>>>>>>>>>>>>

## BENEFICIAL USE DEFINITIONS

Municipal and Domestic Supply (**MUN**) waters are used for community, military, municipal or individual water supply systems. These uses may include, but are not limited to, drinking water supply.

Agricultural Supply (**AGR**) waters are used for farming, horticulture or ranching. These uses may include, but are not limited to, irrigation, stock watering, and support of vegetation for range grazing.

Industrial Service Supply (**IND**) waters are used for industrial activities that do not depend primarily on water quality. These uses may include, but are not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection and oil well repressurization.

Industrial Process Supply (**PROC**) waters are used for industrial activities that depend primarily on water quality. These uses may include, but are not limited to, process water supply and all uses of water related to product manufacture or food preparation.

Groundwater Recharge (**GWR**) waters are used for natural or artificial recharge of groundwater for purposes that may include, but are not limited to, future extraction, maintaining water quality or halting saltwater intrusion into freshwater aquifers.

Navigation (**NAV**) waters are used for shipping, travel or other transportation by private, commercial or military vessels.

Hydropower Generation (**POW**) waters are used for hydroelectric power generation.

Water Contact Recreation **(REC 1***) waters are used for recreational activities involving body contact with water where ingestion of water is reasonably possible. These uses may include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, whitewater activities, fishing and use of natural hot springs.

* The **REC 1** and **REC 2** beneficial use of designations assigned to surface waterbodies in this Region should not be construed as encouraging recreational activities. In some cases, such as Lake Matthews and certain reaches of the Santa Ana River, access to the waterbodies is prohibited because of potentially hazardous conditions and/or because of the need to protect other uses, such as municipal supply or sensitive wildlife habitat. Where **REC 1** or **REC 2** is indicated as a beneficial use in Table 3-1, the designations are intended to indicate that the uses exist or that the water quality of the waterbody could support recreational uses.

Non-contact Water Recreation (**REC 2***) waters are used for recreational activities involving proximity to water, but not normally involving body contact with water where ingestion of water would be reasonably possible. These uses may include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing and aesthetic enjoyment in conjunction with the above activities.

Commercial and Sportfishing (**COMM**) waters are used for commercial or recreational collection of fish or other organisms, including those collected for bait. These uses may include, but are not limited to, uses involving organisms intended for human consumption.

Warm Freshwater Habitat (**WARM**) waters support warmwater ecosystems that may include, but are not limited to, preservation and enhancement of aquatic habitats, vegetation, fish and wildlife, including invertebrates.

Limited Warm Freshwater Habitat (**LWRM**) waters support warmwater ecosystems which are severely limited in diversity and abundance as the result of concrete-lined watercourses and low, shallow dry weather flows which result in extreme temperature, pH, and/or dissolved oxygen conditions. Naturally reproducing finfish populations are not expected to occur in **LWRM** waters.

Cold Freshwater Habitat (**COLD**) waters support coldwater ecosystems that may include, but are not limited to, preservations and enhancement of aquatic habitats, vegetation, fish and wildlife, including invertebrates.

Preservation of Biological Habitats of Special Significance (**BIOL**) waters support designated areas or habitats, including, but not limited to, established refuges, parks, sanctuaries, ecological reserves or preserves, and Areas of Special Biological Significance (ASBS), where the preservation and enhancement of natural resources requires special protection.

Wildlife Habitat (**WILD**) waters support wildlife habitats that may include, but are not limited to, the preservation and enhancement of vegetation and prey species used by waterfowl and other wildlife.

Rare, Threatened or Endangered Species (**RARE**) waters support the habitats necessary for the survival and successful maintenance of plant or animal species designated under state or federal law as rare, threatened or endangered.

* The **REC 1** and **REC 2** beneficial use of designations assigned to surface waterbodies in this Region should not be construed as encouraging recreational activities. In some cases, such as Lake Matthews and certain reaches of the Santa Ana River, access to the waterbodies is prohibited because of potentially hazardous conditions and/or because of the need to protect other uses, such as municipal supply or sensitive wildlife habitat. Where **REC 1** or **REC 2** is indicated as a beneficial use in Table 3-1, the designations are intended to indicate that the uses exist or that the water quality of the waterbody could support recreational uses.

Spawning, Reproduction and Development (**SPWN**) waters support high quality aquatic habitats necessary for reproduction and early development of fish and wildlife.

Marine Habitat (**MAR**) waters support marine ecosystems that include, but are not limited to, preservation and enhancement of marine habitats, vegetation (*e.g.,* kelp), fish and shellfish and wildlife (*e.g.,* marine mammals and shorebirds).

Shellfish Harvesting (**SHEL**) waters support habitats necessary for shellfish (*e.g.,* clams, oysters, limpets, abalone, shrimp, crab, lobster, sea urchins and mussels) collected for human consumption, commercial or sport purposes.

Estuarine Habitat (**EST**) waters support estuarine ecosystems, which may include, but are not limited to, preservation and enhancement of estuarine habitats, vegetation, fish, and shellfish, and wildlife, such as waterfowl, shorebirds, and marine mammals.

**<<<<<<<<<<<<>>>>>>>>>>>>**

More than one beneficial use may be identified for a given waterbody. The most sensitive use must be protected. The Regional Board reserves the right to resolve any conflicts among beneficial uses based on the facts in a given case.

## WETLANDS

The Clean Water Act was enacted by Congress to restore and maintain the chemical, physical and biological integrity of the nation's waters. The nation's waters include *wetlands*, as well as rivers, streams, lakes, estuaries and the territorial seas. Generally, wetlands include swamps, marshes, bogs, sloughs, mangroves, wet meadows, savannas, wet tundra, playa lakes and vernal pools. Wetlands serve a number of important functions, including absorption of floodwaters, shoreline erosion control and water quality improvement by the removal of pollutants. They also provide habitat for wetland species, and have important aesthetic, recreational, scientific and educational values. More than half of the wetlands in the United States have been destroyed. Due to this high loss, a goal of "no net loss" of wetlands has been established at both the federal and state level.

The definition of wetlands varies widely among the federal agencies, however both the United States Army Corps of Engineers and United States Environmental Protection Agency (US EPA) agree on the definition in Section 404 of the Clean Water Act, which specifies that wetlands are "those areas that are inundated or saturated with surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." Wetlands are generally agreed to have three characteristics: hydrophytic vegetation; hydric soils; and wetland hydrology. Hydrophytic vegetation describes those plants adapted for growing in water, soil or on a substrate that is at least periodically deficient in oxygen as a result of excessive water content. Hydric soils are those soils that are oxygen-depleted due to saturation for long periods during

the growing season. Wetland hydrology can be described as the presence of water at or above the soil surface for a sufficient period of the year to significantly influence the plant types and soil that occur in the area. Strict definitions of these characteristics have not been formally adopted. The Regional Board includes these characteristics and criteria as general reference and not as guidance.

As part of an overall effort to protect the Nation's wetland resources, US EPA has called for states to adopt water quality standards (beneficial uses and water quality objectives) for wetlands. Applying water quality standards to wetlands provides a regulatory basis for a variety of wetlands management programs. For example, these standards will play an important role in the State and Regional Boards' water quality certification process by providing the basis for approving, conditioning or denying federal permits and licenses as appropriate. (This certification process, conducted in accordance with Section 401 of the CWA is described in more detail in Chapter 5.)

The 1975 and 1983 Basin Plans listed a number of waterbodies which are known to be or to include wetlands (*e.g.,* San Joaquin Freshwater Marsh, Upper Newport Bay, Anaheim Bay-National Wildlife Refuge). These Plans specified both beneficial uses and water quality objectives for these waterbodies. In the earlier Plans, these waters were not specifically identified as wetlands. In this plan, a "Wetlands" waterbody category has been added to the Table of Beneficial Uses. Certain waters known to be wetlands are listed under this category and their beneficial uses are designated. (Note: estuarine wetlands continue to be shown in the "Bays, Estuaries and Tidal Prisms" category). The numeric objectives specified for these wetlands in the earlier Basin Plans are included in this Plan (Chapter 4). Additional numeric objectives will be developed and implemented as part of the ongoing Basin Planning process. Further detailed review of the water resources within the Region is also expected to result in the listing of additional wetlands.

The intent of including the wetlands category is to provide a more accurate description of the Region's waters. The listing of specific wetlands does not trigger any new or different regulatory actions by the Regional Board. Standards applied to permitting, 401 certification, and/or enforcement actions will not be affected by this listing. Again, the listing of wetlands in this Plan is a <u>partial</u> one only and should not be construed as placing any limitations on the exercise of the Regional Board's responsibilities or authorities with respect to the protection of wetlands in the region. Nor is the present listing intended to define wetlands which are subject to the United States Army of Corps of Engineers jurisdiction.

Figure 3-1 shows the general locations of the wetlands listed in this Plan. The specific boundaries of each of these wetland areas will be determined on an as-needed basis (for 401 certifications and the like), using the methods described in the 1987 Corps of Engineers Wetland Delineation Manual or other accepted techniques.

A brief description of each of the wetlands listed in this Plan is provided in Appendix III. Some of these wetlands occur naturally. Others were created, either incidentally, as the result of the construction of dams or levees, or purposefully, as mitigation for

development projects elsewhere. Examples of created wetlands include those in the Prado Basin, which resulted from the construction of Prado Dam, and the San Joaquin Freshwater Marsh, created for development mitigation purposes.

A third type of wetlands, constructed wetlands, is proposed for the Santa Ana Region. Constructed wetlands would be designed, built and managed to provide wastewater treatment to meet specific waste discharge requirements. Constructed wetlands do not include percolation ponds, equalization basins or other conventional treatment works. At this time, the proposed use of constructed wetlands in the region would be principally for nitrogen removal. The use of constructed wetlands for management of stormwater flows may also be proposed. Currently, the Orange County Water District is using approximately 600 acres of ponds in the Prado area to investigate the use of constructed wetlands for nitrogen removal. The City of Riverside proposes to construct and operate wetlands treatment ponds in the Hidden Valley area. Constructed wetlands are also being contemplated by Eastern Municipal Water District and Elsinore Valley Municipal Water District.

While the purpose of these constructed wetlands would be to provide wastewater treatment, they will inevitably have other uses and benefits, including the support of waterfowl and other wildlife and opportunities for education and recreation. The Regional Board's approach toward regulation of the use of these constructed wetlands will be to ensure that these affiliated uses are reasonably protected, while appropriate wastewater treatment uses are supported. As an example, the Board could allow the use of constructed wetlands for the treatment of various parameters such as nitrogen and phosphorus. However, the Board may disallow the use of wetlands for treatment of certain parameter such as toxics if there is evidence that these parameters would adversely and unreasonably affect the affiliated uses of the constructed wetlands. In this case, the Board would require compliance with toxics limits prior to discharge to the constructed wetlands.

In August 1993, the "California Wetlands Conservation Policy" was announced by the Governor. The Policy, included in the Appendix III, has three principal objectives:

- to ensure no overall net loss of wetlands and achieve a long-term gain in the quantity, quality and permanence of wetlands acreage and values;

- to reduce procedural complexity and confusion in the administration of wetlands conservation programs; and

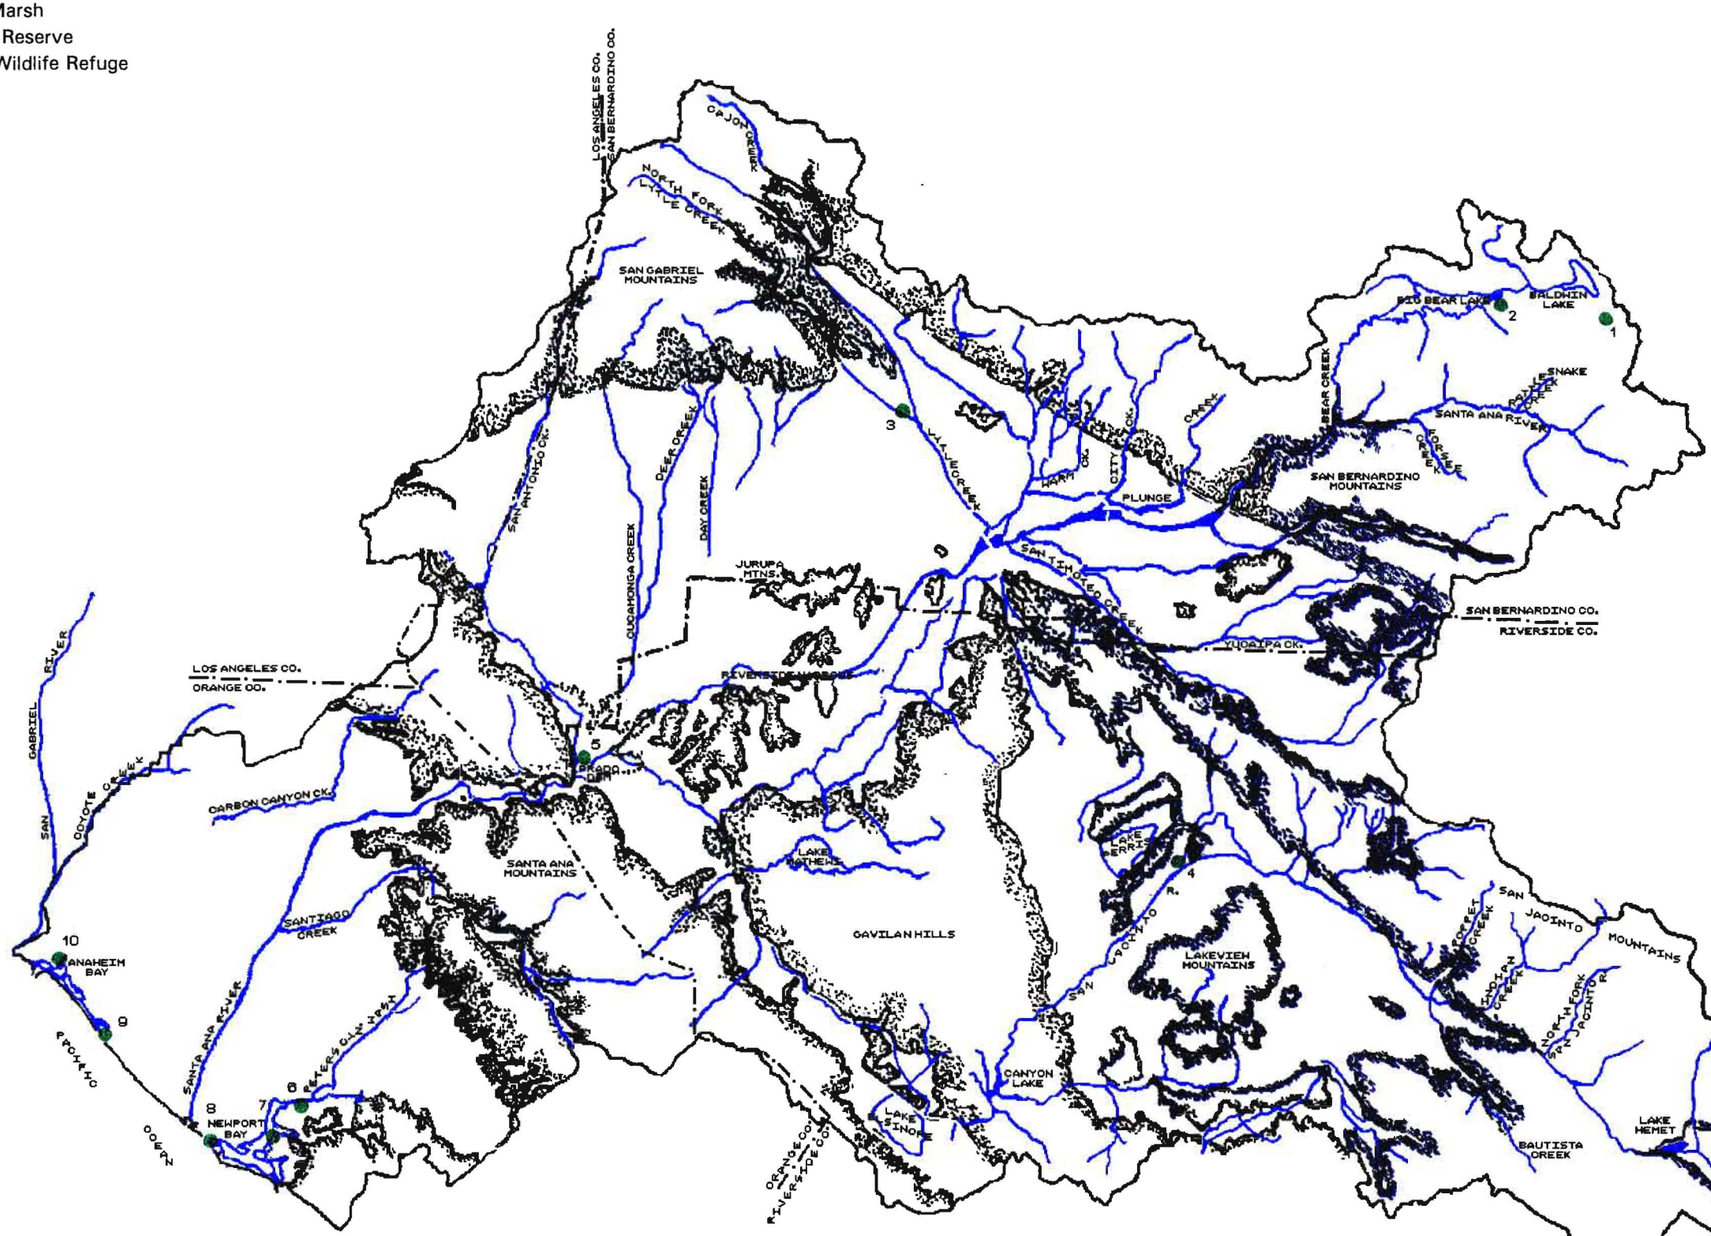
- make cooperative planning efforts and landowner incentive programs the primary focus of wetland conservation and restoration.

The methods identified to achieve these objectives are numerous and include:

- a statewide wetlands inventory and identification of conservation, restoration and enhancement goals;

- development of a consistent wetlands definition, standards, and guidelines for regulatory purposes; and

- integration of wetlands policy and planning with other environmental and land use processes.



An interagency task force on wetlands is to be created to direct and coordinate administration and implementation of this policy.

**GROUNDWATER (Amended by Resolution No. R8-2004-0001, January 22, 2004)**

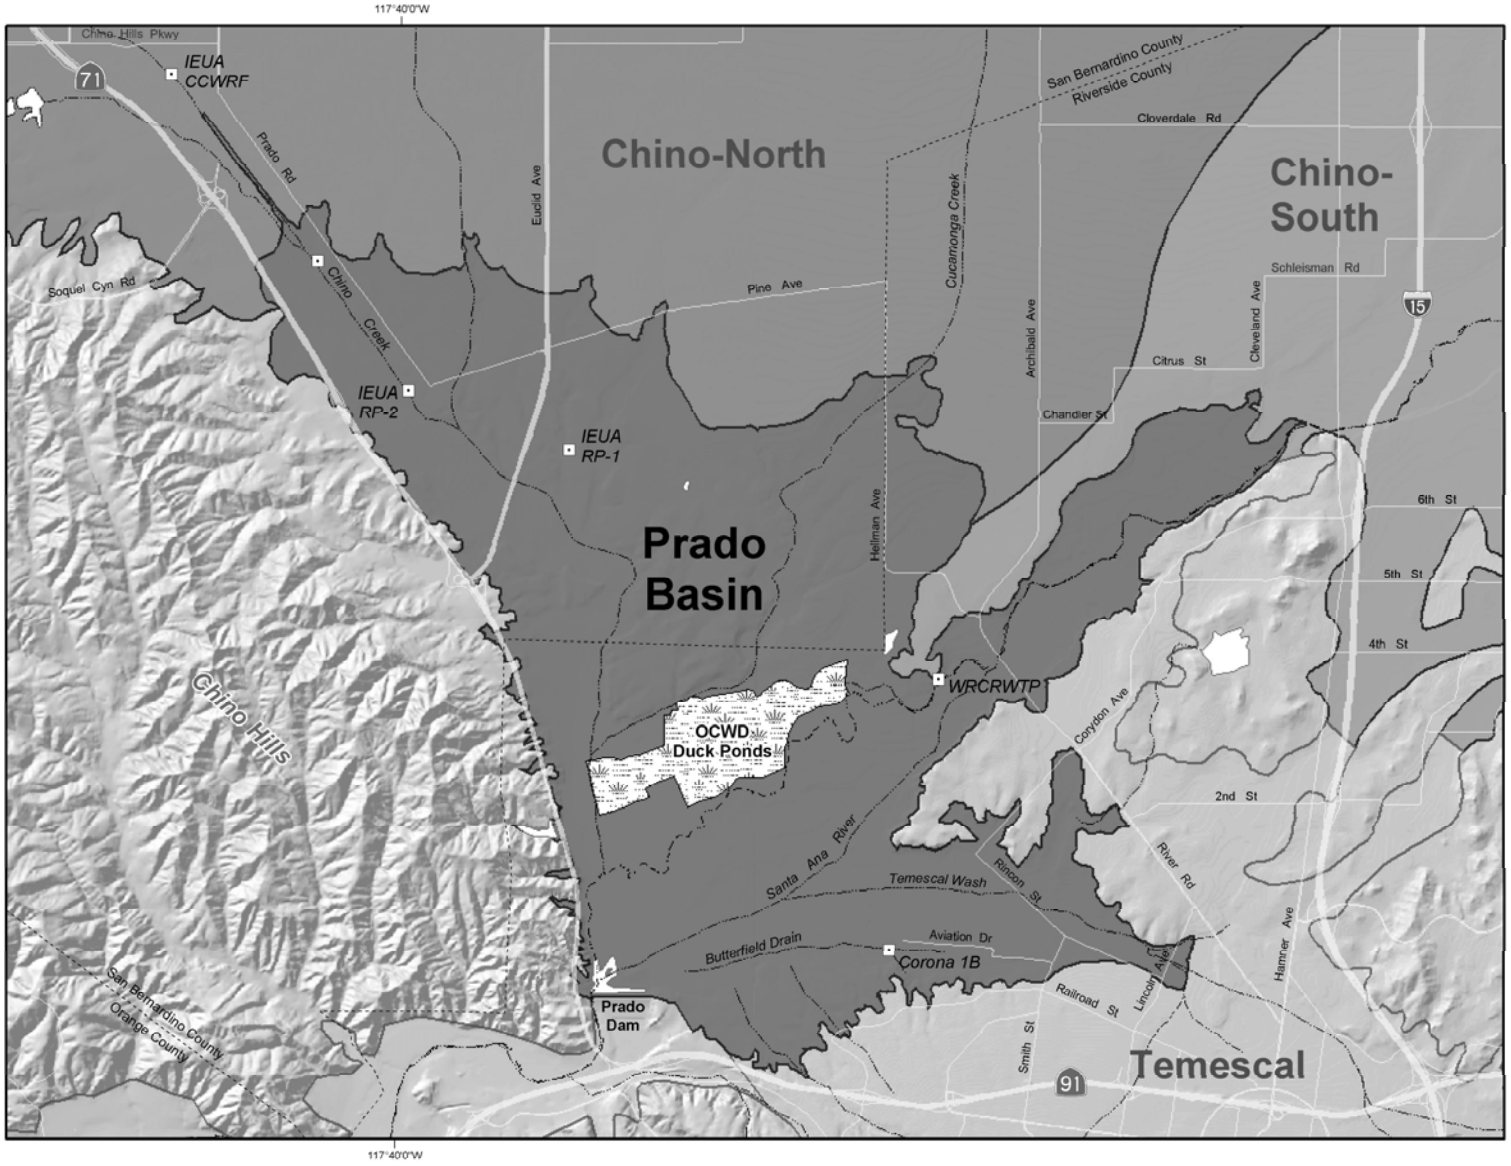
Groundwater subbasin boundaries included in the 1975 and 1984 Basin Plans, and initially in this 1995 Basin Plan, were, for the most part, based on data and information collected in the 1950's and 1960's. Since these boundaries were first established in the 1975 Basin Plan, a considerable amount of new water level, water quality and geologic data has become available. As part of the 2004 update of the TDS/Nitrogen management plan in the Basin Plan (see further discussion of this work in Chapter 5 – Salt Management Plan), these new data were used to review and revise the sub-basin boundaries.

To accomplish this task, all available geologic studies of the Santa Ana Region, through 1995, were gathered and re-analyzed. A comprehensive database of water level and water quality data and well drilling logs was created and utilized to delineate revised groundwater subbasin boundaries, now designated as groundwater "Management Zones". The groundwater Management Zones are shown in Figures 3-3 through 3-7.

The specific technical basis for distinguishing each groundwater Management Zone is provided in the report entitled "TIN/TDS Study – Phase 2A Final Technical Memorandum," Wildermuth Environmental, Inc., July 2000. In general, the new groundwater Management Zone boundaries were defined on the basis of (1) separation by impervious rock formations or other groundwater barriers, such as geologic faults; (2) distinct flow systems defined by consistent hydraulic gradients that prevent widespread intermixing, even without a physical barrier; and (3) distinct differences in water quality. Groundwater flow, whether or not determined by a physical barrier, was the principal characteristic used to define the Management Zones. Water quality data were used to support understanding of the flow regime and to assure that unusually high or poor quality waters were distinguished for regulatory purposes.

In addition to these technical considerations, water and wastewater management practices and goals for the Chino Basin were considered and used to define an alternative set of Management Zone boundaries for that area. These so-called "maximum benefit" Management Zone delineations , shown in Figure 3-5a, were developed as part of recommendations by the Chino Basin Watermaster and the Inland Empire Utilities Agency (IEUA) to implement a "maximum benefit" proposal, including an Optimum Basin Management Plan (OBMP), for the area.[1] These agencies have committed to the implementation of a specific set of projects and

[1] The term "maximum benefit" is drawn from the state's antidegradation policy (SWCRB Resolution No. 68-16; see Chapter 2)), which provides that high quality water can be lowered only if beneficial uses are fully protected and water quality consistent with *maximum benefit* to the people of the state is maintained.



requirements in order to demonstrate that the "maximum benefit" Management Zone boundaries, and particularly the "maximum benefit" nitrate-nitrogen and TDS objectives for these Zones (see Chapter 4), assure protection of beneficial uses and are of maximum benefit to the people of the state (see Chapter 5, VII. Maximum Benefit Implementation Plans for Salt Management, A. Salt Management – Chino Basin and Cucamonga Basin). These "maximum benefit" Management Zone boundaries apply for regulatory purposes provided that the Regional Board continues to find that the Watermaster and IEUA are demonstrating "maximum benefit" by timely and appropriate implementation of these agencies' commitments. If, after consideration at a duly noticed Public Hearing, the Regional Board finds that these commitments are not being met and that "maximum benefit" is not being demonstrated, then the Management Zone boundaries for the Chino Basin shown in Figure 3-5b apply for regulatory purposes.

**PRADO BASIN SURFACE WATER MANAGEMENT ZONE (PBMZ)**

The flood plain behind Prado Dam has unique hydraulic characteristics. Chino Creek, Cucamonga Creek (which flows into Mill Creek) and Temescal Creek join the Santa Ana River behind the dam. Flood control operations at the dam, coupled with an extremely shallow groundwater table and an unusually thin aquifer, significantly affect these surface flows, as well as subsurface flows in the area. Depending on how the dam is operated, surface waters may or may not percolate behind the dam. There is little or no groundwater storage in the flood plain behind the dam. Any groundwater in storage is forced to the surface because the foot of Prado Dam extends to bedrock and subsurface flows cannot pass through the barrier created by the dam and the surrounding hills. Given these characteristics, this area is designated as a surface water management zone, rather than a groundwater management zone. The Prado Basin Management Zone is generally defined by the 566-foot elevation above mean sea level. It extends from Prado Dam up Chino Creek, Reach 1A and 1B to the concrete-lined portion near the road crossing at Old Central Avenue, up the channel of Mill Creek (Prado Area) to where Mill Creek becomes named as Cucamonga Creek and the concrete-lined portion near the crossing at Hellman Road, up what was formerly identified as Temescal Creek, Reach 1A (from the confluence with the Santa Ana River upstream of Lincoln Avenue) (this area is indistinguishable because of shifting topography and is now considered a part of the Prado Basin Management Zone), and up the Santa Ana River, Reach 3 to the 566-foot elevation (just west of Hamner Avenue). The Prado Basin Management Zone encompasses the Prado Flood Control Basin, which is a created wetlands as defined in this Plan (see the discussion of wetlands elsewhere in this Chapter). Orange County Water District's wetlands ponds are also located within the Prado Basin Management Zone.

The beneficial uses of the proposed PBMZ include all of the beneficial uses currently designated for the surface waters identified above. The PBMZ also incorporates the Prado Flood Control Basin. The beneficial uses previously identified for this Basin are designated also for the Zone (See Table 3-1, Beneficial Uses, page 3-21).

**The Prado Basin Management Zone is shown in Figure 3-2.**

## BENEFICIAL USE TABLE

Table 3-1 lists the designated beneficial uses for waterbodies within the Santa Ana Region. In this table, an "X" indicates that the waterbody has an existing or potential use. Many of the existing uses are well-known; some are not. Lakes and streams may have potential beneficial uses established because plans already exist to put he water to those uses, or because conditions (*e.g.,* location, demand) make such future use likely. The establishment of a potential beneficial use serves to protect the quality of that water for such eventual use.

An "I" in Table 3-1 indicates that the waterbody has an intermittent beneficial use. This may occur because water conditions do not allow the beneficial use to exist year-round. The most common example of this is an ephemeral stream. Ephemeral streams in this region include, at one extreme, those which flow only while it is raining or for a short time afterward, and at the other extreme, established streams which flow through part of the year but also dry up for part of the year. While such ephemeral streams are flowing, beneficial uses are made of the water. Because such uses depend on the presence of water, they are intermittent. Waste discharges which could impair intermittent beneficial uses, whether they are made while those uses exist or not, are not permitted.

A "+" in the **MUN** column in Table 3-1 indicates that the waterbody has been specifically excepted from the **MUN** designation in accordance with the criteria specified in the "Sources of Drinking Water Policy."

The listing of waters within the basin attempts to include all significant surface streams and bodies of water, as well as the significant groundwater basins and subbasins which are receiving waters. Specific waters which are not listed have the same beneficial uses as the steams, lakes or reservoirs to which they are tributary or the groundwater basins or subbasin to which they are tributary or overlie.

| 845.63 | Yorba Linda HSA Split |

NOTE:

1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 130 Series except as explained below.
2. The numbering system used on this map is an adaptation of the numbering system used in the 130 Series.
3. The boundary between Region 8 and Region 4 follows the boundary between Los Angeles County and Orange or San Bernardino Counties, not the Hydrologic Boundary. The San Bernardino County line splits Hydrologic Unit 1 (Santa Ana River HU) so that Sub-Areas 481.21, 481.22, and 481.23 are legally in Region 4 but drain into Region 8. The Orange County line splits Hydrologic Unit 5 (Los Angeles-San Gabriel River HU) so that Sub-Areas 845.15, 845.61, 845.62 and 845.63 are legally in Region 8 but drain into Region 4. Therefore, a 5 digit number on the map indicates that a regional boundary divides a hydrologic unit, area or subarea. In these cases the second digit is the number of the region from which the hydrologic area has been separated by the regional boundary. All other digits are as described in the legend.
4. The 1986 updated names shown on the map are in accordance with an agreement with DWR and US Geological Survey.

++ Chino North “maximum benefit” management zone applies unless Regional Board determines that lowering of water quality is not of maximum benefit to the people of the state; in that case, the Chino 1, 2, and 3 “antidegradation” management zones would apply (see also discussion in Chapter 5).

@ Chino East and South are the designations in the Chino Basin Watermaster “maximum benefit” proposal (see Chapter 5) for the management zones identified by Wildermuth Environmental, Inc. (July 2000) as Chino 4 and 5, respectively.

# CHAPTER 4

# WATER QUALITY OBJECTIVES

## INTRODUCTION

The Porter-Cologne Act defines water quality objectives as "…the limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area" (§13050 (h)). Further, the Act directs (§13241) that:

"Each regional board shall establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses as the prevention of nuisance; however, it is recognized that it may be possible for the quality of water to be changed to some degree without unreasonably affecting beneficial uses. Factors to be considered by a regional board in establishing water quality objectives shall include, but not necessarily be limited to, all of the following:

(a) Past, present, and probable future beneficial uses of water.

(b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.

(c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.

(d) Economic considerations.

(e) The need for developing housing within the region.

(f) The need to develop and use recycled water."

Two important additional factors which were also considered in setting the water quality objectives in this Plan are (1) historic and present water quality, and (2) the antidegradation policies cited in Chapter 2.

The water quality objectives in this plan supersede and replace those adopted in the 1983 Basin Plan. Perhaps the most significant difference between this and the prior Plan is the inclusion of new objectives for un-ionized ammonia and site-specific objectives for the middle Santa Ana River system for copper, cadmium, and lead.

Some of these water quality objectives refer to "controllable sources" or "controllable water quality factors." Controllable sources include both point and nonpoint source discharges, such as conventional discharges from pipes, as well as discharges from land areas or other diffuse sources. Controllable water quality factors are those characteristics of the discharge and/or the receiving water which can be controlled by

treatment or management methods. Examples of other activities which may not involve waste discharges, but which also constitute controllable water quality factors, include the percolation of storm water, transport/delivery of water via natural stream channels, and stream diversions.

The water quality objectives in this Plan are specified according to waterbody type: ocean waters; enclosed bays and estuaries; inland surface waters; and groundwaters.

The narrative water quality objectives below are arranged alphabetically. They vary in applicability and scope, reflecting the variety of beneficial uses of water that have been identified (Chapter 3). Where numerical objectives are specified, they generally represent the levels that will protect beneficial uses. However, in establishing waste discharge requirements for specific discharges, the Regional Board may find that more stringent levels are necessary to protect beneficial uses. In other cases, an objective may prohibit the discharge of specific substances, may tolerate natural or "background" levels of certain substances or characteristics but no increases over those values, or may express a limit in terms of not impacting other beneficial uses. An adverse effect or impact on a beneficial use occurs where there is an actual or threatened loss or impairment of that beneficial use.

## OCEAN WATERS (Amended by Resolution No. 97-20, April 18, 1997)

Water quality objectives specified in the "Water Quality Control Plan for Ocean Waters of California" (Ocean Plan) and the "Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California" (Thermal Plan) are incorporated into this Basin Plan by reference. The provisions of the Ocean Plan and Thermal Plan apply to the ocean waters within this Region. **(End of Resolution No. 97-20)**

## ENCLOSED BAYS AND ESTUARIES

"Enclosed bays" means indentations along the coast which enclose an area of oceanic water within distinct headlands or harbor works. "Estuaries" means waters, including coastal lagoons, located at the mouths of steams which serve as areas of mixing for fresh and ocean waters. Enclosed bays and estuaries do not include ocean waters or inland surface waters (see definition in the Inland Surface Waters section).

The objectives which are included below apply to all enclosed bays and estuaries within the region. In addition to these parameter-specific objectives, the following narrative objective shall apply:

*Enclosed bay and estuarine communities and populations, including vertebrate, invertebrate, and plant species, shall not be degraded as a result of the discharge of waste. Degradation is damage to an aquatic community or population with the result that a balanced community no longer exists. A balance community is one that is (1) diverse, (2) has the ability to sustain itself through cyclic seasonal changes, (3) includes necessary food chain species, and (4) is not dominated by pollution-tolerant*

*species, unless that domination is caused by physical habitat limitations. A balanced community also (5) may include historically introduced non-native species, but (6) does not include species present because best available technology has not been implemented, or (7) because site-specific objectives have been adopted, or (8) because of thermal discharges.*

**Algae**

Excessive growth of algae and/or other aquatic plants can degrade water quality. Algal blooms sometimes occur naturally, but they are often the result of excess nutrients (*i.e.,* nitrogen, phosphorus) from waste discharges or nonpoint sources. These blooms can lead to problems with tastes, odors, color, and increased turbidity and can depress the dissolved oxygen content of the water, leading to fish kills. Floating algal scum and algal mats are also an aesthetically unpleasant nuisance.

*Waste discharges shall not contribute to excessive algal growth in receiving waters.*

**Bacteria, Coliform**

Fecal bacteria are part of the intestinal flora of warm-blooded animals. Their presence in bay and estuarine waters is an indicator of pollution. Total coliform is measured in terms of the number of coliform organisms per unit volume. Total coliform numbers can include non-fecal bacteria, so additional testing is often done to confirm the presence and numbers of fecal coliform bacterial. Water quality objectives for numbers of total and fecal coliform vary with the uses of the water, as shown below.

*Bays and Estuaries*

**REC-1** *Fecal coliform: log mean less than 200 organisms/100 mL based on five or more samples/30 day period, and not more than 10% of the samples exceed 400 organisms/100 mL for any 30-day period.*

**SHEL** *Fecal coliform: median concentration not more than 14 MPN (most probable number )/100 ml and not more than 10% of samples exceed 43 mpn / 100 mL*

**Chlorine, Residual**

Wastewater disinfection with chlorine usually produces a chlorine residual. Chlorine and its reaction products are toxic to aquatic life.

*To protect aquatic life, the chlorine residual in wastewater discharged to enclosed bays and estuaries shall not exceed 0.1 mg/L.*

**Color**

Color in water may arise naturally, such as from minerals, plant matter or algae, or may be caused by industrial pollutants. Color is primarily an aesthetic consideration.

*Waste discharges shall not result in coloration of the receiving waters which causes a nuisance or adversely affects beneficial uses. The natural color of fish, shellfish or other bay and estuarine water resources used for human consumption shall not be impaired.*

**Floatables**
Floatables are an aesthetic nuisance as well as a substrate for algae and insect vectors.

*Waste discharges shall not contain floating materials, including solids, liquids, foam or scum, which cause a nuisance or adversely affect beneficial uses.*

**Oil and Grease**
Oil and grease can be present in water as a result of the discharge of treated wastes and the accidental or intentional dumping of wastes into sinks and storm drains. Oils and related materials have a high surface tension and are not soluble in water, therefore forming a film on the water's surface. This film can result in nuisance conditions because of odors and visual impacts. Oil and grease can coat birds and aquatic organisms, adversely affecting respiration and/or thermoregulation.

*Waste discharges shall not result in deposition of oil, grease, wax or other materials in concentrations which result in a visible film or in coating objects in the water, or which cause a nuisance or adversely affect beneficial uses.*

**Oxygen, Dissolved**
Adequate dissolved oxygen (D.O.) is vital for aquatic life. Depression of D.O. levels can lead to fish kills and odors resulting from anaerobic decomposition. Dissolved oxygen content in water is a function of water temperature and salinity.

*The dissolved oxygen content of enclosed bays and estuaries shall not be depressed to levels that adversely affect beneficial uses as a result of controllable water quality factors.*

**pH**
pH is a measure of the hydrogen ion concentration of water. pH values generally range from 0 (most acidic) to 14 (most alkaline). Many pollutants can alter the pH, raising or lowering it excessively. These extremes in pH can have adverse effects on aquatic biota and can corrode pipes and concrete. Even small changes in pH can harm aquatic biota.

*The pH of bay or estuary waters shall not be raised above 8.6 or depressed below 7.0 as a result of controllable water quality factors; ambient pH levels shall not be changed more than 0.2 units.*

**Radioactivity**
*Radioactive materials shall not be present in the bay or estuarine waters of the region in concentrations which are deleterious to human, plant or animal life.*

**Solids, Suspended and Settleable**
Settleable solids are deleterious to benthic organisms and may cause anaerobic conditions to form. Suspended solids can clog fish gills and interfere with respiration in aquatic fauna. They also screen out light, hindering photosynthesis and normal aquatic plant growth and development.

*Enclosed bays and estuaries shall not contain suspended or settleable solids in amounts which cause a nuisance or adversely affect beneficial uses as a result of controllable water quality factors.*

**Sulfides**
Sulfides are generated by many industries and from the anaerobic decomposition of organic matter. In water, sulfides can react to form hydrogen sulfide ($H_2S$), commonly known for its "rotten egg" odor. Sulfides in ionic form are also toxic to fish.

*The dissolved sulfide content of enclosed bays and estuaries shall not be increased as a result of controllable water quality factors.*

**Surfactants (surface-active agents)**
This group of materials includes detergents, wetting agents, and emulsifiers.

*Waste discharges shall not contain concentrations of surfactants which result in foam in the course of flow or the use of the receiving water, or which adversely affect aquatic life.*

**Taste and Odor**
Undesirable tastes and odors in water may be a nuisance and may indicate the presence of a pollutant(s).

*The enclosed bays and estuaries of the region shall not contain, as a result of controllable water quality factors, taste- or odor-producing substances at concentrations which cause a nuisance or adversely affect beneficial uses. The natural taste and odor of fish, shellfish or other enclosed bay and estuarine water resources used for human consumption shall not be impaired.*

**Temperature**
Waste discharges can cause temperature changes in the receiving waters which adversely affect the aquatic biota. Discharges most likely to cause these temperature effects are cooling tower and heat exchanger blowdown.

*All bay and estuary waters shall meet the objective specified in the Thermal Plan.*

**Toxic Substances**
*Toxic substances shall not be discharged at levels that will bioaccumulate in aquatic resources to level which are harmful to human health.*

*The concentrations of toxic substances in the water column, sediments or biota shall not adversely affect beneficial uses.*

**Turbidity**
Turbidity is a measure of light scattered due to particulates in water.

*Increases in turbidity which result from controllable water quality factors shall comply with the following:*

| *Natural Turbidity* | *Maximum Increase* |
|---|---|
| *0-50 NTU* | *20%* |
| *50-100 NTU* | *10 NTU* |
| *Greater than 100 NTU* | *10%* |

*All enclosed bay and estuaries of the region shall be free of changes in turbidity which adversely affect beneficial uses.*

## INLAND SURFACE WATERS

Inland surface waters include streams, rivers, lakes, and wetlands in the Region. Ocean waters and enclosed bays and estuaries are not considered inland surface waters.

The narrative objectives which are included below apply to all inland surface waters within the region, including lakes, streams, and wetlands. In addition, specific numerical objectives are listed in Table 4-1. Where more than one objective is applicable, the stricter shall apply. In addition to these objectives, the following shall apply:

*Inland surface water communities and populations, including vertebrate, invertebrate, and plant species, shall not be degraded as a result of the discharge of waste. Degradation is damage to an aquatic community or population with the result that balanced community no longer exists. A balanced community is one that is (1) diverse, (2) has the ability to sustain itself through cyclic seasonal changes, (3) includes necessary food chain species, and (4) is not dominated by pollution-tolerant species, unless that domination is caused by physical habitat limitations. A balanced community also (5) may include historically introduced non-native species, but (6) does not include species present because best available technology has not been implemented, or (7) because site-specific objectives have been adopted, or (8) because of thermal discharges.*

**Algae**

Excessive growth of algae and/or other aquatic plants can degrade water quality. Algal blooms sometimes occur naturally, but they are often the result of excess nutrients (*i.e.,* nitrogen, phosphorous) from waste discharges or nonpoint sources. These blooms can lead to problems with tastes, odors, color, and increased turbidity and can depress the dissolved oxygen content of the water, leading to fish kills. Floating algal scum and algal mats are also an aesthetically unpleasant nuisance.

*Waste discharges shall not contribute to excessive algal growth in inland surface receiving waters.*

**Ammonia, Un-ionized**

Un-ionized ammonia ($NH_3$, or UIA) is toxic to fish and other aquatic organisms. In water, UIA exists in equilibrium with ammonium ($NH_4+$) and hydroxide (OH) ions. The proportions of each change as the temperature, pH, and salinity of the water change.

The 1983 Basin Plan specified an UIA objective of 0.8 mg/L for waterbodies designated **WARM**. The SWRCB directed the Regional Board to review the 0.8 mg/L objective because of concerns that it is not stringent enough to protect aquatic wildlife. The USEPA concurred that this review was necessary.

The Regional Board contracted with California State University, Fullerton to conduct a study of un-ionized ammonia in the Santa Ana River and to develop recommendations regarding the UIA objective. This study, which was conducted in 1985-87, was complemented by additional Regional Board staff analysis. The additional staff analysis focused on adjusting EPA's national criteria for **WARM** waters (published in 1984 and amended in 1992), using the recalculation procedure. With this procedure, cold and warmwater species not found in the Santa Ana Region's **WARM** designated waters were deleted from the database used to derive the national criteria, and new criteria were calculated.

Based on these analyses, this Plan specifies UIA objectives for **WARM** and **COLD** designated waterbodies in the Region. **Note:** site-specific objectives have been developed for the Santa Ana River and certain tributaries (see next page).

**Acute (1-hour) UIA-N Objectives**

For waterbodies designed **COLD**:

Objective = 0.822 [0.52/FT/FPH/2], where

$FT = 10^{(0.03(20-T))}$ $0 \le T \le 20°C$

$FT = 1$ $20 \le T \le 30°C$

$FPH = \frac{1+10^{(7.4-pH)}}{1.25}$ $6.5 \le pH \le 8$

$FPH = 1$ $8 \le pH \le 9$

For waterbodies designated **WARM**:
Objective = 0.822[0.87/FT/FPH/2], where

$FT = 10^{(0.03(20-T))}$ $0 \le T \le 25°C$
$FT = 0.7079$ $25 \le T \le 30°C$

$FPH = \frac{1+10^{(7.4-pH)}}{1.25}$ $6.5 \le pH \le 8$
$FPH = 1$ $8 \le pH \le 9$

**Chronic (4-day) UIA-N Objectives**
For waterbodies designated **COLD**:
Objective = 0.822[0.52/FT/FPH/RATIO], where

$FT = 10^{(0.03(20-T))}$ $0 \le T \le 15°C$
$FT = 1.4125$ $15 \le T \le 30°C$

$FPH = \frac{1+10^{(7.4-pH)}}{1.25}$ $6.5 \le pH \le 8$
$FPH = 1$ $8 \le pH \le 9$

$RATIO = \frac{24[10^{(7.7-pH)}]}{1+10^{(7.4-pH)}}$ $6.5 \le pH \le 7.7$
$RATIO = 13.5$ $7.7 \le pH \le 9$

For waterbodies designed **WARM**:
Objective = 0.822[0.87/FT/FPH/RATIO], where

$FT = 10^{(0.03(20-T))}$ $0 \le T \le 20°C$
$FT = 1$ $20 \le T \le 30°C$

$FPH = \frac{1+10^{(7.4-pH)}}{1.25}$ $6.5 \le pH \le 8$
$FPH = 1$ $8 \le pH \le 9$

$RATIO = \frac{24[10^{(7.7-pH)}]}{1+10^{(7.4-pH)}}$ $6.5 \le pH \le 7.7$
$RATIO = 13.5$ $7.7 \le pH \le 9$

*Calculated numerical UIA-N objectives as well as corresponding total ammonia nitrogen concentration for various pH and temperature conditions are shown in Tables*

*4-2 and 4-3. Table 4-4 lists the above equations in a form that can be entered into a computer or calculator program.*

**Site-specific Un-ionized Ammonia Objective for the Santa Ana River System**
In addition to the un-ionized ammonia (UIA) objectives specified above, this Plan includes a chronic (4-day) site-specific UIA objective for the middle Santa Ana River, Chino Creek, Mill Creek (Prado Area), Temescal Creek, and San Timoteo Creek. This site-specific objective is based on carefully controlled chronic toxicity tests on Santa Ana River water conducted as part of the Santa Ana River Use-Attainability Analysis Study. The Santa Ana River water was spiked with UIA concentrations ranging from 0.0 (control) to 1.0 mg/L. The No Observed Effect Level (NOEL) was found to be at a UIA concentration of 0.24 mg/L (or 0.19 mg/L as UIA-nitrogen). Using a 50% safety factor, the UIA objective developed is 0.12 mg/L (or 0.098 mg/L UIA-nitrogen).

*To prevent chronic toxicity to aquatic life in the Santa Ana River, Reaches 2, 3, and 4, Chino Creek, Mill Creek (Prado Area), Temescal Creek and San Timoteo Creek, discharges to these waterbodies shall not cause the concentration of un-ionized ammonia (as nitrogen) to exceed 0.098 mg/L ) ($NH_3$-N) as a 4-day average.*

**Bacteria, Coliform**
Fecal bacteria are part of the intestinal flora of warm-blooded animals. Their presence in surface waters is an indicator of pollution. Total coliform is measured in terms of the number of coliform organisms per unit volume. Total coliform numbers can include non-fecal bacteria, so additional testing is often done to confirm the presence and numbers of fecal coliform bacteria. Water quality objectives for numbers of total and fecal coliform vary with the uses of the water, as shown below.

*Lakes and Streams*

**MUN** *Total coliform: less than 100 organisms/100 mL*

**REC-1** *Fecal coliform: log mean less than 200 organisms/100 mL based on five or more samples/30 day period, and not more than 10% of the samples exceed 400 organisms/100 mL for any 30-day period*

**REC-2** *Fecal coliform: average less than 2000 organisms/100 mL and not more than 10% of samples exceed 4000 organisms/100 mL for any 30-day period*

**Boron**
Boron is not considered a problem in drinking water supplies until concentrations of 20-30 mg/L are reached. In irrigation, boron is an essential element. However, boron concentrations in excess of 0.75 mg/L may be deleterious to certain crops, particularly citrus. The maximum safe concentration of even the most tolerant plants is about 4.0mg/L of boron.

*Boron concentrations shall not exceed 0.75 mg/L in inland surface waters of the region as a result of controllable water quality factors.*

**Chemical Oxygen Demand (COD)**
COD is a measure of the total amount of oxidizable material present in a sample, including stable organic materials which are not measured by the BOD test.

*Waste discharges shall not result in increases in COD levels in inland surface waters which exceed the values shown in Table 4-1 or which adversely affect beneficial uses.*

**Chloride**
Excess chloride concentrations lead primarily to economic damage rather than public health hazards. Chlorides are considered to be among the most troublesome anions in water used for industrial or irrigation purposes since they significantly affect the corrosion rate of steel and aluminum and can be toxic to plants. A safe value for irrigation is considered to be less than 175 mg/L of chloride. Excess chlorides affect the taste of potable water, so drinking water standards are generally based on potability rather than on health. The secondary drinking water standard for chloride is 500 mg/L.

*The chloride objectives listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors.*

**Chlorine, Residual**
Wastewater disinfection with chlorine usually produces a chlorine residual. Chlorine and its reaction products are toxic to aquatic life.

*To protect aquatic life, the chlorine residual in wastewater discharged to inland surface waters shall not exceed 0.1 mg/L.*

**Color**
Color in water may arise naturally, such as from minerals, plant matter, or algae, or may be caused by industrial pollutants. Color is primarily an aesthetic consideration, although it can discolor clothes and food. The secondary drinking water standard for color is 15 color units.

*Waste discharges shall not result in coloration of the receiving waters which causes a nuisance or adversely affect beneficial uses. The natural color of fish, shellfish or other inland surface water resources used for human consumption shall not be impaired.*

**Dissolved Solids, Total (Total Filtrable Residue)**
The department of Health Services recommends that the concentration of total dissolved solids (TDS) in drinking water be limited to 1000 mg/L (secondary drinking water standard) due to taste considerations. For most irrigation uses, water should have a TDS concentration under 700mg/L. Quality-related consumer cost analyses

have indicated that a benefit to consumers exist if water is supplied at or below 500mg/L TDS.

*The dissolved mineral content of the waters of the region, as measured by the total dissolved solids test ("Standard Methods for the Examination of Water and Wastewater, 16th Ed.," 1985: 209B (180˚C), p. 95), shall not exceed the specific objectives listed in Table 4-1 as a result of controllable water quality factors.*

**Filtrable Residue, Total**
See Dissolved Solids, Total

**Floatables**
Floatables are an aesthetic nuisance as well as a substrate for algae and insect vectors.

*Waste discharges shall not contain floating materials, including solids, liquids, foam or scum, which cause a nuisance or adversely affect beneficial uses.*

**Fluoride**
Fluoride in water supply used for industrial or irrigation purposes has certain detrimental effects. Fluoride in optimum concentrations in water supply (concentrations dependent upon the mean annual air temperature) is considered beneficial for preventing dental caries, but concentrations above approximately 1 mg/L, or its equivalent at a given temperature, are considered likely to increase the risk of occurrence of dental fluorosis.

*Fluoride concentrations shall not exceed values specified in the table below in inland surface waters designated* **MUN** *as a result of controllable water quality factors.*

| Annual Average of Maximum Daily Air Temperature (˚C) | Optimum Fluoride Concentration (mg/L) |
|---|---|
| 12.0 and below | 1.2 |
| 12.1 to 14.6 | 1.1 |
| 14.7 to 17.6 | 1.0 |
| 17.7 to 21.4 | 0.9 |
| 21.5 to 26.2 | 0.8 |
| 26.3 to 32.5 | 0.7 |

**Hardness (as $CaCO_3$)**
The major detrimental effect of hardness is economic. Any concentration (reported as mg/L $CaCO_3$) greater than 100mg/L results in the increased use of soap, scale buildup in utensils, in domestic uses, and in plumbing. Hardness in industrial cooling waters is generally objectionable above 50mg/L.

*The objectives listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors. If no hardness objective is listed in Table 4-1, the hardness of*

*receiving waters used for municipal supply (**MUN**) shall not be increased as a result of waste discharges to levels that adversely affect beneficial uses.*

**Inorganic Nitrogen, Total**
see Nitrogen, Total Inorganic

**Metals**
Metals can be toxic to human and animal life.

In 1990, the Environmental Protection Agency (EPA) placed the Santa Ana River, reaches 2, 3, and 4, and Chino Creek on the §304(1) list of "Waters Not Meeting Applicable Water Quality Standards" based on its review of data on certain metals in POTW discharges to the River.

The Santa Ana River dischargers and the Regional Board disagreed with and objected to EPA's §304(1) designation. To demonstrate whether or not the §304(1) designation is correct and what effects, if any, heavy metal levels may have on aquatic life in the Region, the Santa Ana River Dischargers Association and the Santa Ana Watershed Project Authority agreed to conduct a Use-Attainability Analysis (UAA).

The purpose of a Use-Attainability Analysis is to evaluate the "physical, biological, chemical, and hydrological conditions of a river to determine what specific beneficial uses the waterbody can support." If local conditions preclude full attainment of an aquatic life beneficial use for reasons unrelated to water quality, federal and state authorities may allow variances from the generic water quality criteria.

The UAA began in February 1991 and concluded in March 1992. It provided detailed information on chemical, biological, and hydrologic conditions in the middle Santa Ana River aquatic system. Conclusions and recommendations were presented to the Board in June 1992. The information presented is reflected in the Santa Ana River discussion in Chapter 1 and in the new **LWRM** Beneficial Use designation (Chapter 3). Data provided by the UAA was also used to support the adoption of site-specific objectives for three metals, cadmium (Cd), copper (Cu), and lead (Pb) for the Santa Ana River (Reaches 2, 3, and 4) and the perennial portions of some tributaries (including Chino Creek, Cucamonga/Mill Creek, Temescal Creek, and creeks in the Riverside Narrows area).

In adopting these SSOs the Regional Board found (RWQCB Resolution No. 94-1) that:

a. The Site-Specific Water Quality Objectives (SSOs) will protect the beneficial uses of the Santa Ana River.

b. The SSOs are conservative.

c. The SSOs, which represent higher quality than presently exists, will not result in degradation of water quality.

d. Existing levels of cadmium, copper, and lead in the Santa Ana River do not contribute to toxicity in the Santa Ana River.

The toxicity of these metals varies with water hardness. No fixed hardness value is assumed; objectives are calculated using the hardness of the collected sample.

The following equations represent the SSOs which apply to these waterbodies. These SSOs are expressed as the dissolved form of the metals.

SSO *for cadmium*:

$$\text{Cd SSO} = 0.85[e^{(0.7852*\ln(TH)-3.490)}]$$

SSO for Copper

$$\text{Cu SSO} = 0.85[e^{(0.8545*\ln(TH)-1.465)}]$$

SSO for lead

$$\text{Pb SSO} = 0.25\ [e^{(1.237*\ln(TH)-3.958)}]$$

*where TH is the total hardness (as $CaCO_3$) in mg/L.*

The SSOs for cadmium and copper are simply the hardness-dependent formulas for calculating the objective (national criteria), corrected by the dissolved-to-total (metal) ratio. The SSO for lead is the recalculated* hardness-dependant formula, corrected by the dissolved-to-total ratio.

*****Recalculation for lead was carried out by EPA-Region IX, using the lowest genus mean acute value (GMAV) as the final acute value (FAV) and an acute-to chronic ratio (ACR) of 51.29, resulting in a final chronic value (FCV) of 2.78 and the SSO formula already shown.

The Table below shows the site-specific objectives for cadmium, copper, and lead that would apply to a water sample with 200 mg/L total hardness (as $CaCO_3$).

| Metal | Calculated WQO | Recalculated Value | EPA Correction Factor | SSO |
|---|---|---|---|---|
| Cd | 2.0 | NA | 0.85 | 1.7 |
| Cu | 21.4 | NA | 0.85 | 18.2 |
| Pb | 7.7 | 16.2 | 0.25 | 4.1 |

Toxicity testing performed as part of the Santa Ana River Use-Attainability Analysis (UAA) has demonstrated that the levels of dissolved metal shown below are safe and non-toxic in Santa Ana River water.

| | |
|---|---|
| Cadmium | 4 µg/L |
| Copper | 37 µg/L |
| Lead | 28 µg/L |

There is also evidence that levels as much as 100% higher than those shown above do not result in chronic toxicity.

**Methylene Blue-Activated Substances (MBAS)**
The MBAS test is sensitive to the presence of detergents (see surfactants). Positive results may indicate the presence of wastewater. The secondary drinking water standard for MBAS is 0.05 mg/L.

*MBAS concentrations shall not exceed 0.05mg/L I inland surface waters designated **MUN** as a result of controllable water quality factors.*

**Nitrate**
High nitrate concentrations in domestic water supplies can be toxic to human life. Infants are particularly susceptible and may develop methemoglobinemia (blue baby syndrome). The primary drinking water standard for nitrate (as $NO_3$) is 45 mg/L or 10 mg/L (as N) in inland surface waters designated MUN as a result of controllable water quality factors.

*Nitrate-nitrogen concentrations shall not exceed 45 mg/L (as $NO_3$) or 10 mg/L (as N) in inland surface waters designated **MUN** as a result of controllable water quality factors.*

**Nitrogen, Total Inorganic**
*The objectives listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors.*

**Oil and Grease**

Oil and grease can be present in water as a result of the discharge of treated wastes and the accidental or intentional dumping of wastes into sinks and storm drains. Oils and related materials have a high surface tension and are not soluble in water, therefore forming a film on the water's surface. This film can result in nuisance conditions because of odors and visual impacts. Oil and grease can coat birds and aquatic organisms, adversely affecting respiration and/or thermoregulation.

*Waste discharges shall not result in deposition of oil, grease, wax, or other material in concentrations which result in a visible film or in coating objects in the water, or which cause a nuisance or adversely affect beneficial uses.*

**Oxygen, Dissolved**

Adequate dissolved oxygen (D.O.) is vital for aquatic life. Depression of D.O. levels can lead to fish kills and odors resulting from anaerobic decomposition. Dissolved oxygen content in water is a function of water temperature and salinity.

*The dissolved oxygen content of surface waters shall not be depressed below 5mg/L for waters designated **WARM**, or 6mg/L for waters designated **COLD**, as a result of controllable water quality factors. In addition, waste discharges shall not cause the median dissolved oxygen concentration to fall below 85% of saturation or the 95$^{th}$ percentile concentration or fall below 75% of saturation within a 30-day period.*

**pH**

pH is a measure of the hydrogen ion concentration of water. pH values generally range from 0 (most acidic) to 14 (most alkaline). Many pollutants can alter the pH, raising or lowering it excessively. These extremes in pH can have adverse effects on aquatic biota and can corrode pipes and concrete. Even small changes in pH can harm aquatic biota.

*The pH of inland surface waters shall not be raised above 8.5 or depressed below 6.5 as a result of controllable water quality factors.*

**Radioactivity**

*Radioactivity materials shall not be present in the waters of the region in concentrations which are deleterious to human, plant or animal life. Waters designated **MUN** shall meet the limits specified in the California Code of Regulations, Title 22, and listed here:*

| | | |
|---|---|---|
| *Combined Radium-226 and Radium-228* | *5* | *pCi/L* |
| *Gross Alpha particle activity* | *15* | *pCi/L* |
| *Tritium* | *20,000* | *pCi/L* |
| *Strontium-90* | *8* | *pCi/L* |
| *Gross Beta particle activity* | *50* | *pCi/L* |
| *Uranium* | *20* | *pCi/L* |

**Sodium**
The presence of sodium in drinking water may be harmful to persons suffering from cardiac, renal, and circulatory diseases. It can contribute to taste effects, with the taste threshold depending on the specific sodium salt. Excess concentrations of sodium in irrigation water reduce soil permeability to water and air. The deterioration of soil quality because of the presence of sodium in irrigation water is cumulative and is accelerated by poor drainage.

*The sodium objectives listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors.*

**Solids, Suspended and Settleable**
Settleable solids are deleterious to benthic organisms and may cause anaerobic conditions to form. Suspended solids can clog fish gill and interfere with respiration in aquatic fauna. They also screen out light, hindering photosynthesis and normal aquatic plant growth and development.

*Inland surface waters shall not contain suspended or settleable solids in amounts which cause a nuisance or adversely affect beneficial uses as a result of controllable water quality factors.*

**Sulfate**

Excessive sulfate, particularly magnesium sulfate ($MgSO_4$) in potable waters can lead to laxative effects, but this effect is temporary. There is some taste effect from magnesium sulfate in the range of 400-600 mg/L as $MgSO_4$. The secondary drinking water standard for sulfate is 500 mg/L. Sulfate concentrations in waters native to this region are normally low, less than 40 mg/L, but imported Colorado River water contains approximately 300 mg/L of sulfate.

*The objectives listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors.*

**Sulfides**
Sulfides are generated by many industries and from the anaerobic decomposition of organic matter. In water, sulfides can react to form hydrogen sulfide ($H_2S$), commonly known for its “rotten egg” odor. Sulfides in ionic form are also toxic to fish.

*The dissolved sulfide content of inland surface waters shall not be increased as a result of controllable water quality factors.*

**Surfactants (surface-active agents)**
This group of materials includes detergents, wetting agents, and emulsifiers. See also Methylene Blue-Activated Substances (MBAS).

*Waste discharges shall not contain concentrations of surfactants which result in foam in the course of flow or use of the receiving water, or which adversely affect aquatic life.*

**Taste and Odor**
Undesirable tastes and odors in water may be a nuisance and may indicate the presence of a pollutant(s). The secondary drinking water standard for odor (threshold) is about 3 odor units.

*The inland surface waters of the region shall not contain, as a result of controllable water quality factors, taste- or odor-producing substances at concentrations which cause a nuisance or adversely affect beneficial uses. The natural taste and odor of fish, shellfish or other regional inland surface water resources used for human consumption shall not be impaired.*

**Temperature**
Waste discharges can cause temperature changes in the receiving waters which adversely affect the aquatic biota. Discharges most likely to cause these temperature effects are cooling tower and heat exchanger blowdown.

*The natural receiving water temperature of inland surface waters shall not be altered unless it can be demonstrated to the satisfaction of the Regional Board that such alteration in temperature does not adversely affect beneficial uses. The temperature of waters designated **COLD** shall not be increased by more than 5˚F as a result of controllable water quality factors. The temperature of waters designated **WARM** shall not be raised above 90˚F June through October or above 78˚F during the rest of the year as a result of controllable water quality factors. Lake temperatures shall not be raised more than 4˚F above established normal values as a result of controllable water quality factors.*

**Total Dissolved Solids**
See Dissolved Solids, Total

**Total Filtrable Residue**
See Dissolved Solids, Total

**Total Inorganic Nitrogen**
See Nitrogen, Total Inorganic

**Toxic Substances**
*Toxic substances shall not be discharged at levels that will bioaccumulate in aquatic resources to levels which are harmful to human health.*

*The concentrations of contaminants in waters which are existing or potential sources of drinking water shall not occur at levels that are harmful to human health.*

*The concentrations of toxic pollutants in the water column, sediments or biota shall not adversely affect beneficial uses.*

**Turbidity**
Turbidity is a measure of light scattered due to particulates in water. The secondary drinking water standard for turbidity is 5 NTU (nephelometric turbidity units).

*Increases in turbidity which result from controllable water quality factors shall comply with the following:*

| *Natural Turbidity* | *Maximum Increase* |
|---|---|
| 0-50 NTU | 20% |
| 50-100 NTU | 10 NTU |
| *Greater than* 100 NTU | 10% |

*All inland surface waters of the region shall be free of changes in turbidity which adversely affect beneficial uses.*

## GROUNDWATERS

The narrative objectives that are included below apply to all groundwaters, as noted. In addition, specific numerical objectives are listed in Table 4-1. With the exception of the "maximum benefit" objective identified in this Table (see further discussion below and in Chapter 5), where more than one objective is applicable, the stricter shall apply.

**Arsenic**
*Arsenic concentrations shall not exceed 0.05 mg/L in groundwater designated **MUN** as a result of controllable water quality factors.*

**Bacteria, Coliform**
Fecal bacteria are part of the intestinal flora of warm-blooded animals. Their presence in groundwater is an indicator of pollution. Total coliform is measured in terms of the number of coliform organisms per unit volume. Total coliform numbers can include non-fecal bacteria, so additional testing is often done to confirm the presence and numbers of fecal coliform bacteria. Water quality objectives for numbers of total fecal coliform vary with the uses of the water, as shown below.

*Total coliform numbers shall not exceed 2.2 organism/100 mL median over any seven-day period in groundwaters designated **MUN** as a result of controllable water quality factors.*

**Barium**
*Barium concentrations shall not exceed 1.0mg/L in groundwaters designated **MUN** as a result of controllable water quality factors.*

**Boron**
Boron is not considered a problem in drinking water supplies until concentrations of 20-30 mg/L are reached. In irrigation, boron is an essential element. However, boron concentrations in excess of 0.75 mg/L may be deleterious to certain crops, particularly citrus. The maximum safe concentration of even the most tolerant plants is about 4.0 mg/L of boron.

*Boron concentrations shall not exceed 0.75 mg/L in groundwaters of the region as a result of controllable water quality factors.*

**Chloride**
Excess chloride concentrations lead primarily to economic damage rather than public health hazards. Chlorides are considered to be among the most troublesome anion in water used for industrial or irrigation purposes since they significantly affect the corrosion rate of steel and aluminum and can be toxic to plants. A safe value for irrigation is considered to be less than 175 mg/L of chloride. Excess chlorides affect the taste of potable water, so drinking water standards are generally based on potability rather than on health. The secondary maximum contaminant level range - upper for chloride is 500 mg/L (CCR, Division 4, Chapter 15, Article 16, § 64449).

*Chloride concentrations shall not exceed 500 mg/L in groundwaters of the region designated MUN as a result of controllable water quality factors.*

**Color**
Color in water may arise naturally, such as from minerals, plant matter or algae, or may be caused by industrial pollutants. Color is primarily an aesthetic consideration, although it can discolor clothes and food. The secondary drinking water standard for color is 15 color units.

*Waste discharges shall not result in coloration of the receiving waters which causes a nuisance or adversely affects beneficial uses.*

**Cyanide**
*Cyanide concentrations shall not exceed 0.2mg/L in groundwaters designated **MUN** as a result of controllable water quality factors.*

**Dissolved Solids, Total (Total Filtrable Residue)**
The Department of Health Services recommends that the concentration of total dissolved solids (TDS) in drinking water be limited to 500 mg/L (secondary maximum contaminant level) (CCR, Division 4, Chapter 15, Article 16, § 64449), due to taste considerations. For most irrigation uses, water should have a TDS concentration under 700 mg/L. Quality-related consumer cost analyses have indicated that a benefit to consumers exists if water is supplied at or below 500 mg/L TDS[2].

*The dissolved mineral content of the waters of the region, as measured by the total dissolved solids test ("Standard Methods for the Examination of Water and Wastewater, 20th Ed.," 1998: 2540C (180˚C), p.2-56), shall not exceed the specific objectives listed in Table 4-1 as a result of controllable water quality factors. (See also discussion of management zone TDS and nitrate nitrogen water quality objectives).*

**Filtrable Residue, Total**
See Dissolved Solids, Total

**Fluoride**
Fluoride in water supply used for industrial or irrigation purposes has certain detrimental effects. Fluoride in optimum concentrations in water supply (concentration dependent upon the mean annual air temperature) is considered beneficial for preventing dental caries, but concentrations above approximately 1 mg/L, or its equivalent at a given temperature, are considered likely to increase the risk of occurrence of dental fluorosis.

*Fluoride concentrations shall not exceed 1.0 mg/L in groundwaters designated **MUN** as a result of controllable water quality factors.*

**Hardness (as $CaCO_3$)**
The major detrimental effect of hardness is economic. Any concentration (reported as mg/L $CaCO_3$) greater than 100mg/L results in the increased use of soap, scale buildup in utensils in domestic uses, and in plumbing. Hardness in industrial cooling waters is generally objectionable above 50 mg/L.

*The hardness of receiving waters used for municipal supply (**MUN**) shall not be increased as a result of waste discharges to levels that adversely affect beneficial uses.*

**Metals**
Metals can be toxic to human and animal life.

*Metals concentrations shall not exceed the values listed below in groundwaters designated **MUN** as a result of controllable water quality factors.*

[2] These TDS values are noted for information purposes only. For some management zones, the historic ambient quality, on which the TDS objectives are largely based (see also discussion of maximum benefit objectives for specific management zones), exceeds these recommended levels.

| *Metal* | *Concentration (mg/L)* |
|---|---|
| *Cadmium* | 0.01 |
| *Chromium* | 0.05 |
| *Cobalt* | 0.2 |
| *Copper* | 1.0 |
| *Iron* | 0.3 |
| *Lead* | 0.05 |
| *Manganese* | 0.05 |
| *Mercury* | 0.002 |
| *Selenium* | 0.01 |
| *Silver* | 0.05 |

**Methylene Blue-Activated Substances (MBAS)**
The MBAS test is sensitive to the presence of detergents (see surfactants in inland surface waters discussion). Positive results may indicate the presence of wastewater. The secondary drinking water standard for MBAS is 0.05 mg/L.

*MBAS concentrations shall not exceed 0.05 mg/L in groundwaters designated **MUN** as a result of controllable water quality factors.*

**Nitrate**
High nitrate concentrations in domestic water supplies can be toxic to human life. Infants are particularly susceptible and may develop methemoglobinemia (blue baby syndrome). The primary drinking water standard for nitrate (as $NO_3$) is 45 mg/L or 10 mg/L (as N).

*Nitrate-nitrogen concentrations listed in Table 4-1 shall not be exceeded as a result of controllable water quality factors. (See also discussion of management zone TDS and nitrate nitrogen water quality objectives below).*

**Oil and Grease**
Oil and grease can be present in water as a result of the discharge of treated wastes and the accidental or intentional dumping of wastes into sinks and storm drains. Oils and related materials have a high surface tension and are not soluble in water, therefore forming a film on the water's surface. This film can result in nuisance conditions because of odors and visual impacts.

*Waste discharges shall not result in deposition of oil, grease, wax or other materials in concentrations which cause a nuisance or adversely affect beneficial uses.*

**pH**
pH is a measure of the hydrogen ion concentration of water. pH values generally range from 0 (most acidic) to 14 (most alkaline). Many pollutants can alter the pH,

raising or lowering it excessively. These extremes in pH can corrode pipes and concrete.

*The pH of groundwater shall not be raised above 9 or depressed below 6 as a result of controllable water quality factors.*

**Radioactivity**

*Radioactive materials shall not be present in the waters of the region in concentrations which are deleterious to human, plant or animal life. Groundwaters designated **MUN** shall meet the limits specified in the California Code of Regulations, Title 22, and listed here:*

| | | |
|---|---|---|
| *Combined Radium-226 and Radium-228* | *5* | *pCi/L* |
| *Gross Alpha particle activity* | *15* | *pCi/L* |
| *Tritium* | *20,000* | *pCi/L* |
| *Strontium-90* | *8* | *pCi/L* |
| *Gross Beta particle activity* | *50* | *pCi/L* |
| *Uranium* | *20* | *pCi/L* |

**Sodium**

The presence of sodium in drinking water may be harmful to persons suffering from cardiac, renal and circulatory diseases. It can contribute to taste effects, with the taste threshold depending on the specific sodium salt (US Geological Survey, Resources Agency of California – State Water Resources Control Board). Excess concentrations of sodium in irrigation water reduce soil permeability to water and air. The deterioration of soil quality because of the presence of sodium in irrigation water is cumulative and is accelerated by poor drainage (California State Water Resources Control Board).

*The California Department of Health Services and the U.S. Environmental Protection Agency have not provided a limit on the concentration of sodium in drinking water. Sodium concentrations shall not exceed 180 mg/L in groundwaters designated MUN as a result of controllable water quality factors.*

*Groundwaters designated AGR shall not exceed a sodium absorption ration (SAR[3]) of 9 as a result of controllable water quality factors.*

**[3] Sodium absorption ratio (SAR)=** $\frac{Na}{\left[\frac{1}{2}(Ca + Mg)\right]^{1/2}}$

where Sodium (Na), Calcium (Ca) and Magnesium (Mg) are concentrations in milliequivalents per liter

**Sulfate**

Excessive sulfate, particularly magnesium sulfate ($MgSO_4$) in potable waters can lead to laxative effects, but this effect is temporary. There is some taste effect from magnesium sulfate in the range of 400-600mg/L as MgSO4. The secondary drinking water standard for sulfate is 500mg/L (CCR, Division 4, Chapter 15, Article 16, §64449). Sulfate concentrations in waters native to this region are normally low, less than 40mg/L, but imported Colorado River water contains approximately 300mg/L of sulfate.

*Sulfate concentrations shall not exceed 500 mg/L in groundwaters of the region designated MUN as a result of controllable water quality factors.*

**Taste and Odor**

Undesirable tastes and odors in water may be a nuisance and may indicate the presence of a pollutant(s). The secondary drinking water standard for odor (threshold) is 3 odor units.

*The groundwaters of the region shall not contain, as a result of controllable water quality factors, taste- or odor-producing substances at concentrations which cause a nuisance or adversely affect beneficial uses.*

**Total Dissolved Solids**

See Dissolved Solids, Total

**Total Filtrable Residue**

See Dissolved Solids, Total

**Total Inorganic Nitrogen**

See Nitrogen, Total Inorganic

**Toxic Substances**

*All waters of the region shall be maintained free of substances in concentrations which are toxic, or that produce detrimental physiological responses in human, plant, animal or aquatic life.*

**Management Zone TDS and Nitrate-nitrogen Water Quality Objectives (Amended by Resolution No. R8-2004-0001, January 22, 2004)**

The TDS and nitrate-nitrogen objectives specified in the 1975 and 1984 Basin Plans, and initially in this 1995 Basin Plan, were based on an evaluation of groundwater samples from the five year period 1968 through 1972. This period represented ambient quality at the time of preparation of the 1975 Basin Plan. As part of the 2004 update of the TDS/Nitrogen management plan in the Basin Plan, historical ambient quality was reviewed using additional data and rigorous statistical procedures. This update also included characterization of current water quality. A

comprehensive description of the methodology employed is published in the "Final Technical Memorandum for Phase 2A of the Nitrogen-TDS Study" (Wildermuth Environmental Inc., July 2000). This effort, coupled with "maximum benefit" demonstrations by certain agencies in the watershed (see further discussion below and in Chapter 5), culminated in the adoption of the TDS and nitrate-nitrogen objectives specified in Table 4-1.

For the most part, the TDS and nitrate-nitrogen water quality objectives for each management zone are based on historical concentrations of TDS and nitrate-nitrogen from 1954 through 1973 and are referred to herein as the "antidegradation" objectives. This period brackets 1968, when the State Board adopted the state's antidegradation policy in Resolution No. 68-16, "Policy with Respect to Maintaining High Quality Waters". This Resolution establishes a benchmark for assessing and considering authorization of degradation of water quality. The 20-year period was selected in order to ensure that at least 3 data points in each management zone would be available to calculate historical ambient quality. In general, the following steps were taken to calculate the TDS and nitrate objectives:

a. Annual average TDS and nitrate-nitrogen data from 1954 – 1973 for each well in a management zone were compiled;
b. For each well, the data were statistically analyzed. The mean plus "t" (Student's t) times the standard error of the mean was calculated;
c. A rectangular grid across all management zones was overlaid. Groundwater storage within each grid was computed; and,
d. The volume-weighted TDS and nitrate-nitrogen concentration for each management zone was computed. These concentrations are the calculated historical ambient quality for each zone. [4]

These volume-weighted TDS and nitrate-nitrogen concentrations for each management zone were typically identified as the appropriate objectives. However, it is important to note that if the calculated nitrate-nitrogen concentration exceeded 10 mg/L, the nitrate-nitrogen objective was set to 10 mg/L to be consistent with the primary drinking water standard, or to current ambient quality if less than 10 mg/L.

Finally, in some cases, certain agencies proposed alternative, less stringent TDS and nitrate-nitrogen objectives for specific management zones, based on additional consideration of antidegradation requirements and the factors specified in Water Code Section 13241 (see below and Chapter 5). Table 4-1 includes both the historical ambient quality TDS and nitrate-nitrogen objectives (the "antidegradation" objectives) and the objectives based on this additional consideration (the "maximum benefit"

[4] In limited cases, data for ammonia-nitrogen and nitrite-nitrogen as well as nitrate-nitrogen were available and included in the analysis. The ammonia-nitrogen and nitrite-nitrogen values were insignificant. The objectives are thus expressed as nitrate-nitrogen, even where ammonia-nitrogen and nitrite-nitrogen data were included in the analysis.

objectives) for specific management zones. Chapter 5 specifies detailed requirements noticed Public Hearing, the Regional Board finds that “maximum benefit” is not being demonstrated, then the “antidegradation” objectives apply for regulatory purposes.

## THE SANTA ANA RIVER

Setting objectives for the flowing portions of the Santa Ana River is a significant feature of this Basin Plan. The River provides water for recreation and for aquatic and wildlife habitat. River flows are a significant source of groundwater recharges in lower basin, which provides domestic supplies for more than two million people. These flows account for about 70% of the total recharge.

The dividing line between reaches 2 and 3 of the River, and between the upper and lower Santa Ana Basins, is Prado Dam, a flood control facility built and operated by the U.S. Army Corps of Engineers. The dam includes a subsurface groundwater barrier, and as a result all ground and surface waters form the upper basin are forced to pass through the dam (or over the spillway). For this reason, it is an ideal place to measure flows and monitor water quality.

The Prado Settlement, a stipulated court judgement (Orange County Water District vs. City of Chino, *et al*), which requires that a certain minimum amount of water be released each year from the upper basin, is overseen by the Santa Ana River Watermaster. The U.S. Geologic Survey (USGS) operates a permanent continuous monitoring station immediately below Prado Dam, and the data collected there are utilized by the Watermaster. Orange County Water District (OCWD) samples the river monthly at the USGS gage and determines the water quality. Compliance with the objective for reaches 2 and 3 is monitored by the Regional Board, using the data and information available from the USGS gage and these sources, plus the data from its own specific sampling programs. (see Chapter 6).

The quality of the Santa Ana River is a function of the quantity and quality of the various components of the flows. The two major components of total flow are storm flow and base flow. Storm flow is the water which results directly from rainfall (surface runoff) in the upper basin; it also includes the stormwater runoff form the San Jacinto Basin which may reach the River via Temescal Creek. Most storms occur during the winter rainy season (December through April). Base flow is composed of wastewater discharges, rising groundwater, and nonpoint source discharges. Wastewater discharges are the treated sewage effluents discharged by municipalities to the river and its tributaries. Rising groundwater occurs at a number of locations along the River, including the San Jacinto Fault, Riverside Narrows, and in or near the Prado flood Control Basin. Nonpoint source discharges include uncontrolled runoff from agricultural and urban areas which is not related to storm flows.

Nontributary flow is a third element of total flow. It is generally imported water released in the upper basin, for recharge in the lower basin (Santa Ana Forebay).

The Santa Ana River Watermaster calculates the amount and quality of total flow for each water year (October 1 to September 30). The Watermaster's Annual Report is used to determine compliance with the stipulated judgement referred to earlier, which set quality and quantity limits on the river. The Watermaster's report presents summary data compiled from the continuous monitoring of flow in cfs (cubic feet per second) and salinity as EC (electrical conductivity) at the USGS Prado Gaging Station. The Watermaster's annual determination of total flow quality will be used to determine compliance with the total flow objective in this Plan. In years of normal rainfall, most of the total flow of the river is percolated in the Santa Ana Forebay, and directly affects the quality of the groundwater. For that reason, compliance with the total dissolved solids (TDS) water quality objective for Reach 2 will be based on the five-year moving average of the annual TDS content of total flow. Use of this moving average allows the effects of wet and dry years to be smoothed out over the five-year period.

As was noted earlier, the three components of base flow in the river are wastewater, rising water, and nonpoint source discharges. These three components are present in varying amounts throughout the year, and the contributions and quality of each can be affected by the regulatory activities of the Regional Board. The quantity of storm flow is obviously highly variable; programs to control its quality are in their nascent stages. For these reasons, water quality objectives for controllable constituents are set based on the base flow of the river, rather than on total flow.

The regulatory activities of the Regional Board include setting waste discharge requirements on point source discharges. Waste discharges requirements are developed on the basis of the limited assimilative capacity of the river (see TDS and Nitrogen Wasteload Allocation, Chapter 5). Nonpoint source discharges, generally urban runoff (nuisance water) and agricultural tailwater, will be regulated by requiring compliance with Best Management Practices (BMPs), where appropriate. The rising water component of base flow will be affected by the extraction of brackish groundwater in several subbasins (a Basin Plan implementation action), by regulation of wastewater discharges, and other activities.

In order to determine whether the water quality and quantity objectives for base flow in Reach 3 are being met, the Regional Board will collect a series of grab and composite samples when the influence of storm flows and nontributary flows is at a minimum. This typically occurs during August and September. At this time of year, there is usually no water impounded behind Prado Dam. The volumes of storm flows, rising water and nonpoint source discharges tend to be low. The major component of base flow at this time is municipal wastewater. The results of this sampling will be compared with the continuous monitoring data collected by USGS and data from other sources. These data will be used to evaluate the efficacy of the Regional Board's regulatory approach, including the TDS and nitrogen wasteload allocations (see Chapter 5). Additional sampling in Reach 3 by the Board and other agencies will help evaluate the fate and effects of the various constituents

of base flow, including the validity of the 50% nitrogen loss coefficient (discussed in Chapter 5).

Future river flows and quality (TDS and TIN) were projected by computer models. The results indicate that the objectives for TDS and total nitrogen will be met. The objectives for individual mineral constituents are expected to be met if the TDS objective is met.

### Prado Basin Surface Water Management Zone

As discussed in Chapter 3 – Beneficial Uses, the Prado Basin Management Zone (PBMZ) is generally defined as a surface water feature within the Prado Basin. It is defined by the 566-foot elevation above mean sea level along the Santa Ana River and the four tributaries to the Santa Ana River in the Prado Basin (Chino Creek, Temescal Creek, Mill Creek and Cucamonga Creek). Nitrogen, TDS and other water quality objectives that have been established for these surface waters that flow within the proposed PBMZ are shown in Table 4-1. For the purpose of regulating discharges that would affect the PBMZ and downstream waters, these surface water objectives apply. This application of the existing surface water objectives assures continued water quality and beneficial use protection for waters within and downstream of the PBMZ.

## "MAXIMUM BENEFIT" WATER QUALITY OBJECTIVES

As part of the 2004 update of the TDS/Nitrogen Management plan in the Basin Plan, several agencies proposed that alternative, less stringent TDS and/or nitrate-nitrogen water quality objectives be adopted for specific groundwater management zones and surface waters. These proposals were based on additional consideration of the factors specified in Water Code Section 13241 and the requirements of the State's antidegradation policy (State Board Resolution No. 68-16). Since the less stringent objectives would allow a lowering of water quality, the agencies were required to demonstrate that their proposed objectives would protect beneficial uses, and that water quality consistent with maximum benefit to the people of the state would be maintained (thus, the use of the term "maximum benefit" water quality objectives).

Appropriate beneficial use protection/maximum benefit demonstrations were made by the Chino Basin Watermaster/Inland Empire Utilities Agency, the Yucaipa Valley Water District and the City of Beaumont/San Timoteo Watershed Management Authority to justify alternative "maximum benefit" objectives for the Chino North, Cucamonga, Yucaipa, Beaumont and San Timoteo groundwater management zones. These "maximum benefit" proposals, which are described in detail in Chapter 5 – Implementation, entail commitments by the agencies to implement specific projects and programs. While these agencies' efforts to develop these proposals indicate their strong interest to proceed with these commitments, unforeseen circumstances may impede or preclude it. To address this possibility,

this Plan includes both the “antidegradation” and “maximum benefit” objectives for the subject waters (See Table 4-1). Chapter 5 specifies the requirements for implementation of these objectives. Provided that these agencies’ commitments are met, then the agencies have demonstrated maximum benefit, and the “maximum benefit” objectives included in Table 4-1 for these waters apply for regulatory purposes. However, if the Regional Board finds that these commitments are not being met and that “maximum benefit” is thus not demonstrated, then the “antidegradation” objectives for these waters will apply. Chapter 5 also describes the mitigation requirements that will apply should discharges based on “maximum benefit” objectives occur unsupported by the demonstration of “maximum benefit”.

**COMPLIANCE WITH OBJECTIVES (Amended by Resolution No. 00-27, May 19, 2000)**

“The Regional Board recognizes that immediate compliance with new, revised or newly interpreted water quality objectives adopted by the Regional Board or the State Water Resources Control Board, or with new, revised or newly interpreted water quality criteria promulgated by the U.S. Environmental Protection Agency, may not be feasible in all circumstances. Where the Regional Board determines that it is infeasible for a discharger to comply immediately with effluent limitations specified to implement such objectives or criteria, compliance shall be achieved in the shortest practicable period of time, not to exceed ten years after the adoption or interpretation of applicable objectives or criteria. This provision authorizes schedules of compliance for objectives and criteria that are adopted or revised or newly interpreted after the effective date of this amendment July 15, 2002.

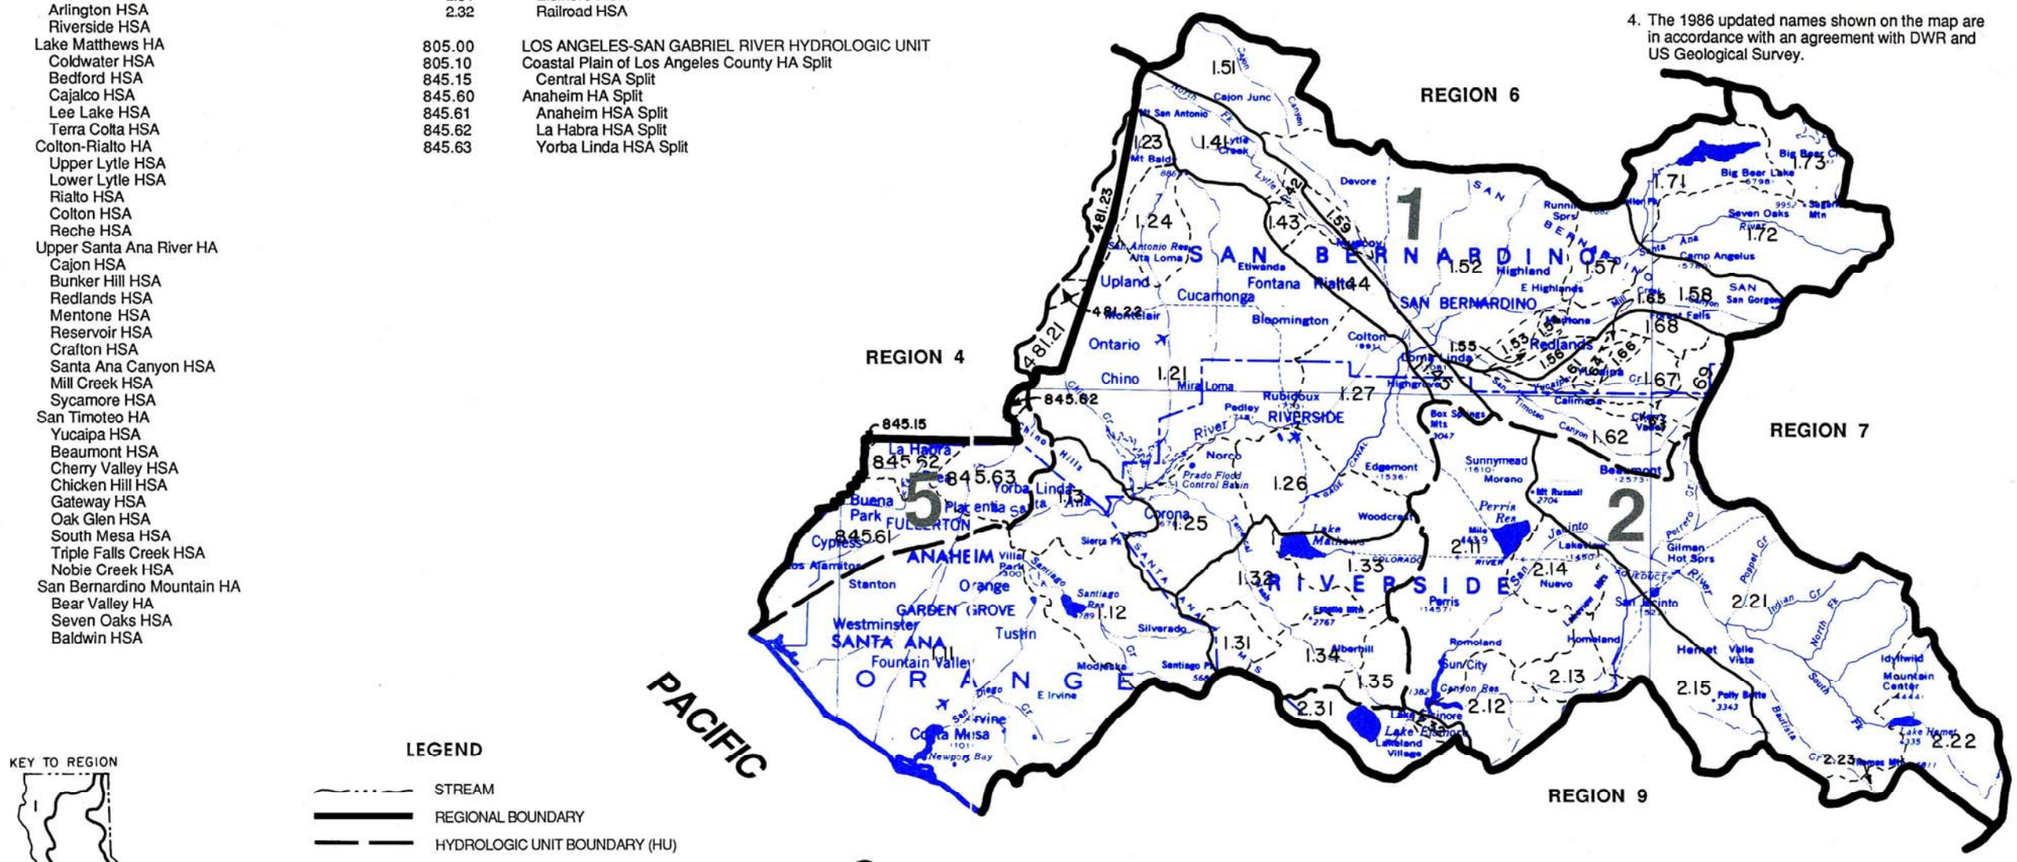
## REGION 8 INDEX



| | |
|---|---|
| 801.00 | SANTA ANA RIVER HYDROLOGIC UNIT |
| 801.10 | Lower Santa Ana River HA |
| 1.11 | East Coastal Plain HSA |
| 1.12 | Santiago HSA |
| 1.13 | Santa Ana Narrows HSA |
| 801.20 | Middle Santa Ana River HA Split |
| 801.21 | Chino HSA Split |
| 481.21 | Chino HSA Split |
| 481.22 | Harrison HSA |
| 801.23 | Claremont Heights HSA Split |
| 481.23 | Claremont Heights HSA Split |
| 801.24 | Cucamonga HSA |
| 1.25 | Temescal HSA |
| 1.26 | Arlington HSA |
| 1.27 | Riverside HSA |
| 801.30 | Lake Matthews HA |
| 1.31 | Coldwater HSA |
| 1.32 | Bedford HSA |
| 1.33 | Cajalco HSA |
| 1.34 | Lee Lake HSA |
| 1.35 | Terra Cotta HSA |
| 801.40 | Colton-Rialto HA |
| 1.41 | Upper Lytle HSA |
| 1.42 | Lower Lytle HSA |
| 1.43 | Rialto HSA |
| 1.44 | Colton HSA |
| 1.45 | Reche HSA |
| 801.50 | Upper Santa Ana River HA |
| 1.51 | Cajon HSA |
| 1.52 | Bunker Hill HSA |
| 1.53 | Redlands HSA |
| 1.54 | Mentone HSA |
| 1.55 | Reservoir HSA |
| 1.56 | Crafton HSA |
| 1.57 | Santa Ana Canyon HSA |
| 1.58 | Mill Creek HSA |
| 1.59 | Sycamore HSA |
| 801.60 | San Timoteo HA |
| 1.61 | Yucaipa HSA |
| 1.62 | Beaumont HSA |
| 1.63 | Cherry Valley HSA |
| 1.64 | Chicken Hill HSA |
| 1.65 | Gateway HSA |
| 1.66 | Oak Glen HSA |
| 1.67 | South Mesa HSA |
| 1.68 | Triple Falls Creek HSA |
| 1.69 | Nobie Creek HSA |
| 801.70 | San Bernardino Mountain HA |
| 1.71 | Bear Valley HSA |
| 1.72 | Seven Oaks HSA |
| 1.73 | Baldwin HSA |

| | |
|---|---|
| 802.00 | SAN JACINTO VALLEY HYDROLOGIC UNIT |
| 802.10 | Perris HA |
| 2.11 | Perris Valley HSA |
| 2.12 | Menifee HSA |
| 2.13 | Winchester HSA |
| 2.14 | Lakeview HSA |
| 2.15 | Hemet HSA |
| 802.20 | San Jacinto HA |
| 2.21 | Gilman Hot Springs HSA |
| 2.22 | Hemet Lake HSA |
| 2.23 | Bautista HSA |
| 802.30 | Elsinore Valley HA |
| 2.31 | Elsinore HSA |
| 2.32 | Railroad HSA |

| | |
|---|---|
| 805.00 | LOS ANGELES-SAN GABRIEL RIVER HYDROLOGIC UNIT |
| 805.10 | Coastal Plain of Los Angeles County HA Split |
| 845.15 | Central HSA Split |
| 845.60 | Anaheim HA Split |
| 845.61 | Anaheim HSA Split |
| 845.62 | La Habra HSA Split |
| 845.63 | Yorba Linda HSA Split |

NOTE:

1. The names and areas shown on this map are the same as used by the Department of Water Resources (DWR) in their Bulletin 130 Series except as explained below.
2. The numbering system used on this map is an adaptation of the numbering system used in the 130 Series.
3. The boundary between Region 8 and Region 4 follows the boundary between Los Angeles County and Orange or San Bernardino Counties, not the Hydrologic Boundary. The San Bernardino County line splits Hydrologic Unit 1 (Santa Ana River HU) so that Sub-Areas 481.21, 481.22, and 481.23 are legally in Region 4 but drain into Region 8. The Orange County line splits Hydrologic Unit 5 (Los Angeles-San Gabriel River HU) so that Sub-Areas 845.15, 845.61, 845.62 and 845.63 are legally in Region 8 but drain into Region 4. Therefore, a 5 digit number on the map indicates that a regional boundary divides a hydrologic unit, area or subarea. In these cases the second digit is the number of the region from which the hydrologic area has been separated by the regional boundary. All other digits are as described in the legend.
4. The 1986 updated names shown on the map are in accordance with an agreement with DWR and US Geological Survey.

## Table 4-1 WATER QUALITY OBJECTIVES

| OCEAN WATERS | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solids** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| **NEARSHORE ZONE*** | | | | | | | | | |
| San Gabriel River to Poppy Street in Corona del Mar+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Poppy Street to Southeast Regional Boundary+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| **OFFSHORE ZONE** | | | | | | | | | |
| Waters Between Nearshore Zone And Limit of State Waters+ | --- | --- | --- | --- | --- | --- | --- | | |

* Defined by Ocean Plan Chapter II A.1.: "Within a zone bounded by shoreline and a distance of 1000 feet from shoreline or the 30-foot depth Contour, whichever is further from shoreline…"

\+ Numeric objectives have not been established; narrative objectives apply.

## Table 4-1 WATER QUALITY OBJECTIVES - Continued

| BAYS, ESTUARIES, AND TIDAL PRISMS | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solid** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| Anaheim Bay – Outer Bay+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Anaheim Bay – Seal Beach National Wildlife Refuge+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Sunset Bay – Huntington Harbour+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Bolsa Bay+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Bolsa Chica Ecological Reserve+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Lower Newport Bay+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Upper Newport Bay+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Santa Ana River Salt Marsh+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Tidal Prism of Santa Ana River (to within 1000' of Victoria Street) and Newport Slough+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| Tidal Prism of San Gabriel River – River Mouth to Marina Drive+ | --- | --- | --- | --- | --- | --- | --- | 845.61 | |
| Tidal Prisms of Flood Control Channels Discharging to Coastal or Bay Waters+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |

+ Numeric objectives have not been established; narrative objectives apply.

## Table 4-1 WATER QUALITY OBJECTIVES - Continued

| **INLAND SURFACE STREAMS** | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solids** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| **LOWER SANTA ANA RIVER BASIN** | | | | | | | | | |
| Santa Ana River | | | | | | | | | |
| Reach 1 – Tidal Prism to 17th Street in Santa Ana+ | (Flood Flows Only) | | | | | | | 801.11 | |
| Reach 2 - 17th Street in Santa Ana to Prado Dam | 650[1] | --- | --- | --- | --- | --- | --- | 801.11 | 801.12 |
| Aliso Creek+ | --- | --- | --- | --- | --- | --- | --- | 845.63 | |
| Carbon Canyon Creek+ | --- | --- | --- | --- | --- | --- | --- | 845.63 | |
| Santiago Creek Drainage | | | | | | | | | |
| Santiago Creek | | | | | | | | | |
| Reach 1 – below Irvine Lake | 600 | --- | --- | --- | --- | --- | --- | 801.12 | 801.11 |
| Reach 2 - Irvine Lake (see Lakes, Pg. 4-46) | | --- | --- | --- | --- | --- | --- | | |
| Reach 3 – Irvine Lake to Modjeska Canyon | 350 | 260 | 20 | 12 | 2 | 80 | --- | 801.12 | |
| Reach 4 – in Modjeska Canyon | 350 | 260 | 20 | 12 | 2 | 80 | --- | 801.12 | |
| Silverado Creek | 650 | 450 | 30 | 20 | 1 | 275 | --- | 801.12 | |
| Black Star Creek+ | --- | --- | --- | --- | --- | --- | --- | 801.12 | |
| Ladd Creek+ | --- | --- | --- | --- | --- | --- | --- | 801.12 | |

[1] Five-year moving average

\+ Numeric objectives have not been established; narrative objectives apply.

## Table 4-1 WATER QUALITY OBJECTIVES - Continued

| **INLAND SURFACE STREAMS** | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solids** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| San Diego Creek Drainage | | | | | | | | | |
| San Diego Creek | | | | | | | | | |
| Reach 1 – below Jeffrey Road | 1500 | --- | --- | --- | 13 | --- | 90 | 801.11 | |
| Reach 2 – above Jeffrey Road to Headwaters | 720 | --- | --- | --- | 5 | --- | --- | 801.11 | |
| Other Tributaries: Bonita Creek, Serrano Creek, Peters Canyon Wash, Hicks Canyon Wash, Bee Canyon Wash, Borrego Canyon Wash, Agua Chinon Wash, Laguna Canyon Wash, Rattlesnake Canyon Wash, Sand Canyon Wash and other Tributaries to these Creeks+ | --- | --- | --- | --- | --- | --- | --- | 801.11 | |
| San Gabriel River Drainage | | | | | | | | | |
| Coyote Creek (within Santa Ana Regional Boundary)+ | --- | --- | --- | --- | --- | --- | --- | | |

+ Numeric objectives have not been established; narrative objectives apply.

## Table 4-1 WATER QUALITY OBJECTIVES - Continued

| **INLAND SURFACE STREAMS** | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solids** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| **UPPER SANTA ANA RIVER BASIN** | | | | | | | | | |
| Santa Ana River | | | | | | | | | |
| Reach 3 – Prado Dam to Mission Blvd. in Riverside – Base Flow[2] | 700 | 350 | 110 | 140 | 10[3] | 150 | 30 | 801.21 | 801.27, 801.25 |
| Reach 4 – Mission Blvd. in Riverside to San Jacinto Fault in San Bernardino | 550 | --- | --- | --- | 10 | --- | 30 | 801.27 | 801.44 |
| Reach 5 – San Jacinto Fault in San Bernardino to Seven Oaks Dam | 300 | 190 | 30 | 20 | 5 | 60 | 25 | 801.52 | 801.57 |
| Reach 6 – Seven Oaks Dam to Headwaters (see also Individual Tributary Streams) | 200 | 100 | 30 | 10 | 1 | 20 | 5 | 801.72 | |
| San Bernardino Mountain Streams | | | | | | | | | |
| Mill Creek Drainage: | | | | | | | | | |
| Mill Creek | | | | | | | | | |
| Reach 1 – Confluence with Santa Ana River to Bridge Crossing Route 38 at Upper Powerhouse | 200 | 100 | 30 | 10 | 1 | 20 | 5 | 801.58 | |
| Reach 2 – Bridge Crossing Route 38 at Upper Powerhouse to Headwaters | 110 | 100 | 25 | 5 | 1 | 15 | 5 | 801.58 | |

[2] Additional Objectives: Boron: 0.75 mg/l

[3] Total nitrogen, filtered sample

## Table 4-1 WATER QUALITY OBJECTIVES - Continued

| INLAND SURFACE STREAMS | WATER QUALITY OBJECTIVES (mg/l) | | | | | | | Hydrologic Unit | |
|---|---|---|---|---|---|---|---|---|---|
| | **Total Dissolved Solids** | **Hardness** | **Sodium** | **Chloride** | **Total Inorganic Nitrogen** | **Sulfate** | **Chemical Oxygen Demand** | Primary | Secondary |
| Mountain Home Creek | 200 | 100 | 30 | 10 | 1 | 20 | 5 | 801.58 | |
| Mountain Home Creek, East Fork | 200 | --- | --- | --- | --- | --- | --- | 801.70 | |

## INTRODUCTION

This chapter describes the implementation plan, the actions that are necessary to achieve the water quality objectives specified in Chapter 4 and thereby protect the beneficial uses of the region's surface and groundwaters (Chapter 3). These actions will require the coordinated efforts of the Regional Board and numerous water supply and wastewater management agencies, as well as city and county governments and other planning entities within the Region.

The Implementation chapter of the 1983 Basin Plan focused largely on the mineral imbalance problem in the region and the management of total dissolved solids (TDS) through waste discharges requirements, wastewater reclamation requirements, improvements in water supply quality, recharge projects, and other measures. Since the adoption of the 1983 Basin Plan, the Regional Board's knowledge of the water quality problems in the Santa Ana Region has increased considerably, and the number and variety of water quality programs undertaken to address those problems have increased accordingly. Several new programs are being implemented statewide by each regional board, including broad new responsibilities related to landfill operations and closure, oversight of leaking underground storage tank cleanup activities, and control of nonpoint sources such as urban runoff and stormwater from industrial facilities and construction sites. These new programs are part of the Board's implementation plan and are described in this chapter.

## IMPLEMENTATION THROUGH WASTE DISCHARGE REQUIREMENTS

The Regional Board's principal means of achieving the water quality objectives and protecting the beneficial uses specified in this plan is the development, adoption, issuance and enforcement of waste discharge requirements. By regulating the quality of wastewaters discharged, and in other ways controlling the discharge of wastes which may impact surface and groundwater quality, the Regional Board works to protect the Region's water resources.

The Regional Board's regulatory tools include National Pollutant Discharge Elimination System permits, Waste Discharge Requirements, Water Reclamation Requirements, Water Quality Certification and Waste Discharge Prohibition.

**National Pollutant Discharge Elimination System (NPDES)**

National Pollutant Discharge Elimination System (NPDES) permits are required for discharges of pollutants to "navigable waters" of the United States, which includes any discharge to surface waters – lakes, rivers, streams, bays, the ocean, dry streambeds, wetlands and storm sewers that are tributary to any surface water body. NPDES permits are issued under the federal Clean Water Act, Title IV "Permits and Licenses," Section 402 (33 USC 466 *et seq*.). The Regional Board issues these permits in lieu of direct issuance by the US EPA, subject to review and approval by the US EPA Regional Administrator (EPA Region IX). The terms of these NPDES permits implement pertinent provisions of the federal Clean Water Act and the Act's implementing regulations including pretreatment, sludge management, effluent limitations for specific industries and antidegradation. In general, the discharge of pollutants is to be eliminated or reduced as much as practicable so as to achieve the Clean Water Act's goal of "fishable and swimmable" navigable (surface) waters. Technically, all NPDES permits issued by the Regional Board are also Waste Discharge Requirements issued under the authority of the California Water Code.

In addition to regulating discharges of wastewater to surface waters, NPDES permits also require municipal sewage treatment facilities to implement and monitor industrial pretreatment programs if their design capacity is greater than five million gallons per day (MGD). Smaller municipal treatment systems may also be required to conduct pretreatment programs if there are significant industrial contributions to their systems. The pretreatment programs must comply with the federal regulations specified in 40 CFR 403.

At this time, there are approximately 2,000 NPDES permits in effect in the Santa Ana Region. As shown in Table 5-1, these NPDES permits regulate discharge from publicly owned treatment works (POTWs, or sewage treatment plants), industrial discharges, stormwater runoff, dewatering operations, and groundwater cleanup discharges. NPDES permits are issued for five years or less and are therefore to be updated regularly. The rapid and dramatic population and urban growth in the Santa Ana Region has caused a significant increase in NPDES permit applications for new waste discharges. Because of staff resource limitations, the Board generally focuses its permitting efforts on the issuance of permits for these new discharges. NPDES permit updates are done to the extent feasible, particularly for the more significant discharges. In some cases, if the discharge does not change substantially over the permitting period, administrative extensions of the existing permits are issued by the Regional Board's Executive Officer.

To expedite the permit issuance process, the Regional Board has adopted several general NPDES permits, each of which regulates numerous discharges of similar types of wastes. These general permits address discharges from groundwater cleanup projects (Order No. 91-63) and dewatering activities (Order No. 93-49). Proponents of groundwater cleanup or dewatering projects are required to file individual permit applications, which are reviewed

by Regional Board staff to determine whether the requirements of the general permits apply and are sufficient to assure water quality protection. If so, the applicants are authorized by the Regional Board's Executive Officer to discharge in conformance with the general permit. A general permit for boatyard operations is being drafted. Additional general permits will be developed and adopted as appropriate to streamline the permitting process.

Similarly, the State Board has issued general permits for stormwater runoff from industrial facilities and construction sites statewide (see discussion on stormwater runoff). Stormwater discharges from industrial and construction activities in the Santa Ana Region can be covered under these general permits, which are administered jointly by the State Board and Regional Boards.

**(Amended by Resolution No. 00-27, May 19, 2000)**
Where the Regional Board determines that it is infeasible to achieve immediate compliance with an effluent limitation specified to implement a new, revised or newly interpreted water quality objective, whether numeric or narrative, adopted by the Regional Board or State Water Resources Control Board, or with a new, revised or newly interpreted water quality criterion promulgated by the U.S. Environmental Protection Agency, the Regional Board may establish a schedule of compliance in a discharger's waste discharge requirements (NPDES permit). The schedule of compliance shall include a time schedule for completing specific actions that demonstrate reasonable progress toward attainment of the effluent limitation and, thereby, the objective or criterion. The schedule shall contain a final compliance date, based on the shortest practicable time (determined by the Regional Board at a public hearing) required to achieve compliance. In no event shall an NPDES permit include a schedule of compliance that allows more than ten years from the date of adoption or interpretation of the applicable objective or criterion. Schedules of compliance are authorized by this provision only for those effluent limitations that implement objectives and criteria adopted, revised or newly interpreted after the effective date of this provision, July 15, 2002.

To document the need for and justify the duration of any such compliance schedule, a discharger must submit the following information, at a minimum: (1) the results of a diligent effort to quantify pollutant levels in the discharge and the sources of the pollutant(s) in the waste stream; (2) documentation of source control efforts currently underway or completed, including compliance with any Pollution Prevention programs that have been established; (3) a proposed schedule for additional source control measures or waste treatment; (4) the discharge quality that can reasonably be achieved until final compliance is attained; and (5) a demonstration that the proposed schedule is as short as possible, taking into account economic, technical and other relevant factors. The need for additional information and analyses will be determined by the Regional Board on a case-by-case basis. **(End of Resolution No. 00-27)**

Table 5-1

Representative NPDES Permitted Facilities in the Santa Ana Region
(as of November 3, 1993)[1]

| Facility Type | Number Requested |
|---|---|
| Boatyards | 10 |
| Dewatering Operations | 31 |
| Groundwater Cleanup Projects | 150 |
| Stormwater Discharges<br>39 individually regulated by RWQCB;<br>1800 regulated by SWRCB's general permits | 1839 |
| Publicly Owned Treatment Works | |
| **TOTAL** | **2054** |

[1] The list of facilities is regulated under NPDES permits is updated periodically and is available at the Regional Board office.

Table 5-2

Representative WDR Permitted Facilities in the Santa Ana Region
(as of November 3, 1993) [2]

| Facility Type | Number Regulated |
|---|---|
| Brine Evaporation | 24 |
| Composing | 19 |
| Groundwater Cleanup | 32 |
| Dairies | 468 |
| Landfills | 43 |
| Mobile Home Parks (community septic systems) | 22 |
| Publicly Owned Treatment Works | 37 |
| **TOTAL** | **645** |

[2] The list of facilities regulated under WDR permits is updated periodically and is available at the Regional Board office.

Where the terms of these general permits are not sufficient to protect water quality, the Board issues individual permits for these discharges.

## Waste Discharge Requirements

Waste Discharge Requirements (WDRs) are issued by the Regional Board under the provisions of the California Water Code, Division 7 "Water Quality," Article 4 "Waste Discharge Requirements." These requirements regulate the discharge of wastes which are not made to surface waters but which may impact the region's water quality by affecting underlying groundwater basins. Such WDRs are issued for POTWs' wastewater reclamation operations, discharges of wastes from industries, subsurface waste discharges such as septic systems, sanitary landfills, dairies and a variety of other activities which can affect water quality. There are approximately 550 WDRs in place, as indicated in Table 5-2.

Table 5-2 shows that most WDRs have been issued to dairies. To streamline the permit process, the Regional Board has developed a general permit for dairies and other animal confinement facilities (Order No. 94-7). To implement the federal stormwater requirements, this permit will be issued as an NPDES permit.

## Waivers

The California Water Code allows Regional Boards to waive waste discharge requirements (WDRs) for a specific discharge or types of discharges where it is not against the public interest (Section 13269). These waivers are conditional and may be terminated at any time.

On May 11, 1984, the Regional Board adopted Resolution No. 84-48, which waives WDRs for certain types of discharges. Resolution No. 84-48 was amended by Resolution No. 91-75 in 1991. Resolution No. 84-48 and Resolution No 91-75 are incorporated into the Basin Plan by reference and are included in Appendix IV. Only discharges which comply with the conditions contained in Resolution No. 84-48 as amended by Resolution No. 91-75, qualify for this waiver. Even though a discharge may qualify for a waiver, dischargers are still required to file Reports of Waste Discharge (ROWD), together with the appropriate filing fees. Regional Board staff determines if the effort expended in reviewing the ROWD justifies retaining any portion of the fee. If not, the fee is fully refunded.

## Water Reclamation Requirements

Reclaimed water is water that, as a result of treatment, is suitable for a direct beneficial use or a controlled use that would otherwise not occur and is therefore considered a valuable resource. The State Board adopted the Reclamation Policy to encourage development of water reclamation facilities to increase the availability of reclaimed water to help meet the growing water requirements of the State (Chapter 2). The State Board is authorized to provide loans for the development of water reclamation facilities, or for studies and investigations in connection with water reclamation.

Section 13521 of the California Water Code requires the State Department of Health Services to establish statewide reclamation criteria for each type of use of reclaimed water, where such use involves the protection of public health. These regulations, contained in Title 22 of the California Code of Regulations, are the basic regulations governing the use of reclaimed water in California. The existing Title 22 regulations were adopted in 1978; proposed new regulations are currently under review.

The Regional Board implements the provisions of Title 22 by issuing Water Reclamation Requirements (WRRs) to the producer, the user of reclaimed water, or both. WRRs are issued for a variety of uses, including, but not limited to, landscape irrigation, fodder crop irrigation, duck ponds, freeway landscape irrigation, groundwater recharge, injection for seawater intrusion barrier, use in toilet flushing, and other non-domestic uses in high rises or nonresidential buildings.

The Santa Ana Regional Board currently has 76 WRRs issued to producers and/or users of reclaimed water. Some of the producers have received or applied for Master Reclamation Requirements (MRR) which would allow the producer to distribute their reclaimed water to various users without additional user reclamation requirements for the Regional Board. With the water shortage in southern California, there is an increase in the demand for reclaimed water. With sophisticated treatment technologies, reclaimed water could be used for almost anything, except domestic supply.

The detailed requirements, conditions, prohibitions, and other specifications included within NPDES, WDR, and WRR permits are developed on the basis of existing state and federal law, Sate Board Water Quality Control Plans and Policies (*e.g.*, the Ocean Plan), and the contents of this Basin Plan. The foremost consideration is the protection of water quality. The quality of the discharge specified through the limitations in the permit is calculated to allow the water quality objectives of the receiving water to be met or maintained, and in some cases, the water quality is improved.

When the limits included in the NPDES, WDR or WRR permits cannot be met because treatment facilities are inadequate or the water supply is inferior, these permits may include a time schedule for compliance and interim discharger a period of time to make the necessary changes and/or improvements.

## Waste Discharge Prohibitions

The Regional Board also implements this Basin Plan through the adoption of waste discharge prohibitions as necessary. Section 13243 of the California Water Code states that a Regional Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted. The Regional Board implements this section of the Water Code by adopting waste discharge requirements issued to individual discharges and in the Basin Plan itself.

A. General Prohibitions

1. Unless regulated by appropriate waste discharge requirements, the discharge to surface or groundwaters of waste which contains the following substances is prohibited.

    - Toxic substances or materials;
    - Pesticides;
    - PCB's (polychlorinated biphenyls);
    - Mercury or mercury compounds;
    - Radioactive substances or material in excess of levels allowed by the California Code of Regulations.

   This list is not necessarily all-inclusive. The Regional Board may modify or update this list as appropriate.

B. Prohibitions Applying to Inland Surface Waters

1. The discharge of untreated sewage to any surface water stream, natural or man-made, or to any drainage system intended to convey stormwater runoff to surface water streams is prohibited.

2. The discharge of treated sewage to streams, lakes or reservoirs, or to tributaries thereto, which are designated **MUN** and which are used as a domestic water supply is prohibited unless approved by the California Department of Health Services. The discharge of treated sewage to waterbodies which are excepted from **MUN** (see Table 3-1) but which are tributary to waters designated **MUN** and are used as a domestic water supply is prohibited unless the discharge of treated sewage to the drinking water supply is precluded or approved by the California Department of Health Services.

C. Prohibitions Applying to Oceans, Bays, and Estuary Waters

   The prohibitions included in the California Ocean Plan, Thermal Plan, and the Policy for Enclosed Bays and Estuaries are hereby incorporated into this plan by reference.

D. Prohibitions Applying to Groundwaters

1. The discharge of the following materials to the ground, other than into impervious facilities, is prohibited:

    a. Acids or caustics, whether neutralized or not, and

    b. Excessively saline wastes (electrical conductivity greater than 2000 µmhos/cm)

2., Prohibitions Applying to Subsurface Leaching Percolation Systems

In 1973, the Regional Board adopted prohibitions on the use of subsurface disposal systems in the following areas:

a. Grand Terrace (CSA 70, Improvement Zone H);

b. Yucaipa-Calimesa (Yucaipa Valley County Water District);

c. Lytle Creek above 2600 foot elevation;

d. Mill Creek above 2600 foot elevation; and

e. Bear Valley (includes Baldwin Lake Drainage Area);

In 1982, the Regional Board adopted prohibition on the use of subsurface disposal systems for the Homeland-Green Acres area and Romoland areas (exact boundaries for these prohibition areas are shown on maps on file at the Regional Board office).

The Board adopted specified dates for final compliance with these prohibitions. In some cases, these dated have been revised via Basin Plan amendments. The compliance dates are as follows:

a. Grand Terrace: February 1, 1988

b. Yucaipa-Calimesa – February 1, 1988

c. Lytle Creek – July 1, 1978

d. Mill Creek - July 1, 1978

e. Bear Valley – July 1, 1980

f. Homeland-Green Acres – July 1, 1990

g. Romoland – July 1, 1990

Exemptions from these prohibitions may be granted if certain criteria are satisfied (exemption criteria are described in Appendix V).

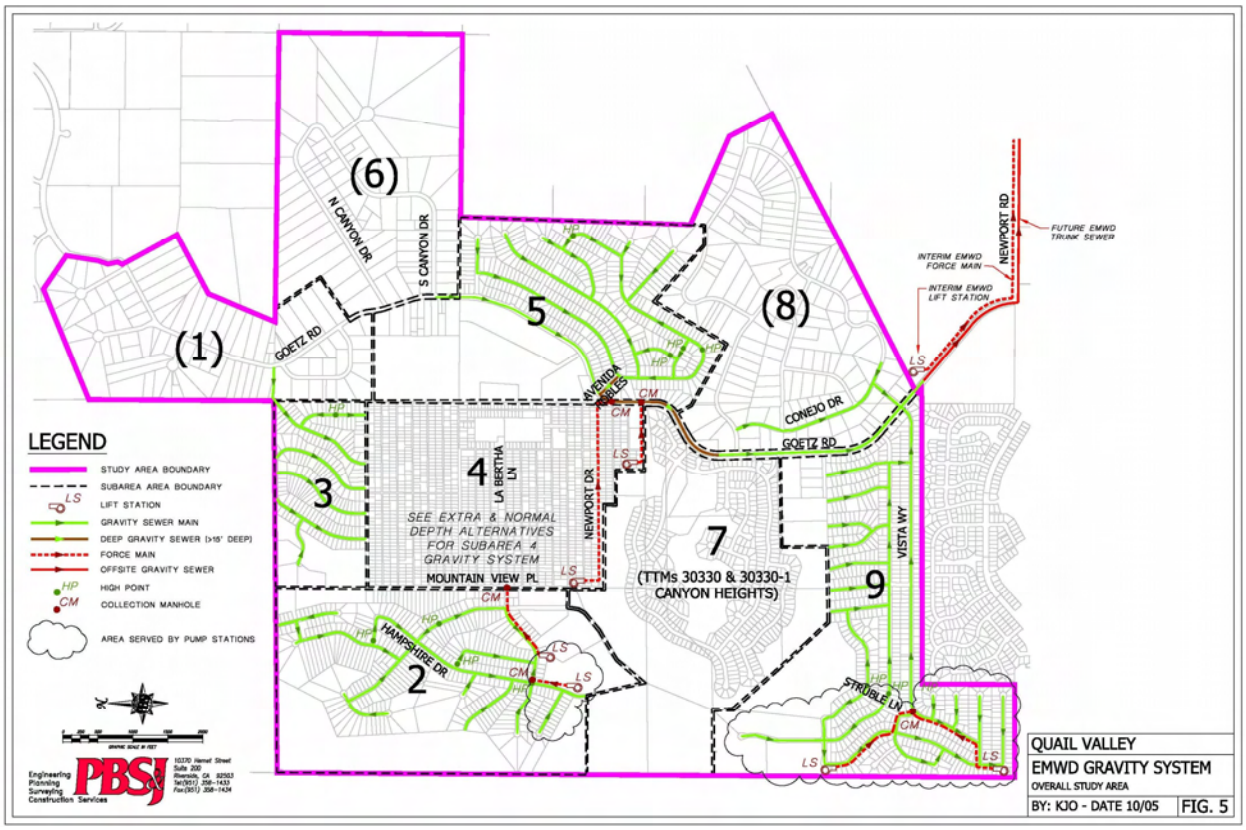
Quail Valley On-site Septic Tank-Subsurface Disposal System Prohibition
(Amended by Resolution No. R8-2006-0024, October 3, 2006)

On October 3, 2006, the Board adopted a Basin Plan amendment prohibiting the use of septic tank-subsurface disposal systems in the Quail Valley area of Riverside County in accordance with the following:

Effective Date: August 20, 2007

(1) The discharge of waste from new on-site septic tank-subsurface disposal systems in the Quail Valley area of Riverside County is prohibited, if a sewer system is available to serve the lot. Except as provided in (2) below, the discharge of waste from existing on-site septic tank-subsurface disposal systems in the Quail Valley area of Riverside County is prohibited, if a sewer system is available to serve the lot.

(2) All existing septic tank-subsurface disposal systems shall connect to the sewer designed to serve the lot within one year of sewer installation. New septic tank-subsurface disposal systems shall not be permitted in Quail Valley if a sewer system is available to serve the lot.



(3) This prohibition applies to all areas within Quail Valley as depicted on a detailed map maintained in the Regional Board office (Quail Valley Septic Tank Prohibition Boundary Map). A copy of the boundary map is attached as Attachment "A".

(4) Upon the effective date of this prohibition, new septic systems in Quail Valley (see Attachment "A") shall not be permitted, except as follows:

(a) For areas in Quail Valley other than areas 4 and 9, new systems may be permitted, provided the Regional Board finds that the sewering agency proposes, and is on schedule, to provide sewer service for areas 4 and 9 within five years of the effective date of this amendment, and if the lot proposed for a septic system meets all Board and Riverside County requirements.

(b) If the Board finds that the sewering agency cannot meet the schedule identified in 1(4)(a), above, but that design of the project proceeds nonetheless, then, upon completion of the sewer system design, new systems may be permitted in areas other than 4 and 9, if all Board and Riverside County requirements are met.

## ATTACHMENT "A": MAP OF QUAIL VALLEY PROHIBITION AREA
## FIGURE 5-1a

**Water Quality Certification (Section 401)**

In addition to the issuance of NPDES permits or waste discharge requirements, the Regional Board acts to protect the quality of surface waters through water quality certification as specified in Section 401 of the Clean Water Act (33 USC 466 *et seq.*). Section 401 requires that any person applying for a federal permit or license for an activity which may result in a discharge of pollutants into waters of the nation must obtain a state water quality certification verifying that the activity complies with the state's water quality standards.

No license or permit can be granted until certification required by Section 401 has been obtained or waived. Further, no license or permit can be granted if certification has been denied by the state. Similarly, coastal states must concur that the activity meets the requirements of the Coastal Zone Management Program of the state or waive their right to concur by not taking action by a specified time.

The following permits or licenses require 401 Certification:

- NPDES permits issued by US EPA under Section 402 of the CWA (33 USC 466 *et seq.*);
- CWA Section 404 (33 USC 466 *et seq.*) permits issued by the U.S. Army Corps of Engineers;
- Permits issued under Sections 9 and 10 of the Rivers and Harbors Act (33 USC 466 *et seq.*) (for activities which may affect navigation);
- Licenses for hydroelectric power plants issued by the Federal Energy Regulatory Commission under the Federal Power Act; and
- Licenses issued by the Nuclear Regulatory Commission.

To date, the Regional Board's water quality certification activities have focused on applications for permits for the discharge of dredged or fill material to surface waters. These permits are issued by the U.S. Army Corps of Engineers (Section 404 permits) subject to any conditions imposed by the Regional Board.

The Section 404 program is administered at the federal level by the U.S. Army Corps of Engineers and the US EPA. The U.S. Fish and Wildlife Service and the National Marine Fisheries Service have important advisory roles. The U.S. Army Corps of Engineers has the primary responsibility for the permit program and is authorized, after notice and opportunity for a public hearing, to issue permits of the discharge of dredged or fill material. US EPA developed the regulations under which permits may be granted. States may assume the responsibility for implementation of the 404 permit program, however, California has not done so.

The Regional Board evaluates the projects for which 404 permits are requested and determines whether to deny water quality certification, issue a certification with conditions, or waive the certification. A certification is usually denied if the activity violates any water

quality standard; if the activity may violate standards, a conditional certification is given; when the activity does not violate any standard, a 401 waiver may be given.

Presently, the executive Director of the State Board issues all water quality certifications in accordance with recommendations from the Regional Board.

## MONITORING AND ENFORCEMENT

Waste discharge requirements issued by the Regional Board include requirements for monitoring of discharges. In some cases, the receiving waters must be monitored by the dischargers. The results of the "self monitoring" programs are reported to the Board and are used to determine compliance with the waste discharge requirements (see Chapter 6).

The California Water Code provides the Regional Board with a number of enforcement remedies for violations of requirements. Enforcement actions include Time Schedules, Cease and Desist Orders, Cleanup and Abatement Orders, and the issuance of Administrative Civil Liability Complaints.

### Time Schedules

When a discharge is taking place or threatening to occur that will cause a violation of a Regional Board requirement, a discharger may be required to submit a detailed compliance plan and schedule (California Water Code Section 13300). These schedules may also be required when the waste collection treatment or disposal facility of a discharger are approaching capacity. Time Schedules are adopted by the Regional Board after a public hearing or by the Executive Officer pursuant to his or her authority.

### Cease and Desist Order

If discharge prohibitions or requirements of the State Board or Regional Board are violated or threatened to be violated, the Regional Board may adopt a Cease and Desist order (California Water Code Section 13301) requiring the discharger to comply in accordance with a time schedule, or if the violation is threatened, to take appropriate remedial or preventive action. Cease and Desist orders may restrict or prohibit the volume, type or concentration of waste added to community sewer systems, if existing or threatened violations of waste discharge requirements occur. Cease and Desist Orders may specify interim time schedules as well as limitations that must be complied with until full compliance is achieved. Cease and Desist orders are adopted by the Regional Board after a public hearing.

### Cleanup and Abatement Order

The Board may order *any* person who has discharged, is discharging or is threatening to discharge wastes that will result in a violation of waste discharge requirements or other order or prohibition of the State Board or Regional Board, to cleanup and abate the effects

of the discharge or to take appropriate remedial action (California Water Code 13304). The Regional Board has delegated issuance of these orders to its Executive Officer; Cleanup and Abatement orders do not require Board action, but are often brought before the Regional Board for consideration.

### Administrative Civil Liability

The Regional Board may also issue Administrative Civil Liability complaints (ACLs) to those who intentionally or negligently violate enforcement orders of the Board, or who intentionally or negligently discharge wastes in violation of any order, prohibition or requirement of the Board where the discharge causes conditions of pollution or nuisance (California Water Code Sections 13350). ACLs may also be issued in cases where a person fails to submit reports requested by the Board (California Water Code Sections 13261 and13268) or when a person discharges waste without first having filed the appropriate Report of Waste Discharge (ROWD) (California Water Code Section113265). ACLs may be issued pursuant to California Water Code Section 13385 for violations of any Regional Board prohibition or requirement implementing specified sections of the Clean Water Act, or any requirement in an approved pretreatment program, without showing intent or negligence. Issuance of ACLs is delegated to the Board's Executive Officer, but, all administrative civil liability settlements must be affirmed by the Board. Amounts of administrative civil liability that the Board can impose range up to $10,000 per day of violation. The Water Code also provides that a superior court may impose civil liability assessments in substantially higher amounts. The Regional Board may conduct a hearing if a discharger contests the imposition of the Administrative Civil Liability.

The Water Code provides that a Regional Board may request the State Attorney General to petition a superior court to enforce orders and complaints issued by the Board. The Regional Board may also request that the Attorney General seek injunctive relief in specific situations, such as violations of Cease and Desist orders or discharges which cause or threaten to cause a nuisance or pollution that could result in a public health emergency (California Water Code Sections 13331 and 13340).

## TOTAL DISSOLVED SOLIDS AND NITROGEN MANAGEMENT (Amended by Resolution No. R8-2004-0001, December 22, 2004)

### 1. Background

The 1975 and 1983 Basin Plans for the Santa Ana River Basin reported that the most serious problem in the basin was the build up of dissolve minerals, or salts, in the ground and surface waters. Sampling and computer modeling of groundwaters showed that the levels of dissolved minerals, generally expressed as total dissolved solids (TDS) or total filterable residue (TFR), were exceeding water quality objectives or would do so in the future unless appropriate controls were implemented. Nitrogen levels in the Santa Ana River, largely in the form of nitrate, were likewise projected to exceed objectives. As was discussed in Chapter 4, high levels of TDS and nitrate adversely affect the beneficial uses

of ground and surface waters. The mineralization of the Region's waters, and its impact on beneficial uses, remains a significant problem.

Each use of water adds an increment of dissolved minerals. Significant increments of salts are added by municipal and industrial use, and the reuse and recycling of the wastewater generated as it moves from the hydrologically higher areas of the Region to the ocean. Wastewater and recycled water percolated into groundwater management zones is typically pumped and reused a number of times before reaching the ocean, resulting in increased salt concentrations. The concentration of dissolved minerals can also be increased by evaporation or evapotranspiration. One of the principal causes of the mineralization problem in the Region is historic irrigated agriculture, particularly citrus, which in the past required large applications of water to land, causing large losses by evaporation and evapotranspiration. TDS and nitrate concentrations are increased both by this reduction in the total volume of return water and by the direct application of these salts in fertilizers. Dairy operations, which began in the Region in the 1950's and continue today, also contribute large amounts of salts to the basin.

The implementation chapters of the 1975 and 1983 Basin Plans focused on recommended plans to address the mineralization problem. The 1975 Plan initiated a total watershed approach to salt source control. Both Plans called for controls on salt loadings from all water uses including residential, commercial, industrial and agricultural (including dairies). The plans included: measures to improve water supply quality, including the import of high quality water from the State Water Project; waste discharge regulatory strategies (e.g., wasteload allocations, allowable mineral increments for uses of water); and recharge projects and other remedial programs to correct problems in specific areas. These Plans also carefully limited reclamation activities and the recycling of wastewaters into the local groundwater basins.

These salt management plans were developed using a complex set of groundwater computer models and programs, known collectively as the Basin Planning Procedure (BPP).

The modeling work focused on the upper Santa Ana Basin and, to a lesser extent, on the San Jacinto Basin, where the BPP was less developed and refined. The constituent modeled in those Plans was TDS.

For the salt management plan specified initially in the 1995 Basin Plan, when the Plan was adopted and approved in 1994 and 1995, modeling was conducted with the BPP for both the upper Santa Ana and San Jacinto Basins. However, most of the attention was again directed to the upper Santa Ana Basin, for which significant improvements to the BPP were made under a joint effort by the Santa Ana Watershed Project Authority, the Santa Ana River Dischargers Association, the Metropolitan Water District of Southern California, and the Regional Board. The most significant change to the BPP was the addition of a nitrogen modeling component so that projections of the nitrogen (nitrate) quality of groundwaters could be made, in addition to TDS. This enabled the development of a management plan for nitrogen, as well as TDS.

The BPP has not been used to model groundwater quality conditions in the lower Santa Ana Basin. For that Basin, the Regional Board's TDS and nitrogen management plans have relied, in large part, on the control of the quality of the Santa Ana River flows, which are a major source of recharge in the Basin. As discussed in Chapter 4, most of the baseflow (80-90%) is composed of treated sewage effluent; it also includes nonpoint source inputs and rising groundwater. Baseflow generally provides 70% or more of the water recharged in the Orange County Management Zone. In rare wet years, baseflow accounts for a smaller, but still significant, percentage (40%) of the recharge on an annual basis. Therefore, to protect Orange County groundwater, it is essential to control the quality of baseflow. To do so, baseflow TDS and nitrogen objectives are specified in this Plan for Reach 3 of the River. Wasteload allocations have been established and periodically revised to meet those and other Santa Ana River objectives.

For the 1983 Basin Plan, QUAL-II, a surface water model developed initially by the US EPA, was calibrated for the Santa Ana River and used to make detailed projections of River quality (TDS and nitrogen) and flow. The model was used to develop wasteload allocations for TDS and nitrogen discharges to the River that were approved as part of that Plan. (Wasteload allocations are discussed in detail in Section III of this Chapter). An updated version of the model, QUAL-2e, was used to revise these wasteload allocations, which were included as part of the initial salt management plan in the 1995 Basin Plan. The models were used to integrate the quantity and quality of inputs to the River from various sources, including the headwaters, municipal wastewater treatment plant discharges, and rising groundwater, based on the water supply and wastewater management plans used in the BPP. Data on rising groundwater quality and quantity were provided to the QUAL-II/2e models by the BPP. As with the BPP, the QUAL-II/2e model projections were used to identify water quality problems and to assess the effectiveness of changes in TDS and nitrogen management strategies.

## II. Update of the Total Dissolved Solids/Nitrogen Management Plan

The studies conducted to update the TDS/Nitrogen Management Plans in the 1983 and 1995 Basin Plans were not designed to validate or revise the TDS or nitrate-nitrogen objectives for groundwater. Rather, the focus of the studies was to determine how best to meet those established objectives. During public hearings to consider adoption of the 1995 Basin Plan, a number of water supply and wastewater agencies in the region commented that the TDS and nitrate-nitrogen objectives for groundwater should be reviewed, considering the estimated cost of complying with them (several billion dollars). In response, the Regional Board identified the review of these objectives as a high Basin Plan triennial review priority, and stakeholders throughout the Region agreed to provide sufficient resources to perform the necessary studies. In December 1995, these agencies, under the auspices of the Santa Ana Watershed Project Authority (SAWPA), formed the Nitrogen/Total Dissolved Solids (TDS) Task Force (Task Force) to undertake a watershed-wide study (Nitrogen/TDS Study) to review the groundwater objectives and the TDS/Nitrogen Management Plan in the Basin Plan as a whole. SAWPA managed the study, and Risk Sciences and Wildermuth Environmental, Inc., served as project consultants. Major tasks included review of the groundwater

subbasin boundaries, development of recommendations for revised boundaries, development of appropriate TDS and nitrate-nitrogen objectives for the subbasins (management zones), and update of the TDS and TIN wasteload allocations to ensure compliance with both the established objectives for the Santa Ana River and tributaries and the recommended groundwater objectives. A complete list of all tasks completed in Phases 1A & 1B and 2A & 2B is included in the Appendix. The Task Force effort resulted in substantive proposed changes to the Basin Plan, including new groundwater management zones (Chapter 3) and new nitrate-nitrogen and TDS objectives for the management zones (Chapter 4). These changes necessitated the update and revision of the TDS/Nitrogen Management Plan, which is described below.

The Task Force studies, including the technical methods employed, are documented in a series of reports (Ref. 1-5). The Task Force studies differed from prior efforts to review the TDS and nitrogen management plans in that the BPP was not utilized. A revised model approach, not involving use of the QUAL-2e model, was used to update the wasteload allocations for the Santa Ana River. The Task Force concluded that the BPP no longer remained a viable tool for water quality planning purposes, and also concluded that the development of a new model was beyond the scope and financial capabilities of the Task Force. The efficacy of modeling to formulate and update salt management plans in this Region has been well demonstrated; in the future, priority should be given to the development of a new model that would assist with future Basin Plan reviews.

## III. TDS/Nitrogen Management Plan

TDS and nitrogen management in this Region involves both regulatory actions by the Regional Board and actions by other agencies to control and remediate salt problems. Regulatory actions include the adoption of appropriate TDS and nitrogen limitations in requirements issued for waste disposal and municipal wastewater recycling, and the adoption of waste discharge prohibitions. These regulatory steps are described earlier in this Chapter. Actions by other agencies include projects to improve water supply quality and the construction of groundwater desalters and brine lines to remove highly saline wastes from the watershed. The following sections discuss these programs in greater detail.

### A. Water Supply Quality

Water supply quality has a direct affect on the quality of discharges from municipal wastewater treatment plants, discrete industrial discharges, returns to groundwater from homes using septic tank systems, returns from irrigation of landscaping in sewered and unsewered areas, and returns to groundwater from commercial irrigated agriculture. Water supply quality is an important determinant of the extent to which wastewater can be reused and recycled without resulting in adverse impacts on affected receiving waters. This is particularly true for TDS, since it is a conservative constituent, less likely than nitrogen to undergo transformation and loss as wastewater is discharged or recycled, and typically more difficult than nitrogen to treat and remove.

Water supplies cannot be directly regulated by the Regional Board; however, limitations in waste discharge requirements, including NPDES permits, may necessitate efforts to improve source water quality. These efforts may include drilling new wells, implementing alternative blending strategies, importing higher quality water when it is available, and constructing desalters to create or augment water supplies.

Imported water supplies are an important part of salt management strategies in the region from both a quantity and quality standpoint. Imported water is needed by many agencies to supplement local sources and satisfy ever-increasing demands. The import of high quality State Water Project water, with a long-term TDS average less than 300 mg/L, is particularly essential. The use of State Water Project water allows maximum reuse of water supplies without aggravating the mineralization problem. It is also used for recharge and replenishment to improve the quality of local water supply sources, which might otherwise be unusable. Thus, the use of high quality State Water Project water in the Region has water supply benefits that extend far beyond the actual quantity imported.

In some cases, the TDS quality of water supplies in a wastewater treatment service area may make it infeasible for the discharger to comply with TDS limits specified in waste discharge requirements. In other cases, the discharger may add chemicals that enable compliance with certain discharge limitations, but also result in TDS concentrations in excess of waste discharge requirements. The Board recognizes these problems and incorporates provisions in waste discharge requirements to address them. These and other aspects of the Board's regulatory program are described next.

## B. TDS and Nitrogen Regulation

As required by the Water Code (Section 13263), the Regional Board must assure that its regulatory actions implement the Basin Plan. Waste discharge requirements must specify limitations that, when met, will assure that water quality objectives will be achieved. Where the quality of the water receiving the discharge is better than the established objectives, the Board must assure that the discharge is consistent with the state's antidegradation policy (SWRCB Resolution No. 68-16). The Regional Board must also separately consider beneficial uses, and where necessary to protect those uses, specify limitations more stringent than those required to meet established water quality objectives. Of course, these obligations apply not only to TDS and nitrogen but also to other constituents that may adversely affect water quality and/or beneficial uses.

As indicated previously, the Regional Board's regulatory program includes the adoption of waste discharge prohibitions. The Board has established prohibitions on discharges of excessively saline wastes and, in certain areas, on discharges from subsurface disposal systems (see "Waste Discharge Prohibitions," above). The Board has also adopted other requirements pertaining to the use of subsurface disposal system use, both to assure public health protection and to address TDS and nitrogen-related concerns. These include the Regional Board's "Guidelines for Sewage Disposal from Land Developments" [Ref. 6], which are hereby incorporated by reference, and the

minimum lot size requirements for septic system use (see Nonpoint Source section of this Chapter).

However, the principal TDS and nitrogen regulatory tool employed by the Regional Board is the issuance of appropriate discharge requirements, in conformance with the legal requirements identified above. Several important aspects of this permitting program warrant additional discussion:

1. Salt assimilative capacity
2. Mineral increments
3. Nitrogen loss coefficients
4. TDS and nitrogen wasteload allocations
5. Wastewater reclamation
6. Special considerations – subsurface disposal systems

1. Salt Assimilative Capacity

Some waters in the Region have assimilative capacity for additions of TDS and/or nitrogen; that is, wastewaters with higher TDS/nitrogen concentrations than the receiving waters are diluted sufficiently by natural processes, including rainfall or recharge, such that the TDS and nitrogen objectives of the receiving waters are met. The amount of assimilative capacity, if any, varies depending on the individual characteristics of the waterbody in question.

The adoption of new groundwater management zone boundaries (Chapter 3) and new TDS and nitrate-nitrogen objectives for these management zones (Chapter 4), pursuant to the work of the Nitrogen/TDS Task Force, necessitated the re-evaluation of the assimilative capacity findings initially incorporated in the 1995 Basin Plan. To conduct this assessment, the Nitrogen-TDS study consultant calculated current ambient TDS and nitrate-nitrogen water quality using the same methods and protocols as were used in the calculation of historical ambient quality (see Chapter 4). The analysis focused on representing current water quality as a 20-year average for the period from 1978 through 1997. [Ref. 1]. For each management zone, current TDS and nitrate-nitrogen water quality were compared to water quality objectives (historical water quality)[1]. Assimilative capacity was also assessed relative to the "maximum benefit" objectives established for certain management zones. If the current quality of a management zone is the same as or poorer than the specified water quality objectives, then that management zone does not have assimilative capacity. If the current quality is better than the specified water quality objectives, then that management zone has assimilative capacity. The difference between the objectives and current quality is the amount of assimilative capacity available.

[1] As noted in Chapter 4, ammonia-nitrogen and nitrite-nitrogen data were also included in the analysis, where available. This occurred for a very limited number of cases and ammonia-nitrogen and nitrite-nitrogen concentrations were insignificant.

Tables 5-3 and 5-4 show the water quality objectives and the current ambient quality for TDS and nitrate-nitrogen, respectively, for each management zone. These tables also list the TDS and nitrate-nitrogen assimilative capacity of the management zones, if any. Of the thirty-seven (37) management zones, twenty-seven (27) lack assimilative capacity for TDS, and thirty (30) lack assimilative capacity for nitrate-nitrogen (this assumes the "maximum benefit" objectives are in effect). There are five (5) management zones for which there were insufficient data to calculate TDS and/or nitrate-nitrogen water quality objectives and, therefore, assimilative capacity. For regulatory purposes, these 5 management zones are assumed to have no assimilative capacity. Dischargers to these management zones may demonstrate that assimilative capacity for TDS and/or nitrate-nitrogen is available. If the Regional Board approves this demonstration, then the discharger would be regulated accordingly.

As indicated in Table 5-3, it will be assumed for most regulatory purposes that there is no assimilative capacity for TDS in the Orange County groundwater management zone. The 20 mg/L of management zone-wide TDS assimilative capacity calculated for this zone will be allocated to discharges resulting from groundwater remediation and other legacy contaminant removal projects implemented within the Orange County Management Zone.

Tables 5-3 and 5-4 show the assimilative capacity available in management zones for which "maximum benefit" objectives have been specified. As described in Chapter 4 and later in this Chapter, the application of these objectives is contingent on the implementation of certain projects and programs by specific dischargers as part of their maximum benefit demonstrations. Assimilative capacity created by these projects/programs will be allocated to the party(-ies) responsible for implementing them.

Chapter 3 delineates the Prado Basin Management Zone, and Chapter 4 identifies the applicable TDS and nitrogen objectives for this Zone (the objectives for the surface waters that flow in this Zone). No assimilative capacity exists in this zone.

These assimilative capacity findings are significant from a regulatory perspective. If there is assimilative capacity in the receiving waters for TDS, nitrogen or other constituents, a waste discharge may be of poorer quality than the objectives for those constituents for the receiving waters, as long as the discharge does not cause violation of the objectives and provided that antidegradation requirements are met. However, if there is no assimilative capacity in the receiving waters, such as the management zones identified in Tables 5-3 and 5-4, the numerical limits in the discharge requirements cannot exceed the receiving water objectives or the degradation process would be accelerated.[2] This rule was expressed clearly by the State Water Resources

[2] A discharger may conduct analyses to demonstrate that discharges at levels higher than the objectives would not cause or contribute to the violation of the established objectives. See, for example, the discussion of wasteload allocations for discharges to the Santa Ana River and its tributaries (Section III. B. 4.) If the Regional Board approves this demonstration, then the discharger would be regulated accordingly.

Control Board in a decision regarding the appropriate TDS discharge limitations for the Rancho Caballero Mobilehome park located in the Santa Ana Region (Order No. 73-4, the so called “Rancho Caballero decision”) [Ref. 7]. However, this rule is not meant to restrict overlying agricultural irrigation, or similar activities, such as landscape irrigation. Even in management zones without assimilative capacity, groundwater may be pumped, used for agricultural purposes in the area and returned to the management zone from which it originated.

In regulating waste discharges to waters with assimilative capacity, the Regional Board will proceed as follows. (see also Section III.B.6., Special Considerations – Subsurface Disposal Systems).

If a discharger proposes to discharge wastes that are at or below (i.e., better than) the current ambient TDS and/or nitrogen water quality, then the discharge will not be expected to result in the lowering of water quality, and no antidegradation analysis will be required. TDS and nitrogen objectives are expected to be met. Such discharges clearly implement the Basin Plan and the Board can permit them to proceed. Of course, other pertinent requirements, such as those of the California Environmental Quality Act (CEQA) must also be satisfied. For groundwater management zones, current ambient quality is as defined in Table 5-3 and Table 5-4, or as these Tables may be revised (through the Basin Plan amendment process) pursuant to the detailed monitoring program to be conducted by dischargers in the watershed (see Section V., Salt Management Plan – Monitoring Program Requirements).

If a discharger proposes to discharge wastes that exceed the current ambient TDS and/or nitrogen quality, then the Board will require the discharger to conduct an appropriate antidegradation analysis. The purpose of this analysis will be to demonstrate whether and to what extent the proposed discharge would result in a lowering of ambient water quality in affected receiving waters. That is, to what extent, if any, would the discharge use available assimilative capacity. If the discharger demonstrates that no lowering of water quality would occur, then antidegradation requirements are met, water quality objectives will be achieved, and the Regional Board can permit such discharges to proceed. If the analysis indicates that a lowering of current ambient water quality would occur, other than on a minor or temporally or spatially limited basis, then the discharger must demonstrate that: (1) beneficial uses would continue to be protected and the established water quality objectives would be met; and (2) that the resultant water quality would be consistent with maximum benefit to the people of California; and, (3) that best practicable treatment or control has been implemented. Best practical treatment or control means levels that can be achieved using best efforts and reasonable control methods. For affected receiving waters, the discharger must estimate the amount of assimilative capacity that would be used by the discharger. The Regional Board would employ its discretion in determining the amount of assimilative capacity that would be allocated to the discharger. Rather than allocating assimilative capacity, the Regional Board may require the discharger to mitigate or offset discharges that would result in the lowering of water quality.

Again, discharges to waters without assimilative capacity for TDS and/or nitrogen must be held to the objectives of the affected receiving waters (with the caveat identified in footnote 3 previous page). In some cases, compliance with management zone TDS objectives for discharges to waters without assimilative capacity may be difficult to achieve. Poor quality water supplies or the need to add certain salts during the treatment process to achieve compliance with other discharge limitations (e.g., addition of ferric chloride) could render compliance with strict TDS limits very difficult. The Regional Board addresses such situations by providing dischargers with the opportunity to participate in TDS offset programs, such as the use of desalters, in lieu of compliance with numerical TDS limits. These offset provisions are incorporated into waste discharge requirements. Provided that the discharger takes all reasonable steps to improve the quality of the waters influent to the treatment facility (such as through source control or improved water supplies), and provided that chemical additions are minimized, the discharger can proceed with an acceptable program to offset the effects of TDS discharges in excess of the permit limits.

Similarly, compliance with the nitrate-nitrogen objectives for groundwaters specified in this Plan would be difficult in many cases. Offset provision may apply to nitrogen discharges as well.

An alternative that dischargers might pursue in these circumstances is revision of the TDS or nitrogen objectives, through the Basin Plan amendment process. Consideration of less stringent objectives would necessitate comprehensive antidegradation review, including the demonstrations that beneficial uses would be protected and that water quality consistent with maximum benefit to the people of the State would be maintained. As discussed in Chapter 4 and later in this Chapter, a number of dischargers have pursued this “maximum benefit objective” approach, leading to the inclusion of “maximum benefit” objectives and implementation strategies in this Basin Plan. Discharges to areas where the “maximum benefit” objectives apply will be regulated in conformance with these implementation strategies. Any assimilative capacity created by the maximum benefit programs will be allocated to the parties responsible for implementing them.

Table 5-3
Total Dissolved Solids (TDS) Assimilative Capacity Findings

[2] Assimilative capacity created by "maximum benefit" objectives is allocated solely to agency(ies) responsible for "maximum benefit" implementation (see Section VI.).

2. Mineral Increments

The fundamental philosophy of TDS management plans in Santa Ana Region Basin Plans to date has been to allow a reasonable use of the water, to treat the wastewater generated appropriately, and to allow it to flow downstream (or to lower groundwater basins) for reuse. "Reasonable use" is defined in terms of appropriate mineral increments that can be applied to water supply quality in setting discharge limitations.

The Department of Water Resources has recommended values for the maximum use incremental additions of specific ions that should be allowed through use, based on detailed study of water supplies and wastewater quality in the Region [Ref. 8]. Their recommendations are as follows:

| | |
|---|---|
| Sodium | 70 mg/L |
| Sulfate | 40 mg/L |
| Chloride | 65 mg/L |
| TDS | 250 mg/L |
| Total Hardness | 30 mg/L |

These mineral increments were incorporated into the 1983 Basin Plan. They will be incorporated into waste discharge requirements when appropriate and necessary.

3. Nitrogen Loss Coefficients

The Regional Board's regulatory program has long recognized that some nitrogen transformation and loss can occur when wastewater is discharged to surface waters or reused for landscape irrigation. For example, the Total Inorganic Nitrogen (TIN) wasteload allocation adopted for the Santa Ana River in 1991 included unidentified nitrogen losses in the surface flows in Reach 3 of the River. Waste discharge requirements have allowed for nitrogen losses due to plant uptake when recycled water is used for irrigation.

In contrast, nitrogen has been considered a conservative constituent in the subsurface, not subject to significant transformation or loss, and no such losses have been identified or assumed for regulatory purposes.

One of the tasks included in the Nitrogen/TDS Task Force studies leading to the 2004 update of the N/TDS Management Plan was the consideration of subsurface transformation and loss. One objective of this task was to determine whether dischargers might be required to incur costs for additional treatment to meet the new groundwater management zone nitrate-nitrogen objectives (Chapter 4), or whether natural, subsurface nitrogen losses could achieve any requisite reductions. The second objective was to develop a nitrogen loss coefficient that could be used with certainty to develop appropriate limits for nitrogen discharges throughout the Region.

To meet these objectives, the Nitrogen/TDS study consultant, Wildermuth

Environmental, Inc. (WEI), evaluated specific recharge operations (e.g., the Orange County Water District recharge ponds overlying the Orange County Forebay), wastewater treatment wetlands (e.g., the Hidden Valley Wildlife Area, operated by the City of Riverside) and Santa Ana River recharge losses (for the Santa Ana River, water quality in reaches where recharge is occurring ("losing" reaches) was compared with local well data). In each case, WEI evaluated long-term (1954 to 1997) nitrogen surface water quality data and compared those values to long-term nitrogen data for adjacent wells.

Based on this evaluation, a range of nitrogen loss coefficients was identified. [Ref. 1] In light of this variability, the N/TDS Task Force recommended that a conservative approach to be taken in establishing a loss coefficient. The Task Force recommended that a region-wide default nitrogen loss of 25% be applied to all discharges that affect groundwater in the Region. The Task Force also recommended that confirmatory, follow-up monitoring be required when a discharger requested and was granted the application of a nitrogen loss coefficient greater than 25%, based on site-specific data submitted by that discharger.

The City of Riverside also presented data to the Task Force regarding nitrogen transformation and losses associated with wetlands. These data support a nitrogen loss coefficient of 50%, rather than 25%, for the lower portions of Reach 3 of the Santa Ana River that overlie the Chino South groundwater management zone. [Ref. 9]. In fact, the data indicate that nitrogen losses from wetlands in this part of Reach 3 can be greater than 90%. However, given the limited database, the Task Force again recommended a conservative approach, i.e., 50% in this area, with confirmatory monitoring.

The 25% and, where appropriate, 50% nitrogen loss coefficients will be used in developing nitrogen discharge limits. These coefficients will be applied to discharges that affect groundwater management zones with and without assimilative capacity.

For discharges to groundwater management zones with assimilative capacity, the TIN discharge limitation would be calculated as follows:

$$\text{TIN Discharge Limit (mg/)} = \frac{\text{management zone nitrate-nitrogen current ambient water quality}}{(1 - \text{nitrogen loss coefficient})}$$

The Regional Board will employ its discretion in specifying a higher TIN limit that would allocate some of the available assimilative capacity.

For discharges to groundwater management zones without assimilative capacity, the TIN discharge limitation would be calculated as follows:

$$\text{TIN Discharge Limit (mg/)} = \text{management zone nitrate-nitrogen water ambient water quality} \div (1 - \text{nitrogen loss coefficient})$$

These coefficients do not apply to discharges specifically addressed by the TIN wasteload allocation, described in the next section, since surface and subsurface nitrogen losses were accounted for in developing this allocation.

4. TDS and Nitrogen Wasteload Allocations for the Santa Ana River

Wasteload allocations for regulating discharges of TDS and total inorganic nitrogen (TIN) to the Santa Ana River, and thence to groundwater management zones recharged by the River, are an important component of salt management for the Santa Ana Basin. As described earlier, the Santa Ana River is a significant source of recharge to groundwater management zones underlying the River and, downstream, to the Orange County groundwater basin. The quality of the River thus has a significant effect on the quality of the Region's groundwater, which is used by more than 5 million people. Control of River quality is appropriately one of the Regional Board's highest priorities.

Sampling and modeling analyses conducted in the 1980's and early 1990's indicated that the TDS and total nitrogen water quality objectives for the Santa Ana River were being violated or were in danger of being violated. Under the Clean Water Act (Section 303(d)(1)(c); 33 USC 466 *et seq.*), violations of water quality objectives for surface waters must be addressed by the calculation of the maximum wasteloads that can be discharged to achieve and maintain compliance. Accordingly, TDS and nitrogen wasteload allocations were developed and included in the 1983 Basin Plan. The nitrogen wasteload allocation was updated in 1991; an updated TDS wasteload allocated was included in the 1995 Basin Plan when it was adopted and approved in 1994/1995.

The wasteload allocations distribute a share of the total TDS and TIN wasteloads to each of the discharges to the River or its tributaries. The allocations are implemented principally through TDS and nitrogen limits in waste discharge requirements issued to municipal wastewater treatment facilities (Publicly Owned Treatment Works or POTWs) that discharge to the River, either directly or indirectly[3]. Nonpoint source inputs of TDS and nitrogen to the River are also considered in the development of these wasteload allocations. Controls on these inputs are more difficult to identify and achieve and may be addressed through the areawide stormwater permits issued to the counties by the Regional Board or through other programs. For example, the Orange County Water District has constructed and operates more than 400 acres of wetlands ponds in the

[3] With some exceptions that may result from groundwater pumping practices, the ground and surface waters in the upper Santa Ana Basin (upstream of Prado Dam) eventually enter the Santa Ana River and flow through Prado Dam. Discharges to these waters will therefore eventually affect the quality of the River and must be regulated so as to protect both the immediate receiving waters and other affected waters, including the River.

Prado Basin Management Zone to remove nitrogen in flows diverted from, and then returned to, the Santa Ana River.

Because of the implementation of these wasteload allocations, the Orange County Water District wetlands and other measures, the TDS and TIN water quality objectives for the Santa Ana River at Prado Dam are no longer being violated, as shown by annual sampling of the River at the Dam by Regional Board staff [Ref. 10A]. However, as part of the Nitrogen/TDS Task Force studies to update the TDS/nitrogen management plan for the Santa Ana Basin, a review of the TDS and TIN wasteload allocations initially contained in this Basin Plan was conducted. In part, this review was necessary in light of the new groundwater management zones and TDS and nitrate-nitrogen objectives for those zones recommended by the N/TDS Task Force (and now incorporated in Chapters 3 and 4). The wasteload allocations were evaluated and revised to ensure that the POTW discharges would assure compliance with established surface water objectives and would not cause or contribute to violation of the groundwater management zone objectives. The Task Force members also recognized that this evaluation was necessary to determine the economic implications of assuring conformance with the new management zone objectives. Economics is one of the factors that must be considered when establishing new objectives (Water Code Section 13241).

WEI performed the wasteload allocation analysis for both TDS and TIN [Ref. 3, 5], In contrast to previous wasteload allocation work, the QUAL-2e model was not used for this analysis. Further, the Basin Planning Procedure (BPP) was not used to provide relevant groundwater data. Instead, WEI developed a projection tool using a surface water flow/quality model and a continuous-flow stirred-tank reactor (CFSTR) model for TDS and TIN. The surface water Waste Load Allocation Model (WLAM) is organized into two major components – RUNOFF (RU) and ROUTER (RO). RU computes runoff from the land surface and RO routes the runoff estimated with RU through the drainage system in the upper Santa Ana watershed. Both the RU and RO models contain hydrologic, hydraulic and water quality components.

To ensure that all hydrologic regimes were taken into account, hydrologic and land use data from 1950 through 1999 were used in the analysis. The analysis took into account the TDS and nitrogen quality of wastewater discharges, precipitation and overland runoff, instream flows and groundwater. Off-stream and in-stream percolation rates, rising groundwater quantity and quality, and the 25% and 50% nitrogen loss coefficients described in the preceding section were also factored into the analysis. The purpose of the modeling exercise was to estimate discharge, TDS and TIN concentrations in the Santa Ana River and tributaries and in stream bed recharge. These data were then compared to relevant surface and groundwater quality objectives to determine whether changes in TDS and TIN regulation were necessary.

Discharges from POTWs to the Santa Ana River or its tributaries were the focus of the analysis. POTW discharges to percolation ponds were not considered. The wasteload allocation analysis assumed, correctly, that these direct groundwater discharges will be

regulated pursuant to the management zone objectives, findings of assimilative capacity and nitrogen loss coefficients identified in Chapter 4 and earlier in this Chapter.

The surface waters evaluated included the Santa Ana River, Reaches 3 and 4, ChinoCreek, Cucamonga/Mill Creek and San Timoteo Creek. Management zones that are directly under the influence of these surface waters and that receive wastewater discharges were evaluated. These included the San Timoteo, Riverside A, Chino South, and Orange County Management Zones[4]. In addition, wastewater discharges to the Prado Basin Management Zone were also evaluated.

WEI performed three model evaluations in order to assess wasteload allocation scenarios through the year 2010. These included a "baseline plan" and two alternative plans ("2010-A" and "2010-B"). The baseline plan generally assumed the TDS and TIN limits and design flows for POTWs specified in waste discharge requirements as of 2001. These limits implemented the wasteload allocations specified in the 1995 Basin Plan when it was approved in 1995. A TDS limit of 550 mg/L was assumed for the Rapid Infiltration and Extraction Facility (RIX) and the analysis assumed a 540 mg/L TDS for the City of Beaumont. The baseline plan also assumed reclamation activities at the level specified in the 1995 Basin Plan, when it was approved. The purpose of the baseline plan assessment was to provide an accurate basis of comparison for the results of evaluation of the two alternative plans. For alternative 2010-A, it was generally assumed that year 2001 discharge effluent limits for TDS and TIN applied to POTW discharges, but projected year 2010 surface water discharge amounts were applied. TDS limits of 550 mg/L and 540 mg/L were again assumed for RIX and the City of Beaumont discharges. The same limited reclamation and reuse included in the baseline plan was assumed (see Table 5-7 in Section III.B.5.). For alternative 2010-B, POTW discharges were also generally limited to the 2001 TDS and TIN effluent limits (RIX was again held to 550 mg/L and Beaumont to 540 mg/L). However, in this case, large increases in wastewater recycling and reuse were assumed (Table 5-7), resulting in the reduced surface water discharges projected for 2010.

Analysis of the model results demonstrated that the TDS and nitrogen objectives of affected surface waters would be met and that water quality consistent with the groundwater management zone objectives would be achieved under both alternatives. It is likely that water supply and wastewater agencies will implement reclamation projects with volumes that are in the range of the two alternatives. The wasteload allocations would be protective throughout the range of surface water discharges identified. The year 2010 flow values are not intended as limits on POTW flows; rather, these flows were derived from population assumptions and agency estimates and are

[4] The City of Beaumont discharges to Coopers Creek in a subunit of the Beaumont Management Zone. However, for analytical and regulatory purposes, it is considered a discharge to the San Timoteo Management Zone since it enters that Management Zone essentially immediately. Recharge of wastewater discharges by YVWD and Beaumont in downgradient management zones that may be affected by surface water discharges (e.g., Bunker Hill B, Colton), is not expected to be significant. Therefore, these management zones were not evaluated as part of the wasteload allocation analysis.

used in the models for quality projections. Surface water discharges significantly different than those projected will necessitate additional model analyses to confirm the propriety of the allocations.

The wasteload allocations for TDS and TIN are specified in Table 5-5. Allocations based on the 2010-A and 2010-B alternatives are shown for both TDS and TIN to reflect the expected differences in surface water discharge flows that would result from variations in the amount of wastewater recycling actually accomplished in the Region. As shown in this Table, irrespective of these differences, the TDS and TIN allocations remain the same.

It is essential to point out that the wasteload allocations in Table 5-5 will be not be used to specify TDS and TIN effluent limitations for wastewater recycling (reuse for irrigation) and recharge by the listed POTWs, but will be applied only to the surface water discharges by these POTWs to the Santa Ana River and its tributaries. TDS and TIN limitations for wastewater recycling and recharge by these POTWs will be based on the water quality objectives for affected groundwater management zones or, where appropriate, surface waters. These limitations are likely to be different than the wasteload allocations specified in Table 5-5.

For most dischargers, the allocations specified in Table 5-5 are the same as those specified in the prior 1995 Basin Plan TDS and TIN wasteload allocations. However, for certain dischargers, two sets of TDS and TIN wasteload allocations are shown in Table 5-5. One set is based on the assumption that the “maximum benefit” objectives defined in Chapter 4 for the applicable groundwater management zones are in effect. The other set of wasteload allocations applies if maximum benefit is not demonstrated and the antidegradation objectives for these management zones are therefore in effect. Maximum benefit implementation is described in Section VI. of this Chapter.

In addition, in contrast to the prior wasteload allocations, a single wasteload allocation for TDS and TIN that would be applied on a flow-weighted average basis to all of the treatment plants operated by the Inland Empire Utilities Agency as a whole is specified. These allocations are based on the water quality objectives for Chino Creek, Reach 1B (550 mg/L TDS and 8 mg/L TIN), to which the IEUA discharges occur, directly or indirectly. As described in Section VI, IEUA proposes to implement a “maximum benefit” program to support the implementation of the “maximum benefit” TDS and nitrate-nitrogen objectives for the Chino North and Cucamonga Management Zones. Separate “maximum benefit” and “antidegradation” wasteload allocations are not necessary for IEUA, as they are for YVWD and Beaumont. This is because the IEUA wasteload allocations are based solely on the Chino Creek objectives and are not contingent on “maximum benefit” objectives or implementation. The IEUA surface water discharges do not affect the groundwater management zones for which “maximum benefit” objectives are to be implemented.

Finally, the TDS wasteload allocation for the RIX facility is less stringent (550 mg/L) than the prior wasteload allocation. The new allocation will assure beneficial use protection and

will not result in a significant lowering of water quality. As such, it is consistent with antidegradation requirements. Given this, the less stringent effluent limitation can be specified pursuant to the exception to the prohibition against backsliding established in the Clean Water Act, Section 303(d)(4)(a).

In most cases, the surface water discharges identified in Table 5-5 will affect or have the potential to affect groundwater management zones without assimilative capacity for TDS and/or nitrogen. As discussed earlier in this section, the lack of assimilative capacity normally dictates the application of the water quality objectives of the affected receiving waters as the appropriate waste discharge limitations. However, as shown in Table 5-5, the TIN and, in some cases, TDS wasteload allocations for these discharges exceed the objectives for these management zones. This is because the wasteload allocation analysis conducted by WEI demonstrated that POTW discharges at these higher-than-objective levels will not result in violations of the TDS and nitrate-nitrogen objectives of the affected management zones, or surface waters. Accordingly, these wasteload allocations will be used for surface water discharge regulatory purposes, rather than the underlying groundwater management zone objectives. If the extensive monitoring program to be conducted by the dischargers (see Salt Management Plan – Monitoring Program Requirements, below) indicates that this strategy is not effective, then this regulatory approach will be revisited and revised accordingly.

Table 5-5

Alternative Wasteload Allocations through 2010
based on "Maximum Benefit" or "Antidegradation" Water Quality[1]

| Publicly Owned Treatment Works (POTW) | Alternative 2010A – Reclamation in 1995 Basin Plan | | | Alternative 2010B – Reclamation Plans Advocated by POTWs/others | | |
|---|---|---|---|---|---|---|
| | Surface Water Discharge (MGD) | TDS (mg/L) | TIN (mg/L) | Surface Water Discharge (MGD) | TDS (mg/L) | TIN (mg/L) |
| Beaumont – "max benefit" [2] | 2.3 | 490 | 6.0 | 1.0 | 490 | 6.0 |
| Beaumont – "antideg" [2, 3] | 2.3 | 320[3] | 4.1[3] | 1.0 | 320[3] | 4.1[3] |
| YVWD – Wochholz – "max benefit" | 5.7 | 540 | 6.0 | 0.0 | 540 | 6.0 |
| YVWD – Wochholz – "antideg" [3] | 5.7 | 320[3] | 4.1[3] | 0.0 | 320[3] | 4.1[3] |
| Rialto | 12.0 | 490 | 10.0 | 10.0 | 490 | 10.0 |
| RIX | 49.4 | 550 | 10.0 | 28.2 | 550 | 10.0 |
| Riverside Regional WQCP | 35.0 | 650 | 13.0 | 26.1 | 650 | 13.0 |
| Western Riverside Co. WWTP | 4.4 | 625 | 10.0 | 3.3 | 625 | 10.0 |
| EMWD[4] | 43 | 650 | 10.0 | 6.0 | 650 | 10.0 |
| EVMWD – Lake Elsinore Regional | 7.2 | 700 | 13.0 | 2.0 | 700 | 13.0 |
| Lee Lake WRF | 1.6 | 650 | 13.0 | 1.6 | 650 | 13.0 |
| Corona WWTP # 1 | 3.6 | 700 | 10.0 | 2.0 | 700 | 10.0 |
| Corona WWTP # 2 | 0.2 | 700 | 10.0 | 0.5 | 700 | 10.0 |
| Corona WWTP # 3 | 2.0 | 700 | 10.0 | 0.5 | 700 | 10.0 |
| IEUA Facilities [5] | 80.0 | 550 | 8.0 | 37.4 | 550 | 8.0 |

1. "Antidegradation" wasteload allocation is the default allocation if the Regional Board determines that "maximum benefit" commitments are not being met.
2. Beaumont discharges to Coopers Creek, a tributary of San Timoteo Creek, Reach 4, it is a *de facto* discharge to San Timoteo Creek/San Timoteo Management Zone.
3. "Antidegradation" wasteload allocations for City of Beaumont and YVWD based on additional model analysis performed by WEI (WEI, October 2002).
4. EMWD discharges are expected to occur only during periods of wet weather.
5. IEUA facilities include the RP#1, Carbon Canyon WRP, RP#4 and RP#5; These facilities are to be regulated as a bubble (see text).

Ammonia

Total inorganic nitrogen is used for regulatory purposes in wasteload allocations and surface water discharge limits. It is the sum of nitrate, nitrite and ammonia. Ammonia dissociates under certain conditions to the toxic un-ionized form. Thus, nitrogen discharges to the Santa Ana River and other surface waters pose a threat to aquatic life and instream beneficial uses, as well as to the beneficial uses of affected groundwater.

Un-ionized ammonia objectives are specified in Chapter 4 of this Basin Plan for warmwater aquatic habitats, such as the Santa Ana River system. Table 5-6 specifies the ammonia limits necessary to achieve these objectives. These limits were derived using QUAL2E, the Colorado Ammonia Model, water quality data on the River and effluent quality.

The un-ionized ammonia objectives have not been approved by the United States Environmental Protection Agency (USEPA), which recommends that the objectives be reviewed and revised based on the Agency's revised national ammonia criteria. A review of the un-ionized ammonia objectives is included in the Regional Board's 2002 Triennial Review Priority List. Any revised objectives and revised ammonia effluent limits needed to achieve the revised objectives will be incorporated in future amendments to this Plan once the requisite review is completed.

Table 5-6
Effluent Limits for Total Ammonia Nitrogen[1]

| Discharge Location | Effluent Limit - Total Ammonia Nitrogen[2] (mg/L) | |
|---|---|---|
| | Year 1995 | Year 2000 |
| San Timoteo Wash | 5.0 | 4.5 |
| Santa Ana River - Reach 4 | 5.0 | 4.5 |
| Santa Ana River - Reach 3 | 5.0 | 5.0 |
| Chino Creek | 5.0 | 4.5 |
| Mill Creek (Prado Area) | 5.0 | 4.5 |
| Temescal Creek | 5.0 | 4.5 |
| Other **WARM** designated waterbodies | Determined on a case-by-case basis | |

[1] Total Ammonia Nitrogen Wasteload Allocation is specified in order to meet the site-specific Santa Ana River un-ionized ammonia objective (See Chapter 4).

[2] Total Ammonia Nitrogen = Un-ionized Ammonia Nitrogen ($NH_3$-N) Ammonium Nitrogen ($NH_4^+$-N).

## 5. Wastewater Reclamation

Reclamation of wastewater for reuse (recycled water) is an important feature of wastewater and water management for the Santa Ana Region. The California Legislature has declared the primary interest of the people of California in the development of facilities to recycle wastewater to supplement existing water supplies and to meet future water demands (Water Code Section 13510-13512). State policy (State Board Resolution No. 77-1) affirms this commitment to encourage recycled water use. However, because reclamation projects tend to add to the salt balance problem in the Region, they must be carefully planned and implemented. The significant benefits that result from such projects, include:

- The total water supply can be effectively increased, reducing the need for imports;
- Wastewater treatment costs can be reduced in some cases. Meeting the level of treatment required for discharge to surface waters may be more expensive than treating the effluent for use in irrigation;
- Stream flows can be established or enhanced, providing aquatic riparian habitat and allowing recreation and other beneficial uses of the stream;
- Downstream delivery commitments can often be met by discharges of appropriately treated wastewater.

Concerns related to wastewater reclamation projects include:

### 1. Mineral Quality Effects

The mineral quality of the receiving water (surface or groundwater) can be adversely affected. Each cycle of water use increases the salinity of the water. The amount of the increase depends on the type of use; normal domestic use generally adds 200-300mg/L of TDS to the initial concentration. Agricultural use generally doubles the salinity, while industrial uses most often degrade water quality to a level where it may be unsuitable for discharge. Therefore, it is important that the type of reclaimed wastewater use and the likely effects on water quality be evaluated carefully prior to initiating such reuse. Certain waters in the upper Santa Ana Basin do not have assimilative capacity to accept the additional salinity that would be expected to result from reclamation.

### 2. Public Health Effects

Municipal wastewaters contain significant concentrations of bacteria, viruses, and organics. These wastewaters must be treated extensively to remove pathogens before they can be reclaimed. Stable organics in reclaimed water are also cause for considerable concern. Chlorination of treated wastewater effluents can

produce chlorinated hydrocarbons, some of which are carcinogenic. For this reason, the California State Department of Health Services is concerned with proposals that would return a high proportion of treated wastewater effluent into domestic water supply aquifers. Adequate treatment and dilution of the wastewater is essential. The Department is developing guidelines for the purposed use of reclaimed wastewater for groundwater recharge.

Because of the high percentage of wastewater in river baseflow, the Santa Ana River Water Quality and Health (SARWQH) Study was initiated by OCWD in 1994 to evaluate the use of the Santa Ana River to recharge the Orange County groundwater basin. The goal of the SARWQH Study was to characterize the quality of the Santa Ana River water and the quality of the groundwater basin it recharges. The study included an examination of hydrogeology, microbiology, water chemistry, toxicology and public health. The results of the study indicate that current recharge practices using Santa Ana River water are protective of public health.

3. Land Use Considerations

One of the major problems facing the future of wastewater reclamation is a decrease in the total amount of agricultural land in the basin. As the population of the basin increases, commercial and residential developments eliminate agricultural land and the need for irrigation waters. Some reclaimed wastewater may be used for irrigating landscaping in the new developments, but the volume utilized will almost certainly be reduced.

4. The Prado Settlement

On October 18, 1963, the Orange County Water District filed a class action lawsuit against the water users in the upper Santa Ana Basin, seeking an adjudication of water rights against substantially all the water users in the area tributary to Prado Dam in the Santa Ana River watershed. As a result of the 1969 settlement of this case, the wastewater dischargers in the upper basin are required to provide 42,000 acre-feet at Prado Dam. This can consist of treated wastewater effluent or imported water as well as certain natural flows (*e.g.,* rising water); stormflows are not included. The amount of flow delivered is subject to adjustment based upon the TDS content of the water. Reclamation uses within the upper basin are thus limited to a degree by the need to ensure compliance with this settlement.

Wastewater is presently being reclaimed in the Santa Ana Watershed in a number of different ways:

1. Irrigation of Agricultural Land and Landscaping

Most of the direct reclamation of wastewater in the Region occurs as part of commercial agricultural and landscape irrigation, although this will change as recharge projects using recycled water are implemented (see below). This use is conducted under water reclamation requirements issued by the Regional Board, typically as part of Waste Discharge Requirements and NPDES permits. In the San Jacinto Watershed, most of the wastewater is reclaimed for agricultural uses.

2. Discharge to the Santa Ana River

Although it is not widely considered as such, discharges of treated wastewater to Reaches 3, 4 and 5 of the Santa Ana River constitute the largest single reclamation activity in the Region. These discharges make up as much as 95 percent of the river's dry weather flow and enhance the in-stream beneficial uses of the river throughout its 26-mile length (San Bernardino to Prado Dam). Essentially all of this water is recharged into the groundwater basin in Orange County

3. Groundwater Recharge by Percolation

This type of reclamation is common throughout the Region. Most wastewater treatment plants that do not discharge directly to the River discharge their effluent to percolation ponds. All of the treated wastewater in the upper Santa Ana Basin that is not directly reclaimed for commercial agricultural and landscape irrigation purposes, or discharged directly to the Santa Ana River, is returned to local or downstream groundwater management zones by percolation. In Orange County, reclaimed water is used for greenbelt and landscape irrigation, and injected into coastal aquifers to control sea water intrusion.

Significant additional reclamation activities are planned in the Region, as reflected in Table 5-7. The Chino Basin Watermaster, Inland Empire Utilities Agency, Yucaipa Valley Water District, the City of Beaumont and the San Timoteo Watershed Management Authority propose to implement extensive groundwater recharge projects using recycled water. To accommodate these projects and other water and wastewater management strategies, these agencies have made the requisite demonstrations necessary to support the "maximum benefit" TDS and nitrate-nitrogen water quality objectives specified in this Plan for certain groundwater management zones (see Chapter 4). The recharge projects will provide reliable sources of additional water supply needed to support expected development within the agencies' areas of jurisdiction. These agencies' "maximum benefit" programs are described in detail in Section VI. of this Chapter.

In Orange County, significant reclamation activities include the implementation of the Groundwater Replenishment System, a joint effort of the Orange County Water District and Orange County Sanitation District. Treated wastewater provided by the Sanitation District will receive extensive advanced treatment, including microfiltration, reverse osmosis, and disinfection using ultraviolet light and hydrogen peroxide. In the first phase of the project, approximately 70,000 acre-feet per year of highly treated recycled water will be produced and distributed to groundwater recharge facilities and to injection wells used to maintain a seawater intrusion barrier. The System will enhance both the quality and quantity of groundwater resources, the major source of water supply in the area. It will reduce the need for imported water and prevent, or at least delay, the need for an additional ocean outfall for disposal of the wastewater treated by the Sanitation District. Implementation of the GWR System will be phased**.** Operation of Phase 1 will begin in 2007. Future phases to expand the capacity of the GWR System are possible.

4. Dual Water Supply Systems

Given increasing demands for water supply but diminishing resources, there is great interest in using reclaimed water in office buildings and the like for flushing toilets and urinals. Clearly, the addition of this water supply source must be carefully planned and overseen to prevent public health problems. No dual systems have been implemented as yet in the upper basin; in Orange County, the Irvine Ranch Water District has implemented dual systems (a reclaimed water system in addition to a potable supply) in a number of office buildings in its service area, with the approval of the Department of Health Services and the Regional Board.

The Salt Management Plan draws a balance between the benefits and problems of reclamation by including carefully planned reclamation activities in the watershed. The Recommended Plan provides for reclamation within the upper basin, as shown in Table 5-7. All recycled water recharge projects will be regulated pursuant to the process identified in the discussion regarding assimilative capacity, and in accordance with the “maximum benefit” implementation strategies identified later in this Chapter (see section VI., Maximum Benefit Implementation Plans for Salt Management).

Recycled water used for landscape irrigation deserves special regulatory consideration. As discussed in the section on nitrogen loss coefficients, the Regional Board does not regulate nitrogen in recycled water used for landscape irrigation, recognizing the nitrogen losses that will occur as the result of plant uptake. The Nitrogen /TDS Task Force sponsored update of the TDS/Nitrogen Management Plan demonstrated that it is appropriate also to apply a 25 percent nitrogen loss coefficient to recycled water discharges applied to land to account for subsurface transformation and loss. Nitrogen losses due to plant uptake and subsurface transformation justify the Board’s regulatory approach. With respect to TDS, the

water quality effects of recycled water used for landscape irrigation will be evaluated on a case-by-case basis and regulated accordingly.

6. Special Considerations – Subsurface Disposal Systems

In addition to establishing prohibitions and minimum lot size requirements for the use of subsurface disposal systems for sanitary wastes, the Regional Board issues waste discharge requirements where necessary to assure the protection of water quality and public health. In most cases, these requirements have been issued for commercial and industrial facilities, including mobile home parks, RV parks and truck washing operations, where the volume of waste is high and/or there is the potential for the discharge of wastes other than domestic sewage. Waste discharge requirements for individual residential systems and low volume (less than 500 gallons per day) domestic waste discharges from industrial and commercial facilities have been largely waived, pursuant to the waiver provisions of the Water Code (see discussion of waivers in the "Implementation through Waste Discharge Requirements" section, above). These waivers are conditional and may be revoked by the Regional Board at any time.

The Board has included TDS limitations in these waste discharge requirements in order to assure that the discharges are consistent with the TDS objectives of the affected receiving waters. These limits are expressed as both a maximum value that is based on the TDS objective of the receiving water, and a value that allows a reasonable use increment of 250 mg/L TDS above water supply quality. The more restrictive of the two TDS limits controls the allowed quality of the discharges.

TDS and nitrogen contributions from domestic waste discharges to existing commercial, industrial and residential subsurface disposal systems are reflected in the determinations of current ambient ground water quality and assimilative capacity (see preceding section – B.1.) on salt assimilative capacity). These determinations were made as part of the N/TDS Task Force sponsored update of the TDS/nitrogen management plan in this Basin Plan. These contributions are expected to decline over time as these discharges are eliminated through the expansion of regional sewer systems.

Compliance with TDS limits by these facilities is particularly problematic, since these facilities typically have little or no control over the TDS quality of water supplied to them, unlike POTWs. Further, sewering of the discharges is often not an option, at least at the present time, although this is changing as rapid new development in many parts of the region continues to drive the expansion of sewer facilities. As systems expand, many of these discharges will be eliminated as they are connected to the sewers. Finally, the offset provisions that are applied to POTWs are unnecessary for existing residential commercial and industrial domestic waste discharges, given that they are addressed as part of the Regional Board's minimum

lot size program for subsurface disposal systems and through the updated TDS and nitrogen management plan in this Basin Plan as part of the overlying land-use considerations and ambient water quality determinations.

Taking these factors into consideration, the waste discharge requirements that have been issued and will be updated periodically for domestic waste discharges from these existing residential, commercial and industrial facilities will include TDS requirements that specify a maximum mineral increment of 250 mg/L TDS to the water supply quality. This will assure reasonable use and prevent the disposal of highly saline wastes. Existing facilities are defined as those for which waste discharge requirements have been issued, or that have been built as of December 23, 2004.

Table 5-7
Wastewater Reclamation

| Subbasin (Management Zone) Receiving Reclaimed Water | Source | Amount AF/Y 2010-A[1] | Amount AF/Y 2010-B[2] |
|---|---|---|---|
| Beaumont MZ | Beaumont, City of | 250 | 1,500 |
| Yucaipa MZ | Yucaipa Valley Water District | -- | 6,400 |
| Bunker Hill B MZ | San Bernardino, City of and Colton, City of | 117 | 26,200 |
| Colton MZ | Rialto, City of | 200 | |
| Chino North MZ | IEUA RP-1 | 1,200 | 48,000 |
| Chino North MZ | IEUA RP-2A | 2,470 | |
| Chino North MZ | IEUA RP-4 | 3,300 | |
| Chino North MZ | California Institute for Men | 650 | 650 |
| Chino North MZ | Upland Golf Course | 31 | 31 |
| Temescal MZ | Corona, City of | 1,000 | 3,100 |
| | **TOTAL** | **9,218** | **86,000** |

[1] wastewater reclamation assumed in 2010-A is the same as that assumed in the 1995 Basin Plan when approved in 1994/1995 (also known as Table 5-7)

[2] wastewater reclamation assumed in 2010-B as identified by POTWs (see Ref. 3, 5).

## V. Other Projects and Programs

In addition to the regulatory efforts of the Regional Board described in the preceding section, water and wastewater purveyors and other parties in the watershed have implemented, and propose to implement, facilities and programs designed to address salt problems in the groundwater of the Region. These include the construction of brine lines and groundwater desalters, implementation of programs to enhance the recharge of high quality stormwater and imported water, where available, and re-injection of recycled water to maintain salt water intrusion barriers in coastal areas. These projects and programs are motivated by the need to protect and augment water supplies, as well as to facilitate compliance with waste discharge requirements.

### A. Brine Lines

There are two brine line systems in the Region, the Santa Ana Regional Interceptor (SARI) and the older Chino Basin Non-Reclaimable Line (NRL). These lines are used to transport brine wastes out of the basin for treatment and disposal to the ocean. They are a significant part of industrial waste management and essential for operation of desalters in the upper watersheds. The SARI Line was constructed and is owned by SAWPA. It is approximately 93 miles of 16 inch to 84 inch pipeline connected to the Orange County Sanitation District treatment facilities. SAWPA owns capacity rights in SARI downstream of Prado Dam. The line extends from the Orange County Line near Prado Dam northeast to the San Bernardino area. Recently, the SARI Line has been extended to serve the San Jacinto Watershed. SARI Reach 5 extends up the Temescal Canyon from the City of Corona to the Eastern Municipal Water District (EMWD) brine line terminus in the Lake Elsinore area. EMWD's Menifee Desalter and other high salinity discharges from EMWD and Western Municipal Water District now have access to the brine line.

The Chino Basin Non-Reclaimable Line (NRL) is connected to the Los Angeles County Sanitation District sewer system in the Pomona area. The NRL, which is owned and operated by Inland Empire Utilities Agency, exports non-reclaimable industrial wastes and brine from the Chino Basin. It extends eastward from the Los Angeles County Line to the City of Fontana. It was originally built to serve industries including the Kaiser Steel Company and Southern California Edison Power Plants.

### B. Groundwater Desalters

The studies leading to the development of the TDS/Nitrogen management plan included in this Basin Plan when it was approved in 1995 demonstrated that it was not realistic to achieve compliance with all the nitrogen and TDS objectives for the groundwater subbasins then identified within the Region. Long-term historic land use practices, particularly agriculture, have left an enormous legacy of salts that are now

in the unsaturated soils overlying the groundwater subbasins (now, newly defined groundwater management zones). A significant amount of these salts will, over time, degrade groundwater quality. The programs of groundwater extraction, treatment, an replenlishment needed to completely address these historic salt loads were shown to far exceed the resources available to implement them.

While the boundaries of the groundwater management zones have been revised and new TDS and nitrate-nitrogen water quality objectives established, the salt legacy problem remains. The construction and operation of groundwater desalters to extract and treat poor quality groundwater continues to be an essential component of salt management in the Region. Such projects will be increasingly important to protect local water supplies and to provide supplemental, reliable sources of potable supplies.

A number of groundwater desalters have already been constructed, and more are planned. These facilities are described below.

1. Upper Santa Ana Basin

In the Upper Santa Ana Basin, the Santa Ana Watershed Project Authority constructed and operates the Arlington desalter. This desalter, with a capacity of about 7 MGD, treats water extracted from the Arlington Management Zone, which was heavily impacted by historic agricultural activities.

In the Chino Basin, the Chino Desalter Authority operates the Chino 1 desalter, which is planned for expansion from 8 MGD to 13 MGD capacity. Additional desalters and desalter capacity will be constructed as part of a “maximum benefit” proposal by the Chino Basin Watermaster and the Inland Empire Utilities Agency (see Section VI., Maximum Benefit Implementation Plans for Salt Management).

The City of Corona began operation of the Temescal desalter in late 2001. The desalter has a capacity of 10 MGD. The City is currently expanding the desalter by 5 MGD. It is expected to be operational in the early 2004. The product water is used to supplement current municipal supplies. The improved TDS quality of these supplies is an important part of the City’s efforts to assure compliance with waste discharge requirements.

In the San Timoteo Watershed areas, desalters will be implemented as necessary for the Yucaipa and Beaumont areas, as discussed in detail in Section VI., Maximum Benefit San Timoteo Watershed Salt Management Plan.

2. San Jacinto Watershed

EMWD operates the Menifee desalter, which has a capacity of about 3 MGD. Product water is added to the EMWD municipal supply system, and the waste brine is discharged to a non-reclaimable waste disposal system that is ultimately connected to the SAWPA SARI system. The desalter extracts groundwater from the Perris South and Menifee Management Zones, both of which are adversely affected by historic salt loads contributed largely by agricultural activities.

EMWD plans to construct a desalter with capacity of about 4.5 MGD to treat poor quality water extracted from the Perris South and Lakeview/Hemet North Management Zones. The purpose of this facility is to stop subsurface migration of poor quality groundwater from the Perris South Management Zone into the Lakeview/Hemet North Management Zone.

3. Orange County

The Tustin Nitrate Removal project, which began operation in 1996, added approximately 3,000 acre-feet of water annually to Tustin's domestic water supply. Treatment systems employing reverse osmosis and ion exchange are operating at two wells that had been shut down because of excessive nitrate concentrations. The Orange County Water District and Irvine Ranch Water District (IRWD) are moving forward with the Irvine Desalter, a dual-purpose regional groundwater remediation and water supply project located in the City of Irvine and its sphere of influence. The project consists of an extensive seven-well groundwater extraction and collection system, a treatment system, a five-mile brine disposal pipeline, a finished water delivery system, and ancillary facilities. While providing approximately 6,700 acre-feet per year to IRWD for potable supply, the desalter will extract and treat brackish groundwater and capture an overlapping regional plume of TCE-contaminated groundwater demonstrated to have originated from the U.S. Marine Corps Air Station-El Toro.

C. Recharge of Stormwater and/or Imported Water

The Orange County Water District, San Bernardino Valley Water Conservation District and other agencies in the Region operate extensive facilities designed to enhance the capture and recharge of high quality stormwater. More such facilities are planned as part of "maximum benefit" proposals by the Chino Basin Watermaster/Inland Empire Utilities Agency, Yucaipa Valley Water District, San Timoteo Watershed Management Authority and the City of Beaumont (Section VI., Maximum Benefit Implementation Plans for Salt Management). These proposals also include efforts to import and recharge high quality State Water Project water, when it is available. These activities increase both the quantity and quality of available groundwater resources.

D. Sea Water Intrusion Barriers

The Orange County Water District operates advanced facilities designed to provide significantly enhanced tertiary treatment of secondary treated municipal wastewater from the Orange County Sanitation District's (Sanitation District) Fountain Valley Reclamation Plant No. 1. The recycled water is injected into a series of wells located along Ellis Avenue in the City of Fountain Valley to maintain the Talbert Gap Seawater Intrusion Barrier. The treatment facility, currently known as Water Factory 21, will be supplanted by the Groundwater Replenishment System (GWRS) being constructed jointly by Orange County Water District and the Sanitation District (see preceding section on wastewater reclamation).

## V. Salt Management Plan -- Monitoring Program Requirements

California Water Code Section 13242 specifies that Basin Plan implementation plans must contain a description of the monitoring and surveillance programs to be undertaken to determine compliance with water quality objectives. The adoption of new groundwater TDS and nitrate-nitrogen water quality objectives (Chapter 4) in response to the studies sponsored by the N/TDS Task Force triggered the need to develop and implement a new, watershed-wide nitrogen/TDS monitoring program. The Task Force provided additional impetus for this comprehensive monitoring program. The Task Force recommended that future review and update of the salt management plan, including findings of assimilative capacity, appropriate changes to the wasteload allocations, etc., should be based on real-time data obtained through a rigorous monitoring program, rather than on model projections. As discussed earlier (see Section II., Update of the Total Dissolved Solids/Nitrogen Management Plan), the Task Force concluded that the development of new, workable modeling tools to assist in this review was beyond the scope and financial capability of the Task Force.

The monitoring program must consist of both surface water and groundwater components. Some of these are already being implemented, including the annual sampling of the Santa Ana River, Reach 3 at Prado Dam by Regional Board staff (see Chapter 4 and below). Certain agencies have committed to conduct monitoring of specific water bodies as part of their "maximum benefit" proposals (see Section VI., Maximum Benefit Implementation Plans for Salt Management, below). The N/TDS Task Force members, and other parties as appropriate, will be required to propose a comprehensive monitoring program that would integrate these existing commitments with other monitoring recommendations. These parties will be required to implement this program upon approval by the Regional Board.

A. Surface Water Monitoring Program Requirements for TDS and Nitrogen

Implementation of a surface water monitoring program is needed to determine compliance with the nitrogen and TDS objectives of the Santa Ana River, and

thereby, the effectiveness of the wasteload allocations. It is also needed to provide data required to evaluate the effects of surface water discharges on affected groundwater management zones. In particular, data are needed to confirm the validity of the 50% nitrogen loss coefficient that will be applied in regulating discharges to that part of Reach 3 of the River that overlies the Chino South groundwater management zone (see Section III.B.3., Nitrogen loss coefficients).

As discussed in Chapter 4, the Basin Plan specifies baseflow TDS and total nitrogen objectives for Reach 3 of the River. For Reach 2, a TDS objective based on a five-year moving average of the annual TDS concentration is specified. Use of this moving average allows the effects of wet and dry years to be integrated over the five-year period and reflects the actual long-term quality of water recharged by Orange County Water District downstream of Prado Dam.

The Basin Plan specifies a monitoring program to determine compliance with the Reach 3 baseflow objectives at Prado Dam (see Chapter 4). As noted above, Regional Board staff conducts this program on an annual basis. Measurement of baseflow quality, rather than the quality of flows in Reach 2, has long been used to indicate the effects of recharge of Santa Ana River flows on Orange County groundwater. The efficacy of this approach was evaluated as part of the 2004 update of the TDS/nitrogen management plan in the Basin Plan. Insufficient data were available to draw a direct correlation between the long-term TDS and nitrogen quality of River flows at Prado Dam and that of affected Orange County groundwater. However, the conclusion drawn was that reliance on the Reach 3 baseflow objectives to protect Orange County groundwater, and the existing monitoring program designed to measure compliance, is adequate.

In addition to this baseflow sampling program and the surface water monitoring commitments associated with certain agencies' "maximum benefit" programs, the comprehensive monitoring program to be proposed and implemented by the Task Force members, and other agencies as appropriate, must include an evaluation of compliance with the TDS and nitrogen objectives for Reaches 2, 4 and 5 of the Santa Ana River. Compliance with the Reach 2 TDS objective can be determined by evaluation of data collected by the Santa Ana River Watermaster, Orange County Water District, the United States Geological Survey, and others.

Surface water monitoring program requirements for TDS and nitrogen are as follows:

1. No later than March 23, 2005, Orange County Water District, Inland Empire Utilities Agency, Chino Basin Watermaster, City of Riverside, City of Corona, Elsinore Valley Municipal Water District, Eastern Municipal Water District, City of Colton, City of San Bernardino Municipal Water Department, Jurupa Community Services District, Western Riverside County Regional Wastewater Authority, Lee Lake Water District, Yucaipa Valley Water District, City of Beaumont, the San Timoteo Watershed Management Authority and the City of Rialto shall submit to the Regional Board for approval, a proposed surface water TDS and nitrogen

monitoring program that will provide an evaluation of compliance with the TDS and nitrogen objectives for Reaches 2, 4 and 5 of the Santa Ana River.

In lieu of this coordinated monitoring plan, one or more of the parties identified in the preceding paragraph may submit an individual or group monitoring plan. Any such individual or group monitoring plan shall also be submitted no later than March 23, 2005.

2. By April 15th of each year, the Orange County Water District, Inland Empire Utilities Agency, City of Riverside, City of Corona, Elsinore Valley Municipal Water District, Eastern Municipal Water District, Lee Lake Water District, City of Colton, City of San Bernardino Municipal Water Department, Jurupa Community Services District, Western Riverside County Wastewater Agency, Yucaipa Valley Water District, City of Beaumont, the San Timoteo Watershed Management Authority and the City of Rialto, shall submit an annual report of Santa Ana River, Reach 2 , 4 and 5 water quality. Data evaluated shall include that collected by the Santa Ana River Watermaster, Orange County Water District, and the US Geologic Survey, at a minimum.

   In lieu of this coordinated annual report, one or more of the parties identified in the preceding paragraph may submit an individual or group annual report. Any such individual or group report shall also be submitted by April 15th of each year.

Additional surface water monitoring programs may be specified by the Regional Board depending upon watershed conditions, waste discharge specifications and/or any special studies related to TDS and nitrogen.

B. Groundwater Monitoring Program for TDS and Nitrogen

Implementation of a watershed-wide TDS/nitrogen groundwater monitoring program is necessary to assess current water quality, to determine whether TDS and nitrate-nitrogen water quality objectives for management zones are being met or exceeded, and to update assimilative capacity findings. Groundwater monitoring is also needed to fill data gaps for those management zones with insufficient data to calculate TDS and nitrate-nitrogen historical quality and current quality. Finally, groundwater monitoring is needed to assess the effects of POTW discharges to surface waters on affected groundwater. In particular, monitoring is needed to confirm the 50% nitrogen loss coefficient for discharges to that part of the Santa Ana River, Reach 3 that affect the Chino South Management Zone.

Groundwater monitoring requirements for TDS and nitrogen are as follows:

1. No later than June 23, 2005, Orange County Water District, Irvine Ranch Water District, Inland Empire Utilities Agency, Chino Basin Watermaster, City of Riverside, City of Corona, Elsinore Valley Municipal Water District, Eastern Municipal Water District, City of Colton, City of San Bernardino Municipal Water Department, City of

Redlands, Jurupa Community Services District, Western Riverside County Regional Wastewater Authority , Lee Lake Water District, Yucaipa Valley Water District, City of Beaumont, the San Timoteo Watershed Management Authority and the City of Rialto shall submit to the Regional Board for approval, a proposed watershed-wide TDS and nitrogen monitoring program that will provide data necessary to review and update the TDS/nitrogen management plan. Data to be collected and analyzed shall address, at a minimum: (1) determination of current ambient quality in groundwater management zones; (2) determination of compliance with TDS and nitrate-nitrogen objectives for the management zones; (3) evaluation of assimilative capacity findings for groundwater management zones; and (4) assessment of the effects of recharge of surface water POTW discharges on the quality of affected groundwater management zones. The determination of current ambient quality shall be accomplished using methodology consistent with that employed by the Nitrogen/TDS Task Force (20-year running averages) to develop the TDS and nitrogen water quality objectives included in this Basin Plan. [Ref. 1] The determination of current ambient groundwater quality throughout the watershed must be reported by July 1, 2005, and, at a minimum, every three years thereafter.

In lieu of this coordinated monitoring plan, one or more of the parties identified in the preceding paragraph may submit an individual or group monitoring plan. Any such individual or group monitoring plan shall also be due no later than June 23, 2005.

Details to be included in the proposed monitoring program shall include, but not be limited to, the following:

- Monitoring program goals
- responsible agencies
- groundwater water sampling locations
- surface water sampling locations (if appropriate)
- water quality parameters
- sampling frequency
- quality assurance/quality control
- database management
- data analysis and reporting

*Within 30 days of Regional Board approval of the proposed monitoring plan, the monitoring plan must be implemented.*

2. No later than June 23, 2005, the City of Colton, City of San Bernardino Municipal Water Department, City of Riverside, Jurupa Community Services District and the City of Rialto, shall submit to the Regional Board for approval, a monitoring program that will be utilized to confirm the 50% Santa Ana River, Reach 3 nitrogen loss coefficient.

In lieu of this coordinated monitoring plan, one or more of the parties identified in the preceding paragraph may submit an individual or group monitoring plan. Any such individual or group monitoring plan shall also be due no later than June 23, 2005.

*Within 30 days of Regional Board approval of the monitoring plan, the monitoring program must be implemented.*

Additional groundwater monitoring programs may be specified by the Regional Board depending upon watershed conditions, waste discharge specifications and/or any special studies related to TDS and nitrogen.

## VI. Maximum Benefit Implementation Plans for Salt Management

As discussed in Chapter 4, with some limited exceptions, TDS and nitrate-nitrogen objectives for groundwater management zones in the Santa Ana Region were established to ensure that historical quality is maintained, pursuant to the State's antidegradation policy (State Board Resolution No. 68-16). However, alternative, less stringent "maximum benefit" objectives are also specified in Chapter 4 for certain groundwater management zones. These "maximum benefit" objectives, which would allow the lowering of water quality, were established based on demonstrations by the agencies recommending them that antidegradation requirements were satisfied. First, these agencies demonstrated that beneficial uses would continue to be protected. Second, these agencies showed that water quality consistent with maximum benefit to the people of the state would be maintained. Other factors, such as economics, the need to use recycled water, and the need to develop housing in the area were also taken into account in establishing the objectives (see Chapter 4).

The demonstrations of "maximum benefit" by these agencies are contingent on the implementation of specific projects and programs by the agencies. As discussed in Chapter 4, if these projects and programs are not implemented to the Regional Board's satisfaction, then the alternative "antidegradation" objectives apply to these waters for regulatory purposes.

This section identifies the specific commitments by the Chino Basin Watermaster and Inland Empire Utilities Agency, the Yucaipa Valley Water District, the City of Beaumont and the San Timoteo Water Management Authority to implement projects and programs to support the "maximum benefit" objectives established for groundwater management zones affected by their wastewater and water management practices.

A. Salt Management – Chino Basin and Cucamonga Basin

As shown in Chapter 4, both "antidegradation" and "maximum benefit" objectives for TDS and nitrate-nitrogen are specified in this Plan for certain parts of the Chino Basin and the Cucamonga groundwater Management Zone. The application of the "maximum benefit" objectives relies on the implementation by the Chino Basin Watermaster and the Inland Empire Utilities Agency of a specific program of projects

and requirements [Ref. 10B], which are an integral part of the Chino Basin Optimum Basin Management Program (OBMP) [Ref. 10C]. The OBMP was developed by the Watermaster under the supervision of the San Bernardino County Superior Court. The OBMP is a comprehensive, long-range water management plan for the Chino Basin as a whole, including the Chino North (or Chino 1, 2, and 3) and Cucamonga Management Zones. The OBMP includes the use of recycled water for basin recharge, initially in the Chino North Management Zone. Recycled water recharge in the Cucamonga Management Zone may be pursued in the future. The OBMP also includes the capture of increased quantities of high quality storm water runoff, recharge of imported water when its TDS concentrations are low, improvement of water supply by desalting poor quality groundwater, and enhanced wastewater pollutant source control programs. The OBMP maps a strategy that will provide for enhanced yield for the Chino Basin and seeks to provide reliable water supplies for development expected to occur within the Basin. The OBMP also includes the implementation of management activities that would result in the hydraulic isolation of Chino Basin groundwater from the Orange County Management Zone, thus insuring the protection of downstream beneficial uses and water quality.

Table 5-8a identifies the projects and requirements that must be implemented to demonstrate that water quality consistent with maximum benefit to the people of the state will be maintained. An implementation schedule is also specified. The Regional Board will revise IEUA's waste discharge requirements, issue appropriate permits to the Chino Basin Watermaster, and utilize the authority provided by Section 13267 of the Water Code as necessary to require that these commitments be met. It is assumed that maximum benefit is demonstrated, and that the "maximum benefit" TDS and nitrate-nitrogen objectives apply to the Chino North and Cucamonga Management Zones as long as the schedule is being met. If the Regional Board determines that the maximum benefit program is not being implemented effectively in accordance with the schedule shown in Table 5-8a, then maximum benefit is not demonstrated, and the "antidegradation" TDS and nitrate-nitrogen objectives for the Chino 1, 2, and 3 and Cucamonga Management Zones apply. In this situation, the Regional Board will require mitigation for TDS and nitrate-nitrogen discharges to these management zones that took place in excess of limits based on the "antidegradation" objectives.

## *Table 5-8a*

Chino Basin Maximum Benefit Commitments

| **Description of Commitment** | **Compliance Date – as soon as possible, but no later than** |
|---|---|
| 1. Surface Water Monitoring Program | |
| a. Submit Draft Monitoring Program to Regional Board | a. January 23, 2005 |
| b. Implement Monitoring Program | b. Within 30 days from date of Regional Board approval of monitoring plan |
| c. Quarterly data report submittal | c. April 15, July 15, October 15, January 15 |
| d. Annual data report submittal | d. February 15th |
| 2. Groundwater Monitoring Program | |
| a. Submit Draft Monitoring Program to Regional Board | a. January 23, 2005 |
| b. Implement Monitoring Program | b. Within 30 days from date of Regional Board approval of monitoring plan |
| c. Annual data report submittal | c. February 15th |
| 3. Chino Desalters | |
| a. Chino 1 desalter expansion to 10 MGD | a. Prior to recharge of recycled water |
| b. Chino 2 desalter at 10 MGD design | b. Recharge of recycled water allowed once award of contract and notice to proceed issued for construction of desalter treatment plant |
| 4. Future desalters plan and schedule submittal | October 1, 2005 Implement plan and schedule upon Regional Board approval |
| 5. Recharge facilities (17) built and in operation | June 30, 2005 |
| 6. IEUA wastewater quality improvement plan and schedule submittal | 60 days after agency-wide 12 month running average effluent TDS quality equals or exceeds 545 mg/L for 3 consecutive months or agency-wide 12 month running average TIN equals or exceeds 8 mg/L in any month.<br>Implement plan and schedule upon approval by Regional Board. |

Table 5-8a

Chino Basin Maximum Benefit Commitments (cont.)

| **Description of Commitment** | **Compliance Date – as soon as possible, but no later than** |
|---|---|
| 7. Recycled water will be blended with other recharge sources so that the 5-year running average TDS and nitrate-nitrogen concentrations of water recharged are equal to or less than the "maximum benefit" water quality objectives for the affected Management Zone (Chino North or Cucamonga). | Compliance must be achieved by end of 5th year after initiation of recycled water recharge operations. |
| a. Submit a report that documents the location, amount of recharge, and TDS and nitrogen quality of stormwater recharge before the OBMP recharge improvements were constructed and what is projected to occur after the recharge improvements are completed | a. Prior to initiation of recycled water recharge |
| b. Submit documentation of amount, TDS and nitrogen quality of all sources of recharge and recharge locations. For stormwater recharge used for blending, submit documentation that the recharge is the result of CBW/IEUA enhanced recharge facilities. | b. Annually, by February 15th, after initiation of construction of basins/other facilities to support enhanced stormwater recharge. |
| 8. Hydraulic Control Failure | |
| a. Plan and schedule to correct loss of hydraulic control | a. 60 days from Regional Board finding that hydraulic control is not being maintained |
| b. Achievement and maintenance of hydraulic control | b. In accordance with plan and schedule approved by Regional Board. The schedule shall assure that hydraulic control is achieved as soon as possible but no later than 180 days after loss of hydraulic control is identified. |
| c. Mitigation plan for temporary failure to achieve/maintain hydraulic control | c. By January 23, 2005. Implement plan upon Regional Board determination that hydraulic control is not being maintained. |
| 9. Ambient groundwater quality determination | July 1, 2005 and every 3 years thereafter |

Description of Chino Basin Watermaster and Inland Empire Utilities Agency Commitments

1. Surface Water Monitoring Program (Table 5-8a #1)

The Chino Basin Watermaster (Watermaster), in conjunction with staff of the Orange County Water District and Regional Board, has developed a proposed surface water monitoring program. By January 23, 2005 and prior to the discharge of recycled water to the Chino Basin, Watermaster shall submit the recommended surface water monitoring program to the Regional Board for approval. The monitoring program must be implemented within 30 days of Regional Board approval, and six months of data must be generated prior to the discharge of recycled water to the Chino Basin.

At a minimum, the surface water monitoring program shall include the collection of bi-weekly measurements of general minerals and nitrogen components at the locations listed in Table 5-8b. Data reports shall be submitted to the Regional Board Executive Officer by April 15, July 15, October 15, and January 15 each year. An annual report summarizing all data collected for the year and evaluating compliance with relevant surface water objectives shall be submitted by February 15$^{th}$ of each year.

2. Groundwater Monitoring Program (Table 5-8a, #2)

The purpose of the Groundwater Monitoring Program is to (1) identify potential impacts from implementation of the Chino Basin "maximum benefit" water quality objectives on water levels and water quality within the Chino Basin and in downgradient basins and (2) determine whether hydraulic control (see # 8, below) is being achieved and maintained. By January 23, 2005 and prior to the discharge of recycled water to the Chino Basin, Watermaster shall submit to the Regional Board for approval a proposed groundwater monitoring program to determine hydraulic control and ambient water quality in the Chino North and Cucamonga Management Zones. Within 30 days of Regional Board approval of the monitoring plan, the groundwater monitoring program must be implemented.

An annual report, including all raw data and summarizing the results of the approved groundwater monitoring program, shall be submitted to the Regional Board by February 15$^{th}$ of each year.

3. Chino 1 and Chino 2 Desalters (Table 5-8a, # 3)

Prior to the recharge of recycled water in the Chino Basin, the Chino 1 desalter must be expanded and in operation at a capacity of 10 million gallons per day (MGD). Also, contracts for the construction of the Chino 2 desalter treatment plant must be awarded and a notice to proceed with the construction must be given prior to recharge of recycled water.

4. Future Desalter Development (Table 5-8a, # 4)

No later than October 1, 2005, the schedule for implementation of the next 20 MGD of desalter capacity, pursuant to the Peace Agreement that implements the Chino Basin OBMP, and as required by the San Bernardino Superior Court, must be submitted to the Regional Board by the Chino Basin Watermaster. IEUA and/or the Chino Basin Watermaster and/or other responsible parties deemed acceptable by the Executive Officer, will initiate building of the next desalter when the 12-month running average effluent concentration (measured as an average for all IEUA wastewater treatment facilities) reaches 545 mg/L TDS for three consecutive months.

(Source: Ref. 10B)

5. Recharge Facilities (Table 5-8a, # 5)

By June 30, 2005, or no later than one year from the start of discharge of recycled water, the 17 recharge facilities identified in the August 2001 Watermaster Recharge Master Plan and as updated by the Watermaster and IEUA, must be completed and operated to maximize the capture of storm water in the Chino Basin. The Watermaster has also committed to optimize the recharge of imported water in the Chino Basin based on the goal of maximizing recharge of State Project water when the TDS of that water is lowest.

The Watermaster proposal recognizes the importance and necessity of recharge of both storm water and imported water to meet the water supply demands on the Chino Basin. Recharge of high quality supplies to the Chino Basin is necessary to offset the quality effects of recycled water and to achieve an ambient water quality equal to or better than the "maximum benefit" TDS and nitrate-nitrogen water quality objectives.

6. IEUA Wastewater Effluent Quality (Table 5-8a, # 6)

Within 60 days after the IEUA 12-month running average effluent concentration (measured as an average for all IEUA wastewater treatment facilities) for TDS exceeds 545 mg/L for 3 consecutive months, or the 12-month running average total inorganic nitrogen (TIN) concentration (measured as an average for all IEUA wastewater treatment facilities) exceeds 8 mg/L in any month, the IEUA shall submit to the Regional Board a plan and time schedule for implementation of measures to insure that the12-month running average agency wastewater effluent quality does not exceed 550 mg/L and 8 mg/L for TDS and TIN, respectively. The Plan and schedule are to be implemented upon Regional Board approval.

7. Recycled Water Use (Table 5-8a, # 7)

The use and recharge of recycled water within the Chino Basin is a critical component of the Watermaster OBMP and is necessary to maximize the use of the water resources of the Chino Basin. The demonstration of maximum benefit, and the continued application of the "maximum benefit" TDS and nitrate-nitrogen water quality objectives, depends on the recharge to the Chino North Management Zone of 5-year annual average (running average) TDS and nitrogen concentrations of no more than 420 mg/L and 5 mg/L, respectively. If and when recycled water recharge in the Cucamonga Management Zone is pursued, the application of the "maximum benefit" objectives will depend on the recharge to that zone of 5-year running average TDS and nitrogen concentrations no greater than 380 mg/L and 5 mg/L, respectively. IEUA has committed to meeting these levels and recognizes that the maximum benefit objectives depend on achieving these 5-year running average concentrations.

Accordingly, the use of recycled water for groundwater recharge shall be limited to the amount that can be blended on a volume-weighted basis with other sources of

recharge to the management zone to achieve a 5-year running average concentration equal to or less than the "maximum benefit" TDS and nitrogen water quality objectives of the affected Management Zone (Chino North or Cucamonga). The 25% nitrogen loss coefficient will be applied to calculate recycled water nitrogen quality when determining the amount of recharge of other water sources that must be achieved to meet the 5-year running averages.

8. Hydraulic Control (Table 5-8a, # 8)

"Hydraulic Control" is defined as eliminating groundwater discharge from the Chino Basin to the Santa Ana River, or controlling the discharge to *de minimis* levels. The surface water and groundwater monitoring programs described above are intended to demonstrate whether hydraulic control is achieved and maintained. In the event that the Regional Board finds that hydraulic control is not being accomplished, the Watermaster shall submit to the Regional Board within 60 days of that finding a plan and time schedule to correct (within 180 days from the Regional Board approval of the plan and schedule) the failure to achieve and maintain hydraulic control.

By January 23, 2005, the Watermaster and IEUA shall prepare a proposed plan and schedule to mitigate temporary losses of hydraulic control. These agencies must implement this plan upon a determination by the Regional Board that hydraulic control is not being achieved or maintained.

9. Ambient Groundwater Quality Determination (Table 5-8a, # 9)

By July 1, 2005, and every three years thereafter, Watermaster shall submit a determination of ambient TDS and nitrate-nitrogen quality in the Chino North and Cucamonga Management Zones. This determination shall be accomplished using methodology consistent with the determinations (20-year running averages) used by the TDS/Nitrogen Task Force to develop the "antidegradation" TDS and nitrate-nitrogen water quality objectives for groundwaters subbasins within the Region. [Ref. 1].

<u>Implementation by Regional Board</u>

1. Revision of the Inland Empire Utilities Agency NPDES Permits

To implement the "maximum benefit" objectives, the Regional Board will revise the NPDES permits for IEUA wastewater discharges to reflect the commitments described above, as appropriate. This includes the following. TDS and TIN (includes nitrate-nitrogen) limits of 550 mg/L and 8 mg/L, respectively, will be specified as an agency-wide, volume weighted-average. The limits will be expressed as 12-month running averages. These limits implement the wasteload allocations for IEUA surface water discharges (see Table 5-5), and are not

contingent on the "maximum benefit" objectives or demonstration[5]. IEUA will be required to implement measures to improve effluent quality when the 12 month running average effluent concentration (measured as an average for all IEUA treatment facilities) exceeds 545 mg/L for 3 consecutive months, or when the 12-month running average total inorganic nitrogen concentration (also measured as an average for all IEUA treatment facilities) exceeds 8 mg/L in any month. The permits will require that recycled water used for recharge shall be limited to the amount that can be blended in the management zone with other water sources, such as stormwater or imported water, to achieve 5-year running average concentrations equal to or less than the "maximum benefit" TDS and nitrate-nitrogen objectives for the affected management zone (Chino North or Cucamonga). Recycled water recharge is not currently contemplated in other parts of the Chino Basin. Alternative TDS and nitrate-nitrogen limitations based on the "antidegradation" objectives will also be specified for recycled water recharge in the Chino 1, 2 and 3 and Cucamonga Management Zones. These limits will apply should the Regional Board find that maximum benefit is not demonstrated. If recharge projects are implemented elsewhere in the Chino Basin, TDS and TIN limits will be based on the TDS and nitrate-nitrogen objectives of the affected management zones.

The effluent limits for IEUA, which establish an upper limit on TDS and TIN concentrations of recycled water discharged in the basin, are a cornerstone of the maximum benefit demonstration. The cap on effluent TDS and TIN concentrations provides a controlling point for management of TDS and nitrogen water quality in the Chino Basin. The TDS in IEUA's effluent is expected to reach 550 mg/L before the groundwater in the Chino North Management Zone or the Cucamonga Management Zone reaches the "maximum benefit" objectives of 420 mg/L and 380 mg/L, respectively. The IEUA/Chino Basin Watermaster maximum benefit proposal commits to the initiation of construction of another Chino Basin desalter when the TDS in IEUA's effluent reaches 545 mg/L for three consecutive months. This desalter may be constructed by IEUA and/or Chino Basin Watermaster and/or other responsible parties deemed acceptable by the Executive Officer. Further, IEUA will immediately implement a salt management program to reduce the salts, including nitrogen, entering IEUA's wastewater treatment plants. This salt management program will include: 1) connection of new industries that have wastewater discharges with TDS greater than 550 mg/L to the brine line; 2) regulation of the use of new and existing water softeners to the extent allowed by law, with incentives provided for the removal of on-site regenerative water softeners and the use of exchange canisters or other off-site regenerative systems; 3) connection of existing domestic system industries with high TDS waste discharges to the brine lines; 4) percolation of State Water Project water into the Chino Basin when that water is low in TDS; and 5) development of a plan for sewering areas presently served by septic

[5] Surface water discharges by IEUA do not affect the groundwater management zones for which "maximum benefit" objectives are specified. Thus, the wasteload allocations do not vary depending on whether or not the "maximum benefit" objectives apply.

tanks to reduce the nitrogen loading into the Chino and Cucamonga Management Zones. IEUA's permits will reflect these commitments.

Implementing these measures will assure that the groundwater quality remains at or below the Chino North Management Zone objective of 420 mg/L and the Cucamonga Management Zone objective of 380 mg/L. Maintenance of this ambient groundwater quality is necessary, in turn, to assure that IEUA's wastewater treatment facilities are able to meet the effluent TDS limits. Chino Basin groundwater is a significant component of the water supplied in IEUA's service area and its quality thus has an important effect on effluent quality. Poor ambient water quality will preclude IEUA from meeting effluent limits, without desalting. IEUA can revise treatment plant operations to assure that the TIN limit is achieved. These TDS and TIN limitations assure beneficial use protection for Chino Basin and downstream Orange County groundwater, as well as surface waters (including Chino Creek and the Santa Ana River) affected by IEUA discharges.

IEUA's revised permits will also reflect the surface and groundwater monitoring program requirements described above.

2. Issuance of permits to Chino Basin Watermaster

The Regional Board will issue appropriate permits to the Watermaster, individually or jointly with IEUA, for the recharge of recycled water in the Basin. These permits will implement the commitments described above for recharge of other water sources to offset the quality of the recycled water. The parties will be required to document the amount, quality and location of recharge of these other sources, and to demonstrate that stormwater recharge used for blending purposes occurred as the result of the parties' efforts to enhance such recharge. Other "maximum benefit" commitments will be reflected in these permits, or in other orders of the Regional Board, as appropriate.

3. Review of Project Status

No later than 2005, and every three years thereafter (to coincide with the Regional Board's triennial review process), the Regional Board intends to review the status of the activities planned and executed by the Watermaster and IEUA to demonstrate maximum benefit and to justify continued implementation of the "maximum benefit" water quality objectives. This review is intended to determine whether the commitments specified above and summarized in Table 5-8a are met. If, as a result of this review and after consideration at a duly noticed Public Hearing, the Regional Board finds that the Watermaster and IEUA commitments are not met, the Regional Board will make a finding that the lowering of water quality associated with TDS and nitrate-nitrogen water quality objectives that are higher than historical water quality (the "antidegradation" objectives") is not of maximum benefit to the people of the state. By default, the scientifically derived, "antidegradation objectives" for the Chino 1, 2 and 3 and Cucamonga Management Zones would become effective (280 mg/L,

250 mg/L, 260 mg/L and 210 mg/L TDS respectively; 5.0 mg/L, 2.9 mg/L, 3.5 mg/L and 2.4 mg/L for nitrate-nitrogen – see Chapter 4).

The Watermaster and IEUA have made clear commitments to the implementation of projects and management strategies to achieve the "maximum benefit" objectives. A finding of "maximum benefit to the people of the state" is also a very strong commitment of support by the Regional Board for the goals, vision and future plans of the Watermaster and IEUA. Watermaster and IEUA have indicated that the supervision of the Watermaster program by the San Bernardino County Superior Court will ensure that the Watermaster and IEUA commitments are met. However, people change, commitments may be changed, and public agency decisions may certainly change. If the commitments are not met and "maximum benefit" is not demonstrated, then the Regional Board will require that Watermaster and IEUA mitigate the effects of discharges of recycled and imported water that took place under the maximum benefit objectives. Under this circumstance, mitigation will be required such that, after mitigation, the salt and nitrogen loads to the basin from imported water, newly captured stormwater inputs under the Watermaster enhanced stormwater interception program, and recycled water are made to be equivalent to the salt loads that would have been allowed to the Chino Basin under the antidegradation objectives. Discharges in excess of the antidegradation objectives that must be considered for mitigation include both recycled water and imported water at TDS concentrations in excess of the antidegradation objectives. Mitigation by groundwater extraction and desalting must be adjusted to address concentrations of salt and nitrogen in the basin, not simply salt load. (Desalting will be an effective mitigation strategy, but desalting removes water, as well as salt, and the resulting salt concentrations in the groundwater will not completely mitigate the effects of the maximum benefit discharges, if mitigation is considered simply on a salt load, rather than concentration, basis.) This remediation will be required of the agencies that were responsible for the discharge of recycled and imported water (waste discharge permit holders) under the maximum benefit objectives. The remediation must be completed within a 10-year period following the finding by the Regional Board that the antidegradation objectives apply. The Regional Board will also require mitigation of any adverse effects on water quality downstream of the Chino Basin that result from failure to implement the "maximum benefit" commitments.

## B. Salt Management - San Timoteo Watershed

### 1. San Timoteo and Yucaipa Management Zone - Yucaipa Valley Water District

Two sets of objectives have been adopted for the San Timoteo and Yucaipa Management Zones; the "maximum benefit" objectives and objectives based on historic ambient quality ("antidegradation" objectives) (see Chapter 4). The application of the "maximum benefit" objectives relies on the implementation by the Yucaipa Valley Water District (YVWD) (and in the case of the San Timoteo Management Zone, by the City of Beaumont/STWMA (see discussion below)) of a specific program of projects and requirements [Ref. 10D]. This program is a part of a watershed-scale water resources management plan designed by YVWD and other members of the San Timoteo Watershed Management Authority (STWMA) (the City of Beaumont, the Beaumont-Cherry Valley Water District and the South Mesa Water Company) to assure reliable supplies to meet present and anticipated demands. The projected water demands for the Yucaipa area for the year 2030 require approximately an additional 10,000 AF/Y of supplemental water, including State Water Project water, water imported from local sources, recharged storm water and recycled water. YVWD is in the process of implementing the water resources management plan, which includes enhanced recharge of stormwater and recycled water, optimizing direct use of recycled and imported water, and conjunctive use.

In addition to its water supply responsibilities, YVWD provides sewage collection and treatment services within its service area. YVWD operates a wastewater treatment facility that currently discharges tertiary treated wastewater to San Timoteo Creek, Reach 3. This unlined reach of the Creek overlies and recharges the San Timoteo groundwater management zone.

Table 5-9a identifies the projects and requirements that must be implemented by YVWD to demonstrate that water quality consistent with maximum benefit to the people of the state will be maintained. An implementation schedule is also specified. The Regional Board will revise YVWD's waste discharge requirements to require that these commitments be met. It is assumed that maximum benefit is demonstrated, and that the "maximum benefit" water quality TDS and nitrate-nitrogen objectives apply to the Yucaipa and San Timoteo Management Zones, as long as the schedule is being met[6]. If the Regional Board determines that the maximum benefit program is not being implemented effectively in accordance with the schedule shown in Table 5-9a (and in the case of the San Timoteo Management Zone, the commitments and schedule shown in Table 5-10a (see next section)), then maximum benefit is not demonstrated and the "antidegradation" TDS and nitrate-nitrogen objectives apply. In this situation, the Regional Board will require mitigation for TDS and nitrate-nitrogen

[6] Application of "maximum benefit" objectives for the San Timoteo Management Zone is also contingent on the timely implementation of the commitments by the City of Beaumont and the San Timoteo Watershed Management Authority which are discussed in the next section.

discharges affecting these management zones that took place in excess of limits based on the “antidegradation” objectives. As for Chino Basin Watermaster and Inland Empire Utilities Agency, discharges in excess of the antidegradation objectives that must be considered for mitigation include both recycled water and imported water, at TDS concentrations in excess of the antidegradation objectives. Mitigation by groundwater extraction and desalting must be adjusted to address concentrations of salt and nitrogen in the basin, not simply salt load.

Upon Regional Board approval |

A. Description of Yucaipa Valley Water District Commitments

1. Surface Water Monitoring Program (Table 5-9a, # 1)

The YVWD shall develop and submit for Regional Board approval a surface water monitoring program for San Timoteo Creek and the Santa Ana River Reaches 4 and 5. The monitoring program must be implemented within 30 days of Regional Board approval of the monitoring plan, and six months of data must be generated prior to the implementation of any changes made to the effluent discharge points and before any recycled water is used in the Yucaipa or San Timoteo Management Zones.

At a minimum, the surface water monitoring program shall include the collection of monthly measurements of TDS and nitrogen components in San Timoteo Creek and Santa Ana River, Reaches 4 and 5 (see Table 5-9b). Data reports shall be submitted to the Regional Board's Executive Officer by April 15, July 15, October 15 and January 15 each year. An annual report summarizing all data collected for the year and evaluating compliance with relevant surface water objectives shall be submitted by February 15$^{th}$ of each year.

2. Groundwater Monitoring Program (Table 5-9a, #2)

The purpose of the Groundwater Monitoring Program is to identify the effects of the implementation of the San Timoteo and Yucaipa Management Zones maximum benefit water quality objectives on water levels and water quality within the San Timoteo and Yucaipa Management Zones. Prior to discharge of recycled water to the San Timoteo and/or Yucaipa Management Zones, YVWD shall submit to the Regional Board for approval a groundwater monitoring program to determine ambient water quality in the San Timoteo and Yucaipa Management Zones . The groundwater monitoring program must be implemented within 30 days of approval by the Regional Board.

An annual report, including all raw data and summarizing the results of the approved groundwater monitoring program, shall be submitted to the Regional Board by February 15$^{th}$ of each year.

3. Desalters and Brine Disposal (Table 5-9a, #3)

YVWD anticipates that demineralization of groundwater or recycled water will be necessary in the future. YVWD is committed to construct and operate desalting and brine disposal facilities when:

1) The 5-year running average TDS concentration in recycled water produced at the YVWD wastewater treatment plant exceeds 530 mg/L; or

2) The volume-weighted TDS concentration in the Yucaipa Management Zone reaches or exceeds 360 mg/L

The construction of these facilities will be in accordance with a plan and schedule submitted by YVWD and approved by the Regional Board. The schedule shall assure that these facilities are in place within 7 years of Regional Board approval. These facilities shall be designed to stabilize or reverse the degradation trend evidenced by effluent and/or management zone quality.

4. Non-potable water supply distribution system (Table 5-9a, # 4)

A key element of the YVWD's water resources management plan is the construction of a non-potable supply system to serve a mix of recycled water and un-treated imported water for irrigation uses. The intent of blending these sources is to minimize the impact of recycled water use on the Yucaipa and San Timoteo Management Zones.

Parts of this system are under design and construction. A higher proportion of State Project water will be used in wet, surplus years, while larger amounts of recycled

water will be used in dry, deficit years. YVWD will produce a non-potable supply with a running ten-year average TDS concentration less than the “maximum benefit” objective for the Yucaipa Management Zone (370 mg/L).

**This space has been intentionally left blank**

Table 5 – 9b

Surface Water Monitoring Sites for Monitoring Water Quality and Quantity
Yucaipa Valley Water District

| Site Name | Discharge | Owner | Type | Discharge Frequency | Monitoring Period | Water Quality Monitoring Frequency | Period | Analyses |

| 11059300 Gage | Santa Ana River | USGS | Total Discharge | Bi-weekly | Jan-Dec | Bi-weekly | Jan-Dec | TDS, TIN, Physical |
| At Waterman Ave | Santa Ana River | YVWD | Total Discharge | Bi-weekly | Jan-Dec | Bi-weekly | Jan-Dec | TDS, TIN, Physical |
| Recharged to Yucaipa MZ | State Water Project | YVWD | Total Discharge | Monthly | Jan-Dec | Monthly | Jan-Dec | TDS, Nitrate-N |
| Recharged to Yucaipa MZ | Storm water | YVWD | Total Discharge | Monthly | Jan-Dec | Monthly | Jan-Dec | TDS, Nitrate-N |

## 5. Recycled Water Use (Table 5-9a, # 5)

The use and recharge of recycled water within the Yucaipa Management Zone is a critical component of the YVWD water management plan and is necessary to maximize the use of the water resources of the Yucaipa area. The demonstration of "maximum benefit" and the continued application of the "maximum benefit" objectives depends on the combined recharge (recycled water, imported water, storm water) to the Yucaipa Management Zone of a 5-year annual average (running average) TDS concentration of 370 mg/L and nitrate-nitrogen concentration of 5 mg/L. If recycled water recharge in the proposed San Timoteo Management Zone is pursued, then the application of the "maximum benefit" objectives will depend on the combined recharge to that Zone of 5-year annual average (running average) concentrations of 400 mg/L or less TDS, and 5 mg/L or less nitrate-nitrogen.

To meet this requirement, YVWD will establish a fund to purchase imported water from local sources and/or the State Water Project and will recharge water with a TDS concentration less than 300 mg/L (recent long term historical average of water delivered from the State Project). YVWD will also pursue implementation, with the City of Yucaipa and the San Bernardino County Flood Control District, of the *Yucaipa Water Capture and Resource Management Complex* by December 31, 2010.

Accordingly, the use of recycled water for groundwater recharge in the Yucaipa or San Timoteo Management Zone shall be limited to the amount that can be blended in the management zone on a volume-weighted basis with other sources of recharge to achieve 5-year running average concentrations less than or equal to the "maximum benefit" objectives for the affected groundwater management zone. The 25% nitrogen loss coefficient will be applied in determining the amount of recharge of other water sources that must be achieved to meet the 5-year running average nitrogen concentrations.

6. Ambient Groundwater Quality Determination (Table 5-9a, # 6)

By July 1, 2005, and every three years thereafter, YVWD shall submit a determination of ambient TDS and nitrate-nitrogen quality in the San Timoteo and Yucaipa Management Zones. This determination shall be accomplished using methodology consistent with the calculation (20-year running averages) used by the Nitrogen/TDS Task Force to develop the TDS and nitrate-nitrogen "antidegradation" water quality objectives for groundwater management zones within the region. [Ref. 1].

7. Replacement of Denitrification Facilities (Table 5-9a, #7)

YVWD shall replace existing denitrification facilities to provide effluent total inorganic nitrogen quality (6 mg/L) needed to assure compliance with the "maximum benefit" nitrate-nitrogen objective of the San Timoteo and Yucaipa Management Zones (see Wasteload Allocation section of this Chapter). A maximum three year schedule for completion of these facilities will be required. This schedule will be specified in a revised NPDES permit for YVWD's discharges to San Timoteo Creek.

8. YVWD Recycled Water Management (Table 5-9a, #8)

YVWD expects to limit the TDS concentration in its effluent to less than or equal to 540 mg/L by using a low TDS source water supply for potable uses, selective desalting of either source water and/or recycled waters, and minimizing the TDS waste increment. YVWD is currently constructing a 12-MGD treatment plant to treat and serve State Project Water. The plant will also be able to treat low TDS Mill Creek and Santa Ana River water. When necessary, YVWD will construct desalters to reduce either the TDS concentration in water supplied to customers or the TDS concentration in the effluent. YVWD will also use best efforts to enact ordinances and other requirements to minimize the TDS use increment.

Within 60 days after the YVWD 12-month running average concentration for TDS equals or exceeds 530 mg/L for 3 consecutive months, or the 12-month running average TIN concentration equals or exceeds 6 mg/L in any month (once replacement denitrification facilities are in place), YVWD shall submit to the Regional Board a plan and time schedule for implementation of measures to insure that the average agency wastewater effluent quality does not exceed 540 mg/L and 6 mg/L for TDS and TIN, respectively. The plan and schedule are to be implemented upon approval by the Regional Board.

9. Relocation of San Timoteo Creek Discharge (Table 5-9a, #9)

YVWD has established the goal of eliminating its discharge to the unlined reach of San Timoteo Creek by 2008. First priority will be given to the direct reuse and limited recharge of this recycled water in the YVWD service area (principally the area overlying the Yucaipa Management Zone). The District may construct a pipeline to convey the recycled water to the San Jacinto watershed for reuse. The District is also planning the construction of a pipeline to convey recycled water downstream to the lined reach of the Creek (Reach 1A) to minimize recycled water effects on the San Timoteo Management Zone. In the long-term, discharges to this area of the Creek are likely to be infrequent and limited to the wintertime, when the recycled water cannot be used in the YVWD (or potentially, the San Jacinto) service areas. However, YVWD is obligated to maintain flows in the Creek to support existing riparian habitat (State Board Order No. WW-26) and may need to continue recycled water discharges at some level. Groundwater and imported State Project water may also be used as alternative water sources.

Whole or partial removal of the discharge from the unlined reach of San Timoteo Creek would improve the quality of groundwater in the San Timoteo Management Zone and supplement recycled water supplies available for reuse elsewhere in the service area.

By June 23, 2005, YVWD shall submit a proposed plan and schedule to remove/reduce the discharge of recycled water to the unlined reach of San Timoteo Creek. The plan and schedule shall be implemented upon Regional Board approval.

10. Construction of Western Regional Interceptor (Table 5-9a, # 10)

YVWD will construct the Western Regional Interceptor to provide wastewater collection and treatment services to Dunlap Acres in order to mitigate what has been identified as a poor quality groundwater area due to prior agricultural use and existing septic systems. The Dunlap Acres area was inadvertently omitted from the Yucaipa-Calimesa septic tank subsurface disposal system prohibition established by the Regional Board in 1973. The interceptor includes the construction of a major wastewater interceptor pipeline, a force main and pump station. YVWD committed to complete construction of these facilities prior to 2010. Regional Board action may be necessary to require connection of properties to the wastewater collection system, when it is completed.

By June 23, 2005, YVWD shall submit a plan and schedule for construction of the

Interceptor. The Interceptor is to be complete no later than January 1, 2010. YVWD shall implement the plan and schedule upon Regional Board approval.

B. Implementation by Regional Board

1. Revision to Yucaipa Valley Water District NPDES Permit

To implement the "maximum benefit" objectives, the Regional Board will revise the NPDES permit for YVWD wastewater discharges to reflect the commitments described above, as appropriate. This includes the following.

The discharge limits for TDS and TIN will be specified as an annual volume-weighted average not to exceed 540 mg/L TDS and 6 mg/L TIN. These limits are based on the "maximum benefit" wasteload allocations shown in Table 5-5. A schedule not to exceed December 23, 2007 for compliance with this TIN limit shall be included in the permit. This schedule will enable YVWD to replace its existing denitrification facilities. Alternative TDS and nitrate-nitrogen limitations based on the "antidegradation" objectives will also be specified and will apply should the Regional Board find that maximum benefit is not demonstrated. These alternative limits are also specified in Table 5-5. Compliance schedules for these alternative limits will be specified in YVWD's waste discharge requirements, as necessary.

YVWD will be required to implement measures to improve effluent quality when the 12-month running average effluent TDS quality equals or exceeds 530 mg/L for 3 consecutive months, and/or when the 12-month running average TIN concentration equals or exceeds 6 mg/L in any month (once replacement denitrification facilities are in place).

YVWD's waste discharge requirements will require that recycled water used for recharge shall be limited to the amount that can be blended with other water sources, such as stormwater or imported water, to achieve 5-year running average concentrations equal to or less than the "maximum benefit" TDS and nitrate-nitrogen objectives for the affected management zone (Yucaipa or San Timoteo). Alternative TDS and nitrate-nitrogen limitations based on the "antidegradation" objectives will also be specified for recycled water recharge in these management zones.

The effluent limits for YVWD, which establish an upper limit on TDS and TIN concentrations of recycled water discharged in the Yucaipa and/or San Timoteo Management Zones, are a cornerstone of the maximum benefit demonstration. The cap on effluent TDS and TIN concentrations provides a controlling point for management of TDS and nitrogen water quality. YVWD will be required to initiate the building of a desalter and brine disposal line when the 5-year running average TDS in YVWD's effluent reaches 530 mg/L, or when the volume weighted-average TDS concentration in the Yucaipa Management Zone reaches 360 mg/L. YVWD will immediately implement a salt management program to reduce the salts entering the District's wastewater treatment plant. This salt management program will include: 1) provision of incentives for the removal of on-site regenerative water softeners and the

use of off-site regenerative systems; and 2) percolation of State Water Project water into the Yucaipa Management Zone when State Water Project water has low TDS. Implementing these measures will assure that the groundwater quality remains at or below the Yucaipa Management Zone objective of 360 mg/L TDS. Maintenance of this ambient groundwater quality is necessary, in turn, to assure that YVWD's wastewater treatment facility is able to meet the effluent TDS limits. Yucaipa Management Zone groundwater is a significant component of the water supplied in YVWD's service area, and its quality thus has an important effect on effluent quality. Poor ambient quality will preclude YVWD from meeting effluent limits without desalting.

YVWD will be required to submit proposed plans and schedules for the removal/reduction of its wastewater discharges from the unlined reach of San Timoteo Creek and for the construction of the Western Regional Interceptor. YVWD's revised permit will also reflect the surface and groundwater monitoring program requirements described above. This includes the determination of ambient quality in the San Timoteo and Yucaipa Management Zones.

2. Review of Project Status

No later than 2005, and every three years thereafter (to coincide with the Regional Board's triennial review process), the Regional Board intends to review the status of the activities planned and executed by the YVWD to demonstrate maximum benefit and justify continued implementation of the "maximum benefit" water quality objectives. This review is intended to determine whether the commitments specified above and summarized in Table 5-9a are met. As indicated above, if, as a result of this review, the Regional Board finds that the YVWD commitments are not met and after consideration at a duly noticed Public Hearing, the Regional Board will make a finding that the lowering of water quality associated with TDS and nitrate-nitrogen water quality objectives that are higher than historical water quality (the "antidegradation" objectives) is not of maximum benefit to the people of the state. By default, the scientifically derived "antidegradation" objectives for the San Timoteo (300 mg/L for TDS, 2.7 mg/L for nitrate-nitrogen) and Yucaipa (320 mg/L for TDS and 4.2 mg/L for nitrate-nitrogen Management Zones would become effective (see Chapter 4).

Furthermore, in the event that the projects and actions specified in Table 5-9a are not implemented, the Regional Board will require that the YVWD mitigate the adverse water quality effects, both on the immediate and downstream waters, that resulted from the recycled water discharges based on the "maximum benefit" objectives.

## 2. San Timoteo and Beaumont Management Zones – City of Beaumont and San Timoteo Watershed Management Authority (STWMA)

As shown in Chapter 4, two sets of TDS and nitrate-nitrogen objectives have been adopted for both the San Timoteo and Beaumont Management Zones: the "maximum benefit" objectives and objectives based on historic ambient quality (the "antidegradation" objectives). The application of the "maximum benefit" objectives for these Management Zones is contingent on the implementation of commitments by the City of Beaumont/STWMA (and, in the case of the San Timoteo Management Zone, by the Yucaipa Valley Water District (YVWD; see preceding discussion)) to implement a specific water and wastewater resources management program [Ref. 10E]. This program is part of a coordinated effort by the member agencies of STWMA to develop and implement projects that will assure reliable water supplies to meet rapidly increasing demands in this area. The San Timoteo Watershed Management Program (STWMP) developed by STWMA entails enhanced recharge of native and recycled water, maximizing the direct use of recycled water, optimizing the direct use of imported water, recharge and conjunctive use.

Wastewater collection and treatment services in the STWMA service area are provided by the City of Beaumont, as well as YVWD. Beaumont discharges tertiary treated wastewater to Coopers Creek, a tributary of San Timoteo Creek, Reach 3. This unlined reach of the Creek overlies and recharges the San Timoteo groundwater management zone.

Table 5-10a identifies the projects and requirements that must be implemented by Beaumont/STWMA to demonstrate that water quality consistent with maximum benefit to the people of the state will be maintained. STWMA, acting for all its member agencies, has committed to conduct the regional planning and monitoring activities necessary to implement these "maximum benefit" commitments, and the San Timoteo Watershed Management Program as a whole. Table 5-10a also specifies an implementation schedule. The Regional Board will revise the City of Beaumont's waste discharge requirements and take other actions as necessary to require that these commitments be met. It is assumed that maximum benefit is demonstrated, and that the "maximum benefit" water quality TDS and nitrate-nitrogen objectives apply to the Beaumont and San Timoteo Management Zones, as long as the schedule is being met[7]. If the Regional Board determines that the maximum benefit program is not being implemented effectively in accordance with the schedule shown in Table 5-10a (and in the case of the San Timoteo Management Zone, the commitments and schedule shown in Table 5-9a (see preceding section)), then maximum benefit is not demonstrated, and the "antidegradation" TDS and nitrate-nitrogen objectives apply. In this situation, the Regional Board will require mitigation for TDS and nitrate-nitrogen discharges

[7] Application of "maximum benefit" objectives for the San Timoteo Management Zone is also contingent on the timely implementation of the commitments by the Yucaipa Valley Water District which are discussed in the preceding section.

affecting these management zones that took place in excess of limits based on the "antidegradation" objectives.

A. Description of City of Beaumont, San Timoteo Watershed Authority Commitments

1. Surface Water Monitoring Program (Table 5-10a, #1)

The City of Beaumont and the STWMA shall develop and submit for Regional Board approval a surface water monitoring program for San Timoteo, Little San Gorgonio and Noble Creeks at the locations listed in Table 5-10b. The monitoring program must be implemented within 30 days of Regional Board approval of the monitoring plan, and six months of data must be generated prior to the implementation of any changes to the effluent discharge points and before any recycled water is used in the Beaumont or San Timoteo Management Zones.

At a minimum, the surface water monitoring program shall include the collection of monthly measurements of TDS and nitrogen components at locations in San Timoteo, Little San Gorgonio and Noble Creeks (see Table 5-10b). Data reports shall be submitted to the Regional Board's Executive Officer by April 15, July 15, October 15 and January 15 each year. An annual report summarizing all data collected for the year and evaluating compliance with relevant surface water objectives shall be submitted February 15th of each year.

2. Groundwater Monitoring Program (Table 5-10a. #2)

The purpose of the groundwater monitoring program is to identify the effects of the implementation of the Beaumont and San Timoteo Management Zone maximum benefit TDS and nitrate-nitrogen water quality objectives on water levels and water quality within the Beaumont and San Timoteo Management Zones. Prior to discharge of recycled water to the Beaumont and/or San Timoteo Management Zone, the City of Beaumont and the STWMA shall submit to Regional Board for approval a groundwater monitoring program to determine ambient water quality in the Beaumont and San Timoteo Management Zones. The groundwater monitoring program must be implemented within 30 days of approval by the Regional Board.

An annual report, including all raw data and summarizing the results of the approved groundwater monitoring program, shall be submitted to the Regional Board by February 15th of each year.

3. Desalters and Brine Disposal (Table 5-10a. #3)

The City of Beaumont and the STWMA shall construct and operate desalting facilities and brine disposal facilities when:

a. The 5-year running average TDS concentration in recycled water produced at the City of Beaumont wastewater treatment plant exceeds 480 mg/L, or

b. The volume-weighted TDS concentration in the Beaumont Management Zone equals or exceeds 320 mg/L.

The construction of these facilities will be in accordance with a plan and schedule submitted by Beaumont/STWMA and approved by the Regional Board. The schedule shall assure that these facilities are in place within 7 years of Regional Board approval. These facilities shall be designed to stabilize or reverse the degradation trend evidenced by effluent and/or management zone quality.

| At Freeway 10 | Little San Gorgonio Cr. | Beaumont & STWMA | Total Discharge | Bi-weekly | Jan-Dec | Bi-weekly | Jan-Dec | TDS, TIN, Physical |
| At Freeway 10 | Noble Creek | Beaumont & STWMA | Total Discharge | Bi-weekly | Jan-Dec | Bi-weekly | Jan-Dec | TDS, TIN, Physical |
| Recharged to Beaumont MZ | State Water Project | Beaumont & STWMA | Total Discharge | Bi-weekly | Jan-Dec | Monthly | Jan-Dec | TDS, Nitrate-N |
| Recharged to Beaumont MZ | Storm water | Beaumont & STWMA | Total Discharge | Bi-weekly | Jan-Dec | Monthly | Jan-Dec | TDS, Nitrate-N |

4. Non-potable water supply distribution system (Table 5-10a, #4)

Like YVWD, the City of Beaumont is constructing a non-potable water system that will convey untreated State Project water and recycled water for irrigation within its service area. The intent of blending these sources is to minimize the impact of recycled water use on groundwater quality in the proposed Beaumont and San Timoteo Management Zones. A higher proportion of State Project water will be used in wet, surplus years, while larger amounts of recycled water will be used in dry, deficit years.

5. Recycled Water Use (Table 5-10a, #5)

The use of recycled water within the Beaumont Management Zone is a critical component of the City of Beaumont and STWMA water management plan and is necessary to maximize the use of the water resources of the Beaumont area.

The demonstration of "maximum benefit" and the continued application of the "maximum benefit" objectives depends on the combined recharge (recycled water, imported water, storm water) to the Beaumont Management Zone of a 5-year annual average (running average) TDS concentration of 330 mg/L and a nitrate-nitrogen concentration of 5 mg/L. If recycled water recharge in the San Timoteo Management Zone is pursued, then the application of the "maximum benefit" objectives will depend on the combined recharge to that Zone of 5-year annual average (running average) concentrations of 400 mg/L or less TDS, and 5 mg/L or less nitrate-nitrogen.

To comply with this requirement, the STWMA member agencies are developing plans to recharge and store State Project water in the proposed Beaumont Management Zone. The Beaumont-Cherry Valley Water District (BCVWD) is developing a new 80-acre groundwater recharge project that will increase storm water recharge in the Beaumont Basin by 4,100 acre-ft/yr. This facility will also be used to recharge State Water project water. The City of Beaumont is also developing storm water recharge in facilities in newly developing areas, which is expected to result in the recharge of an additional 2,400 acre-ft/yr of stormwater runoff.

Accordingly, the use of recycled water for use or recharge in the Beaumont or San Timoteo Management Zone shall be limited to the amount that can be blended on a volume-weighted basis with other sources of recharge to achieve 5-year running average concentrations less than or equal to the "maximum benefit" objectives for the affected groundwater management zone. The 25% nitrogen loss coefficient will be applied in determining the amount of recharge of other water sources that must be achieved to meet the 5-year running average nitrogen concentrations.

6. Ambient Groundwater Quality Determination (Table 5-10a, # 6)

By July 1, 2005, and every three years thereafter, the City of Beaumont and STWMA shall submit a determination of ambient TDS and nitrate-nitrogen quality in the Beaumont and San Timoteo Management Zones. This determination shall be accomplished using methodology consistent with the calculation (20-year running averages) used by the Nitrogen /TDS Task Force to develop the TDS and nitrate-nitrogen "antidegradation" water quality objectives for groundwater management zones within the region [Ref. 1].

7. Replacement/modification of denitrification facilities (Table 5-10a, #7)

The City of Beaumont has committed to produce recycled water with a 12-month average TIN concentration of 6 mg/L or less by 2008. This may be accomplished via operational changes, or may require the installation/modification of facilities. This TIN effluent quality is specified in the TIN wasteload allocation (see Table 5-5) and is necessary to assure compliance with the proposed "maximum benefit" nitrate-nitrogen objective for the Beaumont and San Timoteo Management Zones (5 mg/L). An appropriate schedule, not to exceed December 23, 2007 for compliance with this effluent limit will be specified in a revised NPDES permit for the City.

8. City of Beaumont Wastewater Management (Table 5-10a, #8)

Beaumont expects to limit the TDS concentration in its effluent to less than or equal to 490 mg/L by using a low TDS source water supply for potable uses, selective desalting of either source water and/or recycled waters, and minimizing the TDS waste increment.

Within 60 days after the Beaumont 12-month running average concentration for TDS equals or exceeds 480 mg/L for 3 consecutive months, or the 12-month running average TIN concentration equals or exceeds 6 mg/L in any month (once facility/operational changes needed to achieve 6 mg/L TIN are in place), the City of Beaumont shall submit to the Regional Board a plan and time schedule for implementation of measures to insure that the average agency wastewater effluent quality does not exceed 490 mg/L and 6 mg/L for TDS and TIN, respectively. The plan and schedule are to be implemented upon approval by the Regional Board.

9. Relocation of San Timoteo Creek Discharge (Table 5-10a, #9)

Like YVWD, Beaumont has established the goal of eliminating its discharge to the unlined reach of San Timoteo Creek by 2008 to minimize the impacts of these discharges on the San Timoteo Management Zone. The STWMP anticipates that Beaumont's recycled water will be almost completely reused within the Beaumont area for landscape irrigation, habitat enhancement, and potentially for groundwater recharge. Like YVWD, Beaumont and STWMA are also considering the export of a portion of Beaumont's surplus recycled water to the San Jacinto basin, where the

TDS objectives are higher than those for the Beaumont Management Zone and recycled water demands are greater than supplies. Some limited recycled water discharge to Coopers Creek and thence /San Timoteo Creek may need to be continued to support existing riparian habitat.

Whole or partial removal of the discharge from the unlined reach of San Timoteo Creek would improve the quality of groundwater in the San Timoteo Management Zone and supplement recycled water supplies available for reuse elsewhere in the service area.

By June 23, 2005, Beaumont/STWMA shall submit a proposed plan and schedule to remove/reduce the discharge of recycled water to the unlined reach of San Timoteo Creek. The plan and schedule shall be implemented upon Regional Board approval.

B. Implementation by Regional Board

1. Revision of City of Beaumont NPDES Permit

To implement the "maximum benefit" objectives, the Regional Board will revise the NPDES permit for the City of Beaumont wastewater discharge to reflect the commitments described above, as appropriate. This includes the following.

The discharge limits for TDS and TIN will be specified as an annual volume-weighted average not to exceed 490 mg/L TDS and 6 mg/L TIN. These limits are based on the wasteload allocation shown in Table 5-5. A schedule not to exceed December 23, 2007 for compliance with this TIN limit shall be included in the permit. This schedule will enable Beaumont to make the necessary facility/operational changes. Alternative TDS and nitrate-nitrogen limitations based on the "antidegradation" objectives will also be specified and will apply should the Regional Board find that maximum benefit is not demonstrated. These alternative limits are also specified in Table 5-5. Compliance schedules for these alternative limits will be specified in Beaumont's waste discharge requirements, as necessary.

Beaumont will be required to implement measures to improve effluent quality when the 12-month running average effluent TDS quality equals or exceeds 480 mg/L for 3 consecutive months, and/or when the 12-month running average TIN concentration equals or exceeds 6 mg/L in any month (once the facility/operational changes necessary to assure compliance with the 6 mg/L limit are in place).

Beaumont's waste discharge requirements will require that recycled water used for recharge shall be limited to the amount that can be blended with other water sources, such as stormwater or imported water, to achieve 5-year running average concentrations equal to or less than the "maximum benefit" TDS and nitrate-nitrogen objectives for the affected management zone (Beaumont or San Timoteo).

The effluent limits for the City of Beaumont, which establish an upper limit on TDS and TIN concentrations of recycled water discharged in the management zones, are

a key part of the maximum benefit demonstration. The cap on effluent TDS and TIN concentrations provides a controlling point for management of TDS and nitrogen water quality. The City of Beaumont has committed to initiate the building of a groundwater desalter and brine disposal line when the TDS in the City's effluent reaches 480 mg/L. Further, the City will immediately implement a salt management program to reduce the salts entering the City's wastewater treatment plant. This salt management program will include: 1) provision of incentives for the removal of on-site regenerative water softeners and the use of off-site regenerative systems; and 2) percolation of State Water Project water into the Beaumont Management Zone when State Water Project water has low TDS. Implementing these measures will assure that the groundwater quality remains at or below the Beaumont management zone objective of 330 mg/L TDS. Maintenance of this ambient groundwater quality is necessary, in turn, to assure that the City's wastewater treatment facility is able to meet the effluent TDS limits. Beaumont Management Zone groundwater is a component of the water supplied to the City and its quality thus has an important effect on the effluent quality. Poor ambient quality will preclude the City from meeting effluent limits without desalting.

Beaumont will be required to submit a proposed plan and schedule for the removal/reduction of its wastewater discharges from the unlined reach of San Timoteo Creek. Beaumont's revised permit will also reflect the surface and groundwater monitoring program requirements described above. This includes the determination of ambient quality in the San Timoteo and Beaumont Management Zones.

2. Review of Project Status

No later than 2005, and every three years thereafter (to coincide with the Regional Board's triennial review process), the Regional Board intends to review the status of the activities planned and executed by the City of Beaumont and STWMA to demonstrate maximum benefit and justify continued implementation of the "maximum benefit" water quality objectives. This review is intended to determine whether the commitments specified above and summarized in Table 5-10a are met. As indicated above, if, as a result of this review, the Regional Board finds that the City of Beaumont and STWMA commitments are not met and after consideration at a duly noticed Public Hearing, the Regional Board will make a finding that the lowering of water quality associated with TDS and nitrate-nitrogen water quality objectives that are higher than historical water quality (the "antidegradation" objectives) is not of maximum benefit to the people of the state. By default, the scientifically derived "antidegradation" objectives for the Beaumont and San Timoteo Management Zones would become effective (230 mg/L TDS and 1.5 mg/L nitrate-nitrogen for the Beaumont Management Zone; 300 mg/L TDS and 2.7 mg/L nitrate-nitrogen for the San Timoteo Management Zone (see Chapter 4).

Furthermore, in the event that the projects and actions specified in Table 5-10a are not implemented, the Regional Board will require that the City of Beaumont and STWMA mitigate the adverse water quality effects, both on the immediate and

downstream waters, that resulted from the recycled water discharges based on the "maximum benefit' objectives. As for CBW/IEUA and YVWD, discharges in excess of the antidegradation objectives that must be considered for mitigation include both recycled water and imported water, at TDS concentrations in excess of the antidegradation objectives. Mitigation by groundwater extraction and desalting must be adjusted to address concentrations of salt and nitrogen in the basin, not simply salt load.

**(End of Salt Management Plan Section) (End of Resolution R8-2004-0001)**

## NONPOINT SOURCE PROGRAM

Considerable improvements in water quality have been achieved in the nation through the control of point source discharges such as those from sewage treatment plants or industrial facilities. It is now recognized that in many areas, nonpoint source inputs, such as urban nuisance flows and stormwater runoff, are the principal sources of contaminant inputs to surface and groundwaters.

In contrast to point sources, which discharge wastewater of predictable quantity and quality at a discrete point (usually at the end of a pipe), nonpoint source inputs are diffuse in origin and variable in quality. Management of nonpoint source inputs is in many ways more difficult to achieve, since it requires an array of control techniques customized to local watershed conditions.

### Nonpoint Source Management Plan

Section 319 of the 1987 amendments to the Clean Water Act (33 USC 466 *et seq.*), established the framework for nonpoint source activities. Section 319 requires each state to prepare a Nonpoint Source Management Plan and to conduct an assessment of the impact nonpoint sources have on the state's waterbodies. In response to these requirements, the State Board adopted the Nonpoint Source Management Plan (NPSMP) in 1988 and the Water Quality Assessment in 1990 (see Chapter 6 for a discussion of the Water Quality Assessment). The NPSMP establishes a statewide policy for managing nonpoint source inputs to California's waters and is part of this Basin Plan.

The State Board defined six objectives of the Nonpoint Source Management Plan, four of which apply to activities in the Santa Ana Region:

1. Initiate and institutionalize activities for control of nonpoint source pollution (drainage from urban activities, agriculture, silviculture, abandoned mines construction, grazing, hydrologic modification, and individual disposal systems). These activities include outreach, education, public participation, technical assistance, financial assistance, interagency coordination, and demonstration projects.

A major part of the Regional Board staff's nonpoint source activities is participation in outreach activities. Board staff attend committee meetings to exchange information and to coordinate planning efforts among the various agencies in the region. Staff also coordinates with other public agencies and citizens' groups engaged in protecting water quality form nonpoint source impacts, generally by participating in technical advisory committees. Regional outreach activities are also beginning to include identification of best management practices such as education, information dissemination, and structural and nonstructural water quality controls.

2. Fund contracts for nonpoint source projects selected for nonpoint source grant funding in State Fiscal Year 1992-93. Regional water Board staff will also participate in these projects and provide technical assistance.

   Regional Board staff has managed or acted in an advisory capacity for a number of nonpoint source grant funded contracts. These projects have included Newport Bay studies to develop a hydrodynamic model of the Bay as well as a study to monitor sources of toxics into the Bay.

3. Initiate nonpoint source watershed pilot programs on nine watersheds in the state.

   San Diego Creek was designated as the region's pilot watershed project. The Creek's water quality has been impaired by excessive sedimentation, nitrates, pesticides, and metals originating from point and nonpoint sources (see the following discussion on the Newport Bay Watershed). In addition, the Upper Newport Bay Dredging Project was identified as the Region's focused nonpoint source watershed project. The U.S. Army Corps of Engineers, under Congressional authorization, is investigating dredging Upper Newport Bay to deepen the channel. The Army Corps of Engineers' activities could modify the Upper Bay's water quality and currents. Regional Board staff are aiding the Army Corps of Engineers in their development of preliminary ideas so as to prevent potential water quality degradation.

4. Implement the requirements of the 1990 Reauthorization of the Coastal Zone Management Act (CZMA) which requires the State Water Board and the California Coastal Commission to develop and implement an enforceable nonpoint source program in the coastal zone.

   The reauthorization of the CZMA, together with specific guidance from the US EPA and the National Oceanic & Atmospheric Administration (NOAA), requires coastal states to develop coastal nonpoint pollution control programs. These programs are to implement management measures for the control of land uses which contribute nonpoint source pollution to coastal waters. Management measures, which include specific measures for mitigating water quality impacts, are specified for the following land uses: agriculture; gazing; confined animal facilities; forestry; urban development; roads; marinas and recreational boating; hydromodification; and mines. The state's coastal program is to be considered for approval by the US EPA and NOAA in July 1995.

Revision of the NPSMP has been initiated. The revised NPSMP will go beyond the requirements of the Coastal Zone Management Act by specifying management measures that are applicable throughout the state. There will also be more of an emphasis placed on watershed based nonpoint source controls in the revised NPSMP. To develop these management measures, the State Board is forming Task Force Committees composed of experts in the various nonpoint source categories. The management measures developed by the Task Force Committee will be reviewed by an oversight committee made up of State and Regional Board staff prior to inclusion in the revised NPSMP. The anticipated date of completion of the revised NPSMP is in 1995.

Some major nonpoint source problems which have been addressed in the Santa Ana Region include:

- Urban runoff: addressed through the stormwater permitting program;
- Animal confinement facilities: addressed through the Dairy Regulatory Strategy;
- On-site disposal system: addressed through prohibitions and the Minimum Lot-Size Criteria; and
- Erosion/sedimentation in the Newport Bay watershed: addressed through the implementation of the Areawide 208 Plan.

**Stormwater Program**

The 1987 Clean Water Act amendments required the U.S. Environmental Protection Agency (US EPA) to establish regulations to control stormwater discharges associated with industrial activity, and discharges from large and medium municipal separate storm sewer systems. Large municipal separate storm sewer systems serve a population of 250,000 or more and medium municipal separate storm sewer systems serve a population of more than 100,000 but less than 250,000. On November 16, 1990, EPA published the final regulations that established the National Pollutant Discharge Elimination System (NPDES) permit requirements for discharges of stormwater from large and medium municipal separate storm sewer systems and stormwater discharges associated with industrial activities, including construction activities.

The stormwater NPDES permitting program is administered by the State Board and the Regional Boards.

A. Municipal Stormwater Discharge Permits

Prior to the promulgation of EPA's final regulations, the Santa Ana Regional Water Quality Control Board adopted areawide urban NPDES stormwater permits for each of the three counties in the Region. As shown in Table 5-9, as part of the areawide urban permits, the counties are named as the principal permittee and the incorporated cities are named as co-permittees. These permits require the development and

implementation of programs to identify and eliminate illegal/illicit discharges to municipal stormwater conveyance systems, the development and implementation of best management practices (BMPs) to reduce pollutants in stormwater and urban runoff, and the development and implementation of monitoring programs.

Table 5-9
Municipal
Stormwater Permits
Santa Ana Region

| Municipality | Order Number | Date Issued |
|---|---|---|
| Orange County Environmental Management Agency, the County of Orange, and 23 incorporated cities | 90-071<br>NPDES - CA8000180 | 7/12/90 |
| Riverside County Flood Control and Water Conservation District, the County of Riverside, and 13 incorporated cities | 90-104<br>NPDES - CA8000192 | 7/13/90 |
| San Bernardino County Transportation and Flood Control Department, the County of San Bernardino, and 16 incorporated cities | 90-136<br>NPDES - CA8000200 | 10/19/90 |

B. Industrial and Construction Stormwater Discharge Permits

The federal regulations identify eleven industrial categories which are subject to stormwater discharge permitting:

1. Facilities subject to stormwater effluent guidelines (40 CFR Subchapter N);
2. Manufacturing facilities;
3. Mining and Oil and Gas facilities;
4. Hazardous waste treatment, storage or disposal facilities;
5. Landfills, land application sites, and open dumps that receive industrial waste;
6. Recycling facilities such as metal scrap yards, battery reclaimers, salvage yards, and automobile yards;
7. Steam electric generating facilities;
8. Transportation facilities;
9. Sewage treatment plants;
10. Construction activities; and
11. Certain facilities if materials are exposed to stormwater.

As shown these categories include construction activities (#10), which are covered by a separate permit in the State of California (see below).

To satisfy the federal requirements, the State Board issued two general permits: the General Industrial Activities Stormwater Permit (State Board Order No. 91-13-DWQ as amended by State Board Order No. 92-12-DWQ); and the General Construction Activity Stormwater Permit (State Board Order No. 92-08-DWQ). Industrial facilities and proponents of construction projects must file a Notice of Intent (NOI) with the State Board to be covered under the applicable general permit.

The General Industrial Activities Stormwater Permit requires dischargers to comply with federal regulations to reduce or eliminate industrial stormwater pollution, to develop and implement a stormwater pollution prevention plan, and to perform monitoring of stormwater discharges. This permit covers stormwater discharges from all the listed categories of industrial activity, except construction activities.

The General Construction Activity Stormwater Permit addresses stormwater discharges associated with a construction activity where grading, clearing, and excavation results in a land disturbance of five acres of more. A stormwater discharge from a construction resulting in a land disturbance of less than five acres also requires a permit if the construction is a part of a larger common plan of development or sale.

The use of general permits to regulate these various types of stormwater discharges streamlines the permitting process, which greatly benefits the Regional Board. It is also the least costly way for a discharger to obtain a permit and comply with federal and state regulations.

For industrial and construction activities in the Region, it is the Regional Board's responsibility to enforce the General Industrial Activities and General Construction Activity stormwater permits. In addition to these general permits, the Regional Board has issued and will continue to issue individual permits for stormwater dischargers if warranted by the character of the discharges and/or sensitivity of the receiving waters.

**Animal Confinement Facilities (Dairies)**

As described earlier in this chapter, one of the most significant water quality problems confronting the region is increasing concentrations of TDS and nitrates in the groundwater. This problem is particularly acute in those groundwater subbasins without assimilative capacity, including the Chino II and III Groundwater Subbasins (Subbasins changed by December 22, 2004 amendment).

In 1989-90, the Regional Board conducted a special investigation of the salt balance problem in the Chino Basin, described in "Dairies and Their Relationship to Water Quality Problems in the Chino Basin" or Dairy Report [Ref. 10]. The findings of this study showed that while irrigated agriculture and municipal wastewater disposal are contributors to the degradation, wastes form dairies and other animal confinement facilities play an overwhelmingly significant role.

Dairy operations began in the Chino Basin about 40 years ago and continue intensively today. In fact, the Chino Basin contains the highest concentration of dairy animals found anywhere in the world. Within an area of about 15,000 acres, there are approximately 300 dairies, housing about 300,000 animals. These animals produce approximately 0.5 million tons (dry weight) per year of manure. Significant quantities of water are used to wash the cows prior to milking. Both this wastewater and the manure contain significant quantities of salts (TDS and nitrogen). The Regional Board's studies showed that close to 30,000 tons of salts reach Chino Basin groundwater every year as a result of the disposal of these dairy wastes.

Dairy operations and waste disposal practices can also affect the quality of surface waters. Discharges of washwater and/or runoff of stormwater which has come into contact with manure contribute salts and other pollutants to receiving streams, which ultimately flow into the Santa Ana River. While the Regional Board prohibits these discharges (with the exception of stormwater under certain conditions), these discharges do occur as a result of inadequate construction and maintenance of containment facilities. Drainage from upstream urban areas exacerbates this problem.

The quality of the Santa Ana River is affected indirectly as well: significant quantities of the poor quality groundwater in the Chino Basin rise to the surface and enter the River just upstream of Prado Dam. The TDS and nitrogen problems in the Santa Ana River, which are addressed by the implementation of wasteload allocations, have been described previously. The failure to address and correct the water quality problems in the Chino Basin could compromise the effectiveness of the water quality improvements implemented by the sewage treatment plants in response to those allocations.

The Regional Board initiated a regulatory program to address the water quality impacts of the salt loads from dairy operations in 1972. Waste discharge requirements are issued to all dairies and other significant animal confinement facilities. (See the Dairy Report for a detailed description of the Regional Board's waste discharge requirements). However, the Regional Board's studies demonstrated that changes in this regulatory program were necessary.

The Regional Board developed a revised regulatory strategy, working closely with dairy industry representatives. As described in the Dairy Report, it consists of a comprehensive, three part program. Part I is designed to address the present and future impacts from ongoing dairy activities. Part II addresses the impacts from past dairy activities, and Part III addresses the need for improved drainage facilities upstream of and within the dairy area. Although termed a "dairy" regulatory strategy, the strategy is intended to apply to <u>all</u> animal confinement facilities within the Chino Basin. The term "dairy" is used here for simplicity.

Part I. Dairy Waste Discharge Requirements: Impacts of Ongoing Operations

The first part of the strategy addresses dairy waste discharge requirements and the impacts of ongoing operations. Four specific changes to the dairy regulatory program are included: an improved manure tracking system; inclusion of groundwater monitoring requirements for dairy operators; submittal of engineered waste

management plans; and revision of waste discharge requirements to prohibit dairy waste disposal unless suitable offset programs are implemented.

1. Implementation of Manure Tracking and Reporting System

The Regional Board determined that the manure tracking system in use was not adequate to determine the full effects of dairy waste management practices on groundwater quality nor was it adequate to determine compliance with waste discharge requirements related to manure disposal.

In response, a new manure tracking manifest form was developed and is now being used. Dairy operators are required to complete the form and submit it annually in a report to the Regional Board.

2. Implementations of Groundwater Monitoring Requirements

Comprehensive groundwater quality data is necessary for planning mitigation activities in the Chino Basin. Groundwater monitoring requirements will be included in the waste discharge requirements for all dairy operators in the Chino Basin. The WDRs will provide the operators with the option of participating in an established, comprehensive groundwater monitoring program in lieu of their individual monitoring efforts. Such a monitoring program is now being conducted by the Chino Basin Watermaster.

3. Preparation of an Engineered Waste Management Plan as part of the Report of Waste Discharge

Historically, the Regional Board has required that dairy operators provide a general description of their proposed containment controls as part of the Report of Waste Discharge (ROWD). Experience has shown, however, that this is not adequate and that illegal discharges of manured water occur due to improper design, construction, and maintenance of containment controls.

To address this problem, the Regional Board now requires that a waste management plan be prepared by a registered engineer, member of the Soil Conservation Service or others who are suitably qualified. This plan must address containment of all washwater and stormwater runoff, as well as protection of the facility from inundation, as required by the waste discharge requirements. For any given property, the engineering plan must address necessary containment controls for the property as a whole, even in situations where some portion of that property is leased, subleased or operated by another party (for example, cultivation of agricultural crops by a farmer on a portion of dairy property).

Engineered waste management plans are required to be submitted as part of the ROWD for new or substantially modified dairy operations. These plans are also

required when the containment controls at facilities are known or suspected to be inadequate.

4. Revision of the Manure and Washwater Disposal Requirements

As noted earlier, the Chino II and III Groundwater Subbasins lack assimilative capacity for additional salt inputs. In basins without assimilative capacity, mineral increments are not permitted when regulating waste discharges (see preceding section on salt balance and assimilative capacity, State Board Order No. 73-4, the Rancho Caballero decision [Ref. 7]). To meet the Chino Basin groundwater objectives, the discharge of manure and dairy washwater and their application as fertilizer and irrigation water cannot be legally permitted.

The implications of prohibiting manure and washwater disposal are significant. Recognizing this, the strategy allows for the implementation of programs to offset the salt loads contributed by ongoing manure/washwater disposal. An offset program would work as follows: for every ton of salt that will reach groundwater as a result of continued disposal/application of manure or washwater within the Chino Basin, the dairy operator must remove an equivalent amount of salt from the Basin through participation in a desalter or other appropriate means. The offsets required of the dairy industry would depend on the industry's success in identifying acceptable methods of manure and wastewater disposal; the more manure and washwater that is removed form the basin, the less need there is for offset.

The strategy calls for the waste discharge requirements for dairy operators in the Chino Basin to "prohibit the disposal of manure and washwater, and their application as fertilizer or irrigation water in the Chino Basin unless the dairy operator participates in an offset program. The offset program must ensure that water quality impacts of continued manure and/or washwater disposal/application practices are mitigated."

Implementation of this element of the dairy regulatory strategy has been withheld since acceptable mitigation projects are now being developed. As described in the preceding section the selected TDS and nitrogen management plan (Alternative 5C) includes two desalters in the Chino Basin, which are being built by the Santa Ana Watershed Project Authority and other participating agencies. These desalters, though not designed or implemented specifically to address ongoing dairy salt loading, will provide sufficient groundwater treatment and salt loads identified in Alternative 5C. This includes the salt loads from present and future dairy operations and other agriculture, unsewered areas, and other sources.

Part II. Impacts of Past Dairy Operations

This part of the dairy regulatory strategy addresses the mitigation of water quality impacts caused by past discharges of dairy waste in the Chino Basin.

While the two desalters mentioned above should be adequate to offset present and future salt wasteloads, they will not provide sufficient groundwater treatment to address the historic contributions of salts from long-term dairy or other agricultural activities, municipal wastewater disposal, etc. These historic salt inputs must be addressed to protect the beneficial uses of the Basin's groundwaters and to prevent long-term adverse impacts to the Santa Ana River.

Additional desalters or other treatment facilities and strategies will be necessary. The implementation of these measures may have significant costs. To be equitable, each of the sources of TDS and nitrogen input to the Basin, including dairies, other types of agriculture, and municipalities, should assume its fair share of the Chino Basin cleanup costs. The dairy regulatory strategy incorporates the concept of shared responsibility and directs the use of this concept to develop an equitable approach to water quality correction in the Chino Basin.

A comprehensive study of water resources management in the Chino Basin is now being conducted. The study, the Chino Basin Water Resources Management Study, is funded by a task force which includes representatives of the Chino Basin Watermaster (composed of water users in the Chino Basin including the agricultural industry), Chino Basin Municipal Water District, Western Municipal Water District, the Santa Ana Watershed Project Authority, Metropolitan Water District, and the Regional Board. The goal of this study is to identify a water resources management plan which will provide for water quality protection, water demands are met, and the quality of the Santa Ana River is not adversely affected by outflow from the Basin.

Part III. Surface Water Quality Impacts: Control of Drainage in the Chino Agricultural Preserve

The third part of the dairy strategy addresses surface water drainage problems in the Chino Agricultural Preserve, where most of the dairies are located. These problems are caused both by inadequate and poorly maintained drainage facilities within the Preserve, and by inadequate controls on drainage from upstream urban areas.

Runoff from the rapidly developing areas upstream of the dairy area creates additional difficulties for many dairy operators in complying with the manured water containment requirements specified in their waste discharge requirements. A number of studies have been conducted to determine the best method of preventing urban stormwater runoff impacts in the dairy area. The most recent study, "Chino Agricultural Preserve Drainage and Land Use Study"[Ref. 11], was conducted with federal 205(j) planning funds and was completed in 1987. The recommended

solution to these urban drainage problems was the construction of a trapezoidal earth swale at the northern boundary of the dairy area (roughly, at Riverside Avenue, between Campus Avenue and the Cucamonga Creek flood control channel, just west of Archibald Avenue). This swale would intercept flows from upstream urban areas (cities of Ontario and Chino) and convey these flows to the Lower Cucamonga Spreading Grounds, adjacent to the Cucamonga Creek Channel.

To alleviate drainage problems in the dairy area and reduce surface water quality problems which result from dairy waste inputs, the following measures need to be implemented:

1. Riverside Avenue interceptor swale – San Bernardino County and/or the cities of Ontario and Chino should pursue the funding and implementation of the interceptor swale project at Riverside Avenue.
2. Other drainage controls – Both San Bernardino and Riverside counties and the cities tributary to the dairy area should identify and implement a coordinated program of drainage controls necessary to supplement the interceptor swale and prevent drainage problems within the dairy area.

These recommendations are directed to the counties and cities, rather than to the dairy industry. The counties are required to implement such best management practices (BMPs) as part of their NPDES stormwater permits.

**Dairy Operations Outside the Chino Basin**

Since the greatest concentration of dairies occurs in the Chino Basin, the dairy strategy has appropriately focused on mitigating the problems in this area. However, in recent years, many new dairies have been established elsewhere in the Region, specifically in the San Jacinto Basin, and this trend appears to be continuing. To prevent the recurrence of the groundwater quality problem now confronting the Region in the Chino Basin, an appropriate dairy waste management strategy for the San Jacinto Basin must be developed and implemented. The pattern of dairy land use, the quality of underlying groundwater, and the availability of assimilative capacity in the San Jacinto Groundwater Subbasins should be considered in more detail before recommending a complete dairy strategy. However, it is anticipated that the wastewater management plan, the manure tracking system, and the groundwater monitoring elements of the strategy recommended for the Chino Basin will also apply in the San Jacinto Basin.

**Minimum Lot Size Requirements and Exemption Criteria for New Developments Using On-Site Septic Tank-Subsurface Leaching/Percolation Systems**

The Santa Ana Region is characterized by dramatic population growth. Most of this population is concentrated in urban areas, where high density development on small lots is typical. Sanitary sewers are not available in many areas where rapid growth is occurring, so many of these high density developments use on-site septic tank-subsurface disposal systems for sewage disposal.

In 1989, the Regional Board investigated the relationship between these high density developments and the nitrate problems found in the groundwater of the Region [Ref. 12]. The findings showed that the use of high density subsurface disposal systems would cause or add to nitrate quality problems. To control these impacts, the Board found that it was necessary to limit the density of new subsurface systems.

On October 13, 1989, the Regional Board adopted Resolution No. 89-157, amending the Water Quality Control Plan to add a one-half acre minimum lot size requirement for new developments using on-site septic tank-subsurface leaching/percolation systems region-wide. Certain exemptions from the minimum lot size requirement were specified in Resolution No. 89-157. On December 7, 1990, the Regional Board adopted Resolution No. 90-158, which revised the exemption criteria. However, on June 7, 1991, the Regional Board adopted Resolution No. 91-51, rescinding Resolution No. 90-158 and revising the exemption criteria in Resolution No. 89-157. On July 16, 1993, the Regional Board adopted Resolution No. 93-40, revising the requirements and exemption criteria in Resolution No. 89-157, as amended by Resolution No. 91-51. Resolution No. 89-157, as amended by Resolution No. 93-40, stipulates the following:

1. A minimum lot size of one-half acre (average gross) per dwelling unit is required for new developments in the Region using on-site septic tank-subsurface leaching/percolation systems.

   A. The term “one-half acre” specified as the minimum lot size requirement means an average gross area of land of one-half acre per dwelling unit. Easements (including streets, curbs, commons, and greenbelts), or those portions thereof which are part of the property proposed for development shall be included in the calculation of the average gross area of land.

   B. A “new” development is defined as a proposed tract, parcel, industrial or commercial development for which:

      1. One or more of the following has not been granted on or prior to September 7, 1989:

         a. Conditional approval or approval of a tentative parcel or tract map by the local agency such as the county/city Planning Commission, City Council or the Board of Supervisors.

         b. A conditional use permit.

         c. Conditional approval or approval by the San Bernardino County Department of Environmental Health Services, Riverside County Department of Health Care Agency or other local agency; or

2. One or more of the conditional approvals or approvals listed under B.1., above, were granted on or prior to September 7, 1989 but had expired prior to September 7, 1989.

C. The minimum lot size requirement does not apply to existing developments where septic tank-subsurface disposal systems have been installed on or prior to September 7, 1989. Replacement of the existing septic tank-subsurface disposal systems shall be exempt from the minimum lot size requirements under the following conditions:

1. For Residential, Commercial and Industrial Developments

   Replacement of the existing septic tank-subsurface disposal systems is necessary to bring the system up to code as required by the local health care agencies and/or the building and safety departments.

2. For Single-Family Residential Only

   Replacement of the existing septic tank-subsurface disposal systems is proposed to allow additional flows resulting from additions to the existing dwelling unit. (This does not include any free-standing additional structures.)

   (Note: Board staff does not consider the number of bedrooms and/or bathrooms for existing or proposed single-family dwelling units in determining compliance with the exemption criteria.)

   a. An existing development on land zoned single-family residential will be considered as a new development if the addition of any free-standing structures which result in additional wastewater flows to the septic system is proposed. Commercial and/or industrial developments will be considered as new development if any additions to the existing structures are proposed which will result in additional wastewater flows to the septic system.

   b. For single-family residential developments, if the existing septic system could accommodate additional wastewater flows, then additional installations (rooms/bathroom) to these developments shall be exempt from the minimum lot size requirements.

D. Those tracts, parcels, industrial or commercial developments which have received one or more of the approvals listed in B.1., above, on or prior to September 7, 1989 are exempt from minimum lot size requirements for use of septic tank-subsurface disposal systems. However, those tracts, parcels, industrial or commercial developments which had received one or more of the approvals listed in B.1., above, but for which the approval had expired prior to

September 7, 1989 are considered as new development and are subject to the minimum lot size requirements.

E. Industrial/commercial developments are developments other than single-family residential developments. For new industrial commercial developments utilizing septic tank-subsurface disposal systems, the wastewater flow for each one-half acre gross area of land may not exceed that from a three-bedroom, two bathroom single-family dwelling unit. For determining compliance with this criterion, a flow rate of 300 gallons per day shall be considered as the flow equivalent to that from a 3-bedroom, 2-bathroom single-family dwelling. For industrial/commercial developments with lots smaller than one-half acre, this flow rate requirement shall be prorated. (For example, an industrial/commercial development on a one-quarter (1/4) acre parcel will be in compliance with this requirement if the wastewater flow does not exceed 150 gallons per day.)

F. This minimum lot size requirement does not affect the lot size criterion for continuing exemptions in prohibition areas (1 acre minimum).

G. This minimum lot size requirement does not preclude the prescription of more stringent lot size requirements in specific areas if it is determined necessary to protect water quality.

H. No exemptions shall be granted for new developments on lots less than one-half acre which are 200 feel or less from a sewer which could serve that tract/parcel, barring legal impediments to such use. All other developments shall be considered on sliding scale, *e.g.,* for each additional unit (any development which is more than a single-family dwelling), this requirement should be increased by 100 feet per dwelling unit. For example, a 10-lot subdivision shall be required to connect to a sewer if the sewer is within 1,100 feet (200 + 9 x 100 feet = 1,100 feet) of the proposed development barring legal impediments to connection to the sewer. For this subsection, a commercial/industrial development which produces a wastewater flow of up to 300 gallons per day would be considered equivalent to a single-family dwelling unit.

I. New lots of less than one-half acre may be formed by combining two or more lots which have received one of the approvals specified in Section B.1., above on or prior to September 7, 1989. Individually, these existing lots would be eligible for an exemption from the minimum lot size requirement. Developments on the combined lots may also be granted an exemption provided that the total number of units proposed for the new parcel is equal to or less than the total number of units proposed for the existing parcel. For the purposes of this subsection, a combined lot of less than one-half acre formed from two or more existing lots shall not be considered a new development.

J. Exemptions from the minimum lot size requirements for the use of septic tank-subsurface disposal systems on lots smaller than one-half acre may be granted if the following conditions are met:

   1. The project proponent implements an acceptable offset program. Under an offset program, the project proponent can proceed with development using septic systems on lots smaller than one-half acre if the proponent connects an equivalent number of septic systems to the sewer. The unsewered developments must be those which would not otherwise be required to connect to the sewer.

   2. If the septic systems (developments) proposed are not identical to the ones connected to the sewer (the offset), an engineering report shall be submitted certifying that the nitrogen loading rate from the proposed development(s) is(are) equivalent to or less than the nitrogen loading rate from the septic systems in the offset program.

   3. The proposed use of septic tank-subsurface disposal systems complies with the Regional Board's "Guidelines for Sewage Disposal from Land Developments,"

K. The project proponent may propose an alternative treatment system for sewage disposal as the basis for an exemption from the minimum lot size requirement. Each request for use of an alternative treatment system shall be reviewed on a case-by-case basis and submitted to the Regional Board for consideration.

**Newport Bay Watershed**

Water quality problems in Newport Bay were described in detail in reports prepared in response to Senate Concurrent Resolutions 38 and 88 [Ref. 16, 17]. These problems are essentially nonpoint source problems and fall into four major categories: 1) TMDL for sediment; 2) bacterial contamination; 3) eutrophication and 4) toxic substances contamination. Each of these problems have been or is being addressed by either local or state agencies. A brief description follows:

### 1.a Phase 1 of the TMDL for Sediment (Amended by Resolution 98-101)

The Total Maximum Daily Load for sediment in the Newport Bay/San Diego Creek Watershed includes the following quantifiable targets and Load Allocations that shall be implemented by the Cities (Irvine, Tustin, Lake Forest, Costa Mesa, Santa Ana and Newport Beach) and County responsible for the sediment discharged into stormwater and flood control conveyances under their control which discharge into San Diego Creek and/or Newport Bay.

1. Sediment control measures shall be implemented and maintained to ensure that sediment discharges into Newport Bay will not significantly change the existing acreages of aquatic, wildlife, and rare and endangered species habitat, and to maintain the navigational and non-contact recreational beneficial uses of the bay. The existing aquatic and wildlife habitat of the Upper Bay, which is comprised of approximately 210 acres of marine aquatic habitat, 214 acres of mudflat habitat, 277 acres of salt marsh, and 31 acres of riparian habitat within, and adjacent to**,** the 700 acre Upper Newport Bay Ecological Reserve and the existing navigational and recreational uses of Newport Bay, will be used by the Regional Board as a performance standard of the effectiveness of the sediment TMDL. If these acreages are changed by more than 1% as the result of sediment deposition, if the in-bay sediment basins or the in-channel sediment basins are not maintained, or if there are impacts to navigational and recreational uses, this will indicate that the local sediment control measures are not adequate to protect the beneficial uses provided by these areas, and the Board will reevaluate the sediment TMDL for Newport Bay and San Diego Creek. Since the intent of the sediment TMDL is to protect these beneficial uses, this quantifiable target will be used as the primary measurement of the success of the TMDL. In order to maintain the marine aquatic habitat of the Unit 1 and 2 Sediment Basins in Upper Newport Bay, a minimum depth of 7 feet below mean sea level shall be maintained**.** The Cities and County, acting through cooperative agreements under the Newport Bay Watershed Executive Committee, shall conduct bathymetric and vegetation surveys of Newport Bay no less than once every three years or as agreed upon by the Executive Officer. This information will be used to evaluate compliance with the acreage and depth targets. If these acreages are changed by more than 1% as the result of sediment deposition, if the minimum depth is not maintained**,** and if the 50% target sediment reduction described below is not achieved, the Regional Board may consider appropriate enforcement action.

2. It is recognized that the Department of Fish and Game, which is responsible for the management of the Reserve, may wish to modify the habitat composition and acreages of the Reserve to address wildlife needs. The habitat acreages identified above will be revised accordingly through the Basin Plan Amendment process.

3. The second quantifiable target is to reduce the annual average sediment load in the watershed from a total of approximately 250,000 tons per year to 125,000 tons per year, thereby reducing the sediment load to Newport Bay to approximately 62,500 tons per year and limiting sediment deposition in the drainages to approximately 62,500 tons per year. Sediment control measures shall be implemented and maintained to result in a 50% reduction in the current load of sediment in the Newport Bay/San Diego Creek Watershed within 10 years. The Regional Board will determine compliance with this target by calculating the annual average amount of suspended solids measured in San Diego Creek at Jamboree Boulevard and Campus Drive over a ten year period, and by evaluating the scour studies of the creek channels and topographic surveys of all the sediment control basins in the watershed to estimate the amount of deposition. Given that annual sediment deposition can vary widely based on weather and other conditions, it is appropriate to evaluate compliance with

the sediment reduction target as a 10 year running annual average of the suspended solids load measured in San Diego Creek at Jamboree Boulevard and Campus Drive. The Regional Board will compare this information to the bathymetric and scour studies information to determine if the monitoring data accurately reflects sediment deposition in the bay and creek channels and to determine compliance with this target.

4. Sediment control measures shall be implemented and maintained to comply with the following Load Allocations (implemented as 10-year running annual averages) for discharges of sediment to Newport Bay: 1) no more than 28,000 tons per year of sediment shall be discharged to Newport Bay from open space areas within the watershed, 2) no more than 19,000 tons per year shall be from agricultural land, 3) no more than 13,000 tons per year from construction sites, 4) no more than 2,500 tons per year discharged from urban areas. The Cities and County, acting through cooperative agreements under the Newport Bay Watershed Executive Committee, shall be required to provide a proposal for evaluating compliance with these individual land use type load allocations that is subject to the approval of the Executive Officer. This proposal shall be implemented upon approval of the Executive Officer.

5. Sediment control measures shall be implemented and maintained to comply with the following Load Allocations (implemented as 10-year running annual averages) in addition to the load allocations specified above for Newport Bay for discharges of sediment to tributaries of Newport Bay: 1) no more than 28,000 tons per year of sediment shall be discharged to San Diego Creek and its tributaries from open space areas within the watershed, 2) no more than 19,000 tons per year shall be discharged to San Diego Creek and its tributaries from agricultural land, 3) no more than 13,000 tons per year discharged to San Diego Creek and its tributaries from construction sites, 4) no more than 2,500 tons per year discharged to San Diego Creek and its tributaries from urban areas. The Cities and County, acting through cooperative agreements under the Newport Bay Watershed Executive Committee, shall be required to provide a proposal for evaluating compliance with these individual land use type load allocations that is subject to the approval of the Executive Officer. This proposal shall be implemented upon approval of the Executive Officer.

6. Sediment control measures shall be implemented such that Upper Newport Bay, including In-Bay Sediment Basins 1 and 2, need not be dredged more frequently than about once every 10 years, and the long term goal of Phase 1 of the TMDL for sediment is to reduce the frequency of dredging to once every 20 to 30 years. It is recognized that extreme rainfall conditions may necessitate more frequent dredging of the in-bay basins. The Regional Board will adopt waste discharge requirements for such dredging projects as the means of recommending Clean Water Act Section 401 Water Quality Certification for the dredging, and to ensure proper disposal of the dredged sediment.

7. Waste Discharge Requirements will be waived for maintenance dredging of flood control channels and drainages throughout the watershed in order to maintain flood control capacity, under the following conditions; 1) any vegetation removal or earthwork conducted between March 1 and September 1 shall be supervised by a

qualified biologist, approved by the Department of Fish and Game, to ensure compliance with the Endangered Species Act and Migratory Bird Treaty Act (this monitor shall have the authority to the stop or divert work to avoid impacts as necessary); and 2) the information in a complete application (report of waste discharge) demonstrates that the waiver criteria specified herein and in Regional Board Resolution No. 96-9, Waiver of Waste Discharge Requirements for Certain Types of Discharges, are met.

8. All in-channel and foothill sediment control basins throughout the drainages in the watershed shall be maintained to have at least 50% of design capacity available prior to November 15 of each year. Waste Discharge Requirements will be waived for sediment control basin maintenance activities under the following conditions: 1) any vegetation removal or earthwork conducted between March 1 and September 1 shall be supervised by a qualified biologist, approved by the Department of Fish and Game, to ensure compliance with the Endangered Species Act and Migratory Bird Treaty Act (this monitor shall have the authority to the stop or divert work to avoid impacts as necessary); 2) the use of herbicides for the control of vegetation within channels shall be avoided to the greatest extent practicable; and 3) the information in a complete application (report of waste discharge) demonstrates that the waiver criteria specified herein and in Regional Board Resolution No. 96-9, Waiver of Waste Discharge Requirements for Certain Types of Discharges, are met.

9. Waste Discharge Requirements will be waived for drainage channelization and stabilization projects on drainages within the watershed between the foothill sediment basins and Upper Newport Bay, under the following conditions: 1) while modifying the channels, no native riparian wetland vegetation shall be removed from within the basins or adjacent to the basins during the period between April 1 and September 1 of each year, in order to protect the federally listed least Bell's vireo, unless one to one mitigation is provided for the loss of the riparian and aquatic habitat; 2) any vegetation removal or earthwork conducted between March 1 and September 1 shall be supervised by a qualified biologist, approved by the Department of Fish and Game, to ensure compliance with the Endangered Species Act and Migratory Bird Treaty Acts (this monitor shall have the authority to stop or divert work to avoid impacts as necessary); and 3) the information in a complete application (report of waste discharge) demonstrates that the waiver criteria specified herein and in Regional Board Resolution No. 96-9, Waiver of Waste Discharge Requirements for Certain Types of Discharges, are met. The Regional Board will continue to work with the U.S. Army Corps of Engineers and other appropriate agencies towards the adoption of a Special Area Management Plan (or comparable plan) and General Permit for channel stabilization and flood control projects in accordance with Section 404 and 401 of the Clean Water Act. If a plan for completing the Special Area Management Plan by June 1, 1999 is not submitted to the Executive Officer by January 1, 1999, then the Executive Officer is directed to require, as an additional condition for obtaining a waiver, the completion of a comprehensive delineation of all the wetlands in the watershed and an evaluation of the cumulative impacts of projects to control sediment and the build-out of the watershed on the beneficial uses of these waters

of the State. This evaluation of the cumulative impacts must be completed, according to a plan acceptable to the Executive Officer, by June 1, 1999. Staff intends to use the delineation to propose a general permit to the Regional Board that will cover the kind of activities described in the amendment. Until the SAMP, or, alternatively, the comprehensive delineation described above, is completed, staff will continue to process individual permit applications for each project.

10. The Cities and County, acting through cooperative agreements under the Newport Bay Watershed Executive Committee, shall evaluate: 1) the amount of sediment being discharged from areas that contribute sediment to the total load discharged to Newport Bay; and 2) the effectiveness of the local sediment control plan (the 208 Plan). Where areas that contribute sediment are not under the jurisdiction of entities that are currently part of the Newport Bay Watershed Executive Committee, the Cities and County shall recommend to the Regional Board, if necessary, a new formula for allocating sediment loads and sharing of the costs of implementing the sediment control measures that will provide a 50% reduction in the current load of sediment. This evaluation shall, at a minimum, address the sediment loads from the Santa Ana-Delhi Channel, Bonita Creek, the federal lands within the watershed, and the City of Lake Forest.

These conditions shall not supersede more restrictive conditions of other agencies, such as the U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, the State Department of Fish and Game, or other local agencies.

### 1.b Phase 2 of the TMDL for Sediment: Monitoring and Reassessment

The Newport Bay Watershed Executive Committee has developed an agreement whereby the County of Orange conducts the monitoring of sediment discharge within the watershed, with the costs shared by all parties, except the Department of Fish and Game. There has been no site specific monitoring of the various sources of sediment, so it is impossible to determine the effectiveness of specific BMPs. It is also too soon to reach any conclusions about the overall effectiveness of the local sediment control measures.

Since 1983, the County has monitored flow and total suspended solids at three locations and conducts periodic scour studies to evaluate sediment transport and deposition in the drainages within the watershed. In addition, the County has conducted two topographic surveys of the Upper Bay to determine sediment accumulation in the Upper Bay. The County intends to continue this monitoring program on behalf of the Newport Bay Watershed Executive Committee.

In addition, the Newport Bay Watershed Executive Committee shall:

1. Propose monitoring stations and schedules to be established to monitor the discharge of sediment from the Santa Ana-Delhi Channel and Bonita Canyon Creek into the Upper Bay and to evaluate the effectiveness of the BMPs being implemented in the watershed. This monitoring plan shall also propose monitoring to evaluate compliance with the Load Allocations for various land use types. This

monitoring plan will not become effective until approved by the Regional Board at a duly noticed public hearing as specified in Chapter 1.5, Division 3, Title 23 of the California Code of Regulations (Section 647 et seq.).

2. Propose monitoring stations and schedules to conduct the scour studies for the drainages in the watershed to be conducted annually. These surveys shall determine the amount of sediment accumulated in San Diego Creek and its tributaries, the in-channel sediment basins, the foothill sediment basins, and any other sediment basins in the watershed. The survey report shall be used to demonstrate whether the sediment basins have at least 50% capacity prior to November 15 of each year. This monitoring plan will not become effective until approved by the Regional Board at a duly noticed public hearing as specified in Chapter 1.5, Division 3, Title 23 of the California Code of Regulations (Section 647 et seq.).

3. Conduct topographic and vegetation surveys of Upper Newport Bay at least every three years, or as agreed upon by the Executive Officer, and after any year in which the monitoring for total suspended solids at Campus Drive shows that more than 250,000 tons of sediment were discharged to the Bay. In any year in which these surveys are required, the surveys shall be conducted by July 1. The results of these surveys shall be submitted as part of an annual report by December 31 of each year. The topographic and vegetation surveys shall be conducted to determine the amount of sediment deposition in the two In-Bay basins and the other marine aquatic habitat areas and to determine changes in the areal extent of the existing aquatic, wildlife and endangered species habitat areas.

4. Submit an annual report by December 31 of each year providing the monitoring data and information collected by the Newport Bay Watershed Executive Committee, including the flow and suspended solids monitoring data, the scour studies, the bathymetric and vegetation surveys, (and any additional information collected by the Committee). The monitoring shall be completed prior to July 1 of each year and this information shall be used to determine the maintenance requirements of all sediment basins in the watershed. Additionally, the Newport Bay Watershed Executive Committee shall submit a report by November 15 of each year certifying whether the sediment basins in the watershed have at least 50% capacity. The Regional Board will use the information collected by this monitoring program to evaluate the effectiveness of the sediment TMDL and will reevaluate the sediment TMDL as part of the Regional Board's Basin Planning process.

5. The monitoring data and information collected by the Newport Bay Watershed Executive Committee, including the flow and suspended solids monitoring data, the scour studies, the bathymetric surveys and the vegetation surveys, (and any additional information collected by the Newport Bay Watershed Executive Committee) shall be submitted in an annual report by December 31 of each year. The monitoring shall be completed prior to July 1 of each year and this

information shall be used to determine the maintenance requirements of all sediment basins in the watershed. Additionally, the Newport Bay Watershed Executive Committee shall submit a report by November 15 of each year certifying whether the sediment basins in the watershed have at least 50% capacity. The Regional Board will use the information collected by this monitoring program to evaluate the effectiveness of the sediment TMDL and will reevaluate the sediment TMDL as part of the Board's Basin Planning process. (End of Amendment Resolution No. 98-101)

2. Bacterial Contamination

Bacterial contamination of the waters of Newport Bay can directly affect two designated beneficial uses: water-contact recreation (**REC-1**) and shellfish harvesting (**SHEL**). The Orange County Health Care Agency (OCHCA) conducts routine bacteriological monitoring and more detailed sanitary surveys as necessary, and is responsible for closure of areas to recreational and shellfish harvesting uses if warranted by the results.

Because of consistently high levels of total coliform bacteria, the upper portion of Upper Newport Bay (Upper Bay) has been closed to these uses since 1974. In 1978, the shellfish harvesting prohibition area was expanded to include all of the Upper Bay, and the OCHCA generally advises against the consumption of shellfish harvested anywhere in the Bay. Bacterial objectives established to protect shellfish harvesting activities are rarely met in the Bay. (Fecal coliform objectives for the protection of shellfish harvesting and water-contact recreation are shown in Chapter 4, “Enclosed Bays and Estuaries”. The OCHCA has relied on total coliform standards specified in the California Health and Safety Code. Fecal coliform are a subset of total coliform.). Certain areas in the lower parts of the Upper Bay and in Lower Newport Bay (Lower Bay) are also closed to water-contact recreation on a temporary basis, generally in response to storms. In these areas, there is generally good compliance with water-contact recreation bacterial objectives in the summer.

Data collected by the OCHCA demonstrate that tributary inflows, composed of urban and agricultural runoff, including stormwater, are the principal sources of coliform input to the Bay. As expected, there are more violations of bacterial standards in the Bay during wet weather, when tributary flows are higher, than in dry weather. There are few data on the exact sources of the coliform in this runoff. Coliform has diverse origins, including: manure fertilizers which may be applied to agricultural crops and to commercial and residential landscaping; the fecal wastes of humans, household pets and wildlife; and other sources. Special investigations by OCHCA have demonstrated that food wastes are a significant source of coliform. Many restaurants wash down equipment and floor mats into storm drains tributary to the Bay and may improperly dispose of food waste such that it eventually washes into the Bay. Such discharges likely contribute to the chronic bacterial quality problems in certain parts of the Bay.

Another source of bacterial input to the Bay is the discharge of vessel sanitary wastes. Newport Bay has been designated a no-discharge harbor for vessel sanitary wastes since 1976. Despite this prohibition, discharges of these wastes have continued to

occur. Since these wastes are of human origin, they pose a potentially significant public health threat.

The Regional Board, the City of Newport Beach (City), the County of Orange, the City of Newport Beach Harbor Quality Committee, and other parties have taken or stimulated actions to enforce the vessel waste discharge prohibition. The principal focus of these efforts has been to make compliance with the prohibition convenient and therefore more likely. Vessel waste pumpouts have been installed at key locations around the Bay and are inspected routinely by the OCHCA. A City ordinance addresses people-intensive boating activities to ensure proper disposal of sanitary wastes. The ordinance requires that sailing clubs, harbor tour, and boat charter operations install pumpouts for their vessels. Another City ordinance addresses vessel waste disposal by persons living on their boats. Efforts have also been made to ensure that there are adequate public rest rooms onshore. The City also sponsors an extensive public education campaign designed to advise both residents and visitors of the discharge prohibition, the significance of violations, and of the location of pumpouts and rest room facilities. The effectiveness of these extensive vessel waste control efforts is not known.

As noted, the fecal waste of wildlife, including waterfowl that inhabit the Bay and its environs, is a source of coliform input. The fecal coliform from these natural sources may contribute to the violations of water quality objectives and the loss of beneficial uses, but it is currently unknown to what extent these natural sources contribute to, or cause, the violations of bacterial quality objectives in Newport Bay.

Reports prepared by Regional Board staff describe the bacterial quality problems in the Bay in greater detail and discuss the technical basis for the fecal coliform TMDL that follows (21, 22). Implementation of this TMDL is expected to address these bacterial quality problems and to assure attainment of water quality standards, that is, compliance with water quality objectives and protection of beneficial uses.

## 3.a. Fecal Coliform TMDL (Amended by Resolution No. 99-10)

A prioritized, phased approach to the control of bacterial quality in the Bay is specified in this TMDL. This approach is appropriate, given the complexity of the problem, the paucity of relevant data on bacterial sources and fate, the expected difficulties in identifying and implementing appropriate control measures, and uncertainty regarding the nature and attainability of the SHEL use in the Bay. The phased approach is intended to allow for additional monitoring and assessment to address areas of uncertainty and for future revision and refinement of the TMDL as warranted by these studies.

Table 5-9f summarizes the TMDL, Waste Load Allocations (WLAs) for point sources of fecal coliform inputs and Load Allocations (LAs) for nonpoint source inputs. As shown, the TMDL, WLAs and LAs are established to assure compliance with water contact recreation standards no later than December 30, 2014 and with shellfish standards no later than December 30, 2019. WLAs are specified for vessel waste and urban runoff, including stormwater, the quality of which is regulated under a County-wide NPDES

permit issued by the Regional Board. This runoff is thus regulated as a point source, even though it is diffuse in origin. LAs are specified for fecal coliform inputs from agricultural runoff, including stormwater, and natural sources. The TMDL is to be adjusted, as appropriate, based upon completion of the studies contained in Table 5-9g. Upon completion of these studies, an updated TMDL report will be prepared summarizing the results of the studies and making recommendations regarding implementation of the TMDL. The results of the studies may lead to recommendations for changes to the TMDL specified in Table 5-9f to assure compliance with existing Basin Plan standards (objectives and beneficial uses). The study results may also lead to recommendations for changes to the Basin Plan objectives and/or beneficial uses. If such standards changes are approved through the Basin Plan amendment process, then appropriate changes to the TMDL would be required to assure attainment of the revised standards. Revision of the TMDL, if appropriate, would also be considered through the Basin Plan amendment process.

Upon completion and consideration of the studies and any appropriate Basin Plan amendments, a plan for compliance with the TMDL specified in Table 5-9f, or with an approved amended TMDL, will be established. It is expected that this plan will specify a phased compliance approach, based on consideration of such factors as geographic location, the priority assigned by the Regional Board to specific locations for control actions (see Section 3.a.ii, “Beneficial Use Assessment”), season, etc. Interim WLAs, LAs and compliance dates that lead to ultimate compliance with the TMDL will be established.

The TMDL and its allocations contain a significant margin of safety. The margin of safety can be either incorporated implicitly through analytical approaches and assumptions used to develop the TMDL or added explicitly as a separate component of the TMDL. A substantial margin of safety is implicitly incorporated in the TMDL in the fact that the TMDL does not apply criteria for dilution, natural die-off, and tidal flushing. The TMDL, WLAs, and LAs are established at concentrations equivalent to the water quality objectives.

**Table 5-9f: Total Maximum Daily Load, Waste Load Allocations, and Load Allocations for Fecal Coliform in Newport Bay**

| Total Maximum Daily Load for Fecal Coliform In Newport Bay | Waste Load Allocations for Fecal Coliform in Urban Runoff, including stormwater, Discharges to Newport Bay | Load Allocations for Fecal Coliform in Agricultural Runoff, including stormwater, Discharges to Newport Bay | Load Allocations for Fecal Coliform from Natural Sources in all Discharges to Newport Bay | Waste Load Allocations for Vessel Waste |

### 3.a.i. TMDL Implementation

As soon as possible but no later than the dates specified in Table 5-9g, the County of Orange, the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest and Newport Beach and agricultural operators in the Newport Bay watershed shall submit the plans and schedules shown in Table 5-9g and described in Section 3.a.ii. Subsequent phases of TMDL implementation shall take into account the results of the monitoring and assessment efforts required by the initial study phase of the TMDL implementation plan and other relevant studies.

The following sections describe the requirements for the submittal of plans by dischargers in the Newport Bay watershed to complete specific monitoring, investigations and analyses. In each and every case, the plans submitted by the named dischargers will be considered for approval by the Regional Board at a duly noticed public hearing as specified in Chapter 1.5, Division 3, Title 23 of the California Code of Regulations (Section 647 et seq.). The plans are to be implemented upon Regional Board approval and completed as specified in Table 5-9g.

### 3.a.ii. Monitoring and Assessment

Routine monitoring and special investigations and analyses are an important part of this phased TMDL. Routine monitoring is necessary to assess compliance with the bacterial quality objectives in the Bay and with the WLAs and LAs specified in the TMDL. Special investigations and analyses are needed to identify and characterize sources of fecal coliform input and to determine their fate in the Bay so that appropriate control measures can be developed and implemented. The effectiveness of current and future bacterial control measures needs to be evaluated. The results of these studies may warrant future changes to this TMDL.

#### 3.a.ii.a. Routine Monitoring

By January 30, 2000, the County of Orange, the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest and Newport Beach, and the agricultural operators in the Newport Bay watershed shall propose a plan for routine monitoring to determine compliance with the bacterial quality objectives in the Bay.

At a minimum, the proposed plan shall include the collection of five (5) samples/30-days at the stations specified in Table 5-9h and shown in Figure 5-1 and analysis of the samples for total and fecal coliform and enterococci. Reports of the collected data shall be submitted monthly. An annual report summarizing the data collected for the year and evaluating compliance with the water quality objectives shall be submitted by September 1 of each year.

In lieu of this coordinated, regional monitoring plan, one or more of the parties identified in the preceding paragraph may submit an individual or group plan to conduct routine monitoring in areas solely within their jurisdiction to determine compliance with the bacterial objectives in the Bay (if appropriate). Any such individual or group plans shall also be submitted by January 30, 2000. Reports of the data collected pursuant to approved individual/group plan(s) shall be submitted monthly and an annual report summarizing the data and evaluating compliance with water quality objectives shall be submitted by September 1 of each year.

The monitoring plan(s) shall be implemented upon Regional Board approval.

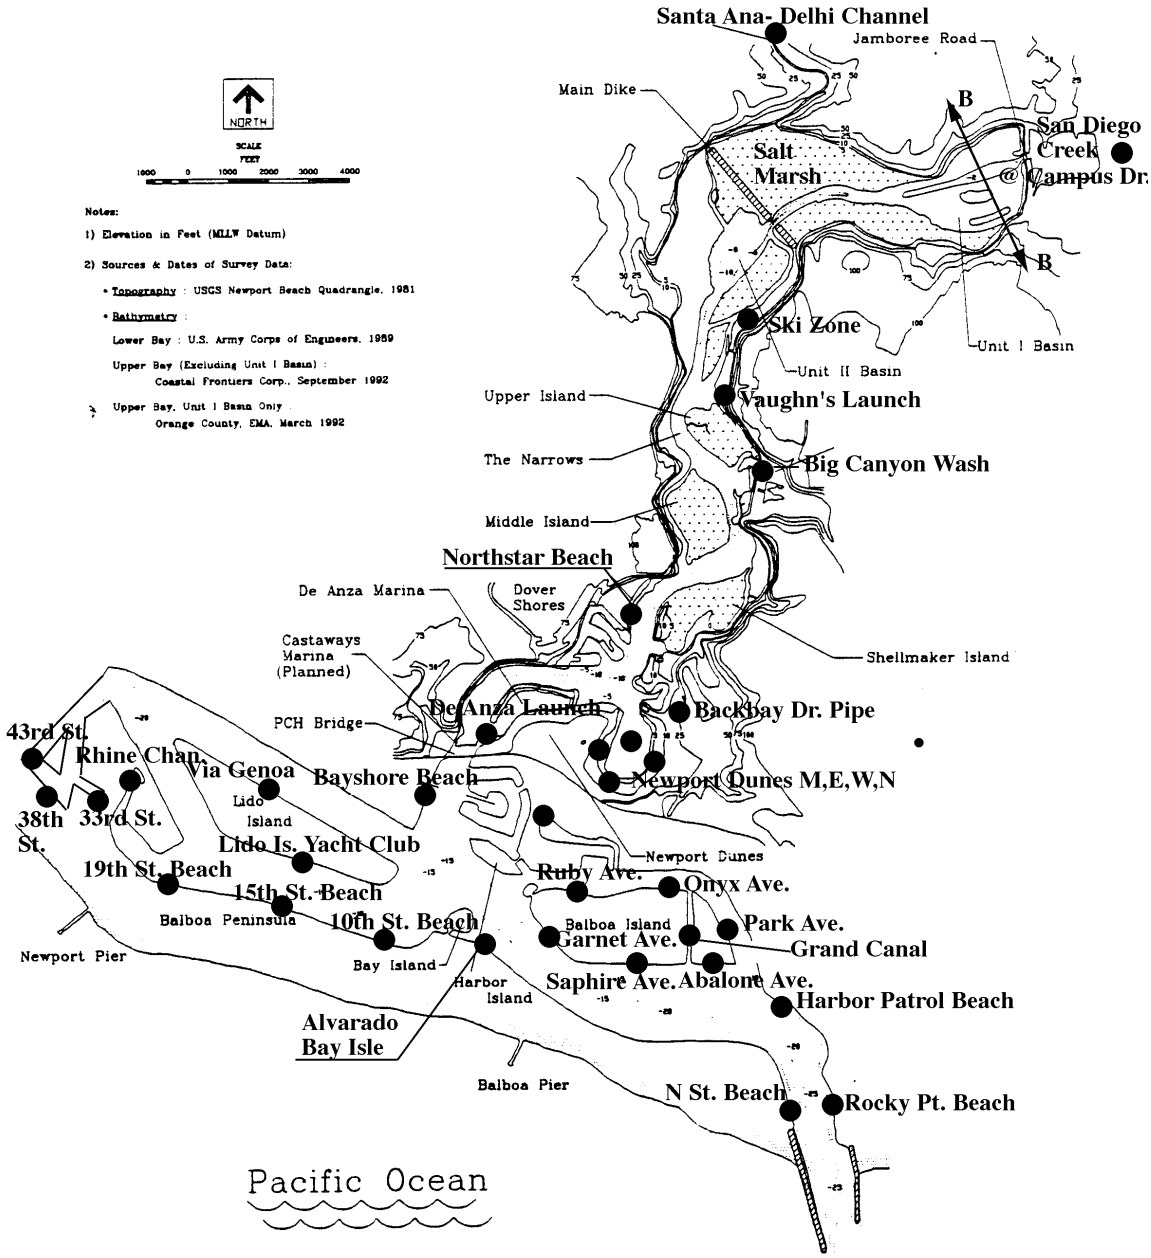

Figure 5-1: Newport Bay Bacterial Quality Monitoring Stations

3.a.ii.b. Fate of Bacterial Inputs

By January 30, 2000, the County of Orange, the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest, and Newport Beach and the agricultural operators in the Newport Bay watershed shall submit a plan for the development and submittal of a water quality model to be completed by 13 months after Regional Board approval of the plan. The model shall be capable of analysis of fecal coliform inputs to Newport Bay, the fate of those inputs, and the effect of those inputs on compliance with bacterial quality objectives in the Bay.

3.a.ii.c. Beneficial Use Assessment

By January 30, 2000, the County of Orange , the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest and Newport Beach shall submit a plan to complete, by 13 months after Regional Board approval of the plan, a beneficial use assessment to identify and quantify water contact recreation activities in Newport Bay. By 13 months after Regional Board approval of the beneficial use assessment plan, these parties shall submit a report of the results of the water contact recreation beneficial use assessment.

By March 1, 2001, the County of Orange , the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest and Newport Beach shall submit a plan to complete, by 13 months after Regional Board approval of the plan, a beneficial use assessment to identify and quantify shellfish harvesting activities in Newport Bay. By 13 months after Regional Board approval of the beneficial use assessment plan, these parties shall submit a report of the results of the shellfish harvesting beneficial use assessment.

The beneficial use assessment reports shall contain recommendations for prioritizing areas within Newport Bay for purposes of evaluation and implementation of cost-effective and reasonable control actions as part of the TMDL process. The Regional Board will consider these recommendations and make its determinations regarding high priority water contact recreation and shellfish harvesting areas at a duly noticed public hearing. These determinations will be considered in establishing interim WLAs and LAs and compliance dates (Task 10, Table 5-9g).

3.a.ii.d. Source Identification and Characterization

By March 1, 2000 the County of Orange and the City of Newport Beach shall submit a proposed plan for a program, to be completed within 7 months after Regional Board approval of the plan to identify and characterize fecal coliform inputs to The Dunes Resort. In lieu of this coordinated plan, each of these parties may submit an individual plan to identify and characterize fecal coliform inputs to The Dunes Resort. Any such individual plan shall also be submitted by March 1, 2000 and completed within 7 months after Regional Board approval of the plan(s).

By (60 days after State TMDL approval),* the County of Orange and the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest, and Newport Beach shall submit a proposed plan for a program, to be completed within 13 months after Regional Board approval of the plan to identify and characterize fecal coliform inputs to Newport Bay from urban runoff, including stormwater. In lieu of this coordinated, regional plan, one or more of these parties may submit an individual or group plan to identify and characterize fecal coliform inputs to the Bay from urban runoff from areas within its jurisdiction. Any such individual or group plan shall also be submitted by (60 days after State TMDL approval)* and completed within 13 months after Regional Board approval of the plan(s).

By April 1, 2000, the agricultural operators in the Newport Bay watershed shall submit a proposed plan for a program, to be completed within 16 months after Regional Board approval of the plan, to identify and characterize fecal coliform inputs to Newport Bay from agricultural runoff, including stormwater. In lieu of this coordinated plan, one or more of the agricultural operators may submit an individual or group plan to identify and characterize fecal coliform inputs to the Bay from agricultural runoff from areas within their jurisdiction. Any such individual or group plan shall also be submitted by April 1, 2000, and completed within 16 months after Regional Board approval of the plan(s).

By April 1, 2000, the County of Orange and the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest, and Newport Beach shall submit a proposed plan for a program, to be completed within 16 months after Regional Board approval of the plan, to identify and characterize fecal coliform inputs to Newport Bay from natural sources. In lieu of this coordinated, regional plan, one or more of these parties may submit an individual or group plan to identify and characterize fecal coliform inputs to the Bay from natural sources from areas within its jurisdiction. Any such individual or group plan shall also be submitted by April 1, 2000 and completed within 16 months after Regional Board approval of the plan(s).

3.a.ii.e. Evaluation of Vessel Waste Control Program

By April 1, 2000 the County of Orange and the City of Newport Beach shall submit a plan to complete, by one year after Regional Board approval of the plan, an assessment of the effectiveness of the vessel waste control program implemented by those

agencies in Newport Bay. The plan shall be implemented upon approval by the Regional Board. A report of the study results shall be submitted, together with recommendations for changes to the vessel waste program necessary to ensure compliance with this TMDL.

The Regional Board will consider appropriate changes to the vessel waste control program. These changes shall be implemented in accordance with a schedule to be established by the Regional Board.

3.a.ii.f. TMDL, WLA and LA Evaluation and Source Monitoring Program

By (3 months after completion of Tasks 2, 4a, and 6 as shown in Table 5-9g)* the County of Orange, the Cities of Tustin, Irvine, Costa Mesa Santa Ana, Orange, Lake Forest and Newport Beach, and the agricultural operators in the Newport Bay watershed shall propose a plan for evaluation and source monitoring to determine compliance with the WLAs and LAs specified in Table 5-9f. In lieu of this coordinated, regional plan, one or more of these parties may submit an individual or group plan to conduct TMDL, WLA, LA and Source Evaluation monitoring from areas solely within their jurisdiction. Any such individual or group plan shall also be submitted by (3 months after completion of Tasks 2, 4a, and 6 as shown in Table 5-9g).* Reports of the data collected pursuant to approved individual/group plan(s) shall be submitted monthly and an annual report summarizing the data and evaluating compliance with WLAs and LAs shall be submitted by September 1 of each year. The annual report shall also include an evaluation of the effectiveness of control measures implemented to control sources of fecal coliform, and recommendations for any changes to the control measures needed to ensure compliance with the TMDL, WLAs, and LAs.
The evaluation and source monitoring plan(s) shall be implemented upon Regional Board approval.

3.a.ii.g. Updated TMDL Report

The County of Orange, the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Orange, Lake Forest and Newport Beach, and the agricultural operators in the Newport Bay watershed shall submit Updated TMDL Reports as specified in Table 5-9g. These updated TMDL reports shall, at a minimum, integrate and evaluate the results of the studies required in Table 5-9g (Task 1 – 7). The reports shall include recommendations for revisions to the TMDL, if appropriate and for interim WLAs, LAs and compliance schedules

3.a.ii.h. Adjust TMDL; Adopt Interim WLA, LAs and Compliance Dates

Based on the results of the studies required by Table 5-9g and recommendations made in the Updated TMDL Reports, changes to the TMDL for fecal coliform may be warranted. Such changes would be considered through the Basin Plan Amendment process. Upon completion and consideration of the studies and any appropriate Basin Plan amendments, interim WLAs and LAs that lead to ultimate compliance with the TMDL specified in Table 5-9f, or with an approved amended TMDL, will be established with interim compliance dates. Schedules will also be established for submittal of implementation plans for control measures to achieve compliance with these WLAs, LAs, and compliance dates. These implementation plans will be considered by the Regional Board at a duly noticed public hearing.

The Regional Board is committed to the review of this TMDL every three years or more frequently if warranted by these or other studies. The County of Orange, the Cities of Tustin, Irvine, Costa Mesa, Santa Ana, Lake Forest, and Newport Beach, The Irvine Company and the Irvine Ranch Water District have undertaken to prepare a health risk assessment for Newport Bay for water contact recreation and shellfish harvesting beneficial uses. This study will evaluate whether exceedances of fecal coliform objectives correlates with actual impairment of beneficial uses and may recommend revisions to the Basin Plan objectives and/or beneficial use designations. Because this study is in progress, it is not required by this TMDL implementation plan, but will be considered in conjunction with the studies required by the implementation plan.
**(End of Resolution No. 99-10)**

## 4. Eutrophication (Amended by Resolution No. 98-9)

Nutrient loading to the Bay, particularly from the San Diego Creek watershed, contributes to seasonal algal blooms which can create a recreational and aesthetic nuisance. These algal blooms may also adversely affect wildlife.

The nutrient TMDL for the Newport Bay/San Diego Creek Watershed distributes the portions of the waterbody's assimilative capacity to various pollution sources so that the waterbody achieves its water quality standards. The Regional Board supports the trading of pollutant allocations among sources where appropriate. Trading can take place between point/point, point/nonpoint, and nonpoint/nonpoint pollutant sources. Optimizing alternative point and nonpoint control strategies through allocation tradeoffs may be a cost effective way to achieve pollution reduction benefits.

While there are a number of sources of nutrient input, tailwaters from the irrigation of agricultural crops and from several commercial nurseries in the watershed have been the predominant source. The Regional Board issued Waste Discharge Requirements to the three nurseries, requiring substantial reductions in their nutrient loads. Significant improvements have been achieved by these nurseries, largely due to the implementation of drip irrigation systems (which greatly reduce the amount of tailwater) and/or recycle systems. Installation of drip irrigation systems for other agricultural crops

has also significantly reduced the volume of nutrient-laden tailwaters. These improvements, coupled with the increased tidal flushing caused by the in-bay basins, appears to have resulted in a substantial downward trend in nitrate concentrations in the Bay. However, algal blooms are still occurring in Newport Bay and San Diego Creek. As a result, Newport Bay and San Diego Creek are listed as water quality impaired due to nutrients pursuant to Section 303(d) of the Clean Water Act. A nutrient TMDL to address this problem for Newport Bay and San Diego Creek is described in the following sections.

The hydrodynamic, sediment transport, and water quality models of Newport Bay being jointly developed by the U.S. Army Corps of Engineers and the Regional Board will be used in the future to further refine the algae and nutrient relationships in the Bay. These refinements will be considered in future reviews and revisions of the nutrient TMDL.

## 2.a. Quantifiable Nutrient Targets

The annual loading of total nitrogen and phosphorus to Newport Bay shall be reduced by 50% by 2012. The seasonal and annual loading targets are listed in Table 5-9a.

Table 5-9a Summary of Loading Targets and Compliance Time Schedules.

| **TMDL** | **December 31, 2002[5]** | **December 31, 2007[5]** | **December 31, 2012[5]** |
|---|---|---|---|
| Newport Bay Watershed<br>Total Nitrogen - Summer Load[1] | 200,097 lbs. | 153,861 lbs. | |
| Newport Bay Watershed<br>Total Nitrogen - Winter Load[2] | | | 144,364 lbs. |
| Newport Bay Watershed<br>Total Phosphorus - Annual Load[3] | 86,912 lbs. | 62,080 lbs. | |
| San Diego Creek, Reach 2<br>Total Nitrogen - Daily Load[4] | | | 14 lbs. |

1 Total nitrogen summer loading limit applies between April 1 and September 30.

2 Total nitrogen winter loading limit applies between October 1 and March 31 when the mean daily flow rate at San Diego Creek at Campus Drive is below 50 cubic feet per second (cfs), and when the mean daily flow rate in San Diego Creek at Campus Drive is above 50 cubic feet per second (cfs), but not as the result of precipitation.

3 Total phosphorus annual loading is the sum of summer and winter loading during all daily flow rates.

4 Total nitrogen daily loading limit applies when the mean daily flow rate at San Diego Creek at Culver Drive is below 25 cubic feet per second (cfs), and when the mean daily flow rate in San Diego Creek at Culver Drive is above 25 cubic feet per second (cfs), but not as the result of precipitation.

5 Compliance to be achieved no later than this date. The Regional Board may require earlier compliance with these targets when it is feasible and reasonable.

The margin of safety of the nutrient TMDL is implicit through the use of conservative assumptions. These conservative assumptions include controlling all forms of nitrogen and phosphorus and controlling seasonal and annual loading.

Load Allocations

The 5, 10, and 15 year seasonal load allocations of total nitrogen for the Newport Bay Watershed are presented in Table 5-9b. The 5 and 10-year annual total phosphorus load allocations for the Newport Bay Watershed are presented in Table 5-9c. The 15 year daily total nitrogen load allocations for San Diego Creek, Reach 2 are presented in Table 5-9d. The nutrient load reduction targets will be incorporated into waste discharge requirements as effluent limits, load allocations, and waste load allocations as necessary to ensure that:

a. the total inorganic nitrogen and narrative water quality objectives for Newport Bay and San Diego Creek are achieved

b. Clean Water Act requirements for the implementation of a TMDL are satisfied

**Table 5-9b Seasonal Load Allocations of Total Nitrogen for the Newport Bay Watershed.**

| Nutrient TMDL | 1990-1997 Loading | 2002 Allocation[8] | 2002 Summer Allocation (April-Sept)[8] | 2007 Allocation[8] | 2007 Summer Allocation (April-Sept)[8] | 2012 Allocation[8] | 2012 Winter Allocation (Oct-Mar)[7, 8, 11] |

Table 5-9d Annual Total Nitrogen Load Allocations For San Diego Creek, Reach 2 During Non-Storm Conditions.[1]

| | 2012 Allocation lbs/day TN[2] |
|---|---|
| TMDL | 14 lbs/day (TN) |
| Waste Load Allocation (Urban runoff) | 5.5 lbs/day (TN) |
| Load Allocation (Nurseries, agriculture, undefined sources) | 8.5 lbs/day (TN) |

[1] Total nitrogen loading limit applies when the mean daily flow rate at San Diego Creek at Culver Drive is below 25 cubic feet per second (cfs), and when the mean daily flow rate in San Diego Creek at Culver Drive is above 25 cubic feet per second (cfs), but not as the result of precipitation.

[2] Compliance to be achieved no later than this date. The Regional Board may require earlier compliance with these targets when it is feasible and reasonable.

2.b. Phase I of the Nutrient TMDL

1. Review and Revision of Water Quality Objectives

By December 31, 2000, the Regional Board shall review, and revise as necessary, the numeric water quality objectives for total inorganic nitrogen for San Diego Creek, Reaches 1 and 2. The Regional Board shall also examine the appropriateness of establishing numeric water quality objectives for phosphorus for San Diego Creek, Reaches 1 and 2.

2. Establish New Waste Discharge Requirements

By December 31, 1999, the Regional Board shall issue new Waste Discharge Requirements (WDRs) to nursery operations of 5 acres or greater which currently are not regulated by WDRs (as of the effective date of this amendment) but discharge nutrients in excess of 1 mg/L TIN to storm channels which are tributary to Newport Bay. The new WDRs shall incorporate the appropriate wasteload, load, and margin of safety allocations identified in the nutrient load targets for the Newport Bay Watershed. Appropriate monitoring programs to evaluate compliance with load targets and allocations shall be required and incorporated into the WDRs

3. Revision of Existing Waste Discharge Requirements

a. By December 31, 1998, the Regional Board shall revise existing WDRs for nursery operations which currently (as of the effective date of this amendment) discharge nutrients in excess of 1 mg/L TIN to drainages which are tributary to Newport Bay. The revised WDRs shall incorporate the appropriate wasteload, load, and margin of safety allocations identified in the nutrient load reduction targets for the Newport Bay Watershed. Appropriate monitoring programs to evaluate compliance with load targets and allocations shall be required and incorporated into the WDRs.

b. By December 31, 1998, the Regional Board shall revise existing NPDES permits for discharges which currently (as of the effective date of this amendment) discharge nutrients in excess of 1 mg/L TIN to drainages which are tributary to Newport Bay. The revised NPDES permits shall incorporate the appropriate wasteload, load, and margin of safety allocations identified in the nutrient load reduction targets for the Newport Bay Watershed. Appropriate monitoring programs to evaluate compliance with load targets and allocations shall be required and incorporated into the NPDES permits.

c. By March 31, 1999, the Regional Board shall revise the Monitoring and Reporting Programs of existing NPDES permits and WDRs for groundwater dewatering and cleanup operations which discharge to drainages which are tributary to Newport Bay to include requirements for phosphorus and total nitrogen sampling and analysis. This monitoring will generate the data necessary to develop appropriate wasteload allocations for these discharges.

4. Agricultural Activities

A watershed-wide nutrient management program for agricultural activities shall be developed by the Orange County Farm Bureau, University of California Cooperative Extension, and the affected growers, in conjunction with Regional Board staff. The proposed management program shall be submitted by July 1, 1999. The nutrient management program will not become effective until approved by the Regional Water Quality Control Board at a duly noticed public meeting as specified in Chapter 1.5, Division 3, Title 23 of the California Code of Regulations (Section 647 et seq.).

5. Urban Stormwater

Co-permittees of the Orange County Areawide Urban Stormwater Permit (Order No. 96-31) shall be required to submit for approval by the Regional Board's Executive Officer an analysis of appropriate Best Management Practices which will be additionally implemented through the Drainage Area Management Plan (DAMP) to achieve the short term (5-year) interim targets and final nutrient load reduction targets for the Newport Bay Watershed. The co-permittees shall also be required to provide a proposal for 1) evaluating the effectiveness of control actions implemented and 2) evaluating compliance with the nutrient load allocation. The proposal and analysis shall be submitted by July 1, 1999, and shall be implemented upon approval of the Executive Officer as specified by Section IV.1.a.ii.A of Order No. 96-31.

6. Phosphorus

The primary reduction of phosphorus loading is expected to be achieved by the implementation of the total maximum daily load for sediment in the Newport Bay/San Diego Creek watershed. The sediment TMDL is incorporated into the nutrient TMDL for the Newport Bay/San Diego Creek watershed by reference (Note - the sediment TMDL will be appropriately referenced once it is approved by OAL). Limits on phosphorus discharges shall be incorporated into the new and revised Waste Discharge Requirements previously listed, as necessary.

## 2.c. Phase II of the Nutrient TMDL

### 1. Monitoring

The Regional Board will establish and oversee a regional monitoring program (RMP) for the Newport Bay watershed. The new and revised WDRs, NPDES permits, DAMP, and agricultural nutrient management plans shall have include requirements to conduct self-monitoring, or in lieu of self-monitoring, to participate in the RMP. Participation in the RMP could result in the reduction of self-monitoring requirements. The RMP will not become effective until approved by the Regional Water Quality Control Board at a duly noticed public meeting as specified in Chapter 1.5, Division 3, Title 23 of the California Code of Regulations (Section 647 et seq.).

The RMP shall be designed by the Regional Board to assess the attainment of the goals of the nutrient TMDL. The objectives of the monitoring program shall be the quantification of the three endpoints of the nutrient TMDL: (1) the seasonal nutrient loading from the watershed; (2) the nutrient concentration in San Diego Creek, Reaches 1 and 2; and (3) the extent, magnitude, and duration of algal blooms in San Diego Creek and Newport Bay. The monitoring plan shall be implemented by March 1999.

The Regional Board will initiate investigations into the currently unknown sources of nutrients in the Newport Bay Watershed. The Regional Board, in cooperation with other agencies and entities, will investigate the occurrence of rising shallow groundwater in the Newport Bay Watershed. The study will focus on the contributions of rising groundwater to the loading of nutrients to drainage channels which are tributary to Newport Bay. Additionally, the study of the nutrient and algae processes of Newport Bay and San Diego Creek will be encouraged and supported by the Regional Board. Regional Board support could include financial resources, personnel, agency coordination, and scientific review.

### 2. Actions and Schedule to Achieve Water Quality Objectives

The actions and schedule to achieve water quality objectives is outlined in Table 5-9e. Meeting load reduction targets is highly dependent upon the effectiveness of individual actions; therefore, the Regional Board will review the TMDL, WDRs and compliance schedule at least once every 3 years. Any or all of these may be revised in order to meet water quality standards.

**Table 5-9e Schedule of Actions to Achieve Water Quality Objectives.**

| Program Actions | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Review and revision of water quality objectives | | | X | | | | | | | | | | | | | |
| New nursery permits | | X | | | | | | | | | | | | | | |
| Revise existing permits | X | | | | | | | | | | | | | | | |
| Nurseries | X | | | | | | | | | | | | | | | |
| NPDES permit | X | | | | | | | | | | | | | | | |
| Groundwater cleanup/dewatering | | X | | | | | | | | | | | | | | |
| Agricultural nutrient management plans | | X | | | | | | | | | | | | | | |
| Urban runoff BMP plan | | X | | | | | | | | | | | | | | |
| Sediment TMDL implementation | X | | | | | | | | | | | | | | | |
| Monitoring | | X | | | | | | | | | | | | | | |
| Newport Bay Watershed total nitrogen - summer TMDL targets | | | | | X | | | | | X | | | | | | |
| Newport Bay Watershed total nitrogen - winter TMDL target | | | | | | | | | | | | | | | X | |
| Newport Bay Watershed total phosphorus - annual TMDL targets | | | | | X | | | | | X | | | | | | |
| San Diego Creek, Reach 2 total nitrogen - daily target | | | | | | | | | | | | | | | X | |
| Evaluation of TMDL | | | X | | | X | | | X | | X | | | X | | X |

2.d. Estimated Costs of Agricultural Water Quality Control Programs and Potential Sources of Financing

The estimates of capital and operational costs to achieve the nutrient targets of the nutrient TMDL for the San Diego Creek/Newport Bay watershed range from $0.69 million/year to $4.73 million/year.

Potential funding sources include:

1. Private financing by individual sources.

2. Bonded indebtedness or loans from governmental institutions.

3. Surcharge on water deliveries to lands contributing to the drainage problem.

4. Ad Valorem tax on lands contributing to the drainage problem.

5. State or federal grants or low-interest loan programs.

6. Single-purpose appropriations from federal or State legislative bodies (including land retirement programs).

## 4. Toxic Substance Contamination (Amended by Resolution No. R8-2003-0039)

San Diego Creek and Newport Bay are not attaining water quality standards with respect to certain classes of toxic pollutants. On June 14, 2002, USEPA established Total Maximum Daily Loads (TMDLs) for selenium, heavy metals (cadmium, copper, lead, and zinc), organochlorine pesticides (chlordane, dieldrin, DDT, and toxaphene), PCBs, and organophosphate pesticides (diazinon and chlorpyrifos). In addition, USEPA established a separate TMDL for the Rhine Channel in Lower Newport Bay. Table 5-9i shows these TMDLs, the constituents addressed, and the waterbodies affected.

USEPA's TMDLs do not specify implementation plans, which are the responsibility of the Regional Board. The Regional Board has adopted or will adopt Basin Plan amendments to incorporate the USEPA TMDLs, revised if and as appropriate, into the Basin Plan. These amendments will include implementation plans. The anticipated schedule for these Basin Plan amendments is also shown in Table 5-9i.

**Table 5-9i. USEPA TMDLs Established June 14, 2002**

| TMDL | Basin Plan Schedule | Location | Constituents |
|---|---|---|---|
| Organophosphate Pesticides | 2003 | SDC | Diazinon, chlorpyrifos |
| | | UNB | Chlorpyrifos |
| Selenium | 2007 | SDC, UNB LNB | Selenium |
| Metals | 2007 | SDC | Cd, Cu, Pb, Zn |
| | | UNB | Cd, Cu, Pb, Zn |
| | | LNB | Cu, Pb, Zn |
| Organochlorine Compounds | 2007 | SDC | Chlordane, dieldrin, DDT, PCBs, toxaphene |
| | | UNB | Chlordane, DDT, PCBs |
| | | LNB | Chlordane, dieldrin, DDT, PCBs |
| Rhine Channel | 2007 | Rhine Channel | Se, Cr, Hg, Cu, Pb, Zn<br>Chlordane, dieldrin, DDT, PCBs |

*SDC= San Diego Creek; UNB=Upper Newport Bay; LNB=Lower Newport Bay*

## 4.a Diazinon and Chlorpyrifos TMDL

Aquatic toxicity in San Diego Creek and Upper Newport Bay causes adverse impacts to the established beneficial uses of those waterbodies.

A report prepared by Regional Board staff describes the aquatic life toxicity problems in San Diego Creek and Upper Newport Bay in greater detail and discusses the technical basis for the TMDL that follows[1]. This TMDL is the same as that promulgated by the USEPA on June 14, 2002, but an implementation plan is also specified (see Section 4.a.i.). The USEPA TMDL was, in fact, based on a draft TMDL prepared by Regional Board staff. The TMDL addresses toxicity due to diazinon and chlorpyrifos in San Diego Creek and chlorpyrifos in Upper Newport Bay. Implementation of this TMDL is expected to address, to a significant extent, the occurrence of aquatic life toxicity in these waterbodies. Reduction in aquatic life toxicity will help assure attainment of water quality standards; that is, compliance with water quality objectives and protection of beneficial uses.

Table 5-9j shows the TMDL and the allocations for diazinon and chlorpyrifos in San Diego Creek.

[1] Diazinon and Chlorpyrifos TMDL, Upper Newport Bay and San Diego Creek, April 4, 2003

Table 5-9j. Diazinon and Chlorpyrifos Allocations for San Diego Creek

| Category | Diazinon (ng/L) | | Chlorpyrifos (ng/L) | |
|---|---|---|---|---|
| | Acute | Chronic | Acute | Chronic |
| Wasteload Allocation | 72 | 45 | 18 | 12.6 |
| Load allocation | 72 | 45 | 18 | 12.6 |
| MOS | 8 | 5 | 2 | 1.4 |
| **TMDL** | **80** | **50** | **20** | **14** |

*MOS = Margin of Safety; Chronic means 4-consecutive day average*

Table 5-9k shows the TMDL and the allocations for chlorpyrifos in Upper Newport Bay.

Table 5-9k. Chlorpyrifos Allocations for Upper Newport Bay

| Category | Acute (ng/L) | Chronic (ng/L) |
|---|---|---|
| Wasteload allocation | 18 | 8.1 |
| Load allocation | 18 | 8.1 |
| MOS | 2 | 0.9 |
| **TMDL** | **20** | **9** |

*MOS = Margin of Safety; Chronic means 4-consecutive day average*

The TMDL and its allocations contain an explicit 10% margin of safety. In addition, a substantial margin of safety is implicitly incorporated in the TMDL through use of conservative assumptions.

### 4.a.i TMDL Implementation

Table 5-9l outlines the tasks and schedules to implement the TMDL.

Table 5-9l. TMDL Task Schedule

| Task No. | Task | Schedule | Description |
|---|---|---|---|
| 1 | USEPA Re-Registration Agreements | 12/2001 to 12/2006 | Phase-out of uses specified in the re-registration agreements. Should end over 90% of usage. [2] |
| 2 | Revise Discharge Permits | 2005 | WDR and NPDES permits will be revised to include the TMDL allocations, as appropriate. |
| 3 | Pesticide Runoff Management Plan | 2004 | A pesticide runoff management plan will be developed |
| 4 | Monitoring | 2003 | Modify existing regional monitoring program to include analysis for organophosphate pesticides and toxicity |
| | Special Studies | | |
| 5a | Atmospheric deposition | 2003 | Quantify atmospheric deposition of chlorpyrifos loading to Upper Newport Bay |
| 5b | Mixing volumes in Upper Newport Bay | 2003 | Model mixing and stratification of chlorpyrifos in Upper Newport Bay during storm events |

**Task 1: USEPA Re-Registration Agreements**

The re-registration agreements negotiated by USEPA with the manufacturers of diazinon and chlorpyrifos are the most significant factor affecting the implementation plan. Usage of both diazinon and chlorpyrifos in the Newport Bay Watershed is expected to be reduced by over 90 percent.

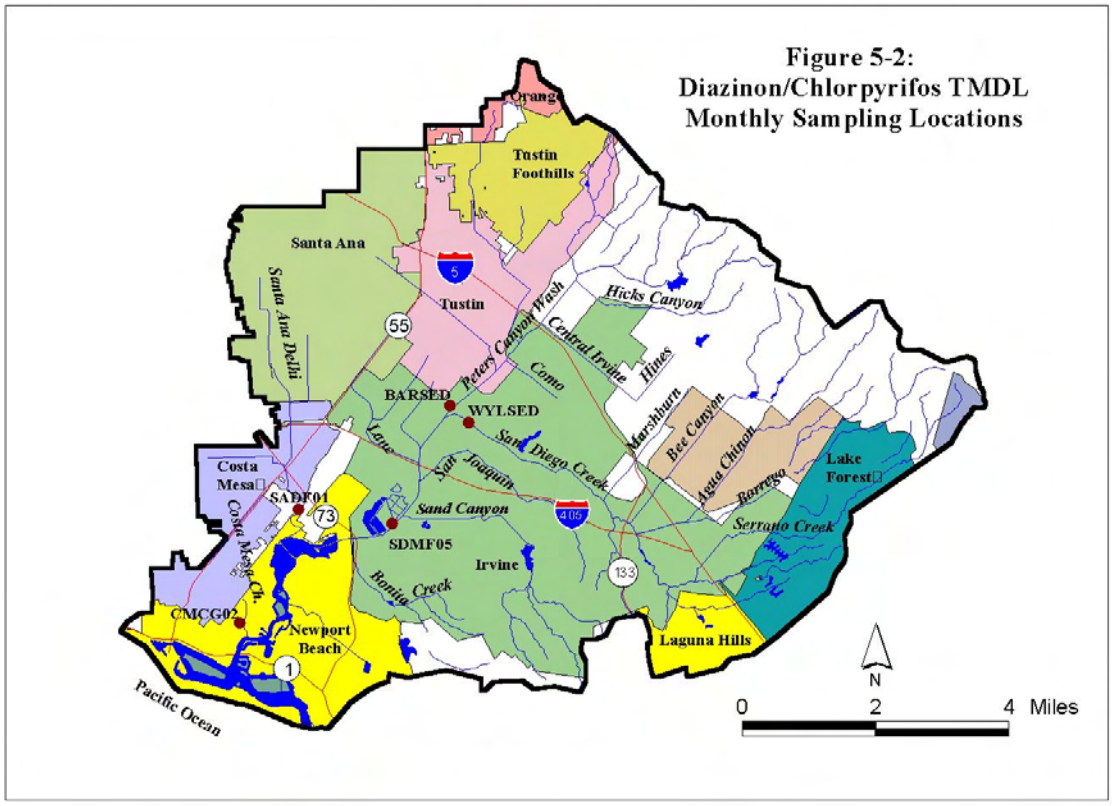
**Task 2: Revise Discharge Permits**

The TMDL allocates wasteloads to all dischargers in the watershed. Since the TMDL is concentration-based, these wasteloads are concentration limits. The concentration limits will be incorporated into existing and future discharge permits in the watershed. Compliance schedules would be included in permits only if they are demonstrated to be necessary. Compliance would be required as soon as possible, but no later than December 1, 2007.

**Task 3: Pesticide Runoff Management Plan**

A pesticide runoff management plan will be developed for the watershed as a cooperative project between the Regional Board and stakeholders.

**Task 4: Monitoring**



Routine monitoring is necessary to assess compliance with the allocations specified in the TMDL. The County of Orange, the Cities of Tustin, Irvine, Costa

[2] This task is not within the purview of the Regional Board, but is nevertheless of critical significance for implementation of the TMDL.

Mesa, Santa Ana, Orange, Lake Forest and Newport Beach, and the agricultural operators in the Newport Bay watershed will be required to propose a plan by January 30, 2004 for routine monitoring to determine compliance with the TMDL allocations for diazinon and chlorpyrifos. At a minimum, the proposed plan must include the collection of monthly samples at the stations specified in Table 5-9m and shown in Figure 5-2 and analysis of the samples for diazinon and chlorpyrifos. Monthly toxicity tests should also be conducted at several locations in the watershed. Data summaries will be required monthly. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL will be required to be submitted by November 30 of each year.

Table 5-9m. Minimum Required Monthly Sampling Stations

| Station Code | Location |
|---|---|
| BARSED | Peters Canyon Wash |
| WYLSED | San Diego Creek at Harvard Dr. |
| SDMF05 | San Diego Creek at Campus Dr. |
| SADF01, or<br>CMCG02 | Santa Ana Delhi Channel, or<br>Costa Mesa Channel |

In lieu of this coordinated, regional monitoring plan, one or more of the parties identified in the preceding paragraph may submit an individual or group plan to conduct routine monitoring in areas solely within their jurisdiction to determine compliance with the TMDL. Any such individual or group plans must also be submitted by January 30, 2004. Reports of the data collected pursuant to approved individual/group plan(s) will be required to be submitted monthly, and an annual report summarizing the data and evaluating compliance with the TMDL will be required to be submitted by November 30 of each year.

It is likely that implementation of these requirements will be through the issuance of Water Code Section 13267 letters to the affected parties. The monitoring plan(s) will be considered by the Regional Board and implemented upon the Regional Board's approval.

**Task 5: Special Studies**

With the anticipated assistance of stakeholders in the watershed, the Regional Board will conduct investigations to (1) quantify the significance of atmospheric deposition of chlorpyrifos to Upper Newport Bay, and (2) determine the adequacy of the freshwater allocations for chlorpyrifos in the tributaries to Upper Newport Bay in achieving the lower saltwater allocations. The existing hydrodynamic model for Newport Bay is being used to perform simulations that predict contaminant concentrations in the Bay based on various flow and management scenarios. The model results will be used to verify whether the TMDL allocations for chlorpyrifos in the watershed will be sufficient to achieve the TMDL allocations in Upper Newport Bay. One of the questions to be addressed is the magnitude of toxic exposure that could result from development of a freshwater lens associated with the discharge of stormwater to Upper Newport Bay.

**4.a.ii Adjust TMDL**

Based on the results of the special studies and recommendations made in the Pesticide Runoff Monitoring reports, changes to the TMDL may be warranted. Such changes would be considered through the Basin Plan Amendment process.

The Regional Board is committed to the review of this TMDL every three years, or more frequently if warranted by these or other studies.**(End of Resolution No. RB-2003-0039)**

**Anaheim Bay/Huntington Harbour**

As in Newport Bay, bacteria and toxics threaten the water quality and beneficial uses of Anaheim Bay/Huntington Harbour. As shown in Table 5-10, the presence of toxic metals and pesticides/herbicides has resulted in the designation of Anaheim Bay and Huntington Harbour as a Toxic Hot Spot for some constituents and a Potential Toxic Hot Spot for other constituents. Two major storm drains, the Bolsa Chica Channel and the East Garden Grove Wintersburg Channel, as well as their tributaries, drain in to the Anaheim Bay/Huntington Harbour complex. Inputs of stormwater and urban nuisance flows via

these channels appear to be significant sources of pollutants. The Count of Orange's general stormwater permit requires the implementation of best management practices (BMPs) and other measures in the watershed to control these inputs to the maximum extent practicable.

During 1992-93, the Regional Board contracted with UC Irvine and UC Davis to evaluate the occurrence and impacts of these toxics in Huntington Harbour [Ref. 21, 22]. Results of the study indicated that concentrations of trace metals have decreased over a 13 year period and 1992/93 measurements met established water quality criteria. However, an unidentified nonpolar organic compound was found to be acutely toxic to test species.

Anaheim Bay (inland of Pacific Coast Highway bridge) and Huntington Harbour are designated as no discharge areas for vessel sanitary wastes. Pumpout facilities are in place throughout the Harbour to facilitate compliance. Additional discussion of the activities of the Huntington Harbour Waterways Committee is provided in Chapter 7.

**Big Bear Lake (Amended by Resolution No. R8-2006-0023)**

Big Bear Lake, located in the San Bernardino Mountains, was created by the construction of the Bear Valley Dam in 1884. The Lake has a surface area of approximately 3,000 acres, a storage capacity of 73,320 acre-ft and an average depth of 24 feet. The lake reaches its deepest point of 72 feet at the dam. The Big Bear Lake drainage basin encompasses 37 square miles and includes more than 10 streams. Local stream runoff and precipitation on the Lake are the sole source of water supply to the Lake. The spillway altitude is 6,743.2 feet. The major inflows to the lake are creeks, including Rathbone (Rathbun) Creek, Summit Creek, and Grout Creek. Outflow from the Lake is to Bear Creek, which is tributary to the Santa Ana River at about the 4,000-foot elevation level. Twelve percent of Big Bear Lake's drainage basin consists of the Lake itself. The US Forest Service is the largest landowner in the Big Bear area. Two ski resorts, Bear Mountain and Snow Summit, lease land from the Forest Service.

The beneficial uses of Big Bear Lake include cold freshwater habitat (COLD), warm freshwater habitat (WARM), water contact recreation (REC1), non-contact water recreation (REC2), municipal and domestic supply (MUN), agriculture supply (AGR), groundwater recharge (GWR), wildlife habitat (WILD) and rare, threatened or endangered species (RARE).

Big Bear Lake is moderately eutrophic. During the summer months, deeper water may exhibit severe oxygen deficits. Nutrient enrichment has resulted in the growth of aquatic plants, which has impaired the fishing, boating, and swimming uses of the lake. To control this vegetation, mechanical harvesters are used to remove aquatic plants, including the roots.

Toxics may be entering the Big Bear Lake watershed and accumulating in aquatic organisms and bottom sediments at concentrations that are of concern, not only for the

protection of aquatic organisms, but for the protection of human health as well. Past Toxic Substances Monitoring Program data have indicated the presence of copper, lindane, mercury, zinc, and PCBs in fish tissue.

During 1992-93, the Regional Board conducted a Phase I Clean Lakes study (Section 314 of the Clean Water Act) to evaluate the current water quality condition of the lake and its major tributaries [Ref. 20]. The focus of the study was to identify the tributaries responsible for inputs of toxics and nutrients. As a result of data collected in the Clean Lakes Study, Big Bear Lake and specific tributaries were placed on the 1994 Clean Water Act Section 303(d) List of Water Quality Limited Segments for the reasons indicated in Table 5-9a-b.

Table 5-9a-b

Big Bear Lake Watershed Waterbodies on the
1994 303(d) List of Impaired Waters

| WATERBODY | STRESSOR |
|---|---|
| Big Bear Lake | nutrients |
| | noxious aquatic plants |
| | sedimentation/siltation |

| Rathbone (Rathbun) Creek | nutrients |
| | sedimentation/siltation |
| Grout Creek | metals |
| | nutrients |
| Summit Creek | nutrients |
| Knickerbocker Creek | metals |
| | pathogens |

In 2000, the Regional Board convened a TMDL workgroup to assist in the development of Total Maximum Daily Loads for the Big Bear Lake watershed. The Big Bear Municipal Water District, a key contributor to the workgroup, created the Big Bear Lake TMDL Task Force, including representatives of the District, Regional Board staff, the San Bernardino County Flood Control District, the City of Big Bear Lake, the Big Bear Area Regional Wastewater Authority, the State of California, Department of Transportation (Caltrans), the US Forest Service and the Big Bear Mountain Resorts. Initial TMDL development efforts were focused on nutrients, leading to Regional Board adoption of a nutrient TMDL for dry

hydrological conditions for Big Bear Lake in 2006. Nutrient TMDLs for wet and/or average hydrological conditions will be incorporated in the Basin Plan when these TMDLs are developed in the future. As shown in Table 5-9a-f, the development of these TMDLs is a requirement of the adopted TMDL implementation plan for the nutrient TMDL for dry hydrological conditions.

## 1. Big Bear Lake Nutrient Total Maximum Daily Loads (TMDLs)

Past studies, starting in 1968/1969, have shown that Big Bear Lake is moderately eutrophic and that the limiting nutrient is generally phosphorus. In Big Bear Lake, nutrients (nitrogen and phosphorus) are available in the water column and sediment and are taken up by aquatic macrophytes and algae. Nutrients are also bound in living and dead organic material, primarily macrophytes and algae. Decomposition of this organic material, as well as macrophyte and algal respiration, consumes dissolved oxygen, resulting in the depletion of dissolved oxygen from the water column. Oxygen depletion in the hypolimnion results in anoxic conditions, leading to periodic fish kills in Big Bear Lake. Oxygen depletion also results in the release of nutrients from the sediment into the water column, promoting more algae and aquatic macrophyte production. Nutrients released by plant decomposition are cycled back into a bioavailable form.

Although aquatic macrophytes provide protection from shoreline erosion, habitat for fish and other aquatic biota and waterfowl habitat, excessive growth of noxious and nuisance species, particularly Eurasian watermilfoil (*Myriophyllum spicatum*) impairs recreational uses of the Lake and reduces plant and animal species and habitat diversity.

As stated above, development of nutrient TMDLs to address these problems was initiated in 2000. In this process, it was recognized that insufficient data for wet or average hydrological conditions were available to allow calibration of the lake water quality model used to calculate the TMDL. Accordingly, a TMDL was developed to address dry hydrologic conditions only (see Section 1.B., below). This TMDL was adopted by the Regional Board in 2006 and became effective on August 21, 2007. The implementation plan included with this TMDL specifies a requirement for the development of nutrient TMDLs for wet and/or average hydrological conditions.

A key step in the development of the nutrient TMDL was the identification of the numeric targets to be achieved. The numeric targets, identified in Section 1.A., below, do not vary based upon hydrological condition. Like the approved TMDL for dry hydrological conditions, the TMDLs for wet and/or average hydrological conditions that will be developed are expected to assure also that these numeric targets are achieved. Indeed, since the TMDL for dry hydrological conditions was developed to meet the targets under the critical, worst-case conditions, consistent compliance with these targets is expected to be achieved even in the absence of TMDLs for wet/average hydrological conditions, given the greater lake volume and dilution anticipated under

wetter conditions. It is recognized that future modifications to the targets may be found necessary.

### 1. A. Numeric Targets

As shown in Table 5-9a-c, both "causal and response" numeric targets are specified for Big Bear Lake. The causal target is for phosphorus. Phosphorus is the primary limiting nutrient in Big Bear Lake[1] Response targets include macrophyte coverage, percentage of nuisance aquatic vascular plant species and chlorophyll *a* concentration. These response targets are more direct indicators of impairment and are specified to assess and track water quality improvements in Big Bear Lake

A weight of evidence approach will be used to assess compliance with the TMDL, which means that data pertaining to all the numeric targets will be evaluated and non-compliance with one target will not automatically imply non-compliance with the TMDL.

[1]There is evidence that nitrogen is a limiting nutrient under certain conditions. However, given data and analytical limitations, no nitrogen targets are specified. Nitrogen monitoring is required as part of this TMDL. The data will be used to specify nitrogen targets in the future, as warranted.

Table 5-9a-c
Big Bear Lake Nutrient TMDL Numeric Targets[a]

| Indicator | Target Value |
|---|---|
| Total P concentration | Annual average[b] no greater than 35 µg/L;<br>to be attained no later than 2015 (dry hydrological conditions), 2020 (all other times)[c] |
| Macrophyte Coverage | 30-40% on a total lake area basis;<br>to be attained by 2015 (dry hydrological conditions), 2020 (all other times) [c, d] |
| Percentage of Nuisance Aquatic Vascular Plant Species | 95% eradication on a total area basis of Eurasian Watermilfoil and any other invasive aquatic plant species; to be attained no later than 2015 (dry hydrological conditions), 2020 (all other times) [c, d] |
| Chlorophyll *a* concentration | Growing season[e] average no greater than 14 µg/L;<br>to be attained no later than 2015 (dry hydrological conditions), 2020 (all other times)[c] |

[a] Compliance with the targets to be achieved as soon as possible, but no later than the date specified

[b] Annual average determined by the following methodology: the nutrient data from both the photic composite and discrete bottom samples are averaged by station number and month; a calendar year average is obtained for each sampling location by averaging the average of each month; and finally, the separate annual averages for each location are averaged to determine the lake-wide average. The open-water sampling locations used to determine the annual average are MWDL1, MWDL2, MWDL6, and MWDL9 (see 1.B.4. Implementation, Task 4.2, Table 5-9a-i).

[c] Compliance date for wet and/or average hydrological conditions may change in response to approved TMDLs for wet/average hydrological conditions.

[d] Calculated as a 5-yr running average based on measurements taken at peak macrophyte growth as determined in the Aquatic Plant Management Plan (see 1.B.4. Implementation, Task 6C)

[e] Growing season is the period from May 1 through October 31 of each year. The open-water sampling locations used to determine the growing season average are MWDL1, MWDL2, MWDL6 and MWDL9 (see 1.B.4. Implementation, Task 4.2, Table 5-9a-i). The chlorophyll *a* data from the photic samples are averaged by station number and month; a growing season average is obtained for each sampling location by averaging the average of each month; and finally, the separate growing season averages for each location are averaged to determine the lake-wide average.

## 1.B. Big Bear Lake Nutrient Total Maximum Daily Load (TMDL) for Dry Hydrological Conditions

The TMDL technical report [Ref. #25] describes in detail the technical basis for the TMDL for Dry Hydrological Conditions that follow.

### 1. B. 1. Nutrient TMDL, WLAs and LAs and Compliance Dates – Dry Hydrological Conditions

A TMDL, and the WLAs and LAs necessary to achieve it, are established for total phosphorus for dry hydrological conditions only. As stated above, phosphorus and nitrogen are the nutrients that cause beneficial use impairment in Big Bear Lake. Dry hydrological conditions are defined by the conditions observed from 1999-2003; that is, average tributary inflow to Big Bear Lake ranging from 0 to 3,049 AF, average lake levels ranging from 6671 to 6735 feet and annual precipitation ranging from 0 to 23 inches. TMDLs, WLAs and LAs for wet and/or average hydrological conditions will be established as part of the TMDL Phase 2 activities once additional data have been collected (see 1.B.4. TMDL Implementation, Task 9).

The phosphorus TMDL for Big Bear Lake for dry hydrological conditions is shown in Table 5-9a-d. Wasteload allocations for point source discharges and load allocations for nonpoint source discharges are shown in Table 5-9a-e.

Table 5-9a-d

Big Bear Lake Nutrient TMDL for Dry Hydrological Conditions

| | **Total Phosphorus (lbs/yr)** [b] |
|---|---|
| TMDL[a] | 26,012 |

[a] Compliance to be achieved as soon as possible, but no later than December 31, 2015.
[b] Specified as an annual average for dry hydrological conditions only.

Table 5-9a-e

Big Bear Lake
Phosphorus Wasteload and Load Allocations for Dry Hydrological Conditions

| Big Bear Lake Nutrient TMDL for Dry Hydrological Conditions | Total Phosphorus Load Allocation (lbs/yr)[a, b] |
|---|---|
| **TMDL** | 26,012 |
| | |
| **WLA** | 475 |
| Urban | 475 |
| | |
| **LA** | 25,537 |
| Internal Sediment | 8,555 |
| Internal macrophyte | 15,700 |
| Atmospheric Deposition | 1,074 |
| Forest | 175 |
| Resort | 33 |

[a] Allocation compliance to be achieved as soon as possible, but no later than December 31, 2015.
[b] Specified as an annual average for dry hydrological conditions only.

## 1.B.2. Margin of Safety

The Big Bear Lake Nutrient TMDL for Dry Hydrological Conditions includes an implicit margin of safety (MOS) as follows:

1. The derivation of numeric targets based on the 25$^{th}$ percentile of nutrient data;
2. The use of conservative assumptions in modeling the response of Big Bear Lake to nutrient loads.

## 1. B.3. Seasonal Variations/Critical Conditions

The critical condition for attainment of aquatic life and recreational uses in Big Bear Lake occurs during the summer and during dry years, when nutrient releases from the sediment are greatest and water column concentrations increase. Macrophyte biomass peaks in the summer/early fall. Recreational uses of the lake are also highest during the summer. This nutrient TMDL for Big Bear Lake is focused on the critical dry hydrological conditions and, in particular, on the control of the internal sediment loads that dominate during these periods. This is the first phase of TMDLs needed to address eutrophication in Big Bear Lake. The next phase will include collection of data needed to refine the in-lake and watershed models (see

1.B.4. TMDL Implementation, Task 6A) and to develop TMDLs that address other hydrological conditions (see 1.B.4. TMDL Implementation, Task 9). TMDLs for wet and average hydrological conditions will be developed to address external loading that contributes to the nutrient reservoir in the lake and thus eutrophic conditions, particularly during the critical dry periods. However, it is important to note again that since the TMDL for dry hydrological conditions was developed to meet the numeric targets under the critical, worst-case conditions, consistent compliance with these targets is expected to be achieved even in the absence of TMDLs for wet/average hydrological conditions, given the greater lake volume and dilution anticipated under wetter conditions.

The TMDL recognizes that different nutrient inflow and cycling processes dominate the lake during different seasons. These processes were simulated in the in-lake model using data collected during all seasons over a multi-year period**.** Thus, the model results reflect all seasonal variations. The phosphorus numeric target is expressed as an annual average, while the chlorophyll *a* numeric target is expressed as a growing season average. The intent is to set targets that will, when achieved, result in improvement of the trophic status of Big Bear Lake year-round.

Compliance with numeric targets will ensure water quality improvements that prevent excessive algae blooms and fish kills, particularly during the critical summer period when these problems are most likely to occur.

## 1.B.4. TMDL Implementation

Table 5-9a-f outlines the tasks and schedules to implement the TMDL for Dry Hydrological Conditions. Each of these tasks is described below.

Table 5-9a-f

Big Bear Lake Nutrient TMDL Implementation
Plan/Schedule Report Due Dates

| Task | Description | Compliance Date-As soon As Possible but No Later Than |
|---|---|---|
| **TMDL Phase** 1 | | |
| Task 1 | Establish New Waste Discharge Requirements for Nutrient Sources | February 29, 2008 |
| Task 2 | Establish New Waste Discharge Requirements for Lake Restoration Activities | February 28, 2009 |
| Task 3 | Revise Existing Waste Discharge Requirements | February 29, 2008 |
| Task 4 | Nutrient Water Quality Monitoring Program<br>4.1 Watershed-wide Nutrient Monitoring Plan(s)<br>4.2 Big Bear Lake Nutrient Monitoring Plan(s) | Plan/schedule due November 30, 2007. Annual reports due February 15 |
| Task 5 | *Atmospheric Deposition Determination* | Plan/schedule due August 31, 2008 |
| Task 6 | *Big Bear Lake – Lake Management Plan, including:*<br>*6A. Big Bear Lake and Watershed Model Updates*<br>6B. Big Bear Lake In-Lake Sediment Nutrient Reduction Plan<br>6C. Big Bear Lake Aquatic Plant Management Plan | Plan/schedule due August 31, 2008. Annual reports due February 15 |
| TMDL Phase 2 | | |
| ***Task 7*** | Review/Revision of Big Bear Lake Water Quality Standards<br>7.1 Review/Revise Nutrient Water Quality Objectives<br>7.2 Development of biocriteria<br>7.3 Development of natural background definition | December 31, 2015 |
| Task 8 | Review Big Bear Lake Tributary Data | December 31, 2008 |
| Task 9 | Develop TMDLs, WLAs and LAs for wet and/or average hydrological conditions | December 31, 2012 |
| Task 10 | Review of TMDL/WLAs/Las | Once every 3 years |

**Task 1: Establish New Waste Discharge Requirements for Nutrient Sources**

On or before February 29, 2008, the Regional Board shall issue the following new waste discharge requirements

1.1 Waste Discharge Requirements (WDRs) or Conditional Waiver of WDRs to the US Forest Service to incorporate the nutrient load allocations, compliance schedule and monitoring and reporting requirements for Forested Areas.

Other nutrient discharges will be addressed and permitted as appropriate.

**Task 2: Establish New Waste Discharge Requirements for Lake Restoration Activities**

On or before February 28, 2009, the Regional Board shall issue the following new waste discharge requirements

NPDES Permit to the US Forest Service, the State of California, Department of Transportation (Caltrans), the County of San Bernardino, San Bernardino County Flood Control District, the City of Big Bear Lake, and Big Bear Mountain Resorts for Lake restoration activities, including, but not limited to alum treatment and/or herbicide treatment. Requirements specified in these Waste Discharge Requirements, shall be developed using the Aquatic Plant Management Plan and Schedule submitted pursuant to Task 6C.

**Task 3: Review and/or Revise Existing Waste Discharge Requirements**

Waste Discharge Requirements (WDRs) have been issued by the Regional Board regulating discharge of various types of wastes in the Big Bear Lake watershed. On or before February 29, 2008, these WDRs shall be reviewed and revised as necessary to incorporate the nutrient wasteload allocations, compliance schedule and TMDL monitoring and reporting requirements.

3.1 Waste Discharge Requirements for the San Bernardino County Flood Control and Transportation District, the County of San Bernardino and the Incorporated Cities of San Bernardino County within the Santa Ana Region, Areawide Urban Runoff, NPDES No. CAS 618036 (Regional Board Order No. R8-2002-0012). The current Order has provisions to address TMDL issues. In light of these provisions, revision of the Order may not be necessary to address TMDL requirements.

3.2 State of California, Department of Transportation (Caltrans) Stormwater Permit

Provision E.1 of Order No. 99-06-DWQ requires Caltrans to maintain and implement a Storm Water Management Plan (SWMP). Annual updates of the SWMP needed to maintain an effective program are required to be submitted to the State Water

Resources Control Board.

Provision E.2 of Order No. 99-06-DWQ requires Caltrans to submit a Regional Workplan by April 1 of each year for the Executive Officer's approval. As part of the annual update of the SWMP and Regional Workplan, Caltrans shall submit plans and schedules for conducting the monitoring and reporting requirements specified in Task 4 and the special studies required in Task 6.

## Task 4: Monitoring

### 4.1 Watershed-wide Nutrient Water Quality Monitoring Program

No later than November 30, 2007, the US Forest Service, the State of California, Department of Transportation (Caltrans), the County of San Bernardino, San Bernardino County Flood Control District, the City of Big Bear Lake and Big Bear Mountain Resorts shall, as a group, submit to the Regional Board for approval a proposed watershed-wide nutrient monitoring program that will provide data necessary to review and update the Big Bear Lake Nutrient TMDL, to determine specific sources of nutrients and to develop TMDLs for other hydrological conditions. Data to be collected and analyzed shall address, at a minimum, determination of compliance with the phosphorus dry condition TMDL, including the WLAs and LAs, and with the existing total inorganic nitrogen (TIN) objective.

At a minimum, the proposed plan shall include the collection of samples at the stations specified in Table 5-9a-g and shown in Figure 5-7, at the frequency specified in Table 5-9a-h. Modifications to the required sampling stations, sampling frequencies and constituents to be monitored (see below) will be considered upon request by the stakeholders, accompanied by a report that describes the rationale for the proposed changes and identifies recommended alternatives. In addition to water quality samples, every two weeks on a year-round basis, visual monitoring (including documenting flow type and stage) determinations shall be made at all stations shown in Table 5-9a-g. Flow measurements will be required each time water quality samples are obtained.

At a minimum, samples shall be analyzed for the following constituents:

- Total nitrogen
- Nitrate + nitrite nitrogen
- Total phosphorus
- Total dissolved phosphorus
- Suspended sediment concentration
- Chlorophyll *a*
- Dissolved oxygen
- Alkalinity
- Bedload concentration
- Total nitrogen in sediment
- Ammonia nitrogen
- Total dissolved nitrogen
- Ortho-phosphate (SRP)
- Temperature
- Turbidity
- pH
- Conductivity
- Hardness
- Grain size
- Total phosphorus in sediment

Note: Chlorophyll *a* to be collected and analyzed only from May 1- October 31 of each year at the frequencies described in Table 5-9a-h; chlorophyll *a* sampling not required at Bear Creek outlet.

In addition, the proposed plan shall include a proposed plan and schedule for development of a Big Bear Lake Sedimentation Processes Plan for the determination of nutrient loads associated with sediment. At a minimum, the proposed plan shall include the placement of sediment traps at the mouths of Rathbun, Knickerbocker, Grout and Boulder Creeks to determine the rate of influx of sediment and particulate nutrients to Big Bear Lake, as specified in Table 5-9a-g and shown in Figure 5-7, at the specified frequency indicated in Table 5-9a-h. Modifications to the required sampling stations, sampling frequencies and constituents to be monitored will be considered upon request by the stakeholders, accompanied by a report that describes the rationale for the proposed changes and identifies recommended alternatives. The proposed monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL/WLAs/LAs shall be submitted by February 15 of each year.

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. Any such individual or group monitoring plan is due no later than November 30, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report of data collected pursuant to approved individual/group plan(s) shall be submitted by February 15 of each year. The report shall summarize the data and evaluate compliance with the TMDL/WLAs/LAs.

Table 5-9a-g
Big Bear Lake Watershed
Minimum Required Sampling Station Locations

| Station Number | Station Description |
|---|---|
| MWDC2 | Bear Creek Outlet |
| MWDC3 | Grout Creek at Hwy 38 |
| MWDC4 | Rathbun Creek at Sandalwood Ave. |
| MWDC5 | Summit Creek at Swan Dr. |
| MWDC6 | Rathbun Creek below the Zoo |
| MWDC8 | Knickerbocker Creek at Hwy 18 |
| MWDC13 | Boulder Creek at Hwy 18 |

Note: Bear Creek outlet to be sampled monthly from March – November. At a minimum, samples shall be analyzed at the frequencies specified in Table 5-9a-h:

Table 5-9a-h
Big Bear Lake Watershed
Sampling Frequency

| Flow type | Months monitoring is required | Frequency |
|---|---|---|
| Baseflow | January 1 – December 31 | Once/month when baseflow is present; |
| Snowmelt | January 1 – May 31[1] | Varied -See note 2 below |
| Storm events | January 1 – December 31 | 3 storms per year[3] |

[1] Sampling to begin after the first substantial snowfall resulting in an accumulation of 1.0 inch or more of snow

[2] Samples to be collected daily for the first three days of the snowmelt period. If ambient air temperatures remain above freezing after three days have passed, snowmelt sampling will then be performed once a week for the following three weeks or until the snowmelt period ceases. Snowmelt cessation will be determined by one of the following: a) ambient air temperatures drop below freezing during most of the day; or b) a storm/rain precipitation event occurs after the snowmelt event was initiated. Beginning March 15th of each year, snowmelt flows will most likely be continuous since ambient air temperatures will usually remain above freezing. From March 15th through May 31 of each year, snowmelt sampling events will be conducted daily for the first two days of a snowmelt event and then once a week thereafter until the spring runoff period has ended or the tributary station location shows no signs of daily flows for one week. Flow status will be evaluated in the afternoon, when ambient air temperatures are highest and flow potential is greatest.

[3] Two storm events to be sampled during October – March; 1 storm event to be sampled during April – September. For each storm event, eight samples across the hydrograph are to be collected.

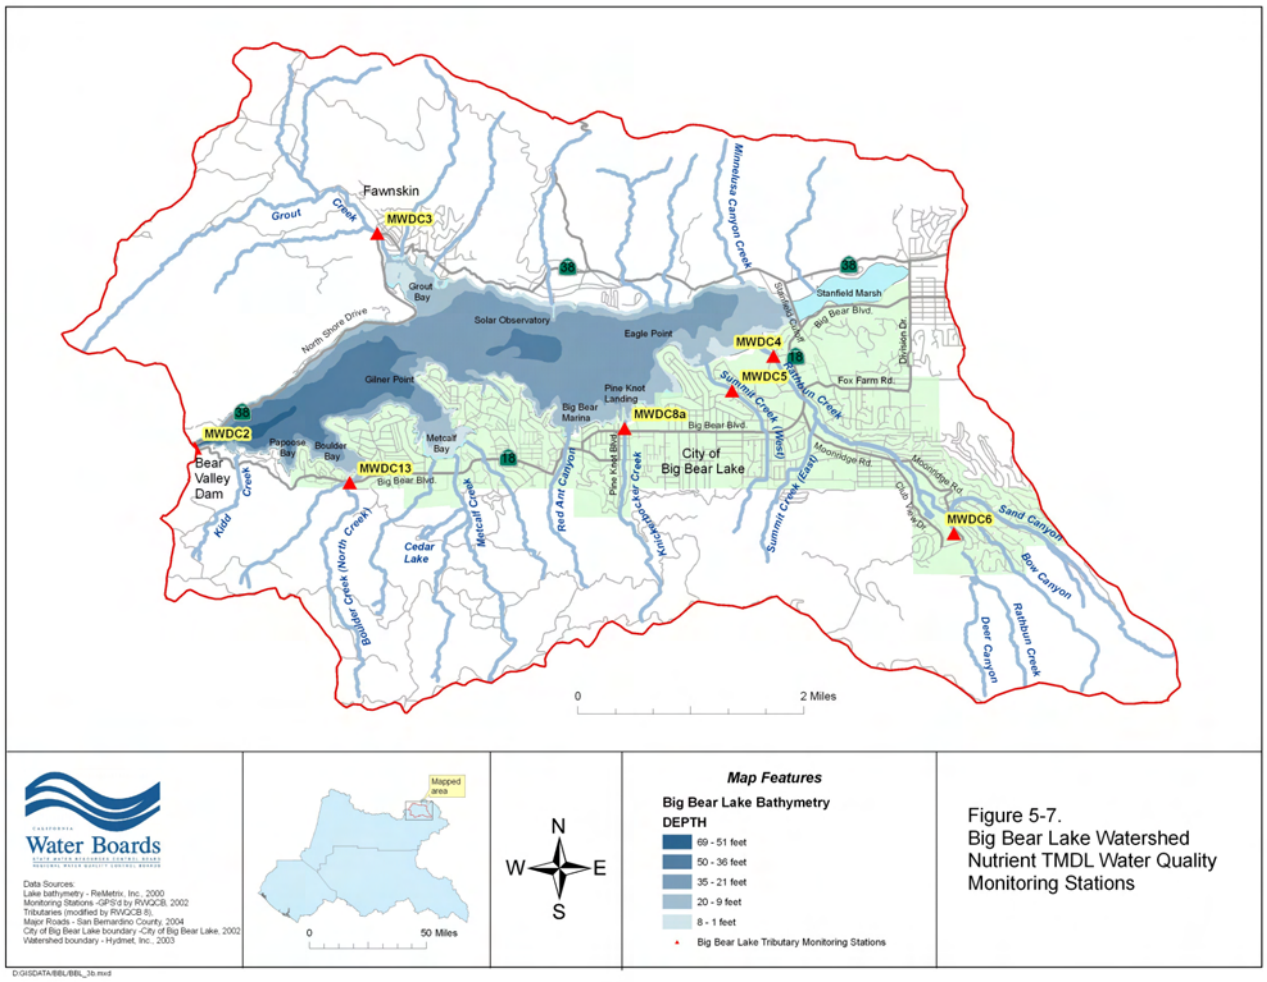

Figure 5-7 – Big Bear Lake Watershed Nutrient TMDL Water Quality Stations

## 4.2 Big Bear Lake: In-Lake Nutrient Monitoring Program

No later than November 30, 2007, the US Forest Service, the State of California, Department of Transportation (Caltrans), the County of San Bernardino, San Bernardino County Flood Control District, the City of Big Bear Lake, and Big Bear Mountain Resorts shall, as a group, submit to the Regional Board for approval a proposed Big Bear Lake nutrient monitoring program that will provide data necessary to review and update the Big Bear Lake Nutrient TMDL, and to develop TMDLs for other hydrological conditions. Data to be collected and analyzed shall address, at a minimum: (1) determination of compliance with phosphorus and chlorophyll *a* numeric targets; (2) determination of compliance with the existing total inorganic nitrogen (TIN) objective; and (3) refinement of the in-lake model for the purposes of TMDL review and development.

At a minimum, the proposed plan shall include the collection of samples at the stations specified in Table 5-9a-i and shown in Figure 5-8, at the specified frequency indicated in Table 5-9a-i. Modifications to the required sampling stations, sampling frequencies and constituents to be monitored (see below) will be considered upon request by the stakeholders, accompanied by a report that describes the rationale for the proposed changes and identifies recommended alternatives. With the exception of hardness, alkalinity, total organic carbon (TOC), dissolved organic carbon (DOC), and chlorophyll *a,* each sample to be analyzed shall be collected as a photic zone composite (from the surface to 2 times the secchi depth) and as a bottom discrete (0.5 meters off the surface bottom) sample. Hardness, alkalinity, TOC, DOC, and chlorophyll *a* shall be collected as photic zone composites. Dissolved oxygen, water temperature, turbidity, specific conductance, and pH shall be measured at 1-meter intervals from the surface to 0.5 meters from the bottom using a multi-parameter water quality meter. Water clarity shall be measured with a secchi disk.

At a minimum, in-lake samples must be analyzed for the following constituents:

- Specific conductance
- Water temperature
- Chlorophyll *a*
- Total nitrogen
- Nitrate +nitrite nitrogen
- Total phosphorus
- Total hardness
- Total dissolved phosphorus
- Dissolved organic carbon(DOC)
- Total dissolved nitrogen
- Dissolved oxygen
- Water clarity (secchi depth)
- Ammonia nitrogen
- Alkalinity
- Turbidity
- Ortho-phosphate (SRP)
- Total suspended solids (TSS)
- pH
- Total dissolved solids (TDS)
- Total organic carbon (TOC)

The monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL/WLAs/LAs and numeric targets shall be submitted by February 15 of each year.

Table 5-9a-i

Big Bear Lake Minimum Required Sampling Station Locations

| Station Number | Station Description |
|---|---|
| MWDL1 | Big Bear Lake – Dam |
| MWDL2 | Big Bear Lake – Gilner Point |
| MWDL6 | Big Bear Lake – Mid Lake Middle |
| MWDL9 | Big Bear Lake – Stanfield Middle |

Frequency of sampling at all stations: for all constituents except TOC and DOC, monthly from March – November; bi-weekly (i.e., every other week) from June 1 through October 31. TOC and DOC to be monitored four times per year (quarterly) from January through December.

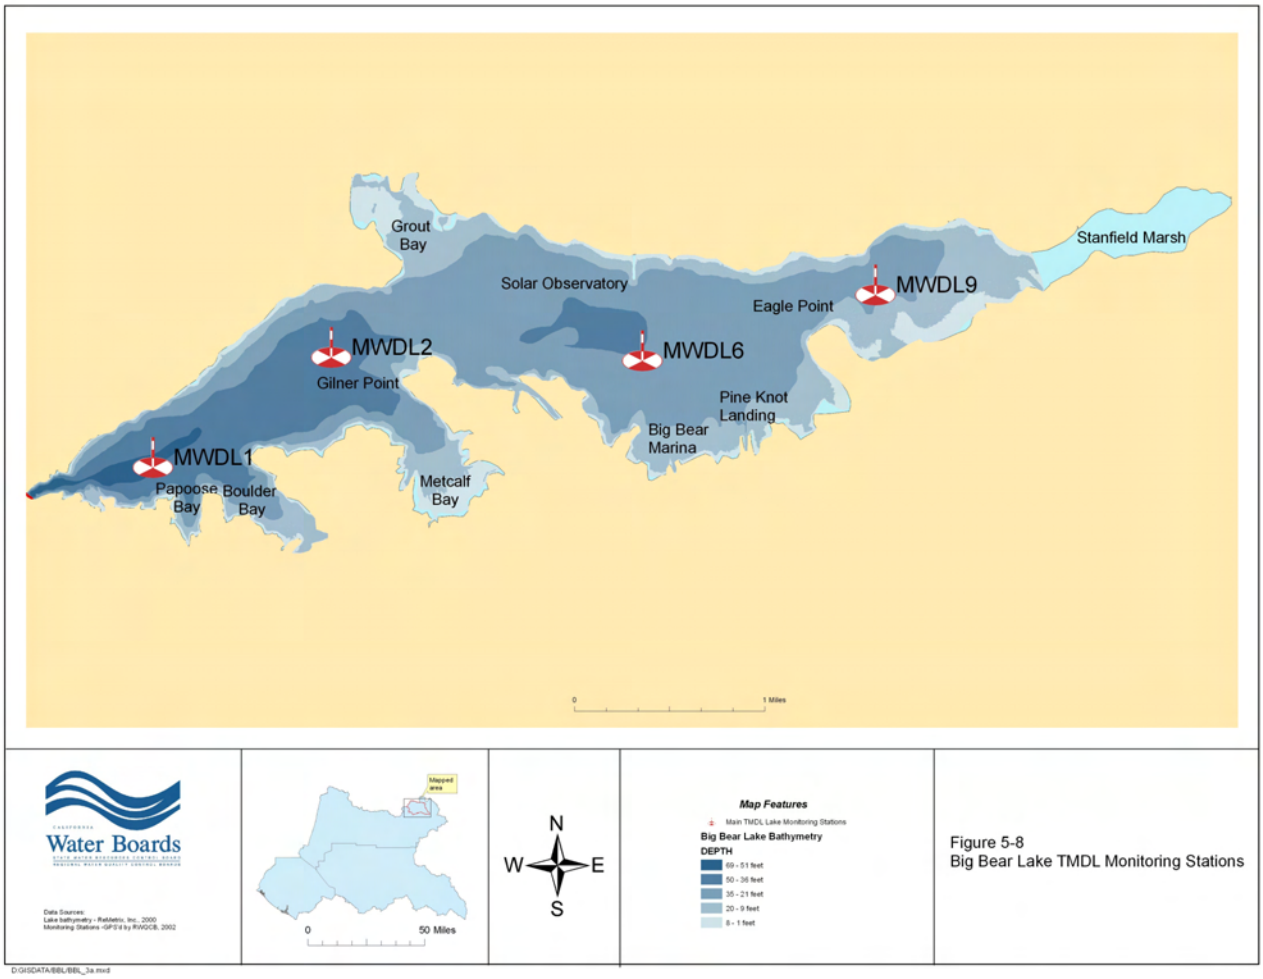

**Figure 5-8 Big Bear Lake TMDL Monitoring Stations**

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. Any such individual or group monitoring plan is due no later than November 30, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report of data collected pursuant to approved individual/group plan(s), shall be submitted by February 15 of each year. The report shall summarize the data and evaluate compliance with the TMDL/WLAs/LAs and numeric targets.

### Task 5: Atmospheric Deposition Determination

No later than August 31, 2008, the Regional Board, in coordination with local stakeholders, the South Coast Air Quality Management District and the California Air

Resources Board, shall develop a plan and schedule for quantifying atmospheric deposition of nutrients in the Big Bear Lake watershed.

**Task 6: Big Bear Lake-Lake Management Plan**

No later than August 31, 2008, the US Forest Service, the State of California, Department of Transportation (Caltrans), the County of San Bernardino, San Bernardino County Flood Control District, the City of Big Bear Lake, and Big Bear Mountain Resorts, shall, as a group, submit to the Regional Board for approval a proposed Lake Management Plan for Big Bear Lake. The purpose of the plan is to identify a coordinated and comprehensive strategy for management of the lake and surrounding watershed to address restoration and protection of the lake's beneficial uses.The plan shall include the following:

A) A proposed plan and schedule for updating the existing Big Bear Lake watershed nutrient model and the Big Bear Lake in-lake nutrient model. The plan and schedule must take into consideration additional data and information that are or will be generated from the required TMDL monitoring programs (Tasks 4.1 and 4.2, above).

B) A proposed plan and schedule for in-lake sediment nutrient reduction for Big Bear Lake. The proposed plan shall include an evaluation of the applicability of various in-lake treatment technologies to support development of a long-term strategy for control of nutrients from the sediment. The submittal shall also contain a proposed sediment nutrient monitoring program to evaluate the effectiveness of any strategies implemented.

C) The proposed plan shall include an evaluation of the applicability of various in-lake treatment technologies to control noxious and nuisance aquatic plants. The plan shall also include a description of the monitoring conducted and proposed to track aquatic plant diversity, coverage, and biomass. Data to be collected and analyzed shall address, at a minimum, determination of compliance with the numeric targets for macrophyte coverage and percentage of nuisance aquatic vascular plant species (see 1.A., above).

In addition, at a minimum, the proposed plan shall also address the following:

- The plan shall be based on identified and acceptable goals for lake capacity, biological resources and recreational opportunities. Acceptable goals shall be identified in coordination with the Regional Board and other responsible agencies, including the California Department of Fish and Game and the U.S. Fish and Wildlife Service.
- The plan shall include a proposed plan and schedule for the development of biocriteria for Big Bear Lake. (This is intended to complement Regional Board efforts to develop biocriteria and to signal the parties' commitment to participate substantively.)
- The plan must identify a scientifically defensible methodology for measuring changes in the capacity of the lake.

- The proposed plan shall identify recommended short and long-term strategies for control and management of sediment and dissolved and particulate nutrient inputs to the lake.
- The plan shall also integrate the beneficial use survey information required to be developed pursuant to the Regional Board's March 3, 2005, Clean Water Act Section 401 Water Quality Standards Certification for Big Bear Lake Nutrient/Sediment Remediation Project, City of Big Bear Lake, County of San Bernardino, California. The purpose of the beneficial use survey is to correlate beneficial uses of the lake with lake bottom contours. The survey is required to be conducted throughout the lake. The survey will determine the location and the quality of beneficial uses of the lake and the contours of the lake bottom where these uses occur. The survey is expected to be used in regulating future lake dredge projects to maximize the restoration and protection of the lake's beneficial uses.

The Big Bear Lake – Lake Management Plan shall be implemented upon Regional Board approval at a duly noticed public meeting. Once approved, the plan shall be reviewed and revised as necessary at least once every three years. The review and revision shall take into account assessments of the efficacy of control/management strategies implemented and relevant requirements of new or revised TMDLs for Big Bear Lake and its watershed. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL/WLAs/LAs and numeric targets shall be submitted by February 15 of each year.

In lieu of this coordinated plan, one or more of the parties identified above may submit a proposed individual or group Big Bear Lake – Lake Management Plan and schedule for approval by the Regional Board. Any such individual or group plan must conform to the requirements specified above and is due no later than August 31, 2008. An individual or group plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL/WLAs/LAs and numeric targets shall be submitted by February 15 of each year.

**Task 7: Review and Revision of Big Bear Lake Water Quality Standards**

By December 31, 2015, the Regional Board shall:

7.1 Review/revise as necessary the total inorganic nitrogen and total phosphorus numeric water quality objectives for Big Bear Lake. The Regional Board shall also consider the development of narrative or numeric objectives for other indicators of impairment (e.g., chlorophyll *a*, macrophyte coverage and species composition), in lieu of or in addition to review/revision of the numeric objectives for phosphorus and nitrogen.

7.2 Develop biocriteria for Big Bear Lake.

7.3 Develop a definition for natural background sources of nutrients (and other constituents) to Big Bear Lake and its tributaries.

Given budgetary constraints, completion of these tasks are likely to require substantive contributions from interested parties.

**Task 8: Review of Big Bear Lake Tributary Data**

No later than December 2008, the Regional Board shall review data collected on Rathbun Creek, Summit Creek and Grout Creek to determine whether beneficial uses of these tributaries are impaired by nutrients. If the Creeks are found to be impaired by nutrients, the Regional Board shall develop a TMDL development project plan and schedule. If these tributaries are found not to be impaired by nutrients, Regional Board shall schedule the delisting of the tributaries from the 303(d) list of impaired waters at the earliest opportunity.

**Task 9: Development of TMDLs for Wet and/or Average Hydrological Conditions**

No later than December 31, 2012, the Regional Board shall utilize additional water quality data and information collected pursuant to monitoring program requirements (Tasks 4 and 5) and model updates (Task 6A) to develop proposed nutrient TMDLs for Big Bear Lake for wet and/or average hydrological conditions. Completion of this task is contingent on the collection of requisite data for wet and/or average hydrological conditions.

**Task 10: Review/Revision of the Big Bear Lake Nutrient TMDL for Dry Hydrological Conditions (TMDL "Re-opener")**

The basis for the TMDL for Dry Hydrological Condtions, the implementation plan and schedule will be re-evaluated at least once every three years[2] to determine the need for modifying the allocations, numeric targets and TMDL. Regional Board staff will continue to review all data and information generated pursuant to the TMDL requirements on an ongoing basis. Based on results generated through the monitoring programs, special studies and/or modeling analyses, changes to the TMDL may be warranted. Such changes will be considered through the Basin Plan Amendment process.

The Regional Board is committed to the review of this TMDL every three years, or more frequently if warranted by these or other studies.

---

[2] The three-year schedule is tied to the 3 year triennial review schedule.

## Lake Elsinore/San Jacinto River Watershed (Amended by Resolution No. R8-2006-0023)

The Lake Elsinore/San Jacinto River Watershed is located in Riverside County and includes the following major waterbodies: Lake Hemet, San Jacinto River, Salt Creek, Canyon Lake and Lake Elsinore. The total drainage area of the San Jacinto River watershed is approximately 782 square miles. Over 90 percent of the watershed (735 square miles) drains into Canyon Lake. Lake Elsinore is the terminus of the San Jacinto River watershed. The local tributary area to Lake Elsinore, consisting of drainage from the Santa Ana Mountains and the City of Lake Elsinore, is 47 square miles.

Land use in the watershed includes open/forested, agricultural (including concentrated animal feeding operations such as dairies and chicken ranches, and irrigated cropland), and urban uses, including residential, industrial and commercial. Vacant/open space is being converted to residential uses as the population in the area expands. The municipalities in the watershed include the cities of San Jacinto, Hemet, Perris, Canyon Lake, Lake Elsinore and portions of Moreno Valley and Beaumont.

### 1. Lake Elsinore and Canyon Lake Nutrient Total Maximum Daily Load (TMDL)

Lake Elsinore and Canyon Lake are not attaining water quality standards due to excessive nutrients (nitrogen and phosphorus). Reports prepared by Regional Board staff describe the impact nutrient discharges have on the beneficial uses of Lake Elsinore and Canyon Lake [Ref. #26,27] Lake Elsinore was formed in a geologically active graben area and has been in existence for thousands of years. Due to the mediterranean climate and watershed hydrology, fluctuations in the level of Lake Elsinore have been extreme, with alternate periods of a dry lake bed and extreme flooding. These drought/flood cycles have a great impact on lake water quality. Fish kills and excessive algae blooms have been reported in Lake Elsinore since the early 20th century. As a result, in 1994, the Regional Board placed Lake Elsinore on the 303(d) list of impaired waters due to excessive levels of nutrients and organic enrichment/low dissolved oxygen.

Canyon Lake, located approximately 5 miles upstream of Lake Elsinore, was formed by the construction of Railroad Canyon Dam in 1928. Approximately 735 square miles of the 782 square mile San Jacinto River watershed drain to Canyon Lake. During most years, runoff from the watershed terminates at Canyon Lake without reaching Lake Elsinore, resulting in the buildup of nutrients in Canyon Lake. While Canyon Lake does not have as severe an eutrophication problem as Lake Elsinore, there have been periods of algal blooms and anecdotal reports of occasional fish kills. Accordingly, in

1998, the Regional Board added Canyon Lake to the 303(d) list of impaired waters due to excessive levels of nutrients.
A TMDL technical report prepared by Regional Board staff describes the nutrient related problems in Canyon Lake and Lake Elsinore in greater detail and discusses the technical basis for the TMDLs that follow [Ref. # 28].

## A. Lake Elsinore and Canyon Lake Nutrient TMDL Numeric Targets

Numeric targets for Lake Elsinore and Canyon Lake are based on reference conditions when beneficial uses in the lakes were not significantly impacted by nutrients. Table 5-9n shows both "causal" and "response" interim and final numeric targets for both lakes. Causal targets are those for phosphorus and nitrogen. Phosphorus and nitrogen are the primary limiting nutrients in Lake Elsinore and Canyon Lake, respectively. However, under certain conditions, nitrogen may be limiting in Lake Elsinore and phosphorus may be limiting in Canyon Lake. Targets for both nutrients are therefore necessary . Reduction in nitrogen inputs will be necessary over the long-term and only final targets are specified. Response targets include chlorophyll *a* and dissolved oxygen. These targets are specified to assess water quality improvements in the lakes. Finally, ammonia targets are specified to prevent un-ionized ammonia toxicity to aquatic life.

Table 5-9n

Lake Elsinore and Canyon Lake Nutrient TMDL Numeric Targets*

| Indicator | Lake Elsinore | Canyon Lake |
|---|---|---|
| Total P concentration (Final) | Annual average no greater than 0.1 mg/L; to be attained no later than 2020 | Annual average no greater than 0.1 mg/L; to be attained no later than 2020 |
| Total N concentration (Final) | Annual average no greater than 0.75 mg/L; to be attained no later than 2020 | Annual average no greater than 0.75 mg/L; to be attained no later than 2020 |
| Ammonia nitrogen concentration (Final) [Ref. #4] | Calculated concentrations to be attained no later than 2020<br><br>Acute: 1-hour average concentration of total ammonia nitrogen (mg/L) not to exceed, more than once every three years on the average, the CMC (acute criteria), where<br>$CMC = 0.411/(1+10^{7.204-pH}) + 58.4/(1+10^{pH-7.204})$<br><br>Chronic: thirty-day average concentration of total ammonia nitrogen (mg/L) not to exceed, more than once every three years on the average, the CCC (chronic criteria)<br>$CCC = (0.0577/(1+10^{7.688-pH}) + 2.487/(1+10^{pH-7.688})) * \min(2.85, 1.45*10^{0.028(25-T)})$ | Calculated concentrations to be attained no later than 2020<br><br>Acute: 1-hour average concentration of total ammonia nitrogen (mg/L) not to exceed, more than once every three years on the average, the CMC (acute criteria), where<br>$CMC = 0.411/(1+10^{7.204-pH}) + 58.4/(1+10^{pH-7.204})$<br><br>Chronic: thirty-day average concentration of total ammonia nitrogen (mg/L) not to exceed, more than once every three years on the average, the CCC (chronic criteria)<br>$CCC = (0.0577/(1+10^{7.688-pH}) + 2.487/(1+10^{pH-7.688})) * \min(2.85, 1.45*10^{0.028(25-T)})$ |
| Chlorophyll *a* concentration (Interim) | Summer average no greater than 40 ug/L; to be attained no later than 2015 | Annual average no greater than 40 ug/L; to be attained no later than 2015 |
| Chlorophyll *a* concentration (Final) | Summer average no greater than 25 ug/L; to be attained no later than 2020 | Annual average no greater than 25 ug/L; to be attained no later than 2020 |
| Dissolved oxygen concentration (Interim) | Depth average no less than 5 mg/L; to be attained no later than 2015 | Minimum of 5 mg/L above thermocline; to be attained no later than 2015 |
| Dissolved oxygen concentration (Final) | No less than 5 mg/L 1 meter above lake bottom; to be attained no later than 2020 | Daily average in hypolimnion no less than 5 mg/L; to be attained no later than 2020. |

* compliance with targets to be achieved as soon as possible, but no later than the date specified

## B. Lake Elsinore and Canyon Lake Nutrient TMDLs, Wasteload Allocations, Load Allocations and Compliance Dates

As discussed in the technical TMDL report, nutrient loading to Canyon Lake and Lake Elsinore varies depending on the hydrologic conditions that occur in the San Jacinto watershed. As part of the TMDL analysis and development, three hydrologic scenarios

and the relative frequency of each of these conditions (based upon an 87 year record of flow data at the USGS Gauging station downstream of Canyon Lake), were identified as shown in Table 5-9o. The resulting TMDLs, wasteload allocations and load allocations are based on 10-year running flow weighted average nutrient loads, taking into account the frequency of the three hydrologic conditions and the nutrient loads associated with each of them. Phosphorus and nitrogen TMDLs for Canyon Lake and Lake Elsinore are shown in Table 5-9p. The TMDLs, expressed as 10–year running averages, will implement the numeric targets and thereby attain water quality standards,. Phosphorus and nitrogen wasteload allocations for point source discharges and load allocations for nonpoint source discharges, also expressed as 10-year running averages, are shown in Tables 5-9q and 5-9r. No TMDLs, wasteload allocations or load allocations are specified for chlorophyll a, dissolved oxygen or ammonia. Chlorophyll a and dissolved oxygen targets are intended to serve as measures of the effectiveness of phosphorus and nitrogen reductions implemented to meet TMDL requirements. Until ammonia transformations, and nitrogen dynamics in general, are better understood, no ammonia TMDLs, wasteload allocations or load allocations are specified.

Table 5-9o
San Jacinto River Hydrologic Conditions with Relative Flow Frequency at the USGS Gauging Station Downstream of Canyon Lake (Station No. 1170500)

| Hydrologic Condition | Representative Water Year | Years of Hydrologic Condition | Relative Frequency (%) | Description |
|---|---|---|---|---|
| Wet | 1998 | 14 | 16 | Both Canyon Lake and Mystic Lake overflow; flow at the USGS gauging station 11070500 17,000 AF or greater |
| Moderate | 1994 | 36 | 41 | No Mystic Lake overflow; Canyon Lake overflowed; flow at the USGS gauging station 11070500 less than 17,000 AF and greater than 2,485 AF |
| Dry | 2000 | 37 | 43 | No overflows from Mystic Lake or Canyon Lake; flow at the USGS gauging station 11070500 371 AF or less |

Table 5-9p
Nutrient TMDLs and Compliance Dates for Lake Elsinore and Canyon Lake

| TMDL | Final Total Phosphorus TMDL (kg/yr)[a, b] | Final Total Nitrogen TMDL (kg/yr) [a, b] |
|---|---|---|
| Canyon Lake | 8,691 | 37,735 |
| Lake Elsinore | 28,584 | 239,025 |

[a] Final compliance to be achieved as soon as possible, but no later than December 31, 2020.
[b] TMDL specified as 10-year running average.

Table 5-9q

Canyon Lake
Nitrogen and Phosphorus Wasteload and Load Allocations[a]

| Canyon Lake Nutrient TMDL | Final Total Phosphorus Load Allocation (kg/yr)[b, c] | Final Total Nitrogen Load Allocation (kg/yr) [b, c] |
|---|---|---|
| **TMDL** | **8,691** | **37,735** |
| **WLA** | 486 | 6,248 |
| Supplemental water | 48 | 366 |
| Urban | 306 | 3,974 |
| CAFO | 132 | 1,908 |
| **LA** | **8,205** | **31,487** |
| Internal Sediment | 4,625 | 13,549 |
| Atmospheric Deposition | 221 | 1,918 |
| Agriculture | 1,183 | 7,583 |
| Open/Forest | 2,037 | 3,587 |
| Septic systems | 139 | 4,850 |

[a] The TMDL allocations for Canyon Lake apply to those land uses located upstream of Canyon Lake.
[b] Final allocation compliance to be achieved as soon as possible, but no later than December 31, 2020.
[c] TMDL and allocations specified as 10-year running average.

Table 5-9r

Lake Elsinore
Nitrogen and Phosphorus Wasteload and Load Allocations[a]

| Lake Elsinore Nutrient TMDL | Final Total Phosphorus Load Allocation (kg/yr)[b, c] | Final Total Nitrogen Load Allocation (kg/yr)[c, d] |
|---|---|---|
| **TMDL** | **28,584** | **239,025** |
| WLA | 3,845 | 7,791 |
| Supplemental water [d] | 3,721 | 7,442 |
| Urban | 124 | 349 |
| CAFO | 0 | 0 |
| **LA** | **21,969** | **210,461** |
| Internal Sediment | 21,554 | 197,370 |
| Atmospheric Deposition | 108 | 11,702 |
| Agriculture | 60 | 213 |
| Open/Forest | 178 | 567 |
| Septic systems | 69 | 608 |
| CL Watershed [e] | 2,770 | 20,774 |

[a] The Lake Elsinore TMDL allocations for urban, agriculture open/forest, septic systems and CAFOs only apply to those land uses located downstream of Canyon Lake.
[b] Final allocation compliance to be achieved as soon as possible, but no later than December 31, 2020.
[c] TMDL and allocations specified as 10-year running average.
[d] WLA for supplemental water should met as soon as possible as a 5 year running average.
[e] Allocation for Canyon Lake overflows

The TMDL distributes the portions of the waterbody's assimilative capacity to various pollution sources so that the waterbody achieves its water quality standards. The Regional Board supports the trading of pollutant allocations among sources, where appropriate. Trading can take place between point/point, point/nonpoint, and nonpoint/nonpoint pollutant sources. Optimizing alternative point and nonpoint control strategies through allocation tradeoffs may be a cost-effective way to achieve pollution reduction benefits. (See Section E. TMDL Implementation, Task 11, below).

## C. Margin of Safety

The Canyon Lake and Lake Elsinore Nutrient TMDLs include an implicit margin of safety (MOS) as follows:

- the derivation of numeric targets based on the 25$^{th}$ percentile of data for Lake Elsinore; Canyon Lake numeric targets to be consistent with the Lake Elsinore targets;
- the use of multiple numeric targets to measure attainment of beneficial uses and thereby assure TMDL efficacy;
- the use of conservative literature values in the absence of site-specific data for source loading rates in the watershed nutrient model;
- the use of conservative assumptions in modeling the response of Lake Elsinore and Canyon Lake to nutrient loads; and
- requiring load reductions to be accomplished during hydrological conditions when model results indicate, in some instances, that theoretical loads could be higher.

## D. Seasonal Variations/Critical Conditions

The Canyon Lake and Lake Elsinore Nutrient TMDLs account for seasonal and annual variations in external and internal nutrient loading and associated impacts on beneficial uses by the use of a 10-year running average allocation approach. This 10-year running average approach addresses variation in hydrologic conditions (wet, moderate and dry) that can dramatically affect both nutrient loading and lake response.

Compliance with numeric targets will ensure water quality improvements that prevent excessive algae blooms and fish kills, particularly during the critical summer period when these problems are most likely to occur.

## E. TMDL Implementation

Typically, under dry and moderate conditions, the internal nutrient loading drives the nutrient dynamics in both Canyon Lake and Lake Elsinore. However, it is the extreme (albeit infrequent) loading that occurs during wet conditions that provides the nutrients to the lakes that remain in the lakes as internal nutrient sources in subsequent years. Given the complexity of the San Jacinto River watershed hydrology, control of nutrients input to the lakes is needed for all hydrologic conditions. Collection of additional monitoring data is critical to developing long-term solutions for nutrient control. With that in mind, the submittal of plans and schedules to implement the TMDLs should take into consideration the need to develop and implement effective short-term solutions, as well as allow for the development of long-term solutions once additional data have been generated.

Implementation of tasks and schedules as specified in Table 5-9s is expected to achieve compliance with water quality standards. Each of these tasks is described below.

This space has been intentionally left blank

## Table 5-9s

## Lake Elsinore and Canyon Lake Nutrient TMDL Implementation Plan/Schedule Report Due Dates

| Task 11 | Watershed and Canyon Lake and Lake Elsinore In-Lake Model Updates | Plan/schedule due March 31, 2007 |
| Task 12 | Pollutant Trading Plan | Plan/schedule due September 30, 2007 |
| Task 13 | Review and Revise Nutrient Water Quality Objectives | December 31, 2009 |
| Task 14 | Review of TMDL/WLA/LA | Once every 3 years to coincide with the Regional Board's triennial review |

**Task 1: Establish New Waste Discharge Requirements**

On or before March 31, 2006, the Regional Board shall issue new waste discharge requirements (NPDES permit) to Elsinore Valley Municipal Water District for supplemental water discharges to Canyon Lake that incorporate the appropriate interim and final wasteload allocations, compliance schedule and monitoring program requirements.

Other proposed nutrient discharges will be addressed and permitted as appropriate.

**Task 2: Review and/or Revise Existing Waste Discharge Requirements**

There are five Waste Discharge Requirements (WDRs) issued by the Regional Board regulating discharge of various types of wastes in the San Jacinto watershed. On or before March 31, 2006, each of these WDRs shall be reviewed and revised as necessary to implement the Lake Elsinore and Canyon Lake Nutrient TMDLs, including the appropriate nitrogen and phosphorus interim and final wasteload allocations, compliance schedules and/or monitoring program requirements.

2.1 Waste Discharge Requirements for the Riverside County Flood Control and Water Conservation District, the County of Riverside and the Incorporated Cities of Riverside County within the Santa Ana Region, Areawide Urban Runoff, NPDES No. CAS 618033 (Regional Board Order No. R8-2002-0011). The current Order has provisions to address TMDL issues (see Task 7.1, below). In light of these provisions, revision of the Order may not be necessary to address TMDL requirements.

2.2 Watershed-Wide Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with New Developments in the San Jacinto Watershed, Order No. 01-34, NPDES No. CAG 618005. It is expected that this Order will be rescinded once the Regional Board/Executive Officer approves a Water Quality Management WQMP) under Order No. R8-2002-0011 (see 2.1, above and Task 7.2, below)

2.3 General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) within the Santa Ana Region, NPDES No. CAG018001 (Regional Board Order No. 99-11).

2.4 Waste Discharge and Producer/User Reclamation Requirements for the Elsinore Valley Municipal Water District, Regional Water Reclamation Facility Riverside County, Order No. 00-1, NPDES No. CA8000027. Revised permit specifications will take into consideration the Lake Elsinore Recycled Water Pilot Project findings.

2.5 Waste Discharge Requirements for Eastern Municipal Water District, Regional Water Reclamation System, Riverside County, Order No. 99-5, NPDES No. CA8000188[1]. Revised permit specifications will take into consideration the Lake Elsinore Recycled Water Pilot Project findings.

2.6 Waste Discharge Requirements for US Air Force, March Air Reserve Base, Storm Water Runoff, Riverside County, Order No. R8-2004-0033, NPDES CA 00111007

**Task 3: Identify Agricultural Operators**

On or before October 31, 2005, the Regional Board shall develop a list of all known agricultural operators in the San Jacinto watershed that will be responsible for implementing requirements of this TMDL. The Regional Board will send a notice to these operators informing them of their TMDL responsibility and alerting them to potential regulatory consequences of failure to comply.

**Task 4: Monitoring**

No later than December 31, 2005, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval monitoring program as required by Tasks 4.1, 4.2 and 4.3.

If modifications to the monitoring program are warranted, no later than December 31, 2006, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a revised proposed Watershed nutrient monitoring program (Task 4.1), Lake Elsinore monitoring program (Task 4.2) and Canyon Lake nutrient monitoring program (Task 4.3).

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval for the monitoring program specified in tasks 4.1, 4.2 and 4.3. Any such individual or

[1] Contingent on Eastern Municipal Water District discharge of recycled water to Lake Elsinore.

group monitoring plan is due no later than December 31, 2005. If needed, any individual or group revised monitoring plan is due no later than December 31, 2006.

## 4.1 Watershed-wide Nutrient Water Quality Monitoring Program

The US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a proposed watershed-wide nutrient monitoring program that will provide data necessary to review and update the Lake Elsinore and Canyon Lake Nutrient TMDL. Data to be collected and analyzed shall address, at a minimum: (1) determination of compliance with interim and/or final nitrogen and phosphorus allocations; and (2) determination of compliance with the nitrogen and phosphorus TMDL, including the WLAs and LAs.

At a minimum, the stations specified in Table 5-9t and shown in Figure 5-3, at the frequency specified in Table 5-9t, shall be considered for inclusion in the proposed monitoring plan. If one or more of these monitoring stations are not included, rationale shall be provided and proposed alternative monitoring locations shall be identified in the proposed monitoring plan. In addition to water quality samples, at a minimum, daily discharge (stream flow) determinations shall be made at all stations shown in Table 5-9t.

At a minimum, samples shall be analyzed for the following constituents:

- organic nitrogen
- nitrite nitrogen
- total phosphorus
- total hardness
- total suspended solids (TSS)
- biological oxygen demand (BOD)
- ammonia nitrogen
- nitrate nitrogen
- ortho-phosphate (SRP)
- total dissolved solids (TDS)
- turbidity
- chemical oxygen demand (COD)
- pH
- water temperature

The proposed monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the WLAs/LAs shall be submitted by August 15 of each year.

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. This individual monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report of data collected pursuant to approved individual/group plan(s) shall be submitted by August 15 of each year. The report shall summarize the data and evaluate compliance with the WLAs/LAs.

It may be that implementation of these monitoring requirements will be required through the issuance of Water Code Section 13267 letters to the affected parties. The monitoring plan(s) will be considered by the Regional Board and implemented upon the Regional Board's approval.

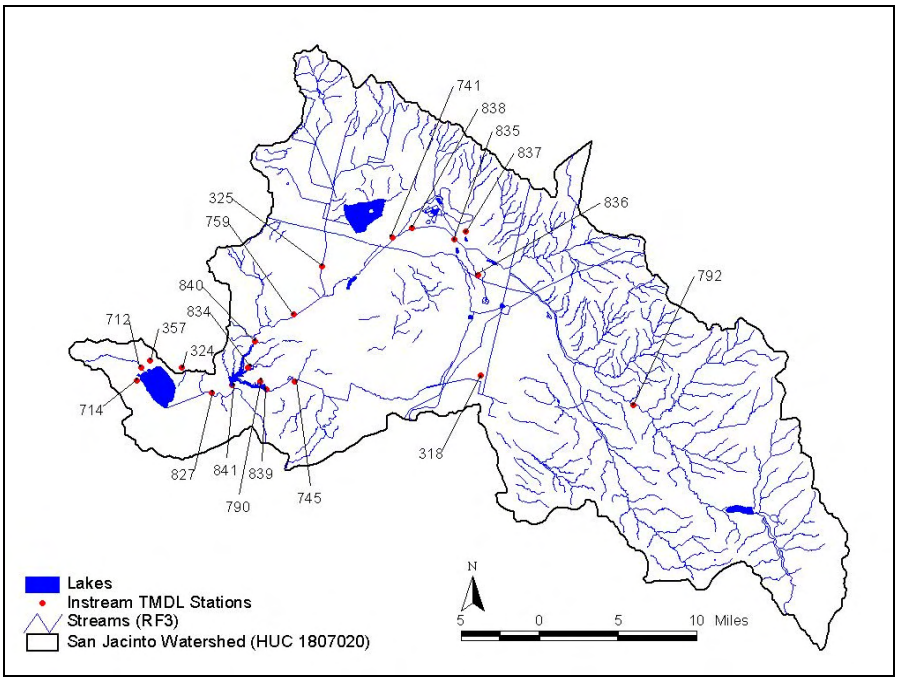

Figure 5-3 – San Jacinto River Watershed Nutrient TMDL Water Quality Stations Locations

Table 5-9t
Lake Elsinore and Canyon Lake Watershed
Minimum Required Sampling Station Locations

| Station Number | Station Description |
|---|---|
| 792 | San Jacinto River @ Cranston Guard Station |
| 318 | Hemet Channel at Sanderson Ave. |
| 745 | Salt Creek @ Murrieta Road |
| 759 | San Jacinto River @ Goetz Rd |
| 325 | Perris Valley Storm Drain @ Nuevo Rd. |
| 741 | San Jacinto River @ Ramona Expressway |
| 827 | San Jacinto River upstream of Lake Elsinore |
| 790 | Fair Weather Dr. Storm Drain in Canyon Lake |
| 357 | 4 Corners Storm Drain in Elsinore |
| 714 | Ortega Flood Channel in Elsinore |
| 324 | Lake Elsinore Outlet Channel |
| 712 | Leach Canyon Channel in Elsinore |
| 834 | Sierra Park Drain in Canyon Lake |
| 835 | Bridge Street and San Jacinto River |
| 836 | North Side of Ramona Expressway near Warren Road |
| 837 | Mystic Lake inflows |
| 838 | Mystic Lake outflows |
| 841 | Canyon Lake spillway |

Frequency of sampling at all stations: dry season – none; wet season; minimum of 3 storms/year whenever possible and 8 samples across each storm hydrograph

## 4.2 Lake Elsinore: In-Lake Nutrient Monitoring Program

The US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a proposed Lake Elsinore nutrient monitoring program that will provide data necessary to review and update the Lake Elsinore Nutrient TMDL. Data to be collected and analyzed shall address, at a minimum: determination of compliance with interim and final nitrogen, phosphorus, chlorophyll *a*, and dissolved oxygen numeric targets. In addition, the monitoring program shall evaluate and determine the relationship between ammonia toxicity and the total nitrogen allocation to ensure that the total nitrogen allocation will prevent ammonia toxicity in Lake Elsinore.

At a minimum, the proposed plan shall include the collection of samples at the stations specified in Table 5-9u and shown in Figure 5-4, at the specified frequency indicated in Table 5-9u. With the exception of dissolved oxygen and water temperature, all samples to be analyzed shall be depth integrated.

The monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL shall be submitted by August 15 of each year.

Table 5-9u

Lake Elsinore Minimum Required Sampling Station Locations

| Station Number | Station Description |
|---|---|
| LE 14 | Lake Elsinore – inlet |
| LE 15 | Lake Elsinore – four corners |
| LE 16 | Lake Elsinore – mid-lake |

Frequency of sampling at all stations: monthly October through May; bi-weekly June through September.

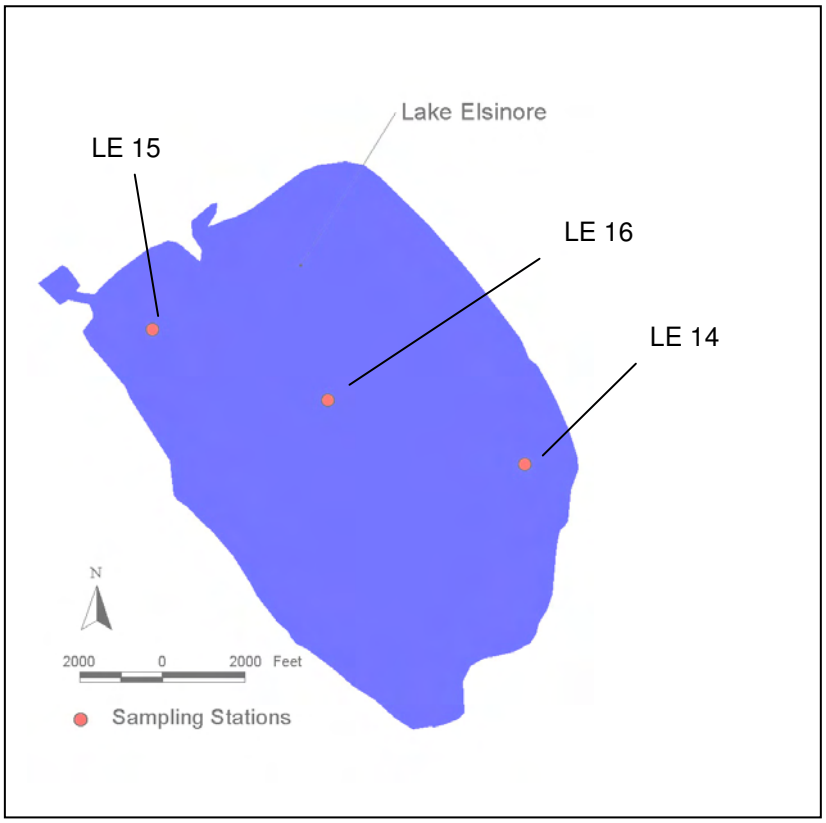

Figure 5-4 Lake Elsinore TMDL monitoring Stations

At a minimum, in-lake samples must be analyzed for the following constituents:

- specific conductance
- water temperature
- pH
- chlorophyll *a*
- organic nitrogen
- nitrite nitrogen
- organic phosphorus
- total hardness
- total dissolved solids (TDS)
- chemical oxygen demand (COD)
- dissolved oxygen
- water clarity (secchi depth)
- ammonia nitrogen
- nitrate nitrogen
- turbidity
- ortho-phosphate (SRP)
- total suspended solids (TSS)
- biological oxygen demand (BOD)

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. This individual monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report of data collected pursuant to approved individual/group plan(s), shall be submitted by August 15 of each year. The report shall summarize the data and evaluate compliance with the numeric targets.

It may be that implementation of these requirements will be required through the issuance of Water Code Section 13267 letters to the affected parties. The monitoring plan(s) will be considered by the Regional Board and implemented upon the Regional Board's approval.

### 4.3 Canyon Lake Nutrient Monitoring Program

The US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a proposed Canyon Lake nutrient monitoring program that will provide data necessary to review and update the Canyon Lake Nutrient TMDL. Data to be collected and analyzed shall address, at a minimum: determination of compliance with interim and final nitrogen, phosphorus, chlorophyll *a*, and dissolved oxygen numeric targets. In addition, the monitoring program shall evaluate and determine the relationship between ammonia toxicity and the total nitrogen allocation to ensure that the total nitrogen allocation will prevent ammonia toxicity in Canyon Lake.

At a minimum, the proposed plan shall include the collection of samples at the stations specified in Table 5-9v and shown in Figure 5-5, at the specified frequency indicated in Table 5-9v. Discrete samples in Canyon Lake are to be collected in the epilimnion, hypolimnion and thermocline when and where appropriate.

The monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report summarizing the data collected for the year and evaluating compliance with the TMDL shall be submitted by August 15 of each year.

This space has been intentionally left blank

Table 5-9v

Canyon Lake Minimum Required Sampling Station Locations

| Station Number | Station Description |
|---|---|
| CL 07 | Canyon Lake – At the Dam |
| CL 08 | Canyon Lake – North Channel |
| CL 09 | Canyon Lake – Canyon Bay |
| CL 10 | Canyon Lake – East Bay |

Frequency of sampling at all stations: monthly October through May; bi-weekly June through September.

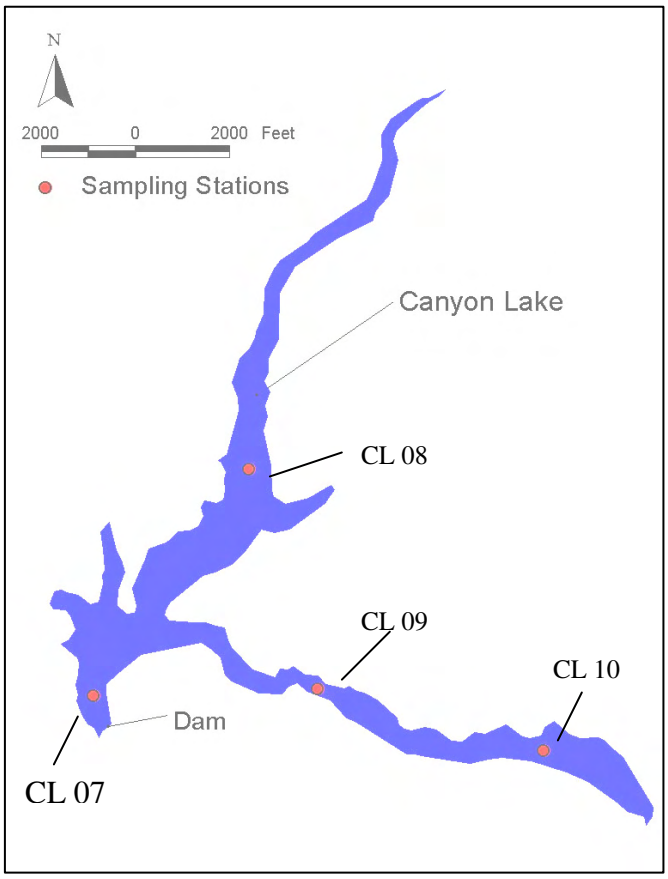

**Figure 5-5 – Canyon Lake Nutrient TMDL Monitoring Station Locations**

At a minimum, in-lake samples must be analyzed for the following constituents:

- specific conductance
- water temperature
- pH
- chlorophyll *a*
- organic nitrogen
- nitrite nitrogen
- organic phosphorus
- total hardness
- total dissolved solids (TDS)
- chemical oxygen demand (COD)
- dissolved oxygen
- water clarity (secchi depth)
- ammonia nitrogen
- nitrate nitrogen
- turbidity
- ortho-phosphate (SRP)
- total suspended solids (TSS)
- biological oxygen demand (BOD)

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. This individual plan shall be implemented upon Regional Board approval at a duly noticed public meeting. An annual report of data collected pursuant to approved individual/group plan(s) shall be submitted by August 15 of each year. The report shall summarize the data and evaluate compliance with the numeric targets.

It may be that implementation of these requirements will be required through the issuance of Water Code Section 13267 letters to the affected parties. The monitoring plan(s) will be considered by the Regional Board and implemented upon the Regional Board's approval.

### Task 5: Agricultural Activities

No later than September 30, 2007, the agricultural operators within the Lake Elsinore and Canyon Lake watershed (see Task 2), in cooperation with the Riverside County Farm Bureau, the UC Cooperative Extension, Western Riverside County Ag Coalition shall, as a group, submit a proposed Nutrient Management Plan (NMP). The Nutrient Management Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

In lieu of a coordinated plan, one or more of the parties identified above may submit a proposed individual or group Nutrient Management Plan to conduct the above studies for areas within their jurisdiction. Any such individual or group plan shall also be submitted for Regional Board approval no later than September 30, 2007. This Nutrient Management Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

At a minimum, the NMP shall include, plans and schedules for the following. In order to facilitate any needed update of the numeric targets and/or the TMDLs and/or agricultural LA, the proposed schedule shall take into consideration the Regional Board's triennial review schedule.

- implementation of nutrient controls, BMPs and reduction strategies designed to meet load allocations;
- evaluation of effectiveness of BMPs;
- development and implementation of compliance monitoring; and
- development and implementation of focused studies that will provide the following data and information
  - inventory of crops grown in the watershed;
  - amount of manure and/or fertilizer applied to each crop with corresponding nitrogen and phosphorus amounts; and
  - amount of nutrients discharged from croplands.

The Regional Board expects that the NMP will be submitted and implemented pursuant to these TMDL requirements. Where and when necessary to implement these requirements, the Regional Board will issue appropriate waste discharge requirements.

Compliance with the agricultural load allocation may be achieved through a Regional Board approved pollutant trading program.

## Task 6: On-site Disposal Systems (Septic System) Management Plan

No later than 6 months after the effective date of an agreement between the County of Riverside and the Regional Board to implement regulations adopted pursuant to Water Code Sections 13290-13291.7, or if no such agreement is required or completed, within 12 months of the effective date of these regulations, the County of Riverside and the Cities of Perris, Moreno Valley and Murrieta shall, as a group, submit a Septic System Management Plan to identify and address nutrient discharges from septic systems within the San Jacinto watershed. The Septic System Management Plan shall implement regulations adopted by the State Water Resources Control Board pursuant to California Water Code Section 13290 – 13291.7.

At a minimum, the Septic System Management Plan shall include plans and schedules for the development and implementation of the following. In order to facilitate any needed update of the numeric targets and/or the TMDLs and septic system LA, the proposed schedule shall take into consideration the Regional Board's triennial review schedule.

- public education program;
- tracking system, including maintenance thereof;

- maintenance standards;
- enforcement provisions;
- monitoring program; and
- sanitary survey.

In lieu of a coordinated plan, one or more of the agencies with septic system oversight responsibilities may submit an individual or group Management Plan to develop the above Plan for areas within their jurisdiction. Any such individual or group plan shall also be submitted no later than March 31, 2006. This Septic System Management Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

Compliance with the septic systems load allocation may be achieved through a Regional Board approved pollutant trading program.

**Task 7: Urban Discharges**

Urban discharges, including stormwater runoff, are those discharges from the cities and unincorporated communities in the San Jacinto River watershed. These discharges are regulated under the Riverside County MS4 NPDES permit, the San Jacinto Watershed Construction Activities Storm Water permit, the State Board's General Permit for Storm Water Runoff from Construction Activities, and the State Board's General Permit for Storm Water Runoff from Industrial Activities. Nuisance and stormwater runoff from state highways and right of ways is regulated under the State of California, Department of Transportation (Caltrans) statewide general NPDES permit. Finally, nuisance and stormwater runoff from the March Air Reserve Base is also regulated through an NPDES permit.

7.1 Revision to the Drainage Area Management Plan (DAMP)

Provision XIII.B. of Order No. R8-2002-0011 (see 2.1, above) requires the permittees to revise their Drainage Area Management Plan (DAMP) to include TMDL requirements. By August 1, 2006, the permittees shall review and revise the DAMP and or WQMP (see 7.2 below) as necessary to address the requirements of these nutrient TMDLs. Further review and revision of the DAMP needed to address these TMDLs shall be completed in accordance with the requirements of Order No. R8-2002-0011 or amendments/updates thereto that are adopted by the Regional Board at a public hearing. The DAMP revisions shall include schedules for meeting the interim and final nutrient wasteload allocations. In order to facilitate any needed update of the numeric targets and/or the TMDLs and urban discharge WLA, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. The revised DAMP/WQMP shall also include a proposal for 1) evaluating the effectiveness of BMPs and other control actions implemented and 2) evaluating compliance with the nutrient waste load allocation for urban runoff. The proposal must be implemented upon approval by the Regional Board after public notice and public hearing, or upon approval by the Executive Officer if no significant comments are received during the public notice period.

7.2 Revision of the Water Quality Management Plan (WQMP)

Provision VIII.B. of Order No. R8-2002-0011 (see 2.1, above) requires the permittees to develop and submit a WQMP by June 2004 for approval. On September 17, 2004, the Board approved a WQMP developed by the permittees. The approved WQMP includes source control BMPs, design BMPs and treatment control BMPs. Further revisions to the WQMP and/or the DAMP may be necessary to meet the WLA for urban runoff. By August 1, 2006, the permittees shall submit a revised WQMP and/or revised DAMP (see 7.1 above) that addresses the nutrient input from new developments and significant redevelopments to assure compliance with the nutrient wasteload allocations for urban runoff. The WQMP shall also address requirements currently in Order No. 01-34 (see 2.2, above). Once the WQMP is approved, Order No. 01-34 may be rescinded. Further review and revision of the WQMP necessary to assure that TMDL requirements are addressed shall be completed in accordance with the requirements of Order No. R8-2002-0011 or amendments/updates thereto that are adopted by the Regional Board at a public hearing.

7.3 Revision of the State of California, Department of Transportation (Caltrans) Stormwater Permit

Provision E.1 of Order No. 99-06-DWQ requires Caltrans to maintain and implement a Storm Water Management Plan (SWMP). Annual updates of the SWMP needed to maintain an effective program are required to be submitted to the State Water Resources Control Board.

Provision E.2 of Order No. 99-06-DWQ requires Caltrans to submit a Regional Workplan by April 1 of each year for the Executive Officer's approval. By April 1, 2006, Caltrans shall submit a Regional Workplan that includes plans and schedules for meeting the interim and final nutrient wasteload allocations, and provides a proposal for 1) evaluating the effectiveness of BMPs and other control actions implemented and 2) evaluating compliance with the nutrient waste load allocations for urban runoff , which includes runoff from Caltrans facilities. In order to facilitate any needed update of the numeric targets and/or the TMDLs and urban discharge WLA, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. The proposal shall be implemented upon the Executive Officer's approval. Annual updates to the Regional Workplan shall include, as necessary, revised plans and schedules for meeting the interim and final nutrient wasteload allocations and revised proposals for evaluating the efficacy of control actions and compliance with the nutrient wasteload allocations.

7.4 Revision to the United States Air Force, March Air Reserve Base, Stormwater Permit

Order No. R8-2004-0033 specifies monitoring and reporting requirements for stormwater runoff from the US Air Force, March Air Reserve facility. Provision C.17

indicates that the order could be reopened to incorporate TMDL requirements. Provisions C.18.a and C.18.b require that March Air Reserve Base submit a report and revise the Stormwater Pollution Prevention Plan (SWPPP) to address any pollutants that may be causing or contributing to exceedances of water quality standards. Results from the TMDL nutrient monitoring program conducted pursuant to Task 3, shall serve as the basis for revision of the SWPPP and/or reopening the order.

Development of the Municipal permittee's WQMP and revisions to their DAMP, development of the Caltrans SWMP and Regional Workplan, and Revision to the March Air Reserve Base SWPPP, shall address the urban component of the nutrient TMDL.

Compliance with the urban wasteload allocation may be achieved through a Regional Board approved pollutant trading program.

### Task 8: Forest Area –Identification of Forest Lands Management Practices

No later than September 30, 2007, the US Forest Service shall submit for approval a plan with a schedule for identification, development and implementation of Management Practices to reduce nutrient discharges emanating from the Cleveland National Forest and the San Bernardino National Forest . The Plan shall identify watershed-specific appropriate Best Management Practices (BMPs) that will be implemented to achieve the interim and final load allocations for forest/. The proposal shall include specific recommendations and a schedule for 1) evaluating the effectiveness of control actions implemented to reduce nutrient discharges from forest and 2) evaluating compliance with the nutrient load allocation from forest/open space. The revised watershed-specific Management Practices shall be implemented upon Regional Board approval at a duly noticed public meeting.

Compliance with the open space/forest load allocation may be achieved through a Regional Board approved pollutant trading program.

### Task 9: Lake Elsinore Sediment Nutrient Reduction Plan

No later than March 31, 2007, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, the State of California, Department of Transportation (Caltrans), the State of California, Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a proposed plan and schedule for in-lake sediment nutrient reduction for Lake Elsinore. The proposed plan shall include an evaluation of the applicability of various in-lake treatment technologies to prevent the

release of nutrients from lake sediments to support development of a long-term strategy for control of nutrients from the sediment. The submittal shall also contain a proposed sediment nutrient monitoring program to evaluate the effectiveness of any strategies that are implemented. The Lake Elsinore In-lake Sediment Nutrient Reduction Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

In lieu of this coordinated plan, one or more of the parties identified above may submit a proposed individual or group In-lake Sediment Nutrient Reduction Plan for approval by the Regional Board. Any such individual or group Plan is due no later than March 31, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting.

Compliance with the Lake Elsinore Sediment Nutrient Reduction Plan requirement may be achieved through a Regional Board approved pollutant trading program.

**Task 10: Canyon Lake Sediment Nutrient Treatment Evaluation Plan**

No later than March 31, 2007, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Murrieta, Riverside and Beaumont, Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators within the San Jacinto watershed shall, as a group, submit to the Regional Board for approval a proposed plan and schedule for evaluating in-lake sediment nutrient treatment strategies for Canyon Lake. The proposed plan shall include an evaluation of the applicability of various in-lake treatment technologies to prevent the release of nutrients from lake sediments in order to develop a long-term strategy for control of nutrients from the sediment. The submittal shall also contain a proposed sediment nutrient monitoring program to evaluate the effectiveness of any strategies that are implemented. The Canyon Lake In-lake Sediment Nutrient Treatment Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

In lieu of this coordinated plan, one or more of the parties identified above may submit a proposed individual or group In-lake Sediment Nutrient Treatment Evaluation Plan for approval by the Regional Board. Any such individual or group Plan is due no later than March 31, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting.

**Task 11: Update of Watershed and In-Lake Nutrient Models**

No later than March 31, 2007, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities

of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators shall, as a group, submit to the Regional Board for approval a proposed plan and schedule for updating the existing Lake Elsinore/San Jacinto River Nutrient Watershed Model and the Canyon Lake and Lake Elsinore in-lake models. The plan and schedule must take into consideration additional data and information that are generated from the respective TMDL monitoring programs. In order to facilitate any needed update of the numeric targets and/or the TMDLs/WLAs/LAs, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. The plan for updating the Watershed and In-lake Models shall be implemented upon Regional Board approval at a duly noticed public meeting.

In lieu of this coordinated plan, one or more of the parties identified above may submit a proposed individual or group plan for update of the Lake Elsinore/San Jacinto River Nutrient Watershed Model and the Canyon Lake and Lake Elsinore in-lake models. The plan and schedule must take into consideration additional data and information that are generated from the respective TMDL monitoring programs. In order to facilitate any needed update of the numeric targets and/or the TMDLs/WLAs/LAs, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. Any such individual or group Plan is due no later than March 31, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting.

**Task 12: Pollutant Trading Plan**

No later than September 30, 2007, the US Forest Service, the US Air Force (March Air Reserve Base), March Joint Powers Authority, California Department of Transportation (Caltrans), California Department of Fish and Game, the County of Riverside, the cities of Lake Elsinore, Canyon Lake, Hemet, San Jacinto, Perris, Moreno Valley, Riverside and Beaumont, Eastern Municipal Water District[1], Elsinore Valley Municipal Water District, concentrated animal feeding operators and other agricultural operators shall, as a group, submit to the Regional Board for approval a proposed Pollutant Trading Plan. At a minimum, this plan shall contain a plan, schedule and funding strategy for project implementation, an approach for tracking pollutant credits and a schedule for reporting status of implementation of the Pollutant Trading Plan to the Regional Board, The Pollutant Trading Plan shall be implemented upon Regional Board approval at a duly noticed public meeting.

In lieu of this coordinated plan, one or more of the parties identified above may submit a proposed individual or group Pollutant Trading Plan. Any such individual or group Plan is due no later than September 30, 2007 and shall be implemented upon Regional Board approval at a duly noticed public meeting.

**Task 13: Review and Revision of Water Quality Objectives**

By December 31, 2009, the Regional Board shall review and revise as necessary the total inorganic nitrogen numeric water quality objectives for Lake Elsinore and Canyon Lake. In addition, the Regional Board shall evaluate the appropriateness of establishing total phosphorus and un-ionized ammonia numeric water quality objectives for both Lake Elsinore and Canyon Lake. Given budgetary constraints, completion of this task is likely to require substantive contributions from interested parties.

**Task 14: Review/Revision of the Lake Elsinore/Canyon Lake Nutrient TMDL**

The basis for the TMDLs and implementation schedule will be re-evaluated at least once every three years[2] to determine the need for modifying the load allocations, numeric targets and TMDLs. Regional Board staff will continue to review all data and information generated pursuant to the TMDL requirements on an ongoing basis. Based on results generated through the monitoring programs, special studies, modeling analysis, and/or special studies by one or more responsible parties, changes to the TMDL, including revisions to the numeric targets, may be warranted. Such changes would be considered through the Basin Plan Amendment process.

The Regional Board is committed to the review of this TMDL every three years, or more frequently if warranted by these or other studies

**(End of Resolution No. R8-2004-0037)**

---

[2] The three-year schedule will coincide with the Regional Board's triennial review schedule.

## Middle Santa Ana River Watershed (Amended by Resolution No. R8-2005-0001)

The Middle Santa Ana River Watershed covers approximately 488 square miles and lies largely in the southwestern corner of San Bernardino County, and the northwestern corner of Riverside County. A small part of Los Angeles County (Pomona/Claremont area) is also included. This watershed is comprised of three sub–watersheds. The first sub-watershed is the Chino Basin Watershed, which includes portions of San Bernardino County, Los Angeles County, and Riverside County. Surface drainage in this area is directed to Chino Creek and Cucamonga/Mill Creek and is generally southward, from the San Gabriel Mountains toward the Santa Ana River and the Prado Flood Control Basin. The second sub–watershed, the Riverside Watershed, is located in Riverside County. Surface drainage in this area is generally westward from the City of Riverside to the Santa Ana River, Reach 3. The third sub–watershed, the Temescal Canyon Watershed, is also located in Riverside County. Surface drainage in this area is generally northward to Temescal Creek.

Land uses in the Middle Santa Ana River watershed include urban, agriculture, and open space. Although originally developed as an agricultural area, the watershed is being steadily urbanized. Incorporated cities in the Middle Santa Ana River watershed include Pomona, Chino Hills, Upland, Montclair, Claremont, Ontario, Rancho Cucamonga, Rialto, Chino, Fontana, Norco, Corona, and Riverside. In addition, there are several pockets of urbanized unincorporated areas. The current population of the watershed, based upon 2000 census data, is approximately 1.4 million people. The principal remaining agricultural area in the watershed is the area formerly known as the Chino Dairy Preserve. This area is located in the south–central part of the Chino Basin watershed and contains approximately 300,000 cows, which generate the waste equivalent of more than two million people. Recently, the cities of Ontario and Chino annexed the San Bernardino County portions of this area. The remaining portion of the former preserve, which is in Riverside County, remains unincorporated. Open space areas include National Forest lands and State Parks lands.

## Middle Santa Ana River Watershed Bacterial Indicator Total Maximum Daily Loads(TMDLs)

Middle Santa Ana River Watershed waterbodies listed on the Clean Water Act Section 303(d) list of impaired waters due to violations of REC1 fecal coliform bacteria objectives are shown in Table 5-9w.

Table 5-9w – Middle Santa Ana River Watershed Waterbodies on the 303(d) List Due to Bacterial Contamination

| Waterbody, Reach |
|---|
| Santa Ana River, Reach 3 |
| Chino Creek, Reach 1 |
| Chino Creek, Reach 2 |
| Mill Creek (Prado Area) |
| Cucamonga Creek, Reach 1 |
| Prado Park Lake |

During storm events, these waterbodies receive and transport runoff from urban, agricultural, and open space areas. During dry weather, these waterbodies receive and transport nuisance runoff, primarily from urban areas. Based on monitoring results, and observed waterbody conditions (fish kills and waste-laden stormflows), the Regional Board placed these waterbodies on the 303(d) list of impaired waters due to levels of bacterial indicators that exceeded established objectives for REC1 uses. The listings took place from 1988 to 1998.
A TMDL technical report prepared by Regional Board staff describes the bacterial indicator related problems in the Middle Santa Ana River Watershed waterbodies in greater detail and discusses the technical basis for the TMDLs that follow [Ref. # 30].

## A. Middle Santa Ana River Watershed Bacterial Indicator TMDL Numeric Targets

Bacterial indicator numeric targets for the Middle Santa Ana River Watershed waterbodies shown in Table 5-9x are based, in part, on the fecal coliform water quality objective specified in Chapter 4 for the protection of body-contact recreation (REC1) in inland surface waters.

Recognizing that, in the future, *Escherichia coli* (*E. coli*) may be incorporated into the Basin Plan as new bacterial water quality objectives for REC1, alternative numeric targets for *E. coli* are also specified[1]. These targets are based on *E. coli* criteria recommended by the U.S. Environmental Protection Agency [Ref #31]. The *E. coli* levels were chosen to roughly correspond to the health risk level associated with the fecal coliform objectives.

---

[1] USEPA is requiring the states to evaluate and incorporate more appropriate bacterial indicators, including *E. coli*, as water quality standards based on its Ambient Water Quality Criteria for Bacteria – 1986. The Regional Board is participating in the efforts of the Storm Water Quality Standards Task Force (SWQSTF), which is evaluating USEPA's bacterial indicator recommendations and REC1 beneficial use designations for waterbodies within the Santa Ana Region, including the Middle Santa Ana River watershed waterbodies. This numeric target and resulting TMDLs, WLAs and LAs will be adjusted accordingly when and if recommendations from the SWQSTF are incorporated into the Basin Plan.

The numeric targets for both bacterial indicators incorporate an explicit 10% margin of safety to address uncertainties recognized in the development of the TMDLs.

These numeric targets are specified as follows:

> **Fecal coliform: log mean less than 200 organisms/100 mL based on five or more samples per 30 day period, and not more than 10% of the samples exceed 400 organisms/100 mL for any 30–day period**.
>
> ***E. coli*: log mean less than 126 organisms/100 mL based on five or more samples per 30–day period, and not more than 10% of the samples exceed 235 organisms/100mL for any 30 day period.**

The fecal coliform numeric targets (and other fecal coliform related provisions of these TMDLs) will become ineffective upon the replacement of the fecal coliform REC1 objectives in the Basin Plan with REC1 objectives based on *E. coli* Incorporation of new *E. coli* objectives will be considered through the Basin Planning process.

## B. Middle Santa Ana River Watershed Bacterial Indicator TMDLs, Wasteload Allocations, Load Allocations and Compliance Dates

As discussed in the technical TMDL Report, the bacterial indicator TMDLs are expressed in terms of density since it is the number of organisms in a given volume of water (i.e., their density), and not their mass that is significant with respect to public health and the protection of beneficial uses. Similarly, the wasteload allocations for point source discharges (WLAs) and load allocations for nonpoint source discharges (LAs) are also based on density. The density–based WLAs and LAs do not add up to equal the TMDLs, since this is not scientifically valid. To achieve the density–based TMDLs, each WLA and LA must meet the density–based TMDL. As indicated in Table 5-9x, the TMDLs, WLAs and LAs also include a 10% margin of safety (see C., below) applied to the existing Basin Plan fecal coliform objective for REC1 for inland surface waters and to the alternative indicator *E. coli* criteria recommended by the U.S. Environmental Protection Agency. Again, the *E. coli* was chosen to correspond with the health risk level associated with the fecal coliform objectives.

WLAs are specified for urban discharges and discharges from Confined Animal Feeding Operations, including stormwater. LAs are specified for runoff from other types of agriculture and from natural sources (open space/undeveloped forest land). TMDLs, WLAs and LAs are specified for both dry weather discharges and wet weather discharges, with separate compliance schedules. An extended schedule for compliance with the wet weather TMDLs is specified in light of the expected increased difficulty in achieving compliance under these conditions.

**Table 5-9x – Total Maximum Daily Loads, Waste Load Allocations, and Load Allocations for Bacterial Indicators in Middle Santa Ana River Waterbodies[a,b,c]**

| Indicator | Total Maximum Daily Loads for Bacterial Indicators | Waste Load Allocation for Bacterial Indicators in Urban Runoff including stormwater discharges | Waste Load Allocation for Bacterial Indicators in Confined Animal Feeding Operations discharges | Load Allocation for Bacterial Indicators in Agricultural runoff discharges | Load Allocation for Bacterial Indicators from Natural Sources |
|---|---|---|---|---|---|
| **Dry Summer Conditions: April 1 through October 31, as soon as possible, but no later than December 31, 2015** | | | | | |
| **Fecal coliform** | 5–sample/30–day Logarithmic Mean less than 180 organisms/100mL, and not more than 10% of the samples exceed 360 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100mL, and not more than 10% of the samples exceed 360 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100mL, and not more than 10% of the samples exceed 360 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100mL, and not more than 10% of the samples exceed 360 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100mL, and not more than 10% of the samples exceed 360 organisms/100mL for any 30–day period. |
| **E. coli** | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. |
| **Wet Winter Conditions: November 1 through March 31, as soon as possible, but no later than December 31, 2025** | | | | | |
| **Fecal coliform** | 5–sample/30–day Logarithmic Mean less than 180 organisms/100ml, and not more than 10% of the samples exceed 360 organisms/100ml for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100ml, and not more than 10% of the samples exceed 360 organisms/100ml for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100ml, and not more than 10% of the samples exceed 360 organisms/100ml for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100ml, and not more than 10% of the samples exceed 360 organisms/100ml for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 180 organisms/100ml, and not more than 10% of the samples exceed 360 organisms/100ml for any 30–day period. |
| **E. coli** | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. | 5–sample/30–day Logarithmic Mean less than 113 organisms/ 100mL, and not more than 10% of the samples exceed 212 organisms/100mL for any 30–day period. |

[a] To be achieved as soon as possible, but no later than dates specified.
[b] TMDLs, WLAs and LAs, include a 10% Margin of Safety
[c] The fecal coliform TMDLs, WLAs, and LAs become ineffective upon the replacement of the REC1 fecal coliform objectives in the Basin Plan by approved REC1 objectives based on E. coli.

## C. Margin of Safety

A 10% margin of safety is explicitly incorporated into the Bacterial Indicator TMDLs for the Middle Santa Ana River Watershed to account for unknowns, such as bacterial regrowth, bacteria dilution and organism die–off. As additional data on bacterial dynamics in the Middle Santa Ana River watershed are developed, the margin of safety can be adjusted accordingly.

## D. Seasonal Variations/Critical Conditions

The Basin Plan REC1 fecal coliform objectives apply year-round; no distinctions based on climate or other conditions that may affect actual REC1 use are specified[2]. As shown in Table 5-9x, different compliance dates are specified for dry season discharges and wet season discharges. This ensures that dry season recreational beneficial uses are addressed on a priority basis. Additional time is allowed to address complexities associated with the control of wet weather discharges.

## E. TMDL Implementation

Implementation is expected to result in compliance with the water quality objectives/numeric targets for fecal coliform and with the numeric targets for *E. coli*. The intent is to ensure protection of the REC1 beneficial uses of Middle Santa Ana River Watershed waterbodies. Collection of additional monitoring data is critical to developing long-term solutions for bacterial indicator control, as well as to consider whether changes to the TMDL are appropriate. With that in mind, the requirements for submittal of plans and schedules to implement the TMDLs take into consideration the need to develop and implement effective short-term solutions, as well as allow for the development of long-term solutions once additional data have been generated.

Implementation of tasks and schedules as specified in Table 5-9y is expected to achieve compliance with the TMDLs and, thereby, water quality standards. Each of these tasks is described below.

---

[2] The SWQSTF may recommend changes to the REC1 objectives to reflect conditions, such as high flows, that affect REC1 use. Any such changes will be considered through the Basin Planning process

| Task 6 | Review of TMDLs/WLAs/LAs | Once every 3 years to coincide with the Regional Board's triennial review, or more frequently as warranted |

## Task 1: Review and/or Revise Existing Waste Discharge Requirements

There are three Waste Discharge Requirements (WDRs) issued by the Regional Board regulating discharge of various types of wastes in the watershed. On or before **February 28, 2008**, each of these WDRs shall be reviewed and revised as necessary to implement the TMDLs, including the appropriate wasteload allocations, compliance schedules and/or monitoring program requirements.

1.1 Waste Discharge Requirements for the San Bernardino County Flood Control and Transportation District, the County of San Bernardino and the Incorporated Cities of San Bernardino County within the Santa Ana Region, Areawide Urban Runoff, NPDES No. CAS 618036 (Regional Board Order No. R8-2002-0012). The current Order has provisions to address TMDL issues (see Task 4, below). In light of these provisions, revision of the Order may not be necessary to address TMDL requirements.

1.2 Waste Discharge Requirements for the Riverside County Flood Control and Water Conservation District, the County of Riverside and the Incorporated Cities of Riverside County within the Santa Ana Region, Areawide Urban Runoff, NPDES No. CAS 618033 (Regional Board Order No. R8-2002-0011). The current Order has provisions to address TMDL issues (see Task 4, below). In light of these provisions, revision of the Order may not be necessary to address TMDL requirements.

1.3 General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) within the Santa Ana Region, NPDES No. CAG018001 (Regional Board Order No. 99-11). Updated waste discharge requirements for Concentrated Animal Feeding Operations are expected to be considered by the Regional Board in 2005. These requirements will include appropriate TMDL requirements.

Other waste discharge requirements may be reviewed and/or revised to address bacterial indicator discharges as appropriate.

## Task 2: Identify Agricultural Operators

On or before **June 30, 2007**, the Regional Board shall develop a list of all known agricultural owners/operators in the Middle Santa Ana River watershed that will be responsible for implementing requirements of these TMDLs. The Regional Board will send a notice to these operators informing them of their TMDL responsibility and alerting them to the potential regulatory consequences of failure to comply.

To implement the agricultural load allocations for non-Concentrated Animal Feeding Operations, monitoring program requirements specified in Task 3 and the agricultural source evaluation studies (Task 5), the Regional Board may issue waste discharge requirements or a waiver of such waste discharge requirements that is conditioned on satisfactory compliance with these TMDL elements.

**Task 3: Watershed-Wide Bacterial Indicator Water Quality Monitoring Program**

No later than **November 30, 2007**, the US Forest Service, the County of San Bernardino, the County of Riverside, the cities of Ontario, Chino, Chino Hills, Montclair, Rancho Cucamonga, Upland, Rialto, Fontana, Norco, Riverside, and Corona, Pomona and Claremont and agricultural operators in the watershed, shall as a group, submit to the Regional Board for approval a proposed watershed-wide monitoring program that will provide data necessary to review and update the TMDLs. Data to be collected and analyzed shall address, at a minimum, determination of compliance with the TMDLs, WLAs and LAs.

At a minimum, the stations specified in Tables 5-9z and 5-9aa and shown in Figure 5-6, at the frequency specified in Tables 5-9z and 5-9aa, shall be considered for inclusion in the proposed monitoring plan. If one or more of these monitoring stations are not included, the rationale shall be provided and proposed alternative monitoring locations shall be identified in the proposed monitoring plan. The proposed monitoring plan shall also include a plan to compile streamflow measurements at existing USGS stream gauging stations.

At a minimum, samples shall be analyzed for the following constituents:

- Fecal Coliform
- Escherichia Coli (E. coli)
- Total Suspended Solids
- pH
- Temperature
- Electrical Conductivity
- Dissolved Oxygen
- Turbidity

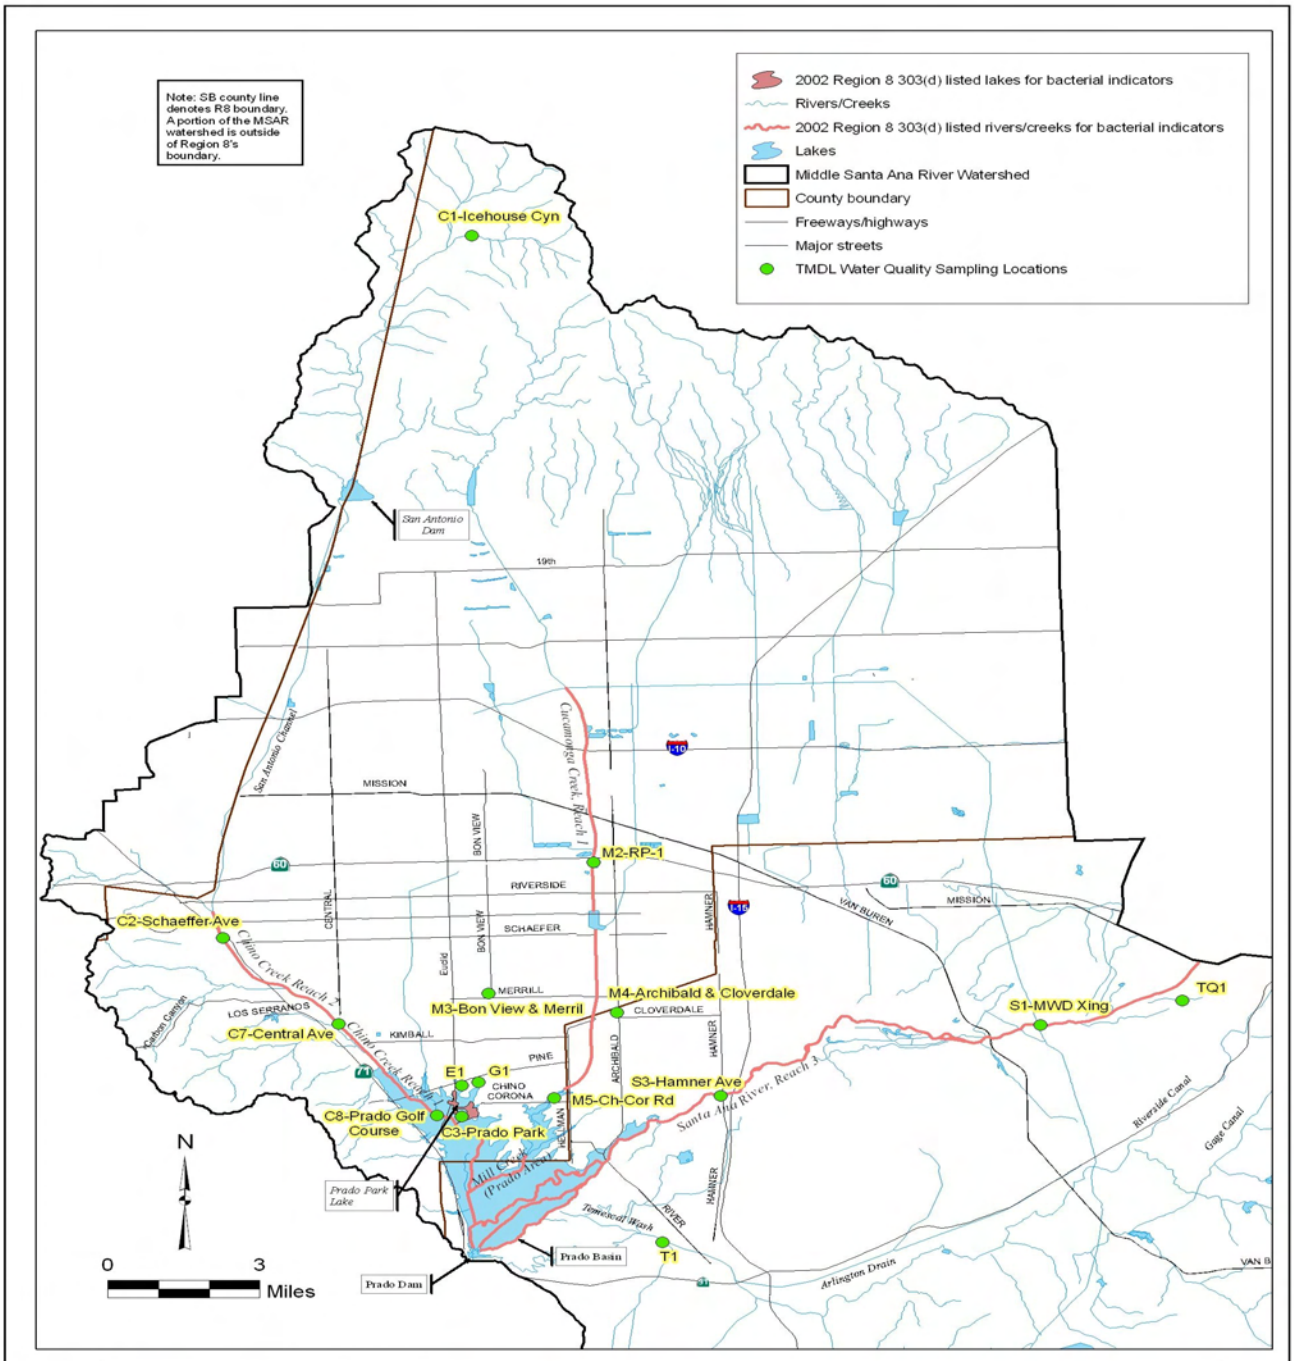
The proposed monitoring plan shall be implemented upon Regional Board approval at a duly noticed public meeting. Seasonal reports summarizing and including copies of the data collected during the dry season and wet season monitoring periods shall be submitted by May 31 and December 31 of each year. In order to facilitate review and update of the numeric targets and/or the TMDLs, WLAs, LAs, a triennial report summarizing the data collected for the preceding 3 year period and evaluating compliance with the WLAs/LAs shall be submitted every three years, beginning with the first report due February 15, 2010.

In lieu of this coordinated monitoring plan, one or more of the parties identified above may submit a proposed individual or group monitoring plan for Regional Board approval. Any such individual or group monitoring plan is due no later than **November 30, 2007** and shall be implemented upon Regional Board approval at a duly noticed public

meeting. Seasonal reports summarizing and including copies of the data collected during the dry season and wet season monitoring periods shall be submitted by May 31 and December 31 of each year. In order to facilitate review and update of the numeric targets and/or the TMDLs, WLAs, LAs, a triennial report summarizing the data collected for the preceding 3 year period and evaluating compliance with the WLAs/LAs shall be submitted every three years, beginning with the first report due **February 15, 2010**.

It may be that implementation of these monitoring requirements will be required through the issuance of Water Code Section 13267 letters to the affected parties. The monitoring plan(s) will be considered by the Regional Board and shall be implemented upon the Regional Board's approval.

Table 5-9z – Watershed Minimum Required Weekly Sampling Station Locations



| **Station Number** | **Station Description** |
|---|---|
| C1 | Icehouse Canyon Creek |
| C2 | Chino Creek at Schaeffer Avenue |
| C3 | Prado Park Lake at lake outlet |
| C7 | Chino Creek at Central Avenue |
| C8 | Chino Creek at Prado Golf Course |
| M2 | Cucamonga Creek at Regional Plant No. 1 |
| M5 | Mill Creek at Chino–Corona Road |
| S1 | Santa Ana River at MWD Crossing |
| S3 | Santa Ana River at Hamner Avenue |
| T1 | Temescal Wash at Lincoln Avenue |
| TQ1 | Tequesquite Arroyo at Palm Avenue |

Frequency of sampling:
dry season: weekly
wet season: two 30-day sampling periods during which a minimum of 5 samples are to be collected (at least one sample weekly) and if possible, a minimum of 5 of those samples must be from storm events.

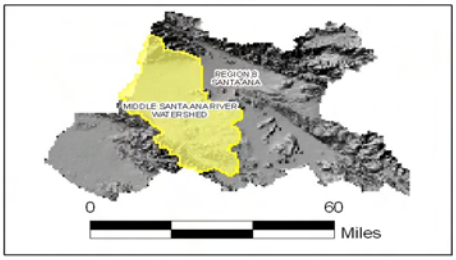


**Table 5-9a-a --Additional Watershed Storm Event Sampling Locations**

| Station Number | Station Description |
|---|---|
| M3 | Bon View Avenue @ Merrill Avenue |
| M4 | Archibald Avenue @ Cloverdale Avenue |
| G1 | Grove Channel @ Pine Avenue |
| E1 | Euclid Avenue Channel @ Pine Avenue |

Frequency of sampling: wet weather – one sample/storm event for 5 storm events/year; dry weather – none.

## Task 4: Urban Discharges

Phase I urban discharges, including stormwater runoff, include those from the cities and unincorporated communities in the Middle Santa Ana River Watershed. These discharges are regulated under the MS4 NPDES permits identified in Tasks 1.1 and 1.2 (Review and Revise Existing Waste Discharge Requirements), above. The requirements of these NPDES permits differ somewhat and therefore the TMDL implementation requirements that pertain to the permittees under each permit also vary slightly, as shown below[3].

### 4.1 Develop and Implement Bacterial Indicator Urban Source Evaluation Plans

On or before **November 30, 2007**, the County of San Bernardino, the County of Riverside, the cities of Ontario, Chino, Chino Hills, Montclair, Rancho Cucamonga, Upland, Rialto, Fontana, Norco, Riverside, and Corona, Pomona and Claremont shall develop a Bacterial Indicator Urban Source Evaluation Plan(s) (USEP). This plan shall include steps needed to identify specific activities, operations, and processes in urban areas that contribute bacterial indicators to Middle Santa Ana River Watershed waterbodies. The plan shall also include a proposed schedule for completion of each of the steps identified. The proposed schedules can include contingency provisions that reflect uncertainty concerning the schedule for completion of the SWQSTF work and/or other investigations that may affect the steps that are proposed. The USEP shall be implemented upon Regional Board approval at a duly noticed public meeting.

### 4.2 Revise the San Bernardino County Municipal Storm Water Management Program (MSWMP)

Provision XVI.3. of Order No. R8-2002-0012 (see 1.1, above) requires the permittees to revise their Municipal Storm Water Management Program (MSWMP) to include TMDL requirements. Revisions to the MSWMP may be necessary based on the results of Task 4.1, Basin Plan amendments to address recommendations of the SWQSTF, or other investigations. Because of uncertainties regarding the timing of completion of these studies, it is not feasible to identify an explicit date whereby the revision of the MSWMP is to be accomplished. Instead, the Executive Officer shall notify the permittees of the need to revise the MSWMP. Within 90 days of notification by the Executive Officer, the permittees shall submit for Regional Board approval, a plan and schedule to review and revise the MSWMP as necessary to incorporate measures to address the results of

[3] The San Bernardino MS4 permit requires the development and implementation of a Municipal Stormwater Management Program (MSWMP) to address stormwater discharges from existing urban activities. For the Riverside County MS4 permit, the Drainage Area Management Plan (DAMP) addresses stormwater discharges from existing urban activities.

the USEP and/or other studies. Further review and revision of the MSWMP needed to address these TMDLs shall be completed in accordance with the requirements of Order No. R8-2002-0012 or amendments thereto that are adopted by the Regional Board at a public hearing. The MSWMP revisions shall include schedules for meeting the bacterial indicator wasteload allocations based on the schedule established in these TMDLs. In order to facilitate any needed update of the numeric targets and/or the TMDLs and urban discharge WLAs, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. The permittees shall also provide a proposal and schedule for 1) evaluating the effectiveness of BMPs and other control actions implemented and 2) evaluating compliance with the bacterial indicator waste load allocations for urban runoff. The plan and schedule to review the MSWMP must be implemented upon approval by the Regional Board after public notice and public hearing, or upon approval by the Executive Officer if no significant comments are received during the public notice period.

**4.3 Revise the Riverside County Drainage Area Management Plan (DAMP)**

Provision XIII.B. of Order No. R8-2002-0011 (see 1.2, above) requires the permittees to revise their Drainage Area Management Plan (DAMP) to include TMDL requirements. Revisions to the DAMP may be necessary based on the results of Task 4.1, Basin Plan amendments to address recommendations of the SWQSTF, or other investigations. Because of uncertainties regarding the timing of completion of these studies, it is not feasible to identify an explicit date whereby the revision of the DAMP is to be accomplished. Instead, the Executive Officer shall notify the permittees of the need to revise the DAMP. Within 90 days of notification by the Executive Officer, the permittees shall submit for Regional Board approval, a plan and schedule to review and revise the DAMP as necessary to incorporate measures to address the results of the USEP and/or other studies. Further review and revision of the DAMP needed to address these TMDLs shall be completed in accordance with the requirements of Order No. R8-2002-0011 or amendments/updates thereto that are adopted by the Regional Board at a public hearing. The DAMP revisions shall include schedules for meeting the bacterial indicator wasteload allocations based on the schedule established in these TMDLs. In order to facilitate review and update of the numeric targets and/or the TMDLs and urban discharge WLAs, the proposed schedule shall take into consideration the Regional Board's triennial review schedule. The revised DAMP shall also include a proposal and schedule for 1) evaluating the effectiveness of BMPs and other control actions implemented and 2) evaluating compliance with the bacterial indicator waste load allocations for urban runoff. The plan and schedule to review and revise the DAMP must be implemented upon approval by the Regional Board after public

notice and public hearing, or upon approval by the Executive Officer if no significant comments are received during the public notice period.

### 4.4 Revise the San Bernardino County Water Quality Management Plan (WQMP)

Provision XII.B. 1. of Order No. R8-2002-0012 requires the permittees to develop and submit a WQMP for new developments and significant redevelopments by January 2004 for the Executive Officer's approval. Revisions to the WQMP may be necessary based on the results of Task 4.1, Basin Plan amendments to address recommendations of the SWQSTF, or other investigations. Because of uncertainties regarding the timing of completion of these studies, it is not feasible to identify an explicit date whereby the revision of the WQMP is to be accomplished. Instead, the Executive Officer shall notify the permittees of the need to revise the WQMP. Within 90 days of notification by the Executive Officer, the permittees shall submit for Regional Board approval a plan and schedule to review and revise the WQMP that addresses the bacterial indicator input from new developments and significant redevelopments to assure compliance with the bacterial indicator wasteload allocations for urban runoff. Further review and revision of the WQMP necessary to address TMDL requirements, shall be completed in accordance with the requirements of Order No. R8-2002-0012 or amendments/updates thereto that are adopted by the Regional Board at a public hearing.

### 4.5 Revise the Riverside County Water Quality Management Plan (WQMP)

Provision VIII.B. of Order No. R8-2002-0011 (see 1.2, above) requires the permittees to develop and submit a WQMP for new developments and significant redevelopments by June 2004 for approval. On September 17, 2004, the Board approved a WQMP developed by the permittees. The approved WQMP includes source control BMPs, design BMPs and treatment control BMPs. Further revisions to the WQMP may be necessary to meet the WLA for urban runoff. Such revisions may be necessary based on the results of Task 4.1, Basin Plan amendments to address recommendations of the SWQSTF, or other investigations. Because of uncertainties regarding the timing of completion of these studies, it is not feasible to identify an explicit date whereby the revision of the WQMP is to be accomplished. Instead, the Executive Officer shall notify the permittees of the need to revise the WQMP. Within 90 days of notification by the Executive Officer, the permittees shall submit for Regional Board approval a plan and schedule for review and revision of the WQMP that addresses the bacterial indicator input from new developments and significant redevelopments to assure compliance with the bacterial indicator wasteload allocations for urban runoff. Further review and revision of the WQMP necessary to address TMDL requirements, shall be completed in accordance with the requirements of

Order No. R8-2002-0011 or amendments/updates thereto that are adopted by the Regional Board at a public hearing.

If the results of studies conducted pursuant to Tasks 3 and 4.1 above demonstrate that either the Phase II non-traditional small MS4 discharges covered under the statewide Waste Discharge Requirements for Stormwater Discharges from Small Municipal Separate Storm Systems (Order No. 2003-0005-DWQ) or industrial discharges from facilities covered by the statewide Industrial Stormwater General Permit (Order 97-03-DWQ) or any Regional Board individual industrial permit, are responsible, to a significant degree, for exceedances of the urban WLAs, the Regional Board will take the appropriate regulatory steps to address these discharges.

**Task 5: Agricultural Discharges**

Agricultural discharges include stormwater runoff, wastewater release and tailwater runoff from agricultural land uses. Tailwater runoff is irrigation water that runs off of agricultural land. Agricultural land uses include concentrated animal feeding operations and irrigated and dry-land farming in the Middle Santa Ana River Watershed. Concentrated animal feeding operations are regulated under WDRs (see Task 1.3,above); irrigated agriculture and dry-land farming are not currently regulated.

**5.1 Develop and Implement Bacterial Indicator Agricultural Source Evaluation Plans**

On or before **November 30, 2007**, concentrated animal feeding facility operators and agricultural operators in the Middle Santa Ana River Watershed shall develop and implement Bacterial Source Agricultural Source Evaluation Plans (AGSEP). These plans shall include steps needed to identify specific activities, operations, and processes in agricultural areas that contribute bacterial indicators to Middle Santa Ana River Watershed waterbodies. The plan shall also include a proposed schedule for completion of each of the steps identified. The proposed schedules can include contingency provisions that reflect uncertainty concerning the schedule for completion of the SWQSTF work and/or other investigations that may affect the steps that are proposed. The AGSEP shall be implemented upon Regional Board approval at a duly noticed public meeting.

The Regional Board expects that the AGSEP will be submitted and implemented pursuant to these TMDL requirements. Where and when necessary to implement these requirements, the Regional Board will utilize appropriate waste discharge requirements including those for concentrated animal feeding operations (see 1.3, above), or other Water Code authorities.

In lieu of a coordinated source evaluation plan, one or more of the parties identified above may submit a proposed individual or group AGSEP to conduct the above studies for areas within their jurisdiction. Any such individual or group plan shall also be submitted for Regional Board approval no later than. **November 30, 2007**. This AGSEP shall be implemented upon Regional Board approval at a duly noticed public meeting.

**5.2 Develop and Implement a Bacterial Indicator Agricultural Source Management Plan**

Based on the results of Task 5.1 or other studies conducted in the watershed, concentrated animal feeding operators and agricultural operators within the Middle Santa Ana River Watershed shall, as a group, submit a proposed Bacterial Indicator Agricultural Source Management Plan (BASMP). Because of uncertainties regarding the timing of completion of these studies and in recognition that readily identifiable steps may be taken to reduce bacterial discharges from agricultural lands, it is not feasible to identify an explicit date whereby the development and implementation of the BASMP is to be accomplished. Instead, the Executive Officer shall notify agricultural operators of the need to submit the proposed BASMP in whole or to submit plans and schedule to address a subset of tasks identified in the AGSEP. Within 90 days of notification by the Executive Officer, the proposed BASMP, or a subset thereof, shall be submitted. The BASMP, or subset thereof, shall be implemented upon Regional Board approval at a duly noticed public meeting. At a minimum, the BASMP shall include, plans and schedules for the following:

A. implementation of bacterial indicator controls, BMPs and reduction strategies designed to meet load allocations;
B. evaluation of effectiveness of BMPs; and
C. development and implementation of compliance monitoring program(s).

The Regional Board expects that the BASMP will be submitted and implemented pursuant to these TMDL requirements. Where and when necessary to implement these requirements, the Regional Board will utilize appropriate waste discharge requirements or other Water Code authorities.

In lieu of a coordinated plan, one or more of the parties identified above may submit a proposed individual or group BASMP to develop and implement the above plan for areas within their jurisdiction. Any such individual or group plan shall also be submitted for Regional Board approval. Because of uncertainties regarding the timing of completion of these studies and in recognition that readily identifiable steps may be taken to reduce bacterial discharges from agricultural lands, it is not feasible to identify an explicit date whereby the development and implementation of the BASMP is to be accomplished. Instead, the Executive Officer shall notify agricultural operators of the need to submit the proposed BASMP in whole or to submit plans and schedule to address a subset of tasks

identified in the AGSEP. Within 90 days of notification by the Executive Officer, the proposed BASMP, or a subset therefore, shall be submitted. This BASMP, or a subset thereof, shall be implemented upon Regional Board approval at a duly noticed public meeting.

**Task 6: Review/Revision of the Bacterial Indicator TMDL (TMDL "Re-opener")**

The basis for the TMDLs and implementation schedule will be re-evaluated at least once every three years[4] to determine the need for modifying the load and wasteload allocations, numeric targets and TMDLs. Regional Board staff will continue to review all data and information generated pursuant to the TMDL requirements on an ongoing basis. Based on results generated through the monitoring programs, special studies, modeling analysis, efforts of the Storm Water Quality Standards Task Force[5] and/or special studies by one or more responsible parties, changes to the TMDLs, including revisions to the numeric targets, WLAs and LAs, may be warranted. Such changes would be considered through the Basin Plan Amendment process.

The Regional Board is committed to the review of this TMDL every three years, or more frequently if warranted by the results of monitoring and/or other relevant studies

---

[4] The three-year schedule will coincide with the Regional Board's triennial review schedule.

[5] Stakeholders formed the Storm Water Quality Standards Task Force (Task Force) in 2002 to support review and update of the bacterial quality objectives for REC1 waters and to review the REC1 designations themselves to assure their accuracy. Participants include representatives from the Santa Ana Watershed Project Authority, (SAWPA) flood control agencies from the 3 counties within the Santa Ana Region, POTW dischargers and stormwater staff from various municipalities in the watershed. Environmental groups, Regional Board staff and USEPA staff are also participants. SAWPA staff serve as facilitators for the Task Force.

## BAY PROTECTION AND TOXIC CLEANUP PROGRAM

Legislation enacted in 1989 added Chapter 5.6, Bay Protection and Toxic Cleanup, to Division 7 of the California Water Code (Sections 13390-13396). These new sections require the State Board and Regional Boards to establish programs for the maximum protection of beneficial uses of bays and estuaries, focusing on water quality problems due to toxic substances. In part, the State Board was directed to formulate and adopt a water quality control plan for Enclosed Bays and Estuaries and a workplan for the development of sediment quality objectives. When setting waste discharge requirements, the Regional Boards must implement the water quality control plan and any sediment quality objectives which may be adopted by the State Board.

The Bay Protection and Toxic Cleanup Program (BPTCP) must also include plans to identify and remediate "toxic hot spots." These are areas in the enclosed bays, estuaries or adjacent waters where the contamination affects the interests of the state and "…where hazardous substances have accumulated in the water or sediment to levels which (1) may pose a substantial present or potential hazard to aquatic life, wildlife, fisheries or human health, or (2) may adversely affect the beneficial uses of bay, estuary or ocean waters as defined in water quality control plans, or (3) exceeds adopted water quality or sediment quality objectives." Criteria for the assessment and priority ranking of toxic hot spots are to be developed by the State Board in coordination with the California Department of Fish and Game and the California Office of Environmental Health Hazard Assessment (OEHHA). The ranking criteria will be used by the Regional Board to prioritize toxic hot spots based on the severity of the problem.

The BPTCP consists of both short- and long-term activities. The short-term activities include:

- Develop and maintain a program to identify toxic hot spots, plan for their cleanup or mitigation, and amend Water Quality Control Plans and policies to abate toxic hot spots;
- Develop and implement regional monitoring and assessment programs;
- Develop numeric sediment quality objectives;
- Develop and implement Toxic Hot Spot Cleanup Plans;
- Revise waste discharge requirements, if necessary, to conform to the Basin Plan; and
- Develop a comprehensive database containing information pertinent to describing and managing toxic hot spots.

Long-term activities of the BPTCP include:

- (Continue to) develop numeric sediment quality objectives;
- Develop and implement strategies to prevent the formation of new Toxic Hot Spots and to reduce the severity of effects from existing Toxic Hot Spots;
- Periodic review and update of a Water Quality Control Plan for enclosed bays and estuaries; and
- Maintain the comprehensive database.

The BPTCP is a comprehensive effort to regulate toxic pollutants in enclosed bays and estuaries and is not intended to be a monitoring program resembling the State Mussel Watch Program or the Toxic Substances Monitoring Program (see Chapter 6 for descriptions of these programs). The BPTCP program does, however, use the data from the State Mussel Watch Program and the Toxic Substances Monitoring Program to identify Toxic Hot Spots.

The Santa Ana Region, State Mussel Watch data and data provided by the Orange County Environmental Management Agency have been used to identify toxic hot spots in Newport Bay and Anaheim Bay/Huntington Harbour. Tables 5-10 and 5-11 lists the known toxic hot spots and potential toxic hot spots, respectively. The Regional Board, in coordination with the State Board and the California Department of Fish and Game are currently in the process of confirming these toxic hot spots and potential toxic hot spots using a battery of toxicity tests on both the water column and sediment. Once confirmed, the list of toxic hot spots and potential toxic hot spots will be ranked according to the ranking criteria. The priority ranking will be included in the regional Toxic Hot Spot Cleanup Plan(s) which will include identification of likely contaminant sources and appropriate remedial actions.

## GROUNDWATER CONTAMINATION FROM VOLATILE ORGANIC COMPOUNDS

In 1984, the legislation passed Assembly Bill 1803 which instructed the California Department of Health Services, Office of Drinking Water, to develop and implement a program to require the sampling of public drinking water supply wells for volatile organic compounds. The Department was instructed to provide the results to the appropriate Regional Board. The initial data indicated extensive organic contamination of groundwater supplies throughout the state. As a result, in 1985, the State Board and the Regional Water Quality Control Boards initiated the Well Investigation Program. The intent of the Well Investigation Program was to identify the parties responsible for the organic contamination of municipal drinking water supply wells so that those parties could be made accountable for cleanup.

In order to identify the responsible parties, the Regional Board followed an intensive investigation program for each contaminated public drinking water supply well on a priority basis. This program included:

- Field reconnaissance for potential sources
- Record searches
- Hydrogeological assessments
- Questionnaires, meetings, and inspections
- Requests for preliminary soil investigations and follow-up soil and groundwater investigations of potential sources
- Requests for cleanup
- Enforcement actions, where appropriate

In the late1980's the Well Investigation Program was expanded to include private drinking water supply wells and agricultural and industrial supply wells that were located in areas where organic contamination posed a threat to public drinking water supply wells. In the late 1980's the Well Investigation Program represented the largest single funded program in the Region. However, due to severe budget cuts statewide, the Well Investigation Program was scaled down and eventually discontinued in 1992. Investigation and cleanup of sites identified by the Well Investigation Program are currently being overseen by the Regional Board's Spills, Leaks, Investigations, and Cleanup (SLIC) program.

Currently (1993), there are more than 300 water supply wells identified in the Region which contain organic compound contaminants. The loss of many drinking water supply wells and the threat of loss of additional existing drinking water supply wells due to organic compound contamination is a serious problem in several areas of the Region, most notably the Bunker Hill, Chino, and Santa Ana Forebay Groundwater Basins.

Perchloroethylene (PCE) and trichloroethylene (TCE) are the major contaminants in the Bunker Hill I Subbasin, which underlies northern San Bernardino. The City of San Bernardino lost 25% of its water supply in the early 1980s when 14 wells operated by the City were found to contain concentrations of perchloroethylene above the state and federal drinking water Maximum Contaminant Level (MCL). The Newmark Wellfield was placed on the federal Superfund list in 1988, and EPA assumed lead responsibility for investigating the extent of the contamination and identifying long-term cleanup measures. The Regional Board has identified no specific source of the contamination; potential sources include dry cleaners, airports, and a World War II munitions facility. Interim groundwater extraction and treatment at existing municipal supply wells using air stripping and granulated activated carbon (GAC) facilities funded by the California Department of Toxic Substances Control. These facilities have the capacity to treat 37.6 million gallons per day (MGD). The treated water is used as a potable water supply to replace the water lost as a result of the solvent contamination.

Table 5-10

Known Toxic Hot Spots
Santa Ana Region

| Waterbody Name | Pollutants Involved |
|---|---|
| Lower Newport Bay | Cd, Pb, As, Se, Zn, Cu |
| Upper Newport Bay Ecological Reserve | Pb, Cu, Cd |
| Anaheim Bay | Cd, Cu, Pb, Cr |
| Huntington Harbour | Cd, Pb, Se, Cr, Cu |
| Bolsa Bay | Cr, Cu, Pb |

Table 5-11

Potential Toxic Hot Spots
Santa Ana Region

| Waterbody Name | Pollutants Involved |
|---|---|
| Lower Newport Bay | Chlorpyrifos, Dacthal, PCB, Chlorbenside, DDT, Lindane, Ronnel, Hexachlorbenzene, Chlordane, Endosulfan, Toxaphene, Aldrin, Heptachlorepoxide, Heptachlor |
| Upper Newport Bay Ecological Reserve | Dacthal,DDT,PCB,Endosulfan,Chlordane, Chlorpyrifos, Diazinon, Lindane, Heptachlorepoxide, Hexchlorbenzene |
| Anaheim Bay | Aldrin, Chlordane, Lindane, Chlorbenside, PCB, DDT, Chlorpyrifos, Endosulfan, Heptachlorepoxide, Hexachlorbenzene |
| Huntington Harbour | Aldrin, Chlorbenzide, DDT, Lindane, Endosulfan, Chlordane, Chlorpyrifos, Dieldrin, Endrin, Toxaphene, Heptachlorepoxide |

The Bunker Hill II Subbasin underlying Redlands has been contaminated with TCE and dibromochloropropane (DBCP). It is estimated that the TCE plume covers an area of approximately twenty square miles. Twenty-six water supply wells are impacted by TCE or DBCP, including five municipal water supply wells where the concentration of TCE or DBCP exceeds the MCL. No responsible parties have been identified yet, however, potential sources for the TCE plume include an airport, commercial and industrial facilities, and a former rocket motor testing facility. DBCP, a soil fumigant, was used extensively by the citrus industry prior to the 1960's and the DBCP contamination in the Bunker Hill II Subbasin is believed to be the result of this past legal agricultural use. A 3.0 MGD GAC facility at the Rees Well, which began operation in 1989, treats the contaminated water and provides potable water for the City of Redlands. In addition, an 8.6 MGD wellhead treatment facility at the Texas Street Well Field began operation in 1993. The facility, which was funded by the State Board and the State Department of Toxics, removes TCE and DBCP and also provides potable water back to the City of Redlands.

Forty-four water supply wells in the Chino Basin, primarily the Chino II Subbasin, contain TCE and PCE. To date, only one facility, the former GE Flatiron Plant in Ontario, has been confirmed as a source of organic compound contamination that has impacted a water supply well. In 1993, prior to exploring final cleanup options, GE will be implementing plume containment and interim cleanup activities on the almost two mile long, one-half mile wide TCE plume. Other potential sources in the Chino Basin include the California Institute for Men, the Chino Airport, and the Ontario Airport. Potential responsible parties are in the process of conducting investigative studies.

Organic contamination from TCE, PCE, dichloroethylene (DCE), and dichloroethane (DCA) has been found in water supply wells in Orange County in the Santa Ana Forebay and Irvine Forebay Groundwater Basins. A wellhead treatment unit (air stripping) was installed at the City of Orange Well No. 13 and began operation in 1993. The Regional Board staff oversees investigations at numerous sites in the Forebay area where past discharges of industrial solvents have occurred. Twenty-one of these sites have been identified to date as sources of volatile organic compounds in groundwater. Site investigations are being conducted to identify the extent of contamination and to clean up the effects of the discharges.

The Regional Board has been successful in identifying many sites throughout the region where volatile organic compounds have impacted groundwater. However, with the exception of the former GE Flatiron facility in the Chino Basin, there has been no other direct cause-and-effect relationship drawn between a contaminated drinking water supply well and a specific source. In most cases, records of compounds used at facilities have not been maintained and information regarding past disposal practices is not available, making it difficult to pinpoint specific

sources. In addition, considering that most sources of the volatile organic compounds found in water supply wells are probably industrial discharges that may have occurred as long as 30 years ago, and considering the complex factors affecting the fate of volatile organic compounds in soil and groundwater and the changes in groundwater flow patterns from pumping, etc., it is difficult to backtrack contamination from water supply wells to specific sites which may be sources of local groundwater contamination.

## DEPARTMENT OF DEFENSE FACILITIES

There are six major Departments of Defense (DoD) facilities in the Santa Ana Region, two of which are currently scheduled for closure. Table 5-12 identifies these facilities and the water quality problems of each.

Significant groundwater contamination has been detected at a number of these facilities. Contamination is severe enough at three of these facilities to have them placed on EPA's National Priorities List (NPL) for remediation under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, commonly referred to as Superfund).

For these three National Priorities List facilities (Norton and March Air Force Bases and Marine Corps Air Station – El Toro), the EPA is the lead environmental regulatory agency for oversight of investigation and cleanup. CERCLA requires EPA to consider applicable or relevant and appropriate state laws and regulations when establishing cleanup. CERCLA requires EPA to consider applicable or relevant and appropriate state laws and regulations when establishing cleanup standards for remedial activities. To ensure that the state's concerns are properly addressed, two Cal/EPA agencies, the Regional Board and the Department of Toxic Substances Control (DTSC) also perform a significant oversight role in the investigations and cleanup of these facilities.

The US EPA, DoD, and the state agencies have signed Federal Facility Agreements (FFA) for each of the National Priorities List facilities. The intent of the FFA is to ensure that: (1) environmental impacts are investigated; (2) remedial actions are defined; (3) procedural framework or schedules are established; (4) cooperation among agencies is facilitated; (5) adequate assessment it performed; and (6) compromise is reached.

The US EPA is not involved in the investigation and cleanup of DoD facilities that are not on the National Priorities List (Marine Corps Air Station-Tustin, Naval Weapons Station-Seal Beach, and Armed Forces Reserve Center-Los Alamitos). However, many of these facilities have significant contamination. In these cases, the two state agencies enter info Federal Facility Site Remediation Agreements

Table 5-12

Summary of Water Quality Problems from
Department of Defense (DoD) Facilities

Santa Ana Region

| DoD Facility | Receiving Water Affected | Water Quality Problem Identified to Date |
|---|---|---|
| Norton Air Force Base [1] | Bunker Hill I Subbasin | trichloroethylene (TCE) plume landfills; Superfund listing |
| March Air Force Base | Perris North Subbasin | trichloroethylene (TCE) plume; fuel plume; landfills; Superfund listing |
| Marine Corps Air Station - El Toro | Irvine Forebay Subbasin | trichloroethylene (TCE) plume; fuel plume; benzene plume; landfills; proposed Superfund Listing |
| Marine Corps Air Station - Tustin [1] | Irvine Pressure Subbasin | volatile organic compound (VOC) plume; fuel plume |
| Naval Weapons Station - Seal Beach | Santa Ana Pressure Subbasin | fuel plume; landfills |
| Armed Forces Reserve Center - Los Alamitos | Santa Ana Pressure Subbasin | fuel plume; landfills |

[1] Facilities which are scheduled to be closed. These bases are given high cleanup priority.

(FFSRAs) with DoD. FFSRAs are very similar to the above-mentioned Federal Facility Agreements, with the exception that US EPA is not a party. The Regional Board and Department of Toxic Substances Control have already entered into an agreement with DoD for the Naval Weapons station – Seal Beach and are near the end of negotiations on Federal Facility Site Remediation Agreements for Marine Corps Air Station – Tustin.

The Department of Toxic Substances Control has been identified as the "lead" state agency and the Regional Board as "support" agency for all of the above facilities. A Memorandum of Understanding has been signed by the State Board and Department of Toxic Substances Control which describes the roles of each agency. The Regional Board's oversight role is with regard to the investigation and cleanup of water resources that have been impacted or are threatened by waste discharges from the facilities. The Regional Board's responsibility also extends to source areas (landfills, contaminated soil, etc.) that currently, or may in the future, pose a threat to water quality. DTSC's role is to address all other environmental aspects including health risk assessment, air emissions, community relations, etc.

The State Board and DTSC have entered into a two-year cooperative agreement with the Department of Defense for cleanup and oversight reimbursement. All work performed by the State agencies with regard tot he investigation and cleanup of environmental problems at these facilities is fully reimbursed by DoD.

## LEAKING UNDERGROUND STORAGE TANKS

The Underground Storage Tank Program was enacted in 1983 and took effect January 1,1984. The authority for the program is found in the Health and Safety Code, Division 20, Chapter 6.7, and the regulations for the program are found in the California Code of Regulations, Title 23, Division 3, Chapter 16. In 1988, the State Board and the Department of Health Services (now Department of Toxic Substances Control) issued the Leaking Underground Fuel Tank (LUFT) field manual which prescribes specific methods for evaluating the effects of underground storage tank leaks.

There are approximately 2,000 known cases of leaking underground storage tanks (USTs) in the Region. Approximately 35% of the cases involve instances where only soil contamination is present, 35% are cases which have been closed. The majority of the releases from these underground storage tanks are gasoline and the constituent of most concern is benzene, a known carcinogen. A smaller percentage of the underground storage tank releases involve chlorinated industrial solvents, which are suspected carcinogens. As anticipated, the majority of the sites where these releases have occurred are automotive service stations, with tanks from industrial facilities contributing a smaller, but significant, minority. To date, these groundwater impacts have not grown to the point where drinking water supply wells have been affected. The Regional Board maintains and regularly updates the

Leaking Underground Storage Tank Information Systems (LUSTIS) database, which identifies all known underground storage tank release sites in the Region.

Implementation of the underground storage tank program includes direct Regional Board oversight of leaking underground storage tank cleanups. It also involves coordination of oversight activities with local agencies under contract with the State Board through the Local Oversight Program. Local agencies have the authority, pursuant to Section 25297.1 of the Health and Safety Code, to act on behalf of the Regional Board in requiring investigations and cleanup of underground storage tanks cases. The local agencies also implement the permitting, construction, inspections, and monitoring portion of the Underground Tank Regulations. The Orange County Health Care Agency, the County of Riverside Department of Environmental Health, and the County of San Bernardino Department of Environmental Health Services handle approximately 80% of the active cases in the Region, with several cities managing their own programs. The local agencies' caseload consists of soil cases, while the Regional Board maintains responsibility for the highly complex cases where groundwater has been affected.

As specified in State Board Resolution No. 92-49, "Policies and Procedures for Investigation and Cleanup and Abatement of Discharges," the investigation and cleanup of releases from underground storage tanks involves several steps including: (1) preliminary site assessment and workplan submittal; (2) pollution characterization; (3) remediation; and (4) post-remedial action monitoring. Soil contamination cleanup levels are determined on a case-by-case basis and are established to prevent continued leaching from the affected soils at levels which may cause the underlying groundwater to exceed applicable water quality objectives. Cleanup goals for groundwater contamination cases are generally established at drinking water standards (Maximum Contaminant Levels or Action Levels).

In most areas of the Santa Ana Region, the uppermost portions of the aquifers are considered to be in hydrologic contact with deeper portions which are currently utilized for drinking water supplies. In the pressure zone of Orange County, the uppermost sediments are fine-grained materials which are unable to sustain sufficient pumping rates. However, due to the large volume of water held within these sediments, the close vertical proximity of these areas to underlying pumping locations, and the existence of pathways for movement into the deeper aquifers, the shallow waters in this area are considered as contributing to the sources of drinking water in Orange County. Leaking underground storage tank cleanups must be conducted accordingly.

## Underground Storage Tank Cleanup Fund

The State Board, Division of Clean Water Programs, administers the Underground Storage Tank Cleanup Fund. The Cleanup Fund can be used as a mechanism to satisfy federal financial responsibility requirements and pay for corrective action and

third party liability costs resulting from a leaking petroleum UST. The Fund can also pay for direct cleanup (by local agency or Regional Board) of UST sites requiring emergency and prompt action on abandoned or recalcitrant sites. This fund, collected by the Board of Equalization, is supported by a 0.6 cents per gallon fee for gasoline. The Fund has been established to provide reimbursement to tank owners or operators for the costs of cleanup of the effects of unauthorized releases of petroleum. Up to one million dollars ($1,000,000) can be provided per site, with the first ten thousand dollars ($10,000) being provided by the claimant. With certain qualifications, expenditures made to remediate an unauthorized petroleum release since January 1, 1988 can be reimbursed and letters of credit can be issued for the funding of ongoing remediation activities.

The Regional Boards provide technical support to both the applicants who file claims against the UST Cleanup Fund and the State Board staff who verify the corrective action work covered by the claim. For claims that involve future work, the Regional Boards will oversee site investigation and cleanup on cases for which they are the lead agency.

## ABOVEGROUND STORAGE TANKS

The state's Aboveground Petroleum Storage Act was enacted in 1989 and amended in 1991. The Act became effective on January 1, 1990 (Health and Safety Code, Chapter 6.67).

The purpose of the regulation is to protect the public and the environment from the serious threat of millions of gallons of petroleum-derived chemicals stored in thousands of aboveground storage tanks. The Regional Board inspects aboveground petroleum storage tanks, which were used to store crude oil and its fractions after January 1991, to assure compliance with a federally required site-specific Spill Prevention, Control, and Countermeasure Plan. In the event that a release occurs which threatens surface or groundwater, the Act allows the state to recover reasonable costs incurred in the oversight and regulation of cleanup.

Storage statements are required from facilities with aboveground storage tanks, describing the nature and size of their tanks. Filing fees are required which are intended to fund inspections, training, and research. Approximately 280 aboveground storage tanks are under regulation in the Santa Ana Region as of May 1, 1993. Their number is continually expanding as aboveground storage tanks are increasingly used to replace underground storage tanks. A list of aboveground storage tanks is available from the Regional Board.

## DISPOSAL OF HAZARDOUS AND NONHAZARDOUS WASTE TO LAND

Hazardous and nonhazardous waste disposal can, if not properly managed and regulated, diminish the beneficial uses of the waters of the Region. These are typically losses to groundwater beneficial uses, but in some cases, surface waters

can also be affected by disposal operations or contaminated soil in the vadose zone.

The Regional Board regulates landfills receiving municipal solid wastes and surface impoundments receiving hazardous or designated liquid wastes. Although these sites are closely regulated and monitored, some water quality problems have been detected and are being addressed. There are no hazardous solid waste disposal facilities currently operating in the Region.

The laws and regulations governing the disposal of both hazardous and nonhazardous solid wastes have been revised and strengthened in the last few years. The US EPA, DTSC, the State Board, and Regional Water Quality Control Boards are implementing the federal RCRA regulations. Described below is Regional Board implementation of RCRA and the following state programs: Title 23, Division 3, Chapter 15; Toxic Pits Cleanup Act; and Solid Waste Assessment Tests.

**Resource Conservation and Recovery Act**

The state implements the Resource Conservation and Recovery Act (RCRA) in California through the Department of Toxic Substances Control (DTSC) and the Regional Boards. Chapter 15 monitoring requirements have been implemented through the adoption of waste discharge requirements for both hazardous and nonhazardous waste disposal sites covered by RCRA. The discharge requirements for both hazardous waste sites are part of a state RCRA permit issued by the DTSC. The Regional Board and the Integrated Waste Management Board issues state permits for nonhazardous waste disposal sites.

The Resource Conservation and Recovery Act of 1976 provided for the development of federal and state programs for the regulation of land disposal of waste materials and the recovery of materials and energy resources from the waste stream. The Act regulates not only the generation, transportation, treatment, storage, and disposal of hazardous wastes, but also nonhazardous solid waste disposal facilities. In addition, the 1976 Act called for phasing out the use of open dumps for disposal of solid wastes in favor of sanitary landfills.

The most recent and significant amendments to RCRA (1984) impose a variety of new, more stringent requirements both on hazardous and nonhazardous waste generators, transporters, and the owners/operators of treatment, storage, and disposal facilities within the existing regulated community. Significant provisions include bans on land disposal of certain wastes, restrictions and placement of liquids in landfills, and establishment of minimum technological requirements for landfills and surface impoundments.

Subtitle C of RCRA contains requirements related to the identification and listing of hazardous wastes and standards applicable to generators, transporters, owners, and owner/operators of treatment, storage, and disposal facilities. Primary

responsibility for the implementation of Subtitle C rests with the DTSC, with Regional Board participation as necessary.

Subtitle D of RCRA establishes a framework for federal, state, and local government cooperation in controlling the management of nonhazardous solid waste. The federal role in this arrangement is to establish the overall regulatory direction by providing minimum nationwide standards for protecting human health and the environment and to provide technical assistance to states for planning and developing their own environmentally sound waste management practices. The actual planning and direct implementation of solid waste programs under subtitle D. however, remain largely state and local functions, and the act authorizes states to devise programs to deal with state-specific conditions and needs. US EPA approved the state's proposed solid waste management program, and delegated authority to the state to implement the program in October 1993. In September 1993, the Santa Ana Region adopted a blanket Waste Discharge Requirement (WDR) amendment for all affected landfills in the Region which implements both Subtitle D and Chapter 15.

Subtitle D includes the Criteria for Classification of Solid Waste Disposal Facilities and Practices (40 CFR Part 257). The criteria establish minimum national performance standards necessary to ensure that "no reasonable probability of adverse effects on health or the environment" will result from solid waste disposal facilities or practices.

Part 258 of subtitle D establishes minimum national criteria for municipal solid waste landfills including those used for sludge disposal and disposal of nonhazardous waste combustion and ash. Part 258 also sets forth minimum federal criteria for municipal solid waste landfills, including location restrictions, facility design and operating criteria, groundwater monitoring requirements, financial assurance requirements, and closure and post-closure care requirements. The rule establishes differing requirements for existing and new units, (*e.g.,* existing units are not required to remove wastes in order to install liners).

Subtitle D provides that states with approved water management programs that wish to run the program will have flexibility in implementing these criteria. A municipal solid waste landfill unit that does not meet the Part 258 Criteria will be considered to be engaged in the practice of "open dumping" in violation of Section 4005 of RCRA. Municipal solid waste landfill units that receive sewage sludge and fail to satisfy those criteria will be deemed to be in violation of Sections 309 and 405(e) of the Clean Water Act.

**Title 23, Division 3, Chapter 15**

The most important regulation used by the Regional Board in regulating hazardous and nonhazardous waste disposal is California Code of Regulations (CCR) Title 23,

Division 3, Chapter 15 (formerly Subchapter 15). These regulations include very specific siting, construction, monitoring, and closure requirements for all existing and new waste disposal facilities. Chapter 15 also contains a provision requiring landfill operators to provide assurances of financial responsibility for initiating and completing closure, and for corrective action to address all known or reasonably foreseeable releases from their waste management units. Detailed technical criteria are provided for establishing water quality protection standards, monitoring programs, and corrective action programs for releases from waste management units. Chapter 15 defines waste types to include hazardous wastes (Class I), designated wastes (Class II), and nonhazardous solid wastes (Class III). Hazardous wastes are defined by DTSC in Title 22 of the California Code of Regulations.

Designated wastes are defined as:

1. Those non hazardous wastes consisting of or containing contaminants which under ambient landfill conditions could be released at concentrations that could cause water quality degradation, or

2. Those wastes which are hazardous according to Title 22, but are not considered hazardous by the federal RCRA definition and have been granted a variance from hazardous waste management requirements by DTSC.

Nonhazardous solid wastes are those normally associated with domestic and commercial activities. The California Integrated Waste Management Board (CIWMB) is the lead agency responsible for non-water quality-related issues relating to nonhazardous waste management in California (Division 7 of Title 14 of the CCR). CIWMB has the overall responsibility for landfill operations and ensuring that nonhazardous wastes are collected and disposed of in a manner which protects public health and safety as well as the environment. Inert wastes can be regulated by the Regional Board if necessary to protect water quality.

The Regional Board has regulated nonhazardous municipal solid waste facilities (Class III) since the mid-1970s. Many of the smaller, older facilities have closed, and waste is now typically disposed of at larger regional nonhazardous solid waste facilities. The Regional Board is responsible for the review and revision of waste discharge requirements for both active and inactive permitted sites to assure consistency with the current regulations. These responsibilities include the upgrading of groundwater monitoring systems to identify violations of water quality protection standards, and the establishment of corrective action programs where standards are violated.

A significant task faced by the Regional Board in implementing Chapter 15 at nonhazardous solid waste facilities is defining what constitutes designated wastes. Many wastes which are not hazardous still contain constituents of water quality concern that can become mobile in a nonhazardous solid waste facility, and can

produce leachates that could pose a threat to beneficial uses of the water of the state. The criteria for determining whether a nonhazardous waste is a designated waste are based on water quality objectives for waters located in the vicinity of the sites, the containment features of the solid waste facility, and the solubility/mobility of the waste constituents. To assist in the identification of designated waste criteria, the Regional Board will rely on a methodology acceptable to the Executive Officer and other relevant technical data.

**Landfill Expansion**

A steady increase in the rate of solid waste generation in the region is causing landfills to reach capacity sooner than expected. This situation has man it necessary not only to plan for the closure of some existing landfills, but also to anticipate the need for expansions of existing facilities and the construction of new ones. To minimize the problems associated with the rapid filling and subsequent closure of solid waste disposal facilities, the Regional Board supports efforts to reduce the volume of wastes disposed of at landfills. To reduce the potential for household hazardous wastes entering municipal landfills, the Regional Board also supports public education and household hazardous waste disposal and recycling programs.

The Regional Board conducts many other activities related to the disposal of wastes. Examples of these activities are review and approval of site design plans and construction oversight for new or expanding facilities, implementation of strict drainage and erosion control measures at landfills, soil and groundwater cleanup activities at contaminated disposal sites, and closure/post-closure plan review, approval, and closure construction oversight.

**Toxics Pits Cleanup Act**

The Toxics Pits Cleanup Act of 1984 (TPCA) required that all impoundments containing liquid hazardous wastes or free liquids containing hazardous waste must be either reconstructed with a liner/leachate collection system or be dried out by July 1, 1988. These facilities must also be closed by removing all contaminants or by capping to contain any residual soil contamination. In 1985, there were 11 sites in the Santa Ana Region with ponds subject to TPCA. As of 1993, 2 facilities are continuing to operate following upgrades to meet TPCA requirements, eight facilities have closed, and discharges at the remaining facility have ceased. Lead responsibility for closure of the remaining site has been assumed by the DTSC, with participation continued by the Regional Board.

**Solid Waste Assessment Tests**

Section 13273 was added to the Water Code in 1985, requiring all operations of both active and inactive nonhazardous landfills to complete a Solid Waste

Assessment Test (SWAT). The purpose of the SWAT is to determine whether hazardous or toxic substances above regulatory thresholds, or any other constituents which may threaten water quality, are migrating from the facility. Funding for the SWAT program is provided by the California Integrated Waste Management Board.

There were 159 sites identified in the region subject to this program. Pursuant to a list adopted by the State Board, 150 sites statewide were to be evaluated each year through the year 2001 (approximately 10 sites per year in the Santa Ana Region). These sites were according to their perceived threat to water quality. Active sites, those overlying high quality aquifers, and those already known to have adversely impacted groundwater were replaced in the highest ranks (Rank 1 through 4).

Program funding was eliminated in 1991, but was restored in 1992 for a period of three years to allow for review of reports for sites in Ranks 1 through 5 only. These reviews must be completed by 1995. Although landfill site evaluations, which seek to identify adverse impacts to both surface and groundwater quality, can be required pursuant to Chapter 15 whenever necessary, it appears that the SWAT program will be fully funded after 1995. A revised SWAT ranking list will be created prior to implementation of the program for Rank 6 and beyond.

# CHAPTER 6

# MONITORING AND ASSESSMENT

## INTRODUCTION

The effectiveness of a water quality control program cannot be judged without information supplied by a comprehensive monitoring and assessment program. The State Board, the Regional Boards, and other federal, state, and local agencies monitor water quality throughout the state. Coordination among the agencies is essential to identify data gaps and supplement monitoring efforts as necessary. The results of these programs show where water quality problems exist now and where problems can be expected based on quality trends over time. Monitoring activities in the Santa Ana Region were described as part of Chapter 5 (Plan Assessment) in the 1983 Basin Plan. In this Plan, the discussion has been expanded and updated. New programs have been added and obsolete programs have been deleted. Additionally, this chapter provides a brief description of the databases being used to store and analyze the data collected. This chapter also describes the periodic water quality assessments which are conducted on a statewide basis, using the monitoring data collected.

## STATE MONITORING PROGRAMS

The State Board is the lead agency for statewide monitoring activities. The State Board coordinates extensively with the California Departments of Fish and Game, Water Resources, Health Services, and various federal agencies in its monitoring activities. The objectives of the State's surveillance and monitoring program are as follows:

- To measure the achievement of water quality goals and objectives specified in the Basin Plan;
- To measure the specific effects of water quality changes on established beneficial uses;
- To measure background conditions of water quality;
- To determine long-term trends in water quality;
- To locate and identify sources of water pollution that pose an acute, accumulative, and/or chronic threat to the environment;
- To provide information needed to compare receiving water quality to mass emissions of pollutants from waste discharge;

- To provide data for determining compliance with permit conditions and to support enforcement actions, if necessary;

- To measure wasteloads discharged to receiving waters and to identify their effects, and in water quality limited segments, to prepare wasteload allocations necessary to achieve water quality control;

- To provide data needed to carry on the continuing planning process;

- To measure the effects of water rights decisions on water quality and to guide the State Board in its responsibility to regulate unappropriated water for the control of quality;

- To provide a clearinghouse for the collection and dissemination of water quality data gathered by other agencies and private parties cooperating in the program; and

- To prepare reports on water quality conditions as required by federal and state regulations and other users requesting water quality data.

The monitoring program provides for collection and analysis of samples and the reporting of water quality data. It includes laboratory support and quality assurance, storage of data for rapid and systematic retrieval and preparation of reports and data summaries. Most important is the interpretation and evaluation of data leading to recommendations for action.

The State monitoring program focuses on fresh and marine surface waters. The goal of the State monitoring program is to provide an overall, continuing assessment of water quality in the state. Historically, conventional parameter such as minerals, nutrients, and dissolved oxygen were considered to be the most important parameters. More recently, toxic substances have received increasing attention in federal and state water pollution control activities. The State and Regional Boards are intensifying their efforts to investigate the presence of toxic substances in surface waters and the effects of these substances on aquatic biota.

The State program consists of a toxicity monitoring program, the Inland Surface Waters Toxicity Testing Program, and two toxic substances monitoring programs – the Toxic Substances Monitoring Program and State Mussel Watch.

**Inland Surface Waters Toxicity Testing Program**

The goal of this program, which was initiated in 1990, is to evaluate the extent, magnitude, nature and sources of toxicity in the waters of the State. Emphasis is on those waters where toxicity is associated with unregulated discharges such as runoff from agriculture, mining or urban areas. As part of this program, a toxicity

testing facility at the University of California, Davis was established to conduct State and Regional Board studies. The Regional Board performs the sampling of the waterbodies in the region and supplies the testing facility with the samples.

The toxicity test measures the combined effects of toxics in the water and is not used to separate and identify a specific toxic substance. Toxicity is determined by using water column examples from a waterbody under lab conditions. Appropriate test organisms are observed for their response by using growth, reproduction or mortality as indicators. Two types of toxicity tests are used, acute and chronic, which involve measuring responses in different life stages of the test organisms.

In the Santa Ana Region, Big Bear Lake and its tributaries, the Anaheim and Newport Bay Watersheds, Lake Elsinore, and some creeks have been sampled for toxicity as part of this program.

**Toxic Substances Monitoring Program**

The Toxic Substances Monitoring Program (TSMP) was initiated in 1976 by the State Board. The TSMP was organized to provide a uniform statewide approach to the detection and evaluation of the occurrence of toxic substances in fresh and estuarine waters of the state. The TSMP primarily targets waterbodies with known or suspected impaired water quality and is not intended to give an overall water quality assessment. Data obtained from the TSMP is used to focus the Regional Board's attention on those waterbodies impacted by toxic pollutants. Special TSMP or other studies are then conducted to investigate the source(s) of the pollutants. The State Board has contracted with the Department of Fish and Game to perform the monitoring and chemical analyses associated with this program.

The presence of toxic substances often cannot be determined by water column sampling due to the low concentrations of toxicants in the water. Also, a number of toxic substances are not water soluble, but can be found associated with sediment or organic matter. The process of bioaccumulation acts to concentrate toxicants through the aquatic food web, sometimes many hundreds of times the levels actually in water. Therefore, in the TSMP the flesh of fish and other aquatic organisms (mainly crayfish) is analyzed to indicate whether any toxic substance is present. Fish livers are analyzed for metals, including arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc; fish muscle tissue (filet) is analyzed for mercury and selenium. In addition, fish filet and crayfish tail are analyzed for 45 synthetic organic compounds, which include pesticides and PCBs (Table 6-1). When very small-sized fish are available, only whole-body analyses are conducted.

The objectives of the Toxic Substances Monitoring Program are as follows:

- To develop statewide baseline data and to demonstrate trends in the occurrence of toxic elements and organic substances in the aquatic biota;
- To assess impacts of accumulated toxicants upon the usability of State waters by man;
- To assess impacts of accumulated toxicants upon the aquatic biota; and
- Where problem concentrations of toxicants are detected, to attempt to identify sources of toxicants and to relate concentrations found in the biota to concentrations found in the water.

Based upon the priorities identified by the Regional Board and the TSMP, the number and location of the sampling stations and the constituents investigated vary each year. When the program began, streams and lakes were ranked according to various criteria established to indicate their importance to the state in terms of water quality. The priority I, or highest priority, waterbodies were included in the first phase of monitoring. The Santa Ana River was included in this list and the station at Prado Dam has been sampled annually since the program began. The monitoring was expanded to include four other stations on the Santa Ana River and two of its tributaries, Chino and Cucamonga Creeks. A number of sites in the Newport Bay Watershed have also been sampled, largely in response to findings by the State Mussel Watch Program (see below) of high levels of organics and metals in the Bay itself. The results of this TSMP sampling led to an intensive study of toxics in San Diego Creek in 1985. Several stations were added to the program to monitor Anaheim Bay and its tributaries because of similar concerns. A number of the lakes in the region, including several park lakes, have also been sampled in this program. Table 6-2 lists the TSMP sampling sites in the Santa Ana Region (1978-1991).

Reports which describe the statewide TSMP sampling program sites, the constituents investigated, and the results have been published annually since 1977. A ten-year data summary was published in 1987.

**State Mussel Watch Program**

The State Mussel Watch (SMW) program is the state's long term marine water quality monitoring program, initiated in 1977. The SMW program provides the state with data showing trends in coastal and estuarine water quality. The Regional Board uses the data from SMW to establish the presence or absence of toxic substances and to monitor the variation in the concentrations detected at the various locations. Using this information, the Regional Board then attempts to locate the sources of the contamination. As with the Toxic Substances Monitoring Program, the State Board contracts with the Department of Fish and Game to perform the sampling and analysis.

- The primary goal of the SMW program are as follows:
- To provide long-term monitoring of certain toxic substances levels in coastal marine waters;

- To provide an important element in comprehensive water quality monitoring strategy; and
- To identify on a year-to-year basis specific areas where concentrations of toxic materials are higher than normal.

Mussels were chosen for the State Mussel Watch program because: (1) they are common along the California coast; (2) they are immobile in nature, permitting a localized measurement of water quality; (3) they have the ability to concentrate pollutants above ambient seawater levels; and (4) they provide a time-averaged sample. Where freshwater tributaries are suspected sources of toxics, freshwater clams are used. The trace metals analyzed in mussel and clam tissues are similar to those investigated by the Toxic Substances Monitoring Program and include aluminum, cadmium, chromium, copper, lead, manganese, mercury, nickel, silver, and zinc. Synthetic organic compounds analyzed are listed in Table 6-1.

As with the Toxic Substances Monitoring Program, the number and location of SMW sites investigated varies each year, according to program needs and resource constraints. Several key areas in the Santa Ana Region are frequently sampled in this program (See Table 6-3). Anaheim Bay/Huntington Harbour area sampling locations include the Anaheim Navy Harbor, Anaheim Navy Marsh, Anaheim Bay at Edinger Street, and Anaheim Bay at Warner Avenue. In the Newport area, the most frequently sampled stations include Newport Bay Island, Newport Bay at Hwy 1 Bridge, Newport Bay at Crows Nest, Rhine Channel, and Newport Bay/Upper Rhine Channel. As with the TSMP, statewide SMW reports are published annually and a ten-year data summary for 1977-1987 is available.

## REGIONAL MONITORING PROGRAMS

The regional monitoring programs are grouped with local agencies' programs because they are, for the most part, cooperative efforts. The sampling frequency, sampling stations, constituents, and other details vary from year to year, depending on needs and budgets of the Regional Board and local agencies.

The regional monitoring effort consists of the following:

1. Surface Water Monitoring
2. Groundwater Monitoring
3. Compliance Monitoring
4. Complaint Investigation
5. Intensive Surveys
6. Aerial Surveillance
7. Stormwater Monitoring

## Surface Water Monitoring

With the exception of the annual sampling of the Santa Ana River at Prado Dam, the Regional Board's surface water monitoring program is not strictly formalized. The sampling frequency, locations, constituents, and other details vary from year to year depending on identified problems and needs, and on staff and funding availability. A number of other agencies conduct surface water monitoring programs in the region, including water purveyors, wastewater dischargers, and flood control agencies. The Regional Board makes every effort to coordinate its monitoring activities with these other agencies to maximize the collection and exchange of data, as well as the use of resources.

This Basin Plan specifies water quality objectives applicable to Reach 3 of the Santa Ana River for TDS, nitrogen, and other constituents which are set on the baseflow of the River (see Chapter 4). To determine compliance with these objectives, the Basin Plan requires that sampling of the River be conducted annually at Prado Dam. As directed by the Basin Plan, Board staff conducts the sampling during August, when the quantity and quality of baseflow is most consistent. Staff then reports the results to the Board. The results of this program are used to assess the effectiveness of the Board's regulatory programs and to determine whether changes, such as revisions to the TDS and nitrogen wasteload allocations, are necessary.

## Groundwater Monitoring

The regional groundwater monitoring program depends upon the cooperation of local agencies to ensure that data are collected. The Region's municipal water supply districts sample their potable water wells to assure that the public health regulations are met. The sample results are also submitted to the Regional Board.

This Region relies greatly on groundwater computer models for basin planning studies. The groundwater quality data is collected by numerous agencies. The Regional Board contributes to the collection effort. All data will be collected in a computer database compiled by the Santa Ana Watershed Project Authority.

## Compliance Monitoring

Under this program, data is collected and used to determine compliance with discharge requirements and receiving water standards, and to support enforcement actions and waste discharge prohibitions. The data are collected from self-monitoring reports generated by waste dischargers and from compliance monitoring reports prepared by Regional Board staff.

Self-monitoring reports submitted to the Regional Board are reviewed, and if violations are noted, appropriate action is taken, ranging from administrative

enforcement to judicial abatement, depending on the circumstances. Self-monitoring report data have also been used to develop pollutant loads and to measure general water quality conditions in the receiving water.

**Compliance Monitoring** (Continued form page 6-6)

The lowest concentration by which permit compliance is reliably measured is called the Practical Quantification Level (PQL). The PQL is used and taken into account when establishing waste discharge limits. PQLs will be developed using all available information, and will be established based upon information obtained from regional laboratories.

The Regional Board requires the initiation of a Toxicity Reduction Evaluation (TRE) if a discharge consistently exceeds its chronic toxicity effluent limit. The Regional Board, to date, has interpreted the "consistency exceeds" trigger as the failures of three successive monthly toxicity tests, each conducted on separate samples. Initiation of the TRE has also been conditioned on a determination that a sufficient level of toxicity exists to permit effective application of the analytical techniques required by a TRE. The Regional Board also encourages the development of scientifically sound toxicity test quality control and standardized interpretation criteria to improve the accuracy and reliability of chronic toxicity demonstrations.

Compliance monitoring also involves staff inspections of regulated and unregulated sites and includes observations made by staff members and/or results of analyses performed on samples collected by staff members.

**Complaint Investigation**

This program involves the investigation of complaints from citizens and public governmental agencies regarding the discharge of wastes or creation of nuisance conditions. It is a Regional Board responsibility which includes field studies, preparation of reports and letters, and other necessary follow-up actions to document observed conditions and to initiate appropriate corrective actions.

**Intensive Surveys**

Intensive monitoring surveys provide detailed water quality data to locate and evaluate violations of receiving water standards and to make wasteload allocations. They usually involved localized, intermittent sampling at higher than normal frequency. These surveys are performed in water quality-limited segments or hydrologic units which require additional sampling data to supplement the routine monitoring program results. The surveys are specially designed to evaluate water quality problems.

Beneficial use surveys are executed to aid in the review of the Basin Plan's water quality standards. This periodic review, entitled a "triennial review," is required in the

Clean Water Act. Intensive surveys have been performed on the middle Santa Ana River, Lake Elsinore, Lytle Creek, Mill Creek, San Diego Creek, Newport Bay, Huntington Harbour, and Strawberry Creek.

The Clean Lakes Program is specified in Section 314 of the Clean Water Act, and requires that all publicly owned freshwater lakes be identified and classified according to their trophic conditions. If a lake's condition is not known, a Clean Lakes Program survey may be performed to assess its water quality condition. If the trophic quality of the lake is determined not to protect its beneficial uses, the pollution sources and potential restorative measures are to be identified. The above actions may be conducted under a Clean Lake grant received from the federal government. Clean lake grant-funded studies of Lake Elsinore and Big Bear Lake are currently in progress.

**Aerial Surveillance**

Aerial surveillance is used primarily to gather photographic records of discharges and water quality conditions in the Region. Aerial surveillance is particularly effective because of the overall view of a facility that is obtained and because many facilities can be observed in a short period of time.

**Municipal Stormwater Monitoring**

The stormwater permitting program has been established to protect the water quality of the waterbodies which receive stormwater runoff. See Chapter 5 for a complete description of this program. Sampling of first-flush phenomena has indicated that stormwater discharges contain significant amounts of pollutants. Therefore, the Region's municipal stormwater permits require the permittees to develop comprehensive management and monitoring programs. Because each permit generally covers a large number of waterbodies, the required monitoring program is in two phases.

Phase I requires the discharger to sample those receiving waters where the beneficial uses are threatened or impaired due to runoff of stormwater and urban nuisance water. Under Phase II the dischargers will be required to develop stormwater management and monitoring programs for the remaining waterbodies included under the permit.

Stormwater discharges from urbanized areas consist mainly of surface runoff emanating from residential, commercial, and industrial areas. In addition, there are stormwater discharges from agricultural and other land uses. The constituents of concern in these discharges include: total and fecal coliform, enterococcus, total suspended solids, biochemical oxygen demand, chemical oxygen demand, total organic carbon, oil and grease, heavy metals, nutrients, base/neutral and acid extractibles, pesticides, herbicides, petroleum hydrocarbon products, and/or those causing extremely high or low pH.

The objectives of the stormwater monitoring programs are to: 1) define the type, magnitude, and sources of pollutants in the stormwater discharges within the permittee's jurisdiction so that appropriate pollution prevention and correction measures can be identified; 2) evaluate the effectiveness of pollution prevention and correction measures; and 3) evaluate compliance with water quality objectives established for the stormwater system or its components.

## QUALITY ASSURANCE / QUALITY CONTROL

The purpose of the Quality Assurance Program is to ensure that data generated from environmental measurement studies are technically sound and legally defensible. A State Quality Assurance (QA) Program Plan was prepared under authority of the State Board in April 1990 describing how the State and Regional Boards will implement and manage the QA program. This Plan was approved by the State Board and the US EPA, Region IX, to meet requirements for federal funding.

The federal regulation requiring the State to develop and implement a QA Program is written in EPA Order 5360.1, April 3, 1993. The mandate is identified in 40 CFR 30.503 (July 1, 1987) requiring State agencies involved in environmentally-related measurement projects to develop and implement a Quality Assurance Program for programs partially or fully supported by Federal funds.

This mandate further requires that a QA Program Plan be developed that describes how a State agency will implement and manage a QA Program. It also requires that a QA Project Plan be prepared and approved prior to the start of any field or laboratory activities. A State's QA Program Plan must be approved by the federal award official before federal funds can be released. QA Project Plans are approved by a state's designated QA Officer and are available for federal review.

The State Board has appointed a QA Program Manager to direct and coordinate the overall program. Each State Board division and Regional Board has appointed a QA Officer to administer their respective QA responsibilities. The State and Regional Boards jointly administer the program but the State Board has lead responsibility for managing the overall program and reporting to EPA.

The Regional Board's QA Officer interacts with project managers on the required preparation of QA Project Plans for studies involving field and laboratory activities. The Project Plans should outline project objectives, data quality objectives in which management decisions will be based, and field and laboratory procedures that will be used to achieve the objectives. Once completed, the Plan must be reviewed and approved by an agency QA Officer or, when problems arise, by the State Board QA Program Manager before any field work can begin. Guidelines on Plan preparation have been distributed to the State and Regional Board QA Officers.

## ASSESSMENT PROGRAMS

There are several statewide water quality assessments which are performed periodically. The assessments are used to evaluate the effectiveness of the Regional Boards' water quality programs to determine if making any changes are needed.

### Water Quality Assessment

The Water Quality Assessment (WQA) is a catalog of the State's waterbodies and their water quality condition. The WQA identifies the water quality condition as good, intermediate, impaired or unknown. The data used to categorize waterbodies in the WQA are obtained from the various monitoring programs identified previously. All Regional Boards adopted their regional WQA at public meetings and submitted them to the State Board for inclusion in the State WQA. In addition, for impaired and high priority waters, factsheets were prepared to provide additional detail. The State Board intends the WQA to be updated on a regular basis, generally every two years.

The WQA serves many different purposes. The WQA, a public document, reports the condition of the State's waterbodies in a summary format. The lists of impaired waterbodies, included in the WQA, satisfy several Clean Water Act listing requirements. These federal lists are identified by the applicable Clean Water Act (CWA) section or Code of Federal Regulation (CFR) number. These include:

- CWA 303(d) – Water Quality Limited Segments where water quality objectives will not be met even with the Best Available Treatment/Best Control Technology (BAT/BCT)

- CFR 131.11 – Segments which may be affected by or warrant concern due to toxics

- CWA 314 – Lake Priorities

- CWA 319 – Nonpoint Source Impacted Waters

- CWA 304(l) ("Long List") – Waters designated as impaired because narrative or numeric objectives are violated or beneficial uses are impaired similar to CWA Section 303(d).

- CWA 304(s) ("Short List") – Waters not meeting water quality objectives because of toxics from point source discharges

- CWA 304(m) ("Mini List") – Waters not meeting water quality objectives because of toxics from either point or nonpoint sources.

WQA Water Quality Condition Classification

For each region, the individual waterbodies are listed. They are identified by water resource type, ***i.e.***, bays and harbors, wetlands, coastal waters, estuaries, lakes and reservoirs, groundwater, rivers and streams, and saline lakes. An entire waterbody may be classified with one water quality condition or divided by segments into more than one.

Good: waters that support and enhance the designated beneficial uses. Waterbodies classified as good may be designated a high priority if a threat to water quality is present.

Intermediate: waters that support designated beneficial uses while there is occasional degradation of water quality. Waterbodies suspected of impairment but for which there is inadequate data to conclude impairment are also given this classification.

Impaired: waters not reasonably expected to attain or maintain applicable water quality standards. Standards include both numeric and narrative water quality objectives and the beneficial uses the objectives are intended to protect.

Unknown: waters with unknown water quality where limited or no direct observations are available.

The WQA also provides the foundation for the State Board's Clean Water Strategy process. The current regional WQA and the associated factsheets are included as Appendix VII.

**Clean Water Strategy**

The Clean Water Strategy (CWS) is a process that the State Board implemented to assure that staff and fiscal resources are directed at the highest priority water quality issues throughout California. The primary objective of the CWS is to more effectively define and respond to priorities as revealed by the best available water quality information. A CWS goal is to link State and Regional Board programs together in directing actions on individual waterbodies.

The CWS relies on the Water Quality Assessment condition ratings to provide the technical information necessary to identify waterbodies needing protection or prevention actions, additional assessment or cleanup activities. In addition to the Water Quality Assessment, the regions determined the relative resource value of their waterbodies to recognize the relative importance of individual waters when compared to each other. The regions developed priority waterbody lists which are based upon the severity of their water quality problems or needs and relative resource values, from which the State Board assembled a statewide priority list based upon the same criteria.

There are six phases involved in implementing the Clean Water Strategy. As of this date, phases 1 and 2 have been completed. The State Board has begun a pilot study to determine the feasibility of phases 3 through 6.

Phase 1: Obtain the best information
2: Compare and prioritize waterbody concerns
3: Prioritize actions to address concerns
4: Allocate new resources
5: Implement strategy goals
6: Review results

### 305(b) Report

The 305(b) Report, also known as the National Water Quality Inventory Report, is a summary of all states' water quality reports compiled by the Environmental protection Agency. The report is prepared biennially from information that states are required to submit pursuant to Section 305(b)(1) of the Clean Water Act.

The State Board prepares the State report using information taken from the WQA. The State 305(b) Report includes: (a) a description of the water quality of major navigable waters in the State during the preceding years; (b) and analysis of the extent to which significant navigable waters provide for the protection and propagation of a balanced population of shellfish, fish, and wildlife, and allow recreational activities in and on the water; (c) an analysis of the extent to which elimination of the discharge of pollutants is being employed or will be needed; and (d) estimates of the environmental impact, the economic and social costs necessary to achieve the "no discharge" objective of the Clean Water Act, the economic and social benefits of such achievement, and the dates of such achievement. The report also recommends programs which must be implemented to achieve the CWA goals.

## DATA MANAGEMENT

### Regional Modeling Efforts

SAGIS/ADSS: The Santa Ana Watershed Project Authority Planning Department has devised a modeling program and system called the Advanced Decision Support System (ADSS) to aid in the development of long-range plans to meet water quality and quantity objectives (ARC/INFO is the trademark of the Environmental Systems Research Institute's copyrighted program. Although this product is mentioned in the Basin Plan, the Santa Ana Regional Board is not endorsing any commercial products). The ADSS creates a central data storage facility standardizing data collection, storage, and retrieval. The core of the ADSS is the Santa Ana

Geographic Information Systems (SAGIS). SAGIS is an ARC/INFO[1]-based water resource analysis and graphic tool written in ARC Marco Language. SAGIS includes a library of various geographic overlays to create custom base maps for water resource data. The system also allows the user to view data stored in tabular form and plot the results versus time. SAGIS will produce a variety of water quality and quantity analysis maps and plots. SAGIS includes a comprehensive landuse database of the Santa Ana River Basin to project future water needs.

**Regional Databases**

STORET: STORET, which stands for STOrage and RETrieval, is a national database system that contains environmental monitoring data relating to the water quality within this Regional Board's boundaries and throughout the United States. These data are the result of field and laboratory analyses performed on samples gathered from streams, lakes, estuaries, groundwater, and other waterbodies. The STORET system resides on an IBM 3090 mainframe computer maintained by the US EPA at the National Computer Center in North Carolina.

The original database has evolved into a more comprehensive system capable of performing a broad range of analyses, as well as serving as the depository for data. In California, stations are sampled, in part, by the following agencies: California Department of Water Resources, U.S. Geographical Survey, California Department of Health Services, and the Regional Boards. The Regional Boards, as well as the State Board, EPA, and other regulatory agencies utilize the STORET database to examine the causes and effects of water pollution, to measure compliance with water quality objectives and maintenance of beneficial uses, and to determine water quality trends.

SABRINA: Another part of the ADSS is the Santa Ana Relational Database Management System, or SABRINA. Developed by SAWPA, SABRINA is a menu-driven application written in a database language and stores the data used by SAGIS.

[1] ARC/INFO is the trademark of the Environmental Systems Research Institute's copyrighted program. Although this product is mentioned in the Basin Plan, the Santa Ana Regional Board is not endorsing any commercial products.

# CHAPTER 7

# WATER RESOURCES AND WATER QUALITY MANAGEMENT

## INTRODUCTION

Numerous water resource management studies and projects, focused on water quality and/or water supply, are in progress in the Region under the auspices of a variety of parties. Some of these activities bear directly on the implementation of this Plan and were briefly described earlier (Chapter 5). Others may lead to future Basin Plan amendments to incorporate appropriate changes, such as revised regulatory strategies for POTWs or other dischargers. Excellent examples of these programs are the extensive, multi-agency effort in the Chino Basin to evaluate water resource management alternatives and the implementation of groundwater desalters by the Santa Ana Watershed Project Authority (SAWPA) to address the severe TDS and nitrate quality problems in that Basin. Such investigations, and the implementation of appropriate physical solutions, are an essential and integral part of the effort to restore and maintain water quality in the Region.

Funding for these investigations and projects comes from a variety of sources. Local and regional agencies contribute substantial funds and staff resources. State and federal funds, in the form of loans or grants administered principally by the State Water Resources Control Board or the US EPA, are an important source of support. Volunteer efforts by citizens' groups and private landowners also contribute significantly.

The purpose of this chapter, which is new to the Basin Plan, is strictly informational – the intent is to provide an overview of some of these studies, the agencies conducting them and funding mechanisms. This discussion is necessarily brief and incomplete but should convey a sense of the scope and significance of the participation of others in water resources management in the Region.

## SANTA ANA WATERSHED PROJECT AUTHORITY

The activities of the Santa Ana Watershed Project Authority (SAWPA) have been and remain exceptionally important to the management and protection of water resources in the Region. For this reason, SAWPA warrants special discussion.

As noted in Chapter 1, SAWPA is a joint powers agency which conducts water-related investigations and planning studies, and builds physical facilities where needed for water supply, wastewater treatment or water quality remediation. SAWPA is comprised of the five major water supply and/or wastewater management agencies in the Region: Chino Basin Municipal Water District (CBMWD); Eastern Municipal Water District (EMWD); Orange County Water

District (OCWD); San Bernardino Valley Municipal Water District (SBVMWD); and Western Municipal Water District (WMWD).

Since the early 1970's, SAWPA has played a key role in the development and update of the Basin Plan for the Santa Ana Region. SAWPA continues to sponsor, participate in, and/or oversee numerous water quality planning studies. Ongoing studies include the Chino Basin Water Resources Management Study, the Colton-Riverside Conjunctive Use Project, an investigation of water quality in Lake Elsinore, and studies of nitrogen and organic carbon in the Prado Basin. These studies are briefly described later in this chapter.

SAWPA also plays a crucial role in the implementation of the Basin Plan through the construction of physical facilities. SAWPA built and now operates the Arlington Desalter and is in the process of implementing two such facilities in the Chino Basin. As described in Chapter 5, these desalters are key parts of this Plan's strategy to address salt problems in the upper Santa Ana Basin. Additional desalters for the Riverside/Colton and Temescal areas are being considered.

SAWPA is responsible for the construction of the West Riverside County Regional Wastewater Treatment Facility and, with the cities of San Bernardino and Colton, for the Rapid Infiltration and Extraction treatment facility, which will provide wastewater treatment equivalent to tertiary for those cities. SAWPA built and is now planning expansion of the Santa Ana Regional Interceptor, or SARI line, which transports highly saline wastes out of the Basin (see also Chapter 5). SAWPA constructed and operates treatment facilities for contaminated groundwater at the Stringfellow site. SAWPA has also played a key role in the implementation of the Lake Elsinore Stabilization Project.

As noted in Chapter 6, SAWPA has undertaken to act as a clearinghouse for region-wide data on water quality, landuse, population, etc., by implementing database and geographical information systems including SABRINA, SAGIS (Santa Ana Geographic Information System) and the Advanced Decision Support System.

## NATIONAL WATER RESEARCH INSTITUTE

The National Water Research Institute (NWRI) was founded through funding provided by the Joan Irvine Smith and Athalie R. Clarke Foundation, the County Sanitation Districts of Orange County, the Irvine Ranch Water District, the Municipal Water District of Orange County, Orange County Water District, and the San Juan Basin Authority. The Institute was created to identify and support independent research projects throughout the United States which will lead to improved water quality and water supplies.

The Institute's research priorities include water quality improvement and recycling, watershed management, health risk assessment, membrane research,

and the development of public policy. The Institute uses a number of strategies to fulfill these objectives, including:

- working with local, state, and national water resource organizations to identify research needs;
- encountering broad-based participation in joint venture partnership which support water research;
- providing opportunities for members of the national water research community to meet and exchange ideas;
- developing technical and institutional strategies which ensure that research results are implemented in a timely, cost-effective manner;
- educating the general public about the need for water conservation and research; and
- serving as a catalyst to encourage development of centers of excellence in water research.

The Institute is independently governed by a Board of Directors consisting of one member from each of the contributing agencies. The NWRI and its partners establish joint ventures to sponsor research projects. NWRI has funded numerous projects which benefit the region including research on water quality and wildlife enhancement in the Prado Wetlands, television documentaries focusing on water resources issues on the lower Santa Ana River, investigation of several wastewater treatment technologies, and the treatment of contaminants in groundwater.

## INLAND SURFACE WATERS

### Big Bear Watershed

Big Bear Lake is located in the San Bernardino Mountains in central San Bernardino County. The close proximity of the Lake and mountains to the urban communities within Los Angeles, San Diego, Riverside, and San Bernardino Counties has made it a heavily utilized recreational attraction. During winter, the mountains surrounding Big Bear Lake are visited by hundreds of thousands of skiers and sightseers, while the summer months bring thousands of tourists to enjoy the pleasures of the Lake and the beautiful forested landscape. The Lake is also an important wildlife resource, providing habitat for a wide variety of plants and animals, including rare and endangered species.

A cooperative effort to ensure proper management and protection of this resource is in progress. A number of agencies, private organizations, and

individuals have joined in the development of the Big Bear Valley Coordinated Resource Management Plan (CRMP). A geographic information system will be developed to integrate information on plant and animal habitats, tributaries, and other relevant data. The intent is to use this system as a guide in making land use decisions.

The participants include:

- East Valley Resource Conservation District
- City of Big Bear Lake
- Big Bear Municipal Water District
- County of San Bernardino Planning Department
- Santa Ana Regional Water Quality Control Board
- California Department of Forestry
- California Department of Fish and Game
- California Department of Health Services
- Natural Heritage Foundation
- Big Bear Area Regional Wastewater Agency
- Big Bear City Community Services District
- Bear Mountain Ski Area
- Snow Summit Ski Area
- U.S. Fish and Wildlife Services
- U.S. Army Corps of Engineers
- U.S. Soil Conservation Service
- USDA Forest Service

**Lake Elsinore**

Lake Elsinore is a heavily used recreational waterbody located in the San Jacinto Watershed in southwest Riverside County. As noted in Chapter 1, the lake periodically goes dry, resulting in fish kills and adverse impacts on recreational opportunities. Projects to stabilize the level of the Lake are now being completed or considered. Among these is consideration of the use of reclaimed water to maintain water levels.

SAWPA is overseeing a study of the Lake, funded by a Clean Water Act Section 314 Clean Lakes Program grant. The objectives of the study, which is to be completed by December 1993, are to:

- determine Lake Elsinore's current water quality and its effect on its beneficial uses;

- analyze the potential effects of reclaimed water upon the Lake; and

- prepare a water quality management plan.

The study is a one-year program consisting of water quality sampling and analysis. The Lake's water quality will be compared to the water quality of reclaimed water distributed by Eastern Municipal Water District. A water quality management plan will be prepared and should specify: (1) ways to maximize the Lake's water quality; (2) the feasibility of the proposed improvements; (3) a technical plan; and (4) a schedule with implementation milestones.

**Santa Ana River Mainstream Project**

Because of rapid growth and development in Orange, Riverside, and San Bernardino Counties, the current flood control system is inadequate to manage the runoff in these areas. The three counties are working collaboratively with the U.S. Army Corps of Engineers (Corps) to design and construct the Santa Ana River Mainstream project (Mainstream Project). The Mainstream Project will provide increased flood protection to communities within those counties, and will include specific environmental restoration projects.

The Mainstream Project will cover 75 miles from the Santa Ana River headwaters to its mouth. The project will provide the upper and lower Santa Ana River Basin various levels of flood protection ranging from a 100-year to 190-year flood flows.

The Corps will construct structural improvements including Seven Oaks Dam, Mill Creek Levee, San Timoteo Creek, Prado Dam, Oak Street Drain in Corona, 23 miles of the lower Santa Ana River, and Santiago Creek. Prado Dam and the spillway will be raised an additional thirty feet in height. Ninety-two acres of currently degraded marshland located within the Santa Ana River Salt Marsh will be restored increasing the marsh's value as a wetland habitat. In addition, a large portion of Santa Ana Canyon will be purchased and a resource, habitat, and floodplain management plan will be developed to ensure that that part of the Canyon will not undergo any landuse changes.

**Santa Ana River Total Inorganic Nitrogen/Total Organic Carbon**

Modeling work done for the update of the total dissolved solids and nitrogen management plans for the upper Santa Ana Basin (see Chapter 5) demonstrated the presence of a "nitrogen sink" in the Prado Basin. This sink effectively removes a major portion of the nitrate present in the Santa Ana River. In order to optimize this phenomenon, Orange County Water District and SAWPA have undertaken a study to evaluate the natural biochemical processes impacting total inorganic nitrogen (TIN) and total organic carbon (TOC) concentrations in the water as it flows through constructed wetlands. Based on the study's findings and conclusions, ways to enhance the natural processes to maximize total inorganic nitrogen removal will be recommended.

## Multipurpose Corridor

Eastern Municipal Water District is leading the conceptual development of a natural multipurpose corridor to be located within the San Jacinto River and Salt Creek riparian corridors. The multipurpose corridor would connect adjacent communities, as well as agricultural regions, wildlife habitats, and rural areas. A planning task force has endorsed the idea of establishing such a passageway. The task force is hoping the corridor will lead to other benefits such as the development of:

- A water resource management plan, including groundwater basin recharge and emergency storage, general water quality improvement, storm flow storage, and erosion and flood control;

- coordinated landuse planning, including parks, water conservation measures, recreational areas, buffer zones, shared utility easements, and cost-effective resource management; and

- enhancement of the local environment for both wildlife and people.

## Water Harvesting Demonstration Project

The development of demonstration water harvesting facilities within the San Jacinto watershed has been proposed by Eastern Municipal Water District (EMWD). The objective would be to capture surface water flows, consisting of rainfall runoff and stormwater discharges, which would normally flow unimpeded in the river. EMWD is considering this project because rapid urban development has decreased the amount of surface area available for percolation of rainfall and other runoff into the aquifers.

The District is interested in implementing the water capture plan to supplement their reclaimed water supplies. EMWD could use the harvested runoff directly for irrigation or site percolation ponds in locations where the groundwater basin would be recharged for domestic beneficial uses. Initiation of the program will entail a review of the physical and chemical properties of the runoff, hydrology, operational and maintenance controls of the reuse facilities, economics, compliance with the Basin Plan's water quality objectives, and permitting issues.

Several project locations were identified during a feasibility study and include existing storm drains, conveyance pipelines, and recharge facilities. Facilities currently under consideration are the Buena Vista and San Jacinto Retention Basins and the San Jacinto Reservoir. Conceptual projects include the Salt Creek and San Jacinto Northwest Improvement Plan, and the Lake Hemet Municipal Water District Cooperative Program.

### Multipurpose Wetlands

EMWD and the U.S. Bureau of Reclamation are cooperating in a Multipurpose Wetlands Research and Demonstration Study. The objective is to evaluate the effectiveness and feasibility of integrating constructed wetlands with conventional wastewater treatment facilities.

The agencies have constructed a wetlands research facility located on four acres of Hemet/San Jacinto Regional Water Reclamation Facility. It is being used to determine future design and operating criteria for demonstration wetlands at the Reclamation Facility and to refine the design and operating criteria for future EMWD wetlands projects.

EMWD is interested in the use of desalters to reclaim brackish groundwater for water supply or groundwater recharge purposes. A pilot study at the Wetlands Research Facility is being conducted to evaluate the feasibility of using the reject stream from the desalters in vegetated saline marshes. If they prove feasible, these marshes would provide wildlife habitat as well as additional use of brackish water.

A 20-to-30-acre demonstration project at the Reclamation Facility is expected to begin in the fall of 1993. It will include an integrated system of 5 separate wetlands treatment units, a combined open water and marsh habitat area, and a combined final polishing wetland. One of the objectives of this project is to evaluate the ability of a constructed wetland system to provide treatment of secondary wastewater which is equivalent to that of conventional tertiary treatment facilities, and to remove nitrogen and low levels of metals and organic compounds.

A 20-acre demonstration project at the San Jacinto Wildlife Area is also planned. The intent is to provide additional treatment of wastewater, while maximizing brooding habitat for a variety of birds.

## GROUNDWATERS

### Chino Basin Water Resources Management Study

The purpose of this study is to develop a comprehensive plan for water resources management in the Chino Basin. The objectives are to coordinate the management of imported and local water supplies, including wastewater, and to develop plans and projects which will maximize the use of these resources, assure reliable, good quality supplies, and protect or improve local water quality.

This study is being conducted by a consortium of agencies, including the Chino Basin Municipal Water District, SAWPA, the Metropolitan Water District of Southern California (MWD), the Chino Basin Watermaster (which represents municipal and agricultural water users in the Basin), and the Regional Board.

A significant feature of this study is the development of a new integrated ground and surface water model for the Chino Basin. The model is calibrated for both TDS and nitrogen. This model is much more detailed and refined than the Basin Planning Procedure (BPP) (see Chapter 5) and will supplant the use of the BPP in this area. The new model will be used to evaluate the water quality (and quantity) effects of alternative water resource management plans. These analyses will then be used to select a recommended plan.

The Chino Basin water resources management plan is expected to include the following: management of rising groundwater contributions to the Santa Ana River; use and protection of groundwater supplies; the expansion of wastewater reclamation; optimization of capture of local runoff for recharge purposes; and reduction of water demand through water conservation.

MWD has proposed a groundwater storage program in the Chino Basin, whereby State Water Project water would be recharged in the Basin for use during emergency, drought, and other conditions when the Project water is not available. As proposed, the recharge would occur directly, via spreading or injection of State Project Water, and indirectly, through exchange of Chino Basin groundwater for surface water delivered to local water supply agencies. The Chino Basin study will evaluate opportunities to increase seasonal storage and optimize local and imported water use.

In part because of the involvement and varied interests of so many parties, the development and implementation of the water resources management plan is likely to be very complex. The Regional Board's requirements must also be satisfied. Further, Chino Basin is adjudicated and the requirements of the adjudication must be met or modified, if all the parties agree to the management plan.

The results and recommendations of this study may lead to changes in the Basin Plan. Such changes would be accomplished through appropriate Basin Plan amendments.

**Colton-Riverside Basins Water Resources Management Plan**

Under the auspices of SAWPA, a project task force has been formed to develop a water resources conjunctive use plan for the Colton and Riverside groundwater subbasins. The task force members are:

- Western Municipal Water District
- San Bernardino Valley Municipal Water District
- Orange County Water District
- Eastern Municipal Water District
- Elsinore Valley Municipal Water District

- San Bernardino Valley Water Conservation District
- Yucaipa Valley Water District
- Jurupa Community Services District
- City of Riverside
- City of San Bernardino
- City of Colton
- City of Rialto
- SAWPA

Many other parties have interest in the development and implementation of the management plan, including the Regional Board, which is participating in the study in an advisory role.

The purpose of the plan is to integrate the management of imported water, wastewater, and stormwater in the two subbasins. The overall objective is to maximize the use of local water resources with equitable sharing of the costs among all parties, including water purveyors, regional water management agencies, and wastewater dischargers. The term “conjunctive use” refers to this coordinated management of water supply sources that the yield from these sources is greater than the sum of the yields resulting from independent management of the sources.

Some of the goals identified are to: restore the quality of the Colton and Riverside subbasins; ensure a reliable potable water supply; reduce dependence on imported water; maximize both the use of local groundwater and reuse of wastewater; minimize the cost of wastewater treatment; and redistribute base flow in the Santa Ana River to allow more capture of the flows by Orange County Water District.

Four projects, designated A, B, C, and D, have been identifies to accomplish these goals. Project A involves the improvement of wastewater quality discharged to the Santa Ana River through improvements at the Colton, Rialto, and San Bernardino wastewater treatment plants, and the construction of a pipeline to relocate the wastewater discharge points downstream of the Colton subbasin. Project B involves the production of high-TDS groundwater from the Riverside subbasin with the goal of creating capacity for recharge with higher quality water (such as stormwater, State Project water, and Bunker Hill subbasin groundwater) and seasonal storage of wastewater. Project C would improve groundwater quality in the Colton subbasin by pumping and export of groundwater and recharge with higher quality local runoff, State Project water, Bunker Hill groundwater, and San Bernardino wastewater. Recharge would be accomplished via run-of-river “T” levees. Project D is a Riverside subbasin restoration and water supply project. Groundwater would be extracted and high quality stormwaters, imported water, Bunker Hill groundwater, and reclaimed wastewater would be percolated in a system of “T” levees in the Santa Ana River. The mix of waters recharged would be controlled to produce a water

supply quality that is consistent with both drinking water standards and wastewater discharge limitations.

These projects will be considered and implemented in phases. Wastewater treatment plant improvements (Project A) are already in progress. As in the Chino Basin (see preceding discussion), the involvement and interests of the many parties is likely to make implementation complex. Water resources in this area are also adjudicated and, again, the requirements of the adjudication must be satisfied. The Regional Board's concerns and requirements must also be addressed.

The result of the Conjunctive Use study may lead to changes in this Basin Plan. For example, a revised regulatory strategy for wastewater discharges by San Bernardino, Colton, and Rialto may be found appropriate. Implementation of the identified projects may supplant the need for the Riverside-Colton desalter, which is included in the Recommended Plan (Alternative 5C). If appropriate, amendments to the Basin Plan can be made to incorporate such changes.

**Bunker Hill Basin Replenishment**

The Bunker Hill Basin is artificially recharged by several agencies. Surface stream diversions are made for groundwater replenishment by the Lytle Creek Water Association on Lytle Creek and by the San Bernardino Valley Water Conservation District on Santa Ana River and Mill Creek. The San Bernardino County Flood Control District has facilities on Devil Creek, Twin Creek, Waterman Creek, and Sand Creek which may be used for groundwater recharge. The surface diversion of the waters of Lytle Creek have occurred as early as 1872. Lytle Creek water rights, which include diversions for groundwater recharge, are now administered by the Lytle Creek Water Association for six parties, according to a 1924 judgement. The San Bernardino Valley Water Conservation District began recharging the Bunker Hill Basin with Santa Ana River water (through its predecessor) in 1911 while groundwater recharge on Mill Creek began in the 1890s and was taken over by the Conservation District in 1934. In excess of 1,000,000 acre feet of Santa Ana River and Mill Creek waters have been recharged to replenish the Bunker Hill Basin. In addition, the San Bernardino Valley Municipal Water District has imported State Project water for replenishment into the Bunker Hill Basin. Since 1972, in excess of 150,000 acre feet of imported State Project Water has been recharged in the Bunker Hill Basin. The replenishment activities of the above four agencies play an extremely important role in managing the Bunker Hill Basin to supply the current and future needs of the Basin.

**Hemet and San Jacinto Groundwater Basin Management Program**

The Hemet/San Jacinto Groundwater Association and Eastern Municipal Water District are in the process of developing a Groundwater Management Plan for the Hemet and San Jacinto basins. The Objective of the Management Plan is to

optimize use and management of the groundwater resources in the Hemet and San Jacinto groundwater subbasins through the cooperative efforts of an association of the major basin pumpers. Eastern Municipal Water District is cooperating with the Metropolitan water District of Southern California (MWD), the U.S. Geological Survey, UC Riverside and UC Los Angeles to collect water quality and quantity data, landuse information, and data on basin hydrogeology, and to develop appropriate planning tools. A Management Plan will be developed and will include plans or programs designed to maximize the groundwater resources and ensure future water supplies.

To protect the other subbasins in the San Jacinto watershed, including Perris, Menifee, Lakeview, Winchester, and San Jacinto Lower Pressure, Eastern Municipal Water District has initiated an Assembly Bill (AB) 3030 Groundwater Management Plan. AB 3030 was adopted by the California Legislature in 1992. AB 3030 amends Section 10750 ***et seq.*** of the Water Code to allow a local agency whose service area includes a groundwater basin that is not already subject to groundwater management pursuant to law or court order to adopt and implement a groundwater management plan. The program could include plans to mitigate overdraft conditions, control brackish water, and monitor and replenish groundwater.

**Hemet Groundwater Investigations**

Eastern Municipal Water District and the U.S. Geological Survey (USGS) are currently involved in a four-year investigation of the dynamics of nitrate and TDS movement in the unsaturated zone of the Hemet groundwater subbasin. The Study objectives are to define the thickness and extent of water-bearing materials and to determine the direction of groundwater flow, the chemical quality of groundwater, the flux of nitrate in the unsaturated zone, and the degree of mixing and vertical distribution of nitrate in the saturated zone. The USGS has completed a draft study and is scheduled to provide a final report by the end of 1993.

Eastern Municipal Water District and MWD are also contracting with UC Los Angeles to develop and Optimal Data Collection Design Strategy as a basin management planning tool for the Hemet Basin. Eastern Municipal Water District and MWD contracted with UC Riverside to perform geophysical investigations in order to delineate the bedrock of the Hemet Basin and to obtain information on the available water supply of the Basin.

**San Jacinto River Groundwater Recharge Program**

A groundwater recharge/storage program within the San Jacinto Basin has been developed by EMWD. A demonstration project was begun in October 1990 with cooperation from MWD and the Universities of California, Riverside, and Los Angeles. The objectives of the demonstration project were to evaluate the

infiltration rate, establish the impacts on basin hydrology and groundwater quality, and approximate the distribution of the recharged water.

The demonstration project used ponds located within the San Jacinto riverbed to recharge the aquifer with State Project Water for a three-year period. Interaction between the local groundwater and State Project Water was assessed by monitoring water quality conditions and levels from October 1990 through January 1991. It was concluded that the average percolation rate in these basins is 6.30 feet/day. The study has determined that imported water can be successfully stored seasonally.

**Green Acres Project**

Orange County Water District has obtained funding for the Green Acres project from the State Board. The Green Acres project uses reclaimed wastewater to extend local water supplies. Secondary effluent supplied by the County Sanitation Districts of Orange County is treated at the Green Acres facility site in Fountain Valley. The product water is provided to parks, greenbelts, nurseries, schoolyards, golf courses, and industrial sites within a five-mile radius of the plant. Phase I of the project provides 7.5 million gallons of water each day for those uses. The facility design allows for a second-phase expansion to 15 million gallons per day.

The Green Acres distribution system calls for over 25 miles of pipe ranging in diameter from 6 to 36 inches. The first reach of the pipeline will extend into the City of Fountain Valley. The distribution system will supply areas in Santa Ana, Costa Mesa, and eventually Huntington Beach and Newport Beach.

**Southern California Comprehensive Reclamation and Reuse Study**

In October 1991, SAWPA and several other local agencies became participants in the Southern California Comprehensive Reclamation and Reuse (“SOCAL”) Study. The project is a 6-year, $6 million effort which will be cost-shared 50 percent by the U.S. Bureau of Reclamation and 50 percent by local agencies. The region’s participants include SAWPA, Chino Basin Municipal Water District, Eastern Municipal Water District, Orange County Water District, San Bernardino Valley Municipal Water District, and Western Municipal Water District. The San Diego County Water Authority is a participant as well. The purpose of the study is to develop a long-range strategy for more effective integration of fresh and reclaimed water management programs, and to determine the feasibility of various water reclamation projects within Southern California.

The overall study, initiated on March 10, 1992, consists of two main phases with the first phase consisting of two parts. The first part, Phase 1a, will be the compilation and generation of baseline information. The intended objective of Phase 1a is to more clearly identify the potential for increasing the use of

reclaimed water throughout Southern California. When all data on reclaimed water supply and potential use is collected, possible reclamation project alternatives will be identified, including the possibility of transferring reclaimed water across jurisdictional lines.

Phase 1a will also include the development of screening criteria and tools of analysis necessary to identify and evaluate potential reclaimed water projects. Significant public involvement efforts will begin in Phase 1a and continue through the remainder of the study.

Phase 1a will conclude with the production of a report. The report will include: 1) a description and evaluation of those project alternatives that are considered likely to be feasible given the current and expected economic, environmental, and institutional conditions during the 20-year and 50-year planning horizons; 2) and economic distribution model to be used to further analyze the feasibility of those projects; and 3) a detailed scope of work for Phase 1b.

## COASTAL WATERS

### Southern California Coastal Water Research Project

As discussed in Chapter Six (Monitoring and Assessment), the Regional Board requires that waste dischargers conduct monitoring programs to evaluate the effects of their discharges on the receiving waters. In the Santa Ana Region, the most extensive self-monitoring program (approximately 2 million dollars per year) is carried out by the County Sanitation Districts of Orange County (CSDOC), which discharges about 240 MGD of wastewater to the Pacific Ocean via a 5-mile outfall.

Other ocean dischargers, such as the Southern California Edison's Huntington Beach Generating Station, conduct receiving water monitoring programs, though these are considerably less extensive than that prescribed for CSDOC.

It has been recognized for some time, however, that these individual discharger efforts, despite their intensity and sophistication, are not in themselves sufficient to obtain an accurate and complete picture of the impacts of ocean discharges. A broader, regional perspective is necessary to evaluate the cumulative effects and interactions of all inputs to the coastal waters from both point and nonpoint sources.

Towards that end, the Southern California Coastal Water Research Project (SCCWRP) was established in 1969 by a consortium of waste dischargers. SCCWRP conducts a wide variety of chemical, physical, and biological investigations of the open coastal waters from San Diego to Ventura, and area commonly called the Southern California Bight. SCCWRP's mission is to understand the effects of urban wastes on the marine environment. Annual reports describe the specific research projects conducted to characterize the

sources, fates, and effects of anthropogenic pollution on marine water quality, biota, and sediments.

The organization of the SCCWRP administration was recently revised. The SCCWRP Commission, which provides direction on regional monitoring needs and priorities, now includes staff representatives from the Los Angeles, Santa Ana, and San Diego Regional Boards, the State Board and US EPA, as well as the Sanitation Districts of Orange and Los Angeles Counties and the cities of Los Angeles and San Diego.

**Huntington Beach**

The City of Huntington Beach coordinates the Huntington Beach Waterways and Beaches Committee, a public outreach task force engaged in tracking agency activities in the Huntington Beach area. The public at large is invited to the meetings in which staff from the City Council, Orange County (Environmental Management Agency, Health Care Agency, and Flood Control District), the U.S. Naval Weapons Station at Seal Beach, and Regional Board staff participate. Reports are given to update the activities and studies in which the above agencies are involved. One of the Committee's major concerns is water quality. The Committee is actively involved in public education and efforts to ensure compliance with holding tank requirements.

**Newport Bay Watershed**

Water quality problems in Newport Bay and its watershed and the activities in progress to address them are described briefly in Chapter 5 and, in more detail, in reports prepared in response to Senate Concurrent Resolutions (SCR) 38 and 88. Both SCR reports identify a plan for future action by the agencies and parties with responsibilities and interests related to water quality in the watershed. A major them of these reports is the need for continued interagency coordination to implement these action plans.

Towards this end, the Newport Bay Coordinating Council was formed. It includes representatives from the Regional Board, the Environmental Management and Health Care Agencies of Orange County, Senator Marian Bergeson's office, City of Newport Beach, Newport Harbor Quality Committee, California Department of Fish and Game, U.S. Army Corps of Engineers (Corps), Irvine Company, and various Newport Bay community action groups. The Council provides a forum for the exchange of information on and coordination of activities related to the Bay, from grass roots debris cleanups to the possible Corps dredging in the Upper Bay. The Council also sponsors public education and outreach programs.

Many of the representatives on the Coordinating Council are also members of the City of Newport Beach Harbor Quality Committee. The City of Newport Beach Parks and Recreation and Marine Departments are participants as well. This committee has been involved in many projects to educate the public on ways Newport Harbor water quality can be better protected. It has sponsored excellent outreach projects, such as the Baywatchers Program, and has distributed informational brochures identifying simple pollution prevention practices. The Committee assisted in the development of a pamphlet showing the locations of vessel pumpout stations in the Bay and was instrumental in the adoption of a city ordinance regarding vessel waste management for charter and tour boats. The Committee's action also led to a ban on the use of endosulfan in the Newport Bay watershed.

## FUNDING PROGRAMS

### Grant Programs

Clean Water Act §205(j) Water Quality Planning Grant Program

Section 205(j) of the federal Clean Water Act (CWA) allows each state to reserve up to one percent of its annual Clean Water Construction Grant allotment for water quality management and planning. In addition, Congress has provided funding under Section 604(b), State Revolving Fund Set Aside. Any interstate, regional or local public agency may apply directly to the State Water Resources Control Board for funding. As funds are available, State agencies and publicly-funded educational institutions may also apply.

Generally, the State Board requests a workplan on the project be submitted one year prior to the project's actual start date, due to the period of delay between submittal of the proposal and receipt of federal funding. The State Board notifies interested parties through a Request for Workplans notice. Currently, the workplans are evaluated and ranked according to specific criteria. The criteria include:

- Resource value of the waterbody
- Condition rating of the waterbody
- Whether/how water quality is addressed
- Feasibility of the workplan proposal
- Benefits expected from the work
- Cost of the work

- Applicant's Institutional/financial commitment to implement work products

- Applicant's capability to carry out workplan

The resource value and condition ratings have been calculated and usually are identified in the Water Quality Assessment factsheets. In all cases, there is a minimum 25 percent local funds match requirement for all 205(j)(2) funded projects. The match is calculated on the basis of the total project cost.

Clean Water Act §319 Nonpoint Source (NPS) Grant Program

The Clean Water Act (CWA) Section 319(h) provides grant funds for projects directed at the management of nonpoint source pollution. In California, the State Board determines which project receives Section 319 funds, with input from the Regional Boards. The amount of funds available is dependent upon Congressional Appropriations and therefore varies each year.

The State Board has placed highest priority on projects which implement specified nonpoint source management practices under Section 319 requirements. The State Board must also commit to address nonpoint source waters listed pursuant to CWA section 303(d) (water quality limited segments), and to the protection of high quality waters.

For fiscal Year (FY) 1994, the nonpoint source funds are to be used for the implementation of watershed management plans or strategies that will lead to coordinated water management, or for the demonstration of specific practices considered part of a watershed management effort.

Activities which reduce, eliminate, and/or prevent NPS pollution are eligible projects. The agencies eligible to receive Section 319 funds are those with the demonstrated authority to require implementation of the project (***e.g.***, Resource Conservation Districts). Examples of specific activities eligible for Section 319 funds include the demonstration of best management practices (BMPs) for agricultural drainage, acid mine drainage, acid mine drainage, channel erosion, hydrologic modification, groundwater protection, pollution prevention, and septic systems.

Generally, the State Board requests that a workplan on the project be submitted one year prior to the projects actual start date, due to the period of delay between submittal of the proposal and receipt of federal funding. The State Board notifies interested parties of the availability of finds through a Request for Workplans notice. The workplans are then evaluated and ranked according to specific criteria. The applicant is required to match the grant funds with a 40 percent nonfederal match. The State Board's NPS Program staff should be contacted to get other specific guidance on this grant.

Clean Water Act §314 Clean Lakes Grant Program

The Clean Lakes Program grant is similar to the CWA 205(j) program, but is specified under CWA section 314. Under the Clean Lakes Program, the US EPA, through the State Board, provides assistance in two phases. Phase I awards up to $100,000 per project for diagnostic feasibility studies and requires a 30 percent non-federal match. These studies must be completed in three years. The Phase II awards have no funding cap, but they require a 50 percent non-federal match. These funds are available to support implementation of pollution control and/or in-lake restoration methods and procedures, including final engineering design. These projects must be completed in four years.

Funding is also available for Lake Water Quality Assessment projects, which are projects intended to achieve any needed lake monitoring and assessment which would not otherwise be done. These grants require a fifty percent non-federal match.

All State and local agencies can participate in the 314 Program. Only projects dealing with publicly-owned lakes are eligible for funding. The lake must also be prioritized for remediation by the State, which is demonstrated by placement on the 314 list of impacted water bodies in the Water Quality Assessment.

Currently, procedures require State Board staff to evaluate the proposed projects and draft a project priority list to be brought before the State Board. The State Board adopts and submits the list to the US EPA, which determines the final priority projects for funding.

Small Communities Grant Program

The 1987 amendments to the CWA terminated the federal Clean Water Grant Program but provided for the use of federal funds to capitalize State Revolving Fund (SRF) loan programs (see SRF discussion below). California voters recognized that many small communities would not be able to afford the higher costs of the SRF Program and passed the Clean Water and Water Reclamation Bond Law of 1988. The Clean Water Bond Law contains 25 million dollars in State grant assistance for small communities. The program defines a small community as less than 3,500 people. No grant under this program can exceed 2 million dollars. The Law also states that the State Board may make grants on a sliding scale based on a community's ability to pay.

The Small Communities Grant (SCG) Program provides only the funds to make a wastewater treatment project affordable. It is assumed that a community can afford to spend a certain percentage of its Median Household Income (MHI) calculated, the higher the percentage the community can afford to spend for wastewater facilities. If a community's treatment costs exceeds what the program assumes is affordable, the SCG Program will provide up to 2 million dollars to reduce the costs to make the project more affordable.

A community can receive a SCG for up to 97.5 percent of the allowable project costs and is also eligible to apply to any other State or federal agency to fund the local share of the project costs. A low interest loan from the SRF Program may be obtained, for example, if the project is on the SRF Loan Priority List. If funding is not available for the local share from any source at a reasonable cost, the community may apply for a low interest loan from the Water Quality Control Fund. The combined assistance can not exceed 100 percent of the total project costs.

There are many requirements to receive a SCG. Briefly, the project must be submitted to the Regional Board for placement on a Regional Board SCG Priority List. The project is classified according to the need for a sewage treatment facility. The Regional Board SCG lists are compiled for State Board adoption and further prioritized according to several criteria. There are other restrictions and specific provisions a grantee must satisfy, as specified in guidelines provided by the State Board.

The State Board may use a portion of the SCG to fund pollution study grants. The SCG Program will fund up to 97.5 percent of the eligible costs for an approved pollution study. The objective of the study must be to document the existence of an actual or potential public health or water quality problem.

## Loan Programs

State Revolving Fund (SRF) Loan Program

The SRF Loan Program provides funding for construction of publicly-owned treatment works (POTWs), for nonpoint source correction programs and projects, and for the development and implementation of estuary conservation and management programs. Water reclamation projects are also eligible for SRF funding. The loan interest rate is set at one-half the rate of the most recent sale of a State general obligation bond.

Proposed projects must be submitted to the Regional Board for placement on a Regional Board SRF Priority List. Projects are classified and ranked according to several criteria, including documented health problems, conformance with applicable Water Quality Control Plans, and/or compliance with waste discharge requirements. The Executive Officer can directly submit the list to the State Board. The State Board adopts the Statewide Priority List, after which the funds are available on a first-come, first-served basis.

There are other restrictions and specific provisions which the SRF prioritized projects must satisfy; the State Board's Clean Water Program staff should be contacted for a copy of the guidelines.

Agricultural Drainage Water Management Loan Program (ADLP)

The State Agricultural Drainage Water Management Loan Program is funded with a $75 million bond fund. The program funds are available for feasibility studies and the design and construction of agricultural drainage water management projects. The interest rate is set at one-halt the rate of the most recent sale of a general obligation bond. The loan term is not to exceed 20 years. The loan limitations are $20 million for any one project and $100,000 dollars for each feasibility study.

Only local agencies can apply for this loan. The project must remove, reduce, or mitigate pollution from agricultural drainage. The specific types of projects funded include agricultural drainage projects such as evaporation ponds and deep injection wells, selenium removal project, cleanup of groundwater contaminated form agricultural practices, and agroforestry projects. In this region, projects which have acquired ADLP funds include SAWPA's Arlington Desalter and the Chino Basin West Desalter.

The loan application is obtained from the State Board's Division of Water Quality. The completed loan application is submitted with the project planning documents. Upon completion of the loan contract, the applicant submits the final plans and specifications for the project.

Water Reclamation Loan Program

This program makes available low-interest loans for the design and construction of water reclamation projects. The objective of this program is to meet a portion of the future water needs for California through the use of reclaimed water. Projects funded must be cost-effective compared to the development of new sources of water or alternative new freshwater supplies.

As of July 1, 1989, $33 million were available for use only by local public agencies. The funds are augmented annually by loan repayments. The loan interest rate is set at one-half the rate of the most recent sale of the State general obligation bond. The loan term may not exceed 20 years, with up to $5 million available for any one project. Eligible projects include the wastewater treatment facilities necessary to produce water for beneficial reuse, as well as reclaimed water storage and distribution systems. Only that capacity of wastewater which can be used within five years of the completion of construction is eligible.

A loan application package may be obtained from the State Board's Office of Water Recycling. The completed application is submitted with the project planning documents. Projects with complete application packages are funded on a first-come, first-served basis.

Water Quality Control Fund (WQCF) Loan Program

The WQCF Loan Program is a special set-aside intended only for the construction of wastewater treatment facilities or for wastewater reclamation loan feasibility studies. Approximately 6 million dollars are available with the interest

rate set at one-half the average rate paid by the State on general obligation bonds sold in the preceding year.

This program's eligibility requirements state that the applicant must hold a local election with a simple majority approving the application for the loan. In addition, the applicant must demonstrate that: 1) revenue or general obligation bonds cannot be sold; 2) financial hardship exists; and 3) local funding is not available.

The State Board's Division of Clean Water Programs is the contact for a loan application. The application is submitted with the documents which demonstrate financial hardship, lack of the local share, and the election results.

## TABLE OF CONTENTS - cont.

Chapter Contents — Page No.

Chapter 6 – Monitoring and Assessment
- Introduction ..... 6-1
- State Monitoring Programs ..... 6-1
  - Inland Surface Waters Toxicity Testing Program ..... 6-2
  - Toxic Substances Monitoring Program ..... 6-3
  - State Mussel Watch Program ..... 6-4
- Regional Monitoring Programs ..... 6-5
  - Surface Water Monitoring ..... 6-5
  - Groundwater Monitoring ..... 6-6
  - Compliance Monitoring ..... 6-6
  - Complaint Investigations ..... 6-17
  - Intensive Surveys ..... 6-17
  - Aerial Surveillance ..... 6-18
  - Municipal Stormwater Monitoring ..... 6-18
- Quality Assurance / Quality Control ..... 6-19
- Assessment Programs ..... 6-16
  - Water Quality Assessment ..... 6-20
  - Clean Water Strategy ..... 6-21
  - 305 (b) ..... 6-22
- Data Management ..... 6-22
  - Regional Modeling Efforts ..... 6-22
  - Regional Databases ..... 6-23

Chapter 7 - WATER RESOURCES AND WATER QUALITY MANAGEMENT

- Introduction ..... 7-1
- Santa Ana Watershed Project Authority ..... 7-1
- National Watershed Research Institute ..... 7-2
- Inland Surface Waters ..... 7-3
  - Big Bear Watershed ..... 7-3
  - Lake Elsinore ..... 7-4
  - Santa Ana River Mainstem Project ..... 7-5
  - Santa Ana River TIN/TOC ..... 7-5
  - Multipurpose Corridor ..... 7-6
  - Water Harvesting Demonstration Project ..... 7-4
  - Multipurpose Wetlands ..... 7-7
  - Groundwaters ..... 7-7
    - Chino Basin Water Resources Management Study ..... 7-7
    - Colton-Riverside Basins Water Resources Management Plan ..... 7-8

# One Water One Watershed 2.0 Plan

## Santa Ana River Watershed

## Moving into Implementation

SAWPA

**FINAL**

# Table of Contents

**Executive Summary**

**Chapter 1.0: One Water One Watershed Program**
1.1 Overview
1.2 OWOW 1.0 Plan – Moving Toward Sustainability
1.3 OWOW 2.0 Plan – Moving Into Implementation
1.4 Relation to Local Water Planning

**Chapter 2.0: Governance, Outreach, and Integration**
2.1 Governance Structure
2.2 Stakeholder Involvement and Outreach
2.3 Collaboration, Coordination and Integration

**Chapter 3.0: Watershed Setting**

**Chapter 4.0: Regional Goals and Objectives**
4.1 Vision
4.2 Goals and Objectives
4.3 Planning Targets

**Chapter 5.0: Water Management Strategies and Integration**
5.1 Introduction
5.2 California Water Plan Resource Management Strategies
5.3 Preliminary Integration and Systems Approach
5.4 Water Resource Optimization
5.5 Beneficial Use Assurance
5.5.1 Brine Line to the Salton Sea
5.6 Water Use Efficiency
5.7 Land Use and Water Planning
5.8 Stormwater: Resource and Risk Management
5.9 Natural Resources Stewardship
5.10 Operational Efficiency and Water Transfers
5.11 Disadvantaged and Tribal Community
5.12 Government Alliance
5.13 Energy and Environmental Impact Response
5.14 Integration and Implementation

**Chapter 6.0: Project/Program Review, Evaluation and Prioritization**

**Chapter 7.0: Impacts and Benefits of Sustainable Integrated Solutions**

**Chapter 8.0: Finance**

**Chapter 9.0: Data Management and Plan Performance/Monitoring**

# List of Figures

**Chapter 2.1 Governance Structure**

# Executive Summary

The Santa Ana River Watershed faces enormous challenges as it strives to adapt to changing conditions, many of which are at an unprecedented scale in its modern history. The watershed's population, already one of the most densely populated in the State, continues to grow and urbanize, increasing demands on water supply, water quality, and flood management. Even with its plentiful groundwater resources, several basins now are experiencing declining groundwater levels and overdraft conditions. With the uncertainties of climate change and its impacts, environmental concerns are taking even greater precedence than they ever have in the past, affecting how we manage water for the future.

Most agree that the water management approaches of the past several decades are no longer sustainable in today's environment and economic climate. And most agree that a more integrated and collaborative approach to water resource management will show tremendous promise to water resources everywhere. But in the Santa Ana River Watershed, this approach is not new; it has been our practice and legacy since the first integrated plan was approved by the Santa Ana Watershed Project Authority (SAWPA) Commission in 1998.

In a nutshell, the goal of yesteryear was affordable water for a growing economy. But over time, the goal has changed to become a more complicated balancing act of environmental sustainability, quality of life and, economic growth in a changing environment dominated by water and financial scarcity. The strategy to achieve this goal is integrated water management. This means the various silos of water supply, flood management, water quality, ecosystem restoration, and recreation are brought together as one. Another way to think about it is that while the drop of water may at different times be characterized by different elements, it is still the same drop of water.

The benefits of this approach are better coordination across functions that are often managed separately and across a broader geographic scale larger than the boundaries of individual agencies. Through integration at the watershed scale, economic and environmental performance is more effectively balanced. This water resource planning approach based on a watershed basis has even been recognized by independent review, objective and nonpartisan research organizations such as the Public Policy Institute of California, which cited SAWPA as an excellent example of integrated water management in the State.

> SAWPA 's approach – coordination, cooperation, and integration of water agencies to pool resources and manage water at the basin scale-is one of California's best models for integrated water management.
>
> *Public Policy Institute of California 2011 "Managing California's Water – From Conflict to Reconciliation"*

The Santa Ana River Watershed continues to progress with many "bright spots" and pilot projects accomplished to date. The use of sophisticated "big data" analytics continues to set us apart, resulting in a more robust watershed and a very competitive position to compete for State and Federal funds.

The "One Water One Watershed" (OWOW) 2.0 Plan is the Santa Ana River Watershed's integrated regional water management (IRWM) plan. This plan reflects a collaborative planning process that addresses all aspects of water resources in a region or watershed, in our case. It includes planning of future water demands and supplies over a 20-year time horizon within the watershed as a hydrologic and interconnected system. The plan represents collaboration across jurisdictions, and political boundaries involving multiple agencies, stakeholders, individuals, and groups; and attempts to address the issues and differing perspectives of all the entities involved through mutually beneficial solutions. The plan reflects a new suite of innovative approaches that instead of relying solely on continued imported water deliveries to meet growing water demands in the region, is leading with a water demand reduction strategy. These approaches include the following:

- Multi-beneficial projects and programs that are linked together for improved synergy
- Proactive innovative, and sustainable solutions
- Integrated regional solutions supporting local reliability and local prioritization
- Watershed based project and programs that effectively leverage limited resources, promote trust and produce a greater bang for the buck
- Integrates water supply, water quality, recycled water, stormwater management, water use efficiency, land use, energy, climate change, habitat, and disadvantaged communities and tribes
- Coordinates resources so that water is used multiple times
    - Manages stormwater for drinking water
    - Treats wastewater for irrigation and groundwater replenishment
    - Builds or modifies parks to support water efficiency, ecosystem habitat, and stormwater capture
    - Improves water quality pollution prevention
    - Addresses energy and water nexus

The OWOW 2.0 Plan was funded by the SAWPA member agencies with grant funding assistance from the California Department of Water Resources (DWR) through the Proposition 84 IRWM Planning Grant program, and a funding partnership from the U.S. Bureau of Reclamation (Reclamation) through their Basin Studies program. Work with Reclamation, the State, local and non-profit organizations provided the OWOW 2.0 Plan with the necessary resources to expand outreach and support that ultimately will create more cost effective integrated water resource management solutions.

In the final analysis, the prescription for success is clear; we need to "double down" on integrated water management, strengthen the alignment among all government agencies, and invest in innovation and infrastructure. For the Santa Ana River Watershed, the road map for this success is our IRWM plan known as the OWOW Plan.

The emphasis of this new OWOW 2.0 Plan is that all people are encouraged to adopt a water ethic that focuses on understanding where their water comes from, how much they use of it, what they put into water, and where it goes after they finish using it. To meet growing water demands in the region, a new suite of approaches to planning are needed now that lead with a water demand reduction strategy.

## Analysis and Support Tools

To support implementation of the OWOW 2.0 Plan, SAWPA in conjunction with its funding partners, conducted research and analyses on climate change impacts to the watershed, and developed a variety of new computer support tools to support our modern water management goals. Under this Plan, new resource tools and analyses were developed to help water resource managers adapt to changing climate conditions, support project proponents in better integrated solutions, assist analysis of watershed performance over time, and provide the public better access to water quality for beneficial use.

Through the work of Reclamation, an interactive climate change modeling tool was developed to provide water planners with information on potential impacts of climate change within the Santa Ana River Watershed. This tool provides a simplified modeling framework for evaluating climate change impacts, as well as mitigation/adaptation alternatives. The climate change tool enables the user to explore, identify, and download custom climate change data for various scenarios modeled for the Santa Ana River Watershed**.** Some of the results of the climate change analysis for the watershed that address common public concerns are as follows:

*Will surface water supply decrease?*

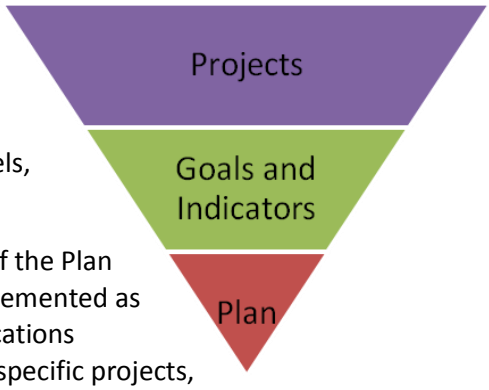
- Annual surface water is likely to decrease over future periods.
- Precipitation is projected to show long-term slightly decreasing trends.
- Temperature is projected to increase, which will likely cause increased water demand and reservoir evaporation.
- Snow melt water runoff is projected to decrease.

*Will I still be able to go skiing at Big Bear Mountain Resorts?*

- The projected warmer temperatures would result in a delayed onset and shortened ski season. Both

Big Bear Mountain Resorts lie below 3,000 meters and are projected to experience declining snowpack that could exceed 70% by 2070.

*How many more days over 95°F are expected in Anaheim, Riverside, and Big Bear City?*



- By 2070, it is projected that the number of days above 95°F will quadruple in Anaheim (4 to 16 days) and nearly double in River*side* (43 to 82 days). The number of days above 95°F at Big Bear City is projected to increase from zero days historically to four days in 2070.

Another powerful tool that Reclamation developed under the OWOW 2.0 Plan is an interactive green house gas (GHG) modeling tool to provide water planners and the public about the impacts of GHG within the Santa Ana River Watershed. This tool enables the user to explore, identify and download custom GHG data for a suite of water technologies modeled for the Santa Ana River Watershed. It also will exhibit energy consumption in the delivery and treatment process with relation to water. In accordance with AB – 32, which requires regions to reduce their overall GHG emissions, the tool also evaluates both water supply and demand in the Santa Ana River Watershed. This tool will prove to be very useful within the watershed because it allows users to calculate different scenarios, which can be used to compare each outcome and result. Further, the tool can be adapted to individual projects and is anticipated for use in future GHG emissions calculations by project proponents.

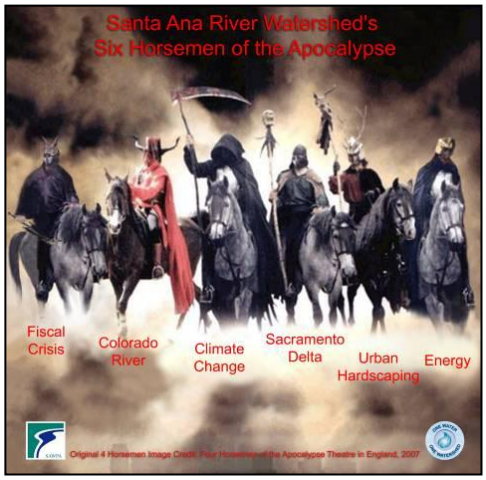
### *Santa Ana River Watershed Water Quality Tools*

SAWPA, partnering with the Santa Ana Regional Water Quality Control Board and local stakeholders, has developed a suite of tools to provide water planners and the public access to water quality information relating to designated beneficial uses, water quality objectives, and water quality data for water bodies and waterways within the Santa Ana River Watershed.

### *Watershed Assessment Tool, Plan Performance and Monitoring*

In order to track progress, SAWPA has developed a system to monitor the implementation of the OWOW Plan and projects implemented under OWOW. The monitoring takes place at two levels, the plan level and project level, to:

- Ensure progress is being made toward meeting objectives of the Plan
- Ensure specific projects identified in the Plan are being implemented as planned in terms of schedule, budget, and technical specifications
- Identify potential necessary modifications to the Plan or to specific projects, to more efficiently and effectively accomplish the goals and objectives of the Plan
- Provide transparency and accountability regarding the disbursement and use of funds for project implementation



To tie the plan and project monitoring together, SAWPA recognized the need for an interface process of measuring progress on meeting the goals and objectives, as well as the health of the Santa Ana River Watershed. SAWPA engaged the services of the Council for Watershed Health, a nonprofit organization, and Dr. Fraser Shilling of the University of California, Davis to develop a watershed assessment framework for the Santa Ana River Watershed. The Council and Dr. Shilling worked with the OWOW Pillars, workgroups of experts and stakeholders organized generally based on water resource management strategies, to update the watershed management goals, establish planning targets, and

utilize data indicators from existing datasets to track progress. With the input of SAWPA staff, a new tracking computer tool was created, incorporating this work that will allow managers to evaluate and assess progress, and assure actionable results for implementation.

## Vision, Mission and Challenges

Under OWOW 1.0, the vision for the watershed was developed and continues under the OWOW 2.0 Plan as follows:

1. A watershed that is sustainable, drought-proofed and salt-balanced by 2035, and in which water resources are protected and water is used efficiently
2. A watershed that supports economic and environmental viability
3. A watershed that is adaptable to climate change
4. A watershed in which environmental justice deficiencies are corrected
5. A watershed in which the natural hydrology is protected, restored, and enhanced
6. A water ethic is created at the institutional and personal level

The mission of the OWOW Plan is to create opportunities for smarter collaboration to find sustainable watershed-wide solutions among diverse stakeholders from throughout the watershed. Clinging to the path of yesteryear will place us at greater risk of producing results with limited impact and unintended consequences. Our 21st Century plan creates a blueprint for more effective water resource management by using data and tools to keep us better informed and allowing us to be more productive in using less energy and producing less GHG emissions.

To achieve this vision and mission, stakeholders must address four major threats, which we have dubbed the Four Horsemen of the Apocalypse: 1) Climate Change resulting in reduced water supplies combined with increased water needs in the region; 2) Colorado River Drought Conditions resulting in pressures on imported supply due to upper basin entitlements and continued long-term drought; 3) San Joaquin-Bay Delta Vulnerability resulting in loss of supply due to catastrophic levee failure or changing management practices of the Delta; and 4) Population Growth and Development resulting in interruptions in hydrology and groundwater recharge while increasing water needs.

To implement OWOW 2.0 and adjust to current affairs, SAWPA and stakeholders needed to adapt to address the new challenges, the Energy and Fiscal Crises. The Four Horsemen of the Apocalypse herd has grown to six. The Fiscal Crisis reflects the impacts of the Great Recession commonly marked by a global economic decline that began in December 2007, and took a particularly sharp downward turn in September 2008. Some say the epicenter was the Inland Empire. By late 2013, the recession remains a part of our lives resulting in far fewer State and Federal funds, and State bond funding being deferred each year as the realization that they would not likely be supported by the California electorate.

Recent energy developments such as the closure of the San Onofre Nuclear Generating Station, have forced us to recognize the water-energy nexus and the need to address our energy needs and escalating costs for delivering energy. Energy costs can be reduced by water agencies through energy efficiency measures, while teaching the public that water conservation equates to energy conservation and thus money saved.

## Goals, Objectives, Targets and Indicators

As previously stated, in order to achieve the watershed's vision, the Pillars worked with the Council of Watershed Health on updating the goals and objectives for the OWOW 2.0 Plan as part of the new watershed assessment framework.

The Pillars and the Council selected five areas: water supply, hydrology, open spaces, beneficial uses, and effective and efficient management. Using these newly defined goals and objectives, an assessment process was established that will assure actionable results for implementation.

Thereafter, the new goals and objectives were shared with the Steering Committee for their acceptance. Planning targets within the watershed along with data indicators were developed to track progress and allow measurement of the extent to which the plan objectives are being met. To achieve the updated goals and objectives, resource and broad management strategies were investigated through work of the Pillars. Quantifiable planning targets were developed in conjunction with the 20-year planning horizon of Year 2035.

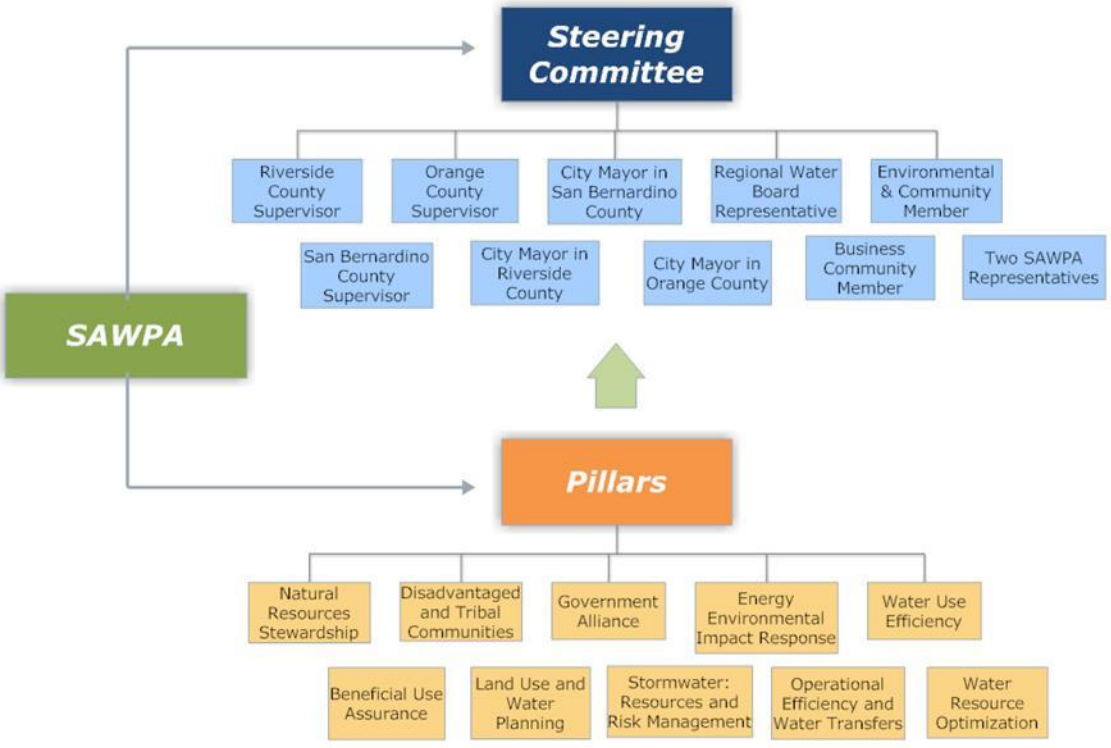
| Goals | Objectives |
|---|---|
| Maintain reliable and resilient water supplies and reduce dependency on imported water | •Decrease water demand<br>•Increase water-use efficiency<br>•Increase use of rainfall and snowpack as a resource<br>•Increase use of recycled water<br>•Sustainably develop local water resources<br>•Maintain sufficient storage to overcome multi-year (3 year) drought over a ten year hydrologic cycle<br>•Reduce green-house-gas emissions and energy consumption from water resource management |
| Manage at the watershed scale for preservation and enhancement of the natural hydrology to benefit human and natural communities | •Preserve and restore hydrologic function of forested and other lands<br>•Preserve and restore hydrogeomorphic function of streams and water bodies<br>•Safely co-manage flood protection and water conservation<br>•Include ecosystem function in new development planning and construction |
| Preserve and enhance the ecosystem services provided by open space and habitat within the watershed | •Increase the capacity of open space to provide recreational opportunities without degrading its quality or increasing its consumption of water & energy<br>•Protect existing and restore native habitats<br>•Protect and maintain healthy forests<br>•Manage aquatic and riparian invasive species<br>•Protect estuarine and marine near-shore habitats<br>•Reduce ornamental irrigated landscapes<br>•Improve management support for landscaping that utilizes native and drought tolerant vegetation<br>•Protect and Restore wildlife corridors<br>•Protect endangered and threatened species and species of special concern through improved habitat |
| Protect beneficial uses to ensure high quality water for human and natural communities | •Attain water quality standards in fresh and marine environments to meet designated beneficial uses<br>•Protect and improve source water quality<br>•Achieve and maintain salt balance in the watershed |
| Accomplish effective, equitable and collaborative integrated watershed management | •Improve regional integration and coordination<br>•Ensure high quality water for all users<br>•Balance quality of life and social, environmental and economic impacts when implementing projects<br>•Maintain quality of life<br>•Provide economically effective solutions<br>•Engage with disadvantaged communities to eliminate environmental injustices<br>•Engage with Native American tribes to ensure equity<br>•Reduce conflict between water resources and protection of endangered species |

The targets and indicators are listed in Chapter 4.3, Planning Targets.

| Goals | Performance Targets for 2035 |
|---|---|
| Maintain reliable and resilient water supplies and reduce dependency on imported water | •Conserve an additional 256,500 AFY of water through water use efficiency and conservation measures<br>•Create 58,000 AFY using a combination of additional wells, treatment, conjunctive use storage and desalination of brackish groundwater<br>•Increase production of recycled water by 157,000 AFY<br>•Increase both centralized and distributed stormwater capture and recharge by 132,000 AFY<br>•Develop 54,000 AFY of ocean water desalination |
| Manage at the watershed scale for preservation and enhancement of the natural hydrology to benefit human and natural communities | •Reduce flood risk in 700 acres using integrated flood management approaches.<br>•Remove 500,000 cubic yards of sediment from debris basins and reservoirs |
| Preserve and enhance the ecosystem services provided by open space and habitat within the watershed | •Preserve or restore 3,500 acres of terrestrial aquatic habitat<br>•Construct 39.5 miles of additional Santa Ana River Trail and Parkway |
| Protect beneficial uses to ensure high quality water for human and natural communities | • Reduce non-point source pollution by treating an additional 35 MGD of surface and stormwater flow, emphasizing higher priority TMDL areas<br>• Remove an additional 25,000 tons of salt per year from the watershed |
| Accomplish effective, equitable and collaborative integrated watershed management | •Engage with 50% (approximately 35) Disadvantaged Communities within the watershed<br>•Engage with 100% of the Non-Federally Recognized Tribes in the watershed |

## OWOW Planning Process

SAWPA officially launched its OWOW 2.0 planning effort on April 20, 2011, with the signing ceremony of the agreement with Reclamation. The work commenced in earnest with the first meeting with the Pillar Co-chairs. Regular workshops throughout the watershed were held with more than 100 agencies and non-profit organizations spanning Riverside, San Bernardino, and Orange counties. From the very beginning, the process has been open to and has received the participation of representatives from all



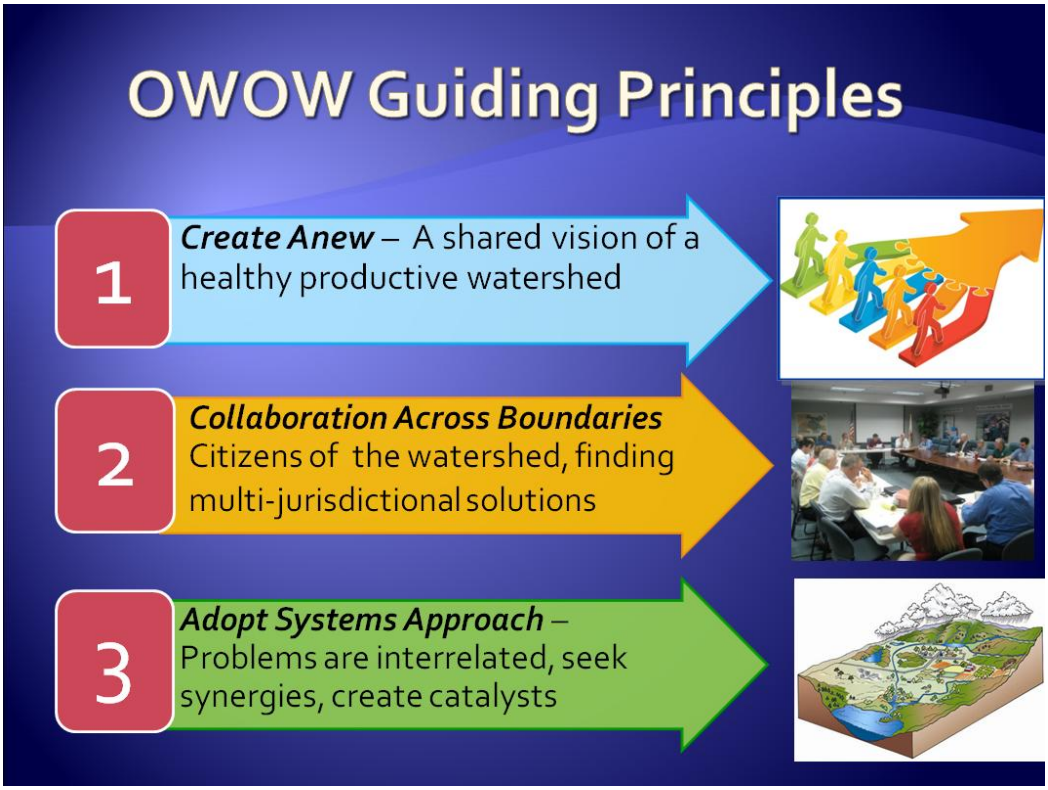
geographic regions and political jurisdictions within the watershed, and from diverse representatives of different sectors of the community (governments, water agencies, the development and environmental community, and the public).

As with the OWOW 1.0 Plan development, the OWOW 2.0 Plan utilized a "bottom up" approach for governance and involvement. Every effort was made to encourage the development of a shared vision and the involvement and participation of all watershed stakeholders in key discussions of major water resource issues, concerns, problems, goals, and objectives, with a particular focus on supporting multi-beneficial system-wide implementation. By expanding the involvement and collaboration to the *on-the-ground* level, greater buy-in and support were realized for this planning development process.

## OWOW 2.0 Governance

As with OWOW 1.0, the OWOW 2.0 Plan is led by an 11-member Steering Committee composed of elected officials from counties and cities in the watershed, representatives from the environmental, regulatory, and business communities, and representatives from SAWPA.

The Steering Committee's role is to serve as the developer of integrated regional water management goals and objectives for the watershed, and to act as the oversight body that performs strategic decision making, crafts and adopts programmatic suites of project recommendations, and provides program advocacy necessary to optimize water resource protection for all.



The Steering Committee is supported by technical experts assembled into ten groupings (known as Pillars), generally aligned along major water resource management strategies, but renamed under the OWOW 2.0 Plan to reflect greater integration and synergy.

While SAWPA facilitates the planning process and provides technical input and support through its staff and consultants, the development of the goals and strategies of the Plan, as well as the decision making process, are under the purview of the Steering Committee and the SAWPA Commission, with support of the Pillars and with consideration to comments from the public.

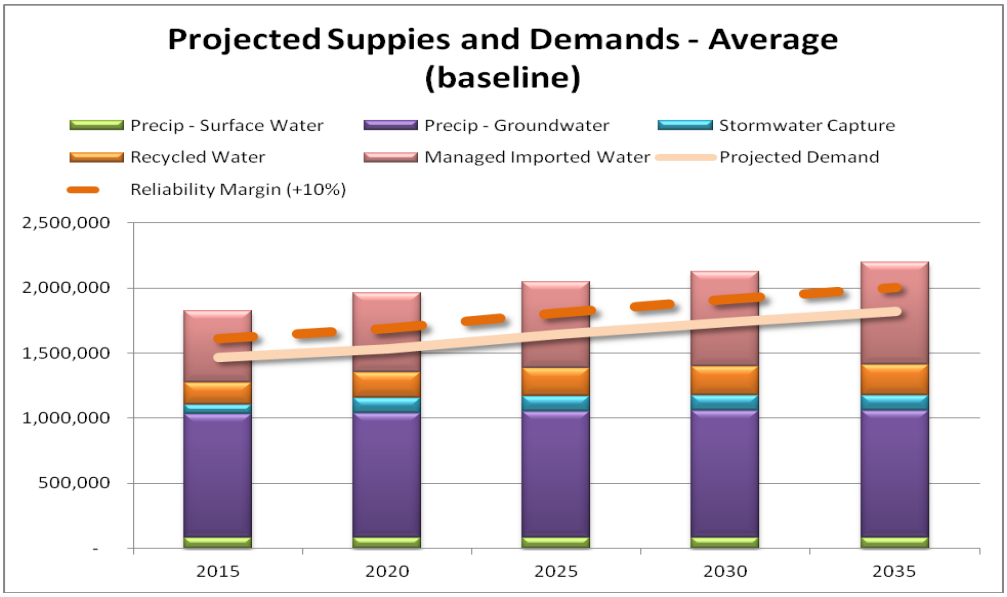
## Pillar Work and Key Findings

Under OWOW 2.0, more emphasis is being placed on the watershed scale, and multi-benefit and multi-purpose solutions. Multi-beneficial projects and greater diversification of water management approaches are achieved through greater collaboration and cooperation, building trust among stakeholders, viewing the watershed as a hydrologic whole, working in concert with nature, and seeing each problem as interrelated that provides opportunities for synergy and efficiencies. These OWOW guiding principles were shared with the Pillars and the watershed stakeholders on multiple occasions.

In preparation for the next phase of OWOW 2.0 planning, SAWPA directed that the OWOW 2.0 Plan was not intended to be merely an update of previous planning data from the OWOW 1.0 Plan, but rather would focus on identifying integrated and watershed-wide implementation actions. To achieve this, SAWPA conducted innovative brainstorming processes with the Pillars utilizing the experience and skills of local experts to inspire and promote integrated system-wide implementation actions that address water resource challenges in the Santa Ana River Watershed.

Starting in September of 2011, three well known water resource experts dubbed the "Master Craftsmen", were tasked to develop a list of conceptual project concepts and to describe the spatial, temporal, regulatory, economic, political, and physical barriers that impair the ability to implement

watershed-based implementation actions that support the vision articulated in the OWOW Plan. From these Master Craftsmen meetings, a white paper was developed that identifies 13 key examples of watershed-based water resource management concepts that, when implemented, would provide tangible and measurable benefits by removing impairments. These watershed-based concepts are ideas, vetted by the Pillars, and provide significant additional benefits such as habitat restoration and increased habitat connectivity. Two types of concepts were included: (1) those that require implementation of capital projects, and (2) those that are programmatic and focus on establishment of regional management practices or policies that increase sustainability of existing resources.



These ideas and concepts were approved by the Steering Committee and the SAWPA Commission. Thereafter, the Pillars commenced their respective meetings over the following 18 months of the OWOW 2.0 planning. They investigated new regional implementation actions within their Pillars that could lead to multiple, integrated benefits that, in turn, could be linked and integrated with other Pillar implementation actions. In addition to conceptual implementation actions, the Pillars developed key findings that will support implementation described as follows:

### *Water Use Efficiency Pillar – Key Findings*

- Water use efficiency practices remain the number one water resource management priority for the watershed.
- Agencies and their partnerships with each other and private industry will continue to collaborate and develop new programs promoting water use efficiency.
- The ultimate goal will be to get water customers to automatically base decisions on what is the most water efficient way to plan, implement, and maintain devices and landscapes. This will require customer education and continued incentives to promote water use efficiency.
- Landscape demonstrates the greatest potential for water savings. Therefore, the Water Use Efficiency Pillar will move forward with collaborative projects that primarily emphasize outdoor efficient use of water.

### *Water Resource Optimization Pillar - Key Findings*

Based on the work of the Water Resource Optimization Pillar, the projected supplies and demands for the average year are as follows:

A key finding from this Pillar's analysis is that with implementation of the 20% water demand reductions by 2020, as well as a reliability margin of 10%, water supplies will be adequate to meet demands through the 20-year planning horizon or Year 2035. This evaluation also was conducted for the single year, the historical year that received the lowest amount of imported water, and the multi-year drought, three- year period that received the lowest amount of imported water. Their findings show that the watershed in the aggregate will be able to meet its demands in a single year drought with a reliability margin of 11% in 2035, and for a multi-year drought of 13% in 2035. The watershed is able to make it through these drought years by relying on the native water, precipitation as surface water and precipitation as groundwater, and imported water storage programs that store water when it is available during wet periods for use during drought periods, and on recycled water that is not impacted by weather.

The Water Resource Optimization Pillar concludes that there is more to be done to ensure water supply reliability for the future. This is particularly true in the face of climate change that may impact local precipitation patterns, the need for intra-basin transfers to maintain groundwater levels, the State-defined mandate for regions to become less dependent on Delta imported water, and a significant funding requirement of water use efficiency and infrastructure to meet future demands.

### *Beneficial Use Assurance Pillar - Key Findings*

- Surface water quality monitoring is not coordinated within the watershed leading to duplicative sampling in some areas and inadequate sampling in others. Work on a plan to improve coordination and development of a regional approach to monitoring that will generate better information and be less expensive.
- New statewide regulations setting biological objectives and nutrient objectives for surface water are being developed and will be a compliance challenge for wastewater agencies. Participate in rule making process to support development of policies and regulations that are effective and efficient.

- A small number of small water systems in operation within the watershed that do not have resources for monitoring and proper operations and maintenance, may result in drinking water provided to customers that is in violation of drinking water standards. Work with California Department of Public Health and county health departments to identify small system water providers, if any, which need assistance with providing safe drinking water. Develop a plan to address any small system water providers that need assistance.
- Sediment deposition in some areas creates water quality impairments, reduces aquatic habitat, and reduces water conservation storage. Reduced sediment flow downstream of dams causes armoring of river/creek beds resulting in reduction in percolation capacity, aquatic habitat, and beach replenishment. Support USACE/OCWD Prado Basin Sediment Management Demonstration Project and Newport Bay Stakeholders to reduce sediment load into Upper Newport Bay.

*Land Use and Water Planning Pillar – Key Findings*

- Water supply agencies should be consulted early in the land use decision-making process regarding technology, demographics and growth projections.
- City and county officials, the watershed stakeholders**,** Local Agency Formation Commissions, special districts and other stakeholders sharing watersheds should collaborate to take advantage of the benefits and synergies of water resource planning at a watershed level.
- Plans, programs, projects and policies affecting land use and water should be monitored and evaluated to determine if the expected results are achieved and to improve future practices.
- Limited, accessible, and low-cost, outdoor recreational opportunities should be promoted throughout the watershed.

*Stormwater: Resource and Risk Management Pillar – Key Findings*

- Comprehensive and integrated stormwater management projects driven by a multi-stakeholder project paradigm can more effectively and efficiently address watershed needs. Such projects can assist stakeholders to achieve compliance with the Municipal Stormwater National Pollutant Discharge Elimination System Permits (MS4 Permits), while increasing capture of stormwater and other flows and groundwater recharge using favorable cost benefit approaches.
- Reducing the risk of loss of life and property damage due to flooding remains a high priority within the Santa Ana River Watershed. The completion of the Santa Ana River Mainstem Project will reduce the risk of a catastrophic flood event in the Santa Ana River Watershed. However, there remains significant flood risk related to tributary watercourses within the watershed, compounded by potential impacts of wildfires and earthquakes.

*Natural Resources Stewardship Pillar – Key Findings*

- A plan for sustainable management of conservation areas with targeted restoration efforts is essential for preventing further deterioration of habitat. Consideration for characteristics of each of the main habitat types: Chaparral/forest, Alluvial fan; Riparian, Wetland, and Coastal and their specific ecosystems, require habitat-specific management plans and restoration criteria.
- Creating sustainable wildlife corridors requires land use planning coordinated across jurisdictional boundaries. Cooperation also must take place among all of the current regional conservation plans, mitigation providers, resource conservation districts, and non-profit conservation organizations.

- Consensus among all agencies and organizations with ownership/stewardship over areas of the Santa Ana River Mainstem and tributaries should be sought that provides for long-term protection of areas where habitat restoration efforts are occurring or need to occur. This kind of cooperative agreement will be critical to the ability of governmental and non-profit organizations to secure mitigation funding to do the necessary habitat restoration work needed in the watershed.
- Grant and bond funding in the watershed have funded the removal of thousands of acres of invasive plants, initial and ongoing restoration of habitat areas, biological monitoring of sensitive species, and conservation of habitat areas. All of these sources and more should continue to support restoration and ongoing maintenance.
- Much of the remaining invasive plant biomass and areas that could benefit from re-establishment activities (removal of invasive species followed by long-term, active planting and biological monitoring) in the watershed is on land owned by Federal, State, and local governments for purposes other than water-oriented habitat conservation. These are prime lands for future habitat restoration projects with multi-use and benefit.

### *Operational Efficiency and Water Transfers Pillar – Key Findings*

- Expand compliance with the SBx7-7 and implement projects that reduce per capita water usage by more than 20 percent by the year 2020.
- Create/ expand supply and system reliability during drought, emergency, and peak demand situations.
- Create/expand coordination with other agencies in the area and develop regional water management strategies that would increase conservation and local water supplies.
- Create/expand local recycled water reuse program(s) in the area with an OWOW 2.0 goal of 157,000 acre feet per year.
- Develop/Implement projects that protect groundwater resources, the environment and consider storage and transfers. These projects are important to assure that water is readily availability in the right place when we need it. This can be overcome with storage and transfers.

### *Disadvantaged and Tribal Communities Pillar – Key Findings*

- Engaging Disadvantage Communities (DACs) and Tribes in water and related resources planning through effective outreach is good for both the community and the water sector itself. There are distinct differences due to cultural and historic context. Both need their voices heard during proposed project development.
- Today, DACs and some Tribes face critical and serious water and related resources challenges, such as failing septic systems, isolation, language barriers, flood risk, and lack of funding and or resources. It is imperative that the water sector and its key stakeholders recognize proposed DAC and Tribe water project needs, and engage these communities early in the process. The OWOW 2.0 process recognizes the various funding needs for DACs and Tribes, and the Federal and State funding programs available to them.
- From engaging and speaking with DAC residents and attending Tribal Council meetings, it is evident that there is a need for continuous networking resulting in consensus based development and implementation of project solutions.

*Government Alliance Pillar – Key Findings*

- Ensure that Federal and State agencies effectively partner in the management of water and other resources within the watershed, and consider other Pillars' perspectives in their support of OWOW goals and objectives.
- Periodically publish updates of the Resource Guide and post them on SAWPA's website.
- Use the Resource Guide's agency contacts, and assure that steps are taken to keep all information current.
- Continue coordination with various governmental agencies, as appropriate, for all proposed projects, initiatives, and integrated water and related resources activities to help identify necessary environmental compliance requirements and or potential areas of conflict.

*Energy and Environmental Impact Response Pillar – Key Findings*

- Annual surface water is likely to decrease over future periods with precipitation showing somewhat long-term decreasing trends. Temperature will increase, which is likely to cause increased water demand and reservoir evaporation. Projected decreases in precipitation and increases in temperature will decrease natural recharge throughout the basin.
- Management actions such as reducing municipal and industrial water demands or increasing trans-basin water imports within the watershed may be required to maintain current groundwater levels.
- Warmer temperatures likely will cause Jeffrey Pines to move to higher elevations and may decrease their total habitat. Forest health also may be influenced by changes in the magnitude and frequency of wildfires or infestations. Alpine ecosystems are vulnerable to climate change because they have little ability to expand to higher elevations.
- Increasing temperatures will result in a greater number of days above 95°F in the future. The number of days above 95°F gets progressively larger for all cities advancing into the future.
- Simulations indicate a significant increase in flow for 200-year storm events in the future. The likelihood of experiencing what was historically a 200-year event will nearly double (i.e. the 200-year historical event is likely to be closer to a 100-year event in the future). Findings indicate an increased risk of severe floods in the future, although there is large variability between climate simulations.
- Sea level rise is likely to inundate beaches and coastal wetlands and may increase coastal erosion. The effects on local beaches depend upon changes in coastal ocean currents and storm intensity, which are highly uncertain at this time. Sea level rise will increase the area at risk of inundation due to a 100-year flood event.
- Existing barriers are sufficient to deter seawater intrusion at Talbert and Alamitos gaps under a 3-foot rise in sea levels. However, operation of barriers under sea level rise may be constrained by shallow groundwater concerns.

To further enhance the integration and linkages among the recommended conceptual implementation actions suggested by the Pillars, Pillar Integration Workshops were conducted by SAWPA throughout the OWOW 2.0 Plan development period. The integration workshops included discussion of system-wide regional or watershed scale implementation actions, addressing different components of the hydrologic cycle, evaluating linkages among proposed projects/programs, and developing and identifying synergy among projects and programs to create anew.

## OWOW 2.0 Plan – Future Implementation

During the last two years, Pillars have been working together to write the next integrated water plan, OWOW 2.0. The Broad Planning/Management Guidance Strategies were distilled from that work and will serve to guide future planning and management in the watershed. The strategies reflect a change in thinking about water resource management. Historically, water activities were organized into different silos, and managers worked to achieve separate and individual goals that were thought to be unrelated. The water supplier's goal was to deliver water for a growing population and economy. The flood control manager's goal was to channelize stormwater to get it out of the community before it could harm people and property. The wastewater manager's goal was to highly treat wastewater before it is discharged into the river or ocean to be carried away. Managing the watershed and water resources as done in the past realized narrow singular goals, but did so with tremendous unintended consequences. The list of endangered species only grew longer, as did the list of impaired water bodies. Societal values have changed, water and funds are scarcer, and together we have realized that the old way is no longer viable.

These Broad Planning/Management Guidance Strategies are not projects or programs themselves. These strategies represent a shift from remediation to protection. It is the opportunity to be proactive rather than reactive. This can facilitate the vision we want, a sustainable and productive watershed, rather than only focusing on solving the problems that past practices have created.

These watershed planning and management strategies are separate and distinct from priorities assigned to evaluate projects for funding that are often dependent on the grant sponsoring agency criteria. These Planning/Management Strategies are meant to guide planning efforts and are *in no particular ranked or priority order* as shown below.

- **Demand Reduction and Water Use Efficiency**

Water use efficiency practices remain a key resource management priority for the watershed and a cost effective tool for reducing the gap between available supplies and projected demand. This is reflected through a reduced per capita water use as well as potentially reduced commercial and industrial water use. Although significant progress is anticipated with mandated reductions through 20% by 2020 legislation, more can be done. Many water use efficiency actions have been implemented locally, but these can be scaled watershed-wide. These include water rates structures that encourage conservation, also known as budget-based water rates, garden friendly landscaping and landscape ordinance application, smart controllers and irrigation nozzles, and turf buy-back programs, to name a few. The last acre foot of water is often the most expensive, reducing that cost goes far to keep water rates stable.

Monitoring data shows wasteful irrigation runs off yards, down streets and culverts collecting pet waste and pollution until it hits the receiving water with a toxic slug causing beach closures and fish kills. At great expense, cities have been tasked to clean up this dry weather urban runoff pollution. This cost can be avoided with successful water use efficiency.

It is understood too that there is a direct link of water use efficiency with energy efficiency and GHG emission reduction.

- **Watershed Hydrology and Ecosystem Protection and Restoration**

Implementing cost effective programs will protect and restore our watershed's ecosystem and hydrologic system so that it will sustainably produce the array of services including water resources. Recognizing that the Santa Ana River Watershed has multiple interrelated parts, a holistic approach to solving issues of supply, quality, flood, and ecosystem management is necessary. This approach recognizes that in order to achieve a healthy productive watershed, improvements starting at the top of the watershed with a healthy and managed forest effectively support downstream stormwater attenuation and runoff capture and water quality improvement. The emphasis is on source control rather than end-of-pipe treatment as a best management practice. Implementation actions under this priority include forest management, pollution prevention, low impact development, stormwater capture and flood management, and MS4 stormwater implementation.

- **Operational Efficiency and Transfers**

Cooperative agreements arising from water transfers, exchanges, and banking can resulted in better use of water resources. With the rich groundwater storage opportunities available in the watershed, expanding the groundwater storage with a variety of available water sources can be more much more cost effective than new surface storage. Such agreements will result in our ability to stretch available supplies and replace the storage lost by a shrinking snowpack. Projects under this category occur by collaboration and cooperation among the multitude of agencies and entities in the watershed, and agencies that import water into the watershed, expanding on the many past successful water agreements within the watershed. New banking agreements can represent both habitat mitigation

banking as well as groundwater banking. These agreements only can occur by entities working together and opening doors to improved efficiency and increased water supply reliance.

- **Innovative Supply Alternatives**

This strategy recognizes the need for more progress in a portfolio approach with expansion of innovative and effective 21st Century technology for water production, recycling, pumping, and desalinization. Traditionally these projects serve as an important component to achieving water supply reliability. Moving forward, a broader range of tools is available to us to serve both economic and environmental objectives. Projects under this category provide multiple benefits and thus can be mutually reinforcing. Brackish desalination and salinity management are necessary to sustain local supplies. Salinity management is essential for groundwater basin health in the watershed.

- **Remediation and Clean up**

Another strategy is implementing Total Maximum Daily Loads (TMDLs) and pollution remediation. Projects under this category must reflect projects that have region wide benefit, are integrated and have multiple benefits without a focus only on local or single purpose needs. Under this strategy, the focus is on preventing pollution and dealing with the pollution that has already occurred. This reflects a desire to duplicate the successes already established in the watershed to prevent and remediate pollution.

The Broad Planning/Management Guidance Strategies were presented and discussed with the Pillars and other stakeholders for possible prioritization of the five strategies. The feedback received is that all five strategies are a priority to the watershed. But as stakeholders of the watershed, entities are encouraged to consider the long term watershed planning approach as they consider competing alternatives to meet needs and give more merit or attention to strategies such as water use efficiency that has been traditionally found to be more cost effective in reducing water demands and generating water supply. Further, projects should consider system wide benefits before other alternatives. This applies particularly to pollution prevention at the source rather than having to address a chain of unintended and possibly negative consequences downstream for future generations.

Shown below is a list of Pillar Recommended Implementation Actions that were prepared based on the Pillar's work and other stakeholder input. These regional implementation actions are not listed in priority, nor are they in any particular order. They represent the integrated work of the Pillars that resulted from their collaboration internally and with other Pillars and are the solutions to the challenges that they identified in each of their Pillar chapters. This list does not represent a list of projects that been rated and ranked projects under the more formal Project Review Process defined under the OWOW 2.0 Plan. However, they are recommended implementation actions that reflect an emphasis on integration and system-wide solutions to the watershed challenges and include the 13 watershed-wide framework concepts previously discuss.

Each of the Pillar-recommended watershed-wide implementation actions eventually could become projects once they are more fully investigated and analyzed. Multi-agency project proponents for these implementation actions have not have been identified yet. It is anticipated that these recommended actions may best help fulfill the vision of the OWOW 2.0 Plan.

## Pillar Recommended Implementation Actions
### (In no particular order)

| Title | Description |
|---|---|
| Water Rate Structures that Encourage Conservation | Create incentive programs for retail water agencies in the watershed to reduce water demand and help meet SBX7-7 required demand reductions. |
| Water Use Efficiency Incentive Program | Create an incentive program for expanded water use efficiency programs including cash for grass, landscape retrofit support, and California-friendly plant discounts. Utilize IEUA Residential Landscape Transformation Program and MWDOC Comprehensive Landscape Water Use Efficiency Programs as template. |
| Watershed Exchange Program | - Upper watershed foregoes development of more water recycling and provides future treated wastewater to the lower watershed via the Santa Ana River<br>- Lower watershed provides "replacement" water to upper/middle watershed |
| Wet Year Imported Water Storage Program | - Upper watershed and MWDSC would implement this strategy<br>- Goal: change MWDSC place of storage from Central Valley to Santa Ana River watershed<br>- Develop MWDSC pricing structure to encourage more storage in watershed<br>- Water stored in wet years for a reduced price. Water pumped in dry years for remaining Tier 1 price |
| Enhanced Santa Ana River stormwater capture below Seven Oaks Dam | Additional stormwater detained by Seven Oaks Dam could enable the diversion of up to 500 cfs and up to 80,000 acre-feet per year. This may require execution of new water rights agreement among SAR Watermaster parties. |
| Off River Storage and Supply Credits | Additional stormwater capture along the SAR tributaries could enhance capture/ recharge. Specific locations in the watershed would need to be defined. New recharge projects could allow for purchase of "MS4 Credits" by cities and counties as part of new development as a regional MS4 compliant recharge project. |
| Re-Operate Flood Control Facilities | Working with flood control agencies re-operate flood control facilities with the goal of increasing stormwater capture increasing flood get away capacity and revising decades old storage curves. Without any impending storms, the flood control agencies may be able to release stormwater at a slower rate. This relatively minor operational change would make stormwater flows easier to capture and put to use. It also would result in impounding the water longer, which would increase artificial recharge during the "holding period". This strategy has already been successfully implemented in some portions of the watershed. |
| Increase Surface Water Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. This project would supplement but not replace existing or proposed groundwater storage. |
| Increase Groundwater Storage | Helps offset drought and climate change while also increasing watershed sustainability and less dependence on imported water. |

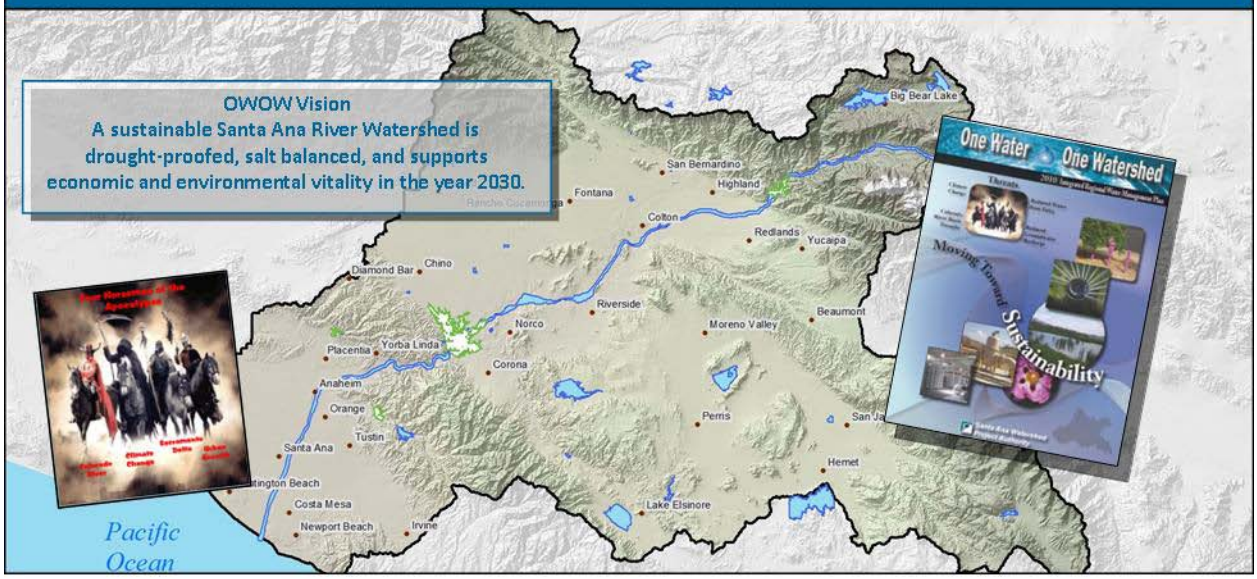
| Title | Description |
|---|---|
| Inland Empire Garden Friendly Demonstration and LID Project | Using the Inland Empire Garden Friendly Program as a template, a demonstration project is proposed to quantify the benefits of installing Inland Empire garden friendly products and further demonstrate Low Impact Development features in a DAC neighborhood. The project would be modeled in part after the successful City of Santa Monica Garden-Friendly Project, as well as the Elmer Ave. Neighborhood Retrofit project in the LA Basin. |
| DAC Water Supply or Water Quality Improvement Projects | Provide funding support to assure drinking water standards are met such as in the County Water Company of Riverside near Wildomar. Construct new sewer system for the areas that have failing septic systems/undersized treatment facilities like Beaumont Cherry Valley. |
| Wetlands Expansion Watershed wide | Create new wetlands along the tributaries of Santa Ana River to provide for natural water quality improvement, ecosystem restoration and recreational opportunities. Water supply for such wetlands would be dry weather urban runoff and available recycled water and would be patterned after the Mill Creek Wetlands in Chino Basin. |
| Watershed wide Multi-Use Corridor Program | Create multi-use corridors along SAR and its tributaries and Upper Newport Bay tributaries in all three counties in watershed to provide for sustainable wildlife corridors, stormwater attenuation and capture, flood control, sediment reduction and erosion restoration, enhanced NPS pollution treatment, removal of non-native species, and creation of recreational trails,. In Riverside County, along Temescal Wash, in San Bernardino in San Timoteo Wash, in Orange County along Borrego Canyon Wash between Irvine Blvd and Town Center Drive. |
| Multi-Species Habitat Plan for Gap areas of Watershed | Create multi-species habitat plan for San Bernardino County and portions of Orange County. Though work is underway on the Upper Santa Ana Wash Land Management and Habitat Conservation Plan, there is no MSHCP covering the growing areas of southwestern San Bernardino County. Western Orange County is also not covered by an MSHCP. |
| Water conservation recharge optimization program | Establish a water conservation-recharge optimization plan for existing and potential future flood control facilities, using the example work of the Chino Basin Recharge Master Plan and implementation projects as a template. |
| Watershed wide geodatabase access | Connect existing county or program-specific geodatabases to create a comprehensive watershed geodatabase that provides access to appropriate stakeholders, and set up a data quality control and maintenance program. The main component County MS4 geodatabases are well under way. |
| Forest Restoration Projects | Expand forest restoration through fuels reduction, meadow and chaparral restoration projects to strategic areas above major stormwater recharge basins for flood control, water supply and water quality benefits. |
| Residential Self-Regenerating Water Softener Removal Rebate Program | Removal of self regenerating water softeners has been proven as an effective strategy to reduce TDS levels at WWTP and assure future salt discharge requirements. The project provides watershed-wide rebates and would be a joint program among water agencies in the watershed. |
| Salt removal projects to achieve Salt Balance | Expand groundwater desalination to key groundwater basins where TDS and Nitrate concentrations are approaching discharge limits. Locations may include Elsinore Basin, Perris Basins in EMWD and Riverside Basins. |

| Title | Description |
|---|---|
| Enhanced stormwater capture from the tributaries of the Santa Ana River | Develop additional stormwater capture projects along the SAR tributaries that support key groundwater management zones identified by SB, RV, and OC Geodatabases. Early estimates indicated a capture potential of 12,000 AFY. |
| Conjunctive Use Storage and Water Transfer Project using Wet Year and Dry Year Allocation | This project concept proposes a purchase by downstream entities of up to 45,000 AF of imported water to be recharged by the upstream agencies during wet years. Water would be purchased at a reduced imported water rate from MWD reflecting the savings of not storing the SWP water at one of MWD's own storage programs such as the Semi-Tropic Water Storage District and/or Kern County Water Bank. In dry years, downstream agencies could request upstream agencies to increase their groundwater production for three years by up to 15,000 AF per year in-lieu of direct deliveries from MWD, while MWD increases deliveries in the downstream area by an equal amount. |
| Salt Assimilative Capacity Building and Recycled Water Transfer Project | EMWD has the capability to discharge 15,000 AFY of recycled water into Temescal Creek. The recycled water discharge will be dependent on surplus recycled water available and not used within EMWD particularly during wet seasons. With the approval of the SAR Watermaster, this flow can be contractually added to the Santa Ana River base flow allocation at Prado. The water quality of EMWD's discharged recycled water may require some salinity mitigation by downstream parties to meet the RWQCB Basin Plan Objective in Orange County. The GWRS will be used to provide the required mitigation for the discharged water, and EMWD will pay downstream parties for the cost of that mitigation. |
| Riverside Basin Aquifer Storage and Recovery Project | Riverside Public utilities, in partnership with Valley District and others are developing a design for a rubber dam that would cross the Santa Ana River and be used to divert flows, while mitigating environment impacts. The project is currently anticipated to capture and recharge 15,000 AFY. |
| Watershed Invasive Plant Removal Project | The Santa Ana Watershed Association, the Front Country District Ranger on the San Bernardino National Forest and Southern California Edison had proposed a major an invasive plant eradication project for the Mill Creek Watershed. This project proposes to expand the San Bernardino Mountains Front Range Invasive Plant Removal Project to an invasive plant removal and restoration project in the Santa Ana River Watershed that has many partners and stakeholders extending from the coast to the headwaters. |
| Regional BMPs to manage municipal stormwater discharges | Develop regional BMPs including infiltration, harvest & reuse, and biotreatment as proposed under current MS4 Permits. Initial phase would be located in MSAR Pathogen TMDL area and expand into other areas of the watershed under future phases to address pathogen treatment. |
| Watershed-wide coordinated surface water monitoring program | Surface water quality monitoring is not coordinated within the watershed leading to duplicative sampling in some areas and inadequate sampling in others. In some cases this may lead to 303(d) listings that do not reflect real impairments. A new program to coordinate surface water quality monitoring to enhance efficiency and reduce costs is proposed. Sources of monitoring data would come from MSAR Watershed TMDL, SWQSTF, MS4 Stormwater Permits, and SCCWRP Bioassessment Program. |
| Watershed Urban Runoff Management | Establishing a Watershed Based Urban Runoff Management Fund to support the implementation of stormwater management programs. Components of this program |

| Title | Description |
|---|---|
| Fund | could include the regulatory basis for a watershed based program, the legal basis and authority for the fund, the agreements, and programmatic elements. |
| Santa Ana River Sediment Transport | Building upon an OCWD demonstration project, implementation of a full scale project that allows for the appropriate transfer of sediment to maximize recharge operations, restore habitat, and reduce operation costs. |
| Transportation Corridor Stormwater Capture and Treatment | New uses of the current transportation right of ways can be expanded to for capturing rain runoff and replenishing groundwater basins. |
| Modified Watershed Brine Management System | Optimizing the water used to transport brine so that less water is lost to the ocean through increased concentrating of brine or delivery to the Salton Sea for beneficial use. |
| Water Industry Energy Use Reduction Incentive Program | Supporting regional purchase and installation programs of water resource related greener energy projects that reduce capital costs and green house gas emissions. |
| Watershed Land Use Planning Tool Kit | Developing a tool kit that translates water principles to support watershed planning decisions and implements a jurisdictional outreach effort for relevant regional, county and city planning agencies that encourages adoption of the guidance ideology into General Plans and zoning codes at the local level. |

## OWOW Projects and Benefits

It is the intent of the OWOW planning process to transcend specific funding cycles. Projects are included in the OWOW 2.0 Plan based on the latest rating and ranking criteria and their merit to address the watershed's strategic needs, regardless of available funding opportunities at any given time. (See list in **Appendix K**)



Shown below is a list of the Round 1 Proposition 84 projects and the benefits that ultimately will be realized once all these projects are fully constructed. Round 2 projects submitted by SAWPA are under consideration by DWR for future grant funding with awards anticipated in early 2014.

**OWOW Proposition 84, Round 1 Projects**

| Project | Project Sponsor | Total Local Cost | Grant Amount | Other State Funds Being Used | Total Cost |
|---|---|---|---|---|---|
| Groundwater Replenishment System - Flow Equalization | OCWD | $14,399,680 | $1,000,000 | $0 | $15,399,680 |
| Sludge Dewatering, Odor Control, and Primary Sludge Thickening | OCSD | $137,115,600 | $1,000,000 | $0 | $138,115,600 |
| Vireo Monitoring | SAWA | $269,207 | $600,000 | $0 | $869,207 |
| Mill Creek Wetlands | City of Ontario | $14,355,000 | $1,000,000 | $5,000,000 | $20,355,000 |
| Cactus Basin | SBCFCD | $8,250,752 | $1,000,000 | $0 | $9,250,752 |
| Inland Empire Brine Line Rehabilitation and Enhancement | SAWPA | $698,153 | $1,000,000 | $5,234,576 | $6,932,729 |
| Arlington Desalter Interconnection Project | City of Corona | $948,049 | $400,000 | $0 | $1,348,049 |
| Perris II Desalination Facility | EMWD | $1,335,752 | $1,000,000 | $0 | $2,335,752 |
| Perchlorate Wellhead Treatment System Pipelines | WVWD | $419,000 | $1,000,000 | $0 | $1,419,000 |
| Chino Creek Wellfield | WMWD | $5,331,118 | $1,000,000 | $0 | $6,331,118 |
| Impaired Groundwater Recovery | IRWD | $36,321,970 | $1,000,000 | $0 | $37,321,970 |
| Alamitos Barrier Improvement Project | OCWD | $10,571,600 | $1,000,000 | $0 | $11,571,600 |
| Arlington Basin Water Quality Improvement Project | WMWD | $3,443,636 | $1,000,000 | $0 | $4,443,636 |
| Grant Total | | $233,459,517 | $12,000,000 | $10,234,576 | $256,354,097 |

- Reduces water demand by 11,200 AF/YR
- Captures 16,300 AFY of stormwater for recharge
- Produces 28,600 AFY of desalted groundwater while removing 21,600 tons of salt
- Creates 90,400 AFY of new water recycling
- Creates 16,400 AF of new storage
- Improves water quality to 7,800 AFY
- Creates or restores 400 acres of habitat
- Leverages $11.7 million in grants funds with $240 million on local funds
- Creates about 3900 construction related jobs for region

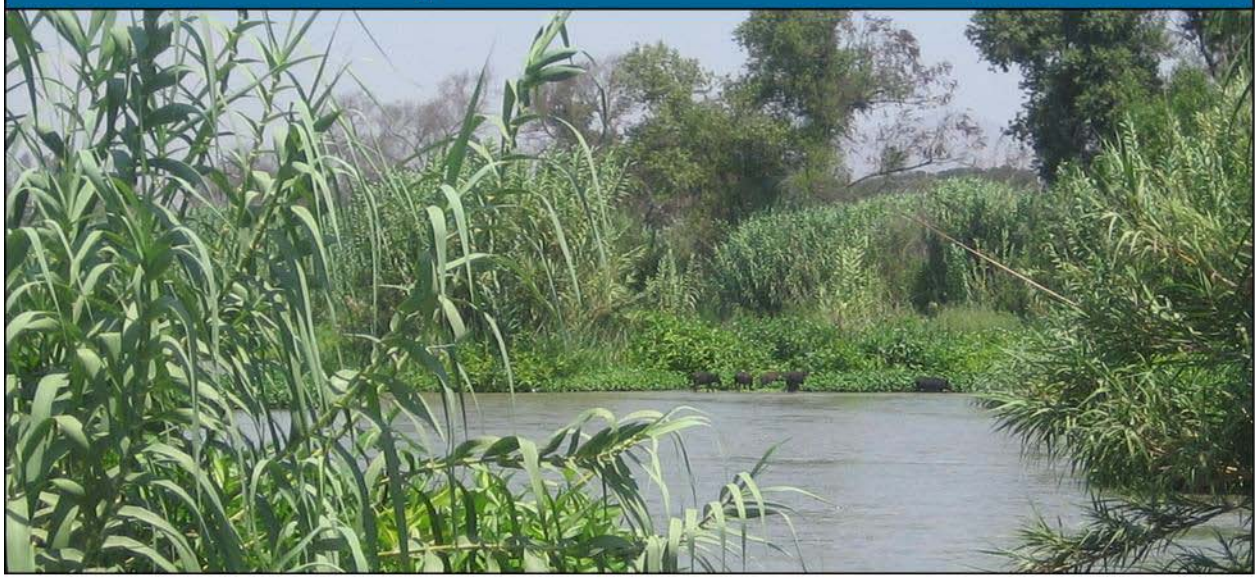
# 1.1 Overview

Santa Ana River Watershed

The One Water One Watershed (OWOW) Program provides a comprehensive view of the watershed and water issues encompassing all sub-regions, political jurisdictions, water agencies, and non-governmental stakeholders (private sector, environmental groups, and the public at large) in the watershed. It is one in which all types of water (imported, local surface and groundwater, stormwater, and wastewater effluent) are viewed as components of a single water resource, inextricably linked to land use, habitat, and that endeavors to limit impacts to natural hydrology.

The OWOW planning process is supported by a diverse group of stakeholders led by a Steering Committee composed of public officials from counties and cities in the watershed, representatives from the environmental, regulatory, and business communities, and representatives from the Santa Ana Watershed Authority (SAWPA). The Steering Committee is supported by technical experts and stakeholders grouped into ten disciplines (known as Pillars), ranging from water supply reliability and quality, to climate change, to environmental justice.

SAWPA acts as the Regional Water Management Group for the process. While SAWPA facilitates the planning process, provides technical input and support through its staff and consultants, the development of the goals and strategies of the Plan, as well as the decision making process, are prepared by the Steering Committee with support of the Pillars, and with consideration to comments from the public at large.



The collaborative, transparent, and watershed-wide view embraced by the OWOW planning process from the onset, builds upon previous planning efforts in the watershed, and seeks to change the way that water and other environmental resources are managed, moving from reliance on large centralized infrastructure projects to a systems approach that complements existing centralized infrastructure with decentralized facilities (e.g., groundwater desalination), technology, natural infrastructure and human capital.

In 2011, SAWPA received funding to update the 2010 OWOW Plan to address the new IRWM Program Guidelines, and implement this process of moving from a water supplier to a water resource manager mentality. The resulting 2013 OWOW 2.0 Plan advances a paradigm change from water supply to an integrated water resource management mentality; moving from a mission of providing abundant high-quality water at the lowest cost possible, to one in which water resources are managed in a sustainable manner and with regard for the needs of the environment and those downstream. Rather than investing more or working harder on the ways of the 20th century, OWOW 2.0 seeks a new approach that is lighter on the land, and protects habitat and a sustainable future for a robust economy and healthy environment. This Plan, in keeping with requirements of the Department of Water Resource's Proposition 84 IRWM Planning Grant award, and the November 2012 IRWM Proposition 84 and 1E Program Guidelines, documents the current IRWM program and processes that have evolved through the OWOW planning process, and is organized according to **Table 1.1-1**.

**Table 1.1-1 Current IRWM Program and Process Evolved through the OWOW Planning Process**

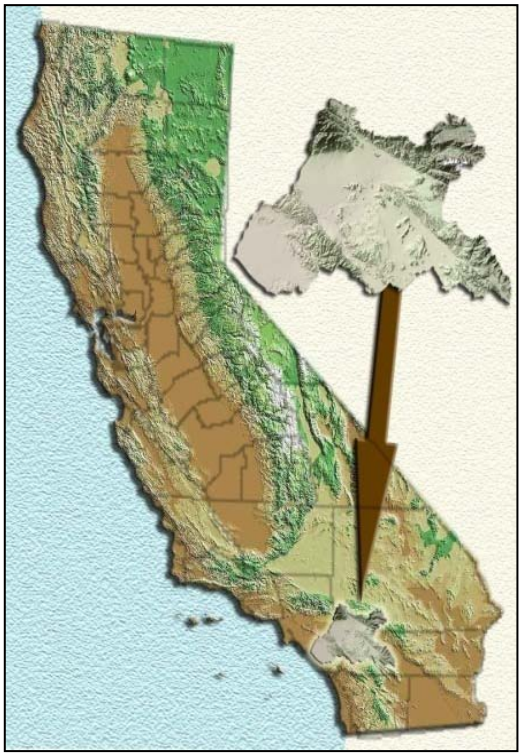
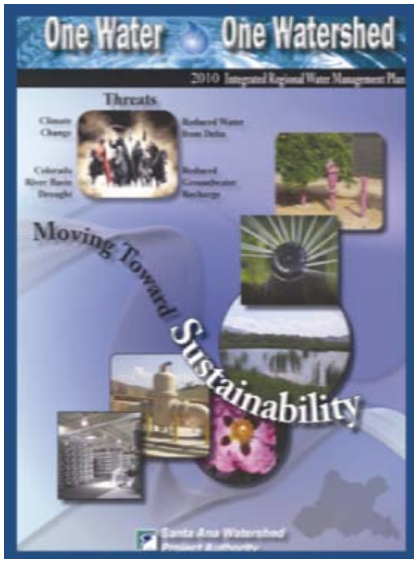
# 1.2 OWOW Plan 1.0
# Moving Towards Sustainability



Wild pigs drinking from the Santa Ana River

## The Planning Process



The development of this One Water One Watershed (OWOW) 2.0 Plan is built upon the planning process of the past to address the challenges of the future. The first phase of OWOW, known as *OWOW 1.0*, produced a broad-based, stakeholder-driven assessment of the watershed. Rather than engage a consultant to prepare a plan, SAWPA developed and convened a process whereby all segments of the water community worked in various workgroups called "Pillars" to produce an Integrated Regional Water Management Plan (IRWMP) for the watershed. Over 300 stakeholders described current conditions within the watershed and developed specific strategies and targets to make the watershed sustainable in 2030.

All aspects of water were considered, from flood risk management to water supply reliability, to habitat and open space. To manage such a complex process, SAWPA engaged the broader community and created a Steering Committee consisting of county supervisors, mayors, and business leaders, as well as water agency officials. At the conclusion of OWOW 1.0, the Steering Committee recommended funding several new integrated projects under Proposition 84 Integrated Regional Water Management (IRWM) funding that provide regional benefit. A wide variety of projects was selected from across the watershed and from varied disciplines, including local water supply development, and stormwater and habitat management. All projects considered provided multiple benefits to a broad area, leveraging scarce resources for many purposes.

With the development of integrated watershed planning, multi-benefit and multi-purpose projects have moved to the forefront and have become one of the primary goals of the OWOW implementation. Past efforts, with a few notable exceptions, primarily focus on single purpose projects. The additional effort required to develop multi-objective solutions has made true multi-benefit projects relatively uncommon. In California, much of which has been prompted by SAWPA's historical integrated watershed programs, there has been an effort to incentivize collaborative planning through IRWM planning and associated funding sources.

Some of the earliest multi-benefit water projects were done through a partnership between those interested in flood and groundwater management. Spreading grounds along the front slopes of local mountains have attenuated flood flows and recharged groundwater basins for nearly 100 years. Orange County Water District partnered early with Orange County Flood Control District (OCFCD) to provide recharge basins within flood control basins. More recently, Inland Empire Utilities Agency has worked with San Bernardino County Flood Control District to modify the operation of the flood control system to maximize recharge opportunities. Irvine Ranch Water District has partnered with the OCFCD to store recycled water in some flood basins. All of these projects primarily were facilitated by operational changes rather than the construction of new infrastructure, although in some cases the flood control system was upgraded. Operational changes could occur only when both parties understood the needs and assets of the other.

Although OWOW planning identifies numerous projects that implement the OWOW vision, the need exists to continually develop high level watershed management concepts, that when implemented, create the opportunity to make significant strides in efforts to make this watershed fully sustainable from a water resource perspective within a 30-year planning horizon. Inherent in this effort is the need to understand where we are today, and identify where we collectively want to be as a watershed in the future. SAWPA began efforts in 2011 to update and refine our IRWMP as the OWOW 2.0 Plan, and take the vision to the next level, encouraging stakeholders to focus on the key water resource management needs in the watershed, and to identify high-level watershed concepts for further development. With this vision in mind, regional stakeholders have been able to work collaboratively, thus improving the process associated with resource planning.

## OWOW 1.0 Challenges

Significant water crises have arisen over the past decade, prompting SAWPA and regional stakeholders to collaboratively find solutions. A vision for the watershed was established as a sustainable watershed that is drought-proofed, salt-balanced, and that supports economic and environmental viability. To achieve this vision, stakeholders under the OWOW 1.0 Plan agreed to address four major threats that SAWPA has labeled as the *Four Horsemen of the Apocalypse*. They are:

Climate Change resulting in reduced water supplies combined with increased water needs in the region.

Colorado River Drought Conditions resulting in threats to imported supply due to upper basin entitlements and continued long-term drought.

San Joaquin Delta Vulnerability resulting in reductions or loss of supply due to catastrophic levee failure or changing management practices of the Delta.

Population Growth and Development resulting in interruptions in hydrology and groundwater recharge while increasing water needs.

Further description as to why these crises must be addressed herein follows.

### Climate Change

One horseman impacting not just our region or State, but the entire world, is climate change. Climate change is occurring and must be addressed immediately to offset the impacts to water resources and the environment. The International Panel on Climate Change has stated that the world's climate is warming by an average of 1.3 degrees Fahrenheit in the past century. Unless current trends are reversed, global warming is projected to keep increasing and raise temperatures by as much as 11.5 degrees by the end of the century. The California Department of Water Resources' report entitled, *Managing an Uncertain Future: Climate Change Adaptation Strategies for California's Water*, details how climate change already is affecting the State's water supplies, and sets forth a number of recommendations to help avoid or reduce climate change impacts to water resources. The report indicated that global warming will present significant challenges to future water supply, water quality, ecosystem protection, and flood management.

Assessments on water supply and other impacts from climate change indicate likely reductions in snow pack, earlier and larger peak stream flows, potential reduction in runoff, greater evaporative losses, declining ecosystem health, sea level rise, and more extreme weather events, including flood and droughts. Other management activities affected by climate change include the need to consider energy use and greenhouse emissions of water resource projects, as well as the regional vulnerability of water systems.

## Colorado River Drought Conditions

In addition to the statewide drought, another horseman of the Apocalypse that has impacted the Santa Ana River Region is the growing threat of possible future imported water flow decreases to Southern California from the Colorado River. For most of the first decade of the 21st century, the Colorado River Basin experienced some of the driest consecutive years in the history of the basin. If similar drought conditions were to continue, reservoirs along the river, such as Lake Powell and Lake Mead, will continue to drop, and thereby reduce storage releases and energy production.

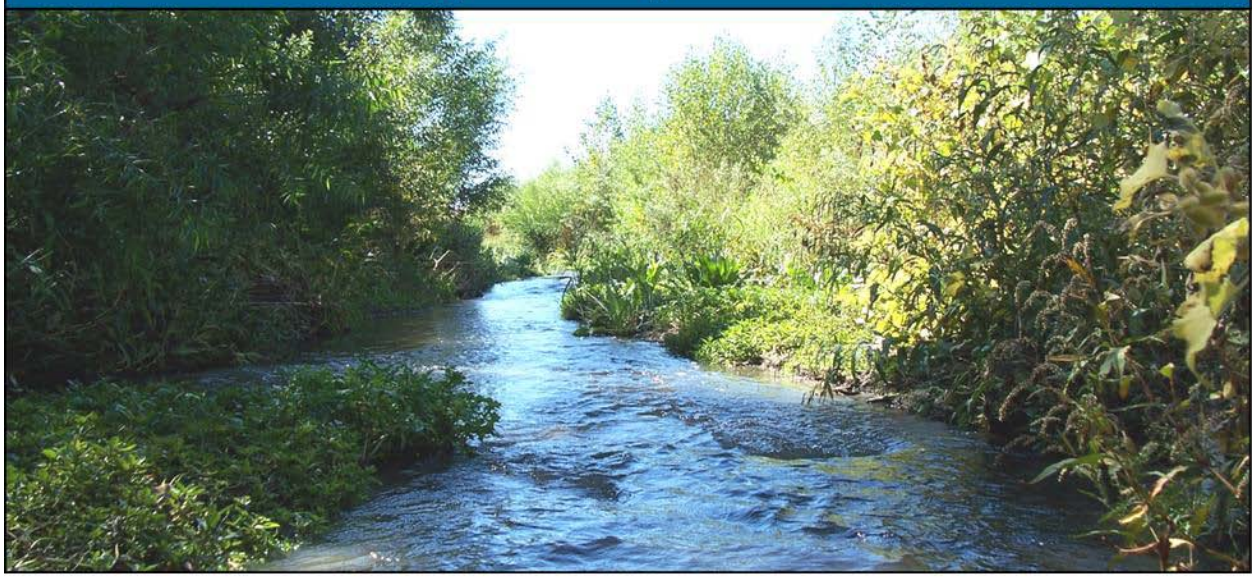
As reported by N. Christensen in his 2004 Climate Change report, *The Effects of Climate Change on Hydrology and Water Resources of the Colorado River Basin*, projections show that by 2050 the Colorado River flow would decline by 18% with the average Colorado River Basin water storage declining by 32%. Experts conducting studies of tree ring data in the Colorado River Basin have determined that severe and prolonged droughts, lasting up to 60 years or more, have occurred in the past and likely will occur again. As population continues to grow throughout the dry desert southwest, the water levels at Lake Powell and Lake Mead likely will continue to drop, with some projections indicating that the lakes may become dry by 2025.

Metropolitan Water District of Southern California, which serves as the importing water agency for most of Southern California, relies heavily on the flows from the Colorado River Aqueduct to assure that water demands are met. Because the drought conditions, as well as climate change, impact the entire Colorado River Basin, river flows are anticipated to decrease. Although under the Colorado River Compact Agreement, Southern California has senior water rights, and under the Quantification Settlement Agreement, is limited to 4.4 MAF. Greater stress will be upon all the Colorado River Compact Agreement parties to reopen the settlement agreement, as drought conditions exacerbate the ability of all parties to take from the river to meet their continued water demands.

## San Joaquin Delta Vulnerability

The San Joaquin Delta is home to over 750 plant and animal species. Out of 29 identified indigenous fish species, 12 of them are threatened either with extinction or already have become extinct. Endangered species include the spring-run and winter-run Chinook salmon and the Delta smelt. Other fish species are threatened as well, including longfin smelt, threadfin shad, and striped bass. Water diversions, urban development, loss of habitat, impaired water quality due to pesticides, and increased competition from invasive species, are all factors thought to be influencing the decline. Many scientists have warned that an ecological crash of the food web and the Delta food web is possible.

The crisis of the Delta centers not just on water pumping issues, but also on the condition of the Delta's levees, many of which were not properly designed. Concerns have arisen that if several key levees should fail, due to increasing sea levels or earthquake conditions, water deliveries could be interrupted again. Looking long-term, rising sea levels caused by climate change also could push additional salt into the Delta, potentially affecting the quality or availability of drinking and irrigation water. Further, climate change also likely will reduce snow pack affecting the volume of water available for export. As a result, public agencies are working together to find a solution to the co-equal Delta goals of reliable water supply deliveries from the Delta and ecosystem restoration, at the same time becoming less dependent on Delta water to meet local water demands for the future.



## Population Growth and Development

Most of the precipitation and snowmelt runoff occurs in the northern part of California, but the majority of the population lives in the drier central and southern portions of the State. This imbalance is not expected to change. According to population estimates issued by California's Department of Finance, Southern California counties will add more than five million people between now and 2050, an increase of 25% over the 2010 census numbers. Los Angeles is expected to remain the most populated county in California, followed by Riverside County, San Diego County, San Bernardino County, and Orange County, all of which portions of the most heavily populated areas fall within the watershed. With the projected increases in population growth, efforts to assure adequate water supply for the region will become more difficult. The crisis to water resources is not the growth of development *per se*, but how the water is used in new development that assures sustainability.

Huge areas of land gradually are being paved over in the watershed, which historically captured and recharged natural runoff into the groundwater and provides important replenishment water for pumping. Instead, the runoff from development is directed to storm sewers and channels that discharge to downstream rivers and streams and eventually are lost to the ocean. This tremendous amount of water that is no longer percolating into the ground is picked up along parking lots and streets and further contaminated by oil, grease, trash, bacteria, and fertilizer additives applied to adjacent landscaping. These byproducts represent a major water quality threat to downstream water bodies, many of which have been listed by water quality regulators as impaired, requiring total maximum daily loads. Taken cumulatively, the water lost from the resulting development when sustainable land use and water use practices are not in place, if continued unchecked, will become a major water crisis for the region, and is one of the four horsemen of the Apocalypse impacting water resources. The need for a water ethic for the preciousness of water, increased water capture and percolation, and improved land use practices will be required to handle this looming problem.

# 1.3 OWOW Plan 2.0
# Moving into Implementation

Santa Ana River

## Moving into Implementation

Building upon its statewide leadership role in integrated water resources planning since 1998, SAWPA and its stakeholders have worked hard to ensure that the integrated water resources planning for the Santa Ana River Watershed program not only meets the California Department of Water Resources (DWR) Integrated Regional Water Management (IRWM) Guidelines, but also actually raises the bar of what an Integrated Regional Water Management Plan (IRWMP) can achieve. By the OWOW 1.0 Plan and our previously approved and successful salt/nutrient management plan, SAWPA also has expanded its collaboration and stakeholder involvement to a broader and more effective level. The integrated regional water resource management approaches conducted in the past have set the framework to address needs for years to come.

However, as the next OWOW update was contemplated, rather than working harder on the old model, SAWPA resolved to create a new model so that stakeholders were not creating the same problems that we still are working to resolve. Instead, a new level in IRWMP planning was envisioned, whichbrings the process to an even higher and more effective model using a *system-wide approach* that creates a new template for collaboration and water management. Past IRWM plans have focused on the water supply professional, often with a focus on water supply reliability and assuring that additional imported water could be brought to regions to address ever growing demands. However, in light of the ongoing water scarcity challenges facing the State and our watershed, SAWPA recognized the need to establish a new planning approach that creates the catalyst for change that could potentially apply to all regions across the State.

This approach is different in that all sectors of our community (water suppliers, water consumers, stormwater managers, parks and recreation providers, environmental stewards, developers, etc.) would be encouraged to adopt a water ethic that focuses on living within our means and living in the

environment that nature has given us. It also is recognizing that excessive irrigation water use and waste creates downstream pollution. Often the problem in achieving solutions is not data gathering, but rather the sharing of existing water information so that water consumers can become the true stewards of water. That information is made available to all levels of the public to better understand where their water comes from, how it is used, what impacts we have on it, and where it goes after it is used. New or expanded existing Web-based tools would be developed to answer this need.

### Creating Anew

SAWPA, under OWOW 2.0 planning, sought to expand collaboration across multiple jurisdictional and institutional boundaries so that natural hydrology is restored, aquifers are protected, ecosystems are enhanced and improved, landscapes are developed appropriate to the arid environment in which we reside, and where people are not using water for waste transport downstream. The work addresses and recognizes the upstream and downstream dynamic. Through these efforts, we sought to resolve conflicts that will arise when more and more stormwater and recycled water is captured and stored upstream as a result of low-impact development and recharge and reuse activities, resulting in less water flowing downstream for their capture and reuse. Water quality challenges would be addressed resulting from nonpoint source pollution carried by stormwater, which is often captured and then recharged into our groundwater basins and aquifers for later use as a drinking water supply. Furthermore, this plan would create effective outreach and liaisons with disadvantaged communities, environmental justice communities, Native American Tribes, and land use planning sectors that would be key to implementing this new paradigm in integrated water resource planning.

## Highlights of New Model in IRWM Planning

As a first step, SAWPA developed a work plan that proposed to raise the bar so that all IRWM Plan Standards are met, all DWR IRWM program preferences are addressed, and the vision for the region is achieved. To accomplish this end and still achieve the OWOW Plan goals and objectives, a new integrated water management plan for the Santa Ana Region was proposed to focus on the following areas.

### Water Demand Reduction Strategies

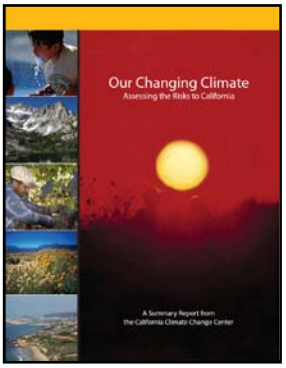
Developing education and outreach actions that encourage implementation of tier-based allocated water conservation rates for not just some, but all retail water agencies in the watershed. This encourages programs such as “Cash for Grass” and indoor water efficient appliance rebates, outdoor irrigation efficiency measures, and implementation of new programs where landscaping and irrigation experts are hired to educate homeowners, homeowner associations and businesses in better methods. It also provides incentives to retrofit high water use lawns and greenways into California Friendly and Water Smart landscaping. This education process would be supported by the development of new or expanded Web-based interactive tools that reach down not only to the water professional, but also to the public, increasing awareness of the full water cycle and water quality impacts to quality of life issues. These tools also would allow the public to continue to enjoy a high quality of life with less per capita water use.

## Water Quality Improvement and Awareness

Creating processes to assure that water sources used to replenish local supplies are safe and clean for public and environmental uses. With increased capture and collection of rainwater with subsequent recharge to local groundwater, assurance must be achieved that nonpoint source pollutants are addressed. Web-based tools would be developed or expanded upon so that the public has full access and an awareness of local water quality conditions of their lakes, streams, and beaches that they may be used for recreation throughout the region.

## Targeted and Expanded Community Outreach

Conducting outreach actions that reach deeply into disadvantaged communities, environmental justice communities, and Native American Tribal communities to support their needs for clean, safe, and reliable water supplies; using trusted facilitators with native language skills that connect with communities rather than relying on surveys or mailers that often are poorly translated and fail to address the water related needs of these communities.



## Restore Natural Systems and Hydrology

Establishing systems where hydrology is restored to its natural paths while preserving environmental habitat, parks and recreation opportunities. Exploring opportunities where mutual benefit projects can be identified that capture, store, and infiltrate rainwater with the assurances that the water is clean and safe for people and wildlife. Continuing the planning and removal of non-native, water-thirsty plants will restore the region's habitat and save water as well.

## Expand Collaboration

Build upon past successful collaboration models to create bridges to key U.S. and State landholders in the region such as the U.S.D.A. Forest Service, U.S. Bureau of Land Management, March Air Reserve Base, California State Parks, and Natural Resources Conservation Service. As a large percentage of the region and the headwaters are on Federal lands, collaboration with Federal entities is critical to the health of the watershed. Furthermore, with a recent MOU with the Bureau of Reclamation, Federal funding support became available to assist the planning process. Working with these Federal partners, our shared goals could be addressed to attend to water supply and water quality compliance issues, while protecting and enhancing the land.

## Climate Change and Energy Impacts

Evaluate complete system impacts of climate change drilling down to the water infrastructure operation and building level to determine greenhouse gas emissions, the sea level rise impacts to Orange County coastal areas, new policies that can assist water managers in providing the flexibility to adapt management actions to respond to changing hydrologic conditions, as well as the chain effects that climate change impacts have on other systems. For example, with less water conveyed to wastewater treatment plants based on water efficiency implementation, the impacts that need to be considered are more highly concentrated wastewater being conveyed to wastewater treatment plants that may result in possible increased treatment processing needs and energy usage. These energy impacts also may translate into other cost impacts associated with water recycling delivery and water quality compliance and protection.

## System-Wide Approaches and Leadership

Seeking to encourage water demand reduction for a region covering 2,650 square miles, six million people and over 65 water agencies is a daunting task. SAWPA and its member agencies and other water agencies in the watershed, are steadily making progress in encouraging water to be used wisely, especially outdoors. However, more must be done to achieve our vision of a high-functioning sustainable watershed. Consequently, new methods to spur change and to be the catalyst for new actions are needed on a watershed-wide, system-wide basis. New models must be developed that inspire behavior change to accomplish plan goals, create synergies, and develop inter-jurisdictional solutions. Using new system approaches developed under this plan for the Santa Ana River Region, a new template then can be shared with other Regional Water Management Groups and be incorporated into their IRWM plans. This would provide the leadership for their respective regions, similar to how LEED certification through the U.S. Green Building Council has caught on nationwide becoming synonymous with “green” building. The IRWM plans can and should become the guidepost for the water ethic and meeting “sustainability” goals for regions across the State.

To implement the work plan and adjust to current affairs, SAWPA and stakeholders needed to adapt to even greater challenges recognizing not only the Four Horsemen of the Apocalypse, but that the herd was growing. At the end of the first decade of the new century, Fiscal Crisis and Energy were identified as two additional Horsemen of the Apocalypse.

# Fiscal Crisis

Budget limitations are changing how we fulfill our goals. Because of the fiscal crisis faced by the Nation, the State, and the Watershed, funding for large scale projects is much less certain. Federal earmarks largely have vanished and future State Bond funding is shaky. Due to these financial limitations, we increasingly have called upon citizens and stakeholder to help craft responsible, sustainable solutions. Many challenges facing the water community today cannot be solved by technology, infrastructure, or engineering alone. Solutions popular in the 20th Century are too expensive today and have too large of a

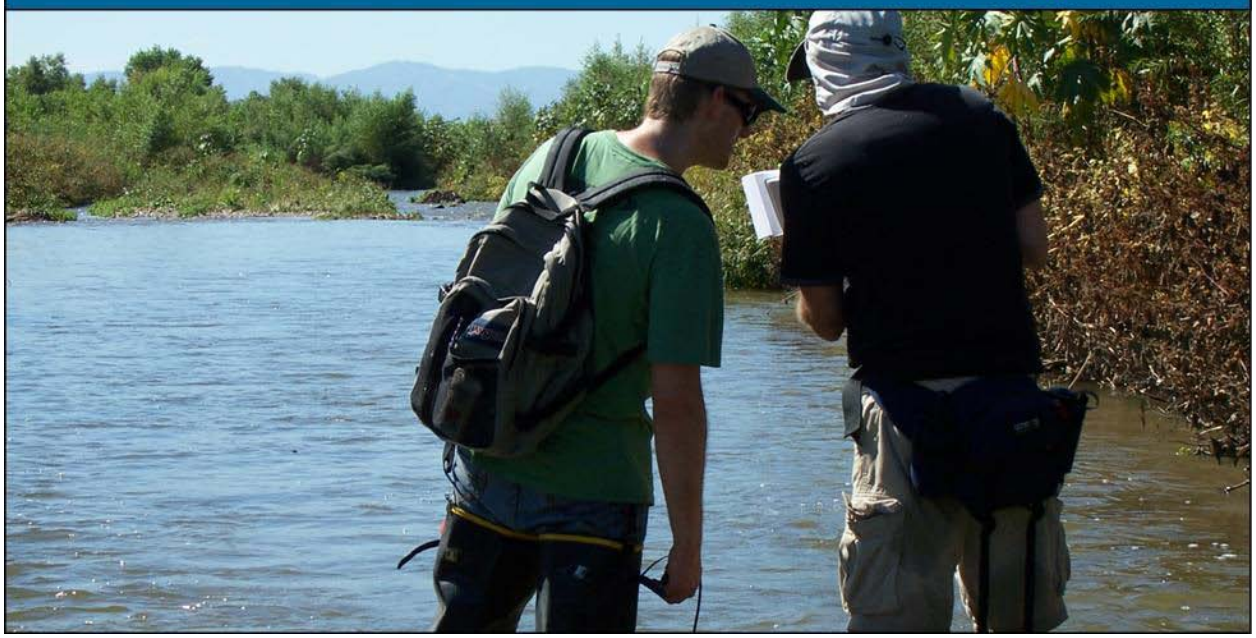
carbon footprint. We hope to solve our problems and meet our needs through collaboration and cooperative agreements in addition to engineering regional projects.

For the 21st Century, the solutions to water resources lie in developing multi-beneficial and collaborative regional solutions. Such projects allow minimal resources to be leveraged providing more "bang for the buck" and multi-needs are addressed through integration. Moreover, we need to look to our rates to support our investments, and this means we need to include our consumers as key stakeholders. We need to engender a water ethic and by this awareness of the water cycle, residents of the watershed will be more mindful of what they spend on water and seek ways to save water and save money.

## Energy

Solar Panels at Western Municipal Water District

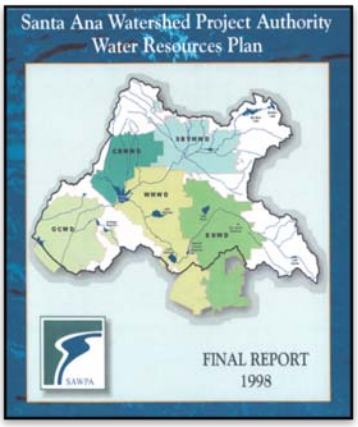
Nearly all water resources infrastructure requires energy, from wastewater treatment plants to groundwater wells; we need energy not only to maintain, but also to harvest this valuable resource. Approximately 19% of all energy in California is used to transport, treat, and heat water. It is clear that water infrastructure is highly energy intensive. However, this also is true the other way. Water is a valuable aspect of the energy production process from cooling towers to mining for oil and minerals. In fact, air-cooled energy production actually is less efficient than water-cooled energy production. We cannot have one without the other. We must realize this vital connection and work toward creating sustainable solutions. Many water agencies in the Santa Ana River Watershed have begun to turn to "greener" sustainable energy sources, such as solar arrays and turbines, alongside existing water infrastructure. Several agencies are researching new, innovative sources of alternative energy from mini-turbines in water conveyance pipelines to capturing energy produced during the wastewater treatment process. Moving the water industry in the watershed toward renewable sources of energy will ease the burden of water resource infrastructure.



Early adopters in the watershed include the Inland Empire Utilities Agency (IEUA), which is pursuing a progressive energy management strategy to be self-sufficient or "Gridless" by the year 2020. In 2008, IEUA installed 3.5 megawatts of solar power and a 2.8 MW fuel cell system. In 2012, IEUA installed 1 megawatt of wind energy at their northern water recycling plant. Western Municipal Water District (WMWD), which manages the Western Riverside County Regional Wastewater Authority, has installed more than 5,000 solar panels at their wastewater treatment plant that will provide up to 1 megawatt of energy during peak energy use hours. Eastern Municipal Water District has completed a 500 kilowatt solar photovoltaic renewable energy facility at its Administrative Campus, and has installed digester gas driven fuel cells at two of their water reclamation fuel cells providing energy during peak hours virtually free of charge, with no toxic emissions, and cutting greenhouse gases by more than 10,600 tons annually. San Bernardino Municipal Water District has installed a co-generation facility that uses the methane gas produced during the treatment processes to fuel two 750-watt generators that supply electricity to the San Bernardino Water Reclamation Plant. Solar arrays also have been installed at the

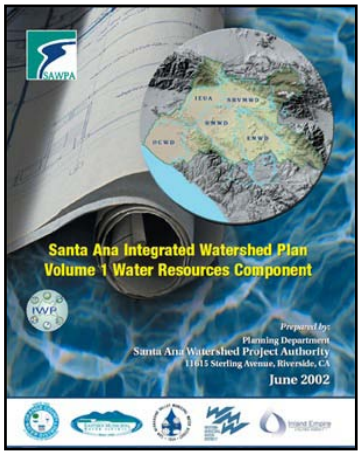
City of Redlands Wastewater Treatment Plant, Irvine Ranch Water District, Cucamonga Valley Water District, and Elsinore Valley Municipal Water District, which are all located in the watershed.

Due to this link between water and energy, to conserve water is to conserve energy. Unfortunately, we generally need a lot of hydro-electrical power and as river flows and dam levels shrink, so does our ability to generate electricity. Thus the path to sustainability not only relies on renewable and innovative energy sources, but also on reducing the amount of water that needs to be treated and pumped throughout the watershed.



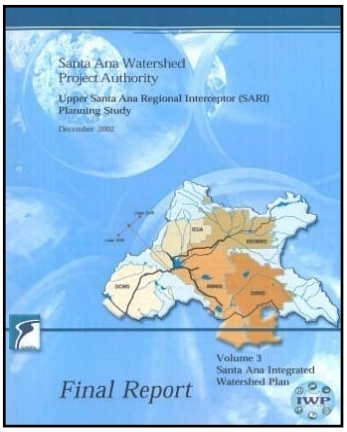
With the addition of these two new Horsemen of the Apocalypse and a new workplan in place, OWOW 2.0 kicked off its IRWM planning with the execution of the DWR IRWM Planning Grant in September 2011 and started with the review and collection of past and current local and sub-regional water planning documents.

# 1.4 Relation to Local Water Planning



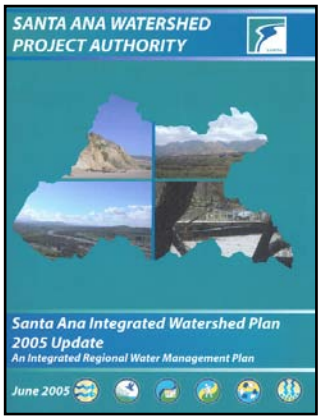
## History of Santa Ana River Watershed Planning

Since its formation, SAWPA and it member agencies have been on the forefront of water resource planning for the region. Initially formed as a regional planning agency in 1967, SAWPA undertook the first water quality management program study for the watershed. These early planning roots provided the important water quality data and analysis for the development of the first Regional Board Basin Plan. SAWPA since has worked closely with the Regional Board in all Water Quality Basin Plan Updates and watershed planning efforts.

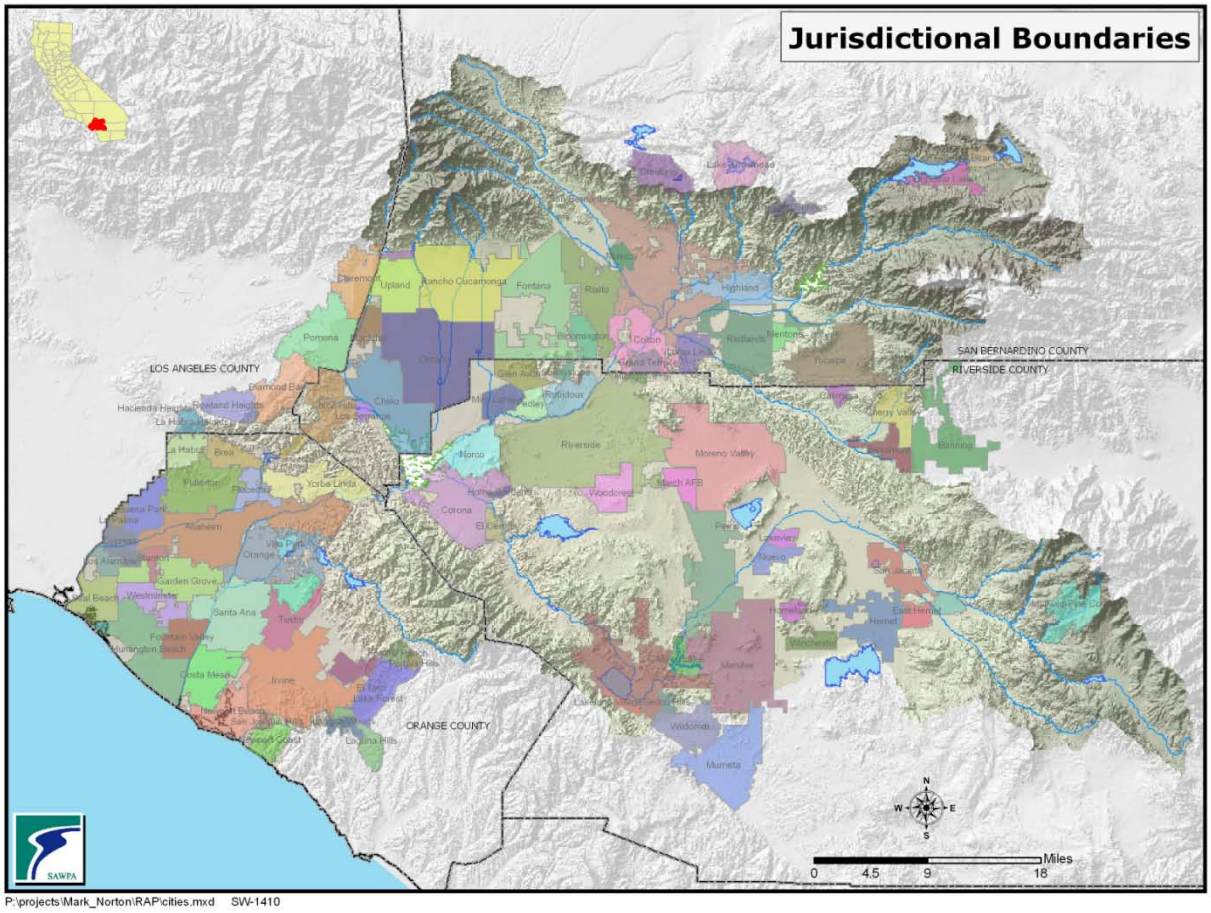


The 1998 SAWPA Water Resources Plan was one of the first watershed-wide water resource plans undertaken by SAWPA to optimize all available water resources in the watershed in an integrated fashion. This plan was initiated after Metropolitan Water District of Southern California (MWDSC) had kicked off their first Integrated Resource Plan in 1995. Because only three of the five SAWPA member agencies were MWDSC member agencies, the SAWPA Commission directed staff to prepare a similar water resource plan for the watershed that would examine all available water resource development opportunities and assets within the watershed. With one of the SAWPA member agencies, San Bernardino Valley Municipal Water District, also serving as an additional importing water agency and State Water Project Contractor within the watershed besides MWDSC, new water resource development projects were identified. This 1998 Plan was prepared entirely by SAWPA's planning staff.

In 2002, SAWPA updated and expanded the water resources planning in its Santa Ana Integrated Watershed Plan (IWP), a three-volume planning document that examines water resource management strategies to address regional needs in an integrated fashion. Water resource management strategies identified in this report included water storage, water quality protection and improvement, water recycling, storm and flood water management, and environment and habitat protection.



The first volume of the IWP is the Water Resources Component, a planning document that built upon member agency long-term water resource plans and management programs, thus providing a vehicle to ensure effective and concerted planning efforts on a regional basis. This volume also describes the necessary water resources projects to achieve zero reliance on imported water supply, and the amount of salt removal facilities necessary to achieve a salt balance in the watershed.
The second volume of the IWP is the Environmental and Wetlands Component. It describes the watershed-wide wetlands program and watershed plan that integrates wetlands, trails, habitat, open space, education, and invasive species removal.



The third volume of the IWP is the Upper Santa Ana Regional Interceptor (SARI) Planning Component, which provides a foundational evaluation of the upper SARI, the watershed brine disposal pipeline, and a future long-term beneficial use of the SARI as the critical facility required to meet the SAWPA goal of transporting highly saline, non-domestic discharges out of the upper watershed to protect its groundwater resources.

The first two volumes of the 2002 Integrated Regional Water Management Plan (IRWMP) were written and prepared by SAWPA planning staff, with the third volume prepared by SAWPA's consultant, CDM Smith. The 2002 three-volume report describes integrated water projects and provides justification for the first IRWMP in the State, described under the State Proposition 13 Water Bond. The success of this effort provided funding totaling $235 million for the watershed.

In 2005, SAWPA prepared the Santa Ana IWP 2005 Update, an IRWMP. This report, also prepared by SAWPA planning staff, updated much of the work from the 2002 report incorporating the Urban Water Management Plans (UWMPs) performed by SAWPA member agencies and sub-agencies, and provided an updated listing of priority projects to achieve the goals of the watershed stakeholders. Recognizing the significant size of the watershed in geography and population, and the sheer complexity of coordination and integration of projects, the 2005 report sought to briefly describe and highlight the many detailed resource planning processes and documents that led to a list of proposed prioritized regional projects, as opposed to serving as a detailed technical or scientific water resource evaluation in itself. Because of these efforts, the plan was ranked among

the top ten IRWMPs by California Department of Water Resources (DWR) staff, and provided the justification for $25 million from Proposition 50 IRWM implementation grant program.

## Planning from OWOW 1.0 to OWOW 2.0

### Integrated Regional and Sub-Regional Water Management Plans

Efforts to obtain improved water quality, sustainability, and other goals represented in the OWOW 2.0 Plan are practiced by water districts and agencies throughout the Santa Ana River Watershed. The IRWMP illustrates the collaboration of different projects, plans, policies, and task forces between SAWPA and other water agencies that strive to reach these goals. For example, in correlation with the Water Use Efficiency Pillar found in the OWOW 2.0 Plan, most water district/agencies administer programs that help reduce water demand through rebate programs on water efficient appliances, and educate the public through water-wise educational programs were described. Under the Water Resource Optimization pillar, several water resource management strategies are encouraged, including the implementation of water recycling programs. The OWOW 2.0 Plan stresses the importance of recycled water to the watershed as a whole, and suggests innovative approaches of recycled water use in a more cost effective systems approach. Through such project and program implementation, the region can support less dependence on imported water, particularly from the California State Water Project (SWP), constituting about 15%- 20% of the region's imported water. Also, SAWPA and its member agencies take initiative in employing water quality improvement and natural resource stewardship by teaming up with multiple task forces established within the region and sub-regions. OWOW 2.0 has worked with many sub-regional areas to provide assistance and improve overall

sustainability, such as the case of Lake Elsinore water quality improvements sitting at the downstream end of the San Jacinto River sub-watershed. The Plan proponents also have encouraged the continued support for Best Management Practices (BMPs). BMPs have proven to be very useful when applied to water related projects and construction. These BMPs have been executed by various districts in the effort to achieve higher water quality, reduce water demand, and achieve resource stewardship.

The overall success of the OWOW Plan is dependent upon the valuable input and local water planning documents from resource agencies across the watershed, including sub-regional IRWMs, Groundwater Management Plan's, Urban Management Water Plan's, County Flood Controls and Water Conservation Districts, and regional government agencies throughout the watershed. The OWOW 2.0 Plan does not replace or supersede local planning; rather the OWOW 2.0 Plan as a regional plan appropriately incorporates local planning elements. Most of the following sub-regional IRWPs were all developed and executed prior to the OWOW 1.0 Plan, but still serve as important resources to the current OWOW plan.

### *San Bernardino Valley Municipal Water District Sub-Regional IRWM*

San Bernardino Valley Municipal Water District (SBVMWD), as a sub- regional water agency, agreed to lead a planning effort and received a grant from the DWR to prepare their sub-regional IRWMP using Proposition 50 grant funding. The main benefit of this plan was the development of the process for managing the San Bernardino Basin Area, and also to obtain more detailed evaluation of water resource needs in the area. The plan was finalized in November 2007. Similar to the OWOW 2.0 Plan, this particular plan was carefully developed through the participation of water managers and stakeholders within the sub-region. This is a very important factor, integrating water plans either regionally or sub-regionally to help create a more sustainable watershed. The update for this sub-regional plan by SBVMWD is scheduled for the first part of 2014. For more information regarding the SBVMWD sub-regional IRWM visit www.sbvmwd.com.

### *Western Municipal Water District Sub-Regional IRWM*

The preparation of the IRWMP for Western Municipal Water District (WMWD) fulfills a need to address long range water supply planning in order to meet the future demands in a rapidly growing area, but also to meet the water supply reliability needs now and in the future. This plan was funded by Proposition 50 and was completed in November 2006. The essence of this IRWMP is the identification and evaluation of water management strategies that could increase local water supply, thereby improving water supply reliability. Additional benefits of the IRWMP are to address local and regional water quality issues; this process was started with discussions of WMWD's member agencies and stakeholders. No plans are anticipated at this stage to update this sub-regional plan by WMWD. For more information regarding the WMWD sub-regional IRWM visit www.wmwd.com.

### *San Jacinto River Watershed Sub-Regional IRWM*

The San Jacinto River IRWMP integrates input from a wide variety of organizations and individuals with a stake in water resource management issues. Development of this report was led by the San Jacinto River Watershed Council (SJRWC) with financial and in-kind support from a number of member and partnering agencies such as SAWPA, as well as local, State, and Federal government agencies, water suppliers, environmental groups, trade organizations, businesses, and individuals. Through a collaborative process, the San Jacinto River Watershed stakeholders were able to identify resource management strategies and associated sub-objectives that improved their sub-region. If improvements are made on a sub-regional level, it only makes the process of implementing the OWOW 2.0 Plan more efficient. No plans

are anticipated at this stage to update this sub-regional plan by SJRWC. For more information regarding the San Jacinto Watershed sub-regional IRWM visit www.sawpa.org/collaboration/projects/san-jacinto-river-watershedcouncil.

### *Central Orange County Sub-Regional IRWM*

The Central Orange County IRWMP addresses critical water resource management needs for the Newport Bay Watershed and the Newport Coast Watershed. This plan was completed on September 2012. Within this developed area are fragile coastal ecosystems with designated critical coastal areas and areas of special biological significance. The Central Orange County sub-regional IRWMP incorporates the tenets of integrated regional water management planning to address challenging issues related to flood risk management, water quality, water supply, habitat, balanced environmental sustainability, and collaboration. It was developed with stakeholder input from a diverse set of views to develop a common vision of the most urgent resource needs within the watersheds. The purpose of the Central Orange County Plan is to provide a bridge between existing and developing watershed planning efforts, allowing collaboration that is more effective and more opportunities to leverage agency resources across jurisdictions. For more information regarding the Central Orange County sub-regional IRWMP, visit ocwatersheds.com.

### *Santa Ana Regional Board Basin Plan*

The State Water Resources Control Board (State Board) and the nine Regional Water Quality Control Boards (Regional Boards) are responsible for the protection and, where possible, the enhancement of the quality of California's waters. The State Board sets statewide policy, and together with the Regional Board, implements State and Federal laws and regulations. Each of the nine Regional Boards adopts a Water Quality Control Plan, or Basin Plan, which recognizes and reflects regional differences in existing water quality, the beneficial uses of the region's ground and surface waters, and local water quality conditions and problems. The Santa Ana River Region includes the upper and lower Santa Ana River Watershed, the San Jacinto River Watershed, and several other small drainage areas. The Santa Ana River Region covers parts of southwestern San Bernardino County, western Riverside County, and northwestern Orange County. The Basin Plan for the Santa Ana River Region is more than just a collection of water quality goals and policies, descriptions of conditions, and discussions of solutions. It also is the basis for the Regional Board's regulatory programs. The Basin Plan establishes water quality standards for the ground and surface waters of the region. The term "water quality standards," as used in the Federal Clean Water Act, includes both the beneficial uses of specific water bodies and the levels of quality that must be met and maintained to protect those uses. The Basin Plan includes an implementation plan describing the actions by the Regional Board and others that are necessary to achieve and maintain the water quality standards. For more information regarding the Santa Ana River Regional Board Basin Plan visit www.swrcb.ca.gov.

## Urban Water Management Plans

The UWMP developed by retail agencies in the watershed have served as a valuable resource to the OWOW planning effort particularly to the Water Resource Optimization Pillar in evaluation of water demands and supplies. The UWMPs are prepared by California's urban water suppliers to support their long-term resource planning and ensure adequate water supplies are available to meet existing and future water demands. Every urban water supplier that either provides over 3,000 acre-feet of water annually or serves more than 3,000 or more connections, is required to assess the reliability of its water

sources over a 20-year planning horizon, considering normal, dry, and multiple dry years. This assessment is to be included in its UWMP, which is to be prepared every five years and submitted to the DWR. SAWPA has gathered all the UWMPs for this region for analysis.

One big difference observed in the 2010 UWMPs used for the OWOW 2.0 plan over previous OWOW planning, was the inclusion of SBX7-7 water conservation requirements. Reporting on agency plans to reduce overall agency water use by 20 percent per capita by the year 2020 was supported by legislation passed in November 2009 as a new requirement. Water demand is very important to urban areas, so it is vital that these areas practice water use efficiency to the fullest extent. In addition, local agencies are encouraged to ensure the reliability of local supplies in any natural event. These practices encompass a broad range from Water Use Efficiency Programs to groundwater desalination plants. The value of these local Water Use Efficiency Programs is the need to transfer BMPs for water use efficiency successfully practiced by one agency over other agencies, so that efficiency in programmatic development and implementation result. OWOW 2.0 has recognized the importance of water use efficiency by acknowledging this as its own Pillar, the Water Use Efficiency Pillar, serving as a roundtable forum to share techniques and procedures to reduce water demand and increase supply. The work from this Pillar is integrated with other pillars, particularly as implementation actions are suggested resulting from the Water Resource Optimization Pillar and the Operational Efficiency and Water Transfer Pillar. Implementation actions can be as simple as checking for leaks throughout a supply line on a regular basis, or implementing more efficient water conveyance strategies through the system. These are only some of the programs and practices encouraged by OWOW.

## County Flood Control and Water Conservation Plans

The watershed is home to three different county flood control districts; Riverside County Flood Control and Water Conservation District, San Bernardino County Flood Control District, and Orange County Flood Control District. The OWOW 2.0 Plan has integrated the planning efforts of these different flood control and water conservation districts, as well as offered support in consideration of system-wide projects. Such efforts are discussed in more detail in the Stormwater Resource and Risk Management Pillar of the OWOW 2.0 Plan.

Flood control and water conservation districts and OWOW 2.0 both support implementing a strategy of fully utilizing natural channels and other environmental features within the flood control system, while evaluating opportunities for stormwater recharge as a future drinking water source. Flood control channels and adjoining detention basins can play an important role also in serving as groundwater recharge facilities in the watershed. In turn, fewer negative impacts would be anticipated to the environment, thus protecting surrounding natural habitats. Through the integration of the flood control plans with other local water resource plans, new multi-benefit approaches will continue to be investigated. It is through the implementation of these synergistic solutions that help improve water quality and capture more water for recharge, while meeting the standards in their respective counties. Overall, county flood control and water conservation agencies have a tremendous influence on the sustainability of the watershed by their practices. It is through stakeholder collaboration with these agencies that key system-wide solutions will arise for the future. For more information visit the county flood control websites and **Chapter 5.8 Stormwater: Resource and Risk Management.**

## Basin and Ground Water Plans

There are dozens of groundwater basins in the watershed that each require careful planning and monitoring. These groundwater basins play a pivotal role in the sustainability of the Santa Ana River Watershed, and are discussed in more detail under **Chapters 5.4 Water Resource Optimization** and **Chapters 5.10 Operational Efficiency and Water Transfers**.

The West San Jacinto Groundwater Basin Management Plan was adopted in 1995. Annual reports on the status of groundwater and water resources efforts in the area have been published since 1996. The 2007 Annual Report compiled, reviewed, evaluated, and analyzed 2007 groundwater quality and water level monitoring program data, summarized groundwater-related changes, and reported results of an extraction monitoring program and status of previous recommendations.

To the east, the Hemet/San Jacinto Water Management Plan was completed in November 2007 by Eastern Municipal Water District, Lake Hemet Municipal Water District, and the Cities of Hemet and San Jacinto to guide and support responsible water management. The plan's objectives include reducing the historical impact of overdraft caused by past groundwater production, increasing recharge of the groundwater basin, providing for the water rights of the Soboba Tribe, ensuring water supply reliability, providing for planned urban growth, and protecting and enhancing water quality. Options to increase water supply and reliability include developing underutilized sources, particularly recycled water and imported water. To accomplish the plan's objectives, the Hemet/San Jacinto Integrated Recharge and Recovery Program are being implemented. This program includes the construction of numerous water supply and conjunctive use projects such as direct and in-lieu recharge, increased use of recycled water, increased conservation, and improved monitoring.

The Chino Basin Watermaster (CBWM) is the manager of Chino groundwater basin. The CBWM prepared the Optimum Basin Management Plan, which describes the state of the basin in terms of historical groundwater levels, storage, production, water quality, and safe yield. Current and projected water demands and water supply plans are described. The goal of the plan is to develop a groundwater management program that enhances the safe yield and the water quality of the basin, enabling all groundwater users to produce water from the basin in a cost-effective manner. The plan includes a monitoring program for groundwater levels, as well as programs for monitoring well construction, abandonment, and destruction.

The City of Corona prepared a Groundwater Management Plan (GWMP) for the Temescal, Bedford, and Coldwater sub-basins. The conditions of each groundwater basin were described including groundwater levels, production, and quality. Current and projected water demands and supplies were evaluated. Basin management objectives were determined and management strategies were set. The objectives include:

- Managing the groundwater basin in a sustainable manner
- Preventing substantial water level declines in the Channel Aquifer
- Protecting groundwater quality in the unconfined aquifer
- Maintaining required outflow at Prado Dam
- Monitoring groundwater levels, quality, and storage

The Orange County Water District prepared the GWMP 2009 Update for the Orange County Groundwater Basin to identify key issues related to groundwater management. The three major objectives are to protect and enhance groundwater quality, protect and increase the basin's sustainable yield, and increase the efficiency of operations. Recommendations in the report to proactively manage the basin include:

- Monitoring water quality and groundwater levels
- Managing groundwater recharge
- Managing groundwater quality by controlling seawater intrusion, evaluating emerging constituents, and preventing future contamination
- Implementing projects to clean up existing contamination problems
- Preparing an integrated demand and supply program

These plans are important to the entire area because they help promote water storage, water supply and reliability, and improved water quality. This coincides with the OWOW 2.0 Plan that encourages all districts/agencies to create a sustainable watershed through better development of basin and groundwater plans, and is a brief summary of some types of methods, goals, and objectives being implemented in the watershed. More information may be found in **Chapter 5.5 Beneficial Use Assurance**.

## Low Impact Development Planning

Low Impact Development (LID) proves to be a very useful tool both regionally and inter-regionally. LID offers many different multi-beneficial gains once properly developed and utilized. OWOW recognizes the importance of LID and encourages it through the Land Use and Water Planning Pillar. Some of the benefits that projects like these could contribute are increased water supply and improved water quality, while practicing resource stewardship. By using water in an effective manner, the Santa Ana River Watershed comes one more step closer to becoming more sustainable. More information may be found in **Chapter 5.7 Land Use and Water Planning**.

## Stormwater Management and Watershed Action Plans

Stormwater management is a crucial part to the development of a more sustainable watershed. Planning for high quality stormwater management allows the Santa Ana River Watershed to improve overall flood control. The plans to implement these strategies mostly are found through local flood control and water conservation districts plans, and watershed action plans required in the MS4 permits for each of the counties in the watershed. The watershed action plans further support the need for collaboration between flood control and water conservation agencies with water agencies in the watershed particularly as regional low impact development practices are considered. OWOW 2.0 has implemented strategies that aid the idea of creating more efficient stormwater management through the increase of stormwater utilization. By doing so, the Santa Ana River Watershed grows in becoming more self-efficient. More information may be found in **Chapters 5.4 Water Resource Optimization**, **Chapter 5.5 Beneficial Use Assurance** and **Chapter 5.8 Stormwater: Resource and Risk Management**.

## Salt and Salinity Management Plans

Another influence OWOW has on regional and sub-regional areas is salt and salinity management. It is important that the salt within the watershed be regulated accordingly in order to improve water quality. This is described more in detail in **Chapter 5.5 Beneficial Use Assurance**. Essentially, salt always has been an issue since the utilization of the Santa Ana River and imported water. Salt always will remain,

which is why the OWOW 2.0 Plan has encouraged the improved management of salt, which has been able to improve the quality of water throughout the Santa Ana River Watershed. SAWPA has been a leader in the State in preparing salt and nutrient management plans with ongoing triennial reporting of groundwater management zone salt and nitrogen monitoring, as well as annual reporting of salt and nutrients in the Santa Ana River. More information may be found in **Chapter 5.5 Beneficial Use Assurance**.

## Emergency Response/Disaster Plans

OWOW supports the integration into the current OWOW 2.0 Plan of emergency and disaster planning in relation to water resources. All major water agencies have an Emergency Response Plan or a Disaster Plan that were used as a resource in evaluating a multi-hazard preparation response. The purpose of these plans is to be prepared for any type of possible event, natural or unnatural. These events typically include storms, earthquakes, drought, or terrorist attacks. Being prepared for any of these disasters allows each sub-region to be self sufficient for a period of time. More information may be found in **Chapter 5.8 Stormwater: Resource and Risk Management**.

## Forestry Service/Fish and Game Planning

Located within the Santa Ana River Watershed are three national forests: the Angeles National Forest, which covers over 650,000 acres and is located northwest of the Watershed; Cleveland National Forest, which covers 460,000 acres and is located in the southern area of the watershed; and San Bernardino National Forest, which covers over 670,000 acres and is located in the northern and eastern areas of the watershed. National forests provide habitat and a safe haven for threatened and endangered plants and animals, as well as provide people with opportunities for recreation in a natural environment. OWOW 2.0 safeguards natural habitats through its Natural Resources Stewardship Pillar. These influences help protect the natural environment and water supplies.

The watershed receives the majority of its local water from rain and snow fall in and around the San Bernardino, San Gorgonio, and the San Jacinto Mountain's forest areas. Precipitation in these areas provides surface water and groundwater basin recharge throughout the region. SAWPA's involvement and implementation of the OWOW 2.0 plan have been able to properly assist in forest planning efforts related to water recharge. These efforts help reduce the risk of any resulting physical, chemical, and biological impacts due to wildfires, which preserves the water that is captured within the forest. In correlation with the Natural Resources Stewardship Pillar, OWOW 2.0 was able to support the California Department of Fish and Wildlife (CDFW), to help protect natural habitats of certain species along the Santa Ana River. OWOW 2.0 also supports TMDL Nutrient Monitoring and Fishery Enhancements, which have given indigenous species vital habitat to call home in the Santa Ana River Watershed.

Through collaborative interests, developers of the OWOW 2.0 Plan, the USDA, the Forest Service San Bernardino National Forest, and Cleveland National Forest were able to create the Forest First Initiative. The purpose of this initiative is to encourage further cooperation among the Forest Service and downstream groundwater management agencies, recharging agencies, flood control and water conservation districts and resources agencies to proactively improve the resilience of the watersheds in the Santa Ana River Watershed that are critical in delivering quality water supplies. This initiative, through involvement of the OWOW 2.0 Plan, was able to offer multi-beneficial results both regionally and inter-regionally by providing high quality water to its constituents. More information may be found

in **Chapters 2.3 Collaboration, Coordination and Integration** and **Chapter 5.9 Natural Resources Stewardship**.

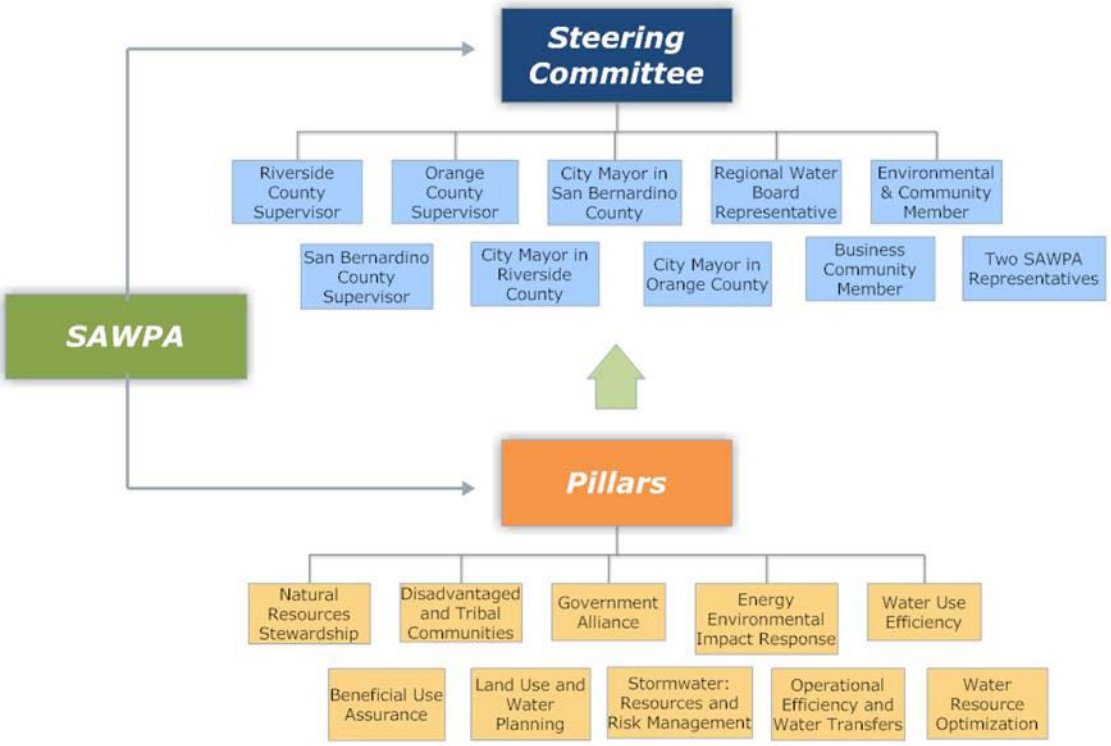
# 2.1 Governance Structure

OWOW Steering Committee

## OWOW Governance



In developing the One Water One Watershed (OWOW) Integrated Regional Water Management (IRWM) plan for the Santa Ana River Watershed, a decided "bottom up" approach was envisioned for governance, as opposed to a "top down" approach. The core of this approach was that unlike previous Santa Ana Watershed Project Authority (SAWPA) IRWM plans or other IRWM planning approaches across the State, every effort was made to allow the key discussions of major water resource issues, concerns, problems, goals and objectives, and potential solutions to originate and be fully vetted at the stakeholder level – the stakeholders being the local agencies, organizations, and other interested parties within the Santa Ana River Watershed. By expanding the involvement and collaboration of stakeholders at the "on-the-ground" level, it was possible to incorporate the deeper understanding of local issues afforded by stakeholders, and generate greater buy-in and support.

Consequently, if one were to ask where the governance for the Santa Ana River Watershed OWOW process originates, we believe it is at the grass-roots level, the foundation of a decentralized and collaborative "big tent" approach. OWOW governance takes place at several levels:

- Involvement from the watershed community at large through the creation of ten working groups (referred to as **Pillars** referencing the foundation of the governance structure) representing different water issues, and in charge of identifying issues, proposing potential solutions, and writing the OWOW Plan
- The Steering Committee, composed of elected officials and representatives from the three counties, municipalities, water districts, the private sector, and the environmental and regulatory communities, were tasked with the development of the goals and objectives of the plan, strategic

decision-making, project prioritization, and issuing recommendations

- The Santa Ana Watershed Project Authority Commission (Commission), a Joint Powers Authority, provides final direction, review, and approval
- SAWPA administration and staff are in charge of facilitating this bottom-up approach to watershed planning

## Pillars

In order to manage the technical and planning work, the stakeholders are organized into separate workgroups, or Pillars, centered on specific water resource management areas, issues, or concepts. They are identified, named, and may be dissolved by, the Steering Committee. Some of the areas where the Pillars support and assist SAWPA staff are in offering creative ideas, conducting brainstorming, vetting ideas, assisting with regional coordination, assisting with outreach efforts, gathering or reviewing data or information, or developing or reviewing analysis.

Under the OWOW 1.0 Plan, ten Pillars originally were established and organized along resource management areas, largely aligned with the Resource Management Strategies identified in the DWR Proposition 84 Guidelines.

| | | | |
|---|---|---|---|
| 1. | Water Supply Reliability | 2. | Flood Risk Management |
| 3. | Water Quality Improvement | 4. | Environment and Habitat Enhancement |
| 5. | Water Recycling | 6. | Parks, Recreation, and Open Space |
| 7. | Water Use Efficiency | 8. | Climate Change |

| | |
|---|---|
| 9. Water and Land Use | 10. Environmental Justice |

The Pillars consist of approximately 10 to 60 volunteers depending on the topic and interest level. The volunteers include participants from local agencies, special districts, non-profit organizations, university officials, Native American Tribes, and private citizens. Each Pillar group is led by a volunteer chair and co-chair, if assigned, with expertise in the water issue assigned to each particular group. The Pillar Chairs are responsible for organizing, leading, and facilitating the workgroup process. The Pillar Chairs were selected based on ad-hoc recommendations to SAWPA by stakeholders, and SAWPA contacted each to determine interest in serving in these positions. The final list of Chair appointments was approved by the Steering Committee and ratified by the SAWPA Commission. No limits are placed on the duration of the position; however, a Pillar Chair may hold only one Chair position at a time.

OWOW Pillar Kickoff meeting

In addition to identifying issues and potential strategies for their particular area of interest, the Pillars were asked to view the watershed problems from a multidisciplinary perspective that extended beyond their topic, and to consider other Pillars' perspectives. For example, the Water Supply Pillar had to keep into consideration environmental and habitat restoration issues when developing their strategies. Through this process, synergies were developed and multi-benefit programs were identified. For example, through this approach, it was possible to incorporate the understanding that many downstream water resource and water quality problems could be more effectively and efficiently addressed upstream at the source, thus requiring collaboration with other entities. Over time, this collaboration among the pillar groups provided a more unified vision resulting in new integrated and multi-beneficial solutions to water resource challenges, which increased collaboration among jurisdictions and geographies. To further encourage collaboration between Pillars, the responsibilities of each were designed to overlap. This overlap enhances the benefits of a unified vision for the watershed.

Pillar work product development is a consensus process. If there are disagreements on specific recommendations, the Steering Committee provides guidance. Pillars are added or subtracted by the Steering Committee as needed to address planning needs. Pillar Co-Chairs, with assistance from SAWPA staff, are responsible for maintaining notification lists of interested stakeholders and notifying them of meetings. SAWPA staff provides lists of interested stakeholders to Pillar Co-Chairs and assists with meeting postings and notifications. Pillar Committee meetings are open to all interested parties.

Another role of the Pillar Co-Chairs is to provide support and input to SAWPA staff as they make recommendations to the Steering Committee about the OWOW goals and objectives. As technical experts in various water resource fields, the Pillar Co-Chairs provide important feedback to the Steering Committee. The Pillar Co-Chairs periodically meet and act, in collaboration with SAWPA staff, as a technical management committee for reviewing and making recommendations to the Steering Committee and to the Commission relative to implementation of the Plan and development of specific proposals for funding. The Pillar Co-Chairs also support SAWPA staff as a technical management committee to provide oversight for OWOW projects.

One of the main functions of the pillar groups is to prepare the water resource management strategy chapters of the OWOW Plan. Under the OWOW 1.0 Plan, each pillar group prepared a chapter of the Plan, documenting current conditions and issues, and describing current and future watershed management strategies. Under OWOW 2.0, the Pillars updated the chapters to reflect recent changes and focused efforts on proposing new regional and integrated projects and programs to address the goals and objectives of the Plan.

It is important to point out that the planning approach taken for the development of this Plan transcends previous integrated regional water resource planning efforts by de-emphasizing planning solely as a prerequisite for an impending grant funding opportunity, or for the development of a list of specific projects. Rather, the emphasis was placed on building a collaborative approach amongst stakeholders to help meet long-term (2030 time horizon) goals and objectives in an integrated and multi-beneficial manner.

### *OWOW 2.0 Plan Pillar Updates*

In July 2011, as part of the OWOW 2.0 Plan development, SAWPA and the OWOW Steering Committee reviewed the OWOW Plan and made several beneficial revisions to the OWOW 2.0 Pillar structure to promote collaboration between groups for a more well-rounded vision. A listing of the new Pillars with their alignment with the DWR Proposition 84 IRWM Guidelines is as follows:

| Pillars | Corresponding DWR Prop 84 Guidelines Resource Management Strategies |
|---|---|
| Water Resource Optimization | Reduce Water Demand<br>Improve Operational Efficiency and Transfers<br>Increase Water Supply<br>Improve Water Quality |
| Beneficial Use Assurance | Improve Water Quality |
| Water Use Efficiency | Reduce Water Demand |
| Land Use and Water Planning | Increase Water Supply<br>Improve Water Quality<br>Practice Resource Stewardship |
| Stormwater Resource and Risk Management | Improve Flood Management |
| Natural Resources Stewardship | Practice Resource Stewardship |
| Operational Efficiency and Water Transfer | Improve the Efficiency of Water Transfers and Infrastructure in the Watershed |
| Disadvantaged and Tribal Communities | Included in Guidelines as part of Impact and Benefit Standard |
| Government Alliance | Create Partnerships between DWR and Member Agencies |
| Energy and Environmental Impact Response | Included in Guidelines as a Separate Standard |

The Water Recycling Pillar was combined with the Water Resource Optimization Pillar. The Water Quality Improvement Pillar was renamed the Beneficial Use Assurance Pillar to better suit its change in responsibilities. The Climate Change Pillar was changed to the Energy and Environmental Impact Response Pillar to reflect the inclusion of the water-energy nexus. The Environment and Habitat Pillar was renamed the Natural Resources Stewardship Pillar to better fit its responsibilities. The Water and Land Use Pillar was changed to the Low Impact Development Planning Pillar; however, by consensus, the Pillar indicated a preference to be renamed the Water and Land Use Planning Pillar, as the Pillar stakeholders felt that Low Impact Development Planning was not comprehensive enough for their subject matter. The Environmental Justice Pillar was changed to the Disadvantaged and Tribal Communities Pillar to better fit its responsibilities. The Flood Risk Management Pillar was revised to the Stormwater Resource and Risk Management Pillar. The Parks, Recreation and Open Space Pillar was removed and folded under Natural Resources Stewardship Pillar, and both a Government Alliance Pillar and Operational Efficiency and Water Transfer Pillar have been added. These changes better reflect the Pillar goals and objectives of the OWOW 2.0 Plan and are reflected in the table above. In addition to the ten new pillar categories, each Pillar now shares leadership among the co-chairs.

Similar to the original Pillar Chair selection, Co-chairs were selected based on ad-hoc recommendations to SAWPA by stakeholders. SAWPA contacted each to determine interest in serving in these positions. The final list of co-chairs was approved by the OWOW Steering Committee and the SAWPA Commission.

Voluntary participation in any Pillar was encouraged through OWOW workshops, email blasts, and the OWOW annual conference.

In late summer of 2011, the new Pillars started meeting monthly to begin the process of updating their chapters, and they evaluated how their area of resource focus could fulfill the OWOW vision, goals and objectives. A SAWPA staff liaison shared with each of the Pillars that the OWOW 2.0 Plan would not merely be an update of information gathered under the OWOW 1.0 Plan. Rather, emphasis was placed on the need for each Pillar to examine what multi-beneficial, multi-jurisdictional implementation projects and programs could be developed and described to address the regional needs. The Pillars also were encouraged to work with other pillar groups as the need arose to assure integration and to avoid duplication of work.

The time commitment by the Pillar Co-chairs and other volunteers varies based on the intensity of the activity, the phase of work, and the personal initiative of the participant. On average, the time commitment is on the order of 10-15 hours per month.

After the completion of the OWOW 2.0 Plan, the pillar groups and other interested stakeholders likely will continue meeting to advance the system-wide projects and programs and to explore new opportunities for collaboration, particularly as funding opportunities arise.

## Steering Committee

The next level of governance up from the foundation of the Pillars is the OWOW Steering Committee. The Steering Committee's role is to serve as the developer of integrated regional water management goals and objectives for the watershed, and to act as the oversight body that performs strategic decision making, crafts and adopts programmatic suites of project recommendations, and provides program advocacy necessary to optimize water resource protection for all. These are described in more detail below.

The OWOW Steering Committee consists of eleven (11) members from the three (3) counties (Orange, Riverside, and San Bernardino) that are within the Santa Ana River Watershed regional planning area. The following describes the composition of the Steering Committee:

- One Supervisor from Orange County
- One Supervisor from Riverside County
- One Supervisor from San Bernardino County
- One Mayor or City Council Member from a City within the Region of Orange County
- One Mayor or City Council Member from a City within the Region of Riverside County
- One Mayor or City Council Member from a City within the Region of San Bernardino County
- Two SAWPA Commission representatives selected by the SAWPA Commission
- One member of the business community
- One member of the environmental community
- One member of the Regional Water Quality Control Board

In September 2012, the transition of Steering Committee members was clarified with adoption of an amended governance document defining the position terms and transition process. The selection and transition process is as follows:

The Steering Committee members serve a four-year term with staggered end dates, and may be appointed for multiple terms. A seated member who loses the status upon which membership on the Steering Committee is based (e.g. leaving an elected office), will continue as a member of the Steering Committee through the balance of that Steering Committee term, or until the entity that selected him/her selects a new representative. Steering Committee members are selected as follows:

- SAWPA Commission representatives shall be selected by the SAWPA Commission
- County Supervisors shall be selected by their respective Boards
- City representatives shall be selected by a majority vote of the Council of Governments in the respective county:
    - Western Riverside County Council of Governments [WRCOG] – Riverside County
    - San Bernardino Association of Governments [SANBAG] – San Bernardino County
    - Orange County Council of Governments [OCCOG] – Orange County
- Business and environmental community representatives shall be selected by a majority vote of the eight governmental representatives on the Steering Committee, based on an application process conducted during a public meeting
- The Regional Water Quality Control Board representative is selected by the Santa Ana Regional Water Quality Control Board

The time commitment associated with the Steering Committee participation is somewhat dependent upon the development activity of the OWOW planning process, and whether or not a funding opportunity occurs. Generally, the Steering Committee meets quarterly during the OWOW planning process. However, when funding opportunities arise, the OWOW Steering Committee input is more time-intensive with more frequent meetings, usually bi-monthly. The Committee plays a key role in providing direction and input to SAWPA staff in the process of updating the project selection criteria development, rating and ranking, and approval of projects for funding based on the project solicitation package defined by the grant administrator. Overall, from the "Call for Projects" to the approval of project selection for funding rounds under Proposition 84, the process usually takes about ten (10) months. To assure continuity and support for the OWOW Steering Committee, SAWPA provides full administrative support, with participation of the SAWPA General Manager at its meetings.

### *Functions of the OWOW Steering Committee*

The Steering Committee is responsible for the development of the Plan. This includes receiving input from staff of their respective agencies, as well as SAWPA staff, providing direction for the development and long-term maintenance of the Plan, and development of a project prioritization process. The Steering Committee may make recommendations to the SAWPA Commission on proposed amendments to this governance document. Any such proposed amendments do not take effect unless approved by the SAWPA Commission.

In implementing the Steering Committee's Goals and Objectives, the Steering Committee will:

1. Acknowledge that water resources of the Santa Ana River Watershed Region should be put to maximum beneficial use and that water waste must be prevented.
2. Acknowledge water as a public resource and respect existing agreements governing the water resources of the Santa Ana River Watershed Region.
3. Seek regional solutions for regional problems.
4. Encourage collaboration across boundaries and between multiple parties in project development.
5. Consider sub-regional plans and planning efforts.

During the OWOW process the Steering Committee will complete the following functions:

1. Provide incentives for the development of multi-benefit integrated projects through the allocation of State Bond funds.
2. Oversee the development of an integrated watershed management plan.
3. Identify institutional barriers and opportunities for more efficient management that further advance the integration of water management activities.
4. Advocate for policy changes the increase interagency effectiveness and efficiency in integrated water management.

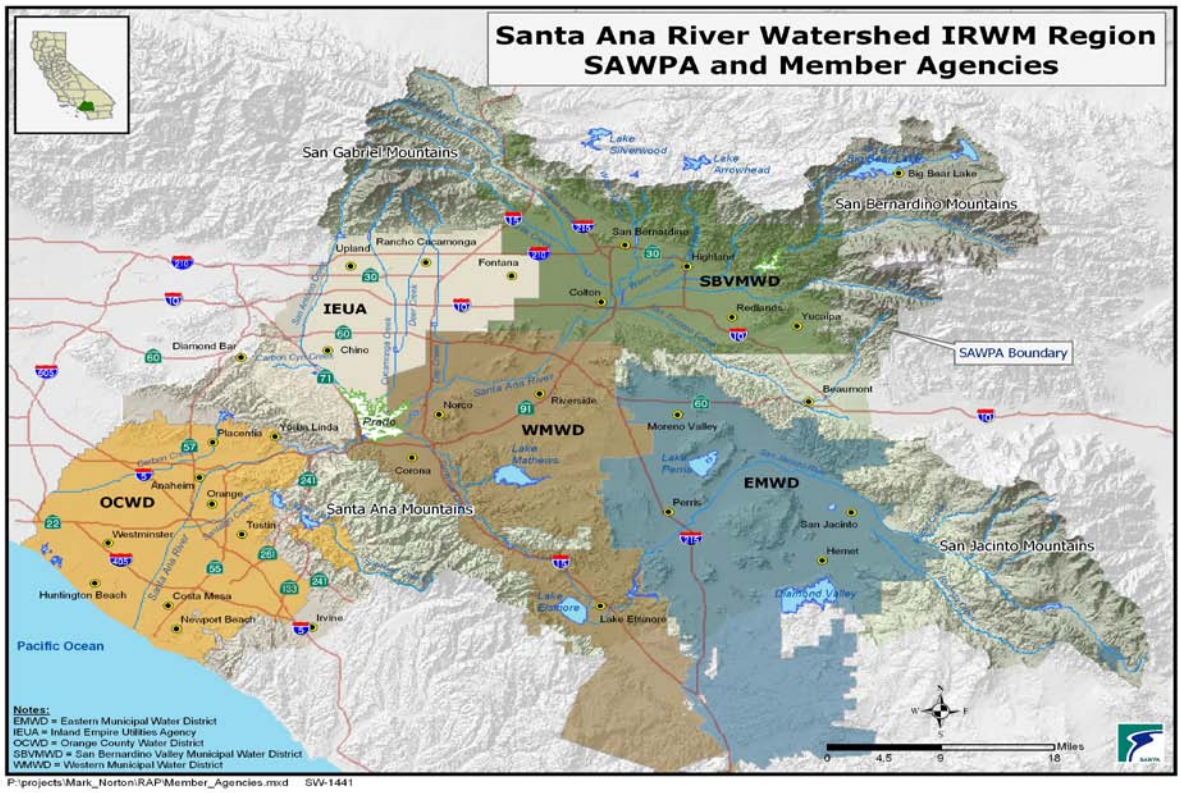
As funding opportunities arise to implement the OWOW plan, the Steering Committee provides the SAWPA Commission an updated Santa Ana River Watershed Region IRWM plan and programmatic portfolio of projects specific to the funding opportunity. The Steering Committee is responsible for the development and implementation of the project selection criteria.

Besides involvement through the OWOW outreach and Pillars, the public also can voice their opinion during the public and noticed meetings held by the Steering Committee. The Steering Committee meetings are held at least annually with the provision that special meetings may be called as needed. All Steering Committee meetings are conducted in accordance with the Ralph M. Brown Act. Meeting minutes are prepared and kept by SAWPA staff and posted on the SAWPA website.

## SAWPA Administration

The other arm to the governance of the OWOW process includes the management function conducted by SAWPA. As a regional water agency for the Santa Ana River Watershed, SAWPA has a long history of supporting regional collaborative efforts of this kind. As with previous IRWMP efforts for the Santa Ana River Watershed, SAWPA serves as support in providing administrative and facilitative assistance to the pillar groups and the Steering Committee for the overall OWOW Plan development.

### *SAWPA and its Member Agencies*



SAWPA is the designated Regional Water Management Group (RWMG) for the Santa Ana River Watershed, and the one DWR-recognized IRWM region within the watershed. SAWPA is a Joint Powers Authority focusing on a broad range of water resource issues including water supply reliability, water quality improvement, recycled water, wastewater treatment, groundwater management, brine disposal, and integrated regional planning. Its stated mission is to develop and maintain regional plans, programs, and projects that will protect the Santa Ana River basin water resources to maximize

beneficial uses within the watershed in an economically and environmentally responsible manner. As a joint powers authority consisting of more than three local agencies, with more than two (2) of which has statutory authority over water supply or water management, the RWMG meets the requirements of CWC 10540, 10541 and 10539.

SAWPA consists of twenty three (23) staff members and serves at the direction of the SAWPA Commission that is composed of its five (5) member agencies, all of which have statutory authority over water supply and water management in their service areas. These five (5) agencies represent the majority of the water management authorities and stakeholders within the region boundary.

SAWPA carries out functions useful to its five (5) member agencies: Eastern Municipal Water District (EMWD), Inland Empire Utilities Agency (IEUA), Orange County Water District (OCWD), San Bernardino Valley Municipal Water District (SBVMWD), and Western Municipal Water District (WMWD). The jurisdiction of SAWPA and its member agencies spans approximately 2,800 square miles of the Santa Ana Watershed encompassing much of Orange County, a sliver of Los Angeles County, and the major population centers of western Riverside and southwestern San Bernardino Counties. Each of these agencies plans and executes long-term projects and management programs of their own; however, it primarily is the agencies working through SAWPA that provide the vehicle for effective and concerted planning efforts on a regional basis.

**Figure 2.1-1 Santa Ana River Watershed IRWM Region SAWPA and Member Agencies**

## Eastern Municipal Water District

Eastern Municipal Water District is a retail water agency servicing an area of approximately 555 square miles in western Riverside County. EMWD serves a population of approximately 675,000 in six (6) incorporated cities and unincorporated portions of western Riverside County. In addition, to its role as a retail agency, it also provides wholesale water to the sub-agencies; Lake Hemet Municipal Water District, City of Hemet, City of San Jacinto, City of Perris, Nuevo Water Company, Elsinore Valley Municipal Water District (EVMWD), and Rancho California Water District.

As a member agency of the Metropolitan Water District of Southern California (MWD), EMWD gained a supply of imported water from the Colorado River Aqueduct (CRA) and ultimately, water from northern California through the State Water Project (SWP), which transports water from northern California via the California Aqueduct. EMWD's initial mission was to deliver imported water to supplement local groundwater supplies. Over time, EMWD's role changed as additional agency responsibilities were added, including groundwater production and resource management, wastewater collection and treatment, and finally regional water recycling.

## Inland Empire Utilities Agency

Inland Empire Utilities Agency's service area covers about 242 square miles in the southwestern corner of San Bernardino County, and serves a population of approximately 800,000. IEUA provides regional wastewater service and imported water deliveries to eight (8) contracting agencies. These include; the City of Chino, City of Chino Hills, Cucamonga Valley Water District (CVWD), City of Fontana, City of Montclair, City of Ontario, City of Upland, and Monte Vista Water District.

As a member agency of MWD, IEUA provides supplemental water, as well as regional wastewater treatment for both domestic and industrial clients, and energy recovery/production facilities. In addition, the Agency has become a recycled water purveyor, biosolids/fertilizer treatment provider, and continues to focus on water supply salt management to protect the region's vital groundwater supplies.

## Orange County Water District

Orange County Water District's service area covers more than 350 square miles and the Orange County Groundwater Basin. The basin provides a water supply to more than 20 cities and water agencies, serving over 2.3 million people. OCWD owns 1,600 acres in and near the Santa Ana River (SAR) in Anaheim and Orange, which it uses to capture flows and recharge the groundwater basin. OCWD also owns 2,400 acres above Prado Dam, which uses it for water conservation and water quality improvement.

OCWD's mission is to manage and protect the Orange County Groundwater Basin in northern and central Orange County. The groundwater basin supplies approximately two-thirds of the water used by over two million residents in this District's service area. The balance is imported from the Colorado River and from northern California through the Sacramento/San Joaquin Delta SWP by MWD.

### San Bernardino Valley Municipal Water District

San Bernardino Valley Municipal Water District's service area covers about 325 square miles, primarily in southwestern San Bernardino County with a very small portion of its service area in Riverside County. The area within SBVMWD includes a population of around 600,000. SBVMWD spans the eastern two-thirds of the San Bernardino Valley, the Crafton Hills, a portion of the Yucaipa Valley, and includes the cities and communities of San Bernardino, Colton, Loma Linda, Redlands, Rialto, Bloomington, Highland, Grand Terrace, and Yucaipa. SBVMWD's mission is to import water into its service area through participation in the California SWP. SBVMWD also is charged with managing groundwater and surface water within its boundaries through various court judgments.

### Western Municipal Water District

Western Municipal Water District's service area covers a 527 square mile area of western Riverside County, with a population of about 825,000 people. WMWD serves more than 24,000 retail and eight wholesale customers with water from the Colorado River and the SWP. As a member agency of MWD, WMWD provides supplemental water to the cities of Corona, Norco, and Riverside, and the water agencies of Box Springs, Lee Lake, Elsinore Valley, and Rancho California, as well as serving customers in the unincorporated areas of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Mathews, and March Air Reserve Base. WMWD also operates and maintains domestic and industrial wastewater collection and conveyance systems for retail and contract services customers in Lake Hills, March Air Reserve Base, Home Gardens, Corona, and Norco.

About one-fifth of the water that WMWD purchases from the MWD comes from the CRA, and about four-fifths from the SWP, which transports water from Northern California via the California Aqueduct. WMWD currently imports a small quantity of water from the San Bernardino basin and intends to increase these imports with the implementation of the Riverside-Corona Feeder project. WMWD also has several wells for pumping in its Murrieta Division.

#### *Role of SAWPA and member agencies in RWMG process*

As a regional water agency for the Santa Ana River Watershed, SAWPA has had a long history of supporting and developing integrated regional water management plans. Over its four decades of existence, SAWPA has assisted with the preparation of the Santa Ana Regional Water Quality Control Board Basin Plan, as well as multiple watershed management plans. Over the last 15 years, integrated watershed plans became an emphasis in regional water planning, and frameworks for such plans were shared by federal agencies. SAWPA, as a watershed entity, took the lead in preparing these plans for the Santa Ana River Watershed. Under its 2002 Santa Ana Integrated Watershed Plan, SAWPA staff wrote and prepared much of the three-volume document and administered consultant services in some support roles. SAWPA staff and its consultants conducted extensive outreach with stakeholders throughout the watershed. Collaborative outreach meetings were held in multiple locations throughout the watershed to assure that input was obtained and included in the Plan. This role was repeated with the June 2005 Update; the report was prepared almost entirely by SAWPA staff with extensive outreach similar to the 2002 effort.

In the current update to the IRWM Plan, the OWOW Plan, SAWPA staff serves in providing administrative and facilitative assistance to water resource management working groups (OWOW Pillars) and the OWOW Steering Committee for the overall OWOW Plan development. This role includes hiring and managing consultant services to support the planning and project selection criteria development process. In addition, SAWPA provides decision support tools to assist the Steering Committee and Pillars in decision-making processes, provides planning documents to allow Pillars to build upon previous existing plans, and performs significant public outreach and education about the integrated planning approach for the Santa Ana River Watershed.

### *SAWPA RWMG Administrative and Oversight Role*

The SAWPA Commission and SAWPA staff is the regional water management group (RWMG) and is responsible for all administrative oversight for the Plan, and for coordinating all on-going administrative responsibilities associated with its implementation. This includes arranging for meetings of the OWOW Steering Committee, preparing agendas, taking and distributing minutes of the meetings, preparing staff reports when directed by the SAWPA General Manager, and other related duties. The Commission reviews the Plan for compliance with applicable laws and guidelines. In the event that no issues or inconsistencies are detected with the Plan or project selection process, the Commission approves the Plan and the project prioritization as submitted by the Steering Committee. Should the Commission determine that the Plan or a specific selected portfolio of projects fails to meet applicable laws and guidelines, it will refer the Plan back to the Steering Committee for further revision and subsequent re-submittal to the Commission for reconsideration and ratification.

Additionally, SAWPA provides decision support tools to assist the Steering Committee and Pillars in decision-making processes, provides planning documents to allow Pillars to build upon previous existing plans, and performs significant public outreach and education about the integrated planning approach for the Santa Ana River Watershed.

Another role that SAWPA plays as the administrator of OWOW and the Regional Water Management Group for the Santa Ana River Watershed is to work closely with several sub-regional IRWM planning efforts in the watershed that took place prior to, or concurrent with, the OWOW planning process. Of particular interest was the need to assure that proper coordination and incorporation of the excellent work conducted by the sub-regional IRWM planning groups was included in the OWOW plan. SAWPA staff conducted outreach to all stakeholders of the sub-regional IRWM planning efforts, and invited their stakeholders to participate in the pillar processes. In some cases, SAWPA staff even participated in the sub-regional IRWM planning process. Where sub-regional IRWM plans previously were completed, these plans were shared with the Pillars to serve as background material to their Pillar planning efforts. In all cases, SAWPA took a lead role in coordinating the sub-regional IRWM lead agencies to assure that their planning work would be folded into the OWOW watershed-wide process as seamlessly as possible. It is understood that the Steering Committee will be responsible for the development and implementation of the project selection criteria.

As previously indicated under the Steering Committee role, as funding opportunities arise to implement the OWOW Plan, the Steering Committee will provide to the SAWPA Commission an updated Plan and programmatic portfolio of projects specific to the funding opportunity. The Commission will review the plan and programmatic project portfolio to ensure that these fulfill the intent and requirements of the specific funding mechanism, any legislation authorizing the funding, all legal requirements as defined by the funding administrative agency and equitable application of the benefits of the project portfolio across the entire region. Review of these items and the project selection process is conducted by the Commission in a public meeting open to all interested stakeholders. If the Commission is unable to ratify a specific portfolio of projects, the Commission will send it back to the Steering Committee.

SAWPA serves as the State liaison for the Santa Ana region, on behalf of the OWOW stakeholders, responsible for all final report submittals, plan adoption processes, grant application submittals, and administrative oversight for the Santa Ana OWOW IRMW Plan funding. As lead, SAWPA also works closely to coordinate with neighboring IRWM regions to coordinate water resource planning efforts. In many instances, joint interregional projects have evolved resulting in relationship building and development of common interests. These cooperative activities with neighboring and overlapping IRWM regions undertaken under OWOW 2.0 planning are explained in detail under **Chapter 2.3 Collaboration, Coordination and Integration**.

Another role that SAWPA administration played particularly under the OWOW 2.0 Plan was to establish individual SAWPA staff liaisons for each of the Pillar workgroups. Although conducted largely informally, SAWPA staff was available to aid the volunteer Pillars in ensuring that new DWR IRWM plan standards were conveyed, and overall direction of the planning process was provided. In some cases, where pillar groups struggled with participation, SAWPA staff also aided a few of the Pillars with support material, consultant support for in-depth analysis, development of tables and graphs, meeting notes preparation and meeting scheduling services. This was largely the exception to the general rule, however, with most Pillars effectively running their own meetings, preparing meeting notes and preparing their own OWOW chapter write-ups.

To support an emphasis on implementation and integration, SAWPA arranged multiple meetings with all ten (10) Pillar Chairs and Co-chairs in the development of a watershed framework document to develop templates for integration and multi-beneficial projects and programs. SAWPA hired three (3) leading watershed thinkers to work with the Pillar Chair in crafting a guidance document that each Pillar then could use to assist them in crafting their own new implementation projects and programs for the future. Cross pollination of new projects and programs among the Pillars was encouraged by SAWPA to promote integration and innovation in the development of new implementation solutions for the region.

## Governance Structure Evaluation

As part of the OWOW 2.0 Plan, an evaluation was conducted of the OWOW governance structure to ensure that the existing structure does in fact reflect a balance of interested persons or entities representing different sectors and interests, and provides them the opportunity to participate,

regardless of their ability to contribute financially to the IRWM Plan. Consideration was given to other possible governance models that address inefficiencies in the interplay between different authorities and roles of Federal, State, local and tribal governments in management water resources as described in a September 2010 publication prepared by the Johnson Foundation Freshwater Summit entitled *Charting New Waters: A Call to Action to Address U.S. Freshwater Challenges.* Periodic self examination and assessment of appropriate water resource governance was considered important to ensure that such governance reflects a jurisdictional framework that integrated water quality and quantity management across geographic scales of governance, and to make recommendations about how to streamline intergovernmental interactions if such improvements are necessary. Further, opportunities should be explored to expand the application of successful cross-jurisdictional governance models that can be adapted to different authorities, create opportunities for local level leadership and innovation, and establish inter-jurisdictional dispute resolution mechanisms.

As an initial step, the DWR Plan guidelines were reviewed to determine requirements for IRWM governance. Requirements for governance are defined as follows:

Regional decision making process - In describing decision making, define how information is collected and processed within the governance structure, and how a decision is vetted with stakeholders in the RWMG.

Equal distribution of power and voice among stakeholders – Define what structures or procedures are in place that ensure there is an equal playing field for all stakeholders involved in the RWMG.

Equal opportunity and representation of stakeholders in multiple roles (leadership, advisory) regardless of economic and power status within the RWMG – Define roles in the governance structure and explain how someone occupies that role. Explain how the governance structure invites participation in the workings of the RWMG.

Terms of service for positions within the structure – Define the kind of time commitment that the positions require and their turn over.

The next step of the examination was to conduct a survey of other similar scale RWMGs in California to evaluate their governance structures and to consider strengths and weaknesses. **Table 2.1-1** shows a comparison of five other RWMGs.

**Table 2.1-1 Comparison of Five other RWMGs**

| Similar IRWM Region | Lead Agency | RWMG Agreement | Governance Structure | Governance Committees | Governance Roles | Governance Members |
|---|---|---|---|---|---|---|
| North Coast | County of Humboldt | MOU. Evaluating formation of North Coast Region Joint Powers Authority, or similar legal entity | Seven counties and six North Coast Tribes comprise the leadership of the North Coast IRWMP. | The NCIRWMP consists of a collaborative partnership between the NCIRWMP Policy Review Panel (PRP), the Technical Peer Review Committee (TPRC), project staff, consultants, and the stakeholders within the North Coast Region. | NCIRWMP Policy Review is supported in their evaluation of projects and plan development by the Technical Peer Review Committee (TPRC). The TPRC is comprised of technical & agency staff appointed from each County Board of Supervisors and Tribal representatives. | With the exception of Modoc County, with one representative, the PRP consists of two representatives appointed by each County's Board of Supervisors and three Tribal Representatives appointed by North Coast Tribes. |
| Bay Area | Bay Area Water Agencies Coalition | Letters of Mutual Understanding (LOMUs) | Organized into four Functional Areas (FA):<br>(1) Water Supply & Water Quality (BAWAC)<br>(2) Wastewater & Recycled Water (BACWA),<br>(3) Flood Protection & Stormwater Management (BAFPAA), and<br>(4) Watershed Management & Habitat Protection and Restoration (BAWN).<br>The Coordinating Committee (CC) is composed of a Chair and Vice Chair. There are 12 voting reps made up of three reps from each FA, each of which has statutory authority over water resources. | Representatives from agencies that represented the four Functional Areas (FAs) formed and provided oversight for the IRWMP process, called the San Francisco Bay Area IRWMP Coordinating Committee. An additional organization structure was formed based on demographic and geographic divisions for the Bay Area. East, West, South, North. | The CC is responsible, directly or through participating agencies, for decision-making and actions including, but not limited to, establishing IRWMP goals and objectives, prioritizing projects, identifying financing for CC and IRWMP activities, implementing Plan activities, making future revisions to the IRWMP, hiring and managing consultants, coordinating, authorizing and/or approving grant proposals and managing funding agreements. | The CC is composed of representatives from Bay Area water supply agencies, wastewater agencies, flood control agencies, ecosystem management and restoration agencies, regulatory agencies, nongovernmental organizations (NGOs), and members of the public. |
| Ventura County | Watersheds Coalition of Ventura County, Ventura County Executive Office and Resource Management Agency Planning Division(staff lead) | MOU | Watershed Coalition of Ventura County (WCVC) working with two new watershed committees/councils. | Calleguas Creek Watershed Management Plan Steering Committee, Santa Clara River Watershed Committee, Ventura River Watershed Council. In addition to the watershed committees, a subcommittee was formed under WCVC to review water management strategies and evaluate the effectiveness of certain types of projects and programs in addressing these strategies. | The WCVC, and its three watershed committees, are engaged in a variety of local planning efforts designed to address the objectives developed by the watershed committees. | The Group includes 41 local governmental agencies (Cities, water agencies, County agencies, local, State and Federal agricultural service agencies), non- governmental organizations (environmental organizations, homeowners groups and public interest groups), and consultants. The majority of the Group, 17 members, represented water and sanitation districts with direct retail supply and/or treatment responsibilities. |

**Table 2.1-1 Comparison of Five other RWMGs (Continued)**

| Similar IRWM Region | Lead Agency | RWMG Agreement | Governance Structure | Governance Committees | Governance Roles | Governance Members |
|---|---|---|---|---|---|---|
| LA County | Los Angeles County Flood Control District, RWMG Chair | MOU of Leadership Committee | Leadership Committee and five Subregional Steering Committees | Leadership Committee has 16 voting members including LC Chair; Chairs and Vice-Chairs of the five Subregional Steering Committees; and five stakeholder agencies representing the following Water Management Areas: Groundwater, Surface Water, Sanitation, Open Space, and Stormwater. | Each of the ten Subregional SC representatives to the LC is elected by the SCs as Chairs and Vice-Chairs of their SCs. The alternate representatives to the LC for each of the five Subregions also serve as Alternates to the Chairs and Vice-Chairs on the SCs. Both the Subregional Chair and Vice-Chair representatives are elected by a majority vote of each Subregional SC according to the rules defined by each SC. The five Water Management Area LC members are elected from nominations provided by SCs. | The Leadership Committee also includes 5 ex-officio (non-voting members), including: California State, Coastal Conservancy, United States Bureau of Reclamation (USBR), United States Department of Agriculture (USDA) Forest Service: Angeles National Forest, United States Department of the Interior, National Park Service, United States Army Corps of Engineers (USACE): Los Angeles District |
| San Diego | San Diego County Water Authority, City of San Diego, County of San Diego | MOU among three entities | Regional Policy Committee provides policy-level input to the IRWM Plan and includes subject matter experts representing environmental groups, academic entities, local business, agricultural groups, water suppliers, wastewater agencies, water quality interests, and regulatory agencies. | Water Authority Member Agency Technical Advisory Committee, Project Clean Water, Project Clean Water Watershed Protection Technical Advisory Committee, Stormwater Copermittee Management Committee | The RAC served as the primary organization that provided direction to the RWMG for plan preparation | The RAC includes representatives of public agencies that serve disadvantaged communities. Additionally, disadvantaged community interests are addressed by several non-government organizations within the RAC. |
| Santa Ana | SAWPA | JPA among five member water resource agencies | Steering Committee and SAWPA Commission | Pillar groups with chair and co chairs based on 10 water resource management strategies | Steering Committee provides policy direction on IRWM Planning. SAWPA reviews and ratifies Steering Committee actions. | Steering Committee is composed of 11 members with 3 county Supervisor and 3 city Mayors from three counties, two water agency reps, development rep, environmental rep, and Regional Board rep |

Recognizing that SAWPA originally was formed as a joint powers authority in 1968 with five (5) member water agencies, apparent from the start of the OWOW 1.0 planning process was the need to expand the governance structure to form a Steering Committee composed of a broader spectrum of watershed stakeholders. The OWOW Steering Committee was developed and organized by SAWPA to reflect not strictly a water agency emphasis, but a cross section of many types of stakeholders such as DACs and Tribes as well as water resource sectors such as stormwater and flood control, thus providing equal opportunity and representation throughout the watershed. Through the Steering Committee, better decision making and distribution of power and voice is provided to the stakeholders of the watershed in the planning process as opposed to only involving the five (5) original water resource agencies of SAWPA. This process of adding a diverse stakeholder governance committee layer follows the path taken by most other IRWMs.

In evaluating other RWMG government structures to SAWPA's OWOW governance, one of the most striking differences was how SAWPA utilized the Pillars approach to reflect one of the most comprehensive involvement and grass roots processes in the integrated regional water management planning across the State and is quite unique. Using the Pillars centered on water resource strategies and asking their voluntary involvement even to the scale of composing and authoring sections or chapters of the OWOW 1.0 Plan, as well as the OWOW 2.0 Plan, has helped to ensure strong buy-in and support by all those who have participated. This approach is highly unusual as compared to other IRWM where a single consultant usually is hired to oversee the IRWM plan development and work with stakeholder groups for input, but with the consultant ultimately responsible for writing the plan. Further, it appears that approximately half of all the recognized 48 IRWM regions across the State utilize the same consultant for their IRWM plan development. This uniform and more cookbook approach for plan preparation, though effective in assuring consistency with meeting IRWM guidelines and requirements, may fail to meet the buy-in and support of stakeholders or achieve the synergistic development of integrated regional solutions as observed in the Santa Ana River Watershed, and perhaps a few other IRWM regions.

Another observation in review of governance structure models in comparison to the current OWOW governance is the emphasis on a fair, neutral, and transparent approach in the selection of projects for funding that meet the goals and objectives of the OWOW Plan. A separate body of outside reviewers is asked to review a rated and ranked list of recommended projects to ensure that the projects reflect the selection criteria approved by the Steering Committee and the SAWPA Commission, and are validated for veracity. Rather than parceling out funding based upon the five JPA SAWPA member agency jurisdictions or subwatershed or subregions as observed in many other RWMGs, the best projects are selected that meet the OWOW project selection criteria and OWOW goals. By this process, SAWPA plays a more neutral role as facilitator rather than as judge or sole governance of funding distribution.

A common concern observed in many IRWMs is the challenge of assuring the involvement of the often under-represented Native American Tribes and DACs in the RWMG governance. To improve governance representation to be more effective under OWOW 2.0 planning, SAWPA revised the OWOW Pillars to include Native American Tribes with the DACs as a distinct Pillar on par with other water resource Pillars. Representation of Native Americans' interests also has occurred at the Steering Committee level with

the 2012 transition of the San Bernardino County Supervisor on the Steering Committee. The new Supervisor selected by the San Bernardino County Board of Supervisors to serve on the OWOW Steering Committee is also a Native American tribal member from a tribe located within the watershed. Sworn in as a member, James Ramos is the first Native American to be elected to the San Bernardino County Board of Supervisors and the OWOW Steering Committee. Mr. Ramos also serves on the California State Native American Heritage Commission.

Also a concern to be addressed was assuring involvement of Federal and State governments in management of water resources under OWOW planning as evidenced in the previously mentioned publication *Charting New Waters: A Call to Action to Address U.S. Freshwater Challenge.* To remedy this challenge, a separate and new Pillar was established called the Government Alliance Pillar. Chaired by a representative from the U.S. Bureau of Reclamation (Reclamation) and co-chaired by a representative from the regional office of the U.S. Army Corps of Engineers, the Government Alliance Pillar included representatives from multiple Federal, State and local agencies and tribes including Reclamation; Army Corps of Engineers; U.S. Fish and Wildlife; Army Corps of Engineers; U.S. Bureau of Indian Affairs; U.S. Geological Survey; U.S. National Park Service, U.S. National Marine Fisheries; U.S. Forest Service; U.S. EPA; California Fish and Wildlife (formerly California Fish and Game); Santa Ana Regional Board; Calif. Dept of Public Health; CAL-Fire; Calif. Dept of Water Resources; Soboba Native American Tribe; San Manuel Native American Tribe, and the emergency support services of all three counties within the watershed. The Government Resource Guide developed by the Government Alliance Pillar will assist coordination among the Federal, State, and local agencies in the implementation of future projects, and will serve as a valuable resource to all stakeholders for years to come.

Finally, in review of the governance structure, it should be mentioned that of the support to the OWOW planning process from the roughly ten (10) multi-agency task forces that SAWPA currently administers as a regional and watershed facilitator. These task forces range from a focus on surface and groundwater water quality issues, to threatened species preservation and restoration, to establishing park and recreation trail opportunities that are integrated with water resources. Taken together, these task forces constitute over one hundred different agencies and organizations in the watershed. The work coming out of these task forces that often involve retail and wholesale water agencies, groundwater management agencies, wastewater agencies, NGOs, businesses, universities and other organizations have been integrated into the OWOW planning processes expanding the support and involvement of stakeholders throughout the Santa Ana Region.

## Planning Updates and Adoption

The OWOW Plan will be a “living document” and will be updated every three to five years in a coordinated manner with local, regional and statewide plans. Plan updates will be adopted formally by the Steering Committee and ratified by the SAWPA Commission. There may be occasions where informal changes that reflect minor process, organizational, or water management changes are conducted by SAWPA staff. The Pillars will continue to be an instrumental part of the update process by providing technical expertise and ensuring that the points of view of different disciplines and interest groups are taken into consideration.

Plan updates will incorporate, for example, changes to city General Plans, land use elements, Stormwater Management Plans, Water and Wastewater Master Plans, Urban Water Management Plans, County land use planning documents, and the Southern California Association of Governments (SCAG) land use data.

In addition, new water management strategies will be incorporated into future versions of the Plan as additional knowledge is gained on the state of the watershed, new technologies and best practices, and changes in policy and public mindsets. Furthermore, the Plan will be updated as necessary to comply with the requirements of future grant funding opportunities.

One example where subsequent formal action was taken by the Steering Committee after adoption of the plan occurred was the addition of several stormwater projects under Proposition 1E Stormwater program. Since many grant programs include language that projects must be cited in the IRWMP, SAWPA has been approached to add these from time to time. SAWPA typically will update its project priority list as part of the funding round opportunities, and then fold these into the next OWOW plan to be adopted. If SAWPA is solicited to add a significant number of projects after the formal "Call for Projects" deadline has passed or after formal adoption of the OWOW Plan, then amendments to the adopted plan may be necessary, with formal approval by the Steering Committee at publicly noticed Steering Committee meetings. If approved, such amendments then are forwarded to the SAWPA Commission for ratification. Re-adoption of the OWOW Plan by the Commission with formal public hearings for these amendments is not considered necessary, as these are considered fairly insignificant changes to the Plan and affect only the Project List in the last adopted OWOW Plan.

To ensure awareness of ongoing planning and projects, stakeholders have been invited to submit projects to SAWPA, both implementable and conceptual, if they so choose using our on-line project information form. The online project information form requires data about the project similar to what is requested under the previous OWOW "Call for Projects" for funding rounds. As an informal practice, project proponents that complete the on-line project information and submit their project information on-line can be considered as a part of the list of projects under the OWOW Plan for their outside grant submittal needs. However, in order to be considered for future IRWM funding through OWOW, rating and ranking by OWOW Governance must occur. Further, each SAWPA OWOW "Call for Projects" solicitation typically conducted under an IRWM funding round starts anew, inviting collaborative parties to submit both conceptual and proposed projects and programs for consideration and evaluation, and must abide by the deadlines and criteria for project evaluation defined under the OWOW program. If a project proponent does not have access to the on-line project information tool, special arrangements will be made to accommodate project data submittal needs.

The OWOW Plan will be provided to cities, counties, water suppliers, nonprofit organizations, and other regional and State agencies for use in their water resource planning efforts. It is anticipated that the findings will support planning efforts and updates to General Plans, Strategic Plans, and other plans and programs. The document also will be helpful input to the Metropolitan Water District of Southern California Integrated Resources Plan, and the State of California DWR Water Plan.

### *IRWM Plan Adoption*

The SAWPA Commission and all its member agencies adopted the SAWPA IRWMP known as the "One Water One Watershed (OWOW)" Plan 1.0 in November of 2010. Since the time of its adoption, the Plan was amended formally in March 2011 to include additional Proposition 1E eligible stormwater projects to the Plan's project list.

In September 2011, an update to the OWOW 1.0 Plan was initiated and is known as the OWOW 2.0 Plan. Prior to commencing work on the update, SAWPA published a formal notice of intention to prepare a plan in September 20, 2011. The emphasis of the OWOW 2.0 Plan is not only to update the planning data, but to emphasize and describe regional implementation projects and programs that meet the OWOW 2.0 goals and objectives. The OWOW 2.0 Plan is anticipated to be adopted by the OWOW Steering Committee and SAWPA Commission in early 2014, with formal notice of intention to adopt the Plan to be published prior to adoption in accordance with Section 6066 of the Government Code.

# 2.2 Stakeholder Involvement and Outreach

Santa Ana River Watershed Conference 2013

## Stakeholder Involvement and Outreach

Engaging stakeholder involvement in a large, diverse watershed is challenging. It is unlikely that any one individual "knows" all of the stakeholders, and as such, the development of mailing lists and notification of workgroup meetings can be daunting. The One Water One Watershed (OWOW) process was designed to be different from other planning processes. One critical difference is that OWOW was designed to be a "bottom-up", rather than a "top-down" process. By encouraging participation from different groups of people and those holding varying viewpoints from throughout the Watershed, the capacity to reach larger numbers of stakeholders also grew.

Similar to our OWOW 1.0 Plan, many of the same procedures, processes, structures and tools were used for stakeholder outreach. However, in some cases where these tools were not deemed effective in reaching adequate numbers of an interest group, they were not used under OWOW 2.0 planning. Thus an evolving process of determining the most effective means of reaching out to involve stakeholders and groups occurred. For example, three (3) forms of outreach used under OWOW 1.0 planning were discontinued under OWOW 2.0 planning. These included the Podcasts, Beam Blasts, and virtual web-based meetings based on relatively light use. New social media outreach tools were established in place of those tools.

For a full timeline of major OWOW 2.0 milestones, including stakeholder outreach events like the OWOW 2.0 Conferences, see **Appendix M**.

## Pillars

The OWOW Pillars represent one of the most effective means to insure public involvement in the planning process. Invites to participate in the Pillar meetings are made through the planning process and are voluntary in nature. Members of the public may choose to participate in one or many Pillars based on their level of interest. Each Pillar is led by a subject area expert, and that person receives a list of volunteers, but as a Pillar leader he/she can also invite potential participants to attend and support the planning efforts. For example, a water supply expert likely knows other water supply experts within and outside the region. These individuals were invited to the process and were an important addition to the vast mailing list maintained by SAWPA. Each Pillar Co-chair is responsible for maintaining a list of contacts interested in their particular Pillars, and SAWPA provides names of additional contacts. The knowledge and contacts of the Pillars provide an important link to watershed stakeholders.

Most of the Pillars were based on water resource strategies similar to the water resource strategies defined in the California Water Plan Update. However, in some cases, special Pillars were established to expand outreach and involvement, such as the Disadvantaged and Tribal Communities Pillar and the Government Alliance Pillar. The Disadvantaged and Tribal Communities Pillar is addressed under **Chapter 5.11 Disadvantaged and Tribal Community**. The work of the Government Alliance Pillar is addressed under **Chapter 5.12 Government Alliance**.

## Outreach Audience

The list of stakeholders involved in our most recent integrated regional water management planning is one of the most extensive ever taken by any regional water management group. The master contacts database includes a rather diverse base of over **4,000 stakeholders**. The focus of the database is to include those entities having an interest in water and representatives from cities located within the watershed. It includes representatives from **120 agencies** associated with water, including flood control, water conservation districts, and water supply agencies. It also includes representatives from the **63 incorporated cities** within the watershed, including mayors, key department heads, city council members, and planning commissioners. The database also includes an up-to-date list of members of the California legislature.

Also included are representatives from County, State, and Federal government; Indian Tribes, the real estate community, members of the environment and environmental justice, agricultural and development communities, consultants, trade associations, academia, non-profit organizations, and others simply interested in water.

The working relationship in the development of the IRWM plan was very positive overall, collaborative, and in many cases, long term. Through SAWPA's history of administering collaborative working groups and task forces, strong working relationships were built with the many entities listed below. The collaborative efforts through workgroup or task forces, also known as SAWPA's Roundtable or Task Forces, are described in detail under **Chapter 2.3 Collaboration, Coordination and Integration**.

With so many organizations and agencies, overlap to some extent exists and some facilities and infrastructure may be shared. However, based on the long history of cooperation and past integrated water resource planning, conflicts and competing policies have been minimal among the members that affect integrated water planning and management.

| 1 | **Wholesale and retail water purveyors; including a local agency, mutual water company, or a water corporation as defined by Section 241 of the Public Utilities Code:** | |
|---|---|---|
| | Banning Heights Mutual Water Company | Municipal Water District of Orange County |
| | Bear Valley Mutual Water Company | Muscoy Mutual Water Company |
| | Beaumont Cherry Valley Water District | Nuevo Water Company |
| | Big Bear Municipal Water District | Orange County Water District |
| | Box Springs Mutual Water Company | Orange Park Acres Mutual Water District |
| | Cucamonga Valley Water District | Pine Cove Water District |
| | Eagle Valley Mutual Water Company | Rancho California Water District |
| | East Orange County Water District | Rancho Santa Margarita Water District |
| | East Valley Water District | Riverside Highlands Water Company |
| | Eastern Municipal Water District | Running Springs Water District |
| | El Toro Water District | San Antonio Water Company |
| | Elsinore Valley Municipal Water District | San Bernardino Valley Municipal Water District |
| | Fern Valley Water District | San Gorgonio Pass Water Agency |
| | Fontana Water Company | Santa Ana River Water Company |
| | Gage Canal Company | Santiago County Water District |
| | Home Gardens County Water District | Serrano Water District |
| | Idyllwild Water District | Southern California Water Company |
| | Inland Empire Utilities Agency | Terrace Water Company |
| | Irvine Ranch Water District | Trabuco Canyon Water District |
| | Lake Hemet Municipal Water District | West Valley Water District |
| | Lee Lake Water District | Western Heights Mutual Water Company |
| | Marygold Mutual Water Company | Western Municipal Water District |
| | Meeks & Daly Water Company | Yorba Linda Water District |
| | Mesa Consolidated Water District | Yucaipa Valley Water District |
| | Monte Vista Water District | |

SAWPA has worked directly with these agencies and companies through our collaborative workgroups and task forces. All were contacted and invited to participate in the OWOW process.

| 2 | **Wastewater Agencies:** |
|---|---|
| | Big Bear Regional Wastewater Authority |
| | Orange County Sanitation District |
| | Western Riverside County Regional Wastewater Authority |

Where wastewater divisions and departments are operated by a city or by joint water and wastewater entities, these agencies are shown under the city or water agency categories. SAWPA has worked extensively with each of the wastewater agencies through the Santa Ana River Dischargers Associations and on several task force efforts, such as the Santa Ana River Use Attainability Analysis, the TIN TDS Task Force, and the Basin Monitoring Program Task Force. The wastewater agencies were particularly active in the water quality pillar and the water recycling pillar efforts of OWOW.

| 3 | **Flood Management Agencies:** |
|---|---|
| | Riverside County Flood Control & Water Conservation District |
| | San Bernardino County Public Works |
| | Orange County Flood Control Division |

SAWPA has a strong and positive working relationship with all three (3) flood control agencies through their involvement in the Flood Risk Management Pillar, the Stormwater Quality Standards Task Force, the various TMDL task forces administered by SAWPA, the brine line improvement coordination, and through low impact development projects and other forums.

Release at Prado Dam

| 4 | Municipal and County Governments and Special Districts: | |
|---|---|---|
| | City of Anaheim | City of Orange |
| | City of Banning | City of Perris |
| | City of Beaumont | City of Placentia |
| | City of Big Bear Lake | City of Pomona |
| | City of Brea | City of Rancho Cucamonga |
| | City of Buena Park | City of Redlands |
| | City of Calimesa | City of Rialto |
| | City of Canyon Lake | City of Riverside |
| | City of Cerritos | City of Running Springs |
| | City of Chino | City of San Bernardino |
| | City of Chino Hills | City of San Jacinto |
| | City of Claremont | City of Santa Ana |
| | City of Colton | City of Seal Beach |
| | City of Corona | City of Stanton |
| | City of Costa Mesa | City of Temecula |
| | City of Cypress | City of Tustin |
| | City of Diamond Bar | City of Upland |
| | City of Eastvale | City of Villa Park |
| | City of Fontana | City of Wildomar |
| | City of Fountain Valley | City of Westminster |
| | City of Fullerton | City of Yorba Linda |
| | City of Garden Grove | City of Yucaipa |
| | City of Grand Terrace | Riverside County |
| | City of Hemet | County of San Bernardino |
| | City of Highland | Orange County Board of Supervisors |
| | City of Huntington Beach | Orange County Public Facilities & Resources Department |
| | City of Irvine | Orange County Resources & Development Management Department |
| | City of Jurupa Valley | Riverside County Department of Waste Management |
| | City of La Habra | Riverside County Park & Open Space District |
| | City of Lake Elsinore | San Bernardino County Board of Supervisors |
| | City of Lake Forest | Big Bear Lake Department of Water & Power |
| | City of Lakewood | Big Bear City Community Services District |
| | City of Loma Linda | Edgewater Community Services District |
| | City of Los Alamitos | Jurupa Community Services District |
| | City of Menifee | Rubidoux Community Services District |
| | City of Montclair | Riverside County Economic Development Agency |
| | City of Moreno Valley | Chino Basin Water Conservation District |
| | City of Murrieta | San Bernardino Valley Water Conservation District |
| | City of Newport Beach | San Timoteo Watershed Management Authority |
| | City of Norco | Chino Desalter Authority |
| | City of Ontario | Lake Elsinore and San Jacinto Watersheds Authority |

SAWPA has conducted extensive outreach to these entities including presentations to City Councils, Boards of Supervisors, and involved cities and counties in the OWOW governance, and worked with many under various workgroups and task forces and in some cases, even served on the these organizations' boards.

| 5 | **Electrical Corporation, as defined in Section 218 of the Public Utilities Code:** |
|---|---|
| | Southern California Public Power Authority |
| | So Cal Edison |
| | Power Sol Energy |
| | Colmac Energy Inc. |

SAWPA has been a strong supporter of the American Society of Civil Engineers Inland Empire Infrastructure Report Card, serving as Chair of the Report Card prepared in 2005. In 2008, an update to the Report Card was prepared, which included the involvement of the electrical corporations listed above. Briefings about the OWOW planning process were shared with the Report Card committee and the results were incorporated into the OWOW Plan. For the OWOW 2.0 Plan, a new pillar was formed to specifically address the water-energy nexus. See **Chapter 5.13 Energy and Environmental Impact Response** for more details.

| 6 | **Native American Tribes that have Lands within the Region:** |
|---|---|
| | Morongo Band of Mission Indians |
| | San Manuel Band of Mission Indians |
| | Santa Rosa Band of Mission Indians |
| | Soboba Band of Luiseño Indians |
| | Temecula Band of Luiseno Mission Indians |

Since OWOW 1.0, significant progress has been made with outreach and involvement of the native American tribes with the establishment of the Disadvantaged and Tribal Pillars, and participation of a tribal member on the OWOW Steering Committee.

| 7 | **Self-supplied Water users, including Agricultural, Industrial, Residential and Park Districts, School Districts, Colleges and Universities, and Others:** |
|---|---|
| | March Air Reserve Base |

SAWPA has worked with the March Air Reserve Base through the Lake Elsinore/Canyon Lake Nutrient TMDL Task Force, which receives briefings on the OWOW process.

| | |
|---|---|
| 8 | **Environmental Stewardship Organizations Including Watershed Groups, Fishing Groups, Land Conservancies, and Environmental Groups** |
| | Audubon Society |
| | Endangered Habitats League |
| | Sierra Club, San Gorgonio Chapter |
| | Newport Bay Naturalists & Friends |
| | Santa Ana River Watershed Alliance |
| | Santa Ana Watershed Association |
| | Coastal Coalition |
| | Southern California Wetlands Restoration Project |
| | Friends of the Northern San Jacinto Valley |
| | Friends of the Santa Ana River |
| | San Jacinto River Watershed Council |
| | Inland Empire WaterKeeper |
| | Orange County CoastKeeper |
| | Western Riverside Regional Conservation Authority |
| | Redlands Conservancy |
| | California Coastal Conservancy |
| | Riverside Land Conservancy |
| | San Gabriel & Lower Los Angeles Rivers & Mountains Conservancy |
| | The Nature Conservancy |
| | The Wildlands Conservancy |
| | San Jacinto Basin Resource Conservation District |
| | Inland Empire Resource Conservation District |
| | Riverside Corona Resource Conservation District |

Recognizing the importance of the relationship of water and the environment, SAWPA has worked actively to involve the environmental community under the Natural Resources Stewardship Pillars, and in the many collaborative workgroups and task forces. Examples include the Santa Ana Fish Conservation group, the Emerging Constituents Workgroup, the Arundo Removal Programs, and Mitigation Banks. In some cases, SAWPA serves on the boards of these organizations.

| | |
|---|---|
| 9 | **Community Organizations, Including Land Owner Organizations, Taxpayer Groups, and Recreational Interests:** |
| | Trails 4 All |
| | Jurupa Area Recreation & Park District |
| | Santa Ana River Trail & Parkway Partnership |
| | Orange County Conservation Corps |
| | March Joint Powers Authority |
| | Canyon Lake Property Owners Association |

| | |
|---|---|
| 10 | **Industry Organizations Representing Agriculture, Developers, and other Industries Appropriate to the Region:** |
| | American Society of Civil Engineers |
| | Building Industry Association of Riverside County |
| | Building Industry Association: Baldy View Chapter |

| |
|---|
| Inland Action Group |
| Valley Group |
| Green Valley Initiative |
| Raincross Group |
| Riverside County Farm Bureau |
| San Bernardino County Farm Bureau |
| Milk Producers Council |
| Western Riverside County Agricultural Coalition |

SAWPA has worked actively to involve several recreational communities in the OWOW planning process and in the many collaborative workgroups and task forces. Examples include the Santa Ana Fish Conservation group, the Emerging Constituents Workgroup, the Santa Ana River Trails group, the Arundo Removal Programs, and Mitigation Banks. In some cases, SAWPA serves on the boards of these organizations.

The feedback and involvement of the building and agricultural industry are important components to the development of the OWOW Plan. Representatives from these organizations have actively participated in various OWOW conferences and outreach meetings. A representative from the Farm Bureau served as Co-chair on the Natural Resources Stewardship Pillar. A strong relationship has developed with the Western Riverside County Agricultural Coalition and various farm bureaus, through SAWPA facilitation of TMDL task forces and other collaborative efforts.

| 11 | **State, Federal, and Regional Agencies or Universities that have Specific Responsibilities or Knowledge within the Region:** | |
|---|---|---|
| | Association of California Water Agencies | California Department of Water Resources |
| | South Coast Air Quality Management District | Caltrans |
| | Southern California Association of Governments | Santa Ana Regional Water Quality Control Board |
| | Western Governors Association | U.S. National Park Service |
| | University of California Riverside | USDA Forest Service, PSW |
| | University of California Irvine | U.S. Bureau of Reclamation |
| | California Baptist University | U.S. Army Corps of Engineers |
| | Cal State University, Fullerton | U.S. National Marine Fisheries Service |
| | California Department of Fish and Game | |

The four universities have worked as consultants and participants in many multi-agency efforts with SAWPA, including the ASCE Report Card, demographic studies for watershed as part of the SAWPA IRWM, joint research projects, the Emerging Constituents Program Task Force, and many other forums. The working relationship with State agencies is very strong particularly with the Santa Ana Regional Water Quality Control Board through their participation in just about every workgroup and task force effort, as well as OWOW planning. The importance of working closely with State and Federal agencies was deemed so vital that a Pillar known as the Government Alliance was formed under OWOW 2.0. Details of their involvement are described under **Chapter 5.12 Government Alliance**.

| 12 | DAC Members and Representatives, Including Environmental Justice Organizations, Neighborhood Councils, and Social Justice Organizations: |
|---|---|
| | Latino Health Network |
| | Rialto Singe Center |
| | Latino Health Access |
| | Riverside County Housing Authority |
| | California Latino Water Coalition |

Of the many agencies and stakeholders involved in the process, particular emphasis was placed on conducting outreach to Disadvantaged Communities and Environment Justice interests. As part of the planning process, it became apparent that in order to fulfill the goal of direct involvement in the environmental justice community, it would be necessary to go directly to communities within disadvantaged census tracts and engage residents directly. It appeared implausible that adequate, unbiased information could be collected from meetings structured like those in the usual water resources planning process. It also became apparent that outreach would need to be conducted in a bilingual setting, as many residents were Spanish speaking and uncomfortable providing information in English.

In order to get the widest possible assessment of the concerns of the residents in minority and/or low income communities in the three counties, the Disadvantaged and Tribal Communities Pillar conducted significant outreach. Details of these efforts are described under **Chapter 5.11 Disadvantaged and Tribal Communities**.

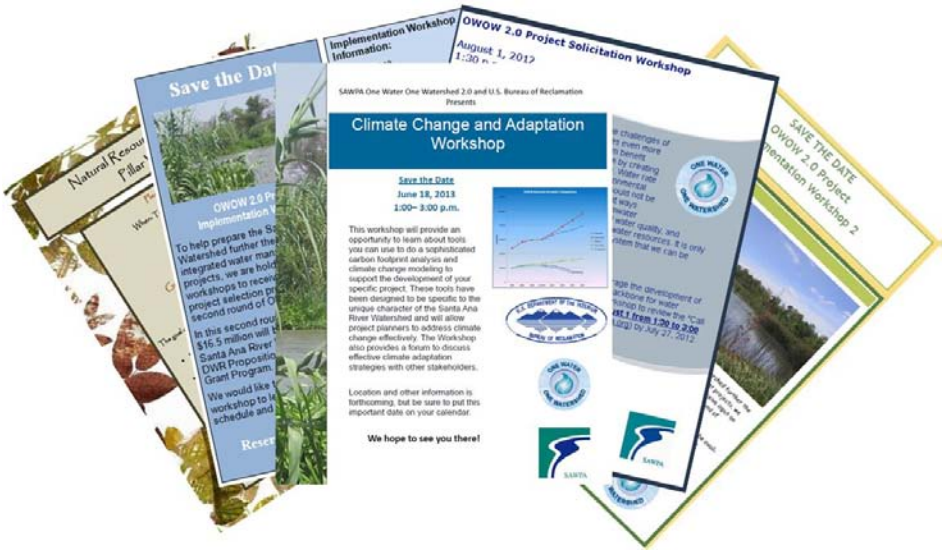
## SAWPA Email Blasts



SAWPA primarily provided communication to stakeholders based on an extensive electronic mailing list maintained on by SAWPA. The list is updated regularly, and anyone requesting information is added to the list using software known as "Constant Contact". Email contact allows regular communication with a broad group of stakeholders throughout the watershed. The mailing list also includes stakeholders outside the watershed who are interested in the watershed issues.

The master contacts database includes a rather diverse base of approximately 4,000 stakeholders. The focus of the database is those having an interest in water and representatives from cities located within the watershed. It includes representatives from 121 agencies associated with water; from flood control, water conservation districts, and water supply agencies. It also includes contacts from the 66 incorporated cities within the watershed, including mayors, key department heads, City Council Members, and Planning Commissioners. The database also includes an up-to-date list of members of the California legislature.

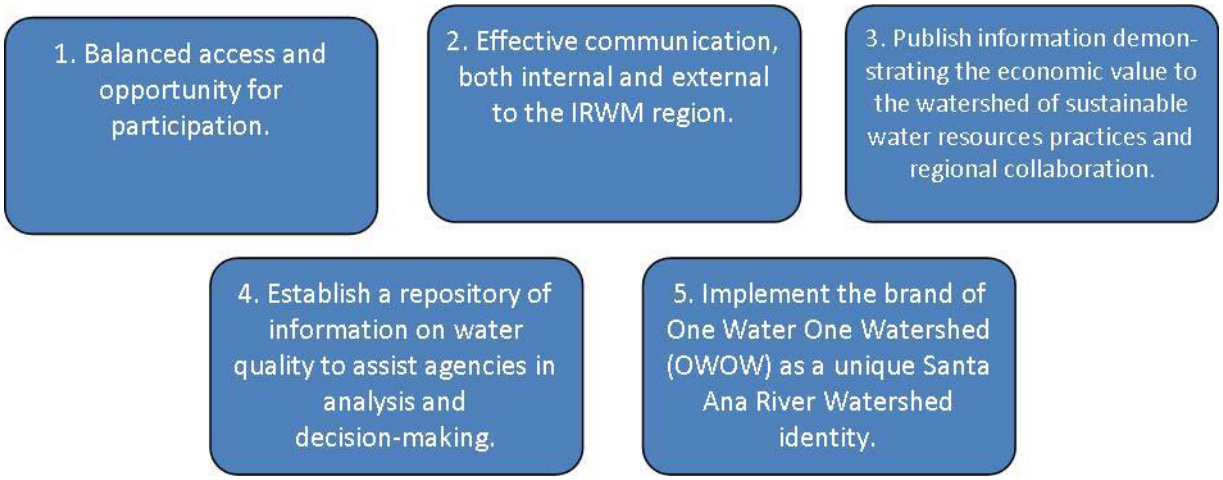
Also included are representatives from County, State, and Federal governments, Indian Tribes, the real estate community, members of the environmental, agricultural and development communities, consultants, trade associations, academia, media, nonprofit organizations, and others simply interested in water.

## Public Meetings, Conferences and Presentations

The core of any public outreach program is the direct contact with interested stakeholder groups. As part of the OWOW process, SAWPA staff has made over 50 presentations to specific stakeholder groups to both inform and to invite participation. Since September 2011, SAWPA has hosted multiple workshops, forums, and presentations in San Bernardino County, Orange County, and Riverside County—to discuss the benefits of collaboration and multi-benefit watershed projects. Emphasis was placed on the next generation of OWOW planning with the kick off of OWOW 2.0 as not simply an update, but the "Implementation" phase of the OWOW plan. The OWOW 1.0 Plan adopted by the SAWPA Commission in November of 2011 was posted on the SAWPA website for reference as stakeholders kicked off the planning work on the OWOW 2.0 Plan.

Since September 2011, SAWPA has hosted its third and fourth annual OWOW watershed conferences on April 25, 2012, at the National Orange Show Events Center in San Bernardino, CA, and on April 11, 2013, at the Westin South Coast Plaza Hotel, Costa Mesa, CA. These events were well attended, each with over 400 attendees. The conferences serve as a very effective opportunity to invite the public to become involved in OWOW, to discuss the OWOW plan development to date, and the new DWR IRWM Plan standards and IRWM Proposal Solicitation Packages under Proposition 84. The conferences also serve to reinforce the OWOW plan goals to encourage a watershed focus, and encourage collaboration in developing multi-benefit projects. Participants identified greater operational efficiencies and reduced environmental impacts as benefits of these kinds of projects.

SAWPA staff also has provided briefings and presentations to a number of specific groups. The presentations included a review of the OWOW program and an invitation to participate in the process. Representative presentations to specific groups are summarized below.



- Cities
- Agricultural Groups
- Business/Economic Development Groups
- Watershed Councils and Groups
- Presentations to Organizations

## Expanded Stakeholder Outreach – Social Media

Under OWOW 2.0, stakeholder outreach expanded in the watershed to more interaction with universities/colleges, the business community, and the public, with the development of new tools and outreach materials. One of the growing sets of tools is the use of social media. Social networking and the tools used to reach out increase the avenue for communicating OWOW goals and encourage involvement and collaboration to broad and diverse audiences. Consequently, SAWPA has folded in social media as a component of its overall public outreach for its strategic plan, as well as support of OWOW outreach.

In the design of an OWOW social media program, SAWPA has built upon the public outreach vehicles used in the past under OWOW 1.0 Plan, such as SAWPA e-newsletter and e-blasts to create additional traffic to the SAWPA website. Further, based on the linkages that exist between social media tools such as websites, Facebook, Twitter, YouTube, and blogs, viewership has increased resulting in more stakeholder interest and participation in the development of the Plan, and consideration of increased integration of future projects and programs that will meet the goals of the Plan.

In the development of social media tools, one of our first steps was to define the goals, strategy, and audience for these tools. In recognition of the multiple roles of SAWPA, new social media tools sought to support mutual goals of the organization, as well as to support the outreach and collaboration necessary for OWOW 2.0 planning. The establishment of strategic goals for public outreach area was a necessary first step. They are listed as follows:

The goals listed above are supported through traditional SAWPA communication efforts and through social media. Particular outreach activities are well suited to social media tools. For example, providing clear, understandable and valuable information to the public is effectively accomplished through social media.

### *What is our Message?*

SAWPA provides leadership and information to all stakeholders in reaching the goal of a sustainable Santa Ana River Watershed. The following key message points describe SAWPA's role in accomplishing this OWOW vision and serves as a guide that is consistently weaved into our outreach.

1. SAWPA is a collaborator/facilitator emphasizing a watershed focus and as such, can provide tools and models useful for addressing watershed issues.
2. Water Ethic is crucial for implementing an integrated watershed vision - every stakeholder should know:
   a. Where does your water come from?
   b. How much of it do you use?
   c. What do you put into the water before it leaves?

d. Where does it go after you use it?

3. SAWPA is a "go to" place, providing valuable information to our stakeholders useful for the implementation of creative solutions to watershed issues.
4. SAWPA is a State model for leadership in watershed planning and can provide a forum and tools for development of integrated solutions.
5. SAWPA is a leader in developing new ways to see and to respond to problems, and we share this information and insight with our stakeholders.
6. Multi-function, multi-beneficial projects are the most cost effective ways of working, and SAWPA provides facilitation/information to support these projects.
7. SAWPA's collaborative models are "WIN-WIN" and adaptable to multiple problems.
8. The world is changing and SAWPA can help manage the change in the way we do business, especially as we face;
   a. Climate change
   b. Increased stress on resources
   c. Reduced financial resources for single purpose projects
9. SAWPA emphasizes the use of local resources as it provides more reliability and sustainability.
10. Sustainability makes good economic and resource sense, and SAWPA serves as a resource to model sustainability.
11. SAWPA continues to develop and share new models for working in response to changing conditions.

### *Who is our Target Audience(s)?*

One of the most important aspects of developing a social media outreach plan is to identify SAWPA's audience. With over six million residents in the Santa Ana River Watershed and in the IRWM region, our audience is diverse in age and communication style. Social media outreach can reach an audience that is diverse in both of these categories. As much as information is distributed to stakeholders via email, it is important to note that email is not the preferred mode of communication of younger stakeholders. Through social media, SAWPA has the ability to immediately connect to a much broader geographic audience by providing valuable information, creating and expanding the value of a water ethic for the 21st Century, and encouraging resource stewardship.

SAWPA's audiences include:

- **All residents of the Santa Ana River Watershed:** For example, the young mom/family concerned about the quality of their drinking water, or the retired resident on a fixed income, or the political advocate. An effort using social media would be particularly effective in these circumstances. SAWPA currently is partnering with its member agencies to provide all watershed residents with unbiased, fact-based information regarding "Emerging Constituents".

- **Decision leaders and elected officials: SAWPA is a leader in providing information and cooperative models for decision leaders** from water and general government, senior management and technical staffs from agencies engaged in water and resource management, the regulatory community, and NGOs. For example, the OWOW Planning effort provides information to all those interested in the management of water and in some cases, provides general stakeholder information to those interested in water. In other cases, the OWOW planning process provides

focused technical information to water resource practitioners. In each case, the appropriateness of communication outreach needs to be considered. In the case of more technical or detailed information, email or other means of communication may be more effective.

- **Stakeholders Engaged in the SAWPA Roundtable Process**: SAWPA convenes a number of roundtable efforts focused on discrete problems or issues within the watershed. The content is often technical in nature and is best communicated through other means such as email, but the actions of these groups often have results of interest to broader audiences. In these cases, social media may be used to provide updates to the broader audience (e.g., emerging constituents' task force group).

SAWPA typically has engaged in a "business to business" (B2B) outreach model; however, by establishing a strong social media presence, SAWPA reaches out to a wider variety of audiences than we traditionally have reached.

Through social media presence, SAWPA provides a virtual venue to invite collaboration and encourage interaction from others, to inspire and educate watershed residents, and provide Web-based information. Under OWOW 2.0 and the use of social media, SAWPA has driven even more visitor traffic to its website, promoting itself as the State's role model for integrated regional watershed management planning, sharing its expertise and knowledge with others, and becoming known as a trendsetter for innovation and collaboration, as well as establishing a brand of a sustainable Santa Ana River Watershed.

SAWPA's website is considered as "home base":

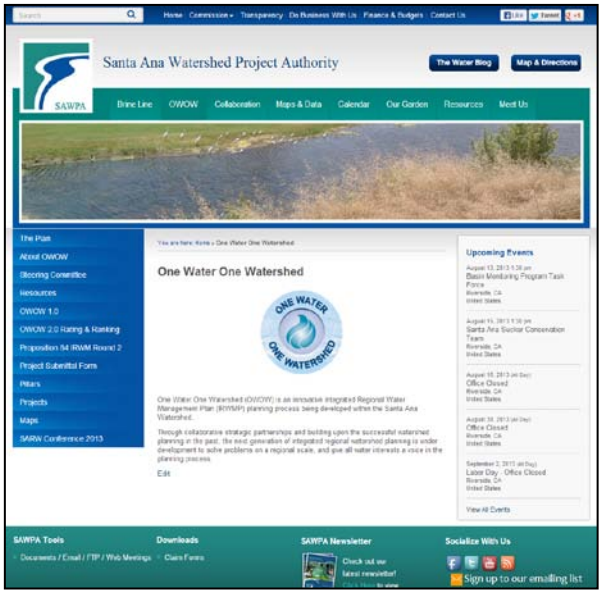
1. By using appropriate social media tools such as Linked In, Facebook, YouTube and Twitter, SAWPA drives more visitor traffic to its website.
2. Through Linked In, Twitter, YouTube and Facebook, SAWPA expands its outreach efforts for events and services provided by SAWPA. For example, Twitter is used to provide real time messaging of conferences and events watershed-wide.
3. Social media provides powerful tools to network and engage in the political process. Many of SAWPA's stakeholders are key decision leaders in water resource management, and SAWPA's integrated approach helps engender a unified voice for political action in a regional manner.
4. With such a large geographic area in the Santa Ana River Watershed, 2,650 square miles and stretching across three counties – Orange, Riverside, and San Bernardino, social media allows SAWPA to provide outreach to a diverse population in an economical and resource-saving manner.
5. SAWPA's website provides links inviting visitors to join us on Facebook, Twitter, YouTube, and LinkedIn.

*Twitter:* https://twitter.com/sawpa_owow

SAWPA currently uses Twitter as a social media tool for providing updates and timely information of interest to watershed stakeholders. Frequency of stakeholder contact occurs at least weekly.

*YouTube:* http://www.youtube.com/user/SAWPATUBE

In efforts to increase SAWPA's social media presence, videos are uploaded to YouTube. Videos are used to promote OWOW events.



*Constant Contact*

SAWPA, as the regional IRWM group for the OWOW 2.0 Update, held numerous workshops and speaking engagements about OWOW, sent out numerous email blasts announcing OWOW related events and actions, and distributed OWOW newsletters by email blasts. The email blasts are sent by an email marketing company called Constant Contact that reaches over 3,000 stakeholders throughout the watershed.

*Website Update*

To support the OWOW planning process, SAWPA has made improvements to its website, including the dedication of resources to an OWOW webpage. The OWOW webpage created in 2010 provides watershed stakeholders and the public with various information and updates relating to SAWPA's integrated regional watershed management program.

*Upcoming Events* http://www.sawpa.org/events/

The SAWPA website events calendar's versatile options allow viewers to choose the type of events they want to see. By selecting the OWOW option, viewers are shown an up-to-date calendar of upcoming OWOW events such as workshops, pillar meetings, and releases from DWR. When opening an event, the viewer has access to agendas and any other documents pertaining to that event.

*Web Links*

The webpage provides viewers access to a number of links to the OWOW plan, as well as program background information, tools, forms, and data.

| **About OWOW** http://www.sawpa.org/owow/about-owow/ | **OWOW Plan (IRWMP)** http://www.sawpa.org/owow/the-plan/ | **How do I get involved?** http://www.sawpa.org/owow/how-do-i-get-involved/ | **Governance** http://www.sawpa.org/owow/steering-committee/ |
|---|---|---|---|
| Viewers are provided with the history of OWOW. From the "Four Horsemen of the Apocalypse" concept to the importance of collaboration in future projects, the "About OWOW" page allows the viewer to understand the many purposes of OWOW. | Viewers have access to the current OWOW plan. Each chapter is linked separately in order to facilitate the downloading process of the plan. | This page engages the viewer's involvement in SAWPA's various ways of staying connected to the OWOW process. This is done by encouraging viewers to sign up to SAWPA's emailing list, joining an OWOW pillar workgroup, and allowing viewers to obtain past workshop's agendas, meeting notes, and presentations. | This page gives the viewer an opportunity to get to know the OWOW Steering Committee by providing a brief background on the elected officials. Viewers also can download the Steering Committee agenda packets.<br><br>Current OWOW Pillars are also listed by Pillar names with their respective SAWPA staff contacts. |

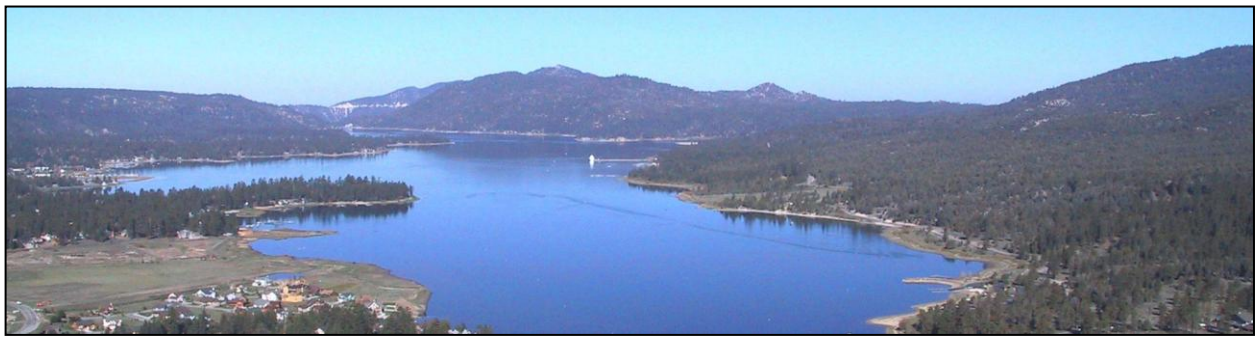
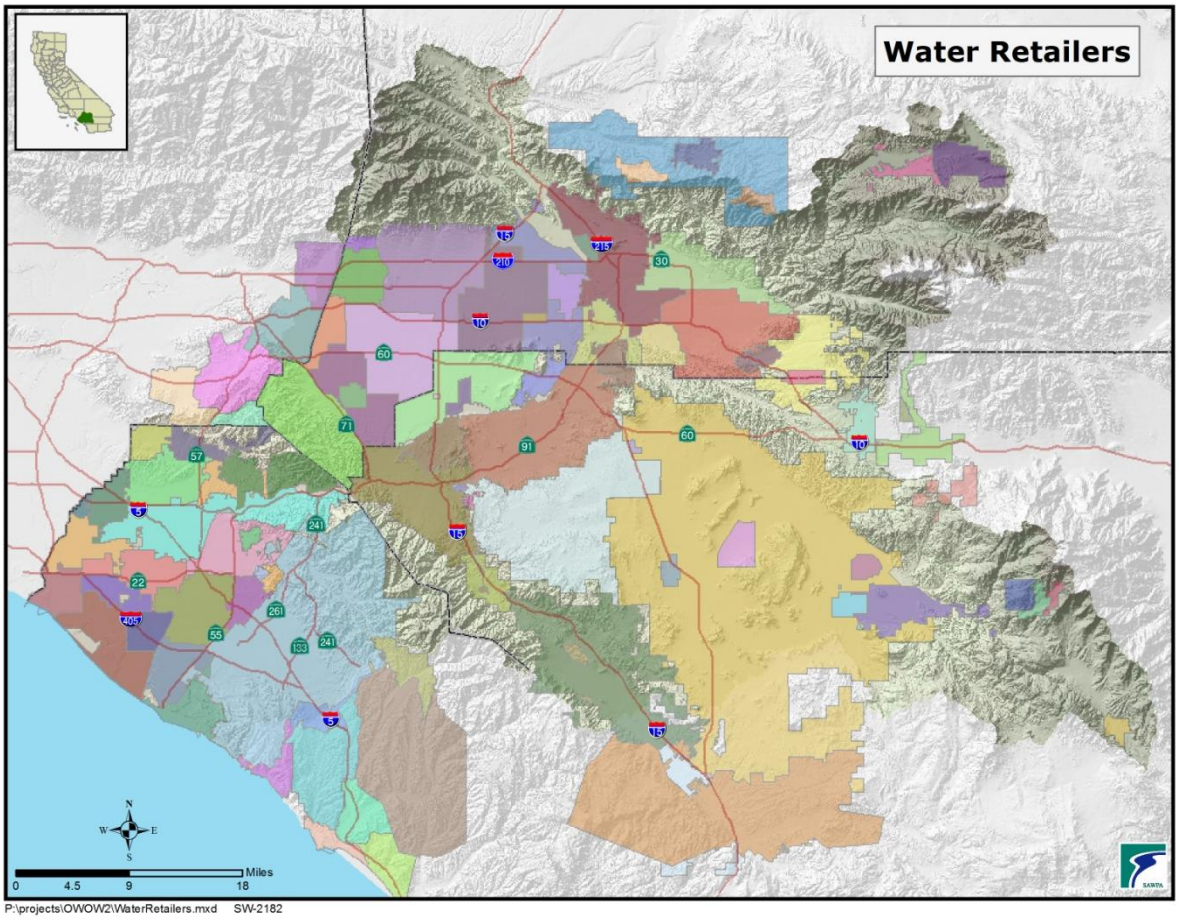
| SAWPA allows agencies to submit their projects for consideration to be included in the OWOW Plan. A list of submitted projects also is available. | This page allows viewers to obtain access to computer support tools that support our modern water management goals. Viewer will find the Greenhouse Gas Emissions Calculator, Climate Change Analysis, and, soon to come, Watershed Report Card. | Viewers are provided with materials that will allow them to be better informed about OWOW. | |



# 2.3 Collaboration, Coordination and Integration

OWOW Call For Projects Workshop



As is likely to occur within any watershed, sometimes conflicting goals or priorities of various watershed agencies can hinder progress towards collaboration and coordination. Within the Santa Ana River Watershed there are over 100 large and small water districts (**Figure 2.3-1** on page 2), local, regional, State and Federal agencies, and public/private stakeholder groups. The Santa Ana Watershed Project Authority (SAWPA) recognizes that all of these stakeholders have their own valid interests in ensuring that there is sufficient clean, reliable water in the watershed, and SAWPA takes the initiative to keep all of these groups working together to solve the watershed's issues under One Water One Watershed (OWOW) 2.0 planning and various other "Roundtable" forums.

SAWPA strives for a collaborative approach to bring together the planning community, including both public and private sector planners, to advance the benefits of planning on a watershed scale and integrating watershed thinking into the everyday planning process. Working with varied interests and agendas, this watershed planning process has opened the doors to great partnerships, funding

opportunities, connectivity, and increased awareness of planning projects and opportunities both in the city next door, and in the community on the other side of the watershed.

**Figure 2.3-1 Santa Ana River Watershed Water Agencies Service Areas**

As many cities and counties are in the process of updating their General Plans, funding opportunities and greater collaboration between water agencies, non-governmental organizations, and local land use authorities are facilitating beneficial projects such as conservation, open space, restoration, enhancement, connectivity, and multi-benefit approaches. In this way, planners are finding themselves in a new place, one of noting the quality of these projects and how to get them through the regulatory planning process with more agreement and greater speed. State law is helpful in this process because Conservation, Safety, Open Space, and Land Use Elements are required elements of every General Plan in the State of California. These elements provide essential components of good watershed plans. In addition, newly proposed Fire Hazard Planning, as well as the more traditional floodplain management guidelines for preparation of General Plans include helpful explanations and instructions for planners trying to make sense of how watershed planning can be and should be integrated into General Plan Updates.

In developing regional plans and prioritizing multi-benefit projects, it is important to not only coordinate efforts with other planning agencies within the region, but it is equally important to coordinate across regional boundaries. During the preparation of the OWOW 2.0 Plan, SAWPA staff exchanged information and discussed priorities with planners from regions adjoining the Watershed. For example, SAWPA staff coordinated closely with planners and project proponents in south Orange County, the Los Angeles and San Gabriel River Valleys, Upper Santa Margarita, Mojave and Coachella Valley regions.

## Collaborative Efforts within the Santa Ana River Watershed

SAWPA, as the leading regional water resource agency for the Santa Ana River Watershed and region, plays a major role in administering, participating, coordinating, and facilitating efforts to address regional water management issues. In fact, since its formation, this has been one of the major purposes of SAWPA in supporting the resolution of water issues and conflicts, and is one of the primary reasons why it was formed in the first place. From the early 1930s to the late 1960s, litigation occurred between upstream and downstream water agencies in the watershed over water rights issues affecting the Santa Ana River, and an adjudicated settlement occurred. As part of the recommendations for the adjudicated settlement, the need for a way to resolve regional differences and conflicts in a cooperative approach was suggested and realized by the creation of SAWPA. The cooperative approach exists today by the regular meetings among the SAWPA member districts but also among the many multi-agency and multi-organizations that SAWPA supports through what is described as the "SAWPA Roundtable".

The results of the Nitrogen and TDS Task Force, the Emerging Constituents Program Task Force and many others serves as an outstanding template for collaboration and was sighted by resolution of the Regional Water Quality Control Board and the State Water Resource Control Board Strategic Plan as an outstanding example of collaborative efforts to resolve water quality issues.

Utilizing the capable skills of SAWPA staff, multi-agency agreements are developed, consultant contracts are managed, and discussion meetings are administered. The end products of these efforts are successful programs and projects that represent the best in collaboration and facilitation support services. In addition, by the positive and cooperative relationship that SAWPA has with the Santa Ana

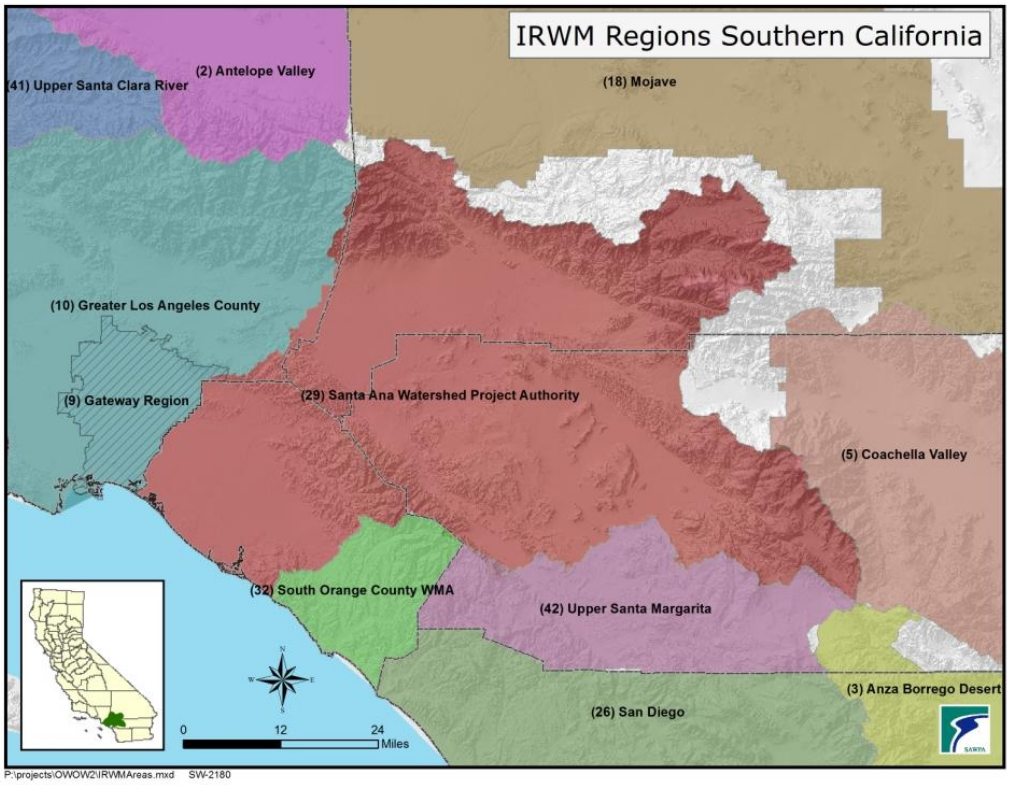
Regional Water Quality Control Board, SAWPA has served as an effective liaison between the regulators and regulated community in producing effective partnerships and working relationships.

The following task forces and workgroups are examples of watershed partnerships that SAWPA has administered and formed often with the Santa Ana Regional Board and represent positive steps toward integrated and collaborative solutions.

## Overview of Governing Laws, Judgments and Agreements

This section lists  mostof the governing laws, judgments, and agreements in place that have had significant influence on water management and addressed conflicts in the watershed.

- Settlement Agreement between City of San Bernardino and City of Riverside and Riverside Water Company, 1922
- Colorado River Compact, 1922
- Seven-Party Agreement, 1931
- Rialto Basin Judgment, 1961
- Chino Basin-City of Pomona Agreement, 1968
- Orange County/Chino Judgment, 1969
- Western/San Bernardino Judgment, 1969
- Western, Chino Basin, County of Riverside, Riverside County Flood Control and Water Conservation District Agreement, 1969
- Chino Basin-Western Agreement, 1970
- Endangered Species Act, 1973
- Santa Ana River-Mill Creek Cooperative Water Project Agreement, 1976
- Big Bear Municipal Water District/North Fork Water Co. Judgment, 1977
- Chino Basin Judgment, 1978
- San Bernardino-City of San Bernardino, City of Riverside Agreement, 1981
- San Bernardino-Western Agreement, 1981
- San Bernardino-Western, Orange County, Riverside, and San Bernardino City Agreement, 1985
- Monterey Agreement, 1994
- Big Bear Municipal and Valley District Agreement, 1996
- Chino Basin Peace Agreement, 2000
- Integrated Regional Water Management Planning Act, 2002
- Groundwater Management Planning Act, 2002
- Seven Oaks Accord, 2004
- Beaumont Basin Judgment, 2004
- Settlement Agreement with San Bernardino Valley Water Conservation District, 2005
- Memorandum of Understanding with the City of Riverside, 2005
- Chino Basin Peace II Agreement, 2008
- Soboba Water Rights Settlement Act, 2008
- Institutional Controls and Settlement Agreement (ICSA), 2004
- Agreement Relating to the Diversion of Water from the SAR System among WMWD, Valley District, and City of Riverside, 2004
- Cooperative Agreement to Protect Water Quality and Encourage the Conjunctive Uses of Imported Water in the SAR Basin, 2007
- Southern California Steelhead Recovery Plan, 2012

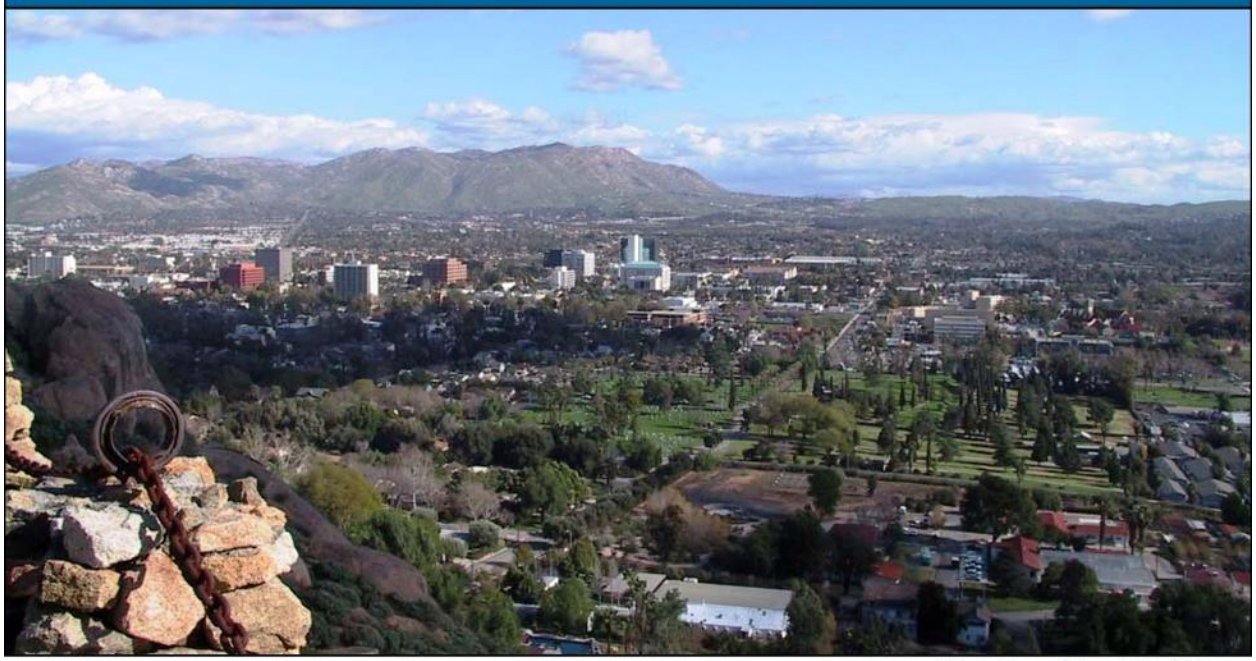


## Collaborative Efforts with Adjacent or Overlapping Areas to Watershed

The Santa Ana IRWM region is surrounded by six other IRWM regions, as shown in the map below, including: South Orange County Watershed Management Area, Upper Santa Margarita, Greater Los Angeles County, Gateway Region, Coachella Valley and Mojave.

SAWPA proactively seeks meeting with neighboring regions to share and stay abreast of critical issues, ongoing efforts, and opportunities for collaboration in the region. Under OWOW 2.0, SAWPA worked closely with the Upper Santa Margarita RWMG serving on their review panel for selecting a consultant to support their IRWM plan development. Through SAWPA staff's involvement on the Water Advisory Committee of Orange County, the Southern California Water Committee, Southern California Water Dialogue, and various other water resource forums, communication and collaboration about water resource planning has been conducted with all six other IRWM regions. When SAWPA conducted multiple climate change workshops working closely with the U.S. Bureau of Reclamation, invites were sent out to all neighboring IRWM regions as well as State and Federal agencies all impacted by the climate change and are currently conducting analysis on their own respective impacts. Feedback received from these surrounding and involved regions was that these workshops were extremely beneficial particularly as each continued development on their respective climate change adaptation plans under the IRWM planning.

Another forum in which SAWPA plays a significant role in promoting cooperation and coordination with other neighboring regions as well as IRWM regions across the State is through the Roundtable of Regions organization. This coalition of IRWMs allows all the regions to voice and discuss common issues and concerns and have worked closely with the CA Dept of Water Resources on many occasions.



The Roundtable of Regions has conducted informational surveys, conducted collaborative workshops and conferences and provided important input to DWR on grant applications and other legislative issues affecting IRWMs. At the IRWM conferences, SAWPA has been very involved in the sponsoring, planning and speaking of the Roundtable of Regions events.

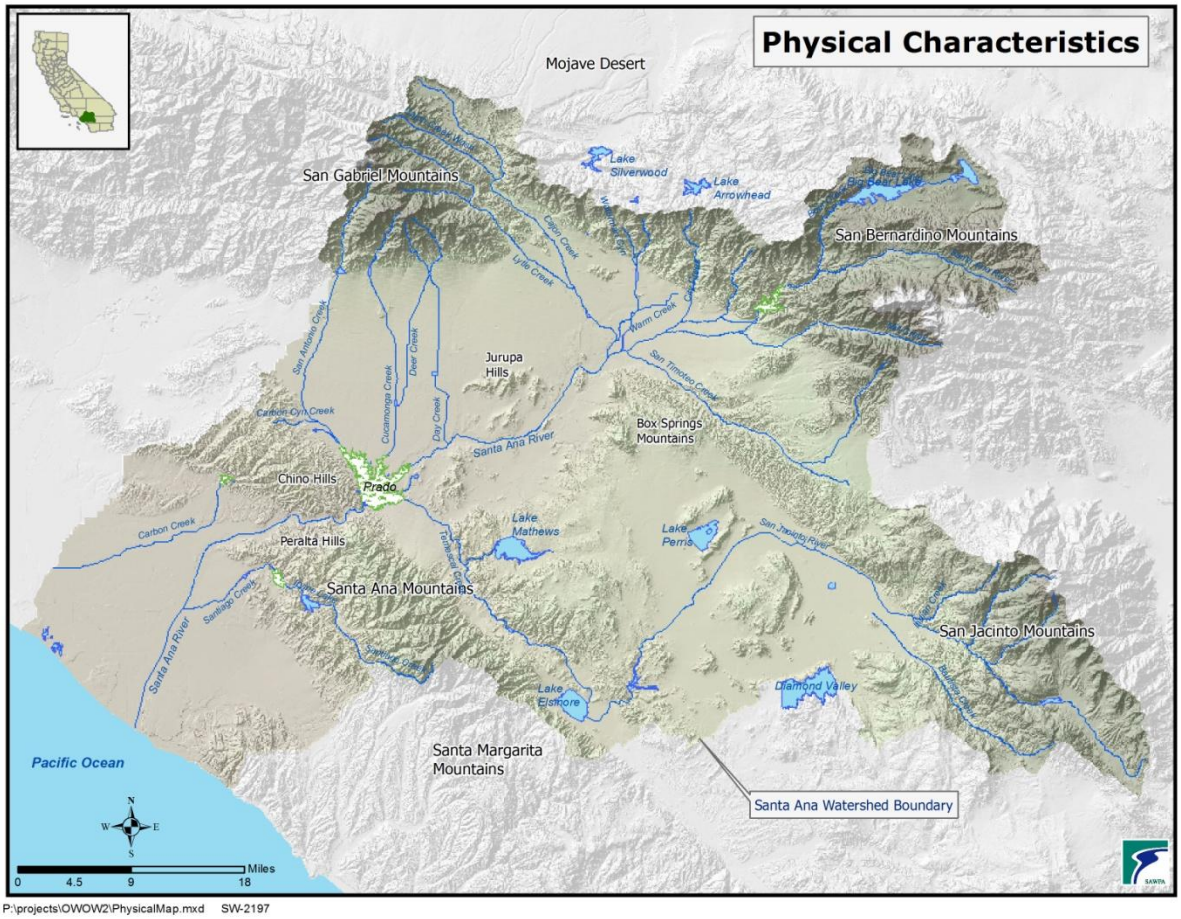
At the State level, SAWPA has also taken a prominent leadership role in assisting the visioning and strategic planning of IRWM for the State through its participation on a select focus group called the IRWM Strategic Plan Focus Group. Selected by his peers along with four other IRWM region staff, Mark Norton, Water Resources and Planning Manager for SAWPA, represents the 48 IRWM regions' voice at the meetings of the focus group. The focus group is designed to review and comment on DWR's planning approach for stakeholder outreach and engagement, validate DWR's efforts to collect, document and assimilate stakeholder input and provide preliminary review and feedback on strategic plan documents to ensure input is appropriately portrayed and addressed. The focus group is expected to serve in this role in 2013-2014.

Finally, the collaboration among neighboring regions has also on occasion led to interregional projects as in the case of the "Brine line to the Salton Sea". This conceptual project was conceived as an opportunity to transfer brine flow that is ordinarily sent to the ocean for disposal as a resource to the inland water body, the Salton Sea located in the Coachella Valley and outside the Santa Ana River Watershed. This brine flow could be delivered to the Salton Sea to help stabilize water levels at the sea and provide water for playa dust abatement. With brine flow concentrations coming out of the Santa Ana River Watershed at 5000-6000 mg/L TDS, these concentrations are far lower than the ambient salt levels of the Salton Sea at 55,000 mg/L and could actually be viewed as a benefit. In discussions of this conceptual project, several meetings were held by SAWPA with the US Bureau of Reclamation, Colorado River Regional Water Quality Control Board, the Salton Sea Authority and representatives from the Coachella Valley IRWM region who are also working to update their IRWM plan. The brine line to the Salton Sea project would involve the construction of a brine disposal pipeline heading east out of the Santa Ana River Watershed and would traverse portions of the Coachella Valley IRWM region to the Salton Sea. In addition to Salton Sea water level stabilization, potential benefit of a new brine disposal pipeline to help dispose of brine from future groundwater desalination from Coachella Valley groundwater basins was also discussed. An appraisal level analysis is described and included under **Chapter 5.5.1 Brine Line to the Salton Sea**.

Though the project at this stage still needs much further study and evaluation, the project serves as an effective demonstration of an inter-regional cooperative project among two neighboring IRWM regions initiated by SAWPA that could enhance efficiencies and help solve salt issues facing both regions.

# 3.0 Watershed Setting

View from Mount Rubidoux
City of Riverside



## Physical Setting

Dunne and Leopold (1978) define a watershed as an area of land that drains water, sediment, and dissolved materials to a common outlet at some point along a stream channel.

The Santa Ana River (SAR) Watershed, depicted in **Figure 3-1**, drains a 2,650 square-mile area. The watershed is home to over 6 million people and includes the major population centers of parts of Orange, Riverside, and San Bernardino Counties, as well as a sliver of Los Angeles County.

The Santa Ana River flows over 100 miles and drains the largest coastal stream system in Southern California. It discharges into the Pacific Ocean at the City of Huntington Beach. The total length of the SAR and its major tributaries is about 700 miles.

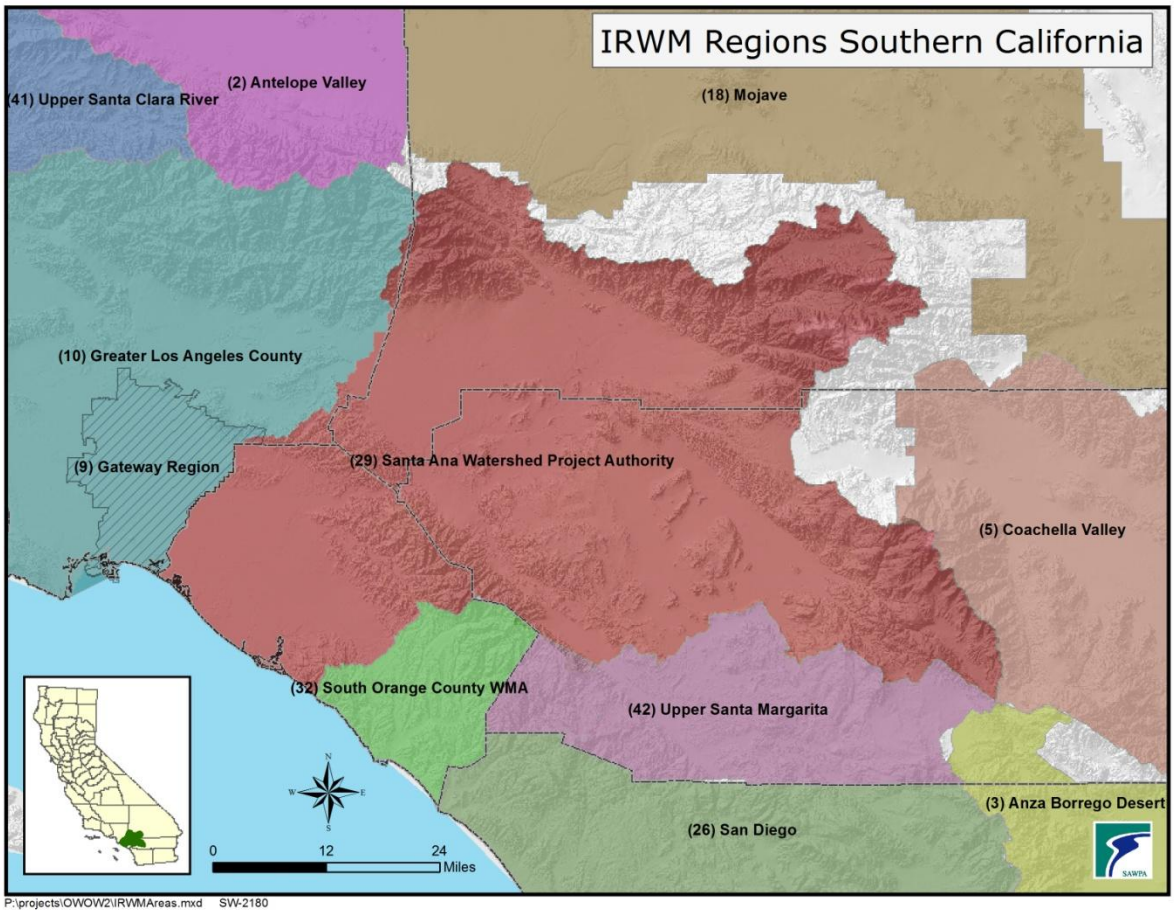


**Figure 3-1 Santa Ana Integrated Regional Water Management Region**

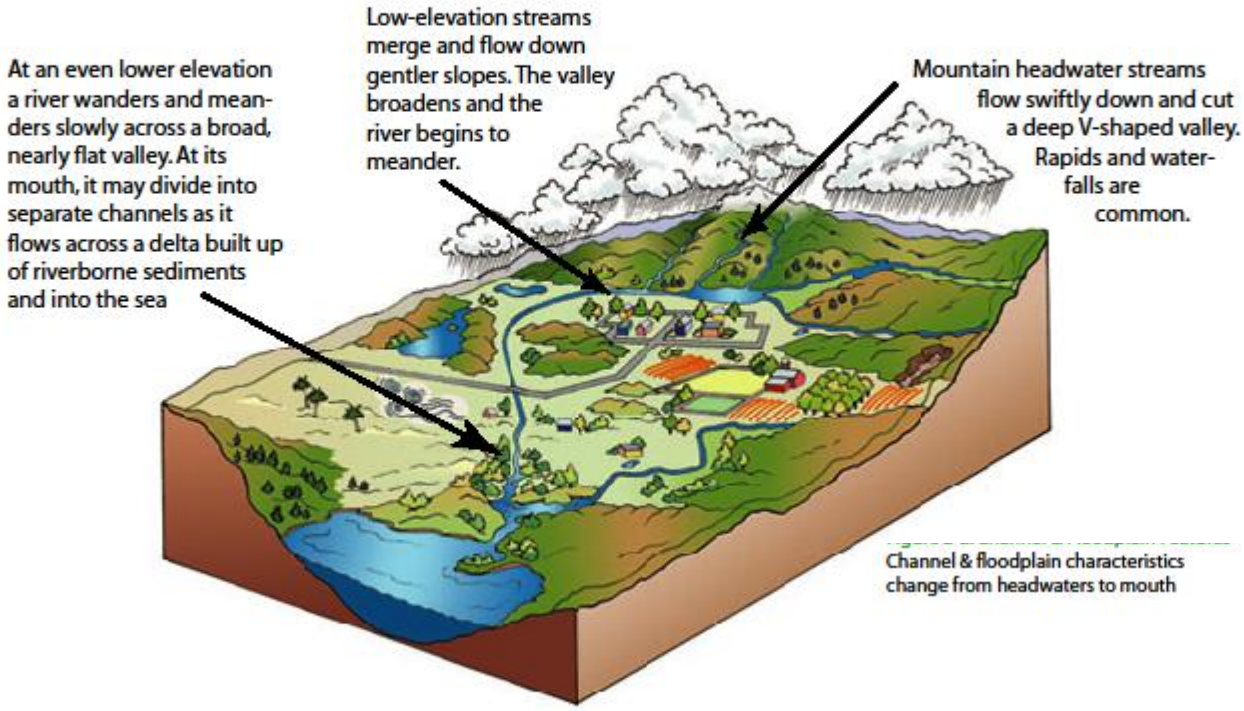
The watershed boundaries nearly match the boundaries of the Santa Ana Regional Water Quality Control Board, an organization with whom the Santa Ana Watershed Project Authority (SAWPA) has worked closely with for many years. In addition, its boundaries match the Integrated Regional Water Management (IRWM) region and the recognized Santa Ana Funding Area, as defined by the Proposition 84 IRWM program. Although there are many sub-watershed planning efforts, One Water One Watershed 2.0 (OWOW) attempts to bring all these efforts, as well as all different jurisdictions in the watershed, into a single watershed-wide vision. Over the years, SAWPA has participated in the development of sub-regional IRWM plans, with the understanding that such plans would be complementary to OWOW.

In addition, SAWPA proactively seeks meeting with neighboring regions, shown in **Figure 3-2** to share and stay abreast of critical issues, ongoing efforts, and opportunities for collaboration in the region.

**Figure 3-2 Santa Ana IRWM Neighboring Regions**



A more detailed write up on regional collaboration is included in **Chapter 2 Governance, Outreach and Integration.**

## Hydrology, and Geomorphologic Features of the Watershed

Much of the movement of materials, energy, and organisms associated with the channel environment and adjoining upland environment depend on the movement of water within the Watershed. To the extent that this movement is altered, so does the potential exist for the system to become "dysfunctional" for species that depend on it. That is, alteration of water movement via damming or channelization can reduce ecosystem functionality. Refer to **Figure 3-3** for an illustration of water and sediment transport throughout a watershed.

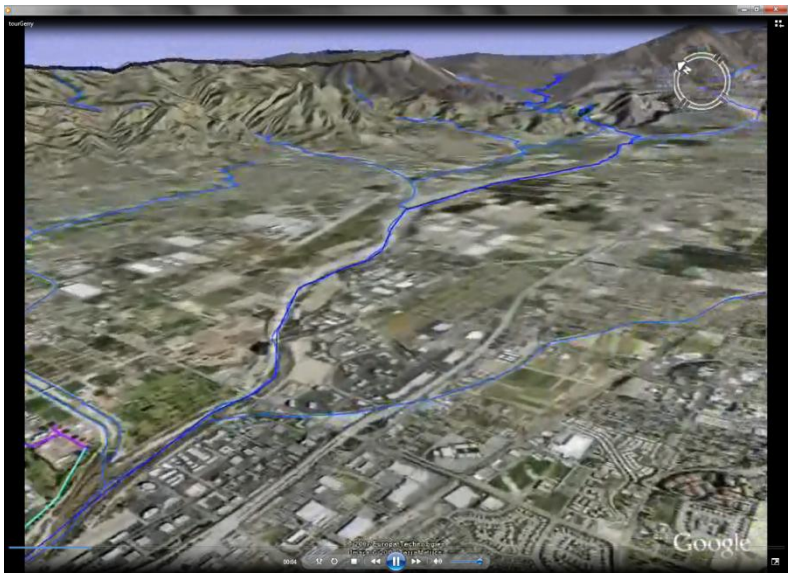
**Figure 3-3 Water and Sediment Transport through the Watershed**

Today, only 20% of the SAR is a concrete channel, the majority being near the mouth of the river. Discharge from publicly owned treatment works (POTWs) have changed natural surface flows and provides base flow in many parts of the Santa Ana River's drainage network. This treated wastewater has altered the natural system by providing year-round river flow. As populations have increased, urban runoff and wastewater flows have increased. Between 1970 and 2000, the total average volume rose from less than 50,000 to over 146,000 acre-feet per year (AFY), as measured at the Prado Dam. Base flow is expected to rise to 370,000 AFY by 2025, a projected increase of 153 percent since 1990.

The geologic and hydrologic features of the watershed or geomorphology – the study of the classification, description, nature, origin, and development of present landforms and their relationships to underlying structures – and of the history of geologic changes as recorded by these surface features includes the following features. The upper watershed or headwaters, including the highest point in the drainage system, is delineated by the east-west ridgeline of the San Gabriel and San Bernardino Mountains. Over this ridgeline lies the Mojave Desert, which is part of the Lahontan Basin. This upper "erosion" zone of the watershed has the highest gradient, highest erosion level of new sediment to the system, and fastest stormwater runoff. As flows consist mainly of snowmelt and storm runoff from the undeveloped land in the San Bernardino National Forest, water quality tends to be high, with low concentrations of total dissolved solids (TDS), nitrates, and other pollutants. In this zone, the SAR channel is confined in its lateral movement, contained by the slope of the high, mountainous terrain. Within the upper watershed, the SAR and its tributaries travel around large boulders and over sand and gravel bars punctuated by pools and riffles reaching depths of about six feet.

In addition to the SAR, several other important watersheds make up the Santa Ana River basin. The Newport Bay sub-watershed encompasses an area of approximately 154 square miles. The sub-watershed is bounded to the north by the Santiago Hills (Loma Ridge) and to the south by the San Joaquin Hills. The Tustin Plain, a broad alluvial valley, occupies the major portion of this watershed. The Newport Bay sub-watershed is within the United States Geological Survey (USGS) hydrologic unit no. 18070204. The Newport Bay sub-watershed is composed of the San Diego Creek sub-watershed, with an area of 119 square miles, which is the largest system draining into Upper Newport Bay. The Santa Ana-Delhi Channel drains 17 square miles and Big Canyon Wash drains 2 square miles. The remaining 16 square miles are divided among several small sub-watersheds that discharge into lower Newport Bay.

Two other important watersheds in the Santa Ana region include the Anaheim-Bay Huntington Harbor (AB-HH) and Lower San Gabriel River/Coyote Creek. The AB-HH watershed encompasses an area of 81 square miles. The main surface water systems that provide drainage in this watershed are the Bolsa Chica Channel that provides drainage to the Anaheim Bay-Huntington Harbor Complex; and the East Garden Grove-Wintersburg Channel that carries flow to Bolsa Bay and ultimately to Huntington Harbor. The Coyote Creek Watershed encompasses an area of 85 square miles within the Santa Ana region. This watershed is located in the northernmost portion of the County of Orange. This watershed straddles the Los Angeles and Orange County border in its upper reaches and then continues through Orange County until it discharges into the San Gabriel River in Long Beach.



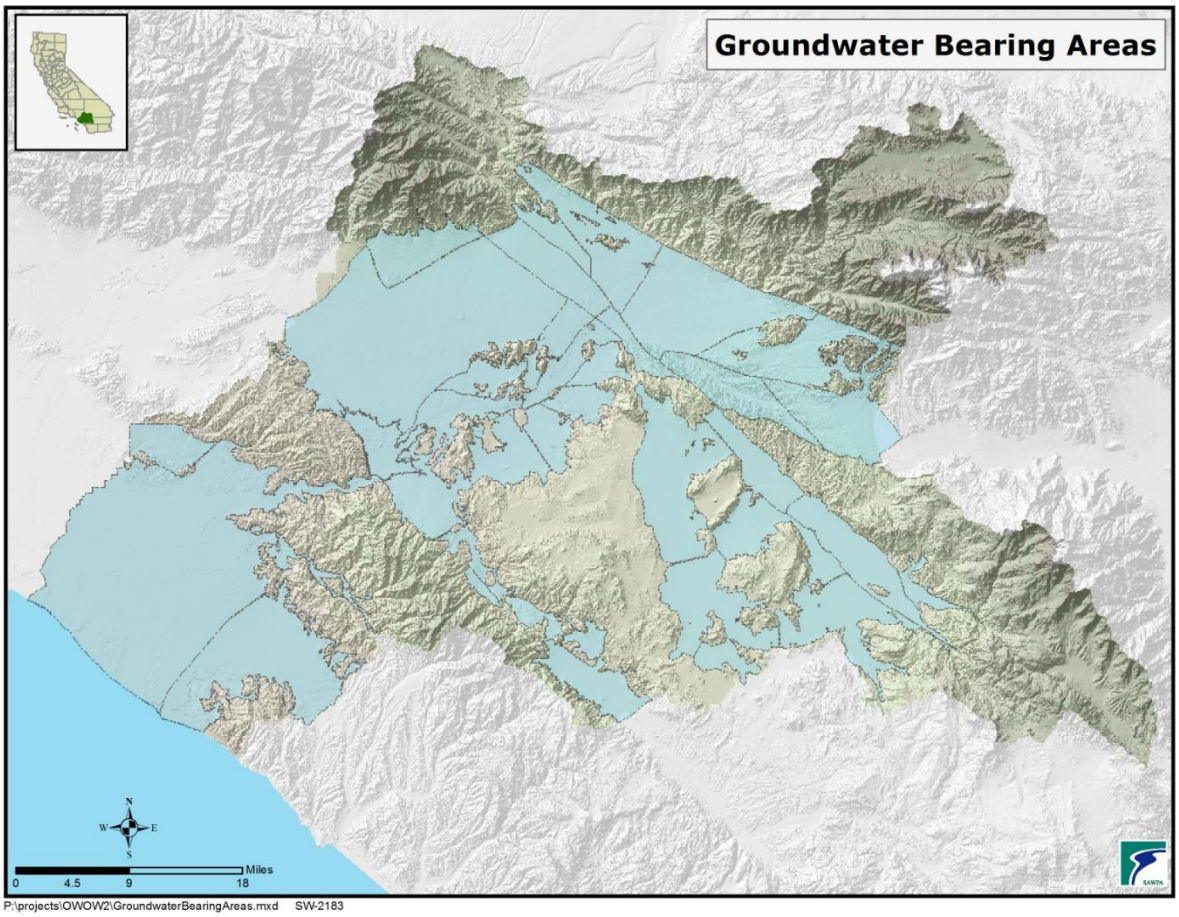
Sedimentary and crystalline materials from the upper watershed move down slope through a process fed by storm pulses; therefore, sediment does not move at a continuous speed. River flow from Seven Oaks Dam to the City of San Bernardino consists mainly of storm flows, flows from the Lower San Timoteo Creek, and groundwater that is rising due to local geological features. From the City of San Bernardino to the City of Riverside, the river flows perennially and much of the reach is operated as a flood control facility. The principal tributary streams in the upper Watershed originate in the San Bernardino and San Gabriel Mountains. These tributaries include San Timoteo, Reche, Mill, Plunge, City, East Twin, Waterman Canyon, Devil Canyon, Cajon Creeks, and University Wash from the San Bernardino Mountains; and Lone Pine, Lytle, Day, Cucamonga, Chino, and San Antonio Creeks from the San Gabriel Mountains.

From the City of Riverside to the recharge basins below Imperial Highway, river flow in Orange County consists of highly treated POTW effluent, urban runoff, irrigation runoff water, imported water applied for groundwater recharge, and groundwater forced to the surface by underground barriers (SAWPA, March 2004). Near Corona, the SAR cuts through the Santa Ana Mountains and the Peralta-Chino Hills, which together form the northern end of the Peninsular Ranges in Southern California. The SAR then flows down onto the Orange County coastal plain where the channel lessens in gradient, the valley floor is reached, and the soft features of the channel where sediment has deposited are more prevalent. Floodplains are strewn with boulders and characterized by sand and gravel washes. Within this valley floor, the transport and depositional processes are less confined by higher terrain as water, dissolved material and sediment move toward the sea. Over time, aquatic and terrestrial wildlife have adapted to this dynamic process and channel form. However, rapid urbanization has artificially increased the rate of

sedimentation and loss of habitat in this part of the watershed, negatively affecting water quality and wildlife habitat.

A visual "fly-through" of the Santa Ana Watershed is available here:
http://www.youtube.com/watch?v=HXDQCXKP6lM

**Figure 3-4 Watershed Flythrough**



In the southern portion of the watershed, the regional boundary divides the Santa Margarita River drainage area, which is not part of the watershed, from that of the San Jacinto River. The San Jacinto River, which is part of the Watershed, starts in the San Jacinto Mountains, runs westerly through Canyon Lake and normally ends in Lake Elsinore. In wet years, the San Jacinto River will overflow the lake and connect with the SAR through the Temescal Wash. Flood flows from the San Jacinto River produce a broad, shallow wetlands area called Mystic Lake.

The Orange County coastal plain is composed of alluvium derived from the mountains. Upstream from the Santa Ana Canyon lay Prado Dam and Prado Wetlands; SAR flows are passed through the Prado Wetlands to improve water quality and remove nitrates before being used for Orange County Groundwater Basin recharge. Santiago Creek, the only major tributary to the lower SAR, joins the SAR in the City of Santa Ana. The lower limit of both the groundwater recharge area and the SAR's ordinary flows is 17$^{th}$ Street in the City of Santa Ana. Prior to channelization of the lower part of the SAR, the channel used to meander slowly across broad flood plains. Currently, the SAR is a concrete channel from 17$^{th}$ Street in the City of Santa Ana to Adams Avenue in Huntington Beach. The riverbed is ordinarily dry from 17$^{th}$ Street in the City of Santa Ana to the Victoria Street Bridge. The Greenville-Banning Channel, which carries stormwater discharge and urban runoff, is channelized to the Victoria Street Bridge where it joins the SAR. Discharge from the Greenville-Banning Channel combines with tidal flow from the Pacific Ocean and the SAR is wet from the Victoria Street Bridge to the mouth of the SAR.

## Groundwater

Groundwater in the watershed is highly controlled by the geology of the area, in both the configuration of bedrock and by the extensive faulting. Most groundwater basins are unconfined, much like a bowl full of sand that has water poured in halfway, see **Figure 3-5**. However, the variable depth to bedrock, and the presence of faults cause pressure zones where water flows towards (or to) the ground surface. In general, groundwater flows the same direction as surface waters from the mountains in the east/north to the Pacific Ocean in the west. There are about 40 groundwater basins in the watershed (depending on how they are defined and boundaries are drawn); many are inter-related. Some of the largest groundwater basins include the Chino Basin (Chino/Ontario/Fontana area), the Orange County Basin, the Bunker Hill Basin (San Bernardino), the San Timoteo Basin (Yucaipa/Banning/Beaumont area), and the San Jacinto/Hemet Basins.

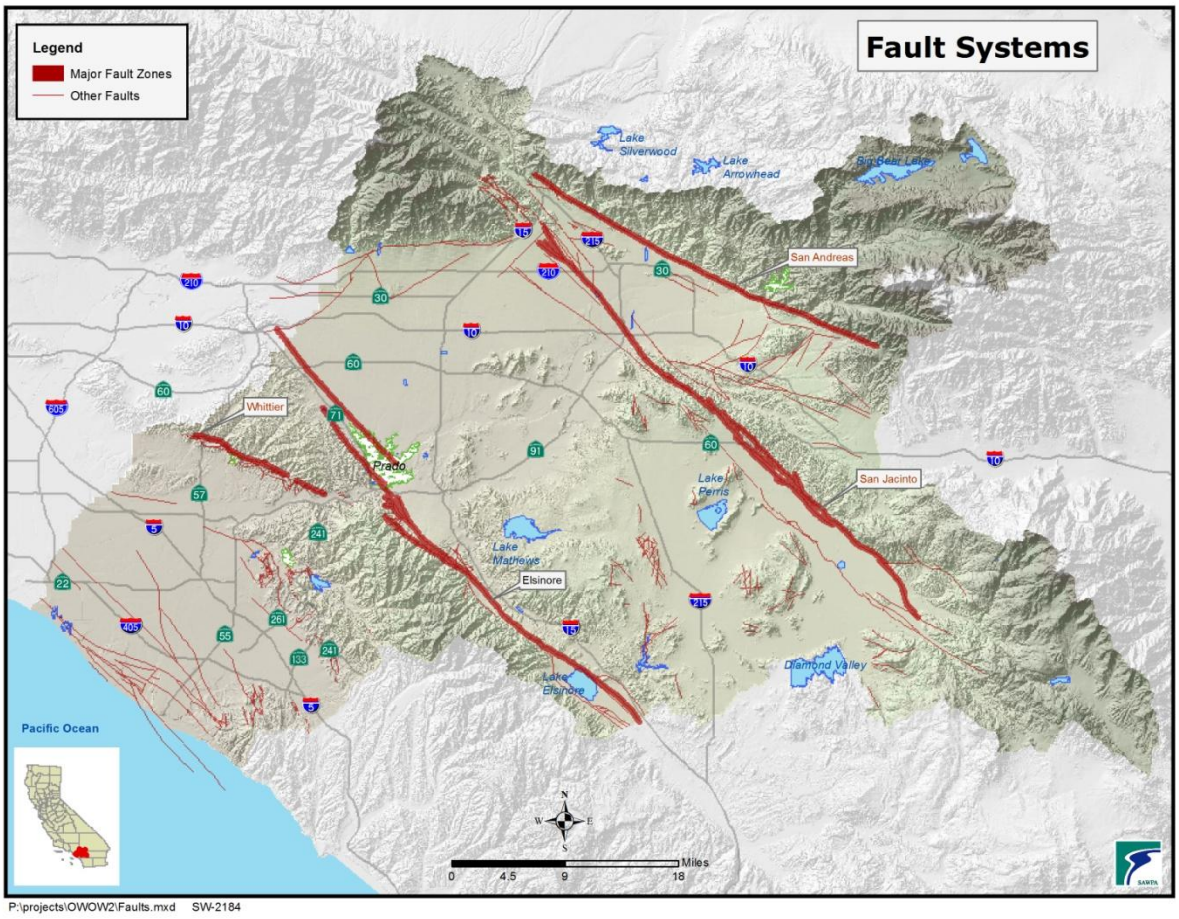


**Figure 3-5 Groundwater Basins**

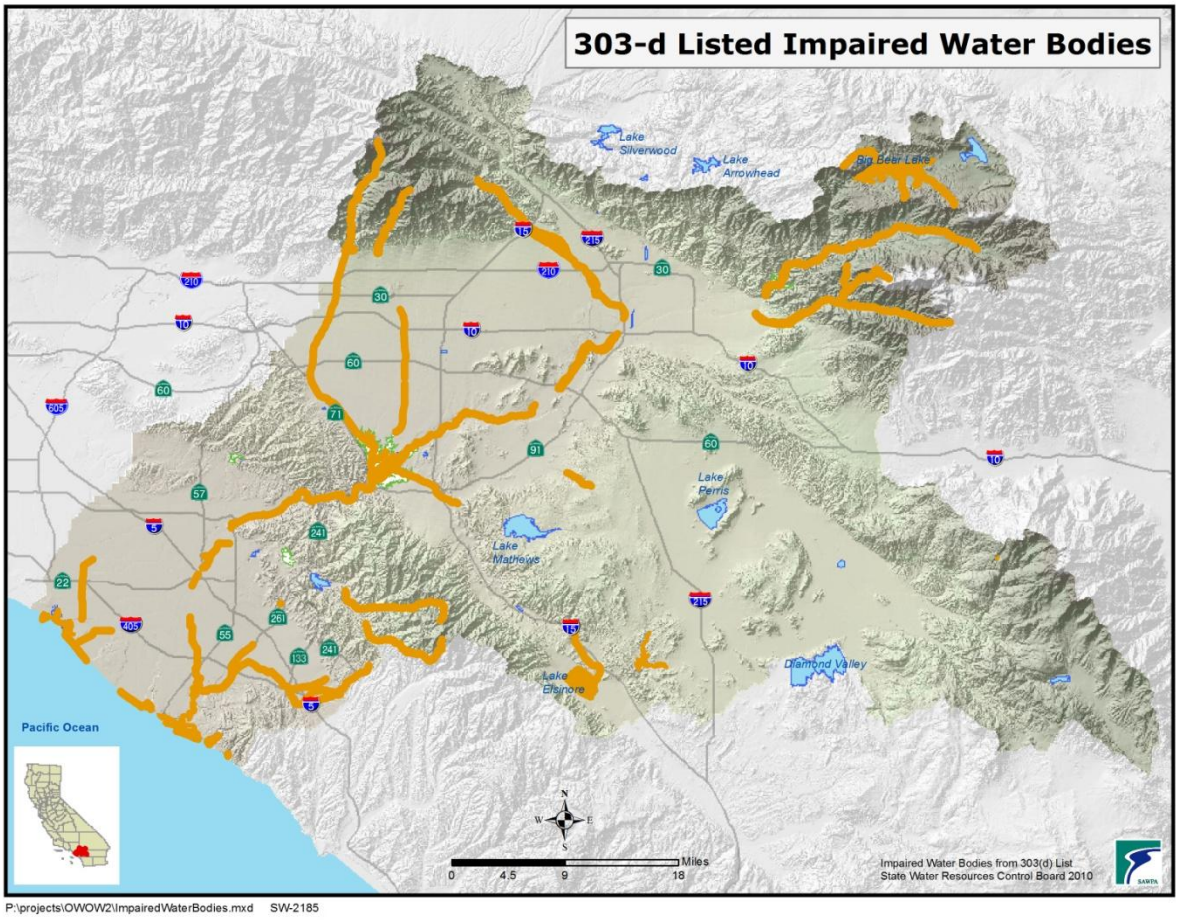
Four primary faults transverse the watershed, with other minor faults either branching off of, or running parallel to, the major faults **(Figure 3-6)**. Within the upper watershed, the San Andreas Fault divides the San Bernardino Mountains from the San Gabriel Mountains and branches off into the San Jacinto Fault near San Bernardino. Known as Southern California's most active fault, the San Jacinto Fault affects groundwater in the San Jacinto River and the SAR, forcing groundwater to the surface at the Bunker Hill

Dike. Toward the central watershed, the Elsinore-Whittier Fault passes under the Prado Dam from the northwest to the southeast. Toward the coast, the Newport-Inglewood Fault enters the region from the Los Angeles area and passes offshore near Newport Beach.

**Figure 3-6 Fault Systems**

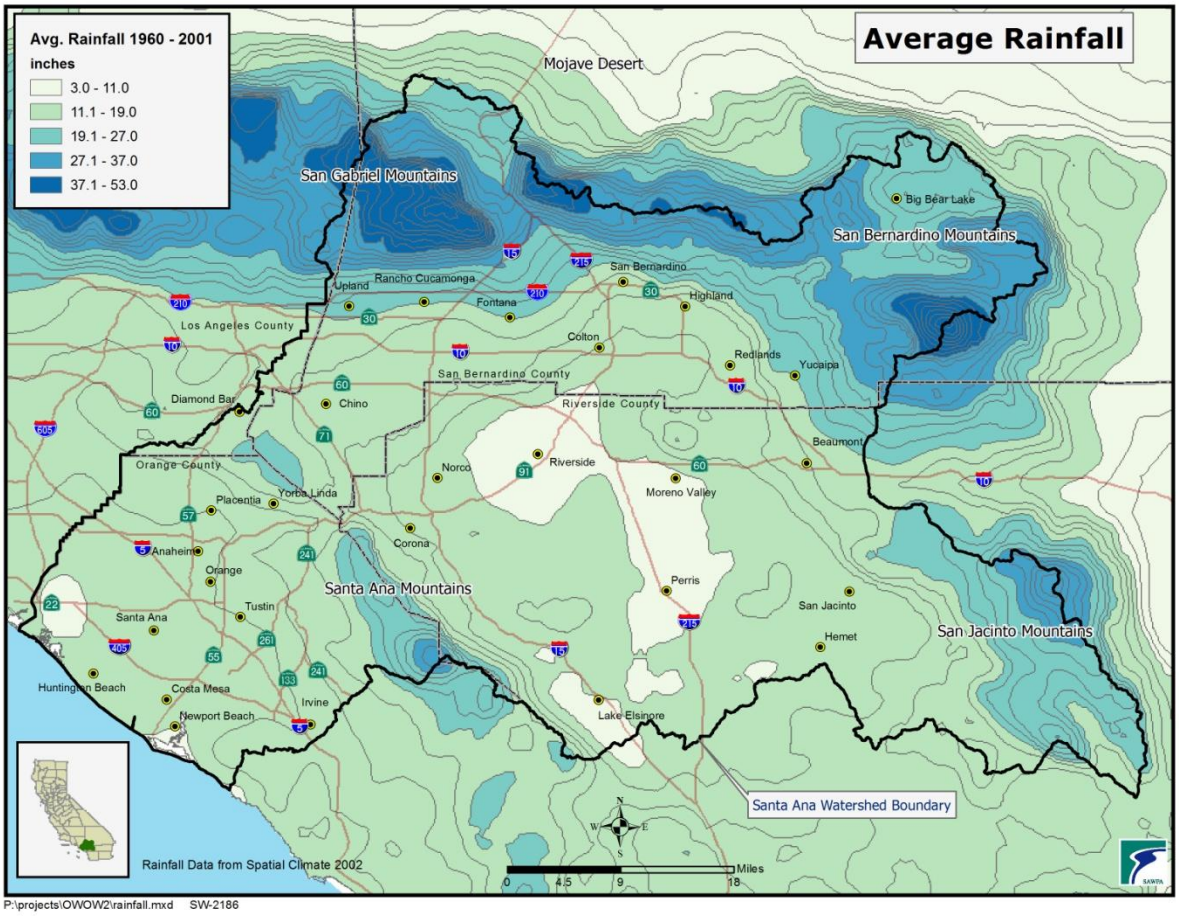


## Water Quality

Fortunately, water quality in the SAR has improved in recent years due to technological developments and water quality planning. Most of the native fishes of the Watershed are adapted to clear, unpolluted water that can support food resources and provide the various habitat conditions necessary to complete their respective life cycles. While fish kills, due to the spill of toxic substances into streams, are dramatic examples of the effects of pollution, these instances are acute, or short-term, rather than chronic. More insidious, however, are the chronic effects on aquatic resources of non-lethal forms of pollution that decrease growth, inhibit reproduction, or impair movement. Chronic elevated water temperatures or high sediment loads are an example of this type of pollution, even though toxic chemicals are not involved. Other examples include elevated but non-toxic levels of ammonia, increases in salinity, and low levels of dissolved oxygen (DO). Because most of the remaining native freshwater fishes live, at some time, in treated wastewater, the issue of chronic, low-level pollution is of great concern, although

the quality of wastewater has increased markedly in past years. Impaired water bodies can be seen in **Figure 3-7**.

**Figure 3-7 Impaired Waterbodies**



A more detailed write up on water quality issues in the Santa Ana Watershed is included in **Chapter 5.5 Beneficial Use Assurance**.

## Climate

The climate of the Watershed is considered Mediterranean with hot, dry summers, and cooler, wetter winters. Average annual precipitation ranges from 12 inches per year in the coastal plain to 18 inches per year in the inland alluvial valleys, reaching 40 inches or more per year in the San Bernardino Mountains (**Figure 3-8**). Most of the precipitation occurs between November and March in the form of rain with variable amounts of snow in the higher mountains of the Watershed. The climatological cycle of the region results in high surface water flows in the spring and early summer period, followed by typically low flows during the dry season. Winter and spring floods generated by precipitation in the high mountains are not uncommon. Similarly, during the dry season, severe thunderstorms in the high mountains periodically have generated torrential floods in local streams.

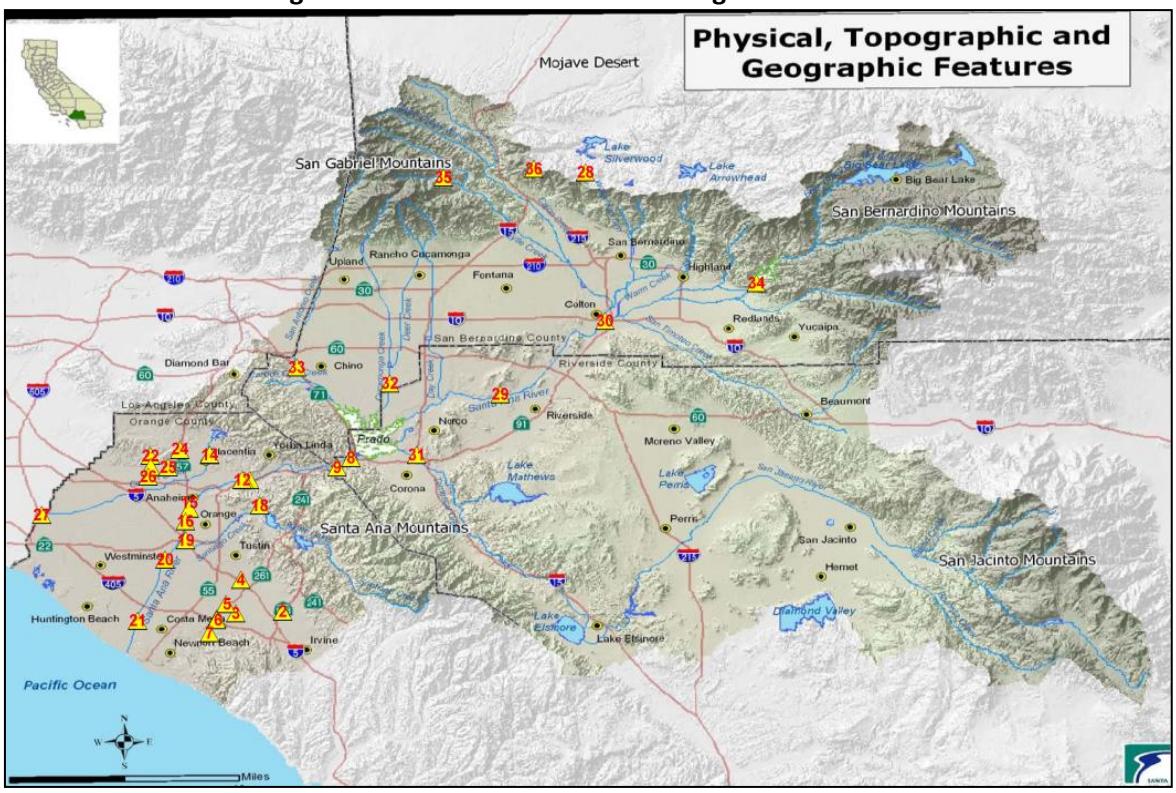


**Figure 3-8 Average Rainfall**

## Climate Impacts

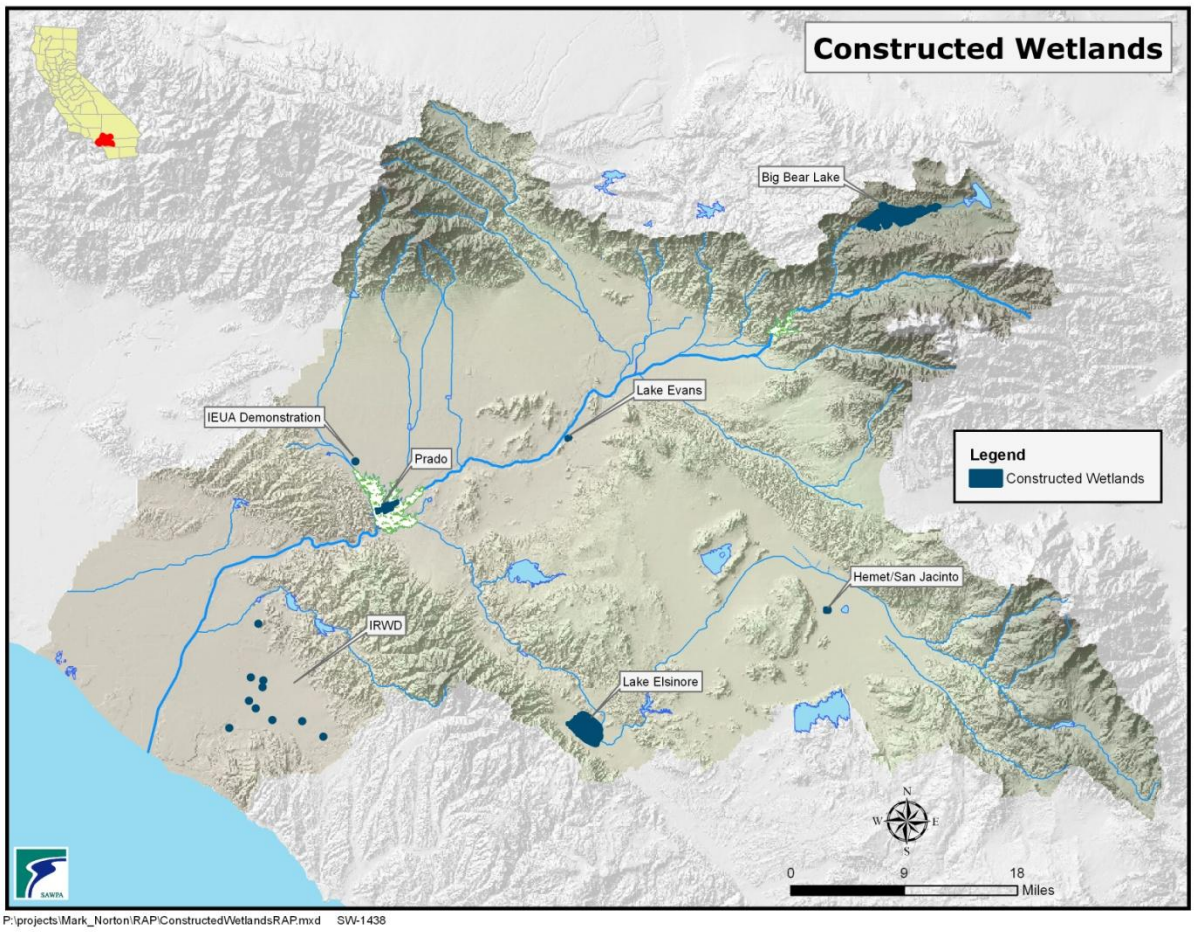
Climate change-related impacts already have taken place in California, and are having an effect within the watershed. According to the Department of Water Resources (DWR), historic hydrologic patterns can no longer be relied upon to forecast the water future. As such, the reliability of the system of imported water that provides significant supply to the region has been lessened. Precipitation and associated runoff patterns are changing, increasing the uncertainty for water supply and quality, flood management, and ecosystem functions. The average early snowpack in the Sierra Nevada has decreased by about ten percent during the last century, representing a loss of 1.5 million AF of snowpack storage. During the same period, the sea level rose seven inches along California's coast. The state's temperature also has risen 1 degree Fahrenheit. Most of the increased temperature readings are at night and during the winter season, with higher elevations showing the greatest increase. Rainfall has become increasingly variable, with Southern California experiencing both its driest and wettest years on record within the past decade.

**Figure 3-9 Climate Model Monitoring Locations**

A more detailed write up on the impacts of Climate Change in the Santa Ana Watershed is included in **Chapter 5.13 Energy and Environmental Impact Response**.

# Habitat and Native Species

## Habitat



OWOW attempts to catalog the locations of many water-oriented habitats within the watershed. While there are several types of habitat within the watershed boundary that are not directly water-oriented (e.g., chaparral, pine forest, oak woodland, grassland), the primary focus is on water-oriented habitat types (e.g., alluvial fans, riparian woodland, emergent wetlands, vernal pools, lakes, streams, estuaries, tidelands, open ocean). These water-oriented habitats tend to show up on maps as the "corridors" that connect the larger, non-water-oriented habitats. Water-oriented habitats locations that are candidates for protection or enhancement are of particular interest.

## Wetlands

Constructed wetlands have a wide range of benefits, including surface water protection . Constructed wetlands designed to treat secondary effluent will directly affect the reclaimed water supply. If water produced from the wetlands is of suitable quality to be recharged into groundwater aquifers, diminishing groundwater resources can be supplemented, or in some areas, reclaimed water can be recharged as part of a groundwater remediation program. Located along the Pacific Flyway, the critical migratory corridor connecting Alaska and Canada to Latin America, Southern California wetlands provide

vital habitat for migratory waterfowl. Opportunities for wildlife enhancement were considered in the construction/preservation of many of the following wetlands with environmental features that increase habitat diversity and wildlife productivity.

**Figure 3-10 Constructed Wetlands**

## Impacts to the Natural System

As noted by Moyle (2002), most of California's inland waterways today bear little resemblance to the streams and lakes encountered by the first European explorers and settlers. In the watershed, this observation is certainly true as flood control and channelization activities have left portions of streams channelized and concrete-lined where once riparian forests grew along a meandering stream. Fortunately, today only 20% of the SAR is concrete-lined. Dam construction and flood control activities were not the only factors influencing the watershed in ways that adversely impact habitat critical for aquatic resources. The following factors have also played a role:

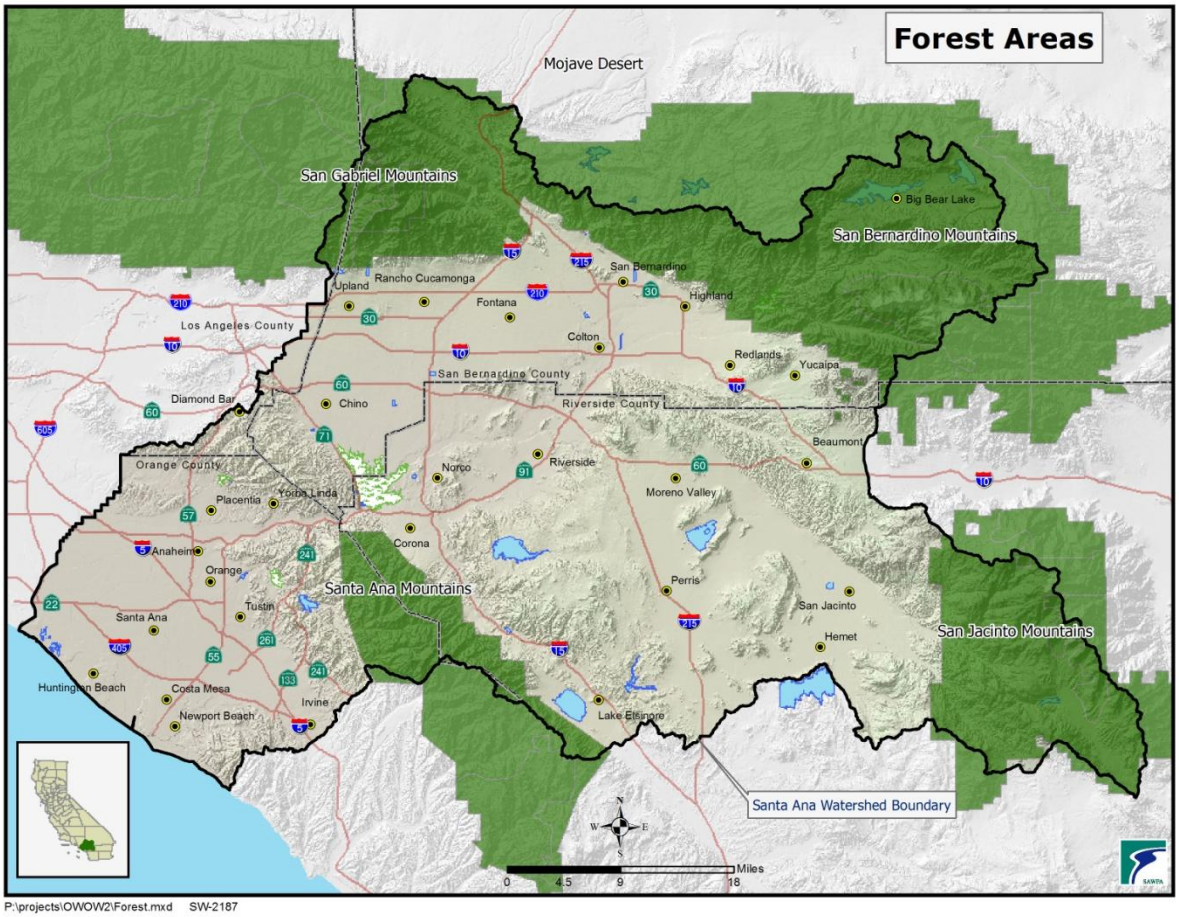
- Stream channel alteration
- Draining of streams and lakes, especially adjacent wetlands

- Livestock grazing and the impact on aquatic and riparian vegetation, sedimentation, and water pollution
- Historical logging practices
- Bark Beetle infestation
- Mining, particularly in-stream aggregate mining
- Watershed changes resulting in cumulative affects to aquatic resources

A more detailed write up on issues relating to natural systems in the Santa Ana Watershed are included in **Chapter 5.9 Natural Resources Stewardship**.

## Forest

As home to the headwaters of the Santa Ana River, the San Bernardino and Cleveland national forests encompass approximately 29% of the Santa Ana watershed's land mass. These forest areas also receive 90% of annual precipitation. Runoff on that land directly affects the amount and quality of water received downstream**.** If there are too many trees, the water supply is reduced by their thirst and the amount of fire fuel is increased resulting in more intense fires which are more difficult to control and have a greater potential for incurring loss of property or life. Meadows, which act as nature's sponge retaining water for groundwater recharge, can dry up due to natural and manmade channelization prohibiting the potential benefit of this resource. Restoration of impaired meadows could restore their beneficial function. The benefit of chaparral has mixed perception, having good benefits for erosion control and water dispersion contrasted by negativity when viewed as excessive fire fuel, therefore a clear method of management has been elusive.



There are two forests under the management of the U.S. Forest Service within the Santa Ana River Watershed; San Bernardino National Forest and Cleveland National Forest. The combined area of these forests is approximately 1.1 million acres. The U.S. Forest Service is challenged with managing this vast area while striving to address the multiple goals of conserving habitat for sensitive and endangered species, hazardous fuels reduction and the restoration of meadows. However, their resources have been limited to proactive measures aimed at protecting urbanized areas in and adjacent to national forest land leaving a substantial quantity of land vulnerable to overgrowth and increased fire risks and intensity.

Fire is an ongoing risk faced by the U.S. Forest Service due to man's encroachment into forested areas as evidenced by the nearly 2,300 special use permits issued each year by the U.S. Forest Service. The variables in weather such as drought seasons and wind also contribute to fire risk. The combinations of variables that contribute to fire risk make predictions and planning for fire events problematic. Hard lessons were learned after the forests experienced devastating fires in the early 2000's and the aftermath of those fires directly impacted the quality of water downstream of the burn areas and it took between three and five years to recover.

A partnership is being pursed among downstream groundwater management agencies, flood control and water conservation districts, water supply agencies, resource agencies and the U.S. Forest Service to

find amicable projects that can be executed in specific areas within the forest that will have a direct effect in preserving the quality and quantity of water resources from the source or headwaters, contributing to the overall health of the watershed. Evidence of a quantitative cost/benefit analysis is being sought to validate investment in projects that when implemented will help the U.S. Forest Service to keep the forest healthy which will in turn promote a gain in both the quantity and quality of available water resources.

**Figure 3-11 Forested Areas in the Santa Ana River Watershed**

A more detailed discussion relating to the partnership between water agencies and the U.S. Forest Service are included in **Chapter 5.12 Government Alliance**.

## Native Riparian Species

### Fish

The SAR historically provided habitat for eight species of native fish (species have multiple forms). Only four native non-game freshwater fishes are currently found in non-estuarine waters: arroyo chub, Santa Ana Speckled Dace, Santa Ana Sucker, and Threespine Stickleback. All of these remaining fishes have limited distributions and face possible extirpation. As previously mentioned, the Santa Ana Sucker is

listed by the Federal government as a "threatened" species pursuant to the Endangered Species Act. Currently, the Western Brook Lamprey, Steelhead, and Unarmored Threespine Stickleback are known to be extirpated from the watershed. The Pacific Lamprey has been observed once in the past 47 years and it likely is extirpated as well. Introduced forms of the rainbow trout have been extensively stocked in the watershed for sport fishing for over 100 years, and it is unknown if any genetically pure rainbow trout stocks endemic to the watershed remain. The partially Armored Threespine Stickleback was widely planted in the watershed for mosquito control in the early 1900s and is now found out of its natural historical range, e.g., Big Bear Lake. In contrast, at least 33 fishes have been introduced into the watershed and are currently present. New species can be expected to be found at any time due to inter-basin water transfers, ship ballast water hitchhikers, bait bucket introductions, and hobbyists disposing of unwanted fishes. Many of the introduced fishes are widespread, while a few are restricted to specific locations or habitats. Of the current inventory of introduced fishes, most were introduced by government agencies to serve as a food resource, for insect control, for sport fishing, or to serve as forage for sport fishes. A smaller number of fish have become established after arriving inadvertently via inter-basin water transfers or in ships' ballast water. For a detailed discussion of the introduction of fishes to California, the reader is directed to Dill and Cordone (1997). Additional information about introductions of fishes to Southern California is presented by Swift *et al*. (1993). Supplemental records can be found in Moyle (2002).

**The Santa Ana sucker is a federally listed fish native to the Santa Ana River**

## Amphibians

During the last 50 years, population growth and urban development in Southern California has displaced many amphibian species, and encroached upon much of former amphibian habitat. Several species are thought to be extinct, and many others have fragmented populations, which are at risk of extirpation. Amphibians especially are sensitive to environmental changes that alter the hydrology, ecology, and geology of a region because they have evolved, highly specialized adaptations that have allowed them to exist in these relatively arid regions. Introduced species also have been a major contributor to the decline in amphibian populations in Southern California. These non-native species increase competition for food sources, as well as prey upon many of the native amphibians.

## Reptiles

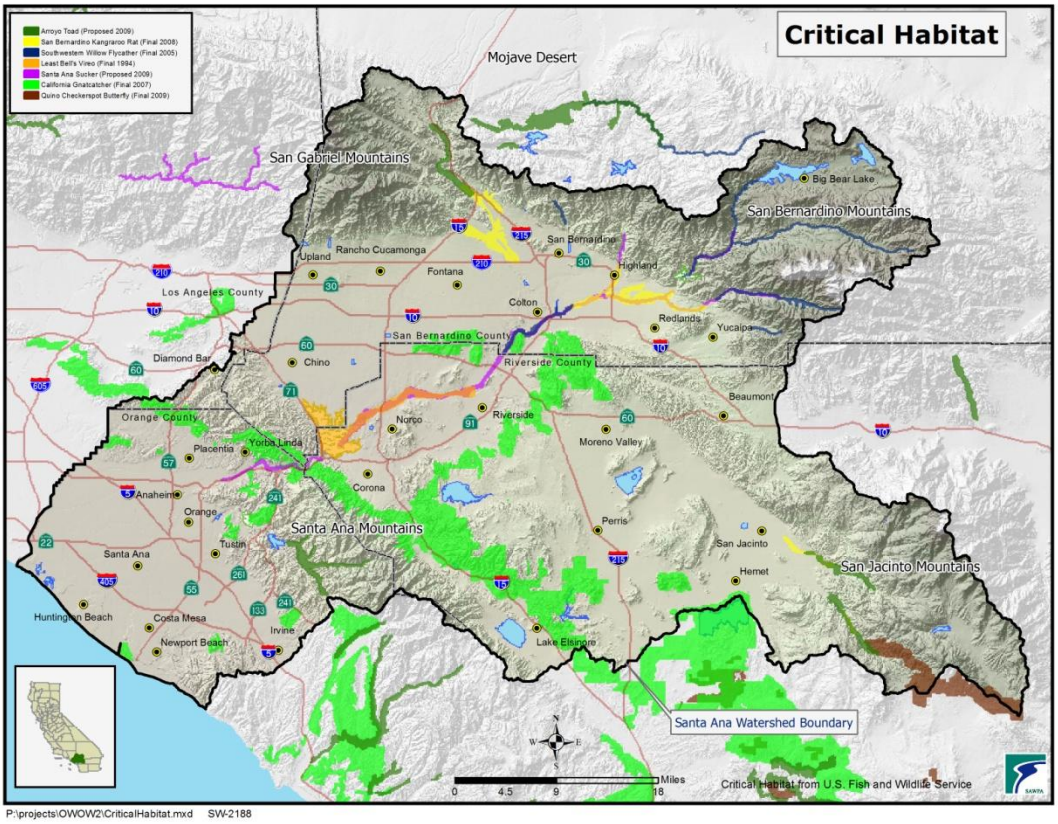
The California Department of Fish and Wildlife (CDFW) considers the Southwestern Pond Turtle (*Clemmys marmorata*) a species of "special concern". Recent reports on *C. marmorata* in Southern California indicates that a few viable populations remain in the regions (see also Brattstrom 1988).

Approximately six to eight viable populations of the turtle remain south of the Santa Clara River system in California. Droughts have exacerbated the negative effects of habitat alteration accumulated over many years over much of this region from changes in land and water use, and abusive grazing practices. In particular, most western pond turtle populations examined in this region appear to show an age structure increasingly biased towards adults, indicating little or no recruitment is taking place. Recent surveys indicate that the southwestern pond turtle also is seriously threatened throughout most of its range outside of California.

## Birds

Riparian ecosystems harbor the highest number of bird species in the arid and semi-arid parts of the southwestern United States. Riparian habitat provides productive breeding grounds and offers vital over-wintering and migration stop-over areas for migrating birds. Loss and degradation of riparian habitat have negatively impacted bird populations throughout the watershed. Other factors affecting bird populations are brood parasitism by the brown-headed cowbird, and disruption of natural hydrological regimes from dams and levees.

**Least Bell's Vireo, a federally listed bird species**



The Federally endangered Least Bell's Vireo has experienced recent population growth within the watershed due to aggressive management activities within Prado Basin and on adjacent lands. Within the basin, the population rose from 19 nesting pairs in 1986 to 123 nesting pairs in 1993. By the end of 1996, the count stood at 195 nesting pairs. This stunning recovery is due to the provision of a high quality habitat for the bird species, in part, due to invasive species removal, a project in place to control populations of the predatory cowbird, and efforts on the part of the U.S. Fish and Wildlife Service (USFWS) , Orange County Water District (OCWD), a number of Resource Conservation Districts (RCDs), and others.

The Federally endangered southwestern willow flycatcher also is affected by cowbird brood parasitism. The implementation of cowbird management programs in addition to preservation and restoration of riparian deciduous shrub habitat is needed to reduce current populations. The bald eagle, listed by the USFWS as endangered in 1978 has experienced population growth over the past two decades. The bald eagle could be considered a USFWS success story: reclassified as "threatened" in 1995 and first proposed for delisting in 2000. Delisting of a species is the USFWS's ultimate goal and only happens when specific recovery goals have been met for a species. Unfortunately, delisting is an infrequent occurrence. In the case of the bald eagle, delisting has been delayed while the USFWS determines how the species would be managed once it is no longer classified as threatened.

## Special Status Species

Second only to Hawaii, the State of California is home to the highest number of endangered species in the United States. As defined within the Federal Endangered Species Act of 1973, an endangered species is any animal or plant listed by regulation as being in danger of extinction throughout all or a significant portion of its geographical range. A threatened species is any animal or plant that is likely to become endangered within the foreseeable future throughout all or a significant portion of its geographical range. Federal law prohibits the "take" of any individuals or habitat of federally listed species without a special permit. In addition to federal laws, the State of California has its own California Endangered Species Act, with a separate listing of species and separate laws governing take of listed species. Enforcement of the Federal Endangered Species Act is administered by the USFWS and the National Marine Fisheries Service, while the CDFW enforces the California Endangered Species Act.

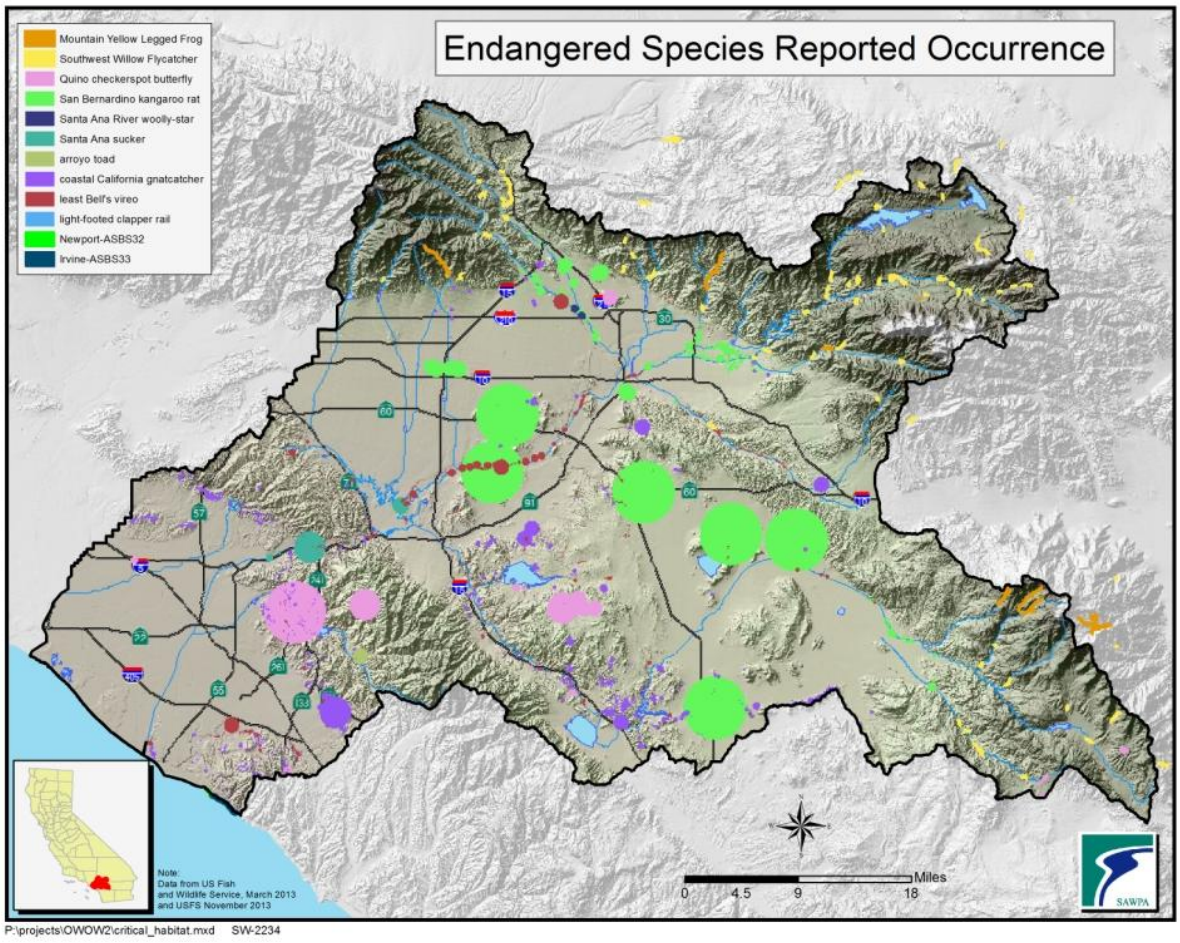


**Figure 3-12 Critical Habitat within the Watershed**

The varied geography and natural features of the Watershed provide habitat for a number of Federally and/or state-listed species. As OWOW 2.0 focuses on the resources in and around the SAR, listed species of concern herein are those that occupy aquatic, wetland, riparian, or riparian adjacent areas. Of these, two are plants – the Santa Ana River Woolly Star (*Eriastrum densifolium*) and the slender-horned spine flower (*Dodecahema leptoceras*); one fish – the Santa Ana River Sucker (*Catostomus santaanae*); one amphibian – the Arroyo Toad (*Bufo californicus*); three birds – the Least Bell's Vireo (*Vireo bellii pusillus*), the Southwestern Willow Flycatcher (*Empidonax traillii*), and the Bald Eagle (*Haliaeetus leucocephalus*);

two mammals – the San Bernardino Kangaroo Rat (*Dipodomys merriami parvus*) and Stephen's Kangaroo Rat (*Dipodomys panamintinus*); and one insect – the Delhi Sands Flower-loving Fly (*Rhaphiomidas terminatus abdominalis*). Any project or policy recommended by the Santa Ana IWP will need to assess potential impacts to listed species, and incorporate measures to avoid impacts to these species.

**Figure 3-13 Endangered Species Reported Occurrence**

## Factors Affecting Native Species

### Introduced Species

The 33 species of introduced fishes greatly outnumber the four remaining native fish species. The number of species, *per se*, is not the problem but, rather, the impact that introduced fishes and other aquatic organisms, have on the native fishes of the watershed. Introduced fishes have dramatically changed the composition of the watershed's fish community and now act as a deterrent to the restoration and enhancement of the native fishes that remain. The manner in which introduced fishes can affect the aquatic resources of the watershed are:

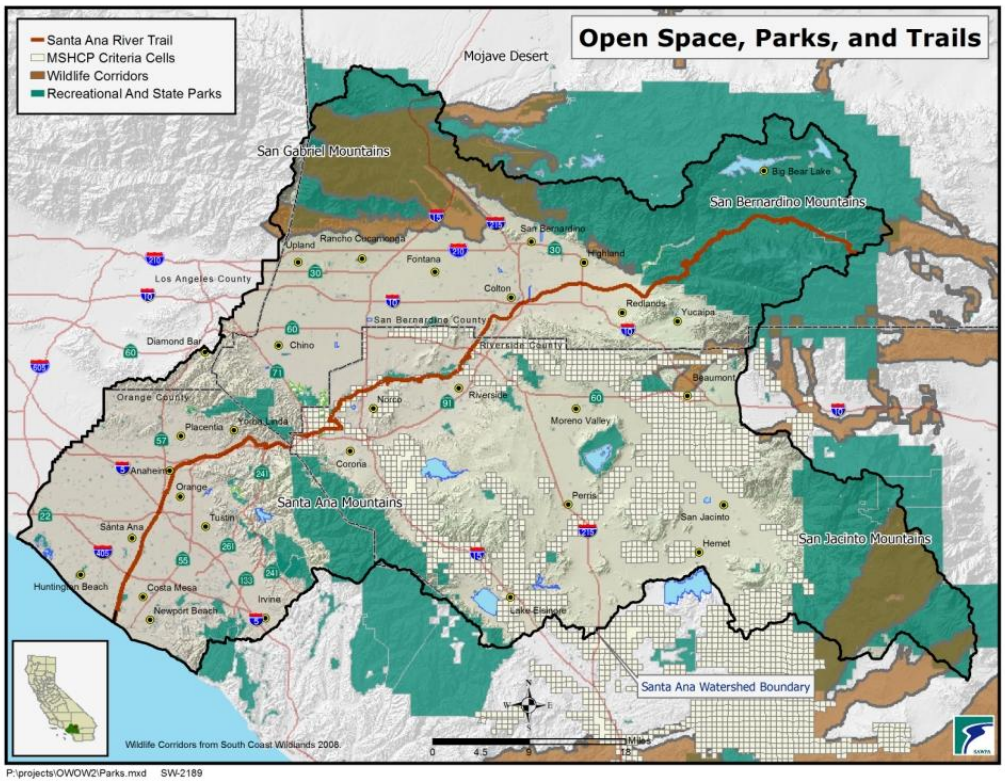
- Competition between native and introduced fishes for food and space
- Predation by introduced species on native fishes
- Habitat interference by introduced fishes that change habitat characteristics
- Introduction of diseases that may infect native fish or other aquatic animals
- Hybridization between closely related species

## Exploitation

Over-exploitation of rainbow trout/steelhead, primarily by angling, was a major factor in driving the native populations to low levels, and perhaps to extinction. Over-fishing, in turn, led to the stocking of hatchery fish and the introduction of various exotic species as angling alternatives to the native trout. The intensity of over-exploitation is illustrated by a report in the July 17, 1892 edition of the *Citrograph*, a Redlands newspaper, which reported that three boys fishing in Bear Creek, a tributary to the SAR in San Bernardino County, had caught 592 trout in three hours. Similar reports are common in the historical press.

It was not until 1872 that the California Legislature banned the use of nets, weirs, baskets, traps, explosives, and poisons as acceptable means of harvesting trout. Unfortunately, there was no one to enforce this statute, nor was there any limit on the number of fish that could be harvested by legal means. The over-exploitation of trout became such a problem in the watershed that in 1894, San Bernardino County, on its own authority, finally took action and limited the number of trout a person could catch to 50 per day. The State of California did not take similar action until 1905, when the harvest was limited to 50 trout per day and 25 total pounds. By then, the native stocks already had become depleted in the watershed.

Each of the aforementioned factors has acted in concert over a long period of time to reduce the native fish community of the Watershed to that which remains today. OWOW 2.0 recognizes that history cannot be undone and the aquatic community cannot be restored to its pre-settlement condition; however, a conservation strategy can be implemented that will ensure the long-term viability of the watershed's aquatic communities.



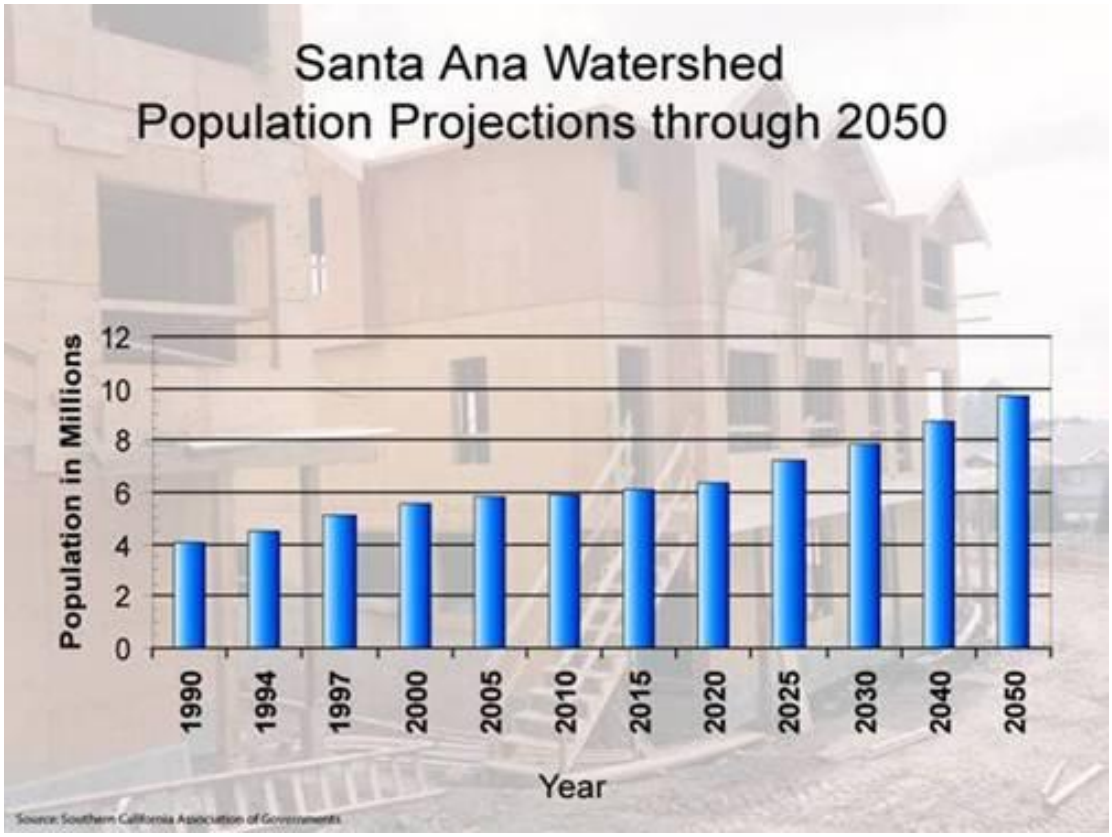
## Open Space and Recreation

The Santa Ana River Watershed is a stunning location with a wide variety of scenery and natural resources. It is a unique location, situated between the desert, mountains, and the sea. The watershed combines a complex arrangement of terrain, climates, and habitats that extend from the San Bernardino Mountains down to the Pacific Ocean.

Taking advantage of the watershed's beautiful landscape, the Santa Ana River Trail, highlighted in **Figure 3-14** links open space areas throughout the Watershed. Building the SART has been a highly successful collaborative effort and should be used as a model for other recreation projects in the future. The

SART's achievements only could have been accomplished through a variety of partnerships, combining the expertise and resources of multiple counties, cities and other groups.

**Figure 3-14 Recreational Opportunities within the Santa Ana River Watershed**



A more detailed write up on issues relating to recreational opportunities in the Santa Ana Watershed are included in **Chapter 5.9 Natural Resources Stewardship**.

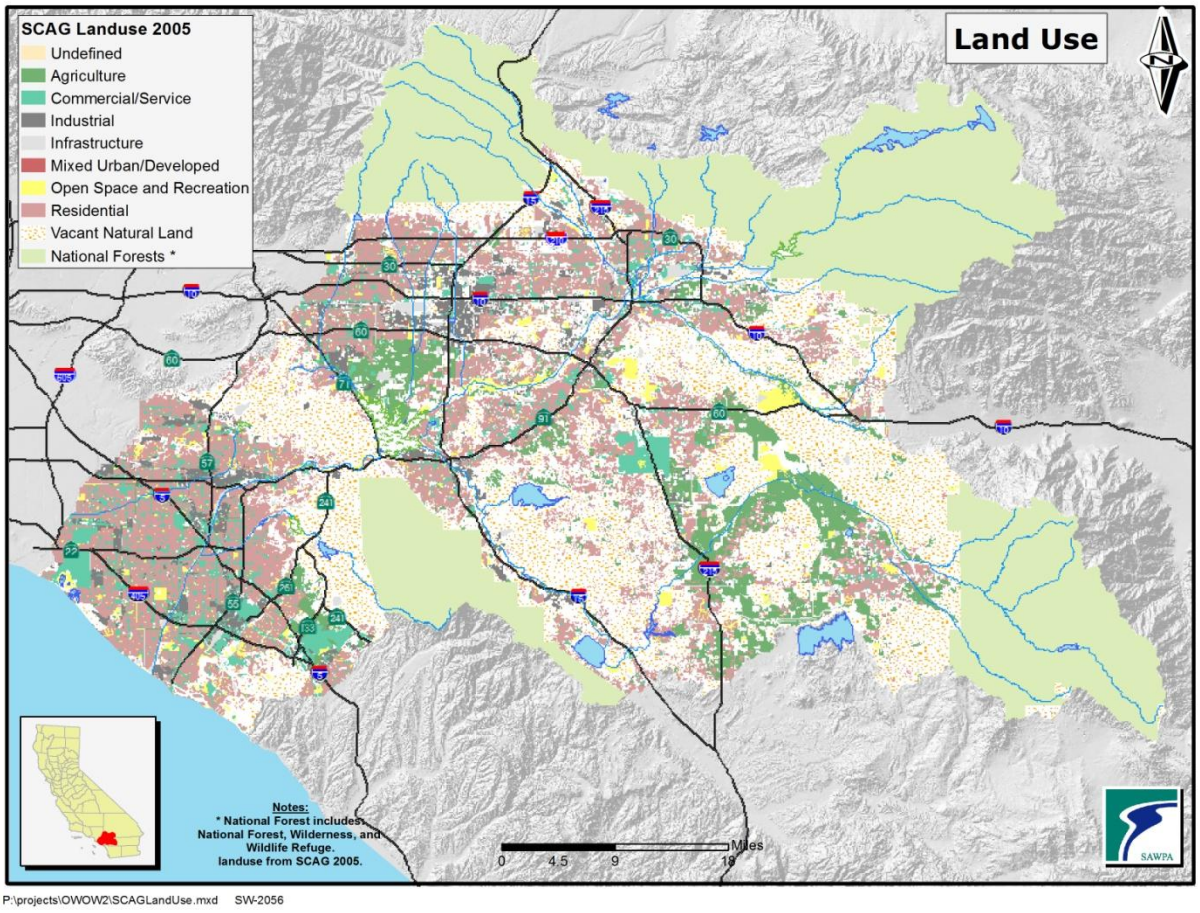
# Watershed Demographics

## Population and Population Projections

The Santa Ana River Watershed has experienced significant population growth in recent years and is expected to continue growing at a considerable pace over the next 40 years. According to the U.S. Census Bureau, the watershed had a population of 5.9 million in 2010 and is expected to reach 9.9 million by 2050, or an average annual growth rate of 1.3 percent (**Figure 3-15**). The recent recession most likely will slow this growth rate substantially. Although recent Southern California Association of Governments (SCAG) reports show that the Santa Ana Watershed will continue to grow and reach long–term population estimates, the timeline is uncertain. Until the issues of higher unemployment and high-foreclosure rates within the region are resolved, population growth rates will be slowed.

**Figure 3-15 Population Projections**

Demographic estimates for the watershed indicate that much of future population growth will take place in Riverside and San Bernardino counties, as Orange County is fairly built out. According to the U.S. Census Bureau, Riverside County grew by 37.5% between 2000 and 2010 (or an annual average of 3.6%), compared to 9.1% for the state of California as a whole (an average of less than 1% per year). Population growth will continue at an average of 1.9% per year through 2035, according to Riverside County Center for Demographic Research.



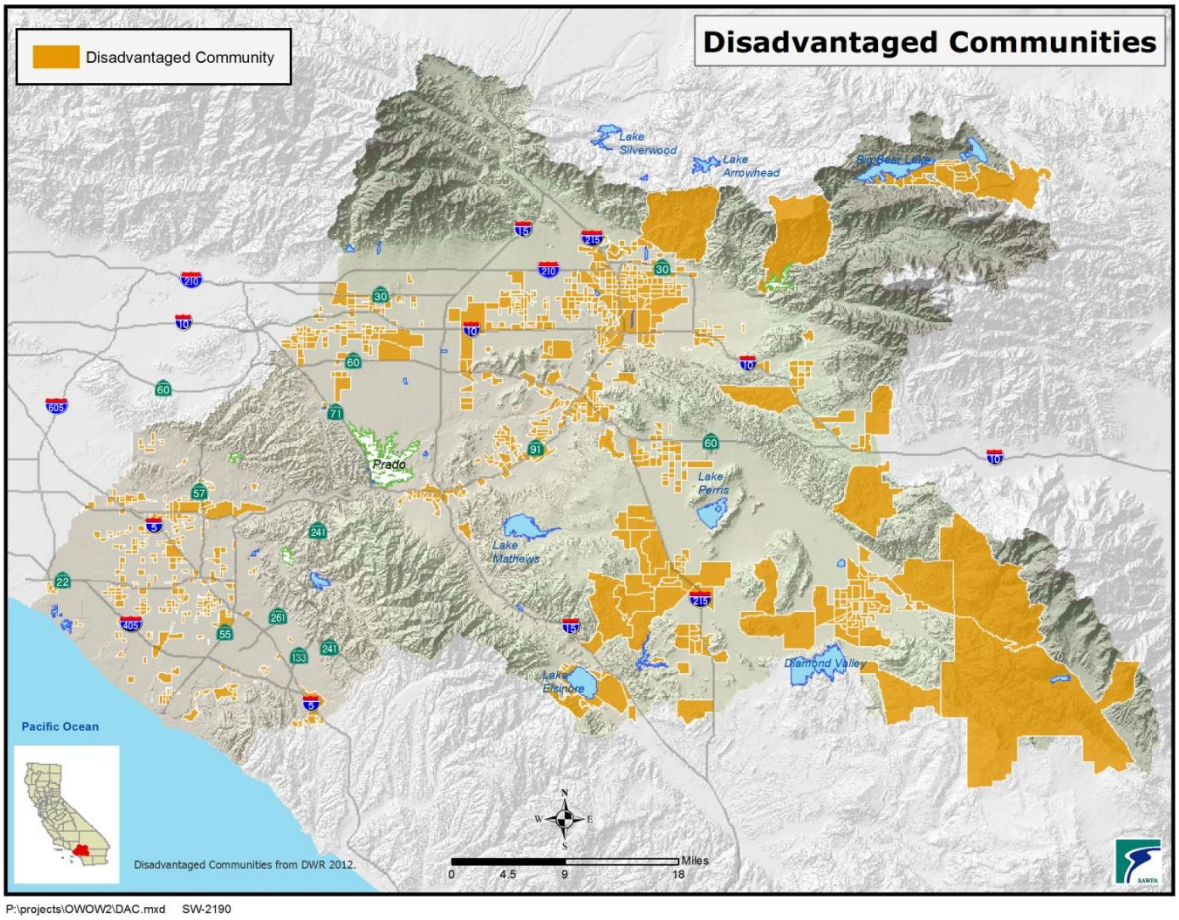
Similarly, San Bernardino County grew by 18.0% in the same period (or 1.8% per year), or almost twice the state rate. In contrast, Orange County grew by 6.3% in the same period, below the State average. Population growth will exacerbate some of the issues previously described for the watershed if no action is taken. In particular, population growth could result in more habitat fragmentation, increased impervious surfaces, modification of natural hydrology, increased water demand, and increased waste generation. The types of multi-benefit and multi-jurisdictional or watershed-wide projects promoted by the OWOW plans could help reverse this trend.

## Land Use

The watershed is substantially urbanized; about 32 percent of the land use is residential, commercial, or industrial. Agricultural land, once accounting for virtually all of the use of the watershed during the days of the ranchos, now accounts for a mere ten percent. Instead of a scattered population of indigenous

peoples, the watershed now supports over 5 million people. **Figure 3-16** presents a breakdown of the major land use categories of the watershed obtained from the SCAG 2005 land use dataset.

**Figure 3-16 Land Use**



A more detailed write up on issues relating to land use planning in the Santa Ana Watershed are included in **Chapter 5.7 Land Use and Water Planning**.

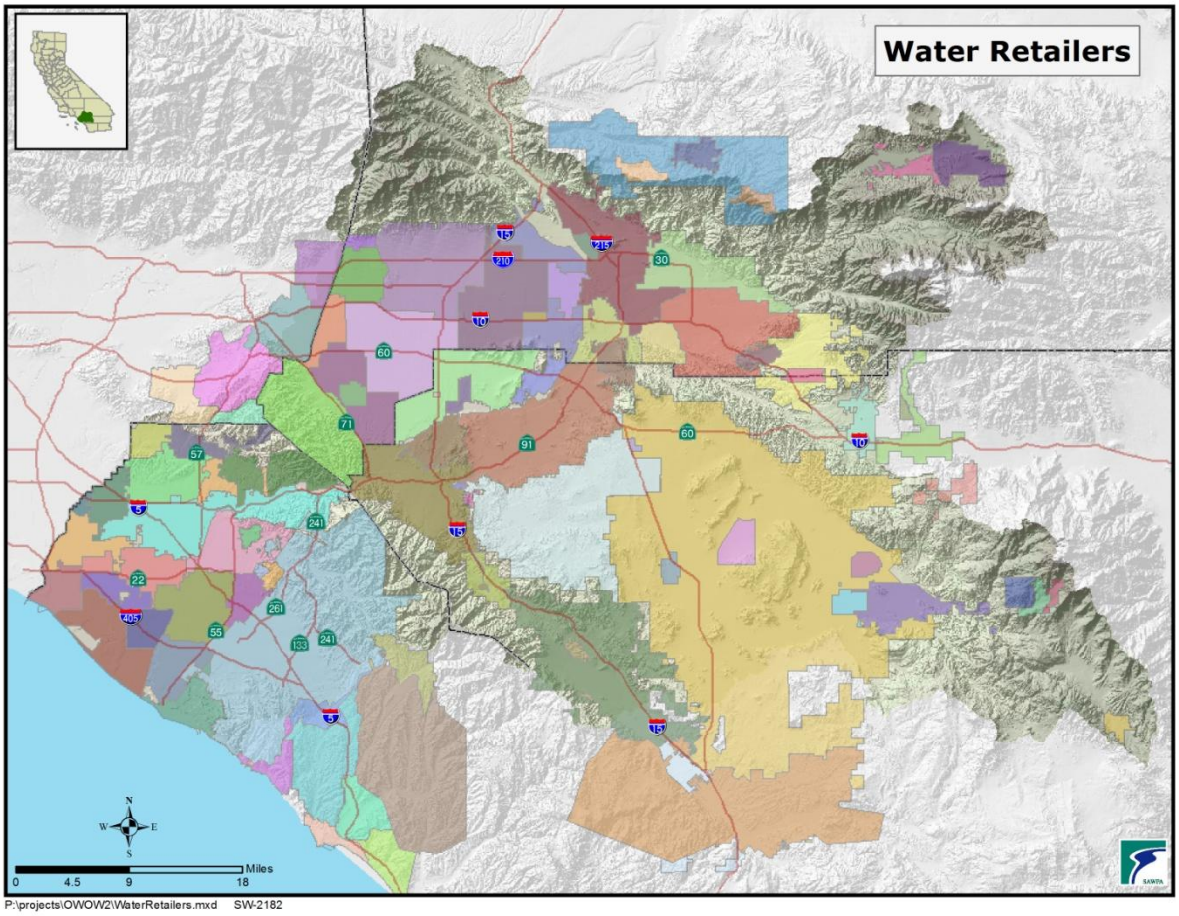
## Disadvantaged Communities

The SAR Watershed contains one of the fastest growing regions in California and also some of the State's poorest residents. In 2000, the per capita income of portions of the Inland Empire was about 25% below the state average (Schreiber, 2003). **Figure 3-17** depicts watershed income in the SAR Watershed by census tract, based on 2007 incomes as collected by the Claritas division of Nielson Company in 2008. This disparity in income is exacerbated by the recent economic downturn which has had a detrimental effect on the region in general and specifically impacted laborers in disadvantaged communities with limited job skills.

**Figure 3-17 Disadvantaged Communities in the Santa Ana River Watershed**

A more detailed write up on issues relating to disadvantaged and tribal communities in the Santa Ana Watershed are included in **Chapter 5.9 Natural Resources Stewardship**.

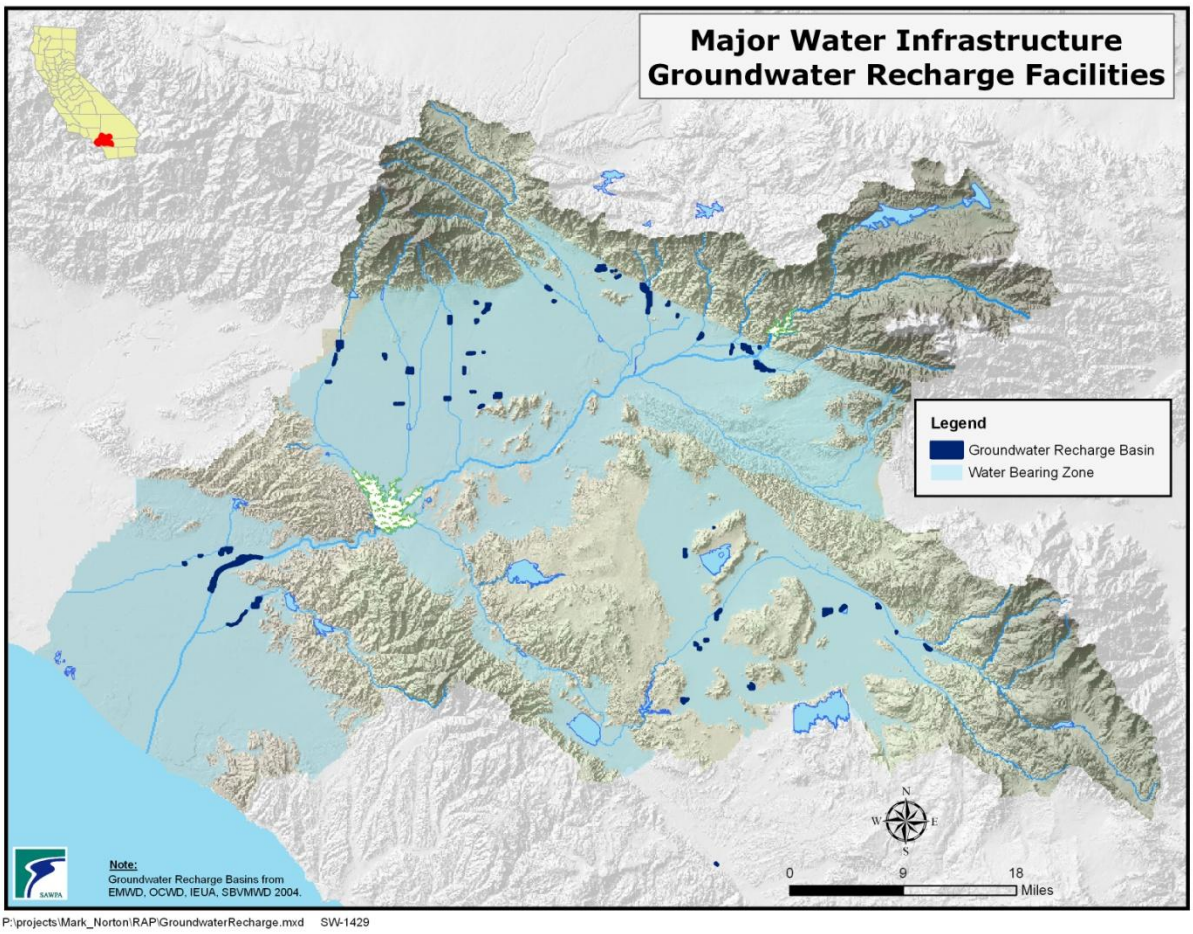
## Water Infrastructure Systems



In order to suggest ways to improve water reliability for the future, the existing water infrastructure system must be considered as the foundation to build upon. Particularly in this watershed, when we describe water infrastructure, we are describing not just the large-scale systems, services, and facilities that are necessary to support the collection, storage, treatment and delivery of water to customers in the region, but also many other systems, service and facilities, such as trails, parks, and land use that may use or have a nexus with water. In addition, since water demands and supplies are interrelated to a variety of other natural and man-made support systems, several different maps are included in this chapter to fully convey the opportunities to coordinate among infrastructure systems, as well as land use for the development of multi-beneficial integrated projects.

The importance of an effective water-related infrastructure system cannot be understated. Evaluations of the infrastructure in the watershed were conducted by the American Society of Civil Engineers in 2010 as conveyed in two separate infrastructure report cards, one for the San Bernardino and Riverside

Counties and one for the Orange County. These infrastructure report cards evaluated the condition, capacity, operations and security as criteria for assigning grades to the systems. In the San Bernardino and Riverside counties, the most populated and developed areas of the counties lie within the western portions (Inland Empire) and within the SAR Region.

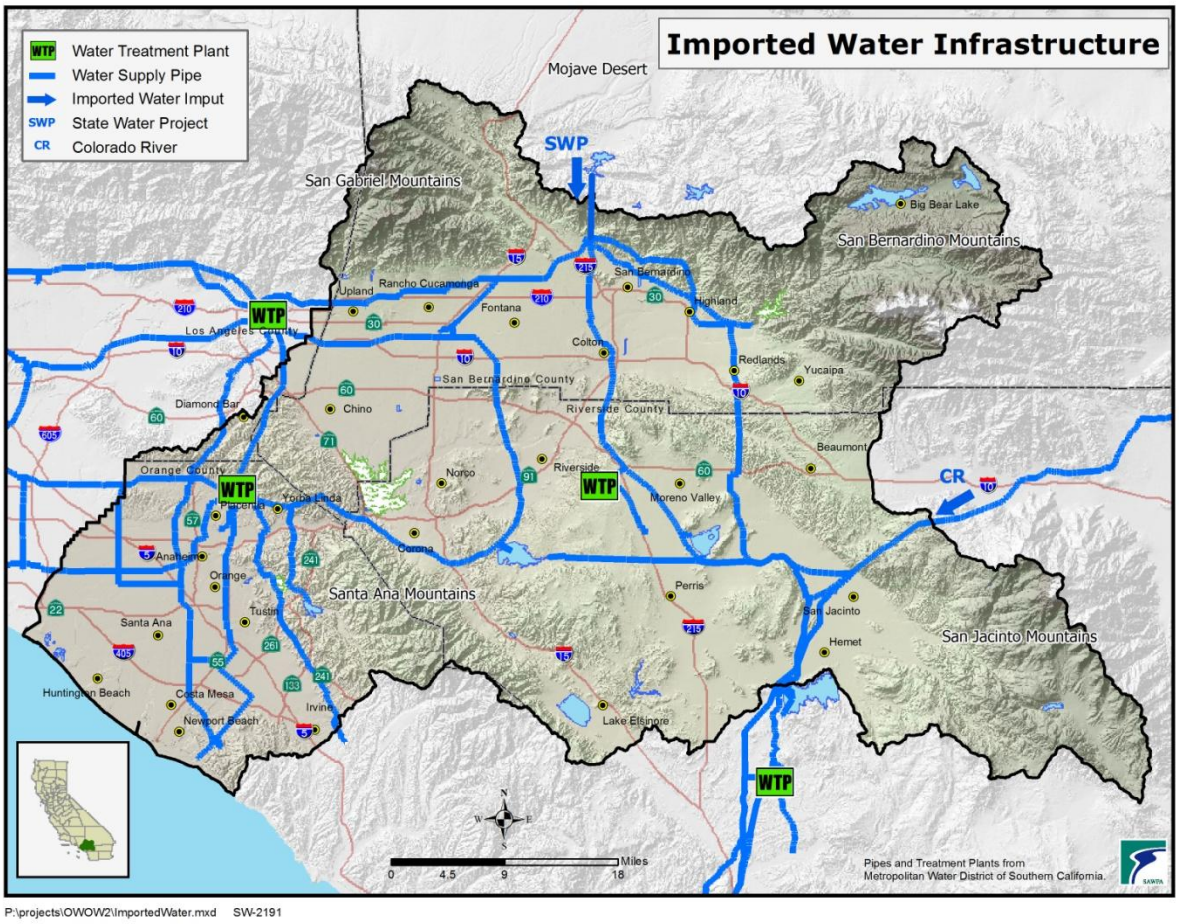


In review of the water-related infrastructure grades for the Inland Empire, room for improvement clearly exists, particularly as this area struggles to maintain and provide water-related infrastructure for two counties, as reflected in **Figure 3-18**, which shows the various water retail service areas within the SAR region.

**Figure 3-18 Water Retail Service Areas in the Santa Ana River Watershed**

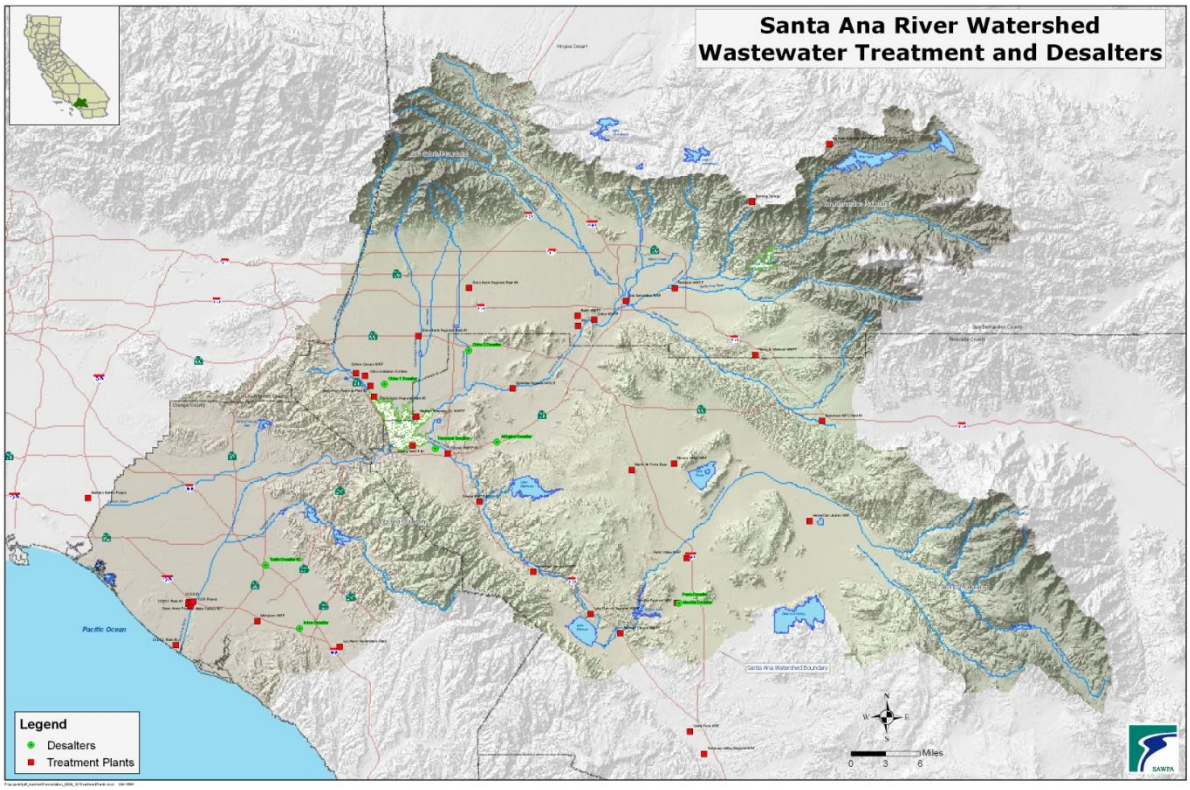
In Orange County, the strains of an increasingly built-out area with a population base of 2,846,289 (2000 census), the second most populous county in the State of California, have resulted in both surface quality and groundwater recharge concerns to meet the needs in this area. New infrastructure is required to clean up urban runoff, increase groundwater recharge, treat increasing wastewater flows for recycled use, and expand capture of upper watershed flows to recharge the groundwater supply. **Figure 3-19** displays groundwater recharge facilities within the Santa Ana River Watershed.

**Figure 3-19 Groundwater Recharge Facilities in the Santa Ana River Watershed (overlying GW basins)**



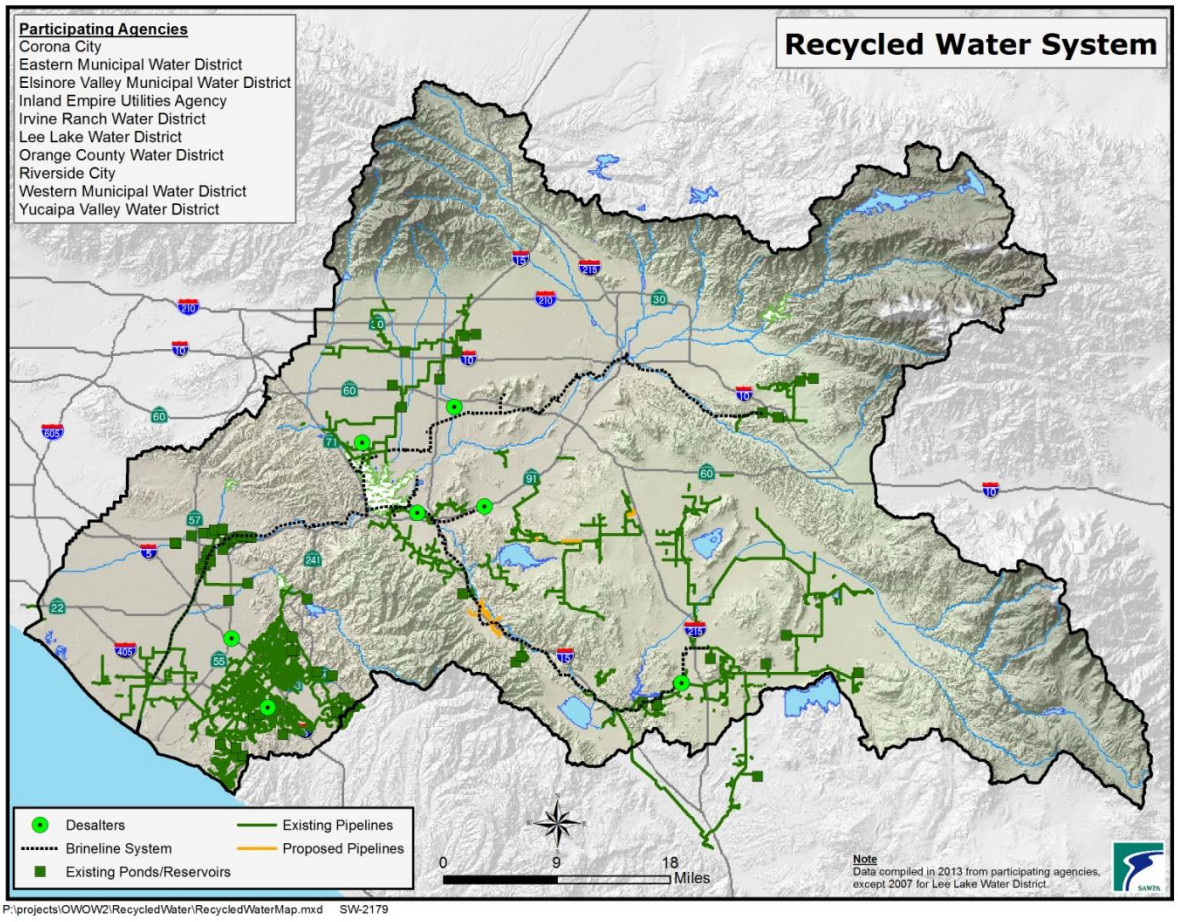
To best understand the water-related infrastructure in the Watershed, some sense of the water development history of the region is appropriate. Prior to the Mission and Rancho periods of the 1800s, the primary land use in the Watershed consisted of grazing cattle and horses. With the advent of Mormon settlements, agricultural lands began to be developed, utilizing the readily available surface springs as a dependable source of irrigation water. As more and more settlers arrived and communities sprang up demanding more water supplies, issue of water rights arose along with competition for the best diversion points. Gradually, a system of water rights was established and shares in a water supply became marketable commodities. As agricultural activity continued to increase in the inland areas of the Watershed, more and more infrastructure was needed to provide the necessary water. First windmills, then motors, and finally, deep well turbines were installed. Gradually over time with increasing urbanization, the dominant land use of the region, agriculture, was subsumed by residential, commercial and industrial areas to serve a burgeoning population drawn to the semi-arid warm climate of this region (see Year 1933-2000 Land Use Transition Maps).

In the late 1920s, to assure adequate water supplies for the population growth of Southern California and following the lead of the City of Los Angeles in its construction of the LA Aqueduct in the early 1910s, efforts commenced to raise money to import water from other places. Metropolitan Water



District (MWD) built and still operates the Colorado River Aqueduct, which each year imports millions of AF of water westward across the Mojave Desert and into the SAR Region. After SWP facilities were extended into the region in the early 1970s, State Water Contractors received deliveries from northern California's Bay Delta region to constructed pipelines to deliver imported water to serve the rapidly growing water demands of the region. Connections were established for the SAR Region by four State Water Contractors: MWD, Valley District, San Gorgonio Pass Water Agency (SGPWA), and the San Gabriel Valley Municipal Water District as shown in **Figure 3-20**.

**Figure 3-20 Imported Water Infrastructure in the Santa Ana River Watershed**

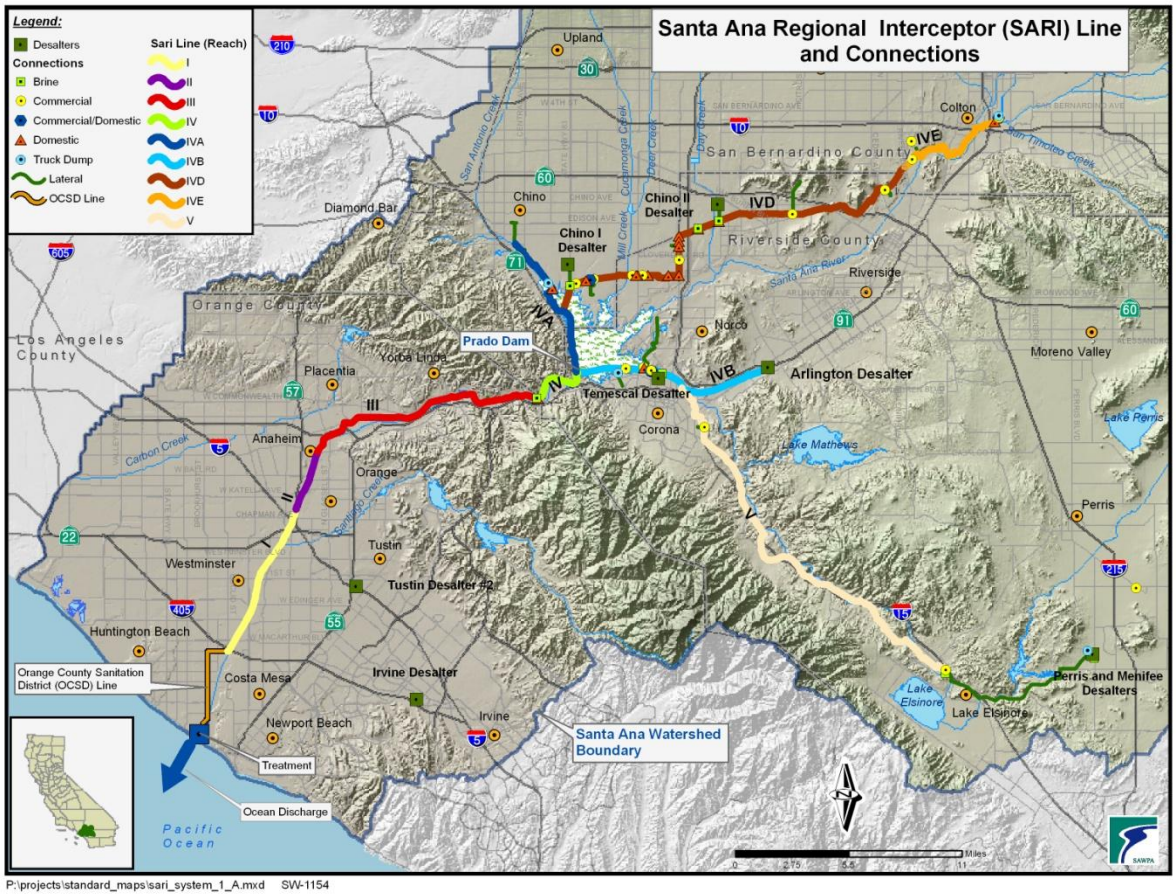


After use of available local and imported water by urban populations, wastewater treatment infrastructure collects and treats the effluent at locations, shown in **Figure 3-21**, but with the majority located near the SAR due to their proximity to a discharge location.

**Figure 3-21 Wastewater Treatment Facilities in the Santa Ana River Watershed**

Gradually over time, the once perennial flows of the SAR, which often dwindled to a near trickle during the summer months in the late 1800s, were replaced with predominantly steady and reliable, tertiary-treated discharge flows that could be captured downstream for reuse and recharge by downstream entities. Major infrastructure developed to support water reuse is shown in **Figure 3-22**.

**Figure 3-22 Major Recycled Water Infrastructure in the Santa Ana River Watershed**



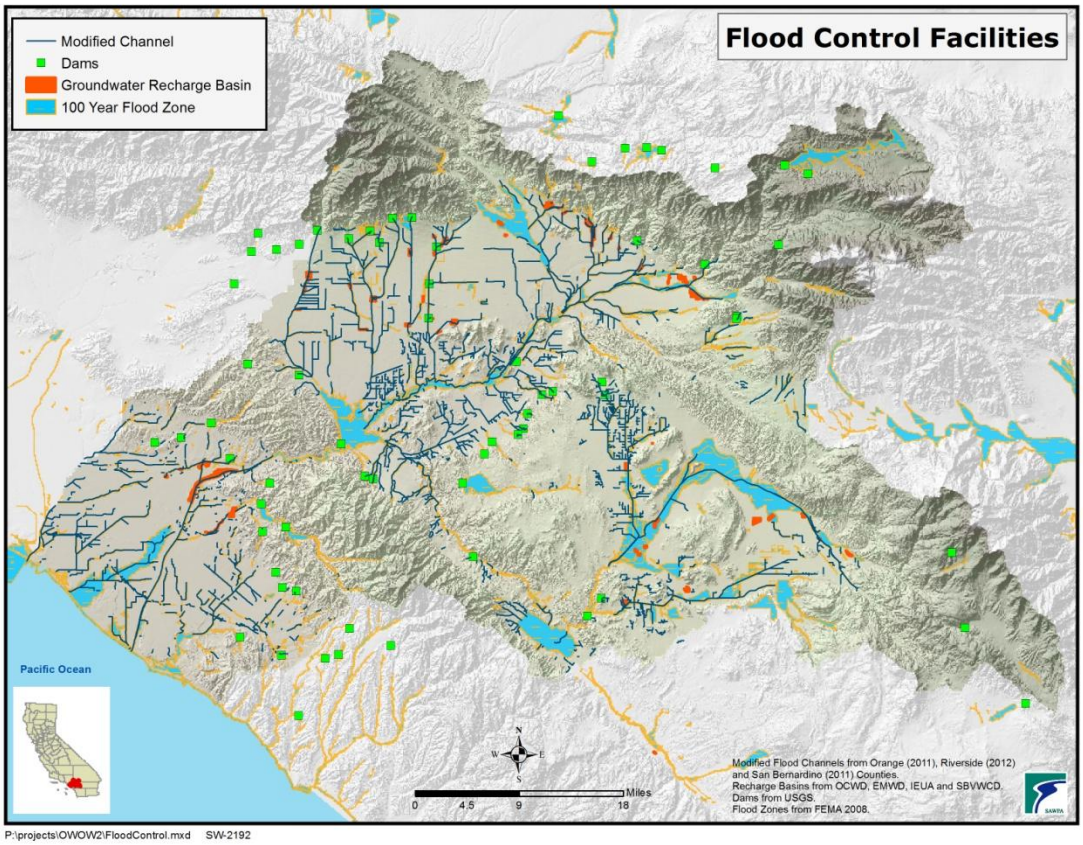
A more detailed write up on issues relating to water supply and demand relating to water resources in the Santa Ana Watershed are included in **Chapter 5.4 Water Resource Optimization**.

## Salt Management

One of the most predominant concerns arising from the heavy use of the watershed for past agricultural practices, and now from the imported water and use of water, is the buildup of salts. Almost a century of agricultural and industrial use has resulted in salts and other constituents of concern infiltrating many aquifers and streams within the watershed. As the watershed continues to grow, cities encroach ever closer in proximity to dairies and other agricultural operations. To counter this added stress to the stream and groundwater supplies, producers have developed advanced methods of reducing potential conflicts. Technologically advanced wastewater control infrastructure has been rigorously employed, and negative impacts from agricultural runoff continue to be minimized. Nevertheless, the existing salts and contaminants present in the watershed from past practices still need to be removed, as improving water quality is inextricably linked to improving water supplies and implementing a comprehensive groundwater storage program.

As part of the solution to the TDS issues within the Watershed, SAWPA constructed approximately 93 miles of the 16- inch to 84-inch Inland Empire Brine Line to convey non reclaimable high saline brine out of the Watershed, as shown in **Figure 3-23**. These brine flows are collected throughout the upper Watershed and sent to Orange County Sanitation District (OCSD) wastewater treatment facilities before final discharge to the ocean. SAWPA owns capacity rights in Brine Line downstream of Prado Dam, and owns the brine line pipeline upstream of Prado Dam. With projected future growth, both developmentally and economically, the watershed's reliance on this 100-mile long pipeline will continue to be a critical factor in the overall plan to minimize future drought impacts, achieve the desired salt balance, and improve the quality of the water resources in the upper SAR Basin. Therefore, maintaining the integrity of the brine line and optimizing its future use are of utmost importance.

**Figure 3-23 Inland Empire Brine Line and Connections**



## Flood Control

Flood control in the Santa Ana River has been the focus of U.S. Army Corps of Engineers projects starting with the authorization of Prado Dam in 1936. The dam was completed in 1941. Levees were constructed in Riverside in 1955.

Prado Dam was built primarily for downstream flood protection, and 92 percent of the watershed lies above it. More recently, the dam also has become a vital component of the water supply management program in the region, and has allowed the creation of ecologically important habitat areas behind the dam. Prado Dam was originally designed to provide protection against flooding in a 200-year event but as the watershed urbanized, the protection had decreased to a 70-year event with the downstream channel only having capacity for a 50-year event. To address these deficiencies the Army Corps of Engineers (Corps) initiated study of the Santa Ana River Main Stem Project (SARP) in 1964. Construction of the SARP was initiated in 1989.

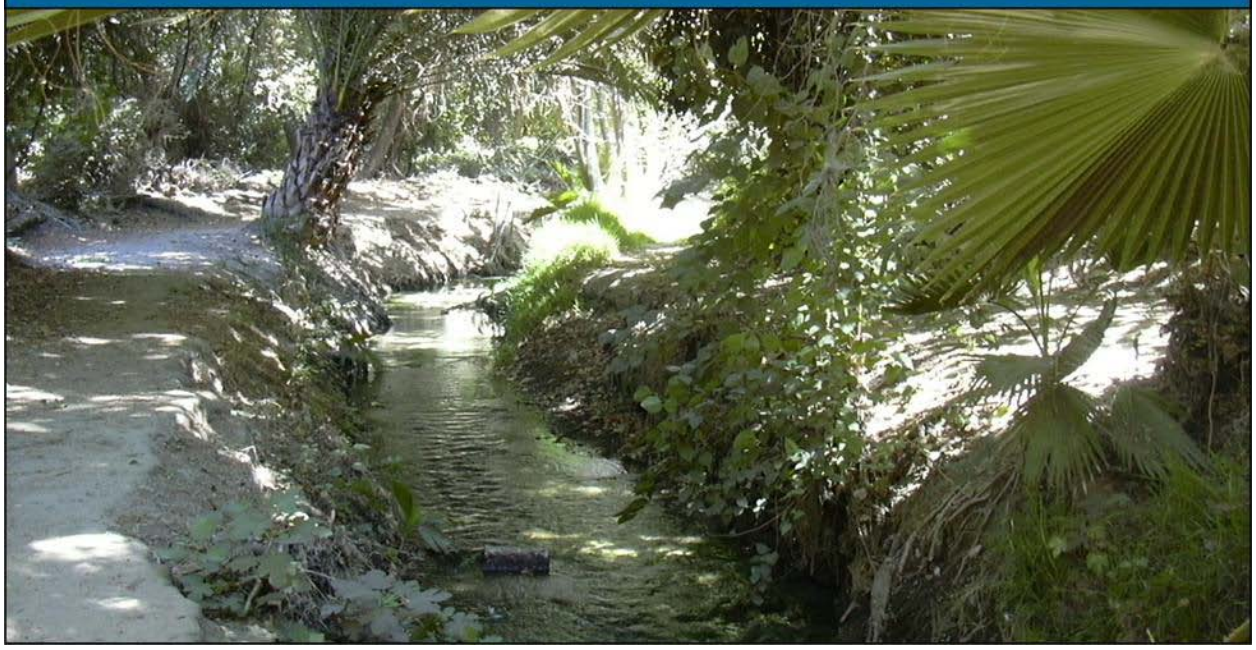
The SARP is located along a 75-mile reach of the Santa Ana River in Orange, Riverside and San Bernardino Counties. The project's objective is to provide the developed and developing areas in the watershed with approximately 100-year flood protection through the end of the project life.

**Figure 3-24 Built Flood Control Systems and 100-Year Flood Zones in the Santa Ana River Watershed**

A more detailed write up on issues relating to stormwater and flood risks in the Santa Ana River Watershed are included in **Chapter 5.8 Stormwater: Resource and Risk Management.**

## Conservation and Reducing Dependence on Delta Supply Regionally

With pressures on available local groundwater and imported water supplies in the watershed increasing due to continuing drought conditions, increasing population, climate change impacts and mandated cutbacks in imported water, particularly from the Bay Delta, collaborative and integrated water resource planning is critical for a sustainable future. A study by the Pacific Institute, "Waste Not, Want Not: The Potential for Urban Water Conservation in California," concludes that Water Use Efficiency (WUE) is the most cost-effective way to maximize diminishing water supplies, which makes it one of the most important components for diversifying the region's water portfolio in the coming years.



Over the past decade, significant WUE measures have been implemented by Southern California water agencies. These programs include the large-scale replacement of old inefficient water fixtures and the upgrade of building and plumbing codes in the state requiring low-flow toilets and showerheads in all new development. It is anticipated that these types of regulatory mandates will continue to be enhanced as emerging technologies become available. Through these programs, the amount of water imported into much of Southern California has remained fairly constant, sufficiently meeting demands despite significant development and population increases. However, with the water supply outlook continuing to worsen, WUE will be a critical resource management strategy that this region will need to embrace.

With implementation of expanded water use efficiency practices as well as other integrated local water resource development, the OWOW 2.0 Plan will help reduce dependence on Delta supply regionally. A more detailed write up on issues relating to water conservation and water use efficiency practice that are proposed for the Santa Ana River Watershed are included in **Chapter 5.6 Water Use Efficiency**

## Future

As we in the watershed move forward with an eye on sustainability, future water infrastructure improvements will be key to achieving a sustainable balance. Keeping these systems, on which we depend so completely, in a good state of repair, is not a luxury, but prudent self-interest. Without a continued and reliable flow of infrastructure services, the viability of the region, as defined by our quality of life and economic well being, is put at risk. It is up to us now to assure that adequate infrastructure is in place to meet the needs of the region for tomorrow.

# 4.1 Vision

In order to guide the development of the One Water One Watershed (OWOW) 1.0 Plan, the Santa Ana Watershed Project Authority (SAWPA), working with the Steering Committee and Pillars, established a vision along with goals and objectives for the watershed that would allow a holistic approach to resource management. Since the adoption of the OWOW 1.0 Plan and the kick off of the OWOW 2.0 Plan, a process began to reevaluate the goals and objectives again in order to fine tune them based on additional information and to ensure that OWOW goals and objectives could be monitored for progress in watershed improvement. Much of this reevaluation was prompted by the development of a new tool discussed later in **Chapter 9 Data Management and Plan Performance/ Monitoring**, known as the Santa Ana River Watershed Assessment.

## Vision

Prior to embarking on any major regional planning effort involving multiple stakeholders, the stakeholder values and principles needed to be established to serve as a foundation to the work ahead. With a firm foundation in place, a vision of the future could be defined with steps to accomplish that vision defined in a plan mission, goals and objectives. For the initial OWOW Plan, this work was conducted in late 2007 as the first step in the development of the OWOW 1.0 Plan. To define these parameters, SAWPA, with the consulting support of Bob Ohland of Stantec, led a two-day eco-charette workshop with the OWOW Steering Committee and the Pillar Leader group to create a holistic approach to resource management. This event provided an interactive and thought-provoking forum to discuss ideas and priorities in the pursuit of sustainable water resources and to discuss and take a first step toward developing goals and objectives for the watershed. In depth discussions were held regarding the values and principles that

would be used as guiding principles for the Pillars to follow in the development the OWOW IRWMP. Further, the eco-charette format served to provide a consensus of the OWOW leadership values and principles, challenges, and strategies via group input and voting mechanisms to refine and enhance the overall vision of the group.

The results of that initial foundational workshop continue today and remain largely unchanged as the foundation to our current watershed planning under the OWOW 2.0 Plan. It is recognized that as new watershed challenges arise, fiscal and energy crises, dubbed the 5th and 6th Horsemen of the Apocalypse under **Chapter 1.0 One Water One Watershed Program**, SAWPA governance must adapt and reevaluate the specific goals and objectives of the watershed plan to fine tune and focus regional efforts to affect positive change. Further, with improved tools and tracking systems to monitor progress in attaining watershed goals, we now have the capability to establish indicators of change so that the performance can be assessed. With development of the indicators, the language of the goals and objectives for the OWOW 2.0 Plan were redefined and clarified.

## OWOW Vision and Mission

The vision of the OWOW Plan is:

1. A watershed that is sustainable, drought-proofed and salt-balanced by 2035, and in which water resources are protected and water is used efficiently
2. A watershed that supports economic and environmental viability
3. A watershed that is adaptable to climate change
4. A watershed in which environmental justice deficiencies are corrected
5. A watershed in which interruptions to natural hydrology are minimized
6. A water ethic is created at the institutional and personal level

Listed below is a summary of the issues that rose to the top as priorities at the eco-charette.

### Values

- Sustainability
- Comprehensive Water Strategy
- Smart Growth/Urban Centers Communities
- Maintain Quality of Life

With an established values, vision and mission, the OWOW Steering Committee conveyed a sense of urgency that moderately aggressive to aggressive planning was needed. Furthermore, they were effective in conveying direction to produce a plan that is more aggressive in taking steps to plan for major changes in how developing, protecting, and conserving water is approached. At the end of the eco-charette, the general direction was as follows:

- There was a shared understanding that all water within the Santa Ana River Watershed is a precious resource. Climate change, continuing Colorado River drought, questions about the San Joaquin Bay Delta's vulnerability and its ability to reliably deliver water to southern California, and interruptions

to the hydrologic cycle as the result of our very own successful growth and development will stress our ability to provide sufficient water to supply to our Watershed for economic and environmental sustainability.

- There was an expressed commitment to invest time and resources for high quality planning, both long-range and short-range, to ensure the best possible outcome and to achieve the stated mission of making the Santa Ana River Watershed drought-proofed, salt-balanced, and to continue its economic and environmental vitality.
- As major paradigm changes are being considered, the quality of life of the residents must be protected, and the economic impact of a recommended change must be understood before implementation.
- The group indicated through voting that in order to meet these challenges, the leadership in the watershed would need to consider significant review of current practices and expectations. The best solutions would likely engender new ways of thinking about water use and its value.
- There was acknowledgment that while many advances would need to be made in conservation and water use efficiency, the planning process should consider if agricultural water conservation measures could free up water for urban use, or if water could be purchased from agriculture for urban use.
- There was a commitment to employ emerging technologies to further urban water efficiencies and to develop new water supplies.

The next step was the establishment of a set of principles to guide the watershed planning. These principles serve as the guiding rules or qualities that most people can support and reflect the essential elements for planning of water resources in the Santa Ana River Watershed.

## Principles for Watershed Planning

- The planning process must be watershed-wide and bottom-up in order to allow for a holistic and systematic approach to watershed management.
- It is necessary to involve stakeholders representing counties, cities, and water districts, as well as the private sector and the regulatory, environmental, and environmental justice communities. The active participation of this diverse group of stakeholders integrates the different interests in the watershed beyond political boundaries.
- The OWOW Plan and the projects included therein must pursue multiple objectives beyond the "traditional" objective of providing reliable water, and include ensuring reliable water supply, ensuring high quality water for all users, preserving and enhancing the environment, promoting sustainable water solutions, managing rainfall as a resource, preserving open-space and recreational opportunities, maintaining quality of life (including addressing the needs of disadvantaged communities), providing economically effective solutions, and improving regional integration and coordination.
- The OWOW Plan must continue the paradigm change already in play from water supply to an integral water management mentality: moving from a mission of providing abundant high-quality water at the lowest cost possible, to one in which water resources are managed in a sustainable manner and with regard for the needs of the environment.

- Watershed-wide planning must transcend specific funding opportunities (e.g. State grants).
- The implementation of the Plan must result in agreements among the Watershed stakeholders on how to manage and operate the watershed.
- The Plan must improve life conditions throughout the watershed, ensuring that an improvement in the welfare of one area is not at the expense of others.

Generally, the consensus is that the OWOW effort needs to be bold and innovative to meet the watershed's vision.

# 4.2 Goals and Objectives

## Goals and Objectives

As a result of the two-day eco-charette for One Water One Watershed (OWOW) 1.0 back in 2007, the Steering Committee, as well as the Pillar leaders, met on several occasions to develop goals and objectives based on the eco-charette exercises. There also was interest in matching the quality of water delivered to the water quality needed for a specific purpose. For example, highly treated drinking water is not needed for agriculture or landscaping use. The Steering Committee members and Pillar Co-Chairs discussed the impacts of land use decisions on water quality and the quantity of water available. There was a desire for better communication and coordination between the water industry and those charged with land use planning. Furthermore, Steering Committee members and Pillar Co-chairs also discussed how much public open space is dedicated to grass and how much of residential personal outdoor space can be maintained in grass verses other plantings that would be less water dependent. They acknowledged the need for grass play areas while seeing opportunities for water savings by replacing grass with drought tolerant plantings in other areas. The Steering Committee and Pillar Co-chairs suggested that the price paid for water by the consumer versus the actual cost of water, including environmental, wheeling, and infrastructure replacement costs, be reconciled.

With this guidance in mind, a draft set of Goals and Objectives was established after extensive stakeholder outreach and review. The final 2007 product of their efforts is shown below in **Table 4.2-1**, which summarizes the goals and objectives developed in consensus by the group.

**Table 4.2-1 OWOW 1.0 Goals and Objectives**

| Goals | Objectives |
|---|---|
| Provide reliable water supply | Reduce dependency on imported water<br>Meet current and future water demands during all hydrologic conditions<br>Meet water demands during emergency or catastrophic conditions<br>Maximize water use efficiency<br>Increase use of recycled water |
| Preserve and enhance the environment | Protect and enhance the ecological function of open-space<br>Protect and enhance water-related habits<br>Reduce or eliminate invasive riparian and aquatic species<br>Protect sensitive marine and estuarine environments<br>Consider ecological functionality in new development |
| Promote sustainable water solutions | Promote strategies that link land and water use<br>Reduce greenhouse gas emissions<br>Reduce energy consumption and promote urban greening projects<br>Develop partnerships for planning and implementation of economically, environmentally, and socially sustainable watershed projects |
| Ensure high quality water for all users | Attain water quality standards in fresh and marine environments<br>Match water quality with intended uses<br>Protect and improve source water<br>Manage salinity |
| Provide economically effective solutions | Leverage existing financial and infrastructure assets<br>Minimize capital, O&M, and life-cycle cost<br>Promote aggressive pursuit of grants and loans<br>Pursue innovative, non-traditional revenue-generating concepts<br>Protect and value green infrastructure |
| Improve regional integration and coordination | Engage stakeholders in planning and implementation of watershed projects<br>Increase communication and coordination<br>Search for projects that meet multiple goals across geographic and water resource services |
| Manage rainfall as a resource | Provide appropriate flood control capacity and other benefits to the community<br>Maximize beneficial use of rain water |
| Preserve open-space and recreational opportunities | Increase opportunities for recreation and open-space<br>Provide useable open-space for all residents of the watershed |
| Maintain quality of life | Balance quality of life, and social, environmental, and economic impacts when implementing projects<br>Consider the needs of disadvantaged communities |

These goals and objectives were created with the Department of Water Resources (DWR) Program Preferences and the California Water Plan in mind. These goals and objectives are at the core of the OWOW 1.0 Plan and the Pillar groups. Additionally, **Table 4.2-2** shows how the OWOW Plan complies with the CWC§10540(C) Objectives. These goals were not prioritized based on the need for OWOW governance to have the flexibility to weight the objectives in accordance with funding opportunities or current water resource challenges that may change over time.

**Table 4.2-2 OWOW Plan Goals and CWC§10540(C) Objectives**

| CWC§10540(C) Objectives | Corresponding OWOW Plan Goals |
|---|---|
| Protection and improvement of water supply reliability, including identification of feasible agricultural and urban water use efficiency strategies | Provide reliable water supply<br>Promote sustainable water solutions<br>Provide economically effective solutions<br>Improve regional integration and coordination<br>Manage rainfall as a resource |
| Identification and consideration of the drinking water quality of communities within the area of the Plan | Ensure high quality water for all users |
| Protection and improvement of water quality within the area of the Plan consistent with relevant basin plan | Ensure high quality water for all users |
| Identification of any significant threats to groundwater resources from over-drafting | Provide reliable water supply<br>Promote sustainable water solutions<br>Manage rainfall as a resource |
| Protection, restoration, and improvement of stewardship of aquatic, riparian, and watershed resources within the region | Preserve and enhance the environment<br>Promote sustainable water solutions<br>Improve regional integration and coordination<br>Preserve open-space and recreational opportunities |
| Protection of groundwater resources from contamination | Ensure high quality water for all users<br>Promote sustainable water solutions |
| Identification and consideration of water-related needs of disadvantaged communities in the area within boundaries of the Plan | Provide reliable water supply<br>Provide economically effective solutions<br>Improve regional integration and coordination<br>Maintain quality of life |

## OWOW 2.0 Goals and Objectives Update

While all of the goals and objectives under OWOW 1.0 pave the way to a sustainable watershed, SAWPA recognized the need for a common method of measuring progress on meeting the goals and objectives, as well as the health of the Santa Ana River Watershed. As a first step, SAWPA engaged the services of the Council for Watershed Health, formerly known as the Los Angeles and San Gabriel Watersheds Council, a 501(c) 3 nonprofit organization that helped develop a methodology for the California Watershed Assessment Framework (WAF), a derivative of a U.S. Environmental Protection Agency (EPA) Science Advisory Board framework (EPA 2002). The techniques and technology of the Framework developed by the Council are well accepted by DWR and also play a role in the development of the California Water Plan 2013 Update. The value of the assessment is particularly important to the OWOW 2.0 process, as the current guidelines from DWR require inclusion of performance monitoring in all Integrated Regional Water Management (IRWM) planning efforts.

The use of the framework initially was applied by the Council for Watershed Health in 2010 to a watershed located in Los Angeles County called the Aroyo Seco watershed, and provided a template for an assessment process. Under OWOW 2.0, the development and analysis of a framework for indicator assessment was kicked off as a collaborative process among SAWPA, the Pillars, the Council for Watershed Health, and Dr. Fraser Shilling of UC Davis.

One of the key strengths of the Framework is that it uses existing watershed management goals as the focus of the assessment. This allows a variety of managers to participate in creation of the assessment, and assures actionable results for implementation. The watershed management goals drive the selection of indicators and metrics that often can be drawn from existing datasets or data collection efforts.

The process included presentations of the Framework and its application in working sessions orchestrated by SAWPA for stakeholders. This learning process included both small-group meetings with SAWPA staff, as well as larger-scale stakeholder sessions with the Pillars.

Under the facilitation and guidance of the Council for Watershed Health, goals and objectives from the original OWOW Plan were compared to the OWOW 2.0 Framework to identify and fill gaps. The Pillars selected five areas for which to update goal definition for OWOW 2.0: water supply, hydrology, open spaces, beneficial uses, and effective & efficient management. The goals and objectives for each of these five areas are detailed in this section.

## Water Supply

**Goal**: Maintain reliable and resilient water supplies and reduce dependency on imported water

**Objectives**:

- Decrease water demand
- Increase water-use efficiency
- Increase use of rainfall and snowpack as a resource
- Increase use of recycled water
- Sustainably develop local water resources
- Maintain sufficient storage to overcome multi-year (3 year) drought over a ten year hydrologic cycle
- Reduce green-house-gas emissions and energy consumption from water resource management

The Santa Ana River Watershed, among all the services it provides, is the source of a great deal of the water used by human communities, and virtually all of the non-human communities. In fact, approximately 70% of the supply is of local origin coming from local groundwater, local precipitation and surface flows, and recycled water. The supply of water to communities is foremost in the management effort of the watershed, and this goal seeks to understand the effectiveness and efficiency of the water supply system.

## Hydrology

**Goal**: Manage at the watershed scale for preservation and enhancement of the natural hydrology to benefit human and natural communities.

**Objectives**:

- Preserve and restore hydrologic function of forested and other lands
- Preserve and restore hydrogeomorphic function of streams and water bodies
- Safely co-manage flood protection and water conservation
- Include ecosystem function in new development planning and construction

The physical processes of the watershed exist on the land and in the water. This goal highlights how managers of water and land (and the relationship between the two) are striving to protect and restore natural processes that benefit other goals within the watershed, like supply or habitat augmentation.

## Open Spaces

**Goal**: Preserve and enhance the ecosystem services provided by open space and habitat within the watershed.

**Objectives**:

- Increase the capacity of open space to provide recreational opportunities without degrading its quality or increasing its consumption of water and energy
- Protect existing and restore native habitats
- Protect and maintain healthy forests
- Manage aquatic and riparian invasive species
- Protect estuarine and marine near-shore habitats
- Reduce ornamental irrigated landscapes
- Improve management support for landscaping that utilizes native and drought tolerant vegetation
- Protect and Restore wildlife corridors
- Protect endangered and threatened species and species of special concern through improved habitat

Like the Hydrology goal, the desire to protect open spaces reveals efforts to maintain land in a natural condition. Here, however, the focus is more on the habitat and recreational value of the open space. Changing the ethic for managing developed open space, even at the household scale, also is included here, found in the objectives to diminish irrigation and water-intensive ornamental landscapes.

## Beneficial Uses

**Goal**: Protect beneficial uses to ensure high quality water for human and natural communities

**Objectives**:

- Attain water quality standards in fresh and marine environments to meet designated beneficial uses
- Protect and improve source water quality
- Achieve and maintain salt balance in the watershed

Strong Federal and State regulatory authority drives water quality management. This goal acknowledges the need for water quality on the surface and in the ground to be improved through management changes.

## Effective & Efficient Management

**Goal:** Accomplish effective, equitable and collaborative integrated watershed management

**Objectives**:

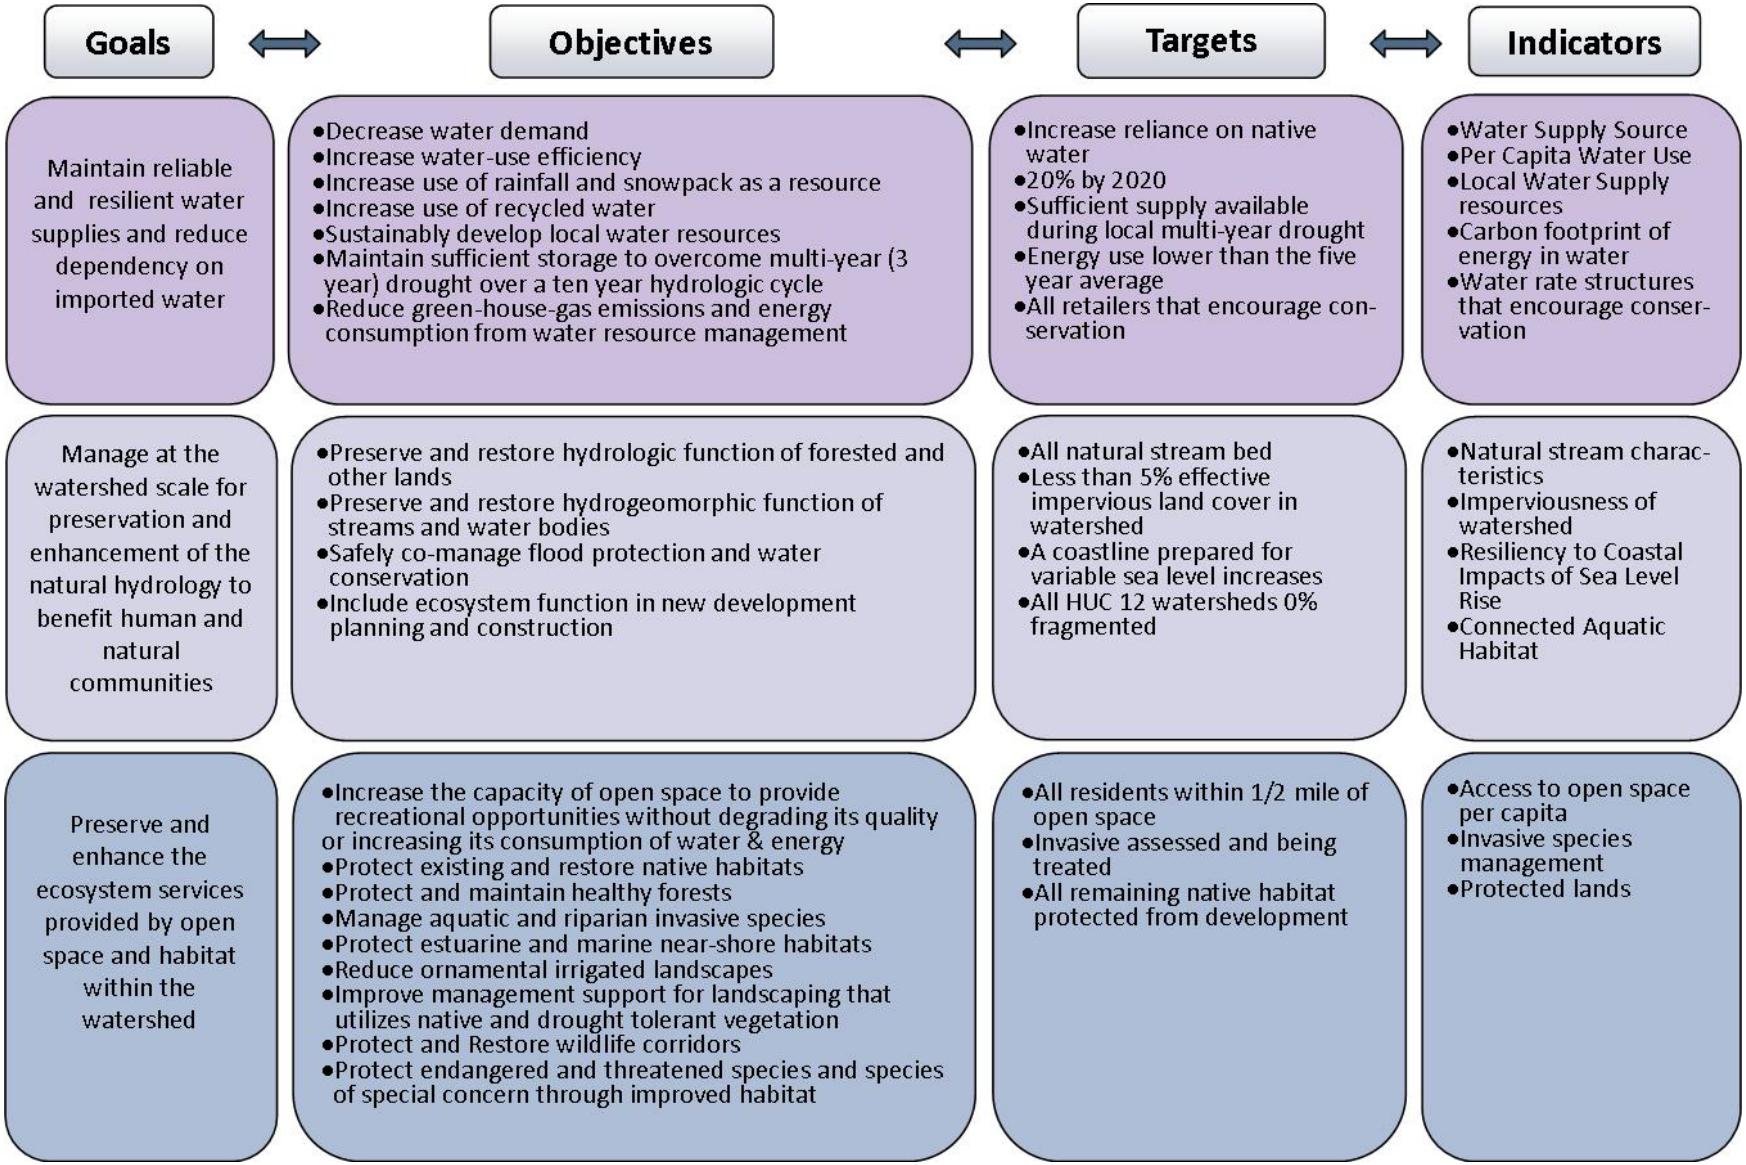
- Improve regional integration and coordination
- Ensure high quality water for all users
- Balance quality of life and social, environmental, and economic impacts when implementing projects
- Maintain quality of life
- Provide economically effective solutions
- Engage with disadvantaged communities to eliminate environmental injustices
- Engage with Native American tribes to ensure equity
- Reduce conflict between water resources and protection of endangered species

This goal is at the heart of the OWOW process, saying that only through inclusive collaborative processes can the necessary unity of purpose be achieved. Managing the Santa Ana watershed requires actors at multiple scales and with vastly different authorities and responsibilities. Through an adaptive management process OWOW seeks to achieve the correct organization of decision-makers for the decisions that must be made.

The watershed assessment and the indicators for the updated goals and objectives under OWOW 2.0 are explained in detail under **Chapter 9.0 Data Management and Plan Performance Monitoring**. The assessment is an effective tool that can be repeated in a time interval to include a set of metrics that express trends. The assessment conducted in this exercise is a snapshot of the current day in the Santa Ana River Watershed, and many of the goals are specifically designed to encourage progress. In five years, perhaps sooner, this assessment can be repeated to uncover laudable progress and spots where efforts should be redoubled.

# 4.3 Planning Targets

## Planning Targets



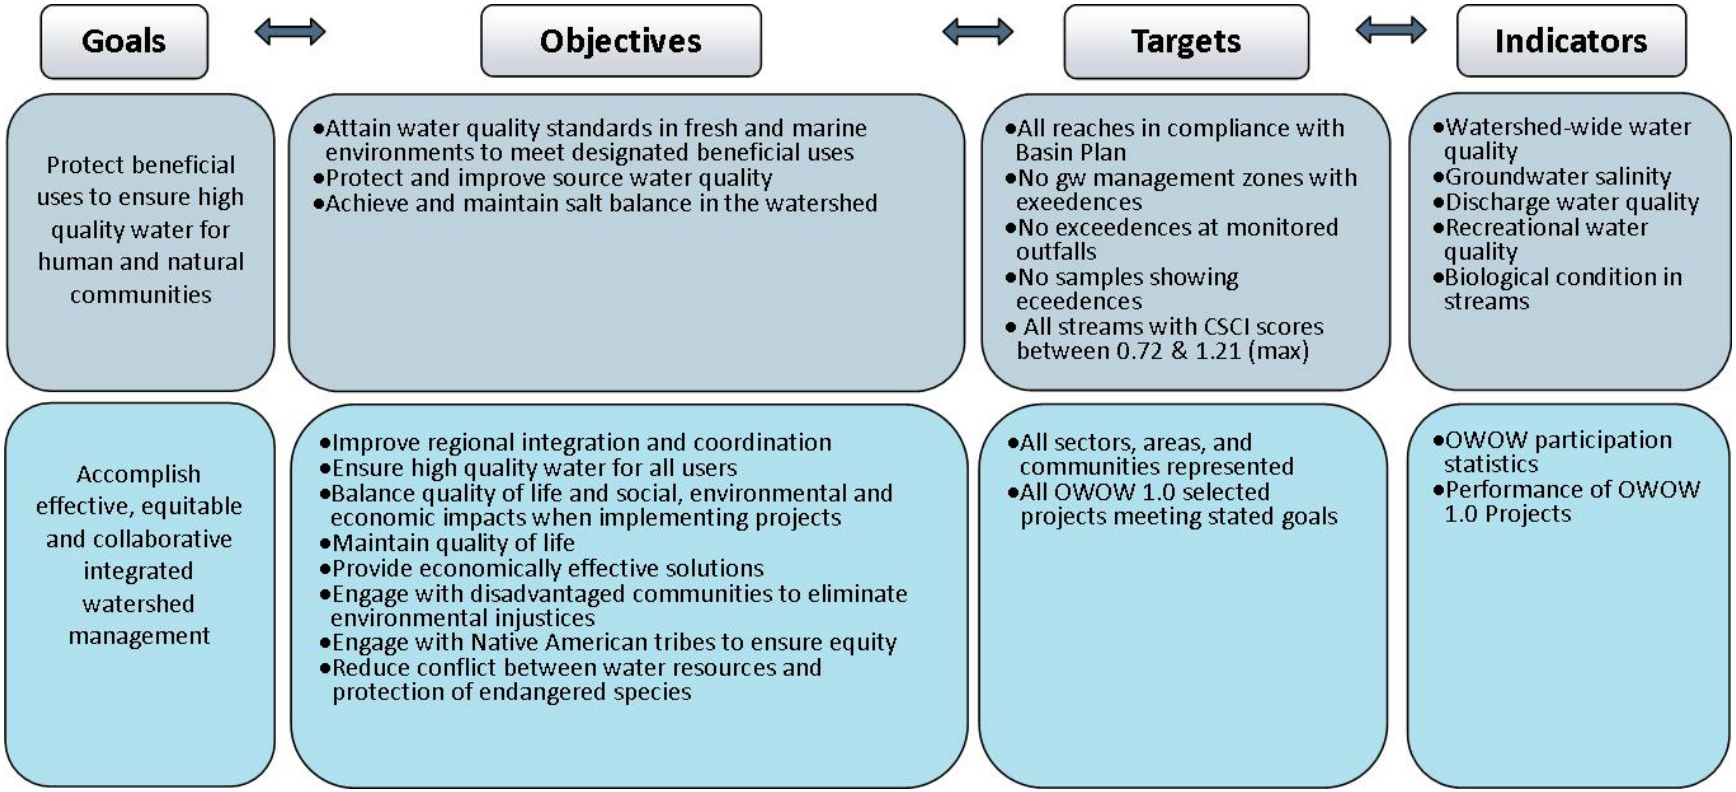
Based on the new watershed assessment previously discussed, the Santa Ana Watershed Project Authority (SAWPA) now has improved planning targets, described as “wanted conditions” or “metrics” and indicators, that will allow stakeholders to track progress in achieving the planning targets associated with each goal. The metrics and indicators are discussed in more detail under **Appendix A**. **Figure 4.3-1** reflects an overview of the One Water One Watershed (OWOW) Plan Guiding Principles, Goals, Objectives, Targets, and Indicators. The lists below reflect that the OWOW governance chose not to prioritize the OWOW goals, objectives, or targets with the understanding that each objective is equally important relative to the others, given that the OWOW Plan is intended to be a truly integrated plan. The OWOW governance may choose, however, to prioritize these objectives relative to grant requirements to enhance project prioritization and selection. In those cases, the type of funding program will dictate which target should be emphasized.

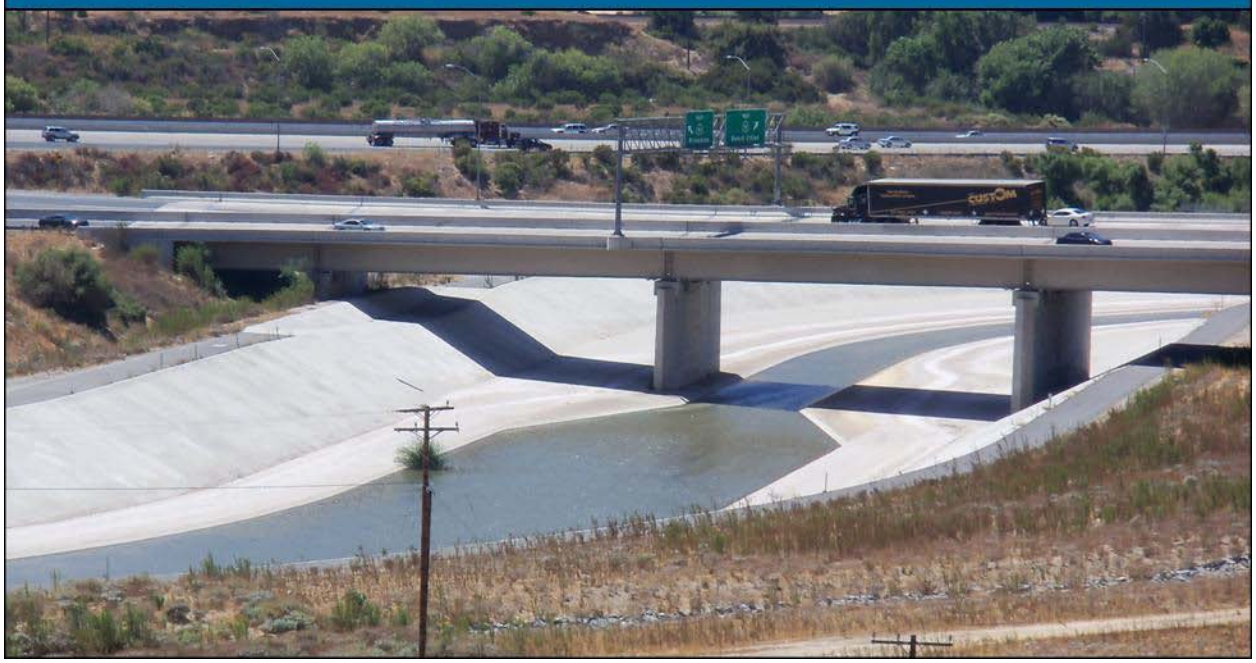
In addition to the watershed assessment tool, planning targets were developed for many of the quantifiable objectives based on the work of the Pillars to provide additional metrics to gage the watershed’s progress toward meeting the goals over a 25-year time period (2010 through 2035). The objective relating to the greenhouse gas emission reduction uses a longer 40-year time horizon to reflect the current science of climate change time scales and impact estimates that use the year 2050. The targets, summarized in **Table 4.3-1**, will help the Santa Ana River Watershed to define projects that will help it to address its water-related issues.

One planning target of particular interest for tracking progress in water demand reduction within the watershed is the level of water use efficiency. Water use efficiency measures will help reduce water demand and free up water supplies for other uses. Retail water suppliers within the watershed, as with the rest of the State, are required to report and meet water conservation targets in compliance with regulations set forth in the Water Conservation Act of 2009, also known as 20x2020 or SBX7-7. 20x2020 seeks a reduction in State-wide daily per person potable water use of 20 percent by the year 2020, and uses Urban Water Management Plans (UWMPs) as the compliance reporting vehicle. The first UWMPs completed with 20x2020 requirements were due to DWR in 2011. Each retail water supplier was required to include a calculation of the demand reduction target to meet 20x2020 as part of its 2010 UWMP.

The target reflects what can be achieved if the watershed's municipal water providers are able to meet the targets identified for 20x2020. The OWOW watershed target of 256,500 AFY by 2035 was developed based on a compilation of UWMPs through 2020, Water Resource Optimization Pillar demand projections data, and assumptions of continued 20% reduction per decade from (2020-2035). Through 2020, significant progress is anticipated in the watershed with a total 34,100 AFY increase in water savings by 2015, and 91,000 AFY by 2020 compared to Year 2010 levels as reported by the retail water agencies in their UWMPs.

**Figure 4.3-1 OWOW Plan Guiding Principles, Goals, Objectives and Targets**





Goals
Objectives
Targets
Indicators
Protect beneficial uses to ensure high quality water for human and natural communities
•Attain water quality standards in fresh and marine environments to meet designated beneficial uses
•Protect and improve source water quality
•Achieve and maintain salt balance in the watershed
•All reaches in compliance with Basin Plan
•No gw management zones with exeedences
•No exceedences at monitored outfalls
•No samples showing eceedences
• All streams with CSCI scores between 0.72 & 1.21 (max)
•Watershed-wide water quality
•Groundwater salinity
•Discharge water quality
•Recreational water quality
•Biological condition in streams
Accomplish effective, equitable and collaborative integrated watershed management
•Improve regional integration and coordination
•Ensure high quality water for all users
•Balance quality of life and social, environmental and economic impacts when implementing projects
•Maintain quality of life
•Provide economically effective solutions
•Engage with disadvantaged communities to eliminate environmental injustices
•Engage with Native American tribes to ensure equity
•Reduce conflict between water resources and protection of endangered species
•All sectors, areas, and communities represented
•All OWOW 1.0 selected projects meeting stated goals
•OWOW participation statistics
•Performance of OWOW 1.0 Projects

**Table 4.3-1 Performance Targets for 2035**

| Goals | Performance Targets for 2035 |
|---|---|
| Maintain reliable and resilient water supplies and reduce dependency on imported water | •Conserve an additional 256,500 AFY of water through water use efficiency and conservation measures<br>•Create 58,000 AFY using a combination of additional wells, treatment, conjunctive use storage and desalination of brackish groundwater<br>•Increase production of recycled water by 157,000 AFY<br>•Increase both centralized and distributed stormwater capture and recharge by 132,000 AFY<br>•Develop 54,000 AFY of ocean water desalination |
| Manage at the watershed scale for preservation and enhancement of the natural hydrology to benefit human and natural communities | •Reduce flood risk in 700 acres using integrated flood management approaches<br>•Remove 500,000 cubic yards of sediment from debris basins and reservoirs |
| Preserve and enhance the ecosystem services provided by open space and habitat within the watershed | •Preserve or restore 3,500 acres of terrestrial aquatic habitat<br>•Construct 39.5 miles of additional Santa Ana River Trail and Parkway |
| Protect beneficial uses to ensure high quality water for human and natural communities | • Reduce non-point source pollution by treating an additional 35 MGD of surface and stormwater flow, emphasizing higher priority TMDL areas<br>• Remove an additional 25,000 tons of salt per year from the watershed |
| Accomplish effective, equitable and collaborative integrated watershed management | •Engage with 50% (approximately 35) Disadvantaged Communities within the watershed<br>•Engage with 100% of the Non-Federally Recognized Tribes in the watershed |

# 5.1 Introduction

In the early stages of the One Water One Watershed 2.0 (OWOW) planning process, various resource management strategies were evaluated. In 2000, as reflected in the Santa Ana Watershed Project Authority's (SAWPA) early integrated water resource plans, six resource management strategies were developed that covered a broad spectrum of water resource planning. At the time, the integration of these six strategies 1) Groundwater Cleanup and Purification, 2) Water Storage, 3) Flood Protection, 4) Wetlands, Habitat, and the Environment, 5) Water Recycling and 6) Recreation and Conservation was considered innovative in proposing a new way to support the needs of water resources in a region. Past water resource management practices focused primarily on water supply functions without considering the more expansive and integrated benefits of integrating other resource management strategies.

To further emphasize the importance of integrated regional water management planning, the State incorporated the integrated resource management approach into its California Water Plan Update 2005 and again in its 2009 Update. This latest plan emphasizes the value of an integrated regional water management approach using multiple resource management strategies as defined in California Water Plan.

In 2006, in light of new threats to water resources in the Santa Ana River Watershed and to the State overall such as climate change, fiscal crises and the energy crises, SAWPA reviewed its past resource management strategies to update. New resource management strategies defined in the California Water Plan, previous Department of Water Resources (DWR) guidelines for Integrated Regional Water Management Plan (IRWMP) development, and local water resource needs were considered. For the

OWOW 1.0 Plan, the following resource management strategies were defined and aligned along ten major areas of focus, or Pillars:

| Pillar | Corresponding Proposition 84 Guidelines Resource Management Strategies |
|---|---|
| Land Use and Water | Increase water supply |
| Water Supply Reliability | Reduce water demand |
| Water Recycling | Increase water supply |
| Water Use Efficiency | Reduce water demand |
| Water Quality | Improve water quality |
| Environmental and Habitat Restoration | Practice resource stewardship |
| Stormwater Risk Assessment | Improve flood management |
| Environmental Justice | Included in Guidelines as part of Impact and Beneficial |
| Parks and Open Space | Not explicitly mentioned in Guidelines |
| Climate Change | Included in Guidelines as separate standard |

In 2011 with the commencement of OWOW 2.0 Plan and the focus on implementation, the water resource management strategies and OWOW Pillars were again reevaluated. To assure that these OWOW Plan resource management strategies are comprehensive and fully reflect the resource management strategies as defined in the California Water Plan Update 2009, the following new OWOW 2.0 Plan resource management strategies or Pillars were established, many of which continued from the previous Pillars, but with new "implementation oriented" titles.

| Pillar | Corresponding DWR Prop 84 Guidelines Resource Management Strategies |
|---|---|
| Water Resource Optimization | Reduce water demand<br>Improve operational efficiency and transfers<br>Increase water supply<br>Improve water quality |
| Beneficial Use Assurance | Improve water quality |
| Water Use Efficiency | Reduce water demand |
| Land Use and Water Planning | Increase water supply<br>Improve water quality<br>Practice resource stewardship |
| Stormwater Resource and Risk Management | Improve flood management |
| Natural Resources Stewardship | Practice resource stewardship |
| Operational Efficiency and Water Transfer | Improve the efficiency of water transfers and infrastructure in the watershed |

| | |
|---|---|
| Disadvantaged and Tribal Communities | Included in Guidelines as part of Impact and Benefit Standard |
| Government Alliance | Create partnerships between DWR and member agencies |
| Energy and Environmental Impact Response | Included in Guidelines as separate standard |

In order to manage the initial planning work, the stakeholders were organized into ten workgroups, or Pillars, centered on a specific water resource management issue. Discussion of the formation of the Pillars and their work approach is previously described in **Chapter 2.1 Governance Structure**.

## Pillar Chapter Development

The following chapters of this report have been written and prepared by the respective OWOW water management strategy committees (Pillars), and represent the culmination of work by the Pillar Chair and the Pillar members (local stakeholders). Unlike a single agency or consultant-prepared report, SAWPA did not significantly modify the following Pillar chapters, other than minor editing, in order to ensure that the work developed through the grassroots stakeholder-driven OWOW process was genuinely conveyed intact, and best reflects the interests, issues, and potential solutions of interested stakeholders in the Watershed.

Each Pillar was led by a recognized expert in their subject area, and was selected by the SAWPA Commission. A list of Pillar Leaders is shown as follows:

| Pillar | Pillar Co-Chairs |
|---|---|
| Water Resource Optimization | Robert Tincher<br>Mark Tettemer |
| Beneficial Use Assurance | Greg Woodside<br>Mark Adelson |
| Water Use Efficiency | Pam Pavela<br>Gail Covey |
| Land Use and Water Planning | Susan Lien-Longville<br>Jerry Blum |
| Stormwater: Resource and Risk Management | Maryanne Skorpanich<br>Stuart McKibben |
| Natural Resources Stewardship | Lee Reeder<br>Nancy Gardner |
| Operational Efficiency and Water Transfer | Behrooz Mortazavi<br>Craig Miller |
| Disadvantaged and Tribal Communities | Maria Elena Kennedy |

| | |
|---|---|
| | Leslie Cleveland |
| Government Alliance | Eileen Takata<br>Jack Simes |
| Energy and Environmental Impact Response | Roy Herndon<br>Craig Perkin |

Local stakeholders participated in a number of Pillar or subject area meetings held in person throughout the watershed. The number of meetings scheduled for each particular group was determined by the individual Pillar leaders with support and guidelines provided by SAWPA staff. Additional stakeholders with an interest in particular subject areas were referred to Pillar leaders for inclusion into the process.

Each of the following sections to this chapter reflects the direction given to each Pillar by SAWPA to update their Pillar write-ups from OWOW 1.0, and then consider and identify regional implementation projects and programs. These conceptual implementation projects and programs were developed using the updated goals and objectives, review of Proposition 84 IRWM Plan standards, past suggested strategies by their Pillars, or by integration of their Pillars with other Pillars. The results of the collaboration are described in Chapters 5.4 – 5.13. **Chapter 5.14 Integration and Implementation** reflects even further integration of the Pillars output through integration workshops with the Pillars to improve implementation synergy and linkages.

# 5.2 California Water Plan Resource Management Strategies

With the development of integrated watershed planning, multi-benefit, multi-purpose projects have moved to the forefront and have become one of the primary goals of the One Water One Watershed (OWOW) progression. The idea of meeting a number of community necessities with a single project is not new; however, specialization within agencies that deal with water has often moved these project types to the backburner. Efforts in the past primarily focused on single purpose projects; the additional effort required to develop multi-objective solutions have made true multi-benefit projects relatively uncommon. The best way to create multi-beneficial projects and to encourage diversification of water management approaches to mitigate uncertain future circumstances is the application of Resource Management Strategies (RMS).

RMS are set standards that encourage the diversification of water management approach as a way to mitigate for uncertain future circumstances. Integrated regional strategies were encouraged for the management of water resources and to provide funding, through competitive grants, for projects that protect communities from drought, protect and improve water quality, and improve local water security by reducing dependence on imported water. These standards are met through the application of the OWOW 2.0 Plan with the creation and implementation of the Pillars. Listed below are the RMSs defined by the California Water Plan Update 2009.

**Table 5.2-1 CA Water Plan Update 2009 Resource Management Strategies**

| CA Water Plan Update 2009 Resource Management Strategies | |
|---|---|
| • Agricultural Water Use Efficiency<br>• Urban Water Use Efficiency<br>• Crop Idling for Water Transfers<br>• Irrigated Land Retirement<br>• Conveyance – Delta<br>• Conveyance – Regional/Local<br>• System Reoperation<br>• Water Transfers<br>• Flood Risk Management<br>• Agricultural Lands Stewardship<br>• Economic Incentives (Loans, Grants and Water Pricing)<br>• Ecosystem Restoration<br>• Forest Management<br>• Recharge Area Protection<br>• Watershed Management | • Conjunctive Management & Groundwater Storage<br>• Desalination<br>• Precipitation Enhancement<br>• Recycled Municipal Water<br>• Surface Storage – CALFED<br>• Surface Storage – Regional/Local<br>• Drinking Water Treatment and Distribution<br>• Groundwater Remediation/Aquifer Remediation<br>• Land Use Planning and Management<br>• Matching Quality to Use<br>• Pollution Prevention<br>• Salt and Salinity Management<br>• Urban Runoff Management<br>• Water-Dependent Recreation |

## Consideration when Implementing RMS

For the development of the OWOW 2.0 Plan, multiple RMS were considered relative to the new IRWM Plan 2013 objectives and the RMS listed in the California Water Plan Update 2009 (DWR, 2009). The purpose of reviewing these management strategies was to identify which ones will help achieve the OWOW 2.0 Plan objectives through project or program implementation within the Santa Ana River Watershed. When choosing specific RMS that are met by the OWOW 2.0 Plan, it is important to remain cognitive of contributing factors that may be problematic. As defined by the California Water Plan 2013 updates, climate change tends to be a reoccurring problematic factor. Climate change is expected to impact water use, as rising temperatures will result in higher evapotranspiration and higher water use requirements. The effects of climate change must be evaluated when implementing specific RMSs (Listed on **Table 5.2-1**); with particular note of the following:

- Concerns over groundwater impacts, overdraft, and loss of recharge
- Increase in the vulnerability of trees and vegetation and burn area susceptibility
- Unpredictability of changing climate

All of these issues were taken into consideration when developing the OWOW 2.0 and yet the Integrated Regional Water Management (IRWM) is still capable of implementing RMS defined by the guidelines.

## Implementation of RMS

Implementation of RMS is an important objective met and influenced by the OWOW Plan. Within the OWOW 2.0 Plan, these RMS, as defined by the guidelines of Proposition 84 and 1E, meet the standard of a project, program, or policy that help local and government agencies involved in water management. The OWOW 2.0 Plan was developed for the implementation of multi-beneficial projects, programs, and policies throughout the watershed.

This implementation of the CWP 2009 Update RMS has encouraged water agencies within the watershed to adopt new strategies for a sustainable watershed. To assure that these RMS for the OWOW Plan are comprehensive and fully reflect as many of the resource management strategies as possible, as defined in the California Water Plan Update 2009 and guidelines, the OWOW Plan Pillars are largely aligned with the resource management strategies identified in the Proposition 84 Guidelines.

The following California Water Plan Update 2009 Resource Management Strategies are met in the OWOW Plan and can be seen in **Table 5.2-2**.

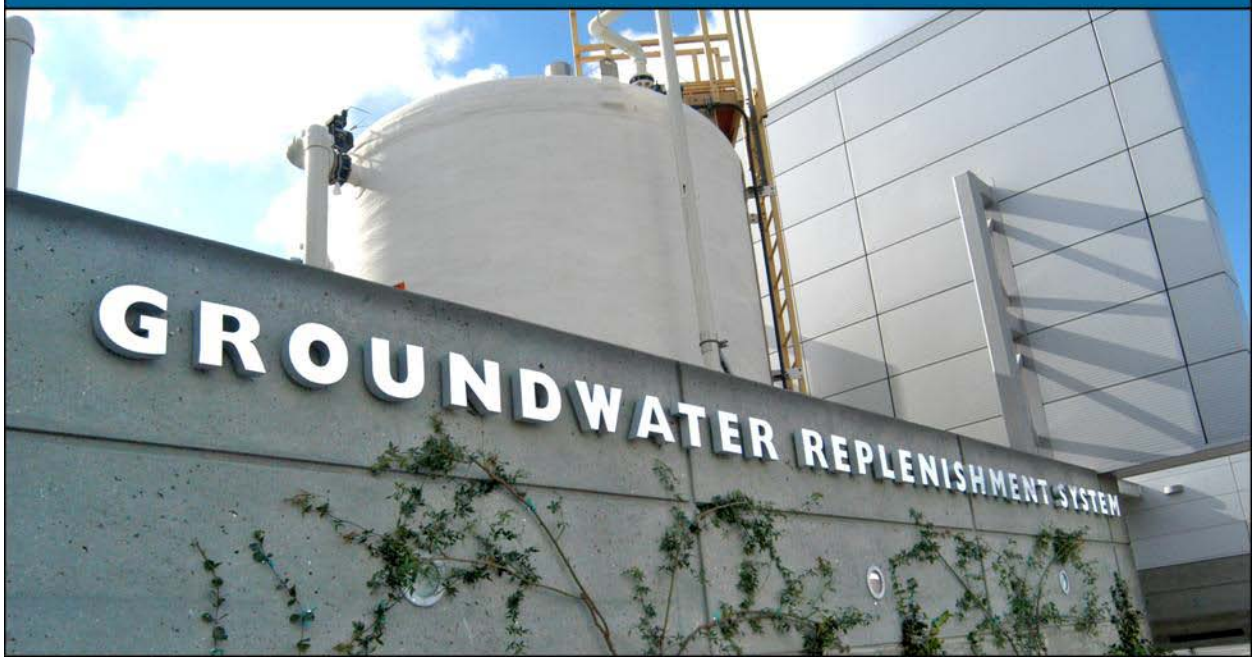
**Table 5.2-2 RMS and Pillar Group Relationship**

| Pillar | Resource Management Strategy | Management Goal |
|---|---|---|
| Natural Stewardship | Agricultural Lands Stewardship<br>Ecosystem Restoration<br>Recharge Area Protection<br>Water-Dependent Recreation<br>Forest Management | Practice Resource Stewardship |
| Water Use Efficiency | Agricultural Water Use Efficiency<br>Urban Water Use Efficiency | Reduce Water Demand |
| Water Resource Optimization | Conjunctive Management and Groundwater Storage<br>Recycled Municipal Water<br>Conveyance – Regional/Local<br>System Reoperation<br>Water Transfers | Increase Water Supply |
| Beneficial Use Assurance | Desalination<br>Groundwater Remediation/Aquifer Remediation<br>Matching Water Quality to Use<br>Pollution Prevention<br>Salt and Salinity Management<br>Urban Runoff Management | Increase Water Supply<br>Improve Water Quality |
| Stormwater: Resource and Risk Management | Flood Risk Management<br>Recharge Area Protection | Improve Flood Management<br>Practice Resource |

| | | |
|---|---|---|
| | | Stewardship |
| Government Partnership | Economic Incentives | Fund Procurement |
| Energy and Environmental Impact | Ecosystem Restoration<br>Pollution Prevention | Reduce Pollutants |
| Land Use and Water Planning | Agricultural Water Use Efficiency<br>Pollution Prevention<br>Recharge Area Protection<br>Land Use Planning and Management | Increase Water Supply<br>Improve Water Quality<br>Practice Resource Stewardship |

The following RMSs were not applicable to the Santa Ana River Watershed or were not considered as effective practices within our watershed:

| CA Water Plan Update 2009 Resource Management Strategies | |
|---|---|
| • Crop Idling for Water Transfers<br>• Irrigated Land Retirement<br>• Conveyance – Delta | • Precipitation Enhancement<br>• Surface Storage – CALFED<br>• Surface Storage – Regional/Local<br>• Drinking Water Treatment and Distribution |



## Integration of RMS

As shown in the table above, it is apparent that the relationship between the Pillars described in OWOW 2.0 and the RMS in the guidelines, correlate with each other to accomplish set OWOW 2.0 objectives. These objectives benefit both local and government agencies located within the watershed. Integration is a key aspect of this relationship; obtaining strategies and putting them together produce multi-beneficial results throughout the watershed.

It is the intent of OWOW 2.0 to facilitate the formation of multi-agency partnerships of local and governmental agencies; this is described in more detail within **Chapter 5.12 Government Alliance**.

The development of multi-benefit projects, through the implementation of resource management strategies, will remain challenging and require sustained effort by agencies that manage water. There are approximately 100 agencies that manage water in some way, and OWOW 2.0 endeavors to bring them all together to create and achieve regional and inter-regional goals. Agencies and non-profits organizations in the watershed through the OWOW will need to eventually prioritize collaborative projects and provide the staff resources to ensure that such projects are implemented in order to achieve the implementation of resource management strategies.

# 5.3 Preliminary Integration and Systems Approach

As indicated in Department of Water Resources (DWR) Integrated Regional Water Management Plan (IRWMP) Guidelines, one of the primary purposes of the inclusion of an integration standard is to ensure that the region intentionally creates a system where integration can occur. Integration is at the heart of Santa Ana Watershed Project Authority's (SAWPA) IRWM as reflected in the genesis of its regional plan name, One Water One Watershed Plan (OWOW Plan) where stakeholders across the watershed work collaboratively to develop an integrated water resource plan, where all types of water (local surface and groundwater, imported water, stormwater, and treated wastewater effluent) are viewed in a comprehensive, integrated manner as a "single" water resource.

The achievements of a "grass roots" but integrated regional planning approach as defined under the previous OWOW 1.0 Plan were a testament to innovation. In fact, on May 2, 2011, Harvard University's Kennedy School of Government selected the program as one of the 25 most innovative programs in the country representing the best in creative problem solving of local, state, and federal municipalities around the Country.

Building upon the framework of integration from the OWOW 1.0 plan, SAWPA under OWOW 2.0 planning sought to raise the bar further with an emphasis on integration and implementation at a regional and holistic scale. To promote this concept of watershed based and integrated approach under OWOW, SAWPA conducted innovative brainstorming processes utilizing the experience and skills of local experts to inspire and promote integrated system-wide projects and programs that address water resource challenges in the Santa Ana River Watershed. The first brainstorming process conducted under OWOW 1.0 planning involved gathering a group of 11 watershed experts that SAWPA termed the "Dream Team." The second brainstorming group convened under OWOW 2.0 planning was termed the

"Master Craftsmen." These two groups consisted of some of the best and brightest experts in the water resources field, who were familiar with the Santa Ana River watershed and willing to set aside their local agency thinking to brainstorm ideas and describe new regional projects and programs.

Some of the regional projects and programs proposed by the Dream Team and Master Craftsmen are not entirely new, but may not have been ready to be implemented in the past due to historical regulatory, institutional, or financial barriers. As with any project or program, timing plays a key role toward implementation. After these ideas and concepts were shared by the experts and recorded, they were shared with the Pillar co-chairs, the Steering Committee, and the SAWPA Commission to serve as sounding boards and contributors to these early visioning and brainstorming meetings. The purpose of these early screening processes was to provide templates and examples of integrated regional solutions for the Pillars to consider as they developed more specific regional implementation projects and programs affecting their respective water resource, or a combination of other water resources in the watershed.

## Dream Team

In early 2010, SAWPA recognized the need to encourage a stronger systems approach and motivate development of new multi-jurisdiction, multi-benefit solutions that weren't as readily apparent in the previous Proposition 84 Round 1 OWOW Call for Projects. Thus, SAWPA assembled a "Dream Team" of high level water resource visionaries to brainstorm new cross-jurisdictional proposals to achieve a shared vision of a multi-benefit, integrated, multipurpose, highly-functioning Santa Ana River Watershed. The Dream Team included the following individuals:

- Joe Grindstaff, Past Executive Director, Delta Stewardship Council and CA Bay Delta Authority
- Wyatt Troxel, Past IEUA Director and SAWPA Director
- Mark Wildermuth, President Wildermuth Environmental, Inc.
- Gerard Thibeault, Past Exec. Officer, Santa Ana RWQCB
- Tim Moore, Risk Sciences
- Jerry King, Vice President , Michael Brandman Associates
- Larry McKenney, Past Vice President, RBF
- Don Schroeder, Vice President, CDM Smith
- Steve PonTell, Past Board member, Santa Ana RWQCB
- Pete Dangermond, Dangermond Group President
- Jeff Mosher, Exec. Director National Water Research Institute; Dream Team Chair

The Dream Team was convened in a one-day workshop with the direction to think big and broadly. Water resources maps were made available to the Team to reference as they considered conceptual projects. The first half of the workshop focused on background issues and discussion of watershed sustainability goals from the OWOW 1.0 plan, and then

subgroups were formed generally based on multiple water resource strategies. The latter part of the day reconvened the subgroups for reporting to the combined larger group.

The following is a listing of the early results.

**Stormwater is a local supply**
- Water District and Flood District projects key
- Rubber dams, retrofit of basins, alluvial fan park projects
- Local control needed for system of dams

**Recycled water is underutilized**
- Develop storage in-ground
- Serve water down-gradient

**Existing storage under-used**
- Lake Perris
- Connection system between reservoirs and recycled plants needed (includes Met to OC connection)
- Ground water basins have capacity

**Local water is dependent on Federal Lands**
- Comprehensive overhaul of management needed
- Forest First program

**Regional entity needed for support**
- Expand SAWPA Commission to include County Supervisors
- Develop "marketplace" to link groundwater recharge with MS-4 compliance

**IE Brine Line (SARI) is source of new water**
- Can provide 32,000 AF to OC basins by gravity
- Recycling and groundwater desalting will depend on IE Brine Line for foreseeable future

**State Water Project is important, but somewhat unreliable**
- Dependent on decisions in Delta
- Link SWP entitlements to conservation compliance multipliers
- Infiltrate water when available, including from alternate sources

**Connect the "waste water" system to the supply system**
- GWRS prime example
- Additional groundwater injection, desalting of waste water, development of storage capacity for recycled water needed
- Desalting can support basin clean up and regional salt management across the watershed
- IE Brine Line (SARI) critical infrastructure link

**Better connect flood control system to groundwater system**
- Alluvial fan recharge to improve groundwater quality
- Re-purpose retention and detention basins
- Recharge within system requires revised management strategies
- MS-4 Permit compliance may encourage increased stormwater capture

Overall, the Dream Team encouraged researching processes, such as sponsorship of key agencies in the watershed that may spur large scale actions, leverage available resources and reflect major institutional and/or behavioral changes.

The second exercise implemented by SAWPA under OWOW 2.0 planning to inspire and motivate system-wide solutions, was the creation of a three-person group of well-respected experts in water policy and project implementation. These experts were affectionately labeled the "Master Craftsmen", continuing the theme of constructing better 21st century solutions. Brief biographies of each of the Master Craftsmen are listed as follows:

**Jerry A. King**

*Former Vice President, Michael Brandman Associates (MBA)*

Jerry King brings over 25 years of professional experience in water resources planning, management, and regulation with an emphasis on water quality, wetlands treatments and urban runoff management. Mr. King has drafted guidelines for Storm Water Pollution Prevention Plans and developed a number of basin master plans. Mr. King's expertise includes governmental relations, planning coordination, land use analysis, land development processing, project management, and public utility policy development. He also is well versed in agricultural regulations and permitting, wetlands creation and restoration, development of storm water regulations, and regulatory policy oversight and permitting.

**Richard Meyerhoff**

*Associate at CDM Smith- Greater Denver*

Richard Meyerhoff has more than 19 years of experience involving developing, evaluating and implementing programs for the protection of surface water resources. Mr. Meyerhoff assisted numerous clients with federal and state Clean Water Act -related activities, including development and/or implementation of water quality studies, TMDL implementation plans, and the technical basis of water quality standards regulations, bio-assessments, and water quality permitting.

**Wyatt Troxel**

*Former Vice Chair, Santa Ana Watershed Project Authority*

Wyatt Troxel was a former vice chair of the Santa Ana Watershed Project Authority and is former president of the board of directors of the Inland Empire Utilities Agency, representing the City of Rancho Cucamonga since 1992. Mr. Troxel has more than 36 years of experience in municipal water and wastewater activities in both the public and private sectors, and is an independent consultant in the field of wastewater treatment. Mr. Troxel has the highest certifications in wastewater treatment plant operations in both California and Hawaii, and holds a lifetime teaching credential from the California Board of Education.

The Master Craftsmen acted as facilitators and worked closely with the OWOW Pillar co-chairs to describe the spatial, temporal, regulatory, economic, political, and physical barriers that impair the ability to implement watershed-based concepts supporting a regional approach to water resource management that support the vision articulated in the OWOW Plan. These impairments are well known and acknowledged by water resource practitioners. The OWOW process provides a mechanism to overcome these barriers when stakeholders in a watershed-based project can clearly identify the tangible benefits that will be received through participation in such a project. Pillar leader engagement was critical to the success of any project. Thereafter, efforts began to take this vision to the next level by initiating a series of meetings that provided opportunity for the Pillar Leaders to focus in on the key water resource management needs in the watershed, and to identify high-level watershed concepts for further development. This effort started with identification of six watershed-based or system-wide strategies as follows:

- Increase Water Use Efficiency
- Regional Water Quality Enhancement
- Water Banking and Intra-Regional Transfer
- Salt Export & Groundwater Management
- Stormwater Capture and Off-River Storage
- Disadvantaged Community Infrastructure Enhancement
- Water Recycling
- Land Use Practice

From these Master Craftsmen meetings, a white paper was developed that identifies key examples of watershed-based water resource management concepts that, when implemented throughout the watershed as a single project or series of interconnected projects, can provide tangible and measurable benefits by removing impairments. These watershed-based concepts are ideas vetted by the Pillar groups that target a particular water resource management need, and in addressing that need, provide significant additional benefits, e.g. habitat restoration and increased habitat connectivity, and improvements to the environment. Two types of concepts were included: (1) those that require implementation of capital projects, and (2) those that are programmatic and focus on establishment of regional management practices or policies that increase sustainability of existing resources.

The product of the Master Craftsmen's work is reflected in the document "OWOW Santa Ana River Watershed Planning Framework" as shown in **Appendix B**. This document includes 13 concepts that target a particular water resource management need, and at the same time provides significant corollary benefits, e.g., water supply, water quality, stormwater attenuation, habitat restoration, increased habitat connectivity, increased open/green space, and provides an improved quality of life for citizens in the watershed. A brief description of each of the 13 watershed-wide concepts is shown on the following pages.

**Water Budget Based Rate -** Incentive to our water retailers to implement sustainable water rate systems resulting in a stable revenue stream to the water agency, a significant water demand reduction by all water users, and reduced runoff pollution in TMDLs.

**Efficient Water Use Guidebook -** Developing an outreach tool or guidebook that is a well-designed, appealing, and easy to understand that provides information on how to use landscape water more efficiently and landscape appropriately for the Santa Ana River Watershed with simple easy –to-use tools, and establishes a water ethic that becomes the new norm for the next generation.

**Forest First Program Incentives -** Working with the U.S. Forest Service to support programs and projects that provide downstream water supply and water quality benefits including: Hazardous Fuels Reduction; 2) Meadow Restoration; 3) Chaparral Restoration on the front country above recharge areas; 4) Run-off reduction on roads that cross forest lands; and 5) Removal of invasive vegetative species.

**Watershed Land Use Planning Tool Kit -** Developing a tool kit that translates water principles to support watershed planning decisions and implements a jurisdictional outreach effort for relevant regional, county , and city planning agencies that encourages adoption of the guidance ideology into General Plans and zoning codes at the local level.

**Multi-Use Flood Control Corridor -** Expanding the use of existing flood control retention or detention facilities along, streams and tributaries of the Santa Ana River for water supply augmentation through stormwater capture and recharge while maintaining greenways, habitat, and recreational use.

**Water Banking and Transfer -** Constructing facilities and developing agreements to allow water to be stored in one part of the watershed in groundwater basins for later use and purchase by water agencies in other locations.

**Off-River Storage and Supply Credits -** Under a capture and replenishment program, a city or county could provide a "water credit" as part of new development that allows reconstituted or restored wetlands off river, providing opportunities to capture storm runoff and valued natural habitat.

**Watershed Urban Runoff Management Fund -** Establishing a watershed-based Urban Runoff Fund to support implementation of stormwater management programs. Components of this program could include the regulatory basis for a watershed-based program, the legal basis and authority for the fund, the agreements, and programmatic elements.

**Transportation Corridor Stormwater Capture and Treatment -** New uses of wide transportation right-of-way areas can be expanded for capturing rain runoff and replenishing groundwater basins.

**Santa Ana River Sediment Transport -** Implementing measures to assure that sediment is appropriately transferred along the entire Santa Ana River system to maximize recharge operations, restore habitat, and reduce operation costs.

**Modified Watershed Brine Management System -** Optimizing the water used to transport brine so that less water is lost to the ocean through increased concentrating of brine or delivery to the Salton Sea for beneficial use.

**Water Industry Energy Use Reduction Incentive Program -** Supporting regional purchase and installation programs of water resource related greener energy projects that reduce capital costs and reduce greenhouse gas emissions.

**Watershed Habitat Conservation Gap Planning -** Developing regional habitat conservation planning that covers areas that are not currently covered by existing conservation programs, and that allows implementation of land use decisions consistent with a plan without project-by-project review and permitting by the resource agencies, that also results in greater economic development certainty and provides for and maintains biological diversity by creating a network of interconnected Conservation Areas.

With the OWOW Santa Ana River Watershed Planning Framework document release in April 2012, the Pillars commenced their respective meetings over the following 18 months of the OWOW 2.0 planning. They investigated new regional implementation projects/programs that could lead to multiple, integrated benefits that in turn support other projects/programs concepts.

The following chapters represent the work of each stakeholder pillar as written by the Pillars, centered on a water resource strategy or need. The implementation projects and programs of each Pillar typically are shown at the end of each chapter. In many situations, the Pillars held joint meetings with other Pillars to improve synergy and integration, and to reflect a better final regional implementation project or program. **Chapter 5.14 Integration and Implementation** covers integration and implementation support to the Pillars under multiple workshops.

# 5.4 Water Resource Optimization

Arlington Desalter (WMWD)
Riverside, CA

## Recommendations

Based on the data from 2010 Urban Water Management Plans (UWMPs), the Santa Ana River Watershed is able to meet its demands in the average, single-year drought and multi-year drought scenarios while maintaining a reliability margin of 10%, or greater, to help offset future unknowns. The UWMPs assume that:

1. Future local precipitation patterns will be the same as past precipitation patterns (possible effects of climate change addressed later in the Chapter)
2. The predicted reliability of the State Water Project as taken from the Department of Water Resources (DWR) *The State Water Project Delivery Reliability Report 2009* (August 2010) is accurate
3. Imported water projections include possible effects of climate change
4. Imported water will be managed to store wet year supply for use during dry years
5. Future demands will match the estimated demand
6. The watershed will invest over $4 billion in water conservation and infrastructure projects
7. Significant investments will be made to improve the reliability of imported water supplies as detailed in Metropolitan Water District of Southern California's (MWDSC) 2010 Regional UWMP

Given the uncertainty in these assumptions, it is recommended that the Santa Ana River Watershed focus on the implementation of water management concepts marked with a ☑ over the next five years to achieve water supply reliability over the broadest area of the watershed at the most reasonable cost. Each of these concepts is described in more detail in the **Water Management Strategies and Watershed-wide Project/Program Concepts to Improve Water Supply Reliability** section of the Chapter.

# Summary of Water Management Strategies and Watershed-wide Project/Program Concepts to Improve Water Supply Reliability

(☑ indicates a concept recommended for focus during the next planning cycle)

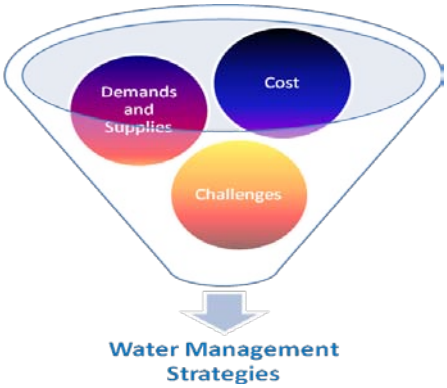
| | Strategy<br>Concept (in no particular order) | Status | Estimated Benefit |
|---|---|---|---|
| **REDUCE DEMAND** | | | |
| ☑ | Water rate structures that encourage conservation | Widely implemented | Help meet SBX7-7 required demand reductions |
| ☑ | Public education to encourage water conservation | Widely implemented | Help meet SBX7-7 required demand reductions |
| | Outdoor conservation | Widely implemented | Help meet SBX7-7 required demand reductions |
| | Reduce evapotranspiration | Conceptual | More investigation required |
| **OPTIMIZE IMPORTED WATER** | | | |
| | Wet year storage program | In process | Increases storage in watershed |
| ☑ | Bay Delta Conservation Plan[1] | In process | $730{,}000 \times 0.18 = 131{,}400$ Acre Feet per Year (AFY) and improved water quality |
| | Imported water banking | Widely implemented | Water in dry years |
| | Prevent invasive species from clogging infrastructure | In process | Consistent deliveries |
| **STORMWATER CAPTURE** | | | |
| ☑ | Enhanced Santa Ana River stormwater | In process | 12,000 AFY |
| ☑ | Enhanced stormwater capture from tributaries of Santa Ana River | In process | 28,000 AFY |
| ☑ | Riverside North Aquifer Storage and Recovery Project | In process | 12,800 AFY |
| ☑ | Enhanced Santa Ana River stormwater capture at Prado Dam | Conceptual | 10,000 AFY |
| ☑ | MS4 Credits | Conceptual | Increased stormwater capture |
| ☑ | Re-operate flood control facilities | In process | More investigation required |
| ☑ | Size flood control facilities for stormwater capture | Conceptual | Increased stormwater capture |
| ☑ | Forest First: Forest management for increased downstream stormwater capture | In process | Increased stormwater capture |

[1] Assume average maximum entitlement for the State Water Project (SWP) increases from 60% to 78%.

| | | | |
|---|---|---|---|
| | Development Standards that enhance stormwater capture | Conceptual | Increased stormwater capture |
| **RECYCLE WATER** | | | |
| ☑ | Recycled water exchange | Conceptual | Capital and energy savings ($100s millions), improved water quality |
| ☑ | Recycled water for potable use | Conceptual | More investigation required |
| | Recycle wastewater flowing to the ocean | In process | 157,000 AFY |
| | Import recycled water from outside the watershed | Conceptual | More investigation |
| | Ocean Desalination[2] | | 54,000 AFY |
| | Recycled water use to offset potable demand | In process | This is widely implemented by several agencies and part of the projected water supply portfolio |
| **INCREASE STORAGE** | | | |
| ☑ | Surface Water Storage | In process | Helps offset drought and climate change |
| ☑ | Groundwater storage | In process | Helps offset drought and climate change |
| **IMPLEMENT EMERGENCY MEASURES** | | | |
| | Emergency Measures | In process | Preparation for catastrophic event |
| | **Total** | | **405,200 AFY** |

The climate and geography of the State of California present a unique challenge to the management and delivery of water. While most of the precipitation falls on the northern portion of the State, most of California's population resides in the semi-arid, southern portion of the State. Water is diverted, stored, and then transferred from the water-rich north when needed to the more arid central and southern sections of the state through the California State Water Project (SWP), the Central Valley Project (CVP), and the Los Angeles Aqueduct.

In addition to the projects that transport water from the north to the south, the southern coastal area relies on water imported through MWDSC's Colorado River Aqueduct (CRA). The U.S. Bureau of Reclamation and seven basin states manage the Colorado River (CR) system under the authority of the Secretary of the Interior and for the benefit of seven "basin states". California's share of the CR Supply is 4.4 million acre-feet (maf).

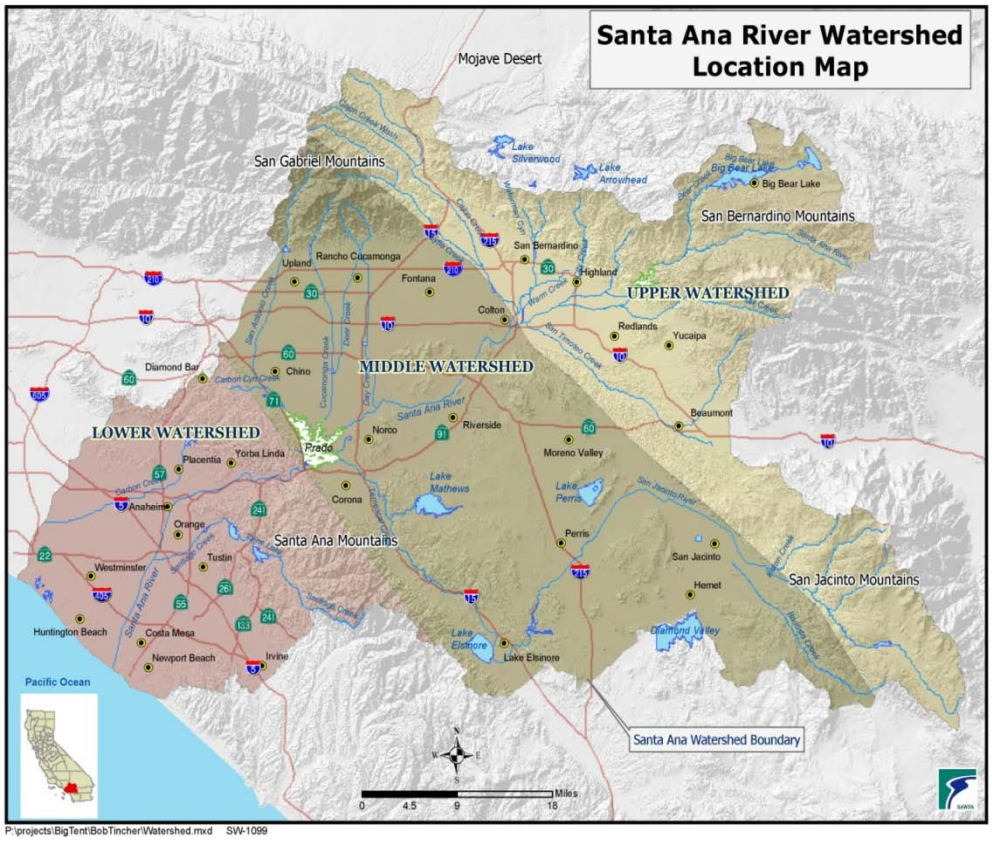


During most years the supply available to the region has been adequate for its needs. The region has gotten through the drier years by using water that was stored during wetter years.

[2]Poseidon Huntington Beach Ocean Water Desalination, 50 million gallons per day.

Even though the State's water supply is more than adequate for its population and economic needs, the laws of the State and Federal governments have allocated the majority of that supply for environmental purposes and made building new surface storage increasingly difficult and expensive. This has forced Californians to seek more creative and sustainable and often more expensive solutions to water resource management wherever possible.

The Santa Ana River Watershed lies in semi-arid Southern California. Like many other areas, the watershed is carefully evaluating water supplies and demands and seeking creative, cost-effective strategies to provide a reliable water supply into the future. Water supply reliability in Southern California will be challenged by multi-year droughts, droughts on the CR, limited local water resources, the vulnerability of the Sacramento-San Joaquin River Bay-Delta, and the threat of climate change. In addition, vulnerabilities in regional and statewide infrastructure could increase due to major seismic events. Designing a diverse and flexible water resource management system that can meet these challenges will help to ensure water reliability and a sustainable and vibrant economy for the Watershed.



The One Water One Watershed (OWOW) collaborative process has facilitated the discussion of water management and sustainability throughout the Watershed. The key objective for water supply reliability is a cost-effective and diverse water supply and water storage portfolio that makes better use of existing facilities and supplies; improves overall water use efficiency; achieves a practical level of inter-connections and redundancy; and optimizes water storage for use during drought periods. This section of the plan focuses on how to maintain a robust and reliable water supply within the watershed.

## Current Conditions

There are five principal wholesale agencies that form the Santa Ana Watershed Project Authority (SAWPA) and manage most of the water supplies within the watershed, both local and imported. In addition to these regional water agencies, the watershed also contains portions of four counties represented, as well as retail and wholesale water agencies. For purposes of this report, the analysis has been organized by three general areas: upper watershed, middle watershed, and lower watershed. These areas are subsets of the Santa Ana River Watershed (**Figure 5.4-1**). The regional water agencies within each general area are described below.

**Figure 5.4-1 Watershed Areas**

## Upper Watershed

*San Bernardino Valley Municipal Water District (Valley District)* is a State Water Contractor and provides imported water from the SWP to local retail agencies in its 325 square mile service area to supplement and enhance groundwater resources. Valley District's service area generally includes the cities and communities of San Bernardino, Colton, Loma Linda, Redlands, Rialto, Bloomington, Highland, Grand Terrace, and Yucaipa. Valley District is a member agency of SAWPA.

*San Gorgonio Pass Water Agency (SGPWA)* is a State Water Contractor, and provides imported water from the SWP to local retail agencies in its 225 square mile service area to supplement and enhance groundwater resources. SGPWA's Service area includes Calimesa, Beaumont, Banning, Cherry Valley, Cabazon, and Morongo Indian Reservation. The SGPWA service area straddles the Watershed, with its western two-thirds in the watershed and eastern one-third in the Whitewater River watershed.

## Middle Watershed

*Eastern Municipal Water District (EMWD)* is a member agency of MWDSC and provides both water and sewer service throughout its 555 square mile service area. Major communities include Moreno Valley, Hemet, San Jacinto, Perris, Sun City, Menifee, Winchester, and parts of Temecula, and Murrieta. In addition to retail customers, EMWD wholesales water through seven local water agencies. EMWD is a member agency of SAWPA.

*Western Municipal Water District (WMWD)* is a member agency of MWDSC and provides water service throughout its 510 square mile service area in western Riverside County. Within its boundaries lie the communities of Jurupa, Rubidoux, Riverside, Norco, Corona, Elsinore Valley, and parts of Temecula. WMWD serves imported water directly to customers who are located in the unincorporated and non-water bearing areas around Lake Mathews and portions of the City of Riverside. Ten wholesale customers are served by WMWD with both CR and SWP water. WMWD is a member agency of SAWPA.

*Inland Empire Utilities Agency (IEUA)* is a member agency of MWDSC and provides water and sewer services to a 242 square mile area in the western portion of San Bernardino County. Within its boundaries lie the Cities of Chino, Chino Hills, Fontana, Montclair, Ontario, Rancho Cucamonga, and Upland. IEUA is a member agency of SAWPA. Also, the majority of the IEUA service area overlies the Chino Basin Watermaster boundary.

*Chino Basin Watermaster (Watermaster)* is a consensus-based organization facilitating the development and utilization of the Chino Groundwater Basin. The Watermaster consists of various entities pumping water from the Basin including cities, water districts, water companies, agricultural, commercial, and other private concerns. The Watermaster's mission is "to manage the Chino Groundwater Basin in the most beneficial manner and to equitably administer and enforce the provisions of the Chino Basin Watermaster Judgment", Case No. RCV 51010 (formerly Case No. SCV 164327).

### Lower Watershed

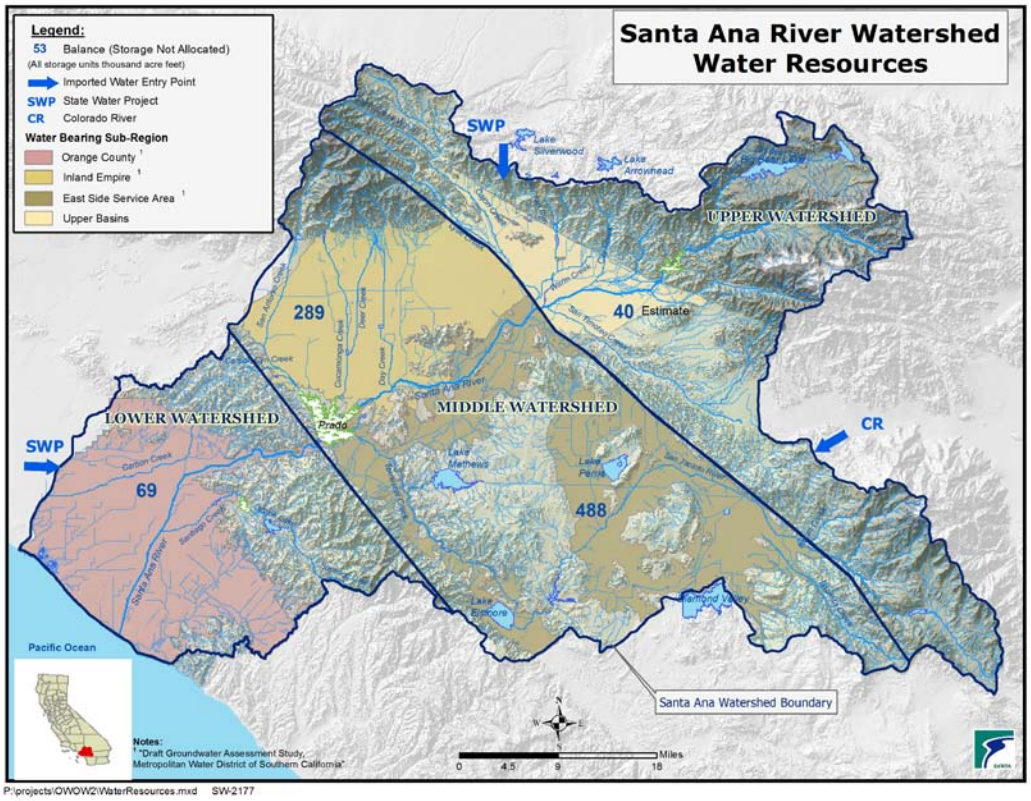
*Orange County Water District (OCWD)* manages groundwater within its 355 square mile service area. Within its boundaries lie the Cities of Anaheim, Buena Park, Costa Mesa, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Palma, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda. OCWD recharges the groundwater basin with surface water flows from the Santa Ana River and Santiago Creek, recycled water from the OCWD Groundwater Replenishment System (GWRS), and imported water which is purchased from the Municipal Water District of Orange County. OCWD is a member agency of SAWPA.

*Municipal Water District of Orange County (MWDOC)* is a member agency of MWDSC and sells imported water to 29 retail water agencies and cities in north and south Orange County. MWDOC also sells water to OCWD. MWDOC also straddles the Watershed, with its northernmost portion being in the Watershed and its southern portion being outside of the watershed.

Within each of these regional agencies, there are a number of retail water agencies. For purposes of brevity, these local agencies have not been individually listed in this report. However, these agencies did provide invaluable input into the OWOW process.

## Water Sources

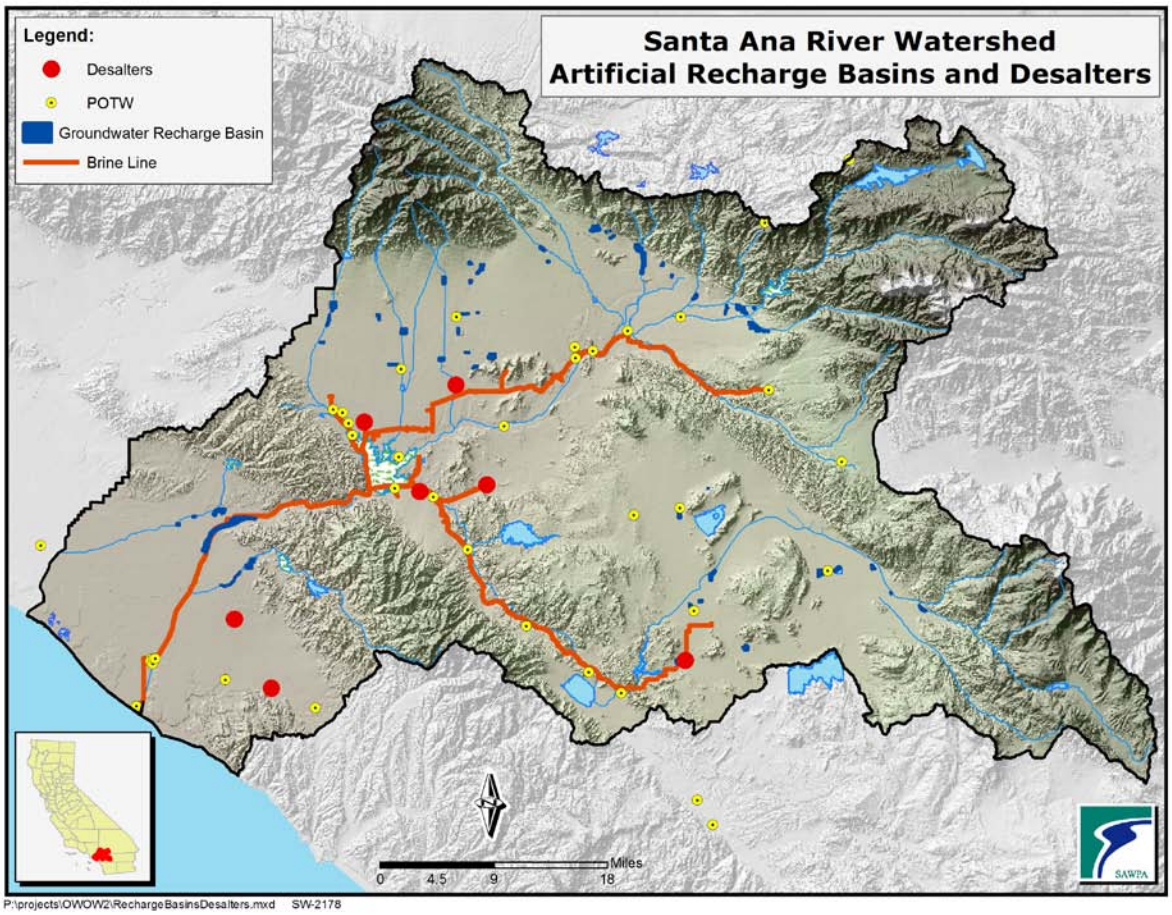
The Watershed gets about 50% of its water from local precipitation in the form of surface water and stored as groundwater. The Watershed imports about 30% of its water from the SWP and Colorado



River. The remaining 20% of the Watershed's water supply is recycled water. Each of these sources are explored below.

### *Precipitation Stored as Groundwater*

The underground pore space between soil granules provides a location to store water, referred to as groundwater, which can be later extracted using wells. To avoid double-counting water supplies, OWOW 2.0 limits the term groundwater to precipitation stored as groundwater. Imported water stored in the ground is classified as "imported water". The watershed's underground storage space functions essentially like a series of underground reservoirs. These underground reservoirs, or basins, range from a few hundred to over one thousand feet in thickness. Basins upstream from Prado Dam underlie about 1,200 square miles of the watershed, while basins downstream from Prado Dam underlie about 400 square miles of the watershed. Yields of nearly all of the basins within the watershed have been estimated using past hydrology and, for planning purposes, agencies have assumed that this past hydrology will continue to repeat itself and does not include any possible effects from climate change. Possible water resource effects from climate change are addressed later in this chapter and the possible overall effects of climate change are addressed in **Chapter 5.13 Energy and Environmental Impact Response**. Recognizing that hydrological patterns are expected to be altered due to climate change with subsequent impacts to demand and supplies, climate change impacts are discussed and addressed later in this chapter. Basin's safe yield is the amount of water that can be annually pumped from a basin on a permanent basis without emptying the basin.



In general, the watershed relies on precipitation stored as groundwater to provide about 50% of the water supply. **Figure 5.4-2** generally shows the larger groundwater basins within the watershed along with any available storage capacity (individual basins and sub-basins have been omitted for clarity). These basins provide storage space for local and imported water supplies that can be used during droughts or other shortages. The amount of storage space in the lower watershed is based on the storage volume that could be available in approximately eight out of ten years.

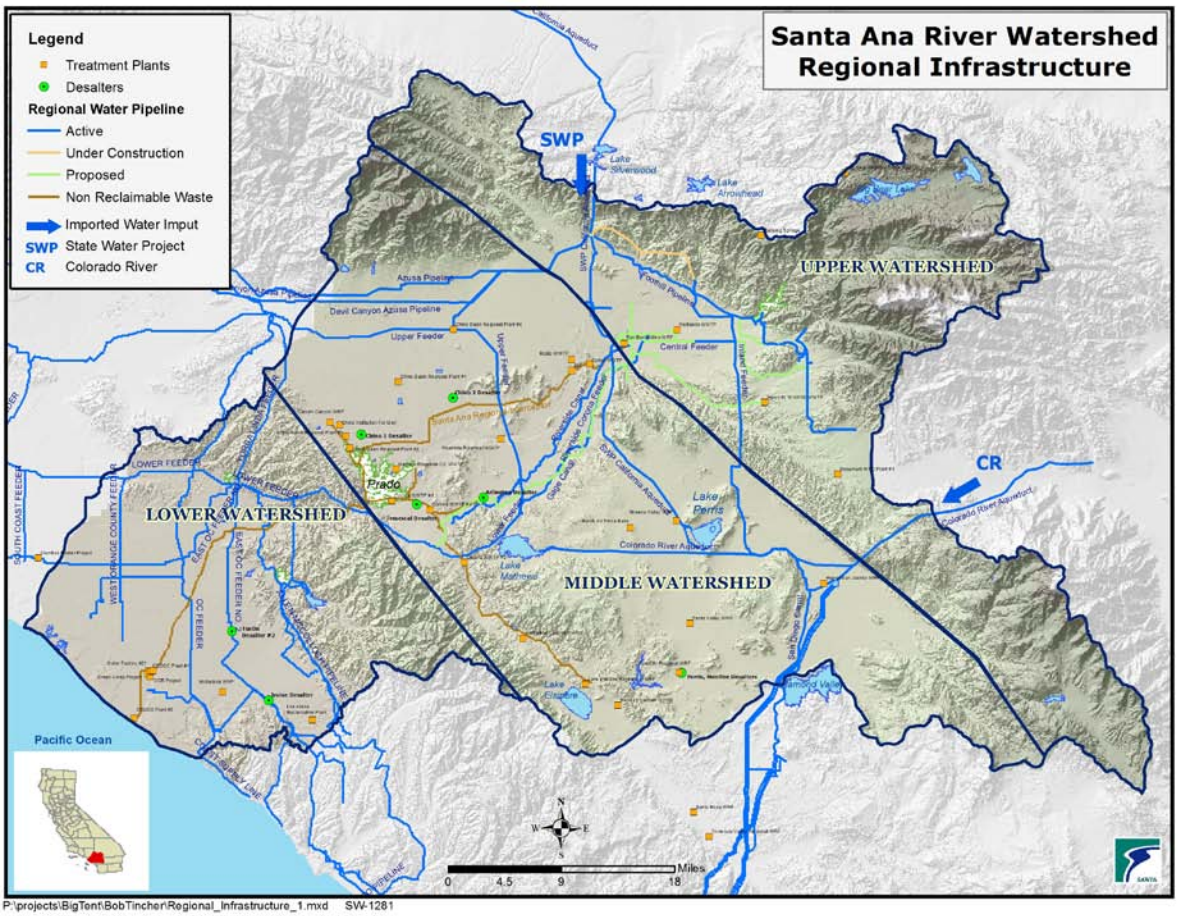
**Figure 5.4-2 Groundwater Resources within the Watershed (Thousand acre-feet)**

Artificial replenishment involves storing additional water in the basin(s), over and above precipitation stored as groundwater. The most common type of artificial replenishment is “spreading” water into open “pits”, or basins, and allowing it to soak into the ground down to the “water table”. Another commonly used method is called “in-lieu” replenishment. This method involves replacing groundwater with another source of water. This corresponding reduction in groundwater pumping results in less water being removed from the basin which effectively acts to replenish the groundwater supply. Finally, the most costly method of artificial replenishment is to inject the water into the basin using an injection well(s). Of the various methods available, artificial recharge the most common throughout the Watershed. **Figure 5.4-3** shows the locations of spreading basins in the watershed.

**Figure 5.4-3 Artificial Recharge Basins and Desalters**

One challenge to groundwater supplies in the watershed is poor water quality, typically due to total dissolved solids (TDS or salinity) and nitrates. These salts accumulate mostly through use and evaporation, but also are introduced to the water supply by way of agricultural fertilizers and septic tanks. Further, there are numerous forms of contamination found in the watershed, such as; TCE, PCE (commonly used solvents) and Perchlorate (fertilizer, fireworks and explosives). All these forms of contamination must be removed using various treatment methods before it can be introduced into the water supply system.

### *Precipitation as Surface Water*



In 2005, the amount of precipitation that flowed from rivers and streams that was diverted and used accounted for approximately 5% of the total water supply. Local surface water is largely seasonal, meaning that most of the water comes in the "wet" or rainy season, and is dramatically reduced in the "dry" season to snowmelt, natural springs, and treated wastewater flows. Facilities, such as dams and flood control detention basins divert and slow storm runoff providing additional opportunity for groundwater replenishment. In the upper watershed, only a portion of storm runoff is being diverted and used as surface water. In other portions of the watershed, the exact opposite is true. Much of the

runoff from the upper and middle watershed is captured by the U.S. Army Corps of Engineers' Prado Dam and later is used by the Lower Watershed. A similar opportunity is available in the upper watershed at the U.S. Army Corps of Engineers Seven Oaks Dam and other dams in the watershed.

### *Imported Water*

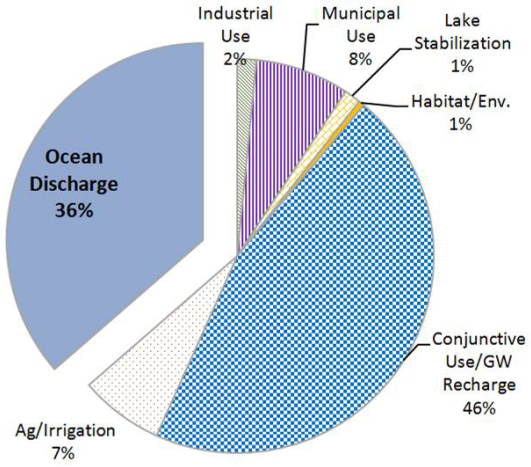
The watershed relies upon imported water for about 1/3 of its water supply. Water is imported into the area by MWDSC (SWP and CR), SGPWA (SWP) and Valley District (SWP). Current and predicted reliability of the SWP was taken from DWR's *The State Water Project Delivery Reliability Report 2009* (August 2010). **Figure 5.4-4** shows the regional infrastructure and the entry points for the SWP and the CR.

**Figure 5.4-4 Regional Infrastructure within the Watershed**

As shown on **Figure 5.4-4**, there are significant regional pipelines (48 inch diameter and larger) and surface storage reservoirs in the watershed. These pipelines provide opportunities for water transfers, especially in an emergency situation. **Table 5.4-1** provides a list of surface water reservoirs in the watershed and their capacities.

**Table 5.4-1 Surface Water Reservoir Capacities**

| Reservoir | Capacity (acre-feet) |
|---|---|
| Lake Arrowhead | 48,000 |
| Big Bear Lake | 73,000 |
| Diamond Valley Reservoir | 800,000 |
| Lake Elsinore | 45,000 |
| Canyon Lake | 12,000 |
| Lake Mathews | 178,500 |
| Lake Perris | 120,000 |
| Prado Dam | Flood control and conservation |
| Seven Oaks Dam | Flood control (conservation pending) |
| Lake Silverwood | 74,970 |
| Irvine Lake | 25,000 |



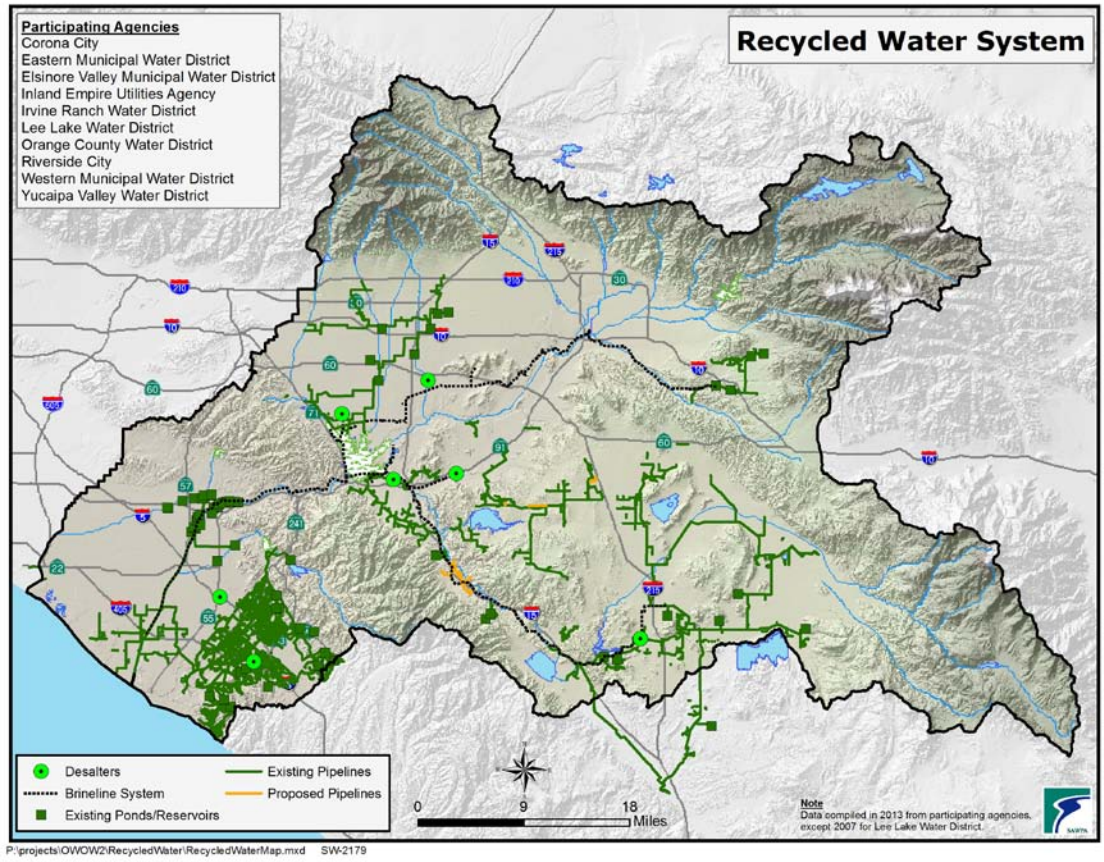
## Recycled Water

Water recycling, also known as water reclamation or water reuse, is a reliable, economically feasible, and environmentally sensitive means to preserve the State's potable water resources, assist with drought mitigation, and reduce the demand on potable water supplies.

Statewide, over 669,000 (AF) of wastewater is recycled each year according to the State Water Resources Control Board (SWRCB). Currently, recycled water is used to irrigate agricultural crops, urban landscapes, golf courses, and freeway medians; replenish groundwater basins; flush toilets and urinals; and act as a barrier to sea water intrusion into freshwater groundwater basins. It is also increasingly used by industry in cooling processes, in new home and other construction, and for other purposes. In the future, the level of recycling will increase to help meet the needs of the State's burgeoning population.

## Current Conditions in the Watershed

**Figure 5.4-5 Current Rate of Recycled Water Use within the Watershed**



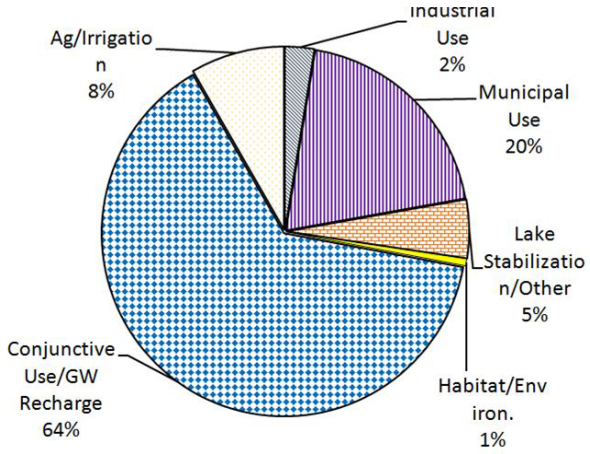
Recycled water has been used in the watershed for many years to supplement local and imported potable supplies. Water reclamation involves treating wastewater to State standards so that the water is safe for State-approved applications. Currently, over 285,000 AFY of recycled water is being used to meet groundwater recharge (72%), municipal (12%), agricultural irrigation (11%), lake stabilization (2%) , industrial (2%), and habitat and environmental (1%) water needs within the Santa Ana River Watershed (see **Figure 5.4-5**). The 285,000 AFY includes approximately 100,000 AFY of tertiary treated wastewater that flows down the Santa Ana River from San Bernardino and Riverside Counties that is recharged by OCWD in surface recharge basins in Anaheim and Orange. OCWD generally captures all of the river flows, except during periods of high storm flow. As seen in in **Figure 5.4-5** only 36% of recycled water in the watershed, or 157,000 AF is currenlty being discharged to the ocean.

The 100,000 AFY is considerably more than the 42,000 AF at Prado Dam required by the 1969 Orange County Judgment. As demands continue to increase and other supplies become less reliable, the upper and middle watershed have plans to increase recycling. Over time, any reduction in treated wastewater flow in the river would have to be replaced by OCWD recycling more of the wastewater that flows into the ocean, importing more water, desalting the ocean, or some other new source of supply. Tables 5a.8 through 5a.11 of **Appendix C** show the proposed increase in recycled water use in the upper watershed from 2015 through 2035.

Overall recycled water currently represents the third largest water supply source to the watershed, accounting for approximately 20% of total water demands. **Appendix C** includes information about existing and proposed treatment facilities, plant flow and recycled water use.

**Figure 5.4-6** shows the recycled water systems in the watershed. Included in the display are existing and proposed recycled water pipelines, existing and proposed wastewater treatment plants, existing and proposed storage tanks, existing storage ponds, and the Inland Empire Brine Line. Agencies that provided map information include Big Bear Area Regional Wastewater Agency, City of Corona, City of Riverside, EMWD, EVMWD, IEUA, Irvine Ranch Water District, Lee Lake Water District (LLWD), Orange County Sanitation District (OCSD), OCWD, WMWD, and Yucaipa Valley Water District (YVWD).

**Figure 5.4-6 Recycled Water Systems**



## Proposed Recycled Use

As urban and suburban growth and development in the watershed continue, an increasing amount of recycled water will be available while the traditional demand by agricultural customers will decrease. This creates a challenge to establish a growing recycled water market for groundwater recharge, commercial, industrial, and institutional customers as well as developing innovative and creative markets elsewhere.

Current projections for 2035 indicate 432,000 AFY of water treatment plant flows will be recycled in the watershed, and 205,000 AFY discharged into the ocean. **Figure 5.4-7** depicts the estimated distribution of the recycled water in 2035.

**Figure 5.4-6 Projected 2035 Rate of Recycle Water Use within the Watershed**

## Current Management Strategies

Current management strategies include the planned and conceptual recycled water projects as described below.

**EMWD** has completed a Recycled Water Strategic Plan to identify the preferred strategy to be pursued in developing its recycled water system through the year 2030. The principal goal of the Strategic Plan was to develop a preferred long term strategy for highest beneficial reuse of recycled water. EMWD's Recycled Water Strategic Plan recommended the Indirect Potable Reuse (IPR) Project, using advanced treated water for recharge of basins in the Hemet/San Jacinto Water Management Plan area. Currently, EMWD is working on a phase I planning study. This next step in the planning process consists of determining blending water strategy, brine disposal alternatives, salt balance considerations, regulatory requirements, facilities needs assessment & constraints analysis and program cost analysis. This phase will produce 5,000 AFY, and is scheduled to be completed in 2020.

**City of Riverside -** The SWRCB approved the City of Riverside's wastewater change petition on May 20, 2008. The primary condition of the Order requires that the City of Riverside discharge not less than 25,000 AFY of treated wastewater from its Regional Water Quality Control Plant to the Santa Ana River. The Order also modified the purpose of recycle water use to include municipal, industrial, and agricultural purposes and expanded the place of use to included areas within the City's limits, the City's water service area boundary, and within the boundary of the Jurupa Area Plan to reflect diversion of treated wastewater to recycled water use sites. To be able to meet these future projected needs without increasing the City of Riverside's reliance upon imported State Water purchases, it will be critical for the City of Riverside to significantly expand its use of the recycled water recently made available.

In addition to the description of the City of Riverside's recycled water efforts, the City of Riverside Public Utilities also received a master reclamation permit from the Regional Water Quality Control Board.

**IEUA** recently developed a Three Year Business Plan to rapidly expand the recycled water distribution system and increase recycled water use by 35,000 AFY. The capital program emphasizes increased system storage as well as distribution system piping and piping to reach high capacity recharge sites. The business strategy, while regional in nature, is founded on the principle of partnerships with IEUA member agencies, both from a water marketing standpoint and a capital facilities standpoint. The partnerships are having the effect of "supercharging" the capital program through conversion of member agency owned local potable water facilities to regional recycled water facilities.

**LLWD** has completed a recycled water master plan that will allow for the connection of the local parks and schools in the near future. They also have partnered with the City of Corona in its Ground Water Management Plan for the basins underlying LLWD's boundaries. LLWD currently is investigating potential groundwater recharge options.

**OCWD and OCSD** jointly developed the GWRS. In 2011, the GWRS produced 72,000 AF of recycled water. OCWD is constructing the Initial Expansion of the GWRS. This project will increase the amount of water produced by 31,000 AFY. When construction is completed in 2014, the total amount of water produced by the GWRS will be 103,000 AFY. OCWD is also evaluating an additional expansion of the

GWRS. Implementation of additional expansion of the GWRS would further reduce the amount of effluent discharged into the ocean. Because they reduce the amount of water discharged into the ocean, expansions of the GWRS are a new regional water source that would increase the net overall supply of water to the watershed.

**City of Riverside** in May 2013, the Regional Water Quality Control Board adopted Order No. R8-2013-0028 granting the City of Riverside Public Utilities a waste discharge requirements and master reclamation permit for distributing recycled water.

**Valley District** does not own or operate a wastewater treatment plant within its service area. However, recycled water is part of the region's water budget as they move toward the future. The City of San Bernardino Municipal Water Department is planning a "clean water factory" that may produce up to 14,000 AFY in the future.

**WMWD** expanded its recycled water portfolio with the expansion of the Western Water Recycling Facility (WWRF) in 2011. The plant is capable of producing up to three Million Gallons per Day (MGD) of tertiary-treated recycled water. Plans call for eventually expanding to five MGD.

WMWD possesses an extensive non-potable distribution system that includes both storage and pumping capabilities. This system functions as the backbone distribution system to expand use of recycled water (for irrigation) within its service area. One major commercial area (Meridian Business Center) and one large residential community already are dual-piped for recycled water use and a new Riverside Unified School District (RUSD) high school has been retrofitted to allow recycled water use. Two new large residential projects (including a golf course development) will be conditioned to install dual plumbing. WMWD also will work with RUSD to dual plumb new campuses, including a new middle school west of the Orangecrest area.

The City of Riverside is still working with WMWD to conduct joint planning for recycled water use. At this time, the City does not plan to deliver recycled water to Riverside's greenbelt. The system also will distribute non-potable groundwater through the legacy canal system thereby maximizing use of local water resources.

WMWD is working with the Riverside County Ben Clark Training Center to site a large recycled water storage impoundment on their facility located just south of Van Buren Boulevard and west of I-215. This proposed 600 AF impoundment would serve the County as a dive/water training facility while providing wet weather storage for recycled water produced by the WWRF, a truly unique and innovative use of recycled water.

Finally, WMWD is in the early stages of evaluating the use of recycled water to recharge local groundwater basins as a new source of supply. As total summer irrigation demands likely will exceed recycled water supply, recharge will probably be limited to winter months. Close coordination with the Regional Board and California Department of Public Health (CDPH) will be required.

**YVWD** adopted a Strategic Plan in August 2008, which outlines the methods used to maximize the use of recycled water to meet future water demands. This policy requires new homes to install dual water meters to provide potable water and non-potable water to each property. The use of recycled water

delivered to residential and commercial properties for irrigation is expected to reduce future potable water demands by 50%-60% per equivalent dwelling unit. This policy will require YVWD to implement a salinity control program which will provide extremely high quality recycled water to new neighborhoods providing a sustainable water supply for the future.

Other reclamation projects in the watershed include innovative uses such as toilet and urinal flushing in high-rise buildings and schools as well as residential landscaping irrigation, as evidenced by recycled water programs in IRWD.

## Barriers and Constraints

Challenges related to recycling projects include: regulatory requirements, brine line constraints, storage/seasonal constraints, financial constraints, water quality management, and public perception. They are discussed below.

### *Regulatory Requirements*

An important component of maximizing local supplies is the ability to safely and efficiently regulate and permit recycled water use. California's laws governing the permitting of recycled water were established more than 20 years ago, and are in need of updating to communicate that recycled water is a valued commodity, not a waste. Additionally, the current permitting framework establishes multiple recycled water permitting paths and overlapping jurisdictions overseeing the process which has resulted in confusing, costly delays and often inconsistent requirements.

To address some of these concerns, the Recycled Water Act of 2013 is currently making its way through the legislative process with the support of many water agencies and water reuse proponents. This bill will address barrier to recycled water use. It will align recycled water spill reporting and incidental runoff in codes, and authorize SWRCB permitting of advanced treated water. Clear, comprehensive legislation is required to maximize the use of recycled water in the future and to further reduce reliance on imported water.

In November 2011, the CDPH released draft regulations regarding recycling water for public comment. These draft regulations pertain to groundwater replenishment with recycled water. CDPH reviewed the public comments and released another draft in March of 2013. The final proposed version will proceed through the formal regulation adoption process and will be subject to public review and comment as part of that process.

### *Storage/Seasonal Constraints*

The recycled water supply is not dependent on weather patterns; supply is fairly constant throughout the year. For these reasons, recycled water is viewed as one of the most reliable sources of water in the Watershed. However, because recycled water is used primarily for irrigation purposes and associated seasonal demands, recycled water demands can be variable and are often affected by weather and the season. In some areas, demands increase in dry years. However, wet years generally pose a greater operational challenge as customer demand decreases and storage facilities fill. Storage during periods of low demand is necessary to meet high demand during other times of the year. The amount of available recycled water storage varies greatly between agencies. Some have little or no storage and others have

thousands of AF of storage. Each agency's existing and proposed recycled water storage facility capacities, excluding groundwater basins, are shown in **Appendix C**.

### *Financial Constraints*

The cost of infrastructure to produce, store, and distribute recycled water is expensive. Given that demands for recycled water are more scattered throughout communities, recycled water distribution pipelines are built only where demands justify the expense and where customers agree to use recycled water. This is especially true where sites need to be retrofitted to use recycled water as opposed to newly constructed sites where rules may dictate its use. Other issues include the cost of recycled water use to the customers as well as administration of the recycled water system by both the distributor and user. Because of the cost, there are sites where there may be willing customers but no infrastructure to serve them. Grant funds and other forms of financial aid can help make some projects viable, but other projects still may not be financially viable.

Other issues include the cost of recycled water use to the customers as well as administration of the recycled water system by both the distributor and user. Many agencies are unable to charge the true cost to produce this high quality water due to the stigma attached.

Costs associated with recycled water use could include retrofitting of existing systems, required inspections and cross-connection shutdown testing, employee training, and use site maintenance. Administrative requirements include extensive permitting, recordkeeping, and reporting requirements.

Each use area also must have a Site Supervisor knowledgeable of the use area system and recycled water use restrictions. The Site Supervisor must be available at all times to correct any condition that does not conform to use area requirements specified by regulations and the recycled water distributor.

### *Water Quality Management*

Higher TDS source water, such as the Colorado River (up to 650 mg/l average) adds cost because TDS removal, or demineralization, requires energy intensive reverse osmosis. Residential use of water typically adds 200 to 300 mg/L of TDS to the wastewater stream, and self-regenerating water softeners can add another 60 to 100 mg/L. If an area receives CR water with a TDS of 650 mg/L, and residents add 300 mg/L through normal use, the recycling facility will produce water with a TDS concentration of 950 mg/L. This would not meet basin plan objectives anywhere in the watershed. It is also problematic for industrial customers and virtually unusable for many agricultural customers which limit the marketability. Nutrients such as nitrate present similar issues as TDS.

### *Public Perception*

Public perception of recycled water is changing! One successful example of this is OCWD's GWRS project that undergoes an advanced treatment process including two membrane filtration systems – microfiltration and reverse osmosis, and treatment by ultraviolet light and hydrogen peroxide. Once purified, the water is sent to recharge basins where it seeps into the ground, like rain, and blends with groundwater. The GWRS provides a new drought-proof water source for northern and central Orange County, reducing reliance on imported water. Additionally, the GWRS will save additional funds in the future by improving the quality of the water in the Orange County groundwater basin. This successful

effort utilized widespread public outreach activities involving the scientific, political, and other communities to assist in informing the public and addressing potential public perception issues.

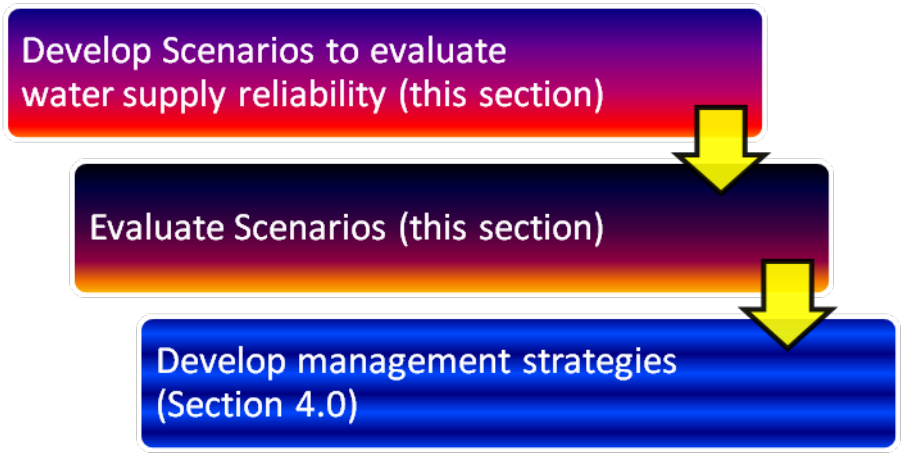
## Evaluate Water Supply Reliability

Water supply reliability for the Watershed was evaluated using the scenarios given in the Urban Water Management Planning Act (**Table 5.4-2**) and using some additional scenarios developed by the Water Resource Optimization Pillar (**Table 5.4-3**).

**Table 5.4-2 Water Supply Reliability Scenarios Provided in the Act**

| Scenario | Description |
|---|---|
| Average conditions* | What are the water supply reliability vulnerabilities given average supplies to the region? |
| Single year drought*[1] | What are the water supply reliability vulnerabilities given a single year of drought? |
| Multi-year drought*[1] | What are the water supply reliability vulnerabilities given a multi-year drought? |
| 50% reduction in imported water supplies*[1] | What are the water supply reliability vulnerabilities if the Watershed loses 50% of imported water supplies? |
| Natural Disaster | What are the water supply reliability vulnerabilities if a catastrophic interruption occurs due to an earthquake or other disaster? |

**Table 5.4-3 Additional Water Supply Reliability Scenarios Evaluated as part of the OWOW Process**



| Scenario | Description |
|---|---|
| Climate Change | What are the water supply reliability vulnerabilities given the assumed effects of climate change as presented in the Draft 2007 State Water |
| Zebra and/or Quagga Mussels | What are the water supply reliability vulnerabilities of the Zebra Mussel and/or the Quagga Mussel were to infiltrate the SWP? |
| Sediment Transport | How does sediment transport at Seven Oaks Dam and/or Prado Dam affect water supply reliability? |
| Wildfire | How does the threat of wildfire affect water supply reliability? |
| Channel Armoring | How does channel armoring in the Santa Ana River affect water supply reliability? |
| Water quality degradation | How does water quality degradation affect water supply reliability? |
| Terrorism | How does terrorism affect water supply reliability? |

*Scenario presented in the Catastrophic Interruption, Urban Water Management Planning Act.

Collectively, **Tables 5.4-2** and **5.4-3** provide a complete list of the evaluated scenarios.

All of the scenarios pose a threat to water supply reliability. The evaluation consisted of analyzing anticipated water supplies for each of these scenarios to determine if they are adequate to meet the anticipated demands. If anticipated demands are less than anticipated supplies, the system is deemed reliable. If anticipated demands are greater than anticipated supplies, water management strategies will need to be developed to offset these deficits. **Figure 5.4-8** provides an overview of the evaluation process.

**Figure 5.4-7. Overview of the Water Supply Reliability Evaluation Process**

The scenarios analyzed in this document represent a "snapshot" in time. As new challenges and constraints to water supply reliability are identified, they will require evaluation.

## Evaluation of Water Supply Reliability Scenarios

Every urban water supplier that either provides over 3,000 acre-feet of water annually or serves more than 3,000 or more connections is required to assess the reliability of its water sources over a 20-year planning horizon considering normal, dry, multiple dry years and other scenarios. The scenarios evaluated in OWOW are summarized in **Table 5.4-4**. The assessment of water sources is reported in an UWMP, which is to be prepared every 5 years and submitted to DWR. DWR reviews the UWMPs to ensure they have completed the requirements from the Urban Water Management Planning Act (Division 6 Part 2.6 of the Water Code §10610 - 10656). Current and predicted reliability of the State Water Project used in the UWMPs was taken from the Department of Water Resources *The State Water Project Delivery Reliability Report 2009* (August 2010).

In November 2009,SB X7-7 (Steinberg) was passed requiring urban water suppliers to reduce per capita use 10% by 2015 and 20% by 2020. This required reduction in per capita consumption is reflected in the 2010 UWMPs which were used to evaluate water supply reliability for the watershed. This legislation results in a significant reduction in demand since OWOW 1.0 which eliminated the deficit between supplies and demands shown in OWOW 1.0. In each of the UWMP scenarios, the watershed is able to meet its projected demands plus the 10% Reliability Margin with the projected supplies. However, it is

important to recognize that both the reduced demand and anticipated supplies are dependent upon a significant public investment. In the Proposition 84 process, the total estimated cost for projects that reduce demand and improve supply is over $4 billion and that does not include ongoing operations and maintenance costs.

To eliminate the potential for "double-counting", OWOW supplies are characterized by their source. For example, imported water recharged into a groundwater basin would be labeled "imported water" rather than "groundwater".

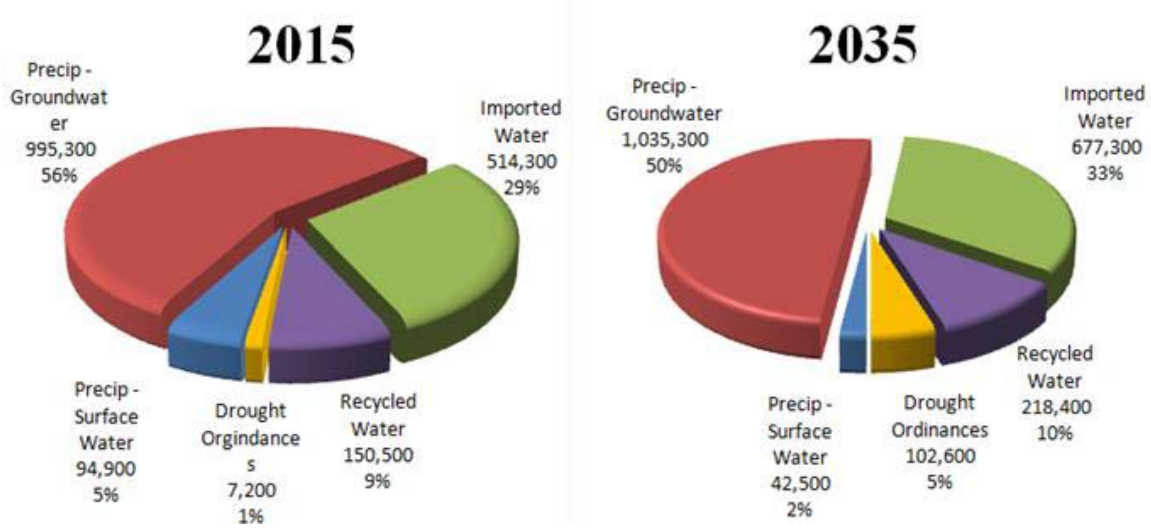
**Table 5.4-4 Summary of Water Supply Reliability Scenarios**

| Short-term Impacts | Long-term Impacts |
|---|---|
| **Catastrophic Interruption** | Average Hydrologic Conditions |
| Earthquake[1] | |
| Power outage[1] | Single-year Drought Hydrologic Conditions |
| Mussels[1] | |
| Wildfire[1] | Multi-year Drought Hydrologic Conditions |
| Water quality degradation | |
| Terrorism[1] | Climate Change[1] |
| | Sediment Transport[1] |

1 Actual effects uncertain.

## Reliability Margin

There are many hydrologic uncertainties including future weather patterns, the effects of climate change and possible legal restrictions that could be placed on water supplies such as past restrictions placed on the SWP. To help prepare for these and any other uncertainties, it is recommended that supplies exceed demands thereby providing a buffer, or "reliability margin". For the OWOW process, this reliability margin was established at 10% to be consistent with other water budgets in the watershed.



## Average Year (Baseline)

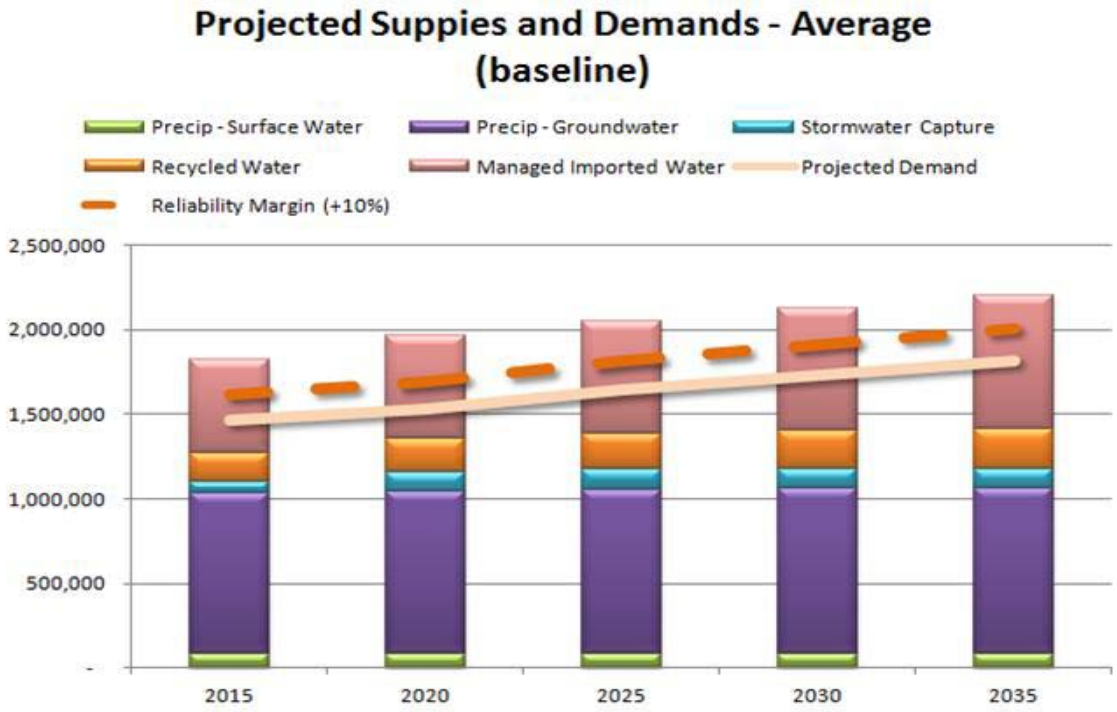
Evaluating average water supplies provides a "baseline" for comparison purposes. **Figure 5.4-9** summarizes the data for 2010 and 2035, which is based upon the UWMPs but also includes the following proposed stormwater capture projects that were not included in the UWMPs:

**Table 5.4-5 Stormwater Capture Projects Not Included in UWMPs but Included in OWOW Water Budget**

| Project | Amount (AF/Y) | | |
|---|---|---|---|
| | IEUA | SBVMWD | WMWD/RPU |
| Chino Basin Recharge Master Plan | 5,000 | | |
| Stormwater capture along the tributaries of the Santa Ana River (Active Recharge Project) | | 20,000 | 8,000 |
| Riverside North [Basin] Aquifer Storage and Recovery Project | 5,000 | 5,000 | 5,000 |
| **Total** | 10,000 | 25,000 | 13,000 |

**Figure 5.4-8 Summary of Water Supply Estimated from UWMP Data for 2015 and 2035**

Local precipitation presently meets about 60% of the demand and, due to increasing demand over time, is projected to meet about 50% of the demand in 2035. Other sources of supply and/or conservation measures are needed to meet the remaining 40% and 50% of demands, respectively. Although "drought ordinances" result in a reduction in demand, they have been presented as a supply to add emphasis and ensure they are not overlooked.



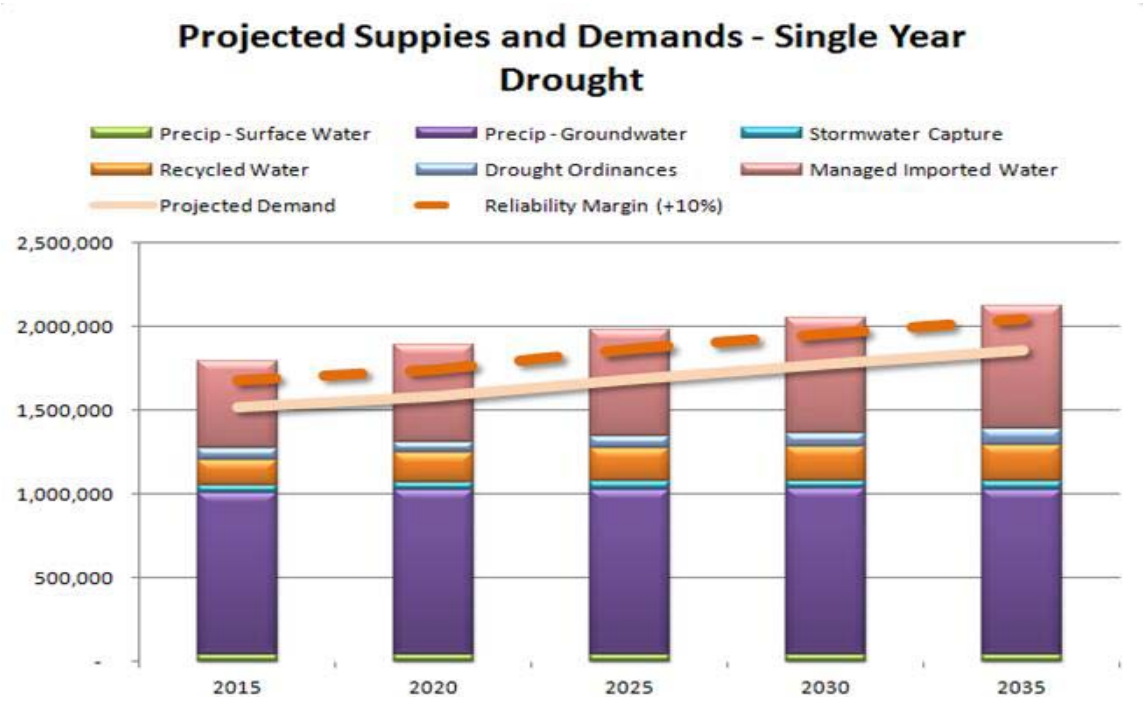
Given average hydrologic conditions, **Figure 5.4-10** shows that the watershed will be able to meet its needs through 2035 with a reliability margin of 15% in 2035. However, although the watershed, as a whole, will be able to meet demands, the SGPWA is projecting a 16,500 AF deficit. So, the watershed will need to work together to help overcome this deficit. The overall projections based on the UWMP data are positive and are generally based on the following assumptions:

1. Future local precipitation patterns will be the same as past precipitation patterns (possible effects of climate change addressed later in the chapter)

2. The predicted reliability of the State Water Project as taken from the Department of Water Resources *The State Water Project Delivery Reliability Report 2009* (August 2010) is accurate
3. Imported water projections include possible effects of climate change
4. Imported water will be managed to store wet year supply for use during dry years
5. Future demands will match the estimated demand
6. The watershed will invest over $4 billion in water conservation and infrastructure projects
7. Significant investments will be made to improve the reliability of imported water supplies as detailed in MWDSC's 2010 Regional UWMP

Given these unknowns, the watershed should continue to strive toward efficiency and toward projects that provide redundancy in case hydrologic projections are incorrect.

**Figure 5.4-9 Comparison of Total Supply (by source) versus the Projected Demand**



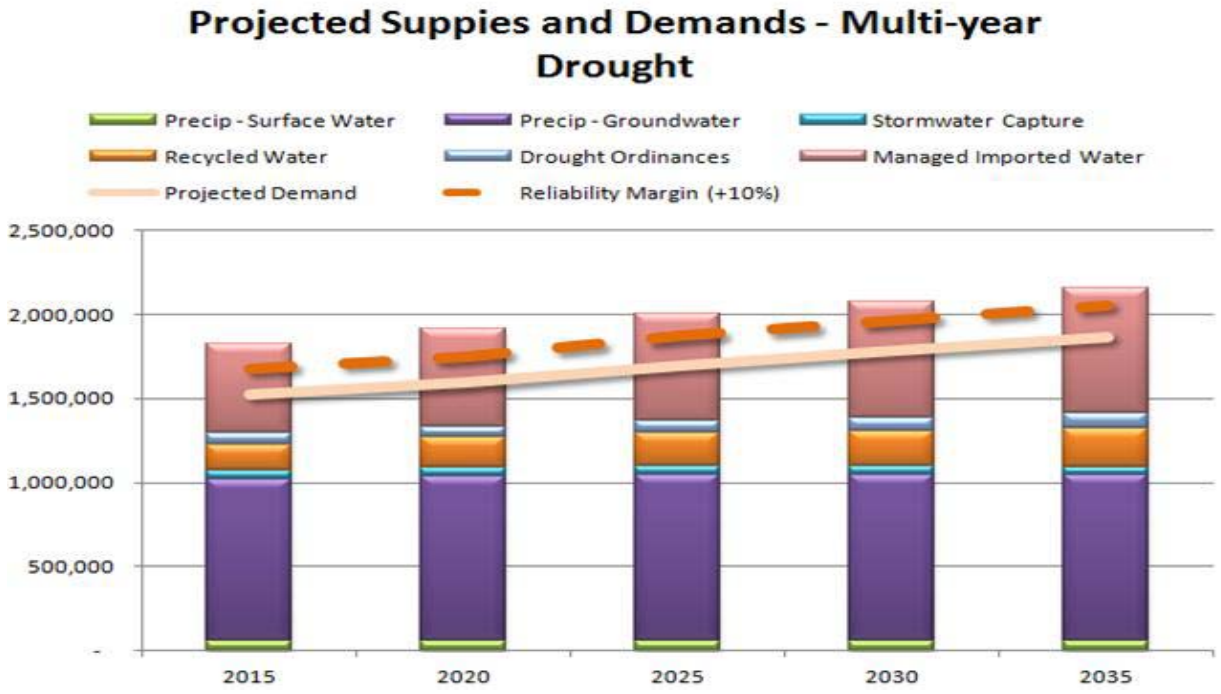
## Single-Year Drought

**Figure 5.4-11** summarizes the UWMP data for a single year drought. Nearly all of the water agencies defined the single-year drought as the year that they historically received the lowest amount of imported water. The watershed will be able to meet its demands in a single year drought with a reliability margin of 11% in 2035. The watershed is able to make it through a single year drought by relying on the various imported water storage programs that store water when it is available during wet periods for use during drought periods and on recycled water which is not impacted by weather. Although the watershed, as a whole, has enough supply to meet demand during a single year drought, the SGPWA projects a shortage of 27,000 AF in a single year of drought. Much of this deficit would be met by taking groundwater out of storage in the SGPWA service area. The overall projections based on the UWMP data are positive and are generally based on the same seven assumptions listed above.

Given these unknowns, the watershed should continue to strive toward efficiency and toward projects that provide redundancy in case hydrologic projections are incorrect.

**Figure 5.4-10 Anticipated Supply (by source) versus Projected Demand for a Single Year of Drought**

## Multi-Year Drought



This scenario evaluates the water supply reliability for the Watershed assuming a multi-year (3 year) drought. Nearly all of the water agencies chose a3 year period that had the lowest, historic delivery of imported water.

**Figure 5.4-12** summarizes the UWMP data for a multi-year drought and shows that the watershed will be able to meet demands with a reliability margin of 13% in 2035, higher than a single year drought. Although a 3 year drought lasts longer, the average entitlement available during multi-year drought is slightly higher than the entitlement available during a single year drought. The watershed is able to meet its needs during a multi-year drought due mostly to the storage programs implemented by MWDSC, Valley District, SGPWA, and others. However, despite the overall ability to meet demand, SGPWA is expecting a deficit of about 23,000 AF during a multi-year drought. Much of this would be met by withdrawing groundwater from storage in the SGPWA service area.[3]The overall projections based on the UWMP data are positive and are generally based on the seven assumptions listed above.

[3]Upper Santa Ana River Watershed Integrated Regional Water Management Plan, Table 3-12, November 2007, pg. 3-20.

Given these unknowns, the watershed should continue to strive toward efficiency and toward projects that provide redundancy in case hydrologic projections are incorrect.

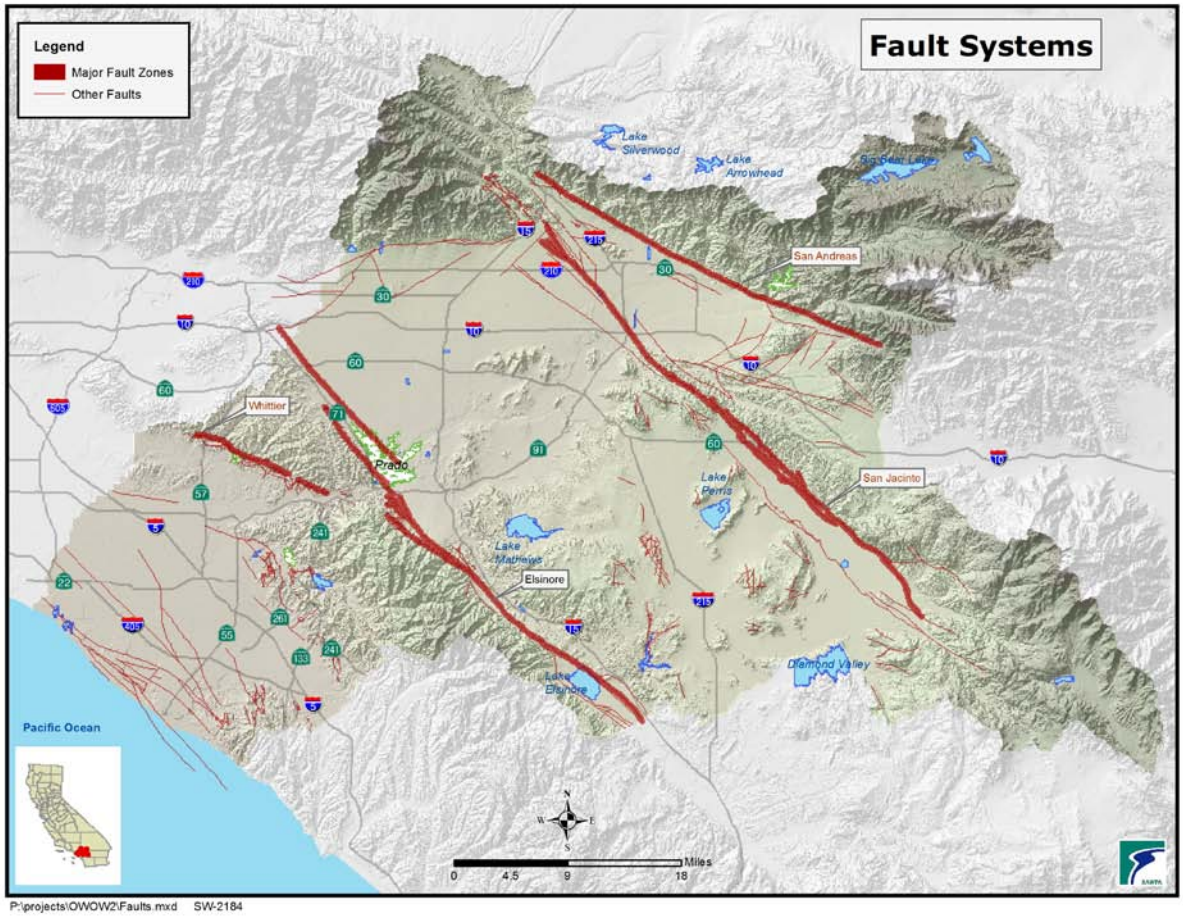
**Figure 5.4-11 Projected Supply (by source) versus Projected Demand during a Multi-Year Drought**

## Evaluate a Short-term 50% Reduction in Imported Water Supplies

One of the scenarios water agencies must evaluate as part of their UWMP is a 50% reduction in supplies. To maintain consistency with this requirement, it was decided to evaluate a 50% reduction in imported water supplies for the watershed. However, both a single year drought and multi-year drought result in greater reductions in imported water supplies than 50%. Since both the single-year drought and multi-year drought scenarios reduce imported water supplies more than 50%, this scenario is less conservative and, therefore, did not warrant detailed evaluation.

## Evaluate a Catastrophic Interruption in Water Supplies

The water system that serves both local and imported water to the watershed is made up of a variety of facilities including pipes, canals, and levees that are all susceptible to damage or failure from a catastrophic event. The catastrophic events that were evaluated as part of the OWOW process are earthquake, Delta levee failure, power failure, wildfire, and terrorism. While catastrophic events may not be avoided entirely, measures can be developed and set in place to minimize the interruption to water service following a catastrophic event. These measures include: assessing the vulnerability of systems, quantifying available resources, determining optimal use of resources, increasing the flexibility of distribution systems, increasing regional coordination and establishing repair priorities.



### *Evaluate the Effect of an Earthquake on Water Supplies*

The watershed is located within a seismically active region of Southern California. As shown on **Figure 5.4-13**, six active major earthquake faults and a number of smaller faults extend through the Watershed. As shown on **Table 5.4-6**, a seismic event along one of the major active faults within the Watershed could result in an earthquake in the range of magnitude 6.0 to 8.0 on the Richter Scale.

**Table 5.4-6 Estimated Maximum Richter Magnitude for Various Faults in the Watershed**

| Fault | Maximum Magnitude |
|---|---|
| San Andreas | 8.0 |
| San Jacinto | 7.5 |
| Elsinore | 6.8 |
| Chino | 6.5 |
| Whittier | 6.8 |
| Peralta Hills | 6.6 |
| Puente Hills | 7.5 |
| Newport/Inglewood | 6.9 |

**Figure 5.4-12 Major Earthquake Faults in the Watershed**

Depending on the intensity of the earthquake and location of the epicenter, catastrophic damage and interruptions of water service could occur throughout the watershed. Regional water conveyance systems, including the CRA; the Upper, Lower and Coastal Feeder Systems; as well as the East Branch of the California Aqueduct (also known as Foothill Pipeline) could sustain significant damage from a major earthquake that would interrupt the delivery of imported water supplies to the watershed. It also would make it difficult to transport water regionally within the watershed. Additionally, damage could occur to local water transmission systems operated by retail water agencies within the watershed, such as the Gage Transmission Main, Waterman Transmission Main, and the Riverside Canal. In addition to the potential damage to transmission facilities, damage also could occur to groundwater pumping facilities, water storage facilities, and water treatment plants as a result of seismic shaking impacts and/or from liquefaction impacts in areas that have high groundwater tables.

Based upon past seismic events, it is assumed that the impacts of a seismic event will be short-term. Due to the uncertainty tied to seismic events (magnitude, epicenter, etc.), it is not possible to determine the exact impact of a seismic event on water supply. However, the watershed can implement strategies that will better prepare the watershed for such an event. These strategies are provided in the *Management Strategies to Improve Water Supply Reliability* section.

*Evaluate a Delta Levee Failure on Water Supplies*

The Sacramento-San Joaquin Delta is a region where two of California's largest rivers, the Sacramento River and the San Joaquin River meet. It is the hub of the State's water supply system. About two-thirds of all California residents and millions of acres of irrigated farmland rely on the Delta for water from the SWP and the Federal Central Valley Project. The structural integrity of the delta levee system is vital to maintain water supplies to southern California. However, the Delta levee system is aging and a considerable amount of the land along the Delta levee system has subsided below sea level. The earthen levees are subject to risk from earthquakes, flooding and salt water intrusion. Catastrophic damage sustained by the levees would result in interruptions to SWP supplies to the Watershed due mostly to saltwater intrusion. The New Orleans levee failures resulting from Hurricane Katrina on August 29, 2005 particularly prompted awareness of the severe consequences and export outages that would occur with catastrophic multi-island levee failures resulting from a severe earthquake in the Sacramento-San Joaquin Delta region.

A severe earthquake in the Delta region of a frequency similar to a Hurricane Katrina would result in multiple levee breaches and slumping causing multi-island failures. There would be extensive levee slumping and overtopping resulting from liquefaction of levee foundations, severely hampering levee restoration efforts. This failure scenario would allow excessive salinity to enter the central and south Delta increasing salinity at the export pumps significantly beyond levels for municipal and agricultural uses. The difficulty in restoring water quality at the pumps is driven by the inability to displace saline water out of that region.

For example, a June 2005 report by Jack Benjamin and Associates in association with Resource Management Associates and Economic Insights (Preliminary Seismic Risk Analysis Associated with Levee Failures in the Sacramento – San Joaquin Delta June 2005) indicates a 6.5 earthquake in the western Delta would generate a 21-island failure and a 28-month duration water supply disruption in the Delta to restore levees in their current state. There is a 66% probability that a 6.5 magnitude earthquake will occur in the Delta region by 2032 or within the next 20 years (United States Geological Survey Delta Seismic Risk Report 2005). Further, one or more dry years immediately before or within the disruption period would substantially increase economic impacts and may lengthen the disruption period due to less availability of fresh waters within the Delta.

Determining the length of time water supplies will be shut down by severe earthquakes is influenced by a combination of complicated hydrodynamic, emergency response, water operations, and water treatment and geotechnical factors. In 2005, DWR released a study that estimated Delta levee failure resulting from a 6.5 magnitude earthquake would eliminate deliveries on the SWP for 28 months[4]. Assuming a 28 month repair period, the effects of this catastrophic interruption would be very similar to a multi-year drought. Thus, the strategies that are implemented to offset the effects of a multi-year

[4] Jack R. Benjamin & Associates, Inc. in association withResource Management Associates and Economic Insights, Preliminary Seismic Risk Analysis Associated with Levee Failures in the Sacramento – San Joaquin Delta, June 2005, Page 18.

drought also would be helpful to offset this event. Should the levee failure(s) occur after a drought period when stored water supplies are severely depleted, other emergency strategies would need to be implemented, such as extreme conservation and mandatory rationing.

In 2011, an independent analysis of impacts to levees along the Middle River emergency freshwater pathway have been performed by URS under contract to MWDSC considering all seismic hazards relevant to the central Delta pathway region (Estimated Levee Displacement Pathway Alignment, Sacramento - San Joaquin Delta, California July 2011). The analyses indicates that levee slumping in excess of ten feet can occur from an earthquake with a frequency of a hurricane Katrina resulting from liquefaction of loose sand levee foundations, placing the levees below high tide elevation and severely hampering restoration efforts. More recent RMA analyses supporting the preparation of the 2012 DWR Delta Flood Emergency Preparedness, Response and Recovery plan studies suggest that, depending on hydrologic conditions, several years would be required for a catastrophic multi-island levee failure to restore salinity concentrations necessary for municipal water quality needs at the export pumps. RMA analyses contained in the February 2007 Moffat & Nichol report (Delta Emergency Preparedness, A Feasibility Plan for Protecting the State's Water Supplies during a Catastrophic Collapse of Multiple Delta Islands) indicate that reservoir releases alone could not restore water quality at the export pumps adequate for municipal use.

The MWDSC Board has sought a comprehensive emergency preparedness and response strategy to safeguard water exports from the Delta. On April 10, 2007 the Board approved a strategy to respond to a plausible multiple-island failure scenario by restoring an emergency freshwater pathway through the Delta generally along Middle River to water export facilities in the south Delta in approximately 6-months. This strategy has been accepted by DWR in their preparation of a Delta Flood Emergency Preparedness and Response Plan (EPRRP) due for publishing in 2012 in coordination with the U.S. Army Corps of Engineers. This Plan covers a wide range of emergency response strategies ranging from isolated levee failures, up to and including catastrophic multiple-island failures causing severe water export disruptions. MWDSC has also promoted levee improvements on pathway levees to reduce levee slumping and breaches, as well as advance placement of redundant materials stockpiles such as rock and sheet pile for the reliable closure of breaches to ensure freshwater pathway restoration. Both pathway levee improvements and preparedness stockpiles have been initiated and will continue to completion in the next several years.

### *Evaluate a Power Failure on Water Supplies*

Power failure can occur as isolated incidents or as part of larger event such as a regional power grid failure caused by a catastrophic event. During a large-scale power failure, water conveyance systems, water treatments plants, and ground water pumping wells could cease to operate.

Most power officials believe that under a scenario when only a portion of the regional power grid fails, the loss of power should not extend beyond 24 hours. However, under a scenario where all three grids of the North American Grid fail, the loss of power could extend for days. Depending on how much of the grid is lost and the length of time it takes to repair, the loss of power could have a profound impact on water delivery.

Power failure likely would have a short-term impact on water supply reliability. Due to the uncertainty of this scenario, it is not possible to determine the exact impact. However, the same strategies that will help to prepare for an earthquake will help prepare for such an event. These strategies are provided in the *Management Strategies to Improve Water Supply Reliability* section.

### *Evaluate Wildfire on Water Supplies*

Wildfire can damage water delivery facilities or the power infrastructure used by water facilities. In addition, the loss of vegetation resulting from a wildfire can change runoff patterns, increase sediment, and reduce water storage. There also are potential water quality concerns associated with ash falling into surface reservoirs, which could overwhelm filtration plants as turbidities increase by orders of magnitude.

The effects of wildfire likely will have a short-term impact on water supply. Possible effects are loss of vegetation, change in runoff patterns, increased sedimentation, reduced natural water storage, and ash falling into surface reservoirs. Due to the uncertainty of this scenario, it is not possible to determine the exact impacts. However, the same strategies that will help to prepare for an earthquake will help prepare for such an event. These strategies are provided in the *Management Strategies to Improve Water Supply Reliability* section.

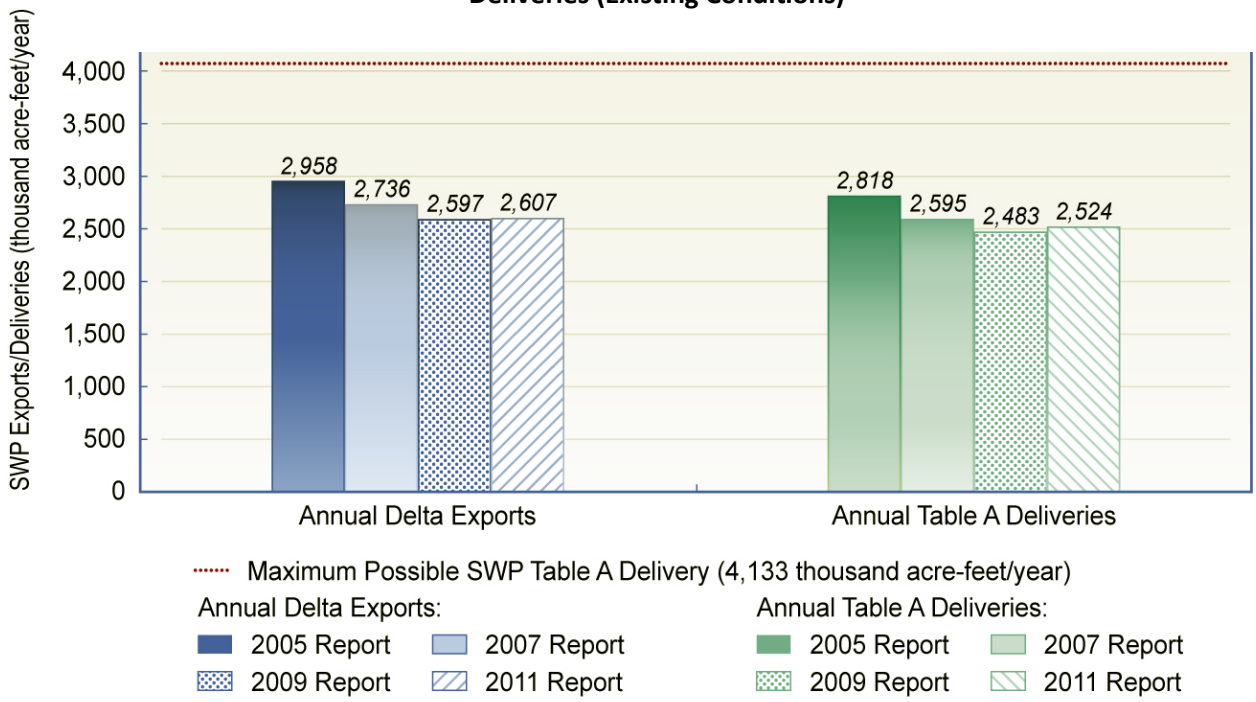
### *Evaluate the Effects of Terrorism on Water Supplies*

There is always a possibility that water infrastructure could be targeted by terrorists. Water agencies have responded to this potential threat by reducing public access to water infrastructure or even the information about infrastructure. They have also responded by increasing security measures at their facilities.

The effects of a terrorist attack likely will cause short-term reduction in water supply reliability. Due to the uncertainty of this scenario, it is not possible to determine the exact impacts. However, the same strategies that will help to prepare for an earthquake will help prepare for such an event. These strategies are provided in Management *Strategies to Improve Water Supply Reliability.*

### *Evaluate Delta Flow Restrictions on Water Supplies*

On December 14, 2007, U.S. District Judge Oliver Wanger issued an Interim Remedial Order to protect the threatened Delta smelt, which restricted water exports from the Delta to agricultural and urban customers of the SWP and CVP. In December 2008, the U.S. Fish and Wildlife Service issued a biological opinion covering Project effects on Delta smelt. In June 2009, the National Marine Fisheries Service issued a biological opinion covering Project effects on winter-run and spring-run Chinook salmon, steelhead, green sturgeon, and killer whales. The biological opinions replaced opinions issued earlier by the federal agencies.



The 2008 and 2009 biological opinions were issued shortly before and shortly after the Governor proclaimed a statewide water shortage state of emergency in February 2009, amid the threat of a third

consecutive dry year. Both opinions have been subject to considerable litigation. Recent Court decisions and settlements have changed specific operational rules in 2011-12, and both opinions have been remanded to the agencies for further review and analysis.

The impacts of the above decisions were analyzed by DWR in The State Water Project Delivery Reliability Report 2009 which was used in the 2010 UWMPs.

DWR has also released a draft update titled "The State Water Project DRAFT Delivery Reliability Report 2011". As shown in the **Figure 5.4-14**, estimated average annual Delta exports and SWP Table A water deliveries have generally decreased since 2005 but are slightly up as compared with 2009. Under existing conditions, average annual Delta exports have decreased since 2005 from 2,960 thousand acre-feet per year (taf/year) to 2,610 taf/year in 2011, a decrease of 350 taf or 12%. Similarly, average annual Table A deliveries have decreased since 2005 from 2,820 taf/year to 2,520 taf/year in 2011, a decrease of 300 taf or 10%.

**Figure 5.4-13 Trends in Estimated Average Annual Delta Exports and SWP Table A Water Deliveries (Existing Conditions)**

A number of water agencies, federal and state resources agencies and non-governmental organizations are currently engaged in the development of a Bay Delta Conservation Plan (BDCP). An explanation of the BDCP is provided later in this chapter.

### *Evaluate Climate Change on Water Supplies*

Temperature data suggest that California's climate is getting warmer. This phenomenon is being referred to as "climate change". Climate change could have an impact on water supply reliability. In a recent report, the U.S. Bureau of Reclamation provides potential impacts including reduction in snow pack, changes in the timing and amount of runoff, changes in the frequency and magnitude of extreme storm events, increased watershed vegetation demands due to higher evapotranspiration rates, changes in future agriculture and urban water demands, changes in sea level rise, and increased potential for salt water intrusion to the Sacramento-San Joaquin Delta and groundwater basins near the coast.

From a water management perspective, the strategies that increase reliability without climate change will also increase reliability with climate change. As a result, there are no specific strategies targeting climate change. To plan for this and other unknowns, the Watershed has implemented a "reliability margin" of 10%. More discussion about climate change impacts are included in the Energy and Environmental Impact Response pillar chapter later in this OWOW 2.0 report.

### *Evaluate the Impact of Quagga and/or Zebra Mussels on Water Supplies*

Quagga mussels (*Dreissenabugensis*) were discovered in Lake Mead in January 2007 and rapidly spread throughout the lower Colorado River and Metropolitan's CRA system. Quagga mussels are indigenous to the Ukraine and are a related species to the better-known zebra mussels (*Dreissenapolymorpha*). Similar to the zebra mussel, which was most likely introduced to the Great Lakes in the late 1980s via ship ballast water, Quagga mussels were introduced to Lake Mead most probably through the translocation of boats. Although the introduction of these two species into drinking water supplies does not typically result in violation of drinking water standards, invasive mussel infestations can adversely impact aquatic environments. Two areas of relevance for aquatic environments used as sources of drinking water are the potential for clogging of intakes and raw water conveyance systems via attachment of high numbers of mussels to surfaces and a long-term potential for rendering lakes more susceptible to deleterious algae blooms. Control of mussel infestations can cost water conveyance systems millions of dollars annually in facility improvements and/or maintenance. Quagga mussels have infested water conveyance systems linked to the lower Colorado River. There is concern that Quagga mussels could become more widespread and infest the State Water Project System and other watersheds by boats and watercraft vehicles. Preventive measures implemented include boat inspections prior to entering un-infested water bodies and decontamination (clean, drain and dry) of vessels departed infested water bodies.

### *Evaluate the Effects of Santa Ana River Channel Armoring and Sediment Transport*

The Santa Ana River is a productive recharge "facility" that helps replenish the Watershed's groundwater basins. The transport and deposition of sediment along the Santa Ana River is critical to maintaining existing groundwater recharge capacity. A sandy river bottom allows surface water to percolate easily into the groundwater basin and maximizes recharge rates. If this process is interrupted, the amount of recharge can be reduced.

The transport and disposition of sand within the Santa Ana River is interrupted when it is trapped by both the Seven Oaks Dam and Prado Dam. Seven Oaks Dam traps sediment at the base of the San Bernardino Mountains while Prado Dam traps sediment just upstream of Orange County. This entrapment of the sand causes negative impacts on the recharge capacity of the riverbed.

In addition, as the sand washes away and no longer is being replaced by sand from upstream, the river bottom gradually transitions from a "soft" bottom to a coarser bottom that includes heavier material such as gravel and cobbles. The gravel and cobbles eventually interlock with fine sediments and form an "armored" layer. This process is referred to as "channel armoring," which can reduce the recharge rate of the river. A Groundwater Recharge Study prepared by OCWD estimates that the armoring of the Santa Ana River has resulted in a loss of percolation of about 1% per year. With a long-term degradation of recharge rates, longer stretches of the river would be needed to recharge the same amount of water that is recharged today or some other kind of mitigation would be required.

Additionally, sediment loading behind the two dams can reduce surface water storage volumes. The continued build up of sediment behind the dams will reduce the overall storage capacity of the dams, which will, in turn, reduce the amount of storm flow that can be temporarily stored and released for groundwater recharge.

Channel armoring could reduce recharge rates along the Santa Ana River. Sediment transport could reduce storage volumes behind Prado Dam and Seven Oaks Dam thereby reducing the amount of stormwater that can be captured and used.

### *Evaluate the Effects of Water Quality Degradation on Water Supplies*

Water supply reliability in the Watershed can be improved by reinstating local water resources that have been avoided due to poor water quality. For example, some groundwater basins in the Watershed have been impacted by high concentrations of salts. In the past, rather than pump and treat this poorer quality water, many groundwater producers chose to replace it with another source(s) of water that did not require treatment. This same approach also has been used in groundwater basins that were polluted by volatile, organic compounds and other contaminants. If, instead, these local resources were to be treated and used, they effectively would become "new" sources of water within the watershed which would act to increase water supply reliability. Water supply reliability can be increased if water resources that were avoided in the past due to poorer water quality are, instead, treated and utilized.

### *Summary of Evaluation Results*

The water supply reliability scenarios that were evaluated as part of this analysis can be divided into two general categories, short-term impacts and long-term impacts. **Table 5.4-4** summarizes the two general categories. Those in the short-term category are difficult to quantify. Those in the long-term category are more easily quantified with the exception of climate change, sediment transport and channel armoring which are still under investigation. However, all of the recommended water management strategies to help the watershed overcome the long-term impacts will also help the watershed endure the short-term impacts.

Based on the data from 2010 UWMPs, the watershed is able to meet its demands in the average, single-year drought and multi-year drought scenarios while maintaining a reliability margin of 10%, or greater, to help offset future unknowns. These results assume that:

8. Planned infrastructure will be constructed
9. Demand projections are correct
10. It will rain locally the same in the future as it did in the past
11. The watershed will continue to manage imported supplies by storing water in wet years for later use during droughts

Given the uncertainty in these assumptions, it is recommended that the watershed continue to invest in planned infrastructure projects and that it implement a broad range of management strategies to diversify supplies thereby enhancing water supply reliability.

## Water Management Strategies and Watershed-wide Project/Program Concepts to Improve Water Supply Reliability

To increase reliability, the following water management strategies are recommended:

**Reduce Demand**
**Stormwater Capture**
**Optimize Imported Water**
**Recycle Water**
**Increase storage**
**Implement emergency measures**

Each of these strategies enhances reliability to offset unknowns.

Water agencies throughout the watershed are implementing one, or more, of these strategies for their individual service areas. The goal of OWOW 2.0 was to develop watershed-wide project/program concepts, based on these strategies, which would increase water supply reliability throughout the watershed while reducing costs. The following sections discuss a number of watershed-wide project/program concepts organized by water management strategy. Some of the concepts build on OWOW 1.0 and some are new for OWOW 2.0. The concepts marked with a ☑ are recommended for focus over the next five years.

### Reduce Demand

One of the ways the watershed can increase water supply reliability is to reduce demand, wherever possible, by using water more efficiently. The following concepts are recommended for the watershed:

☑*Water Rate structures that encourage conservation*

*Estimated benefit: Help achieve a 20% demand reduction by 2020.*

Water rates that increase as consumption increases have been shown to reduce consumption. While many of the retail water agencies have this type of rate structure in place, there are still agencies in the watershed that do not have this type of rate structure.

☑*Public education to encourage water conservation*

*Estimated benefit: Help achieve a 20% demand reduction by 2020.*

Educating the public on the State and watershed's water supply system is a crucial component to implementing permanent change in water use habits. If the public understands the water supply situation, they will understand the need to raise rates, change water use habits permanently and continue investing in the Watershed's water supplies.

*Outdoor conservation*

*Estimated benefit: Help achieve a 20% demand reduction by 2020.*

The upper and middle watershed uses 60 – 70% of its water outdoors. A significant number of outdoor water use efficiency programs are already in place. The watershed has made considerable progress in this area through the Inland Empire Garden Friendly, and other, programs. More details about this and other suggested water conservations measures are discussed in the Water Use Efficiency Pillar chapter later in the OWOW 2.0 Plan.

*Reduce evapotranspiration*

*Estimated benefit: More investigation required*

One of the only measurable "losses" in the Watershed is evapotranspiration. Evapotranspiration is the combined water loss associated with evaporation and transpiration. Evaporation is the movement of water to the air from the land surface and water bodies. Transpiration is the movement of water into plants and the subsequent loss of water as vapor through its leaves. The losses associated with evaporation might be reduced by developing and implementing specific programs to increase the amount of shaded area such as planting trees or constructing shade structures. However, more analysis is required to estimate savings and determine whether the increased water use by any new shade trees would offset any potential decrease in evaporation associated with their shade. This strategy would be most appropriate in the areas of the watershed with the highest evaporation rates, namely the upper and middle Watershed.

## Optimize Imported Water

The Watershed is dependent upon imported water to meet approximately one-third of its needs into the future. However, the reliability of this source of water has proven to be less certain, at times, due to unforeseen circumstances such as the "Delta Smelt Decision" in 2007. This historic decision resulted in one of the single largest court-ordered SWP delivery reductions in state history to protect the endangered Sacramento/San Joaquin Delta smelt (fish). As a result of this and other problems in the

Delta, the SWP operates below its delivery capacity. However, the Watershed may be able to implement strategies that could help offset the various uncertainties, and possibly even increase the amount of imported water available to the watershed.

☑*Wet Year Imported Water Storage Program*

*Estimated benefit: Improved reliability and reduced cost by storing water locally.*

This concept was introduced in OWOW 1.0 as "Base Load Off of Imported Water" and involves storing imported water (primarily SWP water) in wet years for later use in dry years. This not only improves water supply reliability but could also reduce costs by dramatically reducing the amount of imported water that is purchased during dry years when the "market rate" is the highest. The watershed has made strong progress on this strategy. The largest State Water Contractor for the watershed, MWDSC, has had a wet year storage program for many years that stores water in surface reservoirs and groundwater basins including the Central Valley during wet years for later use in dry years. San Bernardino Valley Municipal Water District, the State Water Contractor serving the upper watershed, has stored over 100,000 acre-feet of imported water in the San Bernardino Basin Area since 2008.

The Pillar explored the possibility of improving this concept by changing the MWDSC storage location from the Central Valley to the watershed. The most likely and effective way to change the storage location would be for the MWDSC member agencies (4 of the 5 SAWPA agencies) in the watershed to purchase more imported water during wet years when they typically purchase less, if any, imported water due to its higher cost. The Pillar worked on a possible MWDSC payment structure that would lower member agencies costs during wet years but result in full compensation to MWDSC in the dry year when the water is used. MWDSC currently offers a similar groundwater storage program titled "Conjunctive Use Program (CUP)".

The proposed payment structure was compared to the existing CUP program. The evaluation assumed a 120,000 AF storage program (imported water and storage capacity of approximately 60,000 AFY and 40,000 AFY of groundwater pumping capacity) and was based on a 10 year cycle consisting of 2 wet years, 3 dry years and 5 normal years. **Table 5.4-7** below compares the MWDSC CUP program to the proposed Program (key differences are bolded).

**Table 5.4-7 Term Comparison between MWD's CUP Program and Proposed Program**

| Component | MWD CUP | Proposed Program |
|---|---|---|
| "Put" Capacity | 60,000 AFY | 60,000 AFY |
| "Take" Capacity | 40,000 AFY | 40,000 AFY |
| Program Storage Capacity | 120,000 AF | 120,000 AF |
| Storage/Extraction Capital Cost | None | Paid by member agency |

| | | |
|---|---|---|
| Annual Administration Costs | None | None |
| Program Term | 25 years | 25 years |
| Storage Losses | Varies by basin | Varies by basin |
| Total Payment at Time of "Put" | None | • MWDSC Variable Supply Cost<br>• MWDSC Variable Treatment Cost<br>• Watershed Incentive |
| Total Payment at Time of "Take" | • MWDSC Tier 1 (at time of extraction) | • MWDSC Tier 1 (at delivery) less "Put" Payment |

A preliminary economic analysis suggested that the revenue from the proposed program was comparable to the existing MWD CUP program. However, the proposed program would result in water being stored in the watershed which could increase participation and thereby increase the amount of water in storage within the watershed.

☑*Bay Delta Conservation Plan*

*Estimated benefit: Would restore the reliability of the SWP to 78% from 60% which equates to about 131,400 acre-feet per year for the watershed.*

The proposed BDCP offers a solution that would restore reliability to the SWP. Nearly all of the reduction of imported water deliveries through the SWP is due to environmental and other problems in the Delta. The proposed solution which will achieve the "coequal goals" of improving the health of the ecological system as a whole while also protecting SWP deliveries (SWP deliveries are less than 20% of the total flow through the Delta) is to transport SWP deliveries "around" or "under" the Delta in some sort of "Delta conveyance facility." Not only would this "Delta conveyance facility" increase the reliability of deliveries, but it would also improve SWP water quality in the form of lower Total Dissolved Solids (TDS). The decrease in TDS will reduce water recycling costs. The BDCP which is being prepared by a group of local water agencies, environmental and conservation organizations, state and federal agencies, and other interest groups includes such a facility. When complete, the BDCP will provide the basis for the issuance of endangered species permits for the operation of the state and federal water projects. Implementation of the plan will occur over a 50 year time frame.

*Imported Water Banking*

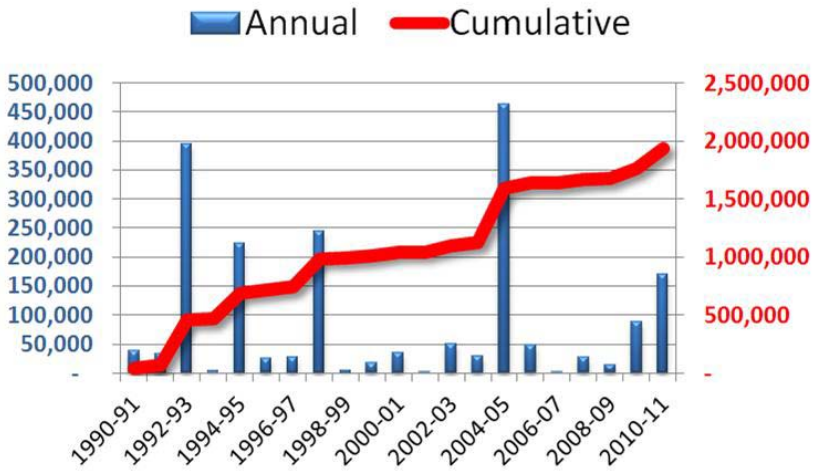
*Estimated benefit: Dry year supply.*

Although the watershed has significant groundwater storage, it is not easily accessible to the entire watershed. In some cases, it may be more efficient to participate in a groundwater storage opportunity

outside the watershed. These storage opportunities are often referred to as “water banks” and are located throughout the State.

The wholesale water agency that covers 80% of the watershed, MWDSC, already has significant water banking throughout the state. Since OWOW 1.0, the upper watershed has participated in a water bank in the central valley and in Big Bear Lake to help keep surface water treatment plants operational during drought periods. The watershed has made significant progress in this area.

*Prevent Invasive Species from Clogging Infrastructure*



*Estimated benefit: Consistent deliveries.*

Quagga Mussels and the closely related Zebra Mussels are small shellfish, usually less than half inch in size. Once only found in the Great Lakes, the Quagga Mussel has now been discovered in Lake Mead, the CRA, and a local reservoir in San Diego County. They will live and reproduce in pipes causing them to clog. Once they are established, they are very difficult to eradicate. Quagga Mussels can be controlled by super chlorination and drying out, sometimes requiring the temporary drawing down of water supplies. The additional maintenance costs associated with controlling these mussels could cost tens of millions of dollars a year. There is concern that Quagga Mussels could become more widespread and migrate into the watershed through untreated water pipelines or larvae carried on boats and other watercraft. The watershed should participate in any programs, such as the one initiated by MWDSC, which target the prevention of these species from entering water infrastructure.

## Stormwater Capture

Capturing stormwater runoff within the Watershed is challenging due to the “flashy” hydrology. The watershed tends to be either extremely wet or extremely dry. **Figure 5.4-15** shows how much stormwater has gone to the Pacific Ocean since 1990. As the figure shows, most of the un-captured flow came during “flood” years when it was nearly impossible to capture. However, even if these flood years are removed, there is still an opportunity to capture more stormwater throughout the watershed.

**Figure 5.4-15 Stormwater Flow Lost to the Ocean since 1990**

Because stormwater originates in the mountains, it can be diverted at high elevation enabling it to be delivered by gravity thereby saving energy costs. Diverting it higher in the watershed also provides the opportunity to use the water more than once before it reaches the ocean. In addition to the low energy cost, this water is also high quality, which helps the Watershed achieve both surface water and groundwater quality objectives established by State and Federal agencies. The watershed is currently working on the following projects that will use more local stormwater. More details on many of these projects, though briefly described below, are covered in greater detail **Chapter 5.8 Stormwater: Resource and Risk Management** later in the OWOW 2.0 Plan report.

☑*Enhanced Santa Ana River stormwater capture below Seven Oaks Dam*

*Estimated benefit: 12,000 acre-feet per year.*

The upper watershed has obtained a water right for the additional stormwater detained by Seven Oaks Dam and is presently designing facilities that will enable the diversion of up to 500 cfs and up to 80,000 acre-feet per year.

☑*Enhanced stormwater capture from the tributaries of the Santa Ana River*

*Estimated benefit: 28,000 acre-feet per year.*

The upper watershed has completed the conceptual design of improvements and operational changes that result in additional stormwater capture from the tributaries of the Santa Ana River.

☑*Riverside Basin Aquifer Storage and Recovery Project*

*Estimated benefit: 28,000 acre-feet per year.*

Riverside Public utilities, in partnership with Valley District and others are developing a design for a rubber dam that would cross the Santa Ana River and be used to divert flows into off-stream recharge basins.

☑*Enhanced Santa Ana River stormwater capture at Prado Dam*

*Estimated benefit: 10,000 acre-feet per year.*

The lower watershed is evaluating the feasibility of increasing the Prado flood season water storage elevation from 498 MSL to 505. After the Santa Ana River Mainstem flood control project is completed in approximately 2022, it may be possible to store water to higher elevations in Prado Dam for water conservation. A preliminary economic analysis of storing water to elevation 510 feet and 514 feet is summarized in **Table 5.4-8** below.

**Table 5.4-8 Preliminary Economic Analysis - Enhanced Stormwater Capture at Prado Dam**

| Category | Storage to 510 feet | Storage to 514 feet |
|---|---|---|
| Estimated capital cost[1] | $54M | $125M |
| Estimated annual operations and maintenance cost | $300,000 | $400,000 |
| Estimated water yield (acre-feet per year)[2] | 5,000 | 10,000 |
| Estimated cost per acre-feet[3] | $600 | $700 |

[1] Includes environmental mitigation

[2] Estimated water yield in comparison to year-round 505 ft storage

[3] Based on capital cost repayment over 30 years at 5% interest

☑*MS4 Credits*

*Estimated benefit: Increased reliability by utilizing more local stormwater.*

The Municipal Separate Storm Sewer Systems (MS4) permit process is intended, among other things, to increase the amount of stormwater captured and recharged in the watershed. These permits require the owner to construct their project in such a way to recharge stormwater on their site. However, in some cases, it may be more ideal from a water management perspective to recharge the stormwater somewhere upstream. One way to introduce flexibility into this process would be to allow owners to purchase "MS4 Credits" that could be applied to recharge projects in other locations. There may also be an opportunity to allow these credits to be used throughout the watershed. For example, a project in Orange County could purchase credits that could be used for a project in the upper watershed.

☑*Re-operate flood control facilities*

*Estimated benefit: More investigation required.*

Working with flood control agencies to re-operate flood control facilities with the goal of increasing stormwater capture increasing flood get away capacity and revising decades old storage curves. For example, when weather forecasts do not show any impending storms, the flood control agencies may be able to release stormwater at a slower rate. This relatively minor operational change would make stormwater flows easier to capture and put to use. It also would result in impounding the water longer, which would increase artificial recharge during the "holding period". This strategy has already been successfully implemented in some portions of the watershed.

☑*Size flood control facilities for stormwater capture*

*Estimated benefit: Increased reliability by utilizing more local stormwater.*

Another way to increase stormwater capture would be to work with flood control agencies to increase the size of existing, or new, detention basins. Larger detention basins would slow the flow and increase the recharge area, which would increase the amount of stormwater that is artificially recharged. In addition to this increased recharge, the larger basins also would provide greater flood protection. A related strategy would be to construct additional surface water reservoirs within the watershed. Unlike detention basins, which need to be drained every year before the flood season, surface water reservoirs provide the added flexibility of allowing the water to be stored until it is needed. In addition, surface water reservoirs also provide a storage location(s) for other sources of water such as imported water. Although effective, both of these strategies would be viable only in areas of the watershed that have vacant land.

☑*Forest First: Forest management for increased downstream stormwater capture*

*Estimated benefit: Increased reliability by utilizing more local stormwater.*

Another way to increase stormwater capture would be to work under the Forest First MOU with SAWPA to support collaborative projects among the U.S. Forest Service and downstream flood control and groundwater management agencies to support forest management including a) fuels reduction, b) chaparral restoration, c) meadows restoration, and 4) forest maintenance road runoff control. With collaboration between upstream and downstream parties, water flows from the forest may be spread more evenly over the hydrograph cycle allowing for slower and more even flows from the forest lands to the plains resulting in increased recharge. This will also result in less sediment transport particularly after forest burn events and water quality improvement downstream.

☑*Development Standards that enhance stormwater capture*

*Estimated benefit: Increased reliability by utilizing more local stormwater.*

Another strategy to increase stormwater capture would be to implement new development standards that promote the construction of infrastructure that increases the infiltration of stormwater such as porous concrete, infiltration galleries, and perforated pipelines. These facilities could be implemented in public areas such as parking lots, schoolyards, parks and greenbelts, as well as private areas, by establishing a requirement in local development codes.

## Recycle Water

Treating and reusing wastewater, referred to as "recycled water", provides the most reliable sources of water in the watershed. Wherever recycled water can be put to use, it effectively replaces a like amount of potable water. Over the years, the watershed has seen significant accomplishments in the development of recycled water. In fact, at present, nearly all of the recycled water from the upper and middle watershed is being discharged into the Santa Ana River and is being reused at various locations downstream. In the future, the upper and middle watershed plan to develop enhanced recycling programs that could change the place of use for much of this resource. Should enhanced recycling occur in the upper and middle watershed, it would reduce the amount of recycled water flowing to the lower watershed. This could be offset in the lower watershed by increasing water recycling, increasing conservation measures, desalting the ocean and/or purchasing more imported water. There may also be an opportunity for the upper, middle and lower watersheds to leave their treated wastewater in the river in exchange for the lower watershed providing a "replacement" source, of like quantity and reliability, to the upper and middle watershed. This concept was first introduced in OWOW 1.0 and has been further developed in OWOW 2.0 as "Recycled Water Exchange".

☑*Recycled Water Exchange*

*Estimated benefit: Although many details would need to be worked out, this type of concept could potentially save the watershed nearly $1/2 billion in capital costs and, perhaps even more, in energy costs not to mention the potential to reduce the amount of salt imported into the watershed.*

This concept was first introduced in OWOW 1.0 and could save the watershed nearly $1 billion in facilities and, perhaps even more, in energy costs. The upper watershed currently delivers nearly all of its treated wastewater effluent to the lower watershed via the Santa Ana River. The Lower Watershed uses the effluent to recharge its groundwater basin and reduce the need for imported water.

This concept would exchange treated wastewater from the upper watershed for a like amount of imported water delivered to the upper watershed. The following summarizes this concept:

- *Treated wastewater flows remain in the river for lower watershed*– The Upper Watershed would continue to deliver treated wastewater to the Lower Watershed via the Santa Ana River instead of developing recycled water programs (the concept seems most feasible in areas without mature recycled water programs).
- *Lower watershed provides imported water Upper Watershed* – The Lower Watershed would essentially change the place of delivery for some of the imported water they are already planning to

import to the Upper Watershed which would replace the treated wastewater flowing from the Upper Watershed.

- *Comparable reliability* – Recycled water is 100% reliable and imported water is about 60% reliable. This concept would mitigate the reduced in reliability to the upper watershed by storing imported water in the upper watershed, or some other water bank, during wet years for later use in dry years.

A preliminary evaluation of this concept identified the following benefits as compared to current plans:

- *Less salt* – under this Program, the lower watershed would provide imported water to the upper watershed. The only source of imported water available to the upper watershed is SWP which is higher quality than Colorado River and many of the existing groundwater basins in the Watershed. To the extent that SWP water delivered to the upper watershed replaces CR water delivered to the lower watershed and/or is stored in a basin of lower water quality, there could be a water quality improvement in the watershed.
- *1/3 Return on investment*– under this program, the lower watershed essentially changes the place of delivery for imported water from the lower watershed to the upper watershed. Since approximately 1/3 of every acre-foot delivered to the upper watershed ends up as treated wastewater and back in the river, the lower watershed essentially receives 1 - 1/3 acre-feet for every acre-foot delivered, a 33% return on investment!
- *Lower cost – less energy* – The energy required to produce recycled water and to pump it up to higher elevation where it can be used throughout a water system is substantial. This concept would eliminate these energy costs. Since the imported water delivered to the upper watershed from the lower watershed would have been imported anyway, there is no increase in energy associated with this component of the concept.
- *Dry Year Reliability* – Recycled water is 100% reliable which benefits the lower watershed. Although imported water is only about 60% reliable, it can be stored in wet years so that it is available in dry years to improve the reliability. Thus, both the Upper and the lower watershed end up with a reliable supply.

☑*Recycled Water for Potable Use*

*Estimated benefit: Improved reliability by increasing the amount of times water can be used*

Legislation will be required to allow recycled water to be used for potable use. The watershed should work together to promote such legislation.

☑*Recycle sewage effluent from Orange County Sanitation District Plants No. 1 and No. 2 that is currently flowing to the ocean*

*Estimated benefit: 157,000 acre-feet per year*

As presented in the Recycled Water section of this chapter, OCSD expects to "dispose" of effluent into the ocean each year from its Plant No. 1. This effluent could be treated and used for a variety of

purposes including the offset of any reduction in recycled water flows to the lower watershed due to recycling in the upper and middle watersheds.

As presented in the Recycled Water section of this chapter, by 2030 the Orange County Sanitation District expects to "dispose" of effluent into the ocean each year from its Plant No. 2. However, based on current Department of Public Health (DPH) requirements, this water cannot be recycled because it includes the effluent from the Inland Empire Brine Line which contains discharges from the String fellow Hazardous Waste Site, and other sources that would require further characterization by DPH. The Watershed should consider working with DPH on a strategy that would allow this effluent to be recycled.

*Importation of recycled water from outside the Watershed*

There may be opportunities to import recycled water from outside the Watershed. Any recycled water imported into the watershed would be viewed as a new supply.

*Recycled water use to offset potable demand*

This is widely implemented by several agencies and part of the projected water supply portfolio

## Desalt the Pacific Ocean

*Estimated benefit: 54,000 acre-feet per year*

The lower watershed borders the Pacific Ocean and while ocean desalination generally is considered technically and institutionally feasible, it is also expensive both in capital and operational costs and is subject to significant regulatory scrutiny depending upon the environmental impact of the specific project. It also requires significant base loaded energy that is costly. Over the last five years, a number of water agencies have been investing significant effort and funds in ocean desalination program development work. There are currently two sites along coastal Orange County that have completed extensive exploratory work and permit approvals to construct desalination facilities but to date neither completely permitted or successful in securing contracts for the supply.

The cost of this water is significantly more expensive than any other current source of supply. For this reason, the watershed should focus on the other strategies.

## Increase Storage

In general, the hydrology for the watershed can be characterized by a short series of wet years followed by a longer series of dry years. When the wet years come, they tend to be really wet, or "flood" type years. Thus, a fundamental water management challenge for the watershed is to capture the water during wet years, when it is plentiful, and store it for later use during dry years. The water may be stored in surface water reservoirs or the groundwater basins within the watershed.

☑*Surface Water Storage*

*Estimated benefit: Helps offset the effects of drought, climate change and emergencies*

As shown in **Table 5.4-1**, the watershed is fortunate to have a number of surface water reservoirs. However, additional surface storage space would allow the capture of additional stormwater and "unused" imported water. Not only do surface water reservoirs provide a location to store water when it is available, but they also enhance reliability during a disaster. Therefore, the Watershed should work toward increasing surface water storage both inside and outside the region. Due to the fast development within the watershed, the number of potential reservoir sites inside the watershed continues to diminish every year. Potential surface storage opportunities outside of the watershed would include any additional reservoirs constructed as part of the SWP and/or the CRA.

☑*Groundwater Storage*

*Estimated benefit: Helps offset the effects of drought and climate change*

In addition to additional surface water storage, the watershed also should pursue the utilization of any unused groundwater storage in the watershed. Like a surface water reservoir, these underground reservoirs provide a place to store wet year supplies for later use during extended drought periods.

Some groundwater basins in the middle and lower watershed have been abandoned or have not been fully utilized due to high salt content, contamination, color, odor or some other concern. Projects to pump and treat water in these basins, or portions thereof, provide restoration of groundwater storage that may not have been historically available for municipal use. In addition to recovering the storage space, it could also result in new yield.

## Emergency Measures Strategies

*Estimated benefit: Improved recovery time following a disaster*

Despite careful planning, there will still be catastrophic events and unforeseen circumstances. Although the timing and extent of such events or circumstances are unknown, the following strategies will help the watershed prepare for the unknown.

### *Local Emergency Plans*

Each of the water agencies within the Watershed must have an emergency plan that complies with both the Standardized Emergency Management System (SEMS) and the National Incident Management System (NIMS).

### *Mutual Aid and Coordination*

All of the water agencies should have mutual aid agreements in place. One mutual aid option used by many of the water agencies is to join the California Water/Wastewater Agency Response Network (Cal

WARN), www.calwarn.org. CalWARN provides a "standard" mutual aid agreement, and also maintains a database of personnel and equipment that could be made available during an emergency. It is recommended that each of the water agencies in the Watershed join CalWARN and "upload" their personnel and equipment data. In addition to participating in mutual aid agreements, the water agencies also may want to consider additional coordination with one another through a regional group. Two such groups already have been formed in the Watershed: Water Emergency Response Organization of Orange County (WEROC), and the Emergency Response Network of the Inland Empire (ERNIE). Water agencies should consider partnering with one of these groups or, perhaps, forming an additional group, if necessary.

### *System Interconnections*

Wherever possible, water agencies should pursue interconnections to increase redundancy and provide aid during an emergency situation.

### *Extraordinary Conservation*

"Extraordinary" conservation would be required following an extreme catastrophic event such as an earthquake. In these situations, the only way demands can be met is by asking the public to implement extraordinary conservation measures such as halting all outside irrigation, limiting the frequency of bathing, etc. In the upper Watershed, outside uses account for nearly 70% of water use. Thus, this type of extreme conservation could reduce demands in the upper watershed by the same amount.

### *Optimize Outside Funding Opportunities*

The watershed is encouraged to work together to maximize outside funding opportunities that provide the greatest overall benefit to the watershed.

# 5.5 Beneficial Use Assurance

This chapter presents a general overview of water quality issues in the Santa Ana River Watershed (SARW) and programs to improve water quality. The change in name from "Water Quality Improvement" from the One Water One Watershed (OWOW) 1.0 Plan to "Beneficial Use Protection" reflects a focus on striving to meet water quality objectives for all waterbodies in the SARW. Collaboration of stakeholders with the Santa Ana Regional Water Quality Control Board (Regional Board) is essential to achieve this goal. To expand outreach with Regional Board staff, the Chief of Regional Planning Programs served as the Co-Chair of the Beneficial Use Protection Pillar Group.

The three focus areas of this chapter, surface water, groundwater, and ocean water quality, are described from the top of the watershed downstream to the ocean. This discussion includes the significant impact of imported water supplies and stormwater runoff on water quality.

Surface water discharges to the ocean impact ocean water quality. Ocean water, defined as the zone from the beach to three miles offshore, and bays and estuaries near the coast, are included in this report, reflecting the comprehensive, integrated approach utilized in the development of the new Integrated Regional Water Management Plan (IRWMP).

This chapter also includes coastal watersheds such as Anaheim Bay-Huntington Harbor, Newport Bay, and Newport Coastal streams, as well as, Coyote Creek and Carbon Creek in the San Gabriel River Watershed in the northern part of the watershed. Although outside the Santa Ana River Watershed boundaries, these areas are within the jurisdiction of the Regional Board Region 8.

## Brief History of Santa Ana River Watershed

The Santa Ana River (SAR), its tributary streams, and the groundwater basins provided adequate water for early inhabitants of the watershed. By the late nineteenth century, the region had developed a successful agricultural economy. By the early twentieth century, expanding farms and orchards along with increased population began to outgrow available water supplies. The Colorado River Aqueduct (CRA) was the first facility to bring imported water into the region, followed by the State Water Project (SWP).

By the time of passage of the California Porter-Cologne Water Quality Act in 1969, population growth, agriculture, and industry already had created a legacy of water quality problems. Agricultural irrigation, fertilizer use, and dairy operations added nutrients and salts to groundwater supplies. Use of pesticides contributed to the contamination of soils and groundwater. In some areas, chemicals used in military facilities and industrial processes were improperly disposed of, resulting in the migration of hazardous substances into groundwater. Impacts from urbanization of the watershed included stormwater runoff from urban areas, non-storm nuisance flows from landscape irrigation, increased salt concentrations, and elevated levels of nutrients.

Local agencies, non-governmental organizations, and other stakeholders, working in conjunction with regulatory agencies, have made progress in restoring the quality of water in the watershed. Challenges still remain.

## Regulatory Framework

### Drinking Water Regulations

The California Safe Drinking Water Act (Health and Safety Code, Section 116270 et seq.) directs the California Department of Public Health (CDPH) Division of Drinking Water and Environmental Management to set standards for drinking water quality. Drinking water regulations are addressed in Title 17 and Title 22 of the California Code of Regulations. These include establishing the Maximum Contaminant Limits (MCLs) and treatment requirements for potable water and recycled water.

### Water Quality Control Plan, Santa Ana River Basin

The State Water Resources Control Board (State Board) and the Regional Board are responsible for implementing California's Porter-Cologne Water Quality Control Act and the Federal Clean Water Act. These State and Federal laws, and associated regulations and policies, provide the overall framework for managing water quality. Extensive voluntary efforts of stakeholders play an important role in protecting and improving water quality in the watershed.

The Water Quality Control Plan, Santa Ana River Basin (Basin Plan) guides the Regional Board's water quality control programs, water quality management decisions, and enforcement efforts. The Basin Plan establishes water quality standards, which include beneficial uses, water quality objectives (WQOs), and implementation plans to achieve the standards.

Beneficial uses as listed in the Basin Plan for waterbodies within the SARW include:

- Municipal and domestic supply
- Agricultural supply
- Industrial service supply
- Industrial process supply
- Groundwater recharge; navigation
- Hydropower generation
- Water contact recreation
- Non-contract water recreation
- Commercial and sport fishing
- Warm freshwater habitat
- Cold freshwater habitat
- Preservation of biological habitats of special significance
- Wildlife habitat
- Rare, threatened, or endangered species
- Spawning, reproduction and development
- Marine habitat
- Shellfish harvesting.

WQOs are set to establish reasonable protection of the beneficial uses. WQOs and beneficial uses are specified according to water body type: ocean waters, enclosed bays and estuaries, inland surface waters, and groundwater.

Since its last major revision in 1995, the Basin Plan has been amended eleven times. Amendments added Total Maximum Daily Loads (TMDLs) in 1998, 1999, and 2003through 2006; made provisions for and included time schedules in waste discharge requirements (2000); revised bacterial objectives in ocean waters (1997); and incorporated a revised Nitrogen/Total Dissolved Solids (N/TDS) management plan (2004). To implement the N/TDS plan, stakeholders and the Regional Board formed the Basin Monitoring Program Task Force (BMPTF). The Task Force is developing and implementing a monitoring program for nitrate and TDS in both groundwater and surface water in the watershed.

Basin Plan amendments are adopted through a public basin planning process. The process requires approval by the Regional Board, State Board, California Office of Administrative Law, and United States Environmental Protection Agency (EPA). The Regional Board establishes priorities for Basin Plan revisions approximately every three years; the latest of these triennial reviews was conducted in 2006. Clearly, the schedule for triennial reviews has slipped reflecting a lack of resources and staff at the Regional Board to be able to conduct these reviews as planned. Updating the 2006 triennial review would be the first step in an effort to determine water quality project preferences in the watershed and to integrate with other regional needs to define integrated management strategies that meet water quality and water supply goals.

The primary methods of enforcing water quality regulations are through the issuance of the (Federal) National Pollutant Discharge Elimination System (NPDES) Permits and State Waste Discharge Requirements.In California, both permit programs are administered by the State Board and the Regional Boards. These permits regulate discharges to surface waterbodies of both wastewater and urban runoff from municipal and industrial systems, and stormwater runoff from municipal separate storm sewer systems, industrial sources, and construction sites. Permit requirements are based on technology-based limits for wastewater and maximum extent practicable standard for stormwater intended to meet water quality standards.

Several monitoring programs in the watershed involve the collection of data on the water quality of surface waterbodies and groundwater basins. The BMPTF is responsible for collecting and analyzing data in order to calculate the ambient TDS and nitrate concentrations in the region's groundwater basins. The Regional Board requires a re-calculation of ambient concentration every three years. The Imported Water Recharge Workgroup is tasked with the responsibility of documenting the TDS and nitrate load to groundwater basins from the use of imported water for groundwater recharge. The Emerging Constituents Workgroup conducts a program to sample and analyze surface waterbodies in the watershed to test for a selected group of emerging constituents. The Middle SAR TMDL Task Force developed and is implementing a Comprehensive Bacteria Reduction Plan for Riverside and San Bernardino Counties, which includes sampling selected surface water sites to be analyzed for fecal bacteria indicators. The Stormwater Quality Standards Task Force conducted a comprehensive evaluation of surface waterbodies to assess conditions for and existing use of sites for water-contact recreation.

### *Total Maximum Daily Loads*

The Federal Clean Water Act Section 303(d) requires states to identify as impaired those waters that do not, or are not, expected to meet water quality standards. Impaired waterbodies are placed on the Clean Water Act Section 303(d) List of Water Quality Limited Segments, which initiates a process to develop TMDLs. A TMDL is considered to be adopted when approved by the Regional Board, the State Board, the California Office of Administrative Law, and the EPA.

A TMDL defines how much of a pollutant a water body can tolerate and still meet water quality standards. Each TMDL must account for all sources of the pollutant, including:

- discharges from wastewater treatment facilities
- non-point source pollutants in runoff from residential areas
- forested lands
- agriculture
- streets or highways, etc.
- soils/sediments polluted with legacy contaminants such as DDT and PCBs
- on-site disposal systems (septic systems); and deposits from the air

Projected growth that could increase pollutant levels may be considered. TMDLs allocate allowable pollutant loads for each source and identify management measures that, when implemented, will assure that water quality standards are attained.

### *California Toxics Rule*

The California Toxic Rule was promulgated by the EPA to set numeric water quality criteria for priority toxic pollutants and other provisions for water quality standards to be applied to California waters. The criteria apply to all inland surface waters and enclosed bays and estuaries regulated by the Clean Water Act.

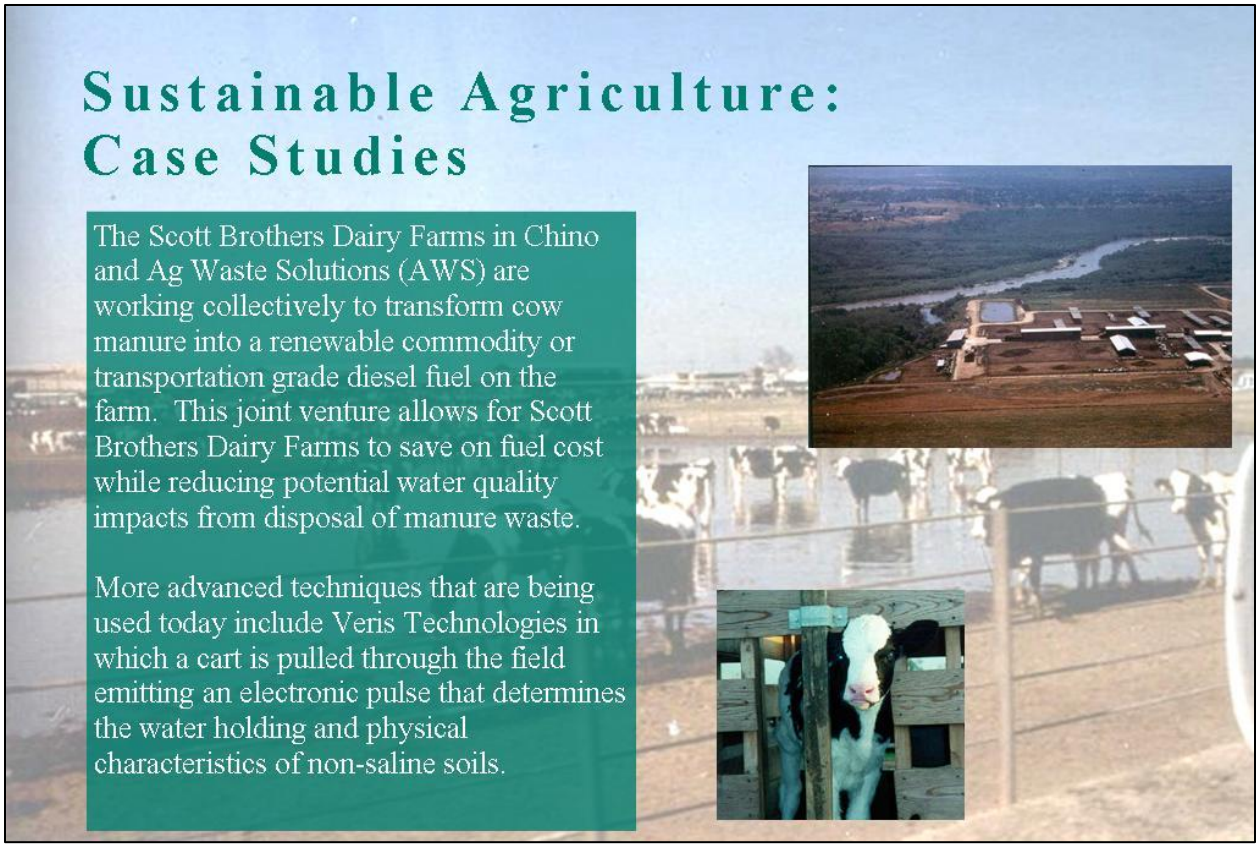
### *California Ocean Plan*

The California Ocean Plan is the state water quality control plan for ocean waters prepared by the State Board as required by the Clean Water Act. The plan is implemented by State Board and the coastal Regional Boards. It lists beneficial uses for marine waters, including protection of Areas of Special

Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, recreation, fishing, aesthetic enjoyment, and others. Narrative and numerical WQOs are set to protect designated beneficial uses. The objectives are implemented through a program that sets waste discharge limitations, monitoring, and enforcement. Through a triennial review process, the plan sets priorities for actions over the next three-year period.

### *Ocean Water-Contact Standards- AB 411*

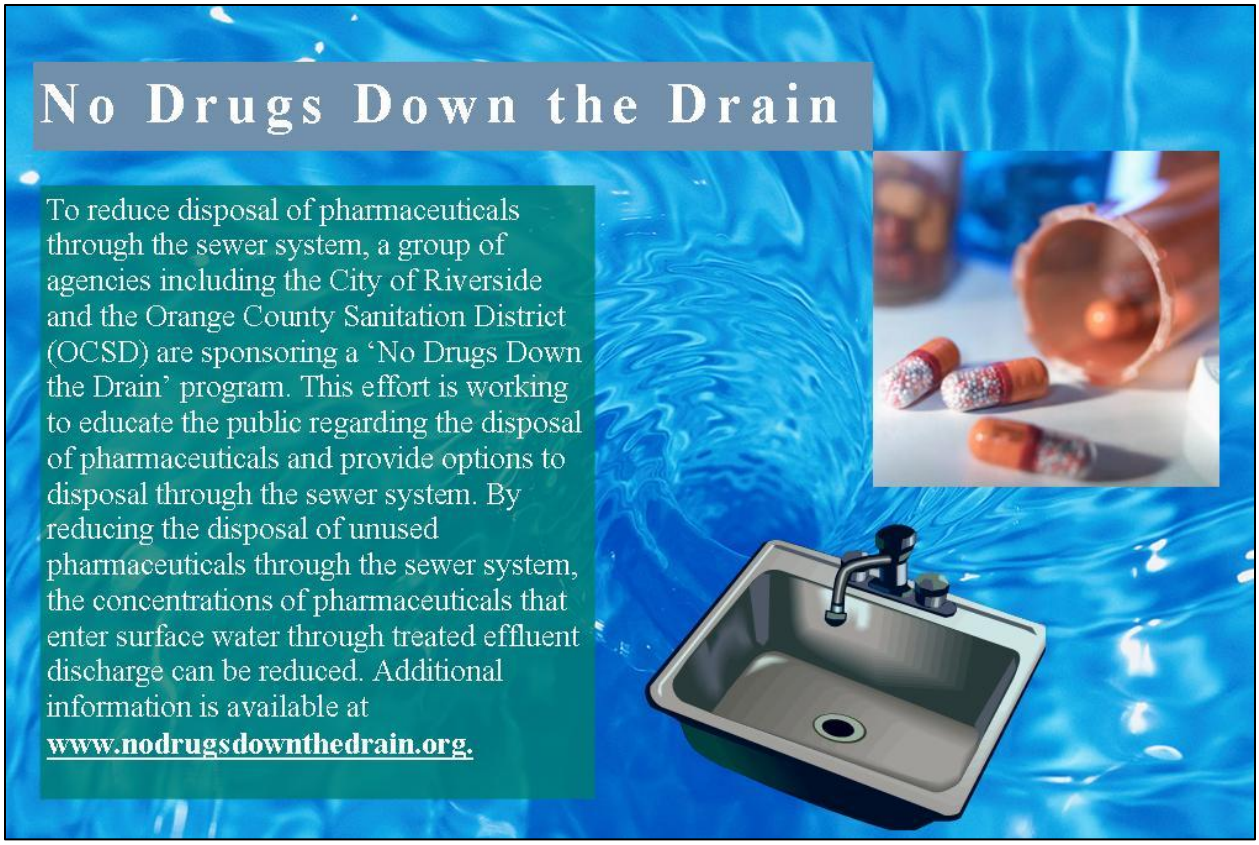
In 1996, AB 411 (Wayne) required the establishment of bacteriological ocean water quality standards to protect public health (CCR Sections 7956-7962). Contaminated runoff and untreated sewage spills are two of the most common factors that negatively impact ocean water quality. The AB 411 standards require that waters adjacent to ocean and bay public beaches be monitored for total coliforms, fecal coliforms, and enterococci bacteria. When any waters adjacent to a public beach fail to meet any of the standards, warnings are issued to the public. In the event that sewage is known or suspected, access to the affected waters is restricted.



### *Agriculture and Dairies: Water Quality Protection*

Regulatory agencies in the watershed have taken a number of regulatory actions to address water quality impacts related to agricultural and dairy practices in the region, including impacts to both surface water and groundwater due to runoff from manure in dairy farm corrals, spreading of manure for fertilizer in agricultural fields, and use of pesticides.

In 2007 the Regional Board issued R8-2007-0001 *(NPDES No. CAG018001): General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) within the Santa Ana Region (Santa Ana RWQCB, 2007)* prohibiting all dairies in the watershed from discharging process wastewater or stormwater runoff up to a 25-year, 24-hour rainfall event and requiring each facility to develop a Engineered Waste Management Plan. This permit was amended with adoption of R8-2013-0001, which directed dairies in the San Jacinto Watershed to collaborate with Eastern Municipal Water District's Salinity Management Program.

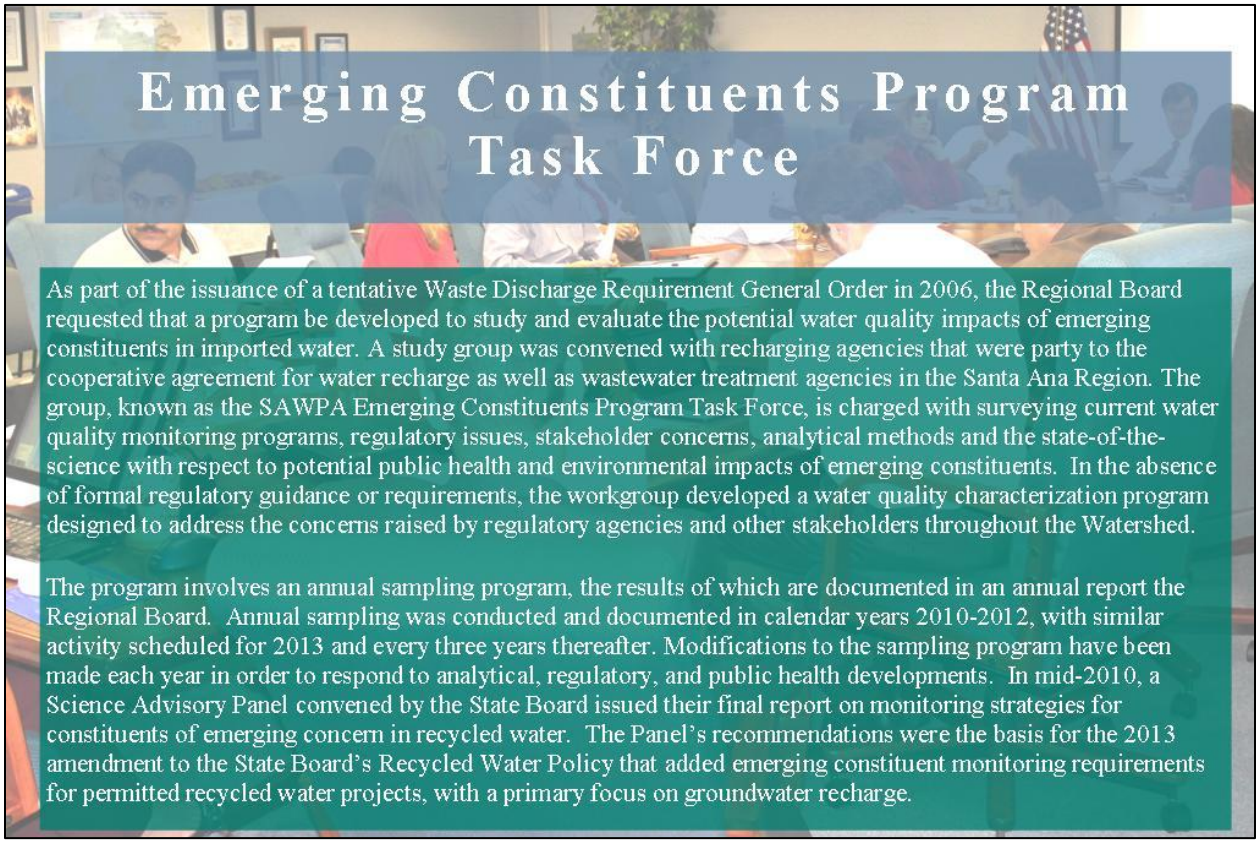


The Riverside County Ordinance 427.2, passed by the Riverside Board of Supervisors, regulates safe transportation and application of manure in certain county districts by requiring operators and/or landowners to report manure application. The purpose of the ordinance is to minimize impacts to neighboring properties, local waterways, underground water supplies, and soil resources.

The San Jacinto Basin Resource Conservation District and the Western Riverside County Agriculture Coalition developed a multi-phase process for establishing and running a Manure Manifest System (MMS) as part of the Integrated Regional Dairy Management Plan (IRDMP). The IRDMP addresses dairy issues of concern on a regional basis. The MMS addresses nutrient and salt loadings by specifying that manure be applied to land at rates consistent with cropping practices and groundwater conditions. The MMS will prohibit over-application at sites where potential impacts to groundwater basins are a concern. Excerpts of the MMS have been adopted by the RWQCB in the new manifest forms under the new 2013 permit.

### *Constituents of Emerging Concern*

The potential impact of trace levels of constituents of emerging concern in water supplies has become an increasing concern for water and wastewater agencies, regulators, and the public.



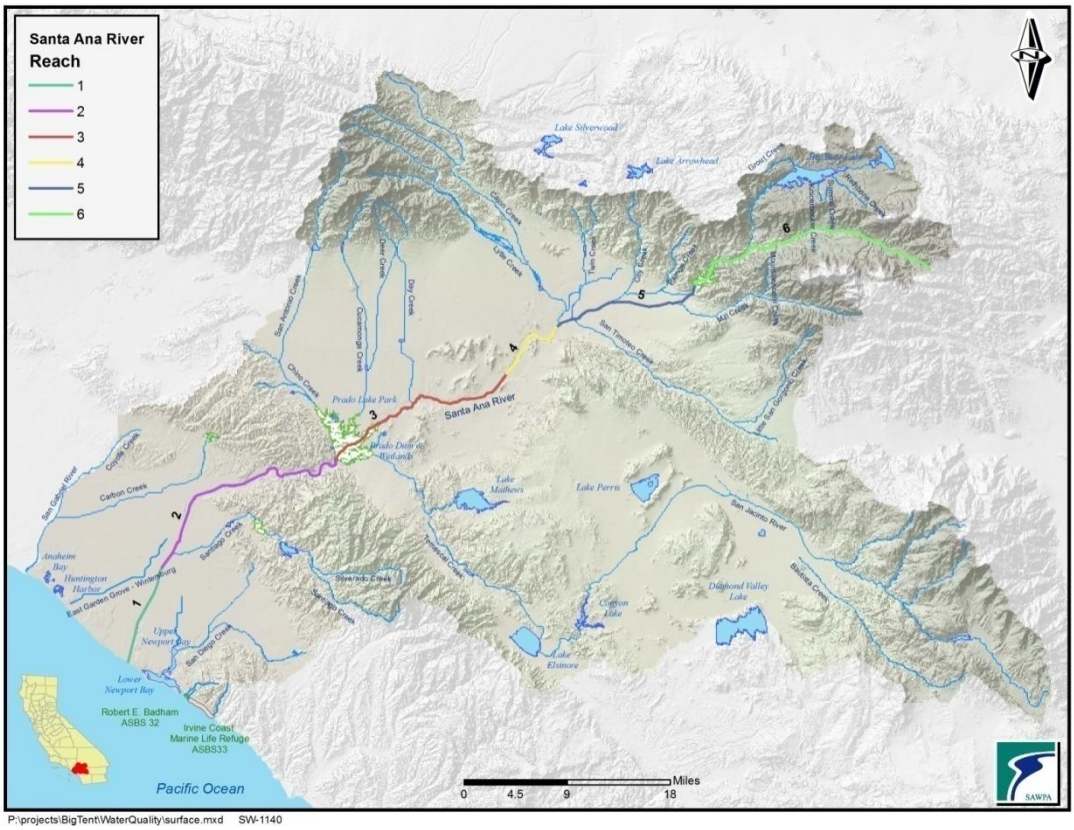
These constituents, also referred to as 'emerging constituents', include a wide range of chemical constituents, including pharmaceuticals, personal care products, pesticides, and other synthetic organic compounds. Potential constituents may include thousands of chemicals in consumer and health-related products such as drugs, food supplements, fragrances, sun-screen agents, deodorants, and insect repellants. Typically, these constituents of emerging concern are found at very low concentrations (*i.e.*, parts per trillion) in waterbodies. Some of these chemicals enter surface water through the discharge of treated effluent when the public disposes of unused pharmaceuticals through the sewer system or the pharmaceuticals that are consumed are not entirely broken down in the human body.

Constituents of emerging concern currently are not regulated by Federal or State agencies and very few have regulatory levels or California Notification Levels. In general, when detected, the chemicals occur at low concentrations in surface water. Although ecological impacts to fish and other wildlife have been shown for some of these trace contaminants in waterbodies, less is known about potential human health effects. However, some of these constituents are known or suspected to have endocrine disrupting effects, if present at a sufficiently high concentration. In addition, concerns are being raised about the potential reproductive and developmental effects of these compounds. There is a significant amount of research being done in the area of ecological and human health effects and new information continues to be developed on the significance of this issue.

A major driver in characterizing these constituents in water supplies is the use of newly developed analytical methods. As laboratory methods improve, new tests can detect substances at lower and lower concentrations. As many of these methods are not standard, they are considered research methods with

development still ongoing. As part of the methods development process, issues such as method detection limits and intra- and inter-laboratory comparisons are being evaluated.

Additional research is needed on the public health significance of low level concentrations of these constituents, especially when they occur as mixtures. Knowledge of the potential human health effects at low concentrations is limited for compounds other than pharmaceuticals, and data gaps exist in trying to establish levels of human health risk or regulatory limits. However, public concern is a significant issue and will need to be addressed before complete scientific-based health information is available.



## Surface Water

Surface water in this chapter includes rivers, streams, creeks, lakes, and bays and estuaries. These waters provide many benefits to the watershed, including water supply, habitat, and recreation.

### *Current Conditions*

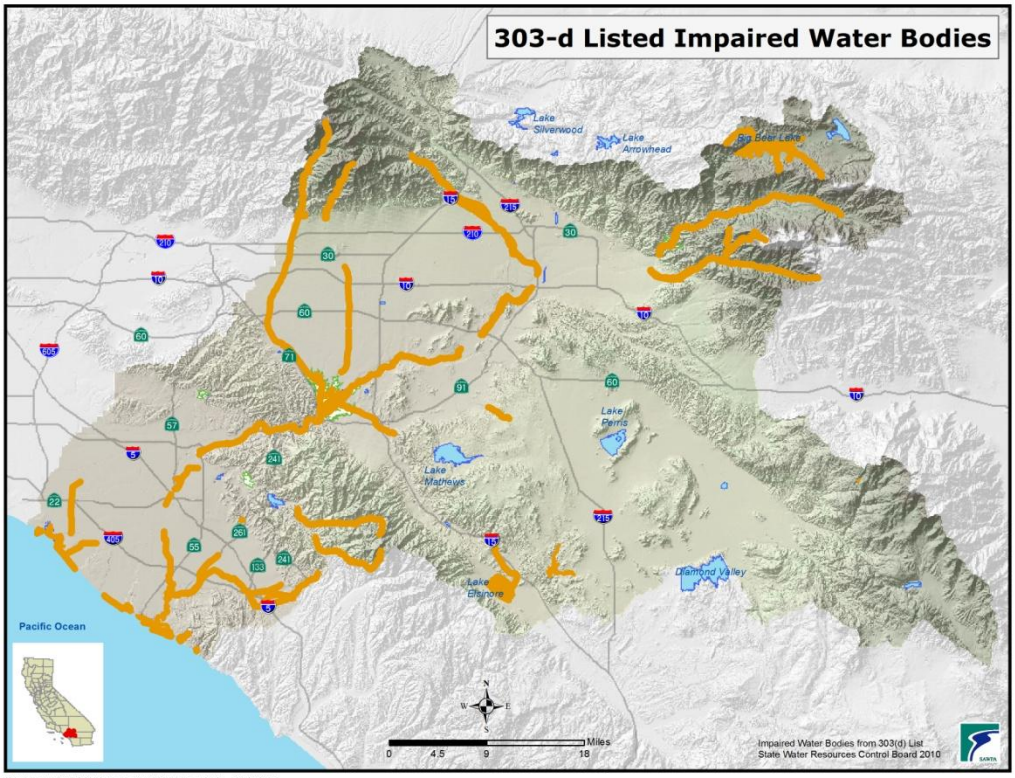
Water in less developed and non-agricultural areas of the watershed is typically the highest quality water in the watershed. Agricultural, industrial, commercial, and residential developments over the last, approximately, 150 years have degraded surface water quality. Pollutants include nutrients, sediment, pesticides and microbial contaminants, such as bacteria. Concentrations of soluble mineral substances commonly referred to as 'salinity' or 'TDS', also impact surface water quality. In developed areas and agricultural areas, stormwater carries pollutants from roads, parking lots, and other sources, degrading the quality of water as it flows downstream. The following sections describe surface water conditions in each reach of the Santa Ana River Watershed as defined by the Basin Plan and shown in **Figure 5.5-1**.

**Figure 5.5-1 Santa Ana River Watershed, Surface Waters**

Waterbodies that do not meet water quality standards are identified as impaired and are placed on the 303(d) List of Water Quality Limited Segments. A water body remains on the list until a TMDL is adopted and the water quality standards are attained or there are sufficient data to demonstrate that water quality standards have been met and delisting should take place.

**Figure 5.5-2** shows the locations of impaired waterbodies where the Regional Board has yet to begin the process of developing TMDLs. Surface waterbodies where TMDL projects are in the process of development, as shown on the Regional Board's TMDL project list, are shown in **Figure 5.5-3**.

**Figure 5.5-2 Santa Ana River Watershed, Impaired Waterbodies**



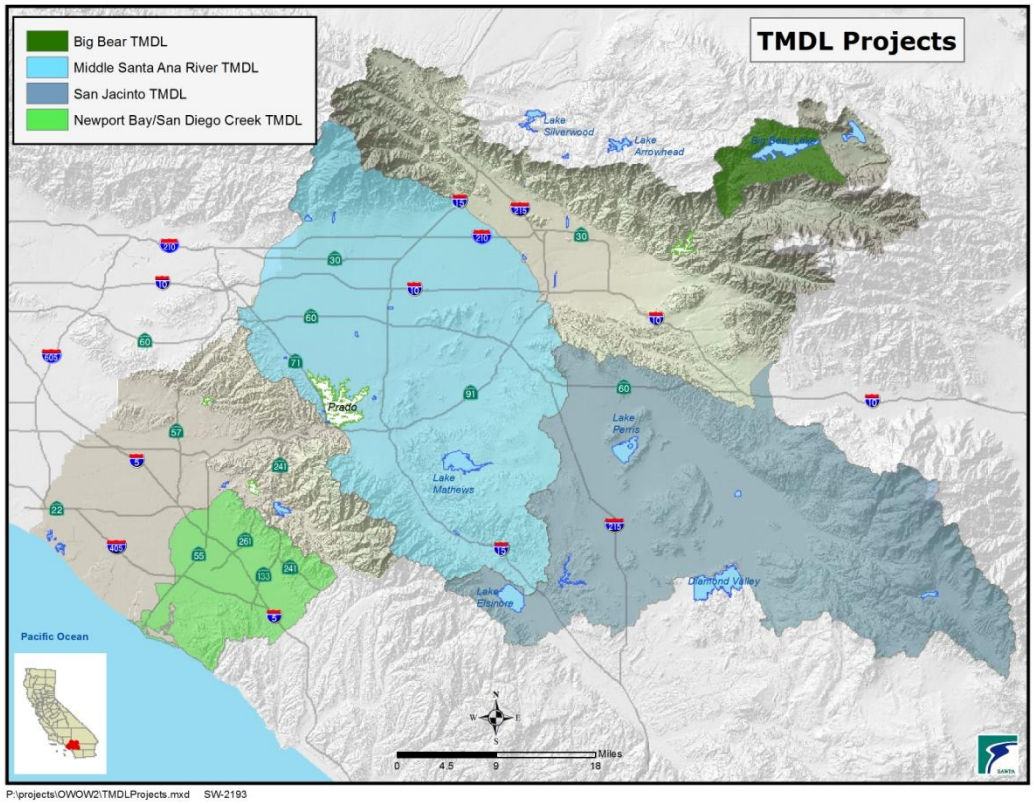


**Figure 5.5-3 Santa Ana River Watershed, TMDL Projects**

*SAR Reach 6*

Past and present land use practices have negatively impacted water quality in Big Bear Lake and the SAR, Reach 6. Impairments and current TMDL projects are shown in **Table5.5-1** and **Table5.5-2.**

**Table 5.5-1 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Big Bear Lake Watershed**

| Water Body | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Big Bear Lake | Mercury | Resource extraction | 2007 |
| | PCBs | Unknown | 2019 |
| | Noxious Aquatic Plants | Construction/Land Development and Unknown Nonpoint Source | 2007 |
| | Nutrients | Construction/Land Development and Snow Skiing Activities | 2007 |

**Table 5.5-2 TMDL Projects – Big Bear Lake Watershed**

| Water Body | Pollutant (s) | TMDL Project | Status |
|---|---|---|---|
| Big Bear Lake | Noxious aquatic plants<br>Nutrients | Nutrient TMDL for Dry Hydrological Conditions for Big Bear Lake | Implementation Phase |

Shay Creek, Shay Meadows, and Baldwin Lake are relatively undeveloped areas that contain natural resources highly valued by stakeholders. Shay Creek and Baldwin Lake have threatened and endangered plant species, as well as the endangered, unarmored three-spine stickleback fish and a unique wetlands system. The U.S. Fish and Wildlife Service, U.S. Forest Service, and the California Department of Fish and Wildlife are interested in restoring the quality of these waters.

Grout, Knickerbocker, Summit, and Rathbone (Rathbun) Creeks, tributaries to Big Bear Lake, are listed as impaired, as shown in **Table 5.5-3**.

**Table 5.5-3 TMDL Projects in the Big Bear Lake Watershed**

| Impaired Water Body | Pollutant (s) | TMDL Project | Status |
|---|---|---|---|
| Grout Creek | Nutrients | Nutrient TMDLs for Big Bear Lake Tributaries | Under development |
| Knickerbocker Creek | Pathogens | Knickerbocker Creek Bacterial Indicators | USEPA Action |
| Rathbone Creek | Nutrients | Nutrient TMDLs for Big Bear Lake Tributaries | Under development |
| | Sedimentation/ siltation | Sediment TMDLs for Big Bear Lake and Rathbone Creek | Other Action |
| | Cadmium | Cadmium TMDLs for Rathbone Creek | TMDL Required |
| | Copper | Copper TMDLs for Rathbone Creek | TMDL Required |
| Summit Creek | Nutrients | Nutrient TMDLs for Big Bear Lake Tributaries | TMDL Required |

Mountain Home Creek and mountain reaches of Mill Creek and Lytle Creek are impacted by high seasonal recreational use and/or flow through remote residential communities. Impairments are shown in **Table 5.5-4.** Although the potential sources on the official 2010 303(d) list for pathogens is "unknown nonpoint source", sources are likely from sewage spills, recreational activities, and residential development.

**Table 5.5-4 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs**

| Water Body | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Lytle Creek, Mountain Home Creek, Mountain Home Creek-East Fork, Mill Creek-Reaches 1 and 2 | Pathogens | Unknown nonpoint source | 2019 |
| Santa Ana River Reach 6 | Cadmium. Copper, Lead | Source Unknown | 2021 |
| San Antonio Creek | pH | Source Unknown | 2021 |

The water quality of Reach 6 (the SAR upstream of the Seven Oaks Dam) and Reach 5 (the Seven Oaks Dam to the San Jacinto Fault) and their tributaries is generally very good, with low to very low levels of TDS, indicator bacteria, or other pollutants. Impounding water behind the Seven Oaks Dam reduces water quality because of sediment entrapment and algae growth. This may render some of the impounded water unsuitable for use unless additional treatment is provided. The U.S. Army Corps of Engineers is studying this problem.

Many of the mountain reaches of these streams support self-sustaining populations of trout and other indigenous aquatic species. Several rare, threatened, and endangered species inhabit these areas including the unarmored three spine stickleback, the San Bernardino kangaroo rat, the yellow-legged mountain frog, the speckled dace, the Santa Ana woolly star, the least Bell's vireo, and the Southwest Willow Flycatcher.

### *Santa Ana River Reach 5*

Reach 5 and its primary tributaries are believed to meet the Basin Plan's water quality standards. However, this may be due to the lack of recent or rigorous water quality assessments rather than a true indication of water quality. Segments of many of these streams support or have the potential to support a wide range of beneficial uses.

### *Santa Ana River Reach 4*

Reach 4 includes the river from the San Jacinto Fault down to Mission Boulevard Bridge in Riverside. In this reach, all the WQOs are being met except for fecal coliform. **Table 5.5-5** summarizes the 303(d) listing for pathogens for Reach 4.

**Table 5.5-5 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs**

| Water Body | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Santa Ana River-Reach 4 | Pathogens | Nonpoint source | 2019 |

### *Santa Ana River Reach 3 and Chino Basin Surface Waterbodies*

Reach 3 includes the portion of the river from Mission Boulevard Bridge to Prado Dam. Rising groundwater feeds small creeks tributary to Reach 3 that are important breeding and nursery areas for native fish. Excessive nutrient loading in Reach 3 was addressed by amendments to the Basin Plan as recommended by the N/TDS Task Force. Watershed partners are working closely with regulators to improve the quality of impaired waterbodies and to develop TMDLs as shown in **Tables 5.5-6** and **5.5-7**.

**Table 5.5-6 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Santa Ana River, Reach 3**

| Water Body | Pollutant/ Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Chino Creek-Reach 1 and Mill Creek (Prado Area) | Nutrients | Agriculture, dairies | 2019 |
| Mill Creek (Prado Area) | TSS | Dairies | 2019 |
| Prado Park Lake | Nutrients | Nonpoint source | 2019 |
| SAR Reach 3 | Lead | Source Unknown | 2021 |
| | Copper | Source Unknown | 2021 |
| Chino Creek Reach 2 | pH | Source Unknown | 2021 |
| Cucamonga Creek – Valley Reach | Cadmium | Source Unknown | 2021 |
| | Copper | Source Unknown | 2021 |
| | Lead | Source Unknown | 2021 |
| | Zinc | Source Unknown | 2021 |
| Cucamonga Creek – Mountain Reach | pH | Source Unknown | 2021 |
| Chino Creek Reach 1B | COD | Source Unknown | 2021 |
| | Nutrients | Agriculture | 2019 |
| Temescal Creek Reach 1 | pH | Source Unknown | 2021 |
| Temescal Creek, Reach 6 | Indicator Bacteria | Source Unknown | 2021 |

**Table 5.5-7 TMDL Projects-Santa Ana River Watershed, Reach 3**

| Impaired Water Body | Pollutant(s) | TMDL Project | Status |
|---|---|---|---|
| Chino Creek-Reach 1, Mill Creek (Prado Area); SAR-Reach 3, Prado Park Lake | Pathogens | Bacterial Indicator TMDLs for the Middle SARWWaterbodies | Implementation Phase |
| Chino Creek-Reach 2;Cucamonga Creek-Valley Reach | High coliform count | | |
| SAR – Reach 3 | Nitrate | SAR, Reach 3 Nitrate TMDL | Implementation Phase |

*Prado Wetlands*

The Orange County Water District (OCWD) operates the Prado Wetlands in Riverside County to remove nitrogen from SAR water. During non-storm conditions, the river flow upstream of the Prado Wetlands consists predominately of tertiary-treated effluent discharged from wastewater treatment plants. Before reaching the Prado Dam, river water is diverted through 465 acres of constructed wetlands with more than 50 engineered ponds. Following wetland treatment, the water is then discharged into Chino Creek, and then back to the SAR. The wetlands serve as a natural, cost-effective treatment to reduce nitrate levels before the water flows to Orange County, where it is used for groundwater recharge. The Prado Basin is home to several rare and endangered bird and waterfowl species. More than 124 acres are set aside as protective habitat for the endangered least Bell's vireo and Southwestern Willow Flycatcher.

**Middle Santa Ana River TMDL Task Force**

In 2007, in support of local stakeholders, SAWPA formed a multi-agency task force to address the pathogen TMDLs in the Santa Ana River Reach 3 and its tributaries. This area was named the Middle SAR by the Regional Board. This task force includes county agencies, cities, dairies, and agricultural operators. The MSAR Bacteria TMDL requires implementation of a watershed-wide compliance monitoring program for bacterial indicators. The first water quality assessment was submitted to the Regional Board for sampling conducted from 2007-08. The Counties of Riverside and San Bernardino have completed and are implementing Comprehensive Bacteria Reduction Plans. The agricultural community is developing an Agricultural Source Management plan.

*Temescal Creek*

Temescal Creek, also called Temescal Wash, stretches approximately 25 miles from Lake Elsinore to Prado Basin. However, water overflows from the lake to the creek only during very wet periods. For

most of the year, portions of the creek are dry, and flow in Temescal Creek originates downstream of Lake Elsinore. Water quality in the creek is impacted by non-point source pollution. Recycled water produced at Eastern Municipal Water District's (EMWD) Regional Water Reclamation Facilities, Elsinore Valley Municipal Water District's Regional Water Reclamation Facility, City of Corona's Wastewater Treatment Plant IB, and Lee Lake Water District's Wastewater Treatment Plant is discharged to Temescal Creek.

### *Lake Mathews*

Lake Mathews, located in Riverside County, is the terminal reservoir for the Colorado River Aqueduct. Metropolitan Water District of Southern California (MWDSC) owns and operates the 182,000 acre-foot reservoir to supply Colorado River water to its member agencies. The Lake Mathews Watershed is drained primarily by Cajalco Creek which has intermittent flows during storm events or in the presence of urban or agricultural runoff.

The Lake Mathews Drainage Water Quality Management Plan (DWQMP) was completed in the early 1990's through a partnership between Metropolitan, County of Riverside, and Riverside County Flood Control and Water Conservation District (RCFCandWCD) to protect water quality in Lake Mathews from runoff pollution. Under the DWQMP, runoff would be managed and mitigated by the implementation of BMPs throughout the watershed, including several regional stormwater treatment facilities. As recommended in the DWQMP, the Cajalco Creek Dam and Detention Basin and multiple sediment basins have been constructed to detain runoff flows and allow sediment to settle. In 2012, Metropolitan, County of Riverside, and RCFCandWCD completed the Lake Mathews Watershed Study and developed a watershed model for Lake Mathews to assess the effects of future development on runoff pollution. The study evaluated and prioritized stormwater management options that would be pursued, as watershed development conditions warrant, to ensure long-term protection of Lake Mathews.

### *San Jacinto Watershed*

The San Jacinto River (SJR) originates in the San Jacinto Mountains and flows through the San Jacinto Valley. The valley, although undergoing considerable development, still contains citrus orchards, dairy farms, and other agricultural operations.

The SJR passes through Railroad Canyon to Canyon Lake before draining into Lake Elsinore. Lake Elsinore is a natural endpoint for its tributaries, and has no natural outlet. Historically, the lake was known to dry completely; imported and recycled water are now used to maintain the water level. To provide a water outlet during heavy rains, Lake Elsinore was modified to allow overflow into Temescal Creek, which drains into the SAR. Nutrients from sources such as septic systems, farming, reclaimed water, and poor land use practices can cause significant algae growth in the lake, thereby impairing recreational use and degrading aesthetic values. Moreover, excessive algae growth in the lake depletes dissolved oxygen resulting in occasional fish kills.

**Lake Elsinore and Canyon Lake Nutrient TMDL Task Force**.

In 2006, Lake Elsinore and San Jacinto Watersheds Authority (LESJWA) administered the formation of a multi-agency task force to address nutrient TMDLs for Lake Elsinore and Canyon Lake. Over 20 agencies joined the task force to work with the Regional Board to implement studies, monitoring and water quality improvements necessary to achieve TMDL targets for 2015 and 2020 at both lakes. Many water quality improvements at Lake Elsinore implemented by LESJWA from 2005-2012 that produced significant improvements and progress toward TMDL compliance. With TMDL interim targets approaching, greater focus has been place on water quality improvements at Canyon Lake, upstream of Lake Elsinore.

To assist the Task Force, the Regional Board agreed to defer lake monitoring at Canyon Lake and Lake Elsinore from 2013-2015 to allow funding resources to directed for implementation measures at Canyon Lake. Canyon Lake improvements include chemical addition, alum application, a common nutrient flocculating agent used in water treatment and possible an oxygenation injection system dependent on the results of alum application. The improvements at both lakes will also be supplemented by ongoing BMP measures implemented in the upper watershed by the municipal stormwater permittees and agricultural operators. This Task Force established one of the first TMDL agreements signed by Federal, State, and local parties in the State. The cooperative effort has enabled agencies to combine efforts, economically address water quality challenges, and pursue additional grant funding for this process.

*Lake Elsinore*

Lake Elsinore is on the 303(d) list as impaired for Polychlorinated Biphenyls (PCBs) and unknown toxicity. Nutrient TMDLs for Lake Elsinore and Canyon Lake have been developed as shown in **Table5.5-8** and **Table5.5-9**. A Nutrient Source Assessment, a Nutrient Management Plan, and a Bacteria Source Assessment have been completed on Canyon Lake. The bacterial indicator TMDL for Canyon Lake may be revised by the Regional Board if the Stormwater Quality Standards Task Force's recommended change of the REC-1 Pathogen Standards from fecal coliform to E. coli is adopted into the Basin Plan. Should this change occur, Canyon Lake is likely to be in compliance with REC-1 standards and taken off the 303(d) list.

**Table 5.5-8 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – San Jacinto Watershed**

| Water Body | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Lake Fulmor | Pathogens | Unknown nonpoint source | 2019 |
| Lake Elsinore | PCBs | Source unknown | 2019 |
| | Unknown toxicity | Unknown nonpoint source | 2007 |

**Table 5.5-9 TMDL Projects – San Jacinto Watershed**

| Impaired Water Body | Pollutant(s) | TMDL Project | Status |
|---|---|---|---|
| Canyon Lake (Railroad Canyon Reservoir) | Nutrients | Nutrient TMDLs for Lake Elsinore and | Implementation Phase |
| | Pathogens | Bacterial Indicator TMDLs for Canyon Lake | Other Action |
| Lake Elsinore | Nutrients | Nutrient TMDLs for Lake Elsinore and Canyon Lake | Implementation Phase |
| | Organic Enrichment/ Low Dissolved Oxygen | | |

Conditional Waiver of Waste Discharge Requirements in the San Jacinto River Watershed

In the San Jacinto River Watershed, waste discharges from a variety of sources (urban, agriculture, transportation, and other) are contributing to pollution in Canyon Lake and Lake Elsinore. In response, the Regional Board adopted nutrient TMDLs for the two lakes. The TMDLs include a variety of tasks that need to be completed by watershed stakeholders to achieve the objectives of restoring water quality in the watershed.

Whereas dairy operators are already contributing to the TMDL program, many other agriculture operators are not. To include all operators of irrigated and other agricultural or livestock operations the Regional Board is developing the Conditional Waiver (of waste discharge requirements) for Agricultural Discharges (CWAD, or "quad") program. This program will allow for the waiving of waste discharge requirements provided that certain conditions, established by the regional board, are met. The CWAD program will also satisfy the State's policy for "Implementation and Enforcement of the Non-Point Source Pollution Control Program."

With stakeholder involvement, Regional Board staff is developing conditions that will be incorporated in a draft conditional waiver that will be considered by the Regional Board. Once the conditional waiver of caste discharge requirements is adopted affected agricultural operators will be required to enroll in the CWAD program or to obtain individual waste discharge requirements.

*Lake Perris*

Lake Perris, located in western Riverside County, is owned and operated by the California Department of Water Resources (DWR) and is the 2,000-acre terminal reservoir of the East Branch of the California Aqueduct (State Water Project). The lake is a source of water for the MWDSC Water quality concerns,

including pathogens, taste and odors, algal toxins, and anoxia within the lake's bottom layer, have limited its use for water supplies.

Recreational activities at the lake include body-contact recreation such as, swimming and water skiing and non-body contact activities such as, boating, fishing, camping, and hiking. Over a million people visit each year, with an estimated 50 percent of the peak season visitors involved in body-contact recreation. Beach closures occur in spite of implementation of several BMPs aimed at reducing coliform levels.

The State Board provided funding to MWDSC to study microbial contamination at the lake. The studies concluded that body-contact recreation was a key source of fecal contamination and recommended voluntary alternatives to swimming in the lake, such as swim lagoons, water play areas and other water features. Modeling and risk analysis suggest that such alternatives would reduce the consumer health risk by one-half (to approximately a 5 percent probability of exceeding the EPA maximum risk level). A CALFED Science Panel in March 2005 concurred with the main findings of the report.

## Santa Ana River Reaches 2 and 1 and Santiago Creek Watershed

Reach 2 extends from Prado Dam to 17th Street in the City of Santa Ana. In this reach, the OCWD recharges as much of the river water as possible into the Orange County groundwater basin. Reach 1 extends from 17th Street in the City of Santa Ana to the ocean. In Reach 1, the Talbert and Huntington Beach Channels drain urban and stormwater runoff from the western side of the watershed carrying flow to the Talbert Marsh along the coast. The Greenville-Banning Channel drains the southeast side of the watershed and carries flows to the SAR. This area also includes Huntington Beach State Park.

SAR, Reach 2 is listed as impaired for indicator bacteria. The river's main tributary in Orange County, Santiago Creek, has several impairments as does its tributary, Silverado Creek. Water quality impairments in this area are shown in **Table 5.5-10**.

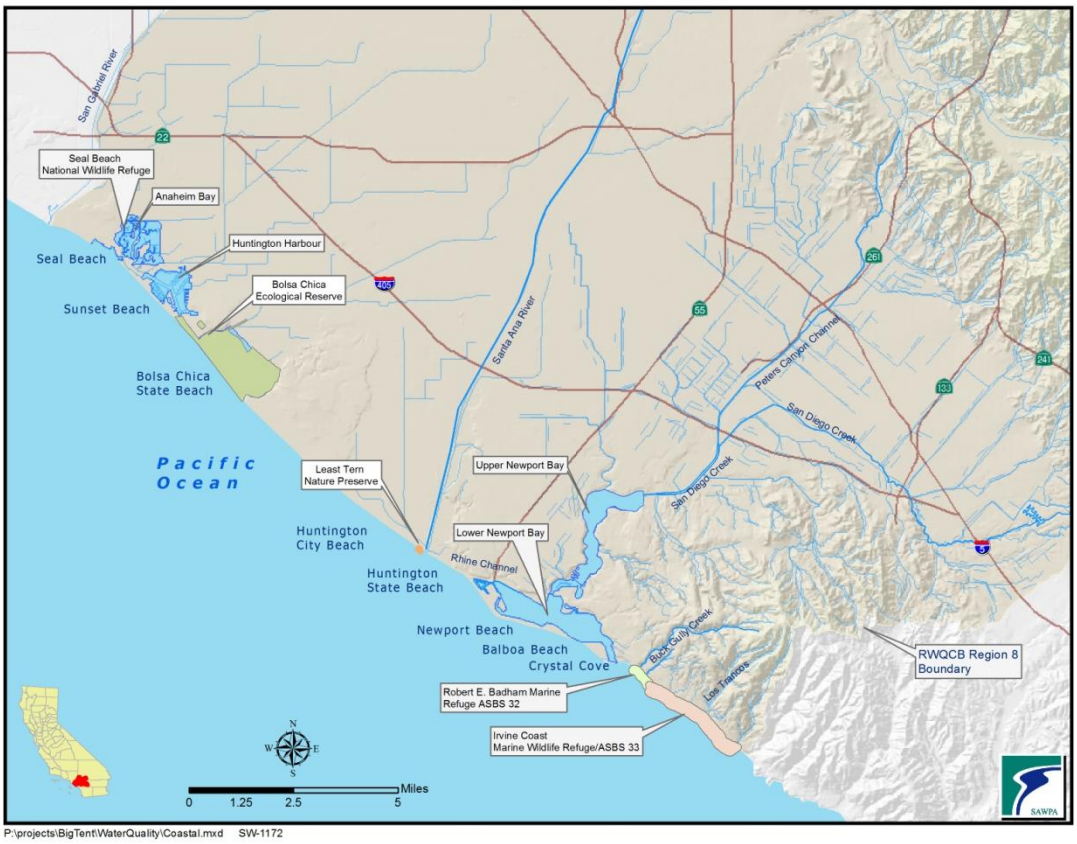

**Table 5.5-10 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Santa Ana River Watershed, Reaches 1 and 2**

| Water Body | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| SAR, Reach 2 | Indicator bacteria | | 2021 |
| Santiago Creek Reach 4 | Salinity, TDS, chlorides | Source unknown | 2019 |
| Silverado Creek | Pathogens, Salinity/TDS/ Chlorides | Unknown nonpoint source | 2019 |
| Huntington Beach State Park | PCBs | Source unknown | 2019 |
| Morning Canyon Creek | Indicator Bacteria | Source Unknown | 2021 |
| Serrano Creek | Ammonia (Unionized)/Indicator Bacteria/pH | Source Unknown | 2021 |

## West Orange County and Coastal Watersheds

This section discusses the water quality challenges facing coastal bays and harbors and coastal area tributary streams, as shown in **Figure 5.5-4**.

**Figure 5.5-4 Coastal Area**

### *San Gabriel River Watershed- Coyote Creek*

The San Gabriel River Hydrologic Unit lies within Los Angeles and Orange Counties. Approximately 86 square miles are within Orange County. The area is drained by a number of tributaries to the San Gabriel River, including Coyote Creek and Carbon Creek that originate in the foothills of northern Orange County. This area is highly urbanized and dry weather urban runoff and wet weather stormwater runoff discharge pollutants into the river. Seal Beach is located just south of the mouth of the San Gabriel River and is impacted by local drainage as well as the water quality of the river. TMDLs for Coyote Creek are listed in **Table 5.5-11**.

**Table 5.5-11 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – San Gabriel Watershed**

| Water Body | Pollutant/Stressor | Potential sources | Proposed TMDL Completion |
|---|---|---|---|
| Coyote Creek | Lead | Major Municipal Point Source-wet weather discharge | TMDL Approval in 2007 |
| | Toxicity | Point source | 2008 |
| | Diazinon, pH | Point, nonpoint source | 2019 |
| | Indicator Bacteria | Source Unknown | 2009 |
| | Copper, Dissolved | Source Unknown | TMDL Approved in 2007 |
| | Ammonia | Point Source | 2019 |
| Seal Beach | Enterococcus, PCBs | Source unknown | 2019 |
| Coyote Creek | Lead | Major Municipal Point Source-wet weather discharge | San Gabriel River Metals (39) |
| | Copper, Dissolved | Source Unknown | San Gabriel River Metals (39) |

Note: Dissolved Copper and Lead is being addressed by a EPA approved TMDL (San Gabriel River Metals (39)) and is being considered for removal under sections 2.2 and 4.1 of the Listing Policy.

### *Anaheim Bay and Huntington Harbour Watershed*

The Anaheim Bay and Huntington Harbour Watershed covers approximately 80 square miles in northwestern Orange County. One of its three tributaries, the Los Alamitos Channel, drains into the San Gabriel River. The Bolsa Chica Channel empties into the Anaheim Bay and Huntington Harbor complex. The East Garden Grove-Wintersburg Channel drains through Bolsa Bay into Huntington Harbor.
The Anaheim Bay and Huntington Harbor complex is located at the northwestern edge of Orange County. Cattle ranching, agriculture, and commercial port facilities preceded rapid urbanization in the 1940s. Discharges containing metals and pesticides from a variety of sources including boating-related activities; stormwater, urban, and agriculture runoff; and past historical inputs have negatively impacted water quality. Impairments in Anaheim Bay and Huntington Harbor are shown in **Table 5.5-12**.

**Table 5.5-12 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Anaheim Bay and Huntington Harbor Watershed**

| Name | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Anaheim Bay | Dieldrin (tissue), nickel, PCBs, sediment toxicity | Source unknown | 2019 |
| Huntington Harbor | Chlordane, copper, lead, nickel, PCBs, sediment toxicity | Source unknown | 2019 |
| | Pathogens | Urban runoff, storm sewers | 2019 |
| Bolsa Chica State Beach | Copper, nickel | Source unknown | 2019 |
| East Garden Grove Wintersburg Channel | Ammonia (Unionized) | Source Unknown | 2021 |
| Bolsa Chica Channel | Ammonia (Unionized) | Other Urban Runoff/Surface Runoff/Storm Sewers/Unknown Nonpoint | 2021 |
| | Indicator Bacteria | Source Unknown | 2021 |
| | pH | Source Unknown | 2021 |

## Newport Bay Watershed

The Newport Bay Watershed covers approximately 152 square miles in central Orange County, draining into upper Newport Bay. San Diego Creek drains 80 percent of the watershed, with Santa Ana Delhi Channel draining 15 percent.

### *San Diego Creek*

San Diego Creek Reach 1 and Reach 2 impairments and TMDL projects are listed in **Tables 5.5-13** and **5.5-14**. The TMDLs include all San Diego Creek tributaries.

**Table 5.5-13 TMDL Projects - Newport Bay/San Diego Creek Watershed**

| Impaired Water Body | Pollutant | TMDL Project | Status |
|---|---|---|---|
| San Diego Creek-Reach 1 | Nutrients | Nutrient TMDL for the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| | Pesticides | San Diego Creek-Newport Bay Organochlorine Compounds TMDLs | Technical TMDLs |
| | | Diazinon and Chlorpyrifos TMDL for San Diego Creek and upper Newport Bay | Implementation Phase |
| | Siltation | Sediment TMDL for the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| San Diego Creek-Reach 2 | Nutrients | Nutrient TMDL for the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| | Siltation | TMDL for Sediment in the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| | Unknown toxicity | Addressed by metals and organochlorine TMDLs | Implementation Phase (Being addressed by EPA Approved TMDL) |

**Table 5.5-14 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Newport Bay/San Diego Creek Watershed**

| Name | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| San Diego Creek- Reach 1 | Selenium | Source unknown | 2007 |
| | Fecal coliform | Urban runoff, storm sewers, other urban runoff | 2019 |
| | Toxaphene | Source unknown | 2019 |
| San Diego Creek- Reach 2 | | | |
| | Indicator Bacteria | Source Unknown | 2021 |
| Peters Canyon- Channel | DDT, Toxaphene, | Source unknown | 2019 |
| | pH | Unknown Point Source, Urban Runoff/Storm Sewers | 2021 |
| | Indicator Bacteria | Source Unknown | 2021 |
| Borrego Creek | Ammonia (Unionized) | Other Urban Runoff/Unknown Nonpoint Source/Surface Runoff/Storm Sewers | 2021 |
| | Indicator Bacteria | Source Unknown | 2021 |

## Newport Bay

San Diego Creek flows into Upper Newport Bay. The bay is a unique area containing a fragile coastal ecosystem that is designated as a State Ecological Reserve. Newport Bay is divided into two distinct areas. The 750-acre **U**pper Bay begins at the Pacific Coast Highway Bridge and extends five miles inland. The Lower Bay encompasses the area below the bridge and includes the Rhine Channel; it is separated from the ocean by Balboa Peninsula.

### *Upper Newport Bay (CCA No. 69)*

Upper Newport Bay, a Critical Coastal Area (CCA) with a significant ecosystem, is the receiving waters for impaired flows emanating from the San Diego Creek Watershed. It supports seven diverse estuarine habitats with several hundred species of marine and terrestrial flora and fauna including six federal and state listed, threatened, and endangered species (five bird species, one plant species). The Bay's fish diversity is rated as the highest of the seven major coastal embayments between San Diego and Point Conception; it provides critical habitat for commercially and ecologically important species, such as California halibut, sand bass, gobies, topsmelt, and anchovy. Impairments and TMDL projects for upper Newport Bay are listed in **Table 5.5-15** and **Table 5.5-16**.

**Table 5.5-15 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs – Newport Bay/San Diego Creek Watershed**

| Name | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Newport Bay, Lower | Copper | Source unknown | 2007 |
| | Chlordane, DDT, PCBs, sediment toxicity | Source unknown | 2019 |
| Newport Bay, Upper (Ecological Reserve) | Copper | Source unknown | 2007 |
| | Chlordane, DDT, metals, PCBs, sediment toxicity | Source unknown | 2019 |
| Rhine Channel | Copper, lead, mercury, PCBs, sediment toxicity, | Source unknown | 2019 |
| Balboa Beach | DDT, dieldrin, PCBs | Source unknown | 2019 |
| Santa Ana Dehli Channel | Indicator Bacteria | Source Unknown | 2021 |
| Newport Slough | Enterococcus/Fecal Coliform/Total Coliform | Source Unknown | 2021 |

**Table 5.5-16 TMDL Projects - Newport Bay Watershed**

| Name | Pollutant/ Stressor | Potential Sources | Status |
|---|---|---|---|
| Newport Bay, Lower | Nutrients | Nutrient TMDL for the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| | Pathogens | TMDL for Fecal Coliform Bacteria in Newport Bay | Implementation Phase |
| | Pesticides/Priority Organics | San Diego Creek-Newport Bay Organochlorine Compounds TMDLs | Technical TMDLs |
| | | Organochlorine Compounds and Metals TMDL, Lower Newport Bay: Rhine Channel | |
| | Siltation | TMDL for Sediment in the Newport Bay-San Diego Creek Watershed | Implementation Phase |
| Newport Bay, Upper (Ecological Reserve) | Metals | San Diego Creek and Newport Bay Metals TMDLs | Technical TMDLs |
| | | Newport Bay-San Diego Creek Selenium TMDL | |
| | Nutrients | Nutrient TMDL for the Newport Bay/San Diego Creek Watershed | Implementation Phase |
| | Pathogens | TMDL for Fecal Coliform Bacteria in Newport Bay | Implementation Phase |
| | Pesticides | Diazinon and Chlorpyrifos TMDL for San Diego Creek and upper Newport Bay | Implementation Phase |
| | | San Diego Creek-Newport Bay Organochlorine Compounds TMDLs | Technical TMDLs |
| | Siltation | TMDL for Sediment in the Newport Bay-San Diego Creek Watershed | Implementation Phase |

### *Lower Newport Bay and Rhine Channel*

The Lower Newport Bay with two main channels is a small boat harbor berthing 9,000 boats. The Rhine Channel is located at the western end of lower Newport Bay. It has been designated by the Regional Board as one of Orange County's hot spots for toxic sediments. Years of operating canneries, metal plating companies, and shipyards deposited PCBs, mercury, and other pollutants in the channel. Several studies have documented contamination in the channel. Impairments and TMDL projects in the Lower Bay and Balboa Beach are listed in **Table 5.5-17** and **Table 5.5-18.**

### *Newport Bay Watershed Toxics TMDLs*

In addition to State Board TMDLs, the EPA has also promulgated Toxics TMDLs in the Newport Bay Watershed. EPA established technical TMDLs (without implementation plans) for toxic pollutants in San Diego Creek and Newport Bay on June 14, 2002. Regional Board staff is developing the State required Basin Plan amendments, including implementation plans. These TMDLs are listed in **Table 5.5-17**.

**Table 5.5-17 Newport Bay Watershed Toxics TMDLs**

| Water Body | Element/Metal | Organic Compound |
|---|---|---|
| San Diego Creek | Cd, Cu, Pb, Se, Zn | Chlorpyrifos, Diazinon, Chlordane, Dieldrin, DDT, PCBs, Toxaphene |
| Upper Newport Bay | Cd, Cu, Pb, Se, Zn | Chlorpyrifos, Chlordane, DDT, PCBs |
| Lower Newport Bay | Cu, Pb, Se, Zn | Chlordane, Dieldrin, DDT, PCBs |
| Rhine Channel | Cu, Pb, Se, Zn, Cr, Hg | Chlordane, Dieldrin, DDT, PCBs |

### *Newport Coastal Streams Watershed*

The Newport Coastal Streams Watershed encompasses approximately eight square miles south of the Newport Bay Watershed. Several coastal canyons drain this area directly into the ocean, into two ASBS. Both Buck Gully and Los Trancos Creeks are listed as impaired for fecal coliform and total coliform, as shown in **Table 5.5-18**. The City of Newport Beach conducted a study of the water quality of eight coastal canyon creeks (Newport Coast Flow and Water Quality Assessment Final Report, January 2007) to determine if conditions protect beneficial uses and to investigate sources of water quality impairments.

**Table 5.5-18 2010 CWA 303(d) List of Water Quality Limited Segments Requiring TMDLs**

| Name | Pollutant/Stressor | Potential Sources | Proposed TMDL Completion |
|---|---|---|---|
| Buck Gully Creek and Los Trancos (Crystal Cove Creek) | Fecal coliform, total coliform (downstream of Pacific Coast Highway) | Source unknown | 2019 |

**Nitrogen and Selenium Management Plan**

Nitrogen is an essential nutrient that causes algal blooms when present in excessive quantities. Selenium is a naturally occurring trace element that is found in ancient marine sediments in the foothills of Newport Bay Watershed. When selenium is released to surface waterbodies, such as via passive groundwater seepage and groundwater cleanup/dewatering operations, it accumulates in the food chain to levels that can be harmful to fish and birds.

In renewing the region-wide permit for discharges that pose an insignificant (de minimus) threat in 2004, the Regional Board issued a separate permit for the Newport Bay Watershed for short term groundwater-related discharges. The concern was that high levels of nitrogen and selenium in groundwater discharges would violate established TMDLs. The Regional Board recognized that numerical effluent limits for selenium would be difficult, if not impossible, to meet as there is no technically feasible and economically practical treatment technology available for selenium. As an alternative, the permit allowed for the formation of a working group to develop a comprehensive understanding of and a management plan for controlling levels of selenium and nitrogen in groundwater discharges. In 2005, the participating watershed stakeholders formed the Nitrogen and Selenium Management Program (NSMP) and agreed to fund and implement the NSMP Workplan, which was scheduled to be completed in 2009.

The NSMP Work Plan tasks include monitoring, testing and evaluation of best management practice (BMP), development of an offset and trading program, total maximum daily loads (TMDL) and site-specific water quality objective, among others. Since 2005, the NSMP Working Group has made significant progress and completed essentially all Work Plan tasks. However, achieving the numerical selenium limitations before the 2009 deadline was infeasible. On December 10, 2009, the Regional Board adopted the Time Schedule Order (TSO) No. R8-2009-0069 that extended the compliance deadline to December 9, 2014. Currently, watershed stakeholders are implementing the tasks outlined in the TSO.

## Current Management Strategies for Surface Water

As described in the previous sections, regulatory efforts aimed at maintaining and improving surface water quality and cleaning up poor quality water are based on implementing the Basin Plan. Non-regulatory approaches are also being implemented to protect and improve water quality.
Attaining water quality standards is a framework identified in the Federal Clean Water Act and its associated regulations, and includes four components:

- Protecting beneficial uses
- Attaining water quality objectives to protect beneficial uses
- Implementing the State and Federal anti-degradation policies
- Executing the Implementation Plan

The approaches available to manage surface water quality include managing urban runoff through municipal National Pollutant Discharge Elimination System (NPDES) permits, developing Drainage Area Management Plans (DAMP) and water quality management plans for new development and redevelopment, and encouraging low impact development. Protection of surface waters also can be achieved through construction of wetlands, implementing BMPs, using brine lines, and building and operating appropriate wastewater treatment facilities. These tactics are listed in **Table 5.5-19**.

**Table 5.5-19 Surface Water Quality Goals, Strategies, and Tactics**

| Goal | Strategies | Tactics |
|---|---|---|
| • Water Quality Standards attained (includes California Toxics Rule) | • Protect good surface water quality<br>• Clean up poor quality surface water<br>• Re-evaluate water quality standards where appropriate | • Monitoring water quality<br>• Protecting source water<br>• Wastewater treatment by Publicly Owned Treatment Works (POTWs): source control, tertiary treatment, and nutrient removal<br>• Urban runoff management<br>• NPDES permits for other dischargers such as dewatering operations<br>• TMDLs<br>• Brine lines<br>• BMPs that include constructed wetlands<br>• Research<br>• Public outreach |

## Future Water Quality Issues

In addition to addressing present water quality problems in the Santa Ana River Watershed, regulators and stakeholders will likely face new challenges. Below is a list of new challenges followed by a brief discussion of several of these issues.

- Establishing new pathogen indicators
- Reevaluating water quality standards to assure that limited resources are allocated appropriately
- Amending the Basin Plan, including additions to the 303(d) list
- Revising the Lake Elsinore/Canyon Lake TMDL
- Setting new residual chlorine objectives
- Establishing nutrient objectives
- Setting new statewide sediment toxicity standards
- Managing sediment loading
- Encouraging appropriate low-impact development
- Evaluating the effects of water use efficiency on wastewater treatment plants and recycled water

- Remediating pollution from septic systems

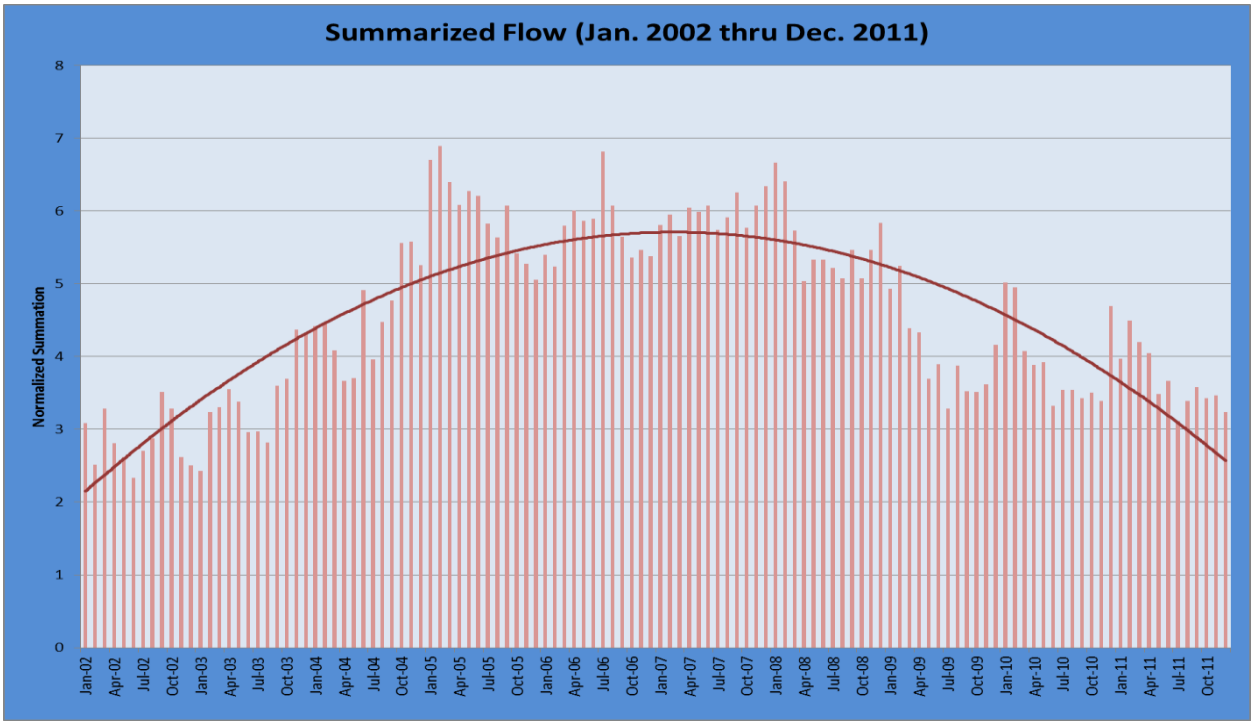
### *Recreational Water Quality Standards Basin Plan Amendment*

As a follow up to the 2002 triennial review of the Basin Plan, the Stormwater Quality Standards Task Force was convened with representatives from major water, wastewater, and stormwater management agencies, environmental groups, the Regional Board and the EPA. Funding for the effort was provided by the stormwater programs of Orange, Riverside, and San Bernardino Counties, and by SAWPA and Orange County Sanitation District. The Task Force's approach was to work within the existing law, to understand the science underlying the standards, and to agree upon an approach to standards that is appropriate, enforceable, achievable, and that focuses effort on reducing the actual risk of illness.

The Task Force met regularly from 2003 to 2011 to evaluate key issues related to beneficial use designations and appropriate water quality objectives for water contact recreation, including definitions of body contact recreation and non-contact recreation, science underlying the use of bacteria as pathogen indicators, statistical risk bases for setting indicator objectives, channel characteristics associated with recreational uses, and the actual recreational uses that are occurring in the watershed. This deliberation was the most thorough consideration of recreational use standards ever undertaken in California. As part of the Task Force's evaluation to measure the frequency and nature of activity associated with specific waterbodies, digital cameras were installed to record images of the waterbodies at 15-minute intervals. The resulting 275,000 images provided an unprecedented record of the incidence of water contact recreation in a number of representative waterbodies. This information, together with water quality data and a GIS-based assessment of channel characteristics, supported the submission of use attainability analyses justifying the re-designation of beneficial uses in four channels.

The Task Force's recommendations included changing the appropriate indicator to *E.coli* with new geometric mean objectives for that indicator, an agreement on how to address single sample data, and the protection of water designated for non-contact recreation, and a consensus on defining and implementing a strategy for a high-flow suspension of recreational uses during dangerous flood conditions. In addition, the amendments expressly acknowledge the continuing requirement to protect beneficial uses not only at a particular location, but downstream from that location. The amendments address only fresh water and therefore do not affect the standards that apply at ocean beaches.

The amendments will allow local agencies responsible for protecting public health to focus their attention on those areas where recreation actually occurs, thus being more efficient with public resources and likely reducing public health risks. It will be feasible for municipalities to use treatment technologies where needed to protect swimmers without remaining technically out of compliance with basin plan standards.



During the long process, the Task Force was adamant about seeking consensus so as to avoid any opposition for its ultimate recommendations and actively sought the involvement of staff from the State Board and the EPA. By the end of 2012, the basin plan amendments recommended by the Task Force were approved by the Regional Board. The Task Force continues to work with the State Board and the EPA to incorporate language changes requested by the EPA.

*Changes in Wastewater Characteristics*

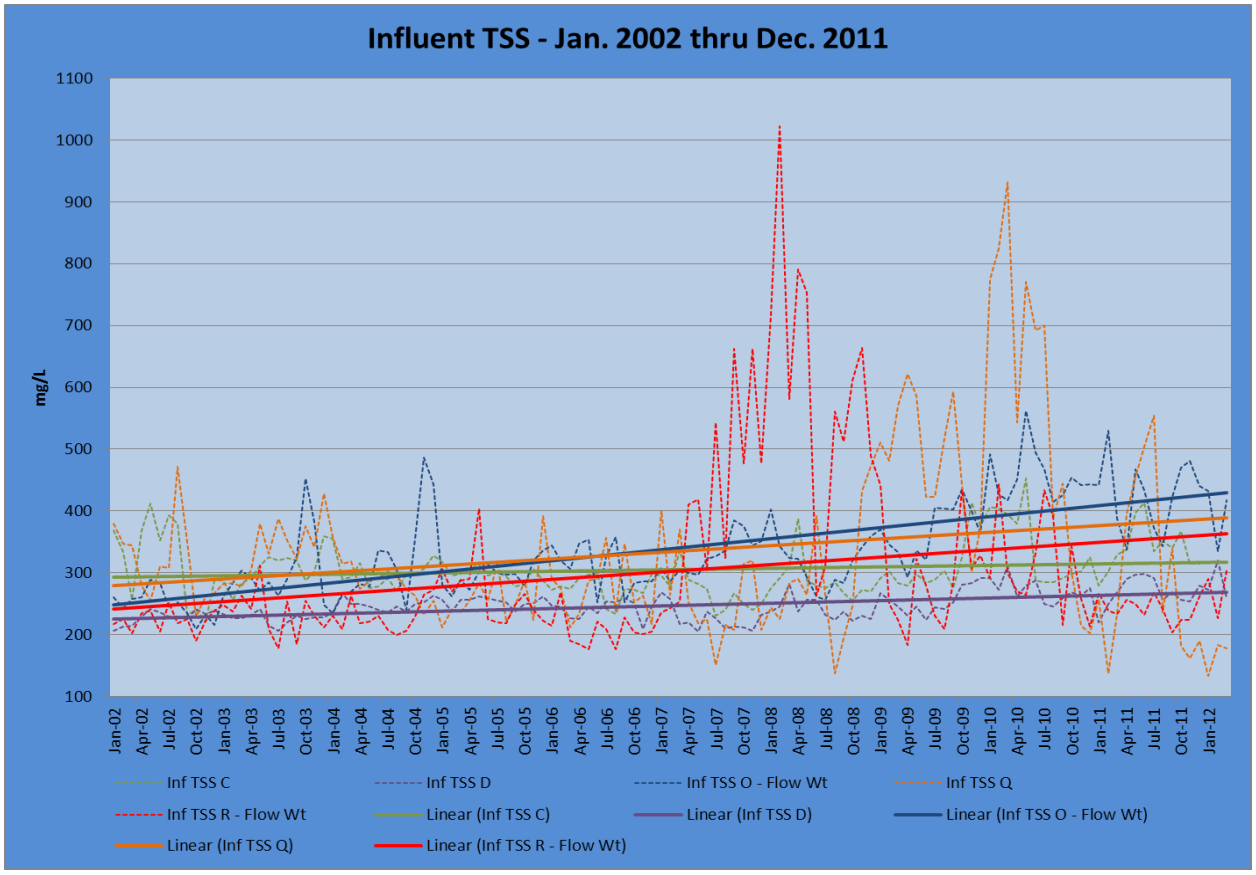
The water reclamation facilities located in the Santa Ana River Watershed are experiencing changes in the influent flows to their facilities due to the depressed economy and heightened focus on water use efficiencies. Because of these changes, the Santa Ana River Dischargers Association (SARDA) compiled their respective wastewater quality data to determine if there have been any changes in the wastewater quality influents. The preliminary evaluations of the wastewater quality have indicated an increase of total suspended solids (TSS) and biological oxygen demand (BOD) in the influent quality. Though not yet conclusive, the data presented below indicates that flows are decreasing and wastewater quality is changing.

Influent flow data from the water reclamation facilities indicate flow rates increased until approximately 2007, then declined. **Figure 5.5-5** shows a normalized summation of the total flow from 16 facilities located in the watershed. The figure is a normalized set of values for each month data point with each facility having the same weighted value no matter the volume of flow. As shown, the summarized influent flow displays a bell-shaped curve with the peak around January 2007.

**Figure 5.5-5 Normalized Summation of Total Flow from Sixteen Facilities Located in the Watershed**

A hypothesis was considered that water use efficiency efforts would cause an increase in influent TSS and BOD. Ten years of data from eight water reclamation plants was compiled and graphed for trending purposes. **Figure 5.5-6** and **Figure 5.5-7** represent the influent water quality results for TSS and BOD, respectively. Both figures indicate an increasing trend in concentration of TSS and BOD for the Santa Ana River Watershed water reclamation facilities since 2002. The influent BOD concentrations displayed more consistent increases than TSS, and thus appear amenable to linear interpretation. In comparison to the influent flow data in **Figure 5.5-5** for the same facilities, both the influent TSS and BOD appear to be uninfluenced by the influent flow. That is, the influent flow data presented a "bell" shaped curve, while the TSS and BOD displayed a more increasing linear line over the same time period. The hypothesis that water use efficiency strategies may increase influent TSS and BOD is a plausible conclusion.

**Figure 5.5-6 Influent Water Quality Results for TSS**



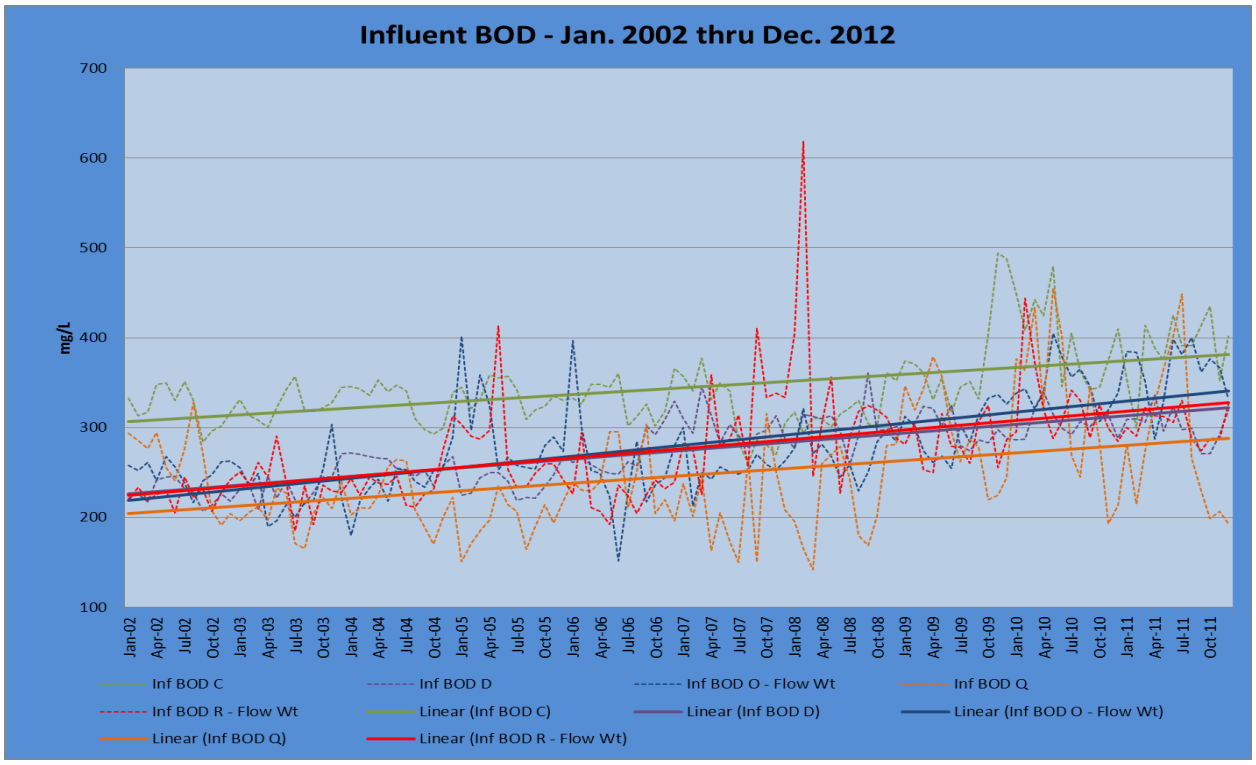


**Figure 5.5-7 Influent Water Quality Results for BOD**

Based on these preliminary results showing a consistent trend in wastewater quality for the SARDA facilities, further evaluations may need to be done. BOD and TSS are only two of the key constituents to measure the strength of the influent. There are other constituents that may also be upward trending such as total dissolved solids (TDS) and nutrients. TDS is a concern because the wastewater plants do not effectively reduce TDS, and these changes may affect compliance with the discharge permits. Further evaluation will help agencies to better understand any potential impact to their facilities and these findings can be incorporated into water reclamation facility design and management.

## Proposed New Water Quality Criteria for Nutrients and Biological Objectives

There are two efforts led by the State Board to develop new water quality criteria for nutrients and biological objectives. The intent of the water quality criteria is to protect aquatic systems. Presently, the State Board uses either narrative or numeric standards that have been identified in the Regional Board's Basin Plan for these aquatic systems. These standards then become NPDES permit limitations. The regulators recognize the complexity of aquatic systems and are attempting to include other indicators of adverse impacts rather than exclusively using chemical, physical, and toxicological thresholds. To add to this complexity it is understood that aquatic systems do not behave similarly. Therefore, site specific indicators may be required. The outcome of the State Board's effort will translate into revised NPDES permit limits and therefore these regulations need to be followed closely to ensure that the proposed criteria will be practicable. Brief descriptions of the two efforts underway are described in the following page.

### *Nutrient Criteria*

EPA has committed to the development of nutrient criteria and knowing the complexity of the aquatic systems and that they vary significantly across the country, EPA has delegated this effort to the States. California has been evaluating nutrient criteria models for several years. The State Board determined that the nutrient criteria framework needs to contain, in addition, to nutrient concentrations, targeting information on secondary biological indicators such as benthic algal biomass, planktonic chlorophyll, dissolved oxygen, dissolved organic carbon, macrophyte cover, and clarity. These secondary indicators provide a more direct risk-based linkage to beneficial uses than the nutrient concentrations alone.

The State Board has evaluated a model called the California Numeric Nutrient Endpoint (NNE) approach. This approach classifies the waterbodies based on three beneficial use risk categories, where Category I is not expected to exhibit impairment, Category II is in an intermediate range, where additional information and analysis may be needed to determine if a use is supported, threatened, or impaired, and Category III has a probable risk of impairment due to the presence of nutrients. Based on the site specific characteristics and secondary indicators, the NNE model will calculate a nutrient water quality objective for the water body. The State Board has pilot tested this approach and has learned that the development of nutrient criteria suggests that no one approach will be suitable for all diverse waterbodies within California. However, the State Board further recognizes that the NNE and its risk based approach will provide solutions to many of the issues that need to be addressed in setting numeric nutrient endpoints in California.

### *Biological Objectives*

The State Board is proposing a statewide biological objectives policy for perennial wadeable streams. The policy will address the need for statewide consistent, enforceable, and scientifically rigorous tools for evaluating aquatic life use attainment in these waterbodies. Most of the State Board's waterbodies have one or more aquatic beneficial uses assigned to them, therefore this policy will affect the streams with beneficial use designations of warm water habitat, cold water habitat, marine or estuarine habitat, migration, spawning, wetland habitat, wildlife habitat, and preservation of rare, threatened, or endangered species. Currently, the biological indicators in most of the Regional Board Basin Plans are narrative and are therefore not enforceable.

The State Board is writing a policy and developing the tools to assess aquatic life uses in the perennial wadeable streams. In addition, the State Board will supply consistent, statewide guidance for establishing biological targets for restorations, permits, and other regulatory actions. The State Board believes that this policy will maximize the efficiency of the extensive pool of bio-assessment data now available in California by producing objectives that are applicable to the greatest number of waterbodies possible in the State. And it reduces the expenditures of time and resources that are necessary to evaluate aquatic life uses on a case by case basis.

### *Regional Solutions for MS4 Stormwater Management*

Regulators and watershed stakeholders agree that stormwater is a valuable resource for the region and that increased capture of stormwater will be an increasingly important component of the region's local water supply. Currently, MS4 permit compliance[1] is focused on integrating BMPs such as vegetated swales, meandering linear parks, and rain gardens into local permits. Two alternative compliance provisions, regional infiltration facilities and in-lieu fee programs, can complement BMPs and offer greater opportunities to transform stormwater into long-term, sustainable groundwater supplies. Interestingly, some of the obstacles to developing regional infiltration projects and in-lieu programs lie within the MS4 permits. For example, one of the requirements is that a regional facility, which may be on a separate construction timeline, must be fully operational once the development is completed. Another challenge is that some projects require costly evaluations to determine that a site is not suitable for infiltration so that alternative approaches can be incorporated into the project. And, although in-lieu payments are included as an option, a preliminary program has yet to be developed.

However, the greatest benefits will be realized when regulations and programs strike a balance between requiring on-site BMPs and utilizing alternative compliance approaches, which improve surface water quality, maximize beneficial use of stormwater for water supply, and protect groundwater quality;progress is being made in these areas. Riverside and San Bernardino Counties have completed the first phase of their Watershed Action Plans. These are interactive online programs that will provide tools to locate an individual parcel, outline potential site constraints that may limit use of certain BMPs, and identify potential future sites for regional infiltration facilities. A similar program has been developed by the County of Orange, the *Coyote Creek Watershed Infiltration and Hydromodification Management Plan*, and is the first in a series of sub-watershed plans that has been finalized.

## Existing Management Plans

A variety of water quality management plans have been prepared within the watershed. This section discusses existing plans.

### *Upper Santa Ana River Watershed Sub-Regional IRWMP (November 2007)*

The upper Santa Ana River Water Resources Association members, lead by the San Bernardino Valley Municipal Water District (Valley District), prepared the upper Santa Ana River Watershed IRWMP to address water management issues in the upper Santa Ana River Watershed. This plan aims to evaluate water management opportunities, improve water supply reliability, reduce dependence on and optimize the use of imported water, and assist local agencies to optimize management and protection of water resources in the region. This plan's objectives include improving surface and groundwater management, water supply reliability, the quality of surface water and groundwater resources, and ecosystem and environmental restoration. This plan was funded in part by the State of California Proposition 50 IRWMP Planning Grant and by local funding sources.

[1] MS4 permits: Municipal Separate Storm and Sewer System permits issued by Regional Water Quality Control Boards to municipalities. The permits regulate the discharge of stormwater into county and municipal storm drains and other surface waters.

*Western Municipal Water District Sub-Regional IRWMP (October 2006)*

Western Municipal Water District prepared their IRWMP to evaluate water management alternatives, address long range water supply planning to meet future demands, and increase system reliability as the amount of available supply of imported water becomes less certain. This plan was funded in part by the State of California Proposition 50 IRWMP Planning Grant and by local funding sources.

This IRWMP identifies and evaluates management strategies that aim to increase local water supplies and to address local and regional water quality concerns. The report focuses predominately on projects that result in an increase in available local water supplies. Projects were ranked with an emphasis on those with regional benefits and based on total percent of demand met. A plan for water conservation also was included.

*San Jacinto River Sub-Regional IRWMP (December 2007)*

Water resources in the SJR Watershed are particularly important due to high demand from urban, agricultural, and recreational users. The nutrient TMDL for Canyon Lake and Lake Elsinore, as well as NPDES stormwater permits are regulatory drivers for improved management of water resources. The IRWMP area consists of the SJR Hydrologic Unit. Most of the watershed falls within Riverside County; with only a small portion extending into Orange County. The SJR, Salt Creek, Perris Valley Storm Drain, Mystic Lake, Perris Reservoir, Canyon Lake, and Lake Elsinore are the dominant hydrologic features in the watershed. Through a collaborative process, the SJR IRWMP was developed and led by the San Jacinto River Watershed Council (SJRWC) with financial assistance from the State of California Proposition 50 Grant and in-kind support and input from a number of member and partnering agencies.

*Chino Creek Integrated Plan (2006)*

The Chino Creek Integrated Plan was prepared by a broad stakeholder group and administered by the Inland Empire Utilities Agency (IEUA). This plan focuses attention on the lower Chino Creek area as a step in the process of preserving and restoring the Prado Basin. IEUA, with a grant from State Board, technical support from OCWD, and funding from the City of Chino, worked with stakeholders over the course of four years to prepare the plan.

Integrated Plan goals were identified as implementable, multi-barrier strategies aimed at reducing pollutants and providing multi-purpose opportunities such as constructing treatment wetlands and natural flood control technologies. Recommended projects identified in the Integrated Plan aim to create recreational linkages, provide public education, develop sustainable development projects for the built environment, preserve habitat, and environmental restoration.

*North Orange County Watershed Management Area Sub-Regional IRWMP*

With a wide range of stakeholders, the County of Orange has completed the North Orange County Watershed Management Area (WMA) IRWMP. This IRWMP will be used to guide watershed management programs and support the region in pursuing funding opportunities. The plan's objectives will include:

- Protecting and enhancing water quality in the region, including current and planned TMDLs
- Enhancing local water supplies
- Promoting flood management

- Enhancing wetlands
- Addressing runoff and its related impacts from existing and future and uses
- Enhancing public education programs
- Reducing invasive species and enhance habitat
- Promoting environmental justice

### *Coyote Creek Watershed Management Plan (January 2007)*

The Coyote Creek Watershed Management Plan provides a blueprint for improving the health of the watershed through multi-objective projects, policies, and site design guidelines. Rather than focusing on the ecological problems that have resulted from piecemeal management of land and water resources, it serves as a user guide on how to improve the management of the watershed for maximum social, economic, and environmental benefit.

### *Central Orange County Sub-Regional IRWMP (COC IRWMP)*

The County of Orange led the first IRWM effort for the Central Orange County Watershed Management Area (WMA), which culminated in the production of the Phase I Central Orange County IRWM Plan (IRWMP). The Phase I IRWMP was undertaken to provide a bridge between existing and developing watershed planning efforts, allowing for more effective collaboration and greater opportunity to leverage agency resources across jurisdictions. It had a strong emphasis on the sensitive coastal resources, ASBS and Critical Coastal Areas (CCAs) that are located within the Central Orange County WMA. The Phase I IRWMP was also developed to meet Proposition 50 priorities. The Phase I IRWMP was integral to subsequent watershed planning efforts led by the City of Newport Beach.

In January 2006, the City of Newport Beach was awarded a planning grant by the State Board through Proposition 40 for preparation of an Integrated Coastal Watershed Management Plan (ICWMP) to address area of biological significance (ASBS) and CCA issues along Newport Coast. Much of the material in the Phase I Central Orange County IRWMP was used during the preparation of the ICWMP. In May 2006, the City of Newport Beach was awarded a second planning grant by the DWR through Proposition 50 for the preparation of an IRWMP for the Newport Bay Watershed including data collection, analysis, and formulation of policy and guidelines. Though building on some new elements, this Phase II effort incorporated the Phase I Central Orange County IRWMP.

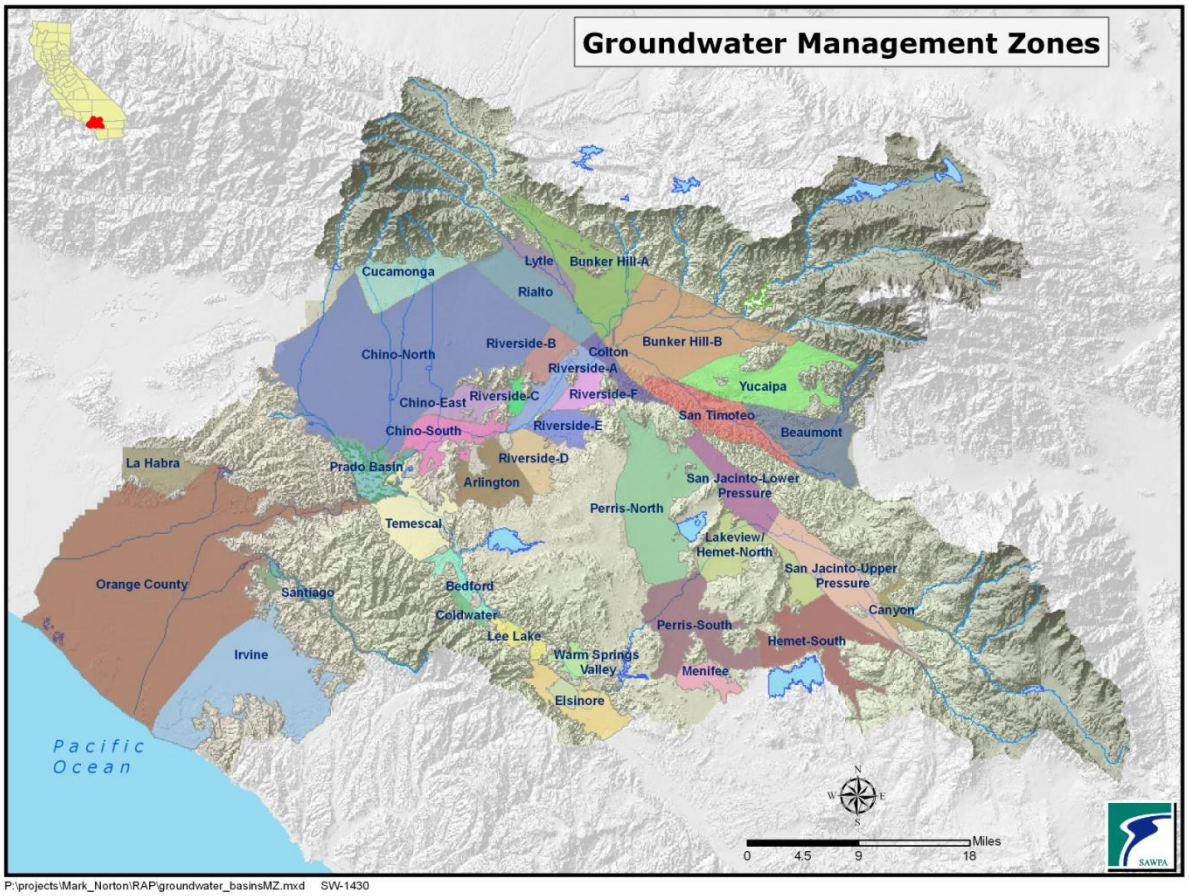
The County of Orange completed Phase III of the Central Orange County IRWMP. Phase III is a compilation and revision of the first two IRWMPs; the information contained in the Phase I and Phase II was used to form the basis of the Phase III plan. The purpose of the Central Orange County IRWM Plan is to provide a local plan that bridges the gap between existing and developing watershed planning efforts, allowing for more effective collaboration and greater opportunity to leverage agency resources across jurisdictions.

Extensive water resource program development and implementation has occurred in this region over the past three decades, with agency partnerships, agreements, and the formation of a formal stakeholder involvement structure. The water quality issues are daunting; within this region there are eight waterbody segments listed on the State Board 2010 Section 303(d) list and there are five TMDLs for nutrients, fecal coliform, sediment, toxics, and organophosphate pesticides, with more TMDLs

pending. Water quality has been the overarching issue that has brought the water resource and land use agencies, environmental groups, and other stakeholders within the region together in the spirit of collaboration. Public agencies and private interests have entered into numerous cooperative agreements to leverage financial resources for the development of programs that implement studies, best management practices (BMPs), and other control measures consistent with regulatory requirements and regional goals for watershed conditions. These water quality-related projects and programs have not been undertaken with a narrow focus or single purpose; the stakeholders within this region, both public and private, understand the nexus between growth, land use decisions, water resource management, and watershed impacts.

This region has experienced significant population growth over the past 20 years, with development of former agricultural lands and expansion in the established urban areas. In addition to addressing water quality issues, the water and wastewater agencies have established partnerships to develop local resources, including groundwater and recycled water, to ensure a reliable source of water supply and to minimize the need for imported water. Public agencies and private entities have implemented a broad range of multi-purpose projects and programs to protect and enhance watershed conditions. The IRWMPbuilds on this history of successful collaboration and furthers the interests of the stakeholders through this integrated planning approach.

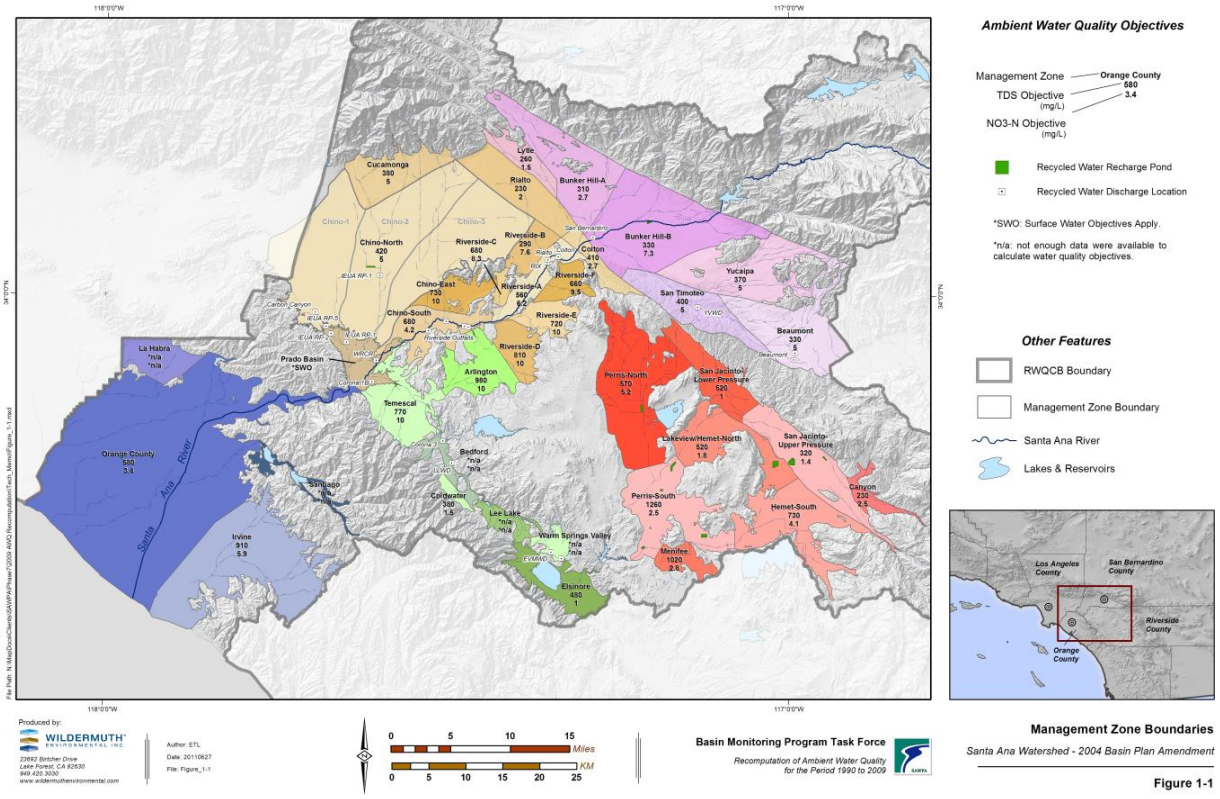
## Groundwater



Groundwater is a major source of water supply in the watershed. Protection of this source is critical to maintain the viability of local water supplies. The Basin Plan identifies 39 groundwater management zones in the Santa Ana River Watershed as shown in **Figure 5.5-8**.
Basin Plan amendments that were approved by the Regional Board in 2004, provide a comprehensive, watershed approach to controlling nitrogen and TDS in the watershed, while also encouraging water recycling and reuse.

This section describes the TDS and nitrate-nitrogen WQOs and current ambient water quality. Ambient water quality, as defined here, is based on the 20-year period ending in 2009. Where the ambient water quality is better than the WQO, this increment is referred to as the assimilative capacity.

All but five groundwater management zones in the watershed have TDS and nitrate WQOs identified in the Basin Plan. The five that were not identified had insufficient data to establish TDS and nitrate WQOs. In this discussion, the groundwater management zones are grouped as follows:



- Upper Santa Ana River Basin
- Chino Basin
- Middle Santa Ana River Basin
- San Jacinto River Basin
- Lower Santa Ana River Basin
- San Jacinto River Basin
- Lower Santa Ana River Basin

**Figure 5.5-8 Santa Ana River Watershed: Groundwater Management Zones**

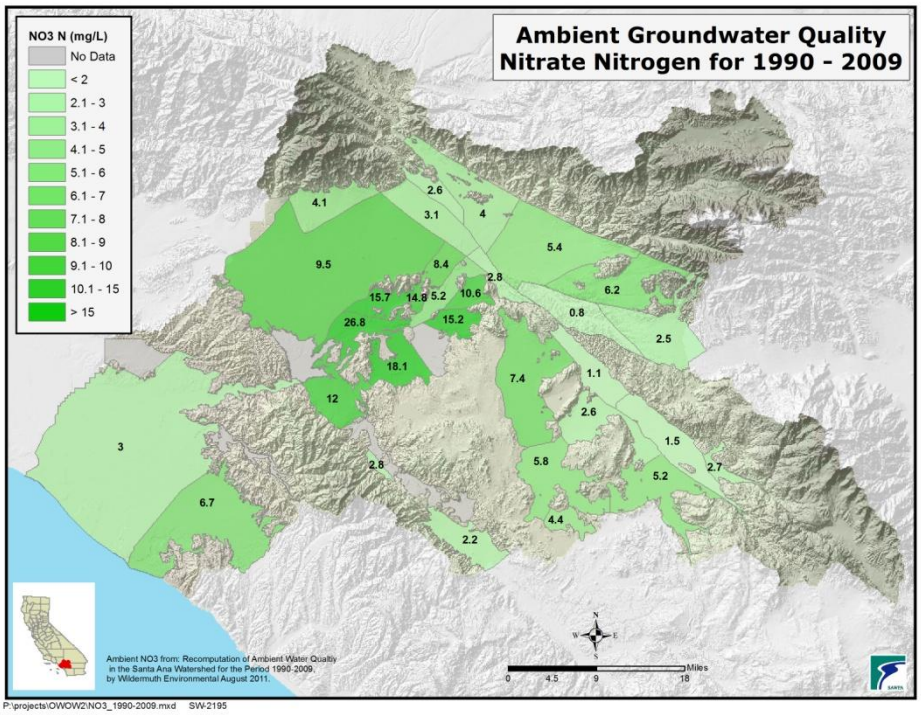
The Basin Plan requires that concentrations of TDS and nitrate in each groundwater management zone be estimated every three years. These ambient conditions are compared to the WQOs to determine the amount of assimilative capacity in each zone. In areas where there is no assimilative capacity, the Regional Board will not permit waste discharges that degrade water quality. **Figure 5.5-9** shows the ambient WQOs for TDS and nitrates in groundwater management zones. Ambient water quality for the years 1990-2009 for nitrates is shown in **Figure 5.5-10** and for TDS in **Figure 5.5-11**.

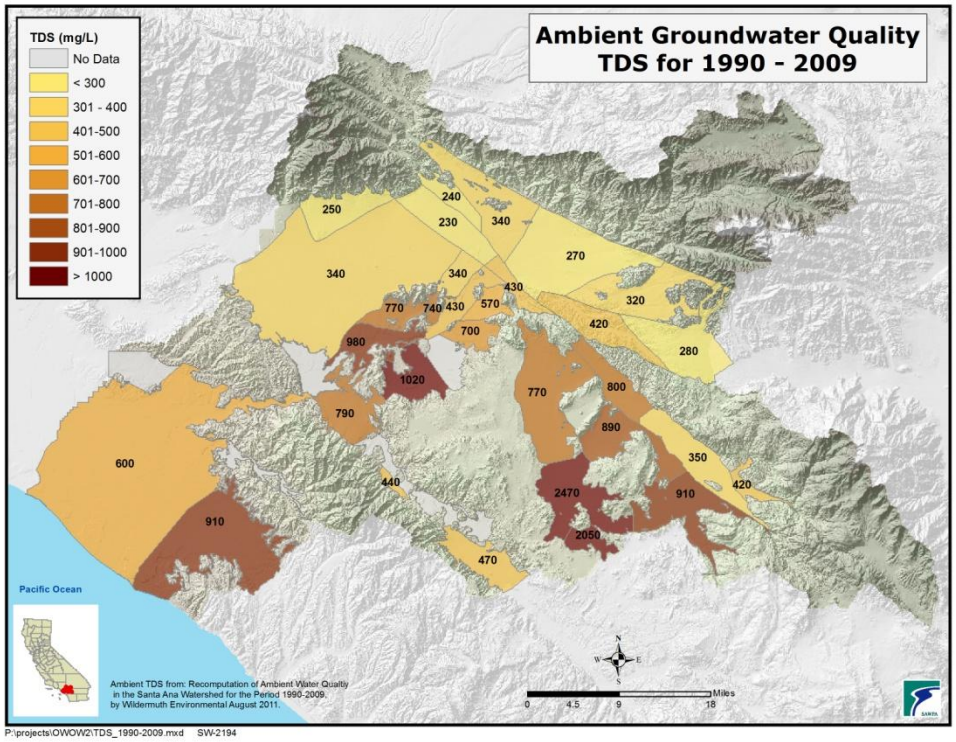
**Figure 5.5-9 Ambient Water Quality Objectives**

## *Current Conditions*

High salt and nitrate concentrations are two long-standing groundwater quality issues in the SARW. Sources of elevated levels include mineral content in the sediments, recharge and drainage patterns, source water quality, irrigation, wastewater discharges, and historic land use. Managing levels of TDS in groundwater basins is a significant challenge as the recycling of waste water increases in the watershed. Each cycle of residential water use typically adds approximately 200 mg/L of salt to the water. Industrial and commercial operations may contribute higher levels. Construction and use of salinity management facilities, such as brine lines and desalters, are being used to prevent salt-build up and to remediate high TDS groundwater basins.

**Figure 5.5-10 Ambient Water Quality Objectives 1990-2009 - Nitrates**





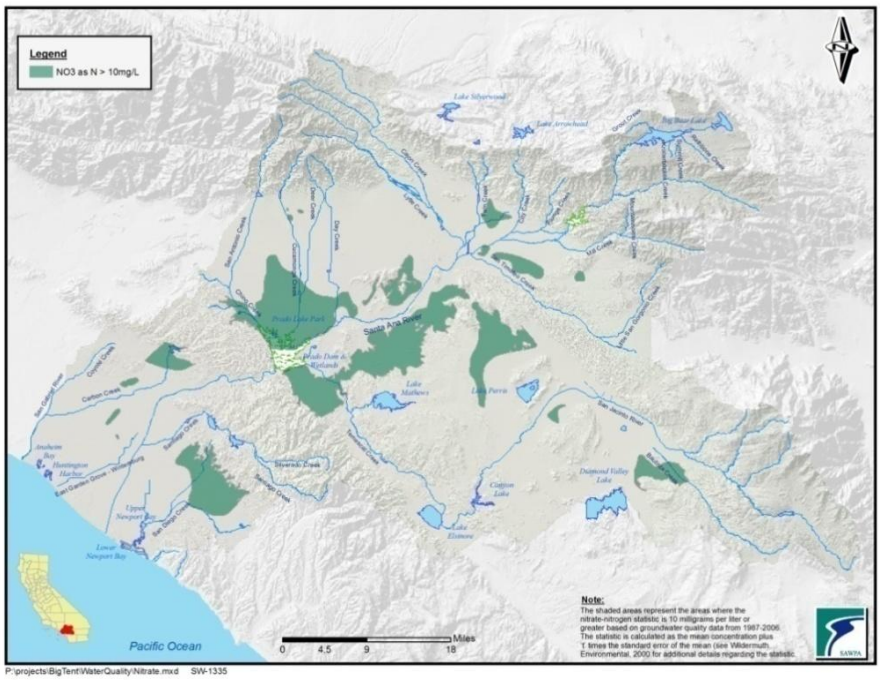


**Figure 5.5-11 Ambient Water Quality Objectives 1990-2009 – TDS**

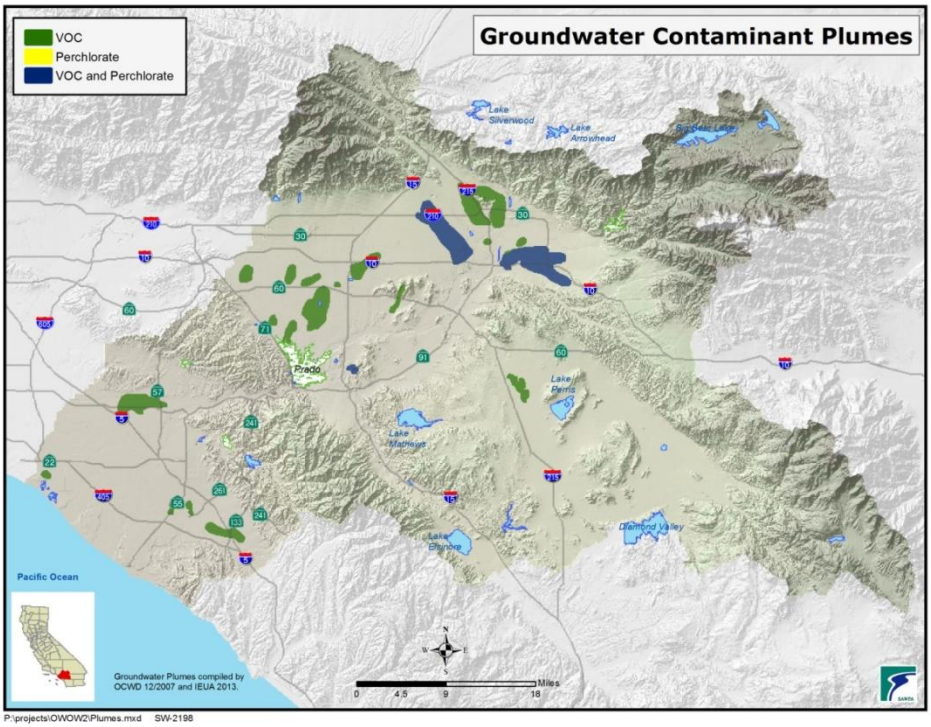

Elevated levels of nitrates in groundwater originate primarily from use of fertilizers, confined animal feedlots, and waste water treatment facilities. Areas with elevated nitrates (nitrate-nitrogen greater than the Maximum Contaminant Levels (MCL) of 10 mg/L, using the ambient water quality statistics) in groundwater are shown in **Figure 5.5-12**.

**Figure 5.5-12 Groundwater with Elevated Nitrate Levels**

Approximately 25 years ago, volatile organic compounds (VOCs) were discovered in groundwater in some areas. More recently, contamination due to perchlorate has become a major concern in some portions of the watershed. Areas with groundwater contamination above the primary MCLs for VOCs and perchlorate are shown in **Figure 5.5-13**.

**Figure 5.5-13 Groundwater Contamination Plumes**

## Upper Santa Ana River Basin

The upper Santa Ana River Basin is divided into seven management zones. TDS and nitrate WQOs and current ambient water quality levels are summarized in **Table 5.5-20**.

In the Bunker Hill management zones, the largest area of groundwater contamination is the Newmark Superfund Site. Treatment plants are operating to remove VOC contamination. A total of 13 extraction wells produce on average approximately 26,000 AFY, which is treated at the four treatment plants.

In the Bunker Hill B management zone, a six-mile long plume of VOC and ammonium perchlorate contamination, known as the Crafton-Redlands Plume, was first detected in the early 1980's. Approximately 46 drinking water wells have been affected. A number of well head treatment units and treatment plants to remove these contaminants are being operated by the Cities of Redlands, Loma Linda and Riverside.

Cherry Valley is an unincorporated area located northeast of the City of Beaumont, in the Beaumont management zone. The community is not served by a sanitary sewer system. The only source of drinking water for the community is the groundwater. A study commissioned by the San Timoteo Watershed Management Authority indicated an ongoing degradation of the quality of the groundwater due to nitrate. The source of the nitrate was attributed to the onsite waste treatment systems, *i.e.*, septic systems.

**Table 5.5-20 Water Quality Objectives for Upper Santa Ana River Basins**

| Management Zone | TDS | | Nitrate-nitrogen | |
|---|---|---|---|---|
| | Water Quality Objective (mg/L) | Ambient Quality (mg/L) | Water Quality Objective (mg/L) | Ambient Quality (mg/L) |
| Big Bear Valley | 300 | NA | 5.0 | NA |
| Beaumont | 330 | 280 | 5.0 | 2.5 |
| Bunker Hill A | 310 | 340 | 2.7 | 4.0 |
| Bunker Hill B | 330 | 270 | 7.3 | 5.4 |
| Lytle | 260 | 240 | 1.5 | 2.6 |
| San Timoteo | 400 | *420* | 5.0 | 0.8 |
| Yucaipa | 370 | 320 | 5.0 | 6.2 |

Source: Wildermuth Environmental (2011)

Note: Current ambient water quality computations for the San Timoteo management zone were not made during this study. These values were published in *Preliminary Assessment of Assimilative Capacity*

The County of Riverside has adopted three ordinances to ban new septic systems unless the systems are designed to remove 50 percent of the nitrogen in the discharged wastewater. Beaumont Cherry Valley Water District is in the process of providing sewer service to a major portion of the area and has applied for State Revolving Fund loans for the project.

## Chino Basin, Cucamonga, and Rialto Management Zones

The Chino Basin is divided into three management zones. This section covers these three zones, and the adjacent Cucamonga, Colton, and Rialto management zones. The Basin Plan established "maximum benefit" and "anti-degradation" TDS and TIN water quality for the Chino and Cucamonga management zones as summarized in **Table 5.5-21**.

**Table 5.5-21 Water Quality Objectives for Chino Basin and Rialto**

| Management Zone | TDS | | Nitrate-nitrogen | |
|---|---|---|---|---|
| | Water Quality Objective (mg/L) | Ambient Quality (mg/L) | Water Quality Objective (mg/L) | Ambient Quality (mg/L) |
| Chino North | 420 | 340 | 5.0 | 9.5 |
| Chino East | 730 | 770 | 10.0 | 15.7 |
| Chino South | 680 | 980 | 4.2 | 26.8 |
| Colton | 410 | 430 | 2.7 | 2.8 |
| Cucamonga | 380 | 250 | 5.0 | 4.1 |
| Rialto | 230 | 230 | 2.0 | 3.1 |

Source: Wildermuth Environmental (2011)

The Chino Basin is experiencing rapid commercial and residential development. The groundwater quality in the basin is generally good, with better groundwater quality found in the northern portion where recharge occurs. Salinity (TDS) and nitrate concentrations increase in the southern portion of the Basin. Between 2001 and 2006, about 80 percent of the private wells south of Highway 60 had nitrate concentrations greater than the MCL. Pollution from point sources and emerging contaminants are concerns for the overall groundwater quality in Chino Basin. Constituents that have the potential to impact groundwater quality include VOCs, arsenic, nitrates, and perchlorate.

Groundwater in several areas is impacted by elevated levels of perchlorate. Sources of perchlorate include the Stringfellow Acid Pits, Chilean nitrate fertilizer that was imported in the early 1900s for the citrus industry, and other manmade sources such as ammunition manufacturing.

**Newmark Cleanup Restores Groundwater Supplies**

In 1980, the California Department of Health Services discovered the chlorinated solvents tetrachloroethylene (PCE) and trichloroethylene (TCE) in several municipal water supply wells in the northern San Bernardino/Muscoy region. Investigations into the extent of contamination led the EPA to place the area on the National Priorities List in 1989. This Superfund site was determined to contain two plumes originating from the same source near the site of a closed World War II Army site: an approximately eight-mile Newmark plume and an approximately six-mile Muscoy plume.

Contamination impacted 25 percent of the municipal water supplies for the City of San Bernardino. In addition, 75 percent of the water supplies for the City of Riverside downgradient of the contamination plume were threatened as were water supplies for the Cities of Colton, Loma Linda, Fontana, and Rialto.

The San Bernardino Municipal Water Department, in cooperation with the EPA, constructed 13 extraction wells to contain the plume and treat the contaminated groundwater. As a result, 12 of the 20 contaminated wells were brought back into operation; clean up operations continue.

Pictured below is a façade house built around one of the extraction wells.

EPA Well 111 with façade house.

In the Rialto management zone, at least 20 wells providing 40,135 gallons per minute (gpm) of domestic water supply capacity to the Cities of Rialto and Colton, West Valley Water District and Fontana Water Company have been contaminated by perchlorate. Well head treatment is operating on 11 of these wells.

Arsenic at levels above the MCL appears to be limited to the deeper aquifer zone near the City of Chino Hills. Total chromium and hexavalent chromium, while currently not a groundwater issue for Chino Basin, may become so depending on the promulgation of future standards.

**Maximum Benefit Demonstrations in Santa Ana River Watershed**

A successful template for groundwater quality management is the maximum benefit demonstration utilized in the Chino, Beaumont/Yucaipa, and San Jacinto basins. Stakeholders collaborated with the Regional Board to demonstrate that groundwater quality can be protected not solely based on historical quality (the "antidegradation" objectives). Instead, the Regional Board agreed to "maximum benefit" objectives to protect groundwater quality for the "maximum benefit to the people of the State".

In the Chino, Beaumont/Yucaipa, and San Jacinto basins, local stakeholders proposed programs to implement local cooperative projects, such as groundwater desalination plants, expanded stormwater capture and recharge basins, and comprehensive groundwater management plans in order to protect groundwater basin quality and meet existing and downstream beneficial uses. Through an aggressive series of monitoring requirements, the State will be able to assure that water quality is protected. The antidegradation objectives are defined as the default condition if the commitments made to protect water quality are not attained. The success of this multi-agency approach to maximize the use of water resources while protecting water quality as defined by the State Board serves as a progressive water management and water quality protection example for other regions in the state, according to the State Board.

## Middle Santa Ana River Basin

The management zones for the Middle Santa Ana River Basin are listed in **Table 5.5-22** and **Table 5.5-23**. Agriculture and dairy activities are suspected to be partially responsible for elevated salt and nitrate concentrations in the groundwater. As the population within the Riverside Basins continues to grow, homes, commercial centers, new industry, and warehouses are replacing agriculture and open space.

Several areas in the Riverside basin are impacted by the presence of nitrate, dibromochloropropane (DBCP), and perchlorate. As such, the City of Riverside has increased monitoring schedules at select production well sites and has implemented blending plans and provided treatment for DBCP removal at its Palmyrita GAC plant.

**Table 5.5-22 Water Quality Objectives for Riverside Basin**

| Management Zone | TDS | | Nitrate-nitrogen | |
|---|---|---|---|---|
| | Water Quality Objective (mg/L) | Ambient Quality (mg/L) | Water Quality Objective (mg/L) | Ambient Quality (mg/L) |
| Riverside-A | 560 | 430 | 6.2 | 5.2 |
| Riverside-B | 290 | 340 | 7.6 | 8.4 |
| Riverside-C | 680 | 740 | 8.3 | 14.8 |
| Riverside-D | 810 | NA | 10.0 | NA |
| Riverside-E | 720 | 700 | 10.0 | 15.2 |
| Riverside-F | 660 | 570 | 9.5 | 10.6 |

| Lee Lake | NA | NA | NA | NA |
| Temescal | 770 | 790 | 10.0 | 12.0 |

Source: Wildermuth Environmental (2011)

## San Jacinto River Basin

Agricultural activities in the San Jacinto River Basin are suspected to be partially responsible for elevated salt and nitrate concentrations in the groundwater. Septic tank discharges are creating significant water quality problems that have triggered local agency and the Regional Board's regulatory response in the unincorporated areas of Quail Valley (north of Canyon Lake) and Enchanted Heights (west Perris). The basin is dotted with several other areas believed to be at risk of water quality degradation from septic systems. A septic system management plan has been developed by RCFCWCD.

A Groundwater Salinity Management Program, developed by EMWD, addresses several water quality issues in this area. The Perris South Sub-basin contains a surplus of marginal to unusable quality groundwater that flows into the adjacent high quality Lakeview Sub-basin, rendering several wells unusable and threatening the remaining production of the basin. Due to the unavailability of imported water, blending to improve water quality is not an option. Therefore, three desalination facilities, two

constructed and one being designed, will recover high TDS water in the Menifee and Perris South Groundwater Management Zones for potable use. In addition to providing clean drinking water, the desalters will play a role in reducing the migration of brackish groundwater into areas of good quality groundwater. WQOs are shown in **Table 5.5-24**.

**Table 5.5-24 Water Quality Objectives for San Jacinto River Basins**

| Management Zone | TDS | | Nitrate-nitrogen | |
|---|---|---|---|---|
| | Water Quality Objective (mg/L) | Ambient Quality (mg/L) | Water Quality Objective (mg/L) | Ambient Quality (mg/L) |
| Canyon | 230 | 420 | 2.5 | 2.7 |
| Hemet – South | 730 | 910 | 4.1 | 5.2 |
| Lakeview/Hemet-North | 520 | 890 | 1.8 | 2.6 |

## Lower Santa Ana River Basin

The Lower Santa Ana River Basin contains four groundwater management zones: Orange County, Irvine, La Habra, and Santiago. The La Habra and Santiago Management Zones have minimal pumping and TDS and nitrate WQOs have not been established due to the scarcity of data. This section focuses on the Orange County and Irvine Management Zones, which are important sources of water in Orange County.

### *Orange County Groundwater Basin*

The Orange County Groundwater Basin is the source of approximately 70 percent of the water supply for 2.4 million people. Of this total production, about 90 percent meets drinking water standards without treatment. The remaining 10 percent requires treatment for VOCs, salts, or other constituents. WQOs for nitrates and TIN/TDS are listed in **Table 5.5-25**.

A shallow VOC plume exists in the Anaheim/Fullerton area where VOC concentrations exceed MCLs over approximately six square miles. To address this plume, the North Basin Groundwater Protection Project is being constructed to extract and treat VOC contaminated groundwater and recharge treated water back into the groundwater basin. Other VOC plumes exist in Orange, Santa Ana, the Seal Beach Naval Weapons Station, and the now closed Tustin Marine Corps Air Station. Various other sites have generally shallow VOC contamination or other contaminants. The Tustin desalters, using reverse osmosis and ion

exchange, treat high TDS, nitrate, and perchlorate levels in a section of Tustin. Areas in Garden Grove have groundwater with high nitrate concentrations that are likely the result of historic agricultural practices.

**Table 5.5-25 Water Quality Objectives for Lower Santa Ana River Basin Management Zones**

| Management Zone | TDS | | Nitrate-nitrogen | |
|---|---|---|---|---|
| | Water Quality Objective (mg/L) | Ambient Quality (mg/L) | Water Quality Objective (mg/L) | Ambient Quality (mg/L) |
| Orange County | 580 | 600 | 3.4 | 3.0 |
| Irvine | 910 | 910 | 5.9 | 6.7 |
| La Habra | NA | NA | NA | NA |
| Santiago | NA | NA | NA | NA |

Source: Wildermuth Environmental (2008)

### *Irvine Management Zone*

The Irvine Management Zone is a sub-basin of the Orange County Groundwater Basin. Water naturally flows between the boundaries, but the operation of the Irvine Desalter limits movement of water between the two management zones.

Groundwater contaminated with VOCs exceeding MCLs from the now closed El Toro Marine Corps Air Station, also contains high TDS and nitrate concentrations. The Irvine Desalter, using reverse osmosis, air stripping, and carbon absorption, was built to treat the contaminated water. Water treated for VOC contamination is distributed after treatment through the Irvine Ranch Water District non-potable system (irrigation and other non-potable uses); water treated for high TDS and nitrate is distributed through the potable system.

## Current Management Strategies for Groundwater

Three goals are defined for groundwater quality. These goals are:

- Attaining water quality standards
- Meeting drinking water standards
- Achieving salt and nutrient balances

Attaining water standards is a framework identified in the Federal Clean Water Act and its associated regulations, and includes four components:

- Protecting beneficial uses
- Attaining water quality objectives to protect beneficial uses
- Implementing the State and Federal anti-degradation policies
- Executing the Implementation Plan

**Table 5.5-26 Groundwater Quality Goals, Strategies, and Tactics**

| Goals | Strategies | Tactics |
|---|---|---|
| • Water Quality Standards attained<br>• Drinking water standards (DWS) met<br>• Salt and nutrient balance achieved | • Protect good quality groundwater<br>• Clean up poor quality groundwater<br>• Re-evaluate water quality standards where appropriate | • Monitoring, assessment and reporting<br>• Source water protection programs<br>• Pollutant source identification and control<br>• Groundwater treatment<br>Pump and treat for local plumes<br>Wellhead treatment (e.g., for arsenic and perchlorate)<br>Desalters<br>• Brine lines<br>• Recharge of recycled, stormwater and imported water<br>• Research<br>• Public outreach |

Meeting drinking water standards will require the attainment of both maximum contaminant levels for primary drinking water contaminants and secondary drinking water standards. Goals for improving groundwater quality and protecting groundwater supplies also include achieving a salt and nutrient balance. Strategies and tactics to achieve these goals are listed in **Table 5.5-26**. A summary of two of these issues is as follows:

*Matching Water Quality with Water Use*

The possibility of replacing potable water supplies used for landscape irrigation with pumped groundwater containing some contamination should be considered in discussions on improving local water supply reliability. Groundwater may have slightly elevated salinity or nutrient levels or, at the other extreme, may be contaminated with high levels of VOCs, pesticides, and/or perchlorate. In cases of groundwater with low levels of contaminants, use of this water for irrigation could have several benefits beyond reduced use of potable water supplies.

Supplies unsuitable for drinking water that are used for irrigation and carefully managed to allow for infiltration may naturally be purified of some contamination, such as low levels of VOCs and nitrates. Some contaminates also would be absorbed by vegetation. Over time as the water percolates back into aquifers, contamination levels may be reduced naturally.

One example of an approach utilizing groundwater contaminated by nitrates is a cooperative project by the City of Corona and the community of Home Gardens. Home Gardens ceased pumping of nitrate contaminated groundwater because of lack of treatment options. Construction of a pipeline will allow

for groundwater, pumped by Home Gardens, to be conveyed to Corona's Temescal Desalter for treatment and blending. The resulting potable supply will be shared by the two agencies.

A potential new water supply may be to utilize shallow groundwater in Orange County for irrigation. In areas where slightly elevated nitrate levels or low concentrations of VOCs in the shallow aquifer preclude utilizing that supply, development of a clean-up strategy could consider irrigation use as a means to reduce contaminant concentrations and prevent spread of contamination into deeper drinking water aquifers.

Certainly, these projects must be carefully considered for unintended, negative impacts. One such consideration must be the likely increase in TDS of percolated water that would result from using pumped groundwater for irrigation.

### *Hindrances to Groundwater Cleanup Projects*

When it occurs, groundwater contamination is ideally cleaned up by the entity that caused it. In cases where this does not occur, regulatory agencies may be required to force the responsible party to remedy the contamination.

In some situations, the regulatory agencies may not have the resources to investigate contaminated areas and oversee and enforce investigation and cleanup actions, particularly for contamination that has migrated beyond the property where the contamination originally occurred. In these situations, the local water district may desire to implement a cleanup or remediation project to protect local water supplies. The water district may do this at the district's expense and seek cost recovery from the entities that caused the contamination.

Local agencies seeking to cleanup groundwater contamination encounter many hurdles. For example, a groundwater cleanup project proposed by a water district has experienced opposition by potentially responsible parties through legal challenges to California Environmental Quality Act (CEQA) documentation. Additionally, existing laws may not provide adequate legal authority for recovery of the cleanup costs from the entities that caused the contamination.

The issue considered here is the extent to which CEQA challenges can be used to discourage, hinder, and slow down a groundwater cleanup project. Arguably, the groundwater cleanup project is beneficial to the environment, since it benefits water quality and protects drinking water supplies. If the project is not implemented, contamination will continue to spread in the aquifer and the environment would continue to be degraded by continued migration of contamination.

An agency in the watershed received CEQA legal challenge by entities believed to have caused the contamination the project was intended to address. In brief, the project consists of extraction wells, pipelines, a treatment plant, and injection wells to recharge the treated water. The challenge was unsuccessful in court. However, the agency had to expend substantial public funds to defend itself in court. Additionally, the legal challenge can delay project implementation.

Legal challenges have also been a reason for the delay in the implementation of projects. For example, an event occurred in which an agency within the SARW had received a CEQA legal challenge by entities who believed to have caused the contamination of a project that they originally intended to address.

If progress on implementing cleanup projects is hindered, this allows contamination to spread further, threatening even more drinking water supplies. Even if the project is ultimately constructed after legal challenges are addressed, the delays are harmful to the environment.

Consideration should be given to streamlining CEQA to facilitate groundwater cleanup projects implemented by public agencies with powers to manage groundwater. For example, a Statutory Exemption for groundwater cleanup projects, or a streamlined approach to comply with CEQA could be proposed. There is an existing Categorical Exemption that may apply to certain relatively small projects. This Categorical Exemption should be evaluated and the type and size of projects covered under the exemption should be expanded, if appropriate.

## Existing Groundwater Management Plans

### *2005 Regional Groundwater Management Plan*

A Regional Groundwater Management Plan was prepared by SAWPA in 2005. SAWPA is not directly responsible for managing groundwater basins in the watershed. However, the agency coordinates numerous groundwater management planning efforts within the watershed. This plan describes the water and groundwater management plans in the Santa Ana River Watershed.

### *Upper Santa Ana Basin Plans*

In 2005, the Upper Santa Ana Water Resources Association developed an Integrated Regional Groundwater Management Plan (IRGM Plan) to address major water management issues for the communities of the Upper Santa Ana River Watershed. Valley District led the planning effort. The plan developed a process for managing the San Bernardino Basin Area and identified proposed regional projects. The two management objectives were to improve water reliability during drought periods and reduce liquefaction, and to protect water quality and maximize conjunctive use opportunities. Computer models were used to evaluate the various water management strategies.

### *San Jacinto Basin Plans*

The West San Jacinto Groundwater Basin Management Plan was adopted in 1995. Annual reports on the status of groundwater and water resources efforts in the area have been published since 1996. The 2007 Annual Report compiled, reviewed, evaluated, and analyzed 2007 groundwater quality and water level monitoring program data; summarized groundwater-related changes; and reported results of an extraction monitoring program and on the status of previous recommendations.

To the east, the Hemet/San Jacinto Water Management Plan was completed in November 2007 by EMWD, Lake Hemet Municipal Water District, and the Cities of Hemet and San Jacinto to guide and support responsible water management. The plan's objectives include, reducing the historical impact of overdraft caused by past groundwater production, increasing recharge of the groundwater basin, providing for the water rights of the Soboba Tribe, ensuring water supply reliability, providing for planned urban growth, and protecting and enhancing water quality. Options to increase water supply and reliability include developing underutilized sources particularly recycled water and imported water. To accomplish the plan's objectives, the Hemet/San Jacinto Integrated Recharge and Recovery Program is being implemented. This program includes the construction of numerous water supply and

conjunctive use projects such as direct and in-lieu recharge, increased use of recycled water, increased conservation, and improved monitoring.

*Elsinore Valley Municipal Water District, Elsinore Basin Groundwater Management Plan (March 2005)*

The objective of this Groundwater Management Plan (GWMP) is to provide an evaluation of the groundwater basin and develop a reliable groundwater supply to meet drought and dry season demands through the year 2020. This plan addresses the hydrogeologic understanding of the basin, the evaluation of baseline conditions, identification of management issues and strategies, and the definition and evaluation of four alternatives. This document concludes with an implementation plan of the recommended plan. This GWMP was adopted by the Elsinore Valley Municipal Water District Board of Directors on March 24, 2005 under the authority of the Groundwater Management Planning Act (California Water Code Part 2.75, §10753) as amended.

*Chino Basin Watermaster, Optimum Basin Management Plan, State of the Basin Report 2006 (June 2007)*

The Chino Basin Watermaster (CBWM) is the manager of Chino Groundwater Basin. CBWM prepared the Optimum Basin Management Plan which describes the state of the basin in terms of historical groundwater levels, storage, production, water quality, and safe yield. Current and projected water demands and water supply plans are described. The goal of the plan is to develop a groundwater management program that enhances the safe yield and the water quality of the basin, enabling all groundwater users to produce water from the basin in a cost-effective manner. The plan includes a monitoring program for groundwater levels, as well as programs for monitoring well construction, abandonment, and destruction.

*City of Corona, Department of Water and Power, Groundwater Management Plan (June 2008)*

The City of Corona prepared a Groundwater Management Plan for the Temescal, Bedford, and Coldwater sub-basins. The conditions of each groundwater basin were described including groundwater levels, production, and quality. Current and projected water demands and supplies were evaluated. Basin management objectives were determined and management strategies were set. Objectives include to:

- Manage the groundwater basin in a sustainable manner
- Prevent substantial water level declines in the Channel Aquifer
- Protect groundwater quality in the unconfined aquifer
- Maintain required outflow at Prado Dam
- Monitor groundwater levels, quality, and storage

*OCWD Groundwater Management Plan (2009 Update)*

The OCWD prepared the Groundwater Management Plan 2009 Update for the Orange County Groundwater Basin to identify key issues related to groundwater management. The three major objectives are to protect and enhance groundwater quality, to protect and increase the Basin's sustainable yield, and to increase the efficiency of operations. Recommendations in the report to proactively manage the Basin include:

- Monitoring water quality and groundwater levels
- Managing groundwater recharge
- Managing groundwater quality by controlling seawater intrusion, evaluating emerging constituents, and preventing future contamination
- Implementing projects to clean up existing contamination problems
- Preparing an integrated demand and supply program

*WMWD Arlington Basin Groundwater Management Plan (September 2012)*

The goal of this Groundwater Management Plan (GWMP) is to provide a planning framework to operate and manage the groundwater basin in a sustainable manner to ensure a long-term reliable supply for beneficial uses among all stakeholders in the basin.

The purpose of this GWMP, including development of the plan and the plan document itself, is to inform the public of the importance of groundwater to the Arlington Basin and the challenges and opportunities it presents; develop consensus among stakeholders on issues and solutions related to groundwater; build relationships among stakeholders within the Arlington Basin and with local, State, and Federal agencies; and define actions for developing project and management programs to ensure the long-term sustainability of groundwater resources in the Arlington Basin. This GWMP provides action items that, when implemented, are designed to optimize groundwater levels, enhance water quality, and minimize land subsidence.

*RPU Riverside Basin Groundwater Management Plan (October 2012)*

The goal of the Riverside Basin Groundwater Management Plan (GWMP) is to provide a planning framework to operate and manage the groundwater basin in a sustainable manner to ensure a long term reliable supply for beneficial uses among all stakeholders in the basin.

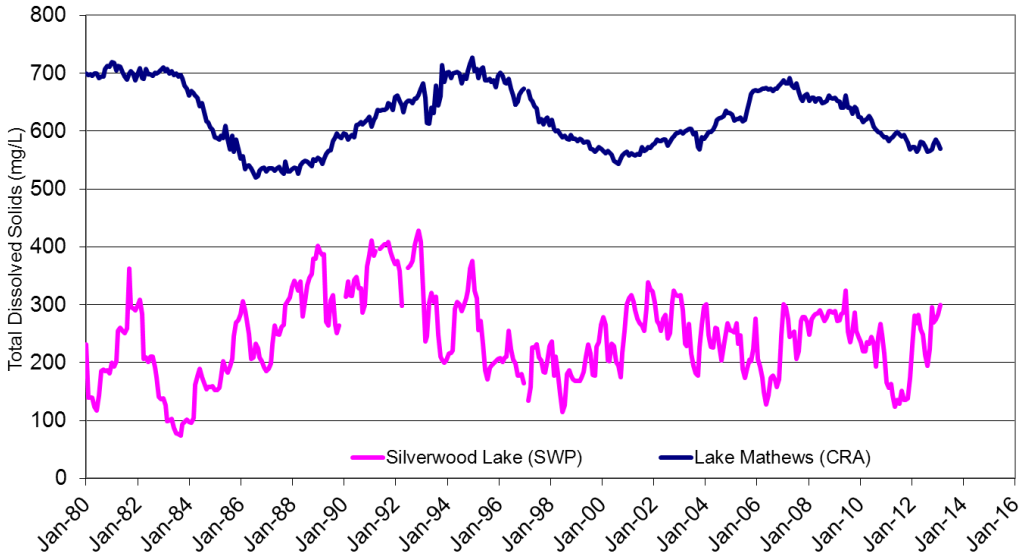
The purpose of this Riverside Basin GWMP, including the development of the plan and the plan document itself, is to inform the public of the importance of groundwater to the Riverside Basin and the challenges and opportunities it presents; develop consensus among stakeholders on issues and solutions related to groundwater; build relationships among stakeholders within the basin and between local, State, and Federal agencies; and define actions for developing project and management programs to ensure the long term sustainability of groundwater resources in the Riverside Basin. This GWMP provides action items that, when implemented, are intended to optimize groundwater levels, enhance water quality, and minimize land subsidence.

## Imported Water Quality

Water agencies in the Santa Ana River Watershed receive imported water from the CRA and the SWP. The majority of this imported supply used by local agencies is received from the Metropolitan. The San Bernardino Valley Municipal Water District and the San Gorgonio Pass Water Agency also provide imported water from the SWP to local agencies within their service areas. The quality of imported water that is used for recharging groundwater directly affects groundwater quality. Since imported water is a significant source of potable water in the region, it affects the quality of discharges from wastewater treatment plants for certain constituents, such as salinity.

CRA and SWP source water is of high quality. This section provides a summary of key water quality constituents within the imported water systems. Source water protection activities aimed at maintaining a safe and reliable imported water supply are described.

## Colorado River



The Colorado River travels approximately 1,400 miles from the Rocky Mountains to its outlet into the Gulf of California in Mexico. The Colorado River Watershed encompasses 242,000 square miles, including portions of seven states–Wyoming, Utah, Colorado, Nevada, New Mexico, Arizona, and California–and portions of Mexico. Several dams and reservoirs along the Colorado River control river flows and Lake Havasu, formed by Parker Dam, serves as the Forebay for Metropolitan's CRA. The CRA, which has a flow capacity of 1,800 cubic feet per second (cfs), spans 242 miles between Whitsett Intake on Lake Havasu and Lake Mathews in Riverside County. The CRA system consists of pumping plants, reservoirs, conveyance infrastructure (i.e., canals, conduits, siphons and tunnels), and an extensive power transmission system. This section describes water quality in the CRA system.

### *Salinity*

Colorado River salinity averages 630 mg/L, with cycles up and down over multiple years based on hydrologic conditions. Salinity changes are gradual over time due to large storage reservoirs along the river such as Lake Mead and Lake Powell. **Figure 5.5-14** shows historical TDS levels at Lake Mathews, the terminal reservoir on the CRA system.

Salinity in the basin is due to both natural sources and anthropogenic activities. Metropolitan's goal is to achieve an annual average salinity concentration of 500 mg/L for treated waters in order to reduce financial impacts to water consumers, impediments to recycling projects, and salt buildup in groundwater basins. This goal has been met primarily by blending Colorado River water with SWP supplies. It is anticipated that there may be periods when this goal cannot be achieved.

**Figure 5.5-14 Imported Water TDS Levels**

### *Nutrients*

Phosphorus is the limiting nutrient for algal growth in the CRA system. Currently there is no regulatory limit for total phosphorus in drinking water. Despite relatively low concentrations (near 0.010 mg/L), any increase can cause algal growth; excessive growth can result in unpleasant taste and odor, filter clogging, organic carbon, and toxins.

Increasing wastewater discharges from the Las Vegas area to Lake Mead may increase nutrient loads in the lower Colorado River system. Metropolitan and other stakeholders work closely with Las Vegas area wastewater agencies who have taken steps to optimize treatment and reduce phosphorus loading.

A large number of septic systems are located near Lake Havasu, the intake for the CRA, and nearby communities have recorded some groundwater well sites with nitrate values well above the MCL. As a result of elevated nitrate levels in groundwater, many communities are converting to centralized wastewater treatment systems. Nitrate levels in recent years at the intake of the CRA have averaged <0.5 mg/L as nitrogen, well below the nitrate MCL of 10 mg/L measured as nitrogen.

### *Perchlorate*

Perchlorate has been detected at low levels in Metropolitan's CRA water supply. In 1997, perchlorate contamination in the Colorado River was traced to Las Vegas Wash, originating from two chemical manufacturing sites in Henderson, Nevada. Under the oversight of the Nevada Division of Environmental Protection, remediation systems were put in place in the late 1990's and since then perchlorate levels in the river have declined. Since 2006, monitoring has typically indicated non-detectable levels (less than 2 µg/L) entering Metropolitan's conveyance system.

### *Uranium*

Uranium is a naturally occurring radioactive element found at low levels in rock, soil, and water. A 16 million-ton pile of uranium tailings from a former uranium mill site near Moab, Utah, lies approximately

750 feet from the Colorado River, approximately 650 miles upstream of the CRA intake at Lake Havasu. Although uranium levels at the intake are much lower than the MCL of 20 pCi/L, averaging 3.2-3.4 pCi/L, there continues to be a looming threat of the tailings being washed directly into the Colorado River during a significant flood or earthquake. This threatens downstream consumers and harms the public's confidence in the safety of this critical water supply. In 2009, the United States Department of Energy began removing the tailings via rail to an engineered disposal cell located 30 miles northwest of the mill tailings pile site. As of April 2013, approximately 5.9 million tons of uranium mill tailings have been removed.

### *Chromium VI*

There is a contaminated groundwater plume located adjacent to the Colorado River near Needles, CA. This plume contains hexavalent chromium (chromium VI), a form of chromium used as an anti-corrosive agent. The chromium VI groundwater plume exists from past waste disposal practices at the Topock Pacific Gas and Electric gas-compressor station. The California Department of Toxic Substances Control is the lead regulatory agency responsible for the investigation and cleanup activities for the site. The project is currently in the design phase and construction is anticipated for completion in 2016. Chromium VI levels in the river downstream of the site have been mostly non-detect (<0.03 µg/L) with an occasional low background level (0.03-0.04 µg/L).

## State Water Project

SWP water originates at Lake Oroville, located on the Feather River, and flows into the Sacramento-San Joaquin Delta from where it is transported through the California Aqueduct to water users in Central and Southern California. The two major sources of freshwater inflow to the Delta are the Sacramento and San Joaquin Rivers which during wet years can exceed flows of 100,000 cfs and 50,000 cfs, respectively. The SWP vastly encompasses the 27,000-square-mile Sacramento River and the 13,000-square-mile San Joaquin River watersheds. Overall, the SWP, which terminates at Lake Perris in Riverside County, consists of a series of pump stations, reservoirs, aqueducts, tunnels, and power plants operated by the DWR. This section describes water quality in the SWP system.

### *Organic Carbon and Bromide*

Total organic carbon (TOC) can originate from decayed plant material and organics from wastewater and urban and agricultural runoff. Seawater intrusion is the primary source of bromide in the Delta and SWP. TOC and bromide in SWP water react with disinfectants during the water treatment process. Some disinfection byproducts are considered carcinogenic and may cause adverse reproductive or developmental effects in animals at very high doses. During the period of record through 2010, TOC levels ranged from <0.1 to 8.4 mg/L and bromide levels ranged from 0.03 to 0.64 mg/L at the intake to the California Aqueduct. Ozone treatment has been added to three of Metropolitan's water treatment plants to reduce the formation of chlorine disinfection byproducts. Metropolitan's other two plants are expected to have ozone treatment online in 2014 and 2016, respectively.

### *Salinity*

Salt in the Sacramento and San Joaquin Rivers originates from natural sources, agricultural discharges, urban runoff and seawater intrusion. Although TDS concentrations in the East Branch of the California Aqueduct averages 250 mg/L, concentrations can vary significantly in response to hydrologic conditions in the Delta watersheds. SWP supplies, significantly lower in TDS concentrations than the Colorado River, are blended with CRA water to reduce the salinity of delivered water. Historical TDS levels at Silverwood Lake, a reservoir along the East Branch of the SWP system, are shown in **Figure 5.5-14**.

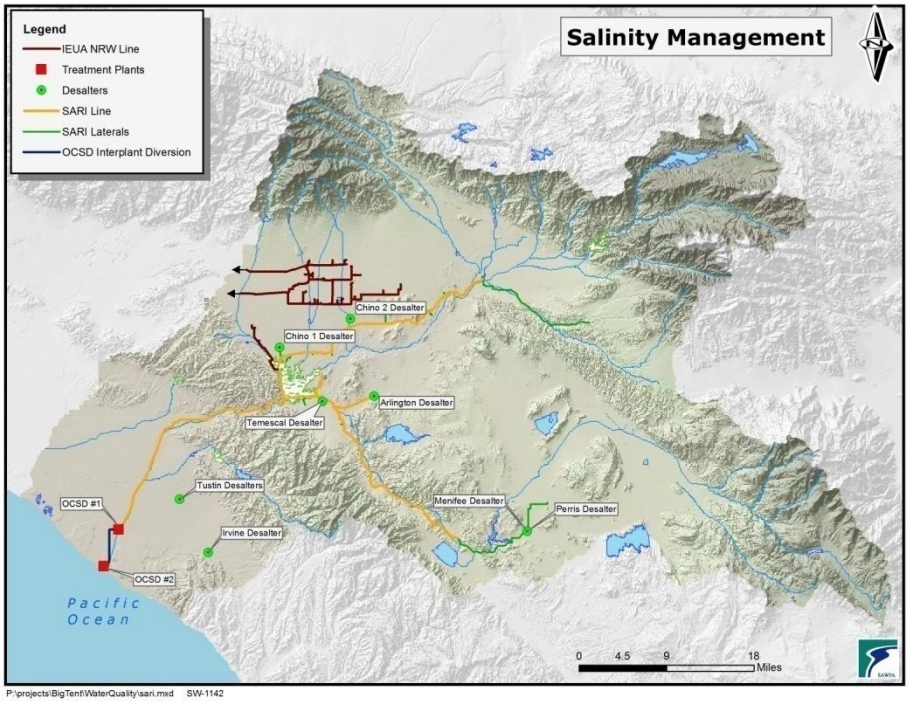
### *Nutrients*

Wastewater discharges and agricultural drainage in the Delta are two primary sources of nutrient loading to the SWP. During the reporting period through 2010, nitrate levels along the California Aqueduct ranged from 0.2 to 7.1 mg/L as nitrate and total phosphorus levels ranged from 0.06 to 0.21 mg/L. Although nitrate levels are well below the MCL of 45 mg/L measured as nitrate, they are higher than those found in the Colorado River. Total phosphorus levels in the SWP are also higher than in the Colorado River.

### *Arsenic*

Arsenic is a naturally occurring element found in rocks, soil, water, and air, and is used in certain agricultural applications, wood preservatives, paints, dyes, and soaps. Of all the regulated inorganic chemicals, arsenic is the most problematic in SWP supplies. Groundwater in the Central Valley which can contain higher arsenic concentrations enters the California Aqueduct through water exchange and banking programs. These programs are managed to protect downstream water quality while also meeting supply targets. Routine monitoring between 1997 and 2010 at key SWP locations recorded maximum concentrations of 6 µg/L. Although levels are still below the MCL of 10 µg/L, increasing coagulant dosages during drinking water treatment may be needed to maintain safe levels for delivered water.

## Salinity and Nutrient Management



As stated earlier in this report, two of the most serious water quality problems in the Santa Ana River Watershed are the buildup of TDS in surface and groundwater and nitrogen levels. Consideration of potential changes to climate, as discussed in **Appendix F2**, includes prediction of an increase in drought conditions in the watershed. One of the most important impacts this may have to the watershed would be an increase in salinity of water resources. This section discusses on-going efforts aimed at achieving and maintaining a salt balance in the watershed, and efforts to manage nitrogen.

### *Salinity Management Facilities*

The Inland Empire Brine Line (Brine Line), formally known as the Santa Ana Regional Interceptor, was built by SAWPA over a period of 25 years (1975-2000) to collect and transport industrial brine that could not be treated at local (inland) wastewater treatment facilities. The section of the 93-mile-long Brine Line that runs above the Riverside-Orange County line (Reaches IV and V) is owned and operated by SAWPA. Reach IV serves the Cities of Riverside, Chino, and San Bernardino; Reach V lies along the Temescal Wash and terminates near the City of Lake Elsinore. In Orange County, the Brine Line (Reaches I, II, and III) is owned by OCSD.

The Brine Line is used to dispose of brine from groundwater desalters, industrial wastewater high in TDS concentrations, water with high nutrient levels, and other domestic and industrial wastewater. The wastewater is treated at OCSD's treatment plant in Huntington Beach prior to discharge to the ocean. Additional brine lines have been constructed by IEUA and the IRWD. Salinity management facilities in the watershed are shown in **Figure 5.5-15**. These facilities are vital to on-going protection of water quality in the watershed.

**Figure 5.5-15 Santa Ana Region Salinity Management Facilities**

In January 2010, SAWPA completed the Phase 1 Salinity Management Plan Technical Memorandum (CDM 2010), which identifies a significant long-term salt imbalance in the watershed (see **Table 5.5-27**). Despite progress made over the years, through the implementation and operation of the Brine Line, groundwater desalters, and other projects and activities with salt reduction have been a primary goal. Much of the discussion in this section is taken from the Phase 1 Salinity Management Plan Technical Memorandum.

Salinity problems are anticipated to exacerbate if no action is taken, as the import of surface water continues, particularly from the Colorado River Aqueduct, which historically has a TDS concentration of 650 mg/L or more; water reuse increases, effectively increasing the salinity of the recycled water supply if demineralization is not provided; and as industrial and commercial growth continues.

In fact, the Salinity Management Plan projects that the seven groundwater management zones in the watershed modeled will exceed Basin Plan TDS standards in the future, as groundwater extraction and saltier water import continues. Five of the seven management zones have some assimilative capacity that will allow them to meet TDS standards for some years (Beaumont, Bunker Hill-B, Chino-North,

Elsinore, and Yucaipa); while the remaining two already are in excess of TDS standards and thus have no assimilative capacity available (Bunker Hill-A and Temescal).

Future salt removal needs in the Watershed will be driven by four main regulatory limits:

- TDS objectives in the Basin Plan
- EPA secondary MCL for TDS in the potable water supply
- TDS discharge limits in the NPDES permits of POTWs
- TDS concentrations in recycled water that exceed the Basin Plan water quality objectives, thus preventing its use for irrigation or recharge in zones with no assimilative capacity

**TDS Objectives in Basin Plan**: As previously mentioned, two of seven management zones in the watershed have no assimilative capacity, and are already in excess of Basin Plan TDS criteria. For the remaining five, it is anticipated that desalination or other mitigation will be required if and when TDS concentration is within 10 mg/L of the standard. It is anticipated that this condition would occur by 2028 for Beaumont, 2016 for Yucaipa, and 2023 for Chino-North.

**EPA Secondary MCL**: The 500 mg/L secondary MCL may be exceeded in the future if mitigation measures are not taken. Potential measures include desalting, blending, importing lower-salinity water, and capturing and recharging more stormwater upstream of supply wells. According to the Salinity Management Plan, at least eight of 59 management zones in the watershed are anticipated to exceed potable water TDS standards and will require action in the future.

**TDS Discharge from POTWs:** Similar to potable water, the Salinity Management Plan estimates likely exceedances of TDS effluent discharge limits by wastewater treatment plants in the Watershed. Plants exceeding NPDES limits, with TDS effluent concentrations in the 490 to 700 mg/L range, will require actions such as desalinating all or a portion of the effluent. According to these estimates, eight out of 12, POTWs in the region will require action at some point over the next 30 years.

**TDS concentrations in recycled water**: TDS concentration in recycled water is a function of the salinity in the original potable water supply (*i.e.*, imported water and/or groundwater), which drives the salinity of effluent and in any salt reduction actions being taken. As described above, salinity issues are anticipated for groundwater basins, potable water supplies, and eventually wastewater effluent. Desalination of all or a portion of effluent may be required in the future in some areas to allow water recycling.

The Salinity Management Plan describes a number of projects planned or ongoing in the watershed that will address salinity issues. These projects include:

- Yucaipa Valley Water District wastewater desalting and reuse
- City of Riverside water supply and wastewater desalination projects
- Western Municipal Water District and City of Corona water supply projects

- Eastern Municipal Water District groundwater desalter expansion and wastewater desalting and reuse

Even with the implementation of these projects, a gap for salt removal remains. The Salinity Management Plan identifies potential long-term options to address the need for additional salt removal, including:

- Best Management Practices (BMPs)
- Desalters for water supply
- Desalters for wastewater
- Zero liquid discharge/evaporative ponds
- Sanitation Districts of Los Angeles (LACSD) Non-reclaimable wastewater system

**Best management practices**: BMP's include source control measures aimed at reducing salt mass balances that would otherwise be discharged to ground or surface waters, or introduced into the wastewater stream. Examples of BMPs include: eliminating salt-based domestic water softening devices, promoting the use of low-salt detergents, addressing salt runoff, and implementing pre-treatment programs.

**Desalters for water supply**: As previously mentioned, there are some agencies whose blended water supply could slightly exceed the 500 mg/L secondary MCL. Agencies potentially could add additional source water desalination because it is cost effective, or because there are limited alternative supplies.

**Desalters for wastewater**: Similar to potable water, some agencies potentially will exceed TDS effluent discharge limits. Agencies could reduce TDS in their effluent by implementing additional source control programs; reducing TDS of source water, as mentioned above; or adding desalination to all or a portion of their effluent stream. Providing advanced treatment to secondary effluent would also increase the possibility of reusing the effluent, including indirect potable water reuse via groundwater recharge or surface storage augmentation.

**Zero liquid discharge**: Some agencies in the watershed are exploring brine concentration projects to reduce the quantity of flows to the Brine Line, while exporting the same amount of salt but at a higher concentration.

**LACSD non-reclaimable wastewater system**: IEUA owns 60 miles of pipelines used to convey high TDS water to an interceptor owned by LACSD for treatment at Carson Treatment Plant and ocean discharge. Capacity is available (approximately six MGD) for additional brine disposal through this system.

The Salinity Management Plan projects a need for future brine exports in the amount of 35.5 MGD, which is approximately 23 percent greater than the nominal capacity of the SARI. This is equivalent to nearly 271,000 tons of salt per year. This amount does not include 2.27 MGD of domestic wastewater discharges that could potentially be eliminated from the SARI.

**Table 5.5-27 Summary Potential Future Brine Export Needs**

| Project | Salt load (tons/yr) Current/ near term | Future | Total | Brine flow (mgd) Current/ near term | 2010-2015 increase | 2015-2025 increase | Beyond 2025 increase | Total |
|---|---|---|---|---|---|---|---|---|
| Water supply | 131,392 | 38,144 | 169,536 | 10.08 | 0.32 | 5.00 | -- | 15.40 |
| Wastewater and recycled water | 8,760 | 69,170 | 77,930 | 1.20 | 0.80 | 11.55 | 0.00 | 13.55 |
| Unspecified desalting [(1)] | -- | 24,006 | 24,006 | -- | -- | -- | 3.74 | 3.74 |
| Other | | | | | | | | |
| Domestic wastewater | -- | Remove | 0 | 2.27 | 0.00 | Remove (-2.27) | 0.00 | 0.00 |
| Direct industrial connection and waste haulers | -- | -- | 0 | 0.69 | 0.50 | 1.00 | 0.60 | 2.79 |
| **Total** | **140,152** | **131,320** | **271,472** | **14.24** | **1.62** | **15.28** | **4.34** | **35.48** |

The Phase 2 SARI Planning Technical Memorandum (CDM, May 10, 2010), complements the Salinity Management Plan, as well as identified strategies and their associated cost to address the anticipated deficit in the capacity of the Brine Line. Six potential reconfigurations of the Brine Line system were considered:

1. *Baseline*: Continue use of current configuration in which the Brine Line flows to OCSD POTWs prior to ocean discharge.

2a. *Centralized in-line brine minimization*: All water flows are diverted from the Brine Line to a centralized facility with biological treatment and desalination. Concentrate will flow back to the Brine Line, and in turn to OCSD and the ocean.

2b. *Decentralized brine minimization*: Groundwater desalters implement further concentrate management via secondary RO process, thus reducing flows to the Brine Line.

3a. *Direct ocean discharge with brine minimization*: Groundwater desalters implement further concentrate management via secondary RO process, and discharge directly to a new parallel

pipeline to the ocean. Pretreatment will be required for some discharges to keep BOD concentrations below 30 mg/L.

3b. *Direct ocean discharge without brine minimization*: Groundwater desalters discharge brine without further concentration directly to a new parallel pipeline to the ocean. Pretreatment will be required for some discharges to keep BOD concentrations below 30 mg/L.

4. *Salton Sea discharge*: A new 125-mile pipeline from south of Prado Dam to the Salton Sea is built to transport all Brine Line flows, with no treatment at OCSD.

SAWPA prepared the Brine Line Market Analysis (EEC August, 2009) to gain an understanding of how the use of the Brine Line by industry and other brine dischargers could be increased to increase revenue and reduce cost to all users. Several factors impacting the use of the Brine Line were identified, along with potential solutions. SAWPA believes that a stronger marketing effort is needed to convey to potential users the value they will receive from discharging brine to the Brine Line when compared to other alternatives, SAWPA estimates that waste disposal to the Brine Line costs approximately $0.05 per gallon, compared to a cost of $0.25 per gallon of discharging to other alternatives in the Los Angeles basin.

## Colorado River Basin Salinity Control Forum

The Colorado River Basin Salinity Control Forum, established by the Colorado River Basin states in 1973, has developed projects to meet agreed-upon numeric criteria along the lower Colorado River. The Salinity Control Program projects include improving agricultural irrigation practices in the upper Colorado River Basin and reducing salinity from natural sources. The Federal government and Colorado River Basin states, contribute approximately $50 million annually for this effort.

**Basin Monitoring Program Task Force**

On January 22, 2004, the Regional Board approved the Basin Plan Amendment for Nitrogen and TDS. Approximately 20 specific agencies throughout the watershed were charged with the responsibility to conduct several monitoring and analyses programs for nitrogen and TDS. These requirements included the preparation of an annual water quality report for the SAR and a triennial report to determine the ambient water quality (Nitrogen and TDS) in each groundwater management zone. To cost-effectively prepare these reports, a task force, which included the Regional Board, was convened in 2004 with SAWPA as the administrator to conduct the data gathering, consultant support and river analyses programs.

In 2009, the State Board adopted a “Policy for Water Quality Control for Recycled Water” that required the development of salt and nutrient management plans for all groundwater basins in the State. The basin monitoring program approved by the Santa Board in 2004 satisfies the requirements in the State Recycled Water Policy and as such as been determined to be in conformance with that policy.

## Southern California Salinity Coalition

The Southern California Salinity Coalition (SCSC; www.socalsalinity.org) was formed in 2002 to address the critical need to control salinity in water supplies and to protect the water resources in California from increasing salinity. SCSC's purpose is to coordinate salinity management strategies and programs, including research projects, with water and wastewater agencies throughout Southern California. Members of the coalition include major water and sewer districts in San Bernardino, Riverside, Orange, Los Angeles, and San Diego Counties; the National Water Research Institute; and SAWPA. SCSC's objectives are to:

- Establish proactive programs to address the critical need to remove salts from water supplies
- Preserve, sustain, and enhance the quality of source water supplies
- Support economic development
- Help drought-proof the community
- Reach out to the general public on salinity problems

## Future Issues

Due to increased water usage, irrigation and agricultural use, and other activities, the control of salinity will continue to be a challenge for the region. Inland desalination studies of brackish water must be funded as well as construction of facilities for concentrate disposal and management to help address salinity issues. The use of high quality imported water and region-wide planning to promote BMPs for reducing runoff impacts will continue to be essential. Managing salinity inputs to wastewater collections from water softeners also is an important factor in protecting water quality and maintaining the ability to use recycled water.
