Funds collected by MWD (through penalty rates) will be applied towards investments in conservation and local resources development within the service area of the Member Agency that incurs the penalties. MWD will assess penalties at the end of the twelve-month allocation period and currently proposes to provide Member Agencies with three months to pay any penalties that are incurred.

If the MWD WSAP is implemented by MWD and IEUA is assessed penalties, IEUA will enact penalty rates consistent with the MWD WSAP and the IEUA Drought Plan pursuant to IEUA Ordinance 70, Division II, Part II, Section 201. IEUA will not assess penalties if the whole IEUA service area is in compliance with its MWD WSAP allocation after the July 2009 – June 2010 period, even though WFA, CVWD or possibly FWC may exceed its IEUA Drought Plan allocation. This is consistent with IEUA's historic Tier 1 and Tier 2 billing procedures.

**Table 9. MWD Penalty Rates under MWD Water Supply Allocation Plan**

| Standard MWD Penalty Rates | | | |
|---|---|---|---|
| **Water Use** | Base Water Rate | Penalty Rate | Total Rate |
| **100% of Allocation** | Tier 1 | 0 | Tier 1 |
| **Between 100% and 115%** | Tier 1 | 2 x Tier 2 | Tier 1 + (2 x Tier 2) |
| **Greater Than 115%** | Tier 1 | 4 x Tier 2 | Tier 1 + (4 x Tier 2) |

### 3.7 IEUA Billing Under an MWD Allocation

If the MWD WSAP is implemented by MWD, IEUA's monthly billing process will remain the same. At the end of the twelve-month allocation period, IEUA will receive from MWD an invoice that includes an assessment of penalties if IEUA's 2009 MWD WSAP allocation has been exceeded. IEUA will summarize WFA, CVWD and FWC total imported water purchases based upon the monthly MWD invoices to IEUA and determine whether either agency exceeded its individual allocation. Based on this determination, IEUA will assess penalties in accordance with IEUA's adopted Ordinance 70, but only if IEUA is assessed a penalty from MWD. If penalties are incurred, IEUA will allow payment of these penalties, consistent with the MWD WSAP, to be spread over three monthly billing periods. IEUA will work as needed with each member agency to develop an appropriate payment schedule.

MWD has an administrative procedure for reviewing and making changes to the MWD WSAP allocation based upon loss of local supplies and other extraordinary conditions. IEUA will work with the Member Agencies and MWD to ensure that any changes to the MWD WSAP allocation are appropriately considered before penalties are assessed to any agency within the IEUA service area.

### 3.8 IEUA Tracking and Reporting

Consistent with current IEUA practice and the requirements of the MWD WSAP and the DYY Program, Member Agency imported water purchases and local water use will be summarized and reported on a monthly basis. This information will help IEUA and its Member Agencies to monitor and evaluate water use demands, project annual usage and avoid any over usage that would result in MWD WSAP and DYY Program penalties. IEUA will rely on the full cooperation of Member Agencies to collect monthly water demand and supply information in a timely manner.

### 3.9 Revisiting the IEUA Drought Plan

Principal objectives in the development of the IEUA Drought Plan are to ensure equity and fairness throughout IEUA's service area. However, due to the complexity of these issues and the possibility that unforeseen circumstances may occur, IEUA offers the opportunity to review and refine components of this plan as appropriate.

IEUA and the Member Agencies will continue to meet regularly during the next year to monitor DYY Program and MWD WSAP performance and will have the opportunity to revisit the plan and offer any recommendations to the IEUA Board that will improve the method, calculation, and approach of this plan.

Metropolitan has a similar process which will allow opportunity to review the MWD WSAP as approved.

## Section 4 – Summary

In February 2008, in anticipation of possible water supply shortages, the MWD Board of Directors adopted the Water Supply Allocation Plan (MWD WSAP). The MWD WSAP provides guidance for allocating limited water supplies to Member Agencies should the need arise. MWD is closely monitoring water supply conditions. If it is determined the MWD WSAP needs to be implemented, this decision will be made by the MWD Board of Directors on April 14, 2009, and the plan would go into effect July 1$^{st}$, 2009.

The Inland Empire Utilities Agency (IEUA) Drought Plan was developed for the purpose of implementing the MWD WSAP within the IEUA's service area in a manner that is fair and equitable to IEUA's Member Agencies. The IEUA Drought Plan is an extension of the MWD WSAP. All MWD WSAP definitions, policies, principals and program provisions are incorporated here by reference and are considered to be a part of the IEUA Drought Plan. A complete copy of the adopted MWD WSAP is provided as Appendix A.

IEUA's Drought Plan is consistent with and contributes to the existing IEUA policies and programs. For example, the plan's principles encourage development and full utilization of local water resources, such as recycled water, and extraordinary conservation measures. The plan also addresses MWD's DYY Program and the need for best management of the DYY Program "shift" obligations in concurrence with the MWD WSAP reductions of imported water supplies to IEUA.

# APPENDIX L

## Retail Agency Drought Plans

ORDINANCE NO. 286

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF CHINO HILLS, CALIFORNIA, REPEALING CHAPTER 13.08 WATER CONSERVATION AND ORDINANCE NO. 214 OF THE CHINO HILLS MUNICIPAL CODE IN ITS ENTIRETY, AND ESTABLISHING A NEW CHAPTER 13.08 WATER CONSERVATION OF THE CHINO HILLS MUNICIPAL CODE AND FINDING THAT THIS PROJECT IS EXEMPT FROM REVIEW UNDER THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF CHINO HILLS DOES HEREBY ORDAIN AS FOLLOWS:

SECTION 1. The City Council does hereby make the following findings of fact:

a. It is necessary to repeal the exisiting Chapter 13.08 Water Conservation and Ordinance No. 214 as both no longer comply with State of California regulations and current water enacted requirements.

b. It is necessary to establish a new Chapter 13.08 Water Conservation in its stead so as to comply with California State Water Resources Control Board Regulations as adopted on May 5, 2015.

c. It is necessary to minimize the potential for water shortage through the practice of water conservation pursuant to California Water Code § 375 et seq., based upon the need to conserve water supplies and to avoid or minimize the effects of any future shortage.

d. It is further necessary to reduce the potential effect of a water shortage on the residents, businesses and visitors of Chino Hills and to adopt provisions that will significantly reduce the inefficient consumption of water, thereby extending the available water resources necessary for the domestic, sanitation, and fire protection of the community to the greatest extent possible.

e. On January 17, 2014, the Governor issued a proclamation of a state of emergency under the California Emergency Services Act based on drought conditions.

f. On April 25, 2014, the Governor issued a proclamation of a continued state of emergency under the California Emergency Services Act based on continued drought conditions.

g. On April 1, 2015, the Governor issued an Executive Order that, in part, directs the Califonia State Water Resources Control Board to impose restrictions on water suppliers (including the City of Chino Hills) to achieve a statewide 25 percent reduction to potable urban usage through February 28, 2016.

h. The drought conditions that formed the basis of the Governor's emergency proclamations continue to exist.

i. The present year is critically dry and has been immediately preceded by two or more consecutive below normal, dry, or critically dry years.

j. The drought conditions will likely continue for the foreseeable future and additional action by both the California State Water Resources Control Board and local water suppliers will likely be necessary to prevent waste and unreasonable use of water and to further promote conservation.

k. On May 5, 2015, the California State Water Resources Control Board adopted California Code of Regulations, title 23, section 866 and re-adopted sections 863, 864, and 865 that requires, among other things, that, beginning June 1, 2015, the City of Chino Hills reduce its total potable water production by 28 percent for each month as compared to the amount used in the same month in 2013.

l. California Water Code section 375 et seq. empower any public entity which supplies water at retail or wholesale to adopt and enforce a water conservation program to reduce the quantity of water used by those within its service area after holding a public hearing and making appropriate findings of necessity for the adoption of a water conservation program.

m. Pursuant to California Water Code Section 375, on May 16, 2015, the City published notice in the Chino Champion, a regularly published newspaper, providing notice of the time and place of the May 26, 2015 public hearing on the proposed ordinance. A duly noticed public hearing before the City Council was conducted on May 26, 2015, at which time all interested persons were given an opportunity to testify.

n. Based on the facts noted above, and all other facts presented to the City Council, this ordinance is adopted for the immediate preservation of the public peace, health or safety and is passed by no less than a four-fifths vote of the City Council.

SECTION 2. The City Council finds that this ordinance is exempt from review under the California Environmental Quality Act (California Public Resources Code §§ 21000, et seq., "CEQA") and CEQA regulations (Title 14 California Code of Regulations §§ 15000, et seq.) because it consists of the operation of existing facilities involving no expansion of use and consists of actions taken to assure the maintenance, protection

and enhancement of natural resources and the environment. Consequently, it is categorically exempt from further CEQA review under California Code of Regulations Title 14, §§ 15301, 15307 and 15308.

SECTION 3. That Chapter 13.08 Water Conservation of the Chino Hills Municipal Code and Ordinance No. 214 are hereby repealed in their entirety.

SECTION 4. That Chapter 13.08 Water Conservation of the Chino Hills Municipal Code is hereby adopted and shall read as follows:

## Chapter 13.08
## WATER CONSERVATION

**Sections:**

**13.08.010 - Findings of Necessity.**

It is necessary to minimize the potential for water shortage through the practice of water conservation pursuant to California Water Code § 375 et seq., based upon the need to conserve water supplies and to avoid or minimize the effects of any future shortage. It is further necessary to reduce the potential effect of a water shortage on the residents, businesses and visitors of Chino Hills and to adopt provisions that will significantly reduce the inefficient consumption of water, thereby extending the available water resources necessary for the domestic, sanitation, and fire protection of the community to the greatest extent possible. Nothing in this chapter shall prevent the City from also declaring a water emergency pursuant to Water Code Section 350.

**13.08.020 - Water Customer.**

Water customer, for the purposes of this chapter, shall mean any person, partnership, business, corporation, or association or legal entity to whom the City of Chino Hills (City) supplies water or user of water supplied by the City.

**13.08.030 - Application.**

This chapter shall be applicable to all water customers.

**13.08.040 - Exceptions and Exemptions.**

A. **Exceptions**. The City Manager or his/her designee shall grant an exception from the requirements of this chapter for any of the following reasons:
   1. Water use is necessary for public health and safety; or
   2. Recycled water is being used; or
   3. Water use is necessary due to the medical needs of the water customer.

B. **Exemptions**. The Public Works Commission may grant an exemption to the requirements of this chapter, with or without conditions, if it determines that a water customer would otherwise experience extreme financial

hardship that cannot be mitigated. The Public Works Commission shall review any requests for an exemption from compliance with this chapter. A written request for an exemption must be submitted to the Public Works Department a minimum of two weeks prior to the Commission meeting at which the exemption is to be considered. If appropriate, the Public Works Commission may require the customer granted an exemption to reduce water use by other appropriate alternative methods. A decision of the Public Works Commission may be appealed to the City Council in accordance with Chino Hills Municipal Code Section 1.20.010. The City Council may establish by resolution an "exemption processing fee."

**13.08.050 - Authorization.**

The City Council may declare the conservation stage based on any of the following circumstances:

- Issuance of a water emergency executive order by the Governor of California; or
- Adoption of certain regulations by the California State Water Resources Control Board; or
- Major interruptions in water supply from Metropolitan Water District, the Inland Empire Utilities Agency or any other major water supplier to the City; or
- Occurrence of a major water emergency emanating from a natural or man-caused disaster.

As declared, the City Council shall see to the enforcement of all prohibitions and restrictions as outlined in the following four stages:

Stage 1 - Voluntary Water Conservation Alert;
Stage 2 - Moderate Water Conservation Alert;
Stage 3 - High Water Conservation Alert; and
Stage 4 - Severe Water Conservation Alert

**13.08.060 - Stage I Voluntary Water Conservation Alert.**

Chino Hills water customers are requested to voluntarily limit the amount of water used from March 1st through October 31st of each year to the amount absolutely necessary for health, safety, business, and irrigation. During Stage 1, all elements of the prohibitions and restrictions for moderate, high and severe conservation alerts shall apply on a voluntary basis.

**13.08.070 - Stage II Prohibitions and Restrictions — Moderate Water Conservation Alert.**

The following restrictions and exceptions shall be applicable during a Moderate Water Conservation Alert as declared by the City Council, whenever the City's water supply is anticipated to be reduced by up to ten (10) percent, and voluntary conservation does not achieve the desired reduction, or whenever any of the

conditions noted under Section 13.08.050 are met requiring conservation measures noted in this stage:

A. Sprinkling or irrigating any shrubbery, trees, lawns, grass, groundcovers, plants, vines, gardens, vegetables, flowers, or any other landscaped or vegetated areas between the hours of 9:00 a.m. and 6:00 p.m. This provision shall not apply to equestrian and livestock businesses, dairies, nurseries, golf courses, or other water dependent industries;
B. Applying potable water to outdoor landscapes in a manner that causes runoff such that water flows onto adjacent property, non-irrigated areas, private and public walkways, roadways, parking lots, or structures;
C. Applying potable water to any hard surface, including but not limited to driveways, sidewalks, parking areas, asphalt, patios, porches, verandas;
D. Permitting water to leak on any premises. Such leak shall be repaired in a timely manner after notification by the City, but in no case in excess of forty-eight (48) hours after notification;
E. Serving of drinking water other than upon request in eating or drinking establishments, including but not limited to restaurants, hotels, cafes, cafeterias, bars, or other public places where food or drink are served and/or purchased;
F. Using potable water in a non-residential fountain or other decorative water feature, except where the water is part of a recirculating system;
G. Using water from fire hydrants shall be limited to fire fighting and related activities necessary to maintain the public health, safety, and welfare. An exception may be made for construction use through a proper City-designated meter where recycled water is not available;
H. Permitting noncommercial washing of privately owned livestock, vehicles, trailers, buses or boats, except from a bucket and/or a hand-held hose equipped with a shut-off nozzle used for a quick rinse; and
I. Using a hand held hose that dispenses potable water without a shut-off valve. Such use shall not be in conflict with any provision within this code.

**13.08.080 - Stage III Prohibitions and Restrictions — High Water Conservation Alert.**

The following restrictions and exceptions shall be applicable during a High Water Conservation Alert as declared by the City Council whenever the City's water supply is anticipated to be reduced by more than ten (10%) percent and up to twenty-five (25%) percent or whenever any of the conditions noted under Section 13.08.050 are met requiring conservation measures noted in this Stage:

A. All prohibitions and restrictions in Section 13.08.070 shall be in effect;
B. All residential customers shall be limited in the outdoor use of water for sprinkling, watering, or irrigating any shrubbery, trees, lawns, grass, groundcovers, plants, vines, gardens, vegetables, flowers, or any other landscaped or vegetated areas to a two days per week schedule based on street address. Designated days of irrigation: Residential addresses ending in an even number may use water on Wednesdays and Saturdays and

residential addresses ending in an odd number may use water on Thursdays and Sundays. All such irrigation may only occur between 12:01 a.m. and 9:00 a.m. or between 6:00 p.m. and 12:00 a.m. and shall not exceed fifteen (15) minutes per watering-station, except for drip or micro-spray irrigation systems which shall not exceed 30 minutes per station. No irrigation shall occur between the hours of 9:00 a.m. and 6:00 p.m.;

C. Non-residential customers, including commercial nurseries, golf courses, institutions and other water dependent industries shall be prohibited from watering lawns, landscapes, or other turf areas more than twice per week. Such irrigation may only occur on Tuesdays and Fridays between 12:01 a.m. and 9:00 a.m. or between 6:00 p.m. and 12:00 a.m. and shall not exceed fifteen (15) minutes per watering-station during assigned days, except for drip or micro-spray irrigation systems which shall not exceed 30 minutes per station. No irrigation shall occur between the hours of 9:00 a.m. and 6:00 p.m. Entities using recycled water are exempted from this prohibition for their recycled water use. However, such entities are not exempted for their potable water use. Alternatively, non-residential customers may be exempted from this prohibition by reducing their potable water usage by 28 percent from their usage in 2013;
D. The outside irrigation of landscapes with City-supplied potable water for new construction of homes and buildings in a manner inconsistent with regulations or other requirements established by the California Building Standards Commission;
E. The application of potable water to outdoor landscapes during and within 48 hours after measurable rainfall is prohibited. Measureable rainfall is defined as rainfall of one tenth of an inch (1/10") or more falling within a forty eight (48) hour period;
F. To promote water conservation, operators of hotels and motels shall provide guests with the option of choosing not to have towels and linens laundered daily. The hotel or motel shall prominently display notice of this option in each guestroom using clear and easily understood language;
G. Swimming pool refilling or new-construction swimming pool filling shall be limited to the same days as set forth in subsection B for outdoor use of water;
H. Washing of vehicles or boats is prohibited except:
    1. When using a hose that is equipped with a shut-off valve; or
    2. When washed in either an automatic or manual commercial car wash. Notwithstanding the above, temporary car washes held for fundraising purposes are prohibited;
I. Use of misting systems, commonly used in business establishments for cooling purposes, are prohibited;
J. Use of potable water for dust control is prohibited where recycled water is readily available for connection by the property owner.

**13.08.090 - Stage IV Prohibitions and Restrictions—Severe Water Conservation Alert.**

In the event of a major earthquake, large-scale fire, or other so called "Act of Nature" which could have serious impacts on the City's total available water storage capacity, whether storage capacities have been reduced or not, or in the case of a reduction in City water supply anticipated to be more than twenty-five (25%) percent or whenever any of the conditions noted under Section 13.08.050 are met requiring conservation measures noted in this Stage, a Severe Water Conservation Alert shall be declared by the City Council. The following conservation measures shall apply:

A. All previous restrictions noted in Sections 13.08.070 and 13.08.080 shall be in effect;
B. There shall be no outdoor use of water at any time, including the use of a hand-held hose with shut-off valve;
C. All decorative fountains, decorative (i.e., non-swimming) pools shall be drained and made dry. Such fountains and pools shall not be refilled until the City has returned to a Stage III water conservation stage. Fountains, ponds or pools that are filled with recycled water are not subject to this provision. Decorative ponds that contain fish as a feature shall be exempt from this restriction as long as the system is maintained in good working order with measures taken to reduce the volume of makeup water required for evaporative losses; and
D. No commitments shall be made to provide water service as part of any new land use entitlement (general plan, specific plan or amendments requesting new water allocations) until the City has returned to a stage three drought restriction. Currently approved specific plans with accompanying development agreements and projects or properties that have received water allocations in advance of full entitlements may be issued building permits so long as they comply with the remainder of this chapter.

**13.08.100 - Penalties.**

A. No water customer of the City shall knowingly use, or permit the use of, water in a manner contrary to any provision of this chapter, or in an amount in excess of that use permitted by the provisions of this chapter;
B. Unless otherwise provided, any water customer violating any provision of this chapter shall be guilty of an infraction or misdemeanor as specified in this section, and each day or portion thereof such violation, which is in existence, shall be a new and separate offense;
C. Any violation of this chapter is deemed an infraction, punishable as provided in Section 1.36.020 of this code. Subsequent violations shall also be punished as provided in Section 1.36.020 of this code;
D. Notwithstanding the above, the City Attorney or Deputy District Attorney may charge and prosecute second and subsequent offenses as misdemeanors at the City's sole discretion pursuant to California Water Code § 377. In addition to the above penalties, the City may file an action

for civil abatement and, at the discretion of the court, be entitled to reimbursement for all necessary costs and attorney's fees incurred through investigation, discovery, analysis, inspection, abatement and other actual costs incurred by the City or its agents pertaining to the violation;

E. The court shall fix the amount of any such reimbursements upon submission of proof of such costs by the City. Payment of any penalty provided in this section shall not relieve a person, firm or corporation, or other entity from the responsibility of correcting the condition resulting from the violation; and

F. In addition to the above remedies, the City Manager or his/ her designee is empowered, to enforce any or all of the following penalties:
   1. Place a flow restricting device upon the water service;
   2. Lock off a water meter;
   3. Remove a water meter; and
   4. Shut off the service connection.

All costs or expenses incurred by the City for enforcement of this section shall be borne by the water customer. No water service shall be limited or discontinued until the City Manager or his/her designee provides a written notice of intent to so limit or discontinue such service and the reasons for such decision, and further, provides such water customer notice of the right to request an administrative review and hearing pursuant to the procedures set forth in Section 1.18.090 of this code, except that any reference to "citation" in that section shall instead be deemed a reference to a "notice of intent" as described in this section. A written notice of intent shall be provided either by first class mail, by personal service to the water customer, or by posting said notice in a conspicuous place on the property wherein the violation occurred. Notwithstanding any other provision of this code, there shall be no right to further administrative review or appeal.

**13.08.110 - Compliance.**

Any City Code Enforcement Officer, Utility Conservation Coordinator and any other employee designated by the City Manager shall enforce the provisions of this chapter.

**13.08.120 – Implementing policies.**

The City Manager is authorized to promulgate policies and procedures to implement this chapter.

SECTION 4. If any section, subsection, subdivision, sentence, clause, phrase, or portion of this Ordinance is, for any reason held to be invalid or unconstitutional by the decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of this Ordinance. The City Council hereby declares that it would have adopted this Ordinance, and each section, subsection, subdivision, sentence, clause, phrase, or portion thereof, irrespective of the fact that any one or

more sections, subsections, subdivisions, sentences, clauses, phrases, or portion thereof be declared invalid or unconstitutional.

SECTION 5. Upon the effective date of this Ordinance, the provisions hereof shall supersede any inconsistent or conflicting provisions of the San Bernardino County Code as the same were adopted by reference by City Ordinance Nos. 91-01 and 92-02.

SECTION 6. This Ordinance must be broadly construed in order to achieve the purposes stated in this Ordinance. It is the City Council's intent that the provisions of this Ordinance be interpreted or implemented by the City and others in a manner that facilitates the purposes set forth in this Ordinance.

SECTION 7. Repeal of any provision of the Chino Hills Municipal Code does not affect any penalty, forefeiture, or liability incurred before, or preclude prosecution and imposition of penalties for any violation occurring before, this Ordinance's effective date. Any such repealed part will remain in full force and effect for sustaining action or prosecuting violations occurring before the effective date of this ordinance.

SECTION 8. The City Clerk shall certify as to the adoption of this Ordinance and shall cause a summary thereof to be published within ten (10) days of the adoption and shall post a certified copy of this Ordinance, including the vote for and against the same, in the Office of the City Clerk, in accordance with Government Code Section 36933 and Water Code Section 376.

SECTION 9. This ordinance will become effective upon its passage and adoption as provided in Water Code Section 376, subdivision (a).

PASSED, APPROVED AND ADOPTED this 9th day of June, 2015.

CYNTHIA MORAN, MAYOR

ATTEST:

CHERYL BALZ, CITY CLERK

APPROVED AS TO FORM:

MARK D. HENSLEY, CITY ATTORNEY

STATE OF CALIFORNIA )
COUNTY OF SAN BERNARDINO ) ss
CITY OF CHINO HILLS )

I, CHERYL BALZ, City Clerk of the City of Chino Hills, DO HEREBY CERTIFY that Ordinance No. 286 was duly introduced at a regular meeting held May 26, 2015; and adopted at a regular meeting of the City Council held on the 9th day of June, 2015 by the following roll call vote, to wit:

| | | |
|---|---|---|
| AYES: | COUNCIL MEMBERS: | MORAN, BENNETT, GRAHAM, MARQUEZ, AND ROGERS. |
| NOES: | COUNCIL MEMBERS: | NONE |
| ABSENT: | COUNCIL MEMBERS: | NONE |

CHERYL BALZ, CITY CLERK

(SEAL)

I hereby certify that the foregoing is the original of Ordinance No. 286 duly passed and adopted by the Chino Hills City Council at their regular meeting held on June 9, 2015, and that Summaries of the Ordinance were published on May 30, 2015 and June 13, 2015 in the Chino Hills Champion newspaper.

CHERYL BALZ, CITY CLERK

(SEAL)

AFFIDAVIT OF POSTING

STATE OF CALIFORNIA )

ORDINANCE NO 2009-04

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF CHINO, CALIFORNIA, AMENDING CHAPTER 13 05 (ORDINANCE NO 91-21) OF THE CHINO MUNICIPAL CODE

The City Council of the City of Chino hereby does ordain as follows:

Section 1. Chapter 13.05 of the Chino Municipal Code hereby is amended in full and it shall read as follows:

Chapter 13.05

WATER CONSERVATION

Sections:

13.05.010 Purpose and Policy
13.05.020 City Council Authority
13.05.030 Definitions
13.05.040 Applicability
13.05 050 Party Responsible for Compliance
13 05.060 Adequate Water Supply Conditions – Permanent Measures
13.05 070 Stage 1 Water Shortage – Restrictions to Take Effect
13.05.080 Stage 2 Water Shortage – Restrictions to Take Effect
13.05.090 Stage 3 Water Shortage – Restrictions to Take Effect
13 05 095 General Provisions
13 05 100 Exceptions to Provisions
13 05.105 Exemptions from Provisions
13.05.110 Hardship and Special Cases – Implementation/Review Board
13.05.120 Failure to Comply – Violation/Penalty

**13.05.010 Purpose and Policy**

It is declared that because of the water conditions prevailing in the State of California, the statewide drought and the declared policy of the state, it is necessary and appropriate for the City to adopt and implement a water conservation program to reduce the quantity of water used by persons in the city Furthermore, the general welfare requires the reasonable and efficient use of the City's water resources, the waste or unreasonable use of water to be prevented, and the implementation of water conservation measures that will reduce water consumption within the City's service area.

**13.05.020 City Council Authority**

A. The City Council shall authorize and direct implementation of the applicable provisions of this chapter upon determination that such implementation is necessary to

protect the public health, welfare and safety, or when the demand for water consumption threatens to exceed the City's available supply of potable water to the customer

B. When any water shortage stage of this chapter is declared by resolution of the City Council, the specific level called for shall be made by public announcement and shall be published at least twice in a newspaper of general circulation and shall become effective immediately on the date specified in the newspaper publications. When any other water shortage stage is declared or the drought conditions no longer exist, then publication of the applicable portion of this chapter, or a statement stating that the drought conditions no longer exist, shall be published an additional two times.

**13.05.030 Definitions**

Unless the context specifically indicates otherwise, the following terms and phrases, as used in this chapter, shall have the meanings hereinafter designated:

A. "City Council" means the Council of the City of Chino

B. "Conservation Offset" means the implementation of proven conservation techniques which, when installed, will result in no additional demand on water supplies.

C "Customer" means any person, persons, association, corporation, or governmental agency supplied and/or billed for water service by the City

D "Graywater" means untreated household wastewater which has not come into contact with toilet waste. Graywater includes used water from bathtubs, showers, bathroom wash basins, and clothes washing machines.

E. "Potable Water" means water which is suitable for drinking.

F "Recycled Water" means treated domestic water (effluent) from a wastewater treatment plant that is suitable for a direct beneficial use or a controlled use that would not otherwise occur

G. "Single Pass Cooling Systems" means equipment where water is circulated only once to cool equipment before being disposed.

H. "Water Shortage" means a determination by the City in consideration of the existing conditions of water production and/or an announcement by any state water agency, the Metropolitan Water District of Southern California, or any of its water suppliers.

**13.05.040 Applicability**

The provisions of this chapter shall apply to all persons, customers, or property, wherever situated, utilizing water provided by the City

**13.05.050 Party Responsible for Compliance**

A. For purposes of this chapter, it shall be presumed that a person, corporation or association in whose name the water service account with the City is or was last billed or who is receiving the economic benefit of said water supply will be responsible for complying with this chapter

B. For the purpose of this chapter, a use of water by a tenant or by an employee, agent, contractor or other acting on behalf of a customer, whether with real or ostensible authority, shall be imputed to the customer

**13.05.060 Adequate Water Supply Conditions – Permanent Measures**

The following activities are hereby prohibited at all times:

A. Allowing irrigation water to run off into a gutter, ditch, drain, driveway, sidewalk, street or onto pavement or other hard surface.

B. Outdoor irrigation of landscape for more than fifteen (15) minutes of watering per day per station. This restriction does not apply to landscapes that utilize drip irrigation systems.

C. Automated irrigation of landscape during the hours of six a.m. to eight p.m. Customers are encouraged to avoid the use of sprinklers on windy days. Irrigation by hand held hoses with automatic shutoff nozzles, drip irrigation, or hand held buckets is permitted anytime.

D Outdoor irrigation of landscape on rainy days.

E. Washing down hard or paved surfaces, including but not limited to sidewalks, walkways, driveways, parking areas, patios, and alleys, except when necessary to alleviate safety or sanitary hazards.

F Excess use, loss or escape of water through breaks, leaks, or other malfunctions in the plumbing system or distribution system for any period of time after such escape of water should have reasonably been discovered and corrected.

G. Washing of automobiles, trucks, trailers, boats, airplanes, and other types of mobile equipment, unless done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses.

H. Restaurants serving water to their customers, except when specifically requested by their customers.

I Operating a decorative water fountain or feature, built or installed after the adoption of this ordinance, that does not include re-circulated water

J. Operating a commercial car wash or laundry, built or installed after the adoption of this ordinance, that does not use re-circulated water

K. Operating a single-pass cooling system built or installed after the adoption of this ordinance.

**13.05.070 Stage 1 Water Shortage – Restrictions to Take Effect**

The following additional measures shall take effect upon a declaration by the City Council that needed supplies are anticipated to be reduced approximately ten percent or less. Upon this declaration, the following restrictions shall apply to all customers or persons who use the water utility of the City·

A. Restaurants shall not use non-conserving dish spray valves.

B. Ornamental lakes or ponds shall not be filled or refilled with potable water, except to the extent needed to sustain aquatic life.

C Outdoor irrigation of landscape with potable water will only be allowed every other day from May 1st through September 30th.

**13.05.080 Stage 2 Water Shortage – Restrictions to Take Effect**

In the event the City Council determines that the measures outlined in Sections 13 05.060 and 13.05.070 do not produce a sufficient reduction in demand, or if the estimated needed supplies are reduced approximately ten percent to twenty percent, then the following additional restrictions shall be implemented:

A. Outdoor irrigation of landscape with potable water will only be allowed every other day

B Hotels, motels, and other commercial lodging establishments shall not launder towels and linen daily, except when specifically requested by their customer

**13.05.090 Stage 3 Water Shortage – Restrictions to Take Effect**

In the event the City Council determines that the measures outlined in Sections 13.05.060, 13.05.070 and 13.05.080 do not produce a sufficient reduction in demand or if the estimated needed supplies are reduced approximately twenty percent or more, then the following additional restriction shall be implemented:

A. Potable water service will not be provided to new land development projects except under the following circumstances:

1 A valid building permit has been issued for the project, or

2. The project is necessary to protect public health, safety, and welfare, or

3. The applicant provides evidence that the project will include conservation offsets prior to the provision of new water service.

**13.05.095 General Provisions**

A. Recycled water shall be used instead of potable water for landscape irrigation, construction, dust control, and other approved uses to the extent feasible where recycled water is available to supply all or some of the water demand.

B. All measures and restrictions outlined in this chapter shall apply to recycled water use except for Subsections 13.05.070(B), 13.05.070(C), 13.05.08(A), and 13.05.090(A).

C All restrictions resulting from any water shortage stage shall remain in effect with each successive and more severe water shortage stage until such time that the City Council changes a particular restriction or declares that drought conditions no longer exist.

D Additional restrictions may be implemented as determined by the City, after notice to customers.

**13.05.100 Exceptions to Provisions**

None of the restrictions outlined in this chapter shall apply to the following:

A. The routine and necessary use of water by a governmental entity in pursuit of its functions for protecting the public health, safety and welfare. This exception does not apply to landscape irrigation by a governmental agency

B. The necessary use of water for the routine maintenance and/or repair of water distribution facilities, residential and commercial plumbing, and existing landscape irrigation systems.

C The prohibited uses set forth in this subsection do not apply to Graywater This provision shall not be construed to authorize the use of Graywater if such use is otherwise prohibited by law

**13.05.105 Exemptions from Provisions**

Nothing contained in Sections 13.05.070 through 13.05.090 shall require any single-family residential customer to reduce the customer's consumption of water to any amount less than nine billing units per month (two hundred twenty-four gallons per day) during any billing period.

**13.05.110 Hardship and Special Cases – Implementation/Review Board**

A. A Review Board is established to review hardship and special cases which cannot follow the letter of this chapter The Review Board shall consist of any two of the following or their respective designees: Director of Community Development, Director of Finance, or Director of Public Works. Appeal of any Board decision shall be made to the City Manager

B. It is the purpose of the Review Board to review hardship or special cases and to determine whether or not said case warrants an exemption. The decision of the Review Board shall be prepared in writing, include terms and conditions, if any, set forth findings in support of the decision, and are promptly sent to the applicant. The Board shall consider the facts of each case and decide whether to grant an exemption within five working days of the receipt of a properly completed "Application for Exemption from Mandatory Water Restrictions" form. The application must include pertinent information and a written statement from the applicant. An exemption shall be granted for reasons of economic hardship which is defined as, but not limited to, a threat to an individual business's primary source of income (but under no circumstances shall inconvenience or the potential for damage of landscaping be considered an economic hardship which justifies an exemption.) An exemption may also be granted in instances where the water use restrictions cannot be met without threatening public health or safety, or there has been a significant change in the customer's circumstances. No exemption will be granted to any customer for any reason in the absence of a demonstration that the customer has achieved the maximum practical reduction in water consumption. The Board shall authorize only the implementation of equitable water use restrictions which further the purpose and intent of the emergency water conservation plan. The special water use restrictions authorized by the Board in each special or hardship case shall be set forth on the face of the exemption.

C An exemption to any element of this ordinance granted under any adequate water supply condition or water shortage condition shall not be valid upon implementation of any more severe water supply condition of this chapter An exemption expires under its own terms and conditions and/or when the next higher stage of the emergency water conservation ordinance takes effect. A separate application for exemption must be submitted at each higher stage of the water conservation ordinance unless the exemption conditions specifically do not require such separate application.

D Any person, corporation or association who is granted an exemption and makes use of the water utility of the City pursuant to said exemption shall provide proof of said exemption upon demand by any peace officer or person authorized by the City to enforce this chapter Upon conviction of any person, corporation or association for violating any provision of this part, the Review Board shall revoke any exemption previously granted. However, the Board shall notify applicant of the proposed revocation in writing no less than five working days before taking such action, and applicant shall be given the opportunity to be heard by the Review Board prior to its taking such action.

E. Persons wishing to appeal the decision of the Board shall have the right of appeal to the City Manager Appeal shall be made in writing within ten working days of the Board decision. The decision of the City Manager shall be final.

**13.05.120 Failure to Comply – Violation /Penalty**

A. Penalties. It is unlawful for any water customer to fail to comply with any of the provisions of this chapter Notwithstanding any other provision of the City Code, the penalties set forth herein shall be exclusive and not cumulative with any other provisions of this code. Furthermore, any and all violations that occur on any one day shall be treated as one violation for the purposes of determining a penalty under Subsection B. The penalties for failure to comply with the provisions of this chapter shall be as set out in subsection B of this section.

B. Range of Penalties

1 For the first violation by any customer of any of the provisions of sections 13.05.060, 13.05.070, 13.05.080, or 13.05 090, the City shall issue a written notice of the fact of such violation to the customer

2. For a second violation by any customer of any of the provisions of sections 13.05.060, 13.05.070, 13.05.080, or 13.05.090 within the same twelve month period beginning with the first violation, the City shall issue a final written notice of the fact of such violation to the customer

3. For a third violation by any customer of any of the provisions of sections 13.05.060, 13.05.070, 13.05.080, or 13.05.090 within the same twelve month period beginning with the first violation, a surcharge in the amount of fifty dollars shall be added to the customer's water bill.

4 For a fourth violation by any customer of any of the provisions of sections 13.05.060, 13.05.070, 13.05.080, or 13.05.090 within the same twelve month period beginning with the first violation, a surcharge in the amount of one hundred dollars shall be added to the customer's water bill that follows the customer's water bill containing the fifty dollar surcharge for the third violation.

5 For a fifth and any subsequent violation by any customer of any of the provisions of sections 13.05.060, 13.05.070, 13 05 080, or 13.05.090 within the same twelve month period beginning with the first violation, a surcharge in the amount of one hundred and fifty dollars shall be added to the customer's water bill that follows the customer's water bill containing the one hundred dollar surcharge for the fourth violation.

6. After a fifth violation of sections 13.05 060, 13.05.070, 13.05.080 or 13.05.090 within the same twelve month period beginning with the first violation, the City may install a flow restricting device of one gallon per minute (1 GPM) capacity for services up to one and one-half inch size and comparatively sized restrictors for larger services. Such action shall be taken only after a hearing

held by the Review Board where the customer has an opportunity to respond to the City's information or evidence that the customer has repeatedly violated this chapter's rules regarding the conservation of water and that such action is reasonably necessary to assure compliance with this chapter regarding the conservation of water Appeal of Board decisions shall be made in writing to the City Manager within ten working days of the Board hearing. The decision of the City Manager shall be final. Any such restricted service may be restored upon application of the customer made not less than forty-eight hours after the implementation of the action restricting service and only upon a showing by the customer that the customer is ready, willing and able to comply with the provisions of this chapter's rules regarding the conservation of water Prior to any restoration of service, the customer shall pay all City charges for any restriction of service and its restoration as provided for in a separate ordinance.

Section 2. Severability If any section, subsection, sentence, clause, phrase or portion of this Ordinance is held invalid or unconstitutional by any court of competent jurisdiction, such determination shall not affect the validity of the remaining portions of this Ordinance. The City Council declares that it would have enacted this Ordinance and each section, subsection, sentence, clause and phrase hereof irrespective of any determination of invalidity

Section 3. The City Clerk of the City of Chino shall certify to the passage and adoption of this Ordinance and shall cause the same to be published in a newspaper of general circulation, printed and published within said City in accordance with the provisions of the Government Code.

APPROVED AND ADOPTED THIS 5th DAY OF MAY 2009

DENNIS R. YATES, MAYOR

ATTEST

LENNA J. TANNER, CITY CLERK

State of California )
County of San Bernardino ) §
City of Chino )

I, Lenna J. Tanner, City Clerk of the City of Chino, do hereby certify the foregoing Ordinance was duly adopted by the Chino City Council at a regular meeting held on the 5th day of May 2009, by the following votes:

AYES: COUNCIL MEMBERS: YATES, DUNCAN, ELROD, HAUGHEY, ULLOA

# CHAPTER 8A: EMERGENCY WATER CONSERVATION

6-8.20 Scope and title

6-8.21 Statement of policy and declaration of purpose

6-8.22 Authorization

6-8.23 General prohibitions

6-8.24 Exceptions

6-8.25 Voluntary conservation

6-8.26 Stage 1 water shortage–water supply reduced by up to ten percent (10%)

6-8.27 Stage 2 water shortage–water supply reduced by ten percent (10%) to twenty percent (20%)

6-8.28 Stage 3 water shortage–water supply reduced by more than twenty percent (20%)

6-8.29 Stage 4 water shortage–emergency interruption in water supply

6-8.30 Relief from compliance

6-8.31 Failure to comply

6-8.32 Hearing regarding violations

**Sec. 6-8.20. Scope and title.**

This Chapter shall be known as “The Water Conservation Plan of the City of Ontario.”

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.21. Statement of policy and declaration of purpose.**

(a) Because of the water supply conditions prevailing in the City and/or the area from which the City obtains a portion of its supply, the general welfare requires that the water resources available to the City of Ontario be put to the maximum beneficial use to the extent to which they are capable, and that the waste or unreasonable use, or unreasonable method of use of water be prevented and that the conservation of such water be practiced with a view to that reasonable and beneficial use thereof in the interest of the people of the City.

(b) The purpose of this chapter is to minimize the potential for water shortage through the practice of water conservation, and to minimize the effect of a shortage of water supplies on the water customers of the City. It is furthermore the intent of this chapter to adopt provisions that will significantly reduce the inefficient consumption of water, thereby extending the available water resources necessary for the domestic, sanitation, and fire protection of the community to the greatest extent possible.

(c) This chapter shall be applicable to all water customers. For the purposes of this chapter, any person, business, corporation, or association to whom the city supplies water shall be considered a water customer.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.22. Authorization.**

(a) The City Council may declare a water shortage based on a determination by Metropolitan Water District or the Inland Empire Utilities Agency, or based upon any interruption in water supply or delivery that the City Council determines in its sole discretion necessitates water conservation pursuant to this chapter.

(b) In the event of an unplanned interruption of water supply causing a water shortage, the City Manager or his/her designee is authorized to restrict water use and apportion the available supply of water among its customers in the most equitable manner possible to continue service fairly and without discrimination, except that preference shall be given to such service as is essential to the public interest and to the preservation of life and health.

(c) A notice of a water shortage shall be published in a daily newspaper of general circulation within the City. Any restrictions on the use of water shall become effective immediately upon such publication.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.23. General prohibitions.**

(a) The following are prohibited in new connections:

(1) Non-recycling decorative fountains;

(2) Single-pass cooling systems; and

(3) Conveyor and in-bay vehicle wash and commercial laundry systems which do not reuse water.

(b) No water customer of the City shall make, cause, use, or permit the use of water from the City in a manner contrary to any provision of this chapter or in an amount in excess of the

use permitted by any restriction provisions then in effect pursuant to the provisions of this chapter.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.24. Exceptions.**

(a) The prohibited uses of water and water use restrictions provided within this chapter are not applicable for the use of recycled water or the use of potable water necessary to public health and safety or for essential government services such as police, fire and other similar services.

(b) Nothing contained within this chapter shall be construed to require the city to curtail the supply of water necessary for the health, safety, and welfare of any customer.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.25. Voluntary conservation.**

Water customers are encouraged to voluntarily limit the amount of water used to the amount absolutely necessary for health, business, and irrigation. The following elements of conservation apply at all times on a voluntary basis:

(a) Avoid hose washing of sidewalks, walkways, driveways, parking areas or other paved surfaces, except as required for sanitary purposes.

(b) Wash motor vehicles, trailers, boats and other types of mobile equipment using a hand held bucket or a hose equipped with a positive shutoff nozzle for quick rinses, or at the immediate premises of a commercial car wash or with recycled wastewater for approved uses.

(c) Avoid using water to clean, fill or maintain levels in decorative fountains, ponds, lakes or other

similar aesthetic structures unless such water is part of a recycling system.

(d) Encourage restaurants, hotels, cafés, cafeterias or other public places where food is sold, served or offered for sale, to serve drinking water only to those customers expressly requesting water.

(e) Promptly repair all leaks from indoor and outdoor plumbing fixtures.

(f) Avoid watering lawn, landscape or other turf area more often than every other day and during the hours between 6:00 a.m. and 6:00 p.m.

(g) Avoid causing or allowing the water to run off landscape areas into adjoining streets, sidewalks or other paved areas due to incorrectly directed or maintained sprinklers or excessive watering.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.26. Stage 1 water shortage-water supply reduced by up to ten percent (10%).**

(a) The following restrictions on the use of potable water shall be applicable when the City Council determines that the City's water conservation goals are not being met by voluntary water conservation measures, or that the City's water supplies are likely to be reduced by up to ten percent (10%).

(1) There shall be no hose washing of sidewalks, walkways, driveways, parking areas or other paved surfaces, except as required for sanitary purposes.

(2) Washing of motor vehicles, trailers, boats and other types of mobile equipment shall be done only with a hand-held bucket or a hose equipped with a positive shutoff nozzle for quick rinses, except that washing may be done at the immediate premises of a commercial car wash or with reclaimed wastewater.

(3) No water shall be used to clean, fill or maintain levels in decorative fountains, ponds, lakes or other similar aesthetic structures unless such water is part of a recycling system.

(4) No restaurant, hotel, café, cafeteria or other public place where food is sold, served or offered for sale, shall serve drinking water to any customer unless expressly requested.

(5) All water customers of the City shall promptly repair all leaks from indoor and outdoor plumbing fixtures. Such leak shall be repaired in a timely manner after notification by the city, but in no case after notification in excess of seventy-two (72) hours for the first violation and then every seventy-two (72) hours thereafter for the second and third violations.

(6) No person shall sprinkle, water, or irrigate any shrubbery, trees, lawns, grass, groundcovers, plants, vines, gardens, vegetables, flowers, or any other landscaped or vegetated areas between the hours of 9:00 a.m. and 4:00 p.m. In any event, such watering shall not be in excess of needs nor be of a manner that allows water to flow onto streets. The above mentioned plants may be watered by a hand-held hose equipped with a shut-off nozzle at any time of the day. This provision shall not apply to commercial nurseries, golf courses and other water-dependent industries.

(7) No water customer of the City shall cause or allow the water to run off landscape areas into adjoining streets, sidewalks or other paved areas due to incorrectly directed or maintained sprinkler or excessive watering.

(8) The use of water from fire hydrants shall be limited to fire fighting and related activities necessary to maintain the public health, safety, and welfare. An exception may be made for construction use through a proper city-designated meter. The use of potable water for construction activities shall be restricted in areas where recycled water is available for such use.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.27. Stage 2 water shortage-water supply reduced by ten percent (10%) to twenty percent (20%).**

(a) The following restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than ten percent (10%) but less than twenty percent (20%) in its water supplies.

(1) All prohibitions and restrictions in § 6-8.26 shall be in effect provided that more restrictive measures noted in this section shall take precedence.

(2) Commercial nurseries, golf courses, and other water dependent industries shall be prohibited from watering lawn, landscape, or other turf areas more than every other day. Irrigation shall occur between the hours of 6:00 p.m. and 6:00 a.m. only.

(3) All water customers other than commercial nurseries, golf courses, and other water dependent industries shall be limited in the use of outdoor watering for sprinkling, watering, or irrigating any shrubbery, trees, lawns, grass, groundcovers, plants, vines, gardens, vegetables, flowers, or any other landscaped or vegetated areas to a two (2) day per week schedule between the hours of 4:00 p.m. and 9:00 a.m. based on street address.

(i) All locations ending in an odd number shall have outdoor water scheduled on Mondays and Thursdays.

(ii) All locations ending in an even number shall have outdoor water scheduled on Wednesdays and Saturdays.

(iii) There shall be no outdoor watering on Tuesdays, Fridays, or Sundays.

(iv) The use of a hand-held hose with shut-off valve shall be permitted at any time.

(v) The replenishment of swimming pools shall be limited to the same days as other outdoor watering.

(4) Filling or refilling empty swimming pools shall not occur without permission from the City Manager or his/her designee.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.28. Stage 3 water shortage-water supply reduced by more than twenty percent (20%).**

(a) The following restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than twenty percent (20%) in its water supplies.

(b) All the prohibitions and restrictions in § 6-8.27 shall be in effect provided that the more restrictive measures noted in this section shall take precedence.

(c) Commercial nurseries, golf courses and other water dependent industries shall be prohibited from watering lawn, landscaping and other turf areas more often than every third day. Irrigation shall occur between the hours of 6:00 p.m. and 6:00 a.m. only. There shall be no restriction on watering utilizing recycled water.

(d) The use of water from fire hydrants shall be limited to fire fighting and related activities and other uses of water for municipal purposes shall be limited to activities necessary to maintain the public health, safety and welfare. The use of potable water for construction activities shall be prohibited.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.29. Stage 4 water shortage-emergency interruption in water supply.**

(a) The following restrictions on the use of potable water shall be applicable during an emergency water shortage which may be declared in the event of a major earthquake, large-scale fire, or other so called "Act of God" which could have serious impacts on the city's total available water supply.

(1) All the prohibitions and restrictions in § 6-8.28 shall be in effect provided that the more restrictive measures noted in this section shall take precedence.

(2) There shall be no use of outdoor water at any time except the minimal amount by hand-held hose equipped with a shut-off nozzle.

(3) Commercial nurseries, golf courses, and other water dependent industries shall be prohibited from the use of outside water except by a hand-held hose equipped with a shut-off nozzle.

(4) All nonessential uses of water shall be prohibited including the filling, cycling, filtering, or refilling swimming pools, spas, Jacuzzis, fountains or other like devices.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.30. Relief from compliance.**

(a) A water customer of the City may file a written application for relief in whole or in part, from the water use restriction provisions of this chapter. The City Manager or his/her designee shall review the request for a variance and take such steps as he or she deems reasonable to resolve the application for relief. The decision of the City Manager shall be final.

(b) A relief may be granted if the water customer shows that he or she has achieved the maximum practical reduction in water consumption other than in the specific areas in which

relief is being sought. No relief shall be granted to any water customer who, when requested by the City Manager, fails to provide any information necessary for resolution of the customer's application for relief.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.31. Failure to comply.**

(a) Violations of the provisions of this chapter:

(1) First violation. For a first violation, the City shall issue a written warning to the water customer.

(2) Second violation. For a second violation, the City shall impose a surcharge in an amount of One Hundred Dollars ($100.00) added to the water customer's water bill.

(3) Third violation. For a third violation, the City shall impose a surcharge in an amount of Two Hundred Dollars ($200.00) added to the water customer's water bill.

(4) Subsequent Violations. For the fourth and any subsequent violation during, the City shall impose a surcharge in an amount of Five Hundred Dollars ($500.00) added to the water customer's water bill. In addition to the surcharge, the City may also install a flow restricting device on the service of the customer at the premises at which the violation occurred for a period of not less than forty-eight (48) hours. The City shall charge the water customer the reasonable costs incurred for installing and for removing the flow-restricting devices and for restoration of normal service. The charge shall be paid before normal service can be restored.

(b) The City shall give notice of violation to the water customer committing the violation as follows:

(1) First notice of violation shall be given in writing by regular mail to the address at which the water customer is normally billed.

(2) Notice of second or subsequent violations shall be given in writing by certified mail to the address at which the water customer is normally billed.

(§ 2, Ord. 2907, eff. June 16, 2009)

**Sec. 6-8.32. Hearing regarding violations.**

(a) Any water customer receiving notice of a violation of §§ 6 8.23, 6-8.26, 6-8.27, 6-8.28, or 6-8.29, which includes the imposition of a surcharge, shall have a right to a hearing by the City Manager or his/her designee within fifteen (15) days of mailing or other delivery of the notice of violation.

(b) The water customer's timely written request for a hearing shall automatically stay installation of flow-restricting device on the customer's premises until after the City Manager or his/her designee renders his or her decision.

(c) The water customer's timely written request for a hearing shall not stay the imposition of a surcharge unless within the time period to request a hearing, the water customer deposits with the City money in the amount of any unpaid surcharge due. If it is determined that the surcharge was wrongly assessed, the City will refund any money deposited to the water customer.

(d) The decision of the City Manager or his/her designee shall be final except for judicial review.

(§ 2, Ord. 2907, eff. June 16, 2009)

# Chapter 13.16 WATER CONSERVATION

## 13.16.010 Generally

A. Declaration of Policy. It is declared that because of the water conditions prevailing in the city, the general welfare requires that the water resources available to the city, region and state be put to the maximum beneficial use, that the waste or unreasonable use of water be prevented, and that the conservation of water is to be encouraged at all times.

B. Authorization.

1. The city manager shall request the city council to declare that demand for water is anticipated to be in excess of supply, immediately after it appears that such a situation exists or is threatened, if the city council is in session. If the council is not in session, the city manager shall immediately cause a request for a special meeting of the city council to be delivered to each council person who can be located.

2. The city council shall have the power to declare the necessity to implement the applicable provisions of this chapter when in its opinion the demand for water consumption exceeds the city's available supply (allowing for a safe reserve), or threatens to do so, provided there are no immediate resources available to remedy the situation. Such declaration shall be made by public announcement and shall be published in a newspaper of general circulation and shall become effective immediately upon such publication.

C. Application. The provisions of this chapter shall apply to all persons, customers within the city, or property utilizing city water wherever situated.

D. Presumption. For purposes of this title, it shall be presumed that a person, corporation or association in whose name the water utility of the city is or was last billed or who is receiving the economic benefit of the water supply has knowingly made, caused, used or permitted the use of water received from the city for a purpose in a manner contrary to any provision of this title. (Ord. 1786 § 1 (part), 2005: prior code § 7730.0)

## 13.16.020 Penalties

A. Compliance—Guidelines.

1. No customer of the city or person who uses water within the city shall knowingly use, or permit the use of water in a manner contrary to any provision of this chapter, or in an amount in excess of that use permitted by the provisions of this title or that is reasonably necessary to satisfy the water usage need.

2. Unless otherwise provided, any person, firm or corporation violating any provision of this title as adopted by reference above, other than the provisions of Sections 13.20.010 through 13.20.040 of this code, shall be guilty of an infraction or misdemeanor as hereinafter specified at the city's discretion, and each day or portion thereof such violation is in existence shall be a new and separate offense.

B. Any person so convicted shall be:

1. Guilty of an infraction offense and punished by a fine of not less than $25.00 but not exceeding $100.00 for a first violation during any calendar year or declared conservation stage, whichever time period is shorter in duration;

2. Guilty of an infraction offense and punished by a fine not less than $50.00 and not exceeding $200.00 for a second violation during any calendar year or declared conservation stage, whichever time period is shorter in duration;

3. On conviction of a third violation, guilty of a misdemeanor offense and shall be punished by a fine not less than $500.00 nor more than $1,000.00 during any calendar year or declared conservation stage, whichever time period is shorter in duration.

C. 1. Notwithstanding the above, a first or second offense may be charged and prosecuted as a misdemeanor at the city's sole discretion. In addition to the above penalties, such convicted person, firm, corporation or other entity may, in the discretion of the court, be ordered to reimburse the city for all necessary costs incurred through investigation, discovery, analysis, inspection, abatement and other actual costs incurred by the city or its agents pertaining to the violation.

2. The court shall fix the amount of any such reimbursements upon submission of proof of such costs by the city. Payment of any penalty herein provided shall not relieve a person, firm or corporation, or other entity from the responsibility of correcting the condition resulting from the violation.

D. In addition to the above, the water utility director is empowered to enact other penalties and restrictive measures that are intended to abate the conductor circumstances comprising the violation, including but not limited to the following: placement of a flow restricting device upon the water service, locking off of water meter, removal of water meter, and shutting off of the service line valve. (Ord. 1812 § 1 (part), 2006: prior code § 7731.00)

## 13.16.030 Conservation program—Year-round stage.

A. The following activities are prohibited:

1. The washing of sidewalks, walkways, driveways, public and private parking areas and all other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety;

2. Excessive or unreasonable runoff of water or unreasonable spray of the areas being watered. Every customer is deemed to have his or her water system under control at all times, to know the manner and extent of this water use and any runoff, and to employ available alternatives to apply irrigation water in a reasonably efficient manner;

3. Allowing, permitting or causing the escape of water through breaks or leaks within the customer's plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of 72 hours after the customer discovers such a break or leak or receives notice from the city of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak;

4. Outdoor irrigation of landscape by sprinklers during the hours of 10:00 a.m. to 6:00 p.m. Citizens are encouraged to avoid the use of sprinklers on windy days. Irrigation by handheld hose,

drip irrigation, hand-held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains;

5. Washing of automobiles, trucks, trailers, boats, airplanes, and other types of equipment (mobile or otherwise) unless done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff. However, this section does not apply to the washing of the above-listed vehicles or mobile equipment when conducted on the immediate premises of a commercial carwash;

6. All eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall not provide drinking water to any person unless it is expressly requested.

B. Exceptions. None of these restrictions shall apply to the following:

1. The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2. The necessary use of water for the routine maintenance and/or repair of water distribution facilities, residential and commercial plumbing and permanently installed landscaped irrigation systems. (Ord. 1786 § 1 (part), 2005: prior code § 7732.00)

## 13.16.040 Conservation program—Moderate shortage stage.

A. In the event the city council determines that the measures outlined in Section 13.16.030 fail to produce a sufficient reduction in demand so as to produce a sufficient supply, the use of water within the city shall be additionally restricted and the following provisions shall become effective upon a declaration by the city council and publication of same as follows:

1. The washing of sidewalks, walkways, driveways, public and private parking areas and all other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety.

2. Excessive or unreasonable runoff of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his or her water system under control at all times, to know the manner and extent of this water use and any runoff, and to employ available alternatives to apply irrigation water in a reasonably efficient manner.

3. Allowing, permitting or causing the escape of water through breaks or leaks within the customer's plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of 72 hours after the customer discovers such a break or leak or receives notice from the city of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak.

4. Outdoor irrigation of landscape by sprinklers is permitted only on even days of the month for those locations having a street address with an even last digit. Outdoor irrigation by sprinklers is

permitted only on odd days of the month for those locations having a street address with an odd last digit. Outdoor irrigation for locations not having a street address shall occur on even days of the month if located west of San Antonio Avenue or only on odd days of the month if located east of San Antonio Avenue. No outdoor irrigation shall take place between the hours of 10:00 a.m. and 6:00 p.m. Irrigation by hand-held hose, drip irrigation, hand-held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains.

5. Washing of Vehicles, Trailers, Boats, Airplanes and Mobile Equipment.

a. The washing of automobiles, trucks, trailers, boats, airplanes and other types of equipment (mobile or otherwise) is prohibited except on the designated outdoor water use days pursuant to subsection (A)(4) of this section between the hours of 12:00 midnight to 12:00 noon and sundown to 12:00 midnight. Such washing, when allowed, shall be done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff.

b. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin-operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved city standards with equipment to recycle water for use within their facility.

c. Washing trucks, trailers and other types of mobile equipment (such as garbage trucks and vehicles used to transport food and other perishables), when such washing is necessary in order to protect the health, safety and welfare of the public, shall be restricted to the hours of sundown to noon. Such washing, when allowed, shall be done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use.

d. Nonprofit and community based organizations' fundraising car washes shall be allowed, provided they are otherwise in accordance with all other provisions of the Upland Municipal Code and this section, and have obtained a permit to operate a nonprofit carwash from the finance department, the cost of same to be $5.00, which sum is found to cover the city's costs to issue the permit. Such activities shall be limited to no more than two times in one month. Permit shall become void upon the effective date of the declaration of severe shortage.

6. All eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall not provide drinking water to any person unless it is expressly requested.

7. The refilling or adding of water to swimming pools is prohibited except on designated outdoor water use days, which shall be the same days as outdoor watering is permitted pursuant to subsection (A)(4) of this section.

8. Any non-business, operation-related pond, ornamental fountain or other structure making similar use of water is prohibited.

9. The irrigation of golf course fairways is prohibited. This section shall not apply to the irrigation of any golf course solely with reclaimed wastewater.

10. The use of water from fire hydrants shall be limited to firefighting and emergency-related activities and/or other activities necessary to maintain the health, safety, and welfare of the citizens of Upland. This restriction shall not apply to businesses which require the use of water for land development and building construction processes, pursuant to prior written approval by the review board as defined in Section 13.16.070.

B. Exceptions. None of the moderate shortage restrictions shall apply to the following uses of water:

1. The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2. The routine and necessary use of water, other than for landscape irrigation, for land development (e.g., roadway base preparation, flushing of utility lines, dust control, concrete and asphalt work) and for building construction processes;

3. The necessary use of water for the routine maintenance and/or repair of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems;

4. The use of water necessary to irrigate large, landscaped areas in commercial and institutional establishments as authorized by the terms and conditions of an approved compliance agreement issued by the review board, as defined in Section 13.16.070;

5. The use of water pursuant to the approved terms and conditions of a variance granted by the review board as defined in Section 13.16.070. (Ord. 1786 § 1 (part), 2005: prior code § 7733.00)

## 13.16.050 Conservation program—High shortage stage.

A. In the event the city council determines that the measures outlined in Section 13.16.040 fail to produce a sufficient reduction in demand so as to produce a sufficient supply, the use of water within the city shall be additionally restricted and the following provisions shall become effective upon a declaration by the city council and publication of same as follows:

1. The washing of sidewalks, walkways, driveways, public and private parking areas and other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety is prohibited.

2. Excessive runoff of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his or her water system under control at all times, to know the manner and extent of this water use and any runoff, and to employ available alternatives to apply irrigation water in a reasonably efficient manner.

3. Allowing, permitting or causing the escape of water through breaks or leaks within the customer's plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of 72 hours after the customer discovers such a break or leak or receives notice from the city of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak.

4. Outdoor irrigation of landscape by sprinklers is permitted only on Wednesday and Sunday for those locations having street address with an even last digit. Outdoor irrigation by sprinklers is permitted only on Tuesday and Saturday for those locations having a street address with an odd last digit. Outdoor irrigation for locations not having a street address shall occur on Wednesday and Sunday if located west of San Antonio Avenue or only on Tuesday and Saturday if located east of San Antonio Avenue. No outdoor irrigation shall take place between 6:00 a.m. until one hour before

sundown. Irrigation by hand-held hose, drip irrigation, or handheld bucket or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains.

5. Washing of Vehicles, Trailers, Boats, Airplanes and Mobile Equipment.

a. The washing of automobiles, trucks, trailers, boats, airplanes and other types of equipment (mobile or otherwise) is prohibited except on the designated outdoor water use days pursuant to subsection (A)(4) of this section between the hours of 12:00 midnight to 12:00 noon and sundown to 12:00 midnight. Such washing, when allowed, shall be done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff.

b. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin-operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved city standards with equipment to recycle water for use within their facility.

c. Washing trucks, trailers and other types of mobile equipment (such as garbage trucks and vehicles used to transport food and other perishables), when such washing is necessary in order to protect the health, safety and welfare of the public, shall be restricted to the hours of sundown to noon. Such washing, when allowed, shall be done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use.

d. Nonprofit and community-based organizations' fundraising car washes shall be allowed, provided they are otherwise in accordance with all other provisions of the Upland Municipal Code and this section, and have obtained a permit to operate a nonprofit carwash from the finance department, the cost of same to be $5.00, which sum is found to cover the city's costs to issue the permit. Such activities shall be limited to no more than two times in one month. Permit shall become void upon the effective date of the declaration of severe shortage.

6. All eating and drinking establishments of any kind whatsoever including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall not provide drinking water to any person unless it is expressly requested.

7. The refilling or adding of water to existing swimming pools is prohibited except on designated outdoor water use days which shall be the same days as outdoor water is permitted pursuant to subsection (A)(4) of this section. New pool construction filling shall be by permit only.

8. Any non-business, operation-related pond, ornamental fountain or other structure making similar use of water is prohibited.

9. The watering of golf course tee areas and fairways is prohibited unless done with reclaimed wastewater.

10. The use of water from fire hydrants shall be limited to firefighting and emergency-related activities and/or other activities necessary to maintain the health, safety, and welfare of the citizens of Upland. This restriction shall not apply to businesses which require the use of water for land development and building construction processes, pursuant to prior written approval by the review board as defined in Section 13.16.070.

B. Exceptions. None of the high shortage restrictions shall apply to the following uses of water, provided there is prior written approval by the review board as defined in Section 13.16.070:

1. The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2. The routine and necessary use of water, other than for landscape irrigation, for land development (e.g., roadway base preparation, flushing of utility lines, dust control, concrete and asphalt work) and for building construction processes;

3. The necessary use of water for the routine maintenance and/or repair of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems;

4. The use of water necessary to irrigate large landscaped areas in commercial and institutional establishments as authorized by the terms and conditions of an approved compliance agreement issued by the review board, as defined in Section 13.16.070. (Ord. 1786 § 1 (part), 2005: prior code § 7734.00)

## 13.16.060 Conservation program—Severe shortage stage.

In the event the city council determines that the measures outlined in Section 13.16.050 fail to produce a sufficient reduction in demand so as to produce a sufficient supply, then the use of water within the city shall be additionally restricted and the following provisions shall become effective upon a declaration by the city council and publication of same as follows:

A. The washing of sidewalks, walkways, driveways, public and private parking areas and other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety is prohibited.

B. Excessive runoff of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his or her water system under control at all times, to know the manner and extent of this water use and any runoff, and to employ available alternatives to apply irrigation water in a reasonably efficient manner.

C. Allowing, permitting or causing the escape of water through breaks or leaks within the customer's plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of 72 hours after the customer discovers such a break or leak or receives notice from the city of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak.

D. Outdoor irrigation of landscape by sprinklers is permitted only on Sunday for those locations having street address with an even last digit. Outdoor irrigation by sprinklers is permitted only on Saturday for those locations having a street address with an odd last digit. Outdoor irrigation for locations not having a street address shall occur on Sunday if located west of San Antonio Avenue or only on Tuesday and Saturday if located east of San Antonio Avenue. No outdoor irrigation shall take place between 6:00 a.m. until one hour before sundown. Irrigation by hand-held hose, drip irrigation, or hand-held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted

anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains.

E. Washing of Vehicles, Trailers, Boats, Airplanes and Mobile Equipment.

1. The washing of automobiles, trucks, trailers, boats, airplanes, and other types of equipment (mobile or otherwise) is prohibited except as provided elsewhere in this section.

2. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin-operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved city standards with equipment to recycle water for use within their facility. Washing of vehicles in such facilities shall occur only between the hours of 6:00 a.m. and 12:00 noon.

3. Washing trucks, trailers, and other types of mobile equipment (such as garbage trucks and vehicles used to transport food and other perishables), when such washing is necessary in order to protect the health, safety and welfare of the public, shall be restricted to the hours of sundown to 12:00 noon. Such washing when allowed, shall be done with a hand-held bucket or hand-held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use.

F. All eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall not provide drinking water to any person unless it is expressly requested.

G. Washing sidewalks, driveways, public and private parking areas, tennis courts, patios, or other paved areas, except to alleviate an immediate health hazard, is prohibited.

H. The refilling or adding of water to existing swimming pools is prohibited except on designated outdoor water use days which shall be the same days as outdoor water is permitted pursuant to subsection D of this section. New pool construction filling shall be by permit only.

I. Any non-business, operation-related pond, ornamental fountain or other structure making similar use of water is prohibited.

J. The watering of golf course tee areas and fairways is prohibited unless done with reclaimed wastewater. (Ord. 1786 § 1 (part), 2005: prior code § 7735.00)

## 13.16.070 Implementation.

A. Review Board—Variances, Permits and Compliance Agreements. A review board is established to review special cases which cannot follow the letter of this chapter. The review board shall consist of the water utility director, the city engineer, the fire chief, the city planning director and the city attorney, or their appointed representative.

B. Appeal of review board decisions shall be made to the city council. It is the purpose of the review board to review special cases and to determine whether or not such cases warrant a variance, permit or compliance agreement including conditions of approval. The board shall consider the facts of each case and decide whether to grant a variance or a permit or to enter into a compliance agreement within five working days of the receipt of a properly completed application for variance/permit/compliance agreement form.

C. A variance shall be granted only for reasons of economic hardship, which is defined as a threat to an individual business's primary source of income. (Under no circumstances shall inconvenience or the potential for damage of landscaping be considered an economic hardship, which justifies a variance.) The

board shall authorize only the implementation of equitable water use restrictions which further the purpose and intent of the water conservation plan. The special water use restrictions authorized by the board in each case shall be set forth on the face of the variance, permit or compliance agreement. A nonrefundable fee of $50.00 per permit application for all requests shall be assessed to reimburse the city for administrative costs.

D. 1. A variance or permit issued under moderate shortage shall not be valid upon implementation of high or severe shortage stages unless the permit specifically addresses either or both of those stages upon initial issuance. The multistage permit would have to reflect significant additional savings of water, or nonuse of water, under progressively more critical shortage stages. A variance or permit shall expire under its own terms and conditions and/or when another water conservation stage is in effect.

2. Exception. If, within the period of the permit, the conservation stage for which the permit was originally issued is reinstated, the permit will be considered valid until the original expiration date, as long as that conservation stage is in effect.

E. Any person, corporation or association who is issued a variance or permit and makes use of water pursuant to the variance, permit or compliance agreement shall provide proof of the variance, permit or compliance agreement upon demand by any peace officer or person authorized by the city to enforce this title.

F. Upon conviction of a person, corporation or association of violating any provision of this chapter, the review board shall revoke any permit, variance, or compliance agreement previously granted. However, the board shall notify applicant of the proposed revocation five working days before taking such action, and applicant shall be given the opportunity to be heard by the review board prior to its taking such action.

G. Persons wishing to appeal the decision of the review board shall have the right of appeal to the city council. Appeal shall be made in writing within 10 working days of the review board decision. The decision of the city council shall be final. (Ord. 1786 § 1 (part), 2005: prior code § 7736.00)

# ORDINANCE NO. 47

## AN ORDINANCE OF THE CUCAMONGA VALLEY WATER DISTRICT OF SAN BERNARDINO COUNTY, CALIFORNIA, RESCINDING ORDINANCE 41 AND ENCOURAGING WATER USE EFFICIENCY

WHEREAS, the State of California and western United States has limited supplies of drinking water, and;

WHEREAS, Cucamonga Valley Water District practices diligent stewardship of this valuable resource, and;

WHEREAS, the District's Board of Directors encourages the efficient use of all water supplies.

WHEREAS, it is hereby declared that the conditions prevailing in areas served by Cucamonga Valley Water District, the areas of the State of California and elsewhere from which the District obtains its water supplies require that the water resources available to the District be put to the maximum beneficial use to the extent to which they are capable, and that waste or unreasonable method of use of water be prevented, and the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interests of the people of the District and for the public welfare.

WHEREAS, Water Code Section 31026 authorizes the District to restrict the use of water during any emergency caused by drought, or other threatened or existing water shortage, and to prohibit the waste of District water or the use of District water during such periods, for any purpose other than household use. Other restricted uses may be determined to be necessary by the District.

WHEREAS, Water Code Section 350 et seq. and Section 375 et seq. authorize the District to declare a water shortage emergency condition whenever it finds and determines that the ordinary demands and requirements of water consumers will not be satisfied without depleting the water supply of the District to the extent that there will be insufficient water for human consumption, sanitation and fire protection. The District has the power and authority to enact a water conservation measures pursuant to Water Code Section 350 et seq. and 375 et seq.

NOW, THEREFORE, THE BOARD OF DIRECTORS OF THE CUCAMONGA VALLEY WATER DISTRICT OF SAN BERNARDINO COUNTY, CALIFORNIA, DOES ORDAIN AS FOLLOWS:

**SECTION 1: As of the effective date of this Ordinance No. 47,** Ordinance No. 47 shall supersede, and otherwise control, over Ordinance 41 and Ordinance 41 shall be of no further force or effect.

## SECTION 2: DEFINITIONS

2.1 "DISTRICT": Cucamonga Valley Water District

2.2 "AREA OF SERVICE": For the purposes of this Ordinance, the area of service shall be defined as all of the Cucamonga Valley Water District

2.3 "CUSTOMER/PERSON": Any natural person, firm, or corporation.

2.4 "GENERAL MANAGER/CEO": The person designated by the District to supervise the operation of the public water system and who is charged with certain duties and responsibilities by this Ordinance, or his/her duly authorized representative.

## SECTION 3: AUTHORITY

This Ordinance is adopted pursuant to Water Code Sections 31026, 31027, 350 et seq., and 375 et seq. Pursuant to the Water Code Sections 31027, 350 et seq., and 375 et seq., a notice of public hearing was published at least seven (7) days prior to the date of the public hearing which was conducted on March 24, 2009 at 6:00 p.m., or as soon thereafter as practicable at 10440 Ashford Street, Rancho Cucamonga, CA 91730-2799 as part of the Regular Meeting of the Board of Directors. A certified copy of the proposed Ordinance was also posted at the District offices at least five (5) days before the hearing. Notice of the time and place of the public hearing was published in a newspaper of general circulation within the District. The Public Hearing was continued to the May 12, 2009 Regular Meeting of the Board of Directors and a subsequent notice of the continuation was published in the newspaper of general circulation, on the District's website and on the bulletin board at the District office.

## SECTION 4: WATER USE EFFICIENCY PRACTICES

Customers are required to practice the following activities:

(1) Hosing paved areas for health and safety purposes only with the use of a waterbroom or water-efficient pressure washer using not more than 5 gallons per minute.

(2) Wash vehicles using a hose equipped with a shutoff nozzle so that water does not flow to waste.

(3) All decorative fountains shall be equipped with recirculating systems.

(4) Upon notification by the District, repair all leaks.

(5) Adjust sprinklers so there is no run-off, over-spray or excessive irrigation from the property.

(6) Restaurants will only serve water on request.

(7) Hotels will offer guests the option to not launder linen daily.

(8) Industrial customers will review their water-using processes to evaluate ways to increase water conservation

No water customer of the District shall make, cause, use, or permit the use of water in a manner contrary to any provision of this Ordinance.

**SECTION 5: FAILURE TO COMPLY**

Financial penalties will be assessed when a customer who, in the reasonable discretion of the General Manager/CEO, or his/her representative, violates this Ordinance. Exhibit A, attached hereto and incorporated herein by reference, outlines those penalties and the method of notifying a customer that he/she is violating District's Ordinance. If the General Manager/CEO, or his/her representative deems it appropriate, water service will be terminated at the location where the violation occurred due to a failure to comply with this Ordinance or a failure to pay financial penalties. Any such service termination shall be implemented under the District's authority and procedures including, but not limited to, the District's rules and regulations for water service. The regulatory purpose of imposing the requirements and financial penalties, as set forth in this Ordinance and Exhibit "A," are to conserve water, deter waste and unreasonable use of water, encourage efficiency, and to cover the costs incident to the investigation, inspection, and administration of the enforcement of this Ordinance and Exhibit "A." Such costs of this regulatory program include, but are not necessarily limited to, the cost of District personnel for administration of this program, notices, publications, implementation of conservation measures/programs and the monitoring and enforcement of penalties.

**SECTION 6: SEVERABILITY**

If any provision, paragraph, word, section, or article of this Ordinance is invalidated by any court of competent jurisdiction, the remaining provision, paragraphs, words, sections, and articles shall not be affected and shall continue in full force and effect.

**SECTION 7: EFFECTIVE DATE OF ORDINANCE**

This Ordinance is effective immediately upon its adoption. Within ten (10) days after adoption of this Ordinance, this full Ordinance with the names of those Directors voting for and against the Ordinance shall be published in a newspaper of general circulation and a certified copy of this Ordinance, along with the names of those Directors voting for and against the Ordinance, will be posted in the District offices.

**ADOPTED May 12, 2009**

# ORDINANCE NO. 47

## EXHIBIT "A"

Financial penalties will be assessed when a customer violates the requirements outlined in Section 4 of Ordinance 47. The penalties are as follows:

(a) First violation. The District shall issue a written notice of a first violation to the water customer.

(b) Second violation. For a second violation, the District shall impose a penalty in the amount of Fifty Dollars ($50.00) which will be added to the water customer's water bill.

(c) Third violation. For a third violation, the District shall impose a penalty in the amount of One Hundred Dollars ($100.00) which will be added to the water customer's water bill.

(d) Fourth violation. After a fourth and any subsequent violation, the District shall impose a penalty in the amount of One Hundred Fifty Dollars ($150.00) which will be added to the water customer's water bill.

The regulatory purposes of imposing the requirements and financial penalties, as set forth in this Ordinance and Exhibit "A," are to conserve water, deter waste and unreasonable use of water, encourage efficiency, and to cover the costs incident to the investigation, inspection, and administration of the enforcement of this Ordinance and Exhibit "A." Such costs of this regulatory program include, but are not necessarily limited to, the cost of District personnel for administration of this program, notices, publications, implementation of conservation measures/programs and the monitoring and enforcement of penalties.

**NOTICING**

The District shall give notice of violation of Ordinance No. 47 to the water customer as follows:

(a) The first notice of violation shall be a warning given to the customer by using a door hanger.
(b) The second violation shall be in writing by regular mail to the address at which the water customer is normally billed.
(c) Notice of subsequent violations shall be given in writing in the following manner:

(i) By giving the notice to the customer at the property where the violation occurred; or

(ii) If the water customer is absent from or unavailable at the premises at which the violation occurred, by leaving a copy with some person of suitable age and discretion

at the premises and sending a copy through the regular mail to the address at which the water customer is normally billed; or

(iii) If a person of suitable age or discretion cannot be found, then by affixing a copy in a conspicuous place at the premises at which the violation occurred, and also sending a copy through the regular mail to the address at which the customer is normally billed.

The notice shall contain a description of the facts of the violation and a statement of the penalties for each violation.

**APPEAL PROCESS**

(1) The application of this Ordinance is not intended to have a disproportionate impact on customers who have implemented conservation methods or installed water saving devices.

(2) A water customer may appeal to the District in writing if he/she feels that this Ordinance causes an undue hardship. The written request shall provide a justification for a reduction of a restricted use violation. Documentation must be provided to support the request and reasons outlining the hardship must be included.

(3) The request shall be reviewed by the General Manager or designee(s) and the customer will receive a written response from the District.

(4) A customer may appeal the District's decision by requesting a review by a committee designated by the Board of Directors. The decision of this committee will be final.

DRAFT OF A

RESOLUTION IMPLEMENTING THE WATER SHORTAGE CONTINGENCY PLAN
(Ready for adoption should the need the arise)

SAN GABRIEL VALLEY WATER COMPANY

RESOLUTION ADOPTED BY THE BOARD OF DIRECTORS

_____
DATE

**WHEREAS**, the California Legislature enacted Assembly Bill 11X during the 1991 Extraordinary Session of the California Legislature (an act to amend California Water Code Sections 10620, 10631, and 10652, and to add Section 10656 to the California Water Code, relating to water); and

**WHEREAS**, AB11X requires that every urban water supplier providing potable water directly to more than 3,000 customers or supplying more than 3,000 acre feet of water to develop a Water Shortage Contingency Plan; and

**WHEREAS**, AB 11X mandates that said Water Shortage Contingency Plan be filed with the California Department of Water Resources by January 31, 1992; and

**WHEREAS**, San Gabriel Valley Water Company is an urban water supplier providing water to more than 3,000 customers, and therefore, has prepared and filed a Water Shortage Contingency Plan, in compliance with requirements of AB 11X.

**WHEREAS**, public hearings have been conducted regarding the implementation of the Company's Water Shortage Contingency Plan;

**NOW, THEREFORE, BE IT RESOLVED** that:

1. The Water Shortage Contingency Plan is hereby implemented;

2. The Company is hereby authorized (should the need arise) to declare a Water Shortage Emergency and implement the Water Shortage Contingency Plan;

3. The Company shall implement additional procedures regarding rules and regulations to carry out effective and equitable allocation of water during a declared water shortage, as approved and adopted by the California Public Utilities Commission.

5. The Company take necessary actions to mitigate the effects on customers of the water shortage while continuing to fulfill its duties as a public utility water company.

# IMPORTANT NOTICE

## 10% Voluntary Water Use Reduction Requested

Dear Customer:

Because of the severe 5-year drought we are experiencing, San Gabriel Valley Water Company is requesting that effective immediately all water customers reduce their water use, on a **voluntary basis**, by at least 10% compared to the same period last year.

As you may be aware, the Metropolitan Water District of Southern California (MWD) has adopted stringent water conservation measures to greatly reduce water usage because of the severe drought in California. Effective March 1, 1991, MWD has declared a Stage V water shortage. Fortunately, MWD supplies only a small portion of the water provided by San Gabriel Valley Water Company. Nevertheless, because of the drought, we also must request your cooperation in conserving water.

We believe that you and our other customers can achieve the requested 10% reduction on a voluntary basis and that it will not be necessary to implement strict water rationing and penalty rates. **Obviously, if our customers are unable to achieve the conservation goals on a voluntary basis, we would be forced to consider mandatory cutbacks and higher water costs.**

To assist you in meeting the conservation goal, your current water use and your use during the corresponding period last year is shown on your water bill. On future water bills we will be showing your conservation goal for the coming month. In addition, the water conservation measures shown on the back of this letter can help save water. Thank you for your cooperation.

Very truly yours,

SAN GABRIEL VALLEY WATER COMPANY

# SAN GABRIEL VALLEY WATER COMPANY
# WATER CONSERVATION MEASURES

1. Lawn watering and landscape irrigation should be done only between the hours of 4 p.m. and 8 a.m. every other day. Public and recreational facilities such as parks, school grounds, golf courses, and recreational fields can be irrigated on any day. Agricultural users and commercial nurseries and landscape contractors can continue to irrigate as necessary but should curtail all non-essential water uses.

2. Other watering can be done at any time if a handheld hose equipped with a positive shutoff nozzle is used, a handheld faucet-filled bucket of five gallons or less is used, or a drip irrigation system is used.

3. Do not allow water to run off landscaped areas into adjoining streets, sidewalks, or other paved areas because of excessive watering or incorrectly directed or maintained sprinklers.

4. Washing of cars, trucks, trailers, boats, airplanes, or buildings should only be done with a handheld bucket or with a handheld hose equipped with a positive shutoff nozzle for quick rinses.

5. Do not use water to wash down sidewalks, driveways, parking areas, tennis courts, patios, or other paved areas except to alleviate immediate fire, sanitation, or health hazards.

6. There should be no filling or refilling of ponds, fountains, or artificial lakes. Pools and spas should be filled or refilled only between 4 p.m. and 8 a.m.

7. Restaurants should not serve water to their customers unless specifically requested.

8. Leaks from indoor and outdoor plumbing fixtures should be repaired as soon as discovered and should not be allowed to continue for more than 48 hours.

9. Do not leave water running while brushing your teeth, shaving, soaping in the shower, or washing dishes in the sink.

Also, to further assist customers in conserving water, the company has water conservation kits available and water-saving information literature available free of charge at each of the company's commercial offices. You may call or stop by one of the company's commercial offices to avail yourself of these materials. The commercial offices are located at:

11142 Garvey Avenue, El Monte, CA

# RULE NO. 14.1

## MANDATORY WATER CONSERVATION AND RATIONING PLAN

### GENERAL INFORMATION

If water supplies are projected to be insufficient to meet normal customer demand, the utility may elect to implement voluntary conservation using the portion of this plan set forth in Section A of this Rule after notifying the Commission's Water Utilities Branch of its intent. If in the opinion of the utility more stringent water conservation measures are required, the utility shall request Commission authorization to implement the mandatory conservation and rationing measures set forth in Section B.

The Commission shall authorize mandatory conservation and rationing by approving Tariff SCHEDULE NO. 14.1, MANDATORY WATER CONSERVATION AND RATIONING. When Tariff Schedule No. 14.1 has expired or is not in effect, mandatory conservation and rationing measures will not be in force. Tariff Schedule No. 14.1 will set forth water use allocations, excess water use penalties, charges for removal of flow restrictors, and the period during which mandatory conservation and rationing measures will be in effect.

When Tariff Schedule No. 14.1 is in effect and the utility determines that water supplies are again sufficient to meet normal demands and mandatory conservation and rationing measures are no longer necessary, the utility shall seek Commission approval to rescind Tariff Schedule No. 14.1 to discontinue rationing.

In the event of a water supply shortage requiring a voluntary or mandatory program, the utility shall make available to its customers water conservation kits as required by Rule No. 20. The utility shall notify all customers of the availability of conservation kits.

(continued)

JUL 90

RULE NO. 14.1
(continued)

A. CONSERVATION - NONESSENTIAL OR UNAUTHORIZED WATER USE

No customer shall use utility-supplied water for nonessential or unauthorized uses as defined below:

1. Use of water through any connection when the utility has notified the customer in writing to repair a broken or defective plumbing, sprinkler, watering or irrigation system and the customer has failed to make such repairs within 5 days after receipt of such notice.

2. Use of water which results in flooding or run-off in gutters, waterways, patios, driveways, or streets.

3. Use of water for washing aircraft, cars, buses, boats, trailers or other vehicles without a positive shutoff nozzle on the outlet end of the hose, except for the washing of vehicles at commercial or fleet vehicle washing facilities operated at fixed locations where equipment using water is properly maintained to avoid wasteful use.

4. Use of water through a hose for washing buildings, structures, sidewalks, walkways, driveways, patios, parking lots, tennis courts, or other hard-surfaced areas in a manner which results in excessive run-off or waste.

5. Use of water for watering streets with trucks, except for initial wash-down for construction purposes (if street sweeping is not feasible), or to protect the health and safety of the public.

6. Use of water for construction purposes, such as consolidation of backfill, dust control, or other uses unless no other source of water or other method can be used.

7. Use of water for more than minimal landscaping in connection with any new construction.

(continued)

JUL 90

RULE NO. 14.1
(continued)

A. 8. Use of water for outside plants, lawn, landscape and turf areas more often than every other day, with even numbered addresses watering on even numbered days of the month and odd numbered addresses watering on the odd numbered days of the month, except that this provision shall not apply to commercial nurseries, golf courses and other water-dependent industries.

9. Use of water for outside plants, lawn, landscape and turf areas during certain hours if and when specified in Tariff Schedule No. 14.1 when the schedule is in effect.

10. Use of water for watering outside plants and turf areas using a hand held hose without a positive shut-off valve.

11. Use of water for decorative fountains or the filling or topping off of decorative lakes or ponds. Exceptions are made for those decorative fountains, lakes, or ponds which utilize recycled water.

12. Use of water for the filling or refilling of swimming pools.

13. Service of water by any restaurant except upon the request of a patron.

B. RATIONING OF WATER USAGE

In the event the conservation measures required by Section A are insufficient to control the water shortage, the utility shall, upon Commission approval, impose mandatory conservation and rationing. The water allocated for each customer, the time period during which rationing shall be in effect, and any additional conditions, will be set forth in Tariff Schedule No. 14.1, which shall be filed for this purpose at the time such rationing is approved by the Commission.

Before rationing is authorized by the Commission the utility shall hold public meetings and take all other applicable steps required by Sections 350 through 358 of the California Water Code.

JUL 90

Cal. P.U.C. Sheet No.

Canceling Cal. P.U.C. Sheet No.

RULE NO. 14.1
(continued)

C. ENFORCEMENT OF MANDATORY CONSERVATION AND RATIONING

1. The water use restrictions of the conservation program in Section A of this rule become mandatory when the rationing program goes into effect. These restrictions are applicable whether or not the customer exceeds the monthly water allocation.

2. Upon inception of the mandatory provisions of this Rule the utility may, after one verbal and two written warnings, install a flow-restricting device on the service line of any premises where utility personnel observe water being used for any nonessential or unauthorized use as defined in Section A.

3. A flow restrictor shall not restrict water delivery by greater than 50% of normal flow and shall provide the premises with a minimum of 6 Ccf/month. The restrictor may be removed only by the utility, after a three-day period has elapsed, and upon payment of the appropriate removal charge as set forth in Tariff Schedule No. 14.1.

4. After the removal of a restricting device, if any nonessential or unauthorized use of water continues, the utility may install another flow-restricting device. This device shall remain in place until rationing is no longer in effect and until the appropriate charge for removal has been paid to the utility.

5. Each customer's water allocation shall be shown on the water bill. Water allocations may be appealed in writing as provided in Section D of this Rule. If a customer uses water in excess of the allocated amount, the utility may charge the excess usage penalty shown in Tariff Schedule No. 14.1.

6. Any monies collected by the utility through excess usage penalties shall not be accounted for as income, but shall be accumulated by the utility in a separate account for disposition as directed or authorized from time to time by the Commission.

7. The charge for removal of a flow-restricting device shall be in accordance with Tariff Schedule No. 14.1.

JUL 90

(continued)

Cal. P.U.C. Sheet No.

Canceling Cal. P.U.C. Sheet No.

RULE NO. 14.1
(continued)

D. APPEAL PROCEDURE

Any customer who seeks a variance from any of the provisions of this mandatory water conservation and rationing plan or a change in water allocation shall notify the utility in writing, explaining in detail the reasons for such a variation. The utility shall respond to each such request.

Any customer not satisfied with the utility's response may file an appeal with the staff of the Commission. The customer and the utility will be notified of the disposition of such appeal by letter from the Executive Director of the Commission.

If the customer disagrees with such disposition, the customer shall have the right to file a formal complaint with the Commission. Except as set forth in this Section, no person shall have any right or claim in law or in equity, against the utility because of, or as a result of, any matter or thing done or threatened to be done pursuant to the provisions of this mandatory water conservation and rationing plan.

E. PUBLICITY

In the event the utility finds it necessary to implement this plan, it shall notify customers and hold public hearings concerning the water supply situation, in accordance with Chapter 3, Water Shortage Emergencies, Sections 350 through 358, of the California Water Code. The utility shall also provide each customer with a copy of this plan by means of billing inserts or special mailings; notifications shall take place prior to imposing any fines associated with this plan. In addition, the utility shall provide customers with periodic updates regarding its water supply status and the results of customers' conservation efforts. Updates may be by bill insert, special mailing, poster, flyer, newspaper, television or radio spot/ advertisement, community bulletin board, or other appropriate method(s).

JUL 90

## Sections of the California Water Code
## Chapter 3 - Water Shortage Emergencies

Section 350. The governing body of a distributor of a public water supply, whether publicly or privately owned and including a mutual water company, may declare a water shortage emergency condition to prevail within the area served by such distributor whenever it finds and determines that the ordinary demands and requirements of water consumers cannot be satisfied without depleting the water supply of the distributor to the extent that there would be insufficient water for human consumption, sanitation, and fire protection.

Section 351. Excepting in event of a breakage or failure of a dam, pump, pipe line or conduit causing an immediate emergency, the declaration shall be made only after a public hearing at which consumers of such water supply shall have an opportunity to be heard to protest against the declaration and to present their respective needs to said governing board.

Section 352. Notice of the time and place of hearing shall be published pursuant to Section 60 of the Government Code at least seven days prior to the date of hearing in a newspaper printed, published, and circulated within the area in which the water supply is distributed or if there is no such newspaper, in any newspaper printed, published, and circulated in the county in which the area is located.

Section 353. When the governing body has so determined and declared the existence of an emergency condition of water shortage within its service area, it shall thereupon adopt such regulations and restrictions on the delivery of water and the consumption within sa area of water supplied for public use as will in the sound discretion of such governing bod conserve the water supply for the greatest public benefit with particular regard to domest use, sanitation, and fire protection.

Section 354. After allocating and setting aside the amount of water which in the opinion of th governing body will be necessary to supply water needed for domestic use, sanitation, and fire protection, the regulations may establish priorities in the use of water for other purposes and provide for the allocation, distribution, and delivery of water for such other purposes, without discrimination between consumers using water for the same purpose purposes.

Section 355. The regulations and restrictions shall thereafter be and remain in full force and effect during the period of the emergency and until the supply of water available for distribution within such area has been replenished or augmented.

Section 356. The regulations and restrictions may include the right to deny such applications for new or additional service connections, and provision for their enforcement by discontinuing service to consumers willfully violating the regulations and restrictions.

Section 357. If the regulations and restrictions on delivery and consumption of water adopted pursuant to this chapter conflicts with any law establishing the rights of individual consumers to receive either specific or proportionate amounts of the water supply available for distribution within such service area, the regulations and restrictions adopted pursuant to this chapter shall prevail over the provisions of such laws relating to water rights for the duration of the period of emergency; provided, however, that any distributor of water which is subject to regulation by the State Public Utilities Commission shall before making such regulations and restrictions effective secure the approval thereof of the Public Utilities Commission.

Section 358. Nothing in this chapter shall be construed to prohibit or prevent review by any court of competent jurisdiction of any finding or determination by a governing board of the existence of an emergency or of regulations or restrictions adopted by such board, pursuant to this chapter, on the ground that any such action is fraudulent, arbitrary, or capricious.

# ORDINANCE 33

## AN ORDINANCE OF THE BOARD OF DIRECTORS OF THE MONTE VISTA WATER DISTRICT, COUNTY OF SAN BERNARDINO, STATE OF CALIFORNIA, TO ESTABLISH WATER USE EFFICIENCY BEST PRACTICES AND STAGED WATER SUPPLY SHORTAGE MEASURES

---

The Board of Directors of the Monte Vista Water District (District) of San Bernardino County, California, does hereby ordain the following:

**Section 1: Purpose**

Monte Vista Water District is responsible for providing reliable water supply for the beneficial use, health, safety and welfare of its customers. The District has worked diligently to educate its customers about the value of water use efficiency and available water supplies to the District. In the unlikely event of a water shortage, the District shall request that its customers make reasonable and necessary reductions in their water use, according to the provisions of this Ordinance.

**Section 2: Policy**

1. The waste or unreasonable use of water by District customers shall be prevented to the greatest extent possible, and the efficient use of water shall be encouraged.

2. The District shall meet its urban water efficiency targets as set forth in California Water Code Sections 10608-10608.60, requiring the District to achieve a 20% reduction in per capita water use or a comparable water use reduction goal by December 31, 2020.

3. The District shall declare respective water supply shortage stages only if the District determines one or more of the following situations has occurred or may occur in the foreseeable future:

   a. The District may be unable to acquire or produce adequate water supplies to meet projected customer demands; or,

   b. The cost to acquire or produce adequate water supplies to meet projected customer demands may rise above the projected revenues generated by currently adopted water rates.

   Such circumstances would most likely occur due to one or more of the following events: imported water supply cutbacks by Metropolitan Water District of Southern California, extended drought, equipment failure, act of terrorism, and/or natural disaster.

4. During a declared water supply shortage, the District shall reduce water deliveries to wholesale water customers equal to the percentage of water demand reduction requested from the District's retail customers. The wholesale customer shall be responsible for managing water demand within its service area to comply with reduced deliveries during the declared water supply shortage.

5. The District shall offer to local agencies within whose boundaries the District provides retail and wholesale water service, upon their request, reasonable levels of assistance in complying with California Government Code Sections 65591-65599 (Water Conservation in Landscaping Act), enacted by Assembly Bill No. 1881 (2006).

**Section 3: Authority and Implementation**

1. The Board of Directors has the statutory power to declare that water supply shortage conditions exist and to implement the various staged provisions of this Ordinance as required to maintain reliable and safe water service to District customers.

2. The General Manager shall request the Board of Directors to declare a water supply shortage at a regular or special meeting of the Board of Directors. The Board shall receive evidence of water supply conditions at a public hearing and shall make findings concerning the adequacy of water supplies for the District and the necessity, if any, of declaring a water supply shortage.

3. The declaration of the Board that a water supply shortage exists or is threatened to exist shall be made by Resolution and public announcement, and shall be published in a newspaper of general circulation within ten (10) calendar days of adoption. The declaration shall become effective immediately upon adoption. The Resolution shall set a time schedule for expiration after review of water supply shortage conditions as reported by the General Manager.

**Section 4: Compliance Responsibility**

The District customer whose name is on the account shall be responsible for compliance with the provisions of this Ordinance.

**Section 5: Water Use Efficiency Best Practices**

1. District customers are required to implement the following water use efficiency best practices at all times:

    a. Set automatic irrigation controllers to water outdoor landscaped areas only between the hours of 8 p.m. and 8 a.m. and for no more than fifteen (15) minutes per day per valve-controlled station. Exempt from this requirement:

        i. Watering by hand.

        ii. Drip irrigation.

        iii. Irrigation systems equipped with weather-based or soil moisture-based irrigation controllers.

    b. Adjust irrigation system so there is no run-off, over-spray or excessive irrigation causing irrigation water to flow off of the customer's property.

    c. Turn off outdoor irrigation during rain.

    d. Repair all plumbing and irrigation system leaks within seven (7) days of discovery.

e. Wash motor vehicles, trailers, boats and other types of mobile equipment with a hand-held bucket or a hand-held hose equipped with a shutoff nozzle, or use a commercial vehicle wash equipped with a water recycling system.

f. Wash paved areas for health and safety purposes only with the use of a waterbroom or water-efficient pressure washer.

g. Restaurants serve water only upon request.

h. Hotels offer guests the option to not launder linen daily.

2. The following technologies shall be equipped with water recycling, recirculation or reuse systems prior to the establishment of new water service:

   a. Cooling towers and evaporative cooling systems.

   b. Decorative water fountains.

   c. Conveyer vehicle washes and in-bay automatic vehicle washes.

3. The District shall offer local agencies and retail and wholesale customers reasonable assistance in complying with State and local water use efficiency guidelines and requirements.

**Section 6: Significant Water Supply Shortage**

If the Board of Directors finds that current or near-term water supply shortage conditions require a 10 to 25 percent demand reduction, the Board may pass a Significant Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Section 5 above:

1. Landscaping and Landscape Irrigation.

   a. All lawns, landscape or turf areas shall be irrigated only on Tuesday, Thursday and Saturday of each week. Exempt from this requirement:

      i. Commercial nurseries, golf courses and other water-dependent industries.

      ii. Watering by hand.

      iii. Drip irrigation.

      iv. Irrigation systems equipped with weather-based or soil moisture-based irrigation controllers.

   b. Water consumption through water meters designed for landscape irrigation shall not exceed 75 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

2. Potable water used on a one-time basis for construction and dust control shall be limited to that quantity identified in the plan submitted by the user which describes water use requirements. The plan shall be submitted to and approved by the General Manager. Upon availability, non-potable recycled water will be made available for these uses.

3. The use of water from fire hydrants shall be limited to fire fighting and related activities, or for municipal activities necessary to maintain the public health, safety and welfare, or for construction use and dust control as approved by the General Manager.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by 10 to 25 percent, effective upon the date of its public announcement of a Significant Water Supply Shortage. The General Manager shall consult with District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 7: Critical Water Supply Shortage**

If the Board of Directors finds that current or near-term water supply shortage conditions require a 25 to 40 percent demand reduction, the Board may pass a Critical Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Sections 5 and 6 above:

1. Landscaping and Landscape Irrigation.

    a. All lawns, landscape or turf areas shall be watered only on Tuesday and Saturday of each week.

    b. Water consumption through water meters designed for landscape irrigation shall not exceed 50 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

    c. No person or entity shall implement any landscaping requirements of any homeowners association, developer or governing agency if it will result in an increase in water consumption from the prior calendar year.

2. No washing of motor vehicles, trailers, boats and other types of mobile equipment shall be permitted, unless done on the premises of a commercial car wash.

3. No one shall empty or refill swimming pools, spas or ponds for cleaning purposes. Water levels may be maintained.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by 25 to 40 percent, effective upon the date of its public announcement of a Critical Water Supply Shortage. The General Manager shall consult with the District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 8: Emergency Water Supply Shortage**

If the Board of Directors finds that, due to emergency circumstances, current or near-term water supply shortage conditions require a 40 percent or higher demand reduction, the Board may pass an Emergency Water Supply Shortage Resolution, enacting the following water use requirements in addition to those described in Sections 5, 6 and 7 above:

1. Landscaping and Landscape Irrigation.

    a. All lawns, landscape or turf areas shall be watered only on Saturday of each week.

    b. Water consumption through water meters designed for landscape irrigation shall not exceed 33 percent of the amount of water used during the same billing period in the last calendar year during which no water shortage was declared.

    c. No installation of new landscaping shall be permitted.

2. No potable water for construction and dust control shall be permitted. Upon availability, non-potable recycled water will be made available for these uses.

3. No water shall be used to fill or maintain swimming pools, spas or ponds.

4. The District shall reduce wholesale water deliveries in the same amount applicable to its retail customers, by at least 40 percent, effective upon the date of its public announcement of an Emergency Water Supply Shortage. The General Manager shall consult with District wholesale customers prior to the announcement to coordinate and implement periods of reduction in water delivery.

**Section 9: Exceptions**

No water use requirements described in Sections 5, 6, 7 and 8 above shall apply to the following water uses:

1. The use of recycled water distributed through the District's recycled water distribution system and used for landscape irrigation, construction, dust control or other approved uses, or the use of recycled water produced for direct reuse by commercial car washes, commercial laundries and various industries utilizing industrial water reuse systems.

2. The routine and necessary use of water by a governmental entity in pursuit of its functions for protecting the public health, safety and welfare of its citizens. This exception does not apply to the use of potable water for landscape irrigation by a governmental agency.

3. The necessary use of water for the routine maintenance, testing and/or repair of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems.

4. The use of "gray water". For the purposes of this Ordinance, "gray water" is defined as non-septic domestic wastewater collected from clothes washers, bathtubs, showers, and sinks. This provision shall not be construed to authorize the use of "gray water" if such use is otherwise prohibited by law.

**Section 10: Immediate Water Shortage Response**

In the event that an immediate shortage of water supply occurs due to disaster, the General Manager shall declare the extent of the water supply shortage and shall implement the appropriate water supply shortage stage as defined herein. The General Manager shall report such water supply shortage condition and level of response to the Board of Directors at a time which is reasonable and practicable.

**Section 11: Failure to Comply**

1. Any District customer violating the provisions set forth in this Ordinance shall be subject to the procedures and/or penalties described in this Section.

2. The following table outlines the procedures and penalties for violating the provisions set forth in this Ordinance, and each subsequent violation which occurs at least seven (7) days subsequent to the previous violation:

| | First Violation | Second Violation | Third Violation | Fourth Violation | Fifth Violation |
|---|---|---|---|---|---|
| **Best Practices** | Written Notice | Final Written Notice | $50 Fine | $100 Fine | $150 Fine; Flow Restrictor |
| **Significant Water Supply Shortage** | Written Notice | $50 Fine | $100 Fine | $150 Fine | $200 Fine; Flow Restrictor |
| **Critical Water Supply Shortage** | Written Notice | $100 Fine | $200 Fine | $300 Fine; Flow Restrictor | --- |
| **Emergency Water Supply Shortage** | Written Notice | $150 Fine | $300 Fine; Flow Restrictor | --- | --- |

3. Written Notice

   a. Notice of a violation of Ordinance provisions, as outlined in Subsection 2 above, shall be given in writing by regular mail or personal delivery to the customer at the address on file with the District. If notice is given by mail, the person depositing the notice by mail shall complete a Proof of Service by Mail form indicating the time, date and place the notice was deposited in the U.S. Mail.

   b. If personal delivery is used, any notice of violation of the water use requirements shall be made in the following manner:

i. By handing the notice to the customer personally. The person serving the notice shall complete a Proof of Service form indicating the time, date and place of service.

ii. If the customer is absent from or unavailable at the premises at which the violation occurred, by leaving a copy with some person of suitable age and discretion at the premises and sending a copy through the regular mail to the customer at the address at which the customer is normally billed.

iii. If a person of suitable age or discretion cannot be found, by affixing a copy in a conspicuous place at the premises at which the violation occurred and also sending a copy through the regular mail to the customer at the address at which the customer is normally billed.

c. The notice shall contain a description of the facts of the violation, a statement of the possible penalties for each violation and a statement informing the customer of his or her right to request a waiver due to hardship or special circumstances.

4. After multiple violations of Ordinance provisions, as outlined under Subsection 2 above, the District may install a flow restricting device on a customer's water meter. The District may terminate a customer's landscape meter service upon a prior determination that the customer has repeatedly violated this Ordinance. Such action will only be taken after a hearing held by the Review Board where the customer will have the opportunity to respond to the District's evidence of repeated violation.

5. Any restricted or terminated service may be restored upon request of the customer made not less than forty-eight (48) hours after the implementation of the action restricting or terminating service and only upon a showing by the customer that the customer is ready, willing and able to comply with the provision of this Ordinance. Prior to any restoration of the service, the customer shall pay all District charges for any restriction or termination of service and its restoration.

**Section 12: Review Board**

1. A District customer may request a waiver from any provisions of this Ordinance due to hardship or special circumstances. A Review Board comprised of members of the District staff shall be designated by the General Manager to review such requests. The Review Board shall respond to a waiver request within ten (10) working days of receipt of request.

2. The Review Board shall review customer written requests for a waiver from Ordinance provisions due to hardship or special circumstances, and determine whether or not the case warrants a waiver. No waiver shall be granted unless the water customer shows that he or she has achieved the maximum practical reduction in water consumption other than in the specific area(s) in which a waiver is being sought. No waiver shall be granted to any water customer who, when requested by the District, fails to provide any information necessary for resolution of the customer's request for a waiver.

3. Any customer who is granted a waiver shall provide proof of compliance with said waiver upon demand by any person authorized by the District. If the customer is found to violate any provision of the waiver, the Review Board shall revoke the waiver. The Review Board shall notify the customer in writing of the proposed revocation five (5) working days before taking such action, and the customer shall be given the opportunity to be heard by the Review Board prior to its taking such action.

4. A waiver issued under a particular water supply shortage stage shall not be valid upon passage of a higher water supply shortage stage. A new waiver must be granted by the Review Board for each enacted water supply shortage stage.

5. Appeal of Review Board decisions shall be made in writing to the Board of Directors, whose decision shall be final. The Board of Directors shall consider the appeal within thirty (30) days from the date the appeal was filed. The appealing customer shall be given the opportunity to address the Board of Directors and submit evidence orally and in writing.

**Section 13: Validity**

If any section, sub-section, clause, phrase or portion of this Ordinance is for any reason held to be invalid or unconstitutional by any court of competent jurisdiction, such decision shall not affect the validity of remaining portions of this Ordinance.

**Section 14: Consistency**

1. This Ordinance is consistent with the provision of California Water Code Sections 375-378, inclusive, and Sections 31020-31035.1, inclusive.

2. This Ordinance fulfills the District's water supply shortage planning obligation as required by California Water Code Sections 10610-10656, inclusive (Urban Water Management Planning Act). Subsequent District Urban Water Management Plan updates shall comply with this Ordinance.

**Section 15: Effective Date**

This Ordinance shall be effective immediately upon adoption and shall be published in any newspaper of general circulation and distributed within the District as required by law.

The President of the Board of Directors shall sign this Ordinance and the Secretary shall attest to the same. The Secretary shall cause this Ordinance to be published within ten (10) days after its adoption, at least once in a newspaper of general circulation which is distributed within the boundaries of the Monte Vista Water District.

**Section 16: Repeal and Rescind**

Upon adoption of this Ordinance, Ordinance 32 shall be repealed and rescinded effective on the date of adoption of this Ordinance.

ADOPTED THIS 12th day of May 2010.

Sandra S. Rose
President of the Board of Directors
MONTE VISTA WATER DISTRICT

ATTEST:

Mark N. Kinsey
Secretary to the Board of Directors
MONTE VISTA WATER DISTRICT

RESOLUTION No. 2006–06-03
A RESOLUTION OF THE BOARD OF DIRECTORS OF THE
SAN ANTONIO WATER COMPANY ESTABLISHING PROCEDURES IN THE CASE OF A WATER SHORTAGE

Entitled

"WATER SHORTAGE CONTINGENCY PLAN"

WHEREAS, the Board of Directors at its regular meeting of September 19, 2006, did discuss and establish the protocols and procedures attendant to the conduct of meetings of the Board of Directors.

NOW THEREFORE, BE IT RESOLVED that the San Antonio Water Company establish a plan to respond to water shortages,

WHEREAS, the Board is concerned that our precious water resources are protected so shareholders can expect to receive a reliable supply of quality water on demand; and

WHEREAS, the Board has a responsibility to provide water to its shareholders through the creation and maintenance of the infrastructure necessary to pump, store and distribute water; and

WHEREAS, the Board acknowledges the City of Upland Water Conservation Ordinance No. 1786 and shares the City of Upland's City Council's concern regarding the proper management of our precious water resources to ensure a reliable supply of quality water; and

WHEREAS, the San Antonio Water Company periodically needs supplemental water supply service from the City of Upland, which in accordance with City of Upland Ordinance No. 1786, as a prerequisite for receiving water supply service from the City of Upland, requires the implementation of water conservation measures; and

WHEREAS, the Board has adopted a resolution to water conservation,

NOW, THEREFORE, THE SAN ANTONIO WATER BOARD, CALIFORNIA, DOES RESOLVE, DECLARE, DETERMINE AND ORDER AS FOLLOWS:

## I. GENERALLY

A. Declaration of policy. It is hereby declared that because of the water conditions prevailing in the Water Company service area, the general welfare requires that the water resources available to the Water Company, Region and State be put to the maximum beneficial use, that the waste or unreasonable use of water be prevented, and that the conservation of water is to be encouraged at all times.

B. Authorization. The General Manager shall request the Board to declare that demand for water is anticipated to be in excess of supply, immediately after it appears that such a situation exists or is threatened, if the Board is in session. If the Board is not in session, the General Manager immediately cause a request for a special meeting of the Board to be delivered to each Board Member who can be located. The Board shall have the power to declare the necessity to implement the applicable provisions of this part when in their opinion the demand for water consumption exceeds the Water Company's available supply (allowing for a safe reserve), or threatens to do so, provided there are no immediate resources available to remedy the situation. Said declaration shall be made by public announcement and shall be published in a newspaper of general circulation and shall become effective immediately upon such publication.

C. Application. The provisions of this chapter shall apply to all shareholders, customers within the Water Company's service area, or property serviced by the Water Company wherever situated.

II. CONSERVATION PROGRAM-YEAR ROUND STAGE

A. The following activities are hereby prohibited:

1.0 The washing of sidewalks, walkways, driveways, public and private parking areas and all other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety;

a. Excessive or unreasonable run off of water or unreasonable spray of the areas being watered. Every shareholder is deemed to have his/her water system under control at all times, to know the manner and extent of this water use and any run off, and to employ available alternatives to apply irrigation water in a reasonably efficient manner;

2.0 Allowing, permitting or causing the escape of water through breaks or leaks within the customers plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of seventy-two (72) hours after the customer discovers such a break or leak or receives notice from the Water Company of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak;

3.0 Outdoor irrigation of landscape by sprinklers during the hours of 10:00 a.m. to 6:00 p.m. Shareholders are encouraged to avoid the use of sprinklers on windy days. Irrigation by hand held hose, drip irrigation, hand held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, and alleys or storm drains;

4.0 Washing of automobiles, trucks, trailers, boats, and other types of equipment (mobile or otherwise) unless done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff. However, this section does not apply to the washing of the above-listed vehicles or mobile equipment when conducted on the immediate premises of a commercial carwash;

5.0 With respect to eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, that benefits from the supply of water by the Water Company shall not provide drinking water to any person unless expressly requested.

B. Exceptions: None of these restrictions shall apply to the following:

1.0 The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2.0 The necessary use of water for the routine maintenance, repair or construction of distribution and water supply facilities, residential and commercial plumbing and permanently installed landscaped irrigation systems.

3.0 Available non-potable water which is only delivered for irrigation purposes and/or not available for distribution by current Water Company production and conveyance facilities.

III. MODERATE SHORTAGE STAGE

A. In the event the Board determines that the measures outlined above fail to produce a sufficient reduction in demand so as to produce a sufficient supply, the use of water within the Water Company's service area shall be additionally restricted and the

following provisions shall become effective upon a declaration by the Board and publication of same as follows:

1.0 The washing of sidewalks, walkways, driveways, public and private parking areas and all other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety;

a. Excessive or unreasonable run off of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his/her water system under control at all times, to know the manner and extent of this water use and any run off, and to employ available alternatives to apply irrigation water in a reasonably efficient manner;

2.0 Allowing, permitting or causing the escape of water through breaks or leaks within the customers plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of seventy-two (72) hours after the customer discovers such a break or leak or receives notice from the Water Company of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak;

3.0 Outdoor irrigation of landscape by sprinklers is permitted only on even days of the month for those locations having a street address with an even last digit. Outdoor irrigation by sprinklers is permitted only on odd days of the month for those locations having a street address with an odd last digit. No outdoor irrigation shall take, place between the hours of 10:00 a.m. and 6:00 p.m. Irrigation by hand held hose, drip irrigation, hand held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains;

4.0 Washing of vehicles, trailers, boats, and mobile equipment:

a. The washing of automobiles, trucks, trailers, boats, and other types of equipment (mobile or otherwise) is prohibited except on the designated outdoor water use days between the hours of 12:00 midnight to 12:00 noon and sundown to 12:00 midnight. Such washing, when allowed, shall be done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff;

b. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved county standards with equipment to recycle water for use within their facility;

c. Nonprofit and community based organizations' fundraising car washes shall be allowed, provided they are otherwise in accordance with all other provisions of a permit to operate a nonprofit carwash.

5.0 With respect to eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, that benefits from the supply of water by the Water Company shall not provide drinking water to any person unless expressly requested.

6.0 The refilling or adding of water to swimming pools is prohibited except on designated outdoor water use days, which is restricted between the hours of 10am and 6 pm.

7.0 Any non-business, operation related pond, ornamental fountain or other structure making similar use of water is prohibited.

8.0 The irrigation of golf course fairways is prohibited. This section shall not apply to the irrigation of any golf course solely with available non-potable or reclaimed wastewater.

9.0 The use of water from fire hydrants shall be limited to firefighting and emergency related activities and/or other activities necessary to maintain the health, safety, and welfare of the citizens of the San Antonio Water Company's service area. This restriction shall not apply to businesses, which require the use of water for land development and building construction processes with prior written approval by the Water Company.

B. Exceptions: None of the moderate shortage restrictions shall apply to the following uses of water:

1.0 The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2.0 The routine and necessary use of water, other than for landscape irrigation, for land development (e.g., roadway base preparation, flushing of utility lines, dust control, concrete and asphalt work) and for building construction processes;

3.0 The necessary use of water for the routine maintenance and/or repair or construction of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems;

IV. CONSERVATION PROGRAM-HIGH SHORTAGE STAGE

A. In the event the Board determines that the measures fail to produce a sufficient reduction in demand so as to produce a sufficient supply, the use of water within the Water Company's service area shall be additionally restricted and the following provisions shall become effective upon a declaration by the Board and publication of same as follows:

1.0 The washing of sidewalks, walkways, driveways, public and private parking areas and other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety is prohibited;

a. Excessive run off of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his/her water system under control at all times, to know the manner and extent of this water use and any run off, and to employ available alternatives to apply irrigation water in a reasonably efficient manner;

2.0 Allowing, permitting or causing the escape of water through breaks or leaks within the customers plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of seventy-two (72) hours after the customer discovers such a break or leak or receives notice from the Water Company of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak;

3.0 Outdoor irrigation of landscape by sprinklers is permitted only on Wednesday and Sunday for those locations having street address with an even last digit. Outdoor irrigation by sprinklers is permitted only on Tuesday and Saturday for those locations having a street address with an odd last digit. Outdoor irrigation for locations not having a street address shall occur on Wednesday and Sunday if located west of San Antonio Avenue or only on Tuesday and Saturday if located east of San Antonio Avenue. No outdoor irrigation shall take place between 6:00 a.m. until one (1) hour before sundown. Irrigation by hand held hose, drip irrigation, or hand held bucket or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In

no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains;

4.0 Washing of vehicles, trailers, boats and mobile equipment:

a. The washing of automobiles, trucks, trailers, boats, airplanes and other types of equipment (mobile or otherwise) is prohibited except on the designated outdoor water use days between the hours of 12:00 midnight to 12:00 noon and sundown to 12:00 midnight. Such washing, when allowed, shall be done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use to ensure the water supply is shutoff;

b. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved county standards with equipment to recycle water for use within their facility;

c. Trucks, trailers and other types of mobile equipment (such as garbage trucks and vehicles used to transport food and other perishables) when said washing is necessary in order to protect the health, safety and welfare of the public, shall be restricted to the hours of sundown to noon. Such washing, when allowed, shall be done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use;

d. Nonprofit and community based organizations' fundraising car washes shall be allowed, provided they are otherwise in accordance with all other provisions of the appropriate agency with that jurisdiction and this section, and have obtained the necessary permits to operate a nonprofit carwash. Such activities shall be limited to no more than two (2) times in one (1) month. Permit shall become void upon the effective date of the declaration of severe shortage.

5.0 All eating and drinking establishments of any kind whatsoever including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall only provide drinking water to any person unless expressly requested.

6.0 The refilling or adding of water to existing swimming pools is prohibited except on designated outdoor water use days. New pool construction filling shall be by permit only.

7.0 Any non-business, operation related pond, ornamental fountain or other structure making similar use of water is prohibited.

8.0 The waters of golf course tee areas and fairways are prohibited unless done with reclaimed wastewater or non-potable water.

9.0 The use of water from fire hydrants shall be limited to firefighting and emergency related activities and/or other activities necessary to maintain the health, safety, and welfare of the citizens of the San Antonio Heights. This restriction shall not apply to businesses, which require the use of water for land development and building construction processes, pursuant to prior written approval by the Water Company.

B. Exceptions: None of the high shortage restrictions shall apply to the following uses of water provided there is prior written approval by the Board:

1.0 The routine and necessary use of water, other than for landscape irrigation, by a governmental entity in pursuit of its governmental functions for the benefit of the public, such as construction projects and for the cleaning of streets to prevent debris and harmful substances from entering water systems via storm drains;

2.0 The routine and necessary use of water, other than for landscape irrigation, for land development (e.g., roadway base preparation, flushing of utility lines, dust control, concrete and asphalt work) and for building construction processes;

3.0 The necessary use of water for the routine maintenance and/or repair or construction of water distribution facilities, residential and commercial plumbing and permanently installed landscape irrigation systems;

V. CONSERVATION PROGRAM – SEVERE SHORTAGE STAGE

A. In the event the Board of Directors determines that the measures fail to produce a sufficient reduction in demand so as to produce a sufficient supply, then the use of water within the Company's service area shall be additionally restricted and the following provisions shall become effective upon a declaration by the Board of Directors and publication of same as follows:

1.0 The washing of sidewalks, walkways, driveways, public and private parking areas and other impervious hard surfaced areas by direct hosing when runoff water directly flows to a gutter or storm drain, except as may be necessary to properly dispose of flammable or other dangerous liquids or substances, wash away spills that present a trip and fall hazard, or to prevent or eliminate materials dangerous to the public health and safety is prohibited;

a. Excessive run off of water or unreasonable spray of the areas being watered is prohibited. Every customer is deemed to have his/her water system under control at all times, to know the manner and extent of this water use and any run off, and to employ available alternatives to apply irrigation water in a reasonably efficient manner;

2.0 Allowing, permitting or causing the escape of water through breaks or leaks within the customers plumbing or private water distribution system for any substantial period of time within which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of seventy-two (72) hours after the customer discovers such a break or leak or receives notice from the Water Company of a break or leak, is a reasonable time within which to correct such break or leak, or, at a minimum, to stop the flow of water from such break or leak;

3.0 Outdoor irrigation of landscape by sprinklers is permitted only on Sunday for those locations having street address with an even last digit. Outdoor irrigation by sprinklers is permitted only on Saturday for those locations having a street address with an odd last digit. Outdoor irrigation for locations not having a street address shall occur on Sunday if located west of San Antonio Avenue or only on Saturdays if located east of San Antonio Avenue. No outdoor irrigation shall take place between 6:00 a.m. until one (1) hour before sundown. Irrigation by hand held hoses, drip irrigation, or hand held bucket, or similar container or by use of a cleaning machine equipped to recycle any water used are permitted anytime. In no event shall any water so used be permitted to run off into adjacent property, streets, alleys or storm drains;

4.0 Washing of vehicles, trailers, boats, and mobile equipment.

a. The washing of automobiles, trucks, trailers, boats, and other types of equipment (mobile or otherwise) is prohibited except as provided elsewhere in this section;

b. No individual, firm or business that regularly washes vehicles for remuneration or provides facilities for customers to do so through coin operated machinery shall be permitted to operate such a business unless their place of business is equipped and operating to approved county standards with equipment to recycle water for use within their facility. Washing of vehicles in such facilities shall occur only between the hours of 6:00 a.m. and 12:00 noon;

c. Trucks, trailers, and other types of mobile equipment (such as garbage trucks and vehicles used to transport food and other perishables) when said washing is necessary in order to protect the health, safety and welfare of the public, shall be restricted to the hours of sundown to 12:00 noon. Such washing when allowed, shall be done with a hand held bucket or hand held hose equipped with a positive shutoff nozzle for quick rinses. The nozzle shall be removed when the hose is not in use.

5.0 All eating and drinking establishments of any kind including, but not limited to, any restaurant, hotel, cafe, cafeteria, bar or club, whether public or private, shall only provide drinking water to any person unless expressly requested.

6.0 The refilling or adding of water to existing swimming pools is prohibited except on designated outdoor water use days. New pool construction filling shall be by permit only.

7.0 Any non-business, operation related pond, ornamental fountain or other structure making similar use of water is prohibited.

8.0 The watering of golf course tee areas and fairways is prohibited unless done with reclaimed wastewater.

VI. IMPLEMENTATION

A. In case of severe water shortage, which could occur due to a catastrophic failure of any of the Water Company's key water supply sources (i.e. SAWCo Tunnel) would result in an emergency meeting with the Board to set the appropriate reduction of entitlement per share effective upon a declaration by the Board of Directors and publication of same.

B. The Board shall review special cases, which cannot follow the letter of this part for recommendation to the Board who may grant variances.

1.0 A variance shall be granted only for reasons of economic hardship, which is defined as a threat to an individual business's primary source of income. (Under no circumstances shall inconvenience or the potential for damage of landscaping be considered an economic hardship, which justifies a variance.) The Board shall recommend only the implementation of equitable water use restrictions, which further the purpose and intent of the water conservation plan. The special water use restrictions recommended by the Board of Directors in each case shall be set forth on the face of the variance, permit or compliance agreement. A nonrefundable fee of fifty dollars ($50.00) per permit application for all requests shall be assessed to reimburse the Water Company for administrative costs.

2.0 A variance or permit issued under moderate shortage shall not be valid upon implementation of high or severe shortage stages unless the permit specifically addresses either or both of those stages upon initial issuance. Said multi-stage permit would have to reflect significant additional savings of water, or nonuse of water, under progressively more critical shortage stages. A variance or permit shall expire under its own terms and conditions and/or when another water conservation stage is in effect.

a. Exception: If, within the period of the permit, the conservation stage for which the permit was originally issued is reinstated, the permit will be considered valid until the original expiration date, as long as that conservation stage is in effect.

3.0 Any person, corporation or association who is issued a variance or permit and makes use of water pursuant to said variance, permit or compliance agreement shall provide proof of said variance, permit or compliance agreement upon demand by any person authorized by the Water Company.

4.0 Upon findings of non-compliance of a shareholder of any provision of this part, will cause revocation of any permit, variance, or compliance agreement previously granted. However, the applicant shall be notified of the proposed revocation five (5) working days before taking such action, and applicant shall be given the opportunity to be heard by the Board.

VI. ADDITIONAL ASSESSMENT FOR VIOLATION OF THIS RESOLUTION

A. Guidelines.

1.0 Any shareholder who uses water provided by the Water Company knowingly use, or permit the use of water in a manner contrary to any provision of this part, or in an amount in excess of that use permitted by the provisions of this resolution or that is reasonably necessary to satisfy the water usage need shall be found in non-compliance with this resolution and assessed the following:

a. If found in non-compliance of this resolution for a first occurrence during any calendar year or declared conservation stage, whichever time period is shorter in duration shall be assessed $50;

b. If found in non-compliance of this resolution for a second occurrence during any calendar year or declared conservation stage, whichever time period is shorter in duration shall be assessed $100;

c. If found in non-compliance of this resolution for a third occurrence or more during any calendar year or declared conservation stage, whichever time period is shorter in duration shall be assessed $500.

2.0 In addition to the above, the General Manager is hereby empowered to enact other restrictive measures that are intended to abate the conductor circumstances comprising the occurrence, including but not limited to the following: placement of a flow restricting device upon the water service, locking off of water meter, removal of water meter, and shutting off of the service line valve.

VII. If any section, subsection, sentence, clause, phrase, or portion of this Resolution is for any reason held to be invalid or unenforceable by a court of competent jurisdiction, the remaining portions of this Resolution shall nonetheless remain in full force and effect. The shareholders of the Water Company hereby declare that they would have adopted each section, subsection, sentence, clause, phrase, or portion of this Resolution, irrespective of the fact that anyone or more sections, subsections, sentences, clauses, phrases, or portions of this Resolution be declared invalid or unenforceable.

The foregoing ordinance was PASSED, APPROVED AND ADOPTED by the Board of Directors of the San Antonio Water Company on the ~~17~~ 19th day of ~~October~~ September, 2006.

# 1.0 INTRODUCTION

The Water Facilities Authority (Authority) owns and operates the Agua de Lejos Water Treatment Plant (WTP), a conventional surface water treatment facility that treats and disinfects imported water supplies, primarily State Water Project (SWP) water that is purchased from the Metropolitan Water District (MWD) through the Inland Empire Utilities Agency (IEUA). The WTP is located on sixteen acres in Upland. It began operations in 1988 and has the capacity to treat 81 million gallons per day (mgd). Recent historical flows through the treatment plant is normally in the range of 55-60 mgd during the peak summer months and can be as low as 8 mgd during the lower demand winter months. (With an administrative minimum flow penalty waiver from Metropolitan Water District, the deliveries can be as low as 4 mgd.)

The three-year period from 2012 through 2014 was the driest three-year period on record in California, and 2015 opened with the driest January in the state's weather record history. The Sierra Nevada snowpack typically peaks by April 1; this year, the snowpack was measured at five percent of historic average, the lowest measurement in recorded history. Governor Brown declared a drought State of Emergency on January 17, 2014 and directed state officials to take all necessary actions to prepare for water shortages. The State Water Resources Control Board on March 17, 2015 announced new restrictions on water use, including limiting outdoor watering to two days per week and prohibiting lawn watering during rainfall and during the next two days. Earlier this month, the governor directed the State Water Resources Control Board to implement mandatory water reductions in cities and towns across California to reduce water usage by 25 percent.

MWD amended its Water Supply Allocation Plan at its Board of Directors meeting held on December 9, 2014, with the following adjustments:

- Update to base period to Fiscal Years ending 2013 and 2014;
- Update to Conservation Demand Hardening credit based on member agency per capita water use reductions with considerations of early enforcement of mandatory conservation requirements;
- Includes a separate allocation for drought-impacted groundwater basins; and
- Replaces current penalty rate with an Allocation Surcharge based on marginal water conservation program costs.

On April 14, 2015, the Board of Directors took action to declare a Condition 3 – Water Supply Allocation and implement the Water Supply Allocation at a Level 3 Regional Shortage Level (approximately 15%), effective July 1, 2015 through June 30, 2016.

In order to manage the limited imported water supply deliveries through the treatment plant, staff collaborated with the Technical Advisory Committee (TAC) to develop the current Contingency Operations Plan (COP) to provide a guide outlining monthly delivery allocations to each of the members.

# 2.0 DRY YEAR YIELD PROGRAM

In June 2003, a Conjunctive Use Program Agreement (Number 49960) was executed between MWD, Three Valleys MWD (TVMWD), Chino Basin Watermaster (CBWM) and IEUA to establish a 100,000 AF conjunctive use and storage program for MWD, called the Dry Year Yield Program.

The Agreement provides for storage of up to 25,000 AFY unless CBWM allows for more, and extraction, at MWD's call, during dry years of up to 33,000 AFY not to exceed the amount of water in the MWD storage account.

The Agreement was amended in September 2014 to improve and clarify measurement of storage and extraction from the MWD storage account, define baseline conditions for calculations in performance targets, define procedures for variances for performance targets, revise administrative milestones, and make miscellaneous updates. Exhibit G was revised providing for a safety-net condition of imported water delivery of a minimum 40,000 AFY during Call Years, establishing minimum needs for direct deliveries from MWD.

MWD's storage account has not been replenished since it was emptied in the last set of calls during the last drought condition (2008-2011). Therefore, performance by the DYY Program participants is not required at this time.

# 3.0 WATER SUPPLY ALLOCATION PLAN

IEUA, along with other MWD members, worked with MWD staff in developing the Water Supply Allocation Plan (WSAP) that outlines measures to be taken to further reduce demand on the MWD system, if required. Previously, the WSAP was implemented at a Regional Shortage Level 2 (10%) from July 1, 2009 through June 30, 2010 and again from July 1, 2010 through June 30, 2011. Due to vastly improved water supply conditions, the allocation was rescinded in April 2011.

Since June 2014, MWD convened a number of working group meetings to revisit the WSAP in preparation for mandatory supply allocations in 2015. The recent discussions focused on three areas of the WSAP: (1) the Base Period, (2) the Allocation Formula, and (3) the Allocation enforcement mechanism.

In December 2014, the MWD Board of Directors approved adjustments to the WSAP. The adjustments included the following:

1. **Base Period**. The previous base period of CY 2004-2006 is replaced with FY ending 2013 and FY 2014.

2. **Conservation Demand Hardening Credits**. The current calculation intensive method is replaced with observed reductions in GPCD, compared to the baseline GPCD. The Conservation Demand hardening credit will be based on an initial ten percent of the GPCD-based Conservation savings plus an additional five percent for each level of Regional shortage set by the MWD Board during implementation of the WSAP. The credit will also be adjusted for the overall percentage reduction in retail water demand and the member agency's dependence upon MWD.

3. **Drought-Impacted Groundwater Basins**. A limited allocation made for drought impacted groundwater basins based on overdraft conditions, water quality restrictions, and verified need for replenishment, with final amounts and allocations determined following consultation with groundwater basin managers and member agencies.

4. **WSAP Penalty Rates**. The current Penalty Rate is based on a multiple of the fully encumbered Tier 2 Untreated Rate, over and above the water rates for the use of the water. The Penalty Rate is replaced with an Allocation Surcharge, based on the current cost of the turf removal program.

Inland Empire Utilities Agency (IEUA) reports that a Level 3 (~15%) allocation was adopted by MWD. Estimated IEUA Member Agency WSAP Allocation based on % IW purchased during WSAP baseline FY13-FY14, is presented as follows:

| Agency | 2012-13 | 2013-14 | % IW Delivery | Baseline | Level 3 | Level 4 |
|---|---|---|---|---|---|---|
| CVWD | 25,845 | 28,825 | 43% | 28,069 | 26,640 | 25,602 |
| **WFA** | 27,954 | 28,438 | 45% | 28,953 | **27,479** | 26,408 |
| FWC | 5,215 | 9,792 | 12% | 7,705 | 7,313 | 7,028 |
| **TOTAL** | **59,014** | **67,055** | **100%** | **64,726** | **61,431** | **59,038** |

(1) Baseline values as calculated by MWDs WSAP formula, FY12/13 and FY13/14 were the initial years used to forecast FY15/16 needs. The Baseline value includes growth and other various credits as defined by the approved WSAP. Each IEUA member agency will receive their % share of IEUAs total allocation based upon the percent's provided in "%IW Delivery" column.

**(2) Values are estimates and are subject to change. Final allocations expected from MWD by end April or early May 2015.**

## 3.1 ALLOCATION SURCHARGE

The Allocation Surcharge is based on the costs that MWD and its Member Agencies are incurring to implement outdoor waster use reductions through turf removal programs. The Allocation Surcharge would provide a price signal based on the marginal conservation costs incurred to reduce water use in dry and shortage years. Any revenues collected from the Allocation Surcharge would be used to fund the implementation of the Turf Removal Program or other similar programs designed to conserve water and reduce future demands.

The Allocation Surcharge is based on MWD's current cost of the Turf Removal Program. MWD is currently paying $2 per square foot of turf removed. The estimated water savings is 44 gallons per year for each square foot of turf removed for a period of ten years. Based on this savings rate, the estimated cost of the program is $1,480 per acre-foot.

**Table 3. MWD Surcharge (per AF)**

| Water Use | Base Rate | Surcharge | Total Cost |
|---|---|---|---|
| 100% of Allocation | Tier 1 | 0 | Tier 1 |
| Between 100% & 115% | Tier 1 | $1,480 | Tier 1 + $1,480 |
| Greater than 115% | Tier 1 | $2,960 | Tier 1 + $2,960 |

# 4.0 CONTINGENCY OPERATIONS PLAN DEVELOPMENT

The Authority's Operations' staff recognizes that the projected imported water supply reductions mandated by the WSAP requires collaboration and coordination with it Member Agencies for the day-to-day operations. Further, the approximate level of reduced imported water deliveries available to the Authority under projected scenarios of program implementation are estimated for planning purposes.

Planning worksheets identifying possible delivery scenarios have been developed and discussed at length through the Technical Advisory Committee. It is important to note that any COP requires adaptability as conditions and circumstances change and as water supply updates are provided. Therefore, the content of the COP will be revisited as much as necessary to address changing conditions. While an expressed numerical analysis is presented, a number of assumptions were considered as they were known at the time of development to formulate these results and only serve to guide the Authority's staff in operating the WTP in a coordinated manner integrating the interests of the individual members and their demand for imported water supplies.

Further, the individual members are required to monitor and perform in accordance with any mandatory reductions required by the WSAP, certifying compliance accordingly to the appropriate administering agency.

## 4.1 BASELINE DETERMINATION

The revised WSAP relies upon an historical two-year period, being identified as FYE 2013 through FYE 2014 including a growth adjustment and other credits applied.

### 4.1.1 WSAP BASELINE (RAW DELIVERY DATA)

**Table 4 WSAP Baseline Determination (Historical Deliveries FYE 2013-2014) in AF**

| | Jul | Aug | Sep | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | **Total** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2013 | 3,168 | 3,261 | 3,053 | 2,333 | 1,763 | 1,141 | 1,110 | 1,128 | 1,610 | 2,856 | 3,113 | 3,419 | **27,954** |
| 2014 | 3,782 | 3,678 | 3,341 | 2,199 | 1,507 | 1,049 | 1,643 | 1,290 | 1,625 | 2,052 | 2,993 | 3,296 | **28,455** |
| 2 Yr Average | 3,475 | 3,469 | 3,197 | 2,266 | 1,635 | 1,095 | 1,377 | 1,209 | 1,617 | 2,454 | 3,053 | 3,358 | **28,204** |

## 4.2 MEMBER ALLOCATION METHODOLOGY

Previously, the Authority utilized a formula for distributing the available imported water allocation amongst the members. This formula was the Ten Year Rolling Average (Fiscal Years 2004-2014 Basis with a one-year lag) of historical deliveries percentages (Table 5).

**Table 5 Allocation Methodology**

| Agency | Allocation Formula (FY 10 YRA) |
|---|---|
| Chino | 12.6% |
| MVWD/Chino Hills | 26.4% |
| Ontario | 43.2% |
| Upland | 17.8% |
| Total = | 100.0% |

### 4.2.1 MEMBERS WATER SUPPLY ALLOCATION

The FY 10 year rolling average of historical deliveries percentages in Table 6 was applied to the projected WSAP allocation (Level 3) identified in Table 6 below.

**Table 6 Determination of Available Deliveries**

| Agency | Allocation Formula (FY 10 YRA) | | Available Deliveries |
|---|---|---|---|
| Chino | 3,575 | **12.6%** | 3,462 |
| MVWD/Chino Hills[(1)] | 7,509 | **26.4%** | 7,255 |
| Ontario | 12,286 | **43.2%** | 11,871 |
| Upland | 5,066 | **17.8%** | 4,891 |
| Total = | 28,436 | 100.0% | **27,479** |

[(1)]Per Joint water supply agreement between Monte Vista WD and City of Chino Hills

# 4.3 CONTINGENCY OPERATIONS

After much discussion during the development of the COP through the Technical Advisory Committee, the majority opinion was to design the COP wherein most of the projected available imported water supply would be delivered primarily during peak demand in the summer months, with emphasis given to July through October, while attempting to maintain minimum deliveries in the remainder or some portion of the year.

Since the construction of the Low Flow Modification Project, the WTP has the flexibility to operate at a minimum 4-mgd flow, as presented in the following tables, during the off-peak months so that most of the available supplies would be directed to the higher demand peak months. Further, a prolonged shutdown can be avoided with the lower minimum flow capability. Therefore, the plan is to operate the WTP throughout the year, unless a brief shutdown is required by MWD for maintenance on the Rialto Pipeline or for special maintenance at the WTP.

It should be noted that MWD has previously granted the Authority a waiver of their Administrative Code 4504(b) during WSAP implementation to allow minimum raw water supply deliveries less than the required minimum 10% of influent valve capacity (8 mgd) or to avoid minimum 8 mgd purchase payments for deliveries at less than the minimum.

In the following planning scenarios, the projected annual volume of water available for deliveries is distributed or allocated to the Authority's members according to the FY 10 YRA methodology previously used and considered the members' preferences in accordance to their individual systems' demands.

## 4.3.1 MONTHLY WATER SUPPLY ALLOCATION SCENARIO

In this scenario, Table 7 and Table 8 illustrate the allocation of projected water deliveries in acre-feet and million gallons per day, respectively. The allocation is distributed to the members in accordance with the FY 10 YRA methodology based on the historical delivery pattern. Scenarios in Tables 9-10 provide a distribution based on a winter minimum flow pattern. Scenarios in Tables 11-12 provide a distribution based on a winter no flow pattern.

[PAGE INTENTIONALLY LEFT BLANK]

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

BOARD ACTION

- Board of Directors
  *Water Planning and Stewardship*

4/14/2015 Board Meeting

**8-3**

## Subject

Express support for Governor's Executive Order B-29-15; declare Water Supply Condition for 2015; approve implementation of Water Supply Allocation Plan; adopt supporting resolution; and conduct public hearing

## Executive Summary

Based on the continuing drought conditions in California, Governor Brown's Executive Order calling for 25 percent reductions in water use, and a poor outlook for the final State Water Project Table A allocation, staff recommends the following actions:

1. Express support for the Governor's call for a 25 percent reduction in consumer water use and Executive Order B-29-15.
2. Declare a Condition 3 – Water Supply Allocation.
3. Implement Metropolitan's Water Supply Allocation Plan (WSAP) at a Level 3 Regional Shortage Level, effective July 1, 2015 through June 30, 2016.
4. Adopt the WSAP Level 3 allocation as a water conservation program pursuant to Water Code Section 375 et seq.
5. Adopt a resolution implementing the actions listed above.

## Details

### Background

On April 1, 2015, Governor Brown issued an Executive Order (Order) calling for a 25 percent reduction in consumer water use in response to the historically dry conditions throughout the state of California (**Attachment 1**). The Governor's Order also includes mandatory actions aimed at reducing water demands, with a particular focus on outdoor water use. In addition to the broad call for mandatory use reductions, the Order announces initiatives to:

- Remove and replace turf with drought tolerant landscape options
- Support rebate programs for water efficient devices
- Restrict water use on commercial, industrial, and institutional properties in order to achieve 25 percent reductions in potable water use
- Prohibit irrigation of ornamental turf on street medians with potable water supplies
- Prohibit irrigation of new construction with potable water unless drip or microspray systems are used
- Direct water suppliers to develop rate structures and pricing mechanisms to maximize water conservation consistent with statewide water restrictions

Metropolitan supports these efforts to respond to the historic drought conditions while taking actions that can have lasting benefits for the State of California in future years. Southern California has a proven track-record of aggressively implementing water conservation. Potable per capita water use in the region has declined by about 24 percent since 1990. These water use reductions have allowed the region to add an additional 5 million people while actually reducing reliance on imported supplies. Over the last 25 years, Metropolitan has invested more than $750 million in water use efficiency matched by significant local and consumer funding. The Governor's Executive Order recognizes the significant effort made by certain regions and directs the State Water Resources Control Board (SWRCB) to take that into account in setting specific reduction goals. Clearly Southern California's actions merit consideration by the SWRCB and staff will work with the SWRCB to ensure final actions are appropriate.

**Hydrologic Conditions**

2014 was an historically dry year in the State of California. According to the U.S. Drought Monitor, an estimated 58 percent of California was in "Exceptional Drought Conditions," the worst category possible, with over 80 percent of California in "Extreme Drought Conditions."

Immediately following the Governor's Emergency Drought Declaration in January 2014, Metropolitan took a series of actions to address drought conditions. In February 2014, Metropolitan declared a "Condition 2 – Water Supply Alert" to provide public messaging and to urge local water agencies within the Metropolitan service area to adopt and enact water saving ordinances. Metropolitan followed with the creation of the Water Management Fund (Fund) which set aside $232 million for financing drought-related projects and actions. Recognizing the importance of indoor and outdoor conservation in managing the ongoing drought and in establishing water efficiency for a sustainable future, the Board approved the addition of $40 million from the Water Management Fund to the conservation budget, increasing Metropolitan's total conservation budget to $100 million. Metropolitan also authorized additional expenditures from the Fund to improve storage withdrawal capabilities and acquire additional dry-year supplies through transfers and exchanges. In addition, Metropolitan conducted an enhanced public outreach program including an extensive radio and television advertising campaign that has greatly increased the public awareness of the water supply situation and has encouraged significant conservation savings.

The record dry and hot conditions of 2014 significantly impacted the water resources of both the State of California and Metropolitan. The California Department of Water Resources (DWR) limited supplies from the State Water Project (SWP) to only 5 percent of the contractors' SWP Table A amounts in 2014. This allocation was the lowest ever in the history of the SWP. Metropolitan was able to meet demands in 2014 by relying heavily on storage reserves to make up for the historically low allocation on the SWP. Metropolitan's dry-year storage reserves ended 2014 at approximately 1.2 million acre-feet (MAF).

Hydrologic conditions in 2015 have continued this severe dry trend. 2015 is the fourth consecutive drought year and the seventh dry year out of the last eight in California. The water year started with improved conditions, but the latter half of the winter has produced little additional snowpack. In fact, for the year to date, statewide snowpack is currently at its lowest level in recorded history. DWR announced an initial 2015 SWP allocation of 10 percent in December. Since then, the 2015 SWP allocation has only increased to 20 percent. DWR's recent SWP analysis indicates that an additional increase in the 2015 SWP allocation is possible, but the final allocation is unlikely to be more than 25 percent. Additionally, any increase in the 2015 SWP allocation is likely to occur later in the year, after DWR is able to assess the results of spring and summer SWP operations. Under these conditions, further withdrawals from Metropolitan's dry-year storage reserves will be necessary in order to meet demands. Although water demands in Southern California have reduced somewhat through ongoing conservation efforts and outreach, implementation of the WSAP to support the Governor's call for additional demand reductions and reduce withdrawals from Metropolitan's dry-year storage reserves is now necessary.

**Potential Shortage Allocation Scenarios**

By implementing the WSAP, Metropolitan places limits on the amount of water member agencies can purchase without facing a surcharge. Surcharges are from $1,480 per acre-foot up to $2,960 per acre-foot for water use in excess of a given member agency's allocation limit. Any revenues collected from these surcharges would be used to fund the implementation of Metropolitan's turf removal program or other similar programs designed to conserve water and reduce future demands. Once implemented, the WSAP would be in place from July 1, 2015 through June 30, 2016. Metropolitan estimates that the baseline deliveries plus losses under the WSAP would be approximately 2.2 MAF. However, current deliveries in Metropolitan's system are trending to be 2.1 MAF with losses. These lower deliveries reflect the positive response consumers have already shown to help manage with the drought conditions. Deliveries are expected to drop approximately 100 thousand acre-feet (TAF) with each level of allocation that is declared, unless member agencies exceed their allocations. While the numbers will vary among agencies based on their local supply conditions, each level of allocation is roughly a 5 percent reduction in wholesale water use on a regional level.

Staff considered the following objectives in developing the recommendation to implement the WSAP:

Set WSAP Level in 2015/16 while:

a. Supporting the Governor's April 1, 2015 Executive Order
b. Avoiding use of Emergency storage
c. Managing storage for the following years
d. Allowing for supply uncertainties
e. Avoiding steep increases in WSAP levels in future years, if dry conditions persist

The following table shows the balances of water supply and demand and the estimated impacts on regional storage through June 30, 2016, under two possible scenarios. A more detailed description of the supplies available to Metropolitan in calendar year 2015 is available in the April 2015 Water Surplus and Drought Management Report. Staff projects that approximately 128 TAF will be withdrawn from dry-year storage reserves in the first six months of 2015, leaving 1.057 MAF in dry-year storage reserves as of July 1. In Scenario A, a SWP Table A allocation of 25 percent is assumed. In Scenario B, a SWP Table A allocation of 20 percent is assumed. Both scenarios assume approximately 165 TAF of transfer/exchange supplies. Under Scenario A, staff estimates that a maximum of 459 TAF of dry-year storage could be withdrawn during the allocation period given projected capacity constraints. Under Scenario B, approximately 442 TAF of dry-year storage can be accessed due to the lower SWP allocation, which reduces the amount of storage that can be accessed via exchange.

| **SUPPLY DEMAND BALANCE** | **SCENARIO A** (25% SWP Allocation) | **SCENARIO B** (20% SWP Allocation) |
|---|---|---|
| SWP Supply | 478,000 | 382,000 |
| CRA Supply | 925,000 | 925,000 |
| Transfers/Exchanges | 165,000 | 165,000 |
| Total Supply | 1,568,000 | 1,472,000 |
| **WSAP Level 2 Option:** | | |
| Deliveries* (July 1, 2015 – June 30, 2016) | 1,900,000 | 1,900,000 |
| Dry-Year Storage (Take) | (332,000) | (428,000) |
| Dry-Year Storage Remaining For 2016/17 | 725,000 | 629,000 |

**WSAP level 3 Option:**

| | | |
|---|---|---|
| Deliveries* (July 1, 2015 – June 30, 2016) | 1,800,000 | 1,800,000 |
| Dry-Year Storage (Take) | (232,000) | (328,000) |
| Dry-Year Storage Remaining for 2016/17 | 825,000 | 729,000 |

**WSAP level 4 Option:**

| | | |
|---|---|---|
| Deliveries* (July 1, 2015 – June 30, 2016) | 1,700,000 | 1,700,000 |
| Dry-Year Storage (Take) | (132,000) | (228,000) |
| Dry-Year Storage Remaining for 2016/17 | 925,000 | 829,000 |

*Includes aggregate deliveries to member agencies available without an Allocation Surcharge, including losses.

**Assuming a WSAP Level 2** is implemented with supplies shown in Scenarios A or B above, it is possible that a sizable amount of Metropolitan's dry-year storage reserves could be required to meet demands; however, no use of emergency storage would be required. Staff also analyzed the potential WSAP levels that might be necessary to avoid any draws on emergency storage in 2016/17 should Scenario A or Scenario B be repeated. Under these conditions, if a WSAP Level 2 is implemented in 2015/16, then a Level 2 might be necessary in 2016/17 under Scenario A and an allocation as deep as a Level 5 might be necessary under Scenario B.

**Assuming a WSAP Level 3** is implemented with supplies shown in Scenarios A or B above, a lesser amount of Metropolitan's dry-year storage reserves would be required to meet demands. Should Scenario A occur again in 2016/17, then a WSAP Level 3 could be implemented again without any draw on emergency storage. Under a repeat of Scenario B, the WSAP Level would need to drop from Level 3 in 2015/16 to Level 4 in 2016/17 in order to eliminate any draw on emergency storage.

**Implementing a WSAP Level 4** under the same scenarios would reduce the need for withdrawals from storage and allow Metropolitan to maintain or even reduce the allocation level in the subsequent year, should the same conditions repeat. Of the three options, WSAP Level 4 is the most protective of regional storage.

**Supply Uncertainties**

Scenario A and B both make assumptions about the supplies that will be available to Metropolitan. If dry conditions persist, some risks to these assumptions are possible. Base supplies available to Metropolitan on the Colorado River Aqueduct could be reduced if higher priority users have high Colorado River water use this year. It is also possible that the Lower Basin of the Colorado River could be in shortage conditions as early as 2016, which could limit Metropolitan's ability to access Intentionally Created Surplus reserves currently stored in Lake Mead. Under certain conditions, the 2015 SWP allocation may not increase from 20 to 25 percent. It is also possible that some member agencies would actually exceed their allocation limits, which would result in higher deliveries than shown in Scenario A and B. On the other hand, consumer reductions could exceed the requirements of the allocation resulting in lesser draws from dry-year storage. Both scenarios assume the benefits of transfers and exchanges. While it is likely that some transfer supplies may be affected by curtailments to water districts in Northern California, staff is pursuing transfer supplies on both the SWP and Colorado River to achieve approximately165 TAF in total supplies across both systems. Actual supply availability may end up being higher or lower than this assumption.

In general, a deeper WSAP Level provides more protection against supply risks as compared to a lower WSAP Level.

**Recommendation on WSAP Implementation**

Staff recommends that the Board express support for the Governor's call for a 25 percent reduction in consumer water use and declare a water supply "Condition 3 – Water Supply Allocation". Metropolitan would implement surcharges on agencies should their deliveries exceed limits at a WSAP Level 3 Regional Shortage Level. A WSAP Level 3 will implement surcharges on member agencies that don't reduce their deliveries in order to

achieve a roughly 15 percent reduction in regional deliveries. In addition to this action, Metropolitan staff will bring to the Board additional tools that can be used to help retail agencies reduce water use further, in support of the Governor's call for greater reductions. These tools will include:

- A focused expanded outreach and media strategy geared at achieving greater consumer awareness and knowledge on how to reduce water use
- Additional budget approval to continue regional conservation incentives through FY 2015/16
- Partnering with the State on funding of rebate and outreach programs
- Modifications to the turf removal program to maintain and encourage broad participation while focusing on a long-term transition toward drought tolerant landscapes
- Monthly tracking and reporting of member agency water use and enforcement actions to achieve greater reductions in consumer water use
- Working with the State on accelerating funding from Proposition 1 for local projects
- Recommendations on key elements of local water use landscape ordinances, and tiered rate structures that can help achieve long-term changes in water use throughout the region

Based on the analysis provided in the previous section, a WSAP Level 3 meets the objectives outlined in this letter. Staff believes that implementing a WSAP Level 3 along with the additional actions listed above will help Southern California meet the Governor's outlined goals. However, a WSAP Level 4 is certainly more protective of regional water storage levels. While a WSAP Level 2 could be adequate to meet regional demands in combination with draws from storage, it is less supportive of the Governor's call for broad water use reductions.

Staff recommends a WSAP Level 3 based on current supply conditions, the recent DWR assessment of SWP allocations for 2015, and the Governor's Executive Order. Given the unprecedented drought occurring statewide, it is recognized that local and regional supply conditions still remain dynamic over the next several months. As a result, these conditions and response to the WSAP will be closely monitored and reported to the Board. If any significant changes in supply and demand conditions occur, staff will provide options on water use efficiencies and supply management for board consideration, if necessary.

Staff also recommends the Board adopt the WSAP allocation as a water conservation program pursuant to Water Code section 375 et set (**Attachment 2**). In addition to the general authorities provided under the MWD Act, Water Code section 375 specifically authorizes public agencies to adopt and enforce programs and rate structures aimed at encouraging water conservation. Adopting the WSAP allocation as a water conservation program is consistent with actions taken by our member agencies and retail agencies and will assist in public outreach efforts to communicate the severity of the current drought and the need for conservation in managing through the drought.

A resolution (**Attachment 3**) describing the water supply conditions in California and Metropolitan's service area and implementing the actions recommended above is attached.

**Key Implementation Items and Timelines**

Staff has been coordinating directly with member agencies to reconcile local supply and consumptive use estimates. Initial Member Agency WSAP allocations of supply will be provided to the member agencies for their use in implementing their local actions. Final member agency allocation limits are dependent on certified local supply production during the Allocation Year. There are several key implementation items to note following the Board's action to implement the WSAP.

- WSAP Effective Date – July 1, 2015, through June 30, 2016
- Member Agency Initial Allocations – May 15, 2015
- Water Use Tracking and reporting – May 2015 through June 2016

- Local Supply Certification – July 2016
- Allocation Surcharge assessment and billing – August 2016 through September 2016
- Member Agency Appeals – Process available throughout Allocation Year

Staff will report on a monthly basis the tracking of member agency deliveries during the allocation period and key updates to member agency data that affect the allocation limits.

## Policy

By Minute Item 47393, dated February 12, 2008, the Board adopted the Water Supply Allocation Plan

By Minute Item 48376, dated August 17, 2010, the Board approved adjustments to the Water Supply Allocation Plan

By Minute Item 48803, dated September 12, 2011, the Board approved adjustments to the Water Supply Allocation Plan

By Minute Item 74526, dated February 11, 2014, the Board adopted the Water Supply Alert Resolution

By Minute Item 49979, dated December 9, 2014, the Board approved adjustments to the Water Supply Allocation Plan

## California Environmental Quality Act (CEQA)

CEQA determination for Options #1 and #2:

Adoption of the WSAP previously was determined to be categorically and statutorily exempt under the provisions of CEQA and State CEQA Guidelines. Specifically, the WSAP was found to be exempt under Sections 15301 (Class 1), 15307 (Class 7), 15308 (Class 8) and 15378(b)(4) of the State CEQA Guidelines. In addition, the WSAP was found to be exempt pursuant to Water Code Section 10652, to the extent this plan serves as the basis for the urban water shortage contingency analysis required under Water Code Section 10632 and is incorporated into Metropolitan's RUWMP.

Similarly, the proposed actions are exempt from or otherwise not covered by CEQA. Specifically, implementation of the WSAP is statutorily exempt from CEQA under Water Code section 10652, which expressly exempts actions listed in and taken pursuant to a RUWMP's urban water shortage contingency analysis. Likewise, implementation of a WSAP allocation and its adoption as a water conservation program under Water Code section 375 are intended to promote conservation of scarce water supplies during a period of extreme drought. As such, these actions are categorically exempt from CEQA under Sections 15307 (Class 7) and 15308 (Class 8) of the State CEQA Guidelines. In addition, implementation of a WSAP allocation merely involves the potential application of a surcharge to those member agencies whose deliveries of water from Metropolitan exceed their allocations, but it does not otherwise prohibit or restrict such deliveries. As such, the proposed action is not defined as project under Section 15378(b)(4) of the State CEQA Guidelines, because it involves government fiscal activities that do not involve a commitment to any specific project that may result in a potentially significant impact. Finally, where it can be seen with certainty that there is no possibility that the proposed actions may have a significant impact on the environment, those actions are not subject to CEQA pursuant to Section 15061(b)(3) of the State CEQA Guidelines.

The CEQA determination is: Determine that the proposed actions are statutorily and categorically exempt, are not defined as a project and are not subject to CEQA, pursuant to Water Code section 10652 and Sections 15307, 15308, 15378(b)(4) and 15061(b)(3) of the State CEQA Guidelines.

CEQA determination for Option #3:

None required

## Board Options

**Option #1**

Adopt the CEQA determination that the proposed actions are statutorily and categorically exempt, are not defined as a project, and are not subject to CEQA, and

a. Express support for the Governor's call for a 25 percent reduction in consumer water use and Executive Order B-29-15;
b. Declare a "Water Supply Condition 3 – Water Supply Allocation";
c. Implement the Water Supply Allocation Plan at a Level 3 Regional Shortage Level, effective July 1, 2015, through June 30, 2016;
d. Adopt the WSAP Level 3 allocation as a water conservation program pursuant to Water Code Section 375 et seq.; and
e. Adopt the resolution shown in **Attachment 3** implementing the actions listed above.

**Fiscal Impact:** None directly related to the declaration of a water supply condition or to the implementation of the WSAP. Future water sales may be impacted due to any regional reductions in water use as a result of the implementation of the WSAP.

**Business Analysis:** Implementing a WSAP Level 3 would result in the delivery of supplies at a level that likely avoids the use of emergency storage, allows for some supply uncertainties during the allocation year, and helps avoid steep increases in the WSAP Level in future years, should dry conditions persist.

**Option #2**

Adopt the CEQA determination that the proposed actions are statutorily and categorically exempt, are not defined as a project, and are not subject to CEQA, and

a. Express support for the Governor's call for a 25 percent reduction in consumer water use and Executive Order B-29-15;
b. Declare a "Water supply Condition 3 – Water Supply Allocation";
c. Implement the Water Supply Allocation Plan at a Regional Shortage Level to be determined by the Board, effective July 1, 2015 through June 30, 2016;
d. Adopt the WSAP Level as a water conservation program pursuant to Water Code Section 375 et seq.; and
e. Adopt the resolution shown in **Attachment 3,** revised to implement the actions listed above.

**Fiscal Impact:** None directly related to the declaration of a water supply condition or to the implementation of the WSAP. Future water sales may be impacted due to any regional reductions in water use as a result of the implementation of the WSAP.

**Business Analysis:** Implementing a WSAP Level will help Metropolitan manage regional storage levels given current drought conditions. It may be more difficult for member and local water agencies to reduce water use in order to avoid surcharges under deeper WSAP Levels. However, a deeper WSAP Level in 2015/16 could be more protective of regional storage levels and could reduce the need for potential deeper allocations in a future year, if drought conditions persist. A lower WSAP level could be less supportive of the Governor's call for broad water use reductions.

**Option #3**

Direct staff to return to the Board at a later date to revisit WSAP implementation.

**Fiscal Impact:** None

**Business Analysis:** Delaying the decision to implement the WSAP would allow for more certain information on water supply conditions to be entered into the decision on the appropriate level for the WSAP. However, a later decision date would also delay communication and coordination needed to make an implementation of the WSAP effective region-wide and potentially impact storage resources.

## Staff Recommendation

Option #1

Executive Department
State of California

## EXECUTIVE ORDER B-29-15

**WHEREAS** on January 17, 2014, I proclaimed a State of Emergency to exist throughout the State of California due to severe drought conditions; and

**WHEREAS** on April 25, 2014, I proclaimed a Continued State of Emergency to exist throughout the State of California due to the ongoing drought; and

**WHEREAS** California's water supplies continue to be severely depleted despite a limited amount of rain and snowfall this winter, with record low snowpack in the Sierra Nevada mountains, decreased water levels in most of California's reservoirs, reduced flows in the state's rivers and shrinking supplies in underground water basins; and

**WHEREAS** the severe drought conditions continue to present urgent challenges including: drinking water shortages in communities across the state, diminished water for agricultural production, degraded habitat for many fish and wildlife species, increased wildfire risk, and the threat of saltwater contamination to fresh water supplies in the Sacramento-San Joaquin Bay Delta; and

**WHEREAS** a distinct possibility exists that the current drought will stretch into a fifth straight year in 2016 and beyond; and

**WHEREAS** new expedited actions are needed to reduce the harmful impacts from water shortages and other impacts of the drought; and

**WHEREAS** the magnitude of the severe drought conditions continues to present threats beyond the control of the services, personnel, equipment, and facilities of any single local government and require the combined forces of a mutual aid region or regions to combat; and

**WHEREAS** under the provisions of section 8558(b) of the Government Code, I find that conditions of extreme peril to the safety of persons and property continue to exist in California due to water shortage and drought conditions with which local authority is unable to cope; and

**WHEREAS** under the provisions of section 8571 of the California Government Code, I find that strict compliance with various statutes and regulations specified in this order would prevent, hinder, or delay the mitigation of the effects of the drought.

**NOW, THEREFORE, I, EDMUND G. BROWN JR.,** Governor of the State of California, in accordance with the authority vested in me by the Constitution and statutes of the State of California, in particular Government Code sections 8567 and 8571 of the California Government Code, do hereby issue this Executive Order, effective immediately.

**IT IS HEREBY ORDERED THAT:**

1. The orders and provisions contained in my January 17, 2014 Proclamation, my April 25, 2014 Proclamation, and Executive Orders B-26-14 and B-28-14 remain in full force and effect except as modified herein.

**SAVE WATER**

2. The State Water Resources Control Board (Water Board) shall impose restrictions to achieve a statewide 25% reduction in potable urban water usage through February 28, 2016. These restrictions will require water suppliers to California's cities and towns to reduce usage as compared to the amount used in 2013. These restrictions should consider the relative per capita water usage of each water suppliers' service area, and require that those areas with high per capita use achieve proportionally greater reductions than those with low use. The California Public Utilities Commission is requested to take similar action with respect to investor-owned utilities providing water services.

3. The Department of Water Resources (the Department) shall lead a statewide initiative, in partnership with local agencies, to collectively replace 50 million square feet of lawns and ornamental turf with drought tolerant landscapes. The Department shall provide funding to allow for lawn replacement programs in underserved communities, which will complement local programs already underway across the state.

4. The California Energy Commission, jointly with the Department and the Water Board, shall implement a time-limited statewide appliance rebate program to provide monetary incentives for the replacement of inefficient household devices.

5. The Water Board shall impose restrictions to require that commercial, industrial, and institutional properties, such as campuses, golf courses, and cemeteries, immediately implement water efficiency measures to reduce potable water usage in an amount consistent with the reduction targets mandated by Directive 2 of this Executive Order.

6. The Water Board shall prohibit irrigation with potable water of ornamental turf on public street medians.

7. The Water Board shall prohibit irrigation with potable water outside of newly constructed homes and buildings that is not delivered by drip or microspray systems.

8. The Water Board shall direct urban water suppliers to develop rate structures and other pricing mechanisms, including but not limited to surcharges, fees, and penalties, to maximize water conservation consistent with statewide water restrictions. The Water Board is directed to adopt emergency regulations, as it deems necessary, pursuant to Water Code section 1058.5 to implement this directive. The Water Board is further directed to work with state agencies and water suppliers to identify mechanisms that would encourage and facilitate the adoption of rate structures and other pricing mechanisms that promote water conservation. The California Public Utilities Commission is requested to take similar action with respect to investor-owned utilities providing water services.

**INCREASE ENFORCEMENT AGAINST WATER WASTE**

9. The Water Board shall require urban water suppliers to provide monthly information on water usage, conservation, and enforcement on a permanent basis.

10. The Water Board shall require frequent reporting of water diversion and use by water right holders, conduct inspections to determine whether illegal diversions or wasteful and unreasonable use of water are occurring, and bring enforcement actions against illegal diverters and those engaging in the wasteful and unreasonable use of water. Pursuant to Government Code sections 8570 and 8627, the Water Board is granted authority to inspect property or diversion facilities to ascertain compliance with water rights laws and regulations where there is cause to believe such laws and regulations have been violated. When access is not granted by a property owner, the Water Board may obtain an inspection warrant pursuant to the procedures set forth in Title 13 (commencing with section 1822.50) of Part 3 of the Code of Civil Procedure for the purposes of conducting an inspection pursuant to this directive.

11. The Department shall update the State Model Water Efficient Landscape Ordinance through expedited regulation. This updated Ordinance shall increase water efficiency standards for new and existing landscapes through more efficient irrigation systems, greywater usage, onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. It will also require reporting on the implementation and enforcement of local ordinances, with required reports due by December 31, 2015. The Department shall provide information on local compliance to the Water Board, which shall consider adopting regulations or taking appropriate enforcement actions to promote compliance. The Department shall provide technical assistance and give priority in grant funding to public agencies for actions necessary to comply with local ordinances.

12. Agricultural water suppliers that supply water to more than 25,000 acres shall include in their required 2015 Agricultural Water Management Plans a detailed drought management plan that describes the actions and measures the supplier will take to manage water demand during drought. The Department shall require those plans to include quantification of water supplies and demands for 2013, 2014, and 2015 to the extent data is available. The Department will provide technical assistance to water suppliers in preparing the plans.

13. Agricultural water suppliers that supply water to 10,000 to 25,000 acres of irrigated lands shall develop Agricultural Water Management Plans and submit the plans to the Department by July 1, 2016. These plans shall include a detailed drought management plan and quantification of water supplies and demands in 2013, 2014, and 2015, to the extent that data is available. The Department shall give priority in grant funding to agricultural water suppliers that supply water to 10,000 to 25,000 acres of land for development and implementation of Agricultural Water Management Plans.

14. The Department shall report to Water Board on the status of the Agricultural Water Management Plan submittals within one month of receipt of those reports.

15. Local water agencies in high and medium priority groundwater basins shall immediately implement all requirements of the California Statewide Groundwater Elevation Monitoring Program pursuant to Water Code section 10933. The Department shall refer noncompliant local water agencies within high and medium priority groundwater basins to the Water Board by December 31, 2015, which shall consider adopting regulations or taking appropriate enforcement to promote compliance.

16. The California Energy Commission shall adopt emergency regulations establishing standards that improve the efficiency of water appliances, including toilets, urinals, and faucets available for sale and installation in new and existing buildings.

**INVEST IN NEW TECHNOLOGIES**

17. The California Energy Commission, jointly with the Department and the Water Board, shall implement a Water Energy Technology (WET) program to deploy innovative water management technologies for businesses, residents, industries, and agriculture. This program will achieve water and energy savings and greenhouse gas reductions by accelerating use of cutting-edge technologies such as renewable energy-powered desalination, integrated on-site reuse systems, water-use monitoring software, irrigation system timing and precision technology, and on-farm precision technology.

**STREAMLINE GOVERNMENT RESPONSE**

18. The Office of Emergency Services and the Department of Housing and Community Development shall work jointly with counties to provide temporary assistance for persons moving from housing units due to a lack of potable water who are served by a private well or water utility with less than 15 connections, and where all reasonable attempts to find a potable water source have been exhausted.

19. State permitting agencies shall prioritize review and approval of water infrastructure projects and programs that increase local water supplies, including water recycling facilities, reservoir improvement projects, surface water treatment plants, desalination plants, stormwater capture, and greywater systems. Agencies shall report to the Governor's Office on applications that have been pending for longer than 90 days.

20. The Department shall take actions required to plan and, if necessary, implement Emergency Drought Salinity Barriers in coordination and consultation with the Water Board and the Department of Fish and Wildlife at locations within the Sacramento - San Joaquin delta estuary. These barriers will be designed to conserve water for use later in the year to meet state and federal Endangered Species Act requirements, preserve to the extent possible water quality in the Delta, and retain water supply for essential human health and safety uses in 2015 and in the future.

21. The Water Board and the Department of Fish and Wildlife shall immediately consider any necessary regulatory approvals for the purpose of installation of the Emergency Drought Salinity Barriers.

22. The Department shall immediately consider voluntary crop idling water transfer and water exchange proposals of one year or less in duration that are initiated by local public agencies and approved in 2015 by the Department subject to the criteria set forth in Water Code section 1810.

23. The Water Board will prioritize new and amended safe drinking water permits that enhance water supply and reliability for community water systems facing water shortages or that expand service connections to include existing residences facing water shortages. As the Department of Public Health's drinking water program was transferred to the Water Board, any reference to the Department of Public Health in any prior Proclamation or Executive Order listed in Paragraph 1 is deemed to refer to the Water Board.

24. The California Department of Forestry and Fire Protection shall launch a public information campaign to educate the public on actions they can take to help to prevent wildfires including the proper treatment of dead and dying trees. Pursuant to Government Code section 8645, $1.2 million from the State Responsibility Area Fire Prevention Fund (Fund 3063) shall be allocated to the California Department of Forestry and Fire Protection to carry out this directive.

25. The Energy Commission shall expedite the processing of all applications or petitions for amendments to power plant certifications issued by the Energy Commission for the purpose of securing alternate water supply necessary for continued power plant operation. Title 20, section 1769 of the California Code of Regulations is hereby waived for any such petition, and the Energy Commission is authorized to create and implement an alternative process to consider such petitions. This process may delegate amendment approval authority, as appropriate, to the Energy Commission Executive Director. The Energy Commission shall give timely notice to all relevant local, regional, and state agencies of any petition subject to this directive, and shall post on its website any such petition.

26. For purposes of carrying out directives 2–9, 11, 16–17, 20–23, and 25, Division 13 (commencing with section 21000) of the Public Resources Code and regulations adopted pursuant to that Division are hereby suspended. This suspension applies to any actions taken by state agencies, and for actions taken by local agencies where the state agency with primary responsibility for implementing the directive concurs that local action is required, as well as for any necessary permits or approvals required to complete these actions. This suspension, and those specified in paragraph 9 of the January 17, 2014 Proclamation, paragraph 19 of the April 25, 2014 proclamation, and paragraph 4 of Executive Order B-26-14, shall remain in effect until May 31, 2016. Drought relief actions taken pursuant to these paragraphs that are started prior to May 31, 2016, but not completed, shall not be subject to Division 13 (commencing with section 21000) of the Public Resources Code for the time required to complete them.

27. For purposes of carrying out directives 20 and 21, section 13247 and Chapter 3 of Part 3 (commencing with section 85225) of the Water Code are suspended.

28. For actions called for in this proclamation in directive 20, the Department shall exercise any authority vested in the Central Valley Flood Protection Board, as codified in Water Code section 8521, et seq., that is necessary to enable these urgent actions to be taken more quickly than otherwise possible. The Director of the Department of Water Resources is specifically authorized, on behalf of the State of California, to request that the Secretary of the Army, on the recommendation of the Chief of Engineers of the Army Corps of Engineers, grant any permission required pursuant to section 14 of the Rivers and Harbors Act of 1899 and codified in section 48 of title 33 of the United States Code.

29. The Department is directed to enter into agreements with landowners for the purposes of planning and installation of the Emergency Drought Barriers in 2015 to the extent necessary to accommodate access to barrier locations, land-side and water-side construction, and materials staging in proximity to barrier locations. Where the Department is unable to reach an agreement with landowners, the Department may exercise the full authority of Government Code section 8572.

30. For purposes of this Executive Order, chapter 3.5 (commencing with section 11340) of part 1 of division 3 of the Government Code and chapter 5 (commencing with section 25400) of division 15 of the Public Resources Code are suspended for the development and adoption of regulations or guidelines needed to carry out the provisions in this Order. Any entity issuing regulations or guidelines pursuant to this directive shall conduct a public meeting on the regulations and guidelines prior to adopting them.

31. In order to ensure that equipment and services necessary for drought response can be procured quickly, the provisions of the Government Code and the Public Contract Code applicable to state contracts, including, but not limited to, advertising and competitive bidding requirements, are hereby suspended for directives 17, 20, and 24. Approval by the Department of Finance is required prior to the execution of any contract entered into pursuant to these directives.

This Executive Order is not intended to, and does not, create any rights or benefits, substantive or procedural, enforceable at law or in equity, against the State of California, its agencies, departments, entities, officers, employees, or any other person.

**I FURTHER DIRECT** that as soon as hereafter possible, this Order be filed in the Office of the Secretary of State and that widespread publicity and notice be given to this Order.

**IN WITNESS WHEREOF** I have hereunto set my hand and caused the Great Seal of the State of California to be affixed this 1st day of April 2015.

EDMUND G. BROWN JR.
Governor of California

ALEX PADILLA
Secretary of State

# WATER CONSERVATION PROGRAMS
# WATER CODE SECTIONS 375-378

**Section 375**

(a) Notwithstanding any other provision of the law, any public entity which supplies water at retail or wholesale for the benefit of persons within the service area or area of jurisdiction of the public entity may, by ordinance or resolution adopted by a majority of the members of the governing body after holding a public hearing upon notice and making appropriate findings of necessity for the adoption of a water conservation program, adopt and enforce a water conservation program to reduce the quantity of water used by those persons for the purpose of conserving the water supplies of the public entity.

(b) With regard to water delivered for other than agricultural uses, the ordinance or resolution may specifically require the installation of water-saving devices which are designed to reduce water consumption. The ordinance or resolution may also encourage water conservation through rate structure design.

(c) For the purposes of this section, "public entity" means a city, whether general law or chartered, county, city and county, special district, agency, authority, any other municipal public corporation or district, or any other political subdivision of the state.

**Section 375.5**

a) A public entity, as defined by Section 375, may undertake water conservation and public education programs in conjunction with school districts, public libraries, or any other public entity.

(b) (1) A public entity may undertake water conservation and public education programs using an information booklet or materials for use in connection with the use or transfer of real estate containing up to four residential units. For the purposes of this subdivision, the public entity may use water conservation materials prepared by the department.

(2) It is the intent of the Legislature that on or before December 31, 2007, a review of the program be conducted to obtain information on both of the following matters:

(A) The extent to which public entities have undertaken water conservation and public education programs referred to in paragraph (1).

(B) The extent to which water conservation may be attributable to the implementation of water conservation and public education programs referred to in paragraph (1).

(c) A public entity may take into account any programs undertaken pursuant to this section in a rate structure design implemented pursuant to Section 375.

(d) The Legislature finds and declares that a program undertaken pursuant to this section is in the public interest, serves a public purpose, and will promote the health, welfare, and safety of the people of the state.

**Section 376**

(a) Any ordinance or resolution adopted pursuant to Section 375 is effective upon adoption. Within 10days after its adoption, the ordinance or resolution shall be published pursuant to Section 6061 of the Government Code in full in a newspaper of general circulation that is printed, published, and circulated

in the public entity. If there is no such newspaper, the ordinance or resolution shall be posted within 10 days after its adoption in three public places within the public entity.

(b) The publication of ordinances or resolutions, as required by subdivision (a), may be satisfied by either of the following actions:

(1) The public entity may publish a summary of a proposed ordinance, resolution, or proposed amendment to an existing ordinance or resolution. The summary shall be prepared by an official designated by the governing body. A summary shall be published and a certified copy of the full text of the proposed ordinance, resolution, or amendment shall be posted in the office of the governing body at least five days prior to the governing body's meeting at which the proposed ordinance, resolution, or amendment is to be adopted. Within 15 days after adoption of the ordinance, resolution, or amendment, the governing body shall publish a summary of the ordinance, resolution, or amendment with the names of those members voting for and against the ordinance, resolution, or amendment and the official shall post in the office of the governing body a certified copy of the full text of the adopted ordinance, resolution, or amendment along with the names of those members voting for and against the ordinance, resolution, or amendment.

(2) If the official designated by the governing body determines that it is not feasible to prepare a fair and adequate summary of the proposed or adopted ordinance, resolution, or amendment, and if the governing body so orders, a display advertisement of at least one-quarter of a page in a newspaper of general circulation in the county shall be published at least five days prior to the governing body meeting at which the proposed ordinance, resolution, or amendment is to be adopted. Within 15 days after adoption of the ordinance, resolution, or amendment, a display advertisement of at least one-quarter of a page shall be published. The advertisement shall indicate the general nature of, and provide information about, the proposed or adopted ordinance, resolution, or amendment, including information sufficient to enable the public to obtain copies of the complete text of the ordinance, resolution, or amendment, and the names of those members voting for and against the ordinance, resolution, or amendment.

**Section 377**

From and after the publication or posting of any ordinance or resolution pursuant to Section 376, violation of a requirement of a water conservation program adopted pursuant to Section 376 is a misdemeanor. Upon conviction thereof such person shall be punished by imprisonment in the county jail for not more than 30 days, or by fine not exceeding one thousand dollars ($1,000), or by both.

**Section 378**

A public entity may enter into agreements with other public entities, businesses, community associations, or private entities to provide water conservation services and measures and materials for implementing water conservation programs adopted pursuant to this chapter.

RESOLUTION _____

**RESOLUTION OF THE BOARD OF DIRECTORS**

**OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA SUPPORTING THE GOVERNOR'S CALL FOR A 25 PERCENT REDUCTION IN CONSUMER WATER USE AND EXECUTIVE ORDER B-29-15,**

**IMPLEMENTING ITS WATER SUPPLY ALLOCATION**

**PLAN, ESTABLISHING THE**

**REGIONAL SHORTAGE LEVEL, AND IMPLEMENTING AN ALLOCATION SURCHARGE**

**PURSUANT TO CALIFORNIA WATER CODE SECTION 375**

**WHEREAS,** on January 17, 2014, the Governor proclaimed a State of Emergency to exist throughout the State of California due to severe drought conditions ; and

**WHEREAS**, on April 25, 2014, the Governor issued a second proclamation declaring a continuing State of Emergency and noting that drought conditions had persisted for the last three years; and

**WHEREAS,** Governor Brown issued Executive Order B-29-15 on April 1, 2015 instituting emergency actions and mandatory water use reductions for the State of California; and

**WHEREAS,** State snowpack levels, as indicated by manual surveys and automatic gauge measurements throughout the Sierra Nevada, have been below normal for four consecutive years; and

**WHEREAS,** the official projections for the State of California show well below normal runoff for the fourth consecutive year, with the runoff from the Sierra snowpack being below the amounts needed to fill California's storage reservoir system or support delivery of supplies requested by Metropolitan and other export contractors; and

**WHEREAS,** State runoff that replenishes the state's reservoir system, as indicated by the Department of Water Resources, have been below normal levels eight of the last nine years; and

**WHEREAS,** rainfall levels locally, as indicated by the measurement at the Los Angeles Civic Center, have been below normal for three consecutive years; and

**WHEREAS,** the dry year storage available to Metropolitan has been reduced by approximately 55 percent since January 2012; and

**WHEREAS,** storage in the state's reservoir system is well below normal levels, with Lake Oroville at 50 percent of capacity; and

**WHEREAS,** runoff in the Colorado River system, as indicated by the Bureau of Reclamation, have been below normal levels 13 of the last 16 years; and

**WHEREAS,** storage in the Colorado River system is well below normal levels, with Lake Mead at 40 percent of capacity; and

**WHEREAS,** Biological Opinions issued to protect Delta smelt, Central Valley salmon, longfin smelt and other species have continued to contribute to reduced water supplies available for delivery from the State Water Project; and

**WHEREAS,** the Department of Water Resources' current allocation of State Water Project water available to Metropolitan and the other state water contractors is only 20 percent of contracted supply as of the date of this resolution; and

**WHEREAS**, in February 2008, Metropolitan's Board of Directors adopted its Water Supply Allocation Plan under which the Board may determine that a regional shortage exists, establish a regional shortage level and implement an Allocation Surcharge for water use in excess of a member agency's annual allocation under the Water Supply Allocation Plan; and

**WHEREAS**, the Water Supply Allocation Plan is intended to be implemented during periods of regional water shortages in order to promote conservation of scarce water supplies; and

**WHEREAS**, pursuant to the Water Supply Allocation Plan, the Board may establish a regional shortage level and assess an allocation surcharge on water use in excess of a member agency's annual allocation under the plan; and

**WHEREAS**, in light of the extreme drought and poor water supply conditions noted above, the Board believes it is necessary and in the best interests of Metropolitan and its member agencies to implement the Water Supply Allocation Plan at a Level 3 Regional Shortage Level and to assess an allocation surcharge on any member agency whose use exceeds its Level 3 allocations; and

**WHEREAS**, California Water Code section 375 authorizes public agencies to adopt programs and rate structures aimed at encouraging water conservation after holding a public hearing and making appropriate findings of necessity; and

**WHEREAS**, adopting the Water Supply Allocation Plan Level 3 allocations and surcharges as a water conservation program is consistent with actions taken by our member agencies and other retail agencies and will assist Metropolitan and its member agencies in public outreach efforts to communicate the severity of the current drought and the need for conservation; and

**WHEREAS**, on April 13, 2015 Metropolitan conducted a public hearing and made appropriate findings of necessity for the adoption of the Water Supply Allocation Plan Level 3 allocations and surcharges as a water conservation program.

**NOW, THEREFORE,** the Board of Directors of Metropolitan does hereby resolve, determine and order as follows:

Section 1. Metropolitan's Board of Directors declare Metropolitan's support for the Governor's Executive Order B-29-15.

Section 2. Metropolitan's Board of Directors declare that the regional water shortage in Metropolitan's service area continues and declare a Water Supply Condition 3 – Water Supply Allocation.

Section 3. The Water Supply Allocation Plan shall be implemented, effective July 1, 2015 through June 30, 2016.

Section 4. The Water Supply Allocation Plan shall be set at Regional Shortage Level 3.

Section 5. The Allocation Surcharge, as part of the Water Supply Allocation Plan, shall be the means enabled by Section 375 of the California Water Code to encourage the regional conservation of water supplies.

Section 6. The General Manager is hereby authorized and directed to take all necessary action to implement the Water Supply Allocation Plan, consistent with its terms.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a Resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on April 14, 2015.

_____

Secretary of the Board of Directors
of The Metropolitan Water District
of Southern California

# APPENDIX 5.2

# METROPOLITAN WATER DISTRICT BOARD LETTER ON WATER SUPPLY ALLOCATION PLAN AMENDMENT, DECEMBER 2014

[PAGE INTENTIONALLY LEFT BLANK]

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

BOARD ACTION

- Board of Directors
  *Water Planning and Stewardship Committee*

12/9/2014 Board Meeting

**8-2**

## Subject

Approve adjustments to Metropolitan's Water Supply Allocation Plan

## Executive Summary

Staff is recommending several adjustments to Metropolitan's Water Supply Allocation Plan to address the current unprecedented drought conditions and water needs within the Metropolitan service area. The recommended adjustments were developed with the input of the member agency managers and staff through a member agency working group process that began in July 2014. The recommended adjustments include: (1) Updating the Base Period from Calendar Years 2004 - 2006 to Fiscal Years Ending 2013 and 2014; (2) updating the Conservation Demand Hardening credit to a method based on member agency per capita water use reductions with considerations for the early enforcement of mandatory conservation ordinances and requirements; (3) including a separate allocation for drought-impacted groundwater basins; and (4) replacing the current penalty rates with an Allocation Surcharge based on marginal water conservation program costs.

## Details

### Background

The state of California and Metropolitan have been managing through severe drought conditions, and 2014 has been called "unprecedented" in terms of drought and water supply[1]. Although Metropolitan has been able to successfully manage its operations during the California drought thus far, 2014 has required significant use of regional storage reserves. It is expected that the end of year total dry year storage reserves will approach levels similar to those in 2009 when mandatory supply allocations were imposed by Metropolitan. While storage levels remain relatively strong, as in 2009, prudent management of remaining storage if severe drought conditions continue into 2015 will likely result in Metropolitan imposing mandatory supply allocations.

In February 2008, the Board approved Metropolitan's Water Supply Allocation Plan (WSAP). The approved WSAP serves as the current policy for allocating water supplies to the member agencies in times of declared water shortages with the goal of reducing the quantity of water used within Metropolitan's service area to conserve supply. The WSAP includes specific formulas for calculating Metropolitan supply allocations to each member agency and also includes implementation elements needed for administering a water supply allocation. The WSAP was developed through an extensive working group process with the management and staff of the member agencies and with the Board. The resulting WSAP allocates supplies based on the needs of agencies throughout the service area and the proposed adjustments in this letter are consistent with that approach. The original development process covered an eight month period starting in July 2007. The WSAP was also formally reviewed on two separate occasions since its adoption. The review processes each resulted in board-adopted adjustments to the plan.

[1] The Governor of California proclaimed a State of Emergency due to drought conditions on January 17, 2014 and, on April 24, 2014 issued an Executive Order proclaiming a continued State of Emergency noting drought conditions have persisted for the last three years and authorizing adoption and implementation of emergency regulations.

The WSAP was implemented in the last drought. The WSAP was implemented at a Regional Shortage Level 2 from July 1, 2009 through June 30, 2010 and again from July 1, 2010 through June 30, 2011. The Board rescinded the allocation in April 2011 due to vastly improved water supply conditions.

**Process**

Following discussion at the June 2014 Water Planning and Stewardship Committee, Metropolitan staff convened a member agency working group to revisit the WSAP plan. The purpose of the working group was to collaborate with the member agencies to identify potential revisions to the WSAP in preparation for mandatory supply allocations in 2015. There have been eight working group meetings and three discussions at the monthly Member Agency Managers' Meeting. **Attachment 1** shows a listing of the meetings that were held as part of the WSAP working group process.

The process focused on three areas of the WSAP: the Base Period, the Allocation Formula, and the Allocation enforcement mechanism. To prepare the working group for discussion in each of the areas, Metropolitan staff conducted an in-depth review of the current WSAP and its supporting policies. The working group then discussed and reviewed potential revisions in each of the areas, developing or eliminating items from discussion. In some cases, items were deferred and are intended to be addressed at a later time. Based on the process and discussion from the working group, staff recommends the following adjustments to the WSAP.

**Recommended Adjustments to the Water Supply Allocation Plan**

Staff recommends that the Board consider four adjustments to the WSAP:

1. Update the WSAP Base Period to Fiscal Years Ending 2013 and 2014. This would include a process to account for agencies that had mandatory water use restrictions in place during the updated Base Period;
2. Update the method for calculating Conservation Demand Hardening Credits;
3. Add a separate allocation for drought-impacted groundwater basins; and
4. Replace the WSAP Penalty Rates with an Allocation Surcharge based on the marginal costs of conservation programs.

If approved, these adjustments would replace related elements of the current WSAP. The recommended adjustments are detailed below.

1. Update the WSAP Base Period to Fiscal Years Ending 2013 and 2014 - The WSAP "Base Period" is used to determine the retail consumptive water demands for each member agency. The "Base Period" retail demand is adjusted for growth in population, conservation savings, and non-potable recycling production occurring from the base period to the Allocation Year. The current method uses the average of retail consumptive water demand in Calendar Years 2004-2006. Keeping the current WSAP Base Period for a 2015 Allocation Year would require 10 years of estimated growth adjustments.

   The proposed update to the WSAP Base period replaces Calendar Years 2004-2006 with Fiscal Years 2013 and 2014. These more recent years provide a more up to-date-estimate of current retail consumptive water demand. For a 2015 Allocation Year, only one year of estimated growth adjustments would be required, thus minimizing any estimation error involved in adjusting retail water use. **Attachment 2** includes the data used to calculate retail consumptive water demands for each member agency and estimated Allocation Year amounts.

   There are member and retail agencies within Metropolitan's service area that were in mandatory water use restrictions and/or rationing during the updated Base Period. For those agencies, using the updated Base Period could reflect lower retail water use due to mandatory restrictions that were already in place. Without adjusting for this, those agencies could be required to enforce even higher levels of restrictions under an allocation than those agencies that have not started mandatory restrictions. Staff recommends a consultation process that would allow member agencies to describe mandatory restrictions that were in place during the updated Base Period. Restrictions vary among agencies, but include restricted water uses, fines, and water budget or penalty based rate structures that are enacted by the governing body of the member agency or retail agency. Following the consultation process, staff would recommend

adjustments for an agency based on evidence of reduced Gallons Per Capita Per Day (GPCD). To qualify for an adjustment, reductions would have to be observed that are beyond those expected from the agency's ongoing conservation efforts and trends. Any adjustments determined to be appropriate would be reported to the Board in conjunction with future staff recommendations for implementing the WSAP.

2. Update the methodology for calculating Conservation Demand Hardening Credits – Conservation Demand Hardening occurs at the retail water use level as consumers implement more conservation savings devices and programs. In short, member agencies whose customers have implemented conservation savings devices and programs have "harder" demands than those that have not. The current WSAP formula includes a method for estimating total conservation savings and providing additional supply allocation to account for demand hardening due to the conservation savings.

   The current WSAP method uses an extensive model calculation that includes installed conservation devices, water savings rates, demographic growth, plumbing codes/ordinances, and estimates of conservation due to price and water rate structures to determine conservation savings. The updated methodology would replace the current calculation-intensive method with one based on observed reductions in GPCD.

   In order to estimate conservation savings, each member agency will establish a historical baseline GPCD calculated in a manner consistent with California Senate Bill SBx7-7. Reductions from the baseline GPCD to the Allocation Year would be the basis used to calculate the equivalent conservation savings in acre-feet. The Conservation Demand hardening credit will be based on an initial 10 percent of the GPCD-based Conservation savings plus an additional 5 percent for each level of Regional Shortage set by the Board during implementation of the WSAP. The credit will also be adjusted for:

   a. The overall percentage reduction in retail water demand
   b. The member agency's dependence on MWD

   This provides a base demand hardening credit equal to 10 percent of conservation savings and increases the credit as deeper shortages occur, which is when conservation demand hardening has a bigger impact on the retail consumer. The credit also increases based on the percentage of an agency's demand that was reduced through conservation. This accounts for increased hardening that occurs as increasing amounts of conservation are implemented. Lastly, the credit is scaled to the member agency's dependence on Metropolitan to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in Metropolitan supply.

3. Add a separate allocation for drought-impacted groundwater basins - The current WSAP does not provide an allocation specifically to assist drought impacted groundwater basins. Groundwater basins help provide vital local supplies that can buffer the region from short-term drought impacts. Longer droughts can result in reductions to the many sources of water that replenish groundwater basins, resulting in lower basin levels and potential impacts to the overlying consumptive demands. Limited imported deliveries under these conditions may help avoid impacts to the basins that may be drawn out of their normal operating range or subject to water quality or regulatory impacts. Staff recommends a limited allocation for drought impacted groundwater basins based on the following framework:

   a. Staff would hold a consultation with a requesting member agency and the appropriate groundwater basin manager to document whether the basin is in one of the following conditions:

      i. Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or

      ii. Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries.

   b. Provide an allocation based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would

then be reduced by the declared WSAP Regional Shortage Level (5 percent for each Regional Shortage Level).

c. Any allocation provided under this provision for drought impacted groundwater basins is intended to help support and maintain groundwater production for consumptive use. As such, a member agency receiving an allocation under this provision will be expected to maintain groundwater production levels equivalent to the average pumping in the Base Period. Any adjustments to a member agency's M&I allocation due to lower groundwater production would be reduced by deliveries made under this provision.

d. Agencies for which this allocation does not provide sufficient supplies for the needs of the groundwater basin may use the WSAP Appeals Process to request additional supply (subject to Board approval). The appeal should include a Groundwater Management Plan that documents the need for additional supplies according to the following tenets:

i. Maintenance of groundwater production levels;

ii. Maintenance of, or reducing the further decline of, groundwater levels;

iii. Maintenance of key water quality factors/indicators;

iv. Avoidance of permanent impacts to groundwater infrastructure or geologic features; and

v. Consideration of severe and/or inequitable financial impacts.

While final amounts and allocations will be determined following consultation with groundwater basin managers and member agencies, **Attachment 3** shows the ten-year average of historical replenishment purchases for member agencies that have been active in purchasing replenishment water since 2010. **Attachment 3** also shows estimated allocations of Groundwater Replenishment under the different Regional Shortage Levels.

4. Replace the WSAP Penalty Rates with an Allocation Surcharge based on the marginal costs of conservation programs - The current WSAP uses a Penalty Rate to disincentivize member agencies from exceeding their supply allocations. The Penalty Rate is based on a multiple of Metropolitan's fully encumbered Tier 2 Untreated Rate for water. Water use between 100 percent to 115 percent of supply allocations is charged a Penalty Rate of two times the fully encumbered Tier 2 Untreated Rate, and use greater than 115 percent of supply allocations is charged a Penalty Rate of four times the fully encumbered Tier 2 Untreated Rate. The Penalty Rate is charged over and above the water rates for the use of the water.

Staff recommends replacing the WSAP Penalty Rates with an Allocation Surcharge. The proposed Allocation Surcharge is based on the costs that Metropolitan and its member agencies are incurring to implement outdoor water use reductions through turf removal programs. The Allocation Surcharge would provide a price signal based on the marginal conservation costs incurred to reduce water use in dry and shortage years. Any revenues collected from the Allocation Surcharge would be used to fund the implementation of the Turf Removal program or other similar programs designed to conserve water and reduce future demands.

The Allocation Surcharge is based on Metropolitan's current cost of the turf removal program. Metropolitan is currently paying $2 per square foot of turf removed. The estimated water savings is 44 gallons per year for each square foot of turf removed for a period of ten years. Based on this savings rate, the estimated cost of the program is $1,480 per acre-foot.

Water use between 100 percent and 115 percent of WSAP supply allocations would be charged with the Allocation Surcharge of $1,480 per acre-foot. Water use greater than 115 percent of WSAP supply allocations would be charged two times the Allocation Surcharge or $2,960 per acre-foot. Two times the Allocation Surcharge would allow the funding of additional turf removal and conservation programs to

conserve additional water and further reduce demand or, if appropriate, allow for a higher per square foot incentive payment.

**Recommendation**

Following the input from the member agencies during the WSAP working group process, staff recommends that the Board approve the four described adjustments to the WSAP. If approved, staff will incorporate the adjustments into the WSAP and prepare the plan for use in any upcoming implementations of the WSAP. Staff will also make available an updated version of the Water Supply Allocation Plan Handbook that incorporates the approved adjustments.

In the interest of completing WSAP revision discussions for board consideration in December, both Metropolitan and member agency staff recognize that not all outstanding issues can be resolved during this timeframe. Two issues have been identified that remain for future policy development and are not addressed in the current proposed revisions to the WSAP. One issue is to investigate how Metropolitan provides incentives through its varied programs, including the WSAP, to ensure development of locally produced supplies consistent with Metropolitan's Integrated Resource Plan objectives. The second issue is a desire to develop a policy framework for groundwater replenishment deliveries that recognizes the long-term consumptive demand on MWD, and establishes service provisions consistent with both the variable nature of replenishment demands and payment of Metropolitan's full service rate.

## Policy

By Minute Item 47393, dated February 12, 2008, the Board adopted the Water Supply Allocation Plan.

By Minute Item 48376, dated August 17, 2010, the Board adopted proposed adjustments to the Water Supply Allocation Plan, and approved the allocation of seawater barrier supplies for 2010/11.

By Minute Item 48803, dated September 13, 2011, the Board adopted proposed adjustments to the Water Supply Allocation Plan.

## California Environmental Quality Act (CEQA)

CEQA determination for Option #1

The Water Supply Allocation Plan previously was determined to be categorically and statutorily exempt under the provisions of CEQA and State CEQA Guidelines. Specifically, the WSAP was found to be exempt under 15301 (Class 1), 15307 (Class 7), 15308 (Class 8) and 15378(b)(4) of the State CEQA Guidelines. In addition, the WSAP was found to be exempt pursuant to Water Code Section 10652, to the extent this plan serves as the basis for the urban water shortage contingency analysis required under Water Code Section 10631 and is incorporated into Metropolitan's RUWMP. These determinations were made on February 12, 2008, and a Notice of Exemption (NOE) was filed shortly thereafter. With the current board action, there is no substantial change proposed to the project. Hence, the previous environmental documentation prepared in conjunction with the project fully complies with CEQA and the State CEQA Guidelines. In addition, the proposed action is not defined as a project under CEQA because it involves continuing administrative actions, such as general policy and procedure making (Section 15378(b)(2) of the State CEQA Guidelines), and other government fiscal activities which do not involve any commitment to any specific project which may result in a potentially significant physical impact on the environment (Section 15378(b)(4) of the State CEQA Guidelines). Accordingly, no further CEQA documentation is necessary for the Board to act with regard to the proposed action.

The CEQA determination is: Determine that the WSAP has been addressed previously in the original NOE, the proposed action is not defined as a project subject to CEQA, and that no further environmental analysis or documentation is required.

CEQA determination for Option #2:

None required

## Board Options

**Option #1**

Adopt the CEQA determination that the item is categorically and statutorily exempt and approve adjustments to the Water Supply Allocation Plan.

**Fiscal Impact:** None

**Business Analysis:** Recommended adjustments improve the existing WSAP and also address groundwater basin needs during shortage conditions.

**Option #2**

Do not approve adjustments to the Water Supply Allocation Plan and keep the current Water Supply Allocation Plan as Metropolitan's policy and method for allocating water to the member agencies.

**Fiscal Impact:** None

**Business Analysis:** Current Water Supply Allocation Plan has some deficiencies that will be kept in place without the approval of adjustments. Groundwater replenishment needs and deliveries will not be addressed under the current Water Supply Allocation Plan.

[(1)] Chino Hills deliveries combined with MVWD, per agreement

Adopted Ordinance 2010-07-01 July 2010

Tier 1 Annual Limit (Effective CY): Ten-year rolling average of firm deliveries of treated water, excluding in-lieu deliveries for the Dry Year Yield Program, on a fiscal year basis trailing one-year. Beginning July 2010, utilized unsubscribed capacity volumes from that time forward shall be subtracted from the delivery volumes. An individual Member Agency's share of the Tier 1 Annual Limit shall be based on the Authority's 10 YRA. (The "ten-year running average" of metered deliveries utilized in Fund 1 and Fund 2 for allocating capital replacement costs remains unchanged and is not replaced by the "10 YRA" described above).

Indirect Operating Cost (Effective FY): The cost will be allocated to the Member Agencies based on each Agency's percentage of the 10 YRA. At the end of the fiscal year, each Member Agency's charges will be adjusted to reflect their proportionate share of the indirect operating net audited cost for that fiscal year. (In those instances where a negative value is given to the City of Chino Hills for its 10 YRA determination, due to its water supply agreement with Monte Vista Water District and use of in-lieu deliveries for the DYY Program, the values for these Member Agencies will be combined when applying the cost allocation for Indirect Operations.)

Capacity Charge (Effective FY): The Capacity Charge will be allocated to each Member Agency based on each Agency's percentage of average water deliveries in the 10 YRA.

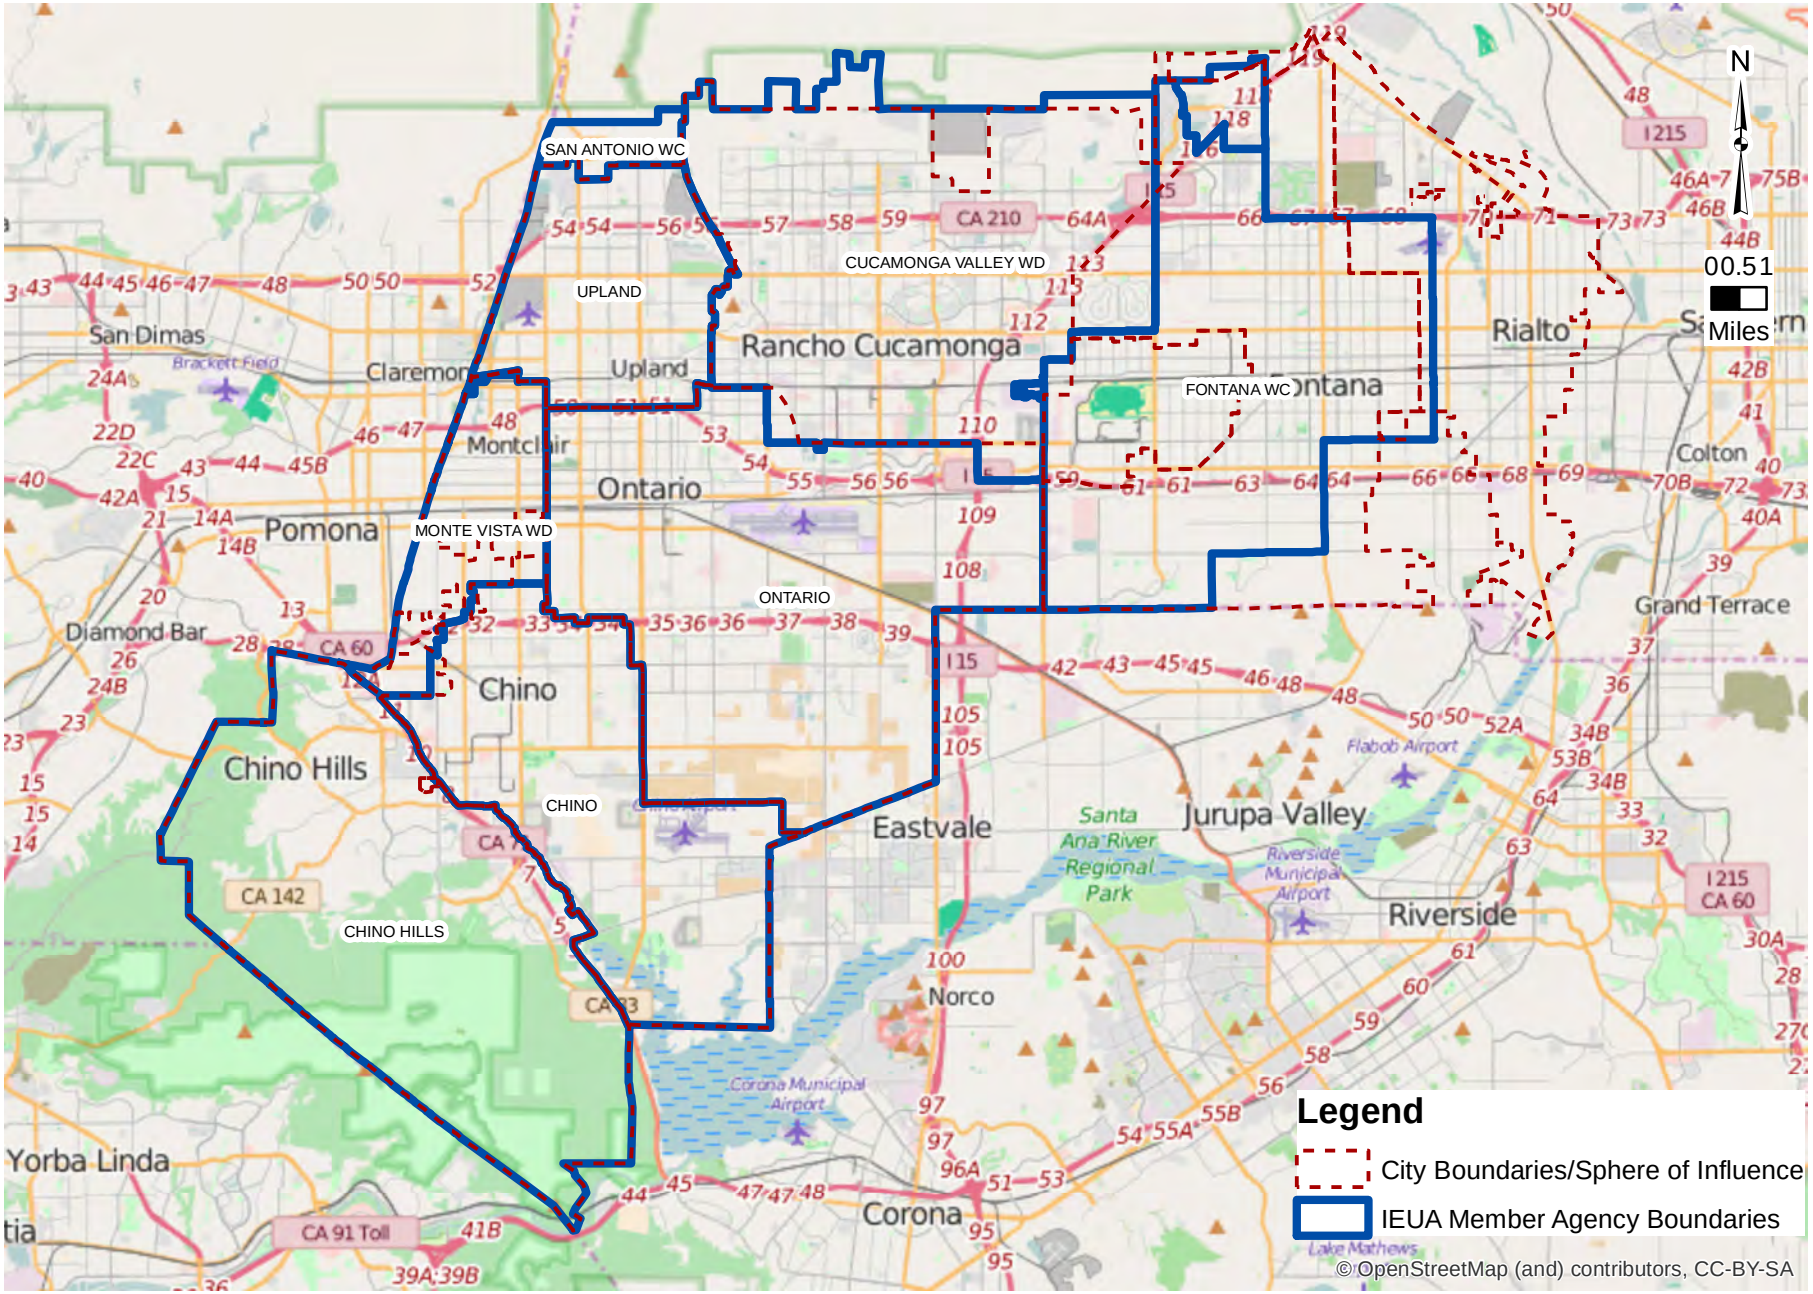
# 1 INTRODUCTION

This Technical Memorandum (TM) summarizes the process used to develop a water demand projection model and identify land use based water demand projections for Inland Empire Utilities Agency (IEUA) and its member agencies. IEUA's member agencies include the cities of Chino, Chino Hills, Ontario, and Upland, Cucamonga Valley Water District (CVWD), Fontana Water Company (FWC), Monte Vista Water District (MVWD), and San Antonio Water Company (SAWCo).

Data development and assumptions are presented in this TM along with a description of the methodologies used to develop the model and projections. The demand projection analysis includes data development and assumptions; and a discussion of the model tool and resulting projections.

# 2 METHODOLOGY

Project objectives are described in this section along with the project study area, an overview of the projection methodology, and a summary of the Demand Model development and use.



## 2.1 Objectives

To support its planning efforts, IEUA developed a Land Use Based Demand Model (Demand Model) to augment its Integrated Regional Plan (IRP) process in order to provide consistently developed member agency demand projections through 2040. The primary objective was to develop a land use based water demand model that disaggregates regional data to the member agency level for IEUA's Urban Water Management Plan (UWMP). The demand projections can be used by IEUA and member agencies for any system or supply planning purpose that requires detailed demand estimates and projections, such as conservation savings analyses.

## 2.2 Study Area and Boundaries

The study area is IEUA's sphere of influence (SOI). This boundary was established by IEUA to define its limit of future annexation to their existing service area. The SOI for IEUA is established by San Bernardino County Local Agency Formation Commission (LAFCO) to represent LAFCO's designation of the spatial extent of IEUA service. The IEUA SOI is the outermost extent of the study area, with demands projected within this boundary. The SOI delineation has undergone public review and California Environmental Quality Act (CEQA) analysis on growth inducing and other impacts.

Within this IEUA SOI boundary, the eight member agencies have boundaries established to prevent overlapping water service and demand projections. The SOIs for public water purveyors are also established by San Bernardino County LAFCO. Private water companies are governed by the State of California Public Utilities Commission, and do not have LAFCO designated SOIs, thus the use of their established member agency boundaries within IEUA is important. These boundaries are presented on Figure 2-1.

Inland Empire Utilities Agency
A MUNICIPAL WATER DISTRICT

INLAND EMPIRE UTILITIES AGENCY, CALIFORNIA
DEMAND MODEL

**Study Area Boundaries**

ARCADIS

May 2016
FIGURE 2-1

Within the study area and underlying each of the member agency boundaries, lie eight cities with land use planning authority. The cities of Chino, Chino Hills, Fontana, Montclair, Ontario, Rancho Cucamonga, Rialto, and Upland, also have SOIs established by San Bernardino County LAFCO. These boundaries were useful in developing demand projections based on future land uses, as discussed in more detail in Section 3.

## 2.3 Overview of Projection Methodology

As presented on Figure 2-2, , the methodology used to create the Demand Model and identify demand projections relied on developing a land use database within a geographic information system (GIS), and determining Land Use Unit Demands (LUDs). LUDs measure water use on a per acre basis. Figure 2-2 presents the primary tasks for: 1) developing a land use database in orange, 2) unit demands in blue, and 3) demand projections in green.

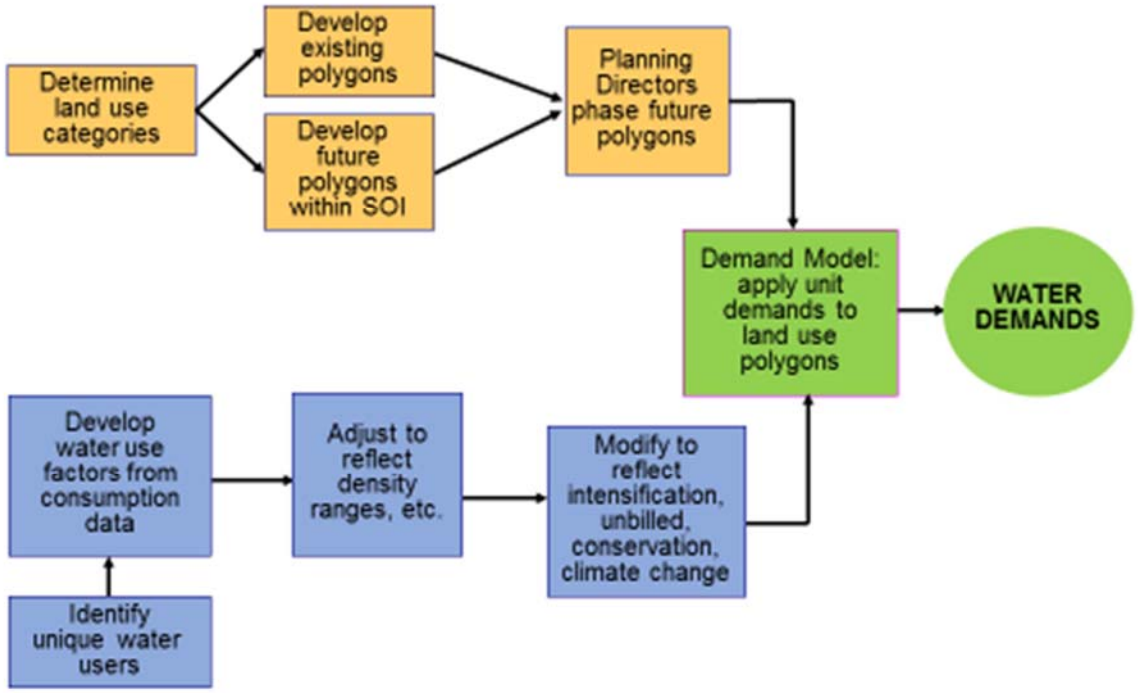


**Figure 2-2: Land Use Based Demand Model Development Process**

The demand projection process relied on the following key assumptions and data development steps.

*Land Use*

- The land use database relied on the SOIs as boundaries for IEUA, public member agencies, and cities.
- Because general plans reflect allowable development, not existing development, actual land uses were mapped by first using city parcel data that was updated as a part of the project to reflect actual land use, thus improving accuracy.
- The projections relied on using approved general plans, specifically the land use element and map for vacant lands identified for future development.
- Planning staff at each land use agency phased development by providing an estimate of potential construction dates for these future land uses.

*Land Use Unit Demands*

- Billing data and unbilled water estimates were provided by member agencies for the previous five years.
- The billing data from 2010 through 2014 were averaged to determine the existing year 2015 "normalized demands", thus smoothing out the annual and seasonal effects of weather and other variables. This approach to normalizing demands was used because of the difficulty separating out the economic complexities of the past eight years (i.e., the Great Recession) and years of drought. The normalized demand became the starting point for the demand projections.
- LUDs were generated for each member agency using existing land use acreage and member agency billing data to ensure that the LUDs reflected the unique demand characteristics of each water purveyor's service area.
- The unbilled water estimate (or unaccounted for water) reflects the percent difference between metered production and consumption; these percentages were provided by each member agency and used as an adjustment factor.
- Climate change impacts on estimated demands in 2040 were obtained from IRP assumptions and used as an adjustment factor.
- Redevelopment, increased densities, repurposing buildings, and other forms of land use intensification as land values increase can have a great effect on future water demands. This was accounted for in the adjustment factors based on an analysis of demand impacts associated with strong market conditions, which was noted in the IRP.
- Conservation savings were obtained from the IRP for plumbing code and efficiency regulation impacts.
- The Demand Model has an adjustment factor category called "Other" that is available to accommodate active conservation savings analyses, by percentage, for each land use, time frame, and member agency.

*Demand Model*

- The Demand Model relied on existing land use and LUDs normalized for 2015 existing demands.
- The Demand Model relied on future land uses and future LUDs, which were existing LUDs adjusted to reflect future changed conditions, to determine water demand projections in five year increments to 2040.
- Demands were identified and projected for each member agency separately which were combined for the IEUA service area in total.

More specific information follows regarding each of these key assumptions and data development steps.

## 2.4 Demand Model Development and Use

The project resulted in a GIS based software application, or tool, to calculate future water demands, called the Demand Model. The Demand Model linked GIS land use polygons and existing land use unit demands (input data) to calculate average annual projections 25 years into the future.

The Demand Model is a Microsoft Access database that contains GIS data collected from IEUA members and land use agencies including parcel data, member agency SOIs, and land use agency boundaries. Additionally, the database also contains layers for future land uses that were developed by the consultant team after consultation with each of the eight land use planning directors (described in Section 3.3 and 3.4). All original data in the individual parcel layer were maintained in this database. A few fields were added to each parcel layer, including the general plan land use, existing land use, year anticipated to be developed, and water purveyor serving the parcel.

The Demand Model can be used to develop demands spatially (by member agency and land use) and temporally (2015 to 2040 in five-year increments). Analysis, such as determining the savings associated with various demand management tools, can be conducted by land use and time frame for member agencies or the entire IEUA service area. The resulting study area Demand Model projections were similar to IRP projections, as described in Section 5.1. The Demand Model projection of approximately 278,000 AF at 2040 were four percent higher than the high range IRP projection.

# 3 LAND USE AND TRENDS

The process of consolidating general plan land use categories for all eight land use planning agencies into one master set of categories is described below, along with how existing and future land use GIS layers and the resulting land use inventories were developed.

## 3.1 Consolidation of Land Use Categories

All cities and counties in California have a general plan to provide and implement the vision for development of each community. All general plans contain a land use element and land use map to describe specific allowable land use and densities for each parcel. City general plans include all lands within their SOI overlapping in some areas with the San Bernardino County general plan that addresses all lands outside of city limits (unincorporated lands).

Each city uses different land use categories in their general plan; therefore, it was important to standardize these categories into a master set for the Demand Model. Appendix A presents the various general plan land use designations and the master set developed for the land use mapping and demand projections. Table 3-1 presents the resulting master set of land use categories and associated residential densities.

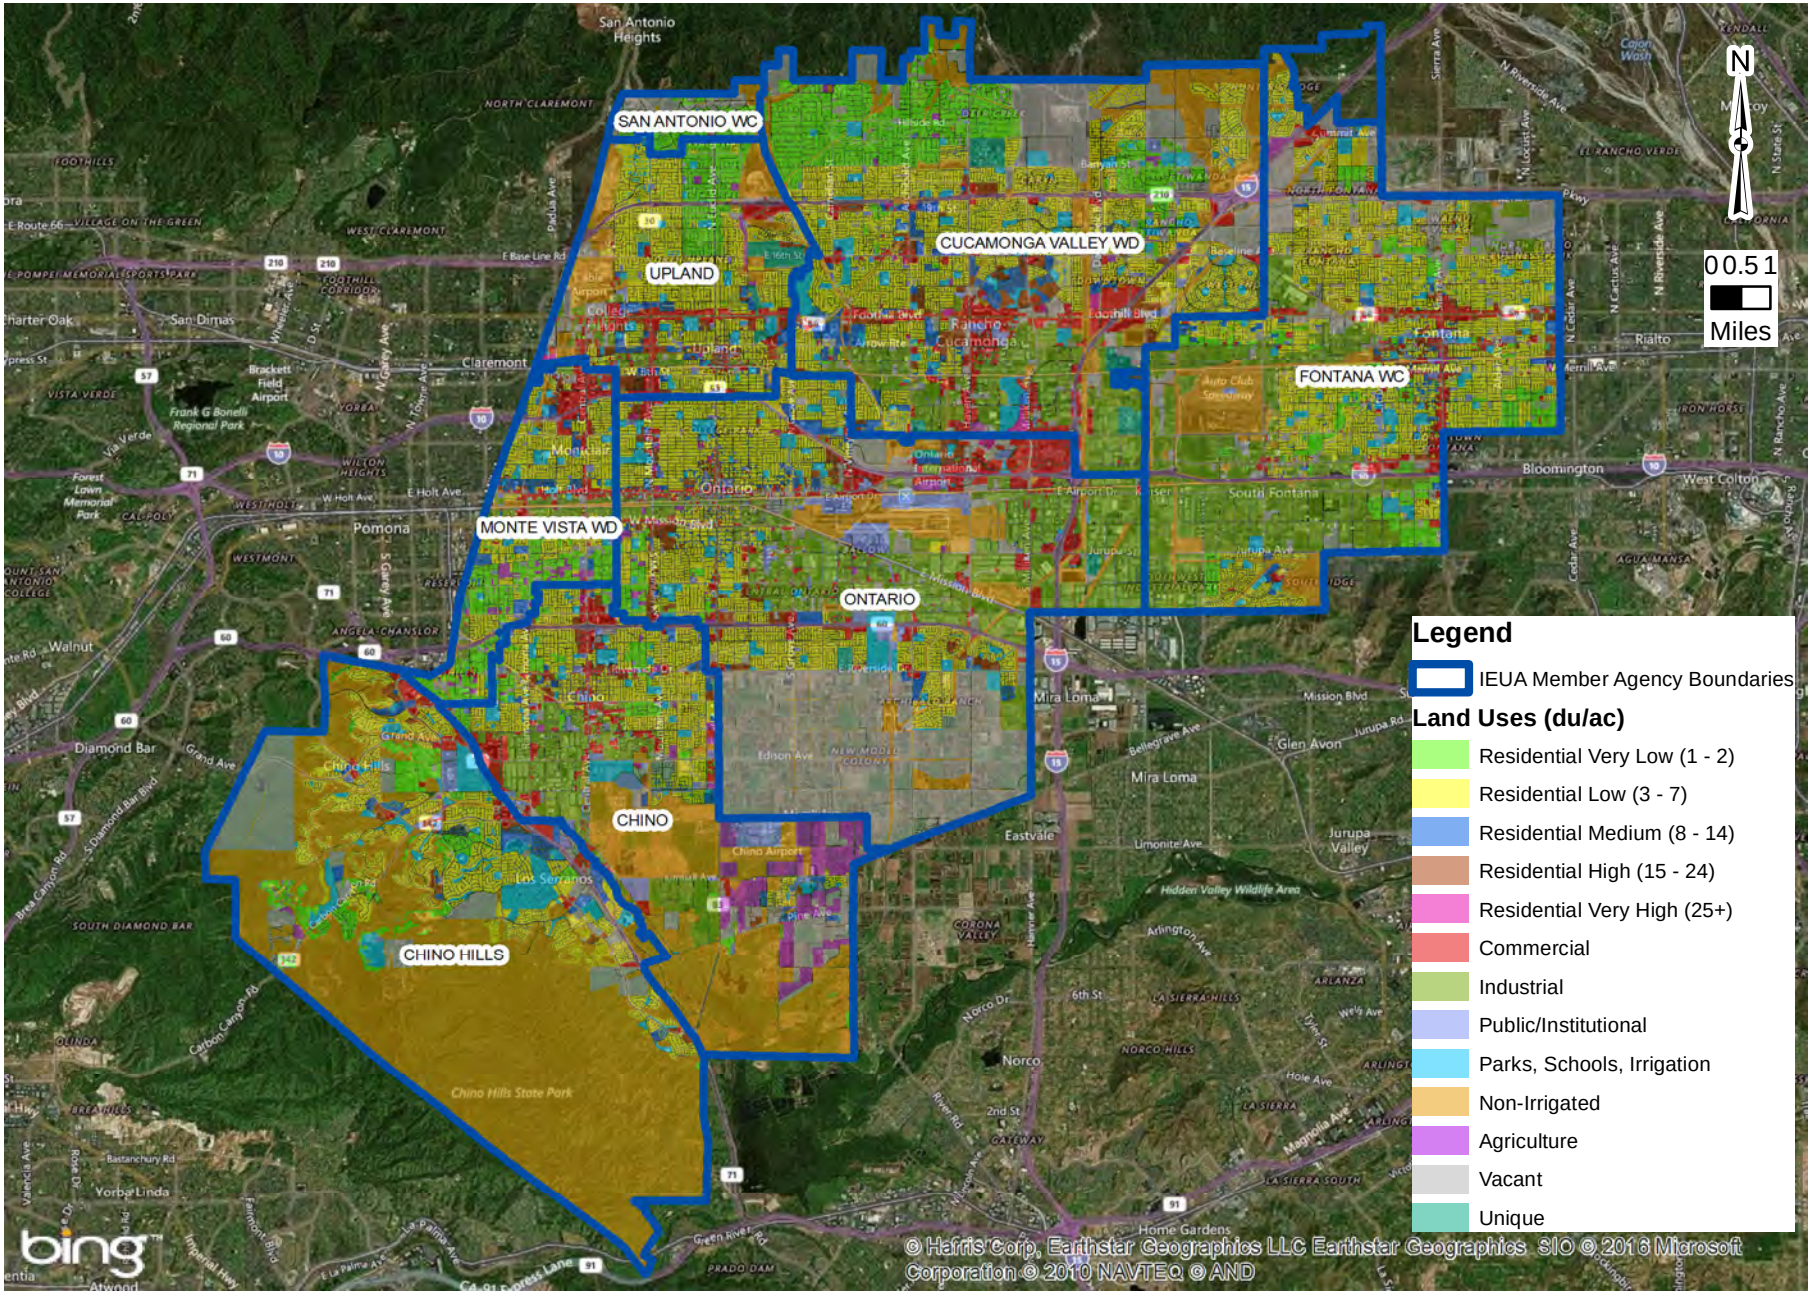
**Table 3-1: Land Use Categories**

| Master Land Use Categories |
|---|
| Very Low Residential (<1-2 dwelling units per acre [du/ac]) |
| Low Residential (3-7 du/ac) |
| Medium Residential (8-14 du/ac) |
| High Residential (15-24 du/ac) |
| Very High Residential (25+ du/ac) |
| Commercial |
| Industrial |
| Public/Institutional |
| Parks, Schools, Irrigation |
| Agriculture |
| Unique Water Users |
| Non-irrigated |
| Vacant |

These land use categories were grouped to reflect similar water demand patterns. For example, parks, and other large turf areas receiving irrigation water (served with potable or recycled water, versus private wells) were identified as Parks, Schools, Irrigation, and retained in the database. Lands that do not receive water service were removed or identified as non-irrigated lands. The parks, schools, and other primarily irrigation uses reflect outdoor irrigation water use that aids in analyzing outdoor water demands. This category includes homeowner association common area irrigation accounts wherever possible.

Residential densities were separated into five categories that reflect new development patterns, density groupings of most general plans, and general customer control over irrigation. For example, residential densities associated with apartment buildings and condominiums typically have no control over outdoor irrigation.

“Mixed use” designations in the general plans reflected different configurations of mixed uses such as different commercial use, or commercial and residential use within the same project boundary but not necessarily on the same parcel. A standard convention for mixed use designations is commercial use on the ground floor with residential above, with a “mixed use” land use category developed. However, since the model needs spatial land use data, and the standard convention was not used for these cities, mixed use lands were delineated to reflect the percentages identified in the general plan or specific plan of planned land uses for each individual development project.



When the Demand Model is updated in the future, a new land use category should be considered to reflect higher densities of residential use. The Very High category in the model reflects densities of 25 du/ac or greater, which is appropriate now. As the region develops “up not out”, it is likely the general plans will be amended to accommodate higher density development.

## 3.2 Existing Land Use Layer Development

Spatially referenced existing land use polygons were created for the entire IEUA service area. Each polygon represents an area of predominant land use identified through parcel data provided by the cities and the county. The parcel data indicating existing land use typically have one category each for single family residential and multi-family residential use. In addition, many of the parcels are labeled “undefined”. For this study, existing land use categories were more specifically defined (e.g., five categories of residential land use and identification of all undefined parcels) using Google Earth maps and street view, windshield surveys, and meetings with community development departments. This extensive effort to improve the classification accuracy of over 70 percent of the existing land use resulted in a detailed database of existing land use that will yield increased accuracy of the LUDs.

The existing land use layer is not an exact replica of land uses but a best estimate. The process started with the use of parcel boundaries used to delineate each land use. But this often resulted in odd shaped polygons in areas such as airport tarmacs or new growth areas in southern Ontario where the ownership boundary does not match the general plan land use boundaries. Areas with parcel shapes that would have a significant impact on the accuracy of the demands, such as New Model Colony in Ontario, were modified to reflect the general plan land use map polygons.

“Unique water users” are identified as customers with consumption patterns determined by the agencies to be unusual, significantly higher (up to 1,240 percent higher) or lower (up to 340 percent lower) than the average customer of that sector. Unique users were separated from general land use categories to prevent a high or low water user from skewing the average unit demand for that particular land use for

FIGURE 3-1

each member agency. The unique water users were maintained in the Demand Model as a separate land use.

The result is a GIS layer with existing land use that is presented on Figure 3-1 for the entire study area. Figure 3-2 presents an example of existing land use polygons. Existing land use maps for each member agency can be found in Appendix B.

**Figure 3-2: Detail of Existing Land Uses**

An important land use category in the existing land use database is “Vacant” lands. These vacant lands were defined as not having a current water demand but were designated on the general plans for future urban use having a demand for water. Vacant and agricultural lands that were not identified in the general plan for a future urban use were designated as “Non-irrigated” and include open space, agricultural lands with private water supply, or other lands with private water supplies that will remain private. Although open space lands could include uses with a water demand, each was carefully reviewed to determine if it was natural open space that was not irrigated or was irrigated by private well water. Non-irrigated lands also include significant road and highway rights-of-way and airport tarmacs; supporting airport uses with a water demand were not included in the non-irrigated tarmac polygons; these large land areas are an urban use but typically have minimal demand. The vacant lands with a future urban use were incorporated into a new GIS mapping layer for future land uses.

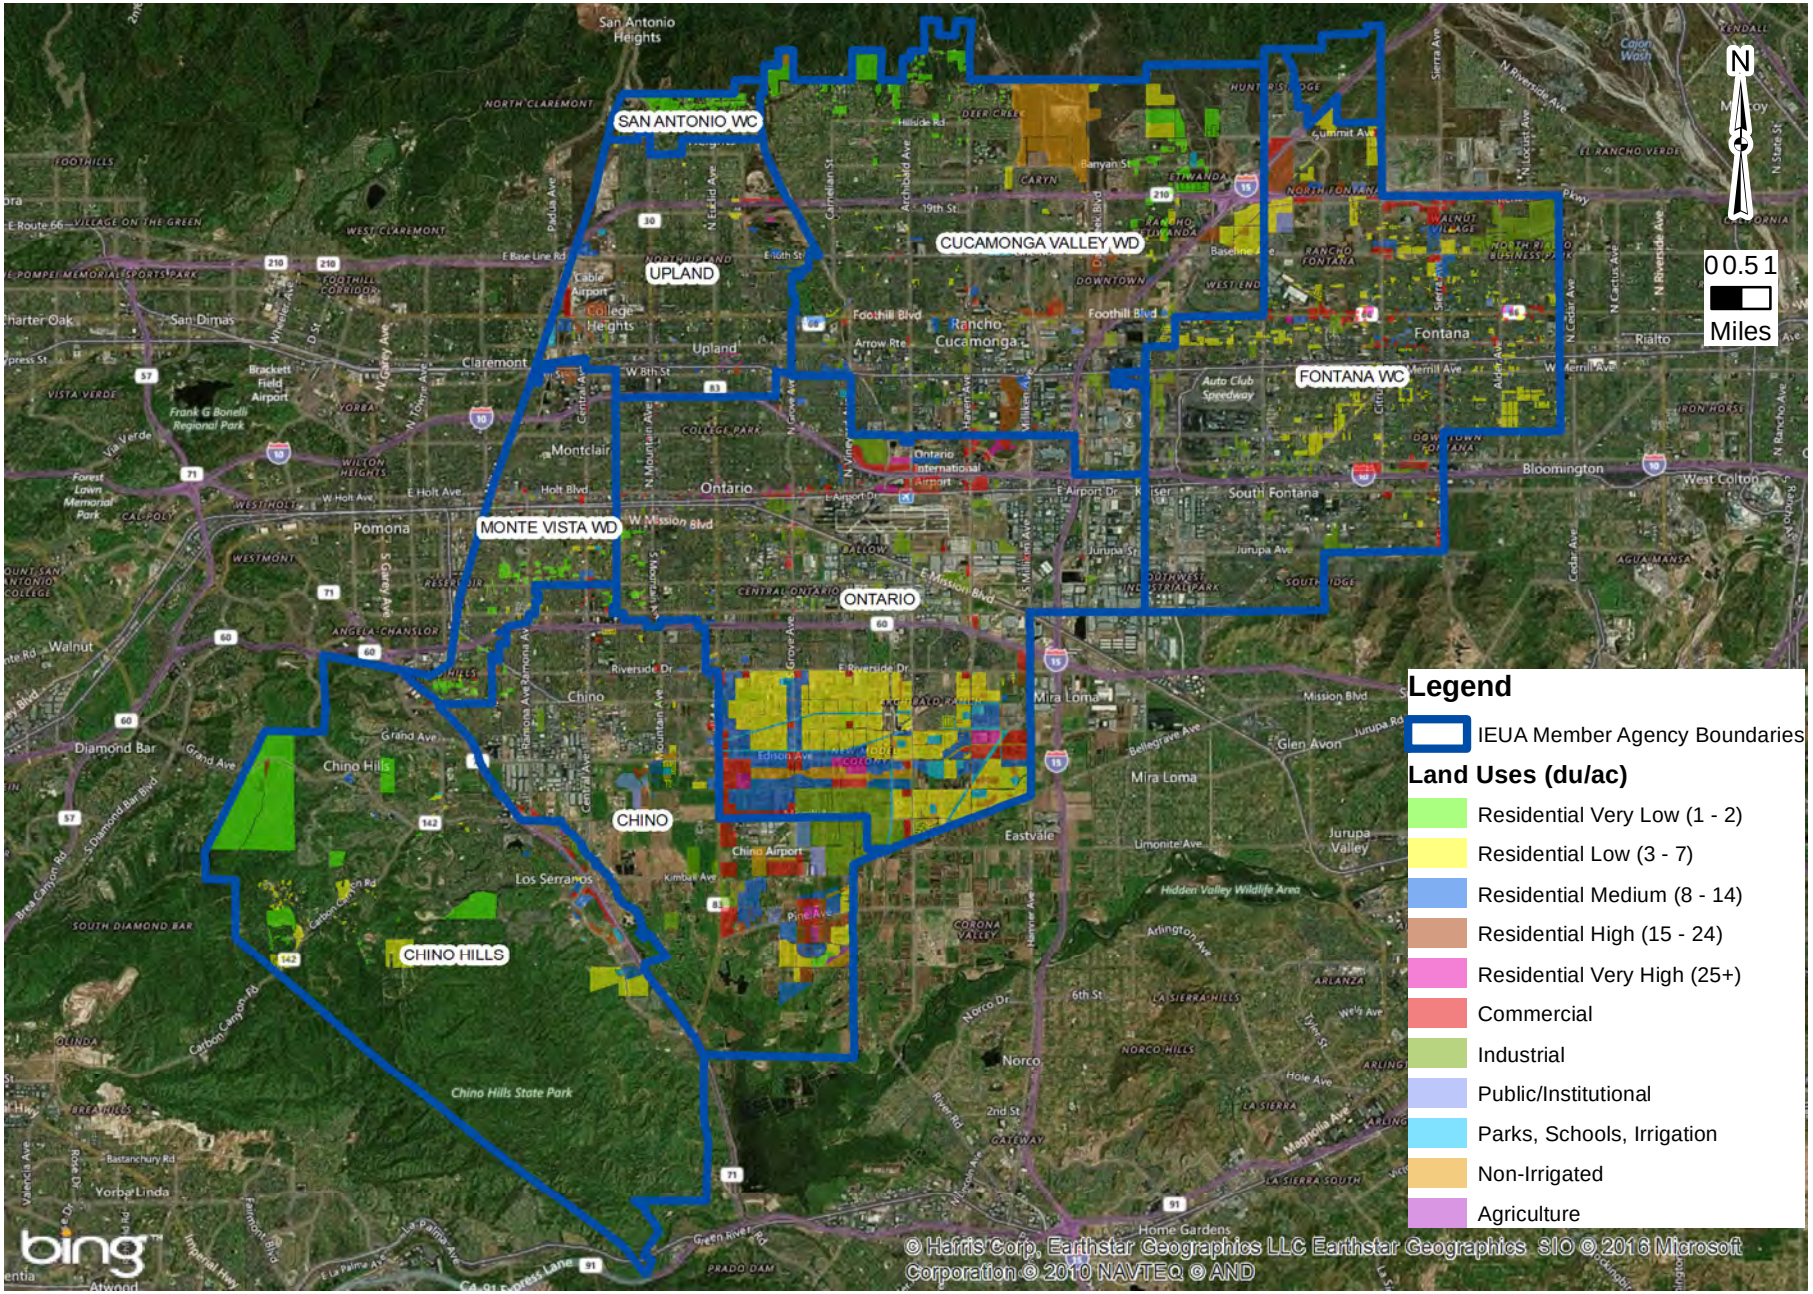
## 3.3 Future Land Use Layer Development

An important part of developing land use based water demand projections, is reliance on locally defined visions of how communities are to grow and change during the planning horizon. Using vacant land use parcels identified during existing GIS land use map development, the city general plan maps were applied to these vacant lands to identify future land uses. Future GIS land use maps were then generated to reflect these future developments. General plans are the most reliable indicators of future development policy because they have been subjected to extensive public review and rigorous environmental documentation prior to adoption. General plans, however, have a single hypothetical buildout date, used for analyses of environmental impacts associated with the full buildout of all lands in accordance with the

land use map. Actual development will occur at varying rates and times, and can extend beyond these general plan dates. Therefore, a more accurate method for identifying the timing of projected water demands based on the general plan was used and is described in the subsequent section.

## 3.4 Land Use Planning Agency Meetings

It is important to have city land use planners identify anticipated timing of development. They are the most knowledgeable of development activities, growth patterns, and trends within their city. The project team held meetings with planning or community development departments of each city (see inset below), with representatives of the applicable water purveyor in attendance, along with IEUA representative(s).



Existing land use maps were provided for each of the eight member agencies using their boundaries to capture service area land use. Future land use maps were also provided for each city within their SOIs. The meetings focused on the confirmation or identification of general plan land use for vacant land that is developable, and the planning representatives' best estimate of development time frame in five year increments through 2040. As 2015 is the year for existing demands, any development under way currently or in the recent past, and not in water billing data, was assigned a 2020 development date for water demand purposes. Also addressed at the meetings were confirmation of boundaries and a general review of existing land uses.

**Land Use Agencies**

- City of Chino
- City of Chino Hills
- City of Fontana
- City of Montclair
- City of Ontario
- City of Rancho Cucamonga
- City of Rialto (partially in Fontana Water Company boundary)

Planning staff provided information on observed land use trends and areas of redevelopment (creating denser development) and reuse (reusing existing buildings for different purposes) in their cities. Trends are discussed later in Section 4.3. Most densification changes are anticipated to not be a change in land use designation, but rather a reuse or repurposing of buildings or redevelopment of lands with higher density buildings within general plan-allowable ranges. These areas reflecting an intensification of use, will result in increased water demands but not necessarily a change in land use designation. The process to accommodate intensification of uses is discussed in Section 4.3.

The existing and future land use maps were edited in the GIS database based on these planning agency meetings. Figure 3-3 presents future land uses within the study area. Appendix B provides future land use maps for each of the member agencies.

## 3.5 Acreage Inventories

Based on the existing and future land use GIS mapping effort as described in previous sections, acreage inventories were generated in the Demand Model for each member agency. Table 3-2 presents the acreage of each land use within the study area to be developed over the planning horizon. The total acreage may not reflect the total IEUA service area because large areas of open space lands that will not have a water demand (e.g., most of Chino Hills State Park) were not included. Table 3-3 presents the net change in acreages for each land use.

**Table 3-2: Study Area Acreage Inventory**

| | Acreage Inventory by Year | | | | | |
|---|---|---|---|---|---|---|
| **Land Use (du/ac)** | **2015** | **2020** | **2025** | **2030** | **2035** | **2040** |
| **Residential Very Low (<1 - 2)** | 9,089 | 9,504 | 10,155 | 10,282 | 10,115 | 11,522 |
| **Residential Low (3 - 7)** | 26,329 | 27,090 | 28,463 | 29,691 | 30,804 | 32,593 |
| **Residential Medium (8 - 14)** | 3,067 | 3,500 | 3,959 | 4,425 | 4,663 | 5,915 |
| **Residential High (15 - 24)** | 2,349 | 2,678 | 3,131 | 3,263 | 3,300 | 3,427 |
| **Residential Very High (25+)** | 231 | 256 | 283 | 408 | 466 | 646 |
| **Commercial** | 6,838 | 6,925 | 7,180 | 7,994 | 8,456 | 9,221 |
| **Industrial** | 16,974 | 18,587 | 19,856 | 20,141 | 20,306 | 20,420 |
| **Public/Institutional** | 2,979 | 2,990 | 3,066 | 3,095 | 3,289 | 3,334 |
| **Parks, Schools, Irrigation** | 5,629 | 5,687 | 5,657 | 5,890 | 5,963 | 6,154 |
| **Agriculture** | 2,026 | 1,534 | 1,175 | 630 | 376 | 68 |
| **Unique Water Users** | 863 | 863 | 852 | 852 | 852 | 852 |
| **Non-Irrigated** | 34,438 | 34,410 | 35,668 | 35,833 | 35,904 | 36,085 |
| **Vacant** | 19,724 | 16,512 | 11,090 | 8,032 | 6,042 | 298 |
| **Total** | **130,537** | **130,537** | **130,537** | **130,537** | **130,537** | **130,537** |

Acreage inventories from the Demand Model for each member agency can be found in Appendix C. As shown in Table 3-2, the largest percent increase in land use in the study area is very high density residential at 180 percent increase. The largest acreage increase by 2040 is low density residential by 6,264 acres. The majority of this new low density residential is attributed to new growth areas in Ontario's New Model Colony and Chino's The Preserve. These lands are currently agricultural lands, but as shown in Table 3-2, most agricultural lands will decline over time as they are converted to urban uses. Medium and high density residential lands are also anticipated to increase at a greater rate (percentage) than very low and low density.

Land use patterns that are unique to each member agency can be identified by studying the maps in Appendix B and the acreage inventories in Appendix C. This is where the agricultural conversions of Ontario and to a lesser extent, Chino, are apparent. And MVWD's service area does not have a lot of

vacant or agricultural land for development but is still growing as infill parcels are developed. Another interesting characteristic in the future acreage inventories in Appendix C is the decrease in acreage for the Parks, Schools, Irrigation land use designation for Rancho Cucamonga and Upland. This decrease in acreage reflects a statewide trend of golf courses replacing some or all of its lands with medium or other density residential uses.

**Table 3-3: Changes in Acreage from 2015 to 2040**

| Land Use (du/ac) | Percent Change |
|---|---|
| **Residential Very Low (1 - 2)** | 27 |
| **Residential Low (3 - 7)** | 24 |
| **Residential Medium (8 - 14)** | 93 |
| **Residential High (15 - 24)** | 46 |
| **Residential Very High (25+)** | 180 |
| **Commercial** | 35 |
| **Industrial** | 20 |
| **Public/Institutional** | 12 |
| **Parks, Schools, Irrigation** | 9 |
| **Agriculture** | -97 |

What is not apparent from the inventories are characteristics such as the extensive underutilized lands in the Fontana Water Company service area that will be consolidated and developed with higher densities. There are currently many acres of very low density (<1 to 2 du/ac) residential lands with a small house on a large unirrigated parcel, and is designated as low density residential. A development pattern has emerged where parcels have been consolidated and homes replaced with a subdivision reflecting a general plan designation of low density (up to 7.6 du/ac in the Fontana General Plan). An example is provided on Figure 3-4.

As discussed in Section 4, acreages have a LUD assigned to them that represents average conditions for that land use within that service area. The LUDs for each land use were adjusted to reflect changing conditions in the study area such as intensification of land uses. An exception to the use of LUD adjustment factors to accommodate intensification can be found with Fontana's very low density land use.

**Fontana Very Low Density Residential**

This is an example of very low density residential land use next to a subdivision of low density residential that was likely built from a consolidation of parcels.

**Figure 3-4: Fontana Very Low Density Residential**

# 4 WATER USE AND ADJUSTMENT FACTORS

Existing water demands are described in this section, along with the development of LUDs, LUD adjustment factors, and the resulting future LUDs.

## 4.1 Existing Demands

### 4.1.1 Establishing Existing Year Demands

Year 2015 was selected at the "existing year" to develop existing demands. To smooth out the effects of weather, and other annual variability, five years of billing data by billing sector were averaged. Averaging of data was used as the methodology to "normalize" demands because of the difficulty teasing out the effects of multiple dry years sandwiching a wet year versus conservation outreach to the public versus the economy partially rebounding from the Great Recession. Water billing data reflects metered consumption. Both the historical five year period of metered consumption and the normalized 2015 demand are presented on Figure 4-1. The existing year (2015) demands are 190,175 acre-feet (AF).

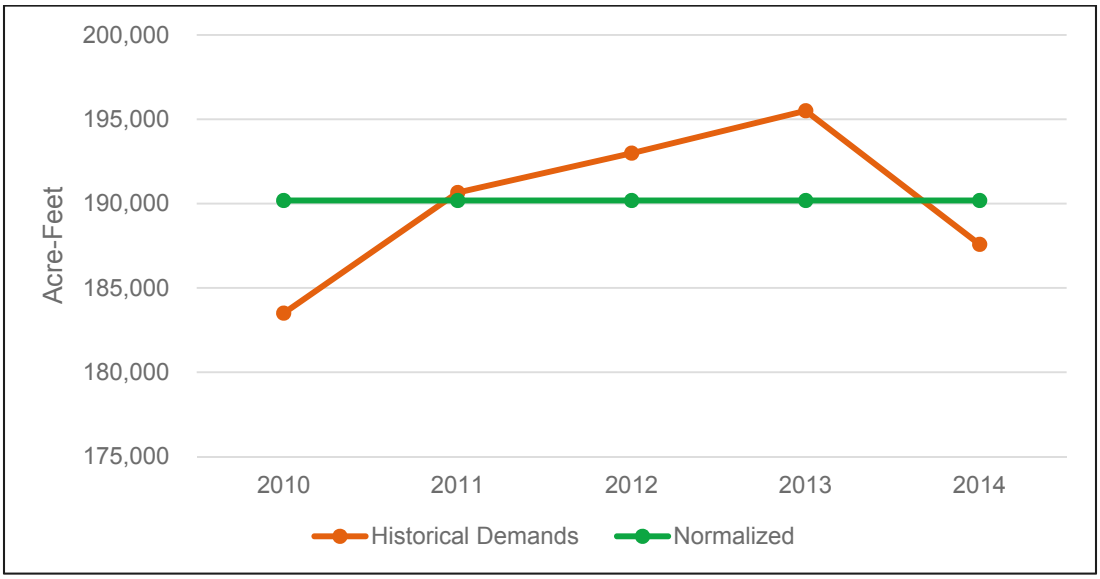

**Figure 4-1: Historical Water Demands**

## 4.2 Existing Land Use Unit Demands

Consumption patterns vary throughout IEUA's service area based on local conditions such as microclimate, demographics, economics, and land use densities. Land Use Unit Demands or LUDs were generated to represent these spatial characteristics of consumption patterns by developing existing LUDs on a per acre basis for each land use within each member agency boundary.

### 4.2.1 Disaggregation of Billing Data

In general, LUDs are calculated by dividing the estimated normalized consumption by the acres for a similar land use. This results in a unit demand of x acre-feet per acre per year (af/ac/yr) for each land use

for each member agency. For example, five years of commercial billing data in CVWD averaged 2,196 acre-feet per year (AFY). The total acreage of commercial use is 1,592 acres. Therefore, 2,196 divided by 1,592 equals an existing CVWD commercial LUD of 1.38 af/ac/yr.

Each member agency tracks and bills metered water consumption differently. The billing data range from 3 to 10 billing sectors or categories for each member agency. Since many of these do not align exactly with the 13 master land uses of the Demand Model, the billing data were disaggregated to apply to the land use categories. For example, data for a "single family residential" billing category were disaggregated into three land use categories: Very Low, Low, and Medium, by determining the prevalent average density of each of the three land use categories multiplied by the total number of existing acres of each land use (based on the Demand Model acreage inventory) to determine the approximate number of dwelling units.

An AFY)/Dwelling Unit (DU) factor was developed using the sum of the dwelling units; this unit factor was then apportioned to each of the three single family land use densities to reflect consumption patterns based on density. For example, approximately 40,600 single family residential dwelling units (i.e., very low, low, and medium densities) in CVWD's service area were calculated from identified densities. Single family residential billing data of 27,790 AFY was divided by 40,600 DUs resulting in 0.68 AFY/DU. Applying 0.68 AFY/DU to approximately 26,140 single family-low density dwelling units resulted in a distribution of Low Density Residential demands of approximately 17,900 AFY. The Very Low category has a higher consumption for the individual home (approximately 1 AF/DU) yet has a lower consumption on a per acre basis (1.85 af/ac/yr), compared with the other categories. Conversely, a Medium density residential dwelling unit has a lower consumption (0.46 AF/DU) than a Very Low and Low density dwelling unit, but has a higher consumption on a per acre basis (4.57 af/ac/yr) because there are more dwelling units per acre.

For multi-family residential billing data, since the majority of water demands are associated with indoor water consumption, the billing data were applied to the estimated total number of dwelling units (based on the prevalent average densities) and the same unit demand per dwelling unit was applied to the average prevalent density to obtain the calculated LUD.

Often the commercial, industrial, and other non-residential uses are combined in the billing data. LUDs from other communities were sometimes used to separate out the demands associated with a specific land use. For example, Fontana Water Company has a Public Authority billing category. The Public/Institutional LUDs from four other member agencies were averaged to obtain an LUD for Public/Institutional for Fontana Water Company with the balance of its Public Authority billing data assigned to Parks, Schools, and Irrigation. This resulted in LUDs for both categories that are within range of the other member agencies.

Another example is the City of Upland. Billing data from its Commercial/Industrial category was separated by applying a typical commercial LUD obtained from Irvine Ranch Water District and East Bay Municipal Utility District LUDs, which were similar, to the data with the balance assigned to Industrial. This resulted in an Industrial LUD for Upland which is higher than the other member agencies for Industrial. Since Upland does not have low water uses associated with warehousing and distribution that other member agencies have, the resulting LUDs are reasonable.

### 4.2.2 Existing LUDs

Table 4-1 presents a comparison of existing LUDs for each member agency by land use. These LUDs represent normalized consumption, but without unbilled water (production) estimates. As shown in Table 4-1, each agency has different service area characteristics represented in their unit demands. These LUDs are calculated outside of the Demand Model using current billing data. They can be easily updated in the future with new billing data and updated existing land use inventories for each agency.

**Table 4-1: Existing Land Use Unit Demands**

| Land Use | Existing Land Use Unit Demands (af/ac/yr) | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Chino | Chino Hills | CVWD | FWC | MVWD | Ontario | SAWCO | Upland |
| **Residential Very Low (<1 - 2)** | 1.73 | 1.40 | 1.85 | 1.25 | 1.27 | 1.20 | 2.34 | 1.90 |
| **Residential Low (3 - 7)** | 2.60 | 2.47 | 2.88 | 2.75 | 2.11 | 2.12 | 0.00 | 2.84 |
| **Residential Medium (8 - 14)** | 4.36 | 4.10 | 4.57 | 6.70 | 4.67 | 5.27 | 4.95[1] | 4.95 |
| **Residential High (15 - 24)** | 4.78 | 4.28 | 6.07 | 11.55 | 9.86 | 7.60 | 6.36 | 8.95 |
| **Residential Very High (25+)** | 6.88 | 6.88[4] | 8.81 | 15.66 | 0.00 | 13.20 | 0.00 | 13.96 |
| **Commercial** | 1.31 | 3.34 | 1.38 | 6.54 | 2.13 | 2.82 | 2.20 | 2.13 |
| **Industrial** | 0.22[3] | 1.07 | 0.51 | 0.33 | 0.65 | 0.38 | 0.00 | 1.07 |
| **Public/Institutional** | 1.31 | 1.17 | 2.73[2] | 2.73[2] | 2.39 | 2.82 | 2.20 | 3.52 |
| **Parks, Schools, Irrigation** | 4.99 | 3.11 | 6.88 | 4.99 | 4.72 | 7.48 | 0.00 | 5.87 |
| **Agriculture** | 0.00 | 0.00 | 0.28 | 0.00 | 0.34 | 15.08 | 0.00 | 0.00 |
| **Unique Water Users #1** | 299[5] | | 3.62 | | 5.59 | 47.57 | | 1.33 |
| **Unique Water Users #2** | 186[5] | | 1.47 | | 43.49 | 18.81 | | 242[5] |
| **Unique Water Users #3** | 81[5] | | 7.43 | | | 10.07 | | 4.57 |
| **Unique Water Users #4** | | | 2.58 | | | | | 3.08 |

Note: Existing LUDs reflect normalized consumption billing data. Unbilled estimate (production) not included here.

[2] Average Public/Institutional LUD from four agencies applied to FWC and CVWD

[3] Highest Industrial LUD used for Chino Hills due to lack of warehousing and distribution uses

[4] Used Chino Very high density residential LUD for future Chino Hills Very high density residential

[5]Chino Unique Water Users and 1 Upland Unique are not located; 1 acre was used with full water demands.

## 4.3 Adjustment Factors

Looking back on Figure 2-2, the LUDs presented in Table 4-1 are applied in the Demand Model to the acreages of land use to determine existing and future demands. The land uses may be undeveloped or

agricultural lands presently to be converted to an urban use in the future – this is a simple calculation of changing the agricultural land use category for each polygon reflecting the City planning staff input on timing resulting in overall increased urban acreage. The next step is to adjust the resulting water demands to reflect more specific existing and future conditions. There are two types of adjustment factors applied to existing LUDs. One, an unbilled water estimate to change the demands from billed consumption to total production demands. The second type are future adjustment factors to approximate how water demands change over time due to climate change, intensification, and conservation. The land use changes over time were discussed in Section 3.3. The adjustment factors described here were applied to the Existing LUDs using the Demand Model to calculate Future LUDs. Each of these adjustment factors are described here along with their correlation to impacts on water demands.

### 4.3.1 Unbilled Water

The existing demand reflects metered consumption data, or billed water use. The Demand Model identified water needs for the quantity of water entering distribution systems, or production requirements. The difference between production and consumption demands has historically been called unaccounted for water or unmetered water. These uses reflect authorized water use that is not billed and other water losses. Authorized uses typically include fire flows, unmetered public facilities, and water main flushing. Other water system losses typically include losses from pipe breaks, storage facilities, and service connections. System losses also can include unauthorized consumption, metering inaccuracies, and other unidentified loss. For the Demand Model, the difference between production and billed consumption is called the unbilled water estimate.

Unbilled water, as provided by each member agency, ranged from two to nine percent of production. The unbilled water estimates were applied to the individual existing LUDs for each member agency. The total production demands are five percent higher than total normalized metered consumption data. It is recommended that as the member agencies conduct water loss analyses, or reduce system losses over time, that their adjustment factor be modified to reflect updated information.

### 4.3.2 Climate Change

The following impacts identified by the Department of Water Resources are associated with climate change that could also impact the study area.

- Increased surface temperature of 5.5 to 10.4 degrees fahrenheit anticipated by the end of the century
- Heat waves will increase in frequency, magnitude, and duration
- Longer, drier, and more frequent periods of droughts are anticipated with up to 2.5 times the number of critically dry years by the end of the century

The IEUA IRP analyzed long term climate change impacts on water demands by reviewing recent predictions of potential increases in temperature. Long term climate change assumptions were based on a National Oceanic and Atmospheric Administration (NOAA) Technical Report (NOAA, 2013), which stated that the anticipated increased temperatures of 3.6 degrees Fahrenheit have the potential to increase water use by as much as 4.3 percent by 2040. However, this number was reduced to 3.2 percent by 2040 for this Demand Model region and applied to four of the residential density demands and outdoor irrigation demands to reflect the trend of new development having less outdoor irrigated landscaping. Using 0

percent at 2015 and 3.2 percent at 2040, an adjustment factor for the intervening years was calculated as a linear interpolation and input to the Demand Model.

### 4.3.3 Intensification

There are many factors that influence water demands associated with land use development patterns, land uses, and activities. Our understanding of these factors is based on discussions during the eight land use planning agency meetings, research on local socioeconomic trends and conditions, analyses of land use patterns observed from the GIS database in the Demand Model, and land use planning trends observed throughout California. The study area is still rebounding from the Great Recession and market conditions for the region are noted by economists to be strong with higher employment and higher occupancy rates anticipated. As agricultural lands develop to urban uses, some communities are reaching "buildout". But the term buildout is a bit of a misnomer as lands are continually evolving over time, resulting in an "up not out" land use pattern shift. In addition, land values are increasing and are anticipated to increase over the 25 year planning horizon which contributes to higher densities and higher utilization of existing buildings or lands. Although difficult to quantify specifically, all of these conditions result in an intensification of land uses and thus higher water demands on a per acre basis. Visual examples are provided in the photos of denser commercial land use patterns (e.g., newer 2-story buildings with high occupancy, smaller floor space but more businesses, more food services, and less parking) reflecting intensification resulting in higher unit water use demands on a per acre basis.

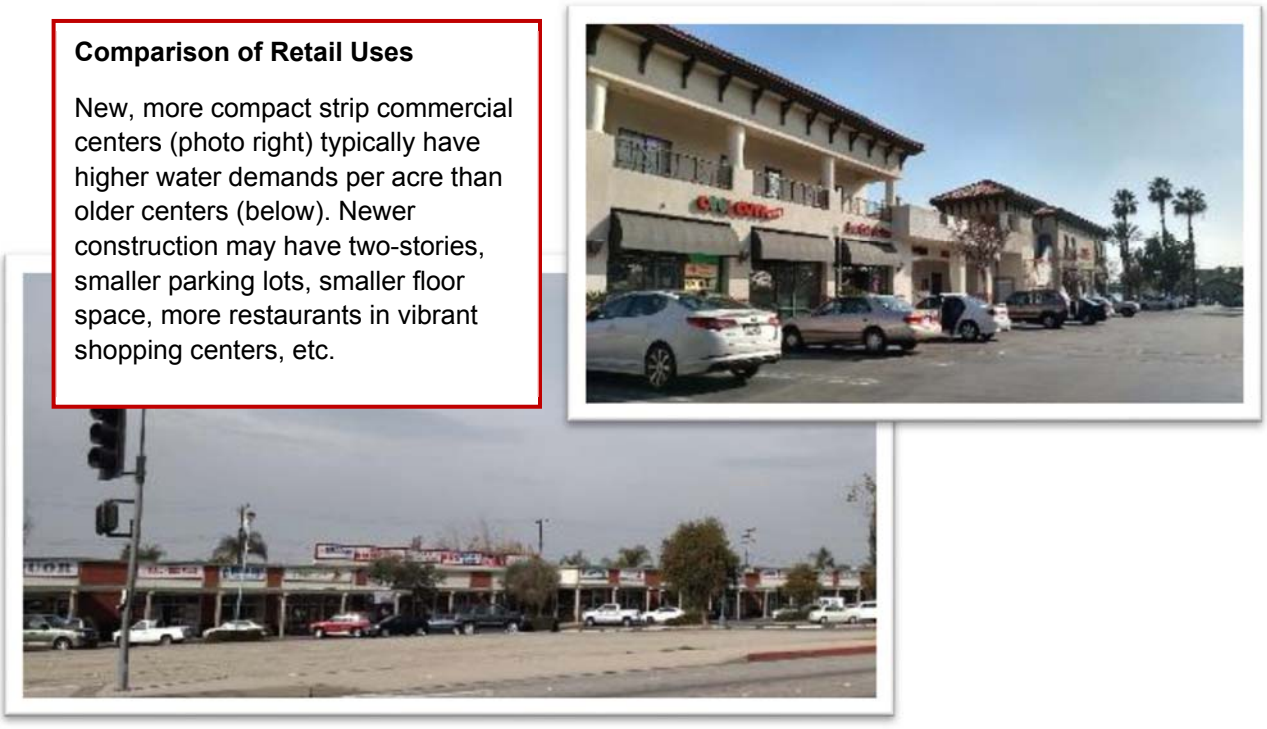

**Figure 4-2: Comparison of Retail Uses**

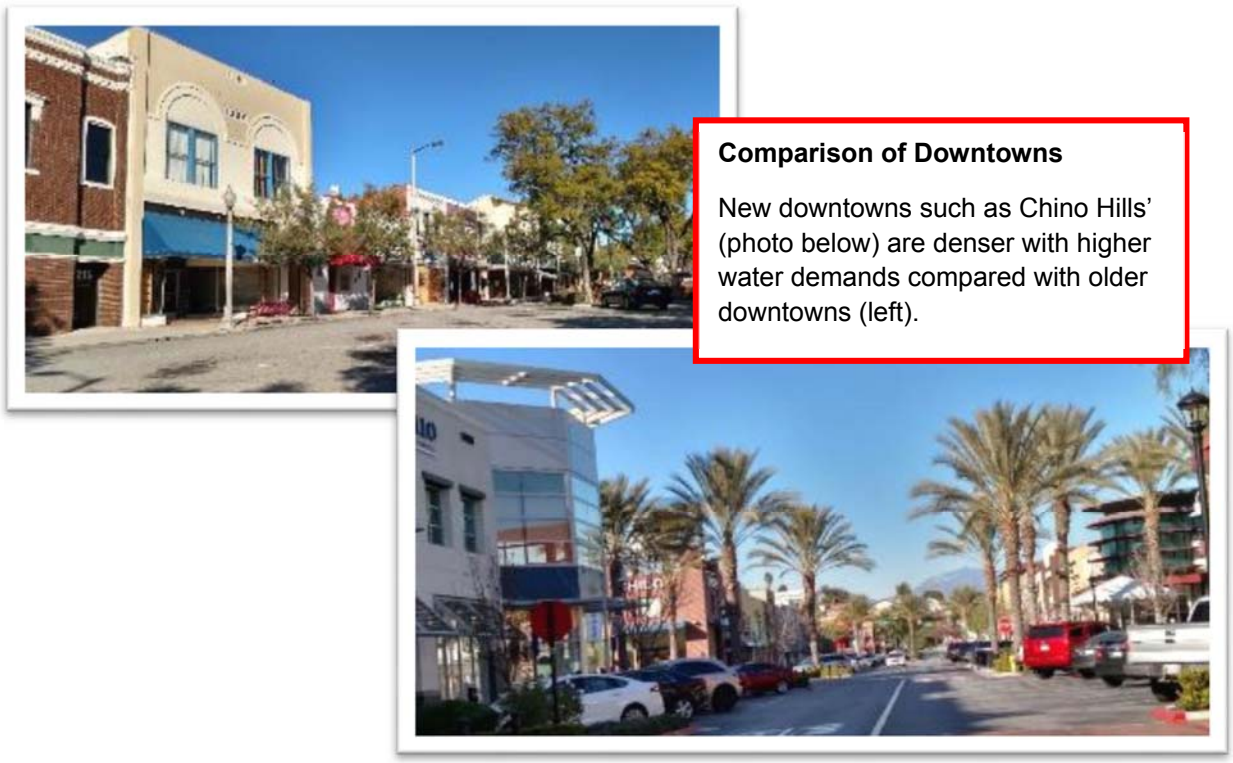

**Figure 4-3: Comparison of Downtowns**

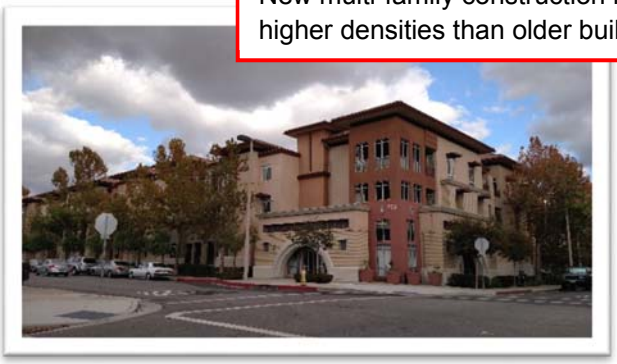
As the member agencies observed during the past eight years, recessions result in reduced water use. Rebound from the Great Recession is still occurring in the study area with gradually increasing demands with strong market conditions anticipated through 2040. Vacant industrial lands are rapidly being developed, and although the predominant industrial use is warehousing and distribution – with low water use – most vacant industrial lands were anticipated by the land use agencies to be built out by 2025 if not sooner. When these large vacant parcels are built out, the region will likely see a consolidation of smaller parcels with currently underutilized uses, replaced with new industrial uses. For example, several city planning staff indicated that older industrial buildings that are vacant or have low occupancy or otherwise underutilized uses are being purchased with adjoining parcels with the intent to consolidate the lands and build larger industrial facilities. Although office commercial vacancy rates are currently very high, with no construction occurring in this sector, the lack of new construction will eventually result in vacancy rates decreasing with more employees per acre, until new commercial office lands are developed.



A "jobs per acre" analysis was conducted to determine the intensification of employment on non-residential lands. The total 2015 employment estimate of 350,460 for the study area (IRP data from Center for Demographic Research using Southern California Association of Governments data) was applied to the 2015 acreage inventory (for commercial, industrial, and public/ institutional land uses) resulting in 13.1 jobs per acre. The 2035 employment estimate of 488,930 was applied to the 2035 acreage, resulting in 15.3 jobs per acre, a 17 percent increase.

There are many acres of underutilized lands which will change in character as land values increase, such as the industrial example described above. Another example is new retail or office construction in shopping center parking lots. Most of the large areas of underutilized lands are in unincorporated areas under San Bernardino County development regulations, although all unincorporated lands in the study area are also within a sphere of influence of a city. Within cities, underutilized lands and buildings also exist, but aren't as prevalent. Land use planners discussed many redevelopment projects where obsolete buildings will be replaced with higher density and intensity of uses, within the same land use designation. This is likely to occur throughout the study area as land values continue to increase and population increases.

Existing residential land use, of which 35,420 acres are low and very low density residential (46 percent of 2015 lands with a water demand), will have changes in water demands associated with unpermitted conversion of garages to living spaces, increased numbers of multiple generational households under one roof, and expansion of homes to accommodate more people per household. A study in the Bay Area comparing water consumption between 1996 and 2005 for low density residential sample areas, found an increase in water demands ranging from 6 to 12 percent due increased intensification of existing land uses (EBMUD, 2009).

Repurposing buildings – for example a train station housing retail stores or restaurants – will likely occur throughout the study area as the economy improves. Another trend is that cities are allowing underutilized industrial buildings to accommodate more customer related functions, such as will-call centers or sports activities, resulting in more employees and customers per acre.

The most prominent trend discussed at the land use agency meetings and observed in the analysis of existing land uses, is the overall increased densities of residential land use occurring and planned in the study area. Increased residential densities have the greatest potential for increasing water demands on a per acre basis, although actual demands decrease on a per dwelling unit and per capita basis due to the reduction of outdoor landscaping associated with compact residential growth.

New multi-family construction has higher densities than older buildings.

Compact development is evident in the land use inventory data that shows the majority of land uses are low density residential but the greatest increase in residential land use is associated with very high density residential use. Each community is planning for higher densities and in general, developers are maximizing allowable densities as cities experience frequent general plan amendment requests. Smart growth is a concept typically associated with compact development along and near transportation corridors, and this trend is being observed in the cities' promoting a revitalization of their downtowns and near Metrolink stations.

Another form of intensification is typically found with the development of small infill parcels that are too small, less than five acres, to be identified on the GIS existing land use layer. However, for this analysis, because much of the existing land use data provided in the GIS parcel files needed clarification, it provided an opportunity to specifically identify many of these small vacant lots. They were therefore included with the land use inventory as vacant, instead of being included as another factor to consider in the development of an intensification adjustment factor.

The intensification adjustment factor was determined using economic data developed for the IRP. The impact to water demands associated with strong market conditions alone, were estimated to increase demands by seven percent. A more conservatively lower estimate of six percent by 2040, with an extrapolation from 2015 for interim demands, was applied in the Demand Model.

In the future when individual customer meters are geocoded and consumption data can be linked and saved in the Demand Model GIS, it is recommended that sample areas be analyzed to compare consumption patterns of older development to newer development of similar land use. This historical comparison data will contribute to quantifying part of the intensification adjustment factor.

### 4.3.4 Conservation

Conservation savings associated with plumbing code changes and water use efficiency programs were determined in IEUA's 2015 Wastewater Facilities Master Plan. Flow monitoring of older residential developments compared with new homes indicated a reduction of indoor flows from an average of 55 gallons per capita per day (GPCD) to 37 GPCD. The proportional share of this indoor reduction on total 2040 residential demands is approximately 2.8 percent. This 2.8 percent at 2040, with an extrapolation from 2015 for interim demands, was used as the conservation adjustment factor and applied to the member agencies' land uses in the Demand Model.

### 4.3.5 Other

The Demand Model has an additional tab in the adjustment factors to allow the user to conduct demand management or other scenarios. The conservation adjustment factor addresses the indoor plumbing code and other efficiency savings, but the "Other" adjustment factor tab could be used by IEUA or its member agencies to study savings potential associated with conservation program scenarios for different land uses.

## 4.4 Future Land Use Unit Demands

There are over 2,000 adjustment factors in the Demand Model. Tables with these adjustment factors can be found in Appendix D. The adjustment factors for each member agency, are applied in the Demand Model to the Existing LUDs to generate Future LUDs, for each land use under each planning period and each member agency. Appendix D Land Use Unit Demands, contains tables of the resulting LUDs after they were adjusted. The LUDs are applied in the Demand Model to the acreage inventories for each member agency to calculate the total production water demands.

# 5 WATER DEMAND PROJECTIONS

Based on the land use GIS layers (existing and future) and the LUDs (existing and future) developed for each member agency, future demands for each land use within each member agency were calculated. This process is summarized in this section along with a discussion of other projection methodologies. Use of the Demand Model is also summarized here with a reference to the User Guide.

## 5.1 Demand Projections through 2040

Future demands were calculated in the Demand Model by applying the Final LUDs (Appendix D) to the acreage inventories of land use for each member agency's service area. This resulted in a total IEUA demand of approximately 278,040 AF at 2040, a 38 percent increase over 2015 normalized production demands (production demands include system losses). Table 5-1 and Figure 5-1 presents the water demands for the IEUA service area for existing normalized 2015, and projected years 2020, 2025, 2030, 2035, and 2040.

**Table 5-1: Demand Projections for IEUA**

| Land Use (du/ac) | Five Year Incremental Demand Projections (AF) | | | | | |
|---|---|---|---|---|---|---|
| | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
| Residential Very Low (<1 - 2) | 15,761 | 16,753 | 18,097 | 18,557 | 18,778 | 21,303 |
| Residential Low (3 - 7) | 73,060 | 75,949 | 80,499 | 84,647 | 88,824 | 94,202 |
| Residential Medium (8 - 14) | 16,012 | 18,376 | 20,967 | 24,117 | 25,806 | 33,264 |
| Residential High (15 - 24) | 18,611 | 21,212 | 25,739 | 27,062 | 27,752 | 28,827 |
| Residential Very High (25+) | 2,634 | 2,904 | 3,300 | 5,105 | 6,009 | 8,292 |
| Commercial | 19,607 | 19,922 | 20,885 | 24,281 | 27,068 | 29,455 |
| Industrial | 6,974 | 7,601 | 8,143 | 8,318 | 8,436 | 8,529 |
| Public/Institutional | 7,285 | 7,354 | 7,627 | 7,746 | 8,138 | 8,257 |
| Parks, Schools, Irrigation | 32,890 | 33,607 | 33,756 | 35,988 | 36,975 | 38,926 |
| Agriculture | 2,274 | 1,466 | 1,188 | 559 | 309 | 23 |
| Unique Water User #1 | 3,848 | 3,872 | 3,878 | 3,903 | 3,926 | 3,949 |
| Unique Water User #2 | 1,487 | 1,498 | 1,507 | 1,515 | 1,523 | 1,533 |
| Unique Water User #3 | 1,068 | 1,074 | 1,082 | 1,088 | 1,095 | 1,101 |
| Unique Water User #4 | 368 | 371 | 373 | 375 | 377 | 379 |
| | **201,879** | **211,959** | **227,041** | **243,261** | **255,016** | **278,040** |

On Figure 5-1, total IEUA demands are shown using the shaded area and values read from the right vertical axis. The individual member agency demands are shown using different lines and values are reads from the left vertical axis.

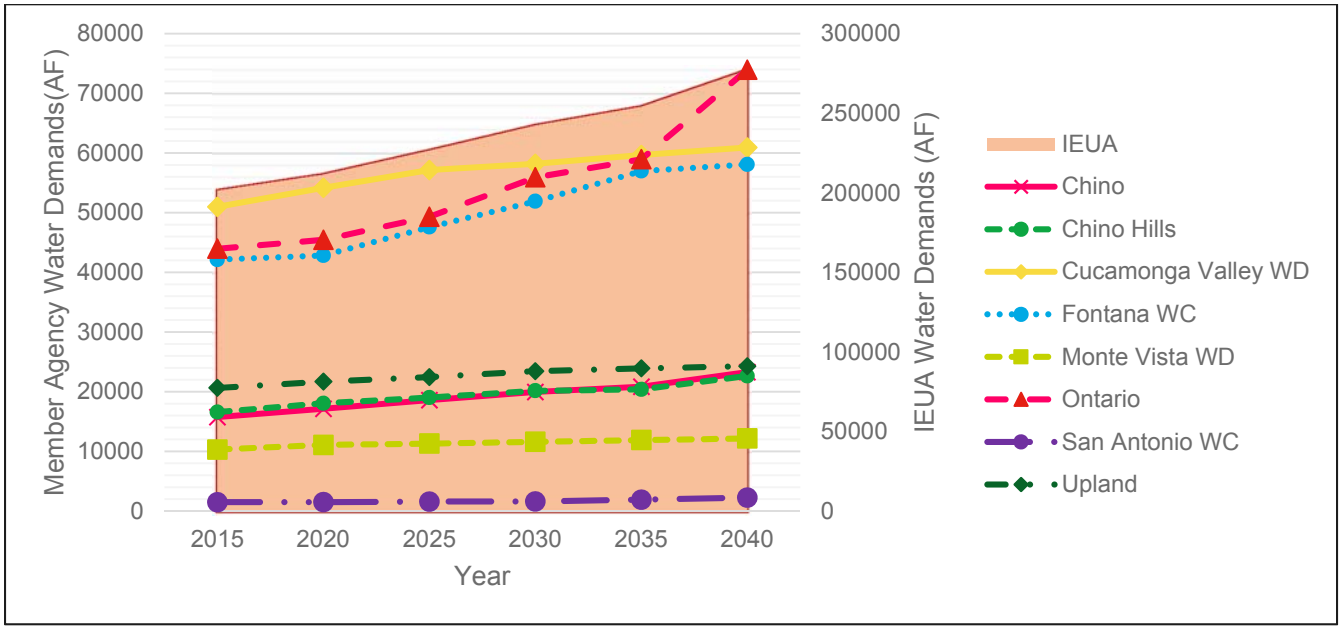


**Figure 5-1: Demand Projections by Member Agency**

As shown on Figure 5-1, total water demands increase gradually between 2015 and 2035 with a slightly steeper curve between 2035 and 2040. The steeper curve in later years is primarily attributed to the large amounts of residential land uses to be developed in Ontario's New Model Colony. Development this land is anticipated to be at the outer end of the study planning horizon. Appendix E contains tables of the resulting projection of water demands by member agency and combined into a total IEUA demand.

Because the projections do not include active conservation efforts, these projections should be considered an upper end. If the City of Ontario's New Model Colony developments are delayed, its projections will likely extend beyond 2040.

There are many methodologies used to project water demands, ranging from simple per capita projections to complex, data-intensive econometric models. The various methodologies rely on different data and assumptions in trying to project future conditions in a changing environment. The land use based demand projections are typically within approximately 10 percent above and 10 percent below actual demands when smoothed to remove annual climatic influences, assuming nothing significant occurs like a great recession. If something significant occurs, since the demands are based on general plan land uses, the later date projections typically remain while interim demands recover.

Different methods can result in slightly or significantly different projections. Per capita projections are inexpensive and simple to develop because they rely on easily available data. However, they are not rigorous, and do not reflect the complexities of water demand patterns or different community characteristics. Therefore, although the results may be consistent with land use based demands for the first few years, as the land use composition (changing percentage of each land use) and characteristics (e.g., higher densities) change over time to reflect that planned for by the community, the per capita demands do not reflect these changing conditions.

Econometric models can be rigorous if socioeconomic data are available and used, as with the IEUA IRP model. These models are typically more cost effective for large service areas, such as Metropolitan Water

District (MWD) or IEUA as a region, to capture regional demographic, economic, and other (e.g., climate change) characteristics and trends that are not site specific to smaller entities. IEUA's econometric model demand projections were similar to the land use based demand projections. Several of its analytical analyses quantifying demand characteristics, such as passive conservation, economic rebound, and climate change, were of particular value to the Demand Model, as presented in this TM.

In summary, different demand projection methodologies will result in different projections. The more rigorous methodologies typically result in projections within a range of plus 20 percent and minus 20 percent of each other. This may be attributable to the use of underlying source data. The similarity in projections of the land use based Demand Model and the IRP econometric model (within four percent) provides a very high level of confidence to use the results as a reliable predictor for future planning projects.

It is recommended that demand projections be updated every ten years or less. This will ensure that changing community characteristics are captured, and that accurate projections are continually relied on for planning purposes.

## 5.2 Use of Demand Model

The land use based Demand Model (welcome menu screenshot presented on Figure 5-2) was developed to perform the calculations described in the previous sections. The major inputs to the model included city general plans, parcel data, city boundaries, IEUA retail agency SOIs in GIS format, and LUDs calculated as described in sections 4.3 and 4.4.

The main purpose of the Demand Model was to provide detailed, rigorously developed demand projections for each member agency. The model does that, as well as test various scenarios to study the effects of conservation, for example, through the use of adjustment factors. The resulting projections described in Section 5.1 were developed using the best available data at a point in time.

As the cities and communities in IEUA's service area develop and change over time, the demand projections can be updated based on new data. For example, if new growth areas in the City of Ontario, which has large land areas converting from agricultural uses to urban over an extended period of time, change land use designations to higher densities than now planned, the acreage inventories can be modified through changes to the GIS files. The model would be re-run to determine the effect on the city's or IEUA's overall demand. Another example is with the intensification of the older commercial areas in the IEUA service area; higher densities are being proposed by developers for underutilized and infill sites. The land use categories can be easily modified in the GIS files to reflect these approved changes and the model re-run. The underlying GIS files and LUDs can also be updated if the development timelines assumed in this study change or updated LUDs are calculated by retail agencies. Appendix F contains a User Guide as a reference document to run these scenarios. The Demand Model, created in Microsoft Access, is completely open and customizable if IEUA or its member agencies choose to add more features in the future.

# APPENDIX N

## Model User Guide

# Land Use Base Water Demand Model User Guide

This Demand Model is built in Microsoft Access which is linked with ArcGIS and provides users with an easy-to-use interface to view and update factor and demands.

## 1 WELCOME

The Welcome page (Figure 1-1 ) is the first interface the user sees when they open the model and is the primary interface for viewing, entering and updating model parameters and inputs like acreages, Land Use Demand Factors (LUD), and adjustment factors.

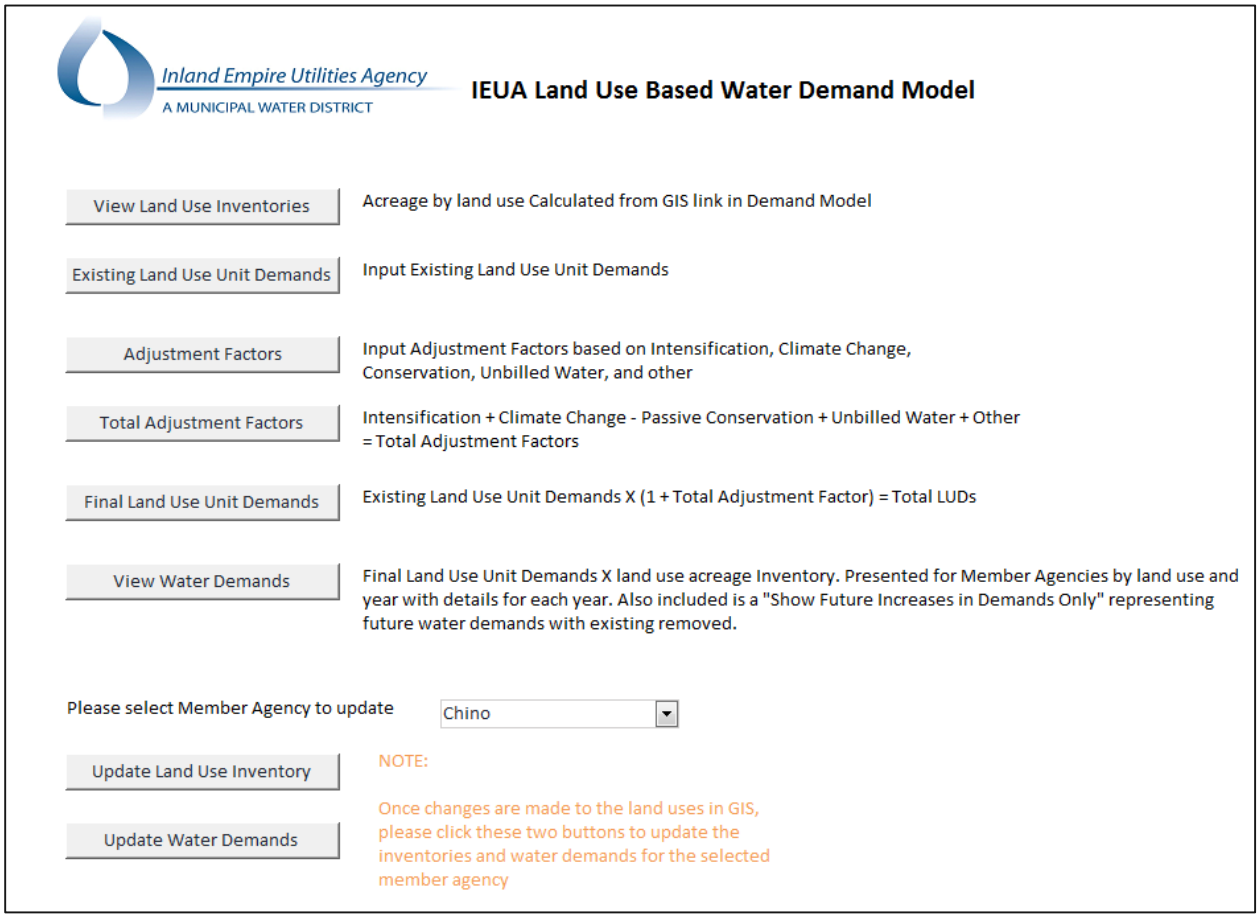

Figure 1-1 Welcome Form

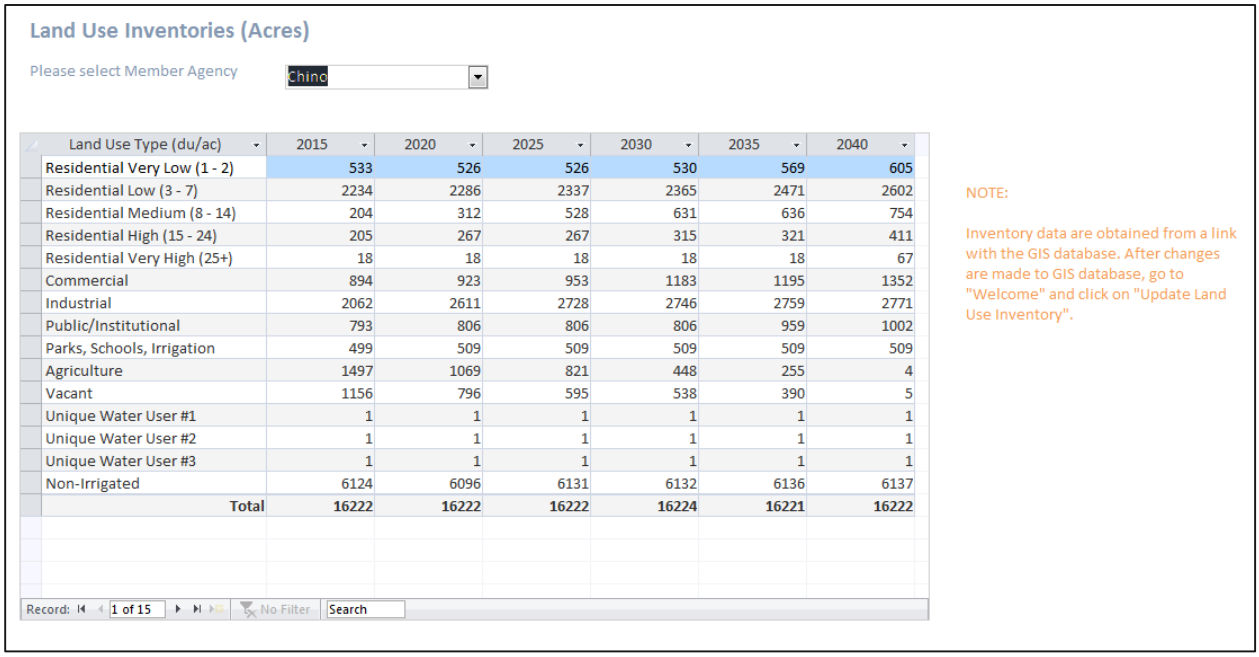
Below list describes the functions for each of the buttons on the Welcome page -



- Click “View Land Use Inventories” to view land use acreages by member agency which are calculated from GIS linked in the Demand Model. Any modification to the acreages and Landuse type must be done using GIS.
- Click “Existing Land Use Unit Demands” to view or update Existing LUD by member agency. LUDs are calculated outside the model as described in the memo. Users can manually update the LUDs when they are updated in the futures. Users can also update the Final Land Use Unit Demands from this form.

- Click “Adjustment Factors” to view or update Adjustment Factors by member agency. Users can also update the Total Adjustment Factors from this form.
- Click “Total Adjustment Factors” to view Total Adjustment Factors by member agency and update the Final Land Use Unit Demands.
- Click “Final Land Use Unit Demands” to view Final Land Use Unit Demands by member agency and update the Water Demands.

If updates are made to the GIS land use layers, users can select the appropriate member agency or all member agencies from the dropdown list and click ”Update Land Use Inventory” and “Update Water Demands” to update acreage inventories and total water demands.

# 2 VIEW LAND USE INVENTORIES

Click on View Land Use Inventories on the Welcome Page to view the acreages by land use. Select a member agency or “All Member Agencies” from the dropdown list to view their land use acreages. The acreages are calculated directly from the GIS database. This table cannot be manually updated without updating the background GIS layers.

| Land Use Type (du/ac) | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| Residential Very Low (1 - 2) | 533 | 526 | 526 | 530 | 569 | 605 |
| Residential Low (3 - 7) | 2234 | 2286 | 2337 | 2365 | 2471 | 2602 |
| Residential Medium (8 - 14) | 204 | 312 | 528 | 631 | 636 | 754 |
| Residential High (15 - 24) | 205 | 267 | 267 | 315 | 321 | 411 |
| Residential Very High (25+) | 18 | 18 | 18 | 18 | 18 | 67 |
| Commercial | 894 | 923 | 953 | 1183 | 1195 | 1352 |
| Industrial | 2062 | 2611 | 2728 | 2746 | 2759 | 2771 |
| Public/Institutional | 793 | 806 | 806 | 806 | 959 | 1002 |
| Parks, Schools, Irrigation | 499 | 509 | 509 | 509 | 509 | 509 |
| Agriculture | 1497 | 1069 | 821 | 448 | 255 | 4 |
| Vacant | 1156 | 796 | 595 | 538 | 390 | 5 |
| Unique Water User #1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Unique Water User #2 | 1 | 1 | 1 | 1 | 1 | 1 |
| Unique Water User #3 | 1 | 1 | 1 | 1 | 1 | 1 |
| Non-Irrigated | 6124 | 6096 | 6131 | 6132 | 6136 | 6137 |
| Total | 16222 | 16222 | 16222 | 16224 | 16221 | 16222 |

Figure 2-1 Land Use Inventories Form

# 3 EXISTING LAND USE UNIT DEMANDS

Click on Existing Land Use Unit Demands on the Welcome Page to view and update the Existing land Use Unit Demands manually. The Dropdown menu on the Existing Land Use Unit Demand table can be used view and update LUDs. These Existing LUDs are calculated from the Existing Water Consumption based on the Land Uses (explained in the Technical Memorandum). Updates to LUDS can be made by simply entering the number in the appropriate cell in the table.

After updating the LUD values, Click “Update Final Land Use Unit Demands” to update the final unit demands of all member agencies with the adjustment factors applied.

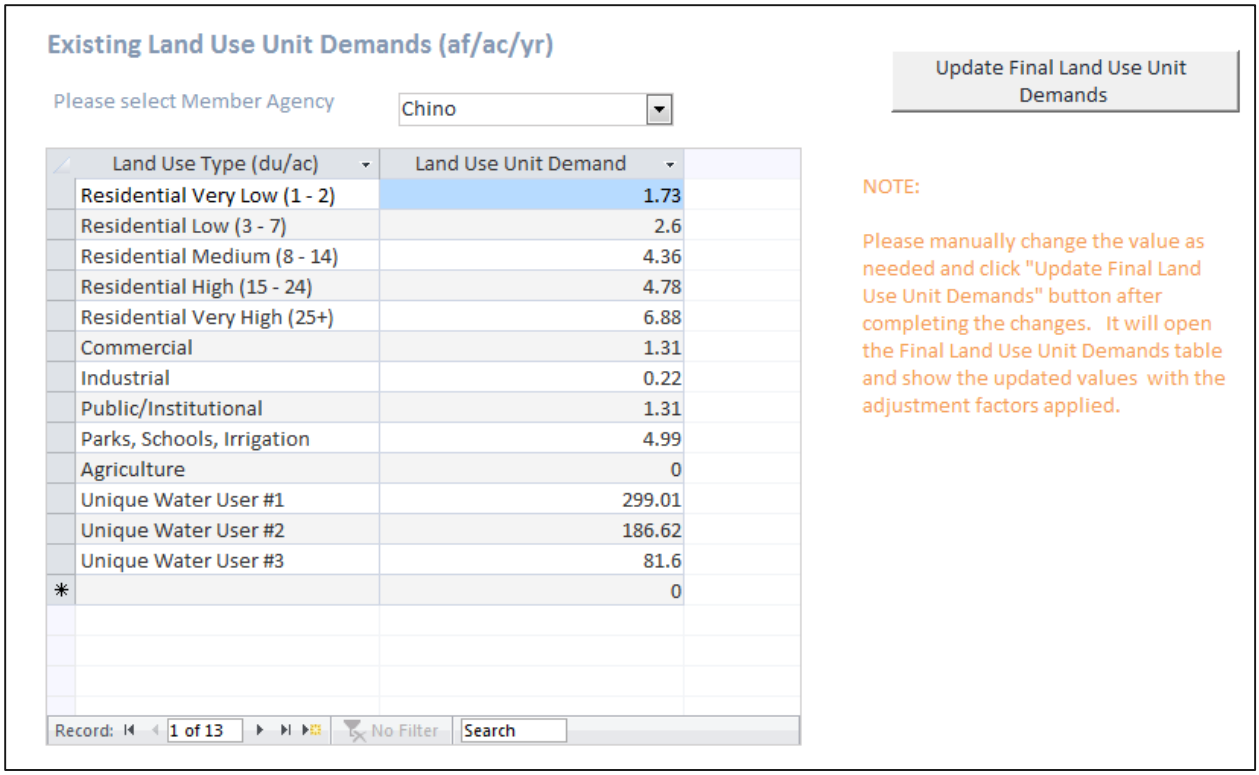


Figure 3-1 Existing land Use Unit Demands Form

# 4 ADJUSTMENT FACTORS

Click on 

on the Welcome Page to view and update the various Adjustment Factors (Figure 4-1). Select a member agency from the drop down menu on the Adjustment Factors table to view and update factor values in each factors. Definition for each Adjustment Factor and how it affects the existing LUDs is provided in the Technical Memorandum.

## 4.1 Intensification

Click on the “Intensification” tab to view the values for each land use by member agency and to update the intensification factors independently. To perform a global update for all land use types, enter a number in the "Update Intensification" box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

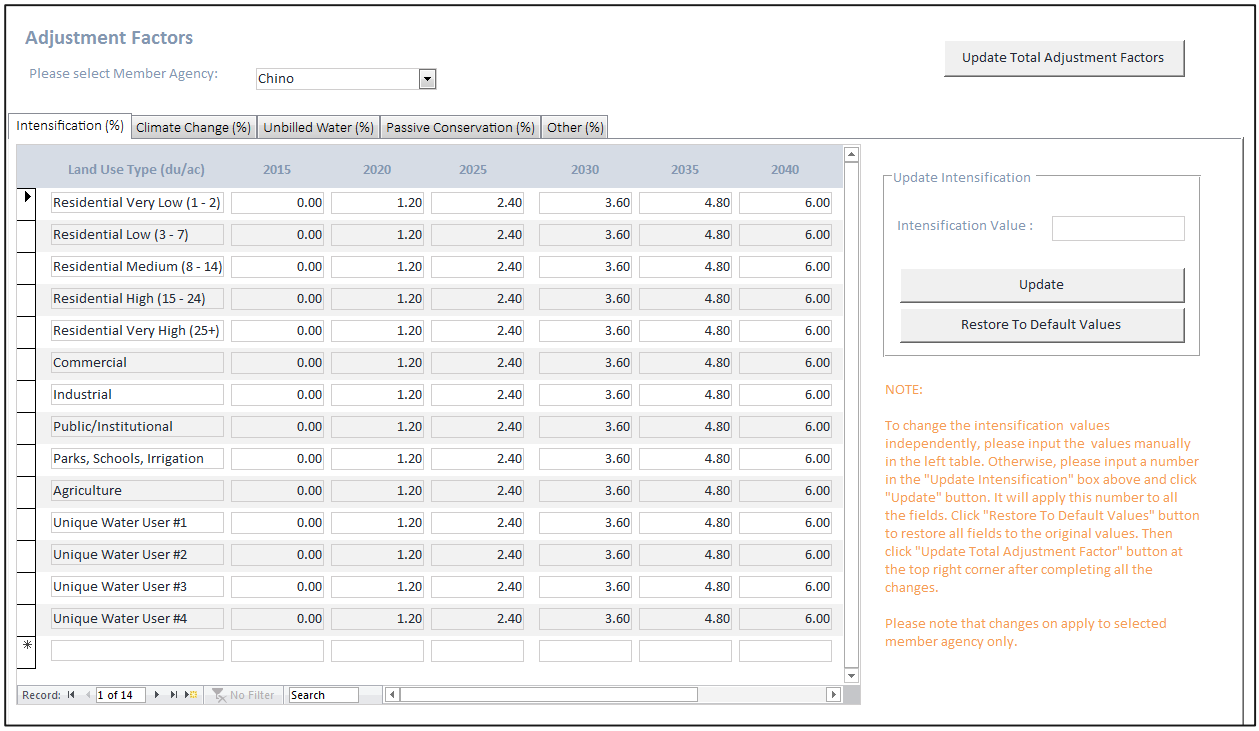

Figure 4-1 Intensification Form

## 4.2 Climate Change

Click on the “Climate Change” tab to view the values for each land use by member agency and to update the factors independently.

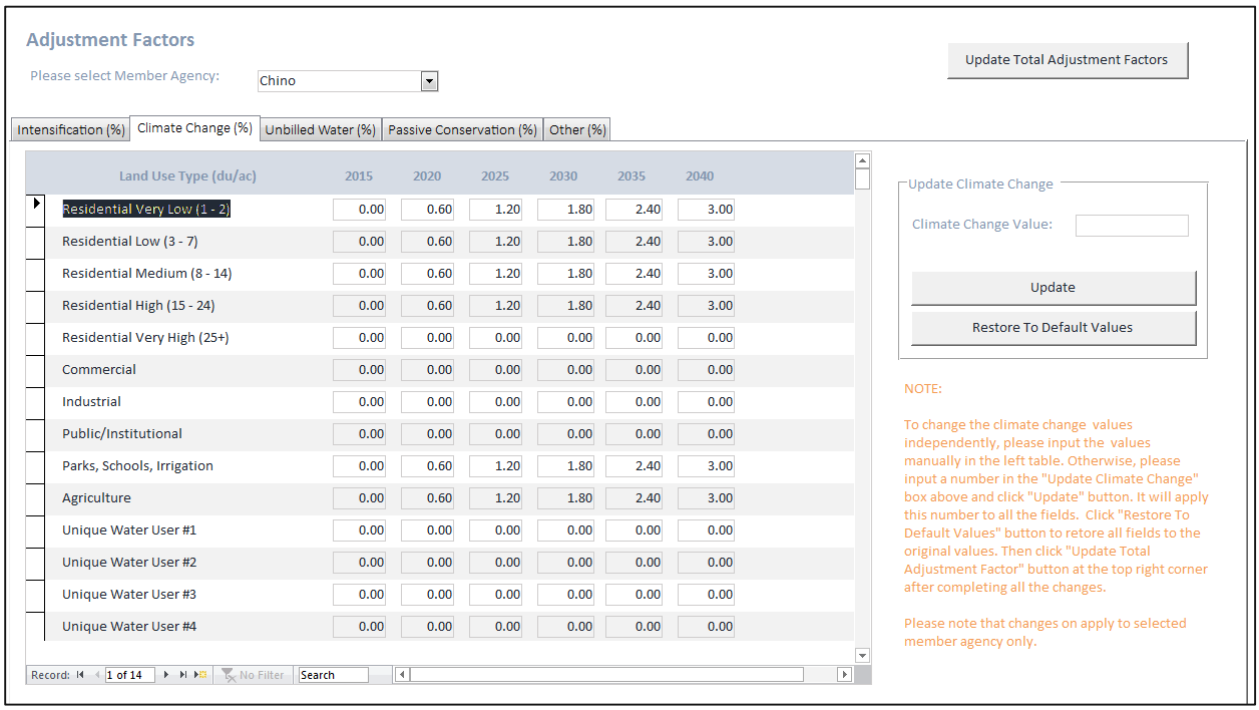

Figure 4-2 Climate Change Form

To perform a global update for all land use types, enter a number in the "Update Climate Change" box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

## 4.3 Unbilled Water

Click on the “Unbilled Water” tab to view the values by member agency and to update the factors. Unbilled Water factors is applied uniformly for all land uses. Click "Restore To Default Values" button to restore it to the original value.

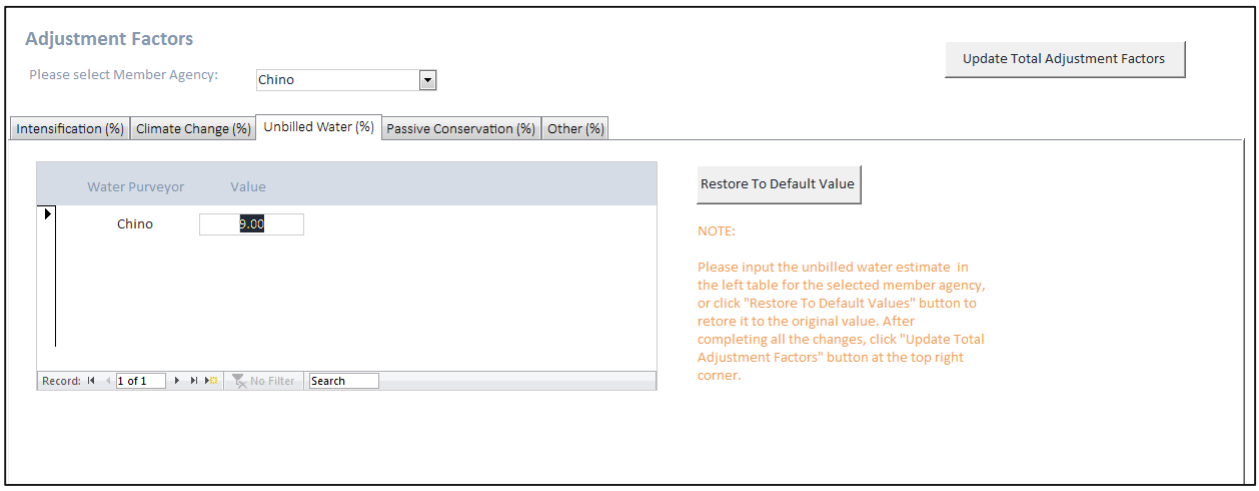

Figure 4-3 Unbilled Water Form

## 4.4 Passive Conservation

Click on the “Passive Conservation” tab to view the values for each land use by member agency and to update the factors independently. To perform a global update for all land use types, enter a number in the "Update Passive Conservation” box and click "Update" button. Click "Restore To Default Values" button to restore all fields to the original values.

Entering a positive number for passive conservation to indicate decrease in adjustment factor and demand.

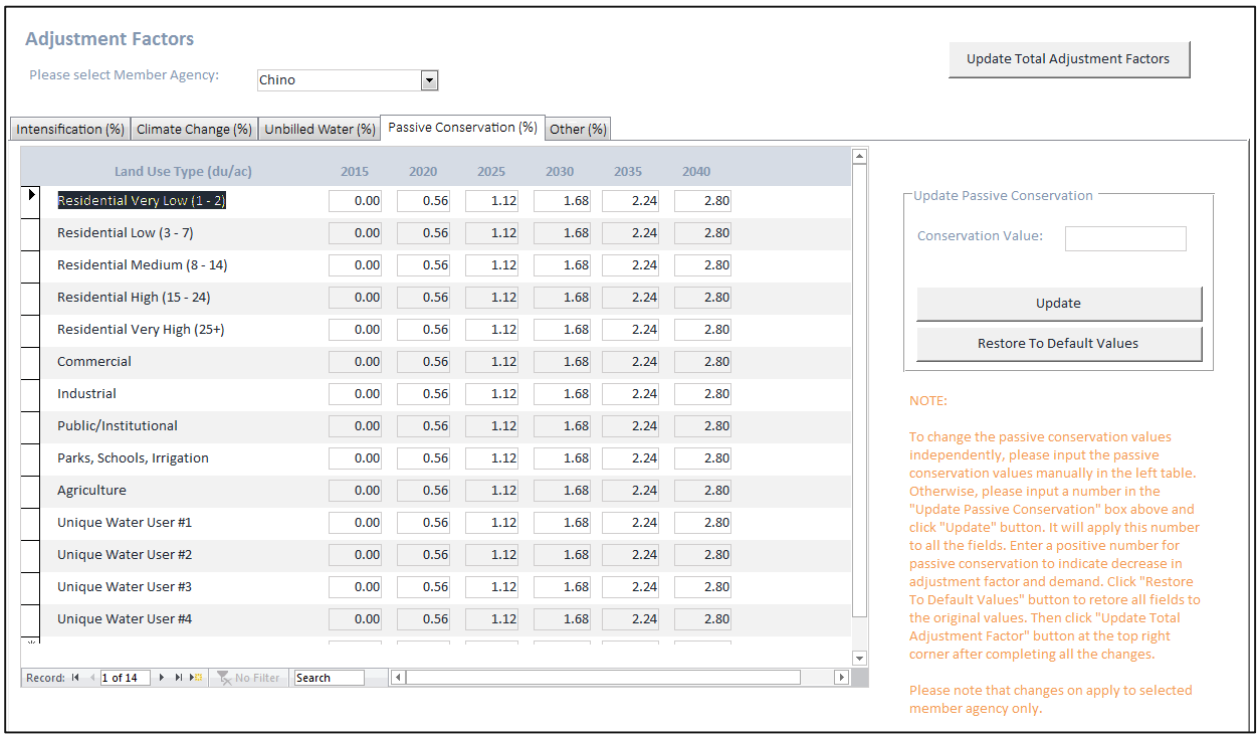

Figure 4-4 Passive Conservation Form

## 4.5 Other

The “Other” tab is an empty form that user can use to capture any additional adjustment factor not captures in the other tabs. The default value is 0 in all cells.

To perform a global update for all land use types, enter a number in the "Update Other Value” box and click "Update" button. Click "Restore To Default Values" button to restore all fields to 0.

A positive value will increase the Existing LUD and hence the total demand. And a negative number will decrease the Existing LUD.

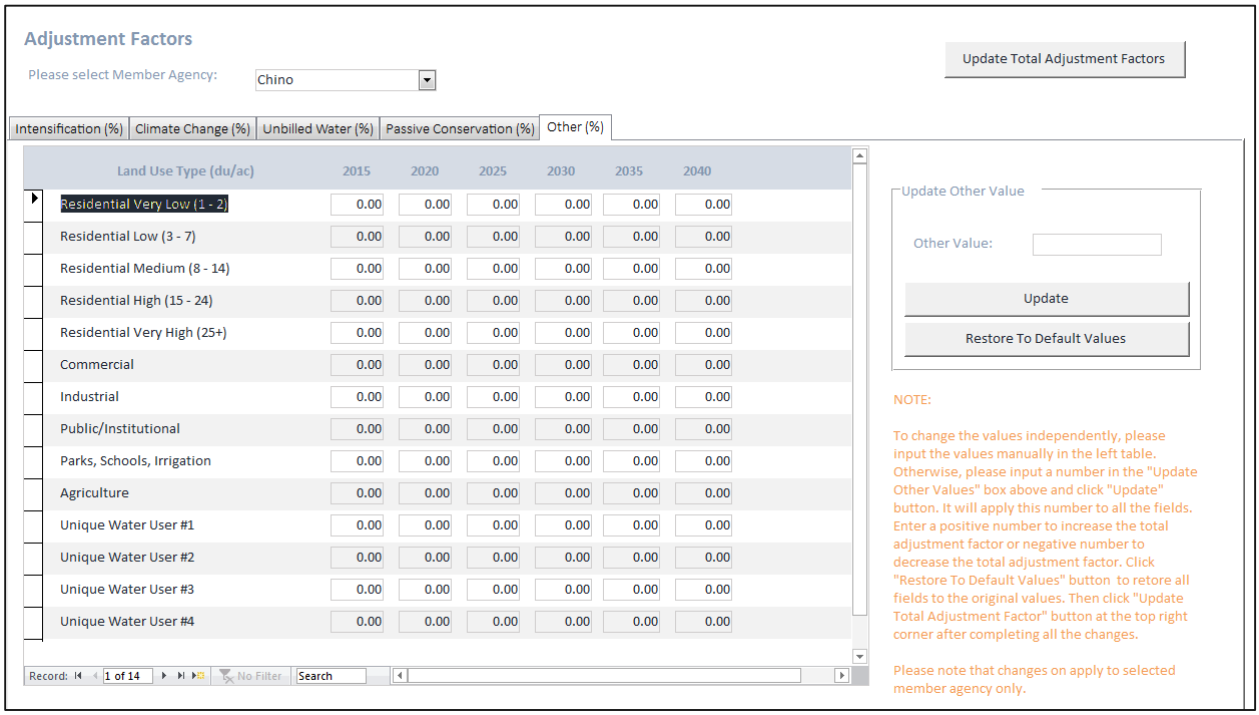

Figure 4-5 Other Form

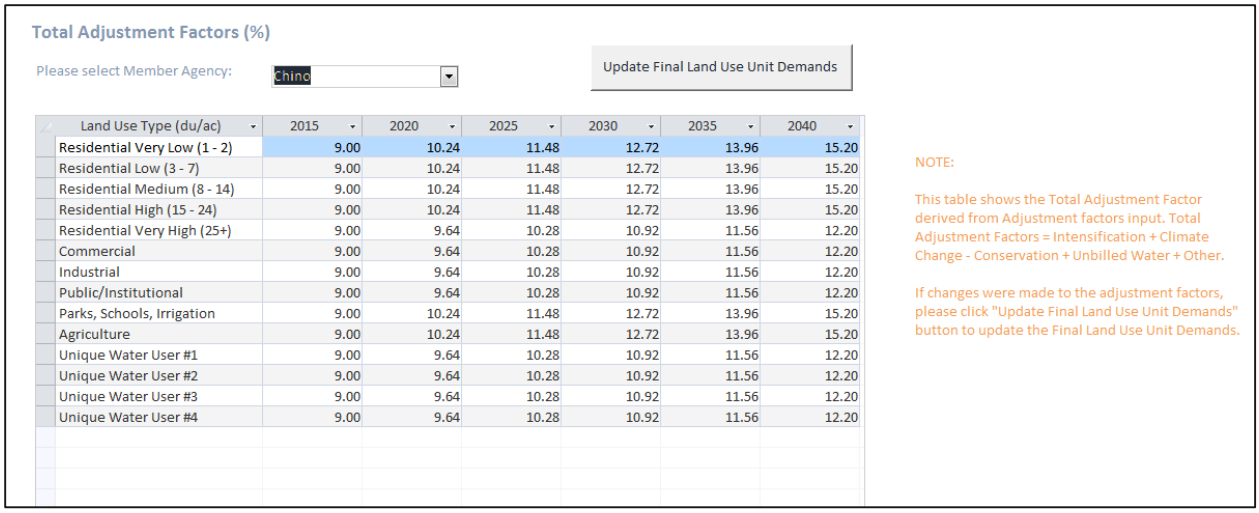

After updating or changing any adjustment factor, click "Update Total Adjustment Factor" button. It will recalculate the Total Adjacent Factors for all member agencies. Then the “Total Adjustment Factors” Form will pop up to show the new Adjustment Factors.

# 5 TOTAL ADJUSTMENT FACTORS

Click on Total Adjustment Factors on the Welcome Page to view the Total Adjustment Factors (Figure 5-1). Use the dropdown box to select the appropriate member agency. These values cannot be changed in this table. These values is calculated using the Adjustment Factors table using below equation

Total Adjustment Factors = Intensification + Climate Change - Conservation + Unbilled Water + Other.

If changes were made to the adjustment factors, please click "Update Final Land Use Unit Demands" button to update the Final Land Use Unit Demands of all member agencies. Then the “Final Land Use Unit Demands” form will pop up to show the results (Figure 6-1)

Total Adjustment Factors (%)

Please select Member Agency: Chino

Update Final Land Use Unit Demands

| Land Use Type (du/ac) | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |

| Unique Water User #4 | 9.00 | 9.64 | 10.28 | 10.92 | 11.56 | 12.20 |

NOTE:

This table shows the Total Adjustment Factor derived from Adjustment factors input. Total Adjustment Factors = Intensification + Climate Change - Conservation + Unbilled Water + Other.

If changes were made to the adjustment factors, please click "Update Final Land Use Unit Demands" button to update the Final Land Use Unit Demands.

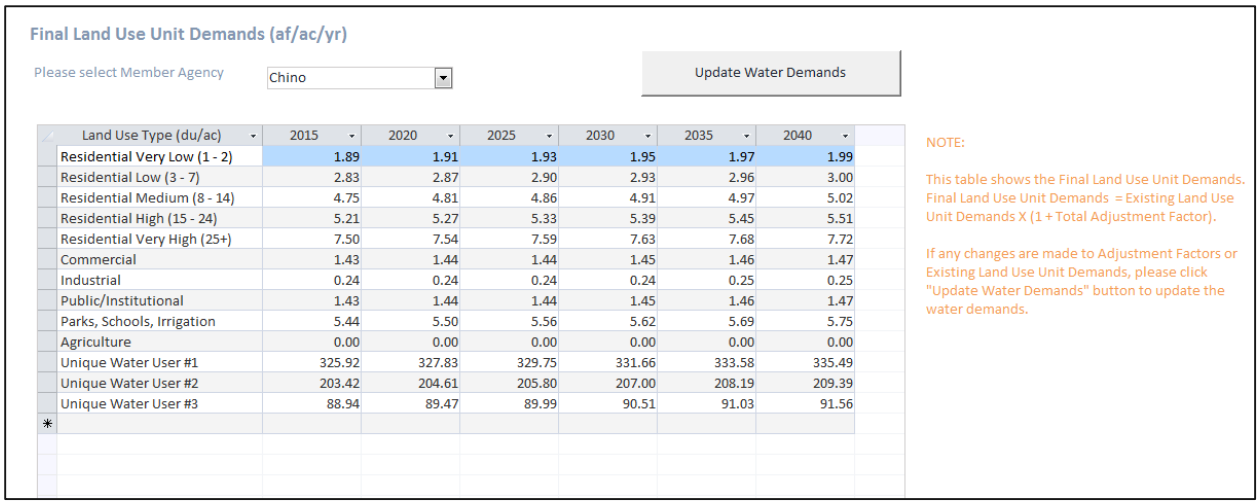

Figure 5-1 Total Adjustment Factors Form

# 6 FINAL LAND UNIT DEMANDS

Click on Final Land Use Unit Demands on the Welcome Page to view the Final LUDs (Figure 6-1) by member agency. Final LUDs is calculated using the below formula

Final Land Use Unit Demands = Existing Land Use Unit Demands X (1 + Total Adjustment Factor)

If changes were made to Adjustment Factors or Existing Land Use Unit Demands, please click "Update Water Demands" button to update the water demands of all member agencies. Then the “Water Demands” Form will pop up to show results.

Final Land Use Unit Demands (af/ac/yr)

Please select Member Agency Chino

Figure 7-3 Water Demands by Year

## 7.3 Water Demands Graph

Water Demands table also displays a graph of the water demands of all member agencies throughout the years. Total IEUA demands is shown as default. Click “Not Show IEUA” to show curves of member agencies only.

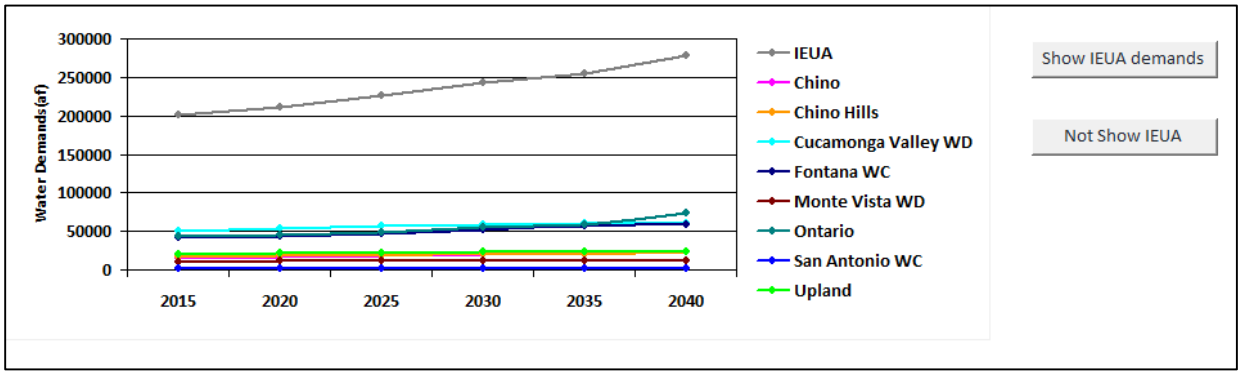

Figure 7-4 Water Demands Graph

# 8 UPDATE LAND USES IN ARCGIS

The model database contain multiple GIS feature classes with land use data which can be updated if changes to land uses occurs or year of development changes. These updates must be done within GIS.

The feature classes in the database is organized based on Cities within IEUA service area. Each city has two data tables: existing data and future data except City of Ontario and City of Upland. These two cities have existing and future data combined in one feature classes.

Since the land uses are mapped to existing parcel data, users only need to update the existing and future land use in the [CityName]_Existing or [CityName]_Existing_GeneralPlan tables. Below table shows which Feature Class is used to calculates acreages in the model. These can be updated within GIS when changes to Land Use type or development year happens.

| City Name | Feature Class Name | Used for Inventory Calculation |
|---|---|---|
| **Chino** | Chino_Existing | Y |
| | Chino_GeneralPlan | Y |
| **Chino Hills** | ChinoHills_Existing | Y |
| | ChinoHills_GeneralPlan | N |
| **Fontana** | Fontana_Existing | Y |
| | Fontana_GeneralPlan | N |
| **Montclair** | Montclair_Existing | Y |
| | Montclair_GeneralPlan | N |
| **Ontario** | Ontario_Existing_GeneralPlan | Y |
| **Rancho Cucamonga** | RanchoCucamonga_Existing | Y |
| | RanchoCucamonga_GeneralPlan | N |
| **Rialto** | Rialto_Existing | Y |
| | Rialto_GeneralPlan | N |
| **Unincorporated area between Montclair and Chino** | UINC_MontClair_Chino_Existing | Y |
| | UINC_MontClair_Chino_GP | N |
| **Upland** | Upland_Existing_GeneralPlan | Y |

In the [CityName]_Existing or [CityName]_Existing_GeneralPlan, besides the geographic information, a few new fields were added (below table).

| Field Name | Description |
|---|---|
| **Master_LU** | Existing land use (in 2015) |
| **GeneralPlan_LU** | Original planned future land use (Not used in inventory calculation) |
| **Future_LU** | Future land use |
| **Year_Developed** | The year the future land use developed |
| **WaterPurveyor** | The member agency belonged to |

To update land use in ArcGIS,

A) Be sure to close the database opened in MS Access
B) Add the needed feature classes to ArcMap and start Editor.
C) Change the land use in Master_LU for existing or change the land use in Future_LU for future and change the Year_Developed as well. Year_Developed value need to be multiples of 5 and starting from 2015 (till 2040). For example, a future land use will be developed in 2023, please input “2020” in Year_Developed field
D) Save the edits and close ArcGIS

Please note, Chino is a special case when editing future land uses. Since the parcels at southeast of Pine Ave & Chino Corona Rd changes significantly in future, the parcels in Chino_GeneralPlan are used for representing the land use in future. If future land uses in the colored area (shown in figure 8-1) needs to be changed, please update the Future_LU and Year_Developed fields in Chino_GeneralPlan feature class. For all other landuse changes, please update these two fields in Chino_Existing feature class.

Figure 8-1 Parcels representing future land uses in Chino

# 9 UPDATE WATER DEMAND MODEL

Once you have completed and saved the changes to the GIS feature classes, use the update features on Welcome page to update land use inventories and water demands.

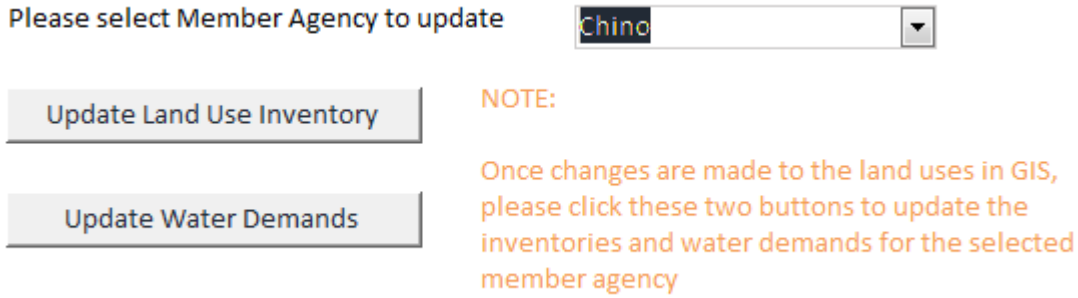

Figure 9-1 Update section in Welcome Form

## 9.1 Update Land Use Inventories

Before making the update, make sure the database is not opened in ArcGIS. Select a member agency or “All Member Agencies” in the dropdown list and click “Update Land Use Inventory” button to run the

calculation. This update procedure can take several minutes, please don't interrupt it. The "Land Use Inventories" window will pop up once the updating finished.

## 9.2 Update Water Demands

Once the inventories update is done, click "Update Water Demands" button to re-calculate the total water demands and the "Water Demands" form will pop up once the updating finished.

# APPENDIX O

## Water Loss Audit

# AWWA Free Water Audit Software v5.0

American Water Works Association Copyright © 2014, All Rights Reserved.

This spreadsheet-based water audit tool is designed to help quantify and track water losses associated with water distribution systems and identify areas for improved efficiency and cost recovery. It provides a "top-down" summary water audit format, and is not meant to take the place of a full-scale, comprehensive water audit format.

Auditors are strongly encouraged to refer to the most current edition of AWWA M36 Manual for Water Audits for detailed guidance on the water auditing process and targetting loss reduction levels

The spreadsheet contains several separate worksheets. Sheets can be accessed using the tabs towards the bottom of the screen, or by clicking the buttons below.

**Please begin by providing the following information**

| | | |
|---|---|---|
| Name of Contact Person: | Terry Caitlin | |
| Email Address: | tlcatlin@wfajpa.org | |
| Telephone \| Ext.: | 909-981-9454 | 12 |
| Name of City / Utility: | Water Facilities Authority | |
| City/Town/Municipality: | Upland | |
| State / Province: | California (CA) | |
| Country: | USA | |
| Year: | 2014 | Financial Year |
| Start Date: | 07/2014 | Enter MM/YYYY numeric format |
| End Date: | 06/2015 | Enter MM/YYYY numeric format |
| Audit Preparation Date: | 4/5/2016 | |
| Volume Reporting Units: | Acre-feet | |
| PWSID / Other ID: | | |

**The following guidance will help you complete the Audit**

All audit data are entered on the ***Reporting Worksheet***

- Value can be entered by user
- Value calculated based on input data
- These cells contain recommended default values

Use of Option (Radio) Buttons: Pcnt: 0.25% Value:

Select the default percentage by choosing the option button on the left

To enter a value, choose this button and enter a value in the cell to the right

**The following worksheets are available by clicking the buttons below or selecting the tabs along the bottom of the page**

***Instructions***
The current sheet. Enter contact information and basic audit details (year, units etc)

***Reporting Worksheet***
Enter the required data on this worksheet to calculate the water balance and data grading

***Comments***
Enter comments to explain how values were calculated or to document data sources

***Performance Indicators***
Review the performance indicators to evaluate the results of the audit

***Water Balance***
The values entered in the Reporting Worksheet are used to populate the Water Balance

***Dashboard***
A graphical summary of the water balance and Non-Revenue Water components

***Grading Matrix***
Presents the possible grading options for each input component of the audit

***Service Connection Diagram***
Diagrams depicting possible customer service connection line configurations

***Definitions***
Use this sheet to understand the terms used in the audit process

***Loss Control Planning***
Use this sheet to interpret the results of the audit validity score and performance indicators

***Example Audits***
Reporting Worksheet and Performance Indicators examples are shown for two validated audits

***Acknowledgements***

**Water Audit Report for:** Water Facilities Authority
**Reporting Year:** 2014 7/2014 - 6/2015

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

**All volumes to be entered as: ACRE-FEET PER YEAR**

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

<---------- Enter grading in column 'E' and 'J' ---------->

Master Meter and Supply Error Adjustments

### WATER SUPPLIED

| | | | | | Pcnt: | Value: | |
|---|---|---|---|---|---|---|---|
| Volume from own sources: | n/a | 0.000 | acre-ft/yr | | | | acre-ft/yr |
| Water imported: | 8 | 27,605.500 | acre-ft/yr | 5 | | | acre-ft/yr |
| Water exported: | n/a | 0.000 | acre-ft/yr | | | | acre-ft/yr |

Enter negative % or value for under-registration
Enter positive % or value for over-registration

**WATER SUPPLIED:** 27,605.500 acre-ft/yr

### AUTHORIZED CONSUMPTION

Click here: ? for help using option buttons below

| | | | | Pcnt: | Value: | |
|---|---|---|---|---|---|---|
| Billed metered: | 6 | 27,338.900 | acre-ft/yr | | | |
| Billed unmetered: | n/a | 0.000 | acre-ft/yr | | | |
| Unbilled metered: | n/a | 0.000 | acre-ft/yr | | | |
| Unbilled unmetered: | 10 | 0.001 | acre-ft/yr | | 0.001 | acre-ft/yr |

Use buttons to select percentage of water supplied **OR** value

**AUTHORIZED CONSUMPTION:** 27,338.901 acre-ft/yr

**WATER LOSSES (Water Supplied - Authorized Consumption)** 266.599 acre-ft/yr

**Apparent Losses**

| | | | | Pcnt: | Value: | |
|---|---|---|---|---|---|---|
| Unauthorized consumption: | 6 | 0.001 | acre-ft/yr | | 0.001 | acre-ft/yr |
| Customer metering inaccuracies: | 7 | 68.519 | acre-ft/yr | 0.25% | | acre-ft/yr |
| Systematic data handling errors: | | 68.347 | acre-ft/yr | 0.25% | | acre-ft/yr |

**Default option selected for Systematic data handling errors - a grading of 5 is applied but not displayed**

**Apparent Losses:** 136.867 acre-ft/yr

**Real Losses (Current Annual Real Losses or CARL)**

**Real Losses = Water Losses - Apparent Losses:** 129.732 acre-ft/yr

**WATER LOSSES:** 266.599 acre-ft/yr

### NON-REVENUE WATER

**NON-REVENUE WATER:** 266.600 acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

### SYSTEM DATA

| | | | |
|---|---|---|---|
| Length of mains: | 7 | 4.9 | miles |
| Number of active AND inactive service connections: | 9 | 7 | |
| Service connection density: | | 1 | conn./mile main |

Are customer meters typically located at the curbstop or property line? Yes

Average length of customer service line:

(length of service line, beyond the property boundary, that is the responsibility of the utility)

**Average length of customer service line has been set to zero and a data grading score of 10 has been applied**

Average operating pressure: 9 89.5 psi

### COST DATA

| | | | | |
|---|---|---|---|---|
| Total annual cost of operating water system: | 9 | $3,342,185 | $/Year | |
| Customer retail unit cost (applied to Apparent Losses): | 9 | $1.50 | $/100 cubic feet (ccf) | |
| Variable production cost (applied to Real Losses): | 7 | $638.71 | $/acre-ft | ☐ Use Customer Retail Unit Cost to value real losses |

### WATER AUDIT DATA VALIDITY SCORE:

***** YOUR SCORE IS: 76 out of 100 *****

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

### PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Water imported
2: Billed metered
3: Systematic data handling errors

**Water Audit Report for:** Water Facilities Authority
**Reporting Year:** 2014 | 7/2014 - 6/2015

*** YOUR WATER AUDIT DATA VALIDITY SCORE IS: 76 out of 100 ***

**System Attributes:**

| | | | |
|---|---|---|---|
| | Apparent Losses: | 136.867 | acre-ft/yr |
| + | Real Losses: | 129.732 | acre-ft/yr |
| = | **Water Losses:** | **266.599** | acre-ft/yr |
| ? | Unavoidable Annual Real Losses (UARL): | See limits in definition | acre-ft/yr |
| | Annual cost of Apparent Losses: | $89,429 | |
| | Annual cost of Real Losses: | $82,861 | Valued at **Variable Production Cost** |

Return to Reporting Worksheet to change this assumpiton

**Performance Indicators:**

| | | | |
|---|---|---|---|
| Financial: | Non-revenue water as percent by volume of Water Supplied: | 1.0% | |
| | Non-revenue water as percent by cost of operating system: | 5.2% | Real Losses valued at Variable Production Cost |
| Operational Efficiency: | Apparent Losses per service connection per day: | 17455.26 | gallons/connection/day |
| | Real Losses per service connection per day: | N/A | gallons/connection/day |
| | Real Losses per length of main per day*: | 23,636.21 | gallons/mile/day |
| | Real Losses per service connection per day per psi pressure: | N/A | gallons/connection/day/psi |

| | | | |
|---|---|---|---|
| | From Above, Real Losses = Current Annual Real Losses (CARL): | 129.73 | acre-feet/year |
| ? | Infrastructure Leakage Index (ILI) [CARL/UARL]: | | |

* This performance indicator applies for systems with a low service connection density of less than 32 service connections/mile of pipeline

Use this worksheet to add comments or notes to explain how an input value was calculated, or to document the sources of the information used.

| | |
|---|---|
| **General Comment:** | Water Facilities Authority provides wholesale water treatment and delivery to its five Member Agencies. Scope of water audit software designed primarily for retail water delivery. Water supply volumes for Water Facilities Authority in this audit includes both water treatment process and distribution delivery volumes. |

| Audit Item | Comment |
|---|---|
| Volume from own sources: | |
| Vol. from own sources: Master meter error adjustment: | |
| Water imported: | Calibration results from 2011 for treatment plant process meters and Member Agency service meters, owned by Water Facilities Authority. Raw water supply received from Metropolitan's meter at CB-12 on the Rialto Feeder (#3). MWD meter serves the CB-12 connection and is used as the reference. Set score of 8. |
| Water imported: master meter error adjustment: | Standard |
| Water exported: | |
| Water exported: master meter error adjustment: | |
| Billed metered: | Member Agency service meters and MWD's CB-12 meter are reviewed and logged once a month (Audit Questionaire #2c). Meter calibration for treatment plant process meters and Member Agency service meters completed in 2011 and scheduled for 2016 per "Flow Meter" p. 8). Meter reads are manual on a monthly basis. Collective Member Agency service meters' readings is compared to single CB-12 treatment plant influent meter reading, resulting in variance adjustments to Member Agency service meters billing volume, compared to MWD's CB-12 meter. Net billed volume includes both Distribution & Treatment Plant process volumes. |
| Billed unmetered: | |
| Unbilled metered: | |

| Audit Item | Comment |
|---|---|
| Unbilled unmetered: | |
| Unauthorized consumption: | Not clear that actual policies or procedures are in place to identify or mitigate potential unauthorized consumption. |
| Customer metering inaccuracies: | Limited customer rmeter inaccuary testing is conducted. Meter population is small and fairly new (oldest from 2004). |
| Systematic data handling errors: | |
| Length of mains: | Wholesale transmission/distribution pipeline is 3.8 mile (14). Electronic model not used to store information (17). |
| Number of active AND inactive service connections: | 6 active and 1 inactive service connection (12). No fire hydrants or retail meters. Electronic system does not exist but location of meters assumed to be accurate due to number and frequency of reads (14). |
| Average length of customer service line: | N/A |
| Average operating pressure: | Weighted average for pipeline was calculated. Main pipeline (2.2 mi @ 87.9 psi); MVDW#1 (0.2 mi @ 183.5 psi); Ontario pipeline (2.5 mi @ 98 psi) |
| Total annual cost of operating water system: | Reliable cost accounting system in place, audited internally yearly. (25) |
| Customer retail unit cost (applied to Apparent Losses): | Used $593+15+45.71 = $653.71 per AF is equal to $1.50 per CCF from wholesale billing statement. Audited monthly and annualy by third party and CPA, not by third party aware of M36 methodology. |
| Variable production cost (applied to Real Losses): | Charge for MWD imported water purchases and WFA Direct Operating Cost ($593 + 45.71 = $638.71) |

## TABLE OF CONTENTS

**Section** **Page**

Table of Contents ..... I
List of Tables ..... XI
List of Figures ..... XIV
List of Abbreviations ..... XV
Summary of Compliance ..... XIX

**Executive Summary ..... ES-1**
Factors Considered ..... ES-1
Demand Projections ..... ES-1
Total Demands ..... ES-2
Total Conservation ..... ES-2
Total Local Supplies ..... ES-3
Water Use Reduction Achievement in 2015 ..... ES-3
Supply Capabilities ..... ES-3
Hydrologic Conditions and Reporting Period ..... ES-4
Colorado River Aqueduct Supplies ..... ES-4
State Water Project Supplies ..... ES-4
Storage ..... ES-4
Findings of the 2015 Urban Water Management Plan ..... ES-5

**1. Introduction ..... 1-1**

**1.1 Introduction to this Document and the Agency ..... 1-1**
Organization of this Document ..... 1-1
Urban Water Management Planning Act ..... 1-3
Changes in the Act Since 2010 ..... 1-3
Senate Bill 7 of the Seventh Extraordinary Session of 2009, Water Conservation in the Delta Legislative Package ..... 1-4
Metropolitan's Compliance with the Urban Water Management Planning Act ..... 1-5
DWR Guidance ..... 1-5

**1.2 The Metropolitan Water District of Southern California ..... 1-6**
Formation and Purpose ..... 1-6
Service Area ..... 1-6
Member Agencies ..... 1-6
Board of Directors and Management Team ..... 1-11

**1.3 Metropolitan Service Area Historical Information ..... 1-12**
Population ..... 1-12
Historical Retail Water Demands ..... 1-13
Climate and Rainfall ..... 1-14

**1.4 Current Conditions ..... 1-17**
Current Challenges ..... 1-17
Sacramento-San Joaquin River Delta Issues ..... 1-17
Water Supply Conditions ..... 1-18
Current Available Resources ..... 1-18
Metropolitan's Recent and Near-term Drought Response Actions ..... 1-22
Increasing Water Conservation ..... 1-23

## TABLE OF CONTENTS

**Section** **Page**

Increasing Local Resources ..... 1-24
Augmenting Water Supplies ..... 1-24
Improving Return Capabilities of Storage Programs ..... 1-25
Modifying Metropolitan's Distribution System ..... 1-25
Implementing the Water Supply Allocation Plan ..... 1-26
Short-term Supply Outlook ..... 1-28

**2. Planning for the Future ..... 2-1**

**2.1 Integrated Water Resource Planning ..... 2-2**
The 1996 IRP ..... 2-2
The 2004 IRP Update ..... 2-3
The 2010 IRP Update ..... 2-3
Adaptive Management Strategy ..... 2-3
The 2015 IRP Update ..... 2-4
Findings and Conclusions ..... 2-4

**2.2 Estimating Demands on Metropolitan ..... 2-6**
Demand Forecast ..... 2-6
Total Demands ..... 2-6
Conservation Adjustment ..... 2-7
Local Supplies ..... 2-7
Determining Demands on Metropolitan ..... 2-9

**2.3 Water Supply Reliability ..... 2-12**

**2.4 Water Shortage Contingency Analysis ..... 2-17**
Water Surplus and Drought Management Plan ..... 2-17
WSDM Plan Development ..... 2-17
WSDM Plan Implementation ..... 2-18
Water Supply Condition Framework ..... 2-19
Water Supply Allocation Plan ..... 2-20
Water Supply Allocation Plan Development ..... 2-21

**2.5 Catastrophic Supply Interruption Planning ..... 2-23**
Emergency Storage Requirements ..... 2-23
Electrical Outages ..... 2-23

**2.6 Other Supply Reliability Risks ..... 2-24**
Supplies ..... 2-24
Operations and Water Quality ..... 2-24
Demand ..... 2-24
Distribution System Water Losses ..... 2-25
Climate Change ..... 2-25
Potential Impacts ..... 2-25
Metropolitan's Activities Related to Climate Change Concerns ..... 2-26

**2.7 Pricing and Rate Structures ..... 2-29**
Revenue Management ..... 2-29

## TABLE OF CONTENTS

**Section** **Page**

Elements of Rate Structure ..... 2-29
System Access Rate (SAR) ..... 2-29
Water Stewardship Rate (WSR) ..... 2-29
System Power Rate (SPR) ..... 2-29
Treatment Surcharge ..... 2-30
Capacity Charge ..... 2-30
Readiness-To-Serve Charge (RTS) ..... 2-30
Tier 1 Supply Rate ..... 2-30
Tier 2 Supply Rate ..... 2-30

**3. Implementing the Plan ..... 3-1**

**3.1 Colorado River Aqueduct ..... 3-2**
Background ..... 3-2
Changed Conditions ..... 3-4
California's Colorado River Water Use Plan and the Quantification Settlement Agreement ..... 3-4
Current Dry Condition ..... 3-5
Quagga Mussels ..... 3-5
Implementation Approach ..... 3-5
Colorado River Water Management Programs ..... 3-6
Achievements to Date ..... 3-8

**3.2 State Water Project ..... 3-10**
Background ..... 3-10
Changed Conditions ..... 3-13
Implementation Approach ..... 3-14
SWP Reliability ..... 3-14
SWP Water Quality ..... 3-18
SWP System Outage and Capacity Constraints ..... 3-19
Achievements to Date ..... 3-21
SWP Reliability ..... 3-21
SWP Water Quality ..... 3-23
SWP System Reliability ..... 3-23

**3.3 Central Valley/State Water Project Storage and Transfer Programs ..... 3-24**
Background ..... 3-24
Implementation Approach ..... 3-24
Storage and Transfer Programs ..... 3-24
Achievements to Date ..... 3-28

**3.4 Demand Management and Conservation ..... 3-30**
Background ..... 3-30
Implementation Approach ..... 3-31
Public Education and Outreach ..... 3-32
Public Education Programs ..... 3-32
Outreach ..... 3-33
Community Partnering Program ..... 3-34
California Friendly Landscape Education and Training Program ..... 3-34

## TABLE OF CONTENTS

**Section** **Page**

Water Conservation Programs....3-35
Regional Conservation Programs....3-35
Metering....3-38
Research and Development Programs....3-38
Measurement and Evaluation....3-38
Recognition for Conservation Achievements....3-38
Asset Management Program....3-43
Maintenance Management Program....3-43
Infrastructure Protection Plan....3-44

**3.5 Recycling, Groundwater Recovery, and Desalination....3-46**
Background....3-46
Recycling....3-46
Groundwater Recovery....3-56
Seawater Desalination....3-56
Changed Conditions....3-57
Recycled Water....3-57
Groundwater Recovery Brine Disposal....3-58
Seawater Desalination....3-58
Implementation Approach....3-59
Local Resources Program....3-59
Regional Recycling Program....3-59
Seawater Desalination Program....3-60
Achievements to Date....3-60

**3.6 Surface Storage and Groundwater Management Programs: Within the Region....3-64**
Background....3-64
Implementation Approach....3-64
Surface Storage....3-64
Groundwater Storage....3-65
Achievements to Date....3-66

**3.7 Water Use Reduction....3-68**
Achievement as of 2015....3-68

**3.8 Energy Management Initiative....3-70**

**4. Water Quality....4-1**
Background....4-1
Colorado River....4-1
State Water Project....4-2
Local Agency Supplies and Groundwater Storage....4-2
Issues of Potential Concern....4-3
Salinity....4-3
The Salinity Management Policy....4-3
Colorado River....4-4
State Water Project....4-5
Recycled Water....4-6
Groundwater Basins....4-7

## TABLE OF CONTENTS

**Section** **Page**

Perchlorate ..... 4-8
Total Organic Carbon and Bromide ..... 4-9
Nutrients ..... 4-10
Arsenic ..... 4-12
Uranium ..... 4-13
Chromium-6 ..... 4-14
Constituents of Emerging Concern ..... 4-15
N-Nitrosodimethylamine ..... 4-15
Pharmaceuticals and Personal Care Products ..... 4-15
Other Water Quality Programs ..... 4-16
Source Water Protection ..... 4-16
Colorado River Water Quality Partnerships ..... 4-17
SWP Water Quality Programs ..... 4-17
Regulatory and Legislative Actions ..... 4-17

**5. Coordination and Public Outreach ..... 5-1**
Collaborative Regional Planning ..... 5-1
Development of "Water Tomorrow," a Regional Plan ..... 5-1
Coordination with Other Appropriate Agencies ..... 5-2
Board of Directors Oversight ..... 5-2
Collaboration with Member Agencies and Other Organizations ..... 5-3
Public Outreach During IRP/UWMP Preparation ..... 5-3
UWMP Public Notice and Adoption ..... 5-4
Submission and Availability of Final 2015 UWMP ..... 5-5

## TABLE OF CONTENTS

**Section** **Page**

**A.1 Demand Forecast**

Forecast Overview ..... A.1-1
Retail M&I Demand Forecast ..... A.1-1
Effects of the Great Recession on SCAG's and SANDAG's Forecasts ..... A.1-4
Trends in Southern California ..... A.1-4
Population ..... A.1-4
Employment ..... A.1-4
Residential Consumers ..... A.1-5
Water Demands ..... A.1-7
Retail Demand ..... A.1-7
Residential Water Use ..... A.1-7
Nonresidential Water Use ..... A.1-7
Conservation Savings ..... A.1-8
Projected M&I Demand by Sector ..... A.1-8

**A.2 Existing Regional Water Supplies**

Local Water Supplies ..... A.2-1
Major Groundwater Basins ..... A.2-4
Major River Systems and Reservoirs ..... A.2-5
Water Recycling and Groundwater Recovery ..... A.2-8
Imported Water ..... A.2-9
Colorado River ..... A.2-9
State Water Project ..... A.2-13
Los Angeles Aqueduct ..... A.2-15
Historic Total Regional Water Supplies ..... A.2-15

**A.3 Justifications for Supply Projections**

Colorado River Aqueduct Deliveries ..... A.3-1
Colorado River Supplies ..... A.3-1
Rationale for Expected Supply ..... A.3-2
Financing ..... A.3-3
IID – Metropolitan Conservation Program ..... A.3-3
Source of Supply ..... A.3-3
Expected Supply Capability ..... A.3-4
Rationale for Expected Supply ..... A.3-4
Financing ..... A.3-5
Federal, State, and Local Permits/Approvals ..... A.3-5
Palo Verde Irrigation District Land Management, Crop Rotation and Water Supply Program ..... A.3-5
Source of Supply ..... A.3-5
Expected Supply Capability ..... A.3-6
Rationale for Expected Supply ..... A.3-6
Financing ..... A.3-7
Federal, State, and Local Permits/Approvals ..... A.3-7
Management of Metropolitan-Owned Land in Palo Verde ..... A.3-7
Source of Supply ..... A.3-7
Expected Supply Capability ..... A.3-7
Rationale for Expected Supply ..... A.3-7

## TABLE OF CONTENTS

**Section** **Page**

Financing ..... A.3-8
Federal, State, and Local Permits/Approvals ..... A.3-8
All-American and Coachella Canal Lining Projects ..... A.3-8
Source of Supply ..... A.3-8
Expected Supply Capability ..... A.3-8
Rationale for Expected Supply ..... A.3-8
Financing ..... A.3-9
Federal, State, and Local Permits/Approvals ..... A.3-9
Metropolitan-CVWD Delivery and Exchange Agreement for 35,000 Acre-Feet A.3-10
Source of Supply ..... A.3-10
Expected Supply Capability ..... A.3-10
Rationale for Expected Supply ..... A.3-10
SNWA and Metropolitan Storage and Interstate Release Agreement ..... A.3-12
Source of Supply ..... A.3-12
Expected Supply Capability ..... A.3-12
Rationale for Expected Supply ..... A.3-12
Lower Colorado Water Supply Project ..... A.3-13
Source of Supply ..... A.3-13
Expected Supply Capability ..... A.3-13
Rationale for Expected Supply ..... A.3-14
Financing ..... A.3-14
Lake Mead Storage Program, Drop 2 (Brock) Reservoir Funding, Yuma Desalting Plant Pilot Project, and Binational Intentionally Created Surplus ..... A.3-14
Source of Supply ..... A.3-14
Expected Supply Capability ..... A.3-15
Rationale for Expected Supply ..... A.3-15
Programs Under Development ..... A.3-17
California Aqueduct Deliveries ..... A.3-18
State Water Project Deliveries ..... A.3-18
Source of Supply ..... A.3-18
Expected Supply Capability ..... A.3-18
Rationale for Expected Supply ..... A.3-18
Financing ..... A.3-19
Federal, State, and Local Permits/Approvals ..... A.3-19
Desert Water Agency/Coachella Valley Water District/Metropolitan Water Exchange and Advance Delivery Programs ..... A.3-19
Source of Supply ..... A.3-19
Expected Supply Capability ..... A.3-20
Rationale for Expected Supply ..... A.3-20
Financing ..... A.3-21
Semitropic Water Banking and Exchange Program ..... A.3-21
Source of Supply ..... A.3-21
Expected Supply Capability ..... A.3-21
Rationale for Expected Supply ..... A.3-22
Financing ..... A.3-22
Federal, State, and Local Permits/Approvals ..... A.3-22

## LIST OF TABLES

| Table | | Page |
|---|---|---|
| 1-1 | July 1, 2015 Area and Population in the Six Counties of Metropolitan's Service Area | 1-7 |
| 1-2 | Metropolitan's Member Agencies and Type of Water Service Provided | 1-8 |
| 1-3 | Member Agencies | 1-9 |
| 1-4 | Weather Variables in Three Zones in Metropolitan's Service Area | 1-16 |
| 1-5 | Local Supplies for Average and Dry Years | 1-22 |
| 1-6 | Recent Metropolitan's Board Drought Response Actions | 1-27 |
| 1-7 | Multiple Dry-Year Supply Capability, Repeat of 1990-1992 Hydrologies | 1-28 |
| 2-1 | Metropolitan Regional Water Demands, Single Dry-Year | 2-10 |
| 2-2 | Metropolitan Regional Water Demands, Multiple Dry-Year | 2-11 |
| 2-3 | Metropolitan Regional Water Demands, Average Year | 2-12 |
| 2-4 | Single Dry-Year Supply Capability and Projected Demands, Repeat of 1977 Hydrology | 2-15 |
| 2-5 | Multiple Dry-Year Supply Capability and Projected Demands, Repeat of 1990-1992 Hydrology | 2-16 |
| 2-6 | Average Year Supply Capability and Projected Demands, Average of 1922-2012 Hydrologies | 2-17 |
| 2-7 | Water Supply Condition Framework | 2-21 |
| 2-8 | Schedule of Reporting and Water Supply Allocation Decision-Making | 2-23 |
| 2-9 | Rate Structure Components | 2-32 |
| 2-10 | Metropolitan Water Rates and Charges | 2-33 |
| 2-11 | Capacity Charge Detail Calendar Year 2016 | 2-34 |
| 2-12 | Readiness-to-Serve Charge (by Member Agency), Calendar Year 2016 | 2-35 |
| 2-13 | Purchase Order Commitments and Tier 1 Limits (by Member Agency), January 2015-December 2024 | 2-36 |
| 3-1 | Colorado River Aqueduct Program Capabilities Year 2035 | 3-9 |
| 3-2 | California Aqueduct Program Capabilities Year 2035 | 3-18 |
| 3-3 | Central Valley/State Water Project Storage and Transfer Programs Supply Projection Year 2035 | 3-26 |
| 3-4 | School Education Programs | 3-39 |
| 3-5 | Metropolitan's Conservation Credits Program | 3-40 |
| 3-6 | Grant Program Funding | 3-41 |
| 3-7 | Conservation Achievements in Metropolitan's Service Area | 3-42 |
| 3-8 | Existing and Projected Total Effluent Capacity Wastewater Treatment Plants Within Metropolitan's Service Area | 3-47 |
| 3-9 | 2015 Recycled Water Use for Groundwater Replenishment and Seawater Barrier Injection | 3-49 |
| 3-10 | Seawater Desalination Program Project Status | 3-62 |
| 3-11 | Other Potential Seawater Desalination Projects in Metropolitan's Service Area | 3-62 |
| 3-12 | 2015 Recycled Water Use and Groundwater Recovery | 3-63 |
| 3-13 | Local Resources Program | 3-63 |
| 3-14 | Contractual Conjunctive Groundwater Projects | 3-67 |
| 5-1 | Summary of Metropolitan Board of Directors Committee Meetings | 5-2 |
| 5-2 | 2015 Technical Process Member Agency Participation | 5-6 |
| 5-3 | Water Supplier Information Exchange | 5-7 |

## LIST OF TABLES

| Table | | Page |
|---|---|---|
| A.1-1 | MWD-EDM Variables | A.1-2 |
| A.1-2 | Population Growth in Metropolitan's Service Area (July) | A.1-9 |
| A.1-3 | Urban Employment Growth in Metropolitan's Service Area (July) | A.1-9 |
| A.1-4 | Occupied Housing Growth in Metropolitan's Service Area | A.1-10 |
| A.1-5 | Total Retail Demand in Metropolitan's Service Area with Area Conservation and SB X7-7 | A.1-10 |
| A.1-6 | Total Retail Municipal and Industrial Demand in Metropolitan's Service Area with Conservation and SB X7-7 | A.1-11 |
| A.1-7 | Total Retail Agricultural Demand in Metropolitan's Service Area | A.1-11 |
| A.1-8 | Single Family Retail Demand in Metropolitan's Service Area | A.1-12 |
| A.1-9 | Multi-family Retail Demand in Metropolitan's Service Area | A.1-12 |
| A.1-10 | Commercial, Industrial and Institutional Retail Demand in Metropolitan's Service Area | A.1-12 |

## Summary of Compliance

| | |
|---|---|
| ***SB X7-7*** | |
| **Water Code § 10608.36 – Assessment of Measures, Programs, and Policies** | Assess present and proposed future measures, programs, and policies to help achieve water use reduction targets<br>• Metropolitan's actions to help achieve the urban per capita water use reduction pursuant to the goals set forth in SB X7-7 are discussed in Sections 3.4, 3.5, and 3.7. |
| ***Agency Coordination*** | |
| **Water Code § 10620(d)(2) Coordination with Appropriate Agencies** | Describe the coordination of the plan preparation.<br>• See Section 5. |
| **Water Code § 10620(f) - Describe Resource Maximization / Import Minimization Plan** | Discuss how water management tools and options are used to maximize resources and minimize the need to import water.<br>• Metropolitan's planning strategy within the IRP and adaptive implementation approach are discussed in Section 2 and provide an overview of the water management tools and options. See pages 2-1 through 2-9.<br>• Further details are provided in Sections 1.4 (conservation, page 1-23), 3.4 (demand management and conservation, pages 3-30 through 3-45), and 3.5 (recycling, groundwater recovery, and desalination, pages 3-46 through 3-63.) |
| **Water Code § 10621(b) - City and County Notification and Participation** | Notify any city or county within service area of Urban Water Management Plan (UWMP) review & revision at least 60 days before public hearing. May consult with and obtain comments from notified cities and counties.<br>• Notification and participation are discussed in Section 5, pages 5-1 through 5-10, and Appendix 10, DWR Table 10-1. |
| **Water Code § 10621(d) – Plan Submittal to Department of Water Resources (DWR)** | Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016<br>• Submission of the 2015 UWMP by the July 1, 2016 deadline is detailed in Section 5. |
| ***Contents of UWMP*** | |
| **Water Code § 10631(a) - Service Area Information** | Describe service area of supplier<br>• Service area is discussed on Section 1.2, pages 1-6 through 1-10 and shown in Figure 1-1.<br>Include current and projected population<br>• Population is discussed in Section 1.3 and shown in Table 1-1, Figure 1-2, and Figure 1-3.<br>• Population analysis is discussed in Appendix 1, page A.1-4. Projections are on page A.1-9, Table A.1-2.<br>• Current and projected population are shown in Appendix 10, DWR Table 3-1.<br>Population projections must be based on data from state, regional or local service agency projections<br>• See footnote Table A.1-2, page A.1-9.<br>Describe climate characteristics that affect water management<br>• See Section 1.3, pages I-14 through I-16, Figure 1-5, and Table 1-4, and Section 2.6, pages 2-26 through 2-29.<br>Describe other demographic factors affecting water management<br>• See Section 1.3, pages I-13 through 1-14 and Appendix 1. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10631(b) - Water Sources** | Identify existing and planned water supply sources<br>Provide existing and planned water supply quantities<br>• Current supplies and quantities are described in Section 1.4, pages 1-18 through 1-28.<br>• Historic and current water supplies are described in Appendix 2.<br>• Planned water supplies and quantities are discussed in Section 2, and details are provided in Appendix 3, and particularly in Table A.3-7, pages A.3-48 through A.3-60.<br>• See Appendix 10, DWR Table 6-8 and 6-9. |
| **Water Code § 10631(b)(1-4) - If Groundwater Identified as Existing or Planned Source** | • Metropolitan does not supply or plan to supply groundwater. However, Metropolitan does use groundwater basins for groundwater banking.<br>• See Section 3.6 and Appendix 2 (pages A.2-4 through A.2-5) and Appendix 3 (pages A.3-43 through A.3-46) for discussions of issues related to groundwater basins.<br>• See Section 4 for salinity issues related to groundwater basins. |
| **Water Code § 10631(c)(1) - Reliability of Supply** | Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage<br>• Section 2.3, pages 2-13 through 2-17 and the discussions presented under the Colorado River Aqueduct (CRA) and State Water Project (SWP), Sections 3.1 and 3.2.<br>Provide data for an average water year, single-dry water year, and multiple-dry water years<br>• Section 2, Tables 2-4 through 2-6, pages 2-15 through 2-17.<br>• See Appendix 10, DWR Table 7-1. |
| **Water Code § 10631(c)(2) - Water Sources Not Available on a Consistent Basis** | Describe plans to supplement or replace inconsistent sources with alternative sources or water Demand Management Measures (DMMs)<br>• For discussion of Metropolitan's recent and near-term drought response actions, see Section 1.4, pages 1-22 through 1-28.<br>• For a discussion on water DMMs, see Section 2.1, pages 2-2 through 2-5, and Section 3.4, pages 3-30 through 3-45.<br>• For discussion on how Metropolitan plans to meet Southern California's water supply needs in the future and supplement or replace inconsistent sources, see Sections 2 and 3. |
| **Water Code § 10631(d) - Transfer or Exchange Opportunities** | Describe short term and long term exchange or transfer opportunities<br>• Section 1.4 (augmenting water supplies), pages 1-24 through 1-26.<br>• Section 3.1 (pages 3-2 through 3-9) describes plans for banking, exchange and transfer opportunities along the Colorado River and Aqueduct.<br>• Section 3.2 (pages 3-10 through 3-23) describes plans for banking, exchange and transfer opportunities within the State Water Project.<br>• Section 3.3 (pages 3-24 through 3-29) describes plans for banking, exchange and transfer opportunities within the Central Valley/State Water Project.<br>• Section 3.6 (pages 3-64 through 3-67) describes plans for banking, exchange and transfer opportunities within the local region.<br>• Further details are provided in Appendix 3, particularly Table A.3-7 on pages A.3-48 through A.3-60. |

## Summary of Compliance

| | |
|---|---|
| **Water Code §§ 10631(e)(1) and (2) - Past, Current, and Projected Water Use** | Quantify past, current, and projected water use by sector in five-year increments<br>• See Section 1.3, page 1-14 and Figure 1-4 for historical retail water demands.<br>• Past, current, and future water uses are shown in Appendix 1, Table A.1-13 on page A.1-13. Water uses by sector and county are shown in Tables A.1-6 through A.1-11 on pages A.1-11 through A.1-13. Water demands by sector are shown in DWR Tables 4-1, 4-2, and 4- 3, on pages A.10-3 and A.10-4.<br>Identify and quantify sales to other agencies<br>• See Section 1.3, page 1-13 and Figure 1-4 for historical retail water demands.<br>• Historic sales are presented in Table A.2-2 on page A.2-3.<br>• Metropolitan does not project sales by individual agency. However, total projected sales/demands to other agencies are shown in Section 2.2, pages 2-6 through 2-12. |
| **Water Code §§ 10631(e)(1)(J), (e)(3)(A)&(B) – Distribution System Water Loss** | Quantify distribution system water loss for most recent 12-month period available<br>• Section 2.6, page 2-26, Appendix 7, Table A.7-1, and Appendix 10 (DWR Table 4-4). |
| **Water Code § 10631(e)(4)(A) and (B) – Water Savings Estimate** | Water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans<br>Provide citations to the codes, standards, ordinances, or transportation and land use plans used to make projections<br>Indicate extent that water use projections consider savings from codes, standards, ordinances, or transportation and land use plans.<br>• See discussion on estimating demands and code based conservation in Section 2, page 2-6 and Appendix 6. |
| **Water Code §§ 10631(f)(2), 10631(i) – Description of Supplier's Water Demand Management Measures, Distribution System Asset Management, Assistance Programs; Option for CUWCC Members** | Provide narrative description of items in §10631(f)(1)(B)(ii), (iv), (vi), and (vii), distribution system asset management, and wholesale supplier assistance programs<br>• See discussion on metering, Section 3.4, page 3-37.<br>• See discussion on public education and outreach, Section 3.4, pages 3-32 through 3-35.<br>• See discussion on water conservation programs, Section 3.4, pages 3-35 through 3-37.<br>CUWCC members deemed to be in compliance with Water Code §10631(f) by complying with Dec. 10, 2008 MOU and submitting annual reports required by Section 6.2 of that MOU<br>• See CUWCC filings in Appendix 8.<br>• See discussion on demand management and conservation, Section 3.4, pages 3-30 through 3-42.<br>• See discussion on distribution system asset management, Section 3.4, pages 3-43 through 3-45.<br>• See discussion on assistance programs to retail water agencies (rebate programs, public education and outreach, and other efforts to reduce water demand), Section 3.4, pages 3-32 through 3-42. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10631(g) - Planned Water Supply Projects and Programs** | Detailed description of expected future supply projects & programs to meet projected water use<br>Timeline for each proposed project or program<br>Quantification of each projects average yield (AFY)<br>Quantification of each projects single dry-year yield (AFY)<br>Quantification of each projects multiple dry-year yield (AFY)<br>• Section 3.1 (pages 3-2 through 3-9) describes plans for banking, exchange and transfer opportunities along the Colorado River and Aqueduct.<br>• Section 3.2 (pages 3-10 through 3-23) describes plans for banking, exchange and transfer opportunities within the State Water Project.<br>• Section 3.3 (pages 3-24 through 3-29) describes plans for banking, exchange and transfer opportunities within the Central Valley/State Water Project.<br>• Section 3.6 (pages 3-64 through 3-67) describes plans for banking, exchange and transfer opportunities within the local region.<br>• Further details are provided in Appendix 3, particularly Table A.3-7 on pages A.3-48 through A.3-60.<br>• See Appendix 10, DWR Table 6-7. |
| **Water Code § 10631(h) - Opportunities for Development of Desalinated Water** | Describe opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply<br>• See discussion on groundwater recovery and seawater desalination in Section 1.4, pages 1-20 through 1-22, and Section 3.5, pages 3-46 through 3-63.<br>• See Appendix 5, Table A.5-2 on pages A.5-9 through A.5-11 for a list of existing and conceptual groundwater recovery projects and their ultimate yield/capacity.<br>• See Appendix 5, Table A.5-3 on page A.5-12 for a list of conceptual, planned, and under construction seawater desalination projects. |
| ***Determination of Demand Management Measures Implementation*** | |
| **Water Code § 10631(i) - Members of CUWCC Deemed in Compliance with §10631(f)** | CUWCC members must comply with MOU re Urban Water Conservation in California (Dec. 10, 2008) and submit required annual reports<br>• Metropolitan is a CUWCC member.<br>• 2011-2014 BMP annual updates are included in Appendix 8.<br>• See discussion in Section 3.4. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10631(j) – If Supplier Receives or Projects Receiving Water from a Wholesale Supplier** | Urban water suppliers that rely on wholesale agency for water source must provide wholesale agency with water use projections in 5-year increments to 20 years or as far as data is available. Wholesaler to provide existing and planned water supply availability projections, by source, and planned water supply quantities to member agencies<br>• See discussions on Metropolitan and member agency coordination for the IRP Process in Sections 2 and 5.<br>• See Appendix 3, Table A.3-7, and Appendix 10, DWR Table 2-4. |
| **Water Code § 10631.1 - Projected Water Use for Low-Income Housing** | Water use projections for single-family and multi-family residential housing for lower income household<br>• This is incorporated with the retail demand forecast, as reflected in Section 2 and Appendix 1. |
| **Water Code § 10631.2 – Voluntary Calculation or Estimation of Energy Intensity of Urban Water Systems** | May include any of the following: estimated amount of energy for extraction or diversion (from sources), conveyance, treatment, distribution, and storage of water, and any other appropriate energy-related information<br>• Estimate of the amount of energy used and energy intensity is presented in Appendix 9.<br>• See Section 3.8 for discussion of Metropolitan's Energy Management Initiative. |
| ***Water Shortage Contingency Plan*** | |
| **Water Code § 10632 - Water Shortage Contingency Analysis of Elements within Water Supplier's Authority**<br>**Water Code § 10632(a)(1) - Stages of Action** | Provide stages of action in response to water supply shortages<br>Provide the water supply conditions for each stage<br>Includes plan for up to 50 percent reduction in water supply<br>• Documentation of the stages of action Metropolitan would undertake to address up to 50 percent reduction in its water supplies and a catastrophic interruption in water supplies is included in its Water Surplus and Drought Management (Section 2.4) and Water Supply Allocation Plans (Section 2.4 and Appendix 4), in the discussion of the implementation of its Water Supply Allocation Plan in Section 1.4, page 1-26, in the discussion of its Water Shortage Contingency Analysis in Section 2.4, pages 2-18 through 2-23, in the discussion of its Water Supply Condition Framework in Section 2.4, pages 2-20 through 2-21, and in the discussion of its Emergency Storage Requirement developed under its catastrophic supply interruption plan in Section 2.5, page 2-24.<br>• See Appendix 10, DWR Table 8-1, |
| **Water Code § 10632(a)(2) - Three-Year Minimum Water Supply** | Identify driest 3-year historic sequence<br>Estimated minimum water supply available for each of the next three years<br>• Metropolitan has projected its supply capabilities for each of the next three years 2016 through 2018 under a multiple dry year hydrology (based on a repeat of 1990-1992 hydrology, which represents the three years of shortest supplies). See Section 1.4, page 1-28, Table 1-7 on page 1-28, and Appendix 10, DWR Table 8-4. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10632(a)(3) - Preparation for Catastrophic Water Supply Interruption** | Actions to prepare for and implement during catastrophic water supply interruption<br>Provide catastrophic supply interruption plan and summarize<br>Emergency Response Plan<br>Regional power outage<br>Earthquake<br>Delta levee failure<br>Aqueduct failure<br>• See Sections 2.5 and 2.6, pages 2-24 through 2-29. |
| **Water Code § 10632(a)(4) - Prohibitions on End Users** | List the mandatory prohibitions against specific water use practices during water shortages (i.e., prohibiting use of potable water for street cleaning)<br>• Not applicable to Metropolitan because prohibitions against specific water use practices are enforced on end users and are not within Metropolitan's authority as a wholesaler. |
| **Water Code § 10632(a)(5) - Consumption Reduction Methods** | List the consumption reduction methods the water supplier will use to reduce water use in the most restrictive stages with up to a 50 percent reduction in water supply.<br>• See Section 1.4, pages 1-22 through 1-28, for a description of Metropolitan's recent and near-term drought response actions.<br>• Section 2.4 for Metropolitan's Water Surplus and Drought Management Plan<br>• Section 2.4 and Appendix 4 for Water Supply Allocation Plan.<br>• See Section 3.4 for a description of Metropolitan's demand management through conservation. |
| **Water Code § 10632(a)(6) - Penalties or Charges** | List penalties or charges for excessive use, where applicable<br>• Not applicable to Metropolitan because enforcing penalties or charges for excessive use by end users is not within Metropolitan's authority as a wholesaler. However, Metropolitan's WSDM Plan and WSAP are described in Section 2.4.<br>• Metropolitan's WSAP is attached in Appendix 4. |
| **Water Code § 10632(a)(7) - Revenue and Expenditure Impacts** | Describe how actions and conditions impact revenues and expenditures<br>Describe proposed measures to overcome the revenue and expenditure impacts, such as development of reserves and rate adjustments<br>• See Section 2.7, pages 2-30 through 2-36, and Appendix 4. |
| **Water Code § 10632(a)(8) - Water Shortage Contingency Resolution or Ordinance** | Attach a copy of the draft water shortage contingency resolution or ordinance.<br>• Not applicable to Metropolitan. The WSDM Plan, Water Supply Condition Framework, and WSAP adopted to deal with water shortages are discussed in Section 2.4, pages 2-18 through 2-23. The WSAP is also included as Appendix 4. |
| **Water Code § 10632(a)(9) - Water Use Reduction Measuring Mechanism** | Provide mechanisms for determining actual reductions in water use<br>• Metropolitan's water sales are metered. See Section 3.4. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10632(b) – Water Features** | Analyze and define water features artificially supplied with water separately from swimming pools and spas when developing water shortage contingency analysis<br>• Not applicable to Metropolitan because prohibitions against specific water use practices are enforced on end users and are not within Metropolitan's authority as a wholesaler. |
| ***Recycled Water Plan*** | |
| **Water Code § 10633 - Recycled Water as Potential Water Source; Agency Coordination** | Provide information, to the extent available, on recycled water and its potential as a water source in the supplier's service area.<br>Coordinate plan preparation with local water, wastewater, groundwater, and planning agencies within supplier's service area.<br>• See Section 1.4, pages 1-20 through 1-26, Section 3.5, pages 3-46 through 3-63, Tables 3-12 and 3-13 on page 3-63, Appendix 2, pages A.2-8 through A.2-9, and Appendix 5, Table A.5-1.<br>• Coordination of the plan preparation is discussed in Section 5. |
| **Water Code § 10633(a) - Wastewater System Description** | Describe the wastewater collection and treatment systems in the supplier's service area<br>Quantify the volume of wastewater collected and treated<br>• Not applicable to Metropolitan because it does not collect or treat the wastewater generated within its service area. Instead, Metropolitan provides a general narrative description of the wastewater collection and treatment systems operated by others in its service area.<br>• See Section 3.5, pages 3-46 through 3-63, Table 3-8 on page 3-47, Tables 3-12 and 3-13 on page 3-63, Appendix 2, pages A.2-8 through A.2-9, and Appendix 5, Table A.5-1. |
| **Water Code § 10633(a) through (d) - Wastewater Disposal and Recycled Water Uses** | Describes methods of wastewater disposal in the supplier's service area<br>• Not applicable to Metropolitan because it does not dispose of wastewater within its service area. Instead, Metropolitan provides a general narrative description of the use of recycled water by others in its service area, including potential uses and the technical and economic feasibility of serving the potential uses of recycled water<br>• See Section 3.5, pages 3-46 through 3-63, Section 4, page 4-6, Appendix 2, pages A.2-8 through A.2-9, and Table A.5-1. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10633(e) - Projected Uses of Recycled Water** | Projected use of recycled water in service area<br>• See Section 2, Tables 2-1 through Table 2-3, pages 2-10 through 2-12 and Section 3.5.<br>Compare UWMP 2010 projections with UWMP 2015 actual use of recycled water<br>• The 2010 RUWMP, Tables 2-6, 2-7, and 2-8 included the following projections for recycled water use in 2015: 408 TAF for a single dry year; 400 TAF for a multiple dry year; and 404 TAF for an average year. In 2015, actual recycled water use is estimated at 414 TAF, as discussed in Table 3-12 on page 3-63 and Appendix 2, page A.2-8 of this 2015 UWMP.<br>• See Appendix 10, DWR Table 6-5. |
| **Water Code §§ 10633(f), (g) – Actions to Encourage Use of Recycled Water**<br>**Plan to Optimize Use of Recycled Water** | Describe actions, including financial incentives, that might be taken to encourage recycled water uses<br>Describe projected results of these actions in terms of acre-feet of recycled water used per year<br>Provide a plan to optimize the use of recycled water in the supplier's service area<br>• Metropolitan provides a general narrative description of the actions it takes to encourage recycled water uses in its service area<br>• See Section 1.4, pages 1-20 through 1-22, 1-24, Table 1-6, Section 3.5, pages 3-46 through 3-63, Tables 3-12 and 3-13 on page 3-63, and Appendix 5, Table A.5-1. |
| ***Water Quality Impacts on Reliability*** | |
| **Water Code § 10631(c)(2) - Water Sources Not Available at a Consistent Level of Use** | Discuss plans to supplement or replace with alternative sources or DMMs any water source that may not be available at a consistent level of use given specific water quality factors<br>• See Section 2.1, pages 2-2 through 2-5, and Section 3.4, pages 3-30 through 3-45, for water DMMs.<br>• See Section 3.2, SWP Water Quality, pages 3-18 through 3-19, 3-23.<br>• See Section 4, Water Quality, pages 4-1 through 4-17. |
| **Water Code § 10634 - Water quality impacts on availability of supply** | Discuss water quality impacts by source upon water management strategies and supply reliability<br>• See Section 3.2, SWP Water Quality, pages 3-18 through 3-19, 3-23.<br>• See Section 4, Water Quality, pages 4-1 through 4-17. |
| ***Water Service Reliability*** | |
| **Water Code § 10635(a) - Supply and Demand Comparison: Normal Water Year** | Compare the projected normal water supply to projected normal water use over the next 20 years, in 5-year increments.<br>• For projected water use, see Section 2, Table 2-3, page 2-12.<br>• For projected water supply, see Table 2-6, page 2-17 and Table A.3-7 in Appendix 3, pages A.3-48 through A.3-60, and Appendix 10, DWR Table 7-2. |
| **Water Code § 10635(a) - Supply and Demand Comparison: Single-Dry Year Scenario** | Compare the projected single-dry year water supply to projected single-dry year water use over the next 20 years, in 5-year increments.<br>• For projected water use, see Section 2, Table 2-1, page 2-10.<br>• For projected water supply, see Table 2-4, page 2-15 and Table A.3-7 in Appendix 3, pages A.3-48 through A.3-60, and Appendix 10, DWR Table 7-3. |

## Summary of Compliance

| | |
|---|---|
| **Water Code § 10635(a) - Supply and Demand Comparison: Multiple-dry Year Scenario** | Project a multiple-dry year period occurring between 2015-2020 and compare projected supply and demand during those years<br>Project a multiple-dry year period occurring between 2021-2025 and compare projected supply and demand during those years<br>Project a multiple-dry year period occurring between 2026-2030 and compare projected supply and demand during those years<br>Project a multiple-dry year period occurring between 2031-2035 and compare projected supply and demand during those years<br>• Metropolitan has projected multiple dry year periods for years ending in "0" or "5". Its planning for multiple dry years is based on the three years of shortest supplies (1990-1992 hydrology). The results presented in Section 2 for multiple dry years are for an average of three years with this extreme hydrology.<br>• For projected water use, see Section 2, Table 2-2, page 2-11.<br>• For projected water supply, see Table 2-5, page 2-16 and Table A.3-7 in Appendix 3, pages A.3-48 through A.3-60.<br>• See Appendix 10, DWR Table 7-4. |
| **Water Code § 10635(b) – Plan Submittal to Cities and Counties** | Supplier to provide portion of plan on water service reliability to cities and counties within its service area no later than 60 days after plan submittal.<br>• Provision of Plan to cities and counties is described in Section 5. |
| **Water Code § 10641 – Consultations with public agency, state agency or experts** | Supplier may consult with and obtain comments from any public agency, state agency, or any person with special expertise as to water demand management methods and techniques<br>• Stakeholder, state agency, public agency, and expert participation, consultation, outreach, comments, and notification are described in Section 5. |
| **Water Code § 10642 – Public Hearing; Notice; Adoption** | Encourage involvement of diverse social, cultural & economic community groups prior to and during plan preparation<br>• See Section 5, pages 5-1 through 5-11.<br>Prior to adoption, plan available for public inspection and hold public hearing<br>• See Section 5, pages 5-5 and 5-11.<br>Provide proof of public hearing and notice<br>• See Section 5, page 5-10.<br>Provide meeting notice to any city or county in service area<br>• See Section 5, page 5-9, and Appendix 10, DWR Table 10-1.<br>After hearing, plan adopted as prepared or as modified after hearing.<br>• See Section 5, page 5-11. |

## Summary of Compliance

| | |
|---|---|
| **Water Code §§ 10615, 10643 – Plan Implementation** | Include in plan strategy and time schedule for implementation<br>Implement plan in accordance with the schedule set forth in the plan<br>• Metropolitan has conducted a review of its planning progress through the 2015 IRP Update, discussed in Section 2. In addition, in each section, Metropolitan has included an "Achievement to Date" that discusses progress towards its planning goals, and discusses current issues and potential problems with continued implementation of the plan.<br>• Section 3 summarizes the implementation plan and continued progress in developing a diversified resource mix consistent with the IRP to meet the region's water supply needs<br>DMM Programs<br>• Metropolitan is a member of CUWCC, and has submitted its recent BMP reports to the CUWCC to comply with the UWMP requirements. In addition, Metropolitan has discussed its conservation plan and approach in Section 3.4. Individual conservation programs are discussed on pages 3-30 through 3-42. |
| **Water Code § 10644(a)(1) –Plan Submittal** | Submit to DWR, the California State Library, and any city or county within service area copy of plan no later than 30 days after adoption.<br>• Plan submission is described in Section 5. |
| **Water Code § 10644(a)(2) – Plan shall include any Standardized Forms, Tables, or Displays specified by DWR** | Submit plan electronically<br>Include in plan DWR standardized forms, tables, or displays<br>• Plan submission is described in Section 5.<br>• DWR standardized tables for wholesale urban water agencies are completed and presented in Appendix 10. |
| **Water Code § 10645 – Plan Available for Public Review** | No later than 30 days after plan submittal, the supplier and DWR to make the plan available for public review during normal business hours.<br>• Posting of Plan on Metropolitan's website for public review is described in Section 5. |

This page intentionally left blank.

# Executive Summary

Metropolitan's 2015 Urban Water Management Plan (UWMP) has been prepared in compliance with Water Code Section 10608.36 of SB X7-7, which was enacted in 2009, and Sections 10610 through 10656 of the Urban Water Management Planning Act (Act), which were added by Statute 1983, Chapter 1009, and became effective on January 1, 1984. This Act requires that every urban water supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually prepare and adopt, in accordance with prescribed requirements, an urban water management plan.

The Act requires urban water suppliers to describe and evaluate sources of water supply, efficient uses of water, demand management measures, implementation strategy and schedule, and other relevant information and programs. Urban water suppliers are required by the Act to update their UWMP and submit a complete plan to the California Department of Water Resources (DWR) every five years. An UWMP is required in order for a water supplier to be eligible for DWR administered state grants and loans and drought assistance.

As with Metropolitan's previous plans, the 2015 UWMP does not explicitly discuss specific activities undertaken by its member agencies unless they relate to one of Metropolitan's water demand or supply management programs. Presumably, each member agency will discuss these activities in its UWMP.

The information included in the 2015 UWMP represents the most current and available planning projections of supply capability and demand developed through a collaborative process with the member agencies. Metropolitan's Board recently adopted the 2015 Integrated Water Resources Plan, Water Tomorrow (2015 IRP Update), which represents Metropolitan's comprehensive planning process and will serve as Metropolitan's blueprint for long-term water reliability, including key supply development and water use efficiency goals.

## Factors Considered

The Act requires reporting agencies to describe their water reliability under a single dry-year, multiple dry-year, and average year conditions, with projected information in five-year increments for 20 years. The factors used to evaluate Metropolitan's supply and demand balance for the 2015 UWMP are presented below. Some of the considerations and resulting projections may change as Metropolitan's planning progresses. These changes may be reflected in future updates of the UWMP.

### *Demand Projections*

Within Metropolitan's service area, retail water demands can be met with local supplies or imported supplies. Metropolitan's supply reliability evaluation focuses on the future demands for Metropolitan's imported supplies. The expected firm demand on Metropolitan is the difference between total demands, adjusted for conservation, and projected total local supplies. Thus, in order to project the regional need for imported water, Metropolitan starts with a projection of total demand including retail Municipal and Industrial (M&I), retail agricultural,

seawater barrier, and replenishment demands, determines the adjustments from total conservation, and subtracts the total local supplies that are available to meet a portion of those demands.

### *Total Demands*

Metropolitan updates its retail M&I projection periodically based on the release of official regional demographic and economic projections. The projections of retail M&I water demands used in the 2015 UWMP are based on data from the following reports:

- Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan/Sustainable Community Strategy (April 2012)
- San Diego Association of Governments (SANDAG) Series 13: 2050 Regional Growth Forecast (October 2013)

The SCAG and SANDAG regional growth forecasts are the core assumptions that drive the estimating equations of the retail demand forecasting in Metropolitan's Econometric Demand Model (MWD-EDM). SCAG's and SANDAG's projections undergo extensive local review, incorporate zoning information from city and county general plans, and are supported by Environmental Impact Reports.

Retail agricultural demands consist of water use for irrigating crops. Metropolitan's member agencies estimate agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Each member agency estimates its agricultural demands differently, depending on availability of information. Metropolitan relies on member agencies' estimates of agricultural demands for the 2015 UWMP.

Metropolitan also includes in its assessment of total demands the local groundwater requirements for seawater barrier and groundwater basin replenishment. Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Replenishment demands represent the amount of water that member agencies plan to use to replenish the groundwater basins as available. Metropolitan relies on member and groundwater management agencies' projections for these demands.

### *Total Conservation*

Projected regional water demand is adjusted to account for water conserved by Best Management Practices from active, code-based, and price-effect conservation. Active conservation levels are derived by calculating water savings from all active program device-based savings installed to date. Code-based conservation levels are derived by calculating water savings from devices covered by existing water conservation ordinances and plumbing codes, including the state Model Water Efficient Landscape Ordinance, with replacement and new construction rates driven by demographic growth consistent with SCAG and SANDAG land use and transportation plans used to derive retail demand. Price-effect conservation is derived by calculating water savings by retail customers attributable to the effect of changes in the real (inflation adjusted) price of water.

Water use reduction under Senate Bill 7 (SB X7-7) (see description below) is factored into local water supplies. This has been done to recognize the fact that one method of compliance with SB X7-7 is the development of recycled water in addition to conservation.

### *Total Local Supplies*

Projections of local supplies are based on information gathered from a number of sources including past urban water management plans, Metropolitan's annual local production surveys, and communications between Metropolitan and member agency staff. The projections include groundwater and surface water production, recycled water and recovery of contaminated or degraded groundwater (funded under the Metropolitan's Local Resources Program, as well as local agency funded programs), and seawater desalination. The local supply projections presented in demand tables for the 2015 UWMP include existing projects that are currently producing water, projects that are under construction, and Metropolitan's IRP local supply targets included as programs under development.

The total local supplies presented in the 2015 UWMP also include Los Angeles Aqueduct deliveries and non-Metropolitan water supplies imported by or exchanged with member agencies from sources outside of Metropolitan's service area.

## *Water Use Reduction Achievement in 2015*

On November 10, 2009, the state Legislature passed Senate Bill 7 as part of the Seventh Extraordinary Session, referred to as SB X7-7 or the Water Conservation Act of 2009. This law is the water conservation component to the historic Delta legislative package, and seeks to achieve a 20 percent statewide reduction in urban per capita water use in California by December 31, 2020. According to Water Code § 10608.36, wholesale agencies are required to include in their UWMPs an assessment of present and proposed future measures, programs, and policies that would help achieve the water use reductions required under SB X7-7. Urban wholesale water suppliers are not required to comply with the target-setting and reporting requirements of SB X7-7.

As a wholesale water agency, Metropolitan is not required to establish or report on an urban water use reduction target. However, Metropolitan's regional conservation programs are designed to assist member agencies and retail water suppliers in the service area to comply with SB X7-7. Therefore, Metropolitan monitors the progress of its service area. Also, in compliance with SB X7-7, Metropolitan assesses its actions, programs, and policies to help achieve the water use reductions required by SB X7-7.

Based on an analysis of population, demand, and the methodologies for setting targets described in the legislation, Metropolitan's baseline is 181 GPCD and the 2020 reduction target is 145 GPCD. From 2011-2014, there was a slight increase in per capita water use explained in part by continued economic recovery and drier weather as compared to previous years. With mandatory restrictions from the state, Water Supply Allocation from Metropolitan and retail water suppliers, the 2015 gallons per capita per day (GPCD) is 131, a 28 percent reduction from the baseline.

Over the next five years, Metropolitan will periodically assess water supply conditions and trends in per capita demand within its service area and evaluate potential programs to ensure attainment of the goal. Metropolitan also continues to provide support for retail agency efforts through technical assistance, legislation, code and standards updates, and potential financial incentives where needed for market transformation to increase water use efficiency.

## *Supply Capabilities*

The 2015 UWMP reports on Metropolitan's water reliability and identifies projected supplies to meet the long-term demand within its service area. Metropolitan's supply capabilities are evaluated using the following assumptions:

### *Hydrologic Conditions and Reporting Period*

The 2015 UWMP presents Metropolitan's supply capabilities from 2020 through 2040 under the three hydrologic conditions specified in the Act: single dry-year (represented by a repeat of 1977 hydrology), multiple dry-year (represented by a repeat of 1990 to 1992 hydrologies), and average year (represented by the average of 1922 to 2012 hydrologies).

### *Colorado River Aqueduct Supplies*

Colorado River Aqueduct (CRA) supplies include supplies that would result from existing and committed programs and from implementation of the Quantification Settlement Agreement (QSA) and related agreements. The QSA establishes the baseline water use for each of the agreement parties and facilitates the transfer of water from agricultural agencies to urban uses. A detailed discussion of the QSA is included in Section 3. Colorado River Water Management Programs are potentially available to supply additional water up to the CRA capacity of 1.2 MAF on an as-needed basis.

### *State Water Project Supplies*

State Water Project (SWP) supplies are estimated using the 2015 SWP Delivery Capability Report distributed by DWR in July 2015. The 2015 Delivery Capability Report presents the current DWR estimate of the amount of water deliveries for current (2015) conditions and conditions 20 years in the future. These estimates incorporate restrictions on SWP and Central Valley Project (CVP) operations in accordance with the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on December 15, 2008, and June 4, 2009, respectively. Under the 2015 Delivery Capability Report with existing conveyance and low outflow requirements scenario, the delivery estimates for the SWP for 2020 conditions as percentage of Table A amounts are 12 percent, equivalent to 257 TAF for Metropolitan, under a single dry-year (1977) condition and 51 percent, equivalent to 976 TAF for Metropolitan, under the long-term average condition.

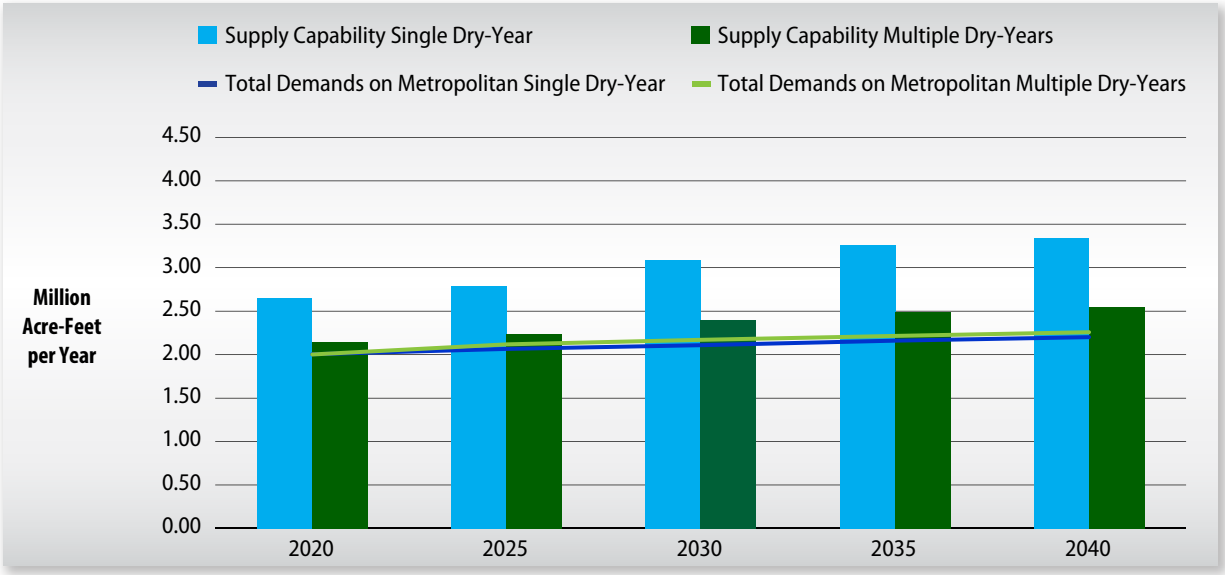
In dry, below-normal conditions, Metropolitan has increased the supplies received from the California Aqueduct by developing flexible Central Valley/SWP storage and transfer programs. Over the last two years under the pumping restrictions of the SWP, Metropolitan has worked collaboratively with the other contractors to develop numerous voluntary Central Valley/SWP storage and transfer programs. The goal of these storage/transfer programs is to develop additional dry-year supplies that can be conveyed through the California Aqueduct during dry hydrologic conditions and regulatory restrictions.

### *Storage*

A key component of Metropolitan's water supply capability is the amount of water in Metropolitan's storage facilities. Storage is a major component of Metropolitan's dry-year resource management strategy. Metropolitan's likelihood of having adequate supply capability to meet projected demands, without implementing the Water Supply Allocation Plan, is dependent on its storage resources.

In developing the supply capabilities for the 2015 UWMP, Metropolitan assumed the current (2015) storage levels at the start of simulation and used the median storage levels going into each of the five-year increments based on the balances of supplies and demands. Under the median storage condition, there is an estimated 50 percent probability that storage levels would be higher than the assumption used, and a 50 percent probability that storage levels would be lower than the assumption used. All storage capability figures shown in the 2015 UWMP reflect actual storage program conveyance constraints. It is important to note that

under some conditions, Metropolitan may choose to implement the WSAP in order to preserve storage reserves for a future year, instead of using the full supply capability. This can result in impacts at the retail level even under conditions where there may be adequate supply capabilities to meet demands.



### *Findings of the 2015 Urban Water Management Plan*

The 2015 UWMP provides a comprehensive summary of Metropolitan's demand and supply outlook through 2040. As a reporting document, the UWMP will be updated every five years to reflect changes in water demand and supply projections.

The 2015 UWMP satisfies all the reporting requirements mandated by the Act. The key reporting points of this 2015 UWMP are as follows:

- Metropolitan has supply capabilities that would be sufficient to meet expected demands from 2020 through 2040 under single dry-year and multiple dry-year hydrologic conditions, as presented in Figure ES-1, as well as average year hydrologic conditions.
- Metropolitan has comprehensive plans for stages of actions it would undertake to address up to a 50 percent reduction in its water supplies and a catastrophic interruption in water supplies through its Water Surplus and Drought Management and Water Supply Allocation Plans. Metropolitan also developed an Emergency Storage Requirement to mitigate against potential interruption in water supplies resulting from catastrophic occurrences within the Southern California region, including seismic events along the San Andreas fault. In addition, Metropolitan is working with the State on the Delta Risk Management Strategy to reduce the impacts of a seismic event in the Delta that would cause levee failure and disruption of SWP deliveries.
- Metropolitan will continue investments in water use efficiency measures to help the region achieve the 20 percent per person potable water use reduction by 2020.
- Metropolitan has plans for supply implementation and continued development of a diversified resource portfolio including programs in the CRA, SWP, Central Valley storage and transfers programs, local resource projects, and in-region storage that enables the region to meet its water supply needs.
- Metropolitan has a collaborative process for its planning initiatives, including the preparation of the 2015 UWMP.

## Figure ES -1 Supply Capabilities under Single Dry-Year and Multiple Dry-Year Hydrologies

Note:

1. Supply capabilities are derived using the simulated median storage level going into each of five-year increments based on the balances of supplies and demands. Under the median storage condition, there is an estimated 50 percent probability that storage levels would be higher than the assumption used, and a 50 percent probability that storage levels would be lower than the assumption used.
2. Under some conditions, Metropolitan may choose to implement the WSAP in order to preserve storage reserves for a future year, instead of using the full supply capability. This can result in impacts at the retail level even under conditions where there may be adequate supply capabilities to meet firm demands.
3. All storage capability figures shown in the 2015 UWMP reflect actual storage program conveyance constraints.

# Introduction 1

## 1.1 Introduction to this Document and the Agency

### *Organization of this Document*

This report complies with the Urban Water Management Planning Act of 1984 (Act). In addition to complying with the Act, this report details Metropolitan's current situation and how it will meet the challenges of the future. This document contains five sections. The first section is the Introduction that defines Metropolitan in terms of governance, structure, and current water supply status. This section also briefly outlines how Metropolitan will meet current and future challenges. The second section describes Metropolitan's planning activities and explains how the agency will manage the region's water resources to ensure a reliable water supply for the region. The third section describes the actions Metropolitan has taken to implement the plans outlined in Section 2 and lists future programs and activities. The fourth section addresses the issue of water quality and steps taken to deliver high-quality water to Metropolitan's service area. The last section details the public outreach component integrated with Metropolitan's planning processes. Appendices that include supporting documents for this report are at the conclusion of this report. The sections are further described in detail below:

#### *Section 1 - Introduction*

In addition to demonstrating how this report complies with the Act, the 2015 Urban Water Management Plan (UWMP) details Metropolitan's current situation and outlines its plan for meeting the challenges of the future. The Introduction section includes:

- Discussion of the Act and Metropolitan's reporting responsibilities under the Act;
- Introduction to Metropolitan and description of its formation, purpose, service area, member agencies, and governance;
- Historical and demographic information on Metropolitan's service area;
- Discussion of Metropolitan's current condition, challenges, and resource planning strategies; and
- Evaluation of Metropolitan's supply capabilities for the next three years under a multiple dry-year scenario.

#### *Section 2 - Planning for the Future*

The Planning for the Future section discusses how Metropolitan plans to meet Southern California's water needs in the future. The section highlights the importance of Integrated Water Resources Planning by summarizing Metropolitan's planning processes over the years and emphasizes the need for Metropolitan to implement adaptive planning strategies that will prepare the region to deal with uncertainties. This section also includes:

- Evaluation of regional water demand under single dry-year, multiple dry-year, and average year conditions for years 2020 through 2040;

- Evaluation of supply capabilities under single dry-year, multiple dry-year, and average year conditions for years 2020 through 2040;
- Discussion of water shortage contingency analysis though the Water Surplus and Drought Management Plan and the Water Supply Allocation Plan;
- Discussion of other supply reliability risks including climate change; and
- Discussion of the different elements of Metropolitan's rate structure and revenue management.

### *Section 3 – Implementing the Plan*

The Implementing the Plan section summarizes Metropolitan's progress in developing a diversified resource mix that enables the region to meet its water supply needs. The investments that Metropolitan has made and its continuing efforts in many different areas coalesce toward its goal of long-term supply reliability for the region. This section includes:

- Discussion of resources and program development for the CRA, SWP, Central Valley/SWP storage and transfers programs, conservation, local resources program (groundwater recovery, recycling, desalination), and groundwater; and
- Discussion of Metropolitan's measures, programs, and policies to help meet the SB X7-7 goal of 20 percent water use reduction by 2020 and the region's progress in meeting this target.

### *Section 4 - Water Quality*

The Water Quality section identifies key regional water quality issues and discusses the protection of the quality of source water and development of water management programs that maintain and enhance water quality. This section also includes:

- Discussion of water quality issues of concern, constituents of emerging concern, and water quality programs that Metropolitan has undertaken to protect its water supplies.

### *Section 5 – Coordination and Public Outreach*

The Coordination and Public Outreach section presents the processes undertaken in the development of the 2015 IRP Update and 2015 UWMP with the public and other stakeholders. It provides a list of all meetings and workshops conducted to promote and achieve consensus and collaborative planning. Included in this section are the public notification letters and announcements distributed by Metropolitan as required by the Act and a copy of the Metropolitan resolution adopting and approving the 2015 UWMP for submittal to DWR.

### *Appendices*

The appendices provide detailed background on the information presented in the 2015 UWMP.

Appendix 1 - Demand Forecast

Appendix 2 - Existing Regional Water Supplies

Appendix 3 - Justifications for Supply Projections

Appendix 4 - Water Supply Allocation Plan

Appendix 5 - Local Projects

Appendix 6 - Conservation Estimates and Water Savings from Codes, Standards, and Ordinances

Appendix 7 - Distribution System Water Losses

Appendix 8 - Recent CUWCC Filings

Appendix 9 - Metropolitan's Energy Intensity Calculations, Including Conveyance and Distribution Generation

Appendix 10 - DWR's Standardized Tables

### *Urban Water Management Planning Act*

This report has been prepared in compliance with Water Code Sections 10610 through 10656 of the Urban Water Management Planning Act (Act), which were added by Statute 1983, Chapter 1009, and became effective on January 1, 1984. This Act requires that "*every urban water supplier shall prepare and adopt an urban water management plan*" (Water Code § 10620(a)). An "urban water supplier" is defined as a supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually (Water Code § 10617). These plans must be filed with the California Department of Water Resources (DWR) every five years. However, the 2015 plans must be submitted to DWR by July 1, 2016. The Act's requirements include:

- Detailed evaluation of the supplies necessary to meet demands over at least a 20-year period, in five-year increments, for a single dry water year, in multi-year droughts, and during average year conditions;
- Documentation of the stages of actions an urban water supplier would undertake to address up to a 50 percent reduction in its water supplies;
- Description of the actions to be undertaken in the event of a catastrophic interruption in water supplies; and
- Evaluation of reasonable and practical efficient water uses, recycling, and conservation activities.

In addition, Water Code § 10608.36 requires wholesale agencies to include in their UWMPs an assessment of present and proposed future measures, programs, and policies that would help achieve water use reduction targets.

### *Changes in the Act Since 2010*

Since 2010, several amendments have been made to the Act. The following is a summary of the significant changes in the Act that have occurred from 2010 to the present:

- Changes the deadline for water suppliers to submit their 2015 UWMPs to DWR to July 1, 2016 (Water Code § 10621(d)).
- Adds "distribution system water loss" to the list of past, present, and projected future water uses that the UWMP is to quantify to the extent that records are available and over the same 5-year increments described in Water Code § 10631(a). (Water Code § 10631(e)(1)(J)). For the 2015 UWMP, the distribution system water loss must be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss must be quantified for each of the 5 years preceding the plan update. (Water Code § 10631(e)(3)(A)). The distribution system water loss quantification must be reported in accordance with a worksheet approved or developed by DWR through a public process. The water loss quantification worksheet must be based on the water system balance methodology developed by the American Water Works Association (AWWA) (Water Code § 10631(e)(3)(B)).
- If available and applicable to an urban water supplier, water use projections may display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as

applicable to the service area (Water Code § 10631(e)(4)(A)). To the extent that an urban water supplier reports the information described in § 10631(e)(4)(A), an urban water supplier shall do both of the following: (1) provide citations of the various codes, standards, ordinances, or transportation and land use plans used in making the projections; and (2) indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall note that fact (Water Code § 10631(e)(4)(B)).

- Requires plans by retail water suppliers to include a narrative description that addresses the nature and extent of each water demand management measure (DMM) implemented over the past 5 years. The narrative must describe the water DMMs that the supplier plans to implement to achieve its water use targets pursuant to Water Code § 10608.20 (Water Code § 10631(f)(1)(A)). The narrative must also include descriptions of the following water DMMs: water waste prevention ordinances, metering, conservation pricing, public education and outreach, programs to assess and manage distribution system real loss, water conservation program coordination and staffing support; and other DMMs that have a significant impact on water use as measured in GPCD, including innovative measures, if implemented (Water Code § 10631(f)(1)(B).
- Requires plans by wholesale water suppliers to include a narrative description of metering, public education and outreach, water conservation program coordination and staffing support, and other DMMs that have a significant impact on water use as measured in GPCD, including innovative measures, if implemented, as well as a narrative description of their distribution system asset management and wholesale supplier assistance programs (Water Code § 10631(f)(2)).
- Adds the voluntary reporting in the UWMP of any of the following information: an estimate of the amount of energy used: (1) to extract or divert water supplies; (2) to convey water supplies to water treatment plants or distribution systems; (3) to treat water supplies; (4) to distribute water supplies through the distribution system; (5) for treated water supplies in comparison to the amount used for non-treated water supplies; and (6) to place water into or to withdraw water from storage; and (7) any other energy-related information the urban water supplier deems appropriate (Water Code § 10631.2(a)). DWR included in its UWMP guidance a methodology for the voluntary calculation or estimation of the energy intensity of urban water systems (Water Code § 10631.2(b)).
- Requires urban water suppliers to submit plans or amendments to plans electronically and to include any standardized forms, tables, or displays specified by DWR (Water Code § 10644(a)(2)).

### *Senate Bill 7 of the Seventh Extraordinary Session of 2009, Water Conservation in the Delta Legislative Package*

In addition to changes to the Act, the state Legislature passed Senate Bill 7 as part of the Seventh Extraordinary Session, referred to as SB X7-7, on November 10, 2009, which became effective February 3, 2010. This law was the water conservation component to the historic Delta legislative package, and seeks to achieve a 20 percent statewide reduction in urban per capita water use in California by December 31, 2020. This implements the Governor's similar 2008 water use reduction goals. The law requires each urban retail water supplier to develop urban water use targets to help meet the 20 percent goal by 2020, and an interim urban water reduction target by 2015.

The bill states that the legislative intent is to require all water suppliers to increase the efficiency of use of water resources and to establish a framework to meet the state targets for urban water conservation called for by the Governor. The bill establishes methods for urban retail water suppliers to determine targets to help achieve increased water use efficiency by the year 2020. The law is intended to promote urban water conservation standards consistent with the California Urban Water Conservation Council's adopted best management practices.

An urban retail water supplier may update its 2020 urban water use target in its 2015 UWMP (Water Code § 10608.20(g)).

Urban wholesale water suppliers are not required to perform all of the target-setting and reporting requirements of SB X7-7. However, wholesale agencies must include in their UWMPs an assessment of present and proposed future measures, programs, and policies that would help achieve the water use reductions required under this law (Water Code § 10608.36).

Metropolitan addresses in Sections 3.4, 3.5, and 3.7 the actions it is taking to help urban retail water suppliers to achieve the urban per capita water use reduction pursuant to the goals set forth in SB X7-7.

### *Metropolitan's Compliance with the Urban Water Management Planning Act*

As with Metropolitan's previous plans, this Plan does not explicitly discuss specific activities undertaken by member agencies unless they relate to one of Metropolitan's water demand or supply management programs. Presumably, each member agency will discuss these activities in its Urban Water Management Plan, but elements of this Plan do not necessarily have to be adopted by the urban water suppliers or the public agencies directly providing retail water.

### *DWR Guidance*

In 2010, DWR provided a guidebook to aid water suppliers in developing their urban water management plans. These materials helped water suppliers to comply with the law and DWR staff to review submitted plans for regulatory compliance. The 2010 guidebook consisted of two parts: (1) preparing a UWMP – specific guidance for addressing UWMP requirements in the Water Code; and (2) UWMP supporting information – a detailed discussion of specific subjects or supporting documents related to preparing a UWMP. The 2010 guidebook also included a checklist for cross-referencing sections of the respondent water supplier's plan with the relevant sections of the Water Code to confirm that it addressed all relevant provisions of the Act.

In March 2016, DWR issued the Final 2015 UWMP Guidebook for Urban Water Suppliers. The 2015 guidebook has been updated from the 2010 version to reflect new legislation and to group the Water Code requirements by topic. As part of the guidebook, DWR has developed standardized tables for the reporting and submittal of UWMP data to DWR. As mentioned above, water suppliers are required to use these standardized tables for electronic submittal of their UWMPs to DWR to satisfy the new legislative requirement (Water Code § 10644(a)(2)). For the 2015 UWMP, Metropolitan electronically submitted the standardized tables to the designated DWR portal. In addition, Metropolitan included the standardized submittals in this Plan as Appendix 10.

The 2015 guidebook includes a voluntary checklist to show reporting of required elements to assist DWR with its review of the submitted UWMP. Included in the beginning of this Plan is a compliance checklist, organized by Water Code section, which summarizes Metropolitan's response to the requirements of the Water Code and indicates where each required element can be found in the Plan.

## 1.2 The Metropolitan Water District of Southern California

### *Formation and Purpose*

The Metropolitan Water District of Southern California (Metropolitan) is a public agency organized in 1928 by a vote of the electorates of 13 Southern California cities. The agency was enabled by the adoption of the original Metropolitan Water District Act (Metropolitan Act) by the California Legislature "for the purpose of developing, storing, and distributing water" to the residents of Southern California. The Metropolitan Act also allows Metropolitan to sell additional water, if available, for other beneficial uses. In 1992, the Metropolitan Board of Directors adopted the following mission statement:

> *"To provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way."*

The first function of Metropolitan was building the Colorado River Aqueduct (CRA) to convey water from the Colorado River. Deliveries through the aqueduct to member agencies began in 1941 and supplemented the local water supplies of the Southern California member cities. In 1960, to meet growing water demands in its service area, Metropolitan contracted for additional water supplies from the State Water Project (SWP) via the California Aqueduct, which is owned and operated by DWR. SWP deliveries began in 1972. Metropolitan currently receives imported water from both of these sources: (1) Colorado River water via the CRA, and (2) the SWP via the California Aqueduct.

### *Service Area*

Metropolitan's service area covers the Southern California coastal plain. It extends about 200 miles along the Pacific Ocean from the city of Oxnard on the north to the international boundary with Mexico on the south, and it reaches as far as 70 miles inland from the coast (Figure 1-1). The total area served is approximately 5,200 square miles, and it includes portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. Table 1-1 shows that although only 14 percent of the land area of the six Southern California counties is within Metropolitan's service area, nearly 85 percent of the populations of those counties reside within Metropolitan's boundaries.

### *Member Agencies*

Metropolitan is currently composed of 26 member agencies, including 14 cities, 11 municipal water districts, and one county water authority. Metropolitan is a water wholesaler with no retail customers. It provides treated and untreated water directly to its member agencies.

Metropolitan's 26 member agencies deliver to their customers a combination of local groundwater, local surface water, recycled water, and imported water purchased from or exchanged with Metropolitan. For some member agencies, Metropolitan supplies almost all the water used within that agency's service area, while others obtain varying amounts of water from Metropolitan to supplement local supplies. Over the last ten years (from 2006-2015), Metropolitan has provided between 50 and 60 percent of the municipal, industrial, and agricultural water used in its service area. The remaining water supply comes from local wells, local surface water, recycling, the city of Los Angeles' aqueducts from the Owens Valley/Mono Basin east of the Sierra Nevada, and water conserved by the Imperial Irrigation District and the All-American and Coachella Canal Lining Projects for the San Diego County Water Authority which is exchanged for water supplies delivered by Metropolitan. Member agencies also implement conservation programs that can be considered part of their supplies.

Some member agencies provide retail water service, while others provide water to the local area as wholesalers. Table 1-2 shows Metropolitan's member agencies and the type of service that they provide. As shown in the table, 15 member agencies provide retail service to customers, 9 provide only wholesale service, and 2 provide a combination of both. Throughout Metropolitan's service area, approximately 250 retail water suppliers directly serve the population.

Metropolitan's member agencies serve residents in 152 cities and 89 unincorporated communities. Table 1-3 shows the member agencies of Metropolitan, as well as the cities and communities served by those member agencies. Figure 1-1 also shows the geographical area served by the member agencies.

Currently, member agencies receive water from Metropolitan at various delivery points, and pay for service through a rate structure made up of multiple components. The majority of these components consist of uniform volumetric rates, and the majority of the revenue is collected through a tiered volumetric supply charge. The second tier of this rate is set at the cost of developing new supplies. Metropolitan's pricing and rate structure are described in detail in Section 2.7.

To aid in planning future water needs, member agencies advise Metropolitan in April of each year of how much water they anticipate they will need during the next five years. In addition, Metropolitan works with its member agencies to forecast future water demands.

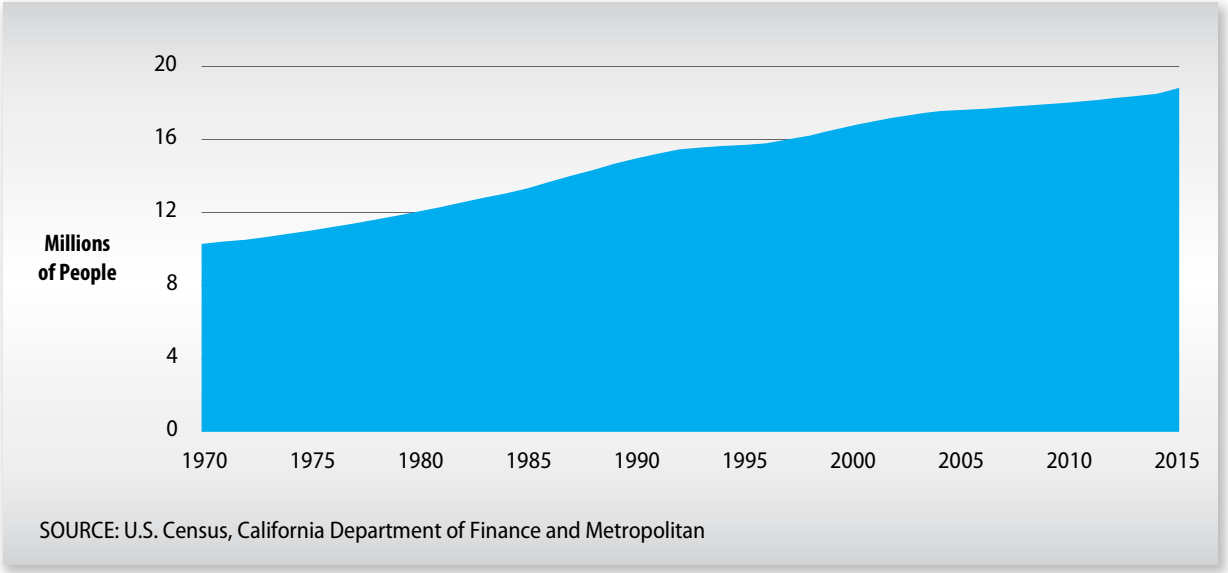
### *Board of Directors and Management Team*

Metropolitan's Board of Directors currently consists of 38 directors. The Board consists of at least one representative from each member agency, with each agency's assessed valuation determining its additional representation and voting rights. Directors can be appointed by the chief executive officer of the member agency or be elected by a majority vote of the governing body of the agency. Metropolitan does not compensate directors for their service. The Board includes business, professional, and civic leaders. Board meetings are generally held on the second Tuesday of each month and are open to the public.

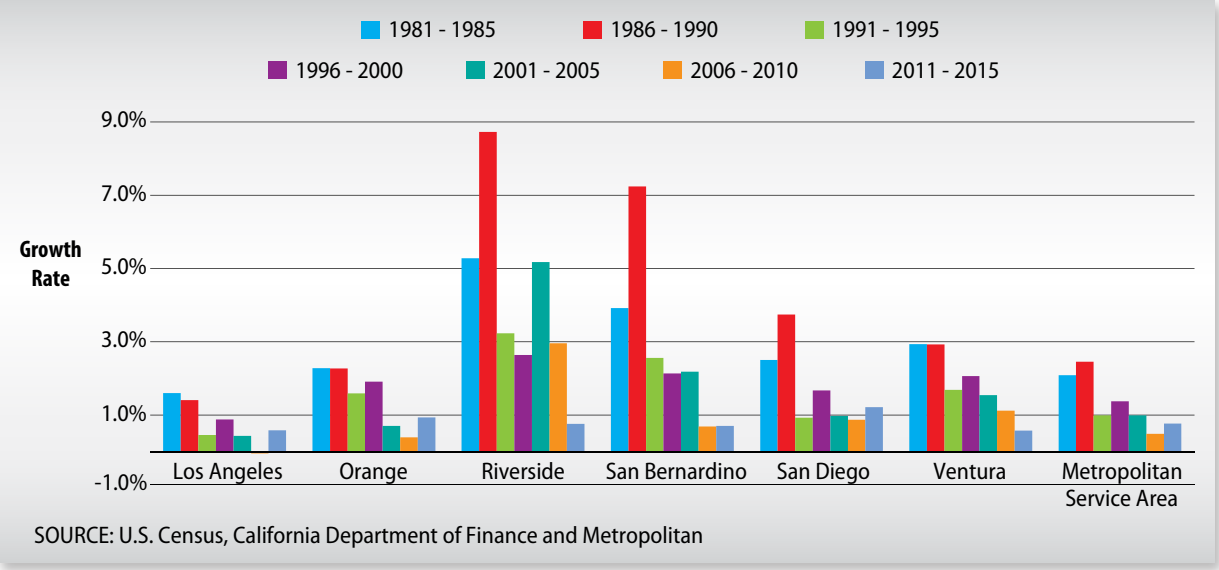
Throughout its history, the Board has delegated certain tasks to Metropolitan staff, which are codified in Metropolitan's Administrative Code. In addition, Metropolitan has developed policy principles to help achieve its mission to provide adequate and reliable supplies of high-quality water in an environmentally and economically responsible way. These policies can be found in a variety of documents including: specific policy statements, the Administrative Code, Board-adopted policy principles, and letters submitted to the Board. Policy statements are also embedded in formal Board meeting discussions and recorded in meeting minutes. The policies established by the Board are subject to all applicable laws and regulations. The management of Metropolitan is under the direction of its General Manager, who serves at the discretion of the Board, as do Metropolitan's General Auditor, General Counsel, and Ethics Officer.



## 1.3 Metropolitan Service Area Historical Information

### *Population*

In 1990, the population of Metropolitan's service area was approximately 15.0 million people. By 2015, it had reached an estimated 18.7 million, representing almost half of the state's population. In the past, annual growth has varied from about 200,000 annually in the 1970s and early-to-mid-1980s to more than 300,000 annually in the late 1980s. Population growth slowed due to economic recession during the early 1990s to just over 50,000 in 1995, before again rising to more than 250,000 per year in the period 1999 through 2002. Growth has generally averaged 120,000 persons per year during the last 10 years from 2006 to 2015. Figure 1-2 shows the service area population growth from 1970-2015.



The most populated cities within Metropolitan's service area are Los Angeles (largest city in the state), San Diego (second largest in the state), Long Beach, Anaheim, Santa Ana, and Riverside. The Department of Finance State Population Report from May 2015 reports biggest numeric increases occurring in the cities of Los Angeles and San Diego, consistent with their larger population base. Figure 1-3 shows the 5-year growth rates for the six counties within Metropolitan's service area. As can be seen from this figure, there has been an overall increase in population growth rate in the last 5 years. Appendix 1 presents a detailed discussion of the demographic trends in Southern California and their impacts on regional demand forecasts.

### *Historical Retail Water Demands*

Figure 1-4 presents historical retail water demands on a calendar year basis in Metropolitan's service area. Since 1980, retail water demands varied from 2.9 million acre-feet (MAF) in 1983 to nearly 4.2 MAF in 2007. Due to the economic recession, drought impacts, conservation, and mandatory water use restrictions, demands declined to 3.1 MAF in 1991. Demand remained below the peak level as a result of continuing effects from the recession and the drought coupled with a number of wet years and ongoing conservation efforts. In 2000, retail demands reached 3.9 MAF, surpassing the early peak level for the first time in a decade. Since 2000, retail demands reached a new peak level in 2007 with nearly 4.2 MAF. Calendar year 2007 was the driest year since 1989, with precipitation measured at 5.66 inches in Downtown Los Angeles. Since the peak retail demand in 2007, a decrease in demand was observed during the economic recession of 2008-2012. Starting in 2012, the severe drought in California led to a massive conservation campaign and water use restriction by the State, Metropolitan, and local water agencies resulting in a decrease in demand in 2015.

In 2015, about 97 percent of the retail demands were used for municipal and industrial purposes (M&I), and 3 percent for agricultural purposes. The relative share of agricultural water use has declined due to urbanization and market factors, including the price of water. Agricultural water use accounted for 19 percent of total regional water demand in 1970, 12 percent in 1980, 10 percent in 1990, and 3.5 percent in 2010.

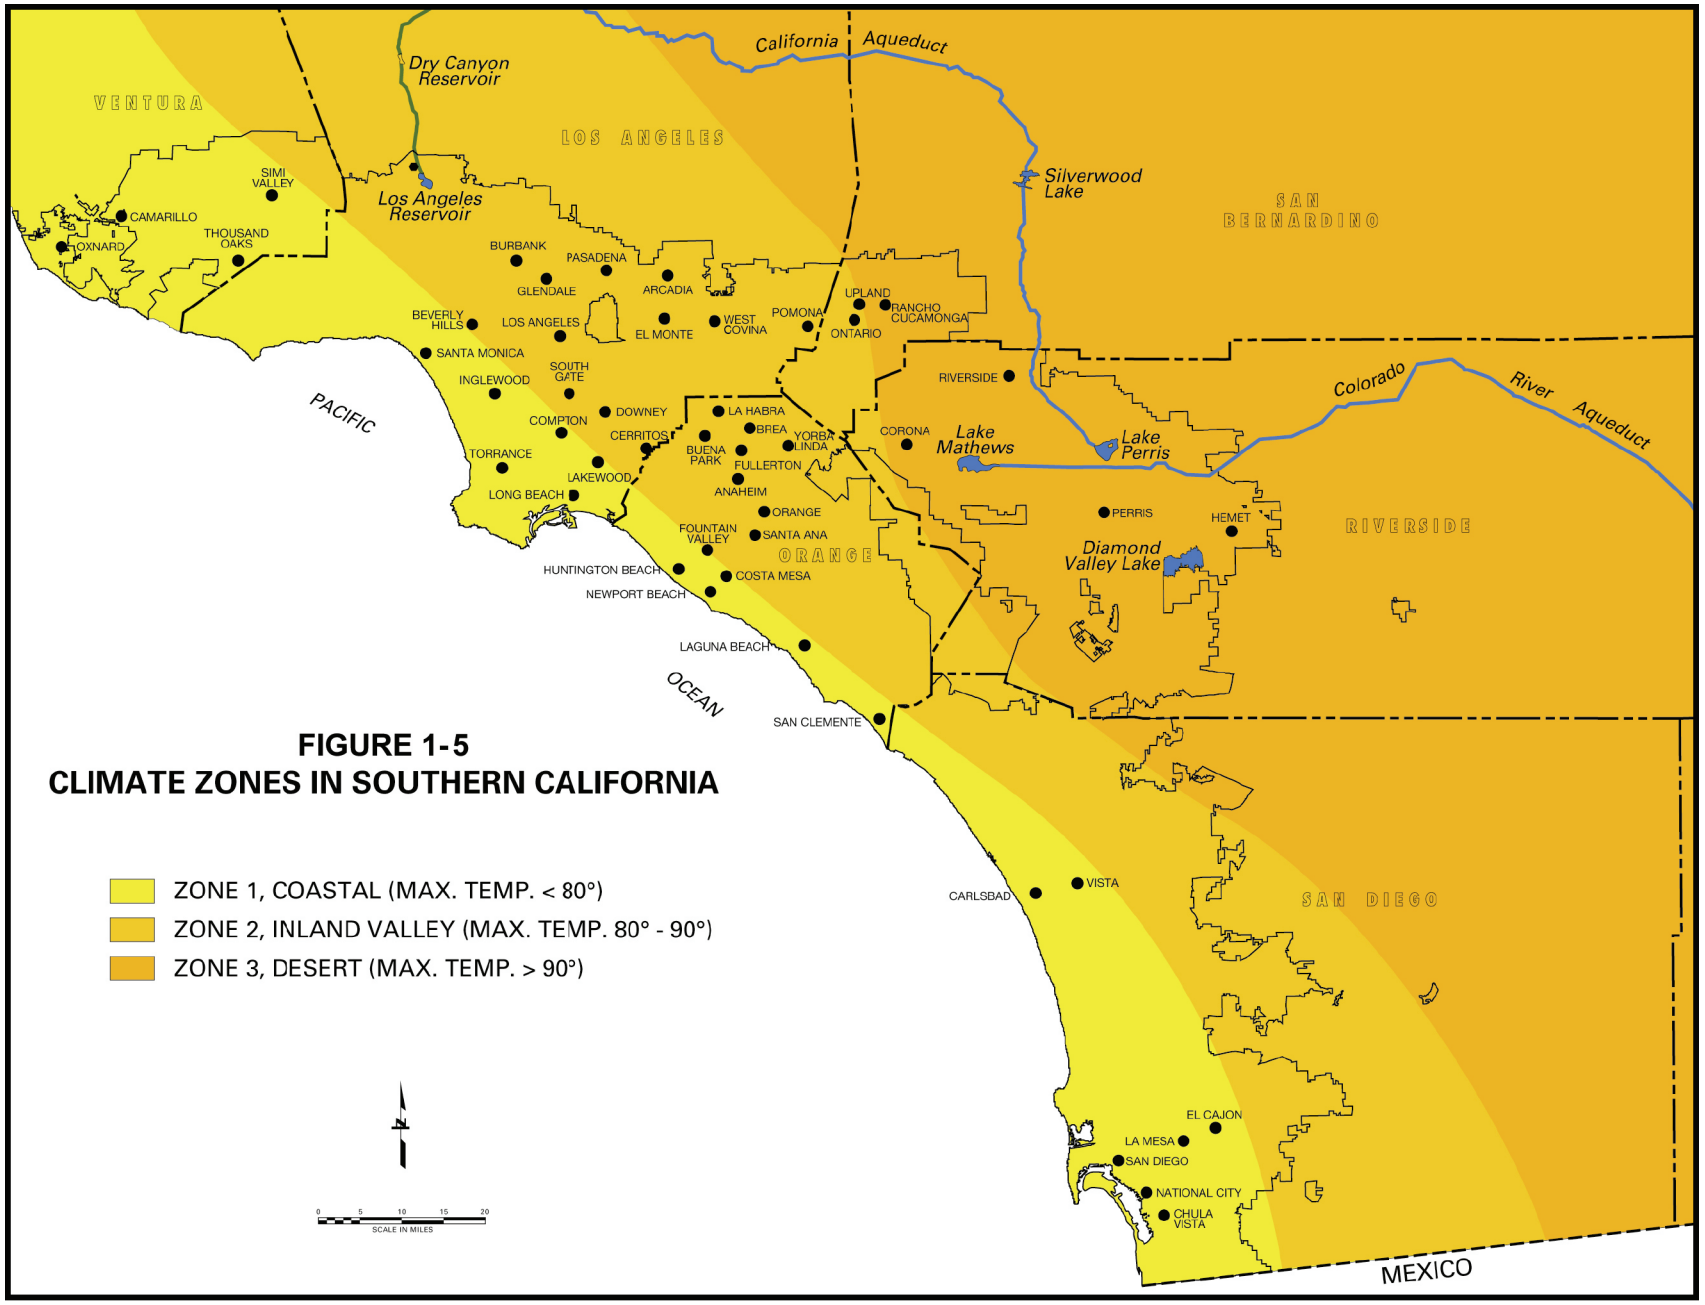

**Figure 1-4 Retail Demand in Metropolitan's Service Area**

* 2015 estimated based on best available data as of October 2015.

### *Climate and Rainfall*

As Figure 1-5 shows, Metropolitan's service area encompasses three major climate zones. Table 1-4 reports the 30-year (1985-2014) average temperature, rainfall, and evapotranspiration (expressed as $Et_o$) information for representative locations within those three zones.

## 1.4 Current Conditions

### *Current Challenges*

Metropolitan faces a number of challenges in providing adequate, reliable, and high quality supplemental water supplies for southern California. One of those challenges is dry hydrologic conditions that can have a significant impact on Metropolitan's imported water supply sources. This section offers a brief discussion of Metropolitan's current challenges, current available resources, short-term supply outlook, and recent and near-term actions to meet these challenges.

Dry conditions persisted into 2015, resulting in a fourth consecutive dry year for California. The year began with the driest January on record. The peak of the snowpack season traditionally occurs on April 1; however, in 2015, the snowpack peaked in January at only 17 percent of the April 1 average measurement, resulting in the earliest and lowest snowpack peak in recorded history. The statewide snowpack was all but gone by April 1, 2015, and registered a record low of 5 percent of average for that day. This dry hydrology produced only 51 percent of average runoff for the water year and consequently kept state reservoirs below average storage levels. As a result, Metropolitan only received 20 percent of its contract water supplies from the State Water Project (SWP) in 2015.

In 2015, the Upper Colorado River Basin snowpack peaked in March at 76 percent of normal. Runoff for that basin measured 94 percent of normal due to above normal rainfall in May, June and July, which averted a Colorado River shortage condition for 2016. This allowed Metropolitan to implement new water management programs and bolster supplies in 2015. The Colorado River, however, is experiencing a 16-year drought causing total storage levels in that system to steadily decline and increasing the likelihood of shortage in future years beyond 2016. The restrictions on water use generated a record demand for water-saving rebates and refocused efforts to increase development of local water resources.

#### *Sacramento-San Joaquin River Delta Issues*

The Sacramento-San Joaquin River Delta (Bay-Delta) is the hub of California's water supply and is critically important to the entire state. About 30 percent of Southern California's water supply moves across the Bay-Delta. The Bay-Delta's declining ecosystem, caused by a number of factors that include agricultural runoff, predation of native fish species, urban and agricultural discharge, changing ecosystem food supplies, and overall system operation, has led to reduction in water supply deliveries. SWP delivery restrictions due to regulatory requirements resulted in the loss of about 1.5 MAF of supplies to Metropolitan from 2008 through 2014, reducing the likelihood that regional storage can be refilled in the near-term. Operational constraints will likely continue until a long-term solution to the problems in the Bay-Delta is identified and implemented.

In April 2015, the Brown Administration announced California WaterFix, as well as a separate ecosystem restoration effort called California EcoRestore. Together, the California WaterFix and California EcoRestore will make significant contributions toward achieving the coequal goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem established in the Sacramento-San Joaquin Delta Reform Act of 2009. A detailed description of the Bay-Delta issues is included in Section 3.2.

### *Water Supply Conditions*

The water conditions that the region faced in 2015 were shaped by supply conditions and resource actions that occurred in the preceding years, including several extraordinary events, such as:

- Historic drought in California leading to record low contract supplies available from the SWP in 2014 (5 percent of contract supplies) and in 2015 (20 percent of contract supplies);
- An extended 16 year drought in the Colorado River watershed that has decreased storage levels in Lake Mead and Lake Powell to 38 percent and 51 percent of capacity, respectively, at the end of November 2015 and keeping storage below surplus levels despite an ease in drought conditions in 2014 and 2015;
- Groundwater basins and local reservoirs dropping to very low operating levels due to record-dry hydrology in Southern California;
- Restrictions of SWP deliveries by federal court orders due to endangered Delta smelt and salmon which resulted in the combined loss of approximately 3 MAF of SWP supplies between 2008 and 2014. These losses have impacted Metropolitan's ability to meet demands and refill regional storage;
- In 2014, Lake Oroville storage dropped within 10 TAF of its lowest operating levels since the historic drought of 1977; and
- Supply availability in the Los Angeles Aqueduct system continues to be affected by both the drought and environmental mitigation efforts related to Owens Lake and the Lower Owens River.

These dry hydrologic conditions and reduced imported water supplies have led to significant withdrawals from Metropolitan's storage reserves, including Diamond Valley Lake (DVL) and its groundwater banking and conjunctive use programs to meet scheduled water deliveries. During the 2007-2009 drought, Metropolitan withdrew a combined 1.2 MAF from storage reserves to balance supplies and demands. In 2014 alone, Metropolitan withdrew 1.1 MAF from dry-year storage to balance supplies and demands because of the historic low final SWP allocation in that year.

In addition, challenges such as the detection of the quagga mussel in the Metropolitan's CRA supplies and increasingly stringent water quality regulations to control disinfection byproducts exacerbate the water supply condition and underscore the importance of flexible and adaptive regional planning strategies.

## ***Current Available Resources***

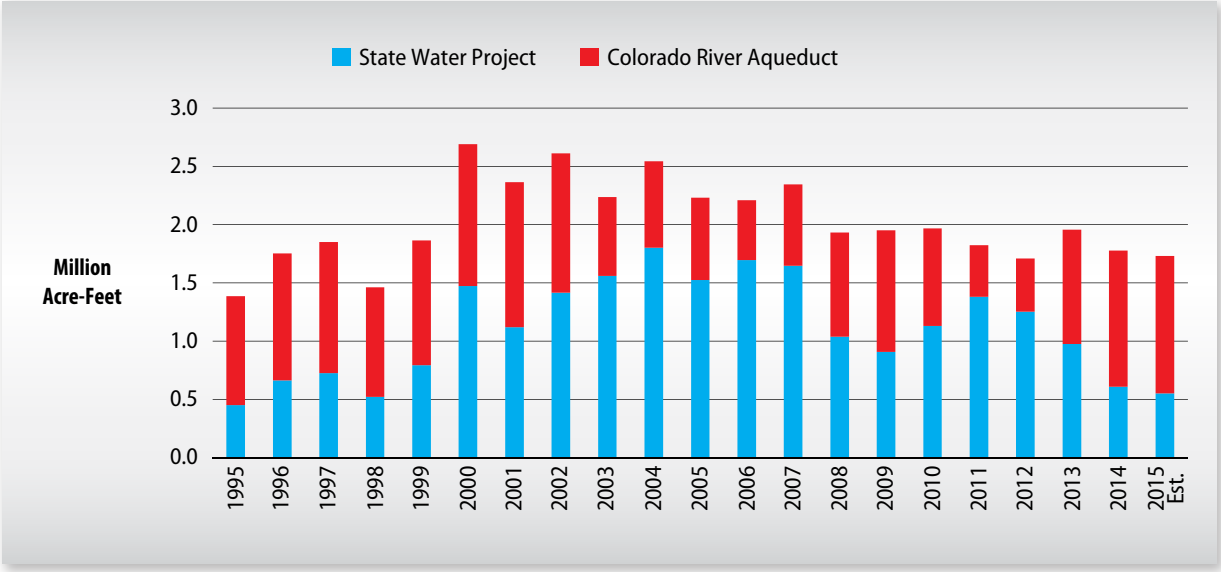
Metropolitan's primary purpose is to provide a supplemental supply of water for domestic and municipal uses at wholesale rates to its member public agencies. Metropolitan's principal sources of water are the SWP and the Colorado River. Metropolitan's robust planning strategy continues to balance available local and imported water resources and member agencies' demands within Metropolitan's service area.

### *A. Imported Supplies*

Metropolitan receives water from the SWP through the California Aqueduct and from the Colorado River through the Colorado River Aqueduct (CRA). Figure 1-6 shows the historic annual deliveries from the SWP and the CRA.

Colorado River

The Colorado River was Metropolitan's original source of water after Metropolitan's establishment in 1928. Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. The CRA, which has a capacity of 1.2 MAF a year, is owned and operated by Metropolitan. It transports water from Lake Havasu, at the border of the state of California and Arizona, approximately 242 miles to its terminus at Lake Mathews in Riverside County.



Over the years, Metropolitan increased reliable supply from the CRA through programs that it helped fund and implement including: farm and irrigation district conservation programs, improved reservoir system operations, land management programs, and water transfers and exchanges through arrangements with agricultural water districts in southern California, San Diego County Water Authority, and entities in Arizona and Nevada that use Colorado River water, and the U.S. Department of the Interior, Bureau of Reclamation (USBR). A detailed discussion of availability of Colorado River water for delivery to Metropolitan is described in Section 3.1.

State Water Project

Metropolitan imports water from the SWP, owned by the state of California and operated by the California Department of Water Resources (DWR). This project transports Feather River water stored in and released from Oroville Dam and conveyed through the Bay-Delta, as well as unregulated flows diverted directly from the Bay-Delta south via the California Aqueduct to four delivery points near the northern and eastern boundaries of Metropolitan's service area.

In 1960, Metropolitan signed a contract with DWR for SWP water supplies. Metropolitan is one of 29 agencies that have long-term contracts for water service from DWR, and is the largest agency in terms of the number of people it serves (nearly 19 million), the share of SWP water that it has contracted to receive (approximately 46 percent), and the percentage of total annual payments made to DWR by agencies with State water contracts (approximately 53 percent in 2015). A more detailed discussion of the SWP supplies is provided in Section 3.2.

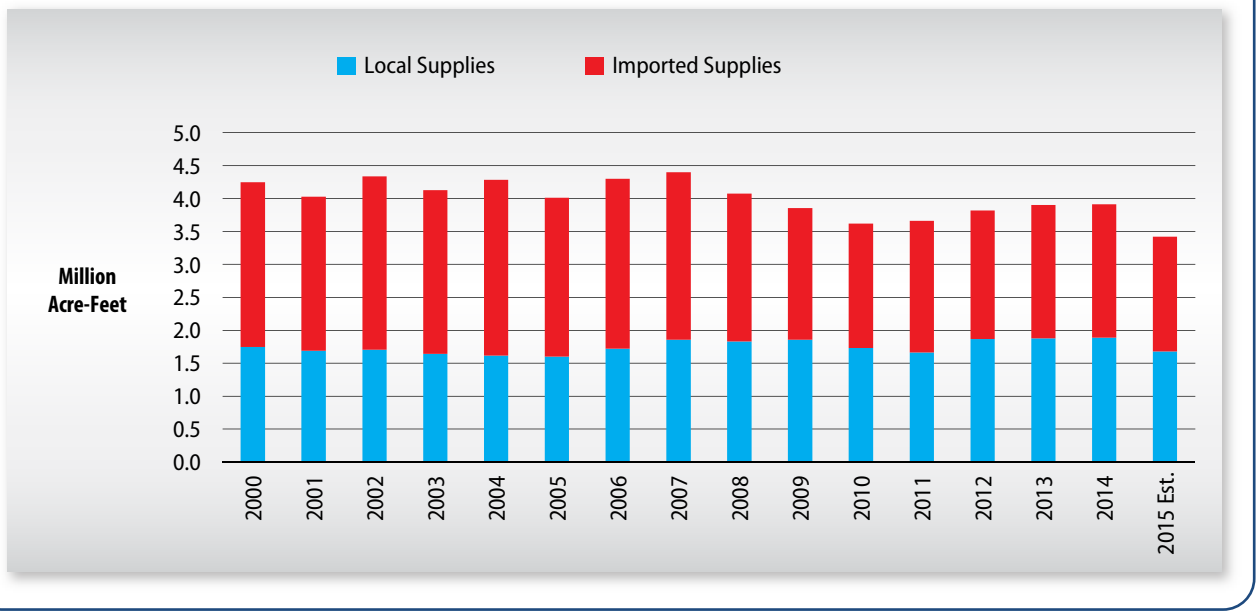


**Figure 1-6 Imported Water Supplies in Metropolitan's Service Area**

### *B. Local Supplies*

Approximately 50 percent of the region's water supplies come from resources controlled or operated by local water agencies. These resources include water extracted from local groundwater basins, catchment of local surface water, non-Metropolitan imported water supplied through the Los Angeles Aqueduct, and Colorado River water exchanged for Metropolitan supplies. Figure 1-7 shows the historic annual use of local and imported water suppplies within Metropolitan's service area.

**Figure 1-7 Annual Regional Water Supplies in Metropolitan's Service Area**

Groundwater

The groundwater basins that underlie the region provide nearly 35 percent of the water supply in Southern California. The major groundwater basins provide an annual average supply of approximately 1.35 MAF. Natural recharge of the groundwater basins is supplemented by active recharge of captured stormwater, recycled water, and imported water to support this level of annual production.

Estimates indicate that available storage space in the region's groundwater basins in mid-2015 is approximately 4.8 MAF. Successive dry years have resulted in groundwater depletions that will need to be replaced with natural recharge during wet years and active spreading of captured stormwater, recycled water, and imported water. Groundwater basin managers and water suppliers have taken steps to store water in advance of dry years to soften the potential impact on groundwater aquifers and to maintain reliable local water supplies during dry years.

Recycling, Groundwater Recovery, and Seawater Desalination

Recycling and groundwater recovery are local resources that add balance to Southern California's diverse water portfolio. In addition to replenishment groundwater basins described above, water recycling provides extensive treated wastewater for applicable municipal and industrial uses. Common uses of recycled water include landscape irrigation, agricultural

irrigation, and commercial and industrial applications. Groundwater recovery employs additional treatment techniques to effectively use degraded groundwater supplies that were previously not considered viable due to high salinity or other contamination.

While water recycling and groundwater recovery projects in the Southern California region are primarily developed by local water agencies, many newer projects have been developed with financial incentives provided through Metropolitan's Local Resources Program (LRP). The LRP is a performance-based program that provides incentives to expand water recycling and support recovery of degraded groundwater. In 2015, the regional water production from water recycling and groundwater recovery totaled approximately 530 TAF, of which 244 TAF was developed with Metropolitan funding assistance. A detailed discussion of recycling and groundwater recovery is presented in Section 3.5.

Seawater desalination represents a significant opportunity to diversify the region's water resource mix with a new, locally-controlled, reliable potable supply. Metropolitan supports seawater desalination to its member agencies by providing technical assistance, regional facilitation of research and information exchanges, and financial incentives through the LRP.

In the fall of 2015, the San Diego County Water Authority (SDCWA) began operation of the largest seawater desalination facility in the United States. The 56 TAF project will meet about eight percent of San Diego's demands and add a new, drought-resistant supply to the region. Seawater desalination is discussed in more detail in Section 3.5.

Surface Water

In addition to the groundwater basins, local agencies maintain surface reservoir capacity to capture local runoff. The average yield captured from local watersheds is estimated at approximately 104 TAF per year. The majority of this supply comes from reservoirs within the service area of the SDCWA.

Los Angeles Aqueduct

Although the Los Angeles Aqueduct (LAA) imports water from outside the region, Metropolitan classifies water provided by the LAA as a local resource because it is developed and imported by a local agency (the Los Angeles Department of Water and Power). This resource is estimated to provide approximately 260 TAF per year on average, which may be reduced to approximately 27 TAF during a historical dry period for a year like 2015.

Imperial Irrigation District / San Diego County Water Authority Transfer

The SDCWA has executed an agreement with the Imperial Irrigation District (IID) under which IID is transferring water to SDCWA. Since this supply is developed and transferred through an agreement by a local agency (SDCWA), Metropolitan also classifies this water as a local resource. Currently, the water transferred by IID is made available by SDCWA to Metropolitan for diversion at Lake Havasu. Metropolitan provides a matching volume of water to SDCWA by exchange. Under the transfer, 100 TAF was transferred and exchanged with Metropolitan in 2015. The transfer volumes increase beginning in 2018 in accordance with an annual build-up schedule, reaching 205 TAF in 2021 and stabilizing at 200 TAF annually in 2023. Currently, the water is being conserved through land fallowing and on-farm efficiency conservation arrangements made by IID with its customers. By 2017, all of the transferred water should be made available through efficiency conservation measures.

Coachella and All-American Canal Lining Projects

The Coachella Canal Lining Project consists of a 35-mile concrete-lined canal, including siphons, which replaced an earthen canal. The project was completed in December 2006. The project is conserving 30,850 AF annually. The All-American Canal Lining Project consists of a concrete-lined canal constructed parallel to 23 miles of earthen canal. Two reaches of the project were placed in service in 2008 with the third reach placed in service in 2009. In 2010, this project began conserving 67,700 AF annually.

Pursuant to the QSA and related agreements, the 98,550 AF of water resulting from these projects annually is allocated as follows in 2015: 16,000 AF to Metropolitan, 80,200 AF to SDCWA, and up to 2,350 AF for Coachella Canal Lining Project mitigation, with the amount not needed for mitigation becoming available to SDCWA. The water is made available at Lake Havasu for diversion by Metropolitan, and by exchange, Metropolitan delivers a volume of water to SDCWA equal to the amount made available by SDCWA to Metropolitan. Metropolitan classifies the portion of the supply exchanged with SDCWA as local resources.

Table 1-5 shows the projected local supplies estimated for average and dry years for 2020, 2030, and 2040.

**Table 1-5**
**Local Supplies for Average and Dry Years**
(Acre-Feet)

[1] Average Year is based on 1922 through 2012.
[2] Dry Year is based on Multiple Dry Years (1990-92)

### *Metropolitan's Recent and Near-term Drought Response Actions*

Metropolitan progressively addressed the challenges of water shortages caused by the unprecedented drought since 2012. Metropolitan took actions that include: (1) Increasing water conservation by expanding outreach, adding devices, and increasing incentives to residents, (2) Increasing local resources by providing incentives for on-site recycled water hook-up and increasing incentives for the LRP, (3) Augmenting water supplies through water transfers and exchanges, (4) Improving return capability of storage programs,

(5) Modifying Metropolitan's distribution system to enhance Colorado River water delivery, and (6) Implementing the Water Supply Allocation Plan to distribute the limited imported supplies and preserve storage reserves.

### *Increasing Water Conservation*

When the most recent drought period started in 2012 and progressed into 2013, Metropolitan recognized the need to increase the efficiency and effectiveness of its conservation program. In September 2013, Metropolitan's Board added several new initiatives to its conservation program to target water reduction by public agencies, landscaping, fitness centers, and the commercial and multi-family housing sectors. In addition, rebates became available for new devices - soil moisture sensor system, plumbing flow control valves, and rain barrels – and increased incentives were provided for high-efficiency toilets (HETs) that are more efficient than the low-flush toilets sold in the market.

In January 2014, Governor Edmund G. Brown Jr. issued a drought emergency proclamation calling for Californians to reduce their water use by 20 percent and for water agencies to implement water shortage plans. In response to the governor's drought proclamation, Metropolitan ramped up conservation efforts in Southern California. In February 2014, Metropolitan declared a Water Supply Alert, calling upon local cities and water agencies to immediately implement extraordinary conservation measures and institute local drought ordinances. In addition, Metropolitan significantly expanded its water conservation and outreach programs and doubled funding for conservation incentive programs to $40 million.

In April 2014, the governor issued a second proclamation, asking the state to redouble drought actions and directing the SWRCB to adopt emergency regulations to implement the directive. Accordingly, the SWRCB adopted outdoor water restrictions on July 15, 2014 that targeted outdoor urban water use that would normally increase under the hot and dry conditions. In May 2014, Metropolitan increased its turf removal incentives from $1 to $2 per square foot; increased the funding for incentives for rain barrels and recycled water hookups; and continued funding rebates for high efficiency toilets to speed up conversion from non-conserving toilets.

In July 2014, Metropolitan launched a $5.5 million outreach campaign, the largest in Metropolitan's history. The campaign seeks to raise awareness of the drought and urges residents and businesses to save water. The campaign features multiple media platforms, including radio and television, with enhanced outreach to the region's ethnic communities. Activity on Metropolitan's bewaterwise.com® website quadrupled as a result of the campaign. Metropolitan's conservation programs saw record-breaking increases in applications for rebates. It is clear that Southern California is responding to these calls for increased conservation efforts. Metropolitan is committed to doing its part in promoting water-use efficiency and increasing local supplies while collaborating with other stakeholders to protect critical reserves. As a result of the strong response to its conservation incentive program, Metropolitan again increased its conservation budget to a total of $100 million in December 2014.

On April 1, 2015, Governor Brown issued an Executive Order (Order) calling for a 25 percent reduction in consumer water use in response to the historically dry conditions throughout the State of California. As a wholesale water agency providing a supplemental water supply to its member agencies, Metropolitan is not subject to the requirements of the Governor's Order, which applies to retail water agencies. However, in May 2015, Metropolitan again increased funding for its conservation program to a total amount of $450 million over fiscal years 2014-15 and 2015-16 due to strong response to the incentive program and to assist retail agencies in the

service area to meet their mandatory water reduction targets established by the SWRCB. Turf removal is the most popular element of Metropolitan's conservation incentive program, and it is expected to result in 172 million square feet of turf removed and water savings of 800 TAF over the next ten years.

### *Increasing Local Resources*

Since 1982, Metropolitan has assisted local agencies in the development of water recycling and groundwater recovery under the LRP. In light of hot and dry conditions in 2013 and the low SWP allocation in 2014, Metropolitan worked with member agencies to identify constraints to local resources development and proposed refinements to the LRP.

In February 2014, Metropolitan's Board approved the On-site Retrofit Pilot Program to offer incentives to modify existing water users' potable water systems to utilize recycled water. In October 2014, Metropolitan's Board approved the LRP refinements to support further development of local resources, which included increasing the maximum incentive amount, offering alternate incentive payment structures, including on-site recycled water retrofit costs, including other water resources (such as seawater desalination and stormwater), and providing reimbursable services for Metropolitan's technical assistance.

### *Augmenting Water Supplies*

Augmenting water supplies through water transfers and exchanges is an element of Metropolitan's IRP to mitigate water shortages during dry periods.

The Colorado River System has been suffering from the effects of drought since 2000, leading to substantially decreased water levels in both Lakes Mead and Powell. In March 2014, Metropolitan's Board approved entering into an agreement with the Central Arizona Water Conservation District, Denver Water, Southern Nevada Water Authority (SNWA), and the United States to establish a two-year pilot program to compensate entitled users of the Colorado River water for voluntary reductions in water use, including fallowing of agricultural lands.

Metropolitan also entered into several agreements to improve Metropolitan's operational flexibility in 2015:

- In January 2015, Metropolitan's Board authorized an exchange of up to 50,000 acre-feet with Westside Mutual Water Company and Kern County Water Agency. This one-for-one exchange provides water at a time in the year when SWP supplies are expected to be low and provides flexibility on timing of returning water.
- In September 2015, Metropolitan's Board authorized an amendment to the operational storage agreement with SNWA and the Colorado River Commission of Nevada allowing Metropolitan access to additional Colorado River water during 2015. Metropolitan would pay SNWA $44.375 million for 150,000 AF of water apportioned to but not used by SNWA during 2015. When SNWA requests return of water stored under this amendment, SNWA would reimburse Metropolitan for the costs paid for the initial delivery of water.
- In November 2015, Metropolitan's Board authorized entering into agreements with Antelope Valley-East Kern Water Agency (AVEK) to develop exchange and storage programs for SWP supplies. This would be an uneven exchange: for every two acre-feet provided to Metropolitan, AVEK would receive back one acre-foot in the future. Metropolitan may also store at least 30,000 AF of its SWP supplies in wet years in the Antelope Valley groundwater basin.

### *Improving Return Capabilities of Storage Programs*

Metropolitan has a number of storage programs with water agencies along the California Aqueduct that would allow it to store SWP supplies during surplus conditions and to have stored water returned when needed. In 2015, Metropolitan provided up-front capital costs to its water management program partners to build infrastructure to improve the return capabilities of several storage programs.

- In September 2014, Metropolitan's Board authorized providing capital funds to Semitropic Water Storage District to enhance the pumpback capacity of the Semitropic Groundwater Storage Program by 13,200 AFY. The capital costs would be reimbursed to Metropolitan should Semitropic market the added capacity to another party after Metropolitan has at least one year of recovery capability.
- In March 2015, Metropolitan's Board authorized entering into agreement with Arvin Edison Water Storage District to restore 2,500 AFY of return capability by replacing groundwater wells of the Arvin Edison/Metropolitan Water Management Program. The capital costs will be reimbursed as credits to future Program costs.
- Also in March 2015, Metropolitan's Board authorized entering into agreement with Kern-Delta Water District to improve the return reliability of the Kern-Delta Water District Water Management Program. The improvement includes a pipeline that would reduce losses when Kern River supplies are delivered for exchange. Metropolitan's upfront costs will be more than offset through an elimination of put regulation fees on the next 20,000 AF delivered into the Program.

### *Modifying Metropolitan's Distribution System*

As a result of ongoing extraordinary dry conditions throughout the state of California, the SWP allocation for calendar year 2014 was five percent, which represents about 96,000 acre-feet of SWP Table A water allocation for Metropolitan, the lowest in the history of the SWP. Although Metropolitan has been utilizing storage reserves to help bridge the gap between the low SWP supplies and the demand for SWP water, a number of extraordinary operational actions were taken in 2014 to deliver available Colorado River water and DVL storage supplies to areas that ordinarily only receive SWP supplies.

Metropolitan modified its normal operations in several areas of the system to deliver Colorado River water to areas as far west as the cities of Thousand Oaks and Calabasas, as well as other locations within Metropolitan's system, some of which had not received Colorado River water for extended periods since the completion of the SWP in the early 1970s. System modifications have also been implemented to increase system flexibility to deliver Colorado River water and DVL water into new areas of the system.

- In April 2014, Metropolitan's Board authorized the project to interconnect between the Inland Feeder and the Lakeview Pipeline, near San Jacinto, California. This project was completed in October 2014, and allowed Metropolitan to serve water from multiple sources, such as DVL, to the Mills Treatment Plant in Riverside.
- In May 2014, Metropolitan's Board authorized enhancing water supply reliability in the West Valley area by rehabilitating a pump station and constructing flow control modifications to the outlet of the Jensen Water Treatment Plant. This project allowed the West Valley area, which was served normally by SWP water only, to receive blended supplies from the SWP and the CRA.

Additionally, several Metropolitan member agencies made modifications within their own local systems to maximize the use of more readily available Colorado River water and DVL supplies, to further reduce the use of scarce SWP supplies.

### *Implementing the Water Supply Allocation Plan*

Metropolitan's Water Supply Allocation Plan (WSAP) was developed in 2008. The WSAP was developed to fairly distribute a limited amount of water supply and applies it through a detailed methodology to reflect a range of local conditions and needs of the region's retail water consumers. Metropolitan's Board authorized the implementation of the WSAP for the period of July 2009 through April 2011 in response to the drought and low storage reserves.

Dry periods resumed in 2012. In 2014, California was challenged with a third year of severe drought. Metropolitan managed its operations through significant use of regional storage reserves. It was anticipated that end of year total dry year storage reserves would approach levels similar to those when the WSAP was first implemented in 2009. On December 9, 2014, Metropolitan's Board approved adjustments to the formula for calculating member agency supply allocations for future implementation of the WSAP. On April 14, 2015, Metropolitan's Board approved implementation of the WSAP at a Level 3 Regional Shortage Level, effective July 1, 2015 through June 30, 2016. The WSAP allows member agencies the flexibility to choose among various local supply and conservation strategies to help ensure that demands on Metropolitan stay in balance with limited supplies. More details of the WSAP are included in Section 2.4 and Appendix 4.

As of December 2015, Metropolitan has observed an approximate 23 percent reduction in deliveries to member agencies under the WSAP for the rolling 12-month period ending December 31, 2015.

Table 1-6 gives a timeline of Metropolitan's Board authorization for the above actions. It shows Metropolitan's progressiveness and adaptation to changing water supply conditions.

**Table 1-6**
**Recent Metropolitan's Board Drought Response Actions**

| Year | Month | Actions |
|---|---|---|
| 2013 | September | Authorized new conservation program initiatives and devices for rebates |
| 2014 | February | Declared Water Supply Alert<br>Doubled conservation budget to $40 million<br>Approved incentives for on-site recycled water retrofit |
| | March | Authorized a pilot program to fund water use efficiency measures for increasing Colorado River storage |
| | April | Authorized and appropriated funds for final design of drought response to enhance water supply reliability for the Henry J. Mills Water Treatment Plant |
| | May | Increased turf removal incentives from $1 to $2 per square foot<br>Added rebates for new devices including rain barrels<br>Authorized projects to enhance water supply reliability in the West Valley Area |
| | September | Authorized improvement of the return capacity of the Semitropic Groundwater Storage Program |
| | October | Authorized refinements to the Local Resources Program to encourage and expedite local resource production |
| | December | Increased the conservation incentive budget to a total of $100 million |
| 2015 | January | Authorized an exchange of up to 50,000 AF with water agencies in Kern County to enhance Metropolitan's operational flexibility in 2015 |
| | March | Authorized projects to improve return capacity from storage programs with Arvin Edison Water Storage District and Kern-Delta Water District |
| | April | Declared Water Supply Allocation and approved the implementation of Water Supply Allocation Plan at a Regional Shortage Level 3 effective July 1, 2015 through June 30, 2016 |
| | May | Increased conservation incentive budget to a total of $450 million |
| | September | Authorized an amendment to the operational agreement with SNWA and the Colorado River Commission of Nevada allowing Metropolitan access to additional Colorado River water during 2015 |
| | November | Authorized entering into storage and exchange agreements with Antelope Valley-East Kern Water Agency |

### *Short-term Supply Outlook*

Metropolitan evaluated the short-term supply outlook during each of the next three years from 2016 through 2018 and determined the minimum water supplies available based on the driest three-year historic sequence of 1990 through 1992. This analysis incorporates the actual storage levels at the beginning of 2015 and the forecasted supplies and demands under a multiple dry-year sequence. This evaluation of supply capabilities also takes into account the actual storage program conveyance constraints. Table 1-7 shows the projected yields of the in-region storage and imported supplies from the SWP and CRA, for both current programs and those under development. Detailed descriptions of the current programs and programs under development are included in Appendix 3.

For this supply capability evaluation, SWP supplies are estimated using the 2015 SWP Delivery Capability Report distributed by DWR in July 2015. The 2015 Capability Report base scenario represents the current DWR estimate of the amount of water deliveries for current conditions. These estimates incorporate restrictions on SWP and Central Valley Project (CVP) operations in accordance with water quality objectives established by the State Water Resources Control Board and the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on December 15, 2008, and June 4, 2009, respectively.

Metropolitan's forecast shows that under a multi-dry year hydrology, Metropolitan could face reduced supply capability during the next three years. This places considerable emphasis on developing robust short-term actions that will increase supply reliability to Metropolitan's service area.

**Table 1-7**

| **Maximum Metropolitan Supply Capability** | **1,935,371** | **1,636,530** | **1,798,633** |

[1] Represents supply capability for resource programs under listed year type.
[2] California Aqueduct includes Central Valley transfers and storage program supplies conveyed by the aqueduct.
[3] Colorado River Aqueduct includes water management programs, IID-SDCWA transfer and exchange and canal lining projects.
Maximum CRA deliveries limited to 1.20 MAF including IID-SDCWA transfer and exchange, and canal lining projects.

# Planning for the Future

2

The purpose of this section is to show how Metropolitan plans to meet Southern California's water supply needs in the future. In its role as supplemental supplier to the Southern California water community, Metropolitan faces ongoing challenges in meeting the region's needs for water supply reliability and quality. Increased environmental regulations and competition for water from outside the region have resulted in changes in delivery patterns and timing of imported water supply availability. At the same time, the Colorado River watershed has experienced a protracted drought since 2000.

As described in the previous chapter, the water used in Southern California comes from a number of sources. From 2006 through 2015, Metropolitan has provided 50 percent to 60 percent of the water needs in its service area from the Colorado River via the CRA, and from the Sacramento-San Joaquin River Watershed via the SWP. As Metropolitan continues to face various water supply challenges, development of adaptable strategies for managing resources to meet the range of estimated demands into the future and for adjusting to changing resource conditions is ongoing.

Metropolitan's continued progress in developing a diverse resource mix enables the region to meet its water supply needs. The investments that Metropolitan has made and its ongoing efforts in many different areas coalesce toward its goal of long-term regional water supply reliability. Metropolitan's actions have been focused on the following:

- Pursuing long-term solutions for the Delta
- Developing storage programs related to the SWP and the Colorado River
- Developing storage and groundwater management programs within the Southern California region
- Increasing conservation
- Increasing water recycling, groundwater recovery, and seawater desalination
- Developing water supply management programs outside of the region

Metropolitan has undertaken a number of planning initiatives over the years. This section summarizes these efforts, which include the Integrated Water Resources Plan (IRP), three IRP Updates, the Water Surplus and Drought Management Plan, and the Water Supply Allocation Plan. Collectively, they provide a policy framework guidelines and resource targets for Metropolitan to ensure regional water supply reliability.

While Metropolitan coordinates regional supply planning through its inclusive IRP process, Metropolitan's member agencies also conduct their own planning analyses – including their own urban water management plans – and may develop projects independently of Metropolitan. Appendix 5 shows a list of potential local projects provided to Metropolitan by its member agencies.

## 2.1 Integrated Water Resource Planning

In 1993, Metropolitan commenced an Integrated Water Resources Planning process as the beginning of a new era of regional reliability planning. As this planning process began, Metropolitan held a series of three regional assemblies from 1993 through 1995 addressing strategic planning issues. Attendance at these regional assemblies included Metropolitan's Board, Metropolitan's senior management, member agency managers, local retail water providers, groundwater basin managers, and invited public representatives. The purpose of these regional assemblies was to gain consensus on resource policy issues, provide direction for future work, and to endorse regional objectives, principles, and strategies.

A key outcome of the regional assemblies was the establishment and adoption of water supply principles which provided critical guidance for the development and adoption of future Metropolitan IRPs. In summary, these principles state:

- No water supplier in Southern California is an isolated, independent entity unto itself, and all, to varying degrees, are dependent upon a regional system of water importation, storage, and distribution.
- Metropolitan is Southern California's lead agency in regional water management, having the responsibility for importing water from outside the region and convening dialogues on regional water issues, encouraging local water development and conservation, advocating the region's interests to the state and federal governments, and leading the region's water community.
- Water suppliers at all levels have a responsibility to promote a strong water ethic both within the water community and among the public, developing plans through open processes, committing to achieving adopted regional goals and strategies, and committing to a policy of equity and fairness in development and implementation of water management programs.

These regional assemblies laid the foundation for Metropolitan's integrated regional planning path from 1996 to the present. This path has guided Metropolitan's water resources strategy from the initial adoption of the Metropolitan's IRP in 1996 to successive IRP updates in 2004, 2010, and 2015.

### *The 1996 IRP*

Metropolitan's IRP established a long-term, comprehensive water resources strategy to provide the region with a reliable and affordable water supply. One of the fundamental outcomes of the 1996 IRP was the implementation of a diverse portfolio of resource investments in both imported and in-region supplies, and in water conservation measures. The 1996 IRP further emphasized the construction and creation of a network of water storage facilities, both below and above ground.

The 1996 IRP process identified cost-effective solutions that offered long-term reliability to the region. Having identified the need for a portfolio of different supplies to meet its demands, the 1996 IRP analyzed numerous resource portfolios seeking to find a "Preferred Resource Mix" that would provide the region with reliable and affordable water supplies through 2020. The analysis determined the best mix of resources based on cost-effectiveness, diversification, and reliability. Establishing the "Preferred Resource Mix" was an integral part of the 1996 IRP, and subsequent updates have continued to focus on how best to diversify Metropolitan's water portfolio and establish the broad resource targets for the region.

### *The 2004 IRP Update*

The 2004 IRP Update reviewed the goals and achievements of the 1996 IRP, identified the changed conditions for water resource development, and updated resource development targets through 2025. These targets included increased conservation savings and planned increases in local supplies. The 2004 IRP Update also explicitly recognized the need to handle uncertainties inherent in any planning process. Some of these uncertainties include:

- Fluctuations in population and economic growth
- Changes in water quality regulations
- Discovery of new chemical contaminants
- Regulation of endangered species affecting sources of supplies
- Changes in climate and hydrology

As a result, a key component of the 2004 IRP Update was the addition of a 10 percent "planning buffer." The planning buffer identified additional supplies, both imported and locally developed, that could be implemented to address uncertainty in future supplies and demands.

### *The 2010 IRP Update*

In keeping with this reliability goal of meeting full-service demands at the retail level under all foreseeable hydrologic conditions, the 2010 IRP Update sought to stabilize Metropolitan's traditional imported water supplies and establish additional water resources to withstand California's inevitable dry cycles and growth in water demand. Metropolitan acknowledged the increasing impact that emerging challenges such as environmental regulations, threats to water quality, climate change, and economic unknowns and the uncertainty that these challenges would have on planning for a reliable, high quality, and affordable water supply. By 2010, the Colorado River had experienced below-average precipitation conditions for most of the previous decade, and the SWP was facing historic regulatory cutbacks that significantly reduced its supplies that pass through the Sacramento-San Joaquin Delta in Northern California. Recognizing that the conditions for developing and maintaining water supply reliability had changed, Metropolitan set out not only to update the IRP, but also to examine how best to adapt to the new water supply paradigm.

#### *Adaptive Management Strategy*

The 2010 IRP Update specifically planned for uncertainty with a range of adaptive management strategies that both meets demands under observed hydrology and responds to future uncertainty. The plan provided solutions by developing diverse and flexible resources that perform adequately under a wide range of future conditions. Specifically, the adaptive management strategy was a three-component plan that included the following:

- Core Resources Strategy – Designed to maintain reliable water supplies under known conditions. The Core Resources Strategy represented baseline efforts to manage water supply and demand conditions. This strategy was based on "what we know today," including detailed planning assumptions about future demographic scenarios, water supply yields, and a range of observed historical weather patterns. Under this strategy, Metropolitan and its member agencies would advance water use efficiency through conservation and recycled water, along with further local supply development such as groundwater recovery and seawater desalination. Metropolitan would also stabilize traditional imported supplies from the Colorado River and Northern California.

- Uncertainty Buffer – A suite of actions which help to mitigate short-term changes. The 2010 IRP set goals for a range of potential buffer supplies to protect the region from possible shortages in a cost-effective manner, starting with a further expansion of water use efficiency on a region-wide basis. The buffer would enable the region to adapt to future circumstances and foreseeable challenges that were not assumed under the Core Resources Strategy, such as short-term loss of local supplies or regulatory restrictions.
- Foundational Actions – Strategies for additional water resources to augment the core or buffer supplies. Foundational Actions were designed to prepare the region by determining viable alternative supply options for long-range planning. These preparatory actions, including feasibility studies, technological research, and regulatory review, were designed to lay the foundation for potential alternative resource development.

### *The 2015 IRP Update*

Since the 2010 IRP, drought in California and across the southwestern United States has put the IRP adaptive management strategy to the ultimate stress test. Dry conditions in California have persisted into 2015, resulting in a fourth consecutive year of drought. The year 2015 began with the driest January on record, resulting in the earliest and lowest snowpack peak in recorded history at only 17 percent of the traditional snowpack peak on April 1st. In the ten years since 2006, there were only two wet years, with the other eight years having been below normal, dry, or critically dry. The Colorado River watershed has also experienced an extended reduction in runoff. Within Southern California, continuing dry conditions have impacted the region's local supplies, including its groundwater basins.

Southern California has a remarkable, unparalleled tradition of meeting its water challenges as a single cohesive region. Metropolitan serves as both importer of water and regional water planner. For the past generation, the IRP has served as the reliability road map for the region.

Throughout 2015, Metropolitan engaged in a comprehensive process with its Board of Directors and member agencies to review how conditions have changed since the 2010 IRP Update and to establish targets for achieving regional reliability, taking into account known opportunities and risks. Areas reviewed in the 2015 IRP Update include demographics, hydrologic scenarios, water supplies from existing and new projects, water supply reliability analyses, and potential resource and conservation targets. Metropolitan's Board of Directors adopted the 2015 IRP Update on January 12, 2016.[1]

The 2015 IRP Update approach explicitly recognizes that there are remaining policy discussions that will be essential to guiding the development and maintenance of local supplies and conservation. Following adoption of the 2015 IRP Update and its targets for water supply reliability, Metropolitan has begun a process to address questions such as how to meet the targets for regional reliability, what are local and what are regional responsibilities, how to finance regional projects, etc. This discussion will involve extensive interaction with Metropolitan's Board of Directors and member agencies, with input from the public.

### *Findings and Conclusions*

The findings and conclusions of the 2015 IRP Update are:

- Action is needed – Without the investments in conservation, local supplies, and the California WaterFix targeted in the 2015 IRP Update, Metropolitan's service area would experience unacceptable level of shortage allocation frequency in the future.

[1] http://www.mwdh2o.com/PDF_About_Your_Water/2015_IRP_Update_Report.pdf

- Maintain Colorado River supplies – The plan to stabilize deliveries at 900,000 AF in a typical year will require more than 900,000 AF of planned actions.
- Stabilize SWP supplies – A collaborative approach with state and federal agencies to pursue better science for resolving questions about SWP operations and advancing coequal goals of Delta restoration and statewide water supply reliability in the near term. Also work collaboratively with state and federal agencies in the California WaterFix and EcoRestore efforts.
- Develop and protect local supplies and water conservation – The 2015 IRP Update embraces and advances the regional self-sufficiency ethics by increasing the targets for additional local supplies and conservation. These targets are discussed in detail in Section 3 of this UWMP.
- Maximize the effectiveness of storage and transfers – Rebuilding Metropolitan's supply of water reserves is imperative when the drought is over. A comprehensive water transfer approach that takes advantage of water when it is available will help to stabilize and build storage reserves, increasing the ability for Metropolitan to meet water demands in dry years.
- Continue with the adaptive management approach – The IRP is updated periodically to incorporate changed conditions, and an implementation report is prepared annually to monitor the progress in resources development. The 2015 IRP Update also includes Future Supply Actions that would advance a new generation of local supplies through public outreach; development of legislation and regulation; technical studies and support; and land and resource acquisitions.

## 2.2 Estimating Demands on Metropolitan

The Urban Water Management Planning Act requires that three basic planning analyses be conducted to evaluate supply reliability. The first is a water supply reliability assessment requiring development of a detailed evaluation of the supplies necessary to meet projected demands over at least a 20-year period. This analysis is to consider average, single-year, and multi-year drought conditions. The second is a water shortage contingency plan which documents the actions that would be implemented in addressing up to a 50 percent reduction in an agency's supplies. Finally, a plan must be developed specifying the steps that would be taken under a catastrophic interruption in water supplies.

To address these three requirements, Metropolitan developed estimates of future demands and supplies from local sources and from Metropolitan sources based on 91 years (1922-2012) of historic hydrology. The 91-year period was chosen because the USBR modeling for Colorado River supplies is only available for a period starting in 1922 and ending in 2012. Supply and demand analyses for the single-dry and multiple-dry year cases were based on conditions affecting the SWP as this supply availability fluctuates the most among Metropolitan's sources of supply. Using the same 91-year period of the SWP supply availability, 1977 is the single driest year and 1990-92 is the driest 3 consecutive years for SWP supplies to Metropolitan. In addition, staff analysis of the 8-river index indicated that 1977 is the single driest year and 1990-92 is the lowest 3 consecutive dry years from 1922 through 2015. The 8-river index is used widely by DWR and other water agencies as an estimate of the unimpaired runoff (or natural water production) of the Sacramento and San Joaquin River basins, which are sources of water for the SWP.

### *Demand Forecast*

Metropolitan developed its demand forecast by first estimating total retail demands for its service area and then factoring out water savings attributed to conservation.[2] Projections of local supplies then were derived using data from current and expected local supply programs and the IRP Local Resource Program Target. The resulting difference between total demands net of conservation and local supplies is the expected regional demands on Metropolitan supplies. These various estimates are shown in Tables 2-1 through 2-3. Major categories used in these tables are defined below.

#### *Total Demands*

Total demands are the sum of retail demand for M&I and agricultural, seawater barrier demand, and replenishment demand. Total demands represent the total amount of water needed by the member agencies. Total demands include:

- Retail Municipal and Industrial (M&I) Demand — Retail M&I demands represent the full spectrum of urban water use within the region. These include residential, commercial, industrial, institutional, and un-metered water uses. The demographic and economic data used in developing these forecasts were taken from the Southern California Association of Governments' (SCAG) 2012 Regional Transportation Plan/Sustainable Community Strategy (April 2012) and from the San Diego County Association of Governments' (SANDAG) Series 13: 2050 Regional Growth Forecast (October 2013). The SCAG and SANDAG regional growth forecasts are the core assumptions that drive the estimating equations in Metropolitan's Econometric Demand Model (MWD-EDM). SCAG's and SANDAG's projections undergo extensive local review and incorporate zoning information from city and county general plans and are backed by Environmental Impact Reports.

[2] Information generated as part of this analysis is contained in Appendix 1.

Impacts of potential annexation are not included in the demand projections for the 2015 UWMP. However, Metropolitan's Review of Annexation Procedures concluded that the impacts of annexation within the service area beyond 2020 would not exceed two percent of overall demands.

- Retail Agricultural Demand — Retail agricultural demands consist of water use for irrigating crops. Member agencies estimate agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Each member agency estimates its agricultural demand differently, depending on the availability of information. Metropolitan relies on member agencies' estimates of agricultural demands for the 2015 UWMP.
- Seawater Barrier Demand — Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Groundwater management agencies determine the barrier requirements based on groundwater levels, injection wells, and regulatory permits.
- Storage Replenishment Demand — Storage replenishment demands represent the amount of water member agencies plan to use to replenish their groundwater basins or surface reservoirs in order to maintain sustainable basin/reservoir heath and production. For the 2015 UWMP, replenishment deliveries are not included as part of firm demands.

### *Conservation Adjustment*

Savings from conservation reduces total retail demand. Conservation savings consists of the following:

- Code-Based Conservation — Water savings resulting from plumbing codes and other institutionalized water efficiency measures. Sometimes referred to as "passive conservation," this form of conservation would occur as a matter of course without any additional financial incentives from water agencies. Water savings from codes, standards, and ordinances are discussed in Appendix 6.
- Active Conservation — Water saved as a direct result of programs and practices directly funded by a water utility (e.g., measures outlined by the California Urban Water Conservation Council's "Best Management Practices"). Active conservation is unlikely to occur without agency action.
- Price Effect Conservation — Reductions in customer use attributable to changes in the real (inflation adjusted) cost of water. Because water has a positive price elasticity of demand, increases in water price will decrease the quantity demanded.
- Pre-1990 Savings — Conservation savings are commonly estimated from a base-year water-use profile. Beginning with the 1996 IRP, Metropolitan identified 1980 as the base year for estimating conservation because it marked the effective date of a new plumbing code in California requiring toilets in new construction to be rated at 3.5 gallons per flush or less. Between 1980 and 1990, Metropolitan's service area saved an estimated 250,000 acre-feet per year as the result of this 1980 plumbing code and unrelated water rate increases. Within Metropolitan's planning framework, these savings are referred to as "pre-1990 savings."

### *Local Supplies*

Local supplies represent water produced by the member agencies to meet their total demands. Local supplies are a key component in determining how much Metropolitan supply is needed. Projections of local supplies relied on information gathered from a number of

sources including past urban water management plans, Metropolitan's annual local production surveys, and communications between Metropolitan and member agency staff. Local supplies include:

- Groundwater and Surface Water — Groundwater production consists of extractions from local groundwater basins. Surface water comes from stream diversions and rainwater captured in reservoirs.
- The Los Angeles Aqueduct — A major source of imported water is conveyed from the Owens Valley via the Los Angeles Aqueduct (LAA) by Los Angeles Department of Water and Power (LADWP). Although LADWP imports water from outside of Metropolitan's service area, Metropolitan classifies water provided by the LAA as a local resource because it is developed and controlled by a local agency.
- Seawater desalination — Highly treated seawater suitable for municipal and industrial potable use.
- Groundwater Recovery and Recycled Water — Developed and operated by local water agencies, groundwater recovery projects treat degraded groundwater to meet potable use standards. Recycled water projects recycle wastewater for municipal and industrial use.
- Non-Metropolitan Imports — Water supplies imported or exchanged by member agencies from sources outside of the Metropolitan service area.

The local supplies projections presented in demand tables include existing projects currently producing water, projects under construction, and Metropolitan's IRP Local Supply targets. The method for including local supply projects begins with an inventory of local supplies that have been identified within Metropolitan's service area. Appendix 5 contains the inventory of local supplies by type of supply, and includes a classification that shows the current stage of development for each supply in the inventory. The stages of development included in Appendix 5 are: Existing, Under Construction, Fully Designed with Appropriated Funds, EIR/EIS Certified, Feasibility, and Conceptual. The project inventory in Appendix 5 was updated and completed as part of the 2015 IRP Update survey completed by Metropolitan's member agencies in April and July 2015.

Projects, potential supply yields, and online dates from the local supply inventory in Appendix 5 are used in two ways. First, projects that are classified as Existing or Under Construction are included in forecasts that reflect local supply production that is expected to occur without any additional development actions from Metropolitan or the local agencies. Projects in these categories of development are included here because they have a higher level of certainty. Second, projects that are classified as Fully Designed with Appropriated Funds, EIR/EIS Certified, Feasibility, and Conceptual are considered, along with the associated information on supply yield and online dates, as the potential projects that could be developed and go toward meeting IRP Local Supply targets described in Metropolitan's IRP. The IRP Local Supply targets are characterized in forecasts and tables that include Programs Under Development, which are described in Appendix 3.3 in the IRP Development Targets Section under In-Basin Storage and Supplies. It is anticipated that a combination of regional and local approaches will be required in order to meet the IRP Local Supply targets. The local supply inventory provides a connection of the IRP Local Supply targets with potential projects that have been identified, but not developed to a point of relative certainty. The inventory of potential projects is important, as historical implementation, timing, and ultimate production of local supply projects in the service area have fallen short of projections. This is increasingly true with the projects in the less than certain Feasibility and Conceptual categories. It is important that the inventory of

potential projects is greater than the IRP Local Supply targets for new local supply, as the development of projects in the inventory will also be needed under conditions where other existing local supplies are lost or their yields are reduced.

### *Determining Demands on Metropolitan*

Metropolitan serves imported water to its 26 member agencies. For most member agencies, they have other sources of water produced locally from groundwater basins, surface reservoirs, the LAA, recycled water projects, groundwater recovery projects, and seawater desalination projects. When local supplies are not enough to meet retail demands, member agencies purchase imported water from Metropolitan to meet their needs.

In determining demands for imported water, Metropolitan developed its Sales Model to calculate the difference between total forecasted retail demands and local supply projections. The balance is the demand on Metropolitan's imported water supply. The Sales Model calculates the difference between forecasted demands and projected local supplies after factoring in climate impacts. The Sales Model employs a modeling method using historical hydrologic conditions from 1922 to 2012 to simulate the expected demands on Metropolitan supplies based on hydrologic conditions. Each hydrologic condition results in one possible outcome for the forecast year in the planning horizon. For example, each forecast year, such as 2020, has 91 possible outcomes, one for each historical hydrology year during the period 1922 to 2012. This method of modeling produces a distribution of outcomes ranging from the driest to the wettest years within this historical period.

The Sales Model forecasts three types of demands on Metropolitan:

1. Consumptive Use – Metropolitan's supplies that are used to meet retail M&I demand.
2. Seawater Barrier – Imported water needed to hold back seawater intrusion into the coastal groundwater basins.
3. Replenishment – Water for groundwater or reservoir replenishment, when available, to meet replenishment demands.

For additional information on Metropolitan's demand forecast, see Appendix 1.

## 2.3 Water Supply Reliability

After estimating demands for single dry year, multiple dry years, and average years, the water reliability analysis requires urban water suppliers to identify projected supplies to meet these demands. Table 2-4 summarizes the sources of supply for the single dry year (1977 hydrology), while Table 2-5 shows the region's ability to respond in future years under a repeat of the 1990-92 hydrology. Table 2-5 provides results for the average of the three dry-year series rather than a year-by-year detail because most of Metropolitan's dry-year supplies are designed to provide equal amounts of water over each year of a three-year period. These tables show that the region can provide reliable water supplies under both the single driest year and the multiple dry-year hydrologies. Table 2-6 reports the expected situation on average over all of the historic hydrologies from 1922 to 2012. Appendix 3 contains detailed justifications for the sources of supply used for this analysis.

Metropolitan's supply capabilities are evaluated using the following assumptions:

### *Colorado River Aqueduct Supplies*

CRA supplies include supplies that would result from existing and committed programs and from implementation of the QSA and related agreements. The QSA establishes the baseline water use for each of the agreement parties and facilitates the transfer of water from agricultural agencies to urban uses. A detailed discussion of the QSA is included in Section 3.1. Colorado River transactions are potentially available to supply additional water up to the CRA capacity of 1.2 MAF on an as-needed basis.

### *State Water Project Supplies*

SWP supplies are estimated using the 2015 SWP Delivery Capability Report distributed by DWR in July 2015. The 2015 SWP Delivery Capability Report presents current DWR estimates of the amount of water deliveries for current (2015) conditions and conditions 20 years in the future. These estimates incorporate restrictions on SWP and Central Valley Project (CVP) operations in accordance with the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on December 15, 2008, and June 4, 2009, respectively. Under the 2015 SWP Delivery Capability Report with existing conveyance and low outflow requirements scenario, the delivery estimates for the SWP for 2020 conditions as percentage of Table A amounts are 12 percent, equivalent to 257 TAF for Metropolitan, under a single dry-year (1977) condition and 51 percent, equivalent to 976 TAF for Metropolitan, under long-term average condition.

The goal for the 2015 IRP Update for SWP supplies is to manage flow and export regulations in the near term and ultimately to achieve a long-term Bay-Delta solution. This goal involves continued engagement in collaborative science-based approaches to manage regulations in the near-term and continued participation in the long-term California WaterFix and the California EcoRestore efforts. This approach targets an average of 984 TAF of SWP supplies in the near-term and 1.2 MAF of supplies on average starting in 2030 when the long-term Delta solution is assumed to be in place. More detailed description of SWP supplies is included in Section 3.2.

In dry and below-normal conditions, Metropolitan has increased the supplies received from the California Aqueduct by developing flexible Central Valley/SWP storage and transfer programs. Further descriptions of these programs can be found in Section 3.3.

### *Storage*

A key component of Metropolitan's water supply capability is the amount of water in Metropolitan's storage facilities. Over the past two decades, Metropolitan has developed a large regional storage portfolio that includes both dry-year and emergency storage capacity. Storage is a key component of water management. Storage enables the capture of surplus amounts of water in normal and wet climate and hydrologic conditions when it is plentiful for supply and environmental uses. Stored water can then be used in dry years and in conditions where augmented water supplies are needed to meet demands. Metropolitan's resource analysis model considers all the capacities and constraints of its storage facilities and programs and simulates the fill and withdrawal of these facilities through the 91 hydrologic conditions from 1922-2012.

## 2.4 Water Shortage Contingency Analysis

In addition to the Water Supply Reliability analysis addressing average year and drought conditions, the Act requires agencies to document the stages of actions that they would undertake in response to water supply shortages, including up to a 50 percent reduction in their water supplies. Metropolitan has captured this planning in its Water Surplus and Drought Management (WSDM)[2] Plan which guides Metropolitan's planning and operations during both shortage and surplus conditions. Furthermore, Metropolitan developed the Water Supply Allocation Plan (WSAP)[3], which provides a standardized methodology for allocating supplies during times of shortage.

### *Water Surplus and Drought Management Plan*

Metropolitan's Board adopted the WSDM Plan in April 1999, which provides policy guidance for managing regional water supplies to achieve the reliability goals of the IRP and identifies the expected sequence of resource management actions that Metropolitan will execute during surpluses and shortages to minimize the probability of severe shortages and reduce the possibility of extreme shortages and shortage allocations. Unlike Metropolitan's previous shortage management plans, the WSDM Plan recognizes the link between surpluses and shortages, and it integrates planned operational actions with respect to both conditions.

#### *WSDM Plan Development*

Metropolitan and its member agencies jointly developed the WSDM Plan during 1998 and 1999. This planning effort included more than a dozen half-day and full-day workshops and more than three dozen meetings between Metropolitan and member agency staff. The result of the planning effort is a consensus plan that addresses a broad range of regional water management actions and strategies.

WSDM Plan Principles and Goals

The guiding principle of the WSDM Plan is to manage Metropolitan's water resources and management programs to maximize management of wet year supplies and minimize adverse impacts of water shortages to retail customers. From this guiding principle came the following supporting principles:

- Encourage efficient water use and economical local resource programs
- Coordinate operations with member agencies to make available as much surplus water as possible for use in dry years
- Pursue innovative transfer and banking programs to secure more imported water for use in dry years
- Increase public awareness about water supply issues

The WSDM plan also declared that if mandatory import water allocations become necessary, they would be calculated on the basis of need, as opposed to any type of historical purchases. The WSDM plan contains the following considerations that would go into an allocation of imported water:

- Impact on retail consumers and regional economy
- Investments in local resources, including recycling and conservation

---

[2] Metropolitan Water District of Southern California. *Water Surplus and Drought Management Plan*, Report No. 1150, August, 1999.

[3] Metropolitan Water District of Southern California, Water Supply Allocation Plan, December 2014.

- Population growth
- Changes and/or losses in local supplies
- Participation in Metropolitan's non-firm (interruptible) programs
- Investment in Metropolitan's facilities

### *WSDM Plan Implementation*

Each year, Metropolitan evaluates the level of supplies available and existing levels of water in storage to determine the appropriate management stage. Each stage is associated with specific resource management actions designed to: (1) avoid an Extreme Shortage to the maximum extent possible; and (2) minimize adverse impacts to retail customers if an Extreme Shortage occurs. The current sequencing outlined in the WSDM Plan reflects anticipated responses based on detailed modeling of Metropolitan's existing and expected resource mix.

#### Surplus Stages

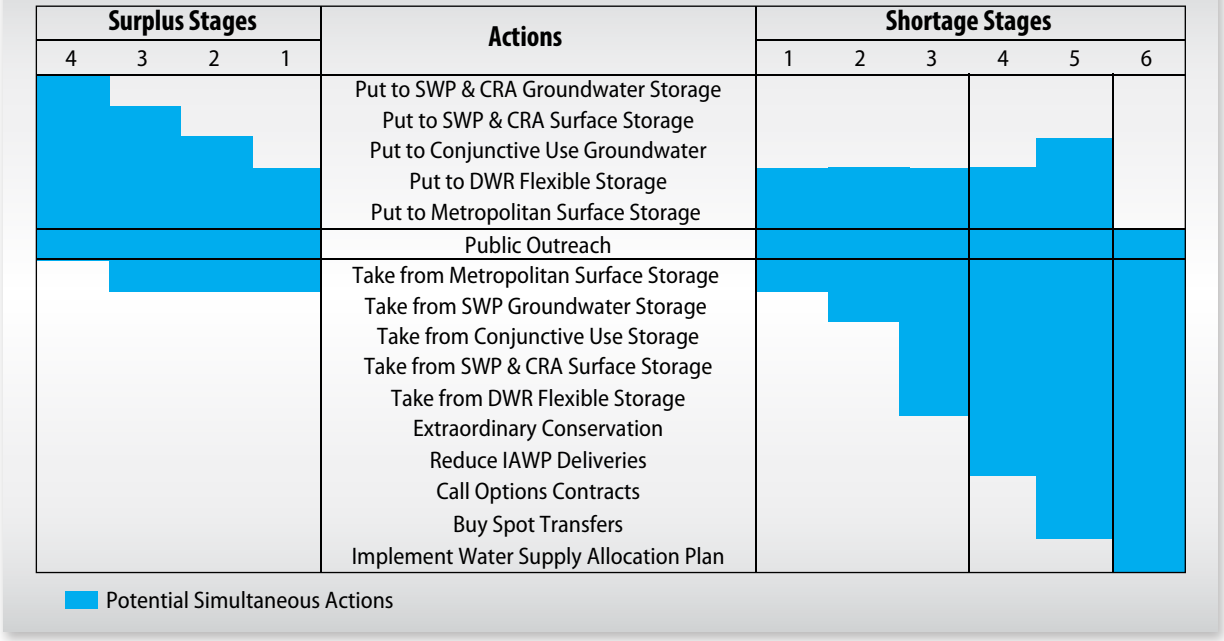
Metropolitan's supply situation is considered to be in surplus as long as net annual deliveries can be made to water storage programs. The WSDM Plan further defines four surplus management stages that guide the storage of surplus supplies in Metropolitan's storage portfolio. Deliveries for storage in DVL and in SWP terminal reservoirs continue through each surplus stage provided there is available storage capacity. Withdrawals from DVL for regulatory purposes or to meet seasonal demands may occur in any stage. Deliveries to other storage facilities may be interrupted, depending on the amount of the surplus.

#### Shortage Stages

The WSDM Plan distinguishes between Shortages, Severe Shortages, and Extreme Shortages. Within the WSDM Plan, these terms have specific meanings relating to Metropolitan's ability to deliver water to its customers.

*Shortage*: Metropolitan can meet full-service demands and partially meet or fully meet interruptible demands, using stored water or water transfers as necessary.

*Severe Shortage*: Metropolitan can meet full-service demands only by using stored water, transfers, and possibly calling for extraordinary conservation.



*Extreme Shortage*: Metropolitan allocates available supply to full-service customers.

The WSDM Plan also defines six shortage management stages to guide resource management activities. These stages are not defined merely by shortfalls in imported water supply, but also by the water balances in Metropolitan's storage programs. Thus, a 10 percent shortfall in imported supplies could be a stage one shortage if storage levels are high. If storage levels are already depleted, the same shortfall in imported supplies could potentially be defined as a more severe shortage.

When Metropolitan must make net withdrawals from storage to meet demands, it is considered to be in a shortage condition. Under most of these stages, Metropolitan is still able to meet all end-use demands for water. For shortage stages 1 through 3, Metropolitan will meet demands by withdrawing water from storage. At shortage stages 4 and 5, Metropolitan may undertake additional shortage management steps, including issuing public calls for extraordinary conservation and exercising water transfer options, or purchasing water on the open market.

Figure 2-1 shows the actions under surplus and shortage stages and when an allocation plan would be necessary to enforce mandatory cutbacks. The overriding goal of the WSDM Plan is to avoid reaching Shortage Stage 6, an Extreme Shortage.

**Figure 2-1 Resource Stages, Anticipated Actions, And Supply Declarations**

### *Water Supply Condition Framework*

Consistent with the WSDM Plan, Metropolitan's Board adopted a Water Supply Condition Framework in June 2008. The purpose of the framework is to communicate the urgency of the region's water supply situation and the need for further water conservation practices. The framework is intended to encourage proactive steps to reduce the region's water demand to mitigate the need for more severe actions, up to and including implementation of the WSAP to allocate water supply shortages to member agencies. The framework has four conditions, each calling for an increasingly heightened level of conservation response:

- Baseline Water Use Efficiency
- Condition 1: Water Supply Watch
- Condition 2: Water Supply Alert
- Condition 3: Water Supply Allocation

Table 2-7 below shows the framework and the associated conservation actions.

**Table 2-7**
**Water Supply Condition Framework**

| | Water Supply Condition Framework |
|---|---|
| **Baseline Water Use Efficiency** | Ongoing conservation, outreach, and recycling programs to achieve permanent reductions in water use and build storage reserves. |
| **Condition 1: Water Supply Watch** | Local agency voluntary dry-year conservation measures and use of regional storage reserves. |
| **Condition 2: Water Supply Alert** | Regional call for cities, counties, member agencies and retail water agencies to implement extraordinary conservation through drought ordinances and other measures to mitigate use of storage reserves. |
| **Condition 3: Water Supply Allocation** | Implement Metropolitan's Water Supply Allocation Plan. |

The drought periods of 2007-2011 and 2012-2015 provide an example of how the Water Supply Condition Framework is used. In June 2008, Metropolitan's Board declared a Condition 2: Water Supply Alert to highlight that storage reserves were dropping and that drought conditions were building, corresponding to WSDM shortage stages 1-5. In April 2009 and again in April 2010, Metropolitan's Board moved deeper into a Condition 3: Water Supply Allocation, corresponding to an extreme shortage stage 6 in the WSDM Plan. The April 2010 Water Supply Allocation condition was later terminated by Metropolitan's Board in April 2011 when hydrologic conditions improved during the 2010/2011 water year. The region returned to the Baseline Water Use Efficiency condition following the improvement in water supply. As dry conditions returned in 2012 and 2013, Metropolitan returned to using regional storage and sponsoring outreach efforts with member agencies to encourage voluntary conservation. In 2014, record dry and hot conditions significantly impacted the water resources of both the State of California and Metropolitan. In light of these conditions, which precipitated the January 2014 Emergency Drought Declaration by Governor Brown, Metropolitan's Board declared a Condition 2: Water Supply Alert in February 2014 to again provide public messaging and to urge local water agencies within Metropolitan's service area to adopt and enact water savings ordinances. Extremely dry conditions continued in 2015. In support of the Governor's Executive Order B-29-15 calling for 25 percent reductions in statewide consumer water use, Metropolitan's Board declared a Condition 3: Water Supply Allocation in April 2015.

### *Water Supply Allocation Plan*

The WSAP provides a formula for allocating available water supplies to the member agencies in case of extreme water shortages within Metropolitan's service area. The WSAP was approved by Metropolitan's Board in February 2008 and has since been implemented three times, most recently in April 2015. The WSAP was developed in consideration of the principles and guidelines described in the WSDM Plan, with the objective of creating an equitable needs-based allocation. The WSAP formula seeks to balance the impacts of a shortage at the retail level for shortages of Metropolitan supplies of up to 50 percent. The formula takes into account

growth, local investments, changes in supply conditions, and the demand hardening aspects of non-potable recycled water use and the implementation of conservation savings programs.

### *Water Supply Allocation Plan Development*

Between July 2007 and February 2008, Metropolitan staff worked jointly with Metropolitan's member agencies to develop the WSAP. Throughout the development process, Metropolitan's Board was provided with regular progress reports on the status of the WSAP. The WSAP was adopted at the February 12, 2008 Board meeting. Since the WSAP's adoption in 2008, Metropolitan has worked extensively with the member agencies to periodically review the WSAP formula. Following Board-directed formal review of the WSAP at 12 months after initial implementation and at 3 years after initial adoption, the Board approved adjustments to the WSAP formula on August 17, 2010, and September 13, 2011. In light of drought conditions, Metropolitan staff convened a member agency working group between July and November 2014 to revisit the WSAP before possible implementation in 2015. On December 9, 2014, the Board approved additional adjustments to the formula.

#### The WSAP Formula

The WSAP formula is calculated in three steps: base period calculations, allocation year calculations, and supply allocation calculations. The first two steps involve standard computations, while the third step contains specific methodology developed for the WSAP.

##### *Step 1: Base Period Calculations*

The first step in calculating a water supply allocation is to estimate water supply and demand using a historical base period with established water supply and delivery data. The base period for each of the different categories of demand and supply is calculated using data from fiscal years (July through June) ending 2013 and 2014.

##### *Step 2: Allocation Year Calculations*

The next step in calculating the water supply allocation is estimating water needs in the allocation year. This is done by adjusting the base period estimates of retail demand for population growth and changes in local supplies.

##### *Step 3: Supply Allocation Calculations*

The final step is calculating the water supply allocation for each member agency based on the allocation year water needs identified in Step 2. There are a number of adjustments that go into a member agency's water supply allocation. Each element and its application in the allocation formula are discussed in detail in Metropolitan's WSAP.

#### Annual Reporting Schedule on Supply/Demand Conditions

Managing Metropolitan's water supply resources to minimize the risk of shortages requires timely and accurate information on changing supply and demand conditions throughout the year. To facilitate effective resource management decisions, the WSDM Plan includes a monthly schedule for providing supply/demand information to Metropolitan's senior management and Board, and for making resource allocation decisions. Table 2-8 shows this schedule.

**Table 2-8**
**Schedule of Reporting and Water Supply Allocation Decision-Making**

| Month | Information Report/Management Decision |
|---|---|
| January | Initial supply/demand forecasts for year |
| February - March | Update supply/demand forecasts for year |
| April - May | Finalize supply/demand forecasts<br>Management decisions re: Contractual Groundwater and Option Transfer Programs<br>Board decision re: Need for Extraordinary Conservation |
| October - December | Report on Supply and Carryover Storage |

## 2.5 Catastrophic Supply Interruption Planning

The third type of planning needed to evaluate supply reliability is a catastrophic supply interruption plan that documents the actions necessary for a catastrophic interruption in water supplies. For Metropolitan, this planning is captured in the analysis that went into developing the Emergency Storage Requirements.

### *Emergency Storage Requirements*

Metropolitan established its criteria for determining emergency storage requirements in the October 1991 Final Environmental Impact Report for the Eastside Reservoir, which is now named Diamond Valley Lake. These criteria were again discussed in the 1996 IRP. Metropolitan's Board approved both of these documents.

Emergency storage requirements are based on the potential of a major earthquake damaging the aqueducts that transport Southern California's imported water supplies (SWP, CRA, and Los Angeles Aqueduct). The adopted criteria assume that damage from such an event could render the aqueducts out of service for six months. Therefore, Metropolitan has based its planning on a 100 percent reduction in these imported supplies for a period of six months, which is a greater shortage than required by the Act.

To safeguard the region from catastrophic loss of water supply, Metropolitan has made substantial investments in emergency storage. The emergency plan outlines that under such a catastrophe, non-firm service deliveries would be suspended, and firm supplies to member agencies would be restricted by a mandatory cutback of 25 percent from normal-year demand levels. At the same time, water stored in surface reservoirs and groundwater basins under Metropolitan's program would be made available, and Metropolitan would draw on its emergency storage, as well as other available storage. In addition to DVL, Metropolitan has access to emergency storage at its other reservoirs, and at the SWP terminal reservoirs, and in its groundwater conjunctive use storage accounts. With few exceptions, Metropolitan can deliver this emergency supply throughout its service area via gravity, thereby eliminating dependence on power sources that could also be disrupted by a major earthquake. The WSDM Plan shortage stages will guide Metropolitan's management of available supplies and resources during the emergency to minimize the impacts of the catastrophe. Additional discussion of emergency storage is included in Appendix A.3.3.

### *Electrical Outages*

Metropolitan has also developed contingency plans that enable it to deal with both planned and unplanned electrical outages. These plans include the following key points:

- In event of power outages, water supply can be maintained by gravity feed from regional reservoirs such as DVL, Lake Mathews, Castaic Lake, and Silverwood Lake.
- Maintaining water treatment operations is a key concern. As a result, all Metropolitan treatment plants have backup generation sufficient to continue operating in the event of supply failure on the main electrical grid.
- Valves at Lake Skinner can be operated by the backup generation at the Lake Skinner treatment plant.
- Metropolitan owns mobile generators that can be transported quickly to key locations if necessary.

## 2.6 Other Supply Reliability Risks

Metropolitan provides water to a broad and heterogeneous service area with water supplies from a variety of sources and geographic regions. Each of these demand areas and supplies has its own unique set of benefits and challenges. Among the challenges Metropolitan faces are the following:

### *Supplies*

- The region and Colorado River Basin have been experiencing drought conditions for multiple years. In the past 16 years (2000-2015), there have been only three years when the Colorado River flow has been above average. The last above-average year was 2011, when the unregulated water year inflow to Lake Powell was 139 percent of average.
- Endangered species protection and conveyance needs in the Sacramento-San Joaquin River Delta System have resulted in operational constraints that are particularly important because pumping restrictions impact many water resource programs – SWP supplies and additional voluntary transfers, Central Valley storage and transfers, in-region groundwater storage, and in-region surface water storage.
- Changing climate patterns are predicted to shift precipitation patterns and possibly affect water supply.
- Difficulty and implications of environmental review, documentation, and permitting for multi-year transfer agreements, recycled water projects, and seawater desalination plants.
- Public perception of recycled water use.
- Opposition to local seawater desalination projects from environmental groups and community organizations.

### *Operations and Water Quality*

- The cost and use of energy and greenhouse gas emissions.
- Water quality regulations and issues like the quagga mussels within the CRA. Controlling the spread and impacts of the quagga mussels will require more extensive maintenance and reduced operational flexibility.
- Salt and concentrate balance from a variety of sources.

### *Demand*

- Fluctuations in population and economic growth.
- Uncertain location of growth.
- Uncertain housing stock and density.
- Changes in outdoor water use patterns.

The challenges posed by continued population growth, environmental constraints on the reliability of imported supplies, and new uncertainties imposed by climate change demand that Metropolitan assert the same level of leadership and commitment to taking on large-scale regional solutions to providing water supply reliability. New solutions are potentially available in the form of dramatically improved water-use efficiency, indirect and direct potable use of recycled water, and large-scale application of ocean desalinization.

### *Distribution System Water Losses*

Metropolitan followed the AWWA Water Audit methodology to track all sources of water and uses of water within its system. The AWWA Water Audit methodology quantifies real and apparent water system losses in an agency's distribution system. Section 10631(e)(3)(A) of the California Water Code requires that the 2015 Urban Water Management Plan update quantify distribution system water losses for the most recent 12-month period available.

For the distribution system water losses assessment, Metropolitan included its water balance audit for calendar years 2014 and 2013. In addition, Metropolitan also included a memorandum that provides water balance assessment for year 2012.

The results of Metropolitan's audit showed that the total amount of distribution system water losses in 2014 was approximately 6.4 TAF. A detailed discussion of Metropolitan's distribution system water losses for 2014 is included in Appendix 7 and summarized in Table A.7-1. In addition to the distribution system losses described in the AWWA tables, Metropolitan estimates that 37 TAF was lost from reservoir evaporation occurring in Lake Mathews, Lake Skinner, and DVL during CY 2014.

### *Climate Change*

Climate change adds its own uncertainties to the challenges of planning. Metropolitan's water supply planning has been fortunate in having almost one-hundred years of hydrological data regarding weather and water supply. This history of rainfall data has provided a sound foundation for forecasting both the frequency and the severity of future drought conditions, as well as the frequency and abundance of above-normal rainfall. But, weather patterns can be expected to shift dramatically and unpredictably in a climate driven by increased concentrations of carbon dioxide in the atmosphere. These changes in weather significantly affect water supply planning, irrespective of the debate associated with the sources and cause of increasing concentrations of greenhouse gasses. As a major steward of the region's water supply resources, Metropolitan is committed to performing its due diligence with respect to climate change.

#### *Potential Impacts*

While uncertainties remain regarding the exact timing, magnitude, and regional impacts of these temperature and precipitation changes, researchers have identified several areas of concern for California water planners. These include:

- Reduction in Sierra Nevada snowpack;
- Increased intensity and frequency of extreme weather events; and
- Rising sea levels resulting in
    - Impacts to coastal groundwater basins due to seawater intrusion;
    - Increased risk of damage from storms, high-tide events, and the erosion of levees; and
    - Potential pumping cutbacks on the SWP and Central Valley Project (CVP).

Other important issues of concern due to global climate change include:

- Effects on local supplies such as groundwater;
- Changes in urban and agricultural demand levels and patterns;
- Impacts to human health from water-borne pathogens and water quality degradation;
- Declines in ecosystem health and function; and
- Alterations to power generation and pumping regimes.

### *Metropolitan's Activities Related to Climate Change Concerns*

Resource Planning

Under the 2015 IRP Update, Metropolitan recognizes additional risks and uncertainties from a variety of sources:

- Water quality
- Climate change
- Regulatory and operational changes
- Project construction and implementation issues
- Infrastructure reliability and maintenance
- Demographic and growth uncertainty

Any of these risks and uncertainties, should they occur individually or collectively, may result in a negative impact to water supply reliability. While it is impossible to know how much risk and uncertainty to guard against, the region's reliability will be more secure with a long-term plan that recognizes risk and provides resource development to offset that risk. Some risk and uncertainty will be addressed by following the findings of the 2015 IRP Update. But there are other risks that may take longer to manifest, like climate change or shifts in demographic growth patterns that increase or move the demands for water.

Metropolitan has established an intensive, comprehensive technical process to identify key vulnerabilities. This Robust Decision Making (RDM) approach was used with the 2010 IRP Update. The RDM approach can show how vulnerable the region's reliability is to longer-term risks and can also establish "signposts" that can be monitored to see when critical changes may be happening. Signposts include monitoring the direction of ever-changing impacts from improved Global Climate Models, and housing and population growth patterns. The RDM approach will be revisited with the new resource reliability targets identified in the 2015 IRP Update. Initial 2015 IRP analysis indicated an additional 200,000 AF of water conservation and local supplies may be needed to address these risks. This additional supply goal will be considered when examining implementation policies and approaches as the IRP process continues.

Knowledge Sharing and Research Support

Metropolitan is an active and founding member of the Water Utility Climate Alliance (WUCA). WUCA consists of ten nationwide water providers collaborating on climate change adaptation and greenhouse gas mitigation issues. As a part of this effort, WUCA pursues a variety of activities on multiple fronts.

Member agencies of WUCA annually share individual agency actions to mitigate greenhouse gas emissions to facilitate further implementation of these programs. WUCA also monitors development of climate change-related research, technology, programs, and federal legislation.

In addition to supporting federal and regional efforts, WUCA released a white paper entitled "Options for Improving Climate Modeling to Assist Water Utility Planning for Climate Change" in January 2010. The purpose of this paper was to assess Global Circulation Models, identify key aspects for water utility planning, and make seven initial recommendations for how climate modeling and downscaling techniques can be improved so that these tools and techniques can be more useful for the water sector. Another recent WUCA publication related to water

planning is: "Embracing Uncertainty: A Case Study Examination of How Climate Change is Shifting Water Utility Planning" (2015). A fundamental goal of this recent white paper is to provide water professionals with practical and relevant examples, with insights from their peers, on how and why to modify planning and decision-making processes to better prepare for a changing climate.

In addition to these efforts, the member agencies of WUCA annually share individual agency actions to mitigate greenhouse gas emissions to facilitate further implementation of these programs. At a September 2009 summit at the Aspen Global Change Institute, WUCA members met with global climate modelers, along with federal agencies, academic scientists, and climate researchers, to establish collaborative directions to progress climate science and modeling efforts. WUCA continues to pursue these opportunities and partnerships with water providers, climate scientists, federal agencies, research centers, academia and key stakeholders.

Metropolitan also continues to pursue knowledge sharing and research support activities outside of WUCA. Metropolitan regularly provides input and direction on California legislation related to climate change issues. Metropolitan is active in collaborating with other state and federal agencies, as well as non-governmental organizations, on climate change related planning issues. The following list provides a sampling of entities that Metropolitan has recently worked with on a collaborative basis:

- USBR
- U.S. Army Corps of Engineers
- AWWA Research Foundation
- National Center for Atmospheric Research
- California Energy Commission
- California Department of Water Resources

Quantification of Current Research

Metropolitan continues to incorporate current climate change science into its planning efforts. A major component of the current IRP update effort is to explicitly reflect uncertainty in Metropolitan's future water management environment. This involves evaluating a wider range of water management strategies, and seeking robust and adaptive plans that respond to uncertain conditions as they evolve over time, and that ultimately will perform adequately under a wide range of future conditions. The potential impacts and risks associated with climate change, as well as other major uncertainties and vulnerabilities, have been incorporated into the update. Overall, Metropolitan's planning activities strive to support the Board adopted policy principles on climate change by:

- Supporting reasonable, economically viable, and technologically feasible management strategies for reducing impacts on water supply,
- Supporting flexible "no regret" solutions that provide water supply and quality benefits while increasing the ability to manage future climate change impacts, and
- Evaluating staff recommendations regarding climate change and water resources under the California Environmental Quality Act (CEQA) to avoid adverse effects on the environment.

Implementation of Programs and Policies

Metropolitan has made great efforts to implement greenhouse gas mitigation programs and policies for its facilities and operations. To date, these programs and policies have focused on:

- Exploring water supply/energy relationships and opportunities to increase efficiencies;
- Participating in The Climate Registry, a nonprofit greenhouse gas emissions registry for North America that provides organizations with the tools and resources to help them calculate, verify, report, and manage their greenhouse gas emissions in a publicly transparent and credible way;
- Acquiring "green" fleet vehicles, and supporting an employee Rideshare program;
- Developing solar power at both the Skinner water treatment plant (completed) and the Weymouth water treatment plant (in progress); and
- Identifying and pursuing development of "green" renewable water and energy programs that support the efficient and sustainable use of water.

Metropolitan also continues to be a leader in efforts to increase regional water use efficiency. Metropolitan has worked to increase the availability of incentives for local conservation and recycling projects, as well as supporting conservation Best Management Practices for industry and commercial businesses.

## 2.7 Pricing and Rate Structures

### *Revenue Management*

A high proportion of Metropolitan's revenues come from volumetric water rates. Water sales revenues are approximately 80 percent of Metropolitan's total revenues. As a result, Metropolitan's revenues vary according to regional weather and the availability of statewide water supplies. In dry years, local demands increase, and Metropolitan may receive higher than anticipated revenues due to increased sales volumes. In contrast, in wet years, demands decrease, and revenues drop due to lower sales volumes. In addition, statewide supply shortages such as those in 2009 and 2015 also affect Metropolitan's revenues. Such revenue surpluses and shortages could cause instability in water rates. To mitigate this risk, Metropolitan maintains financial reserves, with a minimum and target balance, to stabilize water rates during times of reduced water sales. The reserves hold revenues collected during times of high water sales and are used to offset the need for revenues during times of low sales.

Another way to mitigate rate increases is by generating a larger portion of revenues from fixed sources. Metropolitan currently has two fixed charges, the Readiness-to-Serve Charge (RTS) and the Capacity Charge. Metropolitan also collects tax revenue from taxable property within its boundaries. The revenues from fixed charges generate approximately 18 percent of all Metropolitan revenues. RTS revenues have been increasing gradually, from $136 million in fiscal year 2011-12, to $155.5 million in fiscal year 2015-16.

Finally, Metropolitan generates revenue from interest income, hydroelectric power sales, and miscellaneous income such as rents and leases. For the last five fiscal years, these averaged approximately three percent of all Metropolitan revenues. These internally generated revenues are referred to as revenue offsets and reduce the amount of revenue that needs to be collected from rates and charges.

### *Elements of Rate Structure*

This section provides an overview of Metropolitan's rate structure. The different elements of the rate structure are discussed below and summarized in Table 2-9.

#### *System Access Rate (SAR)*

The SAR is a volumetric system-wide rate levied on each acre-foot of water that moves through the Metropolitan system. All system users (member agency or third party) pay the SAR to use Metropolitan's conveyance and distribution system. The SAR recovers the cost of providing conveyance and distribution capacity to meet average annual demands.

#### *Water Stewardship Rate (WSR)*

The WSR recovers the costs of providing financial incentives for existing and future investments in local resources including conservation and recycled water. These investments or incentive payments are identified as the "demand management" service function in the cost of service process. The WSR is a volumetric rate levied on each acre-foot of water that moves through the Metropolitan system.

#### *System Power Rate (SPR)*

The SPR recovers the costs of energy required to pump water to Southern California through the SWP and CRA. The cost of power is recovered through a uniform volumetric rate. The SPR is applied to all deliveries to member agencies.

### *Treatment Surcharge*

The treatment surcharge recovers the costs of providing treated water service through a uniform, volumetric rate. The treatment surcharge recovers all costs associated with providing treated water service, including commodity, demand, and standby related costs.

### *Capacity Charge*

The capacity charge is levied on the maximum summer day demand placed on the system between May 1 and September 30 for a three-calendar year period. Demands measured for the purposes of billing the capacity charge include all firm demands, including wheeling service and exchanges.

The capacity charge is intended to pay for the cost of peaking capacity on Metropolitan's system, while providing an incentive for local agencies to decrease their use of the Metropolitan system to meet peak day demands and to shift demands into lower use time periods. Over time, a member agency will benefit from local supply investments and operational strategies that reduce its peak day demand on the system in the form of a lower total capacity charge.

### *Readiness-To-Serve Charge (RTS)*

The costs of infrastructure projects needed to provide service, including emergency storage and those costs related to the conveyance and distribution system that are available but not used on average, are recovered by the RTS.

The RTS is allocated to the member agencies based on each agency's proportional share of a ten-year rolling average of all firm deliveries. A ten-year rolling average leads to a relatively stable RTS allocation that reasonably represents an agency's potential long-term need for standby service under different demand conditions. Member agencies may choose to have a portion of their total RTS obligation offset by standby charge collections levied by Metropolitan on behalf of the member agency. These standby charges are assessed on parcels of land within the boundaries of a given member agency.

### *Tier 1 Supply Rate*

The costs of maintaining existing supplies and developing additional supplies are recovered through a two-tiered pricing approach. The Tier 1 Supply Rate recovers the cost of maintaining a reliable amount of supply. Each member agency has a predetermined amount of water that can be purchased at the lower Tier 1 Supply Rate. Purchases in excess of this limit will be made at the higher Tier 2 Supply Rate.

### *Tier 2 Supply Rate*

The Tier 2 Supply Rate reflects Metropolitan's cost of purchasing water transfers north of the Delta. The Tier 2 Supply Rate encourages the member agencies and their customers to maintain existing local supplies and develop cost-effective local supply resources and conservation.

**Table 2-9**
**Rate Structure Components**

| Rate Design Elements | Service Provided/ Costs Recovered | Type of Charge |
|---|---|---|
| System Access Rate | Conveyance/Distribution (Average Capacity) | Volumetric ($/AF) |
| Water Stewardship Rate | Conservation/Local Resources | Volumetric ($/AF) |
| System Power Rate | Power | Volumetric ($/AF) |
| Treatment Surcharge | Treatment | Volumetric ($/AF) |
| Capacity Charge | Peak Distribution System Capacity | Fixed ($/cfs) |
| Readiness-To-Serve Charge | Conveyance/Distribution/Emergency Storage(infrastructure necessary to provide service) | Fixed ($Million) |
| Tier 1 Supply Rate | Supply | Volumetric ($/AF) |
| Tier 2 Supply Rate | Supply | Volumetric ($/AF) |

The following tables provide further information regarding Metropolitan's rates. Table 2-10 summarizes the rates and charges effective January 1, 2014, January 1, 2015, and January 1, 2016. Average costs by member agency will vary depending upon an agency's RTS allocation, Capacity Charge, and relative proportions of treated and untreated Tier 1, and Tier 2 water purchases. Table 2-11 provides the details of the Capacity Charge, calculated for calendar year 2016.

Table 2-12 provides the details of the Readiness-to-Serve Charge calculation for calendar year 2016 by member agency. Table 2-13 provides the current Purchase Order commitment quantities that member agencies will purchase from Metropolitan over the 10-year period starting January 2015 through December 2024. Tier 1 annual average limits for each member agency are also shown in this table.

**Table 2-10**
**Metropolitan Water Rates and Charges**

| Effective | Jan 1, 2014 | Jan 1, 2015 | Jan 1, 2016 |
|---|---|---|---|
| Tier 1 Supply Rate ($/AF) | $148 | $158 | $156 |
| Tier 2 Supply Rate ($/AF) | $290 | $290 | $290 |
| System Access Rate ($/AF) | $243 | $257 | $259 |
| Water Stewardship Rate ($/AF) | $41 | $41 | $41 |
| System Power Rate ($/AF) | $161 | $126 | $138 |
| Full Service Untreated Volumetric Cost ($/AF) | | | |
| Tier 1 | $593 | $582 | $594 |
| Tier 2 | $735 | $714 | $728 |
| Treatment Surcharge ($/AF) | $297 | $341 | $348 |
| Full Service Treated Volumetric Cost ($/AF) | | | |
| Tier 1 | $890 | $923 | $942 |
| Tier 2 | $1,032 | $1,055 | $1,076 |
| Readiness-to-Serve Charge ($M) | $166 | $158 | $153 |
| Capacity Charge ($/cfs) | $8,600 | $11,100 | $10,900 |

**Table 2-11**
**Capacity Charge Detail Calendar Year 2016**

| | Peak Day Demand (cfs) (May 1 through September 30) Calendar Year | | | | |
|---|---|---|---|---|---|

# Implementing the Plan 3

This section summarizes Metropolitan's implementation plans and continued progress in developing a diversified resource mix that enables the region to meet its water demands under a wide range of possible future conditions. The investments that Metropolitan has made and its on-going efforts in many different areas coalesce toward its goal of long-term regional water supply reliability. Many of the resource programs discussed are already successfully implemented. Others will take more time to execute. Considerations are also in place for emerging integrated supplies, which could augment sources of regional water supply from non-traditional sources. In addition, water demand reductions brought about by legislative mandates could also affect the landscape of future supply planning and implementation. The following sections discuss each of these programs, presenting both successes to date and the programs that are still underway.

Metropolitan's IRP implementation approach has been consistent with the Governor's California Water Action Plan that was released in January of 2014. The Governor's Plan is discussed briefly below.

### *California Water Action Plan*

California Water Action Plan: Actions for Reliability, Restoration and Resilience, was released by Governor Brown in January 2014. A collaborative effort of the California Natural Resources Agency, the California Environmental Protection Agency, and California Department of Food and Agriculture, the California Water Action Plan was developed to meet three broad objectives: more reliable water supplies, the restoration of important species and habitat, and a more resilient, sustainably managed water resources system (water supply, water quality, flood protection, and environment) that can better withstand inevitable and unforeseen pressures in the coming decades.

Over the next five years, the actions outlined below are designed to move California toward more sustainable water management by providing a more reliable water supply for farms and communities, restoring important wildlife habitat and species, and helping the state's water systems and environment become more resilient.

1. Make conservation a California way of life;
2. Increase regional self-reliance and integrated water management across all levels of government;
3. Achieve the co-equal goals for the Delta;
4. Protect and restore important ecosystems;
5. Manage and prepare for dry periods;
6. Expand water storage capacity and improve groundwater management;
7. Provide safe water for all communities;
8. Increase flood protection;
9. Increase operational and regulatory efficiency; and
10. Identify sustainable and integrated financing opportunities.

## 3.1 Colorado River Aqueduct

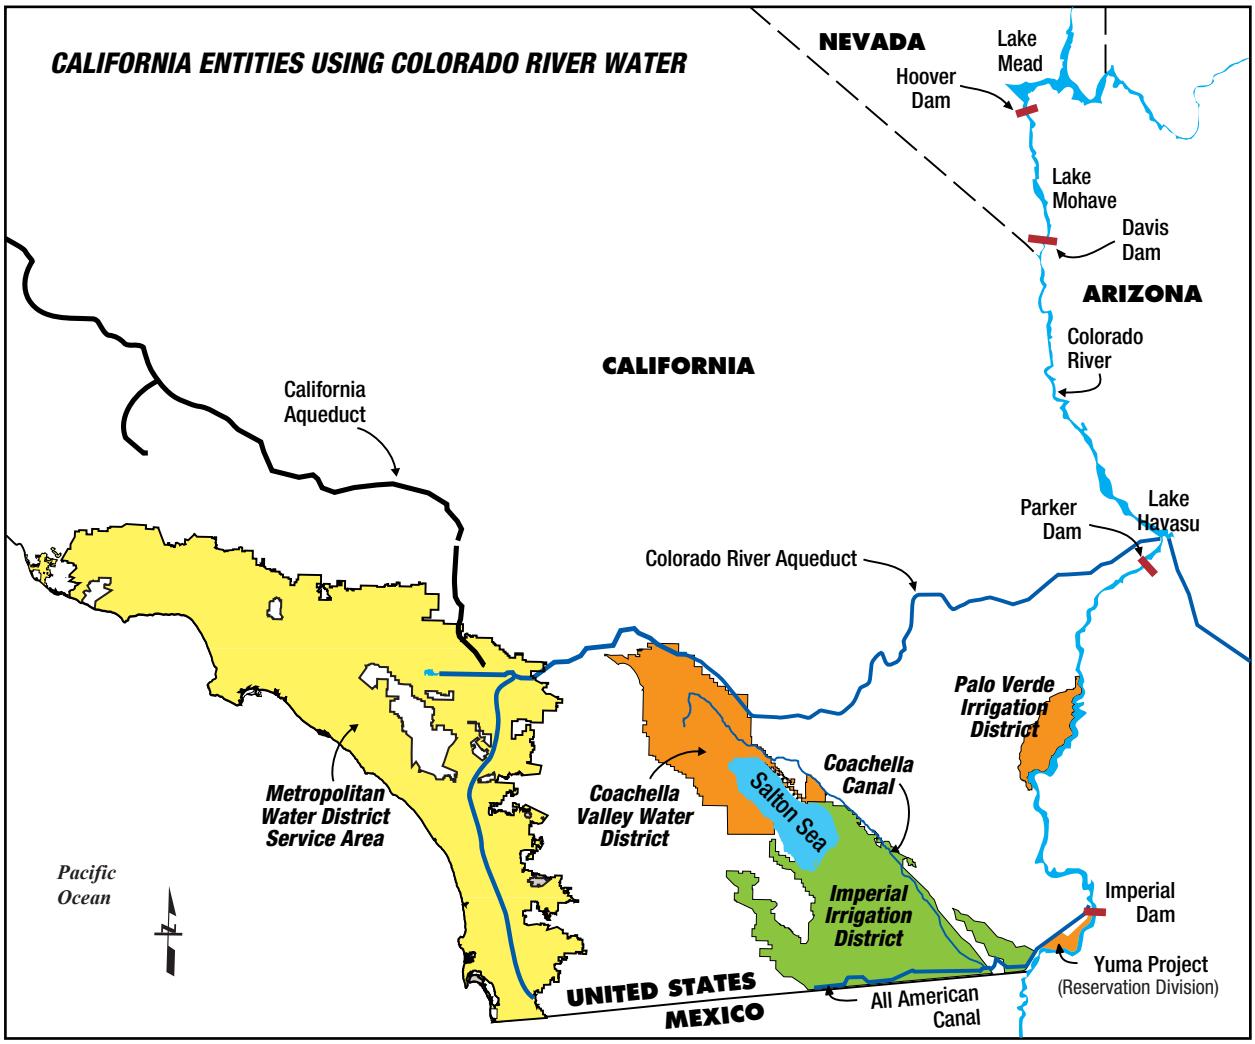
The goal for CRA supplies is to maintain current supplies and programs, while also maintaining flexibility through dry-year programs and storage. This goal involves protecting existing supply and storage programs in the face of risks that could impact CRA supplies in the future. To accomplish this goal, the 2015 IRP Update targets are to develop sufficient base supply programs to ensure that a minimum of 900 TAF of diversions are available when needed, and to ensure access to 1.2 MAF of supplies in dry years through flexible programs and storage.

### *Background*

Metropolitan was established to obtain an allotment of Colorado River water, and its first mission was to construct and operate the CRA. Under its contracts with the federal government, Metropolitan has a basic entitlement of 550 TAF per year of Colorado River water. Metropolitan also holds a fifth priority for an additional 662 TAF per year that exceeds California's 4.4 MAF per year basic apportionment, and another 180 TAF per year when surplus flows are available. Metropolitan can obtain water under the fifth priority from:

- Water unused by the California holders of priorities 1 through 3
- Water saved by the Palo Verde land management, crop rotation, and water supply program, or
- When the U.S. Secretary of the Interior makes available either or both:
    - Surplus water, and
    - Water apportioned to, but unused by, Arizona and/or Nevada.

To satisfy a condition imposed by Congress in the Boulder Canyon Project Act, California's legislature enacted the Limitation Act in 1929, agreeing to limit consumptive use of Colorado River water to 4.4 MAF per year, plus not more than one-half of any excess or surplus waters unapportioned by the Colorado River Compact. The 1931 Seven Party Agreement provides the basis for the priorities among California's contractors to use of Colorado River water made available to California. Palo Verde Irrigation District (PVID), the Yuma Project (Reservation Division), Imperial Irrigation District (IID), and Coachella Valley Water District (CVWD), collectively the "agricultural entities", and Metropolitan are the entities that currently hold the priorities. These priorities are included in the contracts that the Department of the Interior executed with the California agencies in the 1930s for delivery of water from Lake Mead. The first four priorities total 4.4 MAF per year. Metropolitan has the fourth priority of 550 TAF to California's basic apportionment and the fifth priority to 662 TAF per year. Under priorities 1 through 3, an amount not to exceed 3.85 MAF was apportioned to the agricultural entities for beneficial consumptive use. The Seven Party Agreement did not specify individual quantities for each of the first three priorities; rather, the amount of water available under the third priority was limited to the amount unused by the holders of priorities 1 and 2 on designated areas of land. This lack of quantification among the agricultural priorities posed an obstacle to the acquisition of water from the agricultural entities for use in Metropolitan's service area.



The Consolidated Decree issued in 2006 by the U.S. Supreme Court in *Arizona v. California*, preceded by a 1964 decree, confirmed the allocation of 4.4 MAF per year to California. This limit effectively reduced Metropolitan's dependable supply of Colorado River water to its fourth priority amount of 550 TAF per year. A 1979 decree quantified present perfected rights (PPRs) to the use of Colorado River water by certain Indian reservations, federal wildlife refuges, and other users. Some, but not all of these PPRs, are encompassed by the Seven Party Agreement. Consumptive use under these non-encompassed PPRs, known as "Miscellaneous and Indian

PPRs," could reach as much as 61 TAF annually. Since 1985, these PPR holders have used less than 20 TAF annually. Because over 5.362 MAF of Colorado River water were already allocated by California's Seven Party Agreement, it was not clear which rights would be affected by the use of these non-encompassed PPRs.

For a period following the Court's 1964 ruling, Metropolitan's fifth priority rights were satisfied with water allocated to, but unused by, Arizona and Nevada. With the commencement of Colorado River water deliveries to the Central Arizona Project in 1985, the availability of Colorado River water to meet Metropolitan's needs was determined on a year-by-year basis. At that time, no formal guidelines existed to determine whether surplus water would be available. Decisions regarding surplus water availability were to be made at the discretion of the Secretary of the Interior. As a result, the year-to-year availability of Colorado River water to Metropolitan was uncertain.

Figure 3-1 shows the major aqueducts within southern California including those from the Colorado River, and entities within the state having rights to use water from the Colorado River.

**Figure 3-1**

### *Changed Conditions*

#### *California's Colorado River Water Use Plan and the Quantification Settlement Agreement*

Metropolitan and the State of California acknowledged that Metropolitan would obtain less water from the Colorado River in the future than Metropolitan had in the past, but the lack of clearly quantified water rights hindered efforts to promote water management projects. The Secretary of the Interior asserted that California's users of Colorado River water had to limit their use to a total of 4.4 MAF per year, plus any available surplus water. Under the auspices of the state's Colorado River Board, these users developed a draft plan to resolve the problem, which was known as "California's Colorado River Water Use Plan" or the "California Plan." It characterized how California would develop a combination of programs to allow the state to limit its annual use of Colorado River water to 4.4 MAF per year plus any available surplus water. The 2003 QSA among IID, CVWD, and Metropolitan is a critical component of the California Plan. It establishes the baseline water use for each of the agencies, facilitates the transfer of water from agricultural agencies to urban uses, and specifies that IID, CVWD, and Metropolitan would forbear use of water to permit the Secretary of the Interior to satisfy the uses of the PPRs not covered by the Seven Party Agreement.

On November 5, 2003, IID filed a validation action in Imperial County Superior Court, seeking a judicial determination that thirteen agreements associated with the QSA are valid, legal, and binding. Other lawsuits also were filed challenging the execution, approval, and subsequent implementation of the QSA on various grounds. All of the QSA cases were coordinated in Sacramento County Superior Court. After more than a decade of litigation, the final challenges to the QSA were dismissed, and the agreements were upheld.

SDCWA is participating in two QSA-related projects that are providing additional water supplies to that agency.[4] The water conserved by these projects is made available to Metropolitan, resulting in increased amounts of Colorado River water being diverted into the CRA. In exchange, Metropolitan is delivering an amount of water equal to the amount conserved for SDCWA. Federal law allocates a portion of the water available as a result of the Coachella and All-American Canal lining projects for the benefit of parties, including five Indian Bands, involved in litigation over water rights to the San Luis Rey River in San Diego County once certain conditions have been satisfied. Metropolitan has agreed to exchange that water and provide an equal amount of water to the United States for use by the San Luis Rey Settlement Parties, and SDCWA has agreed to convey the water when capacity is available for use within the Settlement Parties' service areas. As the Settlement Parties have not yet satisfied the conditions required to receive the benefit of those supplies, Metropolitan has utilized this water. The remainder of the water available as a result of the canal lining projects is exchanged with SDCWA.

In 2005, Metropolitan entered into a settlement agreement in *Arizona v. California* with the Quechan Indian Tribe and other parties. The Tribe uses Colorado River water on the Fort Yuma Indian Reservation. Under the settlement agreement, the Tribe, in addition to the amounts of water decreed for the benefit of the Reservation in the 1964 decree, is entitled to (a) an additional 20 TAF of diversions from the Colorado River, or (b) the amount necessary to supply the consumptive use required for irrigation of a specified number of acres, and for the satisfaction of related uses, whichever is less. Of the additional water, 13 TAF became available to the Tribe in 2006. An additional 7 TAF becomes available to the Tribe in 2035. Metropolitan and the Tribe agreed that Metropolitan would provide incentive payments to the Tribe to limit

[4] These projects, the SDCWA/IID transfer and the Coachella and All-American canal lining projects, will be discussed in SDCWA's Urban Water Management Plan.

proposed development and utilization of their lands which would increase the tribal diversion of any of the additional water each year, thereby allowing the water to be diverted by Metropolitan.

### *Current Dry Condition*

The Colorado River Basin has been experiencing a prolonged drought, where runoff above Lake Powell has been below average for twelve of the last sixteen years. Within those sixteen years, runoff in the Colorado River Basin above Lake Powell from 2000 through 2007 was the lowest eight-year runoff on record. While runoff returned to near normal conditions during 2008-2010, drought returned in 2012 with runoff in 2012 being among the four driest in history. During these drought conditions, Colorado River system storage has decreased to 50 percent of capacity.

### *Quagga Mussels*

Quagga mussels were discovered in January of 2007 in Lake Mead and rapidly spread downstream to the Lower Colorado River. The presence and spawning of quagga mussels in the Lower Colorado River and in reservoirs located in southern California poses an immediate threat to water and power systems serving more than 25 million people in the southwestern United States. Quagga mussels (*Dreissena bugensis*) are a related species to the better-known zebra mussels (*Dreissena polymorpha*) and are indigenous to the Ukraine. They were introduced to the Great Lakes in the 1980s from fresh-water ballast of a transoceanic ship traveling from Eastern Europe. Although the introduction of these two species into drinking water supplies does not typically result in violation of drinking water standards, invasive mussel infestations can adversely impact aquatic environments and infrastructure. If unmanaged, invasive mussel infestations have been known to severely impact the aquatic ecology of lakes and rivers; clog intakes and raw water conveyance systems; reduce the recreational and aesthetic value of lakes and beaches; alter or destroy fish habitats; and render lakes more susceptible to deleterious algae blooms.

## *Implementation Approach*

Metropolitan's planning strategy recognized explicitly that program development would play an important part in reaching the target level of deliveries from the CRA. The implementation approach explored a number of water conservation programs with water agencies that receive water from the Colorado River or are located in close proximity to the CRA. Negotiating the QSA was a necessary first step for all of these programs. On October 10, 2003, after lengthy negotiations, representatives from Metropolitan, IID, and CVWD executed the QSA and other related agreements. Parties involved also included SDCWA, the California Department of Water Resources (DWR), the California DFW, the U.S. Department of the Interior, and the San Luis Rey Settlement Parties. One of those related agreements was the Colorado River Water Delivery Agreement: Federal Quantification Settlement Agreement which specifies to which agencies water will be delivered under priorities 3a and 6a of the Seven Party Agreement during its term.

Metropolitan has identified a number of programs that could be used to achieve the regional long-term development targets for the CRA, as shown in Table 3-1. Metropolitan has entered into or is exploring agreements with a number of agencies as described in this section. In addition, Appendix 3 provides a detailed discussion of these programs and describes whether the programs are being implemented, are deferred, or are under investigation.

### *Colorado River Water Management Programs*

Imperial Irrigation District / Metropolitan Water District Conservation Program

Under agreements executed in 1988 and 1989, Metropolitan has funded water efficiency improvements within IID's service area in return for the right to divert the water conserved by those investments. Under this program, IID implemented a number of structural and non-structural measures, including the lining of existing earthen canals with concrete, constructing local reservoirs and spill-interceptor canals, installing non-leak gates, and automating the distribution system. Other implemented programs include the delivery of water to farmers on a 12-hour rather than a 24-hour basis and improvements in on-farm water management through the installation of drip irrigation systems. Through this program, IID has conserved an additional 105 TAF per year on average upon completion of program implementation. Execution of the QSA and amendments to the 1988 and 1989 agreements resulted in changes in the availability of water under the program, extending the term to 2078 if the term of the QSA extends through 2077 and guaranteeing Metropolitan at least 85 TAF per year. The remainder of the conserved water is available to CVWD when needed.

Palo Verde Land Management, Crop Rotation, and Water Supply Program

In May 2004, Metropolitan's Board authorized a 35-year land management, crop rotation, and water supply program with PVID. Under the program, participating farmers in PVID are paid to reduce their water use by not irrigating a portion of their land. A maximum of 29 percent of the lands within the Palo Verde Valley can be fallowed in any given year. Under the terms of the QSA, water savings within the PVID service area are made available to Metropolitan. This program provides up to 133 TAF of water to be available to Metropolitan in certain years. In 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, and 2014 approximately 108.7, 105.0, 72.3, 94.3, 120.2, 116.3, 122.2, 73.7, 32.8, and 43.0 TAF of water, respectively, were saved and made available to Metropolitan. In March 2009, Metropolitan and PVID entered into a one-year supplemental fallowing program within PVID that provided for the fallowing of additional acreage, with savings of 24.1 TAF in 2009 and 32.3 TAF in 2010.

Management of Metropolitan-Owned Land in Palo Verde

In 2001, Metropolitan acquired 8,946 acres of irrigable farmland within the Palo Verde Irrigation District (PVID). These lands were leased to growers and were eventually enrolled in the PVID Land Management, Crop Rotation and Water Supply Program when it began in 2005. In 2015, Metropolitan acquired approximately 12,049 irrigable acres from Verbena LLC, bringing Metropolitan's ownership in the Palo Verde Valley to approximately 20,995 acres of irrigated farmland. The lands have historically been leased to growers who produced high water-using crops, such as alfalfa, using flood irrigation.

With the expiration of all leases in 2016, Metropolitan is currently identifying long-term management objectives for the land, including a shift toward less water-intensive agriculture. Strategies for reducing water use may include transitioning to low water-using crops, adopting efficient irrigation technologies such as microspray, and adopting deficit irrigation practices. In addition, Metropolitan is developing technologies for monitoring crop water use via remote sensing imagery and on-the-ground sensors.

By managing the lands for lower consumptive water use, Metropolitan expects to reduce water use in PVID by 15–29 TAF per year (additional to savings from the fallowing program), while maintaining the valley's agricultural economy. Under the terms of the QSA, any water savings within the PVID service area are made available to Metropolitan. The additional water savings are expected to accrue in 2017, after new leases for the lands are put into place.

Southern Nevada Water Authority and Metropolitan Storage and Interstate Release Agreement

SNWA has undertaken extraordinary water conservation measures to maintain its consumptive use within Nevada's basic apportionment of 300 TAF. The success of the conservation program has resulted in unused basic apportionment for Nevada. As SNWA expressed interest in storing a portion of the water with Metropolitan, the agencies, along with the United States and the Colorado River Commission of Nevada, entered into a storage and interstate release agreement in October 2004. Under the agreement, additional Colorado River water supplies are made available to Metropolitan when there is space available in the CRA to receive the water. SNWA stored approximately 330,000 acre-feet with Metropolitan through 2015. SNWA is not expected to call upon Metropolitan to return water until after 2019.

Lower Colorado Water Supply Project

In March 2007, Metropolitan, the City of Needles, and the USBR executed a Lower Colorado Water Supply Project contract. Under the contract, Metropolitan receives, on an annual basis, Lower Colorado Water Supply Project water unused by Needles and other entities adjacent to the river that do not have rights or have insufficient rights to use Colorado River water. The water supply for the project comes from groundwater wells located along the All-American Canal. A portion of the payments made by Metropolitan to Needles are placed in a trust fund for potentially acquiring a new water supply for the Project should the groundwater pumped from the project's wells become too saline for use. Metropolitan received 6.1 TAF from this project in 2014, and an estimated 5.9 TAF in 2015 based on the amount of water pumped and used by other project water users.

Lake Mead Storage Program

In May 2006, Metropolitan and the USBR executed an agreement for a demonstration program that allowed Metropolitan to leave conserved water in Lake Mead that Metropolitan would otherwise have used in 2006 and 2007. USBR would normally make unused water available to other Colorado River water users, so the program included a provision that water left in Lake Mead must be conserved through extraordinary conservation measures and not simply be water that was not needed by Metropolitan in the year it was stored. This extraordinary conservation was accomplished through savings realized under the Palo Verde Land Management, Crop Rotation, and Water Supply Program. Through the two-year demonstration program, Metropolitan created 44.8 TAF of "Intentionally Created Surplus" (ICS) water. In December 2007, Metropolitan entered into agreements to set forth the rules under which ICS water is developed, stored in, and delivered from Lake Mead. The amount of water stored in Lake Mead, created through extraordinary conservation, that is available for delivery in a subsequent year is reduced by a one-time deduction of five percent, resulting in additional system water in storage in the lake, and an annual evaporation loss of three percent, beginning in the year following the year the water is stored. Metropolitan created ICS water in 2009, 2010, 2011, and 2012 and withdrew ICS water in 2008, 2013, and 2014. As of January 1, 2015, Metropolitan had a total of 61.8 TAF of Extraordinary Conservation ICS water in Lake Mead.

The December 2007 federal guidelines concerning the operation of the Colorado River system reservoirs provided the ability for agencies to create "System Efficiency ICS" through the development and funding of system efficiency projects that save water that would otherwise be lost from the Colorado River. To that end, in 2008 the Central Arizona Water Conservation District (CAWCD), SNWA, and Metropolitan contributed funds for the construction of the Drop 2 (Brock) Reservoir by the USBR. The purpose of the Drop 2 (Brock) Reservoir is to increase the capacity to regulate deliveries of Colorado River water at Imperial Dam, reducing the amount

of excess flow downstream of the dam by approximately 70 TAF annually. In return for its $25 million net contribution toward construction, operation, and maintenance, 100 TAF of water that was stored in Lake Mead was assigned to Metropolitan as System Efficiency ICS. Through 2014, Metropolitan has diverted 35 TAF of this amount, with 65 TAF remaining in storage.

In 2009, Metropolitan entered into an agreement with the United States, SNWA, the Colorado River Commission of Nevada, and CAWCD to have USBR conduct a one-year pilot operation of the Yuma Desalting Plant at one-third capacity. The pilot project operated between May 2010 and March 2011 and provided data for future decision making regarding long-term operation of the Plant and developing a near-term water supply. Metropolitan's contribution toward plant operating costs secured 24.4 TAF of System Efficiency ICS which was stored in Lake Mead as of January 1, 2015.

Quagga Mussel Control Program

The presence and spawning of quagga mussels in the lower Colorado River from Lake Mead through Lake Havasu poses a threat to Metropolitan and other Colorado River water users due to the potential to continuously seed water conveyance systems with mussel larvae. Chlorination is the most frequently used means to control mussel larvae entering water systems.

Metropolitan developed the Quagga Mussel Control Program (QMCP) in 2007 to address the long term introduction of mussel larvae into the CRA from the lower Colorado River which is now heavily colonized from Lake Mead through Lake Havasu. The QMCP consists of surveillance activities and control measures. Surveillance activities are conducted annually alongside regularly scheduled 2-3 week-long CRA shutdowns. Control activities consist of continuous chlorination at the outlet of Copper Basin Reservoir (5 miles into the aqueduct), a mobile chlorinator for control of mussels on a quarterly basis at outlet towers, and physical removal of mussels from the trash racks at Whitsett Intake Pumping Plant in Lake Havasu. Since 2007, the CRA has scheduled 2 to 3 week-long shutdowns each year for maintenance and repairs which provide the opportunity for direct inspections for mussels and the additional benefit of desiccating quagga mussels. Recent shutdown inspections have demonstrated that the combined use of chlorine and regularly scheduled shutdowns effectively control mussel infestation in the CRA since only few and small mussels have been found during these inspections.

In addition, Metropolitan has appropriated $9.55 million to upgrade chlorination facilities in the aqueduct and at two additional locations in its system, the outlets of Lakes Mathews and Skinner. It is likely that additional upgrade costs will be incurred for these facilities. Chemical control (chlorination) at Copper Basin Reservoir, Lake Mathews, and the Lake Skinner Outlet costs approximately $3.0-3.2 million per year depending on the amount of Colorado River water conveyed through the aqueduct.

### *Achievements to Date*

Metropolitan has developed a number of supply and conservation programs to increase the amount of supply available from the CRA. However, other users along the River have rights that will allow their water use to increase as their water demands increase. The Colorado River faces long-term challenges of water demands exceeding available supply with additional uncertainties due to climate change. Because Metropolitan holds the lowest priority rights in California during a normal Lake Mead storage condition, future supply available could decrease. Metropolitan's supply and conservation programs, as well as planned additional water management programs for 2035, are shown in Table 3-1.

## 3.2 State Water Project

Much of the SWP water supply passes through the San Francisco-San Joaquin Bay-Delta (Bay-Delta). The SWP consists of a series of pump stations, reservoirs, aqueducts, tunnels, and power plants operated by DWR. Figure 3-2 shows SWP facilities. This statewide water supply infrastructure provides water to 29 urban and agricultural agencies throughout California. More than two-thirds of California's residents obtain some of their drinking water from the Bay-Delta.

The original State Water Contract called for an ultimate delivery capacity of 4.2 MAF, with Metropolitan holding a contract for 1,911 TAF. For decades, the Bay-Delta has experienced water quality and supply reliability challenges and conflicts due to variable hydrology and environmental standards that limit pumping operations. SWP deliveries in the most recent critically dry years lagged these projections, and were 5 percent of contractual amounts in 2014 and 20 percent of contractual amounts in 2015. Consequently, Metropolitan's key concern is the continual deterioration of water supply reliability.

Another important concern for Metropolitan is sustained improvement in SWP water quality. Metropolitan must be able to meet the increasingly stringent drinking water regulations that are expected for disinfection by-products and pathogens in order to protect public health. Meeting these regulations will require improving the Bay-Delta water supply by cost effectively combining alternative source waters, source improvement, and treatment facilities. Additionally, Metropolitan requires water quality improvements of Bay-Delta water supplies to meet its 500 mg/L salinity blending objective in a cost-effective manner, while minimizing resource losses and helping to ensure the viability of regional recycling and groundwater management programs.

### *Background*

The listing of several fish species as threatened or endangered under the federal or California Endangered Species Acts (respectively, the "Federal ESA" and the "California ESA" and, collectively, the "ESAs") has adversely impacted operations and limited the flexibility of the SWP. Currently, five species (the winter-run and spring-run Chinook salmon, Delta smelt, North American green sturgeon, and Central Valley steelhead) are listed under the ESAs. In addition, on June 25, 2009, the California Fish and Game Commission declared the longfin smelt a threatened species under the California ESA.

In 2004 and 2005, the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) issued biological opinions and incidental take statements that govern operations of the SWP and the CVP with respect to the Delta smelt, the winter-run and spring-run Chinook salmon, and the Central Valley steelhead. In July 2006, the USBR reinitiated consultation with the USFWS and NMFS with respect to the 2004 and 2005 biological opinions (with the addition of the North American green sturgeon, which was listed in April 2006) following the filing of legal challenges to those biological opinions and incidental take statements.

**Figure 3-2**
**Current and Projected Facilities of the State Water Project**

The Delta smelt, Sacramento River winter-run and spring-run salmon, and Central Valley steelhead are listed species under the Federal ESA. Because of the listing, the federal Central Valley Project (CVP) and SWP are prohibited from "taking" the fish in their operations and must consult with federal fisheries agencies to determine whether their operations will jeopardize the existence of the species, and if so, establish "reasonable and prudent alternatives" (RPAs) to normal project operations to minimize their impacts on the smelt and salmon.

In its revised Biological Opinion adopted on December 15, 2008, the USFWS provided criteria for operation of the CVP and SWP in a manner not likely to jeopardize the continued existence of the Delta smelt or adversely modify designated critical habitat. The NMFS made a similar finding with respect to project operation effects on the listed salmon and steelhead in its revised Biological Opinion issued on June 4, 2009. Earlier Biological Opinions were found invalid in litigation described in past annual audit-pending litigation reports. Consequently, both agencies issued an "incidental take statement" which allows the CVP and SWP to continue operation despite the fact that such operation would result in incidental take of some of the listed fish. Project operations must incorporate RPAs suggested by the agencies in the 2008 and 2009 Biological Opinions to ensure they are exempt from the otherwise applicable prohibition on "take" of Federal ESA-listed species.

In 2009, multiple lawsuits were filed by water contractors challenging the 2008 Delta smelt Biological Opinion and the USBR's failure to analyze the environmental impacts of accepting and implementing the Biological Opinion's RPAs under the National Environmental Policy Act (NEPA). The lawsuits were adjudicated before Judge Wanger in federal district court in Fresno, California. Following lengthy hearings, on December 14, 2010, the Court granted summary judgment to the water contractor plaintiffs, finding that the Delta smelt Biological Opinion was invalid and would have to be remanded to the USFWS to be redone. The Court issued a final amended judgment on May 18, 2011, remanding the matter to the USFWS. Appeals of the final amended judgment to the U.S. Court of Appeals for the Ninth Circuit were filed by the Federal Defendants and the Environmental-Interveners. The plaintiffs also filed cross-appeals. On March 13, 2014, the Ninth Circuit issued a 2-1 decision reversing the district court, and upholding the Delta smelt Biological Opinion *San Luis & Delta Mendota Water Authority v. Jewell*, 747 F.3d 581 (9th Cir. 2014). The two-judge majority ruled that the district court should not have considered extra-record testimony of experts retained by the parties, and that the Biological Opinion and RPA restrictions were supported by the best available science and were not arbitrary and capricious.[5] In October 2014, Metropolitan and other water contractors petitioned the U.S. Supreme Court for a writ of certiorari for the Court's review of whether USFWS must consider economic impacts of the RPA restrictions on the general public and third parties. On January 12, 2015, the U.S. Supreme Court denied the petitions. *Stewart & Jasper Orchards v. Jewell*, U.S., No. 14-377, *cert. denied* 1/12/15, *State Water Contractors v. Jewell*, U.S., No. 14-402, *cert. denied* 1/12/15. The Court's orders let stand the March 2014 Ninth Circuit ruling upholding the Biological Opinion and RPAs.

In 2009, multiple lawsuits were also filed challenging the 2009 salmon Biological Opinion and also adjudicated before Judge Wanger in federal district court. On September 20, 2011, the Court issued a decision that invalidated the salmon Biological Opinion and remanded it to NMFS for preparation of a new Biological Opinion. Both the Environmental-Interveners and the Federal Defendants appealed the final judgment to the Ninth Circuit. In a decision issued on

[5] The Ninth Circuit confirmed the District Court ruling that USBR must analyze the RPAs under NEPA. USBR has prepared a Final Environmental Impact Statement analyzing the impacts of implementing the RPAs in both Biological Opinions and expects to issue a Record of Decision in early 2016. It remains to be seen whether USBR will approve an alternative to the RPAs or how that may affect SWP supplies.

December 22, 2014, a three-judge panel of the Ninth Circuit unanimously reversed the district court decision by Judge Wanger. The ruling validates the Biological Opinion and the RPAs issued by NMFS in 2009, which include seasonal limits on export and river operations imposed to protect the salmonid species.

The impact on SWP deliveries attributable to the Delta smelt and salmonid species biological opinions combined is estimated to be 1.0 MAF in an average year, reducing SWP deliveries from approximately 3.3 MAF to approximately 2.3 MAF for the year under average hydrology.

In addition to the litigation under the Federal ESA, in March 2009, the State Water Contractors filed suit in Sacramento Superior Court challenging the California ESA 2081 permit that authorizes the incidental take of longfin smelt from SWP operations. The lawsuit alleges that the restrictions on water exports imposed under the 2081 California ESA permit are excessive and are not scientifically justified. This case was voluntarily dismissed without prejudice in February 2014 pursuant to a settlement agreement which provides for dismissal of the litigation and the establishment of a collaborative longfin smelt science study program.

DWR has altered the operations of the SWP to accommodate species of fish listed under the ESAs. These changes in project operations have adversely affected SWP deliveries. Between 2008 and 2014, restrictions on Bay-Delta pumping under the Biological Opinion have reduced deliveries of SWP water by 3 MAF to the state water contractors and by approximately 1.5 MAF to Metropolitan.

Operational constraints likely will continue until a long-term solution to the problems in the Bay-Delta is identified and implemented. The Delta Vision process, established by Governor Schwarzenegger, was aimed at identifying long-term solutions to the conflicts in the Bay-Delta, including natural resource, infrastructure, land use, and governance issues. In addition, State and federal resource agencies and various environmental and water user entities are currently engaged in the development of the Bay Delta Conservation Plan (BDCP)/California WaterFix, which is aimed at making physical and operational improvements to the SWP system in the Delta necessary to restore and protect ecosystem health, south-of-Delta SWP and CVP water supplies, and water quality.

Other issues, such as the recent decline of some fish populations in the Bay-Delta and surrounding regions and certain operational actions in the Bay-Delta, may significantly reduce Metropolitan's water supply from the Bay-Delta. Biological opinions or incidental take authorizations under the Federal ESA and California ESA might further adversely affect SWP and CVP operations. Additionally, new litigation, listings of additional species under the ESAs, or new regulatory requirements imposed by the SWRCB could further adversely affect SWP operations in the future by requiring additional export reductions, releases of additional water from storage, or other operational changes impacting water supply operations. Metropolitan cannot predict the ultimate outcome of any of the litigation or regulatory processes described above, but believes they could have an adverse impact on the operation of the SWP pumps, Metropolitan's SWP supplies, and Metropolitan's water reserves.

### *Changed Conditions*

In July 2015, DWR released the 2015 State Water Project Delivery Capability Report. The 2015 Delivery Capability Report provides estimates of the current (2015) and future (2035) SWP delivery capability for each SWP contractor under a range of hydrologic conditions. These estimates incorporate regulatory requirements in accordance with USFWS and NMFS biological opinions. In addition, these estimates of future capability also reflect potential impacts of climate change and sea level rise.

Metropolitan used a number of modeling studies from the 2015 Delivery Capability Report for its SWP supplies forecasts during the 2015 UWMP planning horizon. Metropolitan used the Base Scenario as the current 2015 condition and transitioned to the delivery capability from the Early Long-Term in the next five years. For 2020 through 2029, Metropolitan uses the forecasts from the Existing Conveyance Low Outflow (ECLO) scenario. Metropolitan uses the Alternative 4a study associated with the recirculated draft environmental impact report (EIR)/supplemental draft environmental impact statement (EIS) on the California Water Fix for SWP deliveries for 2030 and beyond.

### *Implementation Approach*

Metropolitan's implementation approach for the SWP depends on the full use of the current State Water Contract provisions, including its basic contractual amounts, Article 21 interruptible supplies, and Turnback Pool supply provisions. In addition, it requires successful negotiation and implementation of a number of agreements**,** including the Sacramento Valley Water Management (Phase 8 Settlement) Agreement, and the BDCP/California WaterFix. Each of these stakeholder processes or agreements involves substantial Metropolitan and member agency staff involvement to represent regional interests. Metropolitan is committed to working collaboratively with DWR, SWP contractors, and other stakeholders to ensure the success of these extended negotiations and programs.

#### *SWP Reliability*

This discussion provides details of the major actions Metropolitan is undertaking to improve SWP reliability. The BDCP/California WaterFix is being prepared through a collaboration of state, federal, and local water agencies, state and federal fish agencies, environmental organizations, and other interested parties. At the outset of the BDCP process, a planning agreement was developed and executed among the participating parties, and a Steering Committee was formed. The plan would identify a set of water flow and habitat restoration actions that would contribute to the recovery of endangered and sensitive species and their habitats in California's Bay-Delta. The goal of the BDCP was to provide for both species/habitat protection and improved reliability of water supplies.

The First Administrative Draft of the BDCP was released in March 2012. The Administrative Draft EIR/EIS analyzed 15 alternatives, including a broad combination of water delivery configurations, capacities, operations and habitat restoration targets, as well as a no action alternative. The alternatives are the result of public scoping sessions conducted in 2008 and 2009, the Sacramento-San Joaquin Delta Reform Act, ongoing public discussions, and input from responsible/trustee state agencies and NEPA cooperating agencies.

In July 2012, Governor Jerry Brown and U.S. Interior Secretary Ken Salazar outlined revisions to the proposed BDCP plan, along with a full range of alternative proposals. Elements of the preferred proposal include construction of two side-by-side tunnels and water intake facilities with a total capacity of 9,000 cfs - down from the earlier proposal of 15,000 cfs. Operation of the facilities was planned to be phased in over several years.

Throughout 2012 and 2013, additional public meetings were held to answer questions and gather public comments. In August 2013, an optimized proposal was released that balanced costs, engineering design, and ease of construction while significantly reducing local dislocation and disturbance in the Delta.

In December 2013, the State released the Draft BDCP and the Draft EIR/EIS. The documents detailed 22 specific actions, called Conservation Measures, which included new water delivery

facilities in the north Delta, as well as measures to restore or protect up to 150,000 acres of habitat and measures to address other stressors to fish and wildlife in the Delta.

In December 2014, the State announced further refinements to the water delivery facilities to reduce impacts to Delta communities, minimize disturbances or dislocation of Greater Sandhill Cranes, and improve the long-term reliability and operation of the proposed infrastructure. During the 2013-2014 public comment period, commenters expressed concerns about the impacts of a large-scale habitat restoration effort on the Delta economy and community character. Other comments articulated concerns about the expected effectiveness of certain habitat restoration measures, the nature of climate change, and the related level of scientific uncertainty. Additionally, there were widespread concerns that the 50-year permit term sought under the BDCP was too long given the uncertainties about climate change and the effectiveness of habitat restoration, and commenters suggested that DWR should pursue permits of shorter duration. These comments prompted the State to reconsider the BDCP's ability to justify the continued pursuit of 50-year permits associated with a comprehensive conservation plan and resulted in the consideration of a sub-alternative to the original proposed project, as well as additional sub-alternatives that do not include a 50-year permit application or associated conservation plan.

In April 2015, State agencies announced a modified preferred alternative, Alternative 4A. Alternative 4A (California WaterFix) was developed as the new CEQA and NEPA Preferred Alternative, replacing Alternative 4 (the proposed BDCP). Alternative 4A includes the conveyance facilities proposed under Alternative 4 and those mitigation measures and environmental commitments needed to obtain necessary permits and authorizations for implementation under Section 7 of the Federal ESA and through the California Department of Fish and Wildlife's 2081(b) process.

California WaterFix and EcoRestore would be implemented under different Federal and State ESA regulatory permitting process (Section 7 versus Section 10(a) of the Federal ESA, and pursuant to section 2081 of the State ESA instead of the Natural Community Conservation Planning Act). This would fulfill the requirement of the 2009 Delta Reform Act to contribute toward meeting the coequal goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem.

The new water conveyance facilities would be constructed and operated under the California WaterFix, which proposes design changes to the water conveyance facilities. Refinements to the design reduce the overall environmental/construction impacts, and increase long term operational and cost benefits. Some of the engineering configuration improvements include moving the tunnel alignment away from local communities and environmentally sensitive areas. Reconfiguration of intake and pumping facilities lessen construction impacts in local communities and longer term operational impacts.

The main objective under the EcoRestore Program is the restoration of at least 30,000 acres of Delta habitat, with the near-term goal of making significant strides toward that objective by 2020. These restoration programs would include projects and actions that are in compliance with pre-existing regulatory requirements designed to improve the overall health of the Delta. Other priority restoration projects would also be identified by the Sacramento-San Joaquin Delta Conservancy and other agencies and local governments. Funding would be provided through multiple sources, including various local and federal partners, state bonds, and other state-mandated funds. State Water Project/Central Valley Project contractors would provide funds as part of existing regulatory obligations. The California WaterFix is being evaluated in the partially recirculated draft EIR/supplemental EIS released in July 2015. In that document, the cumulative impacts of the California WaterFix and EcoRestore Program are evaluated,

along with other reasonably foreseeable future projects. The public comment period closed on October 30, 2015. DWR and USBR released a working draft of the ESA biological assessment on January 15, 2016 and the independent science peer review of the draft biological assessment began on March 25, 2016.

Lead agencies for the BDCP/California WaterFix EIR/EIS are DWR, USBR, the USFWS, and NMFS, in cooperation with the California DFW, the U.S. Environmental Protection Agency (USEPA), and the U.S. Army Corps of Engineers.

Monterey Amendment

The Monterey Amendment originated from disputes between the urban and agricultural SWP contractors over how contract supplies are to be allocated in times of shortage. In 1994, in settlement discussions in Monterey, the contractors and DWR reached an agreement to settle their disputes by amending certain provisions in the long-term water supply contracts. These changes, known as the Monterey Amendment, altered the water allocation procedures such that both shortages and surpluses would be shared in the same manner for all contractors, eliminating the prior "agriculture first" shortage provision. In turn, the agricultural contractors agreed to permanently transfer 130 TAF to urban contractors and permanently retire 45 TAF of their contracted supply. The amendment facilitated several important water supply management practices including groundwater banking, voluntary water marketing, and more flexible and efficient use of SWP facilities such as borrowing from Castaic Lake and Lake Perris and using carryover storage in San Luis Reservoir to enhance dry-year supplies. It also provided for the transfer of DWR land to the Kern County Water Agency for development of the Kern Water Bank. The Monterey Amendment was challenged in court, and the original EIR invalidated. Following a settlement, DWR completed a new EIR and concluded the CEQA review in May 2010.

However, the project has been challenged again in a new round of lawsuits. Central Delta Water Agency, South Delta Water Agency, California Water Impact Network, California Sportfishing Protection Alliance, and the Center For Biological Diversity filed a lawsuit against DWR in Sacramento County Superior Court challenging the validity of the EIR under CEQA and the validity of underlying agreements under a reverse validation action (the "*Central Delta I*" case). These same plaintiffs filed a reverse validation lawsuit against the Kern County Water Agency in Kern County Superior Court ("*Central Delta II*"). This lawsuit targets a transfer of land from Kern County Water Agency to the Kern Water Bank, which was completed as part of the original Monterey Agreement. The third lawsuit is an EIR challenge brought by Rosedale-Rio Bravo Water Storage District and Buena Vista Water Storage District against DWR in Kern County Superior Court ("*Rosedale*"). The *Central Delta II* and *Rosedale* cases were transferred to Sacramento Superior Court, and the three cases were consolidated for trial.

In January 2013, the Court ruled that the validation cause of action in *Central Delta I* was time-barred by the statute of limitations. On October 2, 2014, the court issued its final rulings in *Central Delta I* and *Rosedale*, holding that DWR must complete a limited scope remedial CEQA review addressing the potential impacts of the Kern Water Bank. However, the court's ruling also allows operation of the SWP to continue under the terms of the Monterey Agreement while the remedial CEQA review is prepared and leaves in place the underlying project approvals while DWR prepares the remedial CEQA review. The *Central Delta II* case was stayed pending resolution of the *Central Delta I* case. The plaintiffs have appealed the decision.

SWP Terminal Storage

Metropolitan has contractual rights to 65 TAF of flexible storage at Lake Perris (East Branch terminal reservoir) and 154 TAF of flexible storage at Castaic Lake (West Branch terminal

reservoir). This storage provides Metropolitan with additional options for managing SWP deliveries to maximize yield from the project. Over multiple dry years, it can provide Metropolitan with 73 TAF of additional supply. In a single dry year like 1977, it can provide up to 219 TAF of additional supply to Southern California.

Yuba Dry Year Water Purchase Program

In December 2007, Metropolitan entered into an agreement with DWR providing for Metropolitan's participation in the Yuba Dry Year Water Purchase Program between Yuba County Water Agency and DWR. This program provides for transfers of water from the Yuba County Water Agency during dry years through 2025.

Desert Water Agency/Coachella Valley WD SWP Table A Transfer

Under the transfer agreement, Metropolitan transferred 100 TAF of its SWP Table A contractual amount to Desert Water Agency/CVWD (DWCV). Under the terms of the agreement, DWCV pays all SWP charges for this water, including capital costs associated with capacity in the California Aqueduct to transport this water to Perris Reservoir, as well as the associated variable costs. The amount of water actually delivered in any given year depends on that year's SWP allocation. Water is delivered through the existing exchange agreements between Metropolitan and DWCV, under which Metropolitan delivers Colorado River supplies to DWVC equal to the SWP supplies delivered to Metropolitan. While Metropolitan transferred 100 TAF of its Table A amount, it retained other rights, including interruptible water service; its full carryover amounts in San Luis Reservoir; its full use of flexible storage in Castaic and Perris Reservoirs; and any rate management credits associated with the 100 TAF. In addition, Metropolitan is able to recall the SWP transfer water in years in which Metropolitan determines it needs the water to meet its water management goals. The main benefit of the agreement is to reduce Metropolitan's SWP fixed costs in wetter years when there are more than sufficient supplies to meet Metropolitan's water management goals, while at the same time preserving its dry-year SWP supply. In a single critically dry-year like 1977, the call-back provision of the entitlement transfer can provide Metropolitan about 13 TAF of SWP supply. In multiple dry years like 1990-1992, it can provide Metropolitan about 19 TAF of SWP supply.

Desert Water Agency/Coachella Valley WD Advance Delivery Program

Under this program, Metropolitan delivers Colorado River water to the Desert Water Agency and CVWD in advance of the exchange for their SWP Contract Table A allocations. In addition to their Table A supplies, Desert Water Agency and CVWD, subject to Metropolitan's written consent, may take delivery of SWP supplies available under Article 21 and the Turn-back Pool Program. By delivering enough water in advance to cover Metropolitan's exchange obligations, Metropolitan is able to receive Desert Water Agency and CVWD's available SWP supplies in years in which Metropolitan's supplies are insufficient without having to deliver an equivalent amount of Colorado River water. This program allows Metropolitan to maximize delivery of SWP and Colorado River water in such years. These Table A deliveries are incorporated into the estimate of SWP Deliveries under Current Programs shown in Table 3-2.

Desert Water Agency/Coachella Valley WD Other SWP Deliveries

Since 2008, Metropolitan has provided Desert Water Agency and CVWD written consent to take delivery of non-SWP supplies separately acquired by each agency from the SWP facilities. These deliveries include water acquired from the Yuba Dry Year Water Purchase Program and the 2009 Drought Water Bank. Metropolitan has also consented to:

- 10 TAF of exchange deliveries to CVWD for non-SWP water acquired from the San Joaquin Valley from 2008 through 2010,
- 36 TAF of exchange deliveries to Desert Water Agency for non-SWP water acquired from the San Joaquin Valley from 2008 through 2015, and
- 16.5 TAF of exchange deliveries to CVWD from groundwater storage of Kern River flood flows or SWP water delivered from Kern County Water Agency provided by Rosedale Rio Bravo Water Storage District from 2012 through 2035.

Table 3-2 summarizes Metropolitan's SWP supply range for 2035. Appendix 3 provides a detailed discussion of the current SWP programs and programs that are under development.

### *SWP Water Quality*

Metropolitan requires a safe drinking water supply from the Bay-Delta to meet current and future regulatory requirements for public health protection. Finding cost-effective ways to reduce total organic carbon (TOC), bromide concentrations, pathogenic microbes, and other unknown contaminants from the Bay-Delta water supply is one of Metropolitan's top priorities. Metropolitan also requires a SWP supply that is consistently low in salinity - Total Dissolved Solids (TDS) - so it can blend SWP water with higher-salinity Colorado River water to achieve salinity goals for its member agencies. In addition, Metropolitan needs consistently low-salinity SWP water to increase in-basin water recycling and groundwater management programs. These programs require that blended water supplied to the member agencies meets the TDS goals adopted by Metropolitan's Board, which specify a salinity objective of 500 mg/L for blended imported water.

Metropolitan is actively involved in DWR's Municipal Water Quality Investigations (MWQI) Program. The highly variable quality of State Water Project water influences the operation of

Metropolitan's system and its water treatment process. Increasingly restrictive State and Federal drinking water standards, concerns over emerging contaminants such as personal care products and pharmaceuticals, algal taste and odors, and Delta ecosystem fisheries issues are critical variables. DWR's MWQI Program strives to monitor, protect, and improve drinking water quality of Delta water deliveries to the urban State Water Contractors and other users of Delta water. The program focuses on issues related to drinking water quality through regular water quality monitoring, special field and laboratory studies, the use of forecasting tools such as computer models and data management systems, and reporting. While the program has developed extensive monitoring in the Delta including real-time monitoring, increased monitoring along the California Aqueduct is the next major step.

Levee modifications at Franks Tract and other source control actions may significantly reduce ocean salinity concentrations in Delta water, which would benefit Delta water users and export interests alike. Franks Tract is an island located in the central Delta that was actively farmed until levee breaches in 1936 and 1938. Since 1938, the tract has remained a flooded island, and its levees remain in disrepair. Tidal flows in the Delta entrap saline ocean water in the flooded tract, resulting in degraded water quality for both in-Delta and export users. Recent computer modeling analyses by Metropolitan, DWR, and the US Geological Survey indicate that reducing this salinity intrusion by partially closing existing levee breach openings and/or building radial gate flow control structures will significantly reduce TDS and bromide[7] concentrations in water from the Delta during the summer and fall months and in drought years. Based on Metropolitan's analysis, improvements to Franks Tract alone could reduce peak bromide concentrations in the summer and fall months by about 33 percent at Contra Costa Water District's (CCWD) Rock Slough intake, by 27 percent at CCWD's Old River intake, and by 24 percent at the SWP intake in the South Delta.

DWR and USBR proposed to implement the Franks Tract Project to improve water quality and fisheries conditions in the Bay-Delta. DWR and USBR are evaluating installing operable gates to control the flow of water at key locations (Three Mile Slough and/or West False River) to reduce sea water intrusion, and to positively influence movement of fish species of concern to areas that provide favorable habitat conditions. By protecting fish resources, this project also would improve operational reliability of the SWP and CVP because curtailments in water exports (pumping restrictions) are likely to be less frequent.

The state has adopted an "equivalent level of public health protection" (ELPH) program that targets water quality actions outside the Delta. The Bay-Delta Program is coordinating a feasibility study on water quality improvement in the California Aqueduct.

Metropolitan and the Friant Water Users Authority (FWUA) have entered into a partnership to investigate the potential of enhancing the quantity and affordability of the eastern San Joaquin Valley's water supply while improving Southern California's water quality. The FWUA and Metropolitan studied projects that benefited both regions. Using Proposition 13 funds, an existing canal belonging to the Arvin-Edison Water Storage District was enlarged, enabling greater volumes of water to be exchanged between their groundwater and the California Aqueduct.

### *SWP System Outage and Capacity Constraints*

As its infrastructure ages, the SWP becomes increasingly vulnerable to natural disasters, particularly the Delta levee system and the California Aqueduct, which are both susceptible to floods and earthquakes. In June 2004, a levee in the Jones Tract of the Delta failed, resulting in

[7] The importance of bromides is discussed in the Water Quality chapter.

total inundation of the island and disrupting SWP operations. Catastrophic loss of either the Delta levee system or the aqueduct would shut down the project, affecting the welfare of millions. While Metropolitan has made substantial investments in local resources and in-basin storage to insulate Southern California against loss of its imported water supplies, additional investment is needed in the at-risk infrastructure.

The Bay-Delta Levees Program coordinates Delta levee maintenance and improvement activities. Its goal is to protect water supplies needed for the environment, agriculture, and urban uses by reducing the threat of levee failure and seawater intrusion. Over the next two to three years, DWR and other agencies will carry out a Comprehensive Program Evaluation (CPE). It will incorporate the risk study that has been commissioned by DWR, including the currently-proposed expanded scope of that study. The CPE will: (a) supplement the DWR risk study to ensure that it considers all relevant levee risks, (b) include the development of a formal strategic plan that contains a description of any proposed future program changes, and (c) recommend priorities and estimate funding needs for the Levees Program. For example, the Army Corps of Engineers' (P.L. 84-99 ROD) target will be reevaluated as part of the CPE using information from the Risk Study.

The California Aqueduct remains susceptible to floods at several points as it travels from the Delta along the west side of the San Joaquin Valley. Key among these is where the aqueduct crosses the Arroyo Pasajero, an alluvial fan located near Coalinga, California. At that spot, the aqueduct effectively forms a barrier to Arroyo flood flows. Although flood control facilities were built to protect the aqueduct, the volumes of runoff and sediment deposition are much greater than originally estimated, so a significant flood risk remains. The aqueduct was severely damaged during March of 1995 when a flood overwhelmed control facilities and overtopped the aqueduct with 10 TAF of floodwater and an estimated 800,000 cubic yards of sediment. Impacts to downstream water users lasted through the summer of 1995. In December of 2004, DWR began construction of "Phase I" improvements to the aqueduct where it crosses the Arroyo. These improvements will increase the size of the detention basins west of the aqueduct to protect it against a 50-year storm event.

DWR is also investing in the replacement of aging SWP infrastructure critical to SWP operations. It is midway into its Turbine Rehabilitation Program at Oroville Reservoir's Hyatt-Thermalito complex. In 2004, DWR awarded a contract to replace four pumps at the Edmonston Pumping Plant. Moreover, improved maintenance procedures have decreased the amount of time pumps at Edmonston come off-line for maintenance to less than 10 percent of the time.

Because of the risk of a prolonged shutdown of the SWP caused by seismic or hydrologic events either within the Delta or along the California Aqueduct, Metropolitan has acted decisively to ensure that Southern California has adequate emergency storage. Diamond Valley Lake (DVL) and SWP terminal reservoir storage, combined with member-agency emergency storage, are jointly capable of providing the region with a six-month supply of water if combined with a temporary 25 percent reduction in demand. Metropolitan engineering studies indicate this would provide sufficient time to repair the SWP and resume delivery.

Metropolitan is investigating potential opportunities for carbon sequestration in subsided islands within the legal Delta to create a potential revenue source for Delta landowners and other interested parties. Farming the Delta peat soils generates a large amount of carbon dioxide ($CO_2$), and growing native vegetation (versus continued farming operations) not only decreases greenhouse gas emissions, but can actually sequester an even larger amount of $CO_2$ over time while rebuilding new peat soils. With rebuilding new peat soils to historic elevations, the risk of levee failure would decrease, and may eventually be eliminated.

### *Achievements to Date*

#### *SWP Reliability*

Delta Vision

The Delta has suffered from multiple crises for years – ecosystem, water supply, levee stability, water quality, policy, program, and litigation. The ecosystem condition continues to deteriorate, with record-low reports of fish populations, Delta smelt, and other species on the brink of extinction, and the commercial salmon season shut down completely for two years in a row. Continued drought conditions and court-ordered restrictions on water exports have led to reductions in water deliveries to contractors. Deteriorating levees, land subsidence, earthquake risk, and climate change all contribute to growing concerns about mass Delta levee failure. Delta water quality also continues to be a critical issue, as both local agricultural and urban communities contribute contaminants to the system. Litigation related to Delta environmental concerns and the proposed California WaterFix/ EcoRestore/ BDCP will likely continue in the future.

Metropolitan's Long-Term Action Plan

Besides the short- and mid-term actions described earlier in Section 1.4, Metropolitan's adopted Delta action plan in June 2007 includes a long-term Delta Plan. The long-term action plan recognizes the need for a global, comprehensive approach to the fundamental issues and conflicts in the Delta to result in a truly sustainable Delta. A piecemeal approach cannot satisfy the many stakeholders that have an interest in the Delta and will fail; there must be a holistic approach that deals with all issues simultaneously. In dealing with the basic issues of the Delta, solutions must address the physical changes required, as well as the financing and governance. There are three basic elements that must be addressed: Delta ecosystem restoration, water supply conveyance, and flood control protection and storage development. In addition, the state needs to establish governance structures and financing approaches to implement and manage the three identified elements.

Governor's Delta Vision Process

Through this enduring Delta crisis, the Legislature and the Governor initiated, in 2006, a process to develop a new long-term vision for the Delta. SB 1574 (Kuehl/2006) required a cabinet committee to present recommendations for a Delta strategic vision. The governor created a Delta Vision Blue-Ribbon Task Force to advise the Cabinet Committee. The Task Force produced an October 2008 Strategic Plan, which the Cabinet Committee largely adopted and submitted, with its recommendations, to the Legislature on January 3, 2009. Metropolitan, as a stakeholder to the process, provided input to the Task Force.

The 2009 Delta Legislation

After delivery of the Delta Vision recommendations, the Legislature held informational hearings from Delta experts, Task Force members, and the Schwarzenegger Administration, as well as the public at large, and engaged in vigorous water policy discussions. Following the informational hearings, several legislators began developing detailed legislation which culminated in pre-print proposals being issued in early August of 2009 for public review and discussion over the summer recess. The Assembly Water, Parks and Wildlife Committee and the Senate Natural Resources and Water Committee then held joint informational hearings on the pre-print proposals and received extensive public comment. Thereafter, legislative leadership appointed a conference committee, which convened and held additional public hearings,

with further legislator discussions on key issues. That work continued into the 7th Extraordinary Session, which was called by the governor specifically to address the pending Delta and water issues, and culminated in the signing of a historic package of bills. One of the keystones of that package was SB X7-1, which reformed Delta policy and governance. Specifically, SB X7-1:

- Establishes a new legal framework for Delta management, emphasizing the coequal goals of "providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem" as foundation for state decisions as to Delta management.
- Reconstitutes and redefines role of the Delta Protection Commission (DPC), to narrow membership to focus on local representation and to expand the DPC's role in economic sustainability.
- Creates a new Sacramento-San Joaquin Delta Conservancy (Conservancy), to support efforts that advance environmental protection and the economic well-being of Delta residents.
- Creates the Delta Stewardship Council (Council) as an independent state agency to guide actions in the Delta which furthers the coequal goals of Delta restoration and water supply reliability.
- Repeals the CALFED Bay-Delta Authority Act and transfers existing staff, contracts, etc. to the Council.
- Creates the Delta Independent Science Board (Science Board) and Delta Science Program.
- Requires the State Water Resources Control Board (SWRCB), by August 12, 2010, to develop new flow criteria for the Delta ecosystem necessary to protect public trust resources.
- Requires the Department of Fish and Game (DFG), now the Department of Fish and Wildlife (DFW), by December 31, 2010, to develop and recommend to the SWRCB flow criteria and quantifiable biological objectives for aquatic and terrestrial species.
- Creates a Delta Watermaster as the enforcement officer for the SWRCB Division of Water Rights in the Delta.
- Requires the Council to develop, adopt, and commence implementation of the "Delta Plan" by January 1, 2012, with a report to the Legislature by March 31, 2012.
- Requires the DPC to develop a proposal to protect, enhance, and sustain the unique cultural, historical, recreational, agricultural, and economic values of the Delta as an evolving place.
- Requires the Delta Plan to further the coequal goals of Delta ecosystem restoration and a reliable water supply.
- Requires the Delta Plan to promote statewide water conservation, water use efficiency, and sustainable use of water, as well as improvements to water conveyance/storage and operation of both to achieve the coequal goals.
- Requires the Delta Plan to attempt to reduce risks to people, property, and state interests in the Delta by promoting effective emergency preparedness, appropriate land uses, and strategic levee investments.
- Announces a statewide policy to reduce reliance on the Delta in meeting California's future water supply needs through a statewide strategy of investing in improved regional supplies,

conservation, and water use efficiency. Each region that depends on water from the Delta watershed shall improve its regional self-reliance for water through investment in water use efficiency, water recycling, advanced water technologies, local and regional water supply projects, and improved regional coordination of local and regional water supply efforts.

- Requires the Council to include the Bay Delta Conservation Plan (BDCP) in the Delta Plan and makes the BDCP eligible for state funding if:
  - The BDCP complies with Natural Community Conservation Planning Act (NCCPA) and is approved as a Habitat Conservation Plan under the Federal ESA.
  - The BDCP complies with the California Environmental Quality Act and includes a full range of alternatives, including a reasonable range of flow criteria, rates of diversion, and other operational criteria.
  - DWR consults with the Council and Science Board during development of the BDCP.
  - DFW approves the BDCP as a Natural Community Conservation Plan and determines that it meets the requirements for incorporation into the Delta Plan.

### *SWP Water Quality*

The most significant achievement for SWP water quality has been continued definition and advancement of the Delta Improvement Package. Most notably, the Franks Tract studies identified cost-effective ways to achieve significant improvements in the quality of Delta export water.

Progress was also made on the Southern California-San Joaquin Regional Water Quality Exchange Project. In 2009, Metropolitan and Arvin Edison Water Storage District enlarged their South Canal to enable exchanging more water between their groundwater basins and the California Aqueduct. Their relatively pure water allows Metropolitan to improve source water, and increase quantities, during times when quality and quantity are relatively poor. This project also allows Metropolitan better access to water it has stored in the Arvin Edison Groundwater Storage Project.

### *SWP System Reliability*

The completion and filling of DVL marked the most important achievement with respect to protecting Southern California against an SWP system outage. Water began pouring into the reservoir in November 1999, and the lake was filled by early 2003. The lake can hold up to 810 TAF which provides Southern California with a six-month emergency water supply, as well as carryover and regulatory storage.

#### The Inland Feeder Project

The Inland Feeder is a 44-mile-long conveyance system that connects the State Water Project to DVL and the CRA. The Inland Feeder provides greater flexibility in managing Metropolitan's major water supplies and allows greater amounts of State Water Project water to be accepted during wet seasons for storage in DVL. In addition, the Inland Feeder increases the conveyance capacity from the East Branch of the SWP by 1,000 cubic feet per second, allowing the East Branch to operate up to its full capacity. The project also improves the quality of the Southland's drinking water by allowing more uniform blending of better quality water from the SWP with Colorado River supplies, which have a higher mineral content. Construction of the Inland Feeder was completed in September 2009.

## 3.3 Central Valley/State Water Project Storage and Transfer Programs

Metropolitan endeavors to increase the reliability of supplies received from the California Aqueduct by developing flexible SWP storage and transfer programs. Over the years, Metropolitan has developed numerous voluntary SWP storage and transfer programs, to secure additional dry-year water supplies.

### *Background*

Metropolitan has a long history of managing the wide fluctuations of SWP supplies from year to year by forming partnerships with Central Valley agricultural districts along the California Aqueduct, as well as with other Southern California SWP Contractors. These partnerships allow Metropolitan to store its SWP supplies during wetter years for return in future drier years. Some programs also allow Metropolitan to purchase water in drier years for delivery via the California Aqueduct to Metropolitan's service area.

Because yields from individual programs can vary widely depending on hydrologic conditions and CVP/SWP operations, the dry-year yields for the various programs reported in this section are expected values only. In any given year, actual yields could depart from the expected values. Despite that uncertainty, Metropolitan's models of these programs indicate that in the aggregate, they can meet the resource target under a wide range of hydrologic conditions and CVP/SWP operations.

In addition, the SWP storage and transfer programs have served to demonstrate the value of partnering, and increasingly, Central Valley agricultural interests see partnering with Metropolitan as a sensible business practice beneficial to their local district and regional economy.

### *Implementation Approach*

Metropolitan is currently operating several SWP storage programs that serve to increase the reliability of supplies received from the California Aqueduct. Metropolitan is also pursuing a new storage program with Antelope Valley-East Kern Water Agency, which is currently under development. In addition, Metropolitan pursues SWP water transfers on an as needed basis. Table 3-3 lists the expected yields from these storage and transfer programs. Figure 3-3 shows the location of Metropolitan's statewide groundwater banking programs.

#### *Storage and Transfer Programs*

Semitropic Storage Program

Metropolitan has a groundwater storage program with Semitropic Water Storage District located in the southern part of the San Joaquin Valley. The maximum storage capacity of the program is 350 TAF. The specific amount of water Metropolitan can store in and subsequently expect to receive from the program depends upon hydrologic conditions, any regulatory requirements restricting Metropolitan's ability to export water for storage, and the demands placed on the Semitropic Program by other program participants. In 2014, Metropolitan amended the program to increase the return yield by an additional 13.2 TAF per year. The minimum annual yield available to Metropolitan from the program is currently 34.7 TAF, and the maximum annual yield is 236.2 TAF, depending on the available unused capacity and the SWP allocation. During wet years, Metropolitan has the discretion to use the program to store portions of its SWP water that are in excess of the amounts needed to meet Metropolitan's service area demand. In Semitropic, the water is delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously

stored water to Metropolitan by direct groundwater pump-in return and the exchange of SWP supplies.

Arvin-Edison Storage Program

Metropolitan amended the groundwater storage program with Arvin-Edison Water Storage District in 2008 to include the South Canal Improvement Project. The project increases the reliability of Arvin-Edison returning higher water quality to the California Aqueduct. In addition, Metropolitan and Arvin-Edison often enter into annual operational agreements to optimize program operations in any given year. The program storage capacity is 350 TAF. The specific amount of water Metropolitan can expect to store in and subsequently receive from the program depends upon hydrologic conditions and any regulatory requirements restricting Metropolitan's ability to export water for storage. The storage program is estimated to deliver 75 TAF. During wet years, Metropolitan has the discretion to use the program to store portions of its SWP supplies which are in excess of the amounts needed to meet Metropolitan's service area demand. The water can be either directly recharged into the groundwater basin or delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously stored water to Metropolitan by direct groundwater pump-in return or by exchange of surface water supplies. In 2015, Metropolitan funded the installation of three new wells at a cost of $3 million that will restore the return reliability by 2.5 TAF per year. The funding will ultimately be recovered through credits against future program costs.

Table 3-3 summarizes Metropolitan's Central Valley/SWP transfer programs supply range for 2035. The supply capabilities shown reflect actual storage program conveyance constraints. In addition, SWP supplies are estimated using DWR's 2015 SWP Delivery Capability Report released in July 2015. Appendix 3 provides a detailed discussion of the current Central Valley and SWP storage and transfers programs and programs that are under development.

San Bernardino Valley MWD Storage Program

The San Bernardino Valley MWD Storage program allows for the purchase of a portion of San Bernardino Valley MWD's SWP supply. The program includes a minimum purchase provision of 20 TAF and the option of purchasing additional supplies when available. This program can deliver between 20 TAF and 70 TAF in dry years, depending on hydrologic conditions. The expected delivery for a single dry year similar to 1977 is 20 TAF should supplies be available. The agreement with San Bernardino Valley MWD also allows Metropolitan to store up to 50 TAF of transfer water for use in dry years. The agreement can be renewed until December 31, 2035.

San Gabriel Valley MWD Exchange Program

The San Gabriel Valley MWD program allows for the exchange of up to 5 TAF each year. For each acre-foot Metropolitan delivers to the City of Sierra Madre, a San Gabriel Valley MWD member agency, San Gabriel Valley MWD provides two acre-feet to Metropolitan in the Main San Gabriel Basin, up to 5 TAF. The program provides increased reliability to Metropolitan by allowing additional water to be delivered to Metropolitan's member agencies Three Valleys MWD and Upper San Gabriel Valley MWD.

Antelope Valley-East Kern Water Agency Exchange and Storage Program

The Antelope Valley-East Kern Water Agency (AVEK) exchange and storage program provides Metropolitan with additional supplies and increased reliability. Under the exchange program, for every two acre-feet Metropolitan receives, Metropolitan returns one acre-foot to AVEK to

improve its reliability. The exchange program is expected to deliver 30 TAF over ten years, with 10 TAF available in dry years. Under the program, Metropolitan will also be able to store up to 30 TAF in the AVEK's groundwater basin, with a dry year return capability of 10 TAF.

Kern-Delta Water District Storage Program

This groundwater storage program has 250 TAF of storage capacity. The program is capable of providing up to 50 TAF of dry-year supply. In 2015, Metropolitan funded the cross river pipeline that, when completed, will help improve Metropolitan's return reliability by reducing losses during exchanges. Water for storage can be either directly recharged into the groundwater basin or delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously stored water to Metropolitan by direct groundwater pump-in return or by exchange of surface water supplies.

Mojave Storage Program

Metropolitan entered into a groundwater banking and exchange transfer agreement with Mojave Water Agency on October 29, 2003. This agreement was amended in 2011 to allow for the cumulative storage of up to 390 TAF. The agreement allows for Metropolitan to store water in an exchange account for later return. Through 2021, and when the State Water Project allocation is 60 percent or less, Metropolitan can annually withdraw the Mojave Water Agency's SWP contractual amounts in excess of a 10 percent reserve. When the SWP allocation is over 60 percent, the reserved amount for Mojave's local needs increases to 20 percent. Under a 100 percent allocation, the State Water Contract provides Mojave Water Agency 82.8 TAF of water.

Central Valley Transfer Programs

Metropolitan secures Central Valley water transfer supplies via spot markets and option contracts to meet its service area demands when necessary. Hydrologic and market conditions, and regulatory measures governing Delta pumping plant operations, will determine the amount of water transfer activity occurring in any year. Recent transfer market activity, described below, provides examples of how Metropolitan has secured water transfer supplies as a resource to fill anticipated supply shortfalls needed to meet Metropolitan's service area demands.

In 2003, Metropolitan secured options to purchase approximately 145 TAF of water from willing sellers in the Sacramento Valley during the irrigation season. These options protected against potential shortages of up to 650 TAF within Metropolitan's service area that might have arisen from a decrease in Colorado River supply or as a result of drier-than-expected hydrologic conditions. Using these options, Metropolitan purchased approximately 125 TAF of water for delivery to the California Aqueduct.

In 2005, Metropolitan, in partnership with seven other State Water Contractors, secured options to purchase approximately 130 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was 113 TAF. Metropolitan also had the right to assume the options of the other State Water Contractors if they chose not to purchase the transfer water. Due to improved hydrologic conditions, Metropolitan and the other State Water Contractors did not exercise these options.

In 2008, Metropolitan, in partnership with seven other State Water Contractors, secured approximately 40 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 27 TAF.

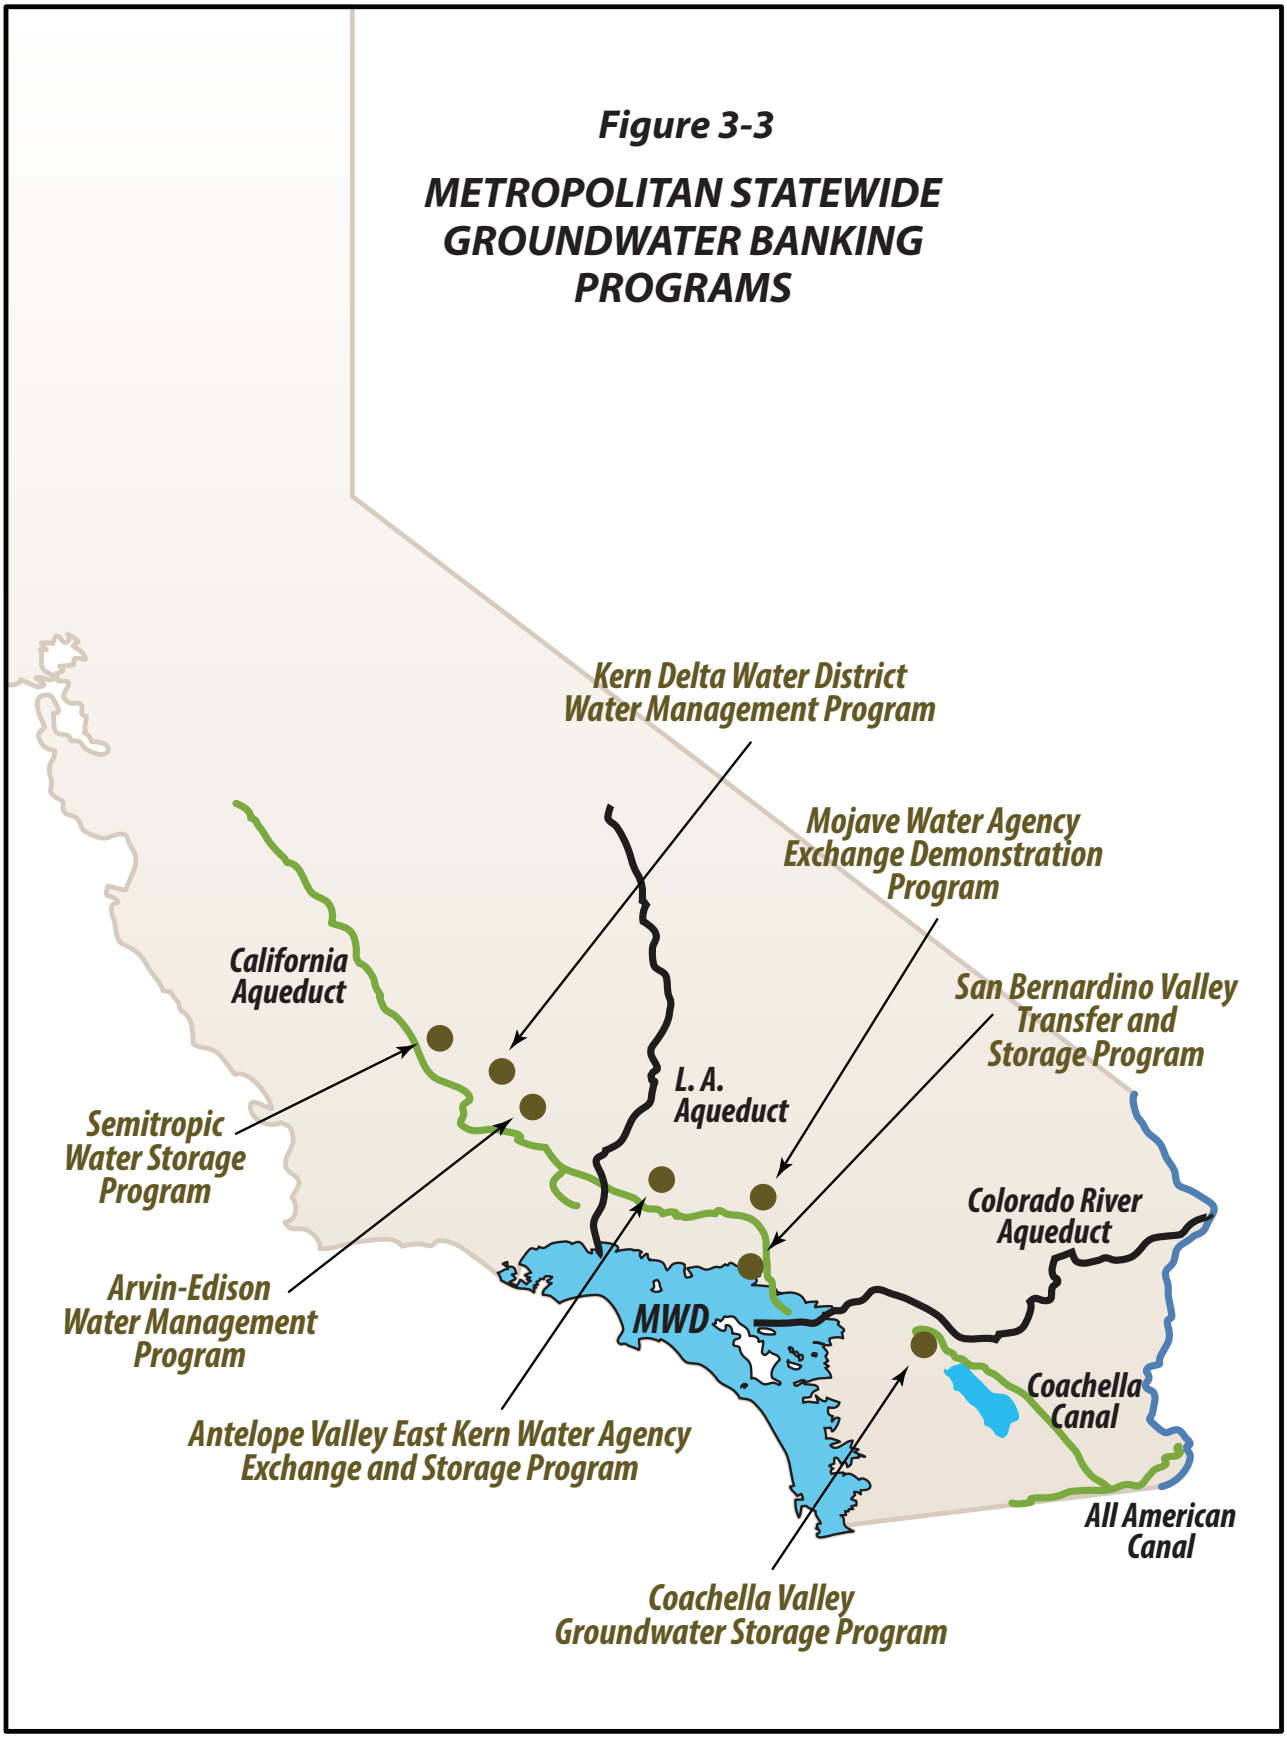
In 2009, Metropolitan, in partnership with 8 other buyers and 21 sellers, participated in a statewide Drought Water Bank, which secured approximately 74 TAF, of which Metropolitan's share was approximately 37 TAF.

In 2010, Metropolitan, in partnership with three other State Water Contractors, secured approximately 100 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 88 TAF. Metropolitan also purchased approximately 18 TAF of water from Central Valley Project Contractors located in the San Joaquin Valley. In addition, Metropolitan entered into an unbalanced exchange agreement that resulted in Metropolitan receiving approximately 37 TAF.

In 2015, Metropolitan, in partnership with eight other State Water Contractors, secured approximately 20 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 13 TAF.

In addition, Metropolitan has secured water transfer supplies under the Yuba Accord, which is a long-term transfer agreement. To date, Metropolitan has purchased approximately 165 TAF.

Finally, Metropolitan has secured water transfer supplies under the Multi-Year Water Pool Demonstration Program. In 2013 and 2015, Metropolitan secured 30 TAF and 1.3 TAF, respectively.



Metropolitan's recent water transfer activities demonstrate Metropolitan's ability to develop and negotiate water transfer agreements either working directly with the agricultural districts who are selling the water or through a statewide Drought Water Bank. Because of the complexity of cross-Delta transfers and the need to optimize the use of both CVP and SWP facilities, DWR and USBR are critical players in the water transfer process, especially when shortage conditions increase the general level of demand for transfers and amplify ecosystem and water quality issues associated with through-Delta conveyance of water. Therefore, Metropolitan views state and federal cooperation to facilitate voluntary, market-based exchanges and sales of water as a critical component of its overall water transfer strategy.

### *Achievements to Date*

Metropolitan has made rapid progress to date developing SWP storage and transfer programs. Most notably, Metropolitan has utilized approximately 457 TAF to supplement its SWP supplies during the recent 2012-2015 unprecedented drought. Of this total, approximately 325 TAF are from SWP storage program extractions in Semitropic, Arvin, Kern Delta, and Mojave; 57 TAF are from the San Bernardino and San Gabriel Valley MWD programs; and 78 TAF of SWP transfer supplies were purchased from the State Water Contractors Buyers Group, Multi-Year Water Pool, and Yuba water purchase programs.

## Figure 3-3

## METROPOLITAN STATEWIDE GROUNDWATER BANKING PROGRAMS

## 3.4 Demand Management and Conservation

Demand management through conservation is a core element of Metropolitan's long-term water management strategy. Metropolitan continues to build on a nearly 25-year investment in conservation of more than $495 million, reflecting a long-term commitment to water conservation. Among other measures, this investment has resulted in the replacement of more than 3.4 million toilets with more water efficient models, distribution of more than 530,000 high-efficiency clothes washers (HECWs), and removal of approximately 170 million square feet of grass from both commercial and residential properties. Collectively, Metropolitan's conservation programs and other conservation in the region will reduce Southern California's reliance on imported water by more than 1.0 MAF per year by 2025.

In response to the continuing drought, Metropolitan's Board of Directors took unprecedented action in fiscal year 2014-15 to increase conservation and permanently reduce demand within Southern California. In December 2014, the Board authorized an additional $40 million for regional conservation incentives, raising the two year conservation budget to $100 million (fiscal years 2014-15 and 2015-16). In May 2015, the Board further increased the two-year conservation budget to an unprecedented $450 million, with $340 million committed to turf removal incentives for fiscal years 2014-15 and 2015-16. The Board also authorized $11 million for multimedia, multicultural, water awareness and conservation outreach campaigns that were implemented in 2014 and 2015.

### *Background*

Metropolitan's conservation policies and programs are guided by the conservation savings target adopted in the IRP. These policies and programs directly relate to the demand management measures for wholesale water agencies in the Urban Water Management Planning Act and the urban water conservation Best Management Practices (BMPs) in the California Urban Water Conservation Council Memorandum of Understanding Regarding Water Conservation in California (Urban MOU). As a signatory to the Urban MOU, Metropolitan pledged to make a good faith attempt to implement the BMPs.

Conservation savings result from active, code-based, and price-effect conservation efforts. Active conservation consists of water-agency funded programs such as rebates and incentives for water efficient fixtures and equipment and turf removal. Code-based and price-based conservation consists of demand reductions attributable to conservation-oriented plumbing codes and usage reductions resulting from increases in the price of water. Metropolitan does not currently assign a savings value for public awareness campaigns and conservation education because any initial effect on demand reduction and the longevity of the effect are difficult to measure. It is generally accepted that these outreach programs prompt consumers to install water saving fixtures and change water-use behavior, thereby creating a residual benefit of increasing the effectiveness of complementary conservation programs.

Distinguishing between active, code-based, and price-effect conservation can be analytically complex when, for example, active programs for fixtures are concurrent with conservation-related plumbing codes. Metropolitan uses specially designed estimating models to quantify and project conservation savings. This plan combines active, code-based, and price-effect conservation savings using methods that avoid double counting.

Conservation savings are commonly estimated from a base-year water-use profile. Metropolitan uses 1980 as the base year because it marked the effective date of a new plumbing code in California requiring toilets in new construction to be rated at 3.5 gallons per flush or less. Between 1980 and 1990, the region saved an estimated 250 TAF per year as the

result of this 1980 plumbing code and unrelated water rate increases. These savings are referred to as "pre-1990 savings." Metropolitan's resource planning target combines pre-1990 savings and estimates of more recently achieved savings.

Including regional pre-1990 conservation savings, Metropolitan continues to pursue a 2025 total conservation target of approximately 1.13 MAF per year. A large share of the target has already been achieved through existing Metropolitan and member agency programs, pre-1990 savings, price-effects, and continued savings that accrue from plumbing codes. The remainder is expected to be achieved through additional agency-sponsored active conservation programs, code changes, and price-effects.

### *Implementation Approach*

Metropolitan's approach for achieving the conservation target includes implementing a suite of demand management measures, including public education and outreach, a variety of conservation programs, metering, research and development, and asset management. These programs include cost-effective BMP-oriented active conservation programs and new, innovative programs that address regional water uses. Metropolitan also provides support to member agencies for local programs that assist with implementing retail BMPs and reducing per capita water use. The stewardship charge in Metropolitan's rate structure provides the funding mechanism for active conservation programs and non-incentive strategies. Metropolitan continues to seek state and federal grant funding for conservation in coordination with its member agencies.

Metropolitan's conservation programs are closely linked to the efforts of the California Urban Water Conservation Council (CUWCC), the organization created to administer the Urban MOU. As a signatory to the Urban MOU, Metropolitan has pledged to make a good faith effort to implement a prescribed set of urban water conservation BMPs. Metropolitan provides technical and financial support needed by member agencies in meeting the terms of the Urban MOU. Enclosed with this report, as Appendix 8, are copies of the BMP reports Metropolitan has filed with the CUWCC since Metropolitan's 2010 urban water management plan.

In addition to implementing cost-effective BMPs, Metropolitan actively supports many CUWCC committee and research activities. For example, Metropolitan has historically assisted in CUWCC's ongoing efforts to document and increase the effectiveness of BMP-related conservation efforts. Presently, Metropolitan is represented on the following CUWCC committees:

- Board
- Commercial, Industrial, and Institutional Committee
- Residential Committee
- Landscape Committee
- Research and Evaluation Committee
- Utility Operations Committee
- Education Committee
- BMP Reporting Committee

Metropolitan also participates in national water efficiency efforts. Metropolitan is a USEPA WaterSense partner, helping to promote water efficient products and practices in Southern California. Metropolitan is also a member of the Alliance for Water Efficiency, participating in the committees on research, WaterSense and water efficient products, and education and outreach.

The following sections describe Metropolitan's demand management measures and conservation programs.

### *Public Education and Outreach*

Metropolitan provides comprehensive education and outreach programs throughout its service area. Metropolitan's wide-ranging and comprehensive education program recently received California's highest environmental honor: the Governor's Environmental and Economic Leadership Award.

#### *Public Education Programs*

Metropolitan's water education programs reach thousands of students every year with lessons on water quality, conservation, and stewardship. Free teacher workshops, classroom materials, field trips, and class instruction are provided to schools throughout the district. A comprehensive K-12 curriculum meets state standards for each grade level in the areas of science, math, language arts, and social studies. Table 3-4 shows Metropolitan's extensive commitment to conservation-related education programs.

Metropolitan also provides all-day instruction for grades 4-7 through the Diamond Valley Lake Education Program with several thousand students and teachers participating each year. Metropolitan also collaborated with the Western Science Center Outreach Program to provide activities for more than 5,000 students in grades 2-5, and oversaw the Diamond Valley Lake Visitor Center that educated over 10,000 people on Metropolitan's water systems and operations, programs, and water stewardship.

More than 20,000 people viewed student artwork from Metropolitan's "Water is Life" Student Art and Calendar program, which stresses the importance of conservation at home, school, and in the community. The 2015 Student Art Exhibit toured and was displayed at 27 member and retail agencies in 2015.

One of Metropolitan's signature events is the annual Solar Cup™ at Lake Skinner for high school students. This is a team-based educational program in which students develop and apply skills in math, engineering, and communications while learning about water resources and creating conservation-focused public service announcements. In 2015, 41 teams and more than 800 high school students built, equipped, and raced 16-foot solar powered boats in a successful three-day event that received extensive news coverage.

For college students, Metropolitan offers the Southern California World Water Forum College Grant Program with support from USBR and the Los Angeles County Sanitation Districts. The 2014–2017 program will provide 17 grants to colleges and universities for local and globally-focused projects that foster a better understanding and community awareness of water issues, while improving technology related to water supply and delivery, water conservation, and/or sanitation programs.

Metropolitan recently launched a new education resources website. This site highlights Metropolitan's water-based Science-Technology-Engineering-Arts-Math (STEAM) programs for pre-kindergarten through college students and hosts a downloadable curriculum, aligned to the state's education standards. This website, which has many mobile features, is a resource for

students, parents, teachers, and community educators interested in learning and teaching about water's critical role in society.

Metropolitan's education related Twitter postings received more than 37,000 impressions, and Metropolitan's education Web page for kindergarten through college students drew over 40,000 visitors.

### *Outreach*

In fiscal year 2013-14, Metropolitan implemented a variety of conservation and education outreach programs throughout our service area. Since late 2013, the primary focus of these programs has been on the drought and the need for additional conservation in order to maintain the region's water supply reserves. In March 2014, Metropolitan's Board of Directors authorized a $5.5 million regional outreach campaign for conservation and to raise water awareness. The multimedia campaign used television and radio advertisements and traffic report sponsorships, along with online, streaming radio and mobile ads, plus focused billboard and movie theater advertising. Many of the campaign elements were provided in-language to help engage the region's ethnically diverse population. Campaign tools, such as television and radio ads and graphics for bill inserts, billboards, and websites, were available to local agencies at no cost. As part of the campaign, Metropolitan conducted several interviews for television and radio and placed several "advertorial" news stories in the online editions of the *Los Angeles Times* and *Union Tribune-San Diego* newspapers. These elements promoted the ongoing need for conservation in Southern California, describing long-term investments in water storage and development of local water resources, and the availability of rebates and incentives for turf removal and purchase of water-saving devices and appliances.

In March 2015, Metropolitan's Board of Directors authorized $5.5 million for a second multi-lingual communications, outreach, and advertising campaign. The campaign tagline, "Let's All Take A Turn," emphasizes the seriousness of the drought and brings the message to residents that if we all do a little more to save water, it adds up to make a huge difference.

Metropolitan launched the research-based advertising campaign in the spring with digital and radio, in cooperation with the district's 26 member public agencies. For the first time, the entire campaign was produced in five languages: English, Spanish, Mandarin, Korean, and Vietnamese. The summer campaign called for online, social media, streaming radio, and mobile ads, along with billboards, television commercials, and special events -- such as the transformation of the iconic Randy's donut in Inglewood to the giant red Turn knob -- in order to effectively communicate the need for everyone to conserve water during the historic, ongoing drought.

Metropolitan also held press conferences on its own or in conjunction with others such as the Southern California Water Committee (SCWC) urging more conservation during the ongoing drought. These were augmented by op-ed pieces describing Southern California's response to the drought that were placed in newspapers such as the *Los Angeles Times* and *Orange County Register*.

Throughout the year, Metropolitan officials conducted dozens of interviews with news reporters to discuss a wide range of water-related topics such as the impact of the drought, water supply reliability, and conservation. As part of this public outreach, Metropolitan's General Manager blogged on Metropolitan's home web page, mwdh2o.com, about various water challenges facing the region.

In 2014, Metropolitan began a focused outreach effort for leading businesses and industries that are high volume water use customers within Metropolitan's service area. Metropolitan's

executive management has met with executives in the beverage, bottling, refining, aerospace, tourism, and golf industries to discuss Southern California's water outlook, key policy issues, and opportunities to collaborate on water use efficiency projects that will reduce demand for potable water.

Metropolitan's bewaterwise.com® web site continues to play a key role in educating the public, attracting nearly 760,000 unique visitors from July 1, 2014 through June 30, 2015. The website includes a new page focused on the drought and enhanced information on Metropolitan's rebate and incentive programs. Metropolitan also provides a Spanish language version of the site to help educate and inform the region's Spanish-speaking population. In addition, the website features California Friendly® Landscape training classes where home gardeners and landscape professionals can learn the latest ways to reduce water use in landscapes. Classes cover the basics of irrigation systems, watering and fertilizing, landscape design, and plant identification.

Metropolitan is active on social media, regularly posting to Facebook and Twitter. The Facebook page, mwdh2o, has over 12,000 likes, and the Bewaterwise Twitter account, @bewaterwiseh2o, has over 3,000 followers. Metropolitan's Instagram page began in September 2015. To increase collaboration with environmental organizations, Metropolitan helped organize a regional Twitter campaign, #WaterYouDoing, to help spread water-saving messages.

Metropolitan provides a speakers bureau and regularly presents for business and community organizations. Metropolitan also provides direct outreach to federal, state, and local government leaders and their staff to inform them of key water issues and provide updates on Metropolitan's activities and programs.

### *Community Partnering Program*

In fiscal year 2014-15, the Community Partnering Program sponsored and actively participated in nearly 60 water-related education and outreach programs for member agencies, community groups, educational institutions, public agencies, non-profit organizations, and professional associations. Projects included community festivals and events, conservation and garden projects, web-based information and social media, publications in multiple languages, educational materials dealing with watersheds, conservation, water recycling, and other initiatives.

### *California Friendly Landscape Education and Training Program*

Metropolitan provides education and training on ways to conserve water in homes and landscapes. Offerings include in-person and online classes, surveys, and audits.

#### Landscape Classes

Metropolitan offers in-person and online courses in irrigation efficiency and water-wise garden design through its California Friendly Landscape Training Program. In FY 2014-15, Metropolitan conducted 197 classes for 6,590 students throughout Metropolitan's service area.

#### Landscape Irrigation Audits

Metropolitan provides irrigation surveys for large landscape customers. These surveys are performed by a certified Landscape Irrigation Auditor and provide the customer with specific recommendations on how to improve irrigation efficiency at the site. The survey report

generated by the auditor also provides information on incentives to help the customer fund the needed improvements. In fiscal year 2014-15, 123 surveys covering 453 acres were conducted.

Irrigation Evaluations and Residential Surveys

Metropolitan provides funding to its member agencies that choose to implement irrigation evaluations and indoor surveys for residents. Irrigation evaluations provide customers with a recommended irrigation schedule and suggested improvements for irrigation systems. Indoor residential surveys provide customers with information on identifying leaks and making changes to water-using devices in the home.

### *Water Conservation Programs*

Metropolitan's water conservation programs focus on two main areas: (1) residential water use, and (2) commercial, industrial, and institutional water use. Metropolitan directly implements regional programs, and provides financial support for local programs that are implemented by the member agencies. Metropolitan's Water Use Efficiency team provides program development, implementation, administration, monitoring, evaluation, and research.

Metropolitan's Conservation Credits Program (CCP) provides the basis for financial incentives and funding for the conservation programs and other demand management related activities. Established in 1988, this funding mechanism supports Metropolitan's commitment to conservation as a long-term water management strategy.

The basis of Metropolitan's financial support to member agency conservation efforts is estimated at $195 per acre-foot of water saved up to the device cost. In general, CCP-funded water conservation project proposals must:

- Have demonstrable water savings;
- Reduce water demands on Metropolitan's system; and
- Be technically sound and require Metropolitan's participation to make the project financially and economically feasible.

Table 3-5 summarizes CCP savings and investments. Additional funding for conservation programs has been made available through federal and state government agencies. Metropolitan has worked to obtain a share of this funding to enhance the region's water conservation investments. Table 3-6 describes past sources and uses of these funds.

Table 3-7 summarizes the types and numbers of efficient devices that have been installed through Metropolitan's conservation programs since they began in fiscal year 1990-91.

### *Regional Conservation Programs*

As mentioned above, Metropolitan's conservation programs focus on two main sectors: (1) residential water use, and (2) commercial, industrial and institutional water use.

Residential Programs

Metropolitan's residential conservation activities consist of two major programs:

- SoCal Water$mart - Metropolitan provides a region-wide residential rebate program named SoCal Water$mart. Since its inception in 2008, rebate activity has increased dramatically as many residential customers became increasingly aware of the financial incentives available to them to help offset the purchase of water-efficient devices. To date, this program helped to replace over 3.3 million toilets, 530,000 washing machines, 37,000 urinals, 300,000 smart

irrigation controllers, 2.3 million rotating nozzles, and hundreds of thousands of other devices and appliances.

- Metropolitan-Funded Residential Programs Administered by Member Agencies - Metropolitan's member and retail agencies also implement local residential water conservation programs within their respective service areas and receive Metropolitan incentives for qualified retrofits and other water-saving actions. Typical projects include high-efficiency toilet (HET) distributions, locally administered clothes washer rebate programs, turf removal programs, and residential water audits.

*Residential Rebate Items*

Metropolitan provides incentives on a variety of water efficient devices for the residential sector. The following is a brief description of current and past devices that contribute to projected conservation savings:

- Turf Removal (Residential) - About 50 percent of residential household water demand is used for outside irrigation where opportunities to conserve water are substantial. Southern California residents have turned the turf removal program into Metropolitan's most popular conservation measure. With an increased incentive rate ($2 per square foot of turf removed) during this current drought, approximately 45 million square feet of grass have been removed from residential properties since July 2014 through the regional rebate program, and more turf removal projects are anticipated. To encourage market transformation, Metropolitan has committed over $282 million for the regional turf removal program for both residential and commercial properties for fiscal years 14-15 and 15-16.
- High-Efficiency Clothes Washers - HECWs continue to be a major component of indoor water conservation. The water efficiency of clothes washers is represented by the "integrated water factor," which is a measure of the amount of water used to wash a standard load of laundry. Washers with a lower integrated water factor will save more water. Metropolitan has continued to move the water conservation rebate standards by requiring lower integrated water factors for eligible washers. The program eligibility requirement is currently set at an integrated water factor 3.7, which saves over 10,000 gallons per year per washer over a conventional top loading washer.
- High-Efficiency Toilets - Metropolitan has provided incentives for water efficient toilets since 1988. Metropolitan recently changed its rebate program to provide funding for toilets that flush at 1.1 gallons or less. Metropolitan uses the USEPA's WaterSense list of performance tested high-efficiency toilets and the Maximum Performance of Premium Toilet Models testing list to distinguish qualifying models.
- Rotating Nozzles for Sprinklers - Pop-up spray heads with multi-stream, multi-trajectory rotating nozzles provide outdoor water savings. Field tests and studies have demonstrated these nozzles apply water more evenly than traditional nozzles with fixed fan spray patterns, offering the potential for water savings. Low precipitation rates associated with these nozzles can reduce run-off, thereby offering a significant value-added benefit when irrigating sloping landscapes.
- Irrigation Controllers - Smart irrigation controllers and soil moisture sensors adjust irrigation schedules based on rain, temperature, sunlight, soil moisture, soil conditions, plant types, slope or some combination of indicators. Metropolitan uses the USEPA WaterSense list for eligible controllers.

*Commercial, Industrial and Institutional Programs*

Metropolitan's commercial industrial and institutional (CII) conservation consists of three major rebate and incentive programs:

- SoCal Water$mart Program - The majority of the commercial conservation activity comes from Metropolitan's regional SoCal Water$mart program, which also extends rebates to multi-family properties. The SoCal Water$mart program had its largest year in fiscal year 2014-15, providing about $51.0 million in CII rebates for about 328,000 product replacements.
- Water Savings Incentive Program - The Water Savings Incentive Program provides financial incentives for customized landscape irrigation and industrial process improvements. This program allows large-scale water users to create their own conservation projects and receive incentives for up to 10 years of water savings for measured water-use efficiency improvements.
- Metropolitan-Funded Commercial Programs Administered by Member Agencies - Member and retail agencies also implement local commercial water conservation programs using Metropolitan incentives. Projects target specific commercial sectors, with some programs also receiving assistance from state or federal grant programs. Metropolitan incentives are also used as the basis for meeting cost-share requirements for the grants.

*Commercial Rebate Items*

Metropolitan's CII programs provide rebates for water-saving plumbing fixtures, landscaping equipment, food-service equipment, cleaning equipment, HVAC (heating, ventilation, air conditioning) equipment, and medical equipment.

- Turf Removal (Commercial) - Similar to the residential sector, water demand for landscape irrigation on commercial, industrial, and institutional properties is significant. Opportunities to conserve water are substantial, particularly in areas with ornamental turf. With an increased incentive rate ($2 per square foot of turf removed) during this current drought, approximately 27 million square feet of grass have been removed from commercial, industrial, and institutional properties since July 2014 through the regional rebate program, and more turf removal projects are anticipated. To encourage market transformation, Metropolitan has committed over $282 million for the regional turf removal program for both residential and commercial properties for fiscal years 2014-15 and 2015-16.
- Commercial Devices - Following is a list of current and past devices that contribute to projected conservation savings:
    - Connectionless Food Steamers
    - Cooling Tower Conductivity Meters
    - Dry Vacuum Pumps
    - High-Efficiency Clothes Washers
    - High-Efficiency Toilets
    - High-Efficiency Urinals
    - Ice Machines
    - In-Stem Flow Regulators
    - Large Rotors - High Efficiency Nozzles
    - Multi Stream Rotating Nozzles
    - pH Cooling Tower Controllers
    - Plumbing Flow Control Valves
    - Pre-rinse Spray Heads
    - Steam Sterilizers
    - Ultra-Low-Flush Toilets
    - Ultra-Low-Flush Urinals
    - Water Brooms
    - Weather-Based Irrigation Controllers
    - X-ray Processors
    - Zero Water Urinals

### Metering

Metropolitan's water distribution system is metered. Metropolitan has over 400 service connections that meter water deliveries to our member agencies. Meters at these service connections are checked every six months or sooner to verify that they are measuring correctly. More extensive maintenance is done on a yearly basis to ensure the meter systems continue to operate reliably.

### Research and Development Programs

Metropolitan is committed to conservation research as a way to advance technology, improve program results, and help transform markets. Self-funded studies include water savings analysis of various rotating nozzle incentive programs, water savings from turf removal projects, and water savings analysis of smart/weather based irrigation controllers.

Metropolitan's Innovative Conservation Program (ICP) is a competitive grant program that evaluates water savings and reliability of new water saving devices, technologies, and strategies. With funding provided by USBR, SNWA, Central Arizona Project, and Metropolitan, approximately $500,000 of funding was available for research for the 2013 ICP. After evaluating 50 project proposals, thirteen were selected. The majority focused on landscape water use, but there were also commercial, agricultural, and residential water use studies as well. The next round of grants will be implemented in fiscal year 2016-17.

Metropolitan has partnered with the Alliance for Water Efficiency (AWE) for water conservation research. Recent projects include: a drought management study of Australia, a water neutral development ordinance; and a study on commercial kitchen efficiency, outdoor impacts of the drought, and reasons and rationale for landscape choices.

#### Measurement and Evaluation

Measurement and evaluation are important components of Metropolitan's conservation programs. These serve four primary functions:

- Providing a means to measure and evaluate the effectiveness of current and potential conservation programs
- Developing reliable estimates of various conservation programs and assessing the relative benefits and costs of these interventions
- Providing technical assistance and support to member agencies in the areas of research methods, statistics, and program evaluation
- Documenting the results and the effectiveness of Metropolitan-assisted conservation efforts

Metropolitan's staff has served as technical advisors for a number of state and national studies involving the quantification and valuation of water savings.

### Recognition for Conservation Achievements

Conservation is an integral part of water supply planning at Metropolitan. Metropolitan works to improve the understanding of the costs and benefits of conservation so investment decisions are both efficient and effective at meeting program goals. As a cooperative member of California's water conservation community, Metropolitan has made significant contributions to the development and coordination of conservation activities throughout the state. These contributions have been recognized in the form of "Gold Star" certification from the Association of California Water Agencies and awards from the USBR and California Municipal Utilities Association. Metropolitan was recently awarded the AWWA's 2014 Public Communications Achievement Award for its water awareness and conservation outreach campaign.

**Table 3-4**
**School Education Programs**

| Program or Activity | Date Initiated | Date Updated | Current Status | Grades | Description |
|---|---|---|---|---|---|
| Admiral Splash | 1983 | 2006 | Ongoing | Grades 4-5 | A two-week program focusing on Southern California history, the water cycle, supply and the distribution system, water uses and conservation. |
| All About Water | 1991 | 2008 | Ongoing | K-2 | Activities to teach young students about droughts, conservation, water quality and physical properties of water. |
| Geography of Water | 1993 | 1998 | Ongoing | Grades 4-8 | A curriculum module on the relationship between population, precipitation, geography, economics, and water distribution. |
| Guzzler Gang | 1993 | 2004 | Ongoing | K-3 | Water conservation book introduces students to characters who are known for "guzzling" water. |
| Water Ways | 1995 | 2006 | Ongoing | Grade 5 | A supplement integrated into fifth-grade U.S. History curricula regarding water use, sources, ethics, and environment issues selected from three historical periods. This includes historical attitudes towards the stewardship of water. |
| Water Quality | 2001 | - | Ongoing | Grades 7-12 | Hands-on activities to investigate water quality issues, with conservation as an element of the overall picture. |
| Water Works | 2001 | - | Ongoing | Grades 7-12 | A school-to-career, job-specific program featuring activities and profiles on a variety of water-related careers, including conservation specialist. |
| Water Times | 2005 | - | Ongoing | Grade 6 | An age-appropriate newspaper that provides interdisciplinary concepts, tools, and calculations related to water conservation, and that conveys an overall ethic of water stewardship. |
| Conservation Connection: Water and Energy Use in Southern California | 2010 | - | Ongoing | Grades 6-8 | An activity-focused unit designed to engage students in finding solutions to conserve both water and energy at school and home. The curriculum also contains an online water and energy survey for students and their families. |
| Little Splash | 2012 | | Ongoing | K-3 | Collection of 21 activity and coloring pages including reading, writing, coloring, drawing, and working puzzles that teach concepts about water. |

**Table 3-5**
**Metropolitan's Conservation Credits Program**

| Fiscal Year | Annual Water Savings (AF) | Investment |
|---|---|---|
| 2014 – 2015 | 179,000 | $142 million |
| 2013 – 2014 | 157,000 | $16.9 million |
| 2012 – 2013 | 161,000 | $11.4 million |
| 2011 - 2012 | 156,000 | $12.9 million |
| 2010 - 2011 | 153,000 | $16.0 million |
| 2009 - 2010 | 147,000 | $36.7 million |

**Table 3-6**
**Grant Program Funding**

| Funding Source | Program/Project | Funding Amount ($1,000s) | Description | Status |
|---|---|---|---|---|
| **CALFED** | | | | |
| | Residential HECW | $925 | Increase rebate amount | Completed |
| | Protector del Agua | $100 | Course development | Completed |
| **Prop 13 Grants** | | | | |
| | HECW | $2,500 | Increase rebate amount | Completed |
| | ET Controllers | $1,800 | Initiate rebates | Completed |
| **CPUC (w/CUWCC)** | | | | |
| 2003 | Pre-Rinse Spray Valves: Phase 1 | $1,600[1] | 12,000 direct installations[1] | Completed |
| 2004 | Pre-Rinse Spray Valves: Phase 2 | $2,200[1] | 17,000 direct installations[1] | Completed |
| **USBR** | | | | |
| 2003 | CA-Friendly Landscapes | $182 | New home landscapes | Completed |
| 2003 | Data Loggers | $50 | Software error analysis | Deferred |
| 2004 | CA-Friendly Landscapes | $60 | New home landscapes | Completed |
| 2004 | Synthetic Turf pilot | $220 | Provide incentives | Completed |
| 2004 | World Forum | $50 | College/university grants | Completed |
| 2004 | CII Region wide | $250 | Additional dollars to rebate amounts and for administration | Completed |
| 2005 | Protector del Agua | $50 | Develop web classes | Completed |
| 2005 | Landscape Market Analysis | $50 | Analyze landscape conservation opportunities | Completed |
| 2005 | City Makeover | $50 | Public landscapes | Completed |
| 2006 | Innovative Conservation Program | $300 | Support research projects | Completed |
| 2008 | Innovative Conservation Program | $300 | Support research projects | In Progress |
| 2012 | Sprinkler Nozzle Incentive Program | $1,501 | Provide incentives | In Progress |
| 2013 | High Efficiency Clothes Washer Program | $500 | Provide incentives | In Progress |
| 2014 | California Friendly Turf Replacement – Phase 2 Incentive Program | $300 | Provide incentives | In Progress |
| **Water for the West** | | | | |
| | Protector del Agua | $25 | Develop web classes | Completed |
| **Prop 50** | | | | |
| | Residential HECW | $1,660 | Increase rebate amount | Completed |
| | CA-Friendly Landscapes | $423 | Common area landscapes | Completed |
| | High Efficiency Toilets | $1,000 | Increase rebate amount | Completed |
| | Protector del Agua | $78 | Develop on-line classes | Completed |
| 2008 | Residential HECW | $2,000 | Increase rebate amount | Completed |

[1] This is the funding amount and number of installations that represent Metropolitan's share of the project.

**Table 3-7**
**Conservation Achievements in Metropolitan's Service Area**

### *Asset Management Program*

In fulfillment of California Water Code §10631(f)(2), provided below is a description of Metropolitan's distribution system asset management program.

Metropolitan's approach to asset management is contained within its Infrastructure Reliability Strategy. The goal of Metropolitan's Infrastructure Reliability Strategy is to ensure long-term reliable performance of the system in an efficient and cost-effective manner. Infrastructure reliability is addressed through two primary programs: the Maintenance Management Program and the Infrastructure Protection Plan. The activities performed under these programs allow for Metropolitan to extend the life span of its facilities and equipment and improve the overall reliability of the entire conveyance, treatment, and distribution system.

#### *Maintenance Management Program*

Metropolitan manages the maintenance on approximately 135,000 pieces of equipment located at its five treatment plants, sixteen hydro-electric power plants, five desert pumping plants, 242 miles of canals, and over five thousand structures on 819 miles of pipeline.

Computerized Maintenance Management System**:** A Computerized Maintenance Management System (CMMS) is used to track, plan, and schedule the required activities. The system currently has over 28,000 preventative maintenance cycles scheduled with approximately 96 percent of these performed at fixed intervals (Time Based). The remaining four percent are performed based on the condition or use of the equipment (Condition Based).

Routine Maintenance, Inspection, and Monitoring

Monitoring, inspection, and maintenance of equipment and facilities are a proactive effort to assess the overall condition of the assets. It encompasses identifying needed repairs and performing routine maintenance.

Time-Based Maintenance

Metropolitan currently uses time-based maintenance as the primary means of maintaining equipment reliability. Time-based maintenance for equipment is set at specific time intervals using manufacturer recommendations. These recommendations are used to develop Job Plans in the CMMS which detail the individual steps required for a particular maintenance operation.

Condition-Based Maintenance

Condition-based maintenance (CBM) relies on an understanding of how a piece of equipment degrades or fails to meet its intended function. It requires a greater depth of understanding of the manufacturer's recommended maintenance, industry standards, or practices. This knowledge is used in conjunction with field experience to develop a technique to gauge the equipment's condition. Through trending or analysis, a determination can then be made as to when the equipment may reach a point where corrective maintenance will be required including rehabilitation or replacement. A regular inspection cycle is set in the CMMS software to evaluate current equipment condition. High and low condition alarms are also set that trigger a corrective maintenance activity when equipment is starting to degrade or its use has reached a servicing checkpoint.

Predictive maintenance is a subcategory of CBM that uses diagnostic equipment or testing to determine the equipment condition. Predictive maintenance is also used to detect impending problems before the equipment malfunctions. In some cases, Metropolitan has automated the inspections such as through online vibration monitoring systems that trend the performance of

critical and large equipment. A fundamental characteristic of this type of maintenance is that it provides the capability to anticipate potential problems while the equipment is still operating. This provides several key benefits when compared to time-based maintenance or allowing equipment to reach a point where corrective maintenance is required. These benefits include: improved availability or uptime, enhanced reliability, and reduced cost.

Corrective Maintenance

Corrective maintenance is performed on equipment that either has already failed or has had a problem detected during routine (time or condition based) maintenance. Corrective maintenance needs to be scheduled, requires replacing equipment components, or involves a shutdown of the impacted system. Corrective maintenance is also tracked, planned, and scheduled in the CMMS.

Major Scheduled Outages/Shutdowns

In addition to the general maintenance described above, Metropolitan may take major systems out of service, such as water treatment plants, large pipelines, conveyance systems, or other large facilities, typically for periods of seven to twenty-one days. This is done to perform major maintenance or repairs on several components or systems, upgrade or add new processes, or perform other important work.

Reports and Metrics

Metropolitan produces internal reports that track maintenance management activities including overall backlog and past due work orders (including any missed regulatory preventive maintenance). In addition, other CMMS reports are available that provide managers, planners/schedulers, and maintenance staff with the data needed to evaluate and track work.

Metropolitan utilizes best management practices and performance metrics from the Society of Maintenance & Reliability Professionals to ensure a reliable and cost effective maintenance management program.

### *Infrastructure Protection Plan*

Activities under the Infrastructure Protection Plan ensure long-term infrastructure reliability by conducting special condition assessments and vulnerability assessments of Metropolitan's facilities.

Special Condition Assessments

Special Condition Assessments are extensive inspections, investigations, and evaluations of Metropolitan facilities and equipment that go beyond routine maintenance and monitoring activities. The assessments are conducted to identify needed rehabilitation and replacement projects which can lead to long-term reliability programs. These assessments include: inspections of facilities during shutdowns when the facility may otherwise be non-accessible, investigations of systemic issues, and evaluations of Metropolitan's ability to maintain deliveries in the event of an unplanned facility outage or loss of water supply.

Special Condition Assessments may be initiated through requests from Operations, in response to a specific event or concern within Metropolitan's system, or due to an issue identified within the water industry that could potentially affect Metropolitan. Through these activities, long-term infrastructure reliability programs are developed and executed to ensure that the

reliability of Metropolitan's distribution system is unimpeded and the overall life-expectancy of its assets is maintained to the most cost-effective standard possible.

Vulnerability Assessments

Vulnerability Assessments involve simulating hazards such as vehicle impact, flooding, fire, equipment failure, third-party impacts, and earthquakes in order to identify their potential impacts to Metropolitan's ability to deliver water. Like the condition assessments, Vulnerability Assessments utilize operator experience and event reviews to identify potential vulnerabilities and impacts. The assessments evaluate both the reliability of individual facilities, as well as the reliability of Metropolitan's system as a whole, if it is exposed to a potential hazard. It is through these assessments that mitigation options are identified to improve reliability.

Potential mitigation includes facility and equipment upgrades, and procedural changes for designing, operating, or maintaining facilities. In addition, mitigation options may include recommendations for Metropolitan's emergency response planning to improve the capability to respond to an unplanned outage and restore service as quickly as possible. The types of hazards assessed include: seismic activity, hydraulic surge, vehicle impact, equipment malfunction, erosion or flooding, fire, corrosion, wind-blown projectiles, third party construction, and vandalism.

As a part of the Vulnerability Assessments, a specific set of reliability design criteria for water treatment plants have been developed to ensure optimal reliability, starting in the design phase. These reliability design criteria establish design practices that ensure that reliability is designed into new facilities, and that the staff uses this criterion when reviewing each capital project.

## 3.5 Recycling, Groundwater Recovery, and Desalination

Metropolitan continues to support local resources development through its Local Resources Program. The Local Resources Program provides financial incentives for local agencies to develop supplies including water recycling, groundwater recovery, and seawater desalination.

Metropolitan's involvement in local resources development started in 1982 as the Local Projects Program to provide financial incentives to its member agencies to develop recycled water projects. In 1991, Metropolitan established the Groundwater Recovery Program to provide financial assistance for the development of groundwater recovery projects. In 1995, these two programs evolved into the Local Resources Program (LRP).

Water recycling projects involve further treatment of secondary treated wastewater that is currently discharged to the ocean, streams, or lands and use it for non-potable uses such as landscape and agricultural irrigation, commercial and industrial purposes, and for indirect potable uses such as groundwater recharge, seawater intrusion barriers, and surface water augmentation. Currently, more than half of the water recycling in California occurs in Metropolitan's service area.

Groundwater recovery projects involve treatment of high salinity or contaminated groundwater for potable uses. Groundwater recovery projects use a variety of treatment technologies to remove undesirable constituents such as nitrates, volatile organic compounds (VOCs), perchlorate, color, and salt. Desalination of brackish groundwater and other local supplies enhances the continued supply reliability of the region by maximizing local groundwater resources.

Metropolitan's service area is also leading the development of seawater desalination in California. The 56 TAF Carlsbad Project in San Diego County started operations in December 2015 and represents the largest seawater desalination project in the country. Several other local water agencies are also considering seawater desalination projects. These projects have the potential to help meet Metropolitan's current goals for new local supplies.

### *Background*

#### *Recycling*

This section provides a description of the wastewater sources that potentially could be recycled. This section also discusses the existing and potential uses of recycled water, as well as the technical and economic issues associated with those uses. In general, Metropolitan supports:

- Increasing water recycling in California and the Colorado River Basin
- Advocating funding assistance by parties that benefit both directly and indirectly from the use of recycled water
- Expanding recycled water uses
- Reviewing recycled water regulations to ensure streamlined administration, and public health and environmental protection
- Planning efforts and voluntary cooperative partnerships at the local and statewide levels
- Conducting research and studies to address public acceptance, new technologies, and health effects assessments
- Increasing cooperation between agencies to serve recycled water in other agency service areas

Wastewater Disposal in the Service Area

As part of regional planning that encourages use of recycled water, a database has been developed that includes the name of each wastewater treatment facility, operating agency, location and elevation of the facility, extent of wastewater treatment, capacity and anticipated production, method of effluent disposal, and influent and effluent water qualities. Shown in Table 3-8 are the existing and projected total effluent capacities of the wastewater treatment plants from a database of 89 plants identified within Metropolitan's service area.

Wastewater treatment capacity provides an indication of the amount of wastewater being generated and disposed in Metropolitan's service area. Most wastewater plants in the service area provide secondary treatment, a level of treatment that complies with the Clean Water Act. Inland wastewater plants generally provide treatment to tertiary levels so the effluent may be disposed of in a stream or other water body or for beneficial reuse. A small percentage of tertiary treated effluent undergoes reverse osmosis or electrodialysis reversal processes, producing high-quality recycled water for groundwater recharge, industrial uses, or, in some instances, municipal uses.

Within Metropolitan's service area, many local agencies collect and treat municipal wastewater. Some of the largest agencies include:

- Los Angeles County Sanitation Districts
- Orange County Sanitation District
- City of Los Angeles Bureau of Sanitation
- San Diego Metropolitan Wastewater Department
- Eastern Municipal Water District
- Inland Empire Utilities Agency

**Table 3-8**
**Existing and Projected Total Effluent Capacity**
**Wastewater Treatment Plants within Metropolitan's Service Area**

| Treatment Level | Existing Capacity (MGD) | 2040 Capacity (MGD) |
|---|---|---|
| Primary | 1,770 | 3,139 |
| Secondary | 1,169 | 2,708 |
| Tertiary | 434 | 1,464 |
| Advanced | 104 | 229 |

This data was compiled as part of the Southern California Comprehensive Water Reclamation and Reuse Study.

Many small special-purpose wastewater agencies, dual-purpose (water and wastewater) special districts, and municipal wastewater agencies also provide wastewater treatment and disposal services within Metropolitan's service area.

Wastewater is collected in a sewer collection system. From there, it flows to a wastewater treatment plant. Once treated, wastewater is disposed of through one of three mechanisms:

### *Ocean Outfalls*

Treated wastewater is either disposed of directly through an ocean outfall or conveyed to the ocean outfall via a land outfall.

### *Reuse*

Currently, about 414 TAF per year of recycled water is used for landscape irrigation, industrial processes, and groundwater recharge applications in the region. A few inland treatment plants (in Riverside and San Bernardino counties) irrigate feed and fodder crops with recycled water. While this use is considered beneficial, it is not necessarily the highest and best use for recycled water. Higher value uses of recycled water include landscape or agricultural irrigation, commercial and industrial applications, groundwater recharge, seawater intrusion barrier, and other uses such as street sweeping and dust control, etc.

### *Stream Discharge*

The majority of inland plants discharge treated effluent into local streams and rivers. That water is then used downstream for beneficial uses, eventually flowing to the ocean. Some of the affected rivers (or ephemeral streams) include:

- Los Angeles River
- Santa Ana River
- Calleguas Creek
- Rio Hondo & San Gabriel Rivers
- Santa Margarita River

### Uses of Recycled Water

Water recycling is a reliable water supply, and it helps local agencies comply with environmental regulations. Uses of recycled water can generally be categorized as below.

### *Industrial*

Industrial users represent a large potential market for recycled water, particularly in heavily industrialized areas, such as the cities of Vernon, Commerce, Industry, and the Wilmington area of Los Angeles. Additionally, refineries in West Basin MWD's service area and the city of Torrance use recycled water. Typical industrial uses include cooling tower makeup water, boiler feed water, paper manufacturing, carpet dying, and process water. Industrial users are high-demand, continuous-flow customers, which allows greater operational flexibility by allowing plants to base load operations rather than contend with seasonal and diurnal flow variations. Because of these operational benefits, industrial users reduce the need for storage and other peak demand facilities and management.

### *Irrigation*

Recycled water is used to irrigate golf courses, parks, schoolyards, cemeteries, greenbelts, roadway medians, and agricultural purposes throughout Southern California. Using recycled water for irrigation reduces the need for imported water during the critical summer months and in drought situations when water supplies are scarce. Unlike industrial uses, irrigation demands have large seasonal variations in reuse.

*Indirect Potable*

Indirect Potable Reuse (IPR) refers to the use of recycled water for groundwater recharge, and surface water reservoir augmentation purposes. These types of uses require additional treatment levels beyond irrigation uses and use of an environmental buffer.

1. *Groundwater Recharge* – Metropolitan's service area overlies numerous groundwater basins, most of which rely on artificial recharge to sustain groundwater production, and some of which are threatened by seawater intrusion. Water agencies along the Los Angeles and Orange Counties coastline inject water into the underlying groundwater basins to create a barrier against this seawater intrusion and protect groundwater quality. The use of recycled water for seawater intrusion barrier projects is increasing and is replacing imported water used for this purpose. Increasing the proportion of recycled water can free imported water for direct consumption. Table 3-9 presents a summary of this recycled water use.
2. *Surface Water Augmentation* – Surface Water Augmentation includes use of advanced treated recycled water to augment a surface water reservoir. The reservoir serves as an environmental buffer (similar to groundwater in the case of groundwater recharge) prior to when recycled water is treated for potable uses. Blended water from the reservoir is then treated at a conventional water treatment plant for potable purposes. There is currently no reservoir augmentation with recycled water in Metropolitan's service area. The Division of Drinking Water (DDW) of the State Water Resources Water Control Board (SWRCB) is required under SB 918 to establish surface water augmentation regulations by December 31, 2016. The City of San Diego is currently operating a demonstration project to evaluate the feasibility and expected permitting requirements of a full-scale reservoir augmentation project.

**Table 3-9**
**2015 Recycled Water Use for**
**Groundwater Replenishment and Seawater Barrier Injection**
(TAF per year)

| Groundwater Basin | Recycled Water Use |
|---|---|
| Central Basin | 45 |
| Chino Basin | 11 |
| Orange County Basin | 88 |
| West Coast Basin | 12 |
| Other Basins | 2 |
| **Total** | **158** |

*Direct Potable Reuse*

Direct Potable Reuse (DPR) refers to the use of advanced treated municipal recycled water as a direct supply to or immediately after a conventional water treatment plant. DPR differs from IPR by having no environmental buffer. DPR eliminates the need and cost to store water in an environmental buffer (groundwater or surface water reservoir) for several months and instead

requires additional treatment or testing to ensure public health requirements are achieved. Currently, there are no permitted DPR projects in California. DDW is required under SB 918 to review recommendations of an expert panel to evaluate and report on the feasibility of DPR to the legislature by December 31, 2016.

Technical and Economic Issues of Recycled Water

Recycled water use is growing rapidly in Metropolitan's service area. Further expansion depends on progress in research, regulatory change, public acceptance, water quality issues, cost, operational issues, and conflicting institutional objectives. Each of these challenges, as well as opportunities for recycled water use, lessons learned, and recommendations to enhance the development of recycled water, are discussed below.

Challenges

*Lengthy and Variable Permitting Process*

The SWRCB established the Recycled Water Policy (Policy). This Policy requires the SWRCB and the nine Regional Water Quality Control Boards (Regional Boards) to encourage the use of recycled water, consistent with state and federal water quality laws. The Policy provides additional directions to the Regional Boards on appropriate criteria to be used in regulating recycled water projects. The DDW and the nine Regional Boards are responsible for setting the rules and permitting for recycled water projects. The timeline and roadmap for getting a permit are challenging and inconsistently implemented in different regions of the state. Limited history and technical information (e.g., on direct potable reuse) to inform regulations and limited staffing at DDW and other agencies have challenged the ability to propose, revise, and adopt new regulations in a timely manner. Agencies planning and designing DPR and IPR projects face delays because of regulatory uncertainty. In addition, many project proponents hoping for grant or loan funding have identified lengthy CEQA review as a challenge.

Indirect potable reuse projects face regulatory constraints such as treatment, blend water, retention time, and Basin Plan Objectives, which are the designated uses assigned by the SWRCB and which may limit how much recycled water can feasibly be recharged into the groundwater basins. For example, the Basin Plan Objective for TDS of a particular basin may be lower than the quality of the tertiary water effluent available, resulting in the need for more blend water or advanced levels of treatment. These treatment requirements impact the economic feasibility of a project.

*Public Perception/Conflicting Messaging*

Conflicting messaging confuses the public about the safety of recycled water. There is not a clear understanding by the public of the difference between non-potable reuse, indirect potable reuse, and direct potable reuse uses. The public is most familiar with non-potable reuse as they see recycled water in use at parks, golf courses, schools, and other large landscapes. However, public perception and acceptance of drinking recycled water (IPR and DPR) is a much bigger challenge. Signage for non-potable reuse projects at parks, schools, and golf courses that read, "Using recycled water; do not drink" can adversely affect the public's acceptance of DPR and IPR. Although public acceptance of recycled drinking water has improved, effective education and public outreach is still needed. There is a need for new messaging to reduce the confusion.

### *Cost*

Cost, including up-front capital and ongoing operation and maintenance, remains a barrier to recycled water development. Most low-cost projects have been built. The price tag for expanding the recycled water distribution systems remains a barrier to full implementation of non-potable reuse projects – these projects require pipelines connecting the treatment plants and the individual users. Some agencies may also be considering indirect potable reuse and direct potable reuse projects to reduce the need to have extensive recycled water distribution systems because of the cost. Some non-potable reuse and indirect potable reuse projects and all direct potable reuse projects require advanced treatment facilities, which are comparatively expensive. Advanced treatment may also require additional brine concentrate disposal facilities (e.g., a brine line) and extensive infrastructure for injection wells/spreading facilities, or for delivery of the product water to a spreading ground, surface reservoir, or water treatment plant for potable uses. End users play a very important role for recycled water advancement. Site conversion costs (borne by the customer) and additional conveyance infrastructure for new customers can also be a barrier to reaching full non-potable reuse project capacity. Some agencies may be challenged with cash flow issues or cannot secure the funding needed to implement projects.

In addition, with the increasing prospect of statewide regulations for indirect potable reuse and direct potable reuse, some agencies pursuing indirect potable reuse are hesitant to extend their existing distribution system for non-potable reuse projects for fear of stranded facilities. Similarly, some agencies pursuing direct potable reuse may delay their planned indirect potable reuse projects to prevent stranded distribution facilities[7].

### *Source Control and Effluent Water Quality Needs*

Source water quality and flow control is essential to help safeguard the water recycling treatment process and the end use of the water by placing controls on the type, timing, and amount of wastewater that comes into the plant. A good source control program limits treatment plant disruptions and ensures treatment processes are capable of handling spikes in volume, industrial influent, and high salinity influent. When it comes to the treatment process, recycled water policy requires that the effluent meets certain water quality standards. Salt and nutrient management plans protect groundwater beneficial uses and prevent excess degradation, which may limit expanded indirect potable reuse applications if the agency does not have funds for advanced treatment to remove salts to meet the Basin Plan Objectives. In some cases, existing source control plans may need to be updated to deal with constituents of emerging concern and with more stringent needs of the users.

Water use efficiency helps conserve water, but also incidentally reduces wastewater volume resulting in an increase in the concentration of wastewater. As a result, additional treatment is needed, which increases operation and maintenance costs of the system. Source water quality is especially important for implementing indirect potable reuse and direct potable reuse projects to protect potable water systems.

### *Operational Issues*

While each agency is different, it is important to recognize the possible operational issues that may occur with the use of recycled water, including:

- Reduction in wastewater flows due to ongoing conservation and drought

[7] Indirect potable reuse projects usually require injection wells or a distribution system to a surface reservoir or recharge basin, and may also require improvements to a surface reservoir, recharge basin, or treatment facility.

- Lack of seasonal storage to address diurnal and seasonal demands; construction of storage facilities may be needed for flow equalization
- Brine disposal needs
- Environmental flow or stream discharge requirements may limit the ability to deliver recycled water during high demand periods
- Regulatory issues such as blend requirements and water quality objectives may impact the effectiveness of indirect potable reuse
- Lack of regional GIS data to optimize recycled water deliveries
- Need for multiple barriers to ensure recycled water quality and for monitoring techniques that provide feedback in real-time to respond to plant disruptions, especially with DPR projects
- Need for additional operator training and certification

#### *Conflicting Institutional Objectives*

Institutional coordination among drinking water, wastewater, and groundwater management agencies may be challenging, and the agencies may face barriers due to the difficulty in aligning varying institutional objectives. The main objective of a wastewater agency is to collect, treat, and safely dispose of wastewater based on a set of established standards. This may conflict with the objectives of a groundwater agency that is legally tasked to protect the quality of groundwater. At the same time, water agencies developing recycled water projects are usually seeking a consistent, higher quality treated wastewater for a successful recycling program – though the wastewater agency may not be treating the wastewater to such higher quality for its normal disposal, and the groundwater agency may still be concerned about the quality of the return flows of this recycled water to the groundwater basin.

### Opportunities

#### *Progress Towards New Regulatory Process*

The State of California has made some progress in developing permit standards that provide opportunities to expand recycled water use.

Non-potable reuse: The SWRCB developed a general permit for non-potable uses of recycled water in June 2014 that provides an opportunity for new projects to come online sooner with more standardized monitoring requirements. Further, revisions are being considered to attract additional users and further streamline recycled water projects.

Indirect and direct potable reuse: The SWRCB is facing a December 2016 deadline under SB 918 to develop regulations for surface water augmentation and to investigate and report to the legislature the feasibility of DPR.

Metropolitan is also working with the WateReuse Association and other agencies on legislative and regulatory issues to streamline permitting processes and to provide needed funding and support for increased use of the recycled water.

#### *New Funding Opportunities*

On January 17, 2014, as part of the governor's emergency drought declaration, the SWRCB, under the Clean Water State Revolving Fund, offered up to $800 million in low-interest loans for water recycling projects that offset or augment state water supplies and can be completed

within three years. Projects must apply for the funding through the SWRCB by December 2, 2015. As of May 27, 2015, over 30 projects had applied requesting more than $1.6 billion in funding.

Proposition 1 (Assembly Bill 1471, Rendon) authorized $7.545 billion in general obligation bonds for water projects with $725 million for water recycling and desalination projects. Another $625 million will be administered through SWRCB's Water Recycling Funding Program for water recycling and $100 million through DWR for desalination.

In 2014, Metropolitan increased the financial incentives under its Local Resources Program (LRP) for agencies to develop recycled water. Metropolitan also established the On-site Retrofit Pilot Program to provide rebates to customers that convert their irrigation and industrial system from potable water to recycled water. In addition, Metropolitan established the Reimbursable Services Program to provide technical and construction assistance to its member agencies for local project development. Under this program, Metropolitan advances funds and is reimbursed by the agency.

### *Improving Public Perception*

The drought has heightened water awareness in the region and has provided momentum for water conservation and reuse. The public is more willing to accept alternative supplies such as recycled water. Public outreach and education have also helped improve the public's perception of recycled water. Public sharing of information, open door stakeholder meetings, and focus groups have been very effective at distributing information and addressing public concerns. Case studies and demonstration projects are used to educate and improve public perception on recycled water.

Ample opportunities exist for cooperation among agencies to address the issue of conflicting and confusing messaging by branding or the use of alternative terminologies. A regional workgroup could explore and encourage outreach partnerships among agencies.

### *New Technologies, Research, and Information Sharing*

New technologies, research, and information sharing greatly enhance the development of recycled water. Programs such as Metropolitan's Foundational Actions Funding Program focus on technical studies and pilot projects that reduce barriers to future local production. Projects under this program include optimizing new treatment techniques for recycled water, exploring new monitoring methodologies, and testing innovative brine concentration technology. In addition to the technical portions of this program, the FAF Program supports collaboration between agencies and regional sharing of information.

Research is especially critical in advancing new water supply options, such as DPR. WateReuse, in partnership with other agencies (including Metropolitan), is leading the California Direct Potable Reuse Initiative[8] to advance DPR as a water supply option in California and to address regulatory, utility, and community concerns. WateReuse's report ***Direct Potable Reuse: A Path Forward***[9] provides an overview of DPR and identifies research needs.

Regional studies can also examine the needs of multi-jurisdictional areas and foster communication among agencies to promote the use of recycled water. For example, sharing regional information such as GIS data can identify areas of recycled water surpluses and needs.

[8] https://www.watereuse.org/foundation/research/direct potable reuse-Initiative
[9] https://www.watereuse.org/product/direct-potable-reuse-path-forward

In addition, a clearinghouse could be developed to collect and disseminate information on research and technology developments and studies.

*Partnerships*

Drinking water, wastewater, and groundwater management agencies share some common objectives, including access to source water, cost minimization, and protection of the environment. Many agencies are successfully cooperating and developing recycled water projects. These partnerships can allow sanitation districts to reduce the cost of disposing treated wastewater in the ocean, reduce impacts to the marine environment, and provide a source of reclaimed water to water agencies for recycling. At the same time, groundwater basin management agencies could be the recipients of final recycled water, helping maintain or increase groundwater levels.

*Lessons Learned*

There have been many success stories on recycled water development. Focusing on public outreach and education has improved public perception. Partnerships and joint efforts among water and wastewater agencies proved to be an effective way to remove barriers and make progress. Numerous studies and research funded by federal, state, and local agencies are benefitting local and regional effort.

*Public Outreach is Important*

Public outreach and education have helped improve the public's perception of recycled water. When the public is informed and takes part in the decision making process, they will likely be more accepting of a project.

Water shortages raise awareness for alternate ways to conserve. As a result, the public is more willing to accept alternative supplies such as recycled water, support the more expensive projects, and tolerate rate increases. Some residential property owners are interested in using recycled water for watering plants to help with the drought. For example, residents have access to recycled water from "residential recycled water fill stations" in the Irvine Ranch Water District. Developing similar programs throughout Southern California would help increase recycled water use and conservation of potable supplies.

*Additional Funding is Needed*

LRP incentives and onsite retrofit program funding have increased use of recycled water in the region by almost 200 percent. However, incentives alone may not be enough to spur project development - capital funding is also necessary because the LRP only provides funding after a project begins operation. As an example, even though Metropolitan recently increased its LRP incentive rates, there are only a few applications for new projects because agencies lack capital funding to construct the project in the first place. Although available construction funding for recycled water projects has increased under the recently passed Proposition 1, projects generally still require a 50 percent local match. One source of funding is typically not enough to fund a recycled water project.

Funding is also needed for studies, pilot projects, and research. Metropolitan's Foundational Actions Funding Program provided funding for studies and pilot projects to help advance the development of local supplies.

*Partnerships Can Be Successful*

History shows us that partnerships among agencies help advance use of recycled water and provide tangible benefits to each participating agency. A good example of partnerships working well is the agreement between Orange County Water District (OCWD) and the Orange County Sanitation District. This partnership began in the 1970s, when OCWD built the Water Factory 21 to produce recycled water to mitigate seawater intrusion in the Orange County Groundwater Basin. Twenty years later, the two agencies decided to jointly build the Groundwater Replenishment System (GWRS) recycled water project. The GWRS is the largest planned indirect potable reuse facility in the world with a current capacity of 100,000 AFY and future expansion to 130,000 AFY.

Other examples of cooperation between agencies to further recycled water use include partnerships between the city of Los Angeles and West Basin Municipal Water District (West Basin Water Recycling Program), the City of Los Angeles and the City of Burbank (North Hollywood Water Recycling Project), City of Long Beach and the Water Replenishment District (Alamitos Barrier Water Recycling Project), and the Sanitation Districts of Los Angeles County and Central Basin Municipal Water District (Century and Rio Hondo Water Recycling Project).

*Water Industry Organizations and Regional Collaboration Help Advance Recycled Water*

Recent advancements to recycled water development are due, in large part, to cooperation and collaboration among water and sanitation districts, as well as other water industry organizations. Historically, the WateReuse Association was one of the main advocates for recycled water development in the state. Their activities initially focused on permitting issues, public outreach/education, conferences for information sharing, and research related to recycled water. As recycled water became a core resource for water and wastewater agencies, they started to ramp up their activities to help advance recycled water and utilized partnerships with academia along with other trade organizations such as the Association of California Water Agencies, California Urban Water Agencies, WateReuse Association, and California Association of Sanitation Agencies. Professional organizations such as American Water Works Association (AWWA) are another vehicle to promote recycled water through research, technical seminars, and operator training and certification. These organizations have proven to be effective in promoting regional collaboration on research and leveraging resources.

Recommendations

*Explore Opportunities to Improve Permitting Process*

- Streamline and simplify water recycling regulations with uniform administration consistent with operations, public health, and the environment
- Support legislation and regulation that expands the types of recycled water uses consistent with the protection of public health and help achieve the state's recycled water goal (an additional 1 million acre-feet by 2020)
- Convene a forum to discuss projects, permitting, and treatment technologies

*Improve Public Education and Awareness of Water Recycling*

- Pursue unified, consistent messaging
- Consider expanding residential fill stations to further advance public acceptance of recycled water

*Explore Various Investment Strategies, Such as Incentives, Ownership, and Partnerships*

- Promote collaboration among stakeholders and agencies to facilitate implementation of recycled water projects in California
- Promote development of new financing to increase water recycling, advance research in science and technology, assess health effects, develop additional regional planning, and study innovative technologies
- Explore a business case for further development of recycled water partnerships or ownership
- Consider additional end user programs to replace potable water systems with recycled water
- Collaborate on pursuing grant funding

*Consider Joint Technical Studies and Projects*

- Explore a collaborative regional effort to develop a regional GIS data set
- Explore integration approaches
- Investigate programs for the development of new technologies, such as comprehensive real-time monitoring devices and techniques that improve water quality and ensure public health, and maintain public confidence
- Study opportunities to protect or improve the quality of wastewater source supplies
- Explore development of a regional study to help identify opportunities for seasonal storage

### *Groundwater Recovery*

All Southern California groundwater basins experience varying degrees of water quality challenges as a result of urban and agricultural uses. The accumulation of high-salinity water and degradation from volatile organics are two common constraints to the economic use of groundwater for urban applications. In some cases, the threat of increased salt buildup can also complicate conjunctive use of groundwater basins and imported supplies.

Use of degraded groundwater normally requires high levels of treatment. Membrane processes used to recover the majority of severely degraded water have a high capital cost and incur a high operational cost for power. Once treated, however, recovered groundwater may be integrated into potable water systems. Metropolitan initiated its Groundwater Recovery Program (GRP) in 1991 to encourage local agencies to treat and use degraded groundwater for municipal purposes. The GRP was open to all technologies that recovered and used degraded groundwater. It was retired in 1998 and folded into Metropolitan's LRP.

### *Seawater Desalination*

The constant availability of ocean water regardless of weather or climate is one of the key benefits of seawater desalination. Thus, Metropolitan and its member agencies have been considering seawater desalination as a potential new supply source since the 1960s. Up until the 1990s, seawater desalination was considered too expensive compared to other resource alternatives, especially imported water. However, advances in membrane technology, energy recovery, and process design in the 1990s lowered desalination costs compared to other new supply alternatives. By the early 2000s, several member agencies began pursuing local projects to diversify their resource portfolios. In 2001, Metropolitan created an incentive program, the

Seawater Desalination Program, to support these projects. Soon after, the Board approved Metropolitan's role as a regional facilitator for seawater desalination with the purpose of assisting the member agencies with state and regional development issues. In 2014, Metropolitan merged seawater desalination projects into the LRP to promote development of additional local supplies in the region.

### *Changed Conditions*

The status of locally planned projects changes from year to year. Metropolitan periodically surveys its member agencies for planned projects to coordinate local supply projections and plans. Recent changes in long-term strategies, regulations, and funding priorities could provide new opportunities to develop these resources.

#### *Recycled Water*

Several recent state policies and adopted codes help recycled water development as described below.

SWRCB adopted the State Recycled Water Policy (Policy) in February 2009 after several years of negotiation and amended it in 2013 to include the monitoring and analytical requirements for constituents of emerging concern (CEC). The Policy supports the SWRCB Strategic Plan to promote sustainable local water supplies and establishes a mandate to increase the use of recycled water in California by 1 MAF per year over 2002 levels (approximately 525,000 AF) by 2020 and by an additional 3 MAF per year by 2030. The Policy is organized into recycled water goals, roles of agencies, salt and nutrient management plans, landscape irrigation, groundwater recharge, anti-degradation, emerging constituents, and recycled water incentives.

SWRCB's General Permit for Recycled Water Use was adopted June 4, 2014, in response to the Governor's draught declaration and to facilitate the use of recycled water to offset potable water demands. Coverage is available to most treated municipal wastewater for non-potable uses, but specifically excludes groundwater replenishment. Monitoring for CECs is not required for non-potable uses. Application of recycled water for irrigation sites is limited to agronomic rates.

On November 18, 2009, the Building Standards Commission unanimously voted to approve the California Dual Plumbing Code that establishes statewide standards for installing both potable and recycled water plumbing systems in new commercial, retail, and office buildings, theaters, auditoriums, condominiums, schools, hotels, apartments, barracks, dormitories, jails, prisons, and reformatories. The code was adopted January 15, 2010, with an effective date of January 1, 2011.

Assembly Bill 2071 (Levine 2014) directs SWRCB by December 31, 2016, in consultation with other agencies, to determine if the voluntary use of disinfected treated recycled water for watering animals would pose a significant risk to the public and animal health. The SWRCB shall approve the use or establish uniform statewide recycling criteria to address identified risks. Use of recycled water would be prohibited for dairy animals that are producing items for human consumption.

Assembly Bill 2282 (Gatto 2014) directs the California Building Standards Commission to adopt in the 2016 Intervening Code Adoption Cycle mandatory building standards for the installation of recycled water systems for newly constructed commercial and residential buildings in areas where there is access to a water recycling facility.

### *Groundwater Recovery Brine Disposal*

The management of existing regional brine lines and the development of new brine line systems will be a critical factor in the continued growth in brackish groundwater desalination. The brine line will also be applicable for disposing brine from advanced treatment of wastewater for recycled water use. All processes that recover degraded groundwater also produce concentrated waste flows for which disposal can be problematic. Most importantly, membrane processes such as reverse osmosis – the predominant desalting technology used in Southern California – produce significant volumes of brine that can account for about 15 percent of the treated water. In Southern California, brines generated from brackish water desalination are typically disposed through dedicated brine lines to ocean outfalls or sanitary sewers.

The region currently has one fully operating brine line, the Santa Ana Regional Interceptor (SARI line). The SARI line collects brine from desalters in San Bernardino, Riverside, and Orange Counties. A key benefit of the SARI line is that it has allowed inland water agencies to recover impaired groundwater resources which would otherwise be unusable.

A lower portion of a second brine line, Calleguas Regional Salinity Management Pipeline, is in operation while the upper reach is still under construction. The Calleguas Regional Salinity Management Pipeline delivers brine from recycled water plants and groundwater desalination facilities in Ventura County to the ocean.

A third regional line is in the planning phase in San Diego County. The Southern California Salinity Coalition, a coalition of water and wastewater agencies, has advocated for state and federal financial assistance to build these regional brine lines.

### *Seawater Desalination*

In the past five years, State agencies have implemented new regulations which could negatively impact the future development of seawater desalination. This includes the SWRCB's Ocean Plan amendments and Once-Through Cooling regulations, as well as the establishment of Marine Life Protected Areas (MLPAs) in Southern California. At the same time, the impacts of the current drought and the potential for multi-decadal dry-periods due to climate change have increased interest in seawater desalination as a potential long-term response to water shortages.

#### Ocean Plan Regulations

In May 2015, after five years of development, the SWRCB updated California's Ocean Plan with regulations affecting new seawater desalination projects. The regulations include stringent requirements for intakes, outfalls, brine discharges, and marine life mitigation. Regional Water Quality Control Boards will be responsible for implementing the regulations and will have broad powers over project design elements. The new regulations may increase project costs and could limit the ability to develop regional-scale projects.

#### Once-Through Cooling Regulations

Prior to the revised Ocean Plan regulations, the SWRCB in 2010 adopted regulations requiring coastal power plants to phase out the use of once-through-cooling (the use of seawater to cool generators in a single-pass system) by 2030. As once-through-cooling is phased out, many of the environmental and operational benefits of co-locating seawater desalination projects with power plants will be diminished. However, coastal power plants remain attractive sites for

development due to the presence of coastal-dependent industrial zoned land, power infrastructure, and the potential to repurpose existing infrastructure.

Marine Life Protected Areas

In 2011, the California DFW adopted a system of 50 MLPAs covering approximately 15 percent of Southern California's coastline[11]. MLPAs are defined zones along the coast where certain commercial and recreational activities are restricted. Most construction and operational activities associated with seawater desalination are prohibited in MLPAs with the exception of certain types of subsurface intakes. MLPAs are located along the Channel Islands, as well as along the mainland coast. The MLPAs network includes areas near planned seawater desalination projects. Depending on how MLPAs enforcement regulations are interpreted, they could be a limiting factor for some planned seawater desalination projects.

## *Implementation Approach*

### *Local Resources Program*

The Local Resources Program (LRP) is the primary tool for Metropolitan to incentivize local resources development. The success of the LRP is due to its adaptability to changed conditions. Periodically, Metropolitan and its member agencies review and update the LRP in response to water supply conditions.

Metropolitan continues to explore ways to help increase recycled water use. In order for a site to receive recycled water, the potable water systems must be retrofitted for recycled water use. On-site conversion costs (borne by customers) are generally high. In July 2014, Metropolitan established the On-site Retrofit Pilot Program to provide financial incentives to customers for the conversion of their potable industrial and irrigation systems to recycled water.

Furthermore, in October 2014, Metropolitan made significant improvements to the LRP that included increasing the incentive amount and providing three incentive payment structures. Metropolitan offers three LRP incentive payment structure options to choose from: sliding scale incentives up to $340/AF over 25 years, sliding scale incentives up to $475/AF over 15 years, or fixed incentives up to $305/AF over 25 years. In addition, onsite retrofit costs for recycled water uses are eligible for LRP incentives. Under the enhanced program, LRP projects include other local water resources development including seawater desalination. To expedite development of ready-to-proceed projects, Metropolitan would also provide reimbursable services, such as engineering design, to member agencies.

### *Regional Recycling Program*

On November 10, 2015, Metropolitan's Board authorized Metropolitan to enter into an agreement with the County Sanitation District No. 2 of Los Angeles County (Sanitation District) to implement a demonstration-scale recycled water treatment plant and to establish the framework of terms and conditions for development of a regional recycled water supply program. Under this proposed agreement, Metropolitan has the opportunity to work collaboratively with the Sanitation District to develop a potential regional recycled water supply program that would purify and reuse water for the recharge of groundwater basins. Metropolitan and the Sanitation District would jointly develop this program to purify secondary effluent from the Sanitation District's Joint Water Pollution Control Plant (JWPCP) using advanced treatment technologies to produce water that is near-distilled in quality and that

[11] http://www.wildlife.ca.gov/Conservation/Marine/MPAs/Network/Southern-California

would be equal to or better than the quality of water currently used to replenish groundwater basins in the Southern California region. The secondary effluent from the JWPCP is currently discharged to the Pacific Ocean. The purified water would be delivered to Metropolitan's member agencies to meet their groundwater recharge and storage requirements. A collaboration between the two districts could advance the reuse of water at a scale, timing, and strategic location to serve the direct needs of multiple member agencies for recharge of groundwater basins in Southern California, and to augment regional supplies for Metropolitan's service area.

The demonstration project would serve as a proof of concept and would provide critical information needed for implementation of a potential regional recycled water supply program. The demonstration project would consist of three components: (1) a one million gallon per day (MGD) demonstration-scale treatment plant, which would verify source water quality criteria and confirm the advanced treatment process needed to purify water for groundwater recharge; (2) feasibility studies of the delivery system to determine the distribution facilities, routing, capacity, phasing, and timing needed to recharge various groundwater basins within Metropolitan's service area, and (3) a financing plan to assess the economic viability of a full-scale regional program. The proposed agreement also establishes the framework for the development of a full-scale regional recycled water supply program that would enable a potential reuse of up to 150 MGD of treated effluent from the Sanitation District's JWPCP.

### *Seawater Desalination Program*

Metropolitan's Seawater Desalination Program (SDP) was created in 2001 through a competitive Request for Proposals (RFP) to encourage the development of potential projects by local agencies. Like the LRP, it offers sliding-scale incentives to member and local agencies, providing up to $250 per AF for produced supplies. In response to the RFP in 2001, Metropolitan entered into SDP agreements with three member agencies. The Carlsbad Project was originally part of the SDP program, but has proceeded without an SDP agreement or incentives. A fifth potential project in the initial RFP was not pursued.[12] In 2014, Metropolitan expanded regional funding opportunities for seawater desalination by merging it into the LRP incentive program described above. Table 3-10 provides a summary of the status of the SDP projects. Local agencies are also considering a number of projects independent of the SDP with the potential to produce up to 360 TAF per year if developed. Table 3-11 provides a summary of these local agency projects.

Metropolitan also provides regional facilitation for seawater desalination by providing technical assistance, supporting member agency projects during permit hearings and other proceedings, coordinating responses to proposed legislation and regulations, and working with the member agencies to resolve related issues. To further these goals, Metropolitan help found and now participates in CalDesal, a consortium of water utility and private companies promoting desalination as an element of California's future supply portfolio.

## ***Achievements to Date***

Metropolitan has continued to develop and refine its programs to encourage the involvement of its member agencies in water recycling, groundwater recovery, and desalination. Developing and managing these programs requires considerable coordination and refinement. Changing conditions over the last five years have reduced the costs of these options and allow Metropolitan to rely on these sources for future water supply.

[12] The LADWP opted to not pursue its potential seawater desalination project in the mid-2000s.

Metropolitan is committed to providing financial assistance to the development of water recycling projects throughout its service area. Since 1982, Metropolitan has executed LRP contracts for 75 recycled water projects, 59 of which produced about 184 TAF in 2015. Local projects not receiving funding from Metropolitan provide an additional 272 TAF of recycled water to the region.

Since 1991, Metropolitan has executed GRP and LRP contracts for 24 recovered groundwater projects, 22 of which produced about 57 TAF in 2015. In addition to the projects under Metropolitan's programs, about 50 TAF of degraded groundwater is recovered by agencies in Metropolitan's service area without Metropolitan's financial assistance.

Table 3-12 provides a summary of recycled water use and groundwater recovery in 2015. To date, Metropolitan has invested $372 million in recycling programs and $132 million for groundwater recovery. Table 3-13 provides a summary of the groundwater and recycled water production and incentive payments under Metropolitan's programs to date.

Member agency seawater desalination projects under Metropolitan's SDP are still in the planning stages, though significant pilot testing and related studies have been completed by the local agencies in support of the projects. The 56 TAF Carlsbad project was completed and is now operational without Metropolitan's financial assistance.

**Table 3-10**
**Seawater Desalination Program Project Status**

| Project | Member Agency Service Area | Capacity Range AF per Year | Status | SDP Agreement |
|---|---|---|---|---|
| Long Beach Seawater Desalination Project | Long Beach Water Department | 10,000 | Long-term intake testing | Yes |
| Doheny Desalination Project | Municipal Water District of Orange County/ South Coast Water District | 5,000 – 16,000 | Pre-EIR Studies | Yes |
| Carlsbad Seawater Desalination Project | San Diego County Water Authority | 56,000 | Operational | No |
| West Basin Seawater Desalination Project | West Basin Municipal Water District | 20,000 – 60,000 | Pre-EIR Studies | Yes |
| **Total: Seawater Desalination Projects** | | **91,000 – 142,000** | | |

**Table 3-11**
**Other Potential Seawater Desalination Projects in Metropolitan's Service Area**

| Project | Member Agency Service Area | AF per Year | Status |
|---|---|---|---|
| Huntington Beach Seawater Desalination Project | Municipal Water District of Orange County / Orange County Water District | 56,000 | Permitting |
| Camp Pendleton Seawater Desalination Project | San Diego County Water Authority | 56,000 to 168,000 | Planning |
| Ventura County | Calleguas Municipal Water District | 20,000 to 80,000 | Feasibility Study |
| Rosarito Beach | San Diego County Water Authority, Otay Water District | 56,000 to 112,000[1] | Feasibility study |
| **Total: Other Potential Projects** | | **160,000 – 360,000** | |

[1] Metropolitan's service area would receive a share of the total supply produced by the project.

**Table 3-12**
**2015 Recycled Water Use and Groundwater Recovery**
(TAF)

| Type of Project | With Metropolitan Funding | Without Metropolitan Funding | Total |
|---|---|---|---|
| Recycled Water[1] | 184 | 230[1] | 414 |
| Groundwater Recovery | 60 | 55 | 115 |
| **Total** | **244** | **285** | **529** |

[1] Including 60 TAF of Santa Ana River baseflow.

**Local Resources Program**

| | Recovered Groundwater | Recycled Water | Total |
|---|---|---|---|
| **Projects** | | | |
| In Operation | 24 | 75 | 99 |
| Ultimate Yield (TAF) | 112 | 310 | 422 |
| **Deliveries (TAF)** | | | |
| FY 2014-2015 | 60 | 184 | 244 |
| Since Inception | 791 | 2,237 | 3,028 |
| **Payments ($ millions)** | | | |
| FY 2014-2015 | $8 | $30 | $38 |
| Since Inception | $132 | $372 | $504 |

## 3.6 Surface Storage and Groundwater Management Programs: Within the Region

Since the 1950s, local water management in Metropolitan's service area has included the surface water storage and conjunctive use of groundwater. Conjunctive use of water refers to the use and storage of imported surface water supplies in groundwater basins and reservoirs during periods of abundance. This stored water is available for use during periods of low surface water supplies as a way of augmenting seasonal and multiyear shortages.

### *Background*

Metropolitan established general long-term storage guidelines in its WSDM Plan. The WSDM Plan provides for flexibility during dry years, allowing Metropolitan to use storage for managing water quality, hydrology, SWP, and CRA issues. Dry-year surface storage yields have been characterized in several ways, including delivery capabilities over two- and three-year dry periods. The approach used in Metropolitan's resource planning assumes that dry-year surface storage can be used as needed and as available within the WSDM planning framework. In addition to surface reservoirs in the region, storage capacity in the region's groundwater basins allows for conjunctive use programs. In 2000, the Association of Ground Water Agencies (AGWA) published Groundwater and Surface Water in Southern California: A Guide to Conjunctive Use that estimated the potential for dry-year or long-term conjunctive use in Metropolitan's service area at approximately 4.0 MAF. In 2007, Metropolitan published the Groundwater Assessment Study that estimated 3.2 MAF of space in groundwater basins available for storage within Metropolitan's service area. Metropolitan's 1996 IRP calls for the development of conjunctive use programs with member agencies and groundwater basin managers to store surplus imported supplies in wet years to provide dry-year supplies.

To prepare for supply disruptions, Metropolitan and its member agencies have adopted goals for water storage within the region. Metropolitan has identified in-region storage that should be set aside for use in emergencies, such as a disruption to imported supplies due to a major seismic event at the San Andreas Fault.

### *Implementation Approach*

#### *Surface Storage*

Since the beginning of the Metropolitan's planning process, two significant changes have occurred to regional surface storage. These two changes are the construction of DVL and Metropolitan receiving operational control of 218,940 AF in Castaic Lake and Lake Perris.

Diamond Valley Lake

Construction of Southern California's newest and largest reservoir nearly doubled the area's surface water storage capacity. Transport of imported water to the lake began in November 1999, and the lake reached capacity in early 2003. DVL holds up to 810 TAF, some of which is for dry-year or seasonal storage, and the remainder for emergency storage.

SWP Terminal Reservoirs

Under the 1994 Monterey Agreement and Amendment, Metropolitan received operational control of 218,940 AF in the reservoirs at the southern terminals of the California Aqueduct. Control of this storage capacity in Castaic Lake and Lake Perris gives Metropolitan greater flexibility in handling supply shortages. In 2005, seismic concerns arose regarding Perris Dam. In response, DWR reduced the storage amount at Lake Perris by half until those concerns can be studied and addressed; however, Metropolitan's operational storage remained the same. Since then, Metropolitan has continued to withdraw and replace water from the reservoir

operating from the lower level. In November 2011, DWR issued a Final EIR for the repair of the dam at Lake Perris. Construction work began on August 2014 and is anticipated to continue through 2017.

### *Groundwater Storage*

Many local groundwater storage programs have been implemented over the years to maximize the use of local water supplies. These programs have included the diversion of water flows into percolation ponds for recharging groundwater basins and the recovery of degraded groundwater.

- For many years, flood control agencies within Metropolitan's service area have captured and spread stormwater for groundwater replenishment. Local runoff and reclaimed water have been conserved via spreading grounds, injection wells, reservoirs, and unlined river channels. In addition, flood control agencies have operated seawater barrier projects in Los Angeles and Orange Counties to prevent seawater intrusion into the coastal groundwater basins.
- Water quality problems have raised serious concerns about the ability to sustain average annual production levels in some groundwater basins. The federal Superfund program, although slow to implement clean-up projects, has helped maintain or increase the usable groundwater. These increased levels have been augmented by groundwater water recovery projects discussed in Section 3.5.

Conjunctive use of the aquifers offers an even more important source of dry year supplies. Unused capacity in Southern California groundwater basins can be used to optimize imported water supplies, and the development of groundwater storage projects allows effective management and regulation of the region's major imported supplies from the Colorado River and SWP. Over the years, Metropolitan has implemented conjunctive water use through various programs. Typically, this storage takes place in one of two ways:

- Direct deliveries to storage – Metropolitan delivers recharge water directly to water storage facilities, including spreading sites and injection wells.
- In-lieu deliveries to storage – Metropolitan delivers additional water directly to a member agency's distribution system. The member agency then uses this water rather than pumping the groundwater it otherwise would have taken out of storage. The deferred local production results in water being left in local storage (surface or groundwater) for future use.

Metropolitan has developed a number of local programs to work with its member agencies to increase storage in groundwater basins. Metropolitan has encouraged storage through its cyclic and conjunctive use storage programs. These programs allow Metropolitan to deliver water into a groundwater basin in advance of agency demands. Cyclic storage agreements allow pre-delivery of imported water for recharge into groundwater basins in excess of an agency's planned and budgeted deliveries making best use of available capacity in conveyance pipelines, use of storm channels for delivery to spreading basins, and spreading basins. This water is then purchased at a later time when the agency has a need for groundwater replenishment deliveries. Conjunctive use agreements provide for storage of imported water that can be called for use by Metropolitan during dry, drought, or emergency conditions. During a dry period, Metropolitan has the option to call water stored in the groundwater basins pursuant to its contractual conjunctive use agreements. At the time of the call, the member agency pays Metropolitan the prevailing rate for that water. Metropolitan has drawn on dry-year supply from cyclic storage accounts and nine contractual conjunctive use storage programs to address shortages from the SWP and the CRA.

### *Achievements to Date*

In 2000, Metropolitan entered an agreement with DWR to administer $45 million of Proposition 13 state bond funds for Metropolitan's Southern California Water Supply Reliability Projects Program. Metropolitan paired the $45 million of state funds with $35 million of Metropolitan capital funds to develop nine groundwater storage programs in partnership with member and retail agencies and groundwater basin managers. These nine contractual storage programs provide for storage of up to 212 TAF and dry-year yield of up to 70 TAF. These programs are summarized in Table 3-14.

In 2007, Metropolitan prepared the Groundwater Assessment Study Report in collaboration with its member agencies and with groundwater basin managers. The report finds that while there is substantial storage space in service area groundwater basins that could be used for conjunctive use, there are significant challenges that must be overcome in order to implement additional storage programs. Use of additional storage opportunity requires:

- Capture, delivery, and recharge of additional local and imported surface supplies;
- Improved capability to store available surplus surface supplies with adequate conveyance and recharge capacity; and
- Resolution of constraints including: remediation of contamination, institutional and legal issues, funding for significant investment in capital infrastructure, and incongruity between aquifer capability with overlying demand for water supplies.

To follow up on the findings of the Groundwater Assessment Study Report, Metropolitan initiated a series of seven groundwater workshops beginning in July 2008 among Metropolitan, member agencies, groundwater basin managers, and stakeholders to discuss challenges for increasing conjunctive use and to develop recommendations for addressing the challenges. The workgroup's recommendations were submitted as a Board Report to Metropolitan's Board of Directors and provided as input to Metropolitan's current planning process. The recommendations are as follows:

1. Enhance groundwater recharge with increased stormwater, recycled water, and imported water recharge.
2. Streamline requirements, remove policy constraints, clarify procedures, increase coordination and sharing of information to accomplish recharge goals.
3. Develop flexible regional policies and programs that can be tailored to meet specific local needs of each groundwater basin.
4. Increase integration of local groundwater and regional water supplies with a proposal for a comprehensive modeling study to initiate review of innovative opportunities.
5. Use appropriate price signals to encourage conjunctive use and investments for storage.
6. Increase coordination among Metropolitan, member agencies, basin managers, groundwater producers, and stakeholders inclusive of collaboration for legislative, regulatory, and educational efforts in support of specific initiatives and funding needed for sound groundwater management.

As part of Metropolitan's 2015 IRP Update, two workshops focusing on sustainable local groundwater were held with member agencies and groundwater basin managers. Since 2013, Metropolitan has also been working with the SCWC Stormwater Task Force to evaluate the feasibility of further supporting groundwater production with increases in stormwater capture for groundwater recharge. In 2015, the SCWC's 4th Annual Stormwater Workshop was held to invite input to Metropolitan's IRP process.

**Table 3-14**
**Contractual Conjunctive Groundwater Projects**

| Project and Project Proponents | Storage Capacity (TAF) | Dry-Year Yield (TAF/Year) | Storage Account Balance as of 12/31/2015 (TAF) |

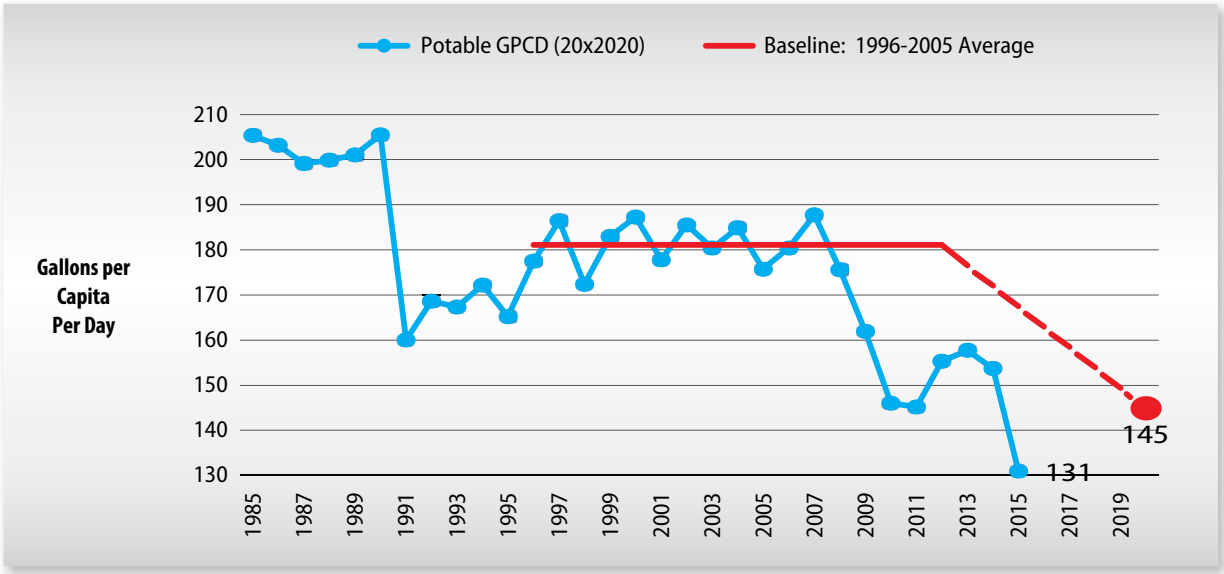
## 3.7 Water Use Reduction

In November 2009, Governor Arnold Schwarzenegger signed the Water Conservation Act of 2009 (SB X7-7) into law as part of the historic comprehensive water package designed to address the State's growing water challenges. The Act represented the culmination of efforts by water industry leaders (including Metropolitan), the environmental community, and the Legislature to enact legislation that would answer the governor's call for the state to reduce per capita water use 20 percent by the year 2020 (referred to as "20x2020") as part of a larger effort to ensure reliable water supplies for future generations and restore the Bay-Delta.

The 20x2020 legislation requires urban retail water suppliers to develop urban water use targets to help meet the 20 percent reduction in water use by 2020, with interim targets for 2015. The legislation provides flexibility in how targets are established and achieved. Per capita reductions can be accomplished through any combination of increased water conservation, improved water use efficiency, and increased use of recycled water to offset potable demand. Potable demand offsets can occur through direct reuse of recycled water, such as for irrigation, or indirect potable reuse through groundwater recharge and reservoir augmentation. Retail water suppliers receive partial credit for past efforts in conservation and recycled water; therefore, not all agencies need to reduce demand by 20 percent in order to comply with the law.



### *Achievement as of 2015*

As a wholesale water agency, Metropolitan is not required to establish or report an urban water use reduction target. However, Metropolitan's CCP and LRP are designed to assist member agencies and retail water suppliers in the service area to comply with SB X7-7. These programs are described in Sections 3.4 and 3.5. Therefore, Metropolitan monitors the progress of its service area.

Based on an analysis of population, demand, and the methodologies for setting targets described in the legislation, Metropolitan's baseline is 181 GPCD, and the 2020 reduction target is 145 GPCD, as illustrated in Figure 3-4. From 2011-2014, there was a slight increase in per capita water use explained in part by continued economic recovery and drier weather as compared to previous years. With mandatory restrictions from the state and water supply allocation from Metropolitan, the 2015 GPCD is 131, a 28 percent reduction from the baseline.

Over the next five years, Metropolitan will periodically assess water supply conditions and trends in per capita demand within its service area and evaluate potential programs to ensure attainment of the goal. Metropolitan also continues to provide support for retail agency efforts through technical assistance, legislation, code and standards updates, and potential financial incentives where needed for market transformation to increase water use efficiency.

**Figure 3-4 Potable Per Capita Water Use: 20% Reduction by 2020 Metropolitan's Service Area (Calendar Year)**

## 3.8 Energy Management Initiative

To further Metropolitan's mission to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way, Metropolitan has adopted an energy management initiative. The energy management policies guide the agency in energy-efficient design and operation of its facilities, cost-effective power acquisition strategies, and the implementation of cost-effective renewable energy technologies. To highlight a few recent accomplishments, Metropolitan completed the Energy Management & Reliability Study in December 2009 to identify the issues and potential future actions for Metropolitan to consider in achieving energy reliability and cost control. Metropolitan is a registered member in The Climate Registry and has prepared annual greenhouse gas emissions inventories since 2005, and also reports emissions data to the California Air Resources Board under mandatory reporting regulations.

In May 2009, Metropolitan completed a 10-acre field of solar panels at the Robert A. Skinner Water Treatment Plant in the Temecula Valley of southwestern Riverside County. The 1 megawatt solar installation is designed to generate approximately 2.4 million kilowatt-hours (kWh) of clean, renewable energy a year, equal to the power used by about 250 homes annually. Metropolitan received more than $5 million in rebates during the first five years of the facility's operation.

In August 2010, Metropolitan's Board adopted Energy Management Policies, to provide staff with the necessary guidance to move forward with cost-effective and environmentally responsible programs, projects, and initiatives. Identified projects are considered by Metropolitan's Board of Directors for authorization on a case-by-case basis. These policies recognize the upward pressure on costs caused by the reduction of Metropolitan's Hoover power allocation in 2017, by evolving power markets, by increased direct and indirect regulatory pressure to reduce greenhouse gas (GHG) emissions, and by the risk of reduced Colorado River hydropower supplies with climate change. The specific policies are as follows:

- Water/Energy Nexus: Identify collaborative programs and initiatives between the water and energy industries, constructing sustainable partnerships to reduce costs and provide enhanced reliability.
- Regulatory: Track federal and state greenhouse gas regulations and develop strategies to hedge against price and regulatory risks towards Metropolitan.
- Legislation: Pursue legislation to protect or enhance reliability of energy supply and mitigate energy cost risk.
- Contracts: Maintain maximum flexibility on existing and future contracts with Hoover and other energy contracts to hedge against cost and regulatory risks.
- Projects/Partnerships: Pursue cost-effective renewable energy projects and partnerships to hedge against energy price increases and regulatory risks, while reducing Metropolitan's carbon footprint.
- Revenue Stream: Pursue revenue stream renewable energy facilities on operational lands to assist in cost containment.
- Economic & Environmental Stewardship: Based on projected economic and regulatory conditions, develop cost-effective programs, projects, and initiatives to control operational costs.
- Energy Management Updates: Continue to consider/implement actions or projects consistent with Energy Management Policies and report progress to the Board.

On December 20, 2011, the President signed the Hoover Power Allocation Act. The Act stipulated that Metropolitan and the other Hoover power contractors would receive 95 percent of their current Hoover allocation when the new contract becomes effective in 2017. The new contract will have a term of 50 years, from 2017 to 2067.

Metropolitan also started construction work in 2015 for a 3-megawatt solar installation at the Weymouth plant. This planned solar installation would meet up to 20 percent of the Weymouth plant's expected daily power consumption. A 1-megawatt solar project planned for Metropolitan's Jensen facility is now in design.

Moving forward with these energy management initiatives will enhance Metropolitan's ability to provide long-term power reliability, to protect against energy market price volatility, and to hedge against overall cost risks for operation of Metropolitan's distribution system and the CRA.

This page intentionally left blank.

# Water Quality 4

Metropolitan's planning efforts have recognized the importance of the quality of its water supplies. To the extent possible, Metropolitan responds to water quality concerns by protecting the quality of the source water and developing water management programs that maintain and enhance water quality. Contaminants that cannot be sufficiently controlled through protection of source waters must be handled through changed water treatment protocols or blending. These practices can increase costs and/or reduce operating flexibility. This section discusses source water quality and issues of concern affecting water management strategies and water supply reliability.

## Background

Metropolitan's planning efforts for groundwater storage, recycled water, and other water management strategies require meeting specific water quality targets for imported water. Metropolitan has two major sources of water: the Colorado River and the State Water Project (SWP). Groundwater inflows are also received into the SWP through groundwater banking programs in the Central Valley. Each source has specific quality issues, which are summarized in this section. To date, Metropolitan has not identified any water quality risks that cannot be mitigated. As described in this section, the only potential effect of water quality on the level of water supplies based on current knowledge might be increases in the salinity of water resources. Under California's current drought conditions, decreased flows have altered Delta flow patterns and, while the effects of the drought have not been fully studied, there have been some observable changes in water quality such as increased salinity due to increased seawater intrusion. However, even under drought conditions, SWP salinity is significantly lower than Colorado River water salinity, and Metropolitan relies on blending imported water sources to mitigate for the higher salinity Colorado River water. During recent periods of drought, Metropolitan's SWP allocation has been reduced, including to a historical low of zero percent in January 2014, which affected blending operations. Metropolitan increased its reliance on Colorado River water in 2014 and 2015, and subsequently, salinity in treatment plant deliveries increased overall from the higher Colorado River salinity levels. Metropolitan anticipates no significant reductions in water supply availability from imported sources due to water quality concerns, such as salinity, over the next five years.

### Colorado River

High salinity levels remain a significant issue associated with Colorado River supplies. In addition, Metropolitan has been engaged in efforts to protect its Colorado River supplies from threats of uranium, perchlorate, and chromium-6, which are discussed later in this section. Metropolitan has also been active in efforts to protect these supplies from potential increases in nutrient loading due to agriculture and urbanization, as well as tracking the occurrence of constituents of emerging concern, such as N-nitrosodimethylamine (NDMA) and pharmaceuticals and personal care products (PPCPs). Metropolitan fully expects its source

water protection efforts to be successful, so the only foreseeable water quality constraint to the use of Colorado River water will be the need to blend (mix) it with SWP supplies to meet Metropolitan's Board-adopted salinity standards.

### *State Water Project*

The key water quality issues for the SWP are disinfection byproduct precursors, in particular, total organic carbon and bromide. Metropolitan is working to protect the water quality of this source, but it has needed to upgrade its water treatment plants to deal adequately with disinfection byproducts. Disinfection byproducts result from total organic carbon and bromide in the source water reacting with disinfectants at the water treatment plant, and they may place some near-term restrictions on Metropolitan's ability to use SWP water. Metropolitan is overcoming these treatment restrictions through the use of ozone disinfection at its treatment plants. Ozone facilities have been completed at four of Metropolitan's treatment plants, and construction is underway for ozone facilities at the Weymouth water treatment plant. Arsenic is also of concern in some groundwater storage programs. Groundwater inflows into the California Aqueduct are managed to comply with regulations and protect downstream water quality while meeting supply targets. Additionally, nutrient levels are significantly higher in the SWP system than within the Colorado River, leading to the potential for algal related concerns that can affect water management strategies. Metropolitan is engaged in efforts to protect the quality of SWP water from potential increases in nutrient loading from wastewater treatment plants.

### *Local Agency Supplies and Groundwater Storage*

Drinking water standards for contaminants, such as arsenic, chromium-6, and other emerging constituents, may add costs to the use of groundwater storage and may affect the availability of local agency groundwater sources. These contaminants are not expected to affect the availability of Metropolitan supplies, but they may affect the availability of local agency supplies. This could affect the level of demands on Metropolitan supplies if local agencies abandon supplies in lieu of treatment options. Metropolitan has not analyzed the effect that many of these water quality issues could have on local agency supply availability.

In summary, the major regional water quality concerns include the following:

- Salinity
- Perchlorate
- Total organic carbon and bromide (disinfection byproduct precursors)
- Nutrients (as they relate to algal productivity)
- Arsenic
- Uranium
- Chromium-6
- Constituents of Emerging Concern (e.g., NDMA and PPCPs)

Metropolitan has taken several actions and adopted programs to address these contaminants and to ensure a safe and reliable water supply. These actions, organized by contaminant, are discussed below, along with other water quality programs that Metropolitan has been engaged in to protect its water supplies.

## *Issues of Potential Concern*

### *Salinity*

The State Water Resources Control Board's Division of Drinking Water (DDW), formerly the California Department of Public Health, established a secondary drinking water standard for salinity, commonly expressed as total dissolved solids (TDS), with a recommended maximum contaminant level (MCL) of 500 milligrams per liter (mg/L) and upper limit MCL of 1,000 mg/L. Imported water from the Colorado River has high salinity levels, so it must be blended (mixed) with lower-salinity water from the SWP to meet salinity management goals. Higher salinity levels in Colorado River water would increase the proportion of SWP supplies required to meet Metropolitan's Board-adopted imported water salinity objectives. High levels of salinity can impact various water uses such as limiting groundwater and recycled water uses, reducing the lifespan of household appliances, and reducing crop yields. These salinity impacts affect various sectors including residential, agricultural, commercial, industrial, utility, groundwater, and recycled water. Metropolitan adopted an imported water salinity goal because higher salinity could increase costs and reduce operating flexibility. For example,

1. If diminished water quality causes a need for membrane treatment to remove TDS, the process typically results in losses of up to 15 percent of the water processed. These losses would result in both an increased requirement for additional water supplies and environmental constraints related to brine disposal. In addition, the process is costly. However, only a portion of the imported water would need to be processed, so the possible loss in supplies is small.
2. High TDS in water supplies leads to high TDS in wastewater, which lowers the usefulness and increases the cost of recycled water.
3. Water quality degradation of imported water supply could limit the use of local groundwater basins for storage because of standards controlling the quality of water recharged to the basins.

In addition to the link between water supply and water quality, Metropolitan has identified economic benefits from reducing the TDS concentrations of water supplies. Estimates show that a reduction in salinity concentrations of 100 mg/L in both the Colorado River and SWP supplies will yield economic benefits of $95 million per year (1999 dollars) within Metropolitan's service area.[12] This economic benefit provides an additional incentive to reduce salinity concentrations within the region's water supplies.

#### The Salinity Management Policy

Considering all of these factors, Metropolitan's Board approved a Salinity Management Policy on April 13, 1999. The policy set a goal of achieving salinity concentrations in delivered water of less than 500 mg/L TDS when practical, understanding that hydrologic conditions will make this infeasible at times. It also identified the need for both local and imported water sources to be managed comprehensively to maintain the ability to use recycled water and groundwater. To achieve these targets, lower TDS SWP water supplies are blended with Colorado River supplies. Using this approach, the salinity target could be met an estimated seven out of ten years. In the other three years, hydrologic conditions would result in a reduced volume of SWP supplies and increased salinity. Since 1999, Metropolitan has met the salinity objective, but due to drought conditions, the target goal was exceeded between 2008 and 2011 and again

[12] Metropolitan Water District of Southern California and U.S. Bureau of Reclamation, Salinity Management Study: Final Report (June 1999)

between 2013 and 2015. Metropolitan has alerted its local agencies that high salinity levels are inevitable under these drought conditions despite its best efforts. Metropolitan has also urged its member agencies to structure the operation of their local projects and groundwater supplies so they are prepared to mitigate the effect of higher salinity levels in imported waters. In addition, Metropolitan seeks to obtain better quality water in the spring/summer months (April through September) to maximize the use of recycled water in agriculture.

The adoption of the Salinity Management Policy resulted from the completion of a Salinity Management Study in 1999. Metropolitan worked collaboratively with multiple stakeholders to complete the salinity study which assessed regional salinity problems and developed management strategies. Metropolitan is currently working with the USBR and Southern California Salinity Coalition to update the study. The current study objectives include updating the economic impact model to complete a revised salinity economic damage assessment of Metropolitan's service area; developing regional salinity indicators to increase awareness and facilitate salinity management in groundwater basins; and assessing Metropolitan's long-term capability of delivering low-salinity water supplies and determining whether new salinity operational goals should be established.

Within Metropolitan's service area, local water sources account for approximately half of the salt loading, and imported water accounts for the remainder. All of these sources must be managed appropriately to sustain water quality and supply reliability goals. The following sections discuss the salinity issues relevant to each of Metropolitan's major supply sources and other resources.

Colorado River

Water imported via the CRA has the highest level of salinity of all of Metropolitan's sources of supply, averaging around 630 mg/L since 1976. Concern over salinity levels in the Colorado River has existed for many years.

To deal with the concern, the International Boundary and Water Commission approved Minute No. 242, Permanent and Definitive Solution to the International Problem of the Salinity of the Colorado River, in 1973, and the President approved the Colorado River Basin Salinity Control Act in 1974. High TDS in the Colorado River as it entered Mexico and the concerns of the seven Basin states regarding the quality of Colorado River water in the United States drove these initial actions. To foster interstate cooperation on this issue, the seven basin states formed the Colorado River Basin Salinity Control Forum (Forum).

The salts in the Colorado River system are indigenous and pervasive, mostly resulting from saline sediments in the Basin that were deposited in prehistoric marine environments. They are easily eroded, dissolved, and transported into the river system. The Colorado River Basin Salinity Control Program is designed to prevent a portion of this abundant salt supply from moving into the river system. The program targets the interception and control of non-point sources, such as surface runoff, as well as wastewater and saline hot springs. Examples of salinity control measures include improved irrigation practices, rangeland management, and the operation of a deep well brine injection project.

The Forum proposed, the states adopted, and the USEPA approved water quality standards in 1975, including numeric criteria and a plan for controlling salinity increases. The standards require that the plan ensure that the flow-weighted average annual salinity remain at or below the 1972 levels, while the Basin states continue to develop their 1922 Colorado River Compact-apportioned water supply. The Forum selected three stations on the main stream of the lower Colorado River as appropriate points to measure the river's salinity. These stations and numeric

criteria are: (1) below Hoover Dam, 723 mg/L; (2) below Parker Dam, 747 mg/L; and (3) at Imperial Dam, 879 mg/L.

Per the Forum, concentrations of salts in the Colorado River cause approximately $382 million in quantified damages (2014 dollars) in the lower Basin each year.[13] The salinity control program has proven to be very successful and cost-effective. Salinity control projects remove over a million tons of salts from Colorado River water, resulting in reduced salinity concentrations of over 100 mg/L as a long-term average.

During the high water flows of 1983-1986, salinity levels in the CRA dropped to a historic low of 525 mg/L. However, during the 1987-1992 drought, higher salinity levels of 600 to 650 mg/L returned. TDS in Lake Havasu was measured at 626 mg/L in June 2015 and is projected to continue increasing as water development occurs throughout the Colorado River basin, particularly as the Upper Colorado River Basin States continue to develop their apportioned water reducing dilution in the Colorado River. Also, under drought conditions, Lake Powell has received higher salinity water, and as the system normalizes, salinity is expected to increase in the lower Colorado River as water from Lake Powell is released downstream.

State Water Project

Water supplies from the SWP have significantly lower TDS concentrations than the Colorado River, averaging approximately 250 mg/L in water supplied through the East Branch and 325 mg/L on the West Branch over the long-term, with short term variability as a result of hydrologic conditions.[14] Because of this lower salinity, Metropolitan blends SWP water with high salinity CRA water to reduce the salinity concentrations of delivered water. However, both the supply and the TDS concentrations of SWP water can vary significantly in response to hydrologic conditions in the Sacramento-San Joaquin watersheds.

As indicated above, the TDS concentrations of SWP water can vary widely over short periods of time. These variations reflect seasonal and tidal flow patterns, and they pose an additional problem for use of blending as a management tool to lower the higher TDS from the Colorado River supply. For example, during the 1977 drought, the salinity of SWP water reaching Metropolitan increased to 430 mg/L, and supplies became limited. During this same event, salinity at the SWP's Banks pumping plant exceeded 700 mg/L. Under future similar circumstances, Metropolitan's 500 mg/L TDS objective could only be achieved by reducing imported water from the CRA. Thus, it may not always be possible to maintain both the salinity objective and water supply reliability unless salinity concentrations of source supplies can be reduced.

A federal court ruling and a resulting biological opinion issued through consultation with U.S. Fish and Wildlife Service addressing the effects of the water supply pumping operations on sensitive fish species in the Delta has limited SWP exports at specified times of the year since December 2007. These restrictions have increased reliance on higher salinity Colorado River water, impacting the ability at times to meet Metropolitan's goal of 500 mg/L TDS at its blend plants. Drought conditions leading to lower SWP water supply allocations in recent years also affect Metropolitan's ability to meet its salinity goal. The target goal was exceeded between 2008 and 2011 when water supply allocations were reduced to 35-50 percent. Similarly, the target goal has been exceeded between 2013 and 2015 under current drought conditions with

[13] Colorado River Basin Salinity Control Program–Briefing Document (May 1, 2015)

[14] The higher salinity in the West Branch deliveries is due to salt loadings from local streams, operational conditions, and evaporation at Pyramid and Castaic Lakes.

restricted annual water supply allocations reduced to 5-35 percent and briefly reduced to a historical zero percent allocation in January 2014.

TDS objectives in Article 19 of the SWP Water Service Contract specify a ten-year average of 220 mg/L and a maximum monthly average of 440 mg/L. These objectives have not been met, and Metropolitan is working with DWR and other agencies on programs aimed at reducing salinity in Delta supplies. These programs aim to reduce salinity on the San Joaquin River through modifying agricultural drainage and developing comprehensive basin plans. In addition, operable gates and channel barriers have been placed in strategic locations in the Delta to impede transport of seawater derived salt. For the first time since 1977, in response to California's drought emergency, DWR installed a temporary rock barrier across False River in May 2015 to help limit salt intrusion from the San Francisco Bay into the central Delta. DWR is also leading the development of the California WaterFix, which involves water delivery upgrades that could reduce SWP salinity levels by diverting a greater percentage of lower salinity Sacramento River flows to the South Delta export pumps.

Recycled Water

Wastewater flows always experience significantly higher salinity concentrations than the potable water supply. Typically, each cycle of urban water use adds 250 to 400 mg/L of TDS to the wastewater. Salinity increases tend to be higher where specific commercial or industrial processes add brines to the discharge stream or where brackish groundwater infiltrates into the sewer system.

Where wastewater flows have high salinity concentrations, the use of recycled water may be limited or require more expensive treatment (e.g., reverse osmosis). Landscape irrigation and industrial reuse become problematic at TDS concentrations over 1,000 mg/L. Some crops such as strawberries and avocados are particularly sensitive to high TDS concentrations, and the use of high-salinity recycled water may reduce yields of these crops. In addition, Basin Plan Objectives may lead to restrictions on the use of recycled water on lands overlying those groundwater basins.

These issues are exacerbated during times of drought, when the salinity of imported water supplies may increase salinity in wastewater flows and recycled water. Basin management plans and recycled water customers may restrict the use of recycled water at a time when its use would be most valuable. Therefore, to maintain the cost-effectiveness of recycled water, the salinity level of the region's potable water sources and wastewater flows must be controlled.

In May 2009, the SWRCB adopted a Recycled Water Policy[15] to help streamline the permitting process and to help establish uniform statewide criteria for recycled water projects. The policy was amended in January 2013 to include monitoring requirements for constituents of emerging concern. This policy promotes the development of watershed- or basin-wide salt management plans (to be adopted by the respective Regional Boards) to meet water quality objectives and protect beneficial uses, rather than imposing project-by-project restrictions. The Recycled Water Policy identifies several criteria to guide recycled water irrigation or groundwater recharge project proponents in developing a salt (and nutrient) management plan (SNMP).

[15] http://www.swrcb.ca.gov/water_issues/programs/water_recycling_policy/docs/recycledwaterpolicy_approved.pdf

Groundwater Basins

Increased TDS in groundwater basins occurs either when basins near the ocean are over drafted, leading to seawater intrusion, or when agricultural and urban return flows add salts to the basins. Much of the water used for agricultural or urban irrigation infiltrates into the aquifer, so where irrigation water is high in TDS or where the water transports salts from overlying soil, the infiltrating water will increase the salinity of the aquifer. In addition, wastewater discharges in inland regions may lead to salt buildup from fertilizer and dairy waste. In the 1950s and 1960s, high-TDS Colorado River water was used to recharge severely overdrafted aquifers and prevent saltwater intrusion, resulting in significant salt loadings to the region's groundwater basins.

In the past, these high salt concentrations have caused some basins within Metropolitan's service area to be unsuitable for municipal uses if left untreated. The Arlington Basin in Riverside and the Mission Basin in San Diego required demineralization before they could be returned to municipal service. The capacity of the larger groundwater basins makes them better able to dilute the impact of increasing salinity. While most groundwater basins within the region still produce water of acceptable quality, this resource must be managed carefully to minimize further degradation. Even with today's more heightened concern regarding salinity, approximately 600,000 tons of salts per year accumulate within the region, leading to ever-increasing salinity concentrations in many groundwater basins.[16] Drought conditions have further impacted salinity levels in recycled water, reflective of increased salinity levels in source water. Increased recycled water salinity levels make it difficult for dischargers to comply with water quality objectives for groundwater basins.

To protect the quality of groundwater basins, Regional Boards often place restrictions on the salinity concentrations of water used for basin recharge or for irrigation of lands overlying the aquifers. Those situations may restrict water reuse and aquifer recharge, or they may require expensive mitigation measures. SNMPs offer an opportunity for stakeholders to work with Regional Boards to address salt and nutrient issues regionally. The SNMP development process is locally-driven and focuses on addressing all sources of salts and nutrients, instead of only regulating individual recycled water projects which may not address all sources impacting groundwater. The SNMP objectives include: optimizing recycled water use, protecting groundwater supply and beneficial uses, protecting agricultural beneficial uses, and protecting human health. SNMPs were to be completed by May 2014 with a possible two year extension. After completion, SNMPs may be adopted in a Basin Plan Amendment.

Several SNMPs were completed by the completion deadline, while other plans were granted an extension for completion in 2016. The Santa Ana Region Basin Plan updated its TDS and Nitrogen Management Plan with a subsequent SNMP amendment in 2014. This SNMP highlights efforts to implement extensive groundwater recharge projects using recycled water in the Chino Basin and expansion of the GWRS in Orange County. The Central Basin and West Coast Basin SNMP was approved as an amendment to the Los Angeles Region Basin Plan in February 2015. This SNMP highlights existing and planned implementation measures to ensure future compliance with water quality objectives including increased recharge at seawater intrusion barriers, increased groundwater pump and treat by the Goldsworthy and Brewer Desalters, and increased recycled water use for irrigation. Multiple SNMPs have been completed in the San Diego Region, and basin plan amendments are being considered. SNMPs are also being developed for the Main San Gabriel Basin, Raymond Basin, San Fernando Valley Basin, and Calleguas Creek and Oxnard Plains.

[16] Metropolitan Water District of Southern California and U.S. Bureau of Reclamation, Salinity Management Study: Final Report (June 1999)

### *Perchlorate*

Perchlorate compounds are used as a main component in solid rocket propellant, and are also found in some types of munitions and fireworks. Perchlorate compounds quickly dissolve and become highly mobile in groundwater. Unlike many other groundwater contaminants, perchlorate neither readily interacts with the soil matrix nor degrades in the environment. Conventional drinking water treatment (as utilized at Metropolitan's water treatment plants) is not effective for perchlorate removal.

The primary human health concern related to perchlorate is its effect on the thyroid. Perchlorate can interfere with the thyroid's ability to produce hormones required for normal growth and development. Pregnant women who are iodine deficient and their fetuses, infants and small children with low dietary iodide intake, and individuals with hypothyroidism may be more sensitive to the effects of perchlorate.

DDW established a primary drinking water standard for perchlorate in 2007 with an MCL of 6 micrograms per liter (μg/L). In February 2015, the California Office of Environmental Health Hazard Assessment (OEHHA) lowered the public health goal (PHG) for perchlorate from 6 μg/L to 1 μg/L. In response to the new PHG, DDW will review the perchlorate MCL. There is currently no federal drinking water standard for perchlorate, but the USEPA is in the process of developing a national primary drinking water regulation.

Perchlorate was first detected in Colorado River water in June 1997 and was traced back to Las Vegas Wash. The source of contamination was found to be emanating from a chemical manufacturing facility in Henderson, Nevada. Tronox, Inc. was responsible for the ongoing perchlorate remediation of the site, although contamination resulted from years of manufacturing operations from site predecessors. Another large perchlorate groundwater plume is also present in the Henderson area from a second industrial site. Remediation activities are ongoing for cleanup of that plume by American Pacific Corporation (AMPAC).

Following the detection of perchlorate in the Colorado River, Metropolitan, along with USEPA and agencies in Nevada including the Nevada Division of Environmental Protection (NDEP), organized the forces necessary to successfully treat and decrease the sources of perchlorate loading. Under NDEP oversight, remediation efforts began in 1998, and treatment operations became fully operational in 2004. These efforts have reduced perchlorate loading into Las Vegas Wash from over 1,000 lbs/day (prior to treatment) to 50-90 lbs/day since early 2007. This has resulted in over 90 percent reduction of the perchlorate loading entering the Colorado River system. In January 2009, Tronox filed for Chapter 11 bankruptcy protection citing significant environmental liabilities taken from the previous site owner. A settlement was reached in February 2011 which resulted in the formation of the Nevada Environmental Response Trust (NERT). NERT received $81 million for cleanup efforts while pursuing additional funding sources.

In April 2014, Tronox reached a $5.15 billion settlement with its predecessors which awarded approximately $1.1 billion, directed to NERT, to clean up perchlorate and other contaminants at the former Tronox site in Henderson. The settlement, which represents one of the largest environmental recoveries in history, went into effect in January 2015 and helps to ensure adequate funds are available for site cleanup and protection of the downstream Colorado River. NERT is currently conducting remedial investigations for long-term soil and groundwater cleanup, while NDEP is initiating a regional investigation of downstream perchlorate-contaminated areas to further reduce loading into Las Vegas Wash. The remedial plan has an established goal to reduce perchlorate loading into Las Vegas Wash to less than 10 lbs/day, which would result in levels well below 1 μg/L in the Colorado River. This would help ensure

compliance with any potential reduction of California's perchlorate MCL of 6 µg/L, in light of the new 1 µg/L public health goal.

As a result of the aggressive clean-up efforts, perchlorate levels in Colorado River water at Lake Havasu have decreased significantly in recent years from a peak of 9 µg/L in May 1998. Levels have remained less than 6 µg/L since October 2002, and have been typically less than 2 µg/L since June 2006. Metropolitan routinely monitors perchlorate at over 30 locations within its system, and levels currently remain below 2 µg/L. Metropolitan has not detected perchlorate in the SWP since monitoring began in 1997.

Perchlorate has also been found in groundwater basins within Metropolitan's service area, largely from local sources. The vast majority of locations where perchlorate has been detected in the groundwater are associated with the manufacturing or testing of solid rocket fuels for the Department of Defense and the National Aeronautics and Space Administration (NASA), or with the manufacture, storage, handling, or disposal of perchlorate (such as Aerojet in Azusa in the Main San Gabriel Basin and the Jet Propulsion Laboratory/NASA in the Raymond Basin). Past agricultural practices using fertilizers laden with naturally occurring perchlorate have also been implicated in some areas. Per SWRCB's water quality database, reported monitoring results from 2011 to 2014 indicate that 10 Metropolitan member agencies have detected perchlorate in their service areas at levels greater than 4 µg/L in 36 sources, while 7 member agencies have detected levels greater than 6 µg/L.

Metropolitan has investigated technologies to mitigate perchlorate contamination. Perchlorate cannot be removed using conventional water treatment. Nanofiltration and reverse osmosis do work effectively, but at a very high cost. AMPAC and NERT utilize a biological fluidized bed reactor (FBR) process train for the cleanup of their Henderson sites. A number of sites in Southern California have successfully installed ion exchange systems to treat perchlorate impacted groundwater. In November 2009, a study of biological treatment for perchlorate removal in the City of Pasadena's groundwater was completed with funding provided through a Congressional mandate from USEPA to Metropolitan. The City of Pasadena decided to continue using ion exchange treatment for perchlorate removal and expanded treatment to two well sites.

Treatment options are available to recover groundwater supplies contaminated with perchlorate. However, it is very difficult to predict whether treatment will be pursued to recover all lost production because local agencies will make decisions based largely on cost considerations, ability to identify potentially responsible parties for cleanup, and the availability of alternative supplies.

### *Total Organic Carbon and Bromide*

Disinfection byproducts (DBPs) form when source water containing high levels of total organic carbon (TOC) and bromide is treated with disinfectants such as chlorine or ozone. Studies have shown a link between certain cancers and DBP exposure. In addition, some studies have shown an association between reproductive and developmental effects and chlorinated water. While many DBPs have been identified and some are regulated under the Safe Drinking Water Act, there are others that are not yet known. Even for those that are known, the potential adverse health effects may not be fully characterized.

Water agencies began complying with new regulations to protect against the risk of DBP exposure in January 2002. This rule, known as the Stage 1 Disinfectants and Disinfection Byproducts (D/DBP) Rule, required water systems to comply with new MCLs and a treatment technique to improve control of DBPs. USEPA then promulgated the Stage 2 D/DBP Rule in

January 2006 requiring systems to comply at terminus locations in the distribution system to be more representative of maximum residence time and to protect the public. Metropolitan has been in compliance with the Stage 2 D/DBP Rule since it became effective.

Existing levels of TOC and bromide in Delta water supplies present challenges for water utilities to maintain safe drinking water supplies and comply with regulations. Levels of these constituents in SWP water increase several-fold due to agricultural drainage and seawater intrusion as water moves through the Delta.

Source water quality improvements must be combined with cost-effective water treatment technologies to ensure safe drinking water at a reasonable cost. Metropolitan has five treatment plants: two that receive SWP water exclusively, and three that receive a blend of SWP and Colorado River water. In 2003 and 2005, Metropolitan completed upgrades to its SWP-exclusive water treatment plants, Mills and Jensen, respectively, to utilize ozone as its primary disinfectant. This ozonation process minimizes the production of certain regulated disinfection byproducts that would otherwise form in the chlorine treatment of SWP water. The non-ozone plants utilizing blended water have met federal guidelines for these byproducts through managing the blend of SWP and Colorado River water. To maintain the byproducts at a level consistent with federal law, Metropolitan limits the percentage of water from the SWP for plants utilizing chlorine as the primary disinfectant. In 2010 and 2015, Metropolitan completed ozone upgrades at Skinner and Diemer water treatment plants, respectively. Construction of ozonation facilities is underway at Weymouth water treatment plant and is expected to be completed in 2017. The estimated ozone retrofit cost for all five treatment plants is over $1.1 billion.

### *Nutrients*

Elevated levels of nutrients (phosphorus and nitrogen compounds) can stimulate nuisance algal and aquatic weed growth that affects water system operations and consumer acceptability, including the production of noxious taste and odor compounds and algal toxins. In addition to taste and odor and toxin concerns, increases in algal and aquatic weed biomass can impede flow in conveyances, shorten filter run times, increase solids production at drinking water treatment plants, and add to organic carbon loading. Further, nutrients can provide an increasing food source that may lead to the proliferation of quagga and zebra mussels, and other invasive biological species. Studies have shown phosphorus to be the limiting nutrient in both SWP and Colorado River supplies. Therefore, any increase in phosphorus loading has the potential to stimulate algal growth, leading to the concerns identified above.

SWP supplies have significantly higher nutrient levels than Colorado River supplies. Wastewater discharges, agricultural drainage, and nutrient-rich soils in the Delta are primary sources of nutrient loading to the SWP. Metropolitan and other drinking water agencies receiving Delta water have been engaged in efforts to minimize the effects of nutrient loading from Delta wastewater plants. The Sacramento Regional County Sanitation District (SRCSD), the primary discharger to the Sacramento River, is in the process of constructing wastewater treatment plant upgrades to comply with its 2010 discharge permit requirements for ammonia and nitrate removal. Excessive levels of ammonia are suspected to be altering the Delta's food web which, in turn, has implications for SWP supply reliability. SRCSD expects to complete its EchoWater Project by 2023 and has stated that the project will serve multiple benefits including improving water quality in the Sacramento River, protecting the fragile Delta ecosystem, and expanding recycled water use opportunities. The improvements include a biological nutrient removal process for ammonia and nitrate removal. The project also includes tertiary treatment processes for filtration and enhanced disinfection. In 2014, the City of Stockton Wastewater

Treatment Plant, a discharger to the San Joaquin River, was issued a draft permit with a more stringent nitrate discharge limit consistent with the final discharge limits issued in SRCSD's permit. The City of Stockton may have to implement similar plant upgrades as SRCSD to comply with discharge permit requirements.

Metropolitan reservoirs receiving SWP water have experienced several taste and odor episodes in recent years. For example, between 2010 and 2014, Metropolitan reservoirs experienced 11 taste and odor events requiring treatment. A taste and odor event can cause a reservoir to be bypassed and potentially have a short-term effect on the availability of that supply. Metropolitan has a comprehensive program to monitor and manage algae in its source water reservoirs. This program was developed to provide an early warning of algae related problems and taste and odor events to best manage water quality in the system.

The issue of cyanotoxins has become a growing concern as a result of increasing occurrences both nationally and internationally. For example, in August 2014, an algae bloom producing Mycrocystin in Lake Erie significantly affected water supply for Toledo, Ohio, prompting the city to issue urgent notices to residents to not drink or boil the drinking water. This event stimulated state and federal legislation to develop health advisories and strategic plans for algal toxins. In June 2015, USEPA issued health advisories for two cyanobacterial toxins: Microcystins and Cylindrospermopsin. The health advisories serve as recommended precautionary levels and are not enforceable federal water quality standards. Cyanotoxins are included on the current Contaminant Candidate List (CCL3), which identifies contaminants considered for regulation under the Safe Drinking Water Act. USEPA is currently developing improved analytical methods for cyanotoxins to support nationwide monitoring for Microcystins, Anatoxin-a, and Cylindrospermopsin through the Unregulated Contaminant Monitoring Rule 4 program, which would be published in late 2016 and require monitoring to begin in January 2018. Metropolitan would comply with Unregulated Contaminant Monitoring Rule monitoring and reporting requirements.

Although phosphorus levels are much lower in the Colorado River than in the SWP, this nutrient is still of concern. Despite relatively low concentrations (Colorado River has been considered an oligotrophic, or low-productivity, system), any additions of phosphorus to Colorado River water can result in increased algal growth. In addition, low nutrient Colorado River water is relied upon by Metropolitan to blend down the high nutrient SWP water in Metropolitan's blend reservoirs. With population growth expected to continue in the Las Vegas area in the future, ensuring high levels of treatment at wastewater treatment plants to maintain existing phosphorus levels will be critical in minimizing the operational, financial, and public health impacts associated with excessive algal growth and protecting downstream drinking water uses. Metropolitan and other affected drinking water agencies collaborate with wastewater dischargers in the Las Vegas area to protect the phosphorus-limited Colorado River. Since 2001, wastewater dischargers have undertaken considerable efforts to improve treated effluent water quality by removing phosphorus on a year-round basis. In 2005, dischargers also began optimizing their treatment processes to remove greater amounts of phosphorus, maintaining levels well below current permit requirements.

Although current nutrient loading is of concern for Metropolitan and is anticipated to have cost implications, with its comprehensive monitoring program and response actions to manage algal related issues, there should be no impact on availability of water supplies. Metropolitan's source water protection program will continue to focus on preventing future increases in nutrient loading as a result of urban and agricultural sources.

### *Arsenic*

Arsenic is a naturally occurring element found in rocks, soil, water, and air. It is used in wood preservatives, alloying agents, certain agricultural applications, semi-conductors, paints, dyes, and soaps. Arsenic can get into water from the natural erosion of rocks, dissolution of ores and minerals, runoff from agricultural fields, and discharges from industrial processes. Long-term exposure to elevated levels of arsenic in drinking water has been linked to certain cancers, skin pigmentation changes, and hyperkeratosis (skin thickening).

In April 2004, OEHHA set a public health goal for arsenic of 0.004 µg/L, based on lung and urinary bladder cancer risk. The MCL for arsenic in domestic water supplies was lowered to 10 µg/L, with an effective date of January 2006 in the federal regulations, and an effective date of November 2008 in the California regulations. Monitoring results submitted to California Department of Public Health (now DDW) since 2010 showed that arsenic is ubiquitous in drinking water sources, reflecting its natural occurrence. They also showed that many sources have arsenic detections above the 10 µg/L MCL. Southern California drinking water sources that contain concentrations of arsenic over 10 µg/L include San Bernardino (25 sources), Los Angeles (27 sources), Riverside (12 sources), San Diego (2 sources), Orange (2 sources), and Ventura (2 sources).[17]

The arsenic drinking water standard impacts both groundwater and surface water supplies. Historically, Metropolitan's water supplies have had low levels of this contaminant and did not require treatment changes or capital investment to comply with the standard. However, some of Metropolitan's water supplies from groundwater storage programs are at levels near the MCL. These groundwater storage projects are called upon to supplement flow only during low SWP allocation years. Under drought conditions, Metropolitan has further relied on groundwater storage programs and continues to participate in the California Aqueduct Pump-in Facilitation Group to ensure that water quality in the SWP is not adversely affected when considering water supply decisions. Metropolitan has had to restrict flow from one program to limit arsenic increases in the SWP. Implementation of an arsenic treatment facility, which is operated by a groundwater banking partner, has increased groundwater supply costs. Moreover, Metropolitan has invested in solids handling facilities at its treatment plants and implemented operational changes to manage arsenic in the treatment process residual solids.

The state detection level for purposes of reporting (DLR) of arsenic is 2 µg/L. Between 2009 and 2014, arsenic levels in Metropolitan's water treatment plant effluents ranged from non-detect (< 2 µg/L) to 3.9 µg/L. For Metropolitan's source waters, levels in Colorado River water have ranged from not detected to 3.5 µg/L, while levels in SWP water have ranged from non-detect to 4.4 µg/L. Increasing coagulant doses at water treatment plants can reduce arsenic levels for delivered water.

Some member agencies may face greater problems with arsenic compliance due to naturally occurring arsenic in groundwater. Per the Water Replenishment District's 2013-2014 Regional Groundwater Monitoring Report, arsenic concentrations greater than the 10 µg/L MCL are detected in about a third of the Central Basin wells.[18] Water supplies imported by the Los Angeles Department of Water and Power may also contain arsenic above the MCL. The cost of arsenic removal from these supplies could vary significantly.

---

[17] DDW data reported from web site: http://geotracker.waterboards.ca.gov. Numbers reported may change as the website is frequently updated. Also, the website includes additional source data reported by other entities.

[18] *Regional Groundwater Monitoring Report Water Year 2013-2014, Los Angeles County, California*, prepared by Water Replenishment District, February 2015.

### *Uranium*

The U.S. Department of Energy (DOE) has completed about 50 percent of a project to move a 16-million-ton pile of uranium mill tailings near Moab, Utah which lies approximately 750 feet from the Colorado River. Due to the proximity of the pile to the Colorado River, there is a potential for the tailings to enter the river as a result of a catastrophic flood event or other natural disaster. In addition, contaminated groundwater from the site is slowly seeping into the river. The DOE is responsible for remediating the site, which includes removal and offsite disposal of the tailings and onsite groundwater remediation.

Previous investigations have shown uranium concentrations contained within the pile at levels significantly above the California MCL of 20 picocuries per liter (pCi/L). Metropolitan has been monitoring for uranium in the CRA and at its treatment plants since 1986. Monitoring at Lake Powell began in 1998. Uranium levels measured at Metropolitan's intake have ranged from 1 to 6 pCi/L, well below the California MCL. Conventional drinking water treatment, as employed at Metropolitan's water treatment plants, can remove low levels of uranium; however, these processes would not be protective if a catastrophic event washed large volumes of tailings into the Colorado River. Public perception of drinking water safety is also of particular concern as to uranium.

Remedial actions at the site since 1999 have focused on removing contaminated water from the pile and groundwater. To date, over 4,400 pounds of uranium in contaminated groundwater have been removed. In July 2005, DOE issued its Final Environmental Impact Statement with the preferred alternative of permanent offsite disposal by rail to a disposal cell at Crescent Junction, Utah, located approximately 30 miles northwest of the Moab site.

Rail shipment and disposal of the uranium mill tailings pile from the Moab site began in April 2009 using American Recovery and Reinvestment Act 2009 funding which helped to accelerate initial cleanup efforts. Through August 2015, DOE has shipped over 7.7 million tons of mill tailings to the Crescent Junction disposal cell. DOE estimates completing movement of the tailings pile by 2025, depending on annual appropriations. Metropolitan continues to track progress of the remediation efforts and work with Congressional representatives to support increased annual appropriations and expedite cleanup.

Another uranium-related issue began receiving attention in 2008 due to a renewed worldwide interest in nuclear energy and a resulting increase in uranium mining claims filed throughout the western United States. Of particular interest were thousands of mining claims filed near Grand Canyon National Park and the Colorado River. Metropolitan sent letters to the Secretary of the Interior to highlight source water protection and consumer confidence concerns related to uranium exploration and mining activities near the Colorado River, and advocate for close federal oversight over these activities. In 2009, Secretary of the Interior Ken Salazar announced a two-year hold on new mining claims on 1 million acres adjacent to the Grand Canyon to allow necessary scientific studies and environmental analyses to be conducted. In January 2012, Secretary Salazar formally signed a 20-year moratorium on new uranium and other hard rock mining claims. The moratorium has been challenged by a number of industry groups and was most recently upheld by a U.S. District Court in September 2014. Meanwhile, local conservation groups continue to defend the moratorium and are seeking additional protection of lands with mines that have been inactive for long periods of time, but may resume operations. Although of no direct impact to Metropolitan due to its upstream location and resulting dilution, in August 2015, an accidental release of wastewater from an abandoned mine in southwest Colorado demonstrated the potential threat that mining activities can have on public health and the environment.

### *Chromium-6*

Chromium is a naturally occurring element found in rocks, soil, plants, and animals. Chromium III is typically the form found in soils and is an essential nutrient that helps the body use sugar, protein, and fat. Chromium-6 is used in electroplating, stainless steel production, leather tanning, textile manufacturing, dyes and pigments, wood preservation, and as an anti-corrosion agent. Chromium occurs naturally in deep aquifers and can also enter drinking water through discharges of dye and paint pigments, wood preservatives, chrome plating liquid wastes, and leaching from hazardous waste sites. In drinking water, chromium-6 is very stable and soluble, whereas chromium III is not very soluble. Chromium-6 is the more toxic species and is known to cause lung cancer in humans when inhaled, but the health effects in humans from ingestion are still in question. There is evidence that when chromium-6 enters the stomach, gastric acids may reduce it to chromium III. However, recent studies conducted by the National Toxicology Program have shown that chromium-6 can cause cancer in animals when administered orally.

Effective July 1, 2014, California's Office of Administrative Law approved a primary drinking water standard of 10 μg/L for chromium-6. USEPA regulates chromium-6 as part of the total chromium drinking water standard of 100 μg/L and is currently evaluating whether a new federal drinking water standard for chromium-6 is warranted based on new health effects information.

Metropolitan utilizes an analytical method with a minimum reporting level of 0.03 μg/L, which is less than the State DLR of 1 μg/L. In the past 5 years, the results from all of Metropolitan's source and treated waters are less than the State DLR. The following summarizes chromium-6 levels found in Metropolitan's system:

In the past 5 years, results of source and treated water monitoring for chromium-6 indicate the following:

- Levels in Colorado River water are mostly not detected (<0.03 μg/L), but when detected, levels range from 0.03 to 0.08 μg/L. SWP levels range from 0.03 to 0.8 μg/L. Treated water levels range from 0.03 to 0.7 μg/L.
- There is a slight increase in chromium-6 in the treated water from the oxidation (chlorination and ozonation) of natural background chromium (total) to chromium-6.
- Colorado River monitoring results upstream and downstream of the site of a Pacific Gas and Electric (PG&E) gas compressor station located along the Colorado River near Topock, Arizona (discussed below) have ranged from not detected (<0.03 μg/L) to 0.06 μg/L.
- Chromium-6 in Metropolitan's groundwater pump-in storage programs in the Central Valley has ranged from not detected (< 1 μg/L) to 8.9 μg/L in 2014, with the average for the different programs ranging from < 1 μg/L to 3 μg/L.

PG&E used chromium-6 as an anti-corrosion agent in its cooling towers at the Topock site from 1951 to 1985. Wastewater from the cooling towers was discharged from 1951 to 1968 into a dry wash next to the station. Monitoring wells show the plume concentration has peaked as high as 16,000 μg/L in groundwater. Since 2004, PG&E has operated an interim groundwater extraction and treatment system that is protecting the Colorado River. Quarterly monitoring of the river has shown levels of chromium-6 less than 1 μg/L, which are considered background levels. The California Department of Toxic Substances Control (DTSC) and the U. S. Department of the Interior are the lead state and federal agencies overseeing the cleanup efforts. Metropolitan participates through various stakeholder workgroups and partnerships that

include state and federal regulators, Indian tribes, and other stakeholders (e.g., Colorado River Board) involved in the corrective action process. In January 2011, a final treatment remedy was selected, and an Environmental Impact Report was certified. In November 2015, PG&E completed the final remedy design based on the selected remedy which involves the installation of an in-situ bioremediation treatment system. In April 2015, DTSC required the preparation of a Subsequent Environmental Impact Report (EIR) to address new design details. The Subsequent EIR will be completed in Spring 2017. Construction is expected to be completed in early 2022, followed by operation of the treatment system for an estimated 30 years.

The federal- and state-approved technologies for removing total chromium from drinking water include coagulation/filtration, ion exchange, reverse osmosis, and lime softening. For several years, the cities of Glendale, Burbank, and Los Angeles have been voluntarily limiting chromium-6 levels in their drinking water to 5 µg/L, which is significantly lower than the state MCL of 10 µg/L that went into effect on July 1, 2014.

### *Constituents of Emerging Concern*

#### *N-Nitrosodimethylamine*

N-Nitrosodimethylamine (NDMA) is part of a family of organic chemicals called nitrosamines. NDMA is a chloramine disinfection by-product, and it is the most abundantly detected nitrosamine in drinking water systems. Metropolitan utilizes chloramines as a secondary disinfectant at its treatment plants. Wastewater treatment plant discharges can contribute organic matter into source waters, which react with chloramines to form NDMA at drinking water treatment plants. Certain coagulation aid polymers used in water treatment, e.g., polydiallyldimethylammonium chloride (polyDADMAC), can also contribute to NDMA formation. Some NDMA control measures are being used to avoid adverse impacts on Southern California drinking water supplies. Metropolitan is involved in several projects to understand the impact of different treatment processes on NDMA and its precursors at drinking water treatment plants and in distribution systems. Certain pre-oxidation processes, such as chlorine and ozone, have been shown to destroy NDMA precursors. Additional studies are being conducted to better understand how polyDADMAC contributes to NDMA formation and to identify measures to reduce polymer-derived NDMA formation.

USEPA considers NDMA to be a probable human carcinogen. USEPA placed NDMA in the Unregulated Contaminant Monitoring Rule 2 (UCMR2) and on the Contaminant Candidate List 3 (CCL3). Although there is no federal regulation for nitrosamines in drinking water, DDW set a notification level of 0.01 µg/L each for NDMA and two other nitrosamines. Occurrences of NDMA in treated water supplies at concentrations greater than 0.01 µg/L are recommended to be included in a utility's annual Consumer Confidence Report. In December 2006, OEHHA set a public health goal for NDMA of 0.003 µg/L. Since 1999, Metropolitan has conducted voluntary monitoring of the five treatment plant effluents and representative distribution system locations semi-annually. In 2014, NDMA was the only detected nitrosamine in Metropolitan's treated water systems, and it was in a range of non-detect (<0.002 µg/L) to 0.005 µg/L. NDMA or a broader class of nitrosamines may likely be the next class of disinfection by-products to be regulated by USEPA.

#### *Pharmaceuticals and Personal Care Products*

Pharmaceuticals and personal care products (PPCPs) are a growing concern to the water industry. Numerous studies have reported the occurrence of these emerging contaminants in

treated wastewater, surface water, and sometimes, in finished drinking water in the United States and around the world. The use of ozone in treatment processes may have a beneficial effect on PPCP removal in drinking water. The sources of PPCPs in the aquatic environment include (but may not be limited to) treated wastewater and industrial discharge, agricultural run-off, and leaching of municipal landfills. Currently, there is no evidence of human health risks from long-term exposure to the low concentrations (low ng/L; parts per trillion) of PPCPs found in some drinking water. Furthermore, there are no regulatory requirements for PPCPs in drinking water. USEPA included 13 PPCPs on the CCL3; however, currently there are no standardized analytical methods for these compounds. USEPA's strategy for addressing PPCPs involves strengthening analytical methods, conducting source studies, improving public understanding of PPCPs in water, building partnerships and promoting stewardship opportunities, and taking regulatory action when appropriate.

In 2007, Metropolitan implemented a short-term monitoring program to determine the occurrence of PPCPs and other organic wastewater contaminants in Metropolitan's treatment plant effluents and selected source water locations within the Colorado River and SWP watersheds. Currently, PPCP monitoring is conducted on an annual basis for Metropolitan's source waters and treatment plants. Some PPCPs have been detected at very low ng/L levels, which is consistent with reports from other utilities. However, analytical methods are still being refined, and more work is required to fully understand occurrence issues. Metropolitan has been actively involved in studies related to PPCPs, including analytical methods improvements, and characterization of drinking water sources in California.

### *Other Water Quality Programs*

In addition to monitoring for and controlling specific identified chemicals in the water supply, Metropolitan has undertaken a number of programs to protect the quality of its water supplies. These programs are summarized below.

#### *Source Water Protection*

Source water protection is the first step in a multi-barrier approach to provide safe and reliable drinking water. In accordance with California's Surface Water Treatment Rule, Title 22 of the California Code of Regulations, DDW requires large utilities delivering surface water to complete a Watershed Sanitary Survey every five years to identify possible sources of drinking water contamination, evaluate source and treated water quality, and recommend watershed management activities that will protect and improve source water quality. The most recent sanitary surveys for Metropolitan's water sources are the Colorado River Watershed Sanitary Survey – 2010 Update and the State Water Project Watershed Sanitary Survey – 2011 Update.[20] The next Sanitary Surveys for the watersheds of the Colorado River and the SWP will report on watershed and water quality issues through 2015.

Metropolitan has an active source water protection program and continues to advocate on numerous issues to protect and enhance SWP and Colorado River water quality. As part of its source water protection program, Metropolitan monitors and forecasts source water quality, including closely monitoring the biology and limnology of lakes and aqueducts. Monitoring is conducted to comply with regulatory requirements, respond to water quality events, assess temporal variability, advise operations, and investigate emerging constituents and invasive species.

[20] Metropolitan Water District of Southern California, *Colorado River Watershed Sanitary Survey, 2010 Update*. For the State Water Project, the sanitary survey report was prepared on behalf of the State Water Project Contractors Authority, in 2011, and was titled *California State Water Project Watershed Sanitary Survey, 2011 Update*.

### *Colorado River Water Quality Partnerships*

Metropolitan collaborates with external partners to asses and manage watershed threats to Colorado River water quality. Metropolitan is a member of the Clean Colorado River Sustainability Coalition, which was formed in 1997 and focuses on protecting and enhancing the Colorado River through monitoring and analysis of water quality to assure and sustain high quality water for all users of the Colorado River. In 2011, Metropolitan formed the Lower Colorado River Water Quality Partnership with SNWA and Central Arizona Project to identify and implement collaborative solutions to address water quality issues facing the Colorado River. Metropolitan also participates in the Lake Mead Water Quality Forum which was formed in 2012, and its Lake Mead Ecosystem Monitoring Workgroup subcommittee. The Lake Mead Water Quality Forum's goals are to support the protection of human health and the environment and to preserve and improve the water quality of the Las Vegas Wash, Las Vegas Bay, and Lake Mead (and as a result, the Colorado River). In addition, as discussed earlier, Metropolitan is a member of the Colorado River Basin Salinity Control Forum which facilitates coordination between Basin states and federal agencies on salinity matters and the implementation of the Colorado River Basin Salinity Control Program.

### *SWP Water Quality Programs*

Metropolitan supports DWR policies and programs aimed at maintaining or improving the quality of SWP water delivered to Metropolitan. In particular, Metropolitan supported the DWR policy to govern the quality of non-project water conveyed by the California Aqueduct. In addition, Metropolitan has supported the expansion of DWR's Municipal Water Quality Investigations Program beyond its Bay-Delta core water quality monitoring and studies to include enhanced water quality monitoring and forecasting of the Delta and SWP. These programs are designed to provide early warning of water quality changes that will affect treatment plant operations both in the short-term (hours to weeks) and up to seasonally. The forecasting model is currently suitable for use in a planning mode. It is expected that with experience and model refinement, it will be suitable to use as a tool in operational decision making.

Metropolitan has implemented selective withdrawals from the Arvin-Edison storage program and exchanges with the Kern Water Bank to improve water quality. Although these programs were initially designed to provide dry-year supply reliability, they can also be used to store SWP water at periods of better water quality so the stored water may be withdrawn at times of lower water quality, thus diluting SWP water deliveries. Although elevated arsenic levels have been a concern in one groundwater banking program, there are also short-term water quality benefits that can be realized through storage programs, such as groundwater pump-ins into the California Aqueduct with lower TOC levels (as well as lower bromide and TDS, in some programs).

### *Regulatory and Legislative Actions*

Metropolitan conducts technical reviews of regulatory and legislative actions that may have an effect on the quality of Metropolitan's source waters. These may include changes in federal and state water quality standards; California Environmental Quality Act (CEQA) documents for projects or programs within Metropolitan's source watersheds; National Pollutant Discharge Elimination System permits for wastewater discharges into the Delta or Colorado River systems; and regulations or statewide policies and permits affecting source water quality or reservoir management issues. In addition, Metropolitan advocates and provides funding requests for key source water protection priorities, including the Moab uranium tailings cleanup and Colorado River salinity control.

# Coordination and Public Outreach

5

### *Collaborative Regional Planning*

Southern California has a remarkable, unparalleled tradition of meeting its water challenges as a single cohesive region. Metropolitan serves as both importer of water and regional water planner, and for the past generation, Metropolitan's Integrated Water Resources Plan (IRP) and the related Urban Water Management Plan (UWMP) have served as the reliability road map for the region. Metropolitan's 2015 IRP Update and 2015 UWMP were prepared concurrently through a collaborative process that included extensive coordination with Southern California's wholesale and retail water agencies, as well as municipal service providers and public planning agencies. The process also included outreach to engage the general public, businesses, environmental organizations, diverse communities, and other stakeholders with an interest in the future of Southern California's water supplies.

This chapter describes how Metropolitan's process to develop the 2015 UWMP complies with the provisions for coordination and public outreach in the Urban Water Management Planning Act (CA Water Code §10610, et seq.).

### *Development of "Water Tomorrow," a Regional Plan*

In early 2015, Metropolitan initiated a process to concurrently update its 2010 IRP and prepare the 2015 UWMP. Metropolitan branded this IRP update as "Water Tomorrow," which underlines the purpose of the plan and its importance to the region. The 2015 IRP Update seeks to integrate into a single plan the many local water actions that take place throughout Metropolitan's service area. This information was then used to prepare the UWMP.

For Metropolitan, the process to update the IRP and prepare the UWMP began with considerable homework. Local supply surveys, estimates of retail demands, and data within local urban water management plans were among the many key building blocks. Regional planning agencies provided updated demographics and population projections. In addition, planning processes for the Colorado River supply and the SWP (the region's primary imported water supplies) provided estimates of water supply availability given a range of possible future circumstances. The data were analyzed through Metropolitan's own planning model.

Data and documents are important, but it is the collaboration – with Metropolitan's 26 member agencies, its 38-member Board of Directors, numerous important stakeholders, and the general public – that truly enriched this process and shaped the final plans. Broad policy discussions and reviews were held at the board level. Member agency workshops dug into considerable technical detail. Public meetings, even social media, provided important feedback on how best to plan for a reliable water future.

The end result was the integration of many strategies, and many possible future water scenarios, into an adaptable regional plan – an IRP – and the related UWMP. The comprehensive process behind the 2015 IRP Update and preparation of the 2015 UWMP continues the tradition of Southern California working together to have reliable supplies of water for tomorrow.

### *Coordination with Other Appropriate Agencies*

Metropolitan coordinated the preparation of this UWMP with its 26 member agencies, wastewater management agencies, municipal service providers, groundwater management agencies, and regional planning agencies. The extensive regional coordination is consistent with the requirements of California Water Code Sections 10620(d)(2), 10641, and 10642.

#### *Board of Directors Oversight*

Metropolitan's Board of Directors provided oversight throughout the concurrent process for the 2015 IRP Update and the preparation of the 2015 UWMP. The process began with a presentation to Metropolitan's Water Planning and Stewardship Committee in February 2015. To provide focused involvement of the Metropolitan Board, the board created an Integrated Resources Planning Committee (IRP Committee), which is made up of 17 Metropolitan board directors. Beginning in March 2015, the IRP Committee met on a regular basis to provide guidance and receive information from Metropolitan staff. The IRP Committee held 10 meetings between March 2015 and January 2016, as summarized in Table 5-1.

**Table 5-1**
**Summary of Metropolitan Board of Directors Committee Meetings**

| Date | Committee | Topic |
|---|---|---|
| February 9, 2015 | WP&S Committee | Overview of the upcoming IRP process |
| March 24, 2015 | IRP Committee | Overview of the upcoming 2015 IRP Update and UWMP process, including a historical overview of previous IRPs, and description of proposed topics and timeline |
| April 28, 2015 | IRP Committee | Detailed review of current IRP targets and initial look at changed conditions |
| May 26, 2015 | IRP Committee | Expert presenters on Conservation Rates and Conservation Potential; Member Agency Technical Process Update |
| June 23, 2015 | IRP Committee | Expert presenters on Groundwater and Stormwater; Member Agency Technical Process Update |
| July 28, 2015 | IRP Committee | Expert presenters on Climate Change and Uncertainty; Member Agency Technical Process Update |
| August 18, 2015 | IRP Committee | Initial Results and Water Balances, IRP/UWMP Outreach, Delta Assumptions |
| September 29, 2015 | IRP Committee | Draft Results; IRP/UWMP Outreach |
| October 27, 2015 | IRP Committee | IRP/UWMP Outreach, Technical Recommendations, Draft IRP Issue Paper Addendum |
| December 7, 2015 | IRP Committee | Draft 2015 IRP Update, Overview of Phase 1 Policy Inventory and Phase 2 Policy Process |
| January 12, 2016 | IRP Committee | Final 2015 IRP Update |

### *Collaboration with Member Agencies and Other Organizations*

For guidance, discussion, and information-sharing on technical topics, Metropolitan staff collaborated with Metropolitan's member agencies through an IRP Member Agency Technical Workgroup. The Technical Workgroup met 11 times between April and October 2015. Each meeting focused on specific subjects. Through the workgroup, member agency staff provided Metropolitan staff with data and information essential for updating the 2015 IRP Update forecasts, feedback on draft analyses, and policy topics for the policy discussions following the adoption of the 2015 IRP Update. Additionally, member agency staff and external experts provided input and direction on the development of the 2015 IRP Update Issue Paper Addendum and collaborated with Metropolitan staff during the writing process.

Metropolitan distributed data sets of demographics, total demands after conservation, local supplies, and demands on Metropolitan at the regional and member agency levels using a 25-year planning horizon. The data were provided to the member agencies in five-year increments under single-dry, multi-dry, and average-year conditions as required in California Water Code §10631(j). When requested, Metropolitan staff met individually with the member agencies to review the data sets and discuss any agency-specific questions or issues. Regional issues and analysis methodologies were discussed during the technical workgroup meetings. Demand and supply estimates were included in the draft copy of the 2015 UWMP distributed to the member agencies in December, 2015.

IRP/UWMP briefings were also periodically presented during regular Member Agency Managers meetings held at Metropolitan. Metropolitan's update process also coordinated dialogue with the monthly water use efficiency meeting held with conservation coordinators from Metropolitan's member agencies and their retail sub-agencies. These meetings served as a forum for input on Metropolitan's conservation model methodology. Metropolitan staff also met with the member agency Conservation Program Advisory Committee for technical discussion and comments on Metropolitan's Conservation Savings Model. Additional meetings included the Local Resources Program (LRP) Coordinator's meeting and webinar where member agencies and retailers provided input to the recycled water discussion. The Technical Workgroup and other member agency planning meetings are summarized in Table 5-2.

### *Public Outreach during IRP/UWMP Preparation*

Public involvement was an important element of the process to update the IRP and prepare the 2015 UWMP. Public outreach efforts complement the technical processes with the IRP committee and the member agencies. Most importantly, the efforts that were implemented during 2015 establish a means for the public to provide input to the policy discussions that are occurring following the adoption of the 2015 IRP Update.

Metropolitan's three key objectives for the public involvement element of the 2015 IRP Update and preparation of the UWMP are as follows:

- Ensure that the 2015 IRP Update/UWMP process is understandable and accessible to anyone who has an interest in Southern California's water supplies
- Provide opportunities for learning, dialogue, and input
- Create a pathway to encourage continued engagement in future policy discussions

To achieve the first objective, Metropolitan branded the 2015 IRP Update as "Water Tomorrow," which underlines the purpose of the plan and its importance to the region. Metropolitan then created a new website, MWDWaterTomorrow.com, which provides extensive information on the current update process, as well as the history of Metropolitan's IRP over the past two

decades. For the 2015 IRP Update, the site includes a calendar of past and future meetings, technical analysis and presentations, brief descriptions of Southern California's water resources, a comment section, and ways to participate. Metropolitan shares news and updates about Water Tomorrow through traditional and social media, Metropolitan's "Your Water" e-newsletter, and a variety of social media platforms. Metropolitan also provides speakers for community and business organizations throughout its service area.

While the first objective addresses public awareness, the second objective seeks to ensure that public involvement advances the region's understanding of water issues, challenges and perspectives and benefits Metropolitan's planning process. Metropolitan worked with the Southern California Water Committee to present the 2015 IRP Update process and technical issues at two workshops held at Metropolitan. Approximately 150 people participated in the first workshop in June to discuss a "Drought Proof Strategy." The second workshop was held in August where approximately 125 attendees discussed the future of outdoor water conservation. In September, Metropolitan met with the Southern California Water Dialogue whose diverse membership includes environmental organizations, private industry, and public agencies. The Southern California Association of Governments presented an overview of demographic projections, and Metropolitan staff provided an introduction to the technical analysis for the 2015 IRP Update. The IRP Committee Chair facilitated discussion on the 2015 IRP Update among the approximately 75 participants.

Following the three focused workshops held with the Southern California Water Committee and the Southern California Water Dialogue, Metropolitan convened the Water Tomorrow public workshop on October 22, 2015. More than 450 people participated in the all-day workshop, which was offered both in person and online to encourage broad participation throughout Metropolitan's service area. Staff recapped the technical analysis and key findings. Professional facilitators guided participant discussion in key resource areas: conservation, local resources, groundwater, and imported supplies. The key discussion points, ideas, and outcomes were reported to the IRP Committee to help inform future board policy discussions.

The third outreach objective looks to the future. One of Metropolitan's overarching communication goals is to develop the general public's knowledge of water resource issues and the range of solutions available to Southern California. An informed public is better able to contribute to the discussions and understand the implications and opportunities afforded by decisions. Metropolitan is building on the progress in the first phase of the 2015 IRP Update to encourage continued involvement in future discussions for the IRP and other water issues. These discussions will focus on solutions to challenges, and topics will range from policy and regulations to technology and behavior change.

As social media has become part of mainstream communications, Metropolitan tried a supplemental means of public engagement. Metropolitan worked with Northern Rift, a firm that has created a software platform to engage the public in raising and collaborating on ideas, to offer an online Water Tomorrow Innovation Game. Participants proposed ideas to solve Southern California's water challenges and then collaborated on the ideas to help grow them or discuss their limitations. The top ideas selected by the community of participants and those selected by a panel of water resource and policy experts were recognized at a reception hosted by Metropolitan. The Board of Directors may consider the ideas in future discussions on implementation of the 2015 IRP Update.

### *UWMP Public Notice and Adoption*

Metropolitan provided notice of the availability of the draft 2015 UWMP and the public hearing to consider adoption, in accordance with California Water Code Sections 10621(b) and 10642,

and Government Code Section 6066. The public review draft of the plan was posted prominently on Metropolitan's website, mwdh2o.com, on February 1, 2016, more than 60 days in advance of the public hearing on April 11, 2016. The notice of availability of the document was sent to the member agencies, as well as cities and counties in the Metropolitan service area. In addition, a public notice advertising the public hearing was published in six Southern California newspapers on February 1 and 8, 2016. A copy of the notification letter sent to the member agencies, cities and counties in Metropolitan's service area is included in this chapter, as well as the notice published in the newspapers. Table 5-3 provides a list of participating member agencies and other appropriate agencies that Metropolitan coordinated with in its regional planning, as well as the cities and counties that were notified about the preparation of its 2015 UWMP.

Metropolitan held the public hearing for the draft 2015 UWMP on April 11, 2016, at the Board's Water Planning and Stewardship Committee meeting. On May 10, 2016, Metropolitan's Board determined that the 2015 UWMP is consistent with the Act and an accurate representation of the water resources plan for the Metropolitan service area. As stated in Resolution 9209, the Board adopted the 2015 UWMP and authorized its submittal to the State of California. A copy of Resolution 9209 is included in this section.

### *Submission and Availability of Final 2015 UWMP*

In fulfillment of California Water Code §10645, Metropolitan's Final 2015 UWMP was posted on the mwdh2o.com website on May 10, 2016, following its adoption by the Metropolitan board.

In fulfillment of California Water Code §§ 10635(b) and 10644(a)(1), Metropolitan also mailed copies of the Final 2015 UWMP (in electronic pdf format) to the California State Library and all cities and counties within Metropolitan's service area within 30 days of Board adoption.

In fulfillment of California Water Code § 10621(d) and § 10644(a)(1) and (2), Metropolitan's Final 2015 UWMP was electronically submitted to the State of California through DWR's WUE data website https://wuedata.water.ca.gov/secure/ in June 2016.

**Table 5-2**

# Letter Notifying Cities and Counties

February 1, 2016

[Sent via US Mail to Member Agencies, City Managers and County Administrators]

Notice of Public Hearing on The Metropolitan Water District of Southern California's Draft 2015 Urban Water Management Plan

The Metropolitan Water District of Southern California (Metropolitan) cordially invites you to participate and provide comments at a public hearing on the draft 2015 Urban Water Management Plan (UWMP). The UWMP presents Metropolitan's long-term plan for ensuring water supply reliability and water quality for the region. The draft UWMP complies with California state law requiring urban water suppliers to prepare and update urban water management plans every five years. The hearing will be held as part of the meeting of the Water Planning and Stewardship Committee whose board members are helping to shape a public dialogue on the future of water management and conservation in the region. The meeting is at:

The Metropolitan Water District of Southern California
700 North Alameda Street, Los Angeles, CA 90012
Water Planning and Stewardship Committee Meeting – Room 2-456
Monday, April 11, 2016 at 10:00 AM

The draft UWMP is posted on Metropolitan's web site, mwdh2o.com for your review. Public input is encouraged and will be considered during finalization of the 2015 UWMP. Written comments are due by **April 11, 2016**. Please send comments to:

The Metropolitan Water District of Southern California
PO Box 54153
Los Angeles, CA 90054-0153
**Attn: Edgar Fandialan**

If you would like more information or have any questions, please contact Edgar Fandialan at (213) 217-6764 or via email at efandialan@mwdh2o.com.

Very Truly Yours,

Devendra Upadhyay
Manager, Water Resource Management

**(Newspaper publication per California Water Code §10642 and Government Code §6066)**

# PUBLIC HEARING SCHEDULED ON DRAFT URBAN WATER MANAGEMENT PLAN

The Metropolitan Water District of Southern California (Metropolitan) will hold a public hearing on **Monday, April 11, 2016** to receive comments on its draft 2015 Urban Water Management Plan (UWMP).

The hearing will be held as part of the meeting of the Water Planning and Stewardship Committee whose board members are helping to shape a public dialogue on the future of water management and conservation in the region. The meeting is at:

The Metropolitan Water District of Southern California
700 North Alameda Street, Los Angeles, CA 90012
Water Planning and Stewardship Committee Meeting – Room 2-456
Monday, April 11, 2016 at 10:00 AM

The UWMP presents Metropolitan's long-term plan for ensuring water supply reliability and water quality for the region. The draft UWMP complies with California state law requiring urban water suppliers to prepare and update urban water management plans every five years.

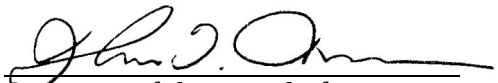
The draft plan is available on Metropolitan's web site, mwdh2o.com. Public input is encouraged and will be considered during finalization of the 2015 UWMP. Metropolitan will accept written comments on the draft plan. All written comments must be received by **April 11, 2016**, by sending them to:

The Metropolitan Water District of Southern California
P.O. Box 54153
Los Angeles, CA 90054-0153
**Attn: Edgar Fandialan**

For more information on the draft UWMP, please contact Edgar Fandialan of Metropolitan's Water Resource Management Group at (213) 217-6764.

# Resolution 9209

**RESOLUTION**
**OF THE BOARD OF DIRECTORS**
**OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA**
**ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN**



WHEREAS, the California Urban Water Management Planning Act requires urban water suppliers providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to prepare and adopt, in accordance with prescribed requirements, an urban water management plan every five years; and

WHEREAS, the California Urban Water Management Planning Act specifies the requirements and procedures for adopting such Urban Water Management Plans; and

WHEREAS, the Board of Directors of The Metropolitan Water District of Southern California has duly reviewed, discussed, and considered such Urban Water Management Plan and has determined the 2015 Urban Water Management Plan to be consistent with the California Urban Water Management Planning Act and to be an accurate representation of the water resources plan for The Metropolitan Water District of Southern California.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of The Metropolitan Water District of Southern California that, on May 10, 2016, this District hereby adopts this 2015 Urban Water Management Plan for submittal to the State of California.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on May 10, 2016.

Secretary of the Board of Directors
of The Metropolitan Water District
of Southern California

# Appendix 1

# DEMAND FORECAST

# Appendix 1
# DEMAND FORECAST

## Forecast Overview

Retail water demand forecasting is essential for planning total water requirements in Metropolitan's service area. Retail water demand can be met with conservation, local supplies, or imported supplies. As a wholesale imported water supplier, Metropolitan's long-term plans focus on the future demands for Metropolitan's supplies. In order to project the need for resources and system capacity, Metropolitan begins with a long-term projection of retail water demands.

Total retail demands include:

- Retail Municipal and Industrial (M&I) — Retail M&I demands represent urban water use within the region including residential, commercial, industrial, and institutional water uses. To forecast retail M&I demands, Metropolitan uses econometric models that have been adapted for conditions in Southern California. The econometric models are statistical models that can capture and explain the impacts of long-term socioeconomic trends on retail M&I demands. The econometric models incorporate projections of demographic and economic variables from regional transportation planning agencies to produce forecasts of water demand.
- Retail Agricultural Demand — Retail agricultural demands consist of water use for irrigating crops. Metropolitan's member agencies provide projections of agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Metropolitan relies on member agencies' projections of agricultural demands.
- Seawater Barrier Demand — Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Groundwater management agencies determine the barrier requirements based on groundwater levels, injection wells, and regulatory permits.
- Replenishment Demand — Replenishment demands represent the amount of water member agencies plan to use to replenish their groundwater basins in order to maintain sustainable basin health and production.

### *Retail M&I Demand Forecast*

In forecasting retail M&I water demand, Metropolitan adopted a new econometric model (the Metropolitan Water District – Econometric Demand Model or MWD-EDM) developed by The Brattle Group (January 2015). MWD-EDM utilizes multiple regression, which is generally favored by academics and practitioners for long-term water demand analysis. It uses demand relationships based on actual observed behavior to consider the effect of anticipated changes in demand factors on long-term demand.

MWD-EDM is comprised of three separate regression models described below. Each model is developed using historical water consumption and socio-demographic and economic data specific to the sector:

- Single-Family Residential (SFR) Model - SFR water demand is modeled as a function of price, weather, retailer level housing, socio-demographic characteristics, and member agency level fixed effects. The model used water consumption data from 153 retailers with 3,000 accounts or more in Metropolitan's service area. The dataset, ranging from 1994 to 2011, consisted of 1,225 observations and represented 80 percent of all SFR accounts from all 26 Metropolitan member agencies.
- Multi-family Residential (MFR) Model - MFR demand is modeled as a function of price, retailer level housing, socio-demographic characteristics, and member agency level fixed effects. Water consumption data was collected from 53 water retailers consisting of 469 observations and representing 23 out of 26 Metropolitan member agencies.
- Commercial, Industrial, and Institutional (CII) Model - CII demand is modeled as a function of price, weather, employment, the share of employment in the manufacturing sector, and member agency level fixed effects. Water consumption data was collected from 75 water retailers consisting of 709 observations and representing 25 out of 26 Metropolitan member agencies.

The SFR and MFR models forecast average monthly household consumption before conservation, while the CII model forecasts average monthly consumption per employee. Table A.1-1 shows the dependent and the covariates uses in the econometric models for each sector.

**Table A.1-1**
**MWD-EDM Variables**

| Sector | Dependent Variable | Independent Variable (Covariate) |
|---|---|---|
| SFR | Water-Use Per Household | Total Average Cost<br>Total Average Cost x Median Lot Size<br>Annual precipitation<br>Average Max Temperature<br>Median Income<br>Average Household Size<br>Median Lot Size |
| MFR | Water-Use Per Household | Median Tier Price<br>Median Income<br>Median Lot Size<br>Average Household Size |
| CII | Water-Use Per Employee | Median Tier Price<br>Cooling Degree Days<br>Average Max Temperature<br>Share of Employment In Manufacturing<br>Median Tier Price x Share of Manufacturing |

Total retail M&I demand is the product of projected household/employee and the average monthly consumption.

Price Elasticity

Price elasticity of demand is a measure used in economics to show the responsiveness of the quantity of water demanded to a change in its price. The assumed price increase reduces the water use. This reduction can be assessed in MWD-EDM and is considered a conservation savings due to price or "price-effect." Consumers can respond to price increases by installing water-conserving fixtures and appliances such as high-efficiency toilets. However, many of the fixture-based conservation savings options are already factored into Metropolitan's Conservation Savings Model. As more water efficient fixtures are installed, the impact of changing water using behavior through price or rates is reduced. Consider consumers who respond to rate increases by taking shorter showers. Their behavior adjustment will save less water if they use a water-efficient low-flow showerhead compared to a regular showerhead. This effect is known as demand hardening. In order to avoid double-counting conservation savings and account for demand hardening, the impact of price elasticity is reduced. In MWD-EDM, price elasticity is reduced to 33 percent by 2020 and is kept constant beyond 2020. Price-effect savings are reduced (and demands increased) as a result of this adjustment. The elasticity is reduced in proportion to increases in conservation savings from the conservation model. Reducing price elasticity to 1/3 of its originally estimated levels is based on professional judgment, assuming that much of the easily obtained water use efficiencies will be achieved by 2020, but allowing for new conservation technologies.

Fixed Effects

MWD-EDM forecasts retail M&I demand for each of the 26 member agencies. To account for the differences observed between each agency, MWD-EDM uses the fixed effects or the constant term that represents the member agency specific intercepts that account for all time-invariant unobserved factors common to an agency.

Demographics

Demographics are recognized by the water industry as drivers of water demand. Metropolitan's retail demand modelling is driven by key demographics such as projected population, households, employment, and median household income.

Metropolitan uses demographic growth projections produced by two regional transportation planning agencies: the Southern California Association of Governments (SCAG) and the San Diego Association of Governments (SANDAG). Together they represent more than 200 cities in Southern California and produce long-term transportation plans for sustainable communities. Among other responsibilities, SCAG and SANDAG also prepare projections of population, households, income, and employment for their regions. Both planning agencies update their regional growth forecasts approximately every four years, at different times. SCAG is the regional planning agency for six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SANDAG is the regional planning agency for San Diego County. Significantly, SCAG's and SANDAG's official growth projections are backed by environmental reports. These regional growth forecasts provide the core assumptions underlying Metropolitan's retail demand forecasting model.

In April 2012, SCAG released the *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy* growth forecast (RTP-12). The RTP-12 incorporated updated data and assumptions that reflected the 2007-2009 economic recession, the 2010 Census count, and 2011 employment data from the California Employment Development Department for the Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. Metropolitan uses the forecast for every county except Imperial, which is outside of Metropolitan's service area.

In October 2013, SANDAG released the *Series 13: 2050 Regional Growth Forecast* (Series 13). Series 13 is a comprehensive projection of the regional demographic, economic, and housing trends expected over the next four decades for the San Diego region. Metropolitan uses the forecast for the San Diego County Water Authority's service area in the retail demand forecast.

### *Effects of the Great Recession on SCAG's and SANDAG's Forecasts*

The Great Recession of 2007-09 severely impacted the region's economic growth. Economic growth is a major factor in population growth through migration. Job availability attracts people to the region. Conversely, a scarcity of employment leads to out-migration as people leave in search of work. Between 2007 and 2010, the region lost approximately 750,000 jobs. The state and the region experienced disproportionately high job losses compared with the nation. Because patterns of migration are influenced by job availability, Southern California saw net outbound domestic migration. Other major factors that affect population growth are fertility and mortality. The acute economic uncertainties also affected people's decision to start a family. Consequently, delayed family formation and reduced birth rate contributed to slower population growth than was anticipated before the recession. However, mortality rates were projected to be lower as the proportion of older people (age 65+) significantly increases. As a result, the net growth in population in the post-recession era is projected to be lower than previously projected in the 2010 IRP Update.

## Trends in Southern California

### *Population*

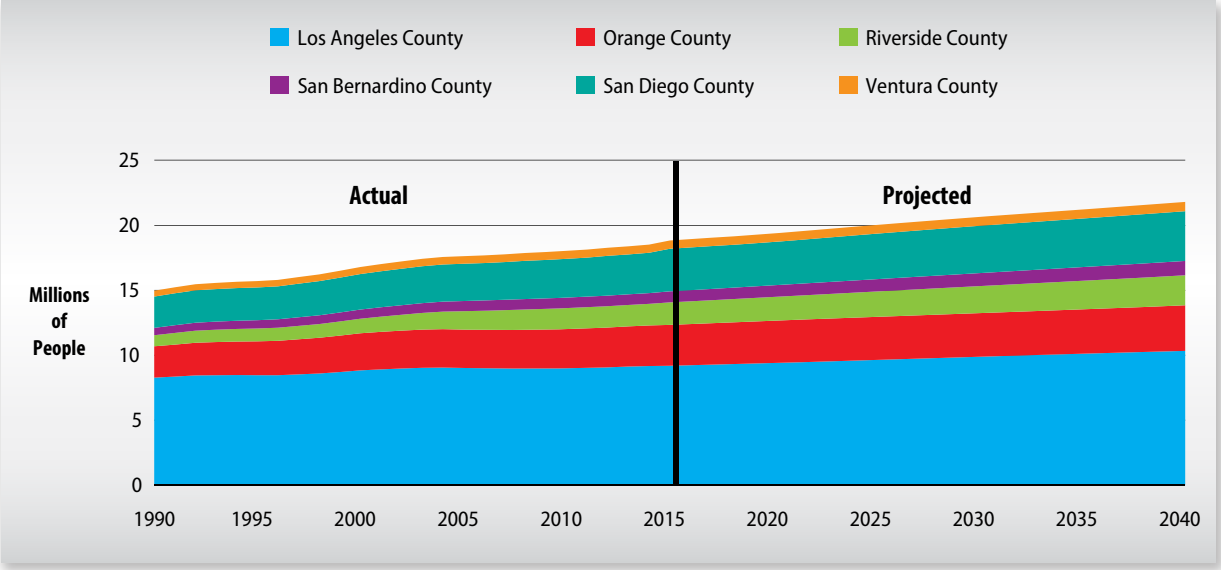
According to SCAG and SANDAG estimates, the population in Metropolitan's service area will reach 19.4 million in 2020, 20.0 million in 2025, and 21.8 million by 2040. While Los Angeles County leads in total population, the inland areas of Riverside and San Bernardino counties are projected to grow at the fastest rates over the next ten years. Generally speaking, however, annual growth rates will slow for all counties between 2010 and 2040. In part, this is due to changing patterns of migration. It also reflects the effects of the recession of the late 2000s and the ongoing restructuring of the Southern California economy.

### *Employment*

Within Metropolitan's service area, employment growth is likely to occur unevenly across the six counties. Over the 25-year period between 2015 and 2040, the greatest employment increases are expected to occur in Riverside, Los Angeles, and San Diego Counties with estimated increases of 383, 379, and 237 thousand jobs respectively. Relative to existing employment, Riverside and San Bernardino counties are expected to have the highest rates of employment growth.

Figure A.1-2 and Table A.1-3 summarize the projected growth of commercial, industrial, and institutional employment in Metropolitan's service area. Total urban employment is expected to increase from 8.2 million in 2015 to about 9.6 million in 2040. This increase of about 17 percent is greater than the projected population increase of 16 percent, suggesting a slightly increased share of the population will be employed over time.

**Figure A.1-1 Actual and Projected Population**



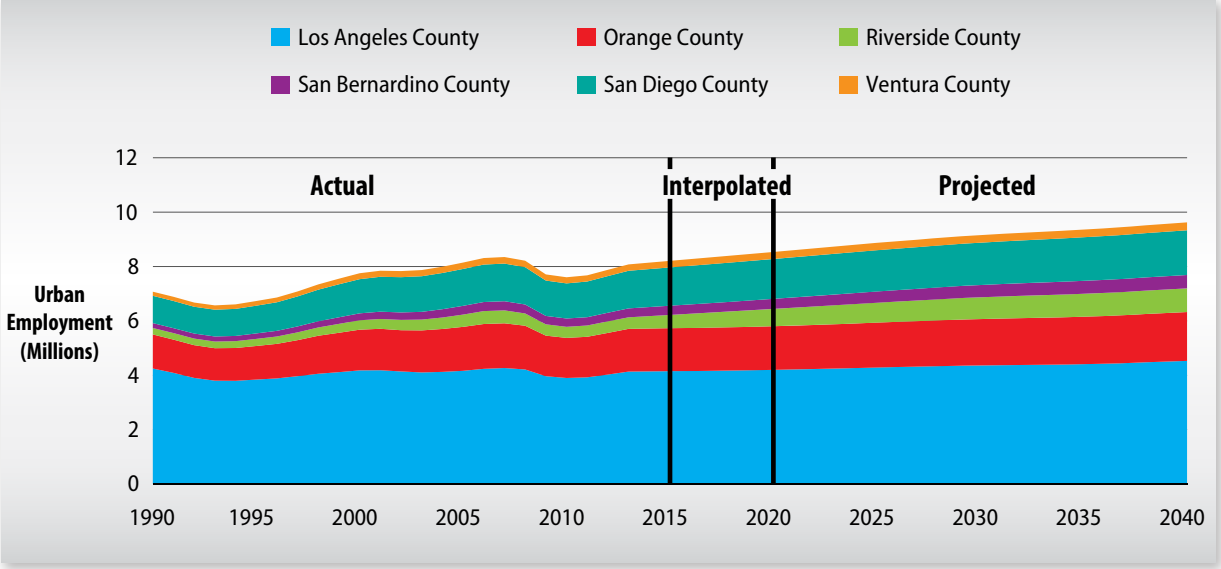


**Figure A.1-2 Actual and Projected Urban Employment**

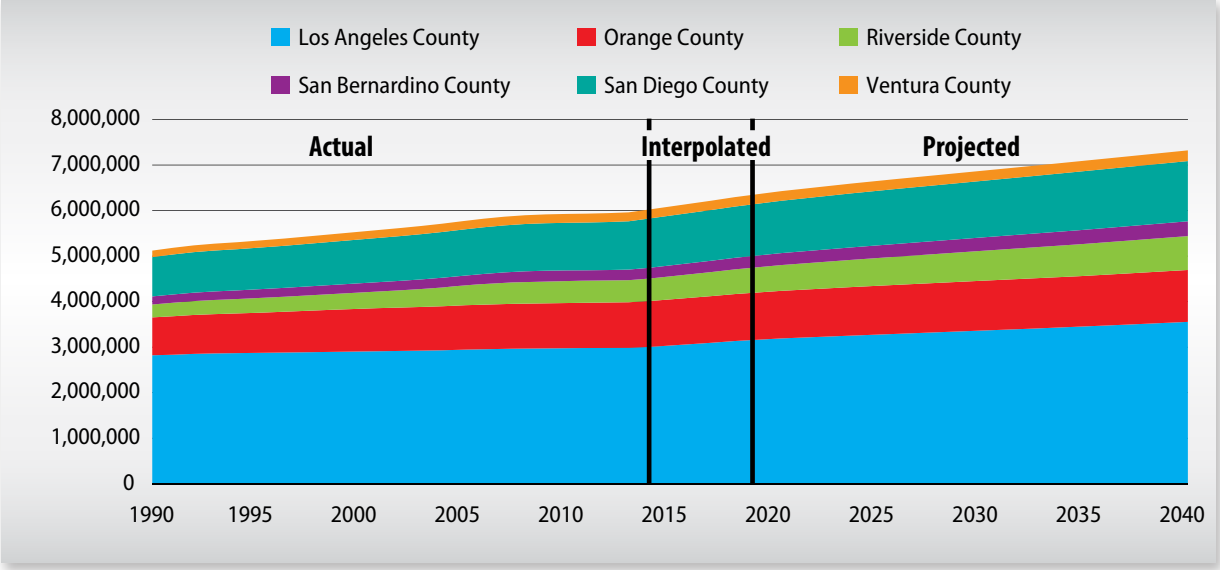
### *Residential Consumers*

Southern California's regional planning agencies have forecast residential housing growth in all parts of the Metropolitan service area. These forecasts are shown in Figure A.1-3 and Table A.1-4. The total occupied housing stock is expected to increase more than 20 percent between 2015 and 2040, growing from 6.1 to around 7.3 million housing units. Much of this growth will likely occur in hotter inland areas of Southern California. Within the service territory, the household occupancy size (household population divided by total occupied dwelling units) is projected to decline slightly from about 3.0 persons per unit currently to 2.9 persons per unit by 2040.

Permits for new residential housing construction are another indicator of the future growth in water demand. Figure A.1-4 shows the pattern of historical growth in residential housing permits between 1970 and 2040. The effect of economic cycles can clearly be seen over time with the precipitous fall in housing construction during the 2007 to 2010 recession being most notable. There is a recent slight increase of construction from 2011 to 2014.

**Figure A.1-3 Actual and Projected Households**



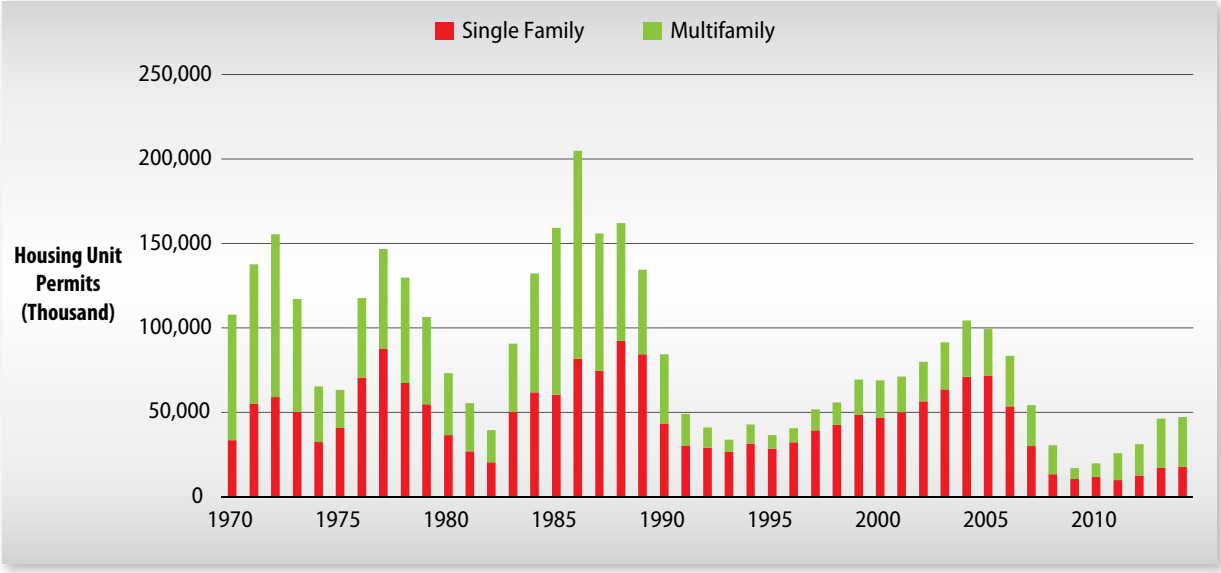


**Figure A.1-4 Residential Housing Permits in Six-County Region**

## Water Demands

As shown in Figure A.1-5 and Table A.1-5, actual retail water demands in 2015 was 3.1 million acre-feet (MAF), which is approximately the same as in 1980. This is due to a number of factors including an aggressive outreach campaign due the severe drought since 2012, advancement in conservation, and mandatory water use restriction.

Of the estimated 3.1 MAF of total retail water use in 2015, agricultural water use was only about 99 TAF. This is due to severe drought, water rate increases, and water use restrictions. By 2040, under average conditions, retail agricultural demand is expected to be about 160 TAF.

### *Retail Demand*

It is estimated that total M&I water use will grow from an annual average of 3.0 MAF in 2015 to 3.8 MAF in 2040. All water demand projections assume normal weather conditions. Future changes in estimated water demand assume continued water savings due to conservation measures such as water savings resulting from plumbing codes, price effects, and the continuing implementation of utility-funded conservation BMPs. Retail demand was greatly reduced in 2015 due to extraordinary response to statewide calls for a 25 percent reduction in water use in light of historic drought conditions. Regional water use is projected to increase slightly until 2020 as demands rebound towards more normal levels. Between 2020 and 2040, regional water use will grow slowly as driven by population and economic growth while water use efficiency increases.

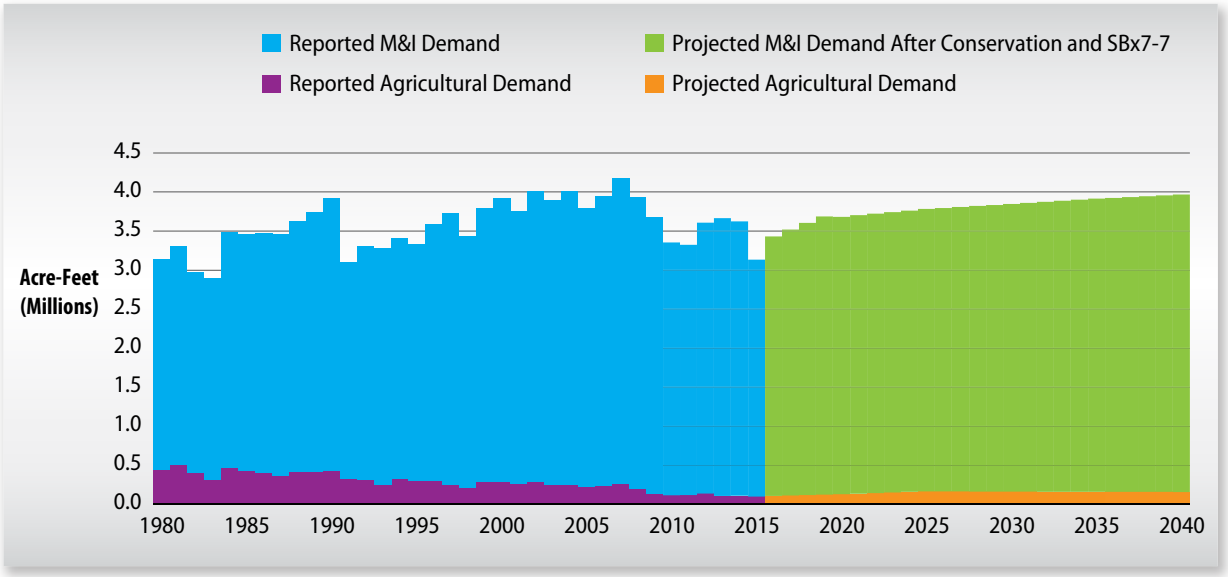
#### By County

M&I water demand is not expected to grow uniformly across counties. Consistent with the general pattern of future demographic distributions, the largest absolute increases in urban water demands are expected to occur in Los Angeles and Riverside Counties, with respective estimated increases of about 231 TAF and 202 TAF between 2015 and 2040.

#### By Sector

Water use can also be broken down by sector. Between 2015 and 2040, single-family residential water use is expected to increase by 18.5 percent (Table A.1-8), while multifamily water use is estimated to increase by 32.9 percent (Table A.1-9). Table A.1-10 shows estimated nonresidential water use increasing by 19.0 percent between 2015 and 2040.

### *Residential Water Use*



While single-family homes are estimated to account for about 60 percent of the total occupied housing stock in 2015, they are responsible for about 77 percent of total residential water demands (Tables A.1-8 and A.1-9). This is consistent with the fact that single-family households are known to use more water than multifamily households (e.g., those residing in duplexes, triplexes, apartment buildings and condo developments) on a per housing-unit basis. This is because single-family households tend to have more persons living in the household; they are likely to have more water-using appliances and fixtures; and they tend to have more landscaping.

### *Nonresidential Water Use*

Nonresidential water use represented approximately 25 percent of the total M&I demands in Metropolitan's service area in 2015 (Table A.1-10). This includes water that is used by businesses, services, government, institutions (such as hospitals and schools), and industrial (or manufacturing) establishments. Within the commercial/institutional category, the top water

users include schools, hospitals, hotels, amusement parks, colleges, laundries, and restaurants. In Southern California, major industrial users include electronics, aircraft, petroleum refining, beverages, food processing, and other industries that use water as a major component of the manufacturing process.

**Figure A.1-5 Actual and Projected Retail Water Demand**

### *Conservation Savings*

Table A.1-12 shows estimated conservation savings resulting from active conservation programs ("Active"), ongoing conservation from natural replacement of plumbing fixtures ("Code-Based"), and conservation induced by projected increases in the real price of water ("Price"). Code-Based savings account for the largest share of total conservation. However, aggressive utility-funded conservation programs have made a significant contribution in this area. For example, Metropolitan-assisted programs were responsible for an estimated 179 TAF in savings during FY 2014-15 and nearly 800 TAF in cumulative conservation savings since FY 1990/91.

### *Projected M&I Demand by Sector*

Table A.1-13 provides a summary of municipal and industrial demands, broken down by sector, along with each sector's share of total retail demand. In 2015, residential use accounted for about 70 percent of total projected M&I demand, while non-residential use constituted nearly 21 percent of projected M&I demand. These shares are expected to remain the same until 2040. System losses and unmetered use are expected to remain relatively constant over this period at about 9 percent.

## Table A.1-2 Population Growth in Metropolitan's Service Area (July)

(Acre-feet)

| County | Actual | | | | Estimated | Projected | | | | |
|---|---|---|---|---|---|---|---|---|---|---|

# Appendix 2

# EXISTING REGIONAL WATER SUPPLIES

# Appendix 2
# EXISTING REGIONAL WATER SUPPLIES

Water used in Metropolitan's service area comes from both local and imported sources. Local sources include groundwater, surface water, and recycled water. Sources of imported water include the Colorado River, the State Water Project (SWP), and the Owens Valley/Mono Basin. On average over the last 10 years (from 2006 to 2015), local sources met about 45 percent of the water needs, while imported sources supplied the remaining 55 percent.

The City of Los Angeles imports water from the Owens Valley/Mono Basin east of the Sierra Nevada through the Los Angeles Aqueduct (LAA). This water currently meets about 4 percent of the region's water needs based on a ten-year average from 2006 to 2015, but is dedicated for use by the City of Los Angeles. Metropolitan provides imported water supplies to meet the remaining 51 percent of the region's water needs based on the same ten-year period. These imported supplies are received from Metropolitan's Colorado River Aqueduct (CRA) and the SWP's California Aqueduct. Table A.2-1 and Figure A.2-1 show the historical sources of local and imported supplies within Metropolitan's service area.

Table A.2-2 shows the quantities of Metropolitan water used by member agencies during the last ten years. Metropolitan's largest water customers are the San Diego County Water Authority (27 percent), City of Los Angeles (17 percent), and Municipal Water District of Orange County (13 percent).

The following sections describe the current supply sources in more detail. The main body of the Urban Water Management Plan contains descriptions of planned future supplies.

## Local Water Supplies

Local sources of water available to the region include surface water, groundwater, and recycled water. Some of the major river systems in Southern California have been developed into systems of dams, flood control channels, and percolation ponds for supplying local water and recharging groundwater basins. For example, the San Gabriel and Santa Ana Rivers capture over 85 percent of the runoff in their watersheds. The Los Angeles River system, however, is not as efficient in capturing runoff. In its upper reaches, which make up 25 percent of the watershed, most runoff is captured with recharge facilities. In its lower reaches, which comprise the remaining 75 percent of the watershed, the river and its tributaries are lined with concrete, so there are no recharge facilities. The Santa Clara River in Ventura County is outside of Metropolitan's service area, but it replenishes groundwater basins used by water agencies within Metropolitan's service area. Other rivers in Metropolitan's service area, such as the Santa Margarita and San Luis Rey, are essentially natural replenishment systems.

## Table A. 2-1
## Sources of Water Supply to the Metropolitan Service Area

(Acre-Feet)[1]

| Calendar Year | Local Supplies | L.A. Aqueduct | Colorado River Aqueduct[2] | State Water Project[3] | Total |
|---|---|---|---|---|---|
| 1976 | 1,363,000 | 430,000 | 778,000 | 638,000 | 3,209,000 |
| 1977 | 1,370,000 | 275,000 | 1,277,000 | 209,000 | 3,131,000 |
| 1978 | 1,253,000 | 472,000 | 710,000 | 576,000 | 3,011,000 |
| 1979 | 1,419,000 | 493,000 | 784,000 | 532,000 | 3,227,000 |
| 1980 | 1,452,000 | 515,000 | 791,000 | 560,000 | 3,317,000 |
| 1981 | 1,500,000 | 465,000 | 791,000 | 827,000 | 3,583,000 |
| 1982 | 1,392,000 | 483,000 | 686,000 | 737,000 | 3,298,000 |

1. Based on best available data and estimates as of September 2015.

**Figure A.2-1 Sources of Supply to Metropolitan's Service Area**

Local supplies fluctuate in response to variations in rainfall. During prolonged periods of below-normal rainfall, local water supplies decrease. Conversely, prolonged periods of above-normal rainfall increase local supplies. Sources of groundwater basin replenishment include local precipitation, runoff from the coastal ranges, and artificial recharge with imported water supplies. In addition to runoff, recycled water provides an increasingly important source of replenishment water for the region.

## Major Groundwater Basins

Groundwater sources account for about 90 percent of the local water supplies, which are found in many basins throughout the Southern California region and provide an annual average total production of about 1.35 MAF per year. Figure A.2-2 shows the location of the groundwater basins within Metropolitan's service area. Groundwater yield comes from natural recharge from the percolation of rainfall and stream runoff and active recharge from spreading and injection of captured stormwater, recycled water, and imported water. In certain major drainage areas, runoff is retained in flood control reservoirs and released into spreading basins for percolation into the ground. In Los Angeles County, many groundwater recharge facilities located along the upper reaches of the Los Angeles River and San Gabriel River systems provide recharge to San Fernando, Raymond, Main San Gabriel, Central, and West Coast groundwater basins. The Orange County Water District operates a system of diversion structures and recharge basins along the Santa Ana River that captures much of the storm runoff, as well as water from reclamation facilities in Riverside and San Bernardino counties. Storm runoff is also diverted to recharge basins in the Chino Basin. This water, which would otherwise flow into the Pacific Ocean, is allowed to percolate into the underlying aquifers so it may be pumped for local use when needed. Recycled water use for groundwater recharge has increased steadily. The Water Replenishment District of Southern California (WRD) has spread recycled water at the Montebello Forebay to recharge Central and West Coast basins for many years and is working to expand this practice. The Inland

Empire Utilities Agency (IEUA) provides recycled water for recharge of the Chino Basin. Orange County Water District has implemented the Groundwater Replenishment System (GWRS) to recharge over 100 TAF per year of highly-treated recycled water to the Orange County Basin. Highly treated recycled water is also used at seawater barriers in the West Coast, Central, and Orange County basins and has largely replaced use of imported water for this purpose.

Almost all major groundwater basins in Southern California are either adjudicated or managed by special districts or agencies. Over 90 percent of the groundwater used in Metropolitan's service area is produced from adjudicated or managed groundwater basins. Adjudicated basins in the region include: Raymond Basin, Upper Los Angeles River Area basins (which include San Fernando, Sylmar, Verdugo, and Eagle Rock Basins), Main San Gabriel Basin, Central Basin, West Coast Basin, Six Basins, Chino Basin, and Cucamonga Basin. The Orange County Groundwater Basin is managed by Orange County Water District; portions of the Ventura County Basins are managed by the Fox Canyon Groundwater Management Agency; and the West San Jacinto Basins and Hemet-San Jacinto Basins are managed by Eastern Municipal Water District. In general, these basins have management plans that include protection from seawater intrusion in the coastal region, water quality deterioration, and excessive lowering of water levels. Groundwater basin managers address treatment of contamination, manage recharge and storage programs, and monitor extraction, water levels, and water quality.

### Major River Systems and Reservoirs

Local surface water resources consist of runoff captured in storage reservoirs and diversions from streams. Reservoirs hold the runoff for later direct use, and diversions from streams are delivered directly to local water systems. As Table A.2-3 shows, local water agencies currently own and operate 34 reservoirs. These reservoirs provide a storage capacity of approximately 897 TAF. The historic average yield of these local surface supplies, which come from reservoir releases and stream diversions, is about 90 TAF per year. The annual yield varies widely between wet and dry years, and most reservoirs that capture local surface runoff are operated with minimal carry-over storage. San Diego County has the greatest storage capacity for these types of reservoirs, with approximately 84 percent of the total local agency storage capacity in Metropolitan's service area.

In addition to the storage that is owned and operated by local agencies, Metropolitan operates DVL, Lake Skinner, and Lake Mathews. DVL stores water imported during years of ample supply. Of DVL's 810 TAF capacity, up to half is dedicated to emergency storage; the remainder is available to augment supplies during dry years and for seasonal storage. In contrast, Lake Skinner and Lake Mathews are largely used for system operations rather than dry year storage. Table A.2-4 lists Metropolitan-owned reservoirs with significant storage capacity.

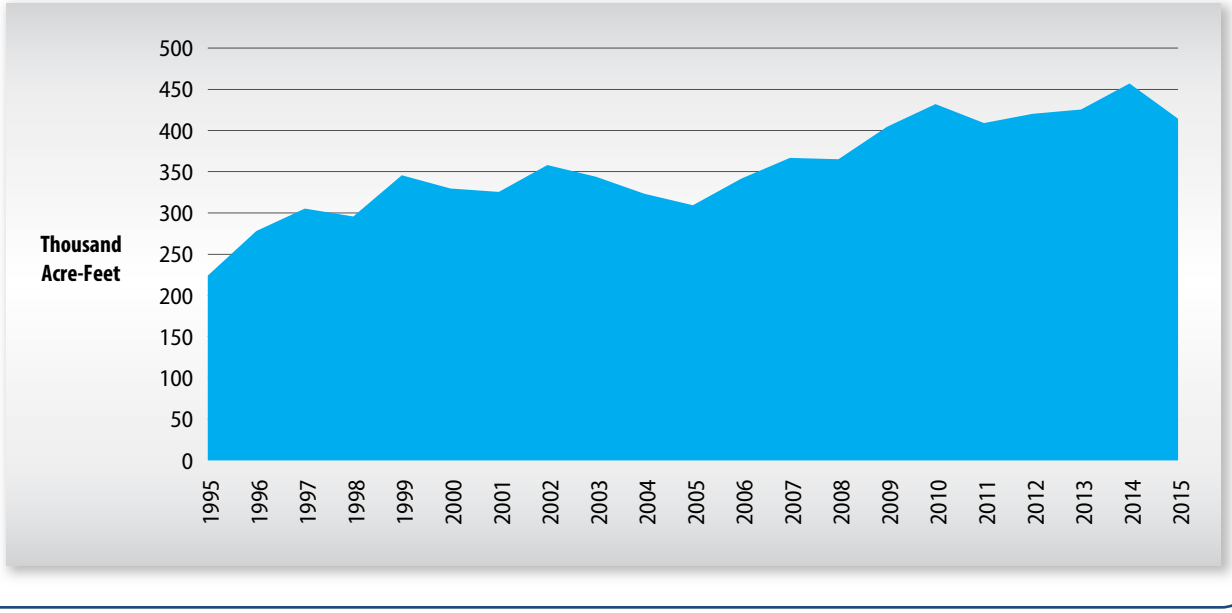
**Regional Storage Reservoirs in Metropolitan's Service Area**
(Thousands Acre-feet)

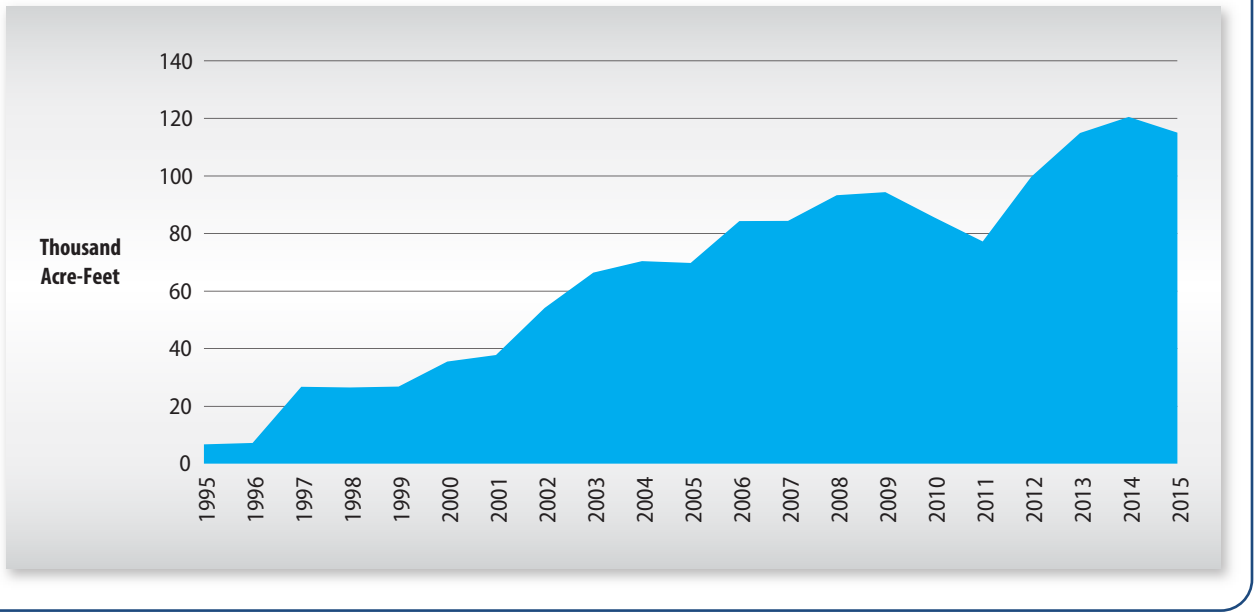
| Reservoir | Capacity |
|---|---|
| Diamond Valley Lake | 810 |
| Lake Skinner[1] | 44 |
| Lake Mathews[1] | 182 |



[1] These are used for operations and not primarily for dry year storage.

Lastly, Castaic and Perris are the terminal reservoirs to the West Branch and East Branch of the California Aqueduct operated by DWR. Through the Monterey Amendment to its SWP water service contract, Metropolitan has access to 219 TAF of flexible storage capacity in these SWP terminal reservoirs.

## Water Recycling and Groundwater Recovery



Water recycling projects involve treating wastewater to a level that is acceptable and safe for many non-potable applications. This resource is providing an increasing level of local water. In 1982, Metropolitan began helping to fund its member agencies' recycled water projects. Since that time, Metropolitan has invested approximately $372 million. In fiscal year 2014-15, water recycling projects in which Metropolitan has invested produced over 184 TAF. Local agency projects that did not receive financial assistance from Metropolitan produced an additional 170 TAF, and approximately 60 TAF of Santa Ana River base flow were used to recharge the Orange County basin. This brings the regional total to 414 TAF of recycled water use. Figure A.2-3 demonstrates the increase in this regional supply for direct use.

**Figure A.2-3 Recycled Water**

In addition, local agencies have implemented several projects to recover contaminated or degraded groundwater for potable uses. The groundwater recovery projects use a variety of treatment technologies to remove nitrates, volatile organic compounds, perchlorate, color, and salt. In 1991, Metropolitan began helping fund its member agencies' groundwater recovery projects. Since that time, Metropolitan has invested approximately $132 million. In FY 2014-15, these groundwater recovery projects produced 60 TAF. Other member agency projects that did not receive funding from Metropolitan produced another 55 TAF, for a regional total of 115 TAF. Figure A.2-4 shows this increase in supply.

**Figure A.2-4 Groundwater Recovery**

## Imported Water

Most member agencies and retail water suppliers depend on imported water for a portion of their water supply. For example, Los Angeles and San Diego (the largest and second largest cities in the state) have historically obtained up to 85 percent of their water from imported sources. These imported water requirements are similar to those of other metropolitan areas within the state, such as San Francisco and other cities around the San Francisco Bay.

Figure A.2-5 shows the conveyance facilities for the state's imported water supplies. Descriptions of each of the imported sources of water available to Metropolitan's service area follow. Justification for projected water supplies from these sources is provided in Appendix 3.

### *Colorado River*

A number of water agencies within California have rights to divert water from the Colorado River. Through the Seven Party Agreement (1931), seven agencies recommended apportionments of California's share of Colorado River water within the state. Table A.2-5 shows the historic apportionment of each agency, and the priority accorded that apportionment.

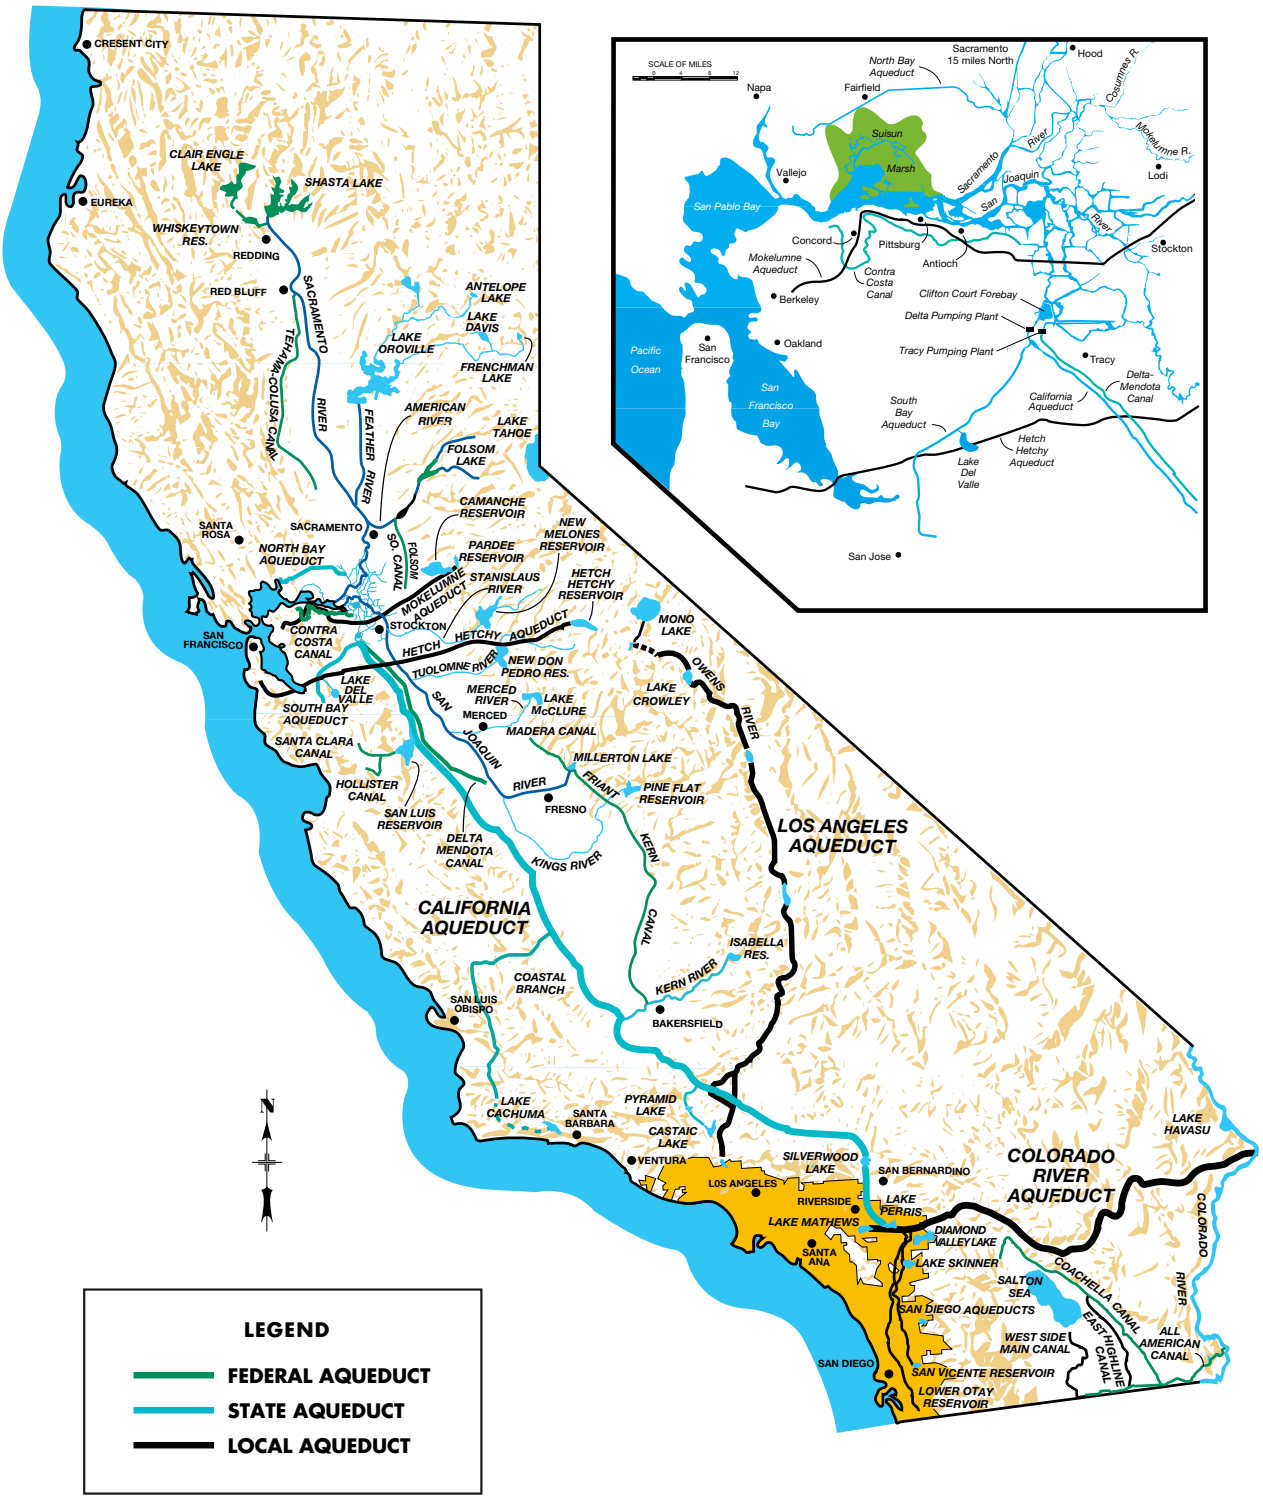


**Table A.2-5**
**Priorities in Seven-Party Agreement and Water Delivery Contracts**

| Priority | Description | TAF Annually |
|---|---|---|
| 1 | Palo Verde Irrigation District – gross area of 104,500 acres of land in the Palo Verde Valley | |
| 2 | Yuma Project (Reservation Division) – not exceeding a gross area of 25,000 acres in California | |
| 3(a) | Imperial Irrigation District and land in Imperial and Coachella Valleys[1] to be served by All American Canal | 3,850 |
| 3(b) | Palo Verde Irrigation District—16,000 acres of land on the Lower Palo Verde Mesa | |
| 4 | Metropolitan Water District of Southern California for use on the coastal plain of Southern California | 550 |
| Subtotal | | 4,400 |
| 5(a) | Metropolitan Water District of Southern California for use on the coastal plain of Southern California | 550 |
| 5(b) | Metropolitan Water District of Southern California for use on the coastal plain of Southern California[2] | 112 |
| 6(a) | Imperial Irrigation District and land in Imperial and Coachella Valleys[1] to be served by the All American Canal | |
| 6(b) | Palo Verde Irrigation District—16,000 acres of land on the Lower Palo Verde Mesa | 300 |
| 7 | Agricultural Use in the Colorado River Basin in California | |
| | **Total Prioritized Apportionment** | **5,362** |

[1] The Coachella Valley Water District now serves Coachella Valley.

[2] In 1946, the City of San Diego, the San Diego County Water Authority, Metropolitan, and the Secretary of the Interior entered into a contract that merged and added the City of San Diego's rights to store and deliver Colorado River water to the rights of Metropolitan. The conditions of that agreement have long since been satisfied.

**Figure A.2-5**
**MAJOR WATER CONVEYANCE FACILITIES IN CALIFORNIA**

The water is delivered to Metropolitan's service area by way of the Colorado River Aqueduct (CRA), which has a capacity of nearly 1,800 cfs. The CRA conveys water 242 miles from its Lake Havasu intake to its terminal reservoir, Lake Mathews, near the City of Riverside. Conveyance losses along the CRA of 10 TAF per year reduce the amount of Colorado River water received in the coastal plain.

Since the date of the original contract, several events have occurred that changed the dependable supply that Metropolitan expects from the CRA. The most significant event was the 1964 U.S. Supreme Court decree in *Arizona v. California* that reduced Metropolitan's dependable supply of Colorado River water to 550 TAF per year. The reduction in dependable supply occurred with the commencement of Colorado River water deliveries to the Central Arizona Project. In 1987, Metropolitan entered into a contract with the U.S. Bureau of Reclamation (USBR) for an additional 180 TAF per year of surplus water when surplus water is available. In addition, Metropolitan has obtained a minimum of approximately 85 TAF per year of Colorado River water since 1996 through a conservation program with the Imperial Irrigation District.

In 1979, the Present Perfected Rights (PPRs) of certain Indian reservations, cities, and individuals along the Colorado River were quantified. These PPRs predate the Seven-Party Agreement, but the rights holders were not included in the Seven Party Agreement prioritizing California's use and storage of Colorado River water.

In 1999, under the auspices of the Colorado River Board of California, a draft plan, "California's Colorado River Water Use Plan", was developed. The Colorado River Board of California protects California's rights and interests in the resources provided by the Colorado River and represents California in discussions and negotiations regarding the Colorado River and its management. The overall purpose of California's Colorado River Water Use Plan is to provide Colorado River water users with a framework by which programs, projects, and other activities may be coordinated and cooperatively implemented. This framework specified how California would make the transition from relying on surplus water supplies from the Colorado River to living within its normal (basic) water supply apportionment.

To implement these plans, a number of agreements have been executed. In October 2003, representatives from Metropolitan, IID, and Coachella Valley Water District (CVWD) executed the Quantification Settlement Agreement (QSA) and several other related agreements. Parties involved include the San Diego County Water Authority (SDCWA), the California Department of Water Resources (DWR), the California Department of Fish and Wildlife, the U.S. Department of the Interior, and the San Luis Rey Indian Water Rights Settlement Parties. The QSA quantifies the use of water under the third priority of the Seven Party Agreement and allows for implementation of agricultural conservation, land management, and other programs identified in Metropolitan's 1996 IRP. Quantification of the third priority provides the needed numeric baseline from which conservation and transfer programs may be measured. The QSA has helped California reduce its reliance on Colorado River water above its normal apportionment.

The quantification of the agricultural priorities under the QSA provided for the water saved under the Palo Verde Land Management and Crop Rotation Program to be made available to Metropolitan. This program provides up to 133 TAF of water to be available to Metropolitan in certain years and will supply a minimum of 33 TAF per year.

In October 2004, SNWA and Metropolitan entered into a storage and interstate release agreement. Under this program, SNWA can request that Metropolitan store unused Nevada apportionment. The amount of water which Metropolitan diverted through 2014 under this agreement was over 272 TAF. In subsequent years, SNWA may request return of approximately

205 TAF stored before 2015 and 125 TAF of the water stored in 2015. It is expected that SNWA will not request return of water stored prior to 2015 until after 2019. Water stored in 2015 allowed Metropolitan to augment its water supply from the Colorado River in 2015.

In December 2007, the Secretary of the Interior approved the adoption of specific interim guidelines for reductions in Colorado River water deliveries during declared shortages and coordinated operations of Lake Powell and Lake Mead. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage, normal, and surplus conditions in the Lower Basin; provide a mechanism for the storage and delivery of conserved system and non-system water in Lake Mead; and modify and extend interim surplus guidelines through 2026. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs, and allow the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions.

In May 2006, Metropolitan and the USBR executed an agreement for a demonstration program that allowed Metropolitan to leave conserved water in Lake Mead that Metropolitan would otherwise have used in 2006 and 2007. The water left in Lake Mead must have been made available through extraordinary conservation measures, which was accomplished in 2006 and 2007 through savings realized under the Palo Verde Land Management, Crop Rotation, and Water Supply Program. This demonstration program was an activity eligible for creation of Extraordinary Conservation Intentionally Created Surplus (ICS) under the provisions of the December 2007 federal guidelines for the operation of Lake Powell and Lake Mead. Metropolitan continued to store water in Lake Mead through extraordinary conservation measures as provided in the December 2007 federal guidelines in 2009, 2010, 2011, and 2012. Metropolitan took delivery of a portion of its extraordinary conservation ICS in 2013 and 2014. As of January 1, 2015, Metropolitan had approximately 61.8 TAF of extraordinary conservation ICS water in Lake Mead.

The December 2007 federal guidelines provided Colorado River contractors the ability to create System Efficiency ICS through development and funding of system efficiency projects. To that end, in 2008 the Central Arizona Water Conservation District, SNWA, and Metropolitan contributed funds for the construction of the Drop 2 (Brock) Reservoir by the USBR. The purpose of the Drop 2 reservoir is to increase the capacity to regulate deliveries of Colorado River water at Imperial Dam, reducing the amount of water released downstream by approximately 70 TAF annually. In return for funding one-sixth of the project cost, 100 TAF of water stored in Lake Mead was assigned to Metropolitan as System Efficiency ICS in 2008. Including the Drop 2 reservoir, Metropolitan created System Efficiency ICS storage of over 124 TAF from 2008-2011. Of this total, approximately 24 TAF of System Efficiency ICS was achieved through financially contributing to a one-year pilot operation of the Yuma Desalting Plant. As of January 1, 2015, Metropolitan had approximately 89 TAF of System Efficiency ICS water in Lake Mead.

Metropolitan is undertaking ongoing efforts to maintain and improve the flexibility and quality of its water supply from the Colorado River. Section 3.1 of this report describes current programs and plans related to flexibility, and Chapter 4 describes water quality programs.

### *State Water Project*

The State Water Project, which is owned by the state and operated by DWR, is the second source of Metropolitan's imported water supplies. The SWP comprises 32 storage facilities (reservoirs and lakes), 662 miles of aqueduct, and 25 power and pumping plants.

The SWP conveys water from Northern California to the north and south of the San Francisco Bay Area and areas south of the Bay Delta region. Water from the SWP originates at Lake Oroville, which is located on the Feather River in Northern California. That water, along with all additional unused water from the watershed, flows into the Sacramento/San Joaquin Delta. Water from the Delta is then either pumped to water users in the San Francisco Bay area or transported through the California Aqueduct to water users in Central and Southern California.

DWR contracted to deliver water in stages to 32 SWP contractors, with an ultimate delivery of 4,172 TAF per year. Currently, DWR is delivering water to 29 of these SWP contractors. Metropolitan is the largest, with a contractual amount of 1,911 TAF per year, or approximately 46 percent of the total contracted amount. Metropolitan receives deliveries of SWP supplies via the California Aqueduct at Castaic Lake in Los Angeles County, Devil Canyon Afterbay in San Bernardino County, and Box Springs Turnout and Lake Perris in Riverside County. The first delivery of SWP water to Metropolitan occurred in 1972.

The initial facilities of the SWP, completed in the early 1970s, were designed to meet the original needs of the SWP contractors. It was intended that additional SWP facilities would be built over time to meet projected increases in contractors' delivery needs. Each contractor's SWP contract provided for a buildup in contractual amount over time, with most contractors reaching their maximum annual contractual amount by the year 1990. Since the completion of the initial SWP facilities in the early 1970s, major improvements to the system have included: four new pumps added to the Banks Pumping Plant at the Delta, the completion of the Coastal Branch, and the East Branch enlargement. Even with these improvements, however, there are still significant capacity constraints within the SWP that limit the delivery capability of the full contracted amount. During the same time, the contractors' needs for water from the SWP have increased. As a result, the contractors' demands for SWP water currently exceed the dependable yield.[1] Metropolitan has developed groundwater storage programs with Semitropic Water Storage District, Arvin-Edison Water Storage District, and Kern Delta Water District to supplement the available water supply.

The amount of contractual supplies DWR approves for delivery varies annually with contractor demands and projected water supplies from tributary sources to the Delta, based on snowpack in the Sierra Nevada, reservoir storage, operational constraints, and demands of other water users. Deliveries to Metropolitan reached a high of 1,802 TAF in calendar year 2004. Metropolitan experienced shortages in SWP supplies in fiscal years 1991 and 1992, with reduced deliveries of 391 TAF and 710 TAF, respectively.[2] SWP deliveries were limited during the recent drought – a record low 5 percent of contractual amount in 2014 and 20 percent of contractual amount in 2015.

In recent years, the listing of several fish species in the Sacramento/San Joaquin River Delta (Delta) under both state and federal Endangered Species Acts has constrained SWP operations and created more uncertainty in SWP supply reliability. These listed species include Delta smelt, winter-run Chinook salmon, spring-run Chinook salmon, and splittail. In July 2015, DWR released the SWP Delivery Capability Report. The report shows that future SWP deliveries will be impacted by two significant factors. The first is significant restrictions on SWP and Central Valley Project (CVP) Delta pumping required by the biological opinions issued by the U.S. Fish and

[1] The dependable yield of the existing SWP facilities is considered to be the delivery capability during a critically dry seven-year period.

[2] These numbers are Metropolitan's allocated contractual amount. Total water deliveries to Metropolitan's service area are shown in Table A.2-1.

Wildlife Service (December 2008) and National Marine Fisheries Service (June 2009). The second is climate change, which is altering the hydrologic conditions in the State.

Metropolitan is undertaking ongoing efforts to maintain and improve the reliability and quality of its water supply from the State Water Project. Sections 3.2 and 3.3 in the 2015 UWMP describe current programs and plans for reliability, and Chapter 4 addresses water quality issues.

### *Los Angeles Aqueduct*

The City of Los Angeles imports water from the eastern Sierra Nevada through the Los Angeles Aqueduct (LAA). The original LAA, completed in 1913, imported water from the Owens Valley. In 1940, the aqueduct was extended to the Mono Basin. A second aqueduct, which parallels the original, was completed in 1970.

Prior to the 1990-1991 drought, the City of Los Angeles had imported an average of 440 TAF of water annually from the combined Owens Valley/Mono Basin system, of which about 90 TAF came from the Mono Basin. In 1986, the aqueduct delivered a record 520 TAF of water.

In the late 1980s, a series of court injunctions limited the amount of water that Los Angeles could receive from its aqueduct system. In 1990, these limitations, along with a persistent drought, limited the delivery from the aqueduct to only 106 TAF. The Mono Lake Water Rights Decision (Decision) in September of 1994 ended the litigation in the Mono Basin, while negotiations continued with Inyo County on the fate of the Owens Valley water supply. In the Decision, the state ruled that Mono Lake should rise 17 feet over the next 25 years. During this time, Los Angeles would only be permitted to divert a fraction of its historical amounts. After the lake had risen, the City of Los Angeles would still be allowed only significantly reduced diversions. However, the high precipitation during the 1990s allowed increased diversions of water to the LAA to occur at a much earlier time frame than had been foreseen at the time of the Decision.

More recently, the LAA diversions of water from the Owens Valley came under additional pressure. A long history of diversions of water from the Owens River had led to the drying up of Owens Lake by the end of the 1920s. This dry lakebed became a major source of windblown dust, resulting in EPA pressure to develop a State Implementation Plan to bring the region into compliance with federal air quality standards. In 1998, the Los Angeles Department of Water and Power entered into a Memorandum of Agreement with the Great Basin Air Pollution Control District that specified actions needed to control the problem. These actions included shallow flooding and managed vegetation at various lakebed locations. An estimated 54 TAF per year will be required to maintain the dust control measures, further restricting the water available for diversion through the LAA. More recently, the city has been required to restore portions of the Owens River, which could further restrict the water that can be provided from this source. During the last 5 years (2011 to 2015), LAA supplies ranged from 370 TAF in the wet 2011 year to a low of 27 TAF in 2015.

## Historic Total Regional Water Supplies

The previous sections have presented the various sources of Metropolitan and the region's water supply. The amount of water supplied by each local and imported source from 1976 through 2015 appears in Table A.2-1. The imported supplies represent the amount of water imported into Metropolitan's service area, not the amount delivered to member agencies, which is shown in Table A.2-2. The difference between Metropolitan's imports and deliveries is water placed into or withdrawn from storage.

# Appendix 3

# JUSTIFICATIONS FOR SUPPLY PROJECTIONS

# Appendix 3
# JUSTIFICATIONS FOR SUPPLY PROJECTIONS

Water Code §10631 requires that urban agencies identify and quantify existing and planned sources of water and include a detailed description of all water supply projects and water supply programs that may be undertaken to meet the total projected water use. In addition, legislation authored by Senator Sheila Kuehl (Senate Bill 221 – now Water Code §10613, *et seq.*) and Senator Jim Costa (Senate Bill 610 – now Water Code §66473.7) requires water retailers to demonstrate that their water supplies are sufficient for certain proposed subdivisions and large development projects subject to the California Environmental Quality Act (CEQA). Although Metropolitan and other wholesalers do not have verification responsibilities under this legislation, information provided by Metropolitan may be useful to retailers in complying with these responsibilities. This Appendix provides the basis for the water availability contained in this report, by major source of supply. Such bases and proofs are required for supply verification under the legislation. Links to the copy of the guidebook for implementation of the legislation can be found at http://www.water.ca.gov/pubs/use/sb_610_sb_221_guidebook/guidebook.pdf.

Throughout this Appendix, references are made to Metropolitan's operating budget and its long-term capital investment plan. The most recent operating budget (for fiscal years 2014-15 and 2015-16) was adopted at the April 8, 2014 Board Meeting. A copy of the budget summary and the Capital Investment Plan for fiscal years 2014-15 and 2015-16 can be found at http://www.mwdh2o.com/PDF_Who_We_Are/1.4.7_Biennial_budget.pdf.

Another document of interest related to Metropolitan's water supply planning is its annual report to the state Legislature in compliance with Senate Bill 60 of 1999 (Hayden).[3] Senate Bill 60 requires that Metropolitan report on its progress in increasing its emphasis on cost-effective conservation, recycling, and groundwater recharge.

## A.3.1 Colorado River Aqueduct Deliveries

### *A. Colorado River Supplies*

Metropolitan obtains water from the Colorado River under a number of categories specified in its supplemental water storage and delivery contract with the Secretary of the Interior: its basic apportionment that is classified as Priority 4 water, unused and surplus water that is classified as Priority 5 and Priority 6(a) water, and water resulting from a number of conservation programs that is classified as Priority 3(a) water. Pursuant to a U.S. Supreme Court decree, and regulations and operating guidelines of the USBR, Metropolitan may receive as unused apportionment, water supplies unused by agricultural districts, supplies unused by the states of Arizona and Nevada, and as Intentionally Created Surplus, supplies stored from previous years'

[3] Metropolitan Water District of Southern California, *Annual Progress Report to the California State Legislature: Achievements in Conservation, Recycling and Groundwater Recharge* (February 2016), which can be found at http://www.mwdh2o.com/PDF_About_Your_Water/2.1.1_Regional_Progress_ReportSB60.pdf. The legislation requiring this information can be found at http://www.leginfo.ca.gov/pub/99-00/bill/sen/sb_0051-0100/sb_60_bill_19990916_chaptered.pdf. Similar reports have been filed with the Legislature since 2000.

extraordinary conservation and efficiency improvements to the operations of the Colorado River system. Subject to the terms of agreements, this stored water may be withdrawn as needed during years in which insufficient supplies are available. Appendix 2 describes the history of water supplies and the expected availability from this source, and Section 3.1 of the 2015 UWMP describes the agreements for water supplies.

### *Rationale for Expected Supply*

Historical Record

Water supply under Metropolitan's Priority 4 apportionment of Colorado River water has been delivered since 1939. By existing contract, it is expected to be available in perpetuity because of California's senior water rights to use of Colorado River water.

The historical record for available Colorado River water indicates that Metropolitan's fourth priority supply has been available in every year and can reasonably be expected to be available over the next 20 years.

Written Contracts or Other Proof

Metropolitan's entitlement to Colorado River water is based on a series of interstate compacts, federal laws, agreements, court decrees, and guidelines collectively known as "The Law of the River,"[4] which govern the distribution and management of Colorado River water. The following documents specifically determine Metropolitan's dependable supplies:

1931 Seven Party Agreement.[5] The 1931 Agreement recommended California's Colorado River use priorities and has no termination date. California's basic annual apportionment is 4.4 MAF. Palo Verde Irrigation District (PVID), Yuma Project (Reservation Division), Imperial Irrigation District (IID), Coachella Valley Water District (CVWD), and Metropolitan are the entities that hold the priorities. As shown in Table A.2-5, these priorities are included in the contracts that the Department of the Interior executed with the California agencies in the 1930s for water from Lake Mead. Metropolitan holds Priority 4 to California's basic apportionment of Colorado River water and utilizes this water – 550 TAF per year – every year. In addition, Metropolitan has access to additional Colorado River water – up to 662 and 38 TAF per year, respectively – through its Priority 5 and Priority 6(a) in the California apportionment. Appendix 2 describes the current status of water available under these priorities.

Metropolitan's Basic Contracts.[6] Metropolitan's 1930, 1931, and 1946 basic contracts with the Secretary of the Interior permit the delivery of 1.212 MAF per year when sufficient water is available. Metropolitan's 1987 surplus flow contract with USBR permits the delivery of water to fill the remainder of the Colorado River Aqueduct when water is available.

Consolidated Court Decree.[7] The 1964 U.S. Supreme Court Decree confirmed the Arizona, California, and Nevada basic apportionments of 2.8 MAF per year, 4.4 MAF per year, and 300 TAF per year, respectively. The 1964 Decree also permits the Secretary of the Interior to make water available that is unused by one of the states for use in the other two states. In addition, it permits the Secretary of the Interior to make surplus water available. A number of

[4] A description of many of these documents can be found at http://www.usbr.gov/lc/region/pao/lawofrvr.html.

[5] This agreement among the seven California agencies was dated August 18, 1931, and was codified in federal regulations promulgated by the Secretary of the Interior on September 28, 1931.

[6] Including contract number Ilr-645 dated April 9, 1930, supplemented September 28, 1931.

[7] The Consolidated Decree entered by the U.S. Supreme Court on March 27, 2006, in *Arizona v. California, et al.*, can be found at http://www.usbr.gov/lc/region/pao/pdfiles/scconsolidateddecree2006.pdf.

decrees were subsequently entered by the U.S. Supreme Court in the case *Arizona v. California, et al.*, culminating in the Consolidated Decree entered on March 27, 2006.

2003 Quantification Settlement Agreement (QSA) and several other related agreements were executed in October 2003.[8] The QSA quantifies the use of water under the third priority of the Seven Party Agreement, and further allocates 38 TAF of the sixth priority to Metropolitan. The QSA provides the numeric baseline needed to measure conservation and transfer programs, and it allows for implementation of agricultural conservation, land fallowing, and other programs identified in the 1996 IRP. Although this agreement does not directly impact Metropolitan's entitlements, Metropolitan agreed to forbear consumptive use when necessary so that the Secretary of the Interior can satisfy the uses of holders of miscellaneous and Indian present perfected rights in excess of 14.5 TAF.

2005 Settlement Agreement with Quechan Indian Tribe. In 2005, Metropolitan entered into a settlement agreement with the Quechan Indian Tribe and other parties. The Tribe uses Colorado River water on the Fort Yuma Indian Reservation. Under the settlement agreement, the Tribe, in addition to the amounts of water decreed for the benefit of the Reservation in 1964, is entitled to: (a) an additional 20 TAF of diversions from the Colorado River or (b) the amount necessary to supply the consumptive use required for irrigation of a specified number of acres, and for the satisfaction of related uses, whichever is less. Of the additional water, 13 TAF became available to the Quechan Indian in 2006. An additional 7 TAF becomes available to the Tribe in 2035. Metropolitan and the Tribe agreed that if the Tribe chooses to limit proposed development and utilization of their irrigable lands, which would require the diversion of any of the additional water in a year, and instead allows the water which would otherwise be used to be diverted by Metropolitan, Metropolitan provides an incentive payment to the Tribe to avoid or reduce a loss of supply.

Colorado River Interim Guidelines for Lower Basin Shortage and the Coordinated Operations for Lake Powell and Lake Mead. In December 2007, the Secretary of the Interior approved a Record of Decision establishing specific interim guidelines for reductions in Colorado River water deliveries in the Lower Basin during declared shortages and coordinated operations of Lake Powell and Lake Mead. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage, normal, and surplus conditions in the Lower Basin, and provide a mechanism for Metropolitan to store and take delivery of conserved system and non-system water in Lake Mead.

#### *Financing*

Metropolitan's operating budget (referenced at the beginning of this appendix) includes the cost of delivering Colorado River water and the payment to the Quechan Indian Tribe, which is paid from water sales revenue.

#### *Federal, State, and Local Permits/Approvals*

Metropolitan's fourth priority Colorado River water is currently available, and this priority assures delivery of the basic apportionment.

### *B. IID - Metropolitan Conservation Program*

#### *Source of Supply*

The IID-Metropolitan Conservation Program provides an annual supply that is delivered to Metropolitan's service area via its Colorado River Aqueduct (CRA). In 1988, Metropolitan

[8] These agreements can be found at http://www.iid.com/water/library/qsa-water-transfer.

executed a Conservation Agreement to fund water efficiency improvements within IID's service area in return for the right to divert the water conserved by those improvements. The program consists of structural and non-structural measures, including the concrete lining of existing canals, the construction of local reservoirs and spill-interceptor canals, installation of non-leak gates, and automation of the distribution system. Other implemented projects include the delivery of water to farmers on a 12-hour basis rather than a 24-hour basis and improvements in on-farm water management through drip irrigation systems.

### *Expected Supply Capability*

The IID-Metropolitan Conservation Program activity began in 1990, has been fully operational since 1998, and makes available 105 TAF of conserved water annually from 2016 onward. The initial program agreement provided CVWD the option to call up to about 45 TAF per year if needed to meet its demands. Execution of the QSA has reduced CVWD's option to a maximum of 20 TAF. This water is available to Metropolitan if not required by CVWD, but the minimum supply to MWD has been increased to 85 TAF from 2016 onward through a second amendment to the agreement, and the clarification on the number of 12-hour deliveries that would be included in the program through a letter agreement.

### *Rationale for Expected Supply*

Historical Record

The IID-Metropolitan Conservation Program has been fully operational since 1998. Existing agreements have extended the initial term to at least 2041 or 270 days after the termination of the QSA, whichever is later, and they guarantee Metropolitan a minimum of 85 TAF per year from 2016 onward.

With operations beginning in 1990, the program has conserved as much as 109.46 TAF per year to date. By an amendment to the program agreement beginning in 2007, and a 2014 letter agreement, the annual conserved water yield will be 105 TAF. The historical record indicates that Metropolitan's expected minimum supply of 85 TAF per year would be available over the next 26 years at least.

Written Contracts or Other Proof

Metropolitan's annual supply from the IID-Metropolitan Conservation Program is based on three agreements and amendments to the agreements.

1988 IID-Metropolitan Conservation and Use of Conserved Water Agreement. This Agreement was executed in December 1988 by IID and Metropolitan for a 35-year term following completion of program implementation (1998–2033).

1989 Approval Agreement. This Agreement secured the approval of PVID and CVWD to not divert an amount of water equal to the amount conserved except under limited circumstances. The Agreement was executed in December 1989.

1989 Supplemental Approval Agreement. This Agreement was executed in December 1989 between Metropolitan and CVWD to coordinate Colorado River diversions and the use of the conserved water provided by the Program.

2003 Amendments to 1988 Agreement and 1989 Approval Agreement. These amendments revise Metropolitan's potential obligation to reduce its use of the conserved water yield in favor of its use by CVWD down to 20 TAF annually. Any of this water not used by CVWD would be available to Metropolitan.

2007 Amendments to 1988 Agreement and 1989 Approval Agreement. These amendments specify that beginning in 2007, the annual conserved water yield has and will be 105 TAF with continued operation of 24 tailwater pumpback systems, of which up to 20 TAF would be made available to CVWD upon its request.

2014 Letter Agreement Related to the 1988 Agreement. This letter agreement specifies that beginning in 2016, the annual conserved water yield has and will be 105 TAF, of which up to 20 TAF would be made available to CVWD upon its request. This amendment also removes tailwater recovery systems from the conservation actions and quantifies the yield and number of 12-hour deliveries that are included in the program.

#### *Financing*

The water efficiency improvements under this Program have already been funded, constructed, and put into operation. Metropolitan's five-year financial forecast in the budget includes the cost of operating, maintaining, and delivering the conserved water under the IID-Metropolitan Conservation Program.

#### *Federal, State, and Local Permits/Approvals*

A comprehensive environmental review process supported implementation.

EIR for Program. The IID Board certified the final EIR for the Program in December 1986.[9]

EIR for Supplemental Program. The IID Board certified the final EIR for the Completion Program in June 1994.[10]

Program EIR for Quantification Settlement Agreement. Metropolitan's Board certified the final Program EIR for the QSA in June 2002.[11]

Addendums to the QSA Final Program EIR. Metropolitan's Board adopted the Addendum to the QSA Final Program EIR in December 2002 and a second addendum in September 2003. Metropolitan's Board also adopted the Findings of Fact and Statement of Overriding Considerations, and Mitigation and Monitoring and Reporting Program at that time.

### *C. Palo Verde Irrigation District Land Management, Crop Rotation and Water Supply Program*

#### *Source of Supply*

At its May 11, 2004 meeting, Metropolitan's Board authorized a 35-year land management, crop rotation, and water supply program with the PVID. Under the program, participating landowners in PVID are being paid to reduce their water use by not irrigating a portion of their land. A maximum of 29 percent of lands within PVID can be fallowed in any given year. Under the terms of the QSA, water savings within the PVID service area are made available to Metropolitan. PVID has the first priority for Colorado River water under the water delivery contracts with the USBR. Implementation of the program began in January 2005. The agreement also specifies that the participating landowners will fallow land in an amount equal to 25% of the landowner's total maximum fallowing commitment during each year.

---

[9] Imperial Irrigation District, *Final EIR, Proposed Water Conservation Program and Initial Water Transfer, Imperial Irrigation District*, October, 1986. SCH Number: 1986012903.

[10] Imperial Irrigation District, *Final EIR for Modified East Lowline and Trifolium Interceptors, and Completion Projects*, May 1994. SCH Number: 1992071061.

[11] Coachella Valley Water District, Imperial Irrigation District, Metropolitan, San Diego County Water Authority, *Final Program EIR, Implementation of the Colorado River Quantification Settlement Agreement*, June 2002, SCH Number 2000061034.

### *Expected Supply Capability*

It is estimated that the PVID/Metropolitan Program would provide up to 133 TAF per year of additional Colorado River water. This water would be available in any year as needed and in accordance with the provisions described in the agreements with Palo Verde Valley landowners and PVID.

### *Rationale for Expected Supply*

Historical Record

Metropolitan and PVID tested the concept of developing a water supply for Metropolitan by entering into an agreement in 1992.[12] Agreements were signed with landowners and lessees in the Palo Verde Valley to forego irrigation for a two-year period from August 1992 to July 1994. Water unused by PVID, in the amount of 186 TAF, was stored in Lake Mead for Metropolitan. Both PVID and Metropolitan signed approved Principles of Agreement in 2001. PVID issued the Final EIR for the Proposed Palo Verde Irrigation District Land Management, Crop Rotation and Water Supply Program in September 2002.[13]

Implementation of the program began in January 2005. In March 2009, Metropolitan and PVID entered into a one-year supplemental fallowing program within PVID that provided for the fallowing of additional acreage, with savings of 24.1 TAF in 2009 and 32.3 TAF in 2010.

| **Calendar Year** | **Volume of Water Saved** (TAF) |
|---|---|
| 2005 | 108.7 |
| 2006 | 105.0 |
| 2007 | 72.3 |
| 2008 | 94.3 |
| 2009 | 120.2 |
| 2010 | 116.3 |
| 2011 | 122.2 |
| 2012 | 73.7 |
| 2013 | 32.8 |
| 2014 | 43.0 |
| 2015 | 85.0 (estimated) |

Written Contracts or Other Proof

Contracts for this program are listed below.

August 2004 Forbearance and Fallowing Program Agreement. This agreement establishes the PVID/Metropolitan Program, which provides for a solicitation of and provisional approval of landowner participation offers, specifies the process for incorporating offers into agreements with landowners, and states the terms and conditions for fallowing, including payments made by Metropolitan.

[12] Presented to Metropolitan's Board at its regular meeting on January 14, 1992.
[13] SCH Number 2001101149.

Landowner Agreements for Fallowing in PVID. These agreements specify an escrow process to consummate the transaction, an easement deed to encumber land for fallowing, a tenant agreement to subordinate a tenant's lease to the agreement and easement, and an encumbrance agreement to subordinate any encumbrance (e.g., a mortgage) to the easement. These agreements also state the landowner's fallowing obligation, payments to be made by Metropolitan, and land management measures to be implemented.

#### *Financing*

Metropolitan's annual O&M budget (referenced above) includes the cost of the PVID/Metropolitan Program.

#### *Federal, State and Local Permits*

EIR for Program. A Notice of Preparation for the PVID/Metropolitan Program was published on October 29, 2001. PVID issued the Final EIR for the Proposed Palo Verde Irrigation District Land Management, Crop Rotation, and Water Supply Program in September 2002 (see reference above).

### *D. Management of Metropolitan-Owned Land in Palo Verde*

#### *Source of Supply*

In 2016, Metropolitan will negotiate new leases on its 20,995 irrigable acres in the Palo Verde valley. Starting in 2017, additional water savings beyond what is achieved by the Land Management, Crop Rotation, and Water Supply Program will be generated on Metropolitan-owned farmland in PVID through a shift to less water-intensive crops, the adoption of more efficient irrigation technologies, and/or precision irrigation practices. Any conserved water created in PVID will flow to Metropolitan's fourth priority Colorado River allocation.

#### *Expected Supply Capability*

Metropolitan's lands in PVID already generate 24 – 94 TAF of water savings through the existing PVID Land Management, Crop Rotation and Water Supply Program, depending on the call. Changes in land management through cropping and irrigation practices are expected to generate an additional 15 and 29 TAF annually from 2017 onward. Savings will be small at first but are expected to increase over the first several years as new crops are planted and irrigation systems are upgraded. Because all Metropolitan-owned lands are enrolled in the PVID Land Management, Crop Rotation and Water Supply Program, the savings from agricultural practices will depend on the fallowing call for each year, with a high call resulting in lower savings due to lower baseline usage.

#### *Rationale for Expected Supply*

The exact water savings will depend on the details of the land management proposals developed by Metropolitan's lessees. However, Metropolitan's goal is to reduce the current consumptive water use on the lands by at least 1.5 AF per acre per year. This reduction is consistent with a switch from flood-irrigated alfalfa to deficit-irrigated alfalfa or to drip-irrigated vegetables, two possible cropping strategies that have been proposed.

Metropolitan owns 20,995 irrigable acres in the valley, but depending on the fallowing call, which varies from 7 to 35% of eligible acreage, only 13,647–19,525 acres are in production in any given year. If a 1.5 AF per acre reduction were realized on all of the irrigated acres in production in a given year, the resulting savings would be 20–29 TAF per year, depending on the call. Savings in the first few years are likely to be as low as 15 TAF while crops and irrigation systems are transitioned.

### *Financing*

Metropolitan's annual O&M budget includes the cost of the PVID land management program.

### *Federal, State and Local Permits*

This program is not subject to any permits or environmental impact reviews under federal, state, or local laws.

## *E. All-American and Coachella Canal Lining Projects*

### *Source of Supply*

Water is being conserved by the replacement of earthen portions of the Coachella Canal and the All-American Canal with concrete-lined canals. The concrete lining reduces the amount of water lost to seepage from the canals.

### *Expected Supply Capability*

Pursuant to the October 10, 2003 Allocation Agreement, Metropolitan is entitled to delivery of 16 TAF annually until the San Luis Rey Settlement Parties[14] satisfy the conditions described in Section 104 of the San Luis Rey Indian Water Rights Settlement Act (Public Law 100-675 Title 1 as amended). Once the statutory conditions have been met, Metropolitan will provide by exchange water to the United States for use by the Settlement Parties, and San Diego County Water Authority will convey the water for use by the Settlement Parties.

### *Rationale for Expected Supply*

The All-American and Coachella canal lining projects were implemented pursuant to the authorization contained in Title II of Public Law 100-675. The allocation of the water resulting from these projects is provided under the Allocation Agreement. The Allocation Agreement is a QSA-related agreement. The USBR, on behalf of the Secretary of the Interior, has issued interim determinations for the Coachella Canal Lining Project (January 31, 2008) and the All-American Canal Lining Project (December 4, 2009) that result in the annual delivery to Metropolitan of 4.5 TAF and 11.5 TAF, respectively. Delivery of this water for Metropolitan's use continues until conditions described in Section 104 of Public Law 100-675 and the Allocation Agreement are satisfied.

Program Facilities

The Coachella Canal is owned by the United States and is operated by CVWD. The All-American Canal is owned by the United States and is operated by IID. The water is conveyed through existing CRA facilities from Lake Havasu to Metropolitan.

Historical Record

The Coachella Canal Lining Project began conserving water in 2006 and reached its full conservation yield in calendar year 2009. The All-American Canal Lining Project began conserving water in 2008 and reached its full conservation yield in calendar year 2010. Actual annual deliveries to Metropolitan are as follows:

[14] The San Luis Rey Settlement Parties are the La Jolla, Pala, Pauma, Rincon and San Pasqual Bands of Mission Indians, the San Luis Rey Indian Water Authority, and the City of Escondido and Vista Irrigation District.

| Calendar Year | Volume Delivered to Metropolitan (AF) |
|---|---|
| 2006 | 172 |
| 2007 | 4,500 |
| 2008 | 6,013 |
| 2009 | 15,648 |
| 2010 | 16,000 |
| 2011 | 16,000 |
| 2012 | 16,000 |
| 2013 | 16,000 |
| 2014 | 16,000 |
| 2015 | 16,000 (estimated) |

Written Contracts or Other Proof

2003 Allocation Agreement. This agreement among the United States, Metropolitan, CVWD, IID, San Diego County Water Authority, and the San Luis Rey Settlement Parties provides for the determination by the Secretary of the Interior of the conserved water yield from the All-American Canal Lining Project and the Coachella Canal Lining Project, the allocation of water as a result of the Projects among IID, SDCWA, Metropolitan, and the Settlement Parties, and the delivery of the allocated amounts to the respective users by the Secretary of the Interior.

### *Financing*

Under the Allocation Agreement, water resulting from the All-American and Coachella Canal lining projects is made available to Metropolitan until the conditions specified in Sections 7.2.1, 7.2.2, and 7.2.4 of the Allocation Agreement have been satisfied. Metropolitan sets aside funding for the portion of the conserved water it receives in trust for the San Luis Rey Indian Water Authority as part of its annual O&M budget.[15]

### *Federal, State, and Local Permits/Approvals*

A comprehensive environmental review process supported implementation.

Program EIR for Quantification Settlement Agreement. Metropolitan's Board certified the final Program EIR for the QSA in June 2002.[16]

Addendums to the QSA Final Program EIR. Metropolitan's Board adopted the Addendum to the QSA Final Program EIR in December 2002 and a second addendum in September 2003. Metropolitan's Board also adopted the Findings of Fact and Statement of Overriding Considerations, and Mitigation and Monitoring and Reporting Program at that time.

EIR/EIS for the All-American Canal Lining Project. USBR approved the Record of Decision for the All American Canal Lining Project on July 29, 1994. IID certified the All-American Canal Lining Project Final EIS/EIR and approved the project on August 16, 1994. USBR released a Supplemental Information Report on the All American Canal Lining Project, dated January 12, 2006.

---

[15] Payments from Metropolitan for Supplemental Water and Related Power Delivered Prior to Satisfaction of Section 104.

[16] Coachella Valley Water District, Imperial Irrigation District, Metropolitan, San Diego County Water Authority, Final Program EIR, Implementation of the Colorado River Quantification Settlement Agreement, June 2002, SCH Number 2000061034.

EIR/EIS for the Coachella Canal Lining Project. USBR approved the Record of Decision for the Coachella Canal Lining Project on March 27, 2002. CVWD certified the Coachella Canal Lining Project Final EIS/EIR and approved the project on May 15, 2001.

Metropolitan certified that it had reviewed and considered the information contained in those two documents and adopted the Lead Agencies' findings on December 13, 1994, for the All-American Canal Lining Project and on September 11, 2001, for the Coachella Canal Lining Project.

Addendum to EIS/EIR for the Coachella Canal Lining Project. An addendum to the Coachella Canal Lining Project Final EIS/EIR was published on February 27, 2004. CVWD certified the Addendum and approved the project on March 2, 2004.

### *F. Metropolitan-CVWD Delivery and Exchange Agreement for 35,000 Acre-Feet*

#### *Source of Supply*

Metropolitan delivers to CVWD up to 35 TAF from Metropolitan's available State Water Project (SWP) Table A supply without condition on the actual Department of Water Resources (DWR) allocation for that year. As CVWD does not have a connection to the SWP, the water is delivered to CVWD by an exchange with Colorado River water. Metropolitan takes delivery of the Table A supply in conjunction with forgoing diversion of an equal volume of its Colorado River supply, effectively leaving this water in the River for diversion by CVWD at Imperial Dam. Exchange deliveries may also be made at the CRA Whitewater service connection or through the Metropolitan-CVWD-Desert Water Agency Advance Delivery Agreement. This program represents a net debit to Metropolitan's supplies.

#### *Expected Capability*

Up to 35 TAF of Metropolitan's SWP Table A supply will be delivered annually to CVWD by exchange.

#### *Rationale for the Expected Supply*

This program is undertaken pursuant to the Delivery and Exchange Agreement between Metropolitan and Coachella for 35,000 AF dated October 10, 2003, and is a QSA-related agreement.

Program Facilities

Metropolitan takes delivery of the Table A supply from the East Branch of the California Aqueduct at Devil Canyon Afterbay. At Metropolitan's request, the USBR releases a portion of Metropolitan's available Colorado River supply from Lake Mead for diversion by CVWD at Imperial Dam and conveyance through the All-American Canal System.

Historical Record

Since the 2003 execution of the QSA and the Delivery and Exchange Agreement, the following volumes of exchange water were delivered to CVWD at Imperial Dam:

| Calendar Year | Volume of Exchange Water (AF) |
|---|---|
| 2003 | 0 |
| 2004 | 0 |
| 2005 | 0 |
| 2006 | 34,958 |
| 2007 | 0 |
| 2008 | 0 |
| 2009 | 0 |
| 2010 | 10,000 |
| 2011 | 0 |
| 2012 | 0 |
| 2013 | 0 |
| 2014 | 0 |
| 2015 | 313 |

Written Contracts or Other Proof

2003 Delivery and Exchange Agreement. This agreement between Metropolitan and CVWD provides for the delivery of up to 35,000 AF of Metropolitan SWP Table A supply by exchange with Colorado River water.

### *Federal, State, and Local Permits/Approvals*

Program EIR for Quantification Settlement Agreement. Metropolitan's Board certified the final Program EIR for the QSA in June 2002.[17]

Addendums to the QSA Final Program EIR. Metropolitan's Board adopted the Addendum to the QSA Final Program EIR in December 2002 and a second addendum in September 2003. Metropolitan's Board also adopted the Findings of Fact and Statement of Overriding Considerations, and Mitigation and Monitoring and Reporting Program at that time.

September 2002 Final Program EIR for Coachella Valley Water Management Plan and State Water Project Entitlement Transfer. The final Program EIR for the Coachella Valley Water Management Plan and SWP Entitlement Transfer was certified by the CVWD on October 8, 2002.

[17] Coachella Valley Water District, Imperial Irrigation District, Metropolitan, San Diego County Water Authority, Final Program EIR, Implementation of the Colorado River Quantification Settlement Agreement, June 2002, SCH Number 2000061034.

## G. SNWA and Metropolitan Storage and Interstate Release Agreement

### Source of Supply

The source of supply is SNWA's unused Nevada apportionment of Colorado River water made available to Metropolitan for diversion and storage. In later years, Metropolitan would return water through reduced diversions of Colorado River water made at the request of SNWA.

### Expected Capability

As of January 1, 2015, over 272 TAF had been diverted by Metropolitan since 2004. In 2015, Metropolitan diverted 150 TAF to SNWA.

Returns to SNWA are limited to no more than 30 TAF annually unless Metropolitan agrees to a larger amount. SNWA has agreed to forgo requesting return through 2019 of water stored prior to 2015 unless Metropolitan agrees to the return. In 2020 and 2021, SNWA may request return of an amount equal to the shortage allocated by the Secretary of the Interior to Nevada. If the Secretary of the Interior apportions less than 280 TAF of basic apportionment for use in Nevada, SNWA may request the return of up to 50 TAF, 1 acre-foot for each acre-foot less than the 280 TAF of basic apportionment apportioned for use in Nevada.

Of the amount proposed to be stored in 2015, 125 TAF would be available for return to SNWA.

If less than 75 TAF has been returned, then during each year prior to 2027 for which Lake Mead begins the year at or below elevation 1,045 feet, Metropolitan will create 50 TAF of Intentionally Created Surplus (ICS) in Lake Mead, until the combined sum of ICS and the amount of water stored for SNWA returned equals 75 TAF. Prior to 2027, Metropolitan would be able to request delivery of this ICS during a year in which Lake Mead begins the year at or above elevation 1,080 feet.

### Rationale for the Expected Supply

Program Facilities

Water is diverted through the CRA by Metropolitan. To return the water to SNWA, Metropolitan would reduce its CRA diversions, and the Secretary of the Interior would make water available to SNWA at Lake Mead.

Historical Record

The annual volumes of water diverted into the CRA, and the volume of water stored for SNWA by Metropolitan are as follows:

| Calendar Year | Volume of Water Diverted (AF) | Volume of Water Stored for SNWA (AF) |
|---|---|---|
| 2004 | 10,000 | 10,000 |
| 2005 | 10,000 | 10,000 |
| 2006 | 5,000 | 5,000 |
| 2007 | 0 | 0 |
| 2008 | 45,000 | 45,000 |
| 2009 | 0 | 0 |
| 2010 | 0 | 0 |
| 2011 | 0 | 0 |
| 2012 | 62,839 | 41,892 |
| 2013 | 75,000 | 50,000 |
| 2014 | 65,000 | 43,333 |
| 2015 | 150,000 | 125,000 |

No water has been returned to SNWA.

Written Contracts or Other Proof

2004 Storage and Interstate Release Agreement. This agreement among Metropolitan, the Colorado River Commission of Nevada, SNWA, and the United States provides for the Secretary of the Interior to make available to Metropolitan for diversion and storage unused Nevada apportionment. In subsequent years, the agreement provides for Metropolitan to make water available to SNWA by forgoing diversion of a portion of its available Colorado River supply.

Operational Agreement. As amended on August 11, 2009, on October 24, 2012, and on October 19, 2015, the Operational Agreement specifies the conditions under which Metropolitan would divert and store unused Nevada apportionment through 2026 and the return of water to SNWA.

## *H. Lower Colorado Water Supply Project*

### *Source of Supply*

Groundwater is pumped by the Lower Colorado Water Supply Project near the All-American Canal and is discharged to the Canal. IID reduces its net diversions of Colorado River water by an amount equal to the amount of Project water discharged into the Canal, permitting entities along the Colorado River that do not have rights or have insufficient rights to divert Colorado River water to obtain a supply of water. In 2007, Metropolitan entered into a contract with the USBR and the City of Needles to utilize the unused Project capacity.

### *Expected Capability*

Metropolitan estimates that it received 5.9 TAF of Lower Colorado Water Supply Project water in 2015.

### *Rationale for the Expected Supply*

Program Facilities

Two Lower Colorado Water Supply Project wells pump water into the All-American Canal. The groundwater level in one of the wells has declined to the point that it cannot operate at capacity with existing equipment. Replacement equipment to restore pumping capacity has been installed. Two new Project wells are expected to become operational in 2016 to augment pumping capacity.

Historical Record

Metropolitan has received the following amounts of Lower Colorado Water Supply Project water:

| **Calendar Year** | **Volume of Water** (AF) |
|---|---|
| 2007 | 5,011 |
| 2008 | 6,300 |
| 2009 | 2,349 |
| 2010 | 3,872 |
| 2011 | 3,611 |
| 2012 | 3,253 |
| 2013 | 4,208 |
| 2014 | 6,109 |
| 2015 | 5,965 (estimated) |

Written Contracts or Other Proof

2007 Lower Colorado Water Supply Project Contract among the United States, the City of Needles, and Metropolitan. This contract as amended in 2010 provides for the United States to deliver Colorado River water to Metropolitan, the availability of which results from the pumping of Lower Colorado Water Supply Project groundwater and the exchange of such water.

### *Financing*

Metropolitan's O&M budget includes the cost associated with receipt of Lower Colorado Water Supply Project water.

## *I. Lake Mead Storage Program, Drop 2 (Brock) Reservoir Funding, Yuma Desalting Plant Pilot Project, and Binational Intentionally Created Surplus*

### *Source of Supply*

Water has been and will be stored in Lake Mead as Intentionally Created Surplus (ICS) through extraordinary conservation measures, such as water saved through the Palo Verde Irrigation District Land Management, Crop Rotation, and Water Supply Program.

Water has been and will be stored in Lake Mead as ICS through system efficiency measures, such as Metropolitan's funding contributions toward construction of the Drop 2 (Brock) Reservoir near the All-American Canal and pilot operation of the Yuma Desalting Plant.

Water will be stored in Lake Mead as Binational ICS through implementation of pilot conservation projects in Mexico.

### *Expected Capability*

Metropolitan may create as much as 400 TAF of Extraordinary Conservation ICS water in a single year less the amount that may be created by IID, which could be as much as 25 TAF.

Upon creation, 5 percent of the Extraordinary Conservation ICS is deducted, resulting in additional system water in storage in Lake Mead and leaving 95 percent of the water available for release to Metropolitan. Each year thereafter, the remaining balance at the end of the year is reduced by three percent to account for evaporation losses.

The amount of Extraordinary Conservation ICS accumulated in Lake Mead for Metropolitan is limited to 1.5 MAF less the amount accumulated by IID which could be as much as 50 TAF.

Metropolitan may take delivery of as much as 400 TAF of Extraordinary Conservation ICS from Lake Mead in a year less the amount delivered to IID, which could be as much as 50 TAF.

Rather than storing Extraordinary Conservation ICS water in Lake Mead, IID may, with the written consent of Metropolitan, have up to 25 TAF of this water delivered to Metropolitan for storage in any one calendar year. Upon request by IID, Metropolitan would return 90 percent of the stored water to IID with the remaining 10 percent left for Metropolitan's use. Also, Metropolitan may make temporary use of IID's Extraordinary Conservation ICS accumulated in Lake Mead.

As of January 1, 2015, Metropolitan has 89 TAF of System Efficiency ICS stored in Lake Mead. There are no evaporation losses charged to stored System Efficiency ICS. Metropolitan may take delivery of as much as 24 TAF of this System Efficiency ICS resulting from pilot operation of the Yuma Desalting Plant and 25 TAF of this System Efficiency ICS resulting from construction of the Drop 2 (Brock) Reservoir beginning in 2015 annually. The USBR may reduce this delivery if it determines a reduction is necessary to avoid a shortage.

Metropolitan will receive 23.75 TAF of Binational ICS in Lake Mead by December 31, 2017.

### *Rationale for the Expected Supply*

Program Facilities

This program makes use of Lake Mead and the CRA.

Historical Record

From 2006 to 2010, Metropolitan created approximately 201.5 TAF of Extraordinary Conservation ICS. From 2008 to 2011, Metropolitan created approximately 124.4 TAF of System Efficiency ICS.

In 2008, the USBR assigned to Metropolitan 100 TAF of water stored in Lake Mead as System Efficiency ICS due to Metropolitan's contributions to the Drop 2 Reservoir project.

In 2010 and 2011, the USBR assigned to Metropolitan 16.75 TAF and 7.647 TAF of water stored in Lake Mead as System Efficiency ICS, respectively, due to Metropolitan's contributions to the Yuma Desalting Plant pilot project.

From 2011 to 2012, Metropolitan created approximately 348.7 TAF of Extraordinary Conservation ICS, and zero System Efficiency ICS.

As of January 1, 2015, Metropolitan's Extraordinary Conservation and System Efficiency ICS volumes in Lake Mead were approximately 61.8 TAF and 89.4 TAF, respectively.

Written Contracts or Other Proof

2007 Lower Colorado River Basin Intentionally Created Surplus Forbearance Agreement among the Arizona Department of Water Resources, PVID, IID, the City of Needles, CVWD, Metropolitan, SNWA, and the Colorado River Commission of Nevada. This agreement sets forth the rules under which ICS water is developed, stored in, and delivered from Lake Mead.

2007 California Agreement for the Creation and Delivery of Extraordinary Conservation Intentionally Created Surplus among Metropolitan, PVID, IID, CVWD, and the City of Needles. This agreement determines the conditions under which California contractors receiving Colorado River water may store and deliver water from Lake Mead.

2007 Agreement among the United States, the Colorado River Commission of Nevada, and the SNWA for the Funding and Construction of the Lower Colorado River Drop 2 Storage Reservoir Project. This agreement provides for: the United States to design and construct the Drop 2 Storage Reservoir Project; SNWA to fund the capital cost of the Project; the United States to credit SNWA's ICS account with 600 TAF of System Efficiency ICS; and allows Metropolitan to become a party to the agreement, requiring that Metropolitan provide funding for a portion of the capital cost.

2007 Delivery Agreement between the United States and Metropolitan. This agreement provides the procedures for creating the ICS water and guarantees delivery of the water to Metropolitan.

2008 Metropolitan Notice of Election to Participate as a Party to the Drop 2 Funding Agreement. This notice requires Metropolitan to provide funding for a portion of the capital cost of the Drop 2 Storage Reservoir Project, and the United States to credit Metropolitan's ICS account with 100 TAF of System Efficiency ICS, reducing the amount of System Efficiency ICS in SNWA's account by an equal amount.

2009 Agreement among the United States, Metropolitan, the Colorado River Commission of Nevada, SNWA, and the Central Arizona Water Conservation District for a Pilot Project for Operation of the Yuma Desalting Plant. This agreement provides for the allocation of the costs for the preparation and pilot operation of the Yuma Desalting Plant.

2010 Yuma Desalting Plant Pilot Project Delivery Agreement between the United States and Metropolitan. This agreement secures delivery of the ICS water created and specifies the manner in which this water will be accounted.

2012 Agreement among the United States, Metropolitan, the Colorado River Commission of Nevada, SNWA, and the Central Arizona Water Conservation District for a Pilot Program for the Conversion of Intentionally Created Mexican Allocation to Intentionally Created Surplus. This agreement provides for the allocation of the costs among the agencies for the implementation of pilot conservation projects within Mexico and the allocation of 95 TAF of conserved water among the non-federal agencies as Binational ICS in Lake Mead.

2012 Interim Operating Agreement for Implementation of Minute No. 319 of the International Boundary and Water Commission. This agreement among the United States, the Upper Basin states, and Lower Basin states' agencies, including Metropolitan, sets forth the rules under which Intentionally Created Mexican Allocation is to be converted to Binational ICS for storage in and delivery from Lake Mead.

2012 Lower Colorado River Basin Forbearance Agreement for Binational Intentionally Created Surplus. This agreement among the state of Arizona, the Colorado River Commission of Nevada and SNWA, and California Colorado River water contractors, including Metropolitan, ensures

that the Binational ICS made available to a contractor that invests in a project in Mexico would not be claimed by another contractor in another state.

2012 Binational ICS Delivery Agreement. This agreement between Metropolitan and the United States secures delivery of the Binational ICS water made available by exchange and specifies the manner in which this water would be accounted.

2013 Agreement between Metropolitan and IID Regarding Binational Intentionally Created Surplus. This agreement allows IID to provide a payment to Metropolitan of up to 50 percent of the financial contribution to be made to the United States by Metropolitan for the implementation of pilot conservation projects within Mexico. As a result of IID's payment, Metropolitan will receive 23.75 TAF and IID will receive 23.75 TAF of Binational ICS by December 31, 2017.

### *J. Programs Under Development*

Expansion of the Palo Verde Irrigation District (PVID) Land Management Program: Additional fallowing agreements may be developed in subsequent years as needed.

Arizona Storage and Interstate Release Agreement: A storage and interstate release program with the Central Arizona Project has been under consideration. In lieu of Arizona storing Colorado River water in groundwater basins, water would be stored with Metropolitan for later return.

Bard Water District Seasonal Fallowing Pilot Program: In January 2016, Metropolitan's Board of Directors authorized the General Manager to enter into a pilot seasonal fallowing program with Bard Water District (Bard). Farmers in Bard have expressed interest in participating in a two-year pilot program to conduct seasonal fallowing on their lands. A number of farmers in Bard grow one or more vegetable crops in the fall and winter followed by a field crop in the spring and summer. This rotation of crops provides an opportunity to fallow land for a four-month period from April to July. Based on the interest expressed by farmers in Bard, staff for Metropolitan and Bard have developed proposed terms for a two-year pilot program that could provide Metropolitan with an estimated 4.6 TAF in both 2016 and 2017. Metropolitan and Bard would enter into a pilot program agreement which would specify that a maximum of 2,000 acres within Bard would be fallowed per season and that Bard would not deliver any water to the fallowed acres from April 1 to July 31, 2016 and 2017. Metropolitan would enter into an agreement with each individual farmer through which the farmer would agree to fallow at least 10 contiguous acres for the four month period. Implementation of a pilot program would provide information that could lead to the development of a longer term land management and fallowing program with Bard.

## A.3.2 California Aqueduct Deliveries

### *A. State Water Project Deliveries*

#### *Source of Supply*

The State Water Project (SWP) provides imported water to the Metropolitan service area and has provided from 25 to 50 percent of Metropolitan's supplies. In accordance with its contract with the Department of Water Resources (DWR), Metropolitan has a Table A allocation of 1,911,500 AF per year under contract from the SWP. Actual deliveries have never reached this amount because they depend on the availability of supplies as determined by DWR. The availability of SWP supplies for delivery through the California Aqueduct over the next 18 years is estimated according to the historical record of hydrologic conditions, existing system capabilities as may be influenced by environmental permits, requests of the SWC and SWP contract provisions for allocating Table A, Article 21 and other SWP deliveries including San Luis carryover to each contractor. As shown in this 2015 UWMP, the estimates of SWP deliveries to Metropolitan are based on DWR's July 2015 SWP Delivery Capability Report.

As part of its contract with DWR, Metropolitan pays both the fixed costs of financing SWP facilities construction and the variable costs of operations, maintenance, power, and replacement costs for water delivered each year. SWP water is delivered to Metropolitan through the East Branch at Devil Canyon Power Plant afterbay, along the Santa Ana Valley Pipeline, and at Lake Perris. Metropolitan takes delivery from the West Branch at Castaic Lake.

#### *Expected Supply Capability*

The Edmund G. Brown California Aqueduct is capable of transporting Metropolitan's full contract amount of 1,911,500 AF per year. However, the quantity of water available for export through the California Aqueduct can vary significantly year to year. The amount of precipitation and runoff in the Sacramento and San Joaquin watersheds, system reservoir storage, regulatory requirements, and contractor demands for SWP supplies impact the quantity of water available to Metropolitan.

#### *Rationale for Expected Supply*

Metropolitan and 28 other public entities have contracts with the State of California for SWP water. These contracts require the state, through DWR, to use reasonable efforts to develop and maintain the SWP supply. The state has made significant investment in infrastructure. It has constructed 28 dams and reservoirs, 26 pumping and generation plants, and about 660 miles of aqueducts. More than 25 million California residents benefit from water from the SWP. DWR estimates that with current facilities and regulatory requirements, the project will deliver approximately 2.3 MAF under average hydrology considering impacts attributable to the combined Delta smelt and salmonid species biological opinions.

On a yearly basis, DWR estimates the amount of supplies that are available for that year. Metropolitan uses a forecasting method for SWP deliveries based on historical patterns of precipitation, runoff, and actual deliveries of water.

Further, under the water supply contract, DWR is required to use reasonable efforts to maintain and increase the reliability of service to Metropolitan. As discussed in a subsequent section, DWR is participating in the Bay-Delta process to achieve these requirements.

Historical Record

The historical record shows significant accomplishments by DWR in providing its contractors with SWP water supplies. Through 2013, the SWP has delivered over 90 MAF to its contractors. The maximum annual water supply was delivered in 2005, and totaled 3.75 MAF. In 2006 and 2011 the project delivered 3.7 MAF. DWR has continued to invest in SWP facilities to deliver water to its contractors.

Written Contracts or Other Proof

1960 Contract between the State of California and The Metropolitan Water District of Southern California for a Water Supply. This contract, initially executed in 1960 and amended numerous times since, is the basis for SWP deliveries to Metropolitan. It requires DWR to make reasonable efforts to secure water supplies for Metropolitan and its other contractors. The contract expires in 2035. At that time, Metropolitan has the option to renew the contract under the same basic conditions.

### *Financing*

Metropolitan's payments for its State Water contract obligation are approved each year by its Board of Directors and currently constitute approximately a third of the annual budget.

### *Federal, State and Local Permit/Approvals*

Operation of the SWP. The DWR is responsible for acquiring, maintaining, and complying with numerous federal and state permits for operation of the SWP. Metropolitan has been active in monitoring the issues affecting its contract with DWR.

EIR for the East Branch Enlargement. In April 1984, DWR prepared and finalized an EIR for the Enlargement of the East Branch of the Governor Edmund G. Brown California Aqueduct.

EIR for the Harvey O. Banks Pumping Plant. In January 1986, DWR prepared and finalized an EIR for the additional pumping units at Harvey O. Banks Delta Pumping Plant.

EIR for the Mission Hills Extension. In 1990, DWR prepared and finalized an EIR for the SWP Coastal Branch, Phase II and Mission Hills Extension.

East Branch Extension Project Phase 1. In 1998, DWR completed an EIR to extend the East Branch of the California Aqueduct to provide service to San Gorgonio Pass Water Agency. Phase 1 was completed in 2002.

U.S. Fish and Wildlife Service Biological Opinion. In December 2008, U.S. Fish and Wildlife issued a Biological Opinion for Delta smelt.

National Marine Fisheries Service Biological Opinion. In June 2009, the National Marine Fisheries Service issued a Biological Opinion for salmon.

## *B. Desert Water Agency/Coachella Valley Water District/Metropolitan Water Exchange and Advance Delivery Programs*

### *Source of Supply*

The Desert Water Agency (DWA) and CVWD, both in Riverside County, have rights to SWP deliveries, but do not have any physical connections to the SWP facilities. Both agencies are adjacent to the CRA. For DWA and CVWD to obtain water equal to their SWP allocations, Metropolitan has agreed to exchange an equal quantity of its Colorado River water for DWA and CVWD's SWP water. DWA has a SWP Table A contract right of 55.75 TAF per year, and CVWD has a SWP Table A contract right of 138.35 TAF per year, for a total of 194.1 TAF per year.

### *Expected Supply Capability*

Under the existing agreements, Metropolitan provides water from its CRA to DWA and CVWD in exchange for SWP deliveries. Metropolitan can deliver additional water to its DWA/CVWD service connections, permitting these agencies to store water. When supplies are needed, Metropolitan can then receive its full Colorado River supply, as well as the SWP allocation from the two agencies, while the two agencies can rely on the stored water for meeting their water supply needs. The amount of DWA and CVWD SWP Table A water available to Metropolitan depends on total SWP deliveries and varies from year to year.

In addition to their Table A supplies, DWA and CVWD, subject to Metropolitan's written consent, may take delivery of SWP supplies available under Article 21, the Turn-back Pool Program, and non-SWP water supplies they may acquire and convey through the SWP facilities. These other supplies are delivered to DWA and CVWD by exchange with Metropolitan in the same manner as Table A deliveries. DWA and CVWD are participants in the Yuba Dry Year Water Purchase Program. Additionally, DWA participated in the 2009 Drought Water Bank and the 2015-2016 Multi-Year Water Pool Demonstration Program. CVWD has also purchased non-project supplies from partners in the San Joaquin Valley on an annual basis since 2008. Metropolitan has also consented to:

- 10 TAF of exchange deliveries to CVWD for non-SWP water acquired from the San Joaquin Valley from 2008 through 2010, and
- 36 TAF of exchange deliveries to DWA for non-SWP water acquired from the San Joaquin Valley from 2008 through 2015.

### *Rationale for Expected Supply*

The DWR estimates the amount of supplies that are available each year. Metropolitan uses a forecasting method for SWP deliveries based on historical patterns of precipitation, runoff and actual deliveries of water.

Historical Record

DWA and CVWD Exchange Program is currently in operation. The Advance Delivery Agreement has been in place since 1984. Since 1973, Metropolitan has been taking delivery of these agencies' SWP Table A water and has provided equivalent water to those agencies from Metropolitan's CRA supplies. Metropolitan has also been delivering water in advance of the amount needed under the exchange agreements. With water having been delivered in advance, Metropolitan can reduce deliveries to DWA and CVWD as needed. Indeed, from the end of August 2012 through October 2015, Metropolitan drafted approximately 164 TAF, leaving 207 TAF in the Advance Delivery account.

Written Contracts or Other Proof

1967 and 1983 Water Exchange Contract and Agreements. The DWA and CVWD Program is currently in operation. The DWA and CVWD water exchange contract has been in place since 1967, was amended in 1972, and was modified with execution of additional agreements in 1983.

1984 Advance Delivery Agreement. The Advance Delivery Agreement allows Metropolitan to supply DWA and CVWD with Colorado River water in advance of the time these agencies are entitled to receive water under the exchange agreements. In future years, Metropolitan can recover this water by reducing its deliveries under the exchange agreements.

The 2003 Exchange Agreement. DWA, CVWD, and Metropolitan executed the 2003 Exchange Agreement under which Metropolitan transferred 88,100 AF and 11,900 AF of its SWP Table A water to DWA and CVWD, respectively, reducing Metropolitan's Table A volume from 2,011,500 AF to 1,911,500 AF. The 2003 Exchange Agreement became operational in calendar year 2005 with the execution of letter agreements among DWA, CVWD, and Metropolitan governing its implementation. The exhibits to the November 9, 2004, and November 19, 2007, letter agreements also modify certain provisions of the Water Exchange Contract and Agreements and the Advance Delivery Agreement.

November 2012 Letter Agreement. CVWD and Metropolitan executed the letter agreement to deliver non-SWP water in exchange for Colorado River water under which CVWD arranged for the delivery of up to 16.5 TAF per year of water to Metropolitan provided by Rosedale-Rio Bravo Water Storage District to CVWD. Metropolitan delivers to CVWD an equal amount of Colorado River water.

#### *Financing*

The funds for deliveries under this Program are included in Metropolitan's O&M budget and Long-Range Finance Plan (referenced above).

#### *Federal, State, and Local Permits/Approvals*

DWR is responsible for acquiring, maintaining, and complying with numerous Federal and State permits for operation of the SWP.

July 26, 1983, CVWD Negative Declaration, Whitewater River Spreading Area expansion Phase 1.

February 1983, DWA Final EIR for the proposed extension of time for utilizing Colorado River water to recharge the upper Coachella Valley groundwater basins to the year 2035, Volume I and II, April 1983, Volume III.

September 2002, Final Program EIR for Coachella Valley Water Management Plan and SWP Entitlement Transfer was certified by CVWD on October 8, 2002.

### *C. Semitropic Water Banking and Exchange Program*

#### *Source of Supply*

The agreement between Semitropic Water Storage District (Semitropic) and Metropolitan was executed in February 1994. Semitropic obtains water from the SWP through its contracts with the Kern County Water Agency. SWP supplies irrigate an area of 161,200 acres within Semitropic's service area. When this surface water is not available, these growers withdraw water from the underlying aquifer. The agreement between Semitropic and Metropolitan allows Metropolitan to make use of 350 TAF of storage in Semitropic's groundwater basin. In years of plentiful supply, Metropolitan can deliver available SWP supplies to Semitropic through the California Aqueduct. During dry years, Metropolitan can withdraw this stored water. Five other banking partners participate in this Program and use 650 TAF of storage in Semitropic's groundwater basin.

#### *Expected Supply Capability*

The Semitropic-Metropolitan Program provides Metropolitan with the capacity to store up to 350 TAF of water under the current agreement. During dry years, Metropolitan can recover its stored water through a combination of direct pumping of the groundwater and delivery of Semitropic's SWP Table A water in the California Aqueduct. In 2014, Metropolitan amended the program to increase the return yield by an additional 13.2 TAF per year. The minimum

annual yield available to Metropolitan from the program is currently 44.7 TAF, and the maximum annual yield is 236.2 TAF depending on the available unused capacity and the SWP allocation. The average annual supply capability for a single dry year similar to 1977 is 125 TAF or for multiple dry years similar to the period 1990-1992 is 107 TAF.

#### *Rationale for Expected Supply*

Historical Record

The Semitropic-Metropolitan Water Banking and Exchange Program has been operational since 1994. With existing agreements, it will continue to operate over the term of 41 years (1994-2035). By the end of 2015, the program had 137 TAF in its storage account.

Written Contracts or Other Proof

1992 Turn-in/out Construction, Operation and Maintenance Agreement. This Agreement was executed in 1992 by DWR and Semitropic to allow construction, operation, and maintenance of the Semitropic California Aqueduct Turn in/out.

1993 Temporary Semitropic-Metropolitan Water Banking Agreement. This Agreement was executed in February 1993 by Semitropic and Metropolitan to allow the storage of available Metropolitan supplies in advance of execution of the long-term agreement.

1994 Semitropic/Metropolitan Water Banking and Exchange Agreement. This Agreement was executed in December 1994 by Semitropic and Metropolitan to implement the program for a 41-year term (1994-2035).

1995 Point of Delivery Agreement. This agreement, with DWR, Kern County Water Agency, and Metropolitan, allows Metropolitan to divert water from the California Aqueduct into Semitropic's service area.

1995 Introduction of Local Water into the California Aqueduct. This agreement, with DWR, Kern County Water Agency, and Semitropic, allows Metropolitan to receive water from the program into the California Aqueduct.

2014 Amendment to Increase Program Yield. The amendment increased Metropolitan's minimum return yield by 13,200 acre-feet per year.

#### *Financing*

Metropolitan's O&M budget (referenced above) includes payments for the Semitropic Program.

#### *Federal, State, and Local Permits/Approvals*

Final EIR. Semitropic acting as the lead agency under CEQA and Metropolitan acting as a responsible agency jointly completed the EIR for the Program. The EIR was certified by Semitropic in July 1994 and adopted by Metropolitan in August 1994.

Regulatory Approvals. All regulatory approvals are in place, and the program is operational.

### *D. Arvin-Edison Water Management Program*

#### *Source of Supply*

The Arvin-Edison Water Storage District (Arvin-Edison) manages the delivery of local groundwater and water imported into its service area from the Central Valley Project's (CVP) Millerton Reservoir via the Friant-Kern Canal. The surface water service area consists of 132,000 acres of predominantly agricultural land, and to a minor degree, municipal and industrial uses. It is situated in Kern County. Arvin-Edison operates its supplies conjunctively, storing water in the underlying aquifer when imported supplies are available and withdrawing

that water when the availability of imported supplies is reduced. In 1997, Metropolitan entered into an agreement with the Arvin-Edison Water Storage District. The agreement allows Metropolitan to store available water in Arvin-Edison's groundwater basin, either through direct spreading operations, or through deliveries to growers in Arvin-Edison's service area. Similar to Arvin-Edison's own usage, this previously stored water could be withdrawn when the availability of imported supplies to Metropolitan is reduced.

### *Expected Supply Capability*

The Arvin-Edison/Metropolitan Program provides Metropolitan with the capacity to store up to 350 TAF of water under the current agreement. During dry years, Metropolitan can recover its stored water either through direct pumping of the groundwater or through exchange. Based on the terms and conditions of the program agreement, the return of water to Metropolitan ranges from a minimum of 40 TAF per year (peak 4-month summer period) up to 110 TAF (over a 12-month period). The average annual supply capability for this program is 75 TAF for either a single dry year similar to 1977 or for each year of a multiple dry year period similar to the period 1990-1992.

### *Rationale for Expected Supply*

Historical Record

The Arvin-Edison/Metropolitan Water Management Program has been operational since 1997. With existing agreements, it will continue to operate over the term of 38 years (1997-2035). By the end of 2015, the program had 124 TAF in its storage account.

Written Contracts or Other Proof

1997 Arvin-Edison/Metropolitan Water Management Agreement. This Agreement was executed in December 1997 by Arvin-Edison and Metropolitan to implement the program for a 30-year term (1997-2027).

1998 Turn-in/out Construction and Maintenance Agreement. This Agreement was executed in 1998 by DWR, Kern County Water Agency, Arvin-Edison, and Metropolitan to allow construction, operation and maintenance of the Arvin-Edison California Aqueduct Turn in/out.

1998-2002 Water Delivery and Return Agreements. These agreements, with DWR, Kern County Water Agency, Arvin-Edison, and Metropolitan, allow Metropolitan to divert water from, and introduce water to, the California Aqueduct.

2004 Point of Delivery Agreement. This agreement, with DWR, Kern County Water Agency, and Metropolitan, allows Metropolitan to divert water from the California Aqueduct into Arvin-Edison's service area.

2004 Introduction of Water into the California Aqueduct. This agreement, with DWR, Kern County Water Agency, and Arvin-Edison, allows Metropolitan to receive water from the program into the California Aqueduct.

2007 First Amended and Restated Agreement Between Arvin-Edison Water Storage District and The Metropolitan Water District of Southern California for a Water Management Program. This amendment increased the maximum storage level to 350 TAF, extended the agreement term to 2035, and provided for the construction of the South Canal Improvement Project. The project increases the reliability of Arvin-Edison returning higher water quality to the California Aqueduct.

### *Financing*

Metropolitan's O&M budget (referenced above) includes payments for the Arvin-Edison Program.

### *Federal, State, and Local Permits/Approvals*

Environmental Status: A Negative Declaration was completed in 1996.

An Addendum to the 1996 Negative Declaration was completed in 2003.

A Negative Declaration for the Arvin-Edison South Canal Improvement Project was completed in 2007.

Regulatory Approvals: All regulatory approvals are in place, and the program is operational.

## *E. San Bernardino Valley Municipal Water District Program*

### *Source of Supply*

The San Bernardino Valley Municipal Water District Program allows Metropolitan to purchase a dependable annual supply, as well as an additional supply for dry year needs. Under this program, Metropolitan purchases water provided to San Bernardino Valley Municipal Water District (Valley District) from its annual State Water Project (SWP) water allocation. Valley District delivers the purchased supplies to Metropolitan's service area through the coordinated use of facilities and interconnections within the water conveyance system of the two districts.

The purchased SWP supply is provided to Metropolitan as direct deliveries of annual SWP water through the California Aqueduct to Metropolitan's service area, as well as through deliveries of recaptured SWP water previously stored in the San Bernardino groundwater basin to Metropolitan's service area. Under this program, Metropolitan purchases a minimum of 20 TAF per year of SWP allocation every year. In addition, Metropolitan has the option to purchase Valley District's additional SWP allocation, if available, and the first right-of-refusal to purchase additional SWP supplies available beyond the minimum and option amounts. In the event that Metropolitan's operational needs do not require all, or a portion of the minimum purchased water, that unused amount may be carried forward up to a total of 50 TAF for later delivery. Finally, the program establishes a critical dry year supply account for Metropolitan that could provide additional amounts of dry year supplies. During any year designated by DWR as a critically dry year, Valley District could deliver from this account up to 50 TAF of recaptured SWP water previously stored in the San Bernardino groundwater basin.

To facilitate the transfer, the program also provides the coordinated use of existing facilities, including the Valley District's Foothill Pipeline and the Inland Feeder, to improve the conveyance capabilities of the delivery of SWP water to the service areas of both districts. The intertie between the Foothill Pipeline and the Inland Feeder has been constructed and was operational as of December 2002. This intertie allows Metropolitan to move SWP water from the East Branch of the California Aqueduct through the Foothill Pipeline and Inland Feeder, into DVL and the CRA. As a result of this intertie, Metropolitan has an alternative conveyance capacity of 260 cfs into Metropolitan's system should an outage occur on the upper section of the Inland Feeder.

### *Expected Supply Capability*

The average annual supply capability for a single dry year similar to 1977 is 70 TAF. For multiple dry years similar to the period 1990-1992, the expected supply capability is 37 TAF.

### *Rationale for Expected Supply*

Historical Record

The San Bernardino Valley Municipal Water District Program began operations in 2001 and is expected to be renewed continually in the future. Since its inception in 2001, this program has delivered 103 TAF to Metropolitan. There was no water remaining in the carryover account in 2009. Deliveries in 2013, 2014, and 2015 have been suspended by mutual agreement.

Written Contracts or Other Proof

Metropolitan's annual and dry-year supplies from the San Bernardino Valley Municipal Water District Program are based on Metropolitan Board actions and agreements.

2000 Board Approval of Coordinated Operating Agreement. In June 2000, Metropolitan's Board authorized entering into a Coordinated Operating Agreement between Metropolitan and Valley District to develop projects that could provide benefits to both districts through the coordinated use of facilities and SWP supplies.

2000 Coordinated Operating Agreement. The Coordinated Operating Agreement between Metropolitan and Valley District was executed in July 2000.

2001 Board Approval of the Coordinated Use Agreement. In April 2001, Metropolitan's Board authorized entering into the Coordinated Use Agreement for Conveyance Facilities and SWP Water Supplies between Metropolitan and Valley District for the purchase of dependable annual and dry year supplies by Metropolitan.

2001 Coordinated Use Agreement. The Coordinated Use Agreement for Conveyance Facilities and SWP Water Supplies between Metropolitan and Valley District for the purchase of dependable annual and dry year supplies by Metropolitan was executed May 2001. The Agreement is effective as of July 1, 2001, for an "evergreen" term (10-years with automatic annual extensions unless otherwise notified).

### *Financing*

Metropolitan's O&M budget (referenced above) includes the funds to purchase Program water.

### *Federal, State, and Local Permits/Approvals*

The Program became effective as of July 1, 2001. An environmental review process and regulatory approval supported implementation.

Final EIR. Final Regional Water Facilities Master Plan EIR dated February 1, 2001, was certified by Valley District, as lead agency, and by Metropolitan, as responsible agency. Notices of determinations were filed by Valley District and Metropolitan on May 29, 2001, and April 18, 2001, respectively.

State Water Contractors' Review. In May 2001, the SWC reviewed and issued a letter supporting the program.

DWR Review. DWR agreed to the program in December 2001.

## F. San Gabriel Valley Municipal Water District Program

### Source of Supply

The San Gabriel Valley Municipal Water District Program allows Metropolitan to exchange supplies to provide additional water for normal and dry year needs. Under this program, Metropolitan delivers supplies to the City of Sierra Madre, a San Gabriel Valley MWD member agency. In exchange for Metropolitan delivering one acre-foot, San Gabriel Valley MWD returns two acre-feet to Metropolitan in the Main San Gabriel Basin, up to 5 TAF. For any exchange amount less than 5 TAF, Metropolitan purchases the balance of the 5 TAF. The program provides increased reliability to Metropolitan by allowing additional water to be delivered to Metropolitan's member agencies Three Valleys MWD and Upper San Gabriel Valley MWD that rely upon the Main San Gabriel Basin for their supplies.

### Expected Supply Capability

The average annual supply capability for a single dry year similar to 1977 is a net 2 TAF. For multiple dry years similar to the period 1990-1992, the expected supply capability is 2 TAF.

### Rationale for Expected Supply

Historical Record

The San Gabriel Valley Municipal Water District Program began operations in 2013 and is expected to be renewed continually in the future. Since its inception in 2013, the program has completed the exchange of 10 TAF, with a net increase to Metropolitan's supply by an additional 7.3 TAF.

Written Contracts or Other Proof

Metropolitan's dependable annual and dry-year supplies from the San Gabriel Valley Municipal Water District Program are based on Metropolitan Board action and agreement.

2013 San Gabriel Valley MWD Exchange and Purchase Agreement. The agreement between Metropolitan and San Gabriel Valley MWD was executed in September 2013.

2013 Board Approval of the San Gabriel Valley MWD Exchange and Purchase Agreement. In August 2013, Metropolitan's Board authorized entering into the agreement with San Gabriel Valley MWD.

### Financing

Metropolitan's O&M budget (referenced above) includes the funds to purchase water.

### Federal, State, and Local Permits/Approvals

The Program became effective as of September 2013. An environmental review process supported implementation.

CEQA Compliance. The proposed action involved an exchange and purchase agreement associated with the leasing, licensing, and operating of existing public water conveyance facilities with negligible or no expansion of use and no possibility of significantly impacting the physical environment.

## G. Antelope Valley East Kern Water Agency Exchange and Storage Program

### Source of Supply

The Antelope Valley East Kern Water Agency (AVEK) Program allows Metropolitan to both exchange and store SWP supplies to provide additional water for normal and dry year needs.

Under this program, AVEK provides Metropolitan its unused SWP supplies. For every two acre-feet provided by AVEK, Metropolitan will return one acre-foot. The exchange program is expected to deliver 30 TAF over ten years, with 10 TAF available in dry years. Metropolitan will also have a storage capability in the groundwater basin, with a capacity of 30 TAF, and a dry year return capability of 10 TAF.

#### *Expected Supply Capability*

The average annual supply capability for a single dry year similar to 1977 is 10 TAF for each program. For multiple dry years similar to the period 1990-1992, the expected supply capability is 3 TAF for each program.

#### *Rationale for Expected Supply*

Historical Record

The AVEK Program is projected to provide benefits starting as early as 2016.

Written Contracts or Other Proof

Metropolitan's dependable annual and dry-year supplies from the AVEK Exchange and Storage Program are based on Metropolitan Board action and proposed agreement.

2015 Board Approval of the AVEK Exchange and Storage Agreement. In November 2015, Metropolitan's Board authorized entering into the agreement with AVEK.

#### *Financing*

Metropolitan's Board authorized up $16.6 million for the program with additional funds, if needed, from Metropolitan's O&M budget (referenced above).

#### *Federal, State, and Local Permits/Approvals*

The Program will become effective once the agreement is executed in 2016. An environmental review process supported implementation.

CEQA Compliance. The proposed action involved an exchange and purchase agreement associated with the leasing, licensing, and operating of existing public water conveyance facilities with negligible or no expansion of use and no possibility of significantly impacting the physical environment.

### *H. Bay-Delta Improvements*

#### *Source of Supply*

Improving the water supply reliability of the State Water Project (SWP) is a primary focus of Metropolitan's long-term planning efforts. Metropolitan's strategy is to reduce its dependence on SWP supplies during dry years, when risks to the Bay-Delta ecosystem are greatest, and to maximize its deliveries of available SWP water during wetter years to store in surface reservoirs and groundwater basins for later use during droughts and emergencies.

State and federal resource agencies and various environmental and water user entities are currently engaged in the development of the Bay Delta Conservation Plan (BDCP)/California WaterFix, which is aimed at making physical and operational improvements to the SWP system in the Delta necessary to restore and protect ecosystem health, south-of-Delta SWP and CVP water supplies, and water quality. The goal for the 2015 IRP Update for SWP supplies is to manage flow and export regulations in the near term and ultimately to achieve a long-term Bay-Delta solution. This goal involves continued engagement in collaborative science-based approaches to manage regulations in the near-term and continued participation in the long-

term California WaterFix and the California EcoRestore efforts. This approach targets an average of 984 TAF of SWP supplies in the near-term and an increase of 248 TAF to 1.2 MAF of supplies on average starting in 2030 when the long-term Bay-Delta solution is assumed to be in place. A more detailed description of SWP supplies is included in Section 3.2 of the 2015 UWMP, Section 3.2 and Technical Appendix 10 of the 2015 IRP Update.

The SWP conveys water from the western slope of the Sierra Nevada to water users both north and south of the Bay-Delta. Specifically, SWP water is delivered to Metropolitan's service area through a system of reservoirs, the Bay-Delta, pumping plants, and the California Aqueduct. Owned and operated by the California Department of Water Resources (DWR), the SWP provides municipal and agricultural water to 29 State Water Contractors. Annual deliveries for the SWP average about 2.5 MAF. Municipal uses account for about 60 percent of annual deliveries, with the remaining 40 percent going to agriculture.

SWP supplies are estimated using the 2015 SWP Delivery Capability Report distributed by DWR in July 2015. The 2015 Delivery Capability Report presents the current DWR estimate of the amount of water deliveries for current (2015) conditions and conditions 20 years in the future. These estimates incorporate restrictions on SWP and CVP operations in accordance with the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on December 15, 2008, and June 4, 2009, respectively. Under the 2015 Delivery Capability Report with existing conveyance and low outflow requirements scenario, the delivery estimates for the SWP for 2020 conditions as percentage of Table A amounts are 12 percent, equivalent to 257 TAF for Metropolitan, under a single dry-year (1977) condition and 51 percent, equivalent to 976 TAF for Metropolitan, under long-term average conditions.

In dry, below-normal conditions, Metropolitan has increased the supplies received from the California Aqueduct by developing flexible Central Valley/SWP storage and transfer programs. Over the last two years under the pumping restrictions of the SWP, Metropolitan has worked collaboratively with the other contractors to develop numerous voluntary Central Valley/SWP storage and transfer programs. The goal of these storage/transfer programs is to develop additional dry-year supplies that can be conveyed through the available Banks pumping capacity to maximize deliveries through the California Aqueduct during dry hydrologic conditions and regulatory restrictions.

### *The Bay Delta Conservation Plan*

The BDCP was prepared through a collaboration of state, federal, and local water agencies, state and federal fish agencies, environmental organizations, and other interested parties. At the outset of the BDCP process, a planning agreement was developed and executed among the participating parties, and a Steering Committee was formed. The BDCP identified a set of conservation measures including water conveyance improvements and restoration actions to contribute to the recovery of endangered and sensitive species and their habitats in California's Sacramento-San Joaquin Delta. The BDCP was formulated to contribute to the state's co-equal goals of water supply reliability and ecosystem restoration.

Lead agencies for the EIR/EIS were the DWR, the USBR, the United States Fish and Wildlife Service, and National Oceanic and Atmospheric Administration's National Marine Fisheries Service, in cooperation with the California DFW, the USEPA, and the United States Army Corps of Engineers. Metropolitan served on the steering committee. DWR and USBR are the lead agencies for the California WaterFix.

In order to select the most appropriate elements of the final conservation plan, the BDCP considered a range of options for accomplishing these goals using information developed as part of an environmental review process. Potential habitat restoration and water supply

conveyance options included in the BDCP were assessed through an Environmental Impact Report (EIR)/Environmental Impact Statement (EIS). The BDCP planning process and the supporting EIR/EIS process are being funded by state and federal water contractors. The First Administrative Draft BDCP was released in March 2012, a Second Administrative Draft BDCP and EIR/EIS was released in March 2012, and the Public Draft BDCP and EIR/EIS was released December 2013. Each of the above draft documents was released to the public. The official public comment draft was released in December 2013.

A new permitting approach and associated new alternatives to the BDCP were announced in April 2015. The California WaterFix and California EcoRestore would be implemented under a different Endangered Species Act permitting process. This would fulfill the requirement of the 2009 Delta Reform Act to contribute toward meeting the coequal goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem.

The new water conveyance facilities included in Alternative 4 (the BDCP) would be constructed and operated under the California WaterFix. Proposed changes to the design of the water conveyance facilities reduce the overall environmental/construction impacts to the environment, minimize disruptions to local communities, and increase long term operational and cost benefits. Some of the improvements would include moving the tunnel alignment away from local communities and environmentally sensitive areas. The elimination of pumping plants, reduction of permanent power lines and power use, and the reconfiguration of intake and pumping facilities sediment basins and reconfiguration/relocation of the construction staging sites in the North Delta will lessen construction and longer term operational impacts. If implemented, these would result in reduced environmental and construction impacts and increase improved long-term operational and cost benefits.

The main objective under the EcoRestore Program is to pursue at least 30,000 acres of Delta habitats over the next five years. These restoration programs would include projects and actions that are in compliance with pre-existing regulatory requirements designed to improve the overall health of the Delta. Other priority restoration projects would also be identified by the Delta Conservancy and other local governments. Funding would be provided through multiple sources including state bonds and other state-mandated funds, SWP/CVP contractors funds as part of existing regulatory obligations, and from various local and federal partners.

As part of the new alternatives and the state's proposed project, the regulatory approach to obtaining state and federal endangered species compliance is shifting from the BDCP Habitat Conservation Plan/Natural Community Conservation Plan strategy to an approach that contemplates a Biological Opinion pursuant to Federal ESA Section 7 and a State 2081 Permit. This approach, as well as the proposed revision to the new water facilities and ecosystem restoration actions, are evaluated in the partially Recirculated Draft EIR/EIS released in July 2015. The deadline for comments was October 2015.

The State Water Resources Control Board (SWRCB) is continuing its phased review and update of the 2006 Water Quality Control Plan (WQCP) for the Bay-Delta. The first phase focuses on the southern Delta salinity objectives for the protection of agriculture, San Joaquin River flow objectives for the protection of fish and wildlife, and a program of implementation for achieving those objectives. The second phase considers the comprehensive review of the other elements of the Bay-Delta WQCP, including but not limited to Sacramento River and Delta outflow objectives. Metropolitan has been collaborating with water users and other stakeholders to develop sound science and technical analyses in support of the WQCP review process, including sharing results in technical forums and publishing findings in peer-reviewed scientific journals. Metropolitan has been meeting with Board members and staff to share

findings as new science and analyses are developed and to encourage close coordination between BDCP and WQCP updates.

### *Rationale for Expected Supply*

Implementation Status

Expected supplies are projected in accordance with the approved implementation plan for CALFED's Bay-Delta Program and with the work plans for the Sacramento Valley Water Management Agreement.

Written Contracts or Other Proof

Metropolitan's projected dependable annual and dry-year supplies from planned Bay-Delta improvements are based on Metropolitan Board actions and agreements.

CALFED's Bay-Delta Program.

Bay-Delta Accord approved in December 1994.

Proposition 204 funds approved by voters in November 1996.

Metropolitan policy direction regarding CALFED's Bay-Delta Program adopted in July 1999. This policy direction established water supply goals.

Proposition 13 funds approved by voters in March 2000.

CALFED Framework announced in June 2000.

Final implementation plans for the first phase of CALFED's Bay-Delta Program approved in August 2000, in conjunction with the approval of the Program and conclusion of the environmental review process.

Proposition 50 funds approved by voters in November 2002.

Proposition 1, approved by the voters in 2014, authorized $7.545 billion in general obligation bonds for state water supply infrastructure projects, including surface and groundwater storage, ecosystem and watershed protection and restoration, and drinking water protection.

Annual Federal appropriations.

Metropolitan's Bay-Delta Policies/Agreements.

Execution of Planning Agreement for BDCP (Planning Agreement) approved in October 2006.

Execution of BDCP Cost-Sharing Agreement approved in November 2006.

Delta Action Plan Framework approved in June 2007.

Delta Conveyance Criteria approved in September 2007.

Delta Governance Principles approved in August 2008.

Execution of Initial Funding Agreement approved in December 2008.

Delta Vision Implementation policies approved in January 2009.

Delta-Related Legislation approved in April 2009.

Execution of Amendments to Planning Agreement approved in December 2009.

Execution of Planning Agreement Amendment (additional funds) approved in July 2010.

Execution of Amendment to Memorandum of Agreement approved in August 2011.

Sacramento Valley Water Management Agreement.

Work plans detailing projects that could provide benefits by the 2002 and 2003 water years were developed in October 2001.

Statement of settlement policy principles recommended in December 2001 by negotiators for approval.

Statement of settlement policy principles approved by Metropolitan's Board in January 2002.

A Sacramento Valley Water Management Agreement was signed and approved by settlement parties in December 2002.

### *Financing*

Funding for BDCP would come from federal, state, and local water supplier sources.

The California WaterFix would be paid for by public water agencies that rely on the supplies.

California EcoRestore is a program separate from California WaterFix. The state would pursue at least 30,000 acres of Delta habitat restoration over the next 5 years, pursuant to pre-existing regulatory requirements such as the 2008 and 2009 Biological Opinions and various enhancements to improve the overall health of the Delta ecosystem. Proposition 1 funds and other state public dollars will be directed exclusively for public benefits unassociated with any regulatory compliance responsibilities.

### *Federal, State, and Local Permits/Approvals*

CALFED's Bay-Delta Program.

Programmatic EIR/EIS finalized in July 2000.

Record of Decision issued in August 2000 for the final Programmatic EIR/EIS regarding the CALFED Bay-Delta Program.

Sacramento Valley Water Management Agreement.

Settlement parties approved Sacramento Valley Management Agreement in December 2002.

## *I. Kern Delta Water Management Program*

### *Source of Supply*

In December 1999, Metropolitan advertised a request for proposals for participation in "The California Aqueduct Dry-year Transfer Program." As a result of this request for proposals, four programs, including one from the Kern Delta Water District (Kern Delta), were selected for further consideration. In 2001, Metropolitan entered into Principles of Agreement with Kern Delta for the development of a dry-year supply program. Kern Delta serves 125,000 acres of actively farmed highly productive farmland located in the San Joaquin Valley portion of southern Kern County. Kern Delta has under contract 180 TAF per year of good quality, highly reliable pre-1914 Kern River water and 25.5 TAF per year of SWP Table A contract right (under contract with Kern County Water Agency).

The dry-year supply program between Kern Delta and Metropolitan involves the storage of water with Kern Delta. In years of plentiful supply, the agreement allows Metropolitan to store water in Kern Delta's groundwater basin, either through direct spreading operations or through deliveries to growers in Kern Delta's service area. Metropolitan has the ability to store up to 250 TAF of water. Agreement provisions may allow for storage beyond this amount. When needed, Metropolitan can recover its stored water either through direct pumping of the groundwater or exchange at a rate of 50 TAF per year. The program duration will be from 2002 to 2027 with provisions that allow the water to be withdrawn until 2033.

### *Expected Supply Capability*

The Kern Delta/Metropolitan Program provides Metropolitan with the capacity to store up to 250 TAF of water at any one time. When needed, Metropolitan can recover its stored water either through direct pumping of the groundwater or exchange at a rate of 50 TAF per year.

### *Rationale for Expected Supply*

Implementation Status

Expected supplies are projected in accordance with accepted detailed groundwater modeling that has been accomplished for the program. In addition, the Kern Delta/Metropolitan Water Management Program was operational and accepting water for storage by fall of 2003. By the end of 2015, the program had 119 TAF in its storage account.

Written Contracts or Other Proof

2001 Kern Delta/Metropolitan Principles of Agreement. Principles of agreement were entered into between Kern Delta and Metropolitan in June 2001, covering program costs, operational aspects, and risks/responsibilities.

2002 Kern Delta and Metropolitan Boards of Directors Approval. These actions approved execution of the long-term agreement, which delineates program operations, costs, and risks/responsibilities

### *Financing*

Metropolitan's O&M budget (referenced above) includes payments for the Kern Delta/ Metropolitan Program.

### *Federal, State, and Local Permits/Approvals*

Kern Delta, acting as lead agency under CEQA, has prepared a full EIR. As part of this EIR, Kern Delta published a Notice of Preparation and held meetings with the general public, interested agencies, and resource agencies. In November 2002, the Final EIR was certified by Kern Delta and adopted by Metropolitan.

## *J. Central Valley / State Water Project Storage and Water Transfers*

### *Source of Supply*

Up to 27 MAF of water (80 percent of California's developed water) is delivered for agricultural use every year. Over half of this water is used in the Central Valley; and much of it is delivered by, or adjacent to, SWP and Central Valley Project (CVP) conveyance facilities. This allows for the voluntary transfer of water to many urban areas, including Metropolitan, via the California Aqueduct.

In recent years, a portion of this agricultural water supply has been secured by Metropolitan through mutually beneficial transfer agreements:

The Governor's Water Bank (Bank) in 1991, 1992, 1994, and 2009 secured 75 to 820 TAF per year of water supply. Further, the DWR's Dry Year Water Purchase Program (Purchase Program) in 2001, 2002, and 2003 secured a total of 162 TAF. DWR established and administered the Bank and the Purchase Program by facilitating purchasing water from willing sellers and transferring the water to those with critical needs using the SWP facilities. Sellers, such as farmers and water districts, made water available for the Bank and Purchase Program by fallowing crops, shifting crops, releasing surplus reservoir storage, and by substituting groundwater for surface supplies.

In 2003, Metropolitan secured options to purchase approximately 145 TAF of water from willing sellers in the Sacramento Valley during the irrigation season. Using these options, Metropolitan purchased approximately 125 TAF of water for delivery to the California Aqueduct.

In 2005, Metropolitan, in partnership with three other SWC, secured options to purchase approximately 130 TAF of water from willing sellers in the Sacramento Valley during the irrigation season, of which Metropolitan's share was 113 TAF. Metropolitan also had the right to assume the other SWC options if they chose not to exercise their options. Due to improved hydrologic conditions, Metropolitan and the other SWC did not exercise these options.

In December 2007, Metropolitan entered into a long-term agreement with DWR providing for Metropolitan's participation in the Yuba Dry Year Water Purchase Program between Yuba County Water Agency and DWR that was approved by the SWRCB as part of the Yuba River Accord. This program provides for transfers of water from the Yuba County Water Agency during dry years through the year 2025, and Metropolitan has purchased approximately 165 TAF to date.

In 2008, Metropolitan, in partnership with eight other SWC, purchased approximately 40 TAF of water from willing sellers in the Sacramento Valley during the irrigation season, of which Metropolitan's share was approximately 27 TAF.

In 2009, Metropolitan participated in the Governor's Water Bank, which purchased approximately 74 TAF, of which Metropolitan's share was approximately 36.9 TAF.

In 2010, Metropolitan in partnership with three other SWC, secured approximately 100 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 88 TAF.

In 2010, Metropolitan purchased approximately 18 TAF of water from CVP Contractors located in the San Joaquin Valley. In addition, Metropolitan entered into an unbalanced exchange agreement that resulted in Metropolitan receiving approximately 37 TAF.

In 2015, Metropolitan, in partnership with eight other SWC, secured approximately 20 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 12 TAF.

In addition, Metropolitan has secured water transfer supplies under the Multi-Year Water Pool Demonstration Program. In 2013 and 2015, Metropolitan secured 30 TAF and 1.3 TAF, respectively. Unlike the other transfer programs discussed herein, which were derived from agricultural sellers, a portion of these transfer supplies came from urban sellers.

### *Expected Supply Capability*

Metropolitan's recent water transfer activities demonstrate Metropolitan's ability to develop and negotiate water transfer agreements working either directly with the agricultural districts that are selling the water or with DWR acting as an intermediary via a Drought Water Bank. As discussed in the SWP section of this 2015 UWMP, significant restrictions on SWP and Central Valley Project (CVP) Delta pumping required by the biological opinions issued by the U.S. Fish and Wildlife Service (December 2008) and National Marine Fisheries Service (June 2009) will reduce anticipated SWP deliveries and therefore increase Metropolitan's need for Central Valley water transfer supplies. Unfortunately, these biological opinions result in SWP deliveries being shifted to the summer months thereby restricting the ability to pump water transfer supplies through the Delta pumping plants. On average, in dry years when Delta pumping capacity is available, Metropolitan expects to be able to purchase 125 TAF for delivery via the California Aqueduct.

### *Rationale for Expected Supply*

Historical Record

Metropolitan has made rapid progress in developing SWP transfer programs. This progress may be attributed to several factors, including Metropolitan dedicating additional staff to identify, develop, and implement SWP transfer programs; increased willingness of Central Valley agricultural interests to enter into transfer programs with Metropolitan; and Metropolitan staff's ability to work with DWR and USBR staff to facilitate SWP storage and transfer programs. The availability of dry year supplies has been demonstrated by the annual water purchase programs described above. In addition, Metropolitan participates in longer-term programs to secure water like the Yuba Accord and the Multi-Year Water Pool Demonstration Program.

The historical record for purchases from the Bank, Purchase Program, Metropolitan-initiated Central Valley programs, Yuba Accord, and Multi-Year Demonstration Program, as well as the number of sellers and buyers participating in these Programs, are strong indicators that there are significant amounts of water that can be purchased through spot market or long-term water transfers during dry years. This historical record is summarized in Table A.3-1 below.

Approximately 20 percent of these north of the Delta water transfers are dedicated to improving Delta water quality to comply with regulations governing Delta pumping.

Written Contracts or Other Proof

With near record-low precipitation in California in recent years, Governor Edmund G. Brown Jr. issued several executive orders to expedite processing of water transfers within the state:

Executive Order B-21-13 (May 20, 2013): The Department of Water Resources and the State Water Resources Control Board are to "take immediate action to address the dry conditions and water delivery limitations by doing the following: … (1) Expedite processing of one-year water transfers for 2013 and assist water transfer proponents and suppliers as necessary, provided that the transfers will not harm other legal users of water and will not unreasonably affect fish, wildlife, or other in-stream beneficial uses; (2) The SWRCB shall expedite review and processing of water transfer petitions in accordance with the applicable provisions of the Water Code; (3) The DWR shall expedite and facilitate water transfer proposals in accordance with applicable provisions of the Water Code..."

January 1, 2014 Drought Proclamation: "The Department of Water Resources and the State Water Resources Control Board will expedite the processing of water transfers, as called for in Executive Order B-21-13. Voluntary water transfers from one water right holder to another enables water to flow where it is needed most."

April 25, 2014 Drought Proclamation: "The Department of Water Resources and the State Water Resources Control Board will immediately and expeditiously process requests to move water to areas of need, including requests involving voluntary water transfers, forbearance agreements, water exchanges, or other means. If necessary, the Department will request that the Water Board consider changes to water right permits to enable such voluntary movements of water."

Executive Order B-29-15 (April 1, 2015): "The Department shall immediately consider voluntary crop idling water transfer and water exchange proposals of one year or less in duration that are initiated by local public agencies and approved in 2015 by the Department subject to the criteria set forth in Water Code section 1810." [This executive order incorporated by reference the previous drought proclamations.]

**Table A.3-1**
**Historical Record of MWD Central Valley Water Transfers**

| Program | Purchases (AF per year) | | Participants | |
|---|---|---|---|---|
| | Total | Metropolitan | Sellers | Buyers |
| 1991 Governor's Water Bank | 820,000 | 215,000 | 351 | 13 |
| 1992 Governor's Water Bank | 193,246 | 10,000 | 18 | 16 |
| 1994 Governor's Water Bank | 220,000 | 100 | 6 | 15 |
| 2001 Dry-Year Purchase Program | 138,806 | 80,000 | 9 | 8 |
| 2003 MWD Water Transfer Program | 146,230[1] | 126,230 | 11 | 1 |
| 2005 SWC Water Transfer Program | 127,275[2] | 0 | 3 | 4 |
| 2008 SWC Water Transfer Program | 39,152 | 26,621 | 4 | 8 |
| 2009 Governor's Water Bank | 47,505 | 36,900 | 10 | 9 |
| 2010 SWC Water Transfer Program | 98,959 | 88,159 | 11 | 4 |
| 2013 Multi-Year Water Pool Demo | 92,232 | 30,000 | 4 | 9 |
| 2015 Multi-Year Water Pool Demo | 3,000 | 1,374 | 1 | 14 |
| 2015 SWC Water Transfer Program | 19,686 | 12,358 | 5 | 9 |

[1] Quantities denote options Metropolitan secured, of which 20,000 AF were not exercised due to improved hydrologic conditions.
[2] Quantities denote options Metropolitan secured, but not exercised due to improved hydrologic conditions.

Agreements Between Sellers and Buyers. Since 1991, Metropolitan has entered into Central Valley water transfer agreements in eleven years with sellers, or DWR acting in an intermediary capacity for the Drought Water Banks. The essential terms and conditions for negotiating purchases, including maximum offering price, quantity of water needed, and the timing of delivery, were established in these agreements.

1999 Board Directive. Metropolitan's Board has authorized water transfers in accordance with the Water Surplus and Drought Management Plan (WSDM Plan) adopted in April 1999. The WSDM Plan is a comprehensive policy guideline for managing Metropolitan's water supply during periodic surplus and shortage conditions. During shortage conditions, the plan specifies the type, priority, and timing of drought actions, including the purchase of transfers on the spot market that could be taken in order to prevent or mitigate negative impacts on retail demands.

### *Financing*

Funds for Central Valley water transfers are included in Metropolitan's O&M budget (referenced above).

### *Federal, State, and Local Permits/Approvals*

Environmental documentation for the Drought Water Banks. In November 1993, DWR prepared and finalized a programmatic EIR for the operation of the drought water banks during future

drought events. In 2009, an emergency CEQA exemption was issued to support the Drought Water Bank.

Individual CEQA and NEPA documents for Metropolitan's 2003, 2005, and 2008 Central Valley water transfer programs. Individual sellers prepared CEQA documentation to support their transfers. In addition, the USBR prepared NEPA documentation for those transfers requiring federal approval.

### *K. Yuba Accord Dry Year Purchase Program*

#### *Source of Supply*

As part of a comprehensive settlement of a State Water Resources Control Board (SWRCB) proceeding in which the Yuba County Water Agency (YCWA) is required to increase Yuba River fishery flows, referred to as the "Yuba River Accord" (Accord), YCWA reached agreement with DWR and USBR to sell a portion of the water it would be required to release, plus additional water made available by reoperation of YCWA's storage reservoirs and groundwater substitution. DWR entered into a purchase agreement with YCWA under which one-half of the water available for purchase would be available to SWP contractors that elected to participate in the purchase program.

Under this 25-year program, the price for water is set by the agreement between DWR and the YCWA. There are four categories of water sold, and the price for each type of water depends on hydrology.

#### *Expected Supply Capability*

Metropolitan's share of the water made available under the Yuba Accord Dry Year Purchase Program is approximately 25 percent. Should other participating contractors decline to purchase their respective shares, that water is allocated to the remaining interested participating contractors. Metropolitan's likely share of assured YCWA transfer water would be at least 13,750 AF in dry years and up to 35,000 AF or more in other years. These volumes are as provided by YCWA north-of-the-Delta and are subject to conveyance losses through the Delta to the Banks Pumping Plant (approximately 20 percent).

#### *Rationale for Expected Supply*

Historical Record

Actual volumes purchased by Metropolitan during the eight years of this program were as follows:

| Year | Purchased Volume (AF) |
|---|---|
| 2008 | 26,430 |
| 2009 | 42,915 |
| 2010 | 67,068 |
| 2011 | 0 |
| 2012 | 0 |
| 2013 | 14,548 |
| 2014 | 10,962 |
| 2015 | 8,192 |

Written Contracts or Other Proof

DWR-YCWA Purchase Agreement. This December 4, 2007, agreement provides the annual determination of the amount of water to be made available by YCWA and purchased by DWR. The agreement also specifies the costs of various categories of water to be made available under a variety of hydrologic conditions.

DWR-Metropolitan Participation Agreement. This December 21, 2007, agreement provides Metropolitan's election to purchase water made available by YCWA to DWR and the scheduling delivery of the purchased water. The agreement provides for mechanisms for Metropolitan payments to DWR that are due to YCWA under the DWR-YCWA Purchase Agreement.

Amended DWR-Metropolitan Participation Agreement. This December 5, 2014, amendment established prices for surface water transfer supplies between 2016 and 2020 and clarifies YCWA's rights to sell to third parties.

#### *Financing*

Funds for purchases of water from the Yuba Accord Dry Year Purchase Program are included in Metropolitan's O&M budget (referenced above).

#### *Federal, State, and Local Permits/Approvals*

SWRCB Order WR 2008-0014. Approval of YCWA's petition to modify revised Water Right Decision 1644 related to Water Right Permits 15026, 15027, and 15030 (Applications 5632, 15204, and 15574), and petition for long-term transfer of up to 200,000 AF of water per year from YCWA to the DWR and the USBR under Permit 15026 (Application 5632) - Lower Yuba River in Yuba County.

### A.3.3 In-Basin Storage and Supplies

#### *A. Surface Storage*

#### *Source of Supply*

Surface storage is a critical element of Southern California's water resources strategy. Because California experiences dramatic swings in weather and hydrology, surface storage is important to regulate those swings and mitigate possible supply shortages. Surface storage provides a means of storing water during normal and wet years for later use during dry years, when imported supplies are limited. Since the early twentieth century, DWR and Metropolitan have constructed surface water reservoirs to meet emergency, drought/seasonal, and regulatory water needs for Southern California. These reservoirs include Pyramid Lake, Castaic Lake, Elderberry Forebay, Silverwood Lake, Lake Perris, Lake Skinner, Lake Mathews, Live Oak Reservoir, Garvey Reservoir, Palos Verdes Reservoir, Orange County Reservoir, and Metropolitan's DVL. Some reservoirs such as Live Oak Reservoir, Garvey Reservoir, Palos Verdes Reservoir, and Orange County Reservoir, which have a total combined capacity of about 3,500 AF, are used solely for regulating purposes. The remaining surface reservoirs are primarily used to meet emergency, drought, and seasonal requirements. The total gross storage capacity for these larger remaining reservoirs is 1,768,100 AF. However, not all of the gross storage capacity is available to Metropolitan; dead storage and storage allocated to others reduce the amount of storage that is available to Metropolitan to 1,669,100 AF.

### *Expected Supply Capability*

Surface storage reservoirs are an important tool that allows Metropolitan to meet the water needs of its service area. As discussed in the EIR for the Eastside Reservoir (DVL) Project dated October 1991 and Metropolitan's IRP, the allocation of available surface storage can be divided into two primary components: emergency and drought/seasonal. As specified by Metropolitan's Board of Directors in the Final EIR for DVL, "Metropolitan shall maintain sufficient water reserves within its service area to supplement local production during an emergency or severe water shortage." With DVL in operation, Metropolitan can now re-operate the surface reservoirs and meet the Board's stated objectives.

Updated Emergency Storage Requirements: Metropolitan's criteria for determining emergency storage requirements, which were approved by Metropolitan's Board, were established in the Final EIR for DVL and further discussed in the IRP. Emergency Storage requirements are based on the potential for a major earthquake to damage the CRA, LAA, and both branches of the California Aqueduct that could force the aqueducts out of service for six months. During this period, a mandatory reduction in water use of 25 percent from normal-year demand levels would be instituted, water stored in surface reservoirs and groundwater basins under Metropolitan's interruptible program would be made available, and full local groundwater production would be sustained.

The storage reserved in system reservoirs for emergency purposes is shown in Table A.3-2.

Updated Storage Requirements for Dry-Year Supply and Seasonal Needs: Storage capacity in system reservoirs, including DVL, is also earmarked for dry-year supply and system regulation purposes. Dry-year supply storage within Metropolitan's service area is required to meet the additional water demands that occur during single-year and extended droughts. As specified in the Final EIR for DVL and further discussed in the IRP, this storage requirement is defined as the difference between average-year demand and above average demand during dry years. In addition to dry-year storage, seasonal storage is required to meet seasonal peak demands, which are defined as the difference between average winter demands and average summer demands. The dry-year supply and seasonal storage also provides sufficient reserves to permit approximately five percent downtime for rehabilitation, repair, and maintenance of raw water transmission facilities.

**Table A.3-2**
**Surface Storage Utilization**
(acre-feet per year)

| Forecast Year | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|
| **MWD Dry-Year/Seasonal Surface Storage** | | | | | |
| DVL, Mathews, Skinner | 720,000 | 720,000 | 720,000 | 720,000 | 720,000 |
| Flexible Storage in Castaic & Perris | 219,000 | 219,000 | 219,000 | 219,000 | 219,000 |
| ***Subtotal of Dry-Year/Seasonal Storage*** | ***939,000*** | ***939,000*** | ***939,000*** | ***939,000*** | ***939,000*** |
| **MWD Emergency Storage** | | | | | |
| DVL, Mathews, Skinner | 312,000 | 312,000 | 312,000 | 312,000 | 312,000 |
| Emergency Storage in DWR Reservoirs | 334,000 | 334,000 | 334,000 | 334,000 | 334,000 |
| ***Subtotal of Emergency Storage*** | ***646,000*** | ***646,000*** | ***646,000*** | ***646,000*** | ***646,000*** |
| **Total MWD Surface Storage** | **1,585,000** | **1,585,000** | **1,585,000** | **1,585,000** | **1,585,000** |

Historical Record

Metropolitan has a contract with the DWR that allows use of its terminal reservoirs, such as Castaic Lake on the West Branch and Lake Perris on the East Branch of the California Aqueduct (see Section A.3.3.B for a discussion of Metropolitan's contractual rights to storage in these DWR reservoirs). In addition, Metropolitan owns and operates surface reservoirs such as Lake Skinner, Lake Mathews, and DVL to enhance water supply reliability for its member agencies.

Written Contracts or Other Proof of Usage

The surface reservoirs used by Metropolitan are available either by contract (in the case of the DWR terminal reservoirs) or by construction of its own facilities. The following historical record is provided:

November 1960 Contract between the State of California Department of Water Resources and the Metropolitan Water District of Southern California for a Water Supply. This Contract and its numerous amendments describe Metropolitan's legal access to and obligations for the operation of the SWP for the benefit of its Contractors. Metropolitan has an entitlement to 1,911,500 AF of water each year subject to availability. The terms of this Contract describe Metropolitan's rights to and obligations for the terminal surface reservoirs for water supply purposes.

November 1974 Memorandum of Understanding and Agreement on Operation of Lake Skinner. This MOU and the January 2005 Amendment, signed by Metropolitan and other affected parties, govern Metropolitan's operations of Lake Skinner in Riverside County. The DWR Division of Safety and Dams also reviews monitoring data on the safety of the dam annually.

November 1994 Memorandum of Understanding on Operation of Domenigoni Valley Reservoir (now known as Diamond Valley Lake). This MOU, signed by Metropolitan and other affected parties, governs Metropolitan's operations of DVL in Riverside County. The DWR Division of Safety and Dams also reviews monitoring data on the safety of the dam annually.

Elderberry Forebay Contract for Conditions for Use. Conditions for use of storage are described in the contract between the DWR, State of California, and the Department of Water and Power, City of Los Angeles, for Cooperative Development, West Branch, California Aqueduct; Amendment No. 1, July 3, 1969; and Amendment No. 4, June 27, 1985.

June 2002 Division of Safety of Dams Certificate of Approval. The DWR, Division of Safety of Dams issued the Certificate of Approval for operation of DVL in early 2000, with three conditions. These conditions were: (1) Satisfactory operation of the butterfly valves and emergency gate in the inlet/outlet tower, (2) completion of the Tank Saddle Cutoff remediation, and (3) completion of the Signal Spillway. Metropolitan completed these conditions in 2001, and DVL is currently operational in accordance with the Certificate of Approval.

October 1991 Final EIR for the Eastside Reservoir Project (DVL). The EIR established criteria for integrating the operations of Metropolitan's reservoirs and DWR's southern reservoirs for emergency purposes. These criteria also provided that Metropolitan reservoirs could be expected to withdraw all drought storage water within a two-year period.

## B. Flexible Storage Use of Castaic Lake and Lake Perris

### Source of Storage

Metropolitan's flexible storage accounts in Castaic Lake and Lake Perris, which are SWP reservoirs, is 153,940 AF and 65,000 AF, respectively. These accounts provide Metropolitan with dry-year supply that is independent of the Table A allocation. Metropolitan can withdraw water from these reservoirs in addition to its allocated supply in any year on an as-needed basis. Withdrawn water must be replaced from supplies available to Metropolitan within five years of each withdrawal. This "flexible storage" is available in Castaic Lake to Metropolitan, Ventura County Flood Control and Water Conservation District, and to the Castaic Lake Water Agency. It is available in Lake Perris to Metropolitan only.

### Expected Supply Capability

The dry year supply available to Metropolitan from the flexible storage use of Castaic Lake and Lake Perris totals 218,940 AF, made up of 153,940 AF in Castaic Lake and 65,000 AF in Lake Perris. Table A.3-3 shows the use of this available supply in accordance with Metropolitan's operating criteria.

In 2005, seismic concerns arose regarding the Lake Perris Dam. In response, DWR plans to reduce the storage amount at Lake Perris by half until those concerns can be studied and addressed. In the long-term, the reduction in storage may potentially impact the amount of flexible storage available to Metropolitan from Lake Perris, and also impact the total amount of emergency storage available. However, since 2005, Metropolitan has continued to withdraw and replace water from the reservoir, which is operating at a lower level. In November 2011, DWR issued a Final EIR for the repair of the Dam. Construction began in August 2014 and is anticipated to continue through 2017.

**Table A.3-3**
**Estimated Water Supplies Available for Metropolitan's Use**
**Under the Flexible Storage Use of**

* Source: Metropolitan's operating criteria.

### *Rationale for Expected Supply*

Implementation Status
Express provisions related to flexible storage have been incorporated in Metropolitan's SWP contract since 1995. The operating options have been available for use since that time and will continue to be in effect indefinitely as a part of the SWP contracts.

Historical Record
Metropolitan has exercised the flexible storage provision on numerous occasions through and including calendar year 2014. Its use is based on existing contract provisions.

DWR Bulletin 132-94. The use of Castaic Lake and Lake Perris is determined in accordance with the proportionate use factors from Bulletin 132-94, Table B, upon which capital cost repayment obligations are based. Based on its capital repayment obligations, Metropolitan's proportionate use of Castaic Lake is 96.2 percent and of Lake Perris is 100 percent. Per its SWP contract, Metropolitan has express rights to use certain portions of the SWP southern reservoirs independently of DWR to supply water in amounts in addition to approved SWP deliveries.

Metropolitan's SWP Contract. Metropolitan's SWP contract was amended in 1995 to include Article 54, "Usage of Lakes Castaic and Perris." This article provides flexible storage to contractors participating in repayment of the capital costs of Castaic Lake and Lake Perris. Each contractor shall be permitted to withdraw up to a Maximum Allocation from Castaic Lake and Lake Perris. These contractors may withdraw a collective Maximum Allocation up to 160 TAF in Castaic Lake and 65 TAF in Lake Perris, which shall be apportioned among them pursuant to the respective proportionate use factors, as shown in Table A.3-4 below.

### *Financing*

The cost associated with the withdrawal and replacement of water in the flexible storage is included in Metropolitan's annual payments under the State Water Contract.

### *Federal, State, and Local Permits/Approvals*

The flexible storage provision became effective in 1995. DWR has the approval authority to affect changes in the operations and usage of existing SWP facilities, including Castaic Lake and Lake Perris.

**Table A.3-4**
**Flexible Storage Allocations**

| Participating Contractor | Proportionate Use Factor | Maximum Flexible Storage Allocation (AF) |
|---|---|---|
| Castaic Lake | | |
| Metropolitan | .96212388 | 153,940 |
| Ventura County Flood Control and Water Conservation District | .00860328 | 1,376 |
| Castaic Lake Water Agency | .02927284 | 4,684 |
| Total Castaic Lake | 1.00000000 | 160,000 |
| Lake Perris[1] | 1.00000000 | 65,000 |
| Metropolitan | | |

[1] The 2003 Exchange Agreement among Metropolitan, CVWD, and DWA, among other things, transferred to CVWD and DWA a portion of Metropolitan's capacity in the California Aqueduct and the East Branch including Lake Perris. However, Metropolitan's rights to the full 65,000 AF of Lake Perris flexible storage account was retained by Metropolitan.

## C. Metropolitan Surface Reservoirs

### Source of Supply

Storage capacity in Metropolitan reservoirs, including Lake Skinner, Lake Mathews, Live Oak Reservoir, Garvey Reservoir, Palos Verdes Reservoir, Orange County Reservoir, and DVL, is earmarked to meet emergency, dry-year/seasonal, and system regulation needs, as these have been defined above.

### Expected Supply Capability

The total available storage capacity for all Metropolitan-controlled surface reservoirs (Metropolitan-owned and DWR terminal reservoirs) is 1,585,300 AF. As discussed earlier, approximately 650 TAF has been set aside to meet the emergency storage requirements of the service area. After accounting for emergency storage, the surface storage available in Metropolitan-owned reservoirs to meet dry-year/seasonal requirements is presented in Table A.3-5.

### Rationale for Expected Supply

Program Facilities

Major facilities for Lake Mathews include an earthen dam to impound water and a recently completed new outlet tower. Major facilities for Lake Skinner include an earthen dam to impound water, an outlet tower, an inlet from the San Diego Canal to deliver water into the reservoir, a water treatment filtration facility, and recreational facilities consisting of a marina, parks, swimming areas, golf course, and hiking trails. Major facilities at DVL include three earthen dams to impound water, an inlet/outlet tower, a secondary inlet from the Inland Feeder, a large pumping station to deliver water into the reservoir, and power generating facilities. Recreational facilities consisting of a marina, parks, swimming areas, golf course, hiking trails, equestrian trails, and lodging are planned.

Historical Record

The DVL has been operational for more than 15 years. Lake Mathews and Lake Skinner have been in service for over 30 years.

November 1974 Memorandum of Understanding and Agreement on Operation of Lake Skinner. This MOU and the January 2005 Amendment, signed by Metropolitan and other affected parties, govern Metropolitan's operations of Lake Skinner in Riverside County. The DWR Division of Safety and Dams also reviews monitoring data on the safety of the dam annually.

October 1991 Final EIR for the Eastside Reservoir Project (DVL). The EIR established criteria for integrating the operations of Metropolitan's reservoirs and DWR's southern reservoirs for emergency purposes. These criteria also provided that Metropolitan reservoirs could be expected to withdraw all drought storage water within a two-year period.

November 1994 Memorandum of Understanding on Operation of Domenigoni Valley Reservoir (now known as Diamond Valley Lake). This MOU, signed by Metropolitan and other affected parties, governs Metropolitan's operations of DVL in Riverside County. The DWR Division of Safety and Dams also reviews monitoring data on the safety of the dam annually.

June 2002 Division of Safety of Dams Certificate of Approval. The DWR, Division of Safety of Dams issued the Certificate of Approval for operation of DVL in early 2000, with three conditions. These conditions were: (1) satisfactory operation of the butterfly valves and emergency gate in the inlet/outlet tower, (2) completion of the Tank Saddle Cutoff remediation, and (3) completion of the Signal Spillway. Metropolitan completed these conditions in 2001, and DVL is currently operational in accordance with the Certificate of Approval.

**Table A.3-5**
**Estimated Supplies Available from Metropolitan's Surface Storage**
Program Capabilities
(acre-feet per year)

| Forecast Year | Multiple Dry Years (1990-92) | Single Dry Year (1977) |
|---|---|---|
| 2020 | 189,000 | 566,000 |
| 2025 | 211,000 | 634,000 |
| 2030 | 234,000 | 702,000 |
| 2035 | 262,000 | 788,000 |
| 2040 | 271,000 | 814,000 |

Source: Metropolitan analysis

### *Financing*

The capital cost of DVL, Lake Mathews, and Lake Skinner was financed by a combination of revenue bonds and operating revenues. Annual operating costs, including maintenance and pumping, are included in Metropolitan's annual O&M budget (referenced above).

### *Federal, State, and Local Permits/Approvals*

All necessary permits have been obtained. A permit to generate and sell power has been acquired from the Federal Energy Regulatory Commission. No further regulatory permits are required.

## D. Groundwater Conjunctive Use Programs

### Source of Supply

Metropolitan's IRP established the strategy to store imported water that is most available during wet years in surface reservoirs or groundwater aquifers for later use during droughts and emergencies. In this way, Metropolitan can reduce its reliance on direct deliveries from the SWP and the Colorado River during dry years when competing demands by other users and risks to the watershed ecosystems are greatest.

Groundwater basins in Metropolitan's service area have potential to store more than 4.0 MAF of additional water supplies following depletions that have occurred since 2008 due to continuing extreme dry weather. In 2000, the Association of Ground Water Agencies (AGWA) published "Groundwater and Surface Water in Southern California: A Guide to Conjunctive Use," which estimated a substantial potential for developing dry-year or long term conjunctive use within Metropolitan's service area. In 2007, Metropolitan published the Groundwater Assessment Study which estimated 3.2 MAF of space in groundwater basins available for storage. Based on these studies and recent updates, Metropolitan has implemented a conjunctive use program for imported water storage in groundwater basins within the service area. Additionally, the 2015 Update of the Integrated Water Resources Plan (2015 IRP Update) identified policies and strategies for ensuring sustainable groundwater production in light of a potential for extended multiple-year dry conditions.

### Rationale for Expected Supply

Implementation Status:

The status of implementation for the groundwater conjunctive use programs has been described in the body of this report.

Historical Record

The Main San Gabriel Cyclic Storage Agreements. The cyclic agreements allow supplemental imported water to be delivered to the basin in advance of requirement to support groundwater production. This added flexibility allows scheduling to balance imported water supply availability and delivery capacity with available local conveyance and spreading capacity.

The Cyclic Storage Agreement with Upper San Gabriel Valley MWD allows pre-delivery and storage of up to 100 TAF of imported water. The agreement was originally signed in 1975 for a term of five years and has been extended in five year increments through November 2018. The Cyclic Storage Agreement with Three Valleys MWD allows for pre-delivery and storage of up to 40 TAF. This agreement was originally signed in 1991 for a term of five years and has been extended in five year increments. This agreement is currently extended until November 2018. Both agreements are expected to be renewed repeatedly in the future.

Written Contracts or Other Proof

Metropolitan's dry-year supply from the groundwater conjunctive use programs is based on Metropolitan's Board actions and agreements.

Proposition 13 Groundwater Conjunctive Use Programs.

AGWA published "Groundwater and Surface Water in Southern California: A Guide to Conjunctive Use" in 2000 identifying the potential storage capacity for groundwater basins.

Metropolitan Water District published the Groundwater Assessment Study Report in 2007 in collaboration with its member agencies and groundwater basin managers documenting existing use and development of groundwater resources in Metropolitan's service area and estimating additional groundwater basin storage potential.

Principles for groundwater storage adopted by the Metropolitan Board in January 2000.

Resolution for Proposition 13 Funds adopted by the Metropolitan Board in October 2000.

Agreement executed with the DWR for Interim Water Supply Construction Grant Commitment Safe Drinking Water, Clean Water, Watershed Protection and Flood Protection (Proposition 13, Chapter 9, Article 4) providing for Metropolitan to administer $45 million in state Proposition 13 grant funds for groundwater reliability programs; October 2000

Agreement executed for Long Beach Conjunctive Use Project, July 2002

Agreement executed for Live Oak Conjunctive Use Project, October 2002

Agreement executed for Foothill Area Groundwater Storage Project, February 2003

Agreement executed for Chino Basin Programs, June 2003

Agreement executed for Orange County Groundwater Storage Program, June 2003

Agreement executed for Compton Conjunctive Use Program, February 2005

Agreement executed for Long Beach Conjunctive Use Project — Expansion in Lakewood, July 2005

Agreement executed for Upper Claremont Basin Groundwater Storage Program, September 2005

Agreement executed for Elsinore Basin Conjunctive Use Program, May 2008

All of these programs have an initial 25-year term, with provision for renewal or extension after that period.

### *Financing*

Financing has been supplied from multiple sources as discussed below:

Financing from Proposition 13 and Additional Groundwater Storage Programs.

Proposition 13 funds ($45 million) were allocated to Metropolitan by the state in May 2000 for the development of local groundwater storage projects.

Metropolitan has executed groundwater storage funding agreements for nine storage programs, expended $45 million of the Proposition 13 funds, and appropriated over $35 million of Metropolitan capital funds for the storage programs in the Orange County and Chino groundwater basins. All nine storage programs have completed facilities and are on-line. Metropolitan has called for production of stored water beginning in 2007.

Table A.3-6 provides details on groundwater storage programs.

### *Federal, State, and Local Permits/Approvals*

Long Beach Conjunctive-use Storage Project. Environmental documentation for the Long Beach Conjunctive-use Storage Project was certified by the City of Long Beach in August 2001.

Live Oak Basin Conjunctive-use Storage Project. Environmental documentation for the Live Oak Basin Conjunctive-use Storage Project was certified by Three Valleys MWD in January 2002.

Foothill Area Groundwater Storage Project. Environmental documentation for the Foothill Area Groundwater Storage Project was certified by Foothill Municipal Water District in January 2003.

Chino Basin Programs Groundwater Storage Project. Environmental documentation for the Chino Basin Programs Groundwater Storage Project was certified by Inland Empire Utility Agency in December 2002.

Long Beach Conjunctive Use Storage Project — Expansion in Lakewood. Environmental documentation for the project was certified by the City of Lakewood in May 2005.

City of Compton Conjunctive Use Program. Environmental documentation for the project was certified by the City of Compton in December 2004.

Orange County Groundwater Conjunctive Use Program. Environmental documentation for the project was certified by Orange County Water District in March 1999 and in July 2002.

Upper Claremont Basin Groundwater Storage Program. Environmental documentation for the project was certified by Three Valleys MWD in July 2005.

Elsinore Basin Conjunctive Use Program. Environmental documentation for the project was certified by Elsinore Valley MWD in February 2004.

### *E. Program under Development*

Regional Recycled Water Supply Program: Metropolitan is exploring the potential development of a regional recycled water program in partnership with the Sanitation Districts of Los Angeles County. This program would purify and reuse water for the recharge of groundwater basins and augment water supplies within the Southern California region.

### *F. IRP Development Targets*

Colorado River: The 2015 IRP Update calls for developing sufficient base supply programs to ensure that a minimum of 900 TAF of diversions are available when needed and to ensure access to 1.2 MAF of supplies in dry years through flexible programs and storage. This will require an approach that maintains existing base supply availability, minimizes reductions in base supplies from risks and challenges, and augments base supply amounts to increase resilience to any reductions that may occur.

State Water Project: The 2015 IRP Update goal for SWP supplies is to adaptively manage flow and export regulations in the near term and to achieve a long-term Delta solution that addresses ecosystem and water reliability challenges. The goal for SWP supplies in the 2015 IRP Update is an average of 984 TAF of SWP supplies in the near-term and 1.2 MAF on average starting in 2030 when a long-term Delta solution is estimated to be in place. The increase in supply due to Delta improvements is reflected in Table A.3-7 as a program under development for the California Aqueduct.

Conservation and Local Supplies: The 2015 IRP Update identifies that approximately 200 TAF of new local supply and water conservation is needed, in conjunction with stabilizing, protecting, and restoring the region's imported supplies. The approach for water conservation is targeting water-use reductions through aggressive implementation of the state's Model Water Efficient Landscape Ordinance standards. The water conservation approach, if successful, will result in approximately 180 TAF of new water conservation savings. The approach for local supplies is to develop the remaining 20 TAF of additional need through recycling, groundwater recovery, and seawater desalination. These 2015 IRP Update development targets are reflected in Table A.3-7 as programs under development for In-Region Storage and Programs.

**Table A.3-6**

## List of Acronyms

AF – Acre-feet
CUP – Groundwater Conjunctive Use Program
CWD – County Water District
DWP – Drought Management Plan
IAWP – Interim Agricultural Water Program Reductions and Rates
IICP – Incremental Interruption and Conservation Plan
IRP – Integrated Resources Plan
GPCD – Gallons per Capita per Day
M&I – Municipal and Industrial
MWD – Municipal Water District
RUWMP – Regional Urban Water Management Plan
SWP – State Water Project
WSAP – Water Supply Allocation Plan
WSDM – Water Surplus and Drought Management

## Definitions

**Extraordinary Supplies**- Deliberate actions taken by member agencies to augment the total regional water supply only when Metropolitan is allocating supplies through the WSAP.

**Groundwater Recovery**- The extraction and treatment of groundwater making it usable for a variety of applications by removing high levels of chemicals and/or salts.

**In-lieu deliveries**- Metropolitan-supplied water bought to replace water that would otherwise be pumped from the groundwater basins.

**Seawater Barrier**- The injection of fresh water into wells along the coast to protect coastal groundwater basins from seawater intrusion. The injected fresh water acts like a wall, blocking seawater that would otherwise seep into groundwater basins as a result of pumping.

## Section 1: Introduction

Calendar Year 2007 introduced a number of water supply challenges for the Metropolitan Water District of Southern California (Metropolitan) and its service area. Critically dry conditions affected all of Metropolitan's main supply sources. In addition, a ruling in the Federal Courts in August 2007 provided protective measures for the Delta Smelt in the Sacramento-San Joaquin River Delta which brought uncertainty about future pumping operations from the State Water Project. This uncertainty, along with the impacts of dry conditions, raised the possibility that Metropolitan would not have access to the supplies necessary to meet total firm demands[1] and would have to allocate shortages in supplies to the member agencies.[2]

In preparing for this possibility, Metropolitan staff worked jointly with the member agency managers and staff to develop a Water Supply Allocation Plan (WSAP). The WSAP includes the specific formulas for calculating member agency supply allocations and the key implementation elements needed for administering an allocation should a shortage be declared. The WSAP became the foundation for the urban water shortage contingency analysis required under Water Code Section 10632 and was incorporated into Metropolitan's 2010 Regional Urban Water Management Plan (RUWMP).

## Section 2: Development Process

### Member Agency Input

Between July 2007 and February 2008, Metropolitan staff worked cooperatively with the member agencies through a series of member agency manager meetings and workgroups to develop a formula and implementation plan to allocate supplies in case of shortage. These workgroups provided an arena for in-depth discussion of the objectives, mechanics, and policy aspects of the different parts of the WSAP. Metropolitan staff also met individually with fifteen member agencies for detailed discussions of the elements of the recommended proposal. Metropolitan introduced the elements of the proposal to many nonmember retail agencies in its service area by providing presentations and feedback to a number of member agency caucuses, working groups, and governing boards. The discussions, suggestions, and comments expressed by the member agencies during this process contributed significantly to the development of this WSAP.

### Board of Directors Input

Throughout the development process Metropolitan's Board of Directors was provided with regular progress reports on the status of this WSAP, with oral reports in September, October, and December 2007, an Information Board of Directors Letter with a draft of the WSAP in November 2007, and a Board of Directors Report with staff recommendations in January 2008. Based on Water Planning and Stewardship Committee discussion of the staff recommendations and further review of the report by

[1] Firm demands are also referred to as uninterruptable demands; likewise non-firm demands are also called interruptible demands.

[2] See Appendix A: Metropolitan Member Agencies.

the member agencies, refinements were incorporated into the WSAP for final consideration and action in February 2008. The WSAP was adopted at the February 12, 2008 Board of Directors meeting.[3]

## The 12-Month Review Process

When the Board adopted the WSAP in February 2008, the decision specified a formal revisit of the WSAP commencing in February 2010. The scheduled revisit was meant to ensure the opportunity for Metropolitan staff and the member agencies to re-evaluate the WSAP and recommend appropriate changes to the Board of Directors.

In April 2009, the Board voted to implement the WSAP for the first time. The WSAP was implemented at a Level 2 allocation level, and was in effect for the period of July 1, 2009, through June 30, 2010. Since implementation of the 2009/10 WSAP began in July 2009, a number of practical issues relating to the WSAP were identified by staff and the member agencies for further consideration during the 12-Month Review Process. Metropolitan staff engaged with the member agencies in a formal review of the WSAP from January through May 2010. During the review process the member agency managers participated in a series of six workshops. The focus of these workshops was to facilitate in-depth discussion on WSAP-related issues and lessons learned since the WSAP was implemented in July 2009. The proposed adjustments to the WSAP developed during the review process were adopted at the August 17, 2010 Board of Directors meeting[4].

## The Three-Year Review Process

The Board action to adopt of the WSAP in February 2008 also directed staff to review the WSAP formula three years after the February 2008 adoption. February 2011 marked the three-year anniversary since the adoption of the WSAP. Similar to the 12-Month Review Process, the purpose of the Three-Year Review Process was to provide an opportunity for Metropolitan staff and the member agencies to re-evaluate the plan and recommend appropriate changes for board consideration.

Metropolitan staff met with the member agencies in a formal review of the WSAP from February through August 2011. Staff and member agency managers participated in a series of eleven workshops. Proposed adjustments to the WSAP developed during the process were adopted at the September 13, 2011 Board of Directors meeting.[5]

[3] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix B: Water Supply Allocation Plan Process Timeline.

[4] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix C: 12-Month Review Process and Results.

[5] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix D: Three-Year Review Process and Results.

## 2014 Review Process

In 2014, California was challenged with a third year of severe drought.[6] Metropolitan managed its operations through significant use of regional storage reserves. It was anticipated that end of year total dry storage reserves would approach levels similar to those when the WSAP was last implemented in 2009.

Following discussion at the June 2014 Water Planning and Stewardship Committee, Metropolitan staff convened a member agency working group to revisit the WSAP. The purpose of the working group was to collaborate with member agencies to identify potential revisions to the WSAP in preparation for mandatory supply allocations in 2015. There were eight working group meetings and three discussions at the monthly Member Agency Managers' Meetings.

The process focused on three areas of the WSAP: the Base Period, the Allocation Formula, and the Allocation enforcement mechanism. Proposed adjustments to the WSAP developed during the process were adopted at the December 9, 2014 Board of Directors meeting. [7]

[6] The Governor of California proclaimed a State of Emergency due to drought conditions on January 17, 2014 and, on April 24, 2014 issued an Executive Order proclaiming a continued State of Emergency noting drought conditions have persisted for the last three years and authorizing adoption and implementation of emergency regulations.

[7] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix E: 2014 Review Process and Results.

## Section 3: Review of Historical Shortage Plans[8]

The WSAP incorporates key features and principles from the following historical shortage allocation plans but will supersede them as the primary and overarching decision tool for water shortage allocation.

### Interruptible Water Service Program

As part of the new rate structure implemented in 1981, Metropolitan's Board of Directors adopted the Interruptible Water Service Program (Interruptible Program) which was designed to address short-term shortages of imported supplies. Under the Interruptible Program, Metropolitan delivered water for particular types of use to its member agencies at a discounted rate. In return for this discounted rate, Metropolitan reserved the right to interrupt delivery of this Interruptible Program water so that available supplies could be used to meet municipal and industrial demands.

### Incremental Interruption and Conservation Plan

The ability to interrupt specific deliveries was an important element of Metropolitan's strategy for addressing shortage conditions when it adopted the Incremental Interruption and Conservation Plan (IICP) in December 1990. Reductions in IICP deliveries were used in concert with specific objectives for conservation savings to meet needs during shortages. The IICP reduced Interruptible Service deliveries in stages and provided a pricing incentive program to insure that reasonable conservation measures were implemented.

### 1995 Drought Management Plan

The 1995 Drought Management Plan (DMP) was a water management and allocation strategy designed to match supply and demand in the event that available imported water supplies were less than projected demands. Adopted by the Metropolitan Board of Directors in November 1994, the 1995 DMP was a short-term plan designed to provide for the 1995 calendar year only. The primary objective of the 1995 DMP was to identify methods to avoid implementation of mandatory reductions. The 1995 DMP included various phases and a step-by-step strategy for evaluating supply and demand conditions and utilizing Metropolitan's available options, with the final phase being implementation of the revised IICP.

### 1999 Water Surplus and Drought Management Plan

Metropolitan staff began work on the Water Surplus and Drought Management (WSDM) Plan in March 1997 as part of the Integrated Water Resources Plan (IRP), which was adopted by Metropolitan's Board of Directors in January 1996. The IRP established regional water resource targets, identifying the need for developing resource management policy to guide annual operations. The WSDM Plan defined Metropolitan's resource management policy by establishing priorities for the use of regional resources to achieve the region's reliability goal identified in the IRP. In April 1999, Metropolitan's Board of Directors adopted the WSDM Plan.

[8] A summary of the key elements in the following allocation plan is found in Appendix F: Summary of Historical Shortage Plans.

The WSDM Plan also included a set of principles and considerations for staff to address when developing specific allocation methods. The WSDM Plan stated the following guiding principle to be followed in developing any future allocation scheme:

> *"Metropolitan will encourage storage of water during periods of surplus and work jointly with its member agencies to minimize the impacts of water shortages on the region's retail consumers and economy during periods of shortage."*[9]

This principle reflects a central desire for allocation methods that are both equitable and minimize regional hardship to retail water consumers. The specific considerations postulated by the WSDM Plan to accomplish this principle include the following:[10]

- The impact on retail customers and the economy
- Allowance for population and growth
- Change and/or loss of local supply
- Reclamation/Recycling
- Conservation
- Investment in local resources
- Participation in Metropolitan's interruptible programs
- Investment in Metropolitan's facilities.

## Section 4: Water Supply Allocation Formula

Based on the guiding principle and considerations described in the WSDM Plan, Metropolitan staff and the member agencies developed a specific formula for allocating water supplies in times of shortage. The formula seeks to balance the impacts of a shortage at the retail level while maintaining equity on the wholesale level, and takes into account growth, local investments, changes in supply conditions and the demand hardening[11] aspects of non-potable recycled water use and the implementation of conservation savings programs. The formula, described below, is calculated in three steps: base period calculations, allocation year calculations, and supply allocation calculations.[12] The first two steps involve standard computations, while the third section contains specific methodology developed for this WSAP.

### Base Period Calculations

The first step in calculating a water supply allocation is to estimate water supply and demand using a historical base period with established water supply and delivery data. The base period for each of the different categories of demand and supply is calculated using data from the fiscal years (July through June) ending 2013 and 2014.[13]

---

[9] WSDM Plan, p. 1. Emphasis added.
[10] WSDM Plan, p. 2.
[11] Demand hardening is the effect that occurs when all low-cost methods of decreasing overall water demand have been applied (e.g., low-flow toilets, water recycling) and the remaining options to further decrease demand become increasingly expensive and difficult to implement.
[12] Detailed operational elements of these objectives and a numerical example are discussed in Appendix G: Water Supply Allocation Formula Example.
[13] Exceptions to this methodology are noted in the descriptions of base period calculations.

**Base Period Local Supplies:** Local supplies for the base period are calculated using a two-year average of groundwater production, groundwater recovery, Los Angeles Aqueduct supply, surface water production, and other imported supplies. Non-potable recycling production is not included in this calculation due to its demand hardening effect.

**Base Period Wholesale Demands:** Demands on Metropolitan for the base period are calculated using a two-year average of firm purchases and in-lieu deliveries to long-term groundwater replenishment, conjunctive use, cyclic, and supplemental storage programs.

**Base Period Retail Demands:** Total retail-level municipal and industrial (M&I) demands for the base period are calculated by adding the Base Period Wholesale Demands and the Base Period Local Supplies. This estimates an average total demand for water from each agency.

**Base Period Mandatory Conservation Credit:** Metropolitan allows a consultation process that enables member agencies to describe mandatory water use restrictions and/or rationing restrictions that were in place within their service areas during the Base Period. Restrictions may vary among agencies but include restricted water uses, fines, and water budget or penalty based rate structures that are enacted by the governing body of the member agency or retail agency. Following the consultation process, Metropolitan staff will recommend adjustments based on evidence of reduced GPCD. To qualify for an adjustment, GPCD reductions would have to be observed that are beyond those expected from the agency's ongoing conservation efforts and trends.

## Allocation Year Calculations

The next step in calculating the water supply allocation is estimating water needs in the allocation year. This is done by adjusting the base period estimates of retail demand for population or economic growth and changes in local supplies.

**Allocation Year Retail Demands:** Total retail M&I demands for the allocation year are calculated by adjusting the Base Period Retail Demands for baseline inflation and growth.

***Baseline Inflation Adjustment:*** Baseline inflation occurs when non-potable recycling or conservation is developed after the Base Period. The development of these supplies reduces actual demands for water in the Allocation Year. Because non-potable-recycling and conservation are excluded from the WSAP formula, the actual need for water in the Allocation year is overestimated. The Baseline Inflation Adjustment removes increases in non-potable recycling and conservation annually from the Base Period forward to better reflect the true need for water in the Allocation Year.

***Growth Adjustment:*** The growth adjustment is calculated using the estimated actual annual rate of population growth at the county level, as generated by the California Department of Finance, whenever possible. For years without complete data, the growth rate is calculated using an average of the three most recent years available. Growth will be allocated based on historical per capita water use during the Base Period, with a cap equal to Metropolitan's IRP Target for Water Use Efficiency. For

allocation years up to and including 2014, the cap will be 163 GPCD, and for allocation years 2015-2020 the cap will reduce linearly from 163 to 145 GPCD. On an appeals basis, member agencies may request that their adjustment be calculated using member agency level population growth. A weighted combination of actual population and actual employment growth rates may also be requested.

**Allocation Year Local Supplies:** Allocation Year Local Supplies include groundwater production, groundwater recovery, Los Angeles Aqueduct supply, surface water production, seawater desalination, and other imported supplies. Estimates of Allocation Year Local Supplies are provided by the member agencies upon implementation of a WSAP. If estimates are not provided, Metropolitan will use the sum of the Base Period Local Supplies and Base Period In-Lieu Deliveries as a default. Agencies may provide updated estimates at any time during the Allocation Year to more accurately reflect their demand for Metropolitan supplies.

**Extraordinary Supplies:** Under the WSAP formula, local supply production in the Allocation Year can either be designated as a "planned" supply, or as an "extraordinary" supply.[14] This is an important designation for a member agency because the two types of supplies are accounted for differently in the WSAP formula. Local supplies classified at Extraordinary Supply are only partially included (scaled depending on the WSAP Level) as local supplies. This has the effect of providing significantly more benefit to the member agency in terms of total water supply that is available to the retail customer.[15]

**Allocation Year Wholesale Demands:** Demands on Metropolitan for the allocation year are calculated by subtracting the Allocation Year Local Supplies from the Allocation Year Retail Demands.

## Water Supply Allocation Calculations

The final step is calculating the water supply allocation for each member agency based on the allocation year water needs identified in Step 2. The following table displays the elements that form the basis for calculating the supply allocation. Each element and its application in the allocation formula are discussed below.

Table 1: Shortage Allocation Index

| (a) Regional Shortage Level | (b) Wholesale Minimum Percentage | (c) Maximum Retail Impact Adjustment Percentage |
|---|---|---|
| 1 | 92.5% | 2.5% |
| 2 | 85.0% | 5.0% |
| 3 | 77.5% | 7.5% |
| 4 | 70.0% | 10.0% |

[14] Appendix H: Board Policy Principles on Determining the Status of Extraordinary Supply lists the key Board principles used in determining if a supply qualifies as an Extraordinary Supply.

[15] See Appendix G: Water Supply Allocation Formula Example for specific allocation formulae.

| | | |
|---|---|---|
| 5 | 62.5% | 12.5% |
| 6 | 55.0% | 15.0% |
| 7 | 47.5% | 17.5% |
| 8 | 40.0% | 20.0% |
| 9 | 32.5% | 22.5% |
| 10 | 25.0% | 25.0% |

**Regional Shortage Level:** The WSAP formula allocates shortages of Metropolitan supplies over ten levels.

**Wholesale Minimum Allocation:** The Wholesale Minimum Allocation ensures a minimum level of Metropolitan supplied wholesale water service to each member agency.

**Maximum Retail Impact Adjustment:** The purpose of this adjustment is to ensure that agencies with a high level of dependence on Metropolitan do not experience disparate shortages at the retail level compared to other agencies when faced with a reduction in wholesale water supplies. The Maximum Retail Impact Percentage is prorated on a linear scale based on each member agency's dependence on Metropolitan at the retail level. This percentage is then multiplied by the agency's Allocation Year Wholesale Demand to determine an additional allocation.

**Conservation Demand Hardening Credit:** The Conservation Demand Hardening Credit addresses the increased difficulty in achieving additional water savings at the retail level that comes as a result of successful implementation of water conserving devices and conservation savings programs. To estimate conservation savings, each member agency will establish a historical baseline Gallons Per Person Per Day (GPCD) calculated in a manner consistent with California Senate Bill SBx7-7.[16] Reductions from the baseline GPCD to the Allocation Year are used to calculate the equivalent conservation savings in acre-feet. The Conservation Demand Hardening Credit is based on an initial 10 percent of the GPCD-based Conservation savings plus an additional 5 percent for each level of Regional Shortage set by the Board during implementation of the WSAP. The credit will also be adjusted for:

- The overall percentage reduction in retail water demand
- The member agency's dependence on Metropolitan

The credit is calculated using the following formula:

*Conservation Demand Harding Credit = Conservation Savings x (10% + Regional Shortage Level Percentage) x (1 +((Baseline GPCD – Allocation Year GPCD)/Baseline GCPD)) x Dependence on MWD Percentage*

[16] California Department of Water Resources, February 2011, "Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use. Available at: http://www.water.ca.gov/wateruseefficiency/sb7/docs/MethodologiesCalculatingBaseline_Final_03_01_2011.pdf

This provides a base demand hardening credit equal to 10 percent of conservation savings and increases the credit as deeper shortages occur, which is when conservation demand hardening has a bigger impact on the retail consumer. The credit also increases based on the percentage of an agency's demand that was reduced through conservation. This accounts for increased hardening that occurs as increasing amounts of conservation are implemented. Lastly, the credit is scaled to the member agency's dependence on Metropolitan to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in Metropolitan supply.

**Minimum Per-Capita Water Use Credit:** This adjustment creates a minimum per capita water use threshold. Member agencies' retail-level water use is compared to two different thresholds. The proposed minimum thresholds are based upon compliance guidelines established under Senate Bill X7-7.

- 100 GPCD total water use
- 55 GPCD residential water use

Agencies that fall below either threshold under the WSAP will receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. If an agency qualifies under both thresholds, the one resulting in the maximum allocation adjustment will be given.[17] To qualify for this credit, member agencies must provide documentation of the total agency level population and the percent of retail level demands that are residential; no appeal is necessary.

**Total WSAP Allocation:** The allocation to an agency for its M&I retail demand is the sum of the Wholesale Minimum Allocation, the Retail Impact Adjustment, the Conservation Demand Hardening Credit, and the Minimum Per-Capita Water Use Credit.[18]

**Total Metropolitan Supply Allocations:** In addition to the WSAP Allocation described above, agencies may also receive separate allocations of supplies for and seawater barrier and groundwater replenishment demands. Allocations of supplies to meet seawater barrier demands are to be determined by the Board of Directors independently but in conjunction with the WSAP. Separating the seawater barrier allocation from the WSAP allocation allows the Board to consider actual barrier requirements in the Allocation Year and address the demand hardening issues associated with cutting seawater barrier deliveries. According to the principles outlined for allocating seawater barrier demands, allocations should be no deeper than the WSAP Wholesale Minimum Percentage implemented at that time.

The WSAP also provides a limited allocation for drought-impacted groundwater basins based on the following framework:[19]

[17] See Appendix J: Per Capita Water Use Minimum Example for specific minimum per-capita water use credit formulae and example.
[18] See Appendix G: Water Supply Allocation Formula Example for specific allocation formulae.
[19] See Appendix L: Groundwater Replenishment Allocation for more information.

1. Metropolitan staff will hold a consultation with the requesting member agency and the appropriate groundwater basin manager to document whether the basin is in one of the following conditions:
    a. Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or
    b. Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries
2. An allocation is provided based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would then be reduced by the declared WSAP Regional Shortage Level.

# Section 5: WSAP Implementation

The WSAP will take effect if a regional shortage is declared by the Board of Directors. The following implementation elements are necessary for administering the WSAP during a time of shortage. These elements cover the processes needed to declare a regional shortage level as well as provide information pertaining to the allocation surcharge.

## Allocation Period

The allocation period covers twelve consecutive months, from July of a given year through the following June. This period was selected to minimize the impacts of varying State Water Project (SWP) allocations and to provide member agencies with sufficient time to implement their outreach strategies and rate modifications.

## Setting the Regional Shortage Level

Metropolitan staff is responsible for recommending a Regional Shortage Level for the Board of Directors' consideration. The recommendation shall be based on water supply availability, and the implementation of Metropolitan's water management actions as outlined in the WSDM Plan. Metropolitan staff will keep the Board of Directors apprised to the status of water supply conditions and management actions through monthly reports to the Water Planning and Stewardship Committee. To further facilitate staff in the development of a recommended regional shortage level, member agency requests for local supply adjustments shall be submitted by April 1st.

Metropolitan's Board of Directors, through the Water Planning and Stewardship Committee, is responsible for approving the final Regional Shortage Level at its April meeting. By the April meeting, the majority of the winter snowfall accumulation period will have passed and will allow staff to make an allocation based on more stable water supply estimates. Barring unforeseen large-scale circumstances, the Regional Shortage Level will be set for the entire allocation period, which will provide the member agencies an established water supply level for their planning.

## Exit Strategy

While the Board ultimately has discretion to implement or lift and allocation at any point of time during the year; the WSAP includes a two-part exit strategy that is meant to streamline the WSAP implementation decision making process.

- If the Board decides to implement the WSAP, then any current WSAP allocation would remain in place until the end of the Allocation Year.
- If the Board decides not to implement the WSAP, then any current WSAP allocation would be terminated concurrent with the Board decision.

## Allocation Appeals Process

An appeals process is necessary for the administration of any changes or corrections to an agency's allocation. Metropolitan's General Manager will designate, subsequent to a declaration of an allocation by the Board of Directors, an Appeals Liaison as the official point of contact for all information and inquiries regarding appeals. All member agency General Managers will be notified in writing of the name and contact information of the Appeals Liaison. Only appeals that are made through the Appeals Liaison and in accordance with the provisions outlined in Appendix N: Allocation Appeals Process will be evaluated. Basis for appeals claims can include but are not limited to:

- Adjusting erroneous historical data used in base period calculations
- Adjusting for population growth rates
- Determining if a local supply qualifies as Extraordinary Supply

Additional details and a checklist for the appeals process are available in Appendix N: Allocation Appeals Process and Appendix O: Appeals Submittal Checklist.

## Allocation Surcharge

Member agency allocations are supported by an Allocation Surcharge. The Allocation Surcharge is charged to water use above the Member Agency allocation and is charged in addition to Metropolitan's standard rates for water service. Allocation Surcharges will only be assessed to the extent that an agency's total annual usage exceeds its total annual allocation. Any revenues collected through the Allocation Surcharge will be applied towards Metropolitan's Water Management Fund, which is used to in part to fund expenditures in dry-year conservation. No billing or assessment of allocation surcharges rates will take place until the end of the twelve-month allocation period.

**Allocation Surcharge:** The application of the Allocation Surcharge structure is a two tier structure that provides a lower level of Allocation Surcharge for minor overuse of allocations and a higher level of Allocation Surcharge for major overuse of allocations. The structure and applicable Allocation Surcharges are listed in Table 2.

| Table 2: Allocation Surcharge | | | |
|---|---|---|---|
| **Water Use** | **Base Water Rate[20]** | **Allocation Surcharge[21]** | **Total Rate** |
| 100% of Allocation | Tier 1 | 0 | Tier 1 |
| Between 100% and 115% | Tier 1 | $1,480 | Tier 1 + ($1,480) |
| Greater than 115% | Tier 1 | $2,960 | Tier 1 + ($2,960) |

**Qualifying Income-Based Rate Allocation Surcharge Adjustment:**[22] Any Allocation Surcharges incurred by a member agency under the WSAP will be adjusted to reflect the extent to which retail customers within a member agency's service area are served under a "lifeline" or similar qualified discounted rate program based on income or ability to pay ("Income-Based Rate").

Any member agency who is assessed Allocation Surcharges under the WSAP may submit an acre-foot equivalent of water used by retail customers served under a qualifying Income-Based Rate.[23] This amount of water use would be multiplied by the percentage of retail-level reduction in allocation year demand necessary for that member agency to avoid exceeding its WSAP allocation. The monetary amounts resulting from these acre feet are subtracted from the total monetary amounts incurred by an agency for exceeding its allocation. In the case that the monetary amounts associated with the Income-Based Rate are greater than the total Allocation Surcharges an agency incurs, no Allocation Surcharges will be incurred. The end result of this adjustment is that the member agency will not be subject to Allocation Surcharges for the use of water by their retail customers served under a qualifying Income-Based Rate.

**Growth Rate Allocation Surcharge Adjustment":** In recognition of member agency differences in geography and climate, a Growth Rate Allocation Surcharge Adjustment will be given to any agency that exceeds its WSAP Allocation. The Allocation Surcharge reduction will be based on the difference in acre-feet between the Growth Adjustment applied at Metropolitan's IRP planning goal rate, and the greater of the following:

- The IRP planning goal rate adjusted for the member agency's ETo, or
- The member agency's certified and documented 20x2020 targeted GPCD

If both of these alternatives result in a lower growth adjustment than the IRP planning goal, no Allocation Surcharge reduction will be made.

[20] The base water rate shall be the applicable water rate for the water being purchased. In most cases, it will be the Tier 1 rate (plus Treatment Surcharge for treated water deliveries). However, it is possible that the water being purchased would be in the amount that would put an agency beyond its Tier 1 limit. In that case, the base water rate will be the Tier 2 rate (plus Treatment Surcharge for treated water deliveries).

[21] Allocation Surcharge is applied to water use in excess of an agency's WSAP allocation.

[22] See Appendix K: Qualifying Income-Based Rate Allocation Surcharge Adjustment Example for specific penalty adjustment formulae and example.

[23] Appropriate documentation and certification will be required.

## Tracking and Reporting

Subsequent to a declared regional shortage by the Board of Directors, Metropolitan staff will produce monthly reports of each member agency's water use compared to its allocations based on monthly delivery patterns to be submitted by the member agency. In order to produce these reports, member agencies are requested to submit their local supply use on a monthly basis and certify end of allocation year local supply use. These reports and comparisons are to be used for the purposes of tracking and communicating potential underage/overage of an agency's annual allocations.

## Key Dates for Water Supply Allocation Implementation

The timeline for implementation of an allocation is shown in Table 3. A brief description of this timeline follows:

**January to March**: Water Surplus and Drought Management reporting occurs at Metropolitan's Water Planning and Stewardship Committee meetings. These reports will provide updated information on storage reserve levels and projected supply and demand conditions.

**April**: Member agencies report their projected local supplies for the coming allocation year. This information is incorporated in staff analysis of storage reserves and projected supply and demand conditions in order to provide an allocation recommendation to the Board. Metropolitan's Board will consider whether an allocation is needed. A declaration of an allocation will include the level of allocation to be in effect for the allocation year. Likewise, member agencies will report their projected demands and local supplies needed to meet seawater barrier and groundwater replenishment requirements for the allocation year. Metropolitan's Board will consider whether allocations for seawater barrier demands and groundwater replenishment demands are needed independently from the WSAP allocation decision.**July 1st**: If the Board declared an allocation in April, then it will be effective starting July 1st. The allocation level will be held through June 30th, barring unforeseen circumstances. Member agencies will now be requested to submit their local supply use on a monthly basis and certify end of allocation year local supply use. Local production data must be reported to Metropolitan by the end of the month following the month of use (use in July must be reported by the end of August). This information will be combined with Metropolitan sales information in order to track retail water use throughout Metropolitan's service area. Each month Metropolitan will report on member agency water sales compared to their allocation amounts.

**June 30th**: The allocation year is complete.

**July**: Member agency local supplies must be certified for the month of June, the last month of the previous allocation year.

**August**: Metropolitan will calculate each member agency's total potable water use based on local supply certifications and actual sales data for the allocation year of July through June. Allocation surcharges will be assessed for usage above a given member agency's final adjusted allocation (reflecting the actual local supply and imported water use that occurred in the allocation year).

| Table 3: Board Adopted Allocation Timeline | | | | | |

# Appendix B: Water Supply Allocation Plan Process Timeline

### July 2007

- City of Long Beach Water Department staff briefing
- Member Agency Managers/Member Agency Workgroup meeting
- Northern Managers Group meeting
    - Foothill MWD, City of Pasadena, City of Long Beach, Calleguas MWD, City of Los Angeles, West Basin MWD, City of Burbank, Three Valleys MWD, City of Glendale, Upper San Gabriel MWD

### August 2007

- Central Basin MWD staff briefing
- Eastern MWD staff briefing
- San Diego CWA staff briefing
- Member Agency Managers/Member Agency Workgroup meeting
- Western MWD staff briefing
- City of Beverly Hills staff briefing

### September 2007

- Member Agency Subgroup meetings
    - MWD of Orange County, San Diego CWA, West Basin MWD, Central Basin MWD
- MWD of Orange County staff briefing
- Member Agency Workgroup meeting
- Member Agency Workgroup meeting
- MWD Board of Directors Oral Report

### October 2007

- Inland Empire Utilities Agency staff briefing
- Central Basin MWD Caucus Meeting (included sub-agencies)
- Three Valleys MWD staff briefing
- MWD of Orange County staff briefing
- West Basin MWD staff briefing
- MWD Board of Directors Oral Report

### November 2007

- West Basin MWD Caucus Meeting (included sub-agencies)
- West Basin Water Users Association presentation
- Walnut Valley MWD staff briefing (sub-agency of Three Valleys MWD)
- Foothill MWD Managers Meeting (included sub-agencies)
- Central Basin MWD staff briefing
- City of Claremont City Council (sub-agency of Three Valleys MWD)
- MWD Board of Directors Information Letter with Draft Proposal

### December 2007

- Northern Managers Group Meeting
- California Department of Public Health staff briefing
- City of Long Beach Water Department staff briefing
- Santa Ana River Watershed Project Authority presentation
- Foothill MWD Managers Meeting (included sub-agencies)
- MWD Board of Directors Oral Report

### January 2008

- Northern Managers Group Meeting
- Water Replenishment District Board of Directors presentation
- Three Valleys MWD staff briefing
- Member Agency Conservation Coordinator's Group presentation
- Member Agency Managers/Member Agency Workgroup meeting
- City of Chino Hills presentation (sub-agency of IEUA)
- Member Agency Workgroup meeting
- Hemet/San Jacinto Exchange Club presentation
- MWD Board of Directors Report with Staff Recommended Water Supply Allocation Plan

### February 2008

- MWD of Orange County and Irvine Ranch WD staff briefing
- MWD Board of Directors Action Item
- San Gabriel Valley Water Association Meeting
- Orange County Water Policy Meeting
- SCAG Water Policy Task Force Meeting

# Appendix C: 12-Month Review Process and Results

### January 2010

- WSAP 12-Month Review Process workshop #1
    - Focused discussion of WSAP issues identified by Metropolitan staff and by member agencies since the July 2009 implementation began.

### February 2010

- WSAP 12-Month Review Process workshop #2
    - Continuation of focused discussion
- WSAP 12-Month Review Process workshop #3
    - Continuation of focused discussion

### March 2010

- WSAP 12-Month Review Process workshop #4
    - Continuation of focused discussion
- MWD Board of Directors information item
    - Review of potential modifications to the WSAP definition of Extraordinary Supply

### April 2010

- WSAP 12-Month Review Process workshop #5
    - Recap of identified issues and discussion of Metropolitan staff proposals for adjustments to the WSAP
- Member Agency Managers Meeting
    - Update on the 12-Month Review Process
- WSAP 12-Month Review Process workshop #6
    - Discussion of WSAP issues related to groundwater replenishment
- Member Agency Managers conference call
    - Clarification of WSAP definition for Extraordinary Supply

### May 2010

- Member Agency Managers Meeting
    - Discussion of proposed Extraordinary Supply policy principles and WSAP Local Supply certification process.
- Member Agency Managers conference call
    - Discussion of proposed Extraordinary Supply policy principles

### June 2010

- MWD Board of Directors action item

### July 2010

- MWD Board of Directors information item
    - Review of proposed adjustments to the WSAP developed in the 12-Month Review Process

### August 2010

- MWD Board of Directors action item

## Resulting Changes

- Removed references to Gains and Losses of Local Supply
    - Removed references in the WSAP to "gains and losses of local supplies" in order to better facilitate the accounting of historical base year and allocation year local supplies. This change did not affect the WSAP formula or allocations.
- Removed references to the Regional Shortage Percentage
    - Removed references to the "Regional Shortage Percentage" in the WSAP to reduce unintended confusion between calculation factors and shortage amounts. This change did not affect the WSAP formula or allocations.
- Included the Retail Impact Adjustment in all shortage levels
    - Included the Retail Impact Adjustment for Regional Shortage Levels 1 and 2. This change results in additional allocations to Metropolitan-dependent agencies under Level 1 and Level 2 regional shortages.
- Revised the accounting of Extraordinary Supplies
    - Revised the methodology for accounting of Extraordinary Supply in the WSAP formula by:
        - Removing the Base Period Local Supply threshold provision,
        - Removing the sliding-scale sharing mechanism from the formula, and
        - Including the full amount of the Extraordinary Supply in the calculation of the Retail Impact Adjustment.
- Included a Minimum Per Capita Water Use Threshold
    - Developed a minimum water use credit based on two GPCD water use thresholds. Member agencies would receive additional Metropolitan allocation for an acre-foot equivalent of GPCD below the minimum threshold. Member agency water use, on a gallon per capita per day (GPCD) basis, is compared to the following minimum thresholds established under Senate Bill X7-7 (Water Conservation Act of 2009)
        - 100 GPCD total use or
        - 55 GPCD residential indoor use
- Excluded Seawater Barrier from the WSAP Formula
    - Excluded seawater barrier supplies from the WSAP Base Period and Allocation Year local supply calculations. This allows the Board to determine allocations for seawater barrier demands separately from the WSAP.

# Appendix D: Three-Year Review Process and Results

### February 2011

- WSAP 3-Year Review Process workshop #1
    - Review of the existing WSAP policy formula; review of the process timeline; and focused discussion of WSAP issues identified by Metropolitan staff and by member agencies since the WSAP's adoption in February 2008

### March 2011

- WSAP 3-Year Review Process workshop #2
    - Discussion of issues related to local supplies and baseline inflation due to adjustments for recycling in the WSAP formula
- WSAP 3-Year Review Process workshop #3
    - Continuation of prior workshop

### April 2011

- WSAP 3-Year Review Process workshop #4
    - Discussion of issues and alternatives related to base period selection and baseline inflation in the WSAP formula
- WSAP 3-Year Review Process workshop #5
    - Discussion of recommendations to address baseline inflation in the WSAP formula

### May 2011

- WSAP 3-Year Review Process workshop #6
    - Discussion of issues and alternatives for the growth adjustment methodology in the WSAP formula
- WSAP 3-Year Review Process workshop #7
    - Continuation of prior workshop

### June 2011

- WSAP 3-Year Review Process workshop #8
    - Continuation of prior workshop, discussion of WSAP implementation exit strategy
- WSAP 3-Year Review Process workshop #9
    - Continuation of exit strategy discussion, discussion of baseline inflation due to conservation and related conservation demand hardening issues

### July 2011

- WSAP 3-Year Review Process workshop #9
    - Continued discussion of baseline inflation and conservation issues, and discussion of sharing allocations between agencies with common local resources

### August 2011

- WSAP 3-Year Review Process workshop #10
    - Discussion of WSAP Allocation Year timing vs. Tier 1-Tier 2 rate cycle timing, discussion of approaches for encouraging completion of WSAP local supply certifications
- Review WSAP at Member Agency Managers Meeting
    - Discussion of proposed WSAP adjustments to address baseline inflation issues, revise the growth adjustment methodology, and establish a WSAP exit strategy

## September 2011

- MWD Board of Directors action item

## Resulting Changes

- Baseline Inflation Adjustment
    - Removed non-potable recycling and conservation from the WSAP baseline
        - Increases in recycling and conservation will be subtracted annually from the Base Period forward
        - The annual population growth rate will be applied after deducting the annual increases in recycling and conservation
        - If an agency ends up in allocation penalty, a penalty reduction will be applied in an amount equal to the Code-Based and rate Structure conservation savings that were removed from the WSAP baseline
- Changed the Growth Adjustment methodology
    - Growth will be allocated at historical per capita rate capped at the 2010 Integrated Water Resource Plan (IRP) Target for Water Use Efficiency
        - For years up to and including 2014, the cap will be 163 GPCD
        - For years 2015-2020, the cap will reduce linearly from 163 to 145 GPCD
    - If an agency exceeds its allocation, a penalty reduction will be applied based on either:
        - The differential Evapotranspiration (ETo) of its service area compared to the MWD average, or
        - Certified and documented 20 x 2020 targeted GPCD
- Exit Strategy
    - Clarified the course of action for an existing WSAP allocation when Metropolitan's Board makes a declaration decision for the following WSAP year
        - If there is an allocation for the next year, then the current allocation stays in place
        - If there is no allocation for the next year, then the current allocation is lifted concurrent with the April decision

# Appendix E: 2014 Review Process and Results

### July 2014

- WSAP Workgroup Meeting #1
  - First meeting of the 2014 WSAP Review process; review of the existing WSAP policy and formula; review of the process timeline; began discussion of issues related to base period selection
- WSAP Workgroup Meeting #2
  - Discussion of base period selection

### August 2014

- WSAP Workgroup Meeting #3
  - Continuation of prior workshop discussion; comparison of base period alternatives

### September 2014

- WSAP Workgroup Meeting #4
  - Discussion of a base period proposal; discussion of replenishment issues in the WSAP; discussion of 2015 water supply scenarios
- Review WSAP at Member Agency Managers Meeting
  - Review of WSAP workgroup process; discussion on issues related to base period, demand hardening, and local resources development
- WSAP Workgroup Meeting #5
  - Review of base period recommendation; discussion of issues regarding agencies in mandatory conservation during a base period; discussion on replenishment in the WSAP

### October 2014

- WSAP Workgroup Meeting #6
  - Continuation of prior workshop discussion; discussion of alternative methods for conservation demand hardening credit; discussion of new and existing local supplies
- Review WSAP at Member Agency Managers Meeting
  - Review of WSAP workgroup process; discussion of issues related to base period and demand hardening

### November 2014

- WSAP Workgroup Meeting #7
  - Review and discussion of issues and potential methods for base period selection and adjustment, replenishment allocation, and conservation demand hardening credit; review of estimated effects of potential WSAP changes at the regional level
- WSAP Workgroup Meeting #8
  - Review of proposed recommendations for the WSAP based on workgroup discussion
- Review WSAP at Member Agency Managers Meeting
  - Review of proposed recommendations for the WSAP based on workgroup discussion

## Resulting Changes

- Base Period Update to FY2013 and FY2014
    - Changed the WSAP Base Period from calendar years 2004-2006 to fiscal years ending July 2013 and 2014
    - Mandatory Conservation Adjustment
        - Agencies with mandatory conservation in effect during the base period (FY 2013 and/or FY 2014) may qualify for a demand hardening adjustment, adjustment is subject to a consultation process that includes consideration historical demand and GPCD information

- Modify Conservation Demand Hardening Credit
    - Replaced device calculation-based estimates of conservation savings with a GPCD-based method
        - Conservation savings are calculated by comparing GPCD from a historical baseline to the Allocation Year; the difference is converted to acre-feet using the Allocation Year population.
            - Baseline GCPD is 10-year average ending between 2004 and 2010, with gross water, using gross water use minus non-potable recycled water production and documented historical population
    - Replaced formula for calculating the credit for each Regional Shortage Level
    - Conservation Demand hardening credit will be based on an initial 10 percent of GPCD-based conservation savings plus an additional 5 percent for each level of Regional Shortage; the credit will also be adjusted for the overall percentage reduction in retail water demand and the member agency's dependence on Metropolitan.
- Allocation Surcharge
    - Replaced the WSAP Penalty Rate with an Allocation Surcharge based on the estimated cost of Turf Replacement conservation programs

## Appendix F: Summary of Historical Shortage Plans

These five elements incorporated into the WSAP have, in four out of five instances, been used in previous shortage plans. Both the IICP and the 1995 DMP used a historical base period calculation, adjusted for growth, made local supply adjustments, and used conservation hardening credits in their formulations. The retail impact adjustment is the only feature of the WSAP that has not been used historically.

Table 5: Historical Shortage Plan Overview

| Plan Element | 1991 IICP | 1995 DMP | WSAP |
|---|---|---|---|
| Historical Base Period | √ | √ | √ |
| Growth Adjustment | √ | √ | √ |
| Local Supply Adjustment | √ | √ | √ |
| Conservation Hardening Credit | √ | √ | √ |
| Retail Impact Adjustment | | | √ |

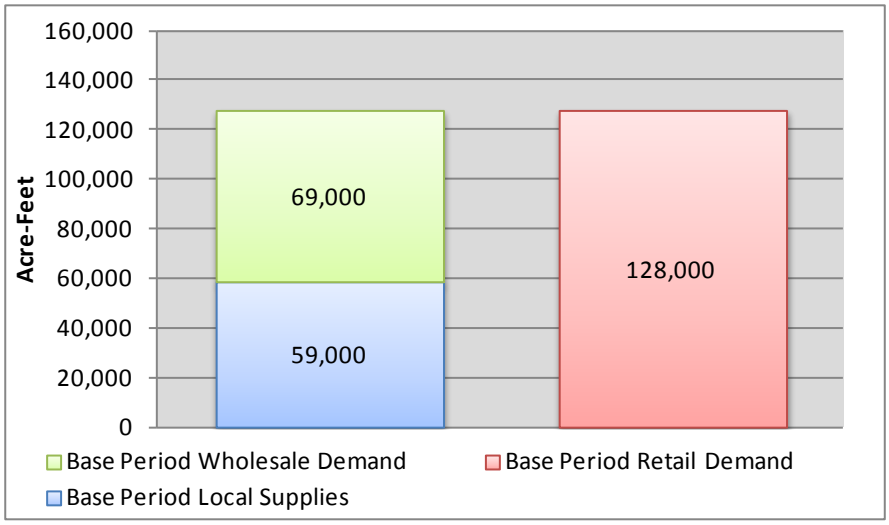
# Appendix G: Water Supply Allocation Formula Example

The following example gives a step-by-step description of how the formula would be used to calculate an allocation of Metropolitan supplies for a hypothetical member agency. All numbers are hypothetical for the purpose of the example and do not reflect any specific member agency.

## Step 1: Calculate Base Period Retail Demand

**Base Period Local Supplies:** Calculated using a two-year average of groundwater (gw), groundwater recovery (gwr), Los Angeles Aqueduct supply (laa), surface water (sw), seawater desalination (sd), and other non-Metropolitan imported supplies (os). For the purpose of this example, assume that the two year average is 59,000 af.

$$[(gw1+gwr1+laa1+sw1+sd1+os1) + (gw2+gwr2+laa2+sw2+sd2+os2)] \div 2 = 59{,}000 \text{ af}$$



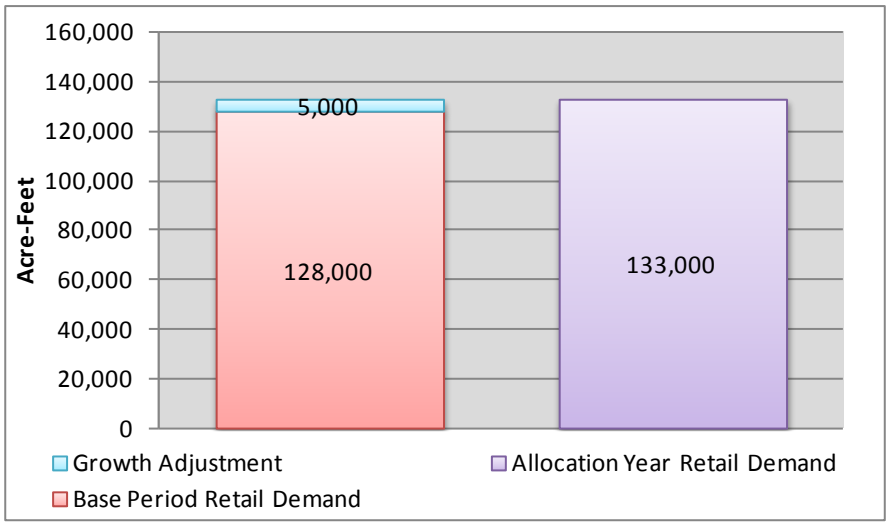
**Base Period Wholesale Demands:** Calculated using the same two-year time period as the Base Period Local Supplies. The Base Period Wholesale Demands include firm purchases (fp) and in-lieu deliveries to long-term groundwater replenishment (il), conjunctive use (cup), cyclic (cyc), and supplemental storage programs (ss). For the purpose of this example, assume that the two year average is 69,000 af.

$$[(fp^1{+}{+}il^1{+}cup^1{+}cyc^1{+}ss^1) + (fp^2{+}il^2{+}cup^2{+}cyc^2{+}ss^2)] \div 2 = 69{,}000 \text{ af}$$

**Base Period Retail Demands:** Calculated as the sum of the Base Period Local Supplies and Base Period Wholesale Demand.

$$59{,}000 + 69{,}000 = 128{,}000 \text{ af}$$

**Figure 1: Base Period Retail Demand Calculation**



**Calculate Adjustment for Base Period Mandatory Rationing (if applicable):** The hypothetical agency used in this example is assumed not to qualify for the Base Period Mandatory Rationing Adjustment. A detailed discussion of the adjustment methodology can be found in Appendix I: Base Period Rationing Adjustment Example.

### Step 2: Calculate Allocation Year Retail Demand

**Allocation Year Retail Demand:** Calculated by adjusting the Base Period Retail Demand for any baseline inflation and growth that occurred since the Base Period.

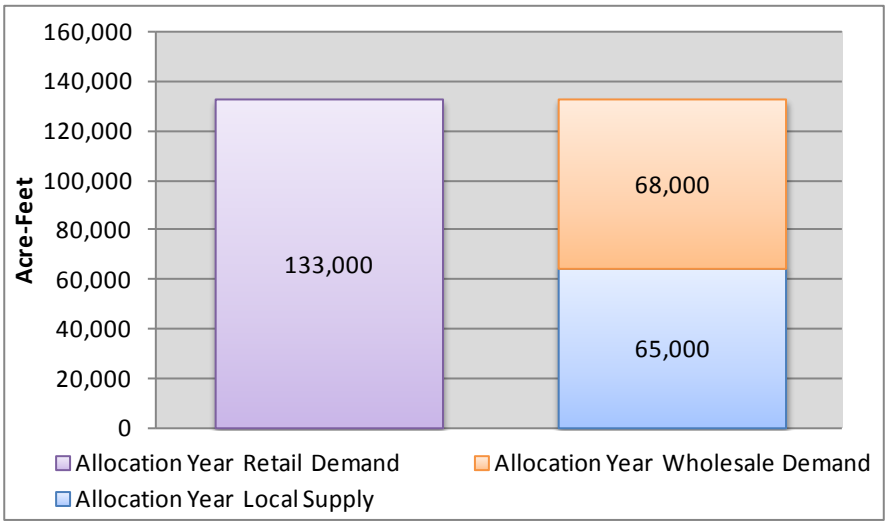
128,000 af + 5,000 af (net adjustment to retail demand) = 133,000 af

**Figure 2: Allocation Year Retail Demand Calculation**

### Step 3: Calculate Allocation Year Wholesale Demand

**Allocation Year Local Supplies:** Estimates of Allocation Year Local Supplies are provided by the member agencies upon implementation of a WSAP. If estimates are not provided, Metropolitan will use the sum of the Base Period Local Supplies and Base Period In-Lieu Deliveries as a default. Agencies may provide updated estimates at any time during the Allocation Year to more accurately reflect their demand for Metropolitan supplies. For this example assume that the Allocation Year Local Supplies total 65,000 acre-feet.

Allocation Year Local Supplies = 65,000 af



For this example assume also that this agency has an additional 5,000 acre-feet of supplies that meet the determinations for Extraordinary Supply. These supplies are withheld from the allocation formula except for in calculating the Retail Impact Adjustment Allocation.

Extraordinary Local Supplies = 5,000 af

**Allocation Year Wholesale Demands:** Calculated by subtracting the Allocation Year Local Supplies (65,000 af) from the Allocation Year Retail Demands (133,000 af).

133,000 af - 65,000 af = 68,000 af

**Figure 3: Allocation Year Wholesale Demand Calculation**

### Step 4: Calculate the Wholesale Minimum Allocation

**Wholesale Minimum Percentage:** Calculate from Table 1 for Regional Shortage Level 4.

| Table 1: Shortage Allocation Index | | |
|---|---|---|
| (a) Regional Shortage Level | (b) Wholesale Minimum Percentage | (c) Maximum Retail Impact Adjustment Percentage |
| 4 | 70.0% | 10.0% |

**Wholesale Minimum Allocation:** Calculated by multiplying the agency's Allocation Year Wholesale Demand (68,000 af) by the Wholesale Minimum Percentage (70%) from the Table 1 for Regional Shortage Level 4.

68,000 af * 70% = 47,600 af

### Step 5: Calculate the Retail Impact Adjustment Allocation

**Maximum Retail Impact Adjustment Percentage:** Calculate from Table 1 for Regional Shortage Level 4.

**Retail Impact Adjustment Allocation:** Calculated first by determining the agency's dependence on Metropolitan by dividing the Allocation Year Wholesale Demand (68,000 af) minus the Extraordinary Supply (5,000 af) by the Allocation Year Retail Demand (133,000 af) and multiplying by 100.

[(68,000 af - 5,000 af)/ 133,000 af] * 100 = 47%

Next, this percentage dependence on Metropolitan (47%) is multiplied by the Maximum Retail Impact Percentage for Shortage Level 4 (10%).

47% * 10% = 4.7%

This percentage is now multiplied by the Allocation Year Wholesale Demand (68,000 af) for the Retail Impact Adjustment Allocation.

68,000 af * 4.7% = 3,221 af

### Step 7: Calculate the Conservation Demand Hardening Adjustment

**Calculate Baseline GPCD:** To estimate conservation savings, each member agency will establish a historical baseline GPCD calculated in a manner consistent with California Senate Bill SBx7-7, using a 10 or 15-year average ending between 2004 and 2010, using gross water use minus non-potable recycle water production and documented historical population. For this example assume that the Baseline GPCD is 154 GPCD

Baseline GPCD = 154 GPCD

**Calculate Allocation Year GPCD:** Next, calculate the allocation year GPCD by converting the Allocation Year Retail Demand to GPCD and dividing by the Allocation Year Population from the WSAP. For this example the Allocation Year Retail Demand is 133,000 AF (see Step 2 above) and assume the Allocation Year Population is 905,000 persons. The resulting GPCD is 131 GPCD.

Allocation Year GPCD = 133,000 af/year * 325,851 gallons/af ÷ 365 days/year ÷ 905,000 persons = 131 GPCD

**Calculate Reduction in GPCD:** Subtract Allocation Year GPCD from Baseline GPCD to determine the GPCD Reduction.

GPCD Reduction = 154 GPCD – 131 GPCD = 23 GPCD

**Calculate Conservation Savings:** Convert the GPCD Reduction to the equivalent annual conservation savings in acre-feet, using the Allocation Year Population.

$$\text{Conservation Savings} = \frac{(\text{GPCD Reduction}) \times 365 \text{ days/yr} \times \text{Population})}{325{,}851 \text{ gallons/af}}$$

Conservation Savings = 23 x 365 x 905,000 ÷ 325,851 = 23,316 af

**Multiply by Regional Shortage Level Percentage:** Multiply the Conservation Savings by 10 percent plus an additional 5 percent for each level of Regional Shortage (see Step 4 above). This example assumes a Regional Shortage Level of 4. This scales the hardening credit by the level of regional shortage, thereby increasing the credit as deeper shortages occur when demand hardening has a larger impact on the retail consumer.

23,316 af x (10% + (4 x 5%) = 6,995 af

**Multiply by Conservation Savings Percentage:** Next, multiply by the percentage of an agency's demand that was reduced through conservation. This scales the hardening by the total percentage reduction to recognize that increased hardening occurs as increasing amounts of conservation are implemented.

Conservation Savings Percentage = 1 + ((Baseline GPCD – Allocation Year GPCD)/Baseline GPCD)

Conservation Savings Percentage = 1+ ((154 GPCD – 131 GPCD)/154 GPCD) = 115%

6,995 af x 115% = 8,044 af

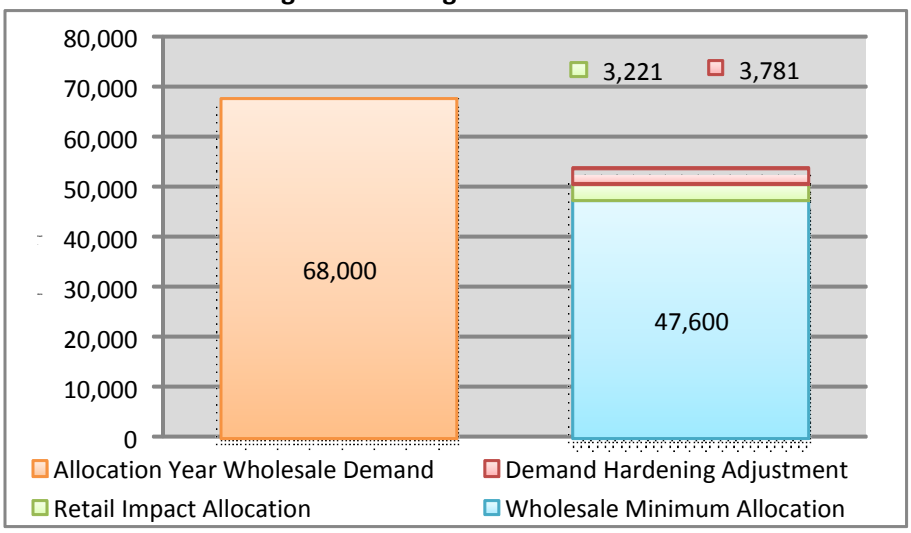
**Multiply by Dependence on MWD:** Next, multiply by the agency's percentage dependence on MWD as shown in Step 5 above. This scales the credit to the member agency's dependence on MWD to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in MWD's supply. For this example, dependence on MWD is 47%.

8.044 af x 47% = 3,781 af

**Summary:** The Conservation Demand Hardening Adjustment calculation is summarized by the following formula:

Conservation Demand Hardening Adjustment = Conservation Savings x (10% + Regional Shortage Level %) x (1+Conservation%) x Dependence on MWD %

Conservation Demand Hardening Adjustment = 23,316 af x (10% + (4 x 5%)) x (115%) x (47%) = 3,781 af



**Step 8: Calculate the Low Per-Capita Adjustment Allocation:** The hypothetical agency used in this example is assumed not to qualify for the Low Per-Capita Adjustment. A detailed discussion and example of the Low Per-Capita Adjustment calculation can be found in Appendix J: Per Capita Water Use Minimum Example.

**Step 9: Calculate the total WSAP Allocation**

**WSAP Allocation:** Calculated by adding the Wholesale Minimum Allocation (47,600 af), the Maximum Retail Impact Adjustment (3,221 af), the Demand Hardening Adjustment (3,781 af), and the Low Per-Capita Adjustment (0 af).

47,600 af + 3,221 af + 3,781 af + 0 af = 54,602 af

**Figure 4: WSAP Allocation Regional Shortage Level 4**

## Step 10: Calculate total retail level reliability

**Retail level reliability:** Calculated by adding the WSAP Allocation (54,602 af), the Allocation Year Local Supply (65,000 af) and the Extraordinary Local Supply (5,000 af) and dividing by the Allocation Year Retail Demand (133,000 af).

(54,602 af + 65,000 af + 5,000 af) ÷ 133,000 af = 93.7%

**Total Metropolitan Supply Allocations:** In addition to the WSAP Allocation described above, agencies may also receive separate allocations of supplies for groundwater replenishment and seawater barrier demands. More information on the groundwater replenishment allocation is located in Appendix L: Groundwater Replenishment Allocation.

# Appendix H: Board Policy Principles on Determining the Status of Extraordinary Supply

At the June 8, 2010 Water Planning and Stewardship Committee meeting Metropolitan's Board of Directors adopted the following policy principles to guide staff in determining the Extraordinary Supply status of future member agency supply programs.

### No Negative Impacts to Other Member Agencies

A potential Extraordinary Supply for a member agency should not decrease the amount of Metropolitan water supply that would be available to the other member agencies in a WSAP. Programs that utilize Metropolitan supplies as a primary or in-lieu source or as a means of payback or future replenishment may have the effect of decreasing supplies, available to other agencies, if designated as Extraordinary Supply.

### Provides Supply in Addition to Existing Regional Supplies

A potential Extraordinary Supply should provide a water supply that increases the overall water supplies that are available to the region in a WSAP. A program that is designed to move existing regional supplies from year to year would not qualify.

### Specifically Designed Program or Supply Action

A potential Extraordinary Supply must be intentionally created and operated to provide additional supply yield. Normal variations in existing and planned local supply programs would not qualify.

### Intended for Consumptive Use in a WSAP

A potential Extraordinary Supply should be designed with the primary intention to deliver water supply to a member agency only at a time when Metropolitan is allocating supplies. Programs designed to deliver water on a regular basis would not qualify. Exceptions for reasonable use of a supply program for emergency or other extenuating local circumstances should be considered.

### Fully Documented Resource Management Actions

A potential Extraordinary Supply should have a full description as to the source, transmission, distribution, storage, and delivery of the water supply.

These principles are intended to identify deliberate actions taken by member agencies to augment supplies only when Metropolitan is allocating supplies through the WSAP. Production from existing local supplies, programs that are operated on an ongoing basis, and incidental increases in water supply would not qualify as Extraordinary Supply. The intent of the Extraordinary Supply designation is to recognize programs and actions that are additive to the total regional water supply as the region continues to confront the water supply challenges from drought and regulatory conditions. To that end, any supply actions taken after the initial implementation of the WSAP in July 2009 that utilize Metropolitan supplies either as a primary source, or to refill or replenish an incurred obligation or deficit at a future date would not qualify as Extraordinary Supply.

## Appendix I: Base Period Mandatory Rationing Adjustment

Agencies that were under mandatory water use restrictions during the Base Period may have water use that is lower due to the mandatory actions already taken. Without adjusting for this, those agencies could be required to enforce even higher levels of restrictions under an allocation than those agencies that had not started mandatory restrictions.

To qualify for a Base Period Mandatory Rationing Adjustment, the member agency must provide Metropolitan staff with the following information:

- Time period when the mandatory conservation was in effect; it must be in effect during the Base Period
- A statement, with documentation, of how drought restrictions comply with the following Mandatory Conservation qualifications:
    - Governing Body-authorized or enacted
    - Includes mandatory demand reduction actions, restrictions or usage limitations including penalty-backed water budgets
    - Enforced by assessing penalties, fines, or rates based upon violating restrictions or exceeding usage limitations
- If the agency in question is a retail subagency, then the retailer's base period water demands during the Base Period in order to determine proportion to the member agency's total demand
- Historical data to construct GPCD base and trend for the consultation

Calculating the Base Period Rationing Adjustment involves following steps:

- Use the Baseline GPCD 10 or 15-year period selected by member agency for the Conservation Demand Hardening Adjustment calculation.
- Interpolate from the GPCD value of the midpoint of the Baseline GPCD period to the average GPCD of the two years preceding the agency's mandatory conservation
- Extrapolate to the WSAP Base Period (FY2013 and FY2014)
- Calculate the difference between estimated and observed GPCD for FY2013 and FY2014
- Convert to Acre-Feet and add to the member agency's Base Period Retail Demands

# Appendix J: Per-Capita Water Use Minimum Example

This adjustment creates a minimum per capita water use threshold. Member agencies' retail-level water use under the WSAP is compared to two different thresholds. The minimum water use levels are based on compliance guidelines for total and residential water use established under Senate Bill X7-7.

**Total Retail Level Use:** 100 GPCD
**Residential Retail Level Use:** 55 GPCD

Agencies that fall below either threshold under the WSAP would receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. To qualify for this credit, member agencies must provide documentation of the total agency level population and the percent of retail level demands that are residential; no appeal is necessary.

The following example gives a step-by-step description of how the Low Per-Capita Water Use Adjustment would be calculated for a hypothetical member agency. All numbers are hypothetical for the purpose of the example and do not reflect any specific member agency. This example was calculated using the following assumptions:

**Allocation Year Retail Demand:** 50,000 acre-feet
**Allocation Year Local Supplies:** 25,000 acre-feet;
**Allocation Year Wholesale Demand:** 25,000 acre-feet
**Base Period Conservation:** 5,000 acre-feet
**Agency Population:** 375,000
**Percent of Retail Demands that are Residential:** 60%

### Step 1: Calculate Total Retail-Level Allocation Year Supplies

Table 6 shows the Allocation Year Local Supply, WSAP Allocation, and the total Allocation Year Supplies for the example agency at each Regional Shortage Level. The WSAP Allocation was calculated using the methodology detailed in Appendix G: Water Supply Allocation Formula Example and the assumptions listed above.

| Table 6: Total Retail Level Allocation Year Supplies | | | |
|---|---|---|---|
| **Regional Shortage Level** | **Allocation Year Local Supply** | **WSAP Allocation** | **Total Allocation Year Supply** |
| 1 | 25,000 | 23,594 | 48,594 |
| 2 | 25,000 | 22,188 | 47,188 |
| 3 | 25,000 | 20,781 | 45,781 |
| 4 | 25,000 | 19,375 | 44,375 |
| 5 | 25,000 | 17,969 | 42,969 |
| 6 | 25,000 | 16,563 | 41,563 |
| 7 | 25,000 | 15,156 | 40,156 |
| 8 | 25,000 | 13,750 | 38,750 |
| 9 | 25,000 | 12,344 | 37,344 |
| 10 | 25,000 | 10,938 | 35,938 |

### Step 2: Calculate the Equivalent Total and Residential GPCD

The next step is to calculate the equivalent water use in gallons per capita per day (GPCD) for the Total Allocation Year Supply. The following equation shows the GPCD calculation under Regional Shortage Level 10.

35,938 af * 325,851 gallons ÷ 375,000 people ÷ 365 days = 85.6 GPCD

The residential per-capita water use is calculated in the same manner. Based on the assumption that 60% of the agency demands are residential, the following equation shows the residential GPCD calculation under Regional Shortage Level 10.

35,938 af * 60% * 325,851 gallons ÷ 375,000 people ÷ 365 days = 51.3 GPCD

### Step 3: Compare the Total and Residential GPCD to the Minimum Water Use Thresholds

The next step is to compare the total GPCD water use to the 100 GPCD total water use threshold. In a Regional Shortage Level 10, the WSAP results in an allocation that is 14.4 GPCD below the minimum threshold.

100 GPCD – 85.6 GPCD = 14.4 GPCD

Likewise the residential GPCD water use is compared to the 55 GPCD residential water use threshold.

55 GPCD – 51.3 GPCD = 3.7 GPCD

### Step 4: Determine the Allocation Adjustment in Acre-Feet

The final step is to calculate the acre-foot equivalent of the GPCD that fell below the minimum threshold. In a Regional Shortage Level 10, the adjustment provides 6,068 acre-feet of additional allocation to the agency; the results for Shortage Levels 1-10 are shown in Table 7.

14.4 GPCD ÷ 325,851 gallons * 375,000 people * 365 days = 6,068 acre-feet

| Table 7: Total Per-Capita Water Use Adjustment | | | | |
|---|---|---|---|---|
| **Regional Shortage Level** | **Allocation Year Supply** | **Equivalent GPCD** | **GPCD Below Threshold** | **Allocation Adjustment** |
| 1 | 48,594 | 115.7 | 0 | 0 |
| 2 | 47,188 | 112.3 | 0 | 0 |
| 3 | 45,781 | 109.0 | 0 | 0 |
| 4 | 44,375 | 105.6 | 0 | 0 |
| 5 | 42,969 | 102.3 | 0 | 0 |
| 6 | 41,563 | 98.9 | 1.1 | 443 |
| 7 | 40,156 | 95.6 | 4.4 | 1,849 |
| 8 | 38,750 | 92.3 | 7.7 | 3,255 |
| 9 | 37,344 | 88.9 | 11.1 | 4,662 |
| 10 | 35,938 | 85.6 | 14.4 | 6,068 |

Again, this step is repeated for the residential water use. In a Regional Shortage Level 10, the adjustment provides 1,540 acre-feet of additional allocation to the agency; the residential water use results for Regional Shortage Levels 1-10 are shown in Table 8.

3.7 GPCD ÷ 325,851 gallons * 375,000 people * 365 days = 1,540 acre-feet

| Table 8: Residential Per-Capita Water Use Adjustment | | | | |
|---|---|---|---|---|
| **Regional Shortage Level** | **Allocation Year Supply** | **Equivalent GPCD** | **GPCD Below Threshold** | **Allocation Adjustment** |
| 1 | 29,156 | 69.4 | 0 | 0 |
| 2 | 28,313 | 67.4 | 0 | 0 |
| 3 | 27,469 | 65.4 | 0 | 0 |
| 4 | 26,625 | 63.4 | 0 | 0 |
| 5 | 25,781 | 61.4 | 0 | 0 |
| 6 | 24,938 | 59.4 | 0 | 0 |
| 7 | 24,094 | 57.4 | 0 | 0 |
| 8 | 23,250 | 55.4 | 0 | 0 |
| 9 | 22,406 | 53.3 | 1.7 | 697 |
| 10 | 21,563 | 51.3 | 3.7 | 1,540 |

Agencies that fall below either threshold under the WSAP would receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. If an agency qualifies under both thresholds, the one resulting in the maximum allocation adjustment would be given. Under this example the agency would receive 6,068 acre-feet of additional allocation in a Regional Shortage Level 10.

# Appendix K: Qualifying Income-Based Rate Allocation Surcharge Adjustment Example

The following example provides a step by step description of how the qualifying income-based rate allocation surcharge adjustment is calculated. To qualify for this adjustment, member agencies must provide documentation showing the amount of retail demands that are covered by a qualifying income-based rate; no appeal is necessary.

The following list summarizes the allocation year demands, local supplies, and allocation as calculated in Appendix G: Water Supply Allocation Formula Example for a hypothetical agency under a Level 4 Regional Shortage. For detailed instructions on how to calculate these figures, reference Appendix G: Water Supply Allocation Formula Example.

**Allocation Year Retail Demand:** 133,000 acre-feet
**Allocation Year Local Supplies:** 68,000 acre-feet;
**Level 4 WSAP Allocation:** 52,735 acre-feet

## Step 1: Allocation Surcharge Calculation

(a) **Water Use above Allocation:** The first step in calculating the income-based rate Allocation Surcharge adjustment is to calculate the agency's total Allocation Surcharge under the WSAP. If the agency did not incur any Allocation Surcharge from the allocation year, the income-based rate allocation surcharge adjustment would not apply. For the purpose of this example, the agency used 61,000 acre-feet of MWD supplies in the allocation year. This represents 8,265 acre-feet of use above the water supply allocation.

| | |
|---|---|
| WSAP Allocation | 52,735 af |
| Actual MWD Water Use | 61,000 af |
| **Use Above WSAP Allocation** | 8,265 af |

(b) **Total Allocation Surcharge:** In this example the agency used 115.7% of its water supply allocation. 7,910 of the 8,265 acre-feet of use above the allocation would be assessed the Allocation Surcharge at an amount of $1,480 per acre-foot and 354 of the 8,265 acre-feet of use above the allocation would be assessed the Allocation Surcharge at an amount of $2,960.

| | | | |
|---|---|---|---|
| Between 100% and 115% of Allocation | 7,910 af | $1,480/af | $11,706,800 |
| Greater than 115% of Allocation | 354 af | $2,960/af | $1,047,840 |
| **Total** | 8,265 af | | $12,754,640 |

## Step 2: Effective Income-Based Rate Cutback

(a) **Calculate Retail Cutback:** The second step in calculating the income-based rate allocation surcharge adjustment is to calculate the amount of supply cutback that would have been expected from qualifying income-based rate customers under the WSAP. Using the water supply allocation that was calculated above, the total retail level impact on the agency can be

determined. In this example the agency receives a retail level cutback of 15,265 acre-feet, or 11.5% of their retail level demand.

| | |
|---|---|
| WSAP Allocation + Allocation Year Local Supplies | 117,735 af |
| Allocation Year Retail Demand | 133,000 af |
| **Effective Cutback** | **15,265 af (11.5%)** |

**(b) Income-based Rate Customer Retail Cutback:** To calculate the effective income-based rate cutback, the amount of demand covered by a qualifying income-based rate is multiplied by the effective retail level cutback. For this example assume that the agency has 10,000 acre-feet of qualifying demands.

| | |
|---|---|
| Qualifying Income-Based Rate Demand | 10,000 af |
| Effective Cutback Percentage | 11.5% |
| **Effective Income-Based Rate Cutback** | **1,148 af** |

**(c) Income-based Rate Cutback Allocation Surcharge:** Once the effective cutback has been calculated, the amount of Allocation Surcharge that is associated with qualifying income-based rate customers can be determined.

| | | | |
|---|---|---|---|
| Between 100% and 115% of Allocation | 794 af | $1,480/af | $1,175,120 |
| Greater than 115% of Allocation | 354 af | $2,960/af | $1,047,840 |
| **Total** | **1,148 af** | | **$2,222,960** |

**(d) Adjusted Allocation Surcharge Calculation:** Finally, the Allocation Surcharge attributable to qualifying income-based rate customers is subtracted from the total Allocation Surcharge that was calculated above to determine the qualifying income-based rate adjusted allocation surcharge. In the case that the monetary amounts associated with the Income-Based Rate are greater than the total amounts an agency incurs, no Allocation Surcharge will be incurred.

| | |
|---|---|
| Total Allocation Surcharge | $12,754,640 |
| Qualifying Income-Based Rate Allocation Surcharge | $2,222,960 |
| **Qualifying Income-Based Rate Adjusted Allocation** | **$10,531,680** |

## Appendix L: Groundwater Replenishment Allocation

Groundwater basins help provide vital local supplies that can buffer the region from short-term drought impacts. Longer droughts can result in reductions to the many sources of water that replenish groundwater basins, resulting in lower basin levels and potential impacts to the overlying consumptive demands. Limited imported deliveries under these conditions may help avoid impacts to the basins that may be drawn out of their normal operating range or subject to water quality or regulatory impacts. To this end, Metropolitan provides a limited allocation for drought impacted groundwater basins based on the following framework:

a) Staff hold a consultation with qualifying member agencies who have taken groundwater replenishment deliveries since 2010 and the appropriate groundwater basin managers to document whether their basins are in one of the following conditions:
    i. Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or
    ii. Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries.

b) Provide an allocation based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would then be reduced by the declared WSAP Regional Shortage Level (5 percent for each Regional Shortage Level).

c) Any allocation provided under this provision for drought impacted groundwater basins is intended to help support and maintain groundwater production for consumptive use. As such, a member agency receiving an allocation under this provision will be expected to maintain groundwater production levels equivalent to the average pumping in the Base Period. Any adjustments to a member agency's M&I allocation due to lower groundwater production would be reduced by deliveries made under this provision.

d) Agencies for which this allocation does not provide sufficient supplies for the needs of the groundwater basin may use the WSAP Appeals Process to request additional supply (subject to Board approval). The appeal should include a Groundwater Management Plan that documents the need for additional supplies according to the following tenets:
    i. Maintenance of groundwater production levels;
    ii. Maintenance of, or reducing the further decline of, groundwater levels;
    iii. Maintenance of key water quality factors/indicators;
    iv. Avoidance of permanent impacts to groundwater infrastructure or geologic features; and
    v. Consideration of severe and/or inequitable financial impacts.

Final amounts and allocations will be determined following the consultations with groundwater basin managers and member agencies.

# Appendix M: Water Rates, Charges, and Definitions

| Table 9: Water Rates and Charges<br>Dollars per acre-foot (except where noted) | | | |
|---|---|---|---|
| **Rate** | **Effective 1/1/2014** | **Effective 1/1/2015** | **Effective 1/1/2016** |
| Tier 1 Supply Rate | $148 | $158 | $156 |
| Tier 2 Supply Rate | $290 | $290 | $290 |
| System Access Rate | $243 | $257 | $259 |
| Water Stewardship Rate | $41 | $41 | $41 |
| System Power Rate | 161 | $126 | $138 |
| Tier 1 | $593 | $582 | $594 |
| Tier 2 | $735 | $714 | $728 |
| Treatment Surcharge | $297 | $341 | $348 |
| Full Service Treated Volumetric Cost | | | |
| Tier 1 | $890 | $923 | $942 |
| Tier 2 | $1,032 | $1,055 | $1,076 |
| Readiness-to-Serve Charge (millions of dollars) | $166 | $158 | $153 |
| Capacity Charge (dollars per cubic foot second) | $8,600 | $11,100 | $10,900 |

### Definitions:

(1) **Tier 1 Supply Rate -** recovers the cost of maintaining a reliable amount of supply.

(2) **Tier 2 Supply Rate** - set at Metropolitan's cost of developing additional supply to encourage efficient use of local resources**.**

(3) **System Access Rate** – recovers a portion of the costs associated with the delivery of supplies.

(4) **System Power Rate** – recovers Metropolitan's power costs for pumping supplies to Southern California.

(5) **Water Stewardship Rate** – recovers the cost of Metropolitan's financial commitment to conservation, water recycling, groundwater clean-up and other local resource management programs.

(6) **Treatment Surcharge** – recovers the costs of treating imported water.

(7) **Readiness-to-Serve Charge -** a fixed charge that recovers the cost of the portion of system capacity that is on standby to provide emergency service and operational flexibility.

(8) **Capacity Charge** – the capacity charge recovers the cost of providing peak capacity within the distribution system.

# Appendix N: Allocation Appeals Process

### Step 1: Appeals Submittal

All appeals shall be submitted to the Appeals Liaison in the form of a written letter signed by the member agency General Manager. Each appeal must be submitted as a separate request, submittals with more than one appeal will not be considered. The appeal request is to include:

- A designated member agency staff person to serve as point of contact.
- The type of appeal (erroneous baseline data, loss of local supply, etc.).
- The quantity (in acre-feet) of the appeal.
- A justification for the appeal which includes supporting documentation.

A minimum of 60 days are required to coordinate the appeals process with Metropolitan's Board process.

### Step 2: Notification of Response and Start of Appeals Process

The Appeals Liaison will phone the designated member agency staff contact within 3 business days of receiving the appeal to provide an initial receipt notification, and schedule an appeals conference. Subsequent to the phone call, the Liaison will send an e-mail to the Agency General Manager and designated staff contact documenting the conversation. An official notification letter confirming both receipt of the appeal submittal, and the date of the appeals conference, will be mailed within 2 business days following the phone contact

### Step 3: Appeals Conference

All practical efforts will be made to hold an appeals conference between Metropolitan staff and member agency staff at Metropolitan's Union Station Headquarters within 15 business days of receiving the appeal submittal. The appeals conference will serve as a forum to review the submittal materials and ensure that there is consensus understanding as to the spirit of the appeal. Metropolitan staff will provide an initial determination of the size of the appeal (small or large) and review the corresponding steps and timeline for completing the appeals process.

### *Steps 4-7 of the appeals process differ depending upon the size of the appeal*

### *Small Appeals*

Small appeals are defined as those that would change an agency's allocation by less than 10 percent, or are less than 5,000 acre-feet in quantity. Small appeals are evaluated and approved or denied by Metropolitan staff.

### Step 4: Preliminary Decision

Metropolitan staff will provide a preliminary notice of decision to the member agency within 10 business days of the appeals conference. The preliminary decision timeline may be extended to accommodate requests for additional information, data, and documentation. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the preliminary decision and the rationale for approving or denying the appeal.

### Step 5: Clarification Conference

Following the preliminary decision the Appeals Liaison will schedule a clarification conference. The member agency may choose to decline the clarification conference if they are satisfied with the preliminary decision. Declining the clarification conference serves as acceptance of the preliminary decision, and the decision becomes final upon approval by Metropolitan's executive staff.

### Step 6: Final Decision

Metropolitan staff will provide a final notice of decision to the member agency within 10 business days of the clarification conference, pending review by Metropolitan's executive staff. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the final decision and the rationale for the decision. A copy of the letter will also be provided to Metropolitan executive staff.

#### Step 6a: Board Resolution of Small Appeal Claims

Member agencies may request to forward appeals that are denied by Metropolitan staff to the Board of Directors through the Water Planning and Stewardship Committee for final resolution. The request for Board resolution shall be submitted to the Appeals Liaison in the form of a written letter signed by the member agency General Manager. This request will be administered according to Steps 6 and 7 of the large appeals process.

### Step 7: Board Notification

Metropolitan staff will provide a report to the Board of Directors, through the Water Planning and Stewardship Committee, on all submitted appeals including the basis for determination of the outcome of the appeal.

### *Large Appeals*

Large appeals are defined as those that would change an agency's allocation by more than 10 percent, and are larger than 5,000 acre-feet. Large appeals are evaluated and approved or denied by the Board of Directors.

### Step 4: Preliminary Recommendation

Metropolitan staff will provide a preliminary notice of recommendation to the member agency within 10 business days of the appeals conference. The preliminary decision timeline may be extended to accommodate requests for additional information, data, and documentation. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the preliminary recommendation and the rationale for the recommendation. A copy of the draft recommendation will also be provided to Metropolitan executive staff.

### Step 5: Clarification Conference

Following the preliminary recommendation the Appeals Liaison will schedule a clarification conference. The member agency may choose to decline the clarification conference if the satisfied with preliminary recommendation. Declining the clarification conference signifies acceptance of the preliminary recommendation, and the recommendation becomes final upon approval by Metropolitan's executive staff.

### Step 6: Final recommendation

Metropolitan staff will provide a final notice of recommendation to the member agency within 10 business days of the clarification conference, pending review by Metropolitan executive staff. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the final recommendation and the rationale for the recommendation. A copy of the final recommendation will also be provided for Metropolitan executive review.

### Step 7: Board Action

Metropolitan staff shall refer the appeal to the Board of Directors through the Water Planning and Stewardship Committee for approval.

# Appendix O: Appeals Submittal Checklist

## Appeal Submittal

- ☐ Written letter (E-mail or other electronic formats will not be accepted)
- ☐ Signed by the Agency General Manager

## Mailed to the appointed Metropolitan Appeals Liaison

## Contact Information

- ☐ Designated staff contact
  - o Name
  - o Address
  - o Phone Number
  - o E-mail Address
- ☐ General Manager
  - o Name
  - o Address
  - o Phone Number
  - o E-mail Address

## Type of Appeal

- ☐ State the type of appeal
  - o Erroneous historical data used in base period calculations
    - Metropolitan Deliveries
    - Local Production
    - Growth adjustment
    - Conservation savings
  - o Exclusion of physically isolated areas
  - o Extraordinary supply designation
  - o Groundwater Replenishment Allocation
  - o Base Period Mandatory Rationing Adjustment
  - o Other

## Quantity of Appeal

- ☐ State the quantity in acre-feet of the appeal

## Justification and Supporting Documentation

- ☐ State the rationale for the appeal
- ☐ Provide verifiable documentation to support the stated rationale
  - o Examples of verifiable documentation Include, but are not limited to:
    - Billing Statements
    - Invoices for conservation device installations
    - Basin Groundwater/Watermaster Reports
    - California Department of Finance economic or population data
    - California Department of Public Health reports

# Appendix 5

# LOCAL PROJECTS

**(From 2015 IRP local supply project survey April and July 2015)**

## Table A.5-1
## Recycled Water Projects

| Existing Projects | Ultimate Yield/Capacity (Acre-Feet) | Online Date |
|---|---|---|
| City of Anaheim | | |
| Anaheim Water Recycling Demonstration Project | 110 | 2012 |

# Appendix 6

# CONSERVATION ESTIMATES AND WATER SAVINGS FROM CODES, STANDARDS, AND ORDINANCES

# Appendix 6
# CONSERVATION ESTIMATES AND WATER SAVINGS FROM CODES, STANDARDS, AND ORDINANCES

## Background

Unlike traditional water supplies, which can be directly measured, conservation reduces water demand in ways that are quantified indirectly. Demand is reduced through changes in consumer behavior and savings from water-efficient fixtures. There are numerous approaches for estimating and projecting conservation savings, and many of them are utility-specific to meet the unique needs of different water agencies. Metropolitan estimates savings from the extensive existing conservation programs that it funds, as well as savings produced by plumbing codes. Metropolitan also incorporates the savings due to the impacts of price on consumers in its demand forecasts. These conservation savings estimates are incorporated into Metropolitan's long-term planning such as the Integrated Water Resources Plan (IRP) and included in its Urban Water Management Plan (UWMP).

Conservation savings are commonly estimated from a base-year water-use profile. Beginning with the 1996 IRP, Metropolitan identified 1980 as the base year for estimating conservation because it marked the effective date of a new plumbing code in California requiring toilets in new construction to be rated at 3.5 gallons per flush or less. Between 1980 and 1990, the Metropolitan service area saved an estimated 250 TAF per year as the result of this 1980 plumbing code and unrelated water rate increases. Within Metropolitan's planning framework, these savings are referred to as "pre-1990 savings." Metropolitan's conservation accounting combines pre-1990 savings and estimates of more recently achieved savings from the following sources of conservation:

- Active Conservation – Water saved directly as a result of conservation programs by water agencies, including implementation of Best Management Practices by the California Urban Water Conservation Council (CUWCC). Active conservation is unlikely to occur without agency action.
- Code-Based Conservation – Water saved as a result of changes in water efficiency requirements for plumbing fixtures in plumbing codes. Sometimes referred to as "passive conservation," this form of conservation would occur as a matter for course without any additional action from water agencies.
- Price-Effect Conservation – Water saved by retail customers attributable to the effect of changes in the real (inflation-adjusted) price of water. Because water has a positive price elasticity of demand, increases in water price will decrease the quantity demanded.

## Metropolitan's Conservation Estimate

In September 19, 2014, Governor Brown signed SB 1420 (Wolk, D-Davis), which added Section 10631(e)(4) to the Water Code. This Section provides that "water use projections may display and account for the water savings estimated to result from adopted codes, standards,

ordinances, or transportation and land use plans" if that information is available and applicable to an urban water supplier.

Metropolitan's conservation estimate involves a comprehensive representation of Metropolitan's active conservation activities, which utilizes a combination of: (1) fixture/program savings rates based on CUWCC reports and other sources, and (2) a measurement of code-based plumbing code conservation from a 1990 base year. In addition, the price-effect savings is also calculated using Metropolitan's MWD-EDM, a statistical model used for forecasting retail water demands. Potential savings from public outreach and education programs are not included in Metropolitan's conservation estimate.

Distinguishing between active, code-based, and price-effect conservation can be complex when, for example, active programs for fixtures are concurrent with conservation-related plumbing codes. Metropolitan's conservation estimate combines active, code-based, and price-effect conservation savings using methods that avoid double counting. Currently, there are 74 devices and programs accounted for in estimating active conservation. These devices are aggregated into residential, landscape, commercial, industrial, and institutional sectors. There are eight fixtures tied to Code-based conservation estimate. Metropolitan's conservation estimate is developed in cooperation with its 26 member agencies and is categorized into:

- Single-family residential (SFR),
- Multi-family residential (MFR), and
- Commercial, industrial, and institutional (CII).

### *Active Conservation*

The estimated savings from active conservation take into account programs administered by Metropolitan and its member agencies since 1990. The savings are calculated by combining counts of active program activity – numbers of devices and/or program implementations – with device-related savings factors. The factors include:

- Savings per device/implementation
- Device life expressed in years
- Decay rate expressed as percent decay per year

Device savings estimates are determined by key assumptions described above. Devices may be represented more than once due to different implementation methods or savings factors. Assumptions are periodically reviewed to ensure they represent the best savings estimates available. Device savings are limited by decay rates, or device life, but not both at the same time. For example, a residential high-efficiency toilet (HET) saves about 38 gallons per day over a lifetime of 20 years with no assumed decay rate.

### *Code-Based Conservation*

Code-Based conservation accounts for water saved as a result of changes in water efficiency requirements for plumbing fixtures in plumbing codes. Plumbing code conservation is the impact of plumbing codes and other ordinances on water demand. Metropolitan's Code-Based conservation estimate represents plumbing code conservation with demographically-driven stock models. The stock models are device- or fixture- specific and are based on the same demographic data used in Metropolitan's retail demand projection. Each stock model tracks the stocks and flows of conserving and non-conserving water devices, allowing it to estimate the impacts of plumbing codes on device saturation and overall savings.

The Metropolitan's Code-Based conservation estimate accounts for the following:

- New Construction: Water fixtures installed due to new construction are assumed to be in compliance with the plumbing codes in effect when the new construction occurs. For instance, a house built in 1997 would meet the efficiency standards set by California's 1992 plumbing code. Therefore, new construction is assumed to result in measurable savings from 1990, which is the baseline for conservation savings calculations. Estimates and projections of the number of fixtures added through new housing units and offices are based on growth in housing units or employment.
- Natural Replacement: Natural replacement accounts for the savings that accrue when fixtures are replaced with more efficient models due to remodeling, failure, or other reasons. Metropolitan's savings estimate represents this effect with a "natural replacement rate" that is expressed as a percentage of existing fixtures that are replaced in a given year. Natural replacement rates vary by device and are linked to the expected life of the device. Devices with short lifespans will be replaced more frequently and thus have higher natural replacement rates. A simple percentage is used to account for this natural turn-over in non-conserving fixtures because it is difficult to back-calculate the age of the fixtures in pre-1990 construction.
- Fixtures Up for Renewal: As water-conserving fixtures reach their useful lives and become defective or inefficient, they may be replaced with water conserving fixtures due to plumbing codes. The water savings from the device is then considered "renewed" savings, which is tracked in Metropolitan's savings estimate. For example, a fixture that was installed through an active conservation program provides water savings that otherwise would not have been realized without plumbing codes. However, subsequent adoption of efficient plumbing codes means that when the fixture reaches the end of its life, it will be replaced by the same or more water-efficient model.

### *Stock Models*

The number of efficient fixtures for each stock model is the sum of fixtures from active programs, new construction, natural replacement, and fixtures up for renewal. Table A.6-1 below shows the fixtures and devices that are assigned stock models based on existing plumbing codes.

**Table A.6-1**
**Stock Models**

| Residential | CII |
|---|---|
| Toilets | Toilets |
| Showerheads | Urinals |
| Faucet Aerators | Pre-Rinse Spray Heads |
| Washing Machines | Washing Machines |

The Stock Models generate separate annual estimates of devices and fixtures for tracking active conservation savings, while also accounting for the impacts of active programs on the overall device saturation rate. As a result, increased levels of active conservation lead to lower levels of plumbing code conservation. This helps avoid double counting in Metropolitan's conservation savings estimate.

### *Plumbing Code Assumptions*

Plumbing code savings are determined by the device-specific assumptions used in the stock models, presented in Table A.6-2. The stock models are driven by projections of housing and employment consistent with the demand projections. Initial device counts and growth in the number of devices are determined by the demographics combined with the following assumptions:

- Devices per Household or Per Employee: This factor represents the average number of devices per household or per employee and is multiplied by the demographic projections to develop estimates of total number of devices or "stock." Devices per household and employee can vary by agency and change over time.
- Plumbing Code Compliance Rate: The plumbing code compliance rate is expressed as a percent and serves two purposes: (1) it indicates the presence of a plumbing code in a specific year, and (2) it determines the overall compliance rate with the plumbing code. This allows plumbing code effects to be phased in over several years.
- Natural Replacement Rate: This represents the rate at which existing non-conserving devices are converted to conserving devices due to remodeling or device failure. It has a strong impact on the saturation rate of devices that existed prior to plumbing codes, such as pre-1992 toilets.
- Device Life: The stock models also account for device life for water-efficient devices installed after 1990. This allows the stock model to track devices installed through active conservation as they reach the end of their life and are replaced due to plumbing codes. The stock models use the same device life specified in the savings assumptions.

**Table A.6-2**
**Plumbing Code Assumptions**

| Stock Model | Device per Household/ Employee | Compliance Rate | Natural Replacement Rate | Plumbing Code Year |
|---|---|---|---|---|
| Res. Toilets | 2 | 99% | 2% | 1992/2014 |
| Res. Shower Heads | 1.8 | 95% | 10% | 1992 |
| Res. Aerators | 3.5 | 90% | 33% | 1992 |
| Res. Washing Machine | 0.74 | 100% | 6.7% | 2007 |
| CII Toilets | 0.27* | 100% | 2% | 1992/2014 |
| CII Urinals | 0.06 | 100% | 4% | 1992 |
| CII Pre-Rinse Spray Heads | 0.0055* | 95% | 16.7% | 2006 |
| CII Washing Machine | 0.0073* | 100% | 5% | 2007 |

* Varies over time and by agency (based on CUWCC BMPs savings factors)

These assumptions are derived from CUWCC conservation reports, American Water Works Association Research Foundation's 1999 end use study, Metropolitan's Orange County Saturation Study, and other sources. In the residential sector, devices per household combine single family and multifamily trends.

### *Model Water Efficient Landscape Ordinance*

The California Water Commission adopted an updated Model Water Efficient Landscape Ordinance (MWELO) on July 15, 2015. The MWELO promotes efficient landscapes in new developments and retrofitted landscapes. The MWELO increases water efficiency standards for new and retrofitted landscapes through more efficient irrigation systems, greywater usage, onsite storm water capture, and by limiting the portion of landscapes that can be covered in turf. Local agencies had until December 1, 2015 to adopt the MWELO or to adopt a Local Ordinance which must be at least as effective in conserving water as MWELO. Local agencies working together to develop a Regional Ordinance had until February 1, 2016 to adopt, but they are still subject to the December 2015 reporting requirements. Local agencies were required to report on the implementation and enforcement of local ordinances by December 31, 2015.

Metropolitan's modeling of code-based conservation includes a calculation of savings that would result from 50 percent of new households having efficient outdoor water use consistent with MWELO. The 50 percent compliance rate for new households is a conservative estimate based on an assessment of the efficacy of the current MWELO ordinance.

Metropolitan's 2015 IRP Update includes a regional target for additional conservation development. This target is based on estimates calculated from the potential savings that could result from increasing MWELO compliance from 50 percent to 100 percent of new households, and on the potential savings that could result from one percent per year of all existing households reducing outdoor water use in a manner consistent with MWELO. Because MWELO does not apply to existing households, it is anticipated that achieving the equivalent MWELO efficient water savings will require a combination of approaches that can target reductions in outdoor water use.

### *Price Savings Assumptions*

Price-effect savings are calculated by comparing MWD-EDM demand projections with price increases to demand projections with constant 1990 water rates. The difference is the price-effect savings measured from a 1990 base. Price-effect savings increase as prices rise over time; they also increase as the household and employment base grow. A price increase applied to 1,000 households will generate more water savings than the same price increase applied to 500 households.

### *Un-metered Water Use Savings*

A final category of savings tracked by Metropolitan is a product of other conservation efforts. MWD-EDM projects un-metered water use as a fixed percentage of total retail M&I demand. As conservation savings lowers residential and CII demands, it lowers un-metered use by the same percent. For instance, if conservation reduces M&I demands by 10 percent in 2020 (compared to demands before conservation), un-metered water use is also reduced 10 percent. This reduction is based on the assumption that un-metered use varies according to overall demand and that reducing overall use also reduces un-metered use. The reduction in un-metered water use is captured in the MWD-EDM model and included as a conservation source.

The total passive savings are shown in Table A.6-3 below.

**Table A.6-3**
**Passive Savings**[1]
**(Acre-feet)**

| | 2010 | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|---|
| **Total** | 701,000 | 765,000 | 846,000 | 931,000 | 1,016,000 | 1,097,000 | 1,180,000 |

[1] Passive savings are accounted for in water use projections in Section 2.

# Appendix 7

# DISTRIBUTION SYSTEM WATER LOSSES

# Appendix 7
# DISTRIBUTION SYSTEM WATER LOSSES

Metropolitan followed the American Water Works Association (AWWA) Water Audit methodology to track all sources of water and uses of water within its system. The AWWA Audit methodology quantifies real and apparent water system losses in an agency's distribution system. Section 10631(e)(3)(A) of the California Water Code requires that the 2015 Urban Water Management Plan quantify distribution system water losses for the most recent 12-month period available.

For the distribution system water losses assessment, Metropolitan is including its water balance audit for calendar years 2014 and 2013, as presented in tables A.7-1 and A.7-2, respectively. In addition, this appendix also includes a memorandum entitled "Metropolitan Water District – Water Balance Validation & Component Analysis Feasibility Study" dated January 16, 2013. This memorandum discusses the water balance assessment for year 2012. The 2014 and 2013 assessments were updated using the methods and worksheets developed in the 2012 assessment, and results were submitted as part of Metropolitan's CUWCC filings included in Appendix 8.

In addition to the distribution system losses described in the AWWA tables, Metropolitan estimates that 37 TAF was lost from reservoir evaporation occurring in Lake Mathews, Lake Skinner, and Diamond Valley Lake during calendar year 2014.

WSO

**TO:** **Mark Graham, Keith Nobriga, Timothy Schaadt**
**FROM:** **WSO**
**DATE:** **January 16, 2013**
**RE:** **Metropolitan Water District – Water Balance Validation & Component Analysis Feasibility Study**

## I. Introduction

Water loss assessment is the focus of the Best Management Practice (BMP) 1.2 in the California Urban Water Conservation Council (CUWCC)'s Memorandum of Understanding (MOU). As a signee of this MOU, the Metropolitan Water District (MWD) is required to submit standard water balances annually and complete a component analysis of real losses every four years. Beyond compliance with the CUWCC BMP 1.2 requirements, regularly assessing water loss provides an opportunity for MWD to realize efficiency improvements and water savings.

Water Systems Optimization (WSO) was hired to validate MWD's water balance and investigate the feasibility of a component analysis of real losses for a transmission system. The standards used in the water balance and component analysis assumptions are geared toward distribution systems with significantly smaller pipe sizes and lower pressures; it is important to evaluate whether this methodology can provide useful insight for a transmission system.

## II. Treated Water Balance Findings

The following outlines the findings from the water loss assessment and highlights important assumptions applied to present a realistic water balance for MWD.

For the treated water system, WSO compiled a basic water balance for the calendar year of 2012. First, the inputs into the treated water system were totaled from MWD's master meter data. Next WSO inventoried all of the treated water service connections. Reviewed and confirmed by MWD staff, WSO tabulated the total volume of water deliveries – or authorized consumption – for the potable water system. Non-revenue water is the difference between these two volumes (Total Water Supplied minus Billed Metered Consumption).

Table 1 presents the non-revenue water determination for the treated water system.

**Table 1: Non-Revenue Water Determination for Treated Water System**

| | | |
|---|---|---|
| **TOTAL WATER SUPPLIED (A)** | 891,434.20 | AF |
| **BILLED CONSUMPTION (B)** | 886,370.10 | AF |
| **NON-REVENUE WATER (A-B)** | 5,064.10 | AF |
| **NON-REVENUE WATER** *as a % of supply* | 0.57% | |

The non-revenue water determination shows that MWD successfully delivered and generated revenue for nearly all of the treated water it produced in CY 2012.

To satisfy the AWWA Water Balance requirements, non-revenue water must be broken down into its three components: 1) Unbilled Consumption, 2) Apparent Losses consisting of meter under-registration and water theft and 3) Real Losses - physical water losses from infrastructure failures.

The assumptions outlined in Table 2 were applied to address these volume of non-revenue water for MWD. It is important to note that many of the AWWA Free Water Audit Software's suggested default values were changed to account for the unique nature of MWD's transmission-only system.

**Table 2: Assumptions Used in Treated Water Balance**

| **Non-Revenue Water** | **Value Used for MWD** | **Notes on Assumption** |
|---|---|---|
| Unbilled Unmetered Consumption | 0.1% of Water Supplied | *This is the volume of water used for operational purposes throughout the year (neither billed nor metered). Though the default value for distribution systems is 1.25% of Water Supplied, a much lower value is applied here.* |
| Meter Under-Registration | 0.25% Meter Under-Registration | *This is the assumed inaccuracy of customer meters. Though Venturi meters are quoted at +/-0.75% accuracy, a lower under-registration is applied to accommodate for the low total of non-revenue water.* |
| Unauthorized Use (Theft) | Zero | *MWD staff reported that water theft in the system is negligible if it exists at all.* |

With these assumptions, a complete water balance – including the real loss volume estimation - was produced. Table 3 presents the finalized water balance for the MWD treated water system

(additionally, the free AWWA Water Audit Software which outlines the same volumes is included in Appendix A).

**Table 3: Water Balance for MWD Treated Water CY 2012**

| WATER BALANCE COMPONENT | CY 2012 VOLUME |
|---|---|
| | (AF) |
| **WATER SUPPLIED** | **891,434.20** |
| Billed Metered Authorized Consumption | 886,370.10 |
| Billed Un-metered Authorized Consumption | NA |
| **BILLED AUTHORIZED CONSUMPTION** | **886,370.10** |
| Un-billed Metered Authorized Consumption | NA |
| Un-billed Un-metered Authorized Consumption | 891.43 |
| **UN-BILLED AUTHORIZED CONSUMPTION** | **891.43** |
| **AUTHORIZED CONSUMPTION** | **887,261.53** |
| **WATER LOSSES** | **4,172.67** |
| Unauthorized Consumption | NA |
| Meter Error | 2,215.93 |
| **APPARENT LOSSES** | **2,215.93** |
| **REAL LOSSES** | **1,956.74** |

It is expected for a system exclusively composed of transmission lines to experience low losses: a large diameter pipe network with low service connection density has few points of infrastructural vulnerability.

**Non-Revenue Water by Zone**

To take a closer look at the treated water system, WSO divided MWD's treated water system into five zones. Examining separate water balances for each of these zones allowed for a more detailed picture of water loss throughout the system. Table 4 describes the parameters for each zone's boundaries.

It is important to note that a number of these zones are overlapping. The combination of Zone A and Zone D capture the total treated water system. Zones, B, C, and E are all within the bigger Zone A.

**Table 4: Zone Boundary Designations**

| ZONE | BOUNDARY DETAILS |
|---|---|
| A | The total treated water zone, excluding the portion off of Skinner Lake |
| B | Exclusively the Allan McColloch Pipeline ("AMP") |
| C | Exclusively the West Valley Feeder #2 and the Calabasas Feeder |
| D | Treated water off of Skinner Lake |
| E | "Los Angeles Central Zone" refers to the the zone where different sources of treated water overlap, boundaries defined as:<br>*Inputs into the Los Angeles Central Zone:*<br>• PVF-0 serves as one of the northern boundaries<br>• MF-1 serves as one of eastern boundaries<br>• 2LF-4W serves as one of the eastern boundaries<br>• MFBP-0 serves as one of the eastern boundaries<br>• WC-0 serves as one of the eastern boundaries<br>• LF-2W serves as one of the eastern boundaries<br>• SC-OS serves as one of the eastern boundaries<br>• SF-V serves as the western boundary<br><br>*Outputs from the Los Angeles Central Zone (distinct from customers):*<br>• LF-2E serves as an outlet on the eastern boundary<br>• 2LF-3E serves as an outlet on the eastern boundary<br>• 2LF/WOCS serves as an outlet on the eastern boundary<br>• SC-ON serves as an outlet on the eastern boundary |

For each zone, WSO determined the non-revenue water volume for the calendar year of 2012. First, the inputs into each zone - metered by one or many of the MWD's master meters – were totaled. Next WSO inventoried all of the service connections by zone. Reviewed and confirmed by MWD staff, WSO tabulated the total volume of water deliveries – or authorized consumption – for each zone. Non-revenue water is the difference between these two volumes (Total Water Supplied minus Billed Metered Consumption).

Table 5 presents the non-revenue determinations for MWD's treated system by zone alongside the number of service connections and mileage for each zone.

**Table 5: Non-Revenue Water Determinations by Zone**

| ZONE | | A | B | C | D | E |
|---|---|---|---|---|---|---|
| **Mileage** | (miles) | 485.29 | 22.96 | 17.95 | 42.08 | 152.09 |
| **Service Connections** | | 284 | 28 | 4 | 12 | 117 |
| | | | | | | |
| **TOTAL WATER SUPPLIED:** | (AF) | | 99,722.30 | 124,294.60 | 153,329.70 | 231,175.50 |
| **BILLED CONSUMPTION** | (AF) | | 100,590.60 | 123,618.20 | 152,790.60 | 232,513.80 |
| **NON-REVENUE WATER:** | (AF) | 4,525.00 | (868.30) | 676.40 | 539.10 | (1,338.30) |
| **NON-REVENUE WATER** *as a % of supply* | | 0.61% | -0.87% | 0.54% | 0.35% | -0.58% |

Examining the non-revenue water determinations by zone confirms that MWD experiences very low water loss levels across its treated water system. The calculations in Zones B and E show that more consumption was billed than entered the particular zone. This implausible scenario likely suggests the impact of meter inaccuracy in the master meter, the customer meters, or both. It is important to note that when non-revenue water is so low, any metering inaccuracy will have significant impacts in the water balance.

**III. Recommendations for Improved Water Loss Assessment**

For future water balances, it is recommended to replace any assumptions applied here with documentation of use specific to MWD's practices. Going forward it will be useful to keep track or actively estimate the following volumes:

- Unbilled Unmetered Authorized Consumption: all operational uses for flushing, maintenance, etc.
- Unauthorized Consumption: documentation of any water theft

It is also recommended to calculate non-revenue water for the whole treated water system – and by zone – on a frequent basis. After inventorying the appropriate inputs and outputs, the designation of zones will serve to highlight smaller areas of attention if the non-revenue water determinations vary. Ongoing attention to the trends of non-revenue water throughout the year will allow for further investigation if it increases and presents a larger problem.

Lastly, it is recommended to continue the current maintenance and testing schedule of all input meters and wholesale customer meters.

**IV. Component Analysis Feasibility and Results**

Transmission mains have long been a challenging component to address effectively in water network audits and modelling of real losses. The lack of reliable methods for assessing this component of real water loss has forced the use of educated guesses and assumptions (Laven and Lambert, 2012).

It is important to note that The Bursts and Background Estimates (BABE) Concept was developed for component analysis of Real Losses on distribution systems (Lambert, 1994; Lambert and Morrison, 1995). It classifies leakage events into three different categories – undetectable background leakage, unreported bursts and reported bursts – each with different characteristics in terms of typical frequencies, flow rates and run-times. Because of this methodology's focus on distribution systems, it becomes challenging to use it to produce a reliable real loss component analysis for a transmission system. The results need to be interpreted in the context of the limitations of conducting a real loss component analysis for a transmission system. A Real Loss component analysis separates the leak and break volumes of real loss into the following categories (see Figure 1).

- **Reported leaks**: those leaks that are called in during the normal course of the day. Reported leaks may be called in by the public, meter readers or by other utility personnel.
- **Unreported leaks**: are those leaks that are not called in and have to be located by proactive leak detection methods.
- **Background Leakage:** the collective weeps and seeps in pipe joints and connections. They have flow rates that are typically too small (1gpm or less) to be detected by conventional acoustic leak detection equipment. They run continuously until they gradually worsen to the point when they can be detected. The only ways of reducing background leakage is through pressure management or infrastructure replacement.

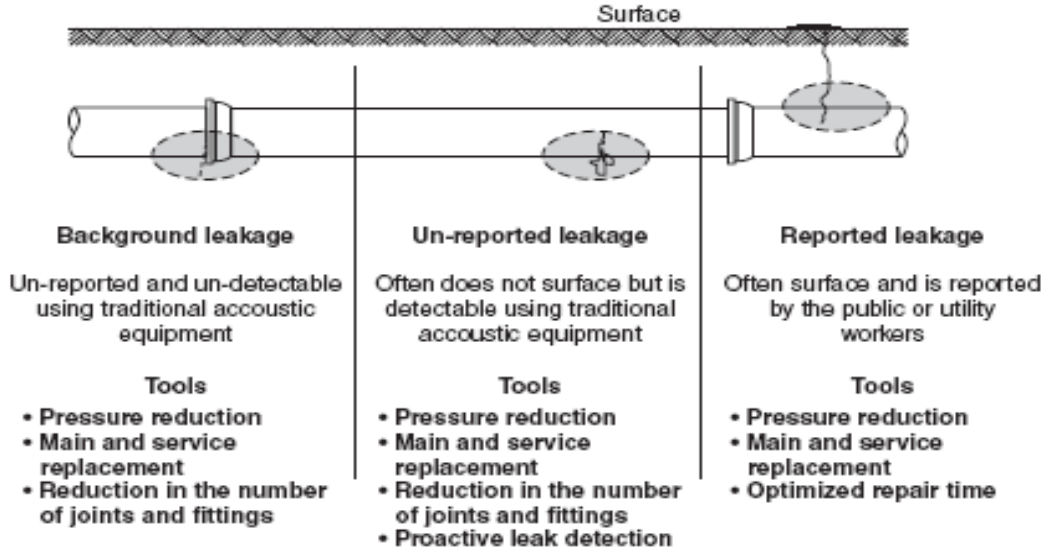

**Figure 1: Components of Real Losses and Tools for Intervention**

## IV. a – Background Leakage

The total volume of estimated background leakage on MWD's treated water transmission system was calculated using an Infrastructure Condition Factor (ICF) of 1.5, which assumes that background leakage is 1.5 times higher than the technical minimum. This assumption was informed by the transmission's high operating pressure and the generally very good condition of the infrastructure. Under this assumption, the total volume of background losses for MWD's treated water transmission system was calculated to be 1,318 AF. This background losses volume accounts for about 67% of the total volume of real losses calculated for CY 2012 (see Figure 2 for the calculation details). Given the high average pressure in the transmission system and the nature of the transmission system infrastructure it appears reasonable that two thirds of the total real loss volume is caused by background leakage, which comprises of weeps and seeps in pipe joints and connections.

**Step 2: BACKGROUND LEAKAGE ON MAINS AND SERVICES**

**Instructions:** The background leakage volume from mains and service connections will be automatically calculated after selecting one of the default Infrastructure Condition Factors (ICF) based on infrastructure age or after a utility specific ICF has been selected and entered in cell P43. The level of background leakage tends to increase with infrastructure age and is higher for systems with higher pressure. The volume of background losses is generally a significant component of the total real loss volume, at times up to 50% of the total volume of real losses. Overestimating (ICF used in model is too high) or underestimating (ICF used in model is too low) the background leakage volume might lead to a real loss control strategy that is not truly optimized. Selecting the ICF based on general age of the distribution network should only be seen as a starting point. It is strongly recommended that over time a utility specific ICF is assessed and confirmed through field tests using one of the recommended approaches outlined in the AWWA M36 manual.

| | | | | | | Pressure Corrected Calculation | |
|---|---|---|---|---|---|---|---|
| System Component | Units | Quantity | Component UARL Values (g/unit/d/psi) | Infrastructure Condition Factor | Average Pressure (psi) | N1 (Leakage-Pressure Exponent) Value | Annual Volume Acre-feet |
| Mains | miles | 527.4 | 2.87 | 1.5 | 261.6 | 1.5 | 1,289.68 |
| Services - Main to Curb-Stop | number | 296 | 0.112 | 1.5 | 261.6 | 1.5 | 28.25 |
| Services - Curb-Stop to Meter | miles | - | 4.78 | 1.5 | 261.6 | 1.5 | - |
| | | | | | **Total Background Leakage on Mains and Services** | | **1,317.93** |

**Select Infrastructure Condition Factor (ICF) based on age of distribution network**

| | |
|---|---|
| ○ ICF 1 for System Age <50 years | 1.0 |
| ◉ ICF 1.5 for System Age 50 - 70 years | 1.5 |
| ○ ICF 2.5 for System Age >70 years | 2.5 |
| OR | |
| ○ Enter ICF values assessed through implementing the approaches outlined in the AWWA M36 manual | |

**Figure 2: Calculation of Background Leakage for MWD Treated Water Transmission System**

## IV. b – Reported Leakage/Failures

There were no reported leaks/failures during CY 2012. Therefore the total volume from reported leakage for 2012 is zero.

## IV. c – Un-Reported Leakage/Failures

There were no un-reported leaks/failures during CY2012 identified through proactive leak detection efforts. Therefore the total volume from un-reported leakage for 2012 is zero.

## IV. d – Real Loss Component Analysis Summary

Figure 3 provides a summary of the real loss component analysis for MWD's treated water transmission system. As mentioned in the introduction to this section the results need to be interpreted in the context of the limitations of conducting a real loss component analysis for a transmission system. The results would indicate that about two thirds of the total real loss volume are due to background leakage, which can only be reduced through pressure reduction or infrastructure replacement. The component analysis model indicates that about 639AF are

due to unreported leaks that are currently running undetected and could possibly be detected by utilizing in-line leak detection technologies. However, given the cost for in-line leak detection services there does not appear to be an economic incentive for MWD to change their current leakage control strategy.

| SUMMARY: REAL LOSS COMPONENT ANALYSIS | | | | |
|---|---|---|---|---|
| System Component | Background Leakage (Acre-feet) | Reported Failures (Acre-feet) | Unreported Failures (Acre-feet) | Total (Acre-feet) |
| Reservoirs | - | - | - | - |
| Mains and Appurtenances | 1,289.68 | - | - | **1,289.68** |
| Service Connections | 28.25 | - | - | **28.25** |
| Total Annual Real Loss | **1,317.93** | - | - | **1,317.93** |
| **Real Losses as Calculated by Water Audit** | | | | **1,956.74** |
| **Hidden Losses/Unreported Leakage Currently Running Undetected** | | | | **638.81** |

**Figure 3: Real Loss Component Analysis Results**

Water Audit Report for: Metropolitan Water District
Reporting Year: 2012 1/2012 - 12/2012

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

**All volumes to be entered as: ACRE-FEET PER YEAR**

| | | | | |
|---|---|---|---|---|
| **WATER SUPPLIED** | | << Enter grading in column 'E' | | |
| Volume from own sources: | 10 | 891,434.200 | acre-ft/yr | |
| Master meter error adjustment (enter positive value): | n/a | | acre-ft/yr | |
| Water imported: | n/a | | acre-ft/yr | |
| Water exported: | n/a | | acre-ft/yr | |
| **WATER SUPPLIED:** | | 891,434.200 | acre-ft/yr | |
| **AUTHORIZED CONSUMPTION** | | | | |
| Billed metered: | 10 | 886,370.100 | acre-ft/yr | |
| Billed unmetered: | n/a | 0.000 | acre-ft/yr | |
| Unbilled metered: | n/a | 0.000 | acre-ft/yr | |
| Unbilled unmetered: | 4 | 891.430 | acre-ft/yr | Pcnt: Value: 891.430 |
| **AUTHORIZED CONSUMPTION:** | | 887,261.530 | acre-ft/yr | |
| **WATER LOSSES (Water Supplied - Authorized Consumption)** | | 4,172.670 | acre-ft/yr | |
| **Apparent Losses** | | | | Pcnt: Value: |
| Unauthorized consumption: | 2 | 0.000 | acre-ft/yr | 0.000 |
| Customer metering inaccuracies: | 8 | 2,215.930 | acre-ft/yr | 2,215.930 |
| Systematic data handling errors: | | 0.000 | acre-ft/yr | |
| Systematic data handling errors are likely, please enter a non-zero value; otherwise grade = 5 | | | | |
| Apparent Losses: | | 2,215.930 | | |
| **Real Losses (Current Annual Real Losses or CARL)** | | | | |
| Real Losses = Water Losses - Apparent Losses: | | 1,956.740 | acre-ft/yr | |
| **WATER LOSSES:** | | 4,172.670 | acre-ft/yr | |
| **NON-REVENUE WATER** | | | | |
| **NON-REVENUE WATER:** | | 5,064.100 | acre-ft/yr | |
| = Total Water Loss + Unbilled Metered + Unbilled Unmetered | | | | |
| **SYSTEM DATA** | | | | |
| Length of mains: | 10 | 527.4 | miles | |
| Number of active AND inactive service connections: | 10 | 296 | | |
| Connection density: | | 1 | conn./mile main | |
| Average length of customer service line: | 10 | 0.0 | ft | (pipe length between curbstop and customer meter or property boundary) |
| Average operating pressure: | 9 | 261.6 | psi | |
| **COST DATA** | | | | |
| Total annual cost of operating water system: | 8 | $1,800,000,000 | $/Year | |
| Customer retail unit cost (applied to Apparent Losses): | 9 | $2.44 | $/1000 gallons (US) | |
| Variable production cost (applied to Real Losses): | 8 | $560.00 | $/acre-ft | |

Click here: for help using option buttons below

Use buttons to select percentage of water supplied OR value

Choose this option to enter a percentage of billed metered consumption. This is NOT a default value

**PERFORMANCE INDICATORS**

**Financial Indicators**

| | |
|---|---|
| Non-revenue water as percent by volume of Water Supplied: | 0.6% |
| Non-revenue water as percent by cost of operating system: | 0.2% |
| Annual cost of Apparent Losses: | $1,761,836 |
| Annual cost of Real Losses: | $1,095,774 |

**Operational Efficiency Indicators**

| | | |
|---|---|---|
| Apparent Losses per service connection per day: | 6683.29 | gallons/connection/day |
| Real Losses per service connection per day*: | N/A | gallons/connection/day |
| Real Losses per length of main per day*: | 3,312.22 | gallons/mile/day |
| Real Losses per service connection per day per psi pressure: | | gallons/connection/day/psi |
| Unavoidable Annual Real Losses (UARL): | 849.09 | acre-feet/year |
| From Above, Real Losses = Current Annual Real Losses (CARL): | 1,956.74 | acre-feet/year |
| Infrastructure Leakage Index (ILI) [CARL/UARL]: | 2.30 | |

* only the most applicable of these two indicators will be calculated

**WATER AUDIT DATA VALIDITY SCORE:**

*** YOUR SCORE IS: 84 out of 100 ***

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

**PRIORITY AREAS FOR ATTENTION:**

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Unauthorized consumption
2: Systematic data handling errors
3: Customer metering inaccuracies

For more information, click here to see the Grading Matrix worksheet

# Appendix 9

# METROPOLITAN'S ENERGY INTENSITY CALCULATIONS, INCLUDING CONVEYANCE AND DISTRIBUTION GENERATION

# Appendix 9
# METROPOLITAN'S ENERGY INTENSITY CALCULATIONS, INCLUDING CONVEYANCE AND DISTRIBUTION GENERATION

## Introduction

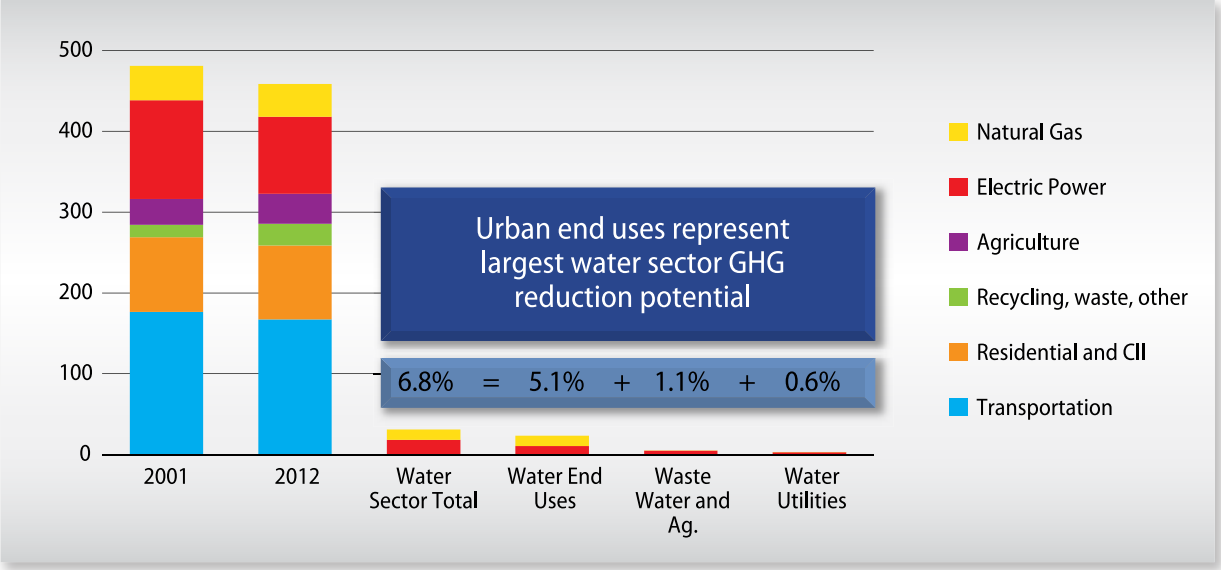
The Metropolitan Water District of Southern California is a wholesale water agency that distributes water to its 26 Member Agencies. These agencies receive treated and untreated water through Metropolitan's 830 miles of interconnected pipelines. There are over 400 service connections to the 26 Member Agencies located throughout Metropolitan's 5200 square mile service area.

## Water-Related Energy Use in California

Water supply by its nature is energy intensive, and it is widely reported that California's "Water Sector" uses 19 percent of the state's electricity and 32 percent of the state's natural gas not used for power generation. However, these facts are often misinterpreted by attributing the entire water-related energy use to urban water agencies such Metropolitan and the Department of Water Resources.

The original source for these figures is the California Energy Commission's 2005 "California's Water – Energy Relationship" report (CEC-700-2005-011-SF, Nov. 2005), which analyzed water-related energy use data for 2001. Based on the information in the report, approximately 3 percent of the electrical use is associated with urban water agency conveyance, treatment, and distribution. Of the remaining 16 percent, 0.8 percent is attributed to wastewater treatment, 4.2 percent is associated with agricultural use, and 11 percent is due to urban end uses – including the heating and cooling of water by customers. For non-power plant natural gas, over 99 percent of use is attributed to urban end uses, while 0.14 percent is used for urban water supply. Table A.9-1 presents the water related energy use in California and is adapted from the 2005 CEC report.

The 3 percent of electricity associated with urban water supply represents the "embedded energy" in water, whereas the 11 percent of electricity and 31 percent of natural gas attributed to end uses represent a direct use of energy by consumers.



This distinction is essential for state policy issues currently under consideration related to energy use and GHG emissions in the water sector. When the results from the CEC study are compared to California's overall GHG emissions from all sectors, it becomes clear that the greatest potential for reducing water-related GHG emissions lies with consumer end uses. Figure A-9.1 shows that while the water sector contributes about 6.8 percent of the State's measured GHG emissions, water utilities contribute just 0.6% of the total. By comparison, water end uses – again, including the heating and cooling of water – account for 5.1 percent.

**Table A.9-1**
**Water Related Energy Use in California**

| | Electricity (Gigawatt-hour) | Natural Gas (Million Therms) |
|---|---|---|
| **Urban Water Supply** | **7,554** | **19** |
| Waste Water Treatment | 2,012 | 27 |
| Urban End Users | 27,887 | 4,220 |
| Agricultural Total | 10,560 | 18 |
| **Total Water Sector Use** | **48,013** | **4,284** |
| | | |
| **Total California Use** | **250,494** | **13,571** |
| | | |
| **Urban Water Supply** | **3.0%** | **0.1%** |
| Waste Water Treatment | 0.8% | 0.2% |
| Urban End Users | 11.1% | 31.1% |
| Agricultural Total | 4.2% | 0.1% |
| **Total Water Sector Use** | **19.2%** | **31.6%** |

Energy has always been a key factor in the development of California's water supply infrastructure. Most water projects in the state are designed to minimize energy use and maximize energy recovery. In response to California's GHG emission goals, Metropolitan and many other water utilities are proactively taking steps to reduce water-related energy use. This includes increasing energy recovery in conveyance and distribution systems, developing renewable energy projects, performing energy studies, auditing facility energy usage, and other related actions. Additionally, the conservation programs administered by Metropolitan and the member agencies save embedded energy, as well as the energy associated with consumer end uses.

**Figure A.9-1 Greenhouse Gas Emissions in California**
**Metric Tonnes of $CO_2$ Equivalent**

Note: Based on the Air Resources Board GHG inventory from 2000 to 2012 data;
http://www.arb.ca.gov/cc/inventory/data/tables/ghg_inventory_scopingplan_00-12_2014-03-24.pdf;
Percentages for the water sector are based on CEC's 2005 Energy Intensity Report: CEC-700-2005-011-SF, Nov. 2005

## Voluntary Energy Use Reporting

SB 1036 (Pavley 2014) added Section 10631.2 to the Water Code, which states that water agencies may voluntarily provide information on estimated energy usage in their Urban Water Management Plans. This Appendix explains how Metropolitan will provide that information. Due to the mixing of water supplies before and after treatment, and the large number of service connections, Metropolitan will provide system-wide Energy Intensity values. In addition, it should be noted that as water supply, water quality, and operational conditions change, including Member Agencies' demands, the annual values for energy use and energy intensity will vary from year to year.

Metropolitan's Energy Intensity for the water it provides to its Member Agencies is broken down into the following functions:

- Source
- Conveyance
- Treatment
- Distribution
- Storage

## Source

The water Metropolitan receives comes from two sources; (1) the California Department of Water Resources' (DWR) State Water Project (SWP), and (2) the Colorado River. The water flows naturally into these sources and does not require energy for extraction or diversion. Therefore, there is no energy used to extract or divert water from these sources.

## Conveyance

To estimate the amount of energy used to convey water supplies to Metropolitan's water treatment plants and distribution system, the energy requirements from the two conveyance systems supplying Metropolitan's water have been combined, along with the volume of water delivered, into a single weighted energy intensity value for conveyance. As the blend of water from the SWP and the Colorado River changes each year due to availability, water quality, and demands, the total energy consumption and energy intensity for the conveyance function vary year to year.

### *State Water Project*

Metropolitan is a contractor for water from DWR's SWP. The SWP uses a combination of natural and man-made systems to move water from Lake Oroville on the Feather River in northern California, through the Sacramento/San Joaquin River Delta (Delta), and into the California Aqueduct for delivery to central and southern California. DWR conveys water through the California Aqueduct using a series of pumps and hydro generators. Metropolitan receives water from DWR through the West Branch of the California Aqueduct at Castaic Lake and from the East Branch of the California Aqueduct at several locations in San Bernardino and Riverside Counties.

The California Aqueduct's net Energy Intensity for the water received from the West Branch is 2,580 kWh/AF and for the East branch it is 3,236 kWh/AF. These values are the nominal pumping requirements of the SWP pumps (Banks, Dos Amigos, Buena Vista, Wheeler Ridge, Wind Gap, Edmonston, Oso, and Pear Blossom) less the nominal generation values from the West and East Branch recovery generating plants (Warne, Castaic, Alamo, Mojave, and Devil Canyon). These values do not incorporate any pumping or generating at the San Luis Gianelli Plant.

The SWP also produces power at its Hyatt/Thermalito complex (HTC) near Lake Oroville and the Feather River in northern California. DWR releases water from Lake Oroville that flows through the HTC hydro generators and produces power for the SWP. Given water operations in the Delta and interactions between the Central Valley Project and the SWP, there is not a direct link from HTC power generation and SWP deliveries; however, the contractors for State Project water, including Metropolitan, pay for the HTC based on their share of the SWP's Variable Operation, Maintenance, Power and Replacement (OMP&R) Component of the Transportation Charge. To determine the benefit Metropolitan receives from the HTC generation in calculating the Energy Intensity of SWP conveyance, this same OMP&R share (percentage) has been used with the total generation from the HTC. From 2004 through 2013, Metropolitan's share of the HTC costs has ranged from 60.2% to 74.3%. A multi-year average percentage has been used to reduce the year-to-year volatility of this factor.

The SWP contract has specific provisions on how and when to account for various water deliveries and the associated costs. This will result in differences between the SWP billing values and the amount of water delivered to Metropolitan from the SWP.

### *Colorado River*

Metropolitan conveys water from the Colorado River through its Colorado River Aqueduct (CRA). The water is pumped through five pumping plants to reach Metropolitan's service area. The nominal Energy Intensity of water conveyed through the CRA is 2000 kWh/AF.

There are no recovery generating plants along the CRA, however, the water that Metropolitan pumps from the Colorado River has been released from Lake Mead through the Hoover Dam generators. Metropolitan receives 28.5% of the energy produced at Hoover. This energy is

used exclusively to power the CRA pumps. The production rate (kWh/AF) is dependent on several factors, including the elevation of Lake Mead. The USBR updates this value monthly. Metropolitan has used its share of the energy produced at Hoover from its water releases in the calculation of the CRA conveyance energy requirement. This calculation utilizes the volume of water delivered into Metropolitan's service territory.

| | | |
|---|---|---|
| 2013 Conveyance Total: | Energy used | 3,627,553,292 kWh |
| | Water Delivered | 1,945,801 AF |
| | Energy Intensity | 1,864 kWh/AF |
| 2014 Conveyance Total: | Energy used | 3,448,714,628 kWh |
| | Water Delivered | 1,768,121 AF |
| | Energy Intensity | 1,951 kWh/AF |

### Treatment

Metropolitan has five treatment plants to provide potable water to its Member Agencies. The estimated amount of energy used to treat water supplies has been calculated by dividing the annual amount of energy consumed at the plant sites by the amount of water treated.

| | | |
|---|---|---|
| 2013 Treatment Total: | Energy used | 46,914,223 kWh |
| | Water Treated | 1,072,870 AF |
| | Energy Intensity | 44 kWh/AF |
| 2014 Treatment Total: | Energy used | 46,695,775 kWh |
| | Water Treated | 1,016,046 AF |
| | Energy Intensity | 46 kWh/AF |

### Distribution

Due to the high elevation at which Metropolitan receives water from the SWP and CRA, very little pumping (and electricity use) is needed to distribute treated and untreated water to its Member Agencies. Instead, gravity, not electricity, is primarily used to deliver water supplies through Metropolitan's distribution system.

In addition, Metropolitan has 16 recovery hydroelectric generating plants in its distribution system that produce greater amounts of power than is consumed from distribution pumping. These generators are on distribution pipelines located throughout Metropolitan's service area. The generators produce electricity from the water flowing through the pipelines. Without the hydrogenerators, the energy in the water would be reduced at facilities called pressure control structures and the potential for greenhouse gas free electricity lost. The energy used in the pumping plants and produced by the generators has been netted, with the result divided by the water delivered to the Member Agencies to calculate the distribution Energy Intensity.

| | | |
|---|---|---|
| 2013 Distribution Total: | Energy used | -239,069,895 kWh (net generation) |
| | Water Delivered | 1,959,867 |
| | Energy Intensity | -122 kWh/AF |
| 2014 Distribution Total: | Energy used | -118,895,649 kWh (net generation) |
| | Water Delivered | 2,015,911 AF |
| | Energy Intensity | -59 kWh/AF |

### Storage

Metropolitan does not use any energy for its internal storage programs. Water is delivered by gravity flow. External water storage and recovery is managed by other parties and is often transacted through exchange arrangements. Any water delivered to Metropolitan from storage programs would be accounted for in the conveyance deliveries. Therefore, there is no energy used for placing water into storage.

### Metropolitan's Annual Energy and Energy Intensity

Energy and Energy Intensity values are provided for each of the non-zero functions listed above: Conveyance; Treatment; and Distribution. As noted previously, these values vary from year to year due to operational changes and differences in source use due to changes in water supply availability and other factors. An estimated overall Energy Intensity is provided for untreated water deliveries and treated water deliveries.

2013

| | |
|---|---|
| Estimated Delivered Untreated Water Energy Intensity: | 1,742 kWh/AF |
| Estimated Delivered Treated Water Energy Intensity: | 1,786 kWh/AF |

2014

| | |
|---|---|
| Estimated Delivered Untreated Water Energy Intensity: | 1,892 kWh/AF |
| Estimated Delivered Treated Water Energy Intensity: | 1,938 kWh/AF |

### Water Energy Tables

Provided in Tables A.9-2 and A.9-3 are the Water Energy Tables for CY 2013 and 2014 using the Water Supply Process Approach in Table O-1A from the 2015 UWMP Guidebook Appendix O.

## Table A.9-2 (Table O-1A for Year 2013): Water Supply Process Approach

| **Reporting Date: CY 2013** | **Urban Water Wholesale Supplies Includes SWP Embedded Energy and Non-Consequential Generation** | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Water Management Process | | | | | | Non-Consequential | |
| | **Extract** | **Storage** | **Conveyance[1]** | **Treatment** | **Distribution** | **Total** | **Hydro** | **Net** |
| Volume (AF) | - | - | 1,945,801 | 1,072,870 | 1,959,867 | - | [2] | [2] |
| Energy (kWh) | - | - | 3,627,553,292 | 46,914,223 | -239,069,895 | - | [2] | [2] |
| **Energy Intensity** | - | - | **1,864** | **44** | **-122** | - | - | - |
| **Treated Energy Intensity** (kWh/AF) | | | | | | **1,786** | - | - |
| **Untreated Energy Intensity** (kWh/AF) | | | | | | **1,742** | - | - |

### Non Hydropower Self Generated Energy

Metropolitan generated 2,239,621 kWh at its Skinner treatment plant solar facility in CY2013.

### Data Quality Narative

[1] Includes SWP deliveries of 973,943 AF at 2,780,057,816 kWhs

[2] Conveyance accounts for hydropower genergation from Hyatt Thermalito Complex at 976,000,000 kWhs, and Hoover Dam generation at 119,770,224 kWhs

### Narative

See above section on Voluntary Energy Reporting.

## Table A.9-3 (Table O-1A for Year 2014): Water Supply Process Approach

| **Reporting Date: CY 2014** | **Urban Water Wholesaler: MWD Operational Control (Includes SWP Embedded Energy and Non-Consequential Generation)** | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Water Management Process | | | | | | Non-Consequential | |
| | **Extract** | **Storage** | **Conveyance[3]** | **Treatment** | **Distribution** | **Total** | **Hydro** | **Net** |
| Volume (AF) | - | - | 1,768,121 | 1,016,046 | 2,015,911 | - | [4] | [4] |
| Energy (kWh) | - | - | 3,448,714,628 | 46,695,775 | -118,895,649 | - | [4] | [4] |
| **Energy Intensity** | - | - | **1,951** | **46** | **-59** | - | - | - |
| **Treated Energy Intensity** (kWh/AF) | | | | | | **1,938** | - | - |
| **Untreated Energy Intensity** (kWh/AF) | | | | | | **1,892** | - | - |

### Non Hydropower Self Generated Energy

Metropolitan generated 2,330,246 kWh at its Skinner treatment plant solar facility in CY2014.

### Data Quality Narative

[3] Includes SWP deliveries of 607,344 AF at 1,683,268,784 kWhs

[4] Conveyance accounts for hydropower genergation from Hyatt Thermalito Complex at 423,752,000 kWhs, and Hoover Dam generation at 132,339,396 kWhs

### Narative

See above section on Voluntary Energy Reporting.

# Appendix 10

# DWR's STANDARDIZED TABLES

# Appendix 10
# DWR's STANDARDIZED TABLES

In fulfillment of CA Water Code § 10621(d) and § 10644(a)(1) and (2), Metropolitan's Final 2015 UWMP was electronically submitted to the State of California through DWR's the WUE data website https://wuedata.water.ca.gov/secure/ in June 2016. This appendix contains the mandatory DWR tables that were uploaded to the WUE data website.

| Table 2-2: Plan Identification | | | |
|---|---|---|---|
| **Select Only One** | **Type of Plan** | | **Name of RUWMP or Regional Alliance** *if applicable* *drop down list* |
| ☑ | **Individual UWMP** | | |
| | ☐ | Water Supplier is also a member of a RUWMP | |
| | ☐ | Water Supplier is also a member of a Regional Alliance | |
| ☐ | **Regional Urban Water Management Plan (RUWMP)** | | |
| NOTES: | | | |

| Unit | AF |
| NOTES: | |

| Table 2-4 Wholesale: Water Supplier Information Exchange (select one) | |
|---|---|
| ☑ | Supplier has informed more than 10 other water suppliers of water supplies available in accordance with CWC 10631. Completion of the table below is optional. If not completed include a list of the water suppliers that were informed. |
| 2015 UWMP Section 5 Table 5-3 | **Provide page number for location of the list.** |
| ☐ | Supplier has informed 10 or fewer other water suppliers of water supplies available in accordance with CWC 10631. **Complete the table below.** |
| Water Supplier Name *(Add additional rows as needed)* | |
| | |
| | |
| | |
| NOTES: See 2015 UWMP Sections 2 and 5 for discussion on Metropolitan's planning coordination, outreach, and notification (list provided in Table 5-3). | |

| Table 3-1 Wholesale: Population - Current and Projected | | | | | | |
|---|---|---|---|---|---|---|
| Population Served | 2015 | 2020 | 2025 | 2030 | 2035 | 2040*(opt)* |
| | 18,740,000 | 19,355,000 | 20,017,000 | 20,639,000 | 21,206,000 | 21,791,000 |
| NOTES: See 2015 UWMP Appendix 1 Table A.1-2. | | | | | | |

| Table 4-1 Wholesale: Demands for Potable and Raw Water - Actual | | | |
|---|---|---|---|
| Use Type *(Add additional rows as needed)* | 2015 Actual | | |
| ***Drop down list*** *May select each use multiple times These are the only use types that will be recognized by the WUE data online submittal tool* | Additional Description *(as needed)* | Level of Treatment When Delivered *Drop down list* | Volume |
| Sales to other agencies | | Drinking Water | 815,431 |
| Sales to other agencies | | Raw Water | 944,248 |
| Losses | | | 44,049 |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | **TOTAL** | 1,803,728 |

NOTES: Sales to other agecies include Metropolitan deliveries to member and non-member agencies and deliveries from conjunctive use programs. Some of these deliveries are not revenue producing nor sales.
Losses include evaporation losses from storage reservoirs, distribution system losses (2014 estimate), and water within Metropolitan's distribution system and regulating reservoirs. Water losses are both drinking and raw water.

| Table 6-5 Wholesale: 2010 UWMP Recycled Water Use Projection Compared to 2015 Actual | | |
|---|---|---|
| ☑ | Recycled water was not used or distributed by the supplier in 2010, nor projected for use or distribution in 2015. The wholesale supplier will not complete the table below. | |
| Name of Receiving Supplier or Direct Use by Wholesaler | 2010 Projection for 2015 | 2015 actual use |
| *Add additional rows as needed* | | |
| | | |
| | | |
| | | |
| **Total** | 0 | 0 |

NOTES: The 2010 RUWMP Table 2-8 included projection for recycled water use in 2015 of 404 TAF under average hydrology. In 2015, the actual recycled water use (regional total within Metropolitan service area) is estimated at 414 TAF, as discussed in this 2015 UWMP Section 3.5 on Table 3-12, page 3-62, and Appendix 2, page A.2-8. Regional total represents the projected production of existing and underconstruction projects by Metropolitan member agencies. Additional recycled production may materialize from the local resources target under Metropolitan's IRP (see 2015 IRP Update Section 2.1).

| Table 6-7 Wholesale: Expected Future Water Supply Projects or Programs | | | | | | |
|---|---|---|---|---|---|---|
| ☐ | No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below. | | | | | |
| ☑ | Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format. | | | | | |
| 2015 UWMP Section 3 and Appendix 3 | Provide page location of narrative in the UWMP | | | | | |
| Name of Future Projects or Programs | Joint Project with other agencies? | | Description *(if needed)* | Planned Implementation Year | Planned for Use in Year Type *Drop Down list* | Expected Increase in Water Supply to Agency |
| | *Drop Down Menu* | *If Yes, Agency Name* | | | | |
| *Add additional rows as needed* | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

NOTES: See 2015 UWMP Section 3 description of resources and program development for the CRA, SWP, Central Valley/SWP storage and transfers programs, conservation, LRP (groundwater recovery, recycling, desalination), and groundwater. Also see Appendix 3 detailed discussion on all supply programs and justifications for supply projections.

| Table 8-1 Wholesale<br>Stages of Water Shortage Contingency Plan | | |
|---|---|---|
| Stage | Complete Both | |
| | Supply Reduction[1] | Water Supply Condition<br>(*Narrative description*) |
| *Add additional rows as needed* | | |
| Baseline Water Use Efficiency | Long-term conservation | Ongoing conservation, outreach, and recycling programs to achieve permanent reductions in water use and build storage reserves. |
| Condition 1: Water Supply Watch | Variable | Local agency voluntary dry-year conservation measures and use of regional storage reserves. |
| Condition 2: Water Supply Alert | Variable | Regional call for cities, counties, member agencies and retail water agencies to implement extraordinary conservation through drought ordinances and other measures to mitigate use of storage reserves. |
| Condition 3: Water Supply Allocation | 5% - 50% | Implement Metropolitan's Water Supply Allocation Plan. |
| [1] *One stage in the Water Shortage Contingency Plan must address a water shortage of 50%.* | | |
| NOTES: See 2015 UWMP Section 2.4 discussion on Water Shortage Contingency Analysis, Water Surplus and Drought Management Plan, Water Supply Allocation Plan, and Water Supply Condition Framework (specifically Table 2-7).<br>As part of Catastrophic Supply Interruption Planning in Section 2.5, Metropolitan's Emergency Storage Requirements discuss planning based on a 100% reduction in imported supplies for a period of 6 months, which is greater than the 50% shortage required by the Act. In addition, the WSAP (included in Appendix 4) includes a Level 10 Regional Shortage Level that addresses regional shortage percentage of 50%. | | |

| Table 8-4 Wholesale: Minimum Supply Next Three Years | | | |
|---|---|---|---|
| | 2016 | 2017 | 2018 |
| Available Water Supply | 1,935,371 | 1,636,530 | 1,798,633 |
| NOTES: See 2015 UWMP Section 1 discussion of Metropolitan's Short-term Supply Outlook and Supply Capability summarized in Table 1-7. | | | |

| Table 10-1 Wholesale: Notification to Cities and Counties (select one) | | |
|---|---|---|
| ☑ | Supplier has notified more than 10 cities or counties in accordance with CWC 10621 (b) and 10642. **Completion of the table below is not required. Provide a separate list of the cities and counties that were notified.** | |
| 2015 UWMP Section 5 Table 5-3 | Provide the page or location of this list in the UWMP. | |
| ☐ | Supplier has notified 10 or fewer cities or counties. **Complete the table below.** | |
| City Name | 60 Day Notice | Notice of Public Hearing |
| *Add additional rows as needed* | | |

# About Metropolitan

The Metropolitan Water District of Southern California is a regional wholesaler that delivers water to 26 member public agencies serving about 19 million people living in Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura counties.

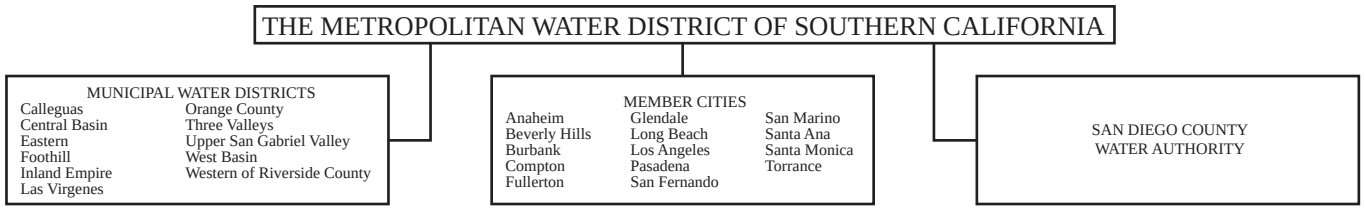
Metropolitan is governed by a 38-member board of directors representing the 26 member agencies consisting of 14 cities, 11 municipal water districts and one county water authority, which directly or through their subagencies serve the residents and businesses of more than 300 cities and numerous unincorporated communities.

Metropolitan directors are selected by their respective member agencies and may serve on the board of that particular member agency. It is a diverse group drawn from a variety of sectors, including business, government, engineering and agriculture. The board operates under a weighted voting system, with voting share determined by assessed property valuation.

The mission of Metropolitan is to provide its 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

To supply Southern California with reliable and safe water, Metropolitan owns and operates an extensive range of capital facilities including the Colorado River Aqueduct, 16 hydroelectric facilities, nine reservoirs, 830 miles of large-scale pipes, and five water treatment plants. Four of these treatment plants are among the 10 largest plants in the nation. In fact, Metropolitan is the largest distributor of treated drinking water in the United States.

The district imports water from the Colorado River and Northern California to supplement local supplies, and helps its member agencies develop increased water conservation, recycling, storage and other local resource programs.



Metropolitan was established in 1928 under an act of the state Legislature to construct and operate the 242-mile Colorado River Aqueduct, which runs from an intake at Lake Havasu on the California-Arizona border, to an endpoint at Metropolitan's Lake Mathews reservoir in Riverside County.

When Metropolitan began delivering water, its service area consisted of approximately 625 square miles. Its service area has increased by 4,575 square miles since that time. The expansion is primarily the result of annexation of the service areas of member agencies.

In 1960, Metropolitan, followed by 30 other public agencies, signed a long-term contract that made possible the construction of the State Water Project's 444-mile California Aqueduct, which currently serves urban and agricultural agencies from the San Francisco Bay Area to Southern California. As the largest of the State Water Contractors, Metropolitan contracts with the state Department of Water Resources, which operates the SWP, for slightly less than half of all State Water Project supplies.

Water supplies from the State Water Project travel to Southern California via the California Aqueduct. Metropolitan also has ground-water banking partnerships and water transfer arrangements that secure additional supplies, and provides financial incentives to its member agencies for local investments in water management projects and programs. An increasing percentage of Southern California's water supply comes from these local sources, including conservation, water recycling and recovered groundwater.

Metropolitan's Board of Directors typically meets on the second Tuesday of each month. Board committee meetings usually occur on the Monday preceding the board meeting, and the second and fourth Tuesday of the month. Board and committee meetings are open to the public and are broadcast on the internet through Metropolitan's website, www.mwdh2o.com. A schedule of board and committee meetings is available on the website.

---

Notes:
Current Directors’ names are shown in capital letters.
A 2001 reorganization reduced the number of directors on the board from 51 to 37.
In late 2015, a one-seat addition for Los Angeles (based on assessed property valuation) increased the number of directors to 38.

effective 6/30/17

*General Manager Jeffrey Kightlinger greets the crowd at the Spring Green Expo, April 2017.*

*Metropolitan board chair Randy Record speaks to reporters on evolving water supply situation, October 2016.*

# Introduction

It was a year punctuated by the spectacular end of California's five-year historic drought, with a record wet winter rapidly filling reservoirs and a dramatic series of events at the State Water Project's Oroville facilities. In Southern California, Metropolitan faced a different challenge—identifying places to store the abundant water supplies. Meanwhile, water agencies throughout the state approached a historic investment decision on the California WaterFix modernization project in the Sacramento/San Joaquin Bay-Delta. The fiscal year drew to a close on June 30 with major progress on a number of fronts.

**Drought Ends, Challenges Begin:** In April 2017, Gov. Edmund G. Brown Jr. officially ended the drought state of emergency as much of the state sought to manage what would be record precipitation for the year. In February of 2015, Brown had imposed the first-ever statewide requirements for urban communities to reduce water use and report to the State Water Resources Control Board. With the drought's end, the state sought to sustain California's conservation ethic as weather patterns became more favorable. "Gov. Brown's mandate that each and every Californian immediately reduce water use sent the right message that we are one state and we can never take water for granted," Metropolitan General Manager Jeffrey Kightlinger said as the governor declared the drought emergency officially over.

Metropolitan's operations team faced significant challenges to manage and maximize the dramatic increase in available supplies, and to place as much water as possible into local storage. The supply windfall allowed Metropolitan to keep a record amount of its Colorado River supply in Lake Mead, providing a much-welcome increase in reservoir levels. Meanwhile, State Water Project supplies comprised the bulk of deliveries in Metropolitan's service area, as other supplies were banked in the Central Valley, stored in groundwater basins and put in Diamond Valley Lake.

**Oroville:** The wet start to the California rainy season had Lake Oroville brimming. In February, the high releases from the lake caused severe damage to the 3,000-foot concrete main spillway and prompted its temporary closure as operators inspected the damage. As a series of atmospheric river storms approached, operators once again initiated limited releases down the battered spillway. Despite the actions, higher-than-expected inflows from the storm into the lake caused water to cascade over Oroville's emergency spillway for the first time in the dam's history. Concerns about the emergency spillway's integrity prompted public safety officials to order an evacuation of 180,000 downstream residents as flows down the main spillway increased.

The incident captured national attention and triggered a historic effort to review dam safety in California. Oroville became a national example of aging infrastructure and the need to improve dam safety activities and infrastructure investments to maintain operational reliability and secure public safety. Once the storms had passed, the Department of Water Resources moved swiftly in a race to beat the clock to repair the main spillway and bolster the emergency spillway before the onset of another winter.

Winter storms also underscored the importance of Metropolitan's long-term water strategy of continuing to lower demand through conservation and increase local baseline supplies. It also demonstrated the value of reliably capturing stormwater from the Sierra Nevada and having a diverse portfolio of storage options to increase the reliability of future water deliveries.

**Recycling and Conservation:** In January 2017, Metropolitan's board reviewed a feasibility study confirming the potential of a large-scale project to treat and purify wastewater in collaboration with the Sanitation Districts of Los Angeles County. Plans progressed toward building a demonstration facility at the Sanitation Districts' wastewater facility in Carson to potentially recycle more than 150,000 acre-feet a year for replenishment of groundwater basins in Los Angeles and Orange counties.

Metropolitan actively promoted conservation and water use efficiencies, ultimately investing $3.5 million for the summer 2016 and spring 2017 advertising campaigns to reinforce the importance of making conservation a California way of life, despite the drought's end.

Efforts to incentivize local supply development advanced in November 2016, with the board approving up to $44 million through Metropolitan's Local Resources Program for four new recycling projects in Los Angeles and Riverside counties. The projects will treat and deliver as much as 5.3 billion gallons per year.

Farther afield, efforts continued to formulate a Colorado River drought contingency plan as voluntary reductions in water deliveries by users in the Lower Basin helped stave off a potential shortage declaration on the river that would have prompted cutbacks in deliveries to Arizona and Nevada. Negotiations with Mexico, meanwhile, brought the Lower Basin closer to a new agreement to further develop conservation, storage and environmental restoration projects.

**California WaterFix:** The California WaterFix project approached historic milestones as state and federal water agencies prepared for important decisions on the proposed project aimed at modernizing the statewide water delivery system in the Delta.

In December 2016, state and federal officials released the project's final environmental impact report and statement. The identified preferred alternative calls for three new intakes in the northern Delta on the Sacramento River and a twin-tunnel pipeline system capable of transporting as much as 9,000 cubic feet per second of supplies. "After more than 10 years of planning analysis and debate, the time for decisions is finally in sight," General Manager Kightlinger said at the time.

In June 2017, permitting under the federal Endangered Species Act was largely completed with the release of biological opinions from the U.S. Fish and Wildlife Service and the National Marine Fisheries Service. As the fiscal year came to a close, the state Department of Fish and Wildlife was finalizing its companion permit for compliance with California environmental statutes.

Metropolitan's board began its deliberations in the summer of 2017 with a comprehensive set of workshops and policy- based white papers on the construction, operations and financing of the project, coupled with a robust outreach and public participation process. The board was slated to vote on the project in the fall.

**Rate structure litigation:** Metropolitan and its member agencies achieved an important legal and financial victory when the California Court of Appeal ruled that the State Water Project is an integral part of Metropolitan's system and therefore Metropolitan may recover State Water Project transportation costs in its transportation rates.

The San Diego County Water Authority had challenged the inclusion of these costs in Metropolitan's transportation rates and in the price term of the parties' 2003 Exchange Agreement. Under that agreement, SDCWA makes available to Metropolitan at Lake Havasu an independent supply of conserved water from the Imperial Irrigation District and the lining of canals, and in exchange Metropolitan delivers a like amount of Metropolitan water to SDCWA. SDCWA had requested that the price be based on Metropolitan's generally applicable transportation rates—which are the same blended rates for transportation costs (regional, Colorado River and State Water Project) charged to all member agencies, reflecting the integrated nature of the Metropolitan system and equitable charges to all agencies—but later challenged that price.

On June 21, 2017, the Court of Appeal upheld this key element of Metropolitan's rate structure and its inclusion in the Exchange Agreement price. "The Water Authority's years-long effort to shift costs relating to their own water supply onto ratepayers elsewhere in Southern California has failed," Kightlinger said. "While Metropolitan has prevailed as to the overwhelming majority of costs under challenge in this litigation, nobody is a winner when water districts decide to fight in court rather than resolve their differences in a democratic and collaborative fashion."

**Leadership continuity:** Metropolitan's board leadership maintained continuity, meanwhile, with the re-election of Randy Record in October 2016 to another two-year term as chairman. Representing the Eastern Municipal Water District since January 2003, Record is the second member of his family to serve on Metropolitan's board (his father, Clayton A. Record, serving from 1999 to 2001).

"These have been incredibly challenging times for Californians and water agencies," Record said at the time of his re-election. "I am grateful for the support of my board and proud of the leadership we have provided during my first term to ensure we prudently manage through the current drought, promote conservation and stewardship, invest in infrastructure and look to the future."

As the fiscal year drew to a close, Metropolitan was better positioned for future challenges and to provide broad regional benefits. It was a year that saw a dramatic rebound in storage reserves, with important steps to promote the development of local supplies and sustain conservation activities. Metropolitan continued to provide strong support for infrastructure investments including an improved Oroville spillway, and the California WaterFix project. Finally, an important appellate court decision upheld a critical element of Metropolitan's rate structure validating Metropolitan's long-standing commitment to regionalism and shared responsibility.

*The Sepulveda Feeder was among many Metropolitan facilities shut down for repairs and inspections during 2016 and 2017.*

# Delivering Metropolitan's Water Supplies

Metropolitan supplies water to its 5,200-square-mile service area through a conveyance and distribution system that consists of the 242-mile-long Colorado River Aqueduct, five pumping plants, approximately 830 miles of pipeline, five water treatment plants and nine reservoirs, plus a participation right in the State Water Project. Metropolitan also has 16 hydroelectric power recovery plants throughout its system. See Table 1-1 for the rated capacity of Metropolitan's five treatment plants.

**TABLE 1-1**
**METROPOLITAN'S DISTRIBUTION SYSTEM**
**WATER TREATMENT PLANTS**

| Plant (Location) | Process/ Water Type | Rated Capacity (MGD) |
|---|---|---|
| Joseph Jensen Water Treatment Plant (Granada Hills) | Conventional treatment with ozone SPW | 750 |
| Robert A. Skinner Water Treatment Plants #1 , #2, & #3 (Winchester)* | Conventional treatment and direct filtration with ozone, blend of CRW/SPW | 630 |
| F. E. Weymouth Water Treatment Plant (La Verne) | Conventional treatment, blend of CRW/SPW | 520 |
| Robert B. Diemer Water Treatment Plant (Yorba Linda) | Conventional treatment with ozone, blend of CRW/SPW | 520 |
| Henry J. Mills Water Treatment Plant (Riverside) | Conventional treatment with ozone SPW | 220 |

SPW = State Project Water
CRW = Colorado River Water
MGD = Million Gallons per Day
* Consists of three separately regulated water treatment plants

Over the past few years, the region has experienced dramatic swings in water supply conditions from the driest to the wettest periods in California's recorded history. As conditions shifted, so did Metropolitan's operations, from implementing extraordinary drought actions to maximizing the delivery and storage of supplies to ensure continued water supply reliability.

In the first half of FY 2016/17, Metropolitan experienced a significant turnaround in its storage reserves, with a gain of over 300,000 AF by the end of December 2016, due in part to a final 2016 SWP allocation of 60 percent, or approximately 1.15 MAF for Metropolitan. By the end of FY 2016/17, northern California had already experienced its wettest water year on record, with the Northern Sierra Eight-Station Index registering 94.2 inches of precipitation (194 percent of normal). The record precipitation led to a SWP allocation of 85 percent, or approximately 1.62 MAF for Metropolitan. Metropolitan was also able to secure 124,000 AF of surplus Article 21 supplies, which are in addition to the regularly allocated SWP supplies, and haven't been available since 2011.

To effectively manage and take full advantage of the extraordinarily high amounts of SWP supplies, Metropolitan reduced the delivery of Colorado River water into the service area to under 300,000 AF, which is the lowest delivery to the service area since the early years of the CRA. This was accomplished by cutting back CRA pumping from the full CRA operations of recent years to only a 3- to 4-pump flow in March through June, leaving the Colorado River supplies in Lake Mead Intentionally Created Surplus to maximize Metropolitan's storage in Lake Mead. An expedited design and construction of a new weir gate in the CRA, downstream of the Whitewater River west of Palm Springs, enabled Metropolitan to also maximize deliveries of Colorado River water into the Advance Delivery Account with Desert Water Agency and Coachella Valley Water District. The 2017 deliveries to this account are on track to be the highest ever in a single calendar year and could well exceed 350,000 AF, far more than the prior record of 298,000 AF in 1986.

Continued conservation, along with significantly higher than normal local supplies due to the wet conditions, suppressed water demands on Metropolitan and reduced Metropolitan's water sales for FY 2016/17 to about 1.5 MAF. This level of sales is significantly

below the 10-year average annual sales of 1.92 MAF. Maximum daily system deliveries were about 6,400 AF per day for the fiscal year compared to 6,050 AF per day last fiscal year and 8,250 AF per day in FY 2006/07. Table 1-2 shows Metropolitan's monthly water sales for FY 2016/17. Additional figures and tables at the end of this chapter show total fiscal year water sales by category, monthly water sales by category, a comparison of water sales by category for the past two fiscal years, historical water sales by calendar and fiscal year, and water use by member agency.

**TABLE 1-2**
**MONTHLY WATER SALES FOR ALL MEMBER AGENCIES**
Fiscal Year 2016/17
(Acre-Feet)

| Month | Full Service[1] | Storage Program[2] | Totals |
|---|---|---|---|
| July | 157,257 | 1,412 | 158,669 |
| August | 156,321 | 2,168 | 158,488 |
| September | 145,064 | 2,349 | 147,413 |
| October | 178,209 | 10,571 | 188,780 |
| November | 156,101 | 10,543 | 166,644 |
| December | 118,952 | 15,963 | 134,915 |
| January | 72,150 | 1,108 | 73,258 |
| February | 57,791 | 613 | 58,404 |
| March | 72,004 | 712 | 72,716 |
| April | 103,879 | 1,629 | 105,508 |
| May | 112,005 | 2,275 | 114,280 |
| June | 123,848 | 1,732 | 125,580 |
| **Totals** | **1,453,580** | **51,074** | **1,504,654** |

[1] Includes Full Service and Exchange sales.
[2] Includes sales from the Conjunctive Use, Cyclic Storage and Soboba Settlement programs.

The combination of high supplies, low demands, and strategic operations resulted in record-breaking increases to storage. It is estimated that over 1 MAF will be added to storage by the end of calendar year 2017, surpassing the previous record of approximately 700,000 AF added to storage in 2011. By the end of calendar year 2016, storage increased by 364,000 AF to a dry-year storage total of 1.3 MAF. Groundwater storage was also repositioned to surface storage in 2016 to make sure ample storage reserves were easily

accessible in case 2017 turned out to be another extremely dry year. However, as supplies rapidly increased, Metropolitan maximized deliveries into every available storage account. Carryover stored in San Luis Reservoir at the end of 2016 was quickly moved down into Metropolitan's system by March 2017 to avoid carryover spill and to make room for incoming SWP supplies. Castaic Lake, which had been drawn down at the end of 2016 for the Department of Water Resources' shutdown work, was completely refilled. Perris Flexible storage, which had not recovered from the drought, was completely full by the end of February 2017. Metropolitan also pursued water management actions to increase deliveries to local groundwater basins. By the end of FY 2016/17, total dry-year storage reserves climbed to over 1.6 MAF, with over 700,000 AF in Diamond Valley Lake.

Overall, with the success of the Metropolitan actions taken this fiscal year to fully maximize storage recovery under high supply conditions, the region is now better positioned to manage future droughts.

# *Major Accomplishments for Fiscal Year 2016/17*

***System Operations and Planning***

- Effectively managed surplus supplies and refilled storage reserves (530,000 AF in FY 2016/17).
- Dramatically adjusted system operations to maximize delivery and storage of abundant SWP supplies, after years of SWP supply shortages.
- Worked with DWR to prevent any interruption of SWP deliveries and negotiated special terms to allow surplus Article 21 supplies to remain available during repairs of the damaged DWR Clifton Court facilities.
- Successfully managed critical shutdowns for system improvements, maintenance and repairs (major shutdowns and service interruptions are shown in Table 1-5).

***Colorado River***

- Maximized storage of Colorado River supplies, positioning Metropolitan to be on track to store a single calendar-year record amount of about 750,000 AF—roughly three-quarters of the available Colorado River supplies—by the end of CY 2017.
- Collaborated with Engineering Services to implement capital projects to deliver record amounts of water to the Advanced Delivery Account with Desert Water Agency and Coachella Valley Water District.

## 2016/17 MAJOR SHUTDOWNS & SERVICE INTERRUPTIONS

| FACILITY | DATES | NO. OF DAYS | LIMITS OF SHUTDOWN | PURPOSE |
|---|---|---|---|---|
| ORANGE COUNTY FEEDER | Feb 13-May 20, 2017 | 97 | From downstream of Service Connection SA-01 to the Willits St. Pressure Control Structure | For re-lining project |
| COLORADO RIVER AQUEDUCT<br>-San Jacinto Pipeline 1&2 | Feb 14-Mar 10, 2017 | 25 | From Whitsett Intake Pumping Plant to Lake Mathews | For sandtrap upgrades at Hinds/Eagle/Iron, concrete damage repair at Eagle Mtn. sand trap, switch house seismic upgrades, electrical testing, and San Jacinto Tunnel seepage measurements |
| SAN DIEGO PIPELINE No.4 | Feb 17-Feb 26, 2017 | 10 | From Skinner plant to SDCWA jurisdiction line | SDCWA requested shutdown to perform inspections in its jurisdiction |
| MILLS TREATMENT PLANT | Feb 28-Mar 1, 2017 | 2 | Mills plant | For inspection of Reservoirs 1 and 2 effluent slide gates, emergency generator testing, new ammonia feed system tie-in, and service water loop backflow valves replacement |
| LOWER FEEDER<br>-Santiago Lateral | Mar 6-Mar 12, 2017 | 7 | From Lake Mathews To Diemer plant | For removal of service valve from Service Connection WR-01 |
| ORANGE COUNTY FEEDER | Mar 13-Mar 15, 2017 | 3 | From the Lincoln Ave. & East St. sectionalizing valve to the Willits St. Pressure Control Structure | For replacement of air release/vacuum valve |
| FOOTHILL FEEDER<br>-San Fernando Tunnel<br>-Jensen Treatment Plant<br>-Sepulveda Feeder<br>-East Valley Feeder<br>-West Valley Feeder No. 1<br>-West Valley Feeder No. 2<br>-Calabasas Feeder | Mar 27-Apr 3, 2017 | 8 | From Castaic Lake to Jensen plant | For Jensen switchgear retrofit work, repair of two isolation valves, installation of new flow meter, and inspections |
| ORANGE COUNTY FEEDER | Jun 19-Jun 23, 2017 | 5 | From the Lincoln Ave. & East St. sectionalizing valve to the Willits St. Pressure Control Structure | For removal of bulkhead and refilling pipeline |

*Agricultural production continues for Metropolitan-owned Delta islands.*

CHAPTER 2

# Strategic Water Initiatives

Metropolitan provides imported water supplies to its member agencies from two primary sources, the Colorado River and the State Water Project. The staff of Strategic Water Initiatives coordinates resources throughout the organization to manage and protect Metropolitan's interests in the watersheds that support these two key systems.

## *Bay-Delta Initiatives*

Bay-Delta Initiatives continued collaboration with state, federal and other water agencies to support actions to improve State Water Project water supply reliability related to the Bay-Delta. Staff supported efforts to: complete the California WaterFix planning phase to improve Delta conveyance; implement habitat restoration in the Bay-Delta system; pursue new and improved fishery management through collaborative science; and participate in key regulatory processes. Figure 2-1 shows a map of the Delta region.

### ***Near-Term Actions***

#### *Habitat Restoration*

BDI has been working with other stakeholders and agencies in evaluating options to improve the floodplain fishery habitat in the Yolo Bypass flood control system. This project, if implemented, will help prevent undesirable flooding impacts to the Yolo Bypass Wildlife Area from subsequent projects designed to provide adult fish passage and salmonid rearing habitat as required by the Yolo Bypass Biological Opinion. BDI has also been involved in the Tule Red Restoration Project through the State and Federal Contractors Water Agency. The objective of this project is to restore about 350 acres of tidal wetlands in the Suisun Marsh.

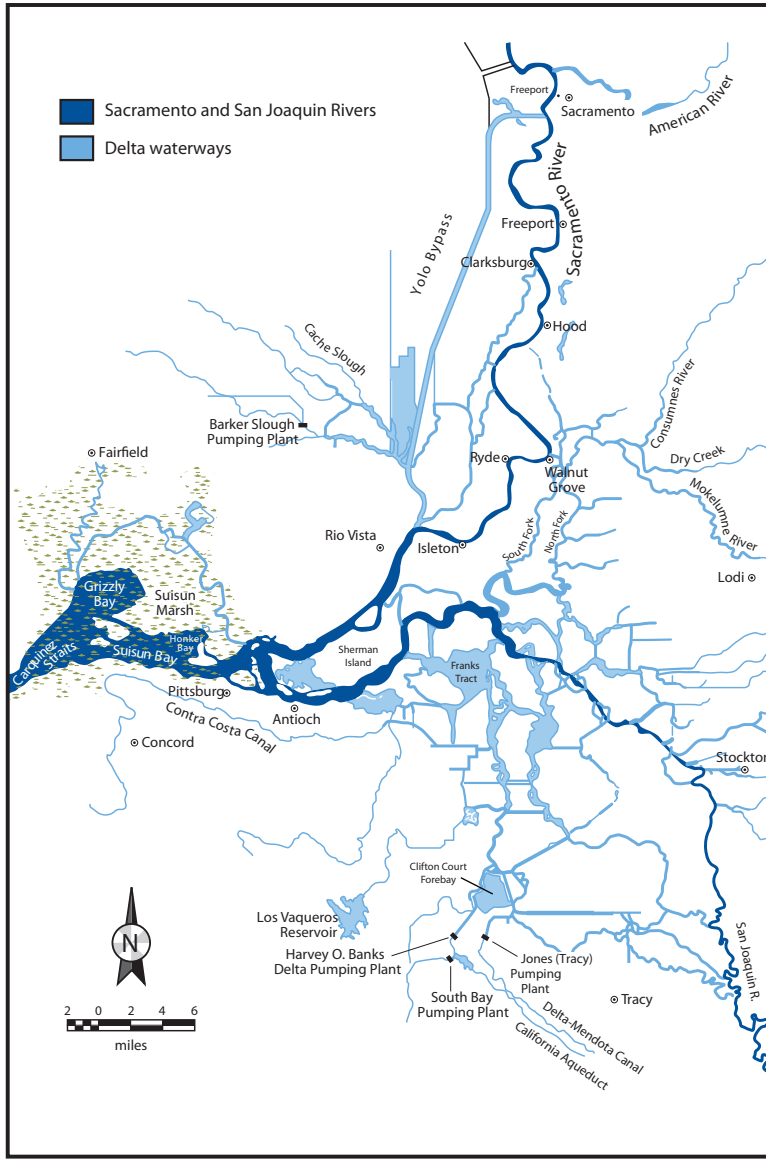

*Figure 2-1. Map of the Delta Region*

*Science Activities*

Metropolitan's water supply reliability is affected by regulatory actions related to the SWP in the Bay-Delta system. For that reason, Metropolitan has an interest in participating in efforts to increase scientific understanding and developing measures that can improve the fish and wildlife conditions in the Bay-Delta system while at the same time providing for more reliability of supply. To further this effort, BDI science staff continues to participate in the Collaborative Science and Adaptive Management Program, initiated in 2013 by the participants in the litigation challenging the U.S. Fish and Wildlife Service and National Marine Fisheries Service biological opinions. Staff is assisting on current Delta smelt studies and work plans addressing priority salmon and Delta smelt science questions. In February, this collaborative program released a report summarizing research on salmon survival in the South Delta. Also, the collaborative process is focusing on the state's Delta Smelt Resiliency Strategy actions and monitoring planned for this year. The process is also assessing the scientific basis for the Fall X2 action in the U.S. Fish and Wildlife Service 2008 Biological Opinion (X2 indicates the location of the low-salinity zone which is a parameter for managing Delta outflow). Staff provided input to the Sacramento Valley Salmon Resiliency Strategy released by the California Natural Resources Agency on June 2. The strategy is a science-based document that addresses near- and long-term needs of Sacramento Valley salmon and steelhead, including actions to restore habitat, improve stream flow, remove stream barriers and reintroduce salmon and steelhead to ideal habitat.

Staff worked with consulting scientists to design and conduct a longfin smelt habitat study, which included field survey work in late September 2016. The study mainly seeks to quantify the factors that affect distribution of longfin smelt and food sources like zooplankton and mysid shrimp in San Pablo Bay. Current research has provided findings and a publication that strongly suggests that the relationship between flow and longfin smelt is locally positively influenced by increases in flows in tributaries throughout the San Francisco Bay rather than just through Delta outflow.

In September, a study on the feasibility of implanting PIT tags and acoustic tags into adult Delta smelt was published in the North

American Journal of Fisheries Management. The study was funded by Metropolitan, and staff participated in the study and co-authored the publication. The development of improved tagging and tracking capabilities for Delta smelt will be essential in understanding Delta smelt behavior and habitat, leading to more effective management actions.

Staff also initiated a project to evaluate the reliability of correlations between environmental variables such as water quality or habitat characteristics and fish populations in the Delta. The project will consist of a literature search of environmental correlations that have been used in the Delta, a re-analysis of the correlations to determine if they hold up in the face of updated data, and recommendations for best practices when using environmental correlations as policy tools. A project report is expected by the end of 2017.

In 2016, staff submitted several grant applications of which two were approved for funding by the CDFW. Two grant agreements were executed, one involving the role of striped bass in Chinook salmon mortality, and the other analyzing factors impacting longfin smelt in the Upper San Francisco Estuary. These grant-funded studies will be important to management decisions in the Delta and will facilitate a continued beneficial relationship with well-respected researchers. Field and analytical work will continue for the next two to three years.

BDI's science staff prepared and submitted a Central Valley Project Improvement Act joint charter study proposal to better understand if modifying or eliminating points of contact between predators and juvenile salmonid can increase their survival. The charter was prepared in collaboration with federal fish agencies and the East Bay Municipal Utility District.

*Regulatory Activities*

The California WaterFix petition proceedings before the State Water Resources Control Board are ongoing, with Part 1 hearings addressing the effects of the proposed project on legal users of water. Part 2 of the hearings are scheduled to begin after the approval of Environmental Impact Report/Environmental Impact Statement, and Endangered Species Act permits. This will address the effects of the proposed project on fish and wildlife, including consideration of

appropriate Delta flow criteria. Staff is participating in collaboration with the State Water Contractors.

*Emergency Preparedness Plan*

Metropolitan has worked extensively with state and federal agencies on how to develop plans for delivering water through the Delta to the export pumps in the event of a major seismic emergency and levee failures. The Delta Flood Emergency Management Plan is currently planned to be completed in 2017. DWR is documenting results of their Emergency Response Tool simulation runs, which will lead to the completion of the plan. The ERT runs have demonstrated strategies to limit the period of export disruption to less than six months following the breach of multiple levees and island flooding from severe earthquake or storm events.

The state Office of Emergency Services has indicated that work is nearly complete on their Northern California Catastrophic Flood Management Plan, including the Delta region. The plan elements were put into practice at an interagency level during the Oroville Spillway failure emergency operations and performed favorably.

*Delta Islands*

In July 2016, Metropolitan purchased Bacon Island, Bouldin Island, Webb Tract and parts of Holland Tract and Chipps Island, located in the Sacramento-San Joaquin Delta, and continued with transfer of titles, leases, and other associated activities. In the first year of Metropolitan's ownership of the Delta Islands properties, staff organized an internal multi-disciplinary team and management structure for ongoing status-quo activities. Farming leases on Metropolitan's islands continue with agricultural production as long-term plans are being developed. Recent accomplishments include the execution of the Semitropic Water Storage District master lease for both Bouldin Island and Webb Tract. Staff is currently working on completing the Holland Tract lease for 2017 and preparing for the Bacon Island lease in 2018. Metropolitan, in assuming ongoing regulatory compliance responsibilities for 2016 Senate Bill 88 (measurement and reporting requirements for water diversions), implemented an approved first-year experiment plan for measuring Delta water diversions, which will provide valuable compliance information through coordination with the Delta Watermaster.

**Long-Term Actions**

*California WaterFix*

After extensive consultation with the DWR and U.S. Bureau of Reclamation, the National Marine Fisheries Service and U.S. Fish and Wildlife Service released their biological opinions for the proposed construction and operation of California WaterFix on June 26. These agencies are responsible for the protection of species listed under the federal ESA. Both biological opinions found that the construction and operation of California WaterFix as proposed would not jeopardize the continued existence of ESA-listed species, destroy, or adversely modify critical habitat for those species. Action on the final EIR/EIS is expected soon, since the action follows the issuance of the biological opinions. Issuance of the state ESA and other state permits will occur after DWR's action on the final EIR.

*California EcoRestore*

California EcoRestore is making progress in advancing restoration actions in the Sacramento-San Joaquin Delta geared toward achieving the goal of restoring at least 30,000 acres of tidal, floodplain and riparian habitats by 2020.

DWR initiated a Request for Proposal inviting private sector companies, non-profit groups and individuals to partner in restoration projects in the Delta. This effort is designed to help achieve California EcoRestore's tidal and other habitat restoration goals. The Delta Science Program convened an interagency adaptive management technical team to aid in developing a Delta ecosystem restoration adaptive management program. It will initially support current EcoRestore projects and provide a strong foundation for a long-term program that would support future restoration in the Delta.

# *Colorado River Resources*

For the first time since 2011, precipitation was above normal in the Colorado River Basin in fiscal year 2016/2017, with total storage in the Colorado River system increasing by about 2.4 million acre-feet. Lake Mead, the largest reservoir in the United States, increased by 8 feet during the fiscal year, but still ended the year with storage at

only 38 percent of capacity. The increase in storage in Lake Mead was due to both the improved hydrology and also the ongoing efforts of agencies, including Metropolitan, to fund conservation activities to conserve water and increase storage levels in Lake Mead.

Figure 2-2 shows a map of the Colorado River Basin and the states that rely on the Colorado River system for water. The map also shows California's major water agencies with federal water supply contracts. California has a basic apportionment of 4.4 million acre-feet, most of which is used by higher-priority agricultural users (Palo Verde Irrigation District, Yuma Project Reservation Division, Imperial Irrigation District and Coachella Valley Water District), as well as Metropolitan.

***Bard Seasonal Fallowing Pilot Program***

During the fiscal year, Metropolitan concluded a two-year seasonal fallowing pilot program with Bard Water District. This pilot program tested the water savings potential of providing financial incentives to farmers to forego planting a crop during a four-month period of spring and summer, when water use is high and crop production is low. The resulting reduction in consumptive water use was made available for use by Metropolitan. In the second year of the program, a total of 1,641 acres were fallowed beginning in the spring of 2017. After the conclusion of the pilot program, Metropolitan will use the information obtained to evaluate whether to explore a longer-term fallowing program with Bard Water District.

***Palo Verde Farmland Leases***

Metropolitan continues to be the largest landowner in the Palo Verde Valley under a September 2015 purchase of about 12,000 acres of land to support the reliability of Colorado River water supplies, in addition to the 8,000 acres of land it had previously owned. The leases on all of Metropolitan's lands terminated in late calendar year 2016. With fee title to more than 20 percent of the irrigated acres, Metropolitan's goals for its land holdings are to maintain agricultural productivity while improving efficient irrigation practices on its land. In 2017, Metropolitan renewed leases with its long-time tenants on its original land purchase and issued leases of its new land purchase after an open bid process. The leases provide farmers financial incentives to reduce historical water use by 25 to 30 percent.

### *IID Storage Agreement*

In calendar year 2016, Imperial Irrigation District conserved and stored a record volume of over 56,000 acre-feet with Metropolitan, in addition to the 38,000 AF delivered in late 2015, under an amended intrastate storage agreement that allows IID to temporarily store additional conserved water in Metropolitan's system. The water, less storage losses, due to evaporation and other factors, will be returned to IID in a future year.

### *Managing Colorado River Programs*

During the fiscal year, Metropolitan continued partnering with IID to fund and implement their agricultural conservation program, saving a total of 105,000 acre-feet in 2016. In fiscal year 2017, under a maximum fallowing call, Metropolitan received about 130,000 acre-feet of water. In FY 2017/18, the fallowing call will be reduced to 90 percent of the contractual limit, under a decision that was made one year in advance, on July 31, 2016.

### *Colorado Drought Response*

During the fiscal year, representatives from Reclamation, Arizona, California, Nevada, and water agencies, including Metropolitan, negotiated key terms for a Lower Basin Drought Contingency Plan. The plan would use voluntary reductions to reduce the risk of Lake Mead falling below critically low elevations. Cutbacks would be taken first by Arizona and Nevada, and then, if needed, by California. Those reductions would be recoverable when Lake Mead's elevation increases. The plan would also increase flexibility for agencies to meet dry-year water needs by allowing them to take delivery of Intentionally Created Surplus water stored in Lake Mead at lower lake elevations, benefitting water users in California, especially Metropolitan. It is anticipated that the agreement will be finalized and brought to the implementing agencies' boards for approval in fiscal year 2018.

*Figure 2-2. Map of the Colorado River Basin*

*Metropolitan provided incentives for retrofit of this irrigation system at Valhalla Memorial Park in Burbank.*

CHAPTER 3

# Water Resource Management

The Water Resource Management Group is responsible for planning, securing and managing high-quality water resources for Metropolitan's member agencies in a reliable, cost-effective and environmentally responsible manner. Principal responsibilities include managing imported water supplies and quality, advancing water-use efficiency and local resource development, and providing supply and demand forecasts that are the foundation for resource and facility planning. Other responsibilities include developing and implementing timely resource programs and projects, assisting member agencies in optimizing local resources to benefit the entire Metropolitan service area, and ensuring a fair return on Metropolitan's contractual investments in local and imported resources.

On May 9, 2017, in response to continued and significantly improved statewide hydrologic conditions, Metropolitan moved from the Water Supply Alert implemented in the previous fiscal year to a Water Supply Watch. Metropolitan's water supply and dry-year storage reserves had steadily declined to record low levels during the unprecedented drought that extended from water years 2012-13 through 2014-15 (a water year runs from October 1 through September 30). Restrictions on wholesale water deliveries began in July 2015 and were finally lifted in May 2016, several months after precipitation levels in northern California reached normal conditions for the first time since the drought began.

The voluntary conservation efforts supported by the Water Supply Watch are consistent with Gov. Brown's call to make conservation a California way of life. In April 2017, the same month that annual Northern California precipitation exceeded the highest amount on record, Gov. Brown declared an end to the drought emergency initially declared in January 2014. By the end of calendar year 2017, Metropolitan expects to put over 1 million acre-feet into dry-year storage reserves, the largest single year addition to storage programs in its history.

# *State Water Project Resources*

Metropolitan holds a water supply contract for 1,911,500 acre-feet annually with the California Department of Water Resources, subject to availability, and participation rights in the State Water Project. Record high precipitation and above-average snowpack during water year 2016-17 allowed for an 85 percent allocation of State Water Project contract supplies for CY 2017, representing the highest SWP allocation since 2006, and an improvement over the previous year's 60 percent allocation. The SWP supplies managed by Metropolitan for FY 2016/17 spanned half of the 85 percent allocation and half of the 60 percent allocation. In addition to allocated contract supplies, Metropolitan received nearly 124,000 acre-feet of Article 21 supplies in FY 2016/17 (Article 21 provides water supplies to SWP contractors when water in excess of the current SWP need is available.) As a result, Metropolitan managed 1,551,872 AF through the SWP system (Fig. 3-1), almost twice as much water as in the previous fiscal year. (FY 2016/17 deliveries and storage are subject to change based on future reconciliations by the Department of Water Resources.) With improved supply conditions, Metropolitan resumed deliveries to San Joaquin Valley groundwater storage programs that were depleted during the recent drought, and restored 70,000 AF to its flexible storage accounts, bringing them to full capacity.

Metropolitan's net SWP payments during FY 2016/17 were $526 million (Table 3-1) on a modified accrual basis. Metropolitan also administered existing storage programs located outside its service area along the SWP system, as described on the following pages.

### ***Water Storage Programs***

*Semitropic/Metropolitan Water Banking and Exchange Program*

In 1994, Metropolitan entered into a groundwater storage agreement with Semitropic Water Storage District in Kern County that allows storage of up to 350,000 AF. During FY 2016/17, Metropolitan stored 24,339 AF with Semitropic. The total water in storage on June 30, 2017 was 146,688 AF.

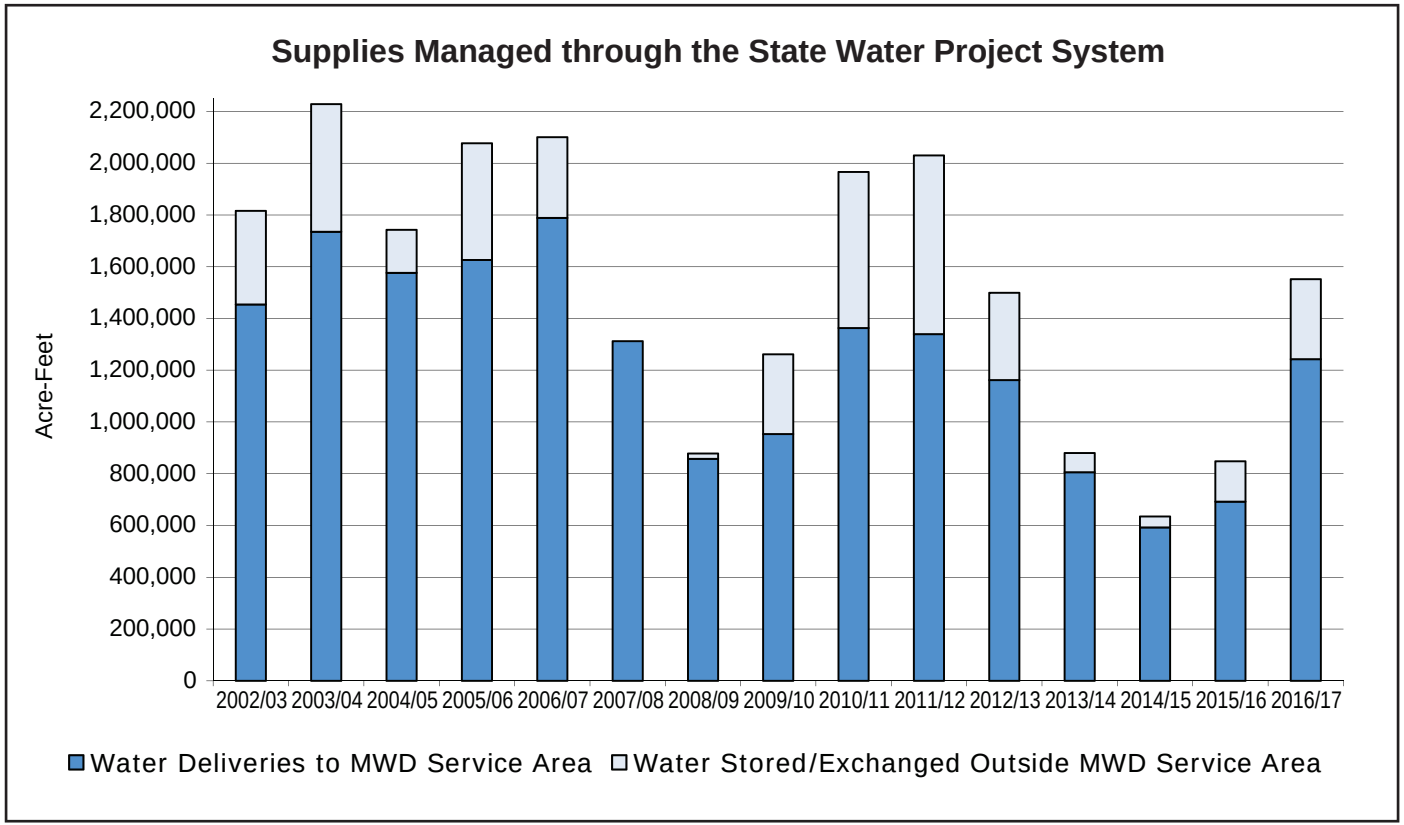

*Figure 3-1. Supplies Managed through the State Water Project System*

# TABLE 3-1
# CHARGES, PAYMENTS AND CREDITS UNDER THE STATE WATER AND DEVIL CANYON CASTAIC CONTRACTS

* Includes costs for excess capacity constructed for Metropolitan on the System and East Branch Enlargement

[1] Minimum Operations, Maintenance, Power, and Replacement charge

[2] DWR requested early payment of $36M to manage cash shortages due to 2001 California's energy crisis

[3] Reporting changed from cash to modified accrual basis in FY 2012/13

*Arvin-Edison/Metropolitan Water Management Program*

Under the December 1997 agreement with Arvin-Edison Water Storage District, Metropolitan can store up to 350,000 AF. During FY 2016/17, Metropolitan cycled the program to provide water quality improvements to the SWP deliveries and reduce program put costs by recovering 12,239 AF of high-quality Arvin-Edison water and returning the same amount of water to Arvin-Edison storage within the same program year. This operation reduced future program put costs by around $600,000. The total water in storage on June 30, 2017 was 108,125 AF.

*San Bernardino/Metropolitan Coordinated Operating Agreement*

A July 2000 coordinated operating agreement with San Bernardino Valley Municipal Water District provided for the annual purchase of 20,000 AF and a carryover storage account of 50,000 AF. It also provided Metropolitan with the option to purchase additional water when available. The agreement terminated on December 31, 2016. The program was successful in providing Metropolitan with 223,500 AF of supplies. In addition, the agreement allowed Metropolitan to convey 556,203 AF of Metropolitan's supplies to Diamond Valley Lake during the construction of the Inland Feeder.

*Kern Delta/Metropolitan Water Management Program*

A 2003 agreement with the Kern Delta Water District allows Metropolitan to store up to 250,000 AF in the groundwater basin underlying Kern Delta and retrieves up to 50,000 AF per year. During FY 2016/17, Metropolitan stored 4,322 AF with Kern Delta. Total water in storage on June 30, 2017 was 102,841 AF.

*Mojave/Metropolitan Water Storage Program*

In 2003, Metropolitan entered into a demonstration agreement with Mojave Water Agency. The agreement allows for the exchange of SWP water on the basis of one acre-foot of return water for each acre-foot of water previously delivered to Mojave. In July 2011, the agreement was amended to extend the term to 2035 and reduce program costs. There was no program activity during FY 2016/17, leaving 27,392 AF in the exchange account on June 30, 2017.

***Water Transfers and Exchanges***

Improved hydrologic conditions in the SWP watershed resulted in no available capacity to convey water transfer supplies at Banks Pumping Plant. Accordingly, Metropolitan did not pursue north of Delta opportunities, but rather focused on south of the Delta purchases and exchanges.

*Multi-Year Water Pool Demonstration Program*

In summer 2016, Metropolitan purchased 6,871 AF of SWP supplies made available under the Multi-Year Water Pool Demonstration Program. This two-year demonstration program terminated on December 31, 2016.

*Central Coast Water Authority/Castaic Lake*

In February 2017, Metropolitan entered into exchange agreements with Central Coast Water Authority and Castaic Lake Water Agency, which had 46,000 AF of supplies at risk of spilling as DWR filled up San Luis Reservoir. By returning two AF of supplies for every three AF received, Metropolitan secured 17,940 AF of additional supplies.

*San Gabriel Valley Municipal Water District Exchange*

Metropolitan entered into a purchase and exchange agreement with San Gabriel Valley Municipal Water District in September 2013. During FY 2016/17, Metropolitan developed 2,471 AF of additional supply by exchange and secured a purchase of 58 AF.

# *Colorado River Resources*

Acquisitions and exchanges made possible by the 2003 Quantification Settlement Agreement continued during FY 2016/17. Metropolitan conveyed 997,023 AF in its Colorado River Aqueduct during CY 2016. As of January 2017, Metropolitan had 85,049 AF of intentionally created surplus stored in Lake Mead. Figure 3-2 illustrates annual water supplies managed through the CRA. These supplies include diversions into Metropolitan's service area and water stored or exchanged outside Metropolitan's service area for Coachella Valley Water District, Desert Water Agency and IID (including

intentionally created surplus supplies) since CY 2004. This figure has been updated with new information since the last annual report.

Figure 3-3 illustrates the storage levels of lakes Mead and Powell through fiscal year 2017. Long-term dry conditions through CY 2016 have delayed equalization releases from Lake Powell to Lake Mead. Above-average precipitation from December 2016 through February 2017 resulted in a projected unregulated inflow to Lake Powell of approximately 116 percent of the April-July average, and approximately 114 percent of average for the water year.

***Water Supply Acquisitions and Exchanges***

In CY 2016, Metropolitan obtained 90,374 AF from its agricultural conservation program with IID, while an additional 125,432 AF was made available from Metropolitan's land fallowing agreements with farmers in the Palo Verde Valley. Metropolitan continued its two-year pilot program with Bard Water District that could provide up to 3,775 AF of Colorado River water in CY 2017. In CY 2016, 178,278 AF of Metropolitan water was delivered to San Diego County Water Authority in exchange for 100,000 AF of IID conserved water plus 78,278 AF of conserved water from the Coachella Canal and All-American Canal lining projects, which was made available to Metropolitan at Lake Havasu. The lining projects also conserved an additional 16,000 AF that was used by Metropolitan.

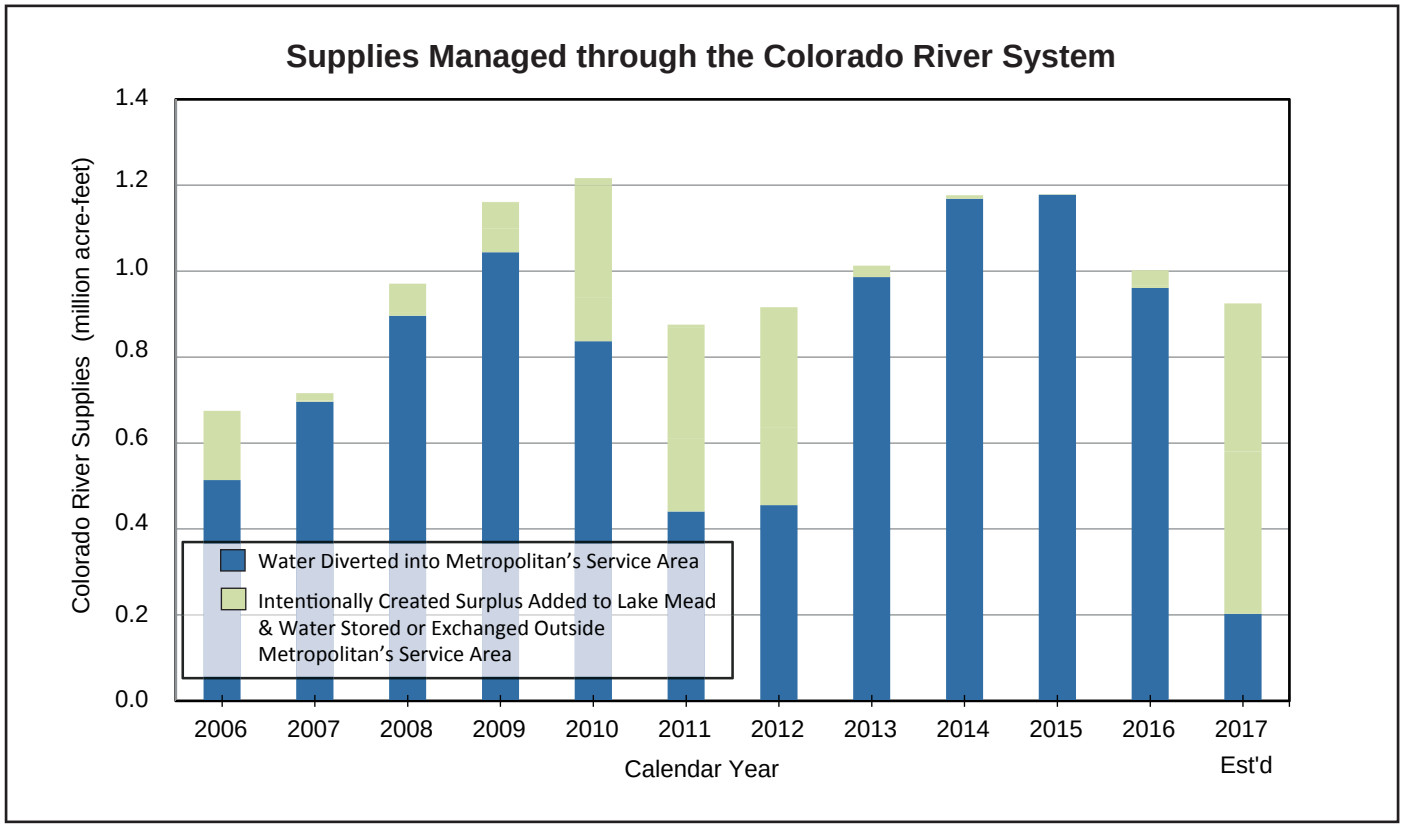

*Figure 3-2. Supplies Managed through the Colorado River System*

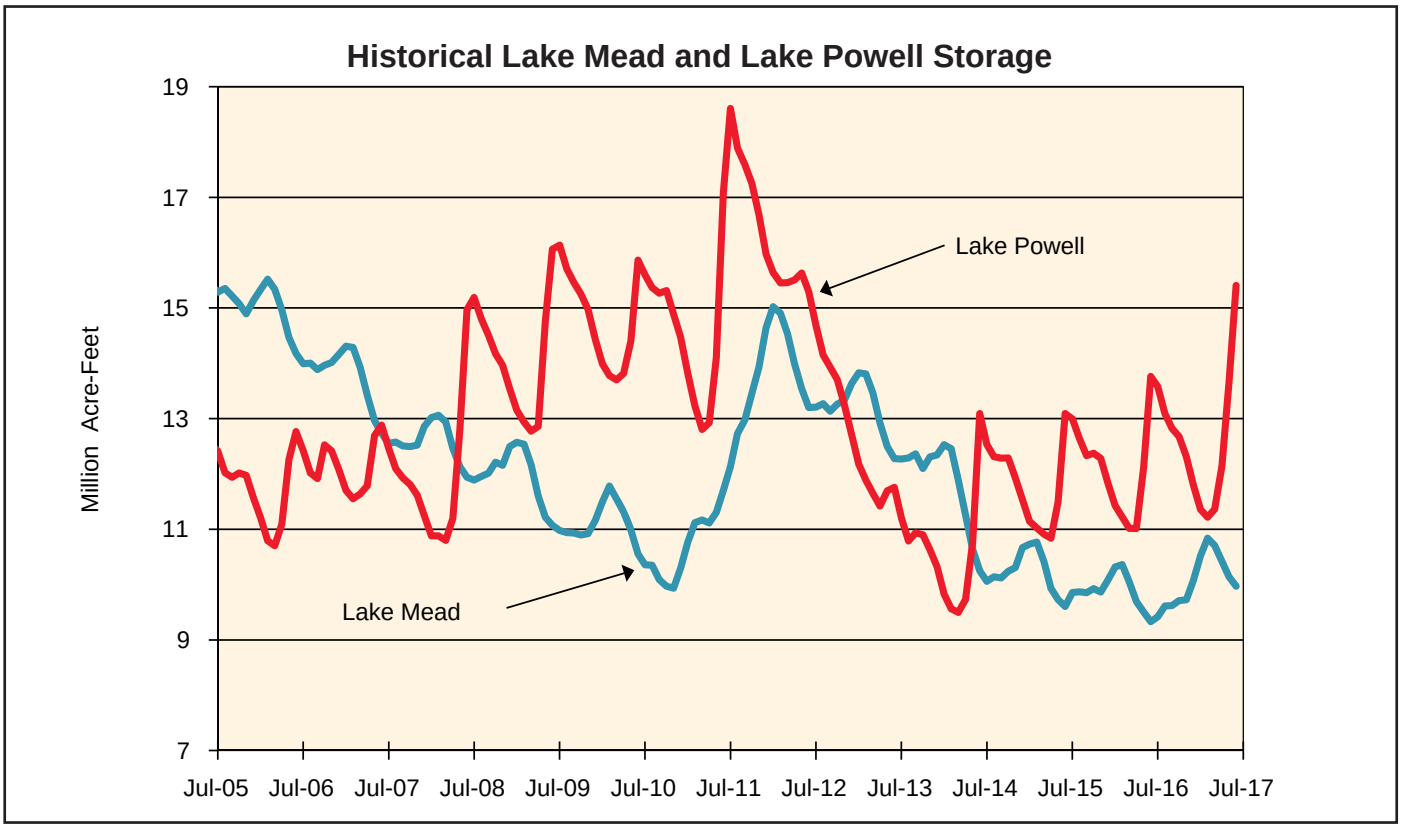

*Figure 3-3. Historical Lake Mead and Lake Powell Storage Fiscal Years 2005/06 - 2016/17*

# *Local Resources*

***Water Recycling and Groundwater Recovery***

Metropolitan's Local Resources Program provided about $607 million since its inception in 1982, producing about 3.53 MAF of recycled water and recovered groundwater, through financial incentives of up to $340/AF. During FY 2016/17, Metropolitan provided $36 million for production of 228,815 AF under the LRP. Currently, there are 107 projects under contract expected to produce about 441,000 AF per year once fully implemented. Contracts include performance targets that are assessed every year and when targets are not met, reductions to the contract can be made. Including LRP projects, the region used about 460,000 AF of recycled water (Fig. 3-4), and about 89,000 AF of recovered groundwater (Fig. 3-5).

To help increase use of recycled water, Metropolitan provides incentives to customers to retrofit their irrigation and industrial potable water systems to recycled water. Since 2014, Metropolitan has committed to provide $8.6 million for 9,800 AFY of recycled water at 305 sites.

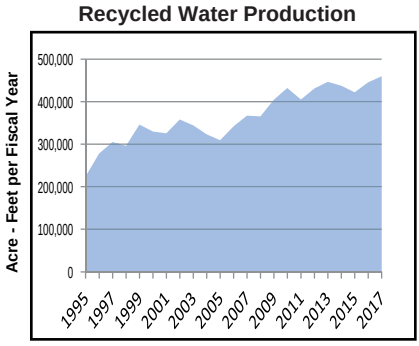

*Figure 3-4.*

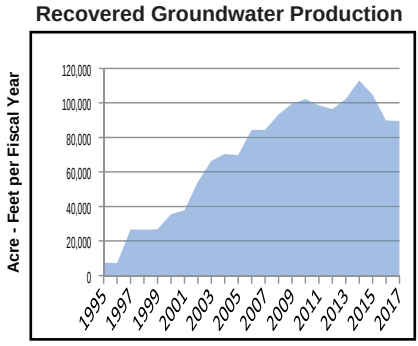

*Figure 3-5.*

*Figures reflect total regional production (including Metropolitan-assisted project production through June 2017), and subject to change due to annual assessments and late invoices. Recycled water production includes Santa Ana River base flows below Prado Dam.*

### *Seawater Desalination*

Since 2001, Metropolitan has maintained agreements with its member agencies to fund three local seawater desalination projects representing 46,000 AFY of potential future supplies. The three projects are currently in the planning stages. During FY 2016/17, Metropolitan supported member agency desalination efforts and continued coordinating regulatory policy for seawater desalination through financial support and participation in CalDesal, a consortium of California water agencies and other stakeholders working to advance seawater and groundwater desalination. Seawater desalination has also been eligible for LRP incentives since 2014.

### *Groundwater Storage*

Metropolitan's conjunctive use programs store imported supplies to enhance reliability during dry, drought and emergency conditions. In FY 2017, due to improved hydrologic conditions, Metropolitan called upon agencies to store water in the conjunctive use accounts. Continued storage over the coming year will increase storage in these accounts. Table 3-2 shows the balance of stored water in each in-region groundwater conjunctive use program as of June 30, 2017.

On April 11, 2017, the board authorized the General Manager to enter into Cyclic Storage Agreements with Metropolitan's member agencies. No new cyclic agreements have been executed as of June 30, 2017. Under the existing cyclic agreements with Upper San Gabriel Valley Municipal Water District and Three Valleys Municipal Water District, 26,532 acre-feet was stored.

## TABLE 3-2
## METROPOLITAN'S CONJUNCTIVE USE PROGRAMS

| Conjunctive Use Program | Total Storage Capacity (AF) | 2016/17 Beginning Balance (AF) | Change in Storage (AF) | 2016/17 Ending (AF) |
|---|---|---|---|---|
| **Los Angeles County** | | | | |
| Claremont | 3,000 | 0 | 0 | 0 |
| Compton | 2,289 | 0 | 0 | 0 |
| Foothill | 9,000 | 0 | 0 | 0 |
| Live Oak | 3,000 | 667 | 0 | 667 |
| Long Beach Phase 1 | 13,000 | 0 | 0 | 0 |
| Long Beach – Lakewood | 3,600 | 0 | 0 | 0 |
| **Orange County** | | | | |
| Orange County | 66,000 | 177 | 1,556 | 1,733 |
| **San Bernardino County** | | | | |
| Chino Basin | 100,000 | 0 | 6,315 | 6,315 |
| **Riverside County** | | | | |
| Elsinore Basin | 12,000 | 0 | 0 | 0 |
| **TOTAL** | **211,889** | **844** | **7,871** | **8,715** |

Some 2016-17 beginning balances differ from 2015-16 ending balances due to data received after publication of the 2016 Annual Report. 2016/17 data presented in this table includes CUP production data that was received by June 30, 2017 and are subject to change.

# *Conservation and Water-Use Efficiency*

The past fiscal year saw California continue to endure one of its worst droughts, followed by one of the wettest years ever on record. Metropolitan's conservation program saw numerous changes from the previous two years of record high conservation activity, as focus shifted from providing incentives and rebates to developing additional training and research programs. The new focus teaches customers the benefits of water efficient landscaping. Ongoing efforts include turf removal classes and development of a residential landscape design assistance program, along with research studies in cooling tower water use and the effects on household water pressure. Metropolitan continues to search for opportunities to increase water-use efficiency in its service territory.

In this past fiscal year, Metropolitan paid a total of $41.2 million in conservation incentives to its customers. The projected lifetime water savings from these conservation expenditures is approximately 91,000 AF of water.

Since 1985, the population within Metropolitan's service area has increased by about 5.5 million, but demands remain flat. Potable per capita water use has declined by about 38 percent during this period, largely attributed to conservation efforts.

# *Water Resource and System Planning*

***Integrated Water Resources Planning***

Throughout the fiscal year, Metropolitan engaged in discussions aimed at developing policy needed to implement the Integrated Water Resources Plan. First adopted by Metropolitan's board in 1996 and updated in 2004, 2010 and 2015, the IRP has fostered supply reliability through diversified investments in water conservation, recycling, groundwater treatment, storage and transfers.

Fiscal year 2016/17 built on a process launched late in the previous fiscal year, during an April 2016 board workshop. The board's Integrated Resources Planning Committee held a series of meetings to review and discuss Metropolitan's historic and current role and

activities in the areas of local resources and conservation development. The committee worked to develop policy principles to be considered by the board early fiscal year 2017/18 relating to the role of Metropolitan in developing local resources, achieving regional reliability, and increasing outdoor water use efficiency to achieve future conservation.

In response to the governor's Executive Order B-37-16 directing state agencies to establish a long-term framework for water conservation and drought planning, Metropolitan participated in an urban stakeholder group advising the state on new long-term water use efficiency targets and new requirements for Water Shortage Contingency Plans. In April 2017, the governor's administration released a package of proposed legislation to implement Executive Order B-37-16 and a report "Making Water Conservation a California Way of Life, Implementing Executive Order B-37-16." Some of the actions described in the report would require additional legislation and expansion of state authority, while others could be implemented under existing authorities.

***Future Supply Actions***

The Future Supply Actions Program consisted of 13 technical studies and pilot projects in the areas of groundwater, recycled water, seawater desalination and stormwater – all of which were completed by 2017. Under the FSA Program, Metropolitan funded up to $500,000 per project per member agency, with participating member agencies providing dollar-for-dollar matching funds. Metropolitan provided approximately $3 million of funding.

Future Supply Actions are relatively low-cost, low risk supply development efforts to better prepare the region for unforeseen water supply challenges. Collectively, the projects funded by this program reduce barriers and enhance regional understanding of the challenges and technical requirements necessary to develop future water supplies.

***Water Resource Data***

Figure 3-6 displays precipitation for FY 2016/17 compared to average annual precipitation figures for three weather stations within Metropolitan's service area. Above-normal annual precipitation

figures for these stations reflect significant easing of drought conditions throughout the service area. For FY 2016/17, downtown Los Angeles recorded precipitation of 19 inches, about 129 percent of the average annual precipitation of 14.77 inches.

Figure 3-7 displays population within Metropolitan's service area since 1990, with historical population based on state Department of Finance estimates and projections based on regional transportation planning agencies. Since 1990, the population served has increased from approximately 15 million to nearly 19 million.

Figure 3-8 displays Metropolitan's historical water sales and exchanges since FY 1989/90, which have ranged between 1.5 MAF and 2.51 MAF. Variations in sales are attributed to many factors that include weather, hydrologic conditions and economic activity.

Figure 3-9 displays Metropolitan's calendar year ending storage reserves for the past 10 years. While long-range forecasts suggested that a strong El Niño favored a wet year for the southwestern United States and the Colorado River Basin in CY 2016, these conditions did not materialize. Southern California received well below-normal precipitation while northern California received above-normal precipitation. These improved supply conditions along with ongoing conservation efforts and water use efficiency achievements allowed Metropolitan to store water for the first time in three years, resulting in storage of about 400,000 AF and allow for rebuilding of its dry-year storage accounts. At the end of CY 2016, Metropolitan had total storage reserves of 1.9 MAF, consisting of 1.3 MAF of dry-year storage and 630,000 AF of emergency storage. Record precipitation and above-average snowpack during the winter of 2016/17 should further rebuild Metropolitan's storage in CY 2017.

CHAPTER 4

# Water System Operations

The Water System Operations Group conveys, treats and distributes water to member agencies that, directly or through their sub-agencies, serve nearly 19 million Southern Californians. WSO ensures excellent water quality for Metropolitan's six-county service area that meets all primary drinking water standards, and operates and maintains Metropolitan's five treatment plants with a combined capacity of more than 2.6 billion gallons of water per day. WSO balances demand and supply as it operates, manages and maintains Metropolitan's water and power systems. It also oversees security; provides machine and fabrication services to support Metropolitan infrastructure; offers technical advice and support to member agencies, customers and other entities; provides technical training to ensure an effective, efficient and safe work environment; runs Metropolitan's Apprenticeship Program; assists in planning, design and construction of new facilities; and responds to emergencies to restore service in the shortest time possible.

## *Water Treatment*

Metropolitan's five water treatment plants treat water from the Colorado River and Northern California. The Robert B. Diemer Water Treatment Plant provides treated water to areas of Orange County and coastal Los Angeles. The Joseph Jensen Water Treatment Plant supplements local water supplies in the San Fernando Valley, Ventura County and central Los Angeles, while the F.E. Weymouth Water Treatment Plant generally serves eastern Los Angeles County, the San Gabriel Valley and parts of Orange County. The Henry J. Mills Water Treatment Plant serves western Riverside County and Moreno Valley. The Robert A. Skinner Water Treatment Plant serves parts of Riverside County and meets the supplemental treated water needs of San Diego County. The Jensen and Mills plants only treat State Water Project supplies, while the other three plants treat a blend of supplies from the SWP and Colorado River.

Construction of ozone facilities continued throughout the year at the Weymouth plant, with a scheduled start date of late calendar year 2017. The Weymouth oxidation retrofit will complete Metropolitan's $1.2 billion water quality improvement program to install ozone systems at all five water treatment plants. Crews installed and integrated ozone mechanical, electrical and instrumentation equipment and added sulfuric acid, liquid oxygen, hydrogen peroxide and ammonia feed equipment. Ozone testing and startup activities commenced this year, involving commissioning of ozone generators and extensive performance testing to ensure ozone production meets design standards.

At the Weymouth plant, rehabilitation of 48 filters was completed in June 2017. Each filter received a new underdrain system and filter media. The backwash troughs were raised to allow more effective backwashing with fewer filter media losses. This upgrade will allow more efficient filtering of the finished water and higher turbidity removal.

The Diemer plant is undergoing a major rehabilitation project on the original east side of the plant, which includes modernizing and improving the four basins, replacing flocculators, and improving flow characteristics through the plant. This project is expected to be completed in August 2017. Staff also completed replacement of the filter valves and seismic improvements to the filter building on the east side of the plant in October 2016. Staff replaced the filter influent, effluent, backwash, surface wash and drain valves for filters 1 through 24, as well as isolation and metering valves on the backwash and surface wash headers. These replacements will improve filter performance and increase reliability. Once work on the east side of the plant is complete, the west side of the plant will be rehabilitated. Work has also begun at the Diemer plant to reinforce the main administration building against damage from earthquakes, with completion expected in early 2018.

At the Jensen plant, rehabilitation projects continued to improve treatment plant performance, power reliability, and solids handling. The November 2016 replacement of module 1 filter valves and controls improved filter performance and increased plant reliability. Following a major shutdown of the Jensen plant in March 2017, the connection of new high-voltage electrical switchgear improved

emergency power reliability for the site. During this shutdown, adjustments to the effluent weir plate and cleaning of jet mix pumps allowed for increased flow of SWP supplies through the Jensen plant in response to increased water supply from Northern California. Completion of a permanent solids transfer pipeline to the Los Angeles Aqueduct Filtration Plant's solids handling lagoons will ensure delivery and storage of solids produced by the Jensen plant treatment process. This replaces a temporary pipeline to the lagoons, which are owned by the L.A. Department of Water and Power, and will ensure long-term plant reliability with improved plant performance, especially under variable water quality conditions. The new solids transfer system will be completed in July 2017.

The Skinner plant continued to optimize plant efficiency and treatment process effectiveness with the installation of an ammonia jet mixing system on the finished water reservoir inlet channel which improved chemical mixing. This project was completed in February 2017. Skinner relocated electrical equipment and pumps for the main mixing process to better protect them from the heat and weather, improving both the efficiency of the units and their reliability for water treatment.

The Mills plant completed construction of a new industrial waste water collection system in May 2017. The system allowed the plant to treat plant runoff water prior to pumping it into the sanitary sewer, resulting in significant savings when compared to hauling the material offsite. Mills plant also upgraded chemical feed systems to provide better control and optimized water treatment across widely varying flow rates. Replacement of coagulant pump needle valves and ammonia feed lances provided finer flow control and better mixing at lower flow ranges.

During fiscal year 2016/17, Metropolitan invested about $59.5 million in refurbishing and upgrading its five water treatment plants to ensure that treated water reliability goals continue to be met. Another $22.9 million was invested in water quality improvement projects, with a major portion of the funds dedicated to construction of the Weymouth ozone facilities.

# *Water Quality*

### *Regulations*

Metropolitan's treated water supplies met all regulatory requirements during fiscal year 2016/17.

On May 31, 2017, the Sacramento County Superior Court invalidated the state's chromium 6 maximum contaminant level for drinking water, which had been set at 10 parts per billion in 2014. The court also ordered the State Water Resources Control Board, Division of Drinking Water to adopt a new MCL for chromium 6. Metropolitan's source and treated water supplies remain below the invalidated MCL and will require no additional treatment. The total chromium MCL of 50 ppb remains in effect.

Metropolitan began compliance monitoring of its potable water system under the federal Revised Total Coliform Rule in April 2016. California has not yet adopted the revised federal rules, so utilities must adhere to the current and revised standards. Based on Metropolitan's past low coliform bacteria results, no compliance issues with the federal and the future state standards are expected.

In March 2017, Metropolitan completed the monthly two-year monitoring of treatment plant influents for *Cryptosporidium* under round 2 of the Long Term 2 (LT2) Enhanced Surface Water Treatment Rule. During 24 months of monitoring, no *Cryptosporidium* oocysts were detected in any of the samples, meaning that no additional surface water treatment will be required.

### *Water Quality Monitoring*

Water Quality Laboratory staff performed 164,396 analytical tests using 183 methods on nearly 45,000 samples this year. Treatment plant laboratory staff performed an additional 150,000 analytical tests using 13 methods in FY 2016/17. The number of samples and analyses for Metropolitan's sources, treatment plants, and distribution system may change each year depending on regulations, monitoring plan, operations and water quality studies. The water quality data presented here represent FY 2016/17 rather than calendar year data that are reported in the annual Water Quality Report. As such, minor differences in reported metrics may be observed.

*Chemical/Physical*

Staff analyzed Metropolitan's source and treated waters for inorganic and organic compounds, physical properties and other constituents. Table 4-1 lists the locations sampled for organic chemicals. No herbicides, pesticides, or synthetic organic compounds were detected. Tables 4-2, 4-3, and 4-4 show locations and results for trace metals, radiologicals (most recent triennial monitoring results summary), and general minerals and physical analyses, respectively.

**TABLE 4-1**
**SAMPLE LOCATIONS FOR ORGANIC COMPOUNDS**
Fiscal Year 2016/17

| Source Water | Treated Water |
|---|---|
| Devil Canyon Afterbay | Diemer Plant Effluent |
| Diamond Valley Lake | Jensen Plant Effluent |
| Jensen Plant Influent | Mills Plant Effluent |
| Lake Havasu Intake | Skinner Reservoir Effluent[1] |
| Lake Mathews Headworks | Weymouth Plant Effluent |
| Lake Perris | |
| Lake Skinner Outlet Conduit | |
| San Jacinto Tunnel | |

[1]Skinner Reservoir Effluent is a combined effluent from three Skinner plants.

*Total Dissolved Solids*

Salinity of the Colorado River Aqueduct is typically higher than the State Water Project, largely due to natural mineral salt deposits within the geology of the Colorado River watershed (Figure 4-1). Changes in salinity tend to occur more rapidly in water from the SWP as opposed to supplies from the CRA, due to the hydrodynamic fluctuations of the system. Figure 4-2 presents salinity as flow-weighted averages of the total dissolved solids levels in the effluents from all five treatment plants. While salinity levels dropped compared to the previous year, during a portion of FY 2016/17, the Diemer, Skinner and Weymouth plants treated lower blends of SWP supply due to its limited availability during the last stages of the drought. As such, flow-weighted TDS averages were above Metropolitan's water quality goal of 500 milligrams per liter (mg/L).

*Disinfection Byproducts*

Metropolitan has monitored for byproducts from disinfection in treatment plant effluents since 1979. Table 4-5 summarizes the levels of disinfection byproducts total trihalomethanes, haloacetic acids and bromate in plant effluents during FY 2016/17. Compliance under the Stage 2 Disinfectants and Disinfection Byproducts Rule began in 2013, requiring drinking water systems to monitor distribution system locations with the highest TTHMs and HAAs in the distribution system and report results as locational running annual averages. The highest locational running annual averages were below the MCLs of 80 micrograms per liter (µg/L) for TTHMs and 60 µg/L for HAA5. Bromate was below 10 µg/L. Figures 4-3 and 4-4 summarize the long-term trends for TTHMs and HAA5, respectively. Locational running annual averages for both TTHMs and HAAs are higher in the distribution system than running annual averages at treatment plant effluents because the required disinfectant residual in the distribution system can increase DBPs. However, overall DBP trends have declined since Metropolitan began using ozone, although changing source water conditions and operational changes can cause locational averages to periodically increase. This conservative monitoring and reporting framework provides the most representative DBP water quality for Metropolitan's customers.

Figure 4-5 exhibits the plant influent levels of the DBP precursors, total organic carbon and bromide. The gap in bromide data for the Skinner plant is due to influent chlorination to control quagga mussels during fiscal years 2008/09 and 2009/10. Bromide levels naturally fluctuate every spring and summer due to mountain snowmelt in the Sierra Nevada and increased outflow from the Sacramento-San Joaquin Delta. Bromate, a byproduct of ozone treatment, was monitored after ozone came online at Mills in 2003, Jensen in 2005, Skinner in 2010 and Diemer in July 2015. Figure 4-6 shows trends in bromate levels. Application of an ammonia-chlorine bromate control strategy began in October 2010 at the Mills plant. The strategy results in lower bromate levels and operating costs when demands justify its use.

*Microbiological*

Metropolitan complied with state and federal drinking water regulations by monitoring treatment plant influents for total coliforms and Escherichia coli (Table 4-6). Coliforms are bacteria that naturally occur in the environment while *E. coli*, a coliform that may indicate fecal contamination, is a factor used in measuring the quality of influent water. The different ranges observed at the plants—from below 100 to tens of thousands—may be influenced by the natural variability of raw water coliforms, storm events, changes in source water, or other factors.

Metropolitan also analyzed nearly 8,000 bacteriological compliance samples in the distribution system to monitor the microbial quality downstream of the water treatment plants. The monthly average of 0.07 percent total coliform-positive samples was well below the regulatory standard of 5.0 percent.

**TABLE 4-6**
**RAW WATER COLIFORM RESULTS**
Fiscal Year 2016/17

| | Treatment Plant Influent[1] | | | | |
|---|---|---|---|---|---|
| | **Diemer** | **Jensen** | **Mills** | **Skinner** | **Weymouth** |

| E. coli | | | | | |
| Range | ND-7 | ND-1 | ND-6 | 1-11 | ND-8 |
| Average[2] | 2 | ND | 2 | 3 | 2 |

Notes:
[1] Samples were collected weekly and analyzed by membrane filtration.
[2] Annual average of monthly averages.
CFU/100 mL = Colony-forming units per 100 milliliters
ND = Not Detected; method detection limit is 1 CFU/100 mL.

Metropolitan tests all five treatment plant influent and effluent sites monthly for the protozoan parasites *Cryptosporidium* and *Giardia*. During the fiscal year 2016/17, *Giardia* was detected in one treatment plant influent sample, at a concentration of 1 cyst per 10 liters. In the last 16 years of monitoring, less than one percent of monthly plant influent samples tested positive for either microbe, and all treated water samples were negative.

***System Management Monitoring***

*Cyanobacteria and Algae Control Program*

Staff analyzed more than 2,900 samples for the earthy/musty taste-and-odor compounds MIB (2-methylisoborneol) and geosmin to monitor and manage T&O events in Metropolitan's source water (Fig. 4-7). Half of the samples were used to evaluate T&O problems caused by cyanobacteria in the State Water Project. This reflects the high cyanobacterial production potential of SWP supplies, which resulted in the California Department of Water Resources treating their lakes several times during the year. Metropolitan treated Lake Skinner five times during the year with a total of 33 tons of copper sulfate. No treatments were conducted on Lake Mathews or Diamond Valley Lake during the current reporting period. (Figure 4-8).

The U.S. Environmental Protection Agency published non-enforceable health advisories for cyanobacterial toxins (cyanotoxins) in drinking water in 2015, and many states, including California, have developed guidelines for recreational water. During FY 2016/17, DWR posted warning and cautionary notices at Pyramid, Castaic, and Silverwood lakes, closing the swim beaches and sometimes the entire lake to bathers and swimmers. However, water delivered to Metropolitan's treatment plants is withdrawn from the deeper parts of the lakes away from the recreational areas, and is usually not impacted by the relatively high concentrations of cyanotoxins that initiate the recreational warnings. Metropolitan has an active monitoring program for cyanotoxins and continues to research and optimize control methods to ensure the safety of its treated water. Ozone, which is Metropolitan's primary disinfectant at four of the treatment plants (all five plants by the end of 2017), is very effective at inactivating cyanotoxins in drinking water supplies.

*Quagga Mussel Control Program*

With the discovery of invasive quagga mussels in the SWP for the first time during FY 2016/17, Metropolitan has intensified its monitoring program and is developing potential control strategies for SWP facilities, in case of confirmed detections and subsequent imposition of regulatory restrictions. Metropolitan's program for monitoring and controlling quagga mussels has been in effect since their detection in the Lower Colorado River in 2007. Quagga control

strategies in the CRA system include chlorination at strategic sites along with desiccation and removal of mussels during shutdowns. Mussel populations in the CRA continue to show seasonal fluctuations but the control measures have successfully limited further population increases. In December 2016, however, a few adult quagga mussels were found in DWR's Angeles Tunnel that connects Pyramid Lake to Castaic Lake on the west branch of the SWP. A few weeks later, suspect but unconfirmed quagga mussel larvae (veligers) were found at two locations downstream of Silverwood Lake. Since the larvae were not confirmed, state regulations on control of invasive mussels weren't triggered. Therefore, as of June 2017, there are no regulatory restrictions on the movement and use of raw water from the Santa Ana Valley and Rialto pipelines and the Inland Feeder, which deliver water from Silverwood Lake on the east branch of the SWP.

### *N-Nitrosodimethylamine*

Since 1999, Metropolitan has monitored its distribution system for NDMA (N-nitrosodimethylamine), a byproduct of the disinfection process that occurs during chloramination. Table 4-7 shows NDMA levels in the distribution system for FY 2016/17. The concentrations were all below the notification level of 10 nanograms per liter (ng/L) established in 2002.

**TABLE 4-7**
**N-NITROSODIMETHYLAMINE LEVELS**
**IN THE DISTRIBUTION SYSTEM**
Fiscal Year 2016/17 [in nanograms per liter (ng/L) or parts per trillion]

| Sample Location[1] | Range[2] |
|---|---|
| Diemer Plant | ND-2 |
| Jensen Plant | 2-3 |
| Mills Plant | ND-4 |
| Skinner Plant | 3 |
| Weymouth Plant | ND |
| Central Pool Sites[3] | ND-5 |

ND - Not Detected; NDMA reporting level is 2 ng/L.
[1] Plant locations are distribution system sites associated with each treatment plant.
[2] SWRCB-DDW notification level is 10 ng/L
[3] Sample locations in the distribution system that can receive water from multiple plants

# *Source Water Protection*

### *Watershed Management and Protection*

Metropolitan continued its oversight and coordination on water quality issues with key Colorado River stakeholders through active participation in the Lower Colorado River Water Quality Partnership, Lake Mead Water Quality Forum and Clean Colorado River Sustainability Coalition. Staff also collaborated with DWR and the State Water Contractors on Delta and SWP water quality monitoring and forecasting programs.

Metropolitan completed the 2015 Update of the Colorado River Watershed Sanitary Survey and submitted it to Division of Drinking Water in December 2016. Metropolitan and other State Water Contractors also prepared the 2016 Update of the SWP Watershed Sanitary Survey for submission to DDW in July 2017. These sanitary surveys identify potential sources of watershed contamination, analyze water quality data, assess effects on treatment, and recommend strategies to protect source waters.

### *Salinity Control*

Metropolitan continued to engage in salinity control efforts through the Colorado River Basin Salinity Control Forum to mitigate salt loading into the Colorado River. Metropolitan also continued to work with the federal Bureau of Reclamation and the Southern California Salinity Coalition on technical studies to update the 1999 Salinity Management Study that estimated economic damages from salinity. Metropolitan updated water supply and water usage information in the salinity economic impact model used to conduct an economic damage assessment for the forum's 2017 Triennial Review. Metropolitan also coordinated with USBR and the forum to restructure the economic impact model to facilitate future uses and validate the current model. A comprehensive model update is anticipated to begin in 2018.

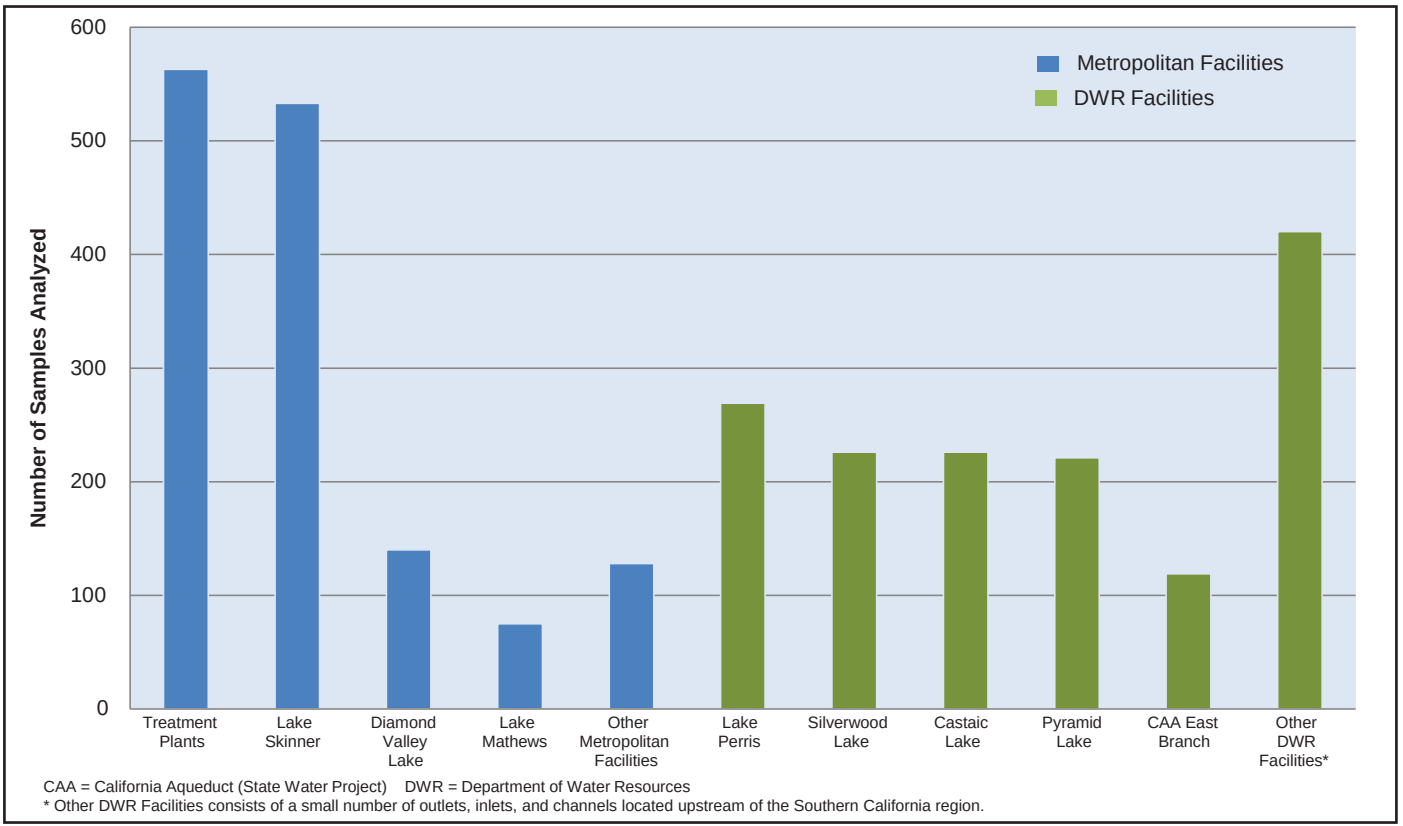

*Figure 4-7. Number of Samples Analyzed for the Taste-and-Odor Compounds 2-Methylisoborneol (MIB) and Geosmin in Source and Treated Water, FY 2016/17*

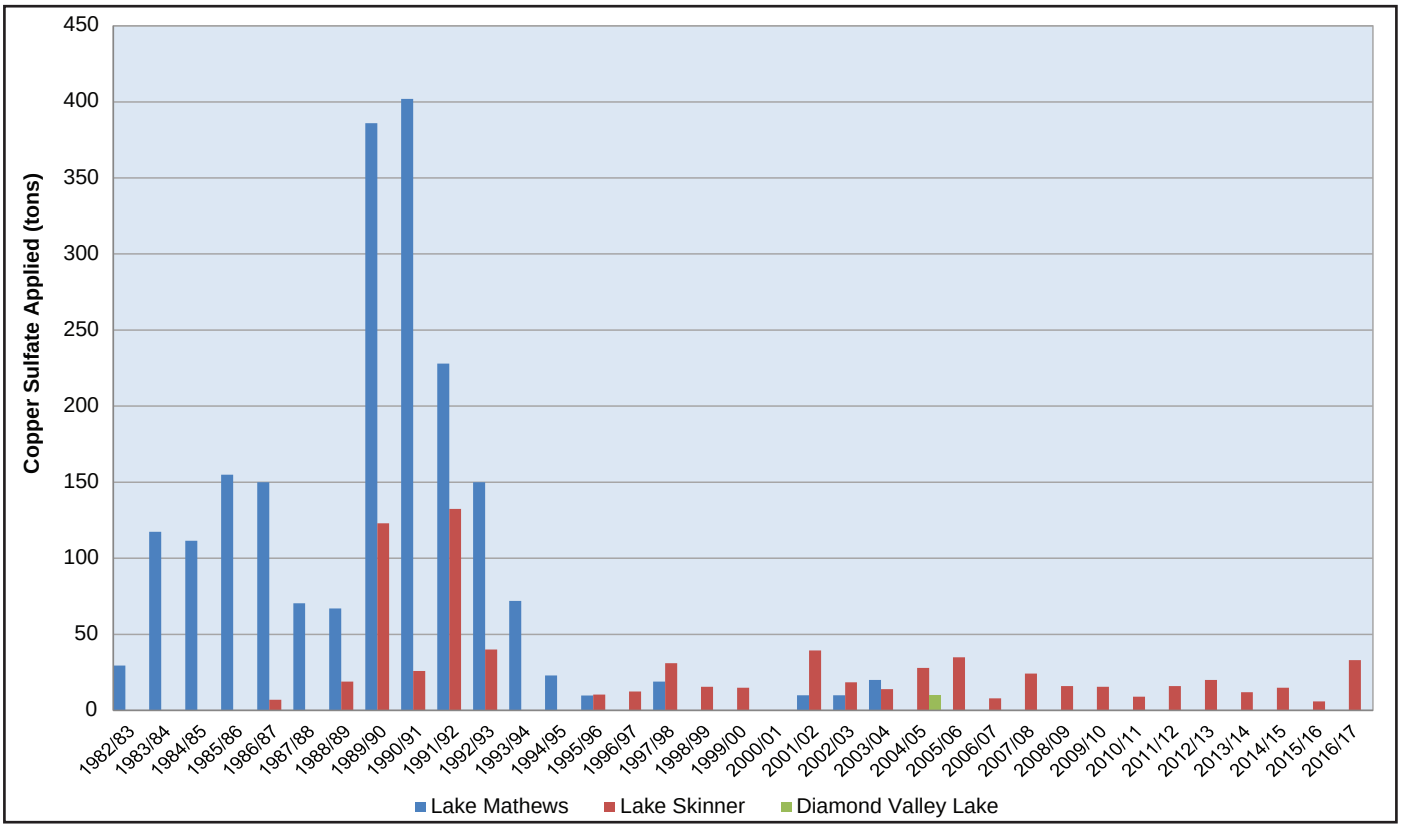

*Figure 4-8. Copper Sulfate Usage in Metropolitan's Reservoirs, FY 1982/83 to 2016/17*

### *Uranium Mill Tailings Cleanup*

Metropolitan continued to monitor remedial efforts and advocate for increased funding to expedite removal of the uranium mill tailings pile along the banks of the Colorado River near Moab, Utah. Since 2009, the U.S. Department of Energy has shipped over 7 million tons of mill tailings via rail to an engineered disposal site approximately 30 miles northwest of Moab. With revised figures showing the DOE less than halfway toward removing the 16 million-ton pile, Metropolitan sent a letter to the Secretary of Energy and the California, Arizona and Utah congressional delegations in June 2017 advocating for increased fiscal year 2017/18 funding to expedite cleanup and meet the targeted completion date of 2025.

### *Chromium 6 Remediation*

Metropolitan continued working with stakeholders to support Pacific Gas & Electric's chromium 6 groundwater remediation efforts along the Colorado River near Topock, Arizona. Metropolitan provided comments on the final design for the selected groundwater treatment remedy involving biological treatment within the groundwater basin, the groundwater model used to measure effectiveness of the final remedy, and the subsequent Environmental Impact Report. Metropolitan also provided a presentation to Topock stakeholders on Colorado River water quality and emphasized the importance of expeditiously implementing the groundwater remedy to ensure protection of Colorado River supplies.

Approval of the final design and certification of the Subsequent Environmental Impact Report is anticipated in fall 2017. Construction is expected to be completed in 2022, followed by operation of the treatment system for an estimated 30 years. Interim measures, consisting of groundwater extraction and treatment, have been in place since 2004 to prevent chromium 6 migration to the Colorado River. Levels of chromium 6 in the river typically remain at non-detect levels (less than three parts per billion).

### *Perchlorate Remediation*

Perchlorate loading into the Las Vegas Wash has dropped more than 90 percent since 1998 as a result of remediation at the former

Tronox, Inc. site, now owned by the Nevada Environmental Response Trust (Figure 4-9). Levels have consistently remained below 2 ppb at Metropolitan's Lake Havasu intake (Figure 4-10).

The trust is currently conducting remedial investigations for long-term soil and groundwater cleanup. Metropolitan continued to monitor performance of the current groundwater remediation system and the development of the long-term treatment remedy for the perchlorate plume. Staff reviewed and commented on remedial documents, participated in stakeholder meetings and technical roundtables, and monitored site operations including disbursement of funds from a $1.1 billion settlement between Tronox and its predecessors for site cleanup. The Nevada Division of Environmental Protection is also conducting a regional investigation of downstream perchlorate-contaminated areas to further reduce loading into the Las Vegas Wash. The remedial plan has a goal to reduce perchlorate loading into the Las Vegas Wash to meet the federal Interim Drinking Water Health Advisory and Preliminary Remediation Goal of 15 ppb. This would further lower perchlorate levels in the Colorado River and help ensure compliance with any potential reduction in California's perchlorate MCL of 6 ppb in light of a 1 ppb public health goal adopted in February 2015.

# *Technology Assessment*

### ***Treatment Process Optimization and Development***

Staff conducted pilot testing of an alternative coagulant while investigating future options for reducing potential formation of NDMA through the water treatment process. Staff continued laboratory studies to treat cyanotoxins using ozone, and investigations to improve and optimize ozone and biofiltration operations at Metropolitan's water treatment plants. Staff conducted a review of the existing domestic water systems at the CRA pumping plants, evaluated technology alternatives, and developed process design criteria for replacement systems. Staff also completed an extensive update of the Operations, Maintenance, and Monitoring Plan for the Weymouth plant. The Operations Plan is required by the Division of Drinking Water for the permit on how Weymouth staff operates, monitors and maintains the facility. The Weymouth plant is the last of

Metropolitan's five treatment plants to add disinfection by ozone, which is anticipated to be the primary disinfectant in fall 2017. This will help improve the aesthetics of the water by reducing taste-and-odor compounds and minimizing the formation of disinfection byproducts associated with chlorine disinfection.

***Service to Member Agencies and Drinking Water Industry***

Metropolitan hosted a Member Agency Water Quality Managers meeting in March 2017, and conducted a specialty workshop on the use of chloramine disinfection and nitrification prevention and control in the distribution system. In addition, staff provided an update to member agency general managers on the occurrence, detection, and control of cyanotoxins, as well as an overview of Metropolitan's response plan. Metropolitan also conducted a workshop on invasive quagga mussels in the SWP, with participants from Metropolitan member agencies, the California Department of Fish and Wildlife, DWR, and other utilities that use water from the SWP.

Metropolitan continued its involvement with the industry's principal advocates, most notably the Association of California Water Agencies, American Water Works Association, Association of Metropolitan Water Agencies, and the California Municipal Utilities Association. These organizations provided regulatory and legislative input on behalf of Metropolitan and other member agencies on federal, state and local drinking water issues.

**TABLE 4-8**

# *Conveyance, Distribution and Support*

***Conveyance and Distribution***

Water System Operations' Conveyance and Distribution Section performs preventive and corrective maintenance activities throughout the year with the objective of ensuring reliable deliveries to member agencies. In addition, the section plans and performs shutdowns to complete pipeline and facility inspections, performs local repairs on pipelines or equipment, and supports capital improvement program projects. A description of fiscal year 2016/17 activities follows:

Staff successfully completed shutdowns on the CRA and pipelines throughout Metropolitan's service area. Using visual inspections and eddy-current inspection technology, staff inspected approximately 26 miles of pipeline to assess the condition of steel mortar-lined and pre-stressed concrete cylinder pipe. Electromagnetic inspections revealed excessive wire breaks on 80 feet of PCCP on the Sepulveda Feeder that required urgent repairs. Completed over a 2-week period, the repairs involved the insertion of steel reinforcement sleeves where the PCCP had become weakened. Operational flexibility within the distribution system allowed this work to be completed without affecting member agency deliveries.

Throughout FY 2016/17, WSO maintained an eight-pump flow capability on the Colorado River Aqueduct. To ensure consistent operation and reliability, refurbishment work took place during a 24-day shutdown of the CRA. Work performed included survey and engineering inspections of the San Andreas Siphon, Big Morongo Siphon, and other areas along the CRA; seismic upgrades; sand trap improvements to prevent abrasive sediment from flowing into the pump units; Copper Basin storage tank inspections; installation of isolation valves and lateral lines; and repairs and testing of high-voltage equipment. No tunnel cleaning was performed during this shutdown, due to the low likelihood of high CRA flows in calendar year 2017.

Although quite rare, one leak was detected in Metropolitan's distribution system this year. During the CRA shutdown, staff installed 15 new internal seals and adjusted three existing seals in the Casa

Loma Siphon No. 1 pipeline to address this small leak. This section of the CRA is located in the city of San Jacinto. In late 2016, staff identified a leak that was small enough to allow repairs to be deferred until the scheduled CRA shutdown, instead of shutting down the CRA at the time the leak was found. Inspection of previously installed seals revealed that they were in good condition, needing only minor adjustments to ensure continued reliability.

The Coatings Program protects Metropolitan's physical assets from corrosion and harsh environments to maximize the useful life of pumps, valves, meters, pipes, buildings and delivery lines. When not focusing on 2016/17 shutdown activities, staff coated 820 pieces of equipment and structures. Structures that are particularly vulnerable to water damage—such as vaults located below road grade—were sealed to prevent water intrusion that accelerates corrosion.

During FY 2016/17, crews performed nearly 228,000 hours of maintenance on conveyance and distribution infrastructure, including shutdowns. See Table 1-5 for a full list of shutdowns that occurred during the year.

### *Operations Support Services*

Operations Support Services provides a wide range of support services to Metropolitan's core operational functions and, on a reimbursable contract basis, to the Department of Water Resources, member agencies and other public entities. Services include maintenance engineering, manufacturing, rehabilitation, new construction and emergency response.

#### *Manufacturing Services*

Manufacturing services provided by the La Verne shops include fabrication, machining and coating services, repairing and testing of valves and pumps, refurbishing equipment, diving inspections, floating reservoir cover maintenance, as well as crane maintenance and annual certification.

As part of the Colorado River Aqueduct Whitewater Flow Augmentation Project, the La Verne shops manufactured three 16-foot-long stainless steel gate guides and a 16-by-16-foot weir gate.

Installing the weir gate and gate guides in the Whitewater siphon transition structure enabled the delivery of a record amount of Colorado River water to groundwater storage programs being operated under an existing agreement with Desert Water Agency and Coachella Valley Water District.

Using a reimbursable agreement, the La Verne shops provided support for DWR's SWP facilities. The shops manufactured new pump components for the Gianelli Pump/Generating Plant Unit No. 3. The shops also fabricated two 12-by-10-foot steel trash gates for Oso Pumping Plant. The new gates replaced two existing ones which had extensive corrosion damage from many years of service.

The La Verne shops also maintained Metropolitan's infrastructure by fabricating 92-inch diameter steel liner pipe for urgent PCCP repair work on the Sepulveda Feeder. Use of Metropolitan's pipe fabrication facility at La Verne expedited the repairs and was less costly than other potential sources for the pipe.

*Construction Services*

Construction Services staff and equipment are deployed throughout Metropolitan's service area to perform general construction, install and transport large equipment, maintain pipeline easements and access roads, support shutdown activities and respond to emergency construction needs.

Staff installed a new 16-inch-diameter potable water and fire line as part of the Weymouth plant upgrades to support the ozone facilities. Staff also completed electrical improvements which will connect to the newly constructed bromate tank farm at the Weymouth plant.

In February 2017, staff constructed a new 24-inch blow off structure along the Orange County feeder that will provide safer access to the pipeline and reduce the amount of discharge water required during future shutdowns. In March 2017, staff installed a new acoustic meter at the LA-29 meter structure on the Sepulveda Feeder.

During heavy rainstorms in early 2017, Metropolitan's patrol roads suffered major erosion damage. Staff surveyed the damaged areas throughout the distribution system and made several repairs and

improvements to reestablish the existing patrol roads and mitigate future storm impacts.

*Power Equipment and Reliability*

The Power Equipment and Reliability staff evaluates maintenance and reliability engineering issues, and maintains hydroelectric power plants, high voltage systems, and HVAC (heating, ventilation, and air conditioning) systems throughout Metropolitan's facilities. Staff also performs technical investigations related to water billing meters.

The North American Electric Reliability Corporation sets reliability standards for owners of large electric transmission systems. The CRA's 230-kilovolt electrical transmission system, a key part of the Metropolitan system, was maintained by staff in compliance with the applicable reliability standards. Staff supported compliance activities required for Metropolitan's power operations, which included implementing recommendations from Southern California Edison-MWD annual transmission reliability assessments, successfully achieving self-certification for 2016, and supporting the Critical Infrastructure Protection cybersecurity training program.

Staff completed quarterly inspections at all 16 hydroelectric plants, including transformer and equipment oil testing, as part of its predictive maintenance program. At the OC-88 pump station, staff refurbished two of the older 12 kV transformers. Transformers are part of the high voltage transmission system into the plant that convert higher voltage power (12 kV) from Southern California Edison to a lower voltage (900 V) that the pumps can utilize for operation. Staff refurbished these transformers after testing and inspections indicated signs of degradation. Staff also completed 2-year maintenance work at Lake Mathews, Foothill, and Rio Hondo hydroelectric power plants. Six-year maintenance and high voltage testing work were completed at Etiwanda, Perris, Corona, and Temescal hydroelectric plants.

Protection relays are critical devices on high voltage systems that shut off power and protect equipment when a malfunction is detected. Two-year testing and calibration of these devices were completed at San Dimas, Foothill, Coyote Creek, Red Mountain, Corona, Temescal, Lake Mathews, Etiwanda, and Sepulveda hydroelectric power plants. Five-year high voltage electrical testing and maintenance work were

completed on the main switchgear at the Skinner, Diemer and Mills plants as well as the Wadsworth pumping plant switchyard at Diamond Valley Lake.

Staff continued to implement improvements in the infrastructure reliability of district facilities. This year maintenance staff completed the initial roll-out of condition-based maintenance practices at all treatment plants. These practices allow Metropolitan staff to diagnose impending equipment problems using diagnostic equipment and tools. Initially staff focused on vertical and horizontal pumps at the treatment plants. The effort will continue in the conveyance and distribution system. This is a multi-year effort that will incorporate other types of equipment over time, such as emergency generators and motors.

*Fleet Services*

WSO's fleet personnel assess, procure, and maintain more than 1,400 mobile assets, as well as approximately 570 facility assets. In FY 2016/17, staff completed some 5,900 preventive maintenance work orders and 2,900 corrective work orders on district equipment and strategically replaced aging vehicles and equipment while meeting air quality regulations.

## *Security and Emergency Management*

Protecting critical infrastructure and safeguarding people and assets are primary Metropolitan objectives. Security professionals provide 24/7 security monitoring and response working with a contracted guard force and a physical security system that protects 72 facilities with more than 1,000 monitoring points, which include card readers, door alarms, motion detectors, and closed-circuit cameras.

Security has been implementing the Security Action Plan developed in 2016. A number of immediate security enhancements have been developed and implemented as a result, including personal security awareness training to over 1,600 employees and the Board of Directors, in an effort to increase employee safety and awareness in response to an increase in workplace violence events nationwide.

Security has reduced metal theft incidents districtwide from over 15 occurrences in 2015 to zero over the past year. This achievement was made possible by hardening the security of prospective targets for metal theft and closely working with an alliance of utilities, law enforcement and vigilant employees.

Metropolitan has renewed a five-year maintenance agreement for the physical security system and initiated an upgrade project for electronic security surveillance and access control. This upgrade project features encrypted card readers and badges, new computer servers, network controllers, and video management system software.

Security has been working with local, state and federal law enforcement partners to meet its objectives. A partnership has been developed with the California Highway Patrol to assist with security emergencies at any of the pumping plants in the desert. Security has facilitated local law enforcement and emergency response exercises at multiple facilities and has performed threat and vulnerability assessments with the assistance of the Department of Homeland Security. This collaboration provides useful feedback and information that is used to enhance Metropolitan's safety and security.

Metropolitan continues to participate on the Board of Directors for the California Utilities Emergency Association and is a founding member of CUEA, since the start of the organization in 1952. CUEA focuses on improving collaboration among member utilities and ensuring clear lines of communication between those agencies and California's Office of Emergency Services. CUEA brings together utilities throughout the state from the water, wastewater, electric, gas, petroleum pipeline and telecommunication industries.

Staff conducted several meetings with member agencies and other utilities to develop two large emergency exercises in fiscal year 2016/17. Both exercises concentrated on realistic emergency scenarios in the Southern California region. The first simulation focused on responding to credible terrorist threats with an emphasis on interagency coordination. Metropolitan and member agency staff, as well as representatives from local and state emergency management agencies, participated in an advanced tabletop exercise where participants discussed how they would jointly respond to terrorist acts at multiple locations.

The second exercise concentrated on assessing Metropolitan's emergency communication systems, including high-volume message testing of Metropolitan's new two-way radio system, and expanded use of an online emergency information sharing system. All Metropolitan emergency response command centers, and most member agencies, participated in this full-scale exercise. These communications systems allow key Metropolitan facilities and the member agencies to receive information through multiple communication platforms across the service area and share the information quickly during an emergency.

These exercises mark the fourth year of a five-year plan to invite all of Metropolitan's member agencies to collaborate and participate in at least one Metropolitan exercise.

# *Energy Management*

### ***Hydroelectric Power Recovery Plant Operations***

Metropolitan has 16 small-conduit hydroelectric power recovery plants that generated a total of 242 million kilowatt-hours for fiscal year 2016/17 (Table 4-9), and earned revenues of $15.2 million. This was about 105 million kilowatt-hours more generation and $7.7 million more revenue compared to FY 2015/16. The boost in energy production was the result of increased State Water Project resources that allowed the Greg Avenue, Sepulveda Canyon, and Etiwanda hydroelectric generators to come back on-line or significantly increase generation. Generation from all 16 power plants was sold under contractual agreements with Pacific Gas & Electric, Southern California Public Power Authority, Los Angeles Department of Water and Power, and two separate agreements with the Department of Water Resources. The overall contracted price for the energy from Metropolitan's 16 hydroelectric generators averaged approximately $63/megawatt-hour, which is comparable with the value of California certified renewable energy. Metropolitan and the SCPPA negotiated a pricing change in the agreement to sell energy from Metropolitan's Rio Hondo, Coyote Creek, Valley View, and Perris hydroelectric generators. The pricing change was in lieu of SCPPA's request for an early termination of the agreement in 2018 rather than the normal termination date of December 31, 2023, due to the contracted price being significantly higher than what was available

in the renewable energy marketplace. Both parties were provided the option of an early termination under the provisions of the agreement. Metropolitan and SCPPA agreed to modify the price rather than terminate the agreement, effective July 1, 2017 through the end of the contracted term with no further provision for an early termination.

### *Solar Power Energy Production*

Metropolitan has three solar photovoltaic energy facilities. The facility at the Skinner plant is rated at one megawatt, the Diamond Valley Lake Visitor Center facility is rated at 0.52 megawatts, and the newest facility, which came online at the end of June 2016 at the Weymouth plant, has a rating of three megawatts. During fiscal year 2016/17, the Skinner plant produced 2,198 megawatt-hours (MWh) of energy and the visitor center produced an estimated 650 MWh, all of which offsets retail energy purchases at the two locations from Southern California Edison.

### *Greenhouse Gases*

Power utilities that emit greenhouse gases from power plants or import energy into California that emitted greenhouse gases when the energy was produced, are obligated to surrender permits or allowances to the California Air Resources Board to cover the amount of gas emitted. In November 2016, Metropolitan submitted allowances to cover its obligation for energy imported into California to serve the CRA pumping load in calendar year 2015. This was the second year Metropolitan had to make such a submittal. The value of the allowances was approximately $210,000.

## TABLE 4-9
## HYDROELECTRIC POWER RECOVERY PLANTS[1]
## PRODUCTION FOR THE PAST TWO FISCAL YEARS

| Power Plant[2] | Nameplate Capacity (Megawatts) | 2016/17 Production (kWh) | 2015/16 Production (kWh) |
|---|---|---|---|
| Greg Ave. | 1 | 1,968,000 | 0 |
| Lake Mathews | 5 | 18,706,183 | 32,835,903 |
| Foothill Feeder | 9 | 42,852,309 | 4,618,409 |
| San Dimas | 10 | 64,728,518 | 14,470,905 |
| Yorba Linda | 5 | 8,289,209 | 2,308,480 |
| Sepulveda Canyon | 9 | 13,457,422 | 0 |
| Venice | 10 | 0 | 0 |
| Temescal | 3 | 8,582,271 | 18,427,367 |
| Corona | 3 | 11,809,510 | 19,103,374 |
| Perris | 8 | 19,322,860 | 712,036 |
| Rio Hondo | 2 | 1,735,277 | 170,378 |
| Coyote Creek | 3 | 3,649,966 | 6,651,452 |
| Red Mountain | 6 | 29,887,522 | 22,770,534 |
| Valley View | 4 | 5,844,349 | 12,456,991 |
| Etiwanda | 24 | 4,623,000 | 27,944 |
| Wadsworth (DVL) | 30 | 6,939,451 | 2,090,548 |
| **TOTAL[3]** | **131** | **242,395,847** | **136,644,321** |

[1] Annual power generation varies significantly, depending on: Member agency demands, mix of water sources (Colorado River Aqueduct vs. State Water Project), what shutdowns/outages are taking place and each generator's operational constraints.

[2] Power plants are listed in the order they became operational. Greg Avenue was first and Wadsworth last.

[3] Nameplate Capacity may be off due to rounding

### *Colorado River Aqueduct Power*

In FY 2016/17, Metropolitan pumped nearly 766,000 AF through the Colorado River Aqueduct, requiring about 1.5 billion kilowatt-hours of electricity. Energy costs for pumping Colorado River water are shown in Table 4-10. The current and historical energy resources used to meet CRA water delivery energy requirements are shown in Table 4-11 and Figures 4-11 and 4-12.

During FY 2016/17, the increase in SWP allocation meant less reliance on CRA water, which lowered the need for energy resources for CRA pumping operations. This was a big change from FY 2015/16, when the CRA pumping had operated at near capacity for most of the year. Metropolitan's FY 2016/17 net energy purchases declined significantly to 32 million kWh. This 657 million kWh decline reduced the purchased energy cost by $15.4 million as compared to FY 2015/16. Metropolitan also maximized the Benefit Energy available from Southern California Edison through the 1987 Service and Interchange Agreement to support CRA pumping.

Notes:

* Includes June 1987 data

[1] Energy provided by Southern California Edison (Edison) at no cost pursuant to 1987 Service and Interchange Agreement.

[2] Energy exchanged with Edison. Negative number indicates net energy banked with Edison.
Positive number indicates net energy received from Edison. These numbers represent what is in the Exchange Balance as of June 30.

[3] Energy Purchases/Sales. A negative number indicates net energy sold to others.

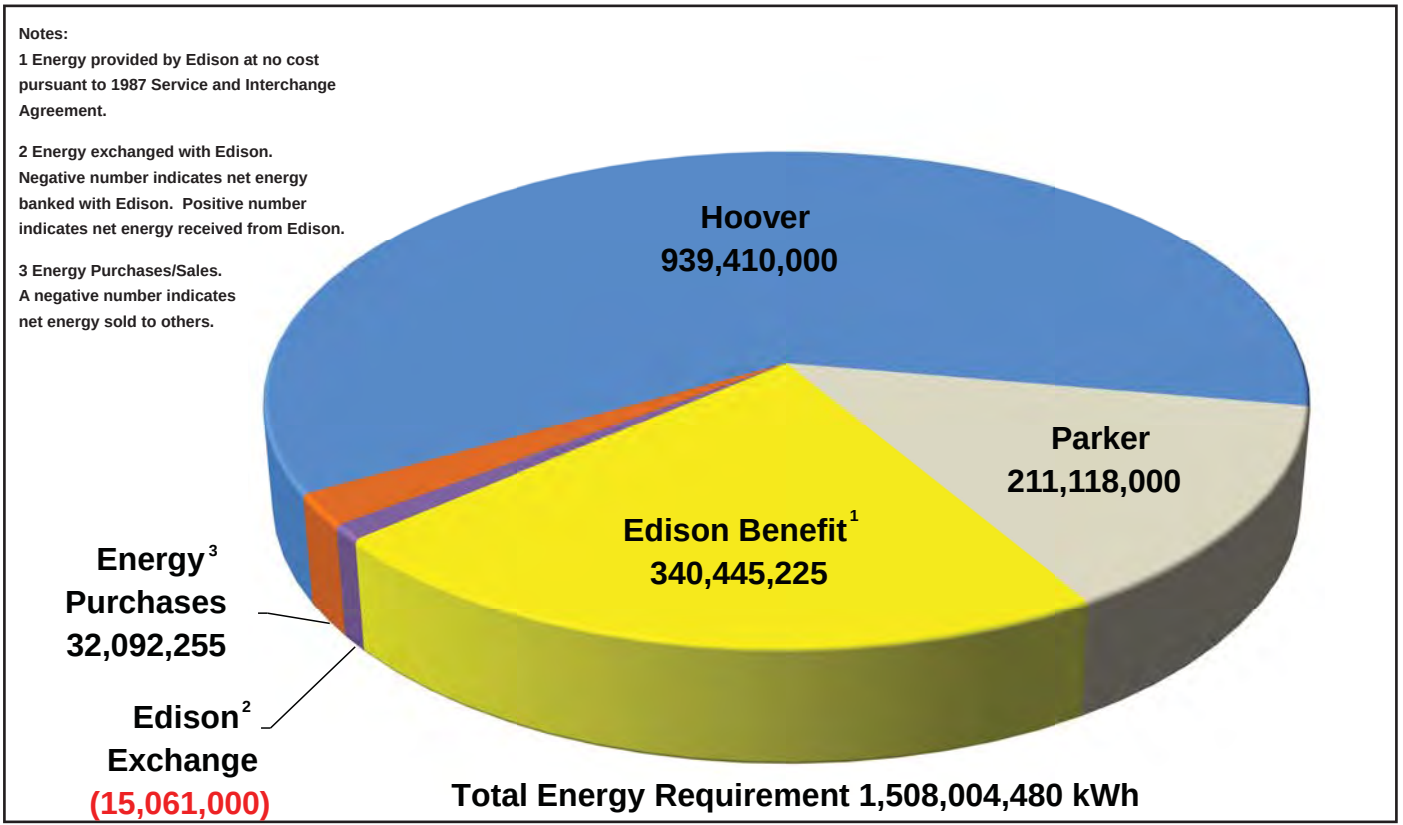

*Figure 4-11 Metropolitan's CRA Electric Energy Use (kWh) Fiscal Year 2016/2017*

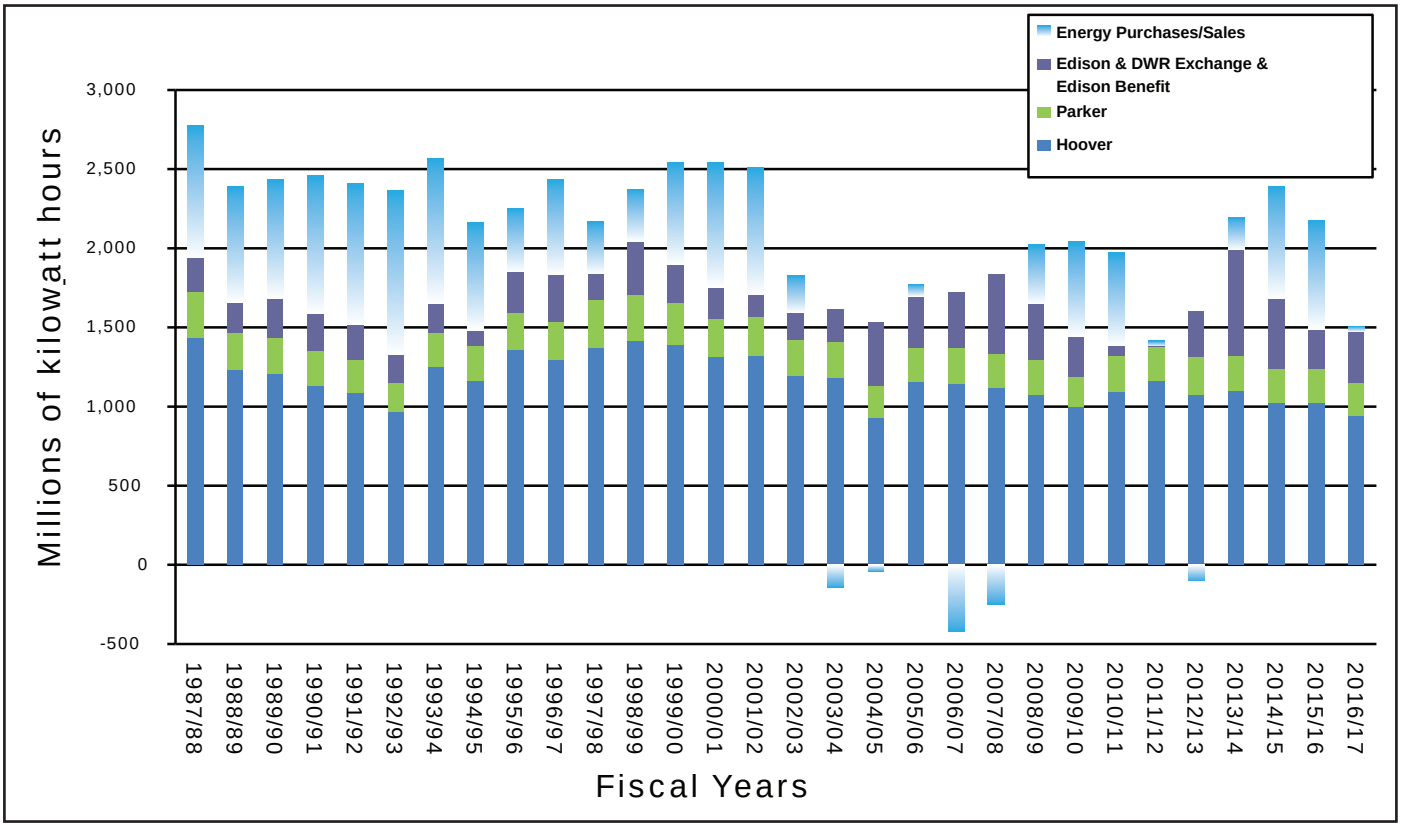

*Figure 4-12 CRA Energy Mix 1987 to 2017*

### *Power Transactions with Southern California Edison*

The Service and Interchange Agreement establishes the operating practices between Southern California Edison and Metropolitan in regards to the integrated electrical systems of the CRA and Edison. A key provision of the agreement is the ability of Metropolitan to engage in energy sales and purchases with Edison. During the first part of fiscal year 2016/17, from July 2016 to January 2017, Metropolitan purchased approximately 314 million kilowatt-hours of energy for CRA pumping from Edison for approximately $7.8 million. This was a savings of approximately $1.5 million over purchasing the energy from out-of-state sources. This value includes the savings from avoiding the acquisition of allowances to offset the greenhouse gases associated with energy imported into California. During the second part of FY 2016/17, when CRA pumping was significantly reduced due to the dramatic improvement in the availability of water from the SWP, Metropolitan sold approximately 282 million kilowatt-hours of excess energy to Edison for approximately $6.5 million. The result was a net purchase of 32 million kWh of energy at $1.25 million to support CRA operations.

### *Expiration and Replacement of Edison Agreement*

The Service and Interchange Agreement with Edison will terminate on September 30, 2017. Edison has stated that it is not interested in continuing to provide transmission-related services under a new agreement. In anticipation of the termination of the agreement, Metropolitan evaluated options for replacing the services previously provided by Edison with a series of new agreements that would provide the most cost-effective and operationally desirable outcome for Metropolitan.

Metropolitan has been in discussions with the Arizona Electric Power Cooperative, a non-profit, membership-based generation and transmission cooperative that can provide transmission services to Metropolitan. AEPCO's services would cost less than if Metropolitan provided the services itself. Negotiations with AEPCO are nearly complete with the goal of having agreements in place before the Edison agreement expires on September 30, 2017. AEPCO would provide services to Metropolitan under the terms of two agreements, both running from October 1, 2017 through December 31, 2035. One

agreement covers transmission system operation services that ensure Metropolitan's facilities comply with national electric reliability standards. Under the other agreement, AEPCO would schedule Metropolitan's energy resources from Hoover and Parker dams, and procure supplemental energy for CRA operations when the available energy from Hoover and Parker is insufficient.

In June 2017, the Metropolitan board authorized approval of an operating agreement with CAISO (California Independent System Operator). The operating agreement will govern the operation of Metropolitan's CRA power system within CAISO's balancing area and allow CAISO to accept Metropolitan's imports and exports of capacity, energy, and ancillary services.

The board also adopted a Resource Adequacy Resolution that will satisfy requirements for the CRA power system to provide sufficient resources to reliably meet its power needs.

Although Edison has indicated that it does not plan to extend the term of the Service and Interchange Agreement, it has requested retention of all the existing points of interconnection at four of Metropolitan's pumping plants and one switching station along the CRA transmission system. This will allow Edison to serve its remote desert retail loads and maintain interconnections with other entities. Interconnection agreements are being negotiated for the Camino Switching Station and the Gene, Iron Mountain, Eagle Mountain and Hinds pumping plants.

***Hoover Electric Service Contract***

The current Hoover Electric Service Contract will terminate on September 30, 2017. Metropolitan and the other Hoover power contractors have been negotiating for several years with the Western Area Power Administration and Bureau of Reclamation on successor contracts. These negotiations were successfully concluded in May 2016 and Metropolitan executed the contracts in March 2017 with an effective date of October 1, 2017. The new Energy Service Contract and Implementation Agreement will provide Metropolitan with 95 percent of its current share of the Hoover project, energy and capacity, for a period of 50 years (2017–2067). This will ensure a

continuing source of reliable and economic energy to power the CRA pumps for another 50 years.

***Mead Substation Interconnection Contract***

The original Mead Substation Interconnection Agreement commenced in 1968 and terminated on May 31, 2017. Metropolitan and the Western Area Power Administration have successfully negotiated the terms of a new 50-year Operation, Maintenance, and Replacement Agreement, which establishes points of ownership and interconnection rights for Metropolitan to continue its existing transmission interconnections to WAPA's Mead Substation. The new agreement will allow Metropolitan to maintain interconnections of its two transmission lines from Metropolitan's Camino Switching Station to the Mead Substation, and to continue to receive power from Hoover and other power resources to serve Metropolitan's CRA pumps. The agreement was executed in March 2017, with an effective date of June 1, 2017.

## *Safety and Regulatory Services*

Operational Safety and Regulatory Services staff continued to oversee compliance with environmental and safety regulations and procedures. Staff conducted numerous site inspections to proactively address environmental and safety issues. In addition, there were 82 routine regulatory inspections in the areas of air quality, wastewater, hazardous materials, hazardous waste, stormwater, underground and aboveground petroleum storage tanks, and safety. Staff coordinated and tracked all identified corrective actions.

***Regulatory***

Staff provided all required compliance reporting for air quality, wastewater, stormwater, underground storage tanks, and hazardous materials/hazardous waste. Staff negotiated with and secured dewatering permits from regulatory agencies in support of Metropolitan's shutdown projects. Staff also managed 395 air quality permits for portable and stationary equipment.

Staff prepared and submitted more than 92 wastewater, storm water and air quality reports, plans, and permits to comply with regulatory requirements. Staff continued to update and implement 20 plans for oil spill prevention control and countermeasures to comply with regulations for aboveground fuel tanks. Staff submitted nearly 38 annual disclosures and business plans dealing with hazardous materials for required Metropolitan sites.

Despite its public health benefit, cost-effectiveness and superior disinfection properties, chlorine is a highly regulated chemical. Staff took the lead in several important regulatory compliance-related activities involving Metropolitan's chlorine systems, including two very successful regulatory inspections and revalidations for the chlorine systems at two treatment plants. In addition, comprehensive internal audits were conducted at all six chlorine facilities. Regulatory authorities found that Metropolitan was 100 percent compliant with the federal Risk Management Program and California Accidental Release Program regulations. The regulators praised the treatment plants' operations, appearance, housekeeping, and high degree of compliance.

***Health & Safety***

Staff provided safety coverage during the FY 2016/17 shutdown season to successfully minimize accidents and injuries. This included safe work practices and ventilation monitoring for all underground operations.

Staff proactively addressed safety performance through site inspections, safety toolbox talks, safety committee communications, and revision of safety procedures. Staff prepared a book of general and specialized Safety Talks for managers to use when conducting weekly safety toolbox meetings. These meetings heighten safety awareness by discussing project plans and reviewing job hazard assessment and requirements. Table 4-12 shows the injuries, illnesses and incidents that required time off from work during FY 2016/17 for each Metropolitan facility. The Occupational Health and Safety Administration defines Total Incident Rate (also known as injury/illness rate), as the number of recordable incidents in a year per 100 employees. Overall, Metropolitan's Total Incident Rate is below the average federal Total Incident Rate for water utilities. A recordable incident is

generally defined as a new work-related injury or illness that results in death, lost time from work, work restriction, or medical treatment beyond first aid.

Staff investigated each incident and worked with managers to implement proactive measures to protect employees. In addition, staff provided training courses to ensure employee safety and compliance with regulations. Course curriculum was updated in accordance with regulatory changes and was provided through a combination of classroom and online eLearning opportunities. Approximately 660 classes covering more than 90 individual topics were presented. Online courses continued to provide flexibility for diverse work schedules and accounted for over one-third of training provided.

### *Apprenticeship Program Training*

The Apprenticeship Program trains industrial mechanics and electricians to ensure skilled trade persons are available to repair and maintain Metropolitan's water treatment and conveyance and distribution system. The state Department of Apprenticeship Standards continues to recognize Metropolitan's curriculum as meeting the breadth and level commensurate with journey-level mechanical and electrical trades.

Metropolitan's Apprenticeship Program has several classes in progress to train electricians and mechanics to the journey level. Over a four-year period, apprentices attend over 700 hours of classroom instruction, must pass more than 90 tests, and complete over 7,200 hours of on-the-job training. To date, the Apprenticeship Program has supplied Metropolitan with a total of 91 journey and electrical craft persons which comprises over 40 percent of the current apprenticeable trades workforce. A recruitment to establish a new two-year hiring eligibility list was conducted in FY 2016/17.

**TABLE 4-12**
**ACCIDENT INCIDENTS**
Fiscal Year 2016/17

| Location | Total* Incident Rate | DART** Incident Rate |
|---|---|---|
| Diemer | 12.3 | 3.1 |
| Diamond Valley Lake | 14.3 | 5.7 |
| Eagle Mountain | 40.7 | 20.3 |
| Eagle Rock | 5.9 | 5.9 |

CHAPTER 5

# Engineering Services

The Engineering Services Group is a full-service engineering organization that provides technical resources and delivers projects so that Metropolitan can treat and distribute water reliably to its member agencies. Engineering Services provides a wide range of technical services with a focus on cost-effectiveness and customer service. Its key functions include program management, engineering design, construction management, facility planning, geodetics and field survey, dam surveillance and corrosion engineering. In addition to performing its core operation and maintenance activities, Engineering Services provides oversight of Metropolitan's Capital Investment Plan, which represents MWD's commitment to construct and rehabilitate facilities that enable long-term, reliable water deliveries.

## *Capital Investment Plan*

Each year, Engineering Services manages and executes capital projects that range in cost from less than $100,000 to more than $100 million. Projects within Metropolitan's CIP are prioritized and scheduled to reflect the strategic goals of providing a reliable supply of high-quality water at the lowest cost possible. The CIP is comprised of 12 major capital programs based on project type, business driver, and location.

During fiscal year 2016/17, expenditures totaled approximately $372 million for all capital programs. This amount includes $174.3 million for the Delta Islands purchase. All other capital expenditures for the fiscal year are depicted in Figure 5-1, while Figure 5-2 shows long-term expenditures for each capital program. During the year, 17 construction contracts were completed with a total value of $222 million, while 23 construction contracts (as shown in

Table 5-2) and seven procurement contracts remained underway with a total value of approximately $174 million.

For a detailed list of projects that completed construction during the year or were under construction or design, see Tables 5-1 through 5-3.

Below are highlights of Engineering Services' major activities for each capital program during FY 2016/17.

***Water Quality/Oxidation Retrofit Program***

Metropolitan initiated the Oxidation Retrofit Program in 1990 to enable ozone to serve as primary disinfectant, reduce the level of disinfection byproducts, and improve the water quality at Metropolitan's five treatment plants. Construction of the main ozonation facilities at the F. E. Weymouth Water Treatment Plant was completed in FY 2016/17. Start-up of the Weymouth system, which represents the final step for the Oxidation Retrofit Program, will be completed within the first half of FY 2017/18. Ozone has been employed as the primary disinfectant at the Joseph Jensen, Henry J. Mills, Robert A. Skinner and Robert B. Diemer water treatment plants for several years.

***Treatment Plant Reliability Program***

Projects under this program maintain reliability and improve the operating efficiency of Metropolitan's water treatment plants. Specific accomplishments included: completion of electrical upgrades at the Diemer plant; completion of upgrades to replace deteriorated filter valves at the Jensen plant; completion of industrial wastewater handling improvements at the Mills plant; continued seismic upgrades to the Administration Building at the Diemer plant; and continued filter and basin structural and equipment upgrades at the Weymouth and Diemer plants.

***Distribution System Reliability Program***

Projects within this program maintain delivery reliability to Metropolitan's member agencies. Specific accomplishments included: completion of the second stage of lining repairs on the Etiwanda Pipeline; completion of a pilot construction project to replace the deteriorated lining on the Orange County Feeder; completion of the

installation of cathodic protection along the Allen-McColloch Pipeline; and continued construction to rehabilitate Palos Verdes Reservoir.

***Colorado River Aqueduct Reliability Program***

Projects within this program maintain the reliability of the Colorado River Aqueduct. Specific accomplishments included: initiating repairs to the delivery line expansion joints at all five CRA pumping plants; initiating construction of erosion protection for the Whitewater Siphons; continued construction to replace the original sand trap equipment at the Iron Mountain, Eagle Mountain and Hinds pumping plants; and continued seismic upgrades to the 6.9 kV switch houses at each CRA pumping plant.

***PCCP Reliability Program***

This long-term, comprehensive program will rehabilitate 100 miles of Metropolitan's 163 miles of prestressed concrete cylinder pipe. Through FY 2016/17, four miles of PCCP have been rehabilitated, leaving 96 miles that remain to be lined or replaced. Specific accomplishments included: completion of electromagnetic inspections along portions of the Rialto Pipeline, Second Lower Feeder, Sepulveda Feeder, Calabasas Feeder and West Valley Feeder No. 2; completion of urgent repairs on the Sepulveda Feeder; board certification of the programmatic Environmental Impact Report for five priority PCCP feeders; and completion of design of the program's initial construction contract to line Reach 1 of the Second Lower Feeder.

***Right of Way and Infrastructure Protection Program***

This comprehensive program protects access rights, minimizes erosion, and secures programmatic environmental permits along all of Metropolitan's feeders throughout the distribution system. This effort will enable rehabilitation work and operational activities to proceed with a minimum of delays over a 10- to 15-year period, and will provide relief from escalating permitting costs. During the year, staff continued to execute the initial phase of the program, including design of improvements, preparation of programmatic environmental impact reports, and identification and resolution of right-of-way issues throughout the distribution system.

***System Flexibility/Supply Reliability Program***

In response to the recent drought and resulting low allocation of State Water Project supplies to Metropolitan, staff continues to execute projects to expand the reach of CRA water throughout Metropolitan's distribution system. During FY 2016/17, staff substantially completed the design to rehabilitate the Greg Avenue Pump Station, which will provide a long-term, reliable backup supply to the Jensen service area.

***System Reliability Program***

Projects within this program will improve or modify facilities located throughout Metropolitan's service area in order to utilize new processes and/or technologies, and improve facility and overall reliability. Specific accomplishments included: completion of preliminary design of building improvements at the Headquarters Building in Los Angeles; and initiation of full-scale upgrades to the control and electrical protection systems for the pump/turbine units at Wadsworth Pumping Plant.

***Regulatory Compliance Program***

This program provides for prudent use and management of Metropolitan's assets in compliance with regulations and codes other than water quality. FY 2016/17 marked the completion of construction upgrades to Metropolitan's Chemical Unloading Facility. This project represents the final stage of a long-term effort to upgrade containment facilities to enhance safety and security.

***Cost Efficiency and Productivity Program***

This program provides economic savings through enhanced business and operating processes, and through reduced energy costs. Construction of a 1-megawatt solar generating facility at the Jensen plant is underway and is expected to be completed in the first half of FY 2017/18. This project will provide a long-term hedge against utility power cost increases at the plant.

***Minor Capital Projects Program***

This program executes refurbishments, replacements, or upgrades at Metropolitan facilities that cost less than $250,000. During FY 2016/17, 24 projects were authorized under this program.

***Potential Regional Recycled Water Program***

This program involves the design and construction of an Advanced Water Treatment Demonstration Plant, which represents the initial step to develop a potential regional recycled water system. The system would purify wastewater for recharge of groundwater basins throughout Southern California. During FY 2016/17, design of the 500,000 gallon-per-day demonstration plant was completed. This work is being undertaken in collaboration with the Sanitation Districts of Los Angeles County.

| | | | Jensen Filter Backwash Biological Control System | June 2018 |
| | | | Jensen Fluoride Tank Replacement | November 2018 |
| **Water Quality/Oxidation Retrofit Program** | | | | |
| 15472 | Enhanced Bromate Control | $13,300,000 | Mills Enhanced Bromate Control | June 2019 |

Following are highlights of Engineering Services' operation and maintenance activities during fiscal year 2016/17:

## *California WaterFix*

Engineering Services provided direct support for the California WaterFix in collaboration with Metropolitan's Bay-Delta Initiatives office. Key activities during the fiscal year included: appearing before the State Water Resources Control Board to deliver testimony related to the California WaterFix program's Change of Point of Diversion hearings; continued participation in the Design and Construction Enterprise to provide program management leadership, including preparation of potential program budgets and schedules, while also conducting studies for the Department of Water Resources to answer questions related to comments on the program's Final Environmental Impact Report/Statement. Staff also met with state and federal resource agencies on the Biological Assessment and Final Biological Opinions as they relate to eventual design and construction of the program facilities, and met with stakeholders on the design and construction aspects of the program.

## *Infrastructure Protection*

Engineering Services regularly monitors critical facilities including dams, reservoirs, pipelines and chemical tanks to assess their condition and identify needed repairs to maintain reliable operation. Staff also reviews third-party requests for crossings or use of Metropolitan's right of way. Key activities during the fiscal year included: external corrosion monitoring of the 450 miles of electrically continuous pipelines within the distribution system; monitoring of over 100 miles of pipelines for corrosion by stray current interference; and maintaining cathodic protection systems throughout the distribution system.

## *Dam Safety*

Engineering Services regularly performs inspection of Metropolitan's dams and conducts deformation monitoring to ensure public safety and avoid unplanned outages. Key activities during the fiscal year included: maintained a continuous safety/surveillance program for all 23 dams permitted by the California Division of Safety of Dams; performed detailed field inspections of all dams, and submitted surveillance reports to DSOD; continued preparation of Emergency Action Plans, in anticipation of new legislation that will require specific features to be included in those plans; completed updating inundation maps for seven dams, and initiated updates for 16 other dams.

## *Seismic Resilience*

Engineering Services has developed a proactive seismic resilience strategy with the goal of ensuring that Metropolitan continues water deliveries after a major seismic event. This approach involves regularly assessing the structural capacity of specific facilities and upgrading them as needed; evaluating the vulnerability of the system as a whole and increasing operational flexibility when needed; and improving the seismic resilience of the distribution system over time by incorporating new, seismic-resilient components, such as flexible pipe joints, where effective and economical. Metropolitan also collaborated with the Los Angeles Department of Water and Power and the California Department of Water Resources to create a task force that addresses the unique vulnerabilities of the major imported water aqueducts crossing the San Andreas Fault, in order to improve the overall seismic resilience of imported water supplies to Southern California.

## *Cooperative Education Program*

Engineering Services continued to offer summer and year-round student intern positions for the 15th consecutive year. This program is designed to provide engineering students with an opportunity to augment their studies with practical work experience in the water industry. Seventeen students participated during FY 2016/17.

## *Technical Leadership*

Engineering Services' staff continued participating in technical and professional organizations, including the publication of three technical papers and presentations at nine conferences. Staff continued active participation on committees of professional organizations including the American Water Works Association, American Society of Civil Engineers, American Public Works Association, American Concrete Institute, Greenbook Committee of Public Works Standards, Inc., International Society of Automation, Society for Mining, Metallurgy and Exploration, and Society of American Value Engineers.

*Metropolitan acquired more than 20,000 acres in the Bay-Delta.*

CHAPTER 6

# Legal

The Legal Department represents Metropolitan, its directors, officers and, on occasion, employees in litigation and administrative proceedings; renders legal advice; prepares or reviews contracts; and monitors litigation, administrative proceedings, and state and federal legislative and regulatory proposals that could affect Metropolitan.

## *Major Events*

***Bay-Delta***

*California WaterFix*

Metropolitan supported efforts by the state Department of Water Resources in proceedings before the SWRCB (State Water Resources Control Board) for additional points of diversion for the State Water Project as part of the California WaterFix. Metropolitan is participating as a party in the petition proceedings through the State Water Contractors.

*Delta Wetlands Land Acquisition and Litigation*

Legal Department attorneys assisted in negotiating and drafting the purchase and sale agreement for acquiring over 20,000 acres in the Sacramento-San Joaquin Delta. They also assisted in conducting pre-acquisition due diligence before escrow closed in July 2016.

Legal Department attorneys also have defended Metropolitan in four lawsuits over the purchase: three CEQA (California Environmental Quality Act) cases; and, one interference with contract case filed in three different courts. They successfully defeated requests for temporary restraining orders and a motion for preliminary injunction in the CEQA and interference with contract actions.

Metropolitan settled two of the CEQA cases on favorable terms. The remaining CEQA case is pending in San Joaquin County, where petitioners are preparing the record and have moved for permission to conduct discovery. In the interference with contract case, Metropolitan successfully moved to dismiss some claims in December 2016. In May 2017, the court tentatively granted MWD's motion to dismiss the remaining claims, with a final ruling expected in August.

***State Water Project***

*SWP Contract Extension*

Staff attorneys provided legal advice and support in connection with proposed amendments of Metropolitan's long-term SWP contract with DWR that would extend the duration of the contract and separately implement the California WaterFix and ancillary Delta projects.

*Diversions*

Working on behalf of Metropolitan and the State Water Contractors, Legal staff participated in SWRCB curtailment enforcement proceedings against Byron-Bethany Irrigation District and Westside Irrigation District and intervened along with SWC and other SWC member agencies in the subsequent cases in Contra Costa County Superior Court to protect Metropolitan interests in State Water Project stored water supplies. Staff participated in studies promoted by the Delta Watermaster to test water monitoring technology and studies to further scientific understanding of in-Delta water use. Legal staff also participated with General Manager staff in developing a Metropolitan study plan to investigate the water balance on Metropolitan's Delta islands properties.

***Colorado River***

*Additional Conservation Agreements*

Working with Reclamation, the Central Arizona Water Conservation District, Denver Water, the Southern Nevada Water Authority, the Upper Colorado River Commission, staff helped negotiate and draft 16 agreements with various water users throughout the Colorado River basin. These agreements implement a pilot program for the creation of Colorado River System water to maintain water levels in Lake Mead and prevent shortage through voluntary water conservation and reductions in use.

*Colorado River Drought Contingency Planning*

Staff attorneys participated in negotiations with other Colorado River water users in California and the seven Colorado River Basin States regarding drought contingency plans, including negotiation of projects to increase Lake Mead and Lake Powell reservoir levels.

***Legislation***

Legal staff reviews and provides advice on a broad range of proposed legislation that may affect Metropolitan. As one example, in-house counsel assisted in drafting legislation introduced as AB 2488, to authorize the California Department of Fish and Wildlife to issue a permit to Metropolitan for incidental take of unarmored threespine stickleback, a fully protected fish species that may be impacted by Metropolitan operations and maintenance activities. AB 2488 was enacted in September 2016 and became effective January 1, 2017.

*Drought Legislation*

Metropolitan attorneys provided legal analyses of draft language for state and federal drought relief actions, including proposed federal drought relief legislation and state emergency drought regulations.

***Water Quality***

Legal staff monitored activities of Regional Water Quality Control Boards considering adoption of municipal stormwater discharge permits with potential impact on Metropolitan's operations. Attorneys provided legal advice to Water Quality staff in connection with an Emerging Constituents Task Force established by Santa Ana Regional Water Quality Control Board to study approaches for potential new regulation of trace chemicals in surface and groundwater supplies. The Legal Department assisted water quality staff in a stakeholder advisory process regarding the proposed remediation plan for chromium 6 groundwater contamination adjacent to the Colorado River at the Pacific Gas & Electric Topock compressor station site. Legal staff continued to monitor remediation of perchlorate and other contaminants at the Tronox site. Staff provided legal assistance to the Environmental Planning Team on analysis and comments on Army Corps of Engineers' Clean Water Act general permit and draft federal and state policies regulating wetlands and other waters subject to Clean Water Act jurisdiction.

Legal staff provided legal assistance regarding detections of quagga mussels in Colorado River and State Water Project supplies; developed quagga mussel control plans and other operational measures to address potential water supply impacts from invasive species, including potential impacts to groundwater recharge or replenishment.

***Finance***

In-house counsel, with special counsel, assisted in the closing of Metropolitan financial transactions totaling over $1.2 billion. As part of due diligence associated with debt issuance, legal staff researched methods of compliance with laws, regulations and executive orders relating to terrorism, trade embargoes or money laundering including executive orders on terrorist financing, the Patriot Act, and regulations administered by OFAC (the Office of Foreign Assets Control) of the U.S Department of Treasury. Legal developed and incorporated provisions into contracts for construction, procurement, and professional services, concerning prohibited relationships with sanctioned countries and persons. Legal staff also researched and recommended firms to assist with screening of Metropolitan's vendors against OFAC's list of Specially Designated Nationals and Blocked Persons List.

*San Diego County Water Authority v. Metropolitan et al.*

Legal staff represented Metropolitan in conjunction with outside counsel in litigation challenging the validity of Metropolitan's rates adopted in 2010, 2012, 2014, and 2016, and its charges adopted in 2016 and 2017. In the 2010 and 2012 cases, the San Diego County Water Authority alleged that Metropolitan's allocation of certain SWP costs and demand management program costs to transportation rates rather than supply rates is unlawful, and that Metropolitan's rates do not account for "dry year peaking." SDCWA also alleged breach of the Exchange Agreement entered into between Metropolitan and SDCWA as part of the QSA (Quantification Settlement Agreement) based on allegedly unlawful rates, miscalculation of member agencies' preferential rights to Metropolitan's water supplies, and that a Rate Structure Integrity clause used in certain contracts is unlawful.

The trial court ruled that 100 percent of the SWP and demand management costs in question could not be allocated to transportation rates and, based on that ruling, found that Metropolitan breached the price term in the Exchange Agreement. The court also ruled in SDCWA's favor

on the preferential rights claim. The court ruled in Metropolitan's favor on the "dry year peaking" and RSI clause claims. The court also limited SDCWA's attorneys' fee award to the amount Metropolitan asserted was proper. The judgments issued in the 2010 and 2012 cases were appealed by Metropolitan and nine member agencies supporting Metropolitan, and by SDCWA. The 2014 and 2016 cases have been stayed pending the outcome of the appeal, and the 2017 case is expected to be similarly stayed. In October 2016, the parties' appellate briefing concluded. Oral argument before the California Court of Appeal took place on May 10, 2017 and an appellate decision was issued on June 21, 2017.

The Court of Appeal ruled in Metropolitan's favor on the key issue of SWP costs. The court held that it is lawful for Metropolitan to recover its SWP transportation costs in the transportation rates charged under the Exchange Agreement with SDCWA and in its wheeling rate. The court held that the rates which include SWP costs—the System Access Rate and System Power Rate—comply with all asserted laws, including Proposition 26. The court further stated that the decision does not preclude inclusion of the Water Stewardship Rate (WSR), which recovers demand management costs, in the full-service rate. The court ruled that, based on the record, Metropolitan cannot include the WSR as a transportation cost in the agreement price or the wheeling rate. The court ruled that because the WSR was included in the agreement price, there was a breach. The court remanded the case to the trial court for a redetermination of damages in light of its WSR ruling. The appellate court held in SDCWA's favor on preferential rights, the RSI clause, prejudgment interest, and interpretation of the agreement's attorneys' fees clause. The court stated that on remand, the trial court is to review attorneys' fees to determine whether one party recovered greater relief than the other.

***Litigation***

*Copper Pitting Cases*

Metropolitan and other water agencies prevailed in a "legal issues trial" dealing with allegations that Metropolitan provided "aggressive and/or corrosive" water to its member agencies and the other defendant water agencies delivered "aggressive and/or corrosive" water to consumers which caused pinhole leaks in residential copper plumbing. The court ruled in the water agencies' favor on all key legal issues. Metropolitan was represented by in-house counsel. Some of the plaintiffs

appealed the trial court's decision. The appeal has been fully briefed, and the parties are waiting for the court to schedule oral argument.

*Construction Litigation – Shimmick Construction Company, Inc. et al. v. Metropolitan Water District*

Shimmick alleges it was damaged by Metropolitan's project changes, delays, disruption, and interference and that Metropolitan improperly withheld $2.5 million in liquidated damages from contract payments. The complaint seeks monetary and equitable relief in excess of $10 million, plus interest. Following unsuccessful settlement discussions, the parties have engaged in extensive discovery.

Metropolitan has produced roughly 100,300 documents and reviewed roughly 455,000 documents produced by Shimmick/Obayashi a joint venture. The trial in the case is scheduled for January 16, 2018. Metropolitan is represented by in-house counsel and special counsel.

***Real Estate Matters***

*Palo Verde Irrigation District Land Holdings*

Metropolitan attorneys assisted staff in negotiating renewals of two leases. Following the review of proposals submitted, Legal assisted staff in negotiating new agricultural leases, with provisions to reduce water use by 30 percent and to encourage innovative agricultural practices in the Palo Verde Valley.

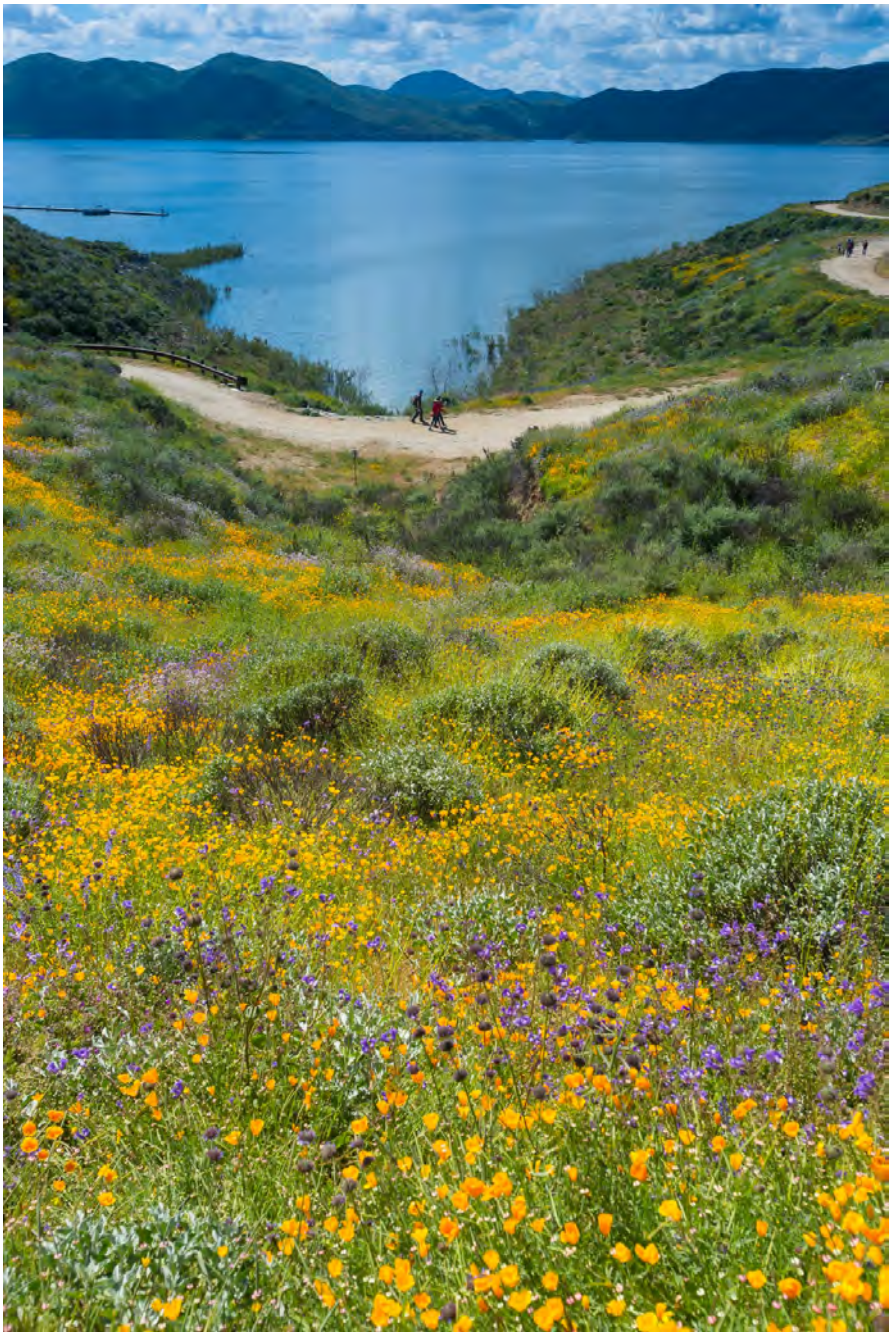
*In re Holy Hill Community Church (US Bankruptcy Court)*

Legal defended Metropolitan real property management interests put at issue in a legal battle between different factions of a bankrupt church. The settlement, approved in 2017, provides for a short term lease of up to five years to a developer entity for the use of the upper floors of the Metropolitan-owned parking structure, with an option to purchase the entire property for $10,000,000. In addition, Metropolitan receives certain protections against any environmental clean-up costs and the dismissal of all litigation involving Metropolitan in this matter.

*Pechanga Tribe Agreement*

Metropolitan staff continued to work with Eastern Municipal Water District and Rancho California Water District to finalize modification of Metropolitan's service area boundaries to provide water to portions of the Pechanga Tribal Reservation in Riverside County. Congress approved the settlement agreement in December 2016 which was a precursor to completion of the related water delivery agreements. Staff continues to work with the parties to complete and implement the agreements.

***Managing Energy Costs***



Metropolitan attorneys assisted staff in the negotiation and drafting of a new 50-year agreement with the Western Area Power Administration for Metropolitan's interconnection with WAPA at the Mead Substation. The use of WAPA's transmission facilities is necessary for Metropolitan to obtain its entitlement to energy and capacity from the Hoover Power Plant.

***Workforce Matters***

Following a jury verdict in Metropolitan's favor, which rejected a $7 million claim for damages based on allegations of religious discrimination and retaliation by a former employee terminated for misconduct, the trial judge on January 30, 2017, awarded Metropolitan $43,430 in costs against the plaintiff. This sum represents the expert fees incurred by Metropolitan after making a settlement offer pursuant to Code of Civil Procedure Section 998. Metropolitan was jointly represented by in-house and special counsel.

***Public Records Act Requests***

Legal staff coordinated Metropolitan's responses to over 165 requests under the Public Records Act, including review of all documents for responsiveness and privilege. Requests related to all areas of Metropolitan's business including bids, proposals, contracts and agreements, water quality data, water treatment, conservation-related rebates, data on uncashed checks, water supply, deliveries, sales and transfers, Metropolitan's land purchases and leases, staff compensation, benefits and expenses, history of Metropolitan's facilities, service area, easements and rights-of-way, and the proposed Bay Delta Conservation Plan/California WaterFix.

*A replenished Diamond Valley Lake improved Southern California water supplies and provided a colorful landscape for recreational activities.*

CHAPTER 7

# Finance

The Office of the Chief Financial Officer is responsible for providing innovative, proactive and strategic financial direction in support of the mission of Metropolitan's Board of Directors, management and employees; maintaining Metropolitan's strong financial position and high credit ratings; developing water rates and charges that are fair and equitable and generate sufficient revenues; assisting in the efficient management of Metropolitan's financial resources; and ensuring that adequate financial controls are in place to accurately record financial transactions, communicate financial results and protect Metropolitan assets.

## *Finance Department Overview*

The roles and responsibilities of the Office of the CFO include:

- Providing comprehensive financial analyses and development of the biennial revenue requirement, supporting cost-of-service studies, the recommended water rates and charges, and long-range financial forecasts.
- Developing a biennial budget that supports Metropolitan's mission and business planning and performance measurement programs.
- Maintaining Metropolitan's official accounting records, cash control and accounting services related to vendor, payroll, and other payments.
- Collecting, investing, safekeeping, and disbursing Metropolitan's funds.
- Maintaining effective financial controls to safeguard assets.

- Issuing debt to efficiently fund Metropolitan's Capital Investment Plan at the lowest possible cost.
- Continuing and improving relations with Metropolitan's bond investors, including investors supporting Metropolitan's diversified variable rate bond portfolio.
- Developing and maintaining accounting guidelines and policies for accurate and timely financial reporting and control.
- Accounting for all assets, liabilities, revenues and expenditures, and determining the availability of funds for investment.
- Providing timely financial reporting, preparing the annual tax levy and annexation fee calculations, and administering rates and charges.
- Managing Metropolitan's Business Continuity Program to ensure critical business processes can continue in the event of a disaster.
- Providing risk management to prevent, control, transfer, and minimize exposure to liability risk to protect Metropolitan's assets.

Details on the biennial budget, rates and charges, financial statements, financial policies, and financing documents can be found at the financial information webpage.

***FY 2016/17 Major Financial Activities and Accomplishments***

*Security Sales/Debt Administration*

Metropolitan maintained Standard & Poor's highest long-term water revenue bond rating of AAA, and the second highest credit rating for Moody's and Fitch of Aa1 and AA+ on its senior lien debt.

In August 2016 and September 2016 Metropolitan successfully repriced the 2009 Series A-2, the 2011 Series A-1 and A-3, SIFMA Index Notes, and the 2013 Series E Flexible Index Notes. The SIFMA notes were repriced at rates that ranged from the SIFMA index plus 12

to plus 16 basis points. SIFMA stands for Securities Industry and Financial Markets Association.

In September 2016, Metropolitan issued $103.6 million Special Variable Rate Water Revenue Refunding Bonds, 2016 Series A1 and A2 to refund a series of variable rate bonds and notes. The refunding is projected to provide approximately $3.1 million in total debt service savings.

In December 2016, Metropolitan issued $175 million Subordinate Water Revenue Bonds, 2016 Authorization Series A (Taxable), to reimburse the purchase of lands from Delta Wetlands Properties. These were the first series of bonds issued under Metropolitan's new Master Subordinate Resolution, adopted by the board in March 2016.

In March 2017, Metropolitan issued $80 million Water Revenue Bonds, 2017 Authorization Series A, to fund a portion of Metropolitan's capital expenditures.

In April 2017 Metropolitan issued $125 million Taxable Flexible Rate Refunding Note, Series A-1 and $125 million Index Notes (Taxable and Refunding), Subseries B-1, to refund notes issued in April 2016. The proceeds of the original note financings were used to replenish financial reserves, after set-aside funds were transferred to fund the Exchange Agreement Set-aside Fund related to the San Diego County Water Authority litigation.

In June 2017 Metropolitan issued $238 million Subordinate Water Revenue Refunding Bonds, 2017 Series A to refund several series of fixed and variable rate bonds and a State of California Revolving Fund loan. The refunding is projected to provide $21.8 million in debt service savings.

In June 2017 Metropolitan issued $12 million Tax Exempt Flexible Rate Revolving Notes, Series 2017 B-1 to partially refund a series of fixed rate bonds. The notes were anticipated to be refunded by bonds issued in July 2017.

*Treasury Operations*

- Successfully managed Short Term and Bond Reserve portfolios averaging $869.8 million, complying with the state Government Code and Metropolitan's Statement of Investment Policy.
- Earned total returns of 0.90, -1.91, and -0.13 percent respectively for the Core, Bond Reserve, and Long-Term portfolios.
- Monitored performance by the external managers of the $344.5 million long-term portfolio, to ensure compliance with Metropolitan's Statement of Investment Policy.
- Provided the necessary liquidity to fund approximately $1.9 billion in expenditures during fiscal year 2016/17.
- Managed debt service, which includes the calculation and coordination of approximately $333.7 million in debt service and swap payments.
- Managed net interest exposure within board-approved parameters.

*Accounting Operations*

- Provided accurate, timely and transparent financial reports to the board and member agencies.
- Recorded and reported Metropolitan's financial activities in a timely manner, ensuring sufficient financial controls to protect Metropolitan's assets.
- Completed the FY 2015/16 external audit with an unmodified (i.e. "clean") opinion.
- Achieved internal financial audit reviews with ratings of generally satisfactory or higher and no major findings.
- Maintained the 90-day past-due amounts on non-DWR accounts receivable to below $600,000.
- Continued the documentation and testing of internal controls over financial reporting, concluding that the controls were effective for the fiscal year ending June 30, 2016.

- Received the Award of Excellence from the Government Finance Officers Association for FY 2015/16 for financial reporting.

*Budget and Financial Planning*

- Implemented Metropolitan's biennial budget and water rates and charges for FY 2016/17.
- Prepared financial analyses to evaluate the financial impacts of the Regional Recycled Water Program.
- Coordinated a member agency workgroup and prepared analyses to support and implement a potential Treatment Fixed Charge and policy principles.
- Worked with the Legal Department to maintain Metropolitan's ad valorem property tax assessment at the FY 2014/15 rate to offset a portion of State Water Contract costs; prepared the analysis to support the updated annexation fee.
- Received the GFOA Distinguished Budget Presentation Award for the FY 2016/17 and 2017/18 biennial budget.

*Business Continuity*

- Enhanced the Business Continuity Management software (Fusion) to capture better information during the Business Impact Analysis and align with industry best practices; enhanced the business continuity plan template to be more comprehensive and produce an actionable and easy-to-follow outline of steps to be taken to resume critical operations.
- Created a SharePoint site to serve as a resource for the business continuity coordinators, providing a cloud-based secure environment to serve as a one-stop repository for training resources, collaboration, FAQ's, schedules for various business continuity activities and more.
- Conducted business continuity tabletop exercises for all plans to create awareness and set the foundation for plan updates in cooperation with leadership and other key personnel.

*Risk Management*

- Completed incident reports involving Metropolitan property damage, liability issues, workplace injuries, regulatory visits, criminal activity and spills; managed Metropolitan's self-insured liability and property claims program.

- Completed risk assessments of professional service agreements, purchase orders, construction contracts, entry permits, easements, special events and film permits within required timeframes.

- Collaborated with the Legal Department to accurately manage liability reserves, and also provided feedback into the claims settlement and litigation process with the Legal Department; renewed excess and specialty insurance coverages below anticipated premium costs and within budget.

# *Financial Information*

Metropolitan operates as a utility enterprise and maintains its accounting records in accordance with generally accepted accounting principles for proprietary funds as prescribed by the Governmental Accounting Standards Board. Metropolitan's financial reports can be found at the financial information webpage.

***Revenues***

Metropolitan's principal revenue source is water sales, which include all revenues received by Metropolitan from charges for the sale and availability of water, including Metropolitan's water rates, readiness-to-serve charge and capacity charge. Other sources of revenue include property taxes, investment income and power sales. Water rates and charges are established by the board of directors on a biennial basis and are not subject to regulation by the California Public Utilities Commission or any other governing body.

The rate structure implemented on January 1, 2003 unbundled Metropolitan's previous water rate into separate rates and charges (a power rate, a treatment surcharge, a system access rate, a water stewardship rate and a capacity charge) to provide transparency

regarding the cost of specific functions to member agencies. This rate structure also includes a two-tiered block pricing structure for water supply. Effective January 1, 2017, the full service Tier 1 rate (including all rate elements), which is based on recovering the cost of maintaining a reliable amount of supply, was $666 per acre-foot for untreated water. Likewise, the full service Tier 2 rate of $760 per acre-foot is set at Metropolitan's cost of purchasing water transfers north of the Delta and encourages member agencies to maintain existing local supplies and develop cost-effective local supply resources and conservation. A complete list of current water rates and charges is available in Table 7-1. Overall, Metropolitan increased rates and charges 4.0 percent effective January 1, 2017.

Metropolitan is empowered under the Metropolitan Water District Act to levy and collect taxes on all taxable property within its boundaries for the purpose of carrying on its operations and paying obligations. Property taxes are levied annually by the board to pay Metropolitan's general obligation bond debt service and part of its State Water Contract costs.

Metropolitan’s revenues in fiscal year 2016/17 totaled $1.484 billion. Sources of revenues include water sales, readiness-to-serve charges, capacity charges, power sales, property taxes, investment income and other income, such as rents. Total revenues were $27 million lower than the prior fiscal year, primarily due to lower water sales.

# TABLE 7-1
# WATER SALES RATE STRUCTURE-CURRENT

(Dollars per acre-foot-unless otherwise specified)

| | Calendar Year[1] | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2017 | 2016 | 2015 | 2014 | 2013 | 2012 | 2011 | 2010 | 2009 | 2008 |
| Tier 1 Supply Rate | $ 201 | $ 156 | $ 158 | $ 148 | $ 140 | $ 106 | $ 104 | $ 101 | $ 109 | $ 73 |

| Investment Income (loss) | 6 | 19 | (13) |
| Other | 7 | 10 | (3) |
| **Total** | **$ 1,484** | **$ 1,511** | $ (27) |

[1] Previously reported as part of water sales.

[2] Previously referred to as power recoveries or hydroelectric power sales.

### *Expenses*

Metropolitan continued its efforts to manage finances, control costs, enhance productivity, pay for conservation and local resource programs, and procure additional supplies during the fiscal year. Major components of Metropolitan operations and maintenance costs include labor, chemicals, utilities, outside services, materials and operating equipment. Table 7-3 lists expenses by function and the changes from the prior year, while Table 7-4 summarizes changes in net position (revenues and expenses).

Metropolitan is one of 29 contractors to the State Water Project. Under the contract, Metropolitan is obligated to pay the state Department of Water Resources its portion of the costs for construction of the system as well as the minimum operations, maintenance, power and replacement costs of the project regardless of the amount of water actually delivered. Variable power charges are based on actual deliveries of supplies from the State Water Project.

In addition, Metropolitan has an obligation to pay its share of the ongoing capital and remediation costs of certain off-aqueduct power facilities regardless of the amount of water delivered.

Metropolitan also buys power to pump Colorado River water into its service area. The power is secured by Metropolitan under federal energy contracts and from purchases of supplemental energy from a variety of sources as available. In addition, Metropolitan has entered into, and is negotiating, a number of agreements with entities along the Colorado River that have higher priority rights to water on the Colorado River. These agreements give Metropolitan firm rights to water that it otherwise would not have.

Construction requirements to rehabilitate and repair facilities, and provide enhanced water treatment capability are being funded by a combination of long-term debt as well as from operating revenues. General obligation bond debt service is funded from ad valorem property taxes. Tables 7-5 and 7-6 show assessed valuations and property tax rates for FY 2016/17 and the preceding nine years, while Table 7-7 shows property tax levies and collections. Revenue bond debt service is funded from water sales revenues. Table 7-8 is a 10-year summary of net operating income and revenue bond service coverage, while Table 7-9 is a listing of Metropolitan's 10 largest water customers.

Fiscal year expenses totaled $1.410 billion. Expenses include power and water costs, operations and maintenance costs, depreciation and amortization, and interest on debt obligations. Total expenses were $301 million less than the prior year, mainly due to $97 million in lower power and water costs, and $162 million less in operations and maintenance costs associated with funding conservation incentives.

**TABLE 7-3**
**EXPENSES**
(Dollars in Millions)

| | Year Ended June 30, | | |
|---|---|---|---|
| | **2017** | **2016** | **Change** |
| Power and Water Costs | $ 455 | $ 552 | $ (97) |
| Operations and Maintenance | 488 | 650 | (162) |
| Depreciation and Amortization | 302 | 377 | (75) |
| Bond Interest | 135 | 127 | 8 |
| Other | 30 | 5 | 25 |
| **Total** | **$ 1,410** | **$ 1,711** | **$ (301)** |

***Budget Process***

Metropolitan combines elements of program budgeting and performance reporting in its budget system. These elements provide for funding, analysis, review and control. The biennial budget for fiscal years 2016/17 and 2017/18 was presented to and discussed by the board during February and March 2016, and approved in April 2016.

The biennial budget process begins in July of odd-numbered years (e.g., July 2015 for the FY 2016/17 and FY 2017/18 biennial budget) when each group identifies major maintenance and capital projects. Project requests are submitted to Engineering Services beginning in July, giving staff adequate time to plan project design and construction schedules, and to allow Water System Operations to plan for system shutdowns. Each department and group prepares operating budgets from August to November. Each program is analyzed and reviewed as to resources required and the extent to which the program is consistent with the priorities and strategies of the General Manager's Business Plan. All recommended programs are then incorporated into the overall budget. The proposed biennial budget includes a 10-year forecast of revenues, expenditures, unrestricted reserve balances and projected rates and charges. These forecasts incorporate projected costs associated with the repair and replacement of existing infrastructure, and also the projected costs of a California WaterFix, to help member agencies and the general public understand long-term cost trends and potential future water rate impacts.

Budgetary control is maintained through monthly variance reports, which compare budget estimates with actual revenues and expenses for board and management information and form the basis for corrective actions. All major expense categories are controlled via the board-approved biennial budget and authorized appropriations. Since adopting a biennial budget, a mid-cycle update is provided to the Metropolitan Board of Directors at the midpoint of the two-year period.

***Treasury Operations and Cash Management***

Annually, Metropolitan's board approves the Statement of Investment Policy and delegates to the Treasurer the authority to invest Metropolitan funds.

Investments by the Treasurer are limited to those instruments specified in the board-approved Statement of Investment Policy, which sets out, in order of priority, three fundamental criteria to be followed: safety, liquidity and return.

Metropolitan is permitted by state law and board policy to invest in a variety of instruments including U.S. Treasury securities, federal agencies, repurchase agreements, negotiable certificates of deposit, bankers' acceptances, prime commercial paper, asset and mortgage-backed securities, and California local agency securities, including securities issued by Metropolitan. Investments can also be made in corporate notes, time deposits, investment contracts, shares of beneficial interest, and the Local Agency Investment Fund.

Treasury activities during the year included the management of the short-term and bond reserve portfolios and oversight of the firms managing the long-term investment portfolios. Metropolitan's total portfolio averaged approximately $1.2 billion during fiscal year 2016/17, with cash basis investment earnings of approximately $15.4 million. As of June 30, 2017, the market value of Metropolitan's investment portfolio was approximately $1.4 billion.

[1] Metropolitan implemented Governmental Accounting Standards Board (GASB) Statement No. 63, *Financial Reporting of Deferred Outflows of Resources, Deferred Inflows of Resources and Net Position*, in fiscal 2012. This pronouncement requires that the difference between assets and liabilities be reported as net position, therefore, net assets are now referred to as net position.

[2] Adjustment relates to Metropolitan's implementation of GASB Statement No. 68 (GASB 68), *Accounting and Financial Reporting for Pensions - an amendment of GASB Statement No. 27,* and GASB Statement No. 71. (GASB 71), *Pension Transition for Contributions Made Subsequent to the Measurement Date - an amendment of GASB Statement No. 68.* GASB 68 requires the reporting of net pension liability in the basic financial statements when an organization's pension liability exceeds the net position available for paying benefits while GASB 71 requires the recognition of beginning deferred outflow of resources for pension contributions made after the measurement date. Fiscal years 2008 through 2014 have not been adjusted.

[3] Adjustment relates to the adoption of GASB No. 65, *Items Previously Reported as Assets and Liabilities*. This pronouncement requires debt issuance costs (except prepaid insurance costs) to be recognized as expense in the period incurred. Fiscal years 2008 through 2010 have not been adjusted.

[4] Adjustment relates to implementation of GASB Statement No. 53, *Accounting and Financial Reporting for Derivative Instruments* . This pronouncement requires derivative instruments to be reported at their fair value on the statements of net position along with a related deferred outflow to be recorded for effective hedges.

[5] Off-Aqueduct Power Facilities.

*IT introduced the idea of supporting Metropolitan operations via unmanned aerial vehicles, such as the drone seen in this simulated montage.*

CHAPTER 8

# Information Technology-Administration

This fiscal year, the former Business Technology Group was reorganized into the Information Technology Group, with administrative services and annexation administration reporting directly to the Chief Administrative Officer, along with environmental planning, which was formerly part of Engineering Services.

## *Information Technology*

The IT Group delivers technology options, services and solutions for enterprise and business applications, mobile/wireless computing, control systems, telecommunications, network services and cyber/information security.

### *IT Strategic Plan Update*

Staff continued implementing initiatives outlined in the IT Strategic Plan optimizing water system operations, improving asset management, streamlining business operations and managing costs.

### *Highlights for Fiscal Year 2016/17*

- Completed the Emergency Response Two-Way Radio Project.
- Initiated deployment of a new phone system.
- Completed 95 percent of the design phase to replace and upgrade the control and electrical protection systems at the Wadsworth Pumping Plant.
- Completed a systemwide hydraulic model to assist with rehabilitation of the pre-stressed concrete cylinder pipe portions of the Second Lower Feeder.

- Obtained board authorization and appropriated $1.54 million to upgrade Metropolitan's cybersecurity capabilities.
- Introduced the use of unmanned aerial vehicles (drones) to support Metropolitan operations, such as the 2017 Solar Cup.
- Implemented Skype for Business for online meetings and conferences.
- Remediated business and security risks associated with 350 computers that were running on older, less-secure operating systems.
- Redesigned bewaterwise.com to be mobile-friendly.
- Implemented a project management enhancement program, which included an extensive training component.

## *Administrative Services*

The Administrative Services Section focuses on business process sustainability and achieving cost reductions and efficiencies. These include contracting services, warehousing, procurement of goods and nonprofessional services, inventory management, Rideshare Program and Spring Green Expo events.

### *Spring Green Expo*

Metropolitan hosted the 10th Annual Spring Green Expo and ECO Innovators Showcase college competition for staff, member agencies and the surrounding community. This year's event showcased over 30 sustainability concept projects designed by nearly 100 students, representing 15 Southern California universities and colleges in Riverside, San Bernardino, San Luis Obispo, San Diego, Orange and Los Angeles counties.

### *Highlights for Fiscal Year 2016/17*

- Enhanced the leave request electronic form, enabling approvals via mobile devices and expanding use of mobile technology to increase productivity.
- Initiated an information enterprise content management system, with information policies and procedures to be

developed in partnership with Information Technology and other Metropolitan business groups.

- Improved online access to warehouse inventory utilizing web-based shopping, with “MyWarehouse” providing an overview of available items throughout Metropolitan’s warehouses.

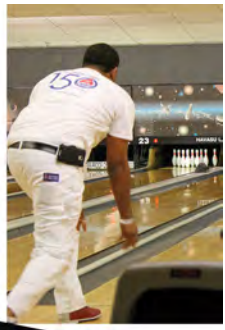
# *Annexations*

Metropolitan processes member agency requests involving annexation into its service area. One annexation totaling approximately 8.3 acres was completed this year, while four annexation requests are pending completion. One pending annexation has the potential to increase Metropolitan’s service area by approximately 460 acres.

# *Environmental Planning*

The Environmental Planning Section provides specialized services for Water System Operations, Water Resources Management, Engineering Services, Real Property, and External Affairs. These services include CEQA (California Environmental Quality Act) compliance, regulatory clearance, construction monitoring, environmental training, reserve management, sustainability planning, and environmental technical support to Metropolitan, members, and outside agencies.

***Highlights for Fiscal Year 2016/17***



- Completed CEQA documentation, including two Programmatic Environmental Impact Reports; prepared multiple addenda to previously-certified EIRs; and filed 45 Notices of Exemption.
- Provided planning support, CEQA and/or regulatory compliance for 143 engineering projects and 106 operations and maintenance projects.
- Provided CEQA clearance for 204 board letters.
- Reviewed and submitted comment letters on 236 external projects with the potential to impact Metropolitan facilities or water supply.

- Procured Clean Water Act, state and federal endangered species acts, and Fish and Game Code permits for two capital and five O&M projects.
- Obtained emergency permits to repair roads damaged by heavy winter rains.
- Participated in 30 legislative actions impacting Metropolitan's interests in environmental regulatory proposals on climate change, endangered species, wetlands, and CEQA.
- Advocated and provided technical expertise on a legislative solution that allows the issuance of a permit to handle and rescue the endangered unarmored threespine stickleback during shutdown, inspection, and maintenance of the Foothill Feeder, culminating in the successful passage of Assembly Bill 2488.
- Participated in print and radio interviews, and collaborated with External Affairs on the award-winning brochure "Leaders in Environmental Stewardship."

*During 2016/17, a blue grosbeak made a rare visit to DVL East Recreation Basin (top) while endangered bighorn sheep were spotted at Hinds Pumping Plant.*

# Employee Appreciation 2016

*Employee Appreciation events were held throughout Metropolitan during fiscal year 2016/17.*

CHAPTER 9

# Human Resources

The Human Resources Group maintained its focus on effective people management, while building strong partnerships with management on selecting, engaging, motivating, developing and valuing staff accomplishments. Employee development, a strategic priority of the General Manager, focused on preparing the workforce to meet current and future business needs. Work continued on updating HR systems, policies and processes to meet changing compliance requirements, and to further improve the delivery of Human Resources services.

## *Major Activities and Accomplishments*

HR continued to emphasize the importance of effective leadership in engaging and motivating the workforce, complying with laws and regulations and consistently delivering cost-effective HR services. It expanded recruitment outreach to fill job openings with diverse and capable talent, and increased talent development opportunities throughout the organization. HR met monthly with group managers to identify areas of needed support, and worked closely with management on the effective deployment of initiatives and early resolution of issues.

The General Manager launched an annual Employee Appreciation Day event during fall 2016. These events were designed and organized by employee committees at each of Metropolitan's facilities, supported by HR. The events successfully recognized the contributions of employees and their commitment to Metropolitan, and provided an opportunity for employees to interact with each other and have fun.

***Strategic Priority: Employee Development***

HR implemented several initiatives to support the General Manager's strategic priority of Employee Development and ensure that Metropolitan is prepared for continuing retirements, which this year reached a record total of 108.

HR staff provided the board and management with workforce analytics to facilitate planning for pending workforce retirements and expanded diversity outreach efforts. This year, minority representation in the workforce grew to 51 percent. Staff also participated in regional workforce development committees and met with universities and colleges to help align the educational curriculum with Metropolitan business needs.

All groups are addressing the loss of talent – primarily due to retirements. HR staff continued efforts with management to ensure talent is available to fill critical positions. HR expanded internal staff development and training opportunities and worked with local management to identify and assess skill gaps, and facilitated various leadership and management development workshops and succession planning. Staff also supported internship and mentoring programs, and expanded use of job rotations and cross-functional training opportunities throughout Metropolitan.

***Organizational Development and Training***

Management development programs were expanded to address the needs of different levels of management. For employees aspiring to become managers, Management Academies have been established to introduce them to managerial roles and responsibilities. Metropolitan Management University, a new six-day management development program, is mandatory for all new managers and strongly encouraged for existing managers. Instruction is provided by staff, in-house experts and expert consultants on effectively leading, engaging and motivating employees. To date, 60 percent of team managers have completed MMU, while 15 unit managers have completed a more advanced version of the program.

Staff also facilitated various initiatives at the group level, such as the Water Resource Management Group's leadership workshops; the Engineering Group's Career Launch; the Water System Operations Group's Development Camp for its Chemistry Unit; and a Leading Technical People program for managers in various groups.

Training curriculum focused on subjects such as: improved teamwork and collaboration, communication and business writing, effective performance conversations, conflict resolution, project management, problem-solving, plus basic and advanced Microsoft Office skills. Staff expanded online and mobile learning offerings to provide all employees and managers 24/7 access to videos, readings and courses on topics

relevant to their work or career needs. Staff hosted a post-probation, "Day 2" orientation focused on early-career financial planning for 60 new employees.

Staff facilitated group leadership forums and management workshops, and supported team-building, conflict resolution, organizational planning, and mentoring for new associate engineers in Engineering Services.

Eighty-four percent of managers completed mandatory drug and alcohol reasonable-suspicion training, 93 percent of Metropolitan's non-management employees completed drug and alcohol awareness training and 93 percent of employees completed personal security awareness training.

Metropolitan's tuition reimbursement program had 116 participants and staff established partnering agreements with eight local universities to provide tuition discounts, grants and other additional educational benefits for employees. Staff also supported on-site certificate programs such as Water Leadership and Management by partnering with the California State University campuses at Los Angeles and San Luis Obispo, and the Augmented Leader programs from Rady School of Management at the University of California, San Diego.

Sixty managers attended in-depth workshops by leading management experts through the Institute of Management Studies which provided access to state-of-the-art management approaches. Internally, HR provided more than 240 managers opportunities to attend presentations on management topics including leadership development, persuasive communication, executive decision-making, business-case writing, collaborative management, and overseeing technical staff. HR also arranged for workshops on legal aspects of managing people and performance and partnered with the Ethics Office to provide ethics training to the Board of Directors. Eight external coaches provided internal coaching and consultations for managers on issues ranging from transition management and personal development to succession planning.

***Performance Management***

The MyPerformance Evaluation process completed its sixth year of providing a year-round performance planning process that sets clear expectations for work products, goals and performance factors for both employees and managers. It is aligned with Metropolitan business

planning cycles and fosters continuing performance conversations and progress checks throughout the year.

HR also facilitated the Department Head Performance Evaluations of executive staff who report directly to the board. In July 2016, 83 percent of the board participated by providing direct feedback about strategic and operational leadership, board relationships and business results during the previous fiscal year. The Home Committees for each department head conducted progress checks on follow-up actions.

***Recruitment and Classification/Compensation***

More than 24,000 people submitted resumes for job openings during fiscal 2016/2017 and 194 regular and part-time positions were filled – almost three times the number filled in the previous year. HR processed 850 applicants and placed 34 new Pre-Apprentices into Metropolitan's Apprenticeship Program, while supporting student intern recruiting for the Real Property, Business Technology, and Water Resource Management and Water System Operations groups. Equal Employment Opportunity staff participated in several job fairs and outreach efforts to promote the hiring of military veterans and individuals with disabilities.

Staff continued to optimize technologies such as Skype for remote interviews, and eSkill online pre-employment skills-testing for some entry-level positions. Staff completed contracting for a new automated recruitment tracking system providing for improved communication and coordination between job candidates and hiring managers. At the start of each recruitment, HR held strategic partnership meetings with hiring managers to speed the recruitment of each position.

Classification staff validated the merits of more than 100 job promotional requests to ensure the proper classification of employees. Staff reviewed, modified, or created job descriptions, as needed, keeping them current with business needs. HR also completed a market salary survey on department heads and other positions based on various salary surveys.

*Benefits*

Staff updated PeopleSoft to maintain compliance of benefits programs and coordinated with Metropolitan's deferred compensation third-party record-keeper, TIAA Financial Services. To assess participant satisfaction with the services provided by TIAA 401(k) / 457(b) support, focus groups

and a satisfaction feedback survey was sent to all 2,700 employee and retiree plan active participants, with 43 percent submitting their feedback. Staff worked with TIAA to enhance the Self-Directed Brokerage platform and TIAA website user-friendliness and key features.

Benefits staff conducted open enrollment for all employees and met in one-on-one sessions with 685 employees. Staff sent benefits confirmation letters and provided data to CalPERS for an audit of member earnings and enrollments. A Patient Care Advocacy program assisted employees with medical referrals, pre-authorizations and claim issues. Benefits also sent every employee a 2016 Total Compensation Statement to convey the value of benefits and salary provided by Metropolitan. Staff partnered with in-house technical staff to provide 2016 IRS-mandated 1095-C forms to all employees and complete the new 1094-C employer report, both in connection with the Affordable Care Act.

To meet fiduciary responsibilities, Benefits hosted instructor-led workshops and webcasts available to all employees on financial planning, budgeting, the new fund lineup, investment basics, pre-retirement and retirement issues at various Metropolitan locations. More than 350 employees participated in these workshops to help participants with their financial planning and transition into retirement or to simply seek more value from the benefits that Metropolitan provides. In addition, a new class, "Your Survivor Benefits and Beneficiary Designation" was launched at the Gene desert facility to address issues for which surviving family members may need to plan ahead.

Staff coordinated with Payroll and Information Technology to respond and close a CalPERS Audit. Two semi-annual Service Awards Program luncheons with executive management and board members recognized more than 123 employees with 20 to 35 years of service.

A new Wellness program has been developed, with implementation set to begin in 2018.

***Employee Relations/Equal Employment Opportunity Program***

The Employee Relations Section successfully negotiated two five-year memoranda of understanding with the Management and Professional Employees Association and the Association of Confidential Employees. Negotiations continued on a successor MOU with the remaining two bargaining units. Staff responded to all grievances within the prescribed timeframes and worked collaboratively with the bargaining units,

whenever possible, to resolve grievances. Staff was also involved in a number of single-item negotiations, primarily over new or revised job descriptions. The Employee Relations Section also continued to partner with Legal on unfair labor practice charges, hearing officer appeals and employment litigation.

Equal Employment Opportunity staff conducted 10 investigations and 21 informal investigations of unlawful discrimination allegations within the timeframes prescribed by Metropolitan procedures. EEO Investigations staff also worked successfully with outside agencies, such as the State Department of Fair Employment and Housing, to resolve complaints filed against Metropolitan with those offices.

Human Resources staff worked with Water System Operations and the four bargaining units in the Desert Housing Workgroup to improve living conditions and bolster recruitment and retention at select desert facilities.

Metropolitan's Affirmative Action program for protected veterans and individuals with disabilities was updated along with the Nondiscrimination Program for women and minorities. Staff also conducted a workforce self-identification survey on the revised race/ethnicity categories to comply with reporting requirements. Staff partnered with internal volunteer-led employee resource groups to plan expanded outreach opportunities.

Outreach and inclusion efforts included the launching of a new employee resource group, Women at Metropolitan, and continued partnership with Women in Non Traditional Roles, Inc. to provide opportunities for women in the skilled trades. New outreach partnerships and events included a successful veterans job fair at Union Station Headquarters, where Metropolitan also participated in a Veterans Breakfast and Apprenticeship event. Discussions with management groups addressed their responsibilities to provide reasonable accommodations for disabilities.

Staff presented semi-annual reports on EEO and Affirmative Action to the Organization, Personnel and Technology Committee, including an assessment of organizational diversity. A 98 percent completion rate was achieved on mandatory EEO workforce training.

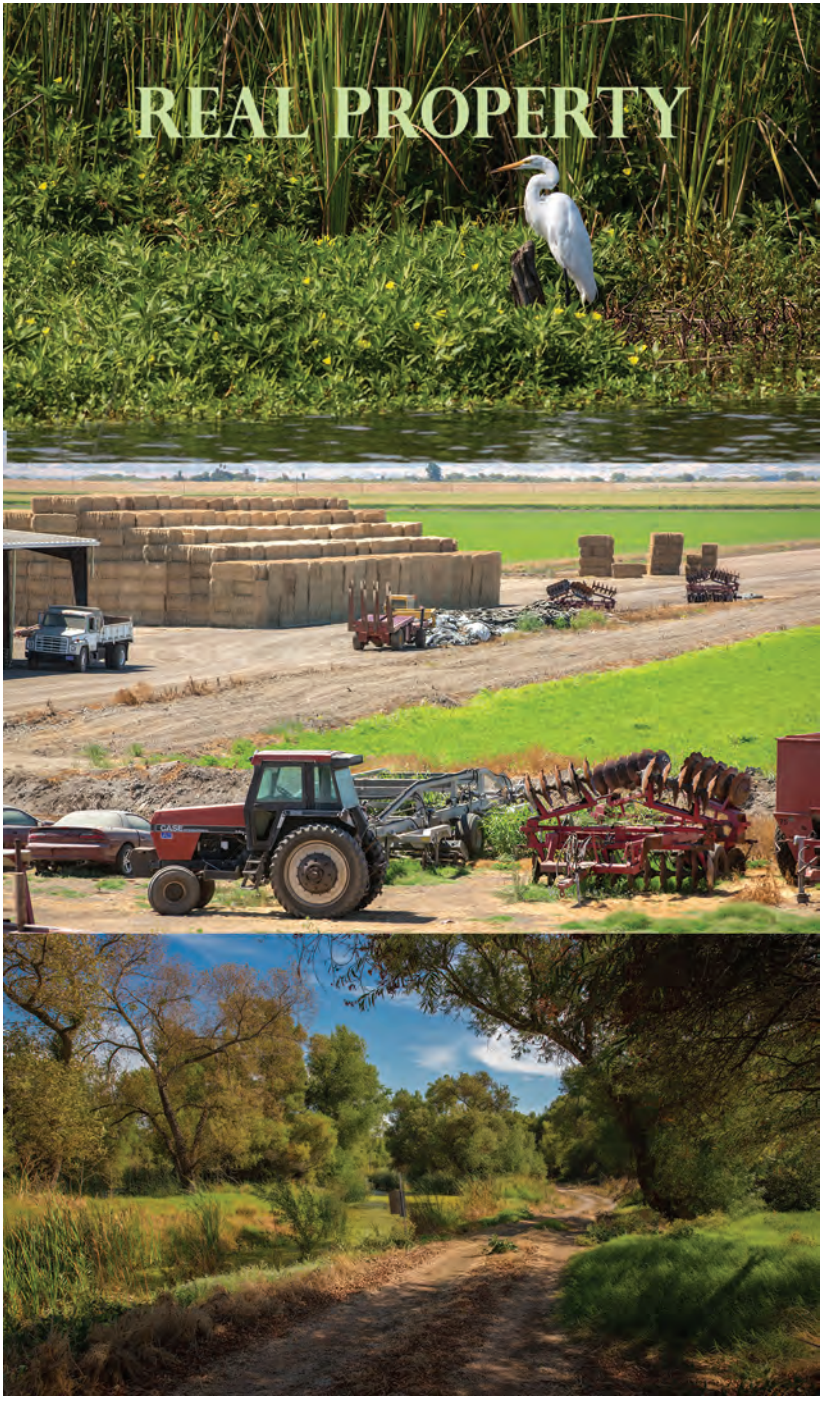
Staff attended the annual CALPELRA (California Public Employees Labor Relations Association) conference which provides legal and legislative updates, as well as topical discussions on various employee relations issues. The Human Resources group manager participated in the

ACWA (Association of California Water Agencies) conference on Defining the Modern Workplace: When Generational Diversity Takes Shape.

### *Workers' Compensation and Medical Screening*

Staff reduced outstanding funding reserves (based on outstanding reserves-per-claim) by 11.7 percent and total workers' compensation payments by 4.6 percent during fiscal year 2016/17. Staff continued to work with employees on workers' compensation or personal medical leave to ensure their timely return to work, with accommodations as necessary.

### *Human Resources Information Systems*



Staff updated HR systems to comply with changes required by new tax laws, MOU agreements, the Affordable Care Act and other technical and security requirements. This entailed creating new benefits structures, leave plans, and records to ensure compliance. Staff also implemented a classification/compensation database to streamline the process and new database to assist with COBRA compliance and administration.

HRIS staff processed all Metropolitan employee job actions, open enrollment processing, salary adjustments and organizational changes keeping MyHR, the employee data system of record, up-to-date and provided reports and analyses for effective people management.

Staff worked to transition Metropolitan's "Reverse 9-1-1" communication system to the Office of the CFO. This is a critical system that can be used to communicate with the workforce during emergencies.

### *Going Forward*

Organizations are continuing to face the challenges fostering an engaged and motivated workforce, competing for talent, adapting to a multi-generational workforce, integrating changing technologies and maintaining compliance with changing requirements. Human Resources continues spearheading efforts to ensure that Metropolitan is prepared to meet future business challenges.

REAL PROPERTY

CHAPTER 10

# Real Property

The Real Property Group applies strategic approaches to the acquisition, management and protection of Metropolitan's real property assets, and seeks to effectively optimize revenues and control land management expenses. Real Property operates under the leadership of the Office of the Chief Administrative Officer, in accordance with policy and principles adopted by the board in August 2011 on managing Metropolitan's real property assets. During fiscal year 2016/17, the group worked to achieve key organizational objectives as outlined in the General Manager's Business Plan.

## *Planning and Acquisition*

The Planning and Acquisition Unit performs property planning, research, valuation, appraisals and acquisition in support of strategic water resources management, environmental mitigation requirements, near and long-term water conveyance, treatment and operational needs. Staff is responsible for ensuring that all rights, interests and benefits inherent in the ownership of real estate are utilized by Metropolitan. Typical processes include performing initial visual inspections to identify environmental concerns; determining historical property uses as part of a qualitative assessment; performing qualitative assessments to identify risk management and implementation; applying real estate valuation principles in conducting highest and best use appraisals; identifying right-of-way needs; conducting complex and detailed property negotiations; and providing relocation assistance services when necessary.

### *Accomplishments for Fiscal Year 2016/17*

- Completed the strategic purchase of four islands in the Sacramento-San Joaquin Delta and a portion of Chipps Island in the Suisun Marsh region, a 20,400-acre investment with

multiple potential values consistent with California's goals of ecosystem restoration and water supply reliability.

- Executed 26 permanent and temporary easements, fallowing easements, entry permits, licenses, consent letters, settlement and release of claims agreements, and leases in pipeline repair and rehabilitation projects including Santa Monica Feeder Pipeline Repair, Rialto Pipeline, San Diego Pipeline No. 3, the Orange County Feeder Relining Project, Calabasas Feeder, Allen-McColloch Pipeline, and the Santa Ana River Bridge Bellows Expansion Joint Replacement.
- Completed review of four independent appraisals for the lease of temporary construction staging areas for the Etiwanda Pipeline North Liner Repair Project; reviewed two easement appraisals for access for the Allen-McColloch Pipeline in Orange County.
- Evaluated proposed alternative alignment options and prepared a study recommending the Preferred Alternative Alignment for the Regional Recycled Water Supply Program.

## *Property Management*

The Property Management Unit ensures that Metropolitan's real property assets and rights are protected, working in conjunction with internal stakeholders and external law enforcement as required. In addition, via secondary land uses, the unit identifies surplus properties and seeks revenue generating opportunities in such market segments as agriculture, telecommunications, energy development, film production, sustainable technology and research. During fiscal year 2016/17, Metropolitan generated over $7.2 million in related revenue.

***Property Management Accomplishments***

- Executed 63 transactions, including secondary use requests; access permits, letters of consent, telecommunication uses, filming permits and infrastructure permits and easements.
- Executed six farm-lease agreements for approximately 22,000 acres within Palo Verde Irrigation District to support Metropolitan's fallowing program and promote agricultural

water use efficiency and innovation, generating approximately $3.5 million per year.

- Executed a lease with Semitropic Water Storage District on Metropolitan-owned islands with anticipated annual revenue of $1 million.
- Collected $1.6 million in revenue from the leases at the Headquarters building.
- Sold 2.75 acres of surplus property near the Inland Feeder Pipeline for $130,000.
- Successfully amended the Sacramento office lease to include two 5-year options, four new offices and six cubicle spaces, four months free rent, and $118,000 of tenant improvements.
- Negotiated a settlement agreement for the Metropolitan-owned parking structure at the Sunset Garage, which provided for a lease with an option to purchase through July 5, 2022 and a release from certain litigation.

## *Facility Management*

The Facility Management Unit is responsible for maintaining and operating the Headquarters building and the Diamond Valley Lake Visitors Center in an energy efficient and sustainable manner. Staff responsibilities include testing and maintenance of all mechanical, electrical and life safety systems.

***Headquarters***

- Performed annual Energy Star audit resulting in an overall rating of 97 out of 100 possible points.
- Completed over 2,000 preventive maintenance tasks to building equipment including the central air-conditioning system, certification and testing of the fire life safety system, and emergency power system.
- Upgraded the building, courtyard fountain, and landscape lighting systems to energy efficient LED fixtures resulting in increased lighting performance and lower maintenance costs.

- Coordinated and completed over 200 employee moves and office reconfigurations creating employee collaboration areas.
- Partnered with Contracting Services to select a vendor for janitorial services.
- Installed hands-free paper towel dispensers and eliminated counter top dispensers, resulting in a projected savings of $20,000 and 1,560 cases of paper towels.
- Certified staging equipment, procured service provider and scheduled window washing services which ceased in 2011 to support water conservation efforts.
- Conducted the biennial food services survey at the Headquarters' building resulting in a satisfaction rating of 3.18 based on a 1.0-4.0 scale, and began working with the vendor to identify areas of improvement.
- Coordinated the hydro-jetting efforts of the entire headquarters sewage system which removed excessive build-up, addressed building plumbing concerns, and reduced plumbing related services by 90 percent.

***Diamond Valley Lake Visitors Center***

- Completed over 500 preventive maintenance tasks to building equipment including the central air-conditioning system, certification and testing of the fire life safety system, and emergency power system.
- Replaced 15 failed solar power inverters, and power washed solar panels to ensure maximum generation and performance of the solar power system.

# *Diamond Valley Lake Recreation Area*

The DVL Recreation Area contains public recreation and education facilities, including the DVL Marina, Lakeview and North Hills trails, and Valley-Wide Recreation and Park District's DVL Community Park and DVL Aquatic Center.

It also contains a Multi-Species Reserve with a seasonal flower trail that opened to the public on February 24 and drew a record

number of visitors to see the rare abundance of color called the "super bloom." Since its 2003 public opening, DVL has hosted approximately 730,000 visitors at its marina facilities and about 160,000 private boats have launched.

The DVL Visitor Center houses key functions of the External Affairs Education program, and is also partially leased to the Western Science Center for the Western Center Academy administrative offices. The DVL Visitor Center and Western Science Center continue to attract year-round visitors for a variety of educational/community events and uses.

***Highlights for Fiscal Year 2016/17***

- Entered into a non-binding Memorandum of Intent with Valley-Wide Park and Recreation District, Eastern Municipal Water District, the city of Hemet, and Riverside Regional Park and Open Space District that will help guide the development of DVL recreation.
- Completed improvements to the DVL Visitor Center Building #4 and then leased the building to the Western Science Center to be used by the Western Center Academy.
- Hosted the 10th annual Bass Fishing Tournament held by the Lake Elsinore Bass Club and National Bass West to honor soldiers who served in Iraq.

## *Staff Training and Development*

Staff attended numerous Metropolitan-sponsored training classes and seminars, webinars and courses offered by the International Right of Way Association and Southern California Chapter of the Appraisal Institute.

Staff has achieved the following state of California professional designations or licenses: Senior Right of Way Professional, Real Estate Salespersons, Broker, Certified General Appraisers, Notary and Facility Management Administrator designation.

CHAPTER 11

# External Affairs

The External Affairs Group is responsible for Metropolitan's communication, public outreach, education, legislative and innovation activities. With the emergence of a "new normal" directly impacting California water conditions, External Affairs worked with the general public, news media, legislators, regulators, educators, community groups, labor, business, Metropolitan public member agencies and other stakeholders to communicate the district's interests and its board-adopted policies, using an evolving set of tools to reach a diverse audience.

## *Major Activities and Accomplishments*

### *Advertising and Outreach Campaign*

Metropolitan's award-winning advertising and public outreach efforts continued to evolve in FY 2016/17. Metropolitan's H2Love conservation campaign, which was initiated as a call to action in response to the drought emergency, adapted to California's improved water supply conditions and the end of the drought by encouraging consumers and businesses to make conservation a lifelong habit. Over the course of the fiscal year, the campaign delivered more than 734 million media impressions in five languages. In addition, the district's H2Love branding and marketing was shared with other utilities that incorporated it into their own advertising, broadening the reach of the conservation messaging. Metropolitan's social media growth rates accelerated and a partnership with Major League Soccer's L.A. Galaxy also contributed to the success of the multimedia, multilingual advertising and outreach campaign valued at approximately $4.8 million, including $1.4 million in bonus advertising.

***Media Activities***

Over the past fiscal year, Metropolitan conducted editorial board meetings, press conferences and briefings, while issuing nearly three dozen press releases, including several statements from the general manager and chairman. External Affairs regularly prepared informational materials, videos, talking points and other tools to communicate Metropolitan's operations, policies, news and programs. The Press Office responded to more than 150 media requests for information and interviews on drought conditions, along with queries about the state's record water year, California WaterFix, the damage to the Oroville Dam spillway, the region's water conservation efforts, San Diego vs. Metropolitan rate litigation, drought contingency planning in the Lower Colorado River Basin, finance, Metropolitan's purchase of land on five Delta islands, a proposed regional water recycling program, conservation rebates, planning for the proposed Sites Reservoir, and other key issues.

***Web and Social Media Activities***

Microsites were created to provide informational resources for many of Metropolitan's key initiatives including Water Tomorrow, providing a gateway to existing and new webpages for California WaterFix, the Colorado River, the proposed Regional Recycled Water Project, the Integrated Water Resources Plan, and the innovation and water conservation outreach programs. Metropolitan's California WaterFix site included an online toolkit containing key documents, fact sheets, presentation materials, videos, photos and maps.

MWDinnovates.com was created to highlight Metropolitan's growing portfolio of programs and activities that support innovation, new technologies and entrepreneurs.

Metropolitan's online conservation portal, bewaterwise.com®, was redesigned with a fresh, mobile-friendly navigation and layout, and translated into Chinese and Spanish.

Metropolitan's Facebook page received more than 10 million impressions, with the number of followers increasing 12 percent. A conservation tip posted in June 2017 received 1 million impressions alone. The district's Twitter followers increased by 20 percent, with

engagement increasing nearly 450 percent. Metropolitan used Facebook Live and Snapchat geofilters to reach a broader audience during its conservation campaign.

In 2017, Metropolitan expanded its use of several e-newsletters, raising the number of subscribers to nearly 30,000 and covering a variety of topics including California WaterFix, water education, and key Metropolitan projects and initiatives.

***Legislative and Policy Activities***

Metropolitan sponsored Assembly Bill 2488, which was signed into law by Governor Brown in September 2016. The legislation will allow Metropolitan to perform important work on the Foothill Feeder by authorizing the state to issue incidental take permits for the unarmored threespine stickleback, a fully protected species under the state Endangered Species Act.

Metropolitan worked with U.S. Senator Feinstein, along with congressional members throughout the West to pursue administrative and legislative remedies to would clarify that water conservation rebates should not be taxed. Metropolitan also supported S. 612, the WIIN (Water Infrastructure Improvements for the Nation) Act signed by President Obama in December 2016. The bill provided funding for water infrastructure as well as flexibility in water delivery operations while protecting existing environmental laws.

***Community Partnerships***

More than 50 Community Partnering Program sponsored projects included community gardens and signage, water resource conferences, Earth Day events, garden classrooms, publications, and educational materials on conservation messaging, watershed issues and recycling.

External Affairs maintained a strong speakers bureau, providing presentation materials and arranging speakers, for more than 100 presentations to service organizations and various community groups in all six Southland counties. The most requested topics included water supply updates, Metropolitan's history and regional benefits, conservation programs and water-saving rebates.

***Water Stewardship Education***

Education staff worked with member agencies to hold more than 400 events and engage nearly 300,000 students, teachers, parents and participants through activities, social media and curriculum materials during the fiscal year. Metropolitan continues to develop K-12 water education curriculum in support of California's Education and Environment Initiative. These educational resources align to modern education standards and support early bilingual education (Spanish and Mandarin). During FY 2016/17, more than 18,000 public visitors and students toured the Diamond Valley Lake Visitor Center to learn more about Metropolitan's water systems and operations, programs and water stewardship.

The World Water Forum College Grant Program concluded during Metropolitan's Spring Green event at Union Station, showcasing water conservation and treatment projects. Solar Cup, the nation's largest high school solar boat race, engaged 43 teams and more than 800 high school students in the STEAM (science, technology, engineering, art and math) topics of water stewardship and renewable energy. Metropolitan's "Water is Life" Student Art Exhibit and Calendar annually compiles over 14,000 pieces of art generated by K-12 students throughout Metropolitan's service area.

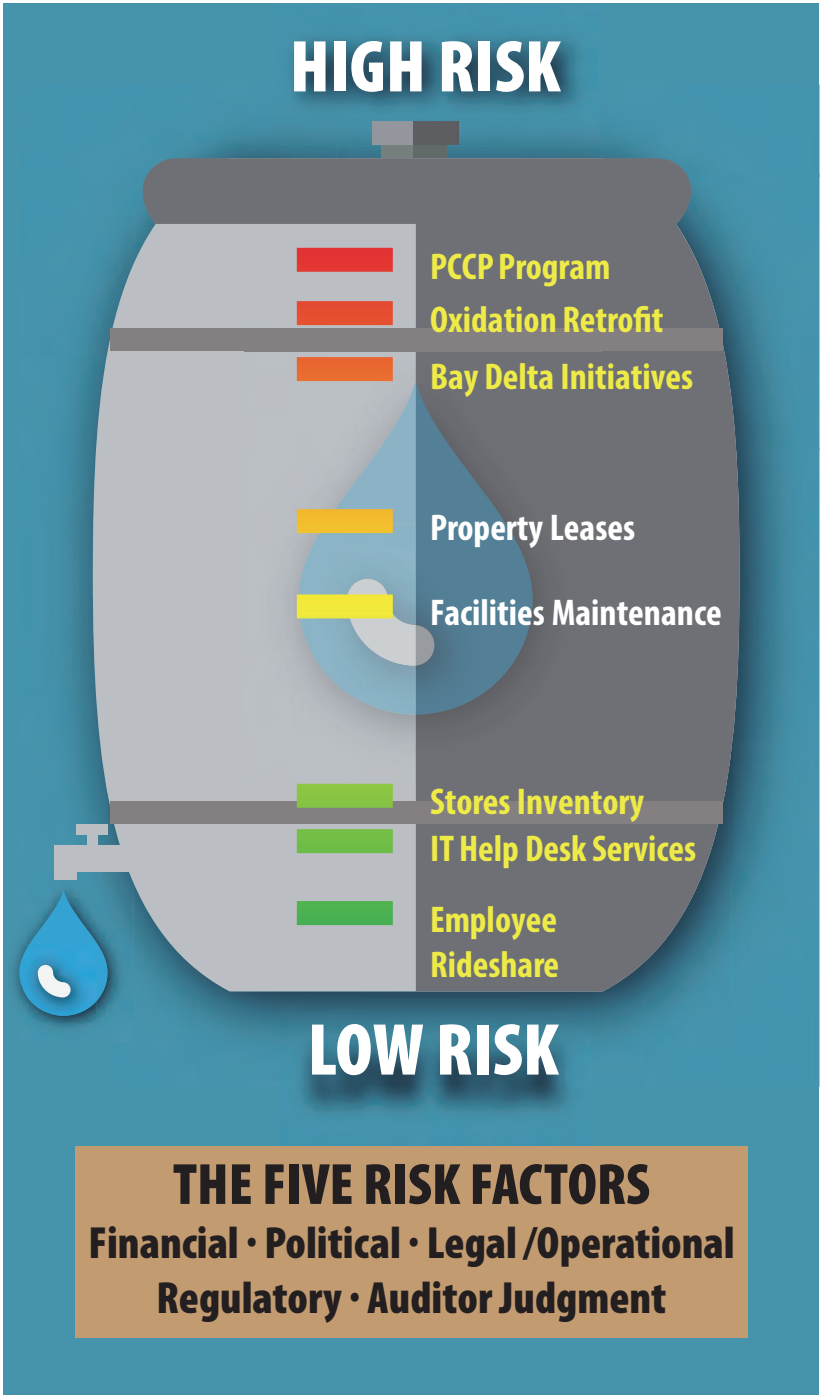
Inspection trips of State Water Project facilities and the Sacramento/San Joaquin Bay-Delta as well as Metropolitan's Colorado River Aqueduct, Diamond Valley Lake and other district facilities helped inform and engage elected officials, community leaders and the public about Southern California's water resources. This year, nearly 2,100 participants visited these facilities on 70 inspection trips.

***Publications, Video***

External Affairs designed, wrote, distributed and posted roughly 50 new publications. The materials covered a wide range of topics including California WaterFix, the Colorado River and programs to strengthen urban-agriculture partnerships, innovation and climate change, the annual Water Quality Report, the SB 60 annual progress report to the state legislature on conservation, recycling and reuse. Other materials included multi-faceted explanations of conservation program and cutting edge local-supply projects, and environmental

and financial stewardship. Metropolitan also produced the 2016 Annual Report and two California Water maps. Staff also helped design, create and disseminate promotional materials for meetings, special events and other forums, and wrote employee/retiree obituaries.

Metropolitan produced informational videos on California WaterFix, solar technology and the district's purchase of Delta islands, along with the general manager's H20Talk video blog. Metropolitan's "Wings Over the Colorado River Aqueduct" video received nearly 350,000 views.



***Outreach for Infrastructure Projects***

External Affairs provided community outreach for major capital and system maintenance projects including pipeline relining, valve replacements, cathodic protection, and maintenance shutdowns. Nearly 6,400 notices were provided, along with community meetings and briefings for city officials.

***Business Outreach, Innovation***

Metropolitan increased its profile as a leader in business outreach and innovation activities including co-hosting the Annual California Construction Expo, which generated more than 1,200 attendees and represented over $150 billion in construction projects. The district's Connect 2 Vet event promoted contracting opportunities to disabled veteran businesses. More than 110 veterans and several member agency representatives attended.

Metropolitan also hosted the Canadian Water Roadshow, at which water technology companies made presentations to Metropolitan member agency staff, and sponsored the "Pilots and Trials" conference featuring technologies pioneered by Metropolitan and its member agencies, as well as other water utilities.

*Audit considers five risk factors when assessing the risks associated with various programs.*

CHAPTER 12

# Internal Audit

Internal Audit provides independent, objective assurance and consulting services designed to add value and improve operations. Internal Audit responsibilities are carried out by audit professionals, who evaluate the extent to which internal controls mitigate risks. Internal Audit also determines whether activities are consistent with policies, procedures, regulatory requirements and contracts. In this way, the audit staff assists management and the Board of Directors in assessing risks that could impact the achievement of their objectives.

Audits are performed in accordance with The Institute of Internal Auditors International Standards for the Professional Practice of Internal Auditing. These standards help define Internal Audit's responsibilities and establish expectations for auditor professionalism and independence. This independence is assured through the Internal Audit Department Charter, which establishes the General Auditor's reporting line to the Board of Directors and the Audit and Ethics Committee.

The Audit and Ethics Committee directs the focus of Internal Audit resources by review and approval of the General Auditor's Annual Audit Plan. The fiscal year 2016/17 Audit Plan resulted from an internal assessment of risks and input from key stakeholders including board members, management and staff.

## *Major Activities and Accomplishments*

During FY 2016/17, Internal Audit contributed to governance activities through the following major actions:

- Successfully carried out the FY 2016/17 Audit Plan, including an audit of the Turf Removal Program that required extensive audit resources and careful coordination with Metropolitan management and contractors.

- Reassessed the Audit Plan quarterly to evaluate whether it met the needs and requests of the Board of Directors and management, focused on highest risks and areas of greatest concern and ascertained whether sufficient progress was being achieved.
- Completed and issued 20 audits and three special projects; monitored five higher risk areas, including board and management requests; issued seven bond comfort letters.

| | **Number of Reports** |
|---|---|
| **Audits:** | **20** |
| Accounts Payable Automation | |
| AECOM, HDR and MWH Americas | |
| Assist External Auditors (2) | |
| AST, Advanced Electronics & Johnson Controls | |
| CH2M Hill & Kennedy Jenks | |

| Consulting Contracts (3) | |
| Systems Development Life Cycle 2-Way Radio | |
| Colorado River Water Users Association | |
| **Bond Comfort Letters:** | **7** |
| Water Revenue Refunding Bonds (7) | |

- Evaluated management's response to all significant control issues noted in audit reports; tracked and reviewed management responses on 21 recommendations included in audit reports and ensured timely responses to all reports.
- Assisted the external auditors, Macias Gini & O'Connell, with the performance of the June 30 Annual Financial Audit and Colorado River Joint Powers Authority Reports.
- Completed a reorganization of internal audit staff to enhance communication and promote consistency.
- Conducted department-wide training on group dynamics and team building employing the Myers-Briggs Type Indicator personality tool.

## *Quality Assurance Activities*

Professional auditing standards require internal auditors to maintain a quality enhancement and continuous improvement program. Accordingly, Internal Audit conducts a comprehensive Quality Assurance and Improvement Program annually. For FY 2016/17, the department contracted with the IIA to perform an external review. The broad objectives of this review were to:

- Assess conformity to IIA Standards
- Assess effectiveness in carrying out the department's mission, as set forth in the Audit Department Charter
- Identify opportunities to strengthen the department's value to Metropolitan

The IIA's report, issued May 30, 2017, judged the department to be in "general conformance" with IIA standards, the highest possible rating.

# *Office of* ETHiCS

*Integrity, Transparency and Compliance*

The Metropolitan Water District of Southern California

CHAPTER 13

# Ethics

Created by state legislation in 1999, Metropolitan's Ethics Office promotes and maximizes Metropolitan's transparency, integrity and good government practices. At a time when ethical principles and standards are being analyzed at the highest levels of government, the Ethics Office is committed to safeguarding one of Metropolitan's most valuable assets—its integrity.

The Ethics Officer's core responsibilities are to provide education and advice; investigate potential violations of Metropolitan's internal ethics rules; develop policy; and promote compliance with state ethics laws. Preventing ethical missteps in the first instance is the cornerstone of the ethics program. However, Ethics also has a robust investigation process intended to fairly and objectively address potential violations and encourage accountability.

***Advice and Education***

To assist Metropolitan directors, employees and others in addressing ethics requirements, the Ethics Office offers advice and provides training tailored to meet the specific needs of the targeted audience. One example was the November 2016 district-wide training designed to fulfill state-mandated ethics training for officials. In addition, a monthly conflicts bulletin provides Metropolitan's governing body with detailed information about agendized items, including the sources of potential conflicts of interest affected by the decisions before them and corresponding conflict of interest regulations, to help determine whether their recusal from certain matters is required.

The office also developed an online training program to assist the hundreds of Metropolitan employees who will be required to disclose personal financial interests for the first time in calendar year 2017. The training introduces employees to the concept of financial disclosure and informs employees of their obligations under state law.

***Policies and Procedures***

The Ethics Office is responsible for continuously evaluating its policies and procedures to ensure that they meet the highest standards for effectively implementing Metropolitan's governmental ethics program, while ensuring fairness for all stakeholders involved. This year, the Ethics Office began a review of multiple ethics-related provisions in the Administrative Code to improve Ethics Office processes and procedures and to strengthen the ability to meet mandates.

***Compliance***

Monitoring for compliance with various state-mandated ethics requirements is one of the office's core duties. This year, the Assistant Ethics Officer ushered in a comprehensive overhaul of Metropolitan's conflict of interest code in compliance with applicable state regulations. The new conflict of interest code has been approved by the board and the Fair Political Practices Commission and will take effect in the coming year.

The Ethics Office continues to perform all filing officer duties for Metropolitan to comply with mandatory disclosures of financial interests of designated officials to the Fair Political Practices Commission. In fiscal year 2016/17, the office handled over 400 financial disclosure reports.

***Investigations***

An essential part of the Ethics Office's mandate is to independently investigate and report on alleged violations of Metropolitan's ethics rules. Investigations promote accountability and identify systemic changes for avoiding future missteps.

The past fiscal year has been notable in requiring more attention and resources for investigations. Ethics began the year with a request from the General Manager to investigate alleged conflicts of interest between a manager's personal investments and official Metropolitan duties. The process, which resulted in minor findings that were readily corrected, was more notable for demonstrating Metropolitan's

commitment to accountability, internal monitoring, and self-correction.

Also this year, the Ethics Office undertook investigations involving core issues of governance. While such investigations often face controversy, the ability to work through the issues, find their root causes, and work toward better solutions is a key part of any ethics program.

***Staffing and Professional Resources***

The Ethics Office is responsible for continuously evaluating whether professional staffing levels are sufficient for compliance with its statutory mandate.

This marked the first fiscal year in which the office had two new Deputy Ethics Officer positions. The office experienced a notable increase in the number of matters resolved and a reduction in the amount of time spent to resolve them. The office also established and filled a permanent administrative support position.

In support of the office's ongoing effort to operate in accordance with best practices in the industry, the Deputy Ethics Officers attended the Council on Governmental Ethics Laws conference, where they engaged with experts and colleagues in the fields of governmental ethics, public records legislation, and other areas. The Ethics Officer also attended the California State Bar's conference on the California Public Records Act and Ralph M. Brown Act. The office continues to increase its involvement with professional organizations in the field of governmental ethics and compliance.

# TABLE OF CONTENTS

**EXECUTIVE SUMMARY ..... ES**

**ACRONYMS AND ABBREVIATIONS ..... ACR**

**SECTION 1 INTRODUCTION ..... 1-1**

1.1 Purpose and Overview ..... 1-1
1.2 Preparation ..... 1-2
*1.2.1 Plan Adoption, Submittal, and Implementation ..... 1-2*
*1.2.2 Local Agency Coordination and Public Participation ..... 1-3*
*1.2.3 Regional Alliance ..... 1-3*

**SECTION 2 WATER SYSTEM DESCRIPTION ..... 2-1**

2.1 District History and Purpose ..... 2-1
2.2 Service Area Characteristics ..... 2-2
*2.2.1 Location ..... 2-2*
*2.2.2 Climate ..... 2-4*
*2.2.3 Population ..... 2-4*
*2.2.4 Land Use ..... 2-6*
2.3 District Water Distribution System ..... 2-6

**SECTION 3 WATER SYSTEM DEMANDS ..... 3-1**

3.1 Recent Water Demand Trends ..... 3-1
3.2 Retail Demand Projections – Land Use Based Model ..... 3-2
3.3 Past, Current, and Projected Water Demands ..... 3-2
3.4 System Water Loss ..... 3-2
3.5 Lower Income Housing Demands ..... 3-4
3.6 Demand Reduction Requirements ..... 3-4
*3.6.1 Baseline Gallons Per Capita Per Day ..... 3-5*
*3.6.2 Target Gallons Per Capita Per Day ..... 3-6*
*3.6.3 Compliance with 2015 Interim Urban Water Use Target ..... 3-8*
*3.6.4 Wholesale Agency Assistance in Meeting Urban Water Use Target ..... 3-8*

**SECTION 4 WATER SYSTEM SUPPLIES ..... 4-1**

4.1 Water Supply Overview ..... 4-1
4.2 Chino Groundwater Basin ..... 4-3
*4.2.1 Basin Overview ..... 4-3*
*4.2.2 Chino Basin Watermaster ..... 4-6*
4.3 State Water Project ..... 4-12
*4.3.1 Metropolitan Water District of Southern California ..... 4-12*
*4.3.2 Inland Empire Utilities Agency ..... 4-17*
*4.3.3 Water Facilities Authority ..... 4-17*
4.4 San Antonio Water Company ..... 4-18
*4.4.1 Surface Water Supply – San Antonio Canyon ..... 4-19*
*4.4.2 Groundwater Supply ..... 4-20*
4.5 Inland Empire Utilities Agency – Recycled Water ..... 4-22
*4.5.1 Wastewater Treatment ..... 4-23*
*4.5.2 Existing Recycled Water Program Supplies ..... 4-27*
*4.5.3 Current and Projected Recycled Water Use in District Service Area ..... 4-28*

4.6 Planned Water Supply Enhancement Projects ....4-28
*4.6.1 Capital Improvement Plan ....4-29*
*4.6.2 Groundwater Recharge Opportunities ....4-29*
*4.6.3 Partnership Opportunities....4-30*
*4.6.4 Transfer and Exchange Opportunities ....4-31*
*4.6.5 Recycled Water Opportunities....4-32*
*4.6.6 Desalinated Water Opportunities....4-35*

**SECTION 5 WATER SUPPLY RELIABILITY....5-1**

5.1 Reliability of District Water Supplies ....5-1
*5.1.1 Chino Groundwater Basin Supply Reliability....5-2*
*5.1.2 Water Facilities Authority Supply Reliability ....5-2*
*5.1.3 Recycled Water Supply Reliability ....5-3*
*5.1.4 San Antonio Water Company Supply Reliability....5-3*
5.2 Water Quality Impacts on Reliability ....5-4
*5.2.1 Chino Groundwater Basin Water Quality ....5-4*
*5.2.2 Water Facilities Authority Water Quality....5-7*
*5.2.3 San Antonio Water Company Water Quality....5-7*
*5.2.4 Recycled Water Quality ....5-7*
*5.2.5 Impact on Water Management Strategies and Supply Reliability....5-8*
5.3 Climatic Impacts on Reliability ....5-8
*5.3.1 Demand Modifications during Dry Years....5-10*
*5.3.2 Climate Change Impacts on Water Supply Reliability ....5-10*
5.4 Reliability Analyses – Normal, Single, Multiple Dry Years....5-11

**SECTION 6 WATER DEMAND MANAGEMENT ....6-1**

6.1 Legislative and Regulatory Requirements ....6-1
*6.1.1 California Urban Water Conservation Council....6-2*
*6.1.2 Assembly Bill 1420 ....6-4*
*6.1.3 The Water Conservation Act of 2009....6-4*
*6.1.4 Assembly Bill 1881 ....6-5*
6.2 Demand Management Measure Implementation ....6-5
6.3 Demand Management Planning ....6-6
*6.3.1 Regional Conservation Programs....6-6*
*6.3.2 District Conservation Programs ....6-11*
*6.3.3 Potential Customer Sector and Economic Impacts ....6-15*

**SECTION 7 WATER SHORTAGE CONTINGENCY PLAN....7-1**

7.1 Water Shortage Contingency Ordinance ....7-1
7.2 Stages of Action ....7-1
7.3 Regional Water Shortage Contingency Planning ....7-3
*7.3.1 MWD's Water Surplus and Drought Management Plan ....7-3*
*7.3.2 IEUA's Drought Plan....7-4*
7.4 Minimum Short-Term Supply Availability ....7-4
7.5 Catastrophic Supply Interruption Plan ....7-5
*7.5.1 Water Shortage Emergency Response....7-5*
7.6 Penalties and Consumption Reduction Methods ....7-8
*7.6.1 Revenue and Expenditure Impacts....7-9*
7.7 Mechanisms to Determine Actual Reductions in Water Use ....7-10

# APPENDICES

Appendix A: Urban Water Management Planning Act of 1983 as Amended to 2015
Appendix B: Water Conservation Act of 2009 (SBX7-7)
Appendix C: Department of Water Resources 2015 Urban Water Management Plan Checklist
Appendix D: Department of Water Resources 2015 Urban Water Management Plan and SBX 7-7 Standardized Tables
Appendix E: Notifications, Notice of Public Hearing, and Resolution for Plan Adoption
Appendix F: Population Estimate Calculations and Methodologies
Appendix G: Land Use Based Water Demand Model Technical Memorandum
Appendix H: Fiscal Year Ending 2015 Water System Audit
Appendix I: Indirect Recycled Water Reuse Calculation
Appendix J: Chino Basin Judgment and Optimum Basin Management Program Implementation Plan
Appendix K: Summary of Chino Groundwater Basin Management
Appendix L: Monte Vista Water District 2011 Recycled Water Master Plan
Appendix M: 2013-2014 CUWCC Best Management Practices Annual Reports and Coverage Reports
Appendix N: 2011-2015 Regional Water Use Efficiency Program Water Savings
Appendix O: Ordinance 33: Establishing Water Use Efficiency Best Practices and Staged Water Supply Shortage Measures

| Watermaster | Chino Basin Watermaster |

# EXECUTIVE SUMMARY

California urban water providers are required by the Urban Water Management Planning Act to develop an Urban Water Management Plan (UWMP or Plan) every five years to ensure they have sufficient water supplies available to meet the long-term needs of its various categories of customers during normal, dry, or multiple-dry years. The Water Conservation Act of 2009 (SB X7-7) added additional UWMP reporting requirements.

The Monte Vista Water District (District) 2015 UWMP has been prepared in compliance with these requirements. In summary, the water reliability analysis in Section 5 of this Plan indicates the District can expect its available supplies to significantly exceed anticipated demands over the 25-year planning period. As a result of these surplus supplies, the District should not experience any problems in meetings its demands during normal, single, or multiple dry-year periods over the next 25 years.

### *Service Area and System Descriptions*

The District is a county water district officially formed in 1927 to provide domestic water service to a primarily agricultural area. In the early days, groundwater was the major water supply. Gradually, additional water supplies were identified and developed, including connections to the Colorado River Aqueduct, the creation of the Water Facilities Authority (WFA) to treat northern California imported surface water, the acquisitions of the Monte Vista Irrigation Company and shares in the San Antonio Water Company (SAWCO), and development of a recycled water distribution system. In addition to its retail customers, the District provides wholesale water supply to the City of Chino Hills. At the current time, the District relies on approximately 75 percent of its water supply from groundwater and other local supplies and 25 percent from imported water. The District's 2008 Water Master Plan addresses its water system, supply, and storage infrastructure needs for the next 30 years.

The District's 9.56-square-mile retail service area includes the City of Montclair, portions of the City of Chino, and unincorporated areas of San Bernardino County. The local climate is generally Mediterranean and semi-arid, with little or no summer rainfall. The District's combined retail and wholesale service area population over the next 25 years is projected to grow 19 percent (from 133,177 to 158,849) by 2035. Growth in the retail service area includes a significant development of high density multi-family residential properties within the North Montclair Downtown Specific Plan area of the City of Montclair.

The District currently has 12 active groundwater wells with a combined capacity of approximately 28.2 million gallons per day (mgd). The District's retail water distribution system is comprised of four pressure zones, 198 miles of pipelines, six reservoirs, seven booster stations, three hydrogenerators, and six emergency interconnections with neighboring water agencies. Water is transported to Chino Hills via transmission mains and delivered through two turnout facilities.

***Water System Demands***

Over the past ten years, the District's retail customers have achieved a significant and sustained reduction in demands. As of the writing of this report (May 2016), retail customer demands are 36 percent less than in 2007.

The District used a Land Use Based Water Demand Model for projecting future retail water demands through 2040. Although historical wholesale demand by Chino Hills has ranged between 8,000 and 14,000 AFY, the District will use its full contractual obligation of 20.22 mgd, or 22,650 AFY, in estimating potential future demands by Chino Hills on the District's water system.

**Past, Current, and Projected Water Demand (AFY)**

| Sector | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| Total Retail Potable Demand | 9,110 | 11,519 | 11,756 | 12,060 | 12,361 | 12,645 |
| Wholesale Potable Demand | 6,933 | 22,650 | 22,650 | 22,650 | 22,650 | 22,650 |
| **Total Potable Demand** | **16,043** | **34,169** | **34,406** | **34,710** | **35,011** | **35,295** |
| Recycled Water | 791 | 1,031 | 990 | 1,019 | 1,069 | 1,069 |
| **Total Water Demand** | **16,834** | **35,200** | **35,396** | **35,730** | **36,081** | **36,364** |

The Water Conservation Act of 2009 requires all California urban water agencies to set and meet certain demand reduction targets, measured in gallons per capita per day (GPCD), in order to assist the state in reducing urban water use by 20 percent by 2020.

The District's Baseline GPCD, the 10-year GPCD average of the years 1996-2005, is 209 GPCD. Opting for a simple 20 percent reduction in total demand, the District's Target GPCD for 2020 is 167 GPCD and its Interim Target GPCD for 2015 is 188 GPCD.

**District Urban Water Use Targets and 2015 Compliance (GPCD)**

| **Baseline Water Use** *(1996-2005)* | **2020 Water Use Target** (-20%) | **2015 Interim Water Use Target** (-10%) | **2015 District Water Use** | **Reduction from Baseline** |
|---|---|---|---|---|
| **209** | **167** | **188** | **137** | **34%** |

The District is required to report in its 2015 UWMP whether we achieved our 2015 Interim Urban Water Use Target of 10 percent reduction from Baseline GPCD. As shown above, **District customers used 137 GPCD in 2015, or 34 percent below our Baseline GPCD, far exceeding our regulatory target of 188 GPCD.**

### *Water System Supplies*

Over the past 15 years, Monte Vista Water District has invested over $50 million in its infrastructure and has increased its water supply capacity to over 50 million gallons per day. Key investments in local groundwater, surface water, and recycled water have focused on building a diverse, drought-resilient water supply portfolio and reducing reliance on imported water.

The District is dependent on four sources for its long-term water supply:

- Groundwater produced from the Chino Groundwater Basin, an adjudicated basin managed by the Chino Basin Watermaster;
- Imported State Water Project surface water received from the Metropolitan Water District of Southern California (MWD) through the Inland Empire Utilities Agency (IEUA) and the WFA;
- Entitlement water deliveries from SAWCO, including groundwater produced from local adjudicated groundwater basins and surface water produced from the San Antonio Creek Watershed; and,
- Recycled water from IEUA.

**Current and Projected Water Supplies**

| Water Supply Sources | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| Chino Groundwater Basin | 8,406 | 28,183 | 28,183 | 28,183 | 28,183 | 28,183 |
| Water Facilities Authority | 7,025 | 21,776 | 21,776 | 21,776 | 21,776 | 21,776 |
| San Antonio Water Company | 611 | 800 | 800 | 800 | 800 | 800 |
| IEUA – Recycled Water | 791 | 1,031 | 990 | 1,019 | 1,069 | 1,069 |
| **Total Water Supply** | **16,833** | **51,790** | **51,749** | **51,778** | **51,828** | **51,828** |

### *Water Supply Reliability*

Reliability is a measure of a water service system's expected success in managing water shortages. In addition to climate, other factors that can cause supply shortages are natural disasters such as earthquakes, chemical spills, energy outages, and water quality issues.

The District safeguards the quality of its water supply by exceeding state and federal monitoring requirements. The District blends its various sources of water to ensure that the quality of drinking water is in strict compliance with standards. Additionally, local and imported water supplies are being constantly monitored and remediated through regional programs.

The reliability of Chino Basin groundwater is based on long-term hydrology and is not directly impacted by single year or multi-year droughts. SAWCo's local surface water supplies can be impacted by short-term drought events. Northern California climate can impact imported surface water supply reliability, but MWD has mitigated these impacts. Recycled water is considered "drought proof" and is not impacted by climate.

The following tables compare the District's current and projected water supplies and demands in normal, single dry-year and multiple dry-year scenarios for the District. **These projections demonstrate that the District can expect its available supplies to significantly exceed anticipated demands over the 25-year planning period. As a result of these surplus supplies, the District should not experience any problems in meetings its demands during normal, single or multiple dry year scenarios during the next 25 years.**

**Supply and Demand Comparisons (AFY)**

*Normal Year*

| | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|
| Total Supply | 51,790 | 51,749 | 51,778 | 51,828 | 51,828 |
| Total Demand | 35,200 | 35,396 | 35,730 | 36,081 | 36,364 |
| **Difference** | **16,590** | **16,353** | **16,048** | **15,748** | **15,464** |

*Single Dry Year*

| | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|
| Total Supply | 51,646 | 51,605 | 51,634 | 51,684 | 51,684 |
| Total Demand | 35,200 | 35,396 | 35,730 | 36,081 | 36,364 |
| **Difference** | **16,446** | **16,209** | **15,904** | **15,604** | **15,320** |

*Multiple Dry Years*

| | | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| **Year 1** | Total Supply | 51,646 | 51,605 | 51,634 | 51,684 | 51,684 |
| | Total Demand | 35,200 | 35,396 | 35,730 | 36,081 | 36,364 |
| | **Difference** | **16,446** | **16,209** | **15,904** | **15,604** | **15,320** |
| **Year 2** | Total Supply | 51,547 | 51,507 | 51,536 | 51,586 | 51,586 |
| | Total Demand | 35,200 | 35,396 | 35,730 | 36,081 | 36,364 |
| | **Difference** | **16,347** | **16,111** | **15,806** | **15,505** | **15,221** |
| **Year 3** | Total Supply | 51,547 | 51,507 | 51,536 | 51,586 | 51,586 |
| | Total Demand | 35,200 | 35,396 | 35,730 | 36,081 | 36,364 |
| | **Difference** | **16,347** | **16,111** | **15,806** | **15,505** | **15,221** |

### *Water Demand Management*

The District is a regional leader in developing and implementing proactive demand management programs that protect existing water resources so that adequate water supplies will be available for sustainable future growth. Investments in reliable local resources have been critical to maintaining current and future water supplies. Equally critical is the promotion of water use efficiency as an integral component of current and future water strategy for the service area.

The District is a charter signatory to the California Urban Water Conservation Council's Memorandum of Understanding Regarding Urban Water Conservation and has maintained its compliance with its Best Management Practices (BMPs—see Appendix M). In addition, the District is required to comply with the Water Conservation Act of 2009's requirements to set and then to meet its urban water use reduction targets of 188 GPCD by 2015 and 167 GPCD by 2020. The District is currently meeting its targets, both individually and regionally, and plans to continue assisting customers in maintaining and enhancing their current water use efficiency practices.

The District was an early adopter in implementing a budget-based tiered rate structure which incentivizes efficient residential and landscape water use. In addition to maintaining and enhancing its local conservation programs, the District will continue to participate in IEUA's Regional Conservation Workgroup, the Water Education Water Awareness Committee, and Chino Basin Water Conservation District programs.

### *Water Shortage Contingency Plan*

The District's Water Shortage Contingency Plan is incorporated into District Ordinance 33 (Appendix O), which establishes year-round water use efficiency best practices and staged water supply shortage measures. This plan addresses emergency shortages, including catastrophic interruptions, and contains mandatory prohibitions, penalties, and consumption reduction methods. The District's stages of action present the measures by which customers are required to implement mandatory water conservation practices during a declared water shortage. The District may declare a shortage due to imported water supply cutbacks by MWD, as well as extended drought, equipment failure, act of terrorism, and/or natural disaster.

During periods of water supply shortages, state-mandated water use restrictions, or emergency conditions, the District may require its customers to reduce demands below levels projected by the current rate structure. This circumstance may result in insufficient revenues to meet necessary expenses. In order to protect the District financially in such circumstances, the District recently adopted "demand reduction rates" as part of its normal rate adoption process in order to ensure financial stability and high quality water service.

# SECTION 1
# INTRODUCTION

## 1.1 PURPOSE AND OVERVIEW

California urban water providers are required by state law to develop an Urban Water Management Plan (UWMP) to ensure they have sufficient water supplies available to meet the long-term needs of its various categories of customers during normal, dry, or multiple-dry years. State of California Water Code (CWC) Sections 10610 through 10656, known as the Urban Water Management Planning Act (Act), requires urban water suppliers (providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet (AF) of water annually) to develop an UWMP every five years in the years ending in zero and five. Senate Bill (SB) X7-7 (2009), known as the Water Conservation Act of 2009, added additional UWMP reporting requirements.

In the Act, the California Legislature declared that the waters of the state are a limited and renewable resource subject to ever increasing demands; that the conservation and efficient use of urban water supplies are of statewide concern; that successful implementation of plans is best accomplished at the local level; that conservation and efficient use of water shall be actively pursued to protect both the people of the state and their water resources; that conservation and efficient use of urban water supplies shall be a guiding criterion in public decisions; and that urban water suppliers shall be required to develop water management plans to achieve conservation and efficient use.

The Monte Vista Water District (District)[1] 2015 UWMP has been prepared in compliance with the requirements of the Act as amended through 2015 (Appendix A) [2], as well as the additional reporting requirements of the Water Conservation Act of 2009 (Appendix B)[3]. The District's 2015 UWMP is an update of its 2010 UWMP, and incorporates significant information from the District's 2008 Water Master Plan, 2011 Recycled Water Master Plan, and other local and regional planning documents. The District relies on the California Department of Water Resources's (DWR) Guidebook to Assist Urban Water Suppliers to Prepare a 2015 Urban Water Management Plan (March 2016) for the Plan's organization and DWR's Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use (updated February 2016) for its compliance with the Water Conservation Act of 2009. A completed DWR 2015 UWMP Checklist, which provides an index showing where Water Code requirements are met in this plan, is included as Appendix C. Appendix D includes reproductions of the standardized tables[4] submitted electronically to DWR along with the 2015 UWMP. All water use and supply data provided in the plan are based on the fiscal year (July through June).

[1] Public Water System Number 3610029.
[2] CWC, Division 6, Part 2.6; §10610, et. seq. Established by AB 797 (1983). Legislation amending the Act since 2010 include AB 2409 (2010), AB 2067 (2014), SB 1420 (2014), and SB 1036 (2014).
[3] CWC, Division 6, Part 2.55; §10608, et. seq.
[4] Tables and content in this plan present the same information as what is included in the DWR standardized tables. However, the table numbers in the plan are not the same as DWR's standardized table numbers. Alignment between the 2015 UWMP's tables and DWR's standardized tables are indicated in both sets of tables.

The UWMP is intended to serve as a general, flexible, and open-ended document that periodically can be updated to reflect changes in regional water supply trends, and conservation and water use efficiency policies. This plan, along with the District's Water Master Plan and other planning documents, will be used by District staff to guide water use and management efforts through the year 2020, when the UWMP is required to be updated.

The Plan is organized into the following sections:

- Introduction
- Water System Description
- Water System Demands
- Water System Supplies
- Water Supply Reliability
- Water Demand Management
- Water Shortage Contingency Plan

In summary, the water reliability analysis in Section 5 of this plan indicates the District can expect its available supplies to significantly exceed anticipated demands over the 25-year planning period. As a result of these surplus supplies, the District should not experience any problems in meetings its demands during normal, single, or multiple dry-year periods over the next 25 years.

## 1.2 PREPARATION

### 1.2.1 Plan Adoption, Submittal, and Implementation

Water Code section 10644(a) requires the District to prepare and adopt the UWMP on or before December 31, and file with the DWR within 30 days after adoption. AB 2067 (2014) provides a six-month extension for adoption of the 2015 UWMP until July 1, 2016. The District's 2015 UWMP was adopted by resolution of the Board of Directors on June 22, 2016, following a public hearing which included discussion of the District's method of revising its urban water use targets under the Water Conservation Act of 2009, certification of meeting its 2015 Interim Urban Water Use Target, and plan to meet its 2020 Urban Water Use Target, as well as the potential economic impacts of meeting these targets (see Sections 3 and 6). This Plan was submitted to local agencies within which the District provides water service, DWR, and the State Library within 30 days of Board adoption. Copies of the Notice of Public Hearing and the Resolution of Plan Adoption are included in Appendix E.

The Draft Plan was made available to the public prior to the Public Hearing and the final adopted Plan was made available to the public within thirty (30) days following District Board approval. This Plan will be used by District staff to guide the District's water use planning and efficiency efforts through 2020 and beyond.

### 1.2.2 Local Agency Coordination and Public Participation

An important component of developing an UWMP is coordination with local public and private stakeholders. These include the following entities:

- Cities and counties that receive water service through the District and direct local land use planning efforts;
- Regional water agencies who work in partnership with the District on regional water resource management strategies; and,
- Local organizations that reflect diverse social, cultural, and economic elements of the District's service population.

Recognizing the importance of this coordination, and in compliance with Water Code Sections 10621(b), 10631(k), and 10642, the District sent letters to the cities of Montclair, Chino, and Chino Hills, to San Bernardino County, and to 11 local community stakeholder organizations in mid-December 2015, notifying them of the District's intent to update its UWMP for 2015 and providing them an opportunity to participate. The District has also communicated with eight additional neighboring cities and local water agencies concerning the District's progress in updating its Plan. A wide range of information and data was obtained, discussed, and used from many of these agencies to assist in the preparation of the Plan. Additionally, these agencies, organizations, and entities were notified of the public hearing and the availability of a draft 2015 UWMP for comment prior to its adoption. A listing of the agencies, organizations, and entities invited to participate in the development of the District's UWMP are listed in Table 1-1. Copies of notifications are included in Appendix E.

### 1.2.3 Regional Alliance

In 2011, the District signed a Memorandum of Understanding for establishing a Regional Alliance to comply with the Water Conservation Act of 2009 (SBX 7-7). SB X 7-7 provides a regional compliance option, where a group of agencies that regionally coordinate conservation efforts can set collective urban water use targets and determine regional methods to achieve said targets through a Regional Alliance. Many of the District's conservation activities are implemented on a regional basis (see Section 6). Other members of the Regional Alliance include the cities of Chino, Chino Hills, Ontario, and Upland, Cucamonga Valley Water District, Fontana Water Company, and San Antonio Water Company. For the Regional Alliance report regarding SBX 7-7 regional compliance, please see Inland Empire Utilities Agency's 2015 UWMP.

**Table 1-1:**
**Local Agency and Organization Coordination**

| **Local Agencies Receiving Water Service from District** (Required) | **60-Day Notice** | **Notice of Public Hearing** |

# SECTION 2
# WATER SYSTEM DESCRIPTION

## 2.1 DISTRICT HISTORY AND PURPOSE

Monte Vista Water District (District) is a county water district that was officially formed in 1927 under CWC, County Water District Law, Division 12, Section 30000 et seq. The District's origins date back to the early 1900s, when a land developer first surveyed a tract of land bounded by the railroad tracks and Phillips Street to the north and south, and the wash and State Street to the east and west. This area of land was then known as the "Monte Vista Land Tract" and was used largely for agricultural purposes, primarily citrus orchard farming. Water that was needed for irrigation for the numerous orange and lemon groves in the area was provided by the Limited Mutual Water Company. Limited Mutual Water Company later made the decision to provide domestic water service, and a number of other companies began to express a similar interest. The desire to form a water district under state law led to the election and formation of the District.

After its formation, the District began the long process of purchasing and accumulating facilities for providing domestic water service, including reservoirs, pipelines, pumps, wells, and other water companies. Land was purchased for facility development, and several annexations were accomplished over the decades, the largest of which occurring in 1989 with the addition of a portion of San Bernardino County Water Works #8 service area. This annexation included a population of over 12,000, increasing the total population served by the District to over 46,000 and resulting in peak demand of 14 million gallons per day (mgd) in the 1990s.

In the early days, groundwater was the major water supply. Enough naturally occurring recharge meant the groundwater was sufficient to meet the needs of the area. Gradually, additional water supplies were identified and developed to meet periods of increased demand and also to blend with high-nitrate groundwater supplies in order to meet state and federal regulatory standards. After the construction of the Colorado River Aqueduct in 1935, connections to that supply source assisted in bringing supplemental water to the rapidly growing region. In the 1980s, the District, along with the cities of Chino, Chino Hills, Ontario, and Upland, entered into a joint powers authority agreement to create the Water Facilities Authority (WFA) treatment plant. The WFA can treat up to 81 mgd of surface water imported from northern California through the State Water Project.

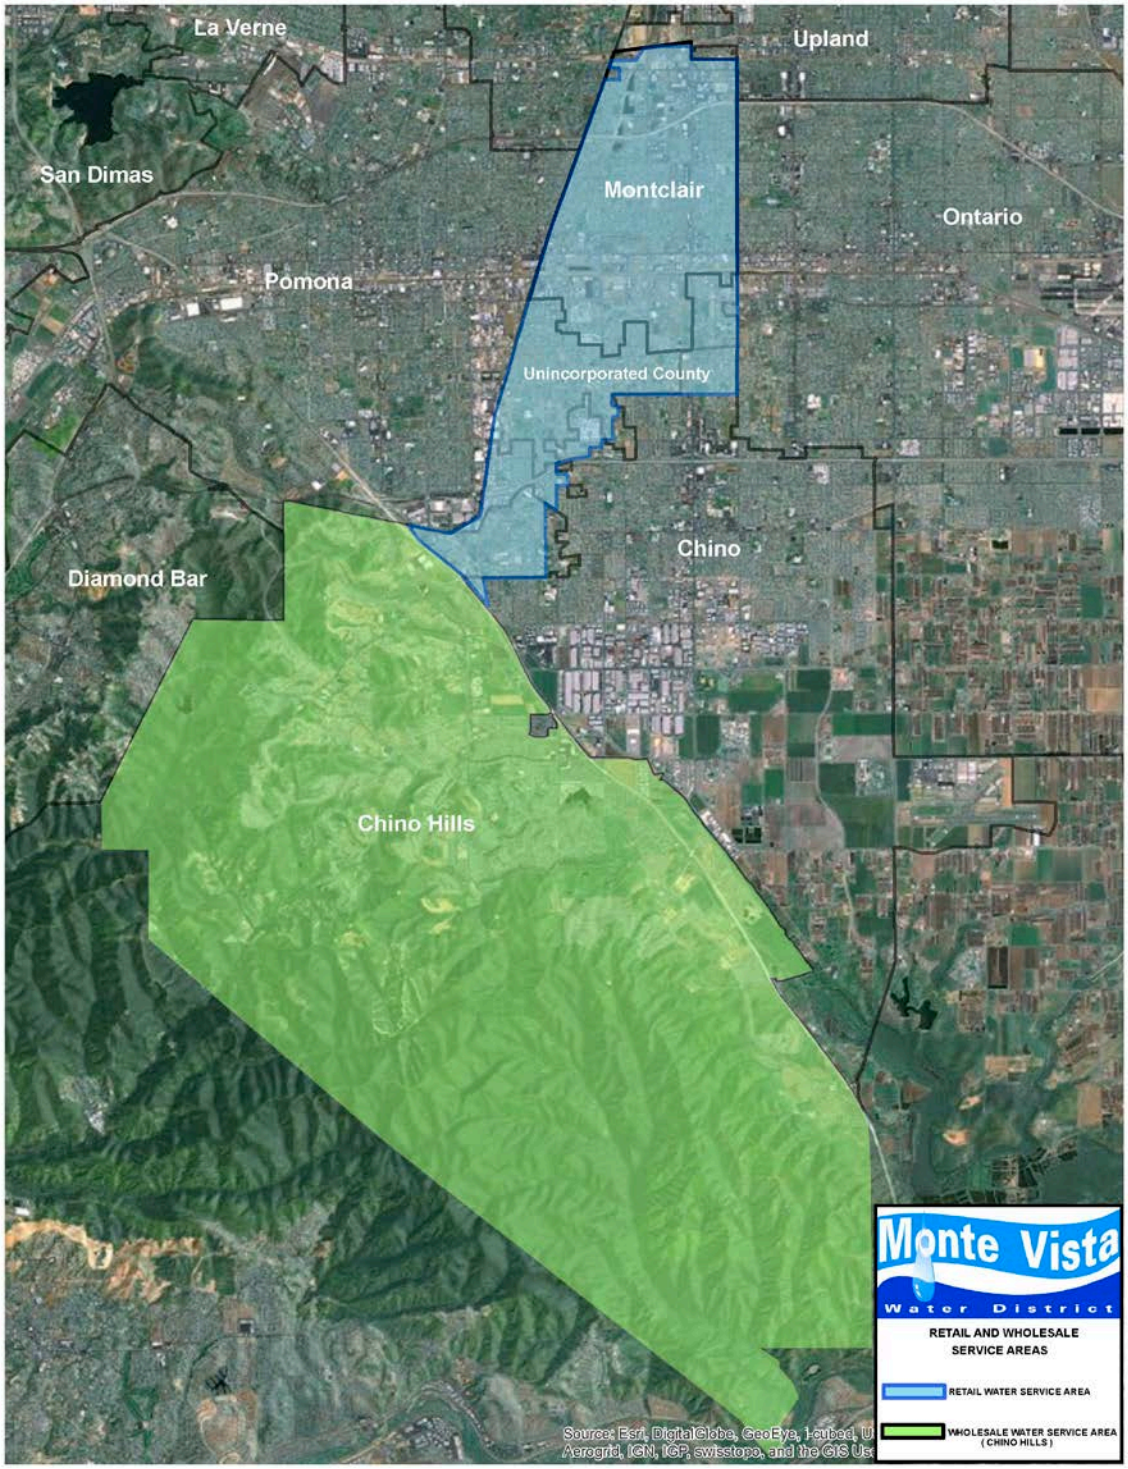
More recently, due to the increased unreliability of imported water supplies, the District has made key acquisitions to further develop its local water supply portfolio. In February 1999, the District purchased the Monte Vista Irrigation Company, a private water company founded in 1908, previously involved with agricultural and domestic water supply to the cities of Montclair and Ontario. Through this acquisition, the District increased its production rights in the Chino Groundwater Basin by approximately 1,000 acre-feet per year (AFY). In 2010, the District purchased 300 shares in the San Antonio Water Company, a local mutual stock water company, providing access to approximately 800 AFY of additional water supply.

Finally, the District has successfully implemented a recycled water distribution system. The system currently delivers 300 AFY of recycled water through a separate non-potable distribution system for landscape irrigation. The District eventually plans to deliver 430 AFY of recycled water to offset demand on its potable water system.

At the current time, the District relies on approximately 75 percent of its water supply from groundwater and other local supplies and 25 percent from imported water. These percentages vary according to changing supply conditions.

In addition to its retail customers, the District provides wholesale water supply to the City of Chino Hills. Under the provisions of a long-term agreement executed in July 1998, the District is contracted to deliver to Chino Hills up to 20.22 mgd. Since initiation of full deliveries in 1999, the District has delivered between 7,500 and 14,000 AFY of water to the City under the terms of the agreement.

In 2009, the District Board of Directors adopted the District's 2008 Water Master Plan as its Capital Improvement Plan (CIP) document, addressing water system, supply, and storage infrastructure needs for the next 30 years. The District's Financial Master Plan was most recently updated in January 2016 to provide a mechanism for funding the identified capital projects at a cost of nearly $100 million. Since adoption of its CIP, the District has completed replacement of several miles of pipeline, the construction of three groundwater wells, the development of a recycled water distribution system, and the purchase of San Antonio Water Company stock.



The operation of the District is governed by a Board of Directors, comprised of five members, elected at large within the District. The Board appoints, by majority vote, a General Manager/Secretary, Manager of Finance and Administration, and Legal Counsel, who serve at the pleasure of the Board. The District currently has 36 full-time employees who work in the areas of engineering, operations, maintenance, field service, customer service, billing, finance, human resources, public affairs and administration.

## 2.2 SERVICE AREA CHARACTERISTICS

### 2.2.1 Location

The District's retail service area contains approximately 6,120 acres (9.56 square miles) and includes the City of Montclair and portions of the City of Chino and unincorporated county areas. The retail service area lies adjacent to the westerly boundary of San Bernardino County, bordered by the cities of Upland and Claremont to the north, Ontario to the east, Chino, Chino Hills, and unincorporated areas to the south, and Pomona in Los Angeles County to the west. Interstate 10 runs east and west through the northern portion of the water service area and California State Route 60 runs east and west through the southern portion. The retail service area lies between 700 and 1,250 feet above mean sea level, rising gently northward toward the San Bernardino Mountains, approximately six miles from the northernmost boundary of the District.

**Figure 2-1:**
**District Retail and Wholesale Service Area**

The District's wholesale service area is comprised of the City of Chino Hills, which was incorporated in 1991 and currently encompasses 46 square miles.

See Figure 2-1 for a map of the District's retail and wholesale service areas.

### 2.2.2 Climate

The District is located in a general drainage area known as the Chino Basin, the largest such basin in the upper Santa Ana River Watershed. The Basin's southern California climate is generally Mediterranean, with low historical precipitation rates with wide periodic variations. The local climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, and Santa Ana winds.

**Table 2-1:**
**Service Area ETo, Temperatures and Rainfall**

| | | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total/ Average |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Average ETo[1] (inches)** | | 1.96 | 2.28 | 3.71 | 4.64 | 5.23 | 5.93 | 6.50 | 6.38 | 4.87 | 3.4 | 2.28 | 1.70 | 48.88 |
| **Temperature[2] (Fahrenheit)** | **Max** | 65.5 | 67.6 | 70.1 | 74.2 | 77.8 | 84.1 | 91.0 | 91.1 | 88.4 | 80.6 | 73.2 | 66.4 | 77.5 |
| | **Min** | 38.1 | 40.3 | 42.3 | 45.6 | 50.0 | 53.4 | 57.7 | 58.1 | 55.3 | 49.8 | 42.6 | 38.4 | 47.6 |
| **Rainfall[2] (inches)** | | 3.56 | 3.49 | 2.82 | 1.22 | 0.35 | 0.10 | 0.01 | 0.07 | 0.26 | 0.78 | 1.56 | 2.77 | 16.97 |

[1] California Irrigation Management Information System, Station #78 (Pomona), wwwcimis.water.ca.gov.
[2] Western Regional Climate Center, Pomona Fairplex (047050), Monthly Climate Summary, Period of Record : 11/1/1893 to 1/20/2015, accessed May 17, 2016. http://www.wrcc.dri.edu/cgi-bin/cliMAIN.pl?ca7050.

Table 2-1 lists the average annual Evapotranspiration ($ET_o$)[5], temperatures, and rainfall for the District's service area. Average high temperatures range from 65 degrees Fahrenheit in January to 91 degrees Fahrenheit in July and August. Average annual precipitation is approximately 17 inches, with most precipitation typically occurring between November and April. There is usually little or no summer rainfall and often the predominant periods of rain do not occur until January. ETo averages 49 inches annually.

### 2.2.3 Population

The high cost of land in Los Angeles area increased the attraction of the Chino Basin and other suburban areas where land was still plentiful during the "urban sprawl" era. Following the economic downturn in the late 2000s, development is starting to return to the region, but there are differing opinions on how rapidly the area will grow in population during the coming decades.

[5] ET is the loss of water to the atmosphere by the combined processes of evaporation (from soil and plant surfaces) and transpiration (from plant tissues). It is an indicator of how much water crops, lawns, gardens, and trees need for healthy growth and productivity. ET from a standardized grass is commonly denoted at $ET_o$.

Current and projected population estimates for the District's retail service area are provided in Table 2-2. The 2015 population estimate was developed based on city growth estimates and known development in the service area since 2010 (see Appendix F). In order to project the District's service area population for the next 25 years, it is necessary to divide the service area by municipal boundaries and use population estimates and growth projections for each subarea, as described in the footnotes to Table 2-2.

As shown in the table, the District's retail service area population over the next 25 years is projected to grow by approximately 18 percent (from 55,581 to 65,649). The largest demographic shift in the foreseeable future for the District retail service area will be a continued increase in multi-family housing units in proportion to single-family housing units. This shift will largely be due to the development of high density residential properties within the North Montclair Downtown Specific Plan area of the City of Montclair. The maximum number of dwelling units projected for the Specific Plan area at build-out is 2,800.[6]

The current population of the District's wholesale customer, the City of Chino Hills, is 77,596. The city projects its population will grow to 94,895, or 22 percent, in 20 years (a 2040 population projection was not provided). For more information on the city's population projections, see Chino Hills's 2015 UWMP.

In total, the District's retail and wholesale population is projected to grow by just over 19 percent (from 133,177 to 158,849) by 2035.

**Table 2-2:**
**Service Area Population – Current and Projected**

| Area | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| City of Montclair[1] | 38,332 | 39,700 | 41,100 | 42,500 | 43,900 | 45,346 |
| City of Chino[2] | 4,235 | 4,955 | 4,955 | 4,955 | 4,955 | 4,955 |
| Unincorporated[3] | 13,014 | 14,352 | 14,605 | 14,854 | 15,099 | 15,347 |

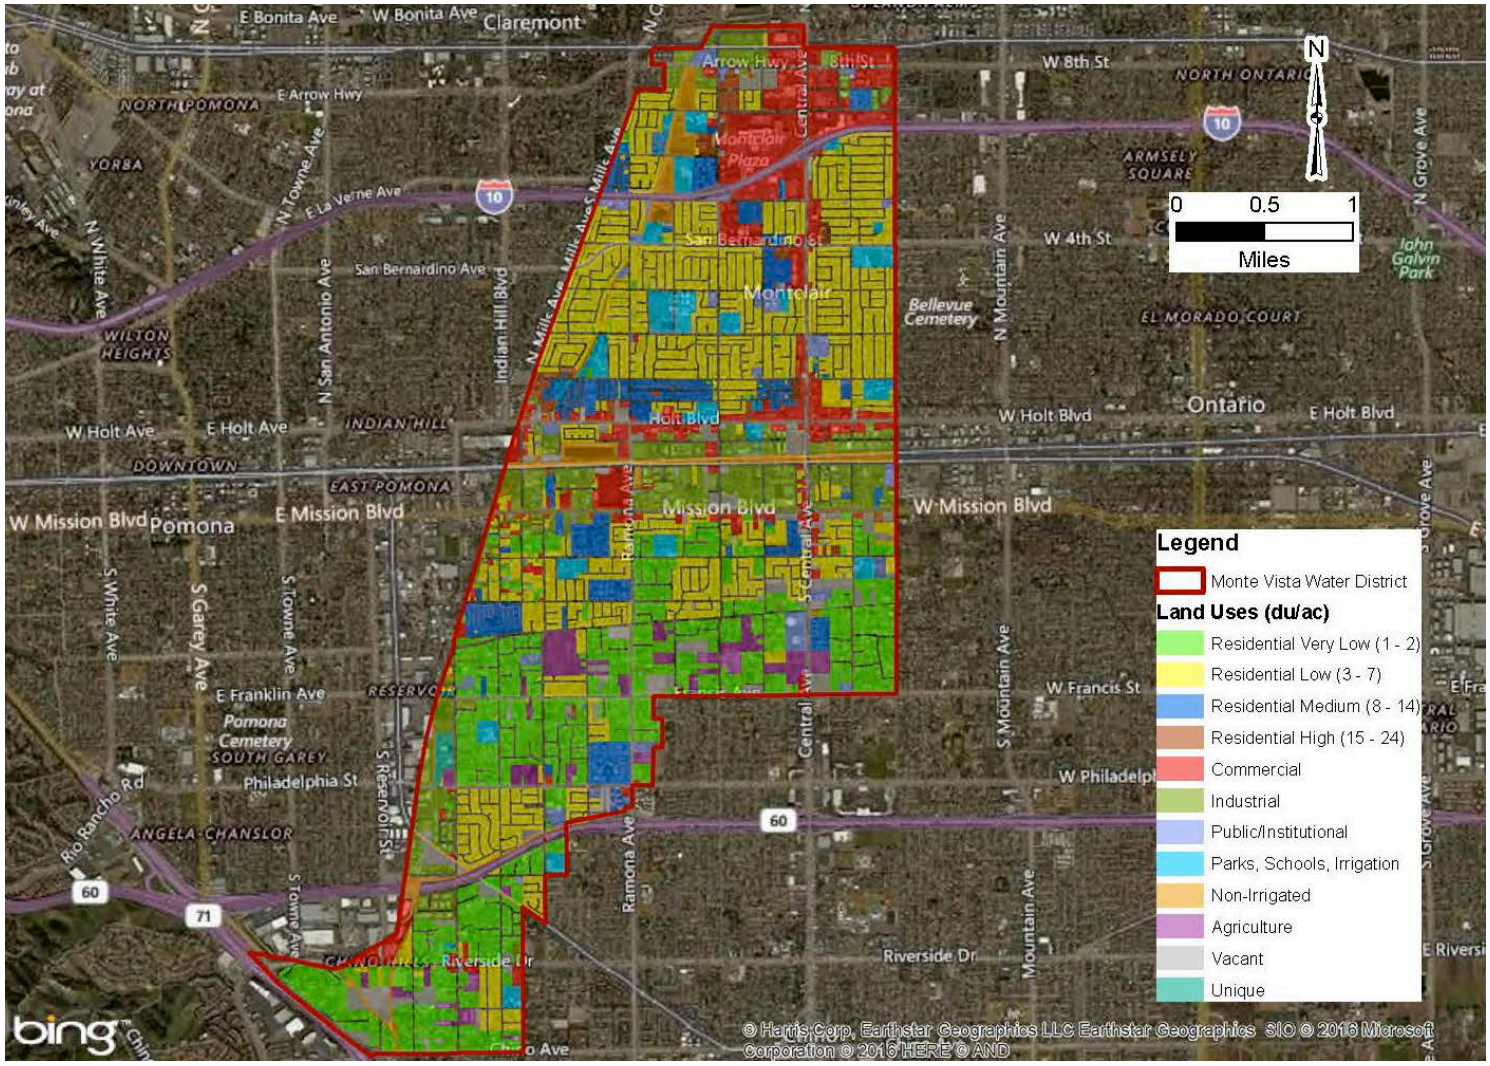
### 2.2.4 Land Use

The area within the District retail service boundary was once mainly used for agricultural purposes, namely citrus orchard farming. Over the course of time, this land has gone through a series of developments, ultimately resulting in the variety of land use types as seen today. The primary land use of this area is now residential, although there is still a large commercial sector as well as some light industrial/manufacturing and agricultural areas. The majority of land within the District's retail service area has already been built out, but there is significant potential for future in-fill developments. Figure 2-2 and Figure 2-3 show existing and future land uses in the retail service area (see Section 3.2).

## 2.3 DISTRICT WATER DISTRIBUTION SYSTEM

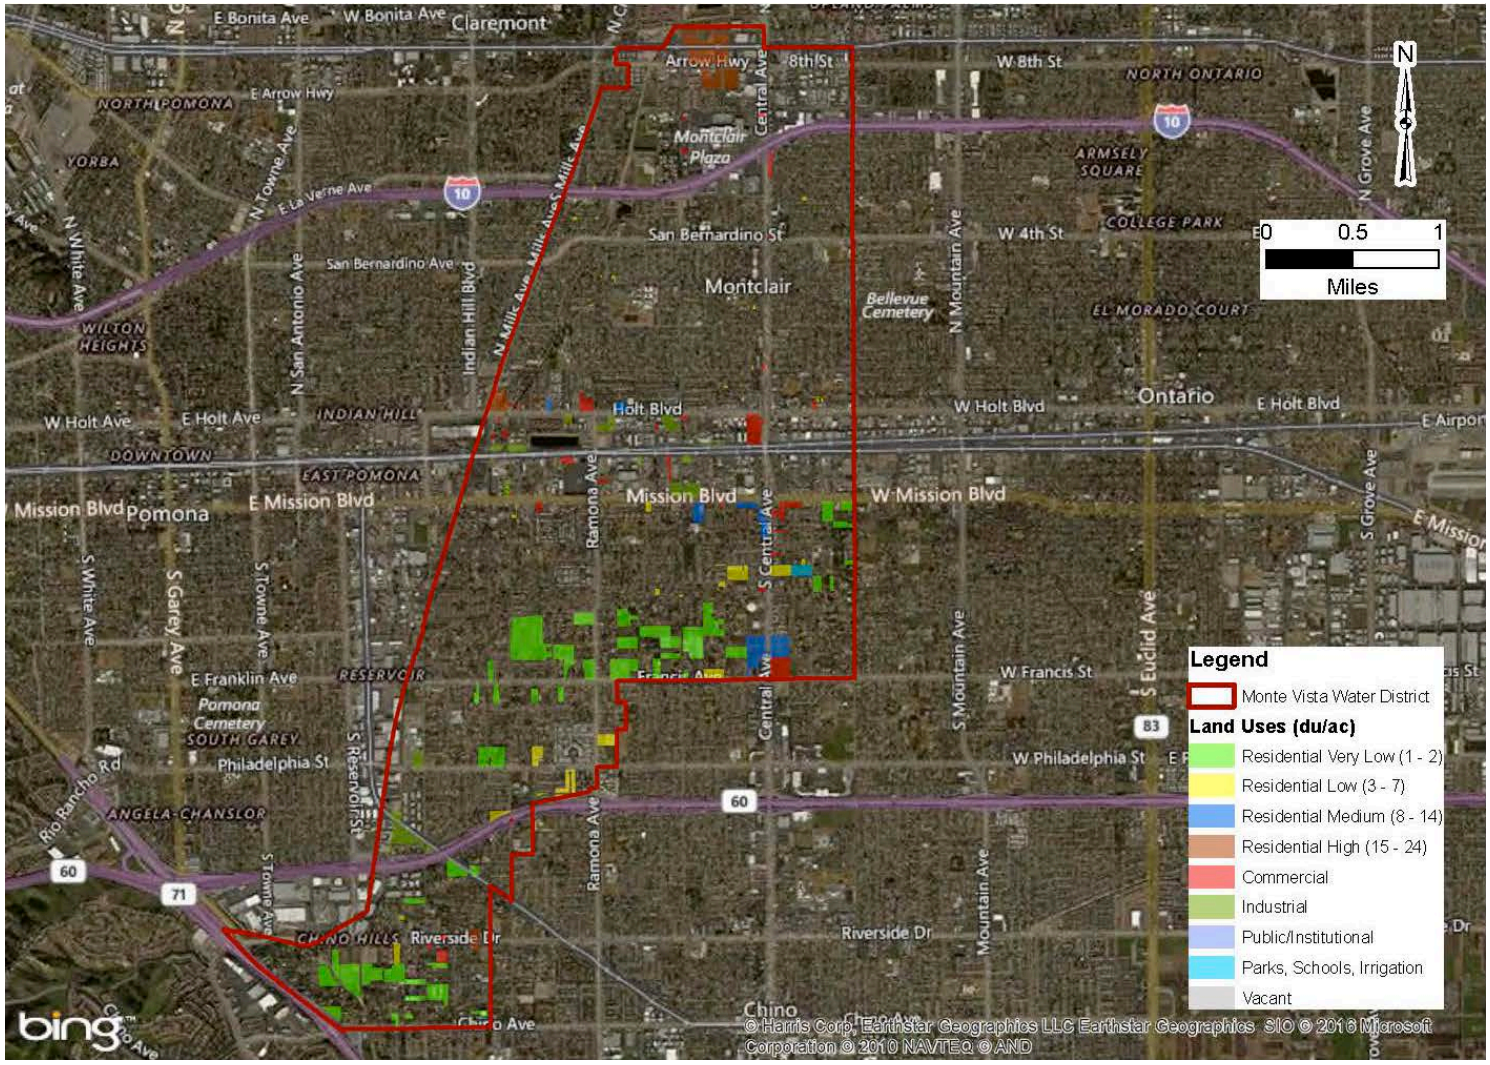
The District's water distribution system is comprised of groundwater wells, reservoirs, transmission and distribution pipelines, pump stations, pressure reducing stations, and a hydrogenation station. The system is used to meet the water demands of the District's retail and wholesale customers.



The District's retail water distribution system serves four separate pressure zones and includes approximately 198 miles of water distribution mains ranging in size from four to 42 inches in diameter, six reservoirs with a combined capacity of 12 million gallons, and seven active pump booster stations used to boost water throughout the system. The District currently has 12 active groundwater wells with a combined production capacity of approximately 28 mgd. Table 2-3 lists the District's wells and capacities.

The District's 2008 Water Master Plan calls for significant pipeline replacements in the next 30 years, as a large portion of its pipelines were constructed around the 1950s and are approaching the end of service life. The Master Plan also calls for the construction or rehabilitation of additional storage facilities to meet needed capacity at build-out.

The District's Water Master Plan includes recommendations for four new or renovated wells to provide for system reliability and continued groundwater pumping. As these wells are primarily to replace capacity of existing older wells which will soon go out of service, no additional capacity is expected within the master planning horizon.



The District currently has six emergency interconnections with neighboring water agencies: Golden State Water Company (formerly Southern California Water Company) and the cities of Chino (x3), Upland, and Chino Hills. Over the last two decades, only the interconnection with Golden State Water has ever been activated, at which time the District delivered water to Golden State Water. The District has also discussed installing interconnections with the cities of Pomona and Ontario. Water is transported from the District to Chino Hills via transmission mains and ultimately delivered through two turnout facilities.

# SECTION 3
# WATER SYSTEM DEMANDS

## 3.1 RECENT WATER DEMAND TRENDS

Over the past ten years, Monte Vista Water District's retail customers have achieved a significant and sustained reduction in demands. As of the writing of this report (May 2016), retail customer demands are 36 percent less than in 2007 (see Figure 3-1).

**Figure 3-1:**
**District Retail Customer Demand – 2007-2016**

The District has consistently and actively promoted water use efficiency and provided educational and financial resources to assist customers in wise and efficient water use. In 2010 the District adopted mandatory year-round water use efficiency "best practices," as well as the region's first budget-based tiered rate structure for single-family residential customers (80 percent of total metered accounts) which incentivizes efficient use. See Sections 6 and 7 below for more information on these programs and activities.

In January 2014, Governor Brown proclaimed a State of Emergency in recognition of record-setting drought conditions across California and the western United States. On April 1, 2015, he issued an executive order requiring a mandatory 25 percent reduction in urban water use across the State – an unprecedented action in California history. In May 2015, the District's Board of Directors declared a Significant Water Supply Shortage in response to Governor Brown's order.

Consistent with the Water Conservation Act of 2009, the District is required to reduce water use on a gallons per person per day basis by 20 percent compared to a ten-year baseline average (see Section 3.6 below)—a goal that District customers have already accomplished! While the District expects overall water demands to slowly increase as drought conditions improve and the current emergency order is lifted, the District will work with its customers to maintain and enhance their water use efficiency in order to comply with the State's requirements and District policy goals.

## 3.2 RETAIL DEMAND PROJECTIONS – LAND USE BASED MODEL

In 2015, as part of its regional integrated resource planning effort, Inland Empire Utilities Agency (IEUA) developed a Land Use Based Water Demand Model for projecting water demands through 2040 for each of its retail water agencies, including the District. This model updates the demand projections used in the District's 2008 Water Master Plan to plan and size future District facilities. For a description of the methodology used by the model to project the District's future retail water demands, including the extent to which passive savings are considered, please see Appendix G. For existing and future land uses, see Figure 2-2 and Figure 2-3.

## 3.3 PAST, CURRENT, AND PROJECTED WATER DEMANDS

Table 3-2 provides the District's existing and projected demands on its water system by customer and water use sector. The projected retail demands are based on Land Use Model projections Section 3.2 and consistent with the demand reduction requirements and urban water use targets described in Section 3.6. Although historical wholesale demand by the City of Chino Hills has been between 8,000 and 14,000 AFY, the District will use its full contractual obligation of 20.22 mgd, or 22,650 AFY, in estimating future potential demands by Chino Hills on the District's water system.

## 3.4 SYSTEM WATER LOSS

Beginning in 2015, water suppliers are required to quantify their distribution system losses for the most recent 12-month period using the American Water Works Association's (AWWA) water system balance methodology. The District has tracked water system loss using AWWA's methodology since 2009. Table 3-1 provides water loss data for Fiscal Year Ending (FYE) 2015. The District's FYE 2015 water system audit using AWWA's Free Water Audit Software (v5.0) is included in Appendix H.

**Table 3-1:**
**District Water Loss – 2015 (AFY)**

| Reporting Period | Volume of Water Loss[1] |
|---|---|
| FYE 2015 | 497 |

Aligns with DWR Standardized Tables 4-4 R and 4-4 W.
[1] Includes both apparent and real losses (Appendix H).

**Table 3-2:**
**Current and Projected Water Demand by Sector (AFY)**

| Sector | 2015 Actual[1] | 2020 Projected | 2025 Projected | 2030 Projected | 2035 Projected | 2040 Projected |
|---|---|---|---|---|---|---|
| Single-family Residential[2] | 4,521 | 5,079 | 5,187 | 5,447 | 5,574 | 5,739 |
| Multi-family Residential[2] | 1,380 | 2,116 | 2,209 | 2,236 | 2,270 | 2,334 |
| Commercial[2] | 1,543 | 1,414 | 1,425 | 1,437 | 1,490 | 1,517 |
| Institutional/governmental[2] | 265 | 309 | 311 | 315 | 336 | 338 |
| Industrial[2] | 31 | 338 | 340 | 344 | 361 | 364 |
| Landscape[2] | 712 | 1,067 | 1,080 | 1,093 | 1,129 | 1,143 |
| Agriculture[2] | 50 | 58 | 51 | 16 | 10 | 0 |
| Hydrant and Fire Service[3] | 28 | 30 | 30 | 30 | 30 | 30 |
| Unbilled Metered Uses[4] | 73 | 175 | 175 | 175 | 175 | 175 |
| Unbilled Unmetered Uses[4] | 7 | 8 | 8 | 8 | 8 | 8 |
| Water Loss[5] | 497 | 525 | 541 | 560 | 579 | 597 |
| Groundwater Recharge (ASR)[6] | 1 | 400 | 400 | 400 | 400 | 400 |
| **Total Retail Potable Demand** | **9,110** | **11,519** | **11,756** | **12,060** | **12,361** | **12,645** |
| Wholesale Potable Demand[7] | 6,933 | 22,650 | 22,650 | 22,650 | 22,650 | 22,650 |
| **Total Potable Demand** | **16,043** | **34,169** | **34,406** | **34,710** | **35,011** | **35,295** |
| Recycled Water (Direct Sales)[8] | 308 | 430 | 430 | 430 | 430 | 430 |
| Recycled Water (Recharge)[8] | 483 | 601 | 560 | 589 | 639 | 639 |
| **Total Non-Potable Demand** | **791** | **1,031** | **990** | **1,019** | **1,069** | **1,069** |
| **Total Water Demand** | **16,834** | **35,200** | **35,396** | **35,730** | **36,081** | **36,364** |

Aligns with data in DWR Standardized Tables 4-1 R, 4-1 W, 4-2 R, and 4-2 W.

[1] 2015 demands obtained from District billing, production, distribution, and water loss audit data for fiscal years (July-June) ending in above year.

[2] Residential, commercial, institutional/governmental, industrial, landscape, and agricultural water demand calculated using the Land Use Based Demand Model, 2015 (Appendix G). Water loss and unbilled metered and unmetered uses subtracted out of total demand factor per customer use category. Single-family residential demands include very low, low, and medium (40 percent) model projected residential demands; multi-family residential demands include medium (60 percent) and high density model projected residential demands. Projected landscape demands include all park and school yard landscape demands, some of which are metered as institutional/governmental.

[3] Includes hydrant meters used during construction and detector check (DC) fire accounts.

[4] Unbilled metered uses include hydrant flushing, fire flow tests, District facility landscape irrigation, and groundwater well pump to waste. Unbilled unmetered uses include groundwater well water quality analyzers, facility washdown, street sweeping, and local firefighting. All approved but unbilled uses are tracked and reported in the annual water system audit (Section 3.4). Usage can be highly variable year to year. Projections based on average use over the past five years.

[5] Includes both real losses (leaks) and apparent losses (customer meter inaccuracies, billing errors, and theft) as reported in the annual water system audit (Section 3.4). Projections based on average loss over the past five years.

[6] The District estimates that available and affordable imported water will be available in one out of five future years for treatment and injection into the Chino Groundwater Basin through the District's Aquifer Storage and Recovery (ASR) wells. During such years, the District estimates it will be able to inject 2,000 AF. As a result, 400 AF is projected as an average annual availability of injection water for conjunctive use (see Section 4.6.2).

[7] 2020-2040 wholesale demand equals full contractual obligation to the City of Chino Hills.

[8] Recycled water direct sales are deliveries to the District's recycled water customers through its retail recycled water distribution system. Recycled water groundwater recharge is the District's purchased City of Montclair share of regional recycled water recharge in the Chino Groundwater Basin (see Section 4.6.5).

## 3.5 LOWER INCOME HOUSING DEMANDS

SB 1087 requires water providers to grant priority service hook-ups to lower income housing developments. The UWMP Act requires documentation of future water demands associated with planned new lower income housing by the local land use planning jurisdiction. A lower income household has an income below 80 percent of area median income, adjusted for family size.

The City of Montclair's updated 2014-2021 Housing Element of the General Plan (adopted February 2014) indicates a quantitative directive for the construction of 278 new low and very low income housing units within the City by 2021. The District is unaware of any lower income housing developments planned for the City of Chino or County of San Bernardino areas of the District service area.

Water demands for planned low income housing by 2021 were based on the average multi-family unit factor from the updated demand projections. New demands associated with planned low income housing are approximately 122 AF by 2020. The District confirms that this demand is included in the projected water demands represented in Table 3-2.

## 3.6 DEMAND REDUCTION REQUIREMENTS

The Water Conservation Act of 2009 requires all California urban water agencies to set and meet certain demand reduction targets in order to assist the State in reducing urban water use by 20 percent by 2020. This collective goal is commonly known as "20 percent by 2020" or "20x2020." The prescribed way to determine the District's compliance is by measuring the per person (or "per capita") daily water usage by District customers.

The Act requires DWR to develop, in consultation with an Urban Stakeholder Committee (USC) comprised of water agency representatives and water use experts, specific methodologies for determining per capita water use and other information required to meet 20x2020 water use reduction requirements. DWR published its Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use (Methodologies) in October 2010 and published an updated version of the Methodologies in February 2016. The District is required to follow the Methodologies when estimating past, current, and projected water system demands in its UWMP in order to establish water use reduction targets for 20x2020 compliance. Additionally, the 2016 Methodologies require the District to update its water use reduction targets using the most recent 2010 U.S. Census data.

This section of the plan outlines the District's process in estimating its system demands and establishing its 20x2020 water use reduction targets. The District's Board of Directors will formally adopt its 2020 water use target as part of its resolution adopting the 2015 UWMP (see Appendix E).

### 3.6.1 Baseline Gallons Per Capita Per Day

The first step toward achieving 20x2020 compliance is to determine the District's Base Daily Per Capita Water Use which is used to form a baseline for the agency's 20 percent reduction in water use target for 2020. The Methodologies require water agencies to identify a continuous 10-year period ending no earlier than 2004 and no later than 2010, and then calculate the gallons per capita per day (GPCD) demands of their customers for each of these years.[7] The average GPCD over this 10-year period forms the agency's Base Daily Per Capita Water Use, or Baseline GPCD.

Following the 2016 Methodologies and using the DWR Population Tool (https://wuedata.water.ca.gov/secure/wue_supplier_tool.asp), the District has recalculated its service area population for the years 1996-2005 using updated 2010 U.S. Census data,[8] and then divided its population by the total gross potable water supply entering its potable water distribution system. As shown in Table 3-3, the final calculation of the District's Baseline GPCD, using the 10-year GPCD average of the years 1996-2005, is 209 GPCD.

The following sections describe how the District determined its population and gross potable water supply for these historical periods.

**Table 3-3:**
**Baseline Gallons Per Capita Per Day Calculation – 10-Year Range**

| Calendar Year | Service Area Population | Annual Gross Water Use (AFY) | Daily Per Capita Water Use (GPCD) |
|---|---|---|---|
| 1996 | 47,020 | 10,708 | 203 |
| 1997 | 46,778 | 11,832 | 226 |
| 1998 | 46,508 | 10,146 | 195 |
| 1999 | 48,048 | 10,612 | 197 |
| 2000 | 48,996 | 11,925 | 217 |
| 2001 | 49,459 | 11,708 | 211 |
| 2002 | 49,648 | 11,990 | 216 |
| 2003 | 50,189 | 11,924 | 212 |
| 2004 | 50,784 | 12,441 | 219 |
| 2005 | 50,960 | 10,871 | 190 |
| **Baseline Gallons Per Capita Per Day (10-Year Average):** | | | **209** |

Aligns with data in DWR Standardized SBX 7-7 Tables 4 and 5.

[7] Water agencies which met at least 10 percent of their total 2008 demand through recycled water could expand their baseline window to 15 years; the District had just started deliveries of recycled water in 2008.
[8] Data from the 2010 U.S. Census was not yet available when the District initially calculated its Baseline GPCD in its 2010 UWMP.

### *Population*

DWR's Methodologies provide a specific method for urban water agencies to estimate their past and present service area populations, depending on available information. The District's service area is not contiguous with one municipal incorporated area, and so it is not able to rely solely on California Department of Finance population estimates for individual incorporated cities. Neither does a regional or wholesale agency provide the District with annual population estimates for its service area. The District, therefore, is required to follow the methods outlined in Methodology 2 of the Methodologies, using the DWR Population Tool which matches data from the most recent U.S. Census with the District's active accounts for each year, to come up with annual population estimates. For its 2015 population, the District used an alternative methodology based on local knowledge. For documentation associated with population estimates, see Appendix F.

### *Gross Potable Water Use*

Gross potable water use is defined by DWR's Methodologies as the total amount of water entering the District's potable water system, minus water exports to other agencies, water placed into long-term storage (e.g., water injected into the groundwater basin), and indirect reuse of recycled water through groundwater recharge.

The District directly meters and accounts for water entering into its potable water distribution system. Water production and deliveries to the District's wholesale agency customer, the City of Chino Hills, is separately metered. Since 2002, the District has purchased the City of Montclair's portion of the regional recycled water recharge into the Chino Groundwater Basin (see Section 4.5); the annual amount of indirect recycled water reuse is calculated using the process outlined in DWR's Methodologies and subtracted from its retail potable water supply, resulting in a calculated gross potable water supply. For documentation associated with indirect recycled water reuse calculation, see Appendix I.

## 3.6.2 Target Gallons Per Capita Per Day

Having established its Baseline GPCD, the District is required by DWR's Methodologies to determine its Urban Water Use Target GPCD for 2020 and its Interim Urban Water Use Target for 2015. The Water Conservation Act of 2009 provides water agencies with four methods for setting its urban water use targets:

- **Method 1:** Reduce total demand on the water system by 20 percent, measured by comparing baseline gallons per capita per day (GPCD) historical usage to GPCD usage in 2020.

- **Method 2:** Meet system-wide water use performance standards for indoor residential water use, landscaped area water use, and other uses.

- **Method 3:** Meet 95 percent of the water agency's hydrologic regional target, as determined by the State's 20x2020 Water Conservation Plan.

- **Method 4:** An additional compliance option, developed by DWR in consultation with the USC, based on water use sector performance standards and past conservation activity.

The District has evaluated each method and reconfirms that Method 1 is the most feasible for the District to use in setting its urban water use targets. Following Method 1, the District's Target GPCD for 2020 must be 80 percent of its Baseline GPCD, or 167 GPCD. The District's Interim Target GPCD for 2015 is calculated by adding the Baseline GPCD and the Target GPCD together, and dividing by two; the result is an Interim Target GPCD of 188 GPCD (see Table 3-4).

**Table 3-4:**
**District Urban Water Use Targets**

| Baseline GPCD | 2020 Urban Water Use Target[1] | 2015 Interim Urban Water Use Target[2] |
|---|---|---|
| **209** | **167** | **188** |

Aligns with data in DWR Standardized Table 5-1 and SBX 7-7 Tables 7-A, 7-F, and 8.
[1] 80% of Baseline GPCD.
[2] (Baseline GPCD + 2020 Urban Water Use Target) / 2

### *Confirm Urban Water Use Targets*

The District's final step in setting its urban water use targets is to confirm that its target meets the minimum threshold set by the Water Conservation Act of 2009 of a five percent reduction from the average GPCD of a five-year contiguous base period between 2003-2010. As demonstrated in Table 3-5, a five percent reduction from the baseline average GPCD for the years 2003-2007 provides a maximum target of 192 GPCD. The District's urban water use target of 167 GPCD is well below this maximum target.

**Table 3-5:**
**Baseline Gallons Per Capita Per Day Calculation – 5-Year Range**

| Calendar Year | Service Area Population | Annual Gross Water Use (AFY) | Daily Per Capita Water Use (GPCD) |
|---|---|---|---|
| 2003 | 50,189 | 11,924 | 212 |
| 2004 | 50,784 | 12,441 | 219 |
| 2005 | 50,960 | 10,871 | 190 |
| 2006 | 51,578 | 11,423 | 198 |
| 2007 | 52,416 | 11,101 | 189 |
| **Baseline Gallons Per Capita Per Day (5-Year Average):** | | | 202 |
| **95% of Baseline Gallons Per Capita Per Day:** | | | **192** |

Aligns with data in DWR Standardized SBX 7-7 Tables 5 and 7-F.

### 3.6.3 Compliance with 2015 Interim Urban Water Use Target

The District is required to report in its 2015 UWMP whether it has achieved its 2015 Interim Urban Water Use Target as required by SBX7-7. As shown in Table 3-6, District customers used 137 GPCD in 2015, which is 34 percent below the Baseline GPCD of 209, far exceeding the 10 percent reduction requirement.

**Table 3-6:**
**Compliance with 2015 Interim Urban Water Use Target**

| Calendar Year | Service Area Population | Annual Gross Water Use (AFY) | Daily Per Capita Water Use (GPCD) |
|---|---|---|---|
| 2015 | 55,581 | 8,532 | **137** |
| **Interim Urban Water Use Target** | | | **188** |
| **Did the District Achieve Targeted Reduction for 2015?** | | | **Yes** |

Aligns with data in DWR Standardized Table 5-2 and SBX 7-7 Table 9.

### 3.6.4 Wholesale Agency Assistance in Meeting Urban Water Use Target

The City of Chino Hills's Base Daily Per Capita Water Use (average of 1995-2004) is 217 GPCD, resulting in a 2020 Urban Water Use Target of 173 GPCD and a 2015 Interim Urban Water Use Target of 195 GPCD. Chino Hills's actual 2015 GPCD was 164 GPCD, which is 24 percent below its Baseline GPCD and well below its 10 percent reduction requirement.[9]

Chino Hills, at this time, has not requested and does not appear to need assistance from the District in achieving its 20x2020 reduction requirements. The District has in the past, and at the request of the city, provided general assistance in meeting California Urban Water Conservation Council Best Management Practices reporting requirements (see Section 6.1.1). The District and Chino Hills also collaborate in various regional conservation programs (Section 6.3.1) and through the Regional Alliance (Section 1.2.3).

# WATER SYSTEM SUPPLIES

## 4.1 WATER SUPPLY OVERVIEW

Over the past 15 years, Monte Vista Water District has invested over $50 million in its infrastructure and has increased its water supply capacity to over 50 million gallons per day. Key investments in local groundwater, surface water, and recycled water have focused on building a diverse, drought-resilient water supply portfolio and reducing reliance on imported water. For a full list of investments, see Table 4-2 below.

The District currently receives its water supply from four sources:

- Groundwater produced from the Chino Groundwater Basin, an adjudicated basin managed through the Chino Basin Watermaster process;
- Imported State Water Project surface water from northern California received from the Metropolitan Water District of Southern California through the Inland Empire Utilities Agency and the Water Facilities Authority;
- Entitlement water deliveries from the San Antonio Water Company, including groundwater produced from local adjudicated groundwater basins and surface water produced from the San Antonio Creek Watershed; and,
- Recycled water from Inland Empire Utilities Agency.

**Table 4-1:**
**Water Supplies – Current and Projected (AFY)**

| Water Supply Sources | 2015 Actual[1] | 2020 Projected | 2025 Projected | 2030 Projected | 2035 Projected | 2040 Projected |
|---|---|---|---|---|---|---|
| Chino Groundwater Basin[2] | 8,406 | 28,183 | 28,183 | 28,183 | 28,183 | 28,183 |
| Water Facilities Authority[3] | 7,025 | 21,776 | 21,776 | 21,776 | 21,776 | 21,776 |
| San Antonio Water Company[4] | 611 | 800 | 800 | 800 | 800 | 800 |
| Inland Empire Utilities Agency – Recycled Water[5] | 791 | 1,031 | 990 | 1,019 | 1,069 | 1,069 |
| **Total Water Supply** | **16,833** | **51,790** | **51,749** | **51,778** | **51,828** | **51,828** |

Aligns with data in DWR Standardized Tables 6-8 R, 6-8 W, 6-9 R, and 6-9 W.
[1] Actual production and purchases for Fiscal Year Ending 2015 (July 2014 – June 2015).
[2] District groundwater well production capacity minus 15% to account for potential well shutdowns for maintenance or testing.
[3] The District may use up to its full share (24%) of WFA treatment plant capacity (81 mgd) at any time, subject to Tier 2 and penalty rates.
[4] Annual non-shortage entitlement through District ownership of outstanding SAWCo shares.
[5] Includes recycled water purchased for direct reuse and groundwater recharge (Table 4-7).

The District's current and projected available water supplies are listed in Table 4-1. All supplies are available for use to meet both retail and wholesale water demands.

**Table 4-2:**
**Investments in Local Water Supply**

| Facilities | Completed | Investment | Supply |
|---|---|---|---|
| Agua de Lejos Water Treatment Plant | 1988 (2016 debt) | $25 million (MVWD share) | 19.4 mgd (MVWD share) |
| Monte Vista Irrigation Company | 1999 | $4.4 million | 1,000 AFY (6,700 AF stored) |
| Well 26 | 2002 | $1.1 million | 2,000 gpm |
| Well 27 | 2002 | $1.7 million | 500-2,000 gpm |
| Well 28 | 2002 | $1.9 million | 2,100 gpm |

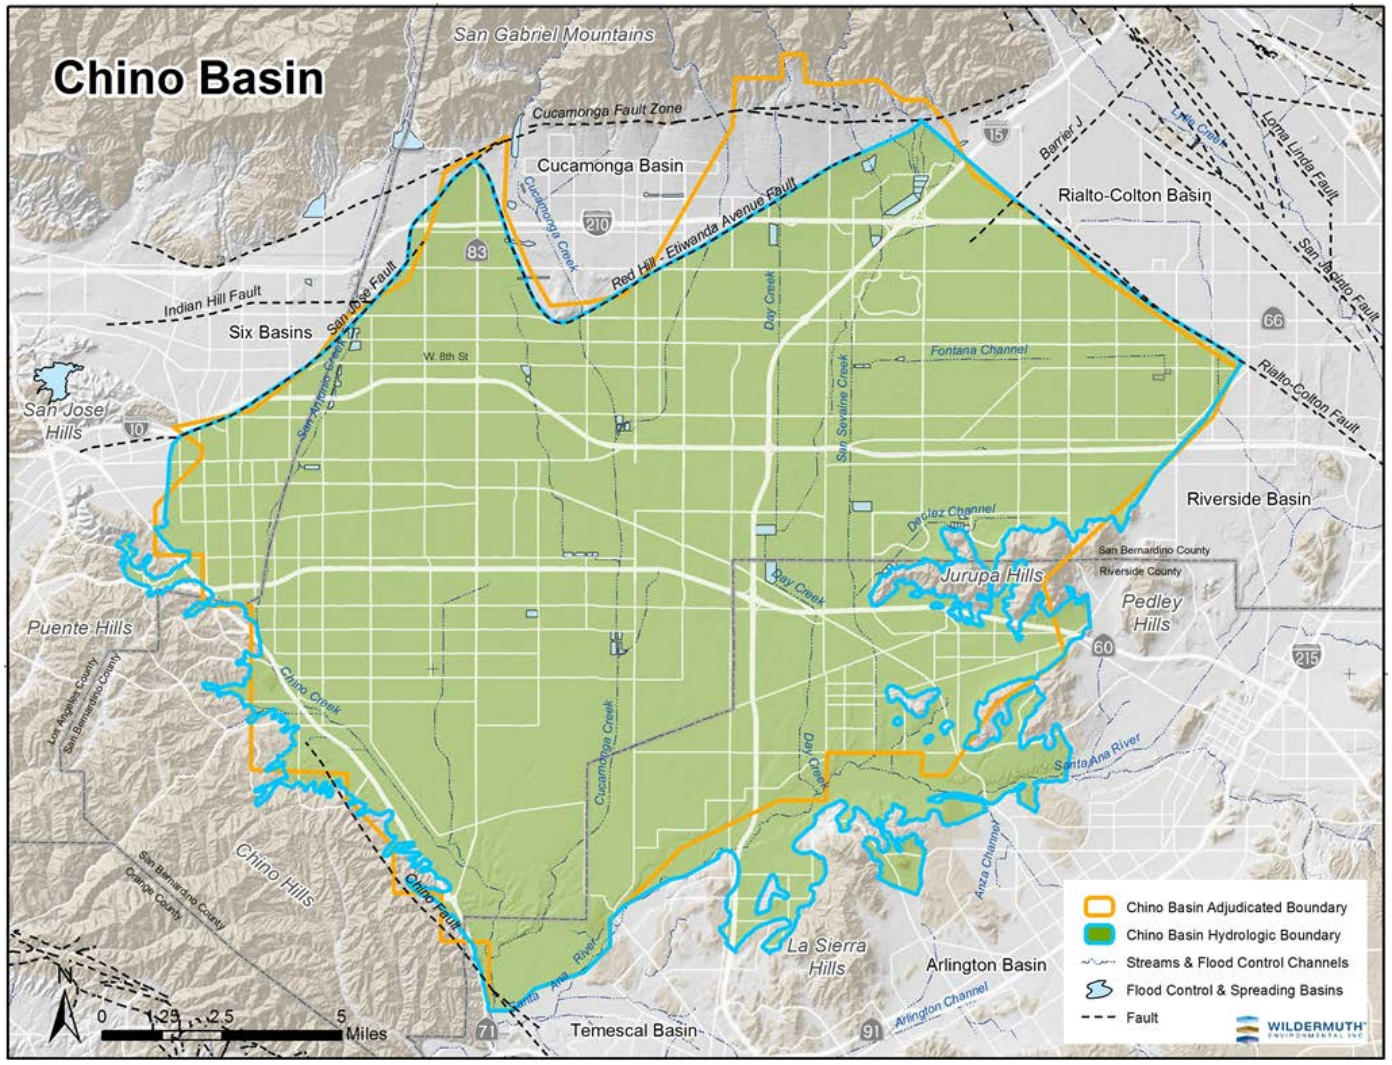
| San Antonio Water Company Shares (300) | 2009 | $9 million | 800 AFY |
| | **Totals** | **$63.5 million** | **50.8 mgd**[1] |

[1] *Based on current total capacity of acquired resources.*

## 4.2 CHINO GROUNDWATER BASIN

### 4.2.1 Basin Overview

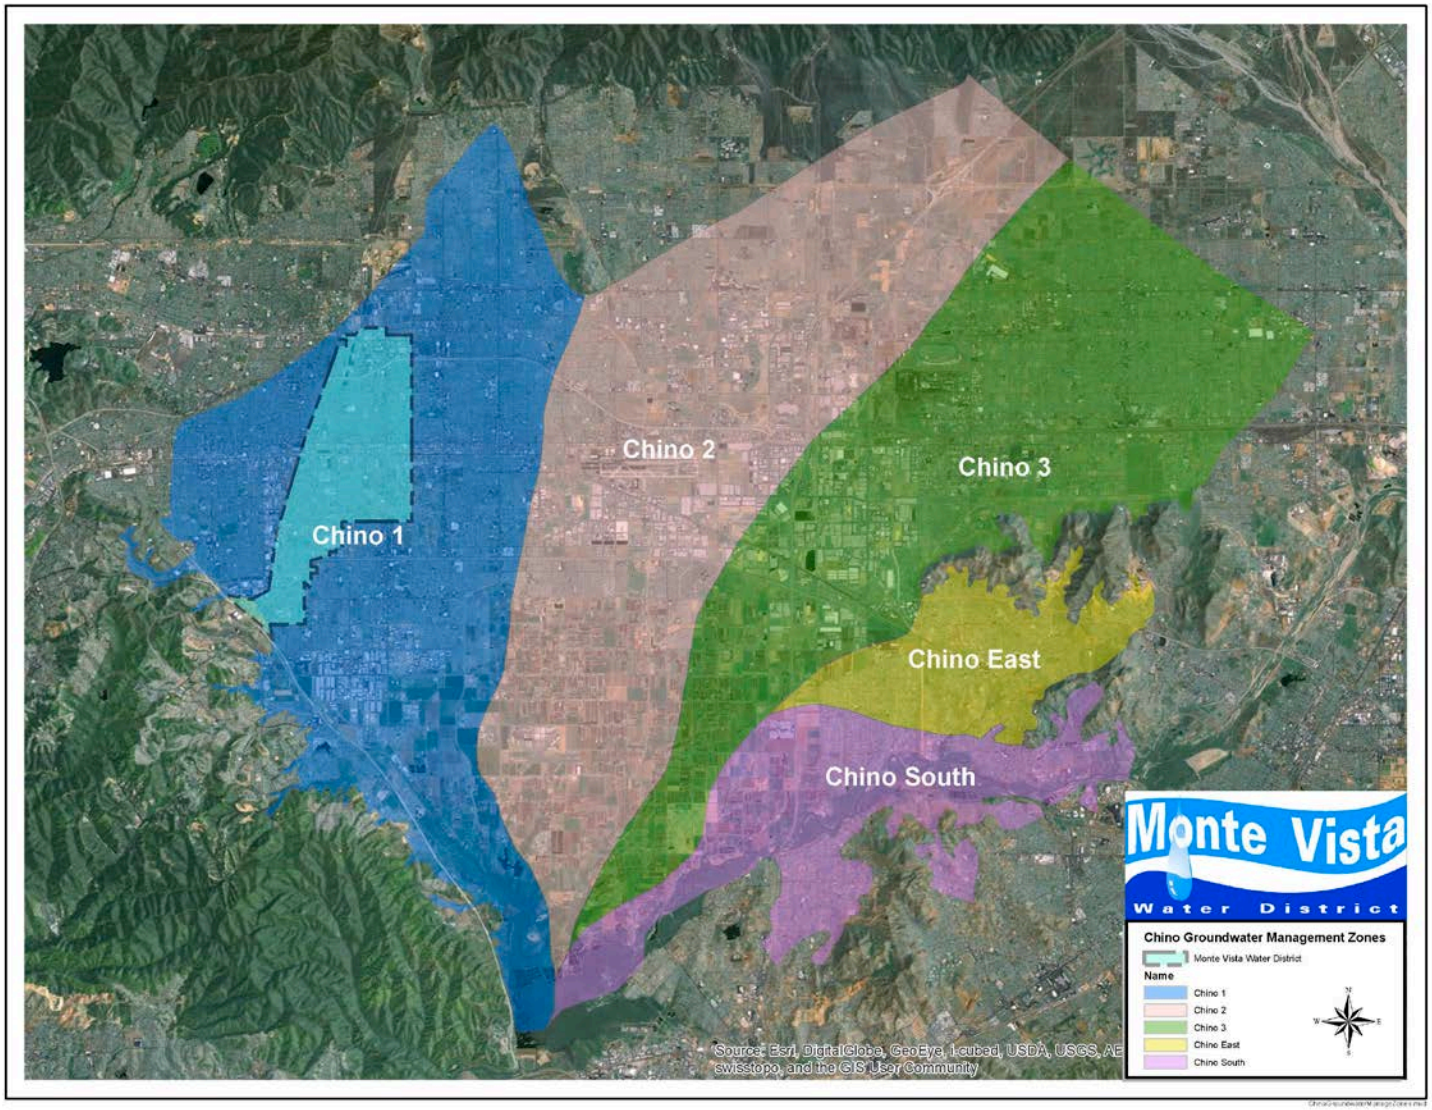
The District's primary source of water supply is the Chino Groundwater Basin (Chino Basin). This basin is located in the Santa Ana River Watershed under a surface area of approximately 220 square miles. The Chino Basin underlies a relatively flat alluvial valley from east to west which slopes from north to south at a one to two percent grade. Valley elevations range from about 2,000 feet in the foothills below the San Gabriel Mountain to about 500 feet near Prado Dam.



The principal surface drainage for the Chino Basin is the Santa Ana River. Year-round flow occurs along the entire reach of the Santa Ana River due to surface inflows at Riverside Narrows, discharges from municipal water recycling plants to the Santa Ana River, and rising groundwater. Multiple concrete-lined channels, including the San Antonio, Chino, Cucamonga, Day, and San Sevaine creeks, collect and drain snowmelt, stormwater, and urban runoff from the foothills and valley area and flow directly into the river or mix with rising groundwater in the wetlands above Prado Dam. Recharge basins have been constructed and are maintained along these channels to capture and recharge native flows, as well as imported water and recycled water, back into the groundwater.

While still considered to be a single groundwater basin, the Chino Basin is hydraulically divided into five distinct underground drainage areas, or Management Zones (MZs), based upon similar hydrologic conditions, and three sub-basins as defined in the Optimum Basin Management Program, June 2000, and the 1995 Water Quality Control Plan for the Santa Ana Watershed (Region 8).

The Chino Basin has a total underground water storage capacity of approximately 6 million acre-feet (MAF) and currently holds approximately 5 MAF of groundwater. The Chino Basin Judgment, adopted by the California Superior Court in 1978 under stipulation by local groundwater producers, designated a safe yield for the basin of 140,000 AF, which is the amount of groundwater that can be pumped from the basin each year without causing undesirable results. Purchasing imported water from MWD through IEUA for basin recharge generally makes up any excess of pumping over the safe yield, although supplemental water may be obtained from any available source including recycled water and imported water. The Judgment also allows for the transfer and storage of excess rights and supplemental supplies (see Section 4.2.2).



The Chino Basin Judgment provides the California Superior Court with continuing jurisdiction over management of the Chino Basin for the benefit of the producing parties and the public. The Judgment creates the Chino Basin Watermaster to serve as an arm of the Court in overseeing implementation of the Judgment, as well as subsequent management agreements, to ensure that the groundwater basin is properly managed. The Judgment and management agreements establish groundwater production rights and a "physical solution" which provides for replenishment of any production over and above a producing party's share of safe yield.

**Figure 4-1:**
**Chino Groundwater Basin Boundaries and Water Features**

*Courtesy of Chino Basin Watermaster, 2016*

**Figure 4-2:**
**Chino Groundwater Basins with Management Zones**

The District currently has base water rights, or an assigned share of the safe yield, of 4,824 AFY. The District also receives annual water rights from reallocations of unpumped agricultural rights, annual transfers from other parties, and recharged recycled water credit. Additionally, the District owns the Monte Vista Irrigation Company, which has 677 AFY of base rights and receives its share of unpumped agricultural rights.

In October 2015, Watermaster submitted to the Court the 2015 Safe Yield Reset Agreement which resets safe yield from 140,000 AFY to 135,000 AFY and administers the resulting reallocation of rights based on existing agreements (see below). If the Court approves the agreement, the District's annual allocation of production rights will decline, but the District's access to basin groundwater will remain unchanged.

### 4.2.2 Chino Basin Watermaster

#### *Governance and Agreements*

Chino Basin Watermaster (Watermaster) was created pursuant to the terms of Court Judgment entered in Superior Court of California, County of San Bernardino Case No. RCV 51010 (formerly Case No. SCV 164327) entitled *Chino Basin Municipal Water District v. City of Chino, et al.* (Appendix J). The Judgment establishes safe yield and annual production rights for the Chino Basin, and provides a forum for basin stakeholders to work cooperatively in managing the basin to meet regional water supply needs.

The Judgment, which was entered on January 27, 1978, established three groundwater "pool" committees: (1) the Overlying Agricultural Pool, which includes the State of California, non-producing water districts, and all producers of water for uses other than industrial or commercial purposes; (2) the Overlying Non-Agricultural Pool, which represents producers of water for industrial or commercial purposes; and (3) the Appropriative Pool, which represents cities, districts and other public or private utilities and water purveyors. Representatives from the pool committees constitute an Advisory Committee that sets basin management policies and advises Watermaster's nine-member Board, which is comprised of designated representatives from the three pools and non-producing municipal water districts. The Watermaster Board, in turn, advises and serves as an arm of the Court in its continuing jurisdiction over the basin under the Judgment.

The Judgment was amended in 2000 through the signing of the Peace Agreement which, among other things, established procedures to implement an Optimum Basin Management Program (OBMP) to preserve and enhance basin yield and water quality, and again in 2007 through the signing of the Peace II Agreement which, among other things, provided for the construction of desalters to treat groundwater degraded by past agricultural practices. These agreements and subsequent court orders also establish a process, consistent with the Judgment, for unproduced Agricultural Pool rights to be transferred to the Appropriative Pool. Finally, these agreements foster a market for the lease or sale of pumping rights within the basin. Annual water exchanges occur regularly among agencies within the Appropriative Pool and between the Non-Agricultural Pool and the Appropriative Pool.

### *Basin Yield and Allocation of Rights*

The Judgment defines "Safe Yield" as the amount of water that can be safely extracted from the basin on an annual basis and sets it at 140,000 AFY.[10] Safe Yield is allocated first to the Agricultural Pool and the Non-Agricultural Pool in fixed quantities of 82,800 AFY and 7,366 AFY, respectively, to satisfy their prioritized overlying (or riparian) water rights as recognized under the Judgment. Once the overlying pools are satisfied, the remainder of Safe Yield is allocated to Appropriative Pool parties based on established percentages. While the allocations to the overlying pools are fixed, the allocation to the Appropriative Pool may increase or decrease depending on changes to Safe Yield or the development of additional yields.

The Judgment defines all basin yield allocated to the Appropriative Pool as "Operating Safe Yield" (OSY). OSY includes the Appropriative Pool's share of Safe Yield, any overdraft of the basin that has been approved by the Court, and any additional yield to the basin not included in Safe Yield. To date, the Court has approved two quantities of basin overdraft:

1. An overdraft of 200,000 AF, allocated to OSY at 5,000 AFY over the first 30 years of the Judgment (1978-2017); and,

2. An overdraft of 400,000 AF to facilitate a basin management program known as "Basin Re-operation," allocated annually by agreement not to the OSY but instead to offset the replenishment obligation of the Chino Desalter Authority production wells.

Yield that has been developed but not incorporated into Safe Yield is defined by the Peace Agreement as "New Yield" and is included in OSY by agreement (except for New Yield generated by desalter wells—see below). To date, and again by agreement, annual quantities of New Yield generated by newly constructed stormwater capture facilities were allocated to Appropriative Pool parties between 2004 and 2008.

Additionally, the Judgment—unique among California groundwater basin adjudications—envisioned a long-term transition in the Chino Basin from agricultural to urban land uses, and incorporated a mechanism for unproduced Agricultural Pool rights to transfer to the Appropriative Pool as the land was developed. The Judgment establishes a priority for distribution of these rights: first to offset the impact of a decline in Safe Yield, then to satisfy land conversion claims, then to all Appropriative Pool parties. Through a series of agreements and court orders, a process was developed to implement this transfer by way of two equal priority methods: an "early transfer" of 32,800 AFY to the entire Appropriative Pool, and a 2 AF per acre transfer to individual Appropriative Pool parties with agricultural land use conversion claims. If the total transfer plus Agricultural Pool production exceeds the Agricultural Pool's share of Safe Yield, each Appropriative Pool party's share of the total transfer is reduced proportionately. The Court also approved a similar reduction of the total transfer when Safe Yield declines.

[10] This summarizes the legal definition that can be found in the Chino Basin Judgment, ¶4(x) (Appendix J).

As stated above, Watermaster has submitted to the Court the 2015 Safe Yield Reset Agreement. If adopted by the Court, the terms of the agreement will go into effect beginning with the 2014-15 production year (July 1, 2014 through June 30, 2015). According to the terms of the agreement, Safe Yield is reduced from 140,000 AFY to 135,000 AFY, inclusive of all New Yield up to this time. Additionally, the agreement finds that up to 20,000 AFY of New Yield generated by the Chino Desalter Authority groundwater wells is enjoined by agreement from being considered part of Safe Yield, thus effectively reducing Safe Yield by an additional 20,000 AFY. This combined 25,000 AFY reduction of Safe Yield must be offset by unproduced Agricultural Pool rights, thus effectively reducing the amount of rights available for reallocation through early transfer and land use conversion claims.

Finally, the Judgment allows Appropriative Pool parties to "carry over" unproduced production rights equal to their annual share of OSY to the following year. Any quantity carried over in excess of OSY must be placed in a local storage account (see below).

A key element of the Judgment's "physical solution" is the provision of replenishment water for production of groundwater in excess of production rights. Watermaster or individual parties may use imported water, recycled water, stored water, and water transfers from other parties as replenishment water to offset overproduction. As long as the producing party does not cause physical injury to another producer or to the basin, they may produce groundwater in excess of their production rights.

### *District Groundwater Production Rights*

The District's total annual Chino Basin production rights vary based on Watermaster's allocation of unused Agricultural Pool rights, District annual purchases from other producers, and other factors. Over the last decade, the District has transitioned from being an overproducer to an underproducer of its available groundwater production rights, resulting in carryover for production in subsequent years and the building up of stored groundwater (see below). Additionally, the District owns and may use some or all of Monte Vista Irrigation Company's (Company) annual production rights, receives production rights credit for a portion of IEUA's regional recycled water recharge (see Section 4.5.2), may receive transfers from SAWCo as part of its entitlement (see Section 4.4), and may purchase additional production rights from other parties. If the District produces in excess of its production rights in any given year, it may transfer stored water, purchase water from another party, or pay Watermaster a replenishment assessment fee.

In Fiscal Year Ending (FYE) 2015 (July 2014 through June 2015), the District's total rights to produce groundwater from the Chino Basin, including Company production rights, recycled water recharge credits, and transfers from SAWCO and the Agricultural and Non-Agricultural Pools, were equal to approximately 14,217 AF. This estimate assumes that the 2015 Safe Yield Agreement is approved by the Court.[11]

[11] The District's fiscal year aligns with Watermaster's production year. Watermaster prepares an Assessment Package each November to determine the assessments for each groundwater producer from the prior fiscal year.

The following are the criteria used for this estimate:

- OSY, comprised of the Appropriative Pool share of the reset Safe Yield, excluding New Yield generated by the Chino Desalter Authority groundwater wells, and including approved overdraft, is 29,834 AFY (135,000 – 82,800 – 7,366 – 20,000 + 5,000 = 29,834). However, as described above, the first priority of use for unproduced Agricultural Pool rights is to offset the impact of a decline in Safe Yield. Therefore, OSY is made whole and increased by 25,000 AFY to 54,834 AFY. The District's share of OSY is 8.797 percent, or 4,824 AFY, and the Company's share of OSY is 1.234 percent, or 677 AFY.

- According to Watermaster records, the Agricultural Pool produced 28,521 AF in FYE 2015, resulting in unproduced rights of 54,279 AF available for reallocation (82,800 – 28,521 = 54,279). The first 25,000 AF is reallocated to offset the decline in Safe Yield, resulting in 29,279 AF remaining to be reallocated through early transfer and land use conversion claims. Using land use conversion claims from the prior year and resulting reallocation adjustments (see Table 4-3), the District estimates that the District and Company will receive 1,460 AF and 201 AF in reallocated Agricultural Pool rights, respectively.

- In FYE 2015, the District and Company participated in the transfer of Non-Agricultural Pool rights under the Peace II Agreement's Exhibit "G" provisions, and purchased 452 AF and 35 AF, respectively. Additionally, SAWCo transferred 387 AF of entitlement deliveries to the District, and the District received a 213 AF transfer from the Non-Agricultural Pool under the Peace II Agreement, Section 9.2 provisions.

- In FYE 2015, the District was allocated 468 AF of supplemental water credit as its share of the regional recycled water recharge program.

Table 4-3 shows how the total FYE 2015 production right is calculated, and then compares it to the total amount produced by the District. As shown, the District underproduced its annual rights by 6,197 AF. Of this amount, 5,284 AF will be carried over into next year's production right and 913 AF will be placed in the Company's excess carryover local storage account (see below).

While the District is currently an under-producer from the Basin, the District has in the past and may in the future overproduce if it is deemed necessary and appropriate to do so. The only consequence to the District when pumping above its basin production water right in any given year is to purchase additional replenishment water for the benefit of the basin, as governed by the Judgment and managed by Watermaster.

---

The most recently completed Assessment Package titled FY 2014/15 is for FY 2013/14 production rights. Due to ongoing litigation associated with the 2015 Safe Yield Reset Agreement, Watermaster was unable to complete a FY 2015/16 Assessment Package for FY 2014/15 production rights; however, Watermaster did publish information associated with FY 2014/15 production rights as part of an interim assessment process.

**Table 4-3:**
**Chino Groundwater Basin Total Annual Production Right,**
**Actual Production and Underproduction – FYE 2015 (AFY)**

| FYE 2015 | Monte Vista Water District | Monte Vista Irrigation Company |
|---|---|---|
| Early Transfer | 2,885 | 405 |
| Land Use Conversion[1] | 55 | 0 |
| Reallocation Adjustment[1] | <1,480> | <204> |
| **Total Ag Pool Safe Yield Reallocation** | **1,460** | **201** |
| Assigned Share of Safe Yield | 4,824 | 677 |
| Carryover from FYE 2014 Underproduction | 4,824 | 677 |
| Transfers[2] | 839 | 35 |
| **Total FYE 2015 Production Right** | **12,628** | **1,590** |
| **Total Assessable FYE 2015 Production[3]** | **<7,553>** | **0** |
| **Net Under-production** | **4,607** | **1,590** |

[1] Subject to change annually.
[2] For the District, includes 452 AF purchased from the Non-Agricultural Pool under Peace II, 387 AF of assigned water rights in lieu of direct deliveries from SAWCo, and 213 AF transferred from the Non-Agricultural Pool under Peace II. For the Company, includes 35 AF purchased from the Non-Agricultural Pool under Peace II.
[3] In FYE 2015, the District produced 853 AF of the City of Chino Hills's production rights. While this amount is included in the District's total groundwater production volume in Table 4-4, it is not included in this table which quantifies production rights.

Table 4-4 provides the amount of groundwater pumped for the last five years. Future groundwater production will be determined based on retail and wholesale demand, as well as replenishment water and imported water supply availability and cost. It is assumed that the District will lease additional groundwater rights or pay Watermaster replenishment rates when its adjudicated supply is exceeded.

**Table 4-4:**
**Groundwater – Volume Pumped (AFY)**

| Well Production | 2011 | 2012 | 2013 | 2014 | 2015 |
|---|---|---|---|---|---|
| Retail | 9,301 | 6,944 | 6,897 | 7,163 | 5,943 |
| Wholesale | 2,732 | 3,594 | 3,428 | 5,359 | 2,462 |
| **Totals** | **12,032** | **10,539** | **10,324** | **12,522** | **8,406** |

Aligns with data in DWR Standardized Tables 6-1 R and 6-1 W.

### *Groundwater Management*

The 1978 Chino Basin Judgment, included in Appendix J,[12] requires that Watermaster develop a management plan for the Chino Basin that meets water quality and water quantity objectives for the region. Three primary agreements govern the adjudication and management of the basin: 1) the 1978 Chino Basin Judgment; 2) the 2000 Peace Agreement, incorporating the Optimum Basin Management Program (OBMP) Implementation Plan; and 3) the 2007 Peace II Agreement. Links to full copies of these agreements are included on the Watermaster website, www.cbwm.org. A detailed discussion of these agreements and the complexities of Chino Basin groundwater management is included in Appendix K.

### *Groundwater Storage*

As stated above, the Chino Basin has approximately 5 MAF of groundwater in storage and has the capacity for storing an additional 1 MAF. The Judgment and Peace Agreements have developed a system for managing storage in the Chino Basin that prioritizes use of basin storage capacity for the benefit of the producing parties (see Appendix K). Each Appropriative Pool and Overlying Non-Agricultural Pool party has the right to store supplemental water and un-produced carryover water in the basin.

As of June 30, 2015, the District estimates it has a total of 26,484 AF of water in its excess carryover and local supplemental storage accounts. This quantity represents a significant reserve for use in times of drought and restrictions on other sources of supply.

### *Conjunctive Use / Dry Year Yield Program*

Conjunctive use is the coordinated operation of surface and groundwater resources, storage, and conveyance facilities to ensure full utilization of available supplies. During wet years when surface water is more readily available, its usage is increased and/or placed into groundwater storage. Then, during dry years, usage of groundwater is increased, offsetting demands on constrained surface water supplies.

Chino Basin producing parties, including the District, have actively engaged with Watermaster, IEUA, and MWD to develop conjunctive use programs that make use of available basin storage and production facilities. In 2004, a series of agreements were executed to implement the Dry Year Yield (DYY) Program with MWD. The DYY Program provided financing to develop facilities capable of producing 33,000 AFY during a dry year out of a designated 100,000 AF storage account. The participants are required to reduce (shift) their imported water usage by a predetermined amount during a dry year. Each participating agency has a specific shift obligation that, when added together, provide MWD with a total of 33,000 AFY of dry year supply. The DYY Program storage account is currently empty.

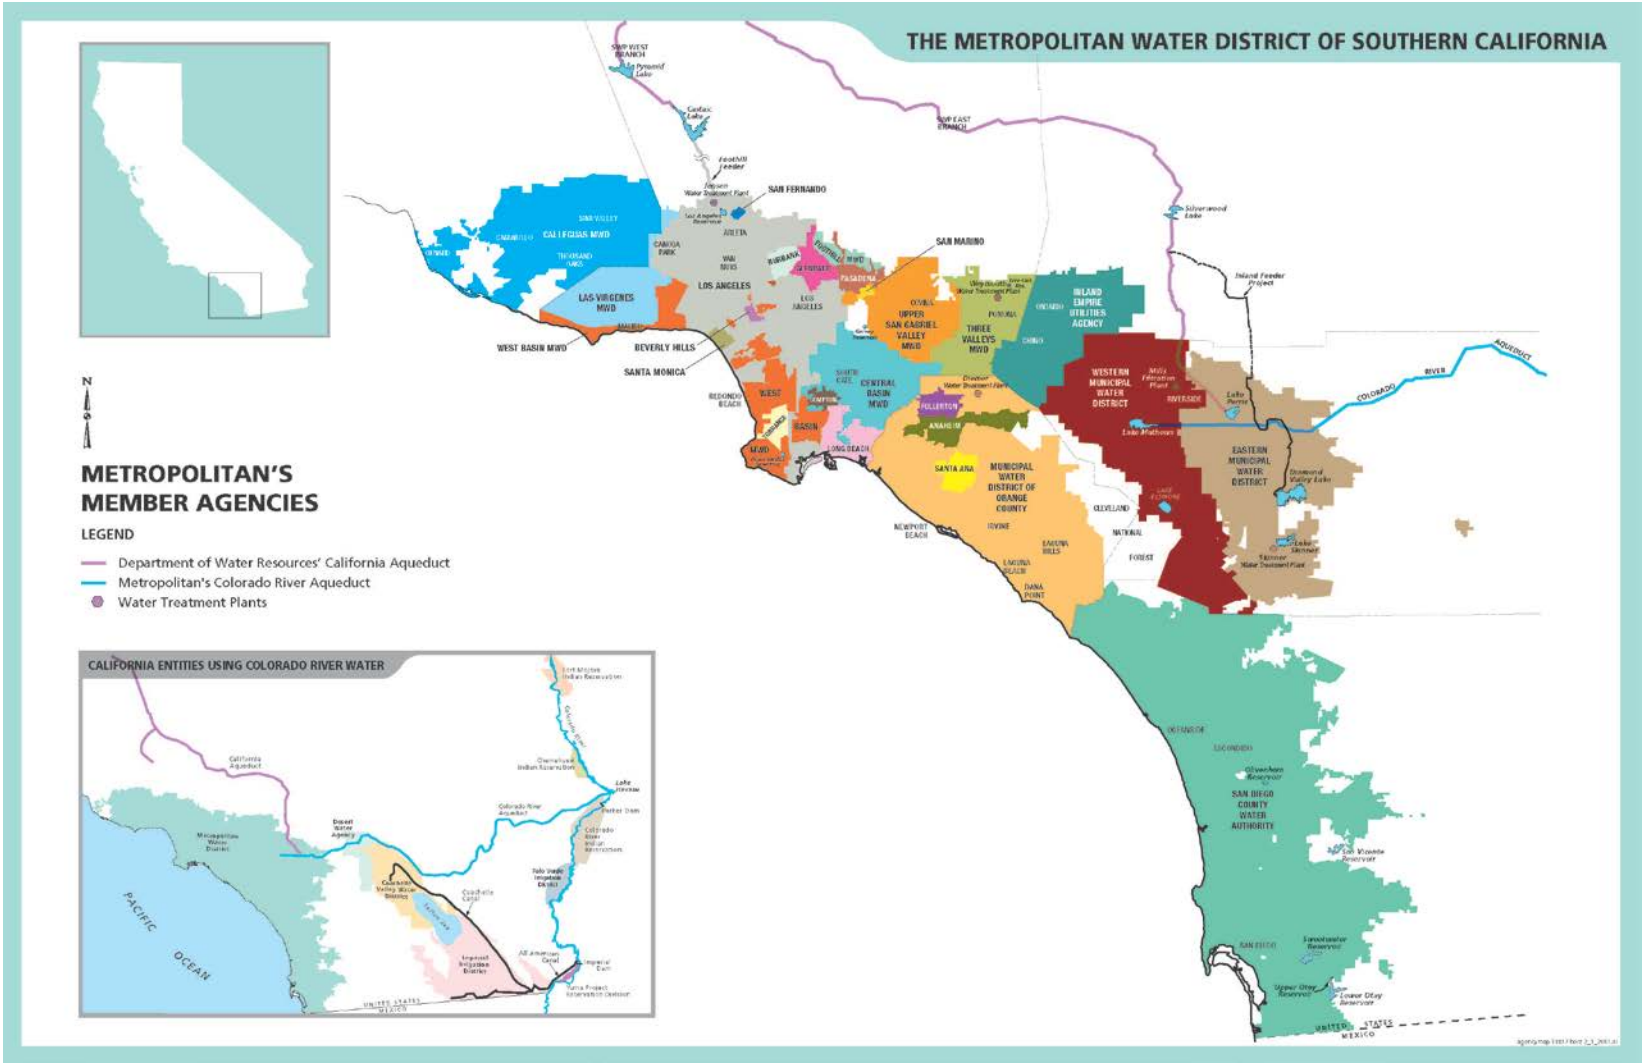
[12] In September 2012, the Court ordered that a Restated Judgment serve as the official and legally operative copy of the Judgment. All Judgment references in this plan are to the 2012 Restated Judgment.

## 4.3 STATE WATER PROJECT

The State Water Project (SWP) is a water storage and delivery system that provides supplemental water to 25 million people, two-thirds of California's population, and approximately 750,000 acres of irrigated farmland. The SWP is comprised of 34 storage facilities, 20 pumping plants, four pumping-generating plants, five hydroelectric power plants, and about 701 miles of open canals and pipelines. Its main purpose is to store water and distribute it to 29 urban and agricultural water suppliers in northern California, the San Francisco Bay area, the San Joaquin Valley, the Central Coast, and southern California. The SWP is maintained and operated by the California Department of Water Resources.

Over the past decade, approximately 40 percent of the District's water supply portfolio is obtained from the SWP. The imported SWP surface water originates in northern California and is transported via the California Aqueduct to Lake Silverwood in the San Bernardino Mountains. This water is extracted from the lake and directed to the Rialto Feeder, a large pipeline owned by Metropolitan Water District of Southern California that travels along the foothills delivering water to area surface water treatment plants. The Water Facility Authority's Aqua de Lejos Treatment Plant in Upland treats the surface water delivered by this pipeline to meet drinking water standards and then distributes it to its member agency owners, including the District.

### 4.3.1 Metropolitan Water District of Southern California



Metropolitan Water District of Southern California (MWD) was formed in the late 1920s to bring imported water to the southern California region. Collectively, the 13 charter members recognized the limited water supplies available within the region, and realized that continued prosperity and economic development of southern California depended on the acquisition and careful management of an adequate supplemental water supply. This foresight made the continued development of southern California possible.

MWD acquires water from northern California via the SWP and from the Colorado River to supply water to most of southern California. As a wholesaler, MWD has no retail customers, and distributes treated and/or untreated water directly to its 26 member agencies, including Inland Empire Utilities Agency (Figure 4-3).

MWD member agencies receive imported water at various delivery points on its system, and pay for it at uniform rates for each class of service established by the Board of Directors. Historically, MWD has been responsible for importing water into the region through its Colorado River Aqueduct and the SWP. Recently, MWD has increased its ability to supply water, particularly in dry years, through implementation of storage and transfer programs. Over the last decade, MWD supplied between 50-60 percent of the municipal, industrial, and agricultural water used within its boundaries.[13]

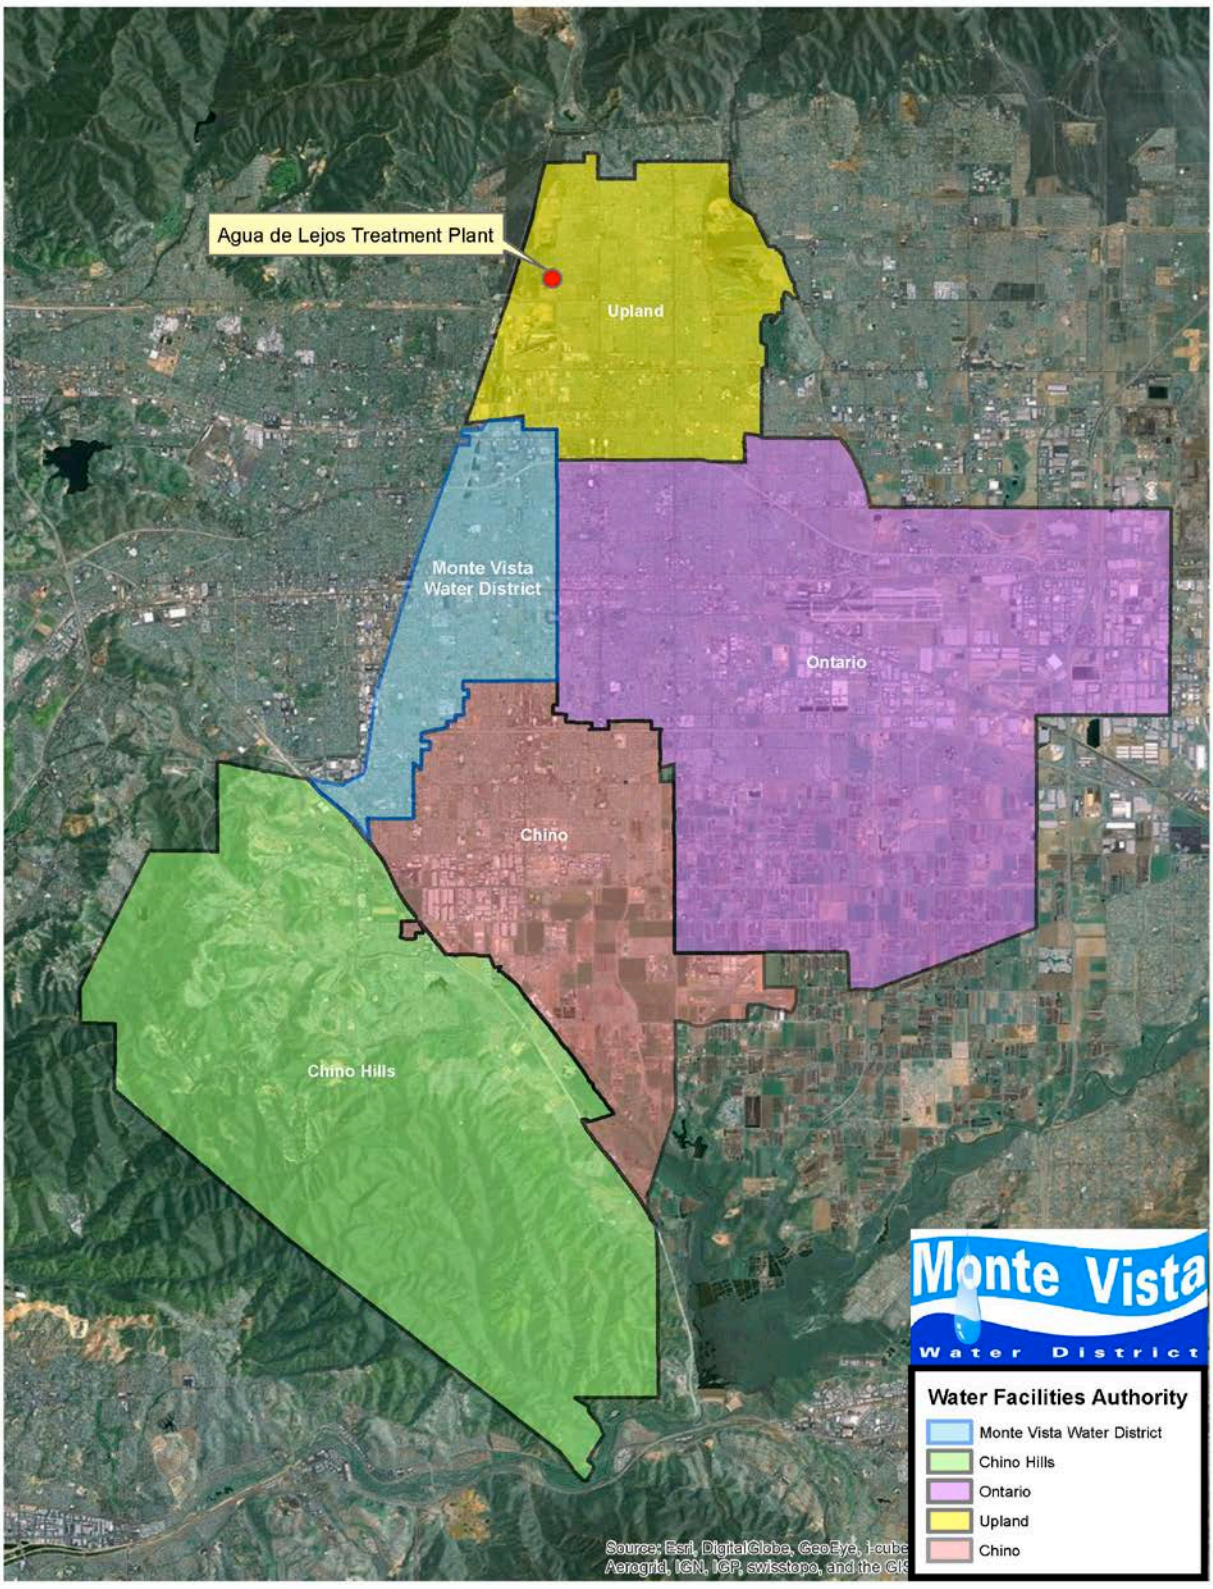
**Figure 4-5:**
**Water Facilities Authority Member Agencies**



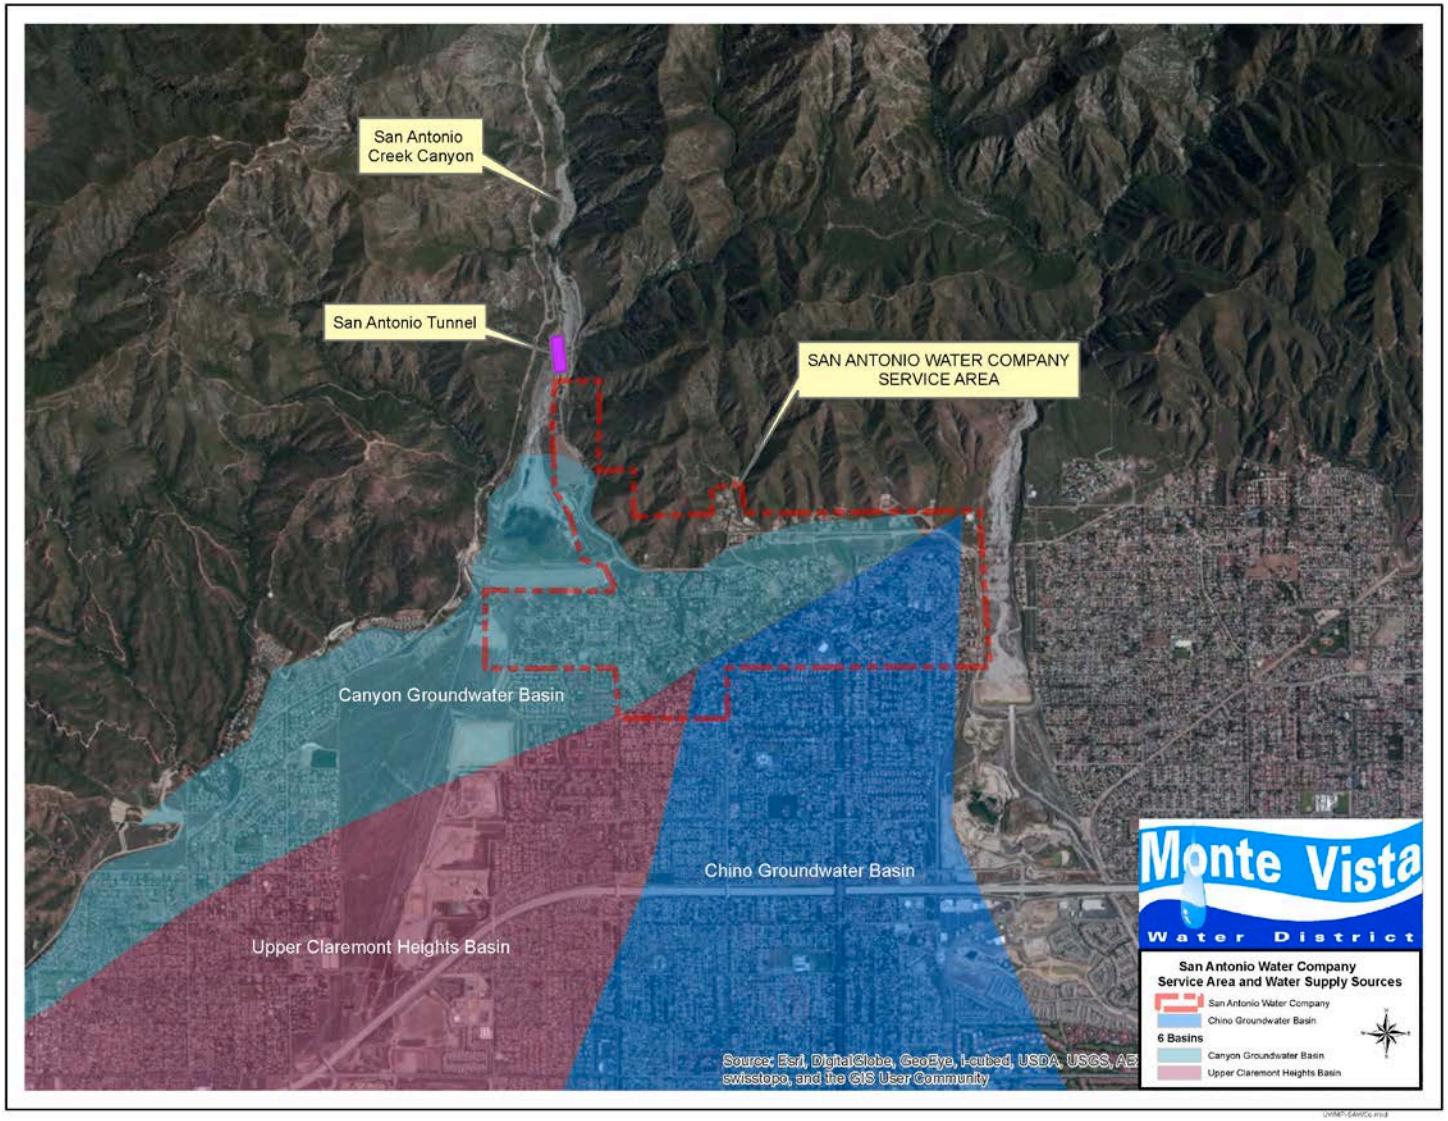


**Figure 4-6:**
**San Antonio Water Company Water Supply Sources**

### 4.3.2 Inland Empire Utilities Agency

Inland Empire Utilities Agency (IEUA) was formed in 1950 to become a member of MWD for the purpose of importing supplemental water to augment local supplies. Since its formation, IEUA has expanded its services to include production of recycled water, distribution of imported and recycled water supplies, sewage treatment, co-composting of manure and municipal biosolids, desalinization of groundwater supplies, and disposal of non-reclaimable industrial wastewater and brine.

IEUA wholesales MWD imported water to three entities: Cucamonga Valley Water District, Fontana Water Company, and the Water Facilities Authority. Although both SWP and Colorado River supplies are available to the region, only SWP supplies are currently used due to groundwater quality constraints (see Section 5.2.2). All three entities take raw imported water deliveries from IEUA and treat it to drinking water standards through independently owned water treatment plants.

### 4.3.3 Water Facilities Authority

The Water Facilities Authority (WFA) is a joint exercise of powers authority formed in 1980 under California Government Code Section 6500 et seq. to provide water supply and distribution services to its members. Currently there are five WFA members: the District and the cities of Chino, Upland, Ontario, and Chino Hills (see Figure 4-5).

In 1986-88, the WFA built the Agua de Lejos Water Treatment Plant, located in Upland, to receive raw SWP water, treat it to drinking water standards, and distribute the treated water to its five member agencies. The WFA currently is permitted to treat 81 mgd of SWP water, which it receives through MWD's Rialto Branch of the Foothill Feeder.

Over the past 10 years, treated water deliveries to the District have ranged from none in the winter months to as high as 30.5 mgd (July 13, 2016) in the summer. WFA water enters the District's potable water distribution system through two turnouts, and the District provides WFA water to Chino Hills through another:

- Turnout Number 1 at Arrow Highway and Benson Avenue
- Turnout Number 2 at Benson Avenue and 17th Street
- City of Chino Hills turnout at Ramona Avenue, south of Philadelphia Street

Treated water is normally delivered into the District's distribution system at Plant 4 after recovering energy using three hydroelectric turbine generators. Water can also be diverted from the Ramona Feeder to reservoirs or through pressure reducing valves.

The District is entitled to 24 percent of the WFA Agua de Lejos Plant capacity (21,776 AFY). The District can take delivery of more than its entitlement when other WFA members are not taking delivery of their full entitlements. Historically, there has always been unused capacity and the District has always had an opportunity to meet water quality standards and demands through additional WFA imported water. Many of the WFA members desire less dependence on imported water and greater reliability and control on local supplies. As a result, development of water supply programs has increased and the continued opportunity for purchase of unused capacity is anticipated.

Discussions on the opportunity to increase the capacity of the WFA treatment plant have occurred; however, analysis would need to be done to determine feasibility and economic benefits considering the climate of imported water reliability. The plant could be increased to 88 mgd through re-rating of the existing plant, and further capacity increases would need to be accomplished by plant expansion.

## 4.4 SAN ANTONIO WATER COMPANY

San Antonio Water Company (SAWCo), which was incorporated in October 25, 1882, is a privately owned mutual water company. Its shareholders are entitled to water supply based on the amount of owned shares and available water supply or SAWCo's ability to produce water.

SAWCo delivers domestic and irrigation water to a variety of shareholders. These shareholders include most residents of San Antonio Heights (an unincorporated area of San Bernardino County), the District, the cities of Upland and Ontario, local golf courses, rock quarries, and grove irrigators. There are a total of 6,389 outstanding SAWCo shares. Upland is the largest shareholder with over 70 percent of the total outstanding shares, and the domestic customers of San Antonio Heights as a group represents the second largest block of shares owning roughly 10 percent of the outstanding shares. The District currently owns 329.75 SAWCo outstanding shares, about 5.2 percent of the total.

According to the current Bylaws of SAWCo, there are two classes of service determined by the principal use known respectively as "domestic" and "irrigation." Any water delivered to a user other than domestic customers in San Antonio Heights is considered "irrigation" use. SAWCo's sources of domestic water supply include groundwater from the San Antonio Tunnel, Chino Groundwater Basin, and Cucamonga Groundwater Basin, and a small amount of purchased water from the City of Upland. SAWCo's sources of irrigation water supply include both surface water from the San Antonio Canyon and groundwater from Chino Groundwater Basin, Cucamonga Groundwater Basin, and the Six Basins area. Surface water from the San Antonio Canyon is used for irrigation, spreading over the San Antonio Tunnel for domestic supply, and delivered to the City of Upland's Surface Water Treatment Plant for domestic supply.

Total annual water supply over the past decade ranged from 20,213 AFY in 2005 to 9,074 AFY in 2015. SAWCO's production rights total approximately 30,000 AFY. Roughly 80 percent of total deliveries are to non-domestic irrigation customers, primarily municipalities. SAWCo has generally fully utilized its water rights in all sources except San Antonio Creek.[14]

Currently, each share is entitled to 1.808 AFY of water deliveries, for a total annual supply of 11,552 AFY. This is a decline from a pre-drought entitlement of 2.594 AFY per share, or 16,574 AFY in total annual supply. For the purposes of this Plan, the District will utilize SAWCo's pre-drought entitlement for normal year and post-drought entitlement for single and multi-dry years.

In September 2010, SAWCO and the District entered into a Water Service Agreement, pursuant to which SAWCO may transfer to the District the right to pump the District's share of the SAWCO entitlement from the Chino Groundwater Basin. Since then, SAWCo and the District have developed additional delivery options, including a wheeling agreement with the City of Upland, an interconnection with the WFA, and transfer of groundwater production rights from Six Basins to the Chino Basin through the City of Pomona. Due to the drought, SAWCo allowed the District's Water Service Agreement lapse at the end of its five-year term (December 31, 2015). The District is currently coordinating with SAWCo and its other municipal shareholders to develop new service agreements consistent with existing conditions.

SAWCo's water supply sources include surface water and groundwater. Surface water is obtained from the San Antonio Watershed. Groundwater sources include the San Antonio Tunnel, Chino Groundwater Basin, Cucamonga Groundwater Basin, and the Six Basins area. The following sections provide detailed descriptions of each source.

### 4.4.1 Surface Water Supply – San Antonio Canyon

SAWCo has rights to surface flow from San Antonio Creek, which appear to be pre-1914 rights and over the years have been supported by court judgments. These water rights are expressed in "miner's inches" (MI), which are equivalent to one cubic foot per second (cfs).

SAWCo has surface water rights in the San Antonio Canyon as follows:

- SAWCo has rights to the first 17 percent of all flow from the San Antonio Creek.
- After deducting 17 percent of the total flow, SAWCo has a priority to the next 18 MI of the remaining flow.

[14] SAWCo, May 18, 2016; SAWCo 2014 Annual Report; SAWCo Water System Master Plan, February 2010.

- After deducting the 17 percent of the total flow and the 18 MI, the balance is divided equally between SAWCo and the West Side Owners (WSO) (currently Pomona Utility Service District), until WSO's share equals 312 MI.

- After WSO's entitlement of up to 312 MI, SAWCo is entitled to divert all additional flow as long as its total diversion does not exceed 740 MI (January 1 to March 31) or 965 MI (April 1 to December 31) annually.

- It is not clear what rights SAWCo has to diversions in excess of the above amounts for domestic use. SAWCo does have rights to spread flows in excess of 10,000 MI for recharge of local groundwater basins.[15]

According to SAWCo, its total rights to surface water from San Antonio Canyon is 17,460 AFY.[16]

Surface water diverted from the San Antonio Creek and the San Antonio Tunnel water (discussed below) may be used for domestic purposes, irrigation, and/or spreading in the Cucamonga Basin or elsewhere.

### 4.4.2 Groundwater Supply[17]

SAWCo utilizes various groundwater sources including the San Antonio Tunnel and groundwater wells in Chino Groundwater Basin, Cucamonga Groundwater Basin and the Six Basins area. SAWCo also engages in spreading operations that enhance the groundwater supply available to SAWCo. These groundwater sources are described below and shown in Figure 4-6.

#### *San Antonio Tunnel*

The San Antonio Tunnel is the primary water supply for SAWCo's domestic water system. SAWCo has rights to all water flowing in the San Antonio Tunnel. Groundwater wells are available to augment the tunnel water supply. Since 1988, the maximum production measured from the San Antonio Tunnel was 4,171 AFY which occurred in 1993. However, the natural supply available to SAWCo from this source is uncertain considering tunnel water flow is enhanced when natural flows are low from spreading San Antonio Canyon water, which is already counted as a source. In general there appears to be a potential correlation between the San Antonio Canyon flow and base flow in the San Antonio tunnel, which is estimated to be approximately 1,050 AFY.

[15] SAWCo Water System Master Plan, February 2010.
[16] SAWCo 2014 Annual Report.
[17] SAWCo Water System Master Plan, February 2010, unless otherwise indicated.

Portions of the deep rock tunnel, a 4-foot by 4-foot rectangular tunnel constructed in 1885, are supported by redwood and rock beams and are situated approximately 100 feet below the ground surface. The deep rock tunnel is fed by groundwater that naturally percolates through the subsurface into the deep rock tunnel. The tunnel is also fed by a portion of water from the San Antonio Canyon, which is diverted into spreading grounds above the tunnel. Water collects in the deep rock tunnel, is piped to SAWCo's Forebay, chlorinated, and piped to SAWCo's potable water reservoirs.

### *Chino Groundwater Basin*

SAWCo overlies the northwesterly portion of the Chino Groundwater Basin and has an appropriative right of 2,164.5 AFY, which represents 2.748 percent of the Basin OSY.

Although subject to change, the OSY of the Basin has historically been 54,834 AFY, of which SAWCo is entitled to 1,506.888 AFY. Recently, agricultural pool water transfers to SAWCo have averaged approximately 795 AFY, though these will decline significantly upon Court adoption of the 2015 Safe Yield Reset Agreement.

For more information on the Chino Groundwater Basin, see Section 4.2.

### *Cucamonga Groundwater Basin*

The Cucamonga Groundwater Basin is located east and north of the Red Hill Fault in the northeastern section of the City of Upland. In 1958, a stipulated Cucamonga Basin Judgment allocated groundwater within the Cucamonga Basin to 24 stipulating parties, which today consists of SAWCo, West End Consolidated Water Company, and Cucamonga Valley Water District.

The Cucamonga Basin Judgment stipulates SAWCo's water production as 6,500 AFY, provided SAWCo spreads an average 2,000 AFY of imported water (from the San Antonio Canyon and/or Creek) into the Cucamonga Groundwater Basin, based on a 10-year rolling average. However, if SAWCo's average annual spreading is less than 2,000 AFY during the 10-year average, SAWCo's stipulated water right of 6,500 AFY can be reduced by up to 2,000 AFY, to a minimum total of 4,500 AFY. Conversely, if SAWCo's average annual spreading is more than 2,000 AFY, SAWCo's stipulated water right of 6,500 AFY can be increased by up to 2,000 AFY, to a maximum total of 8,500 AFY. Only 95 percent of the water spread (up to a maximum of 2,105 AF spread) can be used to augment SAWCo's stipulated right above 6,500 AFY. In summary, to maximize its stipulated water right up to 8,500 AFY, SAWCo is required to spread an average of 4,105 AFY (2,000 + 2,105) of imported water over a rolling 10-year period.

There are currently discussions underway regarding revising the management of the Cucamonga Groundwater Basin to modernize the Judgment and establish storage accounts.

### *Six Basins Area*

The Six Basins area is located north of the San Jose Hills, west of Chino Basin, south of the San Gabriel Mountains, and east of the Main San Gabriel Basin. The Six Basins area consists of six interconnected groundwater basins, which includes the "Four Basins" (Canyon, Upper Claremont Heights, Lower Claremont Heights, and Pomona) and the "Two Basins" (Live Oak and Ganesha).

SAWCo operates groundwater wells overlying the Upper Claremont Heights Groundwater Basin and owns rights to produce groundwater from the Four Basins area. SAWCo's initial water right in Six Basins is about 1,383 AFY, or 7.166 percent of the Four Basins annual OSY as determined by Six Basins Watermaster. In 2006, SAWCo established a storage and recovery account with Six Basins Watermaster that allows SAWCo to recharge up to 1,000 AFY and up to two years of storage. Thus SAWCo's stipulated initial water right in Six Basins can be increased by up to 2,000 AFY to a maximum total of 3,383 AFY. The OSY of Four Basins for 2016 is 16,000 AFY. SAWCo is currently entitled to 1,146.6 AFY and has a storage account balance of 1,390.7 AF.[18]

The Six Basin Judgment did not allocate any production rights from the Two Basins to SAWCo. In addition, rights to the Four Basins and Two Basins are not transferable between the two basins. However, rights may be transferable from within the Four Basins if certain conditions are met.

Parties to the Six Basins Judgment are authorized to produce groundwater in addition to the allocated amounts within Four Basins. Such extractions result in an assessment by Six Basins Watermaster to pay for water to replenish Four Basins through imported surface water recharge.

## 4.5 INLAND EMPIRE UTILITIES AGENCY – RECYCLED WATER

The District receives recycled water from IEUA's wastewater treatment plants and regional recycled water distribution system, which the District then delivers through its retail distribution system to 18 sites for non-potable landscape irrigation.

Water recycling is a critical component of the water resources management strategy for the region. Reuse of highly treated tertiary water is a source of water available to meet the growing water demands of the region, including the District. Recycled water is a proven technology and a dependable, drought-resilient local water supply. In addition, the use of recycled water for groundwater recharge is an integral part of local groundwater management.

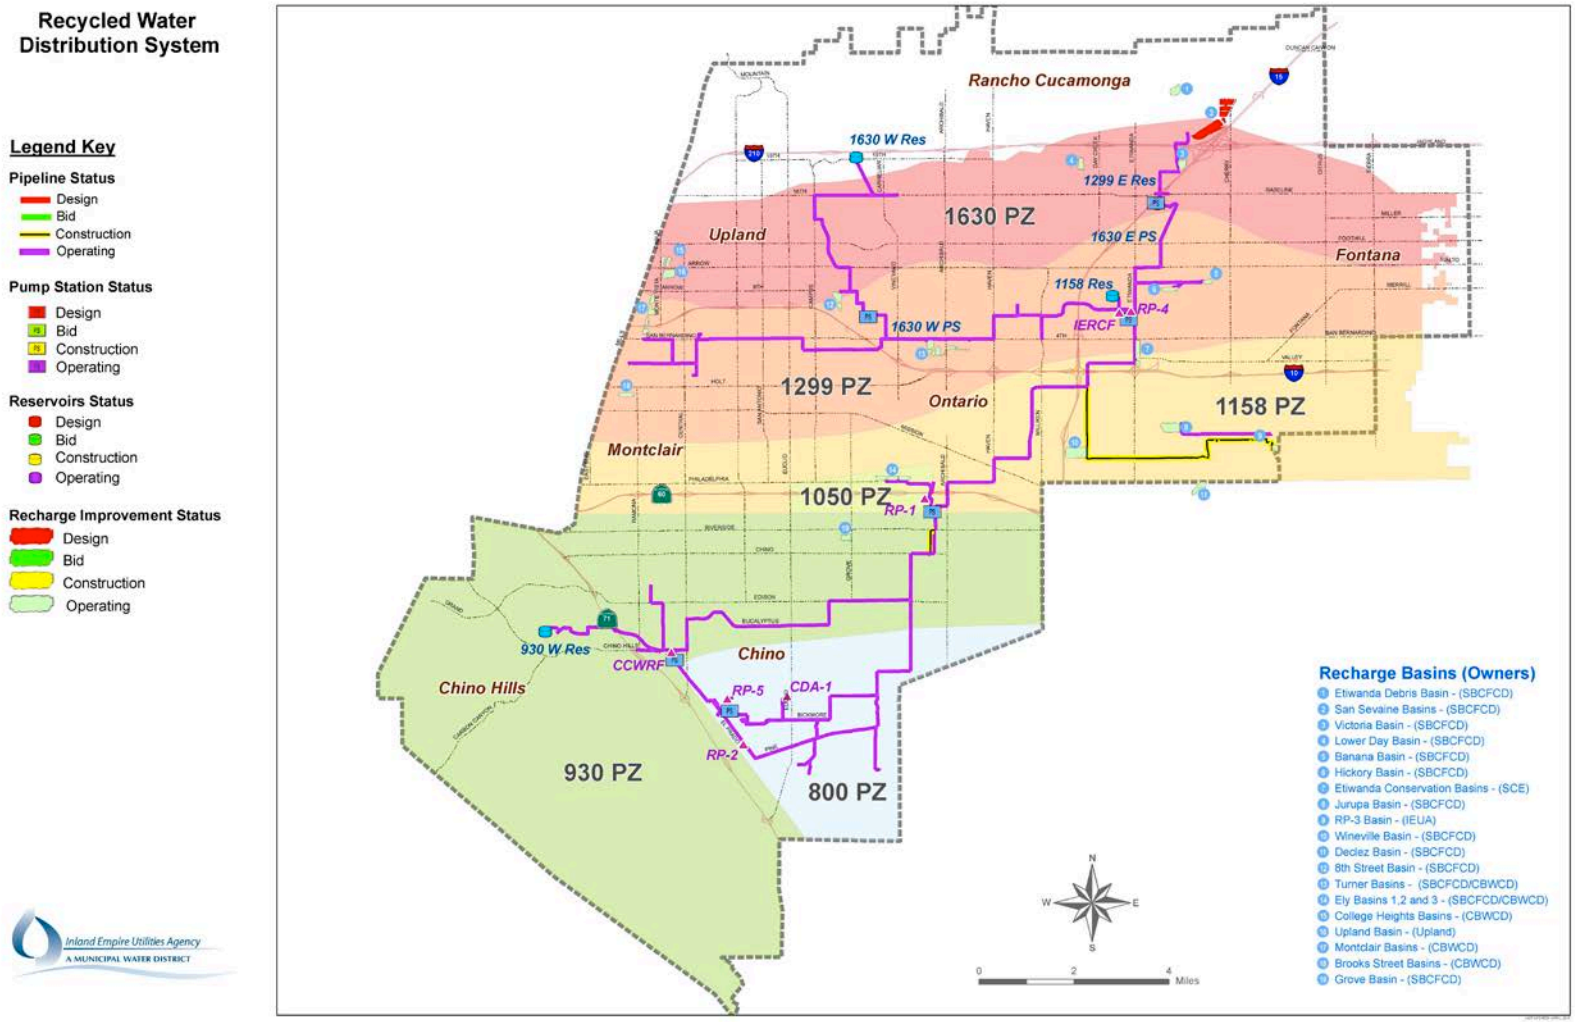
[18] Six Basins Watermaster Board Packet, May 25, 2016.

For background information on IEUA's regional recycled water program, see Section 2.2 of the District's Recycled Water Master Plan (Appendix L). Figure 4-7 shows the current extent and planned expansion of IEUA's regional recycled water distribution system.

IEUA operates four regional wastewater treatment plants that produce disinfected and filtered tertiary treated recycled water in compliance with California's Title 22 regulations: Regional Plants (RP)-1, RP-4, RP-5 and the Carbon Canyon Water Reclamation Facility (CCWRF). A fifth treatment plant, RP-2, was decommissioned in 2004 because it is located in a potential flood zone. Additional sources of recycled water that is received and used within IEUA's service area include the Upland Hills Water Reclamation Plant (operated by the City of Upland) and the California Institution for Men Water Reclamation Plant (operated by the California Institution for Men at Chino).

IEUA's facilities serve eight contracting agencies: the cities of Chino, Chino Hills, Fontana, Montclair, Ontario, and Upland, Cucamonga Valley Water District, and unincorporated areas of San Bernardino County within the IEUA service area.

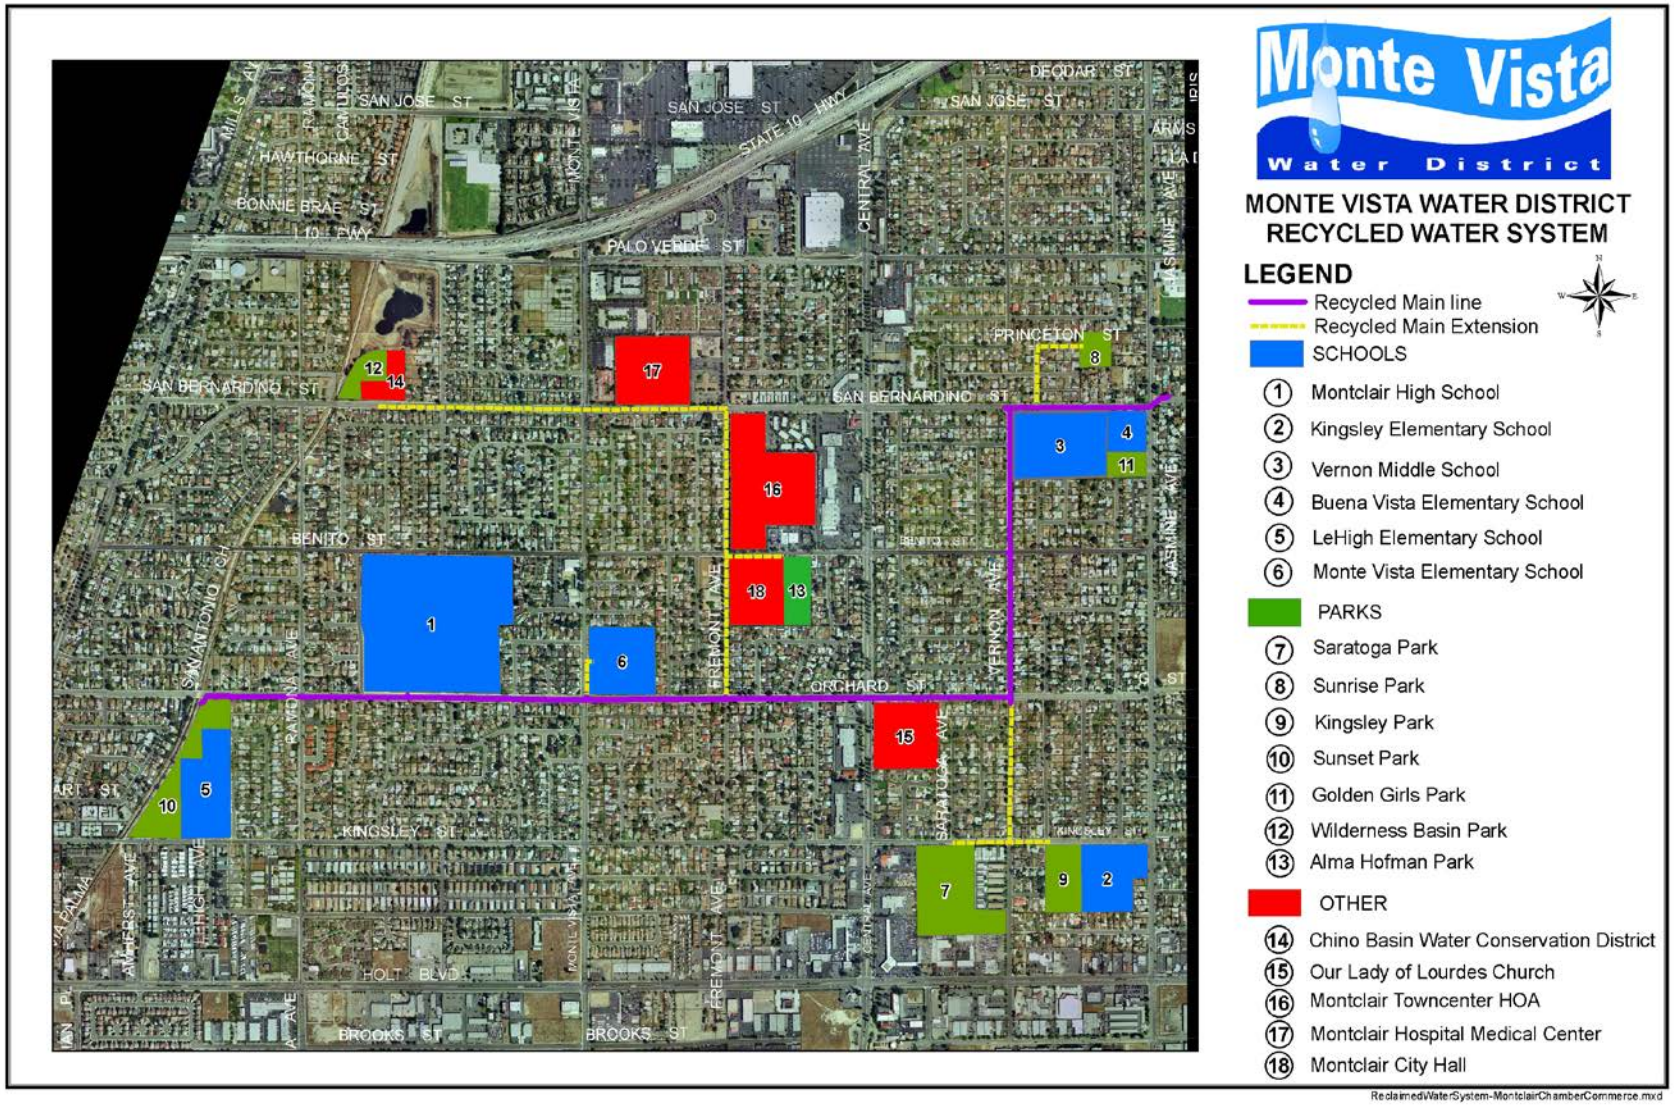
The District has developed a retail recycled water distribution system to deliver recycled water purchased from the City of Montclair and delivered by IEUA's regional distribution system (Figure 4-8). The District currently delivers an average of 340 AFY to seven District customers at 18 different locations for landscape irrigation. The District developed a Recycled Water Master Plan in 2011 which projects near-term expansion of its recycled water distribution system to serve up to 430 AFY (see Section 4.6.5 and Appendix L).



### 4.5.1 Wastewater Treatment

IEUA manages the Regional Sewage Service System within its 242-square miles service area to collect, treat, and dispose of wastewater delivered by contracting local agencies. IEUA's facilities serve seven contracting agencies: the cities of Chino, Chino Hills, Fontana, Montclair, Ontario, and Upland, and Cucamonga Valley Water District. A system of regional trunk and interceptor sewers convey sewage to regional wastewater treatment plants, which are all owned and operated by IEUA. Local sewer systems are owned and operated by local agencies.

#### *Wastewater Treatment Plants*



IEUA operates four regional water recycling production plants: Regional Plant No.1 (RP-1), RP-4, RP-5, and the CCWRF. A fifth treatment plant, RP-2, was decommissioned in 2004 because it was in a potential flood zone due to of the Prado Dam project. Each facility that produces recycled water is briefly described below:

**Figure 4-7:**
**IEUA Regional Recycled Water Distribution System – Current and Projected**

*Inland Empire Utilities Agency, www.ieua.org, 2016.*

**Figure 4-8:**
**Existing Retail Recycled Water Distribution System**

- **RP-1** began operation in 1948 through a joint powers agreement between the cities of Ontario and Upland. IEUA, then known as Chino Basin Municipal Water District, purchased RP-1 in January 1973. Its current capacity is 44 mgd. RP-1 serves all or part of the cities of Ontario, Rancho Cucamonga, Upland, Montclair, Fontana, and unincorporated areas of San Bernardino County.

- **CCWRF** has been in operation since 1992. The recycled water plant capacity is 11.4 mgd, while solids are treated at RP-2. CCWRF serves the cities of Chino, Chino Hills, Montclair, and Upland.

- **RP-4** was completed in 1997 and recently expanded to 14 mgd. RP-4 serves Cucamonga Valley Water District, the City of Fontana, and unincorporated areas of San Bernardino County in the northeast portion of the IEUA service area.

- **RP-5** began operation in March 2004. The 15 mgd plant serves existing and planned development in the cities of Chino, Chino Hills, and Ontario.

Figure 4-7 shows the location of regional wastewater treatment plants and recycled water distribution lines. The combined production of the current wastewater treatment plants is 61,944 AFY (55.3 mgd). By 2035, the plants are expected to produce 82,330 AF of water (73.5 mgd).[19]

Table 4-5 shows the estimated wastewater collected and treated from the District's service area in 2015. It should be noted that, because IEUA's regional recycled water system is fully integrated, the District's recycled water customers are not necessarily delivered recycled water which originated from its service area.

**Table 4-5:**
**Estimated Wastewater Collection from Retail Service Area (AFY)**

| Wastewater Collection | 2015 |
|---|---|
| Wastewater Collected in District Service Area | 2,464 |

Aligns with data in DWR Standardized Table 6-2 R.
IEUA, May 18, 2016. Estimate based on Montclair's percentage of total IEUA wastewater flows.

### *Wastewater Treatment Process*

All of IEUA's wastewater treatment plants produce recycled water that meets or exceeds the requirements of the California State Water Resources Control Board Title 22 for recycled water.

[19] IEUA 2015 Recycled Water Program Strategy, October 2015.

The treatment process begins with raw sewage that is collected from the local cities. The raw sewerage is passed through screening and grit removal units, primary clarifiers, aeration basins, secondary clarifiers, chemical addition, tertiary filters, chlorination, and finally dechlorination facilities prior to discharge. Some of the effluent flow is placed into the nearby creeks and allowed to flow ultimately into the Santa Ana River where it is recharged into Orange County's groundwater basin. The remainder of the flow is pumped into IEUA's recycled water distribution system for reuse.

Solids removed from the liquid treatment processes are thickened and stabilized in anaerobic digesters before being dewatered and transported to the Agency's composting facility in Rancho Cucamonga which is a joint venture with Los Angeles County Sanitation District.

IEUA maintains a federal- and state-approved industrial pre-treatment program for industrial discharges to the sewage system that requires dischargers to comply with water quality objectives and to submit periodic monitoring reports to IEUA.

IEUA produces a supply of highly polished tertiary-treated water suitable for irrigation, industrial water supply, groundwater recharge, environmental enhancement, and unrestricted recreation use such as boating and fishing.

### 4.5.2 Existing Recycled Water Program Supplies

Currently, IEUA produces about 56,000 AFY of recycled water and uses just over 33,000 AF annually (see Table 4-8). The remaining supply of recycled water, about 23,000 AF, was discharged to the Santa Ana River for reuse in Orange County. Recharge of recycled water into the Chino Basin is projected to increase over the 25-year planning horizon (see Section 4.6.5 and Table 4-8).

A transmission line connecting RP-1 and RP-4 serves as part of the backbone system for recycled water use in the northern portion of IEUA's service area. The District's current retail recycled water distribution system relies on deliveries from this portion of IEUA's regional system, specifically through the San Antonio Channel Pipeline which provide recycled water service to Ontario and Montclair. It should be noted that, because IEUA's regional recycled water system is fully integrated, IEUA is capable of delivering recycled water from any of its RPs to meet the demands of the District's recycled water customers.

In 2015, the District delivered 308 AF to its recycled water customers and purchased 483 AF of the City of Montclair's share of regional recycled water groundwater recharge. As shown in Table 4-6, this is 515 AF less than the amount projected in the District's 2010 UWMP, mostly due to delay in expanding the District's recycled water distribution system and the regional recharge program. With the connection of additional customers, it is estimated that recycled water sales will eventually reach 430 AFY.

**Table 4-6:**
**2015 Recycled Water Use vs. 2010 UWMP Projection (AFY)**

| Use Type | 2015 Actual Use | 2010 Projection for 2015 |
|---|---|---|
| Landscape Irrigation | 308 | 430 |
| Groundwater Recharge | 483 | 876 |

Aligns with data in DWR Standardized Table 6-5 R.
All amounts in AF for fiscal year totals.

### 4.5.3 Current and Projected Recycled Water Use in District Service Area

Table 4-7 shows the current and projected recycled water usage in the District's service area through 2040. This includes direct reuse by the District's recycled water customers and indirect reuse through groundwater recharge credits. The recycled water use projections to 2040 are consistent with IEUA's projections included in its 2015 Recycled Water Program Strategy (October 2015).

**Table 4-7:**
**Current and Projected Recycled Water Uses (AFY)**

| | 2015[1] | 2020 | 2025 | 2030 | 2035 | 2040 |
|---|---|---|---|---|---|---|
| **Landscape Irrigation** | 308 | 430 | 430 | 430 | 430 | 430 |
| **Groundwater Recharge**[2] | 483 | 601 | 560 | 589 | 639 | 639 |
| **Totals** | **791** | **1,031** | **990** | **1,019** | **1,069** | **1,069** |

Aligns with data in DWR Standardized Table 6-4 R.
[1] Actual values from District records.
[2] 2020-2040: City of Montclair estimated portion (4.3%) of IEUA's projected recycled water recharge (Table 4-8).

## 4.6 PLANNED WATER SUPPLY ENHANCEMENT PROJECTS

Due to past investments, the District currently has a reliable and drought-resilient water supply capable of meeting projected demands over the next 25 years and beyond. However, the District continues to invest in maintaining existing water supplies and infrastructure, and actively seeks opportunities to further enhance the reliability, affordability, and resiliency of its water supply portfolio.

This section summarizes planned District and local projects to enhance the reliability of the District's water supplies, including a review of the District's capital improvement plan and consideration of partnership, groundwater recharge, transfer and exchange, recycled water, and desalination opportunities available to the District.

For information on regional and wholesale water supply enhancement projects, please refer to the SAWCo, WFA, IEUA, and MWD 2015 Urban Water Management Plans.

### 4.6.1 Capital Improvement Plan

The District's Capital Improvement Plan (CIP), last updated in its 2008 Water Master Plan, is a comprehensive, prioritized outline of recommended projects that involve the repair and/or replacement of existing domestic water system facilities and improvements for future needs. The CIP lists specific prioritized capital improvement projects over the next 10 years and general improvements and projects envisioned over the next 30 years.

The CIP includes a variety of potable water system improvements that are necessary to eliminate current deficiencies as well as improvements for the purpose of providing reliable water services through the year 2039. The accompanying Financial Master Plan, last updated in 2015, provides a mechanism for funding the identified capital projects at a cost of $35.5 million over the next 10 years and $96.7 million over the next 30 years. Projects include:

- A comprehensive pipeline replacement/rehabilitation program;
- Construction of three new wells and retrofitting an existing well maintain existing groundwater production capacity;
- Installation of two back-up power generators at key wells for additional supply reliability during emergency conditions;
- A booster pump station retrofit and capacity enhancement project; and,
- Seismic and plant improvements to various District facilities.

### 4.6.2 Groundwater Recharge Opportunities

In 2013, Chino Basin Watermaster, in partnership with IEUA, completed a stakeholder process of developing an amendment to its 2010 Recharge Master Plan Update (2013 RMPU). The 2013 RMPU identifies a suite of yield enhancement and production sustainability projects to increase recharge and maintain sustainable production in the Chino Basin. The projects are estimated to achieve 6,780 AFY in increased stormwater capture and recharge and 4,900 AFY in recycled water recharge, for a combined increased recharge of 11,680 AFY.

Watermaster and IEUA have begun the process of implementation. Some projects have been determined to be no longer viable, and some additional projects have been recommended for inclusion, but the process continues to move forward. Additionally, the 2015 Safe Yield Reset Agreement, if approved by the Court, establishes a process for Appropriative Pool parties to opt-in and opt-out of participation in project development. The District will continue to participate in the process of developing these projects, and may decide to participate in financing project construction in return for additional basin yield.

### 4.6.3 Partnership Opportunities

The District is constantly seeking partnership opportunities with local and neighboring agencies to develop more reliable, cost-effective water supplies.

#### *City of Pomona*

The District and the City of Pomona have developed a strong working relationship and are collaborating on a number of water supply development projects. In addition to working together with IEUA on a recycled water interconnection study (see below), the District and City have identified significant opportunities to share rights, resources, and infrastructure in order to access and develop low-cost water supplies for the mutual benefit of each agency.

In September 2015, the District and City entered into a Memorandum of Understanding (MOU) to cooperate in the development of water supplies, implement best practices, and reduce operational costs.

#### *Water Facilities Authority*

Historically, there has always been unused capacity in the WFA's Agua de Lejos water treatment plant, and the District has always had an opportunity to meet water quality standards and demands through additional WFA imported water. Many of the WFA members desire less dependence on imported water and greater reliability and control on local supplies. As a result, the development of local water supply programs has received increased attention and the continued opportunity for utilization of unused WFA treatment capacity is anticipated.

Discussions on the opportunity to increase the capacity of the WFA treatment plant have occurred; however, analysis would need to be done to determine feasibility and economic benefits considering the climate of imported water reliability. The plant could be increased to 88 mgd through re-rating of the existing plant, and further capacity increases would need to be accomplished by plant expansion.

### 4.6.4 Transfer and Exchange Opportunities

Water transfers are a water management concept with great potential for helping to alleviate water shortages in the region and across the state. The concept is that two agencies, one willing seller of water and one willing buyer, can enter into an exchange agreement that is mutually beneficial from a water management point of view. Water transfers allow an agency to "move" water from one service area to another, even when the two agencies are not connected by any pipelines.

As a water management tool, water transfers can be effective during periods of severe drought or emergencies. Water transfers, as shown below, can take multiple forms to increase water supply reliability among agencies.

#### *Chino Groundwater Basin Transfers and Conjunctive Use*

The District's ability and right to use a portion of the vast storage capacity of the Chino Basin, and ability to spread significant quantities, gives additional flexibility, particularly if transfer water is available. According to the Peace Agreement, transfers include the assignment, lease, or sale of a right to produce water to another producer within the basin or to another person or entity for use outside the basin whether the transfer is temporary or permanent. Lease of water rights are also permissible to allow producers to make up for the lessee's over-production.

The Chino Basin is also a valuable resource for water transfers because of its ability to be a storage facility for multiple sources of water. Because of the basin's tremendous capability to store water, outside agencies are encouraged to enter into agreements with producing parties to store water. For example, another agency who is a contractor to the SWP may wish to store their surplus SWP water in the basin for future droughts or emergencies. When they need their stored water, the outside agency simply asks the basin agency to pump and utilize the stored water while the outside agency takes direct delivery through the SWP.

Funding was allocated for conjunctive use programs through Proposition 13, the Water Bond passed by California voters in March 2000. The District participated in the groundwater recovery program by constructing new wells and converting inactive wells to injections/recovery wells that utilize imported water during period of low demand to recharge the basin. Water stored under this program could be utilized to meet demand during periods of drought.

In the near future, the Santa Ana River Conservation and Conjunctive Use Program (SARCCUP) is being developed through the Santa Ana Watershed Project Authority (SAWPA) utilizing Proposition 28 Integrated Regional Resource Planning grant funds. Though still in its formative stages, SARCCUP seeks to create a watershed-wide conjunctive use program.

### *Interconnections*

Local water agencies have the ability to enter into contracts between each other to provide water on an annual basis or on an as-needed basis. The District currently has six emergency connections to receive water from the Golden State Water Company and the cities of Chino, Chino Hills, and Upland. The connection with the company can be used for emergencies to serve the City of Claremont. The other interconnections allow water to be supplied or received. The District has utilized the emergency connection when the WFA treated deliveries were interrupted, as well as to received deliveries of purchased or entitlement water supply from the City of Upland and SAWCo.

## 4.6.5 Recycled Water Opportunities

There are many opportunities for the District to expand the direct and indirect reuse of recycled water to offset or enhance potable water supplies. Although the District has established a recycled water retail distribution system to serve most of its major landscape irrigation customers in the City of Montclair, it has identified additional potential recycled water customers in its 2011 Recycled Water Master Plan (Appendix L) for a potential additional use up to 100 AFY of recycled water by 2020. Also, recycled water used to recharge the Chino Basin is expected to expand and increase the District's pumping rights in the basin.

### *Recycled Water Availability*

Region-wide, available recycled water supplies are projected to reach 66,312 AFY in 2020. In conformance with the 1969 Santa Ana River Judgment, a minimum of 17,000 AFY of water will be discharged to the Santa Ana River. This leaves more than 49,000 AFY of recycled water available for beneficial reuse within the IEUA service area by 2020. Table 4-8 shows the projected future uses of IEUA's recycled water supply.

**Table 4-8:**
**Current and Projected Regional Recycled Water Supplies and Usage (AFY)**

| | 2015 | 2020 | 2025 | 2030 | 2035 |
|---|---|---|---|---|---|
| **Recycled Water Supply** | 56,384 | 66,312 | 71,913 | 77,514 | 82,330 |
| **Santa Ana River Discharge** | 17,000 | 17,000 | 17,000 | 17,000 | 17,000 |
| **Direct Use Demand Forecast** | 22,579 | 30,757 | 36,507 | 40,320 | 43,019 |
| **Groundwater Recharge** | 10,840 | 13,977 | 13,027 | 13,707 | 14,871 |
| **Remaining Supply** | 5,965 | 4,578 | 5,379 | 6,487 | 7,440 |

Sources: IEUA, May 19, 2016; IEUA 2015 Recycled Water Program Strategy.

### *Recycled Water for Groundwater Recharge*

As shown in Table 4-8, recharge of recycled water in the Chino Basin is expected to peak at roughly 15,000 AFY in 2035. The City of Montclair's percentage allocation of this recharge is currently 4.3 percent, providing the District with up to 640 AFY of recycled water recharge which becomes part of the District's groundwater production rights (see Section 4.2.2). Montclair's percentage allocation of this total recharge is expected to decrease due to increased wastewater contributions from the cities of Ontario and Chino.

### *Recycled Water Interconnection and Recharge Study*

In 2015, the District, the City of Pomona, and IEUA contracted with Carollo Engineers to develop a recycled water interconnection and recharge feasibility study. The study assessed the viability of interconnecting facilities owned and operated by the District, City, and IEUA to convey treated recycled water to direct use recycled water customers, groundwater recharge basins, and aquifer storage and recovery (ASR) well locations. The study identified a preferred alternative which would generate an estimated 3,500 AFY of additional water supply for the region. The agencies are further evaluating alternatives and seeking grant funding for the proposed project.

### *Encouraging Recycled Water Use*

The District has and will continue to encourage recycled water use by potential recycled water users through a variety of measures. The District is confident that, when performed collectively, these measures will result in an increase in recycled water use through 2040.

**Customer Development Process**

Through the first phase of its recycled water system development, the District successfully implemented the process of developing recycled water customers from identification to final system connection. However, the expansion of the District's recycled water system as described in this Plan will require a more comprehensive customer development process.

The District's first recycled water users have for the most part been large public sector institutional customers, most notably the City of Montclair, Ontario Montclair School District, and Chaffey Joint Union High School District. While the District will continue to work with these large customers in identifying new sites for recycled water use, the District will also focus more on smaller private sector customers, including nurseries, farms, multi-family residential developments, and commercial establishments. The District will draw on its experience working with its initial customers, including public agency partners as well as Montclair Hospital Medical Center, Montclair Towncenter Homeowners Association, and Our Lady of Lourdes Catholic Church, in developing a more robust private sector customer development process.

**Table 4-9:**
**Ten-Step Process for Recycled Water Customer Development**

| Step | Description | Share of Total Effort |
|---|---|---|
| 1. Site Information | Confirm location and status of site | 3% |
| 2. Site Assessment | Contact site representative; introduce District, opportunity of recycled water availability | 20% |
| 3. Site Assessment Summary | Gather onsite water system information; develop schematics; determine tasks to convert to recycled water; develop cost estimate | 5% |
| **Milestone 1** | Sufficient viable potential customers exist along alignment to proceed with recycled water lateral development | |
| 4. Letter of Commitment | Recommend at this stage using letters of commitment rather than formal agreements to secure intent without threat of punitive action | 5% |
| 5. Regulatory Approval | Prepare draft schematics of conversion to recycled water; confirm accuracy with end user; send to State Board and County Department of Health Services for review and tentative approval | 42% |
| 6. Construction Estimates | Obtain three bids from qualified contractors; select one to complete retrofit work | 5% |
| 7. Retrofit Financing Agreement | As required, prepare and circulate retrofit financing agreement | 5% |
| **Milestone 2** | Sufficient progress achieved prior to lateral construction | |
| 8. Construction Oversight | Perform site inspections; document compliance with State Board regulations | 5% |
| 9. Final Cross-Connection Test | Perform final cross-connection test with County State Board; obtain final project approval | 5% |
| 10. Prepare As-Built Drawings | Modify schematics to comply with actual construction; distribute to customer, regulators | 5% |

The District will also build on the experience of other recycled water distribution systems in developing a diverse and robust recycled water customer base. Central Basin and West Basin Municipal Water Districts in Los Angeles County developed a ten-step customer development process that assisted them to quickly identify, assess, and secure potential recycled water customers in order to secure available MWD funding. The steps, outlined in Table 4-9, represent the major events during their customer development process and estimate the effort associated with those steps.

Many potential customers have in the past expressed interest in converting their sites to use recycled water. These customers, including the City of Montclair, Omnitrans, Montclair Towncenter Shopping Center, The Pines Apartments, and the Girl Scouts, have responded positively to the District's initial inquiries and preliminary site investigations to determine near-term expansion possibilities (see Appendix L, Section 9.2).

**Financial Incentives**

The District's recycled water rate is lower than its potable flat water rate, which helps to incentivize use of recycled water. The District has also identified external funding to assist potential recycled water customers in offsetting the expense of retrofitting their onsite irrigation systems to use recycled water (see Appendix L, Section 6).

**Plumbing Codes**

The District's Ordinance 31 requires all new residential, commercial, and industrial developments have dual plumbing so that recycled water (when available) can be used for outdoor irrigation and other non-potable water uses. Additionally, the City of Montclair's AB 1881-compliant Water Efficient Landscape and Conservation Ordinance requires all applicable new developments to dual plumb and use recycled water, if available. The District works closely with the cities and county in which is serves regarding plumbing codes.

#### *Optimizing Recycled Water Use*

The District's 2011 Recycled Water Master Plan, incorporated into this UWMP as Appendix L, is the District's plan to optimize recycled water use within its service area.

### 4.6.6 Desalinated Water Opportunities

Desalination is used to develop a local, reliable source of water that assists agencies in reducing their demand on imported water. Desalination technology currently is being used by the Chino Desalter Authority (CDA) to treat brackish groundwater at the southern end of the Chino Basin for municipal uses. The District currently does not use desalted water from the CDA. However, from a regional perspective, the CDA and other desalination projects within the region indirectly benefit the District.

#### *Desalted Groundwater – Chino Groundwater Basin*

Consistent with the OBMP and the Maximum Benefit Program (approved by the State Board in 2005), desalting facilities must be constructed in the lower portion of the Chino Basin to remove salt and nitrates as well as to prevent poor quality water from the Basin from moving down the watershed and eventually into Orange County groundwater basins. The desalters use a combination of reverse osmosis and ion exchange technology to treat the pumped groundwater. The concentrated brine from the desalter operations is delivered by the Inland Empire Brine Line to the Orange County Sanitation District for treatment and ultimate disposal in the Pacific Ocean.

The Chino I Desalter was constructed in 2000 through a joint participation agreement among five agencies: SAWPA, Western Municipal Water District, Orange County Water District, MWD and IEUA. Located in Chino, the facility currently produces 10,000 AFY of which approximately 9,000 AF is provided as potable water supply to the cities of Chino and Chino Hills. In 2002 the CDA, a joint powers authority comprised of the Jurupa Community Services District, the Santa Ana River Water Company, and the cities of Chino, Chino Hills, Ontario, and Norco, was formed to manage the production, treatment, and distribution of water produced by this facility. The Chino II Desalter was constructed in 2007 and currently produces between 14,000 and 15,900 AFY of potable water. The Chino III Desalter is expected to be complete by 2016 and expand existing capacity by another 14,000 AFY to a total of 40,000 AFY.

# SECTION 5
# WATER SUPPLY RELIABILITY

## 5.1 RELIABILITY OF DISTRICT WATER SUPPLIES

Reliability is a measure of a water service system's expected success in managing water shortages. In addition to climate, other factors that can cause water supply shortages are natural disaster, such as earthquakes, chemical spills, energy outages, and water quality issues.

The District and all southern California communities and water agencies are facing increasing challenges and opportunities in their role as stewards of our publicly owned water resources. The region faces a growing gap between its water requirements and its firm water supplies. Increased environmental regulations and the collaborative competition for water from outside the region have resulted in reduced supplies of imported water. Continued population and economic growth increase water demand within the region, putting an even larger burden on water supplies.

Fortunately, as described in Section 4, the District and other regional agencies have invested hundreds of millions of public dollars to develop, manage, and maintain a robust portfolio of reliable water supplies. These include the Chino Groundwater Basin—one of the largest groundwater basins in southern California which has been sustainably managed for nearly 40 years—as well as a regional recycled water program which provides highly treated non-potable water for both direct use and groundwater recharge, and other local surface and groundwater resources. Metropolitan Water District, our regional supplemental water provider, has invested billions of ratepayer dollars in local and imported water supply reliability, and as a result is able to provide reliable imported water supply even under severe drought conditions.

Due to ongoing investments in reliable supplies, the District and other regional agencies are able to reduce use of imported water during times of drought, as well as store significant amounts of surplus water during wet years for use in dry years. Over the decades, Chino Basin producers have saved nearly 400,000 acre-feet of water stored in the groundwater basin which can be safely accessed during periods of extended drought.

Finally, the District provided leadership in implementing demand management and water use efficiency programs, including turf replacements, landscape irrigation survey and retrofits, efficient appliance rebates, and innovative rate structures.

This section starts with a brief description of the reliability of the District's various water supplies, followed by discussions of the potential impacts on reliability due to water quality and climate. Finally, the section ends with an analysis of the District's overall water supply reliability during normal, single dry-year, and multiple dry-year periods through 2040.

### 5.1.1 Chino Groundwater Basin Supply Reliability

The total maximum daily production capacity of the District's groundwater wells from the Chino Groundwater Basin is approximately 28 mgd (Table 2-3). This production capacity is sufficient to supply significantly more than the total current and projected retail water demand within the District. The District's 2008 Water Master Plan, functioning as its Capital Improvement Program, has developed a schedule of groundwater well replacement and rehabilitation to maintain, if not enhance, this production capacity through 2038.

District groundwater pumping can be influenced by Chino Basin Watermaster policies, including optimizing the basin's safe yield, providing replenishment supplies to offset overproduction, levying and collecting administrative and replenishment assessments, and findings of material physical injury. Nevertheless, under the Judgment and management agreements, the District has the ability to pump sufficient groundwater to meet its water supply needs. For the purposes of reliability planning, in order to allow for equipment breakdown and other contingencies, the District estimates that its full groundwater production capacity will be available 90 percent of the time.

For potential water quality impacts to the District's available groundwater supply, see Section 5.2.1.

### 5.1.2 Water Facilities Authority Supply Reliability

As discussed in Section 4.3.3, the District is entitled to 24 percent of the WFA's Agua de Lejos Plant capacity, or up to 21,776 AFY. The District has never drawn its full contractual amount from WFA, having historically considered its imported water supply as supplemental to and providing redundancy for its local groundwater supply. However, even during dry years, the District may draw its full contractual amount of imported water supply through WFA; the only limitations on the District are higher Tier 2 rates during normal years and, during dry years, its DYY shift obligation and potential MWD penalty rates under allocation requirements.

WFA receives imported water from MWD via the SWP. In its 2015 UWMP, MWD demonstrates its ability to provide imported water supply to its member agencies 100 percent of the time through 2040 during normal, single dry, and multi-dry year scenarios.[20] Even under a simultaneous implementation of MWD's Water Surplus and Drought Management (WSDM) Plan and the regional DYY Program, imported water supply is 100 percent reliable, although potentially subject to penalty rates (see Section 5.3).

[20] MWD 2015 UWMP (Draft March 2016).

***MWD's Water Surplus and Drought Management Plan***

In 1998, MWD's Board of Directors adopted the Water Surplus and Drought Management Plan (WSDM). The guiding principle of the WSDM Plan is to manage MWD's water resources and management programs to maximize management to wet year supplies and minimize adverse impacts of water shortages to retail customers. From this guiding principle come the following supporting principles:

- Encourage efficient water use and economical local resource programs;
- Coordinate operations with member agencies to make as much surplus water as possible available for use in dry years;
- Pursue innovative transfer and banking programs to secure more imported water for use in dry years; and,
- Increase public awareness about water supply issues.

In February of 2008, MWD's Board of Directors adopted the Water Supply Allocation Plan (WSAP). The WSAP was developed in consideration of the principles and guidelines described in the WSDM Plan, with the objective of creating an equitable needs-based allocation. The WSAP formula seeks to balance the impacts of a shortage at the retail level while maintaining equity on the wholesale level for shortages of MWD supplies of up to 50 percent. The WSAP was revised and readopted in 2014.

For an analysis of the impact of this program's implementation in conjunction with the DYY Program see Section 5.3.

### 5.1.3 Recycled Water Supply Reliability

Recycled water is an exceedingly reliable local water resource. According to IEUA, during a single dry year, it has been assumed that recycled water will be 100 percent reliable. During multiple dry years, reliability remains constant and continues to help reduce potable water demands as new recycled water users are added to the regional recycled water system. It has been assumed that during multiple dry years, the production of recycled water will gradually increase from 100 percent during the first dry year to 105 and 110 percent, respectively, during the next two subsequent dry years as more customers become connected to the recycled water system. Recycled water is a reliable resource not subject to droughts or imported water availability.

### 5.1.4 San Antonio Water Company Supply Reliability

SAWCo is responsible for providing water service to its domestic and irrigation shareholders. Water is currently delivered to shareholders based on monthly entitlement and available water supply. If SAWCo is able to produce more water, entitlement increases; if less, entitlement decreases.

The last three years have provided an example of SAWCo actions in the face of reductions to its water supply. In February 2014 and then again in March 2015, due to severe drought conditions, SAWCo reduced its per-share entitlement deliveries by 18 percent and 15 percent, respectively.

However, as SAWCo improves its water supply facilities and increases its ability to produce water over the next 20 years, total water supply and water supply reliability to the shareholders is expected to return to former levels and even increase. The increased water supply would also be driven by the company's shareholders looking to the water company for maximum deliveries of their entitlements. Water deliveries to these shareholders are provided by SAWCo based on the entitled shares and available water supply during different periods of the year. Maximizing the water company's deliveries to its shareholders requires making full use of the groundwater and surface water rights owned by SAWCo. The District will work with SAWCo to maximize its supply and potentially increase its per-share entitlement, thus increasing the District's total annual SAWCo entitlement.

## 5.2 WATER QUALITY IMPACTS ON RELIABILITY

Federal regulations require the U.S. Environmental Protection Agency (EPA) to safeguard drinking water by establishing standards that limit the amount of substances in drinking water. In California, the State Water Resources Control Board (State Board) also safeguards drinking water by establishing standards that are as stringent as the EPA's. These standards, also known as maximum contaminant levels (MCL), are established in two categories: 1) primary standard: to protect the public health; and 2) secondary standard: to preserve water's aesthetic qualities such as taste, odor, clarity, and color.

The District safeguards its water supply by exceeding the monitoring requirements set by the EPA and State Board. In addition to the 165 contaminants for which it regularly monitors and reports in its Annual Water Quality Report, the District safeguards the distribution system by monitoring for coliform bacteria in the distribution system and at each active well. Coliform bacteria are not necessarily harmful, but indicate the possible presence of disease-causing organisms. The District samples 16 State Board-approved locations within the distribution system weekly, and samples each active well monthly. The District also completed two source water assessment in 2002 and 2008 for its active wells to evaluate the vulnerability of water sources to contamination.[21]

### 5.2.1 Chino Groundwater Basin Water Quality

The Chino Groundwater Basin is a critical resource to the District. From a regulatory perspective, the use of basin groundwater to serve potable demands is limited by drinking water standards, groundwater basin water quality objectives, and Santa Ana River water quality objectives.

[21] 2015 Annual Water Quality Report, www.report.mvwd.org.

The groundwater quality in basin is generally very good, with better groundwater quality found in the northern portions of the basin where recharge occurs and where District groundwater wells are primarily located. Salinity and nitrate concentrations increase in the southern portion of the basin resulting from past and continuing agricultural uses.

Other constituents that have the potential to impact groundwater quality from a regulatory standpoint are certain volatile organic compounds, arsenic, and perchlorate. There are a number of point source releases of VOCs in the basin that are in various stages of investigation or cleanup. There are also known point source releases of perchlorate (Milliken Valley Sanitary Landfill, Stringfellow, etc.), and non-point source related perchlorate contamination appears to have resulted from natural and artificial sources. Arsenic at levels above the water quality standard appears to be limited to the deeper aquifer zone near the City of Chino Hills.

The principal groundwater quality issues facing the District involve nitrate dibromochloropropane, total dissolved solids, and perchlorate.

### *Nitrates*

Areas of the basin with significant irrigated land use or dairy waste disposal histories overlie groundwater with elevated nitrate concentrations. The primary areas of nitrate degradation are the areas formerly or currently overlain by citrus in the northern parts of management zones (MZs) 1, 2 and 3, and dairy areas in the southern parts of MZs 1, 2 and 3 and all of MZ 5.

Nitrate in drinking water at levels above 10 ppm can interfere with the capacity of the infant's blood to carry oxygen, causing shortness of breath and blueness of the skin. High nitrate levels may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies.

In 2015, average nitrate concentration in the District wells was 10.7 ppm, while the concentrations ranged from 2.9 to 18.7 ppm. The State Board requires the District to provide a finished blended product that has a nitrate (N) MCL of no more than 8 ppm, or 80 percent of the MCL of 10 ppm. Water from several District wells with higher levels of nitrates is combined with water from other wells with lower levels or with imported water to create a blended supply that is below the MCL. One of the District's wells is equipped with an ion exchange treatment facility that removes salts, in particular nitrates, from the pumped groundwater.

The District's Aquifer Storage and Recovery (ASR) Program, which consists of recharging the groundwater basin through direct injection of treated imported water and subsequent extraction during summer months and dry years, is expected to enhance water quality over time. ASR wells inject higher quality water into an aquifer of lesser quality; the wells operate to create a zone or "bubble" of better quality water to be recovered at a later time. Four ASR wells are now operational.

### *Dibromochloropropane*

Dibromochloropropane (DBCP), an organic chemical, is a banned nematocide (pesticide) that remains in the soils due to run-off or leaching from former use on soybeans, cotton, vineyards, tomatoes, and tree fruit. In 1977, 831,000 pounds of DBCP was used in California, mainly on grapes and tomatoes. In 1979, all registrations of end use products were canceled except for use as soil fumigant for pineapple horticulture in Hawaii. The use was completely canceled in 1985. Some people who drink water containing DBCP in excess of the MCL of 0.0002 million gallons per liter (mg/L) or 200 parts per trillion (ppt) over many years may experience reproductive difficulties and may have an increased risk of developing cancer.

In 2015, average DBCP concentration in the District wells was 0.06 ppt, while the concentrations ranged from non-detect to 0.23 ppt. The State Board requires the District to blend the water so that the concentration is below 0.16 ppt, or 80 percent of the MCL.

### *Total Dissolved Solids*

Total Dissolved Solids (TDS) concentrations in the northeast part of the basin range from about 170 to about 300 mg/L, with typical concentrations in the mid- to low 200s. TDS concentrations in excess of 200 mg/L indicate degradation from overlying land use. With few exceptions, areas with significant irrigated land use or dairy waste disposal histories overlie groundwater with elevated TDS concentrations. Most of these degraded areas are located south of the Interstate 10 Freeway. The impact of agriculture on TDS in groundwater primarily is caused by fertilizer use on crops, consumptive use, and dairy waste disposal.

TDS concentrations in groundwater have increased slightly or remained relatively constant in northern parts of the MZs 1, 2, and 3. TDS concentrations are significantly higher in the southern parts of these zones and in all of MZ 5, where they typically exceed the 500 mg/L recommended secondary MCL and frequently exceed the upper limit secondary MCL of 1,000 mg/L. In 2015, the average TDS concentration in District wells was 250 mg/L.

### *Perchlorate*

The State Board has indicated that perchlorate in groundwater in California likely reflects its use in the aerospace industry as a solid rocket propellant (in the form of ammonium perchlorate). Perchlorate is a regulated drinking water contaminant in California, with an MCL of 6 ppb. Perchlorate is believed to inhibit the thyroid's ability to process iodide. Normal body metabolism requires thyroid hormones, as do normal prenatal and postnatal development and growth.

In 2015, average perchlorate concentration in the District wells was 1.9 ppb, while the concentrations ranged from non-detect to 6.6 ppb. The State Board requires the District to blend the water so that the concentrations are below the MCL of 6 ppb.

### 5.2.2 Water Facilities Authority Water Quality

The District receives imported water through IEUA from MWD, which receives raw water from northern California through the SWP. The SWP water is delivered to the WFA Agua de Lejos Water Treatment Plant through the MWD Rialto Reach of the Foothill Feeder. The WFA receives and treats SWP raw water. The quality of water from the WFA is generally and consistently quite good, although it can vary depending on hydrologic conditions in both northern and southern California.

#### *State Water Project Water Quality*

The key water quality issues on the SWP are disinfection byproduct precursors, in particular total organic carbon and bromide. MWD is working to protect the water quality of this source, but it has needed to upgrade its water treatment plants to deal adequately with disinfection byproducts. Disinfection byproducts result from total organic carbon and bromide in the source water reacting with disinfectants at the water treatment plant, and they may place some near term restrictions on MWD's ability to use SWP water. MWD expects these treatment restrictions to be overcome through the addition of ozone disinfection at its treatment plants. Arsenic is also of concern in some groundwater storage programs.

Groundwater inflows into the California Aqueduct are managed to comply with regulations and protect downstream water quality while meeting supply targets. Additionally, nutrient levels are significantly higher in the SWP system than within the Colorado River, leading to the potential for algal related concerns that can affect water management strategies. MWD is engaged in efforts to protect the quality of SWP water from potential increases in nutrient loading from wastewater treatment plants. Also, as in the Colorado River watershed, MWD is active in studies on the occurrence, sources, and fate and transport of constituents of emerging concern.

### 5.2.3 San Antonio Water Company Water Quality

Surface water from local sources that originate in the San Antonio Canyon, Cucamonga Canyon, Day Creek, Deer Creek, Lytle Creek and several other smaller surface streams is generally of high quality, as these creeks are fed by snowmelt and other precipitation in the San Gabriel Mountains. Nevertheless, surface water sources are treated prior to introduction to the potable water supply in order to insure bacteriological quality and compliance with state and federal drinking water quality standards.

### 5.2.4 Recycled Water Quality

The State Water Resources Control Board has established regulations and guidelines for the use of recycled water under the California Code of Regulations, Title 22. In addition, IEUA sets requirements on recycled water retailers, including the District, that are incorporated in its agreements with retailers and in IEUA Ordinance No. 69, which regulates the availability and use of recycled water.

All of IEUA water recycling treatment plants produce recycled water suitable for full body contact recreation and generally meet the more stringent aquatic habitat criteria. Due to salinity management and the exclusive use of the SWP supply for imported water, TDS concentrations in recycled water remain relatively low for recycled water (typically 500 mg/L). Since recycled water is regulated and monitored carefully, water quality is expected to remain high.

### 5.2.5 Impact on Water Management Strategies and Supply Reliability

While the Chino Groundwater Basin water quality is very good, the District will continue with its blending program for groundwater high in nitrates. Imported water that is treated and delivered through the WFA is consistently of good quality. MWD has identified those water quality issues that are of concern and has implemented necessary water management strategies to minimize the impact on water supplies. SAWCo water is consistently of high quality, as is IEUA's recycled water supply.

If water quality does impact the water supply to the District in the future, the District will continue to implement its Water Master Plan and Capital Improvement Program, which provides for system redundancy and supply. For example, if groundwater becomes unusable due to water quality concerns, more imported water will be required. If imported water becomes limited due to diminished water quality, then more treatment is necessary, and more groundwater may be used.

## 5.3 CLIMATIC IMPACTS ON RELIABILITY

The reliability of Chino Basin's groundwater supply is based on long-term hydrology due to its ability to store groundwater, and therefore it is not directly impacted by single year or multi-year drought events. In contrast, San Antonio Water Company's local surface water supplies can be impacted by short-term drought events, as is currently being experienced (see Section 4.4). The climate of northern California can impact the reliability of the District's imported surface water supply; however, MWD has mitigated these impacts through supply and storage development.[22] Finally, recycled water is considered "drought proof" because it originates from the wastewater resulting from indoor uses which are not impacted by changes in the climate.

Table 5-1 summarizes the projected supply reliability impacts of single and multiple dry-year scenarios for each of the District's water supply sources. The historical bases for the supply reliability data is presented in Table 5-2.

[22] MWD 2015 UWMP (Draft March 2016).

**Table 5-1:**
**Supply Reliability as Percentage of Normal Water Year Supply**

| | | | Multiple Dry Years | | |
|---|---|---|---|---|---|
| **Supply Source** | **Normal Year** | **Single Dry Year** | **Year 1** | **Year 2** | **Year 3** |
| **Chino Groundwater Basin** | 100% | 100% | 100% | 100% | 100% |
| **Water Facilities Authority** | 100% | 100% | 100% | 100% | 100% |
| **San Antonio Water Company**[1] | 100% | 82% | 82% | 70% | 70% |
| **Recycled Water** | 100% | 100% | 100% | 100% | 100% |

Aligns with data in DWR Standardized Tables 7-1 R (multiple versions).
[1] Based on aggregated per-share allocation percentage reductions (Section 4.4).

| **San Antonio Water Company**[1] | 1893-2015 | 2013 | 2013-2015 |

Aligns with data in DWR Standardized Tables 7-1 R (multiple versions).
[1] Western Regional Climate Center, Pomona Fairplex (047050), Monthly Sum of Precipitation, Period of Record: 11/1/1893 to 12/31/2015, accessed May 19, 2016. http://www.wrcc.dri.edu/cgi-bin/cliMAIN.pl?ca7050.
[2] MWD 2015 Urban Water Management Plan (Draft March 2016), Table 7-1 W.

### *Dry Year Yield Program and Water Supply Allocation Plan*

On May 1, 2010, MWD implemented a third consecutive year of the Dry Year Yield (DYY) Program (Section 4.2.2), reducing the amount of direct imported water deliveries IEUA retail agencies could purchase by 31,000 AF. Two months later, on July 1, 2010, MWD implemented a Level 2 regional shortage under WSAP (Section 5.1.2).

The overlap of these two programs brought significant challenges to IEUA's member agencies and changed in how each retailer used its individual water supply. The District responded by reducing its reliance on imported water from MWD by 40 percent during this period through implementation of water use restrictions, public information campaigns, and prudent management and diversification of its water supply portfolio.

As discussed in Section 5.1.2, during normal and dry years MWD will have available supply to meet 100 percent of the District's imported water demands. However, the District can expect to be called upon by MWD to reduce its imported water demand through its DYY Program shift obligation. Simultaneously, the District can expect to have its Tier 1- and Tier 2-priced imported water supplies reduced by 10-40 percent, depending on the level of implementation of MWD's WSAP. Nevertheless, the overlap of these two programs, while creating challenges, does not in any way impact the reliability of the District's water supplies.

### 5.3.1 Demand Modifications during Dry Years
