LOS ANGELES, COUNTY CLERK

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING

DATE: August 5, 2019

TO: State Clearinghouse, Responsible Agencies, Trustee Agencies, Organizations and Interested Parties

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report in Compliance with Title 14, section 15082(a) of the California Code of Regulations

The County of Los Angeles (County) is the lead agency pursuant to the California Environmental Quality Act (CEQA) and intends to prepare an Environmental Impact Report (EIR) for the proposed Project identified below. The County has prepared this Notice of Preparation (NOP) to provide Responsible Agencies and other interested parties with information describing the Project and to identify its potential environmental effects pursuant to State requirements.

AGENCIES: The County requests your agency's views on the scope and content of the environmental information relevant to your agency's statutory responsibilities in connection with the proposed Project, in accordance with Title 14, section 15082(b) of the California Code of Regulations. Your agency will need to use the EIR prepared by the County when considering any permits that your agency must issue, or other approval for the Project.

ORGANIZATIONS AND INTERESTED PARTIES: The County requests your comments and concerns regarding the environmental issues associated with construction and operation of the proposed Project.

PROJECT & PERMIT(S): Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ / Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250.

PROJECT APPLICANT: Sterling Gateway, LP

PROJECT LOCATION: 29053 Coolidge Avenue, Val Verde, CA 91384 APN: 3271-004-012, 3271-004-013, and 3271-005-032

PROJECT DESCRIPTION: To create 222 detached single-family residential lots on 57.9 acres, a passive pocket park on 0.2 acre, a passive park with a tot lot, shade structure and tables on 3.4 acres, and 21,000 square feet of commercial uses with 71 parking spaces on 2.5 acres, five undisturbed open space lots on 21 acres, six landscaped open space HOA lots on 0.1 acre, three access strip lots on 0.2 acre, three infiltration basin lots and six debris basin lots on 8.8 acres, a pump station lot on 0.1 acre, and 19.7 acres of public right-of-way and private and future streets within Zone R-1 on 113.9 acres.

Sterling Gateway, LP proposes the Sterling Ranch Estates Residential Project (Project), a 113.9-acre residential community (See **Figure 1: Site Plan Sheet A**). Of the proposed 222 residential lots, 91 residential lots would be 7,000 square feet to 10,000 square feet in size and 131 residential lots would be greater than 10,000 square feet in size, for an average of 11,364 square feet, consistent with Castaic Area Community Standards District (CSD) development standards. The Project also would include five open space lots on 21 acres, six landscaped/open space HOA lots on 0.1 acre, three access strip lots at Trevylon Street (20' emergency access), Rainbow Drive (20' emergency access) and Lexington Drive (26' project access) on 0.2 acre, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acre, and public streets and private and future streets for the community on 19.7 acres (See **Figure 2: Site Plan Sheet B**).

The Project would provide a private trail, the Sterling Horn Memorial Trail, ten feet in width along the southern portion of the Project site. The private trail would connect with the County's Del Valle Trail outside the Project site as identified in the County's Regional Trail Plan. The Project also would dedicate a twenty-foot wide, multiuse trail easement to the County for the Del Valle Trail, located off-site, on a third party's property. The off-site trail would be a variable-width (five-foot to eight-foot wide), natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request.

The off-site improvements consist of the following: a portion of Del Valle Road from the easterly Project boundary to approximately 772-feet east of the Project boundary within the adjacent property; the off-site construction of a mainline sewer from the Project site to Hasley Canyon Road within Del Valle Road; the upsizing of the existing water line within Hasley Canyon Road; and the dedication of off-site permanent open space on 37.9 acres. The Project also involves the construction of a one-million-gallon water tank, located on approximately 1.4 acres of disturbed land, at an elevation of 1575 feet, approximately 2.2 miles westerly from the Project site, and in the vicinity of the existing Cuyama water tank site.

The proposed uses and densities are consistent with the existing General Plan, the Area Plan land use designations, zoning, and CSD development standards. The Project includes requests for approval of a vesting tentative tract map to create 249 lots, a conditional use permit (CUP) for development within a Hillside Management Area, the grading of more than 100,000 cubic yards of earth and construction and maintenance of a water tank, and an oak tree permit. While the Project would have one mass grading plan and storm drain plan for the entire Project site, the Project could be constructed in up to six phases, with the commercial portion constructed during

Phase 5. The Los Angeles County Waterworks District No. 36 would provide water to the Project, the Los Angeles County Sewer Maintenance Division would operate the pump station, and the Los Angeles County Sanitation District would provide wastewater treatment collection and treatment.

The Project's system of public streets would access Del Valle Road. The extension of Chiquito Canyon Road (as Sterling Parkway) would provide access to the Project site and would include four new intersections with local roadways constructed within the Project site.

The Project site is primarily undeveloped, with the exception of one single-family residential structure, unimproved hiking trails and dirt roads. The Project would demolish and remove the existing on-site residential structure, which is located off Hunstock Street and Coolidge Avenue (proposed Sterling Parkway).

The Project would require an Oak Tree Permit (OTP No. 200700007) to remove two jurisdictional oak trees. The two trees are located at the corner of Hunstock Street and what is currently Coolidge Avenue.

POTENTIAL ENVIRONMENTAL EFFECTS OF THE PROJECT

Based on a preliminary review of the proposed Project consistent with section 15060 of the CEQA Guidelines, the County has determined that an EIR should be prepared for this proposed Project. In addition, consistent with section 15082 of the CEQA Guidelines, the County has identified the following probable environmental effects of the Project, which will be addressed in the EIR for this project:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Geology / Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials
- Hydrology / Water Quality
- Noise
- Public Services
- Recreation
- Transportation / Traffic
- Tribal Cultural Resources

- Utilities / Services Systems
- Wildfire

The County has determined that there is not a likelihood of potentially significant effects related to the following environmental topics:

- Agricultural and Forestry Resources
- Energy
- Land Use / Planning
- Mineral Resources
- Population / Housing

The EIR will include information on the reasons why these effects were determined not to be significant and are therefore not addressed in detail in the EIR.

NOTICE OF SCOPING MEETING: The County will conduct a public scoping meeting for the purpose of soliciting oral and written comments from interested parties as to the appropriate scope and content of the EIR.

All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the EIR. The scoping meetings will include a brief presentation of the Project to be addressed in the EIR and will provide attendees with an opportunity to provide input to the scope of the EIR. The Scoping Meeting will be held on Thursday August 29, 2019 at 6:30 PM at the following location:

Live Oak Elementary
27715 Saddleridge Way
Castaic, CA 91384

Translation in other languages can be made available at the meeting upon request. Please submit translation requests at least seven business days in advance of each scheduled meeting to sdjones@planning.lacounty.gov.

PUBLIC REVIEW PERIOD: The County has determined to make this NOP available for public review and comment pursuant to Title 14, section 15082(b) of the California Code of Regulations. The comment period for the NOP begins on Monday, August 5, 2019 and ends on Thursday, September 5, 2019.

Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the EIR.

Please direct all written comments to the following address:

Steven Jones
County of Los Angeles
Department of Regional Planning
Land Divisions Section
320 West Temple Street, Room 1362
Los Angeles, CA 90012
Tel: 213-974-6433
Fax: (213) 626-0434
sdjones@planning.lacounty.gov

All written responses will be included as Appendices in the Draft EIR and their contents considered in accordance with State and County environmental guidelines.

DOCUMENT AVAILABILITY: The NOP and Initial Study are available for public review during regular business hours at the Los Angeles County Department of Regional Planning address listed above and the following locations:

- Castaic Library, 27971 Sloan Canyon Road, Castaic, CA 91384
- Stevenson Ranch, 25950 The Old Road, Stevenson Ranch, CA 91381

The public is also encouraged to visit the Department of Regional Planning's website to review the initial study at http://planning.lacounty.gov/case/view/03-250.

Thank you for your participation in the environmental review of this project.

Environmental Checklist Form (Initial Study)

County of Los Angeles, Department of Regional Planning

Project title: Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Tract Map No. 060257/Parcel Map No. 82320/ Conditional Use Permit No. 03-250/ Oak Tree Permit No. 200700007/Environmental Assessment No. 03-250.

Lead agency name and address: Los Angeles County, Department of Regional Planning, 320 West Temple Street, Los Angeles, CA 90012

Contact Person and phone number: Steven Jones (213) 974-6433

Project sponsor's name and address:
Sterling Gateway LP
c/o Hunt Williams
5018 E. Meadows Drive, Park City, Utah 84098
Phone: (435) 901-3488

Project location: 29053 Coolidge Avenue (existing, proposed Sterling Parkway), Val Verde, CA 91384
APN: 3271-004-012, 3271-004-013, and 3271-005-032
USGS Quad: Val Verde. Refer to Figure 1, Regional Location Map and Figure 2, Project Site.

Gross Acreage: 151.8 acres (113.9 acres on site and 37.9 acres off-site open space)

General plan designation: H2- Residential 2 (0-2 dwelling units/acre), H5 – Residential 5 (0-5 dwelling units/acre) and CG-General Commercial, off-site – RL5 (0.2 dwelling units/acre)

Community/Area wide Plan designation: Santa Clarita Valley Area Plan, One Valley One Vision (OVOV) (2012), HM - Hillside Management, and U1 -Urban Residential

Zoning: R-1 (Single Family Residence) and C-2 (Neighborhood Commercial)
In addition to the zoning designation, indicate which Community Standards District the property is located within: Castaic Area Community Standards District (CSD), Area 4, Val Verde Area.

Description of project: Sterling Gateway, LP proposes the Sterling Ranch Estates Residential Project (Project), a 113.9-acre residential community consisting of 222 detached single-family residential lots on 57.9 acres, a passive pocket park on 0.2 acres, a passive park with a tot lot, shade structure and tables on 3.4 acres, and 21,000 square feet of commercial uses with 71 parking spaces on 2.5 acres (refer to Figure 3a, 3b, and 3c, Site Plan Sheets). Of the 222 residential lots, 91 lots would be 7,000 square feet to 10,000 square feet in size and 131 lots would be greater than 10,000 square feet in size, for an average of 11,364 square feet, consistent with CSD development standards. The Project also would include five open spaces lots on 21 acres, six landscaped/open space HOA lots on 0.1 acres, three access strip lots at Trevylon Street (20' emergency access), Rainbow Drive (20' emergency access) and Lexington Drive (26' project access) on 0.2 acres, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acres, and streets for the community on 19.7 acres.

Site Plan Sheet C

185-001-18

The Project would provide a private trail, the Sterling Horn Memorial Trail, ten feet in width along the southern portion of the Project site. The private trail would connect with the County's Del Valle Trail outside the Project site as identified in the County's Regional Trail Plan. The Project also would dedicate a twenty-foot wide, multiuse trail easement to the County for the Del Valle Trail, located off site, on a third party's property. The off-site trail would be a variable-width (five-foot to eight-foot wide), natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request.

The off-site improvements consist of the following: a portion of Del Valle Road from the easterly Project boundary to approximately 772-feet east of the Project boundary within the adjacent property; the off-site construction of a mainline sewer from the Project site to Hasley Canyon Road within Del Valle Road; the upsizing of the existing water line within Hasley Canyon Road; and the dedication of off-site permanent open space on 37.9 acres. The Project also involves the construction of a one-million-gallon water tank, located on approximately 1.4 acres of disturbed land, at an elevation of 1575', approximately 2.2 miles westerly from the project site, and in the vicinity of the existing Cuyama water tank site,

The proposed uses and densities are consistent with the existing General Plan, the Area Plan land use designations, zoning, and CSD development standards. The Project includes requests for approval of a vesting tentative tract map to create 249 lots, a conditional use permit (CUP) for development within a Hillside Management Area, the grading of more than 100,000 cubic yards of earth, clustering and the maintenance of water tanks for the storage and distribution of water and an oak tree permit. While the Project would have one mass grading plan and storm drain plan for the entire Project site, the Project could be constructed in up to six phases, with the commercial portion constructed during Phase 5. The Los Angeles County Waterworks District No. 36 would provide water to the Project, the Los Angeles County Sewer Maintenance Division would operate the pump station, and the Los Angeles County Sanitation District would provide wastewater treatment collection and treatment.

The Project's system of public streets would access Del Valle Road. The extension of Chiquito Canyon Road (as Sterling Parkway) would provide access to the Project site and would include four new intersections with local roadways constructed within the Project site.

The Project site is primarily undeveloped, with the exception of one single-family residential structure, man-made hiking trails and dirt roads. The Project would demolish and remove the existing on-site residential structure, which is located off Hunstock Street and Coolidge Avenue (proposed Sterling Parkway).

The Project would require an Oak Tree Permit (OTP No. 200700007) to remove two jurisdictional oak trees. The two trees are located at the corner of Hunstock Street and what is currently Coolidge Avenue.

Surrounding land uses and setting: The Project site lies on both sides of Del Valle Road, south of Hasley Creek Canyon. The community of Val Verde lies south and west of the Project site. The Valencia Commerce Center with commercial and industrial uses lies east of the Project site. Residential uses border the Project site on the west and south. Largely undeveloped land lies north of the Project site. Surrounding land uses designations include H5 (Residential 5, 0-5 du/ac) to the south and west, RL2 (Rural Land 5, 1 du/2ac) to the north, and IO (Industrial Office) to the east. Surrounding zoning uses include R-1 (Single-family residence) to the south and west, A2-2 (Light and Heavy Agriculture) to the north, and MPD-DP (Manufacturing industrial planned development) to the east.

The Chiquito Canyon Sanitary Landfill is located approximately 1 mile southeast of the Project site beyond the residential uses. Val Verde Community Regional Park, which is a 58-acre community regional facility, is located approximately 0.25 miles southwest of the Project site.

Interstate 5 (I-5) is located approximately 2 miles east of the Project site and State Route 126 (SR 126) is located approximately 2 miles south of the Project site. Chiquito Canyon Road via SR 126 and Del Valle Road via I-5 would provide access to the Project site.

The topography of the surrounding area consists of low-lying rolling hills. The Project site varies from flat to moderately steep north and south facing slopes with elevations ranging from approximately 1,200 feet above mean sea level (amsl) along the southern boundary of the Project site to approximately 1,400 feet amsl in the northeastern portion of the Project site. The on-site vegetation is typical of an arid California climate, and primarily consists of annual brome grasslands and coastal sage scrub.

Within the Project site, two ephemeral channel features are present that support indicators of an ordinary high water mark (OHWM), bed and bank, and riparian vegetation. Based on these indicators, the features would be jurisdictional to the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW). These ephemeral channel features are currently within the Project footprint and would be impacted; therefore, mitigation for impacts would be required and is currently proposed to be fulfilled via the purchase of credits through a local mitigation bank or conservation organization. The mitigation requirement would be finalized during the Clean Water Act (CWA) Section 404 permitting process with the USACE, the CWA Section 401 Water Quality Certification with the RWQCB, and the California Department of Fish and Game Code (DFG Code) section 1600 Lake or Streambed Alteration Agreement (LSAA) permitting process.

Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code § 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

On September 27, 2017, a search of the Sacred Lands Files from the Native American Heritage Commission (NAHC) was requested. A response letter was received via email from the NAHC on September 28, 2017, stating the Sacred Lands File did not indicate the presence of Native American cultural resources in the immediate project area. The NAHC also provided a list of 11 Native American groups and individuals who may have knowledge of cultural resources in the project area. Letters were sent to each representative on October 23, 2017. This coordination was conducted for informational purposes only and does not constitute formal government-to-government consultation. To date, two responses were received: Fernandeno Tataviam Band of Mission Indians (Tataviam), Jairo Avila; and Santa Ynez Band of Mission Indians (Chumash), Freddie Romero.

Other public agencies whose approval may be required (e.g., permits, financing approval, or participation agreement):

Public Agency	*Approval Required*
_____	_____
_____	_____

Major projects in the area:

Project/Case No.	*Description and Status*
02-121/TR61105	Mission Village. 621 lots on 598 acres, Newhall Ranch, Approved March 28, 2019
98034/TR52584-1	Amendment to Revised Los Valles, 564 lots on 430.4 acres, approved February 5, 2019
R2012-02667/TR072126	Tapia Ranch, 511 lots on 1,167 acres pending review.
2018-003253/PM82110	Three commercial parcels on 2.52 acres pending review.
PM060030	Commercial/industrial parcels on 116.6 gross acres.
R2004-00559	Chiquita Canyon, LLC landfill lateral expansion, increased maximum height elevation and increased daily disposal limits on 639 acres

Reviewing Agencies:

Responsible Agencies

- ☐ None
- Regional Water Quality Control Board:
  - ☒ Los Angeles Region
  - ☐ Lahontan Region
- ☐ Coastal Commission
- ☐ Army Corps of Engineers
- ☐ LAFCO

Special Reviewing Agencies

- ☒ None
- ☐ Santa Monica Mountains Conservancy
- ☐ National Parks
- ☐ National Forest
- ☐ Edwards Air Force Base
- ☐ Resource Conservation District of Santa Monica Mountains Area

Regional Significance

- ☐ None
- ☒ SCAG Criteria
- ☒ Air Quality
- ☐ Water Resources
- ☐ Santa Monica Mtns. Area

Trustee Agencies

- ☐ None
- ☒ State Dept. of Fish and Wildlife
- ☒ State Dept. of Parks and Recreation
- ☐ State Lands Commission
- ☐ University of California (Natural Land and Water Reserves System)

County Reviewing Agencies

- ☒ DPW
- ☒ Fire Department
  - Forestry, Environmental Division

  - Land Development Unit
  - Health Hazmat
- ☒ Sanitation District
- ☐ Public Health/Environmental Health Division: Land Use Program (OWTS), Drinking Water Program (Private Wells), Toxics Epidemiology Program (Noise)
- ☒ Sheriff Department
- ☒ Parks and Recreation
- ☒ Subdivision Committee

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project.

☒ Aesthetics	☒ Greenhouse Gas Emissions	☒ Public Services
☐ Agriculture/Forestry	☒ Hazards/Hazardous Materials	☒ Recreation
☒ Air Quality	☒ Hydrology/Water Quality	☒ Transportation
☒ Biological Resources	☐ Land Use/Planning	☒ Tribal Cultural Resources
☒ Cultural Resources	☐ Mineral Resources	☒ Utilities/Services
☐ Energy	☒ Noise	☒ Wildfire
☒ Geology/Soils	☐ Population/Housing	☒ Mandatory Findings of Significance

DETERMINATION: (To be completed by the Lead Department.)
On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

_____ _____

Signature (Prepared by) Date

_____ _____

Signature (Approved by) Date

EVALUATION OF ENVIRONMENTAL IMPACTS:

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources the Lead Department cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the Lead Department has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level. (Mitigation measures from Section XVII, "Earlier Analyses," may be cross-referenced.)

5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA processes, an effect has been adequately analyzed in an earlier EIR or negative declaration. (State CEQA Guidelines § 15063(c)(3)(D).) In this case, a brief discussion should identify the following:

   a) Earlier Analysis Used. Identify and state where they are available for review.

   b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of, and adequately analyzed in, an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

   c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

7) The explanation of each issue should identify: the significance threshold, if any, used to evaluate each question, and; mitigation measures identified, if any, to reduce the impact to less than significance. Sources of thresholds include the County General Plan, other County planning documents, and County ordinances. Some thresholds are unique to geographical locations.

1. AESTHETICS

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	☒	☐	☐	☐

For purposes of determining significance under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public. The Santa Clarita Area Plan discusses scenic resources within the area and states that urban development has the potential to impair scenic resources if not carefully planned and controlled. The Santa Clarita Area Plan has designated specific ridgelines and established land use policies designed to preserve the views of these ridgelines. The Project sits in a canyon area, surrounded by mountains and rolling hills. Scenic ridgelines surround the Project site, the closest being the ridgeline between the Project site and the commercial and industrial uses to the east.

SR 126 is located approximately 2 miles south of the Project site and is a state designated scenic highway. Because the Project sits in a canyon, it is not be visible from SR 126 and, for this reason, there would be no impact to scenic vistas visible from this state designated scenic highway.

The Project does not propose changes to the scenic ridgeline that sits between the Project site and the commercial and industrial uses to the east. However, the Project would change views from the ridgeline from mostly vacant, undeveloped land, to primarily residential uses. Further analysis of potential impacts on a scenic resource are required.

b) Be visible from or obstruct views from a regional riding, hiking, or multi-use trail?	☒	☐	☐	☐

The Project site is located in a portion of the Santa Clarita Valley that contains several trails identified as "Existing Official Trails on Public Lands" on the County of Los Angeles "Trail Network Map." The only trail that currently exists near the Project site is the Hasley Canyon Trail, an approximately two-mile-long hiking, bicycling, and horseback riding trail located just over 0.50 miles northeast of the Project site. Due to the elevations of the surrounding area, portions of the Project may be visible from the trail. The Project would also include the construction of two additional trails. The Sterling Horn Memorial Trail would be a private trail, ten-feet in width along the southern portion of the Project site. This trail would connect with the County's Del Valle Trail outside the Project site as identified in the County's Regional Trail Plan.

The Project would also dedicate a twenty-foot wide, multiuse trail easement to the County for the Del Valle Trail, located off site, on a third party's property. on the off-site parcel. The off-site trail would be a variable width (five-foot to eight-foot-wide), natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request. Further evaluation of the visibility of the Project site from trails in the area is needed to determine the significance of any impact.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
c) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☒	☐

The Project site contains native and nonnative plant species on rolling topography, including three oak trees, two of which are afforded protection under the Los Angeles County Oak Tree Ordinance, while the third oak tree does not meet the size criteria under the ordinance. All three of these oak trees are proposed for removal. An oak tree report has been conducted, and oak tree permits have been obtained in order to remove the two jurisdictional oak trees from the property. The Project would be required to mitigate removal of the two trees by payment of in-lieu fees, which is further discussed in Section 4, Biological Resources below. Impacts on oak trees would be considered less than significant.

As mentioned, scenic ridgelines surround the Project site, the closest being the ridgeline between the Project site and the commercial and industrial uses to the east. The Project does not propose changes to the scenic ridgeline that sits between the Project site and the commercial and industrial uses to the east. The Project would be required to adhere to the Hillside Management Regulations/Guidelines in order to protect views of this ridgeline. The Hillside Design Guidelines are intended to implement policies by ensuring that hillside development projects use sensitive and creative engineering, architectural, and landscaping site design techniques. The Guidelines also help ensure that hillside development projects are designed in a manner that allows a project to meet the findings of the Hillside Management Areas Ordinance. The Guidelines are divided into five major design categories (site planning, grading and facilities, road circulation, building design, and landscaping) containing a variety of sensitive hillside design measures. In order to comply with the ordinance, all projects must use the design measure contained in the Guidelines that reasonably can be implement into a project's design. The Project would be required to incorporate these design measures, and impacts would be considered less than significant.

Additionally, SR 126, located approximately 2 miles south of the Project site is a state designated scenic highway. Because the Project site sits in a canyon, it is not visible from SR 126 and, therefore, there would be no impact.

d) Substantially degrade the existing visual character or quality of public views of the site and its surroundings because of height, bulk, pattern, scale, character, or other features or conflict with applicable zoning and other regulations governing scenic quality? (Public views are those that are experienced from publicly accessible vantage point)	☒	☐	☐	☐

The Project site is undeveloped except for one single-family residence. The Project would include grading and the development of 222 single-family homes and 21,000 square feet of commercial uses, both of which would alter the visual character of the Project site.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
e) Create a new source of substantial shadows, light, or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

The Project would include development of one- and two-story homes on lots between 7,000 square feet to greater than 10,000 square feet and single-story commercial uses that would not create substantial shadows affecting any solar access or sensitive uses.

The Project would be built according to the Community Standards District (CSD) and County rural standards, which require fewer street lights than typical lighting associated with single-family homes and a small commercial center. The Project would be developed in accordance with applicable standards and would not create substantial light adversely affecting nighttime views. The homes and commercial center also would not include reflective materials adversely affecting daytime views. Impacts would be less than significant.

2. AGRICULTURE / FOREST

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒

The Project site is identified as "Grazing Land" and "Other Land" on the Los Angeles Important Farmland 2016 map by the California Department of Conservation.[1] Grazing Land is defined as land on which the existing vegetation is suited to the grazing of livestock and Other Land is defined as land not included in any other mapping category. Common examples include low density rural developments, brush, timber, wetland, and riparian areas. The site is not identified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Due to the lack of historic agricultural use, no impact to important farmland would occur.

b) Conflict with existing zoning for agricultural use, with a designated Agricultural Resource Area, or with a Williamson Act contract?	☐	☐	☐	☒

The Project site is presently undeveloped land and is zoned R-1 (Single Family Residence) and C-2 (Neighborhood Commercial). Additionally, the site is not under a Williamson Act Contract.[2] No impact to land zoned for agricultural use or subject to a Williamson Act contract would occur.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code § 12220 (g)), timberland (as defined in Public Resources Code § 4526), or timberland zoned Timberland Production (as defined in Government Code § 51104(g))?	☐	☐	☐	☒

1 California Department of Conservation Division of Land Resource Protection Farmland Mapping and Monitoring Program, https://maps.conservation.ca.gov/agriculture/#dataviewer.

2 State of California Department of Conservation, http://www.conservation.ca.gov/dlrp/Pages/qh_maps.aspx.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

The Project site is zoned R-1 (Single Family Residence) and C-2 (Neighborhood Commercial). No impact to land zoned as forestland, timberland or Timberland Production land would occur.

d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒

The Project site is not forest land, so no impact to forest land would occur.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

Agricultural uses and forest land are not located in the immediate vicinity or on the Project site. The Project site is surrounded by developed uses to the east, south, and west. No impact would occur.

3. AIR QUALITY

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Conflict with or obstruct implementation of applicable air quality plans of either the South Coast AQMD (SCAQMD) or the Antelope Valley AQMD (AVAQMD)?	☒	☐	☐	☐

Construction of the Project would involve the use of heavy-duty construction vehicles and on-site stationary equipment which may generate air pollutant emissions in excess of applicable emissions standards. In addition, fugitive dust emissions would be generated during grading and excavation of the Project site. Construction emissions would be short-term in nature, limited to the periods when construction activity would be taking place. Therefore, construction emissions would not add to long-term air quality degradation. However, daily emissions from construction sources may exceed daily SCAQMD emissions thresholds for criteria pollutants. Further evaluation of potential air quality impacts associated with short-term construction activities is needed to determine the significance of these impacts.

Occupancy and use of the Project site would also increase traffic in the area and may result in an increase in emissions from stationary sources associated with natural gas and electrical consumption. Daily emissions from vehicular and stationary sources may exceed daily SCAQMD emissions thresholds for criteria pollutants. Further evaluation is needed to determine the significance of these emissions.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☒	☐	☐	☐

The Project site is located within the South Coast Air Basin (SCAB), which is currently in nonattainment for several criteria pollutants. Operational activities associated with the Project may result in a cumulative increase in air pollutant emissions. Further evaluation of the Project's contribution to cumulative regional air quality impacts is needed to determine the significance of this contribution.

c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐

The Project would develop a residential community and, therefore, would not be considered a sensitive use. However, the Project site is located approximately 285 feet north of Macedonia Church of God, which is considered a sensitive use.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☒	☐	☐	☐

Grading and construction activities may result in short-term fugitive dust or other potential emissions. Further evaluation of the significance of this impact is required.

4. BIOLOGICAL RESOURCES

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS)?	☒	☐	☐	☐

A Draft Biological Technical Report was drafted in April 2019 by Dudek. The Technical Report noted two special status plant species, Slender Mariposa lily and Peirson's morning-glory, which were documented on the Project site during studies conducted in 2014 and 2017.

Additionally, the Technical Report noted the 2017 and 2018 field investigations found a total of four special-status wildlife species on the site, including: southern California rufous crowned sparrow, oak titmouse, Vauxs swift, and San Diegan tiger whiptail. Two additional special-status reptile species, Blainvilles horned lizard and San Diegan tiger whiptail, have potential to occur on the Project site. Special-status bird species may nest and forage within suitable habitat present on the Project site. Additionally, three mammals, American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat, could occur in grassland, coastal scrub, woodland, and riparian vegetation communities as well as disturbed lands on the Project site. No state or federally listed wildlife species were detected during focused surveys conducted by Dudek in 2017 and 2018. The Project may have an effect on sensitive species and further evaluation is required to determine if any significant impacts would result from the Project.

b) Have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations or by CDFW or USFWS?	☒	☐	☐	☐

As noted in the Draft Biological Technical Report, the Project site is not considered an oak woodland and does not otherwise contain communities of other unique native trees. The Project site does not contain riparian habitat or coastal sage scrub.

However, as noted in the report, within the Project site, there are two unnamed ephemeral waterways, characterized as nonwetland waters of the U.S. and state subject to the jurisdiction of the USACE, RWQCB, and CDFW, that would be impacted by Project construction.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
c) Have a substantial adverse effect on federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, and drainages) or waters of the United States or California, as defined by § 404 of the federal Clean Water Act or California Fish & Game code § 1600, et seq. through direct removal, filling, hydrological interruption, or other means?	☒	☐	☐	☐

The Draft Biological Technical Report states that within the Project site there are two unnamed ephemeral waterways, characterized as nonwetland waters of the U.S. and state subject to the jurisdiction of the USACE, RWQCB, and CDFW, that would be impacted by Project construction.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐

The Santa Clara River is considered to be an important wildlife movement and migration corridor.[3] However, as previously mentioned, the Project site is located approximately 1.75 miles west and approximately 2 miles north of the Santa Clara River. As stated in the Draft Biological Technical Report, the Project would potentially interfere with movement by removing access to suitable habitat patches and established native wildlife nursery sites. Further evaluation of the potential impacts to wildlife movements is required.

e) Convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10% canopy cover with oaks at least 5 inch in diameter measured at 4.5 feet above mean natural grade) or other unique native woodlands (juniper, Joshua, southern California black walnut, etc.)?	☐	☐	☒	☐

The Project site contains native and nonnative plant species on rolling topography, including three oak trees, two of which are afforded protection under the Los Angeles County Oak Tree Ordinance. The Project site is not considered an oak woodland and does not otherwise contain communities of other unique native trees.

The Project would permanently impact 0.46 acre of mapped nonnative woodland. The nonnative woodland vegetation community is not recognized in A Manual of California Vegetation, Second Edition (MCV2) and does not carry a global and/or state rarity rank. This vegetation community is comprised of nonnative species and is present in small patches adjacent to existing developed areas associated with the community of Val

3 Santa Clara River Enhancement and Management Plan, May 2005, https://dpw.lacounty.gov/wmd/watershed/sc/docs/SCREMP_Full_Report.pdf and Santa Clarita Valley Area Plan, Conservation and Open Space Element, 2012, Page 144, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch_04_os.pdf.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Verde. Due to the nonnative character and small, patchy distribution of this vegetation community, impacts would be less than significant.

f) Conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (L.A. County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (L.A. County Code, Title 22, Ch. 22.174), the Significant Ecological Areas (SEAs) (L.A. County Code, Title 22, Ch. 102), and Sensitive Environmental Resource Areas (SERAs) (L.A. County Code, Title 22, Ch. 22.44)?	☐	☐	☐	☒

The Project site is not located in area covered by local policies or ordinances protecting biological resources. The Project site is also not in a Significant Ecological Area (SEA).[4] The Project site is also not located within a Wildflower Reserve Area[5] or a Sensitive Environmental Resource Area.[6] The Project site contains three oak trees, two of which are afforded protection under the Los Angeles County Oak Tree Ordinance. In compliance with the County's Oak Tree Ordinance, the Project would require an Oak Tree Permit (OTP No. 200700007) to remove these oak trees. However, the Project site is not considered an oak woodland and does not otherwise contain communities of other unique native trees. As such, the Project would not conflict with local policies or ordinances protecting biological resources and there would be no impact.

g) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan?	☐	☐	☐	☒

The Project site is not located within an area covered by any adopted Habitat Conservation Plans, Natural Community Conservation Plans, or any other approved local, regional, or state habitat conservation plans. As such, implementation of the Project would not conflict with any provisions related to such plans.

4 Santa Clarita Valley Area Plan, 2012, Appendix II: Maps, Figure CO-5: Significant Ecological Areas, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch_a2.pdf.

6 Los Angeles County GIS Data Portal, Sensitive Environmental Resource Areas (SERA), https://egis3.lacounty.gov/dataportal/2015/08/06/sensitive-environmental-resource-areas-sera.

5. CULTURAL RESOURCES

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines § 15064.5?	☐	☐	☒	☐

A Final Cultural Resources Inventory (Inventory) for the Project was conducted by Dudek in August 2018. The report notes no cultural resources have been recorded within the Project site and only three are located within a one-mile search buffer of the Project site. Since there are no known historical resources on the site, the Project would not impact any known historical resources and impacts would be less than significant.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines § 15064.5?	☐	☐	☒	☐

Four archaeological sites (SR-S-01, SR-S-02, SR-S-03, and SR-S-04) and one built environment resource (SR-S-05) were identified and recorded within the Project area during an archeological survey for the Project. The archaeological sites include one slab foundation (SR-S-01), one decomposing asphalt road (SR-S-02), and two historic refuse deposits (SR-S-03 and -04). SR-S-01 has been recommended not eligible for the National Register of Historic Places (NRHP) or the California Register (CR). SR-S-02, SR-S-03, and SR-S-04 were identified in the southern section of the Project area. This area will be preserved and placed in a conservation easement as a component of this Project and therefore these resources would not be impacted by the Project. The built environment resource (SR-S-05) is a single-family, one-story vernacular building built in 1936. This resource was evaluated in a Historic Resource Assessment (HRA) prepared in July 2018 and was determined to be not eligible for listing on either the NRHP or the CR.

Further, any potential impacts associated with the Project would be reduced to a level of less than significant through adherence to State Health and Safety Code Section 7050.5 and other relevant regulatory requirements.

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐

The Final Cultural Resources Inventory notes ground disturbance would occur in areas of high paleontological sensitivity, and adverse effects to paleontological resources could occur if significant resources were uncovered during ground disturbance and subsequently destroyed. Further analysis of grading impacts to paleontological resources is required.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

See 5(b) above. Although no known burial areas are located near the Project site, any potential impacts associated with the Project would be reduced to a level of less than significant through adherence to State Health and Safety Code Section 7050.5 and all relevant regulatory requirements.

6. ENERGY

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐

The proposed homes and commercial center would be designed in compliance with the County Green Building Ordinance and the County of Los Angeles Green Building Standards. Further, the Project would be developed in compliance with all state and local regulations related to energy conservation. As such, less than significant impacts would occur.

b) Conflict with or obstruct a state or local plan for renewal energy or energy efficiency?	☐	☐	☒	☐

The Project would involve the construction of standard residential and commercial buildings and would be designed in compliance with the County Green Building Ordinance and the County of Los Angeles Green Building Standards. Compliance with these standards would ensure impacts would remain less than significant.

7. GEOLOGY AND SOILS

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☒

The Project site is not located within a mapped Alquist-Priolo Earthquake fault zone. The Holser Fault is directly south of the Project site, but this fault is not identified on the Alquist-Priolo Earthquake Fault Map. No additional analysis of potential impacts related to this topic is required.

ii) Strong seismic ground shaking?	☒	☐	☐	☐

The Project area is located in a seismically active area and the potentially active Holser Fault is directly south of the Project site and could generate a maximum estimated earthquake magnitude of 6.5. Other faults near the Project site include the Del Valle Fault, the San Gabriel Fault Zone, the Santa Felicia Fault, and the San Andreas Fault. There is the potential for strong seismic ground shaking to occur due to the proximity of the Project site to several faults.

iii) Seismic-related ground failure, including liquefaction and lateral spreading?	☒	☐	☐	☐

As indicated on the State of California Seismic Hazards Zones for the Val Verde Quadrangle, the Project site is located in an area mapped as being potentially susceptible to liquefaction. Liquefaction areas have been mapped through the Project site. For this reason, further evaluation of this topic is required.

iv) Landslides?	☒	☐	☐	☐

As indicated on the State of California Seismic Hazards Zones for the Val Verde Quadrangle, the Project site is within an area where earthquake-induced landslides have been previously identified. Landslide areas have been mapped along the borders of the Project site. Based on this information, further evaluation of potential impacts related to landslides is required.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b) Result in substantial soil erosion or the loss of topsoil?	☒	☐	☐	☐

Grading would occur on the 113.9-acre portion of the Project site where development is proposed. This grading would involve the cut of approximately 1.5 million cubic yards and 1.5 million cubic yards of fill. No earth materials would be exported from the site. Development of the Project would involve grading of slopes greater than 25 percent. Given the amount of grading proposed, further evaluation of potential impacts related to grading is warranted.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☒	☐	☐	☐

See **7(a)(iv)**, above. Further evaluation of the potential impacts is required.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☒	☐	☐	☐

According to the results of the Geotechnical Report, Preliminary Infiltration Testing, prepared on November 6, 2017, some soil samples contain small percentages of clay which can typically result in expansion. For this reason, further evaluation of this topic is required. Source: Allan E. Seward, Geotechnical Report Results of Preliminary Infiltration Testing, November 6, 2017.

e) Have soils incapable of adequately supporting the use of on-site wastewater treatment systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒

Septic tanks are not proposed as part of the Project.

f) Conflict with the Hillside Management Area Ordinance (L.A. County Code, Title 22, Ch. 22.104)?	☐	☐	☒	☐

The Project would involve grading of slopes greater than 25 percent with surrounding significant ridgelines,[7] and would therefore need to adhere to the requirements of the Hillside Management Regulations/Guidelines. The Hillside Design Guidelines are intended to implement policies by ensuring that hillside development projects use sensitive and creative engineering, architectural, and landscaping site design techniques. The

7 Santa Clarita Valley Area Plan, 2012, Appendix II: Maps, Figure CO-1: Hillsides and Designated Ridgelines, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch_a2.pdf.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Guidelines also help ensure that hillside development projects are designed in a manner that allows a project to meet the findings of the Hillside Management Areas Ordinance. The Guidelines are divided into five major design categories (site planning, grading and facilities, road circulation, building design, and landscaping) containing a variety of sensitive hillside design measures. In order to comply with the ordinance, all projects must use the design measures contained in the Guidelines that reasonably can be implement into a project's design. The Project would be required to incorporate these design measures, and impacts would be considered less than significant.

8. GREENHOUSE GAS EMISSIONS

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Generate greenhouse gas (GHGs) emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐

The Project would result in short-term emissions of greenhouse gas (GHG) emissions during construction. These emissions would generally be associated with the operation of construction equipment and the disposal of construction waste and demolition debris. GHG emissions would also result from operation of the Project, such as mobile vehicles traveling to and from the site, as well as electricity, natural gas, water, landscape equipment, and generation of solid waste and wastewater. Any potential impacts associated with the Project would be reduced to a level of less than significant through the implementation of mitigation and/or adherence to regulatory requirements.

b) Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

Because the Project would have the potential to emit GHG emissions, the Project would have the potential to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases, e.g., Assembly Bill 32, the State's 2013 Green Building Standards Code, or the County's General Plan. However, based on the Project's design, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

9. HAZARDS AND HAZARDOUS MATERIALS

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, storage, production, use, or disposal of hazardous materials?	☐	☐	☒	☐

The Project site is currently and has historically been mostly undeveloped other than one single-family home. During construction, potentially hazardous substances used to maintain and operate construction equipment such as fuels, lubricants, and solvents would be present on the Project site. Occupancy and use of the proposed homes and commercial center would involve the storage and use of small amounts of potentially hazardous materials, such as cleaning supplies, fertilizers, and pesticides needed to maintain the facilities and houses. Typical household waste would be produced by the Project, but it would not pose a risk or significant impact, provided it is disposed of properly and in accordance with the applicable regulations. The existing home on the site would be demolished and removed, which potentially could include hazardous materials such as lead or asbestos. However, the transport, use, storage, and disposal of hazardous materials, such as lead and asbestos, during construction and operation of the Project would be conducted in accordance with all applicable state and federal and state laws, such as the Hazardous Materials Transportation Act, Resource Conservation and Recovery Act, the California Hazardous Material Management Act, and the California Code of Regulations, Title 22. Impacts from the routine transport, storage, production, use, or disposal of hazardous materials would be less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials or waste into the environment?	☐	☐	☒	☐

As mentioned above, during construction of the Project, potentially hazardous substances used to maintain and operate construction equipment, such as fuels, lubricants, and solvents, would be present on the Project site. Operation of the Project would involve storage of potentially hazardous materials such as cleaning supplies, fertilizers, and pesticides needed to maintain the facilities and houses. Typical household waste would be produced by the Project, but it would not pose a risk or significant impact, provided it is disposed of properly and in accordance with the applicable regulations. The existing home on the site would be demolished and removed, which potentially could include hazardous materials such as lead or asbestos. The transport, use, storage, and disposal of hazardous materials during construction and operation of the Project would be conducted in accordance with all applicable state and federal and state laws, such as the Hazardous Materials Transportation Act, Resource Conservation and Recovery Act, the California Hazardous Material Management Act, and the California Code of Regulations, Title 22. Impacts involving a release of hazardous material or waste into the environment would be less than significant.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of sensitive land uses?	☐	☐	☒	☐

The Project site is located approximately 285 feet north of Macedonia Church of God, which is considered a sensitive use. However, the Project would involve residential and some commercial uses, which would not create hazardous emissions. Additionally, the Project would balance the cut and fill on the site; therefore, there would be significantly fewer trucks during construction. The Project would comply with all applicable state and federal and state laws, such as the Hazardous Materials Transportation Act, Resource Conservation and Recovery Act, the California Hazardous Material Management Act, and the California Code of Regulations, Title 22. Impacts would be less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐

The Project site is currently and has historically been undeveloped except for the one single-family home and hiking trails. A site within 1 mile of the Project site is listed on EnviroStor for a School Investigation for Hasley Canyon School Site. There are two sites listed on GeoTracker within approximately 1 mile of the Project site. The first site is a UNOCAL Cleanup Program Site, which is an open but inactive since January 1965, located at the northern end of the Project site. The second site is a Former SADD Lease North and South Pads Cleanup Program Site, which is now closed and located approximately 3,300 feet north of the Project site. Since there are no hazardous materials sites located on the Project site, impacts would be less than significant.

e) For a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒

The Project site is not within an airport land use plan, within 2 miles of a public or private use airport, or within the vicinity of a private airstrip, which could create a safety hazard for people residing or working in the Project area. In addition, the Project does not propose construction of any structure equal to or greater than 150 feet in height, constituting a safety hazard to aircraft and/or operations from an airport. No impact would occur.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
f) Substantially impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐

Interstate 5 located east of the site, and State Route 126 west of the Project site, are both Primary Disaster Routes. There are no other evacuation routes located near the Project site. During construction and infrastructure improvements, temporary road closure/blockage/detour may be necessary, however, closure of the Primary Disaster Routes would not occur, and therefore impacts to existing emergency routes would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving fires, because the project is located:				
i) within a high fire hazard area with inadequate access?	☒	☐	☐	☐

The Project site is located in a very high fire hazard severity zone. A fire technical report will be prepared for the and the Los Angeles County Fire Department would be required to review the proposed Project and the report. Further evaluation of the fire hazard area is required.

ii) within an area with inadequate water and pressure to meet fire flow standards?	☒	☐	☐	☐

Water is provided to the Val Verde area from LA County Waterworks District #36, which is a purveyor under the Castaic Lake Water Agency. There are no known water supply or pressure problems in the area. Fire flow requirements for the Project would be determined by the Fire Department. Further analysis of water supply and fire flow standards is required.

iii) within proximity to land uses that have the potential for dangerous fire hazard?	☒	☐	☐	☐

As stated above, the Project site is located in a very high fire hazard severity zone. A fire technical report will be prepared for the Project and the Los Angeles County Fire Department would be required to review the Project and the report.

h) Does the proposed use constitute a potentially dangerous fire hazard?	☒	☐	☐	☐

See **9(g)(i)** through **(iii)**, above. Further evaluation is required.

10. HYDROLOGY AND WATER QUALITY

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐

Per State regulations, the applicant would be required to prepare a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP would require the use of BMPs (such as gravel bags, silt fences, hay bales, check dams, hydro seed, mulch, and soil binders) during construction, which would prevent excessive storm water runoff pollution. The SWPPP must be approved by the County prior to the issuance of a grading or building permit.

The Project would be required to comply with the County's MS4 permit, which requires the amount of runoff from the site to be the same before and after construction of a project. The Project also includes improvements to stormwater runoff, such as incorporating six infiltration basins throughout the Project site. Because the Project would be required to include site drainage systems according to standards and provisions set forth by the County, impacts related to water quality would be less than significant.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☒	☐	☐	☐

Water is provided to the Val Verde area from Valencia Water Company, which is a purveyor under the Castaic Lake Water Agency. Local groundwater is a source of supply to the purveyors under Castaic Lake Water Agency. The Project would develop 222 single-family units and approximately 21,000 square feet of commercial uses, which would increase demand for water. Further analysis is required to determine whether the Project would cause a significant impact.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
(i) Result in substantial erosion or siltation on- or off-site?	☒	☐	☐	☐

The site currently does not contain any stream or river; however, it does contain ephemeral drainages. Site drainage would be modified substantially by grading, paving, new building construction, and related improvements.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
(ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	☒	☐	☐	☐

The Project site currently does not contain any stream or river; however, it does contain ephemeral drainages. As the Project would substantially alter the existing drainage on the Project site, further review is required.

(iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☐	☒	☐

The Project would be required to comply with the County's MS4 permit, which requires the amount of runoff from the site to be the same before and after construction of a project. The Project also includes improvements to stormwater runoff, such as incorporating six infiltration basins throughout the Project site. Because the Project would be required to include site drainage systems according to standards and provisions set forth by the County, impacts related to water quality would be less than significant.

(iv) Impede or redirect flood flows?	☒	☐	☐	☐

Site drainage would be substantially modified by grading, paving, new building construction, and related improvements. Additionally, the site is in Flood Zone D, which is defined as areas in which flood hazards are undetermined, but possible. Further analysis of flood flows is required.

d) Conflict with the Los Angeles County Low Impact Development Ordinance (L.A. County Code, Title 12, Ch. 12.84)?	☒	☐	☐	☐

LID requirements would apply to the Project. The Project's consistency with the LID ordinance requires further analysis.

e) Use on-site wastewater treatment systems in areas with known geological limitations (e.g. high groundwater) or in close proximity to surface water (including, but not limited to, streams, lakes, and drainage course)?	☐	☐	☐	☒

No on-site wastewater treatment systems exist on the Project site and none are proposed. No further analysis is required.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
f) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☒	☐	☐	☐

The Project site is not within a coastal area. Therefore, tsunamis (seismic sea waves) are not considered a significant hazard at the site. In addition, the Project site is not located downslope of any large bodies of water that could adversely affect the site in the event of earthquake-induced seiches, which are wave oscillations in an enclosed or semi-enclosed body of water. According to Federal Emergency Management Agency (FEMA) Map number 06037C0800F, the Project site is not located in a known flood zone. However, as the site is in Zone D, which is defined as areas in which flood hazards are undetermined, but possible, further analysis of potential flooding is required.

g) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☒	☐	☐	☐

As previously mentioned, the water needed for the Project would come, in part, from groundwater, so further analysis, including analysis of the consistency of the Project with the Santa Clarita Valley Sustainable Groundwater Management Act, is required.

11. LAND USE AND PLANNING

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Physically divide an established community?	☐	☐	☒	☐

Val Verde is located in unincorporated Los Angeles County, and is developed primarily with single-family homes in a rural setting, surrounded by chaparral-covered hillsides and scattered canyon oaks. The Project would develop 222 single-family homes and 21,000 square feet of commercial uses along the edge of the existing Val Verde community. The Project would not create physically divide or create any barriers dividing the existing Val Verde community.

Land Use Policy LU-1.2.9 provides: In Val Verde, protect the existing rural lifestyle and small-town community character while providing residents with additional access to needed services; ensure compatibility between existing residential areas and the nearby landfill; and maintain community character in accordance with the County's Castaic Area Community Standards District; and Land Use Policy LU-4.3.2: Promote business development in Castaic and Val Verde to provide a greater range of goods and services to area residents.[8]

The Project would develop residential lots, all of which would be greater than 7,000 square feet and most of which would be greater than 10,000 square feet, to ensure that the Project would be consistent with the existing rural lifestyle and community character. Additionally, the Project would involve the development of 21,000 square feet of commercial uses to the provide the community with additional commercial uses to meet day-to-day needs within the community. Impacts would be less than significant.

b) Cause a significant environmental impact due to a conflict with any County land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

The Project is consistent with the zoning and land use designation for the Project site. The Santa Clarita Valley Area Plan (SCVAP), which was approved by the County in 2012, designates the vast majority of the Project site as H2 (Urban, 2 DU/Acre) with two smaller areas in the southeast portion of Project site designated as CG (General Commercial) and H5 (Urban 5 DU/Acre). The zoning for most of the Project site is R1 (Single Family Residential) with a small portion in the southeast portion of the Project site designated C2 (Commercial). The Project would provide 222 detached single-family residential lots on 57.9 acres, 21,000 square feet of commercial uses with 71 parking spaces on 2.5 acres, a community park on 3.4 acres, five open spaces lots on 21.0 acres, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acres, and streets for the community on 19.6 acres. The SCVAP would allow 239.9 single-family residential units. The Project would provide fewer dwelling units than allowed under the SCVAP.

The Project would be consistent with the Santa Clarita Valley Area Plan, One Valley One Vision (OVOV), 2012. The proposed uses are allowed under the existing land use designations. These designations have been

8 Santa Clarita Valley Area Plan, 2012, Land Use Element, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch-02-landuse.pdf.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

adopted to maintain the environmental quality and resources in Val Verde, and no land use designation changes are proposed by the Project. Impacts would be less than significant.

Further, the Project would be compatible with and enhance community character. The Project has been designed to preserve the highest points within the Project site and to minimize impacts on the steeper slopes (greater than 50%) on the Project site. The Project would avoid approximately 28.9 % of the 27.0 acres with slopes of greater than 50% and approximately 14.8 % of the 25.6 acres with slopes between 25 and 49.99%. The Project would locate the vast majority (over 75 %) of development on the portions of the Project site with slopes less than 50%.

The Project would meet or exceed all requirements of the Castaic Area Community Standards District, including providing lots with a minimum of 7,000 square feet and with an overall lot average of 10,000 square feet. The CSD also requires the provision of 25% of the Project site as open space. The Project would provide 33.9 acres of open area with 12.7 acres preserved as natural open space, focused on the steep slopes in the northwest and southeast portions of the Project site. Accordingly, the Project would provide 29.8 % of the Project site as open space. Further, the Project would preserve in perpetuity a 37.9-acre undeveloped parcel in a Hillside Management Area just south of VTTM No. 60257. Accordingly, the Project would preserve 50.6 acres of natural open space. With the preservation of this parcel, the Project would provide 90.6 acres of open space or 59.7 % of the total 151.8 acres covered by the Project.

c) Conflict with the goals and policies of the General Plan related to Hillside Management Areas or Significant Ecological Areas?	☐	☐	☒	☐

The Project would involve grading of slopes greater than 25 percent with surrounding significant ridgelines,[9] and is required to conform to the requirements of the Hillside Management Regulations/Guidelines. The Hillside Design Guidelines are intended to implement policies by ensuring that hillside development projects use sensitive and creative engineering, architectural, and landscaping site design techniques. The Guidelines also help ensure that hillside development projects are designed in a manner that allows a project to meet the findings of the Hillside Management Areas Ordinance. The Guidelines are divided into five major design categories (site planning, grading and facilities, road circulation, building design, and landscaping) containing a variety of sensitive hillside design measures. In order to comply with the ordinance, all projects must use the design measure contained in the Guidelines that reasonably can be implement into a project's design. The Project conforms with the Hillside Management Regulations/Guidelines and incorporate these design measures.

To the greatest extent feasible, the Project would preserve the physical integrity of the HMAs on the Project site. Of the 113.9-acre project site, 52.6 acres are designated as Hillside Management Areas. The Project site contains slopes of greater than 50% on 27.0 acres, slopes of 25% to 49.99% on 25.6 acres, slopes of less than 25% on 57.3 acres, and a portion of Del Valle Road, an excluded public street on 4.0 acres. Accordingly, approximately 25% of the Project site contains slopes greater than 50%. The Project would preserve 12.7 acres of the 52.6 acres of the Project site designated Hillside Management Area and has been designed to minimize impacts on the steeper slopes (greater than 50%) on the Project site. The Project would avoid approximately 28.9 % of the 27.0 acres with slopes of greater than 50% and approximately 14.8 % of the 25.6

9 Santa Clarita Valley Area Plan, 2012, Appendix II: Maps, Figure CO-1: Hillsides and Designated Ridgelines, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch_a2.pdf.

acres with slopes between 25 and 49.99%. The Project would locate the vast majority (over 75 %) of development on the portions of the Project site with slopes less than 50%. The Project would provide 33.9 acres of open space area which includes 12.7 acres preserved as natural open space, focused on the steep slopes in the northwest and southeast portions of the Project site. Further, the Project would preserve in perpetuity a 37.9-acre undeveloped parcel in a Hillside Management Area just south of VTTM No. 60257. Accordingly, the Project would preserve 50.6 acres of natural open space.

The Project also would incorporate sensitive hillside design techniques, including contour grading, retention of natural vegetation and undulating slopes.

The Project has been designed to preserve the highest points within the Project site. Most of the grading would be conducted in areas containing slopes of less than 50%. Small areas containing slopes greater than 50% in the northeast area of the Project site would be graded to balance the dirt of the Project site and accommodate required debris and infiltration basins.

These smaller slopes have minimal scenic value. The slopes having maximum scenic value, particularly the highest points within the Project site, would be retained as part of the Project. The Project site does not contain primary or secondary ridgelines. As indicated in the submitted view study, the Project would maintain off-site scenic views and would not impact scenic views of the major ridgelines and slopes surrounding the Project site. As stated above, the Project would be in substantial compliance with the Hillside Design Guidelines as the Project would comply with most of the items on the checklist for the Hillside Design Guidelines. As such, impacts in this regard would be considered less than significant.

Further, as the Project is not located within a Significant Ecological Area[10], there would be no impact to Significant Ecological Areas.

10 Santa Clarita Valley Area Plan, 2012, Appendix II: Maps, Figure CO-5: Significant Ecological Areas, http://planning.lacounty.gov/assets/upl/project/ovov_2012-ch_a2.pdf.

12. MINERAL RESOURCES

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒

According to the Santa Clarita Valley Area Plan Mineral Resource Map, the Project site is not located within a Mineral Resource Zone. There would be no loss of a known mineral resource and therefore no impacts would occur.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

As noted in response 12a above, the Santa Clarita Valley Area Plan Mineral Resource Map, has not designated the Project site as a Mineral Resource Zone. Therefore, no impacts would occur.

13. NOISE

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the County General Plan or noise ordinance (Los Angeles County Code, Title 12, Chapter 12.08), or applicable standards of other agencies?	☒	☐	☐	☐

Noise from construction activity would occur, including haul route trucks arriving, loading graded materials, and departing, although these would be temporary impacts. There also would be unavoidable noise from construction equipment and construction-related activities. There also would be some noise generated by the residents of the Project site when it is occupied, including traffic related noise. Further analysis is required.

b) Generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐

Groundborne vibration or related noise could potentially occur as a result of grading and construction activities, and the hauling of graded materials by truck off-site. Further analysis of groundborne vibration or noise levels is required.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

The Project site is not located within 2 miles of a private airstrip. The closest airport to the Project site is the Whiteman Airport located in the San Fernando Valley approximately 20 miles south of the Project site. No impacts would occur.

14. POPULATION AND HOUSING

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐

The Project would be located within the Santa Clarita Valley, which had an estimated population of 210,888 person in 2017. The average household size for the area is 3.06 persons per household based on data estimates from 2013 to 2017.[11] The Project would include the development of 222 single-family homes. Based on the average persons per household, the Project would add approximately 680 persons to the area. The area is forecast to have 262,200 persons by year 2040.[12] Based on these estimates, the Project would represent approximately 1.33% of the estimated increase by 2040, which is considered minimal and consistent with SCAG projections.

The Project also would develop 21,000 square feet of commercial uses, which could add approximately 9 employees to the area.[13] These employees likely would be residents of the area and would not contribute overall to the population increase. However, this increase in employment would contribute to expected employment increases for the area. In 2012, the number of jobs in the area was 73,500, and the 2040 estimated employment for the area is 95,900 jobs.[14] This increase would be consistent with SCAG projections and would represent approximately 0.04% of the overall increase in employment.

Additionally, roadway and infrastructure improvements would connect into existing roadways and infrastructure and would extend to the Project site only, which would not allow for substantial growth beyond the Project. Since the Project is consistent with population projections and wouldn't result in unplanned population growth, impacts would be considered less than significant.

b) Displace substantial numbers of existing people or housing, especially affordable housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☒	☐

The Project would demolish one existing single-family home and would include the development of 222 single-family homes and 21,000 square feet of commercial uses. The Project would result in a net increase in housing and would not displace substantial numbers of existing housing as the Project would displace one single-family home. Impacts would be considered less than significant.

11 United States Census Bureau, Quick Facts, Santa Clarita City, https://www.census.gov/quickfacts/fact/table/santaclaritacitycalifornia/HSD310217#HSD310217.

12 Southern California Association of Governments (SCAG), Demographics and Growth Forecast, Final Adopted April 2016.

13 Employment Density Study Summary Report, October 31, 2001, https://www.mwcog.org/file.aspx?A=QTTlTR24POOOUIw5mPNzK8F4d8djdJe4LF9Exj6lXOU%3D.

14 Southern California Association of Governments (SCAG), Demographics and Growth Forecast, Final Adopted April 2016.

15. PUBLIC SERVICES

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Would the project create capacity or service level problems, or result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
i. Fire protection?	☒	☐	☐	☐

Fire protection services for the Project site and surrounding are provided by the Los Angeles County Fire Department. The nearest fire station to the Project site is County Fire Station No. 143, located approximately 0.9 miles east of the Project site. As previously mentioned, the Project would add 680 residents to the area designated as a Very High Fire Hazard Zone and the Project would require fire protection. Further analysis of available fire protection in the area is required.

ii. Sheriff protection?	☒	☐	☐	☐

Sheriff protection services for the Project site and surrounding area are provided by the Los Angeles County Sheriff's Department (LACSD) through the Santa Clarita Station, which operates out of its sheriff facility at 23740 Magic Mountain Parkway, approximately 6 miles southeast of the Project site. The Project would add 680 residents to the area and would require sheriff protection. Further analysis of available sheriff protection is required.

iii. Schools?	☐	☐	☒	☐

The Project would be part of the Castaic Union School District, which has a total of three elementary schools (Live Oak Elementary, Castaic Elementary and Northlake Hills Elementary), one middle school (Castaic Middle), and one high school (Castaic High). Total enrollment for elementary schools is 1,497, total middle school enrollment is 539, and current high school enrollment is 0 since the school is opening August 2019.

Castaic Union School District has student generation rates for K-6 and 7-8, which are 0.329 and 0.141 students per residential housing unit, respectively.[15] There is no high school student generation rate since the high school has not yet opened, however, assuming an overall average of 0.47 students per residential housing unit, the Project would generate approximately 105 students for all grade levels.

This increase in students would represent a small percentage of the total existing enrollment of the schools. Additionally, the Project would be required to pay developer school fees, which would ensure impacts to schools from the Project would remain less than significant. Impacts would be less than significant.

15 Castaic Union School District, Thursday, August 11, 2016 Agenda, Student Generation Rates Table.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
iv. Parks?	☒	☐	☐	☐

The Project would introduce a 3.4-acre passive park, a 0.2-acre passive pocket park, and two trails, however, it also would add approximately 680 new residents to the area, which would potentially result in increased usage of existing parks. Further analysis of availability of parks is required.

v. Libraries?	☐	☐	☒	☐

Library services would be provided by the closest libraries to the site, which would be the Castaic Library, the Stevenson Ranch Library and the Santa Clarita Library. The nearest library is the Castaic Library, located at 27971 Sloan Canyon Road in Castaic, approximately 3.25 miles northeast of the Project site. The Project would increase the population by approximately 680 people, however, increased demand to library services would be nominal. According to Los Angeles County Code, the applicant would be responsible for paying all impact fees associated with the Project, such as a library facilities mitigation fee, which in part is intended to ensure adequate funding is available for personnel, materials and equipment needed to provide proper service. However, because increased demand for library facilities from the Project would be nominal, additional library facilities would not be needed. Impacts would be less than significant.

v. Other public facilities?	☒	☐	☐	☐

Impacts to other public facilities (e.g., sewer, storm drains, and roadways) are discussed in Section 17, Transportation/Traffic, and Section 19, Utilities and Public Services, of this Initial Study. As discussed in these sections, impacts to these other facilities need to be further analyzed.

16. RECREATION

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐

The Project would add approximately 680 new residents to the area, however, it also would introduce a 3.4-acre passive park, a 0.2-acre passive pocket park, and two trails that would meet the residents' needs for neighborhood parks. Regional parks may have increased usage; however, the usage would not be considered substantial and would not cause physical deterioration. Impacts would be considered less than significant.

b) Does the project include neighborhood and regional parks or other recreational facilities or require the construction or expansion of such facilities which might have an adverse physical effect on the environment?	☒	☐	☐	☐

In addition to the 3.4-acre passive park and 0.2-acre passive pock park, the Project would include the construction of two additional trails. The Sterling Horn Memorial Trail would be a private trail, ten-feet in width along the southern portion of the Project site. This trail would connect with the County's Del Valle Trail outside the Project site as identified in the County's Regional Trail Plan. The Project also would dedicate a twenty-foot wide, multiuse trail easement to the County for the Del Valle Trail, located off-site on a third party's parcel. The off-site trial would be a variable width (five-foot to eight-foot-wide), natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request.

Potential impacts related to the construction of these facilities will be analyzed in the EIR.

c) Would the project interfere with regional open space connectivity?	☐	☐	☒	☐

As mentioned in 16(b) above, the Project would construct two trails that would allow for better access to existing County trails. Additionally, the location of the Project site would continue to allow for open space connectivity just north of the Project site, on either side of Del Valle Road. Impacts to regional open space connectivity would be considered less than significant.

17. TRANSPORTATION

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☒	☐	☐	☐

The Project would result in increased traffic and an increase in need for public transportation. The Project's consistency with applicable plans, ordinances, and other policies requires further analysis.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☒	☐	☐	☐

While this Checklist Question in Appendix G of the CEQA Guidelines has been modified by the Natural Resources Agency to address consistency with CEQA Guidelines section 15064.3, subdivision (b), which relates to use of the vehicle miles travelled (VMT) as the methodology for evaluating traffic impacts, the County has not yet adopted a VMT methodology to address this updated Checklist Question as the effective date for Section 15064.3 is July 1, 2020. For this reason, the transportation impacts of the Project will be assessed under the County's current guidelines, which require, among other things, use of LOS to evaluate traffic impacts of a Project. At this time, it has not been determined if the Project would result in any significant impacts or changes related to existing levels of service and further analysis is warranted.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☒	☐	☐	☐

The Project would add additional streets and would slightly alter the existing roadway along Del Valle Road. The increase in potential hazards from these additions and changes needs to be further analyzed.

d) Result in inadequate emergency access?	☐	☐	☒	☐

The Project would include the construction of three access strip lots: one at Trevylon Street (20' emergency access); one at Rainbow Drive (20' emergency access); and one at Lexington Drive (26' project access) on 0.2 acres. The installation of these roadways would connect into existing roadways and would provide sufficient access for emergency vehicles. Additionally, the County of Los Angeles Fire Department Fire Prevention Division, has reviewed the Project and has provided a list of conditions the Project must meet to provide adequate emergency access. With adherence to these conditions, impacts would be less than significant.

18. TRIBAL CULTURAL RESOURCES

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code §21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code § 5020.1(k), or	☐	☐	☒	☐

As noted in Section 5(a) above, a Final Cultural Resources Inventory for the Project was conducted by Dudek in August 2018. The report notes no cultural resources have been recorded within the Project area and only three cultural resources are located within a one-mile search buffer. Since there are no known historical resources on the site, the Project would not impact any known historical resources. Further, the Project would comply with the State Health and Safety Code Section 7050.5 and other regulations further reducing the likelihood of impacts to historic resources. Impacts would be less than significant.

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☒	☐	☐	☐

Public Resources Code Section 21080.3.1 establishes a formal process for Lead Agencies to consult with California Native American Tribes to identify potentially significant impacts to Tribal Cultural Resources, as defined in Public Resources Code Section 21074. Letters were sent to each representative of eleven Native American groups and individuals who may have knowledge of cultural resources in the Project area on October 23, 2017. This coordination was conducted for informational purposes only and does not constitute formal government-to-government consultation. To date, no responses have been received.

The Project Applicant is required to comply with existing regulations, including California Public Resources Code Section 21083.2, that specifies a protocol if archaeological resources are discovered during excavation, grading, or construction activities. As the Project would develop and historically undeveloped site, impacts to buried Tribal Cultural Resources could be potentially significant. Further analysis is required.

19. UTILITIES AND SERVICE SYSTEMS

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water draining, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?	☒	☐	☐	☐

The Project would add residents and commercial uses to the area which would result in increased usage of utilities and service systems. The Project also would create an increase in the impervious area of the site and would alter the drainage patterns due to grading. Further evaluation of the potential impacts from increased usage of water, electricity, natural gas, and telecommunications as well as the increased generation of wastewater and storm water is required.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☒	☐	☐	☐

As previously mentioned, the Project would add residents and commercial uses to the area, which would increase water demand. Further analysis of water demand is required.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐

The Project would be connected to a public sewer system. The Project would add residents and commercial uses to the area, which would result in increased wastewater generation. Further evaluation of wastewater treatment is required.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☒	☐	☐	☐

The Project would add residents and commercial uses to the area, which would result in an increase in solid waste. Further evaluation of the Project's solid waste generation is required.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☒	☐	☐	☐

As mentioned above, the Project's solid waste generation requires further evaluation, and, therefore, compliance with regulations related to solid waste also requires further evaluation.

20. WILDFIRE

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, Would the project:				
a) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☒	☐	☐	☐

The Project site is located in a Very High Fire Hazard Severity Zone (Fire Zone 4). For this reason, further evaluation of potential impacts from fire events is needed to determine the significance of any potential impacts.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☒	☐	☐	☐

The Project site is surrounded by ridgelines and slopes, which may have the potential to contribute to exacerbating wildfire risks. Further evaluation of potential impacts from fire events is needed to determine the significance of any potential impacts.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☒	☐

The Project involves the construction of a one-million-gallon water tank, located on approximately 1.4 acres of disturbed land, approximately 2.2 miles westerly from the project site, and in the vicinity of the existing Cuyama water tank site. The Project would also include the construction of three access strip lots: one at Trevylon Street (20' emergency access); one at Rainbow Drive (20' emergency access); and one at Lexington Drive (26' project access) on 0.2 acres. The installation of the water tank and would supplement available water sources for the Project, and the roadways would connect into existing roadways and would not cause a significant impact to the environment due to their size and location. Impacts would be less than significant.

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☒	☐	☐	☐

As previously mentioned, landslide areas have been mapped along the borders of the Project site. Additionally, the Project site is located within a Very High Fire Hazard Severity Zone (Fire Zone 4). Potential impacts due to fire related flooding impacts requires further evaluation to determine the significance of any potential impacts.

21. MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	*Less Than Significant Impact with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐

As mentioned above, the Project would further review biological resources in the EIR. Additionally, although there are no streams on the Project site, the Project is near the Santa Clara River. The Project may have an effect on fish and wildlife habitat and further evaluation is required to determine if any significant impacts would result from the Project.

b) Does the project have the potential to achieve short-term environmental goals to the disadvantage of long-term environmental goals?	☒	☐	☐	☐

As mentioned in the analysis above, further evaluation is required to state the level of significance for several impacts. In order to discuss short-term versus long-term environmental goals, further evaluation is required.

c) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐

As mentioned in the analysis above, further evaluation is required to state the level of significance for several impacts. In order to discuss cumulatively considerable impacts, further evaluation is required.

d) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

As mentioned in the analysis above, further evaluation is required to state the level of significance for several impacts. In order to discuss substantial adverse effects on human beings, further evaluation is required.

RE: Sterling Ranch Residential Project – Notice of Preparation (NOP) and Initial Study
SCH # 2019080092
GTS # 07-LA-2019-02735
Vic. LA-126/PM: R2.895
LA-5/PM: R56.401

Dear Mr. Steven Jones:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced NOP and Initial Study. The proposed project is a 113.9-acre residential community consisting of 222 detached single-family residential lots on 57.9 acres, a passive pocket park on 0.2 acres, a passive park with a tot lot, shade structure and tables on 3.4 acres, and 21,000 square feet of commercial uses with 71 parking spaces on 2.5 acres. The project also would include five open space lots on 21 acres, six landscaped/open space homeowner association lots on 0.1 acres, three access strip lots at Trevylon Street, Rainbow Drive, and Lexington Drive on 0.2 acres, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acres, and streets for the community on 19.7 acres. The County of Los Angeles is considered the Lead Agency under the California Environmental Quality Act (CEQA).

The nearest State facilities to the proposed project are State Route 126 (SR-126) and Interstate 5 (I-5). In the Transportation section of the proposed project's Initial Study checklist, it states that the project would have a potentially significant impact in terms of:

a. Conflicting with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities;

b. Conflicting or being inconsistent with CEQA Guidelines section 15064.3, subdivision (b); and

c. Substantially increasing hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)

The Initial Study checklist also states that the project would have a less than significant impact in terms of causing inadequate emergency access.

As stated in the Initial Study, many of the potentially significant impacts require further analysis. Caltrans looks forward to reviewing this analysis in the upcoming Draft Environmental Impact Report (DEIR) and

to provide further comments, if warranted. From reviewing the Initial Study, Caltrans recommends that for the forthcoming transportation impact study (TIS), which will be included in the DEIR, the Tenth Edition of the Institute of Transportation Engineers' Trip Generation Manual be used for determining trip generation forecasts and trip reductions (e.g. pass-by, diverted, and internal capture trips). Local trip generation rates are acceptable if appropriate validation is provided. Also, Caltrans recommends using the Highway Capacity Manual (HCM) method for conducting all operational and conflict analyses on State highway facilities. Specifically, queuing analyses based on the HCM queuing methodology are required for any Caltrans off-ramps that would be potentially significantly impacted by the project. Also, when the State highway facility has saturated flows, it is encouraged that a micro-simulation model be used for the analyses.

If intersections on the state highway are to be modified, a complete Intersection Control Evaluation (ICE) study is required. Also, if construction traffic is expected to cause delays on any State facilities, please submit a construction traffic management plan detailing these delays for Caltrans' review. Any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways will need a Caltrans transportation permit. We recommend large size truck trips be limited to off-peak commute periods.

As a reminder, Senate Bill 743 (2013) mandates that Vehicle Miles Traveled (VMT) be used as the primary metric in identifying transportation impacts of all future development projects under CEQA, starting July 1, 2020. For information on determining transportation impacts in terms of VMT on the State Highway System, see the Technical Advisory on Evaluating Transportation Impacts in CEQA by the California Governor's Office of Planning and Research, dated December 2018: http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf.

The following information is included for your consideration.

The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. Therefore, Caltrans encourages the Lead Agency to integrate transportation and land use in a way that reduces Vehicle Miles Traveled (VMT) and Greenhouse Gas (GHG) emissions, as well as facilitates a high level of non-motorized travel and transit use. We encourage the Lead Agency to evaluate the potential of Transportation Demand Management (TDM) strategies and Intelligent Transportation System (ITS) applications to meet these goals. Potential strategies for this project include:

- Implement buffered bike lanes with green paint on Del Valle Road
- Create a Class I bike trail to provide access to Castaic Middle and Elementary schools
- Incorporate mixed-uses (i.e., commercial and residential) throughout the development to reduce car-dependency and associated vehicle miles traveled (VMT)
- Install canopy trees, bioswales, drought-tolerant native landscaping, and street furniture to create a livable community and reduce storm water run-off, which is a sensitive issue for Los Angeles county and needs to be accounted for during project design
- Build wide, unobstructed, and Americans with Disabilities Act (ADA)-compliant sidewalks
- Place utilities underground to reduce fire risk and keep sidewalks unobstructed
- Create high-visibility continental crosswalks at intersections and mid-block crosswalks with flashing beacons
- If gated, ensure pedestrian access to transit and main roads with additional entrance/exit doors
- Provide bus shelters and bulb-outs
- Design a grid pattern with short blocks to increase walkability
- Offer bicycle parking at the park, schools, and commercial centers

If you have any questions about these comments, please contact Emily Gibson, the project coordinator, at Emily.Gibson@dot.ca.gov, and refer to GTS # 07-LA-2019-02735.

Sincerely,

MIYA EDMONSON

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Sterling Ranch Residential Project, SCH# 2019080092, Los Angeles County

Dear Mr. Jones:

The California Department of Fish and Wildlife (CDFW) has reviewed the above-referenced Notice of Preparation (NOP) for the Sterling Ranch Residential Project (Project) Draft Environmental Impact Report (DEIR) prepared by the County of Los Angeles acting as Lead Agency under the California Environmental Quality Act (CEQA).

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & Game Code, §§ 711.7, subdivision (a) & 1802; Public Resources Code, § 21070; CEQA Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect state fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Public Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & Game Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" (see Fish & Game Code, § 2050) of any species protected under the California Endangered Species Act (CESA; Fish & Game Code, § 2050 et seq.) or the Native Plant Protection Act (NPPA; Fish & Game Code, §1900 et seq.), CDFW recommends the project proponent obtain appropriate authorization under the Fish and Game Code.

Project Location: The Project site is located at 29053 Coolidge Avenue, Val Verde, CA 91384. The Project site straddles Del Valle Road, south of Hasley Creek Canyon. The community of Val Verde lies south and west of the Project site, the Valencia Commerce Center lies to the east, and residential uses to the west and south. Open space is located north of the Project site.

The Santa Clara River is located two miles north of the Project. The Project contains two ephemeral drainages that are tributary to the Santa Clara River.

Project Description/Objectives: The proposed Project would develop on approximately 113.9 acres of land. Development includes 222 single-family homes with related infrastructure, 21,000 square feet of commercial use, open space, trails, recreation, stormwater retention, and landscape elements. The residential lot sizes would range from 7,000 to over 10,000 square feet. Approximately 21 acres of land in an unknown portion of the Project site will remain open space with the opportunity for hiking and equestrian trail connections in the area. The site is currently undeveloped open space.

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist the County of Los Angeles Department of Regional Planning (County) in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

Specific Comments

1) Regional Setting. CEQA Guidelines section 15125(c) require the Lead Agency to include information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis placed on resources that are rare or unique to the region. The DEIR should include measures to fully avoid and otherwise protect Sensitive Natural Communities from Project-related impacts. CDFW considers these communities as threatened habitats having both regional and local significance. Plant communities, alliances, and associations with a state-wide ranking of S-1, S-2, S-3 and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by visiting https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities#sensitive%20natural%20communities.

2) Jurisdictional Waters. The Project proposes to impact two tributaries to the Santa Clara River. CDFW recommends the Project be designed to avoid all impacts to these tributary drainages, including their floodplain and a suitable buffer. These areas should be avoided and protected under a conservation easement.

   As a Responsible Agency under CEQA, CDFW has authority over activities in streams and/or lakes that will divert or obstruct the natural flow, or change the bed, channel, or bank (including vegetation associated with the stream or lake) of a river or stream, or use material from a streambed. For any such activities, the project applicant (or "entity") must provide written notification to CDFW pursuant to Fish and Game Code Section 1600 *et seq*.

   a) CDFW's issuance of a LSA for a project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency,

CDFW may consider the Environmental Impact Report of the local jurisdiction (Lead Agency) for the Project. To minimize additional requirements by CDFW pursuant to section 1600 *et seq.* and/or under CEQA, the document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring and reporting commitments for issuance of the LSA[1].

b) The Project area may support aquatic, riparian, and wetland habitats; therefore, a preliminary delineation of the streams and their associated riparian habitats should be included in the DEIR. The delineation should be conducted pursuant to the U. S. Fish and Wildlife Service (FWS) wetland definition adopted by CDFW (Cowardin et al., 1970). Be advised that some wetland and riparian habitats subject to CDFW's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers' Section 404 permit and Regional Water Quality Control Board Section 401 Certification.

c) In Project areas which may support ephemeral or episodic streams, herbaceous vegetation, woody vegetation, and woodlands also serve to protect the integrity of these resources and help maintain natural sedimentation processes; therefore, CDFW recommends effective setbacks of sufficient size be established to maintain vegetated buffer areas adjoining ephemeral drainages.

d) Project-related changes in upstream and downstream drainage patterns, runoff, and sedimentation should be included and evaluated in the DEIR.

e) As part of the LSA Notification process, CDFW requests the 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions. CDFW recommends the DEIR evaluate the results and address avoidance, minimization, and/or mitigation measures that may be necessary to reduce potential significant impacts.

3) San Fernando Valley Spineflower. San Fernando Valley spineflower (*Chorizanthe parryi var. Fernandina*), covered under CESA, is known to occur at the adjacent Valencia Commerce Center. The DEIR should include information as to how the Project was surveyed to determine the potential presence of this species on the Project site.

Surveys should cover all areas of the Project, including off-site trails, parks, and any proposed fuel modification requirements for this Project to allow CDFW to assess potential impacts to San Fernando Valley Spineflower.

4) Fuel Modification. CDFW recommends all fuel modification requirements be met on the Project, and not in mitigation lands or habitat adjacent to the Project. Habitat being subjected to fuel modification (e.g., thinning, trimming, removal of mulch layer) should be considered an impact to these vegetation communities and mitigated accordingly. CDFW also recommends any irrigation proposed in fuel modification zones drain back into the development and not onto natural habitat land as perennial sources of water allow for the introduction of invasive Argentine ants.

5) Rodenticide Use. Impacts to biological resources can occur from wildlife directly consuming poison. Impacts can also occur through secondary poisoning where an animal consumes

[1] A notification package for a LSA may be obtained by accessing the Department's web site at www.wildlife.ca.gov/habcon/1600.

another organism that has consumed poison. CDFW confirmed anticoagulant rodenticide in 14 of 14 mountain lions necropsied in 2013 (McMillin, 2013). Lima et al. (2010), tested 96 birds (11 raptor species) in California and found 86 out of 96 raptors tested positive for second generation anticoagulant rodenticides. CDFW recommends the DEIR contain language disallowing the use of rodenticides that could result in direct or secondary poisoning to native mammals, birds, and raptors.

6) Landscaping. CDFW recommends using native, locally appropriate plant species for landscaping on the Project site. CDFW recommends invasive/exotic plants, including pepper trees (*Schinus* genus) and fountain grasses (*Pennisetum* genus), be restricted from use in landscape plans for this Project. A list of invasive/exotic plants that should be avoided as well as suggestions for better landscape plants can be found at http://www.cal-ipc.org/landscaping/dpp/planttypes.php?region=socal.

General Comments

1) Project Description and Alternatives. To enable CDFW to adequately review and comment on the proposed Project from the standpoint of the protection of plants, fish, and wildlife, we recommend the following information be included in the DEIR:

   a) A complete discussion of the purpose and need for, and description of, the proposed Project, including all staging areas and access routes to the construction and staging areas; and,

   b) A range of feasible alternatives to Project component location and design features to ensure that alternatives to the proposed Project are fully considered and evaluated. The alternatives should avoid or otherwise minimize direct and indirect impacts to sensitive biological resources and wildlife movement areas.

2) Wetlands Resources. CDFW, as described in Fish and Game Code section 703(a), is guided by the Fish and Game Commission's policies. The Wetlands Resources policy (http://www.fgc.ca.gov/policy/) of the Fish and Game Commission "...seek[s] to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California. Further, it is the policy of the Fish and Game Commission to strongly discourage development in or conversion of wetlands. It opposes, consistent with its legal authority, any development or conversion that would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission opposes wetland development proposals unless, at a minimum, project mitigation assures there will be 'no net loss' of either wetland habitat values or acreage. The Commission strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values."

   a) The Wetlands Resources policy provides a framework for maintaining wetland resources and establishes mitigation guidance. CDFW encourages avoidance of wetland resources as a primary mitigation measure and discourages the development or type conversion of wetlands to uplands. CDFW encourages activities that would avoid the reduction of wetland acreage, function, or habitat values. Once avoidance and minimization measures have been exhausted, the Project must include mitigation measures to assure a "no net loss" of either wetland habitat values, or acreage, for unavoidable impacts to wetland resources. Conversions include, but are not limited to, conversion to subsurface drains, placement of fill or building of structures within the wetland, and channelization or

removal of materials from the streambed. All wetlands and watercourses, whether ephemeral, intermittent, or perennial, should be retained and provided with substantial setbacks, which preserve the riparian and aquatic values and functions for the benefit to on-site and off-site wildlife populations. CDFW recommends mitigation measures to compensate for unavoidable impacts be included in the DEIR and these measures should compensate for the loss of function and value.

b) The Fish and Game Commission's Water policy guides CDFW on the quantity and quality of the waters of this state that should be apportioned and maintained respectively so as to produce and sustain maximum numbers of fish and wildlife; to provide maximum protection and enhancement of fish and wildlife and their habitat; encourage and support programs to maintain or restore a high quality of the waters of this state; prevent the degradation thereof caused by pollution and contamination; and, endeavor to keep as much water as possible open and accessible to the public for the use and enjoyment of fish and wildlife. CDFW recommends avoidance of water practices and structures that use excessive amounts of water, and minimization of impacts that negatively affect water quality, to the extent feasible (Fish & Game Code, § 5650).

3) CESA. CDFW considers adverse impacts to a species protected by CESA to be significant without mitigation under CEQA. As to CESA, take of any endangered, threatened, candidate species, or State-listed rare plant species that results from the Project is prohibited, except as authorized by state law (Fish and Game Code, §§ 2080, 2085; Cal. Code Regs., tit. 14, §786.9). Consequently, if the Project, Project construction, or any Project-related activity during the life of the Project will result in take of a species designated as endangered or threatened, or a candidate for listing under CESA, CDFW recommends that the Project proponent seek appropriate take authorization under CESA prior to implementing the Project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP) or a consistency determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to a Project and mitigation measures may be required in order to obtain a CESA Permit. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP unless the Project CEQA document addresses all Project impacts to CESA-listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of an ITP. For these reasons, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for a CESA ITP.

4) Biological Baseline Assessment. To provide a complete assessment of the flora and fauna within and adjacent to the project area, with particular emphasis upon identifying endangered, threatened, sensitive, regionally and locally unique species, and sensitive habitats, the DEIR should include the following information:

a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)];

b) A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline);

c) Floristic, alliance- and/or association-based mapping and vegetation impact assessments conducted at the Project site and within the neighboring vicinity. *The Manual of California Vegetation*, second edition, should also be used to inform this mapping and assessment (Sawyer, 2008). Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions;

d) A complete, recent, assessment of the biological resources associated with each habitat type on site and within adjacent areas that could also be affected by the project. CDFW's California Natural Diversity Data Base (CNDDB) in Sacramento should be contacted to obtain current information on any previously reported sensitive species and habitat. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at http://www.dfg.ca.gov/biogeodata/cnddb/submitting_data_to_cnddb.asp;

e) A complete, recent, assessment of rare, threatened, and endangered, and other sensitive species on site and within the area of potential effect, including California SSC and California Fully Protected Species (Fish & Game Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the project area should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the USFWS; and,

f) A recent, wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed project may warrant periodic updated surveys for certain sensitive taxa, particularly if build out could occur over a protracted time frame, or in phases.

5) Biological Direct, Indirect, and Cumulative Impacts. To provide a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts, the following should be addressed in the DEIR:

a) A discussion of potential adverse impacts from lighting, noise, human activity, exotic species, and drainage. The latter subject should address Project-related changes on drainage patterns and downstream of the project site; the volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and, post-Project fate of runoff from the project site. The discussion should also address the proximity of the extraction activities to the water table, whether dewatering would be necessary and the potential resulting impacts on the habitat (if any) supported by the groundwater. Mitigation measures proposed to alleviate such Project impacts should be included;

b) A discussion regarding indirect Project impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian

ecosystems, and any designated and/or proposed or existing reserve lands (e.g., preserve lands associated with a Natural Community Conservation Plan (NCCP, Fish & Game Code, § 2800 et. seq.). Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in adjacent areas, should be fully evaluated in the DEIR;

c) An analysis of impacts from land use designations and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the DEIR; and,

d) A cumulative effects analysis, as described under CEQA Guidelines section 15130. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

6) Compensatory Mitigation. The DEIR should include mitigation measures for adverse Project-related impacts to sensitive plants, animals, and habitats. Mitigation measures should emphasize avoidance and reduction of Project impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. Areas proposed as mitigation lands should be protected in perpetuity with a conservation easement, financial assurance and dedicated to a qualified entity for long-term management and monitoring. Under Government Code section 65967, the Lead Agency must exercise due diligence in reviewing the qualifications of a governmental entity, special district, or nonprofit organization to effectively manage and steward land, water, or natural resources on mitigation lands it approves.

7) Long-term Management of Mitigation Lands. For proposed preservation and/or restoration, the DEIR should include measures to protect the targeted habitat values from direct and indirect negative impacts in perpetuity. The objective should be to offset the Project-induced qualitative and quantitative losses of wildlife habitat values. Issues that should be addressed include (but are not limited to) restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased human intrusion. An appropriate non-wasting endowment should be set aside to provide for long-term management of mitigation lands.

8) Nesting Birds. CDFW recommends that measures be taken to avoid Project impacts to nesting birds. Migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918 (Title 50, § 10.13, Code of Federal Regulations). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the Federal MBTA). Proposed Project activities including (but not limited to) staging and disturbances to native and nonnative vegetation, structures, and substrates should occur outside of the avian breeding season which generally runs from February 1 through September 1 (as early as January 1 for some raptors) to avoid take of birds or their eggs. If avoidance of the avian breeding season is not feasible, CDFW recommends surveys by a qualified biologist with experience in conducting breeding bird

surveys to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 300-feet of the disturbance area (within 500-feet for raptors). Project personnel, including all contractors working on site, should be instructed on the sensitivity of the area. Reductions in the nest buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors.

9) Translocation/Salvage of Plants and Animal Species. Translocation and transplantation is the process of moving an individual from the Project site and permanently moving it to a new location. CDFW generally does not support the use of, translocation or transplantation as the primary mitigation strategy for unavoidable impacts to rare, threatened, or endangered plant or animal species. Studies have shown that these efforts are experimental and the outcome unreliable. CDFW has found that permanent preservation and management of habitat capable of supporting these species is often a more effective long-term strategy for conserving sensitive plants and animals and their habitats.

10) Moving out of Harm's Way. The proposed Project is anticipated to result in clearing of natural habitats that support many species of indigenous wildlife. To avoid direct mortality, we recommend that a qualified biological monitor approved by CDFW be on-site prior to and during ground and habitat disturbing activities to move out of harm's way special status species or other wildlife of low mobility that would be injured or killed by grubbing or Project-related construction activities. It should be noted that the temporary relocation of on-site wildlife does not constitute effective mitigation for the purposes of offsetting project impacts associated with habitat loss. If the project requires species to be removed, disturbed, or otherwise handled, we recommend that the DEIR clearly identify that the designated entity shall obtain all appropriate state and federal permits.

11) Revegetation/Restoration Plan. Plans for restoration and re-vegetation should be prepared by persons with expertise in southern California ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

    a) CDFW recommends that local on-site propagules from the Project area and nearby vicinity be collected and used for restoration purposes. On-site seed collection should be initiated in the near future to accumulate sufficient propagule material for subsequent use in future years. On-site vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various Project components as appropriate.

b) Restoration objectives should include providing special habitat elements where feasible to benefit key wildlife species. These physical and biological features can include (for example) retention of woody material, logs, snags, rocks and brush piles.

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist the County in identifying and mitigating Project impacts on biological resources. If you have any questions or comments regarding this letter, please contact Kelly Schmoker-Stanphill, Senior Environmental Scientist (Specialist), at (626) 335-9092 or by email at Kelly.schmoker@wildlife.ca.gov.

Sincerely,

Erinn Wilson

Case No: RENV-IS03-250-28680
Project: TR060257
Planner: Jones, Steven
Location: 29053 Coolidge Avenue Castaic CA 91384

The Department of Public Health – Environmental Health Division has reviewed the Environmental Assessment for Sterling gateway residential development and recommends that this project not be approved at this time.

DPH agrees that the project could have a potentially significant impact as proposed regarding safe and reliable potable water availability and infrastructure for wastewater disposal and therefore recommends an EIR.

Drinking Water

1. Ultimately, A *Water Availability* letter will be required from the Los Angeles County Waterworks District 36 for the vesting tract map. Although a project with as little as 300 lots under certain conditions may require Water Supply Assessment (WSA), this Department recommends the assurance of potable water supply via a WSA as a significant water demand will be generated from residential, commercial and irrigation demands from the project.

Wastewater

2. Project intends to connect to the Sanitation Districts. Assure the ability of the project to connect to the system by annexing into the sewer district service area by LAFCO or other sewer purveyor resolution.

RENV-IS03-250-28680 (DRAFT INITIAL STUDY)
TRACT NO. 60257
UNINCORPORATED COUNTY COMMUNITY OF VAL VERDE

This letter supersedes our letter dated August 1, 2019

Thank you for the opportunity to review the draft initial study (DIS) for Tract No. 60257, which proposes to create 222 single-family residential lots, 1 commercial lot, 2 recreation center lots, 5 open space lots, 3 infiltration basin lots, 6 debris basin lots, and a pump station lot.

For specific revisions, additions, or deletions of wording directly from the project document, the specific section, subsection, and/or item along with the page number are first referenced and then the excerpt from the document is copied within quotations using the following nomenclature:

Deletions are represented by a ~~strikethrough~~.
Additions are represented by *italics* along with an underline.
Revisions are represented by a combination of the above.

The following comments should be addressed prior to releasing the DIS to the public. We request all future environmental documents associated with this project be submitted to Public Works for review and comments.

1. **ENVIRONMENTAL CHECKLIST FORM**

    1.1. "Project location" subsection (Page 1/47)

        1.1.1. Add the "s" to "APN" and correct the description of APN 3271-005-032 as shown on the tentative map.

        "APN*s*: 3271-004-012, 3271-004-013, and *a portion of* 3271-005-032 *(offsite)"*

2. **SECTION 10. HYDROLOGY AND WATER QUALITY**

    2.1. Subsections 10a-10g (Pages 29-31/47)

        2.1.1. Public Works, Land Development Division, Drainage Section cannot substantiate the DIS findings until the hydrology study for subject development is approved. The approved hydrology study will require the proposed subdivision to be in compliance with all applicable hydrology and water quality standards and requirements to achieve "less than significant impact" or "no impact".

If you have any questions regarding the above hydrology comment, please contact Nargiss Majrooh of Public Works, Land Development Division, at (626) 458-4921 or nmajrooh@pw.lacounty.gov.

3. **SECTION 19. UTILITIES AND SERVICE SYSTEMS**

    3.1. Subsections 19a-19c (Page 43-44/47)

        3.1.1. Public Works, Land Development Division, Sewer Unit cannot substantiate the DIS findings relating to wastewater and solid waste. The impacts of the proposed project on the existing sewer system cannot be verified until a sewer area study is reviewed and approved by Public Works. Sewer mitigations and impacts found in the approved sewer area study, if any, should be reflected in the environmental document.

If you have any questions regarding the above sewer comment, please contact Pedro Romero of Public Works, Land Development Division, at (626) 458-4921 or promero@pw.lacounty.gov.

Once all the above changes are made, the DIS will not need to be re-submitted to Public Works for review. With the changes made, Public Works clears the subject DIS. However, we will reserve our comments for the Draft Environmental Impact Report.

If you have any other questions or require additional information, please contact Phoenix Khoury of Public Works, Land Development Division, at (626) 458-4921 or pkhoury@pw.lacounty.gov.

COUNTY OF LOS ANGELES FIRE DEPARTMENT
FIRE PREVENTION DIVISION

Land Development Unit
5823 Rickenbacker Road
Commerce, CA 90040
Telephone (323) 890-4243, Fax (323) 890-9783

CASE NUMBER: RENV-IS03-25028680 MAP DATE: July 2, 2019
PROJECT NUMBER: TR060257 PLANNER: Steven Jones

THE FIRE DEPARTMENT RECOMMENDS THAT THIS PROJECT NOT TO BE APPROVED AT THIS TIME AND NOT TO PROCEED WITH THE PUBLIC HEARING PROCESS. THIS RECOMMENDATION MAYBE CHANGED WHEN THE HOLDS BELOW HAVE BEEN ADDRESSED.

HOLDS

Access

1. Fire Apparatus Access Roads must be installed and maintained in a serviceable manner prior to and during the time of construction. Fire Code 501.4

2. For proposed streets less than 28'-0" in width, parking is only permitted on one side of the street. "No Parking At Any Time" shall be posted on either side of the street as to maintain the required 20'-0" fire department vehicular access roadway. The minimum width for parking on a cul-de-sac street is 34'-0" for parking on both sides.

3. The cul-de-sac detail shown on the site map shows a typical street width of 56'-0". This is not consistent with the proposed streets sections shown on the site maps. Should the cul-de-sac width be 56'-0", the street alignments should match. Additionally the cul-de-sac detail does not show the centerline turning radius dimension of 32'-0". Revise the proposed cu-de-sac detail to be consistent with the proposed street widths and required turning radii.

WATER

4. Show all existing public fire hydrants to within 300' of all property lines. Should hydrants be in excess of 300', show the nearest public fire hydrant represented by a broken dimension arrow in the location(s) which they exist. Provide the distance dimensions on the site plan.

5. All fire hydrants shall measure 6"x 4"x 2-1/2" brass or bronze, conforming to current AWWA standard C503 or approved equal, and shall be installed in accordance with the County of Los Angeles Fire Department C105.1 CFC.

Reviewed by: Joseph Youman Date: August 1, 2019

6. All required PUBLIC fire hydrants shall be installed, tested and accepted prior to beginning construction. Fire Code 501.4

7. The required fire for the public fire hydrants for single family residential homes less than a total square footage of 3600 feet is 500 gpm at 20 psi residual pressure for 2 hours with one public fire hydrant flowing. Any single family residential home 3601 square feet or greater shall comply too Table B105.1 of the Fire Code in Appendix B

8. Additional fire hydrants and their locations to be determined upon verification of all existing public fire hydrants.

9. Provide a Form 195 signed and completed by the local water purveyor.

CONDITIONS OF APPROVAL – FUEL MODIFICATION

10. This property is located within the area described by the Fire Department as the Very High Fire Hazard Severity Zone. A "Preliminary Fuel Modification Plan" shall be submitted and approved prior to public hearing. For details, please contact the Department's Fuel Modification Unit which is located at Fire Station 32, 605 North Angeleno Avenue in the City of Azusa CA 91702-2904. They may be reached at (626) 969-5205.

Additional comments pending the information returned by the applicant for Fire Department plan check; presently all outstanding comments have been addressed via plan check.

For any questions regarding the report, please contact Joseph Youman at (323) 890-4243 or Joseph.Youman@fire.lacounty.gov.

Dear Mr. Jones:

REVIEW COMMENTS
NOTICE OF PREPARATION
DRAFT ENVIRONMENTAL IMPACT REPORT
STERLING RANCH RESIDENTIAL PROJECT

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to review and comment on the August 2019 Notice of Preparation (NOP) of a Draft Environmental Impact Report (Draft EIR) for the Sterling Ranch Residential Project (Project). The proposed Project, a residential community located at 29053 Coolidge Avenue, Val Verde, CA 91384, involves the development of 222 detached single-family residential units, approximately 30 acres of amenities including landscaped/open space HOA lots, strip lots, infiltration and debris basins, and a pump station; and 19.7 acres for public and private streets for the community.

The proposed Project is located within the service area of the Department's Santa Clarita Valley Station (Station) and may impact the current level of service provided by the Station due to the potential increase in resident population proposed by the Project. The Department will provide further comments for the Draft EIR during the public review period.

Also, for future reference, the Department provides the following updated address and contact information for all requests for review comments, law enforcement service information, California Environmental Quality Act documents, and other related correspondence:

Mr. Steven Jones
Los Angeles County
Department of Regional Planning
320 West Temple Street
Room 1362
Los Angeles, CA 90012

Dear Mr. Jones:

NOP Response for the Sterling Ranch Residential Project

The Santa Clarita Valley Sanitation District (District) received a Notice of Preparation of a Draft Environmental Impact Report for the subject project on August 8, 2019.We offer the following comments regarding sewerage service:

1. The majority of the project area is located outside the sphere of influence of the District, as adopted by the Local Agency Formation Commission (LAFCO). Therefore, until the current sphere of influence for the Santa Clarita Valley Sanitation District has been amended by LAFCO to include this area, the District will be unable to annex the area and provide sewerage service.

2. The entire project area is outside the jurisdictional boundaries of the District and will require annexation into the District before sewerage service can be provided to the proposed development. For a copy of the District's Annexation Information and Processing Fee sheets, go to www.lacsd.org, Wastewater & Sewer Systems, Will Serve Program, and click on the appropriate link. For more specific information regarding the annexation procedure and fees, please contact Ms. Donna Curry at (562) 908-4288, extension 2708.

3. Because of the project's location, the flow originating from the proposed project would have to be transported to the District's trunk sewer by local sewer(s) that are not maintained by the District. If no local sewer lines currently exist, it is the responsibility of the developer to convey any wastewater generated by the project to the nearest local sewer and/or District's trunk sewer. The nearest District's trunk sewer is the Castaic Trunk Sewer, located in Hasley Canyon Road just west of The Old Road. The Districts' 15–inch diameter trunk sewer has a capacity of 3 million gallons per day (mgd) and conveyed a peak flow of 1.5 mgd when last measured in 2018.

4. The District operates two water reclamation plants (WRPs), the Saugus WRP and the Valencia WRP, which provide wastewater treatment in the Santa Clarita Valley. These facilities are interconnected to form a regional treatment system known as the Santa Clarita Valley Joint Sewerage System (SCVJSS). The SCVJSS has a capacity of 28.1 mgd and currently produces an average recycled water flow of 19.6 mgd.

Printed on Recycled Paper

5. The expected average wastewater flow from the project, described in the notice as 222 single family homes and 21,000 square feet of commercial space, is 64,545 gallons per day. For a copy of the District's average wastewater generation factors, go to www.lacsd.org, Wastewater & Sewer Systems, click on Will Serve Program, and click on the Table 1, Loadings for Each Class of Land Use link.

6. The District is empowered by the California Health and Safety Code to charge a fee for the privilege of connecting (directly or indirectly) to the District's Sewerage System for increasing the strength or quantity of wastewater discharged from connected facilities. This connection fee is a capital facilities fee that is imposed in an amount sufficient to construct an incremental expansion of the Sewerage System to accommodate the proposed project. Payment of a connection fee will be required before a permit to connect to the sewer is issued. For more information and a copy of the Connection Fee Information Sheet, go to www.lacsd.org, Wastewater & Sewer Systems, click on Will Serve Program, and search for the appropriate link. In determining the impact to the Sewerage System and applicable connection fees, the Districts' Chief Engineer and General Manager will determine the user category (e.g. Condominium, Single Family home, etc.) that best represents the actual or anticipated use of the parcel or facilities on the parcel. For more specific information regarding the connection fee application procedure and fees, the developer should contact the Connection Fee Counter at (562) 908-4288, extension 2727.

7. In order for the District to conform to the requirements of the Federal Clean Air Act (CAA), the capacities of District wastewater treatment facilities are based on the regional growth forecast adopted by the Southern California Association of Governments (SCAG). Specific policies included in the development of the SCAG regional growth forecast are incorporated into clean air plans, which are prepared by the South Coast and Antelope Valley Air Quality Management Districts in order to improve air quality in the South Coast and Mojave Desert Air Basins as mandated by the CCA. All expansions of District facilities must be sized and service phased in a manner that will be consistent with the SCAG regional growth forecast for the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. The available capacity of District treatment facilities will, therefore, be limited to levels associated with the approved growth identified by SCAG. As such, this letter does not constitute a guarantee of wastewater service, but is to advise the developer that the District intends to provide this service up to the levels that are legally permitted and to inform the developer of the currently existing capacity and any proposed expansion of District facilities.

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2717.

Very truly yours,

Adriana Raza

RE: SCH# 2019080092, Sterling Ranch Residential Project, Los Angeles County

Dear Mr. Jones:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP) for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
   - **a.** A brief description of the project.
   - **b.** The lead agency contact information.
   - **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
   - **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
   - **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   - **a.** Alternatives to the project**.**
   - **b.** Recommended mitigation measures**.**
   - **c.** Significant effects**.** (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   - **a.** Type of environmental review necessary.
   - **b.** Significance of the tribal cultural resources.
   - **c.** Significance of the project's impacts on tribal cultural resources.
   - **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   - **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
   - **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
    a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
    b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
    a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
    b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
    c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Notice of Preparation of a Draft Environmental Impact Report for the Proposed Sterling Ranch Residential Project

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send South Coast AQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. Please forward a copy of the Draft EIR directly to South Coast AQMD at the address shown in the letterhead. **In addition, please send with the Draft EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on South Coast AQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

South Coast AQMD has also developed both regional and localized significance thresholds. South Coast AQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to South Coast AQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts. South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, South Coast AQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by South Coast AQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

- Chapter 11 "Mitigating the Impact of a Project" of South Coast AQMD'S *CEQA Air Quality Handbook* South Coast AQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- South Coast AQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- South Coast AQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the Draft EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

If implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. For more information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available at South Coast AQMD's webpage at: http://www.aqmd.gov.

South Coast AQMD staff is available to work with the Lead Agency to ensure that project's air quality and health risk impacts are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

Notice of Preparation Comments
Sterling Ranch Estates Residential Project VTPM No. 0602257

Dear Mr. Jones:

The Santa Monica Mountains Conservancy (Conservancy) offers the following comments on the Notice of Preparation for the Sterling Ranch Estates Residential Project proposal to construct 222 single family homes on approximately 114 acres in the most easterly extent of the Sierra Madre Mountains north of Highway 126 and east of Interstate 5. The Conservancy opposes the project as proposed because both the ratio of permanent natural open space to development area and the poor connectivity of the proposed dedicated open space are not adequate to offset the loss of habitat from the greater Los Padres and western Angeles National Forest core habitat areas. To reduce these potential significant biological impacts to a less than significant level, the Conservancy offers the following comments to shape the range of alternatives and mitigation measures.

Biological Resources

The Initial Study fails to recognize high biological value plant communities located over large portions of the subject property. The Initial Study asserts, based on the Draft Biological Technical Report, that the "Project site is not considered an oak woodland ... [and] does not contain riparian habitat or coastal sage scrub." However, data layers from GAP/LANDFIRE National Terrestrial Ecosystems dataset produced by the United States Geological Survey documents that mixed oak savanna and coastal sage scrub and chaparral (CSS/C) exist within the Project site. A cursory review of Google Earth also indicates CSS/C exists on northern slopes throughout the Project site. Further, many northern-facing slopes with CSS/C in this immediate area also contain a soil crust of lichens and bryophytes that take over 100 years to fully develop. Venturan sage scrub is increasingly rare in the Santa Clara River watershed. As proposed the project would eliminate scores of acres of

ecologically valuable habitat that remains well connected to core habitat of statewide significance.

Areas south of Del Valle Road appear to contain a low shrub and grassland habitat sometimes termed "Box Springs Goldenbush-grassland" that typically blooms in late August through September and may have been missed by biologists performing Spring surveys. Supplemental biological surveys should be required to ensure this unique and rare habitat is accounted for in the DEIR.

Grasslands (including non-native annual) andscrub-grassland complexes are essential to many raptors for prey hunting. In addition, burrowing owl (*Athene cunicularia*) could well use the grassland habitats onsite to hunt and nest. A focused survey for burrowing owl using California Department of Fish and Wildlife protocol must be conducted prior the release of the Draft EIR.

Because of its regional sensitivity Venturan sage scrub (CSS) should be avoided where possible and set back over 200 feet from homes to prevent inclusion on fuel modification zones. The DEIR should include at least one alternative that, in part, is specifically designed to avoid and permanently protect a minimum 20-acre contiguous block of sage scrub - grassland complex within the 114-acre project boundary. No more than 2 acres of that preserved onsite area should be within any part of a fuel modification zone.

As a Condition of Approval for the nearly adjacent Sterling Gateway Industrial Park, the construction and maintenance of an ephemeral pond was required to mitigate for impacts to western spadefoot toad (*Spea hammondii*) habitat. Regular monitoring visits to this toad pond by Mountains Recreation and Conservation Authority (MRCA) staff have documented intermittent occurrences of western spadefoot toad tadpoles. Given this propensity for western spadefoot toads in the Project site's vicinity (less than one-half mile), additional surveys and mitigation measures for avoidance and potential compensatory loss of this species are recommended. The MRCA holds conservation easements over the pond and its watershed as shown on the attached figure.

Need for Habitat Replacement Mitigation

Time and time again the Regional Planning staff is seeing that the creation and enhancement of upland habitat types as compensatory mitigation is cost prohibitive because of water/irrigation costs, weeding costs, herbivory exclusion, inadequate nursery stock and timing, and susceptibility to drought. The myth of successful upland habitat creation and restoration is near fully exposed. Can the Regional Planning staff or the DEIR preparers identify a single example of a fully successful upland habitat restoration project that is greater than a quarter-acre in size in any County watershed let alone the Santa Clara River watershed? If not, how can such mitigation continue to be allowed to used in EIRs overseen by County staff?

The formation of upland habitats with their soil composition and fauna and age classes of perennial vegetation cannot be cost effectively created even in 5-7 year mitigation time windows. The establishment of either container plants or of all forms of seeding in all types and disturbances states of upland habitats does not adequately mitigate for the elimination of established plant communities – even at high replacement ratios. Upland plant community habitat restoration cannot be included as a mitigation measure to offset habitat loss until the success of such restoration has been demonstrated.

For any impacted chaparral, coastal sage scrub, or shrub-grassland complex onsite, the County should maintain its consistency with conditioning Santa Clara River watershed projects and require that permanent offsite preservation of ecologically equivalent habitat of equal or greater acreage. Required protection of replacement habitat is the only effective mitigation. Furthermore, the long-term efficacy of that replacement habitat mitigation requires permanent protection via conservation easements or fee simple transfers to public park agencies prior to any grading or grubbing impacts. In addition, for that level of ecological mitigation to be sustainable, the property must have a permanently funded form of oversight to both prevent and remedy human-caused degradation. The DEIR mitigation for open space dedications and the requirement of replacement habitat would remain deficient until it includes both permanent protection and a permanent oversight funding source that adjusts for inflation.

Wildlife Movement

As proposed the Project would sever all onsite wildlife movement from regionally significant core habitat area to the northwest to key habitat resources to the south that include protected MRCA habitat, the project's proposed fee simple open space dedication, and habitat linkages that reach both lower Haskell Creek and Castaic Creek. The rights-of-ways for high tension power lines help facilitate these habitat linkages that each only cross one paved road. The DEIR must address the existence and value of these habitat linkages to nearby unchannelized stream courses. How else will wildlife from the Los Padres National Forest ecosystem reach the either the Santa Clara River or Castaic Creek in Los Angeles County given the immense barriers approved with the total Newhall Ranch project?

The project's complete barrier to wildlife movement through the site in any direction is an avoidable significant biological impact. At least two project alternatives must include permanently protected habitat linkages free of all fencing and all other barriers that would adversely affect movement of mule deer, bobcats, and grey foxes from the northern project boundary to the southeastern project corner. Such linkages should include a wildlife underpass beneath De Valle Road that is at least ten feet tall and fifteen feet wide. Attached is a figure that shows such a habitat linkage centerline through the middle of the project aligned with a potential road underpass location. To remain permanently effective, the onsite designated habitat linkage must be covered by a conservation easement.

The proposed 37.9-acre fee simple open space dedication would lose significant ecological value if it is not connected to larger habitat blocks to the north in particular. A near ecologically isolated 37.9 acres habitat block has only a fraction of the wildlife habitat value as a moderately well connected habitat block of the same size and composition. The project proponent cannot control land use on adjoining private properties, but the Draft EIR must at least analyze and disclose what specific real estate ownership offsite protection measures could secure permanent habitat connectivity between the project site and the subject 37.9-acre proposed dedication. Without such information, decision makers cannot adequately assess the ecological value of the 37.9-acre proposed dedication.

The DEIR should also analyze alternatives that incorporate permanent native vegetation growth in additional and/or larger debris or infiltration basins in order to provide cover habitat for species to move through the proposed Project site. Considering the high number of housing units in the project and the total volume of grading required to build the Project as proposed, such additional or larger detention basins and a wildlife crossing structure are project costs that should be easily absorbed. In short, well designed detention and retention basins can be part of a functional wildlife corridor if fencing requirements can be addressed–such as by gentle sloping sides and post and rail fencing.

A dedicated wildlife corridor would also provide opportunities to incorporate additional open space to help mitigate for urbanized heat island effects as climate change continues to raise temperatures in Southern California.

Fee Dedicated Open Space and Long-term Management Funding

In order to ensure long-term protection and mitigation value of the proposed non-contiguous off-site open space dedication, a permanent funding source must be set up as a condition of approval. The options for a permanent funding source to monitor and protect fee simple open space include a developer-funded long-term management account, landscape maintenance district, or community facilities district. Home Owners Association funding via CC&Rs for non-tract-contiguous fee simple open space is not reliable enough over decades to ensure adequate open space oversight and protection.

The optimal ecosystem benefit would come from the fee simple dedication of the off-site open space dedication to a public agency as a condition of tract map recordation. To maintain the ecological value of said dedication, the public agency must have a permanent dedicated funding source from the project via its conditions of approval. The open space will be in close proximity to residential neighborhoods and people like to explore, walk dogs, and revisit open lands near where they live. A guaranteed annual payment of $5,000 with a CPI inflation adjustor to the fee simple holding public agency is essential to ensure the integrity of the open space over the course of decades and increasing pressures from humans and domestic pets.

Please address any future correspondence to Paul Edelman, Deputy Director Natural Resources and Planning, at the above letterhead address, by email at edelman@smmc.ca.gov, or by phone at (310) 589-3200 ext. 128.

Sincerely,

IRMA MUÑOZ
Chairperson

Subject: RE: Sterling Ranch - Project No. 03-250-(5)

CAUTION: This email originated outside of the County. Please do not click links or open attachments unless you recognize the sender and expect the message.

Thank you. I am guessing that this property will not likely be worth too much being outside of the proposed areas.

Thank you for letting me understand where it is located in relationship to the proposed new housing / green space.

Your help is appreciated very much.

No problem. It's about 359 feet from the nearest proposed developed portion of the site and about 1,530 feet from the proposed open space of the project.

Hello,

The scope of the proposed EIR only includes the following APNs:

3271004003
3271004013
3271005024

Your property is a few feet away from the southern end (Hunstock and Chiquito Canyon Road) of the project area.

Please visit the project page on the DRP website for more information and feel free to contact me if you have questions regarding the file material.

Thanks,
Steven Jones

Dear Mr. Jones,

Can you tell me if the property I own is within the scope of the map sent in the recent letter requesting input for an Environmental Impact Report?

My property:

AIN: 3271 018 001

Tract #8672 Lot 22

If it is not in the scope if the project, what is the proximity to the project? Will the roads be improved in the area of my property?

I live about 1 1/2 hours away from the physical documents. Any help you can give will be greatly appreciated.

Thank you.

Dear Mr. Jones,

The following is Quote from the Castaic Standards District filed with the County of Los Angeles for more than two decades. I believe this has not been met in regards to the above referenced proposed project.

> Substantial *Community* Support. The project must have substantial *community* support. For purposes of this requirement, substantial *community* support requires at least two-thirds of all written comment letters received from residents, property owners, and businesses **within 1,000 feet from the project boundary** to support the project. In reaching this threshold, every person signing a written comment letter shall be counted separately, provided that such signature has been verified. The position of elected *community* organizations such as the Castaic Area Town Council will be considered and counted as one comment letter in determining substantial *community* support, provided it is the formal position of the governing board of such organization;

This project does NOT have that support in place and the members of this community within the 1,000 feet of the boundary have not been consulted and informed they have this right. It is shameful that this potential project is trying to ignore the rights of this historical community.

This letter is to officially go on record that I am **against** the proposed project.

Thank you for your attention to this matter.

Respectfully,

APN: 3271-004-012, 3271-004-013, and 3271-005-032

Dear Mr. Jones,

Per the meeting held on August 5, 2019, at Live Oak Elementary School, regarding the proposed environmental impact report for the projected noted above, the following is a list of some of my concerns as a twenty-year resident in Val Verde, residing within 1,000 feet of this proposed project.

- Valley Fever and the very real potential harm that can come to the current residents by disrupting that much soil directly in the middle of the community.
- Project does not meet the Castaic Standards District on file with the County regarding the destruction of ridgelines.
- Suburban HOA Tract Housing in the middle of a rural historical community. This creates a neighborhood of the *Haves And The Have Nots*. The social impact could be devastating.
- The private hiking trails as part of this development continues to create a divide in the neighborhood of the *Haves And The Have Nots*.
- The continued concern that the development wants to put in gates to the new HOA development which continues with the *Haves And The Have Nots* by dividing the community up. More social division creates a lack of cohesiveness.
- Extremely High Fire Zone – will cause current residents to have higher insurance premiums with higher end homes being built inside the current rural neighborhood. Most homeowners are barely able to get and afford the current high premiums for insurance now. This has the potential to create a very real financial hardship on the current residents.
- Widening Three Streets: Lexington will become a drive through street and there is simply not enough space to take the required property to build them without disastrously taking property away from current homeowners' property. They will lose their driveways and front yards. The other two streets set for widening would become fire/emergency streets. These also stand to take property away from current homeowners' property. It is not right to force current people out for an unwanted HOA tract housing development to move in.

- The rest of the entire neighborhood has very thin streets and has always been a concern with the fire department and emergency services trying to get through. Adding a nearly 25% increase in automobiles trying to evacuate during an emergency will cause a bottle neck and people may be killed. This is highly irresponsible of the County to consider such a large project in this area.
- Current homes in the area will have a loss in property value especially during construction. No one will want to buy a home smack in the middle of a massive messy development. After built, the current homes will not be "new" and will not be able to compete with the higher end homes causing a loss in value again.
- After the recent approval for another thirty years of what will become one of the largest landfills in the country under a mile away (Chiquita Canyon Landfill), how can the County justify more people living in the shadow of this giant landfill? The health risks to the residents are still unknown.
- The proposed drainage basin and shopping plaza will divide the existing Val Verde with the private HOA tract housing subdivision. The current residents along Hunstock will have a major drop in the value of their homes with a smelly large drainage basin becoming their direct view in their front yards.
- It is irresponsible of the County to even remotely consider any development in Val Verde until the serious flooding is handled at Del Valle and Hasley Canyon. Currently, the rural community of Val Verde is trapped in the canyon during annual heavy rains when that intersection floods out. A bridge is needed there and has been needed for decades. Adding approximately a 25% increase in population in this canyon is irresponsible without having that project completed first.
- How is it the County of Los Angeles can afford to a lot more water to more homes when we are regularly put under water usage restrictions. This does not add up and is again irresponsible to consider.
- A development of this size would cause a 100% disruption to the current residents with noise, dust, reduced air quality and traffic detours and delays in a HIGH RISK FIRE area.
- This project does NOT satisfy the states low income housing requirements.
- The potential for the 222 new homes to build a second unit/home/living space on their property could become 444 total new homes. That means it would nearly **double** the entire population in the rural canyon community. The impact on the community could be catastrophic. Nothing is designed to handle that many people and automobiles in this high fire risk canyon.
- The wellbeing to he culture of this historical canyon and the feel of life out here would be destroyed forever!
- Quote from the Castaic Standards District: "Substantial *Community* Support. The project must have substantial *community* support. For purposes of this requirement, substantial *community* support requires at least two-thirds of all written comment letters received from residents, property owners, and businesses **within 1,000 feet from the project boundary** to support the project. In reaching this threshold, every person signing a written comment letter shall be counted separately, provided that such signature has been verified. The position of elected *community* organizations such as the Castaic Area Town Council will be considered and counted as one comment letter in determining substantial *community* support, provided it is the formal position of the governing board of such organization;" This project does NOT have

that support. This letter is to officially go on record that I am **against** the proposed project.

The above is a list of my initial comments and concerns, but are not limited to them. I reserve the right to have additional comments and concerns as time reveals more information that come to light with this proposed project.

These concerns and comments are submitted respectfully for your consideration. Thank you for your attention to this matter.

Respectfully,

APN: 3271-004-012, 3271-004-013, and 3271-005-032

Dear Mr. Jones,

Per the meeting held on August 5, 2019, at Live Oak Elementary School, regarding the proposed environmental impact report for the projected noted above, the following is a few ideas for some alternate use for the land. You requested ideas be sent in to you by September 20, 2019.

Develop the land for a destination medium size hotel (maybe 50 or 60 guest rooms) with lots of amenities that a rural area like this can support and uniquely offer. It can include things like hiking trails, country venue setting for weddings and corporate retreats, both inside and outside. The hotel can include a restaurant to service the guests and people from the greater Santa Clarita Valley area. It could offer a beautiful pool, yoga classes / retreats, and a country setting spa for messages and other pampering services for both guests and the people of greater Santa Clarita Valley area. It would bring employment to the area and generate taxes for the County of Los Angeles. The majority of the land could still be open space and utilized for the beauty as well as the hiking trails. The property would have a large increase in value with a development like this and could have a larger buffer between the current residents and the hotel. It would not take nearly as long to develop or require so many changes to the streets. The current proposal has 222 homes which represents a bare minimum of 444 additional vehicles on the streets from those homes without counting any of the delivery vehicles or hired vehicles bringing in the workers like gardeners and repairmen. A hotel of that size would not bring in more than 100 vehicles on average with full occupancy, employees and the local patrons.

An executive golf course could be developed on this land. I understand that is smaller than the traditional full-size golf course. It would keep down the daily traffic and pollution associated with the HOA tract housing development as shown in the first example. It would bring a large increase in value to the land for the land owner, create employment, and generates taxes for the County of Los Angeles. It also creates an astatically pleasing environment and could be developed to be environmentally friendly. It could have a clubhouse that has the ability to hold weddings and corporate retreats to generate more money for the owner of the golf course.

With a little thought, and possibly rezoning of that land, there is potentially a long list of things that it could be used for. The land could still become more valuable for the land owner, which is clearly what is driving this proposed project, and even generate money for the County of Los Angeles. The above is only two ideas without any research. I believe with a little input from the current residents, and some research, a more agreeable option for this land could be discovered.

I am a resident of Val Verde Canyon for over 20 years. I feel putting in this 222 HOA tract housing subdivision, smack in the middle of this historical rural canyon, will destroy it. Please try to consider other options.

I am officially going on the record as **opposed** to the current project being considered for that land.

Thank you for your attention to this matter.

Respectfully,

Abigail DeSesa

Environmental Impact Report Scoping Meeting

Please use this page to submit questions or comments regarding the scope and content of the environmental review and other information that should be included in the Environmental Impact Report.

Regarding perhaps a traditional definition of environmental impact, I would like to suggest that considerations of the impact on wildlife also take pollinators into account. This project proposes to raze acres and acres of sage, buckwheat, seasonal wildflowers, and other forage that is critical to the survival of both native pollinators and honeybees. Most new developments in Santa Clarita have not been replacing this forage with landscaping that is hospitible to pollinators. Additionally, other small fauna such as other insects, small reptiles, and birds need to be considered, as they all operate in balance with each other and with larger fauna, local flora, and us. The space and forage for these small, less considered, and not yet endangered creatures is critical.

Additionally, while perhaps not under the traditional purview of environmental impact, the history and current culture of the town needs to be considered. The town was created as a vacation destination for people of color, at a time when they were often unwelcome in County parks and pools. The town is currently very ethnically diverse, and still carries the vestige of a destination for those who are unwelcome elsewhere. It is not a wealthy community, but it is a community with a common sense of pride about our remote and quiet location. Much of the culture of the town runs contrary to the culture of HOA communities. Sticking a high-end HOA community into the middle of Val Verde would be a slap in the face to all of our diverse, working-class residents, who moved to Val Verde to get away from elitism, city-influences, and who frankly could not afford to go anywhere else. Development is fine, building is fine, but building Stevenson Ranch in the middle of Val Verde is a recipe for disaster.

Sterling Ranch Residential Project SCH No. 2019080092
Project Location – 29053 Coolidge Avenue, Val Verde, CA 91384
APN: 3271-004-012,3271-004-013, and 3271-005-032

Dear Mr. Jones,

I attended the meeting on August 5, 2019, at Live Oak Elementary School, regarding the proposed environmental impact of the project noted above.

As a resident for 18 years and my husband as a resident of 35 years, we have concerns about this project.

- I certainly hope the County of Los Angeles is aware of the historical value of this town and its buildings and amenities. During the early part of the 1900's segregation was a normal practice. The town of Val Verde was THE place to go for blacks. It was considered the black Palm Springs.
- The amount of soil being moved is enormous. I am fully aware of the existence of Valley Fever due to the 1994 earthquake. This amount of soil movement will bring the spores up into the air and make people sick. A housing project is not worth the illness it will cause.
- You have to consider the Chiquita Canyon Landfill's close proximity to the project and the health concerns the current residents have. This project will only add to the health concerns in contention in the courts right now between Los Angeles County, Chiquita Canyon Landfill and the current residents with ill health that is directly related to the operation of the landfill.
- The streets inside this HOA private project will empty on to existing streets in the town of Val Verde. Those existing streets were created in the early 20th century and this project does not address a four lane street emptying on to two (2) lane streets, Del Valle and Chiquito Canyon Road. Nor does it address the emergency streets that barely have room for one car to get through without avoiding other cars either parked or traveling on those roads.
- This project will possibly add over 600 more cars to this historic rural town with the possibility of doubling that number if those homeowners build additional

"homes" on their lots. This project adds 222 homes, at least two possibly three more drivers/cars on the roads. These roads can barely handle the traffic that is funneled through when Interstate 5 is closed, which happens frequently. They will definitely not handle 440+ more residents driving through. If necessary, I can provide pictures of the traffic when Interstate 5 is shut down.

- There is no provision for low income housing. The entire town of Val Verde is low income. This project will give the perception of the haves and the have nots.
- This area is geologically unstable per your own report. The hillsides along Chiquito Canyon Road and Del Valle do become impassable in rain storms. This town has been locked down and/or evacuated for fires and for mud slides on the existing roads. This project will only add to the problem by adding more homes and cars with no improvement to the two existing roads that we use to come into town and leave town.
- The placement of the catch basins is a big concern. The catch basins currently in this area frequently fill up and over flow across streets. The washes that exist overflow onto the roads during heavy rains and also undermine roads. The County of LA does not maintain the roads and washes well enough and streets that are undermined and cave in. I am still waiting for LA County to fill the road on Lincoln that was washed away. The catch basins in this project will overflow into homes in addition to the roads.
- Your own report highlights three areas that will potentially cause significant impact the Aesthetics
- Your own report highlights four areas that will potentially cause significant impact the Air Quality. I receive alerts from the AQMD a couple of times a day. The air is good until about 9 am. Then it becomes unhealthy for Sensitive groups, of which I am one. The quality does NOT go back to good until long after the midnight hour.
- Your own report highlights four areas that will potentially cause significant impact on the biological resources.
- Your own report highlights one area that will potentially cause significant impact on the cultural resources.
- Your own report highlights six areas that will potentially cause significant impact on the Geology and soils.
- Your own report highlights two areas that will potentially cause significant impact on the greenhouse gas emissions.
- Your own report highlights four areas that will potentially cause significant impact on the hazards and hazardous materials.
- Your own report highlights seven areas that will potentially cause significant impact on the hydrology and water quality
- Your report does not highlight the land use and planning impacts as causing significant impact. This development creates two towns. One is a town of the haves and the other of have nots.
- Your own report highlights six areas that will potentially cause significant impact on the noise.
- Your own report highlights three areas that will potentially cause significant impact on the transportation.

- Your own report highlights five areas that will potentially cause significant impact on the utilities and services.
- Your own report highlights three areas that will potentially cause significant impact on the wildfires. The entire Santa Clarita Valley is in a high risk area for wildfires. Current homeowners are having their insurance cancelled and are struggling to get coverage for their homes that they can afford.
- Your own report highlights four areas that will potentially cause significant impact on the mandatory findings of significance.

With all those significant impacts of the project on the area why is this even being considered? The town doesn't want it and we have told Hunt Williams that since he began his quest to develop the land 20 or more years ago. He claims he is honoring his grandfather's legacy. I don't believe that is the reason he wants to develop the land. He wants to make money, plain and simple, at the expense of the residents of this historic community.

This letter only touches on the concerns. I reserve the right to have additional comments and concerns about this project in the future.

Thank you for considering my concerns and your attention to this project.

Respectfully,

Susan M. Evans

Dear Mr. Jones,

The following is Quote from the Castaic Standards District filed with the County of Los Angeles for more than two decades. I believe this has not been met in regards to the above referenced proposed project.

> Substantial *Community* Support. The project must have substantial *community* support. For purposes of this requirement, substantial *community* support requires at least two-thirds of all written comment letters received from residents, property owners, and businesses **within 1,000 feet from the project boundary** to support the project. In reaching this threshold, every person signing a written comment letter shall be counted separately, provided that such signature has been verified. The position of elected *community* organizations such as the Castaic Area Town Council will be considered and counted as one comment letter in determining substantial *community* support, provided it is the formal position of the governing board of such organization;

This project does NOT have that support in place and the members of this community within the 1,000 feet of the boundary have not been consulted and informed they have this right. It is shameful that this potential project is trying to ignore the rights of this historical community.

This letter is to officially go on record that I am **against** the proposed project.

Thank you for your attention to this matter.

Respectfully,

Signature:

Sterling Ranch Residential Project SCH No. 2019080092
Project Location – 29053 Coolidge Avenue, Val Verde, CA 91384
APN: 3271-004-012, 3271-004-013, and 3271-005-032

Dear Mr. Jones,

Per the meeting held on August 5, 2019, at Live Oak Elementary School, regarding the proposed environmental impact report for the projected noted above, the following is a list of some of my concerns.

1. Mr. Williams' former project, IAC Commerce Center, Valencia, had flaws in the plans. After the company had broken ground, the rains came and the project caused a landslide. Due to the landslide, a hillside protected by the CSD, Castaic Community Standards District, was drastically taken down. Today, the once beautiful hillside looks artificially sloped. This created a decrease in property value, as numerous residents' views were compromised. I am concerned that another occurrence could happen with the Sterling Ranch Residential Project. What measures would be in effect to prevent another environmental impact in the building of the new development?
2. Val Verde is a rural community with fewer than 2,500 residents. If the Sterling Ranch Residential Project were to be approved as proposed, the new residents would consist of approximately 20% of the town's population. Our roads leading in and out of town would be affected with at least 400 additional vehicles driving through the streets. I am concerned about the additional traffic that would be created by the project.
3. The area that the Sterling Ranch Residential Project is planned for is a haven for wildlife. After the building of the IAC Commerce Center, Valencia, wildlife populations increased in the neighborhoods. Residents have found an increased number of wild animals (i.e. rats) in their yards and through the streets. I am concerned that the homes of the wild animals will be taken and they will not have any where to go but in our neighborhoods. I am not in favor of exterminating these animals, as they have a right to live in their natural environment (they were here before we were).

The above is a list of my initial comments and concerns, but are not limited to them. I reserve the right to have additional comments and concerns as time reveals more information that come to light with this proposed project. This letter is to officially go on record that I am **against** the proposed project.

These concerns and comments are submitted respectfully for your consideration. Thank you for your attention to this matter.

Respectfully,

Title

Resident Letter Regarding Sterling Ranch Residential Project
by Frank Miscione 30014 Lexington Drive, Val Verde, Ca. 91384

Mr. Jones please enter this letter into the file as part of Public Record regarding Sterling Ranch Residential.

At a time when we should be preserving habitat for all things living by preserving the environment and enter into a new paradigm that requires moral clarity on the part of everybody including the County. To provide leadership in a Just Transition away from fossil fuels, and the antiquated, petro-chemical based models of urban sprawl to which the Sterling Project is fully entrenched, the County is inept to do so as evident as the purveyor of this process. I have gone to great sacrifices economically to remove myself as a Civil Engineer from subdivision projects in an effort to combat the effects of abrupt climate change. For years I have made this sacrifice because I know that beyond pensions and paychecks, I have as a minimum to the future generations a living planet. And here we are, making way for the bulldozers to come in and level the hills, disrupt the hydrological cycle and the EIR has no authority to actually take into account the larger critical issues facing all of us and you are assisting this. A family that has benefitted from the extraction of fossil fuels and the general partner is removed to a residence next to a world class ski resort who's only mission is a fiduciary responsibility to maximize land use to profit his family. The irony is that his family is also at risk. Where is the leadership of the County? As witness to decades of urban sprawl in the Santa Clarita Valley, the vision has been co-opted by developers. The reason why I'am against this project is that I'am on the side of humanity, and the science that is all too clear.

Respectfully,

ENGINEER'S STATEMENT

PREPARED UNDER THE DIRECTION OF;

FRANK MISCIONE R.C.E. 69031 EXP. 6-30-20

Re: Public Comment for Sterling Ranch Residential Project

Project no. 03-250(5)

Mr. Jones,

I am contacting you regarding the public comment for the upcoming EIR for the Sterling Ranch project proposed for Val Verde.

As a resident of Val Verde, a "sensitive receptor", who lives on the border of the proposed project and already bearing the burden of the 30 year extension for the Chiquita Canyon Landfill, I know that I will be greatly, and obviously, negatively, impacted by this project. I feel that being sandwiched in from both sides by projects with such unhealthful impacts is an unjust burden to ask our community and myself to bear.

I have a right to enjoy my home, modest though it may be, and not be subjected to both the nuisance and possible health damages this project, in addition to the landfill, would naturally incur.

My issues are:

Safety-(this one is multi-factorial)

1. Fire-Val Verde is, for all intents and purposes, a "one road town" and, as we discovered during the massive fires during late 2016, we can be trapped in here very easily. At one point during those fires we were surrounded on three sides by fire, so our need to get in and out of Val Verde safely in the event of fire is , without exaggeration , a matter of life and death. According to the proposed map the project will be relocating Del Valle road which leaves my road, Silver, as well as Huntstock and Cromwell streets, completely cut off from egress via Del Valle while they move the access point from that direction. Originally Mr. Williams was required to create another access road out of town for safety concerns but I can see from this map that is no longer the case. We will be trapped in here as fires continue to rage and threaten our state.

   Fire insurance- as homeowners in the entire state are seeing a widespread contagion of insurance companies either dropping them due to "high fire risk", or not insuring people up front, how exactly are these new homes going to be insurable? Will anyone tell the new homeowners that they are less than a mile from a dump and uninsurable? I sure will. These mega-homes will cost a lot more than mine to cover ; has anyone bothered to check with insurance companies to see if these homes are insurable given the "high fire risk" assessment placed on this area?

2. Valley Fever (Coccidioidomycosis)- The disruption of soils inherent in this construction project can disturb the fungus and release the spores, which can cause Valley Fever, which can be fatal. It seems to me not worth the risk to endanger the lives of this community, regardless of the current housing crisis in Los Angeles. The analysis of risk vs. reward for 221 houses, all out of economic reach of the average working class resident, is just not worth the possible lawsuit costs in the event of loss of life.

Traffic-

As previously mentioned, there is really only one way in and one way out of Val Verde. The traffic congestion caused by the addition of trucks, earth movers, bull dozers, workers, etc. will place a large burden on me and add to my already very long commute. Again, I mention the previously proposed addition of a road out of town which has somewhere along the line been forgotten? Our safety is not worth the effort or expense I suspect. How will I be expected to access my home while they move Del Valle road? The intersection to my home at Silver and Del Valle will be greatly impacted.

Dust-

Aside from being an annoyance, and a health risk as previously mentioned, the dust that will be an inevitable by product of this project is unhealthful as a general rule. The PM2.5 threshold will be exceeded if it isn't already by the landfill, so the additional cloud of dust that will permeate this valley, settling on us, and in our lungs is truly adding insult to injury, as well as aggravating chronic asthma and bronchial issues. There will be no viable way to 'mitigate' this issue. It is airborne and uncontrollable, despite watering efforts. During the previous three years of construction on the 5North I could see clouds of dust constantly billowing up from the sites despite watering trucks, and this project will literally sit on top of me and my home, for years.

Nuisance- I have a right to a quality of life and enjoyment of my home with undue disturbances, including noise violations, dust, unhealthful burdens, etc. Unlike the current mega project happening behind Magic Mountain, this one, albeit much smaller and more contained, is literally tearing through our community and is right on top of me since I live on Silver Street. There is no way this construction will not impact my quality of life given its proximity to my home.

Housing- Clearly, LA County is using the 'housing crisis' in LA as a smoke screen to approve this project. We do face an unparalleled housing crisis in LA, but building one more private, unaffordable subdivision, in no way will mitigate the issue. And in fact, as all developments are, this one is required to include a portion of housing for low income residents, and just like the safety access road our community was promised, there are no low income units included in this project. Looks like a violation of the law, if I am not mistaken. LA doesn't have a housing crisis; it has an affordable housing crisis and developers have no interest in resolving that issue. And, just like the case of the approval Chiquita Canyon Landfill for 30 more years, the money that LA County stands to make is more important than the health and welfare of its citizens. The priorities are truly transparent and our recourse very little, but that's the point isn't it.

In conclusion, I am aware that Mr. Williams can do with his land what he pleases. I am painfully aware that the Board of Supervisors, and particularly, Ms. Barger, have no concern for the health and welfare of the community of Val Verde, (that was made eminently obvious when she approved the CCL extension BEFORE the appeal process had even been heard). But I also know that making my case, as a 'sensitive receptor' and a voting citizen, is important in a civil society as well as a matter of public record.

Thank you for accepting my submission for public comment, and thank you for your time,

Sincerely, Laurel M. Taylor

RE: Scoping comments on Notice of Preparation of a Draft Environmental Impact Report for the Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ / Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250.

Dear Mr. Jones,

The Center for Biological Diversity ("the Center") submits the following comments on the Notice of Preparation of a Draft Environmental Impact Report for the Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ / Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250. The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has 1.6 million members and supporters, including many that live, visit and enjoy the native wildlife and landscapes in southern California.

The Sterling Ranch Estates Residential Project (Project) would develop approximately 114 acres into a residential community of 222 residential lots and associated commercial space and infrastructure, while setting aside only 21 acres of "open space" on five lots. While it adjacent on the south side primarily to existing residential development in Val Verde, the project area is currently open space and mostly adjacent to existing open space, further urbanizing wildlands and pushing development into the more remote areas of the County. This type of proposal is antithetical to smart planning. The environmental review must include an analysis of how the proposed project fits into the State goals for affordable housing that the governor recently proposed in order to provide affordable housing in southern California by building housing where housing demands are highest, in existing cities with strong job growth.[1] The proposed project is already an outdated proposal which would fragment Los Angeles County's diminishing open space and wildlife connectivity and habitat, require long commutes on already gridlocked freeways, exacerbate already poor air quality and excessive traffic while increasing

tel: (213) 785 -5407 *email*: ianderson@biologicaldiversity.org
www.BiologicalDiversity.org

the County's greenhouse gas production. The CEQA review must also discuss how the proposed project conforms to the County's newly adopted Our County Plan[2] that was recently unanimously adopted on August 6, 2019 by the County's Board of Supervisors.

In addition, as part of the CEQA review process, the Environmental Impact Report needs to provide:

- a robust analysis of greenhouse gas emissions and climate change impacts from all sources associated with the Project using existing conditions as the analytic baseline;
- a robust analysis of the impact from on-going climate change including an analysis of maintaining wildlife connectivity between the Santa Clara River Significant Ecological Area and the Santa Felicia Significant Ecological Area;
- consideration of alternatives involving zero net-energy use by all Project residences and commercial buildings;
- water supply availability and water quality analysis incorporating the most recent information on anticipated frequency and severity of long-term drought conditions;
- cumulative impacts from adjacent planned and existing projects;
- analysis of air quality impacts of Project including construction and vehicle miles travelled;
- analysis of impacts from additional housing near and upwind from the Chiquita Canyon landfill;
- Analysis of impacts to the Santa Clara River watershed from the additional development and hardening of the landscape;
- Analysis of fire threats due to the fact that the proposed project lies with the Very High Fire Severity Hazard Zone in a State Responsibility Area.[3]

Biological Surveys and Mapping

In order to present a full picture of the biological impacts of the project, thorough, seasonally-appropriate surveys must be performed for sensitive plant species and vegetation communities, and animal species. The Center requests that thorough, seasonal surveys be performed for sensitive plant species and vegetation communities, and animal species under the direction and supervision of the County and resource agencies such as the US Fish and Wildlife Service[4] and the California Department of Fish and Wildlife[5]. For those species that have agency-identified survey protocols, those protocol level surveys must be required, implemented and disclosed in the EIR. Full disclosure of survey methods and results to the public and other agencies without limitations imposed by the applicant must be implemented to assure full CEQA compliance.

Confidentiality agreements should not be allowed for any survey in support of the proposed project. Surveys for the plants and plant communities should follow California Native

2 https://ourcountyla.org/#
3 https://osfm.fire.ca.gov/media/6475/fhszs_map19.jpg
4 https://www.fws.gov/ventura/endangered/species/surveys-protocol.html
5 https://www.wildlife.ca.gov/Conservation/Survey-Protocols

Plant Society (CNPS)[6] and California Department of Fish and Wildlife (CDFW) floristic survey guidelines[7] and should be documented as recommended by CNPS[8]. A full floral inventory of all species encountered needs to be documented and included in the EIR. Surveys for animals should include an evaluation of the California Wildlife Habitat Relationship System's (CWHR) Habitat Classification Scheme. All rare species (plants or animals) need to be documented with a California Natural Diversity Data Base form and submitted to the California Department of Fish and Wildlife using the CNDDB Form[9] as per the State's instructions[10].

In order for the public to properly evaluate the data, the vegetation maps must be at a large enough scale to be useful for evaluating the impacts. Vegetation/wetland habitat mapping should be at such a scale to provide an accurate accounting of wetland and adjacent habitat types that will be directly or indirectly affected by the proposed activities. A half-acre minimum mapping unit size is recommended, such as has been used for other development projects. Habitat classification should follow CNPS' *Manual of California Vegetation* and should follow the CDFW protocol[11].

Adequate surveys must be implemented, not just a single season of surveys, in order to evaluate the existing on-site conditions. Due to unpredictable precipitation in this relatively arid environment, organisms in the proposed project area have evolved to survive in harsh conditions and if surveys are performed at inappropriate times or year or in particularly dry years many plants that are in fact on-site may not be apparent during surveys (ex. annual and herbaceous perennial plants).

Impact Analysis

The EIR must evaluate all direct, indirect, and cumulative impacts to sensitive habitats, including impacts associated with the establishment of intermitted recreational activities, the introduction of non-native plants, the introduction of lighting, noise, and the loss and disruption of essential habitat due to edge effects.

A number of rare resources are known to occur or have high potential to occur on the proposed project site. The proposed set aside of only 21 acres of "open space" appears to be inadequate to allow for adequate wildlife connectivity and preservation, so the EIR needs to carefully detail the open space proposal including how the lands will be managed in perpetuity for conservation which is part of the strategy to avoid, minimize and mitigate impacts to the species found on site. The EIR must also consider open space land acquisition if the on-site conservation of plant communities or wildlife is infeasible. Management plans for the conservation investments must be included as part of the public review EIR.

6 https://www.cnps.org/plant-science/field-protocols-guidelines
7 https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline
8 https://www.cnps.org/plant-science/field-protocols-guidelines
9 https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data#44524419-online-field-survey-form
10 IBID
11 https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline

For rare plants, avoidance is preferable because of the general lack of success in transplanting rare plants[12]. If transplantation is to be a part of the mitigation strategy, a detailed plan must be included as part of the EIR on the methodology for determination of appropriate conservation areas where plants may be transplanted, when/how plant are to be transplanted and identification of success criteria for transplantation. Monitoring of the transplanted plants needs to occur for a time period that is realistic to evaluate *long-term success* of the plants.

Locally Rare Species

The Center requests that the EIR evaluate the impact of the proposed permitted activities on locally rare species (not merely federal- and state-listed threatened and endangered species). The preservation of regional and local scales of genetic diversity is very important to maintaining species. Therefore, we request that all species found at the edge of their ranges or that occur as disjunct locations be evaluated for impacts by the proposed permitted activities.

Alternatives

The EIR must include a robust analysis of alternatives. The stated objectives of the project must not unreasonably constrain the range of feasible alternatives evaluated in the EIR. The County must establish an independent set of objectives that do not unreasonably limit the EIR's analysis of feasible alternatives including alternative sites. At a minimum, alternatives including the no-action alternative, an environmentally preferred alternative, and several on-site alternatives with configurations that accommodate wildlife connectivity/passage, avoid sensitive resources and other conservation-oriented alternatives.

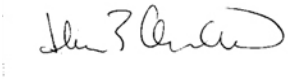
Cumulative Impacts

The cumulative impacts section must also include the number of permitted but unbuilt housing units that the County and local municipalities in the Santa Clara River Valley have already permitted, in Los Angeles County as well as Ventura County. It is our understanding that there are numerous permitted projects in the valley that have yet to be built due to economics. Therefore, the EIR needs to disclose the current permitted projects, including the number of housing units and the proximity to the proposed project in order to evaluate the need for more housing in this area.

12 Fiedler 1991. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=3173

Thank you for the opportunity to submit scoping comments on this proposed Project. Please do not hesitate to contact the Center with any questions at the contact information provided. We look forward to reviewing all further environmental documentation on this project. Please add us to the list for all notices and dissemination of information pertaining to this project.

Sincerely,



Ileene Anderson
Senior Scientist

September 18, 2019

Mr. Steven Jones
County of Los Angeles
Department of Regional Planning
Land Divisions Section
320 West Temple Street, Room 1362
Los Angeles, CA. 90012

Subject: Notice of Preparation of a Draft Environmental Impact Report and Public Scoping Meeting, Sterling Ranch Residential Project.

Please include the following comment as part of the Public Review Period for the subject NOP pursuant to Title 14, section 15082(b) of the California Code of Regulations ending on September 20th, 2019.

The specific topic of this comment is directed to the Transportation/Traffic environmental effects of the Project.

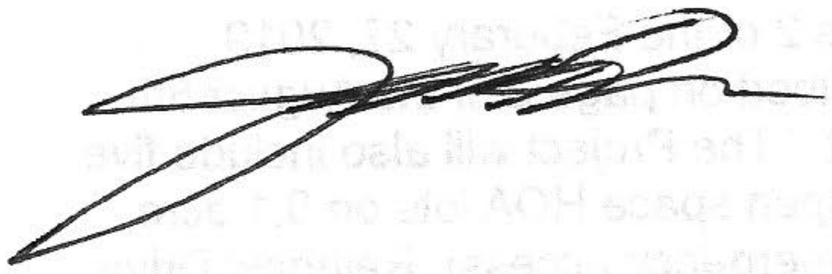
The proposed access roads as shown on page 2 of the Feburary 27, 2019 Tentative Map No. 060257(TTM) and as described on page 2 of the August 5th, 2019 County Document, where it is stated that, ' The Project will also include five open space lots on 21 acres, six landscaped/open space HOA lots on 0.1 acre, three access strip lots at Trevylon Street(20' emergency access), Rainbow Drive (20' emergency access) and Lexington Drive (26' project access) on 0.2 acre,...', are inconclusive and unreliable for the public to provide any comment regarding the environmental effects due to Transportation/Traffic for these specific areas. These proposed access roads are connected in plan view by way of the existing roads. The 26' width shown on the Plan for Lexington Drive, for example, is the current right of way width, however, the County has been derelict in both enforcing and maintaining a 26' right of way since the establishment of this road as well as others.

Attached are civil plans(C1,C2&C3) prepared by FMConsulting that reproduces (see C3) the proposed 26' access road section(Sheet 1) of the TTM superimposed on sections A,B & C that have been mapped in the field. The centerline for these section were established using centerline hubs provided by County Public Works Survey. On August 28, 2019 County Department of Public Works Survey crew were observed to be locating centerline hubs in the intersections of Lexington/Cottage Grove and Lexington/Rainbow Drive. This was confirmed when the 2 crew members were asked if the centerline was being located. The centerline was then projected by FMC using the existing hubs east

where the enclosed sections were mapped out.

By observation of the sections by FMConsulting, it can be seen that several issues arise with respect to drainage, hazards and access related to Transportation with stated road widths. The environmental consequences and variability of effects can not be understood at this time and we demand that; The County disclose as to what degree(using visual aides and commentary) the residents will be impeded upon with respect to both access and egress of properties by enforcing the existing right of ways stated and any related hazards including environmental variability effects related to establishing stated road widths on the TTM. At which point the community may then be able to make informed comments. Its is our assertion that due to insufficient information related the environmental effects of establishing the stated road widths for project, as shown in Civil drawings by FMConsulting, the existing NOP for this environmental review is invalid and must be withdrawn.

Respectfully submitted,



Jaime Briano
CBFC Land Development Committee

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING

DATE: August 5, 2019

TO: State Clearinghouse, Responsible Agencies, Trustee Agencies, Organizations and Interested Parties

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report in Compliance with Title 14, section 15082(a) of the California Code of Regulations

The County of Los Angeles (County) is the lead agency pursuant to the California Environmental Quality Act (CEQA) and intends to prepare an Environmental Impact Report (EIR) for the proposed Project identified below. The County has prepared this Notice of Preparation (NOP) to provide Responsible Agencies and other interested parties with information describing the Project and to identify its potential environmental effects pursuant to State requirements.

AGENCIES: The County requests your agency's views on the scope and content of the environmental information relevant to your agency's statutory responsibilities in connection with the proposed Project, in accordance with Title 14, section 15082(b) of the California Code of Regulations. Your agency will need to use the EIR prepared by the County when considering any permits that your agency must issue, or other approval for the Project.

ORGANIZATIONS AND INTERESTED PARTIES: The County requests your comments and concerns regarding the environmental issues associated with construction and operation of the proposed Project.

PROJECT & PERMIT(S): Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ / Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250.

PROJECT APPLICANT: Sterling Gateway, LP

PROJECT LOCATION: 29053 Coolidge Avenue, Val Verde, CA 91384 APN: 3271-004-012, 3271-004-013, and 3271-005-032

PROJECT DESCRIPTION: To create 222 detached single-family residential lots on 57.9 acres, a passive pocket park on 0.2 acre, a passive park with a tot lot, shade structure and tables on 3.4 acres, and 21,000 square feet of commercial uses with 71 parking spaces on 2.5 acres, five undisturbed open space lots on 21 acres, six landscaped open space HOA lots on 0.1 acre, three access strip lots on 0.2 acre, three infiltration basin lots and six debris basin lots on 8.8 acres, a pump station lot on 0.1 acre, and 19.7 acres of public right-of-way and private and future streets within Zone R-1 on 113.9 acres.

Sterling Gateway, LP proposes the Sterling Ranch Estates Residential Project (Project), a 113.9-acre residential community (See **Figure 1: Site Plan Sheet A**). Of the proposed 222 residential lots, 91 residential lots would be 7,000 square feet to 10,000 square feet in size and 131 residential lots would be greater than 10,000 square feet in size, for an average of 11,364 square feet, consistent with Castaic Area Community Standards District (CSD) development standards. The Project also would include five open space lots on 21 acres, six landscaped/open space HOA lots on 0.1 acre, three access strip lots at Trevylon Street (20' emergency access), Rainbow Drive (20' emergency access) and Lexington Drive (26' project access) on 0.2 acre, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acre, and public streets and private and future streets for the community on 19.7 acres (See **Figure 2: Site Plan Sheet B**).

The Project would provide a private trail, the Sterling Horn Memorial Trail, ten feet in width along the southern portion of the Project site. The private trail would connect with the County's Del Valle Trail outside the Project site as identified in the County's Regional Trail Plan. The Project also would dedicate a twenty-foot wide, multiuse trail easement to the County for the Del Valle Trail, located off-site, on a third party's property. The off-site trail would be a variable-width (five-foot to eight-foot wide), natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request.

The off-site improvements consist of the following: a portion of Del Valle Road from the easterly Project boundary to approximately 772-feet east of the Project boundary within the adjacent property; the off-site construction of a mainline sewer from the Project site to Hasley Canyon Road within Del Valle Road; the upsizing of the existing water line within Hasley Canyon Road; and the dedication of off-site permanent open space on 37.9 acres. The Project also involves the construction of a one-million-gallon water tank, located on approximately 1.4 acres of disturbed land, at an elevation of 1575 feet, approximately 2.2 miles westerly from the Project site, and in the vicinity of the existing Cuyama water tank site.

The proposed uses and densities are consistent with the existing General Plan, the Area Plan land use designations, zoning, and CSD development standards. The Project includes requests for approval of a vesting tentative tract map to create 249 lots, a conditional use permit (CUP) for development within a Hillside Management Area, the grading of more than 100,000 cubic yards of earth and construction and maintenance of a water tank, and an oak tree permit. While the Project would have one mass grading plan and storm drain plan for the entire Project site, the Project could be constructed in up to six phases, with the commercial portion constructed during

Phase 5. The Los Angeles County Waterworks District No. 36 would provide water to the Project, the Los Angeles County Sewer Maintenance Division would operate the pump station, and the Los Angeles County Sanitation District would provide wastewater treatment collection and treatment.

The Project's system of public streets would access Del Valle Road. The extension of Chiquito Canyon Road (as Sterling Parkway) would provide access to the Project site and would include four new intersections with local roadways constructed within the Project site.

The Project site is primarily undeveloped, with the exception of one single-family residential structure, unimproved hiking trails and dirt roads. The Project would demolish and remove the existing on-site residential structure, which is located off Hunstock Street and Coolidge Avenue (proposed Sterling Parkway).

The Project would require an Oak Tree Permit (OTP No. 200700007) to remove two jurisdictional oak trees. The two trees are located at the corner of Hunstock Street and what is currently Coolidge Avenue.

POTENTIAL ENVIRONMENTAL EFFECTS OF THE PROJECT

Based on a preliminary review of the proposed Project consistent with section 15060 of the CEQA Guidelines, the County has determined that an EIR should be prepared for this proposed Project. In addition, consistent with section 15082 of the CEQA Guidelines, the County has identified the following probable environmental effects of the Project, which will be addressed in the EIR for this project:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Geology / Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials
- Hydrology / Water Quality
- Noise
- Public Services
- Recreation
- Transportation / Traffic
- Tribal Cultural Resources

- Utilities / Services Systems
- Wildfire

The County has determined that there is not a likelihood of potentially significant effects related to the following environmental topics:

- Agricultural and Forestry Resources
- Energy
- Land Use / Planning
- Mineral Resources
- Population / Housing

The EIR will include information on the reasons why these effects were determined not to be significant and are therefore not addressed in detail in the EIR.

NOTICE OF SCOPING MEETING: The County will conduct a public scoping meeting for the purpose of soliciting oral and written comments from interested parties as to the appropriate scope and content of the EIR.

All interested parties are invited to attend the scoping meeting to assist in identifying issues to be addressed in the EIR. The scoping meetings will include a brief presentation of the Project to be addressed in the EIR and will provide attendees with an opportunity to provide input to the scope of the EIR. The Scoping Meeting will be held on Thursday August 29, 2019 at 6:30 PM at the following location:

Live Oak Elementary
27715 Saddleridge Way
Castaic, CA 91384

Translation in other languages can be made available at the meeting upon request. Please submit translation requests at least seven business days in advance of each scheduled meeting to sdjones@planning.lacounty.gov.

PUBLIC REVIEW PERIOD: The County has determined to make this NOP available for public review and comment pursuant to Title 14, section 15082(b) of the California Code of Regulations. The comment period for the NOP begins on Monday, August 5, 2019 and ends on Thursday, September 5, 2019.

Any comments provided should identify specific topics of environmental concern and your reason for suggesting the study of these topics in the EIR.

Please direct all written comments to the following address:

Steven Jones
County of Los Angeles
Department of Regional Planning
Land Divisions Section
320 West Temple Street, Room 1362
Los Angeles, CA 90012
Tel: 213-974-6433
Fax: (213) 626-0434
sdjones@planning.lacounty.gov

All written responses will be included as Appendices in the Draft EIR and their contents considered in accordance with State and County environmental guidelines.

DOCUMENT AVAILABILITY: The NOP and Initial Study are available for public review during regular business hours at the Los Angeles County Department of Regional Planning address listed above and the following locations:

- Castaic Library, 27971 Sloan Canyon Road, Castaic, CA 91384
- Stevenson Ranch, 25950 The Old Road, Stevenson Ranch, CA 91381

The public is also encouraged to visit the Department of Regional Planning's website to review the initial study at http://planning.lacounty.gov/case/view/03-250.

Thank you for your participation in the environmental review of this project.

RE: Sterling Ranch Residential Project

Dear Mr Jones

Endangered Habitats League (EHL) is in receipt of the NOP for an EIR for this project. While consistent with the land use designations of the General Plan, EHL is nevertheless concerned over continued automobile dependent sprawl development, GHG emissions therefrom, biological impacts, water supply, and expansion of the wildland-urban interface and fire hazard. For your reference, EHL is a Southern California conservation group dedicated to ecosystem protection and sustainable land use, with a particular interest in Significant Ecological Areas.

Please place or retain EHL on all mailing and distribution lists for the project, including CEQA documents and public hearings.

Thank you
Dan Silver

Re: Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ / Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250

Dear Mr. Jones:

The Friends of the Santa Clara River, now celebrating 26 years of conservation efforts on behalf of the Santa Clara River, wish to express our concerns with several aspects of this project and ask that these issues be addressed by revising the initial study and by addressing them in the Environmental Impact Report for this project.

Sterling Gateway proposes to create 222 detached single-family residential lots on 57.9 acres, as well as additional infrastructure and three debris basins in the rural community of Val Verde, increasing its current population by approximately 25%. The project is located in a Very High Fire Hazard area with only one two lane road in an out f the community. The housing will be located in close proximity to the existing and proposed expansions of the Chiquita Canyon Landfill, making future residents subject to odors and poor air quality caused by this landfill.

We begin by noting that although the community is statistically a majority Hispanic community and a large percentage of the community speaks Spanish at home, no notices or signage where provided in that language so that affected members of the community could participate in their native language. None of the materials received by our group were translated into Spanish nor did any statement appear in Spanish offering to answer questions. We therefore request that the SCOPING meeting be re-scheduled and re-noticed with Spanish translation so that all residents of this community can be informed as to what is being proposed.

Nor did the Notice of Preparation mention anywhere the proximity of the Chiquita Canyon Landfill and the information that the project is proposed in a very high fire hazard area. These are facts important to the public's ability to make meaning suggestions for the NOP process. We request that this information be included when the Department properly re-notices this project.

Notice of Preparation

We concur with the County's preliminarily review that, consistent with section 15060 of the CEQA Guidelines, an EIR should be prepared for this proposed Project. In addition, consistent with section 15082 of the CEQA Guidelines, the County has identified the following probable environmental effects of the Project, which will be addressed in the EIR for this project: •Aesthetics •Air Quality •Biological Resources •Cultural Resources •Geology / Soils •Greenhouse Gas Emissions• Hazards/Hazardous Materials •Hydrology / Water Quality •Noise •Public Services •Recreation •Transportation / Traffic •Tribal Cultural Resources •Utilities / Services Systems •Wildfire.

We do not agree with the County's determination regarding the unlikelihood of potentially significant effects related to the following environmental areas – Energy •Land Use / Planning •Mineral Resource •Population / Housing. We believe that energy should be discussed to ensure that this new community has full access to solar and no new lines creating sources of wildfire ignition will be added. Energy is related to other Chapters such as GHG and Utilities and should be included. Both landuse and population should be included because of the substantial increase to the current population of this rural community that would be incurred by this project. Although the County states that the EIR will include the reasons why they believe these effects would not to be significant, we believe this is not sufficient and these areas should be fully addressed.

Initial Study

Hydrology – The initial study states that two ephemeral channel features are present that support indicators of an ordinary high water mark (OHWM), bed and bank, and riparian vegetation within the Project site, and that, based on these indicators, the features would be jurisdictional to the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW). These ephemeral channel features are currently within the Project footprint and would be impacted. The IA states that mitigation for impacts would be required and is currently proposed to be fulfilled via the purchase of credits through a local mitigation bank or conservation organization.

The Friends support the preservation of natural bed and banks of streams and creeks to ensure sustainable groundwater recharge and the maintenance of natural habitat. We therefore request that the EIR include an alternative that provides for the preservation of these ephemeral streams.

Surrounding Landuses – The County failed to include the approved 1544 unit Landmark project directly across Hwy 126 directly across from Chiquito Canyon Rd which is the entrance to community of Val Verde. Other smaller projects were also not included.

Biology – At this time we concur with statements made and rely on the letters submitted by the Santa Monica Mountains Conservancy and the CA Fish and Wildlife regarding this project. We

note that the recently approved Spring Canyon project in the upper watershed had CUP conditions placed on it against the use of rodenticides and trapping f wildlife due to predation on household pets. We ask that any approval of this project include similar restrictions due to its location in a wildlife corridor.

We also ask that an alternative that preserves the two oak trees on site be developed.

Water Supply – The community of Val Verde is currently served by only one water well. It is important that the County determine the sufficiency of the water supply and that the water quality of that well is not being affected by the Chiquita Canyon Landfill.

We request that a Water Supply Assessment be provided for this project and that any additional proposed pumping to serve this project be coordinated and reviewed by the appropriate ground water sustainability agency.

Cumulative Impacts to the Santa Clara River and its tributaries - We urge that new information regarding cumulative impacts to streams and tributaries of the Santa Clara River be reviewed in light of the 2014 Sustainable Groundwater Management Act.

Conclusion

Thank you in advance for your attention to our concerns. We look forward to the re-notice of this matter with Spanish translation.

Sincerely,

James Danza

Re: Sterling Ranch Residential Project/Project No. 03-250-(5)/Vesting Tentative Parcel Map No. 060257/Conditional Use Permit No. 03-250/ Oak Tree Permit No. 200700007 /Environmental Assessment No. 03-250

Dear Mr. Jones:

The SCOPE Board has reviewed the Notice of Preparation for this project and submits below our comments and concerns. We respectfully ask that these issues be addressed by revising the initial study and by addressing them in the Environmental Impact Report for this project.

These comments are timely made since an extension to Sept. 20th was verbally granted at the scoping meeting and later posted to the County website, though no official notice of extension was circulated to interested parties.

Sterling Gateway proposes to create 222 detached single-family residential lots on 57.9 acres, as well as additional infrastructure and three debris basins in the rural community of Val Verde, increasing its current population by approximately 25%. The housing will be located in close proximity to the existing and proposed expansions of the Chiquita Canyon Landfill, making future residents subject to odors and poor air quality caused by this landfill.

The project is located in a hillside management area and in a Very High Fire Hazard area with only one two lane road in an out f the community. It is subject to the Los Angeles County General Plan, the new County Sustainability Plan, the Santa Clarita Valley area plan and the Val Verde Community Standard District, as well as permitting by numerous resource agencies. The DEIR should describe what is required by each of these plans and how this project will be consistent with the plans and how will abide by the various resources agencies requirements.

The Notice of Preparation does not mention the proximity of the Chiquita Canyon Landfill and the information that the project is proposed in a very high fire hazard area. These are facts important to the public's ability to make meaningful suggestions for the NOP process. We request that this information be included when the Department properly re-notices this project.

Community Standards District According to the Castaic CSD[1], "The Castaic Area Community Standards District ("CSD") is established to protect the rural character, unique appearance, and natural

[1]https://library.municode.com/ca/los_angeles_county/codes/code_of_ordinances?nodeId=TIT22PLZO_DIV10COSTDI_CH22.312CAARCOSTDI

resources of the Castaic Area communities. This CSD also ensures that new development will be compatible with the Castaic area's existing rural neighborhoods and with the goals of the Santa Clarita Valley Area Plan"... "This CSD generally includes the existing communities of Castaic, Castaic Junction, Val Verde, Hasley Canyon, Hillcrest, and Paradise Ranch: the canyons of Charlie, Tapia, Romero, Sloan and Violin canyons…etc." and thus covers the community of Val Verde where this project is located.

We do not believe that this project qualifies for clustering under the CSD. The CSD states that-

2. Clustering is allowed within this CSD only if findings are made that clustering can:
    a. Reduce grading alterations;
    b. Preserve native vegetation;
    c. Preserve unique land features;
    d. Preserve open space;
    e. Enhance recreational areas; or
    f. Protect view corridors and view sheds.

While clustering would create open space, because the proposed open space appears to be too steep to accommodate hiking trails and park space, it will not enhance recreational features. Clustering does not protect the two oak trees slated for removal, so does not preserve native vegetation. The massive amount of grading proposed for this project seems to indicate that grading will not be reduced and hillsides and land features will also not be preserved. The preserved open space is unbuildable, so all that is gained by clustering is pushing more houses into a small area with nothing of the required amenities for the community. The zoning should not be changed to allow clustered housing without the required findings being achievable. We do not see any exception in the Standards that would allow for clustering to violate the Special Standards District.

An alternative that complies with hillside management should be included in the EIR.

Further, it appears that a significant ridgeline runs through the project area. The Castaic CSD includes strict prohibitions against grading significant ridgelines.

Even if the project fills the CSD requirements as it claims to do, it ignores the intent of the CSD which is to maintain the rural character of Val Verde. The County's seeming willingness to permit such an action, i.e., cramming houses into a small buildable area and using the un-buildable area that would not be disturbed anyway to count as open space, is unacceptable

Notice of Preparation

We concur with the County's preliminarily review that, consistent with section 15060 of the CEQA Guidelines, an EIR should be prepared for this proposed Project. In addition, consistent with section 15082 of the CEQA Guidelines, the County has identified the following probable environmental effects of the Project, which will be addressed in the EIR for this project: •Aesthetics •Air Quality •Biological Resources •Cultural Resources •Geology / Soils •Greenhouse Gas Emissions• Hazards/Hazardous Materials •Hydrology / Water Quality •Noise •Public Services •Recreation •Transportation / Traffic •Tribal Cultural Resources •Utilities / Services Systems •Wildfire.

We do not agree with the County's determination regarding the unlikelihood of potentially significant effects related to the following environmental areas – Energy •Land Use / Planning •Mineral Resource •Population / Housing. We believe that energy should be discussed to ensure that this new community has full access to solar and no new lines creating sources of wildfire ignition will be added. Energy is related to other Chapters such as GHG and Utilities and should be included. Both land use and population should be included because of the substantial increase to the current population of this rural community that would be incurred by this project. Although the County states that the EIR will include the reasons why they

believe these effects would not to be significant, we believe this is not sufficient and these areas should be fully addressed.

Initial Study

Hydrology – The initial study states that two ephemeral channel features are present that support indicators of an ordinary high water mark (OHWM), bed and bank, and riparian vegetation within the Project site, and that, based on these indicators, the features would be jurisdictional to the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW). These ephemeral channel features are currently within the Project footprint and would be impacted. The IA states that mitigation for impacts would be required and is currently proposed to be fulfilled via the purchase of credits through a local mitigation bank or conservation organization.

SCOPE supports the preservation of natural bed and banks of streams and creeks to ensure sustainable groundwater recharge and the maintenance of natural habitat. We therefore request that the EIR include an alternative that provides for the preservation of these ephemeral streams.

Further, it appears that there may be some serious problems with drainage on this project. Local residents have reported flooding and sheet flows across the road and have raised concerns that the intense grading may result in landslides and mudflows. Some retention basins appear to be inadequately sized and piping may not be sufficient to provide drainage for storm water runoff. We have attached maps with notes that indicate potential problem areas.

Surrounding Land uses – The County failed to include the approved 1544 unit Landmark project directly across Hwy 126 directly across from Chiquito Canyon Rd which is the entrance to community of Val Verde. Other smaller projects were also not included.

Biology – At this time we concur with statements made and rely on the letters submitted by the Santa Monica Mountains Conservancy and the CA Fish and Wildlife regarding this project. We note that the recently approved Spring Canyon project in the upper watershed had CUP conditions placed on it against the use of rodenticides and trapping of wildlife due to predation on household pets. We ask that any approval of this project include similar restrictions due to its location in a wildlife corridor.

We also ask that an alternative that preserves the two oak trees on site be developed.

Water Supply – The community of Val Verde is currently served by only one water well. It is important that the County determine the sufficiency of the water supply and that the water quality of that well is not being affected by the Chiquita Canyon Landfill.

We request that a Water Supply Assessment be provided for this project and that any additional proposed pumping to serve this project be coordinated and reviewed by the appropriate ground water sustainability agency.

Conclusion

Should the County allow this project to move forward after correcting the serious errors and deviations in road width and the drainage maps, we ask that the following conditions be required of this project in order to protect the community:

1. The open space must be released to the Conservancy 60 days after project approval not after the project completion. Without this requirement, the community cannot be assured that the open space will be preserved. Failure to require or ensure open space conservation transfer or restrictions in other county projects has resulted in park or open space being lost in future development proposals.
2. Due to the proposed housing density and due to potential fire danger, the Chiquita Canyon road should be widened to 3-4 lanes at developer's cost

3. A bridge at Hasley and Del Vale must be completed to guarantee access during flooding.
4. Traffic lights must be installed at the two intersections along Chiquita canyon
5. The impact of this project will damage the charm and rural atmosphere of the community therefore some compensation money should go to the Val Verde community for local improvements of their choosing.

Traffic and Evacuation in a Very High Fire Hazard Area

As discussed by many residents that attended the scoping meeting, the access roads in and out of the project vary in width throughout the community. In some instances they don't even match up to roads within the project (i.e. Lexington, Rainbow Dr, and Trevylon). Ingress and egress to the project is on two lane roads. This community could already face serious evacuation dangers in the event of a fast moving wildfire. Adding another 222 residences to this dangerous situation could create a situation similar to Paradise where people were unable to get out. We noted these issues on the attached map.

Proximity to the Chiquita Canyon Landfill

We oppose placing additional homes near a very large and expanding regional landfill. The community of Val Verde is burdened by air quality and odor problems that impact the quality of life for its current residents. The County should not allow housing that subjects additional residents to this burden. In the event that the County choices to expose new and potentially unaware buyers to this deteriorating environmental situation, the County should require full disclose of the landfill, odor complaints and any violations against to all potential buyers.

Signage and Notice should be provided in Spanish

During the recent Chiquita Canyon Landfill public process, we objected to your department that although the community is statistically a majority Hispanic community and a large percentage of the community speaks Spanish at home, no notices or signage where provided in that language. This resulted in barriers to participation for many of the affected members of the community because they could not participate in their native language.

Although the County stated at the scoping hearing that material were available in Spanish, none of the materials received by our group were translated into Spanish nor did any statement appear in Spanish offering to answer questions. We therefore request that the SCOPING meeting be re-scheduled and re-noticed with Spanish translation so that all residents of this community can be informed as to what is being proposed.

Thank you in advance for your attention to our concerns. We look forward to the re-notice of this matter with Spanish translation.

Sincerely,

President

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report in Compliance with Title 14, section 15082(a) of the California Code of Regulations for Project No. 03-250-(5), Sterling Gateway LP

Dear Mr. Jones,

Thank you for the opportunity for the Val Verde Civic Association (VVCA) to submit comments on the Sterling Gateway project's preparation of a Draft Environmental Impact Report. This project is entirely in the Val Verde, CA area for which we are the County's advisory committee so it is important we are able to voice impacts we foresee with this project. Additionally, please submit this comment letter and attachments into the public record.

We had time to review the project as well as the Scoping Meeting Preparation notes and have received feedback from community members on this development. Below are the main factors we believe need to be addressed in the DEIR or potentially in the final Permit if they do not fall under the CEQA EIR guidelines.

REGARDING THIS PARTICULAR PROCESS

Signage and notices in Spanish

The community of Val Verde is majority spanish speaking in the home. As it was with the Chiquita Canyon Landfill DEIR process, we feel it is necessary to have all information regarding this development including signage and mailings to be distributed in both English and Spanish. It has been voiced to our group that Spanish speaking neighbors are not aware of this project. For this reason, we would like to request an extension on the comment period for Spanish speaking residents and in addition, the scoping meeting notice to be re-distributed in Spanish and any future notifications to be English and Spanish . This project will have a significant impact on most if not all of our residents so we feel it is of utmost importance that our residents receive equal opportunity to be notified and informed of any land developments happening around their homes and in their community. Asking them to contact you if they want information does not account for their work schedules nor offer them this information outright as it is with the English speaking residents. This is discriminatory to our neighbors.

Lack of Identified Developer

Our land use committee has brought forth a major recurring concern about this project, which is the lack of an identified developer. It was expressed to our board and in the development presentation delivered at our public land use committee meeting, that the plans we are now reviewing are not for a developer applying to build but plans to be included in the sale of the land. Due to this, our board and land use committee do not know what developer will potentially instigate this project. This raises concern as the process of public participation may be compromised and the community will potentially not receive the opportunity to directly and publicly navigate the permitting process with the developer. We find it very problematic to go through the permitting process and not know which entity may end up developing this project.

PUBLIC SERVICES

Emergency access points on the western and southern portion of the project pose a substantial impact and high risk to community members as well as those dwelling in the proposed project. Particularly Rainbow Drive, Lexington Drive, and Trevyelon Street. These streets contain blind corners and hills, are very narrow, including only one lane at certain points and often hill-sided with significant grades on one or both sides. This would make it extremely hard for emergency vehicles to navigate getting to the proposed residential area. Additionally, the extreme drop in width from Sterling Gateway to Coolidge will also likely cause issues. This is a high traffic intersection and Huntstock also contains blind hills and narrow streets. To better illustrate the issues we have included images of these streets from a variety of angles. The VVCA requests the scoping for public service access be expanded further in order for this plan to address how large emergency and or maintenance vehicles will access the development at these entry points.

TRAFFIC

The Hwy. 126/Chiquito Canyon Drive Intersection

During the construction of this project, there may be stretches where the only outlet from Val Verde would be the Highway 126/Chiquito Canyon Intersection. Left turns from Chiquito Canyon onto the 126 are extremely dangerous. Many accidents and fatalities have occurred when exiting Val Verde East on the 126 due to it being a higher speed limit, 4 lanes, and a blind curve. Anyone leaving Val Verde and trying to turn East onto the 126 is at a higher risk of harm. In fact, many in the community already refuse to use this outlet and will send visitors out the Del Valle exit due to this situation. There have been a series of formal requests to local government officials including Dante Acosta and now Scott WIlk on installing a temporary light until a permanent light is installed as part of the Newhall Land Development. This temporary light has yet to be installed nor instigated as being so. Regarding the Sterling Gateway Development, Del Valle will be compromised as an exit route whether as a single lane or closed completely sending our residents out on the 126. For this reason it is imperative to include safety measures in the scope of this DEIR including the installation of a temporary light on the 126 exit or additional measures so our residents can safely leave the area on a regular basis. Please see attached correspondances on the Highway 126 matter.

Addition to this will be a large increase in population density for the area (nearly 25% more) adding a significant amount of cars on the road affecting the pace and maneuverability of existing roads and

byways in and around Val Verde.

Limited entry and exit routes for increased population

Currently there are only two entry and outlet points for Val Verde. Del Valle to Hasley Canyon and Chiquito Canyon to the 126 Highway. As it is with our current population of around 2,600 people, two exits have put residents at risk. There have been multiple incidences with weather and fire where residents were not able to use these routes to enter or exit the community. Beyond the current scope of this development is the intersection of Del Valle and Hasley Canyon with even the slightest rainfall produces water run over making it dangerous to drive through. Likewise, Chiquito Canyon Road which allows residents to enter and exit the 126 has also been compromised due to landslides in the past. The Rye canyon fire sent vast numbers of commuters through Val Verde looking for a detour around the I5 shutdown producing panic and stand still traffic exiting and entering the community. With this development's significant increase of traffic and density in Val Verde, we are very concerned with how only two routes in and out of the area will not further endanger our community. We feel this is a significant safety issue which this development can not mitigate but further exacerbate it.

WILDFIRE

As it is with our traffic concerns, our community is already at high risk for wildfire danger. With only two exits it further exacerbates emergency response coming into the community as well as our ability to evacuate in the case of wildfire. Sterling Gateway, adding 220 homes will further impact the safety of the community and its ability to respond to a wildfire emergency. In addition to this major concern is our community members being impacted by increases in fire insurance which have already begun. Ours is a low income community and many residents cannot take on higher insurance fees to protect themselves in the untimely chance damage and destruction from a wildfire occurs.

AESTHETICS

Val Verde is of historical significance and prides itself on being a rural community that is welcoming, quiet, unique, and a refreshing departure from development tracts often found in the area. There are ranches dating back 5 generations of families, farms, large and small homes, many hand built, that are new and older some dating back to the 40's during our community's era as the "Black Palm Springs". Our community has a large ratio of open land and hills to homes and entering or exiting Val Verde along Del Valle has always exemplified this. It is also one of our most beautiful driving routes where the canyon opens up to the road and is the basis for our VVCA logo as seen on this very page. The Sterling Gateway project will completely change these aesthetics into what our residents came to Val Verde to avoid. As it is planned, Sterling Gateway will include two large clusters of gated communities each lining Del Valle as you enter Val Verde. Instead of our lovely open hills, there will be walls, gates, and landscaped grated slopes. All of which are not found in our community and eliminate our welcoming and open aesthetic. Although there are tracts in Val Verde, many are no more than a dozen homes at best and none of these tracts are gated or walled in. The Sterling Gateway project is a typical run of the mill housing tract development and by being so will entirely re-create the aesthetics of our community as well as eliminate our historical and rural feel. We do not feel this is something that can be mitigated.

GREENHOUSE GAS EMISSIONS / AIR QUALITY / WATER QUALITY

Currently Val Verde is surrounded by several developments under construction or pending construction, some will be ongoing for decades. These projects include; Mission Village, Los Valles, Tapia Ranch, Commercial and Industrial ongoing in the Valencia Commerce Center and the IAC Commerce Center, and the massive Newhall Land Development along the 126 highway. These developments have existing impacts on air quality, greenhouse gas emissions, and water quality. Increases in risk of valley fever exposure is a concern of our community as well as the number of children attending preschool and school in our 3 mile radius which is approximately 1500 souls. In addition to the ongoing construction from the developments on our borders is the additional pollution from the Chiquita Canyon Landfill which is adjacent to our community and has now been permitted to double its daily intake. Residents on a near daily basis are reporting landfill odors to SCAQMD. Any additional impact on our air quality is significant largely due to the fact our community is held in a canyon where many of the gasses or air pollutants settle. The Sterling Gateway development, located within our canyon, will have an extremely significant impact on the greenhouse gas and air quality of our canyon. The VVCA requests impact reports on these areas to reflect our topography and relation to surrounding pollutants

HYDROLOGY

Val Verde's drainage systems are extremely limited and any runoff from the development will easily flood the area. As it is now, any increased rainfall inhibits several roads in Val Verde. The VVCA feels further scoping should be included regarding Hydrology based on the surrounding systems and not just that within this project. This includes during construction and after completion.

NOISE

Residents are concerned with noise particularly created during construction with the increase of equipment and noise from the pump station located on the southern edge of the project. As mentioned earlier, our community exists within a canyon so noise is significantly amplified throughout the area. This would be a negative impact on our neighbors' quality of life. Additionally, the pump station location is directly adjacent to existing residential homes potentially affecting their ability to enjoy their backyards etc.

UTILITIES / SERVICE SYSTEMS

One benefit to the project is the replacement of the existing water main along Del Valle. This main has broken repeatedly in the recent past and needs to be replaced.

RECREATION

Sterling Horn Memorial Trail

The VVCA requests the Sterling Horn Memorial Trail be publicly accessible and not a private trail. This particular trail connects with public trails and also allows our residents a safer path alongside the Del Valle Road and exit access to the Hasley Canyon area which is greatly beneficial to our residents. We want to encourage ease of access to the future County trail plans and as this is, the private trail would make an access point inaccessible.

NOT ADDRESSED IN THE SCOPE OF THIS DEIR

LAND USE / PLANNING OR POPULATION / HOUSING
The VVCA believes there is significant impact on the areas of Land Use, Planning or Population, and housing which are currently not included in the scoping documents. 2010 Census data states Val Verde's population as 2,468 residents and around 800 homes. Sterling gateway is an additional 220 homes which is a significant increase in population density for our area. This will in turn affect the impact on existing byways, services, and accessibility of our area.

SOCIAL OR ECONOMIC CHANGE RELATED TO A PHYSICAL CHANGE
At this time we want to address issues surrounding the nature of the project as a social or economic change as a physical change in regards to our existing community. The VVCA bases this on 15382 of the CEQA Guidelines:

> 15382. SIGNIFICANT EFFECT ON THE ENVIRONMENT "Significant effect on the environment" means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant. Note: Authority cited: Section 21083, Public Resources Code; Reference: Sections 21068, 21083, 21100, and 21151, Public Resources Code; Hecton v. People of the State of California, 58 Cal. App. 3d 653.

Sterling Gateway is gated and therefore is automatically "walled off" from public access and the rest of the community. It in turn creates its own "neighborhood" within Val Verde. Economically speaking, Sterling Gateway will be a cluster of brand new homes, a shopping center and park in place to serve the development. The homes will cost more which will decrease the appeal and value of the homes surrounding placing an economic burden on our residents who are primarily low-income minority population. A Sterling Gateway HOA creates an even deeper divide from the community including our role as the Civic Association for all of Val Verde.

In layman terms, it will be automatically establish a new and affluent neighborhood excluding existing residents both socially and economically. We feel this development falls under the auspice of residential segregation and its physical change to the environment should be included in the DEIR as a significant impact on a historical minority and low-income community.

Please feel free to contact us for any further information at vvcivic@gmail.com or 661.670.8663.

Thank you,

The Val Verde Civic Association Board

May 18, 2016

Malcolm Dougherty
Director Caltrans
California Department of Transportation
1120 N Street
MS 49
Sacramento, California 95814

Dear Mr. Dougherty

On behalf of the Castaic community, the Castaic Area Town Council would like to express our grave concern of the traffic situation at the corner of SR 126 and Chiquita Canyon Road. In light of the fact that we have had 2 deaths and a significant number of accidents at this uncontrolled intersection within the past year we would like to ask to have a traffic study to best evaluate this intersection. The two tragic deaths occurred when the vehicles were both entering the east bound lanes of SR 126 coming from south bound on Chiquita canyon road.

Presently there is only a stop sign that holds southbound traffic on Chiquita Canyon Road coming from Val Verde. This traffic must cross two uncontrolled lanes of traffic moving westbound and then merge into the eastbound lanes along SR126. Most Chiquita Canyon southbound traffic proceeds eastbound having to cross oncoming traffic with speeds above 60 MPH. This situation is further complicated by a curve and hill that hides the westbound oncoming traffic on SR 126 from view of the stopped traffic at Chiquita Canyon Rd. This situation gives very little time to make a good judgment to proceed and merge across the lanes.

The Castaic Area Town Council is requesting that a traffic study be conducted to determine the need for a traffic light at this intersection. We realize that this particular traffic light is detailed to be installed in the Newhall Land Mission Village Project, but it is the consensus of the council that the community can wait for this improvement the years this project will take to develop along. We also would like Caltrans to consider the repurpose of the light that will be removed at the corner of SR 126 and Commerce Drive with the completion of the over pass in that area.

Sincerely,

Sandia Ennis President
Castaic Area Town Council

Sacramento, CA 95814

From:
Castaic Area Town Council
PO Box 325
Castaic, CA 91310

Dear Mr. Dougherty

On behalf of the Castaic community the Castaic Area Town Council would like to express our grave concern of the traffic situation at the corner of SR126 and Chiquita Canyon Road. In light of the fact that we have had 2 deaths and a significant number of accidents at this uncontrolled intersection within the past year we would like to ask to have a traffic study to best control this intersection. The two tragic deaths occurred when the vehicles were entering the east bound lanes of SR126 coming from south bound on Chiquita canyon road.

Presently there is only a stop sign that holds southbound traffic on Chiquita Canyon Road coming from Val Verde. This traffic must cross two uncontrolled lanes of traffic moving westbound and then merge into the eastbound lanes along SR126. Most Chiquita Canyon southbound traffic is proceeding eastbound having to cross oncoming traffic with speeds above 60 MPH. This situation is further complicated by a curve and hill that hides the westbound oncoming traffic on SR126 from view of the stopped traffic at Chiquita Canyon Rd. This situation gives very little time to make a good judgment to proceed and merge across the state rout.

The Castaic Area Town Council is asking that a traffic study be conducted to determine the need for a traffic light at this intersection. We realize that this needed light is built into the Newhall Land Mission Village Project, but we do not feel that the community can wait the years this project will take to move along. We also would like Caltrans to consider the repurpose of the light that will be removed at the corner of SR126 and Commerce Drive with the completion of the over pass.

Sincerely,
Castaic Area Town Council

Help save water!

September 29, 2016

Ms. Sandia Ennis
President
Castaic Area Town Council
P.O. Box 325
Castaic, CA 91310

Dear Ms. Ennis:

This is in response to your letter to Mr. Malcolm Dougherty, Director of the California Department of Transportation (Caltrans), in which you expressed concerns about the traffic conditions at the intersection of State Route 126 and Chiquita Canyon Road in Los Angeles County.

The Office of Traffic Engineering will initiate a traffic investigation. We anticipate the results of our investigation will be available in three to four weeks, which will be provided to you.

Thank you for bringing this matter to our attention. Caltrans relies on our civic partners for input regarding the state highway system.

If you should have any further questions regarding this matter, please do not hesitate to contact Mr. Ali Zaghari, Deputy District Director, Traffic Operations, at (213) 897-0362.

Sincerely,

for CARRIE L. BOWEN
District Director

c: Mike Antonovich, LA County Board of Supervisors, District 5
Donna Tremeer, District Director, Senate, District 21
Scott Wilk, Assemblymember, District 38

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability"

Serious drought. Help save water!

March 3, 2017

Ms. Sandia Ennis
President
Castaic Area Town Council
P.O. Box 325
Castaic, CA 91310

Dear Ms. Ennis,

This is a follow up response to the acknowledgement letter sent to you dated September 29, 2016. A field investigation was conducted at the corner of State Route 126 (SR-126) and Chiquita Canyon Road, the location mentioned in your response.

We have initiated an investigation for the installation of a traffic signal at this location. Based on the findings, we have initiated an Installation Order for the following signs to be installed:

- Two CROSS TRAFFIC AHEAD signs, one in each direction, 1000 feet east and 1500 west of the intersection.
- AHEAD sign on the existing CROSS TRAFFIC AHEAD signs on SR-126, east and west of the intersection.
- A LANE ENDS sign 500 feet west of the intersection in the westbound direction on SR-126.
- A CROSS ROAD AHEAD sign on Chiquita Canyon Road, just south of SR-126.

The signs will be special ordered, and may take up to four months to be manufactured. We anticipate the installation of signs to occur in early April 2017. We will continue our investigation into the installation of a traffic signal. We anticipate the results of this investigation to be available by June 2017.

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability."

If you should have further questions regarding this matter, please do not hesitate to contact Mr. Abdi Saghafi, Office Chief, Traffic Engineering-North at (213) 897-9810.

Sincerely,

ALI F. ZAGHARI
Deputy District Director, Traffic Operations

APPENDIX B

Air Quality Model Output

APPENDIX B.1

Proposed Summer

Sterling Ranch Project

Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	19.70	Acre	19.70	858,132.00	0
City Park	12.80	Acre	12.80	557,568.00	0
Single Family Housing	222.00	Dwelling Unit	57.90	399,600.00	635
Regional Shopping Center	21.00	1000sqft	2.50	21,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Park acreage includes passive park and shade structures and debris and pump stations
Asphalt surfaces include public right-of-way and private and future streets

Construction Phase - Construction to begin August 2021

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading equipment per applicant.

Off-road Equipment -

Grading -

Vehicle Trips - Weekday trip rates adjusted per traffic study. Weekend trip rates adjusted per CalEEMod default weekday/weekend ratios.

Woodstoves - No woodstoves.

Construction Off-road Equipment Mitigation - 25 percent of equipment fleet would meet Tier 4 Final specifications. Remaining 75 percent would meet Tier 3/Tier 4 Interim requirements.

Area Mitigation - Compliant with SCAQMD Rule 1113 - Architectural Coating (<50gms/liter).

Energy Mitigation -

Water Mitigation -

Mobile Land Use Mitigation -

Sterling Ranch Project

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	19.70	Acre	19.70	858,132.00	0
City Park	12.80	Acre	12.80	557,568.00	0
Single Family Housing	222.00	Dwelling Unit	57.90	399,600.00	635
Regional Shopping Center	21.00	1000sqft	2.50	21,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Park acreage includes passive park and shade structures and debris and pump stations
Asphalt surfaces include public right-of-way and private and future streets

Construction Phase - Construction to begin August 2021

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading equipment per applicant.

Off-road Equipment -

Grading -

Vehicle Trips - Weekday trip rates adjusted per traffic study. Weekend trip rates adjusted per CalEEMod default weekday/weekend ratios.

Woodstoves - No woodstoves.

Construction Off-road Equipment Mitigation - 25 percent of equipment fleet would meet Tier 4 Final specifications. Remaining 75 percent would meet Tier 3/Tier 4 Interim requirements.

Area Mitigation - Compliant with SCAQMD Rule 1113 - Architectural Coating (<50gms/liter).

Energy Mitigation -

Water Mitigation -

Mobile Land Use Mitigation -

Building Construction	9	681.00	259.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Paving	6	15.00	0.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT
Architectural Coating	1	136.00	0.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use DPF for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Grading - 2021

1 Introduction

Dudek has prepared this Biological Technical Report (report) for Sterling Ranch Estates (Applicant) in support of the Sterling Ranch Estates Residential Project (Project) located in the community of Val Verde in unincorporated Los Angeles County (County), as shown on Figure 1. The purpose of this report is to provide the methods and results of focused and reconnaissance level biological surveys conducted in 2016, 2017, 2018, and 2020, which included vegetation mapping, focused botanical and special-status plant species surveys, general wildlife habitat assessment, coastal California gnatcatcher (*Polioptila californica californica*) and burrowing owl (*Athene cunicularia*) protocol surveys, and a formal (routine) wetland delineation. This report also includes an impact analysis based on survey results and federal, state, and local regulations, and measures for avoiding and minimizing impacts to biological resources. This report has been prepared to assist the County of Los Angeles in the California Environmental Quality Act (CEQA) review process for the Project. It is also intended to support environmental review by other applicable regulatory resource agencies, specifically the U.S. Fish and Wildlife Service (USFWS), U.S. Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), and the Regional Water Quality Control Board (RWQCB), as needed.

1.1 Project Description

The Project includes the development of approximately 222 detached single-family residential lots and a commercial lot with neighborhood-serving retail, recreation/open space (park sites, natural open space, manufactured open space), a homeowners association (HOA) lot, roads, and utility infrastructure (debris basin, infiltration basin, and pump station) within Assessor's Parcel Numbers (APNs) 3271-004-012 and 3271-004-013, herein referred to as Tract Map Site, which comprise approximately 114.3 acres.

Off-site areas include the Off-Site Roadway Improvement Area, Off-Site Open Space Area, Off-Site Water Tank Area, Off-Site Water Line Improvement Area, and Off-Site Sewer Line Improvement Area. The Off-Site Roadway Improvement Area is immediately east of PN 3271-004-013 and totals approximately 6.6 acres.

The Project will conserve in perpetuity, through a conservation easement, 37.9 acres of APN 3271-005-032, referred to herein as the Off-Site Open Space Area. The 41.3 acres of APN 3271-005-032 just east of the proposed 37.9-acre Off-Site Open Space Area conservation easement is already subject to preservation in perpetuity through a conservation easement held by the Mountains Recreation & Conservation Authority. The 16.1 acres of APN 3271-005-032 just north of the proposed 37.9-acre Off-Site Open Space Area conservation easement area is Tentative Tract No. 62000, which is currently proposed for residential development; however, entitlements for Tentative Tract No. 62000 are not being pursued actively at this time. The 41.3-acre conservation easement held by the Mountains Recreation & Conservation Authority and the 16.1-acre Tentative Tract No. 62000 are not a part of the Project but are included as a visual for the contiguous open space area, as shown on Figure 2A.

In conjunction with approval of Project, Los Angeles County Waterworks District No. 36 has required the construction of a water tank. The Project includes a one million gallon-water tank, more capacity than required by Los Angeles County Waterworks District No. 36 for firefighting purposes, at the elevation of the existing Cuyama tanks, referred to herein as Off-Site Water Tank Area, as shown on Figure 2B. The Off-Site Water Tank Area lies in and adjacent to the existing Los Angeles County Waterworks District No. 36 Cuyama tank site. The water tank is located within the District's 1598 pressure zone APNs 3272-029-902 and 3272-029-023, comprising approximately 2.8 acres. Initially the water tank was planned right next to the existing water tank reservoirs; however, this was not feasible due the geologic instability of the slope directly behind the proposed

location. Multiple alternative sites under various ownerships were then explored to find an alternate site at the correct elevation. Due to ownership and geotechnical constraints, none of these alternative sites were feasible. Since the alternative sites were not feasible options, the area slightly to the east of the adjacent water tanks was selected. This site allowed for appropriate water tank siting with the correct elevation and ability to stabilize the adjacent hill by grading a manufactured 2:1 slope. Through researching multiple alternative water tank locations, the proposed location of the Off-Site Water Tank Area is the only site considered feasible for the one million gallon-water tank.

The Off-Site Water Line Improvement Area and Off-Site Sewer Line Improvement Area are proposed in existing roadways, as shown on Figure 2C. The Off-Site Water Line Improvement Area is approximately 10,600 linear feet and would be upgraded along Hasley Canyon Road within approximately 2.4 acres. The Off-Site Sewer Line Improvement Area includes a proposed 12-inch sewer mainline within the existing Del Valle Road right-of-way within the Tract Map Site extending northeast approximately 3,425 feet, approximately 0.8 acres, to the point of connection with the existing 12-inch sewer line in Hasley Canyon Road.

The Project site includes the Tract Map Site, the Off-Site Roadway Improvement Area, the Off-Site Open Space Area, the Off-Site Water Tank Area, the Off-Site Water Line Improvement Area, and the Off-Site Sewer Line Improvement Area, all of which are coterminous with the Biological Survey Areas (BSAs). The Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, and Off-Site Open Space Area BSA are displayed on Figure 2A; the Off-Site Water Tank BSA is displayed on Figure 2B; and the Off-Site Water Line Improvement Area BSA and Off-Site Sewer Line Improvement Area BSA are displayed on Figure 2C.

The Project will involve mass grading within the parcels to facilitate the residential development and associated infrastructure; however, several areas will remain undeveloped and will be preserved as open space. The Project will incorporate Low Impact Development (LID) design standards based on the Los Angeles County Department of Public Works LID Standards Manual (County of Los Angeles 2014a). Tract map preserved parcels are anticipated to be maintained by the HOA. As mentioned above, the Off-Site Open Space Area will conserve, in perpetuity through a conservation easement, 37.9 acres maintained by a third party.

2 Project Setting

2.1 Project Location

The Project is located in the community of Val Verde, north of Chiquito Canyon Road, and northwest and southeast of Del Valle Road. The Project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The Project site and BSA, including the Off-Site Water Tank Area, occur entirely within the U.S. Geological Survey (USGS) 7.5-minute Val Verde quadrangle (USGS 2017a). The Tract Map Site is centered at approximately 34 27′1.00″ N 118 39′ 12.00″ W and falls within Township 4 north, Range 17 west, sections 9 and 10, San Bernardino meridian. The Off-Site Water Tank Area site is centered at approximately 34 27′09.95″ N 118 41′ 22.08″ W and falls within Township 4 north, Range 17 west, section 8.

2.2 Land Uses

2.2.1 On-Site Land Uses

The Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA have remained undeveloped and in largely the same condition for the past 20 years. One residence is located in the southwestern portion of the Tract Map Site BSA, and several access roads are present; however, the lands within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA are best characterized as undeveloped.

The Off-Site Water Tank Area BSA is partially within the existing Los Angeles County Waterworks District No. 36 Cuyama tank site and adjacent private property. The Off-Site Water Tank Area BSA can be characterized as undeveloped.

2.2.2 Surrounding Land Uses

Existing land uses in the immediate vicinity of the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA include residential development in the community of Val Verde to the south and west, commercial/ industrial development associated with the Valencia Commerce Center to the east, oil field operations in the Hasley Canyon Oil Field to the northeast, and undeveloped property to the north of the Tract Map Site BSA and north and east of the Off-Site Open Space Area BSA.

Existing land uses in the immediate vicinity of the Off-Site Water Line Improvement Area BSA include the existing paved Hasley Canyon Road, commercial buildings, residential development, and Interstate 5. Land in the immediate vicinity of the Off-Site Sewer Line Improvement Area BSA is Del Valle Road, and adjacent areas are largely undeveloped.

Land in the immediate vicinity of the Off-Site Water Tank Area BSA is largely undeveloped with the exception of the existing Los Angeles County Waterworks District No. 36 Cuyama tank site.

2.3 Biological Setting

The Project is located within the Transverse Range geomorphic province of Southern California. Topographically, the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA vary from flat to moderate north- and south-facing slopes with elevations ranging from approximately 1,200 feet above mean sea level (amsl) along the southern boundary to approximately 1,400 feet amsl in the northeastern portion of the BSA. Topographically, the Off-Site Water Tank Area BSA consists of moderate north- and south-facing slopes with elevations ranging from approximately 1,550 feet amsl along the northern boundary to approximately 1,750 feet amsl in the southern portion of the site. Soils present within the Project site generally consist of loams, sandy loams, and silty clay loams, which are derived from sedimentary rock or granite. The Project region has a Mediterranean climate with cool, wet winters and hot, dry summers. Rainfall occurs primarily between October and March.

The Project region is located in a broad ecological and biogeographic transition zone for the coastal and mountain ecoregions. The Santa Clara River Valley also provides access via the Santa Clara River to the edges of the Mojave Desert and the foothills of the San Gabriel Mountains. While much of the region has been subject to rapid urbanization and historical agricultural and oil development practices, large areas of open space and natural lands border the region. The Los Padres National Forest is located to the north of the Project site, and the Angeles National Forest lies to the north and east of the Project site. The Santa Susana Mountains, a region of gently rolling hills and sharp, steep walled canyons, are south of the Project site and south of the Santa Clara River.

2.4 Watersheds and Hydrology

The Project site is located largely within the Salt Canyon-Santa Clara River watershed, though the far northeastern portion of the Project is located within the Lower Castaic Creek watershed (HUC 12). Waterways in the vicinity include Chiquito Canyon Creek, located approximately 0.15 miles (776 feet) south of the Tract Map Site BSA, and Castaic Creek, located approximately 0.53 miles (2,790 feet) northeast of the Tract Map Site BSA. Chiquito Canyon Creek and Castaic Creek are both tributaries to the Santa Clara River, and the confluence point of both waterways is located approximately 2 miles south of the Project site. The Santa Clara River flows from east to west and discharges into the Pacific Ocean in Ventura County approximately 39 miles west of the Project site.

The majority of the Project site is situated in the upper elevations of the respective watersheds, and as such, the hydrologic features encountered within the Project site consist of first order (according to the Strahler, “top-down” method of stream order classification) tributaries. These upper watershed features vary in size and formation, from discontinuous swales to ephemeral channels, which directly influence the presence of surface hydrologic indicators, including, but not limited to, an ordinary high water mark (OHWM) and a defined bed and bank. However, each feature mapped during the field assessment and presented herein is assumed to have a hydrologic connection to downslope waters within the overall watershed described above.

3 Regulatory Setting

This section outlines the federal, state, and local regulations pertinent to the biological resources located on the Project site. Some of the biological resources that may be affected by the Project are regulated by resource agencies, which often overlap in jurisdiction. This section identifies and discusses the various programs regulating state- and/or federally listed threatened or endangered plants and wildlife, and jurisdictional aquatic/hydrologic features, such as drainages, streambeds, riparian habitat, and wetlands.

3.1 Endangered Species Acts

3.1.1 California Endangered Species Act

CDFW administers the California Endangered Species Act (CESA) (California Fish and Game Code, Sections 2050, et seq.), which prohibits the "take" of plant and animal species designated by the California Fish and Game Commission as endangered or threatened in the state of California. Under CESA, "take" is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" (California Fish and Game Code, Section 86). CESA stipulates that state agencies may not approve projects that will "jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy" (California Fish and Game Code, Section 2053).

CESA defines an "endangered species" as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease" (California Fish and Game Code, Section 2062). CESA defines a "threatened species" as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the Commission as rare on or before January 1, 1985, is a threatened species" (California Fish and Game Code, Section 2067). "Candidate species" are defined as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the Commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the Commission has published a notice of proposed regulation to add the species to either list" (California Fish and Game Code, Section 2068).

CESA addresses the taking of threatened, endangered, or candidate species by stating, "No person shall import into this state, export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the Commission determines to be an endangered species or a threatened species, or attempt any of those acts, except as otherwise provided in this chapter, the Native Plant Protection Act (Fish and Game Code, Sections 1900–1913), or the California Desert Native Plants Act (Food and Agricultural Code, Section 80001)" (California Fish and Game Code, Sections 2080–2085).

Sections 2081(b) and 2081(c) of the California Fish and Game Code authorize take of endangered, threatened, or candidate species if take is incidental to otherwise lawful activity and if specific criteria are met. These criteria are reiterated in California Code of Regulations (CCR), Title 14, Sections 783.4(a) and 783.4(b). These provisions also

require CDFW to coordinate consultations with the USFWS for actions involving federally listed species that are also state-listed species. In certain circumstances, California Fish and Game Code Section 2080.1 allows CDFW to adopt a federal incidental take statement or a Section 10(a) permit as its own based on its findings that the federal permit adequately protects the species and is consistent with state law.

A Section 2081(b) permit may not authorize the take of fully protected species and "specified birds" (California Fish and Game Code, Sections 3505, 3511, 4700, 5050, 5515, and 5517). However, CDFW may authorize take of those species for necessary scientific research, including efforts to recover fully protected, threatened, or endangered species, and may authorize the live capture and relocation of those species pursuant to a permit for the protection of livestock. If a project is planned in an area where a fully protected species or a specified bird occurs, an applicant must design the project to avoid take.

3.1.2 Federal Endangered Species Act

The federal Endangered Species Act (ESA) of 1973 (16 USC 1531 et seq.), as amended, is administered by the USFWS and the National Oceanic and Atmospheric Administration National Marine Fisheries Service. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend and provide programs for the conservation of those species, thus preventing extinction of plants and wildlife. The ESA defines an "endangered species" as "any species that is in danger of extinction throughout all or a significant portion of its range." A threatened species is defined as "any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under the provisions of Section 9(a)(1)(B) of the ESA, it is unlawful to "take" any listed species. "Take" is defined in Section 3(19) of the ESA as, "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." A Final Rule published in the Federal Register on November 8, 1999, further defines "harm" as any act that kills or injures fish or wildlife, and emphasizes that such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns (e.g., nesting or reproduction) of fish or wildlife (64 CFR 60727–60731). Further, USFWS, through regulation, has interpreted the terms "harm" and "harass" to include certain types of habitat modification that result in injury to or death of species, which therefore are defined as forms of take. These interpretations, however, are generally considered and applied on a case-by-case basis and often vary from species to species.

In a case where a property owner seeks permission from a federal agency for an action that could affect a federally listed plant or wildlife species, the property owner and agency are required to consult with USFWS. Take prohibitions in ESA Section 9 (16 USC 1531 et seq.) do not expressly encompass all plants. Property owners may take listed plant species without violating the take prohibition if:

- The proposed development is private and does not require federal authorization or permit.
- There are no special federal regulations under Section 4(d) that prohibit take of the plant species.
- There are no state laws prohibiting take of the plant species.

Section 9(a)(2) of the ESA (16 USC 1531 et seq.) addresses the protections afforded to listed plants. Unlike CESA, the ESA provides protection to invertebrate species by listing them as threatened or endangered.

Issuance of an incidental take permit by the USFWS or National Marine Fisheries Service is a federal action that is subject to ESA Section 7 (16 USC 1531 et seq.). Section 7 stipulates that any federal agency action that may affect a species listed as threatened or endangered requires a formal consultation with USFWS to ensure that the action

is not likely to jeopardize the continued existence of the listed species or result in destruction or adverse modification of designated critical habitat (16 USC Section 1536(a)(2)). A biological opinion issued by the USFWS at the conclusion of the consultation may include authorization for incidental take of a listed species. In the absence of federal agency involvement, habitat conservation plans under ESA Section 10(a)(1)(B) are required as part of the incidental take permit. The ESA prohibits the transportation of endangered plants across state lines or engaging in trade in any listed species, but it does not prohibit the destruction of endangered plants unless they occur on federal land or the plant species is protected by state law.

3.2 Fish and Game Code

According to Sections 3511, 4700, 5550, and 5515 of the California Fish and Game Code, which regulate birds, mammals, herps, and fish, respectively, a "fully protected" species may not be taken or possessed except for scientific purposes, with a permit from the Fish and Game Commission.

Pursuant to Section 3503.5 of the California Fish and Game Code, it is unlawful to take, possess, or destroy any birds of prey, or to take, possess, or destroy any nest or eggs of such birds. "Birds of prey" refer to species in the orders Falconiformes and Strigiformes (and, by extension Accipitriformes, which includes species previously included under Falconiformes). Active nests of all other birds (except house sparrow [*Passer domesticus*], European starling [*Sturnus vulgaris*], and several other non-native species) are similarly protected under Sections 3503 and 3513 of the Fish and Game Code. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by the CDFW. This statute does not provide for the issuance of an incidental take permit.

3.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was originally passed in 1918 and implements four bilateral treaties, or conventions, for the protection of a shared migratory bird resource (16 USC 703–712). The primary motivation for the international negotiations was to stop the "indiscriminate slaughter" of migratory birds by market hunters and others. Each of the treaties protects selected species of birds and provides for closed and open seasons for hunting game birds. The MBTA protects more than 800 species of birds, which are listed in the Code of Federal Regulations (50 CFR 10.13). Two species of eagles that are native to the United States, the bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*), were granted additional protection within the United States under the Bald and Golden Eagle Protection Act (16 USC 668–668d) to prevent the species from becoming extinct.

The MBTA prohibits the "take" of any migratory bird or any part, nest, or eggs of any such bird. Under the MBTA, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so. Additionally, Executive Order 13186, "Responsibilities of Federal Agencies to Protect Migratory Birds," requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations. The Executive Order requires federal agencies to work with the USFWS to develop a memorandum of understanding. The USFWS reviews actions that might affect these species.

3.4 Jurisdictional Water Resources, Waters of the United States/State, Including Wetlands

There are three primary agencies that regulate activities within inland streams, wetlands, and riparian areas in California: the USACE Regulatory Program regulates activities pursuant to Section 404 of the federal Clean Water Act (CWA); CDFW regulates activities under California Fish and Game Code Sections 1600–1616; and the California RWQCB regulates activities under the Porter-Cologne Water Quality Control Act and CWA Section 401. The following discussion provides information on each agency's regulatory program. In addition, Section IV, Appendix G (Environmental Checklist Form), of the CEQA Statutes and Guidelines (14 CCR Section 15000 et seq.) requires an evaluation of impacts which could have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

3.4.1 U.S. Army Corps of Engineers

Pursuant to CWA Section 404, USACE regulates the discharge of dredged and/or fill material into "waters of the United States." The term "waters of the United States" (waters) is defined in the Definition of Waters of the United States in the USACE regulations (33 CFR 328.3(a)) as:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect foreign commerce including any such waters:
    i. which are or could be used by interstate or foreign travelers for recreational or other purposes; or
    ii. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    iii. which are used or could be used for industrial purpose by industries in interstate commerce;
4. All impoundments of waters otherwise defined as waters of the United States under the definition;
5. Tributaries of waters identified in paragraphs (a) (1) through (4) of this section;
6. The territorial seas;
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a)(1) through (6) of this section.

The term "wetlands" (a subset of waters) is defined in 33 CFR Section 328.3(b) as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

In the absence of wetlands, the limits of USACE jurisdiction in non-tidal waters, such as intermittent streams, extend to the OHWM, which is defined in 33 CFR Section 328.3(e) as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving,

changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas."

On April 12, 2020, the U.S. Environmental Protection Agency and the Department of the Army published the Navigable Waters Protection Rule to define "waters of the United States." The definition was streamlined to include four categories of jurisdictional waters, provide clear exclusions for many water features that traditionally have not been regulated, and define terms in the regulatory text. The four categories regulated include:

1. The territorial seas and traditional navigable waters;
2. Perennial and intermittent tributaries to those waters;
3. Certain lakes, ponds, and impoundments; and
4. Wetlands adjacent to jurisdictional waters.

The Navigable Waters Protection Rule also details 12 categorical exclusions, features that are not "waters of the United States," including:

1. Waterbodies that are not included in the four categories of "waters of the United States."
2. Groundwater, including groundwater drained through subsurface Ephemeral Stream systems, such as drains in agricultural lands.
3. Ephemeral features, including ephemeral streams, swales, gullies, rills, and pools.
4. Diffuse stormwater run-off and directional sheet flow over upland.
5. Many farm and roadside ditches.
6. Prior converted cropland. This exclusion will cease to apply when cropland is abandoned (i.e., not used for, or in support of, agricultural purposes in the immediately preceding five years) and has reverted to wetlands.
7. Artificially irrigated areas, including fields flooded for agricultural production, that would revert to upland should application of irrigation water to that area cease.
8. Artificial lakes and ponds, including water storage reservoirs and farm, irrigation, stock watering, and log cleaning ponds, constructed or excavated in upland or in non-jurisdictional waters.
9. Water-filled depressions constructed or excavated in upland or in non-jurisdictional waters incidental to mining or construction activity, and pits excavated in upland or in non-jurisdictional waters for the purpose of obtaining fill, sand, or gravel.
10. Stormwater control features excavated or constructed in upland or in non-jurisdictional waters to convey, treat, infiltrate, or store stormwater run-off.
11. Groundwater recharge, water reuse, and wastewater recycling structures, including detention, retention and infiltration basins and ponds, that are constructed in upland or in non-jurisdictional waters.
12. Waste treatment systems have been excluded from the definition of "waters of the United States" since 1979 and will continue to be exclude under the final rule. Waste treatment systems are defined as:
    - A waste treatment system includes all components, including lagoons and treatment ponds (such as settling or cooling ponds), designed to either convey or retain, concentrate, settle, reduce, or remove pollutants, either actively or passively, from wastewater or stormwater prior to discharge (or eliminating any such discharge).

The Navigable Waters Protection Rule became effective on June 22, 2020. The discharge of dredge or fill material into waters of the United States, including wetlands, requires authorization from USACE prior to impacts.

3.4.2 California Fish and Game Code

Under California Fish and Game Code Sections 1600–1616, CDFW has authority to regulate work that will substantially divert or obstruct the natural flow, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake. CDFW also has authority to regulate work that will deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. This regulation takes the form of a requirement for a Lake or Streambed Alteration Agreement and is applicable to all federal and nonfederal projects.

Per 14 CCR Section 1.72, a "stream" (including creeks and rivers) is "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation."

Per 14 CCR Section 1.56, a "lake" includes "natural lakes or man-made reservoirs." Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the Fish and Game Code.

3.4.3 California Regional Water Quality Control Board

Pursuant to Section 401 of the federal CWA, the RWQCB regulates discharging waste, or proposing to discharge waste, within any region that could affect a "water of the state" (Water Code, Section 13260(a)), pursuant to provisions of the Porter-Cologne Water Quality Control Act. Waters of the state are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (Water Code, Section 13050(e)). Before USACE will issue a CWA Section 404 permit, applicants must receive a CWA Section 401 Water Quality Certification from the RWQCB. If a CWA Section 404 permit is not required for the project, the RWQCB may still require a permit (i.e., Waste Discharge Requirement) under the Porter-Cologne Water Quality Control Act.

In April 2020, the State Water Resources Control Board released Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Water of the State (2020). The procedures define an area as a wetland if, under normal circumstances:

1. The area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both;
2. The duration of such saturation is sufficient to cause anerobic conditions in the upper substrate; and
3. The areas vegetation is dominated by hydrophytes or the area lacks vegetation.

This modified three-parameter definition is similar to the federal definition in that it identifies three wetland characteristics that determine the presence of a wetland: wetland hydrology, hydric soils, and hydrophytic vegetation. Unlike the federal definition, however, the Procedures' wetland definition allows for the presence of hydric substrates as a criterion for wetland identification (not just wetland soils) and wetland hydrology for an area devoid of vegetation (less than 5% cover) to be considered a wetland.

Furthermore, the Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Water of the State (State Water Resources Control Board 2020) includes California Code of Regulations, Title 23, Section 3831(w), which states that "all waters of the United States are also 'waters of the

state.'" This regulation has remained in effect despite Supreme Court decisions such as Rapanos (EPA 2007) and Solid Waste Agency of Northern Cook County and USACE/U.S. Environmental Protection Agency rules such as the Navigable Waters Protection Rule, which limit features that could be considered a water of the United States. Therefore, the regulation reflects the Water Boards intent to include a broad interpretation of waters of the U.S. into the definition of waters of the state. Waters of the state includes features that have been determined by the U.S. Environmental Protection Agency or the USACE to be "waters of the United States." in an approved jurisdictional determination; "waters of the United States" identified in an aquatic resource report certified by the USACE upon which a permitting decision was based; and features that are consistent with any current or historic final judicial interpretation of "waters of the United States" or any current or historic federal regulation defining "waters of the United States."

3.4.4 County of Los Angeles

The Los Angeles County Santa Clarita Valley Area Plan (SCAP; County of Los Angeles 2012) includes goals, objectives, and policies intended to balance the protection of the environment with the social and economic needs within the plan area. Goal CO-3 (Biological Resources) addresses the protection of biological resources via Objective CO-3.1 and Policy CO-3.1.2, which state: "avoid designating or approving new development that will adversely impact wetlands, floodplains, threatened or endangered species and habitat, and water bodies supporting fish or recreational uses, and establish an adequate buffer area as deemed appropriate through site specific review." Further, Objective CO-3.2 and Policy CO-3.2.1 state: "protect wetlands from development impacts, with the goal of achieving no net loss (or functional reduction) of jurisdictional wetlands within the planning area."

3.5 California Environmental Quality Act

CEQA requires identification of a project's potentially significant impacts on biological resources and ways that such impacts can be avoided, minimized, or mitigated. The act also provides guidelines and thresholds for use by lead agencies for evaluating the significance of proposed impacts.

CEQA Guidelines Section 15380(b)(1) defines endangered animals or plants as species or subspecies whose "survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors." A rare animal or plant is defined in CEQA Guidelines Section 15380(b)(2) as a species that, although not presently threatened with extinction, exists "in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens; or … [t]he species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered 'threatened' as that term is used in the federal Endangered Species Act." Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing, as defined further in CEQA Guidelines Section 15380(c).

3.6 Local Laws, Ordinances, Regulations, and Standards

In addition to the federal and state regulations identified above, the following local laws, ordinances, regulations, and standards apply to the environmental review of potential impacts on biological resources as a result of the Project.

3.6.1 Los Angeles County Planning Area

The Project site is located within the SCAP (County of Los Angeles 2012), Castaic Area Community Standards District. The Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and Off-Site Sewer Line Improvement Area BSA are within both the Val Verde Subarea and the Hasley Canyon Subarea. The Off-Site Open Space Area BSA and the Off-Site Water Tank Area BSA are within the Val Verde Subarea. The SCAP (County of Los Angeles 2012) is a component of the Los Angeles County General Plan, which provides a focused framework for development within the Santa Clarita Valley geographic area. The SCAP includes a set of goals and objectives that provide the basis for the policies adopted in the plan. Policies detailed in the SCAP will be incorporated into the Project planning process to provide consistency with regional planning standards.

3.6.2 Los Angeles County Low Impact Development

In addition to the SCAP, Los Angeles Countywide planning efforts related to biological resources include LID standards (County of Los Angeles 2014a). The Project will adhere to these ordinances during the Project planning phase and comply with their specific requirements.

3.6.3 Los Angeles County Oak Woodlands

In response to regulations enacted by the State of California (California Public Resources Code, Section 21083.4), the County of Los Angeles adopted the Los Angeles County Oak Woodlands Conservation Management Plan (Plan) (August 23, 2011; County of Los Angeles 2011) and drafted the Oak Woodlands Conservation Management Plan Guide (Guide) (March 18, 2014; County of Los Angeles 2014b) as an implementing document for the Plan. The purpose of the regulations and the adopted Oak Woodlands Conservation Management Plan is to determine whether the development of a proposed project "may result in a conversion of oak woodlands that will have a significant effect on the environment" (County of Los Angeles 2011). Should the proposed project result in loss of oak woodlands, the County of Los Angeles requires mitigation measures to offset the losses.

3.6.3.1 Los Angeles County Oak Woodlands Conservation Management Plan

The main goal of the Oak Woodlands Conservation Management Plan is to "preserve and restore oak woodlands so they are conserved in perpetuity with no net loss of existing woodlands. There are three important objectives of the Oak Woodlands Conservation Management Plan: prioritize the preservation of oak woodlands, promote conservation by integrating oak woodlands into the development process in a sustainable manner and effectively mitigate the loss of oak woodlands" (County of Los Angeles 2014).

The Oak Woodlands Conservation Management Plan Guide (County of Los Angeles 2014) interprets the Oak Woodlands Conservation Management Plan's definition of an oak woodland as follows: "an oak stand, including its understory, which consists of two or more oak trees of at least five inches in diameter measured at 4.5 feet above mean natural grade, with greater than 10% canopy cover or that may have historically supported greater than 10% canopy cover as early as January 1, 2005."

In accordance with the Oak Woodlands Conservation Management Plan Guide, when a discretionary project site is found to support oak woodlands, an Oak Woodland Report must be submitted to document potential impacts to oak woodlands resulting from the development of that project.

3.6.3.1.1 Tree and Woodland Definitions

Oak tree is defined by the Oak Woodlands Conservation Management Plan as "all native trees of the genus *Quercus.*" This includes small shrubby oaks typically clustered on slopes, as well as individual large oaks that are naturally widely distributed across the landscape. Under California state law, "oaks [that are part of a woodland] greater than 5 inch diameters at standard height (DSH) are also protected" (California Public Resources Code 21083.4a).

Oak stand is defined by the Oak Woodlands Conservation Management Plan as "a group of similar [oak] trees growing in a contiguous pattern, having sufficiently diverse age-class distribution, composition and structure, and growing on a site of sufficiently uniform quality that it is distinguishable as a unit. Stands are a basic physical unit of vegetation in the landscape and do not have a set size."

Oak woodlands are defined by California Fish and Wildlife Code Section 1361.h and by the Oak Woodlands Conservation Management Plan (County of Los Angeles 2011, page 28) as "an oak stand with a greater than 10% canopy cover or that may have historically supported greater than 10% canopy cover." (Ten times an individual oak tree's canopy is considered by the County as representative of the tree's sphere of influence [SOI]; where these SOIs overlap, they are collectively defined as oak woodlands, each having 10% or greater relative cover of oak tree canopy [woodland].)

This document interprets the Oak Woodlands Conservation Management Plan's definition of an oak woodland (County of Los Angeles 2011) as an oak stand, including its understory, that consists of two or more oak trees of at least 5 inches in diameter measured at 4.5 feet above mean natural grade with greater than 10% canopy cover or that may have historically supported greater than 10% canopy cover as early as January 1, 2005 (effective date of California Public Resources Code, Section 21083.4).

Oak Savanna is lightly wooded grassland with oaks as the dominant tree species. The canopy cover of an oak savanna may often be less than 10%, and therefore oak savannas are not necessarily subject to California Public Resources Code, Section 21083.4. Nevertheless, CDFW considers some types of oak savanna to be sensitive CDFW, and these are given consideration as sensitive natural communities under CEQA (see CDFW Natural Communities List [CDFW 2019a] and CEQA Guidelines Appendix G).

3.6.3.1.2 Conditions and Criteria Definitions

- **Intact** – The site is currently in a "wild" state where all ecological functions such as groundwater infiltration, shade, habitat, nutrient cycling, carbon sequestration, wind/noise/dust abatement, and the stand are self-sustaining and regenerating. Understory may be dominated by invasive grasses and forbs. Fire exclusion or frequency may have altered native woodland. Woodland supports associated flora and fauna and is free from destructive land practices that limit long-term persistence.
- **Moderately Degraded** – Even though the site has been altered, oak woodlands persist and retain some of their functions. Natural regeneration is possible, wildlife use still occurs, and some level of ecosystem services is still present. The majority of oak woodlands in the County fall within this category.
- **Severely Degraded** – The site has been drastically altered from the natural condition to accommodate residential, commercial, or industrial uses, and oak woodlands remain in scattered locations. Natural regeneration is not possible. Soil is compacted, contaminated, or paved. Wildlife habitat is limited, and associated understory vegetation has been replaced by managed non-native landscaping.

3.6.3.2 Oak Woodland Guide

The Oak Woodlands Conservation Management Plan Guide focuses on two categories of recommendations to preserve and restore oak woodlands: (1) alterations to the County's development and environmental review process and (2) revisions to the process by which Los Angeles County agencies address impacts to oak woodlands. The Oak Woodlands Conservation Management Plan Guide is intended to implement portions of the Plan and to be a resource for processing development applications for discretionary projects that are not exempt from CEQA and that may impact oak woodlands.

3.6.4 Los Angeles County Oak Tree Ordinance

3.6.4.1 Regulations

The Los Angeles County Oak Tree Ordinance was established to recognize oak trees as significant historical, aesthetic, and ecological resources. The goal of the ordinance is to create favorable conditions for the preservation and propagation of this unique and threatened plant heritage. By making this part of the project development process, healthy oak trees will be preserved and maintained. The Los Angeles County Oak Tree Ordinance applies to all unincorporated areas of the County of Los Angeles.

Under the Los Angeles County Oak Tree Ordinance, a person shall not cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak tree genus that is 8 inches or more in diameter; 4.5 feet above mean natural grade; or, in the case of oaks with multiple trunks, a combined diameter of 12 inches or more of the two largest trunks, without first obtaining a permit.

3.6.4.2 Definitions

Trees subject to County permit requirements include those defined by Title 22.56.2060, as follows:

> Any tree of the oak genus which is (a) 25 inches or more in circumference (eight inches in diameter) as measured four and one-half feet above mean natural grade; in the case of an oak with more than one trunk, whose combined circumference of any two trunks is at least 38 inches (12 inches in diameter) as measured four and one half feet above mean natural grade.

Additionally, the Los Angeles County Oak Tree Ordinance defines the "Protected Zone" of a tree as "that area within the dripline of an oak tree and extending therefrom to a point at least five feet outside the dripline, or 15 feet from the trunks of a tree, whichever distance is greater" (Title 22.56.2060).

For the purposes of determining tree impacts, trees that have protected zones that have been encroached upon would also be considered impacted.

3.6.5 Los Angeles County Fuel Modification Zones

In accordance with Los Angeles County regulations, a 200-foot fuel modification zone will be established and maintained as stipulated in County of Los Angeles Fire Department Fuel Modification Guidelines (Los Angeles County Fire Department 2011). Fuel modification in Zones A and B (0–100 feet from future structures) will occur within an irrigated and maintained buffer and in Zone C (100–200 feet from future structures) in an unirrigated "thinning zone" to selectively thin vegetation, as determined to be necessary based on a site assessment by fire suppression professionals.

4 Methods

Dudek conducted a literature review and subsequent reconnaissance-level and focused surveys to determine the presence or potential presence of sensitive biological resources on the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, the Off-Site Water Tank Area BSA, the Off-Site Water Line Improvement Area BSA, and the Off-Site Sewer Line Improvement Area BSA. This section describes the literature review, methods of field surveys, and survey limitations.

4.1 Literature Review

According to California Fish and Game Code Sections 3511, 4700, 5550, and 5515 , which regulate birds, mammals, amphibians, reptiles, and fish, respectively, a "fully protected" species may not be taken or possessed except for scientific purposes, with a permit from the Fish and Game Commission.

Prior to conducting the field investigation, Dudek conducted a review of the existing biological resources and species within the vicinity of the survey area using the CDFW California Natural Diversity Database (CNDDB) and the California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants. Dudek obtained special-status species and sensitive vegetation community occurrence data from the above sources by querying records within the Val Verde USGS quadrangle map and the eight quadrangles surrounding the Project site, including the Cobblestone Mountain, Whitaker Peak, Warm Springs Mountain, Piru, Newhall, Simi, Santa Susana, and Oat Mountain USGS quadrangle maps. USFWS Information, Planning, and Consultation (IPaC) and Critical Habitat and Occurrence Data also assisted in determining other species present in the region with potential to occur on site. Dudek reviewed the following available resources to assess the potential for biological and aquatic resources within the Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, Off-Site Open Space Area BSA, and Off-Site Water Tank Area BSA and vicinity:

- CDFW CNDDB (CDFW 2018a, 2020a)
- CNPS Inventory of Rare and Endangered Plants (CNPS 2018, 2020)
- List of potentially occurring listed species generated from a review of the USFWS's IPaC Trust Resources Report (USFWS 2017, 2020a) list of federal and threatened species
- USFWS Critical Habitat and Occurrence Data (USFWS 2018a)
- Los Angeles County Sensitive Bird Species (Audubon 2009)
- USGS National Hydrography Dataset (USGS 2017b, 2020a)
- USFWS National Wetlands Inventory (USFWS 2018b, 2020b)
- StreamStats (USGS 2017c)
- U.S. Department of Agriculture, Natural Resources Conservation Service Web Soil Survey (USDA 2021)

Prior environmental documents prepared for the Project provided information on biological resource constraints previously identified. Prior documents reviewed include:

- Rare Plant Surveys, Sterling Residential Site, Los Angeles County, California (FLx 2014)
- Submittal of 45-Day Report for Coastal California Gnatcatcher Surveys for the Industrial Portion of Green Valley Ranch, a 100-Acre Property in the City of Valencia, Los Angeles County, California (Glenn Lukos 2007)

4.2 Biological Field Surveys

Dudek biologists completed habitat suitability assessments, vegetation mapping, focused botanical and special-status plant species surveys, focused surveys for coastal California gnatcatcher and burrowing owl, and aquatic resource delineation surveys within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA to gain a clear understanding of natural resources present and to identify those species with potential to occur based on the habitats present. Each of the surveys included an inventory of the plant and wildlife species encountered. Biologists documented the presence of special-status species, but negative surveys were not considered confirmation of absence.

The 164.8 acres are composed of the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, Off-Site Water Tank Area BSA, Off-Site Water Line Improvement Area BSA, Off-Site Sewer Line Improvement Area BSA, and the Off-Site Open Space Area BSA includes the proposed residential development area as well as improved recreational open space and preserved open space areas, as shown on Figure 2A, Figure 2B, and Figure 2C. The 2.8-acre Off-Site Water Tank Area BSA includes the one million gallon-water tank and the surrounding hillsides for cut and hillside stabilization required for the water tank protection per Los Angeles County building codes, as shown on Figure 2B. The 3.1 acres of Off-Site Water Line Improvement Area BSA and Off-Site Sewer Line Improvement Area include a proposed water line and sewer line within the existing Del Valle Road and Hasley Canyon Road roadways, as shown on Figure 2C.

Survey methodologies are detailed below. During surveys, biologists walked the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA and recorded visual and audial observations. Table 1 provides the dates, times, site conditions, and observations for each survey.

4.2.1 Vegetation Community and Land Cover Mapping

In 2003, the Vegetation Classification and Mapping Program of the CDFW, Wildlife and Habitat Data Analysis Branch, published the List of California Terrestrial Natural Communities Recognized by the CNDDB; the list was updated in 2011 (CDFG 2011). In September 2010, CDFW published the Natural Communities List (CDFG 2010), which used the scientific name of the dominant species in that alliance as the alliance name, and that was based on the Manual of California Vegetation, Second Edition (Sawyer et al. 2009). These classification systems focused on a quantified, hierarchical approach that included both botanical (plant species) and physiognomic (community structure and form) factors as currently observed (as opposed to predicting climax or successional stages). After Dudek conducted field work for vegetation mapping in 2017, CDFW updated the Natural Communities List in its California Natural Communities List (CDFW 2019a), which incorporated changes based on taxonomic revisions related to dominant plants, reassignment of associations to new or different alliances, and revisions to the rarities rankings of some communities. Therefore, nomenclature for on-site vegetation communities reflects the most current system, found in the Manual of California Vegetation and the updated Natural Communities list (CDFW 2019a). All vegetation communities were mapped based on these sources.

Vegetation mapping was conducted within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in May 2017, in conjunction with the initial focused botanical and special-status plant species survey, and updated in February 2020. The Off-Site Water Tank Area BSA vegetation mapping was conducted in February 2020, as shown in Table 1. All mapping was performed in the field, through interpretation of field maps with a high quality aerial photographic base and/or delineation using a Trimble Geo XT GPS unit capable of submeter accuracy for all sensitive vegetation. Additionally, ESRI Collector was used for vegetation mapping. The maximum scale of the field map was 200-scale (1-inch = 200-foot) base. The GPS data was downloaded into geographic information system (GIS) ArcView for placement onto an aerial figure. In combination with the GPS data, GIS technicians digitized the delineated vegetation boundaries from field maps using ArcView to create the vegetation community map.

4.2.2 Flora

All plant species encountered during the field surveys were identified to subspecies or variety, if possible. Species that could not be identified in the field were brought into the laboratory for further investigation. Scientific and common names for plant species with a California Rare Plant Rank (CRPR; formerly CNPS List) follow the CNPS On-Line Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2020b). For plant species without a CRPR, scientific names follow the Jepson Interchange List of Currently Accepted Names of Native and Naturalized Plants of California (Jepson Flora Project 2020) and common names follow the California Natural Community List (CDFW 2019a) or the U.S. Department of Agriculture, Natural Resources Conservation Service State Plants Checklist (USDA 2020).

4.2.3 Fauna

Biologists recorded all wildlife species detected during field surveys by sight, calls, tracks, scat, or other signs. Scientific and common names for vertebrate species referred to in this report follow Crother (2017) for amphibians and reptiles, American Ornithological Society (AOS 2018) for birds, and Wilson and Reeder (2005) for mammals.

4.2.4 Special-Status and/or Regulated Resources

Special-status biological resources are those defined as follows: (1) species that have been given special recognition by federal, state, or local resource agencies and environmental organizations due to limited, declining, or threatened population sizes; (2) species and habitat types recognized by local and regional resource agencies as special-status; (3) habitat areas or vegetation communities that are unique, are of relatively limited distribution, or are of particular value to wildlife; (4) wildlife corridors and habitat linkages; and (5) USACE jurisdictional waters of the United States (including wetlands), CDFW jurisdictional streams, and waters of the state subject to the permitting authority of the RWQCB.

In addition to state, federal, and Los Angeles County special-status designations, the CNPS (2017) assigns a CRPR to designate the degree of concern for and rarity of plant taxa in California. Special-status plants are assigned to one of six CRPR categories.

CRPR 1A: Plants presumed extirpated in California and either rare or extinct elsewhere

CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere

CRPR 2A: Plants extirpated in California, but common elsewhere

CRPR 2B: Plants rare, threatened, or endangered in California, but more common elsewhere

CRPR 3: Plants about which more information is needed – A Review List

CRPR 4: Plants of limited distribution – A Watch List

In addition to the CRPR, CNPS assigns threat categories to the lists as follows:

> 0.1—Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat) (e.g., 1B.1 would be a plant rare, threatened, or endangered in California and elsewhere and more than 80% of the occurrences threatened or with a high degree of threat).
>
> 0.2—Moderately threatened in California (20% to 80% of occurrences threatened/moderate degree and immediacy of threat)
>
> 0.3—Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

The CNPS rarely assigns a threat category of 0.1 to CRPR 4 plants because they generally have large enough populations to not be significantly threatened in California.

4.2.4.1 Oak Woodlands

The complete Oak Woodland Report for the Sterling Ranch Estates Project is included in Appendix A. Below is a summary of the methods.

4.2.4.1.1 Oak Woodland Assessment Methodology

A field survey to assess and record the condition of the oak woodlands was conducted over several days between February 12, 2020, and July 8, 2020, by Dudek International Society of Arboriculture (ISA) Certified Arborist Ryan Allen and Dudek Biologists Heather Moine, Andrea Dransfield, Mackenzie Forgey, and Tracy Park. Information collected during the survey (Dudek 2020) and discussed includes the following:

- The condition of the oak woodlands, including oak species present, age classes of oaks present, understory vegetation, and surrounding vegetation communities
- The presence and/or potential occurrence of special-status species
- Potential project impacts to the surveyed woodlands

Dudek mapped tree locations for all woodlands located on the Project site (Appendix A, Figure 3, Tree Locations). Tree mapping was conducted using a Trimble Pathfinder Pro XH GPS receiver with H-Star Technology. Since tree canopies can sometimes cause loss of satellite lock by blocking the line-of-sight to satellites, an electronic compass and reflectorless, electronic distance-measuring device were also used in mapping tree locations. The reflectorless, electronic distance-measuring device/compass combination operates in concert with the Pathfinder system to position offsets, and offset information is automatically attached to the GPS position data string. The electronic tree locations were then evaluated using ArcView 10.4 software to determine the position of the trees related to the Project development footprint.

Tree trunk diameters were measured using a diameter tape providing adjusted figures[1] for diameter measurements when wrapping the tape around an object's circumference. Diameter measurements were taken using protocols provided by the Council of Tree and Landscape Appraisers in the Guide for Plant Appraisal (ISA 2020). The trunk diameter measurement of each tree was taken at 4.5 feet above the ground along the trunk axis, with common

[1] Inches divided by 3.14 (π) provide diameter measurement in inches.

exceptions. For example, in cases where a tree's trunk was located on a slope, the 4.5-foot distance was approximated as the average of the shortest and longest sides of the trunk (i.e., the uphill side and downhill side of a tree's trunk, respectively), and the measurement was made at this point. Tree height was visually estimated by experienced tree surveyors.

Tree canopy diameters were typically estimated by "pacing off" the measurement based on the investigator's knowledge of their stride length or by visually estimating the canopy width. The crown diameter measurements were made along an imaginary line intersecting the tree trunk that best approximated the average canopy diameter.

4.2.4.1.2 Oak Woodlands Mapping Methodology

According to the Oak Woodlands Conservation Management Plan, in addition to assessing the oak woodland condition, an accurate estimation of the woodland area is needed to evaluate oak woodlands. The Oak Woodlands Conservation Management Plan Guide requires that a map depicting the proximity of project development to the on-site oak woodlands' SOI be used to determine impacts resulting from the proposed project (Appendix A, Figure 4, Vegetation Communities and Land Cover Types. The Oak Woodlands Conservation Management Plan defines the SOI as the total area of the subject canopy multiplied by 10 (or 3.2 times the radius). The Oak Woodland Report provides survey results for the oak woodlands with SOIs within 200 feet of the limits of Project disturbance activities.

4.2.4.2 Focused Surveys for Special-Status Plant Species

Prior to field surveys, Dudek reviewed the report of a previous special-status plant survey, Rare Plant Species Surveys for the Sterling Residential Site completed by FLx (2014). The FLx report included a detailed inventory of the plant species present within the Project site and detailed the identification of two special-status plant species within the Project site: slender mariposa lily (*Calochortus clavatus* var. *gracilis*) and Peirson's morning glory (*Calystegia peirsonii*), as well as location information for slender mariposa lily. FLx (2014) identified no other special special-status plant species.

Based on the literature review, Dudek identified special-status plant species that had occurred, or that could occur, within or in the vicinity of the Project site. Dudek biologists familiar with the target special-status plant species and general flora of the northern Los Angeles County and Santa Clarita Valley regions conducted seasonally timed focused surveys of the Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, and Off-Site Open Space Area BSA in May and July 2017. Additionally, in May 2020 Dudek biologists familiar with the target special-status plant species and general flora of the northern Los Angeles County and Santa Clarita Valley regions conducted seasonally timed focused surveys of the Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, Off-Site Water Tank Area BSA, Off-Site Water Line Improvement Area BSA, and Off-Site Sewer Line Improvement Area BSA.

The focused botanical surveys were conducted in accordance with the Cypher, CDFW, and CNPS guidelines (Cypher 2002; CDFW 2018b; CNPS 2001). These surveys involved pedestrian transects spaced approximately 20 to 30 meters (66 to 98 feet) apart, depending on topography and vegetative cover. During the surveys, when a special-status plant species was observed, the occurrence was mapped using sub-meter accuracy GPS equipment.

4.2.4.3 Oak Trees

Dudek performed two separate oak tree inventories and evaluations for oak trees within the Project site; as such, the reports are discussed separately.

4.2.4.3.1 Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area Oak Trees

The complete Oak Tree Report for the Sterling Ranch Estates Project, which includes the Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area, is included in Appendix B. Below is a summary of the methods.

Dudek conducted an individual tree evaluation documenting the locations for all oak trees within the Tract Map Site BSA, Off-Site Open Space Area BSA, and Off-Site Roadway Improvement Area BSA. All inventoried and assessed protected trees were tagged with an aluminum tag bearing a unique identification number, which was placed on the trunk of each tree. The trunk diameter, canopy diameter, crown diameter, and composite trunk diameters were recorded. Tree health and structure was evaluated with respect to five distinct tree components: roots, trunk, scaffold branches, small branches, and foliage. Tree impacts were determined by conducting a spatial analysis of individual tree locations and canopy extents visible in Project aerial imagery in relation to the proposed site development plan. Additionally, as allowed under Municipal Code Section 22.56.2140, Dudek ISA-certified arborists calculated the appraised value for each inventoried protected tree identified for removal according to the Guide for Plant Appraisal (ISA 2020).

4.2.4.3.2 Off-Site Water Tank Area Oak Trees

The complete Oak Tree Report for the Sterling Ranch Estates Project, Off-Site Water Tank Area is included in Appendix C. Below is a summary of the methods.

Dudek conducted an individual tree evaluation documenting the locations for all oak trees within the Off-Site Water Tank Area BSA. All inventoried and assessed protected trees were tagged with an aluminum tag bearing a unique identification number, which was placed on the trunk of each tree. The trunk diameter, canopy diameter, crown diameter, and composite trunk diameters were recorded. Tree health and structure was evaluated with respect to five distinct tree components: roots, trunk, scaffold branches, small branches, and foliage. Tree impacts were determined by conducting a spatial analysis of individual tree locations and canopy extents visible in Project aerial imagery in relation to the proposed site development plan. Additionally, as allowed under Municipal Code Section 22.56.2140, Dudek ISA-certified arborists calculated the appraised value for each inventoried protected tree identified for removal according to the Guide for Plant Appraisal (ISA 2020).

4.2.4.4 Burrowing Owl Habitat Assessment and Breeding Season Survey

Qualified Dudek wildlife biologists conducted a habitat assessment for burrowing owls within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in May 2017 in conjunction with the initial focused botanical and special-status plant species survey, as shown in Table 1. The habitat assessment was conducted following the guidelines in Appendix C of the Staff Report on Burrowing Owl Mitigation (CDFG 2012). Based on the results of the habitat assessment, focused breeding season surveys were conducted in 2018 following the protocol in Appendix D of the Staff Report on Burrowing Owl Mitigation (CDFG 2012). The Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA included the entirety of the BSAs; however, due to access limitations, the adjacent properties were not included in the surveys. Surveys focused on those areas considered as suitable habitat, which typically includes short or sparse vegetation; presence of burrows, burrow surrogates, or fossorial mammal dens; well-drained soils; and abundant and available prey.

Qualified Dudek wildlife biologists conducted a habitat assessment for burrowing owls within the Off-Site Water Tank Area BSA in February 2020 in conjunction with vegetation mapping, as shown in Table 1. The habitat assessment was conducted following the guidelines in Appendix C of the Staff Report on Burrowing Owl Mitigation (CDFG 2012). No additional burrowing owl surveys were conducted for the Off-Site Water Tank Area BSA due to the results of the habitat assessment.

4.2.4.5 Coastal California Gnatcatcher Protocol Survey

Qualified Dudek wildlife biologists conducted a habitat assessment for coastal California gnatcatcher within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in May 2017 in conjunction with the initial focused botanical and special-status plant species survey, as shown in Table 1. Based on the results of the habitat assessment, focused breeding season surveys were conducted in 2018 following the currently accepted protocol of the USFWS Coastal California Gnatcatcher (*Polioptila californica californica*) Presence/Absence Survey Protocol (USFWS 1997). The focused surveys for gnatcatcher were conducted between March 29 and June 22, 2018, by Dudek Biologist Melissa Blundell (TE-97717A) and between April 30 and June 30, 2020, by Dudek Biologists Melissa Blundell (TE-97717A), Tommy Molioo (TE-02412D), and Jeffrey Priest (TE-840619). The surveys included six survey passes at a minimum of 7-day intervals. Full survey methodology is included in the 2018 and 2020 reports prepared and submitted to the USFWS documenting the results of the protocol-level surveys, which are included herein as Appendix D and Appendix E, respectively.

4.2.4.6 Wetland Delineation and Jurisdictional Determination

Dudek reviewed hydrologic features that would likely be subject to the jurisdiction of the USACE, RWQCB, and CDFW within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA. The effort included a formal wetland delineation in October 2016 and follow-up delineation field assessments in January 2017 to define and characterize the jurisdictional waters present within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA. The hydrologic features delineated on site are potentially regulated by the USACE acting under CWA Section 404, the RWQCB acting under CWA Section 401 and the Porter-Cologne Act, and the CDFW acting under California Fish and Game Code Sections 1600–1607. The hydrophytic vegetation, hydric soils, and hydrology indicators detailed below provide the basis for the determination of potential waters of the United States and state subject to the jurisdiction of the USACE, RWQCB, and CDFW.

The Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA wetland delineation was conducted in accordance with the procedures of the Corps of Engineers Wetlands Delineation Manual (USACE 1987), the Department of the Army Clarification and Interpretation of the 1987 USACE Wetland Delineation Manual (DOA 1992), and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2*)* (USACE 2008a). Wetland vegetation, if present, would be classified by Cowardin et al. (1979) and Sawyer et al. (2009). Wetland areas under the jurisdiction of the USACE are defined by the presence of hydric soils, hydrophytic vegetation, and wetland hydrology. Non-wetland waters of the United States, potentially under USACE jurisdiction, are defined by the presence of an OHWM. Identification of the OHWM followed the A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States (USACE 2008b), where present. In addition to water of the United States, riparian vegetation associated with a stream channel (above the OWHM) and the portion of channels/streams above the OHWM up to the top of bank is regulated by CDFW and RWQCB. Also, per a site visit with CDFW, swales, which do not support an OHWM, are regulated by CDFW.

In February 2020, Dudek biologists assessed the Off-Site Water Tank Area BSA for potential jurisdictional resources. This assessment included surveying the site for hydrophytic vegetation, hydric soils, hydrology, and OHWM indicators. Based upon the existing conditions, a formal wetland delineation was not performed.

4.2.4.6.1 Hydrophytic Vegetation

Seasonal changes in species composition, land-use practices, and other natural disturbances can adversely affect the process for wetlands vegetation determination. In normal situations, a sample point is considered positive for hydrophytic vegetation if it passes the basic dominance test (Indicator 1), meaning that more than 50% of the dominant species sampled were characterized as either obligate, facultative wetland, and/or facultative per the Arid West 2016 Regional Wetland Plant List (Lichvar et al. 2016). At each seasonal feature sample point, absolute cover and dominance of each observed plant species was recorded. A description of the hydrophytic vegetation categories is provided in Table 2.

Table 2. Hydrophytic Vegetation Indicator Categories

Indicator Status	Definition
OBL (Obligate Wetland Plants)	Almost always occur in wetlands. With few exceptions, these plants (herbaceous or woody) are found in standing water or seasonally saturated soils (14 or more consecutive days) near the surface.
FACW (Facultative Wetland Plants)	Usually occur in wetlands but may occur in non-wetlands. These plants predominately occur with hydric soils, often in geomorphic settings where water saturates the soils or floods the soil surface at least seasonally.
FAC (Facultative Plants)	Occur in wetlands and non-wetlands. These plants can grow in hydric, mesic, or xeric habitats. The occurrence of these plants in different habitats represents responses to a variety of environmental variables other than just hydrology, such as shade tolerance, soil pH, and elevation, and they have a wide tolerance of soil moisture conditions.
FACU (Facultative Upland Plants)	Usually occur in non-wetlands but may occur in wetlands. These plants predominately occur on drier or more mesic sites in geomorphic settings where water rarely saturates the soils or floods the soil surface seasonally.
UPL (Upland Plants)	Almost never occur in wetlands. These plants occupy mesic to xeric non-wetland habitats. They almost never occur in standing water or saturated soils. Typical growth forms include herbaceous, shrubs, woody vines, and trees.
NI (No Indicator)*	Not included on list of hydrophytic vegetation, does not occur in wetlands in the region specified.

Note:
* Not included in Lichvar et al. 2012

4.2.4.6.2 Hydric Soils

The presence of hydric soils was determined in accordance with the Corps of Engineers Wetlands Delineation Manual (USACE 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008a). During the wetland delineation field assessment, the Field Indicators of Hydric Soils in the United States version 8.1 (USDA 2017) was used as a guide for determining the presence or absence of hydric soil indicators at each of the sample points. According to the National Technical Committee for Hydric Soils, hydric soils are "soils that are formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (59 CFR Sections 35680–35681).

Where feasible, soil pits were excavated to depths of approximately 18 to 20 inches. When soils were not naturally moist, per the Field Indicators of Hydric Soils in the United States version 8.1 (USDA 2017), delineators moistened the samples to assess the soil color under optimal conditions. Munsell Soil-Color Charts were used to determine soil chroma and value (Munsell 2009). Excavated soils were examined for evidence of hydric conditions, including low chroma values and redoximorphic features, vertical streaking, sulfidic odor, gleyed soils, and high organic matter content in the upper horizon. Soils from test pits were determined to be hydric if found to support positive indicators defined in the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008a) and the Field Indicators of Hydric Soils in the United States version 8.1 (USDA 2017). Additionally, evidence of previous ponding or flooding was assessed along with the slope, local topography, existing landform characteristics, and soil material/composition, in order to determine if hydric soils were present.

4.2.4.6.3 Hydrology

Per the guidelines prescribed in the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008a), wetland hydrology indicators are separated into four major groups: A, B, C, and D. Group A indicators are based on direct observations of surface flow, ponding, and soil saturation/groundwater. Group B indicators consist of evidence that the site has been or is currently subjected to ponding including, but not limited to, water marks, drift deposits, aquatic invertebrates, and sediment deposits. Group C indicators include signs of previous and/or current saturation including oxidized rhizospheres surrounding living roots and the presence of reduced iron or sulfur, both of which are indicative of extended periods of soil saturation. Group D indicators consist of "vegetation and soil features that are indicative of current rather than historic wet conditions and include a shallow aquitard and results of the FAC-Neutral test." Each group is subdivided into primary and secondary categories based on their frequency and probability to occur in the Arid West region.

4.2.5 Survey Limitations

The 2017 focused botanical survey was completed in the spring and summer following an above-average rain year (NOAA 2020). The 2020 focused botanical survey was completed in the spring and summer following an average rain year (NOAA 2020). The surveys were conducted during the known blooming period for target species and were timed to coincide with peak blooming based on regional conditions. Focused wildlife surveys completed in 2018 and 2020 were conducted during daylight hours under weather conditions that allowed for quality biological observations (e.g., surveys were not conducted during rain). Because surveys were conducted during the day, the likelihood of detecting nocturnal and crepuscular species, such as many mammal species, was relatively low. Negative results for species that were not the subject of focused surveys should not be interpreted as indicating those species are absent.

The Oak Woodland Report is provided in Appendix A. The report includes an introduction, regulatory setting, methods, results, impacts, required mitigation, and conclusion. Oak woodland survey information has not fully been included in this report, and therefore the Oak Woodland Report should be referenced for information regarding the oak woodlands.

Oak tree surveys were performed for the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA and the Off-Site Water Tank Area BSA. The Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, and Off-Site Open Space Area BSA oak tree survey results are included in the Oak Tree Report for the Sterling Ranch Estates Project, provided in Appendix B. The Off-Site Water Tank Area BSA oak tree survey results are included in the Oak Tree Report for the Sterling Ranch Estates Residential Project, Off-Site Water Tank Area, provided in Appendix C. Each report includes an introduction, methods, observations, regulatory definitions and requirements, impacts, mitigation, tree protection measures, and conclusion. Oak trees survey information has not fully been included in this report; therefore, the two oak tree reports should be referenced for information regarding oak trees.

INTENTIONALLY LEFT BLANK

5 Results

This section discusses results of the literature review and focused surveys conducted by Dudek biologists in 2016, 2017, 2018, and 2020, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys. The Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA boundary for each focused survey is shown on Figure 2A, the Off-Site Water Tank Area BSA boundary is shown on Figure 2B, and the Off-Site Water Line Improvement Area BSA and Off-Site Sewer Line Improvement Area BSA are shown on Figure 2C. Cumulative lists of plant species and wildlife species are included in Appendix F and Appendix G, respectively. Photo documentation collected during the field surveys is provided in Appendix H.

5.1 Vegetation Communities and Land Cover Types

This section describes the vegetation communities and wildlife habitats identified in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank BSA as shown on Figure 3A and Figure 3B, respectively. The Off-Site Water Line Improvement Area BSA and Off-Site Sewer Line Improvement Area BSA are shown in Figure 3C. A total of 18 vegetation communities, identified in A Manual of California Vegetation, Second Edition (Sawyer et al. 2009), and Natural Communities List (CDFW 2019a), were mapped during field surveys. Two land cover types characterized as disturbed habitat and urban/developed were also mapped in association with built area and anthropogenic influence. These vegetation communities and land cover types are described below. Vegetation communities encompassed by these physiognomic and physical location types are summarized in Table 3 and described further below.

Notes:
SNA = Semi-Natural Alliance and Semi-Natural Association.
For alliances with state ranks of S1-S3, all associations within them are considered highly imperiled, Sensitive. A question mark (?) denotes an inexact numeric rank due to insufficient samples over the full expected range of the type, but existing information points to this rank (CDFW 2019a).
Coast live oak woodland designated as sensitive by the Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011).

[a] Some totals may appear to be off due to rounding.
[b] A total of 0.03 acres of oak woodlands were mapped at the Water Tank Area according to A Manual of California Vegetation, Second Edition (Sawyer et a. 2009); however, in accordance with Los Angeles County Oak Woodlands Conservation Management Plan Guide (Los Angeles County 2014) there are a total of 0.65 acres of oak woodlands of which there are 0.61 acres of significant impacts to oak woodlands within OW2 and OW3.
[c] The Off-Site Water Tank Area contains 0.03 acres of Schinus molle Association – Ailanthus altissima Semi-natural Association – Eucalyptus (globulus, camaldulensis) Provisional Semi-natural Association.
[d] The Off-Site Water Tank Area contains 0.05 acres of bush mallow scrub (*Malacothamnus fasciculatus – Malacothamnus* spp.) Alliance.
[e] The Off-Site Roadway Improvement Area contains 0.04 acres of Purple sage scrub (*Salvia leucophylla*) Alliance.
[f] The Off-Site Sewer Line Improvement Area contains 0.006 acres of wild oats and annual brome grasslands (*Avena* spp. – *Bromus* spp.) Semi-Natural Alliance
[g] The Off-Site Roadway Improvement Area contains 0.04 acres of Urban/Developed.
[h] The Off-Site Sewer Line Improvement Area contains 0.00003 acres of Disturbed Habitat

5.1.1 Natural Vegetated Communities

5.1.1.1 Woodlands

5.1.1.1.1 Coast Live Oak Woodland (*Quercus agrifolia*) Alliance

The coast live oak woodland alliance vegetation community is characterized by coast live oak (*Quercus agrifolia*) being the dominant or co-dominant tree in the canopy. This alliance has an open to continuous canopy less than 30 meters (98 feet) in height, with a sparse to intermittent shrub canopy and a sparse or grassy ground layer. Coast live oak woodlands occur on alluvial terraces, canyon bottoms, stream banks, slopes, and flats. Soils are deep, sandy, or loamy with high organic matter (Sawyer et al. 2009).

Coast live oak woodlands occur in four patches within the Off-Site Water Tank Area BSA, as shown on Figure 3B. Coast live oak is the only tree species present within the vegetation community; however, a variety of herbaceous species are present. In accordance with a Manual of California Vegetation, Second Edition (Sawyer et al. 2009), mapping standards, coast live oak woodlands comprise 0.3 acres of the Off-Site Water Tank Area BSA. However, oak woodlands are defined and mapped in accordance with Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011), and as such, the following paragraph provides how the oak woodlands are mapped and defined when compared to using Manual of California Vegetation, Second Edition (Sawyer et a. 2009).

The coast live oak woodland alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). The Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011) designates coast live oak woodlands as a sensitive vegetation community. In accordance with the Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011), oak woodlands are mapped differently than mapped using Manual of California Vegetation, Second Edition (Sawyer et al. 2009), resulting in 0.65 acres of oak woodlands, of which there are 0.61 acres of significant impacts to oak woodlands within OW2 and OW3. The Oak Woodland Report has been prepared and is provided in Appendix A, and results are further described in Section 5.4.1.1.

5.1.1.1.2 *Ailanthus altissima - Eucalyptus* (*globulus, camaldulensis*) - *Schinus molle* Semi-Natural Association

The *Ailanthus altissima – Eucalyptus* (*globulus*, *camaldulensis*) – *Schinus molle* semi-natural association is a combined association made up of the individual tree alliances. *Ailanthus altissima* is the tree of heaven semi-natural alliance characterized by tree of heaven (*Ailanthus altissima*) being the dominant tree in the canopy less than 60 meters (197 feet) in height with an open to continuous canopy. *Eucalyptus* (*globulus*, *camaldulensis*) is the eucalyptus semi-natural alliance characterized by *Eucalyptus* spp. being the dominant tree in the canopy less than 60 meters (197 feet) in height with an open to continuous canopy. *Schinus molle* is the pepper tree semi-natural alliance characterized by pepper tree (*Schinus molle*) being the dominant tree in the canopy less than 18 meters (59 feet) in height with an open to continuous canopy (Sawyer et al. 2009).

The *Ailanthus altissima – Eucalyptus* (*globulus*, *camaldulensis*) – *Schinus molle* semi-natural association occurs in three patches within the Tract Map Site BSA and one patch within the northwest portion of the Off-Site Water Tank Area BSA, as shown on Figure 3A and Figure 3B, respectively. Tree of heaven, eucalyptus, and pepper tree are the only tree species present within the vegetation community; however, a variety of herbaceous species are present.

Ailanthus altissima – Eucalyptus (*globulus*, *camaldulensis*) – *Schinus molle* comprises 0.5 acres of the Tract Map Site BSA and 0.0 acres (rounded from 0.03 acres) of the Off-Site Water Tank Area BSA.

Ailanthus altissima – Eucalyptus (*globulus*, *camaldulensis*) – *Schinus molle* are non-native and are not ranked as sensitive by CDFW (2019a). Los Angeles County does not designate *Ailanthus altissima – Eucalyptus* (*globulus*, *camaldulensis*) – *Schinus molle* as a sensitive vegetation community.

5.1.1.2 Riparian

5.1.1.2.1 Arroyo Willow Thickets (*Salix lasiolepis*) Alliance

The arroyo willow thickets alliance includes arroyo willow (*Salix lasiolepis*) as the dominant or co-dominant species in the tall shrub or low tree canopy (Sawyer et al. 2009). Arroyo willow thickets have an open to continuous canopy less than 10 meters (33 feet) in height with an open to continuous shrub layer with a variable herbaceous layer. Arroyo willow thickets occur on stream banks and benches, slope seeps, and stringers along drainages (Sawyer et al. 2009). Arroyo willow thickets occur in one patch in the northern portion of the Tract Map Site BSA, as shown on Figure 3A. Arroyo willow thickets comprise 0.1 acres of the Tract Map Site BSA.

The arroyo willow thickets alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate arroyo willow thickets as a sensitive vegetation community. This vegetation community is associated with an ephemeral channel and is mapped as a riparian plant community. As such, this community is under the jurisdiction of CDFW as a riparian habitat associated with a jurisdictional stream.

5.1.1.2.2 Mulefat Thickets (*Baccharis salicifolia*) Alliance

The mulefat thickets alliance includes mulefat (*Baccharis salicifolia*) as the dominant or co-dominant species in the shrub canopy. Mulefat thickets have a continuous shrub canopy less than 5 meters (16 feet) in height. The herbaceous layer is sparse. Mulefat thickets occur on both seasonally and intermittently flooded habitats, and these stands are inherently variable based on seasonal inundation and scouring (Sawyer et al. 2009).

FIGURE 3C

Off-Site Water Line Improvement Area and Off-Site Sewer Line Improvement Area Vegetation Communities and Land Cover Types

Biological Technical Report for the Sterling Ranch Estates Residential Project

INTENTIONALLY LEFT BLANK

Mulefat thickets occur in one patch immediately adjacent to the arroyo willow thickets vegetation community in the northern portion of the Tract Map Site BSA, as shown on Figure 3A. Mulefat is the only shrub species present within the vegetation community; however, a variety of herbaceous species are present, including tarragon (*Artemisia dracunculus*), shortpod mustard (*Hirschfeldia incana*), silverleaf phacelia (*Phacelia hastata* var. *hastata*), and California goosefoot (*Chenopodium californicum*). Mulefat thickets comprise 0.1 acres of the Tract Map Site BSA.

The mulefat thickets alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate mulefat thickets as a sensitive vegetation community. This vegetation community is associated with an ephemeral channel and is mapped as a riparian plant community. As such, this community is under the jurisdiction of CDFW as a riparian habitat associated with a jurisdictional stream.

5.1.1.2.3 *Rhus trilobata* Association

The *Rhus trilobata* association includes basket bush (*Rhus aromatica*; previously named *Rhus trilobata*) as the dominant species in the shrub canopy. Basket bush has an intermittent continuous shrub canopy less than 5 meters (16 feet) in height and the herbaceous layer is sparse to intermittent. Basket bush occurs on floodplains, stream banks, river terraces, washes, swales, shallow valleys, or upland topography (Sawyer et al. 2009).

Basket bush occurs in two patches, one of which is along the northern boundary of the Tract Map Site BSA and one immediately south of Del Valle Road, as shown on Figure 3A. Other species observed in the *Rhus trilobata* association include blue elderberry (*Sambucus nigra* ssp. *caerulea*) and poison oak (*Toxicodendron diversilobum*) in low cover. The *Rhus trilobata* association comprises 0.9 acres of the Tract Map Site BSA.

The *Rhus trilobata* association is ranked as S3 (NatureServe 2019). This ranking indicates that within California the association is considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate basket bush patches as a sensitive vegetation community. Although basket bush is not a hydrophyte and has a wetland indicator status of facultative upland (FACU), the basket bush patches are located on the slope of an ephemeral waterway south of Del Valle Road, and therefore are mapped as a riparian vegetation community. This community is under the jurisdiction of the CDFW as a riparian habitat associated with a jurisdictional stream. The basket bush patches along the northern boundary of the Tract Map Site BSA are not associated with aquatic features.

5.1.1.3 Chaparral

5.1.1.3.1 Chamise - Black Sage Chaparral (*Adenostoma fasciculatum - Salvia mellifera*) Alliance

The chamise – black sage chaparral (*Adenostoma fasciculatum – Salvia mellifera*) alliance includes chamise and black sage as the co-dominant species in the shrub canopy. The chamise – black sage chaparral alliance has a continuous to intermittent canopy less than 3 meters (10 feet) in height. The herbaceous layer is sparse. Chamise – black sage chaparral occurs on lower to upper slopes of all aspects; however, it occurs predominantly on south-facing slopes (Sawyer et al. 2009).

Chamise – black sage chaparral occurs in one area within the central portion of the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other shrub species observed within the chamise – black sage chaparral vegetation community include California sagebrush (*Artemisia californica*) and California buckwheat (*Eriogonum fasciculatum*). Chamise – black sage chaparral comprises 0.7 acres of the Off-Site Water Tank Area BSA.

The chamise – black sage chaparral alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate chamise – black sage chaparral as a sensitive vegetation community.

5.1.1.4 Scrub

5.1.1.4.1 Black Sage Scrub (*Salvia mellifera*) Alliance

The black sage scrub (*Salvia mellifera*) alliance includes black sage (*Salvia mellifera*) as the dominant or co-dominant species in the shrub canopy. Black sage scrub has a continuous to intermittent shrub canopy less than 2 meters (7 feet) in height. The herbaceous layer is variable; grasses and herbs are seasonal. Black sage scrub occurs on dry slopes and alluvial fans (Sawyer et al. 2009).

Black sage scrub occurs in one patch within the southern portion of the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other shrub species observed within black sage scrub include chamise, California sagebrush, and California buckwheat. Black sage scrub comprises 0.3 acres of the Off-Site Water Tank Area BSA.

The black sage scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate black sage scrub as a sensitive vegetation community.

5.1.1.4.2 Bush Mallow Scrub (*Malacothamnus fasciculatus - Malacothamnus* spp.) Alliance

The bush mallow scrub (*Malacothamnus fasciculatus – Malacothamnus* spp.) alliance includes bush mallow (*Malacothamnus fasciculatus*) as the dominant or co-dominant species in the shrub canopy. Bush mallow scrub has an open to intermittent shrub canopy less than 3 meters (10 feet) in height. The herbaceous layer is usually sparse. Bush mallow occurs on gentle to very steep slopes of variable aspects (Sawyer et al. 2009).

Bush mallow scrub occurs in two patches in the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other shrub species observed within bush mallow scrub include California sagebrush and California buckwheat. Bush mallow scrub comprises 0.0 acres (rounded from 0.05 acres) of the Off-Site Water Tank Area BSA.

The bush mallow scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate bush mallow scrub as a sensitive vegetation community.

5.1.1.4.3 California buckwheat scrub (*Eriogonum fasciculatum*) Alliance

The California buckwheat scrub (*Eriogonum fasciculatum*) alliance includes California buckwheat as the dominant or co-dominant in the shrub canopy, comprising 50% of the relative cover in the shrub canopy. California buckwheat scrub has a continuous or intermittent canopy less than 2 meters (7 feet) in height, and the herbaceous layer is variable and may be grassy. This vegetation community is usually found on upland slopes, intermittently flooded arroyos, channels and washes, and rarely flooded low-gradient deposits (Sawyer et al. 2009).

California buckwheat scrub occurs within the northeastern portion of the Tract Map Site BSA and the northwestern portion of the Off-Site Road Improvement Area BSA on gentle to steep south-facing slopes, as shown on Figure 3A. Other species observed within California buckwheat scrub include sacapellote (*Acourtia microcephala*), California

aster (*Corethrogyne filaginifolia*), black sage, chaparral mallow (*Malacothamnus fasciculatus* var. *fasciculatus*), toyon (*Heteromeles arbutifolia*), redberry (*Rhamnus crocea*), and purple sage (*Salvia leucophylla*). California buckwheat scrub comprises 0.3 acres of the Tract Map Site BSA and 0.3 acres of the Off-Site Roadway Improvement Area BSA, for a total of 0.6 acres.

The California buckwheat scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate California buckwheat scrub as a sensitive vegetation community.

5.1.1.4.4 California Sagebrush – Black Sage Scrub (*Artemisia californica – Salvia mellifera*) Alliance

The California sagebrush (*Artemisia californica*) – black sage scrub (*Salvia mellifera*) alliance includes California sagebrush and black sage as co-dominant in the shrub canopy. California sagebrush – black sage scrub has an intermittent to continuous canopy less than 2 meters (7 feet) in height, and the herbaceous layer is variable. This vegetation community is usually found on steep east- to southwest-facing slopes, and soils are usually colluvial derived (Sawyer et al. 2009).

California sagebrush – black sage scrub occurs within the southeastern portion of the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other species observed within California sagebrush – black sage scrub include purple sage and chamise. California sagebrush – black sage scrub comprises 0.5 acres of the Off-Site Water Tank Area.

The California sagebrush – black sage scrub is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate California sagebrush – black sage scrub as a sensitive vegetation community.

5.1.1.4.5 California Sagebrush – California Buckwheat Scrub (*Artemisia californica - Eriogonum fasciculatum*) Alliance

The California sagebrush – California buckwheat scrub (*Artemisia californica – Eriogonum fasciculatum*) alliance includes California sagebrush and California buckwheat as the co-dominant species in the shrub canopy; when combined, they comprise 30% to 60% of the relative cover in the shrub canopy. California sagebrush – California buckwheat scrub has an intermittent to continuous canopy that is two-tiered with most shrubs less than 2 meters (7 feet) in height with some less than 5 meters (16 feet) in height. The herbaceous layer is seasonally present. California sagebrush – California buckwheat scrub is usually found on steep slopes that are south-facing (Sawyer et al. 2009).

California sagebrush – California buckwheat scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, typically on steep slopes facing south, west, and slightly northwest, as shown on Figure 3A and Figure 3B. Other shrub species observed within California sagebrush – California buckwheat scrub include black sage, chaparral mallow, toyon, redberry, and purple sage. California sagebrush – California buckwheat scrub comprises 24.8 acres of the Tract Map Site BSA, 2.3 acres of the Off-Site Roadway Improvement Area BSA, 5.7 acres of the Off-Site Open Space Area BSA, and 0.2 acres of the Off-Site Water Tank Area BSA, for a total of 33.1 acres.

The California sagebrush – California buckwheat scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate California sagebrush – California buckwheat scrub as a sensitive vegetation community.

5.1.1.4.6 California Sagebrush Scrub (*Artemisia californica*) Alliance

The California sagebrush scrub (*Artemisia californica*) alliance includes California sagebrush as the dominant or co-dominant species in the shrub canopy, when comprising at least 60% of the relative cover in the shrub canopy. California sagebrush scrub has an intermittent to continuous shrub canopy that is two-tiered: one tier includes shrubs less than 2 meters (7 feet) in height, and the second tier includes shrubs less than 5 meters (16 feet) in height. The herbaceous layer is variable both seasonally and annually. California sagebrush scrub is usually found on steep slopes that are rarely flooded and on low-gradient deposits along streams (Sawyer et al. 2009).

California sagebrush scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, particularly on the hillslopes and ridgelines, as shown on Figure 3A and Figure 3B. Other shrub species observed within California sagebrush scrub include California buckwheat, black sage, chaparral yucca (*Hesperoyucca whipplei*), and purple sage. California sagebrush scrub comprises 5.4 acres of the Tract Map Site BSA, 23.9 acres of the Off-Site Open Space Area BSA, and 0.6 acres of the Off-Site Water Tank Area BSA, for a total of 29.8 acres.

The California sagebrush scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate California sagebrush scrub as a sensitive vegetation community.

5.1.1.4.7 Coyote Brush Scrub (*Baccharis pilularis*) Alliance

The coyote brush scrub (*Baccharis pilularis*) alliance includes coyote brush (*Baccharis pilularis*) as the dominant or co-dominant shrub in the canopy. Coyote brush scrub has a variable shrub canopy less than 3 meters (10 feet) in height with a variable ground layer. Coyote brush scrub occurs within river mouths, stream sides, terraces, stabilized dunes of coastal bars, splits along the coastline, coastal bluffs, open slopes, and ridges (Sawyer et al. 2009).

Coyote brush scrub occurs in one area within the Off-Site Road Improvement Area BSA, as shown in Figure 3A. Other species observed in coyote brush scrub include common deerweed (Acmispon glaber), California buckwheat, California sagebrush, and white sage (*Salvia apiana*). Coyote brush scrub comprises 0.1 acres of the Off-Site Roadway Improvement Area BSA.

The coyote brush scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate Coyote brush scrub as a sensitive vegetation community.

5.1.1.4.8 Palmer's Goldenbush Scrub (*Ericameria palmeri*) Provisional Alliance

The Palmer's goldenbush scrub (*Ericameria palmeri*) provisional alliance includes Palmer's goldenbush (*Ericameria palmeri* var. *pachylepis*) as the dominant species in the shrub canopy. The Palmer's goldenbush scrub vegetation

community has an open shrub canopy less than 1.5 meters (4.9 feet) in height and a continuous herbaceous layer. Palmer's goldenbush scrub is usually found on flats and low slopes (Sawyer et al. 2009).

Palmer's goldenbush scrub occurs throughout the Tract Map Site BSA and the Off-Site Open Space Area BSA, typically on gently sloping terrain at the base of hillslopes of varying aspect, as shown on Figure 3A. Other species observed within Palmer's goldenbush scrub include ripgut (*Bromus diandrus*), California aster, compact brome (*Bromus madritensis*), and fascicled tarweed (*Deinandra fasciculata*). Palmer's goldenbush scrub comprises 6.7 acres of the Tract Map Site BSA and 1.4 acres of the Off-Site Open Space Area BSA, for a total of 8.2 acres. Note that due to rounding, the summed totals may be off slightly.

The Palmer's goldenbush scrub provisional alliance is ranked by CDFW (2019a) as an S3? Alliance (NatureServe 2019). This ranking indicates that within California the alliance is considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate Palmer's goldenbush scrub as a sensitive vegetation community.

5.1.1.4.9 Purple Sage Scrub (*Salvia leucophylla*) Alliance

The purple sage scrub (*Salvia leucophylla*) alliance includes purple sage as dominant or co-dominant in the shrub canopy in this vegetation community, comprising 30% of the relative cover in the shrub canopy and often co-dominant with California sagebrush. Purple sage has an intermittent to continuous shrub canopy less than 2 meters (7 feet) in height and a variable herbaceous layer. This vegetation community is found on slopes of variable aspects (Sawyer et al. 2009).

Purple sage scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, and the Off-Site Open Space Area BSA typically on steep slopes facing north, as shown on Figure 3A. Other species observed within purple sage scrub include California sage brush, white sage, giant wildrye (*Elymus condensatus*), toyon, hollyleaf redberry (*Rhamnus ilicifolia*), and grape soda lupine (*Lupinus excubitus*). Purple sage scrub comprises 5.5 acres of the Tract Map Site BSA, 0.0 acres (rounded from 0.04 acres) of the Off-Site Roadway Improvement Area BSA, and 2.3 acres of the Off-Site Open Space Area BSA, for a total of 7.8 acres.

The purple sage scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019a; NatureServe 2019). Los Angeles County does not designate purple sage scrub as a sensitive vegetation community.

5.1.1.5 Grass and Herb Dominated

5.1.1.5.1 *Brassica nigra - Bromus diandrus* Semi-Natural Association

The *Brassica nigra – Bromus diandrus* semi-natural association includes black mustard (*Brassica nigra*) as dominant with associated ripgut brome (*Bromus diandrus*) with an open to continuous canopy less than 3 meters (10 feet) in height. *Brassica nigra – Bromus diandrus* occurs in grasslands, fallow fields, roadsides, and among disturbed coastal sage scrub (Sawyer et al. 2009).

Brassica nigra – Bromus diandrus occurs throughout the Tract Map Site BSA, as shown in Figure 3A. *Brassica nigra – Bromus diandrus* comprises 12.4 acres of the Tract Map Site BSA.

Brassica nigra – *Bromus diandrus* are non-native and are not ranked as sensitive by CDFW (2019a). Los Angeles County does not designate *Brassica nigra* – *Bromus diandrus* as a sensitive vegetation community.

5.1.1.5.2 *Bromus diandrus* Semi-Natural Association

Bromus diandrus semi-natural association includes ripgut brome as dominant with open to continuous cover less than 1.2 meters (3.9 feet) in height. *Bromus diandrus* occurs in all topographic settings in foothills, waste places, rangelands, and openings in woodlands (Sawyer et al. 2009).

Bromus diandrus occurs mainly in the flat valley portions of the Tract Map Site BSA, on south-facing slopes, and in openings between patches of native shrub dominated vegetation communities, as shown on Figure 3A. Other species observed in *Bromus diandrus* include red brome, and slender oat (*Avena barbata*), and native annual species are also present at low concentrations, including chick lupine (*Lupinus microcarpus* var. *densiflorus*), doveweed (*Croton setigerus*), fiddleneck (*Amsinckia menziesii*), and California chicory (*Rafinesquia californica*). *Bromus diandrus* comprises 7.3 acres of the Tract Map Site BSA.

Bromus diandrus is non-native and is not ranked as sensitive by CDFW (2019a). Los Angeles County does not designate *Bromus diandrus* as a sensitive vegetation community.

5.1.1.5.3 Wild Oats and Annual Brome Grasslands (*Avena* spp. - *Bromus* spp.) Semi-Natural Alliance

Wild oats and annual brome grasslands (*Avena* spp. – *Bromus* spp.) semi-natural alliance includes wild oat (*Avena fatua*) and ripgut brome as dominant or co-dominant with open to continuous cover less than 1.2 meters (3.9 feet) in height. Wild oat and annual brome grasslands occurs in all topographic settings in foothills, waste places, rangelands, and openings in woodlands (Sawyer et al. 2009).

Wild oats and annual brome grasslands occurs mainly in the flat valley portions, on south-facing slopes, and in openings between patches of native shrub dominated vegetation communities within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA, and within one patch in the northern part of the Off-Site Water Tank Area BSA, as shown on Figure 3A and Figure 3B respectively. Wild oats and annual brome grasslands comprise 39.8 acres of the Tract Map Site BSA, 2.9 acres of the Off-Site Roadway Improvement Area BSA, 2.0 acres of the Off-Site Open Space Area BSA, and 0.1 acres of the Off-Site Water Tank Area BSA, for a total of 44.8 acres.

Wild oats and annual brome grassland are non-native and are not ranked as sensitive by CDFW (2019a). Los Angeles County does not designate wild oats and annual brome grasslands as a sensitive vegetation community.

5.1.2 Other Land Cover Types

5.1.2.1 Disturbed Habitat

Disturbed habitat consists of the areas that have experienced physical anthropogenic disturbance, and as a result cannot be identified as native or naturalized vegetation communities. However, these areas do have a recognizable soil substrate. The existing vegetation is typically composed of non-native ornamental or exotic species. There can also be impacts from animal uses, grading, or repeated clearing for fuel management on disturbed lands, which leave the land incapable of providing a suitable or sustainable habitat in which native species can persist. Disturbed habitat comprises 5.1 acres of the Tract Map Site BSA, 0.0 acres (rounded from 0.04 acres) of the Off-Site Roadway

Improvement Area BSA, 2.3 acres of the Off-Site Open Space Area BSA, 0.3 acres of the Off-Site Water Line Improvement Area BSA, and 0.0 acres of the Off-Site Sewer Line Improvement Area BSA (rounded from 0.00003 acres), for a total of 7.8 acres. Note that due to rounding, the summed totals may be off slightly.

5.1.2.2 Urban/Developed

Urban/developed represents areas that have been constructed upon or otherwise have been physically altered to an extent that native vegetation communities are not supported. The portions of the BSA characterized as developed consists of existing access roads, graded areas, and existing buildings. Currently, no vegetation is present in these areas, and they appear to be maintained regularly. Urban/developed comprises 5.6 acres of the Tract Map Site BSA, 0.8 acres of the Off-Site Roadway Improvement Area BSA, 0.2 acres of the Off-Site Open Space Area BSA, 2.0 acres of the Off-Site Water Line Improvement Area BSA, and 0.7 acres of the Off-Site Sewer Line Improvement Area BSA, for a total of 9.5 acres. Note that due to rounding, the totals may not sum precisely.

5.2 Plant Species

The Project site supports woodland, chaparral, scrub, riparian, and grass- and herb-dominated vegetation communities. During surveys, Dudek biologists observed a total of 216 plant species, 160 (74%) of which are native species and 56 (26%) of which are non-native species. A cumulative list of the plant species observed is included in Appendix F.

5.3 Wildlife Species

The Project site supports habitat for a number of upland, woodland, and riparian wildlife species. With the exception of the disturbed and developed lands, which are regularly maintained, land covers on the Project site (grassland, shrubland, and woodland upland communities and riparian vegetation) provide a diversity of suitable habitat for the wildlife species. A total of 76 wildlife taxa were recorded on the site during surveys conducted in 2016, 2017, 2018, and 2020. Appendix G provides a cumulative list of wildlife species observed on the Project site.

5.3.1 Invertebrates

The Project site provides a variety of microhabitats that invertebrates could use for foraging and reproduction. No focused invertebrate surveys were conducted. No invertebrate species were recorded during surveys in 2017 and 2018.

5.3.2 Amphibians and Reptiles

Amphibians require standing or flowing water for part or all of their life cycles. Ponds, seasonal pools, and drainages provide suitable habitat for common amphibian species. The Tract Map Site BSA contains ephemeral waterways, and surveys completed in January 2017 included an assessment of ponding habitat for potentially occurring special-status amphibian species. These surveys were timed to follow significant rain events when conditions for ponding would be ideal. No ponding habitat was identified during the January 2017 surveys, and no amphibians were observed within the Tract Map Site BSA in 2017 and 2018; none are anticipated to occur due to the lack of suitable aquatic habitat.

Reptiles occur in a variety of habitats. Many species shelter in small burrows, which they use as refuge from extreme temperatures and to avoid predators. Biologists observed three common reptile species—common side-blotched lizard (*Uta stansburiana*), western fence lizard (*Sceloporus occidentalis*), and San Diegan tiger whiptail (*Aspidoscelis tigris stejnegeri*) —within the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA during surveys in 2016, 2017, 2018, and 2020. Other common reptiles expected to occur on site based on the habitat present include, but are not limited to, western rattlesnake (*Crotalus oreganus*), coachwhip (*Coluber flagellum*), and gopher snake (*Pituophis catenifer*).

5.3.3 Birds

Dudek observed 51 bird species representing 29 families on the Project site, including species common to grasslands, shrublands, woodlands, and riparian/wetland habitats. Grassland species occurring on the Project site include foraging raptors such as red-tailed hawk (*Buteo jamaicensis*). Common shrubland species observed on the Project site include California towhee (*Melozone crissalis*), spotted towhee (*Pipilo maculatus*), California quail (*Callipepla californica*), California scrub-jay (*Aphelocoma californica*), wrentit (*Chamaea fasciata*), California thrasher (*Toxostoma redivivum*), and phainopepla (*Phainopepla nitens*). Common woodland and riparian/wetland species observed on the Project site include great horned owl (*Bubo virginianus*). Several of the bird species observed on the Project site are species that are urban-tolerant or attracted to urban settings, including American crow (*Corvus brachyrhynchos*), white-crowned sparrow (*Zonotrichia leucophrys*), and western kingbird (*Tyrannus verticalis*). The full cumulative list of birds observed on the Project site are provided in Appendix G.

5.3.4 Mammals

The Project site provides a variety of vegetative communities that common small mammalian species can use as cover and for food gathering, in turn providing a prey base for larger mammals and birds of prey. Biologists observed three mammal species—coyote (*Canis latrans*), California ground squirrel (*Spermophilus* [=*Otospermophilus*] *beecheyi*), and desert cottontail (*Sylvilagus audubonii*)—during surveys conducted in 2017. Other common mammal species expected to occur on the Project site based on habitat present include, but are not limited to, Botta's pocket gopher (*Thomomys bottae*), desert woodrat (*Neotoma lepida*), coyote, and potentially mule deer (*Odocoileus hemionus*) and mountain lion (*Puma concolor*).

5.4 Special-Status/Regulated Resources

The following resources are discussed in this section: (1) plant and animal species present or potentially present on the Project site that are given special recognition by federal, state, or local resource agencies and environmental organizations owing to declining, limited, or threatened populations, that are the result, in most cases, of habitat reduction; (2) habitat areas that are unique, of relatively limited distribution, or of particular value to wildlife; and (3) vegetation communities that are unique, of relatively limited distribution, or of particular value to wildlife.

5.4.1 Sensitive Vegetation Communities

Sensitive vegetation communities include wetlands and riparian communities, as well as those communities that CDFW (2019a) has identified as a high priority for inventory due to rarity or threat in California and/or considered

sensitive by Los Angeles County (2011). Five vegetation types in the BSA are considered sensitive by CDFW and/or Los Angeles County:

- Arroyo willow thickets alliance is ranked as S4, which is not sensitive (CDFW 2019a; NatureServe 2019). However, this vegetation community is associated with a jurisdictional water resource and is therefore considered a sensitive community. The Tract Map Site BSA contains 0.1 acres of arroyo willow thickets.
- Mulefat thickets alliance is ranked as S4, which is not sensitive (CDFW 2019a; NatureServe 2019). However, this vegetation community is associated with a jurisdictional water resource and is therefore considered a sensitive community. The Tract Map Site BSA contains 0.1 acres of mulefat thickets.
- *Rhus trilobata* association is ranked as S3, which is sensitive (CDFW 2019a; NatureServe 2019). *Rhus trilobata* association comprises 0.9 acres of the Tract Map Site BSA. One of the occurrences of this vegetation community is located on the bank of an ephemeral waterway and therefore is considered a riparian vegetation community. The Tract Map Site BSA contains 0.6 acres of basket bush thickets associated as a riparian community.
- Palmer's goldenbush scrub alliance is ranked as S3?, which is sensitive (CDFW 2019a; NatureServe 2019). The Tract Map Site BSA contains 6.7 acres and the Off-Site Open Space Area BSA contain 1.4 acres of Palmer's goldenbush scrub, for a total of 8.2 acres. Note that due to rounding, totals may not sum precisely.
- Coast live oak woodland alliance is ranked as S4, which is not sensitive (CDFW 2019a; NatureServe 2019). The County of Los Angeles (2011, 2012) designates coast live oak woodland as a sensitive vegetation community. The Off-Site Water Tank Area BSA contains 0.3 acres of coast live oak woodlands in accordance with the Manual of California Vegetation, Second Edition (Sawyer et al. 2009). In accordance with the Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011), there are 0.65 acres of oak woodlands.

5.4.1.1 Oak Woodland in Accordance with County Standards

5.4.1.1.1 Oak Woodland Assessment

There are three oak woodlands located within the study area comprising varying sizes and age classes of coast live oak and scrub oak (*Quercus berberidifolia*). These woodlands exhibit generally good levels of ecological health (Appendix A, Figure 5, Oak Woodland). The inventory included 52 coast live oak and 8 scrub oak trees; of the 60 total oak trees, 34 met the County of Los Angeles's criteria for a woodland. Overall, the oak woodlands exhibit conditions that are typical of their location in a native setting prone to drought and wildfires.

The woodland trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 6 to 40 inches and multi-stemmed trunk diameters that range from 2 to 20 inches. Tree canopy extents range from 10 feet to approximately 50 feet in diameter.

The total canopy area and associated SOI of Oak Woodlands (OW) 1–3 is approximately 2.07 acres. Figure 5 in Appendix A provides the mapped locations of OW 1–3 and the associated SOIs.

5.4.1.1.2 Condition of Project Oak Woodlands

The condition and composition of OW 1–3, including oak species present, approximate density of oaks, age classes of oaks, understory vegetation, and surrounding vegetation communities, are discussed below. Based on these recorded conditions, a determination of the habitat value/integrity of the woodland was assigned using criteria

provided in the Guide. These conditions criteria definitions are provided in Table 1 of the Guide (Appendix D of Appendix A) and summarized in Section 3.6.3.1.2. In summary, OW1 is Moderately Degraded, and OW2 and OW3 are Intact. Representative photographs of the woodlands are provided in Appendix A of Appendix A.

The locations of OW 1–3 are provided in Appendix A, Figure 5. Representative photos of the surveyed woodlands are provided in Photos 1 to 10. For the purposes of this report, the terms sapling, young, and mature refer to the age-class designation of the trees present within the subject woodland. These designations are as follows: saplings are trees with a DSH measuring less than 5 inches; young trees have a DSH measuring between 5 and 9 inches; and mature trees have a DSH measuring greater than 9 inches.

Oak Woodland 1

OW1 is located adjacent to and northeast of the existing water tank site, on the northern edge of the proposed additional water tank, encompassing a canopy area of approximately 0.03 acres. A total of two coast live oaks were observed, one mature and one young, within the subject woodland. Existing conditions and the understory vegetation within OW1 vary depending on proximity to the existing road. The habitat value/integrity ranking of OW1 is **Moderately Degraded**.

OW1 has been altered from the natural condition to accommodate a paved road with highly disturbed and compacted soils. At the time of the survey, the understory conditions in the vicinity of the road were not conducive to natural regeneration, including the lack of oak seedlings and an intact oak leaf litter layer, as well the absence of understory vegetation associated with woodland habitat. Conditions present within the understory of OW1 are illustrated in Photos 1 to 4 in Appendix A of Appendix A and listed in Table 4 below.

Oak Woodland 1 Understory Assessment Results

- Native species 5%
- Non-native grass 85%
- Non-native forbs 10%

Table 4. Oak Woodland 1 Understory Assessment

Scientific Name	Common Name	Native/Non-Native	Notes
Artemisia californica	California sagebrush	Native	1 individual
Avena barbata	slender oat	Non-native	
Bromus diandrus	ripgut brome	Non-native	
Carduus pycnocephalus ssp. *pycnocephalus*	Italian plumeless thistle	Non-native	
Chenopodium murale	nettleleaf goosefoot	Non-native	
Cynodon dactylon	Bermudagrass	Non-native	
Pseudognaphalium californicum	ladies' tobacco	Native	2 individuals
Salsola tragus	prickly Russian thistle	Non-native	
Sambucus nigra ssp. *caerulea*	blue elderberry	Native	2 individuals
Stipa miliacea var. *miliacea*	smilograss	Non-native	
Artemisia californica	California sagebrush	Native	1 individual

Oak Woodland 2

OW2 is located east of the existing water tank site and is currently in a "wild" state, showing evidence of minimal disturbance. OW2 comprises 14 mature and 4 young coast live oaks and 2 young scrub oaks with a total canopy area of approximately 0.28 acres. The subject woodland supports an open overhead canopy with a relatively undisturbed oak leaf litter layer. Conditions present within the understory of OW2 are illustrated in Photos 5 to 7 in Appendix A of Appendix A and are listed Table 5 below. Based on these conditions, the habitat value/integrity ranking for OW2 is **Intact**.

Oak Woodland 2 Understory Assessment Results

- Native species 75%—Although not reflected in the percent covers, this also includes the native forbs observed during spring, which are included below in Table 5.
- Non-native grasses and forbs 25%

Table 5. Oak Woodland 2 Understory Assessment

Scientific Name	Common Name	Native/ Non-Native	Percent cover
Adenostoma fasciculatum	chamise	Native	5
Artemisia californica	California sagebrush	Native	35
Avena barbata	slender oat	Non-native	5
Bromus diandrus	ripgut brome	Non-native	20
Elymus condensatus	giant wild rye	Native	15
Eriogonum fasciculatum	California buckwheat	Native	5
Heteromeles arbutifolia	toyon	Native	5
Malacothamnus fasciculatus	bush mallow	Native	5
Salvia mellifera	black sage	Native	5

Oak Woodland 3

OW3 is located south of the existing water tank site and is currently in a "wild" state, showing evidence of minimal disturbance. OW3 comprises eight mature and four young coast live oaks with a total canopy area of approximately 0.07 acres (Table 3). The subject woodland supports an open overhead canopy with a relatively undisturbed oak leaf litter layer. Conditions present within the understory of OW3 are illustrated in Photos 8 to 10 in Appendix A of Appendix A. Based on these conditions, the habitat value/integrity ranking for OW3 is **Intact**.

Oak Woodland #3 Understory Assessment Results

- Native species 60%—Although not reflected in the percent covers, this also includes the native forbs observed during spring, which are included below in Table 6. Vegetation community descriptions are included in Table 7. A list of associated understory plant species is included in Table 8.
- Non-native grasses and forbs 40%

Table 6. Oak Woodland 3 Understory Assessment

Scientific Name	Common Name	Native/Non-Native	Percent cover
Adenostoma fasciculatum	chamise	Native	5
Artemisia californica	California sagebrush	Native	25
Avena barbata	slender oat	Non-native	10
Bromus diandrus	ripgut brome	Non-native	30
Elymus condensatus	giant wild rye	Native	5
Eriogonum fasciculatum	California buckwheat	Native	15
Malacothamnus fasciculatus	bush mallow	Native	5
Salvia mellifera	black sage	Native	5

Table 7. Oak Woodland Vegetation Community Descriptions

Code	Vegetation Community Description [a]	Oak Woodland 1 (acres)	Oak Woodland 2 (acres)	Oak Woodland 3 (acres)	Total Area (acres)
BMS	Bush mallow scrub (*Malacothamnus fasciculatus – Malacothamnus* spp.) Alliance	0.00	0.00	—	0.00
C-BSC	Chamise – black sage chaparral (Ad*enostoma fasciculatum – Salvia mellifera*) Alliance	—	0.04	0.04	0.08
CLOW	Coast live oak woodland (*Quercus agrifolia*) Alliance	—	0.22	0.07	0.28
CSB-CB	California sagebrush – California buckwheat scrub (*Artemisia californica – Eriogonum fasciculatum*) Alliance	—	0.04	—	0.04
CSS	California sagebrush scrub (*Artemisia californica*) Alliance	—	0.11	0.09	0.19
WOABG	Wild oats and annual brome grasslands (*Avena* spp. – *Bromus* spp.) Semi-Natural Alliance	0.04	—	—	0.04
	Total area (acres)	**0.04**	**0.41**	**0.20**	**0.65[b]**

Note:

[a] A Manual of California Vegetation, Second Edition (Sawyer et al. 2009), Vegetation Communities within the Los Angeles County–defined oak woodland.

[b] Note that there is a total of 0.65 acres of oak woodlands, of which there are 0.61 acres of significant impacts to oak woodlands within OW2 and OW3

Table 8. List of Associated Native Plant Species for the Oak Woodland Understory

Scientific Name	Common Name
Apiastrum angustifolium	mock parsley
Adenostoma fasciculatum	chamise
Artemisia californica	California sagebrush
Clarkia unguiculata	elegant clarkia
Claytonia perfoliata	miner's lettuce
Collinsia heterophylla var. *heterophylla*	purple Chinese houses
Delphinium parryi ssp. *parryi*	San Bernardino larkspur
Dipterostemon capitatus	bluedicks
Elymus condensatus	giant wild rye
Eriogonum fasciculatum	California buckwheat
Eriophyllum confertiflorum	golden-yarrow
Erysimum capitatum	sanddune wallflower
Heteromeles arbutifolia	toyon
Lupinus bicolor	miniature lupine
Malacothamnus fasciculatus	bush mallow
Phacelia ramosissima	branching phacelia
Pseudognaphalium californicum	ladies' tobacco
Pterostegia drymarioides	woodland pterostegia
Salvia mellifera	black sage
Sambucus nigra ssp. *caerulea*	blue elderberry

Note: This list could be used as a native seed/container plant palette.

5.4.1.1.3 Oak Woodland Special-Status Species

The Oak Woodlands Conservation Management Plan Guide requests a description of the presence or potential use of the site by special-status species. No special-status plant species or wildlife species have been found during surveys of the oak woodlands within the study area. Surveys were conducted in February and May–July 2020, as described in this report. Tables of potentially occurring special-status plant species and wildlife species are also provided in this report as Appendix B and Appendix C of Appendix A, respectively. These tables were reproduced from the Biological Technical Report and were modified for the purposes of the Oak Woodland Report to include only those species with potential to occur within oak woodland habitats. The tables include listed species and other species that, if impacted, would require a mandatory finding of significance pursuant to CEQA, but they do not include potentially occurring "watch list" species.

5.4.2 Special-Status Plant Species

Focused surveys for special-status plants were conducted in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, the Off-Site Water Tank Area BSA, the Off-Site Water Line Improvement Area BSA, and the Off-Site Sewer Line Improvement Area BSA over three separate survey years, in 2014, 2017, and 2020. The potential for occurrence of special-status plant species in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, the Off-Site Water Tank Area BSA, the Off-Site Water Line Improvement Area BSA, and the Off-Site Sewer Line Improvement Area BSA is described in Table 9. Appendix I provides a list of those special-status plant species considered to have low to no potential to occur. Species

are considered to have low to no potential to occur primarily due to the lack of observations within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, the Off-Site Water Tank Area BSA, Off-Site Water Line Improvement Area BSA, and Off-Site Sewer Line Improvement Area BSA during the 2014, 2017, and 2020 focused surveys. The special-status plant species in Appendix I are not analyzed in this report because no direct, indirect, or cumulative impacts are expected. Mapped locations of special-status plant species recorded within 0.5 miles the Off-Site Water Tank Area BSA and Off-Site Water Line Improvement Area BSA and Off-Site Sewer Line Improvement Area BSA are shown in Figure 4B and Figure 4A/4C, respectively.

Table 9. Special-Status Plant Species with Moderate to High Potential to Occur and Present on the Project Site

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/Elevation Range (feet)	Potential to Occur
Calochortus clavatus var. *gracilis*	slender mariposa lily	None/None/1B.2	Chaparral, coastal scrub, valley and foothill grassland/perennial bulbiferous herb/Mar.–June (Nov)/1,045–3,280	Present within the Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, Off-Site Open Space Area BSA, and Off-Site Water Tank Area BSA. Species identified during 2014, 2017, and 2020 focused surveys.
Calystegia peirsonii	Peirson's morning-glory	None/None/4.2	Chaparral, chenopod scrub, cismontane woodland, coastal scrub, lower montane coniferous forest, valley and foothill grassland/perennial rhizomatous herb/Apr.–June/95–4,920	Present within the Tract Map Site BSA, Off-Site Roadway Area BSA, and Off-Site Open Space Area BSA. Species identified during 2014, 2017, and 2020 focused surveys.
Juglans californica	Southern California black walnut	None/None/4.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland; alluvial/perennial deciduous tree/Mar.–Aug./160–2,950	Present within the Tract Map Site BSA. Species identified in 2020 focused surveys.

Status Legend
CRPR:
1B = Plants rare, threatened, or endangered in California and elsewhere
4 = Plants of limited distribution (a watch list)
Threat Rank: 0.2—Moderately threatened in California (20%–80% occurrences threatened/moderate degree and immediacy of threat)
Note: See text for threat ranks.

Three special-status plant species were documented in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA during focused surveys conducted in 2014, 2017, and 2020:

- Slender mariposa lily (CRPR 1B.2)
- Peirson's morning-glory (CRPR 4.2)
- Southern California black walnut (CRPR 4.2)

5.4.2.1 Slender Mariposa Lily (*Calochortus clavatus* var. *gracilis*)

Slender mariposa lily is a CRPR 1B.2 documented in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA. This species is fairly widespread in the Santa Clarita Valley, and was observed throughout the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, primarily on ridgelines and north- and east-facing slopes. Slender mariposa lily typically occurs in chaparral, California sagebrush scrub, and grassland, often on clay and/or rocky soils. Plants were generally mapped in areas of high vegetative cover and on soil types including loam and silty clay loam. Within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, the number of counted flowering individuals varied from 87 in 2014 (FLx 2014) to 208 in 2017, to 8 in 2020. During 2017, the breakdown of the 208 slender mariposa lily individuals observed included 135 individuals within the Tract Map Site BSA, 31 individuals within the Off-Site Roadway Improvement Area, and 42 individuals within the Off-Site Open Space Dedicated Area. During 2020, the breakdown of the eight slender mariposa lily individuals observed included one individual within the Tract Map Site BSA, one individual within the Off-Site Roadway Improvement Area, and six individuals within the Off-Site Water Tank Area. Note that surveys conducted in 2014, 2017, and 2020 included the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, but not all BSAs were surveyed each year. Since the Off-Site Water Tank Area was not surveyed in 2017, the 2020 survey results for the Off-Site Water Tank Area are representative (six individuals). Figure 4A/4C provides the slender mariposa lily observation locations in 2017 for the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA; and Figure 4B provides the slender mariposa lily observation locations in 2020 for the Off-Site Water Tank Area BSA.

5.4.2.2 Peirson's Morning-glory (*Calystegia peirsonii*)

Peirson's morning-glory is a CRPR 4.2 that is endemic to Los Angeles County in the northern San Gabriel Mountains and adjacent Mojave Desert (Antelope Valley). It is a weakly climbing rhizomatous perennial, typically found in chaparral, coastal scrub, chenopod scrub, cismontane woodland, lower montane coniferous forest, and grasslands. The species was observed in the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in 2014, 2017, and 2020. It generally occurs on ridges and slopes, weakly climbing over chaparral, coastal scrub, and grasslands.

Peirson's morning-glory was observed throughout much of the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA. Given the low sensitivity status of the species and the widespread distribution in the region, the exact locations of individuals of this species within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA were not mapped.

5.4.2.3 Southern California Black Walnut (*Juglans californica*)

Southern California black walnut is a CRPR 4.2 endemic to California. It is a perennial deciduous tree which occurs in chaparral, cismontane woodland, coastal scrub, and riparian woodland. Southern California black walnut can generally be found in the southern half of California and can be either a large shrub with one to five trunks or a small single-trunked tree. The main trunk can fork close to the ground making it look like two trees that have grown together, then diverged. One multi-stemmed individual with a cumulative 47-inch DSH was observed in the Tract Map Site BSA, in 2017 and 2020. The 47-inch DSH is comprised of four stems measuring 8 inches, 9 inches, 11 inches, and 19 inches in diameter.

Biological Survey Area

Project Components

- Tract Map Site
- Off-Site Roadway Improvement Area
- Off-Site Sewer Line Improvement
- Off-Site Water Line Improvement
- Off-Site Open Space
- Not a Part
- Biological Survey Area 0.5-Mile Buffer

Focused Survey Results

- Slender mariposa lily *(Calochortus clavatus var. gracilis)*
- Southern California black walnut *(Juglans californica)*

CNDDB and USFWS Occurrence Records

- slender mariposa lily

5.4.3 Oak Trees

5.4.3.1 Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area Oak Trees

The complete Oak Tree Report for the Sterling Ranch Estates Project which includes the Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area is included in Appendix B. Below is a summary of the results.

Three coast live oak and two valley oak (*Quercus lobata*) trees were inventoried within the Tract Map Site BSA, Off-Site Open Space Area BSA, and Off-Site Roadway Improvement Area BSA. Of the five oak trees, four meet Los Angeles County's criteria for a protected oak tree. Appendix B in the Oak Tree Report (Appendix B of this report) presents the location of the individual trees mapped and assessed impact for the Project. Overall, the trees exhibit growth and structural conditions that are typical of their locations in a native oak woodland setting prone to drought and wildfires. The trees include various trunk and branch maladies and health and structural conditions. As presented in Appendix A of the Oak Tree Report (Appendix B of this report), 40% of the individually mapped trees (2 trees) exhibit fair health; 40% (2 trees) are in poor health; and 20% (1 tree) are in good health. Structurally, 20% (1 tree) of the individually mapped trees are considered to exhibit good structure, and 80% (4 trees) exhibit fair structure. The tree in good condition exhibits acceptable vigor, healthy foliage, and adequate structure, and lacks any major maladies. Trees in fair condition are typical, with few maladies but declining vigor. Trees in poor condition exhibit declining vigor, unhealthy foliage, poor branch structure, and excessive lean. The trees in poor condition are directly attributed to the region's recent drought. No pests and/or pathogens were observed on site.

Trees within the tree survey area vary in size and stature according to species and available growing space. The site's trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 14 to 43 inches and multi-stemmed trunk diameters that range from 1 to 17 inches. Tree heights vary from 11 to 45 feet. Tree canopy extents range from 10 feet to approximately 45 feet.

5.4.3.2 Off-Site Water Tank Area Oak Trees

The complete Oak Tree Report for the Sterling Ranch Estates Project, Off-Site Water Tank Area is included in Appendix C. Below is a summary of the results.

Fifty-five coast live oak and four scrub oak (*Quercus berberidifolia*) trees were inventoried within the Off-Site Water Tank Area BSA. Of the 59 oak trees, 36 meet Los Angeles County's criteria for a protected oak tree. Appendix A presents the location of the individual trees mapped and assessed for the Project. Overall, the trees exhibit growth and structural conditions that are typical of their location in a native oak woodland setting prone to drought and wildfires. The trees include various trunk and branch maladies and health and structural conditions. As presented in Appendix A of the Oak Tree Report (Appendix C), 11.9% (7 trees) of the individually mapped trees are in good health; 72.9% (43 trees) exhibit fair health, 13.5% (8 trees) are in poor health, and 1.7% (1 tree) is dead. Structurally, 3.3% (2 trees) of the individually mapped trees are considered to exhibit good structure; 83.1% (49 trees) exhibit fair structure; 11.9% (7 trees) poor structure; and 1 (1.7%) is dead. The trees in good condition exhibit acceptable vigor, healthy foliage, and adequate structure, and lack any major maladies. Trees in fair condition are typical, with few maladies but declining vigor. Trees in poor condition exhibit declining vigor, unhealthy foliage, poor branch structure, and excessive lean. No pests or pathogens were observed on site.

Trees within the survey area vary in size and stature according to species and available growing space. The site's trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 6 to 44 inches, and multi-stemmed trunk diameters that range from 2 to 55 inches. Tree heights vary from 6 to 50 feet. Tree canopy extents range from 5 feet to approximately 50 feet.

5.4.4 Special-Status Wildlife Species

This section discusses results of the literature review and wildlife surveys conducted within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in 2017 and 2018, and assesses the potential for all special-status wildlife species to occur on the Project site. Species-specific biological surveys conducted to date within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA site include protocol surveys for coastal California gnatcatcher and focused surveys for burrowing owl. Additionally, a burrowing owl habitat assessment was conducted within the Off-Site Water Tank Area BSA and concluded that no burrowing habitat was present; thus, no focused burrowing owl surveys were performed. Species-specific surveys also included observations of all wildlife detected within the Project site; however, biologists could not determine the absence of other special-status wildlife species that had potential to occur. Regardless, the species-specific biological surveys completed in 2017 and 2018 of the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA and 2020 habitat assessment of the Off-Site Water Tank Area BSA provide a sound basis for determining the occurrence potential of several special-status wildlife species within the Project site.

No state or federally listed wildlife species were detected during focused surveys conducted by Dudek in 2017 and 2018 or during the 2020 habitat assessment. A total of six special-status wildlife species were identified within the Project site during reconnaissance and focused surveys, including sharp-shinned hawk (*Accipiter striatus*; CDFW Watch List), Southern California rufous crowned sparrow (*Aimophila ruficeps canescens*; CDFW Watch List), oak titmouse (*Baeolophus inornatus*; USFWS Bird of Conservation Concern), Costa's hummingbird (*Calypte costae*; USFWS Bird of Conservation Concern), Vaux's swift (*Chaetura vauxi*; CDFW Species of Special Concern), and San Diegan tiger whiptail (*Aspidoscelis tigris stejnegeri*; CDFW Species of Special Concern). Dudek compiled a list of special-status wildlife species through a query of CNDDB (CDFW 2018a and CDFW 2020a) to determine the potential for special-status wildlife species to occur on the Project site. The query included the Val Verde USGS quadrangle, where the Project site is located, and the surrounding eight USGS quadrangles. Dudek analyzed the resulting special-status wildlife species' occurrence or potential to occur based on known elevation or geographic range, suitable habitat, or general consensus that the species has been extirpated from the region. Appendix J provides a list of those special-status wildlife species considered to have low to no potential to occur based on site surveys, lack of suitable aquatic or terrestrial habitat, and the site being out of the species' range. Species are considered to have low to no potential to occur primarily due to the lack of suitable habitat and/or no observations of the species within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, the Off-Site Water Tank Area BSA, Off-Site Water Line Improvement Area BSA, and Off-Site Sewer Line Improvement Area BSA during the 2016, 2017, 2018, and 2020 focused surveys. The special-status wildlife species in Appendix J are not analyzed in this report because no direct, indirect, or cumulative impacts are expected. In addition, many special-status wildlife species that occur in the area are avian species that may occasionally fly over or forage over the site, but that are not expected to occur during the portion of their life cycle for which their special-status is designated (usually breeding). Therefore, no impacts would occur to these species. In addition to those identified within the Project site, ten other special-status wildlife species have potential to occur based on habitat, including soils, vegetation, and elevation, and the known range of the species.

Potential occurrence of special-status wildlife species on the Project site is discussed in Table 10, Special-Status Wildlife Observed or with Moderate to High Potential to Occur on the Project Site.

In addition to federally and state-listed threatened and endangered species, Table 10 includes other federal and state:

- Birds of Conservation Concern (BCC) are bird species the USFWS considers to be of high conservation priority beyond those listed as threatened or endangered (USFWS 2008).
- California Species of Special Concern (CSC) are vertebrate species that are of concern due to suspected declining populations, limited ranges, and or continuing threats that increase their chance of extinction or extirpation in California (CDFW 2019b).
- California Fully Protected (FP) species are vertebrate species that the state identified for special protection prior to CESA protection, due to rarity or a threat of extinction. Most FP species have been state- and/or federally listed as threatened or endangered, but there are some exceptions (e.g., white-tailed kite [*Elanus leucurus*]).
- Watch List (WL) species are considered "taxa to watch," as first designated in the California Bird Species of Special Concern (Shuford and Gardali 2008) and extended to reptiles and amphibians in California Reptiles and Amphibian Species of Special Concern (Thomson et al. 2016). Species on the WL are not currently state- or federally listed as threatened or endangered, CSC, or FP species (CDFW 2019b).
- Special Animals are vertebrate and invertebrate species that do not have other state designations (i.e., CSC, FP, WL) that are listed on the Special Animals list (CDFW 2019b). "Special Animals" is also a general term for all species the CDFW is currently interested in tracking through the CNDDB. CDFW therefore considers the Special Animals list to be "species at risk" or "special-status species" (CDFW 2019b).

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Reptiles				
Anniella spp.	California legless lizard	None/CSC	Coastal dunes, stabilized dunes, beaches, dry washes, valley–foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils.	Moderate potential to occur based on presence of suitable habitat and difficulty in detection (often subterraneous or in detritus layer). However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/CSC	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	Present. Species observed during surveys completed in 2018.

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Phrynosoma blainvillii	Blainville's horned lizard	None/CSC	Open areas of sandy soil in valleys, foothills, and semi-arid mountains, including coastal scrub, chaparral, valley–foothill hardwood, conifer, riparian, pine–cypress, juniper, and annual grassland habitats.	Low potential to occur based on presence of suitable habitat, but lack of flat, open terrain, and the fact that this species was not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.
Birds				
Accipiter cooperii (nesting)	Cooper's hawk	None/WL	Nests and forages in dense stands of live oak, riparian woodlands, or other woodland habitats often near water.	Moderate potential to nest based on presence of suitable nesting habitat, and the species was observed during surveys completed in 2018 and 2020, but no nest behavior or fledgings were observed during the surveys.
Accipiter striatus (nesting)	sharp-shinned hawk	None/WL	Nests in coniferous forests, ponderosa pine, black oak, riparian deciduous, mixed conifer, Jeffrey pine; winters in lowland woodlands and other habitats.	Present. Species observed during surveys completed in 2018. Not expected to nest based on lack of suitable nesting habitat and not known to nest in the region (Allen et al. 2016).
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow	None/WL	Nests and forages in open coastal scrub and chaparral with low cover of scattered scrub interspersed with rocky and grassy patches.	Present. Species observed during surveys completed in 2018.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/CSC	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows.	Moderate potential to occur in winter or during migration. Breeding season surveys were negative for the species. Low potential to nest. The Project site provides suitable habitat, but no known breeding records from the vicinity (Allen et al. 2016; CDFW 2018a). Nearest CNDDB record is approximately 1.5 miles east of the Project site, near the new industrial area, in winter. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists which consisted of over 248 person hours inclusive of over 93

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
				person hours of protocol coastal California gnatcatcher surveys and a burrowing owl habitat suitability survey assessment and focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012).
Baeolophus inornatus (nesting)	oak titmouse	BCC/None	Montane hardwood-conifer, montane hardwood, blue oak, valley oak and coastal oak woodlands, montane and valley foothill riparian habitats.	Present. Species observed within the Tract Map Site BSA during surveys completed in 2018 and within the Off-Site Water Tank Area BSA during surveys completed in 2020. Note that the species was not observed nesting. Suitable nesting habitat present on the Off-Site Water Tank Area BSA; however, no other suitable habitat within the Project site.
Buteo regalis (wintering)	ferruginous hawk	BCC/WL	Open, dry country, grasslands, open fields, agriculture.	Moderate potential to occur in winter and during migration. Not known to nest in the region. Suitable foraging habitat present on site. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.
Calypte costae (nesting)	Costa's hummingbird	BCC/None	Nests and forages in desert wash, edges of riparian and valley–foothill riparian, coastal scrub, desert scrub, desert succulent scrub, lower-elevation chaparral, and palm oasis.	Present. Species observed during surveys completed in 2020. Not expected to nest based on lack of suitable nesting habitat.
Chaetura vauxi (nesting)	Vaux's swift	None/CSC	Nests in coniferous or mixed forest. Forages in forest openings, especially above streams.	Present. Species observed during surveys completed in 2018. Not expected to nest based on lack of suitable nesting habitat.

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Falco columbarius (wintering)	merlin	None/WL	Coastlines, wetlands, woodlands, agricultural fields, and grasslands.	Moderate potential to occur. Suitable foraging habitat present on site. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.
Gymnogyps californianus	California condor	FE/SE, FP	Nests in rock formations, deep caves, and occasionally in cavities in giant sequoia trees (*Sequoiadendron giganteus*); forages in relatively open habitats where large animal carcasses can be detected.	High potential to fly over the Project site. Not expected to nest or forage on the Project site and BSA. No nesting habitat present on site, and large carrion is not expected to be present due to the lack of livestock grazing; however, there is the potential for deer, coyotes, and dogs. The species is attracted to microtrash (i.e., broken glass, paper and plastic waste, small pieces of metal), which may be brought back to the nesting site. CNDDB records indicate several observations of California condor flying through the area. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.
Lanius ludovicianus (nesting)	loggerhead shrike	BCC/CSC	Nests and forages in open habitats with scattered shrubs, trees, or other perches.	Moderate potential to occur. The Project site provides suitable nesting and foraging habitat for this species. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.
Polioptila californica	coastal California gnatcatcher	FT/CSC	Nests and forages in various sage scrub communities, often	Low potential to occur. Protocol breeding season surveys were negative for the species (Glenn

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
			dominated by California sagebrush and buckwheat; generally, avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet amsl.	Lukos 2007; Dudek 2018 and 2020). Suitable nesting and foraging habitat present on site but determined absent based on present/absent protocol surveys. CNDDB records indicate the nearest reported location of California gnatcatcher is approximately 2.8 miles southwest of the Project site, near the Santa Clara River.
Mammals				
Lepus californicus bennettii	San Diego black-tailed jackrabbit	None/CSC	Arid habitats with open ground; grasslands, coastal scrub, agriculture, disturbed areas, and rangelands.	Low potential to occur. The Project site has areas of short grasslands and open spaced ground suitable for this species for movement. However, not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.
Neotoma lepida intermedia	San Diego desert woodrat	None/CSC	Coastal scrub, desert scrub, chaparral, cacti, rocky areas	High potential to occur. The Project site provides suitable coastal scrub habitat, and several woodrat middens were identified during the focused wildlife surveys in 2018.
Puma concolor (southern and central coast California evolutionary significant units)	mountain lion	None/SC	Dense undergrowth and cover in deserts, humid coast forests, arid hillsides, and scrub and oak woodlands.	High potential to move through and hunt on the Project site based on presence of suitable habitat. Mule deer (*Odocoileus hemionus*) was occasionally observed foraging and moving through the Project site, specifically within the Tract Map Site BSA on three occasions (5/20/2020, 6/22/2020, and 6/22/2020). However, the mountain lion was not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.

Table 10. Special-Status Wildlife Species that have Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Taxidea taxus	American badger	None/CSC	Dry, open, treeless areas, including grasslands, coastal scrub, agriculture, and pastures, especially with friable soils.	Low potential to occur. The Project site provides suitable burrowing and foraging habitat. No burrows with American badger sign (claw marks, scat, fur) observed during the burrowing owl habitat suitability survey assessment or focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012). Additionally, no American badgers observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.

Status Legend
Federal
BCC = USFWS Bird of Conservation Concern
FE = Federally Endangered
FT = Federally Threatened
State
SC = California Candidate
CSC = California Species of Special Concern
FP = Fully Protected
SE = California Endangered
WL = Watch List

5.4.4.1 Reptiles

5.4.4.1.1 California Legless Lizard

California legless lizard (*Anniella* spp.) is a CSC. The California legless lizard is a burrowing animal found primarily in areas with sandy or loose soils where they typically are found beneath leaf litter and in the soil (Holland and Goodman 1998; Zeiner et al. 1988). This species may be found in sparsely vegetated areas in a variety of habitats, including beach dunes; chaparral; California sagebrush scrub; oak woodlands; pine forests; pine–oak woodland; sandy washes; and stream terraces with sycamores, cottonwoods, or oaks (Zeiner et al. 1988; Stebbins 2003; Holland and Goodman 1998). Rocky soils or areas disturbed by development, agriculture, sand mining, or other human uses where the loose substrate has been removed or altered are not suitable for legless lizards (Miller 1944; CDFG 1971; Hunt 1983; Stebbins 2003; Jennings and Hayes 1994). Soil moisture is considered essential for legless lizards to conserve energy at high temperatures and to also allow shedding to occur (Jennings and Hayes 1994). Suitable habitat for this species is present within the Project site, including within the scrub habitats, chaparral habitats, and oak woodland areas. Moderate potential to occur based on presence of suitable habitat. However, California legless lizards were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.

5.4.4.1.2 San Diegan Tiger Whiptail

San Diegan tiger whiptail (*Aspidoscelis tigris stejnegeri*) is a CSC. This species is slim bodied with a long slender tail and can be found in a variety of habitats, including hot and dry open areas with sparse vegetation such as chaparral, woodland, and riparian (CalHerps 2016). San Diegan tiger whiptails were observed on the Project site during the 2018 focused surveys. No San Diegan tiger whiptails were observed on the Project site in 2016, 2017, or 2020. Suitable habitat for this species is present on the Project site, including within the scrub habitats and dry open area habitats on site.

5.4.4.1.3 Blainville's Horned Lizard

Blainville's horned lizard (*Phrynosoma blainvillii*) is a CSC. The species is found in a wide variety of vegetation types in loose sandy soils, including California sagebrush scrub, annual grassland, chaparral, oak woodland, riparian woodland, and coniferous forest (Klauber 1939; Stebbins 1954). Other identified habitat characteristics include open areas with limited overstory for basking and low but relatively dense shrubs for refuge (Jennings and Hayes 1994). Suitable habitat for this species is present on the Project site, including within the scrub habitats and dry open area habitats on site. Low potential to occur based on presence of suitable habitat. However, Blainville's horned lizards not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.

5.4.4.1.4 Birds

5.4.4.1.5 Cooper's Hawk

The Cooper's hawk (*Accipiter cooperii*; nesting) is a CDFW Watch List species. It is found throughout California in wooded areas. It inhabits live oak, riparian, deciduous, or other forest habitats (Curtis et al. 2006). This species nests in many species of trees in both extensive forests or isolated trees in natural and urbanized landscapes often within 1 kilometer of water (Curtis et al. 2006). Cooper's hawks use patchy woodlands and edges with snags for perching while they are hunting for medium-sized birds and small mammals (Zeiner et al. 1990a, Curtis et al. 2006). Although the Project site contains suitable trees for nesting, Cooper's hawks were observed flying over the Project site during 2018 and 2020 surveys. The trees on site also serve as suitable perches for hunting birds and small mammals that may occur in the grassland or scrub habitats on site. Therefore, this species has a high potential to hunt and moderate potential to nest on site.

5.4.4.1.6 Sharp-Shinned Hawk

The sharp-shinned hawk (*Accipiter striatus*; nesting) is a CDFW Watch List species. It nests in coniferous forests, ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine; and winters in lowland woodlands and other habitats. Although the Project site lacks suitable trees for nesting, sharp-shinned hawks were observed flying over the Project site during 2018 surveys. Sharp-shinned hawks are not expected to nest based on lack of suitable nesting habitat and are not known to nest in the region (Allen et al. 2016).

5.4.4.1.7 Southern California Rufous-Crowned Sparrow

Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*) is a CDFW WL species, as well as a designated locally sensitive species within the County of Los Angeles. The avian species is a relatively large sparrow with a long tail and bright reddish-brown crown. This species prefers rocky hillsides with plenty of grass, shrubs, and small trees. Scrub vegetation offers protection for foraging; this species nests on the ground, generally in depressions or at the base of shrubs. The California sagebrush scrub on the Project site offers suitable foraging

and nesting habitat for this species. This species was observed on the Project site during the focused coastal California gnatcatcher surveys conducted in 2018. No southern California rufous-crowned sparrows were observed during surveys conducted on the Project site in 2017 and 2020.

5.4.4.1.8 Burrowing Owl

Burrowing owl is a USFWS BCC and a CSC. With a relatively wide-ranging distribution throughout the west, burrowing owls are considered to be habitat generalists (Lantz et al. 2004). In California, burrowing owls are yearlong residents of open, dry grassland and desert habitats, and in grass, forb, and open shrub stages of pinyon-juniper and ponderosa pine habitats (Zeiner et al. 1990a). Preferred habitat is generally typified by short, sparse vegetation with few shrubs, level to gentle topography, and well-drained soils (Haug et al. 1993).

The presence of burrows is the most essential component of burrowing owl habitat, as they are required for nesting, roosting, cover, and caching prey (Coulombe 1971; Martin 1973; Green and Anthony 1989; Haug et al. 1993). In California, burrowing owls most commonly live in burrows created by California ground squirrels. Burrowing owls may occur in human-altered landscapes such as agricultural areas, ruderal grassy fields, vacant lots, and pastures if the vegetation structure is suitable (i.e., open and sparse); useable burrows are available; and foraging habitat occurs in close proximity (Gervais et al. 2008). Debris piles, riprap, culverts, and pipes can be used for nesting and roosting.

A burrowing owl habitat suitability survey assessment was conducted within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA on May 20, 2016, which found that suitable nesting and foraging habitat for burrowing owl is present in grasslands throughout the BSAs. In spring and summer 2018, focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012), were conducted within the BSAs. Initially, the entirety of the BSAs was surveyed via walking transects spaced approximately 20 meters apart for the presence of suitable burrows and/or burrow surrogates (e.g., debris piles and open pipes), which were mapped using a Trimble Geo XT GPS unit with sub-meter accuracy. During the initial survey, a total of five burrows were identified that met the suitability requirements for the species, including entrances of greater than 11 centimeters in diameter. The remainder of the BSAs contains numerous small mammal burrows; however, the vast majority of these burrows are well below the 11-centimeter threshold and are not considered suitable based on the habitat assessment criteria presented in Appendix B of the Staff Report on Burrowing Owl Mitigation (CDFG 2012). The subsequent survey passes consisted of walking transects spaced approximately 10 meters apart in the immediate vicinity of the mapped burrows and visual surveys over the remainder of the BSAs.

At the conclusion of the breeding season surveys, no burrowing owl or burrowing owl sign was found within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, or the Off-Site Open Space Area BSA, and this species is determined not to be breeding on site. The nearest CNDDB burrowing owl occurrence is within 1.5 miles of the Tract Map Site BSA, the only CNDDB observation within 5 miles. The Los Angeles County Breeding Bird Atlas project did not confirm breeding by burrowing owl in the Santa Clarita Valley and did not note historical occurrences in this area (Allen et al. 2016). Therefore, the species is unlikely to nest on the Project site, but potentially occurs during migration or winter. Due to the limited number of suitable burrows identified and the dense grassland growth, the BSA is determined to be sub-optimal for overwintering. However, burrowing owl were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys, a burrowing owl habitat suitability survey assessment, and focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012).

5.4.4.1.9 Oak Titmouse

The oak titmouse (*Baeolophus inornatus*) is a USFWS BCC. Oak titmouse individuals are known to occur in montane hardwood-conifer, montane hardwood, blue oak, valley oak and coastal oak woodlands, and montane and valley foothill riparian habitats. This species is known to be a common breeding resident in coast live oak and cottonwood riparian communities. Oak titmouse was observed within the Tract Map Site BSA during surveys completed in 2018 and within the Off-Site Water Tank Area BSA during surveys completed in 2020. Note that the species was not observed nesting. Suitable nesting habitat is present on the Off-Site Water Tank Area BSA; however, no other suitable habitat occurs within the Project site.

5.4.4.1.10 Ferruginous Hawk

The ferruginous hawk (*Buteo regalis*) is a USFWS BCC and a CDFW WL species. Ferruginous hawks are present in the region during the wintering season and are not known to breed in California. This species requires large, open tracts of grasslands, sparse shrub, or desert habitats, where it searches for prey from low flights and glides to intercept prey on the ground. It also hovers and hunts from high mound perches (Zeiner et al. 1990a). Suitable winter foraging habitat for this species is present on the Project site, primarily within the open grassland areas. However, ferruginous hawk were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.

5.4.4.1.11 Costa's Hummingbird

The Costa's hummingbird (*Calypte costae*) is a USFWS BCC species. Costa's hummingbird nests and forages in desert wash, edges of riparian and valley–foothill riparian, coastal scrub, desert scrub, desert succulent scrub, lower-elevation chaparral, and palm oasis. Costa's hummingbird was observed during surveys completed in 2020. The Costa's hummingbird is not expected to nest based on lack of suitable nesting habitat.

5.4.4.1.12 Vaux's Swift

The Vaux's swift (*Chaetura vauxi*) is a CSC. Vaux's swift nests in coniferous or mixed forest and forages in forest openings, especially above streams. Vaux's swift was observed during surveys completed in 2018. Vaux's swift is not expected to nest based on lack of suitable nesting habitat.

5.4.4.1.13 Merlin

The merlin (*Falco columbarius*) is a CDFW WL species. Merlins are present in the region during the wintering season (September to May) and are not known to nest in the state. Merlins frequent open habitats at low elevation near water and dense tree stands (Zeiner et al. 1990a). Suitable winter foraging habitat for this species is present within the Project site, primarily within the open grassland areas. However, merlin was not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.

5.4.4.1.14 California Condor

California condor (*Gymnogyps californianus*) is a federally and state-listed endangered species and a California FP species. California condor is known to fly over the Project vicinity when moving from nesting areas in the Sespe Wilderness area to the northwest and foraging areas in the San Gabriel Mountains to the southeast. California

condor are strictly a scavenger, eating carrion such as cattle, sheep, deer, and ground squirrel carcasses. This species requires vast expanses of open savannah, grassland, and foothill chaparral with cliffs, large trees, and snags for roosting and nesting (Zeiner et al. 1990a).

Based on available GPS-tracking data, condors are not known to fly directly over the Project site. The annual brome grassland vegetation community provides suitable foraging habitat for this species; however, no livestock grazing takes place within the BSA, and therefore, the Project site does not support a regular, predicable source of large mammalian carrion (i.e., dead cattle) required by this species. Mule deer and other potential forage items likely occur within the Project site, though this species is not anticipated to be a common resident on site, and the site would not be expected to provide the food source necessary for regular California condor use. However, California condor was not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.

5.4.4.1.15 Loggerhead Shrike

The loggerhead shrike (*Lanius ludovicianus*) is a USFWS BCC and a CSC. It is widespread throughout the United States, Mexico, and portions of Canada (Humple 2008). The species is a yearlong resident in most of the United States, including from California east to Virginia and south to Florida, and in Mexico. In California, while shrikes are widespread at the lower elevations in the state, the largest breeding populations are located in portions of the Central Valley, the Coast Ranges, and the southeastern deserts (Humple 2008).

Preferred habitats for loggerhead shrikes are open areas that include scattered shrubs, trees, posts, fences, utility lines, or other structures that provide hunting perches with views of open ground, as well as nearby spiny vegetation or human-made structures (such as the top of chain-link fences or barbed wire) that provide a location to impale prey items for storage or manipulation (Humple 2008). Loggerhead shrikes occur most frequently in riparian areas along the woodland edge, grasslands with sufficient perch and butcher sites, scrublands, and open canopied woodlands, although they can be quite common in agricultural and grazing areas, and can sometimes be found in mowed roadsides, cemeteries, and golf courses. Loggerhead shrikes occur only rarely in heavily urbanized areas. For nesting, the height of shrubs and presence of sparse canopy cover are most important (Yosef 1996). The Project site provides suitable foraging and nesting habitat for loggerhead shrikes. However, loggerhead shrikes were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.

5.4.4.1.16 Coastal California Gnatcatcher

The coastal California gnatcatcher is a federally listed threatened species and a CSC. It is closely associated with coastal sage scrub habitat and is thereby threatened primarily by loss, degradation, and fragmentation of this habitat. Coastal California gnatcatcher typically occurs below 820 feet amsl within 22 miles of the coast and 1,640 feet amsl for inland regions (Atwood and Bolsinger 1992). The California gnatcatcher typically occurs in or near coastal scrub vegetation, which is composed of relatively low-growing, dry-season deciduous and succulent plants. Characteristic plants of this community include California sagebrush, various species of sage (*Salvia* spp.), California buckwheat, lemonadeberry (*Rhus integrifolia*), California brittle bush (*Encelia californica*), and cactus (e.g., *Opuntia* spp.). California gnatcatchers also occur in chaparral, grassland, and riparian vegetation communities where the coastal scrub community is close by (Bontrager 1991). In addition, studies have suggested that coastal California gnatcatcher avoids nesting on very steep slopes (greater than 40%) (Bontrager 1991). Coastal California gnatcatcher is also impacted by brown-headed cowbird (*Molothrus ater*) nest parasitism (Braden et al. 1997).

No California gnatcatchers were observed during the 2018 protocol-level focused surveys within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, or the Off-Site Open Space Area BSA. No California gnatcatchers were observed during the 2020 protocol-level focused surveys within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, or the Off-Site Water Tank Area BSA. Detailed results of the 2018 and 2020 focused surveys are provided in the Focused California Gnatcatcher Survey Results for the Sterling Ranch Estates Project (Appendix D and Appendix E, respectively). In summary, no coastal California gnatcatcher were observed during 2007 (Glenn Lukos2007), 2018 (Dudek 2018), or 2020 (Dudek 2020) protocol-level focused surveys.

5.4.4.2 Mammals

5.4.4.2.1 San Diego Black-Tailed Jackrabbit

The San Diego black-tailed jackrabbit (*Lepus californicus bennettii*) is listed as a CSC. Species-specific surveys were not conducted on the Project site; however, several focused burrowing owl and coastal California gnatcatcher surveys have been completed, which included an inventory of wildlife within the entire Project site. Although suitable habitat for this species is present, this species would have been detected during surveys, if present. Accordingly, San Diego black-tailed jackrabbit were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours.

5.4.4.2.2 San Diego Desert Woodrat

The San Diego desert woodrat (*Neotoma lepida intermedia*) is listed as a CSC. The San Diego desert woodrat occupies many diverse habitats, including California sagebrush scrub present within the Project site (Zeiner et al. 1990b). Species-specific surveys were not conducted on the Project site; however, several focused burrowing owl and coastal California gnatcatcher surveys have been completed, and woodrat middens were noted as they were encountered throughout the Project site. Woodrat middens were found sporadically within the coastal sage scrub vegetation communities on slopes of varying degree and aspect, though they were most often associated with dense coastal sage scrub at the base of large shrubs. Live-trapping did not take place during the survey effort; however, San Diego desert woodrat are known to occur in the region, and based on the presence of woodrat middens, there is high potential for this species to occur on site.

5.4.4.2.3 Mountain Lion

Mountain lions (*Puma concolor*) are not threatened or endangered in California; however, the southern and central coast California evolutionary significant units are candidate species for listing under CESA. On June 25, 2019, the Center for Biological Diversity and Mountain Lion Foundation formally petitioned the California Fish and Game Commission to protect mountain lions under CESA. In April 2020, the California Fish and Game Commission voted unanimously that listing of an evolutionarily significant unit (southern and central coast California) of mountain lions may be warranted. At this time, CDFW is conducting a 1-year status review. It should be noted that during the status-review period, all candidate species are treated as though they are listed, and therefore take (hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill) cannot be permitted without a CDFW Incidental Take Permit. Mountain lions are large predatory mammals that prefer areas with dense undergrowth and cover in deserts, humid coast forests, arid hillsides, and scrub and oak woodlands. Species-specific surveys and wildlife camera surveys were not conducted; however, there is high potential to move through the Project site based on presence of suitable habitat and presence of their primary prey item, the mule deer. Mule deer (*Odocoileus hemionus*) was occasionally observed foraging and moving through the Project site, specifically within the Tract Map Site BSA on three occasions

(May 20, 2020; June 22, 2020; and June 22, 2020). However, mountain lions or their sign (i.e., scat and/or tracks) were not observed on the Project site during 2016, 2017, 2018 or 2020 surveys conducted by Dudek biologists which consisted of over 248 person hours.

5.4.4.2.4 American Badger

The American badger (*Taxidea taxus*) is a CSC. Badgers are generally associated with dry, open, treeless regions, prairies and grasslands, low-intensity agriculture (e.g., pasture and dryland crops), drier open shrublands and forest, parklands, and cold desert areas (Long 1973; Zeiner et al. 1990b). American badger habitat assessment surveys were conducted under favorable weather conditions on May 20, 2016, and October 10, 2016, and May 8 and 9, 2017, and February 12, 2020, for habitat assessment and focused survey efforts (Table 1). Suitable habitat is present for this species, primarily in the open grassland and disturbed areas. Species-specific surveys were not conducted on the Project site; however, the burrowing owl surveys included a comprehensive burrow survey throughout the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA. During the surveys, no burrows indicative of American badger, claw marks and shape, were identified on site. No individual American badgers or their sign (i.e., scat and/or tracks) have been observed on the Project site during other focused surveys conducted in 2016, 2017, 2018, and 2020 by Dudek biologists, which consisted of over 248 person hours.

5.4.5 Critical Habitat

No USFWS-designated critical habitat for listed wildlife species is located within the Project site. USFWS-designated critical habitat occurs for three species within 5 miles of the Project site: least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and arroyo toad (*Anaxyrus californicus*). Of these, the closest USFWS-designated critical habitat is for arroyo toad, located approximately 1.4 miles west/southwest of the Project site. The remaining species are approximately 1.6 to 1.8 miles from the Project site. Critical habitat for all three species is associated with the Santa Clara River.

5.4.6 Jurisdictional Waters

In 2016/ 2017, Dudek conducted a formal delineation within the Tract Map Site BSA for waters of the United States (including wetlands) potentially regulated by the USACE, waters of the state potentially regulated by the Los Angeles RWQCB, and jurisdictional streambed and riparian vegetation potentially regulated by CDFW. Results following the assessment of each wetland indicator parameter are provided below, and data sheets are included in Appendix K.

5.4.6.1 Hydrophytic Vegetation

A limited variety of hydrophytic vegetation was observed and recorded within the BSA including arroyo willow (FACW), Fremont cottonwood (*Populus fremontii*; FACW), and mulefat (FACW) present within the waters of the United States and state. In general, the hydrologic features present within the BSA supported primarily upland adapted species including annual grasses and shrubs composed of soft brome (FACU), ripgut brome (Not Listed), basket bush (FACU), and blue elderberry (FACU). The hydrologic features are ephemeral in nature and are presumed to convey water only during and immediately following rainfall events. As such, these features do not provide consistent water levels sufficient to support a diverse array of hydrophytic species. Those hydrophytic species present within the Tract Map Site BSA are well established and no new recruits of these species were observed; however, seasonal variation in rainfall is anticipated to result in fluctuations in recruitment and cover of hydrophytic

species. However, any increase in hydrophytic vegetation cover is expected to be contained entirely within the areas mapped as jurisdictional waters during the 2016/2017 wetland delineation survey.

5.4.6.2 Hydric Soils

Soils present within the Project site and the Tract Map Site BSA include Castaic-Balcom silty clay loam (30% to 50% slopes), Saugus loam (30% to 50% slopes), Saugus loam (30% to 50% slopes) eroded, and Yolo loam (2% to 9% slopes) (USDA 2021). Of these, the Castaic-Balcom silty clay loam (30% to 50% slopes) is considered hydric based on the State Soils Data Hydric Soils List (USDA 2018). Soils present within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area are displayed on Figure 5A. Soils present within the Off-Site Water Tank Area BSA are displayed on Figure 5B. Soils present within the Off-Site Water Line Improvement Area and Off-Site Sewer Line Improvement Area are displayed on Figure 5C. It is important to emphasize that the hydric soils lists were designed primarily to generate a list of potentially hydric soils from the National Soil Information System database. Following examination of soil test pits, hydric soil indicators were not found to be present within the potential jurisdictional features (Appendix K).

5.4.6.3 Hydrology

Hydrologic input sources within the Project site are presumed to consist entirely of rainfall runoff during and immediately following storm events, primarily during the winter season. The Project site is located in the upper portion of the Salt Canyon–Santa Clara River watershed as shown on Figure 6, and the moderately to steeply sloping terrain in the northern and eastern portions of the Tract Map Site BSA appears to convey water downslope rapidly during and following rainfall events as evidenced by a clear OHWM and a defined bed and bank. As water flows downslope to the south and west through the Tract Map Site BSA, the slope flattens and the channel features dissipate, with water apparently spreading out over a relatively wide area identified as swales that did not support a readily identifiable OHWM or defined bed and bank during the 2016/2017 wetland delineation. These findings are supported by direct observation during storm events in January 2017. During these storm events, water flow was observed to infiltrate prior to discharging from the site. However, water flows are expected to reach Del Valle Road during heavy rainfall events and sheet flow to the south before discharging in Chiquito Canyon Creek and ultimately into the Santa Clara River.

Hydrology indicators observed within the Tract Map Site BSA were indicative entirely of riverine hydrology, consisting of sediment deposits (B2-riverine), drift deposits (B3-riverine), and drainage patterns (B10). These indicators, along with direct observations, support the identification of two ephemeral waterways within the Tract Map Site BSA.

5.4.6.4 Jurisdictional Delineation

The results of the delineation are summarized in Table 11 and shown in Figure 7. It is important to note that delineation results are subject to review and a final determination by the regulatory agencies. Because laws, regulatory guidance, and judicial rulings change and may affect the final jurisdictional determination, for purposes of this report, identified jurisdictional features are considered potentially regulated based on Dudek's current understanding of the regulations and discussion with CDFW staff during a site visit on June 29, 2018. Potential waters of the United States are located entirely within the CDFW streambeds and waters of the state. Potential waters of the state are coterminous with the greater extent of CDFW streambeds and bank and CDFW riparian habitat within the Tract Map Site BSA. Swales that lack an OHWM are considered potentially regulated by CDFW only. The potential jurisdictional areas are described in more detail below.

Table 11. Potential Jurisdictional Water Resources within the Tract Map Site BSA

Area	Non-Wetland Waters of the United States (acres)	CDFW-Jurisdictional Streambed and Associated Riparian Vegetation, Non-Wetland Waters of the State (acres)	CDFW-Jurisdictional Swale (acres)	Length (linear feet)
Unnamed Ephemeral Waterway 1	0.06	0.41	N/A	629
Unnamed Ephemeral Waterway 2	0.07	0.64	N/A	1,020

5.4.6.4.1 Unnamed Ephemeral Waterway 1 (North of Del Valle Road)

This feature originates north of the Tract Map Site BSA on an adjacent property, collects runoff from adjacent slopes, and directs flows to the southwest. Within the Tract Map Site BSA, the northern portion of this feature is confined within a channel displaying clear OHWM indicators and a defined bed and bank. Additionally, riparian vegetation is also present in the northern portion of this feature and comprises arroyo willow thickets and mulefat thickets. As the feature extends to the south, the channel dissipates into a wide valley floor dominated by wild oats and annual brome grassland vegetation, at which point the OWHM indicators and bed and bank disappear into a swale, as shown in Figure 7. Where the unnamed ephemeral waterway supports indicators of an OHWM, these areas are considered to be potentially jurisdictional to the USACE as non-wetland waters of the United States. While current regulations (Navigable Waters Protection Rule) exclude ephemeral streams from waters of the United States, these features have been regulated by USACE in the past and under certain procedures (e.g., a Preliminary Jurisdictional Determination) could be regulated even under current interpretations.

CDFW-jurisdictional streambed and RWQCB waters of the state include the water of the United States and additional area extending to the top-of-bank of each side of the unnamed ephemeral waterway as determined based on channel topography. Associated riparian vegetation including arroyo willow thickets and mulefat thickets that occur on the bed and bank and immediately surrounding the unnamed ephemeral channel are also considered jurisdictional to CDFW and RWQCB. As the channel slope becomes gentler and the valley widens, indicators of OHWM or bed and bank drop out, and riparian adapted plant species are no longer encountered. In these areas, the features are determined to be swales that are not jurisdictional to the USACE or RWQCB based on the lack of appropriate hydrologic indicators. However, CDFW does take jurisdiction over swales. Local topography transports water flows to the southwest, which is presumed to infiltrate and/ or be transported in sheet flow to the topographic low point where it discharges onto Del Valle Road, before ultimately flowing into Chiquito Canyon Creek approximately 750 feet (0.14 miles) south of the Tract Map Site BSA, as shown in Figure 7. Based on the USGS StreamStats data query (USGS 2017c), the drainage area of this feature totals approximately 0.1 square miles.

5.4.6.4.2 Unnamed Ephemeral Waterway 2 (South of Del Valle Road)

This feature originates north and east of the Tract Map Site BSA on adjacent properties. Similar to Unnamed Ephemeral Waterway 1, this feature collects runoff from adjacent slopes and directs flows to the west and southwest. A significant portion of the hydrologic input is presumed to be from runoff from Del Valle Road that has formed a defined channel in the road shoulder prior to entering the Tract Map Site BSA. Hydrologic inputs from the east do not appear to contribute a significant amount of flow, as no defined OHWM or bed and bank was identified in this area. Regardless, flows coalesce into a confined channel that displays clear OHWM indicators and a defined bed and bank. Where the unnamed ephemeral waterway supports indicators of an OHWM, these areas are considered potentially jurisdictional to the USACE as non-wetland waters of the United States.

CDFW-jurisdictional streambed and RWQCB waters of the state include the water of the United States and additional area extending up to the top-of-bank of each side of the unnamed ephemeral waterway as determined based on channel topography. Associated riparian vegetation including basket bush alliance, which occurs on the bed and bank and immediately surrounding the unnamed ephemeral channel, is also considered jurisdictional to CDFW and RWQCB. While the dominant species in the basket bush thickets vegetation community—basket bush—is not a hydrophytic species, the community has established on the slopes of the channel, and therefore is considered a riparian vegetation community. As the feature extends to the west, the channel transitions into a wild oats and annual brome grassland dominated area; however, OWHM indicators and bed and bank persist for a short distance prior to the point where water discharges onto Del Valle Road, as shown in Figure 7. Flows from this feature are anticipated to combine

with flows from Unnamed Ephemeral Waterway 1 prior to discharging into Chiquito Canyon Creek. Based on the USGS StreamStats data query (USGS 2017c), the drainage area of this feature totals approximately 0.03 square mile.

5.5 Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large areas of natural open space (i.e., core habitat) and provide avenues for dispersal and movement of animals and dispersal of plants (e.g., via wildlife vectors). Wildlife movement corridors contribute to population viability by ensuring exchange of genes between populations of species, which helps maintain genetic diversity, reduction in human-wildlife interactions, and reestablishment of populations in core habitats after stochastic environmental events (i.e., wildfire).

Habitat linkages are narrow or small movement pathways (i.e., trails, strips of native vegetation, etc.) that serve as connections between habitat patches by joining larger core habitat areas that help reduce the adverse effects of habitat fragmentation. Further, the habitat linkages are important in facilitating the movement of multiple small to medium species and in maintaining ecological processes. Although some individual animals may not move through a habitat linkage, the linkage is a potential route for gene flow and long-term dispersal. Habitat linkages may serve as both habitat and avenues of gene flow for small animals such as reptiles, amphibians, and rodents. Habitat linkages may be represented by continuous patches of habitat or by nearby habitat "islands" that function as steppingstones for dispersal and movement (especially for birds and flying insects). Wildlife corridors and habitat linkages provide avenues for dispersal or migration of animals that also contribute to population viability in several ways, including (1) ensuring continual exchange of genes between populations to aid in maintaining genetic diversity, (2) providing habitat for some species, (3) providing access to adjacent habitat areas representing additional territory for foraging and mating, (4) allowing for a greater carrying capacity, and (5) providing routes for colonization of habitat islands following local population extinctions or habitat recovery from ecological catastrophes.

The Project site is situated between an industrial park to the east, community of Val Verde (single-family homes) to the south and southwest, and the larger community of Castaic and Hasley Canyon community to the north with portions of mostly undeveloped surrounding lands to the northwest and west. From a regional perspective, Interstate 5 approximately 2 miles to the east of the Project site is a major barrier to wildlife movement with additional wildlife connectivity restrictions from the industrial park approximately 0.2 miles to the east of the Project site; residential developments to the north, south, and southwest; and the landfill, State Route 126, and the approved Newhall Ranch development (currently the first phase of Newhall Ranch is under construction) to the south. These existing and approved developments constrain wildlife from moving through the Project site. Additionally, there are expansive open spaces further to the west of the existing single-family residential development, which provide connecting north–south habitats and wildlife corridors between the Santa Felicia Significant Ecological Area (SEA) and Santa Clara River SEA through Los Angeles County and Ventura County.

The open space further to the west of the Project site provides important northwest–southeast wildlife habitat for wildlife between the Santa Felicia SEA and Santa Clara River SEA. The Santa Felicia SEA contains core habitat for many terrestrial species; the habitat is largely undeveloped and contains vast stands of intact coast sage scrub and chaparral communities. These intact habitats provide wildlife movement corridors through the Santa Felicia watershed to the northwest in addition to the riparian systems between Piru Lake to the northwest and the San Gabriel Mountain range to the south extending east. The southern portion of the Santa Felicia SEA contains some oil development with a network of dirt roads and few buildings scattered throughout the SEA. The Project site does not restrict movement between Lake Castaic and Castaic Lagoon and/or along the Santa Felicia SEA or the Santa Clara River SEA.

South Coast Missing Linkages: A Wildland Network for the South Coast Ecoregion (South Coast Wildlands 2008) has prioritized and designed landscape linkages that are widely considered the backbone of a conservation strategy for Southern California. The Project site is outside the designated landscape linkages. The Sierra Madre–Castaic Connection approximately 2.3 miles to the north of the Project site connects the Los Padres National Forest and Angeles National Forest. The Santa Monica–Sierra Madre Connection approximately 2.5 miles to the west of the Project site stretches from the Santa Monica Mountains to the peaks of the Santa Susana Mountains and the Sierra Madres Ranges of the Los Padres National Forest (South Coast Wildlands 2008).

The California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010) was prepared because a functional network of connected wildlands is essential to the continued support of California's diverse natural communities in the face of human development and climate change. The report includes a statewide Essential Habitat Connectivity Map, data characterizing areas delineated on the map, and guidance for mitigating the fragmenting effects of roads and for developing and implementing local and regional connectivity plans. The Project site is located approximately 2 miles to the east of Essential Connectivity Areas identified in the California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010).

Although the Project site does not reside within any recognized wildlife corridors identified in the Los Angeles County General Plan, the South Coast Missing Linkages Project landscape linkages (Penrod et al. 2005; South Coast Wildlands 2008), or the California Essential Habitat Connectivity Project essential habitat connectivity areas, the Project site supports natural vegetation communities dominated by woodland, grasslands, and coastal scrub habitats, which support localized wildlife movement through the area. These habitats enable wildlife to move between habitat patches within suburban development and provide habitat linkages from north–south and east–west directions.

Approximately 12.6 acres of the Tract Map site and the manufactured open space around the perimeter of the Tract Map site would continue to facilitate wildlife movement for a variety of wildlife species for the foreseeable future. This area is composed of California sagebrush – California buckwheat scrub alliance, wild oats and annual brome grasslands semi-natural alliance, *Brassica nigra – Bromus diandrus* semi-natural association, and developed habitat.

Contiguous habitat of natural vegetation within the immediate vicinity of the Project site includes:

- The Applicant proposes to dedicate the 37.9-acre Off-Site Open Space Area (within a portion of APN 3271-005-032) as a permanent open space to be preserved in perpetuity in a conservation easement.
- 12.6 acres of the Tract Map Site, particularly areas covered by invasive species such as mustard, wild oats, and annual brome grasses within the northwest and southeast portions of the Tract Map Site, may be used for habitat restoration and enhancement.
- An existing 41.3-acre conservation easement subject to preservation in perpetuity held by Mountains Recreation & Conservation Authority adjacent to the east of the proposed 37.9-acre Open Space area conservation easement (as shown on Figure 8A)
- A 16.1-acre Tentative Tract (TR062000). The tract is currently zoned R-1 (Single Family Residential). The Applicant and current landowner has dedicated a 20-foot-wide trail easement through the site (TR060257) and along the eastern boundary of the TR062000, so the three parcels will remain connected.

These portions and surrounding areas are shown in Figure 8A and Figure 8B, respectively.

Overall wildlife movement is regionally and locally constrained through the Project site from existing and approved developments including Interstate 5; the communities of Castaic, Hasley Canyon, and Val Verde; the industrial park;

the landfill; State Route 126; and the Newhall Ranch development. The Project is located outside of Los Angeles County designated SEAs, South Coast Wildlands-designed landscape linkages, and Essential Connectivity Areas identified in the California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010). However, the Santa Felicia SEA, Santa Clara River SEA, Sierra Madre–Castaic Connection, and Santa Monica–Sierra Madre Connection further to the west of existing and approved developments provide largely undeveloped intact habitat for wildlife movement corridors and habitat linkages.

Potential Jurisdictional Water Resources

Biological Technical Report for the Sterling Ranch Estates Residential Project

INTENTIONALLY LEFT BLANK

6 Project Impacts and Proposed Mitigation

Impacts and significance findings identified in this report would be mitigated through the implementation of measures proposed to avoid, minimize, or reduce potentially significant impacts to biological resources. These measures, if successfully implemented, would reduce potential Project impacts to biological resources to less than significant under CEQA.

6.1 Explanation of Findings of Significance

This report analyzes the significance of impacts due to the implementation of the Project to sensitive vegetation communities or riparian habitat, special-status plant species, special-status wildlife species, wildlife corridors and habitat connectivity, and regional resource planning.

Based on CEQA Guidelines Appendix G and other relevant criteria, the Los Angeles County Department of Regional Planning has established the following criteria for determining whether the Project would have a potentially significant impact on biological resources:

Threshold 1: Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?

Threshold 2: Would the Project have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations, or by the CDFW or USFWS?

Threshold 3: Would the Project have a substantial adverse effect on federally or state protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, and drainages) or waters of the United States, as defined by Section 404 of the federal Clean Water Act (CWA) or California Fish and Game Code Section 1600 et seq., through direct removal, filling, hydrological interruption, or other means?

Threshold 4: Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Threshold 5: Would the Project convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10% canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or otherwise contain oak or other unique native trees (junipers, Joshua tree, southern California black walnut, etc.)?

Threshold 6: Would the Project conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (Los Angeles County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (Los Angeles County Code, Title 22, Ch. 22.56, Part 16), the Significant Ecological Areas (SEAs) (Los Angeles. County Code, Title 22, Section 22.56.215), and Sensitive Environmental Resources Areas (SERAs) (Los Angeles County Code, Title 22, Ch. 22.44, Part 6)?

Threshold 7: Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Plan, or other approved state, regional, or local habitat conservation plans?

6.2 Definition of Impacts

This section defines the types of impacts that would occur as a result of implementation of the Project, including direct permanent impacts, direct temporary impacts, and indirect impacts.

6.2.1 Direct Impacts

Direct impacts are impacts that result from direct ground-disturbing activities and consist of the loss of habitat, including any plant and wildlife species that habitat may contain. Direct impacts may be permanent or temporary.

6.2.1.1 Direct Permanent Impacts

Direct permanent impacts refer to the absolute and permanent physical loss of a biological resource due to Project construction activities, such as clearing and grading. This report analyzes five types of direct permanent impacts: (1) permanent loss of vegetation communities, land covers, and general wildlife and their habitat; (2) permanent loss of or harm to individuals of special-status plant species and special-status wildlife species; (3) permanent loss of suitable habitat for special-status species; (4) permanent loss of wildlife movement and habitat connectivity in the Project site; and (5) permanent loss of jurisdictional waters.

6.2.1.2 Direct Temporary Impacts

Direct temporary impacts refer to a temporary loss of vegetation communities and land covers due to construction of proposed temporary haul roads, new access roads, slope remediation, grade control structures, installation of culverts, and other improvements required for the Project. The main criterion for direct temporary impacts is that impacts would occur for a short period of time and would be reversible. Following completion of work, areas temporarily disturbed by construction activities would be restored and revegetated with a native species mix similar to that which existed prior to disturbance such that full biological function can be restored.

6.2.2 Indirect Impacts

Indirect impacts are reasonably foreseeable effects caused by Project implementation on remaining or adjacent biological resources outside the direct construction disturbance zone. Indirect impacts may occur during construction (i.e., short-term construction-related indirect impacts) or later in time as a result of the development (i.e., long-term, or operational, indirect impacts). Indirect impacts may affect areas within the defined Project site but outside the construction disturbance zone, including open space and areas outside the Project site, such as downstream effects.

Indirect impacts include short-term effects immediately related to construction activities and long-term or chronic effects related to the human occupation of developed areas (i.e., development-related long-term effects).

6.2.2.1 Short-Term Indirect Impacts

Short-term indirect impacts are reasonably foreseeable effects on remaining or adjacent biological resources, and that occur during Project construction, but outside the direct limits of work. Short-term indirect impacts may affect areas within the defined Project site but outside the proposed impact limits, including non-impacted areas, and areas outside the Project site, such as downstream effects. In most cases, indirect effects are not quantified, but in some cases, quantification might be included (i.e., using a noise contour to quantify indirect impacts to nesting birds). These indirect impacts may include, for example, dust and noise that could temporarily disrupt habitat and species vitality, or maintenance-related runoff.

6.2.2.2 Long-Term Indirect Impacts

Long-term indirect impacts are reasonably foreseeable effects on remaining or adjacent biological resources that are caused by Project implementation outside the direct limits of work and occur later in time. Indirect impacts may affect areas within the defined Project site but outside the proposed impact limits, including non-impacted areas and areas outside the Project site, such as downstream effects. Long-term or chronic effects related to this Project are primarily related to human occupation of developed areas (i.e., operation-related long-term effects). The Project is not expected to result in a long-term change to the use of the Project site in terms of human activity, lighting, noise, or non-native invasive animals and/or plant species during construction activities.

Each of the following impact sections identifies direct and indirect impacts for biological resources and provides a significance determination. Mitigation measures that would reduce the impact to less than significant are proposed.

6.3 Impacts to Special-Status Plant Species

Threshold 1: Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?

This section analyzes direct and indirect impacts to all observed special-status plant species Table 9. Direct and indirect impacts to observed wildlife species are analyzed in Section 6.4.

6.3.1 Direct Impacts to Special-Status Plant Species and Proposed Mitigation

Three special-status plant species were documented within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA during surveys conducted in 2014, 2017, and 2020:

- Slender mariposa lily (CRPR 1B.2)
- Peirson's morning-glory (CRPR 4.2)
- Southern California black walnut (CRPR 4.2)

Impact BIO-1

Project construction would result in direct impacts to slender mariposa lily. Slender mariposa lily was detected within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA during surveys conducted in 2014, 2017, and 2020. Flowering individuals ranged from 87 in 2014 (FLx 2014), to 208 in 2017, and to 8 in 2020. During 2017, the breakdown of the 208 slender mariposa lily individuals observed included 135 individuals within the Tract Map Site BSA, 31 individuals within the Off-Site Roadway Improvement Area BSA, and 42 individuals within the Off-Site Open Space Area BSA. During 2020, the breakdown of the eight slender mariposa lily individuals observed included one individual within the Tract Map Site BSA, one individual within the Off-Site Roadway Improvement Area BSA, and six individuals within the Off-Site Water Tank Area BSA. Flowering individuals provide only a relative estimate of the total population and can vary widely from year to year; however, the results of the 2017 surveys are anticipated to represent a high confidence population estimate due to the optimal rainfall experienced in the region. Since the Off-Site Water Tank Area BSA was not surveyed in 2017, the 2020 survey results for the Off-Site Water Tank Area BSA are representative (six individuals).

The visibility of slender mariposa lily individuals may be more difficult within scrub communities than grass- and herb-dominated vegetation communities; however, the bright color and relatively large flower size allow for observations within more dense vegetation. It should be noted that although actual flowers of slender mariposa are quite visible, not all slender mariposa individuals bloom each year due to environmental factors. For many bulb species and other geophytes, the timing and frequency of rainfall can be just as important as total annual rainfall in determining the level of flowering in any given season. Some individuals may reach the vegetative stage, but due to site conditions (including but not limited to associated vegetation types) and precipitation timing, may actually not bloom. Wildfire also affects blooming of *Calochortus* by removing dense overgrowth, increasing nutrients in soil, and, when coupled with heavy rainfall, it can result in a greater abundance of blooming *Calochortus* plants (Gerritsen and Parsons 2007).

A total of 135 mapped slender mariposa lily individuals were observed and mapped within the Tract Map Site BSA during the 2017 surveys, of which 132 individuals would be directly impacted by construction of the Project; 2 individuals would be impacted in the fuel management zone; and 1 individual is outside of impact areas. A total of 31 mapped slender mariposa lily individuals were observed and mapped within the Off-Site Roadway Improvement Area BSA, of which 31 would be directly impacted by construction of the Project. A total of six mapped slender mariposa lily individuals were observed and mapped within the Off-Site Water Tank Area BSA, of which six individuals would be directly impacted by construction of the Project. Surveys were performed during the known blooming period and were timed to coincide with peak blooming based on regional conditions. The 2017 surveys detected the largest number of slender mariposa lilies of any survey yet conducted within the BSA and form the basis for the impact assessment for the Project. Therefore, based on 2017 survey results, the total number of slender mariposa lilies impacted by the Project is estimated to be 171 individuals. During the 2017 surveys, the highest numbers of mariposa lilies were recorded over all portions of the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and Off-Site Water Tank Area BSA, and as described above, the upper limit of the on-site slender

mariposa population is estimated to be near 166 individuals. During the same period, the number of slender mariposa lilies detected within the Off-Site Open Space Area BSA is estimated to be near 42 individuals.

The remaining 43 mapped slender mariposa lily individuals located outside of the impact area in the Tract Map Site BSA (1 individual) and the Off-Site Open Space Area BSA (42 individuals) would not be impacted by the Project. In summary, of 214 individual slender mariposa lilies detected within the BSA in 2017, 169 individuals would be directly impacted by construction of the Project; 2 individuals would be impacted by fuel management zones; and 43 individuals would be preserved outside of impact areas,

Slender mariposa lily is known to occur in chaparral, coastal sage scrub, and valley and foothill grasslands at elevations of 1,050 to 3,281 feet amsl (CNPS 2021a). During Project surveys, slender mariposa lily individuals were observed and mapped in California sagebrush – black sage scrub, California sagebrush – California buckwheat scrub, California sagebrush scrub, Palmer's goldenbush scrub, purple sage scrub, wild oats and annual brome grasslands, and *Brassica nigra – Bromus diandrus* vegetation communities. Individuals were documented in loam and silty clay loam soils at elevations of 1,272 to 1,788 feet amsl. Although individuals were documented on slope gradients from relatively flat to very steep, 5% to 89%, the majority of individuals were found on slopes of 15% to 80%. The slope aspect in areas supporting slender mariposa lily is predominantly northern (north, northwest, northeast), encompassing approximately 97% of the observed individuals, with only 3% on southwest slopes.

Based on the site characteristics described above where slender mariposa has been documented for the Project site (vegetation community, elevation, slope, aspect, and soils), a GIS analysis was conducted to identify areas in the Project site (Tract Map Site BSA, Off-Site Roadway Improvement Area BSA, Off-Site Water Tank Area BSA, Off-Site Water Line Improvement Area BSA, and Off-Site Sewer Line Improvement Area BSA) where those same characteristics occur. Based on this analysis, the Project site contains approximately 57.64 acres of suitable habitat for the slender mariposa lily. Habitat supporting documented slender mariposa lily occupies a cumulative footprint of 0.092 acres based on a 3-foot buffer radius applied to each point and polygon of slender mariposa lily mapped (2017 slender mariposa lily data was used for the Tract Map Site, Off-Site Roadway Improvement Area, and Off-Site Water Tank Area, and 2020 slender mariposa lily data was used for the Off-Site Open Space Area conservation easement). This 0.092 acres is composed of 0.044 acres of the Tract Map Site, 0.017 acres of the Off-Site Roadway Improvement Area, 0.004 acres of the Off-Site Water Tank Area, and 0.028 acres of the Off-Site Open Space Area conservation easement. Of the 0.092 acres of occupied slender mariposa lily habitat, 0.064 acres would be impacted.

Based on the same type of analysis, the Off-Site Open Space Area conservation easement contains approximately 20.32 acres of suitable habitat for the slender mariposa lily. As mentioned above, the Off-Site Open Space Area conservation easement contains 0.028 acres of habitat occupied by slender mariposa lily, which results in a remaining 20.29 acres of suitable slender mariposa lily habitat that can be utilized for mitigation efforts.

Based on this analysis, impacts to slender mariposa lily, a species that is moderately threatened in California (CRPR 1B.2), would be significant without implementation of mitigation. Based on the analysis, the Project has the potential to cause significant direct impacts to slender mariposa lily. Mitigation for impacts to 171 slender mariposa lily individuals shall include preservation of the existing population on the Off-Site Open-Space conservation easement (estimated at 42 individuals), plus a minimum 5:1 replacement mitigation for slender mariposa lily individuals impacted by proposed project development. Replacement mitigation shall be accomplished through overplanting by at least 10 times the target number of 342 slender mariposa lilies within the 20.32 acres of suitable habitat in the Off-Site Open-Space conservation easement. Overplanting shall be implemented to meet the mitigation goal and is necessary to accommodate mortality of seedlings and the normally low incidence of flowering which may result in undercounting of actual population size. Based on the assumption that one slender mariposa lily individual would occupy 28.27 square feet (3-foot buffer radius), the Off-Site Open Space Area conservation area includes sufficient suitable habitat to mitigate for impacts to slender mariposa individuals. Additionally, the conservation easement includes a slender mariposa lily mitigation and monitoring plan to further mitigate impacts through translocating bulbs and collecting and sowing seeds. Implementation of mitigation measure **MM-BIO-1 Conservation Easement**, as described below, including the off-site preservation and the translocation of impacted individuals effort, including the Slender Mariposa Lily Mitigation and Monitoring Plan, would reduce potential impacts to slender mariposa lily to less than significant.

Impact BIO-2

Project construction would result in direct impacts to Peirson's morning-glory. Peirson's morning-glory was detected within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, and the Off-Site Open Space Area BSA in 2014, 2017, and 2020. Peirson's morning-glory has a CRPR of 4.2. CRPR 4 is defined as a Watch List of plants of limited distribution or infrequent throughout a broader area in California, and their status should be monitored regularly. And threat rank 0.2 is defined as moderately threatened in California. Due to its low sensitivity status, individuals and locations were not mapped, so the impact analysis is based on loss of suitable on-site habitat, including California coastal scrub alliances and grass- and herb-dominated alliances and associations. Of the 145.0 acres of suitable on-site habitat for Pierson's morning-glory, the Project would result in permanent direct impacts to 96.5 acres and 6.7 acres of impacts from fuel management zones. Due to the low sensitivity status of this species, the observations being within the known geographic range of this species and recording a 37.9-acre Off-Site Open Space Area conservation easement (**MM-BIO-1 Conservation Easement**), impacts would be less than significant with mitigation.

The purpose of **MM-BIO-1 Conservation Easement** is to prohibit development of any kind in perpetuity within the 37.9 acres. The protected viable native habitat is known not just to support the known populations of slender mariposa lily, Peirson's morning-glory, and sensitive Palmer's goldenbush scrub, but will also support the translocated and seeded slender mariposa lily populations, along with the other native plant and wildlife species that occur in the conserved native habitat.

MM-BIO-1

Conservation Easement. Prior to issuance of grading permits for the Project, to address impacts to habitat for slender mariposa lily, Peirson's morning glory, and sensitive vegetation communities (*Rhus trilobata* association [S3, riparian], and Palmer's goldenbush

scrub [S3?]), the Project Applicant shall record a conservation easement on the 37.9 acre Off-Site Open Space Area, after review, input, and approval from the California Department of Fish and Wildlife (CDFW) and the County of Los Angeles Department of Regional Planning. This includes preservation of the remaining sensitive vegetation communities: 0.04 acres of *Rhus trilobata* association and 1.4 acres of Palmer's goldenbush scrub provisional alliance.

There shall be no grading or other construction activities within the Off-Site Open Space Area conservation easement boundaries. The conservation easement shall prohibit entry into the preserved area with the installation and maintenance of protective measures such as fencing and signage, and trash removal. Controlled entry shall be allowed for approved work, including monitoring and maintenance efforts, implementation of the Slender Mariposa Lily Mitigation and Monitoring Plan (SMLMMP), or for other activities associated with preserve management. The conservation easement shall prohibit development of any kind within the preserved area in perpetuity. The conservation easement shall also specify allowable uses, if any. Signage shall include information on the organization that holds the conservation easement, descriptions of the restoration activities, protection of biological resources, and restrictions to human access. Signage shall designate if permitted access is allowed within the conservation easement and if so, shall designate that humans and domesticated pets shall remain within designated areas, all domesticated pets shall be on leashes, owners shall clean up after domesticated pets, and that smoking is prohibited. If access is permitted in designated areas, dog waste bag dispensers and wildlife-proof receptacles for trash shall be provided. The conservation easement holder shall be an entity which has as part of its mission the protection of the environment, including lands, plant species, and/or wildlife species, and can be expected by its organization and history to remain in existence for the foreseeable future.

As part of recording the conservation easement, a Conservation Management Plan (CMP) shall be prepared that specifically identifies the required resource management activities and the entities that shall be responsible for managing those activities in perpetuity. The CMP shall include an SMLMMP to be approved by CDFW and the County of Los Angeles. The SMLMMP shall provide guidance and methods to preserve the slender mariposa lily individuals known to occur within the Off-Site Open Space Area conservation easement, along with a program of slender mariposa lily seed collection and dispersal within the Off-Site Open Space Area conservation easement. The SMLMMP shall also include methods and approach to translocating slender mariposa lily individuals proposed for impact into the Off-Site Open Space Area conservation easement. The SMLMMP shall be developed and implemented with a program that does not conflict with other conservation easement resource management objectives. The SMLMMP shall include, at minimum 5:1, mitigation for impacts to 171 slender mariposa lily individuals, as well as preservation of the existing population of slender mariposa lily individuals already documented within the Off-Site Open Space Area conservation easement. The 5:1 mitigation ratio for planted mariposa lilies shall be effected through overplanting at 10:1 (mitigation plantings: impacted individuals), in order to accommodate potential mortality of slender mariposa lily individuals and the difficulty of censusing populations due to low frequency of flowering.

The SMLMMP shall include annual pre-construction surveys to map and flag slender mariposa lily individuals recording the location and quantities of slender mariposa lily for seed collection and translocation. Seed collection shall occur for a minimum of 2 years. If Project construction is delayed additional annual surveys and seed collection may occur. Seeds shall be collected once the seed has matured, but prior to the seed capsules opening to disperse the seed. Seeds shall be stored in breathable paper bags in a cool, dry, and dark place until it can be planted within the Off-Site Open Space Area conservation easement. Upon establishment of the Off-Site Open Space Area conservation easement, seed shall be sowed within appropriate habitat in the Off-Site Open Space Area conservation easement.

During pre-construction surveys, slender mariposa lily individual locations will be marked with a high-accuracy GPS unit and a permanent marker established in the field to locate the individuals for bulb collection. Bulbs shall remain in the ground until project development. Prior to Project development, the bulbs shall be translocated within appropriate habitat in the Off-Site Open Space Area conservation easement as directed by the SMLMMP.

The SMLMMP shall provide details on site preparation measures, as well as specific methods for the pre-construction collection of slender mariposa lily seeds and the harvest of bulbs from impacted populations. The SMLMMP shall also provide detailed methods for the dispersal of that seed, and the translocation of the harvested bulbs, into the conservation easement areas. Finally, the SMLMMP shall provide a schedule and action plan for the maintenance and monitoring programs, including success criteria, and remedial contingency measures to be implemented if efforts are not successful. During slender mariposa lily monitoring, the Off-Site Open Space Area conservation easement shall be surveyed for slender mariposa lilies including the translocated bulb and seed locations recorded with a high-accuracy GPS unit and permanent field markers. Slender mariposa lily monitoring data shall include data on both blooming and vegetative slender mariposa lily individuals to track the success of establishment.

The CMP and the SMLMMP shall identify the frequency of weed management and monitoring activities to document on-site special-status plant population dynamics and general vegetation community composition and status. In addition to routine and as-needed weed management, the CMP shall include an eradication program specific to the non-native tree of heaven (*Ailanthus altissima*) individuals, along with a program to replace those non-native trees with native trees appropriate to the habitat.

Monitoring shall take place annually and in perpetuity from the time of establishment of the conservation easement. If it appears that the population of any special-status plant species or the vegetation community composition and status are on the decline or have been degraded, remedial activities shall be implemented according to the CMP and the SMLMMP. These activities may include weed control, additional seeding, native plant establishment, or other activities where appropriate.

Annual monitoring reports shall be submitted by August 31 of each year and shall include an evaluation of current monitoring data in relation to previous population observations

(during previous monitoring years) and native enhancement efforts. These reports shall also include any recommendations for remedial management measures and shall discuss other issues that need to be addressed, such as trespassing or vandalism.

Prior to Project construction, a Property Analysis Record or alternatively approved costing evaluation shall be conducted to determine two cost components: (1) initial and capital costs and (2) perpetual costs (endowment). Funding, as a condition of obtaining the conservation easement, shall be contributed in an amount sufficient to pay all costs for overseeing the conservation easement in perpetuity. This funding requirement includes, but is not limited to, staff time, biological survey costs, monitoring and reporting, conducting weed removal, and other management activities required under the terms of the conservation easement, the CMP and the SMLMMP). The funding amount shall be subject to approval of the conservation easement holder. A separate endowment fund shall be created by the owner/developer that shall be held by the conservation easement holder. This endowment fund shall be established in an amount that is calculated to provide, in 10 years, the conservation easement holder with sufficient funds for ongoing monitoring and management of the conservation easement in perpetuity.

The intent of the conservation easement shall be to protect, in perpetuity, viable native habitat that can support not just the known populations of slender mariposa lily and Peirson's morning-glory, but also the translocated slender mariposa lily populations, along with the other native plant and wildlife species that occur in the conserved coastal sage scrub habitat.

Less-Than-Significant Direct Impacts to Special-Status Plant Species

Project construction would result in direct impacts to one Southern California black walnut tree within the Tract Map Site BSA. Southern California black walnut has a CRPR of 4.2. CRPR 4 is defined as a watch list of plants of limited distribution or infrequent throughout a broader area in California, and their status should be monitored regularly. And threat rank 0.2 is defined as moderately threatened in California. Southern California black walnut is endemic to California and has been documented from San Diego County north through Siskiyou County. It is a perennial deciduous tree which occurs in chaparral, cismontane woodland, coastal scrub, and riparian woodland. The one Southern California black walnut documented at the site was adjacent to an existing residence surrounded by ornamental vegetation and non-native grasslands including annual brome grassland. There are no native woodlands or native tree stands documented near the one Southern California black walnut to indicate a natural occurrence of this individual. No other Southern California black walnut individuals were observed within the local vicinity. This single individual in an otherwise disturbed/developed setting suggests that it might not be a natural occurrence; therefore, this species is not considered sensitive, and no impacts would occur. Additionally, during surveys no special-status wildlife was observed using the tree as habitat.

6.3.2 Indirect Impacts to Special-Status Plant Species and Proposed Mitigation

Potential indirect impacts to special-status plant species include accidental clearing, grading, trampling, and litter; runoff; erosion; sedimentation; fugitive dust; chemical pollution; fertilizers and herbicides; invasive plant species; and wildfires.

Impact BIO-3 Potential indirect short-term and long-term impacts to special-status plant species include accidental clearing, grading, trampling, and litter; runoff; erosion; sedimentation; fugitive dust; chemical pollution; fertilizers and herbicides; invasive plant species; and wildfires. Based on the analysis, the Project has the potential to cause significant indirect short-term and long-term impacts to special-status plant species. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing**, **MM-BIO-4 Stormwater Pollution Prevention Plan**, **MM-BIO-5 Weed Control Plan**, **MM-BIO-6 Landscaping Plan**, **MM-BIO-7 Fire Protection Plan**, and **MM-BIO-8 Biological Monitoring** would reduce potential indirect short-term and long-term impacts to special-status plant species to less than significant.

MM-BIO-2 **Worker Education and Awareness Program.** Prior to issuance of grading permits for the Project, the Applicant shall fund the development of a worker education awareness program (WEAP) by a Los Angeles County-approved biologist for the Project and submit the WEAP to the County of Los Angeles Department of Regional Planning for review and approval. The WEAP shall be attended by all individuals involved in construction of the Project prior to working on the Project and shall include, but not be limited to, the following:

- Natural history and photographs of special-status plant species and special-status wildlife species, current sensitivity status, reasons for decline, and protective measures relevant to the species and habitats;
- Description of sensitive vegetation communities and jurisdictional resources and associated construction-limit staking, and biological monitoring during vegetation clearing and grading activities;
- Active nesting birds and associated set-back work buffers in accordance with federal and state regulations;
- Litter guidelines including direction not to litter and to pick up and store all trash and litter securely at the construction site at the end of each day; and
- Avoidance of driving over or otherwise disturbing areas outside the designated construction areas.

The WEAP shall be submitted to the County of Los Angeles Department of Regional Planning for review and approval 30 days prior to implementation. Prior to entering the Project site for construction work, all workers shall attend the WEAP. Upon completion of the WEAP, attendees shall sign training attendance sheets.

MM-BIO-3 **Construction Fencing.** Prior to commencement of any ground-disturbing activities, construction fencing shall be installed to identify the limits of grading/disturbance as well as buffer areas, which would reduce potential human trampling outside of the construction limits and minimize the potential spread of non-native weeds or invasive plants. A County-approved biologist shall inspect construction fencing once installation is complete.

MM-BIO-4 **Stormwater Pollution Prevention Plan.** Prior to issuance of grading permits, the Project Applicant shall develop a Project-specific Stormwater Pollution Prevention Plan (SWPPP) to include implementation of erosion and sediment control Best Management Practices (BMPs) to be implemented during construction and submit the Project-specific SWPPP to

the County of Los Angeles Department of Regional Planning for review and approval. Implementation of BMPs, including the use of water trucks, would minimize impacts from generation of fugitive dust. Potential chemical pollutants would require secondary containment and storage away from jurisdictional resources. Los Angeles County Public Works will monitor compliance with these SWPPP requirements.

MM-BIO-5 **Weed Control Plan.** Prior to issuance of grading permits, the Applicant shall retain a Los Angeles County-approved, qualified restoration ecologist or biologist to prepare a comprehensive adaptive Weed Control Plan (WCP) to be implemented during the construction and operation of the Project and submit the WCP to the County of Los Angeles Department of Regional Planning for review and approval. The Project's homeowners' association shall implement the WCP within the landscaped areas of the Project to minimize weed invasion into open space areas. The WCP shall include, but not be limited to, the following:

- Weed control treatments shall include legally permitted herbicide, manual, and mechanical methods approved for application. The application of herbicides shall comply with state and federal laws and regulations under the prescription of a Pest Control Advisor, with the concurrence of the County of Los Angeles Department of Regional Planning, and shall be implemented by a Licensed Qualified Applicator. Herbicides shall not be applied during or within 72 hours of a forecasted measurable rain event or during high wind conditions that could cause spray drift onto native vegetation. Where manual or mechanical methods are used, plant debris shall be disposed of at an appropriate off-site location. The timing of the weed control treatment shall be determined for each plant species with the goal of controlling populations before they start producing seeds. Consultation with a County-approved, qualified wildlife biologist or botanist shall be required prior to weed control treatments to avoid any adverse impacts to plants and wildlife in the area.
- Invasive plant species (designated by California Invasive Plant Council) shall not be included in the landscaping plan as they could establish off-site and have negative impacts to the adjacent habitats.
- All seeds and straw materials used during Project construction and operation shall be weed-free rice straw or other weed-free product, and all gravel and fill material shall be weed free. If straw wattles are used, they shall not be encased in plastic mesh. All plant materials used during restoration shall be native, certified weed-free, and approved by the County of Los Angeles Department of Regional Planning.
- Prior to entry to the Project area for the first time, equipment must be free of soil and debris on tires, wheel wells, vehicle undercarriages, and other surfaces (a high-pressure washer and/or compressed air may be used to ensure that soil and debris are completely removed). Compliance with the provision is achieved by on-site inspection and verification or by demonstrating that the vehicle or equipment has been cleaned at a commercial vehicle or appropriate truck washing facility. In addition, the interior of equipment (cabs, etc.) shall be free of mud, soil, gravel and other debris (interiors may be vacuumed or washed).

MM-BIO-6 **Landscaping Plan**. Prior to the issuance of grading permits, the Applicant shall prepare a landscaping plan for the homeowners' association (HOA)-maintained areas and submit the Landscaping Plan to the County of Los Angeles Department of Regional Planning for review and approval. The Landscaping Plan for the HOA-maintained areas shall include, but not be limited to, the following:

- Plant species list shall include scientific name, common name, plant container size, and quantities.
- Plantings shall be in accordance with the County of Los Angeles Fire Department Fuel Modification Guidelines (Los Angeles County Fire Department 2011).
- Invasive plant species (designated by California Invasive Plant Council) shall not be included in the landscaping plan as they could establish off-site and have negative impacts to the adjacent habitats.
- Plant layout shall indicate the location of the plant species.
- Planting notes shall include plant installation requirements such as mulch requirements.
- Where native species are required, the species shall be indigenous native species of the region (locally indigenous native species).

MM-BIO-7 **Fire Protection Plan.** Prior to the issuance of grading permits, the Applicant shall prepare a Fire Protection Plan (FPP) that meets County of Los Angeles Fire Department requirements and submit the FPP to the County of Los Angeles Department of Regional Planning for review and approval. The FPP shall include, but not be limited to, the following:

- All construction equipment shall be equipped with appropriate spark arrestors and carry fire extinguishers.
- Provisions for fire/emergency services access shall be established if roadway blockage occurs due to large loads during construction.
- Cleared, maintained parking areas shall be designated; no parking shall be allowed in non-designated areas.

MM-BIO-8 **Biological Monitoring.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. The Applicant shall fund a County-approved, Biological Monitor during Project construction to monitor construction activities and to ensure compliance with all mitigation measures. The Biological Monitor shall be present on site during all vegetation removal and initial ground disturbance activities for all aspects of the Project and shall regularly inspect the Project site as needed after the initial ground disturbances to ensure that all mitigation measures are being implemented. The Biological Monitor shall ensure that wildlife do not become entrapped in excavations. Safeguards shall be implemented during daytime periods of non-activity and overnight, such as a placing a platform over the entire excavation site, flush with the ground surface; installing escape ramps in trenches; or installing exclusionary fencing. Should relocation be required, construction shall be halted until the Biological Monitor arrives on site and clears the work area (in compliance with all applicable permits and authorizations).

6.4 Impacts to Special-Status Wildlife Species

This report determines the significance of direct impacts to special-status wildlife species by evaluating Project-related loss of suitable habitat for the species in question. However, in some cases, the Project's construction activities have the potential to cause direct impacts on individuals (e.g., injury, mortality) of a particular species or species guild. Where this occurs, the report will also evaluate the individual impacts for significance.

6.4.1 Direct Impacts to Special-Status Wildlife Species and Proposed Mitigation

This section analyzes direct and indirect impacts to all observed special-status wildlife species identified in Table 10.

6.4.1.1 Reptiles

Three special-status reptile species have potential to occur on the Project site: California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail. However, California legless lizard and Blainville's horned lizard were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists.

Impact BIO-4 Project construction would result in direct impacts to suitable habitat for California legless lizard, Blainville's horned lizard, and San Diegan whiptail lizard and could directly affect individuals, which would be a significant impact absent mitigation. California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail generally inhabit grassland, coastal scrub, chaparral, riparian, and woodland communities, which total 147.4 acres within the Project site.

The Project would result in permanent direct impacts to 105.7 acres (98.9 acres from grading impacts and 6.7 acres from fuel modification zone impacts) of suitable on-site habitat for California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail on the Project site. These impacts would be less than significant due to the abundant suitable habitat present in the vicinity of the Project site. Individuals are cryptic and slow moving on the surface or are otherwise underground, and therefore, are highly vulnerable to injury and mortality during construction. Impacts to individuals would be significant because they would result in the permanent loss of individuals that could be injured and killed during construction. Based on the analysis, the Project has the potential to cause significant direct impacts to California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing**, **MM-BIO-8 Biological Monitoring**, and **MM-BIO-9 Reptile Pre-construction Survey and Relocation** would reduce potential impacts to California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail to less than significant.

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-8 **Biological Monitoring**

MM-BIO-9 **Reptile Pre-construction Survey and Relocation.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Within 30 days prior to ground-disturbance activities associated with construction or grading activities for the Project, suitable habitat shall be surveyed to capture and relocate California legless lizard, Blainville's horned lizard, and San Diegan tiger whiptail individuals. A qualified biologist in possession of a valid California Scientific Collecting Permit shall conduct the survey. The survey shall be timed to maximize capture of individual lizards and include a spring survey if construction is planned to begin in the spring or late summer, or fall survey if construction is planned to begin in the winter. Additional pre-construction clearance surveys shall be conducted such that no more than 14 days have elapsed between conclusion of the survey and the commencement of construction activities. Any California legless lizard, Blainville's horned lizard, and/or San Diegan tiger whiptail observed within the grading shall be relocated to a suitable area within the preservation area and outside of the construction zone.

6.4.1.2 Birds

Special-status bird species with potential to occur may nest and forage within suitable habitat present on the Project site including grass and herb dominated, scrub, chaparral, riparian, and woodland vegetation communities. In total, these habitats make up 147.4 acres of cover within the Project site. The Project would permanently impact 98.9 acres (67.1%) of habitat for these bird species.

Impact BIO-5 Project construction would result in direct impacts to nesting and foraging habitat for nesting birds protected under the MBTA and/or the California Fish and Game Code, including special-status species such as Cooper's hawk, loggerhead shrike, oak titmouse, southern California rufous-crowned sparrow, and burrowing owl, and could directly affect individuals, including nests, eggs, and young, which would be significant absent mitigation.

Individual adults of these species are unlikely to be directly killed or injured during construction activities because they are highly mobile and would likely leave the area during construction. Therefore, impacts arising from direct mortality of adults would be less than significant. However, if construction occurs during the breeding season for Cooper's hawk, loggerhead shrike, oak titmouse, and Southern California rufous-crowned sparrow, it could result in nest abandonment or reduced reproductive success. Nests, eggs, and young could be directly affected by vegetation clearing and grading.

The Project would result in permanent direct impacts to 98.9 acres of suitable nesting and foraging habitat for these bird species on site. The loss of nesting and foraging habitat would be less than significant because it would not substantially reduce the available habitat for these species in the Project vicinity. However, any direct impacts to individuals, nests, eggs, or young, including nest abandonment, of these special-status species as a result of construction activities would be significant.

Although sharp-shinned hawk, Costa's hummingbird, and Vaux's swift were observed during surveys, they are not expected to nest within the Project site based on the lack of suitable nesting habitat.

Burrowing owl was not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, including a burrowing owl habitat suitability survey assessment and focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012). Additionally, ferruginous hawk, merlin, California condor, and loggerhead shrike were not observed during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys.

Based on the analysis, the Project has the potential to cause significant direct impacts to nesting birds protected under the MBTA and/or the California Fish and Game Code including special-status species including Cooper's hawk, loggerhead shrike, oak titmouse, Southern California rufous-crowned sparrow, and burrowing owl. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing**, **MM-BIO-8 Biological Monitoring**, **MM-BIO-10 Pre-construction Nesting Bird Survey**, and **MM-BIO-11 Pre-construction Burrowing Owl Survey** would reduce potential impacts to less than significant.

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-8 **Biological Monitoring**

MM-BIO-10 **Pre-construction Nesting Bird Survey.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Within 30 days of ground-disturbing activities associated with construction or grading for the Project that would occur during the nesting/breeding season of native bird species potentially nesting on the site (typically February 15 through August 31 in the Project region, or as determined by the County-approved biologist), suitable habitat shall be surveyed within 7 days prior to initiation of disturbance work by a County-approved biologist to determine if active nests (actively breeding or nesting) of bird species protected by the Migratory Bird Treaty Act and/or the California Fish and Game Code are present in the disturbance zone or within 300 feet (500 feet for raptors) of the disturbance zone. If initiation of ground-disturbing activities is delayed, then additional pre-disturbance surveys shall be conducted such that no more than 7 days will have elapsed between the survey and ground-disturbing activities.

If active nests are found, clearing and construction within 300 feet of the nest (500 feet for raptors) shall be postponed or halted. At the discretion of the County-approved biologist, a no-work buffer zone shall be established suitable to the particular bird species and location of the nest until the nest is vacated and juveniles have fledged, as determined by the County-approved biologist, and there is no evidence of a second attempt at nesting. Limits of construction to avoid an active nest shall be established in the field with flagging, fencing, or other appropriate barriers, and construction personnel shall be instructed on the sensitivity of nest areas. The County-approved biologist shall serve as a construction monitor during those periods when construction activities will occur near active nest areas to ensure that no inadvertent impacts to these nests occur. The results of the surveys,

showing the locations of any active nests detected, and documentation of any avoidance measures taken, shall be submitted to the County of Los Angeles Department of Regional Planning to document compliance with applicable state and federal laws.

MM-BIO-11 **Pre-construction Burrowing Owl Survey**. Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Not less than 14 days prior to construction ground-disturbing activities, a survey for burrowing owls shall be conducted by a County-approved biologist within appropriate habitat, and in accordance with approved methodologies (CDFG 2012). If burrowing owls are found on the Project site, and pursuant to agency guidelines, a protective buffer shall be established around the occupied burrow(s) and no ground-disturbing activities will be permitted within the buffer area (CDFG 2012). The size of the buffer shall be determined as set forth in the Staff Report on Burrowing Owl Mitigation (CDFG 2012), based on the disturbance level of construction activities, whether the owl(s) are present during the breeding season (February 1 through August 31) or non-breeding season (September 1 through January 31), and as determined by the County-approved biologist. The protective buffer around active burrows shall be maintained until the County-approved biologist verifies that the birds have vacated the burrow(s) and left the site.

Impact BIO-6 Since no burrowing owls were recorded during protocol surveys, burrowing owls are not expected to occur on a regular basis, therefore impacts to burrowing owl habitat is less than significant. In addition, no impacts to individual burrowing owls are expected; however, if a burrowing owl individual is present at the time of construction, it can potentially be killed or injured during ground-disturbing activities, which would be considered a significant impact. Therefore, to reduce impacts to burrowing owl individuals to less than significant, **MM-BIO-11 Pre-construction Burrowing Owl Survey** shall be implemented.

MM-BIO-11 **Pre-construction Burrowing Owl Survey**.

6.4.1.3 Mammals

American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat may occur in grassland and herb-dominated vegetation, scrub, chaparral, riparian, and woodland vegetation communities as well as disturbed habitat. In total, these habitats make up 155.2 acres of cover within the Project site. The Project would permanently impact 105.7 acres (68.1%) of habitat for American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat on site.

Impact BIO-7 Project construction would result in direct impacts to suitable habitat for American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat and could directly affect individuals, which would be significant absent mitigation.

Individual adults of American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat are unlikely to be directly killed or injured during construction activities because they are fairly mobile and should be able to escape from construction areas. Therefore, impacts arising from direct mortality of adults are less than significant. The greatest potential for direct impacts to badgers would be mortality of young in a natal den and potentially the mother, which fiercely defends the natal den. Similarly, construction

activities could result in destruction of jackrabbit natal sites (dens, burrows, and depressions), and mortality of young, which are not well coordinated for the first 2 or 3 days after birth and are dependent on the nest. Abandonment of the natal den by the mother could also result in the mortality of young. San Diego desert woodrat young are likely to remain in woodrat middens, and therefore construction could result in mortality of young.

San Diego black-tailed jackrabbit and American badger were not observed on the Project site during 2016, 2017, 2018, or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours. Additionally, no burrows with American badger sign (claw marks, scat, fur) were observed during the burrowing owl habitat suitability survey assessment or focused burrowing owl breeding season surveys following the Staff Report on Burrowing Owl Mitigation, Appendix C (CDFG 2012).

The Project would result in permanent direct impacts to 105.7 acres of suitable habitat for American badger, San Diego black-tailed jackrabbit, and San Diego desert woodrat on site. While American badger and San Diego black-tailed jackrabbit adults are highly mobile and can usually escape human disturbances, young dependent on the nest would be highly vulnerable to injury and mortality during construction. San Diego desert woodrats are reliant on their middens. Based on the analysis, the Project has the potential to cause significant direct impacts to San Diego black-tailed jackrabbit, American badger, and San Diego desert woodrat. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing**, **MM-BIO-8 Biological Monitoring**, **MM-BIO-12 Pre-construction Surveys for San Diego Black-Tailed Jackrabbit**, **MM-BIO-13 Pre-construction Surveys for American Badger**, and **MM-BIO-14 Pre-construction Surveys for San Diego Desert Woodrat** would reduce potential impacts to these species to less than significant.

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-8 **Biological Monitoring**

MM-BIO-12 **Pre-construction Surveys for San Diego Black-Tailed Jackrabbit.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Within 30 days prior to construction activities in grassland, scrub, chaparral, oak woodland, or other suitable habitat, a County-approved biologist shall conduct a survey within the proposed construction disturbance zone and within 200 feet of the disturbance zone, within the limits of the Project property, for San Diego black-tailed jackrabbit.

If San Diego black-tailed jackrabbits are present, non-breeding rabbits shall be flushed from areas to be disturbed. Dens, depressions, nests, or burrows occupied by pups shall be flagged and ground-disturbing activities avoided within of 200 feet of these occupied areas during the pup-rearing season (February 15 through July 1). This buffer may be reduced based on the location of the den upon consultation with California Department of Fish and Wildlife (CDFW). Occupied maternity dens, depressions, nests, or burrows shall

be flagged for avoidance, and a biological monitor shall be present during construction. If unattended young are discovered, they shall be relocated to suitable habitat by a County-approved biologist. The applicant shall document all San Diego black-tailed jackrabbit identified, avoided, or moved and provide a written report to CDFW within 72 hours of identification, avoidance or movement.

Collection and relocation of animals shall only occur with the proper scientific collection and handling permits.

MM-BIO-13 **Pre-construction Surveys for American Badger.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Within 30 days prior to construction activities in grassland, scrub, chaparral, oak woodland, or other suitable habitat, a County-approved biologist shall conduct a survey within the proposed construction disturbance zone and within 200 feet of the disturbance zone, within the limits of the Project site, for American badger.

If American badgers are present, occupied habitat shall be flagged and ground-disturbing activities avoided within 50 feet of the occupied den. Maternity dens shall be avoided during the pup-rearing season (February 15 through July 1) and a minimum 200-foot buffer established. This buffer may be reduced based on the location of the den upon consultation with California Department of Fish and Wildlife (CDFW). Maternity dens shall be flagged for avoidance and identified on construction maps, and a County-approved biologist shall be present during construction. If avoidance of a non-maternity den is not feasible, badgers shall be relocated either by trapping or by slowly excavating the burrow (either by hand or mechanized equipment under the direct supervision of the biologist, removing no more than 4 inches at a time) before or after the rearing season (February 15 through July 1). Any relocation of badgers shall occur only after consultation with CDFW. A written report documenting the badger removal shall be provided to CDFW within 30 days of relocation.

Collection and relocation of animals shall only occur with the proper scientific collection and handling permits.

MM-BIO-14 **Pre-construction Surveys for San Diego Desert Woodrat.** Prior to the issuance of grading permits, the Applicant shall submit the qualifications of the biologists to the County of Los Angeles Department of Regional Planning for review and approval. Within 30 days prior to construction activities in grassland, scrub, chaparral, oak woodland, or other suitable habitat, a County-approved biologist shall conduct a survey within the proposed construction disturbance zone and within 200 feet of the disturbance zone for San Diego desert woodrat.

If active San Diego desert woodrat nests (stick houses) are identified within the disturbance zone or within 100 feet of the disturbance zone, a fence shall be erected around the nest site adequate to provide the woodrat sufficient foraging habitat at the discretion of the County-approved biologist in consultation with California Department of Fish and Wildlife (CDFW). Clearing and construction within the fenced area shall be

postponed or halted until young have left the nest. The biologist shall serve as a construction monitor during those periods when disturbance activities occur near active nest areas to ensure that no inadvertent impacts to these nests occur. If avoidance is not possible, the Applicant shall take the following sequential steps: (1) all understory vegetation shall be cleared in the area immediately surrounding active nests followed by a period of one night without further disturbance to allow woodrats to vacate the nest; (2) each occupied nest shall then be disturbed by a County-approved biologist until all woodrats leave the nest and seek refuge off site; and (3) the nest sticks shall be removed from the Project site and piled at the base of a nearby hardwood tree (preferably a coast live oak or Southern California black walnut). Relocated nests shall not be spaced closer than 100 feet apart, unless a County-approved biologist has determined that a specific habitat can support a higher density of nests. The Applicant shall document all woodrat nests moved and provide a written report to CDFW.

All woodrat relocation shall be conducted by a County-approved biologist in possession of a scientific collecting permit.

Less-Than-Significant Direct Impacts to Special-Status Wildlife Species

Mountain lions are not threatened or endangered in California; however, the southern and central coast California evolutionary significant units are candidate species for listing under CESA. On June 25, 2019, the Center for Biological Diversity and Mountain Lion Foundation formally petitioned the California Fish and Game Commission to protect mountain lions under CESA. In April 2020, the California Fish and Game Commission voted unanimously that listing of an evolutionarily significant unit (southern and central coast California) of mountain lions may be warranted. At this time, CDFW is conducting a 1-year status review. It should be noted that during the status review period, all candidate species are treated as though they are listed, and therefore take (hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture or kill) cannot be permitted without a CDFW Incidental Take Permit.

Mountain lions are large predatory mammals that prefer areas with dense undergrowth and cover in deserts, humid coast forests, arid hillsides, and scrub and oak woodlands. Species-specific surveys and wildlife camera surveys were not conducted; however, there is high potential to move through the Project site based on presence of suitable habitat and presence of their primary prey item, the mule deer. Mule deer was occasionally observed foraging and moving through the Project site, specifically within the Tract Map Site BSA on three occasions (May 20, 2020; June 22, 2020; and June 22, 2020). However, mountain lions or their sign (i.e., scat and/or tracks) were not observed on the Project site during 2016, 2017, 2018 or 2020 surveys conducted by Dudek biologists, which consisted of over 248 person hours. Due to temporary presence of mountain lions, their mobile nature, and abundant suitable habitat present in the Los Angeles County Santa Clara River SEA and Santa Felicia SEA, the South Coast Missing Linkages Sierra Madre – Castaic Connection and Santa Monica – Sierra Madre Connection, and the California Essential Habitat Connectivity Project Essential Connectivity Areas to the northwest, west, and southwest of the Project site, direct impacts to mountain lions and suitable habitat would be less than significant.

Common, not sensitive, vegetation communities provide suitable habitat for special-status wildlife species that have potential to occur within the Project site (see Section 5.4.4). Impacts to special-status wildlife species are addressed by species mitigation, and a loss of suitable habitat will not result in significant impacts to the wildlife species. The establishment of the Off-Site Open Space Area conservation easement, **MM-BIO-1 Conservation Easement**, preserves adjacent natural habitats that can be used by special-status wildlife species. Additionally, mitigation measures **MM-BIO-15 Homeowners' Association Covenants, Conditions, and Restrictions; MM-BIO-16 Trash Receptacles;** and **MM-BIO-17 Lighting** will reduce impacts to special-status wildlife species.

Coastal California gnatcatcher, California condor, ferruginous hawk, and merlin have potential to occur on the Project site within scrub and grass- and herb-dominated vegetation communities on the Project site.

Project construction would result in direct impacts to suitable habitat for coastal California gnatcatcher, which is a federally listed threatened species and a CSC. Coastal California gnatcatcher occupies various alliances of coastal sage scrub but is most closely associated with alliances dominated by California sagebrush and California buckwheat. As detailed in Section 5.4.4.1.16 and Appendix D and Appendix E, focused protocol-level surveys for coastal California gnatcatcher were completed in 2018 and 2020, and no individuals were observed. Therefore, although suitable habitat exists within the Tract Map Site BSA, the Off-Site Roadway Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, this species is determined to be absent from these areas and impacts to suitable habitat would be less than significant.

California condors are known to fly over the Project vicinity between nesting sites to the west and foraging habitat to the east and could potentially utilize the Project site; however, based on available GPS-tracking data, condors are not known to fly directly over the Project site. The species has not been recorded on the Project site. This is potentially due to the lack of suitable food sources (i.e., large carrion), which are not expected to occur with any regularity due to the lack of livestock grazing and the limited presence of mule deer. Although the complete lack of large carrion cannot be conclusively determined, it is expected that these potential food sources would be present on a very infrequent basis, if at all. Therefore, direct impacts to California condor are considered less than significant due to the expected infrequent use of the Project site and the relatively small impact to the overall foraging habitat for this species in the region.

Although California condors are not expected to occur on site, construction debris, litter, leaking equipment, or roadkill may attract California condors to the Project site during construction. This could subject condors to strikes by construction vehicles. Condors are curious birds and have been documented in close association with oil pumps and human activity on the Los Padres National Forest. During cleanup activities at trash sites, condors have been observed sitting on guard rails adjacent to the cleanup activities. Adverse effects to condors have also been documented by the animal's collection of microtrash (i.e., broken glass, paper and plastic waste, small pieces of metal). This waste is often brought back to nest sites where young birds ingest the material. This can lead to mortality of young birds. Ethylene glycol, a component in antifreeze and petroleum products, can also be ingested by condors, which can result in injury or mortality. While there is the potential for injury or mortality to condor individuals from Project activities, this potential is considered to be extremely low due to the generally sporadic occurrence in the vicinity of the site. It would be further reduced by **MM-BIO-2 Worker Education and Awareness Program,** elements of mitigation measures **MM-BIO-4 Stormwater Pollution Prevention Plan**, **MM-BIO-15 Homeowners' Association Covenants, Conditions, and Restrictions**, **MM-BIO-16 Trash Receptacles,** and **MM-BIO-17 Lighting**. **MM-BIO-2 Worker Education and Awareness Program** provides for pre-construction educational meetings and requires that all construction/contractor personnel complete a WEAP to ensure compliance with environmental/permit regulations and mitigation measures. The WEAP includes setting out procedures for minimizing harm to or harassment of wildlife, including condors, during construction and designating a contact person in the event of discovery of dead or injured wildlife. The monitoring biologist shall also be present during initial clearing and grading when the chance of collision between construction equipment and condors would be greatest. **MM-BIO-4 Stormwater Pollution Prevention Plan** also includes measures/restrictions incorporated into the SWPPP that will further reduce the risk of impacts to the condor during construction, including checking and maintaining vehicles to prevent leakage of materials (e.g., toxic antifreeze and petroleum products); removal of excess materials and debris from work areas when construction operations are completed; and installation of fully covered trash receptacles to contain food, food scraps, food wrappers, beverage containers, and other miscellaneous trash that could attract condors to a work site. Additionally, implementation of **MM-BIO-15**

Homeowners' Association Covenants, Conditions, and Restrictions; MM-BIO-16 Trash Receptacles; and **MM-BIO-17 Lighting** would minimize interface with domestic animals, restrict and discourage use of balloons, trash receptacles, and lighting. By appropriately educating construction personnel, providing biological monitoring, and preventing spills of toxic materials and the availability of microtrash, impacts to condors during construction would be less than significant.

Ferruginous hawk and merlin would only use the annual brome grasslands during the winter months as foraging habitat. Impacts to annual brome grasslands would not substantially reduce the available foraging habitat for these species in the Project vicinity, which exists to the east, west, and north of the Project site. Therefore, impacts to these species would be less than significant.

Burrowing owl typically occupies grassland habitats supporting small mammal burrows or burrow surrogates suitable for nesting and as cover. Project construction would result in direct impacts to suitable habitat for burrowing owl, which is a USFWS BCC and a CSC. As detailed in Section 5.4.4.1.16, focused surveys for burrowing owl were completed in 2018, and no individuals were observed. Therefore, although suitable habitat exists within the Project site, this species is determined to be absent from the BSA, and impacts to suitable habitat would be less than significant.

MM-BIO-15 **Homeowners' Association Covenants, Conditions, and Restrictions.** Prior to the issuance of grading permits, the Applicant shall submit the homeowners' association (HOA) Covenants, Conditions, and Restrictions to the County of Los Angeles Department of Regional Planning for review and approval. The HOA Covenants, Conditions, and Restrictions shall include the following requirements to reduce potential human impacts on adjacent habitats and wildlife species:

- All dogs and cats shall be in compliance with requirements found in Sections 10.20.150 through 10.20.350 of the Los Angeles County Code related to appropriate licensing and tagging, leashed animals when appropriate, ensuring that all dogs and cats are neutered or spayed (or an unaltered license in accordance with Los Angeles County Code), and that all dogs and cats have a microchip.
- Smoking shall be prohibited in open space areas.
- Speed limits shall be posted, and the Covenants, Conditions, and Restrictions shall require residents to comply with the posted speed limits.
- The HOA shall not use balloons for any community events, and the use of balloons by individual homeowners shall be discouraged.
- Homeowner reprisals against native wildlife species (i.e., killing or harming native wildlife species in any way) if homeowner pets are killed or harmed by wildlife shall be prohibited.

6.4.2 Indirect Impacts to Special-Status Wildlife Species and Proposed Mitigation

Indirect short-term and long-term impacts to special-status wildlife species may include both habitat degradation and effects on individuals. Indirect construction impacts to wildlife habitat may include fugitive dust; runoff, sedimentation, chemical pollution, and erosion; litter; and accidental clearing, grading, and trampling, as well as attracting predators such as American crows, common ravens (*Corvus corax*), and coyotes, and mesopredators such as raccoons (*Procyon lotor*) and striped skunks (*Mephitis mephitis*).

Since May 2016, Dudek biologists have performed over 248 person hours of surveys on the Project site inclusive of over 93 person hours of protocol coastal California gnatcatcher surveys. A total of 76 wildlife taxa were recorded on the site during surveys, including 51 bird species. A total of six special-status wildlife species were identified within the Project site during reconnaissance and focused surveys, including sharp-shinned hawk (*Accipiter striatus*; CDFW Watch List), Southern California rufous crowned sparrow (*Aimophila ruficeps canescens*; CDFW Watch List), oak titmouse (*Baeolophus inornatus*; USFWS Bird of Conservation Concern), Costa's hummingbird (*Calypte costae*; USFWS Bird of Conservation Concern), Vaux's swift (*Chaetura vauxi*; CDFW Species of Special Concern), and San Diegan tiger whiptail (*Aspidoscelis tigris stejnegeri*; CDFW Species of Special Concern). Impacts to each of these species was analyzed above, and mitigation measures were included, as appropriate, to reduce impacts to less-than-significant levels. Other special-status wildlife species with the potential to occur would likely have been detected during the 248 person hours of surveys if present; therefore, development of the Project would not have a significant impact to special-status wildlife species habitat.

Over the long term, increases in human activity along the open space–urban interface (also referred to as "edge areas") may also result in the trampling of vegetation and compaction of soils. This can affect the long-term viability of plant communities and degrade wildlife habitat quality, as well as increase harassment by pets, invasion by exotic wildlife species (e.g., Argentine ants [*Linepithema humile*]), pesticide use, altered fire regimes, and increased road kill. However, over the long term, indirect impacts on wildlife are expected to be limited along the open space–urban interface because approximately half of the Project site is bordered by existing residential development to the south and southwest; the approved fuel modification plan, which includes a conceptual landscape plan, will be incorporated; and once the residential community is developed, an HOA will oversee and regulate the activities within the development. As part of Project planning, a wildfire study was prepared and indicated that with the approved fuel modification plan, potential fire protection and wildfire effects would be less than significant. The approved fuel modification plan, which includes the conceptual landscape plan, contains specific notes that the plant selections should be made by referencing the Plant Selection Guidelines by Zone (Los Angeles County Fire Department 2011). Los Angeles County Fire-prepared guidelines which include plant selection, undesirable plants/target species, and a fuel modification plant list. The approved fuel modification plan specifically states that all future plantings shall be in accordance with the County of Los Angeles Fire Department Fuel Modification Guidelines (Los Angeles County Fire Department 2011) and approved prior to installation. As this approved fuel modification plan is part of the Project, the potential long-term impacts to adjacent wildlife will be minimized through creation of this fuel modification zone and the implementation of acceptable native plant species as part of the Plant Selection Guidelines (Los Angeles County Fire Department 2011), which provide suitable habitat for wildlife and avoidance of incorporating California Invasive Plant Council-defined invasive plant species. Through implementation of **MM-BIO-6 Landscaping Plan**, prior to issuance of grading permits, a Landscaping Plan for the HOA-maintained areas shall be prepared and submitted to the County of Los Angeles Department of Regional Planning for review and approval. Through implementation of **MM-BIO-15 Homeowners' Association Covenants, Conditions, and Restrictions**, the HOA will maintain the open space areas within the Tract Map Site and oversee the activities within the community, including requiring pets to be leashed, and restricting and discouraging use of balloons, which will decrease the interactions with and impacts on wildlife. **MM-BIO-16 Trash Receptacles** includes the incorporation of trash receptacles. Additionally, there are open space areas, a private trail, debris basins, and infiltration basins proposed within the Tract Map Site, which will act as natural buffers with wildlife. Thus, the Project has been designed along the open space–urban interface to separate sensitive vegetation communities, and potentially jurisdictional aquatic resources, from areas that would be occupied by humans.

Construction noise and vibration may disturb bird breeding activities, potentially resulting in nest abandonment or reduced productivity. Noise can raise the level of stress hormones, interfering with sleep and other activities. Chronic vehicle noise can also affect birds by masking calls, affecting behaviors such as mate attraction and

territory defense. Mammals may generally avoid noisy areas due to increased stress and associated human activities. Vibration may also directly disturb terrestrial species that occupy burrows, dens, and depressions, including reptiles and some amphibians, or cause collapse of burrow systems and dens of fossorial (burrowing) species in areas with highly friable soils.

Lighting related to Project operation and over the long term can have well-documented indirect effects on wildlife (Longcore and Rich 2004), including disorientation; avoidance of areas; disturbances of nighttime rest and sleep periods of diurnal birds; simulated increased day length, affecting reproductive cycles by triggering premature reproductive activity; and increased risk of predation.

Over the long term, pet, stray, and feral animals and mesopredators, which are likely to increase after development, may affect almost all of the wildlife through increased predation and by outcompeting smaller native species for available resources (Crooks and Soulé 1999). The increase in mesopredators in fragmented habitats is often considered an edge effect, but because some of these species can penetrate long distances into natural habitats in the absence of top predators such as coyotes and bobcats, they can also have landscape-level effects. In addition, domestic cats and dogs may be vectors for diseases that affect native wildlife, such as feline immunodeficiency virus, feline leukemia virus, feline infectious peritonitis, feline and canine distemper, panleukopenia, and rabies (Foley 1996; Florida Fish and Wildlife Conservation Commission 2003).

Vehicle collisions with wildlife would potentially increase after the Project is implemented, particularly in areas that were frequently used by wildlife before roads were constructed or improved and other development was built. Almost all of the species are vulnerable to increased traffic collision.

Invasive wildlife may affect several of the species guilds. Development attracts or can provide suitable habitat for several common native wildlife species, such as common ravens, American crows, raccoons (*Procyon lotor*), and striped skunks, and non-native species such as Argentine ants, rock pigeons (*Columba livia*), Virginia opossums (*Didelphis virginiana*), rats (*Rattus* spp.), house mice (*Mus musculus*), and feral cats and dogs. Humans may also release non-native species into the wild. For example, red-eared slider turtles (*Trachemys scripta elegans*), a common pet often bought in pet stores, are often released in nearby streams, ponds, and lakes when owners no longer want to care for their pets. Species such as these may thrive in disturbed or otherwise marginal habitats and can harm native species through predation, competition, and displacement. These risks are particularly high for native reptiles and amphibians and native nesting birds.

Trash and other garbage associated with construction activities and long-term development can degrade vegetation communities and wildlife habitat and can attract nuisance and pest species that affect several of the wildlife guilds. Trash and debris include discarded construction-related materials, such as packaging materials, which may be dispersed into natural areas by wind. Trash generated by construction personnel, such as food packaging and cigarette butts, also can be dispersed by wind and water into natural areas. Pest and predatory species, such as American crows, common ravens, coyotes, striped skunks, and northern raccoons, may be attracted to discarded food. Increased human activity over the long term is also expected to increase the amount of trash and garbage in open space areas.

Long-term indirect edge effects from noise, vibration, vehicle collisions, lighting, and pesticides (except for impacts on water quality), therefore, are less than significant. However, indirect impacts that can occur over a larger landscape could be more substantial, including increased human activity; pet, stray, and feral animals and mesopredators; exotic wildlife; trash and garbage; and disease.

Impact BIO-8 Based on the analysis above, the Project has the potential to cause significant indirect impacts, short-term impacts, and long-term impacts to special-status wildlife. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program; MM-BIO-3 Construction Fencing; MM-BIO-4 Stormwater Pollution Prevention Plan; MM-BIO-5 Weed Control Plan; MM-BIO-6 Landscaping Plan; MM-BIO-7 Fire Protection Plan; MM-BIO-8 Biological Monitoring; MM-BIO-10 Pre-construction Nesting Bird Survey; MM-BIO-15 Homeowners' Association Covenants, Conditions, and Restrictions; MM-BIO-16 Trash Receptacles;** and **MM-BIO-17 Lighting;** and implementing the approved fuel modification plan, which specifically states that All future plantings shall be in accordance with the County of Los Angeles Fire Department Fuel Modification Guidelines (Los Angeles County Fire Department 2011) and approved by County Fire and Planning prior to installation, would reduce potential indirect impacts, short-term impacts, and long-term impacts to wildlife to less than significant.

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-4 **Stormwater Pollution Prevention Plan**

MM-BIO-5 **Weed Control Plan**

MM-BIO-6 **Landscaping Plan**

MM-BIO-7 **Fire Protection Plan**

MM-BIO-8 **Biological Monitoring**

MM-BIO-10 **Pre-construction Nesting Bird Survey**

MM-BIO-15 **Homeowners' Association Covenants, Conditions, and Restrictions**

MM-BIO-16 **Trash Receptacles.** Trash and garbage shall be controlled in areas adjacent to development with waste and recycling receptacles that discourage wildlife foraging in common areas/parks.

MM-BIO-17 **Lighting.** All lighting along the perimeter of natural areas shall be downcast luminaries with light patterns directed away from natural areas.

6.5 Impacts to Critical Habitat

As noted in Section 5.4.5, no designated critical habitat occurs or adjacent to the Project site. No impacts will occur.

6.6 Impacts to Vegetation Communities and Land Cover Types

Threshold 2: Would the Project have a substantial adverse effect on any sensitive natural communities (e.g., riparian habitat, coastal sage scrub, oak woodlands, non-jurisdictional wetlands) identified in local or regional plans, policies, regulations, or by the CDFW or USFWS?

6.6.1 Direct Impacts to Vegetation Communities and Land Cover Types and Proposed Mitigation

Direct permanent and temporary impacts to vegetation communities within the Project site are summarized in Table 12 and shown in Figure 9A, Figure 9B, and Figure 9C. Excluding disturbed and developed land covers, the Project would result in the permanent loss of approximately 105.7 acres (71.7%) of the coverage of vegetation communities present in the Project Site. A total of 98.9 acres is from grading impacts, and 6.7 acres is from fuel modification zone impacts.

Notes:
For alliances with state ranks of S1–S3, all associations within them are considered highly imperiled, Sensitive. A question mark (?) denotes an inexact numeric rank due to insufficient samples over the full expected range of the type, but existing information points to this rank (CDFW 2019a). Coast live oak woodland designated as sensitive by the Los Angeles County Oak Woodlands Conservation Management Plan (County of Los Angeles 2011).

[a] Some totals may not sum due to rounding.
[b] A total of 0.03 acres of oak woodlands were mapped at the Water Tank Area according to A Manual of California Vegetation, Second edition (Sawyer et a. 2009); however, in accordance with Los Angeles County Oak Woodlands Conservation Management Plan Guide (Los Angeles County 2014) there are a total of 0.65 acres of oak woodlands, of which there are 0.61 acres of significant impacts to oak woodlands within OW2 and OW3.
[c] A total of 0.03 acres of impacts to Schinus molle Association – *Ailanthus altissima* Semi-natural Association – *Eucalyptus (globulus, camaldulensis)* Provisional Semi-natural Association.
[d] A total of 0.05 acres of impacts to bush mallow scrub (*Malacothamnus fasciculatus – Malacothamnus* spp.) Alliance.
[e] A total of 0.0001 acres of impacts to California buckwheat scrub (*Eriogonum fasciculatum*) Alliance related to Fuel Management Zones.
[f] A total of 0.04 acres of impacts to purple sage (*Salvia leucophylla*) Alliance.
[g] A total of 0.04 acres of impacts to purple sage scrub (*Salvia leucophylla*) related to Fuel Management Zones.
[h] A total of 0.02 acres of impacts to *Bromus diandrus* Semi-Natural Alliance related to Fuel Management Zones.
[i] A total of 0.006 acres of impacts to wild oats and annual brome grasslands (*Avena* spp. – *Bromus* ssp.) Semi-Natural Alliance.
[j] A total of 0.04 acres of impacts to disturbed habitat associated with Off-Site Roadway Improvement Areas.
[k] A total of 0.00003 acres of impacts to disturbed habitat associated with Off-Site Sewer Line Improvement Areas.
[l] A total of 0.03 acres of impacts to disturbed habitat related to Fuel Management Zones.
[m] A total of 0.04 acres of impacts to urban/ developed related to Fuel Management Zones.

In addition to direct permanent impacts resulting from vegetation removal, impacts associated with fuel modification would occur due to the Project. Impacts within Zone A and Zone B between (0–100 feet from future structures) and within Zone C (100–200 feet from future structures) were quantified for vegetation management activities. Fuel Modification Zone A impacts are included in the direct permanent impacts. Fuel modification in Zone B would result in the disturbance of 2.1 acres, and fuel modification in Zone C would result in the disturbance of 4.6 acres. (Note that due to rounding, totals may not sum precisely.) These are included in the total impact acreages.

The vegetation types within the development footprint that are considered sensitive by CDFW and/or Los Angeles County, as well as under CEQA, are coast live oak woodlands (Los Angeles County sensitive), arroyo willow thickets (riparian), mulefat thickets (riparian), *Rhus trilobata* association (S3, riparian), and Palmer's goldenbush scrub provisional alliance (S3?). Coast live oak woodlands impacts and mitigation are discussed in Section 6.8, Impacts to Wildlife Corridors and Habitat Connectivity, Threshold 5. Impacts to riparian habitats arrow willow thickets, mulefat thickets, and Rhus trilobata association (and sensitive vegetation community) are discussed below in Section 6.7. Impacts to sensitive vegetation community Palmer's goldenbush scrub provisional alliance (S3?) is described below.

Impact BIO-9

Based on the analysis above, the Project has the potential to cause significant direct impacts to sensitive vegetation communities without implementation of mitigation. Project construction would result in 6.7 acres of impacts to Palmer's goldenbush scrub provisional alliance (S3?), which represents 81.7% of the total acreage of this vegetation community within the Project site.

Palmer's goldenbush scrub is an early-successional shrubland that occupies sites after disturbances, generally post-fire but also after other disturbances, in central and southern coastal California and the Sierra Nevada foothills. The early-successional shrubland is dominated by a variable mix of species such as common deerweed, California sagebrush, coyote brush, *Ceanothus* sp., bush monkeyflower (*Diplacus aurantiacus*), California brittle bush, ashy buckwheat (*Eriogonum cinereum*), California buckwheat, golden-yarrow (*Eriophyllum confertiflorum*), sawtooth golden bush (*Hazardia squarrosa*), chaparral yucca, toyon, laurel sumac (*Malosma laurina*), sugarbush (*Rhus ovata*), white sage, purple sage, and black sage (USGS 2020b). This species assemblage is not unique to Palmer's goldenbush scrub and instead are also common in the coastal sage scrub vegetation communities within the 33.3 acres of coastal sage scrub within the Off-Site Open Space Area conservation easement. Palmer's goldenbush scrub establishment is the first step in an area's recovery after disturbance. Palmer's goldenbush (*Ericameria palmeri* var. *pachylepis*), the dominant species in the Palmer's goldenbush scrub provisional alliance (S3?), is a common coastal sage scrub species known to occur from Santa Maria in northern Santa Barbara County south towards San Diego and extending east through the Angeles National Forest and San Bernardino National Forest. Additionally, Palmer's goldenbush is not a special-status plant species. The distribution of Palmer's goldenbush is not limited in the Val Verde area and instead is known to widely occur in the surrounding Los Angeles County and Ventura County areas.

Palmer's goldenbush scrub appears to be similar to that of the sawtooth goldenbush (*Hazardia squarrosa*) and Menzies' goldenbush (*Isocoma menziesii*) alliances, since the stands occur in a larger matrix of annual grasslands (CNPS 2021b). These are early-successional shrublands, generally post-fire, but also after other disturbances (Reid and Evens 2014). Stands of Palmer's goldenbush scrub develop from many types of grassland, chaparral, and coastal sage scrub after recent fires, and on heavy clay soils (Reid and Evens 2014); the locations where the Palmer's goldenbush scrub is found on the Project

site have been classified as loamy soils (USDA 2021). This alliance is transitional from either heavily disturbed annual grasslands or perennial grasslands with *Nassella pulchra* and *Hemizonia fasciculata*, to longer persisting shrublands of *Artemisia californica* or *Salvia leucophylla* (Keeler-Wolf and Evens 2006).

The locations of the Palmer's goldenbush scrub within the proposed Project site are not found within floodways (FEMA 2017) or within or adjacent to previously mapped features (USFWS 2021). As is evident on the USGS's Val Verde 7.5-minute topographic quadrangle (USGS 2021) that contains the Project site, the subwatershed that the Project site is in is relatively small and would not create hydrological conditions that would support floodways with low-energy margins. As stated in the Report, the Project site is located in the upper portion of the Salt Canyon-Santa Clara River watershed, and the moderately to steeply sloping terrain in the northern and eastern portions of the Project appears to convey water downslope rapidly during and following rainfall events. As water flows downslope to the south and west through the Project site, the slope flattens and the channel features dissipate, with water apparently spreading out over a relatively wide area identified as swales that did not support a readily identifiable OHWM or defined bed and bank. These findings are supported by direct observation during storm events in January 2017.

As shown in Figure 1 in Appendix L, the Palmer's goldenbush scrub on the Project site occurs from approximately 1,200 feet amsl at the patch between Coolidge Avenue and Del Valle Road in the southwestern portion to 1,391 feet amsl in the southeastern portion along a minor ridgeline. On a transect going straight east from a point (34.448912, -118.655148 - WGS84 datum) on Del Valle Road in the southern portion of the Project site, the Palmer's goldenbush scrub occurs from approximately 1,225 feet amsl to 1,269 feet amsl, a 44-foot rise in elevation. On a transect going straight east from a point (34.449759, -118.653244) on Del Valle Road in the middle portion of the Project site, the Palmer's goldenbush scrub occurs from approximately 1,257 feet amsl to 1,309 feet amsl, a 52-foot rise in elevation. On a transect going straight east from a point (34.450230, -118.651923) on Del Valle Road in the northern portion of the Project site, the Palmer's goldenbush scrub occurs from approximately 1,279 feet amsl to 1,312 feet amsl, a 33-foot rise in elevation.

Based upon the provided information, the Palmer's goldenbush scrub found on the Project site is not found on the low-energy margins of floodways or dependent on infrequent inundation, and is fact found on slopes based on the elevation range in which it occurs. The Project is within the boundaries of the 1988 Piru Fire, and much of the area of the current Palmer's goldenbush scrub was again burned in the 1992 Hunstock Fire (Zenter and Hagan 2019).

Establishment of 37.9 acres of the Off-Site Open Space Area conservation easement includes 33.3 acres of coastal sage scrub (which includes 1.4 acres of Palmer's goldenbush scrub) and suitable habitat for coastal California gnatcatcher. Specifically, the Off-Site Open Space Area includes 5.7 acres of California sagebrush – California buckwheat scrub alliance, 23.9 acres of California sagebrush scrub alliance, 1.4 acres of Palmer's goldenbush scrub provisional alliance, and 2.3 acres of purple sage scrub alliance. The coastal sage scrub vegetation communities preserved within the Off-Site Open Area conservation easement have similar species assemblage as those within Palmer's goldenbush scrub provisional alliance (S3?) including but not limited to; common deerweed, California sagebrush, coyote

brush, bush monkeyflower, California brittle bush, California buckwheat, golden-yarrow, sawtooth golden bush, chaparral yucca, toyon, sugarbush, white sage, purple sage, and black sage. Although not prominent in quantities to be considered a vegetation community alliance or association, Palmer's goldenbush is a component of the California sagebrush – California buckwheat scrub alliance, California sagebrush scrub alliance, and purple sage scrub alliance present within the Off-Site Open Space Area conservation easement. As Palmer's goldenbush scrub provisional alliance (S3?) is an early-successional shrubland, its type conversion to a more common coastal sage scrub overtime would be well represented by the 33.3 acres of coastal sage scrub (which includes 1.4 acres of Palmer's goldenbush scrub) in the Off-Site Open Space Area conservation easement.

Based on the analysis, the Project has the potential to cause direct impacts to 6.7 acres of Palmer's goldenbush scrub provisional alliance (S3?). As part of the Project, the following mitigation measures shall be implemented to reduce potential direct impacts to Palmer's goldenbush scrub: **MM-BIO-1 Conservation Easement, MM-BIO-2 Worker Education and Awareness Program,** and **MM-BIO-3 Construction Fencing**. The conservation easement is a 37.9-acre area owned by the Applicant located approximately 0.2 miles south of the Tract Map Site consisting of 5.7 acres of California sagebrush – California buckwheat scrub, 23.9 acres of California sagebrush scrub, 1.4 acres of Palmer's goldenbush scrub, 2.3 acres of purple sage scrub, 2.0 acres of wild oats and annual brome grasslands, 2.3 acres of disturbed habitat, and 0.2 acres of urban/developed area.

To fully mitigate for 6.7 acres of direct impacts to Palmer's goldenbush scrub, compensatory mitigation would be required. There shall be a no net loss of Palmer's goldenbush scrub (1:1); however, total mitigation shall be at a minimum of 3:1 (mitigation: impact acres) and shall include one of the options in **MM-BIO-18 Palmer's Goldenbush Scrub Mitigation**.

Additionally, the Off-Site Open Space Area conservation easement contains weed management (including removal of non-native tree of heaven [*Ailanthus altissima*] individuals and establishing native tree species), and 37.9 acres of habitat (including 33.3 acres of intact coastal sage scrub habitat). Implementation of mitigation measures **MM-BIO-1 Conservation Easement**, **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing,** and **MM-BIO-18 Palmer's Goldenbush Scrub Mitigation** would reduce potential direct impacts to sensitive vegetation communities to less than significant.

MM-BIO-1 **Conservation Easement**

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-18 Palmer's Goldenbush Scrub Mitigation

Prior to the issuance of grading permits, to offset the Project's 6.7 acres of direct impacts to Palmer's goldenbush scrub, compensatory mitigation is required. Subject to County approval, there shall be a no net loss of Palmer's goldenbush scrub (1:1) and total mitigation acreages shall be at a minimum of 3:1 (mitigation: impact acres) and shall include one of the following measures:

1. On-site in-kind creation (1:1) and in-kind and out-of-kind preservation (0.2:1 and 5:1) (Total > 5.2:1): In addition to the on-site habitat preservation of existing 1.4 acres of Palmer's goldenbush scrub within the conservation easement area, the Applicant will commit to the following:
   - Creation of 6.7 acres of Palmer's goldenbush in the open space areas within the Tract Map Site (1:1).
   - Establishment of a conservation easement where 31.9 acres of native scrub (a minimum of 0.2:1 in-kind and up to 5:1 out-of-kind) will be preserved in perpetuity.
2. On-site in-kind creation/enhancement and/or preservation (1:1) and in-kind and out-of-kind preservation (0.2:1 and 5:1) (Total > 5.2:1): In addition to the on-site habitat preservation of existing 1.4 acres of Palmer's goldenbush scrub, the Applicant will commit to the following:
   - Creation/enhancement of Palmer's goldenbush within portions of the proposed conservation easement and/or open space areas within the Tract Map Site and/or preservation of existing native scrub alliance(s) with Palmer's goldenbush scrub association within portions of the proposed conservation easement to total 6.7 acres (1:1).
   - Establishment of a conservation easement where 31.9 acres of native scrub (a minimum of 0.2:1 in-kind and up to 5:1 out-of-kind*) will be preserved in perpetuity. *The acreage of Palmer's goldenbush scrub association(s) would count towards in-kind preservation.
3. On-site in-kind creation/enhancement and/or preservation (1:1) and in-kind and out-of-kind preservation (0.2:1 and 5:1), plus off-site in-kind creation/enhancement: In addition to the on-site habitat preservation of existing 1.4 acres of Palmer's goldenbush scrub, the Applicant will commit to the following:
   - Creation/enhancement of Palmer's goldenbush within portions of the proposed conservation easement and/or open space areas within the Tract Map Site and/or preservation of existing native scrub alliance(s) with Palmer's goldenbush scrub association within portions of the proposed conservation easement to total 6.7 acres (1:1).
   - Establishment of a conservation easement where 31.9 acres of native scrub (a minimum of 0.2:1 in-kind and up to 5:1 out-of-kind*) will be preserved in perpetuity. *The acreage of Palmer's goldenbush scrub association(s) would count towards in-kind preservation.
   - If on-site in-kind creation/enhancement and/or preservation and in-kind and out-of-kind preservation do not achieve a total of 3:1, off-site in-kind habitat creation/enhancement will be incorporated to achieve at total of 3:1. Off-site in-kind creation/enhancement of Palmer's goldenbush scrub at a mitigation bank, such as Land Veritas, will be established with an acreage appropriate to achieve a total of 3:1.

Less-Than-Significant Direct Impacts to Vegetation Communities

The Project would permanently impact 0.5 acres of *Schinus molle* – *Ailanthus altissima* – *Eucalyptus* (*globulus*, *camaldulensis*) provisional semi-natural association (no rarity rank), 0.7 acres of Chamise – black sage chaparral alliance (S4), 0.3 acres of black sage scrub alliance (S4), 0.0 acres (rounded from 0.05 acres) (bush mallow scrub alliance (S4), 0.6 acres of California buckwheat scrub alliance (S5), 0.5 acres of California sagebrush – black sage

scrub alliance (S4), 23.0 acres of California sagebrush – California buckwheat scrub alliance (S4), 5.9 acres of California sagebrush scrub alliance (S5), 0.1 acres of coyote brush scrub alliance (S5), 5.5 acres of purple sage scrub alliance (S4), 11.6 acres of *Brassica nigra – Bromus diandrus* semi-natural association (no rarity rank), 7.3 acres of *Bromus diandrus* semi-natural association (no rarity rank), and 41.6 acres of wild oats and annual brome grasslands semi-natural alliance (no rarity rank). These vegetation communities are not considered sensitive based on CEQA standards, and therefore, impacts to these vegetation communities would be less than significant. Focused surveys for special-status wildlife species conducted in 2018 and 2020 were negative for coastal California gnatcatcher; however, other special-status species utilizing these habitats as observed during the 2018 and 2020 focused surveys include Southern California rufous-crowned sparrow, San Diegan tiger whiptail, and oak titmouse. Although the Project would impact suitable habitat for these species, the mitigation measures **MM-BIO-1 Conservation Easement**, **MM-BIO-2 Worker Education and Awareness Program**, **MM-BIO-3 Construction Fencing**, **MM-BIO-4 Stormwater Pollution Prevention Plan**, **MM-BIO-5 Weed Control Plan**, **MM-BIO-6 Landscaping Plan, MM-BIO-7 Fire Protection Plan**, **MM-BIO-8 Biological Monitoring**, **MM-BIO-9 Reptile Pre-construction Survey and Relocation**, **MM-BIO-10 Pre-construction Nesting Bird Survey**, **MM-BIO-11 Pre-construction Burrowing Owl Survey**, **MM-BIO-12 Pre-construction Surveys for San Diego Black-Tailed Jackrabbit**, **MM-BIO-13 Pre-construction Surveys for American Badger**, and **MM-BIO-14 Pre-construction Surveys for San Diego Desert Woodrat** would be sufficient to avoid direct impacts to these species. Based on the proposed preservation of suitable habitat for these species, as well as the large swaths of contiguous suitable habitat adjacent to the Project site, direct impacts to these species are anticipated to be less than significant.

6.6.2 Indirect Impacts to Vegetation Communities and Land Cover Types and Proposed Mitigation

Indirect short-term construction effects to vegetation communities may include fugitive dust; runoff, sedimentation, erosion, and chemical pollution; and accidental clearing, grading, and trampling. Excessive dust from short-term construction can decrease or limit plant survivorship by decreasing photosynthetic output, reducing transpiration, and adversely affecting reproductive success. Construction or other infrastructure upgrades, including mass grading, can severely or permanently alter the surface hydrology in an area and affect plant communities by reducing access to sheet flow during rain events or increasing the chance of erosion. Operation and maintenance of construction equipment can increase the chance of petroleum or other chemical spills or leaks (e.g., fuels, lubricants, cleaning solutions) that can enter off-site vegetation. Vegetation can also be crushed through the inadvertent clearing outside the designated Project footprint.

Over the long term, increases in human activity along the open space–urban interface (also referred to as "edge areas") and within open space areas may result in secondary effects, which include the following:

- Fertilizers and herbicides may penetrate open space areas through runoff and overspray, adversely affecting vegetation communities by killing or weakening native species and/or allowing establishment of non-native species in edge areas.
- Increased urban and stormwater runoff from impervious surfaces such as roads or structures may result in long-term hydrological alterations, including increased runoff volume, increased peak flow rates, increased duration of flows, and altered patterns in the tributary drainages on site.
- Invasive plant species that thrive in edge habitats are a well-documented problem along the open space–urban interfaces in Southern California. Invasive species can degrade habitat by forming monocultures that displace native communities and can colonize virtually any area that is subject to some kind of disturbance,

such as the banks of stream channels and adjacent upland areas, including road shoulders, cleared zones along housing developments, and fire breaks.

- Urbanization also alters wildfire regimes as a result of human activities at the open space–urban interface, such as accidental ignitions from sparks from equipment such as mowers striking rocks, cigarettes, children playing with matches, and intentional ignitions such as arson. While wildfires are most likely to be ignited in edge areas, the actual effect of large wildfires can occur at the much broader landscape level, especially when fires are quickly spread into undeveloped lands by strong winds.

The Project has an approved fuel modification plan (which includes a conceptual landscape plan). The fuel modification plan incorporates details on plant species permitted and not permitted and fuel modification zones which will create a buffer of sorts from the long-term potential impacts to adjacent vegetation. The approved fuel modification plan, which includes the conceptual landscape plan, contains specific notes that the plant selections should be made by referencing the Plant Selection Guidelines by Zone (Los Angeles County Fire Department 2011). Los Angeles County Fire prepared guidelines, which include plant selection, undesirable plants/target species, and a fuel modification plant list. The approved fuel modification plan specifically states that all future plantings shall be in accordance with the County of Los Angeles Fire Department Fuel Modification Guidelines (Los Angeles County Fire Department 2011) and approved prior to installation. As this approved fuel modification plan is part of the Project, the potential long-term impacts to adjacent vegetation will be minimized through the implementation of native plant species and avoidance of incorporating California Invasive Plant Council-defined invasive plant species.

Impact BIO-10 Based on the analysis, the Project has the potential to cause significant indirect short-term and long-term impacts to vegetation communities. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program, MM-BIO-3 Construction Fencing, MM-BIO-4 Stormwater Pollution Prevention Plan**, **MM-BIO-5 Weed Control Plan**, **MM-BIO-6 Landscaping Plan, MM-BIO-7 Fire Protection Plan**, and **MM-BIO-8 Biological Monitoring,** and the approved fuel modification plan, which includes a conceptual landscape plan and notes on plants permitted and not permitted, would reduce potential indirect short-term and long-term impacts to vegetation communities to less than significant.

6.7 Impacts to Jurisdictional Water Resources

Threshold 3: Would the Project have a substantial adverse effect on federally or state protected wetlands (including, but not limited to, marshes, vernal pools, coastal wetlands, and drainages) or waters of the United States, as defined by Section 404 of the federal Clean Water Act (CWA) or California Fish and Game Code Section 1600 et seq., through direct removal, filling, hydrological interruption, or other means?

6.7.1 Direct Impacts to Jurisdictional Water Resources

Within the Project site there are two unnamed ephemeral waterways characterized as non-wetland waters of the United States and state subject to potential regulation by the USACE, RWQCB, and CDFW. Project construction would result in impacts to these jurisdictional water resources.

Impact BIO-11 Project construction would result in direct impacts to potential jurisdictional water resources, which would be significant absent mitigation.

In total, the Project would impact 0.13 acres of non-wetland waters of the United States subject to potential regulation by the USACE, 1.05 acres of streambed and bank and associated riparian vegetation subject to regulation by CDFW , and 0.06 acres of swales subject to regulation by CDFW. The extent of the CDFW streambed and bank and associated riparian vegetation is also under the jurisdiction of RWQCB as non-wetland waters of the state, shown on Figure 9A. Table 13 below provides the impact acreage for each jurisdictional water resource.

Table 13. Impacts to Jurisdictional Waters within the Project Site

Area	Non-Wetland Waters of the United States	CDFW-Jurisdictional Streambed and Associated Riparian Vegetation, Non-Wetland Waters of the State (acres)	CDFW-Jurisdictional Swale (acres)	Length (Linear Feet)
Unnamed Ephemeral Waterway 1	0.06	0.41	N/A	629
Unnamed Ephemeral Waterway 2	0.07	0.64	N/A	1,020
Swale	N/A	N/A	0.06	2,696
Total Impacts to Jurisdictional Areas	**0.13**	**1.05**	**0.06**	**4,345**

Based on the analysis, the Project has the potential to cause significant direct impacts to jurisdictional waters. However, implementation of mitigation measures **MM-BIO-19 Agency Permit Applications** and **MM-BIO-20 Aquatic Resource Habitat Mitigation and Monitoring Plan** would reduce potential direct impacts to less than significant.

MM-BIO-19 **Agency Permit Applications.** Prior to construction work in jurisdictional waters, applications for Clean Water Act (CWA) Section 404 and California Fish and Game Code 1602 permits shall be prepared and submitted to the regulatory agencies and the permits obtained by the Project Applicant. The compensatory mitigation requirements of the resource agencies shall be incorporated into the Aquatic Resource Habitat Mitigation and Monitoring Plan (**MM-BIO-18 Aquatic Resource Habitat Mitigation and Monitoring Plan**). Mitigation shall be proposed at a minimum 1:1 ratio, or as required by the permitting agencies, to preserve, enhance, or restore similar ephemeral streams, streambed and associated riparian habitat, and swales for no net loss of jurisdictional aquatic resources.

MM-BIO-20 **Aquatic Resource Habitat Mitigation and Monitoring Plan**. Prior to the issuance of grading permits, an Aquatic Resource Habitat Mitigation and Monitoring Plan (HMMP) shall be developed in coordination with preparation of the agency permit applications and shall be approved by the regulatory agencies and County of Los Angeles. The Aquatic Resource HMMP shall provide details on the proposed mitigation for impacts to jurisdictional resources present within the Project site including a minimum 1:1 mitigation ratio, or as required by the permitting agencies, of similar ephemeral streams, streambed and associated riparian habitat, and swales for no net loss of jurisdictional aquatic resources. The Aquatic Resource HMMP shall include an overview of the mitigation strategy for impacts to sensitive vegetation as well as specific mitigation locations proposed within off-site areas, including mitigation banks credits (i.e., Santa Paula Creek Mitigation Bank) and conservation lands, if applicable.

The Aquatic Resource HMMP shall include maintenance and monitoring requirements, performance standards, success criteria, and contingency measures, which shall guide the management of the mitigation program and provide the metrics for the determination of success of the Project mitigation.

The U.S. Fish and Wildlife Service, Regional Water Quality Control Board, California Department of Fish and Wildlife, and County of Los Angeles shall review and approve the Aquatic Resource HMMP prior to implementation, ensuring that each of the requirements of these agencies are met and that the Project is consistent with agency policy, permit requirements, and conditions of approval.

6.7.2 Indirect Impacts to Jurisdictional Waters

Indirect short-term construction effects to jurisdictional waters may include runoff, sedimentation, erosion, and chemical pollution, and accidental clearing, grading, and trampling. Construction or other infrastructure upgrades, including mass grading, can severely or permanently alter the surface hydrology in an area. Operation and maintenance of construction equipment can increase the chance of petroleum or other chemical spills or leaks (e.g., fuels, lubricants, cleaning solutions) that can enter jurisdictional water.

Over the long term, increases in human activity along the open space–urban interface (also referred to as "edge areas") and within open space areas may result in secondary effects, which include the following:

- Fertilizers and herbicides may penetrate open space areas through runoff and overspray, adversely affecting jurisdictional waters by killing or weakening native species and/or allowing establishment of non-native species in edge areas.

- Increased urban and stormwater runoff from impervious surfaces such as roads or structures may result in long-term hydrological alterations, including increased runoff volume, increased peak flow rates, increased duration of flows, and altered patterns in the tributary drainages on site.

Impact BIO-12 Based on the analysis, the Project has the potential to cause significant indirect short-term and long-term impacts to jurisdictional waters. However, implementation of mitigation measures **MM-BIO-2 Worker Education and Awareness Program, MM-BIO-3 Construction Fencing, MM-BIO-4 Stormwater Pollution Prevention Plan**, **MM-BIO-8 Biological Monitoring, MM-BIO-15 Homeowners' Association Covenants, Conditions and Restrictions**, and development of an HOA to regulate trash and potential water quality impacts would reduce potential indirect short-term and long-term impacts to jurisdictional waters to less than significant.

MM-BIO-2 **Worker Education and Awareness Program**

MM-BIO-3 **Construction Fencing**

MM-BIO-4 **Stormwater Pollution Prevention Plan**

MM-BIO-8 **Biological Monitoring**

MM-BIO-15 **Homeowners' Association Covenants, Conditions, and Restrictions**

6.8 Impacts to Wildlife Corridors and Habitat Connectivity

Threshold 4: Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

From a regional perspective, the community of Val Verde constrains access to available habitat to the south and southwest, which constitutes some level of impediment to habitat connectivity. However, the open space to the west already provides important wildlife movement corridors for wildlife.

The Project site is situated between an industrial park to the east, the community of Val Verde (single-family homes) to the south and southwest, and the larger community of Castaic and Hasley Canyon community to the north, with portions of mostly undeveloped surrounding lands to the northwest and west. From a regional perspective, Interstate 5 approximately 2 miles to the east of the Project site is a major barrier to wildlife movement, with additional wildlife connectivity restrictions from the industrial park approximately 0.2 miles to the east of the Project site; residential developments to the north, south, and southwest; and the landfill, State Route 126, and the approved Newhall Ranch development (currently the first phase of Newhall Ranch is under construction) to the south. These existing and approved developments constrain wildlife from moving through the Project site. Additionally, there are expansive open spaces further to the west of the existing single-family development which provide connecting north–south habitats and wildlife corridors between the Santa Felicia SEA and Santa Clara River SEA through Los Angeles County and Ventura County. The Santa Felicia SEA, which is largely undeveloped and contains vast stands of intact coastal sage scrub and chaparral communities, contains core habitat to many terrestrial species. These intact habitats provide wildlife movement corridors through the Santa Felicia watershed in addition to the riparian systems between Piru Lake and the San Gabriel Mountain range to the south extending east. The southern portion of the Santa Felicia SEA contains some oil development with a network of dirt roads and few buildings scattered throughout the SEA. The

Project site does not restrict movement between Lake Castaic and Castaic Lagoon and/or along the Santa Felicia SEA or the Santa Clara River SEA.

South Coast Missing Linkages: A Wildland Network for the South Coast Ecoregion (South Coast Wildlands 2008) has prioritized and designed landscape linkages that are widely considered the backbone of a conservation strategy for Southern California. The Project site is outside the designated landscape linkages. The Sierra Madre–Castaic Connection approximately 2.3 miles to the north of the Project site connects the Los Padres National Forest and Angeles National Forest. The Santa Monica–Sierra Madre Connection approximately 2.5 miles to the west of the Project site stretches from the Santa Monica Mountains to the peaks of the Santa Susana Mountains and the Sierra Madres Ranges of the Los Padres National Forest (South Coast Wildlands 2008).

The California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010) was prepared because a functional network of connected wildlands is essential to the continued support of California's diverse natural communities in the face of human development and climate change. The report includes a statewide Essential Habitat Connectivity Map, data characterizing areas delineated on the map, and guidance for mitigating the fragmenting effects of roads and for developing and implementing local and regional connectivity plans. The Project site is located approximately 2 miles to the east of Essential Connectivity Areas identified in the California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010).Overall wildlife movement is regionally and locally constrained through the Project site from existing and approved developments including Interstate 5; the communities of Castaic, Hasley Canyon, and Val Verde; the industrial park; the landfill; State Route 126; and the Newhall Ranch development. The Project is located outside of Los Angeles County designated SEAs, South Coast Wildlands-designed landscape linkages, and Essential Connectivity Areas identified in the California Essential Habitat Connectivity Project: A Strategy for Conserving a Connected California (Spencer et al. 2010). However, the Santa Felicia SEA, Santa Clara River SEA, Sierra Madre–Castaic Connection, and Santa Monica–Sierra Madre Connection further to the west of existing and approved developments provide largely undeveloped intact habitat for wildlife movement corridors and habitat linkages.

Although the Project site is bordered by residential development to the south and southwest, limiting wildlife movement in the area, the Project would potentially interfere with local movement by removing access to suitable habitat patches and established native wildlife nursery sites. Project development would occur within a "pocket" of approximately 144.3 acres of the Tract Map Site, immediately north, east, and northwest of established residential development, and is not expected to permanently prohibit wildlife movement to large open space areas or to natural features. The habitats preserved within the BSA, including the northwest and southeast portions of the Tract Map Site and proposed Off-Site Open Space Area conservation easement, are contiguous with the adjacent open space environments. The establishment of the Off-Site Open Space Area conservation easement would connect to the existing 41.3-acre conservation easement held by the Mountains Recreation & Conservation Authority and would continue to allow wildlife movement through the open space elements.

As previously discussed, the 41.3-acre conservation easement held by the Mountains Recreation & Conservation Authority, the 37.9 acres of open space within the Off-Site Open Space Area conservation easement, the 16.1 acres of Tentative Tract No. 62000 just north of the Off-Site Open Space Area conservation easement, approximately 12.6 acres of the Tract Map site that would remain as natural undisturbed open space, and the manufactured open space around the perimeter of the Tract Map site would continue to facilitate wildlife movement for a variety wildlife species for the foreseeable future. While Tentative Tract No. 62000 is currently proposed for residential development, entitlements for Tentative Tract No. 62000 are not being pursued actively at this time. Accordingly, wildlife movement would continue to occur across the open space areas within the Project area.

Although it is unknown when development of Tentative Tract No. 62000 would occur, several standard development features would continue to permit wildlife movement throughout the Project area. Consistent with County requirements, natural and undisturbed open space, manufactured open space, and a 20-foot-wide multiuse trail easement would be included as part of the development. The natural undisturbed open space and manufactured open space would provide wildlife movement opportunities across the site. Additionally, the 20-foot-wide multiuse trail easement would include a natural multiuse trail surface, approximately 5 to 8 feet in width, that would traverse north–south through the site as identified in the County's Master Plan of Trails. When Tentative Tract No. 62000 is developed, the open space areas and natural multiuse trail would continue to provide north–south wildlife movement opportunities for wildlife in the Project area.

For these reasons, the Project would not result in an adverse impact to identified wildlife corridors and linkages, and impacts would be less than significant.

Threshold 5: Would the Project convert oak woodlands (as defined by the state, oak woodlands are oak stands with greater than 10% canopy cover with oaks at least 5 inches in diameter measured at 4.5 feet above mean natural grade) or otherwise contain oak or other unique native trees (junipers, Joshua tree, southern California black walnut, etc.)?

Oak Woodlands

Description of Impacts

A total of 0.38 acres of canopy area/understory habitat and 1.69 acres of buffer area of County of Los Angeles-defined oak woodland were recorded on site within the Off-Site Water Tank Area BSA and surrounding area. It is anticipated that development of the Project will result in the following Project impacts:

- Removal of approximately 0.09 acres of canopy area/understory habitat
- Removal of approximately 0.56 acres of buffer habitat

Based on these assumptions, the Project design allows for approximately 1.42 acres, or 68.9%, of the existing 2.07-acre oak woodland canopy area (all on-site oak woodland canopy combined) to remain undisturbed during and after Project construction and operations. Oak woodland impacts are listed in Table 6 of Appendix A and depicted on Figure 6, Oak Woodland Impacts in Appendix A.

Oak woodland impacts were determined using GIS software and spatial locations of trees relative to the Project's impact areas (grading footprint). Impacts were further determined based on Dudek's experience with native woodland habitats and their typical responses to root disturbances from construction activities, such as soil compaction, excavation, and grading. The impact analysis results presented herein were used for recommending appropriate mitigation measures for the Project. Impact totals presented are based on proposed disturbance limits and development plans as of the date of the Oak Woodland Report.

Impact Severity and Estimated Level of Significance (Oak Woodland Guide)

Pursuant to the Oak Woodlands Conservation Management Plan Guide, a determination must be made regarding whether the Project will have a substantial adverse effect on oak woodlands and/or result in the conversion of existing oak woodlands. Further, Table 2 of the Oak Woodlands Conservation Management Plan Guide quantifies the severity of Project impacts in relation to the habitat value/integrity of the subject woodland and the anticipated

Project impact(s). Once a determination of the impact severity of the Project is made, an estimated level of significance is assigned in accordance with Table 3 of the Oak Woodlands Conservation Management Plan Guide. Subsequently, these designations are used to assess whether the Project will exceed the threshold for significance for impacts to oak woodlands. Because the Project site contains three oak woodlands, a determination of the impact severity anticipated and the level of significance was assigned for each subject woodland. These designations are discussed in detail below. Tables 2 and 3 of the Oak Woodlands Conservation Management Plan Guide are provided for reference in Appendices E and F of Appendix A, respectively. For ease of presentation, the oak woodland impacts are separated by impact category below.

Oak Woodland with No Impact or Less-Than-Significant Impacts

Oak Woodland 1

- Project impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Moderately Degraded
  - Discussion regarding the woodland integrity ranking of OW1 is provided in Section 5.4.1.1.2 of this report.
- Impact Severity Ranking: Low
  - Excavation and grading activities associated with construction of the new water tank would require the removal of approximately 0.04 acres of the total 0.26-acre woodland canopy and understory habitat associated with OW1, allowing for approximately 84.5% of the total canopy area associated with OW1 to be retained. Because areas within OW1 are currently subject to roadway use, it is anticipated that these activities will continue unmodified. Pursuant to Table 2, Impact Severity, of the Oak Woodlands Conservation Management Plan Guide, Project impacts within the moderately degraded woodland will have an impact severity ranking of low based on the retention of 84.5% of oak woodland canopy associated with OW1 and the assumptions that the current regeneration potential of the subject woodland would be maintained and the current understory vegetation community will persist.
- Estimated Level of Significance: Less than Significant
  - Pursuant to Table 3, Estimated Level of Significance, of the Oak Woodlands Conservation Management Plan Guide, Project impacts within a moderately degraded woodland that have an impact severity ranking of low would be less than significant. No mitigation will be required under the Oak Woodlands Conservation Management Plan Guide.

Oak Woodlands with Less-Than-Significant Impacts with Mitigation

Oak Woodland 2

- Project impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Intact
  - Discussion regarding the woodland integrity ranking of OW2 is provided in Section 5.4.1.1.2 of this report.
- Impact Severity Ranking: High
  - Excavation and grading activities associated with the new water tank will require the removal of approximately 0.41 acres of the total 1.32-acre woodland canopy and understory habitat associated with OW2, allowing for approximately 69.3% of the total canopy area associated with OW2 to be retained. Pursuant to Table 2 of the Oak Woodlands Conservation Management Plan Guide, these activities within the intact woodland will have an impact severity ranking of high based on the assumption that the impact

will result in the net loss of oak woodland acreage and the loss of habitat and understory. Mitigation will be required under the Oak Woodlands Conservation Management Plan Guide.

- Estimated Level of Significance: Potentially Significant
  - Pursuant to Table 3 of the Oak Woodlands Conservation Management Plan Guide, Project impacts within an intact woodland that have an impact severity ranking of high would be significant and result in the following impacts to OW2: net loss of oak woodland acreage and loss of wildlife habitat and food sources. Mitigation will be required under the Oak Woodlands Conservation Management Plan Guide.

Oak Woodland 3

- Project Impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Intact
  - Discussion regarding the Woodland Integrity Ranking of OW3 is provided in Section 5.4.1.1.2 of this report.
- Impact Severity Ranking: High
  - Excavation and grading activities associated with the new water tank will require the removal of approximately 0.20 acres of the total 0.49-acre woodland canopy and understory habitat associated with OW2, allowing for approximately 59.5% of the total canopy area associated with OW2 to be retained. Pursuant to Table 2 of the Oak Woodlands Conservation Management Plan Guide, these activities within the intact woodland will have an impact severity ranking of high based on the assumption that the impact will result in the net loss of oak woodland acreage and the loss of habitat and understory.
- Estimated Level of Significance: Potentially Significant
  - Pursuant to Table 3 of the Oak Woodlands Conservation Management Plan Guide, Project impacts within an intact woodland that have an impact severity ranking of high would be significant and result in the following impacts to OW3: net loss of oak woodland acreage and loss of wildlife habitat and food sources. Mitigation will be required under the Oak Woodlands Conservation Management Plan Guide.

Impact BIO-13 Based on the analysis, Project development would result in a potentially significant impact to OW2 and OW3 and have a less-than-significant impact on OW1. A total of 0.61 acres of significant impacts to oak woodland canopy would occur in OW2 and OW3, combined, which would require mitigation. Implementation of mitigation measure **MM-BIO-21 Off-Site Water Tank Area Oak Woodland and Oak Tree Mitigation** would reduce oak woodland impacts to less than significant.

MM-BIO-21 **Off-Site Water Tank Area Oak Woodland and Oak Tree Mitigation**

Prior to issuance of grading permits, in accordance with the Oak Woodlands Conservation Management Plan Guide (County of Los Angeles 2011, 2014), to offset the Project's total combined significant impact of 0.61 acres of oak woodland canopy in OW2 and OW3, and in accordance with the Los Angeles Oak Tree Ordinance, to offset the Project's impacts to 12 protected oak trees at the Off-Site Water Tank Area, one of the following mitigation measures shall be implemented, subject to County of Los Angeles approval:

1. Purchase mitigation credits for 1.22 acres of oak woodlands from an off-site oak woodland habitat preservation area owned by a third party; or

2. Contribute to the Los Angeles County's Oak Forests Special Fund in an amount of $97,040 (two times the canopy cover area value).

Southern California Black Walnut

Project construction would result in direct impacts to one Southern California black walnut tree within the Tract Map Site BSA. Southern California black walnut has a CRPR of 4.2. CRPR 4 is defined as a Watch List of plants of limited distribution or infrequent throughout a broader area in California, and their status should be monitored regularly. And threat rank 0.2 is defined as moderately threatened in California. Southern California black walnut is not listed on Bureau of Land Management, USFWS, or U.S. Forest Service sensitive species lists. Southern California black walnut is endemic to California and has been documented from San Diego County north through Siskiyou County; thus, this occurrence is well within the known species' range. It is a perennial deciduous tree that occurs in chaparral, cismontane woodland, coastal scrub, and riparian woodland. The one Southern California black walnut documented at the site was adjacent to an existing residence surrounded by ornamental vegetation and non-native grasslands including annual brome grassland; thus, the Southern California black walnut was not occurring on unusual substrates. There are no native woodlands or native tree stands documented near the one Southern California black walnut to indicate a natural occurrence of this individual. No other Southern California black walnut individuals were observed within the local vicinity. This single occurrence of one individual in the disturbed habitat setting is likely not naturally occurring or may have established as a volunteer at the site; therefore, this species is not considered sensitive, and no impacts would occur. Additionally, during surveys no special-status wildlife was observed using the tree as habitat.

Threshold 6: Would the Project conflict with any local policies or ordinances protecting biological resources, including Wildflower Reserve Areas (Los Angeles County Code, Title 12, Ch. 12.36), the Los Angeles County Oak Tree Ordinance (Los Angeles County Code, Title 22, Ch. 22.56, Part 16), the Significant Ecological Areas (SEAs) (Los Angeles County Code, Title 22, Section 22.56.215), and Sensitive Environmental Resources Areas (SERAs) (Los Angeles County Code, Title 22, Ch. 22.44, Part 6)?

Oak Trees – Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area

The complete Oak Tree Report for the Sterling Ranch Estates Project which includes the Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area, is included in Appendix B.

Tree impacts were determined using GIS technology and spatial locations of trees relative to the Project impact areas (limits of grading). Impacts were further determined based on Dudek's experience with native and non-native trees and their typical reactions to root disturbances from construction activities such as soil compaction, excavation, and remedial grading. The impact analysis results presented were used for developing appropriate mitigation measures for the Project.

Impacts to trees can be classified as direct or indirect. Direct impacts to trees related to site improvements are typically the result of physical injuries or changes caused by machinery involved with the development process. Direct impacts include tree removal, root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others. Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Indirect impacts include alterations to stream flow rates, diversion of groundwater flow, introduction of exotic plant species, and alterations to disturbance regimes. Wider-scale alterations to the area near trees, as well as specific changes that occur around the trees, are important considerations.

In general, there is a great deal of variation in tolerance to construction impacts among tree species, ages, and conditions. It is important to know how a certain tree, based on its species, age, and condition, would respond to different types of disturbance. The trees in the Project area are of varying ages and conditions. Mature specimens are typically more sensitive to root disturbance and grade changes. In general, healthy trees will respond better to changes in their growing environment. Trees of poor health or stressed conditions may not be vigorous enough to cope with direct or indirect impacts from construction activities.

Impact totals presented are based on conceptual disturbance limits and development plans as of the date of the oak tree report (Appendix B). As such, the actual number of trees subject to direct and indirect impacts may change as the detailed site planning process proceeds. Actual tree impact numbers may be lower than anticipated and as presented in the oak tree report once detailed grading plans are developed. Measures to reduce impacts are encouraged and would be implemented in the field during grading operations. Following completion of construction-related disturbances, actual protected tree impact totals would be updated and provided along with revised mitigation totals.

Direct Tree Impacts

For the purposes of the Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area oak tree report, provided in Appendix B, direct impacts are those associated with tree removal or encroachment within the tree-protected zone (canopy dripline plus 5 feet or 15 feet from trunk, whichever is greater). Tree removal is expected to be required when the trunk is located inside or within 2 feet of the proposed limits of grading. Encroachment is expected when soil and roots are disturbed within the tree-protected zone. Table 14 summarizes the number of trees by species that are expected to be subject to direct construction-related impacts. Direct tree impacts will result in the removal of two protected trees. A single non-protected-size tree will be removed (Tree Number 2). The locations of impacted trees are presented by impact type on the map in Appendix B of the Oak Tree Report (Appendix B).

Table 14. Summary of Tree Disposition

Scientific Name	Common Name	Removal	Encroachment	Indirect
Quercus agrifolia	coast live oak	2 (1*)	—	—
	Total	**2 (1*)**	—	—

Note:
* (X) Indicates non-protected size tree.

Indirect Tree Impacts

Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Site-wide changes affecting trees include diverting runoff and stormwater, creating retention and detention ponds, relocating streams or making improvements to streams, lowering or raising water tables, altering the capacity for soil moisture recharge, removing vegetation, or damming underground water flow (Matheny and Clark 1998). For the purposes of this Tract Map Site, Off-Site Open Space Area, and Off-Site Roadway Improvement Area oak tree report, as provided in Appendix B, there are no indirect tree impacts expected for trees within 25 feet of the proposed Project's limits of grading.

Candidates Suitable for Preservation

Trees identified as candidates for preservation in place exhibit good health (new growth and vigor) and structure (trunk/branching), have no uncorrectable, outwardly detectable defects, and show no signs or symptoms of serious pest infestation or species-specific pathogens. For the trees to avoid incidental damage during construction, preservation and protection measures must be provided before, during, and after the construction phase.

A total of two protected trees will not be disturbed by active construction-related activities or grading; therefore, these trees will be preserved in place.

Impact BIO-14 Based on the analysis, the Project will directly impact (remove) three oak trees within the Tract Map Site BSA. Of the three oak trees proposed for impact, two are protected by the Los Angeles County Oak Tree Ordinance, and one is a heritage tree, which has the potential to cause significant impacts. The two valley oak trees that have protected zones adjacent to the active construction area shall be protected with the following tree protection measures. Implementation of mitigation measures **MM-BIO-22 Oak Plantings in Tract Map Site Zone C** and **MM-BIO-23 Tree Protection Measures** would reduce impacts to less than significant.

MM-BIO-22 **Oak Plantings in Tract Map Site Zone C.** A total of 12 coast live oak (*Quercus agrifolia*) shall be planted, maintained, monitored, and reported on within the Tract Map Site. The 12 coast live oak trees shall be locally sourced, 1-gallon oak trees planted on preferably north-facing slopes within the northwest corner of the Tract Map Site in Fuel Modification Zone C on non-graded slopes within natural open space, avoiding native habitat disturbance. The planted trees shall be subject to a 7-year monitoring period by an independent third-party certified arborist. This monitoring effort shall consider growth, health, and condition of the subject trees to evaluate success. The monitoring efforts shall result in recommendations of remedial actions should any of the tree plantings exhibit poor or declining health.

MM-BIO-23 **Tree Protection Measures.** To prevent damage to any protected trees that would be avoided during Project construction, the following measures shall be implemented by the Project Developer for any such trees within 20 feet of an active construction area.

Prior to Construction

Fencing: Chain-link fencing, no less than 4 feet high, with tree protection signs shall be erected around all undisturbed trees (or tree groups). The protective fence shall be installed at the protected zone boundary of each tree (or tree group), which is defined as 5 feet beyond the tree canopy dripline, or 1.5 feet per inch of trunk diameter, whichever is greater. The intent of protection fencing is to prevent root damage and/or compaction by grading equipment. An International Society of Arboriculture (ISA)-certified arborist may be required on site if grading activities occur within the tree's protected zone. The fencing shall be secured to 6-foot, heavy-gauge T-bar line posts, pounded in the ground a minimum of 18 inches and spaced a minimum of 8 feet on-center. Fencing shall be attached to T-bar posts with minimum 14-gauge wire fastened to the top, middle, and bottom of each post. Tree protection signs shall be attached to every fourth post. The contractor shall maintain the

fence to keep it upright, taut, and aligned at all times. Fencing shall be removed only after all construction activities in the vicinity of the affected tree(s) are complete.

Pre-construction Meeting: A pre-construction meeting shall be held between all contractors (including grading, tree removal/pruning, and builders) and an ISA-certified arborist. The meeting shall focus on instructing the contractors on tree protection practices and answering any questions. All equipment operators and spotters, assistants, or those directing operators from the ground shall provide written acknowledgement of receiving tree protection training. This training shall include information on the location and marking of protected trees, the necessity of preventing damage, and the discussion of work practices that shall accomplish these tasks.

During Construction

Once construction activities have begun, the following protection measures shall be followed.

Equipment Operation and Storage: Contractors shall avoid heavy equipment operation around the protected trees. Operating heavy machinery around the root zones of trees will increase soil compaction, which decreases soil aeration and subsequently reduces water penetration into the soil. All heavy equipment and vehicles shall, at minimum, stay out of the fenced protected tree zone unless where specifically approved in writing and under the supervision of an ISA-certified arborist or their representative.

Materials Storage and Disposal: Contractors shall not store or discard any supplies or materials, including paint, lumber, and concrete overflow, within the protected zone and shall remove all foreign debris within the protected zone. However, the contractors shall leave the duff, mulch, chips, and leaves around the retained trees for water retention and nutrient supply. In addition, the contractors shall avoid draining or leakage of equipment fluids near retained trees. Fluids such as gasoline, diesel, oils, hydraulics, brake and transmission fluids, paint, paint thinners, and glycol (anti-freeze) shall be disposed of properly. The contractors shall ensure that equipment be parked at least 50 feet from the protected zone to avoid the possibility of leakage of equipment fluids into the soil. The effect of toxic equipment fluids on the retained trees could result in tree decline and/or mortality.

Grade Changes: Contractors shall ensure that grade changes, including adding fill, shall not be permitted within the protected zone without special written authorization and under supervision by an ISA-certified arborist or their representative. Lowering the grade within the protected zone would necessitate cutting main support and feeder roots, jeopardizing the health and structural integrity of the trees. Adding soil, even temporarily, on top of the existing grade would compact the soil further and decrease water and air availability to the tree roots. Contractors shall ensure that grade changes made outside of the protected tree zone shall not create conditions that allow water to pond at the base of the tree. Water trapped at the base of a tree could lead to root rot and other detrimental tree impacts.

Moving Construction Materials: Contractors shall ensure that care be exercised when moving construction equipment or supplies near the undisturbed oak trees, especially overhead. Contractors shall ensure that damage to the trees shall be avoided when

transporting or moving construction materials and working around the tree (even outside of the fenced protected zone). Contractors shall flag aboveground tree parts that could be damaged (e.g., low limbs, scaffold branches, and trunks) with high-visibility flagging, such as florescent red or orange. If contact with the tree crown is unavoidable, conflicting branches may be pruned by an ISA-certified tree worker under supervision by an ISA-certified arborist or their representative and shall adhere to ISA standards.

Trenching: Except where specifically approved in writing beforehand, all trenching shall be outside of the fenced protected zone. Roots primarily extend in a horizontal direction, forming a support base to the tree similar to the base of a wine glass. Where trenching is necessary in areas that contain roots from retained trees, contractors shall use trenching techniques that include the use of either a root pruner (Dosko root pruner or equivalent) or an Air-Spade to limit root impacts. An ISA-certified arborist or their representative shall ensure that all pruning cuts be clean and sharp to minimize ripping, tearing, and fracturing of the root system. Root damage caused by backhoes, earthmovers, dozers, or graders is severe and may result in tree mortality. Use of both root-pruning and Air-Spade equipment shall be accompanied only by hand tools to remove soil from trench locations. The trench shall be made no deeper than necessary.

Irrigation: Irrigation of native protected trees retained on site shall seek to mimic natural rainfall patterns in Southern California. Supplemental irrigation for trees adjacent to construction activity may be necessary during winter or spring months. Summer and fall irrigation may be necessary based on variable climatic and site conditions, but should be conducted judiciously to avoid overwatering. One irrigation cycle shall thoroughly soak the root zones of the trees to a depth of 3 feet. The soil should be allowed to dry out between watering to avoid keeping a consistently wet soil. The contractor shall be responsible for irrigating (deep watering) the trees. Soil moisture shall be checked with a soil probe before irrigating. Irrigation is best accomplished by installing a temporary aboveground micro-spray system that would distribute water slowly (to avoid runoff) and evenly throughout the fenced protection zone. Over-watering of native oaks may promote the growth of tree-damaging agents, such as oak root fungus, so proper soil moisture monitoring is critical to prolonged tree health. For any trees that have been substantially root pruned (30% or more of their root zone), irrigation shall be required for the first 12 months. The first irrigation shall occur within 48 hours of root pruning. The tree(s) should be deep watered every 2 weeks during the summer and once a month during the winter (adjust accordingly with rainfall).

Canopy Pruning: The contractor shall not prune trees until all construction is completed unless standard pruning would reduce conflict between canopy and equipment. This will help protect the tree canopies from damage. All pruning shall be conducted by an ISA-certified tree worker under supervision by an ISA-certified arborist or their representative and shall adhere to ISA pruning standards.

Canopy Washing: During construction, the contractor shall wash the foliage of trees adjacent to construction activity with a strong water stream every 2 weeks before 10:00 a.m. to control mite and insect populations.

Inspection: An ISA-certified arborist or their representative shall inspect the preserved trees adjacent to grading and construction activity on a monthly basis for the duration of the proposed Project's construction period. A report summarizing site conditions, observations, tree health, and recommendations for minimizing tree damage shall be submitted by the ISA-certified arborist or their representative following each inspection.

After Construction

Following the completion of the construction activity within 20 feet of the protected zones of undisturbed oaks, the tree protection fencing may be removed, and the following measures may be performed to sustain and enhance the vigor of the trees.

Mulch: The contractors shall ensure that the natural duff layer under all trees is maintained. This would stabilize soil temperatures in root zones, conserve soil moisture, and reduce erosion. The contractors shall ensure that the mulch is kept clear of the trunk base to avoid creating conditions favorable to the establishment and growth of decay-causing fungal pathogens. Should it be necessary to add organic mulch under retained protected trees, packaged or commercial mulch shall not be used because it may contain oak root fungus. Also, the use of redwood chips shall be avoided because certain inhibitive chemicals may be present in the wood. Other wood chips and crushed walnut shells can be used, but the best mulch that provides a source of nutrients for the tree is its own leaf litter. Any organic mulch added by the contractor shall be applied to a maximum depth of 4 inches where possible.

Pruning: Regular pruning of the trees is not required. An ISA-certified tree worker, under the supervision of an ISA-certified arborist or their representative, shall only prune trees to maintain clearance and remove broken, dead, or diseased branches. No more than 15% of the canopy shall be removed at one time. All pruning shall conform to ISA standards.

Watering: The trees should not require regular irrigation, other than the 12 months following substantial root pruning, if applicable. However, soil probing shall be necessary to accurately monitor moisture levels. Supplemental irrigation for the trees that sustained root pruning and any newly planted trees may be necessary, especially in years with low winter rainfall.

Watering Adjacent Plant Material: All plants near the trees shall require moderate to low levels of water. The contractor shall infrequently water surrounding plants with deep soaks, rather than frequent light irrigation, and allow them to dry out between watering. The soil shall not be allowed to become saturated or stay continually wet, and drainage should not allow ponding of water beneath the canopy of the oak trees. Irrigation spray shall not hit the trunk of any tree. The contractor shall maintain a 30-inch dry zone around all tree trunks. An aboveground microspray irrigation system shall be used in lieu of typical underground pop-up sprays.

Chemical Applications: If the trees are maintained in a healthy state, regular spraying for insect or disease control would not be necessary. If a problem does develop, an ISA-certified arborist/licensed pest control adviser or their representative shall be consulted

since the trees may require application of insecticides to prevent the intrusion of bark-boring beetles and other invasive pests. All chemical spraying shall be performed by a licensed applicator under the direction of a licensed pest control adviser.

Monitoring: An ISA-certified arborist or their representative should inspect the trees retained on site for a period of 7 years following the completion of construction activity. Monitoring visits should be completed quarterly, totaling 20 visits. Following each monitoring visit, a report summarizing site conditions, observations, tree health, and recommendations for promoting tree health shall be submitted. Additionally, any tree mortality shall be noted, and any tree dying during the monitoring period shall be replaced with the same species as specified for minimum replacement standards in this oak tree report.

Oak Trees – Off-Site Water Tank Area

The complete Oak Tree Report for the Sterling Ranch Estates Project, Off-Site Water Tank Area is included in Appendix C.

Tree impacts were determined using GIS software and spatial locations of trees relative to the Project's impact areas (development footprint). Impacts were further determined based on Dudek's experience with native and non-native trees and their typical reactions to root disturbances from construction activities, such as soil compaction, excavation, and grading. The impact analysis results presented herein were used for developing appropriate mitigation measures for the Project.

Impacts to trees can be classified as direct or indirect. Direct impacts to trees related to site development are typically the result of physical injuries or changes caused by machinery involved with the development process. Direct impacts include tree removal, root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others. Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Indirect impacts include alterations to stream flow rates, diversion of groundwater flow, introduction of exotic plant species, and alterations to disturbance regimes. Wider-scale alterations to the area near trees, as well as specific changes that occur around the trees, are important considerations.

In general, there is a great deal of variation in tolerance to construction impacts among tree species, ages, and conditions. It is important to know how a certain tree, based on its species, age, and condition, would respond to different types of disturbance. The trees on the Project site are of varying ages and conditions. Mature specimens are typically more sensitive to root disturbance and grade changes. In general, healthy trees will respond better to changes in their growing environment. Trees of poor health or stressed conditions may not be vigorous enough to cope with direct or indirect impacts from construction activities.

Impact totals presented are based on conceptual disturbance limits and development plans as of the date of the Oak Tree Report for the Sterling Ranch Estates Residential Project, Off-Site Water Tank Area (Dudek 2020) included in Appendix C. As such, the actual number of trees subject to direct and indirect impacts may change as the detailed site planning process proceeds. Actual tree impact numbers may be lower than anticipated and as presented in the Oak Tree Report for the Sterling Ranch Estates Residential Project, Off-Site Water Tank Area (Dudek 2020) included in Appendix C once detailed grading plans are developed. Measures to reduce impacts are encouraged and would be implemented in the field during grading operations. Following completion of construction-related disturbances, actual protected tree impact totals would be updated and provided, along with revised mitigation totals.

Direct Tree Impacts

For the purposes of this report, direct impacts are those associated with tree removal or encroachment within the tree-protected zone (canopy dripline plus 5 feet or 15 feet from trunk, whichever is greater). Tree removal is expected to be required when the trunk is located inside or within 2 feet of the proposed limits of grading. Encroachment is expected when soil and roots are disturbed within the tree protected zone. Table 15 summarizes the number of trees by species that are expected to be directly impacted by construction. Direct tree impacts would result in the removal of 12 protected trees and the encroachment of an additional 11 protected trees. Two non-protected-size trees would be removed. The locations of impacted trees are presented by impact type on the map in Appendix B in the Oak Tree Report (Appendix C).

Table 15. Summary of Direct Tree Impacts

Species		Protected Trees		Non-Protected Trees	
Scientific Name	Common Name	Trees to Remove	Impacted but Not Removed	Trees to Remove	Impacted but Not Removed
Quercus agrifolia	coast live oak	12	11	1	3
Quercus berberidifolia	scrub oak	0	0	1	0
	Total	**12**	**11**	**2**	**3**

Indirect Tree Impacts

Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Site-wide changes affecting trees include diverting runoff and stormwater, creating retention and detention ponds, relocating streams or making improvements to streams, lowering or raising water tables, altering the capacity for soil moisture recharge, removing vegetation, or damming underground water flow (Matheny and Clark 1998). For the purposes of this oak tree report, 31 indirect tree impacts are expected for trees within 25 feet of the Project development footprint. Table 16 summarizes the number of trees by species that are expected to be indirectly impacted by construction.

Table 16. Summary of Indirect Tree Impacts

Scientific Name	Common Name	Protected Trees	Non-Protected Trees
Quercus agrifolia	coast live oak	12	12
Quercus berberidifolia	scrub oak	1	6
	Total	**13**	**18**

Impact BIO-15 Based on the analysis, 28 oak trees will be directly impacted (14 removals and 14 encroachments) by the Project. Of the 28 direct impacts, 12 that are protected by the Los Angeles County Oak Tree Ordinance are expected to require removal. Mitigation is required based on the Los Angeles Oak Tree Ordinance, which can be achieved through purchasing mitigation credits or an in-lieu fee can be paid. Implementing **MM-BIO-21 Off-Site Water Tank Area Oak Woodland and Oak Tree Mitigation** and **MM-BIO-23 Tree Protection Measures** will reduce impacts to oak trees to a less than significant level

MM-BIO-21 **Off-Site Water Tank Area Oak Woodland and Oak Tree Mitigation.**

MM-BIO-23 **Tree Protection Measures**

Threshold 7: **Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan?**

The Project does not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved state, regional, or local habitat conservation plan; therefore, there would be no impacts.

6.9 Impacts to Regional Resource Planning

Zoning for the Project site is R-1 (single-family residence), C-2 (neighborhood commercial), A-1-2 (light agricultural), and A-2-2 (heavy agricultural). Residential uses border the Tract Map Site BSA on the west and south. Largely undeveloped land lies north of the Tract Map Site BSA. Surrounding land use designations include H5-Residenital 5 (0–5 dwelling units per acre) to the south and west, RL2-Rural Land 5 (1 dwelling unit per 2 acres) to the north, and IO-Industrial Office to the east. Surrounding zoning uses include R-1 to the south and west, A-2-2 (light and heavy agriculture) to the north, and MPD-DP (manufacturing industrial planned development) to the east. The Project involves residential and commercial uses for the Project site, which are consistent with the SCAP. The Project would not have significant impacts with respect to SCAP goals and policies.

1 Introduction

This Oak Woodland Report provides an assessment of the oak woodlands located on the Sterling Ranch Estates Residential Project, Off-Site Water Tank Area (project). The project site is located in Los Angeles County, California. As such, this Oak Woodland Report addresses the regulations and requirements for the conversion and/or loss of oak woodlands within the jurisdiction of the County of Los Angeles (County).

Sterling Ranch Estates retained Dudek to conduct an oak woodlands assessment for the project site. A Dudek International Society of Arboriculture (ISA) Certified Arborist performed various functions associated with surveying, inventorying, and evaluating the condition of all protected oak trees located within the project site to meet the County's requirements. A Dudek Registered Professional Forester (RPF) conducted assessments of all potentially impacted oak tree woodlands located within the project site to meet the County's requirements.

The purpose of this Oak Woodland Report is to present the physical characteristics and mapped locations of the site's oak woodlands that may be converted or lost to development during the proposed excavation and grading related activities. This Oak Woodland Report addresses project-related impacts to oak woodlands on the project site.

Contact information for the applicant and a list of project staff are as follows:

Applicant:

Sterling Ranch Estates

Ryan Allen, Arborist
Doug Nickles, Forester

1.1 Project Location

The project site is located in the community of Val Verde, approximately 0.5 miles west of San Martinez Road (Figure 1, Regional Map). The project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The project site and biological study area occur entirely within the U.S. Geological Survey 7.5-minute Val Verde quadrangle (USGS 2017).

1.2 Project Description

In conjunction with approval of the project, Los Angeles County Waterworks District 36 has required the construction of a water tank. The project includes a one-million-gallon-water tank, more capacity than required by Los Angeles County Waterworks District 36 for firefighting purposes, at the elevation of the existing Cuyama tanks, referred to herein as the Off-Site Water Tank Area. The Off-Site Water Tank Area lies in and adjacent to the existing Los Angeles County Waterworks District No. 36 Cuyama tank site. The water tank is located within the Los Angeles County

Waterworks District's 1598 pressure zone, Assessor Parcel Numbers 3272-029-902 and 3272-029-023, which comprises approximately 2.79 acres. The project site, which includes the development footprint and the overall biological study area, is depicted in Figure 2, Vicinity Map.

1.3 Existing Conditions

The project site has one paved access road that dead ends into two water storage tanks on the southwest end of the property. The remaining land within the project site is best characterized as undeveloped oak woodland. Topographically, the project site consists of moderate north- and south-facing slopes with elevations ranging from approximately 1,550 feet above mean sea level along the northern boundary to approximately 1,750 feet above mean sea level in the southern portion of the site.

2 Regulatory Setting

In response to regulations enacted by the State of California (California Public Resources Code, Section 21083.4), the County of Los Angeles adopted the Los Angeles County Oak Woodlands Conservation Management Plan (Plan) (August 23, 2011) and drafted the Oak Woodlands Conservation Management Plan Guide (Guide) (March 18, 2014) as an implementing document for the Plan. The purpose of the regulations and the adopted Plan is to determine whether the development of a proposed project "may result in a conversion of oak woodlands that will have a significant effect on the environment" (County of Los Angeles 2011). Should the proposed project result in loss of oak woodlands, the County requires mitigation measures to offset the losses.

2.1 Los Angeles County Oak Woodlands Conservation Management Plan

"The main goal of the Plan is to preserve and restore oak woodlands so they are conserved in perpetuity with no net loss of existing woodlands. There are three important objectives of the Plan: prioritize the preservation of oak woodlands, promote conservation by integrating oak woodlands into the development process in a sustainable manner and effectively mitigate the loss of oak woodlands" (County of Los Angeles 2014).

The Guide (County of Los Angeles 2014) interprets the Plan's definition of an oak woodland as follows:

> an oak stand, including its understory, which consists of two or more oak trees of at least five inches in diameter measured at 4.5 feet above mean natural grade, with greater than 10 percent canopy cover or that may have historically supported greater than 10 percent canopy cover as early as January 1, 2005.

In accordance with the Guide, when a discretionary project site is found to support oak woodlands, an Oak Woodland Report must be submitted to document potential impacts to oak woodlands resulting from the development of that project.

2.1.1 Tree and Woodland Definitions

Oak tree is defined by the Plan as "all native trees of the genus *Quercus*". This includes small shrubby oaks typically clustered on slopes, as well as individual large oaks that are naturally widely distributed across the landscape. Under California state law, "oaks [that are part of a woodland] greater than 5 inch diameters at breast height (DBH) are also protected" (California Public Resources Code 21083.4a).

Oak stand is defined by the Plan as "a group of similar [oak] trees growing in a contiguous pattern, having sufficiently diverse age-class distribution, composition and structure, and growing on a site of sufficiently uniform quality that it is distinguishable as a unit. Stands are a basic physical unit of vegetation in the landscape and do not have a set size."

Oak woodlands are defined by California Department of Fish and Wildlife Code Section 1361.h and by the Plan (County of Los Angeles 2011, p.28) as "an oak stand with a greater than 10 percent canopy cover or that may have historically supported greater than 10 percent canopy cover." (Ten times an individual oak tree's canopy is considered by the County as representative of the tree's sphere of influence [SOI]; where these SOIs overlap, they are collectively defined as oak woodlands, each having 10% or greater relative cover of oak tree canopy [woodland].)

This document interprets the Plan's definition of an oak woodland (County of Los Angeles 2011) as an oak stand, including its understory, that consists of two or more oak trees of at least 5 inches in diameter measured at 4.5 feet above mean natural grade with greater than 10% canopy cover or that may have historically supported greater than 10% canopy cover as early as January 1, 2005 (effective date of California Public Resources Code, Section 21083.4).

Oak Savanna is lightly wooded grassland with oaks as the dominant tree species. The canopy cover of an oak savanna may often be less than 10%, and therefore oak savannas are not necessarily subject to California Public Resources Code, Section 21083.4. Nevertheless, some types of oak savanna are considered sensitive by the California Department of Fish and Wildlife, and these are given consideration as sensitive natural communities under the California Environmental Quality Act (CEQA) (see California Department of Fish and Wildlife Natural Communities List and CEQA Guidelines Appendix G).

2.1.2 Conditions Criteria Definitions

- **Intact** - The site is currently in a "wild" state where all ecological functions such as groundwater infiltration, shade, habitat, nutrient cycling, carbon sequestration, wind/noise/dust abatement, and the stand are self-sustaining and regenerating. Understory may be dominated by invasive grasses and forbs. Fire exclusion or frequency may have altered native woodland. Woodland supports associated flora and fauna and is free from destructive land practices that limit long-term persistence.
- **Moderately Degraded** - Even though the site has been altered, oak woodlands persist and retain some of their functions. Natural regeneration is possible, wildlife use still occurs, and some level of ecosystem services is still present. The majority of oak woodlands in the County fall within this category.
- **Severely Degraded** - The site has been drastically altered from the natural condition to accommodate residential, commercial, or industrial uses, and oak woodlands remain in scattered locations. Natural regeneration is not possible. Soil is compacted, contaminated, or paved. Wildlife habitat is limited and associated understory vegetation has been replaced by managed non-native landscaping.

2.2 Oak Woodland Guide

The Guide focuses on two categories of recommendations to preserve and restore oak woodlands: (1) alterations to the County's development and environmental review process and (2) revisions to the process by which County agencies address impacts to oak woodlands. The Guide is intended to implement portions of the Plan and to be a resource for processing development applications for discretionary projects that are not exempt from CEQA and that may impact oak woodlands.

3 Methods

3.1 Oak Woodland Assessment Methodology

A field survey to assess and record the condition of the oak woodlands was conducted over several days between February 12, 2020, and July 8, 2020 by Dudek ISA Certified Arborist Ryan Allen and Dudek Biologists Heather Moine, Andrea Dransfield, Mackenzie Forgey, and Tracy Park. Information collected during the survey (Dudek 2020b) and discussed within this Report includes the following:

- The condition of the oak woodlands, including oak species present, age classes of oaks present, understory vegetation, and surrounding vegetation communities
- The presence and/or potential occurrence of special-status species
- Potential project impacts to the surveyed woodlands

Dudek mapped tree locations for all woodlands located on the project site (Figure 3, Tree Locations). Tree mapping was conducted using a Trimble Pathfinder Pro XH GPS receiver with H-Star Technology. Since tree canopies can sometimes cause loss of satellite lock by blocking the line-of-sight to satellites, an electronic compass and reflectorless, electronic distance-measuring device were also used in mapping tree locations. The reflectorless, electronic distance-measuring device/compass combination operates in concert with the Pathfinder system to position offsets, and offset information is automatically attached to the GPS position data string. The electronic tree locations were then evaluated using ArcView 10.4 software to determine the position of the trees related to the project development footprint.

Tree trunk diameters were measured using a diameter tape providing adjusted figures[1] for diameter measurements when wrapping the tape around an object's circumference. Diameter measurements were taken using protocol provided by the Council of Tree and Landscape Appraisers in the Guide for Plant Appraisal (ISA 2000). The trunk diameter measurement of each tree was taken at 4.5 feet above the ground along the trunk axis, with common exceptions. For example, in cases where a tree's trunk was located on a slope, the 4.5-foot distance was approximated as the average of the shortest and longest sides of the trunk (i.e., the uphill side and downhill side of a tree's trunk, respectively), and the measurement was made at this point. Tree height was visually estimated by experienced tree surveyors.

Tree canopy diameters were typically estimated by "pacing off" the measurement based on the investigator's knowledge of their stride length or by visually estimating the canopy width. The crown diameter measurements were made along an imaginary line intersecting the tree trunk that best approximated the average canopy diameter.

3.2 Oak Woodlands Mapping Methodology

According to the Plan, in addition to assessing the oak woodland condition, an accurate estimation of the woodland area is needed to evaluate oak woodlands. The Guide requires that a map depicting the proximity of project development to the on-site oak woodlands' sphere of influence (SOI) be used to determine impacts resulting from the proposed project (Figure 4, Vegetation Communities and Land Cover Types. The Plan defines the SOI as the total area of the subject canopy multiplied by 10 (or 3.2 times the radius). This Oak Woodland Report provides survey results for the oak woodlands with SOIs within 200 feet of the limits of project disturbance activities.

1 Inches divided by 3.14 (π) provide diameter measurement in inches.

4 Results

4.1 Oak Woodland Assessment

There are a total of three oak woodlands located within the study area comprising varying sizes and age classes of coast live oaks (*Quercus agrifolia*) and scrub oak (*Quercus berberidifolia*). These woodlands exhibit generally good levels of ecological health (Figure 5, Oak Woodland). Fifty-two coast live oak and eight scrub oak trees were inventoried; of the 60 total oak trees, 34 met the County's criteria for a woodland. Overall, the oak woodlands exhibit conditions that are typical of their location in a native setting prone to drought and wildfires.

The woodland trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 6 to 40 inches and multi-stemmed trunk diameters that range from 2 to 20 inches. Tree canopy extents range from 10 feet to approximately 50 feet in diameter.

The total canopy area and associated SOI of Oak Woodlands (OW) 1–3 is approximately 2.07 acres. Figure 5 provides the mapped locations of OW 1–3 and the associated SOIs.

4.2 Condition of Project Oak Woodlands

The condition and composition of OW 1–3, including oak species present, approximate density of oaks, age classes of oaks, understory vegetation, and surrounding vegetation communities, are discussed below. Based on these recorded conditions, a determination of the habitat value/integrity of the woodland was assigned using criteria provided in the Guide. These conditions criteria definitions are provided in Table 1 of the Guide (Appendix D of this report) and summarized in Section 2.1.2. In summary, OW1 is Moderately Degraded, and OW2 and OW3 are Intact. Representative photographs of the woodlands are provided in Appendix A.

The locations of OW 1–3 are provided in Figure 5. Representative photos of the surveyed woodlands are provided in Photos 1 to 10. For the purposes of this report, the terms sapling, young, and mature refer to the age-class designation of the trees present within the subject woodland. These designations are as follows: saplings are trees with a dsh measuring less than 5 inches, young trees have a dsh measuring between 5 and 9 inches, and mature trees have a dsh measuring greater than 9 inches.

4.2.1 Oak Woodland 1

OW1 is located adjacent to and northeast of the existing water tank site, on the northern edge of the proposed additional water tank, encompassing a canopy area of approximately 0.03 acres. A total of two coast live oaks were observed, one mature and one young, within the subject woodland. Existing conditions and the understory vegetation within OW1 vary depending on proximity to the existing road. The habitat value/integrity ranking of OW1 is **Moderately Degraded**.

OW1 has been altered from the natural condition to accommodate a paved road with highly disturbed and compacted soils. At the time of the survey, the understory conditions in the vicinity of the road were not conducive to natural regeneration, including the lack of oak seedlings and an intact oak leaf litter layer, as well the absence of understory vegetation associated with woodland habitat. Conditions present within the understory of OW1 are illustrated in Photos 1 to 4.

Oak Woodland 1 Understory Assessment Results

Native species 5%

Non-native grass 85%

Non-native forbs 10%

4.2.2 Oak Woodland 2

OW2 is located east of the existing water tank site and is currently in a "wild" state, showing evidence of minimal disturbance. OW2 comprises 14 mature and 4 young coast live oaks and 2 young scrub oaks with a total canopy area of approximately 0.28 acres. The subject woodland supports an open overhead canopy with a relatively undisturbed oak leaf litter layer. Conditions present within the understory of OW2 are illustrated in Photos 5 to 7. Based on these conditions, the habitat value/integrity ranking for OW2 is **Intact**.

Oak Woodland 2 Understory Assessment Results

Native species 75% – although not reflected in the percent covers, this also includes the native forbs observed during spring, which are included below in Table 2.

Non-native grasses and forbs 25%

Table 2. Oak Woodland 2 Understory Assessment

Scientific Name	Common Name	Native/Non-Native	Percent cover
Adenostoma fasciculatum	chamise	Native	5
Artemisia californica	California sagebrush	Native	35

Bromus diandrus	ripgut brome	Non-Native	20
Elymus condensatus	giant wild rye	Native	15
Eriogonum fasciculatum	California buckwheat	Native	5
Heteromeles arbutifolia	toyon	Native	5
Malacothamnus fasciculatus	bush mallow	Native	5
Salvia mellifera	black sage	Native	5

4.2.3 Oak Woodland 3

OW3 is located south of the existing water tank site and is currently in a "wild" state, showing evidence of minimal disturbance. OW3 comprises eight mature and four young coast live oaks with a total canopy area of approximately 0.07 acres (Table 3). The subject woodland supports an open overhead canopy with a relatively undisturbed oak leaf litter layer. Conditions present within the understory of OW3 are illustrated in Photos 8 to 10. Based on these conditions, the habitat value/integrity ranking for OW3 is **Intact**.

Oak Woodland #3 Understory Assessment Results

Native species 60% - although not reflected in the percent covers, this also includes the native forbs observed during spring, which are included below in Table 3. Vegetation community descriptions are included in Table 4. A list of associated understory plant species is included in Table 5.

Non-native grasses and forbs 40%

Table 3. Oak Woodland 3 Understory Assessment

Pterostegia drymarioides	woodland pterostegia
Salvia mellifera	black sage
Sambucus nigra ssp. *caerulea*	blue elderberry

Note:
* This list could be used as a native seed/container plant palette.

4.3 Oak Woodland Special-Status Species

The Guide requests a description of the presence or potential use of the site by special-status species. No special-status plant species or wildlife species have been found during surveys of the oak woodlands within the study area. Surveys were conducted in February and May–July 2020. Refer to the Biological Technical Report for the Sterling Ranch Estates Residential Project (Dudek 2020a) for a discussion of the methods and results of these surveys, which included the project footprint and a 200-foot buffer around the project footprint. Tables of potentially occurring special-status plant species and wildlife species are also provided in this report as Appendix B and Appendix C, respectively. These tables were reproduced from the Biological Technical Report and were modified for the purposes of this report to include only those species with potential to occur within oak woodland habitats. The tables include listed species and other species that, if impacted, would require a mandatory finding of significance pursuant to CEQA, but they do not include potentially occurring "watch list" species or species considered locally important by the County. See the Biological Technical Report for additional information on potentially occurring special-status species.

INTENTIONALLY LEFT BLANK

5 Project Impacts

5.1 Description of Impacts

A total of 0.38 acres of canopy area/understory habitat and 1.69 acres of buffer area were recorded on site within the project study area. It is anticipated that development of the proposed project will result in the following project impacts:

- Removal of approximately 0.09 acres of canopy area/understory habitat
- Removal of approximately 0.56 acres of buffer habitat

Based on these assumptions, the proposed project design allows for approximately 1.42 acres, or 68.9%, of the existing 2.07-acre oak woodland canopy area (all on-site oak woodland canopy combined) to remain undisturbed during and after project construction and operations. Oak woodland impacts are listed in Table 6 and depicted on Figure 6, Oak Woodland Impacts. Mitigation to offset the significant impacts to oak woodlands is discussed in Section 6, Mitigation Measures, of this report.

Oak woodland impacts were determined using geographic information system software and spatial locations of trees relative to the project's impact areas (grading footprint). Impacts were further determined based on Dudek's experience with native woodland habitats and their typical responses to root disturbances from construction activities, such as soil compaction, excavation, and grading. The impact analysis results presented herein were used for recommending appropriate mitigation measures for the proposed project. Impact totals presented are based on proposed disturbance limits and development plans as of the date of this Oak Woodland Report.

5.2 Impact Severity and Estimated Level of Significance (Oak Woodland Guide)

Pursuant to the Guide, a determination must be made regarding whether the proposed project will have a substantial adverse effect on oak woodlands and/or result in the conversion of existing oak woodlands. Further, Table 2 of the Guide quantifies the severity of project impacts in relation to the habitat value/integrity of the subject woodland and the anticipated project impact(s). Once a determination of the impact severity of the project is made, an estimated level of significance is assigned in accordance with Table 3 of the Guide. Subsequently, these designations are used to assess whether the project will exceed the threshold for significance for impacts to oak woodlands. Because the project site contains three oak woodlands, a determination of the impact severity anticipated and the level of significance was assigned for each subject woodland. These designations are discussed in detail below. Tables 2 and 3 of the Guide are provided for reference in Appendices E and F, respectively. For ease of presentation, the oak woodland impacts are separated by impact category below.

5.2.1 Oak Woodlands with No Impact or Less-Than-Significant Impacts

Oak Woodland 1

- Project impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Moderately Degraded

  - Discussion regarding the woodland integrity ranking of OW1 is provided in Section 4.2.1 of this report.
- Impact Severity Ranking: Low
  - Excavation and grading activities associated with construction of the new water tank would require the removal of approximately 0.04 acres of the total 0.26-acre woodland canopy and understory habitat associated with OW1, allowing for approximately 84.5% of the total canopy area associated with OW1 to be retained. Because areas within OW1 are currently subject to roadway use, it is anticipated that these activities will continue unmodified. Pursuant to Table 2, Impact Severity, of the Guide, project impacts within the moderately degraded woodland will have an impact severity ranking of low based on no trees being proposed for removal, the retention of 84.5% of oak woodland canopy associated with OW1, and the assumptions that the current regeneration potential of the subject woodland would be maintained and the current understory vegetation community will persist.
- Estimated Level of Significance: Less than Significant
  - Pursuant to Table 3, Estimated Level of Significance, of the Guide, project impacts within a moderately degraded woodland that have an impact severity ranking of low would be less than significant. No mitigation will be required under the Guide.

Table 6. Oak Woodland Impact Matrix

Oak Woodland Impacts

INTENTIONALLY LEFT BLANK

5.2.2 Oak Woodlands with Significant Impacts

Oak Woodland 2

- Project impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Intact
  - Discussion regarding the woodland integrity ranking of OW2 is provided in Section 4.2.2 of this report.
- Impact Severity Ranking: High
  - Excavation and grading activities associated with the new water tank will require the removal of approximately 0.41 acres of the total 1.32-acre woodland canopy and understory habitat associated with OW2, allowing for approximately 69.3% of the total canopy area associated with OW2 to be retained. Pursuant to Table 2 of the Guide, these activities within the intact woodland will have an impact severity ranking of high based on the assumption that the impact will result in the net loss of oak woodland acreage and the loss of habitat and understory. Mitigation will be required under the Guide.
- Estimated Level of Significance: Significant
  - Pursuant to Table 3 of the Guide, project impacts within an intact woodland that have an impact severity ranking of high would be significant and result in the following impacts to OW2: net loss of oak woodland acreage and loss of wildlife habitat and food sources. Mitigation will be required under the Guide.

Oak Woodland 3

- Project Impacts: Excavation and grading activities associated with the construction of the new water tank.
- Woodland Integrity Ranking: Intact
  - Discussion regarding the Woodland Integrity Ranking of OW3 is provided in Section 4.2.3 of this report.
- Impact Severity Ranking: High
  - Excavation and grading activities associated with the new water tank will require the removal of approximately 0.20 acres of the total 0.49-acre woodland canopy and understory habitat associated with OW2, allowing for approximately 59.5% of the total canopy area associated with OW2 to be retained. Pursuant to Table 2 of the Guide, these activities within the intact woodland will have an impact severity ranking of high based on the assumption that the impact will result in the net loss of oak woodland acreage and the loss of habitat and understory.
- Estimated Level of Significance: Significant
  - Pursuant to Table 3 of the Guide, project impacts within an intact woodland that have an impact severity ranking of high would be significant and result in the following impacts to OW3: net loss of oak woodland acreage and loss of wildlife habitat and food sources. Mitigation will be required under the Guide.

5.3 Impact Summary

In conclusion, project development will significantly impact OW2 and OW3 and have a less-than-significant impact on OW1. A total of 0.61 acres of significant impacts to oak woodland canopy would occur in OW2 and OW3, combined, which would require mitigation. Project impacts to oak woodlands could be mitigated to a less-than-significant level. These mitigation measures are discussed below.

INTENTIONALLY LEFT BLANK

6 Mitigation Measures

6.1 Determination of Mitigation

Three oak woodlands located on the project site are subject to impacts, two of which require mitigation. The following discusses the mitigation options and recommendations based on the Plan.

6.2 Regulatory Definitions of Mitigation Options

In accordance with the Guide, to offset the project's total combined significant impact of 0.61 acres of oak woodland canopy in OW2 and OW3, one of the following mitigation measures (prioritized by preference for intact woodlands) shall be implemented, subject to County approval (County of Los Angeles 2011, 2014):

1. Acquire oak woodland habitat that is comparable to the habitat that was impacted.
2. Restore degraded woodlands: off-site restoration should be prioritized over on-site restoration and where feasible, should be located nearby the impacted property, preferably within the same watershed or sub-drainage as deemed appropriate by the County Forester and staff biologist, or within the same planning area as the impacted property.

   Off-site restoration may include any of the following, and would be performed on a 2:1 acreage basis:

   - Acquiring off-site fee title for oak woodland habitat;
   - Replacement planting.
   - Restoring moderately or severely degraded oak woodlands. More specifically, removing exotics and restoring appropriate native plant diversity.

   On-site restoration "should be utilized when circumstances at the site allow for long-term sustainability of the replacement plantings, the potential to expand/connect to adjacent oak woodlands, and/or improvement of degraded woodlands. The permittee shall replace/restore lost canopy area [on a 2:1 acreage basis]. All replacement trees should be planted on native undisturbed soil and should be the same species of oak (Quercus sp.) as the removed tree with appropriate associated native vegetation in the understory. The location of the replacement tree should be in the vicinity of other oak trees of the same species. If replacement trees cannot be planted on native undisturbed soil or are not in the vicinity of the same species of oak (*Quercus* sp.) as the removed tree, the County Forester may require additional conditions to ensure the trees thrive.
3. Contributing to LA County's Oak Forests Special Fund at a minimum two to one canopy cover area for the amount removed.
4. Other mitigation measures developed by the County.

6.3 Mitigation Provisions

The following provisions apply to all of the aforementioned mitigation options (County of Los Angeles 2014):

To ensure that mitigation measures are implemented, the County Forester may require the project applicant post a bond in the amount determined by the County Forester.

If possible, on-site mitigation areas or off-site mitigation land should be located adjacent to preserved natural open space unless there are reasons that outweigh this priority (like contributing to a linkage preserving a specific location with special-status species on the mitigation site). The location of the on- or off-site mitigation shall be approved by the County Forester and County Department of Regional Planning Staff Biologist.

Mitigation areas or land should be at a minimum 2:1 canopy cover area for the amount removed. This is the expected canopy extent of the mature trees.

All mitigation areas or lands should be placed in a conservation easement. If a conservation easement is not possible, the land shall be protected in perpetuity by other means deemed acceptable by the County. Mitigation land may be designated public open space if appropriate.

In addition to mitigation for tree removal, the permittee shall prepare a plan to the satisfaction of the County Forester, for protecting remaining oak trees during and after development.

Should on- or off-site replacement plantings be provided to mitigate for significant impacts to oak woodlands, the Department of Regional Planning Staff Biologist may require a Habitat Mitigation and Monitoring Plan that details the long-term maintenance and monitoring plans for the mitigation site.

Pursuant to the Guide, the Habitat Mitigation and Monitoring Plan should be approved prior to issuance of a grading permit and include the following minimum requirements: description of the project/impact and mitigation sites, specific objectives, success criteria, plant palette, implementation plan, maintenance activities, monitoring plan (7-year period including annual reports), and contingency measures. The Habitat Mitigation and Monitoring Plan will need to be approved by the County Forester and Department of Regional Planning Staff Biologist.

6.4 Recommended Mitigation

The Plan identifies mitigation measures for woodland removal or loss associated with a development project when it cannot be resigned to avoid impacts (County of Los Angeles 2011). Below is a review of the applicability of the mitigation measure options available and the recommended option for the project.

Habitat Acquisition

Selecting Mitigation Option 1, acquiring oak woodland habitat, may be possible; it would require the acquisition of 1.22 acres (2 × 0.61 acres) of comparable oak woodland habitat. However, locating a site that has comparable habitat and a willing seller may be difficult.

Degraded Woodland Restoration

To comply with Mitigation Measure 2 requirements, off-site restoration is a priority over on-site restoration; locating a site for restoration that is near the project site, particularly within the same watershed, sub-drainage, or planning area, is preferred. Restoration may include acquiring woodland habitat, replacement planting, or degraded woodland restoration.

Due to the nature of this project, the entirety of the project area is proposed for grading, so there is limited opportunity for on-site restoration. Two of the three woodlands within the development footprint would sustain significant impacts to accommodate the proposed project. The portions of the impacted woodlands outside of the grading footprint would remain "wild," as would the adjacent land, aside from a portion of OW1. Hence, there may be an opportunity for some on-site restoration within the moderately degraded portion of OW1.

Special Fund Contribution

Mitigation Measure Option 3 allows for contribution of funds to the County's Oak Forest Special Fund as mitigation for the loss of oak woodland and habitat. However, information from the County indicates this option is not currently being considered. If the option were proposed, it would require a contribution of two times the value of the removed canopy cover area. The cost for all proposed oak woodland impacts is $48,520 per the Plan; two times the canopy cover area value would be $97,040.

Other Measures

Mitigation Option 4 is undefined, as it would require the County to develop an alternative mitigation option. However, this option may be feasible pending discussions with County staff.

Recommendation

A combination of off-site replacement planting and on-site degraded woodland restoration is the recommended mitigation measure for the project. A total of 24 coast live oak trees would need to be replanted to meet the requirements of the Plan. Dudek recommends all tree plantings be subject to a seven-year monitoring effort by an independent third-party certified arborist. This monitoring effort would consider growth, health, and condition of the subject trees to evaluate success. The monitoring effort may result in a recommendation of remedial actions should any of the tree plantings exhibit poor or declining health.

The specific location of individual mitigation tree plantings on site would be addressed in the mitigation planting plan prepared for the site. Locations may include the degraded portion of OW1, the immediate vicinity around the water tank site, and degraded oak woodlands alongside the water tank access road. The mitigation requirement and the approved tree replacement mitigation ratio is prescribed by the County.

INTENTIONALLY LEFT BLANK

7 Conclusion

The project site contains three woodlands subject to conservation under the Plan. For the purposes of this Report, two of the three woodlands would be significantly impacted by the proposed project. The woodlands subject to impacts would require mitigation using a combination of off-site replacement planting and on-site degraded woodland restoration. A total of 24 coast live oak trees would need to be replanted to meet the requirements of the Plan. The mitigation requirement and the approved tree replacement mitigation ratio is prescribed by the County. Furthermore, this Oak Woodland Report recommends that the remaining three encroached oak woodlands be subject to protection measures that, when implemented, minimize the possibility that the woodlands are inadvertently damaged during the construction process.

Suitable vegetation is present for this species within the project site. Botanical and focused rare plant surveys conducted in 2020 were timed during the species blooming period and the species would have been identified, if present.
Symphyotrichum greatae	Greata's aster	None/None/1B.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest, Riparian woodland; mesic/perennial rhizomatous herb/June–Oct/980–6,595	Absent. Suitable vegetation is present for this species within the project site. Botanical and focused rare plant surveys conducted in 2020 were timed during the species blooming period and the species would have been identified, if present.

Notes:

CRPR – California Rare Plant Rank

1A plants presumed extirpated in California and either rare or extinct elsewhere
1B plants rare, threatened, or endangered in California and elsewhere
2A plants presumed extirpated in California, but common elsewhere
2B plants rare, threatened, or endangered in California, but more common elsewhere
3 plants about which more information is needed – a review list
4 plants of limited distribution – a watch list
0.1 seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
0.2 moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat)
0.3 not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

State Designations

SE – State Listed as Endangered

Federal Designations

FE - Federally Listed as Endangered

Appendix C

Potential for Occurrence of Special-Status Wildlife Species (Oak Woodlands)

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Amphibians				
Rana boylii	foothill yellow-legged frog	None/CSC	Rocky streams and rivers with open banks in forest, chaparral, and woodland.	Not expected to occur. The project site is outside the known range for this species.
Rana draytonii	California red-legged frog	FT/CSC	Lowland streams, wetlands, riparian woodlands, livestock ponds; dense, shrubby or emergent vegetation associated with deep, still or slow-moving water; uses adjacent uplands.	Not expected to occur. No suitable habitat is present on the project site.
Spea hammondii	western spadefoot	None/CSC	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley–foothill woodlands, pastures, and other agriculture.	Not expected to occur. Suitable vegetation is present; however, ephemeral ponds and vernal pools are absent within the project site.
*Taricha torosa (*Monterey Co. south only*)*	California newt	None/CSC	Wet forests, oak forests, chaparral, and rolling grassland.	Not expected to occur. The project site is outside the known range for this species.
Reptiles				
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/CSC	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	Moderate potential to occur. Suitable vegetation present.
Salvadora hexalepis virgultea	coast patch-nosed snake	None/CSC	Brushy or shrubby vegetation; requires small mammal burrows for refuge and overwintering sites.	Low potential to occur. Site lacks suitable small mammal burrows required by this species.
Birds				
*Accipiter cooperii (*nesting*)*	Cooper's hawk	None/WL	Nests and forages in dense stands of live oak, riparian woodlands, or other woodland habitats often near water.	Not expected to nest on site; however, the site provides suitable foraging for this species.
*Baeolophus inornatus (*nesting*)*	oak titmouse	BCC/SA, WL	Montane hardwood-conifer, montane hardwood, blue oak, valley oak and coastal oak woodlands, montane and valley foothill riparian habitats.	Moderate potential to occur. Suitable habitat present.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Buteo swainsoni (nesting)	Swainson's hawk	BCC/ST	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture.	Not expected to occur. Outside nesting range for this species.
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT, BCC/SE	Nests in dense, wide riparian woodlands and forest with well-developed understories.	Not expected to occur. No suitable nesting habitat on the project site.
Elanus leucurus (nesting)	white-tailed kite	None/FP	Nests in woodland, riparian, and individual trees near open lands; forages opportunistically in grassland, meadows, scrubs, agriculture, emergent wetland, savanna, and disturbed lands.	Not expected to occur. No nesting habitat present on site; however, the project site provides suitable foraging habitat.
Falco columbarius (wintering)	merlin	None/WL	Coastlines, wetlands, woodlands, agricultural fields, and grasslands.	Low potential to occur. Suitable woodland habitat present on site.
Lanius ludovicianus (nesting)	loggerhead shrike	BCC/CSC	Nests and forages in open habitats with scattered shrubs, trees, or other perches.	Low potential to occur. The project site provides suitable nesting and foraging habitat for this species.
Polioptila californica californica	coastal California gnatcatcher	FT/CSC	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally, avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet amsl.	Protocol breeding season surveys were negative for the species. Suitable nesting and foraging habitat present on site. CNDDB records indicate the nearest reported location of California gnatcatcher is approximately 2.8 miles southwest of the project site, near the Santa Clara River.
Setophaga petechia (nesting)	yellow warbler	BCC/SSC	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats.	Low potential to occur. Nesting habitat present on site; however, this species can also occur as a migrant through the region. The site provides suitable foraging habitat for this species.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Mammals				
Antrozous pallidus	pallid bat	None/CSC	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees.	Low potential to occur. Low overall suitable roosting habitat on site.
Eumops perotis californicus	western mastiff bat	None/CSC	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels,	Not expected to occur. No suitable roosting or foraging habitat present.
Nyctinomops macrotis	big free-tailed bat	None/CSC	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water.	Low potential to occur. Low overall suitable roosting habitat on site.

State
CSC - California Species of Special Concern
FP – Fully Protected
SE – California Endangered
SA – Special Animals List
ST – California Threatened
WL - Watch List

Appendix D

LA County Oak Woodlands Conservation Management Plan Guide: Table 1 – Woodland Integrity

Table 1. Existing Conditions

Woodland Integrity:	Intact	Moderately Degraded	Severely Degraded
Existing Conditions:	Site is currently in a "wild" state where all ecological functions such as groundwater infiltration, shade, habitat, nutrient cycling, carbon sequestration, wind/noise/dust abatement, and the stand is self-sustaining and regenerating. Understory of grasslands may be dominated by invasive exotic grasses and forbs. Fire exclusion or frequency may have altered native woodland. Woodland supports associated flora and fauna and are free from destructive land practices that limit long-term persistence.	Even though the site has been altered, oak woodlands persist and retain some of their functions. Natural regeneration is possible, wildlife use still occurs, and some level of ecosystem services is still present. The majority of oak woodlands in the County fall within this category.	Site has been drastically altered from the natural condition to accommodate residential, commercial or industrial uses, and oak woodlands remain in scattered locations. Natural regeneration is not possible. Soil is compacted, contaminated or paved. Wildlife habitat is limited and associated understory vegetation has been replaced by managed non- native landscaping.
Examples:		Golf courses intermixed with fragmented oak woodlands, many of the subdivisions and urban wild land interface areas found in the Santa Monica Mountains, Santa Clarita Valley, along the foothills of the San Gabriel Mountains and throughout the Puente Hills.	Small clusters of oaks within or surrounding parking lots, isolated small stands in parks or open spaces surrounded by urban development, or woodlands remaining along freeway corridors.
Recommendation:	Projects that would alter the oak woodland should receive the highest level of scrutiny. Project alternatives that would avoid this alteration should be fully explored and given first consideration.	Project needs to be reviewed within the context of preventing further ecosystem function losses. This could include reduction of project scale, adjusting project footprint to reduce impacts, identifying opportunities to preserve connectivity, increase groundwater retention, and restore habitat.	Site should be reviewed within the context of adjacency to other oak woodland stands, potential for restoration and the potential to restore connectivity and ecosystem functions. A Severely Degraded site may be a good choice for a mitigation area that could be restored.

INTENTIONALLY LEFT BLANK

Appendix E

LA County Oak Woodlands Conservation Management Plan Guide: Table 2 – Impact Severity

Table 2. Impact Severity

Impact Severity	Intact Woodland	Moderately Degraded Woodland	Severely Degraded Woodland
Low:	Minimal disturbance to stand structure and composition and habitat features resulting in no increased edge habitat or fragmentation; road and stream crossings are not being considered; activities will not result in the introduction of exotic or invasive species. Minimal site or spatial disturbance may still result in significant impacts to an intact or core woodland.	Regeneration potential is being maintained across the site; understory oak associates present or can be restored; expansion of developed areas are centralized; new road and stream crossings not being considered. In the absence of special circumstances, statutes or ordinances, this may represent a non-significant impact.	Majority of remnant trees are retained; understory removal or road widening does not compromise existing tree health; no further loss of ecosystem services considered. In the absence of special circumstances, statutes or ordinances, this may represent a non-significant impact.
Moderate:	Detectible change or reduction in canopy, structure or composition; loss of some habitat features, subtle impacts increasing fragmentation, edge creation or loss of connectivity (fences, roads, other artificial barriers or buffers).	Regeneration potential is being marginalized; developed areas expand into previously undeveloped areas; new roads or stream crossings proposed; habitat features are being lost; activities will add exotic an invasive species.	Loss of a majority of existing trees; activities will inhibit or harm residual tree health and vigor; barriers constructed will increase fragmentation; ecosystem services will be lost or degraded.
	These impacts are considered significant.		
High:	Obvious change or reduction or loss of canopy, structure or composition; loss of existing habitat features; fragmentation and parcelization of contiguous ownerships; introduced roads, stream crossings and/or exotic invasive species; creation of edge effects; construction of barriers (fences, roads, etc.).	Large scale impacts including loss of habitat, understory, resulting in fragmentation and increased edge effects; Loss of woodland structure and changes in composition in large continuous woodland patch.	Loss of remnant trees or stand increases fragmentation across the landscape through loss of connectivity.
	These impacts are considered significant.

1 Summary of Tree Disposition.....14

1 INTRODUCTION

This oak tree report provides an inventory and evaluation of the protected oak trees located on the Sterling Ranch Estates Project (proposed project) site. The proposed project site is located in the County of Los Angeles (County), California (Figure 1). As such, this oak tree report covers the regulations and requirements for the protection and removal of protected trees within the County's jurisdiction.

Sterling Ranch Estates retained Dudek to conduct a tree inventory and assessment for the proposed project site. Dudek's Urban and Community Forestry Division's International Society of Arboriculture (ISA)-certified arborists performed various functions associated with surveying, inventorying, and evaluating the condition of all protected oak trees located within the proposed project site, as described in the following text.

The purpose of this oak tree report is to present the physical characteristics and mapped locations of the site's protected trees that are to be removed or protected in place during the proposed grading and construction-related activities. This oak tree report addresses protected and non-protected oak trees on the proposed project site.

1.1 Project Location

The proposed project is located in the community of Val Verde, north of Chiquito Canyon Road, and northwest and southeast of Del Valle Road. The project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The project site and biological study area occur entirely within the U.S. Geological Survey 7.5-minute Val Verde quadrangle (USGS 2017). The project site centered at approximately 34 27′1.00″ N 118 39′ 12.00″ W and falls within Township 4 north, Range 17 west, sections 9 and 10, San Bernardino meridian.

1.2 Site Characteristics

The project site and has remained undeveloped and in largely the same condition for the past 20 years. One residence is located in the southwestern portion of the project site, and several access roads are present; however, the land within the project site is best characterized as undeveloped. Topographically, the project site varies from flat to moderate north- and south-facing slopes with elevations ranging from approximately 1,200 feet above mean sea level along the southern boundary to approximately 1,400 feet above mean sea level in the northeastern portion of the site.

1.3 Project Description

The Sterling Ranch Estates Project (proposed project) includes the development of approximately 222 residential detached single-family lots along with associated commercial lots, parks, open

space lots, roads, infiltration and debris basins, and other infrastructure within Assessor's Parcel Numbers 3271-004-012 and 3271-004-012-013 which comprise approximately 113.9 acres. Off-site improvements will also take place immediately east of the APN 3271-004-012-013 totaling approximately 6.5 acres. In addition, a preservation area associated with the project is located in Assessor's Parcel Number 3271-005-032 totaling approximately 34.7 acres. The project site, which includes the development footprint, and the overall biological study area are both depicted on Figure 1. The proposed project will involve mass grading within the parcels to facilitate the residential development and associated infrastructure; however, several areas will remain undeveloped and will be preserved as open space. The proposed project will incorporate Low Impact Development design standards based on the Los Angeles County Department of Public Works *Low Impact Development Standards Manual* (County 2014). Preserved parcels are anticipated to be placed in a conservation easement, which will be managed by a third-party conservation entity.

INTENTIONALLY LEFT BLANK

2 METHODS

2.1 Individual Tree Evaluation

Dudek mapped tree locations for all trees located on the proposed project site. Tree mapping was conducted using a Trimble Pathfinder Pro XH Global Positioning System (GPS) receiver with H-Star Technology. Since tree canopies can sometimes cause loss of satellite lock by blocking the line-of-sight to satellites, an electronic compass and reflectorless, electronic distance-measuring device were also used in mapping tree locations. The reflectorless, electronic distance-measuring device/compass combination operates in concert with the Pathfinder system to position offsets, and offset information is automatically attached to the GPS position data string. The electronic tree locations were then evaluated using ArcView 10.4 software to determine the position of the trees related to the proposed project.

All inventoried and assessed protected trees were tagged with an aluminum tag bearing a unique identification number, which was placed on the trunk of each tree. These numbers correspond to the tree attribute information presented in the Tree Information Matrix in Appendix A. Tree trunk diameters were measured using a diameter tape providing adjusted figures[1] for diameter measurements when wrapping the tape around an object's circumference. Diameter measurements were taken using protocol provided by the Council of Tree and Landscape Appraisers in the *Guide for Plant Appraisal* (ISA 2000). The trunk diameter measurement of each tree was taken at 4.5 feet above the ground along the trunk axis, with common exceptions. For example, in cases in which a tree's trunk was located on a slope, the 4.5-foot distance was approximated as the average of the shortest and longest sides of the trunk (i.e., the uphill side and downhill side of a tree's trunk, respectively), and the measurement was made at this point. Tree height was visually estimated by experienced tree surveyors. Tree canopy diameters were typically estimated by "pacing-off" the measurement based on the investigator's knowledge of his stride length or by visually estimating the canopy width. The crown diameter measurements were made along an imaginary line intersecting the tree trunk that best approximated the average canopy diameter. Additionally, Dudek calculated composite trunk diameters for multiple stem trees according to ISA standards. According to these standards, the sum of all stem diameters was calculated to ascertain composite trunk diameter values for multiple stem trees.

Pursuant to the *Guide for Plant Appraisal* (ISA 2000), tree health and structure was evaluated with respect to five distinct tree components: roots, trunk, scaffold branches, small branches, and foliage. Each component of the tree was assessed with regard to health factors such as insect or pathogen damage, mechanical damage, presence of decay, presence of wilted or dead leaves, and wound closure. Tree health and structure were graded as good, fair, poor, and dead, with "good"

[1] Inches divided by 3.14 (π) provide diameter measurement in inches.

representing no apparent problems, and "dead" representing a dying and/or dead tree. Good condition trees exhibit acceptable vigor, healthy foliage, and adequate structure, and lack any major maladies. Fair condition trees are typically those with few maladies but declining vigor. This method of tree condition rating is comprehensive and results in ratings that are useful for determining the status of trees based on common urban forestry standards.

Individual tree attribute data is presented in Appendix A (Tree Information Matrix), and protected oak tree locations are presented in Appendix B (Oak Tree Locations and Proposed Impacts Exhibit). Representative protected oak tree photographs are presented in Appendix C.

2.2 Tree Impact Analysis

Dudek's ISA-certified arborists determined tree impacts by conducting a spatial analysis of individual tree locations and canopy extents visible in project aerial imagery in relation to the proposed site development plan. The tree dataset, digital aerial imagery, and site development planning data were evaluated in a geographic information system to determine where individual trees were located in relation to proposed project development areas. Trees located within 5 feet of proposed grading limits are considered impacted by removal due to the extent of the anticipated disturbance (grading, root impacts, etc.). Trees with project-related construction activity occurring within their driplines are considered encroached upon for the purposes of this report. The impact analysis results were utilized for determining overall tree impacts for the project site.

2.3 Tree Appraisal

As allowed under Municipal Code Section 22.56.2140, Dudek ISA-certified arborists calculated the appraised value for each inventoried protected tree identified for removal according to the *Guide for Plant Appraisal* (ISA 2000), as discussed below.

2.3.1 Appraisal Method

Valuation of trees according to ISA standards involves incorporating ratings from three main tree features: (1) species, (2) location, and (3) overall condition. The tree data matrix presented in Appendix A provides information regarding each evaluated tree and its current condition.

The Trunk Formula Method outlined in the *Guide for Plant Appraisal* is appropriate for trees that are too large to commonly be replaced and was used to calculate appraised tree values for trees identified for removal. This method was selected given the variability of tree sizes on the site, and the inclusion of many large-diameter trees in the inventory that could not be reasonably replaced with nursery or transplant stock.

2.3.1.1 Appraisal Variables

The following variables and assumptions were included in generating the appraised tree values contained in this report and are consistent with the Trunk Formula Method for tree appraisal. Further, the descriptions contained herein coordinate with the tree appraisal data and calculations presented in Appendix D.

1. **Species**: Tree species were determined during field inspections.
2. **Condition**: Tree condition was derived from field evaluations of outwardly observable health and structural characteristics. Condition ratings can range between 25% and 100%, based on evaluations of root conditions, trunk form and observable defects, branching structure, and foliage condition.
3. **Trunk Diameter**: Trunk diameters are presented in inches measured at 4.5 feet (54 inches) above grade. Composite trunk diameters were calculated for trees with multiple stems and are the product of the square root of the sum of all squared trunk diameters.
4. **Location**: Location rating is the average value of Site, Contribution, and Placement ratings. Ratings can range from 10% to 100%. Site values are affected by the economic, functional, and aesthetic aspects of the area in which the tree is growing. Contribution accounts for the function and aesthetic values that the tree adds to the location in which it is growing. Placement ratings indicate the effectiveness of tree locations on functional and aesthetic values. Based on the remoteness of portions of the site and the degraded condition of portions of the site, location values applied to this site range from 30% to 36.7%.
5. **Species Rating**: Species rating was derived directly from the Species Classification and Group Assignment report published by the Western Chapter of ISA (Western Chapter ISA 2004). Values were determined, by species, for Southern California Inland Influence areas. Species ratings vary, with higher ratings assigned to native trees and lower ratings assigned to non-native, invasive species.
6. **Replacement Tree Size**: Replacement tree size values were derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion, based on species-specific nursery groups.
7. **Replacement Tree Cost**: Replacement tree costs were derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion and equal to $1,482.
8. **Installation Cost**: Installation costs were valued at $1,200/tree.
9. **Installed Tree Cost**: Installed tree cost is the sum of the replacement tree cost and the installation cost.

10. **Unit Tree Cost/in^2 (square inches)**: Unit tree cost was derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion and varied by Nursery Group number.
11. **Appraised Trunk Area**: Appraised trunk area is the product of the squared trunk diameter value multiplied by 0.785. For trees with trunk measurements exceeding 30 inches, an adjusted trunk area value was used, as identified in Table 4.4 of the *Guide for Plant Appraisal*.
12. **Appraised Tree Trunk Increase**: The appraised tree trunk increase is the difference between the appraised trunk area (11) and the replacement tree size (6).
13. **Basic Tree Cost**: Basic tree cost is the result of multiplying the unit tree cost (10) and the appraised tree trunk increase (12) and adding the installed tree cost (9).
14. **Appraised Value**: The appraised value is the result of the basic tree cost discounted by the Condition (2), Species (5), and Location (4) ratings.

2.3.2 Appraisal Calculations

The matrices presented in Appendix D presents the results of the tree appraisal conducted for trees identified for removal on the Sterling Ranch Estates project site. This matrix was created directly from the Trunk Formula Method Worksheet outlined in the *Guide for Plant Appraisal* (ISA 2000). The calculations in the matrix follow those in the worksheet.

The intent of the conversion of the standard worksheet to the matrix presented in Appendix D was to more efficiently and concisely present the tree appraisal data for the Sterling Ranch Estates project site and allow the report reviewer(s) to more easily compare appraisal value differences between individual trees.

2.4 Scope of Work Limitations

No root crown excavations or investigations, internal probing, or aerial canopy inspections were performed during the tree assessments. Therefore, the presence or absence of internal decay or other hidden or inaccessible inferiorities in individual trees could not be confirmed. It is recommended that any large tree proposed for preservation or relocation in an urban setting be thoroughly inspected for internal or subterranean decay by a qualified arborist before finalizing preservation or relocation plans.

3 OBSERVATIONS

3.1 Individual Trees

There are three coast live oak (*Quercus agrifolia*) and two valley oak (*Quercus lobata*) trees inventoried within the proposed project study area. Of the five oak trees, four meet the County's criteria for a protected oak tree. Appendix B presents the location of the individual trees mapped and assessed impact for the proposed project. Overall, the trees exhibit growth and structural conditions that are typical of their locations in a native oak woodland setting prone to drought and wildfires. The trees include various trunk and branch maladies and health and structural conditions. As presented in Appendix A, 40% of the individually mapped trees (2 trees) exhibit fair health; 40% (2 trees) are in poor health; and 20% (1 tree) are in good health. Structurally, 20% (1 tree) of the individually mapped trees are considered to exhibit good structure, and 80% (4 trees) exhibit fair structure. The tree in good condition exhibits acceptable vigor, healthy foliage, and adequate structure, and lacks any major maladies. Trees in fair condition are typical, with few maladies but declining vigor. Trees in poor condition exhibit declining vigor, unhealthy foliage, poor branch structure, and excessive lean. The trees in poor condition are directly attributed to the region's recent drought. No pests and/or pathogens were observed on site.

Trees within the tree survey area vary in size and stature according to species and available growing space. The site's trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 14 to 43 inches and multi-stemmed trunk diameters that range from 1 to 17 inches. Tree heights vary from 11 to 45 feet. Tree canopy extents range from 10 feet to approximately 45 feet.

INTENTIONALLY LEFT BLANK

4 REGULATORY DEFINITIONS AND REQUIREMENTS

A tree inventory and assessment of the proposed project was performed pursuant to the Los Angeles County Oak Ordinance. The following is an outline of the key aspects of the ordinance.

4.1 Definitions

4.1.1 Los Angeles County Oak Tree Ordinance

Trees subject to County permit requirements include those defined by Title 22.56.2060 as:

> any tree of the oak genus which is (a) 25 inches or more in circumference (eight inches in diameter) as measured four and one-half feet above mean natural grade; in the case of an oak with more than one trunk, whose combined circumference of any two trunks is at least 38 inches (12 inches in diameter) as measured four and one half feet above mean natural grade.

Additionally, the Los Angeles County Oak Tree Ordinance defines the "Protected Zone" of a tree as (Title 22.56.2060) as "that area within the dripline of an oak tree and extending therefrom to a point at least five feet outside the dripline, or 15 feet from the trunks of a tree, whichever distance is greater."

For the purposes of determining tree impacts, trees that have protected zones that have been encroached upon would also be considered impacted.

4.2 Regulations

4.2.1 Los Angeles County Oak Tree Ordinance

The Los Angeles County Oak Tree Ordinance was established to recognize oak trees as significant historical, aesthetic, and ecological resources. The goal of the ordinance is to create favorable conditions for the preservation and propagation of this unique and threatened plant heritage. By making this part of the development process, healthy oak trees will be preserved and maintained. The Los Angeles County Oak Tree Ordinance applies to all unincorporated areas of the County.

Under the Los Angeles County Ordinance, a person shall not cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak tree genus, which is 8 inches or more in diameter, 4.5 feet above mean natural grade, or in the case of oaks with multiple trunks, a combined diameter of 12 inches or more of the two largest trunks, without first obtaining a permit.

4.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (1918) requires tree removal and potentially disturbing construction activities to occur during certain time periods to avoid harassment of nesting birds. According to this act, no construction or other disturbing activities can occur within 300 feet of an active bird nest (500 feet for listed species) during the period beginning in February and ending in September each year. Biological surveys should be conducted to provide clearance for project initiation.

5 IMPACTS

Tree impacts were determined using geographic information system technology and spatial locations of trees relative to the project impact areas (limits of grading). Impacts were further determined based on Dudek's experience with native and non-native trees and their typical reactions to root disturbances from construction activities such as soil compaction, excavation, and remedial grading. The impact analysis results presented were used for developing appropriate mitigation measures for the proposed project.

Impacts to trees can be classified as direct or indirect. Direct impacts to trees related to site improvements are typically the result of physical injuries or changes caused by machinery involved with the development process. Direct impacts include tree removal, root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others. Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Indirect impacts include alterations to stream flow rates, diversion of groundwater flow, introduction of exotic plant species, and alterations to disturbance regimes. Wider-scale alterations to the area near trees, as well as specific changes that occur around the trees, are important considerations.

In general, there is a great deal of variation in tolerance to construction impacts among tree species, ages, and conditions. It is important to know how a certain tree, based on its species, age, and condition, would respond to different types of disturbance. The trees in the proposed project area are of varying ages and conditions. Mature specimens are typically more sensitive to root disturbance and grade changes. In general, healthy trees will respond better to changes in their growing environment. Trees of poor health or stressed conditions may not be vigorous enough to cope with direct or indirect impacts from construction activities.

Impact totals presented are based on conceptual disturbance limits and development plans as of the date of this oak tree report. As such, the actual number of trees subject to direct and indirect impacts may change as the detailed site planning process proceeds. Actual tree impact numbers may be lower than anticipated and as presented in this oak tree report once detailed grading plans are developed. Measures to reduce impacts are encouraged and would be implemented in the field during grading operations. Following completion of construction-related disturbances, actual protected tree impact totals would be updated and provided along with revised mitigation totals.

5.1 Direct Tree Impacts

For the purposes of this oak tree report, direct impacts are those associated with tree removal or encroachment within the tree-protected zone (canopy dripline plus 5 feet or 15 feet from trunk, whichever is greater). Tree removal is expected to be required when the trunk is located inside or

within 2 feet of the proposed limits of grading. Encroachment is expected when soil and roots are disturbed within the tree-protected zone. Table 1 summarizes the number of trees by species that are expected to be subject to direct construction-related impacts. Direct tree impacts will result in the removal of two protected trees. A single non-protected sized tree will be removed (Tree Number 2). The locations of impacted trees are presented by impact type on the map in Appendix B.

Table 1
Summary of Tree Disposition

Scientific Name	Common Name	Removal	Encroachment	Indirect
Quercus agrifolia	Coast live oak	2 (1*)	—	—
	Total	2 (1*)	—	—

Note:
* (X) Indicates non-protected size tree.

5.2 Indirect Tree Impacts

Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Site-wide changes affecting trees include diverting runoff and stormwater, creating retention and detention ponds, relocating streams or making improvements to streams, lowering or raising water tables, altering the capacity for soil moisture recharge, removing vegetation, or damming underground water flow (Matheny and Clark 1998). For the purposes of this oak tree report, there are no indirect tree impacts expected for trees within 25 feet of the proposed project's limits of grading.

5.3 Candidates Suitable for Preservation

Trees identified as candidates for preservation in place exhibit good health (new growth and vigor) and structure (trunk/branching), have no uncorrectable, outwardly detectable defects, and show no signs or symptoms of serious pest infestation or species-specific pathogens. For the trees to avoid incidental damage during construction, preservation and protection measures must be provided before, during, and after the construction phase. Measures that must be implemented during these phases are provided in Section 7, Tree Protection Measures.

A total of two (2) protected trees will not be disturbed by active construction-related activities or grading; therefore, these trees will be preserved in place.

5.4 Tree Impact Summary

In summary, three (3) trees will be directly impacted (three removals) by the proposed project. Of the three (3) direct impacts, two (2) are protected by the Los Angeles County Oak Tree Ordinance. Two protected trees will be preserved in place. Individual tree impacts can be seen in Appendix B.

6 MITIGATION

6.1 Determination of Minimum Replacement Standards

As previously stated, there are four Los Angeles County-protected oak trees located on the proposed project site; as such, mitigation is required based on the County ordinance. Furthermore, the County allows for the payment of in-lieu fees for removed protected oak trees.

6.2 Recommended Mitigation

The County Ordinance identifies tree replacement requirements for tree removal associated with a development project. The following recommendations are provided for utilization of the appraised value of removed trees presented herein.

There are a total of two protected oak trees within the proposed project footprint that will require removal to accommodate the proposed project. It should be noted that Tree Number 1 was assessed previously in 2007 for a value of $8,000, which was then paid to the County. The oak tree was not removed at that time. For purposes of this report, Tree Number One was reassessed to determine the most current value of the oak tree. Additionally, Tree Number 3 was assessed for appraised value. In total, the appraised cost for all proposed protected tree removals is $13,530 though with the subtraction of the previously paid $8,000 the remaining recommended payment balance is $5,530. The full tree appraisal data and calculations are presented in Appendix D.

INTENTIONALLY LEFT BLANK

7 TREE PROTECTION MEASURES

Dudek recommends the following measures to protect the two valley oaks (Tree Numbers 4 and 5) that have protected zones adjacent to the active construction area. To the extent that protected trees for the proposed project site remain undisturbed, Dudek recommends similar tree protection measures for those retained trees.

7.1 Tree Protection Measures Prior to Construction

Fencing: Chain-link fencing, no less than 4 feet high, with tree protection signs shall be erected around all undisturbed trees (or tree groups). The protective fence shall be installed at the protected zone boundary of each tree (or tree group), which is defined as 5 feet beyond the tree canopy dripline, or 1.5 feet per inch of trunk diameter, whichever is greater. The intent of protection fencing is to prevent root damage and/or compaction by gradingequipment. An ISA-certified arborist may be required on site if grading activities occur within thetree's protected zone. The fencing shall be secured to 6-foot, heavy-gauge T-bar line posts,pounded in the ground a minimum of 18 inches and spaced a minimum of 8 feet on-center. Fencingshall be attached to T-bar posts with minimum 14-gauge wire fastened to the top, middle, andbottom of each post. Tree protection signs shall be attached to every fourth post. The contractorshall maintain the fence to keep it upright, taut, and aligned at all times. Fencing shall be removedonly after all construction activities in the vicinity of the affected tree(s) are complete.

Pre-construction Meeting: A pre-construction meeting shall be held between all contractors (including grading, tree removal/pruning, and builders) and an ISA-certified arborist. The meeting shall focus on instructing the contractors on tree protection practices and answering any questions. All equipment operators and spotters, assistants, or those directing operators from the ground shall provide written acknowledgement of receiving tree protection training. This training shall include information on the location and marking of protected trees, the necessity of preventing damage, and the discussion of work practices that shall accomplish these tasks.

7.2 Protection and Maintenance during Construction

Once construction activities have begun, the following protection measures shall be followed.

Equipment Operation and Storage: Contractors shall avoid heavy equipment operation around the protected trees. Operating heavy machinery around the root zones of trees will increase soil compaction, which decreases soil aeration and subsequently reduces water penetration into the soil. All heavy equipment and vehicles shall, at minimum, stay out of the fenced protected tree zone unless where specifically approved in writing and under the supervision of an ISA-certified arborist or their representative.

Materials Storage and Disposal: Contractors shall not store or discard any supplies or materials, including paint, lumber, and concrete overflow, within the protected zone and shall remove all foreign debris within the protected zone. However, the contractors shall leave the duff, mulch, chips, and leaves around the retained trees for water retention and nutrient supply. In addition, the contractors shall avoid draining or leakage of equipment fluids near retained trees. Fluids such as gasoline, diesel, oils, hydraulics, brake and transmission fluids, paint, paint thinners, and glycol (anti-freeze) shall be disposed of properly. The contractors shall ensure that equipment be parked at least 50 feet from the protected zone to avoid the possibility of leakage of equipment fluids into the soil. The effect of toxic equipment fluids on the retained trees could result in tree decline and/or mortality.

Grade Changes: Contractors shall ensure that grade changes, including adding fill, shall not be permitted within the protected zone without special written authorization and under supervision by an ISA-certified arborist or their representative. Lowering the grade within the protected zone would necessitate cutting main support and feeder roots, jeopardizing the health and structural integrity of the trees. Adding soil, even temporarily, on top of the existing grade would compact the soil further and decrease water and air availability to the tree roots. Contractors shall ensure that grade changes made outside of the protected tree zone shall not create conditions that allow water to pond at the base of the tree. Water trapped at the base of a tree could lead to root rot and other detrimental tree impacts.

Moving Construction Materials: Contractors shall ensure that care be exercised when moving construction equipment or supplies near the undisturbed oak trees, especially overhead. Contractors shall ensure that damage to the trees shall be avoided when transporting or moving construction materials and working around the tree (even outside of the fenced protected zone). Contractors shall flag aboveground tree parts that could be damaged (e.g., low limbs, scaffold branches, and trunks) with high-visibility flagging, such as florescent red or orange. If contact with the tree crown is unavoidable, conflicting branches may be pruned by an ISA-certified tree worker under supervision by an ISA-certified arborist or their representative and shall adhere to ISA standards.

Trenching: Except where specifically approved in writing beforehand, all trenching shall be outside of the fenced protected zone. Roots primarily extend in a horizontal direction, forming a support base to the tree similar to the base of a wine glass. Where trenching is necessary in areas that contain roots from retained trees, contractors shall use trenching techniques that include the use of either a root pruner (Dosko root pruner or equivalent) or an Air-Spade to limit root impacts. An ISA-certified arborist or their representative shall ensure that all pruning cuts be clean and sharp to minimize ripping, tearing, and fracturing of the root system. Root damage caused by backhoes, earthmovers, dozers, or graders is severe and may result in tree mortality. Use of both root-pruning and Air-Spade equipment shall be accompanied only by hand tools to remove soil from trench locations. The trench shall be made no deeper than necessary.

Irrigation: Irrigation of native protected trees retained on site shall seek to mimic natural rainfall patterns in Southern California. Supplemental irrigation for trees adjacent to construction activity may be necessary during winter or spring months. Summer and fall irrigation may be necessary based on variable climatic and site conditions, but should be conducted judiciously to avoid over-watering. One irrigation cycle shall thoroughly soak the root zones of the trees to a depth of 3 feet. The soil should be allowed to dry out between watering to avoid keeping a consistently wet soil. The contractor shall be responsible for irrigating (deep watering) the trees. Soil moisture shall be checked with a soil probe before irrigating. Irrigation is best accomplished by installing a temporary aboveground micro-spray system that would distribute water slowly (to avoid runoff) and evenly throughout the fenced protection zone. Over-watering of native oaks may promote the growth of tree-damaging agents, such as oak root fungus, so proper soil moisture monitoring is critical to prolonged tree health. For any trees that have been substantially root pruned (30% or more of their root zone), irrigation shall be required for the first 12 months. The first irrigation shall occur within 48 hours of root pruning. The tree(s) should be deep watered every 2 weeks during the summer and once a month during the winter (adjust accordingly with rainfall).

Canopy Pruning: The contractor shall not prune trees until all construction is completed unless standard pruning would reduce conflict between canopy and equipment. This will help protect the tree canopies from damage. All pruning shall be conducted by an ISA-certified tree worker under supervision by an ISA-certified arborist or their representative, and shall adhere to ISA pruning standards.

Canopy Washing: During construction, the contractor shall wash the foliage of trees adjacent to construction activity with a strong water stream every 2 weeks before 10:00 a.m. to control mite and insect populations.

Inspection: An ISA-certified arborist or their representative shall inspect the preserved trees adjacent to grading and construction activity on a monthly basis for the duration of the proposed project's construction period. A report summarizing site conditions, observations, tree health, and recommendations for minimizing tree damage shall be submitted by the ISA-certified arborist or their representative following each inspection.

7.3 Maintenance after Construction

Following the completion of the construction activity within 20 feet of the protected zones of undisturbed oaks, the tree protection fencing may be removed, and the following measures may be performed to sustain and enhance the vigor of the trees:

Mulch: The contractors shall ensure that the natural duff layer under all trees is maintained. This would stabilize soil temperatures in root zones, conserve soil moisture, and reduce erosion.

The contractors shall ensure that the mulch is kept clear of the trunk base to avoid creating conditions favorable to the establishment and growth of decay-causing fungal pathogens. Should it be necessary to add organic mulch under retained protected trees, packaged or commercial mulch shall not be used because it may contain oak root fungus. Also, the use of redwood chips shall be avoided because certain inhibitive chemicals may be present in the wood. Other wood chips and crushed walnut shells can be used, but the best mulch that provides a source of nutrients for the tree is its own leaf litter. Any organic mulch added by the contractor shall be applied to a maximum depth of 4 inches where possible.

Pruning: Regular pruning of the trees is not required. An ISA-certified tree worker, under the supervision of an ISA-certified arborist or their representative, shall only prune trees to maintain clearance and remove broken, dead, or diseased branches. No more than 15% of the canopy shall be removed at one time. All pruning shall conform to ISA standards.

Watering: The trees should not require regular irrigation, other than the 12 months following substantial root pruning, if applicable. However, soil probing shall be necessary to accurately monitor moisture levels. Supplemental irrigation for the trees that sustained root pruning and any newly planted trees may be necessary, especially in years with low winter rainfall.

Watering Adjacent Plant Material: All plants near the trees shall require moderate to low levels of water. The contractor shall infrequently water surrounding plants with deep soaks, rather than frequent light irrigation, and allow them to dry out between watering. The soil shall not be allowed to become saturated or stay continually wet, and drainage should not allow ponding of water beneath the canopy of the oak trees. Irrigation spray shall not hit the trunk of any tree. The contractor shall maintain a 30-inch dry zone around all tree trunks. An aboveground micro-spray irrigation system shall be used in lieu of typical underground pop-up sprays.

Chemical Applications: If the trees are maintained in a healthy state, regular spraying for insect or disease control would not be necessary. If a problem does develop, an ISA-certified arborist/licensed PCA or their representative shall be consulted since the trees may require application of insecticides to prevent the intrusion of bark-boring beetles and other invasive pests. All chemical spraying shall be performed by a licensed applicator under the direction of a licensed PCA.

Monitoring: An ISA-certified arborist or their representative should inspect the trees retained on site for a period of 7 years following the completion of construction activity. Monitoring visits should be completed quarterly, totaling 20 visits. Following each monitoring visit, a report summarizing site conditions, observations, tree health, and recommendations for promoting tree health shall be submitted. Additionally, any tree mortality shall be noted, and any tree dying during the monitoring period shall be replaced with the same species as specified for minimum replacement standards in this oak tree report.

8 CONCLUSION

The proposed project site includes five oak trees, four of which are protected by the by Los Angeles County. For the purposes of this oak tree report, two protected oak trees will be removed by the proposed project. The two protected trees proposed for removal will require the recommended in-lieu payment of $13,530, of which $8,000 has already been paid for a remaining balance of $5,530. Furthermore, this oak tree report also recommends that the remaining two (2) preserved in place valley oak trees be subject to protection measures that, when implemented, minimize the possibility that trees are inadvertently damaged during the construction process.

INTENTIONALLY LEFT BLANK

9 ARBORIST'S DISCLOSURE STATEMENT

This oak tree report provides conclusions and recommendations based only on a visual examination of the trees and surrounding site by an ISA-certified arborist and reasonable reliance on the completeness and accuracy of the information provided to the arborist. The examination did not include subterranean or internal examination of the trees.

Arborists are tree specialists who use their education, knowledge, training, and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near them. Although trees provide many benefits to those who live near them, they also include inherent risks from breakage or failure that can be minimized but not eliminated.

Arborists cannot detect every condition that could possibly lead to the failure of a tree. Trees are living organisms subject to attack by disease, insects, fungi, weather, and other forces of nature, and conditions that lead to failure are often hidden within trees and belowground. There are some inherent risks with trees that cannot be predicted with any degree of certainty, even by a skilled and experienced arborist. Arborists cannot predict acts of nature, including, without limitation, storms of sufficient strength, which can cause an apparently healthy tree to fail. Additionally, arborists cannot guarantee that a tree will be healthy or safe under all circumstances or for any specific period of time. A tree's condition could change over a short or long period of time due to climatic, cultural, or environmental conditions. Further, there is no guaranty or certainty that recommendations or efforts to correct unsafe conditions will prevent future breakage or failure of a tree.

To live or work near trees is to accept some degree of risk. Neither the author of this oak tree report nor Dudek have assumed any responsibility for or will be liable for any claims, losses, or damages for damage to any tree, death or injury to any person, or any loss of or damage to any personal or real property.

1 INTRODUCTION

This oak tree report provides an inventory and evaluation of the protected oak trees located on the proposed Water Tank site (project site). The project site is located in Los Angeles County, California (Figure 1). As such, this oak tree report covers the regulations and requirements for the protection and removal of protected trees within the jurisdiction of the County of Los Angeles (County).

Sterling Ranch Estates retained Dudek to conduct a tree inventory and assessment for the project site. A Dudek International Society of Arboriculture (ISA)-Certified Arborist performed various functions associated with surveying, inventorying, and evaluating the condition of all protected oak trees located within the project site to meet the requirements of the County Code, Title 22, Part 6, Oak Tree Permits.

The purpose of this oak tree report is to present the physical characteristics and mapped locations of the site's protected trees that are to be removed or protected in place during the proposed grading and construction-related activities. This oak tree report addresses protected and non-protected oak trees on the project site.

1.1 Project Location

The project site is located in the community of Val Verde, approximately 0.5 miles west of San Martinez Road. The water tank site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The site and biological study area occur entirely within the U.S. Geological Survey 7.5-minute Val Verde quadrangle (USGS 2017).

1.2 Site Characteristics

The project site has one paved access road that dead-ends into two water storage tanks on the southwest end of the property. The remaining land within the project site is best characterized as undeveloped oak woodland. Topographically, the project site consists of moderate north- and south-facing slopes with elevations ranging from approximately 1,550 feet above mean sea level along the northern boundary to approximately 1,750 feet above mean sea level in the southern portion of the site.

1.3 Project Description

A 1 million-gallon water tank is proposed in and adjacent to the existing Los Angeles County's Waterworks District No. 36 Cuyama tank site as a component of the Sterling Ranch Project. The water tank is located within the Waterworks District's 1598 pressure zone (Assessor's Parcel Numbers 3272-029-902 and 3272-029-023) comprising approximately 2.79 acres. The project site, which includes the development footprint and the overall biological study area, is depicted in Figure 2.

2 METHODS

2.1 Individual Tree Evaluation

Dudek mapped tree locations for all trees located on the project site. Tree mapping was conducted using a Trimble Pathfinder Pro XH Global Positioning System (GPS) receiver with H-Star Technology. Since tree canopies can sometimes cause loss of satellite lock by blocking the line-of-sight to satellites, an electronic compass and reflectorless, electronic distance-measuring device were also used in mapping tree locations. The reflectorless, electronic distance-measuring device/compass combination operates in concert with the Pathfinder system to position offsets, and offset information is automatically attached to the GPS position data string. The electronic tree locations were then evaluated using ArcView 10.4 software to determine the position of the trees related to the project development footprint.

All inventoried trees and assessed protected trees were tagged with an aluminum tag bearing a unique identification number, which was placed on the trunk of each tree. These numbers correspond to the tree attribute information presented in the Tree Information Matrix in Appendix A. Tree trunk diameters were measured using a diameter tape providing adjusted figures[1] for diameter measurements when wrapping the tape around an object's circumference. Diameter measurements were taken using protocol provided by the Council of Tree and Landscape Appraisers in the Guide for Plant Appraisal (ISA 2000). The trunk diameter measurement of each tree was taken at 4.5 feet above the ground along the trunk axis, with common exceptions. For example, in cases where a tree's trunk was located on a slope, the 4.5-foot distance was approximated as the average of the shortest and longest sides of the trunk (i.e., the uphill side and downhill side of a tree's trunk, respectively), and the measurement was made at this point. Tree height was visually estimated by experienced tree surveyors. Tree canopy diameters were typically estimated by "pacing-off" the measurement based on the investigator's knowledge of their stride length or by visually estimating the canopy width. The crown diameter measurements were made along an imaginary line intersecting the tree trunk that best approximated the average canopy diameter. Additionally, Dudek arborists calculated composite trunk diameters for multiple-stem trees according to ISA standards. According to these standards, the sum of all stem diameters was calculated to ascertain composite trunk diameter values for multiple-stem trees.

Pursuant to the Guide for Plant Appraisal (ISA 2000), tree health and structure were evaluated with respect to five distinct tree components: roots, trunk, scaffold branches, small branches, and foliage. Each component of the tree was assessed with regard to health factors such as insect and pathogen damage, mechanical damage, presence of decay, presence of wilted or dead leaves, and wound closure. Tree health and structure were graded as good, fair, poor, and dead, with "good" representing no apparent problems, and "dead" representing a dying and/or dead tree. Good condition trees exhibit acceptable vigor, healthy foliage, and adequate structure, and lack any major maladies. Fair condition trees are typically those with few maladies but declining vigor. This method of tree condition rating is comprehensive and results in ratings that are useful for determining the status of trees based on common urban forestry standards.

[1] Inches divided by 3.14 (π) provide diameter measurement in inches.

Individual tree attribute data is presented in Appendix A (Tree Information Matrix), and protected oak tree locations are presented in Appendix B (Oak Tree Locations and Proposed Impacts Exhibit). Representative protected oak tree photographs are presented in Appendix C.

2.2 Tree Impact Analysis

Dudek's ISA-certified arborists determined tree impacts by conducting a spatial analysis of individual tree locations and canopy extents visible in project site aerial imagery in relation to the water tank development plan. The tree dataset, digital aerial imagery, and site development planning data were evaluated using GIS software to determine where individual trees were located in relation to proposed water tank development areas. Per the Los Angeles County Oak Tree Ordinance, the "Protected Zone" of a tree is "that area within the dripline of an oak tree and extending there from to a point at least five feet outside the dripline, or 15 feet from the trunks of a tree, whichever distance is greater." Trees with project-related construction activity proposed within their protected zones are considered encroached upon for the purposes of this report. The impact analysis results were used to determine overall tree impacts for the project site.

2.3 Tree Appraisal

As allowed under Municipal Code Section 22.56.2140, Dudek ISA-certified arborists calculated the appraised value for each inventoried protected tree identified for removal according to the Guide for Plant Appraisal (ISA 2000), as discussed below.

2.3.1 Appraisal Method

Valuation of trees according to ISA standards involves incorporating ratings from three main tree features: species, location, and overall condition. The tree data matrix presented in Appendix A provides information regarding each evaluated tree and its current condition.

The Trunk Formula Method outlined in the Guide for Plant Appraisal is appropriate for trees that are too large to commonly be replaced and was used to calculate appraised tree values for trees identified for removal (ISA 2000). This method was selected given the variability of tree sizes on the site, and the inclusion of many large-diameter trees in the inventory that could not be reasonably replaced with nursery or transplant stock.

2.3.1.1 Appraisal Variables

The following variables and assumptions were included in generating the appraised tree values contained in this report, and are consistent with the Trunk Formula Method for tree appraisal (ISA 2000). Further, the descriptions contained herein coordinate with the tree appraisal data and calculations presented in Appendix A, Tree Information Matrix.

1. **Species**: Tree species were determined during field inspections.

2. **Condition**: Tree conditions were derived from field evaluations of outwardly observable health and structural characteristics. Condition ratings can range between 25% and 100% based on evaluations of root conditions, trunk form and observable defects, branching structure, and foliage condition.
3. **Trunk Diameter**: Trunk diameters are presented in inches measured at 4.5 feet (54 inches) above grade. Composite trunk diameters were calculated for trees with multiple stems and are the product of the square root of the sum of all squared trunk diameters.
4. **Location**: Location rating is the average value of site, contribution, and placement ratings. Ratings can range from 10% to 100%. Site values are affected by the economic, functional, and aesthetic aspects of the area where a tree is growing. Contribution accounts for the function and aesthetic values that the tree adds to the location where it is growing. Placement ratings indicate the effectiveness of tree locations on functional and aesthetic values. Based on the remoteness of portions of the project site and the degraded condition of portions of the site, location values applied to this site ranged from 37% to 43.0%.
5. **Species Rating**: Species rating was derived directly from the Species Classification and Group Assignment report published by the Western Chapter of ISA (Western Chapter ISA 2004). Values were determined by species for Southern California Inland Influence areas. Species ratings vary, with higher ratings assigned to native trees and lower ratings assigned to non-native, invasive species.
6. **Replacement Tree Size**: Replacement tree size values were derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion (Western Chapter ISA 2004), based on species-specific nursery groups.
7. **Replacement Tree Cost**: Replacement tree costs were derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion (Western Chapter ISA 2004), and were assessed to be $1,700.
8. **Installation Cost**: Installation costs were valued at $1,200 per tree.
9. **Installed Tree Cost**: Installed tree cost is the sum of the replacement tree cost and the installation cost.
10. **Unit Tree Cost per Square Inch**: Unit tree cost was derived from Table 11 of the Species Classification and Group Assignment report for the Southern California Subregion and varied by Nursery Group number.
11. **Appraised Trunk Area**: Appraised trunk area is the product of the squared trunk diameter value multiplied by 0.785. For trees with trunk measurements exceeding 30 inches, an adjusted trunk area value was used, as identified in Table 4.4 of the Guide for Plant Appraisal (ISA 2000).
12. **Appraised Tree Trunk Increase**: The appraised tree trunk increase is the difference between the appraised trunk area (No. 11) and the replacement tree size (No. 6).
13. **Basic Tree Cost**: Basic tree cost is the result of multiplying the unit tree cost (No. 10) and the appraised tree trunk increase (No. 12), and adding the installed tree cost (No. 9).
14. **Appraised Value**: The appraised value is the result of the basic tree cost discounted by the condition (No. 2), species (No. 5), and location (No. 4) ratings.

2.3.2 Appraisal Calculations

The matrix in Appendix A presents the results of the tree appraisal conducted for trees identified for removal on the project site. This matrix was created directly from the Trunk Formula Method Worksheet outlined in the Guide for Plant Appraisal (ISA 2000). The calculations in the matrix follow those in the worksheet.

The intent of the conversion of the standard worksheet to the matrix presented in Appendix A was to more efficiently and concisely present the tree appraisal data for the project site, and to allow the report reviewers to more easily compare appraisal value differences between trees.

2.4 Scope of Work Limitations

No root crown excavations or investigations, internal probing, or aerial canopy inspections were performed during the tree assessments. Therefore, the presence or absence of internal decay or other hidden or inaccessible inferiorities in individual trees could not be confirmed. While not a mitigation requirement, it is recommended that any large tree proposed for preservation or relocation in an urban setting be thoroughly inspected for internal or subterranean decay by a qualified arborist before finalizing preservation or relocation plans.

3 OBSERVATIONS

3.1 Individual Trees

Fifty-five coast live oak (*Quercus agrifolia*) and four scrub oak (*Quercus berberidifolia*) trees were inventoried within the biological study area. Of the 59 oak trees, 36 meet the County's criteria for a protected oak tree. Appendix B presents the location of the individual trees mapped and assessed for the proposed project.Overall, the trees exhibit growth and structural conditions that are typical of their location in a native oakwoodland setting prone to drought and wildfires. The trees include various trunk and branch maladies and health and structural conditions. As presented in Appendix A, 11.9% (7 trees) of theindividually mapped trees are in good health; 72.9% (43 trees) exhibit fair health, 13.5% (8 trees) are in poor health, and 1.7% (1 tree) is dead. Structurally, 3.3% (2 trees) of the individually mapped trees areconsidered to exhibit good structure, 83.1% (49 trees) exhibit fair structure, 11.9% (7 trees) poorstructure, and 1 (1.7%) is dead. The trees in good condition exhibit acceptable vigor, healthyfoliage,and adequate structure, and lack any major maladies. Trees in fair condition are typical, withfewmaladies but declining vigor. Trees in poor condition exhibit declining vigor, unhealthy foliage,poorbranch structure, and excessive lean. No pests or pathogens were observed on site.

Trees within the biological study area vary in size and stature according to species and available growing space. The site's trees are composed of single- and multi-stemmed trees, with single-stemmed trunk diameters that range from 6 to 44 inches, and multi-stemmed trunk diameters that range from 2 to 55 inches. Tree heights vary from 6 to 50 feet. Tree canopy extents range from 5 feet to approximately 50 feet.

INTENTIONALLY LEFT BLANK

4 REGULATORY DEFINITIONS AND REQUIREMENTS

A tree inventory and assessment of the project site was performed pursuant to the Los Angeles County Oak Tree Ordinance. The following is an outline of the key aspects of the ordinance.

4.1 Definitions

4.1.1 Los Angeles County Oak Tree Ordinance

Trees subject to County permit requirements include those defined by Title 22.56.2060, as follows:

> any tree of the oak genus which is (a) 25 inches or more in circumference (eight inches in diameter) as measured four and one-half feet above mean natural grade; in the case of an oak with more than one trunk, whose combined circumference of any two trunks is at least 38 inches (12 inches in diameter) as measured four and one half feet above mean natural grade.

Additionally, the Los Angeles County Oak Tree Ordinance defines the "Protected Zone" of a tree as (Title 22.56.2060) as "that area within the dripline of an oak tree and extending therefrom to a point at least five feet outside the dripline, or 15 feet from the trunks of a tree, whichever distance is greater."

For the purposes of determining tree impacts, trees that have protected zones that have been encroached upon would also be considered impacted.

4.2 Regulations

4.2.1 Los Angeles County Oak Tree Ordinance

The Los Angeles County Oak Tree Ordinance was established to recognize oak trees as significant historical, aesthetic, and ecological resources. The goal of the ordinance is to create favorable conditions for the preservation and propagation of this unique and threatened plant heritage. By making this part of the project development process, healthy oak trees will be preserved and maintained. The County Oak Tree Ordinance applies to all unincorporated areas of the County.

Under the County Oak Tree Ordinance, a person shall not cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak tree genus that is 8 inches or more in diameter; 4.5 feet above mean natural grade; or, in the case of oaks with multiple trunks, a combined diameter of 12 inches or more of the two largest trunks, without first obtaining a permit.

.

INTENTIONALLY LEFT BLANK

5 IMPACTS

Tree impacts were determined using GIS software and spatial locations of trees relative to the project's impact areas (development footprint). Impacts were further determined based on Dudek's experience with native and non-native trees and their typical reactions to root disturbances from construction activities, such as soil compaction, excavation, and grading. The impact analysis results presented herein were used for developing appropriate mitigation measures for the proposed project.

Impacts to trees can be classified as direct or indirect. Direct impacts to trees related to site development are typically the result of physical injuries or changes caused by machinery involved with the development process. Direct impacts include tree removal, root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others. Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Indirect impacts include alterations to stream flow rates, diversion of groundwater flow, introduction of exotic plant species, and alterations to disturbance regimes. Wider-scale alterations to the area near trees, as well as specific changes that occur around the trees, are important considerations.

In general, there is a great deal of variation in tolerance to construction impacts among tree species, ages, and conditions. It is important to know how a certain tree, based on its species, age, and condition, would respond to different types of disturbance. The trees on the project site are of varying ages and conditions. Mature specimens are typically more sensitive to root disturbance and grade changes. In general, healthy trees will respond better to changes in their growing environment. Trees of poor health or stressed conditions may not be vigorous enough to cope with direct or indirect impacts from construction activities.

Impact totals presented are based on conceptual disturbance limits and development plans as of the date of this oak tree report. As such, the actual number of trees subject to direct and indirect impacts may change as the detailed site planning process proceeds. Actual tree impact numbers may be lower than anticipated and as presented in this oak tree report once detailed grading plans are developed. Measures to reduce impacts are encouraged and would be implemented in the field during grading operations. Following completion of construction-related disturbances, actual protected tree impact totals would be updated and provided, along with revised mitigation totals.

5.1 Direct Tree Impacts

For the purposes of this oak tree report, direct impacts are those associated with tree removal or encroachment within the tree-protected zone (canopy dripline plus 5 feet or 15 feet from trunk, whichever is greater). Tree removal is expected to be required when the trunk is located inside or within 2 feet of the proposed limits of grading. Encroachment is expected when soil and roots are disturbed within the tree protected zone. Table 1 summarizes the number of trees by species that are expected to be directly impacted by construction. Direct tree impacts would result in the removal of 12 protected trees and the encroachment of an additional 11 protected trees. Two non-protected sized trees would be removed. The locations of impacted trees are presented by impact type on the map in Appendix B. Measures to minimize the extent of impacts to encroached trees are provided in Section 7, Tree Protection Measures.

Table 1
Summary of Direct Tree Impacts

Species		Protected Trees		Non-Protected Trees	
Scientific Name	*Common Name*	*Trees to Remove*	*Impacted but Not Removed*	*Trees to Remove*	*Impacted but Not Removed*
Quercus agrifolia	coast live oak	12	11	1	3
Quercus berberidifolia	scrub oak	0	0	1	0
	Total	12	11	2	3

5.2 Indirect Tree Impacts

Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Site-wide changes affecting trees include diverting runoff and stormwater, creating retention and detention ponds, relocating streams or making improvements to streams, lowering or raising water tables, altering the capacity for soil moisture recharge, removing vegetation, or damming underground water flow (Matheny and Clark 1998). For the purposes of this oak tree report, 31 indirect tree impacts are expected for trees within 25 feet of the proposed project's development footprint.

Table 2
Summary of Indirect Tree Impacts

Scientific Name	Common Name	Protected Trees	Non-Protected Trees
Quercus agrifolia	coast live oak	12	12
Quercus berberidifolia	scrub oak	1	6
	Total	13	18

5.3 Tree Impact Summary

In summary, 28 trees will be directly impacted (14 removals and 14 encroachments) by the proposed project. Of the 28 direct impacts, 12 that are protected by the County Oak Tree Ordinance are expected to require removal. Individual tree impacts can be found in Appendix B.

6 MITIGATION

6.1 Determination of Minimum Replacement Standards

Twelve County-protected oak trees are located on the project site. As such, mitigation is required based on the County Oak Tree Ordinance. The County allows for the payment of in-lieu fees for removed protected oak trees.

6.2 Recommended Mitigation

The County Oak Tree Ordinance identifies tree replacement requirements for tree removal associated with a development project. The following recommendations are provided for tree replacement using the appraised value of removed trees presented herein.

A total of 12 protected oak trees occur within the development footprint that will require removal to accommodate the proposed project. To mitigate their removal, 24 coast live oak trees would need to be replanted to meet the requirements of the County Oak TreeOrdinance. Dudek recommends all tree plantings be subject to a 7-year monitoring effort by an independent third-party certified arborist. This monitoring effort would consider growth, health, and condition of the subject trees to evaluate success.The monitoring effort may result in a recommendation of remedial actions should any of the tree plantings exhibit poor or declining health.

The specific location of individual mitigation tree plantings on site would be addressed in the mitigation planting plan or landscape design plan prepared for the site. The mitigation requirement and the approved tree replacement mitigation ratio is at the discretion of the County and subject to a final tree impactanalysis. As such, the final tree numbers associated with tree replacement and other mitigation components may vary from that presented in this tree inventory and assessment.

At the discretion of the County, an in-lieu fee can be paid for the appraised value of the oak trees as an alternative to mitigation tree planting. If the in-lieu fee is choosen, the appraised cost for all proposed protected tree removals is $48,520.The full tree appraisal data and calculations with individual assessment methods for each tree to beremoved can be provided.

INTENTIONALLY LEFT BLANK

7 TREE PROTECTION MEASURES

A total of 45 trees located on the project site would have direct or indirect impacts from construction-related activities. As such, tree protection is required and recommended. Dudek recommends that any County protected tree be preserved according to the tree protection measures discussed in Appendix D.

INTENTIONALLY LEFT BLANK

8 CONCLUSION

The project site contains 59 oak trees, of which 36 are protected by the County. For the purposes of this oak tree report, 23 protected oak trees (12 removed and 11 encroached) would be impacted by the proposed project. The 12 protected oak trees proposed for removal will require the recommended planting of 24 coast live oak trees to meet the requirements of the County Oak Tree Ordinance. Specific replacement planting locations should be accomodated within the Sterling Ranch Estates, in a natural oak woodland landscape. If it is found that a suitable location does not exist on-site for replacement tree plantings, an appropriate off-site location can be determined between the client and County. The mitigation requirement and the approved tree replacement mitigation ratio and planting locations are at the discretion of the County and subject to a final tree impact analysis. As such, the final tree numbers associated with tree replacement and other mitigation components may vary from that presented in this tree inventory and assessment. Furthermore, this oak tree report recommends that the remaining 11 encroached oak trees be subject to protection measures that, when implemented, minimize the possibility that the trees are inadvertently damaged during the construction process. An in-lieu payment of the appraised value of the trees, $48,250, can be made into County Oak Tree Fund, if tree planting is not selected as the method of mitigation by the County,

INTENTIONALLY LEFT BLANK

9 ARBORIST'S DISCLOSURE STATEMENT

This oak tree report provides conclusions and recommendations based only on a visual examination of the trees and surrounding site by an ISA-certified arborist and reasonable reliance on the completeness and accuracy of the information provided to the arborist. The examination did not include subterranean or internal examination of the trees.

Arborists are tree specialists who use their education, knowledge, training, and experience to examine trees; recommend measures to enhance the beauty and health of trees; and attempt to reduce the risk of living near them. Although trees provide many benefits to those who live near them, they also include inherent risks from breakage or failure that can be minimized but not eliminated.

Arborists cannot detect every condition that could possibly lead to the failure of a tree. Trees are living organisms subject to attack by disease, insects, fungi, weather, and other forces of nature, and conditions that lead to failure are often hidden within trees and belowground. There are some inherent risks with trees that cannot be predicted with any degree of certainty, even by a skilled and experienced arborist. Arborists cannot predict acts of nature, including, without limitation, storms of sufficient strength, which can cause an apparently healthy tree to fail. Additionally, arborists cannot guarantee that a tree will be healthy or safe under all circumstances or for any specific period of time. A tree's condition could change over a short or long period of time due to climatic, cultural, and/or environmental conditions. Further, there is no guaranty or certainty that recommendations or efforts to correct unsafe conditions will prevent future breakage or failure of a tree.

To live or work near trees is to accept some degree of risk. Neither the author of this oak tree report nor Dudek assume any responsibility for or will be liable for any claims, losses, or damages for damage to any tree, death or injury to any person, or any loss of or damage to any personal or real property.

APPENDIX D

Tree Protection Measures

Appendix D – Tree Protection Measures

The following sections are included as general guidelines for tree protection from construction impacts. The measures presented should be monitored by arborists and enforced by contractors and developers for maximum benefit to the trees.

Tree Protection Measures Prior to Construction

Fencing: All remaining trees that will not be relocated or removed should be preserved and protected in place. Trees within approximately 15 feet of proposed construction activity should be temporarily fenced with chain link or other material satisfactory to City planning staff throughout grading and construction activities. The fencing should be installed 3 feet outside of the dripline of each tree (or edge of canopy for cluster of trees), be 4 feet tall, and staked every 6 feet. The fenced area should be considered the tree protection zone (TPZ) unless proximate construction required temporary removal.

Pre-Construction Meeting: A pre-construction meeting should be held between all contractors (including grading, tree removal/pruning, builders, etc.) and the arborist. The arborist will instruct the contractors on tree protection practices and answer any questions. All equipment operators and spotters, assistants, or those directing operators from the ground, should provide written acknowledgement of their receiving tree protection training. This training should include information on the location and marking of protected trees, the necessity of preventing damage, and the discussion of work practices that will accomplish such.

Protection and Maintenance During Construction

Once construction activities have begun the following measures should be adhered to:

Equipment Operation and Storage: Avoid heavy equipment operation around the trees. Operating heavy machinery around the root zones of trees will increase soil compaction, which decreases soil aeration and subsequently reduces water penetration in the soil. All heavy equipment and vehicles should, at minimum, stay out of the fenced TPZ, unless where specifically approved in writing and under the supervision of a Certified Arborist or as provided by the approved landscape plan.

Storage and Disposal: Do not store or discard any supply or material, including paint, lumber, concrete overflow, etc. within the protection zone. Remove all foreign debris within the protection zone; it is important to leave the duff, mulch, chips, and leaves around the retained trees for water retention and nutrients. Avoid draining or leakage of equipment fluids near retained trees. Fluids such as gasoline, diesel, oils, hydraulics, brake and transmission fluids, paint, paint thinners, and glycol (anti-freeze) should be disposed of properly. Keep equipment parked at least 50 feet away from retained trees to avoid the possibility of leakage of equipment fluids into the soil. The effect of toxic equipment fluids on the retained trees could lead to decline and death.

Grade Changes: Grade changes, including adding fill, are not permitted within the TPZ without special written authorization and under the supervision of a Certified Arborist or as provided by the approved landscape plan. Lowering the grade within this area will necessitate cutting main support and feeder roots, jeopardizing the health and structural integrity of the tree(s). Adding soil, even temporarily, on top of the existing grade will compact the soil further, and decrease both water and air availability to the trees' roots.

Moving Construction Materials: Care will be taken when moving equipment or supplies near the trees, especially overhead. Avoid damaging the tree(s) when transporting or moving construction materials and working around the tree (even outside of the fenced tree protection zone). Above ground tree parts that could be damaged (e.g., low limbs, trunks) should be flagged with red ribbon. If contact with the tree crown is unavoidable, prune the conflicting branch(es) using International Society of Arboriculture (ISA) standards.

Root Pruning: Except where specifically approved in writing or as provided in Attachment 3, all trenching should be outside of the fenced protection zone. Roots primarily extend in a horizontal direction forming a support base to the tree similar to the base of a wineglass. Where trenching is necessary in areas that contain tree roots, prune the roots using a Dosko root pruner or equivalent. All cuts should be clean and sharp, to minimize ripping, tearing, and fracturing of the root system. The trench should be made no deeper than necessary.

Irrigation: Trees that have been substantially root pruned (30% or more of their root zone) will require irrigation for the first 12 months. The first irrigation should be within 48 hours of root pruning. They should be deep watered every 2 to 4 weeks during the summer and once a month during the winter (adjust accordingly with rainfall). One irrigation cycle should thoroughly soak the root zones of the trees to a depth of 3 feet. The soil should dry out between watering; avoid keeping a consistently wet soil. Designate one person to be responsible for irrigating (deep watering) the trees. Check soil moisture with a soil probe before irrigating. Irrigation is best accomplished by installing a temporary above ground micro-spray system that will distribute water slowly (to avoid runoff) and evenly throughout the fenced protection zone ***but never soaking the area located within 6 feet of the tree trunk, especially during warmer months***.

Pruning: Do not prune any of the trees until all construction is completed. This will help protect the tree canopies from damage. All pruning should be completed under the direction of an ISA Certified Arborist and using ISA guidelines. Only dead wood should be removed from tree canopies.

Washing: During construction in summer and autumn months, wash foliage of trees adjacent to the construction sites with a strong water stream every two weeks in early hours before 10:00 a.m. to control mite and insect populations.

Inspection: An ISA Certified Arborist should inspect the impacted preserved trees on a monthly basis during construction. A report comparing tree health and condition to the original, pre-construction baseline should be submitted following each inspection. Photographs of representative trees are to be included in the report on a minimum annual basis.

Maintenance After Construction

Once construction is complete the fencing may be removed and the following measures performed to sustain and enhance the vigor of the preserved trees.

Mulch: Provide a 4-inch mulch layer under the canopy of trees. Mulch should include clean, organic mulch that will provide long-term soil conditioning, soil moisture retention, and soil temperature control.

Pruning: The trees will not require regular pruning. Pruning should *only* be done to maintain clearance and remove broken, dead or diseased branches. Pruning should only take place following a recommendation by an ISA Certified Arborist and performed under the supervision of an ISA Certified Arborist. No more than 20% of the canopy should be removed at any one time. All pruning should conform to ISA standards.

Watering: The natural trees that are not disturbed should not require regular irrigation, other than the 12 months following substantial root pruning. However, soil probing will be necessary to accurately monitor moisture levels. Especially in years with low winter rainfall, supplemental irrigation for the trees that sustained root pruning and any newly planted trees may be necessary. The trees should be irrigated *only* during the winter and spring months.

Watering Adjacent Plant Material: All plants near the trees should be compatible with water requirements of said trees. The surrounding plants should be watered infrequently with deep soaks and allowed to dry out in-between, rather than frequent light irrigation. The soil should not be allowed to become saturated or stay continually wet. Irrigation spray should not hit the trunk of any tree. A 60-inch dry-zone should be maintained around all tree trunks. An aboveground micro-spray irrigation system is recommended over typical underground pop-up sprays.

Washing: Periodic washing of the foliage is recommended during construction but no more than once every 2 weeks. Washing should include the upper and lower leaf surfaces and the tree bark. This should continue beyond the construction period at a less frequent rate with a high-powered hose only in the early morning hours. Washing will help control dirt/dust buildup that can lead to mite and insect infestations.

Spraying: If the trees are maintained in a healthy state, regular spraying for insect or disease control should not be necessary. If a problem does develop, an ISA Certified Arborist should be consulted; the trees may require application of insecticides to prevent the intrusion of bark-boring beetles and other invading pests. All chemical spraying should be performed by a licensed applicator under the direction of a licensed pest control advisor.

Inspection: All trees that were impacted during construction within the TPZ should be monitored by an ISA Certified Arborist for the first 5 years after construction completion. The Arborist should submit an annual report, photograph each tree and compare tree health and condition to the original, pre-construction baseline.

Subject: ***Focused California Gnatcatcher Survey Results for the Sterling Ranch Estates Project, Val Verde, Los Angeles County, California***

Dear Recovery Permit Coordinator:

This report documents the results of protocol-level presence/absence surveys for the coastal California gnatcatcher (*Polioptila californica californica*; hereafter, gnatcatcher). Focused surveys were conducted throughout all areas of suitable habitat for the Sterling Ranch Estates Project (Project) located in the community of Val Verde in unincorporated Los Angeles County (*Figure 1*). There are approximately 78.58 acres of suitable habitat for gnatcatcher in the Project site (*Figure 2* and *3*).

The gnatcatcher is a federally listed threatened species and a California Department of Fish and Wildlife (CDFW) Species of Special Concern (SSC). It is closely associated with coastal sage scrub habitat and typically occurs below 950 feet elevation and on slopes less than 40% (Atwood 1990), but gnatcatchers have been observed at elevations greater than 2,000 feet. The species is threatened primarily by loss, degradation, and fragmentation of coastal sage scrub habitat, and is also impacted by brown-headed cowbird (*Molothrus ater*) nest parasitism (Braden et al. 1997).

LOCATION AND EXISTING CONDITIONS

The Project is located in the community of Val Verde, north of Chiquito Canyon Road, as well as northwest and southeast of Del Valle Road. The Project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The Project site occurs entirely within the U.S. Geological Survey (USGS) 7.5-minute Val Verde quadrangle (USGS 2017). The Project site is centered at approximately 34 27′1.00″ N 118 39′ 12.00″ W and falls within Township 4 north, Range 17 west, sections 9 and 10, San Bernardino meridian.

The Sterling Ranch Estates Project includes the development of approximately 239 residential lots along with associated parks, open space lots, roads, and other infrastructure within assessor parcel numbers (APNs) 3271-004-012 and 3271-004-013. Overall, the subject parcels comprise

approximately 114 acres. In addition, a preservation area associated with the project is located in APN 3271-005-032 totaling approximately 34 acres. The Project will involve mass grading within the parcels to facilitate the residential development and associated infrastructure; however, several areas will remain undeveloped and will be preserved as open space.

The Project site is located within the Transverse Range geomorphic province of southern California. Topographically, the Project site varies from flat to moderate north and south facing slopes with elevations ranging from approximately 1,200 feet above mean sea level (amsl) along the southern boundary to approximately 1,400 feet amsl in the northeastern portion of the site. Soils present within the site generally consist of loams, sandy loams, and silty clay loams, which are derived from sedimentary rock or granite. The Project region has a Mediterranean climate with cool, wet winters and hot, dry summers. Rainfall occurs primarily between October and March.

VEGETATION COMMUNITIES

In 2003, the Vegetation Classification and Mapping Program of the California Department of Fish and Game (CDFG; now called the California Department of Fish and Wildlife [CDFW]), Wildlife and Habitat Data Analysis Branch, published the *List of California Terrestrial Natural Communities Recognized by the California Natural Diversity Database* (CNDDB) (CDFG 2003 [updated 2011]). In September 2010, the CDFG published the *Natural Communities List* (NCL; CDFG 2010), which uses the scientific name of the dominant species in that alliance as the alliance name, and is based on the *Manual of California Vegetation, Second Edition* (MCV2; Sawyer et al. 2009). These classification systems focus on a quantified, hierarchical approach that includes both botanical (plant species) and physiognomic (community structure and form) factors as currently observed (as opposed to predicting climax or successional stages). Nomenclature for on-site vegetation communities reflects the most current system, MCV2, and NCL. All vegetation communities were mapped based on these sources.

Vegetation mapping was conducted in May 2017. All mapping was performed in the field, through interpretation of field maps with a high quality aerial photographic base and/or delineation using a Trimble Geo XT Global Position System (GPS) unit capable of submeter accuracy for all sensitive vegetation. The maximum scale of the field map was 200-scale (1-inch = 200-foot) base. The GPS data was downloaded into GIS ArcView for placement onto an aerial figure. In combination with the GPS data, GIS technicians digitized the delineated vegetation boundaries from field maps using ArcView to create the vegetation community map.

Vegetation communities (and alliances/sub-associations) that provide potential habitat for the gnatcatcher include basket bush thickets, California buckwheat scrub, California sagebrush scrub, California sagebrush-California buckwheat scrub, Palmer's goldenbush, and purple sagebrush scrub (*Figure 3*). Vegetation communities are described below and acreages present in the survey area are shown in *Table 1*.

Table 1
Existing Vegetation Communities and Land Cover Types in the Survey Area

Macrogroup	Alliance (Code)	State Rank*	Acres
MG049. Western Cordilleran Montane Shrubland and Grassland	*Rhus trilobata* (basket bush thickets) provisional alliance (BABT)	S3?	0.55
MG044. California Coastal Scrub	*Artemisia californica* (California sagebrush scrub) alliance (CSB)	S5	37.92
	Artemisia californica–Eriogonum fasciculatum (California sagebrush–California buckwheat) alliance (CSB-CB)	S4	20.07
	Eriogonum fasciculatum (California buckwheat scrub) alliance (CBS)	S5	6.19
	Ericameria palmeri (Palmer's goldenbush scrub) alliance (PGBS)	S3?	6.98
	Salvia leucophylla (purple sage scrub) alliance (PSS)	S4	6.88
		Total	78.58

* For alliances with state ranks of S1-S3, all associations within them are considered highly imperiled. A question mark (?) denotes an inexact numeric rank due to insufficient samples over the full expected range of the type, but existing information points to this rank (CDFW 2017f).

Basket Bush Thickets

The basket bush thickets vegetation community includes skunk bush (*Rhus aromatica*) as the dominant species in the shrub canopy. The basket bush thickets vegetation community has a continuous shrub canopy less than 2 meters (6.5 feet) in height and the herbaceous layer is grassy or open. Basket bush thickets occur on stream terraces, swales, shallow valleys, or upland topography (Sawyer et al. 2009). Basket bush thickets occur in one patch immediately south of Del Valle Road (*Figure 3*). Skunk bush is the dominant species, although blue elderberry (*Sambucus nigra* ssp. *caerulea*) and poison oak (*Toxicodendron diversilobum*) are also present in lower overall concentrations.

California Sagebrush Scrub

The California sagebrush scrub vegetation community includes California sagebrush (*Artemisia californica*) as the dominant or co-dominant species in the shrub canopy, when comprising at least 60% of the relative cover in the shrub canopy. This vegetation community has an intermittent to continuous shrub canopy that is two-tiered: one tier includes shrubs less than 2 meters (6.5 feet) in height and the second tier includes shrubs less than 5 meters (16 feet) in height. The herbaceous layer is variable both seasonally and annually. This vegetation community is usually found on steep slopes that are rarely flooded and on low-gradient deposits along streams (Sawyer et al. 2009). This vegetation community occurs throughout the survey area, particularly on the hillslopes and ridgelines (*Figure 3*). Dominant species present in this vegetation community include California sagebrush, California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), chaparral yucca (*Hesperoyucca whipplei*), and purple sage (*Salvia leucophylla*).

California Sagebrush – California Buckwheat Scrub

The California sagebrush-California buckwheat scrub vegetation community includes California sagebrush and California buckwheat as the co-dominant species in the shrub canopy, when combined they comprise 30–60% of the relative cover in the shrub canopy. This vegetation community has an intermittent to continuous shrub canopy that is two-tiered with most shrubs less than 2 meters (6.5 feet) in height. The herbaceous layer is seasonally present. This vegetation community is usually found on steep slopes that are usually south facing (Sawyer et al. 2009). This vegetation community occurs throughout the survey area, typically on steep slopes facing south, west, and slightly northwest (*Figure 3*). Dominant species present in this vegetation community include California sagebrush and California buckwheat. Co-occurring species include black sage, chaparral mallow (*Malacothamnus fasciculatus* var. *fasciculatus*), toyon (*Heteromeles arbutifolia*), redberry (*Rhamnus crocea*), and purple sage.

California Buckwheat Scrub

The California buckwheat scrub vegetation community includes California buckwheat as the dominant or co-dominant in the shrub canopy in this vegetation community, comprising 50% of the relative cover in the shrub canopy. The California buckwheat scrub vegetation community has a continuous or intermittent shrub canopy less than 2 meters (6.5 feet) in height and the herbaceous layer is variable. This vegetation community is usually found on upland slopes, intermittently flooded arroyos, channels and washes, and rarely flooded low-gradient deposits (Sawyer et al. 2009). This vegetation community occurs entirely within the northeastern portion

of the survey area on gentle to steep south-facing slopes (*Figure 3*). Dominant species present in this vegetation community include California buckwheat. Co-occurring species include sacapellote (*Acourtia microcephala*), California aster (*Corethrogyne filaginifolia*), black sage, chaparral mallow, toyon, redberry, and purple sage.

Palmer's Goldenbush Scrub

The Palmer's goldenbush scrub vegetation community includes Palmer's goldenbush (*Ericameria palmeri* ssp. *pachylepis*) as the dominant species in the shrub canopy. The Palmer's goldenbush scrub vegetation community has an open shrub canopy less than 1.5 meters (5 feet) in height and a continuous herbaceous layer. This vegetation community is usually found on flats and low slopes (Sawyer et al. 2009). This vegetation community occurs throughout the survey area, typically on gently sloping terrain at the base of hillslopes of varying aspect (*Figure 3*). Dominant species present in this vegetation community include Palmer's goldenbush. Co-occurring species include ripgut (*Bromus diandrus*), California aster, red brome (*Bromus madritensis* ssp. *rubens*), and fascicled tarweed (*Deinandra fasciculata*).

Purple Sage Scrub

Purple sage is dominant or co-dominant in the shrub canopy in this vegetation community, comprising 30% of the relative cover in the shrub canopy and often co-dominant with California sagebrush. The purple sage scrub vegetation community has an intermittent to continuous shrub canopy less than 2 meters (6.5 feet) in height and a variable herbaceous layer. This vegetation community is found on slopes of variable aspect (Sawyer et al. 2009). This vegetation community was found to occur typically in the northern portion of the survey area, typically on steep slopes facing north *(Figure 3*). Dominant species present in this vegetation community include purple sage and California sagebrush. Co-occurring species include white sage (*Salvia apiana*), giant wildrye (*Elymus condensatus*), toyon, hollyleaf redberry (*Rhamnus ilicifolia*), and grape soda lupine (*Lupinus excubitus* var. *excubitus*).

METHODS

The focused surveys for gnatcatcher were conducted between March 29 and June 22, 2018, by Melissa Blundell (TE97717A)(*Table 2*). The surveys were conducted following the currently accepted protocol of the U.S. Fish and Wildlife Service (USFWS) *Coastal California Gnatcatcher (*Polioptila californica californica*) Presence/Absence Survey Protocol* (USFWS 1997). The surveys included six survey passes at a minimum of 7-day intervals. Due to the size of the survey area, each survey pass was conducted across two days resulting in less than 80 acres of suitable habitat

surveyed during each visit (*Table 2*). Survey routes are shown on *Figure 3* and allowed for complete audible and visual coverage of all suitable gnatcatcher habitat on site. Appropriate birding binoculars were used to aid in detecting and identifying bird species. A tape of recorded vocalizations was used frequently in order to elicit a response from the species. The tape was played approximately every 50 to 100 feet. If gnatcatchers were detected, the playing of the tape would cease to avoid harassment.

A topographic map at 200-scale of the site (1 inch = 200 feet) overlain with vegetation polygons and the site area was carried during the survey. Additionally, digital mobile maps were utilized during the surveys to assist in navigating and mapping any gnatcatchers present. Appropriate binoculars (e.g., 8x42 magnification) were used to aid in detecting and identifying bird species. Vocalization-playback would have been terminated immediately upon detection of any gnatcatchers to minimize the potential for harassment. Weather conditions, time of day, and season were appropriate for the detection of gnatcatchers and are provided in *Table 2*.

RESULTS

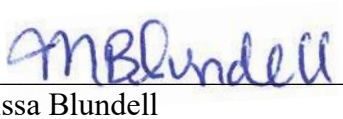
No California gnatcatchers were observed during the focused surveys. Five special-status species were observed during the surveys including Cooper's hawk (*Accipiter cooperii*; CDFW Watch List), sharp-shinned hawk (*Accipiter striatus*; CDFW Watch List), San Diegan tiger whiptail

(*Aspidoscelis tigris stejnegeri*; CDFW SSC), oak titmouse (*Baeolophus inornatus*; USFWS Birds of Conservation Concern), and Vaux's swift (*Chaetura vauxi*; CDFW SSC).

Overall, forty-nine wildlife species were observed during the surveys. A full list of wildlife species observed during the survey is provided in *Attachment A*. Photo plates of the survey area is provided in *Attachment B*. Please feel free to contact me at mblundell@dudek.com or (760) 214-1878 (cell) with questions or if you require additional information regarding this survey.

I certify that the information in this survey report and attached exhibits fully and accurately represent my work.

Sincerely,



Melissa Blundell
Biologist (TE97717A)

ATTACHMENT A

List of Wildlife Species Observed

ATTACHMENT A
List of Wildlife Species Observed

BIRD

BLACKBIRDS, ORIOLES & ALLIES

ICTERIDAE—BLACKBIRDS

Icterus cucullatus—hooded oriole
Sturnella neglecta—western meadowlark

BUSHTITS

AEGITHALIDAE—LONG-TAILED TITS & BUSHTITS

Psaltriparus minimus—bushtit

CARDINALS, GROSBEAKS & ALLIES

CARDINALIDAE—CARDINALS & ALLIES

Passerina amoena—lazuli bunting
Piranga ludoviciana—western tanager

FINCHES

FRINGILLIDAE—FRINGILLINE & CARDUELINE FINCHES & ALLIES

Haemorhous mexicanus—house finch
Spinus psaltria—lesser goldfinch

FLYCATCHERS

TYRANNIDAE—TYRANT FLYCATCHERS

Myiarchus cinerascens—ash-throated flycatcher
Sayornis nigricans—black phoebe
Sayornis saya—Say's phoebe
Tyrannus vociferans—Cassin's kingbird

HAWKS

ACCIPITRIDAE—HAWKS, KITES, EAGLES, & ALLIES

Accipiter cooperii—Cooper's hawk
Accipiter striatus—sharp-shinned hawk
Buteo jamaicensis—red-tailed hawk

HUMMINGBIRDS

TROCHILIDAE—HUMMINGBIRDS

Calypte anna—Anna's hummingbird

Selasphorus sasin—Allen's hummingbird

JAYS, MAGPIES & CROWS

CORVIDAE—CROWS & JAYS

Aphelocoma californica—California scrub-jay
Corvus brachyrhynchos—American crow
Corvus corax—common raven

MOCKINGBIRDS & THRASHERS

MIMIDAE—MOCKINGBIRDS & THRASHERS

Mimus polyglottos—northern mockingbird
Toxostoma redivivum—California thrasher

NEW WORLD QUAIL

ODONTOPHORIDAE—NEW WORLD QUAIL

Callipepla californica—California quail

NEW WORLD VULTURES

CATHARTIDAE—NEW WORLD VULTURES

Cathartes aura—turkey vulture

OLD WORLD SPARROWS

PASSERIDAE—OLD WORLD SPARROWS

* *Passer domesticus*—house sparrow

OLD WORLD WARBLERS & GNATCATCHERS

SYLVIIDAE—SYLVIID WARBLERS

Polioptila caerulea—blue-gray gnatcatcher

PIGEONS & DOVES

COLUMBIDAE—PIGEONS & DOVES

Zenaida macroura—mourning dove

SILKY FLYCATCHERS

PTILOGONATIDAE—SILKY-FLYCATCHERS

Phainopepla nitens—phainopepla

SWALLOWS

HIRUNDINIDAE—SWALLOWS

Petrochelidon pyrrhonota—cliff swallow

SWIFTS

APODIDAE—SWIFTS

Aeronautes saxatalis—white-throated swift
Chaetura vauxi—Vaux's swift

THRUSHES

TURDIDAE—THRUSHES

Sialia mexicana—western bluebird

TITMICE

PARIDAE—CHICKADEES & TITMICE

Baeolophus inornatus—oak titmouse

WATERFOWL

ANATIDAE—DUCKS, GEESE, & SWANS

Branta canadensis—Canada goose

WOOD WARBLERS & ALLIES

PARULIDAE—WOOD-WARBLERS

Oreothlypis celata—orange-crowned warbler
Setophaga townsendi—Townsend's warbler

WOODPECKERS

PICIDAE—WOODPECKERS & ALLIES

Melanerpes formicivorus—acorn woodpecker
Picoides pubescens—downy woodpecker

WRENS

TROGLODYTIDAE—WRENS

Thryomanes bewickii—Bewick’s wren

WRENTITS

TIMALIIDAE—BABBLERS

Chamaea fasciata—wrentit

NEW WORLD SPARROWS

PASSERELLIDAE—NEW WORLD SPARROWS

Aimophila ruficeps—rufous-crowned sparrow
Melospiza melodia—song sparrow
Melozone crissalis—California towhee
Passerculus sandwichensis—savannah sparrow
Pipilo maculatus—spotted towhee
Zonotrichia leucophrys—white-crowned sparrow

MAMMAL

CANIDS

CANIDAE—WOLVES & FOXES

Canis latrans—coyote

HARES & RABBITS

LEPORIDAE—HARES & RABBITS

Sylvilagus bachmani—brush rabbit

SQUIRRELS

SCIURIDAE—SQUIRRELS

Spermophilus (*Otospermophilus*) *beecheyi*—California ground squirrel

REPTILE

LIZARDS

TEIIDAE—WHIPTAIL LIZARDS

Aspidoscelis tigris stejnegeri—San Diegan tiger whiptail

* Species marked with an asterisk are non-native species.

Subject: Focused California Gnatcatcher Survey Results for the Sterling Ranch Estates Project

Dear Recovery Permit Coordinator:

This report documents the results of protocol-level presence/absence surveys for the coastal California gnatcatcher (*Polioptila californica californica*; hereafter, gnatcatcher). Focused surveys were conducted throughout all areas of suitable habitat for the Sterling Ranch Estates Project (Project) located in the community of Val Verde in unincorporated Los Angeles County (Figures 1). There are approximately 80.5 acres of suitable habitat for gnatcatcher in the Project site, including within the Tract Map Site, Off-Site Water Tank Area, Off-Site Roadway Improvement Area, and Off-Site Open Space (Figure 2). The Off-Site Waterline Improvement Area and Off-Site Sewer Line Improvement Area lie in existing roads and contain no suitable habitat for gnatcatchers; therefore, these areas were not included in the survey.

The gnatcatcher is a federally listed threatened species and a California Department of Fish and Wildlife (CDFW) Species of Special Concern (SSC). It is closely associated with coastal sage scrub habitat and typically occurs below 950 feet elevation and on slopes less than 40% (Atwood 1990), but gnatcatchers have been observed at elevations greater than 2,000 feet. The species is threatened primarily by loss, degradation, and fragmentation of coastal sage scrub habitat, and is also impacted by brown-headed cowbird (*Molothrus ater*) nest parasitism (Braden et al. 1997).

LOCATION AND EXISTING CONDITIONS

The Project is located in the community of Val Verde, north of Chiquito Canyon Road, as well as northwest and southeast of Del Valle Road. The Project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The Project site occurs entirely within the U.S. Geological Survey (USGS) 7.5-minute Val Verde quadrangle (USGS 2020). The Project site is centered at approximately 34 27′1.00″ N 118 39′ 12.00″ W and falls within Township 4 north, Range 17 west, sections 9 and 10, San Bernardino meridian.

The Sterling Ranch Estates Project includes the development of approximately 222 detached single-family residential lots; a commercial lot with neighborhood-serving retail; recreation/open space (park sites, natural open space, manufactured open space) lots; and a homeowner's association lot, including roads and utility infrastructure (debris basin, infiltration basin, and pump station) within Assessor's Parcel Numbers (APNs) 3271-004-012 and 3271-004-013. Overall, the subject parcels comprise approximately 113.9 acres. Off-site areas include the Off-Site Roadway Improvement Area, Off-Site Open Space Area, and Off-Site Water Tank Area. The Off-Site Roadway Improvement Area is situated immediately east of the APN 3271-004-013 and totals approximately 6.5 acres.

The Project will conserve in perpetuity through a conservation easement 37.9 acres of APN 3271-005-032, referred to herein as the Off-Site Open Space Area. The 41.3 acres of APN 3271-005-032 located just east of the proposed 37.9-acre Off-Site Open Space Area conservation easement is already subject to preservation in perpetuity through a conservation easement held by the Mountains Recreation & Conservation Authority. The 16.1 acres of APN 3271-005-032 located just north of the proposed 37.9-acre Off-Site Open Space Area conservation easement area is Tentative Tract No. 62000, which is currently proposed for residential development; however, entitlements for Tentative Tract No. 62000 are not being pursued actively at this time. The 41.3-acre conservation easement held by the Mountains Recreation & Conservation Authority and the 16.1-acre Tentative Tract No. 62000 are not a part of the Project but are included as a visual for the contiguous open space area.

The Project site is located within the Transverse Range geomorphic province of southern California. Topographically, the Project site varies from flat to steep north and south facing slopes with elevations ranging from approximately 1,200 feet above mean sea level (amsl) along the southern boundary to approximately 1,400 feet amsl in the northeastern portion of the site. Soils present within the site generally consist of loams, sandy loams, and silty clay loams, which are derived from sedimentary rock or granite. The Project region has a Mediterranean climate with cool, wet winters and hot, dry summers. Rainfall occurs primarily between October and March.

VEGETATION COMMUNITIES

In 2003, the Vegetation Classification and Mapping Program of the California Department of Fish and Game (CDFG; now called the California Department of Fish and Wildlife [CDFW]), Wildlife and Habitat Data Analysis Branch, published the *List of California Terrestrial Natural Communities Recognized by the California Natural Diversity Database* (CNDDB) (CDFG 2003 [updated 2011]). In September 2010, the CDFG published the *Natural Communities List* (NCL; CDFG 2010), which uses the scientific name of the dominant species in that alliance as the alliance name, and is based on the *Manual of California Vegetation, Second Edition* (MCV2; Sawyer et al. 2009). These classification systems focus on a quantified, hierarchical approach that includes both botanical (plant species) and physiognomic (community structure and form) factors as currently observed (as opposed to predicting climax or successional stages). After Dudek conducted field work for vegetation mapping in 2017, CDFW updated the Natural Communities List in its California Natural Communities List (CDFW 2019), which incorporated changes based on taxonomic revisions related to dominant plants, reassignment of associations to new or different alliances, and revisions to the rarities rankings of some communities. Therefore, nomenclature for on-site vegetation communities reflects the most current system, in the Manual of California Vegetation and the updated Natural Communities list (CDFW 2019). All vegetation communities were mapped based on these sources.

Vegetation mapping was conducted in May 2017 in conjunction with the initial focused botanical and special-status plant species survey and updated in February 2020. All mapping was performed in the field, through interpretation of field maps with a high quality aerial photographic base and/or delineation using a Trimble Geo XT Global Position System (GPS) unit capable of submeter accuracy for all sensitive vegetation. The maximum scale of the field map was 200-scale (1-inch = 200-foot). The GPS data was downloaded into GIS ArcView for placement onto an aerial figure. In combination with the GPS data, GIS technicians digitized the delineated vegetation boundaries from field maps using ArcView to create the vegetation community map.

Vegetation communities (and alliances/sub-associations) that provide potential habitat for the gnatcatcher include the scrub communities on-site including: black sage scrub, bush mallow scrub, California buckwheat scrub, California sagebrush – black sage scrub, California sagebrush – California buckwheat scrub, California sagebrush

scrub, coyote brush scrub, Palmer's goldenbush scrub, purple sage scrub, and chamise – black sage chaparral (Figure 3A and 3B). Vegetation communities are described below and acreages present in the survey area are shown in Table 1.

Table 1
Existing Vegetation Communities and Land Cover Types in the Survey Area

Vegetation Community	Alliance (Code)	State Rank[1]	Acres[2]
California Coastal Scrub	Black sage scrub (*Salvia mellifera*) Alliance	S4	0.3
	Bush mallow scrub (*Malacothamnus fasciculatus - Malacothamnus* spp.) Alliance	S4	<0.1
	California buckwheat scrub (*Eriogonum fasciculatum*) Alliance	S5	0.6
	California sagebrush - black sage scrub (*Artemisia californica - Salvia mellifera*) Alliance	S4	0.5
	California sagebrush - California buckwheat scrub (*Artemisia californica - Eriogonum fasciculatum*) Alliance	S4	33.1
	California sagebrush scrub (*Artemisia californica*) Alliance	S5	29.5
	Coyote brush scrub (*Baccharis pilularis*) Alliance	S5	0.1
	Palmer's goldenbush scrub (*Ericameria palmeri*) Provisional Alliance	S3?	8.2
	Purple sage scrub (*Salvia leucophylla*) Alliance	S4	7.8
Chaparral	Chamise - black sage chaparral (*Adenostoma fasciculatum - Salvia mellifera*) Alliance	S4	0.7
		Total	**80.5**

Notes:
[1] For alliances with state ranks of S1-S3, all associations within them are considered highly imperiled. A question mark (?) denotes an inexact numeric rank due to insufficient samples over the full expected range of the type, but existing information points to this rank (CDFW 2019).
[2] The total acres may appear to be off due to rounding.

California Coastal Scrub

Black Sage Scrub (*Salvia mellifera*) Alliance

The black sage scrub (*Salvia mellifera*) alliance includes black sage (*Salvia mellifera*) as the dominant or co-dominant species in the shrub canopy. Black sage scrub has a continuous to intermittent shrub canopy less than 2 meters (7 feet) in height. The herbaceous layer is variable; grasses and herbs are seasonal. Black sage scrub occurs on dry slopes and alluvial fans (Sawyer et al. 2009).

Black sage scrub occurs in one patch within the southern portion of the Off-Site Water Tank Area, as shown on Figure 3B. Other shrub species observed within black sage scrub include chamise, California sagebrush, and California buckwheat. Black sage scrub comprises 0.3 acres of the Off-Site Water Tank Area.

The black sage scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate black sage scrub as a sensitive vegetation community.

Bush Mallow Scrub (*Malacothamnus fasciculatus - Malacothamnus* spp.) Alliance

The bush mallow scrub (*Malacothamnus fasciculatus – Malacothamnus* spp.) alliance includes bush mallow as the dominant or co-dominant species in the shrub canopy. Bush mallow scrub has an open to intermittent shrub canopy less than 3 meters (10 feet) in height. The herbaceous layer is usually sparse. Bush mallow occurs on gentle to very steep slopes of variable aspects (Sawyer et al. 2009).

Bush mallow scrub occurs in two patches in the Off-Site Water Tank Area BSA (Biological Survey Area), as shown on Figure 3B. Other shrub species observed within bush mallow scrub include California sagebrush and California buckwheat. Bush mallow scrub comprises 0.0 acres (rounded from 0.05 acres) of the Off-Site Water Tank Area BSA.

The bush mallow scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate bush mallow scrub as a sensitive vegetation community.

California buckwheat scrub (*Eriogonum fasciculatum*) Alliance

The California buckwheat scrub (*Eriogonum fasciculatum*) alliance includes California buckwheat as the dominant or co-dominant in the shrub canopy, comprising 50% of the relative cover in the shrub canopy. California buckwheat scrub has a continuous or intermittent canopy less than 2 meters (7 feet) in height, and the herbaceous layer is variable and may be grassy. This vegetation community is usually found on upland slopes, intermittently flooded arroyos, channels and washes, and rarely flooded low-gradient deposits (Sawyer et al. 2009).

California buckwheat scrub occurs within the northeastern portion of the Tract Map Site BSA and the northwestern portion of the Off-Site Road Improvement Area BSA on gentle to steep south-facing slopes, as shown on Figure 3A. Other species observed within California buckwheat scrub include sacapellote (*Acourtia microcephala*), California aster (*Corethrogyne filaginifolia*), black sage, chaparral mallow, toyon (*Heteromeles arbutifolia*), redberry (*Rhamnus crocea*), and purple sage (*Salvia leucophylla*). California buckwheat scrub comprises 0.3 acres of the Tract Map Site BSA and 0.3 acres of the Off-Site Roadway Improvement Area BSA, for a total of 0.6 acres.

The California buckwheat scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate California buckwheat scrub as a sensitive vegetation community.

California Sagebrush – Black Sage Scrub (*Artemisia californica – Salvia mellifera*) Alliance

The California sagebrush (*Artemisia californica*) – black sage scrub (*Salvia mellifera*) alliance includes California sagebrush and black sage as co-dominant in the shrub canopy. California sagebrush – black sage scrub has an intermittent to continuous canopy less than 2 meters (7 feet) in height, and the herbaceous layer is variable. This

vegetation community is usually found on steep east- to southwest-facing slopes, and soils are usually colluvial derived (Sawyer et al. 2009).

California sagebrush – black sage scrub occurs within the southeastern portion of the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other species observed within California sagebrush – black sage scrub include purple sage and chamise. California sagebrush – black sage scrub comprises 0.5 acres of the Off-Site Water Tank Area.

The California sagebrush – black sage scrub is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate California sagebrush – black sage scrub as a sensitive vegetation community.

California Sagebrush - California Buckwheat Scrub (*Artemisia californica – Eriogonum fasciculatum*) Alliance

The California sagebrush - California buckwheat scrub (*Artemisia californica – Eriogonum fasciculatum*) alliance includes California sagebrush and California buckwheat as the co-dominant species in the shrub canopy; when combined, they comprise 30% to 60% of the relative cover in the shrub canopy. California sagebrush – California buckwheat scrub has an intermittent to continuous canopy that is two-tiered with most shrubs less than 2 meters (7 feet) in height with some less than 5 meters (16 feet) in height. The herbaceous layer is seasonally present. California sagebrush – California buckwheat scrub is usually found on steep slopes that are usually south-facing (Sawyer et al. 2009).

California sagebrush – California buckwheat scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Reservoir Area BSA typically on steep slopes facing south, west, and slightly northwest, as shown on Figure 3A and Figure 3B. Other shrub species observed within California sagebrush – California buckwheat scrub include black sage, chaparral mallow (*Malacothamnus fasciculatus* var. *fasciculatus*), toyon, redberry, and purple sage. California sagebrush - California buckwheat scrub comprises 24.7 acres of the Tract Map Site BSA, 2.4 acres of the Off-Site Roadway Improvement Area BSA, 5.7 acres of the Off-Site Open Space Area BSA, and 0.2 acres of the Off-Site Water Tank Area BSA, for a total of 33.1 acres.

The California sagebrush – California buckwheat scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate California sagebrush – California buckwheat scrub as a sensitive vegetation community.

California Sagebrush Scrub (*Artemisia californica*) Alliance

The California sagebrush scrub (*Artemisia californica*) alliance includes California sagebrush as the dominant or co-dominant species in the shrub canopy, when comprising at least 60% of the relative cover in the shrub canopy. California sagebrush scrub has an intermittent to continuous shrub canopy that is two-tiered: one tier includes shrubs less than 2 meters (7 feet) in height, and the second tier includes shrubs less than 5 meters (16 feet) in height. The herbaceous layer is variable both seasonally and annually. California sagebrush scrub is usually found on steep slopes that are rarely flooded and on low-gradient deposits along streams (Sawyer et al. 2009).

California sagebrush scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, the Off-Site Open Space Area BSA, and the Off-Site Water Tank Area BSA, particularly on the hillslopes and ridgelines, as shown on Figure 3A and Figure 3B. Other shrub species observed within California sagebrush scrub include California buckwheat, black sage, chaparral yucca (*Hesperoyucca whipplei*), and purple sage. California sagebrush scrub comprises 5.4 acres of the Tract Map Site BSA, 23.6 acres of the Off-Site Open Space Area BSA, and 0.6 acres of the Off-Site Water Tank Area BSA, for a total of 29.5 acres.

The California sagebrush scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate California sagebrush scrub as a sensitive vegetation community.

Coyote Brush Scrub (*Baccharis pilularis*) Alliance

The coyote brush scrub (*Baccharis pilularis*) alliance includes coyote brush as the dominant or co-dominant shrub in the canopy. Coyote brush scrub has a variable shrub canopy less than 3 meters (10 feet) in height with a variable ground layer. Coyote brush scrub occurs within river mouths, stream sides, terraces, stabilized dunes of coastal bars, splits along the coastline, coastal bluffs, open slopes, and ridges (Sawyer et al. 2009).

Coyote brush scrub occurs in one area within the Off-Site Road Improvement Area BSA, as shown in Figure 3A. Other species observed in coyote brush scrub include common deerweed (Acmispon glaber), California buckwheat, California sagebrush, and white sage (*Salvia apiana*). Coyote brush scrub comprises 0.1 acres of the Off-Site Roadway Improvement Area BSA.

The coyote brush scrub alliance is ranked as an S5 alliance (NatureServe 2019). This ranking indicates that within California the alliance is demonstrably secure to ineradicable and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate Coyote brush scrub as a sensitive vegetation community.

Palmer's Goldenbush Scrub (*Ericameria palmeri*) Provisional Alliance

The Palmer's goldenbush scrub (*Ericameria palmeri*) provisional alliance includes Palmer's goldenbush (*Ericameria palmeri* ssp. *pachylepis*) as the dominant species in the shrub canopy. The Palmer's goldenbush scrub vegetation community has an open shrub canopy less than 1.5 meters (4.9 feet) in height and a continuous herbaceous layer. Palmer's goldenbush scrub is usually found on flats and low slopes (Sawyer et al. 2009).

Palmer's goldenbush scrub occurs throughout the Tract Map Site BSA and the Off-Site Open Space Area BSA, typically on gently sloping terrain at the base of hillslopes of varying aspect, as shown on Figure 3A. Other species observed within Palmer's goldenbush scrub include ripgut (*Bromus diandrus*), California aster, compact brome (*Bromus madritensis*), and fascicled tarweed (*Deinandra fasciculata*). Palmer's goldenbush scrub comprises 6.7 acres of the Tract Map Site BSA and 1.4 acres of the Off-Site Open Space Area BSA, for a total of 8.2 acres. Note that due to rounding, the summed totals may be off slightly.

The Palmer's goldenbush scrub provisional alliance is ranked by CDFW (2019) as an S3? Alliance (NatureServe 2019). This ranking indicates that within California the alliance is considered a sensitive vegetation community

(CDFW 2019; NatureServe 2019). Los Angeles County does not designate Palmer's goldenbush scrub as a sensitive vegetation community.

Purple Sage Scrub (*Salvia leucophylla*) Alliance

The purple sage scrub (*Salvia leucophylla*) alliance includes purple sage as dominant or co-dominant in the shrub canopy in this vegetation community, comprising 30% of the relative cover in the shrub canopy and often co-dominant with California sagebrush. Purple sage has an intermittent to continuous shrub canopy less than 2 meters (7 feet) in height and a variable herbaceous layer. This vegetation community is found on slopes of variable aspects (Sawyer et al. 2009).

Purple sage scrub occurs throughout the Tract Map Site BSA, the Off-Site Road Improvement Area BSA, and the Off-Site Open Space Area BSA typically on steep slopes facing north, as shown on Figure 3A. Other species observed within purple sage scrub include California sage brush, white sage (*Salvia apiana*), giant wildrye (*Elymus condensatus*), toyon, hollyleaf redberry (*Rhamnus ilicifolia*), and grape soda lupine (*Lupinus excubitus*). Purple sage scrub comprises 5.5 acres of the Tract Map Site BSA, 0.0 acres (rounded from 0.04 acres) of the Off-Site Roadway Improvement Area BSA, and 2.3 acres of the Off-Site Open Space Area BSA, for a total of 7.8 acres.

The purple sage scrub alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate purple sage scrub as a sensitive vegetation community.

Chaparral

Chamise - Black Sage Chaparral (*Adenostoma fasciculatum - Salvia mellifera*) Alliance

The chamise – black sage chaparral (Adenostoma fasciculatum – Salvia mellifera) alliance includes chamise and black sage as the co-dominant species in the shrub canopy. The chamise – black sage chaparral alliance has a continuous to intermittent canopy less than 3 meters (10 feet) in height. The herbaceous layer is sparse. Chamise – black sage chaparral occurs on lower to upper slopes of all aspects; however, it occurs predominantly on south-facing slopes (Sawyer et al. 2009).

Chamise – black sage chaparral occurs in one area within the central portion of the Off-Site Water Tank Area BSA, as shown on Figure 3B. Other shrub species observed within the chamise – black sage chaparral vegetation community include California sagebrush (Artemisia californica) and California buckwheat (Eriogonum fasciculatum). Chamise – black sage chaparral comprises 0.7 acres of the Off-Site Water Tank Area BSA.

The chamise – black sage chaparral alliance is ranked as an S4 alliance (NatureServe 2019). This ranking indicates that within California the alliance is apparently secure and not considered a sensitive vegetation community (CDFW 2019; NatureServe 2019). Los Angeles County does not designate chamise – black sage chaparral as a sensitive vegetation community.

METHODS

The focused surveys for gnatcatcher were conducted between April 30 and June 30, by Melissa Blundell (TE-97717A), Tommy Molioo (TE-02412D), and Jeff Priest (TE-840619) (Table 2). The surveys were conducted following the currently accepted protocol of the U.S. Fish and Wildlife Service (USFWS) *Coastal California Gnatcatcher (Polioptila californica californica) Presence/Absence Survey Protocol* (USFWS 1997). The surveys included six survey passes at a minimum of 7-day intervals. Due to the size of the survey area, each survey pass was conducted across two days resulting in less than 80 acres of suitable habitat surveyed during each visit (Table 2). Survey routes are shown on Figure 3A and 3B and allowed for complete audible and visual coverage of all suitable gnatcatcher habitat on site. Appropriate birding binoculars were used to aid in detecting and identifying bird species. Recorded vocalizations were used frequently in order to elicit a response from the species. The tape was played approximately every 50 to 100 feet. If gnatcatchers would have been detected, the playing of the tape would have ceased to avoid harassment.

A topographic map at 200-scale of the site (1 inch = 200 feet) overlain with vegetation polygons and the site area was used for the survey. Additionally, digital mobile maps were utilized during the surveys to assist in navigating and mapping any gnatcatchers present. Appropriate binoculars (e.g., 8x42 magnification) were used to aid in detecting and identifying bird species. Vocalization-playback would have been terminated immediately upon detection of any gnatcatchers to minimize the potential for harassment. Weather conditions, time of day, and season were appropriate for the detection of gnatcatchers and are provided in Table 2.

Table 2
Survey Dates and Conditions

Survey Pass	Date	Biologist's Initials[1]	Time	Survey Conditions[2]

[2]Survey Conditions: °F = degrees Fahrenheit; % cc = percent cloud cover; mph = mile per hour

RESULTS

No California gnatcatchers were observed during the focused surveys. Two special-status species were observed during the surveys including Cooper's hawk (*Accipiter cooperii*; CDFW Watch List) and Costa's hummingbird (*Calypte costae*; USFWS Bird of Conservation Concern).

Overall, fifty-nine wildlife species were observed during the surveys. A full list of wildlife species observed during the survey is provided in Attachment A. Photo documentation of the survey area is provided in Attachment B. Please feel free to contact me at mblundell@dudek.com or (760) 214-1878 (cell) with questions or if you require additional information regarding this survey.

I certify that the information in this survey report and attached exhibits fully and accurately represent my work.

Sincerely,

Melissa Blundell	Tommy Molioo	Jeff Priest

Attachment A

List of Wildlife Species Observed

BIRDS

BLACKBIRDS, ORIOLES & ALLIES

ICTERIDAE—BLACKBIRDS

Icterus cucullatus—hooded oriole

BUSHTITS

AEGITHALIDAE—LONG-TAILED TITS & BUSHTITS

Psaltriparus minimus—bushtit

CARDINALS, GROSBEAKS & ALLIES

CARDINALIDAE—CARDINALS & ALLIES

Passerina amoena—lazuli bunting

FINCHES

FRINGILLIDAE—FRINGILLINE & CARDUELINE FINCHES & ALLIES

Haemorhous mexicanus—house finch
Spinus psaltria—lesser goldfinch
Spinus tristis—American goldfinch

FLYCATCHERS

TYRANNIDAE—TYRANT FLYCATCHERS

Empidonax difficilis—Pacific-slope flycatcher
Myiarchus cinerascens—ash-throated flycatcher
Sayornis nigricans—black phoebe
Sayornis saya—Say's phoebe
Tyrannus vociferans—Cassin's kingbird

HAWKS

ACCIPITRIDAE—HAWKS, KITES, EAGLES, & ALLIES

Accipiter cooperii—Cooper's hawk
Buteo jamaicensis—red-tailed hawk

HUMMINGBIRDS

TROCHILIDAE—HUMMINGBIRDS

Calypte anna—Anna's hummingbird
Calypte costae—Costa's hummingbird
Selasphorus sasin—Allen's hummingbird

JAYS, MAGPIES & CROWS

CORVIDAE—CROWS & JAYS

Aphelocoma californica—California scrub-jay
Corvus brachyrhynchos—American crow
Corvus corax—common raven

MOCKINGBIRDS & THRASHERS

MIMIDAE—MOCKINGBIRDS & THRASHERS

Mimus polyglottos—northern mockingbird
Toxostoma redivivum—California thrasher

NEW WORLD QUAIL

ODONTOPHORIDAE—NEW WORLD QUAIL

Callipepla californica—California quail

NEW WORLD VULTURES

CATHARTIDAE—NEW WORLD VULTURES

Cathartes aura—turkey vulture

OLD WORLD SPARROWS

PASSERIDAE—OLD WORLD SPARROWS

* *Passer domesticus*—house sparrow

OLD WORLD WARBLERS & GNATCATCHERS

POLIOPTILIDAE—GNATCATCHERS

Polioptila caerulea—blue-gray gnatcatcher

PIGEONS & DOVES

COLUMBIDAE—PIGEONS & DOVES

Streptopelia decaocto—Eurasian collared-dove

* *Zenaida macroura*—mourning dove

ROADRUNNERS & CUCKOOS

CUCULIDAE—CUCKOOS, ROADRUNNERS, & ANIS

Geococcyx californianus—greater roadrunner

SILKY FLYCATCHERS

PTILOGONATIDAE—SILKY-FLYCATCHERS

Phainopepla nitens—phainopepla

STARLINGS & ALLIES

STURNIDAE—STARLINGS

* *Sturnus vulgaris*—European starling

SWALLOWS

HIRUNDINIDAE—SWALLOWS

Petrochelidon pyrrhonota—cliff swallow

Stelgidopteryx serripennis—northern rough-winged swallow

Tachycineta thalassina—violet-green swallow

SWIFTS

APODIDAE—SWIFTS

Aeronautes saxatalis—white-throated swift

WOODPECKERS

PICIDAE—WOODPECKERS & ALLIES

Colaptes auratus—northern flicker

Dryobates nuttallii—Nuttall's woodpecker

Melanerpes formicivorus—acorn woodpecker

WRENS

TROGLODYTIDAE—WRENS

Catherpes mexicanus—canyon wren
Thryomanes bewickii—Bewick's wren
Troglodytes aedon—house wren

NEW WORLD SPARROWS

PASSERELLIDAE—NEW WORLD SPARROWS

Aimophila ruficeps—rufous-crowned sparrow
Melospiza melodia—song sparrow
Melozone crissalis—California towhee
Pipilo maculatus—spotted towhee

TYPICAL WARBLERS, PARROTBILLS, WRENTIT

SYLVIIDAE—SYLVIID WARBLERS

Chamaea fasciata—wrentit

INVERTEBRATES

BUTTERFLIES

LYCAENIDAE—BLUES, HAIRSTREAKS, & COPPERS

Icaricia acmon acmon—Acmon blue

HESPERIIDAE—SKIPPERS

Erynnis funeralis—funereal duskywing

PIERIDAE—WHITES & SULFURS

Pieris rapae—cabbage white
Pontia protodice—checkered white

MAMMALS

CANIDS

CANIDAE—WOLVES & FOXES

Canis latrans—coyote

CATS

FELIDAE—CATS

Lynx rufus—bobcat

HARES & RABBITS

LEPORIDAE—HARES & RABBITS

Sylvilagus audubonii—desert cottontail

Sylvilagus bachmani—brush rabbit

KANGAROO RATS

HETEROMYDIAE—POCKET MICE & KANGAROO RATS

Dipodomsy sp.—kangaroo rat

POCKET GOPHERS

GEOMYIDAE—POCKET GOPHERS

Thomomys bottae—Botta's pocket gopher

SQUIRRELS

SCIURIDAE—SQUIRRELS

Spermophilus (Otospermophilus) beecheyi—California ground squirrel

UNGULATES

CERVIDAE—DEERS

Odocoileus hemionus—mule deer

REPTILES

LIZARDS

PHRYNOSOMATIDAE—IGUANID LIZARDS

Sceloporus occidentalis—western fence lizard

Uta stansburiana—common side-blotched lizard

Appendix F

Plant Species Compendium

Eudicots

ADOXACEAE—MUSKROOT FAMILY

Sambucus nigra ssp. *caerulea*—blue elderberry

AMARANTHACEAE—AMARANTH FAMILY

Amaranthus blitoides—mat amaranth

ANACARDIACEAE—SUMAC OR CASHEW FAMILY

Rhus aromatica—basket bush

Rhus ovata—sugarbush

* *Schinus molle*—Peruvian peppertree

Toxicodendron diversilobum—poison oak

APIACEAE—CARROT FAMILY

Apiastrum angustifolium—mock parsley

Daucus pusillus—American wild carrot

Lomatium utriculatum—common lomatium

APOCYNACEAE—DOGBANE FAMILY

Asclepias californica—California milkweed

Asclepias fascicularis—Mexican whorled milkweed

ASTERACEAE—SUNFLOWER FAMILY

Acourtia microcephala—sacapellote

Ambrosia acanthicarpa—flatspine bur ragweed

Artemisia californica—California sagebrush

Artemisia dracunculus—wild tarragon

Baccharis pilularis—coyote brush

Baccharis salicifolia ssp. *salicifolia*—mulefat

Brickellia nevinii—Nevin's brickellbush

* *Carduus pycnocephalus* ssp. *pycnocephalus*—Italian plumeless thistle

* *Centaurea benedicta*—blessed thistle

* *Centaurea melitensis*—Maltese star-thistle

Chaenactis glabriuscula var. *glabriuscula*—yellow pincushion

Corethrogyne filaginifolia—sand-aster

Deinandra fasciculata—clustered tarweed

Encelia californica—California brittle bush

Encelia farinosa—brittle bush

Ericameria palmeri var. *pachylepis*—Palmer's rabbitbrush

Ericameria pinifolia—pinebush

* *Erigeron bonariensis*—asthmaweed
Erigeron canadensis—Canadian horseweed
Erigeron foliosus var. *foliosus*—leafy fleabane
Eriophyllum confertiflorum var. *confertiflorum*—golden-yarrow
Hazardia squarrosa var. *grindelioides*—sawtooth bristleweed
Helianthus gracilentus—slender sunflower
Heterotheca grandiflora—telegraphweed
Heterotheca sessiliflora ssp. *echioides*—sessileflower false goldenaster
* *Hypochaeris glabra*—smooth cat's ear
Isocoma menziesii var. *menziesii*—Menzies' goldenbush
* *Lactuca serriola*—prickly lettuce
Lasthenia californica ssp. *californica*—California goldfields
Leptosyne bigelovii—Bigelow's tickseed
Logfia filaginoides—California cottonrose
* *Logfia gallica*—narrowleaf cottonrose
Malacothrix coulteri—snake's head
Malacothrix saxatilis var. *tenuifolia*—cliff desertdandelion
Pseudognaphalium californicum—ladies' tobacco
Pseudognaphalium microcephalum—Wright's cudweed
Rafinesquia californica—California plumeseed
* *Senecio vulgaris*—old-man-in-the-Spring
* *Silybum marianum*—blessed milkthistle
* *Sonchus oleraceus*—common sowthistle
Stephanomeria exigua—small wirelettuce
Stephanomeria pauciflora—brownplume wirelettuce
Stephanomeria virgata ssp. *virgata*—rod wirelettuce
Stylocline gnaphaloides—mountain neststraw
Uropappus lindleyi—Lindley's silverpuffs

BIGNONIACEAE—BIGNONIA FAMILY

* *Catalpa speciosa*—northern catalpa

BORAGINACEAE—BORAGE FAMILY

Amsinckia intermedia—common fiddleneck
Amsinckia menziesii—Menzies' fiddleneck
Amsinckia tessellata var. *tessellata*—bristly fiddleneck
Cryptantha intermedia var. *intermedia*—Clearwater cryptantha
Cryptantha muricata var. *muricata*—pointed cryptantha
Eucrypta chrysanthemifolia var. *chrysanthemifolia*—spotted hideseed
Pectocarya linearis ssp. *ferocula*—sagebrush combseed

Phacelia distans—distant phacelia
Phacelia hastata var. *hastata*—silverleaf phacelia
Phacelia imbricata var. *patula*—imbricate phacelia
Phacelia ramosissima—branching phacelia
Phacelia viscida var. *viscida*—tacky phacelia
Plagiobothrys canescens var. *canescens*—valley popcornflower

BRASSICACEAE—MUSTARD FAMILY

* *Brassica nigra*—black mustard
Erysimum capitatum—sanddune wallflower
* *Hirschfeldia incana*—shortpod mustard
* *Sisymbrium irio*—London rocket
* *Sisymbrium orientale*—Indian hedgemustard
Thysanocarpus laciniatus—mountain fringepod

CACTACEAE—CACTUS FAMILY

Opuntia basilaris var. *basilaris*—beavertail pricklypear
Opuntia littoralis—coast prickly pear

CAPRIFOLIACEAE—HONEYSUCKLE FAMILY

Lonicera interrupta—chaparral honeysuckle

CHENOPODIACEAE—GOOSEFOOT FAMILY

* *Atriplex semibaccata*—Australian saltbush
* *Chenopodium album*—lambsquarters
Chenopodium californicum—California goosefoot
* *Chenopodium murale*—nettleleaf goosefoot
Salicornia bigelovii—dwarf saltwort
* *Salsola australis*—Russian thistle
* *Salsola tragus*—prickly Russian thistle

CONVOLVULACEAE—MORNING-GLORY FAMILY

Calystegia macrostegia—island false bindweed
Calystegia peirsonii—Peirson's morning-glory
* *Convolvulus arvensis*—field bindweed
Cuscuta californica var. *californica*—chaparral dodder

CRASSULACEAE—STONECROP FAMILY

Crassula connata—sand pygmyweed
Dudleya lanceolata—lanceleaf liveforever

CUCURBITACEAE—GOURD FAMILY

Marah macrocarpa—Cucamonga manroot

EUPHORBIACEAE—SPURGE FAMILY

Croton setiger—dove weed
Euphorbia albomarginata—whitemargin sandmat
Stillingia linearifolia—queen's root

FABACEAE—LEGUME FAMILY

Acmispon americanus var. *americanus*—American bird's-foot trefoil
Acmispon glaber—deer weed
Acmispon maritimus—coastal bird's-foot trefoil
Acmispon strigosus—strigose bird's-foot trefoil
Astragalus didymocarpus var. *didymocarpus*—dwarf white milkvetch
* *Gleditsia triacanthos*—honeylocust
Lupinus albifrons—silver bush lupine
Lupinus bicolor—miniature lupine
Lupinus excubitus var. *hallii*—Hall's bush lupine
Lupinus formosus var. *formosus*—summer lupine
Lupinus hirsutissimus—stinging annual lupine
Lupinus microcarpus var. *densiflorus*—whitewhorl lupine
Lupinus microcarpus var. *microcarpus*—valley lupine
Lupinus sparsiflorus—Coulter's lupine
Lupinus succulentus—hollowleaf annual lupine
Lupinus truncatus—collared annual lupine
* *Medicago polymorpha*—burclover
* *Melilotus indicus*—annual yellow sweetclover
* *Spartium junceum*—Spanish broom
Trifolium albopurpureum—rancheria clover
Trifolium ciliolatum—foothill clover

FAGACEAE—OAK FAMILY

Quercus agrifolia—coast live oak
Quercus berberidifolia—Inland scrub oak
Quercus lobata—valley oak

GERANIACEAE—GERANIUM FAMILY

* *Erodium botrys*—longbeak stork's bill
* *Erodium cicutarium*—redstem stork's bill
* *Geranium dissectum*—cutleaf geranium

JUGLANDACEAE—WALNUT FAMILY

Juglans californica—Southern California black walnut

LAMIACEAE—MINT FAMILY

* *Marrubium vulgare*—horehound

Monardella breweri ssp. *breweri*—Brewer's monardella

Salvia apiana—white sage

Salvia columbariae—chia

Salvia leucophylla—purple sage

Salvia mellifera—black sage

Trichostema lanceolatum—vinegarweed

LYTHRACEAE—LOOSESTRIFE FAMILY

* *Punica granatum*—pomegranate

MALVACEAE—MALLOW FAMILY

Malacothamnus fasciculatus—bush mallow

* *Malva parviflora*—cheeseweed mallow

MONTIACEAE—MONTIA FAMILY

Calandrinia menziesii—red maids

Claytonia perfoliata—miner's lettuce

MYRSINACEAE—MYRSINE FAMILY

* *Lysimachia arvensis*—scarlet pimpernel

MYRTACEAE—MYRTLE FAMILY

* *Eucalyptus camaldulensis*—river redgum

NYCTAGINACEAE—FOUR O'CLOCK FAMILY

Mirabilis laevis var. *crassifolia*—California four o'clock

OLEACEAE—OLIVE FAMILY

Fraxinus velutina—velvet ash

ONAGRACEAE—EVENING PRIMROSE FAMILY

Camissonia campestris ssp. *campestris*—Mojave suncup

Camissoniopsis bisorta—southern suncup

Camissoniopsis hirtella—Santa Cruz Island suncup

Camissoniopsis micrantha—miniature suncup

Clarkia cylindrica—speckled clarkia

Clarkia purpurea ssp. *quadrivulnera*—winecup clarkia

Clarkia unguiculata—elegant clarkia
Epilobium canum ssp. *canum*—hummingbird trumpet
Eulobus californicus—California suncup

OROBANCHACEAE—BROOM-RAPE FAMILY

Castilleja affinis ssp. *affinis*—coast Indian paintbrush
Castilleja exserta ssp. *exserta*—exserted Indian paintbrush

PAPAVERACEAE—POPPY FAMILY

Eschscholzia californica—California poppy

PHRYMACEAE—LOPSEED FAMILY

Diplacus aurantiacus—bush monkeyflower

PLANTAGINACEAE—PLANTAIN FAMILY

Antirrhinum coulterianum—Coulter's snapdragon
Collinsia heterophylla var. *heterophylla*—purple Chinese houses
Keckiella cordifolia—heartleaf keckiella
Plantago erecta—dwarf plantain

PLATANACEAE—PLANE TREE, SYCAMORE FAMILY

Platanus racemosa—California sycamore

POLEMONIACEAE—PHLOX FAMILY

Gilia angelensis—chaparral gilia
Gilia capitata ssp. *abrotanifolia*—bluehead gilia
Leptosiphon parviflorus—variable linanthus

POLYGONACEAE—BUCKWHEAT FAMILY

Chorizanthe staticoides—Turkish rugging
Eriogonum angulosum—anglestem buckwheat
Eriogonum elongatum var. *elongatum*—longstem buckwheat
Eriogonum fasciculatum var. *foliolosum*—California buckwheat
Eriogonum gracile var. *gracile*—slender woolly buckwheat
Pterostegia drymarioides—woodland pterostegia
* *Rumex crispus*—curly dock

RANUNCULACEAE—BUTTERCUP FAMILY

Delphinium parryi ssp. *parryi*—San Bernardino larkspur

RHAMNACEAE—BUCKTHORN FAMILY

Rhamnus crocea—redberry buckthorn

Rhamnus ilicifolia—hollyleaf redberry

ROSACEAE—ROSE FAMILY

Adenostoma fasciculatum—chamise
Heteromeles arbutifolia—toyon

RUBIACEAE—MADDER FAMILY

Galium angustifolium ssp. *angustifolium*—narrowleaf bedstraw
Galium aparine—stickywilly

SALICACEAE—WILLOW FAMILY

Populus fremontii ssp. *fremontii*—Fremont cottonwood
Salix laevigata—red willow
Salix lasiolepis—arroyo willow

SAPINDACEAE—SOAPBERRY FAMILY

Acer negundo—box-elder

SIMAROUBACEAE—QUASSIA OR SIMAROUBA FAMILY

* *Ailanthus altissima*—tree of heaven

SOLANACEAE—NIGHTSHADE FAMILY

Datura wrightii—sacred thorn-apple
* *Nicotiana glauca*—tree tobacco
* *Solanum xanti*—Purple nightshade

ULMACEAE—ELM FAMILY

* *Ulmus parvifolia*—Chinese elm

Ferns and Fern Allies

PTERIDACEAE—BRAKE FAMILY

Pellaea andromedifolia—coffee cliffbrake

SELAGINELLACEAE—SPIKE-MOSS FAMILY

Selaginella bigelovii—bushy spikemoss

Monocots

AGAVACEAE—AGAVE FAMILY

Hesperoyucca whipplei—chaparral yucca

LILIACEAE—LILY FAMILY

Calochortus clavatus var. *gracilis*—slender mariposa lily

POACEAE—GRASS FAMILY

* *Arundo donax*—giant reed
* *Avena barbata*—slender oat
* *Avena fatua*—wild oat
* *Bromus diandrus*—ripgut brome
* *Bromus hordeaceus*—soft brome
* *Bromus madritensis*—compact brome
* *Bromus rubens*—red brome
* *Bromus tectorum*—cheatgrass
* *Cynodon dactylon*—Bermudagrass
Elymus condensatus—giant wild rye
Elymus glaucus—blue wildrye
Elymus triticoides—creeping ryegrass
* *Festuca myuros*—rat-tail fescue
* *Hordeum murinum*—mouse barley
Melica imperfecta—smallflower melicgrass
Muhlenbergia microsperma—littleseed muhly
* *Poa annua*—annual bluegrass
Poa secunda—onesided bluegrass
* *Schismus arabicus*—Arabian schismus
* *Schismus barbatus*—common Mediterranean grass
Stipa cernua—nodding needlegrass
Stipa coronata—giant ricegrass
Stipa lepida—foothill needlegrass
* *Stipa miliacea* var. *miliacea*—smilograss
Stipa pulchra—purple needlegrass
* *Triticum aestivum*—common wheat

THEMIDACEAE—BRODIAEA FAMILY

Bloomeria crocea var. *crocea*—common goldenstar
Dichelostemma capitatum ssp. *capitatum*—bluedicks

* signifies introduced (non-native) species

Appendix G

Wildlife Species Compendium

Birds

Blackbirds, Orioles and Allies

ICTERIDAE—BLACKBIRDS

Icterus cucullatus—hooded oriole
Sturnella neglecta—western meadowlark

Bushtits

AEGITHALIDAE—LONG-TAILED TITS AND BUSHTITS

Psaltriparus minimus—bushtit

Cardinals, Grosebeaks and Allies

CARDINALIDAE—CARDINALS AND ALLIES

Passerina amoena—lazuli bunting
Piranga ludoviciana—western tanager

Falcons

FALCONIDAE—CARACARAS AND FALCONS

Falco sparverius—American kestrel

Finches

FRINGILLIDAE—FRINGILLINE & CARDUELINE FINCHES AND ALLIES

Haemorhous mexicanus—house finch
Spinus psaltria—lesser goldfinch
Spinus tristis—American goldfinch

Flycatchers

TYRANNIDAE—TYRANT FLYCATCHERS

Empidonax difficilis—Pacific-slope flycatcher
Myiarchus cinerascens—ash-throated flycatcher
Sayornis nigricans—black phoebe
Sayornis saya—Say's phoebe
Tyrannus verticalis—western kingbird
Tyrannus vociferans—Cassin's kingbird

Hawks

ACCIPITRIDAE—HAWKS, KITES, EAGLES, AND ALLIES

Accipiter cooperii—Cooper's hawk
Accipiter striatus—sharp-shinned hawk
Buteo jamaicensis—red-tailed hawk

Hummingbirds

TROCHILIDAE—HUMMINGBIRDS

Calypte anna—Anna's hummingbird
Calypte costae—Costa's hummingbird
Selasphorus sasin—Allen's hummingbird

Jays, Magpies and Crows

CORVIDAE—CROWS AND JAYS

Aphelocoma californica—California scrub-jay
Corvus brachyrhynchos—American crow
Corvus corax—common raven

Mockingbirds and Thrashers

MIMIDAE—MOCKINGBIRDS AND THRASHERS

Mimus polyglottos—northern mockingbird
Toxostoma redivivum—California thrasher

New World Quail

ODONTOPHORIDAE—NEW WORLD QUAIL

Callipepla californica—California quail

New World Vultures

CATHARTIDAE—NEW WORLD VULTURES

Cathartes aura—turkey vulture

Old World Sparrows

PASSERIDAE—OLD WORLD SPARROWS

* Passer domesticus—house sparrow

Old World Warblers and Gnatcatchers

POLIOPTILIDAE—GNATCATCHERS

Polioptila caerulea—blue-gray gnatcatcher

Owls

STRIGIDAE—TYPICAL OWLS

Bubo virginianus—great horned owl

Pigeons and Doves

COLUMBIDAE—PIGEONS AND DOVES

* Streptopelia decaocto—Eurasian collared-dove

Zenaida macroura—mourning dove

Roadrunners and Cuckoos

CUCULIDAE—CUCKOOS, ROADRUNNERS, AND ANIS

Geococcyx californianus—greater roadrunner

Shorebirds

CHARADRIIDAE—LAPWINGS AND PLOVERS

Charadrius vociferus—killdeer

Silky Flycatchers

PTILOGONATIDAE—SILKY-FLYCATCHERS

Phainopepla nitens—phainopepla

Starlings and Allies

STURNIDAE—STARLINGS

* Sturnus vulgaris—European starling

Swallows

HIRUNDINIDAE—SWALLOWS

Petrochelidon pyrrhonota—cliff swallow

Stelgidopteryx serripennis—northern rough-winged swallow

Tachycineta thalassina—violet-green swallow

Swifts

APODIDAE—SWIFTS

Aeronautes saxatalis—white-throated swift
Chaetura vauxi—Vaux's swift

Titmice

PARIDAE—CHICKADEES AND TITMICE

Baeolophus inornatus—oak titmouse

Waterfowl

ANATIDAE—DUCKS, GEESE, AND SWANS

Branta canadensis—Canada goose

Wood Warblers and Allies

PARULIDAE—WOOD-WARBLERS

Cardellina pusilla—Wilson's warbler
Setophaga townsendi—Townsend's warbler
Leiothlypis celata—orange-crowned warbler

Woodpeckers

PICIDAE—WOODPECKERS AND ALLIES

Colaptes auratus—northern flicker
Dryobates nuttallii—Nuttall's woodpecker
Dryobates pubescens—downy woodpecker
Melanerpes formicivorus—acorn woodpecker

Wrens

TROGLODYTIDAE—WRENS

Catherpes mexicanus—canyon wren
Thryomanes bewickii—Bewick's wren
Troglodytes aedon—house wren

New World Sparrows

PASSERELLIDAE—NEW WORLD SPARROWS

Aimophila ruficeps—rufous-crowned sparrow
Melospiza melodia—song sparrow
Melozone crissalis—California towhee
Passerculus sandwichensis—savannah sparrow
Pipilo maculatus—spotted towhee
Zonotrichia leucophrys—white-crowned sparrow

Typical Warblers, Parrotbills, Wrentit

SYLVIIDAE—SYLVIID WARBLERS

Chamaea fasciata—wrentit

TURDIDAE—THRUSHES

Sialia mexicana—western bluebird

Invertebrates

Butterflies

LYCAENIDAE—BLUES, HAIRSTREAKS, AND COPPERS

Icaricia acmon acmon—Acmon blue

HESPERIIDAE—SKIPPERS

Erynnis funeralis—funereal duskywing

PIERIDAE—WHITES AND SULFURS

Pieris rapae—cabbage white
Pontia protodice—checkered white

Mammals

Canids

CANIDAE—WOLVES AND FOXES

Canis latrans—coyote

Cats

FELIDAE—CATS

Lynx rufus—bobcat

Hares and Rabbits

LEPORIDAE—HARES AND RABBITS

Sylvilagus audubonii—desert cottontail

Sylvilagus bachmani—brush rabbit

Kangaroo Rats

HETEROMYDIAE—POCKET MICE AND KANGAROO RATS

Dipodomys sp.—kangaroo rat

Pocket Gophers

GEOMYIDAE—POCKET GOPHERS

Thomomys bottae—Botta's pocket gopher

Squirrels

SCIURIDAE—SQUIRRELS

Spermophilus (*Otospermophilus*) *beecheyi*—California ground squirrel

Ungulates

CERVIDAE—DEERS

Odocoileus hemionus—mule deer

Reptiles

Lizards

PHRYNOSOMATIDAE—IGUANID LIZARDS

Sceloporus occidentalis—western fence lizard

Uta stansburiana—common side-blotched lizard

TEIIDAE—WHIPTAIL LIZARDS

Aspidoscelis tigris stejnegeri—San Diegan tiger whiptail

* signifies introduced (non-native) species

Appendix I

Special-Status Plant Species Not Expected or With a Low Potential to Occur on the Project Site

APPENDIX I
Special-Status Plant Species Not Expected or With a Low Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Acanthoscyphus parishii var. *parishii*	Parish's oxytheca	None/None/4.2	Chaparral, Lower montane coniferous forest; sandy or gravelly/annual herb/June–Sep/4,000–8,530	Not expected to occur. The Project site is outside of the known elevation range for this species.
Allium howellii var. *clokeyi*	Mt. Pinos onion	None/None/1B.3	Great Basin scrub, Meadows and seeps (edges), Pinyon and juniper woodland/perennial bulbiferous herb/Apr–June/4,265–6,070	Not expected to occur. The Project site is outside of the known elevation range for this species.
Astragalus brauntonii	Braunton's milk-vetch	FE/None/1B.1	Chaparral, Coastal scrub, Valley and foothill grassland; recent burns or disturbed areas, usually sandstone with carbonate layers/perennial herb/Jan–Aug/10–2,100	Absent. Suitable vegetation is present for this species within the Project site; however, sandstone substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Berberis nevinii	Nevin's barberry	FE/SE/1B.1	Chaparral, Cismontane woodland, Coastal scrub, Riparian scrub; sandy or gravelly/perennial evergreen shrub/(Feb)Mar–June/225–2,705	Absent. Suitable vegetation is present for this species within the Project site. This perennial shrub would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys.
California macrophylla	round-leaved filaree	None/None/1B.2	Cismontane woodland, Valley and foothill grassland; clay/annual herb/Mar–May/45–3,935	Absent. Suitable vegetation is present for this species within the Project site; however, clay substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Calochortus catalinae	Catalina mariposa lily	None/None/4.2	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland/perennial bulbiferous herb/(Feb)Mar–June/45–2,295	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Calochortus clavatus var. *clavatus*	club-haired mariposa lily	None/None/4.3	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland; usually serpentinite, clay, rocky/perennial bulbiferous herb/(Mar)May–June/98–4,265	Absent. Suitable vegetation is present for this species within the Project site; however, serpentine substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Calochortus fimbriatus	late-flowered mariposa lily	None/None/1B.3	Chaparral, Cismontane woodland, Riparian woodland; often serpentinite/perennial bulbiferous herb/June–Aug/900–6,250	Absent. Suitable vegetation is present for this species within the Project site; however, serpentine substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Calochortus plummerae	Plummer's mariposa lily	None/None/4.2	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Valley and foothill grassland; granitic, rocky/perennial bulbiferous herb/May–July/325–5,575	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Castilleja gleasoni	Mt. Gleason paintbrush	None/SR/1B.2	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland; granitic/perennial herb (hemiparasitic)/May–June(Sep)/3,805–7,120	Not expected to occur. The Project site is outside of the known elevation range for this species.
Cercocarpus betuloides var. *blancheae*	island mountain-mahogany	None/None/4.3	Closed-cone coniferous forest, Chaparral/perennial evergreen shrub/Feb–May/95–1,970	Absent. Suitable vegetation is present for this species within the Project site. This perennial shrub would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys.
Chorizanthe parryi var. *Fernandina*	San Fernando Valley spineflower	FC/SE/1B.1	Coastal scrub (sandy), Valley and foothill grassland/annual herb/Apr–July/490–4,005	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Clarkia exilis	slender clarkia	None/None/4.3	Cismontane woodland/annual herb/Apr–May/390–3,280	Not expected to occur. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Clinopodium mimuloides	monkey-flower savory	None/None/4.2	Chaparral, North Coast coniferous forest; streambanks, mesic/perennial herb/June–Oct/1,000–5,905	Not expected to occur. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Convolvulus simulans	small-flowered morning-glory	None/None/4.2	Chaparral (openings), Coastal scrub, Valley and foothill grassland; clay, serpentinite seeps/annual herb/Mar–July/95–2,430	Absent. Suitable vegetation is present for this species within the Project site; however, serpentine seep habitat is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Deinandra minthornii	Santa Susana tarplant	None/SR/1B.2	Chaparral, Coastal scrub; rocky/perennial deciduous shrub/July–Nov/915–2,495	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Deinandra paniculata	paniculate tarplant	None/None/4.2	Coastal scrub, Valley and foothill grassland, Vernal pools; usually vernally mesic, sometimes sandy/annual herb/(Mar)Apr–Nov/80–3,085	Absent. Suitable vegetation is present for this species within the Project site; however, vernal pool habitat is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Delphinium parryi ssp. *purpureum*	Mt. Pinos larkspur	None/None/4.3	Chaparral, Mojavean desert scrub, Pinyon and juniper woodland/perennial herb/May–June/3,280–8,530	Not expected to occur. The Project site is outside of the known elevation range for this species.
Dodecahema leptoceras	slender-horned spineflower	FE/SE/1B.1	Chaparral, Cismontane woodland, Coastal scrub (alluvial fan); sandy/annual herb/Apr–June/655–2,495	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Dudleya parva	Conejo dudleya	FT/None/1B.2	Coastal scrub, Valley and foothill grassland; rocky or gravelly, clay or volcanic/perennial herb/May–June/195–1,475	Absent. Suitable vegetation is present for this species within the Project site; however, clay/ volcanic substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Galium grande	San Gabriel bedstraw	None/None/1B.2	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest/perennial deciduous shrub/Jan–July/1,390–4,920	Not expected to occur. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Harpagonella palmeri	Palmer's grapplinghook	None/None/4.2	Chaparral, Coastal scrub, Valley and foothill grassland; Clay; open grassy areas within shrubland/annual herb/Mar–May/65–3,135	Absent. Suitable vegetation is present for this species within the Project site; however, clay substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Helianthus inexpectatus	Newhall sunflower	None/None/1B.1	Marshes and swamps, Riparian woodland; freshwater, seeps/perennial rhizomatous herb/Aug–Oct/1,000–1,000	Not expected to occur. No suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed outside of the species blooming period; however, vegetative growth of this species would have been observed, if present.
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	None/None/1A	Marshes and swamps (coastal salt and freshwater)/perennial rhizomatous herb/Aug–Oct/30–5,005	Not expected to occur. No suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed outside of the species blooming period; however, vegetative growth of this species would have been observed, if present. Species is presumed to be extirpated in the vicinity.
Hordeum intercedens	vernal barley	None/None/3.2	Coastal dunes, Coastal scrub, Valley and foothill grassland (saline flats and depressions), Vernal pools/annual herb/Mar–June/15–3,280	Absent. Suitable vegetation is present for this species within the Project site; however, vernal pool habitat is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Horkelia cuneata var. *puberula*	mesa horkelia	None/None/1B.1	Chaparral (maritime), Cismontane woodland, Coastal scrub; sandy or gravelly/perennial herb/Feb–July(Sep)/225–2,655	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Lepechinia fragrans	fragrant pitcher sage	None/None/4.2	Chaparral/perennial shrub/Mar–Oct/65–4,300	Not expected to occur. Suitable vegetation is present for this species within the Project site. This perennial shrub would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys, which were timed during the species blooming period.

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Lepechinia rossii	Ross' pitcher sage	None/None/1B.2	Chaparral/perennial shrub/May–Sep/1,000–2,590	Not expected to occur. Suitable vegetation is present for this species within the Project site. This perennial shrub would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys, which were timed during the species blooming period.
Lilium humboldtii ssp. *ocellatum*	ocellated Humboldt lily	None/None/4.2	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Riparian woodland; openings/perennial bulbiferous herb/Mar–July(Aug)/95–5,905	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Lupinus paynei	Payne's bush lupine	None/None/3.1	Coastal scrub, Riparian scrub, Valley and foothill grassland; Sandy/perennial shrub/Mar–Apr(May–July)/720–1,380	Absent. Suitable vegetation is present for this species within the Project site. This perennial shrub would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys, which were timed during the species blooming period.
Monardella linoides ssp. *oblonga*	Tehachapi monardella	None/None/1B.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest/perennial rhizomatous herb/(May)June–Aug/2,950–8,105	Not expected to occur. The Project site is outside of the known elevation range for this species.
Navarretia ojaiensis	Ojai navarretia	None/None/1B.1	Chaparral (openings), Coastal scrub (openings), Valley and foothill grassland/annual herb/May–July/900–2,035	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020were timed during the species blooming period and the species would have been identified, if present.
Opuntia basilaris var. *brachyclada*	short-joint beavertail	None/None/1B.2	Chaparral, Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland/perennial stem succulent/Apr–June(Aug)/1,390–5,905	Absent. Suitable vegetation is present for this species within the Project site. This perennial stem succulent would have been identified during the 2014, 2017, and 2020 botanical and focused rare plant surveys, which were timed during the species blooming period.
Orcuttia californica	California Orcutt grass	FE/SE/1B.1	Vernal pools/annual herb/Apr–Aug/45–2165	Not expected to occur. No suitable vernal pool habitat is present within the Project site.
Pentachaeta lyonii	Lyon's pentachaeta	FE/SE/1B.1	Chaparral (openings), Coastal scrub, Valley and foothill grassland; rocky, clay/annual herb/(Feb)Mar–Aug/95–2,265	Absent. Suitable vegetation is present for this species within the Project site; however, rocky/ clay substrate is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Phacelia hubbyi	Hubby's phacelia	None/None/4.2	Chaparral, Coastal scrub, Valley and foothill grassland; gravelly, rocky, talus/annual herb/Apr–July/0–3,280	Absent. Suitable vegetation is present for this species within the Project site; however, rocky/ talus habitat is absent. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Phacelia mohavensis	Mojave phacelia	None/None/4.3	Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland; sandy or gravelly/annual herb/Apr–Aug/4,590–8,200	Not expected to occur. The Project site is outside of the known elevation range for this species.
Pseudognaphalium leucocephalum	white rabbit-tobacco	None/None/2B.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland; sandy, gravelly/perennial herb/(July)Aug–Nov(Dec)/0–6,890	Absent. Suitable vegetation is present for this species within the Project site; however, this species is more typically associated with sandy washes, which are not present within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Senecio aphanactis	chaparral ragwort	None/None/2B.2	Chaparral, Cismontane woodland, Coastal scrub; sometimes alkaline/annual herb/Jan–Apr(May)/45–2,625	Absent. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Stylocline masonii	Mason's neststraw	None/None/1B.1	Chenopod scrub, Pinyon and juniper woodland; sandy/annual herb/Mar–May/325–3,935	Not expected to occur. No suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.
Symphyotrichum greatae	Greata's aster	None/None/1B.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest, Riparian woodland; mesic/perennial rhizomatous herb/June–Oct/980–6,595	Not expected to occur. Suitable vegetation is present for this species within the Project site. Botanical and focused rare plant surveys conducted in 2014, 2017, and 2020 were timed during the species blooming period and the species would have been identified, if present.

Notes:

CRPR – California Rare Plant Rank
1A – plants presumed extirpated in California and either rare or extinct elsewhere
1B – plants rare, threatened, or endangered in California and elsewhere
2A – plants presumed extirpated in California, but common elsewhere
2B – plants rare, threatened, or endangered in California, but more common elsewhere
3 – plants about which more information is needed – a review list
4 – plants of limited distribution – a watch list
0.1 – seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
0.2 – moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat)
0.3 – not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)
State Designations
SE – State Listed as Endangered
Federal Designations
FE – Federally Listed as Endangered

Appendix J

Special-Status Wildlife Species Not Expected or With a Low Potential to Occur on the Project Site

APPENDIX J
Special-Status Wildlife Species Not Expected or With a Low Potential to Occur on the Project Site

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Invertebrates				
Bombus crotchii	Crotch bumble bee	None/None*	Open grassland and scrub communities supporting suitable floral resources.	Low potential for nesting, and low potential for foraging based on its current lack of status, lack of knowledge about the species, and generally wide distribution. The range for this species is very broad (southern half of California and includes locations from coast to desert; however, primarily thought to occur in the central valley [Xerces Society et al. 2018]).There is too little known about the species other than that listing proposal to conclude that it has more than a low chance of occurring. Suitable shrubland for nesting and floral resources occur on Project site.
Danaus plexippus	Monarch butterfly	None/None	Wind-protected tree groves with nectar sources and nearby water sources.	Not expected to occur. No suitable vegetation present.
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	Vernal pools, non-vegetated ephemeral pools.	Not expected to occur. No suitable habitat present.
Fishes				
Catostomus santaanae	Santa Ana sucker	FT/None	Small, shallow, cool, clear streams less than 7 meters (23 feet) in width and a few centimeters to more than a meter (1.5 inches to more than 3 feet) in depth; substrates are generally coarse gravel, rubble, and boulder.	Not expected to occur. No suitable habitat present.
Gasterosteus aculeatus williamsoni	unarmored threespine stickleback	FE/SE, FP	Slow-moving and backwater areas.	Not expected to occur. No suitable habitat present.
Gila orcuttii	arroyo chub	None/CSC	Warm, fluctuating streams with slow-moving or backwater sections of warm to cool streams at depths >40 centimeters (16 inches); substrates of sand or mud.	Not expected to occur. No suitable habitat present.
Oncorhynchus mykiss irideus	steelhead rainbow trout (southern California ESU)	FE/CSC	Clean, clear, cool well-oxygenated streams. Needs relatively deep pools in migration and gravelly substrate to spawn.	Not expected to occur. The Project site is outside the known range for this species. This species is not known to occur above Piru Creek confluence in Ventura County.
Amphibians				
Anaxyrus californicus	arroyo toad	FE/CSC	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering.	Not expected to occur. The Project site does not contain water sources to support this species. In addition, CNDDB records show this species over 2 miles from the Project site.
Rana boylii	foothill yellow-legged frog	None/CSC	Rocky streams and rivers with open banks in forest, chaparral, and woodland.	Not expected to occur. The Project site is outside the known range for this species.
Rana draytonii	California red-legged frog	FT/CSC	Lowland streams, wetlands, riparian woodlands, livestock ponds; dense, shrubby or emergent vegetation associated with deep, still or slow-moving water; uses adjacent uplands.	Not expected to occur. No suitable habitat is present on the Project Site.
Spea hammondii	western spadefoot	None/CSC	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley–foothill woodlands, pastures, and other agriculture.	Not expected to occur. Suitable vegetation is present; however, ephemeral ponds and vernal pools are absent within the BSA.
Taricha torosa (Monterey Co. south only)	California newt	None/CSC	Wet forests, oak forests, chaparral, and rolling grassland.	Not expected to occur. The Project site is outside the known range for this species.
Reptiles				
Actinemys marmorata	western pond turtle	None/CSC	Slow-moving permanent or intermittent streams, ponds, small lakes, and reservoirs with emergent basking sites; adjacent uplands used for nesting and during winter.	Not expected to occur. No suitable breeding or foraging on site due to lack of aquatic habitat.
Arizona elegans occidentalis	California glossy snake	None/CSC	Commonly occurs in desert regions throughout southern California. Also inhabits arid scrub, rocky washes, grasslands, and chaparral. Prefers open sandy areas with scattered brush. Also found in rocky areas.	Low potential to occur. However, the Project does contain suitable habitat for this species.
Salvadora hexalepis virgultea	coast patch-nosed snake	None/CSC	Brushy or shrubby vegetation; requires small mammal burrows for refuge and overwintering sites.	Low potential to occur. Site lacks suitable small mammal burrows required by this species.
Thamnophis hammondii	two-striped gartersnake	None/CSC	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools.	Not expected to occur. No suitable habitat present.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
		Birds		
Accipiter cooperii (nesting)	Cooper's hawk	None/WL	Nests and forages in dense stands of live oak, riparian woodlands, or other woodland habitats often near water.	Not expected to nest on site; however, the site provides suitable foraging for this species.
Agelaius tricolor (nesting colony)	tricolored blackbird	BCC/CSC	Nests near fresh water, emergent wetland with cattails or tules; forages in grasslands, woodland, agriculture.	Not expected to nest based on lack of suitable nesting habitat.
Ammodramus savannarum (nesting)	grasshopper sparrow	None/CSC	Dense, dry or well-drained annual and native grasslands with mix of grasses and forbs. May occur in fallow agricultural fields, especially those periodically planted in oats and barley.	Low potential to occur. Suitable nesting and foraging habitat is present; however, this species is not known to nest in the vicinity (Allen et al. 2016).
Artemisiospiza (Amphispiza) belli belli	Bell's sparrow	BCC/WL	Coastal scrub and chaparral.	Low potential to occur. The Project site provides suitable nesting and foraging habitat; however, this species is not known to nest in the vicinity (Allen et al. 2016).
Buteo swainsoni (nesting)	Swainson's hawk	BCC/ST	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture.	Not expected to occur. Outside nesting range for this species.
Calypte costae (nesting)	Costa's hummingbird	None/SA	Shrubs and arid habitats. Edges of desert riparian and valley foothill riparian, coastal scrub, desert scrub, desert succulent scrub, arid shrublands, lower elevation chaparral, and palm oasis.	Not expected to nest based on lack of suitable nesting habitat.
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT, BCC/SE	Nests in dense, wide riparian woodlands and forest with well-developed understories.	Not expected to occur. No suitable nesting habitat on the Project Site.
Elanus leucurus (nesting)	white-tailed kite	None/FP	Nests in woodland, riparian, and individual trees near open lands; forages opportunistically in grassland, meadows, scrubs, agriculture, emergent wetland, savanna, and disturbed lands.	Low potential to occur. Nesting habitat present on site and the Project Site provides suitable foraging habitat.
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Riparian woodlands along streams and rivers with mature, dense stands of willows or alders; may nest in thickets dominated by tamarisk.	Not expected to nest based on lack of suitable nesting habitat.
Eremophila alpestris actia	California horned lark	None/WL	Nests and forages in grasslands, disturbed lands, agriculture, and beaches; nests in alpine fell fields of the Sierra Nevada.	Low potential to occur. Marginally suitable nesting and foraging habitat present on site. Grasslands present are densely vegetated and do not provide ideal nesting habitat for this species.
Falco mexicanus (nesting)	prairie falcon	BCC/WL	Forages in grassland, savanna, rangeland, agriculture, desert scrub, alpine meadows; nest on cliffs or bluffs.	Not expected to occur. No nesting habitat present on site; however, the Project Site provides suitable foraging habitat.
Icteria virens (nesting)	yellow-breasted chat	None/SSC	Nests and forages in dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush.	Not expected to occur. No suitable habitat present on site.
Passerculus sandwichensis beldingi	Belding's savannah sparrow	None/SE	Nests and forages in coastal saltmarsh dominated by pickleweed (Salicornia spp.).	Not expected to occur. No suitable habitat present.
Pyrocephalus rubinus (nesting)	vermilion flycatcher	None/CSC	Breeding habitat includes riparian woodlands, riparian scrub, and freshwater marshes.	Not expected to nest based on lack of suitable nesting habitat.
Riparia riparia (nesting)	bank swallow	None/ST	Nests in riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with sandy soils; open country and water during migration.	Not expected to occur. No suitable habitat present. Formerly known to breed in the region; however, the Project site is now outside the current known nesting range for this species.
Setophaga petechia (nesting)	yellow warbler	BCC/SSC	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats.	Not expected to nest on site. However, the site provides suitable foraging habitat for this species. No nesting habitat present on site; however, this species can occur as a migrant through the region.
Spinus (Carduelis) lawrencei (nesting)	Lawrence's goldfinch	BCC/SA	Valley foothill hardwood, valley foothill hardwood-conifer; and, in S. CA., desert riparian, palm oasis, pinyon-juniper and lower montane habitats.	Not expected to nest based on lack of suitable nesting habitat.
Sternula antillarum browni (nesting colony)	California least tern	FE/SE, FP	Forages in shallow estuaries and lagoons; nests on sandy beaches or exposed tidal flats.	Not expected to occur. No suitable nesting or foraging on site.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season.	Not expected to occur. No suitable nesting or foraging on site.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
		Mammals		
Antrozous pallidus	pallid bat	None/CSC	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees.	Low potential to occur. Low overall suitable roosting habitat on site.
Euderma maculatum	spotted bat	None/CSC	Foothills, mountains, desert regions of southern California, including arid deserts, grasslands, and mixed-conifer forests; roosts in rock crevices and cliffs; feeds over water and along washes.	Not expected to occur. No suitable roosting or foraging habitat present.
Eumops perotis californicus	western mastiff bat	None/CSC	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels,	Not expected to occur. No suitable roosting or foraging habitat present.
Macrotus californicus	Californian leaf-nosed bat	None/CSC	Riparian woodlands, desert wash, desert scrub; roosts in mines and caves, occasionally buildings.	Not expected to occur. No suitable roosting or foraging habitat present.
Nyctinomops macrotis	big free-tailed bat	None/CSC	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water.	Low potential to occur. Low overall suitable roosting habitat on site.

State
CSC - California Species of Special Concern
FP – Fully Protected
SE – California Endangered
SA – Special Animals List
ST – California Threatened
WL - Watch List

Federal
BCC – USFWS Bird of Conservation Concern
FE – Federally Endangered
FT – Federally Threatened

Notes
* A recent Sacramento Superior Court ruling, *Almond Alliance et al. v. California Fish and Game Commission* (Cases No.: 34-2019-80003216), decided that California Fish and Game Commission has no power to list insects per the language of the CESA and thus Crotch bumble bee has no CESA status.

INTENTIONALLY LEFT BLANK

Appendix K

Wetland Delineation Data Forms and Ordinary High Water Mark Data Forms

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Sterling Estates City/County: Los Angeles Sampling Date: 10/10/16

Applicant/Owner: Sterling Ranch Estates State: CA Sampling Point: DS1

Investigator(s): R. McIntyre & H. Moine Section, Township, Range: Sec 10, T4N, R7W

Landform (hillslope, terrace, etc.): Valley / canyon bottom Local relief (concave, convex, none): Concave Slope (%): ~1-2

Subregion (LRR): C Lat: Long: Datum:

Soil Map Unit Name: Yolo Loam 2-9% slopes NWI classification: N/A

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____	No Y	**Is the Sampled Area within a Wetland?** Yes ____ No X
Hydric Soil Present?	Yes ____	No X	
Wetland Hydrology Present?	Yes X	No ____	

Remarks: Riparian hydrology is present.

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: 5m)	Absolute % Cover	Dominant Species?	Indicator Status
1. Populus fremontii	25	Y	FACW
2.			
3.			
4.			
	25 = Total Cover		
Sapling/Shrub Stratum (Plot size: 5m)			
1. Baccharis pilularis	5	Y	N/L
2. Baccharis salicifolia	10	Y	FAC
3. Ribes aureum	2	N	FAC
4. Rhus trilobata	2	N	N/L
5.

	____ = Total Cover		

% Bare Ground in Herb Stratum 24 % Cover of Biotic Crust ____

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 4 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 50 (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species ____	x 1 = ____
FACW species 25	x 2 = 50
FAC species 12	x 3 = 36
FACU species 1	x 4 = 4
UPL species 82	x 5 = 410
Column Totals: 120 (A)	500 (B)

Prevalence Index = B/A = 4.16

Hydrophytic Vegetation Indicators:

___ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ____ No X

Remarks: Bare ground is mostly crushed vegetation – appears that the area is used as a trail

SOIL

Sampling Point: DS1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Water flows off of the paved road & sheets over the landscape. DS4 is at the beginning of where the feature coalesces into a discernable channel. Channel is weakly formed. The water source may be from a buried pipe under Del Valle Rd that caused road scour.

- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: none

Depth (inches): ___

Hydric Soil Present? Yes ___ No X

Remarks: top layer had less moisture than lower layer, thus the reason for analyzing the layers separately

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) **(Nonriverine)**
- ___ Sediment Deposits (B2) **(Nonriverine)**
- ___ Drift Deposits (B3) **(Nonriverine)**
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) **(Riverine)**
- X Sediment Deposits (B2) **(Riverine)**
- ___ Drift Deposits (B3) **(Riverine)**
- X Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No X Depth (inches): ___

Water Table Present? Yes ___ No X Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): ___

Wetland Hydrology Present? Yes X No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Riverine hydrology indicators are present. Water source suspected to be a burst pipe outside of the project boundary.

Arid West Ephemeral and Intermittent Streams OHWM Datasheet

Project: Sterling Estates
Project Number: 9617
Stream: Unnamed ephemeral water
Investigator(s): R. McCuaig & H. Moine

Date: 10/10/16
Town: Val Verde

State:
Photo end file#:

Y [X] / N [ ] Do normal circumstances exist on the site?

Y [ ] / N [X] Is the site significantly disturbed?

Location Details: DS 1

Projection: **Datum:**
Coordinates:

Potential anthropogenic influences on the channel system:

Lightly used access road crosses the channel. No other apparent influences.

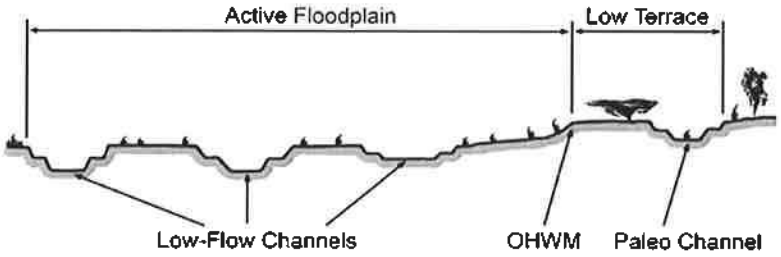
Brief site description:

Site is at the northern (upstream) limit of the property. Channel is small (~6 feet wide) & currently filled w/ Russian thistle. Bed & bank features are present, clearly defining the channel.

Checklist of resources (if available):

- [X] Aerial photography
  Dates:
- [ ] Topographic maps
- [ ] Geologic maps
- [ ] Vegetation maps
- [X] Soils maps
- [ ] Rainfall/precipitation maps
- [ ] Existing delineation(s) for site
- [ ] Global positioning system (GPS)
- [ ] Other studies
- [ ] Stream gage data
  Gage number:
  Period of record:
  - [ ] History of recent effective discharges
  - [ ] Results of flood frequency analysis
  - [ ] Most recent shift-adjusted rating
  - [ ] Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

Hydrogeomorphic Floodplain Units



Procedure for identifying and characterizing the floodplain units to assist in identifying the OHWM:

1. Walk the channel and floodplain within the study area to get an impression of the geomorphology and vegetation present at the site.
2. Select a representative cross section across the channel. Draw the cross section and label the floodplain units.
3. Determine a point on the cross section that is characteristic of one of the hydrogeomorphic floodplain units.
   a) Record the floodplain unit and GPS position.
   b) Describe the sediment texture (using the Wentworth class size) and the vegetation characteristics of the floodplain unit.
   c) Identify any indicators present at the location.
4. Repeat for other points in different hydrogeomorphic floodplain units across the cross section.
5. Identify the OHWM and record the indicators. Record the OHWM position via:
   - [ ] Mapping on aerial photograph
   - [ ] Digitized on computer
   - [X] GPS
   - [ ] Other:

Wentworth Size Classes

Inches (in)	Millimeters (mm)	Wentworth size class	
10.08	256	Boulder	
2.56	64	Cobble	Gravel

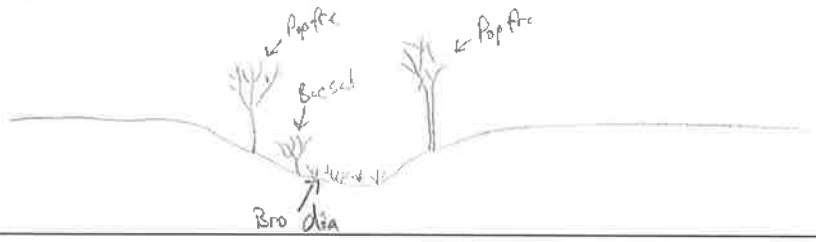
Cross section drawing:



OHWM

GPS point: DS 1

Indicators:

- ☐ Change in average sediment texture
- ☐ Change in vegetation species
- ☒ Change in vegetation cover
- ☒ Break in bank slope
- ☐ Other: _____
- ☐ Other: _____

Comments:

Drought conditions likely reduced the OHWM indicators present; however, there is a clear break in the bank slope & vegetation is less dense below the OHWM.

Floodplain unit:

☒ Low-Flow Channel ☐ Active Floodplain ☐ Low Terrace

GPS point: _____

Characteristics of the floodplain unit:

Average sediment texture: Loam

Total veg cover: 120 % Tree: 25 % Shrub: 19 % Herb: 76 %

Community successional stage:

- ☐ NA
- ☐ Early (herbaceous & seedlings)
- ☐ Mid (herbaceous, shrubs, saplings)
- ☒ Late (herbaceous, shrubs, mature trees)

Indicators:

- ☐ Mudcracks
- ☐ Ripples
- ☐ Drift and/or debris
- ☐ Presence of bed and bank
- ☐ Benches
- ☐ Soil development
- ☐ Surface relief
- ☐ Other: _____
- ☐ Other: _____
- ☐ Other: _____

Comments:

Bed & bank features are weak but there are obvious drainage patterns beginning on the adjacent property to the north. Defined edge of riparian veg & break of bank slope.

Project ID: Sterling Estates **Cross section ID:** DS 1 **Date:** 10/10/2016 **Time:**

AUGUST 2018

Final - Cultural Resources Inventory for the Sterling Ranch Estates Project

EXECUTIVE SUMMARY

Dudek was retained by Sterling Ranch Estates to conduct a cultural and paleontological resources inventory in support of the Sterling Ranch Estates Project (project). This study included the following components: (1) cultural and paleontological records searches covering the proposed project area plus a 1-mile radius, (2) a review of the California Native American Heritage Commission's (NAHC's) Sacred Lands File, (3) a pedestrian survey of the project area for cultural resources, and (4) recommendations.

This study is compliant with California Public Resources Code (PRC) Section 5024.1, Sections 21083.2 and 21084.1 of the California Environmental Quality Act (CEQA) (California PRC Section 21000 et. seq.), and Section 15064.5 of the CEQA Guidelines (California Code of Regulations Section 15000 et. seq.). PRC Section 5024.1 requires identification and evaluation of historical resources that may be affected by a proposed project.

No cultural resources have been recorded within the current project area and only three are located within the one-mile search buffer. The Native American Heritage Commission (NAHC) was contacted to request a search of the Sacred Lands File for the surrounding area. A response letter was received stating that the results of the Sacred Lands File search failed to indicate the presence of Native American cultural resources in the immediate project area. The NAHC provided a list of 11 Native American groups and individuals who may have knowledge of cultural resources in the project area. Letters were sent to each representative. To date, no responses have been received. Should any responses be received, they will be forwarded to the Los Angeles County Department of Public Works.

A Dudek archaeologist performed an intensive pedestrian survey of the project area. As a result of the survey, four newly-identified archaeological site (SR-S-01, SR-S-02, SR-S-03, and SR-S-04) and one built environment resource (SR-S-05) have been identified and recorded within the proposed project area. The archaeological sites include one slab foundation (SR-S-01), one decomposing asphalt road (SR-S-02), and two historic refuse deposits (SR-S-03 and -04). SR-S-01 has been recommended not eligible for the National Register of Historic Places (NRHP) or the California Register (CR). SR-S-02, SR-S-03, and SR-S-04 were identified in the southern section of the project area. This area will be preserved and placed in a conservation easement as a component of this project and therefore these resources will not be impacted as part of the proposed project. The built environment resource (SR-S-05) is a single-family, one-story vernacular building built in 1936. This resource was evaluated in a Historic Resource Assessment (HRA) prepared by Dudek in July 2018 and was determined to be not eligible for listing on either the NRHP or the CR (Corder and Murray 2018)

Construction activities associated with the proposed project would involve ground disturbance in areas of high paleontological sensitivity. Adverse effects to paleontological resources can occur if significant resources are uncovered during ground disturbance and subsequently

destroyed, otherwise harmed, and/or not properly preserved. As such, mitigation should be implemented to ensure that potential impacts to paleontological resources are reduced to a level below significance. It recommended that a qualified paleontologist be retained for the project to ensure implementation of a paleontological monitoring program.

1 INTRODUCTION

Dudek was retained by Sterling Ranch Estates to conduct a cultural and paleontological resources inventory in support of the Sterling Ranch Estates Project (project). This study included the following components: (1) cultural and paleontological records searches covering the proposed project area plus a 1-mile radius, (2) a review of the California Native American Heritage Commission's (NAHC's) Sacred Lands File, (3) a pedestrian survey of the project area for cultural resources, and (4) recommendations.

This study is compliant with California Public Resources Code (PRC) Section 5024.1, Sections 21083.2 and 21084.1 of the California Environmental Quality Act (CEQA) (California PRC Section 21000 et. seq.), and Section 15064.5 of the CEQA Guidelines (California Code of Regulations Section 15000 et. seq.). PRC Section 5024.1 requires identification and evaluation of historical resources that may be affected by a proposed project.

1.1 Proposed Project Work

The Sterling Ranch Estates Project (Project) includes the development of approximately 221 residential detached single-family lots along with associated commercial lots, parks, open space lots, roads, infiltration and debris basins, and other infrastructure within assessor parcel numbers (APNs) 3271-004-012 and 3271-004-012-013. The subject parcels comprise approximately 114 acres. In addition, a preservation area associated with the project is located in APN 3271-005-032 totaling approximately 34 acres.

The Project would provide a private trail, the Sterling Horn Memorial Trail, along the southern portion of the Project Site, which would connect to the County's Del Valle Regional Trail. The Project also would dedicate a twenty-foot wide, multi-use trail easement to the County for the Del Valle Trail, as identified in the Regional Trail Plan, outside of the Project Site. The off-site trail would be a variable-width (five-foot to eight-foot wide), natural soil surface trail.

1.2 Project Location

The project area is located in the community of Val Verde, north of Chiquito Canyon Road as well as northwest and southeast of Del Valle Road. It lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. Specifically, the project area is within Sections 9 and 10 of Township 4N, Range 17W as depicted on the U.S. Geological Survey (USGS) 7.5-minute *Val Verde* quadrangle (Figure 1).

2 REGULATORY SETTING

2.1 Federal

2.1.1 36 CFR 800 and Section 106 of the NHPA

The National Historic Preservation Act (NHPA) established the National Register of Historic Places (NRHP) and the President's Advisory Council on Historic Preservation (ACHP), and provided that states may establish State Historic Preservation Officers (SHPOs) to carry out some of the functions of the NHPA. Most significantly for federal agencies responsible for managing cultural resources, Section 106 of the NHPA directs that "[t]he head of any Federal agency having direct or indirect jurisdiction over a proposed Federal or federally assisted undertaking in any State and the head of any Federal department or independent agency having authority to license any undertaking shall, prior to the approval of the expenditure of any Federal funds on the undertaking or prior to the issuance of any license, as the case may be, take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the NRHP." Section 106 also affords the ACHP a reasonable opportunity to comment on the undertaking (16 U.S.C. 470f).

36 Code of Federal Regulations, Part 800 (36 CFR 800) implements Section 106 of the NHPA. It defines the steps necessary to identify historic properties (those cultural resources listed in or eligible for listing in the NRHP), including: consultation with federally recognized Native American tribes to identify resources with important cultural values; determine whether or not they may be adversely affected by a proposed undertaking; and outline the process for eliminating, reducing, or mitigating the adverse effects.

The content of 36 CFR 60.4 defines criteria for determining eligibility for listing in the NRHP. The significance of cultural resources identified during an inventory must be formally evaluated for historical significance in consultation with the California SHPO to determine if the resources are eligible for inclusion in the NRHP. Cultural resources may be considered eligible for listing if they possess integrity of location, design, setting, materials, workmanship, feeling, and association. The criteria for determining eligibility are essentially the same in content and order as those outlined under the California Environmental Quality Act (CEQA), but the criteria under NHPA are labeled A through D (rather than 1–4 under CEQA).

Regarding criteria A through D of Section 106, the quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, cultural resources,

buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and that:

A. Are associated with events that have made a significant contribution to the broad patterns of our history; or

B. Are associated with the lives of persons significant in our past; or

C. Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Have yielded or may be likely to yield, information important in prehistory or history [36 CFR 60.4].

The current evaluation of prehistoric cultural resources was performed with the intent of assessing historical significance under Criterion D. The ability of an archaeological site to yield important information to history or prehistory is based upon the site's ability to address specific research themes. The research themes addressed in this study are presented in Chapter 3, and these derive from the cultural resources overview presented in this chapter, above.

The ACHP provides methodological and conceptual guidance for identifying historic properties. In 36 CFR 800.4, the steps necessary for identifying historic properties include:

- Determine and document the APE (36 CFR 800.16(d)
- Review existing information on historic properties within the APE, including preliminary data
- Confer with consulting parties to obtain additional information on historic properties or concerns about effects to these
- Consult with Native American tribes (36 CFR 800.3(f)) to obtain knowledge on resources that are identified with places which they attach cultural or religious significance
- Appropriate fieldwork (including phased identification and evaluation)
- Apply NRHP criteria to determine a resource eligibility for NRHP listing

Fulfilling these steps is generally thought to constitute a reasonable effort to identify historic properties within the APE for an undertaking. The obligations of a federal agency must also assess whether an undertaking will have an adverse effect on cultural resources. An undertaking will have an adverse effect when:

> "an undertaking may alter, directly or indirectly, any of the characteristics of a historic property hat qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative" (36 CFR Part 800.5(1)).

The process of determining whether an undertaking may have an adverse effect requires the federal agency to confer with consulting parties in order to appropriately consider all relevant stakeholder concerns and values. Consultation regarding the treatment of a historic property may result in a Programmatic Agreement (PA) and/or Memorandum of Agreement (MOA) between consulting parties that typically include the lead federal agency, State Historic Preservation Officer (SHPO), and Native American tribes if they agree to be signatories to these documents. Treatment documents—whether resource-specific or generalized—provide guidance for resolving potential or realized adverse effects to known historic properties or to those that may be discovered during implementation of the undertaking. In all cases, avoidance of adverse effects to historic properties is the preferred treatment measure and it is generally the burden of the federal agency to demonstrate why avoidance may not be feasible. Avoidance of adverse effects may not be feasible if it would compromise the objectives of an undertaking that can be reasonably said to have public benefit. Other non-archaeological considerations about the benefit of an undertaking may also apply, resulting in the determination that avoidance is not feasible. In general, avoidance of adverse effects is most difficult when a permitted undertaking is being implemented, such as identification of an NRHP-eligible archaeological resource during earthmoving.

2.2 State

2.2.1 California Environmental Quality Act

2.2.1.1 The California Register of Historical Resources (Public Resources Code section 5020 et seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code section 5020.1(j)). In 1992, the California legislature established CRHR "to be

used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria:

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

(California Public Resources Code section 5024.1(c).) Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

2.2.1.2 Native American Historic Cultural Sites (California Public Resources Code section 5097 et seq.)

The Native American Historic Resources Protection Act (Public Resources Code section 5097, et seq.) addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NRHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

2.2.1.3 California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

2.2.1.4 California Environmental Quality Act Statues and Guidelines

As described further below, the following CEQA statutes and CEQA Guidelines are relevant to the analysis of archaeological and historic resources:

1. California Public Resources Code section 21083.2(g): Defines "unique archaeological resource."
2. California Public Resources Code section 21084.1 and CEQA Guidelines section 15064.5(a): Defines historical resources. In addition, CEQA Guidelines section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource. It also defines the circumstances when a project would materially impair the significance of a historical resource.
3. California Public Resources Code section 5097.98 and CEQA Guidelines section 15064.5(e): These statutes sets forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. California Public Resources Code sections 21083.2(b)-(c) and CEQA Guidelines section 15126.4: These statutes and regulations provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; identifies preservation-in-place as the preferred manner of mitigating impacts to significant archaeological sites.

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(b)). An "historical resource" is any site listed or eligible for listing in the CRHR. The CRHR listing criteria are intended to examine whether the resource in question: (a) is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; (b) is associated with the lives of persons important in our past; (c) embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative

individual, or possesses high artistic values; or (d) has yielded, or may be likely to yield, information important in pre-history or history.

The term "historical resource" also includes any site described in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code section 5024.1(q)).

CEQA also applies to "unique archaeological resources". Public Resources Code section 21083.2(g) defines a "unique archaeological resource" as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

In 2014, CEQA was amended to applies to "tribal culture resources" as well, but the amendment did not provide a definition for such resources or identify how they were to be evaluated or mitigated. (Pub.Res.Code §§ 21084.2 and 21084.3.) Instead, Public Resources Code section 21083.09 required that the Office of Planning and Resource develop and adopt guidelines for analyzing "tribal cultural resources" by July 1, 2016. As of the effective date of this Draft EIR, however, those guidelines have not been finalized or adopted. Consequently, this EIR addresses only historic resources and unique archaeological resources.

All historical resources and unique archaeological resources – as defined by statute – are presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). A site or resource that does not meet the definition of "historical resource" or "unique archaeological resource" is not considered significant under CEQA and need not be analyzed further. (Public Resources Code section 21083.2(a); CEQA Guidelines section 15064.5(c)(4)).

Under CEQA and significant cultural impact results from a "substantial adverse change in the significance of an historical resource [including a unique archaeological resource]" due to the "physical demolition, destruction, relocation, or alteration of the resource or its immediate

surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines section 15064.5(b)(1); California Public Resources Code section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

CEQA Guidelines section 15064.5(b)(2).

Pursuant to these sections, the CEQA first evaluates evaluating whether a project area contains any "historical resources," then assesses whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

When a project significantly affects a unique archeological resources, CEQA imposes special mitigation requirements. Specifically, "[i]f it can be demonstrated that a project will cause damage to a unique archeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:"

A. "Planning construction to avoid archeological sites."
B. "Deeding archeological sites into permanent conservation easements."
C. "Capping or covering archeological sites with a layer of soil before building on the sites."
D. "Planning parks, greenspace, or other open space to incorporate archeological sites."

Pub. Resources Code section 21083.2(b)(1)-(4).

If these "preservation in place" options are not feasible, mitigation may be accomplished through data recovery. (Pub.Res. Code § 21083.2(d); CEQA Guidelines § 15126.4(b)(3)(C).) Public Resources Code section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

These same requirements are set forth in slightly greater detail in CEQA Guidelines section 15126.4(b)(3), as follows:

A. Preservation in place is the preferred manner of mitigating impacts to archeological sites. Preservation in place maintains the relationship between artifacts and the archeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.

B. Preservation in place may be accomplished by, but is not limited to, the following:

    1. Planning construction to avoid archeological sites;

    2. Incorporation of sites within parks, greenspace, or other open space;

    3. Covering the archeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]

    4. Deeding the site into a permanent conservation easement.

C. When data recovery through excavation is the only feasible mitigation, a data recovery plan, which makes provision for adequately recovering the scientifically consequential information from and about the historical resource, shall be prepared and adopted prior to any excavation being undertaken.

Note that, when conducting data recovery, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation." (Ibid.) However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center." (CEQA Guidelines section 15126.4(b)(3)(D).)

2.2.2 California Health and Safety Code

CEQA Guidelines section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (section 7050.5b). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the Native American Heritage Commission (NAHC) within 24 hours (section 7050.5c). The NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

2.2.3 Paleontological Resources

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under state (CEQA) laws and regulations. This study satisfies project requirements in accordance with CEQA (13 PRC, 2100 et seq.) and Public Resources Code Section 5097.5 (Stats 1965, c 1136, p. 2792). This analysis also complies with guidelines and significance criteria specified by the Society of Vertebrate Paleontology (SVP) (1995).

2.3 Local

2.3.1 Los Angeles County

Historical, cultural, and paleontological resources are discussed in the County's Conservation and Natural Resources Element of the Los Angeles County General Plan 2035, which was adopted in October of 2015. The County recognizes that historical and cultural resources are an important part of the County's identity and contribute to the local economy. The goals and policies that apply to historical, cultural, and paleontological resources are as follows:

- **Policy C/NR 14.1:** Mitigate all impacts from new development on or adjacent to historic, cultural, and paleontological resources to the greatest extent feasible.

- **Policy C/NR 14.2:** Support an inter-jurisdictional collaborative system that protects and enhances the County's historic, cultural, and paleontological resources.
- **Policy C/NR 14.3:** Support the preservation and rehabilitation of historic buildings.
- **Policy C/NR 14.4**: Ensure proper notification procedures to Native American tribes in accordance with Senate Bill 18 (2004).
- **Policy C/NR 14.5:** Promote public awareness of the County's historic, cultural, and paleontological resources.
- **Policy C/NR 14.6:** Ensure proper notification and recovery processes are carried out for development on or near historic, cultural, and paleontological resources.

The Department of Regional Planning, working with the Historical Landmarks and Records Commission and the Regional Planning Commission, completed and adopted a comprehensive historic preservation ordinance for the unincorporated areas of Los Angeles County. The following text was taken from the Historic Preservation Ordinance for Los Angeles County, which was adopted by the Board of Supervisors in September, 2015:

22.52.3060 Criteria for Designation of Landmarks and Historic Districts.

A. Property which is more than 50 years of age may be designated as a landmark if it satisfies one or more of the following criteria:

   1. It is associated with events that have made a significant contribution to the broad patterns of the history of the nation, State, County, or community.
   2. It is associated with the lives of persons who are significant in the history of the nation, State, County, or community.
   3. It embodies the distinctive characteristics of a type, architectural style, period, or method of construction, or represents the work of an architect, designer, engineer, or builder whose work is of significance to the nation, State, County, or community; or possesses artistic values of significance to the nation, State, County, or community.
   4. It has yielded, or may be likely to yield, information important locally in prehistory or history.
   5. It is listed or has been formally determined eligible by the National Park Service for listing on the National Register of Historic Places, or is listed or has been determined eligible by the State Historical Resources Commission for listing on the California Register of Historical Resources.

6. It is one of the largest or oldest trees of the species located in the County.
7. It is a tree, plant, or other natural land feature having historical significance due to an association with a historic event, person, site, street, or structure, or because it is a defining or significant outstanding feature of a neighborhood.

B. Property less than 50 years of age may be designated as a landmark if it meets one or more of the criteria set forth in subsection (A) of this section, and exhibits exceptional importance.

C. The interior space of a property, or other space held open to the general public, including but not limited to a lobby, may itself be designated as a landmark or included in the landmark designation of a property if the space is more than 50 years of age and satisfies one or more of the criteria set forth in subsection (A) of this section, or if the space is less than 50 years of age and satisfies the requirements of subsection (B) of this section.

D. Historic Districts. A geographic area or a noncontiguous grouping of thematically related properties may be designated as a historic district if greater than 50% of owners in the proposed district consent to the designation, and if the geographic area or noncontiguous grouping meets one or more of the criteria set forth in subsections (A)(1) through (A)(5) of this section and one or more of the following criteria:

1. It exhibits a concentration of historic, scenic or thematic sites, which contribute to each other and are unified aesthetically by plan, physical development or architectural quality; or
2. It exhibits significant geographical patterns, associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of parks or community planning.

INTENTIONALLY LEFT BLANK

3 SETTING

3.1 Environmental and Geological Setting

The project area occurs at the base of the northern flanks of the north-south trending Chiquito Canyon, which lies between the Topatopa Mountains to the west and the Santa Susana Mountains to the South. Topography within the project area varies from gently sloping in the southern portion to steeply sloping in the northern and eastern portions with elevations ranging from 1,200 to 1,435 feet (366 to 437 meters) above mean sea level (amsl). The project is underlain by the following geological units (from youngest to oldest): Quaternary alluvium (map unit Qa), the Saugus Formation (map unit Qts), and the Pico Formation (map unit Tps).

The project area has remained undeveloped and in largely the same condition for the past 20 years. One residence is located in the southwestern portion of the project area and several access roads are present. Existing land uses in the immediate vicinity of the project area include residential development in the community of Val Verde, commercial/industrial development associated with the Valencia Commerce Center, oil field operations in the Hasley Canyon Oil Field, and undeveloped property.

3.2 Prehistoric Context

The project area falls within a part of California that is poorly understood regarding aboriginal occupation. The few significant archaeological studies in the area (e.g., Waugh 1999) have not fully defined local culture history and as a result, researchers have imposed cultural historical schemes developed in adjacent regions onto the Santa Clarita Valley. Even the most recent published archaeological summaries casually lump the Santa Clarita Valley into neighboring cultural historical schemes of the southern California coast (i.e., Glassow et al. 2007). The same is true of the ethnohistoric record, which is based wholly on second-hand accounts of descendants claiming traditional ties to the area (see Section 3.2.2, below).

Note also that one artifact type defined for one region may or may not represent the same time period or human behavior in another. The simple correlations of artifact types or styles does not necessarily indicate a direct functional or causal relationship. That is, the presence of coastal or desert-derived artifacts in Santa Clarita Valley does not necessarily indicate cultural or socioeconomic relationships with inhabitants of those areas. Such relationships must be demonstrated in the archaeological record by ruling out other functional interpretations as less plausible.

To avoid the pitfalls of extending culture histories from adjacent regions into the Santa Clarita Valley, the following sections discuss major archaeological trends in southern California according to a geologic time scale: Terminal Pleistocene (pre-10,000 years before present—bp),

Early Holocene (10,000 – 7500 bp), Middle Holocene (7500 – 4000 bp), and Late Holocene (post – 4000 bp). Reginal culture historical frameworks are then discussed within these categories as appropriate, providing an opportunity to consider their local application.

3.2.1 Terminal Pleistocene (pre – 10,000 bp)

The terminal Pleistocene period has been the subject of much research in North America, although it remains hotly debated in terms of human adaptations. A few things are certain: terminal Pleistocene environments were rapidly changing at the end of the Wisconsonin glaciation period after 18,000 bp; definitive evidence places humans in North American by at least 12,500 bp.

The last major glaciation period (Wisconsonin) ended by about 18,000 bp, marked by a warming and drying trend that started at this time, lasting until at least 15,000 bp (Grayson 1993). Glaciers that covered most of northern North America began to melt forming pluvial lakes; Pleistocene Lake Lahonton being one of the largest covering the Great Basin of western North American (Grayson 1993). In southern California, many of the vegetation communities found at high elevations today were found at lower elevations then. Wood rat middens from the Mojave Desert indicate that the area was covered by a coniferous forest characterized by juniper and sage by 15,000 bp (Spaulding 1983, 1990). As the Pleistocene came to a close by about 10,000 bp, the warming trend continued and upward migration of vegetation communities occurred, firmly establishing desert sage scrub communities and coastal chaparral from 10,000 to 8000 bp. Ocean core sediment analysis of oxygen isotopes and pollen indicate much cooler ocean surface temperatures. Coupled with rising sea levels at a rate of about one meter per century through close of the Pleistocene (Inman 1983), the early Holocene was set to be much more moderate in climatic stability than the Pleistocene.

These environmental changes have been often cited as a key agent in cultural adaptation. A very unique technology defined by fluted projectile points and a highly formal lithic tool kit with almost no processing equipment is recognized as the earliest evidence of human adaptation to North America. Widely known as "Clovis," regional manifestations of this toolkit show important variability both in projectile point styles and tool kit composition. In western North American, fluted points and related items are most often found near or along pluvial lakeshores, leading to the definition of the Western Pluvial Lakes Tradition (WPLT, Bedwell 1973). The WPLT holds as its primary tenet that human adaptive strategies at in the terminal Pleistocene were evolved to exploit the rich flora and fauna located along pluvial shorelines. Emma Lou Davis' (1978) work at China Lake near the Coso Range is one of the more well known examples of a pluvial association with fluted points. Indeed, there is good evidence that Pleistocene megafauna were persisted alongside modern fauna, and tended to cluster around pluvial lakeshores (Grayson 1993).

However, recent research questions the reality of the WPLT through discoveries of Paleoindian toolkits, including fluted points in areas far removed from pluvial lake shores (Basgall et al. 2002). Moreover, the variability in terminal Pleistocene tool kits is just beginning to be understood as various kinds of stemmed projectile points are being reliably assigned to pre-10,000 bp contexts, such as Great Basined Stemmed and Lake Mojave projectile point forms (Basgall et al. 2002; Basgall 2000; Warren 2004).

Whether or not terminal Pleistocene humans focused on hunting large animals or not is also debated. Most hold Clovis and other fluted point-dominated assemblages as a highly specialized large animal hunting complex, but others interpret these technological complexes as generalized, allowing for rapid movement across large areas with flexibility (i.e., Kelly and Todd 1988). Resolution to this issue has yet to come, but strong evidence suggests on either side with direct evidence of megafauna procurement using fluted and other stemmed points (see Meltzer 1993), as well as direct evidence of stemmed projectile points for cutting and grinding, indicating a more generalized intent of use (see Basgall 1993). The truth probably rests in regional variation where localized climatic and environmental patterns affect the resources humans exploit and as a result, their response to changes in the availability of those.

Further complicating the picture is the realization that vegetal processing technology was being intensively used prior to 10,000 bp. The discovery in La Jolla of a robust assemblage of millingstones, handstones, and battered implements, with virtually no formal flaked lithic items associated with dozens of human burials and radiocarbon dates in excess of 10,000 bp indicates at the very least that socioeconomic adaptation was occurring rapidly among California hunter-gatherers during the terminal Pleistocene (Hale 2010a; see also Ike et al. 1979). Assemblages of this nature are often attributed to the Milling Stone pattern that has been interpreted as a response to punctuated middle Holocene aridity (see middle Holocene discussion, below). Regardless, discoveries of artifacts, such as fluted points that are exclusive to terminal Pleistocene cultural adaptations associated with pre-10,000 bp radiocarbon dates indicates that humans reached the coastal margins of western North America during this period (see Erlandson 1988, 1991; Erlandson et al. 2008; Fitzgerald 2000; Rogers 1938; Warren 1968).

Initial efforts to parse out archaeological components somewhat arbitrarily ascribed the "Early Man" phase to southern California (Wallace 1955). Wallace's Early Man phase (10,000 – 6000 B.C. (12,000 – 8000 bp) was allocated to the terminal Pleistocene and early Holocene, but without the benefit of radiocarbon dates. The Early Man phase was ill-defined and based off of Rogers (1938) work with San Dieguito collections—a hunting-related toolkit defined at the Harris Site containing stemmed projectile points similar to Lake Mojave points located in desert regions to the north. Other fluted point discoveries to the north near Pleistocene Lake Tulare certainly biased Wallace's (1955) efforts to define an early phase of human occupation, especially since his primary

region of study (Los Angeles and Ventura Counties) was nestled in between San Dieguito and Lake Tulare archaeological discoveries.

Regardless of early efforts to define a terminal Pleistocene cultural chronology, the upper Santa Clarita River Valley has yielded no evidence of terminal Pleistocene human occupation. Earliest radiocarbon dates extend only into the middle Holocene, and these are also rare. Given the early timeframe, that preservation of organic materials dramatically decreases with time, and that the accretional and degredational depositional context of the upper Santa Clarita River Valley has obscured or wiped out any such evidence, it is unlikely that a terminal Pleistocene component will ever be identified there.

3.2.2 Early Holocene (10,000 – 7500 bp)

Human occupation of southern California during the early Holocene period (10,000 – 7500 bp) is better understood than the terminal Pleistocene, although archaeological evidence for early Holocene human occupation still tends to be regionally clustered. Early Holocene environments continued the warming and drying trend initiated during the terminal Pleistocene, but most of the major pluvial lake systems were fully dessicated, with periodic recharge of some basins provided by seasonal precipitation rather than melting glaciers (Basgall 1993; Waters 1991). Most studies converge on the idea that the early Holocene was noticeably more arid since desert vegetation communities appear strongly established in composition and distribution by 9000 bp (Spaulding and Graumlich 1986; Van Devender et al. 1987). All megafauna (i.e., elephants, camelids, sloths, etc.) were all but gone by 10,000 bp, however with modern fauna attaining their modern vegetation associations by this time.

Most cultural chronologies have their roots in the early Holocene, save for the WPLT, San Dieguito, and other stemmed and fluted point traditions noted earlier. David Banks (D.B.) Rogers (1929) was the first to propose a cultural chronology, though his age estimates suffered from the lack of absolute dating techniques and data at the time. D.B. Rogers (1929) proposed Oak Grove as the earliest robust cultural tradition beginning just after the Pleistocene and early Holocene transition at around 10,000 bp. Later known as the Milling Stone Horizon (Wallace 1955), or Encinitas Tradition (Warren 1968), Oak Grove was recognizable by the large amounts of processing equipment dominated by basined millingstones and handstones, along with a general lack of formal flakedstone hunting tools. Wallace (1955) built on D.B. Roger's work, with Oak Grove representing the Milling Stone Horizon, but the interpretation was the same: an economy dominated by vegetal processing and a general lack of hunting. Warren (1968) sought to clarify regional variability during the early Holocene and proposed the Encinitas Tradition, comprised of various local manifestations of the Milling Stone Horizon assemblages that had locally specific environmental agents driving the development of the processing economies. Warren, however significantly added to the discourse by better defining the San Dieguito

complex as preceding the Milling Stone pattern and being comprised of stemmed projectile points and bifacial knives, with few processing tools (see Warren 2004). San Dieguito appeared to be a coastal southern California manifestation of what is known as Lake Mojave in the northern high deserts.

Coastal evidence for early Holocene human occupation is increasingly common, mostly in the form of pre – 7500 bp radiocarbon dates (Byrd 1997; Curtis 1965; Erlandson 1988, 1991, 1997; Erlandson et al. 1993, 2008; Gallegos and Kyle 1998; Glassow et al. 2007; Hale 2009, 2010a, 2010b; Hale and Becker 2006; Kaldenberg 1982; Levulett et al. 2002; Salls 1991; True 1980). Since the definition of the Milling Stone pattern by Wallace (1955) and Warren (1968), extensive archaeological work in regulatory settings has generated a robust database of radiocarbon dated sites resulting in a clear picture that the Milling Stone pattern is firmly rooted in the early Holocene, by as much as 10,000 bp (see Hale 2010a). In fact, early Holocene radiocarbon dates have come to be expected in certain depositional contexts along the southern California coast because of their commonality and the consistency of the associated archaeological deposit (Hale 2009). Early Holocene dates along the coastal plain of southern California and interior ranges are currently considered part of the "Archaic" pattern; an umbrella term synonymous with Milling Stone.

Desert regions to the north and interior Peninsular Ranges (and intervening valleys) to the east also have relatively robust early Holocene records. To the east, the early Holocene continues to align with the Archaic or Milling Stone pattern (see Hale 2009; Hale and Comeau 2009; Sutton 2011). In the Mojave Desert, traditional early Holocene chronologies are being revised. The Lake Mojave (11,000 – 7500 bp) complex still appears to be the oldest stemmed point tradition that followed fluted point toolkits. Lake Mojave assemblages are characterized by weak shouldered stemmed projectile points and large amounts of formed flake tools with lesser amounts of expedient flaked tools and groundstone. However, recent evidence is pushing back dates for the Pinto complex to as much as 8000 bp, presenting an overlap problem with Lake Mojave (Basgall 2000; Sutton et al. 2007). The significance here is that Pinto sites are dominated by large amounts of ground and battered stone with relatively small amounts of formed flakedstone tools (Basgall and Hall 1993, 1994; Campbell and Campbell 1935; Giambastiani and Basgall 1999; Hall 1992; Schroth 1994; Warren 1968, 1980); Pinto is the first robust processing economy that appears in California deserts and is similar in many respects to the Milling Stone pattern of southern California, though not as old as Milling Stone. The similarities with the Milling Stone pattern include settlement that was characterized by serial occupation of specific sites producing robust assemblages through tool reuse (Hale 2001).

The early Holocene is not represented in Santa Clarita Valley by direct archaeological evidence, despite being known in adjacent desert and coastal regions. No doubt prehistoric populations took advantage of the natural travel corridors linking interior areas to the coast and southern coastal plain. However, as with archaeological deposits of later periods, damaging erosion and flooding have either

destroyed or obscured any such deposits that may have existed. Attempts to locate buried deposits using hollow stem augers (i.e., core samples) in other parts of southern California, such as the Las Flores watershed (Hale and Becker 2006) or Otay River floodplain (Cook and Andrews 2003; Comeau et al. 2014) focused on floodplains with a gradual sedimentation sequence and less frequent and less destructive erosional events. It is no surprise, then that intact archaeological deposits dating to the early Holocene (and later) were identified in those areas. The same is not true for the Santa Clarita River floodplain and surrounding geologic landscape that has seen frequent intervals of violent flooding that eroded any riverbed or nearby terrace deposits.

3.2.3 Middle Holocene (7500-4000 bp)

The middle Holocene (7500-4000 bp) witnessed a continuation of archaeological patterns defined in the early Holocene. However, the middle Holocene was marked by periods of extreme aridity collectively termed the Altithermal by Ernst Antevs (1953). After much research since Antevs' (1953) original work the Altithermal is better understood as having variable effects at a subregional scale. Southern California was already characterized as an arid landscape by the inception of the middle Holocene, thus notable changes include adjustments in the elevation and density of existing vegetation communities and related fauna (Mehringer 1967; Spaulding 1985, 1990; Wells 1983). To be sure, humans respond to changes in the resources they exploit and it is plausible that plants and animals that were the focus of subsistence either decreased in abundance or congregated in more favorable areas. Warren (1968) postulates as much, suggesting that the Encinitas Tradition (i.e., Milling Stone pattern) was adapted in the coastal plain to the margins of lagoons that were magnet locations for vegetation and fauna, and as a result, human occupation.

Whatever the regional environmental differences were, it was clear that humans have been present in southern California throughout the middle Holocene with widespread evidence of humans hunkering down and increasing vegetal processing intensity, rather than depopulating whole areas. In fact, the origin of Milling Stone pattern itself was thought to be a response to Altithermal conditions (Wallace 1955; see Hale 2001, Erlandson 1997). The early Holocene appearance of Milling Stone adaptations, however, runs counter to this explanation, suggesting instead that Milling Stone economies were the first socioeconomic adaptation to stable California environments after the waning of terminal Pleistocene transitions (Hale 2010a, 2011). Regardless, processing economies were apparently well-suited to the arid middle Holocene conditions, based on the ubiquity of Milling Stone assemblages.

Regional cultural histories adjacent to the upper Santa Clarita River Valley continue in the same nomenclature. In the deserts to the north, the Pinto period reigns until at least the end of the middle Holocene (4000 bp); although, Gypsum period assemblages characterized by contracting stem dart points, larger numbers of small flake tools, and some mortar/pestle technology have pushed their

4000 bp inception date to some degree (Hale 2011). Southern coastal regions such as San Diego County and parts of Orange and Los Angeles Counties also retain Milling Stone assemblage dominance, including at the Tank Sites (CA-LAN-1 and -2) in Topanga Canyon that date as late as 2000 bp (see Hale 2001). The middle Holocene is one of the best represented periods in San Diego County and keeping with the Milling Stone or Archiac pattern (Masters and Gallegos 1997; see Hale 2009 for assemblage summaries).

Real socioeconomic change during the middle Holocene appears first in the Santa Barbara Channel with the abrupt appearance of bowl mortars by at least 5500 bp at sites such as CA-SBA-53, CA-SBA-54, CA-SBA-75, and CA-SBA-84 to name a few (Hale 2009; see also Erlandson et al. 2008, Harrison and Harrison 1966; Levulett et al. 2002). Mortars are costly to manufacture (mortar surfaces are manufactured, rather than mostly accruing depth through use), and thus their manufacture in noticeable quantities necessarily signals a shift to a more intensive processing economy (Hale 2010b). It is thought that mortars in the Santa Barabara Channel were used to intensively process nuts such as acorn and buckberry that have substantial nutritional value when processed in mass quantities (Bettinger et al. 1997; Bettinger and Tushingham 2013). Moreover, the complex ecology of acorn masting requires storage for it to be an efficient economic pursuit of humans (Hale 2009; 2010a). The attendant social shifts that must occur to make an acorn economy economically viable are no less complex, requiring defense of territories containing acorn producing oaks and storage facilities; concepts not altogether welcoming to hunter-gatherer societies that have evolved social institutions precisely to cull such behavior (Bettinger 1999).

Other refinements to culture historical frameworks are based on King's (1981) chronology of burial patterns and related artifacts. Minor refinements to King's chronology occur when assemblage data warrant as much, but substantial numbers of Olivella sp. shell beads present in burial populations of the last 3000 years in King's study laid a strong chronological foundation for determining the kinds of socioeconomic patterns that developed during the late Holocene, discussed below.

Overall, the middle Holocene in southern California is primarily defined by processing economies of the Milling Stone pattern, which is undeniably the most robust and visible archaeological pattern found in California (Hale 2001, 2009; Fitzgerald 2000). Archaeologists continued until the turn of the century to be captivated by the Milling Stone pattern, resulting in numerous graduate theses and dissertations, monographs, and articles that focused on analyzing regional variability. That is, research focused on understanding how the Milling Stone pattern varied from place to place. Perhaps the most exhaustive review of the Milling Stone pattern was completed by Basgall and True (1985) for a Caltrans project along the Interstate 15 corridor. Basgall and True (1985) investigated archaeological sites belonging to the Sayles Complex—an inland, Transverse Ranges manifestation of the Milling Stone pattern. They review most of the significant contributions to

the Milling Stone pattern concept as of 1985, and provide an analytical framework for investigating and interpreting archaeological deposits of this kind. Since then, certain early contributions to the topic (i.e., Warren 1968) have been more supported than refuted (see Hale 2001).

Locally, the upper Santa Clarita River Valley certainly has evidence of Milling Stone occupations, but these are confined to the late Holocene period, after 4000 bp, including the work by Waugh (1999) at CA-LAN-2233 and CA-LAN-2235. The Milling Stone component there is dated by proxy with a small number of obsidian hydration readings. Its presence in the upper Santa Clarita River Valley is not surprising; sites of this nature are visible precisely because they were repeatedly occupied on a seasonal basis for a similar processing purpose, resulting aggregations of reused grinding and processing tools.

3.2.4 Late Holocene (post – 4000 bp)

The late Holocene (post – 4000 bp) is characterized by increased variation in environmental conditions and archaeological assemblages. Part of this variability is due to better resolution in both records, but much of it represents an accurate sample of prehistoric times over the last 4000 years. A summary of the various regionally specific paleoenvironmental conditions will not be provided in this brief overview. However, some patterns warrant discussion. With the dissipation of Altithermal conditions after about 4000 bp, increased precipitation is generally evident for southern California. In desert regions, spring flows markedly increased along with the stabilization of marshes, and some lake basins retained shallow waters from runoff (Batchelder 1970; Hunt and Mabey 1966; La Marche 1973; Mehringer 1987; Mehringer and Sheppard 1978; Mehringer and Warren 1976; Smith 1979; Stine 1990, 1994, 1995; Weide 1982). In coastal southern California, lagoons stabilized and destructive erosional processes that gutted them stopped after about 3000 bp (see Byrd and Reddy 2003; Erlandson and Rick 2003). Pollen and oxygen isotope studies from ocean and estuary cores sometimes present conflicting information, but all generally point to climatic instability during the last 3000 years, with a few pronounced periods of extreme climate, such as the Medeival Climatic Anomaly (MCA) from approximately 800 – 1200 BP (see Munns and Arnold 2003).

Erlandson suggests that southern California Mediterranean climates were more characterized by instability and fluctuations in resource availability than by sustained abundance (Erlandson 2003). It is a fact that southern California hunter-gatherer populations grew overtime. Coupled with instability in climate and resource availability, dense aggregations of hunter-gatherers would certainly elicit a socioeconomic response—this seems to be borne out in the archaeological record, at least in coastal regions.

Along the northern bight (Santa Barbara and Ventura coastal plain), archaeological assemblages are referred to as Canalino (D.B. Rogers 1929), or Late Prehistoric (Wallace 1955), while King's (1990) cultural chronology separates the last 2600 years into various divisions of the Middle Period (950-2600 bp [2600 B.C. – A.D. 1150]) and Late Period (post 950 bp [A.D. 1150]). The Southern California Bight (roughly, Orange and San Diego Counties) is characterized uniformly as the Late Prehistoric in most areas, although Gabrielino territory (parts of Orange County and Los Angeles County) tend to mimic the Northern California Bight chronology. Notably, the Southern California Bight witnesses a wholesale continuation of the Milling Stone pattern into the late Holocene, changing little in assemblge composition excepting the addition of the bow and arrow and ceramics (Hale 2009, 2010a). Significant socioeconomic shifts occur just prior to Spanish contact at approximately 450 – 650 bp with an acorn economy starting to emerge (Hale 2009, 2010a).

Santa Barbara, Ventura, and parts of coastal Los Angeles exhibit significant changes in archaeological assemblages. Mortars and pestles are firmly established in the late Holocene by 3500 bp. This is followed by the appearance of the single piece fishhook by approximately 2900 bp, the plank canoe at approximately 1600 bp, bow and arrow (1500 bp), circular fishhook (700 bp), and microlithic tools (700 bp) (Arnold 1992; 1997; Gamble 2002; Glassow 1996; Kennett 2005; C. King 1990; Rick et al. 2002; Strudwick 1985). These technological innovations are successively accompanied by related increases in the formality of other kinds of subsistence tools already present in tool kits (Hale 2010a). Olivella sp. bead manufacturing is present throughout the late Holocene, but becomes a robust industry in the last thousand years. Other items characteristic of late Holocene coastal regions include steatite cooking vessels and containers, perforated stones, arrow shaft straighteners made of steatite, a variety of bone tools, and personal ornaments made from shell, bone, and stone. There is also an increased use of asphalt for waterproofing and as an adhesive.

Many late Holocene coastal sites contain complex objects of art and decoration. Ornaments include drilled whole venus clam (Chione spp.) and drilled abalone (Haliotis spp.). Steatite effigies become more common, with scallop (Pecten spp. and Argopecten spp.) shell rattles common in middens. Mortuary customs are elaborate and include cremation and interment with abundant grave goods.

In Warren's (1968) cultural ecological scheme, the period between A.D. 500 and European contact is divided into three regional patterns. The Chumash Tradition is present mainly in the region of Santa Barbara and Ventura counties; the Takic or Numic Tradition is present in the Los Angeles, Orange, and western Riverside counties region; and the Yuman Tradition is present in the San Diego region. The seemingly abrupt changes in material culture, burial practices, and subsistence focus at the beginning of the Late Prehistoric period was taken to be the result of a migration to the coast of peoples from inland desert regions to the east. In addition to the small triangular and triangular side-notched points similar to those found in the desert regions in the Great Basin and Lower Colorado River,

Colorado River pottery and the introduction of cremation in the archaeological record are diagnostic of the Yuman Tradition in the San Diego region.

In Los Angeles, Orange, and western Riverside counties, similar changes (introduction of cremation, pottery, and small triangular arrow points) are thought to be the result of a Takic migration to the coast from inland desert regions. This Takic or Numic Tradition was formerly referred to as the "Shoshonean wedge" or "Shoshonean intrusion" (Warren 1968). This terminology, used originally to describe a Uto-Aztecan language group, is generally no longer used to avoid confusion with ethnohistoric and modern Shoshonean groups who spoke Numic languages (Heizer 1978:5; Shipley 1978:88, 90).

The growing body of archaeological literature, however, either contradicts the notion of a population migration, or indicates that when they arrived, they adopted local socioeconomic practices (Hale 2009). The longstanding archaeological patterns in the San Diego region are evidence of this. To the north, the similarity of archaeological assemblages and ethnic customs between the Los Angeles region and the Ventura and Santa Barbara regions is interesting, considering the two areas have distinct linguistic profiles. This disparity highlights the problem of considering any artifact type as an ethnic marker, which is not considered good scientific practice because it cannot be supported in the material record. Behavioral norms are the best ethnic marker, but tying behaviors to specific artifact types or patterns, as archaeologists do, measures only similarity in socioeconomic adaptation, which can exist between groups that share no ethnicity. Because of this, the archaeological record is generally the wrong context to measure ethnic association. Rather, among all ethnographic and ethnohistoric studies in California, language is the best discriminator of ethnic identity. Dialectical differences are better indicators of ethnicity when ethnographic information is the only representation of past populations, even though true ethnic markers are embodied in behavioral norms (see McElreath et al. 2003).

Items manufactured in coastal locales, such as shell ornaments and steatite vessels commonly made their way to the interior of California, being found in archeological deposits in the Transverse Ranges and Mojave Desert (e.g., Basgall and Hall 1994; Schroth 1994; Sutton 1980). Likewise, obsidian from the Coso volcanic field near Ridgecrest, California made its way to coastal environments. Whether these artifacts were carried to their location of deposition in the hands of those who made them or whether they were procured through trade is a question specific to each occurrence, ruling out various explanations in favor the most plausible scenario. Regardless, ethnographic and ethnohistoric accounts indicate that transregional trade and exchange was common and did not equate to similarity in ethnic identity since exchanges traversed traditional cultural boundaries (see Heizer 1978). For this reason alone, none of the artifacts common to southern California archaeological assemblages can be considered ethnic markers. This is especially true for ornaments, such as shell beads that may have been used as

form of currency (Arnold 1991, 1997), or the bow and arrow that is widely considered one of the most significant technological innovations of the prehistoric world and that spread rapidly across the globe through adoption (Bettinger 1991).

The archaeological record in the Santa Clarita Valley is best represented by late Holocene assemblages. CA-LAN-2235 (Chiquito Creek I) and -2233 (Chiquito Creek II) are sites with a relatively typical Milling Stone period deposit with no surprising attributes relatively to the norm for this pattern (Waugh 1999; Whitley and Simon 1994a). The Milling Stone component at CA-LAN-2235 dates to approximately 4000 – 3000 bp, predating the cemetery component at CA-LAN-2233 that is bracketed between 2000 and 1630 bp. The latter contains artifacts characteristic of the late Holocene in general, fitting within Wallace's (1955) Late Prehistoric period, including mortars and pestles, time-sensitive shell beads, and the like (Waugh 1999). However, Waugh (1999) concludes that adaptive strategy represented by the Late Prehistoric component is similar to that of the earlier Milling Stone component, despite differences in milling technology. An interesting conclusion by Waugh (1999) is that mitochondrial DNA analysis of burials indicates no physical relationship to Chumash peoples to the west, but strong ties to Tataviam and other Takic peoples located to the east and northeast in desert landscapes.

Also in the upper Santa Clarita River Valley, Whitley and Simon (W&S) (1994a, 1994b) documented several other sites that generally lack substantial assemblages, but can be characterized as Late Prehistoric temporary encampments generally post dating 3000 bp. Aside from their work at CA-LAN-2233 and LAN-2235, W&S (1994a, 1994b) evaluated several other small sites but failed to identify significant archaeological deposits.

W&S (2009) evaluated CA-LAN-4355 along Santa Clarita River in Sand Canyon, California, finding artifacts consistent with prehistoric habitation dating to the Late Prehistoric era (though no radiocarbon dates were provided). These artifacts included mortars and pestles, projectile points, flaked stone tools, steatite ornaments, bone tools, and various cobble based tools. W&S interpreted this site as dating between 400 and 800 bp, based on time sensitive artifacts. CA-LAN-1077, also located in Sand Canyon, was evaluated by Robinson (1980) who had findings similar to those of W&S (2009). CA-LAN-1077 had a weakly developed midden deposit with excavations producing four steatite beads/pendants, three cores, two retouched flakes, one hammerstone, five handstones, two battered cobbles, and fire-affected rock; no chronological placement was offered (Robinson 1980). None of the artifacts from CA-LAN-1077 or CA-LAN-4355 are specific to coastal locales; all types of artifacts recovered can be found in coastal, riparian, or desert environments.

One of the more well-known archaeological sites in the Santa Clarita River Valley dating to the late Holocene is CA-LAN-324. Loetzerich (1998) analyzed the collection from this massive site that contained human remains, residential features, thermal features, one flower pot mortar,

mortars and pestles, millingstones and handstones, flakedstone tools (including bifaces), cobble tools, and several exotic items such as quartz crystals, and schist and other stone beads. The site was interpreted as representing aboriginal occupation continuously from 2600 bp to 400 bp, based on various time-sensitive artifacts (including the flower pot mortar which tend to date to the last 300 years), and that it reflected a well-stratified aboriginal society similar to those seen in Gabrielino territory. The latter is consistent with Loetzerich's findings that burial patterns were similar to those seein the San Fernando Valley.

A few archaeological sites near Vaszquez Rocks in the Sand Canyon area to the northeast of Santa Clarita Valley, such as CA-LAN-618 produced Olivella sp. beads that were tentatively thought to date prior to Chester King's (1990) Early Period have subsequently been found to date after 4000 bp (W&S 1994b). Additionally, Love and Witt (1990) revisted these sites concluding that their earliest documented occupation occurred no earlier than about 2700 bp. In her review, Waugh (1999) reviews the chronological evidence from this site according to the coastally derived cultural chronology developed by King (1990). The reference to King's (1990) bead chronology is justified in the sense that it is a baseline for review of shell bead types but it leaves the impression that the occupants were socioculturally connected to coastal areas, while the non-ornamental archaeological assemblage provides no such justification.

Farther to the north in Antelope Valley, Sutton (1980) studied CA-LAN-488—a substantial prehistoric site dating from 2200 – 300 bp and containing a prehistoric cemetery, including a child burial associated with more than 5,000 shell beads. The archaeological assemblage from this site, dating within the late Holocene was decidedly desert focused, despite this strong shell bead component.

Finally, investigations of the Lovejoy Springs site (CA-LAN-192) summarized nearly a century of investigation at a large, desert site near Lake Los Angeles in the Antelope Valley (Price et al. 2009). The assemblage from CA-LAN-192, dating from approximately 3500 bp to historic times is characteristic of those found in the western Mojave Desert, being dominated almost exclusively by millingstone and handstone technology and the appropriate time-sensitive, desert projectile point forms. A few fragments of mortars and pestles (one decorated), and steatite vessels are present. Similar to CA-LAN-488, thousands of Olivella sp. shell beads were found interred with several of the nine human burials and in the general deposit (Price et al. 2009). Together, the site spans the Gypsum (4000 – 1500 bp), Saratoga Springs (1500 – 900 bp) and the Late Prehistoric periods (post – 900 bp), and exhibits many of the assemblage changes characteristic of each time period within the Mojave Desert.

In sum, the late Holocene saw major socioeconomic development among aboriginal populations within and surrounding Santa Clarita Valley, but that each region is distinct, from the Mojave to the northeast, to the west along the Coast, to the south in the Los Angeles Basin and San Diego County. The

archaeological record within Santa Clarita Valley is meager compared to these other regions and resists efforts to make socioeconomic connections to neighboring regions or their inhabitants. Simple assemblage similarities, such as the presence of coastal beads or burial patterns in Santa Clarita or the Mojave, are not direct evidence of cultural affiliation. If it were, burials located in some of the Mojave Desert sites, such as CA-LAN-488 or CA-LAN-192 would require the assumption that they were Chumash in origin, which is the least likely explanation and one that few archaeologists (if any) would suggest. Rather, it is likely that trade and exchange networks between different ethnic groups were well established with the onset of the late Holocene by at least 3000 years ago (Price et al. 2009). Such networks allowed for the exchange of goods, such as beads across ethnic boundaries without carrying implications for population movement or replacement.

Overall, the archaeological record of the upper Santa Clarita River Valley is poorly understood, especially in comparison to neighboring regions. This is likely a function of the complex geomorphology of the Santa Clarita River watershed reviewed earlier in this report. The areas that would have attracted prehistoric human occupation, such as river terraces and flat ground in valley bottoms, were subject to periodic and destructive flooding and sedimentation, which likely wiped out a large portion of the archaeological record. The San Francisquito Dam failure of 1927 probably exacted a heavy toll on the archaeological landscape of the floodplain since that event undoubtedly trumped previous natural flood events with its near 60-foot high wall of water instantly released into the Santa Clarita River Floodplain.

3.3 Ethnographic Overview

3.3.1 Tataviam

The project area falls within the ethnographic boundary of the Tataviam (Johnson and Earle 1990; King and Blackburn 1978; Kroeber 1925). Tataviam territories included the upper reaches of the Santa Clara River drainage east of Piru Creek, but also encompassed the Sawmill Mountains to the north and the southwestern portion of the Antelope Valley (King and Blackburn 1978). Tataviam territory is bounded by various branches of Chumash to the north and west (including the Ventureño to the west, and Castac and Emigdiano to the northwest), Kitanemuk to the northeast, Serrano to the east, and Gabrielino to the south (King and Blackburn 1978).

Note that there is almost no ethnographic data (i.e., data acquired by means of observation or taken from persons who practiced native lifeways) in existence concerning the Tataviam and their native lifeways. Most of what is known today about the Tataviam comes in the form of ethnohistory (i.e., historical accounts developed through examination of historical records and oral histories) as presented in the works of anthropologists Alfred L. Kroeber (1915, 1925) and John P. Harrington (1935). Their data is largely based on interviews conducted in the early 1900s with a Native American consultant

named Juan José Fustero, a man who spoke Kitanemuk and claimed that his grandparents were born near the town of Newhall and spoke a language that is no longer extant (Bright 1975). Most of the subsequent works published on the Tatatviam (Bright 1975; Hudson 1982; King and Blackburn 1978), including discussions of their cultural and geographic affiliations, were based on the Kroeber and Harrington interviews with Fustero and several other Kitanemuk consultants. Other studies have analyzed Spanish mission baptismal, marriage, and burial registers in an attempt to better understand the distribution of historic village settlements and kinship ties between settlements (Johnson 1978 and 1997; NEA and King 2004).

Early ethnologies referred to the Tataviam as Ataplili'ish (Kroeber 1915), but Kroeber found this name to be too general since it had already been used to describe other indigenous groups (namely the Gabrielino). Kroeber changed the term to Alliklik (1925), which was noted to be a Ventureño Chumash name for the group (although it is believed to be a derogatory term for the sound of the language), but offered almost no information concerning their native lifeways:

In fact, there is nothing known about them except that they held the river up from a point between Sespe and Piru, most of Piru Creek, Castac Creek, and probably Pastoria Creek across the mountains in the San Joaquin Valley drainage and adjacent to the Yokuts (Kroeber 1925:613-614).

The Tataviam are linguistically classified as an Uto-Aztecan Serran sub-branch of Takic speaking groups consisting of Kitanemuk, Serrano (including Vanyume), and Tataviam (Golla 2011; Sutton 2009). William Bright has suggested that Tataviam was actually a separate language with Takic affinities, or perhaps a "remnant, influenced by Takic, of a language family otherwise unknown in southern California" (Bright 1975:230). However, the current and most widely accepted view is that Tataviam is in fact a Takic language (King and Blackburn 1978; Johnson and Earle 1990; Sutton 2009).

King and Blackburn (1978:536) noted several Tataviam settlements based on information provided by Harrington and other sources, including mission registers. Among these is the putative village of tsawayung (also referred to as Chaguayabit, Chaguayanga, takuyama'm), which some believe was located near Castaic Junction at the site of Rancho San Francisco. However, there is a lack of consensus – indeed, significant confusion – as to its exact location. Harrington's own notes reflect this confusion: "Jose Juan Olivas thinks it is over by San Francisquito [Rancho San Francisco] but does not know and never did know just where" (NEA and King 2004:119). Based on diary entries from the Portolá Expedition (Perkins 1957), some have hypothesized that Estancia San Francisco de Xavier (often incorrectly referred to as an asistencia) was placed at the location of the village of tsawayang, but this is based on descriptive diary entries and has never been confirmed by archaeological or other historic evidence. In fact, no physical evidence of the village has ever been found. Other Tataviam villages mapped outside

of the project area include tikatsing located on upper Castaic Creek, and pi'ing located where Castaic Creek meets Elizabeth Lake Canyon. The village of Tochonaga, was recorded on an 1843 land grant map. This site appears to be located to the southeast of Newhall, but it's precise location has also never been confirmed: "Tochononga was located in the mountains northwest of San Fernando…over by Los Alamos somewhere here in the Tejon Ranch " (NEA and King 2004:117). Other villages and seasonal camp sites identified by Harrington include akure'eng, which was located at the original Newhall townsite; apatsitsing, located on upper Castaic Creek; and naqava'atang, located east of Townsend Peak. Piru Creek also contained several village and rancheria sites, located on the northern edge of Tataviam territory (Johnson and Earle 1990).

Pedro Fage's account of the 1769 Portola expedition indicates that the first Chumash settlement encountered upon leaving Tataviam territory was located west of the mouth of Piru Creek. The village of kamulus (Camulos), located east of Piru Canyon, bears a Chumash name (Johnson and Earle 1990), leading to speculation that this village consisted of a mixed Chumash-Tataviam population. There has been much discussion regarding Chumash ties to areas generally accepted as Tataviam territory (see Beeler and Klar 1977).

More recent studies have examined additional Tataviam investigations conducted by Harrington with neighboring groups (Johnson and Earle 1990). These studies support the original Kroeber and Harrington findings that the Tataviam were a distinct group:

> The correspondence between (1) ancestral villages traced using genealogical evidence and (2) independently elicited information regarding Tataviam territoriality builds confidence in the realiability of the ethnographic record compiled by Kroeber and Harrington. The distinctiveness of the Tataviam as an ethnic entity, separate from the Kitanemuk and Fernandeño, is supported by our research (Johnson and Earle 1990:209).

Additional evidence on the subject of Chumash ties to the region has come to light through bioarchaeological studies. In 1999 archaeologists excavated 45 burials from CA-LAN-2233, a prehistoric cemetery dating from approximately 2000 to 1630 bp and located within the Homestead South project area, within Tataviam territory. Examination of mitochondrial DNA (mtDNA) from five burials at CA-LAN-2233 found that these individuals were genetically linked to modern Uto-Aztecan speaking groups, such as the Tataviam:

As Chumash speakers are very low in haplogroup C, this high frequency is not consistent with a close mtDNA genetic affinity with the CA-LAN-2233 population. Additionally, the lack of haplogroup A, which is the most common haplogroup among Chumash samples analyzed,

further suggests that the CA-LAN-2233 population does not have a mtDNA affinity with the Chumash (Waugh 1999:87).

While mortuary customs are largely unknown, mortuary data from Tataviam territory indicates that inhumation is the most frequently observed pattern, with ocassional instances of cremation (Sutton 2009).

3.3.2 Further Ethnohistoric Considerations

The preponderance of evidence indicates that the Tataviam inhabited the Santa Clarita Valley at the time of Spanish Contact in the 1700s and for sometime thereafter, and that there is no demonstrable link indicating direct and prolonged occupation by neighboring Chumash, Kitanemuk, Gabrielino, Serrano, or other ethnohistorically known native groups. The archaeological record contains artifacts that are commonly found in both coastal and desert regions, which is not surprising since Santa Clarita Valley is in the midst of natural corridors connecting the Ventura Coast, southern San Joaquin Valley, and Mojave Desert. The commonality of coastal artifacts in the desert, and desert artifacts at the coast testifies to extensive movement of these items. Artifact translocation primarily occurred through trade and exchange. The widespread manifestation of earlier Milling Stone assemblages throughout all parts of southern California indicates that human populations were strongly established during the early Holocene, likely resulting in the development of ethnic borders and some degree of territoriality. The ethnographic and ethnohistoric record in California indicates that such sociocultural conditions are more conducive to trade and exchange than to open travel through multiethnic territories by unaffiliated individuals or groups.

Considering the ethnohistorically mapped aboriginal villages, any efforts to rectify mapped locations with archaeological deposits would be wrought with tenuous assumptions. Ethnohistoric village location maps for the Santa Clarita Valley were developed through interviews with persons far removed from any aboriginal occupation of those settlements and are estimates only. Discovering an archaeological deposit near a mapped village location does not itself prove that the ethnohistoric village has been located.

With respect to the putative Tataviam village of tsawayung, it was mapped using ethnohistorical data only; no archaeological evidence exists that could confirm its location. Even if archaeological deposits dating to the last few hundred years are identified in the general area, those deposits must be studied to first address basic anthropological questions of settlement, subsistence, and general socioeconomic adapatations, followed by a test of expectations regarding what the ethnohistoric settlement may have looked like. The devastating effect of introduced disease, along with Missionization of California Indians, would have certainly modified the nature of aboriginal

occupation of any village, creating an archaeological signature distinct from the traditional Late Prehistoric record. Moreover, the ethnohistoric period archaeological record from neighboring regions can only be used as a proxy for the kinds of archaeological patterns that may appear in the Santa Clarita Valley. Socioeconomic adaptations in Chumash and Kitanemuk territories were regionally specific and can be expected to have responded differently to the effects of introduced disease, Missionization, and integration into Mexican and American economies—all of which preceded development of the ethnographic and ethnohistoric records of southern California aboriginal groups during the early 1900s.

3.4 Historic-Period Overview

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1848), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

3.4.1 Spanish Period (1769–1821)

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrílllo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrílllo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabrílllo and Vizcaíno (Bancroft 1885; Gumprecht 1999).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish

settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

The Portolá expedition first reached the present-day boundaries of Los Angeles in August 1769, thereby becoming the first Europeans to visit the area. Father Crespi named "the campsite by the river Nuestra Señora la Reina de los Angeles de la Porciúncula" or "Our Lady the Queen of the Angeles of the Porciúncula." Two years later, Friar Junípero Serra returned to the valley to establish a Catholic mission, the Mission San Gabriel Arcángel, on September 8, 1771 (Kyle 2002). Mission San Fernando Rey de España was established nearly 30 years later on September 8, 1797.

3.4.2 Mexican Period (1821–1846)

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. Nine ranchos were granted between 1837 and 1846 in the future Orange County (Middlebrook 2005). Among the first ranchos deeded within the future Orange County were Manuel Nieto's Rancho Las Bolsas (partially in future Los Angeles County), granted by Spanish Governor Pedro Fages in 1784, and the Rancho Santiago de Santa Ana, granted by Governor José Joaquín Arrillaga to José Antonio Yorba and Juan Pablo Peralta in 1810 (Hallan-Gibson 1986). The secularization of the missions (enacted 1833) following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos.

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States

and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

3.4.3 American Period (1846–Present)

War in 1846 between Mexico and the United States precipitated the Battle of Chino, a clash between resident Californios and Americans in the San Bernardino area. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. Territories (Waugh 2003). Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through 1850s. The Gold Rush began in 1848, and with the influx of people seeking gold, cattle were no longer desired mainly for their hides but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains when available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 2005).

3.4.4 Local History of the Project Area

In 1795 Fr. Fermin Lasuen ordered a new report on possible mission sites, and the Francisco Reyes Rancho was ultimately chosen as the new mission site, with Mission San Fernando Rey de España being formally founded in 1797 (Perkins 1957). Shortly thereafter, many of the local Tataviam people were removed from their homeland, relocated to the mission, and their native lifeways taken away.

Despite the fact that the new mission was to be built elsewhere, Mission San Fernando acquired the headwaters of the Santa Clara River east from Piru and named the land Rancho San Francisco. When Mission padres learned that Francisco Avila had claimed a large portion of this land as his own, they protested to Governor José Arrillaga at Monterey, insisting that these lands belonged to the church and not Avila. After acknowledging the church's title to the land, Avila's land grant was rescinded and the padres quickly made plans to build in the area in order to more clearly establish their presence (Perkins 1957).

Using Native American labor in 1804, the church built an "asistencia" at the location that Fr. Crespi has first noted in his diary entry (Perkins 1957). However, it is important to note that mission records suggest that this was actually an outpost known as Estancia San Francisco de Xavier, and that it was likely never elevated to the status of asistencia or sub-mission.

By 1813, Rancho San Francisco had increased its production and herds of cattle had grown larger. It became necessary to construct a fence to keep mission cattle separate from neighboring cattle. The fence was erected at Piru Creek across the river, establishing a formal boundary between San Francisco and Triunfo ranches. An irrigation canal was dug and a small dam built at the eastern boundary of the rancho in order to provide the western side of the rancho with much needed water. (Perkins 1957).

Following secularization of the missions in 1833, the Mexican Government confiscated all mission land holdings and commissioned Lieutenant Antonio Del Valle to take over Mission San Fernando by inventory from the incumbent Padre, Fr. Ybarra in 1834. After meeting his wife Doña Jacoba Felix and having two children, de Valle decided to settle his family on a piece of land. In 1838, he resigned his army commission and petitioned the Mexican Government for Rancho San Francisco (despite the fact that the land was supposed to revert back to Native Americans). On January 22, 1839, the request was granted, and Del Valle became the owner of 48,829 acres of Rancho San Francisco. Just two years later, Antonio Del Valle died, leaving behind thousands of heads of livestock, over 75 square miles of land, and no legal will. Legal battles ensued between his widow Jacoba Felix Del Valle and his oldest son Ygnacio Del Valle, with a judge eventually dividing up the land amongst the parties and their children . Ygnacio would go on to build his own corral on the western edge of the property (in present-day Ventura County in Piru) surrounding the former village of kamulus (Rasmussen 2001). The Camulos Rancho was formerly established by Ygnacio in 1853.

Rancho San Francisco was owned and operated by Ygnacio Del Valle until 1865, by which time it was deep in debt as a result of three years of drought which killed most of the cattle. Del Valle eventually lost the rancho to his financiers who then sold it to oil speculators. This resulted in the first major discovery of oil on the Rancho, and just seven weeks later, the first oil well was installed on the south side of the Santa Clara River near the Del Valle residence. The region eventually be surrounded by oil fields including the Hasley Canyon and Castaic Junction Oil Fields to the north and the historic Pico Oil Field to the south.

The land changed hands a few more times until it was acquired by Henry Mayo Newhall in 1875. Shortly thereafter in 1876, a new townsite known as "Newhall" was founded and a Southern Pacific Railroad (SPRR) right-of-way was granted across the rancho (Perkins 1957). In 1875, work had already begun on the San Fernando Railroad Tunnel, which was constructed by over 1,000

Chinese and 500 white laborers, and overseen Frank Frates. The completion of the tunnel in 1876 resulted in the completion of the SPRR at Lang Station. A Golden Spike ceremony was held the day the final pieces of track were laid (Pollack 2010). That same year the Newhall station was built, although adverse conditions from sand storms would result in the building (and the rest of the townsite) being moved three miles to the south.

When gold was struck in the 1800s, colonial Mexican settlers soon built a boomtown named Val Verde. The town was short lived and by the early 1900s, had dissipated. As tracts of land came up for sale, a group of black professionals, fed up with the Jim Crow laws of the nearby cities, purchased the 30-acre tract encompassing the old boomtown (Worden 1996). Marketing the town as "Eureka Villa," they began to sell parcels to black professionals looking for a place to relax and dine in peace. In 1928, the town of Eureka Villa became an independent township and residents decided to change the name of the community back to Val Verde (Flamming 2005).

In the 1930s, the Works Progress Administration dedicated $39,000 for the development of an Olympic swimming pool within the community. Celebrated with a gala opening attended by black celebrities of the era, the pool remained intact until the 1994 Northridge earthquake (Flamming 2005). In addition to damaging the pool, the earthquake damaged the majority of the original structures.

INTENTIONALLY LEFT BLANK

4 RESEARCH METHODS

4.1 Cultural Resources

4.1.1 Cultural Resources Literature Review

On September 25, 2017, Dudek completed a search at the SCCIC, located on the campus of California State University, Fullerton. This search included mapped prehistoric, historical, and built-environment resources; Department of Parks and Recreation (DPR) site records; technical reports; archival resources; and ethnographic references. Additional consulted sources included historical maps of the project area, the NRHP, the CRHR, the California Historic Property Data File, and the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility. The confidential records search results are also provide in Appendix A.

4.1.2 NAHC Sacred Lands File Search

On September 27, 2017, Dudek requested a search of the Sacred Lands Files from the Native American Heritage Commission (NAHC). A response letter was received via email from the NAHC on September 28, 2017, stating that the results of the Sacred Lands File search failed to indicate the presence of Native American cultural resources in the immediate project area. The NAHC also provided a list of 11 Native American groups and individuals who may have knowledge of cultural resources in the project area. Letters were sent to each representative October 23, 2017. This coordination was conducted for informational purposes only and does not constitute formal government-to-government consultation. To date, no responses have been received. Should any responses be received, they will be forwarded to LADPW. Documentation of coordination with Native American groups and individuals is provided in Appendix B.

4.1.3 Field Methodology

Dudek archaeologists conducted the intensive-level pedestrian survey on October 13, 2017 using standard archaeological procedures and techniques. All field practices met the Secretary of Interior's standards and guidelines for a cultural resources inventory. Where vegetation allowed and slope was 30% or less, pedestrian transects were spaced at 15-m intervals (49-ft) were utilized. Discretionary pedestrian survey was utilized in areas with a slope over 30% and in heavily vegetated areas where systematic survey was not possible. Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials and to record locational information.). Ground disturbances such as burrows, cut banks, and drainages were also visually inspected for exposed subsurface materials. No artifacts were collected during the surveys.

All fieldwork was documented using field notes and iPad technology with close-scale field maps, and aerial photographs. Location-specific photographs were taken using an Apple 3rd Generation IPad equipped with 8 mega-pixel (MP) resolution and georeferenced PDF maps of the project area. All field notes, photographs, and records related to the current study are on file at Dude's Pasadena, California office.

4.2 Paleontological Resources Records Search

Determining potential impacts to significant paleontological resources during the construction phase of a project requires the analysis of the geological units within the proposed project to determine the likelihood of their yielding significant paleontological resources. To determine the paleontological sensitivity of the project, Dudek paleontologists conducted geological and paleontological map and literature reviews. In addition, a paleontological records search, requesting an inventory of paleontological resources within a one-mile-buffer, was sent to the Natural History Museum of Los Angeles (LACM) on December 20, 2017.

5 RESULTS

This section presents the results of the records searches and field survey for the current study. Cultural and paleontological resources are discussed separately.

5.1 Cultural Resources

5.1.1 Records Search Results

5.1.1.1 Previously Conducted Cultural Resource Studies

The SCCIC records indicate that 34 previous cultural resources technical investigations have been conducted within 1.0-mile (1,608 m) of the project area between 1963 and 2013. Of these 34 studies, five overlap with the project area (LA-00285, -02259, -02437, -06585, and -10119) while the remaining 29 are within the records search buffer. All 34 technical investigations are summarized in Table 1.

5.1.1.2 Previously Recorded Cultural Resources

The SCCIC records indicate that three resources have been recorded within 1.0-mile (1,608 m) of the project area. Of these, none are within the boundaries of the current project area, though one is immediately adjacent to the east. All three resources are summarized in Table 2.

Table 2
Previously Recorded Cultural Resources Within the One Mile Search Buffer

Primary Number (P-19-)	Trinomial (CA-LAN-)	Period	NRHP/CRHP Status	Recorded By/Year	Description	Proximity
36	000036/H	Multi-component	6Z (Ineligible)	(Baumhoff); 1981 (L. Tartaglia and R. Wlodarski); 1991 (DS & TK Whitley and J. Simon, W&S Consutlants)	Bower's Cave with rock shelter, a ceramic scatter and caches of artifacts	Outside

100511	--	Prehistoric isolate	6Z (Ineligible)	2005 (J. A. McKenna, McKenna et al.)	Franciscan chert projectile point	Adjacent

5.1.2 Historic Aerial Photography Research

Dudek consulted historic maps and aerial photographs to understand development of the project area and surrounding properties. Topographic maps are available from 1903 to the present and aerial images are available from 1947 to the present (NETR 2018). These images indicate that until the late 1950s, the project area was primarily used for ranching, with roads extending through the area and sporadic homesteads. By 1994, the neighborhoods to the southeast and southwest of the project area are beginning to become more established as the ranching land is divided up for single-family homes. One residence, the current caretakers home, is observed within the project area on the 1952 quadrangle.

5.1.3 Historic Structure Research

Historic aerial photographs and preliminary parcel research indicate that the existing residence is located on Assessor Parcel Number (APN) 3271-004-013 and was constructed in 1936, making it over 45 years old (Figures 2 and 3). The residence has not previously been recorded and therefore has not been formally evaluated as an historical resource under CEQA or the Los Angeles County guidelines.

5.1.4 Survey Results

Surface visibility varied throughout the project area with dirt roadways having a visibility greater than 90% and off road areas having a much lower visibility of approximately 10% to 15% (Figures 4 through 7). Surface vegetation consisted of weed and chaparral communities. At the time of survey the project area extended to the southeast. Several resources were recorded in this area; however, because they are no longer within the proposed project, they are not discussed in this report and they have not been analyzed for significance as part of this report.

As a result of the survey, two newly-identified archaeological sites (SR-S-01) and one built environment resource (SR-S-05) was identified and recorded. No resources have been previously-recorded within the project area. Both resources are detailed below.

Figure 2. Overview of historic structure, view facing southwest.

Figure 3. Overview of historic structure, view facing southeast.

Figure 4. Overview from the southwestern portion of the project area, view facing northeast

Figure 5. Overview from the northwestern portion of the project area, view facing north.

Figure 6. Overview from the central portion of project area, view facing southwest.

Figure 7. Overview from the southern portion of project area, view facing east.

5.1.4.1 Newly Identified Cultural Resources

During the current field efforts, four newly-identified archaeological sites (SR-S-01) and one built environment resource (SR-S-05) was identified and recorded. California DPR 523 Series forms for all recorded resources are included as Appendix C.

Site SR-S-1

This historic archaeological feature consists of the fragmented remnant of a concrete slab foundation first visible on the 1947 aerial photo. The foundation is set back 267 feet from the centerline of Coolidge Avenue. The rectangular foundation roughly measures 107 feet (north-south) by 74 feet (east-west) and is flush with the ground. The full extent of the foundation is unknown as portions of the slab are buried and edges are obscured by vegetation. No siding or walls could be discerned within the foundation given the poor condition of the slab. No historic artifacts or features associated with the foundation were identified. Disturbances to the site area include the removal of all the original construction materials and All Terrain Vehicle (ATV) activity. Based on historic aerial review the site has existed since at least 1947. Aerials from this period show the concrete pad; however, it does not appear that anything has ever been built on the pad. The site does not show up on any historical topographic maps. It's function is unclear, as these images do not indicate any nearby structures or facilities that could be associated with it. Research into the town of Eureka has failed to identify any important persons that are associated with the site. Additionally the site does not have any interesting or notable characteristics, nor is further study likely to yield any important information pertaining to the prehistory or history of the area. As a result of these factors, this site is recommended as not eligible for the NHRP or the CRHR.

Site SR-S-2

Site SR-S-2 is a decomposing asphalt road, first seen on the 1947 aerial photo. The road connects what is currently Hunstock Street at the northern extent with Jackson Street at the southern extent. Based on the 1947 aerial photograph, the road appears to lead from Hunstock Street south approximately 0.3 miles (0.4 km) to an industrial operation to the south, possibly related to mining activity. Historic debris was observed along the entire extent of the road and two large historic refuse deposits were recorded immediately off of the roadway to the west (SR-S-3 and -4, below). Although no measurements were possible due to deterioration, all of the cans appear to date to sometime between the 1920s and 1930s based on morphological characteristics (Simonis n.d.). Disturbances include continued occasional use and ATV activity. This resource is located in the southern section of proposed project. This area will be placed and placed in a conservation easement as a component of this project and therefore these resource will not be impacted as part of the proposed project.

Site SR-S-3

Measuring 40 feet (east-west) by 33 feet (north-south), site SR-S-4 is a historic refuse deposit located on the side of a very steep drainage adjacent to SR-S-2 (decomposed asphalt road). Within the deposit, whole bottles, discrete can dumps, modern construction debris, and modern washed out car parts were observed.

Can types observed included double seam sanitary-type food, key-wind meat, and flat top beverage dating to a range of 1935–1970s (Simonis n.d.). Several complete bottles were observed, including one medicine bottle with an automatic bottle machine suction scar along with an Illinois Glass Company I-Diamond trademark providing a date from 1919 and 1929 and one a clear glass jar base with Hazel-Atlas Glass Company mark dating provide from 1920 to 1964 (Miller 2002, Toulouse 1971). Disturbances include continued occasional use of SR-S-2, pot hunting pits, modern dumping, and ATV activity. This resource is located in the southern section of proposed project. This area will be placed and placed in a conservation easement as a component of this project and therefore these resource will not be impacted as part of the proposed project.

Site SR-S-4

Site SR-S-4 measures 30 feet (north-south) by 20 feet (east-west) and is located approximately 210 feet to the southwest, along the western side of SR-S-02. The site is a historic refuse deposit consisting of approximately 20 crushed cans including sanitary, church-key open and paint, as well as fragments of bottle glass. Modern beer cans were observed throughout the site. Although no measurements were possible due to deterioration, all of the cans appear to date to sometime between the 1930s and 1940s based on morphological characteristics (Simonis n.d.). Disturbances include continued occasional use of SR-S-2 and ATV activity, indicating that the modern beer cans were deposited separately from the historic refuse. This resource is located in the southern section of proposed project. This area will be placed and placed in a conservation easement as a component of this project and therefore these resource will not be impacted as part of the proposed project.

Built Environment Resource SR-S-5

Resource SR-S-05 is a 1936 single-family, one-story vernacular building, irregular in plan with stucco cladding and a low-pitched roof. The main elevation of the building presents as three sections: a left (eastern) section projecting approximately 6 feet from the main body of the building that features a vinyl, horizontal slider window and a small opening that is likely for ventilation, an offset to the east section featuring a wooden projecting porch and entry door, and a right (western) section featuring a vinyl, horizontal slider window. Fenestration across all elevations is irregular and includes entry doors

on the main elevation, the northeast elevation and the southeast elevation, as well as, a variety of sizes of vinyl, horizontal slider windows. The northeast elevation was modified to include a shed roof addition. The site features mature trees, a chain link fence across portions of the main elevation, and multiple dirt areas around the building that are used for parking and storage for the property. This resource was evaluated in a separate HRA and was determined to be not eligible for listing on either the NRHP or the CRHR (Murray and Corder 2018).

5.2 Paleontological Resources

The paleontological records search results were received from the LACM on January 3, 2018. The results of the paleontological records search are included in the discussion of the geological units present within the project area below.

5.2.1 Geological and Paleontological Map and Literature Review

According to surficial geological mapping by Dibblee and Ehrenspeck (1993) at a scale of 1:24,000, the project is underlain by the following geological units (from youngest to oldest): Quaternary alluvium (map unit Qa), the Saugus Formation (map unit Qts), and the Pico Formation (map unit Tps).

5.2.1.1 Quaternary alluvium

Holocene age (< 12,000 years ago) Quaternary alluvium is mapped in the lower drainages within the project area. Dibblee and Ehrenspeck (1993) describe Quaternary alluvium as gravels, sand, and silt deposited within valleys and floodplains. In the paleontological records search, the LACM did not report any fossil localities from Quaternary alluvium within or near the project area, but older, more paleontologically sensitive geological units likely underlie the alluvium at a relatively shallow depth (McLeod, 2018). According to the Society of Vertebrate Paleontology guidelines for the mitigation of adverse impacts to paleontological resources (SVP, 2010), significant paleontological resources (fossils) need to be older than middle Holocene or approximately 5,000 years or older. Therefore, unless excavations are substantial (frequently greater than 5 feet), Quaternary alluvium is generally too young to yield significant paleontological resources, so is it assigned low paleontological sensitivity on the surface, increasing to high at depth.

5.2.1.2 The Saugus Formation

The Pleistocene (~2.6 million years – 12,000 years ago) and possibly late Pliocene (~3.6 million years – 2.6 million years ago) Saugus Formation is mapped in a large percentage of the elevated areas of the northwestern project area. According to Dibblee and Ehrenspeck (1993), the Saugus Formation is terrestrial within the project area; however, some portions of the formation are marine in other parts of

northern Los Angeles County. The Saugus Formation has yielded marine invertebrate fossils (Groves, 1991) and terrestrial vertebrates (Jefferson, 1991) in northern Los Angeles County. McLeod (2018) reported no Saugus Formation localities from within the project area; however, nearby localities produced fossil specimens. The closest of these localities, LACM 6062, is located east of the project area and produced fossil specimens of alligator lizard (*Gerrhonotus*), rabbit (*Leporidae*), pocket mouse (*Perognathus*), and pocket gopher (*Thomomys*). LACM 6063, which is the next closest fossil locality located southeast of the project area on the west side of Castaic Creek between Hasley Canyon Road and Highway 126, yielded a specimen of fossil horse (*Equus*). LACM 1293 is located south of LACM 6063 on a ridge on the north side of the drainage north of Portrero Canyon and produced a fossil camel (Camelidae). McLeod (2018) also suggested collecting sediment samples to test for the presence of microvertebrate specimens. The Saugus Formation is assigned high paleontological sensitivity.

5.2.1.3 The Pico Formation

The Pliocene (~5.3 – 2.6 million years ago) Pico Formation has produced many significant vertebrate and invertebrate fossils in Los Angeles County. Squires et al. (2006) document 53 species of fossil invertebrates from the Pico Formation of the Valencia area, and fossil fishes have been identified in and around the greater Los Angeles area (Fierstine et al., 2012).

McLeod (2018) reported no Pico Formation fossil localities from within the project area; however, nearby localities yielded fossil vertebrate specimens. The nearest locality (LACM 6365), which is located southeast of the project area, produced a fossil sea lion (Otariidae) skull. Further southeast of LACM 6365 west of the Old Road and Interstate 5 north of Calgrove Boulevard between Lyon and Towsley Canyons, LACM 6145 – 6146 yielded bat ray (*Myliobatis*), guitarfish (*Rhinobatos*), requiem shark (*Carcharhinus*), basking shark (*Cetorhinus*), and sheephead (*Semicossyphus*). LACM 6145 – 6146 were recovered from sediments originally mapped as Saugus Formation; however, McLeod (2018) stated these localities are more likely from the underlying Pico Formation. The Pico Formation is assigned high paleontological sensitivity.

INTENTIONALLY LEFT BLANK

6 SUMMARY AND MANAGEMENT RECOMMENDATIONS

Dudek was retained by Sterling Ranch Estates to conduct a cultural and paleontological resources inventory in support of the Sterling Ranch Estates Project. This development includes approximately 220 residential units, associated parks, open space, roads and other infrastructure on approximately 220 acres in the community of Val Verde. The SCCIC records search indicated that three resources have been recorded within 1.0-mile (1,608 m) of the project area, none of which are within its boundaries. As a result of the survey, four newly-identified archaeological sites (SR-S-01, SR-S-02, SR-S-03, and SR-S-04) and one built environment resource (SR-S-05) were identified and recorded within the current project area. The archaeological sites includes one decomposing concrete pad (SR-S-01), one decomposing asphalt road (SR-S-02), and two historic refuse deposits (SR-S-03 and -04) were identified in the southern section of the project area. The built environment resource (SR-S-05) is a single-family, one-story vernacular building built in 1936. SR-S-02, SR-S-03, and SR-S-04 were identified in the southern section of the project area. This area will be preserved and placed in a conservation easement as a component of this project and therefore these resources will not be impacted as part of the proposed project. SR-S-01 and SR-S-05 have both been recommended as ineligible for listing on the NRHP or the CRHR, and as such do not constitute significant resources under CEQA. Impacts to cultural resources resulting from the project as currently designed will be less than significant. Having considered all available information, archaeological, monitoring is recommended only in the event that unanticipated archaeological material is identified. Section 6.1.1 and 6.1.2 below summarized the recommendations for cultural resources.

Though no paleontological resources were observed during survey, the paleontological records search and research into the geological setting of the area indicates that it is an area of high paleontological sensitivity. Therefore monitoring during ground disturbance is recommended. Section 6.1.3 below summarizes the management recommendations for paleontological resources.

6.1 Management Recommendations

6.1.1 Unanticipated Discovery of Archaeological Resources

If archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed project, all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, can evaluate the significance of the find and determine whether or not additional study is warranted. Depending upon the significance of the find under CEQA (14 CCR 15064.5(f); California Public Resources Code, Section 21082), the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under

CEQA, additional work, such as preparation of an archaeological treatment plan and data recovery, may be warranted.

6.1.2 Unanticipated Discovery of Human Remains

In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the County coroner shall be immediately notified of the discovery. No further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur until the County coroner has determined, within 2 working days of notification of the discovery, the appropriate treatment and disposition of the human remains. If the County coroner determines that the remains are, or are believed to be, Native American, he or she shall notify the NAHC in Sacramento within 24 hours. In accordance with California Public Resources Code, Section 5097.98, the NAHC must immediately notify those persons it believes to be the most likely descendant from the deceased Native American. The most likely descendant shall complete their inspection within 48 hours of being granted access to the site. The designated Native American representative would then determine, in consultation with the property owner, the disposition of the human remains.

6.1.3 Paleontological Resources

Construction activities associated with the proposed project would involve ground disturbance in areas of high paleontological sensitivity. Adverse effects to paleontological resources can occur if significant resources are uncovered during ground disturbance and subsequently destroyed, otherwise harmed, and/or not properly preserved. As such, mitigation should be implemented to ensure that potential impacts to paleontological resources are reduced to a level below significance.

The project is underlain by recent Quaternary alluvium, the Pleistocene to Pliocene Saugus Formation, and the Pliocene Pico Formation. Shallow excavations into Quaternary alluvium will not likely impact sediments old enough to contain significant paleontological resources; however, the Saugus and Pico formations have yielded significant paleontological resources in Los Angeles County and therefore paleontological mitigation is recommended for the project. It recommended that a qualified paleontologist be retained for the project to ensure implementation of a paleontological monitoring program. The SVP (2010) defines a qualified paleontologist as having:

1. A graduate degree in paleontology or geology, and/or a publication record in peer reviewed journals; and demonstrated competence in field techniques, preparation, identification, curation, and reporting in the state or geologic province in which the project occurs. An advanced degree is less important than demonstrated competence and regional experience.

2. At least two full years professional experience as assistant to a Project Paleontologist with administration and project management experience; supported by a list of projects and referral contacts.
3. Proficiency in recognizing fossils in the field and determining their significance.
4. Expertise in local geology, stratigraphy, and biostratigraphy.
5. Experience collecting vertebrate fossils in the field.

The qualified paleontologist should attend any preconstruction meetings and manage the paleontological monitor(s) if he or she is not doing the monitoring. A paleontological monitor should be on site during all excavations in areas mapped as Saugus Formation and Pico Formation on the surface and excavations below a depth of five feet in areas mapped as having Quaternary alluvium of the surface. The SVP (2010) defines a qualified paleontological monitor as having:

1. "BS or BA degree in geology or paleontology and one year experience monitoring in the state or geologic province of the specific project. An associate degree and/or demonstrated experience showing ability to recognize fossils in a biostratigraphic context and recover vertebrate fossils in the field may be substituted for a degree. An undergraduate degree in geology or paleontology is preferable, but is less important than documented experience performing paleontological monitoring, or
2. AS or AA in geology, paleontology, or biology and demonstrated two years experience collecting and salvaging fossil materials in the state or geologic province of the specific project, or
3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in the state or geologic province of the specific project.
4. Monitors must demonstrate proficiency in recognizing various types of fossils, in collection methods, and in other paleontological field techniques."

INTENTIONALLY LEFT BLANK

1.0 INTRODUCTION

This report presents the results of a cultural resources inventory for the Sterling Ranch Estates Tank Site Project (Project) located in Los Angeles County, California (see Figure 1). The cultural resources investigation included background research, a records search, Native American Heritage Commission (NAHC) Sacred Land Files search request and an intensive surface survey of the entire Project site, pursuant to California Environmental Quality Act (CEQA) and Los Angeles County cultural resources guidelines.

Project Description

The proposed Project is an offsite improvement associated with the Sterling Ranch Estates Project and includes a one million-gallon storage tank in and adjacent to the existing Los Angeles County's Waterworks District No. 36 Cuyama tank site. The water tank is located within the District's 1598 pressure zone APN 3272-029-902 and 3272-029-023 comprising approximately 2.79 acres.

Summary of Cultural Resources Inventory

A records search conducted at the California Historical Resources Information System (CHRIS), South Central Coastal Information Center (SCCIC) located at California State University, Fullerton determined that no cultural resources have been previously identified within the Project area nor within 1-mile of the proposed Project site. One (1) cultural resource inventory of over 150 acres was completed approximately 500 feet north of the proposed Project site; No previous cultural resource studies have addressed any portion of the proposed Project site.

The proposed Project site was intensively surveyed by Dudek staff archaeologists on February 12, 2020 using 5-meter (approximately 16-foot) transect intervals when appropriate and meandering transects in steep terrain. Ground surface visibility within the proposed Project area was generally good. Special attention was given to barren ground including at the base of trees, within animal trails/paths, areas surrounding structural features such as fence lines and the extant water tanks as well as subsurface soils exposed by burrowing animals. To increase surface visibility, vegetation was casually cleared using shovels or boots at 5 to 10 meter intervals. No prehistoric or historic resources were discovered as a result of the survey. Based on the generally good ground surface visibility and use of shovel/ foot scrapes in areas with more surface vegetation, the intensive archaeological survey results are considered to be reliable. Due to the negative CHRIS records search results and NAHC Sacred Land Files results, negative survey results, and documented evidence of disturbance within the Project site since at least 1928, the potential for buried prehistoric or historic archaeological resources within the proposed Project is considered low.

The proposed Project improvements are not considered to have the potential for significant impacts on prehistoric or historic cultural remains. As a result, no mitigation measures are recommended. In the unlikely event that potentially significant cultural materials are encountered during construction/grading, ground

disturbing activities should be temporarily redirected and/or suspended and a qualified archaeologist contacted in order to assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for archaeological resource treatment consistent with CEQA and County of Los Angeles Cultural Resource Guidelines.

2.0 Regulatory Setting

2.1 State

2.1.a The California Register of Historical Resources (Public Resources Code section 5020 et seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code section 5020.1(j)). In 1992, the California legislature established CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria:

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

(California Public Resources Code section 5024.1(c).) Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, section 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

2.1.b Assembly Bill 52

Assembly Bill 52 of 2014 (AB 52) amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

Consultation with Native Americans

AB 52 formalizes the consultation process between lead agencies and tribal representatives, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with a project area. This includes tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Tribal Cultural Resources

Section 4 of AB 52 adds Sections 21074 (a) and (b) to the PRC, addressing tribal cultural resources and cultural landscapes. Section 21074 (a) defines tribal cultural resources as one of the following:

1. Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
    a. Included or determined to be eligible for inclusion in the California Register of Historical Resources.
    b. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on tribal cultural resources should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]). Information Center." (CEQA Guidelines section 15126.4(b)(3)(D).)

2.1.c Native American Historic Cultural Sites (California Public Resources Code section 5097 et seq.)

The Native American Historic Resources Protection Act (Public Resources Code section 5097, et seq.) addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native

American skeletal remains are discovered during construction of a project; and establishes the NRHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

2.1.d California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

2.1.e California Environmental Quality Act Statues and Guidelines

As described further below, the following CEQA statutes and CEQA Guidelines are relevant to the analysis of archaeological and historic resources:

1. California Public Resources Code section 21083.2(g): Defines "unique archaeological resource."
2. California Public Resources Code section 21084.1 and CEQA Guidelines section 15064.5(a): Defines historical resources. In addition, CEQA Guidelines section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource. It also defines the circumstances when a project would materially impair the significance of a historical resource.
3. California Public Resources Code section 5097.98 and CEQA Guidelines section 15064.5(e): These statutes sets forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. California Public Resources Code sections 21083.2(b)-(c) and CEQA Guidelines section 15126.4: These statutes and regulations provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; identifies preservation-in-place as the preferred manner of mitigating impacts to significant archaeological sites.

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(b)). An "historical resource" is any site listed or eligible for listing in the CRHR. The CRHR listing criteria are intended to examine whether the resource in question: (a) is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; (b) is associated with the lives of persons important in our past; (c) embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or (d) has yielded, or may be likely to

yield, information important in pre-history or history.

The term "historical resource" also includes any site described in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code section 5024.1(q)).

CEQA also applies to "unique archaeological resources". Public Resources Code section 21083.2(g) defines a "unique archaeological resource" as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

All historical resources and unique archaeological resources – as defined by statute – are presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code section 21084.1; CEQA Guidelines section 15064.5(a)). A site or resource that does not meet the definition of "historical resource" or "unique archaeological resource" is not considered significant under CEQA and need not be analyzed further. (Public Resources Code section 21083.2(a); CEQA Guidelines section 15064.5(c)(4)).

Under CEQA and significant cultural impact results from a "substantial adverse change in the significance of an historical resource [including a unique archaeological resource]" due to the "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines section 15064.5(b)(1); California Public Resources Code section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the

project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

2.1.f CEQA Guidelines section 15064.5(b)(2).

Pursuant to these sections, the CEQA first evaluates evaluating whether a project site contains any "historical resources," then assesses whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

When a project significantly affects a unique archeological resources, CEQA imposes special mitigation requirements. Specifically, "[i]f it can be demonstrated that a project will cause damage to a unique archeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:"

1. "Planning construction to avoid archeological sites."
2. "Deeding archeological sites into permanent conservation easements."
3. "Capping or covering archeological sites with a layer of soil before building on the sites."
4. "Planning parks, greenspace, or other open space to incorporate archeological sites."

2.1.g Pub. Resources Code section 21083.2(b)(1)-(4).

If these "preservation in place" options are not feasible, mitigation may be accomplished through data recovery. (Pub.Res. Code § 21083.2(d); CEQA Guidelines § 15126.4(b)(3)(C).) Public Resources Code section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

These same requirements are set forth in slightly greater detail in CEQA Guidelines section 15126.4(b)(3), as follows:

(A) Preservation in place is the preferred manner of mitigating impacts to archeological sites. Preservation in place maintains the relationship between artifacts and the archeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.

(B) Preservation in place may be accomplished by, but is not limited to, the following:

1. Planning construction to avoid archeological sites;
2. Incorporation of sites within parks, greenspace, or other open space;
3. Covering the archeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]
4. Deeding the site into a permanent conservation easement.

(C) When data recovery through excavation is the only feasible mitigation, a data recovery plan, which makes provision for adequately recovering the scientifically consequential information from and about the historical resource, shall be prepared and adopted prior to any excavation being undertaken.

Note that, when conducting data recovery, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation." (Ibid.) However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center." (CEQA Guidelines section 15126.4(b)(3)(D).)

2.1.h California Health and Safety Code

CEQA Guidelines section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (section 7050.5b). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the Native American Heritage Commission (NAHC) within 24 hours (section 7050.5c). The NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

2.2 Local

2.2.a Los Angeles County

Historical, cultural, and paleontological resources are discussed in the County's Conservation and Natural Resources Element of the Los Angeles County General Plan 2035, which was adopted in October of 2015. The County recognizes that historical and cultural resources are an important part of the County's identity and contribute to the local economy. The goals and policies that apply to historical, cultural, and paleontological resources and are specifically relevant to this projects regulatory setting are as follows:

22.44.1570 Archaeological/Paleontological/Historic Cultural Resources.

A. Purpose. The intent of these provisions is protect and preserve archaeological, historical, and paleontological resources from destruction, and avoid impacts to such resources where feasible. Where avoidance is not feasible, impacts to resources shall be minimized to the maximum extent feasible.

C. Applicability. A Cultural Resource Review pursuant to this section shall be required for all projects prior to the issuance of a planning approval, coastal development permit, geological/geotechnical exploratory excavation permit, sewer permit, building permit, grading permit, or prior to the commencement of government-initiated or funded works except those projects necessary for emergency purposes.

F. Archaeological Discoveries. Any person who discovers important cultural resources during the course of construction for a project shall notify the Director of the discovery. Once important cultural resources are discovered, no further excavation shall be permitted without approval of the Director.

The Department of Regional Planning, working with the Historical Landmarks and Records Commission and the Regional Planning Commission, completed and adopted a comprehensive historic preservation ordinance for the unincorporated areas of Los Angeles County. The following text was taken from the Historic Preservation Ordinance for Los Angeles County:

Chapter 22.124 – Historic Preservation

22.124.020 - Purpose.

The purpose of the Historic Preservation Ordinance is to:

A. Enhance and preserve the County's distinctive historic, architectural, and landscape characteristics that are part of the County's cultural, social, economic, political, and architectural history;

B. Foster community pride in the beauty and noble accomplishments of the past as represented by the County's historic resources;

C. Stabilize and improve property values in and around the County's historic resources, and enhance the aesthetic and visual character and environmental amenities of these historic resources;

D. Recognize the County's historic resources as economic assets and encourage and promote the adaptive reuse of these historic resources;

E. Further establish the County as a destination for tourists and as a desirable location for businesses; and

F. Specify significance criteria and procedures for the designation of landmarks and historic districts and provide for the ongoing preservation and maintenance of these landmarks and historic districts.

22.124.050 - County of Los Angeles Register of Landmarks and Historic Districts.

A County Register of Landmarks and Historic Districts is hereby created to record and maintain an inventory of landmarks and historic districts. The Landmarks Commission shall, upon designation by the Board, update and keep a record of landmarks and historic districts on this register.

22.124.070 - Criteria for Designation of Landmarks and Historic Districts.

A. A structure, site, object, tree, landscape, or natural land feature may be designated as a landmark if it is 50 years of age or older and satisfies one or more of the following criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of the history of the nation, State, County, or community in which it is located;

2. It is associated with the lives of persons who are significant in the history of the nation, State, County, or community in which it is located;

3. It embodies the distinctive characteristics of a type, architectural style, period, or method of construction, or represents the work of an architect, designer, engineer, or builder whose work is of significance to the nation, State, County, or community in which it is located; or possesses artistic values of significance to the nation, State, County, or community in which it is located;

4. It has yielded, or may be likely to yield, significant and important information regarding the prehistory or history of the nation, State, County, or community in which it is located;

5. It is listed, or has been formally determined eligible by the United States National Park Service for listing, in the National Register of Historic Places, or is listed, or has been formally determined eligible by the State Historical

Resources Commission for listing, on the California Register of Historical Resources;

6. If it is a tree, it is one of the largest or oldest trees of the species located in the County; or

7. If it is a tree, landscape, or other natural land feature, it has historical significance due to an association with a historic event, person, site, street, or structure, or because it is a defining or significant outstanding feature of a neighborhood.

B. Property less than 50 years of age may be designated as a landmark if it meets one or more of the criteria set forth in Subsection A, above, and exhibits exceptional importance.

C. The interior space of a property, or other space held open to the general public, including but not limited to a lobby, may be designated as a landmark or included in the landmark designation of a property if the space qualifies for designation as a landmark under Subsection A or B, above.

D. Historic Districts. A geographic area, including a noncontiguous grouping of related properties, may be designated as a historic district if all of the following requirements are met:1.More than 50 percent of owners in the proposed district consent to the designation;2.The proposed district satisfies one or more of the criteria set forth in Subsections A.1 through A.5, above; and 3.The proposed district exhibits either a concentration of historic, scenic, or sites containing common character-defining features, which contribute to each other and are unified aesthetically by plan, physical development, or architectural quality; or significant geographical patterns, associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of parks or community planning.

2.2.b Santa Clarita Valley Area Plan (SCVAP)

The Santa Clarita Valley Area Plan Update was adopted by the County Board of Supervisors on November 27, 2012. The Plan Amendment and related zone changes took effect on December 27, 2012.

Chapter 4. Conservation and Open Space Element; Section VII. Cultural & Historical Resources provides a historical overview of the Santa Clarita Valley, describes the City's identification of historical sites, local historic preservation efforts, and detailed previously identified historical and cultural resources within the Planning Area. The subject property is not identified in any of these lists.

3.0 PROJECT DESCRIPTION AND ENVIRONMENTAL SETTING

3.1 Project Description

The Sterling Ranch Estates Project includes the development of approximately 222 residential detached single-family lots along with associated commercial lot, park, open space lot, roads, infiltration and debris basins, and other infrastructure within assessor parcel numbers (APNs) 3271-004-012 and 3271-004-013, which comprise approximately 113.9 acres. Off-site improvements will also take place immediately east of the APN 3271-004-013 totaling approximately 6.5 acres. The Project site this specific investigation is concerning includes a proposed one million-gallon storage tank in and adjacent to the existing Los Angeles County's Waterworks District No. 36 Cuyama tank site. The water tank is located within the District's 1598 pressure zone APN 3272-029-902 and 3272-029-023 comprising approximately 2.79 acres. In addition, a preservation area associated with the Project is located in APN 3271-005-032 totaling approximately 34.7 acres. The Project will involve mass grading within the parcels to facilitate the residential development and associated infrastructure; however, several areas will remain undeveloped and will be preserved as open space. The Project will incorporate Low Impact Development (LID) design standards based on the Los Angeles County Department of Public Works (LADPW) LID standards manual (County 2014). Preserved parcels are anticipated to be placed in a conservation easement, which will be managed by a third-party conservation entity.

3.2 Environmental Setting

The Sterling Ranch Estates Project is located in the community of Val Verde, north of Chiquito Canyon Road, as well as northwest and southeast of Del Valle Road with the tank site (Project) located in the foothills west of San Martinez Road and approximately 1.8 miles due west of the proposed residential development. The Project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The Project site, Off-Site Open Space Area conservation easement and the Off-Site Water Reservoir Area, including the water tank, occur entirely within the U.S. Geological Survey (USGS) 7.5-minute Val Verde quadrangle (USGS 2017a). The Main Project site centered at approximately 34 27'1.00" N 118 39' 12.00" W and falls within Township 4 north, Range 17 west, sections 9 and 10, San Bernardino meridian. The Water Tank Project site is centered at approximately 34 27'09.95" N 118 41' 22.08" W and falls within Township 4 north, Range 17 west, Section 8.

Soils in the proposed Project site are characterized as Metz loamy sand with and Castiac and Saugus soils comprised of residuum weathered from sedimentary rock (United States Department of Agriculture 2019). The Metz loamy sand exists at 0 to 2 percent slopes and has a series profile typically consisting of 0-8 centimeters of dark greyish brown loamy sand; 8-45 centimeters of light yellowish brown loamy sand; 45-95 centimeters of light gray sand; 95-125 centimeters of light olive gray stratified silt loam and fine sand; 125-200 centimeters of light grey sand (USDA 2017). The tank site is located within the southeastern foothills of the Topatopa Mountains and includes both steep undeveloped terrain and relatively flat partially disturbed terrain

resulting from the construction of and access to extant water tanks.

4.0 BACKGROUND RESEARCH

4.1 Prehistoric Setting

The Project area falls within a part of California that is poorly understood regarding aboriginal occupation. The few significant archaeological studies in the area (e.g., Waugh 1999) have not fully defined local culture history and as a result, researchers have imposed cultural historical schemes developed in adjacent regions onto the Santa Clarita Valley. Even the most recent published archaeological summaries casually lump the Santa Clarita Valley into neighboring cultural historical schemes of the southern California coast (i.e., Glassow et al. 2007). The same is true of the ethnohistoric record, which is based wholly on second-hand accounts of descendants claiming traditional ties to the area (see Section 3.2, below).

Note also that one artifact type defined for one region may or may not represent the same time period or human behavior in another. The simple correlations of artifact types or styles does not necessarily indicate a direct functional or causal relationship. That is, the presence of coastal or desert-derived artifacts in Santa Clarita Valley does not necessarily indicate cultural or socioeconomic relationships with inhabitants of those areas. Such relationships must be demonstrated in the archaeological record by ruling out other functional interpretations as less plausible.

To avoid the pitfalls of extending culture histories from adjacent regions into the Santa Clarita Valley, the following sections discuss major archaeological trends in southern California according to a geologic time scale: Terminal Pleistocene (pre-10,000 years before present—BP), Early Holocene (10,000 – 7500 BP), Middle Holocene (7500 – 4000 BP), and Late Holocene (post – 4000 BP). Regional culture historical frameworks are then discussed within these categories as appropriate, providing an opportunity to consider their local application.

Terminal Pleistocene (pre – 10,000 BP)

The terminal Pleistocene period has been the subject of much research in North America, although it remains hotly debated in terms of human adaptations. A few things are certain: terminal Pleistocene environments were rapidly changing at the end of the Wisconsonin glaciation period after 18,000 BP; definitive evidence places humans in North American by at least 12,500 BP.

The last major glaciation period (Wisconsonin) ended by about 18,000 BP, marked by a warming and drying trend that started at this time, lasting until at least 15,000 BP (Grayson 1993). Glaciers that covered most of northern North America began to melt forming pluvial lakes; Pleistocene Lake Lahonton being one of the largest covering the Great Basin of western North America (Grayson 1993). In southern California, many of the vegetation communities found at high elevations today were found at lower elevations then. Wood rat middens from the Mojave Desert indicate that the area was covered by a coniferous forest characterized by juniper and sage by 15,000 BP (Spaulding 1983, 1990). As the Pleistocene came to a close by about 10,000 BP, the warming trend continued and upward migration of

vegetation communities occurred, firmly establishing desert sage scrub communities and coastal chaparral from 10,000 to 8,000 BP. Ocean core sediment analysis of oxygen isotopes and pollen indicate much cooler ocean surface temperatures. Coupled with rising sea levels at a rate of about one meter per century through close of the Pleistocene (Inman 1983), the early Holocene was set to be much more moderate in climatic stability than the Pleistocene.

These environmental changes have been often cited as a key agent in cultural adaptation. A very unique technology defined by fluted projectile points and a highly formal lithic tool kit with almost no processing equipment is recognized as the earliest evidence of human adaptation to North America. Widely known as "Clovis," regional manifestations of this toolkit show important variability both in projectile point styles and tool kit composition. In western North America, fluted points and related items are most often found near or along pluvial lakeshores, leading to the definition of the Western Pluvial Lakes Tradition (WPLT, Bedwell 1973). The WPLT holds as its primary tenet that human adaptive strategies in the terminal Pleistocene were evolved to exploit the rich flora and fauna located along pluvial shorelines. Emma Lou Davis' (1978) work at China Lake near the Coso Range is one of the more well-known examples of a pluvial association with fluted points. Indeed, there is good evidence that Pleistocene megafauna persisted alongside modern fauna and tended to cluster around pluvial lakeshores (Grayson 1993). However, recent research questions the reality of the WPLT through discoveries of Paleoindian toolkits, including fluted points in areas far removed from pluvial lakeshores (Basgall et al. 2002). Moreover, the variability in terminal Pleistocene tool kits is just beginning to be understood as various kinds of stemmed projectile points are being reliably assigned to pre-10,000 BP contexts, such as Great Basined Stemmed and Lake Mojave projectile point forms (Basgall et al. 2002; Basgall 2000; Warren 2004).

Whether or not terminal Pleistocene humans focused on hunting large animals or not is also debated. Most hold Clovis and other fluted point-dominated assemblages as a highly specialized large animal hunting complex, but others interpret these technological complexes as generalized, allowing for rapid movement across large areas with flexibility (i.e., Kelly and Todd 1988). Resolution to this issue has yet to come, but strong evidence suggests on either side with direct evidence of megafauna procurement using fluted and other stemmed points (see Meltzer 1993), as well as direct evidence of stemmed projectile points for cutting and grinding, indicating a more generalized intent of use (see Basgall 1993). The truth probably rests in regional variation where localized climatic and environmental patterns affect the resources humans exploit and as a result, their response to changes in the availability of those.

Further complicating the picture is the realization that vegetal processing technology was being intensively used prior to 10,000 BP. The discovery in La Jolla of a robust assemblage of millingstones, handstones, and battered implements, with virtually no formal flaked lithic items associated with dozens of human burials and radiocarbon dates in excess of 10,000 BP indicates at the very least that socioeconomic adaptation was occurring rapidly among California hunter-gatherers during the terminal Pleistocene (Hale 2010a; see also Ike et al. 1979). Assemblages of this nature are often attributed to the Milling Stone pattern that has been interpreted as a response to punctuated middle Holocene aridity (see middle Holocene discussion, below).

Regardless, discoveries of artifacts, such as fluted points that are exclusive to terminal Pleistocene cultural adaptations associated with pre-10,000 BP radiocarbon dates indicates that humans reached the coastal margins of western North America during this period (see Erlandson 1988, 1991; Erlandson et al. 2008; Fitzgerald and Jones 2000; Rogers 1938; Warren 1968).

Initial efforts to parse out archaeological components somewhat arbitrarily ascribed the "Early Man" phase to southern California (Wallace 1955). Wallace's Early Man phase (10,000 – 6000 B.C. (12,000 – 8000 BP) was allocated to the terminal Pleistocene and early Holocene, but without the benefit of radiocarbon dates. The Early Man phase was ill-defined and based off of Rogers (1938) work with San Dieguito collections—a hunting-related toolkit defined at the Harris Site containing stemmed projectile points similar to Lake Mojave points located in desert regions to the north. Other fluted point discoveries to the north near Pleistocene Lake Tulare certainly biased Wallace's (1955) efforts to define an early phase of human occupation, especially since his primary region of study (Los Angeles and Ventura Counties) was nestled in between San Dieguito and Lake Tulare archaeological discoveries.

Regardless of early efforts to define a terminal Pleistocene cultural chronology, the upper Santa Clarita River Valley has yielded no evidence of terminal Pleistocene human occupation. Earliest radiocarbon dates extend only into the middle Holocene, and these are also rare. Given the early timeframe, that preservation of organic materials dramatically decreases with time, and that the accretional and degredational depositional context of the upper Santa Clarita River Valley has obscured or wiped out any such evidence, it is unlikely that a terminal Pleistocene component will ever be identified there.

Early Holocene (10,000 – 7500 BP)

Human occupation of southern California during the early Holocene period (10,000 – 7500 BP) is better understood than the terminal Pleistocene, although archaeological evidence for early Holocene human occupation still tends to be regionally clustered. Early Holocene environments continued the warming and drying trend initiated during the terminal Pleistocene, but most of the major pluvial lake systems were fully desiccated, with periodic recharge of some basins provided by seasonal precipitation rather than melting glaciers (Basgall 1993; Waters 1991). Most studies converge on the idea that the early Holocene was noticeably more arid since desert vegetation communities appear strongly established in composition and distribution by 9000 BP (Spaulding and Graumlich 1986; Van Devender et al. 1987). All megafauna (i.e., elephants, camelids, sloths, etc.) were all but gone by 10,000 BP, however with modern fauna attaining their modern vegetation associations by this time.

Most cultural chronologies have their roots in the early Holocene, save for the WPLT, San Dieguito, and other stemmed and fluted point traditions noted earlier. David Banks (D.B.) Rogers (1929) was the first to propose a cultural chronology, though his age estimates suffered from the lack of absolute dating techniques and data at the time. D.B. Rogers (1929) proposed Oak Grove as the earliest robust cultural tradition beginning just after the Pleistocene and early Holocene transition at around 10,000 BP. Later

known as the Milling Stone Horizon (Wallace 1955), or Encinitas Tradition (Warren 1968), Oak Grove was recognizable by the large amounts of processing equipment dominated by basined millingstones and handstones, along with a general lack of formal flakedstone hunting tools. Wallace (1955) built on D.B. Roger's work, with Oak Grove representing the Milling Stone Horizon, but the interpretation was the same: an economy dominated by vegetal processing and a general lack of hunting. Warren (1968) sought to clarify regional variability during the early Holocene and proposed the Encinitas Tradition, comprised of various local manifestations of the Milling Stone Horizon assemblages that had locally specific environmental agents driving the development of the processing economies. Warren, however significantly added to the discourse by better defining the San Dieguito complex as preceding the Milling Stone pattern and being comprised of stemmed projectile points and bifacial knives, with few processing tools (see Warren 2004). San Dieguito appeared to be a coastal southern California manifestation of what is known as Lake Mojave in the northern high deserts.

Coastal evidence for early Holocene human occupation is increasingly common, mostly in the form of pre – 7500 BP radiocarbon dates (Byrd 1997; Curtis 1965; Erlandson 1988, 1991, 1997; Erlandson et al. 1993, 2008; Gallegos and Kyle 1998; Glassow et al. 2007; Hale 2009, 2010a, 2010b; Hale and Becker 2006; Kaldenberg 1982; Levulett et al. 2002; Salls 1991; True 1980). Since the definition of the Milling Stone pattern by Wallace (1955) and Warren (1968), extensive archaeological work in regulatory settings has generated a robust database of radiocarbon dated sites resulting in a clear picture that the Milling Stone pattern is firmly rooted in the early Holocene, by as much as 10,000 BP (see Hale 2010a). In fact, early Holocene radiocarbon dates have come to be expected in certain depositional contexts along the southern California coast because of their commonality and the consistency of the associated archaeological deposit (Hale 2009). Early Holocene dates along the coastal plain of southern California and interior ranges are currently considered part of the "Archaic" pattern; an umbrella term synonymous with Milling Stone.

Desert regions to the north and interior Peninsular Ranges (and intervening valleys) to the east also have relatively robust early Holocene records. To the east, the early Holocene continues to align with the Archaic or Milling Stone pattern (see Hale 2009; Hale and Comeau 2009; Sutton 2011). In the Mojave Desert, traditional early Holocene chronologies are being revised. The Lake Mojave (11,000 – 7500 BP) complex still appears to be the oldest stemmed point tradition that followed fluted point toolkits. Lake Mojave assemblages are characterized by weak shouldered stemmed projectile points and large amounts of formed flake tools with lesser amounts of expedient flaked tools and groundstone. However, recent evidence is pushing back dates for the Pinto complex to as much as 8000 BP, presenting an overlap problem with Lake Mojave (Basgall 2000; Sutton et al. 2007). The significance here is that Pinto sites are dominated by large amounts of ground and battered stone with relatively small amounts of formed flakedstone tools (Basgall and Hall 1993, 1994; Campbell and Campbell 1935; Giambastiani and Basgall 1999; Hall 1992; Schroth 1994; Warren 1968, 1980); Pinto is the first robust processing economy that appears in California deserts and is similar in many respects to the Milling Stone pattern of southern California, though not as old as Milling Stone. The similarities with the Milling Stone pattern include

settlement that was characterized by serial occupation of specific sites producing robust assemblages through tool reuse (Hale 2001).

The early Holocene is not represented in Santa Clarita Valley by direct archaeological evidence, despite being known in adjacent desert and coastal regions. No doubt prehistoric populations took advantage of the natural travel corridors linking interior areas to the coast and southern coastal plain. However, as with archaeological deposits of later periods, damaging erosion and flooding have either destroyed or obscured any such deposits that may have existed. Attempts to locate buried deposits using hollow stem augers (i.e., core samples) in other parts of southern California, such as the Las Flores watershed (Hale and Becker 2006) or Otay River floodplain (Cook and Andrews 2003; Comeau et al. 2014) focused on floodplains with a gradual sedimentation sequence and less frequent and less destructive erosional events. It is no surprise, then that intact archaeological deposits dating to the early Holocene (and later) were identified in those areas. The same is not true for the Santa Clarita River floodplain and surrounding geologic landscape that has seen frequent intervals of violent flooding that eroded any riverbed or nearby terrace deposits.

Middle Holocene (7500-4000 BP)

The middle Holocene (7500-4000 BP) witnessed a continuation of archaeological patterns defined in the early Holocene. However, the middle Holocene was marked by periods of extreme aridity collectively termed the Altithermal by Ernst Antevs (1953). After much research since Antevs' (1953) original work the Altithermal is better understood as having variable effects at a subregional scale. Southern California was already characterized as an arid landscape by the inception of the middle Holocene, thus notable changes include adjustments in the elevation and density of existing vegetation communities and related fauna (Mehringer 1967; Spaulding 1985, 1990; Wells 1983). To be sure, humans respond to changes in the resources they exploit and it is plausible that plants and animals that were the focus of subsistence either decreased in abundance or congregated in more favorable areas. Warren (1968) postulates as much, suggesting that the Encinitas Tradition (i.e., Milling Stone pattern) was adapted in the coastal plain to the margins of lagoons that were magnet locations for vegetation and fauna, and as a result, human occupation.

Whatever the regional environmental differences were, it was clear that humans have been present in southern California throughout the middle Holocene with widespread evidence of humans hunkering down and increasing vegetal processing intensity, rather than depopulating whole areas. In fact, the origin of Milling Stone pattern itself was thought to be a response to Altithermal conditions (Wallace 1955; see Hale 2001, Erlandson 1997). The early Holocene appearance of Milling Stone adaptations, however, runs counter to this explanation, suggesting instead that Milling Stone economies were the first socioeconomic adaptation to stable California environments after the waning of terminal Pleistocene transitions (Hale 2010a, 2011). Regardless, processing economies were apparently well-suited to the arid middle Holocene conditions, based on the ubiquity of Milling Stone assemblages.

Regional cultural histories adjacent to the upper Santa Clarita River Valley continue in the same

nomenclature. In the deserts to the north, the Pinto period reigns until at least the end of the middle Holocene (4000 BP); although, Gypsum period assemblages characterized by contracting stem dart points, larger numbers of small flake tools, and some mortar/pestle technology have pushed their 4000 BP inception date to some degree (Hale 2011). Southern coastal regions such as San Diego County and parts of Orange and Los Angeles Counties also retain Milling Stone assemblage dominance, including at the Tank Sites (CA-LAN-1 and -2) in Topanga Canyon that date as late as 2000 BP (see Hale 2001). The middle Holocene is one of the best represented periods in San Diego County and keeping with the Milling Stone or Archiac pattern (Masters and Gallegos 1997; see Hale 2009 for assemblage summaries).

Real socioeconomic change during the middle Holocene appears first in the Santa Barbara Channel with the abrupt appearance of bowl mortars by at least 5500 BP at sites such as CA-SBA-53, CA-SBA-54, CA-SBA-75, and CA-SBA-84 to name a few (Hale 2009; see also Erlandson et al. 2008, Harrison and Harrison 1966; Levulett et al. 2002). Mortars are costly to manufacture (mortar surfaces are manufactured, rather than mostly accruing depth through use), and thus their manufacture in noticeable quantities necessarily signals a shift to a more intensive processing economy (Hale 2010b). It is thought that mortars in the Santa Barbara Channel were used to intensively process nuts such as acorn and buckberry that have substantial nutritional value when processed in mass quantities (Bettinger et al. 1997; Bettinger and Tushingham 2013). Moreover, the complex ecology of acorn masting requires storage for it to be an efficient economic pursuit of humans (Hale 2009; 2010a). The attendant social shifts that must occur to make an acorn economy economically viable are no less complex, requiring defense of territories containing acorn producing oaks and storage facilities; concepts not altogether welcoming to hunter-gatherer societies that have evolved social institutions precisely to cull such behavior (Bettinger 1999).

Other refinements to culture historical frameworks are based on King's (1981) chronology of burial patterns and related artifacts. Minor refinements to King's chronology occur when assemblage data warrant as much, but substantial numbers of *Olivella sp.* shell beads present in burial populations of the last 3000 years in King's study laid a strong chronological foundation for determining the kinds of socioeconomic patterns that developed during the late Holocene, discussed below.

Overall, the middle Holocene in southern California is primarily defined by processing economies of the Milling Stone pattern, which is undeniably the most robust and visible archaeological pattern found in California (Hale 2001, 2009; Fitzgerald and Jones 2000). Archaeologists continued until the turn of the century to be captivated by the Milling Stone pattern, resulting in numerous graduate theses and dissertations, monographs, and articles that focused on analyzing regional variability. That is, research focused on understanding how the Milling Stone pattern varied from place to place. Perhaps the most exhaustive review of the Milling Stone pattern was completed by Basgall and True (1985) for a Caltrans project along the Interstate 15 corridor. Basgall and True (1985) investigated archaeological sites belonging to the Sayles Complex—an inland, Transverse Ranges manifestation of the Milling Stone pattern. They reviewed most of the significant contributions to the Milling Stone pattern concept as of 1985 and provide an analytical framework for investigating and interpreting archaeological deposits of this kind. Since then,

certain early contributions to the topic (i.e., Warren 1968) have been more supported than refuted (see Hale 2001).

Locally, the upper Santa Clarita River Valley certainly has evidence of Milling Stone occupations, but these are confined to the late Holocene period, after 4000 BP, including the work by Waugh (1999) at CA-LAN-2233 and CA-LAN-2235. The Milling Stone component there is dated by proxy with a small number of obsidian hydration readings. Its presence in the upper Santa Clarita River Valley is not surprising; sites of this nature are visible precisely because they were repeatedly occupied on a seasonal basis for a similar processing purpose, resulting aggregations of reused grinding and processing tools

Late Holocene (post – 4000 BP)

The late Holocene (post – 4000 BP) is characterized by increased variation in environmental conditions and archaeological assemblages. Part of this variability is due to better resolution in both records, but much of it represents an accurate sample of prehistoric times over the last 4000 years. A summary of the various regionally specific paleoenvironmental conditions will not be provided in this brief overview. However, some patterns warrant discussion. With the dissipation of Altithermal conditions after about 4000 BP, increased precipitation is generally evident for southern California. In desert regions, spring flows markedly increased along with the stabilization of marshes, and some lake basins retained shallow waters from runoff (Batchelder 1970; Hunt and Mabey 1966; La Marche 1973; Mehringer 1987; Mehringer and Sheppard 1978; Mehringer and Warren 1976; Smith 1979; Stine 1990, 1994, 1995; Weide 1982). In coastal southern California, lagoons stabilized and destructive erosional processes that gutted them stopped after about 3000 BP (see Byrd and Reddy 2003; Erlandson and Rick 2002). Pollen and oxygen isotope studies from ocean and estuary cores sometimes present conflicting information, but all generally point to climatic instability during the last 3000 years, with a few pronounced periods of extreme climate, such as the Medeival Climatic Anomaly (MCA) from approximately 800 – 1200 BP (see Munns and Arnold 2003).

Erlandson suggests that southern California Mediterranean climates were more characterized by instability and fluctuations in resource availability than by sustained abundance (Erlandson 2003). It is a fact that southern California hunter-gatherer populations grew overtime. Coupled with instability in climate and resource availability, dense aggregations of hunter-gatherers would certainly elicit a socioeconomic response—this seems to be borne out in the archaeological record, at least in coastal regions.

Along the Northern California Bight (Santa Barbara and Ventura coastal plain), archaeological assemblages are referred to as Canaliño (D.B. Rogers 1929), or Late Prehistoric (Wallace 1955), while King's (1990) cultural chronology separates the last 2600 years into various divisions of the Middle Period (950-2600 BP [2600 B.C. – A.D. 1150]) and Late Period (post 950 BP [A.D. 1150]). The Southern California Bight (roughly, Orange and San Diego Counties) is characterized uniformly as the Late Prehistoric in most areas, although Gabrielino territory (parts of Orange County and Los Angeles County) tend to mimic the Northern California Bight chronology. Notably, the Southern California Bight witnesses a wholesale

continuation of the Milling Stone pattern into the late Holocene, changing little in assemblage composition excepting the addition of the bow and arrow and ceramics (Hale 2009, 2010a). Significant socioeconomic shifts occur just prior to Spanish contact at approximately 450 – 650 BP with an acorn economy starting to emerge (Hale 2009, 2010a).

Santa Barbara, Ventura, and parts of coastal Los Angeles exhibit significant changes in archaeological assemblages. Mortars and pestles are firmly established in the late Holocene by 3500 BP. This is followed by the appearance of the single piece fishhook by approximately 2900 BP, the plank canoe at approximately 1600 BP, bow and arrow (1500 BP), circular fishhook (700 BP), and microlithic tools (700 BP) (Arnold 1992; 1997; Gamble 2002; Glassow 1996; Kennett 2005; C. King 1990; Rick et al. 2002; Strudwick 1985). These technological innovations are successively accompanied by related increases in the formality of other kinds of subsistence tools already present in tool kits (Hale 2010a). *Olivella sp.* bead manufacturing is present throughout the late Holocene but becomes a robust industry in the last thousand years. Other items characteristic of late Holocene coastal regions includes steatite cooking vessels and containers, perforated stones, arrow shaft straighteners made of steatite, a variety of bone tools, and personal ornaments made from shell, bone, and stone. There is also an increased use of asphaltum for waterproofing and as an adhesive.

Many late Holocene coastal sites contain complex objects of art and decoration. Ornaments include drilled whole venus clam (*Chione spp.*) and drilled abalone (*Haliotis spp.*). Steatite effigies become more common, with scallop (*Pecten spp. and Argopecten spp.*) shell rattles common in middens. Mortuary customs are elaborate and include cremation and interment with abundant grave goods.

In Warren's (1968) cultural ecological scheme, the period between A.D. 500 and European contact is divided into three regional patterns. The Chumash Tradition is present mainly in the region of Santa Barbara and Ventura counties; the Takic or Numic Tradition is present in the Los Angeles, Orange, and western Riverside counties region; and the Yuman Tradition is present in the San Diego region. The seemingly abrupt changes in material culture, burial practices, and subsistence focus at the beginning of the Late Prehistoric period was taken to be the result of a migration to the coast of peoples from inland desert regions to the east. In addition to the small triangular and triangular side-notched points similar to those found in the desert regions in the Great Basin and Lower Colorado River, Colorado River pottery and the introduction of cremation in the archaeological record are diagnostic of the Yuman Tradition in the San Diego region.

In Los Angeles, Orange, and western Riverside counties, similar changes (introduction of cremation, pottery, and small triangular arrow points) are thought to be the result of a Takic migration to the coast from inland desert regions. This Takic or Numic Tradition was formerly referred to as the "Shoshonean wedge" or "Shoshonean intrusion" (Warren 1968). This terminology used originally to describe a Uto-Aztecan language group, is generally no longer used to avoid confusion with ethnohistoric and modern Shoshonean groups who spoke Numic languages (Heizer 1978:5; Shipley 1978:88, 90).

The growing body of archaeological literature, however, either contradicts the notion of a population migration, or indicates that when they arrived, they adopted local socioeconomic practices (Hale 2009). The longstanding archaeological patterns in the San Diego region are evidence of this. To the north, the similarity of archaeological assemblages and ethnic customs between the Los Angeles region and the Ventura and Santa Barbara regions is interesting, considering the two areas have distinct linguistic profiles. This disparity highlights the problem of considering any artifact type as an ethnic marker, which is not considered good scientific practice because it cannot be supported in the material record. Behavioral norms are the best ethnic marker, but tying behaviors to specific artifact types or patterns, as archaeologists do, measures only similarity in socioeconomic adaptation, which can exist between groups that share no ethnicity. Because of this, the archaeological record is generally the wrong context to measure ethnic association. Rather, among all ethnographic and ethnohistoric studies in California, language is the best discriminator of ethnic identity. Dialectical differences are better indicators of ethnicity when ethnographic information is the only representation of past populations, even though true ethnic markers are embodied in behavioral norms (see McElreath et al. 2003).

Items manufactured in coastal locales, such as shell ornaments and steatite vessels commonly made their way to the interior of California, being found in archeological deposits in the Transverse Ranges and Mojave Desert (e.g., Basgall and Hall 1994; Schroth 1994; Sutton 1980). Likewise, obsidian from the Coso volcanic field near Ridgecrest, California made its way to coastal environments. Whether these artifacts were carried to their location of deposition in the hands of those who made them or whether they were procured through trade is a question specific to each occurrence, ruling out various explanations in favor the most plausible scenario. Regardless, ethnographic and ethnohistoric accounts indicate that transregional trade and exchange was common and did not equate to similarity in ethnic identity since exchanges traversed traditional cultural boundaries (see Heizer 1978). For this reason alone, none of the artifacts common to southern California archaeological assemblages can be considered ethnic markers. This is especially true for ornaments, such as shell beads that may have been used as form of currency (Arnold 1991, 1997), or the bow and arrow that is widely considered one of the most significant technological innovations of the prehistoric world and that spread rapidly across the globe through adoption (Bettinger 1991).

The archaeological record in the Santa Clarita Valley is best represented by late Holocene assemblages. CA-LAN-2235 (Chiquito Creek I) and -2233 (Chiquito Creek II) are sites with a relatively typical Milling Stone period deposit with no surprising attributes relatively to the norm for this pattern (Waugh 1999; Whitley and Simon 1994a). The Milling Stone component at CA-LAN-2235 dates to approximately 4000 – 3000 BP, predating the cemetery component at CA-LAN-2233 that is bracketed between 2000 and 1630 BP. The latter contains artifacts characteristic of the late Holocene in general, fitting within Wallace's (1955) Late Prehistoric period, including mortars and pestles, time-sensitive shell beads, and the like (Waugh 1999). However, Waugh (1999) concludes that adaptive strategy represented by the Late Prehistoric component is similar to that of the earlier Milling Stone component, despite differences in milling

technology. An interesting conclusion by Waugh (1999) is that mitochondrial DNA analysis of burials indicates no physical relationship to Chumash peoples to the west, but strong ties to Tataviam and other Takic peoples located to the east and northeast in desert landscapes.

Also in the upper Santa Clarita River Valley, Whitley and Simon (W&S) (1994a, 1994b) documented several other sites that generally lack substantial assemblages, but can be characterized as Late Prehistoric temporary encampments generally postdating 3000 BP. Aside from their work at CA-LAN-2233 and LAN-2235, W&S (1994a, 1994b) evaluated several other small sites but failed to identify significant archaeological deposits.

W&S (2009) evaluated CA-LAN-4355 along Santa Clarita River in Sand Canyon, California, finding artifacts consistent with prehistoric habitation dating to the Late Prehistoric era (though no radiocarbon dates were provided). These artifacts included mortars and pestles, projectile points, flaked stone tools, steatite ornaments, bone tools, and various cobble based tools. W&S interpreted this site as dating between 400 and 800 BP, based on time sensitive artifacts. CA-LAN-1077, also located in Sand Canyon, was evaluated by Robinson (1980) who had findings similar to those of W&S (2009). CA-LAN-1077 had a weakly developed midden deposit with excavations producing four steatite beads/pendants, three cores, two retouched flakes, one hammerstone, five handstones, two battered cobbles, and fire-affected rock; no chronological placement was offered (Robinson 1980). None of the artifacts from CA-LAN-1077 or CA-LAN-4355 are specific to coastal locales; all types of artifacts recovered can be found in coastal, riparian, or desert environments.

One of the more well-known archaeological sites in the Santa Clarita River Valley dating to the late Holocene is CA-LAN-324. Loetzerich (1998) analyzed the collection from this massive site that contained human remains, residential features, thermal features, one flower pot mortar, mortars and pestles, millingstones and handstones, flakedstone tools (including bifaces), cobble tools, and several exotic items such as quartz crystals, and schist and other stone beads. The site was interpreted as representing aboriginal occupation continuously from 2600 BP to 400 Bp, based on various time-sensitive artifacts (including the flower pot mortar which tend to date to the last 300 years), and that it reflected a well-stratified aboriginal society similar to those seen in Gabrielino territory. The latter is consistent with Loetzerich's findings that burial patterns were similar to those seen in the San Fernando Valley.

A few archaeological sites near Vaszquez Rocks in the Sand Canyon area to the northeast of Santa Clarita Valley, such as CA-LAN-618 produced *Olivella sp.* beads that were tentatively thought to date prior to Chester King's (1990) Early Period have subsequently been found to date after 4000 BP (W&S 1994b). Additionally, Love and Witt (1990) revisited these sites concluding that their earliest documented occupation occurred no earlier than about 2700 BP. In her review, Waugh (1999) reviews the chronological evidence from this site according to the coastally derived cultural chronology developed by King (1990). The reference to King's (1990) bead chronology is justified in the sense that it is a baseline for review of shell bead types but it leaves the impression that the occupants were socioculturally connected to coastal

areas, while the non-ornamental archaeological assemblage provides no such justification.

Farther to the north in Antelope Valley, Sutton (1980) studied CA-LAN-488—a substantial prehistoric site dating from 2200 – 300 BP and containing a prehistoric cemetery, including a child burial associated with more than 5,000 shell beads. The archaeological assemblage from this site, dating within the late Holocene was decidedly desert focused, despite this strong shell bead component.

Finally, investigations of the Lovejoy Springs site (CA-LAN-192) summarized nearly a century of investigation at a large, desert site near Lake Los Angeles in the Antelope Valley (Price et al. 2009). The assemblage from CA-LAN-192, dating from approximately 3500 BP to historic times is characteristic of those found in the western Mojave Desert, being dominated almost exclusively by millingstone and handstone technology and the appropriate time-sensitive, desert projectile point forms. A few fragments of mortars and pestles (one decorated), and steatite vessels are present. Similar to CA-LAN-488, thousands of *Olivella sp.* shell beads were found interred with several of the nine human burials and in the general deposit (Price et al. 2009). Together, the site spans the Gypsum (4000 – 1500 BP), Saratoga Springs (1500 – 900 BP) and the Late Prehistoric periods (post – 900 BP), and exhibits many of the assemblage changes characteristic of each time period within the Mojave Desert.

In sum, the late Holocene saw major socioeconomic development among aboriginal populations within and surrounding Santa Clarita Valley, but that each region is distinct, from the Mojave to the northeast, to the west along the Coast, to the south in the Los Angeles Basin and San Diego County. The archaeological record within Santa Clarita Valley is meager compared to these other regions and resists efforts to make socioeconomic connects to neighboring regions or their inhabitants. Simple assemblage similarities, such as the presence of coastal beads or burial patterns in Santa Clarita or the Mojave, are not direct evidence of cultural affiliation. If it were, burials located in some of the Mojave Desert sites, such as CA-LAN-488 or CA-LAN-192 would require the assumption that they were Chumash in origin, which is the least likely explanation and one that few archaeologists (if any) would suggest. Rather, it is likely that trade and exchange networks between different ethnic groups were well established with the onset of the late Holocene by at least 3000 years ago (Price et al. 2009). Such networks allowed for the exchange of goods, such as beads, across ethnic boundaries without carrying implications for population movement or replacement.

Overall, the archaeological record of the upper Santa Clarita River Valley is poorly understood, especially in comparison to neighboring regions. This is likely a function of the complex geomorphology of the Santa Clarita River watershed reviewed earlier in this report. The areas that would have attracted prehistoric human occupation, such as river terraces and flat ground in valley bottoms, were subject to periodic and destructive flooding and sedimentation, which likely wiped out a large portion of the archaeological record. The San Francisquito Dam failure of 1927 probably exacted a heavy toll on the archaeological landscape of the floodplain since that event undoubtedly trumped previous natural flood events with its near 60-foot high wall of water instantly released into the Santa Clarita River Floodplain.

4.2 Ethnohistory

Tataviam

The Project area falls within the ethnographic boundary of the Tataviam (Johnson and Earle 1990; King and Blackburn 1978; Kroeber 1925). Tataviam territories included the upper reaches of the Santa Clara River drainage east of Piru Creek, but also encompassed the Sawmill Mountains to the north and the southwestern portion of the Antelope Valley (King and Blackburn 1978). Tataviam territory is bound by various branches of Chumash to the north and west (including the Ventureño to the west, and Castac and Emigdiano to the northwest), Kitanemuk to the northeast, Serrano to the east, and Gabrielino to the south (King and Blackburn 1978).

Note that there is limited ethnographic data (i.e., data acquired by means of observation or taken from persons who practiced native lifeways) available concerning the Tataviam and their native lifeways. Most of what is known today about the Tataviam comes in the form of ethnohistory (i.e., historical accounts developed through examination of historical records and oral histories) as presented in the works of anthropologists Alfred L. Kroeber (1915, 1925) and John P. Harrington (1935). Their data is largely based on interviews conducted in the early 1900s with a Native American consultant named Juan José Fustero, a man who spoke Kitanemuk and claimed that his grandparents were born near the town of Newhall and spoke a language that is no longer extant (Bright 1975). Most of the subsequent works published on the Tatatviam (Bright 1975; Hudson 1982; King and Blackburn 1978), including discussions of their cultural and geographic affiliations, were based on the Kroeber and Harrington interviews with Fustero and several other Kitanemuk consultants. Other studies have analyzed Spanish mission baptismal, marriage, and burial registers in an attempt to better understand the distribution of historic village settlements and kinship ties between settlements (Johnson 1978 and 1997; NEA and King 2004).

Early ethnologies referred to the Tataviam as Ataplili'ish (Kroeber 1915), but Kroeber found this name to be too general since it had already been used to describe other indigenous groups (namely the Gabrielino). Kroeber changed the term to Alliklik (1925), which was noted to be a Ventureño Chumash name for the group (although it is believed to be a derogatory term for the sound of the language) but offered almost no information concerning their native lifeways. One account of the Tatavium, provides a narrative that they held the river up from a point between Sespe and Piru, most of Piru Creek, Castac Creek, and probably Pastoria Creek across the mountains in the San Joaquin Valley drainage and adjacent to the Yokuts (Kroeber 1925:613-614).

The Tataviam are linguistically classified as an Uto-Aztecan Serran sub-branch of Takic speaking groups consisting of Kitanemuk, Serrano (including Vanyume), and Tataviam (Golla 2011; Sutton 1980). William Bright has suggested that Tataviam was actually a separate language with Takic affinities, or perhaps a "remnant, influenced by Takic, of a language family otherwise unknown in southern California" (Bright 1975:230). However, the current and most widely accepted view is that Tataviam is in fact a Takic language

(King and Blackburn 1978; Johnson and Earle 1990; Sutton et al. 2007).

King and Blackburn (1978:536) noted several Tataviam settlements based on information provided by Harrington and other sources, including mission registers. Among these is the putative village of *tsawayung* (also referred to as *Chaguayabit*, *Chaguayanga*, *takuyama'm*), which some believe was located near Castaic Junction at the site of Rancho San Francisco. However, there is a lack of consensus as to the village's exact location. Harrington's own notes reflect this uncertainty: "Jose Juan Olivas thinks it is over by San Francisquito [Rancho San Francisco] but does not know and never did know just where" (NEA and King 2004:119). Based on diary entries from the Portolá Expedition (Perkins 1957), some have hypothesized that Estancia San Francisco de Xavier (often incorrectly referred to as an asistencia) was placed at the location of the village of *tsawayang*, but this is based on descriptive diary entries and has never been confirmed by archaeological or other historic evidence. In fact, no physical evidence of the village has ever been found. Other Tataviam villages mapped outside of the proposed Project area include *tikatsing* located on upper Castaic Creek, and *pi'ing* located where Castaic Creek meets Elizabeth Lake Canyon. The village of *Tochonaga*, was recorded on an 1843 land grant map. This site appears to be located to the southeast of Newhall, but it's precise location has also never been confirmed: "Tochononga was located in the mountains northwest of San Fernando…over by Los Alamos somewhere here in the Tejon Ranch" (NEA and King 2004:117). Other villages and seasonal camp sites identified by Harrington include *akure'eng*, which was located at the original Newhall town site; *apatsitsing*, located on upper Castaic Creek; and *naqava'atang*, located east of Townsend Peak. Piru Creek also contained several village and rancheria sites, located on the northern edge of Tataviam territory (Johnson and Earle 1990).

Pedro Fage's account of the 1769 Portola expedition indicates that the first Chumash settlement encountered upon leaving Tataviam territory was located west of the mouth of Piru Creek. The village of *kamulus* (*Camulos*), located east of Piru Canyon, bears a Chumash name (Johnson and Earle 1990), leading to speculation that this village consisted of a mixed Chumash-Tataviam population. There has been much discussion regarding Chumash ties to areas generally accepted as Tataviam territory (see Beeler and Klar 1977).

More recent studies have examined additional Tataviam investigations conducted by Harrington with neighboring groups (Johnson and Earle 1990). These studies support the original Kroeber and Harrington findings that the Tataviam were a distinct group:

> The correspondence between (1) ancestral villages traced using genealogical evidence and (2) independently elicited information regarding Tataviam territoriality builds confidence in the reliability of the ethnographic record compiled by Kroeber and Harrington. The distinctiveness of the Tataviam as an ethnic entity, separate from the Kitanemuk and Fernandeño, is supported by our research (Johnson and Earle 1990:209).

In 1996, as the result of a Caltrans District 7 highway widening project for SR-126, archaeologists discovered and excavated 45 burials from CA-LAN-2233, a prehistoric village site dating from

approximately 2000 to 1640 years before present (BP) and located within Tataviam territory. Examination of mitochondrial DNA (mtDNA) from five burials at CA-LAN-2233 found that these individuals were genetically linked to modern Uto-Aztecan speaking groups, such as the Tataviam (Miller et al. 2003).

4.3 Historic Setting

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1848), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

Spanish Period (1769–1821)

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrillo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrillo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabrillo and Vizcaíno (Bancroft 1885; Gumprecht 1999).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

The Portolá expedition first reached the present-day boundaries of Los Angeles in August 1769, thereby becoming the first Europeans to visit the area. Father Crespi named "the campsite by the river Nuestra Señora la Reina de los Angeles de la Porciúncula" or "Our Lady the Queen of the Angeles of the Porciúncula." Two years later, Friar Junípero Serra returned to the valley to establish a Catholic mission,

the Mission San Gabriel Arcángel, on September 8, 1771 (Kyle 2002). Mission San Fernando Rey de España, the mission that served the proposed Project area, was established nearly 30 years later on September 8, 1797.

Mexican Period (1821–1846)

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. Nine ranchos were granted between 1837 and 1846 in the future Orange County (Middlebrook 2005). Among the first ranchos deeded within the future Orange County were Manuel Nieto's Rancho Las Bolsas (partially in future Los Angeles County), granted by Spanish Governor Pedro Fages in 1784, and the Rancho Santiago de Santa Ana, granted by Governor José Joaquín Arrillaga to José Antonio Yorba and Juan Pablo Peralta in 1810 (Hallan-Gibson 1986). The secularization of the missions (enacted 1833) following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos.

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

American Period (1846–Present)

War in 1846 between Mexico and the United States precipitated the Battle of Chino, a clash between resident Californios and Americans in the San Bernardino area. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period.

California officially became a state with the Compromise of 1850, which also designated Utah and New

Mexico (with present-day Arizona) as U.S. Territories (Waugh 2003). Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through 1850s. The Gold Rush began in 1848, and with the influx of people seeking gold, cattle were no longer desired mainly for their hides but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains when available. The cattle boom ended for southern California as neighboring states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 2005).

Local History of the Project Area

In 1795, Fr. Fermin Lasuen ordered a report to identify potential new mission sites. As a result, the Francisco Reyes Rancho was proposed as the site for the new Mission San Fernando Rey de España formally (Perkins 1957). The mission, founded in 1797, was ultimately located elsewhere; however, Mission San Fernando acquired the headwaters of the Santa Clara River east from Piru and named the land Rancho San Francisco. Shortly thereafter, many of the local Tataviam people were removed from their homeland and relocated to the mission where many of their traditional lifeways were no longer feasible.

When Mission padres were made aware that Francisco Avila, wealthy ranchero and alcalde (mayor) of the pueblo of Los Angeles (1810 – 1811), had claimed a large portion of Mission lands as his own, they protested to Governor José Arrillaga at Monterey. The governor acknowledged the church's title to the land, Avila's land grant was rescinded, and the padres quickly made plans to build in the area in order to more clearly establish their presence (Perkins 1957). The church built an outpost at the location using Native American labor, Rancho San Francisco, Fr. Crespi had first noted in his diary entry as a potential Mission site (Perkins 1957). Mission records suggest that this was an outpost known as Estancia San Francisco de Xavier and that it was likely never elevated to the status of "asistencia" or sub-mission.

By 1813, Rancho San Francisco had increased its production and the herds of cattle had grown larger eventually necessitating the need to construct a fence to keep mission cattle separate from neighboring cattle. The fence was erected at Piru Creek across the river, establishing a formal boundary between San Francisco and Triunfo ranches. Additionally, an irrigation canal was dug and a small dam was built at the eastern boundary of the rancho in order to provide the western side of the rancho with much needed water. (Perkins 1957).

Following secularization of the missions in 1833, the Mexican Government confiscated all mission land holdings and commissioned Lieutenant Antonio Del Valle to take over Mission San Fernando by inventory from the incumbent Padre, Fr. Ybarra. Along with his wife Doña Jacoba Felix and two children, Del Valle decided to settle his family on a portion of Rancho San Francisco. In 1838, Del Valle resigned his army

commission, petitioned the Mexican Government for title of Rancho San Francisco and became owner of 48,829 acres of Rancho San Francisco on January 22, 1839. Just two years later, Antonio Del Valle died, leaving behind thousands of heads of livestock, over 75 square miles of land, and no legal will. Legal battles ensued between his widow and his oldest son Ygnacio Del Valle. A judge eventually divided up the land amongst the parties and Ygnacio built his own corral on the western edge of the property (in present-day Piru, Ventura County) surrounding the former village of *kamulus* (Rasmussen 2001) for which the Camulos Rancho was named in 1853.

As a result of three year long drought, which killed most of his cattle, Del Valle eventually lost the rancho in 1865 to his financiers who then sold it to oil speculators. The first significant discovery of oil on the Rancho occurred just seven weeks after the sale and the first oil well was installed on the south side of the Santa Clara River near the Del Valle residence. The region would eventually be surrounded by oil fields including the Hasley Canyon and Castaic Junction Oil Fields to the north and the historic Pico Oil Field to the south.

The Del Valle's portion of Rancho San Francisco changed hands a few more times until it was acquired by Henry Mayo Newhall in 1875. The San Fernando Railroad Tunnel was constructed by over 1,000 Chinese and 500 white laborers, the Southern Pacific Railroad (SPRR) right-of-way was granted across the rancho and the town of "Newhall" was founded in 1876 (Perkins 1957). The Lang and Newhall Railroad Stations were built the same year. The town of Val Verde was founded by colonial Mexican settlers in an effort to take advantage of the gold strike in the late 1800s. The town was short lived and by the early 1900s, had all but disappeared.

In the mid-1920s, a group of black professionals led by insurance man, Norman Houston, and newspaper publisher, Charlotta Bass, began purchasing half-acre lots of a 30-acre tract named Eureka located in the rolling hills west of Castaic Junction between Hasley Canyon and the Santa Clara River. The weekend and summer resort town nicknamed the "Black Palm Springs" eventually became an independent township and retuned to name Val Verde in 1926 (Flamming 2005).

In the 1930s, the Works Progress Administration dedicated $39,000 for the development of an Olympic swimming pool within the community. Celebrated with a gala opening attended by black celebrities of the era, the pool remained intact until the 1994 Northridge earthquake (Flamming 2005). In addition to damaging the pool, the earthquake damaged the majority of the original structures built by the original residents of Eureka and Val Verde.

4.4 Previous Research

CHRIS Records Search

On February 19, 2020, Dudek conducted a search of the California Historical Resources Information System (CHRIS) at the South Central Coast Information Center (SCCIC), located on the campus of California State

University, Fullerton. The search included any previously recorded cultural resources and investigations within a 1-mile radius of the Project area. The CHRIS search also included a review of the NRHP, the CRHR, the California Points of Historical Interest list, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. Confidential Appendix A provides the records search results maps and a complete bibliography of all prior cultural resources studies occurring within 1-mile of the Project area.

Previously Recorded Cultural Resources

No previously recorded cultural resources were identified within the Project site nor within a 1-mile-radius of the Project site as a result of the CHRIS records search conducted at the SCCIC.

Previous Cultural Resources Studies

Results of the CHRIS search indicate that one (1) previously conducted study was identified within the 1-mile records search radius (see Table 2). The study does not overlap the proposed Project area.

Table 1. Cultural Resource Investigations Conducted within 1-Mile of the Project Area

Year	Author	CCIC ID	Report Title	Addresses Project Site
1980	Rechtman, Robert B.	LA-00895	A Preliminary Archaeological Resource Survey of the Garcia Ranch, Los Angeles County, California	No

Native American Heritage Commission Sacred Land Files Request

A search of the Native American Heritage Commission's (NAHC's) Sacred Land File, requested on February 19, 2020 and was conducted on March 30, 2020 by Steven Quinn, NAHC Staff Services Analyst, to determine the presence of any Native American cultural resources within the proposed Project site (see Appendix B). The NAHC results were negative for Native American heritage resources within the proposed Project site. The NAHC identified twelve (12) Native American individuals who would potentially have specific knowledge of the cultural resources identified within the Project site that could be at-risk. Dudek has made no attempt at contact with the individuals identified by the NAHC.

Historic Aerials and Maps

Dudek consulted historic Topographic maps and aerial photographs to better understand development of the Project site and surrounding properties. Topographic maps of the Project site exist for the years 1903, 1908, 1916, 1924, 1930, 1939, 1940, 1943, 1948, 1953, 1959, 1964, 1966, 1967, 1970, 1984, 1988, 1995, and 1999 (NETR 2020). Aerial photographs of the Project site exist for the years 1928, 1930, 1938, 1945, 1947, 1952,

1954, 1963, 1969, 1977, 1978, 1994, 2002, 2010, 2012, 2014, 2016 (Frame Finder, NETR 2020).

Historic Aerials:

- 1928 - historic aerial shows two possible small rectangular structures located where the current water tanks are located.
- 1930 and 1938 - It is difficult to determine in the 1930 historic aerial if the structures were present, due to the quality of the photo. However, the 1930 and 1938 historic aerials show vegetation in a small grid like pattern within the Project area.
- 1945 - historic aerial shows the Project area as modified; possibly graded, but not completely clear of vegetation.
- 1947 - historic aerial shows what appears to be a small rectangular structure present within the Project area. It is possible that structure was not visible on the 1945 historic aerial due to the quality of the photo.
- 1952 - historic aerial does not show vegetation in a grid like pattern.
- 1954 - historic aerial displays no change to the Project area since the 1952 historic aerial.
- 1959 - historic aerial shows something manmade, directly east of the location of the current water tanks. The angles on the object indicates that it was manmade, however due to the quality of the photo you cannot determine its exact nature.
- 1963 - historic aerial displays no change to the Project area since the 1959 historic aerial.
- 1969 - historic aerial does not show any structures within the Project area.
- 1977 - historic aerial shows the current water tanks and only vegetation within the Project area.
- 1978, 1994, 2002, 2010, 2012, 2014, and 2016 – historic aerials show no change to the Project area.

Topographic Maps

- 1953 Topographic map is the earliest map to show a structure present within the Project area. The structure was depicted as small and rectangular.
- 1959, 1966, 1970 and 1984 - topographic maps illustrate the structure as present within the proposed Project site.
- 1964 and 1967 topographic maps do not illustrate a structure within the proposed Project site.
- 1988 - topographic maps illustrating the current water tanks for the first time.

5.0 FIELD INVESTIGATIONS

An intensive archaeological survey of the proposed Project site was completed on February 12, 2020 by Dudek Staff Archaeologists. The pedestrian survey covered the entire Project site in 5-meter (approximately 16-foot) parallel transects. Careful attention was given to barren ground including at the base of trees, within animal trails/paths, areas surrounding structural features such as fence lines and the extant water tanks as well as subsurface soils exposed by burrowing animals. Dense ground cover was occasionally cleared by boot and shovel, when appropriate, to enhance detection of archaeological materials that may have been obscured on the surface.

The proposed Project site includes the areas surrounding the extant water tanks, the majority of which consist of undeveloped land: two ridges that orient northeast-southwest as well as the slopes surrounding these ridges and fairly flat terrain along the northernmost portion of the Project site that parallels West Cuyama Road. Major landscape features within the proposed Project site were identified to provide relative orientation during field documentation; as a result, the northeastern ridge east of the water tanks is referred to as Ridge 1 and the southwestern ridge is referred to as Ridge 2. For purposes of elucidation ground surface visibility is communicated utilizing the following ranges: 0 percent = no visibility; 0-20 percent = poor visibility; 20-40 percent = fair visibility; 40-60 percent = good visibility; 60-80 percent = very good visibility; 80-100 percent = excellent visibility.

Just east of the two extant water tanks and south of West Cuyama Road is a relatively flat area with dense vegetation. Exposed soils in this area are a result of the following: pedestrian foot traffic, animal trails, bioturbation and predominately roadside and/or maintenance activities that are likely associated with West Cuyama Road and the extant water tanks. Dense vegetation, including grasses, bushes, and trees cover approximately 90 percent of this area. Ground visibility was excellent (80-100 percent) within exposed soils and poor to good (20-60 percent) within areas of dense vegetation. In order to improve ground surface visibility within areas of dense vegetation, boot and had scrapes were employed at 10 meter intervals and subjectively as appropriate. Refuse items, including paint cans and buckets, were identified just south of West Cuyama Road. Since no diagnostic (dateable traits) were present and the items were discovered within the same context and location of modern refuse, these items are unlikely to be historic-period resources. The relatively flat terrain drastically increases in slope heading southward with an inclination of approximately 45 degrees or more. Where possible and safe to do so, the slope was surveyed with observations focused on identifying any evident surficial cultural material and/or exposed soils while maintaining a 5-meter spaced transect. Ground surface visibility within this area was poor (between 0-10 percent). Boot and hand scrapes up the slope at 5 to 10 meter intervals were implemented to identify subsurface conditions, when appropriate. No cultural materials were observed in this survey area.

The northeast-southwest oriented Ridge 1 is located south of the flat terrain area previously described. Vegetation atop the ridge is moderately dense with poor to fair (10-20 percent) ground surface visibility. Given the steep terrain and loose sediments presenting an unstable and unsafe surface for an intensive-level

survey, an opportunistic approach was applied. An emphasis was given to identifying and observing exposed soils and photo-documenting areas that were inaccessible due to the steep slopes and dense vegetation. When soils were not observed, boot scrapes were employed at 10 to 20-meter intervals to identify subsurface conditions improving ground surface visibility to good (40-60 percent). No cultural materials were observed within the Ridge 1 survey area.

The northeast-southwest oriented Ridge 2 located southwest of Ridge 1 and presented the same survey conditions and observations. Accordingly, the same survey approach was applied. No cultural materials were observed within the Ridge 2 survey area.

South of the extant water tanks and west and northwest of ridges 1 and 2, respectively, is a heavily vegetated area that slopes north and northwest An opportunistic survey approach was applied by surveying along accessible pathways and seeking exposed ground soils when possible. Ground surface visibility within this area was poor (5-20 percent) depending on the density of trees and bushes. When soils were not observed, boot scrapes were employed at 10 to 20-meter intervals to identify subsurface conditions improving ground surface visibility to good (40-60 percent). Soils identified within this area are consistent with the sandy loam just south of West Cuyama Road as well as sandy, coarse-grained, accumulated decomposed rock from the ridges above. The remains of a fallen wooden fence post and barbed wire, likely used for property boundary delineation, was observed, but no visible diagnostic traits/markers were identified on the post. Additionally, a review of SCCIC records did not identify any historical resources within the Project area. As such, no cultural materials of historical significance were observed within this survey area.

All soils appear to be consistent with the USDA's characterization of Metz loamy sand with and Castiac and Saugus soils comprised of residuum weathered from sedimentary rock (United States Department of Agriculture 2019).

6.0 ASSESSMENT OF POTENTIAL FOR UNRECORDED ARCHAEOLOGICAL RESOURCES

Based on the generally good ground surface visibility and use of shovel scrapes in areas with more surface vegetation, the intensive archaeological pedestrian survey results are considered reliable. Due to the absence of any prehistoric or historic remains identified during background research and the intensive pedestrian survey, and the evidence of disturbance noted on historic aerial imagery, the potential for buried prehistoric or historic archaeological resources within the proposed Project site considered low. Since a large portion of the proposed Project site is located on exposed ridgelines, it is unlikely that the surface soils along ridges 1 and 2 are a function of relatively recent alluvium associated with flooding runoff that could bury potential prehistoric deposits.

7.0 EVALUATION OF POTENTIAL PROJECT EFFECTS

As stated in CEQA Guidelines Section 15064.5(b)(1), a project causing a substantial adverse change in the significance of an historical resource is one that could result in the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings, such that the significance of an historical resource would be materially impaired (i.e., altering those physical characteristics that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources as determined by a lead agency [the County of Los Angeles] for purposes of CEQA; or its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code).

Based on the negative CHRIS records search results and NAHC Sacred Land Files results and the negative survey results in reliable conditions, the potential for proposed Project improvements to cause a substantial adverse change to unknown cultural resources is considered unlikely. Should the proposed Project improvements change in location or nature, this determination should be reconsidered.

8.0 RECOMMENDATIONS

Since no potentially significant resources, as defined by CEQA Guidelines and County of Los Angeles Cultural Guidelines, were identified within the proposed Project site, the proposed Project is not considered to have the potential to result in a significant impact on cultural resources as defined by CEQA Guidelines Section 15064.5(c)(4). As a result, no mitigation measures are recommended.

In the unlikely event that isolated cultural resources are encountered during ground disturbing activities, a County-qualified archaeologist should be notified immediately to assess the significance of the find pursuant to the County of Los Angeles Cultural Resources Guidelines criteria. This standard discovery process would ensure that any inadvertent discovery would be treated appropriately and thus the potential for impacts to cultural resources during Project construction activities would remain less than significant.

Re: Sterling Ranch Estates – Tank Site Project, Los Angeles County

Dear Ms. McDevitt:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: steven.quinn@nahc.ca.gov.

Sincerely,

Steven Quinn
Cultural Resources Analyst

APPENDIX E

Energy Calculations

Table 1. Summary of Energy Use During Construction

Fuel Type	Quantity
Diesel	
On-Site Construction Equipment	268,585 Gallons
Off-Site Motor Vehicles	441,278 Gallons
Total	709,863 Gallons
Gasoline	
On-Site Construction Equipment	0 Gallons
Off-Site Motor Vehicles	305,861 Gallons
Total	305,861 Gallons
Electricity	40,978.9 kWh

Table 2. Summary of Annual Energy Use During Operation

Source	Units	Buildout
Electricity	kWh/yr	
Single Family	kWh/yr	1,742,800
Commercial	kWh/yr	240,240
Total Building	kWh/yr	1,983,040
Water	kWh/yr	431,053
Total Electricty	kWh/yr	2,414,093
Natural Gas		
Single Family	kBTU/yr	5,728,690
Commercial	kBTU/yr	42,000
Total	kBTU/yr	5,770,690
Transportation/On-Site Sources		
Diesel	gallons	76,560
Gasoline	gallons	353,811
Total	gallons	430,371

Table 3. Water by Land Use "Regulatory Compliance"

		Project		
Land Use	**Units**	**Indoor/Outdoor Use**	**Indoor Use**	**Outdoor Use**
Buildout	Mgal	12.8158/23.7784	12.8158	23.7784

Water and Wastewater Electricity Intensity (kWh/gallon)

Supply Water	0.009727
Treat Water	0.000111
Distribute Water	0.001272
Wastewater Treatment	0.001911

Source: CalEEMod User's Guide, Appendix D, Table 9.2 Los Angeles - South Coast Air District

Indoor Water Factor	0.013021	kWh/gallon (supply, treat, distribute, wastewater treatment)
Outdoor Water Factor	0.01111	kWh/gallon (supply, treat, and distribute)

Notes:

Electricity and Natural Gas for the Proposed Project is total operational usage. Electricity, natural gas, and mobile usage was calculated from CalEEMod in ***Appendix G*** *of the EIR. Indoor water factor used for entire Project Site for conservative analysis.*

Table 4. Off-Road Equipment Fuel Usage During Construction

Phase Name	Off-road Equipment Type	Amount	Hours per Day	Horsepower	Load Factor	Number of Days	Diesel Fuel Usage (Gallons per Project)
Grading	Graders	2	8	187	0.41	155	9,507
Grading	Rubber Tired Dozers	10	8	247	0.4	155	61,256
Grading	Scrapers	8	8	367	0.48	155	87,375
Grading	Tractors/Loaders/Backhoes	2	8	97	0.37	155	4,450
Building Construction	Cranes	1	7	231	0.29	783	18,359
Building Construction	Forklifts	3	8	89	0.2	783	16,725
Building Construction	Generator Sets	1	8	84	0.74	783	19,469
Building Construction	Tractors/Loaders/Backhoes	3	7	97	0.37	783	29,507
Building Construction	Welders	1	8	46	0.45	783	6,483
Architectural Coating	Air Compressors	1	6	78	0.48	130	1,460
Paving	Pavers	2	8	130	0.42	132	5,766
Paving	Paving Equipment	2	8	132	0.36	132	5,018
Paving	Rollers	2	8	80	0.38	132	3,210
Total							**268,585**

Notes:

Equipment assumptions from CalEEMod.

Fuel usage estimate of 0.05 gallons per horsepower-hour is from the SCAQMD CEQA Air Quality Handbook, Table A9-3 E.

Table 5. On-Road Vehicle Fuel Usage During Construction

		Daily Trips		Total			Trip Length (Miles)			Total Length (Miles)			Fuel Consumption (Gallons)	
	Days	Worker	Vendor	Worker Trips	Vendor Trips	Haul Trips	Worker	Vendor	Hauling	Worker	Vendor	Hauling	Gasoline	Diesel

155 days of grading

Water Usage

3,020 gallons per acre per day

Source: Air & Waste Management Association, Air Pollution Engineering Manual, 1992 Edition

Supply Water Electricity Intensity

0.009727 kWh/gallons (CalEEMod default for South Coast Air Basin)

Attention: Mr. Hunt Williams

Subject: **GEOLOGIC AND GEOTECHNICAL REPORT**
Review of Vesting Tentative Tract Map 60257 (Dated May 8, 2018)

Project: Vesting Tentative Tract Map 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: See at end of text

Dear Mr. Williams:

This report presents our opinions on the existing geologic and geotechnical conditions on the above-referenced site and their effects on the Vesting Tentative Tract Map (VTTM) 60257 prepared by Sikand Engineering, dated May 8, 2018.

1.0 SCOPE OF WORK

The scope of work performed for this study included the following:

1. Review of previous reports by this firm in the vicinity of the subject site.
2. Review of published reports and maps listed in the References section.
3. Review of the 2003 Munger Map Book, California-Alaska Oil & Gas Field and review of records on the Division of Oil, Gas, and Geothermal Resources (DOGGR) website.
4. Review of Alquist-Priolo Fault Rupture Hazard Zones in California (CDMG Special Publication 42).
5. Coordination with the Supervising Civil Engineer, Sikand Engineering.
6. Review of the site topography and the Vesting Tentative Tract Map design, dated May 8, 2018, provided to our office in computerized format (AutoCAD), prepared by Sikand

Engineering. This computerized map was used as the base for our 80-scale Geotechnical Map. We make no representations regarding the accuracy of this base map.

7. Review of the following aerial photographs:

YEAR	PHOTO	SCALE	AGENCY
1928	E-67 & E-68	1" = 1700'±	Fairchild
11/3/52	AXJ-2K-30, 2K-85 & 2K-86	1" = 1800'±	USDA
6/19/80	105, 106, 107, 108,119, 120 & 121	1" = 1500'±	American Aerial Survey
1980	1080-151 & 1521-VEN 2-47	1" = 3333'±	USDA
1985	-	1" = 4000'±	USDA

8. Coordination with Underground Service Alert to obtain clearance from potentially impacted utilities prior to the subsurface exploration.
9. Preparation of an Access Road and SWPPPS plan in order to perform our subsurface exploration.
10. Obtain a grading permit from the County of Los Angeles Department of Public Works in order to construct the proposed access roads and drill pads for our subsurface investigation.
11. Coordination with California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR).
12. Review of our existing subsurface Trench logs presented within our previous reports for the site. These logs are presented within **Appendix A**.
13. Review of our subsurface excavation logs from our reports from VTTM 60257. Logs in the vicinity of the proposed off-site grading for Del Valle Road are included within **Appendix A**.
14. Geologic field mapping of the site.
15. Excavation, sampling and logging of 12 hollow-stem-auger borings (HS-1A through HS-12A) drilled to a maximum depth of 55 feet, and 2 bucket-auger borings (B-1A and B-2A) drilled to a maximum depth of 80 feet.
16. Excavation, sampling and logging of 48 backhoe trenches (T-1A through T-48A) excavated to a maximum depth of 13 feet.
17. Performed 20 Cone Penetrometer Test (CPT) soundings within the alluvial areas.

LOCATION MAP

JOB NO.: *18-1245A-4* | DATE: *6/08/18*

18. Laboratory testing of samples obtained during our subsurface investigations. Testing included dry density and moisture content of in-situ soils, percent finer than the #200 sieve size, grain-size analysis including hydrometer, Atterberg limits, compaction (modified proctor), direct shear and re-shear, consolidation, hydro-compression (collapse), expansion index, permeability, and corrosivity (soluble sulfate and chloride chloride content, pH and soil resistivity).

19. Performed general earthquake ground motion characterization utilizing the latest seismic ground-motion and active fault data, in accordance with the 2016 California Building Code (CBC), ASCE 7-10, and Special Publication 117A (Guidelines for Evaluating and Mitigating Seismic Hazards in California), dated September 11, 2008. Our evaluation included calculation of CBC response spectrum parameters and potential ground accelerations that could be generated at the site during future earthquakes on nearby faults.

20. Geotechnical assessment of liquefaction potential of site alluvial soils and calculation of associated seismic settlements and lateral spread displacements based on subsurface data, laboratory test results, and estimated ground motions.

21. Geotechnical evaluation of soil density, shear strength, compressibility, permeability, corrosion potential, expansion potential, and shrinkage and bulking factors.

22. Assessment of recommended grading removal depths based on weak soils, calculated seismic settlements, and proposed fill heights above the exiting ground surface.

23. Preparation of 27 cross sections illustrating anticipated geologic conditions for the proposed cut, fill and natural slopes.

24. Preparation of 3 cross sections illustrating anticipated geotechnical conditions within critical alluvial canyon areas.

25. Slope stability analyses of proposed cut slopes, fill slopes, and natural slopes on the site.

26. Geotechnical analyses to assess potential steady-state and transient seepage emanating from proposed stormwater infiltration areas an evaluation of potential hazards to the proposed development and adjacent off-site existing development.

27. Preparation of the enclosed Geotechnical Map (**Plate II**) illustrating our geologic data and recommended mitigation measures in relation to the proposed Vesting Tentative Tract Map design.

28. Preparation of figures and illustrations, including Location Map, drill hole logs, trench logs, CPT logs, laboratory test reports, liquefaction and lateral spreading results and

calculations, slope stability graphical results and data output, and pertinent construction details for inclusion in this report.

29. Preparation of this Geologic and Geotechnical report for submittal to the Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division.

2.0 SITE DESCRIPTION

The subject site consists of approximately 113 acres (gross area) located approximately 2.5 miles west-northwest of Castaic Junction. Access to the site is available from Del Valle Road as well as from the intersection of Chiquito Canyon Road via State Route SR-126. Existing Del Valle Road bisects the subject property. The site is bounded by undeveloped Vesting Tentative Tract Map 60665 to the east, undeveloped property to the north and developed Tracts 8673 and 5317 to the south and west respectively. Elevations on the site range from 1195 to 1446 feet. The specific details of the site topography are shown on the Location Map and Geotechnical Map that accompany this report.

The site is largely undeveloped except for roads and pads associated an existing residential structure and with past oil well drilling and operations. A large (75ft. by 100 ft.) concrete pad/slab is located on the southern portion of the site.

Slopes range from relatively gentle in the canyon floor areas to steep along the northerly and easterly-facing bedrock elevated areas. Vegetation on the site consists of annual grasses to chaparral.

3.0 PROPOSED DEVELOPMENT

The Vesting Tentative Tract Map (VTTM) 60257 proposes 231 residential lots, 1 commercial lot, 7 debris basin lots, 3 infiltration basin lots, 1 pump station lot, and 3 open space lots. The VTTM illustrates the proposed improvement and off-site grading for Del Valle Road. Conventional cut and fill grading techniques will be utilized to construct the proposed development consisting of relatively level building pads and cut and fill slopes. Cut and fill slopes are proposed at gradients of 2:1 (h:v) or flatter. The maximum proposed cut-slope (CS-7) height is 135 feet, which has slope gradient of 3:1. The maximum proposed 2:1 gradient cut slope height is approximately 118 feet (CS-8) and the maximum proposed fill slope height is approximately 70 feet in the vicinity of Lot 140. The maximum depth of cut will be about 90 feet in the vicinity of Lot 223. The maximum depth of proposed fill will be about 55 feet in the vicinity of Lot 135.

4.0 FIELD EXPLORATION, SAMPLING, AND LABORATORY TESTING

4.1 Surface Mapping

For this report, surface geologic mapping in conjunction with aerial photo interpretations was undertaken by personnel from Allan E. Seward Engineering Geology Inc. (AESEGI) using the proposed 80-scale VTTM as the base map. We also reviewed all our previous geologic/geotechnical data and available data by others in the vicinity of the project.

4.2 Subsurface Investigations Sterling Ranch Estates

In 1990 and 1991, this office performed a geologic fault investigation for the project site. This fault investigation included excavation and geologic logging of 25 long trenches (T-1 through T-25) totaling 4,158 lineal feet.

In 2006 and 2007 additional subsurface explorations were performed, which included 7 CPT soundings (CPT-1 through CPT-7), 9 hollow-stem-auger (HS-1A through HS-9A) drill holes, 2 bucket-auger (BA-1A and BA-2A) drill holes, and 36 backhoe trenches (T-1A through T-36A). Valley Well Drilling performed the hollow-stem-auger drill holes. Allways Drilling excavated the bucket-auger drill holes, D.E. Eddings and John Watson excavated the trenches, and Holguin, Fahan & Associates performed the CPT soundings. Bulldozer work was performed by Larry Price.

In 2017 and 2018 additional subsurface explorations were performed, which included 13 CPT soundings (CPT-8 through CPT-20), logging and sampling of 3 hollow-stem-auger (HS-10A through HS-12A) drill holes, and logging of 12 backhoe trenches (T-37A through T-48A). Six of these trench locations were selected for infiltration testing. The infiltration testing (PT-1 through PT-6) was performed in shallow test pits excavated with a backhoe. Infiltration testing (PT-7 through PT-10) was performed in deeper test pits excavated with a loader. Choice Drilling performed the hollow-stem-auger drill holes, Barkley Engineering Corp. excavated the trenches, Kennedy Heavy Equipment Rentals excavated the deeper infiltrations test pits, and Middle Earth Geo Testing performed the CPT soundings.

The drill holes, trenches, and infiltration test pits were logged and sampled by AESEGI personnel. The drill hole logs, trench logs, and CPT soundings are presented in **Appendix A**. Trench logs for PT-1 through PT-6 were not prepared due to their proximity to an existing Trench Log. The locations of the drill holes, trenches and CPTs are shown on the **Geotechnical Map**. The subsurface explorations after 1991 have been designated with an "A" (B-2A, HS-9A, CPT-7A and T-36A) descriptor to separate it from the prior subsurface explorations. The subsurface exploration logs presented within our previous reports for the property are presented within this report for ease of review.

The drill hole logs included in **Appendix A** represent our interpretation of field data prepared for each boring by our geologic/engineering staff at the time of drilling, along with refinements based on observations and laboratory test results. Unit boundaries shown in the graphic log column of our hollow-stem-auger drill hole logs are approximate and may represent gradual transitions.

4.3 Del Valle Road Off-site

The proposed off-site grading of Del Valle Road is on Vesting Tentative Tract Map 60665. Subsurface explorations have been completed by this firm during various phases spanning from 2002 through 2007 for the VTTM 60665 and adjacent parcels for a prior developer entity. These investigations included 34 bucket-auger drill holes, 4 hollow-stem-auger drill holes, 144 pit and long trenches, and 3 dozer cuts. A Geologic and Geotechnical Report, dated 2/5/16, was prepared for this VTTM (see ref. 3) that illustrates the subsurface locations and geologic data. The subsurface explorations that are relevant to the proposed off-site grading for Del Valle Road per VTTM 60257 included 1 bucket-auger drill hole (B-24), 7 pit trenches, 1 long trench (T-94), and 1 dozer cut (DC-3). The drill holes, trench and dozer cut logs are presented in **Appendix A**. The locations of the subsurface explorations are shown on the **Geotechnical Map**.

4.4 Sampling Procedures

California-Drive (relatively undisturbed ring samples) and Standard Penetration Test (SPT) samples were obtained in the exploratory drill holes at various depths (see logs in **Appendix A**). Recovered soil samples were sealed in plastic containers and brought to our laboratory for further classification and testing.

Bulk (disturbed) samples of the near surface soils and bedrock were obtained from cuttings developed during excavation of the exploratory drill holes and trenches. The bulk samples were collected for classification and testing purposes and represent a mixture of soils within the noted depths.

4.5 Laboratory Program

After visual and tactile classification in the field, the soil samples were brought to our laboratory. The soil classifications were checked in accordance with the Unified Soils Classification System. The field logs were reviewed to assess which samples would be analyzed or tested further. The results of the field investigation and the laboratory tests were used as the basis for our analyses and recommendations presented in this report. Laboratory test results are presented in **Appendix B**. In addition, laboratory shear test data from adjacent properties PM 60030 and VTTM 60665 are also presented to supplement the on-site data.

5.0 GENERALIZED GEOLOGIC/GEOTECHNICAL SUBSURFACE CONDITIONS AND SOIL PROPERTIES

5.1 Regional Geology

VTTM 60257 is located in the Transverse Ranges geomorphic province of Southern California in the eastern portion of the Ventura Basin. The Ventura Basin is a west-trending depositional basin produced by tectonic down-warping initiated during the early Miocene geologic epoch (5 to 24 million years ago). This depositional basin has developed a thick accumulation of Cenozoic sediments. The site is underlain by sedimentary rock of the Saugus and Pico Formations. The contact between the Saugus Formation and the Pico Formation is located at the southwestern portion of the site. Alluvium is present in the larger drainage areas and soil and slopewash mantle most of the site. Remnants of fluvial terrace deposits are present in isolated areas of the subject site.

5.2 Geologic Structure

Bedrock on the site has been strongly deformed by north-south compressional tectonic forces producing geologic structures (faults and folds) which trend east-west. These structures include the south branch of the Holser fault, one related sub-parallel fault located at the project northern tract boundary, and the east plunging Oak Canyon anticline (Yeats, et al 1985) traverses the northern portion of the site. The east-west trending, south dipping reverse fault at the northern project boundary was designated informally as the "Oak Canyon fault" for the VTTM 60665 (see ref. 3). The location of the south branch of Holser fault and Oak Canyon fault on the site are not obvious owing to alluvial deposits. Bedrock located near these fault breaks on adjacent properties are strongly deformed due to drag and shearing along the fault. Based on the structural trend and orientation of the faulting and folding, we judge that the Oak Canyon fault and anticline are structurally associated with the Holser fault. The three-dimensional geometry of the subsurface geologic structure is illustrated on the Geotechnical Map and cross sections.

The south branch of the Holser fault is defined by the east-west trending canyon on the southeastern margin of the subject site and by the change from Pico Formation on the south to the Saugus Formation to the north. No geomorphic evidence for recent activity on the South Branch of this fault was observed on the site.

The north branch of the Holser fault is mapped on Parcel Map 60030 which is approximately 1,300 ft to the east of the site. This fault is characterized by steep bedding adjacent to the faults and significant shear zone. However, on the western portion of PM 60030, the steepness of the bedding and the severity of the faulting appears to diminish to the west of the mapped intersection with the Oak Canyon anticline. Test pits and borings adjacent to

the eastern property line of the VTTM 60665 on strike with the north-branch of the Holser fault all reveal regional bedding typically dipping 25 to 35° to the south. The north branch of the Holser fault at the western edge of PM 60030 is not easily identified because it interpreted to be bedding parallel or to end on the eastern portion of VTTM 60665. Shortening along the North Branch may be taken up by the Oak Canyon fault father to the west. Evidence for the north branch of the Holser fault on the VTTM 60257 was not observed. For more detailed discussion on the age of fault movement, see the **Seismic Considerations** section of this report.

South of the Oak Canyon anticline axis bedding generally strikes east west and dips about 23° to 40° to the south. North of the anticline axis bedding generally strikes parallel to the anticline axis and dips about 25° to 55° north. Analysis of folding with an equal-area plot of the poles indicates a fold with a narrow hinge and plunge of the fold axis is approximately 11° to the east (see Stereonet Plot in Appendix G). The Oak Canyon fault is approximately 150 to 200 ft north of the Oak Canyon anticline axial hinge trace. The Oak Canyon fault was observed in trench on the adjacent properties to the north. Bedding adjacent to fault is generally steeply dipping to the north of over-turned with steep dips to the south.

5.3 Geomorphology

The site geomorphology is dominated by four main canyon tributaries of the southward-draining Chiquito Canyon. The three western canyons cut across the structural grain of the underlying Saugus Formation bedrock and the eastern canyon roughly parallels it. Where the intervening ridges are perpendicular to structure, resistant sandstone units form knobs and finer grained units form saddles. Small remnant outliers of Quaternary fluvial terrace deposits have been found at elevations ranging from 1280 to 1400 ft. Recent alluvium is present in each of the major drainages and has locally been incised. The small landslide deposits mapped on the site are poorly to moderately well-defined geomorphically. They are primarily bedding plane failures found on the south-facing dip slopes. The landslide shown in Trenches T-16 and T-17 has poor geomorphic expression and appears to be a remnant of a cross-bedding failure.

The subject property has been affected by slope movements that range in size from small debris flows to larger deeper-seated bedrock failures. Nine landslides have been mapped on the site of which five are located in the southeastern edge of the VTTM.

5.4 Geologic Units

A general description of geologic units, including bedrock, terrace deposits, alluvium, landslides, and artificial fill are presented below. Distribution of these units is shown on the Geotechnical Map, **Plate II**.

5.4.1 Pico Formation (Tp)

The Pliocene, shallow marine Pico Formation consists of moderately indurated, light greenish- to bluish-gray siltstone and sandy siltstone, light brown sandstone, and conglomerate. The Pico Formation is in fault contact with the Saugus Formation along portions of the south branch of the Holser Fault. This fault contact places the Pico Formation over the younger Saugus Formation. The Pico Formation likely underlies the site at depth but is not exposed at the surface with the project site. However, there are outcrops to the south of the site.

5.4.2 Saugus Formation (TQs)

The bedrock underlying the majority of the site consists of the lowermost portion of Plio-Pleistocene Saugus Formation. This section contains fluvial and transitional lithologies of the lower Saugus Formation, including light gray sandstone and conglomerate, greenish-gray siltstone, silty sandstone, claystone and mudstone. The unit is typically moderately cemented and indurated. Sandstone beds are commonly well exposed in outcrop, but overall the Saugus Formation is not well exposed except in existing cuts.

5.4.3 Terrace Deposits (Qt)

Remnants of fluvial terrace deposits are present in isolated areas of the subject site. These deposits consist primarily of moderate to well-bedded, moderately consolidated, light-gray to yellowish-orange sandstone and conglomerate with sandy siltstone interbeds.

5.4.4 Older Alluvium (Qoa)

The Quaternary alluvium that is present the off-site portion on Del Valle Road in the canyon areas that are elevated above the existing active drainages are mapped as older alluvium deposits. These deposits generally consist of interbedded sands, silty and clayey sands, and sandy, silty clays.

5.4.5 Alluvium (Qal)

Recent alluvium deposits occur within the canyon bottoms and associated tributaries. These unconsolidated deposits consist primarily of light to dark yellowish-brown, brown, to reddish-brown fine- to coarse-grained sand, silty sand, and silty clayey sand with trace gravel. Interbedded stiff, sandy lean clays and sandy silts were encountered at some limited locations.

The alluvial areas have been delineated on the Geotechnical Map as Alluvial Canyons 1 through 4. The alluvium is generally loose to medium dense down to the bedrock contact, which generally ranges from about 30 to 50 in maximum depth (see profiles for Canyons 2 and 3 on Cross Sections 28-28’ and 29-29’ in Appendix H).

Based upon blow counts, dry densities, moisture contents and consolidation test results, the upper alluvial soils are considered unsuitable for support of structural fills. Additionally, alluvial soils potentially susceptible to liquefaction are widespread within the canyon areas. Accumulation of loose, potentially liquefiable sediments are particularly thick at the canyon mouths where the adjacent bedrock topography narrows (i.e. at CPT-3 and CPT-13).

Removal and recompaction of alluvial soils that are considered to subject to potential static and seismic settlement have been recommended on the subject site. Please refer to the **Geotechnical Map** for removal depths and limits.

5.4.6 Slopewash (Qsw)

Slopewash, or colluvium, is a heterogeneous deposit formed on slopes as a result of weathering, sheet wash, creep and shallow debris flows on sloping ground. This unit is generally thickest in swales and side canyons, and at the toe of existing natural slopes, where it commonly interfingers with the canyon alluvial deposits. The slopewash generally consists of poorly sorted, pebbly silty sand, but varies depending on the composition of the underlying source material. The maximum thickness of slopewash encountered in our exploratory excavations is about 10 feet.

Slopewash has been noted on the Geologic logs and is indicated on the **Geotechnical Map** where it is estimated to be greater than 4 feet in thickness. In addition, slopewash deposits that may affect the proposed development are also shown on the attached Geotechnical Map. All slopewash in areas of proposed development shall be completely removed prior to the placement of compacted fill.

5.4.7 Residual Soil

Natural areas of the site are mantled by surface soils consisting of moderate to yellowish-brown and yellowish-gray silty sand with scattered pebbles. This unit is noted on our geologic logs but is not shown on the Geotechnical Map.

5.4.8 Artificial Fill (af)

Existing non-compacted artificial fill on the site ranges from minor spill fills generated during past grading of minor roads and oil well pads to larger accumulations placed to bridge roads across drainages (see **Geotechnical Map**). In proposed fill areas, artificial fill should be entirely removed prior to placement of compacted fill. If artificial fill is present below proposed cut grade elevations, it shall be completely removed and replaced with compacted fill.

5.4.9 Landslides (Qls)

Ten landslides, Qls-1 through Qls-10, have been mapped on the project site. In addition, three landslides, Qls-A, Qls-B and Qls-C, have been mapped along proposed off-site grading for Del Valle Road. In general, the mapped landslides are translational failures, which occurred where daylighted (unsupported) clay-rich beds of the Saugus Formation bedrock. However, landslides exhibiting cross bedding failure have been encountered in the vicinity of the Oak Canyon anticline.

The landslide limits and designations are illustrated on the Geotechnical Map. Cross sections have been constructed to illustrate the three-dimensional geometry of the more significant landslides and proposed grades. Stability of the landslides not removed by proposed grades are discussed in the Slope Stability appendix. Remediation recommendations for the landslides that affect the proposed development are discussed in the Earthworks section of this report.

5.4.9.1 Landslide Qls-1 & Qls-2

Landslide Qls-1 on the western edge of the commercial site and a portion of the landslide is off-site. Cross section 1-1' illustrates the interpreted geometry, proposed grades, and partial remedial removal of the landslide. Landslide Qls-2 is contained with the proposed commercial site lot. Proposed grades will remove the majority of the landslide.

5.4.9.2 Landslide Qls-3

Landslide Qls-3 is contained within Open Space Lot 245.

5.4.9.3 Landslides Qls-4 and 5

Landslides Qls-4 and Qls-5 is located in the vicinity of Lot 185. These landslides observed in Trenches T-16 and T-17 have poor geomorphic expression and are opined to be remnant of a cross-bedding failure.

5.4.9.4 Landslides Qls-6 through Qls-10

Landslide Qls-6 through Qls-10 are located within Open Space Lot 246 at the southeastern portion of the project. These landslides are interpreted to be translational failures. Cross Section 23-23' illustrates the interpreted geometry of Landslides Qls-6 and Qls-7. Landslides Qls-8, Qls-9 and Qls-10 are outside the area of proposed development.

5.4.9.5 Landslides Qls-A, Qls-B and Qls-C

These landslides are located to the east of the site south of the existing Del Valle Road. Qls-A is based on similarity of the geomorphology to other landslides on VTTM 60665. Landslides Qls-B and Qls-C are based on the observed discontinuous bedding, fractures and disrupted appearance of the bedrock that was observed in Trenches T-77, T-78 and T-94. These landslides are judged to be circular cross bedding failures based on geologic structure and the findings of subsurface investigation of other landslides on VTTM 60665.

5.4.10 Surficial Failures (Qsf)

Shallow surficial failures involving soil, slopewash and weathered bedrock were observed. Approximate locations and extent are shown on the Geotechnical Map. Any of the surficial failure material, which exists in areas of proposed development, shall be removed prior to the placement of compacted fill.

5.5 Ground Water

Based on the historically highest ground water contours included in the Seismic Hazard Zone Report for the Val Verde 7.5-Minute Quadrangle, the interpolated historic high ground water elevations are 10 feet beneath the elevation of the existing ground surface for the alluvial canyon areas. This historic high groundwater elevation was used in our liquefaction assessment.

Hollow-stem auger Borings HS-1A through HS-9A were drilled in November of 2006 and encountered groundwater at a depth of 20 ft below the ground surface or deeper in Borings HS-2A, HS-3A, HS-5A, HS-6A and HS-7A. Hollow-stem auger Borings HS-10A, HS-11A and HS-12A were drilled in January 2018; groundwater was only encountered in HS-10A at a depth of 45.5 ft following a 24-hour monitoring period.

Ground water was noted in a water well located in the vicinity of the existing residence on the subject site at a depth of 45 ft in 1991. This water well could not be located during our recent investigation of the site.

5.6 Soil Compressibility

Data from CPT soundings and from consolidation testing (including hydro-compression) performed on soil samples from the borings were used to evaluate compressibility of alluvial soils under static loading conditions from proposed fills. Based on this evaluation, potentially compressible layers exist at depths of up to about 30 ft in the alluvium. The recommended removal depths provided in the Earthworks Recommendations section of this report consider these data.

Generally, soils at the site that have an in-situ dry density of 108 pcf or less and in-situ moisture content of 8 percent or less are considered susceptible to hydro-compression. Review of the results of consolidation and density testing of samples from our borings indicates on-site alluvium materials display a minor potential for hydro-compression due to water incursion. Test results of three samples of the alluvium show negligible amounts (~0.1%) of hydro-compression (see **Appendix B** for lab test data). No significant hydro-compression effects due to water incursion are expected at the site after the removals recommended in the Earthwork and Grading section of this report are performed.

5.7 Expansion Potential of Soils

Based on CPT and boring data, alluvial soils at the site generally consist of fine-to medium grained sands, silty sands and clayey sands with interbedded silts and clays. Bedrock (TQs) at the site generally consists of pebbly sandstone to silty sandstone with common claystone beds ("red beds"). The fine-grained materials of the Saugus Formation bedrock may have medium to locally high expansion potential. Results of Expansion Index testing (**Appendix B**) indicate that expansion potential of future fill materials derived from a mixture of alluvial and bedrock soils will be very low to low (Expansion Index $\leq$ 50).

5.8 Potential Corrosivity of Soils

Laboratory testing to measure the soil resistivity and pH (Caltrans 643), soluble sulfate content (Caltrans 417), and soluble chloride content (Caltrans 422) was performed on a mixture of bedrock and alluvium. The tests were performed to evaluate potential corrosive characteristics of future compacted fill soils to exposed concrete, steel reinforcement, and buried metal utilities.

The Geotechnical and Materials Engineering Division (GMED) of the Los Angeles County Department of Public Works regards soil at a site to be corrosive to concrete and/or steel if the measured resistivity is 1,000 ohm-cm or less, and/or if the sulfate concentration is 2000 ppm (0.20%) or greater, and/or if the pH is 5.5 or less. Also, a soil with a chloride concentration greater than or equal to 500 ppm is considered deleterious to ferrous metals.

Based on the measured chloride content (42 ppm), sulfate content (0.02%), resistivity (1295 ohm-cm) and pH (7.6) values, the tested sample does not classify as corrosive to concrete or buried metal based on criteria presented in the current GMED Manual for Preparation of Geotechnical Reports, revised December 2014.

Recommendations based on the anticipated corrosion potential of site soils are provided in the **Design Considerations and Recommendations** section of this report.

5.9 Soils Shear Strength

Direct Shear testing was performed on relatively undisturbed samples of Quaternary Terrace Deposits (Qt), Saugus Formation bedrock (TQs), and on remolded samples of on-site soils from the project site. Direct Shear testing presented for older alluvium, alluvium and landslide mass (Qls) are from the adjacent property VTTM 60665 (see reference 3 for the subsurface locations). Direct Shear testing presented for landslide plane is from PM 60030 (see reference 2 for the subsurface location). The slide plane shear test is from a landslide that is on the boundary between VTTM 60065 and PM 60030, which is on structural trend with the mapped Landslides Qls-A through Qls-C along the proposed off-site grading for Del Valle Road. Results of the on- and off-site testing are presented in **Appendix B** and were used to select design values of shear strength of site materials. Soil shear strength parameters used in design and analyses are presented in **Appendix E**, Slope Stability Analysis.

5.1 Erosion Potential

The existing provisions in the Grading Ordinance for planting and irrigation of constructed slopes in conjunction with drainage recommendations provided in the section "Surface Drainage and Erosion Control," will be sufficient mitigation against potential erosion within the subject site.

5.2 Debris Flow Hazards

Debris flows typically require a combination of loose colluvial soil, steep slopes and be exposed to period(s) of intense rainfall. Destructive debris flows originate on slopes with gradients between 26 to 56 degrees (Campbell 1975). Debris flows on slopes of 27 degrees or less do not tend to accelerate and are not considered a hazard.

Potential debris flow hazard on the natural slopes adjacent to the proposed building pads has been evaluated. Methodology used to assess the site and identify the potential debris source areas are outlined below:

- Review of historic aerial photographs covering the site and adjacent areas for evidence of debris flow in the form of scars, bare rock, variation of vegetation densities that might indicate locations where older debris source areas might be present and geomorphic lobes that might represent accumulation for a debris flow.
- Review of the topographic base map to determine areas that are steeper than approximately 26 degrees or approximately 2:1 horizontal to vertical.

- Field mapping by an engineering geologist to determine locations and general composition of loose colluvial soil. The lateral limits of the debris flow source areas were mapped using the project topographic map as a base.

Review of the tentative tract map design, the topographic base map, and field mapping of the site indicates that potential debris flow hazard relative to proposed development exists at Lots 10, 18 through 22, and 35. The subject slope areas are noted on the attached Geotechnical Map with the abbreviation "PDFH".

Potential debris flow hazard on the VTTM is mitigated by either a debris basin and conveyance channel, debris basin or impact walls. Debris Basins and impact walls are designed for complete containment of potential debris volumes. A summary of the potential debris flow hazard is discussed below for each of the lots.

- Lot 10: The volume of debris is estimated at 572 cubic yards. To mitigate hazard from debris flow from the north and from offsite to the northwest, a minimum freeboard height of 4.5 feet impact/diverter wall is recommended at the top of the proposed cut slope located at the north and west portion of the Lot 10 (see Geotechnical Map). Based on volume calculations it is determined that the designed impact/diverter wall will provide a containment volume of 635 cubic yards and mitigates the potential flow hazard to Lot 10.

- Lots 18 and 19: A debris conveyance channel is illustrated along the toe of natural slope located west of Lots 18 through 20. This channel directs debris material towards the south to a basin located east of Lot 10 and provides for mitigation for potential impact from debris flow by providing an up-slope from the channel bottom up to the proposed pad. Calculated debris volume from the mapped debris flow source areas located directly adjacent to Lots 18 and 19 (see Geotechnical Map) is 42 cubic yards. At the location of potential impact from debris flow adjacent to Lot 18, the up-slope height ranges from 3.7 to 5 feet with an average of about 4.4 feet. The longitudinal length of the channel at this location of potential impact is 34 feet. Based on the average up-slope height of 4.4 feet, and measured channel length of 34 feet, the calculated volume/capacity for this portion of the channel adjacent to Lot 18 is 55 cubic yards. At the location of potential impact from debris flow adjacent to Lot 19, the up-slope height ranges from 6.0 to 7.9 feet with an average of about 6.8 feet. The length of the channel at this location of potential impact is 40 ft. Based on the average up-slope height of 6.8 feet, and measured channel length of 40 feet, the calculated volume/capacity for this portion of the channel adjacent to Lot 19 is 151 cubic yards. The total capacity of the channel adjacent to Lots 18 and 19 is 206 cubic yards (55+151) which is greater than the calculated debris volume

of 42 cubic yards. Based on volume calculations it is determined that the designed conveyance channel provides sufficient mitigation of the potential debris flow hazard for Lots 18 and 19.

- Lot 20: A debris conveyance channel is illustrated along the toe of natural slope located west of Lots 18 through 20. This channel directs debris material to the basin located east of Lot 10 and provides for mitigation for potential impact from debris flow by providing an up-slope from the channel bottom up to the proposed pad. Calculated debris volume from the mapped debris flow source areas located directly adjacent to Lot 20 (see Geotechnical Map) where potential impact could occur is 35 cubic yards. At the location of potential impact from debris flow adjacent to Lot 20, the up-slope height ranges from 3.3 to 5.0 feet with an average of about 4.0 feet. The longitudinal length of the channel at this location of potential impact is 32 feet. Based on the average up-slope height of 4.0 feet, and measured channel length of 32 feet, the calculated volume/capacity for this portion of the channel adjacent to Lot 20 is 45 cubic yards which is greater than the calculated debris volume (35 cubic yards) from the mapped source area. Based on volume calculations it is determined that the designed conveyance channel sufficient mitigation of the potential debris flow hazard for Lot 20.

- Basin Lot 234: The volume of debris from the source areas located along the conveyance channel adjacent to Lots 18-20 (77 cubic yards) combined with the estimated debris volume (301 cubic yards) from the canyon area located north to northwest of the designed basin within Lot 234 is 378 cubic yards (see Geotechnical Map). This combined volume is less than the designed volume of the basin of 696 cubic yards by the Supervising Civil Engineer. Based on volume calculations it is determined that the debris basin at Lot 234 is of sufficient size for 100 percent containment of the potential debris flow hazard volume.

- Lot 21: The west debris basin within Lot 235 located north and northwest of Lot 21 provides mitigation for potential debris flow hazard from the ascending natural slopes. The volume of debris from the source areas adjacent to this lot is calculated to be 609 cubic yards (see Geotechnical Map). This volume is less than the designed volume of the basin of 685 cubic yards by the Supervising Civil Engineer. Based on volume calculations it is determined that the designed basin at Lot 235 is of sufficient size for 100 percent containment of the potential debris flow hazard volume.

- Lot 22: There are two main debris flow source areas located in the vicinity of Lot 22. Calculated debris volume from the mapped potential debris flow source areas located north to north east of this lot (see Geotechnical Map) is 497 cubic yards. This area drains

directly towards the main portion of the basin. The canyon area located north to northwest of the lot has a calculate debris volume from the mapped potential debris flow source areas of 204 cubic yards. This canyon area drains towards the proposed lot where the VTTM illustrates an up-slope from the access road to the lot. At the location of potential impact from debris flow, the up-slope height ranges from 3.4 to 5.4 feet with an average of about 4.4 feet. The width of potential debris containment adjacent to the lot will range from 32 feet at the back of the canyon area to up to 50 feet wide along the access road with an average of 40 feet. Length of the potential containment averages about 40 feet. Based on the average up-slope height of 4.4 feet, and measured containment width of 40 feet, and length of 40 feet, the calculated volume/capacity along the access road where potential impact could occur is 288 cubic yards which is greater than the calculated debris volume (204 cubic yards) from the mapped source area. It is our opinion that the up slope berm provides sufficient protection against impact from debris flow. Based on the volume calculations it is determined that the designed debris conveyance along the basin access road and total volume of potential debris material entering the basin provides mitigation of hazard from debris flow for Lot 20. The total calculated volume of potential debris flow material from the mapped source areas (497 + 204) entering the basin is 701 cubic yards which is less than the provided basin capacity of 806 cubic yards. The debris basin is of sufficient size for 100 percent containment of the potential debris flow hazard volume.

- Lot 35: The debris basin within Lot 236, located north of Lot 35 provides mitigation for potential debris flow hazard from the ascending natural slopes. The volume of debris from the source areas adjacent to this lot is calculated to be 312 cubic yards (see Geotechnical Map). This volume is less than the designed volume of the basin of 564 cubic yards by the Supervising Civil engineer. Based on volume calculations it is determined that the designed basin at Lot 236 is of sufficient size for 100 percent containment of the potential debris flow hazard volume.

6.0 SEISMIC CONSIDERATIONS

6.1 Introduction

The subject property is within the Transverse Ranges Geomorphic Province of southern California. The Transverse Ranges consist of a series of west-trending mountains and intervening valleys. These ranges largely resulted from north-south compression, ultimately causing east-west-trending folds and thrust faults. The south branch of the Holser fault traverse the southern edge of the site. Other faults near the site are the Santa Susana, Northridge (East Oakridge), Del Valle and Sierra Madre (San Fernando) reverse/thrust

faults. The January 17, 1994 Northridge (M6.8) Earthquake occurred on a south-dipping thrust fault which uplifted the Santa Susana Mountains at least 40 cm.

The southern California region is traversed by the San Andreas Fault, which is a transform boundary between the Pacific Plate and the North American Plate. The San Andreas Fault is part of the San Andreas system of northwest-striking, right-lateral faults. The faults of this system are generally historically active, as evidenced by the June 28, 1992 Landers (M7.6).

The southern California region is seismically active and commonly experiences strong ground shaking resulting from earthquakes along active faults. Earthquakes along these faults are part of a continuous, naturally occurring process, which has contributed to the characteristic landscape of the region.

Three common types of geologic hazards may be produced during a seismic event (earthquake). These include:

1. Ground Rupture;
2. Ground Failure; and
3. Ground Motion.

6.2 Ground Rupture

The potential for ground rupture on the site was evaluated utilizing published maps in conjunction with field mapping and subsurface exploration programs. Review of the Earthquake Fault Zone Maps provided in the California Department of Conservation, Division of Mines and Geology, Special Publication 42 indicates that there are not any known active faults within the project site, per Alquist-Priolo criteria. The published references indicate that the south branch of the Holser Fault, which is mapped by Yeats, et al (1985) surface trace traverse the southern edge of the site. The Alquist-Priolo Special Studies Zones Map does not consider the Holser Fault as active, however the Los Angeles County Safety Element (Leighton, 1990) does classify it as active.

Based on regional mapping the south branch of the Holser fault traverse the very southern edge of the VTTM, but its probable location is obscured by alluvium deposit. The north branch of the Holser Fault is mapped to the east of the site on PM 60030 and the projected trace is towards the site. In the 1990's we completed an extensive subsurface investigation of long trench excavations to evaluate the extent and activity of north branch of the Holser fault on the site. We found no significant faults in our subsurface explorations across the trend of the projected trace of the North Branch of the fault. Based on geologic mapping and on the trench exposures we judge that the north branch of the Holser fault is not present

on the site. The 1990 subsurface explorations trench logs on the VTTM 60257 are presented within this report.

In addition, extensive subsurface fault investigation studies have been performed on the adjacent properties to the north and east. The subsurface investigations performed on the property to the north and VTTM 60665 identified several zones of faulting. An east-west trending fault, informally designated as the Oak Canyon fault, is opined to traverse the northern portion of the site, but its probable location is obscured by alluvial deposits. Based on the structural trend and orientation of the faulting, this fault is considered to be structurally associated with the Holser fault.

6.2.1 Age of Fault Movement

Subsequent geologic investigations (since the 1990 Los Angeles County Safety Element) evaluating the activity of the Holser fault by this firm and others indicate no direct evidence of Holocene activity. As a result of these investigations the Los Angeles County Department of Public Works, Geotechnical Materials and Engineering Division is not requiring building setbacks for mitigation of surface fault rupture hazard for the Holser fault.

The age of the last movement on the Oak Canyon fault is poorly constrained based on existing data. Based on the degree of deformation observed along many of the faults and geologically young age of the Saugus Formation bedrock, there has been substantial movement on the observed faults during late Quaternary times. Evidence of Holocene activity is currently lacking; however, no evidence to preclude Holocene fault rupture has been found. The Oak Canyon fault is not overlain by pre-Holocene deposits that could potentially be used to determine if the fault is active per Alquist-Priolo criteria. Based on lack evidence for recent activity on the Holser fault, and no evidence of recent activity on Oak Canyon fault documented during our subsurface explorations, we opine that none of the fault traces on the subject site have produced surface ground rupture during the Holocene (~last 11,000 yrs).

6.2.2 Building Setbacks

Based on lack of evidence for recent activity on faults documented during our subsurface explorations, we judge that none of the fault traces on the subject site have produced surface ground rupture during the Holocene (~last 11,000 yrs). CGS Special Publication 42 defines an active fault as one which has had surface displacement within Holocene time (about the last 11,000 years). Accordingly, the faults observed on the subject site are not considered active as defined by California regulations. We therefore find that the **building setbacks** to mitigate potential ground rupture hazard for these faults are **not required** for

standard commercial and residential development according to current State of California criteria.

6.3 Ground Failure

Ground Failure is a general term describing seismically induced secondary permanent ground deformation caused by strong ground motion. This includes liquefaction, lateral spreading, seismic settlement of poorly consolidated materials (dynamic densification), differential materials response, slope failures, sympathetic movement on weak bedding planes or non-causative faults, shattered ridge effects and ground lurching. Review of the Seismic Hazard Zones map for the Val Verde Quadrangle indicates that the subject site is located within an area of required investigation for both liquefaction and earthquake induced landslides.

Potential secondary seismic hazards to VTTM are described below. The potential for liquefaction and seismic settlement are evaluated in detail in **Appendix C**. The potential for adverse impacts to the proposed development from liquefaction and other secondary seismic effects is considered to be low to non-existent provided that our recommendations are incorporated into the future grading plan and implemented during construction.

6.3.1 Potential for Liquefaction and Associated Ground Failure

Potential for liquefaction at the site and the magnitude of associated liquefaction-induced ground failure (i.e. seismic settlement, lateral spread displacements, and surface manifestation) were evaluated using data from our subsurface explorations, in compliance with the procedures and policies of the County of Los Angeles and the State of California. Ground motions estimated using USGS seismic design map web applications and mapped historic high ground water levels were used in this evaluation. The procedures and results of the evaluation are described in detail in **Appendix C**.

In summary, our evaluation indicates that potential for liquefaction is present within the alluvial portions of the site and that liquefaction-induced ground surface settlement up to about 7.1 inches (prior to recommended removals) could occur if site soils were to liquefy. Review of CPT and boring logs indicates that characteristics for potential lateral spreading are present within the liquefiable soils. Remedial measures to reduce the hazard of liquefaction and associated liquefaction-induced ground failures are described in **Appendix C**.

6.3.1 Potential for Other Modes of Ground Failure

Earthquake-induced slope failures include activation and reactivation of landslides, rock falls, debris flows and surficial failures. The potential for earthquake-induced slope

failures to adversely impact the proposed development is considered negligible, provided that our recommendations and those of the Supervising Civil Engineer are incorporated into the proposed design and implemented during construction.

6.4 Earthquake Ground Motion

6.4.1 General

The proposed development is located in Southern California, which is in a geologically and seismically active region where large magnitude, potentially destructive earthquakes are common. Therefore, it is reasonable to assume that moderate or large magnitude earthquakes will affect the site during the life of a given structure. The San Gabriel fault, which has a surface trace located about 6.2 km northeast of the project site, is the closest known active or potentially active fault to the project site. The active **San Andreas fault** is located about 35 km north of the project site. Large earthquakes along these, or along any of the other numerous faults in the region, are expected to produce strong ground shaking at the project site in the future.

The current standards for construction provided in the 2016 California Building Code are designed to safeguard against major failures and loss of life, but are not intended to limit damage, maintain functions or provide for easy repair. Per Structural Engineers Association of California (SEAOC), conformance to these recommendations does not constitute any kind of guarantee or assurance that significant structural damage will not occur in the event of a maximum level of earthquake ground motion. However, it is reasonable to expect that a well-planned and constructed structure will not collapse in a major earthquake and that protection of life is reasonably provided, but not with complete assurance.

Although research on earthquakes during the last fifty years has greatly enhanced the level of understanding of earthquake faulting in California, the record is much too short to constrain behavior of all faults in Southern California and the attenuation characteristics of all areas relative to each future potential earthquakes. Predicted accelerations should, therefore, be considered **rough estimates** rather than precise facts and ground motions from future earthquakes may exceed the predicted accelerations. Neither the **Time, Location, nor Magnitude** of an earthquake can be accurately predicted at this time.

6.4.2 Earthquake Magnitude

Earthquake **magnitude** is a quantitative measure of the strength of an earthquake or the strain energy released by it, as determined by seismographic or geologic observations. It does not vary with distance or the underlying earth material. This differs from **intensity**, which is a qualitative measure of the effects a given earthquake has on people, structures,

loose objects, and the ground at a specific location. Intensity generally increases with increasing magnitude and in areas underlain by unconsolidated materials,and decreases with distance from the epicenter. The approximate magnitude necessary to generate these effects is shown on the 1956 version of the Modified Mercalli intensity scale (appended). A map illustrating the locations of major faults and historic earthquakes is provided in **Figure D1**.

6.4.3 Evaluation of Peak Ground Acceleration

In compliance with criteria presented in the 2016 California Building Code (CBC) and ASCE 7-10, an updated Probabilistic Seismic Hazard Analysis (PSHA) was completed to evaluate the site peak ground acceleration for use in our liquefaction analyses.

The peak ground acceleration (PGA_M) consistent with maximum considered earthquake (MCE_R) ground motions was evaluated at the site for alluvial soil conditions (Site Class D) in accordance with ASCE 7-10. The mapped PGA_M adjusted for Site Class effects was determined using the U.S. Seismic Design Maps web tool by the United States Geological Survey (USGS) for a 2% probability of exceedance in 50 years (i.e. 2,475-year return period). Based on our evaluation, a probabilistic PGA_M of 1.02g would be produced by the maximum considered earthquake.

Site-specific evaluation of potential ground motions generally utilize multiple attenuation models to capture the uncertainty in both the source and the propagation of seismic waves to obtain a mean hazard. The PGA_M was determined for the site using a weighted average of accelerations estimated with ground motion prediction equations (GMPE) by Boore and Atkinson (2008), Campbell and Borzognia (2008), and Chiou and Youngs (2008).

6.4.4 Deaggregation of Fault Hazard

A probabilistic analysis evaluates a range of magnitudes from 5.0 to the maximum magnitude for each fault. However, the dominant magnitude which statistically generates the peak acceleration within a limited time period (e.g. 2,475 years) is typically less than the maximum magnitude for a given fault.

In order to evaluate what dominant magnitude-distance combination produces the PGA_M, the hazard was deaggregated using the USGS *Beta – Unified Hazard Tool* and an estimated average shear wave velocity ($V_{S,30}$) for the upper 100 feet (~30 meters) of 259 meters per second based on Site Class D soil conditions. Review of the magnitude-distance contributions to the hazard indicates that this acceleration would most likely be generated by a magnitude 6.79 earthquake on the Santa Susana fault located at a distance (Rrup) of less than 10 km from the project site, as shown graphically in **Figure D2**.

A magnitude weighting factor of $M_W^{2.56}/10^{2.24}$ from Youd and Idriss (1997) was used to normalize the MCE_R ground motions to an "equivalent" magnitude 7.5 event. Based on this relationship a weighted peak ground acceleration of 0.84g was used for evaluation of liquefaction potential at the site (see **Appendix C**).

6.4.5 Building Code Response Spectrum Parameters

The following maximum considered earthquake (MCE_R) ground motion parameters should be used for calculation of the 2016 California Building Code (CBC) response spectrum:

FACTOR	VALUE
Site Class	D
Site Coefficient, F_a	1.0
Site Coefficient, F_v	1.5
Short Period Spectral Response Acceleration Adjusted for Site Class, S_{MS}	2.888
1-Second Period Spectral Response Acceleration Adjusted for Site Class, S_{M1}	1.531
Design Spectral Response Acceleration at Short Period, S_{DS}	1.925
Design Spectral Response Acceleration 1-Second Period, S_{D1}	1.021

The values listed above were obtained in accordance with Section 1613.3 of the 2016 CBC for site coordinates of 34.4491°N, 118.6505°W using the U.S. Seismic Design Maps

7.0 GENERAL CONCLUSIONS AND RECOMMENDATIONS

7.1 Feasibility of Development

The Vesting Tentative Tract Map No. 60257 dated May 8, 2018 is feasible for development from a of geology/geotechnical standpoint provided our recommendations are followed and implemented during design and construction.

7.2 Earthwork and Grading Recommendations

7.2.1 Removals and Benching

In order to provide a uniform firm bottom prior to placing fill soil, unconsolidated alluvium, artificial fill, slopewash, colluvium, weathered terrace deposits, severely weathered bedrock, and landslide materials should be removed from areas to receive fill. The estimated depths of removals (excluding landslides) are 10 to 30 feet as shown on the **Geotechnical Map**. Additional alluvial removals are shown in limited areas where shear keys down to bedrock are recommended for mitigation of potential lateral spreading hazard (see Appendix C). Alluvial removals are also recommended below portion of existing Del Valle Road (see Geotechnical Map). Removals at the locations of exploratory

trenches shall be extended to the bottom of the trench backfill if the adjacent removal depths are shallower than the trench (see **Geotechnical Map** for locations). The excavated soils may be used as fill material.

Removal depths for these areas are based on our subsurface investigations, laboratory testing, proposed fill heights, intended use, and analysis results (including liquefaction, seismic settlement, and lateral spreading assessment) as well as geologic and geotechnical judgment. The exact depth and extent of necessary removals will be determined in the field during the grading operations when observations and more location-specific evaluations can be performed.

In areas to receive compacted fill where the surface gradient is steeper than 5:1 (H:V) the soil mantle, colluvium and unsuitable material should be removed and such areas benched horizontally into competent material prior to our in conjunction with fill placement (See **Appendix G, Fill Over Natural Slope**).

7.2.2 Dewatering During Removals

Dewatering may be required to achieve the recommended remedial removals depending on the season when these removals are performed. Ground water was encountered within the alluvium at depths as shallow as 20 feet during our subsurface exploration of the site in 2006 and the mapped historic high ground water level is at a depth of 10 ft; therefore, ground water has the potential to impede the grading operations where deep removals are needed. The grading contractor should be prepared to implement dewatering measures as necessary, if in the event ground water is encountered during the alluvial removals.

Where recommended removals encounter ground water, water levels will probably have to be controlled by providing an adequate excavation bottom slope and sumps for pumping water out as the excavation proceeds, or ground water may be lowered by installing shallow dewatering well points prior to grading. Partial removals of soils above the water table and soil improvement below the water table (e.g. shallow compaction grouting) may be another option.

7.2.3 Over-Excavation

It is recommended that a minimum 5-foot thick over-excavation be performed on all cut-lots, and transitional lots (transitions between bedrock, fill, terrace deposits and alluvium) and a minimum 3-foot thick over-excavation on streets. This over-excavation will provide attenuation of potential differential settlements or differential material response to seismic events and provide a uniform base for structural support of buildings. If on a cut/fill transition lot the maximum depth of fill exceeds 15 feet, then the thickness of the fill cap

should be one-third of the deepest fill thickness below any proposed structure (see **Appendix G, Over-excavation for Transitional Cut and Cut-Fill Lot**).

The bedrock of the Saugus Formation may contain expansive claystone beds that could cause differential expansion. If excavation of the bedrock exposes expansive materials below proposed structures, then the bedrock should be over-excavated beneath the proposed structures and replaced with a compacted fill. A minimum fill cap thickness of 8 ft is recommended to provide a surcharge of sufficient overburden pressure to limit bedrock expansion to acceptable levels for proposed structures. The building over-excavations required to achieve the minimum fill cap thickness are recommended to extend at least 8 feet outside the footprint of the building foundation. The fill cap thickness required to provide a surcharge of sufficient overburden pressure to limit expansion should be confirmed during the grading operations based on swell testing of potentially expansive beds.

7.2.4 Rippability

The bedrock encountered at the site consists primarily of siltstone and sandstone of the Saugus Formation. This formation generally is graded using typical grading equipment and techniques. Heavy single-shank ripping may be required within the more indurated portions.

7.2.5 Fill Materials

Onsite soils that are free of debris, over-size rocks, topsoil and organic matter may be used as sources for compacted fills. Rock or similar irreducible material with a maximum dimension greater than eight (8) inches may not be placed in the fill. Rocks or hard fragments larger than four (4) inches shall not compose more than 25 percent of the fill and/or lift. Any large rock fragments over eight (8) inches in size, may be incorporated into the fill as rockfill in windrows after being reduced to the specific maximum rock fill size (see **Appendix G, Rock Disposal**). Where fill depths are too shallow to allow large rock disposal, special handling or removal may be required.

7.2.6 Fill Compaction

All fill material should be placed in uniform lifts not exceeding eight (8) inches in its loose state, water conditioned to at least optimum moisture content, thoroughly mixed to obtain a near uniform moisture condition and uniform blend of materials, and compacted to a relative compaction to at least 90 percent of Maximum Dry Density (MDD), per ASTM D1557. For fills deeper than 40 feet, the portion of fill below a depth of 40 feet should be compacted to a relative compaction of at least 93 percent of MDD.

7.2.7 Construction of Fill Slopes

Fill slope inclination should not be steeper than 2:1 (h:v). The fill material within approximately one equipment width (typically 12 feet) of the slope face should be constructed with cohesive material obtained from on-site soils. The relative compaction requirement of the finished fill-slope faces depends on the construction method. A compaction of at least 90 percent of the MDD, per ASTM D1557, is for finished fill-slope faces constructed by over-building the slope, typically 2 ft vertically, and cutting back to the compacted fill material. If the fill-slope face is constructed basically on-grade then the outer 10 feet, measured horizontal from the slope face, shall be compacted to at least 92 percent of the MDD, per ASTM D1557.

Where fill slopes are constructed above natural ground with a gradient of 5:1 (H:V) or steeper, all topsoil, colluvium, and unsuitable material shall be removed and a keyway should be constructed at the toe of the fill slope with a minimum width of 15 feet, and a minimum depth of 3 feet into firm undisturbed earth (see **Fill Slope Over Natural Slope** detail in **Appendix G**). It is recommended that a minimum 15-foot width, measured horizontally from the slope face to the bench and/or backcut, be maintained.

Where fill slopes toe out on relatively level natural ground, the removals should be performed to a minimum 1:1 projection from the toe of slope to the recommended removal depth, (see **Fill Slope Toeing Out on Flat Alluviated Canyon** detail in **Appendix G**).

Where sliver fill-slopes are proposed, it is recommended that the slope be constructed with a minimum 15-foot width Stability Fill throughout, which is keyed in at the toe of slope (see **Stability/Buttress Fill and Backdrains** detail in **Appendix G**).

7.3 Shrinkage, Bulking and Subsidence

The following bulking and shrinkage factors are based on and in-situ densities compared to average of 92 percent relative to the maximum dry density as determined per the ASTM D 1557 test, judgment, and our past experience. For the materials encountered at the site, shrinkage (decrease in volume) or bulking of those materials, when excavated, placed and compacted as controlled fill is estimated to be as follows:

MATERIAL TYPE	SHRINKAGE (%)	BULKING (%)
Artificial Fill (af)	12 – 18	
Alluvium (Qal)	18 – 20	
Slopewash (SW)	18 – 20	
Terrace Deposits (Qt)	10 – 16	
Bedrock (TQs) 0-3′ depth[1]	4	

MATERIAL TYPE	SHRINKAGE (%)	BULKING (%)
Bedrock (TQs) >3' depth		0 – 6

[1] Denotes typical upper weathered zones in Saugus Formation (TQs) that are prone to shrinkage.

The above shrinkage, bulking and subsidence factors are only approximations. The actual volume changes from cut to fill depend on the quality or degree of compaction and mixing. The Supervising Civil Engineer should design pad grades with sufficient flexibility to accommodate a possible shortage or excess of fill of up to 10 percent of the total yardage graded.

7.4 Proposed Fill Slopes

Review of the VTTM indicates that fill slopes are proposed at a 2:1 gradient (h:v) or flatter. The maximum proposed fill slope height is 70 feet. Slope stability analyses performed on this 2:1 fill slope, which is considered to be the most critical fill slope (located at Cross Section 31-31'), indicates that the internal stability of proposed fill slopes on the VTTM satisfy the Los Angeles County factor of safety requirements for slope stability under static and pseudostatic loading conditions.

7.5 Proposed Cut-Slopes

We have identified 16 proposed 2:1 gradient or flatter cut-slopes (25± feet or higher) on the VTTM. These cut-slopes have been designated as CS-1 through CS-16 on the Geotechnical Map. The slope geometry, anticipated geologic conditions and recommended mitigation, if necessary, for each slope are presented in **Table 1 – Summary of Cut Slopes** located at the end of the text, and are shown on the Geotechnical Maps. Cross sections have been constructed to illustrate the anticipated geologic conditions relative to the VTTM design. The proposed cut slopes were evaluated and critical slopes that were analyzed within **Appendix E** satisfy the Los Angeles County factor of safety requirements for slope stability for static and pseudostatic loading conditions. See the Slope Stability Appendix for details.

If any of the smaller proposed cut-slopes (less than 25± feet in height) have adverse geologic or grading configurations (fill over cut) they can be mitigated if necessary with a standard 15 to 20-foot wide key (depending on the proposed cut-slope height) and benching similar to a Stability Fill.

Permanent cut-slopes should be constructed at a slope ratio not steeper than 2:1 (horizontal to vertical). All permanent cut-slopes in artificial fill, alluvium or slopewash should be constructed as a Stability Fill. Temporary cut slopes should be evaluated during the Grading Plan stage.

7.6 Natural Slopes

The natural slopes proposed on VTTM have gradients ranging from 5:1 to 1.5:1 (h:v). Natural slopes that are relatively steep and have accumulations of soil and slopewash are prone to debris flow hazard. Cross sections were constructed for analysis where natural slopes are in close proximity to the proposed building pads and/or the adverse geologic conditions either above or below the proposed building pads.

The easterly facing natural slope that ascends from the proposed residential Lots 18 through 20, designated as NS-1 on the Geotechnical Map, has been evaluated. The three-dimensional geometry of the Saugus Formation bedrock is illustrated on Cross Sections 5-5' and 6-6' which are constructed to illustrate the steep natural slopes adjacent to the development. The natural slopes evaluated within **Appendix E** do not satisfy the Los Angeles County factor of safety requirements for slope stability. A RUA is recommended at the toe of the ascending natural slopes for the rear portions of Lots 18 through 21. See **Appendix E** for details.

The south facing natural slope that descends in the vicinity of proposed residential Lots 142, 144, 145 and 152, designated as NS-2 on the Geotechnical Map, has been evaluated. The three-dimensional geometry of the Saugus Formation bedrock is illustrated on Cross Sections 24-24' through 27-27' which are constructed to illustrate the steep natural slopes adjacent to the development. The natural slopes evaluated within **Appendix E** do not satisfy the Los Angeles County factor of safety requirements for slope. A RUA is recommended at the top of the descending natural slopes, which is contained in Open Space Lot 246. The proposed lots that are setback for the natural slopes satisfy the Los Angeles County factor of safety requirements for slope stability under static and pseudostatic loading conditions. See **Appendix E** for details.

7.7 Landslides

Removal depth ranges for landslides located in areas of proposed development are shown on the attached **Geotechnical Map**. Discussion of the landslide and mitigation measures (if required) are discussed below.

7.7.1 Landslide Qls-1

Landslide Qls-1 on the western edge of the commercial site and a portion of the landslide is off-site. Cross Section 1-1' illustrates the interpreted geometry, proposed grades, and partial remedial removal of the landslide. The recommended removals at the toe of the landslide and proposed grades create a toe berm Buttress. Slope stability analysis on Cross Section 1-1' indicates this slope satisfies the Los Angeles County minimum safety factor

requirement of 1.50. Temporary backcuts for the Buttress should be evaluated during the grading plan stage.

7.7.2 Landslide Qls-2

Landslide Qls-2 is contained with the proposed commercial site lot. Proposed grades will remove the majority of the Landslide Qls-2. Based on proposed grading design the landslide will be grossly stable by inspection. Compressible landslide material shall be removed below proposed grade and replaced as compacted fill if a structure is proposed over the remaining landslide material. The required depth of removal should be evaluated at the grading plan stage. The landslide material below proposed grade may be left in-place if structures are not planned over the remaining landslide. LACDPW may require the remaining in-place landslide debris to be recorded as a Restricted Use Area (RUA) on the Final Map.

7.7.3 Landslide Qls-3

Landslide Qls-3 is contained within Open Space Lot 239. A debris basin has been incorporated into the VTTM design to contain the landslide material. The Slope Stability in Appendix E presents a post failure analysis for sizing of the debris basin.

7.7.4 Landslides Qls-4 and 5

Landslide Qls-4 will be completely removed by proposed grades. Landslide Qls-5 is recommended for complete removal.

7.7.5 Landslides Qls-6 through Qls-10

Landslide Qls-6 through Qls-10 are located within Open Space Lot 247 at the southeastern portion of the project. These landslides are interpreted to be translational failures. Cross Section 23-23' illustrates the interpreted geometry of Landslides Qls-6 and Qls-7. The proposed grading removes the top portion of these landslides. The proposed grading increases the gross stability of the landslides by reducing some of the driving force. Landslides Qls-8, Qls-9 and Qls-10 are outside the area of proposed development.

Landslides Qls-6 through Qls-10 should be designated as a Restricted Use Areas (RUA) on the Final Map.

7.8 Deep Fill Areas

The design grading of the subject site proposes some areas of deep fills (deeper than 40 feet). Due to the susceptibility of deeper fills to have a higher degree of settlement over time than thin fills, it is recommended that settlement monitoring be performed for some of the deeper fill areas. Delineation of fills deeper than 40 ft and settlement monument locations should

be performed at the Grading Plan stage. The Los Angeles County Grading Code requires a minimum compaction of at least 93 percent of Maximum Dry Density, per ASTM D1557, for fills placed deeper than 40 ft from proposed grade. This higher compaction requirement may reduce the amount of post grading settlement of the deeper fills.

7.9 Low Impact Development Facilities

7.9.1 General

Low Impact Development (LID) facilities for stormwater retention and infiltration are proposed at the following locations on the VTTM:

- Lot 236, located at the northeast corner of Sterling Parkway (proposed) and Hunstock Avenue (existing).
- Lot 237, located at the western property boundary just north of the proposed commercial site.
- Lot 241, located at the northern property line in Alluvial Canyon 3.

Evaluation of the infiltration basin locations has been performed in accordance with Administrative Manual GS200.2 (dated 6/30/17), *Guidelines for Geotechnical Investigation and Reporting, Low Impact Development Stormwater Infiltration*, prepared by the County of Los Angeles Department of Public Works, Geotechnical and Materials Engineering Division (GMED). Information contained in the Hydrology Study prepared by Sikand Engineering Associates, dated April 20, 2018, was used also used for site-specific seepage analyses, as detailed below.

Our evaluation included site-specific field and laboratory testing to measure infiltration rates of native alluvium at infiltration basin locations. The results of field and laboratory testing that was performed to assess the in-situ infiltration rate of on-site materials was previously presented in our Geotechnical Report dated May 9, 2018 (see reference 4). A detailed discussion of field and laboratory test procedures and results, existing subsurface conditions and soil properties, assessment criteria and methodology, and conclusions and recommended design (corrected) infiltration rates for each basin were presented therein. Our overall conclusions and design considerations relative to site infiltration and geotechnical hazards is discussed below.

7.9.2 Subsurface Conditions, Basin Parameters and Design Infiltration Rates

General subsurface conditions, basin parameters, and the recommended design infiltration rates are summarized herein for reference.

7.9.2.1 Basin 154A at Lot 240

This proposed infiltration basin will be underlain by alluvial soils and require 10 to 17 ft of cut to achieve proposed grade at the invert elevation. Based on the project Hydrology Study this basin has a footprint of 1.8 acres, a storage volume of 8.9 acre-feet, and a maximum retention height of 8 feet. A design (corrected) infiltration rate of 2.3 inches/hour was recommended based on a total reduction factor of $RF_T = 4$.

7.9.2.2 Basin 306A at Lot 241

This proposed infiltration basin will be underlain by alluvial soils and require 10 ft of cut to achieve proposed grade at the invert elevation. Based on the project Hydrology Study this basin has a footprint of 0.3 acres, a storage volume of 0.4 acre-feet, and a maximum retention height of about 3 feet. A design (corrected) infiltration rate of 2.3 inches/hour was recommended based on a total reduction factor of $RF_T = 4$.

7.9.2.3 Basin 203A at Lot 242

This proposed infiltration basin will be underlain by alluvial soils and require 1 to 9 ft of cut to achieve proposed grade at the invert elevation. Based on the project Hydrology Study this basin has a footprint of 1.6 acres, a storage volume of 6.5 acre-feet, and a maximum retention height of about 9 feet. A design (corrected) infiltration rate of 1.7 inches/hour was recommended based on a total reduction factor of $RF_T = 4$.

7.9.3 Transient Seepage Analysis

Analyses were performed to evaluate potential hazards to off-site property due to transient seepage emanating from the infiltration basin on Lot 240. Existing and proposed grades, existing downstream topography, and subsurface conditions were modeled using Slide (by RocScience) based on Cross Section 30-30'. The finite element groundwater seepage analysis option in the software was then used to model time-dependent changes in ground water conditions due to stormwater infiltration. Field and laboratory test data, including site-specific permeability test results, were used to model the subsurface profile and hydraulic properties of the soil. The following parameters were used:

Geologic Unit / Soil Description	Permeability (in/hr)	Residual Water Content (%)	Saturated Water Content (%)
Alluvium (Qal) – Sandy clay to silty, sandy clay	0.5	5	18
Alluvium (Qal) – Silty sand	1.7	5	18
Alluvium (Qal) – Silty sand to sandy silt	0.2	5	18
Alluvium (Qal) – Poorly graded sand with silt	3.0	5	18

Geologic Unit / Soil Description	Permeability (in/hr)	Residual Water Content (%)	Saturated Water Content (%)
Compacted Fill (Cf)	< 0.001	8	15
Saugus Formation Bedrock (TQs)	< 0.001	8	15

The infiltration component of the seepage model was based on data contained in the Hydrology Study and historic rainfall data for the general area on-file in this office. The following information and assumptions were used to generate a transient boundary condition at the basin invert elevation that is considered to be representative of normal seasonal storm events:

- Average seasonal rainfall of 18 inches.
- The LID Design Frequency storm event contributes to 85% of the seasonal rainfall, with an intensity of 1.05 inches per event. 15 storm events are assumed totaling 15.75 inches of rainfall.
- The LID Design Frequency storm event produces a volume of 4.07 ac-ft and equivalent water height of 4.2 ft at Basin 154A. Based on the design infiltration rate for this basin (2.3 inches per hour), the basin drawdown time is about 22 hours.
- A 5-year storm event will contribute 3.4 inches of rain; 1 5-year storm event is assumed, bringing the seasonal total to 19.15 inches.
- Following a 5-year storm event the volume remaining in Basin 154A is 7.7 feet. Based on the design infiltration rate the basin drawdown time for this event is about 40 hours.
- A total of 16 storm events were modeled at 10-day intervals over a period of about 150 days (i.e. from about November through March).

Water entering the basin from the storm events was modeled in the transient seepage analysis as a pressure head equivalent to the maximum water height produced by the storm event and reducing (with time) to zero at the end of the drawdown time. An initial steady-state ground water condition was assumed at a depth of 45 ft, equivalent to what was observed during the most recent site investigation. Six (6) time stages ranging from 15 days to 360 days were analyzed for the transient analysis to assess the potential impact of infiltration to the steady-state ground water level. Results of the analysis are presented on Figures F1 through F7 in **Appendix F**.

7.9.4 General LID Findings, Conclusions and Design Considerations

- Remedial grading required to mitigate seismically induced settlements at the project site will result in the removal of existing soils and replacement with compacted fill to depths of up to 30 feet below existing grades. It is recommended that these removals not be performed beneath planned infiltration basins to preserve infiltration rates.
- Based on seasonal high groundwater elevations and groundwater level monitoring data in June 2018, groundwater elevations are at least 10 feet below anticipated infiltration invert elevations.
- Based on transient seepage analysis, the steady-state ground water elevation is not expected to be significantly impacted beyond the project boundary by stormwater infiltration generated by normal seasonal rainfall; therefore, storm water infiltration is not anticipated to pose a risk of causing sewage effluent mobilization from septic pits, seepage lines, or other sewage disposal within existing developments downstream of the project site.
- Based on shallow historic high groundwater levels used to in our liquefaction evaluation and associated remedial removal depths, stormwater infiltration is not anticipated to increase the potential for liquefaction-induced seismic settlement.

7.10 Oil Wells

Review of the 2003 Munger Map book and the California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR) web page map (DOMSWRBMAP) indicates that the Fernando Oil Co. #1 oil well, which was drilled in the early 1920's, is present within the project limits. Oil well records on file with the DOGGR were obtained for this well and are included after the references. This well was abandoned in 1923 by the operator.

There is no physical evidence of a pad or road for the well location per the DOGGR records. Review of the 1928 aerial photographs indicate a road and possible pad approximately 350 ft southeast of the DOGGR location. Subsequently, a casing was exposed in this area and surveyed. This casing is assumed to be the Fernando Oil Co. #1 oil well. A surface plug was not observed in the casing. The oil well records indicate a plug from 30 ft to surface. The location of this oil well is shown on the Geotechnical Map.

DOGGR will require the future grading plans to be submitted for review relative to the proposed development relative to the oil well. It is opined that DOGGR will require that the well casing be adjusted to 5 ft below proposed grade. This well was abandoned, however

DOGGR will review of the original abandonment files relative to the proposed development and possibly require re-abandonment to the latest DOGGR requirements.

The 2017 County of Los Angeles Building Code, Chapter 1 Section 110.4 Methane Gas Hazards states:

> *Permits shall not be issued for new buildings or enclosed structures regulated by this Code on, adjacent to, or within 300 feet of active, abandoned or idle oil or gas well(s) unless designed according to recommendations contained in a report prepared by a registered design professional, such as a licensed civil engineer and/or licensed petroleum engineer, to evaluate whether such wells are being properly operated or maintained or abandoned. No permits shall be issued until documentation of proper operations, maintenance, or abandonment or reabandonment is submitted to and approved by the Building Official.*

It is our understanding that Los Angeles County Department of Public Works, Environmental Programs Division (EPD) guidelines, dictate that sub-slab methane barriers be installed for structures within 300 feet of an abandoned oil well.

7.11 Drainage Control

Ground water and soil moisture conditions can vary seasonally or for other reasons. It must be recognized that we do not and cannot have complete knowledge of the subsurface conditions at the site. It is possible that seepage could be encountered while stripping and excavating during site preparation at some areas (e.g. in drainages or along terrace/bedrock contacts on the site). Whenever seepage is observed, the condition must be evaluated by the Engineering Geologist and Geotechnical Engineer prior to covering with fill material.

7.11.1 Surface Drainage and Erosion Control

Surface drainage control design should include provisions for positive surface gradients to ensure that surface runoff is not permitted to pond, particularly above slopes or adjacent to building foundations or slabs. Surface runoff should be directed away from slopes and foundations and collected in lined ditches or drainage swales, via non-erodible drainage devices, which should discharge to paved roadways, or existing watercourses. If these facilities discharge onto natural ground, means should be provided for control erosion and to create sheet flow.

It should be expected that, even with the construction of carefully planned and designed erosion control measures, some erosion may occur during the first few wet seasons after the project is completed. Site grading should be observed, particularly after heavy,

prolonged rainfall, to identify erosion areas at an early stage. Maintenance work should be done as soon as practical to repair these areas and prevent their enlargement.

7.11.2 Subsurface Water Control

Fill slopes, Buttress Fill and Stability Fills, as applicable, shall be provided with subsurface drainage as necessary for stability. A typical backdrain detail is included in **Appendix G**. Also, subdrains along the bottom of canyon fills should be constructed (see **Canyon Subdrain** detail in **Appendix G**). Recommended locations for canyon subdrains shall be provided at the grading plan stage.

Compacted fill shear keys that extend down to bedrock and across canyons are recommended for mitigation of potential lateral spreading. Subsurface drainage through these shear keys will be required to prevent the build-up of pore water pressure and ground water elevations up canyon from the shear keys. Recommendations for subsurface drainage devices shall be provided at the grading plan stage.

7.12 Sewage Disposal

It is our understanding that sewage disposal will be by public sanitary sewers.

7.13 Restricted Use Areas

Areas of geologic hazards that will remain after the proposed grading and mitigation measures have been performed shall be shown on the Final Map as Restricted Use Area (RUA). The following recommended RUA's are shown on the Geotechnical Map.

A Restricted Use Area (RUA) is recommended for the graded area above the descending natural slope in the vicinity of Lots 142 through 152. A RUA is recommended for Landslides Qls-6 through Qls-10.

A RUA is recommended at the toe of the ascending natural slopes for the rear portions of Lots 18 through 21. It is our understanding based on discussion with the Los Angeles County Department of Public Works Geotechnical and Materials Engineering Division that this RUA can be part of the Lots if a maintenance easement of covenant is recorded on the Final Map.

7.14 Foundation and Settlement Considerations

No specific building foundation designs have been provided at this time. The following general foundation criteria are provided for future design and planning consideration. The proposed Vesting Tentative Tract Map may generally involve the following foundation support conditions:

- Foundation support within engineered fill
- Foundation support within transition zones of cut and fill

Shallow spread footings for foundation support of residential and commercial structures can adequately be founded on compacted fill. Support for heavier structures, if applicable, should be addressed at the Grading Plan stage. Minimum recommended continuous foundation dimensions are 12 inches width and 12 inches depth below lowest adjacent grade for residential and commercial structures. Tentatively, an allowable bearing capacity of **1,800 psf** can be used for (minimum-sized) shallow foundations constructed in certified compacted fill or bedrock. This tentative allowable bearing value should be confirmed by further field and laboratory testing of the site soils before use in design. Lateral resistance of footing walls should be provided at the Grading Plan stage.

The **Over-excavation for Transitional Cut and Cut-Fill Lots** detail included in **Appendix G** provides a grading detail for locations where foundations will straddle transition zones between cut and fill materials. If the remaining cut-fill transition is steep at depth below the building area, the geometry of the transition should be reviewed during grading operations by the soils engineer on a site-specific basis to evaluate the need for additional over-excavation removals and/or additional foundation reinforcement. As a general guideline, steep cut/fill transitions would include slope gradients steeper than 4:1 (h:v) and overall variations in fill thickness of greater than 15 feet which occur within 20 feet of final pad grade.

To minimize significant settlements, it is recommended that the unsuitable soils in areas to receive fills be removed and replaced with compacted fill. No specific foundation design loads are available at this time. Some settlements will be expected due to loads from high fills (e.g. higher than 30 feet). The locations of proposed deep fills (> 40 ft.) will be provided during the 40-Scale Grading Plan study. Most of the settlements due to the load of added fill will occur during and shortly after rough grading is complete. A settlement monitoring program for some of the deeper fill areas will be necessary at the completion of grading. A settlement monitoring program shall be presented during the 40-Scale Grading Plan study.

At other areas, potential settlements in alluvium will be minimized by the removals and recompaction recommended in this report. Also, potential effects from localized seismically-induced settlements will be attenuated by the recompacted upper layers and proposed additional fills (see **Appendix C**).

7.15 Building Setbacks

The standard setbacks from ascending and descending slopes provided in the Los Angeles County/California Building Code shall be followed. Proposed development areas impacted by natural slopes that do not meet the minimum factor of safety requirements for gross stability are shown as a Restricted Use Area (RUA) on the Geotechnical Map. These non-buildable areas should also be recorded as a Restricted Use Area on the Final Map. The standard building code setbacks from ascending and descending slopes shall be applied from the RUA line delineated on the Geotechnical Map.

7.16 Soil Compressibility Considerations

Based on consolidation testing performed for this project and estimated CPT-based static settlements under future fill loads, **compressibility** and hydro-compression (collapse) settlement potential of subsurface soils below the recommended removal depths are considered to be **low**. Proposed grades are not expected to be adversely affected by soil compressibility or by hydro-compression (collapse) settlement, provided that our recommendations are incorporated into project design and construction.

Due to the predominantly coarse-grained nature of the alluvial soils, it is anticipated that potential static settlement of alluvial soils beneath planned fills will generally occur during grading. However, the settlement monitoring program recommended for deep fill areas (to be established at the 40-scale plan review) may be expanded to assess and confirm completion of primary settlement of alluvial soils where future overburden pressures will be significantly higher than existing overburden pressures.

7.17 Expansive Soils Considerations

Soil expansion has been found to be a significant consideration for design and construction of foundations and concrete slabs-on-grade. The recommendations presented in the attached **Table G1, Minimum Foundation and Slab Recommendations for Expansive Soils**, in **Appendix G**, have been found to minimize the effects of soil expansion potential in southern California when followed during project design and construction. It is anticipated that compacted fill from the onsite materials will have a very low to medium expansion potential. The expansion potential of the site soils exposed at the completion of grading should be tested and the final foundation design should be based on those expansion test results.

7.18 Soil Corrosivity Considerations

The tested soil does not classify as corrosive to concrete. Pending additional testing, either Type I or II cement may be considered for use in concrete placed in contact with the ground.

The tested soil does not classify as corrosive to ferrous metals. However, it is recommended that the following precautionary measures be implemented to mitigate a less significant corrosion potential as indicated by the measured resistivity value:

- Steel and wire reinforcement in concrete structures cast against site soils should have at least 3 inches of concrete cover.
- Buried utilities made of ferrous metals should be protected with polyethylene extruded coating, or with tape over primer per AWWA Standard C209 or C203, or with hot-applied coal tar enamel, or as recommended by manufacturers of the utility conduits.
- Metallic pipes that penetrate concrete structures should be surrounded by plastic sleeves, rubber seals, boots, or other dielectric material in order to prevent contact between the pipe and the concrete structure.
- Below-grade ferrous metals should be electrically insulated (isolated) from above-grade metals.

Mitigating recommendations against soil corrosivity should be revised/expanded based on additional confirmatory tests that should be performed at the completion of the grading operations. Final recommendations for concrete will be in accordance with the latest CBC requirements, and a corrosion specialist should provide mitigating recommendations for potential corrosion of metals in contact with on-site soils.

7.19 Retaining Walls and Pavement Design

Geotechnical recommendations for the design and construction of retaining walls and vehicle pavements will be provided at the Grading Plan stage.

8.0 GEOLOGIST/GEOTECHNICAL ENGINEER OF RECORD

This report has been prepared assuming that Allan E. Seward Engineering Geology, Inc. will refine all geology and geotechnically-related data for the Grading Plan stage of this project. If the recommendations contained in this report are to be utilized and expansion of the geology/geotechnical work is performed by others, the party performing the work must review this report and assume full responsibility for recommendations contained herein. That party would then assume the title of responsibility as "Geologist/Geotechnical Engineer of Record" for the specific work.

9.0 LIMITATIONS

This report has been prepared for the exclusive use of Sterling Gateway, L.P. and their design consultants for the specific site discussed herein. This report should not be considered transferable. Prior to use by others, we should be notified, as additional work may be required to update this report.

In the event that any modifications in the design or location of the proposed development, as discussed herein, are planned, the conclusions and recommendations contained in this report will require a written review by this firm with respect to the planned modifications.

The proposed development is located in southern California, a geologically and tectonically active region, where large magnitude, potentially destructive earthquakes are common. Therefore, ground motions from moderate or large magnitude earthquakes could affect the site during the life of the proposed structure(s).

Typically, faulting is confined to the area adjacent to a known fault. However, absolute assurance against future fault displacement is not possible in tectonically active regions because new faults can form over time as the orientation and magnitude of deformational forces change in the earth's crust. Therefore, the location and magnitude of new ground surface ruptures during a seismic event cannot be anticipated.

In performing these professional services, this firm has used the degree of care and skill ordinarily exercised under similar circumstances by reputable geologists and geotechnical engineers practicing in this or similar localities. The data presented in this report are based on the results of pertinent field and laboratory testing. It should be recognized that subsurface conditions can vary in time, and laterally, and with depth at a given site and that the conclusions and recommendations presented in this report are based on our observations and testing. Therefore, our **conclusions** and **recommendations** are **professional opinions** and are **not meant** to be a control of nature. We make no other **warranty**, either **expressed** or **implied**.

This page intentionally left blank.

This opportunity to be of service is greatly appreciated. Please contact us if you would like to discuss this report further.

Respectfully submitted,

Eric J. Seward, CEG 2110
Principal Engineering Geologist
Vice President

Kevin P. Callahan, MS, GE 2989
Principal Geotechnical Engineer

Table 1 – SUMMARY OF CUT SLOPES

Proposed Cut-slope CS-1

Slope Parameters: 50± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Semicircular - easterly

Cross Section: 1-1'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) striking roughly east-west to N 80 E and dipping approximately 31-38° towards the south. This structural configuration is neutral to the proposed slope face. Landslide Qls-1 will be exposed at the southern portion of the slope. Slope stability analysis performed on critical Cross Section 1-1' indicates that slope mitigation is necessary to achieve the minimum factor of safety requirement for slope stability. Slope stability analysis on Cross Section 1-1', with a proposed remedial toe berm buttress fill, indicates this slope satisfies the Los Angeles County minimum factor of safety requirement of 1.50. **Calculated grossly stable**.

Mitigation Measures: Recommend that the southern portion of the slope be constructed as a **Buttress Fill** utilizing a 22 ft wide by 14 ft deep keyway.

Proposed Cut-slope CS-2

Slope Parameters: 33± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Semicircular - easterly

Cross Section: None

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) striking roughly east-west to N 80 E and dipping 36-37° towards the south. This structural configuration is neutral to the proposed slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-3

Slope Parameters: 30± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Southeast

Cross Sections: 2-2' and 3-3'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking roughly parallel to the slope face with 27-37° dips to the south, which are steeper than the proposed cut slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los

Table 1 – SUMMARY OF CUT SLOPES

Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-4

Slope Parameters: 34± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Southeast

Cross Sections: 8-8' and 9-9'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking parallel to the slope face with 27-37° dips to the south, which are steeper than the proposed cut slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-5

Slope Parameters: 31± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Southeast

Cross Section: None

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking roughly parallel to the slope face with 32-42° dips to the south, which are steeper than the proposed cut slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-6

Slope Parameters: 38± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Southeast

Cross Section: 4-4'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking roughly parallel to the slope face with 32-42° dips to the south, which are steeper than the proposed cut slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los

Table 1 – SUMMARY OF CUT SLOPES

Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-7

Slope Parameters: 122± feet high with a 3:1 (h:v) slope gradient

Direction Slope Faces: Semicircular – Southwest to south to southeast

Cross Sections: 8-8' 10-10' and 11-11'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding roughly striking east-west and dipping towards the south. Bedding dips towards the south at angles ranging from 17° near the upper portion of the slope where it nears the axis to the Oak Canyon Anticline to 38° near the bottom of the slope. Bedding illustrated on cross sections 10-10' and 11-11'indicate that the upper portion of the slope will have bedding plans (apparent dips) dipping out of the slope face. Slope stability analysis performed on critical Cross Section 11-11' indicate that this slope satisfies the Los Angeles County minimum factor of safety requirement of 1.50. **Calculated grossly stable**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-8

Slope Parameters: 118± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Northeast

Cross Sections: 12-12' and 13-13'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with the axis of the approximately east-west trending, east plunging Oak Canyon Anticline within the slope face. Stereonet analysis of bedding plane data from the fold limbs indicates that the fold is plunging approximately 11° towards the east. Cross section 13-13' is oriented along the fold axis and illustrates this bedding configuration relative to the slope face. North of the fold axis apparent dip of the bedding is 28° as illustrated on Cross section 12-12'. Slope stability analysis performed on critical Cross Sections 12-12' and 13-13' indicate that this slope satisfies the Los Angeles County minimum factor of safety requirement of 1.50. **Calculated grossly stable**.

Mitigation Measures: Not required.

Table 1 – SUMMARY OF CUT SLOPES

Proposed Cut-slope CS-9

Slope Parameters: 33± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Northeast, east and southeast

Cross Section: None

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) striking roughly east-west to N80E and dipping 20-34° towards the south. This structural configuration is neutral to the proposed slope face. Comparison of the slope parameters and geologic conditions of this slope to a more critical proposed cut slope (i.e. Cut-slope CS-8) that satisfies the Los Angeles County minimum factor of safety requirement of 1.50 indicates that this slope will also satisfy minimum safety factor requirements. **Grossly stable by comparison**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-10

Slope Parameters: 56± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: South to Southwest

Cross Sections: 14-14'and 15-15'

Anticipated Geologic Conditions: Anticipated to expose TQs bedrock mantled by a relatively thin thickness of terrace deposits (Qt). The terrace deposits are anticipated to be exposed at the top of the slope. The axis of the approximately east-west trending, east plunging Oak Canyon Anticline will be exposed within the proposed slope face. Stereonet analysis indicates an 11° plunge to the east. The Oak Canyon Fault is located approximately 150 ft north of the slope. Bedding on the north limb of the fold is anticipated to be dipping into the slope face. Bedding on the south limb is anticipated to be dipping out of the slope face. Slope stability analysis performed on critical Cross Section 15-15' indicate that this slope satisfies the Los Angeles County minimum factor of safety requirement of 1.50. **Calculated grossly stable**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-11

Slope Parameters: 50± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Northwest

Cross Sections: 16-16', 17-17', 18-18'and 19-19'

Anticipated Geologic Conditions: The eastern portion of this slope is anticipated to expose landslide deposits from designated Qls-B and Qls-C overlying bedrock (TQs) with the fold axis for the Oak Canyon Anticline. These landslide failures are circular as depicted on Cross Sections 16-16', 17-17' and 18-18'. The western portion of the slope is anticipated to expose artificial fill (af) and older alluvium (Qoa). Landslide deposits from designated

Table 1 – SUMMARY OF CUT SLOPES

Qls-A as well as bedrock (TQs) dipping into the slope face may also be exposed. Landslide Qls-A is also a circular type failure and is illustrated on Cross Section 19-19' and is attributed to local deformation along the fold axis and proximity to the Oak Canyon fault located to the north. Slope stability analysis performed on critical Cross Section 18-18' indicate that slope mitigation is necessary to achieve the minimum factor of safety requirement for slope stability. A Buttress Fill would be required to achieve the required factor of safety. The required width of the Buttress keyway would likely require the complete removal of the landslide material and slip surface for temporary stability. However, a 3:1 gradient slope satisfies the Los Angeles County minimum factor of safety requirement of 1.50 for gross stability. Slope stability analysis performed on Cross Section 19-19' satisfies the Los Angeles County minimum factor of safety requirement of 1.50 for gross stability. However, this slope is anticipated to be surficially unstable.

Mitigation Measures: It is recommended that the supervising civil engineer re-design the eastern portion of the is slope to a 3:1 gradient. In addition, it is recommended that this 3:1 slope be constructed as a **Stability Fill** utilizing a 25 ft wide by 5 ft deep keyway to mitigate surficial stability of the landslide debris exposed in the slope face. It is also recommended that the western portion of the proposed 2:1 slope be constructed as a **Stability Fill** utilizing a 15 ft wide by 3 ft deep keyway to mitigate surficial stability.

Proposed Cut-slope CS-12

Slope Parameters: 100± feet high, with a 2:1 (h:v) slope gradient

Direction Slope Faces: Northwest

Cross Section: 20-20'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) striking to the northeast and dipping to the south into the proposed slope face. This slope is anticipated to be **grossly stable**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-13

Slope Parameters: 33± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Northwest

Cross Sections: 21-21'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking to the east and northeast and dipping to the south into the proposed slope face. This slope is anticipated to be **grossly stable**.

Mitigation Measures: Not required.

Table 1 – SUMMARY OF CUT SLOPES

Proposed Cut-slope CS-14

Slope Parameters: 106± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: Westerly

Cross Sections: 22-22'

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking to the east and dipping to the south neutral to the proposed slope face. This slope is anticipated to be **grossly stable**.

Mitigation Measures: None

Proposed Cut-slope CS-15

Slope Parameters: 69± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: West to northwest

Cross Sections: None

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking roughly east-west and dipping 37 to 43° to the south. This configuration is considered neutral to the proposed slope face. This slope is anticipated to be **grossly stable**.

Mitigation Measures: Not required.

Proposed Cut-slope CS-16

Slope Parameters: 53± feet high with a 2:1 (h:v) slope gradient

Direction Slope Faces: North

Cross Sections: None

Anticipated Geologic Conditions: Anticipated to expose bedrock (TQs) with bedding striking roughly east-west and dipping 37 to 43° to the south into the proposed slope face. This slope is anticipated to be **grossly stable**.

Mitigation Measures: Not required.

SOIL CLASSIFICATION CHART

MAJOR DIVISIONS			SYMBOLS GRAPH	SYMBOLS LETTER	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS (MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE)	GRAVEL AND GRAVELLY SOILS (MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE SIZE)	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	Well-graded gravels, gravel-sand mixtures, little or no fines
				GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
		GRAVELS WITH FINES (APPRECIABLE AMOUNT OF FINES)		GM	Silty gravels, gravel-sand-silt mixtures
				GC	Clayey gravels, gravel-sand-clay mixtures
	SAND AND SANDY SOILS (MORE THAN 50% OF COARSE FRACTION PASSING ON NO. 4 SIEVE SIZE)	CLEAN SANDS (LITTLE OR NO FINES)		SW	Well-graded sands, gravelly sands, little or no fines
				SP	Poorly-graded sands, gravelly sands, little or no fines
		SANDS WITH FINES (APPRECIABLE AMOUNT OF FINES)		SM	Silty sands, sand-silt mixtures
				SC	Clayey sands, sand-clay mixtures
FINE GRAINED SOILS (MORE THAN 50% OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE)	SILTS AND CLAYS	LIQUID LIMIT LESS THAN 50		ML	Inorganic silts and very fine sands, clayey silts with slight plasticity
				CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
				OL	Organic silts and organic silty clays of low plasticity
	SILTS AND CLAYS	LIQUID LIMIT GREATER THAN 50		MH	Inorganic silts, micaceous or diatomaceous fine, sandy or silty soils, elastic silts
				CH	Inorganic clays of high plasticity, fat clays
				OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS				PT	Peat and other highly organic soils

Notes:
(1) Dual USCS symbols, such as SP-SM, denote 5 to 12% of minor constituent.
(2) Dual USCS symbols, such as SM/ML, denote borderline soil classifications.
(3) Subsurface information from boring and test pit logs depict conditions only at the specific locations. and dates indicated. Soil conditions and water levels at other locations may differ from conditions at these locations. Also, the conditions at these locations may change with time.
(4) Blow counts on logs are the number of blows to drive the sampler with the weight and drop height indicated on each log.
(5) Split-barrel sampler driving record applies only to hollow-stem-auger and rotary-wash borings.
(6) These logs are subject to the limitations, conclusions, and recommendations in this report.

HS: Hollow-stem-auger boring
RW: Rotary-wash boring
B: Bucket-auger boring

SAMPLE TYPE

STANDARD PENETRATION TEST
Split barrel sampler in accordance with ASTM D-1586 Test Method

CALIFORNIA DRIVE
Split-barrel sampler in accordance with ASTM D-3550 Test Method

DISTURBED CALIFORNIA DRIVE

SHELBY TUBE
Thin-walled sampler in accordance with ASTM D-1587 Test Method

BULK SAMPLE

NO RECOVERY
