Appendix B

APPENDIX B

GEOTECHNICAL LABORATORY INVESTIGATION

1. General

   a. The laboratory investigation used current, accepted test procedures of the American Society of Testing and Materials (ASTM) and/or California Test Standards, wherever practical.

   b. Bulk samples, Standard Penetration Test samples, and Modified California ring samples were obtained during the field investigation. Laboratory sample identification is by project name and number, boring number or trench number, and depth.

1. Geotechnical Index Parameter Tests

   The following Geotechnical Index Parameters tests were performed on samples of in-situ soil/rock collected during the field exploration.

TEST TYPE	NUMBER OF TESTS PERFORMED	TESTING STANDARD
In-situ Moisture Content and Dry Density	37	ASTM D2216 and D7263
Percent-Finer Than #200 Sieve	29	ASTM D1140
Particle-Size Analysis	2	ASTM D422 and D1140
Atterberg Limits	1	ASTM D4318
Expansion Index	2	ASTM D4829

   The purpose of each test type is briefly described below.

   a. In-Situ Moisture Content (ASTM D2216) and Dry Density (ASTM D7263) testing of soils provide an indication of the strength and compressibility of in-situ soils. These data, in conjunction with sampler blow count data, aid in evaluation of soil consistency and in selection of samples for additional laboratory testing. Results of Moisture Content and Dry Density testing are recorded on the Boring and Trench Logs within **Appendix A**.

   b. Percent Finer than #200 Sieve (ASTM D1140) testing was performed on soil samples to aid in classification of the samples in accordance with the Unified Soil Classification System (USCS). Results of Percent Finer than #200 Sieve testing are recorded on the Boring and Trench Logs within **Appendix A** and on applicable laboratory test reports in this Appendix.

   c. Mechanical particle-size analyses of soil fractions larger than 75 microns (No. 200 sieve) and hydrometer analyses of soil fractions smaller than 75 microns were conducted to aid in classification of soils in accordance with the Unified Soil

APPENDIX B

Classification System (USCS). Results of the Particle Size Analysis testing are presented on Lab Report **Figure B1.1** through **B1.9** in this Appendix.

d. Liquid Limit and Plastic Limit tests (ASTM D4318) aid in classification of soils in accordance with the USCS. Results of the Liquid Limit and Plastic Limit testing performed on a selected soil sample are presented on Lab Report **Figure B2** in this Appendix.

e. Expansion Index tests (ASTM D4829) are used to assess expansion potential of soils when inundated with water. Results of Expansion Index testing performed on site soils are presented in the following table.

Sample Location	USCS	% Fines	Expansion Index	Expansion Potential
T-5A & T-17A Mix	SC	40.0	6	Very low

2. Geotechnical Engineering Parameters Tests

The following Geotechnical Engineering Parameters Tests were performed on Modified California ring samples of soil/rock collected at the project site.

Test Type	Number of Tests Performed	Testing Standard
Modified Proctor	2	ASTM D1557
Collapse of Soils	3	ASTM D4546
Direct Shear	20	ASTM D3080
Consolidation	2	ASTM D2435
Permeability	6	ASTM D5084 (Method C)

The purpose of each test type is briefly described below.

a. Modified Proctor (ASTM D1557) tests were performed on selected bulk samples to assess their compacted moisture-density relationship for future use during grading operations. Results of the Modified Proctor tests are presented on **Figures B3.1** and **B3.2** in this Appendix.

b. One-dimensional Collapse of Soils (ASTM D4546) testing was performed on California drive ring samples to assess the hydro-compression potential of alluvial soils when inundated with water under future loading conditions. The samples were incrementally loaded to normal pressures ranging from 200 to 6,400 psf in accordance with Procedure B. The "hydro-compression" was taken as the percent strain when inundated with water under an applied pressure approximately equal to the existing overburden pressure plus future applied foundation bearing pressure at that depth. Results of collapse testing are presented on **Figures B4.1** through **B4.3** in this

Appendix.

c. Direct Shear (ASTM D3080) testing was performed on a mixture of soil from Trenches (remolded to approximately 90 percent of maximum dry density) and on California drive ring samples of bedrock, landslide, terrace deposits and alluvium using a displacement-controlled Direct Shear machine. Prior to shearing, the samples were inundated and consolidated under normal pressures ranging from 1,500 psf to 12,000 psf. Thereafter, the samples were sheared horizontally at a controlled displacement rate until the horizontal shear force reduced to a stable value. For remolded specimens, material passing the No. 4 sieve was used. Results of the Direct Shear testing, including interpreted peak strength and residual shear strength parameters, are presented on **Figures B5.1** through **B5.17** within this Appendix.

d. One-dimensional Consolidation (ASTM D2435) testing was performed on selected ring samples to assess in-situ soil compressibility at applied vertical pressures ranging from 400 psf to 12,800 psf. The soil samples were allowed to consolidate under each applied pressure until the rate of settlement was less than 0.0002 inches per hour. Results of the consolidation testing are presented on **Figures B6.1** and **B6.2** in this Appendix.

e. Permeability tests were performed[1] in a tri-axial compression cell on three (3) selected Modified California ring samples of coarse-grained alluvial soils. The permeability testing was performed in accordance with ASTM D5084 (Method C). Confining pressure approximately equal to the existing over-burden pressure (ranging from about 1,500 to 3,200 psf) was applied to the samples prior to testing. Results of the permeability testing are presented on the attached **Figures 7.1** through **7.6**, prepared by Fugro, in this Appendix.

4. Corrosion Tests

The following corrosivity tests were performed on a mixture of bulk samples of bedrock and alluvial soil obtained at the project site.

TEST TYPE	NUMBER OF TESTS PERFORMED	TESTING STANDARD
Sulfate-Content	1	California Test Method 417
Chloride-Content	1	California Test Method 422
Resistivity and pH	1	California Test 643

[1] Permeability testing was performed in the laboratory of Fugro West, Inc., in Ventura, California.

APPENDIX B

Soluble Sulfates Content, Chloride Content, Resistivity, and pH tests were performed to evaluate corrosivity of soil/rock material from the project site to concrete, ferrous metals, and non-ferrous metals. Results of the testing are presented in the following table.

LOCATION	USCS	RESISTIVITY	CHEMICAL ANALYSES		
		SATURATED (OHM-CM)	pH	CHLORIDE Cl (PPM)	SULFATE SO_4 (%)
T-5A & T-17A Mix	SC	1295	7.6	42	0.02

The following attachments complete this Appendix.

APPENDIX C

EVALUATION OF LIQUEFACTION POTENTIAL AND ASSOCIATED GROUND FAILURE

1. Introduction

Potential at the site for seismic soil liquefaction and for associated ground failure (i.e., earthquake-induced settlement, lateral spread displacements, surface manifestations, and loss of bearing capacity) has been assessed by Allan E. Seward Engineering Geology, Inc. (AESEGI) using data from Cone Penetration Test (CPT) soundings. Soil Behavior Type (SBT) data and apparent fines content (FC) interpreted from a representative CPT sounding (CPT-3) were correlated with visual classifications of soils observed in adjacent hollow-stem auger boring HS-3 and with results of geotechnical index tests performed on selected soil samples from the boring, as discussed herein. The calculation procedures described in the following references were used herein for assessment of liquefaction potential (and associated ground failure):

- *Cyclic Liquefaction and its Evaluation Based on the SPT and CPT*, by Robertson and Wride, 1997.
- *Liquefaction Resistance of Soils: Summary Report* (NCEER/NSF, 2001), by Youd, Idriss, et al.
- *Performance-based Earthquake Design using the CPT*, by Robertson, 2009.
- *Interpretation of Cone Penetration Tests – A Unified Approach*, by Robertson, 2009.
- *SPT-Based Probabilistic Assessment of Seismic Soil Liquefaction Potential*, by Cetin, et. al., 2004.
- *Evaluation of Settlements in Sands Due to Earthquake Shaking*, Tokimatsu and Seed, ASCE, August, 1987.
- *Estimating Liquefaction-Induced Lateral Displacements using the Standard Penetration Test or Cone Penetration Test*, by Zhang et. al., 2004.
- *Evaluation of Flow Liquefaction and Liquefied Strength using the Cone Penetration Test*, by P.K. Robertson, ASCE, August, 2010.

APPENDIX C

Our analyses of liquefaction potential and associated phenomena at the site were performed in accordance with the guidelines and requirements contained in the following documents:

- *Review of Geotechnical Reports Addressing Liquefaction*, memorandum from Los Angeles County Department of Public Works (LACDPW), dated February 24, 2009.
- *Special Publication 117A: Guidelines for Evaluating and Mitigating Seismic Hazards in California*, revised and re-adopted by California State Mining and Geology Board, September 11, 2008.
- *Manual for Preparation of Geotechnical Reports*, LACDPW, July 2013.

2. Data and Assumptions

Factors that affect potential for liquefaction triggering at the site include estimated ground motion parameters, engineering characteristics of site soils, historic high ground water depth, and proposed grading (i.e., removals and/or raising of grade).

a. Estimated Ground Motion Parameters

Based on our probabilistic seismic hazard analyses (PSHA) the Peak Ground Acceleration (PGA_M) at the site, consistent with maximum considered earthquake (MCE_R) ground motions and generated by a magnitude 6.79 earthquake, is 1.02g. This magnitude-acceleration pair is considered to be equivalent to a magnitude 7.5 earthquake (i.e., the "standard" magnitude used to evaluate liquefaction triggering) and a corresponding PGA of 0.79g. This magnitude-acceleration pair was used in our liquefaction potential analyses.

b. Engineering Characteristics of Site Soils

Engineering characteristics of site soils were interpreted from Cone Penetration Test (CPT) corrected cone resistance (q_t) and friction ratio (R_f) and used herein for assessment of soil liquefaction potential and associated seismic settlements and lateral spread displacements. The interpreted soil characteristics include Soil Behavior Type (SBT) and SBT Index (I_c), apparent fines content (FC), relative density (D_r), and liquefied shear strength ($s_{u,liq}$).

The appended CPT logs include raw q_c and R_f data, as well as interpreted SBT classification, SBT Index (I_c), correction factor for grain size (K_c), and equivalent Standard Penetration Test (SPT) blow count data adjusted to 1.0 ton/ft^2 effective vertical soil pressure ($N1_{60}$). These interpreted data were calculated using the procedures in the referenced article by Youd and Idriss (2001) with updates by Zhang et. al. (2002) and Robertson (2009). The CPT logs are presented in **Appendix A**.

APPENDIX C

Per the guidelines of SP117A, the accuracy of the CPT interpretations used for assessment of liquefaction potential should be checked by comparison with data obtained from a correlation boring adjacent to a representative CPT sounding. The visual classifications of soils and results of laboratory testing (measured fines content) on select soil samples from hollow-stem auger boring HS-3 were used to check the SBT classification and apparent fines content (FC) interpreted from adjacent CPT-3. Additionally, boring $N_{1,60}$ values from SPT blow count data were used to check the equivalent SPT $N_{1,60}$ values interpreted from the CPT. The classifications of soils and blow count data obtained from boring HS-3 are generally consistent with data interpreted from adjacent CPT-3. However, the apparent fines content interpreted from the CPT is typically less (and more conservative) than the measured fines content from the boring. Therefore, it may be concluded that the data interpreted from the CPT soundings at the site are an accurate representation of soil conditions at the site and that data from the CPT soundings at the site are appropriate for use in interpretation of liquefaction potential.

c. Ground Water Depth

Based on measurements taken at the CPT sounding and boring locations at the site during the various phases of subsurface exploration, ground water was encountered as shallow as 20 feet. As discussed in the Ground Water section of the report, the historic high ground water depth at the site is shown as 10 feet on the seismic hazard map. The measured and historic high ground water depths at the location of each CPT soundings and boring analyzed are shown on the **Analysis of Liquefaction Potential** sheets at the end of this appendix (**Figures C1.1** through **C1.20**).

Effective vertical soil pressure based on measured ground water depths at the time of the exploration (if encountered) was used in our calculations to adjust CPT tip resistance and friction ratio data to the standard effective vertical soil pressure (i.e., 1.0 ton/ft^2), and ultimately for calculation of the soils cyclic resistance to earthquake shaking. Effective vertical soil pressure based on the historic high ground water depth was used to estimate cyclic shear stress that would be induced by earthquake shaking.

d. Proposed Grading

The liquefaction potential analyses were performed herein for the remedial removals and replacements as shown on **Table C1.**

APPENDIX C

3. Methods of Analysis

a. Liquefaction Potential

Liquefaction is a phenomenon in which pore water pressure generated by earthquake shaking causes sudden, temporary reduction or loss of shear strength in saturated soils with negligible to low plasticity. Structures founded on liquefied soils may experience subsidence and/or lateral movement.

Analyses to evaluate liquefaction potential typically are performed by a method first proposed by Seed and Idriss (1970) and subsequently revised by Youd and Idriss (2001). In these methods, estimated earthquake-induced cyclic shear stress in the ground is compared with cyclic shear strength (i.e., soil resistance to liquefaction) derived empirically from earthquake case histories.

The Youd and Idriss (2001) methodology with updates by Robertson (2009) was used herein for evaluation of liquefaction potential. This procedure estimates cyclic shear strength against liquefaction based on in-situ effective vertical soil pressure, cone resistance (q_t) and friction ration (R_f) data normalized to 1.0 ton/ft^2 vertical effective soil pressure, and fines content data estimated from the normalized q_t and R_f data. The normalized cone resistance ($Q_{t,1N}$) and normalized friction ratio (F_r) values and the interpreted apparent fines content (FC) values are summarized on the **Analysis of Liquefaction Potential** sheets at the end of this appendix, **Figures C1.1** through **C1.19**.

Normalized CPT cone penetration resistance ($Q_{t,1N}$) is used to calculate the Cyclic Resistance Ratio (CRR) for clean sandy soils subjected to magnitude 7.5 earthquakes. Normalization of the tip resistance is performed using the following equations (from Robertson, 2009):

$$C_N = (p_a/\sigma'_o)^n, \quad C_N \leq 2.0,$$
$$Q_{t,1N} = [(q_t - \sigma_o) / p_a] \cdot C_N$$

where: n = variable stress exponent ≤ 1.0
σ'_o = effective vertical soil pressure [tsf]
σ_o = total vertical soil pressure [tsf]
p_a = reference pressure [tsf]
q_t = CPT cone resistance [tsf]

$Q_{t,1N}$ is further corrected for fines content in order to obtain an equivalent clean sand CPT tip resistance value $(Q_{t,1N})_{cs}$ (per Youd and Idriss, 2001, and Robertson, 2009).

APPENDIX C

$(Q_{t,1N})_{cs}$ is used to calculate the Cyclic Resistance Ratio (CRR) against liquefaction (per Youd and Idriss, 2001).

The earthquake-induced cyclic shear stress ratio (CSR or τ_{av}/σ'_v) for each depth in question is calculated using the following equation (by Youd and Idriss, 2001):

$$\tau_{av}/\sigma'_v = 0.65 \cdot (a_{max}/g) \cdot \sigma_o/\sigma'_v \cdot r_d$$

where: a_{max}/g = Peak ground acceleration (PGA_M) at the ground surface divided by the acceleration of gravity

σ_o = Total vertical soil pressure at the depth in question

σ'_v = Effective vertical soil pressure at the depth in question

r_d = Shear stress reduction factor to account for soil deformability at the depth in question

Cyclic Resistance Ratio (CRR) vs. corrected cone-tip resistance $(Q_{t,1N})_{cs}$ curves (based on case histories of clean sands subjected to earthquakes with a magnitude of about 7.5) are presented by Youd and Idriss (2001). Soils with $(Qt,_{1N})_{cs}$ and CSR values that plot above these curves are potentially liquefiable, and soils with $(Q_{t,1N})_{cs}$ and CSR values that plot below these curves generally are not liquefiable. In accordance with the guidelines of the County of Los Angeles Department of Public Works, a soil deposit is considered to be potentially liquefiable if its factor of safety against liquefaction (i.e., CRR divided by CSR) is less than 1.3.

Values of the factor of safety against liquefaction for the soil profiles in each of the CPT logs are calculated at 6-inch intervals using fines content corrected values of tip resistance $(Q_{t,1N})_{cs}$ (per Youd and Idriss, 2001, and updated by Robertson, 2009). A typical spreadsheet with Liquefaction Triggering Analysis calculations is included as **Figure C2.1**.

b. Earthquake-Induced Settlement of Soils

Soils that liquefy as a result of earthquake shaking can densify as earthquake-induced excess pore water pressure in the soil dissipates. Likewise, earthquake shaking can densify predominantly granular, saturated soils (with low liquefaction potential) and unsaturated soils. Soil densification of potentially liquefiable soils and earthquake-induced soil densification that occurs in the absence of liquefaction are both included in our earthquake-induced settlement estimates.

APPENDIX C

The procedures described in Tokimatsu and Seed (1987) are used herein for estimation of earthquake-induced densification of sands that occurs as the result of liquefaction and that occurs in the absence of liquefaction. The Tokimatsu and Seed method is discussed below.

One-dimensional volumetric strain of unsaturated sandy soils caused by earthquake shaking is estimated based on $N1_{60}$ values (estimated from the CPT sounding data) and earthquake-induced cyclic shear strain (estimated using the $N1_{60}$ values and the CSR). This one-dimensional shear strain is doubled in order to estimate volumetric strain produced by multi-directional earthquake shaking. Settlement is calculated by multiplying the volumetric strain value by the thickness of the soil layer. This procedure for estimating earthquake-induced densification was developed based on data from clean to slightly silty sands, therefore the $N1_{60}$ values estimated based on the normalized CPT tip resistance ($q_{c,1N}$) of unsaturated soils were corrected for fines content.

Volumetric strain of saturated sands caused by earthquake shaking is evaluated using $N1_{60}$ values (estimated from the CPT sounding data) and earthquake-induced cyclic shear strain (estimated from the $N1_{60}$ values and the CSR). Since the volumetric strain obtained from the analysis method for saturated sands includes the effect of multi-directional earthquake shaking, it is not necessary to double the volumetric strain calculated for saturated sand deposits. Although this procedure for calculation of volumetric strains strictly applies only to saturated clean sands, the estimated $N1_{60}$ values are corrected for fines content as described in SP 117. Settlement is calculated by multiplying the thickness of the saturated soil layer by the volumetric strain.

A typical spreadsheet with Cyclic Settlement Analysis calculations is included as **Figure C2.2**.

c. Potential for Lateral Spreading

Regression equations for potential lateral spread displacement associated with liquefaction of soil beneath a gently sloping site are presented in the referenced article by Zhang, et al (2004). According to these equations, the magnitude of lateral spreading displacement depends on the factor of safety (FS) against liquefaction (evaluated using the CPT-based method described above), thickness of liquefied layers, maximum cyclic shear strains of saturated sands under seismic loading (γ_{max}), relative density (D_r), grain size characteristics and percent fines, and ground surface geometry. The effects of earthquake characteristics on lateral spread displacements, including magnitude, PGA, and site to fault distance, are assumed to be quantified by

their effects on FS determined in the liquefaction analysis. The effect of fines content on lateral spreading is assumed to be similar as on liquefaction triggering. The equivalent clean sand normalized cone resistance, $(Q_{t,1N})_{cs}$ is used to account for fines content when estimating γ_{max}.

In summary, the $(Q_{t,1N})_{cs}$ and FS estimated from the CPT-based evaluation of liquefaction potential were subsequently used to estimate γ_{max} from the regression equations for different values of relative density, Dr, where,

$$D_r = -85 + 76 \log (Q_{t,1N})_{cs} \qquad (Q_{t,1N})_{cs} \leq 200$$

Integrating γ_{max} with depth yields a value defined as the Lateral Displacement Index (LDI) that quantifies potential for lateral displacement. Based on the analyzed case histories where lateral displacement was observed, empirical correlations were developed to estimate lateral displacement (LD) based on the calculated LDI, ground slope, and/or free face height and distance to free face.

The data base used to develop the lateral spread displacement regression equations is based on case histories in which the liquefiable layers extended laterally for substantial distances without being impeded by boundary effects. It may be inferred that significant lateral spreading has not been observed at narrow sites that are bounded by denser soils or bedrock, or at sites where liquefiable layers are laterally discontinuous. In addition, significant lateral spreading is expected only if a site is underlain by a **laterally continuous**, liquefiable layer of sufficient thickness that has a relative density that corresponds to an equivalent **$N1_{60}$ blow count ≤ 15**. Per the guidelines established by the County of Los Angeles Department of Public Works, soil layers with equivalent $N1_{60}$ blow counts < 15 should be evaluated for lateral spreading hazard. For the CPT-based analyses included herein, potentially liquefiable soil layers (i.e. safety factor against liquefaction ≤ 1.3) with a corrected CPT cone resistance of $(Q_{t,1N})_{cs} \leq 84$ (equivalent to an $N1_{60}$ blow count of 15 with correction for fines content) were included in the evaluation.

The estimated maximum cyclic shear strains and cumulative lateral displacements at the location of each CPT sounding analyzed are shown on the CPT-Based Evaluation of Liquefaction-Induced Lateral Displacement sheets at the end of this appendix (**Figures C3.1** through **C3.16**). A typical spreadsheet with Lateral Spread Displacement Calculations is included as **Figure C4.1**.

APPENDIX C

d. Surface Manifestations and Loss of Bearing Capacity

Surface manifestations of liquefaction, such as sand boils and fissures, do not occur provided there is a sufficient thickness of non-liquefiable soil over potentially liquefiable soil layers with low blow count (i.e. $N1_{60} \leq 10$). Although there is no analytical model available for evaluating the required thickness of this cover, an empirical model for estimation of the cover thickness needed to mitigate surface manifestations of liquefaction was developed by Professor Kenji Ishihara ("Stability Of Natural Deposits During Earthquakes", Proceedings of 11th ICSMFE, 1985) based on a limited number of case histories of vertically continuous liquefied sand deposits subjected to peak horizontal ground acceleration values up to about 0.5g.

4. Results of Analysis

a. Liquefaction Potential Assessment

Results of our liquefaction potential assessment for analyzed CPT sounding and boring locations at the site are graphically summarized herein on individual sheets (**Analysis of Liquefaction Potential - Figures C1.1** through **C1.20**). These sheets present plots of depth vs. normalized CPT cone resistance and friction ratio, fines content interpreted from the CPT data, cyclic shear stress induced by earthquake shaking, resistance to liquefaction caused by cyclic shear stress, and cumulative settlement that would be caused by earthquake shaking (before and after recommended removals). The sheets also display ground water depths at the time of the CPT soundings and estimated historic high ground water depths. Based on data from our CPT soundings, potentially liquefiable soil layers are present at depths ranging from 10 feet (historic high ground water level) to 50 feet (maximum depth analyzed).

b. Earthquake-Induced Settlement

The results of the analyses of potential earthquake-induced settlement are presented in column (d) of Figures C1.1 through C1.20. Based on these analyses, potential earthquake-induced total settlement at the site range from about 2.0 to 7.1 inches.

The Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division (GMED) has developed criteria to determine when structural mitigation and ground improvement is required to mitigate seismically-induced settlement. Total seismic settlements up to 4 inches and differential seismic settlements up to 1 inch (over a horizontal distance of 30 feet) can be mitigated using structural methods, such as additional foundation reinforcement or alternate

foundation types. Calculated settlements in excess of these values would warrant ground improvement, or a combination of ground improvement and structural methods.

Remedial removals are proposed to reduce total seismic settlement generally to less than 2.0 inches and differential seismic settlement to less than 1.0 inch, in order to avoid alternate ground improvement methods.

c. Lateral Spreading

As stated above, significant lateral spreading is expected only if a site is underlain by a laterally continuous liquefiable layer that a relative density that corresponds to a corrected CPT cone resistance of $(Q_{t,1N})_{cs} \leq 84$. Based on our evaluation of lateral spreading hazard, laterally continuous, potentially liquefiable layers with substantial thicknesses of material with a relative density that corresponds to $N1_{60} \leq 15$ blows/ft were identified at most CPT locations analyzed within Alluvial Canyons 1, 2 and 3. Therefore, the risk of lateral spreading at these locations is **moderate to significant**. Within Alluvial Canyon 4, similar soil conditions were observed (HS-8A and HS-9A). However, due to the orientation of proposed fill slopes (slope faces descend across canyon) and confinement of the slopes provided by the bedrock topography, the potential for lateral spreading hazard is considered low.

d. Surface Manifestations

Based on the proposed grading, a cap of non-liquefiable material at least 15 ft in thickness will be present over potentially liquefiable soils within the tract boundaries where structures are proposed. The thickness of the non-liquefiable surface layer and the effective thickness of underlying liquefiable layers with interpreted $N1_{60}$ blow counts ≤ 10 following the recommended removals were reviewed at each analyzed CPT location. Based on this review, the effective thickness of potentially liquefiable layers with low interpreted blow counts is predominantly < 1 ft. The one exception is at CPT-3 where 5.3 feet of potentially liquefiable layers (with low blow counts) will remain following removals. Using the Ishihara model in conjunction with the thickness of potentially liquefiable soils with low blow counts that would remain following the removals (see Summary of Estimated Cyclic Settlements and Removal Depths, **Table C4**), the thickness of the cap of non-liquefiable materials above the remaining potentially liquefiable materials will be sufficient to mitigate the hazard of surface manifestations of liquefaction.

APPENDIX C

e. Conclusions and Recommendations

The principle findings of our liquefaction analyses are as follows:

- Layers of potentially liquefiable alluvial soils are present at the site at depths ranging from about 10 ft to 50 ft. Potential liquefaction and earthquake-induced densification of these soils could cause total ground settlement at the site up to about 7.1 inches. The corresponding differential ground settlement (between locations of adjacent footing foundations or over a horizontal distance of 30 ft) would be up to about 3.5 inch. Since this potential differential settlement exceeds the maximum potential differential settlement considered to be tolerable by Los Angeles County (i.e., 1 inch), removal of in-situ site soils and replacement with compacted fill are recommended as shown on the Geotechnical Map and on the Summary of Estimated Cyclic Settlements and Removal Depths (**Table C4**).

- Following the recommended removals and replacement, potential liquefaction and earthquake-induced densification of soils could cause total ground settlement over most of the site generally up to about 2 inches. The corresponding differential ground settlement (between locations of adjacent footing foundations or over a horizontal distance of 30 ft) would be up to 1.0 inch. The cumulative thickness of potentially liquefiable soil layers remaining varies from 2.5 ft to about 9 ft.

- Near the mouth of Alluvial Canyon 3 (CPT-3 and HS-3) up to 4 inches of potential seismic settlement will remain following removal and replacement. However, due to the confined nature of the area, uniform settlement potential, lack of steep subsurface transitions within and adjacent to this area, and distance between adjacent CPTs indicating less settlement (CP-11), differential seismic settlements over a distance of 30 feet are also expected to be 1 inch, or less.

- Differential settlement could occur over a horizontal distance of 30 ft or between locations of adjacent columns, whichever distance is smaller. For purposes of design, the earthquake-induced settlement should be added to the static settlement that will be caused by structure loads.

- Potential for lateral spreading (following proposed grading) is believed to be moderate to significant within Alluvial Canyon 1, 2 and 3. Following recommended remedial removals, the remaining thickness of soils with potential for lateral spreading and the estimated potential lateral displacements are provided below in Tables C1 to C3.

APPENDIX C

Table C1 – Lateral Spreading Hazard, Canyon 1

Analyzed Location	Total Depth (feet)	Removal Depth (Feet)	Remaining Thickness of Soils with Potential for Lateral Spreading (feet)	Estimated Lateral Spread Displacement (feet)
CPT-16	33.6	19	5.2	5.3

Table C2 – Lateral Spreading Hazard, Canyon 2

Analyzed Location	Total Depth (feet)	Removal Depth (Feet)	Remaining Thickness of Soils with Potential for Lateral Spreading (feet)	Estimated Lateral Spread Displacement (feet)
CPT-1	41.8	24	0.0	0.0
CPT-2	37.4	22	1.3	2.1
CPT-12	25.9	17	3.8	6.0
CPT-13	36.9	26	6.9	10.3
CPT-14	32.8	21	3.1	4.3

Table C3 – Lateral Spreading Hazard, Canyon 3

Analyzed Location	Total Depth (feet)	Removal Depth (Feet)	Remaining Thickness of Soils with Potential for Lateral Spreading (feet)	Estimated Lateral Spread Displacement (feet)
CPT-3	50.2	30	8.9	8.6
CPT-4	31.7	13	0.2	0.1
CPT-6	49.9	15	2.0	1.6
CPT-8	50.2	29	3.6	3.5
CPT-9	31.0	20	$\geq$ 2.1	$\geq$ 1.8
CPT-11	29.9	10	0.2	0.1
CPT-15	38.1	16	2.5	2.0
CPT-17	33.3	15	0.8	0.7
CPT-18	28.7	16	$\geq$ 1.2	$\geq$ 1.2
CPT-20	36.1	10	0.0	0.0

APPENDIX C

In order to mitigate the potential for lateral spreading, shear keys are recommended as shown on the Geotechnical Map. The engineered fill shear keys are to be at least 50 feet in width and extended into bedrock to intercept laterally continuous layers subject to potential lateral spread hazard. Cross Sections 28-28' and 29-29' (see Appendix G) were constructed through Alluvial Canyons 2 and 3, respectively, and illustrate existing grade, proposed grade, depth to bedrock, and recommended removal depths. For the analyses, these cross-section profiles were modeled using the 2D limit equilibrium software, Slide 2018, by RocScience,

Slope stability analyses was performed on each cross section to identify critical areas where potential failure surfaces along liquefied soil layers subject to lateral spreading yield safety factors less than 1.5. An iterative approach was then used to determine the critical locations and widths of remedial shear keys to obtain safety factors of at least 1.5. General shear strength parameters used in the analyses are discussed in Appendix E – Slope Stability Analyses. However, a liquefied shear strength ratio of $s_{u(liq)} / \sigma'_{vo} = 0.5$ was applied to the alluvial soils remaining in place to represent the shear strength of liquefied soils during earthquake loading. This value represents a lower-bound CPT-based estimate using the following equation (Robertson, 2010):

$$s_{u(liq)} / \sigma'_{vo} = [0.02199 - 0.0003124\,(Q_{t,1N})_{cs}] / [1 - 0.02676\,(Q_{t,1N})_{cs} + 0.0001783\,[(Q_{t,1N})_{cs}]^2]$$

Results of the slope stability analyses to evaluate the recommended shear keys for mitigation of potential lateral spreading hazard are included on the appended Slope Stability Diagrams and Data Sheets.

- The cap of non-liquefiable soils (following proposed grading) will be thick enough to mitigate surface manifestations of potential liquefaction, such as sand boils, fissures, and loss of bearing capacity.

APPENDIX C

The following attachments complete this Appendix.

- References - Assessment of Liquefaction Potential and Estimated Cyclic Settlements
- Summary of Estimated Cyclic Settlements and Removal Depths — Table C4
- Analysis of Liquefaction Potential Based on q_t and F_R from CPT Data — Figures C1.1 through C1.19
- SPT-Based Assessment of Seismic Soil Liquefaction Potential (HS-3) — Figure C1.20
- Correlation of N1(60) Blow Count and Percent Fines - Boring vs. CPT Interpretation (HS-3 vs. CPT-3) — Figure C1.21
- Typical Spreadsheet of Liquefaction Triggering Analysis (based on CPT-10) (6 sheets) — Figure C2.1
- Typical Spreadsheet of Cyclic Settlement Analysis (based on CPT-10) (6 sheets) — Figure C2.2
- CPT-Based Evaluation of Liquefaction-Induced Lateral Displacements — Figures C3.1 through C3.16
- Typical Spreadsheet of Lateral Spread Displacement Calculations (based on CPT-9) (5 sheets) — Figure C4.1
- Slope Stability Diagrams and Data Sheets (for Cross Sections 28-28’ and 29-29’)

LIQUEFACTION TRIGGERING ANALYSIS

Project: Sterling Ranch Estates
Val Verde, LA County, California

Project No.: 18-1245A-4
Date: 6/8/2018
Figure No.: C2.1

Location	CPT-10	MCE Mean Magnitude =	6.8
Type of Sampler (CPT/SPT/CD)	CPT	Peak Ground Accel. (M = 6.79) =	1.02 g
Ground Surface Elevation	1244 ft. above MSL	Approx. Distance From Site (miles) =	1.4
Existing Ground Water Depth	45.9 ft. BGS	Basic Earthquake Magnitude =	7.5
Historic Ground Water Depth	10.0 ft. BGS	Magnitude Weighted PGA (M = 7.5) =	0.79 g
		Magnitude Scaling Factor =	1.29

Conditions: CPT Interpretation based on ground water conditions at time of investigation
Evaluation of cyclic stress ratio based on historic high ground water conditions

Layer No.	Mid-layer Depth	Elevation	Depth of layer below ground surface [ft]		Total Unit Weight., γ	Total Vertical Stress, σ_{vo}	In-Situ Effective Vertical Stress, σ'_{vo}	H.H. Effective Vertical Stress, σ'_{vo}	Total Cone Resistance, q_t	Sleeve Friction, f_s	Robertson and Wride (1998) Procedure (Updated by Zhang et al. 2002 and Robertson 2009)											Apparent Fines Content, FC		Stress Reduction Factor, r_d	Cyclic Resistance Ratio, $CRR_{7.5}$	Cyclic Stress Ratio, CSR*	Calculated Factor of Safety, FS
											Evaluation of Soil Behavior Type Index Through Iterations							Corrections to Tip Resistance									
											Normalized Friction Ratio, F_r	Normalized Cone Resistance, $Q_{t,1}$	Normalized Behavior Type Index, $(I_C)_1$	n	Δn	Final n	Final I_c	Normalizing Factor, C_N	For Overburden, $q_{t,1N}$	Fines Factor, K_c	for "Clean Sand" $(q_{t,1N})_{CS}$	Estimated	Lab		M_W = 7.5	for FS = 1.3	$CRR_{7.5}/CSR^*$

CYCLIC SETTLEMENT ANALYSIS

Project:	Sterling Ranch Estates Val Verde, LA County, California	Project No.:	18-1245A-4
		Date:	6/8/2018
		Figure No.:	C2.2

Location	CPT-10	MCE Mean Magnitude =	6.8
Type of Sampler (CPT/SPT/CD)	CPT	Peak Ground Accel. (M = 6.79) =	1.02 g
Ground Surface Elevation	1244 ft. above MSL	Approx. Distance From Site (miles) =	1.4
Existing Ground Water Depth	45.9 ft. BGS	Basic Earthquake Magnitude =	7.5
Historic Ground Water Depth	10.0 ft. BGS	Magnitude Weighted PGA (M = 7.5) =	0.79 g
		Magnitude Scaling Factor =	1.29

Conditions: CPT Interpretation based on ground water conditions at time of investigation

Evaluation of cyclic stress ratio based on historic high ground water conditions

Vol. Strain Ratio For Dry Sands= 0.858

CPT-Based Evaluation of Liquefaction-Induced Lateral Displacements

Sterling Ranch Estates	Ground Slope [%]:	3.3	Project No.:	18-1245A-4
Val Verde, LA County, California	Dist.to Free Face [ft]:	0	Figure No.:	C3.16
For: Sterling Gateway, L.P.	Free Face Height [ft]:	0	Date:	6/8/2018

LATERAL SPREAD DISPLACEMENT ANALYSIS

Project:	Sterling Ranch Estates Val Verde, LA County, California	Project No.: Date: Figure No.:	18-1245A-4 6/8/2018 C4.1

Location	CPT-09		MCE Mean Magnitude =	6.79	
Ground Surface Elevation	1228	ft. above MSL	Peak Ground Accel. (M = 6.79) =	1.02	g
Existing Ground Water Depth	31.0	ft. BGS	Approx. Distance From Site (miles) =	1.4	
Historic Ground Water Depth	25.0	ft. BGS	Basic Earthquake Magnitude =	7.5	
Removal Depth	20	ft.	Magnitude Weighted PGA (M = 7.5) =	0.79	g
Design Safety Factor	1.3		Magnitude Scaling Factor =	1.29	

Options:					
	SS	Free Face Condition [FF] or Gently Sloping Surface [SS]	(Range is 0.2% to 3.5%) Ground Slope, S =	3.3	[%]
	84	$q_{t,1N}$ cut-off value [tsf]	Distance to Free Face, L =		[ft]
	3.5	I_c cut-off value	Free Face Height, H =		[ft]
			(Range is 4 < L/H < 40) L/H =		
			Thickness of Susceptible Layers, T =	3.6	[ft]

Procedure by Zhang et. al., 2004

Mid-layer Depth	Elevation	For Overburden, $q_{t,1N}$	for "Clean Sand" $(q_{t,1N})_{CS}$	Apparent Fines Content, FC	Calculated Factor of Safety, FS	Relative Density, D_r	Max Cyclic Shear Strain, γ_{max}	Lateral Displacement Index, LDI	Lateral Displ.	Cumulative Lateral Displ.

Current/Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Lateral Spread - Shear Key 2	Master Scenario	Spencer: 1.264180	00h:00m:01.663s
	Thru shear key 2	Spencer: 1.131610	00h:00m:01.724s
	Thru shear key 2 (2)	Spencer: 1.329080	00h:00m:01.854s
	Thru shear keys 1 and 2	Spencer: 1.840820	00h:00m:01.870s
	Between shear keys 1 and 2	Spencer: 1.940780	00h:00m:01.847s

General Settings

Units of Measurement: Imperial Units
Time Units: days
Permeability Units: feet/second
Data Output: Standard
Failure Direction: Right to Left

Analysis Options

All Open Scenarios

Slices Type: Vertical

Analysis Methods Used

Spencer

Number of slices: 50
Tolerance: 0.005
Maximum number of iterations: 75
Check maljha < 0.2: Yes
Create interslice boundaries at intersections with water tables and piezos: Yes
Initial trial value of FS: 1
Steffensen iteration: Yes

Groundwater Analysis

All Open Scenarios

Groundwater Method: Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]: 62.4
Use negative pore pressure cutoff: Yes
Maximum negative pore pressure [psf]: 0
Advanced Groundwater Method: None

Random Numbers

All Open Scenarios

Pseudo-random Seed: 10116
Random Number Generation Method: Park and Miller v.3

Surface Options

All Open Scenarios

Surface Type: Non-Circular Block Search
Number of Surfaces: 5000
Multiple Groups: Disabled
Pseudo-Random Surfaces: Enabled
Convex Surfaces Only: Disabled
Left Projection Angle (Start Angle) [°]: 115
Left Projection Angle (End Angle) [°]: 165
Right Projection Angle (Start Angle) [°]: 15
Right Projection Angle (End Angle) [°]: 65
Minimum Elevation: Not Defined
Minimum Depth: Not Defined
Minimum Area: Not Defined
Minimum Weight: Not Defined

Seismic Loading

All Open Scenarios

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Global Minimums

Lateral Spread - Shear Key 2 - Master Scenario — Method: spencer

FS	1.264180
Axis Location:	703.910, 672.522
Left Slip Surface Endpoint:	548.270, 240.773
Right Slip Surface Endpoint:	955.925, 288.960
Resisting Moment:	1.311e+08 lb-ft
Driving Moment:	1.037e+08 lb-ft
Resisting Horizontal Force:	243608 lb
Driving Horizontal Force:	192701 lb
Total Slice Area:	17693.1 ft2
Surface Horizontal Width:	407.655 ft
Surface Average Height:	43.4022 ft

Lateral Spread - Shear Key 2 - Thru shear key 2 — Method: spencer

FS	1.131610
Axis Location:	855.663, 666.652
Left Slip Surface Endpoint:	699.485, 249.877
Right Slip Surface Endpoint:	1091.376, 291.645
Resisting Moment:	1.930564e+08 lb-ft
Driving Moment:	9.058729e+07 lb-ft
Resisting Horizontal Force:	384294 lb
Driving Horizontal Force:	180284 lb
Total Slice Area:	19314.7 ft2
Surface Horizontal Width:	395.896 ft
Surface Average Height:	48.7878 ft

Lateral Spread - Shear Key 2 - Thru shear key 2 (2) — Method: spencer

FS	1.329080
Axis Location:	532.963, 1206.471
Left Slip Surface Endpoint:	136.504, 209.978
Right Slip Surface Endpoint:	1092.282, 291.407
Resisting Moment:	5.476664e+08 lb-ft
Driving Moment:	4.121e+08 lb-ft
Resisting Horizontal Force:	526997 lb
Driving Horizontal Force:	396008 lb
Total Slice Area:	42371.3 ft2
Surface Horizontal Width:	955.778 ft
Surface Average Height:	44.3317 ft

Lateral Spread - Shear Key 2 - Thru shear keys 1 and 2 — Method: spencer

FS	1.840820
Axis Location:	532.963, 1206.471
Left Slip Surface Endpoint:	136.504, 209.978
Right Slip Surface Endpoint:	1092.282, 291.407
Resisting Moment:	8.054e+08 lb-ft
Driving Moment:	4.354e+08 lb-ft
Resisting Horizontal Force:	759304 lb
Driving Horizontal Force:	410474 lb
Total Slice Area:	42371.3 ft2
Surface Horizontal Width:	955.778 ft
Surface Average Height:	44.3317 ft

Lateral Spread - Shear Key 2 - Between shear keys 1 and 2 — Method: spencer

FS	1.940780
Axis Location:	467.860, 952.437
Left Slip Surface Endpoint:	191.662, 211.639
Right Slip Surface Endpoint:	864.780, 287.000
Resisting Moment:	5.136914e+08 lb-ft
Driving Moment:	2.646834e+08 lb-ft
Resisting Horizontal Force:	622112 lb
Driving Horizontal Force:	320548 lb
Total Slice Area:	29176.5 ft2
Surface Horizontal Width:	703.118 ft
Surface Average Height:	41.4959 ft

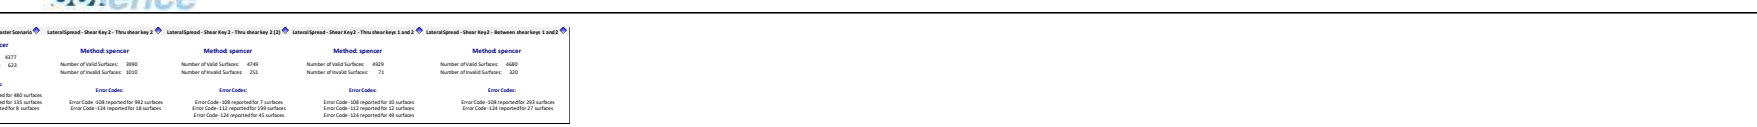
Valid/Invalid Surfaces



Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 kN/m or 0.1 kip/ft).

-112 = The coefficient M-Alpha = cos(alpha)[1+tan(alpha)tan(phi)/F] = 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep-seated slip surfaces with many high negative base angle slices in the passive zone.

-124 = A slice has a width less than the minimum acceptable value.

Groundwater Analysis

AllOpen Scenarios

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

AllOpen Scenarios

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

AllOpen Scenarios

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Enabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	115
Left Projection Angle (End Angle) [°]:	165
Right Projection Angle (Start Angle) [°]:	15
Right Projection Angle (End Angle) [°]:	65
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

AllOpen Scenarios

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

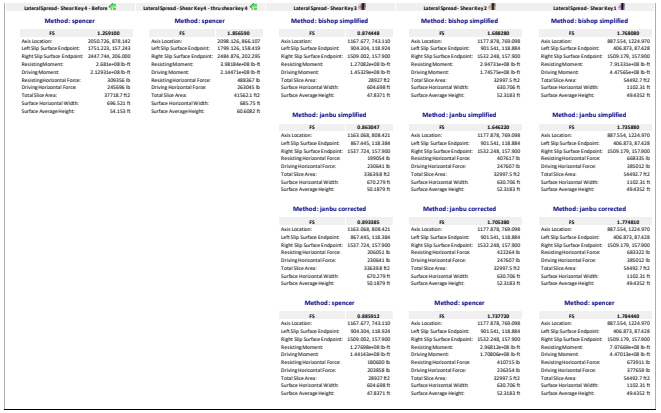
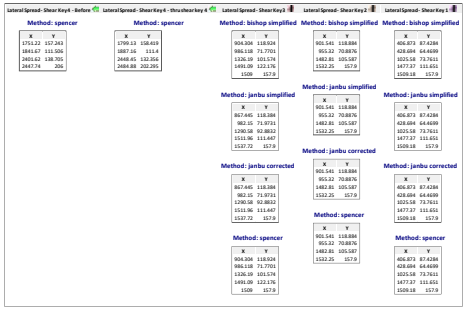
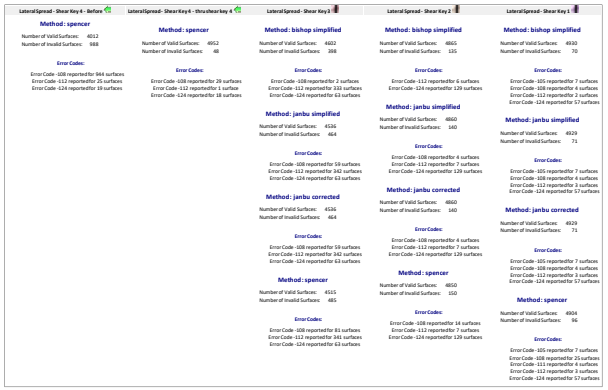
Global Minimums



Global Minimum Coordinates



Valid/Invalid Surfaces



Error Codes

The following errors were encountered during the computation:

-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

MODIFIED MERCALLI SCALE, 1956 VERSION *

	Intensity	Effects	v† cm/s	g‡
M§	I.	Not felt. Marginal and long-period effects of large earthquakes(for details see text).		
3	II.	Felt by persons at rest, on upper floors, or favorably placed.		
	III.	Felt indoors. Hanging objects swing. Vibration like passing of light trucks. Duration estimated. May not be recognized as an earthquake.		0.0035-0.007
4	IV.	Hanging objects swing. Vibration like passing of heavy trucks; or sensation of a jolt like a heavy ball striking the walls. Standing motor cars rock. Windows, dishes, doors rattle. Glasses clink. Crockery clashes. In the upper range of wooden walls walls and frame creak.		0.007-0.015
	V.	Felt outdoors: direction estimated. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset. Doors swing, close, open. Shutters, pictures move. Pendulum clocks stop, start, change rate.	1-3	0.015-0.035
5	VI.	Felt by all. Many frightened and run outdoors. Persons walk unsteadily. Windows, dishes, glassware broken. Kinickkacks, books, etc., off shelves. Pictures off walls. Furniture moved or overturned. Weak plaster and masonry D cracked. Small bells ring (church or school). Trees, bushes shaken (visibly, or heard to rustle - CFR).	3-7	0.035-0.07
	VII.	Difficult to stand. Noticed by drivers of motor cars. Hanging objects quiver. Furniture broken. Damage to masonry D, including cracks. Weak chimneys broken at roof line. Fall of plaster, loose bricks, stones, tiles, cornices (also unbraced parapets and architectural ornaments - CFR). Some cracks in masonry C. Waves on ponds; water turbid with mud. Small slides and caving in along sand or gravel banks. Large bells ring. Concrete irrigation ditches damaged.	7-20	0.07-0.15
6				
	VIII.	Steering from motor cars affected. Damage to masonry C; partial collaspe. Some damage to masonry B; none to masonry A. Fall of stucco and some masonry walls. Twisting, fall of chimneys, factory stacks, monuments, towers, elevated tanks, Frame houses moved on foundations if not bolted down, loose panel walls thrown out. Decayed piling broken off. Branches broken from trees. Changes in flow or temperature of springs and wells. Cracks in wet ground and on steep slopes.	20-60	0.15-0.35
	IX.	General panic. Masonry D destroyed; masonry C heavely damaged, sometimes with complete collaspe; masonry B seriously damaged. (General damage to foundations - CFR.) Frame structures, if not bolted, shifted off foundations. Frames rocked. Serious damage to reserviors. Underground pipes broken. Conspicuous cracks in ground. In alluviated areas sand and mud ejected, earthquake fountains, sand craters.	60-200	0.35-0.7
7				
	X.	Most masonry and frame structures destroyed with their foundations. Some well-built wooden structures and bridges destroyed. Serious damage to dams, dikes embankments. Large landslides. Water thrown on banks of canals, rivers, lakes, etc. Sand and mud shifted horizontally on beaches and flat land. Rails slightly bent.	200-500	0.7-1.2
8				
	XI.	Rails bent greatly. Underground pipelines completely out of service		>1.2
	XII.	Damage nearly total. Large rock masses displaced. Lines of sight and level distorted. Objects thrown into the air.	From Fig. 11.14	

NOTE: Masonry A, B, C, D. To avoid ambiguity of language, the quality of masonry, brick or otherwise, is specified by the following lettering (which has no connection to the conventional Class A, B, C construction).

- *Masonry A*: Good workmanship, mortar, and design; reinforced, especially laterally, and bound together by using steel, concrete, etc.; designed to resist lateral forces.
- *Masonry B*: Good workmanship and mortar; reinforced, but not designed to resist lateral forces.
- *Masonry C*: Ordinary workmanship and mortar; no extreme weaknesses such as non-tied-in corners, but masonry is neither reinforced nor designed against horizontal forces.
- *Masonry D*: Weak materials, such as adobe; poor mortar; low standard of workmanship; weak horizontally.

* From Richter (1958). Adapted with permission of W.H. Freeman and Company.

† Average peak ground velocity, cm/s.

‡ Average peak acceleration (away from source).

§ Magnitude correlation.

SLOPE STABILITY ANALYSES

General

Limit equilibrium analyses were performed to evaluate the stability of proposed cut and fill slopes, critical natural slopes proposed to remain adjacent to the development, and landslide areas which may impact the proposed development. The stability analyses utilized cross sections that were constructed to illustrate the critical structural geometries and maximum heights for each analyzed slope. The analyses included evaluation of gross slope stability, under static and pseudostatic loading conditions, and surficial slope stability. Based on the results, the need for stabilization measures was explored, as needed, and design of appropriate mitigations was performed in a step-by-step fashion to achieve minimum safety factor requirements. Mitigation of proposed cut, fill and natural slopes that did not meet the minimum required safety factors for gross stability included buttress fills and building setback zones.

The analyzed cross sections, calculation procedures and methods, slope conditions, and calculated factors of safety are summarized in **Table E1** along with recommended mitigations. Slope stability diagrams graphically illustrating the results of our analyses for each cross section are attached for review. Critical failure surfaces (factor of safety 1.70 or less) were plotted on the respective cross sections in **Appendix H**.

Geometry and Groundwater

As shown on the cross sections, the analyzed geometries of cut-slopes and natural slopes included removal of vegetation, topsoil, artificial fill, alluvium, landslide debris and bedrock materials and adding compacted fill to achieve the proposed grades, or remedial grades, as needed on portions of the slopes. Anticipated removal depths were shown on the cross section in **Appendix H** only if integral to slope stability calculations. Analyses included across bedding (anti-dip to neutral) and potential adverse bedding with dips ranging from 25 to 38 degrees toward the slope face, depending on geologic data obtained near each cross section listed in **Table E1**. In general, adverse bedding conditions with anisotropic shear strengths were modeled where the dip direction of the bedding was no more than 45 degrees off of the cross section trend (or associated trend directly down slope). Except where subsurface data indicates otherwise, it has been conservatively assumed for the purposes of stability analysis that weak bedding planes may occur anywhere in the proposed cut-slopes.

Where the bedding dip direction was greater than 45 degrees off of the cross section trend (i.e. extreme bedding component), the bedding was considered to be generally neutral to the slope and across bedding shear strengths were used in our assessment. The need for remedial stability fills on slopes with extreme, daylighted bedding components, should be reviewed at the grading plan stage and during grading operations.

APPENDIX E

Review of ground water data in the vicinity and trench and boring log data indicates that the proposed cut-slopes in bedrock are above historic high ground water levels. Ground water was modeled in the slope stability source where a potential for future ground water existed directly up gradient (updip) of the slope being analyzed. In general, a static water table was modeled where existing ground water was encountered and an assumed pore water pressure coefficient (r_u of 0.10) was utilized where a future source of ground water seepage could potentially exist, directly above and directly updip of the slope.

Shear Strength Parameters

Shear strength parameters for bedrock (TQs), terrace deposits (Qt), and proposed compacted fill (Cf) are based on results of direct shear tests performed on representative samples collected at the project site for this study. Direct shear tests were not performed on landslide mass (Qls) or landslide plane (sp) material because of the limited extent of landslides present at the site within the development area and the low impact to development. However, shear strength values adopted from Parcel Map 60030, located approximately 1,300 ft to the east of the site, have been used (See Reference 2). Additionally, shear strength parameters for alluvium are based on direct shear tests performed on samples collected on adjacent VTTM 60665 (see Reference 3) directly to the east. A summary of design shear strength values used in our slope stability analyses is presented in the following table. Associated direct shear test reports are presented in **Appendix B**.

Summary of Design Shear Strength Values

Geologic Unit	Moist Unit Weight, pcf	Peak Shear Strength		Residual Shear Strength	
		Phi, degrees	Cohesion, psf	Phi, degrees	Cohesion, psf
Saugus Formation Bedrock (TQs) across bedding	130	36	300	32	300
Saugus Formation Bedrock (TQs) along bedding	125	23	500	18	300
Landslide Mass (Qls)	120	--	--	29	150
Landslide Plane	120	--	--	12	340
Post-Failure Mass (Qls-PF)	*105*	--	--	*25*	*150*
Terrace Deposits (Qt)	120	32	500	30	260
Alluvium (Qal/Qoa)	115	--	--	27	200
Proposed Compacted Fill (Cf)	130	29	450	29	270

In our analyses, residual shear strengths were utilized for both static and pseudostatic gross slope stability.

APPENDIX E

Building Setbacks for Natural Slopes

Where steep natural slopes are proposed to remain adjacent to proposed development, analyses were completed to evaluate the stability of the slope and to develop appropriate setbacks for future buildings and roads. In all cases, the proposed grading does not adversely impact the existing slope stability and in some cases, the proposed grading reduces the existing driving forces by lowering grade at the top of slopes.

Where development is proposed at the top of a natural slope, the stability of the slope was analyzed. If the slope met or exceeded the minimum factor of safety accepted by the County of Los Angeles (F.S. = 1.50), standard H/3 (40' maximum) setbacks apply. If the slope did not meet the minimum County requirements, additional analyses were completed to locate where potential failure surfaces meet or exceed minimum County requirements. In general, the potential failure surface with a 1.55 factor of safety farthest from the top of the slope was determined and is presented on the applicable cross sections. A Restricted Use Area (RUA), wherein structures and roadways are prohibited, is delineated on the map to encompass areas where the calculated safety factor is less than 1.55 surfaces. Standard H/3 (40' maximum) setbacks should then be applied from the RUA line.

Where development is proposed at the toe of a natural slope, the stability of the slope was analyzed. If the slope met or exceeded the minimum factor of safety accepted by the County of Los Angeles (F.S. = 1.50), standard H/2 (15' maximum) setbacks apply. If the slope did not meet the minimum county requirements, additional analyses were completed to determine an appropriate building setback at the toe of the slope.

Where building pads are proposed at the toe of a natural slope the stability of the ascending slope was evaluated to determine appropriate building setbacks. For slopes that meet or exceed the minimum factor of safety accepted by the County of Los Angeles (F.S. = 1.50), standard H/3 (15' maximum) setbacks apply. For the steep natural slopes that did not meet the minimum county requirements, a stable post-failure geometry was predicted based on the pre-failure critical surface. The post-failure geometry was modeled on applicable cross sections assuming bulking of the failure mass by approximately 20 percent and a runout of the failure mass that yielded a stable condition (i.e. where potential failure surfaces meet or exceed minimum County requirements). A Restricted Use Area (RUA), wherein structures and roadways are prohibited, is delineated on the map to encompass areas where the calculated safety factor is less than 1.55 surfaces. Standard H/2 (15' maximum) setbacks should then be applied from the RUA line.

APPENDIX E

Methods of Analysis

The slope stability analyses performed for this study used the 2D limit equilibrium software, Slide 2018, by RocScience. This software utilizes robust search methods to locate critical circular and non-circular slip surfaces and computes associated minimum factors of safety. The analyses used Spencer's complete equilibrium procedure to evaluate critical potential failure surfaces under static and pseudostatic loading conditions. In general, various search methods were employed for each cross section analyzed to determine either the critical circular failure surfaces (i.e. Grid Search, Slope Search, and Auto Refine) or critical non-circular failure surfaces (Cuckoo Search, Block Search, and Path Search). Critical non-circular slip surfaces were further optimized using the Surface Altering optimization option to assess potential surfaces with lower safety factors. Global and local minimum factors of safety were based on the results that each search method produced.

Analysis for seismic slope stability was performed using the pseudostatic procedure. In this procedure the seismic loading is introduced into the conventional limit equilibrium analysis as a static horizontal force equal to the soil weight multiplied by a seismic coefficient, *k*. The seismic coefficient is an empirical value which in no way models actual seismic forces. However, the pseudostatic procedure does provide some indication of slope stability or instability during seismic loading. In accordance with Los Angeles County Guidelines, we selected a seismic coefficient value of $k = 0.15$ for our analyses.

Surficial Stability Evaluation

Surficial slope stability of fill and cut slopes was not analyzed using the "Infinite Slope" method since the lower-bound cohesion value of bedrock and proposed fill materials is greater than 250 psf. Stability fills are needed and shown on the Geotechnical Map for cut-slopes that exhibit daylighted bedding conditions or have a fill over cut configuration. Surficial stability calculations were not performed on natural slopes because the proposed grading configuration and our debris flow hazard mitigation measure precluded the need for analyses.

Conclusion

The analyzed cut-slopes, proposed grades, remedial grades and compacted fill slopes comply with Los Angeles County minimum requirements for gross stability under static and pseudostatic loading conditions and for surficial stability, as applicable, provided our recommendations are followed and incorporated into project construction. The results of the stability analyses are summarized in **Table E1**.

Error Code -114 reported for 42 surfaces
Error Code -121 reported for 881 surfaces
Error Code -124 reported for 10 surfaces
Error Code -1000 reported for 2235 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 1-1'; non-circular search; bedding plane; pseudo		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t1ps1a.slmd
		Scale:	1:650
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 2

Slide Analysis Information

t1ps1a

Project Summary

File Name:	t1ps1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:22.776s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; bedding plane; pseudo
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6702
Number of Invalid Surfaces: 3357

Error Codes:

Error Code -108 reported for 14 surfaces
Error Code -111 reported for 6 surfaces
Error Code -112 reported for 45 surfaces
Error Code -114 reported for 19 surfaces
Error Code -121 reported for 924 surfaces
Error Code -124 reported for 5 surfaces
Error Code -1000 reported for 2344 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 1-1'; non-circular search; Qls plane; static		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t1s2a.slmd
		Scale:	1:600
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 3

Slide Analysis Information

t1s2a

Project Summary

File Name:	t1s2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:01.587s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; Qls plane; static
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	95
Left Projection Angle (End Angle) [°]:	175
Right Projection Angle (Start Angle) [°]:	5
Right Projection Angle (End Angle) [°]:	85
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 1403
Number of Invalid Surfaces: 3597

Error Codes:

Error Code -105 reported for 2048 surfaces
Error Code -108 reported for 1289 surfaces
Error Code -111 reported for 4 surfaces
Error Code -112 reported for 237 surfaces
Error Code -124 reported for 19 surfaces

Error Codes

The following errors were encountered during the computation:

-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

Slide Analysis Information

t1ps2a

Project Summary

File Name:	t1ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:01.578s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; QIs plane; pseudo
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	95
Left Projection Angle (End Angle) [°]:	175
Right Projection Angle (Start Angle) [°]:	5
Right Projection Angle (End Angle) [°]:	85
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Seismic Load Coefficient (Horizontal): 0.15

Global Minimums

Method: spencer

FS	1.566580
Axis Location:	243.317, 1379.047
Left Slip Surface Endpoint:	131.846, 1270.931
Right Slip Surface Endpoint:	262.927, 1225.000
Resisting Moment:	1.95772e+07 lb-ft
Driving Moment:	1.24968e+07 lb-ft
Resisting Horizontal Force:	111973 lb
Driving Horizontal Force:	71475.7 lb
Total Slice Area:	1652.05 ft2
Surface Horizontal Width:	131.081 ft
Surface Average Height:	12.6032 ft

Global Minimum Coordinates

Method: spencer

X	Y
131.846	1270.93
142.871	1254.81
154.576	1242.81
171.835	1229.04
193.859	1214.95
262.927	1225

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 1336
Number of Invalid Surfaces: 3664

Error Codes:

Error Code -105 reported for 2048 surfaces
Error Code -108 reported for 1104 surfaces
Error Code -111 reported for 64 surfaces
Error Code -112 reported for 429 surfaces
Error Code -124 reported for 19 surfaces

Error Codes

The following errors were encountered during the computation:

-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 4-4'; CS-6; non-circular search; bedding plane; static		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t4s1a.slmd
		Scale:	1:600
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 5

Slide Analysis Information

t4s1a

Project Summary

File Name:	t4s1a.slmd
Slide Modeler Version:	8.014
Project Title:	VTTM 60257
Analysis:	Section 4-4'; non-circular search; bedding plane; static
Author:	K. Callahan
Comments	
	Sterling Gateway, L.P.
	Sterling Ranch Estates
	18-1245A-4

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Non-circular search, static	Master Scenario	Spencer: None	00h:00m:06.683s
	Bedding plane	Spencer: 1.572230	00h:00m:16.878s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

All Open Scenarios	
Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios	
Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios	
Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Bedrock
Color	
Strength Type	Anisotropic Linear
Unit Weight [lbs/ft3]	130
Cohesion 1 [psf]	300
Cohesion 2 [psf]	300
Friction Angle 1 [°]	18
Friction Angle 2 [°]	32
A [°]	1
B [°]	1
Anisotropic Definition	Surface
Angle from 1 [°]	
Anisotropic Surface	Assigned per scenario
Tensile Strength [psf]	0
Water Surface	Assigned per scenario
Ru Value	0

Materials In Use

Material	Master Scenario	Bedding plane
Bedrock	✓	✓

Global Minimums

Non-circular search, static - Master Scenario		Non-circular search, static - Bedding plane	
Method: spencer		**Method: spencer**	
Resisting Moment:	0 lb-ft	**FS**	**1.572230**
Driving Moment:	0 lb-ft	Axis Location:	246.317, 1459.752
Resisting Horizontal Force:	0 lb	Left Slip Surface Endpoint:	112.244, 1351.071
Driving Horizontal Force:	0 lb	Right Slip Surface Endpoint:	252.818, 1287.285
Total Slice Area:	0 ft2	Resisting Moment:	3.14841e+07 lb-ft
Surface Horizontal Width:	0 ft	Driving Moment:	2.00252e+07 lb-ft
Surface Average Height:	0 ft	Resisting Horizontal Force:	167656 lb
		Driving Horizontal Force:	106636 lb
		Total Slice Area:	2241.52 ft2
		Surface Horizontal Width:	140.574 ft
		Surface Average Height:	15.9454 ft

Valid/Invalid Surfaces

Non-circular search, static - Master Scenario

Method: spencer

Number of Valid Surfaces: 0
Number of Invalid Surfaces: 1

Error Codes:

Error Code -129 reported for 1 surface

Non-circular search, static - Bedding plane

Method: spencer

Number of Valid Surfaces: 7942
Number of Invalid Surfaces: 2120

Error Codes:

Error Code -106 reported for 23 surfaces
Error Code -108 reported for 73 surfaces
Error Code -111 reported for 6 surfaces
Error Code -112 reported for 25 surfaces
Error Code -114 reported for 50 surfaces
Error Code -121 reported for 574 surfaces
Error Code -124 reported for 12 surfaces
Error Code -600 reported for 19 surfaces
Error Code -1000 reported for 1338 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-129 = Can not compute anisotropic angle along slip surface.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Non-circular search, static - Master Scenario

Non-circular search, static - Bedding plane

Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Bedrock
Color	
Strength Type	Anisotropic Linear
Unit Weight [lbs/ft3]	130
Cohesion 1 [psf]	300
Cohesion 2 [psf]	300
Friction Angle 1 [°]	18
Friction Angle 2 [°]	32
A [°]	1
B [°]	1
Anisotropic Definition	Surface
Angle from 1 [°]	
Anisotropic Surface	Anisotropic Surface 2
Tensile Strength [psf]	0
Water Surface	None
Ru Value	0

Global Minimums

Method: spencer

FS	1.159620
Axis Location:	296.680, 1510.392
Left Slip Surface Endpoint:	107.543, 1349.065
Right Slip Surface Endpoint:	312.260, 1262.286
Resisting Moment:	7.51335e+07 lb-ft
Driving Moment:	6.47912e+07 lb-ft
Resisting Horizontal Force:	283662 lb
Driving Horizontal Force:	244616 lb
Total Slice Area:	3944.57 ft2
Surface Horizontal Width:	204.716 ft
Surface Average Height:	19.2685 ft

Global Minimum Coordinates

Method: spencer

X	Y
107.543	1349.06

301.77	1262.28
312.26	1262.29

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8048
Number of Invalid Surfaces: 2006

Error Codes:

Error Code -106 reported for 24 surfaces
Error Code -108 reported for 35 surfaces
Error Code -111 reported for 23 surfaces
Error Code -112 reported for 23 surfaces
Error Code -114 reported for 43 surfaces
Error Code -121 reported for 419 surfaces
Error Code -124 reported for 7 surfaces
Error Code -600 reported for 47 surfaces
Error Code -1000 reported for 1385 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.15962

SLIDEINTERPRET 8.014

Analysis:	Section 5-5'; NS-1 critical failure surface; non-circular search; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t5s1a.slmd
		Scale:	1:350
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 7

Slide Analysis Information

t5s1a

Project Summary

File Name:	t5s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:03.261s
Project Title:	VTTM 60257
Analysis:	Section 5-5'; NS-1 critical failure surface; non-circular search; static
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Materials

Property	Compacted Fill	Alluvium	Bedrock
Color			
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	130	120	130
Cohesion [psf]	270	200	300
Friction Angle [°]	29	27	32
Tensile Strength [psf]			0
Water Surface	None	None	None
Ru Value	0	0	0

Global Minimums

Method: spencer

FS	1.269950
Axis Location:	153.032, 1428.769
Left Slip Surface Endpoint:	54.018, 1378.507
Right Slip Surface Endpoint:	133.834, 1319.400
Resisting Moment:	1.13989e+07 lb-ft
Driving Moment:	8.97587e+06 lb-ft
Resisting Horizontal Force:	81819.9 lb
Driving Horizontal Force:	64427.5 lb
Total Slice Area:	1063.86 ft2
Surface Horizontal Width:	79.816 ft
Surface Average Height:	13.3289 ft

Global Minimum Coordinates

Method: spencer

133.834	1319.4

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6766
Number of Invalid Surfaces: 3289

Error Codes:

Error Code -106 reported for 1 surface
Error Code -108 reported for 145 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 31 surfaces
Error Code -112 reported for 40 surfaces
Error Code -114 reported for 50 surfaces
Error Code -121 reported for 870 surfaces
Error Code -124 reported for 4 surfaces
Error Code -600 reported for 74 surfaces
Error Code -1000 reported for 2073 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 5-5'; NS-1 post-failure geometry; non-circular search; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t5s2a.slmd
		Scale:	1:350
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 8

Slide Analysis Information

t5s2a

Project Summary

File Name:	t5s2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:09.542s
Project Title:	VTTM 60257
Analysis:	Section 5-5'; NS-1 post-failure geometry; non-circular search; static
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Materials

Property	Compacted Fill	Alluvium	Post-Failure Landslide	Bedrock
Color				
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	130	120	105	130
Cohesion [psf]	270	200	150	300
Friction Angle [°]	29	27	25	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.562590
Axis Location:	153.488, 1457.604
Left Slip Surface Endpoint:	46.297, 1376.852
Right Slip Surface Endpoint:	153.775, 1323.400
Resisting Moment:	1.09822e+07 lb-ft
Driving Moment:	7.03833e+06 lb-ft
Resisting Horizontal Force:	71319.3 lb
Driving Horizontal Force:	45707.3 lb
Total Slice Area:	1124.57 ft2
Surface Horizontal Width:	107.478 ft
Surface Average Height:	10.4633 ft

Global Minimum Coordinates

Method: spencer

153.775	1323.4

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6834
Number of Invalid Surfaces: 3225

Error Codes:

Error Code -106 reported for 4 surfaces
Error Code -108 reported for 138 surfaces
Error Code -111 reported for 20 surfaces
Error Code -112 reported for 51 surfaces
Error Code -114 reported for 32 surfaces
Error Code -121 reported for 639 surfaces
Error Code -124 reported for 4 surfaces
Error Code -600 reported for 5 surfaces
Error Code -1000 reported for 2332 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 5-5'; NS-1 post-failure geometry; non-circular search; pseudo		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t5ps2a.slmd
		Scale:	1:350
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 9

Slide Analysis Information

t5ps2a

Project Summary

File Name:	t5ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:08.813s
Project Title:	VTTM 60257
Analysis:	Section 5-5'; NS-1 post-failure geometry; non-circular search; pseudo
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Alluvium	Post-Failure Landslide	Bedrock
Color				
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	130	120	105	130
Cohesion [psf]	270	200	150	300
Friction Angle [°]	29	27	25	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.142450
Axis Location:	152.919, 1458.297
Left Slip Surface Endpoint:	45.515, 1376.674
Right Slip Surface Endpoint:	153.775, 1323.400
Resisting Moment:	1.06968e+07 lb-ft
Driving Moment:	9.38276e+06 lb-ft
Resisting Horizontal Force:	69753.7 lb
Driving Horizontal Force:	61184.6 lb
Total Slice Area:	1155.75 ft2
Surface Horizontal Width:	108.26 ft
Surface Average Height:	10.6756 ft

Global Minimum Coordinates

Method: spencer

153.775	1323.4

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6253
Number of Invalid Surfaces: 3804

Error Codes:

Error Code -106 reported for 5 surfaces
Error Code -108 reported for 230 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 157 surfaces
Error Code -112 reported for 58 surfaces
Error Code -114 reported for 56 surfaces
Error Code -121 reported for 871 surfaces
Error Code -124 reported for 11 surfaces
Error Code -600 reported for 7 surfaces
Error Code -1000 reported for 2408 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 6-6'; NS-1 critical failure surface; non-circular search; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t6s1a.slmd
		Scale:	1:350
Project No.: 18-1245A-4	*Date:* 6/25/2018	*Figure No.:*	Run No. 10

Slide Analysis Information

t6s1a

Project Summary

File Name:	t6s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:08.153s
Project Title:	VTTM 60257
Analysis:	Section 6-6'; NS-1 critical failure surface; non-circular search; static
Author:	K. Callahan
Comments	
	Sterling Gateway
	Sterling Ranch Estates
	18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Compacted Fill	Alluvium	Bedrock
Color			
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	130	120	130
Cohesion [psf]	270	200	300
Friction Angle [°]	29	27	32
Tensile Strength [psf]			0
Water Surface	None	None	None
Ru Value	0	0	0

Global Minimums

Method: spencer

FS	1.358370
Axis Location:	142.710, 1443.408
Left Slip Surface Endpoint:	36.028, 1383.303
Right Slip Surface Endpoint:	126.784, 1322.000
Resisting Moment:	1.50491e+07 lb-ft
Driving Moment:	1.10815e+07 lb-ft
Resisting Horizontal Force:	100500 lb
Driving Horizontal Force:	74004.1 lb
Total Slice Area:	1265.14 ft2
Surface Horizontal Width:	90.7559 ft
Surface Average Height:	13.94 ft

Global Minimum Coordinates

Method: spencer

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6883
Number of Invalid Surfaces: 3173

Error Codes:

Error Code -106 reported for 2 surfaces
Error Code -108 reported for 137 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 57 surfaces
Error Code -112 reported for 33 surfaces
Error Code -114 reported for 92 surfaces
Error Code -121 reported for 1028 surfaces
Error Code -124 reported for 18 surfaces
Error Code -600 reported for 64 surfaces
Error Code -1000 reported for 1741 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.

-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.35837

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 7694
Number of Invalid Surfaces: 2365

Error Codes:

Error Code -106 reported for 6 surfaces
Error Code -108 reported for 107 surfaces
Error Code -111 reported for 20 surfaces
Error Code -112 reported for 29 surfaces
Error Code -114 reported for 23 surfaces
Error Code -121 reported for 496 surfaces
Error Code -124 reported for 6 surfaces
Error Code -600 reported for 2 surfaces
Error Code -1000 reported for 1676 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 6-6'; NS-1 post-failure geometry; non-circular search; pseudo		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t6ps2a.slmd
		Scale:	1:350
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 12

Slide Analysis Information

t6ps2a

Project Summary

File Name:	t6ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:07.929s
Project Title:	VTTM 60257
Analysis:	Section 6-6'; NS-1 post-failure geometry; non-circular search; pseudo
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Alluvium	Post-Failure Landslide	Bedrock
Color				
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	130	120	105	130
Cohesion [psf]	270	200	150	300
Friction Angle [°]	29	27	25	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.166800
Axis Location:	145.937, 1461.430
Left Slip Surface Endpoint:	39.999, 1377.297
Right Slip Surface Endpoint:	149.680, 1326.200
Resisting Moment:	9.30771e+06 lb-ft
Driving Moment:	7.98603e+06 lb-ft
Resisting Horizontal Force:	62394.7 lb
Driving Horizontal Force:	53534.7 lb
Total Slice Area:	1137.22 ft2
Surface Horizontal Width:	109.681 ft
Surface Average Height:	10.3684 ft

Global Minimum Coordinates

Method: spencer

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6909
Number of Invalid Surfaces: 3147

Error Codes:

Error Code -106 reported for 2 surfaces
Error Code -108 reported for 175 surfaces
Error Code -111 reported for 122 surfaces
Error Code -112 reported for 46 surfaces
Error Code -114 reported for 20 surfaces
Error Code -121 reported for 561 surfaces
Error Code -124 reported for 9 surfaces
Error Code -600 reported for 6 surfaces
Error Code -1000 reported for 2206 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 7-7'; non-circular search; bedding plane; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t7s1a.slmd
		Scale:	1:550
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 13

Slide Analysis Information

t7s1a

Project Summary

File Name:	t7s1a.slmd
Slide Modeler Version:	8.014
Project Title:	VTTM 60257
Analysis:	Section 7-7'; non-circular search; bedding plane; static
Author:	K. Callahan
Comments	
	Sterling Gateway
	Sterling Ranch Estates
	18-1245A-4

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Planar - static	Master Scenario	Spencer: 0.922335	00h:00m:13.937s
	Cuckoo search	Spencer: 0.922335	00h:00m:13.872s
	Cuckoo search thru toe	Spencer: 1.001390	00h:00m:12.121s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

All Open Scenarios	
Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios	
Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios	
Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	20
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation [ft]:	1230
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	20
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation [ft]:	1230
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Compacted Fill	Alluvium	Landslide	Post-Failure Mass	Bedrock

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6576
Number of Invalid Surfaces: 3481

Error Codes:

Error Code -109 reported for 1 surface
Error Code -112 reported for 1 surface
Error Code -114 reported for 19 surfaces
Error Code -121 reported for 2565 surfaces
Error Code -124 reported for 10 surfaces
Error Code -1000 reported for 885 surfaces

Error Codes

The following errors were encountered during the computation:

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 7-7'; NS-1 post-failure geometry; non-circular search; pseudo		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t7ps2a.slmd
		Scale:	1:550
Project No.:	18-1245A-4	*Date:* 6/25/2018	*Figure No.:* Run No. 15

Slide Analysis Information

t7ps2a

Project Summary

File Name:	t7ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:07.758s
Project Title:	VTTM 60257
Analysis:	Section 7-7'; NS-1 post-failure geometry; non-circular search; pseudo
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	20
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation [ft]:	1230
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Alluvium	Landslide	Post-Failure Mass	Bedrock
Color					
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Anisotropic Linear
Unit Weight [lbs/ft3]	130	120	120	105	130
Cohesion [psf]	270	200	150	150	
Friction Angle [°]	29	27	29	25	
Cohesion 1 [psf]					300
Cohesion 2 [psf]					300
Friction Angle 1 [°]					18
Friction Angle 2 [°]					32
A [°]					1
B [°]					1
Anisotropic Definition					Surface
Angle from 1 [°]					
Anisotropic Surface					Anisotropic Surface 1
Tensile Strength [psf]					0
Water Surface	None	None	None	None	None
Ru Value	0	0	0	0	0

Global Minimums

Method: spencer

FS	1.107020
Axis Location:	308.345, 1573.062
Left Slip Surface Endpoint:	121.088, 1399.300
Right Slip Surface Endpoint:	335.000, 1319.000
Resisting Moment:	4.72917e+07 lb-ft
Driving Moment:	4.27219e+07 lb-ft
Resisting Horizontal Force:	179472 lb
Driving Horizontal Force:	162130 lb
Total Slice Area:	3541.45 ft2
Surface Horizontal Width:	213.912 ft
Surface Average Height:	16.5557 ft

Global Minimum Coordinates

Method: spencer

329.118	1319.01
335	1319

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6413
Number of Invalid Surfaces: 3643

Error Codes:

Error Code -108 reported for 36 surfaces
Error Code -111 reported for 89 surfaces
Error Code -114 reported for 21 surfaces
Error Code -121 reported for 2605 surfaces
Error Code -124 reported for 10 surfaces
Error Code -1000 reported for 882 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 11-11'; CS-7; non-circular search; bedding plane; static		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t11s1a.slmd
		Scale:	1:1300
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 16

Slide Analysis Information

t11s1a

Project Summary

File Name:	t11s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:27.333s
Project Title:	VTTM 60257
Analysis:	Section 11-11'; CS-7; non-circular search; bedding plane; static
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Compacted Fill	Alluvium	Bedrock
Color			
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Anisotropic Linear
Unit Weight [lbs/ft3]	130	120	130
Cohesion [psf]	270	200	
Friction Angle [°]	29	27	
Cohesion 1 [psf]			300
Cohesion 2 [psf]			300
Friction Angle 1 [°]			18
Friction Angle 2 [°]			32
A [°]			1
B [°]			1
Anisotropic Definition			Surface
Angle from 1 [°]			
Anisotropic Surface			Anisotropic Surface 3

Global Minimums

Method: spencer

FS	2.104840
Axis Location:	457.272, 1746.610
Left Slip Surface Endpoint:	131.806, 1411.224
Right Slip Surface Endpoint:	530.302, 1285.005
Resisting Moment:	4.72097e+08 lb-ft
Driving Moment:	2.24291e+08 lb-ft
Resisting Horizontal Force:	967633 lb
Driving Horizontal Force:	459717 lb
Total Slice Area:	12855.1 ft2
Surface Horizontal Width:	398.495 ft
Surface Average Height:	32.2591 ft

Global Minimum Coordinates

Method: spencer

530.302	1285.01

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8693
Number of Invalid Surfaces: 1369

Error Codes:

Error Code -106 reported for 8 surfaces
Error Code -108 reported for 270 surfaces
Error Code -109 reported for 2 surfaces
Error Code -111 reported for 5 surfaces
Error Code -112 reported for 43 surfaces
Error Code -114 reported for 39 surfaces
Error Code -121 reported for 435 surfaces
Error Code -124 reported for 4 surfaces
Error Code -600 reported for 1 surface
Error Code -1000 reported for 562 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Analysis:	Section 12-12'; CS-8; non-circular search; bedding plane; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t12s1a.slmd
		Scale:	1:1000
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 17

Slide Analysis Information

t12s1a

Project Summary

File Name:	t12s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:05.205s
Project Title:	VTTM 60257
Analysis:	Section 12-12'; CS-8; non-circular search; bedding plane; static
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Alluvium	Bedrock
Color		
Strength Type	Mohr-Coulomb	Anisotropic Linear
Unit Weight [lbs/ft3]	120	130
Cohesion [psf]	200	
Friction Angle [°]	27	
Cohesion 1 [psf]		300
Cohesion 2 [psf]		300
Friction Angle 1 [°]		18
Friction Angle 2 [°]		32
A [°]		1
B [°]		1
Anisotropic Definition		Surface
Angle from 1 [°]		
Anisotropic Surface		Anisotropic Surface 1
Water Surface	None	None
Ru Value	0	0

Global Minimums

Method: spencer

FS	1.715290
Axis Location:	471.616, 1508.693
Left Slip Surface Endpoint:	298.640, 1361.553
Right Slip Surface Endpoint:	485.543, 1282.028
Resisting Moment:	6.49416e+07 lb-ft
Driving Moment:	3.78603e+07 lb-ft
Resisting Horizontal Force:	260693 lb
Driving Horizontal Force:	151981 lb
Total Slice Area:	3541.99 ft2
Surface Horizontal Width:	186.902 ft
Surface Average Height:	18.951 ft

Global Minimum Coordinates

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8203
Number of Invalid Surfaces: 1855

Error Codes:

Error Code -106 reported for 13 surfaces
Error Code -108 reported for 218 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 17 surfaces
Error Code -112 reported for 52 surfaces
Error Code -114 reported for 32 surfaces
Error Code -121 reported for 510 surfaces
Error Code -124 reported for 7 surfaces
Error Code -1000 reported for 1005 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.

-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 12-12'; CS-8; non-circular search; bedding plane; pseudo		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t12ps1a.slmd
		Scale:	1:1000
Project No.:	18-1245A-4	*Date:* 6/7/2018	*Figure No.:* Run No. 18

Slide Analysis Information

t12ps1a

Project Summary

File Name:	t12ps1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:04.455s
Project Title:	VTTM 60257
Analysis:	Section 12-12'; CS-8; non-circular search; bedding plane; pseudo
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Alluvium	Bedrock
Color		
Strength Type	Mohr-Coulomb	Anisotropic Linear
Unit Weight [lbs/ft3]	120	130
Cohesion [psf]	200	
Friction Angle [°]	27	
Cohesion 1 [psf]		300
Cohesion 2 [psf]		300
Friction Angle 1 [°]		18
Friction Angle 2 [°]		32
A [°]		1
B [°]		1
Anisotropic Definition		Surface
Angle from 1 [°]		
Anisotropic Surface		Anisotropic Surface 1
Water Surface	None	None
Ru Value	0	0

Global Minimums

Method: spencer

FS	1.260800
Axis Location:	460.544, 1633.180
Left Slip Surface Endpoint:	194.621, 1402.490
Right Slip Surface Endpoint:	485.543, 1282.028
Resisting Moment:	2.1525e+08 lb-ft
Driving Moment:	1.70725e+08 lb-ft
Resisting Horizontal Force:	569821 lb
Driving Horizontal Force:	451954 lb
Total Slice Area:	7526.64 ft2
Surface Horizontal Width:	290.921 ft
Surface Average Height:	25.8717 ft

Global Minimum Coordinates

Method: spencer

463.192	1281.88
475.788	1281.29
485.543	1282.03

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 7522
Number of Invalid Surfaces: 2536

Error Codes:

Error Code -106 reported for 13 surfaces
Error Code -108 reported for 237 surfaces
Error Code -111 reported for 30 surfaces
Error Code -112 reported for 93 surfaces
Error Code -114 reported for 40 surfaces
Error Code -121 reported for 576 surfaces
Error Code -124 reported for 8 surfaces
Error Code -1000 reported for 1539 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Non-circular search, static	Cuckoo search - min FS	Spencer: 1.584210	00h:00m:12.450s
	Cuckoo search	Spencer: 1.985360	00h:00m:09.617s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

All Open Scenarios

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios	
Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Error Code -121 reported for 262 surfaces	Error Code -1000 reported for 2134 surfaces
Error Code -124 reported for 9 surfaces	
Error Code -600 reported for 3 surfaces	
Error Code -1000 reported for 607 surfaces	

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 7198
Number of Invalid Surfaces: 2864

Error Codes:

Error Code -106 reported for 11 surfaces
Error Code -108 reported for 318 surfaces
Error Code -111 reported for 5 surfaces
Error Code -112 reported for 57 surfaces
Error Code -114 reported for 65 surfaces
Error Code -121 reported for 695 surfaces
Error Code -124 reported for 17 surfaces
Error Code -600 reported for 2 surfaces
Error Code -1000 reported for 1694 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Non-circular; static	Cuckoo search - global min FS	Spencer: 2.893920	00h:00m:23.645s
	Qls plane	Spencer: 2.253710	00h:00m:16.988s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

All Open Scenarios

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Non-circular; static - Cuckoo search - global min FS		Non-circular; static - Qls plane	
Search Method:	Cuckoo Search	Surface Type:	Non-Circular Block Search
Initial # of Surface Vertices:	8	Number of Surfaces:	5000
Maximum Iterations:	200	Multiple Groups:	Disabled
Number of Nests:	50	Pseudo-Random Surfaces:	Enabled
Minimum Elevation:	Not Defined	Convex Surfaces Only:	Disabled
Minimum Depth:	Not Defined	Left Projection Angle (Start Angle) [°]:	95
Minimum Area:	Not Defined	Left Projection Angle (End Angle) [°]:	175
Minimum Weight:	Not Defined	Right Projection Angle (Start Angle) [°]:	5
Convex Surfaces Only:	Enabled	Right Projection Angle (End Angle) [°]:	85
		Minimum Elevation:	Not Defined
		Minimum Depth:	Not Defined
		Minimum Area:	Not Defined
		Minimum Weight:	Not Defined

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Error Code -124 reported for 11 surfaces	
Error Code -129 reported for 2693 surfaces	
Error Code -1000 reported for 161 surfaces	

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-129 = Can not compute anisotropic angle along slip surface.
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9003
Number of Invalid Surfaces: 1054

Error Codes:

Error Code -106 reported for 1 surface
Error Code -108 reported for 245 surfaces
Error Code -111 reported for 44 surfaces
Error Code -112 reported for 74 surfaces
Error Code -114 reported for 35 surfaces
Error Code -121 reported for 174 surfaces
Error Code -124 reported for 26 surfaces
Error Code -1000 reported for 455 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9349
Number of Invalid Surfaces: 711

Error Codes:

Error Code -106 reported for 1 surface
Error Code -108 reported for 181 surfaces
Error Code -111 reported for 37 surfaces
Error Code -112 reported for 50 surfaces
Error Code -114 reported for 24 surfaces
Error Code -121 reported for 74 surfaces
Error Code -124 reported for 18 surfaces
Error Code -600 reported for 2 surfaces
Error Code -1000 reported for 324 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Alluvium	Landslide	Landslide Plane	Bedrock
Color				
Strength Type	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb	Mohr-Coulomb
Unit Weight [lbs/ft3]	120	120	120	130
Cohesion [psf]	200	150	340	300
Friction Angle [°]	27	29	12	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.205030
Axis Location:	115.566, 1461.287
Left Slip Surface Endpoint:	93.028, 1315.429
Right Slip Surface Endpoint:	218.729, 1355.742
Resisting Moment:	1.22647e+07 lb-ft
Driving Moment:	1.01779e+07 lb-ft
Resisting Horizontal Force:	77455 lb
Driving Horizontal Force:	64276.2 lb
Total Slice Area:	1364.91 ft2
Surface Horizontal Width:	125.701 ft
Surface Average Height:	10.8584 ft

Global Minimum Coordinates

Method: spencer

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9027
Number of Invalid Surfaces: 1038

Error Codes:

Error Code -106 reported for 4 surfaces
Error Code -108 reported for 230 surfaces
Error Code -109 reported for 2 surfaces
Error Code -111 reported for 66 surfaces
Error Code -112 reported for 85 surfaces
Error Code -114 reported for 37 surfaces
Error Code -121 reported for 86 surfaces
Error Code -124 reported for 27 surfaces
Error Code -600 reported for 2 surfaces
Error Code -1000 reported for 499 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Non-circular; static	Cuckoo search, static along Qls plane	Spencer: 2.838220	00h:00m:42.750s
	Cuckoo search thru slope toe	Spencer: 2.115550	00h:00m:10.392s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

All Open Scenarios	
Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios	
Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios	
Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Non-circular; static - Cuckoo search, static along Qls plane

Method: spencer

Number of Valid Surfaces: 6054
Number of Invalid Surfaces: 4026

Error Codes:

Error Code -108 reported for 71 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 86 surfaces
Error Code -112 reported for 52 surfaces
Error Code -114 reported for 53 surfaces
Error Code -121 reported for 1113 surfaces
Error Code -124 reported for 144 surfaces
Error Code -1000 reported for 2506 surfaces

Non-circular; static - Cuckoo search thru slope toe

Method: spencer

Number of Valid Surfaces: 9460
Number of Invalid Surfaces: 599

Error Codes:

Error Code -108 reported for 89 surfaces
Error Code -111 reported for 90 surfaces
Error Code -112 reported for 43 surfaces
Error Code -114 reported for 48 surfaces
Error Code -121 reported for 86 surfaces
Error Code -124 reported for 8 surfaces
Error Code -1000 reported for 235 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	95
Left Projection Angle (End Angle) [°]:	175
Right Projection Angle (Start Angle) [°]:	5
Right Projection Angle (End Angle) [°]:	85
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Left Slip Surface Endpoint:	112.984, 1299.893
Right Slip Surface Endpoint:	344.167, 1344.652
Resisting Moment:	1.4347e+08 lb-ft
Driving Moment:	4.89776e+07 lb-ft
Resisting Horizontal Force:	494560 lb
Driving Horizontal Force:	168832 lb
Total Slice Area:	7971.43 ft2
Surface Horizontal Width:	231.184 ft
Surface Average Height:	34.4809 ft

Global Minimum Coordinates

Method: spencer

X	Y
112.984	1299.89
223.352	1263.64
326.134	1336.07
344.167	1344.65

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 3692
Number of Invalid Surfaces: 1308

Error Codes:

Error Code -108 reported for 856 surfaces
Error Code -111 reported for 126 surfaces
Error Code -112 reported for 323 surfaces
Error Code -124 reported for 3 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9550
Number of Invalid Surfaces: 512

Error Codes:

Error Code -106 reported for 8 surfaces
Error Code -108 reported for 43 surfaces
Error Code -111 reported for 50 surfaces
Error Code -112 reported for 23 surfaces
Error Code -114 reported for 38 surfaces
Error Code -121 reported for 33 surfaces
Error Code -124 reported for 10 surfaces
Error Code -600 reported for 8 surfaces
Error Code -1000 reported for 299 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Cuckoo search - min FS < 1.5	Master Scenario	Spencer: 1.407790	00h:00m:05.306s
Cuckoo search, static - 1.5 setback	Master Scenario	Spencer: 1.559250	00h:00m:05.99s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

All Open Scenarios

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Bedrock
Color	
Strength Type	Anisotropic Linear
Unit Weight [lbs/ft3]	130
Cohesion 1 [psf]	300
Cohesion 2 [psf]	300
Friction Angle 1 [°]	18
Friction Angle 2 [°]	32
A [°]	1
B [°]	1
Anisotropic Definition	Surface
Angle from 1 [°]	
Anisotropic Surface	Assigned per scenario
Tensile Strength [psf]	0
Water Surface	Assigned per scenario
Ru Value	0.1

Materials In Use

Material	Master Scenario	Master Scenario
Bedrock	✓	✓

Valid/Invalid Surfaces

Cuckoo search - min FS < 1.5

Method: spencer

Number of Valid Surfaces: 9260
Number of Invalid Surfaces: 796

Error Codes:

Error Code -108 reported for 114 surfaces
Error Code -111 reported for 98 surfaces
Error Code -112 reported for 91 surfaces
Error Code -114 reported for 52 surfaces
Error Code -121 reported for 12 surfaces
Error Code -124 reported for 22 surfaces
Error Code -600 reported for 4 surfaces
Error Code -1000 reported for 403 surfaces

Cuckoo search, static - 1.5 setback

Method: spencer

Number of Valid Surfaces: 9449
Number of Invalid Surfaces: 610

Error Codes:

Error Code -108 reported for 46 surfaces
Error Code -111 reported for 19 surfaces
Error Code -112 reported for 85 surfaces
Error Code -114 reported for 57 surfaces
Error Code -121 reported for 42 surfaces
Error Code -124 reported for 26 surfaces
Error Code -1000 reported for 335 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Slice Data

Cuckoo search - min FS < 1.5

Global Minimum Query (spencer) - Safety Factor: 1.40779

SLIDEINTERPRET 8.010

Analysis:	Section 25-25'; NS-2; pseudo; cuckoo search		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t25ps1a.slmd
		Scale:	1:500
Project No.:	18-1245A-4	*Date:* 6/6/2018	*Figure No.:* Run No. 33

Slide Analysis Information

t25ps1a

Project Summary

File Name:	t25ps1a.slmd
Slide Modeler Version:	8.01
Compute Time:	00h:00m:03.706s
Project Title:	VTTM 60257
Analysis:	Section 25-25'; NS-2; pseudo; cuckoo search
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Bedrock
Color	
Strength Type	Anisotropic Linear
Unit Weight [lbs/ft3]	130
Cohesion 1 [psf]	300
Cohesion 2 [psf]	300
Friction Angle 1 [°]	18
Friction Angle 2 [°]	32
A [°]	1
B [°]	1
Anisotropic Definition	Surface
Angle from 1 [°]	
Anisotropic Surface	Anisotropic Surface 1
Tensile Strength [psf]	0
Water Surface	None
Ru Value	0.1

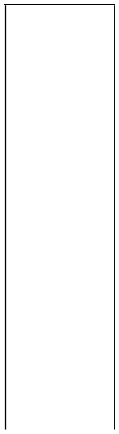
Global Minimums

Method: spencer

FS	1.206890
Axis Location:	120.435, 1413.328
Left Slip Surface Endpoint:	111.213, 1304.346
Right Slip Surface Endpoint:	202.087, 1340.561
Resisting Moment:	1.107e+07 lb-ft
Driving Moment:	9.17234e+06 lb-ft
Resisting Horizontal Force:	92878.8 lb
Driving Horizontal Force:	76957.3 lb
Total Slice Area:	1275.33 ft2
Surface Horizontal Width:	90.8743 ft
Surface Average Height:	14.0341 ft

Global Minimum Coordinates

Method: spencer



X	Y

198.045	1337.51
202.087	1340.56

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9277
Number of Invalid Surfaces: 778

Error Codes:

Error Code -108 reported for 50 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 98 surfaces
Error Code -112 reported for 124 surfaces
Error Code -114 reported for 92 surfaces
Error Code -121 reported for 35 surfaces
Error Code -124 reported for 78 surfaces
Error Code -1000 reported for 300 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.20689

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Cuckoo search, static - min FS	Master Scenario	Spencer: 1.130010	00h:00m:11.1s
Cuckoo search, static - 1.55 setback	Master Scenario	Spencer: 1.554940	00h:00m:10.420s

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

All Open Scenarios

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Cuckoo search, static - min FS

Method: spencer

Number of Valid Surfaces: 9311
Number of Invalid Surfaces: 746

Error Codes:

Error Code -108 reported for 28 surfaces
Error Code -111 reported for 61 surfaces
Error Code -112 reported for 37 surfaces
Error Code -114 reported for 46 surfaces
Error Code -121 reported for 17 surfaces
Error Code -124 reported for 5 surfaces
Error Code -600 reported for 33 surfaces
Error Code -1000 reported for 519 surfaces

Cuckoo search, static - 1.55 setback

Method: spencer

Number of Valid Surfaces: 9467
Number of Invalid Surfaces: 590

Error Codes:

Error Code -108 reported for 6 surfaces
Error Code -111 reported for 1 surface
Error Code -112 reported for 17 surfaces
Error Code -114 reported for 107 surfaces
Error Code -121 reported for 21 surfaces
Error Code -124 reported for 11 surfaces
Error Code -1000 reported for 427 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-600 = Nonconvergence due to tension
-1000 = No valid slip surface is generated

Analysis:	Section 26-26'; NS-2; pseudo; cuckoo search		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t26ps1a.slmd
		Scale:	1:500
Project No.:	18-1245A-4	*Date:* 6/6/2018	*Figure No.:* Run No. 36

Slide Analysis Information

t26ps1a

Project Summary

File Name:	t26ps1a.slmd
Slide Modeler Version:	8.01
Compute Time:	00h:00m:10.114s
Project Title:	VTTM 60257
Analysis:	Section 26-26'; NS-2; pseudo; cuckoo search
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Alluvium	Bedrock
Color		
Strength Type	Mohr-Coulomb	Anisotropic Linear
Unit Weight [lbs/ft3]	120	130
Cohesion [psf]	200	
Friction Angle [°]	27	
Cohesion 1 [psf]		300
Cohesion 2 [psf]		300
Friction Angle 1 [°]		18
Friction Angle 2 [°]		32
A [°]		1
B [°]		1
Anisotropic Definition		Surface
Angle from 1 [°]		
Anisotropic Surface		Anisotropic Surface 1
Tensile Strength [psf]		0
Water Surface	None	None
Ru Value	0	0.1

Global Minimums

Method: spencer

FS	1.179150
Axis Location:	163.780, 1473.315
Left Slip Surface Endpoint:	26.068, 1333.000
Right Slip Surface Endpoint:	193.405, 1278.956
Resisting Moment:	5.32823e+07 lb-ft
Driving Moment:	4.51869e+07 lb-ft
Resisting Horizontal Force:	251563 lb
Driving Horizontal Force:	213342 lb
Total Slice Area:	3713.13 ft2
Surface Horizontal Width:	167.337 ft
Surface Average Height:	22.1895 ft

Global Minimum Coordinates

Method: spencer

193.405	1278.96

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9578
Number of Invalid Surfaces: 478

Error Codes:

Error Code -108 reported for 20 surfaces
Error Code -111 reported for 70 surfaces
Error Code -112 reported for 21 surfaces
Error Code -114 reported for 35 surfaces
Error Code -121 reported for 15 surfaces
Error Code -124 reported for 5 surfaces
Error Code -1000 reported for 312 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slide Analysis Information

t27s1a

Project Summary

File Name: t27s1a.slmd
Slide Modeler Version: 8.01

Currently Open Scenarios

Group Name	Scenario Name	Global Minimum	Compute Time
Cuckoo search, static - min FS	Master Scenario	Spencer: 1.258760	00h:00m:11.253s
Cuckoo search, static - setback	Master Scenario	Spencer: 1.552720	00h:00m:17.865s

General Settings

Units of Measurement: Imperial Units
Time Units: days
Permeability Units: feet/second
Data Output: Standard
Failure Direction: Left to Right

Analysis Options

All Open Scenarios	
Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

All Open Scenarios	
Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

All Open Scenarios	
Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

All Open Scenarios	
Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

All Open Scenarios	
Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Alluvium	Bedrock	Terrace Deposits
Color

Valid/Invalid Surfaces

Cuckoo search, static - min FS

Method: spencer

Number of Valid Surfaces: 9190
Number of Invalid Surfaces: 867

Error Codes:

Error Code -108 reported for 55 surfaces
Error Code -111 reported for 30 surfaces
Error Code -112 reported for 22 surfaces
Error Code -114 reported for 64 surfaces
Error Code -121 reported for 7 surfaces
Error Code -124 reported for 19 surfaces
Error Code -1000 reported for 670 surfaces

Cuckoo search, static - setback

Method: spencer

Number of Valid Surfaces: 9382
Number of Invalid Surfaces: 680

Error Codes:

Error Code -108 reported for 11 surfaces
Error Code -112 reported for 24 surfaces
Error Code -114 reported for 73 surfaces
Error Code -121 reported for 40 surfaces
Error Code -124 reported for 9 surfaces
Error Code -1000 reported for 523 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

Analysis:	Section 27-27'; NS-2; pseudo; cuckoo search; setback analysis		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t27ps1a.slmd
		Scale:	1:500
Project No.:	18-1245A-4	*Date:* 6/6/2018	*Figure No.:* Run No. 39

Slide Analysis Information

t27ps1a

Project Summary

File Name:	t27ps1a.slmd
Slide Modeler Version:	8.01
Compute Time:	00h:00m:13.296s
Project Title:	VTTM 60257
Analysis:	Section 27-27'; NS-2; pseudo; cuckoo search; setback analysis
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis: No
Staged pseudostatic analysis: No

Seismic Load Coefficient (Horizontal): 0.15

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9337
Number of Invalid Surfaces: 719

Error Codes:

Error Code -108 reported for 34 surfaces
Error Code -111 reported for 30 surfaces
Error Code -112 reported for 30 surfaces
Error Code -114 reported for 92 surfaces
Error Code -121 reported for 44 surfaces
Error Code -124 reported for 14 surfaces
Error Code -1000 reported for 475 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 31-31'; 70' high fill slope; cuckoo search; static		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t31s1a.slmd
		Scale:	1:900
Project No.:	18-1245A-4	*Date:* 6/8/2018	*Figure No.:* Run No. 40

Slide Analysis Information

t31s1a

Project Summary

File Name:	t31s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:15.121s
Project Title:	VTTM 60257
Analysis:	Section 31-31'; 70' high fill slope; cuckoo search; static
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Compacted Fill	Remedial Removal	Alluvium	Bedrock

Unit Weight [lbs/ft3]	130	130	120	130
Cohesion [psf]	270	270	200	300
Friction Angle [°]	29	29	27	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.823480
Axis Location:	281.152, 1464.605
Left Slip Surface Endpoint:	265.537, 1260.912
Right Slip Surface Endpoint:	434.737, 1329.897
Resisting Moment:	5.19109e+07 lb-ft
Driving Moment:	2.84877e+07 lb-ft
Resisting Horizontal Force:	233301 lb
Driving Horizontal Force:	128031 lb
Total Slice Area:	2982.12 ft2
Surface Horizontal Width:	169.2 ft
Surface Average Height:	17.6248 ft

Global Minimum Coordinates

Method: spencer

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8670
Number of Invalid Surfaces: 1391

Error Codes:

Error Code -106 reported for 6 surfaces
Error Code -108 reported for 225 surfaces
Error Code -111 reported for 73 surfaces
Error Code -112 reported for 65 surfaces
Error Code -114 reported for 80 surfaces
Error Code -121 reported for 194 surfaces
Error Code -124 reported for 55 surfaces
Error Code -1000 reported for 693 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 31-31'; 70' fill slope; non-circular internal search; pseudo		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t31ps1a.slmd
		Scale:	1:900
Project No.:	18-1245A-4	*Date:* 6/8/2018	*Figure No.:* Run No. 41

Slide Analysis Information

t31ps1a

Project Summary

File Name:	t31ps1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:12.777s
Project Title:	VTTM 60257
Analysis:	Section 31-31'; 70' fill slope; non-circular internal search; pseudo
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Remedial Removal	Alluvium	Bedrock

Cohesion [psf]	270	270	200	300
Friction Angle [°]	29	29	27	32
Tensile Strength [psf]				0
Water Surface	None	None	None	None
Ru Value	0	0	0	0

Global Minimums

Method: spencer

FS	1.285470
Axis Location:	283.788, 1465.948
Left Slip Surface Endpoint:	267.478, 1260.962
Right Slip Surface Endpoint:	437.990, 1329.908
Resisting Moment:	5.12146e+07 lb-ft
Driving Moment:	3.98411e+07 lb-ft
Resisting Horizontal Force:	230797 lb
Driving Horizontal Force:	179543 lb
Total Slice Area:	3072.17 ft2
Surface Horizontal Width:	170.513 ft
Surface Average Height:	18.0173 ft

Global Minimum Coordinates

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8404
Number of Invalid Surfaces: 1655

Error Codes:

Error Code -106 reported for 10 surfaces
Error Code -108 reported for 287 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 74 surfaces
Error Code -112 reported for 112 surfaces
Error Code -114 reported for 60 surfaces
Error Code -121 reported for 229 surfaces
Error Code -124 reported for 31 surfaces
Error Code -1000 reported for 851 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.28547

SLIDEINTERPRET 8.014

Analysis:	Section 31-1'; non-circular search; fill slope over liquefied Qal		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t31s2a.slmd
		Scale:	1:900
Project No.:	18-1245A-4	*Date:* 6/28/2018	*Figure No.:* Run No. 42

Slide Analysis Information

t31s2a

Project Summary

File Name:	t31s2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:21.266s
Project Title:	VTTM 60257
Analysis:	Section 31-1'; non-circular search; fill slope over liquefied Qal
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8457
Number of Invalid Surfaces: 1603

Error Codes:

Error Code -106 reported for 6 surfaces
Error Code -108 reported for 205 surfaces
Error Code -109 reported for 2 surfaces
Error Code -111 reported for 72 surfaces
Error Code -112 reported for 140 surfaces
Error Code -114 reported for 55 surfaces
Error Code -121 reported for 209 surfaces
Error Code -124 reported for 53 surfaces
Error Code -1000 reported for 861 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.

-1000 = No valid slip surface is generated

Slice Data

Results at Stage 6, 360 days

Project Summary

File Name:	t30s4a.slmd
Slide Modeler Version:	8.014
Project Title:	VTTM 60257 - Sterling Ranch Estates
Analysis:	Section 30-30'; Infiltration Basin Seepage Analysis
Author:	K. Callahan
Date Created:	5/11/2018

Comments

Sterling Gateway, L.P.
LID Stormwater Infiltration
18-1245A-4
C1

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	inches/hour
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Steady State FEA
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Tolerance:	1e-06
Maximum number of iterations:	500
Use negative pore pressure cutoff:	No
Advanced Groundwater Method:	Transient FEA

Transient Settings

Stage Name	Time [d]	Calculate Safety Factor
Stage 1	15	No
Stage 2	30	No
Stage 3	60	No
Stage 4	100	No
Stage 5	155	No
Stage 6	360	No
Stage 7	1000	No

Tolerance (Transient):	1e-06
Maximum number of iterations (Transient):	500
Time Steps (Transient):	Automatic
Mesh Element Type:	3 noded triangles
Number of Elements:	2476
Number of Nodes:	1324

Results at Stage 6, 360 days

Project Summary

File Name:	t30s4a.slmd
Slide Modeler Version:	8.014
Project Title:	VTTM 60257 - Sterling Ranch Estates
Analysis:	Section 30-30'; Infiltration Basin Seepage Analysis
Author:	K. Callahan
Date Created:	5/11/2018

Comments

Sterling Gateway, L.P.
LID Stormwater Infiltration
18-1245A-4
C1

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	inches/hour
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Steady State FEA
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Tolerance:	1e-06
Maximum number of iterations:	500
Use negative pore pressure cutoff:	No
Advanced Groundwater Method:	Transient FEA

Transient Settings

Stage Name	Time [d]	Calculate Safety Factor
Stage 1	15	No
Stage 2	30	No
Stage 3	60	No
Stage 4	100	No
Stage 5	155	No
Stage 6	360	No
Stage 7	1000	No

Tolerance (Transient):	1e-06
Maximum number of iterations (Transient):	500
Time Steps (Transient):	Automatic
Mesh Element Type:	3 noded triangles
Number of Elements:	2476
Number of Nodes:	1324

JOB NO.: 18-1245A-4

DATE: 6/8/18 | FIGURE: 1

APPENDIX G

Table G1 - Minimum Foundation and Slab Recommendations for Expansive Soils

Minimum Design Parameters for Footing Foundations						
Expansion Potential Classification (ASTM D4829)	Expansion Index (ASTM D4829)	Footing Embedment (inches)				Reinforcement Of Continuous Footings
		One-story and Two-Story structures		Three-Story structures		
		Perimeter locations	Interior locations	Perimeter locations	Interior locations	
Very Low	0 to 20	18	12	24	18	Per structural requirements
Low	21 to 50	18	12	24	18	One # 4 Rebar, top and bottom
Medium	51 to 90	24	18	30	24	One # 4 Rebar, top and bottom
High	91 to 130	30	18	36	30	Two # 4 Rebars, top and bottom

- Width of continuous footings shall be at least 12 inches (one-story structures); 15 inches (two-story structures); 18 inches (three-story structures). Width of isolated footings that support individual columns shall be at least 24 inches.
- Isolated footings that support exterior structural columns shall be structurally connected to the main foundation system in at least two orthogonal horizontal directions.
- The sides of footings that support interior columns should be connected to the closest adjacent (isolated spread footing and/or continuous footing) foundations using reinforced concrete tie beams. The tie beams should be at least 12 inches wide and should be embedded at least 12 inches beneath pad grade. Reinforcement of the tie beams should be at least ρ_{min} $(200/f_y)$.
- Foundation excavations should be observed by a representative of this firm to verify that the excavations are embedded to the recommended depth into the recommended material, prior to placement of forms, reinforcement, or concrete in the excavations. The excavations should be moisture-conditioned and free of all loose or sloughed material prior to casting of concrete.
- Footing foundations to be underlain by soils with an Expansion Index higher than 130 should be individually designed by the Structural Engineer, based on consultation with the Geotechnical Engineer. Proposed buildings that will be underlain by soils with an Expansion Index higher than 130 may also be supported on post-tensioned slabs or on structural mats, to be designed on a case by case basis by a structural engineer in consultation with the geotechnical engineer. General recommendations for design of post-tensioned slabs and structural mats for soil subgrades with an Expansion Index higher than 130 are provided after the following table.

APPENDIX G

Table G1 - Minimum Foundation and Slab Recommendations for Expansive Soils

Minimum Design Parameters For Concrete Slab-On-Grade Floors					
Expansion Potential Classification (ASTM D 4829)	Expansion Index	Moisture Conditioning of Slab Subgrade	Slab Reinforcement	Minimum Slab Thickness	Thickness of Compacted Granular Material over subgrade and beneath slab
Very Low	0 to 20	None	#3 Rebar at 24", each way	4 inches	2 inches of sand[1] plus 2 inches of sand over vapor retarder
Low	21 to 50	120 percent of Optimum Moisture Content[2] to 18 inches depth	#3 Rebar at 18", each way		
Medium	51 to 90	130 percent of Optimum Moisture Content to 24 inches depth	#4 Rebar at 16", each way	5 inches	4 inches of aggregate base plus 2 inches of sand over vapor retarder
High	91 to 130	140 percent of Optimum Moisture Content to 36 inches depth	#4 Rebar at 14", each way	6 inches	6 inches of aggregate base plus 2 inches of sand over vapor retarder

- Slabs should be constructed using low-slump concrete and with crack control joints spaced 8 ft apart, or closer, in both horizontal directions. In any case, concrete used in slabs-on-grade should satisfy the requirements of Chapter 19 of the California Building Code.
- Interior floor slabs should be structurally tied to continuous footing foundations as directed by the Structural Engineer. As a minimum, slabs constructed over subgrades with medium or high expansion potential should be structurally tied to continuous footing foundations using No. 3 rebars on 36-inch horizontal spacings and to interior column footing foundations by bending No. 3 rebars into the slab on alternating 24-inch and 36-inch horizontal lengths.
- Welded wire mesh should not be substituted for the steel rebar reinforcement recommended in the preceding table because sagging of welded wire mesh between support points during casting of floor slabs typically results in insufficient concrete cover beneath the mesh, even if extra measures are used to keep the mesh at slab mid-height.
- If buildup of water vapor beneath interior floor slabs is acceptable, the floor slabs may be cast directly on the recommended surficial lift of compacted granular material. Otherwise, a membrane vapor retarder with a thickness of at least 10 mils should be placed over the lift of compacted granular material, a 2-inch thick protective cushion of compacted well-graded clean sand should be placed over the membrane, and the floor slab should be cast

[1] Sand "base" should have a Sand Equivalent of at least 30 (e.g., washed concrete sand).
[2] Optimum Moisture Content of subgrade soils, per ASTM D1557.

APPENDIX G

Table G1 - Minimum Foundation and Slab Recommendations for Expansive Soils

on the sand cushion. The membrane should be lapped and/or sealed, and sealed around all plumbing structures and other openings. Care should be taken to avoid puncturing the membrane during placement/compaction of the sand cushion and during casting of the slab. Suitability of materials that will be placed directly above and below the membrane should be evaluated in our geotechnical laboratory prior to transporting them to the project site.

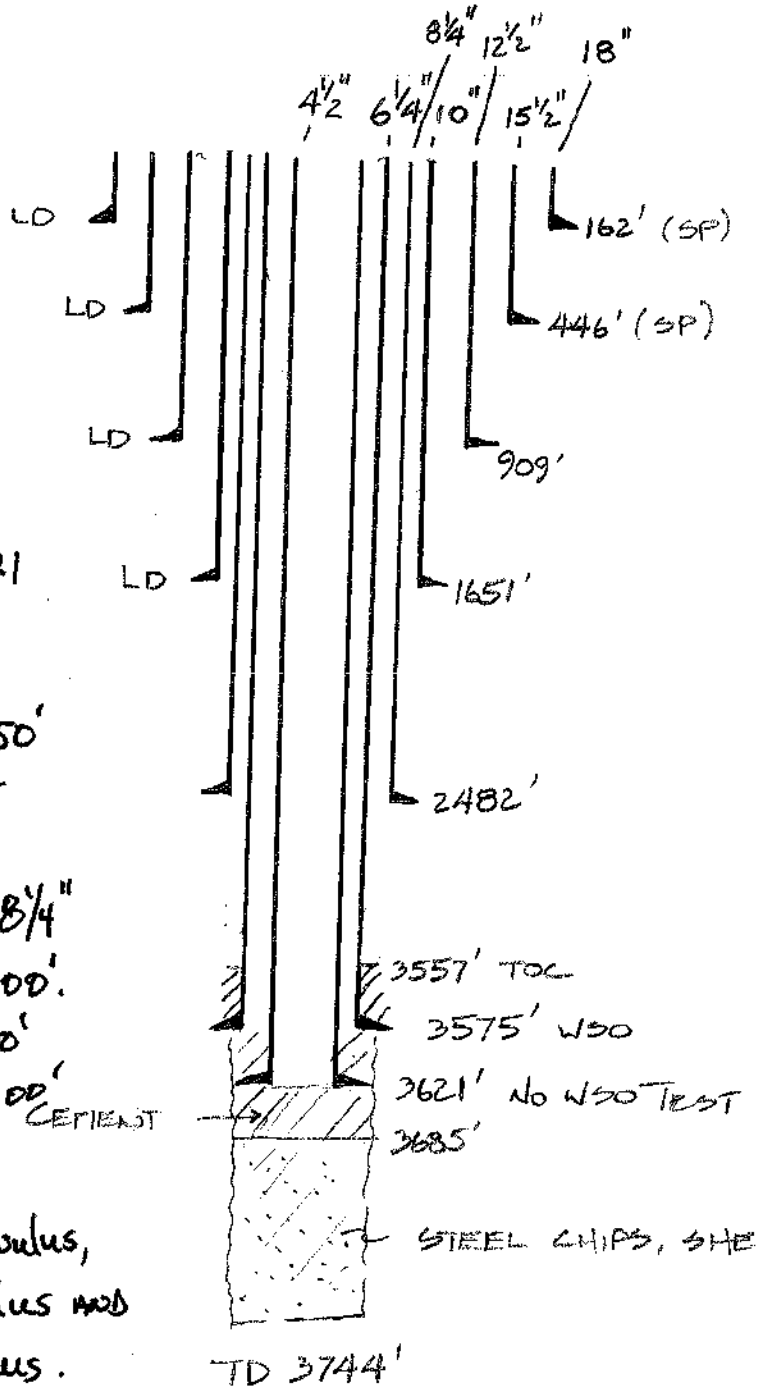
- In order to minimize entry of water beneath interior slab-on-grade floors, utility trenches that cross perimeter footing foundations should be backfilled with lean concrete or with concrete slurry. The slurry plug should extend under the full width of the footing and along the trench for at least 24 inches in the direction of the slab.
- Materials from foundation and/or utility trench excavations should not be spread on areas where concrete slabs will be cast unless the materials are compacted and tested.
- Floor slabs underlain by soils with an Expansion Index greater than 130 should be individually designed by the Structural Engineer based on consultation with the Geotechnical Engineer.

Post-Tensioned Slabs

The following general geotechnical recommendations may be used for design of post-tensioned floors slabs that will be constructed over subgrades with VERY HIGH expansion potential (i.e., Expansion Index higher than 130).

- The upper 3 ft of the subgrade beneath post-tensioned slabs should be water conditioned to at least 130 percent of Optimum Moisture Content and compacted to between 90 and 93 of Maximum Dry Density, per ASTM D1557.
- A vapor barrier between two 2-inch thick layers of compacted sand should be placed on the subgrade of post-tensioned slabs.
- Post-tensioned slabs should be designed to accommodate a vertical deflection as great as 1.0 inch (up or down) over a horizontal distance of 30 feet, as a result of potential swelling/shrinking of the underlying subgrade.

WELL No. 1



Abandonment Requirements

1. c/o to 3617
2. plug with cement 3617-3521
3. Fill hole with 72# mud
4. Cavity shot at 3150'
5. Plug with cement 3150-3050'
6. Pull 4½", 6¼" & 8¼" casing from 1400'.
7. Cavity shot at 1400'
8. Plug from 1400'-1300'
9. Plug from 30'-sfc in 10", 10"x12½ Annulus, 12½"x15½ Annulus and 15½"x18" Annulus.

2006

Summary of Plugging Janes ..ell #1

Filled up with wire drilling line from 3744 ft. to 3730 feet. Dumped bailer of lime and also bailer of cement at 3730.

Plugged hole with steel chips and wire line from 3730 to 3722. Put in one-half bailer of lime and one bailer of cement at 3722.

Plugged hole with steel chips and also put in wire cable and finished up from 3722 to 3714 with wire line and steel chips.

Plugged hole with lead wool from 3714 to 3710.

3710 to 3708 plugged with steel chips. Dumped one-half bailer of lime at 3708.

3708 to 3704 plugged with cement and rock. Put in two sacks cement and one-half bailer of lime.

In running in casing it went to 3708' 8".

3708'8" to 3685 Plugged with shells containing cement and rock and dumped two sacks pure cement.

3685 to 3557filled up with 132 sacks of cement.

Cleaned out and recemented six inch casing. Got seven sacks back of casing. Cementing done by Perkins method using Chemical Cement

Drilled out to 3620. Casing went to 3627. Bridged back to 3617' 9". Dumped in one sack cement.

Cemented 4½ inch casing at 3621 feet. Eleven sacks cement. Cementing done by Perkins using Chemical Cement

Quote.

CALIFORNIA STATE MINING BUREAU

DEPARTMENT OF PETROLEUM AND GAS

Report on Proposed Operations

No. P-1-5788.

Los Angeles, Cal. April 17, 1925.

Mr. E. B. Stout,

Newhall, Cal.

Agent for FERNANDO OIL Company

DEAR SIR:

Your proposal to abandon Well No. 1, Section 10, T. 4N., R. 17W., S.B. B. & M.

Newhall Oil Field, Los Angeles County, dated April 15, 1925,

has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

RECORDS:

Casing: 18" landed 162'.
15½" " 446'.
12⅝" " 909', not tested.
10" " 1651'2", " "
8¼" " 2482'2", " "
6¼" cemented 3575' (water shut off, P-1-2231. Water broke in and recemented, not tested).
4½" cemented 3621', not tested.
Total depth 3744'.

Oil and gas showings:

Small gas showing in sand 3149'-3167'.
Small gas showing in shale at 3355'.
Oil and gas showing in sand 3584'-3690'.

Plugging:

A summary of the plugging done was reported by Mr. O. B. Johnson, Secretary of the Fernando Oil Company, as follows:

"Filled up with wire drilling line from 3744 ft. to 3730 feet. Dumped bailer of lime and also bailer of cement at 3730.

"Plugged hole with steel chips and wire line from 3730 to 3722. Put in one-half bailer of lime and one bailer of cement at 3722.

"Plugged hole with steel chips and also put in wire cable and finished up from 3722 to 3714 with wire line and steel chips.

"Plugged hole with lead wool from 3714 to 3710.

"3710 to 3708 plugged with steel chips. Dumped one-half bailer of lime at 3708.

"3708 to 3704 plugged with cement and rock. Put in two sacks cement and one-half bailer of lime.

"In running in casing it went to 3708'8".

"3708'8" to 3685 plugged with shells containing cement and rock and dumped two sacks pure cement.

"3685 to 3557 filled up with 132 sacks of cement.

"Cleaned out and recemented six inch casing. Got seven sacks back of casing. Cementing done by Perkins with tubing method using chemical cement.

"Drilled out to 3680. Casing went to 3627. Bridged back to 3617'9". Dumped in one sack cement.

Form 111, 92418 11-22 10M

(CONTINUED ON PAGE TWO)

CALIFORNIA STATE MINING BUREAU

DEPARTMENT OF PETROLEUM AND GAS

Report on Proposed Operations

No. P-1-5788.

FERNANDO OIL Company

Well No. 1 Sec. 10, T. 4N., R. 17W., S.B. B. & M.

"Cemented 4½ inch casing at 3621 feet. Eleven sacks cement. Cementing done by Perkins using chemical cement."

THE NOTICE STATES AND PROPOSES:

"The present condition of the well is as follows: The 6¼" casing was landed and cemented at3575' and shut-off of upper water was approved by the Mining Bureau. The well was drilled to 3744' and when tested, flowing water developed. An effort was made to shut off this water in accordance with statement attached. Then the 6¼" casing was recemented by Perkins using tubing and chemical cement. Then the 4½" casing was landed at 3617'6" and cemented by Perkins using chemical cement. As the water is still not shut off, it is the intention to abandon. The open hole below the shoe of the 4½" casing will be filled with cement. This is the only part of the sand that is not already plugged with cement."

RECOMMENDATION:

The proposal is approved subject to the following recommendations:

1. In addition to the plug proposed by you, the following plugging should be done:
   (a) If the 4½" casing is pulled from below the shoe of the 6¼" casing, the top of the 4½" casing left in the well should be plugged with cement, and the plug carried up into the 6¼" casing at least 20'.
   (b) If the 4½" casing cannot be pulled from below the shoe of the 6¼" casing, the top of the 4½" should be plugged with cement inside the 6¼" casing.
   (b) The top of the 6¼" casing left in the well should be plugged with cement.
2. Upon completion of the work of abandonment, please file with this Department a report in duplicate on our form 102, giving in detail the following information:
   (a) Names of all workmen employed.
   (b) Dates of commencement and completion of the work.
   (c) Depths at which casing was cut or shot, with amounts of casing removed from the well.
   (d) Record of all plugging operations.

R. E. COLLOM
State Oil and Gas Supervisor

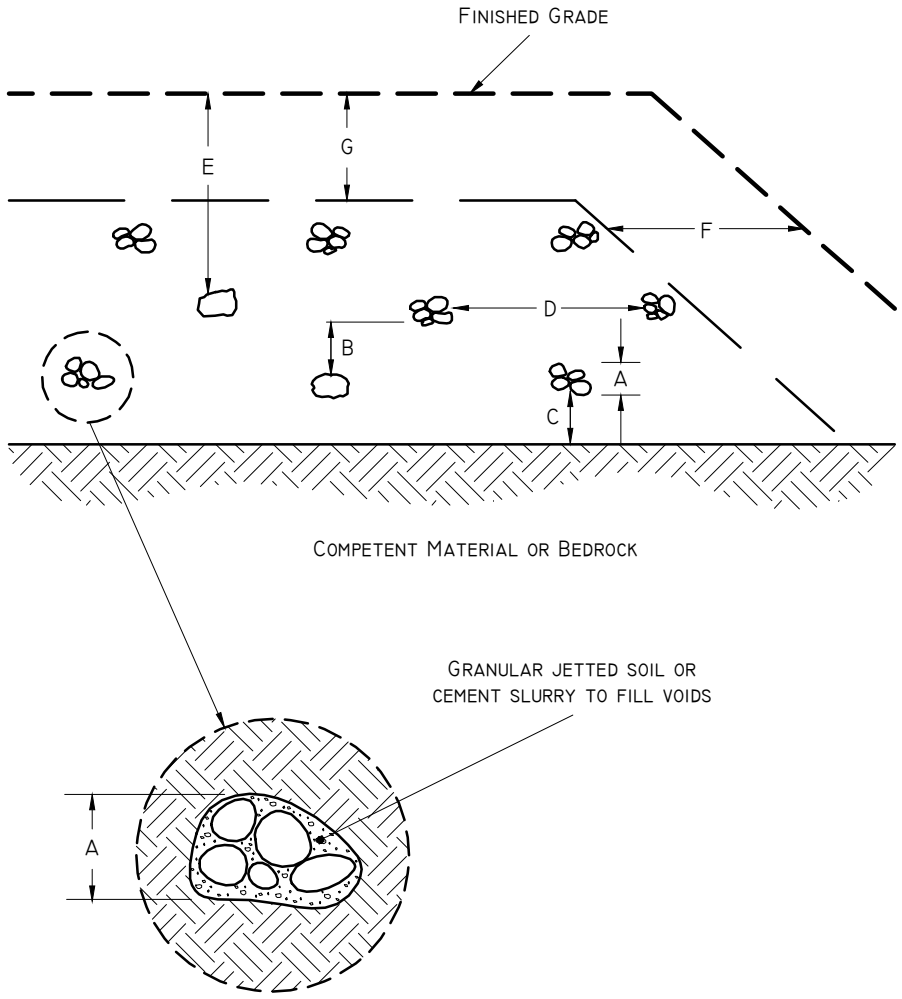
FILL OVER NATURAL SLOPE
5:1 OR STEEPER



EXPLANATION

A) ± 4 FT, HEIGHT AND WIDTH MAY VARY DEPENDING ON ROCK SIZE

B) MINIMUM OF 4 FT FROM STAGGER WINDROW

C) MINIMUM OF 5 FT FROM FIRST SET OF WINDROW TO COMPETENT MATERIAL OR BEDROCK

D) MINIMUM OF 15 FT BETWEEN WINDROWS

E) MINIMUM OF 23 FT FROM OVERSIZED ROCKS (LARGEST DIMENSION ≥ 4 FT) TO FINISHED SUBGRADE. ALL OVERSIZED ROCKS MUST BE INDIVIDUALLY PLACED.

F) MINIMUM OF 25 FT FROM PROJECTED WINDROW AREA TO FINISHED SLOPE SURFACE.

G) MINIMUM OF 15 FT BENEATH FINISHED GRADE TO PROVIDE CLEARANCE FOR FOUNDATIONS AND POOLS, OR 5 FT BELOW THE DEEPEST ADJACENT UTILITY TRENCH, WHICHEVER IS DEEPEST.

ALLAN E. SEWARD

GEOLOGIC AND GEOTECHNICAL REPORT
Review of Revised Vesting Tentative Tract Map dated February 27, 2019

Project: Vesting Tentative Tract Map 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: At end of text

Dear Mr. Williams:

This report is divided into two parts. The first part presents our response to the Geologic and Soils Engineering Review Sheet dated 10/17/18 for Vesting Tentative Tract Map 60257 issued by the Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division (GMED). The second part of the report presents our opinions on the existing geologic and geotechnical conditions and their effects on the proposed development shown on the Vesting Tentative Tract Map 60257 dated 2/27/19. This report is supplementary to our previous report dated 6/8/18 (see ref. 5), hereinafter called "previous report", and the conclusions and recommendations presented therein are still applicable except where they are superseded in this report. The results of supplemental subsurface exploration, laboratory testing, and analyses that was performed for this study are included in the second part.

PART I

GEOLOGIC AND GEOTECHNICAL REPORT – Addendum No. 1

In order to facilitate the review process, we have listed the County of Los Angeles review sheets comments in **bold** in the order in which they appear on the original review sheet. Each comment is followed by our response. A copy of the review sheet is attached after the references.

Comment G1

The toe of landslide Qls-3 is showing crossing a proposed lot boundary. Adjust lot lines to constrain the landslide on one lot or provide remediation of the landslide. The landslide hazard may not be subdivided. If complete removal is proposed, depict the proposed final topography in the area of landslide removal.

Response

The 2/27/19 Vesting Tentative Tract Map (VTTM) adjusted the lot boundary for Lot 228 (Debris Basin). The mapped limits of Landslide Qls-3 is contained entirely in Lot 239 (Open Space). See the attached Geotechnical Map (Plate II) which used the 2/27/19 VTTM as the base map.

Comment G2

The toe of landslide Qls-3 is shown encroaching into the debris cone of a proposed debris basin. Determine that the landslide is stable, recommend mitigation, or increase the basin capacity by an equivalent volume.

Response

The previous report concluded that Landslide Qls-3 and the ascending natural slope do not meet the minimum County factor of safety requirements for gross stability. A stable post-failure geometry was predicted based on the pre-failure critical surface. The post-failure geometry was modeled on Cross Section 7-7' assuming bulking of the failure mass by approximately 20 percent and a runout of the failure mass that yielded a stable condition (i.e. where potential failure surfaces meet or exceed minimum County requirements). The predicted post-failure geometry (see Figure 1) was provided to the Supervising Civil Engineer. It is our understanding that the Supervising Civil Engineer increased the proposed debris basin to account for the potential reduction in the debris cone based on the post-failure geometry. The 2/27/19 VTTM illustrates the revised configuration of the western debris basin on Lot 228,

which provides a debris potential volume (DPV) of 848 cubic yards (cy) versus the required DPV of 278 cy. Revised Cross Section 7-7' illustrates the 2/27/19 VTTM design.

Comment S1

Provide data to substantiate the shear strengths used in the slope stability analyses for the bedrock (cross bedding), post-failure mass, and terrace deposits (see slope stability analyses for cross section 27-27'). Provide revised slope stability analyses and recommend mitigation measures if factors of safety are below the County's minimum standard.

Response

Additional subsurface exploration and six laboratory shear tests of the Saugus Formation (TQs) bedrock was performed to substantiate the cross bedding shear strength. Representative samples of Saugus Formation (TQs) bedrock were obtained from two 24-inch diameter bucket-auger borings (B-3A and B-4A) for laboratory direct shear testing. The 24-inch diameter borings are located at the vicinity of Lots 136 and 97, respectively, and were drilled to a maximum depth of 55 feet on 11/20/18 by Alroy Drilling. The borings were sampled and logged by a Certified Engineering Geologist from this firm. The drill hole logs are presented in **Appendix A** and the locations of the drill holes are shown on the Geotechnical Map (**Plate II**).

A modified California-drive sampler (fitted with 2.42-inch inner diameter by 1-inch-tall brass rings) was used to obtain samples in the exploratory drill holes at various depths (see logs in **Appendix A**). Recovered ring samples were sealed in plastic containers to preserve the in-situ moisture and brought to our geotechnical laboratory for further classification and direct shear testing.

Direct shear testing (ASTM D3080) was performed on intact bedrock samples collected from Boring B-3A at a depth of 39 ft, and from Boring B-4A at depths of 10 ft, 14 ft, 17 ft, 27.5 ft, and 28 ft. Additional laboratory testing performed on the bedrock samples included the following: moisture content (ASTM D2216), dry density (ASTM D7263), Amount of Materials in Soils Finer than No. 200 Sieve (ASTM D1140), and Particle-Size Analysis of Soils (ASTM D422). The results of this testing are presented on the drill logs (**Appendix A**) or laboratory test reports within **Appendix B**.

The test data was used in conjunction with existing on-site shear test data to assess the shear strength parameters previously presented and used for slope stability analyses. The Direct Shear Test Reports presented in **Appendix B** illustrate obtained peak and residual shear stress

values in comparison to the design peak and residual shear strength parameters (i.e. the Mohr-Coulomb failure envelope) established for the prior report. Based on the direct shear test results the across-bedding shear strength parameters for bedrock presented in the previous report remain applicable. Therefore, revised slope stability analysis is not warranted.

The shear strength parameters used in the slope stability analysis for a hypothetical post-failure configuration were selected using professional judgement based on the source bedrock material classification, potential bulking during failure, and ultimately our experience with landslides and landslide mitigation in the vicinity of the project site. The selected values are considered conservative and appropriate for the evaluation method.

The shear strength for the terrace deposits has been corrected for the slope stability analysis performed on Cross Section 27-27'. The updated results of the analysis are provided in **Appendix C**. Based on the results, the previously recommended slope setback at this cross section location remains applicable.

Comment S2

The Soils Engineer showed that a slope graded at 2.4:1 (H:V) on cross section 18-18' will not meet the minimum required factors of safety; however, the proposed slope gradient of CS-11 was between 2:1 and 2.4:1. Verify and provide revised geotechnical map as necessary.

Response

The 5/8/18 VTTM slope contours at the location of Cross Section 18-18' indicate slope gradients of 2:1 (H:V) for the lower portion of the slope and 2.2:1 (H:V) for the upper portion of the slope. This orientation of the Cross Section 18-18' is parallel to the interpreted direction of the landslide movement which orientation is slightly skewed from perpendicular to the proposed slope contours. Therefore, Cross Section 18-18' illustrated a 2.18:1 (H:V) slope gradient based on the proposed slope contours.

Irrespective, the previous report recommended that the eastern portion of proposed Cut-slope CS-11 be re-designed to a 3:1 slope gradient. The eastern portion of Cut-slope CS-11 is designed as a 3:1 slope gradient on the 2/27/19 VTTM. Cross Sections 16-16', 17-17' and 18-18' have been revised to illustrate the 2/27/19 design. Cross Section 18-18' illustrates a 3:1 (H:V) fill slope.

Based on the results of the prior analysis, Cut-slope CS-11 complies with County minimum factor of safety requirements. However, the previous report recommendation that this slope

be constructed as a Stability Fill utilizing a 25 ft wide by 5 ft deep keyway to mitigate surficial stability of the landslide debris anticipated to be exposed in the slope face is still applicable.

Comment S3

Provide temporary slope stability analysis for the proposed backcut shown on cross section 1-1'. Recommend mitigation if factor of safety is below the County's minimum standard.

Response

The configuration of the backcut and keyway of the recommended toe berm buttress has been reconfigured as illustrated on Cross Section 1-1'. Slope stability analysis on the reconfigured toe berm buttress illustrated on Cross Section 1-1' indicates this slope satisfies the Los Angeles County minimum safety factor requirements (see Table C1 in Appendix C).

The new configuration of the toe berm buttress eliminates the requirement of a temporary backcut in the landslide debris and potentially undercutting the slide plane. Temporary slope stability analysis of a backcut is no longer applicable.

Comment S4

Provide chemical test results (sulfate, chloride, resistivity, etc.) for the on-site soils to address the presence of chemicals deleterious to construction materials and utility lines. The chemical tests must be in accordance with California Test Methods, Department of Transportation, or equivalent (aqueous solution tests, such as EPA Tests or similar methods are not acceptable for determination of resistivity). Resistivity tests must be performed on soils in a saturated condition. Recommend mitigation as necessary.

Response

Results of corrosivity testing (soluble sulfate content, chloride content, and resistivity & pH) of on-site soils was provided in the referenced report. The tests were conducted in accordance with applicable California Test Methods on a mixture of bulk soil samples collected from Trenches T-5A and T-17A. The test results indicated that the tested samples did not classify as being corrosive to concrete or buried metal based on criteria presented in the current GMED Manual for Preparation of Geotechnical Reports, dated December 2014. However, standard precautionary measures were recommended to mitigate a less significant corrosion potential. It was also recommended that additional testing be conducted at the completion of grading operations to either confirm or revise the precautionary recommendations.

Comment S5

Show all revised, recommended mitigation measures on the geotechnical map as necessary.

Response

All of the recommended mitigation measures, where appropriate, have been shown on the attached Geotechnical Map (Plate II).

PART II

GEOLOGIC AND GEOTECHNICAL REPORT

Review of Vesting Tentative Tract Map, dated February 27, 2019

Our Geologic and Geotechnical Report dated June 8, 2018 (see ref. 5) addressed the Vesting Tentative Tract Map dated May 8, 2018, prepared by Sikand Engineering. Our response to Geologic and Soils Engineering Review Sheet comments issued by the Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division, is presented in the first part of this report. This portion of the report addresses revisions to the proposed development that are shown on the Vesting Tentative Tract Map dated February 27, 2019 (prepared by Sikand Engineering) from a geologic and geotechnical standpoint.

1.0 PROPOSED DEVELOPMENT

The 2/27/19 Vesting Tentative Tract Map (VTTM) 60257 reduces the number of residential lots from 231 to 222. The number of debris basin lots has been reduced from 7 to 6. The commercial lot, 3 infiltration basin lots, and the pump station lot have remained the same as the 5/8/18 VTTM. The open space lots have been increased from 3 to 5. In addition, 3 access road lots, 6 HOA lots, and 2 park site lots have been added. The general layout of the residential lots is the same as the 5/8/19 design with minor changes to the lot lines. The residential lots between proposed Sterling Parkway and Del Valle Road and north of the infiltration basin (Lot 240 on the 5/8/19 VTTM) have been replaced with a 3.4-acre park site.

The majority of lot numbers on the 2/27/19 VTTM have changed from the 5/8/18 VTTM. The table below presents the 5/8/18 VTTM lot numbers and the equivalent 2/27/19 VTTM lot numbers for select lots that are relevant to specific discussion in the June 8, 2018 Geologic and Geotechnical Report.

Discussion Points in 6/8/18 Report Specific to Lot Numbers	Lot Number	
	5/8/18 VTTM	2/27/19 VTTM
Highest 2:1 Fill slope	Vicinity of 140	Vicinity of 131
Maximum depth of cut	Vicinity of 223	Vicinity of 215
Maximum depth of fill	135	127
Landslide Qls-3	245	238
Landslide Qls-4 & Qls-5	185	176
Natural Slope NS-2	142, 144, 145 & 152	134, 136, 137 & 144
Debris Flow Hazard	10	10
Debris Flow Hazard	18 thru 22	18 thru 22
Debris Flow Hazard	35	35
Debris Flow Hazard	234 (Debris Basin)	227 (Debris Basin)
Debris Flow Hazard	235 (Debris Basin)	228 (Debris Basin)
Debris Flow Hazard	236 (Debris Basin)	eliminated

The 2/27/19 VTTM proposed elevations of the residential pads have minor grade changes of plus or minus 1 ft versus the 5/8/19 VTTM. A canyon fill with a 3:1 gradient fill slope is proposed between Cut-slopes CS-7 and CS-9, which is the maximum proposed fill slope height of 115 ft. The eastern portion of Cut-slope CS-11 is designed at a 3:1 slope gradient. The 2/27/19 VTTM is at a scale of 1-inch equals 100 ft.

2.0 SCOPE OF WORK

Our scope of work included the following tasks:

1. Coordination with the client and the supervising civil engineer regarding the grading concept.
2. Review of the 1-inch equals 100 ft Vesting Tentative Tract Map 60257 prepared by Sikand Engineering, dated 2/27/19.
3. Site reconnaissance and mapping of existing rock exposures.
4. Coordination with Underground Service Alert prior to our subsurface investigation.
5. Excavation, sampling, and logging of two 24-inch diameter bucket-auger borings to a maximum depth of 55 ft.
6. Laboratory testing of selected samples obtained from the borings to help define the engineering characteristics of the bedrock underlying the site.
7. Preparation of a Geotechnical Map (Plate II) using the 2/27/19 Vesting Tentative Tract Map as the base map. We make no representation regarding the accuracy of this base map.
8. Revisions to Cross Sections 1-1', 7-7', 12-12', 16-16, 17-17', 18-18' and 26-26' illustrating existing and proposed grades relative to the underlying geologic conditions.
9. Preparation of the attached drill hole logs, laboratory test results and this report.

3.0 FIELD EXPLORATION, SAMPLING, AND LABORATORY TESTING

3.1 SUBSURFACE EXPLORATIONS

Our subsurface investigation consisted of the excavation, logging and sampling of two 24-inch diameter bucket-auger borings to a maximum depth of 55 ft. The bucket-auger borings were excavated by Alroy Drilling. The bucket-auger borings were logged and sampled by a Certified Engineering Geologist from this firm. The drill hole logs are presented in **Appendix A**. The locations of the drill holes are shown on the Geotechnical Map (**Plate II**).

The drill hole logs included in **Appendix A** represent our interpretation of field data prepared for each boring by our geologic/engineering staff at the time of drilling, along with refinements based on observations and laboratory test results. The distribution and engineering characteristics of materials in adjacent areas may vary from those observed in the explorations.

3.2 SAMPLING PROCEDURES

A modified California-drive sampler (fitted with 2.42-inch inner diameter by 1-inch-tall brass rings) was used to obtain samples in the exploratory drill holes at various depths (see logs in **Appendix A**). Blow counts to drive the sampler were recorded in 6-inch intervals during soil sampling. The blow count values shown on the drill hole logs represent the 12-inch blow count (or fraction of) following an initial 6-inch seating interval. The blow counts are raw values and have not been corrected to account for sampler size/type, overburden pressure, hammer type and efficiency, or rod length. Recovered ring samples were sealed in plastic containers to preserve the in-situ moisture and brought to our geotechnical laboratory for further classification and testing.

Bulk soil samples were obtained from cuttings generated during the excavation of the trenches and drill holes. Materials in these bulk samples represent a mixture of soils within the noted depth range.

3.3 LABORATORY TESTING

Soils encountered in the drill holes were visually classified in the field using visual-manual procedures in accordance with applicable portions of the Unified Soil Classification System (ASTM D2488). Recovered soil samples were brought to our geotechnical laboratory, the visual soil classifications were checked, and the drill hole logs were reviewed in order to select soil samples for testing. The laboratory testing program performed on the on-site soils to evaluate engineering characteristics pertinent to the proposed improvements included the following tests: moisture content (ASTM D2216), dry density (ASTM D7263), Amount of Materials in Soils Finer than No. 200 Sieve (ASTM D1140), Particle-Size Analysis of Soils (ASTM D422), and Direct Shear (ASTM D3080).

The results of the field investigation and the laboratory tests were used as the basis for our analyses and recommendations presented in this report. Laboratory test results are discussed in the applicable sections of this report with graphical results presented in **Appendix B**.

5.0 REVISIONS TO THE TENTATIVE TRACT MAP

Based on our review of the Vesting Tentative Tract Map February 27, 2019, specific revisions to the proposed grading that are pertinent to geology and soils engineering are discussed below.

5.1 PROPOSED FILL SLOPES

A 115 ft high 3:1 gradient (h:v) fill slope is proposed between Cut-slopes CS-7, CS-8 and CS-9. Slope stability analyses performed on a schematic 3:1 fill slope indicates that the internal stability of this proposed fill slope satisfies the Los Angeles County factor of safety requirements for slope stability under static and pseudostatic loading conditions.

5.2 PROPOSED CUT-SLOPES

5.2.1 Cut-slope CS-8

Cut-slope CS-8 has been revised to include a 25-ft wide bench. Cross section 12-12' illustrates the geologic structure and proposed grades for this cut-slope. The toe of the slope is at the same location and the overall height of the slope is 5 ft lower than the previous design evaluated within our 6/8/18 report. Slope stability evaluation of the 5/8/19 VTTM design indicated that Cut-slope CS-8 satisfies the Los Angeles County factor of safety requirements for slope stability under static and pseudostatic loading conditions. This revised design of Cut-slope CS-8 is considered less critical than the previously evaluated design and is anticipated to meet the factor of safety requirement for slope stability.

5.2.2 Cut-slope CS-11

The eastern portion of Cut-slope CS-11 has been revised to a 45 ft high 3:1 (h:v) gradient cut-slope. Cross sections 16-16', 17-17' and 18-18' illustrate the geologic structure and proposed grades for this cut-slope. Cut-slope CS-11 was addressed in the first part of this report. Slope stability evaluation of Cut-slope CS-11 at a 3:1 gradient slope was presented in the previous report indicated that Cut-slope CS-11 satisfies the Los Angeles County factor of safety requirements for slope stability under static and pseudostatic loading conditions.

5.3 NATURAL SLOPES

A 24-inch diameter bucket-auger boring (B-3A) was drilled on Lot 136, which is in the vicinity of natural slope NS-2. Based on the observations in the boring, the terrace deposits / Saugus Formation bedrock contact was revised on Cross Section 26-26'. In addition, the proposed elevation for Lot 136 is 1,332.2, which is 2.2 ft higher than the 5/8/18 VTTM design. The proposed elevation of flat area on Lot 240 south of Lot 136 on 2/27/19 VTTM is the same as the 5/8/18 VTTM. The revised contact for the terrace deposits and the minor

change in the pad elevations do not impact the slope stability analyses previously used to determine the recommended RUA at the top of the descending natural slope. The recommendations and conclusions in the previous report remain applicable.

5.4 LANDSLIDE QLS-3

The proposed lot lines have been adjusted so that Landslide Qls-3 is completely contained within Open Space Lot 238. In addition, the debris basin has been increased in size to account for the potential reduction in the debris cone based on the post-failure geometry as discussed in the first part of this report.

5.5 DEBRIS FLOW HAZARDS

5.5.1 Lot 20

The proposed elevation for Lot 20 is 1,325.2, which is 1 ft lower than the 5/8/18 VTTM design. A debris conveyance channel is illustrated along the toe of the natural slope located west of Lots 18 through 20. The intent of this channel is to direct debris material to the debris basin (Lot 245) located east of Lot 10 and provides for mitigation for potential impact from debris flow by providing an up-slope from the channel bottom up to the proposed pad. Calculated debris volume from the mapped debris flow source areas located directly adjacent to Lot 20 (see Geotechnical Map) where potential impact could occur is 35 cubic yards. At the location of potential impact from debris flow adjacent to Lot 20, the up-slope height ranges from 1.5 to 5.0 feet with an average of about 3.0 feet. Due to insufficient height of this upslope on Lot 20 an impact wall with a minimum freeboard height of 4.0 feet is recommended at the top of the slope to mitigate the debris flow hazard from the west to Lot 20 (see Geotechnical Map). Based on volume calculations it is determined that the impact wall will provide a containment volume of at least 45 cubic yards, which is greater than the calculated debris volume (35 cubic yards) from the mapped source area.

5.5.2 Lot 35

Fill is proposed in the natural area located north of Lot 35 which eliminates the potential debris flow hazard from the ascending natural slopes.

7.0 GEOLOGIST AND GEOTECHNICAL ENGINEER OF RECORD

This report has been prepared assuming that all required geologic and geotechnical field inspections and observations will be performed by Allan E. Seward Engineering Geology, Inc. If these tasks are performed by another party, that party must review this report, assume full responsibility for the recommendations contained herein, and assume the title of responsibility of "Geologist/Geotechnical Engineer of Record" for the specific work.

A representative of the Geologist/Geotechnical Engineer of Record shall be present to observe all grading operations. A report that presents the results of these observations and related testing shall be issued at the end of grading operations using an As-Built Map as a base. All footing excavations shall be observed by a representative of the Geologist/Geotechnical Engineer of Record prior to placing steel or casting concrete in the excavations.

8.0 LIMITATIONS

This report has been prepared for the exclusive use of Sterling Gateway, L.P. and its design consultants for the specific site discussed herein. This report should not be considered transferable. Prior to use by others, we should be notified, as additional work may be required to update this report.

In the event that any modifications in the design or location of the proposed development, as discussed herein, are planned, the conclusions and recommendations contained in this report will require a written review by this firm with respect to the planned modifications.

The proposed development is located in southern California, a geologically and tectonically active region, where large magnitude, potentially destructive earthquakes are common. Therefore, ground motions from moderate or large magnitude earthquakes could affect the site during the life of the proposed structure(s).

Typically, faulting is confined to the area adjacent to a known fault. However, absolute assurance against future fault displacement is not possible in tectonically active regions because new faults can form over time as the orientation and magnitude of deformational forces change in the earth's crust. Therefore, the location and magnitude of new ground surface ruptures during a seismic event cannot be anticipated.

In performing these professional services, this firm has used the degree of care and skill ordinarily exercised under similar circumstances by reputable geologists and geotechnical engineers practicing in this or similar localities. The data presented in this report are based on the results of pertinent field and laboratory testing. It should be recognized that subsurface conditions can vary in time, and laterally, and with depth at a given site and that the conclusions and recommendations presented in this report are based on our observations and testing.

Therefore, our **conclusions** and **recommendations** are **professional opinions** and are **not meant** to be a control of nature. We make no other **warranty**, either **expressed** or **implied**.

TENTATIVE MAP FEASIBILITY IS NOT RECOMMENDED FOR APPROVAL. PRIOR TO RECOMMENDING APPROVAL OF THE TENTATIVE TRACT OR PARCEL MAP:

G1. The toe of landslide Qls-3 is showing crossing a proposed lot boundary. Adjust lot lines to constrain the landslide on one lot or provide remediation of the landslide. The landslide hazard may not be subdivided. If complete removal is proposed, depict the proposed final topography in the area of landslide removal.

G2. The toe of landslide Qls-3 is shown encroaching into the debris cone of a proposed debris basin. Determine that the landslide is stable, recommend mitigation, or increase the basin capacity by an equivalent volume.

S1. Provide data to substantiate the shear strengths used in the slope stability analyses for the bedrock (cross bedding), post-failure mass, and terrace deposits (see slope stability analyses for cross section 27-27'). Provide revised slope stability analyses and recommend mitigation measures if factors of safety are below the County's minimum standards.

S2. The Soils Engineer showed that a slope graded at 2.4:1 (H:V) on cross section 18-18' will not meet the minimum required factors of safety; however, the proposed slope gradient of CS-11 was between 2:1 and 2.4:1. Verify and provide revised geotechnical map as necessary.

S3. Provide temporary slope stability analysis for the proposed backcut shown on cross section 1-1'. Recommend mitigation if factor of safety is below the County's minimum standard.

S4. Provide chemical test results (sulfate, chloride, resistivity, etc.) for the on-site soils to address the presence of chemicals deleterious to construction materials and utility lines. The chemical tests must be in accordance with California Test Methods, Department of Transportation, or equivalent (aqueous solution tests, such as EPA Tests or similar methods are not acceptable for determination of resistivity). Resistivity tests must be performed on soils in a saturated condition. Recommend mitigation as necessary.

S5. Show all revised, recommended mitigation measures on the geotechnical map as necessary.

NOTE: Provide a copy of this review sheet with your resubmittal.

NOTE(S) TO THE PLAN CHECKER/BUILDING AND SAFETY DISTRICT ENGINEER:
OFFSITE GRADING IS PROPOSED.

APPENDIX B

GEOTECHNICAL LABORATORY INVESTIGATION

1. General

   a. The laboratory investigation used current, accepted test procedures of the American Society of Testing and Materials (ASTM).

   b. Bulk samples and ring samples were obtained during the investigation. Laboratory sample identification is by project name and number, boring number, and sample depth.

2. Index Parameters Tests

   The following Index Parameters tests were performed on soil and bedrock materials collected during grading operations.

Test Type	Number of Tests	Testing Standard
In-situ Moisture Content	13	ASTM D2216
In-Situ Dry Density	13	ASTM D7263
Percent-Finer Than #200 Sieve	6	ASTM D1140
Particle-Size Analysis of Soils	6	ASTM D6913

   The purpose of each test is briefly described below:

   a. In-Situ Moisture Content (ASTM D2216) and Dry Density (ASTM D7263) testing of soils provide an indication of the strength and compressibility of in-situ soils. These data, in conjunction with sampler blow count data, aid in evaluation of soil consistency and in selection of samples for additional laboratory testing. Results of Moisture Content and Dry Density testing are recorded on the Drill Hole Logs within **Appendix A**.

   b. Percent Finer than #200 Sieve (ASTM D1140) testing was performed on soil samples to aid in classification of the samples in accordance with the Unified Soil Classification System (USCS). Results of Percent Finer than #200 Sieve testing are recorded on the Drill Hole Logs within **Appendix A** and on applicable laboratory test reports in this Appendix.

   c. Mechanical particle-size analyses of soil fractions larger than 75 microns (No. 200 sieve) were conducted to aid in classification of soils in accordance with the Unified Soil Classification System (USCS). Results of the particle size analyses are presented on **Figures B1.1** and **B1.2** in this Appendix.

APPENDIX B

3. Geotechnical Engineering Parameters Tests

The following Geotechnical Engineering Parameter tests were performed on ring samples of soil collected during the investigation.

TEST TYPE	NUMBER OF TESTS	TESTING STANDARD
Direct Shear	6	ASTM D3080

Direct Shear (ASTM D3080) testing was performed on California drive ring samples of bedrock using a displacement-controlled Direct Shear machine. Prior to shearing, the samples were inundated and consolidated under normal pressures ranging from 1,800 psf to 7,500 psf. Thereafter, the samples were sheared horizontally at a controlled displacement rate until the horizontal shear force reduced to a stable value. Results of the Direct Shear testing, including interpreted peak strength and residual shear strength parameters, are presented on **Figures B2.1** to **B2.6** within this Appendix.

The following attachments complete this Appendix.

- Particle Size Distribution Test Reports Figures B1.1 & B1.2
- Direct Shear Test Reports Figures B2.1 to B2.6

Appendix C

Table C1 – SLOPE STABILITY ANALYSES RESULTS

Cross Section	File Name	Slope Designation	Analyzed Plane	Method	Factor of Safety		Comments	Run No.
					Static	Pseudostatic[1] (Coeff = 0.15)		
1-1′	T1S1A	Landslide Qls-1	Bedding Plane	Spencer	2.01	--	Planar search along-bedding, below Qls, with exit through toe berm.	1
1-1′	T1S2A	Landslide Qls-1	Landslide Plane	Spencer	1.87	1.19	Non-circular path search along Qls plane; run represents min FS achieved along Qls plane with any combination of entry and exit points on slip surface.	2 3
1-1′	T1S2A	Landslide Qls-1	Landslide Mass	Spencer	1.87	1.29	Non-circular cuckoo search limiting entry and exit points to within the landslide mass.	4 5
27-27′	T27S1A	Natural Slope NS-2	Bedding Plane	Spencer	1.58	--	Updated analysis with corrected Qt shear strength; min FS > 1.55 at previously established FS > 1.55 setback line.	6
SCHEMATIC	--	Fill Slope	Non-circular	Spencer	2.05	--	Non-circular (cuckoo) search for minimum safety factor for 115-ft high 3:1 fill slope.	7

[1] Peak shear strength values were not utilized.

Analysis Options

Slices Type:	Vertical

Analysis Methods Used
Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	115
Left Projection Angle (End Angle) [°]:	165
Right Projection Angle (Start Angle) [°]:	15
Right Projection Angle (End Angle) [°]:	65
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Analysis Options

Slices Type:	Vertical

Analysis Methods Used
Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	95
Left Projection Angle (End Angle) [°]:	145
Right Projection Angle (Start Angle) [°]:	5
Right Projection Angle (End Angle) [°]:	85
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 2880
Number of Invalid Surfaces: 2120

Error Codes:

Error Code -108 reported for 1080 surfaces
Error Code -111 reported for 50 surfaces
Error Code -112 reported for 942 surfaces
Error Code -124 reported for 48 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 1-1'; non-circular search; Qls plane; seismic		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t1ps2a.slmd
		Scale:	1:600
Project No.:	18-1245A-4	*Date:* 4/3/2019	*Figure No.:* Run No. 3

Slide Analysis Information

t1ps2a

Project Summary

File Name:	t1ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:02.599s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; Qls plane; seismic
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [°]:	95
Left Projection Angle (End Angle) [°]:	145
Right Projection Angle (Start Angle) [°]:	5
Right Projection Angle (End Angle) [°]:	85
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Alluvium	Landslide	Landslide Plane	Bedrock

328.463	1207

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 2611
Number of Invalid Surfaces: 2389

Error Codes:

Error Code -108 reported for 957 surfaces
Error Code -111 reported for 73 surfaces
Error Code -112 reported for 1311 surfaces
Error Code -124 reported for 48 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-124 = A slice has a width less than the minimum acceptable value.

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.19414

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 8949
Number of Invalid Surfaces: 1111

Error Codes:

Error Code -108 reported for 76 surfaces
Error Code -111 reported for 36 surfaces
Error Code -112 reported for 47 surfaces
Error Code -114 reported for 68 surfaces
Error Code -121 reported for 118 surfaces
Error Code -124 reported for 23 surfaces

Error Code -1000 reported for 743 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 1-1'; non-circular search; Qls; seismic		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t1ps2a.slmd
		Scale:	1:600
Project No.:	18-1245A-4	*Date:* 4/3/2019	*Figure No.:* Run No. 5

Slide Analysis Information

t1ps2a

Project Summary

File Name:	t1ps2a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:12.826s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; Qls; seismic
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Materials

Property	Compacted Fill	Alluvium	Landslide	Landslide Plane	Bedrock
Color

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6265
Number of Invalid Surfaces: 3791

Error Codes:

Error Code -108 reported for 366 surfaces
Error Code -111 reported for 86 surfaces
Error Code -112 reported for 692 surfaces
Error Code -114 reported for 810 surfaces
Error Code -121 reported for 257 surfaces
Error Code -124 reported for 484 surfaces
Error Code -1000 reported for 1096 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

SLIDEINTERPRET 8.014

Analysis:	Section 27-27'; NS-2; static; cuckoo search; setback analysis		
Client:	Sterling Gateway	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t27s1a.slmd
		Scale:	1:450
Project No.:	18-1245A-4	*Date:* 4/3/2019	*Figure No.:* Run No. 6

Slide Analysis Information

t27s1a

Project Summary

File Name:	t27s1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:16.399s
Project Title:	VTTM 60257
Analysis:	Section 27-27'; NS-2; static; cuckoo search; setback analysis
Author:	K. Callahan

Comments

Sterling Gateway
Sterling Ranch Estates
18-1245A-4

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Property	Alluvium	Bedrock	Terrace Deposits
Color			
Strength Type	Mohr-Coulomb	Anisotropic Linear	Mohr-Coulomb
Unit Weight [lbs/ft3]	120	130	120
Cohesion [psf]	200		260
Friction Angle [°]	27		30
Cohesion 1 [psf]		300	
Cohesion 2 [psf]		300	
Friction Angle 1 [°]		18	
Friction Angle 2 [°]		32	
A [°]		1	
B [°]		1	
Anisotropic Definition		Surface	
Angle from 1 [°]			
Anisotropic Surface		Anisotropic Surface 1	
Water Surface	None	None	None
Ru Value	0	0.1	0

Global Minimums

Method: spencer

FS	1.577430
Axis Location:	176.344, 1488.436
Left Slip Surface Endpoint:	23.000, 1330.281
Right Slip Surface Endpoint:	210.862, 1270.867
Resisting Moment:	7.74143e+07 lb-ft
Driving Moment:	4.92481e+07 lb-ft
Resisting Horizontal Force:	323354 lb
Driving Horizontal Force:	205706 lb
Total Slice Area:	5079.92 ft2
Surface Horizontal Width:	187.862 ft
Surface Average Height:	27.0407 ft

Global Minimum Coordinates

Method: spencer

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9595
Number of Invalid Surfaces: 465

Error Codes:

Error Code -108 reported for 21 surfaces
Error Code -111 reported for 4 surfaces
Error Code -112 reported for 25 surfaces
Error Code -114 reported for 29 surfaces
Error Code -121 reported for 277 surfaces
Error Code -124 reported for 2 surfaces
Error Code -1000 reported for 107 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Slice Data

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 9289
Number of Invalid Surfaces: 766

Error Codes:

Error Code -106 reported for 5 surfaces
Error Code -108 reported for 72 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 41 surfaces
Error Code -112 reported for 52 surfaces
Error Code -114 reported for 42 surfaces
Error Code -121 reported for 60 surfaces
Error Code -124 reported for 6 surfaces
Error Code -1000 reported for 487 surfaces

Error Codes

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Attention: Mr. Hunt Williams

Subject: **GEOTECHNICAL REPORT – Addendum No. 1**
Response to County of Los Angeles Geologic and Soils Engineering Review Sheet dated 11/1/18

Project: Low Impact Development
Vesting Tentative Tract Map No. 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: At end of text

Dear Mr. Williams:

This report presents our response to the Geologic and Soils Engineering Review Sheet dated 11/1/18 for Vesting Tentative Tract Map 60257 issued by the Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division (GMED). This report is supplementary to our previous report dated 5/9/18 (see ref. 4) and the conclusions and recommendations presented therein are still applicable.

In order to facilitate the review process, we have listed the County of Los Angeles review sheets comments in **bold** in the order in which they appear on the original review sheet. Each comment is followed by our response. A copy of the review sheet is attached after the references.

Comment 1

Based on the log for Boring HS-2A, the elevation of the proposed infiltration basin at Lot 240 appears to be within 10 feet of the groundwater level. Verify and indicate whether this lot is suitable for stormwater infiltration.

Response

In accordance with Administrative Manual GS200.2 (dated 6/30/17), *Guidelines for Geotechnical Investigation and Reporting, Low Impact Development Stormwater Infiltration*, prepared by the County of Los Angeles Department of Public Works, Geotechnical and Materials Engineering Division (GMED), the seasonal high groundwater elevation beneath the proposed infiltration basin at Lot 240 was established based on site-specific exploration due to the following:

- Review of the Seismic Hazard Zone report for the Val Verde Quadrangle indicates a historic high groundwater depth of 10 feet. However, this groundwater depth is considered arbitrary based on the lack of existing and historic water well data at the project site. Review of the Los Angeles County Flood Control District (LACFCD) web site and the California Department of Water Resources Groundwater Monitoring website indicates that no existing or historic water wells are located within 1,000 feet of the subject site.
- Existing groundwater data was collected over 10 years ago. Boring HS-2A, located to the north (upstream) of the infiltration basin at Lot 240, was drilled in November 2006. Additionally, the location of this boring is located where Alluvial Canyons 1 and 2 merge and the canyon significantly narrows between bedrock spur ridges to the east and west. Groundwater conditions at the location of Boring HS-2A are not considered representative of conditions beneath the proposed infiltration basin.

The site-specific exploration included Hollow-stem auger Borings HS-10A, HS-11A and HS-12A that were drilled at the basin location in January 2018 to depths ranging from 40 to 55 feet. Groundwater was only encountered in HS-10A at a depth of 45.5 ft (elev. 1160) following a 24-hour monitoring period. The proposed basin invert is at an elevation of 1188 ft, which is 28 feet above the groundwater elevation in HS-10A. Therefore, seasonal high groundwater is not expected within 10 feet of the proposed basin bottom elevations.

Comment S2

The lot numbers shown on Page 2 of the 5/9/18 report do not appear to match the lot numbers shown on the latest tentative map. Verify and provide revised data and/or geotechnical map as necessary.

Response

Infiltration basin lot numbers shown on Page 2 of the 5/9/18 report were based on a previous undated VTTM and are not consistent with the associated Geotechnical Map included in the 5/9/18 report, which was based on the 5/8/18 VTTM. Furthermore, the lot designations have

been revised on the most current VTTM dated 2/27/19 that was addressed in our 4/3/19 addendum report (see ref. 6). Correlation of the lot number designations are tabulated below. The Geotechnical Map prepared for the 4/13/19 addendum report is appended to this report for reference purposes only.

INFILTRATION BASIN	LOT NUMBER DESIGNATION		
	UNDATED VTTM (Page 2 of 5/9/18 Report)	5/8/18 VTTM (Map in 5/9/18 Report and 6/8/18 VTTM Report)	2/27/19 VTTM 4/3/19 Addendum Report
Basin located at northeast corner of Sterling Parkway (proposed) and Hunstock Avenue (existing)	236	240	232
Basin located at the western property boundary, just north of the proposed commercial site	237	241	233
Basin located at the northern property line	241	242	234

This opportunity to be of service is appreciated. Please contact us if you would like to discuss this report further.

Respectfully submitted,

Eric J. Seward, CEG 2110
Principal Engineering Geologist
Vice President

Kevin P. Callahan, MS, GE 2989

Subject: **GEOTECHNICAL REPORT – Addendum No. 2**
Response to County of Los Angeles Verbal Review Comment

Project: Vesting Tentative Tract Map 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: At end of text

Dear Mr. Williams:

This addendum report has been prepared in response to a verbal review comment issued on 5/17/19 by Mr. Jeremy Wan, geotechnical reviewer at the Los Angeles County Department of Public Works Geotechnical and Materials Engineering Division (GMED).

Our prior Geotechnical Report dated April 3, 2019 (Ref. 2) presented our response to the Geologic and Soils Engineering Review Sheet dated 10/17/18 for Vesting Tentative Tract Map 60257 issued by GMED. Based on our response provided for *Comment S3* in that review sheet, Mr. Wan requested additional analyses to support our conclusions. The subject comment is summarized below and is immediately followed by our response.

Comment

Critical slip surfaces presented for Cross Section 1-1' in the original Geotechnical Report addressing VTTM 60257, dated June 8, 2018 (see Ref. 1), were not addressed in the addendum response report. The consultant shall evaluate the prior critical slip surface under static and pseudostatic loading conditions based on the revised configuration of the backcut and keyway of the recommended toe berm buttress, as illustrated on Cross Section 1-1' in the addendum report. Recommend mitigation if factor of safety is below the County's minimum standard.

Response

Static and seismic slope stability analyses were previously performed for the requested case using Cross Section 1-1'. However, the results of those analyses were not included in our addendum report dated April 3, 2019. Slope stability diagrams graphically illustrating the results of our analyses are attached herein as requested. Based on the results, the analyzed slope complies with Los Angeles County minimum requirements for gross stability under static and seismic loading conditions (see appended Table C1 from April 3, 2019 report updated with the additional analyses).

This opportunity to be of service is appreciated. If you have any questions regarding this report, please contact us.

Respectfully submitted,

Eric J. Seward, CEG 2110
Principal Engineering Geologist
Vice President

Kevin P. Callahan, MS, GE 2989
Geotechnical Engineer

The following attachment and appendix complete this report.

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6359
Number of Invalid Surfaces: 3697

Error Codes:

Error Code -108 reported for 18 surfaces
Error Code -111 reported for 5 surfaces
Error Code -112 reported for 19 surfaces
Error Code -114 reported for 23 surfaces
Error Code -121 reported for 1160 surfaces
Error Code -124 reported for 6 surfaces
Error Code -1000 reported for 2466 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

SLIDEINTERPRET 8.014

Analysis:	Section 1-1'; non-circular search; bedding plane; static		
Client:	Sterling Gateway, L.P.	*Drawn By:*	K. Callahan
Project:	VTTM 60257 Sterling Ranch Estates	*File Name:*	t1ps1a.slmd
		Scale:	1:650
Project No.:	18-1245A-4	*Date:* 5/21/2019	*Figure No.:*

Slide Analysis Information

t1ps1a

Project Summary

File Name:	t1ps1a.slmd
Slide Modeler Version:	8.014
Compute Time:	00h:00m:12.886s
Project Title:	VTTM 60257
Analysis:	Section 1-1'; non-circular search; bedding plane; static
Author:	K. Callahan

Comments

Sterling Gateway, L.P.
Sterling Ranch Estates
18-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical

Analysis Methods Used

Spencer

Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Seismic Load Coefficient (Horizontal): 0.15

Valid/Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 6348
Number of Invalid Surfaces: 3707

Error Codes:

Error Code -108 reported for 19 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 15 surfaces
Error Code -112 reported for 24 surfaces
Error Code -114 reported for 17 surfaces
Error Code -121 reported for 1085 surfaces
Error Code -124 reported for 5 surfaces
Error Code -1000 reported for 2541 surfaces

Error Codes

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Subject: **GEOTECHNICAL REPORT – Addendum No. 3**
Response to County of Los Angeles Review Comments

Project: Vesting Tentative Tract Map 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: At end of text

Dear Mr. Williams:

This addendum report has been prepared in response to review comments by Mr. Geir Mathisen received via email on 5/22/19, geologic reviewer at the Los Angeles County Department of Public Works Geotechnical and Materials Engineering Division (GMED).

Our prior Geotechnical Report dated April 3, 2019 (Ref. 2) presented our response to the Geologic and Soils Engineering Review Sheet dated 10/17/18 for Vesting Tentative Tract Map (VTTM) 60257 issued by GMED. Based on our response provided for *Comment G2* in that review sheet, Mr. Geir requested additional information regarding Landslide Qls-3 and the proposed debris basin located at the western portion of Lot 228. The reviewer's comments are summarized below and is immediately followed by our responses.

Comment 1

Provided a calculation of the volume of landslide debris that could enter the basin.

Response

The volume of landslide debris that could enter the debris basin proposed on the western portion of Lot 228 is 337 cy. Sikand Engineering provided this calculation (see Figure 2), which is based on the proposed debris basin bottom elevation of 1,319, a debris cone limit at elevation of 1,323, and the predicted post-failure topography for Landslide Qls-3.

It is our understanding that the Supervising Civil Engineer will need to include the calculated Landslide Qls-3 post-failure volume of 337 cy that could potentially enter the debris basin to the calculated 278 cy debris production volume and bulking.

Comment 2

Demonstrate that failure of the slope will not adversely impact the ability of the basin to perform its primary function.

Response

The predicted post-failure topography for Landslide Qls-3 and the ascending natural slope is illustrated on Figure 1 – Landslide Qls-3/Basin Volume Evaluation. The predicted toe of the post-failure configuration in the debris basin is represented by the 1,320 elevation contour.

Based on the exhibit provided by Sikand Engineering the proposed debris basin provides a capacity of 1,110 cy and the debris production volume requirement is 278 cy. The debris capacity of the debris basin in a post failure condition is 773 cy (i.e., 1,110 cy minus 337 cy) which exceeds the debris production volume requirement for the basin of 278 cy. In addition, the debris basin maintenance access road down into the basin is outside of the predicted toe of the post failure configuration and the inlet structure for storm water is at least 20 ft from the predicted toe of the post-failure condition.

It is opined that the potential failure of the Landslide Qls-3 and the ascending slope will not adversely impact the ability of the debris basin to perform its primary function, which is to collect debris before entering the storm drain system and to convey stormwater into the storm drain system.

Comment 3

Include a 111-statement that indicates the design of the basin is safe and that there will be no adverse impact on adjacent and office properties.

Response

In compliance with Section 111 of the Los Angeles County Building Code, it is the finding of this firm that the proposed debris basin on the western portion of Lot 228, and the adjacent grading and residential lots designated on the Vesting Tentative Tract Map dated 2/27/19, will be safe from the hazard of landslide, settlement, or slippage, and will not adversely affect property outside of the development area, provided that all of our recommendations are incorporated in the plans and implemented during construction.

This opportunity to be of service is appreciated. If you have any questions regarding this report, please contact us.

Respectfully submitted,

Eric J. Seward, CEG 2110
Principal Engineering Geologist
Vice President

Kevin P. Callahan, MS, GE 2989
Geotechnical Engineer

Subject: **GEOLOGIC AND GEOTECHNICAL REPORT**
Review of Vesting Tentative Tract Map dated 6/29/20

Project: Vesting Tentative Tract No. 60257
Sterling Ranch Estates
Val Verde, County of Los Angeles, California

References: See end of text

Dear Mr. Williams:

This report presents our opinions on the existing geologic and geotechnical conditions on Vesting Tentative Tract 60257 relative to the current design that is shown on the Map dated 6/29/20 and their effects on the proposed development. This report is supplementary to our previous reports (see references), hereinafter called "previous report", and the conclusions and recommendations presented therein are still applicable except where they are superseded in this report.

1.0 BACKGROUND

This firm previously prepared a Geologic and Geotechnical report dated 6/8/18 addressing the Vesting Tentative Tract Map (VTTM) dated 5/8/18. Subsequent addendum reports dated 4/3/19, 5/21/19 and 5/23/19 were prepared to address a VTTM dated 2/27/19 and in response to County of Los Angeles Department of Public Works, Geotechnical and Materials Engineering Division (GMED) Geologic and Soils Engineering review sheet comments. Feasibility of the 2/27/19 VTTM was subsequently recommended for approval from a geotechnical standpoint in the GMED review sheet dated May 23, 2019.

This report has been prepared to address revisions to the VTTM dated 6/29/20, specifically the addition of a proposed off-site water tank, as shown on Sheet 4, located approximately 1.8

miles to the west of the VTTM 60257 project site. No additional map revisions have been made that are pertinent to geology and geotechnical engineering.

2.0 SCOPE OF WORK

The scope of work performed for this study included the following tasks:

1. Review of the site topography and the Vesting Tentative Tract Map design, dated 6/29/20, provided to our office in computerized format (AutoCAD), prepared by Sikand Engineering.
2. Coordination with the project Supervising Civil Engineer, Sikand Engineering.
3. Review of previous reports by this firm in the vicinity of the subject site.
4. Review of published reports and maps listed in the References section.
5. Review of the referenced consultant report and the 1970 Grading Plan for the existing Los Angeles County Waterworks District 36 water tanks located adjacent to the proposed new off-site water tank.
6. Review of the 2003 Munger Map Book, California-Alaska Oil & Gas Field and review of records on the Division of Oil, Gas, and Geothermal Resources (DOGGR) website.
7. Review of Alquist-Priolo Fault Rupture Hazard Zones in California (CDMG Special Publication 42).
8. Review of the following aerial photographs:

9. YEAR	PHOTO	SCALE	AGENCY

10. Coordination with Underground Service Alert to obtain clearance from potentially impacted utilities prior to the subsurface exploration.

11. Coordination with Los Angeles County Public Works personnel regarding access to the Los Angeles County Waterworks District 36 water tank site.

12. Geologic field mapping of the water tank site and adjacent areas for assessment of potential debris flow hazard source material.

13. Excavation, sampling and logging of 2 hollow-stem-auger borings (HS-1WT and HS-2WT) drilled to a maximum depth of 29 feet, and 1 bucket-auger borings (B-1WT) drilled to a maximum depth of 55 feet.

14. Excavation and logging of 4 hand-dug test pits (TP-1 through TP-4).

15. Laboratory testing of samples obtained during our subsurface investigations for the off-site water tank. Testing included dry density and moisture content of in-situ soils, percent finer than the #200 sieve size, grain-size analysis, compaction (modified proctor), direct shear, hydro-compression (collapse), and corrosivity (soluble sulfate and chloride chloride content, pH and soil resistivity).

16. Performed general earthquake ground motion characterization for the water tank site in accordance with the 2016 California Building Code (CBC), ASCE 7-10, and Special Publication 117A (Guidelines for Evaluating and Mitigating Seismic Hazards in California), dated September 11, 2008. Our evaluation included calculation of CBC response spectrum parameters and potential ground accelerations that could be generated at the water tank site during future earthquakes on nearby faults.

17. Geotechnical evaluation of soil density, shear strength, compressibility, corrosion potential, expansion potential, and shrinkage and bulking factors.

18. Assessment of recommended grading removal depths based on weak soils, calculated static settlements, and proposed fill heights above the existing ground surface.

19. Preparation of a cross section illustrating anticipated geologic conditions for the proposed cut slope and perform slope stability analyses.

20. Preparation of a Regional Geologic Map (**Plate I**). The base map is the topographic contour map generated using the GIS-Net Public web tool provided by Los Angeles County Department of Regional Planning. We make no representation as to the accuracy of this base map.

21. Preparation of a Geotechnical Map (**Plate II**) illustrating our geologic data and recommended mitigation measures in relation to the proposed grading design for the off-site water tank using the Vesting Tentative Tract Map dated 6/29/20, Sheet 4 of 4 at a

scale of 1 inch equals 50 feet, as the base map. We make no representation as to the accuracy of the base map.

22. Preparation of figures and illustrations, including drill hole logs, test pit logs, laboratory test reports, slope stability graphical results and data output for inclusion in this report.

23. Preparation of this Geologic and Geotechnical report for submittal to the Los Angeles County Department of Public Works, Geotechnical and Materials Engineering Division.

3.0 REVISIONS TO THE VTTM

Revisions to the VTTM include the addition of a proposed off-site water tank on sheet 4 of 4. The tank site is located approximately 1.8 miles to the west of the project site and is adjacent to two existing and operational Los Angeles County Waterworks District No. 36 water tanks at 31632 W. Cuyama Road. Access to the proposed water tank site is via the partially paved W. Cuyama Road located at the westerly end of San Martinez Road.

The proposed water tank site will be graded using cuts and fills to construct a tank pad at an elevation of 1,571 feet above mean sea level (msl). The pad will support a water tank approximately 80 feet in diameter. A 2:1 (h:v) gradient cut slope approximately 230 feet in height is proposed that will ascend from the south to southeast side of the tank pad. A 20-ft high 2:1 fill slope is proposed that will descend from the north side of the tank pad. The access road to the existing water tanks will be used for the proposed water tank pad. A reinforced concrete channel between the proposed and existing water tank pads is shown for conveyance of potential debris flow material from the adjacent natural slope to the canyon bottom.

4.0 OFF-SITE WATER TANK SITE DESCRIPTION

The proposed water tank site is located within a side canyon tributary to the main drainage of San Martinez Canyon. The grading design footprint is on four parcels (APN: 3272-029-022, -023, -902 and 3247-035-900). These parcels are shown on sheet 4 of 4 of the VTTM. Assessor parcel number 3272-029-902 contains two existing Los Angeles County Waterworks water tanks and 3247-035-900 contains the existing access road (W. Cuyama Road). The site appears to be in a relatively natural state with the exception of the existing two water tanks and associated access road. A house structure previously existed at the location of the proposed tank site. However, per the original grading plan for the existing water tanks, this house was proposed to be removed during the grading construction.

Topography of the site consists of a relatively gentle narrow side canyon with moderate to steep slopes along the southerly portion of the site. The slopes are covered by annual grasses and sparse to thick chaparral vegetation with scattered oak trees. Elevations at the site range

from 1,550 in the drainage to 1,800 feet up along the ridgeline located southwest of the existing tanks. The site topography is shown on the Regional Geologic Map and Geotechnical Map that accompany this report. A small 8 ft high 2:1 (h:v) gradient fill slope is present directly adjacent to the existing tanks and a small up to 15 ft high 2:1 (h:v) gradient cut slope is present along the northerly side of the existing access road. These slopes are opined to have been constructed during the original grading for the existing water tanks.

5.0 OFF-SITE WATER TANK FIELD EXPLORATION, SAMPLING, AND LABORATORY TESTING

5.1 Surface Mapping

For this report, surface geologic mapping in conjunction with aerial photo interpretations was undertaken by personnel from Allan E. Seward Engineering Geology Inc. (AESEGI) using the proposed 50-scale VTTM as the base map and topography from Los Angeles County GIS website.

5.2 Subsurface Explorations

Our subsurface investigation consisted of the excavation, logging and sampling of four hand-dug test pits (TP-1 through TP-4), one 24-inch diameter bucket-auger boring (B-1WT) drilled to a maximum depth of 55 ft, and two 8-inch diameter hollow-stem auger borings (HS-1WT and HS-2WT) drilled to maximum depth of 29 ft. The bucket-auger and hollow-stem auger borings were excavated by Tri-Valley Drilling and Choice Drilling, respectively. The excavations and bucket-auger borings were logged and sampled by a Certified Engineering Geologist from this firm. The hollow-stem auger borings were logged and sampled by a Geotechnical Engineer from this firm. Our test pit and drill hole logs are presented in **Appendix A**. The locations of the test pits and drill holes are shown on the Geotechnical Map (**Plate II**).

The test pit logs included in **Appendix A** represent our interpretation of field data encountered at each location by our geologist at the time of excavation, along with refinements based on observations and laboratory test results. The drill hole logs included in **Appendix A** represent our interpretation of field data prepared for each boring by our geologic/engineering staff at the time of drilling, along with refinements based on observations and laboratory test results. Unit boundaries shown in the graphic log column of our hollow-stem-auger drill hole logs are approximate and may represent gradual transitions. The distribution and engineering characteristics of materials in adjacent areas may vary from those observed in the explorations.

5.3 Sampling Procedures

A modified California-drive sampler (fitted with 2.42-inch inner diameter by 1-inch-tall brass rings) was used to obtain samples in the exploratory drill holes at various depths (see logs in **Appendix A**). Blow counts to drive the sampler were recorded in 6-inch intervals during soil sampling. The blow count values shown on the drill hole logs represent the 12-inch blow count (or fraction of) following an initial 6-inch seating interval (hollow-stem auger boring only). The blow counts are raw values and have not been corrected to account for sampler size/type, overburden pressure, hammer type and efficiency, or rod length. Ring samples were sealed in plastic containers to preserve the in-situ moisture and brought to our geotechnical laboratory for further classification and testing.

Bulk soil samples were obtained from the test pits and from cuttings generated during the excavation of the drill holes. Materials in these bulk samples represent a mixture of soils within the noted depth range.

5.4 Laboratory Testing

Bedrock encountered in the bucket-auger boring was visually classified based the Wentworth size scale. Soils encountered in the test pits and hollow-stem auger drill holes were visually classified in the field using visual-manual procedures in accordance with applicable portions of the Unified Soil Classification System (ASTM D2488). Recovered soil samples were brought to our geotechnical laboratory, the visual soil classifications were checked, and the subsurface logs were reviewed in order to select soil samples for testing. The laboratory testing program performed on the on-site soils to evaluate engineering characteristics pertinent to the proposed improvements included the following tests: moisture content (ASTM D2216), dry density (ASTM D7263), Amount of Materials in Soils Finer than No. 200 Sieve (ASTM D1140), Particle-Size Analysis of Soils (ASTM D422), Modified Proctor (ASTM D1557), Collapse of Soils (ASTM D4546), Direct Shear (ASTM D3080), sulfate content (CT417), chloride content (CT422) and pH & resistivity (CT643).

The results of the field investigation and the laboratory tests were used as the basis for our analyses and recommendations presented in this report. Laboratory test results are discussed in the applicable sections of this report with graphical results presented in **Appendix B**.

6.0 OFF-SITE WATER TANK GENERALIZED GEOLOGIC/GEOTECHNICAL SUBSURFACE CONDITIONS AND SOIL PROPERTIES

6.1 Regional Geologic

The water tank site is located in the Transverse Ranges geomorphic province of Southern California in the eastern portion of the Ventura Basin. The Ventura Basin is a west-trending depositional basin produced by tectonic down-warping initiated during the early Miocene geologic epoch (5 to 24 million years ago). This depositional basin has developed a thick accumulation of Cenozoic sediments. The Holser fault is located 0.5 miles to the south of the proposed tank and the active San Gabriel is located 4.3 miles to the northeast of the site.

The proposed grading envelope for the water tank site is generally underlain by sedimentary rock of the Pico Formation (Dibblee, 1993). Alluvium and artificial fill are present in the canyon drainage area and soil and colluvium mantle most of the site.

6.2 Geologic Structure

Bedrock at the off-site tank site has been uplifted and tilted by north-south compressional tectonic forces producing geologic structures which trend east-west. The Pico Formation bedding generally strikes northeast and dips about 39° to the south. The three-dimensional geometry of the subsurface geologic structure is illustrated on the Geotechnical Map and Cross Section 32-32'.

6.3 Geologic Units

A general description of geologic units, including bedrock, surficial deposits, alluvium, and artificial fill are presented below. Distribution of these units is shown on the Geotechnical Map.

6.3.1 Pico Formation (Tp)

The Pliocene, shallow to deep marine Pico Formation in the subsurface borings and outcrop exposers in the vicinity of the off-site tank site consists dominantly of moderately indurated, fine-grained sandstone to coarse-grained pebbly sandstone. The sandstone is pale yellow and tan to light olive green and light brown. Dibblee (1993) mapped a light grey claystone and siltstone unit of Pico Formation beneath the off-site tank site. However, our investigation indicates that the Pico Formation unit beneath the site is more consistent with Dibblee's tan, semi friable sandstone, locally pebbly unit.

6.3.2 Quaternary Colluvium (Qcol)

Colluvium is a non-bedded, heterogeneous accumulation of soil and weathered bedrock deposited by gravity on slopes. Colluvium has been mapped within the narrow canyon

bottom both westerly and south of the existing two tanks. The observed colluvium consists of light brown to medium brown to tan silty sand with pebbles.

6.3.3 Quaternary Alluvium (Qal)

Quaternary alluvium is present within the canyon bottom areas adjacent to the tank site. The proposed fill slope that will descend from the tank pad will toe out into the alluviated canyon. The alluvium generally consists of yellowish-brown to brown, medium dense silty, fine-grained sand, stiff sandy silt, and soft sandy, silty clay where exposed near the ground surface. Measured dry densities ranged from 105 to113 pcf at moisture contents that varied from 3.7 to 13.6 percent.

6.3.4 Artificial Fill (af)

Artificial fill was encountered in Boring HS-2WT up to a depth of 6 feet. The fill presumably was placed during grading and construction of the existing water tanks and access road. The fill consists of very loose silty sands and firm sandy, silty clays.

6.4 Ground Water

Due to the elevated nature of the site ground water is not expected to pose a hazard to the proposed development or grading operations at the proposed water tank Site. Ground water or seepage was not observed during the subsurface investigation. Field reconnaissance mapping at the vicinity of the tank site also did not reveal evidence of ground water or seepage.

6.5 Soil Compressibility

Data from hollow-stem auger borings and results of hydro-compression testing performed on soil samples from the borings were used to evaluate compressibility of alluvial soils under static loading conditions. Based on this evaluation, potentially compressible layers exist within the upper 6 to 8 ft of the alluvium. The recommended removal depths provided in the Earthworks Recommendations section of this report consider these data.

Generally, soils at the site that have an in-situ dry density of 108 pcf or less and in-situ moisture content of 8 percent or less are considered potentially susceptible to hydro-compression. Review of the results of consolidation and density testing of samples from our borings indicates on-site alluvium materials display a minor potential for hydro-compression due to water incursion. Test results of five samples of the alluvium show negligible amounts (< 0.5%) of hydro-compression (see **Appendix B** for lab test data). No significant hydro-compression effects due to water incursion are expected at the site after the removals recommended in the Earthwork and Grading section of this report are performed.

6.6 Potential Expansion of Soils

The bedrock beneath the tank pad is anticipated to consist of fine- to coarse-grained sandstone with some fine-grained siltstone beds. The sandstone and siltstone beds are anticipated to have a very low to low expansion potential; however, fine-grained claystone beds of the Pico formation (which are not anticipated based on our subsurface exploration) may have higher expansion potential.

Compacted fills for the proposed grading will likely be generated from excavation in alluvium, colluvium and bedrock. The on-site soils when excavated, mixed and placed as a compacted fill are anticipated to have a very low to low expansion potential.

6.7 Potential Corrosivity of Soils

The Geotechnical and Materials Engineering Division (GMED) of the Los Angeles County Department of Public Works regards soil at a site to be corrosive to concrete and/or steel if the measured resistivity is 1,000 ohm-cm or less, and/or if the sulfate concentration is 2000 ppm (0.20%) or greater, and/or if the pH is 5.5 or less. Also, a soil with a chloride concentration greater than or equal to 500 ppm is considered deleterious to ferrous metals.

Compacted fills for the proposed tank pad will be generated from bedrock over-excavation. The on-site soils when excavated, mixed and placed as a compacted fill are not anticipated to exhibit corrosive characteristics to concrete or ferrous metals.

6.8 Erosion Potential

The existing provisions in the Grading Ordinance for planting and irrigation of constructed slopes in conjunction with drainage recommendations provided in the section "Surface Drainage and Erosion Control," will be sufficient mitigation against potential erosion within the subject site.

6.9 Debris Flow Hazard

Debris flows typically require a combination of loose colluvial soil, steep slopes and be exposed to period(s) of intense rainfall. Destructive debris flows originate on slopes with gradients between 26 to 56 degrees (Campbell 1975). Debris flows on slopes of 27 degrees or less do not tend to accelerate and are not considered a hazard.

Potential debris flow hazard on the north-east facing natural slope south of the existing water tanks has been evaluated. Methodology used to assess the site and identify the potential debris source areas are outlined below:

- Review of historic aerial photographs covering the site and adjacent areas for evidence of debris flow in the form of scars, bare rock, variation of vegetation densities that might

indicate locations where older debris source areas might be present and geomorphic lobes that might represent accumulation for a debris flow.

- Review of the topographic base map to determine areas that are steeper than approximately 26 degrees or approximately 2:1 horizontal to vertical.
- Field mapping by an engineering geologist to determine locations and general composition of loose colluvial soil. The lateral limits of the debris flow source areas were mapped using the VTTM as a base map.
- Excavation and sampling of 4 hand excavated test pits.

Review of the off-site water tank design, the topographic base map, field mapping of the site and excavation of 4 hand dug test pits indicates that there is a potential debris flow hazard to the access point to the proposed water tank pad from the natural slope south of the existing water tanks. The source of the potential debris flow hazard is noted on the attached Geotechnical Map with the abbreviation "PDFH". Based on the potential debris source area and an average depth of 12 inches, the calculated volume of debris is 1,322 cubic yards.

Based on our geotechnical recommendations, the supervising civil engineer incorporated an 8 ft wide by 4 ft wide reinforced concrete conveyance channel for potential debris flow into the water tank site design. Debris flow hazard is mitigated by this reinforced concrete conveyance channel located between the existing water tank and the proposed water tank pad.

7.0 OFF-SITE WATER TANK SEISMIC CONSIDERATIONS

7.1 Introduction

The off-site water tank is within the Transverse Ranges Geomorphic Province of southern California. The Transverse Ranges consist of a series of west-trending mountains and intervening valleys. These ranges largely resulted from north-south compression, ultimately causing east-west-trending folds and thrust faults. Associated faults in the vicinity of the tank site include the Holser, Santa Susana, Northridge (East Oakridge), Del Valle and Sierra Madre (San Fernando) reverse/thrust faults. The January 17, 1994 Northridge (M6.8) Earthquake occurred on a south-dipping thrust fault which uplifted the Santa Susana Mountains at least 40 cm.

The southern California region is traversed by the San Andreas Fault, which is a transform boundary between the Pacific Plate and the North American Plate. The San Andreas Fault is part of the San Andreas system of northwest-striking, right-lateral faults. The faults of

this system are generally historically active, as evidenced by the June 28, 1992 Landers (M7.6).

The southern California region is seismically active and commonly experiences strong ground shaking resulting from earthquakes along active faults. Earthquakes along these faults are part of a continuous, naturally occurring process, which has contributed to the characteristic landscape of the region.

Three common types of geologic hazards may be produced during a seismic event (earthquake). These include:

a. Ground Rupture;
b. Ground Failure; and
c. Ground Motion.

7.2 Ground Rupture

There are no visible signs of ground rupture across the water tank site nor in the aerial photographs reviewed. Regional geology maps do not show any active or potentially active faults as defined by the California Geological Survey (CGS, 1998) with a ground surface trace located on or trending towards the water tank site. The water tank site does not lie within any of the California Alquist-Priolo Earthquake Fault Zones (Hart, 1999 revision). Therefore, the possibility of fault-related ground rupture at the water tank site is believed to be very low.

7.3 Ground Failure

Ground failure is a general term that refers to permanent ground deformation caused by strong earthquake shaking. This includes liquefaction, lateral spreading, ground lurching, seismic settlement of poorly consolidated materials (dynamic densification), differential materials response, slope failure, sympathetic movement on weak bedding planes or non-causative faults, and shattered ridge effects.

Earthquake-induced slope failures include activation and reactivation of landslides, rock falls, debris flows, and surficial slide failures. Provided that the recommendations presented in this report are followed, the potential for earthquake related slope failure at the water tank site is considered to be very low.

7.3.1 Liquefaction Potential

Review of the State of California Seismic Hazard Zones Map for the Val Verde Quadrangle indicates that the tank site pad is not located in a zone of required liquefaction investigation.

7.3.2 Potential for Other Modes of Ground Failure

Earthquake-induced slope failures include activation and reactivation of landslides, rock falls, debris flows and surficial failures. Review of the Seismic Hazard Map for the Val Verde Quadrangle indicates that the project site is within a designated area requiring investigation to evaluate potential earthquake-induced landslides. The stability of constructed slopes which could potentially affect the proposed water tank site has been evaluated and appropriate mitigation recommended, if required. The potential for earthquake-induced slope failures to adversely impact the proposed water tank site is considered negligible, provided that our Recommendations and those of the Supervising Civil Engineer are incorporated into the proposed design and implemented during construction.

7.4 Ground Motion

7.4.1 General

The proposed tank site is located in southern California, which is in a geologically and seismically active region where large magnitude, potentially destructive earthquakes are common. Therefore, it is reasonable to assume that moderate or large magnitude earthquakes will affect the water tank site during the life of a given structure. The Holser fault, which has a surface trace located less than 1 mile to the south of the water tank site, is the closest significant fault. The active **San Andreas fault** is located about 20 miles north of the project site. Large earthquakes along these, or along any of the other numerous faults in the region, are expected to produce strong ground shaking at the project site in the future.

The current standards for construction provided in the 2019 California Building Code are designed to safeguard against major failures and loss of life, but are not intended to limit damage, maintain functions or provide for easy repair. Per Structural Engineers Association of California (SEAOC), conformance to these recommendations does not constitute any kind of guarantee or assurance that significant structural damage will not occur in the event of a maximum level of earthquake ground motion. However, it is reasonable to expect that a well-planned and constructed structure will not collapse in a major earthquake and that protection of life is reasonably provided, but not with complete assurance.

Although research on earthquakes during the last fifty years has greatly enhanced the level of understanding of earthquake faulting in California, the record is much too short to constrain behavior of all faults in southern California and the attenuation characteristics of all areas relative to each future potential earthquakes. Predicted accelerations should,

therefore, be considered **rough estimates** rather than precise facts and ground motions from future earthquakes may exceed the predicted accelerations. Neither the **Time, Location, nor Magnitude** of an earthquake can be accurately predicted at this time.

7.4.2 Earthquake Magnitude

Earthquake **magnitude** is a quantitative measure of the strength of an earthquake or the strain energy released by it, as determined by seismographic or geologic observations. It does not vary with distance or the underlying earth material. This differs from **intensity**, which is a qualitative measure of the effects a given earthquake has on people, structures, loose objects, and the ground at a specific location. Intensity generally increases with increasing magnitude and in areas underlain by unconsolidated materials and decreases with distance from the epicenter. The approximate magnitude necessary to generate these effects is shown on the 1956 version of the Modified Mercalli intensity scale. The table below presents the distances to nearby significant faults located within about 20 miles of the water tank site. The site-to-source distances were obtained from the USGS fault parameters online database (based on 2008 National Seismic Hazards Map). The maximum earthquake magnitudes (M_W) were calculated using the magnitude-area relationships recommended for large magnitudes in the Uniform California Earthquake Rupture Forecast Version 3 (UCERF3) prepared by the Working Group for California Earthquake Probabilities (USGS Open-File Report 2013-1165).

Distance (Miles)	Fault Name	Dip (Degrees)	Slip Sense	Magnitude, Mw
0.84	Northridge	35	thrust	6.86
1.46	Holser, alt 1	58	reverse	6.77
2.74	Oak Ridge Connected	53	reverse	7.35
2.74	Oak Ridge (Onshore)	65	reverse	7.11
4.26	San Cayetano	42	thrust	7.12
5.29	Santa Susana, alt 1	55	reverse	6.84
5.95	San Gabriel	61	strike slip	7.21
8.41	Simi-Santa Rosa	60	strike slip	6.81
14.73	Sierra Madre (San Fernando)	45	thrust	6.63
14.73	Sierra Madre Connected	51	reverse	7.26
16.44	Santa Ynez Connected	70	strike slip	7.31
16.44	Santa Ynez (East)	70	strike slip	7.09
19.06	Verdugo	55	reverse	6.84

7.4.3 Peak Ground Acceleration

The mapped peak ground acceleration (PGA) consistent with maximum considered earthquake geometric mean (MCE_G) ground motions was determined based on Figure 22-9 of ASCE 7-16 using the OSHPD Seismic Design Maps web tool by the Structural Engineers Association of California (SEAOC). The water tank location was identified using site coordinates of 34.4527°N and 118.6894°E. The mapped PGA incorporates a probability of ground motion exceedance equal to 2% in 50 years (i.e. 2,475-year return period) with a deterministic upper limit imposed near large, active faults. The mapped PGA was adjusted for site class effects (PGA_M) based on "very dense soil and soft rock conditions" (Site Class C) in accordance with ASCE 7-16. Based on this evaluation, a site-modified PGA_M of 1.07g would be produced by the maximum considered earthquake.

7.4.4 California Building Code Response Spectrum

The following seismic ground motion parameters should be used for calculation of the 2019 California Building Code (CBC) response spectrum:

FACTOR	VALUE
Site Class	C
Site Coefficient, F_a	1.2
Site Coefficient, F_v	1.4
Mapped Spectral Response Acceleration at Short Period, S_S	2.098
Mapped Spectral Response Acceleration 1-Second Period, S_1	0.741
Short Period Spectral Response Acceleration Adjusted for Site Class, S_{MS}	2.518
1-Second Period Spectral Response Acceleration Adjusted for Site Class, S_{M1}	1.038
Design Spectral Response Acceleration at Short Period, S_{DS}	1.678
Design Spectral Response Acceleration 1-Second Period, S_{D1}	0.692
Peak Ground Acceleration, PGA_M	1.07

8.0 OFF-SITE WATER TANK GENERAL CONCLUSIONS AND RECOMMENDATIONS

8.1 Feasibility of Development

The Vesting Tentative Tract Map No. 60257 dated 6/29/20 is feasible for development from a geologic and geotechnical standpoint provided our recommendations are followed and implemented during design and construction.

8.2 Earthworks and Grading Recommendations[1]

8.2.1 Removals and Benching

In order to provide a uniform firm bottom prior to placing fill soil, unconsolidated alluvium, artificial fill, colluvium, and severely weathered bedrock should be removed from areas to receive fill. The estimated depths of removals range from 6 to 10 feet in the alluvium, as shown on the **Geotechnical Map**. The excavated soils may be used as fill material.

Removal depths for these areas are based on our subsurface investigations, laboratory testing, proposed fill heights, intended use, and analysis results, as well as geologic and geotechnical judgment. The exact depth and extent of necessary removals will be determined in the field during the grading operations when observations and more location-specific evaluations can be performed.

In areas to receive compacted fill where the surface gradient is steeper than 5:1 (H:V) the soil mantle, colluvium and unsuitable material should be removed and such areas benched horizontally into competent material prior to our in conjunction with fill placement (See detail, Fill Over Natural Slope).

8.2.2 Over-Excavation of Water Tank Pad and Access Road

A transition between bedrock and compacted fill is anticipated beneath the water tank footprint. It is recommended that the bedrock be over-excavation to provide a minimum 5-foot thick fill cap extending at least 5 feet outside of the footprint of the proposed water tank. This over-excavation will provide attenuation of potential differential settlements or differential material response to seismic events and provide a uniform base for structural support. If the maximum depth of fill exceeds 15 feet, then the thickness of the fill cap should be one-third of the deepest fill thickness below the water tank (see detail, Over-excavation for Transitional Cut and Cut-Fill Lot). It is also recommended that

[1] Construction details are presented in the 6/8/19 report (see ref. 1).

bedrock beneath the proposed water tank access road be removed and replaced with compacted fill to a depth of at least three feet beneath the pavement subgrade elevation.

The bedrock of the Pico Formation may contain expansive claystone beds that could cause differential expansion. If excavation of the bedrock exposes expansive materials below the water tank footprint, then the bedrock should be over-excavated to provide a minimum 8-foot thick fill cap extending at least 8 feet outside of the footprint of the proposed water tank to provide a surcharge of sufficient overburden pressure to limit bedrock expansion to acceptable levels for proposed structures. The fill cap thickness required to provide a surcharge of sufficient overburden pressure to limit expansion should be confirmed during the grading operations based on swell testing of potentially expansive beds.

8.2.3 Rippability

Grading operations within the granular and poorly cemented surficial deposits can be performed with conventional equipment. Heavy, single-shank ripping may be required within the more indurated portions of the Pico Formation bedrock.

8.2.4 Fill Materials

Onsite soils that are free of debris, over-size rocks, topsoil and organic matter may be used as sources for compacted fills. Rock or similar irreducible material with a maximum dimension greater than eight (8) inches may not be placed in the fill. Rocks or hard fragments larger than four (4) inches shall not compose more than 25 percent of the fill and/or lift. Any large rock fragments over eight (8) inches in size, may be incorporated into the fill as rockfill in windrows after being reduced to the specific maximum rock fill size (see detail, Rock Disposal). Where fill depths are too shallow to allow large rock disposal, special handling or removal may be required.

8.3 Shrinkage, Bulking and Subsidence

The following bulking and shrinkage factors are based on and in-situ densities compared to average of 92 percent relative to the maximum dry density as determined per the ASTM D 1557 test, judgment, and our past experience. For the materials encountered at the site, shrinkage (decrease in volume) or bulking of those materials, when excavated, placed and compacted as controlled fill is estimated to be as follows:

MATERIAL TYPE	SHRINKAGE (%)	BULKING (%)
Artificial Fill (af)	15 – 20	
Alluvium/colluvium (Qal/Qcol)	12 – 18	
Bedrock (Tp) 0-3′ depth[1]	4	
Bedrock (Tp) >3′ depth		0 – 6

[1] Denotes typical upper weathered zones in Pico Formation (Tp) that are prone to shrinkage.

The above shrinkage, bulking and subsidence factors are only approximations. The actual volume changes from cut to fill depend on the quality or degree of compaction and mixing. The Supervising Civil Engineer should design pad grades with sufficient flexibility to accommodate a possible shortage or excess of fill of up to 10 percent of the total yardage graded.

8.4 Proposed Fill Slope

A north-facing fill slope is proposed at a 2:1 (h:v) gradient that descends from the north side of the water tank pad. The maximum proposed fill slope height is about 20 feet. By inspection, this fill slope is anticipated to be grossly stable provided our recommendations are followed and implemented during design and construction.

8.5 Proposed Cut-Slope

Cut-slope CS-1WT is an approximately 230 ft high northwest to northeast-facing 2:1 (h:v) gradient cut-slope. This cut-slope is anticipated to expose bedrock of the Pico Formation striking northeast and dipping 34 to 45° south. This structural configuration is anti-dip to the slope face and is considered grossly stable from a geologic standpoint. Anticipated geologic conditions are illustrated on Cross Section 32-32', which is oriented perpendicular to the slope face. Slope stability analyses performed on Cross Section 32-32' indicates this slope satisfies the Los Angeles County minimum factor of safety requirements for static and seismic loading (see **Appendix C**). Cut-slope CS-1WT is considered grossly stable as designed.

8.6 Landslides

No landslides have been identified beneath the water tank site or the access road.

8.7 Water Wells

Water wells do not currently exist on or in close proximity to the proposed water tank site grading. If water wells are discovered during the future grading operations they should be evaluated relative to the proposed improvements.

8.8 Oil Wells

Review of the California Department of Conservation, Geologic Energy Management Division records (CalGEM website) indicates that oil wells do not currently exist on or in close proximity to the proposed water tank site. If undocumented oil wells are encountered during grading operations, their locations should be surveyed and the current well conditions evaluated immediately.

8.9 Water Tank Subdrain System

A subdrain system should be installed under the proposed water tank to prevent water from infiltrating into descending slopes below the tank in the event of a leak or spill. A synthetic geomembrane (such as high-density polyethylene HDPE) with a coefficient of permeability of 10^{-6} cm/sec or less should be placed beneath the proposed water tank. A leakage collection and discharge system should be provided between the tank bottom and the geomembrane.

8.10 Foundation Considerations

No specific tank foundation designs have been provided at this time. The following general foundation criteria are provided for future design and planning consideration.

Conventional shallow spread footings are considered adequate for the support of the proposed Water Tank, provided footings are supported entirely on a compacted fill cap. Minimum recommended continuous foundation dimensions are 15 inches width and 24 inches depth below lowest adjacent grade. Tentatively, an allowable bearing capacity of **2,000 psf** can be used for (minimum-sized) shallow foundations constructed in compacted fill. This tentative allowable bearing value should be confirmed by further field and laboratory testing of the site soils before use in design. Lateral resistance of footing walls should be provided at the Grading Plan stage.

8.11 Building Setbacks

The standard setbacks from ascending and descending slopes provided in the Los Angeles County/California Building Code shall be followed.

8.12 Soil Compressibility Considerations

Based on consolidation testing performed for the water tank site and estimated static settlements under future fill and structural loads, **compressibility** and hydro-compression (collapse) settlement potential of subsurface soils below the recommended removal depths are considered to be **low**. Proposed grades are not expected to be adversely affected by soil compressibility or by hydro-compression (collapse) settlement, provided that our recommendations are incorporated into project design and construction.

Due to the predominantly coarse-grained nature of the alluvial soils, it is anticipated that potential static settlement of alluvial soils beneath planned fills will generally occur during grading.

8.13 Expansive Soil Considerations

Soil expansion has been found to be a significant consideration for design and construction of foundations and concrete slabs-on-grade. Based on visual and tactile classification of the bulk mix of soil considered representative of future fill it is anticipated that compacted fill from the onsite materials will have a very low to low expansion potential. The expansion potential of the site soils exposed at rough grade should be tested again after site grading is complete and the final foundation design should be based on those expansion test results.

8.14 Corrosive Soil Considerations

The tested soil does not classify as corrosive to concrete. Pending additional testing, either Type I or II cement may be considered for use in concrete placed in contact with the ground.

The tested soil does not classify as corrosive to ferrous metals. However, it is recommended that the following precautionary measures be implemented to mitigate a less significant corrosion potential as indicated by the measured resistivity value:

- Steel and wire reinforcement in concrete structures cast against site soils should have at least 3 inches of concrete cover.
- Buried utilities made of ferrous metals should be protected with polyethylene extruded coating, or with tape over primer per AWWA Standard C209 or C203, or with hot-applied coal tar enamel, or as recommended by manufacturers of the utility conduits.
- Metallic pipes that penetrate concrete structures should be surrounded by plastic sleeves, rubber seals, boots, or other dielectric material in order to prevent contact between the pipe and the concrete structure.
- Below-grade ferrous metals should be electrically insulated (isolated) from above-grade metals.

Mitigating recommendations against soil corrosivity should be revised/expanded based on additional confirmatory tests that should be performed at the completion of the grading operations. Final recommendations for concrete will be in accordance with the latest CBC requirements, and a corrosion specialist should provide mitigating recommendations for potential corrosion of metals in contact with on-site soils.

9.0 GEOLOGIST/GEOTECHNICAL ENGINEER OF RECORD

This report has been prepared assuming that Allan E. Seward Engineering Geology, Inc. will refine all geology and geotechnically-related data for the Grading Plan stage of this project. If the recommendations contained in this report are to be utilized and expansion of the geology/geotechnical work is performed by others, the party performing the work must review this report and assume full responsibility for recommendations contained herein. That party would then assume the title of responsibility as "Geologist/Geotechnical Engineer of Record" for the specific work.

10.0 LIMITATIONS

This report has been prepared for the exclusive use of Sterling Gateway, L.P. and their design consultants for the specific site discussed herein. This report should not be considered transferable. Prior to use by others, we should be notified, as additional work may be required to update this report.

In the event that any modifications in the design or location of the proposed development, as discussed herein, are planned, the conclusions and recommendations contained in this report will require a written review by this firm with respect to the planned modifications.

The proposed development is located in southern California, a geologically and tectonically active region, where large magnitude, potentially destructive earthquakes are common. Therefore, ground motions from moderate or large magnitude earthquakes could affect the site during the life of the proposed structure(s).

Typically, faulting is confined to the area adjacent to a known fault. However, absolute assurance against future fault displacement is not possible in tectonically active regions because new faults can form over time as the orientation and magnitude of deformational forces change in the earth's crust. Therefore, the location and magnitude of new ground surface ruptures during a seismic event cannot be anticipated.

In performing these professional services, this firm has used the degree of care and skill ordinarily exercised under similar circumstances by reputable geologists and geotechnical engineers practicing in this or similar localities. The data presented in this report are based on the results of pertinent field and laboratory testing. It should be recognized that subsurface conditions can vary in time, and laterally, and with depth at a given site and that the conclusions and recommendations presented in this report are based on our observations and testing. Therefore, our **conclusions** and **recommendations** are **professional opinions** and are **not meant** to be a control of nature. We make no other **warranty**, either **expressed** or **implied**.

This opportunity to be of service is greatly appreciated. If you have any questions regarding this report please give us a call.

Respectfully submitted,

Eric J. Seward, CEG 2110
Certified Engineering Geologist
Vice President

Kevin P. Callahan, MS, GE 2989
Geotechnical Engineer

Appendix B

APPENDIX B

GEOTECHNICAL LABORATORY INVESTIGATION

1. General

   a. The laboratory investigation used current, accepted test procedures of the American Society of Testing and Materials (ASTM).

   b. Bulk samples and ring samples were obtained during the investigation. Laboratory sample identification is by project name and number, boring number, and sample depth.

2. Index Parameters Tests

   The following Index Parameters tests were performed on soil and bedrock materials collected during grading operations.

TEST TYPE	NUMBER OF TESTS	TESTING STANDARD
In-situ Moisture Content	26	ASTM D2216
In-Situ Dry Density	26	ASTM D7263
Percent-Finer Than #200 Sieve	11	ASTM D1140
Particle-Size Analysis of Soils	4	ASTM D6913

   The purpose of each test is briefly described below:

   a. In-Situ Moisture Content (ASTM D2216) and Dry Density (ASTM D7263) testing of soils provide an indication of the strength and compressibility of in-situ soils. These data, in conjunction with sampler blow count data, aid in evaluation of soil consistency and in selection of samples for additional laboratory testing. Results of Moisture Content and Dry Density testing are recorded on the Drill Hole Logs within **Appendix A**.

   b. Percent Finer than #200 Sieve (ASTM D1140) testing was performed on soil samples to aid in classification of the samples in accordance with the Unified Soil Classification System (USCS). Results of Percent Finer than #200 Sieve testing are recorded on the Drill Hole Logs within **Appendix A** and on applicable laboratory test reports in this Appendix.

   c. Mechanical particle-size analyses of soil fractions larger than 75 microns (No. 200 sieve) were conducted to aid in classification of soils in accordance with the Unified Soil Classification System (USCS). Results of the particle size analyses are presented on **Figures B1.1** and **B1.2** in this Appendix.

APPENDIX B

3. Geotechnical Engineering Parameters Tests

The following Geotechnical Engineering Parameter tests were performed on ring samples of soil collected during the investigation.

TEST TYPE	NUMBER OF TESTS	TESTING STANDARD
Modified Proctor	1	ASTM D1557
Collapse of Soils	5	ASTM D4546
Direct Shear	6	ASTM D3080

The purpose of each test type is briefly described below.

a. Modified Proctor (ASTM D1557) tests were performed on selected bulk samples to assess their compacted moisture-density relationship for future use during grading operations. Results of the Modified Proctor tests are presented on **Figure B2** in this Appendix.

b. One-dimensional Collapse of Soils (ASTM D4546) testing was performed on California drive ring samples to assess the hydro-compression potential of alluvial soils when inundated with water under future loading conditions. The samples were incrementally loaded to normal pressures ranging from 1,000 to 2,000 psf in accordance with Procedure B. The "hydro-compression" was taken as the percent strain when inundated with water under an applied pressure approximately equal to the existing overburden pressure plus future applied foundation bearing pressure at that depth. Results of collapse testing are presented on **Figures B3.1** through **B3.5** in this Appendix.

c. Direct Shear (ASTM D3080) testing was performed on a mixture of soil from Borings B-1WT and HS-1WT (remolded to approximately 90 percent of maximum dry density) and on California drive ring samples of bedrock and alluvium using a displacement-controlled Direct Shear machine. Prior to shearing, the samples were inundated and consolidated under normal pressures ranging from 1,000 psf to 9,000 psf. Thereafter, the samples were sheared horizontally at a controlled displacement rate until the horizontal shear force reduced to a stable value. For remolded specimens, material passing the No. 4 sieve was used. Results of the Direct Shear testing, including interpreted peak strength and residual shear strength parameters, are presented on **Figures B4.1** through **B4.6** within this Appendix.

APPENDIX B

4. Corrosion Tests

The following corrosivity tests were performed on a mixture of bulk samples of bedrock and alluvial soil obtained at the project site.

TEST TYPE	NUMBER OF TESTS PERFORMED	TESTING STANDARD
Sulfate-Content	1	California Test Method 417
Chloride-Content	1	California Test Method 422
Resistivity and pH	1	California Test 643

Soluble Sulfates Content, Chloride Content, Resistivity, and pH tests were performed to evaluate corrosivity of soil/rock material from the project site to concrete, ferrous metals, and non-ferrous metals. Results of the testing are presented in the following table.

LOCATION	USCS	RESISTIVITY	CHEMICAL ANALYSES		
		SATURATED (OHM-CM)	pH	CHLORIDE Cl (PPM)	SULFATE SO_4 (%)
HS-1WT & B-1WT	SM	3808	7.8	408	0.00

Appendix C

APPENDIX C

SLOPE STABILITY

General

Analyses were performed to evaluate stability of the proposed cut slope which may impact the proposed tank site. The stability analyses utilized Cross Section 32-32' which was constructed to illustrate critical structural geometry and maximum slope height. Our evaluation included gross stability under static and pseudo-static (i.e. earthquake loading simulated by static force) conditions. The results of our stability analyses are summarized in **Table C1**, along with slope parameters, and represent the lowest factors of safety obtained. Slope stability diagrams graphically illustrating the results of the analyzed cross section are attached for review.

Geometry and Groundwater

As shown on the cross section, the analyzed geometry of the cut-slope included removal of vegetation, topsoil, slopewash, and bedrock materials and adding compacted fill to achieve the proposed grades. Based on favorable bedrock structure relative to the slope face, analyses were limited to across-bedding (anti-dip).

Review of ground water data in the vicinity and trench and boring log data indicates that the proposed cut slope in bedrock is above historic high ground water levels.

Shear Strength Parameters

Direct shear tests were performed on site materials as part of our investigation of the water tank site. Recommended shear strength parameters for the water tank site are summarized below and were used for the static and seismic slope stability analyses presented in this report. Associated direct shear test reports are presented in **Appendix B**.

Summary of Design Shear Strength Values

Geologic Unit	Moist Unit Weight, pcf	Residual Shear Strength	
		Phi, degrees	Cohesion, psf
Pico Formation Bedrock (Tp) across bedding	130	35	200
Alluvium (Qal)	120	29	130
Proposed Compacted Fill (Cf)	130	29	200

Methods of Analysis

The slope stability analyses performed for this study used the 2D limit equilibrium software, Slide 2018, by RocScience. This software utilizes robust search methods to locate critical circular and non-circular slip surfaces and computes associated minimum factors of safety.

APPENDIX C

The analyses used Spencer's complete equilibrium procedure to evaluate critical potential failure surfaces under static and pseudostatic loading conditions. In general, the Cuckoo search method was employed to determine either the critical circular or non-circular failure surface, which was further optimized using the Surface Altering optimization option to assess potential surfaces with lower safety factors.

Analysis for seismic slope stability was performed using the pseudostatic procedure. In this procedure the seismic loading is introduced into the conventional limit equilibrium analysis as a static horizontal force equal to the soil weight multiplied by a seismic coefficient, *k*. The seismic coefficient is an empirical value which in no way models actual seismic forces. However, the pseudostatic procedure does provide some indication of slope stability or instability during seismic loading. In accordance with Los Angeles County Guidelines, we selected a seismic coefficient value of $k = 0.15$ for our analyses.

Surficial Stability Evaluation

Surficial stability of fill and cut slopes was analyzed using the "Infinite Slope" method since the cohesion of each material was less than 250 psf. Based on the results, safety factors of at least 1.5 were achieved for the manufactured slopes constructed at a 2:1 (h:v) gradient (see **Figures C1** and **C2**).

Conclusions

The analyzed cut slope and compacted fill slopes comply with County of Los Angeles minimum requirements for gross stability under static and pseudo-static loading conditions and for surficial stability, as applicable, provided our recommendations are followed and incorporated into project construction. The results of the stability analyses are summarized in **Table C1**.

The following attachments complete this Appendix.

Error Code -108 reported for 28 surfaces
Error Code -111 reported for 124 surfaces
Error Code -112 reported for 94 surfaces
Error Code -114 reported for 21 surfaces
Error Code -121 reported for 102 surfaces
Error Code -124 reported for 14 surfaces
Error Code -1000 reported for 2072 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-114 = Surface with Reverse Curvature.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-1000 = No valid slip surface is generated

Analysis Description	Section 32-32'; Water Tank Site; Seismic; Cuckoo Search		
Client	Sterling Gateway	Drawn By	K. Callahan
Project	VTTM 60257 Sterling Ranch Estates	File Name	t32ps1a.slmd
		Scale	1:1200
Project No.:	20-1245A-4	Date: 7/20/2020	Run Number

Slide Analysis Information

t32ps1a

Project Summary

File Name:	t32ps1a.slmd
Slide Modeler Version:	9.008
Compute Time:	00h:00m:04.89s
Project Title:	VTTM 60257
Analysis:	Section 32-32'; Water Tank Site; Seismic; Cuckoo Search
Author:	K. Callahan
Comments	
	Sterling Gateway Sterling Ranch Estates 20-1245A-4

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Right to Left

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	200
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.15

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	2500
Orientation:	Vertical

Materials

Compacted Fill	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	130
Cohesion [psf]	200
Friction Angle [deg]	29
Water Surface	None
Ru Value	0
Alluvium	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	130
Friction Angle [deg]	29
Water Surface	None
Ru Value	0
Bedrock (Tp)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	130
Cohesion [psf]	200
Friction Angle [deg]	35
Tensile Strength [psf]	0
Water Surface	None
Ru Value	0

Global Minimums

Method: spencer

FS	1.356190
Axis Location:	350.276, 2143.917
Left Slip Surface Endpoint:	298.364, 1571.000
Right Slip Surface Endpoint:	777.463, 1758.637
Resisting Moment:	6.80274e+08 lb-ft
Driving Moment:	5.01608e+08 lb-ft
Resisting Horizontal Force:	1.14283e+06 lb
Driving Horizontal Force:	842679 lb
Total Slice Area:	13979.2 ft2
Surface Horizontal Width:	479.099 ft
Surface Average Height:	29.1781 ft

Global Minimum Coordinates

Method: spencer

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	6986
Number of Invalid Surfaces:	3069

Error Codes
Error Code -108 reported for 18 surfaces
Error Code -111 reported for 120 surfaces
Error Code -112 reported for 121 surfaces
Error Code -114 reported for 21 surfaces
Error Code -121 reported for 121 surfaces
Error Code -124 reported for 11 surfaces
Error Code -1000 reported for 2657 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-111 = safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-114 = Surface with Reverse Curvature.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-1000 = No valid slip surface is generated

Geotechnical Report(s) Dated: **7/20/20 (offsite water tank)**, 5/23/19, 5/21/19, 4/3/19, 6/8/18
References:

TENTATIVE MAP FEASIBILITY IS RECOMMENDED FOR APPROVAL FROM A GEOTECHNICAL STANDPOINT

PRIOR TO FILING THE FINAL LAND DIVISION MAP THE FOLLOWING CONDITIONS MUST BE FULFILLED:

G1. The final map must be approved by the Geotechnical and Materials Engineering Division (GMED) to assure that all geotechnical requirements have been properly depicted. For Final Map clearance guidelines refer to policy memo GS051.0 in the County of Los Angeles Department of Public Works *Manual for Preparation of Geotechnical Reports.* The Manual is available at: ***http://dpw.lacounty.gov/gmed/permits/docs/manual.pdf***.

G2. A grading plan must be geotechnically approved by the GMED prior to Final Map approval. The grading depicted on the plan must agree with the grading depicted on the tentative tract or parcel map and the conditions approved by the Planning Commission. If the subdivision is to be recorded prior to the completion and acceptance of grading, corrective geologic bonds may be required.

G3. Prior to grading plan approval, a detailed geotechnical report must be submitted that addresses the proposed grading. All recommendations of the geotechnical consultant(s) must be incorporated into the plan. The report must comply with the provisions of the County of Los Angeles Department of Public Works *Manual for Preparation of Geotechnical Reports*. The Manual is available at: ***http://dpw.lacounty.gov/gmed/permits/docs/manual.pdf***.

G4. All geologic hazards associated with this proposed development must be eliminated. Alternatively, the geologic hazards may be designated as restricted use areas (RUA), and their boundaries delineated on the Final Map. These RUAs must be approved by the GMED, and the subdivider must dedicate to the County the right to prohibit the erection of buildings or other structures within the restricted use areas. For information on the RUA policy refer to policy memo GS063.0 in the County of Los Angeles Department of Public Works *Manual for Preparation of Geotechnical Reports.* The Manual is available at: ***http://dpw.lacounty.gov/gmed/permits/docs/manual.pdf***..

S1. At the grading plan stage, submit grading plans to the GMED for verification of compliance with County Codes and policies.

S2. At the rough grading stage, provide data from the recommended settlement monitoring program to verify that settlements will comply with County codes and policies.

NOTE: Provide a copy of this review sheet with your resubmittal.

NOTE(S) TO THE PLAN CHECKER/BUILDING AND SAFETY DISTRICT ENGINEER:
OFFSITE GRADING IS PROPOSED.

APPENDIX G

Greenhouse Gas Emissions Model Outputs

Sterling Ranch Project

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	19.70	Acre	19.70	858,132.00	0
City Park	12.80	Acre	12.80	557,568.00	0
Single Family Housing	222.00	Dwelling Unit	57.90	399,600.00	635
Regional Shopping Center	21.00	1000sqft	2.50	21,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Park acreage includes passive park and shade structures and debris and pump stations
Asphalt surfaces include public right-of-way and private and future streets

Construction Phase - Construction to begin August 2021

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading equipment per applicant.

Off-road Equipment -

Grading -

Vehicle Trips - Weekday trip rates adjusted per traffic study. Weekend trip rates adjusted per CalEEMod default weekday/weekend ratios.

Woodstoves - No woodstoves.

Construction Off-road Equipment Mitigation - 25 percent of equipment fleet would meet Tier 4 Final specifications. Remaining 75 percent would meet Tier 3/Tier 4 Interim requirements.

Area Mitigation - Compliant with SCAQMD Rule 1113 - Architectural Coating (<50gms/liter).

Energy Mitigation -

Water Mitigation -

Mobile Land Use Mitigation -

Architectural Coating	1	136.00	0.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use DPF for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Grading - 2021

Dear Mr. Williams:

Enclosed please find Citadel Environmental Services, Inc.'s Phase I Environmental Site Assessment Report for the above-referenced location.

The Phase I Environmental Site Assessment Report was conducted for Sterling Gateway, L.P., in accordance with Citadel's Proposal 1158.1001.P, dated August 23, 2017, and a mutually agreed upon scope of work.

If after your review, you have any questions or require additional information, please do not hesitate to telephone me at the Citadel Office in Glendale at (818) 246-2707.

Sincerely,
CITADEL ENVIRONMENTAL SERVICES, INC.

Mark Drollinger, M.Eng., CSP, CHMM, EiT
Director, Engineering and Environmental Sciences

Citadel Environmental Services, Inc. (Citadel) was contracted by Sterling Gateway, L.P. (Client) to perform a Phase I Environmental Site Assessment (Phase I ESA) of the Sterling Ranch Estates, located in Val Verde, a census-designated place within Los Angeles County, California; hereinafter referred to as the "Site."

The Site is generally undeveloped with the exception of a single-family residential structure of approximately 1,106 square feet (SF) at 29053 Coolidge Avenue in the southwest corner of the Western Parcel that is reportedly used as an office and living space for the Site caretaker. The remaining portions of the Western Parcel and the entire Eastern Parcel is undeveloped land comprised of valleys and ridges. Dell Valle Road traverses the southeast portion of the Western Parcel, and Coolidge Avenue traverses the south-southwest portion of the Western Parcel. Huntsock Street traverses the north portion of the Eastern Parcel. Several unimproved roads traverse both the Western and Eastern Parcels of the Site. Access to the Western and Eastern Parcels of the Site is along Del Valle Road and Windsor Road, respectively.

Equipment observed at the Site includes a propane tank, and a leach field and septic tank associated with a wastewater treatment system near the residential structure on the Western Parcel. A large storage container was present near the residential structure; Citadel was not provided with access to the container during the Site reconnaissance. A concrete pad was also observed in the southwest corner of the Western Parcel. No stationary equipment was observed on the Eastern parcel of the Site.

A review of historical sources showed that the Western parcel of the Site was undeveloped from at least 1903. Del Valle Road and Coolidge Avenue that traverse the Western Parcel, and a concrete pad in the southwest portion of the Western Parcel, were developed by 1928. The current residential structure at the Western Parcel was constructed in 1936. City directory listings indicate the structure was used as a residence at least until 2013. The Eastern parcel of the Site has been undeveloped since at least 1903.

Converse Consultants (Converse) performed a Phase I ESA for the Western Parcel of the Site in February 2004. Converse identified a plugged and abandoned dry-hole on the Western Parcel. According to Converse, this well never produced oil or gas and was abandoned in 1923. No other information regarding the well was included in the Converse Phase I ESA. Converse recommended that the plugged and abandoned dry-hole be located and re-abandoned to current Division of Oil, Gas, and Geothermal Resources (DOGGR) requirements. As per the Converse Phase I ESA, the property in the Western Parcel with street address 29053½ Coolidge Avenue was listed on the HAZNET database as a clandestine drug lab. Converse recommended that the residential dwelling and associated structures be accessed and assessed; and asbestos and lead-based paint surveys be conducted prior to demolishing the structures.

The address 29053½ Coolidge Avenue, similar to the address associated with the residential structure on the Western Parcel, was identified on the Clandestine Drug Lab (CDL) database in 1995 as a location where an illegal drug lab was operated or drug lab equipment and/or materials were stored. The address was also identified on the HAZNET database for generating 1.16 tons of laboratory waste chemicals in 1995. The disposal method was listed as transfer station. The waste likely resulted from the identification of the Site as a CDL and the cleanup process. However, it appears that the drug lab may not have taken place at the current residential structure. According to the 1994 Aerial Photograph, several structures appeared developed along Coolidge Avenue, further north of the current residential structure. These structures appeared removed in the 2002 Aerial Photograph. Based on the identified address and its proximity to the current water tank, these structures may have been associated with the drug lab. However, the owner of the Subject Property, Mr. Hunt Williams, stated that this area was once leased to a local resident to keep a number of horses. The location of the CDL could not be discerned and was likely cleaned up to the satisfaction of the regulatory agency.

Citadel reviewed information provided by Environmental Data Resources (EDR) regarding nearby properties to evaluate for potential on-Site vapor encroachment concerns from off-site sources. According to EDR, no historical releases of petroleum products from a leaking underground storage tank (LUST) have occurred within 0.25-mile and upgradient of the Site.

One property was identified as within 0.125-mile and upgradient of the Site on the Historical Gas Station database. This property, located 377 feet east-southeast of the Site, is not likely to have adversely affected the Site. No properties were identified as within 0.125-mile and upgradient of the Site on the Historical Dry Cleaners database.

RECOGNIZED ENVIRONMENTAL CONDITIONS

According to American Society for Testing and Materials (ASTM) Standard of Practice E1527-13, recognized environmental conditions (REC) fall under three specific categories when evaluating a site or properties within the site vicinity. These categories are defined below.

A recognized environmental condition, or REC, means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

A controlled recognized environmental condition, or CREC, is a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

An historical recognized environmental condition, or HREC, is a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

According to ASTM E2600-15, the goal of conducting a vapor encroachment screening on a parcel of property is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of chemicals of concern vapors in the subsurface of the target property (TP) caused by the release of vapors from contaminated soil or groundwater or both either on or near the target property as identified by Tier 1 or Tier 2 procedures. The purpose of Tier 1 is to conduct a screen using Phase I ESA-type information to determine if a VEC exists at the target property. If the Tier 1 screen cannot rule out the possibility of a VEC existing at the target property, then a Tier 2 screen can be conducted. Tier 2 applies numeric screening criteria to existing or newly collected soil, soil gas, and/or groundwater testing results to evaluate whether or not a VEC can be ruled out. Tier 2 has two data collective components: non-invasive and invasive.

Based on our review, the former oil well located on the Western of the Site represents a HREC. The plugged and abandoned well should be located and re-abandoned as per current regulatory requirements. A methane survey should be completed as per Los Angeles County requirements if any development is planned within 300 feet of the former oil well.

The Site was identified on the Clandestine Drug Lab (CDL) listing for an illegal drug lab. The Site was also identified on the HAZNET database for waste likely resulted from the identification of the Site as a CDL and the cleanup process. The location of the CDL could not be discerned and was likely cleaned up to the satisfaction of the regulatory agency.

NON-ASTM SCOPE CONSIDERATIONS

The current Site building was constructed prior to bans using asbestos-containing building materials (ACBMs), lead-based paint (LBP), and polychlorinated biphenyls (PCBs) in electrical equipment came into effect in 1989, 1978, and 1978, respectively. No testing is known to have been performed to evaluate for the presence of ACBMs, LBP, or PCBs at the Site.

The California Bureau of Mines and Geology and California Department of Public Health (CADPH) participated in the United States EPA's State Radon Survey, a Federal survey to measure levels of indoor radon in all states. Based on the results of this survey, CADPH predicted that approximately 0.5% of homes in Region 9 would have radon concentrations over the EPA action level of 4.0 picoCuries per liter (pCi/L).

The Federal EPA Radon Zone for Los Angeles County is Zone 2, which indicates an average indoor concentration greater than or equal to 2.0 pCi/L of air and less than or equal to 4.0 pCi/L. In a survey, 23 tests were performed within the 91384 zip code for the presence of radon. Of these, no tests were found to contain radon in excess of 4.0 pCi/L. Site-specific radon values were not available and were not a part of this ASTM Phase I ESA.

A potable well was not observed on-Site and the Site does not lie within a known or potential flood zone or wetlands.

1.0 INTRODUCTION

Citadel Environmental Services, Inc. (Citadel) was contracted by Sterling Gateway, L.P. (Client) to perform a Phase I Environmental Site Assessment (Phase I ESA) of the Sterling Ranch Estates, located in Val Verde, a census-designated place within Los Angeles County, California; hereinafter referred to as the "Site."

1.1 PURPOSE

The purpose of the Phase I ESA was to review past and present land use practices and to evaluate the presence, or likely presence, of any hazardous substances or petroleum products that have been discharged into the property's structure, ground, groundwater, or surface water. This qualitative assessment was accomplished by review of current and readily available information regarding past and current land use for indications of the manufacture, generation, use, storage and/or disposal of hazardous substances at the Site. A Site visit was also conducted to observe existing Site conditions. This report provides the results of the Phase I ESA performed.

1.2 INVOLVED PARTIES

The involved party(s) in this study, to the best of our knowledge, is Sterling Gateway, L.P.

Citadel understands that this Phase I ESA is being requested in conjunction with due diligence activities by Sterling Gateway, L.P. Citadel recognizes that this report is to be used exclusively by Sterling Gateway, L.P. and its successors, lenders, and assigns. It is a report upon which Sterling Gateway, L.P. and its successors, lenders, and assigns, can rely.

This assessment and report were prepared on behalf of and for the exclusive use of Sterling Gateway, L.P., their lenders and assigns (Client) solely for its use and reliance, subject to the terms and conditions agreed upon between Citadel and the Client.

1.3 SCOPE OF SERVICES

This Phase I ESA was conducted in accordance with the American Society for Testing and Materials (ASTM) Standard of Practice E1527-13 and the standards of care and diligence normally practiced by recognized consulting firms in performing services of a similar nature.

The scope of services for this assessment consisted of the following:

- Performed a Site inspection to verify current Site conditions, and check for visible evidence of previously disposed and/or currently present hazardous waste, surface contamination, underground and above ground storage tanks (USTs/ASTs), suspect polychlorinated biphenyls (PCBs), and other potential environmental hazards.

- Conducted a visual survey of the adjacent properties and the immediate vicinity to determine if any nearby sites posed a significant environmental threat to the Site.

- Reviewed currently and readily available documents, including maps, aerial photographs, governmental databases of known hazardous waste sites and underground tanks, other consultant reports (if any), fire insurance maps, and other accessible records.

- Reviewed results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

- Consulted with appropriate governmental agencies having jurisdiction relative to past history of the property, complaints or incidents in the immediate area, and permits that may have been issued.

- Prepared a Phase I report, inclusive of our findings and recommendations, with applicable illustrations and documentation.

The scope of services outlined above is generally considered sufficient to properly assess the Site based on the data search, reasonably ascertainable documents, and Site inspection.

2.0 GENERAL SITE CHARACTERISTICS

2.1 LOCATION

The irregular -shaped Site is located approximately two miles west of the Interstate 5 Freeway, locally referred to as the Golden State Freeway. The Site is comprised of Tentative Tract Map (TTM) Nos. 062000 and 060257. TTM No. 060257 is located directly northwest and southeast of Del Valle Road and will be referred to as the Western Parcel. TTM No. 062000 is located southeast of the Western Parcel and will be referred to as the Eastern Parcel. The Western Parcel is bounded by undeveloped land to the north and east; and single-family residential properties to the south and west. The Eastern Parcel is bounded by undeveloped land to the north; graded land and commercial properties to the east; the Chiquita Canyon sanitary landfill to the south; and residential properties to the west.

According to the U.S. Geological Survey (USGS) Val Verde Quadrangle (7.5 Minute Series), dated 2012, the Site is at an elevation of approximately 1,270 feet above mean sea level (AMSL) and appears to slope to the south. The Site is located at approximate coordinates of 34° 27' 1.87" North Latitude and 118° 39' 26.04" West Longitude.

A Site Location Map identified as Figure 1 is included in Appendix A.

2.2 SITE DESCRIPTION

According to the County of Los Angeles' Assessor's Parcel Maps, the Site is comprised of three parcels. The Western Parcel includes Assessor's Parcel Numbers (APNs) 3271-004-012 and 3271-004-013, and the Eastern Parcel includes APN 3271-005-032. The Site encompasses approximately 262.6 acres of land.

The Site is generally undeveloped with the exception of a single-family residential structure of approximately 1,106 square feet (SF) at 29053 Coolidge Avenue in the southwest corner of the Western Parcel that is reportedly used as an office. The remaining portions of the Western Parcel and the entire Eastern Parcel is undeveloped land comprised of valleys and ridges. Dell Valle Road traverses the southeast portion of the Western Parcel, and Coolidge Avenue traverses the south-southwest portion of the Western Parcel. Huntsock Street traverses the north portion of the Eastern Parcel. Several unimproved roads traverse both the Western and Eastern Parcels of the Site. Access to the Western and Eastern Parcels of the Site is along Del Valle Road and Windsor Road, respectively.

Equipment observed at the Site includes a propane tank, and a leach field and septic tank associated with a wastewater treatment system near the residential structure on the Western Parcel. A large storage container was present near the residential structure; Citadel was not provided with access to the container during the Site reconnaissance. A concrete pad was also observed in the southwest corner of the Western Parcel. No stationary equipment was observed on the Eastern parcel of the Site.

In general, the Site appeared to be well maintained and the observed ground conditions were good.

A Site Plan is included as Figure 2 in Appendix A. Select photographs of the Site and vicinity are included as Appendix B.

2.3 ADJACENT PROPERTIES

The immediately surrounding properties of the Site consist of the following:

Western Parcel

Direction from Site	Address – Tenant/Use
North	Undeveloped land
East	Undeveloped land
South	Residential properties
West	Residential properties

Eastern Parcel

Direction from Site	Address – Tenant/Use
North	Undeveloped land
East	Graded land and commercial properties
South	Chiquito Canyon sanitary landfill
West	Residential properties

2.4 UTILITIES

Electrical service is supplied to the Site by Southern California Edison (SCE). Gas service is provided by AmeriGas Propane. General rubbish (non-hazardous) is removed from the Site on a regular basis by a Waste Management, Inc.

3.0 ENVIRONMENTAL SETTING

3.1 PHYSICAL SITE CHARACTERISTICS

Based upon the National American Datum (NAD) of 1983, the Site is at an elevation of approximately 1,270 feet AMSL.

The Site is identified on the geologic map of the Val Verde quadrangle, California (Dibblee and Ehrenspeck, 1993) as being slightly indurated, light gray, pebble conglomerate, sandstone and claystone of the Saugus formation (Qts). In addition, alluvial gravel, sand, and silt (Qa) are also identified in the Western Parcel.

The United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) National Cooperative Soil Survey identifies the Site soils as Saugus loam and yolo loam, which has moderate infiltration rates with deep and moderately deep, moderately well and well drained soils with moderately coarse textures; and Castaic loam, which has slow infiltration rates and may have soil layers that impede downward movement of water, or soils with moderately fine or fine textures.

USGS Topographic Map	Val Verde Quadrangle
Groundwater Basin	Santa Clara River Valley – Santa Clara River Valley East
Nearest Surface Water to Site	Santa Clara River, approximately 2.15 miles south of Site
Gradient Direction (Source)	South (topographic maps)
Estimated Depth to Groundwater (Source)	Approximately 23 feet below ground surface, approximately 1.3 miles southeast of Site (LADPW Groundwater Well Database)
Nearest Wetland to Site (Source)	Santa Clara River, approximately 2.15 miles south of Site (National Wetlands Inventory)
Nearest 100 or 500-year Flood Zone	Santa Clara River, approximately 2.15 miles south of Site (Federal Emergency Management Agency)

4.0 SITE RECONNAISSANCE

Citadel representative Mr. Mark Drollinger conducted the Phase I ESA reconnaissance on August 28, 2017. Mr. Drollinger was accompanied by Mr. Hunt Williams, Partner, Sterling Gateway, L.P. The Site reconnaissance consisted of an inspection of the Site and a perimeter survey of the surrounding properties. The report was completed by Ms. Roopal Jani. Ms. Shirley Lee served as the Project Manager and reviewed this Phase I ESA. Findings from the Site inspection, research and perimeter survey are presented below.

4.1 SITE RECONNAISSANCE FINDINGS

Yes	No	Observation
X		Aboveground Storage Tanks (ASTs) and Underground Storage Tanks (USTs)
X		Identified Hazardous Materials
	X	Polychlorinated Biphenyls (PCBs) – Electric or Mechanical Equipment Likely to Contain Fluids
	X	Radioactive Man-Made Materials
	X	Pits, Ponds, and Lagoons
X		Septic Tanks and Cesspools
	X	Wells, Cisterns, Sumps, and Drains
	X	Wastewater or Grease Interceptors
	X	Interior Stains or Corrosion
	X	Strong, Pungent, or Noxious Odors
	X	Pools of Liquid
	X	Stained Soil or Pavement

Yes	No	Observation
	X	Stressed Vegetation
	X	Other

The above-identified observed items are further discussed below.

ABOVEGROUND STORAGE TANKS (ASTs) AND UNDERGROUND STORAGE TANKS (USTs)

A 500-gallon water tank was observed along the west boundary of the Western Parcel. No signs of leaks or spills were observed. The water tank is not expected to represent a significant environmental concern.

IDENTIFIED HAZARDOUS MATERIALS

The following hazardous materials were identified at the Site:

Hazardous Material (size/quantity)	Location	Secondary Containment	Staining/Leaks	MSDS
Propane tank (one 500-gallon)	Near residential structure on Western Parcel of Site	No	None identified	No

The hazardous materials observed are not expected to represent a significant environmental concern.

POLYCHLORINATED BIPHENYLS (PCBs)

Typical sources of polychlorinated biphenyls (PCBs) include electrical transformer cooling oils, fluorescent light fixture ballasts and hydraulic oil. In 1976, the U.S. EPA banned the manufacture and sale of PCB-containing transformers. Prior to this date, transformers were frequently filled with a dielectric fluid containing PCB-laden oil. By 1985, the US EPA required that commercial property owners with transformers containing more than 500 parts per million (ppm) PCBs must register the transformer with the local fire department, provide exterior labeling, and remove combustible materials within 16 feet (40 Code of Federal Regulations 761.30: "Fire Rule").

A pole-mounted transformer was observed near the residential structure at 29053 Coolidge Avenue in the southwest portion of the Western Parcel. No significant environmental impacts to the Site are anticipated from the transformer located at the Site.

SEPTIC TANKS AND CESSPOOLS

A septic tank and leach field were observed near the residential structure on the Western Parcel of the Site; no signs of leaks or spills were observed. The septic tank and leach field are not expected to represent a significant environmental concern based on the residential use.

4.2 NON-ASTM SERVICES

ASBESTOS CONTAINING MATERIALS

The EPA issued a final rule under Section 6 of Toxic Substances Control Act (TSCA) banning most asbestos-containing building materials (ACBMs) in 1989. The ban on ACBMs was vacated in 1991 allowing some building materials to continue to contain asbestos. The applicability of the EPA's

National Emission Standards for Hazardous Air Pollutants (NESHAP, 40 CFR Chapter 61, Subpart M) apply to the owner or operator of a facility where an inspection for the presence of asbestos-containing materials (ACM), including Category I (asbestos containing packings, gaskets, resilient floor coverings and asphalt roofing products), and Category II (all remaining types of non-friable asbestos containing material not included in Category I that when dry, cannot be crumbled, pulverized or reduced to powder by hand pressure), non-friable ACM must occur prior to the commencement of demolition or renovation activities.

Based on the construction date for the Site building, asbestos-containing building materials (ACBMs) were likely used in the construction of the residential structure in the Western Parcel of the Site. A survey for ACBMs was not requested or conducted as part of this Phase I ESA.

LEAD-BASED PAINTS

Lead-based paint (LBP) is defined as any paint, varnish, stain, or other applied coating that has greater than or equal to one milligram per square centimeter (mg/cm^2) (5,000 microgram per gram (µg/g) or 5,000 parts per million (ppm)) of lead by federal guidelines; state and local definitions may differ from the federal definitions in amounts ranging from 0.5 mg/cm^2 to 2.0 mg/cm^2. The US Consumer Product Safety Commission (16 Code of Federal Regulations CFR 1303) banned paint containing more than 0.06% lead for residential use in 1978. Buildings built before 1978 are much more likely to have LBP.

Based on the construction date for the Site building, lead-based paints were likely used within the residential structure in the Western Parcel of the Site. A survey for lead containing materials was not requested or conducted as part of this Phase I ESA.

DRINKING WATER

The residential structure on the Western Parcel of the Site is supplied with municipal drinking water by Los Angeles County Waterworks District No. 36. An assessment of lead in drinking water was not requested or conducted as part of this Phase I ESA.

RADON

The California Bureau of Mines and Geology and California Department of Public Health (CADPH) participated in the United States EPA's State Radon Survey, a Federal survey to measure levels of indoor radon in all states. Based on the results of this survey, CADPH predicted that approximately 0.5% of homes in Region 9 would have radon concentrations over the EPA action level of 4.0 picoCuries per liter (pCi/L).

The Federal EPA Radon Zone for Los Angeles County is Zone 2, which indicates an average indoor concentration greater than or equal to 2.0 pCi/L of air and less than or equal to 4.0 pCi/L. In a survey, 23 tests were performed within the 91384 zip code for the presence of radon. Of these, no tests were found to contain radon in excess of 4.0 pCi/L. Site-specific radon values were not available and were not a part of this ASTM Phase I ESA.

METHANE

The Site is located within Val Verde, in unincorporated Los Angeles County. As such, the County of Los Angeles regulates and oversees the management of methane gas generated from landfills

and oil wells.[1] Based on information from prior consultants and Mr. Williams, an abandoned oil well is present on the Site. This former oil well was previously a part of the Halsey Canyon Oil Field and was installed to a depth of approximately 3,600 feet in 1920. From records obtained from the Division of Oil, Gas and Geothermal Resources (DOGGR), this abandoned oil well was identified as Fernando Oil Well Company No. 1. This oil well was abandoned in 1923.

From Title 26 of the California Building Code, no new building permits are approved for structures within 300 feet of an abandoned oil well. There are exceptions, which are addressed in Title 26. The most effective means of limiting any future concerns with methane is to conduct a methane survey. This would only be required if development was to occur. In the oil well's present state, no actions are required.

5.0 SITE HISTORY

The purpose of the records review is to obtain and review reasonably ascertainable/standard sources that will help identify recognized environmental conditions in connection with the property. Reasonably ascertainable records from standard sources is (1) information that is publicly available, (2) information that is obtainable from its source within reasonable time and cost constraints, and (3) information that is practically reviewable.

Reasonable time and cost means that the information will be provided by the source within 20 calendar days of receiving a written, telephone, or in-person request at no more than a nominal cost intended to cover the source's cost of retrieving and duplicating the information. Information that can only be reviewed by a visit to the source is reasonably ascertainable if the visit is permitted by the source within 20 days of request.

To investigate the history of the Site, Citadel reviewed select historic aerial photographs, building permits, city directories, and Sanborn Fire Insurance Maps provided by Environmental Data Resources Inc. (EDR). In addition, Citadel reviewed client-supplied information, and oil and gas maps, and Citadel interviewed selected individuals regarding historic Site use. Citadel's reviews of these reports and interviews are discussed below.

5.1 HISTORICAL AERIAL PHOTOGRAPHS

Historical aerial photographs of the Site and vicinity were obtained from EDR to ascertain historical land uses and to identify any evidence of hazardous material generation or storage. Below are brief descriptions of observations made from the aerial photographs of the Site and vicinity.

Dates(s)	Site Description	Surrounding Area Descriptions
1928	Western Parcel: Del Valle Road and Coolidge Avenue appear developed; the existing concrete pad is observed in the southwest corner Eastern Parcel: Undeveloped land; several unimproved roads appear developed	**North:** Undeveloped land **East:** Undeveloped land **South:** Undeveloped land with a few residential structures and several streets **West:** Undeveloped land with several streets

[1] County of Los Angeles Building Code, Title 26, Landfill Gas Assessment and Management, Los Angeles County Department of Public Works, Landfill Gas Protection Policy, 2008.

Dates(s)	Site Description	Surrounding Area Descriptions
1940	Western Parcel: Relatively unchanged with the exception of the development of the current residential structure in the southwest corner of the Western Parcel; Eastern Parcel: Relatively unchanged	**North:** Area north of Site not visible on this map **East:** Relatively unchanged **South:** Relatively unchanged **West:** Relatively unchanged
1947	Grading activities appear ongoing in the north portion of the Western Parcel and the south portion of the Eastern Parcel	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** A few residential structures appear developed
1947, 1952, 1969, 1972, 1978, 1983, 1989	Relatively unchanged	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** Relatively unchanged
1994	A few structures appear developed along Coolidge Avenue north of the residential structure at the Western Parcel.	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** Additional residential structures appear developed
2002, 2005, 2009, 2010, 2012	Relatively unchanged	**North:** Relatively unchanged **East:** Relatively unchanged **South:** The Chiquito Canyon sanitary landfill appears developed to the south of the Eastern Parcel **West:** Relatively unchanged

Copies of the Aerial Photographs provided by EDR can be found in Appendix C.

5.2 HISTORIC BUILDING PERMITS

EDR provides a listing of building permits for the Site and adjoining properties, if available. In addition, Citadel reviewed building permits with the County of Los Angeles Building Department.

Permits reviewed indicated that the residential structure on the Western Parcel was constructed in 1936. A stop work notice was issued for this property on April 2, 1992, for Los Angeles County plumbing and electrical code violations. A miscellaneous permit for lot line adjustment was issued for the property on January 29, 2013. No other permits were on file for the Site.

A copy of the EDR Building Permit Report is included as Appendix D.

5.3 HISTORICAL FIRE INSURANCE MAPS

Citadel requested that EDR review its collection of Sanborn Fire Insurance Maps for potential coverage of the Site and vicinity. Sanborn Map coverage was not available for the Site.

A copy of the EDR Sanborn Map Report is included as Appendix E.

5.4 CITY PARCEL PROFILE REPORT

A parcel profile report was not available for the Site.

5.5 HISTORICAL CITY DIRECTORIES

City directories were researched by EDR in order to identify previous Site tenants and/or neighboring properties with a potential for hazardous materials generation and/or storage. EDR researched city directory listings from 1971 through 2013 (non-inclusive) and provided their search results to Citadel for review. The following table summarizes information provided by the city directory search.

Dates(s)	Occupant Listed
1975, 1980, 1985, 1992, 1995	Ruth Castle
1999	Hunt Williams
2003	Occupant unknown
2008, 2013	Hunt Williams

A copy of the EDR City Directory Abstract is included as Appendix F.

5.6 CLIENT-SUPPLIED ENVIRONMENTAL INFORMATION

Citadel reviewed the *Phase I Environmental Site Assessment Report for the Sterling Gateway Property, Western Parcel, Approximate 118.4 acres, Val Verde Park, California, Converse Project No. 04-41-125-01,* prepared by Converse Consultants, dated February18, 2004.

> Converse Consultants (Converse) performed a Phase I ESA for the Western Parcel of the Site in February 2004. Converse identified a plugged and abandoned dry-hole on the Western Parcel. According to Converse, this well never produced oil or gas and was abandoned in 1923. No other information regarding the well was included in the Converse Phase I ESA. Converse recommended that the plugged and abandoned dry-hole be located and reabandoned to current Division of Oil, Gas, and Geothermal Resources (DOGGR) requirements. As per the Converse Phase I ESA, the Site building in the Western Parcel with street address 29053½ Coolidge Avenue was listed on the HAZNET database as a clandestine drug lab. The current owner of the Site, Mr. Hunt Williams was not aware that this address was listed as a drug lab operator site and stated that no such activity took place on the Property under his ownership. Converse recommended the residential dwelling and associated structures be accessed and assessed.

A copy of the reviewed report can be found in Appendix G.

5.7 HISTORICAL TOPOGRAPHIC MAPS

Historical topographic maps were provided by EDR in order to identify natural features and changes in development over a long period of time. The topographic maps provide the user with a regional view of changes to the Site and vicinity that other historical databases such as aerial photographs may not provide. Below are brief descriptions of observations made from the topographic maps of the Site and vicinity.

Dates(s)	Site Description	Surrounding Area Descriptions
1903	Undeveloped, with an unimproved street in the Western Parcel	**North:** Undeveloped with an unimproved road in the current configuration of Hasley Canyon Road further north **East:** Undeveloped **South:** Undeveloped **West:** Undeveloped with an unimproved street in the current configuration of Chiquito Canyon Road further west
1931	An unimproved road appears developed in the current configuration of Del Valle Road in the Western Parcel	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** Several streets appear developed; San Martinez Road appears developed further west
1940	Coolidge Avenue appears as an unimproved street in the Western Parcel	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** Several streets appear developed; San Martinez Road appears renamed as San Martinez Chiquito Road
1941, 1943, 1947,	The current residential structure and Del Valle Road in its current configuration appear developed in the Western Parcel	**North:** Hasley Canyon Road appears developed in its current configuration **East:** Relatively unchanged **South:** Relatively unchanged **West:** Chiquito Canyon Road appears developed in its current configuration; a few residential structures appear developed
1952, 1969, 1974, 1988, 1991, 1995	Relatively unchanged	**North:** Relatively unchanged **East:** Relatively unchanged **South:** Relatively unchanged **West:** Additional residential structures appear developed
2012	Structures not depicted	Structures not depicted

Copies of the historical topographic maps provided by EDR are included as Appendix H.

5.8 HISTORIC OIL AND GAS MAPS

Citadel reviewed information available on-line through the California Department of Conservation's website. DOGGR's Online Mapping System (DOMS) shows that there is an oil well in the northwest portion of the Western Parcel of the Site. The oil well is identified by American Petroleum Institute (API) number 03705395. According to DOMS, the well operator for the well is listed as Fernando Oil Company and the status for the well is plugged. The well was drilled to a depth of 3,744 feet in July 1920 and was abandoned in April 1923. An additional oil well, identified by API 03706091, is present in the southwest portion of the Eastern Parcel of the Site. According to DOMS, the well operator for the well is listed as Chevron USA Inc., and the status for the well is plugged and abandoned. The well was drilled to a depth of 8,411 feet between August 1947 and January 1948, and was abandoned in February 1948. According to the Client, no redevelopment is planned in the vicinity of the former oil well in the Eastern Parcel of the Site.

5.9 INTERVIEWS

Citadel interviewed Mr. Hunt Williams during the Site reconnaissance. Mr. Williams was not aware of any historic or current environmental concerns or hazards at the Site. Citadel also submitted a User Questionnaire to Sterling Gateway, L.P. The completed User Questionnaire can be found in Appendix I.

5.10 ENVIRONMENTAL LIEN

Citadel contracted with EDR to perform an Environmental Lien Search for the Site. The Environmental Lien Search report reviewed did not identify any current environmental liens or other activity and use limitations (AUL) for the Site. The following grant deeds were included in the EDR report:

- The deeds for APNs 3271-004-012 and 3271-004-013, dated July 24, 2013, granted the title from Sterling Gateway, L.P. to Sterling Gateway, L.P. There was no change in ownership of the Site, as the deeds were recorded as part of an APN change,
- The deed for APN 3271-005-032, dated April 29, 2014, granted the title from Sterling Gateway L.P. to Catellus Valencia LLC.

A copy of the environmental lien and AUL search can be found in Appendix J.

5.11 SUMMARY OF SITE HISTORY

A review of historical sources showed that the Western parcel of the Site was undeveloped from at least 1903. Del Valle Road and Coolidge Avenue that traverse the Western Parcel, and a concrete pad in the southwest portion of the Western Parcel, were developed by 1928. The current residential structure at the Western Parcel was constructed in 1936. City directory listings indicate the structure was used as a residence at least until 2013. The Eastern parcel of the Site has been undeveloped since at least 1903.

Converse performed a Phase I ESA for the Western Parcel of the Site in February 2004. Converse identified a plugged and abandoned dry-hole on the Western Parcel. According to Converse, this well never produced oil or gas and was abandoned in 1923. No other information regarding the well was included in the Converse Phase I ESA. Converse recommended that the plugged and abandoned dry-hole be located and re-abandoned to current DOGGR requirements. As per the Converse Phase I ESA, the property in the Western Parcel with street address 29053½ Coolidge Avenue was listed on the HAZNET database as a clandestine drug lab. Converse recommended that the residential dwelling and associated structures be accessed and assessed; and asbestos and lead-based paint surveys be conducted prior to demolishing the structures.

6.0 REGULATORY AGENCY REVIEW

6.1 DATABASE REVIEW

As part of the Phase I ESA, Citadel utilized EDR of Milford, Connecticut, as an information source for regulatory agency database records.

The following summary of the database information is divided into five columns. The first column identifies the environmental database researched; the second column indicates the distance from the Site that was used for the research; the third column indicates if the Site was identified in

the specified database; the fourth column lists the number of listings identified on the database within the specified distance of the Site; and the fifth column indicates if the sites identified are potential environmental concerns to the Site.

Although locations of the orphan sites are frequently unknown, Citadel attempts to evaluate the potential adverse environmental impact that these facilities may have on the Site. This evaluation consists of reviewing street names in an effort to learn whether the street on which the Site is located lies within the search distance of the subject property, a drive-by view of surrounding properties during the Site visit, and evaluating the Site type and information provided by government agencies. The orphan sites included in the following table are those Citadel identified as potentially located within the identified search distance.

Database	Radius	Site Identified	No. of Listings Identified	Potential Environmental Concern to the Site
National Priorities List	1 mile	No	0	
RCRA Corrective Action Treatment/Storage/Disposal (TSD) Facilities (CORRACTS)	1 mile	No	0	
Delisted National Priorities List	1 mile	No	0	
CERCLIS Sites	½ mile	No	0	
CERCLIS No Further Remedial Action Planned (NFRAP) Sites	½ mile	No	0	
RCRA Non-Corrective Action TSD Facilities	½ mile	No	0	
State/Tribal Voluntary Cleanup Sites	½ mile	No	0	
State/Tribal Leaking Registered Storage Tank Sites	½ mile	No	1	No
State/Tribal Brownfield Sites/CERCLIS Equivalent	1 mile	No	3	No
Historic CORTESE List	½ mile	No	0	
State/Tribal Solid Waste Landfill Sites/Facilities	½ mile	No	0	
Federal/State/Tribal Engineering Controls Registries	½ mile	No	0	
Federal/State/Tribal Institutional Controls Registries	½ mile	No	0	
RCRA Large Quantity Generators	¼ mile	No	1	No
RCRA Small Quantity Generators	¼ mile	No	0	
RCRA Non Generators	¼ mile	No	0	
State/Tribal Registered Storage Tank Sites	¼ mile	No	1	No
HIST UST	¼ mile	No	0	
CA FID UST	¼ mile	No	0	
SWEEPS UST	¼ mile	No	0	
Facility Index System (FINDS)	Site	No	0	

Database	Radius	Site Identified	No. of Listings Identified	Potential Environmental Concern to the Site
HAZNET	Site	Yes	1	No, see discussion below
Clandestine Drug Laboratory	Site	Yes	1	No, see discussion below
Orphan	N/A	No	1	No

A brief discussion of select facilities and their database listings are included following the table. The full report provided by EDR and reviewed by Citadel can be found in Appendix K.

Site Name	Clandestine Drug Lab Operator Unknown
Database(s)	HAZNET, CDL
Address	29053½ Coolidge Avenue
Distance/Direction	Target Property
Comments	The address 29053½ Coolidge Avenue, similar to the address associated with the residential structure on the Western Parcel, was identified on the Clandestine Drug Lab (CDL) database in 1995 as a location where an illegal drug lab was operated or drug lab equipment and/or materials were stored. The address was also identified on the HAZNET database for generating 1.16 tons of laboratory waste chemicals in 1995. The disposal method was listed as transfer station. The waste likely resulted from the identification of the Site as a CDL and the cleanup process. However, it appears that the drug lab may not have taken place at the current residential structure. According to the 1994 Aerial Photograph, several structures appeared developed along Coolidge Avenue, further north of the current residential structure. These structures appeared removed in the 2002 Aerial Photograph. Based on the identified address and its proximity to the current water tank, these structures may have been associated with the drug lab. However, the owner of the Subject Property, Mr. Hunt Williams, stated that this area was once leased to a local resident to keep a number of horses. The location of the CDL could not be discerned and was likely cleaned up to the satisfaction of the regulatory agency.

Site Name	Unocal – Del Valle
Database(s)	SLIC
Address	Del Valle Road
Distance/Direction	312 feet east-northeast of the Site
Comments	Unocal – Del Valle was identified on the SLIC database as a Cleanup Program Site as of 1965; no information was available regarding potential media affected of or contaminants of concern associated with the facility. Based on the historical nature of this listing and crossgradient location from the Site, this facility is not considered to represent a significant environmental concern.

Site Name	DD Diesel
Database(s)	UST
Address	28915 Avenue Penn
Distance/Direction	377 feet east-southeast

Comments	DD Diesel was identified on the Los Angeles County Fire Department UST database; no other information about this listing was included in the EDR report. As per documents available through the Los Angeles County Department of Public Works (LADPW) online file review, a 15,000-gallon diesel UST was installed at the Site in January 2002. While an inspection report dated November 21, 2016, indicated that the facility was in violation for failing to conduct secondary containment testing every 36 months, the violation was addressed satisfactorily. Based on a lack of reported spill or leaks, this facility is not expected to represent a significant environmental concern.

Maps showing the location of these facilities and additional information are provided in the Government Records Report in Appendix K.

6.2 VAPOR ENCROACHMENT CONDITION

According to ASTM E2600-15, the goal of conducting a vapor encroachment screening on a parcel of property is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of chemicals of concern vapors in the subsurface of the target property (TP) caused by the release of vapors from contaminated soil or groundwater or both either on or near the target property as identified by Tier 1 or Tier 2 procedures. The purpose of Tier 1 is to conduct a screen using Phase I ESA-type information to determine if a VEC exists at the target property. If the Tier 1 screen cannot rule out the possibility of a VEC existing at the target property, then a Tier 2 screen can be conducted. Tier 2 applies numeric screening criteria to existing or newly collected soil, soil gas, and/or groundwater testing results to evaluate whether or not a VEC can be ruled out. Tier 2 has two data collective components: non-invasive and invasive.

Tier 1 screening begins with the default area of concern (AOC) defined by the approximate minimum search distances adjusted as appropriate for local conditions, and then determining if known or suspected contaminated properties with contaminants of concern (COCs) exist within the established AOC. The default AOC is one third of a mile around the TP for COCs and one-tenth of a mile for petroleum hydrocarbon COCs. The AOC is measured from the TP boundary to a contaminated property with known or suspected COC contamination of soil or groundwater or both. The default AOC may be expanded or reduced by the environmental professional (adjusted AOC) using experience and professional judgment, based on factors like groundwater flow direction, subsurface characteristics, surficial features and man-made features.

If groundwater flow direction is known or can be inferred from the Phase I ESA investigation of the TP, the default AOC in the down-gradient direction may be reduced to the area within the critical distance of 100 feet. The AOC in the cross-gradient direction may also be reduced, depending upon the critical distance and the width of the COC-contaminated plume associated with a known or likely COC-contaminated property located in a cross-gradient direction from the TP. The critical distance is the lineal distance in any direction between the nearest edge of the contaminated plume and the nearest TP boundary, and is equal to 100 feet for COCs or 30 feet for dissolved petroleum hydrocarbon COCs.

For a COC-contaminated property identified in Tier 1 located down-gradient from the TP, it is not necessary to have information on migrating groundwater contaminated plume dimensions as the critical distance is measured from the nearest TP boundary to the source of contamination at the off-site down-gradient property. In this case, the AOC may be reduced to the area within the critical distance.

For a contaminated property identified in Tier 1 located crossgradient from the TP, the AOC will be the area within the critical distance plus one half of a reasonable estimation of the contaminated plume width (at the point nearest the closest TP boundary) that might be associated with the nearby known or suspected COC-contaminated property (that is, the COC-contaminated property where the groundwater contamination originated). The environmental professional's judgment and experience can be used to estimate the width of the COC-contaminated plume that might be associated with the nearby known or suspected COC-contaminated property. If it is not possible to estimate the contaminated plume width, then the AOC cannot be reduced in the cross-gradient direction.

Citadel reviewed information provided by EDR regarding nearby properties to evaluate for potential on-Site vapor encroachment concerns from off-site sources. According to EDR, no historical releases of petroleum products from a leaking underground storage tank (LUST) have occurred within 0.25-mile and upgradient of the Site.

EDR also provided the following listings on the Historical Gas Station database as within 0.125-mile of the Site.

Historical Gas Stations	
Site Name	B & M Truck Repair
Address	28915 Avenue Penn
Distance/Direction	377 feet east-southeast of the Site
Comments	The property was occupied as an automobile repair shop by B & M Truck Repair from 2004 to 2008. As per documents available through the LADPW online file review, a 15,000-gallon diesel UST was installed at the Site in January 2002. While an inspection report dated November 21, 2016, indicated that the facility was in violation for failing to conduct secondary containment testing every 36 months, the violation was addressed satisfactorily. Based on a lack of reported spill or leaks, and crossgradient location from the Site, this listing is not likely to have adversely affected the Site.

EDR did not identify any listings on the Dry Cleaners database as within 0.125-mile of the Site.

A copy of the vapor encroachment screen provided by EDR is included as Appendix L.

6.3 REGULATORY AGENCIES

Local and state agencies, such as environmental health departments, fire prevention bureaus, and building and planning departments are contacted to identify any current or previous reports of hazardous materials use, storage, and/or unauthorized releases that may have impacted the Site.

BUILDING DEPARTMENT

Citadel reviewed permit documents with the County of Los Angeles Department of Public Works for information regarding the Site in order to identify historical tenants and property use. Please see Section 5.2 for further discussion.

FIRE DEPARTMENT

Citadel contacted the County of Los Angeles Fire Department for information regarding the Site in order to identify historical tenants and property use. The agency has not yet responded at the time of this report. However, this limitation is not expected to significantly alter the findings of this assessment.

HEALTH DEPARTMENT

Citadel contacted the Los Angeles County Public Health for information regarding the Site in order to identify historical tenants and property use. The agency has not yet responded at the time of this report. However, this limitation is not expected to significantly alter the findings of this assessment.

AIR QUALITY MANAGEMENT DISTRICT

Citadel reviewed information available on-line through the South Coast Air Quality Management District's Facility Information Detail (FIND) database. The Site was not identified on the FIND database.

REGIONAL WATER QUALITY CONTROL BOARD

The GeoTracker Database is the California State Water Resources Control Board's (SWRCB) Internet-accessible database system used by the SWRCB, regional boards, and local agencies to track and archive compliance data from authorized or unauthorized discharges of waste to land, or unauthorized releases of hazardous substances from underground storage tanks. According to Geotracker, the Del Valle Oil Field located approximately 1.16 miles southwest of the south boundary of the Eastern Parcel of the Site in Valencia, California, is listed as a LUST Cleanup Site. According to information provided by Geotracker, a gasoline leak was discovered in May 1985. The case was completed and closed by the Los Angeles Regional Water Quality Control Board (LARWQCB) on August 17, 1999.

The Chiquita Canyon Sanitary Landfill is located immediately south of the Eastern Parcel. As per a 2014 Master Plan Revision for the landfill, environmental monitoring at the landfill includes groundwater sampling on a quarterly basis and analysis for constituents of concern (COCs) every five years. The closest monitoring wells to the Site are DW-28 (existing) and DW-33 and DW-34 (proposed), located in the north portion of the landfill. Due to its downgradient location from the Site, this facility is not expected to represent a significant environmental concern.

7.0 DATA GAPS

A data gap is a lack of or inability to obtain information despite good faith efforts to gather such information. A data failure is a failure to achieve the historical research objectives even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful.

The following data gaps have been identified during the course of this investigation:

- Additional governmental agencies that are not included in the Government Records report may maintain information regarding environmental conditions at the Site and nearby facilities. Requests have been sent to the County of Los Angeles Fire Department and Public Health. At the time of this report, these agencies have not yet responded.

With regard to these data gaps, Citadel believes that the most significant potential sources for on-site contamination have been identified during the current investigation.

8.0 FINDINGS

Citadel Environmental Services, Inc. (Citadel) was contracted by Sterling Gateway, L.P. (Client) to perform a Phase I Environmental Site Assessment (Phase I ESA) of the Sterling Ranch Estates, located in Val Verde, a census-designated place within Los Angeles County, California; hereinafter referred to as the "Site."

The Site is generally undeveloped with the exception of a single-family residential structure of approximately 1,106 square feet (SF) at 29053 Coolidge Avenue in the southwest corner of the Western Parcel that is reportedly used as an office. The remaining portions of the Western Parcel and the entire Eastern Parcel is undeveloped land comprised of valleys and ridges. Dell Valle Road traverses the southeast portion of the Western Parcel, and Coolidge Avenue traverses the south-southwest portion of the Western Parcel. Huntsock Street traverses the north portion of the Eastern Parcel. Several unimproved roads traverse both the Western and Eastern Parcels of the Site. Access to the Western and Eastern Parcels of the Site is along Del Valle Road and Windsor Road, respectively.

Equipment observed at the Site include a propane tank, and a leach field and septic tank associated with a wastewater treatment system near the residential structure on the Western Parcel. A large storage container was present near the residential structure; Citadel was not provided with access to the container during the Site reconnaissance. A concrete pad was also observed in the southwest corner of the Western Parcel. No stationary equipment was observed on the Eastern parcel of the Site.

A review of historical sources showed that the Western parcel of the Site was undeveloped from at least 1903. Del Valle Road and Coolidge Avenue that traverse the Western Parcel, and a concrete pad in the southwest portion of the Western Parcel, were developed by 1928. The current residential structure at the Western Parcel was constructed in 1936. City directory listings indicate the structure was used as a residence at least until 2013. The Eastern parcel of the Site has been undeveloped since at least 1903.

Converse Consultants (Converse) performed a Phase I ESA for the Western Parcel of the Site in February 2004. Converse identified a plugged and abandoned dry-hole on the Western Parcel. According to Converse, this well never produced oil or gas and was abandoned in 1923. No other information regarding the well was included in the Converse Phase I ESA. Converse recommended that the plugged and abandoned dry-hole be located and reabandoned to current Division of Oil, Gas, and Geothermal Resources (DOGGR) requirements. As per the Converse Phase I ESA, the property in the Western Parcel with street address 29053½ Coolidge Avenue was listed on the HAZNET database as a clandestine drug lab. Converse recommended that the residential dwelling and associated structures be accessed and assessed; and asbestos and lead-based paint surveys be conducted prior to demolishing the structures.

The address 29053½ Coolidge Avenue, similar to the address associated with the residential structure on the Western Parcel, was identified on the Clandestine Drug Lab (CDL) database in 1995 as a location where an illegal drug lab was operated or drug lab equipment and/or materials were stored. The address was also identified on the HAZNET database for generating 1.16 tons of laboratory waste chemicals in 1995. The disposal method was listed as transfer station. The waste likely resulted from the identification of the Site as a CDL and the cleanup process. However, it

appears that the drug lab may not have taken place at the current residential structure. According to the 1994 Aerial Photograph, several structures appeared developed along Coolidge Avenue, further north of the current residential structure. These structures appeared removed in the 2002 Aerial Photograph. Based on the identified address and its proximity to the current water tank, these structures were likely associated with the drug lab. However, the owner of the Subject Property, Mr. Hunt Williams, stated that this area was once leased to a local resident to keep a number of horses. The location of the CDL could not be discerned and was likely cleaned up to the satisfaction of the regulatory agency.

Citadel reviewed information provided by Environmental Data Resources (EDR) regarding nearby properties to evaluate for potential on-Site vapor encroachment concerns from off-site sources. According to EDR, no historical releases of petroleum products from a leaking underground storage tank (LUST) have occurred within 0.25-mile and upgradient of the Site.

One property was identified as within 0.125-mile and upgradient of the Site on the Historical Gas Station database. This property, located 377 feet east-southeast of the Site, is not likely to have adversely affected the Site. No properties were identified as within 0.125-mile and upgradient of the Site on the Historical Dry Cleaners database.

9.0 CONCLUSIONS AND RECOMMENDATIONS

According to ASTM Standard of Practice E1527-13, recognized environmental conditions (REC) fall under three specific categories when evaluating a site or properties within the site vicinity. These categories are defined below.

A recognized environmental condition, or REC, means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

A controlled recognized environmental condition, or CREC, is a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

An historical recognized environmental condition, or HREC, is a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

According to ASTM E2600-10, the goal of conducting a vapor encroachment screening on a parcel of property is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of chemicals of concern vapors in the subsurface of the target property caused by the release of vapors from contaminated soil or groundwater or both either on or near the target property as identified by Tier 1 or Tier 2 procedures. The purpose of Tier 1 is to conduct a

screen using Phase I ESA-type information to determine if a VEC exists at the target property. If the Tier 1 screen cannot rule out the possibility of a VEC existing at the target property, then a Tier 2 screen can be conducted. Tier 2 applies numeric screening criteria to existing or newly collected soil, soil gas, and/or groundwater testing results to evaluate whether or not a VEC can be rules out. Tier 2 has two data collective components: non-invasive and invasive.

Based on our review, the former oil well located on the Western of the Site represents a HREC. The plugged and abandoned wells should be located and re-abandoned per current regulatory requirements. A methane survey should be completed as per Los Angeles County requirements if any development is planned within 300 feet of the former oil well.

The Site was identified on the Clandestine Drug Lab (CDL) listing for an illegal drug lab. The Site was also identified on the HAZNET database for waste likely resulted from the identification of the Site as a CDL and the cleanup process. The location of the CDL could not be discerned and was likely cleaned up to the satisfaction of the regulatory agency.

The current Site building was constructed prior to bans using ACBMs, LBP, and PCBs in electrical equipment came into effect in 1989, 1978, and 1978, respectively. No testing is known to have been performed to evaluate for the presence of ACBMs, LBP, or PCBs at the Site.

Prior to renovation or demolition of building components, particularly roofing materials, Citadel recommends that the Client perform a survey for ACBMs and LBP prior to renovation or demolition activities. Such surveys should be performed to identify if ACBMs or LBP are present and to ensure proper handling and disposal and to allow for measures to protect both worker and building occupant safety during routine building maintenance, renovation or demolition.

10.0 LIMITATIONS

The information and opinions rendered in this report are exclusively for use by the Client. Citadel Environmental Services, Inc. will not distribute this report without the Client's written consent, except as may be required by law or court order. The recommendations expressed in this report took into consideration the purpose and scope of this limited assignment. We accept responsibility for the competent performance of our duties in executing the assignment and preparing this report in accordance with the normal standards of our profession, but disclaim any responsibility for consequential damages resulting from inaccuracies in information provided by the Client, federal, state, county, or local regulatory agencies.

12.0 PROFESSIONAL CERTIFICATION

Citadel has completed a Phase I ESA of the Sterling Ranch Estates located at 29053 Coolidge Avenue, in Val Verde, Los Angeles County, California. The Phase I ESA was performed at the Clients request in accordance with the American Society for Testing and Materials (ASTM) Standard of Practice E1527-2013 and the standards of care and diligence normally practiced by recognized consulting firms in performing services of a similar nature.

The independent conclusions represent our professional judgment based on information and data available to Citadel during the course of this project. Information regarding historical and present operations, conditions and test data provided by the Client or their representative, is assumed to be correct and complete. The conclusions presented by this Phase I ESA are based on information provided to Citadel and from observations and perceived conditions existing on the date of the site reconnaissance.

In expressing the opinions stated in this report, Citadel has exercised the degree of skill and care ordinarily exercised by a reasonable prudent environmental professional. Documentation provided by the Client, Client-designated representatives, interested third-parties, or from the public domain, and referenced in preparation of the Phase I ESA report, have been assimilated with the understanding that Citadel assumes no responsibility or liability for their accuracy.

I declare that to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined by the final All Appropriate Inquiry (AAI) Rule published in 40 CFR Part 312.10 (November 1, 2013). I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting described in this Phase I ESA. I have developed and performed the AAI in conformance with the standard and care of this Rule.

EXPERIENCE

Ms. Jani's experience is in the fields of environmental remediation, geology, and geochemistry. She has previously worked at the Pacific Northwest National Laboratory (PNNL), as a Research Associate, and at Louis Berger NY, as a Junior Hydrogeologist. At PNNL, Ms. Jani was involved in the development of reactive gas-based remediation methods for contaminated soils at the Hanford Site in Washington. While at Louis Berger, Ms. Jani was involved in groundwater remediation and monitoring projects for Superfund sites in New York (Newtown Creek) and New Jersey (Cornell-Dubilier Electronics). Ms. Jani has experience working with geochemical analysis techniques like Inductively Coupled Plasma Mass Spectrometry (ICP-MS), and X-Ray Diffraction (XRD), sampling techniques for groundwater, soil and soil vapor, designing laboratory scale experiments, and preparing technical documents and proposals. Ms. Jani's graduate thesis research focused on the electrochemical and biochemical characterization of the microbial species Shewanella oneidensis, with applications in bioremediation and fundamental evolutionary geology.

ROLE

As Staff Geologist, Ms. Jani's primary responsibility is to assist Senior Operations in the direction, organization, control, and completion of Environmental Geology and Engineering-related projects awarded to Citadel. Her unique experience and skills will significantly enhance the capabilities of the Environmental Geology and Engineering group at Citadel.

EDUCATION

Ms. Jani holds a Master of Science degree in Geology from the University of Wyoming, as well as Bachelor and Master of Science degrees in Geology from the University of Pune (India). Her professional certifications include OSHA's 40 Hour HAZWOPER and NSC's First Aid/Adult CPR/AED.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EDR® Environmental Data Resources Inc

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Citadel Environmental Services on Aug 30, 2017.

TARGET PROPERTY

29053 Coolidge Ave
Castaic, CA 91384

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **YES**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the reason(s) indicated below by the checkmark(s) I have placed next to the applicable item(s) (Section 7031.5, Business and Professions Code): Any city or county that requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for the permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors' State License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he or she is exempt from licensure and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

(_) I, as owner of the property, or my employees with wages as their sole compensation, will do (✓) all of or (_) portions of the work, and the structure is not intended or offered for sale (Section 7044, Business and Professions Code: The Contractors' State License Law does not apply to an owner of property who, through employees' or personal effort, builds or improves the property, provided that the improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the Owner-Builder will have the burden of proving that it was not built or improved for the purpose of sale.).

(_) I, as owner of the property, am exclusively contracting with licensed Contractors to construct the project (Section 7044, Business and Professions Code: The Contractors' State License Law does not apply to an owner of property who builds or improves thereon, and who contracts for the projects with a licensed Contractor pursuant to the Contractors' State License Law).

(_) I am exempt from licensure under the Contractors' State License Law for the following reason:

_____

By my signature below I acknowledge that, except for my personal residence in which I must have resided for at least one year prior to completion of the improvements covered by this permit, I cannot legally sell a structure that I have built as an owner-builder if it has not been constructed in its entirety by licensed contractors. I understand that a copy of the applicable law, Section 7044 of the Business and Professions Code, is available upon request when this application is submitted or at the following Web site: http://www.leginfo.ca.gov/calaw.html.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Citadel Environmental Services were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

Subject: **PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT**
Sterling Gateway Property
Western Parcel
Approximate 118.4-Acres
Val Verde Park, California
Converse Project No. 04-41-125-01

Mr. Bihr:

Converse Consultants (Converse) is pleased to submit the attached report that summarizes the activities and the results of a Phase I Environmental Site Assessment (Phase I ESA) that was conducted at the referenced property (Property).

We appreciate the opportunity to be of service to you. If you should have any questions or comments regarding this report, please contact either Laura Tanaka at (626)-930-1261 or Norman Eke at (626) 930-1260.

Executive Summary

The following is an Executive Summary of the Phase I Environmental Site Assessment (Phase I ESA) that was conducted by Converse Consultants (Converse). Please refer to the appropriate sections of the report for a complete discussion of these issues. In the event of a conflict between this Executive Summary and the report, or an omission in the Executive Summary, the report shall prevail.

This report presents the results of the Converse Consultants (Converse) Phase I Environmental Site Assessment (ESA) performed at the approximate 118.4-acre Sterling Gateway Property/Western Parcel located adjacent to the City of Santa Clarita, Los Angeles County, California, referred to as the Property in this report. Converse was retained by East West Bank to conduct this Phase I ESA. Our study has been conducted in order to identify, to the extent feasible, Recognized Environmental Conditions (RECs) in connection with the Property.

Converse has compiled and reviewed information that was obtained from interviews, document research, and on-site and area reconnaissance to identify potential environmental conditions at the Property, in conformance with *the American Society of Testing and Materials (ASTM) Standard E: 1527-00 Environmental Site Assessment Standard Practice* (*ASTM Standard: E 1527-00*). This Phase I ESA was conducted during the period of February 4 through February 18, 2003.

The subject Property (herein referred to as Property) is located southwest of the Hasley Canyon Road and Del Valle Road intersection, adjacent to the City of Santa Clarita, Los Angeles County, California. The Property is located approximately 2-miles west of Interstate 5 (Santa Ana Freeway). The Property is an irregular-shaped parcel at approximately 118.4-acres. A single-family residential dwelling (29053 Coolidge Avenue) is located on the southwestern portion of the Property. The remaining of the Property is compromised of valleys and ridges covered with low-lying natural vegetation. Several unimproved roads cross the Property.

The general vicinity is characterized by oil production, residential properties, and undeveloped land.

- According to the DOGGR, Map 253, Hasley Canyon Field, one (1) plugged and abandoned dry-hole is located on the Property. This well never produced oil or gas and was abandoned in 1923. No other information regarding the well was available at DOGGR.

  The plugged and abandoned dry-hole should located and reabandoned to current DOGGR requirements. Assessment for historic sumps, boneyards, etc. should be completed.

- The Property (29053 ½ Coolidge Avenue) was listed on the HAZNET database in the EDR report as a Clandestine drug lab. Mr. Williams was not aware that this address was listed as a drug lab operator site and stated that no such activity took place on the Property under his ownership.

  Converse recommends the residential dwelling and associated structures be accessed and assessed. If the structures are to be demolished, asbestos and lead-base paint surveys should be conducted.

Based on the above information, there appears to be a potential for environmental impact to the Property from historical use. Further assessment as noted above appears warranted.

Information has been requested from the CSFM and LACSD. Upon receipt and review, an addendum will be issued if items of concern are noted. In addition, any conclusions and recommendations will be modified accordingly.

1.0 Introduction

1.1 Purpose and Scope of Work

This report presents the results of the Converse Consultants (Converse) Phase I Environmental Site Assessment (ESA) performed at the approximate 118.4-acre Sterling Gateway Property/Western Parcel located adjacent to the City of Santa Clarita, Los Angeles County, California, referred to as the Property in this report. Converse was retained by East West Bank to conduct this Phase I ESA. Our study has been conducted in order to identify, to the extent feasible, Recognized Environmental Conditions (RECs) in connection with the Property. The term Recognized Environmental Conditions is defined in section 1.1.1 of the ASTM Standard Practice as the *presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, past release, or material threat of a release into structures on the property or into the ground, ground water or surface water of the property.*

The work was completed by environmental professionals and has been performed in accordance with our Confirmation of Services dated January 27, 2004. Our work consisted of the following and was completed in general conformance with the scope and limitations of the ASTM Practice E 1527-00:

- Interviews with the property owner representatives
- Property and vicinity reconnaissance
- Review of regulatory agency records
- Description of physical setting
- Historical review
- Interviews with public agency personnel
- Preparation of this report

1.2 Non-Scope Considerations

Business Environmental Risk (BER) considerations, aside from the Innocent Landowners Defense issues, which are addressed by ASTM 1527-00, are considered non-scope considerations (ASTM 1527-00, Section 12). Non-scope issues are not addressed in this report.

1.3 Significant Assumptions

No significant assumptions were made during this assessment.

1.4 Limitations and Exceptions

The residential dwelling and associated structures on the Property were not accessed during this assessment.

1.5 Reliance

This report is for the sole benefit and exclusive use of East West Bank, in accordance with the terms and conditions attached to our proposal under which these services have been provided. Its preparation has been in accordance with generally accepted environmental practices. No other warranty, either expressed or implied, is made. This report should not be regarded as a guarantee that no further contamination beyond that which could be detected within the scope of this assessment is present at the Property.

The conclusions and recommendations presented in this report are based on the agreed upon scope of work. Converse makes no warranties or guarantees as to the accuracy or completeness of information provided or compiled by others. It is possible that information exists beyond the scope of this assessment. It is not possible to absolutely confirm that no hazardous materials and/or substances exist at the subject site. If none are identified as part of a limited scope of work, such a conclusion should not be construed as a guaranteed absence of such materials, but merely the results of the evaluation. Also, events may occur after the Property visit, which may result in contamination of the Property. Additional information, which was not found or available to Converse at the time of report preparation, may result in a modification of the conclusions and recommendations presented. Any reliance on this report by Third Parties shall be at the Third Party's sole risk.

2.0 Property Description

2.1 Current Uses of the Property and General Characteristics

The subject Property (herein referred to as Property) is an irregular-shaped parcel consisting of approximate 118.4-acres. A single-family residential dwelling (29053 Coolidge Avenue) is located on the southwestern portion of the Property. The remaining areas of the Property are compromised of valleys and ridges covered with low-lying natural vegetation. Several unimproved roads cross the Property.

A Property location map and a field generated Property plan are provided in Appendix A. Pertinent Property photographs are provided in Appendix B.

2.2 Location and Legal Description

The Property is located southwest of the Hasley Canyon Road and Del Valle Road intersection, adjacent to the City of Santa Clarita, Los Angeles County, California. The Property is located approximately 2-miles west of Interstate 5 (Santa Ana Freeway).

The Assessor's Parcel Number (APN) for the Property is 3271-004-003 and 3271-004-004. The legal description for the Property is: Tract 8599, Lot A, at the Recorder of Los Angeles County.

2.3 Description of Property Structure(s)

A single-family residential dwelling (29053 Coolidge Avenue) with an associated garage and shed were observed in the southwestern portion of the Property. Access to these structures was not gained during the Property reconnaissance.

2.4 Current Uses of Adjoining Properties

Based on our research and observations during our Property visit, the Property is bordered by the following:

Table 1 – Development of Adjoining Properties

Direction	Current Development
North:	Undeveloped land

Direction	Current Development
Northeast:	Undeveloped land
Northwest:	Undeveloped land
South:	Residential properties
Southeast:	Undeveloped land
Southwest:	Residential properties
East:	Undeveloped land
West:	Undeveloped land and residential properties

2.5 General Vicinity Description

The general vicinity is characterized by oil production, residential properties, and undeveloped land.

3.0 User/Owner Provided Information

3.1 Requested Documents and Information

The ASTM E1527 specifies that the Property owner, key site manager and the User provide any helpful documents that may be available. In order to facilitate, and document, the collection of this information, Converse has prepared a form titled Client/User/Owner Provided Information. Converse requested that the User complete the form and requested the assistance of the Property owner, Mr. Hunt Williams, in completing the form.

The following documents and information were requested from East West Bank, and from Mr. Hunt Williams. Both parties had no information regarding the following:

- Environmental site assessment or audit reports
- Environmental permits or hazardous waste generator notices/reports
- Registrations for Aboveground and underground storage tanks
- Septic systems, oil wells, or water wells
- Community Right to Know Plans; or Safety, Preparedness and prevention Plans; Spill Protection Countermeasures and Control Plans
- Reports regarding Hydrologic conditions on the Property or surrounding area
- Notices or Other Correspondence form any government agency relating to past or current violations of environmental laws with respect to the property or relating to environmental liens encumbering the property.
- Hazardous waste generator notices or reports
- Geotechnical Studies
- Proceedings regarding hazardous substances and petroleum products including any pending, threatened or past: litigation; administrative proceedings; or notices form any governmental entity regarding possible violations of environmental laws or other possible liability related to hazardous substances or petroleum products.

3.2 User Provided Information

The ASTM E1527 outlines specific User responsibilities. This information will help identify the possibility of RECs in connection with the Property. These tasks do not require the technical expertise of an Environmental Professional and are generally not performed by environmental professionals performing a Phase I ESA. The User may perform them. In general, the User should make Converse aware of information they have regarding the following:

- Checking title records for environmental liens

- Specialized knowledge or experience of the User
- Reason for significantly lower purchase price
- Purpose of Phase I ESA if other than to qualify for Innocent Landowner Defense

No specific information regarding the above issues was provided to Converse by the User.

4.0 Records Review

4.1 Physical Setting

4.1.1 Geology

The Property is located between 1,300 and 1,380 feet above mean sea level with surface topography sloping to the southwest (United States Geological Survey [USGS] Topographic Map, Val Verde Quadrangle, 1965 photorevised 1981, California,). The Property is underlain by unconsolidated and semi-consolidated alluvium, lake, playa, and terrace deposits (Division of Mines and Geology, Geologic Map of California, 1991).

4.1.2 Groundwater

The nearest groundwater well to the Property is located approximately 2.5-miles southeast of the Property, at the intersection of Old Road and Henry Mayo Drive. Los Angeles County, Department of Public Works (DPW) well number 4459 was last measured on November 10, 2003. At that time, the depth to groundwater was recorded at 26.1-feet below ground surface. The surface elevation was recorded at 985.8-feet above mean sea level.

According to the DPW Santa Clarita Valley Groundwater Contours Map for Fall 1998, the groundwater level at the Property is 335-feet below mean sea level. The groundwater flow direction is to the southwest.

4.1.3 Potable Water Supplier

There is currently no potable water supplied to the Property.

4.2 Historical Review

4.2.1. Aerial Photograph and Map Review

Available historical aerial photographs from the Fairchild Aerial Photography Collection were reviewed at Whittier College. The years of the photographs reviewed are as follows: 1928-29, 1930, 6-25-40, 5-1952, 2-1956, and 1957.

Historical Sanborn Fire Insurance (Sanborn) map coverage of the Property was requested from Environmental Data Resources (EDR), Inc. According to EDR, there is no Sanborn coverage of the Property.

Topographic maps of the Val Verde Quadrangle, which are published by the USGS, were reviewed. The topographic maps were dated 1916, 1947, 1952, 1969, 1988, 1991, and 1995.

A chronological summary of the aerial photographs and map review is provided in Table 2.

Table 2 – Historical Aerial Photograph and Map Review Summary

Date	Reference	Observations
1916 1928-29 Flight # C-300 : 48 1930 Flight # C-101 : 77	Topographic Map Aerial Photographs	The Property appeared to be undeveloped land with a few unimproved roads and a square concrete pad on the southwestern portion. Del Valle Road appeared to be crossing the eastern portion of the Property. The adjacent properties appeared to be undeveloped land. The general vicinity appeared to be undeveloped land.
6-25-40 Flight # C-6500 : 10 1947	Aerial Photograph Topographic Map	The Property appeared to be improved with a small structure and a concrete pad on the southwestern portion. The remaining areas of the Property appeared to be undeveloped land with a few unimproved roads. Del Valle Road appeared to be crossing the eastern portion of the Property. The north and east adjacent properties appeared to be undeveloped land. The south and west adjacent properties appeared to be improved with scattered residential properties. The general vicinity appeared to be undeveloped land, and scattered structures.
1952 5-1952 Flight # C-17727 : 59 2-1956 Flight # C-22402 : 21 1957 Flight # C-22926 : 101 1969 1988 1991 1995	Topographic Map Aerial Photographs Topographic Maps	The Property appeared to be improved with a two (2) small structures and a concrete pad on the southwestern portion. The remaining of the Property appeared to be undeveloped land with a few unimproved roads. Del Valle Road appeared to be crossing the eastern portion of the Property. The north and east adjacent properties appeared to be undeveloped land. The south and west adjacent properties appeared to be improved with residential properties. The general vicinity appeared to be land covered with shrubs, undeveloped land, and scattered structures.

4.2.2 Building Permit Review

Building permits for 29053 Coolidge Avenue were requested from the County of Los Angeles, Department of Public Works (DPW), Building and Safety Department, Santa Clarita Division. Only one permit was on file. According to the County information, a building permit to remove two (2) rooms and roof repair was issued to R. T. G. Dow on May 6, 1954.

4.2.3 Zoning and Land Use Records

The Property is currently zoned as agricultural (A-1).

4.3 Environmental Database Review

An Environmental Data Resources (EDR) report of Standard Environmental Record Sources (Records) was prepared specifically for the Property. The search radii were expanded by ½ or 1-mile. The complete EDR report is provided in Appendix C, EDR-Radius Map Report.

The Property, identified as Clandestine Drug Lab Operator, 29053 ½ Coolidge Avenue (Map ID No. 1), was reported to be in the California Environmental Protection Agency (Cal EPA), Hazardous Waste Information System (HAZNET) – Database of sites, which submit a hazardous waste manifest to the DTSC. The Property generated laboratory waste chemicals. The disposal method was identified as transfer station.

Other off-site locations of concern identified by EDR within a maximum 1/2-mile radius from the Property are as follows:

- Environmental Protection Agency (EPA), National Priority List (NPL) – The NPL is a listing of uncontrolled or abandoned hazardous waste sites that have been targeted for possible long-term remedial action under the Superfund Act. No NPL sites were identified within a 2-mile radius of the Property.

- EPA, Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) – A list of sites that are either proposed or on the NPL, and sites that are in the screening and assessment phase for possible inclusion on the NPL. No CERCLIS sites were identified within a 2-mile radius of the Property.

- EPA, Corrective Action Report (CORRACTS) – List of facilities undergoing "corrective action." Corrective actions may be required beyond the facility's boundary and can be required regardless of when the release

occurred. No CORRACTS sites were identified within a 2-mile radius of the Property:

- EPA, Resource Conservation and Recovery Information System (RCRIS) Transport, Store, Treat (TSD) Facilities – Information on sites that generate, transport, store, treat and/or dispose of hazardous waste. No sites were identified within a 2-mile radius of the Property.

- EPA, RCRIS Small and Large Quantity Generators – Database that lists facilities that generate, store, transport, treat, or dispose of hazardous waste. Large quantity facilities generated at least 1,000 kilograms per month of non-acutely hazardous waste or one kilogram per month of acutely hazardous waste. No large quantity generator sites were identified within a 3/4-mile radius of the Property.

  Small quantity facilities generate less than 1,000 kilograms per month of non-acutely hazardous waste. The following small quantity generator was identified within a 3/4-mile radius of the Property:

  - Kimball Microelectronics, 28575 Livingston Avenue (Map ID No. 2)

  The potential for impact to the Property from the RCRIS-SQG site appears to be low due to type of regulatory listing.

- Cal EPA, Annual Workplan (AWP) – Identifies known hazardous substance sites targeted for cleanup. No sites were identified within a 2-mile radius of the Property.

- Department of Toxic Substances Control (DTSC) Cal-Sites - Database of potential or confirmed hazardous substance release properties. No sites were identified within a 2-mile radius of the Property.

- State Water Quality Control Board, CORTESE - Database of sites that have been identified as LUST, landfills, or Cal-Sites. The following CORTESE sites were identified within a 1-mile radius of the Property.

  - LA County Fire Department, 28101 Chiquito Canyon Road (Map ID No. B6)
  - Newhall Land & Farming, 3003 Walnut Orchard Road (Map ID No. 13)

  The potential for environmental impact from the CORTESE sites appears to be low due one or more of the following: status of case, involvement of a regulatory agency, type of resource affected, identification of the responsible party, location with respect to the direction of regional groundwater flow, and/or distance.

- State Water Resources Control Board, Toxic Pits – Identifies sites suspected of containing hazardous substances where cleanup has not yet been completed. No sites were identified within a 2-mile radius of the Property.

- Solid Waste Facilities/Landfill Sites (SWF/LF) records from the Integrated Waste Management Board, Solid Waste Information System (SWIS) – Database of active and inactive landfills, incinerators, transfer stations, and disposal facilities. The following SWF/LF sites were identified within a 2-mile radius of the Property.

  - Laidlaw Waste Systems, 29201 Henry Mayo Drive (Map ID No. C8, C9)

  The potential for environmental impact to the Property from the SWF/LF sites appears to be low due to one or more of the following: status assigned to the case, type of resource affected, responsible party has been identified, regulatory agency is involved in remedial efforts, location with respect to the direction of regional groundwater flow, and/or distance from the Property.

- State Water Resources Control Board, Waste Management Unit Database (WMUDS/SWAT) – List which tracks and inventories waste management units. The following WMUDS/SWAT sites were identified within a 2-mile radius of the Property.

  - Universal By-Products-Valencia, 29201 Saugus-Ventura Road (Map ID No. 3, C10)

  The potential for environmental impact to the Property from the WMUDS/SWAT sites appears to be low due to one or more of the following: status assigned to the case, type of resource affected, responsible party has been identified, regulatory agency is involved in remedial efforts, location with respect to the direction of regional groundwater flow, and/or distance from the Property.

- State Water Resources Control Board (RWQCB), Leaking Underground Storage Tank (LUST) – An inventory of reported leaking underground storage tank incidents. The following LUST sites were identified within a 2-mile radius of the Property.

  - LA County Fire Department, 28101 Chiquito Canyon Road (Map ID No. B7)
  - Newhall Land & Farming, 3003 Walnut Orchard Road (Map ID No. 13)

  The potential for environmental impact to the Property from the LUST sites appears to be low due to one or more of the following: status assigned to

the case, responsible party has been identified, regulatory agency is involved in remedial efforts, type of resource affected, location with respect to the direction of regional groundwater flow, and/or distance from the Property.

- State Water Resources Control Board, Underground Storage Tanks (UST) –There are no UST sites identified within a 3/4-mile radius of the Property.

- California Facility Information Database (CA FID) – The CA FID contains active and inactive UST locations. There are no CA FID sites identified within a 3/4-mile radius of the Property.

- California Environmental Protection Agency (Cal EPA), Hazardous Waste Information System (HAZNET) – Database of sites, which submit a hazardous waste manifest to the DTSC. The following HAZNET sites are located within a 3/4-mile radius of the Property:

  - Kimball Microelectronics, 28575 Livingston Avenue (Map ID No. 2)
  - 28201 Franklin Parkway (Map ID No. A5)
  - Laidlaw Waste Systems, 29201 Henry Mayo Drive (Map ID No. C8, C9)

  The potential for environmental impact to the Property from the HAZNET sites is low due to type of regulatory listing.

4.4 Additional Environmental Record Sources

4.4.1 Division of Oil, Gas, and Geothermal Resources (DOGGR)

According to the California Department of Conservation, DOGGR, Wildcat Map W1-2, Los Angeles County, August 17, 2002, the Property is covered by Map 253.

According to California Department of Conservation, DOGGR, Map 253, Hasley Canyon Field, Los Angeles County, February 14, 2002, one (1) plugged and abandoned dry-hole is located on the Property. The DOGGR documents are provided in Appendix D. The Property is located on the edge of the Hasley Canyon Oil Field.

- Fernando Oil Company, well number 1 is located on the northwestern portion of the Property in Section 10, Township 4 North, and Range 17 West. This well was advanced in 1920 to a depth of 3,744-feet below ground surface (bgs). Small amounts of gas were visible in sand between 3,149 and 3,355-feet bgs. Small amounts of oil were visible in sand between 3,584 and 3, 690-feet

bgs. However, there was no indication that the well produced any oil or gas. In 1922, a notice of intention to abandon the well was issued. Fernando Oil Company, well number 1 was plugged with cement, steal chips, and lead wool.

4.4.2 California State Fire Marshall (CSFM), Pipeline Safety Division

Information was requested from CSFM. Upon receipt and review of the information, an addendum will be issued if items of concern are noted. In addition, any conclusions and recommendations will be modified accordingly.

4.4.3 South Coast Air Quality Management District (SCAQMD)

Information was requested from SCAQMD. Upon receipt and review of the information, an addendum will be issued if items of concern are noted. In addition, any conclusions and recommendations will be modified accordingly.

4.4.4 Los Angeles Regional Water Quality Control Board (RWQCB), Underground Storage Tank (UST) and Well Investigation Program (WIP)

There is no information on file with RWQCB regarding the Property.

4.4.5 Los Angeles County, Department of Health Services (DHS), Public Health Investigation

There is no information on file with DHS regarding the Property.

4.4.6 Los Angeles City County Department of Public Works (DPW), Environmental Programs

There is no information on file with DPW regarding the Property.

4.4.7 Los Angeles County Sanitation Districts

Information was requested from Sanitation Districts. Upon receipt and review of the information, an addendum will be issued if items of concern are noted. In addition, any conclusions and recommendations will be modified accordingly.

5.0 Property Reconnaissance

5.1 Methodology

On Tuesday, January 10, 2004, Converse visited the Property to evaluate present use and environmental conditions at the Property. Our methodology involved walking and driving the perimeter while noting observed evidence of present and potential environmental concerns. A field-generated map is provided in Appendix A. Pertinent property photographs are provided in Appendix B.

5.2 Limiting Conditions

Converse's findings are based on the Property conditions observed on Tuesday, January 10, 2004.

The residential dwelling and associated structures on the Property were not accessed during this assessment.

5.3 Interior Observations

No interior observations were made of the residential dwelling or the associated structures.

5.4 Exterior Observations

During our Property visit, Converse made the following observations of the exterior of the Property:

Table 3 – Exterior Observations

Item or Condition	Observed Evidence	No Evidence Observed	Comments
Hazardous Substances & Petroleum Products:	☐	☒	
Storage Tanks & Related Equipment:	☐	☒	
Odors:	☐	☒	
Standing Surface Water	☐	☒	

Item or Condition	Observed Evidence	No Evidence Observed	Comments
or Other Pools of Liquid:			
Drums & Other Containers of Hazardous Substances, Petroleum Products, or Other Unidentified Contents:	☐	☒	
Transformers or Equipment containing Polychlorinated Biphenyls (PCBs):	☐	☒	
Pits, Ponds, or Lagoons:	☐	☒	
Stained Soil or Pavement:	☐	☒	
Stressed Vegetation (other than from insufficient water):	☐	☒	
Evidence of Mounds, Depressions or Filled or Graded Areas Suggesting Trash or Other Solid Waste Disposal:	☐	☒	
Waste Water or any discharge (including storm water) into a Drain, Ditch, or Stream on or Adjacent to the Property:	☐	☒	
Wells (active, inactive, or abandoned):	☐	☒	
Septic Systems or Cesspools:	☐	☒	
Drains and Sumps:	☐	☒	
Prior Structures:	☐	☒	
Roads, Tracks, Railroad Tracks or Spurs:	☐	☒	

6.0 Interviews

During the interviews, the owner was asked if he had any available documents that would be helpful. The documents that were requested are detailed in Section 3.1, Requested Documents and Information.

On February 16, 2004, Mr. Hunt Williams was interviewed regarding his knowledge of past and present uses and/or problems at the Property. Mr. Williams was unaware or had no information regarding the items identified in Section 3.1, Requested Documents and Information. According to Mr. Williams, his family has owned the Property since the early 1950s and to the best of his knowledge the Property was undeveloped. The Property is proposed to be developed as single-family residential dwellings. Mr. Williams stated that the 29053 Coolidge Avenue, single-family residential dwelling was purchased by him eight years ago, remodeled, and is used as a rental property. Mr. Williams was not aware that this address was listed as a drug lab operator site and stated that no such activity took place on the Property under his ownership.

7.0 Findings

A cursory summary of findings is provided below. Details are not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein.

- According to the DOGGR, Wildcat Map W1-2, Los Angeles County, August 17, 2002, one (1) plugged and abandoned dry-hole is located on the Property. This well never produced oil or gas and was abandoned in 1923. No other information regarding the well was available at DOGGR.

- The Property was listed on the HAZNET database in the EDR report as a Clandestine drug lab.

8.0 Opinions and Conclusions

Converse has performed a Phase I Environmental Site Assessment in general conformance with the scope and limitations of ASTM Practice E 1527 for the approximate 118.4-acre Sterling Gateway Property/Western Parcel located adjacent to the City of Santa Clarita, Los Angeles County, California. Any exceptions to or deletions from this practice are described in the Limitations and Exceptions of Assessment section of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the Property except for the following:

- According to the DOGGR, Map 253, Hasley Canyon Field, one (1) plugged and abandoned dry-hole is located on the Property. This well never produced oil or gas and was abandoned in 1923. No other information regarding the well was available at DOGGR.

  The plugged and abandoned dry-hole should located and reabandoned to current DOGGR requirements. Assessment for historic sumps, boneyards, etc. should be completed.

- The Property (29053 ½ Coolidge Avenue) was listed on the HAZNET database in the EDR report as a Clandestine drug lab. Mr. Williams was not aware that this address was listed as a drug lab operator site and stated that no such activity took place on the Property under his ownership.

  Converse recommends the residential dwelling and associated structures be accessed and assessed. If the structures are to be demolished, asbestos and lead-base paint surveys should be conducted.

Based on the above information, there appears to be a potential for environmental impact to the Property from historical use. Further assessment as noted above appears warranted.

Information has been requested from the CSFM and LACSD. Upon receipt and review, an addendum will be issued if items of concern are noted. In addition, any conclusions and recommendations will be modified accordingly.

9.0 Deviations

No deviations or deletions from the ASTM standard Practice were addressed in this report.

10.0 Additional Non-Scope Services

There are environmental issues outside the scope of the ASTM E1527-00 that can be assessed in connection with a commercial real estate transaction. These are dealt with as non-scope considerations since they do not typically present a Superfund Liability. The specific level of inquiry (if any) is defined in the proposal, which contains a Scope of Work. These non-scope services are very client specific and not covered by the ASTM standard. They are frequently related to the business environmental risk which is defined in the ASTM standard as “risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate’’

No non-scope issues were addressed in this report.

12.0 List of Preparers

Norman S. Eke
Senior Vice President/Managing Officer

B.A., Liberal Studies, Environmental Studies Emphasis, University of California, Santa Barbara, 1988.
Cal-EPA Registered Environmental Assessor, #05654
Cal-OSHA Certified Asbestos Consultant, #96-2093

Managing Officer of the southern California environmental offices of Converse Consultants. Mr. Eke has 14 years of experience of conducting Phase I & II Environmental Site Assessments, asbestos surveys, emergency response, hazardous waste transportation, and hazardous materials management. Current duties include technical review and approval of reports.

Principal area of responsibility for this ESA report: Quality Control and Technical Review.

Laura Tanaka
Senior Environmental Scientist

B.S., Biology, California State Polytechnic university, Pomona, 1987
Cal-EPA Registered Environmental Assessor, #06283
Cal-OSHA Site Surveillance Technician, #94-1388
DHS Certified Lead Inspector/Assessor, #I-3086
DHS Certified Project Designer, D-3086
DHS Certified Project Monitor, M-3086

Manager of the Phase I Environmental Site Assessment department. Ms. Tanaka has 13 years experience in the conducting Phase I ESAs, asbestos surveys, lead-based paint surveys, as well as hazardous material audits, completing business plans, and AQMD permitting. Current duties at Converse include project management, business development, and conducting/managing ESAs.

Principal area of responsibility for this ESA report: Project Management, Client Point of Contact, Report Review.

Maggie Tymkow

Senior Staff Environmental Scientist

B.S, Sociology
Minor in Environmental Science
Drexel University, Philadelphia, PA, 2001

Ms. Tymkow has over two years of experience within the environmental field. Ms. Tymkow has conducted Phase I Environmental Site Assessments and Transaction Screens, managed and performed Phase II Soil Investigations for properties throughout Southern California, performed water sampling, air monitoring, and walk-through building inspections.

Principal area of responsibility for this ESA report: Project Management, Research, Property Reconnaissance, and Report Generation.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRIS-SQG list, as provided by EDR, and dated 12/10/2003 has revealed that there is 1 RCRIS-SQG site within approximately 0.75 miles of the target property.

EXECUTIVE SUMMARY

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 2 Cortese sites within approximately 2 miles of the target property.

EXECUTIVE SUMMARY

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, has revealed that there are 2 HAZNET sites within approximately 0.75 miles of the target property.

Facility Type: Other - Does not fall into the category of Municipal/Domestic, Industrial, Agricultural or Solid Waste (Class I, II or III)
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Federal
Waste Type: Not reported
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: Not reported
POTW: Not reported

Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.		
Agency Type:	Private		
Waste Type:	Stormwater Runoff - Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.		
Threat to Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.		
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy		

LAIDLAW WASTE SYSTEMS INC,CHIQ (Continued) **1002687338**

waste ponds.
Reclamation: No reclamation requirements associated with this facility.
POTW: The POTW Does not have an approved pretreatment program. Some POTWs may have local pretreatment programs that have not been approved by the regional board and/or EPA.
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Design Flow: 0 Million Gal/Day Baseline Flow: 0 Million Gal/Day
Facility Type: Solid Waste Site-Class III - Landfills for non hazardous solid wastes.
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Private
Waste Type: Solid Wastes - Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Threat to Water: Major Threat to Water Quality. A violation could render unusable a ground water or surface water resource used as a significant drink water supply, require closure of an area used for contact recreation, result in long-term deleterious effects on shell fish spawning or growth areas of aquatic resources, or directly expose the public to toxic substances.
Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 11/17/03
Date Made Active at EDR: 02/02/04
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 12/22/03
Elapsed ASTM days: 42
Date of Last EDR Contact: 12/22/03

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 11/17/03
Date Made Active at EDR: 02/02/04

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 12/18/03
Date Made Active at EDR: 02/02/04
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 12/26/03
Elapsed ASTM days: 38
Date of Last EDR Contact: 12/08/03

RCRIS: Resource Conservation and Recovery Information System
Source: EPA
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 12/10/03

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 07/15/03
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 12/17/03
Date of Next Scheduled EDR Contact: 03/15/04

RMP: Risk Management Plans
Source: Environmental Protection Agency
Telephone: 202-564-8600
When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 12/08/03
Date of Next Scheduled EDR Contact: 03/08/04

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-566-0250
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/01
Database Release Frequency: Annually

Date of Last EDR Contact: 12/22/03
Date of Next Scheduled EDR Contact: 03/22/04

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/02
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 12/08/03
Date of Next Scheduled EDR Contact: 03/08/04

EDR PROPRIETARY HISTORICAL DATABASES

EDR Historical Gas Station and Dry Cleaners: EDR has searched select national collections of business directories and has collected listings of potential dry cleaner and gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning and gas station/filling station/service station establishments. The categories reviewed included, but were not limited to: *gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, dry cleaner, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc.*

This information is meant to assist and complement environmental professionals in their conduct of environmental site assessments, and is not meant to be a substitute for a full historical investigation as defined in ASTM E1527. The information provided in this proprietary database may or may not be complete; i.e., the absence of a dry cleaner or gas station/filling station/service station site does not necessarily mean that such a site did not exist in the area covered by this report.

(A note on "dry cleaning" sites: it is not possible for EDR to differentiate between establishments that use PERC on-site as a cleaning solvent and sites that function simply as drop-off and pick-up locations or that are traditional wet cleaning/laundry facilities. Therefore, it is essential for environmental professionals to incorporate professional judgment in the evaluation of each site.)

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

BROWNFIELDS DATABASES

VCP: Voluntary Cleanup Program Properties
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Government Version: 11/30/03

Date of Next Scheduled EDR Contact: 03/01/04

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

EAST WEST/STERLING GATEWAY
DEL VALLE ROAD
VAL VERDE, CA 91384

TARGET PROPERTY COORDINATES

Latitude (North):	34.447899 - 34° 26' 52.4''
Longitude (West):	118.649597 - 118° 38' 58.5''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	348456.2
UTM Y (Meters):	3812858.5
Elevation:	1310 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

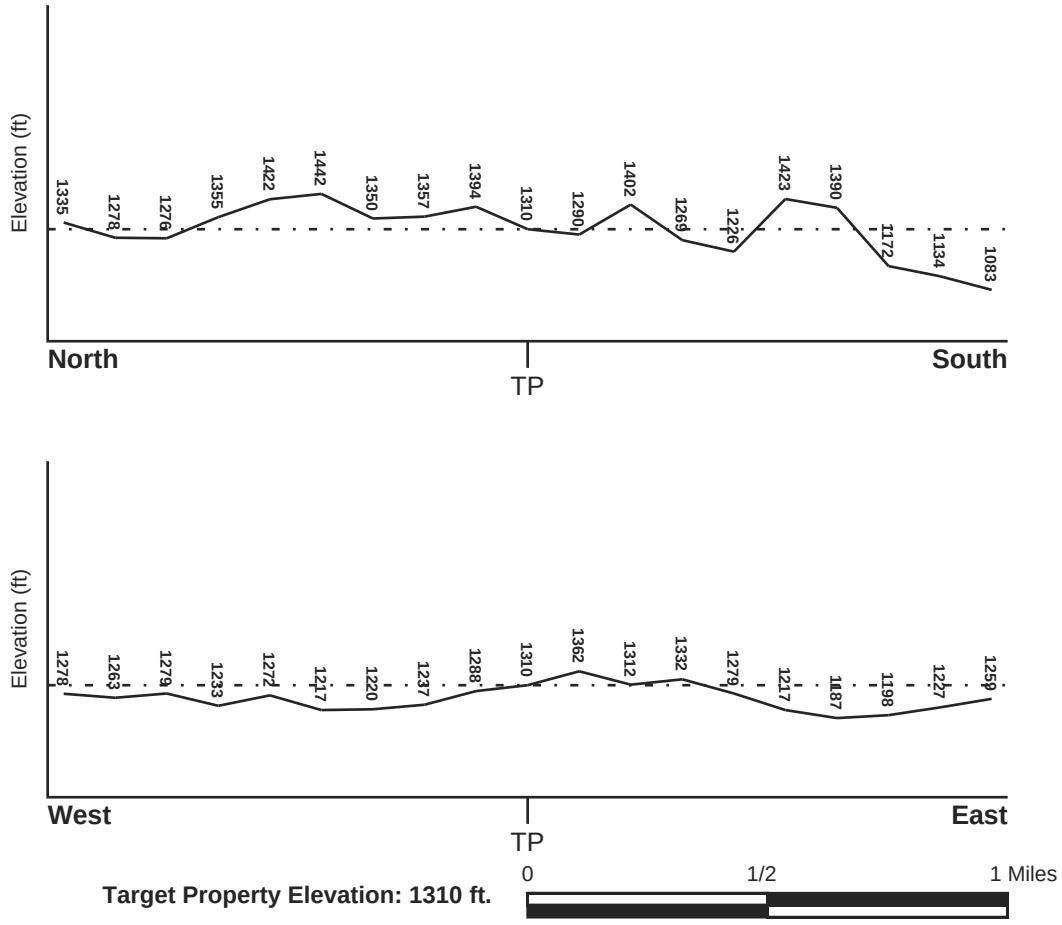
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map:	34118-D6 VAL VERDE, CA
General Topographic Gradient:	General WNW
Source:	USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 1310 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0650430340B

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
VAL VERDE	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Tertiary
Series:	Pliocene
Code:	Tpc *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Continental Deposits

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	CIENEBA
Soil Surface Texture:	loam
Hydrologic Group:	Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.
Soil Drainage Class:	Somewhat excessive. Soils have high hydraulic conductivity and low water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 4 inches
Depth to Bedrock Max:	> 20 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	10 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 7.30 Min: 5.10
2	10 inches	14 inches	weathered bedrock	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: gravelly - sandy loam
silty clay loam
unweathered bedrock
very gravelly - sandy loam
gravelly - loam
very gravelly - silt loam
very fine sandy loam
sandy loam

Surficial Soil Types: gravelly - sandy loam
silty clay loam
unweathered bedrock
very gravelly - sandy loam
gravelly - loam
very gravelly - silt loam
very fine sandy loam
sandy loam

Shallow Soil Types: very gravelly - silt loam

Deeper Soil Types: unweathered bedrock

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE MINING BUREAU
RECEIVED
SEP 13 1920
LOS ANGELES OFFICE

Notice of Intention to Drill New Well

This notice must be given before drilling begins

Los Angeles, Cal. 7/27 1920

Mr. I. V. Augur,

Deputy State Oil and Gas Supervisor

Union League Bldg., Los Angeles, Cal.

DEAR SIR:

In compliance with Section 17, Chapter 718, Statutes of 1915, notice is hereby given that it is our intention to commence the work of drilling well number 1 Section 10 T. 4 R. 17 West SB B. & M., Ventura Newhall #67 Oil Field, Los Angeles County.

The well is 150 feet N. or S., and 150 feet E. or W. from North West Cor. Sec. 10
(Give location in distance from section corners or other corners of legal subdivision)

The elevation of the derrick floor above sea level is 1400 Topo feet.

We propose to use the following strings of casing either cementing or landing them as here indicated:

Size of Casing, Inches	Weight, Lbs. Per Foot	New or Second Hand	Depth	Landed or Cemented
18" Stove pipe		New	200	Landed
14" " "				
12½" Marks	40#	New	1000	

It is understood that if changes in this plan become necessary we are to notify you if possible before cementing or landing the casing.

We estimate that productive oil or gas formation should be encountered at a depth of about _____ feet, more or less.

Respectfully yours,

Address notice to Deputy State Oil and Gas Supervisor in charge of district where well is located

CALIFORNIA STATE MINING BUREAU

DEPARTMENT OF PETROLEUM AND GAS

Report on Proposed Operations

No. P -1-5788.

Los Angeles, Cal. April 17, 1923.

Mr. R. B. Stout,

Newhall, Cal.

Agent for FERNANDO OIL Company

DEAR SIR:

Your proposal to abandon Well No. 1, Section 10, T. 4N., R. 17W., S.B. B. & M.,

Newhall Oil Field, Los Angeles County, dated April 13, 1923,

has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

RECORDS:

Casing: 18" landed 162'.
15⅝" " 446'.
12¼" " 909', not tested.
10" " 1651'2", " "
8¼" " 2482'2", " "
6¼" cemented 3575' (water shut off, T-1-2231. Water broke in and recemented, not tested).
4½" cemented 3621', not tested.
Total depth 3744'.

Oil and gas showings:

Small gas showing in sand 3149'-3167'.
Small gas showing in shale at 3355'.
Oil and gas showing in sand 3584'-3690'.

Plugging:

A summary of the plugging done was reported by Mr. O. B. Johnson, Secretary of the Fernando Oil Company, as follows:

"Filled up with wire drilling line from 3744 ft. to 3730 feet. Dumped bailer of lime and also bailer of cement at 3730.

"Plugged hole with steel chips and wire line from 3730 to 3722. Put in one-half bailer of lime and one bailer of cement at 3722.

"Plugged hole with steel chips and also put in wire cable and finished up from 3722 to 3714 with wire line and steel chips.

"Plugged hole with lead wool from 3714 to 3710.

"3710 to 3708 plugged with steel chips. Dumped one-half bailer of lime at 3708.

"3708 to 3704 plugged with cement and rock. Put in two sacks cement and one-half bailer lime.

"In running in casing it went to 3708'8".

"3708'8" to 3685 Plugged with shells containing cement and rock and dumped two sacks pur cement.

"3685 to 3557 filled up with 132 sacks of cement.

"Cleaned out and recemented six inch casing. Got seven sacks back of casing. Cementing done by Perkins with tubing method using chemical cement.

"Drilled out to 3620. Casing went to 3627. Bridged back to 3617'9". Dumped in one sack cement.

CALIFORNIA STATE MINING BUREAU

DEPARTMENT OF PETROLEUM AND GAS

Report on Proposed Operations

No. P-1-5788.

Page -2-

FERNANDO OIL Company

Well No. 1 Sec. 10, T. 4N., R. 17W., S.B. B. & M.

"Cemented 4½ inch casing at 3621 feet. Eleven sacks cement. Cementing done by Perkins using chemical cement."

THE NOTICE STATES AND PROPOSES:

"The present condition of the well is as follows: The 6¼" casing was landed and cemented at 3575' and shut-off of upper water was approved by the Mining Bureau. The well was drilled to 3744' and whmh tested, flowing water developed. An effort was made to shut off this water in accordance with statement attached. Then the 6¼" casing was recemented by Perkins using tubing and chemical cement. Then the 4½" casing was landed at 3617'6" and cemented by Perkins using chemical cement. As the water is still not shut off, it is the intention to abandon. The open hole below the shoe of the 4½" casing will be filled with cement. This is the only part of the sand that is not already plugged with cement."

RECOMMENDATION:

The proposal is approved subject to the following recommendations:

1. In addition to the plug proposed by you, the following plugging should be done:
   (a) If the 4½" casing is pulled from below the shoe of the 6¼" casing, the top of the 4½" casing left in the well should be plugged with cement, and the plug carried up into the 6¼" casing at least 20'.
   (b) If the 4½" casing cannot be pulled from below the shoe of the 6¼" casing, the top of the 4½" should be plugged with cement inside the 6¼" casing.
   (b) The top of the 6¼" casing left in the well should be plugged with cement.
2. Upon completion of the work of abandonment, please file with this Department a report in duplicate on our form 102, giving in detail the following information:
   (a) Names of all workmen employed.
   (b) Dates of commencement and completion of the work.
   (c) Depths at which casing was cut or shot, with amounts of casing removed from the well.
   (d) Record of all plugging operations.

REMARKS

(Give additional details of drilling, and, if hole is dry or abandoned, final condition of hole.)

Note: Bottom water was encountered in a sand between 3720' and 3740', or about 30 feet below the 106 foot oil sand between 3584' and 3690'. The gas showing in this oil sand was strong enough to keep the water flowing over the casinghead continuously for nearly a year while an unsuccessful attempt was being made to cut off the bottom water. When the well was abandoned, it was plugged from the bottom with several hundred feet of cement.

Summary of Plugging Janes Well #1

Filled up with wire drilling line from 3744 ft. to 3730 feet. Dumped bailer of lime and also bailer of cement at 3730.

Plugged hole with steel chips and wire line from 3730 to 3722. Put in one-half bailer of lime and one bailer of cement at 3722.

Plugged hole with steel chips and also put in wire cable and finished up from 3722 to 3714 with wire line and steel chips.

Plugged hole with lead wool from 3714 to 3710.

3710 to 3708 plugged with steel chips. Dumped one-half bailer of lime at 3708.

3708 to 3704 plugged with cement and rock. Put in two sacks cement and one-half bailer of lime.

In running in casing it went to 3708' 8".

3708'8" to 3685 Plugged with shells containing cement and rock and dumped two sacks pure cement.

3685 to 3557filled up with 132 sacks of cement.

Cleaned out and recemented six inch casing. Got seven sacks back of casing. Cementing done by Perkins with the method using Chemical Cement.
Drilled out to 3620. Casing went to 3627. Bridged back to 3617' 9". Dumped in one sack cement.

Cemented 4½ inch casing at 3621 feet. Eleven sacks cement. Cementing done by Perkins using Chemical Cement.

EDR Historical Topo Map Report

08/30/17

Site Name:

29053 Coolidge Ave
29053 Coolidge Ave
Castaic, CA 91384
EDR Inquiry # 5037804.4

Client Name:

Citadel Environmental Services
111 North Market Street
San Jose, CA 95110-0000
Contact: Roopal Jani

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Citadel Environmental Services were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# 1158.1001
Project: Phase I ESA

Coordinates:

Latitude:	34.45052 34° 27' 2" North
Longitude:	-118.657236 -118° 39' 26" West
UTM Zone:	Zone 11 North
UTM X Meters:	347762.82
UTM Y Meters:	3813356.26
Elevation:	1271.48' above sea level

Maps Provided:

Past Major Occupant(s)	N/A	
Broker(s)	N/A	
Property Manager	Robert H. Williams	Sterling Gateway, L.P.
Building Engineer	N/A	
Other		

TITLE & JUDICIAL RECORDS

Per ASTM E 1527-13 Section 6.2, the User is required to provide and/or report to the environmental professional any title and/or judicial records so identified for the subject property.

Please provide any information on title and/or judicial records:

N/A

ENVIRONMENTAL LIENS OR ACTIVITY AND USE LIMITATIONS

Per ASTM E 1527-13 the User is required to provide and/or report to the environmental professional any environmental liens or AULs so identified for the subject property. The environmental professional per the ASTM practice is not responsible to undertake a review of information to identify environmental liens or AULs.

Please provide any information on environmental liens or activity and use limitations (AULs):

SPECIALIZED OR ACTUAL KNOWLEDGE OF USER

Per the ASTM standard, it is the User's responsibility to communicate to the environmental professional any information that is material to recognized environmental conditions in connection with the subject property based on such specialized knowledge, actual knowledge, experience, or commonly known and reasonably ascertainable information within the local community.

Please provide any information of the following items:

ASTM Scope Item	Property Contact Aware of them (Y/N)	Comment
USTs	No	
ASTs	No	
PCB Electrical Equipment	No	
Hydraulic Equipment	No	
Chemicals, Hazardous Materials, and Raw Materials Storage and Usage	No	
Waste Generation, Storage and Disposal	No	
Wells, Sumps, Pits, and Floor Drains	No	
Stormwater Runoff and Surface Water	No	
Lagoons, Septic Systems, Wastewater Treatment, and Separators	No	
Stressed Vegetation, Staining and Odors	No	
Surficial Disturbances	No	
On-Property Dry Cleaners	No	

NON-ASTM Scope Item	Property Contact Aware of them (Y/N)	Comment
Asbestos Containing Materials	NO	
Radon	NO	
Lead-Based Paint	No	
Lead in Drinking Water	No	
Potable Well	No	
Potential Wetlands	NO	
Air Emissions	NO	
Mold/Water Intrusion	No	

Please refer to "Helpful Documents" section below to provide any relevant reports associated with the above items.

VALUATION REDUCTION FOR ENVIRONMENTAL ISSUES

(For Property Owner) Per the ASTM standard, in a transaction involving the purchase of a parcel of commercial real estate, the user shall consider the relationship of the purchase price of the property to the fair market value of the property if the property was not affected by hazardous substances or petroleum products. The User should try to identify an explanation for a significantly lower price which does not reasonably reflect fair market value if the property was not contaminated, and make a written record of such explanation. The ASTM standard does not require that a real estate appraisal be obtained in order to ascertain fair market value of the property.

PROCEEDINGS INVOLVING THE PROPERTY

Per the ASTM standard, prior to the site visit, the User (if different from the property owner), Key site manager (if any is identified), and property owner shall be asked whether they know of (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property; (2) any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

- **Do you know of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, or from the property? Y / (N)**
  If yes, please explain:

- **Do you know of any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products? Y / N**
  If yes, please explain:

HELPFUL DOCUMENTS

Per the ASTM Standard, Prior to the property visit, the Property owner, key site manager (if any is identified), and User (if different from the property owner) shall be asked if they know whether any of the documents below exist and if so, whether copies can and will be provided within reasonable time and cost constraints:

	User		Key Site Manager		Property Owner	
	Exist	Provided	Exist	Provided	Exist	Provided
ESA Reports	YES	2/18/04	Compliance Biology

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

GRANT DEED

The undersigned grantor declares:

Documentary Transfer Tax not shown pursuant to Section 11932 of the Revenue and Taxation Code, as amended

TRANSFER TAX
NOT A PUBLIC RECORD

County of Los Angeles

FOR VALUABLE CONSIDERATION, receipt of which is hereby acknowledged, STERLING GATEWAY, L.P., a California limited partnership, hereby Grants to CATELLUS VALENCIA, LLC, a Delaware limited liability company, that certain real property in the County of Los Angeles, State of California, which is more particularly described on Schedule "1" ("**Property**") which is attached hereto, subject to:

(a) all matters of title or of record or any matters that would be disclosed by an accurate survey, including, without limitation, the matters set forth on Schedule "2" attached hereto;

(b) a reservation to the Grantor (and/or its successors and assigns) of all oil, oil rights, minerals, mineral rights, natural gas rights and other hydrocarbons by whatsoever name known, geothermal steam and all products derived from any of the foregoing, that may be within or under the Property, together with the perpetual right of drilling, mining, exploring and operating therefor and storing in and removing the same from such Property or any other property, including the right to whipstock or directionally drill and mine from properties other than the Property, oil or gas wells, tunnels and shafts into, through or across the subsurface of the Property, and to the bottom such whipstocked or directionally drilled wells, tunnels and shafts under and beneath or beyond the exterior limits thereof, and to redrill, retunnel, equip, maintain, repair, deepen and operate any such wells or mines without, however, the right to drill, mine,

store, explore or operate through the surface of the Property or the upper 500 feet of the subsurface of such Property; and

(c) a reservation to the Grantor (and/or its successors and assigns) of all water and water rights now or in the future owned by Grantor appurtenant to or related in any way to the Property or used by Grantor in connection with or related to such Property (no matter how acquired by Grantor) together with the right and power to explore, drill, redrill, remove and store the same from, under or in the Property or to divert or otherwise utilize such water, rights or interests on any other property owned or leased by Grantor (and/or its successors and assigns) and the right and power to conduct water over or to store water underneath the Property as Grantor deems reasonable. The water and water rights excepted and reserved to Grantor include, but are not limited to, all riparian water rights, all appropriative water rights, all water rights and rights to store water in subsurface reservoirs based on overlying land ownership, all littoral water rights, all rights to percolating water, all prescriptive water rights, all adjudicated, statutory or contractual water rights, all rights to aquifers, reservoirs, subsurface and surface waters, and all rights to take, use and develop for use any and all water that may now exist or may in the future exist upon, in or under the Property, without, however, the right to drill, mine, store, explore or operate through the surface of the Property or the upper 100 feet of the subsurface of such Property.

[END OF TEXT; SIGNATURES ON FOLLOWING PAGE]

IN WITNESS WHEREOF, the Grantor has caused this Deed to be executed as of the 29th day of April, 2014.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
CRISSAIR INC	***28909 AVENUE WILLIAM***	***ESE 1/8 - 1/4 (0.209 mi.)***	***6***	***9***

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/31/2017 has revealed that there are 3 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the SLIC list, as provided by EDR, has revealed that there is 1 SLIC site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
UNOCAL - DEL VALLE	DEL VALLE RD	ENE 0 - 1/8 (0.059 mi.)	3	8

Global Id: SLT43335333				

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there is 1 UST site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Environmental Interest/Information System
AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/05/2017
Date Data Arrived at EDR: 04/21/2017
Date Made Active in Reports: 05/12/2017

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/05/2017

Next Scheduled EDR Contact: 10/16/2017
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/05/2017

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

Next Scheduled EDR Contact: 10/16/2017
Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/07/2017

Next Scheduled EDR Contact: 10/30/2017
Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.
