US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Version Date:	2012
East Map:	5636847 NEWHALL, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

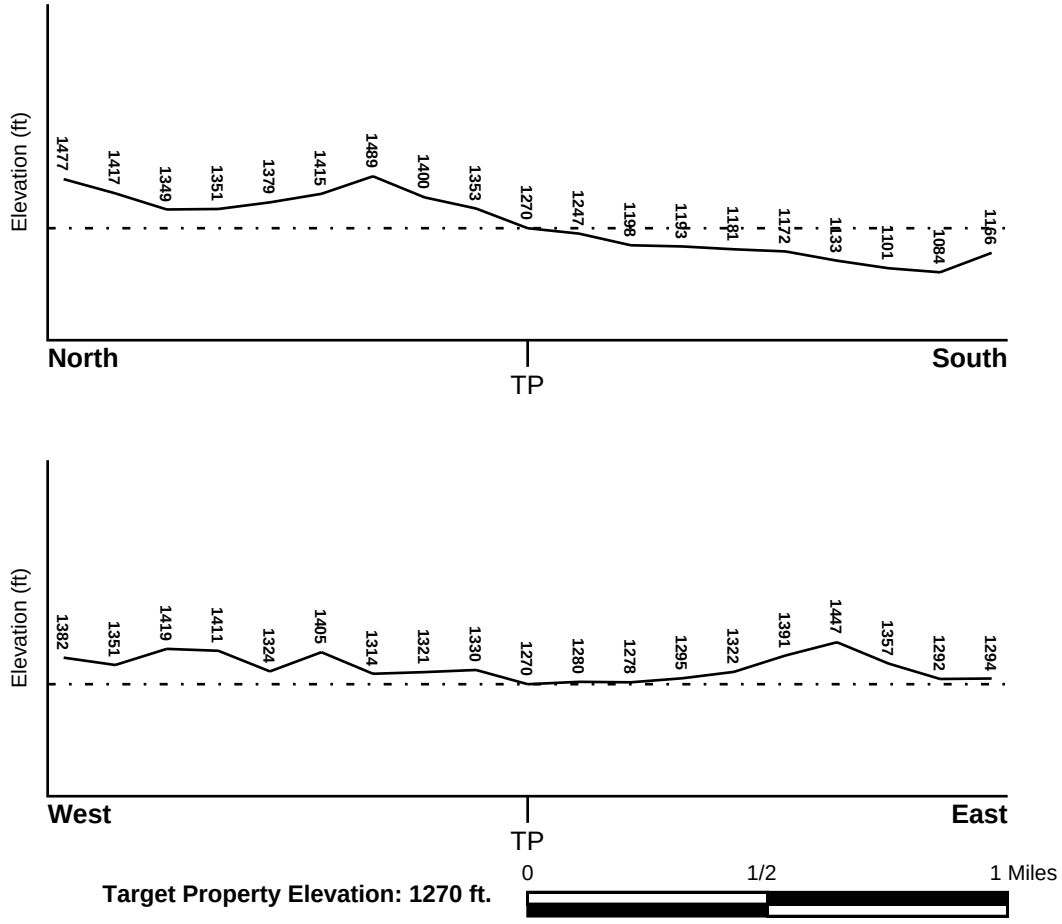
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C0800F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
VAL VERDE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Saugus

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 7.3 Min: 6.1
2	14 inches	42 inches	loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 7.3 Min: 6.1
3	42 inches	46 inches	weathered bedrock	Not reported	Not reported	Max: 0 Min: 0	Max: Min:

Soil Map ID: 2

Soil Component Name: Yolo

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 7.3 Min: 5.6
2	18 inches	72 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.3 Min: 5.6

Soil Map ID: 3

Soil Component Name: Hanford

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 6.1
2	7 inches	70 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 6.1

Soil Map ID: 4

Soil Component Name: Castaic

Soil Surface Texture: silty clay loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.1
2	9 inches	25 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 4 Min: 1.4	Max: 7.8 Min: 6.6
3	25 inches	29 inches	weathered bedrock	Not reported	Not reported	Max: 1.4 Min: 0.42	Max: Min:

Soil Map ID: 5

Soil Component Name: Castaic

Soil Surface Texture: silty clay loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

We have reviewed your Hydrology Study.

[X] The Hydrology Study has been approved.

[X] Refer to comments below:

COMMENTS:

1. Work within soft bottom drainage areas (which may include but is not limited to soft bottom basins, channels, watercourses, grade to drain) will require maintenance permits from Fish and Game, Army Corps of Engineers, and RWQCB prior to approval of the storm drain, and the permits must be still active prior to acceptance.

- HydroCalc Output: Proposed Condition-Design Storm

APPENDIX B CDS Unit's – Preliminary Details

Section 1

Purpose of the Study

The purpose of this study is to analyze the Design and Clear Frequency storm hydrological impacts of the proposed site development against its pre-development receiving outlet conditions, to comply with the requirements established by the County of Los Angeles, and, to provide the criteria for the design of the on-site storm drain systems and other drainage devices.

Project Description

The site is located approximately 1 mile southwest of the intersection of Hasley Canyon and Del Valle Road, in the unincorporated area of Los Angeles County, State of California. The project is bounded to the south by Hunstock Avenue and is situated adjacent to existing residential homes in the Val Verde community.

EXISTING CONDITION:
The project lies entirely within one drainage tributary area. The natural drainage pattern starts from the north and conveys south, as it outlets at the tract boundary on Hunstock Avenue. The project is not located within a FEMA flood zone.

PROPOSED CONDITION: The proposed development is mostly residential, consisting of single-family residential homes and associated streets improvements, utilities and landscaping. The project is also comprised of a commercial site, open spaces, debris basins, and infiltration basins.

All natural areas, primarily located on the northern and eastern areas surrounding the project site, are collected in debris basins before entering the proposed storm drain system. Additionally, all developed area flows are collected within the storm drain system, downstream of the debris basin locations. The system enters a series of infiltration basins to mitigate the peak flow and volume for the project site. Ultimately, the remaining stormwater is conveyed within the system and discharges to a longitudinal perc basin along Hunstock Avenue, where stormwater is discharged to match existing drainage conditions. See Section 4 for Proposed Conditions Map.

Hydrologic Criteria & Methodology

This report follows the hydrologic criteria and methodology set forth by Los Angeles County Department of Public Works, as explained in its "Hydrology Manual", "Sedimentation Manual".

The following are the criteria used in the calculations:

- Design Storm Frequency:
  50-yr for undeveloped areas and developed sump areas,
  25-yr for developed areas.
- Soil Type Number = 097
- Basin Name = Santa Clara
- DPA Zone = 5
- Peak Bulking Factor
  - DPA Zone 5 = 1.465 (for areas ≤ 0.1 sq mi.)
- Debris Production:
  - DPA Zone 5 = 81,000 cy/sq mi. (for areas ≤ 0.1 sq mi.)
- Isohyet = 5.8" (50-yr, 24-hr)
  1.05" (85^{th} Percentile, 24-hr)
- % Imperviousness:
  1% for undeveloped / natural areas,
  10% for developed slope areas
  10% for water quality areas
  42% for single-family residential areas,
  90% for commercial areas,
  91% for paved street areas.

Time of Concentration (TC) and design Peak Flow (Q) for each subarea are calculated using Hydrocalc. Burning of flows, flood routing and confluence Peak Qs are calculated using F0601M program, also know as the Modified Rational Method program (MODRAT).
See Sections 3 & 4, TC and MODRAT Calculations.

Hydraulic calculations for the diversion structures were based on flowrates determined by weir and orifice equations. In order to discharge flow and volume lower than the existing conditions, four diversion structures have been located on the project site to divert stormwater to the proposed infiltration basins. These design features result in an outlet discharge to Hunstock Avenue lower than the existing discharge flow and stormwater volume. See Section 4 for Diversion Structure Hydraulic Calculations.

Debris Production Volumes are calculated using the DPR Chart for undeveloped areas under single DPA Zone; and bulking of the flows are obtained using the Peak Bulk Factors Chart for undeveloped areas under single DPA Zone.
See Section 2 for Charts; Section 5 for Calculations.

LID Discussion and Summary

PROJECT DESIGNATION:
This report follows the LID criteria and methodology set forth by the Los Angeles County Department of Public Works, as explained in the Low Impact Development Manual. Tentative Map 60257 is subject to the stormwater management requirements for Designated Projects under the following category:

- Development project equal to one acre or greater of disturbed area and adding more than 10,000 square feet of impervious surface area.

PERCOLATION REPORT SUMMARY:
The percolation report "Geotechnical Report, Results of Preliminary Infiltration Testing" was prepared by Allan E. Seward Engineering Geology, Inc., dated November 6, 2017. The Conclusions and Recommendations for infiltration feasibility have been summarized within the report, that include infiltration rates specified for the project.

PROJECT LID SUMMARY:
LID implementation for the project site follows the criteria and guidelines provided in the 2014 Los Angeles County Department of Public Works Low Impact Development Manual.

The project site has been designed to infiltrate the Stormwater Quality Design Volume (SWQDv), through the use of proposed infiltration basins. Offsite improvements within Del Valle Road north of the project site include replacement of existing pavement, and therefore does not require treatment.

STORMWATER QUALITY CONTROL MEASURES:
The Stormwater Quality Control Measures chosen to provide treatment for the project include four infiltration basins at the following locations:

- Perc. Basin - 1 (Node 154A)
- Perc. Basin – 2 (Node 203A)
- Perc. Basin – 3 (Node 306A)
- Perc. Basin – 4 (Node 406A)

Infiltration Basin locations have been identified on the Water Quality Map, located in Section 6 of the report.

The On-Site Stormwater Quality Control Measures have been incorporated into the site to provide the required treatment for the LID storm event. The infiltration facilities have been designed to treat the SWQDv, Water Quality Volumes are calculated per the Hydrocalc program, using the Isohyet associated with the 85^{th} percentile, 24 hour rainfall. See Section 6 for LID Calculations.

Hydrology Summary

Comparing the design storm frequency between the Pre-Development and Post-Development conditions at the project outlet point and off-site point, the proposed condition discharges and volumes do not exceed their respective existing condition discharges and volumes, as shown in the Design Frequency Summary Table below. This means that for the design frequency storm, there is no need for any mitigation, as negative impacts to offsite properties are not present for these areas.

Design Frequency Summary Table:

	PRE-DEVELOPMENT				**POST-DEVELOPMENT**			
	Area (ac)	**Q**b (cfs)	**Q**bb (cfs)	**DPV** (cy)	**Area** (ac)	**Q**b+d (cfs)	**Q**bb (cfs)	**DPV** (cy)
PROJECT OUTLET	267.9	427.5	574.1	18,582	271.1	336.7	376.8	8789
OFFSITE	4.3	10.8	15.4	494	4.4	10.7	12.2	165

Additionally, the project is required to compare the clear storm frequency analysis between the Pre-Development and Post-Development conditions at the outlet point to demonstrate the proposed condition Q and Volume do not exceed their respective existing conditions. The results indicate that for the Clear Frequency storm events, there is no need for any mitigation, as negative impacts to offsite properties are not present for these areas.

Hydromodification Clear Frequency Summary Tables:

	Pre-Development		**Post-Development**	
Freq.	**Q** (cfs)	**Vol** (ac-ft)	**Q** (cfs)	**Vol** (ac-ft)
50	404.5	38.4	350.5	33.0
25	326.5	33.3	286.4	27.8
10	228.0	27.2	209.3	21.1
5	152.7	22.8	145.7	16.2
2	61.78	17.2	53.9	9.22
LID	6.4	3.5	3.7	1.7

The proposed project outlet consists of a longitudinal percolation basin that discharges to Hunstock Avenue, designed to match existing drainage conditions. Since the outlet for the project discharges to paved conditions, Hungry Water is not applicable.

Looking at the results of this analysis, the project has demonstrated that proposed development is not contributing negative impacts to the downstream properties.
Preliminary alignments and layouts of the drainage devices, swales, debris basins, infiltration basins, access roads, and storm drain system are shown on the Proposed Conditions Map.

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/12/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	1.790	0.001	1.790	1.790
4.000	3.850	0.001	3.850	3.850
6.000	6.200	0.001	6.200	6.200
7.000	7.500	0.001	7.500	7.500
7.500	8.160	0.001	8.160	8.160
7.600	8.300	5.900	8.296	8.304
7.800	8.580	30.500	8.559	8.601
8.000	8.850	65.700	8.805	8.895

Hydrograph Detention Basin Routing
Hydrograph at 1 154 A Storm Day: 4 Drainage Area = 176.20
Total flood hydrograph volume this storm day = 19.06 Ac. Ft.

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

TOTAL VOLUME THIS HYDROGRAPH = 6.36(Ac.Ft)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/12/18 Input hydrograph file name : 204A.hyd
Output hydrograph file name: BASIN203.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	1.060	0.001	1.060	1.060
4.000	2.340	0.001	2.340	2.340
6.000	3.830	0.001	3.830	3.830
8.000	5.560	0.001	5.560	5.560
8.400	5.940	0.001	5.940	5.940
8.500	6.030	5.900	6.026	6.034
9.000	6.520	60.000	6.479	6.561

Hydrograph Detention Basin Routing
Hydrograph at 1 204 A Storm Day: 4 Drainage Area = 1.60
Total flood hydrograph volume this storm day = 6.23 Ac. Ft.

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

TOTAL VOLUME THIS HYDROGRAPH = .34(Ac.Ft)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 04/10/18 Input hydrograph file name : 307A.hyd
Output hydrograph file name: basin306.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	0.170	0.001	0.170	0.170
3.000	0.290	0.001	0.290	0.290
3.100	0.300	5.900	0.296	0.304
3.500	0.360	65.700	0.315	0.405

Hydrograph Detention Basin Routing
Hydrograph at 1 307 A Storm Day: 4 Drainage Area = 7.50
Total flood hydrograph volume this storm day = 0.32 Ac. Ft.

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/12/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/12/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	1.790	0.001	1.790	1.790
4.000	3.850	0.001	3.850	3.850
6.000	6.200	0.001	6.200	6.200
7.000	7.500	0.001	7.500	7.500
7.500	8.160	0.001	8.160	8.160
7.600	8.300	5.900	8.296	8.304
7.800	8.580	30.500	8.559	8.601
8.000	8.850	65.700	8.805	8.895

Hydrograph Detention Basin Routing
Hydrograph at 1 154 A Storm Day: 4 Drainage Area = 176.20
Total flood hydrograph volume this storm day = 16.47 Ac. Ft.

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

Time (Min)	Inflow (CFS)	Outflow (CFS)	Storage (Ac.Ft)	.0 6.3 12.5 18.8 25.0	Depth (Ft.)

10 YEAR

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/13/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/13/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	1.790	0.001	1.790	1.790
4.000	3.850	0.001	3.850	3.850
6.000	6.200	0.001	6.200	6.200
7.000	7.500	0.001	7.500	7.500
7.500	8.160	0.001	8.160	8.160
7.600	8.300	5.900	8.296	8.304

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1997-2004 Version 6.4

Study Date : 11/12/18 Input hydrograph file name : 154A.hyd
Output hydrograph file name: STERLING.hin

User entry of depth-outflow-storage data

Hydrograph time unit varies
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data @ 1 Min. Intervals:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.001	0.001	0.001	0.001
2.000	1.790	0.001	1.790	1.790
4.000	3.850	0.001	3.850	3.850
6.000	6.200	0.001	6.200	6.200
7.000	7.500	0.001	7.500	7.500
7.500	8.160	0.001	8.160	8.160
7.600	8.300	5.900	8.296	8.304
7.800	8.580	30.500	8.559	8.601
8.000	8.850	65.700	8.805	8.895

Hydrograph Detention Basin Routing
Hydrograph at 1 154 A Storm Day: 4 Drainage Area = 176.20
Total flood hydrograph volume this storm day = 7.63 Ac. Ft.

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

File location: X:/sikand/5100-056/01/Engineering/Hydrology/CALCULATIONS/HYDROCALC/EX/Q50/TM 60257 Report.pdf
Version: HydroCalc 1.0.2

Input Parameters

Project Name	TM 60257
Subarea ID	15A
Area (ac)	27.7
Flow Path Length (ft)	1926.0
Flow Path Slope (vft/hft)	0.1023
50-yr Rainfall Depth (in)	5.8
Percent Impervious	0.01
Soil Type	97
Design Storm Frequency	50-yr
Fire Factor	0
LID	False

Output Results

Modeled (50-yr) Rainfall Depth (in)	5.8
Peak Intensity (in/hr)	2.2085
Undeveloped Runoff Coefficient (Cu)	0.6842
Developed Runoff Coefficient (Cd)	0.6863
Time of Concentration (min)	13.0
Clear Peak Flow Rate (cfs)	41.9862
Burned Peak Flow Rate (cfs)	41.9862
24-Hr Clear Runoff Volume (ac-ft)	2.781
24-Hr Clear Runoff Volume (cu-ft)	121140.1231

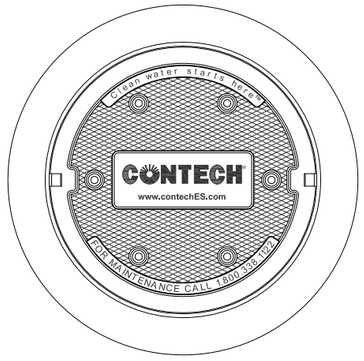
CDS5678-10-C DESIGN NOTES

CDS5678-10-C RATED TREATMENT CAPACITY IS 25.0 CFS [708.0 L/s], OR PER LOCAL REGULATIONS. MAXIMUM HYDRAULIC INTERNAL BYPASS CAPACITY IS 50.0 CFS [1416 L/s]. IF THE SITE CONDITIONS EXCEED 50.0 CFS [1416 L/s], AN UPSTREAM BYPASS STRUCTURE IS REQUIRED.

THE STANDARD CDS5678-10-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION
GRATED INLET ONLY (NO INLET PIPE)
GRATED INLET WITH INLET PIPE OR PIPES
CURB INLET ONLY (NO INLET PIPE)
CURB INLET WITH INLET PIPE OR PIPES
SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS



FRAME AND COVER

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH ( ) ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECHENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.contechES.com
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 AND CASTINGS SHALL MEET HS20 (AASHTO M 306) LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION.
6. PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

6. CDS STRUCTURE SHALL BE PRECAST CONCRETE CONFORMING TO ASTM C-478 AND AASHTO LOAD FACTOR DESIGN METHOD.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE.
C. CONTRACTOR TO INSTALL JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT INLET AND OUTLET PIPE(S). MATCH PIPE INVERTS WITH ELEVATIONS SHOWN. ALL PIPE CENTERLINES TO MATCH PIPE OPENING CENTERLINES.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

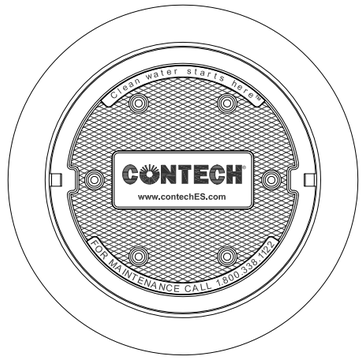
THIS PRODUCT MAY BE PROTECTED BY ONE OR MORE OF THE FOLLOWING U.S. PATENTS: 5,788,848; 6,641,720; 6,511,595; 6,581,783; RELATED FOREIGN PATENTS, OR OTHER PATENTS PENDING.

CDS2020-5-C DESIGN NOTES

CDS2020-5-C RATED TREATMENT CAPACITY IS 1.1 CFS [31.2 L/s], OR PER LOCAL REGULATIONS. MAXIMUM HYDRAULIC INTERNAL BYPASS CAPACITY IS 14.0 CFS [396 L/s]. IF THE SITE CONDITIONS EXCEED 14.0 CFS [396 L/s], AN UPSTREAM BYPASS STRUCTURE IS REQUIRED.

THE STANDARD CDS2020-5-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION
GRATED INLET ONLY (NO INLET PIPE)
GRATED INLET WITH INLET PIPE OR PIPES
CURB INLET ONLY (NO INLET PIPE)
CURB INLET WITH INLET PIPE OR PIPES
SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS



FRAME AND COVER
(DIAMETER VARIES)
N.T.S.

SITE SPECIFIC DATA REQUIREMENTS

STRUCTURE ID			
WATER QUALITY FLOW RATE (CFS OR L/s)			*
PEAK FLOW RATE (CFS OR L/s)			*
RETURN PERIOD OF PEAK FLOW (YRS)			*
SCREEN APERTURE (2400 OR 4700)			*
PIPE DATA:	I.E.	MATERIAL	DIAMETER
INLET PIPE 1	*	*	*
INLET PIPE 2	*	*	*
OUTLET PIPE	*	*	*

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. FOR SITE SPECIFIC DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHT, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.ContechES.com
3. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING. CONTRACTOR TO CONFIRM STRUCTURE MEETS REQUIREMENTS OF PROJECT.
4. STRUCTURE SHALL MEET AASHTO HS20 LOAD RATING, ASSUMING EARTH COVER OF 0' - 2', AND GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION. CASTINGS SHALL MEET AASHTO M306 AND BE CAST WITH THE CONTECH LOGO..
5. IF REQUIRED, PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.
6. CDS STRUCTURE SHALL BE PRECAST CONCRETE CONFORMING TO ASTM C-478 AND AASHTO LOAD FACTOR DESIGN METHOD.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE.
C. CONTRACTOR TO INSTALL JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT INLET AND OUTLET PIPE(S). MATCH PIPE INVERTS WITH ELEVATIONS SHOWN. ALL PIPE CENTERLINES TO MATCH PIPE OPENING CENTERLINES.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

Subject: Fire Services Request Update

CAUTION: External Email. Proceed Responsibly.

Happy Friday! I wanted to touch base with you before the end of the day and inquire about any updates on the information request for fire services? If you're open to phone correspondence next week, it would be greatly appreciated. I look forward to connecting with you.

Have a great weekend.

Thanks,

Zulema Renteria

Office – (213) 335-3434
Direct – (213) 335-5303

Website: www.meridianconsultantsllc.com

1. Which fire stations serve the Project site?

   Fire Station 143 located at 28580 Hasley Canyon Road, Castaic, CA 91355, is the jurisdictional station 1st-due for the Project site, approximately 1.1 miles east of the project. It is staffed with a 3-person engine company which consists of 1 fire captain, 1 fire fighter specialist, and 1 fire fighter on duty for each 24-hour shift.

   Fire Station 76 located at 27223 Henry Mayo Drive, Valencia, CA 91355, is the 2nd-due station for the Project site, approximately 3.5 miles southeast of the project. It is staffed with a 4-person engine company which consists of 1 fire captain, 1 fire fighter specialist, and 2 fire fighters on duty for each 24-hour shift.

   - Distance from each station(s) to the Project.

     See response above.

   - Identification of the first-in and backup stations.

     See response above.

   - Existing staffing levels (i.e. Captains, Lieutenants, firefighters, paramedics, EMT's, Haz Mat-Trained personnel, etc.) for each station serving the Project site.

     See response above.

   - Existing equipment (i.e. number of engines, trucks, ambulances, etc.) for each station serving the Project site.

     See response above.

   - Average response times for each station serving the Project site.

     During the year 2019, Fire Station 143 had an average emergency response time for 1st arriving units of 6:26 minutes, and Fire Station 76 had an average emergency response time for 1st arriving units of 7:03 minutes.

   - Total number of incidents (per year) for each station serving the Project site.

     During the year 2019, Fire Station 143 responded to 537 incidents, and Fire Station 76 responded to 704 incidents.

2. Do the response times and distances for each station serving the Project site meet the performance standards of the LACoFD?

   The primary jurisdictions for Stations 143 and 76 contain a mix of urban, suburban and rural areas, The Fire Department uses national guidelines of a 5-minute response time for the 1st-arriving unit for fire and EMS responses and 8 minutes for the advanced life support (paramedic) unit in urban areas, and 8-minute response time for the 1st-arriving unit and 12 minutes for advanced life support (paramedic) unit in suburban areas.

3. Does LACoFD have any plans to construct new or expand existing fire stations that would serve the Project?

   Currently, there are no plans for facility expansion or new facilities in the project area.

4. Please summarize any plans for Fire Department's service improvements plans or expanded capacity (personnel, equipment), if any, that would serve the project area.

   Currently, there are no plans for additional personnel and equipment in the project area.

5. Will LACoFD be able to serve any known cumulative developments in addition to the proposed Project?

   The effects of cumulative impact by new development are evaluated on a case by case basis. However, this project is expected to have a less than significant impact. Cumulative impacts are mitigated by the Fire Department's developer mitigation fees in effect in the Santa Clarita Valley.

6. How would the proposed Project affect LACoFD's ability to provide services? Please comment on any area of specific concern.

   While each additional development creates greater demands on existing resources, the project would have a negligible effect on service standards and will mitigate any impacts by the payment of the Fire Department's developer mitigation fees.

7. Please provide any additional comments and/or information.

We have no further comments.

Hi Zulema,

Just as I thought we are done, there was a change. we just want to inform you that the Ordinance referenced in our letter should be replaced. We are not going to pull the letter out, but the Los Angeles County Code 22.246.070 shall be referred to for the Law Enforcement Facilities Fee in which this Project falls within the Newhall Zone.

Thank you,

Subject: RE: Sterling Ranch Project - Request for Information

Hello Rochelle,

We are currently in the admin stages of the EIR. We have not yet moved into the "Draft EIR" stages. We are still in the process of submitting all the section to the county and waiting for feedback. I will keep you updated, but feel free to send updates if need be.

I hope this answers your question. If you have anymore, please feel free to reach out.

Thanks,

OFFICE OF THE SHERIFF

COUNTY OF LOS ANGELES

HALL OF JUSTICE

ALEX VILLANUEVA, SHERIFF

April 24, 2020

Zulema Renteria, Staff Planner
Meridian Consultants
706 S. Hill Street, 11th Floor
Los Angeles, California 90014

Dear Ms. Renteria:

REQUEST FOR SHERIFF'S DEPARTMENT SERVICE INFORMATION IN PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT STERLING RANCH RESIDENTIAL PROJECT

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to provide information and responses to specific questions to be addressed under the California Environmental Quality Act (CEQA) in preparing a Draft Environmental Impact Report (Draft EIR), for the Sterling Ranch Residential Project (Project). The proposed Project, located at 29053 Coolidge Avenue, Val Verde, CA 91384, involves the development of 222 detached single-family residential units, approximately thirty acres of amenities including landscaped/open space HOA lots, strip lots, infiltration and debris basins, a pump station; and 19.7 acres for public and private streets for the community.

The proposed Project is located within the service area of the Department's Santa Clarita Valley Station (Station). It may impact the current level of service provided by the Station due to the potential increase in resident population and developed land proposed by the Project. In addition, the Project Applicant will be required to pay all required development fees associated with the project, including those referenced in Ordinance No. 2008-0033 Law Enforcement Mitigation Fee effective August 23, 2008, in which this Project falls within the Newhall Zone. The Department will provide further comments for the Draft EIR during the public review period. The Department also recommends that we have the opportunity to review the design plans to ensure that the principles of Crime Prevention Through Environmental Design have been implemented as stated in the attached response (see correspondence dated April 2, 2020, from Captain Justin Diez).

Should you have any questions regarding this matter, please contact me, at (323) 526-5657, or your staff may contact Ms. Rochelle Campomanes, at (323) 526-5614.

Sincerely,

ALEX VILLANUEVA, SHERIFF

Tracey Jue, Director
Facilities Planning Bureau

SH-AD-32A (8/17)

COUNTY OF LOS ANGELES

SHERIFF'S DEPARTMENT

"A Tradition of Service Since 1850"

DATE: April 2, 2020
FILE NO:

OFFICE CORRESPONDENCE

FROM: JUSTIN R. DIEZ, CAPTAIN
SANTA CLARITA VALLEY STATION

TO: TRACY JUE, DIRECTOR
FACILITIES PLANNING BUREAU

SUBJECT: ENVIRONMENTAL IMPACT REPORT – STERLING RANCH PROJECT

The purpose of this memorandum is to provide a response requested by Facilities Planning Bureau with respect to an environmental impact report of the proposed Sterling Ranch Project. The project, as described below, encompasses a geographic area currently patrolled by the Santa Clarita Valley Sheriff's Station.

The operations staff of the Santa Clarita Valley Station has reviewed the August 2019 Notice of Preparation of a Draft Environmental Impact Report for the Sterling Ranch Residential Project located at 29053 Coolidge Avenue, Val Verde, California 91384. The proposed project is a 113.9-acre residential community, and would contain 222 detached single family residential lots, a pocket park, a pocket park with tot lot, a shade structure and tables, in addition to five undisturbed open space lots, six landscaped open space HOA lots, access strip lots, three infiltration basins, six debris basins, a pump station, and acres of public right of way and future streets.

The proposed project is within the service area of the Santa Clarita Valley Sheriff's Station, which is approximately eight miles from the project site.

The Santa Clarita Valley Sheriff's Station service area encompasses approximately 649 square miles with an estimated resident population of 280,000 persons. The station is currently staffed by 209 sworn personnel and 47 civilian employees. However, with the completion of the project, the station will be understaffed. Assigning additional personnel to the station as a result of this project to meet an acceptable service ratio will exacerbate the current shortage of space and attendant assets. Any expansion of the station, or construction of new facilities, should not only account for the current shortage, but should also accommodate additional personnel and assets that will become necessary as our service area continues to experience growth and intensification of land uses.

- The current Santa Clarita Valley Sheriff's Station service area ratio for every 10,000 residents is 0.74.
- The number of crimes per 1,000 residents is approximately 14.18.

The Uniform Crime Reporting (UCR) Program collects statistics on the number of offenses known to law enforcement. In the traditional Summary Reporting System (SRS), there are eight crimes, or Part I offenses, (murder and non-negligent homicide, rape (legacy & revised), robbery, aggravated assault, burglary, motor vehicle theft, larceny-theft, and arson) to be reported to the UCR Program. These offenses were chosen because they are serious crimes, they occur with regularity in all areas of the country, and they are likely to be reported to the Station.

- The Station receives approximately 4.5 calls per 1,000 residents.

There are no other adjacent stations that could respond to the project area, other than our patrol station. The proposed Project is approximately 8.1 miles from the current patrol station. Our average or anticipated response times for emergent, priority, and routine calls for service received from the proposed project would be 5.03, 12.99, and 65.52 minutes, respectively. However, these are approximate time ranges only and could be affected by traffic conditions. Additionally, these response times are variable because the responding unit may be elsewhere within the station's service area and not necessarily dispatched from the station itself. As a point of reference, the Department generally adheres to the following, widely-accepted industry standard among law enforcement agencies for responding to emergent, priority, and routine calls for service: 10 minutes, 20 minutes, and 60 minutes, respectively.

A proposed new facility to replace the Santa Clarita Valley Sheriff's Station is currently in the construction stage, and will be located at 26201 Golden Valley Road in Santa Clarita.

I also recommend an analysis and impact of the proposed project to the local transportation and circulation system be included in the EIR. Traffic levels at intersections must be identified, studied and analyzed. Preparation of a Construction Mitigation Plan would also help in reducing impacts to traffic levels. A Construction Traffic Management Plan should also be implemented as part of the proposed project to address construction-related traffic congestion and emergency access issues. If temporary lane closures are necessary for the installation of utilities, emergency access should be maintained at all times. Flag persons and/or detours should also be provided as needed to ensure safe traffic operations, and construction signs should be posted to advice of reduced construction zone speed limits.

Finally, the proposed project will increase the employees and daytime population of the station's service area, which, in turn, will generate an increased demand for law enforcement services we provide. I expect the EIR to quantify the population increases, describe potential impacts to our resources and operations, and identify measures that will mitigate these impacts to a level of insignificance.

The Department generally prescribes to the principles of Crime Prevention Thru Environmental Design (CPTED). The goal of CPTED is to reduce opportunities for criminal activities by employing physical design features that discourage anti-social behavior, while encouraging the legitimate use of the site. The overall tenets of CPTED include defensible space, territoriality, surveillance, lighting, landscaping, and physical security. With advanced notice, Station personnel can be available to discuss CPTED with the project developer.

Thank you for including our team in the environmental review process for the project. Should you have any questions regarding this matter, please contact me at (661) 799-5101, or Operations Lieutenant Joseph Fender at (661) 799-5102.

STERLING RANCH RESIDENTIAL ESTATES PROJECT
REQUEST FOR LIBRARY SERVICE INFORMATION

Dear Ms. Renteria:

This is in response to your request for library service information for the Sterling Ranch Residential Estates Project which proposes the development of 222 detached single-family residential lots, 21,000 square feet of commercial use, and associated infrastructure. Attached is a report of LA County Library's analysis of the development and the projected impact to services.

If you have any questions or need additional information, please contact Elsa Muñoz at (562) 940-8450 or EMunoz@library.lacounty.gov.

Very best,

Skye Patrick
Library Director

SP:YDR:GR:EM

c: Jesse Walker-Lanz, Assistant Director, Public Services, LA County Library
Ting Fanti, Departmental Finance Manager, Budget and Fiscal Services, LA County Library

https://lacounty.sharepoint.com/sites/publiclibrary/docs/staffservices/Documents/EIR/Sterling Ranch/Sterling Ranch response.doc

LA COUNTY LIBRARY

STERLING RANCH RESIDENTIAL ESTATES PROJECT
REQUEST FOR LIBRARY SERVICES INFORMATION

1. **Which LA County Library facilities serve the Project site?** (Facility size, staffing levels, collection/inventory size, special facilities, service population, current demand for library services)

   The proposed Project will be served by Castaic Library, located at 27971 Sloan Canyon Rd., Castaic, CA 91384, which is 6.1 miles from the project site. Stevenson Ranch Library, located at 25950 The Old Rd., Stevenson Ranch, CA 91381, is 8.7 miles from the project site and is the next closest library.

   Castaic Library has a facility size of 12,232 square feet, a collection of 48,319 books and other library materials, and 26 public access computers. Castaic Library serves the residents of unincorporated Castaic area of the County of Los Angeles (County), a population of 29,500. Castaic Library staffing includes 4 full time staff (2 Librarians, 1 Library Assistant, and 1 Library Aide) and 5 part-time staff (3 Library Aides and 2 Library Pages).

   Stevenson Ranch Library has a facility size of 11,551 square feet, a collection of 51,328 books and other library materials, and 21 public access computers. The Stevenson Ranch Library serves the residents of unincorporated Stevenson Ranch area of the County of Los Angeles (County), a population of 21,641. Stevenson Ranch Library staffing includes 6 full time staff (3 Librarians, 2 Library Assistants, and 1 Library Aide) and 10 part-time staff (5 Library Aides and 5 Library Pages).

   Also, the Library's Santa Clarita Valley Bookmobile presently serves the residents of Val Verde, an unincorporated community in Los Angeles County.

   LA County Library service level guidelines entail a minimum of 0.50 gross square foot of library facility space per capita, 3.0 items (books and other library materials) per capita for regional libraries and 2.75 items per capita for community libraries, and 1.0 public access computer per 1,000 people served.

2. **Are there any other service standards/goals to meet the County's library service demands?**

   Castaic Library and Stevenson Ranch Library are community libraries and based on the guidelines they do not currently meet the minimum requirements for the population of the service area.

   The libraries will not be able to meet the Project's demand for library facilities. In order to meet the Project's demand for library services Castaic Library will need 2,518 square feet of facility space, 40,181 collection materials, and 4 public access computers; and Stevenson Ranch Library will need 16,604 collection materials.

3. Please provide any current development fees related to library facilities.

To mitigate the impact of residential projects on library services, developers or its successors in interest, are required to pay a Library Facilities Mitigation Fee (Library Fee) at the time building permits are requested for new residential dwellings in the unincorporated areas of the County of Los Angeles (except for Altadena and Palos Verdes). The Library Fees are as follows, by Library Planning Area:

FY 2019-2020 Library Facilities Mitigation Fee Schedule

Planning Area	Fee per Dwelling Unit
Area 1 - Santa Clarita Valley	$969
Area 2 - Antelope Valley	$939
Area 3 - West San Gabriel Valley	$980
Area 4 - East San Gabriel Valley	$967
Area 5 - Southeast	$970
Area 6 - Southwest	$977
Area 7 - Santa Monica Mountains	$972

The proposed project is within the Library's Planning Area 1 – Santa Clarita Valley, with a Library Fee of $969 per dwelling unit or $215,118 ($969 x 222 dwelling units). Library Fees are assessed on residential projects only and there are no fees for commercial, hotel, or office space.

4. Would payment of these fees reduce the proposed Project's potential impacts on the County's library facilities?

We estimate the total increased service cost related to the proposed project to be approximately $434,784 which is illustrated by the following chart:

Sterling Ranch Residential Estates Project	Impact Per Capita (population of 697)	Cost	Total Cost
a. Building	349	$1,000 sq. ft	$ 349,000
b. Land (4:1 land to building ratio)	1,396	$23 (Library Planning Area 1)	$ 32,108
c. Collections	1,917	$28	$ 53,676
d. Computer	0	$1,800	$ 0
Total			$434,784

The Library Facilities Mitigation Fees of $215,118 will reduce the proposed Project's potential impact on the County's library facilities; however, service level guidelines would not be met.

5. **Are there any plans to develop new library facilities or expand existing library facilities within a 10-mile radius of the Project site?**

   There are plans to build a new library facility under the Newhall Ranch development, which is located in the northern portion of unincorporated Los Angeles County in the Santa Clara River Valley, approximately 3.4 miles from the Project site.

6. **Please provide any additional recommendations to reduce the proposed Project's potential impacts on the County's library facilities.**

   The Library is open to discuss options regarding mitigation efforts and supporting the continued enhancement and delivery of library services to the residents of Val Verde.

Re: Sterling Ranch Residential Project

Thank you for your Request for School Facility Information for the Sterling Ranch Residential Project. Here is the information that you requested:

1. The high school designated to serve the students generated from your project are assigned to the Castaic High School. Please see the attached Student Generation Rates Chart. You can use these generation rates to calculate your generation based on your production schedule. We opened that site in August 2019 and are adding a grade level yearly until it will be a 9-12 school. We are also adding programs at that site.

2. I have searched District Policy for the word "overcrowding" have printed the attached policies. In light of the current Covid-19 situation, our policies and standards may change as directed by state officials. Please obtain current information regarding District policy on our website, Hartdistrict.org, Board, Board Policies and Administrative Regulations.

3. See the attached Student Generation Rates Chart.

4. See the attached Developer Fee Rate Schedule.

5. With Covid-19, we are still formalizing our plans for the coming school year on how we will implement the guidelines issued by the state for opening, operating and maintaining schools. We are always looking at improving and expanding our facilities to meet the requirements of our students. We want to provide the best educational programs and facilities to the students that we serve.

6. The District would like to discuss entering into possible mitigation agreements to offset the impacts of large developments.

If you have any questions, or need further information, please feel free to contact me at 661-259-0033 extension 286.

Sincerely,

Karen M. Bladen

All rates listed here are subject to change.

School Attendance Boundaries

When establishing or changing school attendance boundaries, the Governing Board shall take into account racial and ethnic balance, educational programs, school capacities, geographic features, student safety, and transportation considerations. Students shall attend school in their attendance area unless otherwise authorized by the Superintendent or designee.

Demographic changes may result in overcrowded schools or in declining enrollment. Fiscal limitations may prevent the district from opening new schools or maintaining facilities that are unused. Changes in student population cannot always be remedied by a change in school attendance boundaries. The Board shall regularly review school and district enrollments and projected enrollments and will make every effort to ensure that students will be able to attend neighborhood schools. The Board shall hold a public hearing to secure community input before approving any boundary change.

The Superintendent or designee may place some students in a school outside of their attendance area in order to alleviate overcrowding. When possible, siblings will be allowed to attend the same school.

(cf. 5116.1 - Intradistrict Attendance)

(cf. 5116.2 - Open Enrollment)

Policy WILLIAM S. HART UNION HIGH SCHOOL DISTRICT

adopted: 08/11/93 Santa Clarita, California

Interdistrict Attendance

Interdistrict Attendance Permits

The Superintendent or designee may approve an interdistrict attendance permit for a student for any of the following reasons:

1. When the student has been determined by staff of either the district of residence or district of proposed attendance to be a victim of an act of bullying as defined in Education Code 48900(r).

(cf. 5131.2 - Bullying)

2. To meet the student's special mental or physical health needs as certified by a physician, school psychologist, or other appropriate school personnel.

(cf. 6159 - Individualized Education Program)

3. When the student has a sibling attending school in the receiving district, to avoid splitting the family's attendance.

4. To allow the student to complete a school year when his/her parents/guardians have moved out of the District during that year.

5. To allow the student to remain with a class graduating that year from junior or senior high school.

6. To allow a high school senior to attend the same school he/she attended as a junior, even if his/her family moved out of the District during the junior year.

7. When the parent/guardian provides written evidence that the family will be moving into the District in the immediate future and would like the student to start the year in the district.

8. When the student will be living out of the District for one year or less.

9. When recommended by the school attendance review board or by county child welfare, probation, or social service agency staff in documented cases of serious home or community problems which make it inadvisable for the student to attend the school of residence.

(cf. 5113.1 - Chronic Absence and Truancy)

10. When there is valid interest in a particular educational program not offered in the district of residence.

11. To provide a change in school environment for reasons of personal and social adjustment.

12. When the student's parent/guardian is an employee who is eligible for membership in a District bargaining unit, is a confidential employee, or is part of District management.

The Superintendent or designee may deny initial requests for interdistrict attendance permits due to limited district resources, overcrowding of school facilities at the relevant grade level, or other considerations that are not arbitrary. However, once a student is admitted, the district may not deny him/her continued attendance because of overcrowded facilities at the relevant grade level.

(cf. 0410 - Nondiscrimination in District Programs and Activities)

Within 30 days of a request for an interdistrict permit, the Superintendent or designee shall notify the parents/guardians of a student who is denied interdistrict attendance regarding the process for appeal to the County Board of Education as specified in Education Code 46601. (Education Code 46601)

(cf. 5145.6 - Parental Notifications)

Students who are under consideration for expulsion or who have been expelled may not appeal interdistrict attendance denials or decisions while expulsion proceedings are pending or during the term of the expulsion. (Education Code 46601)

(cf. 5119 - Students Expelled from Other Districts)

(cf. 5144.1 - Suspension and Expulsion/Due Process)

Once a student is admitted to a school on the basis of an interdistrict attendance permit, he/she shall not be required to reapply for an interdistrict transfer and shall be allowed to continue to attend the school in which he/she is enrolled. Reapplication is required when a student requests attendance at a school other than one for which he/she is currently approved. Existing interdistrict attendance permits shall not be rescinded for students entering grade 11 or 12 in the subsequent school year. (Education Code 46600)

The District may revoke a student's enrollment if he/she is recommended for expulsion pursuant to Education Code 48918. (Education Code 48309)

Date WILLIAM S. HART UNION HIGH SCHOOL DISTRICT

Issued: September 11, 2013 Santa Clarita, California

Relations With Local Agencies

The Governing Board recognizes the importance of two-way communication with other local agencies in order to provide the best possible school facilities and make the best use of school construction funds. The Board shall consult and coordinate with local agencies as required by law and whenever the expertise of these agencies can assist the district in the planning, design, and construction of facilities. The Board and superintendent or designee shall also work with local agencies to ensure that they are informed about the potential impact of proposed land developments on school facilities.

(cf. 7150 - Site Selection and Development)

City/County General Plan

The superintendent or designee shall monitor land development proposals within district boundaries and shall maintain procedures that ensure an exchange of accurate information with city/county planning staff regarding the impact of land development on the district's educational programs and facility needs.

Recognizing that developer fees, other local revenues, and state bond funds may not suffice to eliminate the overcrowding in district schools caused by new development, the Board urges the city/county to adopt in its general plan or other appropriate planning documents a provision which ensures that adequate school facilities and service will be available concurrent with need.

(cf. 7210 - Methods of Financing)

To help the city/county determine whether a proposed development is consistent with such a general plan, the superintendent or designee shall regularly provide the city/county with information about current and projected enrollment and school capacity. When developmental approvals are proposed, including but not limited to annexations, rezonings, general plan, or specific plan amendments or approvals, the superintendent or designee shall report to the city/county on the adequacy of developer and state monies in meeting school facility needs. If the superintendent or designee determines that a particular proposed development project or projects will have an adverse impact on district facilities and that no funds are currently available to fully mitigate this impact, he/she shall so advise the city/county and request that approval of the project(s) be conditioned on the provision of adequate mitigation of school facility impacts.

Impact Ordinances

The Board shall notify the city council or county board of supervisors whenever it finds, based on clear and convincing evidence: (Government Code 65971)

1. That conditions of overcrowding exist in one or more attendance areas within the district which will impair the normal functioning of the educational programs, and the reason for the existence of those conditions.

2. That all reasonable methods of mitigating conditions of overcrowding have been evaluated and no feasible method for reducing those conditions exist.

The above notice shall specify the mitigation measures considered by the district and shall include a completed application to the Office of Public School Construction for preliminary determination of eligibility for school construction under applicable state law. (Government Code 65971)

Safety

Supervision

The principal of each school shall ensure that certificated employees, teacher aides or yard aides supervise the conduct and safety, and direct the play, of students of the school who are on playgrounds before and after school, during recess, and during other intermissions.

Teachers shall be present at their respective rooms and open them to admit students not less than 30 minutes before the time when school starts, or as specified in the collective bargaining agreement.

Safety rules for the use of facilities and equipment shall include as appropriate:

1. Rules on acceptable playgrounds behavior.

2. Rules relating to gymnasium and field areas in high schools.

3. Safety rules clearly posted in chemistry classes.

4. Shop class rules, including the requirement that power equipment never be used without the teacher's presence in the shop. Students must pass safety tests at mastery level before using such equipment, and test results must be kept on record.

School staff shall train students on the above rules and include safety instruction in their lesson plans when appropriate. Copies of the rules shall be sent to parents/guardians and be readily available at the school at all times.

The principal or designee shall:

1. Clearly identify supervision zones on the playgrounds and require that supervisors remain outside at a location from which they can observe their entire zone of supervision.

2. Require that all individuals supervising students remain alert in spotting dangerous conditions and report any such conditions to the principal or designee promptly and in writing.

3. Establish emergency procedures that ensure swift response to accidents, fighting, and situations that could become dangerous, such as overcrowding or unusual gatherings of students.

The Superintendent or designee shall ensure that teachers, teacher aides, yard aides and volunteers who supervise students receive training in the above safety practices and in supervisory techniques which will help them to forestall problems and resolve conflicts.

When determining the ratio of school ground supervisors to students, the Superintendent or designee shall consider the size of the playground area, the number of blind spots that are not immediately visible, the age and gender of the students, and the general nature of their behavior.

Release of Student to Adult

Students shall be released during the school day in the custody of an adult only if:

1. The adult is the student's parent/legal guardian with custody.

(cf. 5021 - Noncustodial Parents)

2. The adult has appropriate identification and the verified authorization of the student's parent/legal guardian with custody.

3. The adult is a properly authorized law officer acting in accordance with law.

(cf. 5145.11 - Questioning and Apprehension)

4. The adult is taking the student to emergency medical care, at the request of the principal or designee.

(cf. 5141.4 - Child Abuse and Neglect (Reporting Procedures))

Eye Protection Devices

The district shall provide eye protection devices in accordance with law.

Staff shall ensure that all students, teachers and visitors wear eye protective devices when they are engaged in or observing an activity or using hazardous substances likely to cause injury to the eyes. (Education Code 32030, 32031)

The Board shall provide a first pair of the eye safety devices required by law at district expense. If these devices are lost or damaged, students and teachers may obtain replacements for an amount not exceeding their actual cost to the district.

Missing Children

In order to enable district staff to assist in locating missing children, the Superintendent or designee shall ensure that Department of Justice information on missing children is posted at every school.

Laboratory Safety

The principal of each school offering laboratory work to students shall designate a trained certificated employee as "building laboratory consultant" responsible for reviewing, updating and carrying out the school's procedures for laboratory safety.

APPENDIX A – COMMERCIAL/INDUSTRIAL DEVELOPMENT DESCRIPTIONS
APPENDIX B – FACILITIES CAPACITY UPDATE

EXECUTIVE SUMMARY

Education Code Section 17620 authorizes the governing board of a school district to levy school fees to offset the impacts to school facilities from new residential and commercial/industrial construction and reconstruction. In order to levy Level I fees (statutory fees), a school district must prepare and adopt a school fee justification study pursuant to the provisions of Education Code Section 17620 and Sections 65995 and 66001 of the Government Code. The school fee justification study serves as the basis for justifying the levy of Level I fees and presents and documents the nexus findings required by State law.

This School Fee Justification Study ("Study") has been prepared for the Castaic Union School District ("School District") to demonstrate the relationship between new residential and commercial/industrial development and the School District's need for the construction of school facilities, the cost of the school facilities, and the per square foot amount of Level I fees ("School Fees") that may be levied by the School District on residential and commercial/industrial development in accordance with applicable law.

The State Allocation Board ("SAB") reviews and may adjust the maximum authorized School Fees every January in even-numbered years. The SAB increased the Level I fee on January 22, 2020 and the maximum School Fees authorized by Education Code Section 17620 are currently $4.08 per square foot for residential construction/reconstruction and $0.66 per square foot for commercial/industrial construction for unified school districts.

The School District provides education for transitional kindergarten (TK) through 8th grade. Pursuant to Education Code Section 17623(a), the School District, as a nonunified school district sharing common jurisdiction with other nonunified school district(s), entered into a school facilities fee allocation agreement with the William S. Hart Union High School District. The agreement specifies the percentage of the maximum School Fees that may be levied and collected by each school district. According to the agreement, approximately two-thirds (65%) of the maximum School Fees may be charged and collected by the School District, or $2.65 and $0.43 for residential and commercial/industrial development, respectively ("Applicable School Fees"). Based on the findings presented in this Study, the School District is justified in collecting its portion of the maximum residential and commercial/industrial School Fees[1]. The findings are summarized as follows:

Residential Development

New residential development in the School District is projected over the next ten (10) years and beyond. Based on student generation rates determined for the School District, such development could generate an estimated 2,068 new students over the next ten (10) years. The projected student enrollment supports expansion and/or reconstruction of existing school facilities. The school facilities cost impact per residential square foot as determined in this Study are shown in Table E-1.

[1] Except for the new commercial/industrial development categorized as Rental Self-storage facilities, as further described in this Study.

TABLE E-1
RESIDENTIAL SCHOOL FACILITIES COST IMPACT/
APPLICABLE RESIDENTIAL SCHOOL FEE PER SQUARE FOOT

IMPACT PER SQUARE FOOT	APPLICABLE RESIDENTIAL SCHOOL FEE PER SQUARE FOOT
$6.88	$2.65

The cost impact per square foot of residential construction/reconstruction shown in Table E-1 are greater than to the School District's share of the current maximum authorized residential School Fee, which is $2.65 per square foot; therefore, the School District is reasonably justified in levying statutory Level I school fees in an amount up to but not exceeding $2.65 per square foot (the "Applicable Residential School Fee").

Commercial/Industrial Development

As commercial/industrial properties develop new jobs are created. Many of the employees working at the new jobs will move into the School District boundaries, thereby increasing the need for new residential development and further impacting the School District's facilities. Additionally, many employees living outside of but working at new jobs within the School District boundaries will enroll students on an inter-district basis. School Fees may be imposed on commercial/industrial development if the school fees collected on residential development are insufficient to provide adequate school facilities for students generated as a result of new development and nexus findings are presented that justify the imposition of the commercial/industrial school fee.

Section 17621(e)(1)(B) of the Education Code requires that the Study determine the impact of the increased number of employees anticipated to result from commercial/industrial development upon the cost of providing school facilities within the School District. This code section further adds that employee generation estimates shall be based on the applicable employee generation estimates set forth in the January 1990 edition of "San Diego Traffic Generator Study" ("Traffic Study"), a report by San Diego Association of Governments ("SANDAG"). The school facilities cost impacts per commercial/industrial square foot as determined in this Study are shown in Table E-2 by commercial/industrial land use type (each commercial/industrial category is further described in Appendix "A").

The cost impacts per square foot for each category of commercial/industrial construction are equal to or exceed $0.43 per square foot, the School District's maximum authorized School Fee per square foot applicable to new commercial/industrial development; except for Rental Self-Storage development, which may be charged at $0.03 per square foot ("Applicable Com/Ind School Fees"). Therefore, except for Rental Self-Storage development, the School District is fully justified in levying commercial/industrial School Fees on new commercial/industrial development in an amount up to but not exceeding the Applicable Com/Ind School Fees. The

Applicable Com/Ind School Fees that may be charged by the School District are summarized in Table E-2.

TABLE E-2
COMMERCIAL/INDUSTRIAL SCHOOL FACILITIES COST IMPACTS/
APPLICABLE SCHOOL FEES

COMMERCIAL/INDUSTRIAL CATEGORY	IMPACT PER SQUARE FOOT	MAXIMUM APPLICABLE SCHOOL FEES
Banks	$1.45	$0.43
Community Shopping Center	$0.79	$0.43
Neighborhood Shopping Center	$1.43	$0.43
Industrial Business Parks	$1.80	$0.43
Industrial Parks/Warehousing/Manufacturing	$0.69	$0.43
Rental Self-Storage	$0.03	$0.03
Research & Development	$1.56	$0.43
Hospitality(Lodging)	$0.58	$0.43
Commercial Offices (Standard)	$2.45	$0.43
Commercial Offices (Large High Rise)	$2.33	$0.43
Corporate Offices	$1.38	$0.43
Medical Offices	$2.19	$0.43

SECTION I. LEGISLATION AND LEGAL REQUIREMENTS

This section discusses the legislative history of the Level I Fee.

Assembly Bill ("AB") 2926 enacted by the State in 1986, also known as the "1986 School Facilities Legislation" granted school districts the right to levy fees in order to offset the impacts to school facilities from new residential and commercial development. Originally set forth in Sections 53080 and 65995 of the Government Code, AB 2926 authorized statutory school fees to be levied, commencing January 1, 1987, in the amount of $1.50 per square foot of new residential assessable space and $0.25 per square foot of enclosed commercial or industrial assessable space. AB 2926 also provided for an annual increase of the statutory fees based on the Statewide cost index for Class B construction, as determined by the SAB. The provisions of AB 2926 have since been amended and expanded.

AB 1600 was enacted by the State legislature in 1987 and created Government Code Sections 66000 et seq. These sections require a public agency to satisfy the following requirements when establishing, increasing or imposing a fee as a condition of approval for a development project:

1. Determine the purpose of the fee;

2. Identify the use to which the fee is to be put;

3. Determine how there is a reasonable relationship between the fee's use and the type of development project on which the fee is imposed;

4. Determine that there is a reasonable relationship between the need for the public facilities and the type of development project on which the fee is imposed;

5. Determine that there is a reasonable relationship between the amount of the fee and the cost, or portion of the cost of the public facility attributable to the development on which the fee is imposed; and

6. Provide an annual accounting of any portion of the fee remaining unspent or held for projects for more than five (5) years after collection.

AB 181, enacted in 1989, established new requirements for school districts levying school fees and also re-codified Government Code Section 53080 *et seq.* as Education Code Section 17620 *et seq.* The additional provisions established by AB 181 imposed more stringent nexus requirements which must be satisfied by school districts prior to levying school fees, especially with respect to commercial/industrial school fees. Additionally, AB 181 provided that the maximum school fees for residential and commercial/industrial development be subject to an increase every two (2) years rather than annually.

In 1998, Governor Wilson signed into law Senate Bill 50 ("SB 50"), the Leroy F. Greene School Facilities Act of 1998, which reformed State's School Building Program and developer school fee legislation. A significant provision of SB 50 provides school districts the option of adopting

alternative school fees (also known as Level II and Level III fees) in excess of the Level I fee upon meeting certain requirements. SB 50 also placed a $9.2 billion State Bond measure on the November 3, 1998 ballot (Proposition 1A). With the passage of Proposition 1A in November 1998, SB 50 became operative.

SB 50 also limited the power of cities and counties to require mitigation of school facilities impacts as a condition of approving new development and suspended the court cases known as Mira-Hart-Murrieta. The Mira-Hart-Murrieta cases previously permitted school districts to collect mitigation fees in excess of school fees under certain circumstances.

On November 5, 2002, California voters passed Proposition 47, which authorized the issuance of $13.05 billion in State bonds and also enacted AB 16, which provided for additional reformation of the School Building Program. AB 16, among other items, clarified that if the SAB is no longer approving apportionments for new construction due to the lack of funds available for new school facilities construction, a school district may increase its Level II Fee to the Level III Fee. With the issuance of the State bonds authorized by the passage of Proposition 47, this section of AB 16 became inoperable.

Furthermore, Proposition 55 was approved on March 2, 2004, which authorized the sale of $12.3 billion in State bonds. In addition, California voters approved Proposition 1D in the general election held on November 7, 2006. Proposition 1D authorized the issuance of $10.4 billion in State bonds.

Most recently, California voters approved Proposition 51 (the California Public School Facility Bonds Initiative) in the general election held on November 8, 2016, authorizing the issuance of $9 billion in bonds to fund the improvement and construction of school facilities for K-12 schools and community colleges.

SECTION II. PROJECTED UNHOUSED STUDENTS AND ESTIMATED FACILITY AND PER STUDENT COSTS

The objective of this Study is to determine if a nexus exists between future residential and commercial/industrial development and the need for school facilities. In addition, the Study aims to identify the costs of such required school facilities and determine the amount of School Fees that can be justifiably levied on residential and commercial/industrial development according to the estimated impacts caused by such development. This section evaluates whether existing school facilities can accommodate students generated from future residential development, projects student enrollment based on anticipated residential growth, and estimates the costs of school facilities required to accommodate new residential growth. The findings determined in this section are used in following sections to evaluate the cost impact per square foot for new residential and commercial/industrial property. Although many of the figures in this section are primarily derived from residential development projections and impacts, they are adjusted in Section IV. to evaluate the impact of commercial/industrial development.

A. SCHOOL DISTRICT CAPACITY AND STUDENT ENROLLMENT

The School District's existing school facilities capacity and student enrollment were evaluated in order to determine if there is excess capacity to house students generated by new residential and commercial/industrial development.

The School District currently operates three (3) Elementary schools and one (1) Middle school. Per Education Code Section 17071.10, these facilities have a capacity to accommodate 3,842 students. Pursuant to Education Code Section 17071.30 and SAB Regulation 1859.51, portable classrooms were not included in the calculation to the extent they are (i) leased through the State Relocatable Classroom Program, (ii) leased for a period of less than five (5) years, (iii) leased when needed as interim housing (project basis), or (iv) represent the number of portables that exceed 25% of the School District's permanent classrooms. Appendix "B" provides a calculation of the updated facility capacity. It should be noted these capacities are driven by State loading standards and do not necessarily reflect the School District's program goals or the condition of such facilities.

Based on October 2019 Student Enrollment Data provided by the District, the student enrollment of the School District is 2,020 students. Current available capacity is calculated by subtracting current student enrollment from existing school facilities capacity for each school level. This operation results in 1,822 available seats. The available capacity calculation is shown in Table 1.

TABLE 1
FACILITIES CAPACITY AND STUDENT ENROLLMENT

SCHOOL LEVEL	EXISTING PERMANENT FACILITIES CAPACITY	STUDENT ENROLLMENT (OCTOBER 2019)	AVAILABLE/ (DEFICIT) CAPACITY
Elementary School (TK-6)	2,536	1,484	1,052
Middle School (7-8)	1,306	536	770
TOTAL	**3,842**	**2,020**	**1,822**

B. PROJECTED UNHOUSED STUDENTS

1. Projected Residential Units

Based on information published by the City of Santa Clarita ("City") Planning Division, the County of Los Angeles and the information provided in the Student Population Projections by Residence report completed by the School District's demographer, Davis Demographics & Planning, Inc. ("DDP") dated March 2020 (the "Enrollment Report"), Koppel & Gruber Public Finance ("K&G Public Finance") estimated that the School District could experience the development of 7,191 residential units over the next ten (10) years. The projected residential units ("Projected Units") are summarized by residential category in Table 2 below. Units classified as single family detached ("SFD") are those units with no common walls; single family attached ("SFA") are those units sharing a common wall each on a separate and unique assessor's parcel (e.g. townhouses, condominiums, etc.); and multi-family units ("MF") are those units which share a single assessor's parcel and share a common wall (e.g. apartments, duplexes, etc.).

The School District has entered into mitigation agreements with certain property owners and/or developers, whereby the terms of the mitigation agreements require mitigation payments in lieu of paying School Fees. Many of the Projected Units are located within areas subject to mitigation agreements ("Projected Mitigated Units"). Those mitigated Projected Units have been identified and/or estimated and excluded from the calculation.

Currently, 2,805 of the Total Projected Units are within areas subject to mitigation agreements and are thus subtracted from the Total Projected Units, resulting in 4,386 Projected Unmitigated Units.

TABLE 2
PROJECTED UNITS BY RESIDENTIAL CATEGORY

RESIDENTIAL CATEGORY	PROJECTED TOTAL UNITS	PROJECTED UNMITIGATED UNITS	PROJECTED MITIGATED UNITS
Single-Family Detached (SFD)	2,202	1,914	288
Single-Family Attached (SFA)	4,183	1,666	2,517
Multi-Family Attached (MF)	806	806	0
TOTAL	**7,191**	**4,386**	**2,805**

2. Student Generation Rates

In order to calculate student generation rates ("SGR's"), K&G Public Finance utilized information in the Enrollment Report. The Enrollment Report prepared by DDP evaluated residential parcels within the School District, classified by unit type (SFD, SFA MF), and built within the past five (5) years (Calendar Years 2014 through 2018). DDP also matched students, linked by address, to the units built. While this methodology is the most accurate way to estimate the number of students new housing would yield, due to low residential development numbers built within the School District in the last five (5) years, DDP opted to utilize Student Generation Rates based on a Santa Clarita Valley-wide calculation. Table 3 below summarizes the Santa Clarita Valley-wide SGRs by residential type and school level.

TABLE 3
STUDENT GENERATION RATES

SCHOOL LEVEL	SFD UNITS	SFA UNITS	MFA UNITS
Elementary School (TK-6)	0.5010	0.3070	0.2040
Middle School (7-8)	0.1250	0.0730	0.0910
TOTAL	**0.6260**	**0.3800**	**0.2950**

3. Projected Student Enrollment

Projected student enrollment was determined by multiplying the SGRs in Table 3 by the number of Projected Unmitigated Units as shown in Table 2. A total of 2,068 students are estimated to be generated from Projected Units. The projected student enrollment is summarized by school level in Table 4.

TABLE 4
PROJECTED STUDENT ENROLLMENT BY SCHOOL LEVEL

SCHOOL LEVEL	PROJECTED TOTAL STUDENT ENROLLMENT	PROJECTED UNMITIGATED STUDENT ENROLLMENT	PROJECTED MITIGATED STUDENT ENROLLMENT
Elementary School (TK-6)	2,551	1,634	917
Middle School (7-8)	654	434	220
TOTAL	**3,205**	**2,068**	**1,137**

4. Projected Unhoused Students

As shown in Table 1, the School District currently has available facilities capacity of 1,822 seats. However, students generated from Projected Mitigated Units are entitled to any available capacity that exists. Therefore, capacity has been adjusted to reflect current capacity net Projected Mitigated Students, resulting in 135 available seats at the Elementary School level and 550 available seats at the Middle School. Therefore, the projected unhoused students generated by Projected Unmitigated Units ("Projected Unhoused Students") is equal to the Projected Student Enrollment net the adjusted capacity figure. Table 5 shows the number of Projected Unhoused Students.

TABLE 5
PROJECTED UNHOUSED STUDENTS

SCHOOL LEVEL	PROJECTED STUDENT ENROLLMENT	AVAILABLE SEATS	PROJECTED UNHOUSED STUDENTS
Elementary School (K-6)	1,634	135	1,499
Middle School (7-8)	434	550	0
TOTAL	**2,068**	**685**	**1,499**

C. FACILITY NEEDS AND ESTIMATED PER STUDENT COST

1. Facilities Needs

In 2011, the School District conducted and finalized a Facilities Master Plan Assessment ("2011 Plan"). The 2011 Plan identifies both the short-range and long-range facility needs of the School District and focuses on repairs, major maintenance, upgrades, modernization and construction of new facilities that are necessary for the continued use of the School District's existing facilities and to meet educational program needs. In November of 2012, Measure QS provided the School District the authorization to issue up to $51 million in general obligation bonds. To date,

$10,535,000 has been issued. The 2011 Plan does not address strategies to mitigate facilities impacts as a result of student growth generated from new development.

The determination of projected unhoused students shown in Table 5 demonstrates that adequate permanent facilities capacity does not exist to house Projected Student Enrollment at the elementary level and permanent facilities capacity does exist to house Projected Student Enrollment at the middle school level. The capital improvement projects outlined in the 2011 Plan and those projects described in the previous paragraph are necessary for the long-term use to adequately house the existing student population and future enrollment growth at all school levels. The facilities needs exist regardless of the availability of capacity to house student enrollment, inclusive of student enrollment generated from new development; therefore without implementation of the capital improvement projects capacity available for Projected Student Enrollment is deemed inadequate.

Revenues from the imposition of the applicable school fees are intended to help bridge the funding gap between (i) monies available from general obligation bond proceeds, including funding from the Measure QS authorization, or other sources, and (ii) the estimated costs of the capital improvement projects, including the remaining Measure QS capital improvement projects as well as future new construction projects.

2. Estimated Cost Per Student

The estimated cost per student to provide adequate school facilities to house Projected Unhoused Students for each school level was determined based on estimated new school construction costs from a School Fee Justification Study and dated March 31, 2020 prepared by the Newhall School District, which is also located in Los Angeles County. Based on these findings, a reasonable cost per square foot for new classroom construction is estimated $450, excluding costs for interim housing administrative facilities and soft costs. Based on this information, K&G Public Finance determined that $450 per square foot was an appropriate and conservative cost estimate for all school levels. The estimated cost per square foot was then multiplied by the square footage per student as determined by the California Department of Education, which results in the Total Facilities Cost Impact per Seat/Student, which is shown in Table 6.

TABLE 6
TOTAL FACILITIES COST IMPACT PER STUDENT

SCHOOL LEVEL	SQUARE FEET PER STUDENT[1]	COST PER SQUARE FOOT[2]	ESTIMATED TOTAL FACILITIES COST IMPACT PER SEAT/STUDENT
Elementary School (TK-6)	73	$450	$32,850
Middle School (7-8)	80	$450	$36,000

1 Source: California Department of Education Report on Complete Schools, dated May 23, 2007.
2 Source: The average cost of portable replacement for portables in the Newhall Unified School District determined in the 2020 Fee Justification Study.

SECTION III. PROJECTED IMPACT OF RESIDENTIAL DEVELOPMENT

The following sections present the school facility impact analysis for new residential development and provides step-by-step calculations of the estimated per residential square foot cost impact.

To determine the school facilities cost impact per square foot of residential development, first the Facilities Cost Impact per Seat/Student determined in Table 6 is multiplied by the Projected Unhoused Students as shown in Table 5 for each school level. The result of this computation is shown in Table 7 and reflects the estimated school facilities cost impact to house Projected Unhoused Students.

TABLE 7
TOTAL FACILITIES COST IMPACT

SCHOOL LEVEL	FACILITIES COST IMPACT PER SEAT/STUDENT	PROJECTED UNHOUSED STUDENTS	FACILITIES COST IMPACT
Elementary School (TK-6)	$32,850	1,499	$49,242,150
Middle School (7-8)	$36,000	0	$0
TOTAL			**$49,242,150**

The total school facilities impact shown in Table 7 above was then divided by the number of Projected Unmitigated Units shown in Table 2 to determine the school facilities cost per residential unit. The cost per residential unit is shown in Table 8.

TABLE 8
SCHOOL FACILITIES COST PER RESIDENTIAL UNIT

TOTAL FACILITIES COST IMPACT	PROJECTED UNMITIGATED UNITS	FACILITIES COST IMPACT PER RESIDENTIAL UNIT
$49,242,150	4,386	$11,227

The school facilities cost impact per residential square foot is calculated by dividing the school facilities cost per residential unit determined in Table 8 by the weighted average square footage of each residential unit type. This calculation is shown in Table 9. The weighted average square footage square footage of the Projected Unmitigated Units is estimated based on information obtained through the City of Santa Clarita and Los Angeles County project plan information found from other sources.

TABLE 9
SCHOOL FACILITIES COST PER RESIDENTIAL SQUARE FOOT

FACILITIES COST IMPACT PER RESIDENTIAL UNIT	WEIGHTED AVERAGE SQUARE FOOTAGE	FACILITIES COST PER RESIDENTIAL SQUARE FOOT
$11,227	1,631	$6.88

The school facilities impact per residential square foot determined in Table 9 is greater than the School District's share of the current maximum authorized residential School Fees of $2.65 per square foot; therefore, the School District is justified in levying up to but not exceeding the maximum authorized amount for residential construction and reconstruction.

SECTION IV. COMMERCIAL/INDUSTRIAL SCHOOL IMPACT ANALYSIS

The following section presents the school facilities impact analysis for new commercial/industrial development and provides a step-by-step calculation of the estimated per commercial/industrial square foot cost impacts.

A. EMPLOYEE GENERATION

In the course of making the nexus findings to justify School Fees levied on commercial/industrial development, Education Code Section 17621(e)(1)(B) requires that the Study determine the impact of the increased number of employees anticipated to result from commercial/industrial development upon the cost of providing school facilities within the School District. As mentioned in the Executive Summary, for purposes of making such determination this code section further sets out that the employee generation estimates be based on the applicable estimates set forth in the Traffic Study published by SANDAG.

The employee generation estimates per 1,000 square feet of development derived from the Traffic Study are listed by commercial/industrial land use category in Table 10. The land use categories listed are based on those categories described in the Traffic Study and include all land uses recommended by the provisions of Education Code Section 17621(e)(1)(B).

TABLE 10
EMPLOYEE GENERATION PER 1,000 SQUARE FEET OF COMMERCIAL/INDUSTRIAL DEVELOPMENT

COMMERCIAL/INDUSTRIAL CATEGORY	AVERAGE SQUARE FOOTAGE PER EMPLOYEE	EMPLOYEES PER 1,000 SQUARE FEET
Banks	354	2.8253

Corporate Offices	372	2.6848
Medical Offices	234	4.2654

Source: San Diego Traffic Generator Study, January 1990 Edition; SANDAG.

B. RESIDENTIAL IMPACT

1. Households

To evaluate the impact of commercial/industrial development on School District facilities, the employee generation estimates listed in Table 10 were first used to determine the impact of commercial/industrial development on a per household basis. Based on information derived from U.S. Census Bureau data[2], there are approximately 1.59 employed persons per household on average for households located within the School District. Dividing the employee generation estimates listed in Table 9 by 1.59 results in the estimated number of households per 1,000 square feet of commercial/industrial development ("Total Household Impact").

The Total Household Impact determined in the preceding paragraph takes into consideration all employees generated from commercial/industrial development. Since some of those employees will live outside the School District and will therefore have no impact on the School District, the figures are adjusted to reflect only those households within the School District occupied by employees generated from commercial/industrial development built within the School District. Based on information derived from U.S. Census Bureau data[3], it is estimated that approximately 11.80 percent (11.80%) of employees both live and work within the School District. Multiplying the Total Household Impact by 11.80 percent (11.80%) results in the households within the School District impacted per 1,000 square feet commercial/industrial development. The results of these computations are shown in Table 11.

C. NET IMPACT PER COMMERCIAL/INDUSTRIAL SQUARE FOOT

1. Cost Impact

To estimate the school facilities costs required to house new students as a result of additional commercial/industrial development, the Facilities Cost Impact per Residential Unit determined in Table 8 is multiplied by the household impacts calculated in Table 11, resulting in the total school facilities cost impact per 1,000 square feet of commercial/industrial development. The total school facilities cost impacts are shown in Table 12 by commercial/industrial development category.

TABLE 12
SCHOOL FACILITIES COSTS PER 1,000 SQUARE FEET OF COMMERCIAL/INDUSTRIAL DEVELOPMENT

COMMERCIAL/INDUSTRIAL CATEGORY	SCHOOL DISTRICT HOUSEHOLDS PER 1,000 SQUARE FEET COM./IND.	FACILITIES COST IMPACT PER RESIDENTIAL UNIT (HOUSEHOLD)	TOTAL COST IMPACT
Banks	0.2097	$11,227	$2,354
Community Shopping Center	0.1139	$11,227	$1,279
Neighborhood Shopping Center	0.2077	$11,227	$2,332

Corporate Offices	0.1992	$11,227	$2,236
Medical Offices	0.3166	$11,227	$3,554

2. Residential Fee Offsets

The total cost impacts determined in Table 12 represent the amounts required to fully mitigate the impact on school facilities, as a result of new commercial/industrial development within the School District. Many employees as result of new commercial/industrial development will commute from areas outside of the School District boundaries or will reside in existing homes, from which no mitigation will be received from the housing in which they reside. However, new commercial/industrial development, and thereby new employee generation, will also increase the need for new residential development to house those employees living in the School District. Applicable Residential School Fees adopted by the School District under applicable law will also be imposed by the School District on such new residential development. To prevent new commercial/industrial development from paying the portion of impact that is mitigated by the Applicable Residential School Fees, this amount has been calculated and deducted from the school facilities impact costs calculated in Table 12.

The residential fee offsets are first calculated by using the Applicable Residential School Fee of $2.65 per square foot and multiplying that amount by the weighted average square footage of a residential unit in the School District, which is 1,631 square feet. This calculation provides the average residential revenues from a residential unit of $4,322 ($2.65 x 1,631). The average residential revenues from a residential unit

multiplied by the Household Impacts per 1,000 square feet of commercial/industrial development, as shown in Table 8, results in the residential school fee revenues per 1,000 square feet of commercial/industrial development ("Residential Fee Offset"). This computation is shown in Table 13.

TABLE 13
RESIDENTIAL FEE OFFSETS

COMMERCIAL/INDUSTRIAL CATEGORY	SCHOOL DISTRICT HOUSEHOLDS PER 1,000 SQUARE FEET COM./IND.	RESIDENTIAL FEE PER UNIT	RESIDENTIAL FEE OFFSET PER 1,000 SQUARE FEET COM./IND.
Banks	0.2097	$4,322	$906
Community Shopping Center	0.1139	$4,322	$492
Neighborhood Shopping Center	0.2077	$4,322	$898
Industrial Business Parks	0.2609	$4,322	$1,128
Industrial Parks/Warehousing/Manufacturing	0.1000	$4,322	$432
Rental Self-Storage	0.0048	$4,322	$21
Research & Development	0.2257	$4,322	$976
Hospitality(Lodging)	0.0840	$4,322	$363
Commercial Offices (Standard)	0.3555	$4,322	$1,537
Commercial Offices (Large High Rise)	0.3372	$4,322	$1,457
Corporate Offices	0.1992	$4,322	$861
Medical Offices	0.3166	$4,322	$1,368

3. Net School Facilities Costs

Subtracting the Residential Fee Offset determined in Table 13 from the total school facilities costs listed in Table 12 results in the net school facilities costs per 1,000 square feet of commercial/industrial development ("Net School Facilities Costs"). The Net School Facilities Costs are listed in Table 14.

TABLE 14
NET SCHOOL FACILITIES COSTS
PER 1,000 SQUARE FEET COMMERCIAL/INDUSTRIAL DEVELOPMENT

COMMERCIAL/INDUSTRIAL CATEGORY	TOTAL SCHOOL FACILITIES COSTS	RESIDENTIAL FEE OFFSET	NET SCHOOL FACILITIES COSTS
Banks	$2,354	$906	$1,448
Community Shopping Center	$1,279	$492	$787
Neighborhood Shopping Center	$2,332	$898	$1,434
Industrial Business Parks	$2,929	$1,128	$1,801
Industrial Parks/Warehousing/Manufacturing	$1,123	$432	$691
Rental Self-Storage	$54	$21	$33
Research & Development	$2,534	$976	$1,558
Hospitality(Lodging)	$943	$363	$580
Commercial Offices (Standard)	$3,991	$1,537	$2,454
Commercial Offices (Large High Rise)	$3,786	$1,457	$2,329
Corporate Offices	$2,236	$861	$1,375
Medical Offices	$3,554	$1,368	$2,186

The Net School Facilities Costs determined in Table 14 were then divided by 1,000[4] to provide the cost impact on a square foot basis. These cost impacts are listed in Table 15.

TABLE 15
NET COST IMPACTS
PER SQUARE FOOT OF COMMERCIAL/INDUSTRIAL DEVELOPMENT

COMMERCIAL/INDUSTRIAL CATEGORY	NET IMPACTS
Banks	**$1.45**
Community Shopping Center	**$0.79**
Neighborhood Shopping Center	**$1.43**
Industrial Business Parks	**$1.80**
Industrial Parks/Warehousing/Manufacturing	**$0.69**
Rental Self-Storage	**$0.03**
Research & Development	**$1.56**
Hospitality(Lodging)	**$0.58**
Commercial Offices (Standard)	**$2.45**
Commercial Offices (Large High Rise)	**$2.33**
Corporate Offices	**$1.38**
Medical Offices	**$2.19**

[4] The Employee Generation rates derived from the SANDAG study are estimated per 1,000 square feet of development.

The net cost impacts shown in Table 15 are greater than the School District's share of the current maximum authorized commercial/industrial School Fees of $0.43 per square foot, except for the category of Rental Self-Storage development. Therefore, the School District is justified in levying school fees on commercial/industrial in amount up to but not exceeding the School District's share of the maximum authorized statutory fee. For Rental Self-Storage businesses, which typically have extremely low numbers of employees, the School District is justified in collecting $0.03 per square foot.

D. COMMERCIAL/INDUSTRIAL DEVELOPMENT NOT IN PRESCRIBED CATEGORIES

In cases where new commercial/industrial development does not fit within the prescribed categories shown in Table 10, the School District shall evaluate such development on a case-by-case basis to determine if the imposition of the School Fees on the development meets the nexus requirements set forth under Government Code Section 66000 et seq. The School District may levy School Fees on such development in an amount up to but not exceeding the cost per square foot impact determined through such evaluation.

E. AGE-RESTRICTED (SENIOR) HOUSING

Government Code Sections 65995.1 and 65995.2 provides school districts may only charge the fees applicable for commercial/industrial development for qualified age-restricted (senior citizen) housing. Qualified age-restricted housing generates employees resulting in school facility impacts similar to those impacts from other commercial/industrial categories specified herein.

SECTION V. REDEVELOPMENT

Government Code Section 66001, subdivision (a)(3) and (4) requires that a school district, in imposing school-impact fees, establish a reasonable relationship between the fee's use, the need for the public facility and the type of development project on which the fee is imposed. This section addresses and sets forth general policy when considering the levy of school fees on new construction resulting from redevelopment projects within the School District.

Redevelopment means voluntarily demolishing existing residential, commercial, and/or industrial structures and subsequently replacing them with new construction ("Redevelopment"). The School District is aware of Redevelopment projects completed within the School District boundaries and anticipates similar Redevelopment projects may be completed in the next ten (10) years and beyond. School fees authorized pursuant to Education Code Section 17620 and Government Code Sections 65995 et seq. shall be levied by the School District on new construction resulting from Redevelopment projects, if there is a nexus between the School Fees being imposed and the impact of new construction on school facilities, after the impact of pre-existing development has been taken into consideration. In determining such nexus, the School District shall review, evaluate and determine on a case-by-case basis, the additional impact of the proposed new development by comparing the projected square footage, student generation and cost impacts of the proposed new units and the pre-existing residential, commercial and/or industrial development. Such analysis shall utilize the student generation rates identified in Table 5 of this Study, as applicable.

Redevelopment projects featuring a transition in commercial/industrial categorical classification (e.g. a project redeveloping a Hospitality (lodging) into Commercial office (standard) space) should be assessed based on the Applicable School Fee for the new commercial/industrial category multiplied by the total assessable space of the new commercial/industrial project in the case of a complete site redevelopment. In the case where there is a partial redevelopment, or an addition to an existing development, the Applicable School Fee should be calculated on a basis of the marginal assessable space increase multiplied by the maximum Applicable School Fee for the for the assessable space.

The School District may levy school fees, authorized under applicable law, on new units resulting from construction projects in an amount up to the additional impact cost per square foot as determined in accordance with the preceding paragraphs, but not exceeding the applicable school fees.

SECTION VI. GOVERNMENT CODE SECTION 66000

Government Code Sections 66000 *et seq*. were enacted by State Legislature in 1987. In any action establishing, increasing, or imposing a fee as a condition of approval of a development project, such as the Applicable School Fees described herein, these Government Code sections require the public agency to satisfy the following requirements:

1. Determine the purpose of the fee;

2. Identify the use to which the fee is to be put;

3. Determine how there is a reasonable relationship between the fee's use and the type of development project on which the fee is imposed;

4. Determine that there is a reasonable relationship between the need for the public facilities and the type of development project on which the fee is imposed;

5. Determine that there is a reasonable relationship between the amount of the fee and the cost, or portion of the cost of the public facility attributable to the development on which the fee is imposed; and

6. Provide an annual accounting of any portion of the fee remaining unspent or held for projects for more than five (5) years after collection.

The information set forth herein, including the information contained in the Appendices attached hereto, provide factual evidence establishing a nexus between the type of development projected to be built within the School District and the amount of Applicable School Fees levied upon such development based on the need for such Applicable School Fees. The determinations made in this Study meet the requirements of Government Code Section 66000. The findings are summarized as follows:

Purpose of the School Fee

The Board of the School District will levy and collect school fees on new residential and commercial/industrial development to obtain funds for the construction and/or reconstruction of school facilities to accommodate students generated as a result of such development. In accordance with Education Code Section 17620, "construction or reconstruction of school facilities" ***does not*** include any item of expenditure for any of the following:

(i). Regular maintenance or routine repair of school buildings and facilities;
(ii). Inspection, sampling, analysis, encapsulation or removal of asbestos-containing material, except where incidental to school facilities construction or reconstruction for which the expenditure of fees or other consideration collected pursuant to Education Code Section 17620 is not prohibited; and,
(iii). Deferred maintenance as described in Education Code Section 17582.

Identify the Use of the School Fee

The School District has determined that revenues collected from Applicable School Fees imposed on residential and commercial/industrial developments will be used for the following purposes:

(i). Construction or reconstruction of school facilities required to accommodate students generated by new residential and commercial/industrial development in areas of the School District where school facilities are needed;
(ii). Construction or reconstruction of administrative and operations facilities required in response to new student growth from new development;
(iii). Acquisition or lease of property for unhoused students generated from new development;
(iv). Purchase or lease of interim and/or temporary school facilities in order to accommodate student capacity demands;
(v). Furniture for use in new school facilities;
(vi). Costs associated with the administration, collection, and justification for the Applicable School Fees;
(vii). Provide local funding that may be required if the School District applies for State funding through SB 50.

Relationship between the Use of the Fee, the Need for School Facilities and the Type of Development on which the Fee is Imposed

As determined in the preceding sections, adequate school facilities do not exist to accommodate students generated from new residential and commercial/industrial development in the areas of the School District where new development is anticipated. The fees imposed on such new development will be used to finance the acquisition of property and the construction and/or reconstruction of school facilities required to accommodate student enrollment growth generated by new residential and commercial/industrial development.

Determination of the Relationship between the Fee Amount and the School Facilities Costs Attributable to Type of Development on which the Fee is Imposed

The imposition of the Applicable Residential School Fee of $2.65 per square foot of residential development is justified as the fee is equal to or below the per square foot cost impacts to provide adequate school facilities required as a result of such new residential development.

Similarly, the imposition of the Applicable Com/Ind. School Fees of $0.43 per square foot of commercial/industrial development is justified as the fee is equal to or below the estimated per square foot net cost impact to provide adequate school facilities required as a result of such new commercial/industrial development, except for Rental Self-Storage development, where a School Fee of $0.03 per square foot is justified.

Accounting Procedures for the Fees

The School District will deposit, invest, and expend the school fees imposed and collected on residential and commercial/industrial development in accordance with the provision of Government Code Section 66006.

Appendix A
Commercial/Industrial Development Descriptions

Banks	Include small branch offices to regional offices used for banking. Properties under this category allow customers to conduct banking on-site.
Shopping Center	Broadly include regional, community and neighborhood shopping centers which sell merchandise and services to consumers. Include grocery stores, restaurants, retail centers, automotive sales.
Industrial Business Parks	Include any combination of facilities engaged in manufacturing/assembly, warehousing, and/or storage with 15% or more of the total area designated for commercial use.
Industrial Parks/Warehousing/Manufacturing	Include any combination of facilities engaged in manufacturing/assembly, warehousing, and/or storage with limited or no commercial use (less than 15% of the total area designated for commercial use).
Rental Self-Storage	Include warehouse developments which rent small storage vaults and often termed "mini-storage".
Research & Development	Include scientific research and development laboratories, office and/or their supporting facilities.
Hospitality (Lodging)	Include establishments which provide lodging to the general public. Lodging types include hotels, motels, resort hotels and inns. The maximum term of occupancy for establishment within this category shall not exceed 30 days.
Commercial Offices (Standard)[1]	Include general office space occupying less than 100,000 square feet with multiple tenants.
Commercial Offices (Large High Rise)[1]	Include general office space occupying 100,000 square feet and greater with multiple tenants.
Corporate Offices	An office or office building with a single tenant.
Medical Offices	Include medical offices that serve a wide range of medical needs and may include a pharmacy. Medical offices are generally operated by one or more physicians.

[1] Office space used for activities described under banks, research and development, or medical offices should be classified under those categories.

Appendix B
Facilities Capacity Update

STUDENT CAPACITY (In accordance with California Code of Regulation, Title II, Section 1859.35)

Description	General Education		Non-Instructional	Total
	K-6	7-8		
I. Total Classroom Inventory	115	46	10	171
II. Permanent Classrooms				120
III. Portable Classrooms				51
IV. 25% of Permanent Classrooms				30
V. Adjustment (III. Minus IV.)	20	0	1	21
IV. Total (I. minus V.)	95	46	9	150
Student Capacity[1]	2,375	1,242	225	3,842

1.Per Education Code Section 17071.10, school capacities are determined based on loading factors of 25 students per classroom for grades kindergarten through 6 and 27 students per classroom for grades 7 and 8. Also per OPSC, capacity is loaded at 13 students per classroom for special day classes and 25 students per classroom for non-instructional classrooms.

Description	K-6	7-8	Total
General Education	2,375	1,242	3,617
Proration of Non Instructional	161	64	225
Total	**2,536**	**1,306**	**3,842**

Subject: EIR response Sterling Ranch
Attachments: Castaic Fee Justification Study 2020.pdf; sterling ranch.docx

Hello Zulema,

As discussed, I am providing you with the district response regarding the RFI for the Sterling Ranch development. This project has been on the district development tracking for some time. Could you provide an up date with time line for this development. Any other information you could share would be helpful.

I am also enclosing the most recent fee study for your records.

Thank you,

Jaime Garcia
Director Facilities
Castaic Union School District

RE: RFI Draft EIR Sterling Ranch Residential Project – VTTM 60251

Dear Ms. Zulema Renteria:

This letter is in response to your request for information regarding the impact of the proposed project on educational services. The Castaic Union School District serves PreK and Kindergarten through Eighth grade in the north western portion of Los Angeles County. The area specified will be in the Live Oak Elementary School attendance boundary for K-5 grades and Castaic Middle School for grades 6, 7, and 8. There are several projects in the Castaic area that will require further study with regard to available seats at each of our schools.

I have prepared the following information as requested in your letter for VTTM 60251.

1. The project is within the Live Oak Elementary School and the Castaic Middle School attendance boundaries. Current enrollment for Live Oak is 538 and 526 for Castaic Middle. With the addition of portable classrooms, the capacity of Live Oak Elementary is 750. However, the infrastructure is a design capacity of 500 and is under review for modernization. The Castaic Middle School design capacity is 1200. It currently is serving our 7th and 8th grade middle school children.
2. Overcrowding standards used by the district will follow CDE guidelines.
3. Current student generations rates were completed and submitted to the school board on May 14, 2020 and as follows:

Table 4 – Student Yield Factors

(from a large sample of units built between 2013-2018)

Table 2

Student Yield Factors

for the Castaic Union SD*

	SFD** Units	**MFA Units	**APT Units
K-6	.501	.307	.204
7-8	.125	.073	.091
K-8	.626	.380	.295

** = Used a District-wide, 5-year sample*

*** = Sample size for the Castaic District was too small, therefore, used a Santa Clarita Valley-wide sample.*

SFD = Single Family Detached units

MFA = Multi-Family Attached units

APT = Apartment units

4. As of May 14, 2020 the district adopted the SAB statutory rate for Level 1 fees. The residential rate for Castaic Union School district will be $2.65 and $0.43 for industrial/commercial development.
5. The district does not currently have any plan for increasing student housing.
6. The district does have two CFD's that were formed in the 90's. It would be difficult to provide a lead role in the formation of CFD's, but the district would consider options under the right conditions.

The proposed development is located in a rural area that does not provide safe routes to school. Please feel free to contact me if you have any further questions. I can be reached at 661-257-4500 x 1546.

Sincerely,

Jaime Garcia
Director of Facilities

Recreation

APPENDIX L.1

Park Obligation Report

LOS ANGELES COUNTY
DEPARTMENT OF PARKS AND RECREATION

PARK OBLIGATION REPORT

Tentative Map # **60257**	DRP Map Date: **05/08/2018**	SCM Date: **06/14/2018**	Report Date: **06/11/2018**
Park Planning Area # **35B**	CSD: **CASTAIC AREA CSD**		Map Type: **Tentative Map - Tract**

Total Units	= Proposed Units	+ Exempt Units
231	**231**	**0**

Park land obligation in acres or in-lieu fees:

ACRES:	**2.38**
IN-LIEU FEES:	**$485,395**

Sections 21.24.340, 21.24.350, 21.28.120, 21.28.130, and 21.28.140, the County of Los Angeles Code, Title 21, Subdivision Ordinance provide that the County will determine whether the development's park obligation is to be met by:

1) the dedication of land for public or private park purpose or,
2) the payment of in-lieu fees or,
3) the provision of amenities or any combination of the above.

The specific determination of how the park obligation will be satisfied will be based on the conditions of approval by the advisory agency as recommended by the Department of Parks and Recreation.

The Representative Land Value (RLVs) in Los Angeles County Code (LACC) Section 21.28.140 are used to calculate park fees and are adjusted annually, based on changes in the Consumer Price Index. The new RLVs become effective July 1st of each year and may apply to this subdivision map if first advertised for hearing before either a hearing officer or the Regional Planning Commission on or after July 1st pursuant to LACC Section 21.28.140, subsection 3. Accordingly, the park fee in this report is subject to change depending upon when the subdivision is first advertised for public hearing.

The park obligation for this development will be met by:

Trails:

See also attached Trail Report

Comments:

90 percent of all residential lots within the proposed project are within one-half mile of Val Verde Community Regional Park which is approximately 58 acres in size. Thus this project is not required to provide a public park onsite and its Quimby obligation will be satisfied with the payment of in-lieu fees.

For further information or to schedule an appointment to make an in-lieu fee payment:
Please contact Clement Lau at (626) 588-5301 or Loretta Quach at (626) 588-5305
Department of Parks and Recreation, 1000 S. Fremont Avenue, Unit #40. Building A-9 West, 3rd Floor. Alhambra, California 91803.

PARK OBLIGATION WORKSHEET

Tentative Map # **60257** DRP Map Date: **05/08/2018** SCM Date: **06/14/2018** Report Date: **06/11/2018**
Park Planning Area # **35B** CSD: **CASTAIC AREA CSD** Map Type: **Tentative Map - Tract**

The formula for calculating the acreage obligation and or in-lieu fee is as follows:

(P)eople x (0.0030) Ratio x (U)nits = (X) acres obligation
(X) acres obligation x RLV/Acre = In-Lieu Base Fee

Where: P = Estimate of number of People per dwelling unit according to the type of dwelling unit as determined by the U.S. Census
Ratio = The subdivision ordinance provides a ratio of 3.0 acres of park land for each 1,000 people generated by the development. This ratio is calculated as "0.0030" in the formula.
U = Total approved number of Dwelling Units.
X = Local park space obligation expressed in terms of acres.
RLV/Acre = Representative Land Value per Acre by Park Planning Area.

Total Units **231** = Proposed Units **231** + Exempt Units **0**

Trail Report

COUNTY OF LOS ANGELES
DEPARTMENT OF PARKS AND RECREATION
"Parks Make Life Better!"
John Wicker, Director
Norma E. Garcia, Chief Deputy Director

June 14, 2018

TO: Diane Aranda, Principal Regional Planning Assistant
Department of Regional Planning
Land Divisions Section

FROM: Kathline J. King, Chief of Planning
Department of Parks and Recreation
Planning Division

SUBJECT: **NOTICE OF TRAIL CONDITIONS FOR VESTING TENTATIVE TRACT MAP (VTTM) #60257**
(RECEIVED BY REGIONAL PLANNING ON MAY 2, 2018)

The Department of Parks and Recreation (Department) has completed the trail review of VTTM No. 60257. The proposed "Del Valle Trail" alignment, as shown on subject tract map sheet two (2) of three (3) is approved. Due to offsite grading for VTTM No. 60257 within VTTM 60665, the Department is requiring the Subdivider to dedicate a twenty-foot (20') wide trail easement and construct a variable-width five-foot (5') to eight-foot (8') wide multi-use (hiking, mountain biking, and equestrian) trail within the sphere of the offsite grading area.

Trail Conditions of Map Approval:

1. Subdivider shall dedicate a twenty-foot (20') wide multi-use easement to the County for the "Del Valle Trail" and construct, a variable-width five foot (5') to eight foot (8') wide natural soil surface trail within the proposed trail alignment, as shown on subject tract map sheet two (2) of three (3).

   Note:

   - The proposed "Ron Horn Memorial Trail" within the sphere of this subdivision is planned as a private trail to be maintained by the Home Owners Association with connectivity east to the proposed County "Del Valle Regional Trail".

   - The County "Del Valle Regional Trail" is to be constructed within the offsite grading area (VTTM#60665) east of map boundary and South of Del Valle Road right-of-way.

2. The required multi-use trail easement, shall be recorded via separate instrument, prior to final map recordation. Trail easement recordation document number to be inserted, as a note along the trail alignment within final map.

    - Upon request the Department will provide the multi-use trail easement recordation template and coordinate the recordation process.

3. Full public access shall be provided in perpetuity for the multi-use trail.

4. Easement dedication(s) must be outside the public road right-of-way unless approved by the Department of Public Works, Traffic and Lighting Division (DPW).

5. Subdivider shall include the Department in the transmittal of the project grading plan to the Department of Regional Planning. The project grading plan, including trail grading information, shall be submitted simultaneously to the Department for review and approval. The trail grading information shall conform to the County of Los Angeles Trails Manual (Trails Manual) and any applicable County codes, including, but not limited to the following:

    - Cross slope gradients on natural soil not to exceed four percent (4%) with two percent (2%) preferred, and longitudinal (running) slope gradients not to exceed twelve percent (12%) for more than fifty feet (50').

    - Cross slope gradients above four percent (4%) on paved surfaces, such as roadway trail crossings will be evaluated by the Department on a case by case basis.

    - Typical trail section and details to include:

        - Width and name of trail
        - Longitudinal (running) gradients
        - Cross slope gradients

    - Bush hammer (or equivalent rough finish) at minimum width of eight feet (8') for roadway (if concrete surface) trail surface crossings to provide for traction and increase safety.

    - Appropriate retaining walls as needed.

    - Lodgepole fencing required (see condition 7 fencing specifications) on each side of trail with minimum distance of twelve feet within the twenty-

foot (20') wide multi-use trail easement for full length of trail adjacent to Del Valle Road.

  - Rural style fencing is needed to delineate the trail and keep trail users within the authorized trail alignment.

- Eight-foot (8') minimum width of trail is recommended when lodgepole fencing is installed on each side of trail.

- All street trail crossings must be approved by DPW:

  - If needed, Subdivider is responsible to install appropriate curb-cuts and painted crosswalk utilizing DPW specifications.
  - Subdivider is responsible to contact DPW for trail street-crossing signage specifications. Per DPW specifications the trail crossing signage to be installed at five-hundred (500) feet in either direction from each street trail crossing to warn vehicle drivers of trail crossing.

6. After project trail grading plan approvals, but prior to building permit issuance, the Subdivider shall:

   - Submit a preliminary construction schedule showing milestones for completing the trail. As needed, provide the Department updated trail construction schedule(s).

   - Stake/flag the centerline of the proposed trail alignment and then schedule a site meeting with the Trail Planner for trail inspection and approval.

     - Contact Trail Planner if construction is not completed within ninety (90) days of staking/flagging, as trail staking/flagging is only valid for up to a ninety (90) day span.

7. Construction of trail and installation of lodgepole fencing:

   - Trail: Construct a variable-width five-foot (5') to eight-foot (8') wide Natural Trail 2 within the twenty-foot (20') wide dedicated easement in a manner consistent with Section 4.0 Trail Design of the Trails Manual. The Trails Manual is available at http://trails.lacounty.gov.

     - Subdivider must utilize a professional trail contractor approved by the Department.

- Deviation from the proposed regional trail alignment, as shown on sheet two (2) of sheet three (3) is permitted, if due to unforeseen obstacles, such as but not limited to: reduction of trail grade, increase trail width, and/or to provide a safe trail passing area.

Out-slope of trail tread is 2% to 4% with trail running grade at 5%, or up to 8% for <100' or 12% for <50'. Significant deviation from the design guidelines in the Trails Manual must be reviewed and approved by the Department. See Section 4: "Trail Design," for trail construction guidelines and/or contact Trails Section Planner.

- Lodgepole Fencing: Pine posts treated with Alkaline Copper Quaternary (ACQ) wood preservative. Vertical posts are seven feet (7') in height by seven inch (7") diameter. The posts have two (2) holes at eighteen inches (18") on center and top rail is six inches (6") from post top to the centerline of rail hole. The rails are also ACQ treated and they are eight feet (8') in length by four and one-half inches (4½") in diameter with beveled ends. The posts are installed fifty-four inches (54") above grade and thirty inches (30") below grade. Posts are set in three quarter inch (¾") aggregate base layer at eighteen inches (18") deep with four inches (4") of compacted earth as top layer.

8. Notify the Trail Planner within five (5) business days of trail construction completion, including installation of all required lodgepole fencing for a "Final Trail Inspection". The Final Trail Inspection is required to obtain the Department approval and ensure the trail and fencing utilize the trail conditions of approval within this report and also follow the trail construction guidelines within the Trails Manual. Any portions of the constructed trail and fencing not approved, shall be corrected and brought into compliance within thirty (30) calendar days. The Subdivider shall then contact the Department to schedule another site inspection.

9. Prior to the Departments final acceptance of the constructed "Del Valle Trail" alignment, the Subdivider shall:

   - Submit electronic copies on CD (AutoCAD) of the as-built trail grading/construction drawings, and specification sheets for any installed trail infrastructure, such as lodgepole fencing, etc. to the Department's Trails Planning Section.

   - Submit a letter to the Department Trail Planner requesting acceptance of the dedicated constructed trail and lodgepole fencing. The Department will then issue an acceptance letter only after receiving a written request for final trail approval, and copy of the as-built trail drawings.

Note: The Department is responsible to install appropriate trail signage, and trail maintenance after final trail acceptance.

For any questions or concerns, please contact Trail Planner Robert Ettleman, at (626) 588-5323 or by email at rettleman@parks.lacounty.gov.

Good afternoon Zulema,

Thank you for your patience. Below are some answers (green) to your questions. I'm still waiting to hear back from a couple people so I'll send those when I get them. Please feel free to let me know if you have any questions.

1. Which parks and recreational facilities are within a 5-mile radius, currently serve the Project site? Val Verde Community Regional Park

- In addition, for each park facility please identify the acreage of the park 57.92 acres, the facilities found within each park (see list below), the areas of the County each park is intended to serve (Park Planning Area 35B – Castaic/Val Verde), the service population under existing conditions, and each park's service population capacity (Community Parks serve several neighborhoods within a 1 to 2 mile radius of the park – General Plan – Parks and Recreation Element).
    - Community Recreation Center
    - Playground
    - Swimming Pool
    - 2 Restrooms
    - Softball Field
    - Multipurpose Fields
    - Tennis Court
    - Full Size Basketball Court
    - Hiking Trail
    - 2 Horseshoe Pits
    - Camping Site
    - BBQs
    - Picnic Tables
    - Parking
- Are these parks and recreational facilities adequately meeting the Project site's current demand for parks and recreational facilities?
    - Information Pending
- Would these parks and recreational facilities meet the proposed Project's demand for parks and recreational facilities?
    - No. According to the Quimby Obligation calculation, in order for Val Verde Community Regional Park to adequately serve the new population, the Department would require an in-lieu fee of $485,396 (for park upgrades/renovation) or provide a 2.28 acre public park.

2. Does the Department have any plans to develop new parks or recreational facilities or expand existing parks or recreational facilities within a 10-mile radius of the Project site?

- Information Pending

3. Please provide existing ratios of neighborhood and community parkland per resident on a countywide basis and within the Project site.

- LA County Needs Assessment
    - Countywide average of parkland per resident: 3.3 acres per 1,000 residents

- Project site average parkland per resident (Study Area 91): 4.1 acres per 1,000 residents

Thank you,

Loretta Quach

Hello Clement,

Thank you for getting back to me. I know we find ourselves in unusual circumstances, during this time, so I appreciate you reaching out. Yes, I spoke with Julie about the Sterling Ranch Residential Project, last month. We were hoping to get some information regarding parks and recreational facilities in the area.

I have attached the letter that I had sent to Julie. In the interest of saving time, I haven't changed the addressee of the letter, but I can, if you'd like me to. Otherwise, these are the questions we are interested in having answered. Thank you, again, Clement for getting back to me. I look forward to connecting with you.

Hi Zulema,

I understand that you have been trying to reach Julie Yom of my staff. Julie has been temporarily re-assigned as a disaster service worker in response to the COVID-19 pandemic.

I am Julie's supervisor and oversee our Planning & CEQA Section. Please let me know what you need assistance with.

Thank you,

Clement

Existing Park Outside Study Area
Other Open Space

PARK METRICS

PARK LAND: Is there enough park land for the population?

146.2 PARK ACRES within study area | **35,705** POPULATION | **4.1** PARK ACRES PER 1,000

5,261.10 REGIONAL PARK ACRES within study area | **259.7** REGIONAL PARK ACRES PER 1,000

The county average is 3.3 park acres per 1,000

*This section does not include the 881.8 acres of regional open space, nature preserves, or State and National Forest land in this Study Area.

PARK ACCESSIBILITY: Is park land located where everyone can access it?

13% of population living WITHIN 1/2 MILE of a park

The county average is 49% of the population living within 1/2 mile of a park

PARK PRESSURE

How much park land is available to residents in the area around each park?

Castaic Lake State Recreation Area (5,261.08 Acres)
16851.14 park acres per 1,000

Castaic Regional Sports Complex (58 Acres)
19.68 park acres per 1,000

Del Valle Park (5.45 Acres)
1.03 park acres per 1,000

Hasley Canyon Park (5.37 Acres)
0.63 park acres per 1,000

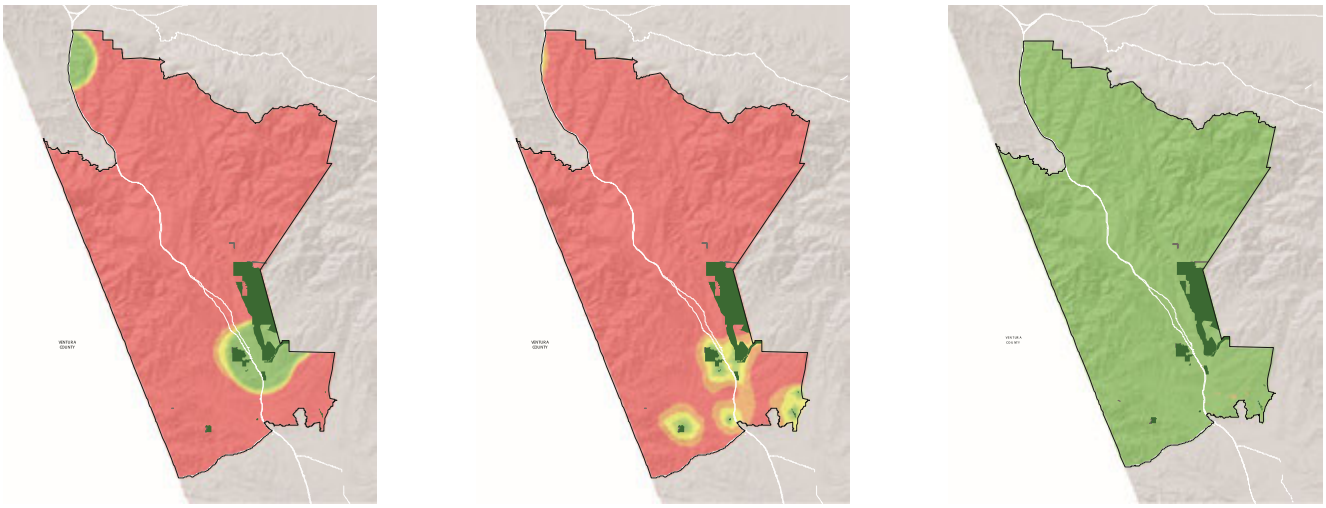
Tesoro Adobe Historic Park (2.25 Acres)
0.68 park acres per 1,000

Val Verde Community Regional Park (57.4 Acres)
10.07 park acres per 1,000

West Creek Park (17.68 Acres)
2.33 park acres per 1,000

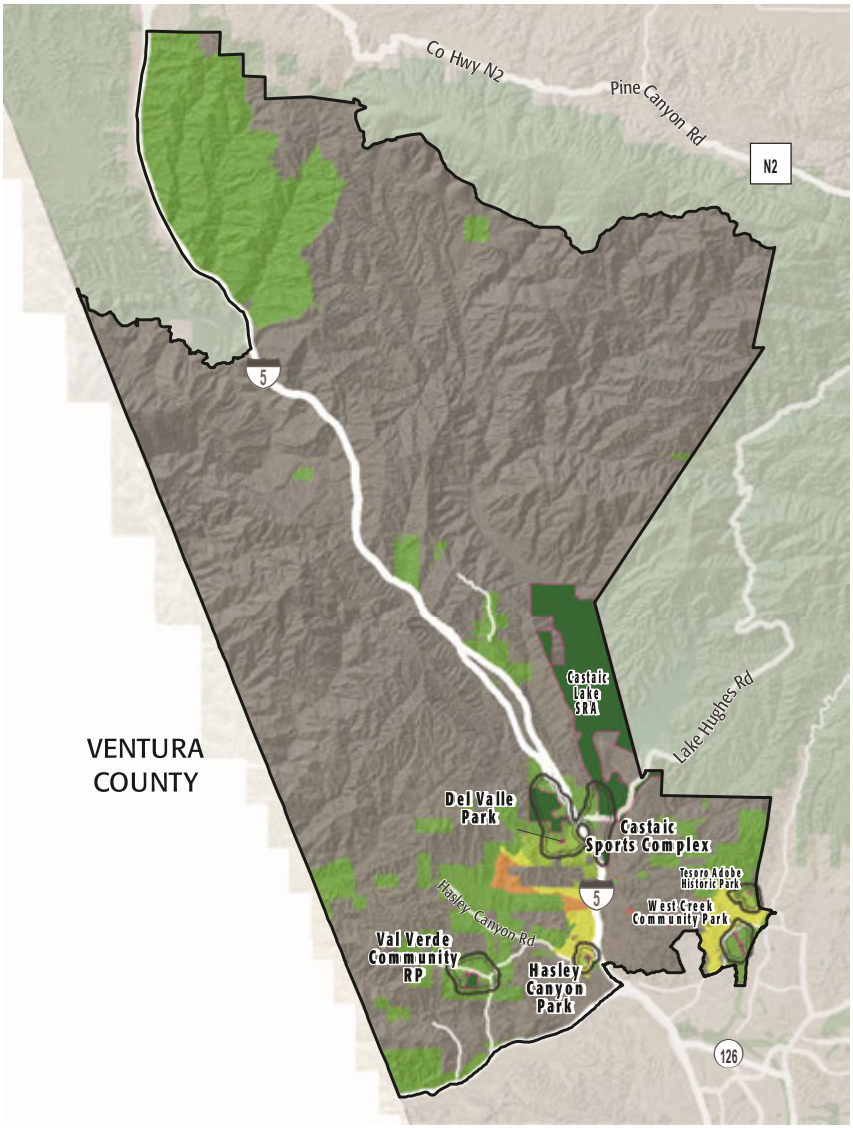
WHERE ARE PARKS MOST NEEDED?

PARK ACRE NEED + DISTANCE TO PARKS + POPULATION DENSITY



= PARK NEED

*Calculated using the following weighting: (20% x Park Acre Need) + (20% x Distance to Parks) + (60% x Population Density)



PARK NEED CATEGORY

- Very High
- High
- Moderate
- Low
- Very Low
- No Population
- Area within 1/2 mile walk of a park

HOW MANY PEOPLE NEED PARKS?

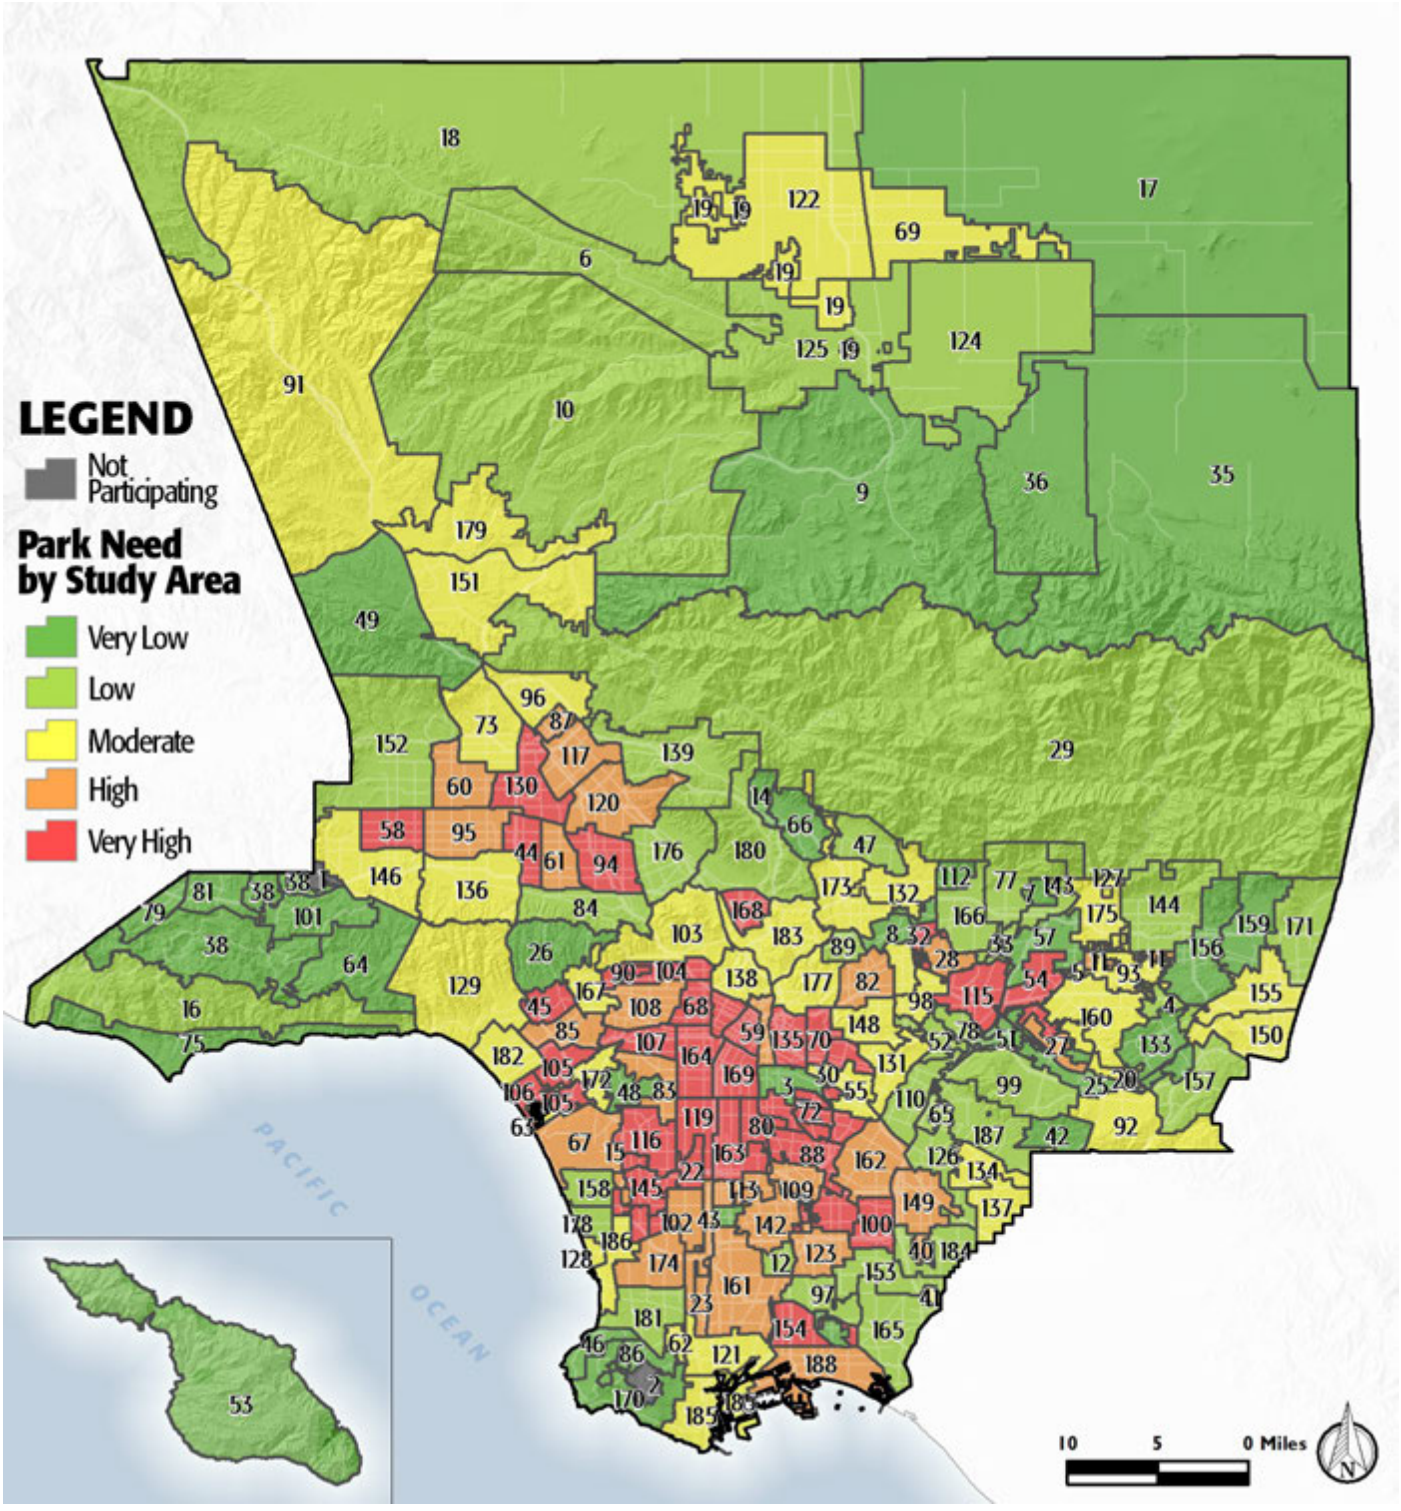
PARK NEEDS FRAMEWORK: COUNTYWIDE ASSESSMENT OF NEED

The results of the analysis of the park metrics were used to determine an overall park need level for each Study Area. Please refer to Section 3.0 Park Needs Framework of the main report for additional information.

Unincorporated Castaic - Val Verde (#91) has a moderate park need.



PROJECT COST ESTIMATES

Study Area:

Unincorporated Castaic - Val Verde

Study Area ID

91

Prioritized Projects

Project Number	Project Description		Cost
1-3	Build New Community Park in the General Vicinity of Val Verde		$12,650,371
	New Park Tasks:		
	Land Acquisition	$138,371	
	Infrastructure/General	$5,280,000	
	Community/Recreation Center	$6,300,000	
	Multipurpose Field- Grass	$932,000	
4	Replace Fitness Zones at Castaic Regional Sports Complex		$70,000
5	Add Tennis Courts at Castaic Regional Sports Complex		$570,000
6-8	Build New regional Park		$15,006,743
	New Park Tasks:		
	Land Acquisition	$276,743	
	Infrastructure/General	$5,280,000	
	Equestrian Park	$9,100,000	
	Trails	$350,000	
9	Add Dog Parks at TBD Existing Park		$695,200
10	Repair Infrastructure/General at Castaic Regional Sports Complex		$5,828,200

Study Area Total Costs

TOTAL COST FOR PRIORITIZED PROJECTS		$34,820,514
TOTAL DEFERRED MAINTENANCE*		$2,954,639,450
Replace amenities in "poor" condition	$2,944,022,178	
Repair amenities in "fair" condition	$10,617,272	
GRAND TOTAL		$2,989,459,964

Each Study Area prioritized 10 projects. These project lists are not intended to supersede or replace any planning documents, nor to obligate the lead agency to implement these projects. For further discussion of projects, please refer to the "Potential Park Projects and Cost Estimates" section of the report.

**Does not include repairs or replacement projects listed as prioritized projects.*

Study Area:

We all need PARKS

Community Engagement Plan

A Community Engagement Meeting must be held in each Study Area between December 1, 2015 and February 15, 2016. The meeting can be run by city staff or by a community-based organization of your choice. The meeting facilitator must attend one of three trainings. At the training, facilitators will receive all information needed to hold the meeting. To offset the cost of the Community Engagement Meeting, a $2,500 stipend is available for each Study Area.

Please answer the questions below and return this form to Rita Robinson
rrobinson@parks.lacounty.gov by **October 15, 2015**

Please tell us about your community engagement meeting:
Date: 01/28/2016
Time: 7:00pm
Location: Castaic Union School District Offices

☑ Parking provided
☑ Accessible by public transportation

What translation services (if any) will be provided? Languages: Spanish and others if requested.

Who will be facilitating your community engagement event(s)?

☐ City Staff
☑ Community-Based Organization. Name of CBO: Castaic Area Town Council

Please provide the contact information for the primary facilitator **and** any secondary facilitator (if applicable) that will be attending the mandatory training. You may have a **maximum** of 2 people.

Name: Sandia Ennis
Title: Vice President
Address: PO Box 325, Castaic, CA 91384
Phone: 661-414-4412
Email: 661-414-4412

Name: Bonnie Nikolai
Title: Event Committee Chair
Address: 661-775-8915
Phone: 661-775-8915
Email: 661-775-8915

Please rank your preference for a mandatory facilitator training date. Space is limited at each training and spaces will be reserved based on the timely return of this form.

3	Monday--November 16, 2015	10:00am-12:00pm	Roy Anderson Recreation Center
2	Tuesday--November 17, 2015	6:30pm-8:30pm	Los Angeles County Arboretum
1	Saturday--November 21, 2015	10:00am-12:00pm	San Fernando Park

Please describe how you will promote your engagement meeting (select all that apply):

☑ Publicly posted notice
☐ Mailers
☑ Website
☑ Social Media
☑ Canvassing
☑ Television/Radio
☐ Other

Please describe your attendance goal (# of attendees): 100+

Please provide any additional details related to your action plan for engaging the community:

Will be attending the webinar training and will provide contract. Thank you.

The list of prioritized parks projects generated at the community engagement meeting is due to the County by **February 29, 2016**.

Sent: Wednesday, April 29, 2020 4:17 PM
To: Zulema Renteria
Subject: Re: Follow Up on Remaining Parks Information

I'm so sorry for the delay!

I had sent Hunt some information of other projects in the area. I don't know if he forwarded it to you. It's just the Los Valles Project:

iStar/Los Valles is providing a 5.28 net-acre Public Park. They are not providing any other public parks for their project, but they are also providing a Trail Rest Area. The park will contain the following improvements:

- Parking Lot
- Restroom Building
- Children's Play Areas (Ages 2-5 and 5-12)
- Group Picnic Shelter
- Basketball Court
- Walking Path
- Benches
- Open Turf Play Area
- Landscaping
- Signage

The Tentative Tract Map was approved February 5, 2019. They need to record their final map by October 31, 2020, so they should be working with us soon for the Park Development Agreement and then we can start working on the Design Development and Construction Documents. I don't have a timeline for construction, but it will probably be a while.

I asked our team about any other projects nearby and they're just deferred maintenance projects. Nothing big.

I'm still waiting for information about our parks adequately meeting the project site's current demand. I'll check in with the Parks staff again.

Thanks,

Loretta Quach

Hi Zulema,

Apologies for the delay. Below are the answers to the remaining questions

- Are these parks and recreational facilities adequately meeting the Project site's current demand for parks and recreational facilities?
    - Our North Agency Deputy Director said to refer to the Park Needs Assessment (Attached)
- Does the Department have any plans to develop new parks or recreational facilities or expand existing parks or recreational facilities within a 10-mile radius of the Project site?
    - The Department has just been working on deferred maintenance for existing parks/recreational facilities
    - iStar/Los Valles is providing a 5.28 net-acre Public Park. This is currently proposed on their Tentative Tract Map and Final Map. The Department has not started on Construction Documents and we have not received a tentativee timeline for construction. The park will contain the following improvements:
        - Parking Lot
        - Restroom Building
        - Children's Play Areas (Ages 2-5 and 5-12)
        - Group Picnic Shelter
        - Basketball Court
        - Walking Path
        - Benches
        - Open Turf Play Area
        - Landscaping
        - Signage

I hope this is enough information for you to use. Feel free to let me know if you have any other questions.

Thank you,

Subject: Re: Follow Up on Remaining Parks Information

I'm so sorry for the delay!

I had sent Hunt some information of other projects in the area. I don't know if he forwarded it to you. It's just the Los Valles Project:

iStar/Los Valles is providing a 5.28 net-acre Public Park. They are not providing any other public parks for their project, but they are also providing a Trail Rest Area. The park will contain the following improvements:

- Parking Lot
- Restroom Building
- Children's Play Areas (Ages 2-5 and 5-12)
- Group Picnic Shelter
- Basketball Court
- Walking Path
- Benches
- Open Turf Play Area
- Landscaping
- Signage

The Tentative Tract Map was approved February 5, 2019. They need to record their final map by October 31, 2020, so they should be working with us soon for the Park Development Agreement and then we can start working on the Design Development and Construction Documents. I don't have a timeline for construction, but it will probably be a while.

I asked our team about any other projects nearby and they're just deferred maintenance projects. Nothing big.

I'm still waiting for information about our parks adequately meeting the project site's current demand. I'll check in with the Parks staff again.

Thanks,

Loretta Quach

February 11, 2021

Mr. Daryl Zerfass
Stantec Consulting Services, Inc.
38 Technology Drive, Suite 100
Irvine, CA 92618-5312

Dear Mr. Zerfass:

STERLING RANCH ESTATES (VTTM 60257)
SUPPLEMENTAL VMT INFORMATION (DECEMBER 8, 2020)
UNINCORPORATED CASTAIC/VAL VERDE AREA

We reviewed the Supplemental VMT Information memo dated December 8, 2020, for the proposed Sterling Ranch Estates project (VTTM 60257). The project site is located in the unincorporated Castaic/Val Verde area.

Project Description

The project includes the construction of 222 single-family residential dwelling units, an approximately 21,000- square foot neighborhood retail commercial center, a 3.4-acre neighborhood park, and a smaller (0.2 acre) pocket park.

Supplemental VMT Information

The memo states the project elements described above will be developed according to the following groupings:

- First group of development includes 115 residential units identified in the project's site plan as Unit Phases 1 and 2.

- Second group of development includes the following:

    - 107 residential units identified in the project's site plan as Unit Phases 3 through 6.
    - 3.4-acre neighborhood park and 0.2-acre pocket park as part of the Unit Phase 3 development.

- 21,000-square-foot retail commercial center as part of the Unit Phase 6 development.

According to the memo, the development of the project elements under the groupings described above will reduce the project's Vehicle Miles Travelled as described in the VMT Impact Analysis dated November 23, 2020.

We generally agree with the findings in the Supplemental VMT Information memo. Consequently, the project's MM-1 described in the letter dated December 2, 2020, (copy enclosed) shall be revised as listed below:

MM-1: The project shall provide community wireless internet connection at the commercial retail and park sites to promote telecommuting.

The retail and community park components shall be developed as listed below.

- 3.4-acre neighborhood park and 0.2-acre pocket park as part of the Unit Phase 3 development.
- 21,000-square-foot retail commercial center as part of the Unit Phase 6 development.

The project applicant shall provide a Covenant and Agreement to Public Works for maintaining the community wireless internet connection prior to final map recordation.

The project applicant shall submit an Exhibit depicting location and function of wireless internet components to Public Works for review and approval prior to final map recordation.

Please note the revisions to MM-1 do not fully mitigate the impact of the residential component of the project. The project's Environmental Impact Report shall describe this significant and unavoidable transportation impact.

If you have any questions regarding the review of this document, please contact Mr. Jeffrey Pletyak of Traffic Safety and Mobility Division, at (626) 300-4776 or jplety@pw.lacounty.gov.

Very truly yours,

MARK PESTRELLA

38 Technology Drive, Suite 100
Irvine, CA 92618-5312

Dear Mr. Zerfass:

STERLING RANCH ESTATES (VTTM 60257)
VEHICLE MILES TRAVELED (VMT) IMPACT ANALYSIS (NOVEMBER 23, 2020)
UNINCORPORATED CASTAIC/VAL VERDE AREA

We reviewed the Vehicle Miles Traveled (VMT) Impact Analysis dated November 23, 2020, for the proposed Sterling Ranch Estates project (VTTM 60257). The project site is located in the unincorporated Castaic/Val Verde area.

Project Description

The project includes the construction of 222 single-family residential dwelling units, an approximately 21,000 square foot neighborhood retail commercial center, a 3.4 acre neighborhood park, and a 0.2 acre pocket park.

Project Components

According to the VMT Impact Analysis, the project proposed the following improvements and/or programs, or equally beneficial and financially equivalent improvements and/or programs, approved by the Director of Public Works as part of the project features.

1) PC-1 & PC-2: The project shall include 222 single-family residential dwelling units, 21,000 square feet of locally serving retail, and community parks (3.4-acre neighborhood park, and a 0.2-acre pocket park) which shall be publicly accessible to the neighboring communities.

2) PC-3: The project shall construct a minimum 12 foot graded shoulders on all on-site public roadways which connect to existing public roadways.

3) PC-4: The project shall provide a private trail, the Sterling Horn Memorial Trail, which connect to the County's Del Valle Trail.

4) PC-5: The project shall dedicate a multiuse trail easement to the County, upon County's request, for the future off-site Del Valle Trail.

The above improvements and/or programs shall be shown on the tentative tract map.

Project's Transportation Impact

According to the VMT Impact Analysis, the residential component of the project will have a significant transportation impact in the North County area. The retail component of the project is less than 50,000 square feet and therefore is presumed to have a less than significant transportation impact. The community park component of the project generates less than 110 trips per day and therefore is presumed to have a less than significant transportation impact. We generally agree with the findings in the VMT impact analysis.

Mitigation of Project's Transportation Impact

According to the VMT Impact Analysis, the projects proposed the following improvement and/or programs to address the projects transportation impacts. However, the proposed improvements and/or programs do not fully mitigate the impact of the residential component of the project. Since the project's transportation impact is not fully mitigated, the project's applicant shall appropriately describe this significant and unavoidable transportation impact in the project's Environmental Impact Report (EIR).

1) MM-1: The project shall provide community wireless internet connection at the commercial retail and park sites to promote telecommuting. The retail and community park components shall be developed prior to the first residential unit. The project applicant shall provide a Covenant and Agreement to Public Works for maintaining the community wireless internet connection prior to final map recordation.
    - The project applicant shall submit building plans depicting location and function of wireless internet components to Public Works for review and approval prior to final map recordation.

2) MM-2: The project shall implement traffic calming measures at appropriate locations to develop low speed roadways for on-site streets and intersections, and encourage bicycle and pedestrian trips, prior to final map recordation.
    - The project applicant shall submit signing and striping plans and bonds for the improvements to Public Works for review and approval prior to final map recordation.

3) MM-3: The project shall implement a Class III bicycle facility on Del Valle Road from Hunstock Street to the project boundaries prior to final map recordation.
    - The project applicant shall submit signing and striping plans and bonds for the improvements to Public Works for review and approval prior to final map recordation.

4) MM-4: The project shall provide amenities to support the use Neighborhood Electric Vehicles (NEV) within the project boundaries prior to final map recordation. The NEV-related amenities shall include NEV parking and charging stations at the commercial retail center and community park. The project applicant shall provide a Covenant and Agreement to Public Works for maintaining the NEV amenities prior to final map recordation.
    - The project applicant shall submit signing and striping plans and bonds for the improvements related to NEV parking located within the public right of way to Public Works for review and approval prior to final map recordation.
    - The project applicant shall submit site plans for the improvements related to NEV parking and charging stations located within privately maintained areas to Public Works for review and approval prior to final map recordation.

5) MM-5: The project shall relocate an existing bus stop to a central location adjacent to retail and park use to increase transit coverage. The new bus stop shall include amenities to facilitate transit use such as shade structures, benches and bike racks.
    - The project applicant shall submit signing and striping plans and bonds for the improvements to Public Works for review and approval prior to final map recordation. Signing and striping plans shall also be approved by the City of Santa Clarita prior to final map recordation.

Project's Cumulative Transportation Impact

According to the VMT Impact Analysis, the project will not have a significant cumulative transportation impact in the North County area. We generally agree with these findings in the TIA.

Site Access Requirements

The project shall provide ingress and egress access for all driveways within the project boundaries.

Other Jurisdictions

We recommend the project applicant consult with the City of Santa Clarita and the California Department of Transportation regarding any potential transportation impacts within their jurisdictions.

If you have any questions regarding the review of this document, please contact Mr. Kent Tsujii of Traffic Safety and Mobility Division, at (626) 300-4776 or ktsujii@pw.lacounty.gov.

Very truly yours,

P:\TSMPUB\STUDIES\EIR 20-0150 - STERLING RANCH VMT.DOCX

bc: Land Development (Lasso, Narag, Suarez)

Stantec Consulting Services Inc.
38 Technology Drive, Irvine CA 92618-5312

December 8, 2020
File: 2042570300

Attention: Mr. Jeff Pletyak
County of Los Angeles Department of Public Works
Traffic Safety and Mobility Division
900 South Fremont Avenue
Alhambra, CA 91803-1331

Dear Mr. Pletyak,

Reference: Supplemental VMT Information for Sterling Ranch Estates (VTTM 60257) Project

This memorandum addresses the implementation and timing of a VMT reduction mitigation measure to be implemented by the Sterling Ranch Estates (VTTM 60257) development (Project). This specific mitigation measure consists of providing free neighborhood Wi-Fi service within the publicly accessible spaces of the Project's community park and commercial retail center areas. As described in Mitigation Measure 1 (MM-1) of the Project's VMT Impact Analysis (Stantec, November 2020), this Wi-Fi will be available to residents of the Project as well as the residents of the greater community to facilitate the ability of residents to work remotely, thereby reducing commuter vehicle-miles.

As we discussed on December 3, 2020, the Project will be developed in unit phases, with the community park and the commercial retail center being constructed in the later unit phases of the development timeline when there would be a sufficient number of new residential units to support the community park and commercial uses. It is anticipated that the unit phasing would occur in two groupings, with the first grouping consisting of approximately 115 units (Unit Phases 1 and 2) and the second grouping consisting of the remaining 107 units (Unit Phases 3 through 6).

Construction of the community park represents an important step to provide a community where residents are able to work and play close to home without the need to drive a vehicle to leave the community. Construction of the community park will occur in the third unit phase of the residential development, which is expected to occur after completion of approximately the first 115 residential units. Therefore, a condition of approval is recommended to require rough grading of the community park prior to occupancy of the 116th residential unit, which is the start of Unit Phase 3. With this timing, the park can be constructed during Unit Phase 3 and the neighborhood Wi-Fi will be accessible to over one-half of Project residents when implemented, positively effecting the reduction of VMT.

Construction of the commercial retail center is anticipated to occur in Unit Phase 5 of Project development. While construction of the center is dependent on the purchase of the commercial lot by a commercial developer, and occupancy of the individual retail stores are dependent on the leasing of units to individual proprietors, the Project can facilitate the eventual occupancy of the commercial center by grading and preparing the lot such that it is ready for sale and development. Therefore, a condition of approval is recommended to require grading of the commercial lot prior to occupancy of the 194th residential unit, which

Reference: **Supplemental VMT Information for Sterling Ranch Estates (VTTM 60257) Project**

is the start of Unit Phase 6. With this timing, additional neighborhood Wi-Fi will be accessible to the community concurrent with the occupancy of the commercial retail center.

With the implementation of free neighborhood Wi-Fi concurrent with construction of the community park and commercial retail center in accordance with the recommended timing of development noted above, a long-term reduction in Project and community-wide VMT will occur as described in the Project's VMT Impact Analysis.

Stantec

Memo

To:	Hunt Williams Sterling Ranch Estates	From:	Daryl Zerfass and Sandhya Perumalla Stantec
File:	2042570300	Date:	November 23, 2020

Reference: Sterling Ranch Estates VMT Impact Analysis

Stantec Consulting Service Inc. (Stantec) has prepared a vehicle miles of travel (VMT) impact analysis for the proposed Sterling Ranch Estates (Project) located in unincorporated Los Angeles County within the Santa Clarita Valley. The Project is located west of the City of Santa Clarita within the Val Verde community (part of the Castaic Area Community Standards District (CSD)). See **Figure 1** for the Project location.

The Project includes the construction of 222 single-family residential dwelling units, an approximately 21,000-square foot neighborhood retail commercial center on 2.04 acres at the northwest corner of Chiquito Canyon Road and Hunstock Street, a 3.4 acre neighborhood park, and a smaller (0.2 acre) pocket park. While the Project is located within a suburban setting, the General Plan designation and zoning for the Project site is Urban. The purpose of this memo is to document the findings of the VMT impact analysis for use in the Project's environmental impact report (EIR).

This VMT analysis complies with the updated California Environmental Quality Act (CEQA) guidelines that incorporate the requirements of Senate Bill 743 (SB 743). SB 743 required the Governor's Office of Planning and Research (OPR) to establish guidelines under CEQA for identifying and mitigating VMT transportation impacts. Generally, SB 743 moves away from using delay-based level of service (LOS) as the metric for identifying a significant impact and instead uses VMT.

The analysis has been prepared in accordance with draft Transportation Impact Analysis (TIA) guidelines from the Los Angeles County Department of Public Works[1], information provided in the LA County Public Works Senate Bill 743 Vehicle Miles Traveled Metric Issue Briefing Sheet[2], and information from the LA County's SB 743 FAQ Brochure[3]. The final Technical Advisory released by OPR in December 2018[4] also provides guidance for evaluating transportation impacts and is also used as the basis for this assessment.

Project Screening

Per OPR's Technical Advisory recommendations, local agencies have the option to utilize screening criteria prior to conducting a full VMT analysis, to determine if a project will have a less-than-significant impact on VMT. The screening criteria utilized in this analysis is consistent with the screening criteria shown in the draft LA County TIA guidelines. OPR's Technical Advisory's recommended screening criteria is also utilized.

The screening criteria is based on factors that include project size, areas of low VMT, locally serving retail, transit proximity and affordable housing, as shown in **Table 1**.

[1] Draft Transportation Impact Analysis Guidelines, Los Angeles County Public Works, July 23, 2020.
[2] Senate Bill 743 – Vehicle Miles Traveled Metric Issue Briefing Sheet, Los Angeles County Public Works, March 10. 2020.
[3] Update to the County's Transportation Impact Analysis Guidelines in Compliance with Senate Bill 743, Los Angeles Public Works and Department of Regional Planning.
[4] Technical Advisory on Evaluating Transportation Impacts in CEQA, Governor's Office of Planning and Research, State of California, December 2018.

Table 1 Project Screening Criteria and Threshold

Category	Criteria/Screening	Threshold
Non-Retail Trip Generation Screening	Small non-retail projects can be screened out from completing a full VMT analysis.	If the Project generates less than 110 trips per day, which allows up to 11 single family units, 16 multi-family condo/apartment units, 10,000 square feet of office, or 15,000 square feet of industrial, is assumed to have a less than significant impact.
Retail Project Site Plan Screening	Retail projects that are locally serving can be screened out from completing a full VMT analysis.	A project that proposes locally serving retail uses that are 50,000 square feet or less.
Transit Proximity Screening	Projects within ½ mile of a major transit stop or a stop located along a high-quality transit corridor generally reduce VMT and therefore can be screened out from completing a full VMT analysis.	If the Project is within ½ mile of a major or high-quality transit stop/corridor, the Project is assumed to have a less than significant impact. The project should generally also meet the following criteria: - FAR >= 0.75 - Not provide more parking than required by Count - Be consistent with the regional SCS - Not replace existing affordable units with a smaller number of moderate to high-income units
Residential Land Use Based Screening	Affordable housing in infill locations can be screened out from completing a full VMT analysis.	If the Project is comprised 100% of affordable units and is located in an infill location, then the Project is assumed to have a less than significant impact.

Non-Retail Project Trip Generation Screening – The Los Angeles County Public Works Traffic Safety and Mobility Division approved the Sterling Ranch Estates Traffic Impact Analysis that showed the volume of new daily trips generated by the Project is approximately 3,309 ADT[5]. Of the 3,309 ADT, the park use would generate a nominal volume of daily trips. Since the park use would generate less than 110 trips per day, the park use can be presumed to have a less than significant impact under this threshold. The residential and commercial uses would generate more than 110 trips per day and, therefore, those uses do not qualify as a small project.

Retail Project Site Plan Screening – A project that proposes locally serving retail uses that are 50,000 square feet or less is eligible to be screened out. The Project includes 21,000 square feet of retail uses that would be locally serving. For example, the commercial center would include businesses such as a small restaurant or cafe, a coffee shop, a small market or deli, mail services and/or a laundromat. Since the retail uses would be locally serving, the retail component of the Project can be presumed to have a less than significant impact under this threshold.

Transit Proximity Screening – A project can be screened out as having a less than significant impact on VMT if the project is within ½ mile of a rail station or bus stop that provides service at least every 15 minutes

[5] Sterling Ranch Estates (VTTM 60257) Traffic Impact Analysis, Stantec Consulting Services Inc., July 18, 2019.

during peak commute periods. Based on this definition, the Project would not be eligible to be screened out under this threshold since it is not within a half-mile of either type of transit facility.

Residential Land Use Based Screening – The Project is not comprised 100% of affordable housing in an infill area, so this screening threshold does not apply.

VMT Analysis Performance Criteria

At the time of analysis, Los Angeles County has not adopted a formal methodology but has released draft significance criteria for use in VMT analyses of this type. The County is also in the process of developing a VMT tool and preliminary data from that tool was obtained from County staff and is included in this analysis. This analysis utilizes the County's draft significance thresholds and VMT metrics as shown in Table 2 and Table 3. Specifically, the residential component of the Project is evaluated based on household VMT per capita and a threshold of significance of 16.8 percent lower than the regional average household VMT per capita. The Department of Public Works has divided the County into a North region and a South region for the purpose of VMT analysis and the Project is located within the North region. The retail portion of the Project is evaluated based on it being locally serving retail and has been screened out from further analysis as noted above. The park portion of the Project is similarly locally serving.

This VMT analysis utilizes VMT data from the Southern California Association of Governments (SCAG) travel demand model, as well as refinements made using data from the California State Transportation Demand Model (CSTDM). The County is in the process of developing detailed SCAG model data suitable for analyses of this type, however, the final VMT statistics from the SCAG model are not available at the time of this analysis. The CSTDM is maintained by Caltrans and is an alternative source of travel demand model data with published and available VMT statistics for the Project area. The CSTDM is a traditional travel demand forecasting model in the same general category of traffic forecasting models as is the SCAG travel demand model. Both models were developed for the primary purpose of forecasting roadway volumes. The CSTDM was determined to the be the most appropriate model to use for this analysis since the final VMT statistics from the County's refined SCAG model are not yet available at this time. Caltrans has made VMT data from the CSTDM readily available for use in SB 743 VMT impact assessments, and case studies from OPR utilized CSTDM VMT data for SB 743 VMT impact analysis[6]. Preliminary VMT data from the County's SCAG model-based VMT tool is also included in this analysis for comparative purposes.

Quantification methodologies from California Air Pollution Control Officers Association (CAPCOA) are utilized to estimate VMT reductions from project components and mitigation measures.

For a residential development, the metric used by the County is residential VMT per capita and the County's draft recommended threshold of significance is 16.8% less than existing regional average household VMT per capita. The County has established baseline VMT metrics by region, North County and South County. Since the Project is in the Santa Clarita Valley, the North County threshold is applicable to this analysis. Detailed zonal VMT estimates from the CSTDM were refined for consistency with the version of the SCAG traffic model that the County used to develop these numerical thresholds of significance, and the refined CSTDM

[6] Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impact in CEQA, Governor's Office of Planning and Research, January 20, 2016.

zonal data is referred to herein as Adjusted CSTDM. **Table 2** summarizes the VMT metrics for the North County area.

Table 2 VMT Metrics for North County Area

Region	2020 Baseline Residential VMT/ Capita	2020 Baseline Employment VMT/ Employee
North County Baseline	20.9	16.4
North County Threshold (with 16.8% reduction)	17.4	13.7
Source: LA County Department Public Works TSM		

If a significant impact is identified utilizing the significance thresholds, mitigation must be identified.

VMT Analysis

As noted above, at the time of this analysis the County is still in the process of developing detailed VMT estimates by TAZ. Therefore, detailed zonal VMT estimates from the CSTDM have been calibrated to match SCAG model data (referred to herein as Adjusted CSTDM data) to allow for comparison to the County's established thresholds of significance, which were derived using the SCAG model. The Project is located in CSTDM TAZ 3614, and while CSTDM TAZ 3614 covers a large area, most of the land in TAZ 3614 is undeveloped and existing residential areas are generally located near each other, particularly within the Val Verde community. The specific area covered by CSTDM TAZ 3614 is covered by three smaller SCAG TAZs. The Project is located within the existing Val Verde residential community and would exhibit the same trip-making characteristics as does the existing residential community.

To adjust the CSTDM zonal VMT estimates for consistency with the SCAG traffic model's VMT estimates for the Santa Clarita Planning Area, VMT data from CSTDM was tabulated for the entire Santa Clarita Planning Area. Next, the CSTDM home-based (HB) VMT per capita data for the Santa Clarita Planning Area was compared to the SCAG HB VMT per capita for this same area. The comparison indicates that the SCAG VMT per capita for the Santa Clarita Planning area is 28% higher than the CSTDM data. Therefore, a factor representing a 28% increase was applied to each CSTDM zone, which results in a CSTDM VMT total for the planning area that is equal to the SCAG VMT total. With this method of factoring, specific adjustments to trip generation or trip lengths are not applicable. **Table 3** shows the Adjusted CSTDM VMT estimates.

Table 3 Adjusted CSTDM Calculations

Description	CSTDM HB VMT per capita[1]	SCAG HB VMT per capita[2]	Adjusted CSTDM HB VMT per capita
CSTDM TAZ 3614	26.8	NA	34.2
Santa Clarita Planning Area	18.9	24.1	24.1
Sources: [1]Caltrans VMT Impact Assessment [2]LA County Department of Public Works Notes: SCAG 24.1 HB VMT per capita / CSTDM 18.9 HB VMT per capita = 1.28 CSTDM 26.8 HB VMT per capita x 1.28 = 34.2 Adjusted CSTDM HB VMT per capita HB = Home-based; NA = Not applicable			

Reference: **Sterling Ranch Estates VMT Impact Analysis**

The Project is located in CSTDM traffic analysis zone (TAZ) 3614 (see attached **Figure 1**) and would generally exhibit the same VMT characteristics as existing neighboring communities, particularly the Val Verde community. For the residential portion of the Project, the adjusted HB VMT per capita for TAZ 3614 is compared against the North County Baseline average HB VMT per capita. The North County 2020 baseline HB VMT per capita is 20.9 VMT per capita, as indicated in **Table 2**. A 16.8% reduction is applied to existing baseline conditions resulting in a regional threshold of significance of 17.4 VMT per capita. The results are summarized in **Table 4** and is referred to as Method 1. As previously discussed, the County is in the process of developing a VMT tool. Preliminary data was obtained from County staff and is shown in **Table 4** as Method 2 and is provided for comparative purposes (See **Attachment B** for preliminary tool output sheet).

Table 4 VMT Analysis Summary

Description	Method 1 Home-Based VMT per capita	Method 2 Home-Based VMT per capita
Project		
Residential VMT	34.2[1]	24.4[2]
Regional Threshold		
North County Existing Baseline	20.9	20.9
North County Threshold of Significance (Existing Baseline with 16.8% reduction)	17.4	17.4
Difference (Project minus Regional Threshold of Significance)	+16.8	+7.0
Is Project above or below Regional Threshold of Significance?	Above	Above
Potential Significant Transportation Impact	Yes	Yes

[1] Adjusted CSTDM TAZ 3614
[2] Parcel number: 3271004013 SCAG TAZ 20224100
Method 1 based on Adjusted CSTDM data
Method 2 based on Preliminary County of Los Angeles VMT Tool data

Under Method 1, the adjusted existing average HB VMT per capita for CSTDM TAZ 3614 is 34.2 VMT per capita. Since 34.2 HB VMT per capita is more than the regional baseline with 16.8% reduction (17.4 VMT per capita), the Project has a potentially significant impact on VMT, and mitigation is required.

Under Method 2, the existing average HB VMT per capita for SCAG TAZ 20224100 is 24.4 VMT per capita. Since 24.4 HB VMT per capita is more than the regional baseline with 16.8% reduction (17.4 VMT per capita), the Project has potentially significant impact on VMT, and mitigation would be required similar to Method 1.

Cumulative Analysis

This cumulative analysis evaluates the long-term project effects on VMT. As noted in the County Guidelines, cumulative effects are determined through consistency with the SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Projects that are consistent with the RTP/SCS in terms of location, density and intensity would have a less than significant cumulative impact on VMT. The Project site is in the Santa Clarita Valley. The Santa Clarita Valley Area Plan was approved in 2012 and contains focused goals, policies, and maps to guide the regulation of development within the Santa Clarita Valley. The Project land use is consistent with the Land Use Policy Map from the Santa Clarita Valley Area Plan and

would therefore be consistent with the RTP/SCS. Since the Project is consistent with the RTP/SCS, the Project has a less than significant cumulative impact.

Project Components and Mitigation

As shown in the previously referenced **Table 4**, the Project's baseline VMT per capita is above the existing regional threshold of significance. Therefore, certain VMT reducing project components and mitigation measures to decrease the Project's VMT per capita to below the existing regional threshold are evaluated. To estimate the effectiveness of project components and mitigation measures that would reduce the Project's VMT, quantification methodologies from CAPCOA are utilized.

The Project has several project components that reduce VMT:

> **PC-1: The Project will include a mix of uses, including on-site locally serving commercial uses and a community park**. The inclusion of locally serving commercial retail and park uses increases diversity within this suburban setting. To quantify the Project's VMT reductions related to providing a mix of uses, CAPCOA LUT-3 Increase Diversity strategy was utilized. CAPCOA describes that "having different types of land uses near one another can decrease VMT since trips between land use types are shorter and may be accommodated by non-auto modes of transport."[7] The Project qualifies for this reduction as it is a project that has residential, commercial retail, and a park within a quarter mile of each other. Based on site acreage, the Project is approximately 90% residential, 4% commercial retail, and 6% park, which results in a Project VMT reduction calculation of 9.0% (See **Attachment A** for calculations). However, research utilized by CAPCOA identifies limitations to the total VMT reductions achievable for a Project by location. The maximum reduction for a project in a suburban setting is 5%. Therefore, the adjusted VMT reduction applicable to the Project is **5.0**%.
>
> **PC-2: The Project's commercial and park uses would divert trips made by the existing residential communities (i.e., Val Verde) and result in an external capture in which existing vehicle trips to farther commercial and parks will be replaced by shorter vehicle trips to the Project's commercial uses and community park**. The existing residential uses adjacent to the Project site currently must drive outside of the Val Verde community to obtain most services. Locating commercial retail and community park uses closer to existing residential uses would reduce neighborhood VMT. VMT reductions are calculated using CAPCOA's LUT-3 Increase Diversity quantification methodology for the Val Verde community since the Project will be increasing land use diversity. This analysis is based on approximately 700 residential units in the existing Val Verde community that will utilize the Project's commercial retail and park components, resulting in an overall community mix of 97% residential, 1% commercial, and 2% park, resulting in a neighborhood VMT reduction of 1.0% (See **Attachment A** for calculations). Based on this reduction in community VMT an equivalency to Project generated VMT can be estimated. The Val Verde community consists of approximately 700 existing residential units, which is approximately 3.15 times greater in size than the Project (222 units). The difference in population can also be considered similar in proportion, so on a per capita basis the reduction in Val Verde VMT is equivalent to 3.15 times less Project VMT on a per capita basis[8]. Therefore, an equivalent reduction to Project VMT is **3.2**% (1% x 3.15 = 3.2%).

---

[7] Page 162 from Quantifying Greenhouse Gas Emissions, California Air Pollution Control Officers Association, August 2010.
[8] The existing Val Verde community is approximately 3.15 times larger than the Project (approximately 700 housing units vs. 222 units). If Val Verde VMT reduces by 1% (from 34.20 VMT/capita to 33.86 VMT/capita) that equates to 0.34 less VMT per capita. That VMT reduction is equivalent to reducing Project VMT by 1.07 per capita (3.15 x 0.34) since the Project is smaller than the

PC-3: The Project will improve pedestrian connectivity by constructing an on-site pedestrian network. The Project will also improve the existing off-site pedestrian network by filling in gaps for pedestrian connectivity. The Project will construct pedestrian improvements that are consistent with the Castaic Area CSD. The Project will construct graded shoulders that will facilitate pedestrian movements throughout the Project and connect to pedestrian improvements while still complying with CSD design requirements. The graded shoulders will link areas within the Project site and encourage residents to walk to the commercial retail center, the community park or walk for exercise around the existing community. The Project's pedestrian facilities will connect the existing communities where there is currently a gap. **Figure 4** shows where the Project will be providing linkages to the existing community and the cross sections show the graded shoulders. The Project will not build walls, landscaping, or slopes that impede pedestrian circulation. The Project will also fill in gaps, such as extending Del Valle Road to Chinquito Canyon Road and improvements along the Project frontage on Hunstock Avenue, that will aid in pedestrian circulation. To quantify the VMT reductions related to this site design feature, SDT-1 Improve Pedestrian Network from CAPCOA is utilized[9]. CAPCOA defines a suburban area as characterized by dispersed, low-density, single-use, automobile dependent land use patterns, usually outside of the central city, is typically 20 miles or more from a central business district and has limited bus service. Based on CAPCOA's definition of a suburban setting, the Project is considered to be in a suburban setting for the purpose of these calculations. Therefore, this measure would result in a Project VMT reduction of **2.0**%.

PC-4: The Project will provide a private trail, the Sterling Horn Memorial Trail, that will connect with the County's Del Valle Trail, as identified in the County's Regional Trail Plan. The Project's proposed Sterling Horn Memorial Trail will be ten feet in width along the southern portion of the Project site. The trail will provide a pedestrian connection between the Project site and off-site communities as well as attract people outside of the Project to utilize the trail, as opposed to driving to a further trail. CAPCOA has not quantified the VMT benefits of providing trails as a standalone measure. Therefore, this would result in a nominal Project VMT reduction.

PC-5: The Project will dedicate a multiuse trail easement to the County, upon request, for the future off-site Del Valle Trail. The Project's proposed multi-use trail would be a twenty-foot wide, located offsite, on a third party's property. The off-site trail would be a variable-width (five-foot to eight-foot wide), a natural soil surface trail within a twenty-foot dedication. An easement for the off-site grading from the adjacent owner has been obtained for this work, including the agreement to dedicate easements to the County upon request. CAPCOA has not quantified the VMT benefits for land dedication as a standalone measure. Therefore, this would result in a nominal Project VMT reduction.

The following mitigation measures would be applicable to this Project:

MM-1: The Project will provide community wireless internet (Wi-Fi) connection at the commercial retail and park sites to promote tele-commuting (tele-work). Statistics from the American Community Survey 2018 5-year Estimates "Means of Transportation Table" was used to estimate the number of employees that currently 'worked at home' in this area. The 'worked at home' category includes self-employed (home-based business owners) and those that are wage and salary

---

existing Val Verde community. This can be demonstrated as follows: 700 DU x 3 persons/DU x -0.34 VMT/person = -714 VMT (Val Verde), and 222 DU x 3 persons/DU x -1.07 VMT/person = -713 VMT (Project).

[9] Page 186 from Quantifying Greenhouse Gas Emissions, California Air Pollution Control Officers Association, August 2010.

employees that telecommute/telework (employees that conduct some or all of their work from home or remotely). The Project is located in Census Tract 9201.06, which includes the existing Val Verde Community and a portion of the Hasley Canyon Community. Approximately 2.4% of survey respondents reported that they worked at home[10]. This means that under existing conditions, 2.4% of households do not drive to get to work. As a conservative estimate, when the self-employed are separated out, it is assumed for the purpose of this analysis that approximately 1.0% telecommute. In comparison, SCAG Connect SoCal (2020 RTP/SCS) reports that 5.67% of employees in the SCAG region 'worked at home'. Of those, it is estimated that 2.9% telecommute (excluding self-employed)[11]. The Project will provide free wi-fi connectivity at community areas, specifically the neighborhood commercial center and parks as shown in **Figure 5**. Residents of the Project and the local community would be able to utilize the free internet connection and shared spaces (i.e., benches, seating, tables) to conduct work-related activities. The Wi-Fi connectivity would be made available at central gathering areas and would be properly signed. A notice of availability (i.e., maps of Wi-Fi hot spots and how to connect using personal devices) would also be made available to the local community. The goal of this measure would be to increase the existing rate of 1% telecommuter/teleworkers to that of the SCAG regional rate of 2.9%. The increase in telecommuters would reduce commute trips and VMT. As shown in Appendix A, with the increased ability to telecommute, this measure would result in a Project VMT reduction of approximately **2.0**%.

MM-2: The Project will provide traffic calming measures such as marked crosswalks at appropriate locations for on-site streets and intersections. The Project roadways will be designed consistent with the Castaic Area CSD but in such a way to reduce motor vehicle speeds and encourage bicycle and pedestrian trips with traffic calming features such as low speed roadways, crosswalks at commercial and park areas, and graded shoulders that will allow pedestrian movements throughout the Project site. To quantify the VMT reductions related to providing traffic calming features, SDT-2 Provide Traffic Calming Measures from CAPCOA was utilized[12]. This would result in a nominal Project VMT reduction.

MM-3: The Project will not block or impede the future planned Class III bicycle facility on Del Valle Road. The County has identified Del Valle Road for a proposed Class III bicycle facility that will span from the proposed Class I (off-road) facility just south of the SR-126 Expressway (Santa Clara River) to Hasley Canyon Road[13]. The Class III facility will connect the existing Val Verde, Sloan Canyon, Hasley Canyon and proposed Sterling Ranch residential communities to the regional Los Angeles County bicycle network. The proposed Class III facility will run through the Project site and will encourage residents to ride their bikes to close destinations. CAPCOA has not quantified the VMT benefits for bicycle connectivity as a standalone measure (Existing and Future bicycle facilities are shown in **Figure 2**). Therefore, this would result in a nominal Project VMT reduction.

MM-4: The Project will provide amenities for neighborhood electric vehicles (NEV) at community locations (commercial and park). NEVs are classified in the California Vehicle Code as

---

[10] Commuting Characteristics for Census Tract 9201.06 Los Angeles County, California, American Community Survey, United States Census Bureau, 2020.
[11] The share of telecommuters (not self-employed) is calculated using the same proportion of teleworkers per 2016 RTP/SCS that reported 5% 'worked at home' and, of those, 2.6% telecommuted.
[12] Page 190 from Quantifying Greenhouse Gas Emissions, California Air Pollution Control Officers Association, August 2010.
[13] Figure A-3 Los Angeles County Existing and Proposed Regional Trail Network, County of Los Angeles Trails Manual, County of Los Angeles, June 2013

a “low speed vehicle” and are ideal for short trips. NEVs would be allowed on the neighborhood streets where the posted speed limit is less than 35 mph (i.e., would not be allowed on Sterling Parkway/Del Valle Road). **Figure 5** shows the routes that the NEVs would be able to utilize to get around the neighborhood and where additional signage would be provided where crossing Sterling Parkway/Del Valle Road. The Project will provide designated NEV parking, charging stations, signage, at the commercial and park areas. The Project will also provide educational tools. CAPCOA quantifies VMT reductions for implementation of a NEV network. Since the Project is providing amenities to encourage NEV usage, the Project is assigned the lowest penetration rate of 0.04 per household. This results in a Project VMT reduction of **0.5**%

MM-5: The Project will increase transit coverage and relocate an existing bus stop to a central location adjacent to retail and park uses. The Project will increase transit coverage since existing buses will benefit from the new roadway alignment, which is more direct and will reduce transit travel time. A nearby existing bus stop on Del Valle Road will be relocated to the proposed Sterling Ranch Parkway at a location in direct proximity to the proposed commercial retail and park uses. The new bus stop will be constructed with amenities to facilitate transit use such as shade structures, benches, and bike racks. CAPCOA has not quantified the VMT benefits for transit access improvement (as a standalone measure) and suggests that this measure be grouped with the Expand Transit Coverage (TST-3) measure. It is estimated that the Project will increase transit coverage by a conservative 10% increase, which results in a nominal Project VMT reduction. (Existing Transit facilities are shown in **Figure 3**).

As shown in **Table 5,** the combination of project components and mitigation measures would achieve an approximately 12.1% reduction in Project VMT. The 12.1% reduction in VMT includes project components and mitigation measures related to land use, neighborhood and site enhancements, and commute trip reduction. This reduction is consistent with the maximum reduction that generally can be achieved for a project located in a suburban setting, which is typically 15%[14].

Table 5 VMT Reductions Summary

Description	CAPCOA Category	Calculated Reduction
Project Components		
1. The Project will increase diversity and include a mix of uses	Land Use	5.0%
2. The Project’s retail and park uses would serve the existing residential communities resulting in an external capture	na	3.2%
3. The Project will construct an on-site pedestrian network and connect to off-site	Neighborhood/ Site Enhancement SDT-1	2.0%
4. The Project will provide a private trail	Neighborhood/ Site Enhancement	nom.
5. The Project will dedicate a multiuse trail easement to the County	Neighborhood/ Site Enhancement	nom.
Mitigation Measures		
1. The Project will provide community wireless internet (Wi-Fi) connection	na	2.0%

[14] Chart 6-2 Transportation Strategies Organization, Quantifying Greenhouse Gas Emissions, California Air Pollution Control Officers Association, August 2010.

2. The Project will provide traffic calming measures	Neighborhood/ Site Enhancement SDT-2	nom.
3. The Project will not block or impede the future planned bicycle facilities	Neighborhood/ Site Enhancement	nom.
4. The Project will provide amenities for NEVs	Neighborhood/ Site Enhancement SDT-3	0.5%
5. The Project will increase transit coverage	Transit System Improvements TST-3	nom.
Total		**12.1**[1]

na – not applicable
nom. – nominal
[1] The calculated reductions do not sum up total since each strategy are multiplicative and not additive.
Overall % VMT Reduction = 1-(1-A)*(1-B)*(1-C) where A, B, C equals reductions for individual strategies

Table 6 summarizes the resulting VMT per capita when the VMT reduction is applied.

Table 6 Project Level VMT Analysis Summary

Description	Method 1 Home-Based VMT per Capita	Method 2 Home-Based VMT per Capita
Regional Threshold		
North County Existing Baseline with 16.8% reduction	17.4	17.4
Project		
Residential VMT	34.2	24.4
Residential with Project Components and Mitigation (-12.1%)	30.1	21.4
Difference (Project minus Regional Threshold)	12.7	4.0
Is Project above or below Regional Threshold?	Above	Above
Significant Transportation Impact	Yes	Yes

As shown in **Table 6**, under Method 1, without consideration of the project components and proposed mitigation measures, the residential portion of the Project would generate approximately 34.2 VMT per capita. With consideration of the project components and proposed mitigation measures, the residential portion of the Project would generate approximately 30.1 VMT per capita.

The regional threshold for the North County area is 17.4 VMT per capita. As shown in **Table 6,** the Project's residential HB VMT per capita would be above the regional threshold even with implementation of all feasible mitigation measures.

Under Method 2, without consideration of the project components and proposed mitigation measures, the residential portion of the Project would generate approximately 24.4 VMT per capita. The Project's residential With consideration of the project components and proposed mitigation measures, the residential portion of the Project would generate approximately 21.4 VMT per capita. The Project's residential HB VMT per capita

Reference: **Sterling Ranch Estates VMT Impact Analysis**

would be above the regional threshold of 17.4 VMT per capita even with implementation of all feasibility mitigation measures.

Conclusion

A VMT impact analysis was conducted for the proposed Project. Based on the County's Draft TIA Guidelines, the Project would not meet the screening criteria and a VMT analysis is required. The VMT analysis under Method 1 showed that the Project would result in an average HB VMT per capita of 34.2. The regional threshold for the North County area is 17.4 HB VMT per capita. Therefore, since the Project would be above the regional threshold, the Project would result in a significant impact. Under Method 2, the Project would result in an average HB VMT per capita of 24.4 and would be above the regional threshold for the North County area of 17.4 HB VMT per capita.

Project components and mitigation measures are identified that would result in VMT reductions. The combination of project components and mitigation measures would result in an overall VMT reduction of 12.1 percent. With the VMT reduction, under Method 1, the Project would result in an average HB VMT per capita of 30.1. When compared to the regional threshold of 17.4 HB VMT per capita, the Project would be above the regional threshold even with implementation of all feasible mitigation measures. Under Method 2, the Project would result in an average HB VMT per capita of 21.4, which would be above the regional threshold of 17.4 HB VMT per capita even with implementation of all feasible mitigation measures.

While the Project is located within a suburban setting, the General Plan designation and zoning of the Project site is Urban. A 15% reduction is generally considered the maximum VMT reduction for a project in a suburban setting. In order to reduce the Project's VMT per capita to below the North County VMT threshold, more than a 15% reduction would be required, which according to CAPCOA, generally cannot be achieved. Nonetheless, all feasible Mitigation Measures have been identified for the Project. Therefore, the residential portion of the Project would have a significant and unavoidable impact on VMT.

The commercial retail component of the Project would be locally-serving retail, as it will serve the residential population of the Project and would provide local commercial retail services to the Val Verde community, which would otherwise need to travel further. Therefore, the commercial/retail portion of the Project would reduce existing VMT from the Val Verde community. Additionally, the size (21,000 square feet) is less than 50,000 square feet, which per OPR's Technical Advisory guidelines, is generally representative of locally serving. Therefore, per the screening criteria, the retail portion of the Project is presumed to have a less than significant impact on VMT. Similarly, the Project's community park would be locally serving, and would similarly result in a less than significant impact on VMT.

If you have any questions on the above material, please feel free to contact Daryl or Sandhya to discuss.

Attachment A: VMT Reduction Calculations

Project Component #1: LUT-3 Increase Diversity (Project Only)

Inputs:
The following information needs to be provided by the Project Applicant:

- Percentage of each land use type in the project (to calculate land use index)

Mitigation Method:

% VMT Reduction = Land Use * B [not to exceed 30%]

Where

Land Use = Percentage increase in land use index versus single use development = (land use index – 0.15)/0.15 (see Appendix C for detail)

Land use index = -a / ln(6) (from [2])

$$a = \sum_{i=1}^{6} a_i \times \ln(a_i)$$

a_i = building floor area of land use i / total square feet of area considered

- a_1 = single family residential
- a_2 = multifamily residential
- a_3 = commercial
- a_4 = industrial
- a_5 = institutional
- a_6 = park

if land use is not present and a_i is equal to 0, set a_i equal to 0.01

B = elasticity of VMT with respect to land use index (0.09 from [1])

not to exceed 500% increase

Source: CAPCOA

Project = 90% Residential, 4% Commercial, and 6% Park

(assumes 57.9 acres residential, 2.5 acres commercial, 3.6 acres park)

Land use index = =-(0.9*LN(0.9)+0.04*LN(0.04)+0.06*LN(0.06)+3*0.01*LN(0.01))/LN(6) = 0.3

VMT reduction = (0.3-0.15)/0.15*0.09 = 9%

Per CAPCOA a 5% reduction is the maximum achievable for a Project in a Suburban setting

Reference: **Sterling Ranch Estates VMT Impact Analysis**

Project Component #2: Increase Diversity for the Existing Community (External Capture)

Existing Residential + Project = 97% Residential, 1% Commercial, and 2% Park

(assumes 185.3 acres residential, 2.5 acres commercial, 3.6 acres park)

Land use index = =-(0.97*LN(0.97)+0.01*LN(0.01)+0.02*LN(0.02)+3*0.01*LN(0.01))/LN(6) = 0.16

VMT reduction = (0.16-0.15)/0.15*0.09 = 1%

Equation source: CAPCOA

Project Component #3: SDT-1 Improve Pedestrian Network

Mitigation Method:

Estimated VMT Reduction	Extent of Pedestrian Accommodations	Context
2%	Within Project Site and Connecting Off-Site	Urban/Suburban
1%	Within Project Site	Urban/Suburban
< 1%	Within Project Site and Connecting Off-Site	Rural

Mitigation Measure #2: SDT-2 Provide Traffic Calming Measures

Mitigation Method:

		% of streets with improvements			
		25%	*50%*	*75%*	*100%*
		% VMT Reduction			
% of intersections with improvements	*25%*	**0.25%**	**0.25%**	**0.5%**	**0.5%**
	50%	**0.25%**	**0.5%**	**0.5%**	**0.75%**
	75%	**0.5%**	**0.5%**	**0.75%**	**0.75%**
	100%	**0.5%**	**0.75%**	**0.75%**	**1%**

Source: CAPCOA

Reference: **Sterling Ranch Estates VMT Impact Analysis**

Mitigation Measure #4: SDT-3 Implement a Neighborhood Electric Vehicle (NEV) Network

Inputs:

The following information needs to be provided by the Project Applicant:

- low vs. high penetration

Mitigation Method:

% VMT reduction = Pop * Number * NEV

Where

Penetration	=	Number of NEVs per household (0.04 to 1.0 from [1])
NEV	=	VMT reduction rate per household (12.7% from [2])

Assumptions:

Data based upon the following reference:

[1] City of Lincoln, MHM Engineers & Surveyors, *Neighborhood Electric Vehicle Transportation Program Final Report*, Issued 04/05/05
[2] City of Lincoln, *A Report to the California Legislature as required by Assembly Bill 2353, Neighborhood Electric Vehicle Transportation Plan Evaluation,* January 1, 2008.

- Low Range % VMT Reduction (low penetration) = 0.04 * 12.7% = 0.5%

Source: United States Census Bureau (Accessed 7/24/2020)

In the SCAG region, about 5.0 percent of all workers telecommute or work from home on a daily basis according to the American Communities Survey (ACS). Separating out the self-employed, the number of full-time telecommuters in the SCAG region is closer to 2.6 percent percent for 2013. Currently, telecommuting is limited to "knowledge-based" workers including some management functions. However, knowledge based workers exist in most industries, allowing some occasional telecommuting.

Source: SCAG 2016 RTP/SCS

Reference: **Sterling Ranch Estates VMT Impact Analysis**

Mitigation Measure #1: Provide Community Wi-Fi to Encourage Telecommute/Telework

TELECOMMUTING/WORK-AT-HOME/FLEXIBLE WORK SCHEDULES

Increasing the number of workers who work-at-home (self-employed, home-based business owners) or who telecommute/telework (wage and salary employees conducting some or all of their work from home or remotely) decreases home-based work trips, VMT, congestion, air pollution and GHGs.

Telecommuting/teleworking can be defined as working outside the traditional office or workplace, usually at home, but also remotely while traveling, at client/customer workplaces, libraries and other Internet accessible locations.

Flexible work schedules involve adjusting hours an employee works, for example working 7:00 to 3:30, or 10:00 to 6:30 instead of 9:00 to 5:30. It also includes 9/80 and 10/40 schedules where employees work nine, nine hour days a pay period or eight, 10 hour days per pay period.

According to the AQMD Rule 2202 Employee Commute Reduction Program (ECRP) data, roughly eight to nine percent of all workers in the South Coast Air Basin utilized a flexible work schedule in the last 15 years.

SCAG defines three types of **teleworkers** based on their home and primary work locations:

- **Self-employed home workers,** for whom home is their primary work location;
- **Remote employee home workers,** who work remotely from home and do not regularly commute to their firm's location; and
- **Telecommuters,** who are defined by one travel behavior characteristic on the teleworking day: they do not make a commute tour (i.e., a minimum of two trips that begin or end at home, with a stop at a regular work location in between these home ends).

According to the American Communities Survey, the percentage of employees who work from home in the SCAG region has grown from 2.64 percent in 1990 to 5.67 percent in 2017. The growth has been more pronounced since 2010, especially in the last few years.

Source: SCAG Connect SoCal 2020 RTP/SCS

Reference: **Sterling Ranch Estates VMT Impact Analysis**

Assumptions:

- Per SCAG's Connect SoCal 2020 RTP/SCS 5.67% of employees "Worked at Home" in the SCAG region. Of those, 2.9% are full-time telecommuters. (assumes same proportion of teleworkers per 2016 RTP/SCS (.026/.05 = 0.52) therefore (0.52 x 0.567 = 0.29))
- Per ACS the current rate for the community area (Census Tract 9201.06) that "Work from Home" is 2.4%
- Per ACS the current rate for the community area that "Worked at Home", separating out the self-employed, is 1% full time telecommuters (per SCAG RTP/SCS methodology).
- Providing internet accessible locations (i.e., free WIFI at the retail center and park) encourage more employees in the community to telework and will help increase the community area telecommuting/telework levels (1%) closer to SCAG regional levels (2.9%). An increase of 1.9%.
- Assume a conservative 1% increase in telework instead of 1.9% that would bring telework levels to 2.9% SCAG regional levels

Step 1: Calculate the increase in employees that would telework in the community.

Census Tract 9201.06 total number of workers = 1,779

Census Tract 9201.06 total number of households = 922

Workers per household = 1779 / 922 = 1.93

Total additional community workers telecommuting = 1,779 workers x 1% = 18 workers

Step 2: Calculate the increase in employees that would telework in the Project.

Number of households = 222

Number of workers = 222 x 1.93 (based on existing census rate) = 428

Total Project workers that telecommuting = 428 x 1% = 4

Step 3: Calculate the increase in total number of teleworkers in the community and the Project. Calculate equivalent Project Commute VMT reduction.

Community + Project:

Total Project workers + Community workers = 18 + 4 = 22

Project Commute Equivalent

% Project Commute VMT reduction = 22 workers / 428 workers = 5.1%

5.1% reduction in commute VMT

Reference: **Sterling Ranch Estates VMT Impact Analysis**

Step 4: Convert commute VMT reduction % (HBW VMT) to total VMT reduction % (HB VMT) by calculating the proportion of HBW trips from all HB trips. HBW Trips = home-based work, commute trips HB Trips = All home-based trips, including commute trips (HBW) Caltrans CSTDM TAZ 3614 HBW VMT = 67,550 HBW VMT Caltrans CSTDM TAZ 3614 Total HB VMT = 174,445 HB VMT 67,550 HBW VMT / 174,445 HB VMT = 0.39 Therefore, 39% of all home-based trips are commute trips (HBW). **Step 5: Calculate total VMT reduction** % Total VMT reduction = .051 x .39 = .02 2% Home-based VMT reduction

Executive Summary

This report, prepared by Stantec Consulting Services Inc. (Stantec), presents the findings of a traffic study carried out to determine the potential traffic impacts of the Sterling Ranch Estates Project, Vesting Tentative Tract Map (VTTM) 60257. The Project site is located in unincorporated Los Angeles County within the Santa Clarita Valley, northwest of the City of Santa Clarita within the Castaic/Val Verde Community. The Project site is accessed via Chiquito Canyon Road to the south and Del Valle Road to the north. It is divided roughly into two halves by the proposed extension of Chiquito Canyon Road (as Sterling Parkway) through the Project site along with the realignment of Del Valle Road within the Project site.

The Project includes the construction of 221 single-family dwelling units (DU), a 21,000-square foot neighborhood retail commercial center at the northwest corner of Chiquito Canyon Road and Hunstock Street, and a 3.1-acre neighborhood park. This traffic study complies with the County's thresholds of significance criteria, the methodologies of the California Department of Transportation (Caltrans), and the Los Angeles County Congestion Management Plan (CMP) requirements.

The Project would generate 3,309 average daily trips, with 204 trips occurring during the AM peak hour and 326 trips occurring during the PM peak hour. The Project trip distribution patterns were derived from the Santa Clarita Valley Consolidated Traffic Model (SCVCTM) and were applied to the peak hour trip generation estimates to produce the estimates of Project traffic.

The analysis in this report is based on traffic conditions for the following scenarios and evaluates the AM and PM peak hour settings for determination of Project impacts:

- Existing conditions – Without Project
- Existing conditions – With Project
- Cumulative Conditions – With Project

The extension of Chiquito Canyon Road (as Sterling Parkway) will provide access to the Project site and will include four new intersections with local roadways constructed within VTTM 60257.

The on-site and local street intersections that would be used to access the Project site were also evaluated under 2035 General Plan Buildout conditions using forecast peak hour turning movement volumes. Based on the analysis, the proposed on-site intersections would operate at an acceptable LOS.

The results of the Project impact analyses for Existing-plus-Project and for cumulative conditions with Project are summarized in detail in Chapter 3.0 of this report.

The Project's impacts will be less than significant at the study intersections under Existing-plus-Project conditions based on County or Caltrans impact criteria.

However, under cumulative with Project conditions the following intersections experience a cumulative significant impact based on the applicable LA County or Caltrans methodology prior to mitigation:

1. Chiquito Canyon Road & SR-126 (County/Caltrans)
4. Del Valle Road & Hasley Canyon Road (County)
5. Commerce Center Drive & Hasley Canyon Road (County)
6. The Old Road & I-5 SB Ramps at Sedona Way (County/Caltrans)
14. Wolcott Way & SR-126 (County/Caltrans)

Mitigation is identified for each of the above intersections which experience a cumulative impact. With mitigation, the cumulative impacts are less than significant. Note that the cumulative impacts at the Caltrans intersection 11, Commerce Center Drive and SR-126 WB Ramps, which is forecast to operate at LOS C using Caltrans methodology, will be less than significant based on Caltrans criteria and therefore mitigation is not required for that location.

The following intersections exceed an acceptable LOS based on the HCM methodology utilized by Caltrans for intersection analysis.

1. Chiquito Canyon Road & SR-126 (County/Caltrans)
6. The Old Road & I-5 SB Ramps at Sedona Way (County/Caltrans)
14. Wolcott Way & SR-126 (County/Caltrans)

Roadway improvements have been identified to mitigate the intersections that are significantly impacted under cumulative conditions. The identified mitigation measures and the Project's fair share of the mitigation cost are summarized in Table ES-1 on the following page.

A Congestion Management Program (CMP) analysis of the Project's traffic impacts on the CMP highway shows that the Project's impacts on the CMP monitoring locations or to transit would be less than significant.

Table ES-1 Cumulative Mitigation Measures and Project Fair-Share Percentages

Int #	Location	Mitigation	Project Traffic Share %
		County Intersections	
4	Del Valle Road & Hasley Canyon Road	Install traffic signal Intersection modification to provide one northbound left-turn lane, one northbound free-flow right-turn lane, and one westbound left-turn lane	18.6%
5	Commerce Center & Hasley Canyon Road	Intersection modification to restripe the eastbound shared left and through lane to a shared left, through and right lane (for 1EB Left, 1 shared EB Left/Through/Right and 1 EB Right)	10.3%
		County/Caltrans Intersections	
1	Chiquito Canyon Road & SR-126	Intersection modification to provide two southbound left-turn lanes, three southbound through lanes, one southbound right-turn lane (for 2 SB Left, 3 SB Through and 1 SB Right), two westbound left-turn lanes, three westbound through lanes, one westbound right-turn lane (for 2 WB Left, 3 WB Through and 1 WB Right), two northbound left-turn lanes, two northbound through lanes, two northbound right-turn lanes (for 2 NB Left, 2 NB Through and 2 NB Right), two eastbound left-turn lanes, three eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 3 EB Through and 1 EB Right). Install traffic signal[1]	1.2%
6	The Old Road & I-5 SB Ramps (at Sedona Way)	Intersection modification to add one southbound left-turn lane (for 2 SB Left and 2 SB Through)	0.6 %
14	Wolcott Way & SR-126	Intersection modification to provide two southbound left-turn lanes, one southbound through lane, one southbound right-turn lane (for 2 SB Left, 1 SB Through and 1 SB Right), two westbound left-turn lanes, four westbound through lanes, one westbound right-turn lane (for 2 WB Left, 4 WB Through and 1 WB Right), one northbound left-turn lanes, one northbound through lanes, two northbound right-turn lanes (for 1 NB Left, 1 NB Through and 2 NB Right), two eastbound left-turn lanes, four eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 4 EB Through and 1 EB Right)	0.9%

Note:
[1]Improvements identified in Caltrans SR-126 PSR
The Caltrans intersection of Commerce Center Drive and SR-126 WB Ramps is forecast to operate at LOS C and is not significantly impacted based on Caltrans methodology, therefore mitigation is not required for that location.
See Appendix D for fair-share calculations

1.0 INTRODUCTION

This report presents the findings of a traffic study conducted to evaluate the potential impacts of the Sterling Ranch Estates Project, Vesting Tentative Tract Map (VTTM) 60257. The Project site is located in unincorporated Los Angeles County within the Santa Clarita Valley, northwest of the City of Santa Clarita within the Castaic/Val Verde Community. Specifically, the Project site comprises an area immediately north of the existing Val Verde Community. The site is accessed via Chiquito Canyon Road and Del Valle Road. It is divided roughly into two halves by the proposed extension of Chiquito Canyon Road (as Sterling Parkway) along with the realignment of Del Valle Road.

1.1 PROPOSED PROJECT

The location of the Project site is shown in Figure 1-1. The Project includes the construction of 221 single-family dwelling units (DU), a 21,000-square foot neighborhood retail commercial center on 2.04 acres at the northwest corner of Chiquito Canyon Road and Hunstock Street, and a 3.1-acre neighborhood park. The Project site plan is illustrated in Figure 1-2 and a conceptual commercial site plan is illustrated in Figure 1-3.

1.2 STUDY AREA

The study area for the local roadway network is shown in the previously referenced Figure 1-1. The study area generally includes intersections and freeway ramps where the Project would add 50 or more trips during either the AM or PM peak hour.

1.3 METHODOLOGY

The traffic study evaluates the Project utilizing the established traffic analysis guidelines of the County of Los Angeles (See Reference 3 in Section 1.6). The scenarios analyzed are as follows:

1. Existing Conditions
2. Existing Plus Project Conditions
3. Cumulative Conditions with Project

The analysis addresses both the Existing plus Project scenario that assumes full buildout of the Project and the Cumulative Conditions scenario which includes buildout of the Project as well as the related projects in the proximity of the study area. Impact methodology for each setting is discussed in the next section.

The Santa Clarita Valley is a growing area with numerous proposed, approved and pending projects (i.e., “Related Projects”), and the Santa Clarita Valley Consolidated Traffic Model (SCVCTM) is utilized to forecast the complex interaction of vehicle trips between existing and these future land uses.

The SCVCTM was developed jointly by the County of Los Angeles Department of Public Works and the City of Santa Clarita and is the primary tool used for forecasting traffic volumes for the Santa Clarita Valley. The SCVCTM provides traffic volume forecasts for a long-range setting, which represents buildout conditions (generally considered as year 2035 or later as well as Interim Year forecasts that are based on a defined list of planned, approved, and pending

projects (i.e., Related Projects). The SCVCTM is regularly updated with known cumulative projects and the buildout version of the model is based on the currently approved General Plans of the County and City of Santa Clarita, and the One Valley One Vision (OVOV) Area Plan. For this analysis, the interim year version of the model was used to forecast traffic data for cumulative plus Project conditions.

To assess the level of service for the roundabout intersections, specialized software (Sidra Intersection) is used. Sidra Intersection is a micro-analytical modeling software widely accepted for roundabout analysis and is recognized by the HCM 2010 and the TRB-FHWA Roundabout Guide.

1.4 PERFORMANCE CRITERIA

The impact analysis is based on specific performance criteria which are outlined in the following paragraphs. Where appropriate, mitigation measures are identified when the analysis indicates the Project's impacts or cumulative impacts will exceed established impact thresholds.

In traffic impact studies, impact criteria are based on two primary measures. The first is "capacity," which establishes the vehicle carrying ability of a road segment, and the second is "volume". The volume measures is either a traffic count (in the case of existing volumes) or a traffic forecast for a future point in time. The ratio between the volume and the capacity gives a volume/capacity (V/C) ratio, and based on that V/C ratio, a corresponding level of service (LOS) is defined. Traffic LOS is designated "A" through "F" with LOS "A" representing free flow conditions and LOS "F" representing severe traffic congestion. Traffic flow quality for each LOS is described in Table 1-1 for arterial roadways and intersections.

Both the V/C ratio and the LOS are used in identifying significant impacts. Certain LOS values are deemed unacceptable and increases in the V/C ratio that cause or contribute to the LOS being unacceptable are defined as a significant impact. Note that while the Caltrans guidelines for the preparation of traffic studies (see Reference 4 in Section 1.6) recommend the HCM 2010 method for the evaluation of State highway facilities, those guidelines do not include a threshold of significance criteria for the determination of a significant Project impact that is based on the HCM 2010 methodologies. While the Caltrans guidelines do not identify specific impact criteria due to differences between rural and urban areas of the State, as well as differences between the northern, central, and southern regions, the local Caltrans District will determine the impact criteria based on the appropriate requirements of that District. As such, the thresholds of significance criteria specified by the local agencies (i.e., Caltrans District 7, County of Los Angeles, and the LA County CMP) are utilized. For this analysis a LOS D threshold is used for Caltrans ramp-arterial intersections consistent with Caltrans methodology for suburban areas.

In establishing V/C based performance criteria, there are certain items that need to be addressed to obtain suitable V/C estimates and relate them to LOS. For instance, while average daily traffic (ADT) is a useful measure to show general levels of traffic on a facility and to provide data for other related aspects such as noise and air quality, highway congestion is largely a peak hour or peak period occurrence and ADT does not reflect peak period conditions very effectively. Because of this, ADT is not used here as the basis for capacity evaluation but instead this evaluation focuses on those parts of the day when such congestion can occur, specifically the AM and PM peak hours.

Table 1-1 Level of Service Descriptions – Arterial Roadways and intersections

LOS	Traffic Flow Description	ICU	Signal & Roundabout Control Delay	Stop Control Delay
A	 Minimal or no vehicle delay	0.00 – 0.60	≤ 10	≤ 10
B	 Slight delay to vehicles	0.61 – 0.70	> 10 – 20	> 10 – 15
C	 Moderate vehicle delays, traffic flow remains stable	0.71 – 0.80	> 20 – 35	> 15 – 25
D	 More extensive delays at intersections	0.81 – 0.90	> 35 – 55	> 25 – 35
E	Long queues create lengthy delays	0.91 – 1.00	> 55 – 80	> 35 – 50
F	 Severe delays and congestion	> 1.00	> 80	> 50

Sources: Congestion Management Program of Los Angeles County; HCM 2010
ICU = Intersection Capacity Utilization
Delay = average seconds of delay per vehicle

LOS for arterial roadway intersections and for freeway mainline segments are determined based on operating conditions during the AM and PM peak hours. For intersections, the intersection capacity utilization (ICU) methodology is applied, providing a planning level basis for determining V/C and LOS. This methodology sums the V/C ratios for the critical movements of an intersection and is the preferred procedure of the County of Los Angeles for intersection analysis.

The ICU calculation methodology and associated impact criteria for the study area arterial system are summarized in Table 1-2. The County utilizes a variable scale of ICU impact that is based on the pre-Project LOS.

1.5 DEFINITIONS

Certain terms used throughout this report are defined below to clarify their intended meaning:

ADT	Average Daily Traffic. Generally used to measure the total two-directional traffic volumes passing a given point on a roadway.
ICU	Intersection Capacity Utilization. A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of intersection volumes.
LOS	Level of Service. A scale used to evaluate circulation system performance based on intersection ICU values or volume/capacity ratios of arterial segments.
Peak Hour	This refers to the hour during the AM peak period (typically 7 AM - 9 AM) or the PM peak period (typically 3 PM - 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.
V/C	Volume to Capacity Ratio. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection.

Table 1-2 Arterial Intersection Performance Criteria

Calculation Methodology

Level of service to be based on peak hour intersection capacity utilization (ICU) values calculated using the following assumptions:

Saturation Flow Rates:

County Methodology: 1,600 vehicles/hour/lane for through lanes, right-turn lanes, and single left-turn lanes
2,880 vehicles/hour/lane for dual left-turn lanes (total of both lanes)

Clearance Interval: 0.10

Sidra delay-based intersection methodology for roundabouts

Performance Standards

County: LOS D (peak hour ICU less than or equal to 0.90) for new and/or future intersections for buildout conditions
Mid-LOS C (peak hour ICU less than 0.75) or existing LOS, whichever is greater, for existing intersections

Caltrans: LOS D or existing LOS, whichever is greater

LOS D defined as -
stopped delay to not exceed 50 seconds for roundabouts

Significant Impact Thresholds[1]

An intersection is considered to be significantly impacted if the Project increases the ICU by an amount equal to or greater than the amounts set forth below:

County Thresholds:	Pre-Project ICU	Project Increment
	0.71 - 0.80 (LOS C)[2]	greater than or equal to 0.04
	0.81 - 0.90 (LOS D)	greater than or equal to 0.02
	0.91 or more (LOS E & F)	greater than or equal to 0.01

[1]Note: For intersections under joint jurisdiction of the County and Caltrans or Caltrans, the analysis utilizes the corresponding threshold of the agency with responsibility for the operation of the intersection, which is typically Caltrans.

[2]Note: The County guidelines do not address situations where pre-Project conditions are less than 0.71. In that situation, County staff has interpreted the guidelines to mean that an increase resulting in a with-Project condition of 0.75 or more is considered significant. The interpretation is based on the following scenario, which is addressed by the guidelines: 0.71 (pre-Project) + 0.04 (Project increment) = 0.75 and is a significant impact.

Abbreviations:
LOS – Level of Service
ICU – Intersection Capacity Utilization

2.0 PROJECT DESCRIPTION

This section describes the Project in terms of its transportation characteristics. Trip generation is summarized and the distribution of residential and commercial Project trips on the adjoining roadway network is presented. The County Master Plan of Highways is shown in Figure 2-1.

2.1 PROJECT TRIP GENERATION

As previously outlined, the Project includes 221 single-family dwelling units, a 21,000-square foot neighborhood retail commercial center, and a 3.1-acre neighborhood park. Table 2-1 summarizes the anticipated trip generation of the Project. The trip generation is based on the trip generation rates from Institute of Transportation Engineers (ITE) Trip Generation Manual (see Reference 1 in Section 1.6). For the neighborhood retail commercial center, the trip generation rate is available for a very broad spectrum of case studies ranging from 9 TSF to 1,510 TSF of Gross Leasable Area (GLA). Therefore, given the Project's 21,000-square foot neighborhood retail commercial center, the trip rate data is filtered for a range of 9-100 TSF GLA and the resulting trip generation rate is used for analysis of the Project. See Appendix A for ITE trip generation data.

Table 2-1 Trip Generation Summary

Scenario	Amount	Unit	AM Peak Hour			PM Peak Hour			ADT
			In	Out	Total	In	Out	Total	
Trip Rates									
Single-Family Detached Housing (210)	-	DU	0.19	0.56	0.74	0.62	0.37	0.99	9.44
Shopping Center (820)[1]	-	TSF	1.69	1.08	2.77	3.48	3.78	7.26	83.01
Public Park (411)		Acres	0.01	0.01	0.02	0.06	0.05	0.11	0.78
Trip Generation									
Single-Family	*221*	*DU*	*41*	*123*	*164*	*138*	*81*	*219*	*2,086*
Internal Capture (Residential)[2]	-	-	2	4	6	8	7	15	174
Total Residential Trips			**39**	**119**	**158**	**130**	**74**	**204**	**1,912**

Total Retail Trips			**28**	**18**	**47**	**59**	**63**	**122**	**1,395**
Public Park	*3.1*	*Acres*	*0*	*0*	*0*	*0*	*0*	*0*	*2*
Total New Trips			***67***	***137***	***204***	***189***	***137***	***326***	**3,309**

Trip Rate Source: Institute of Transportation Engineers (ITE), 10th Edition, 2017, with ITE code in parentheses
[1] Shopping Center rate is based on the filtered data set
[2] Internal capture based on 10% of Retail trip generation
[3] Pass-by trips based on 10% of Retail trip generation
ADT - Average Daily Trips; DU - Dwelling Units

The trip generation estimates show that the proposed Project would result in approximately 3,309 ADT, with 204 trips occurring in the AM peak hour (137 outbound) and 326 trips occurring in the PM peak hour (189 inbound).

2.2 PROJECT TRIP DISTRIBUTION

The distribution percentage of Project trips is broken down into residential-based and commercial-based trips for the Projects study area. The distribution is illustrated in Figure 2-2 and Figure 2-3 for the Project's residential and commercial uses, respectively. The Project distribution percentages were derived from the SCVCTM and were applied to the peak hour trip generation estimates noted previously in Table 2-1.

Approximately 78 percent of the Project's residential trips are oriented to the north via Del Valle Road and approximately 20 percent of the Project's residential trips are oriented to the south via Chiquito Canyon Road. The remaining 2 percent of residential trips interact with the commercial site. Approximately 39 percent of the Project's retail trips are oriented to the north via North Del Valle Road and approximately 6 percent of the Project's retail trips are oriented to the south via Chiquito Canyon Road. The remaining 55 percent of the Project's retail trips are local trips within the existing Val Verde neighborhood.

Figure 2-4 and Figure 2-5 illustrate the Project's AM and PM peak hour traffic volume projections for the residential component of the Project and Figure 2-6 and Figure 2-7 illustrate the corresponding AM and PM peak hour volumes for the Project's retail component. Figure 2-8,Figure 2-9, and Figure 2-10 illustrate the total Project trips (residential and commercial) for ADT as well as the AM and PM peak hours.

2.3 ON-SITE ROADWAY SYSTEM

Access to the Project site will be provided via an extension of Chiquito Canyon Road (as Sterling Parkway) that will intersect with Del Valle Road to create a new alignment, dividing VTTM 60257 roughly in half. This new alignment will include three newly constructed intersections with local roadways constructed within VTTM 60257 and a fourth new intersection with Del Valle Road. The access to and from the commercial retail center will be provided via three driveways, one on Hunstock Street just west of Chiquito Canyon Road/Sterling Parkway, another on Sterling Parkway just north of Hunstock Street, and a third on B Street (VTTM 60257) just west of Sterling Parkway as shown previously in Figure 1-3.

The Project's on-site "B" Street roadway will provide a connection to the existing Lexington Drive. Given the orientation of the Project site in relation to the primary access roadways for the community, no Project traffic is anticipated to utilize Lexington Drive as it would represent a significantly more circuitous route to typical destinations. The connection will provide a more direct and convenient route for the existing residents along Lexington Drive to access Del Valle Road, thereby reducing traffic volumes along various streets within that portion of Val Verde.

Chiquito Canyon Road from Del Valle Road to SR-126 and Del Valle Road from Chiquito Canyon Road to Hasley Canyon Road is designated as a Limited Secondary Arterial Highway in the County Highway Plan as shown previously in Figure 2-1. SR-126 is designated as an Expressway. Hasley Canyon Road between Del Valle Road and Commerce Center Drive is designated as Secondary Highway. Commerce Center Drive south of Hasley Canyon and Hasley Canyon north of Commerce Center Drive are designated as Major Highways.

Figure 2-10

Total Project Trips - PM Peak Hour

2.12

Forecast peak hour turning movement volumes for the 2035 General Plan buildout conditions for the intersections used to access the Project site are illustrated in Figure 2-11 and Figure 2-12 for the AM and PM peak hours respectively. The peak hour traffic volumes referenced above were utilized to derive the intersection lane configurations. Intersection capacity analysis based on these lanes and the forecast peak hour volumes is summarized in Table 2-2. As shown, each of the on-site Project intersections is anticipated to operate at LOS C or better for long-range buildout conditions. ICU calculation worksheets for the intersections are provided in Appendix C.

Table 2-2 Intersection LOS Summary – Project Site and Local Streets (2035 General Plan Buildout Conditions)

Int #	Intersection Name	AM Peak Hour		PM Peak Hour	
		ICU	LOS	ICU	LOS
2	Chiquito Canyon Road & San Martinez	0.67	B	0.80	C
3	Chiquito Canyon Road/Sterling Parkway & Hunstock Street	0.57	A	0.60	A
4	Del Valle Road & Hasley Canyon Road	0.73	C	0.74	C
20	Sterling Parkway & “B” Street (VTTM 60257)	0.55	A	0.57	A
21	Sterling Parkway & “A” Street/Del Valle Road (VTTM 60257)	0.56	A	0.57	A
22	Del Valle Road & “F” Street/”H” Street (VTTM 60257)	0.59	A	0.60	A
23	Del Valle Road & “M” Street/”I” Street (VTTM 60257)	0.59	A	0.61	B

2.3.1 Public Transportation

The Project site is currently serviced by City of Santa Clarita Transit (SCT) Route 2. The nearest bus stop is approximately 1.5 miles away from the Project site on Del Valle Road, just north of Hunstock Street. SCT Route 2 operates along Chiquito Canyon Road, Del Valle, Hasley Canyon east of Del Valle Road, Commerce Center Drive and SR-126. It provides services between Val Verde Park and the McBean Regional Transit Center. Figure 2-13 shows the map of SCT Route 2 in the area of the Project site.

SCT Commuter Express offers express commuter bus travel to Los Angeles, Warner Center, Van Nuys, Century City and the Antelope Valley and can be access from the McBean Regional Transit Center. Three Metrolink stations exist within the City of Santa Clarita, which serve the Antelope Valley line. This line travels between Lancaster and Union Station, Los Angeles.

2.3.2 Active Transportation

The County of Los Angeles adopted the 2012 Bicycle Master Plan in March 2012 and it provides a comprehensive overview of the state of bicycling and walking in the County as well as direction for future investments in bicycle and pedestrian facilities programs. Figure 2-14 illustrates the existing and planned future bicycle facilities in the area.

The Project site and surrounding area currently do not contain bike paths or roadways with bike lanes. However, a future Class II Bike Lane along Hasley Canyon Road as well as along The Old Road, and a Class III Bike Route along Chiquito Canyon Road are identified in the County plan.

3.0 TRAFFIC IMPACT ANALYSIS

This chapter addresses the traffic impacts of the Project. Existing conditions are first summarized, followed by the cumulative setting against which Project impacts are evaluated. The following sections summarize the results of the analysis of the study area.

3.1 EXISTING CONDITIONS

The study area used for this analysis includes intersections where the Project could potentially result in a significant impact. The study area intersections are under the jurisdiction of Los Angeles County, Caltrans or jointly between Los Angeles County and Caltrans.

The study area includes the intersections of the arterial roadways generally spanning the distance between the Project site and SR-126 to the south, Hasley Canyon Road to the north, and I-5 to the east. The distance from the Project site to SR-126 is approximately two miles to the south and the distance to Hasley Canyon Road is approximately one mile to the north. The I-5 freeway is approximately two miles to the east of the Project site and is accessed via a modern interchange at Hasley Canyon Road.

County arterial highways near the Project site consist of Chiquito Canyon Road and Del Valle Road. The SR-126 provides regional access to the site and can be accessed via an intersection with Chiquito Canyon Road. The study area is illustrated in the previously referenced Figure 1-1 and consists of 14 intersections. The existing roadway network in the study area is illustrated in Figure 3-1 in the form of intersection lane configurations for the intersections being studied.

Illustrations of existing conditions for ADT and for peak hour turning movement volumes at each study area intersection can be found in Figure 3-2, Figure 3-3 and Figure 3-4 for the ADT, AM peak hour, and PM peak hours respectively. These traffic counts were collected in late 2017 and early 2018. Copies of the traffic count data sheets are provided in Appendix B.

A summary of the existing ICUs and intersection delay, and the corresponding LOS of the study area intersections is provided in Table 3-1. The intersections are grouped based on jurisdiction. The control type of each intersection, whether stop controlled, signalized or a roundabout is also shown in the table.

The intersections are evaluated using the methodology described in the previous Chapter. The table shows that each intersection currently operates at LOS B or better. Detailed ICU and LOS calculation worksheets are provided in Appendix C.

3.2 EXISTING CONDITIONS – WITH PROJECT

The ADT volumes for Existing plus Project conditions for the study area circulation system are illustrated in Figure 3-5. Illustrations of peak hour turning movement volumes can be found in Figure 3-6 for the AM peak hour and Figure 3-7 for the PM peak hour. Peak hour ICU and delay values, and LOS that correspond with the existing traffic and Existing plus Project traffic forecasts can be found in Table 3-2, which provides a comparison between the no-Project and the with-Project conditions. The evaluation of County intersections is prepared using ICU methodology, the evaluation of Caltrans signalized intersections is based on HCM methodology using Synchro software, and the evaluation of roundabouts is based on HCM methodology using Sidra methodology.

The Project's impacts are less than significant in both the AM and PM peak hour conditions based on County and Caltrans criteria as shown in Table 3-2 below. Each of the study intersections are forecast to operate at LOS C or better with Project traffic added. The two signalized intersections under Caltrans jurisdiction are forecast to operate at LOS B with Project traffic. The two roundabout intersections are forecast to operate at LOS C or better with Project traffic.

3.3 CUMULATIVE CONDITIONS ANALYSIS

The purpose of the cumulative conditions impact analysis is to evaluate the Project's impacts in the context of other approved, planned or anticipated projects (also referred to as an "Existing plus Project plus related projects" analysis). The intent of the analysis is to determine the combined impact of Project and related project traffic. This is in contrast to the direct impact of the Project traffic only, which was evaluated in Section 3.2. If the combined impact of Project and related project traffic triggers a significant impact, the Project will pay its fair-share of mitigation that offsets the Project's share of the combined impact.

Several significant land development projects are planned or are under construction in the immediate vicinity of the Project site. In addition, numerous other projects are at various stages of development throughout the Santa Clarita Valley. Due to the complexity of estimating future traffic volumes for a large number of cumulative projects, a traffic model is utilized for forecasting a cumulative conditions scenario. As previously discussed in Section 1.0, cumulative conditions traffic volumes presented in this analysis are derived by the SCVCTM, which is a sophisticated travel demand model maintained by the City of Santa Clarita.

The cumulative version of the SCVCTM includes the approved, pending and proposed development within the Santa Clarita Valley. Where specific development projects have not yet been proposed, the model includes future land uses as allowed by the current County and City General Plans. For the purpose of this analysis, a listing of projects from the County's Department of Regional Planning GIS-NET3 has been referenced. The SCVCTM was then reviewed to confirm that these cumulative projects are included. The SCVCTM also includes cumulative projects with the City of Santa Clarita.

Table 3-2 Intersection LOS Summary – Existing Plus Project

Figure 3-7

Existing Plus Project Volumes - PM Peak Hour

3.11

Table 3-3 summarizes the cumulative projects within the vicinity of the Project site as well as other significant cumulative projects that are within the Santa Clarita Valley but are further from the Project site. The SCVCTM utilizes a comprehensive database of cumulative projects when developing traffic forecasts and, as such, includes more projects than those listed here. The SCVCTM also includes factors for regional growth. A location map of the cumulative projects within the vicinity of the Project site is provided in Figure 3-8.

The impact analysis for cumulative conditions is based on the buildout year of the Project as well as the known cumulative projects within the study area. A horizon year of 2028 is utilized for this analysis to encompass the broad range of cumulative projects. All the intersections assume existing lane configuration except Intersections 1, 13 and 14 which assume improvements to be constructed by other nearby projects for the purpose of site access, such as construction of the south leg of the SR-126 intersections at Chiquito Canyon Road and at Wolcott Way, as well as the southerly extension of Commerce Center Drive south of Henry Mayo Drive.

Forecast ADT volumes for cumulative with Project conditions are from the SCVCTM and are illustrated in Figure 3-9. Peak hour turning movement volumes for cumulative with Project conditions for the intersections in the study area are illustrated in Figure 3-10 for the AM peak hour and in Figure 3-11 for the PM peak hour.

Peak hour ICU and delay values, and the corresponding LOS can be found in Table 3-4, which provides a comparison between cumulative conditions with the proposed Project to the existing conditions, in accordance with the County's impact analysis guidelines.

Table 3-4 shows that the following intersections experience a cumulative significant impact based on the applicable LA County or Caltrans methodology prior to mitigation. Mitigation that addresses these impacts is presented in the next section.

1. Chiquito Canyon Road & SR-126 (County/Caltrans)
4. Del Valle Road & Hasley Canyon Road (County)
5. Commerce Center Drive & Hasley Canyon Road (County)
6. The Old Road & I-5 SB Ramps (at Sedona Way (County/Caltrans)
14. Wolcott Way & SR-126 (County/Caltrans)

Mitigation is addressed for all the above intersections which experience a cumulative impact under both County and Caltrans criteria. With mitigation, the cumulative impacts are less than significant. A peak hour traffic signal warrant analysis was conducted for the intersection of Del Valle Road and Hasley Canyon Road for existing and cumulative conditions with Project, discussed further in the Section 3.4. Note that the cumulative impacts at the Caltrans intersection of 11. Commerce Center Drive and SR-126 WB Ramps, which is forecast to operate at LOS C using Caltrans methodology, will be less than significant based on Caltrans criteria and therefore mitigation is not required for that location.

As noted above, the intersection of Commerce Center Drive and SR-126 WB Ramps, which operates under the jurisdiction of Caltrans, is forecast to operate at LOS C based on Caltrans LOS methodology, but LOS D based on County methodology. This intersection was recently constructed as part of a Project to construct the grade separated interchange for Commerce Center Drive at SR-126. Since the intersection has been fully improved to its planned configuration based on the Caltrans Project Report for this location, and since it is forecast to operate at an

Bold – denotes significant impact (See Table 1-2 for criteria)
[1] Values in parentheses indicate average delay (seconds/vehicle) and LOS based on HCM delay methodology
[2] Not a significant impact under Caltrans methodology due to LOS D or better conditions based on Caltrans HCM delay calculation (See Appendix C for Delay worksheets)
[3] Roundabouts are calculated using Delay Methodology

acceptable LOS C as set forth in the Caltrans Project Report, the location is not considered significantly impacted and mitigation is not required.

The following intersections exceed an acceptable LOS based on the HCM methodology utilized by Caltrans for intersection analysis.

1. Chiquito Canyon Road & SR-126 (County/Caltrans)
6. The Old Road & I-5 SB Ramps (at Sedona Way (County/Caltrans)
14. Wolcott Way & SR-126 (County/Caltrans)

The two roundabout intersections under joint County/Caltrans jurisdiction will operate at LOS D or better with Project traffic in the cumulative setting. These intersections, which are either under joint County/Caltrans jurisdiction or entirely under Caltrans jurisdiction, are not cumulatively impacted since they are forecast to operate at LOS D or better under cumulative with Project conditions.

3.4 MITIGATION

Roadway improvements have been identified to mitigate the cumulative impacts identified in the previous section. Table 3-5 lists the identified mitigation measures to address cumulative impacts in the cumulative conditions setting. As the identified impacts are cumulative impacts, the Project is responsible for its fair-share of the costs of the identified mitigation measures. The Project's fair-share of the cumulative impact for each location is also shown in the Table 3-5. The fair-share costs for the Project is based on a percentage that is calculated by dividing the volume of peak hour Project traffic by the total volume of new peak hour cumulative traffic. Fair-share calculations are shown in Appendix E. The Project site is not located within one of the County's Bridge and Major Thoroughfare (B&T) District.

A peak hour traffic signal warrant analysis was conducted for the intersection of Del Valle Road and Hasley Canyon Road for existing and cumulative conditions with the Project as illustrated in Figure 3-12 and Figure 3-13, respectively.

For Existing plus Project conditions, the total vehicles per hour (vph) of both approaches for Hasley Canyon Road is 382 and 584 during AM and PM peak hours, respectively. Del Valle Road represents the higher volume approach of the minor street with 14 vph during AM peak hour and 29 vph during the PM peak hour. Plotting these points based on the peak hour warrant criteria indicates that a traffic signal is not warranted at the intersection since the volumes fall below the curve for the applicable type of roadway (one major lane and one minor lane).

Similarly, for cumulative with Project conditions, the total vehicles per hour (vph) of both approaches for Hasley Canyon Road is 880 and 1130 during AM and PM peak hours, respectively. Del Valle Road represents the higher volume approach of the minor street with 120 vph during AM peak hour and 90 vph during the PM peak hour. Plotting these points on the peak hour warrant criteria, a traffic signal is warranted at the intersection since the volumes fall above the curve for the applicable type of roadway (one major lane and one minor lane). Based on the results, a traffic signal is not warranted at the intersection during Existing plus Project conditions, but a signal is warranted under cumulative with Project conditions.

Figure 3-12 Signal Warrant – Existing plus Project Conditions

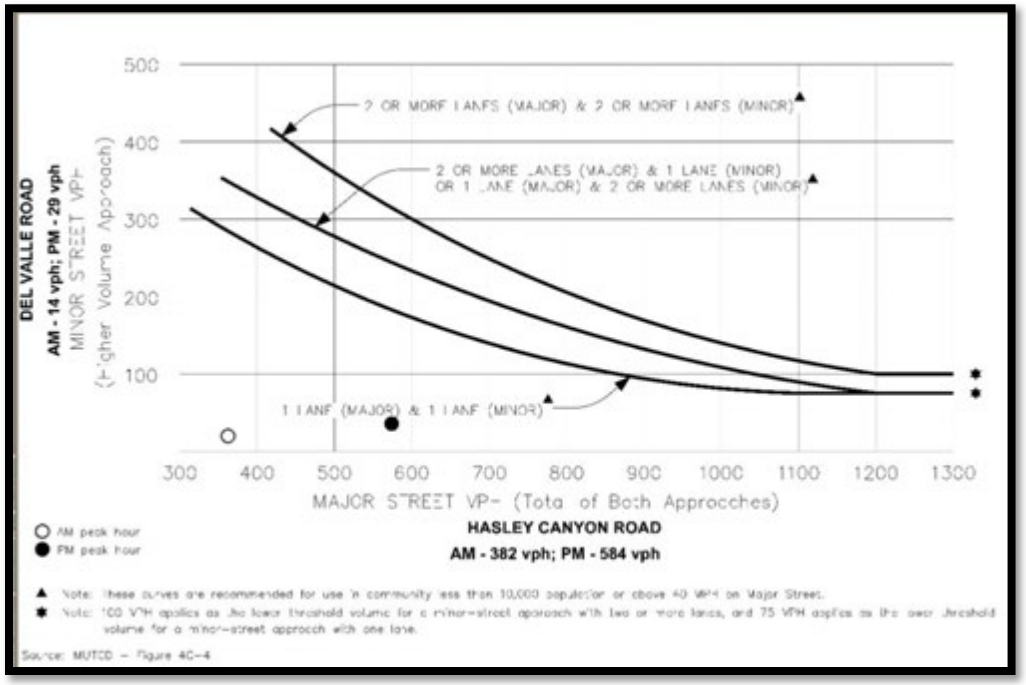

Figure 3-13 Signal Warrant – Cumulative with Project Conditions

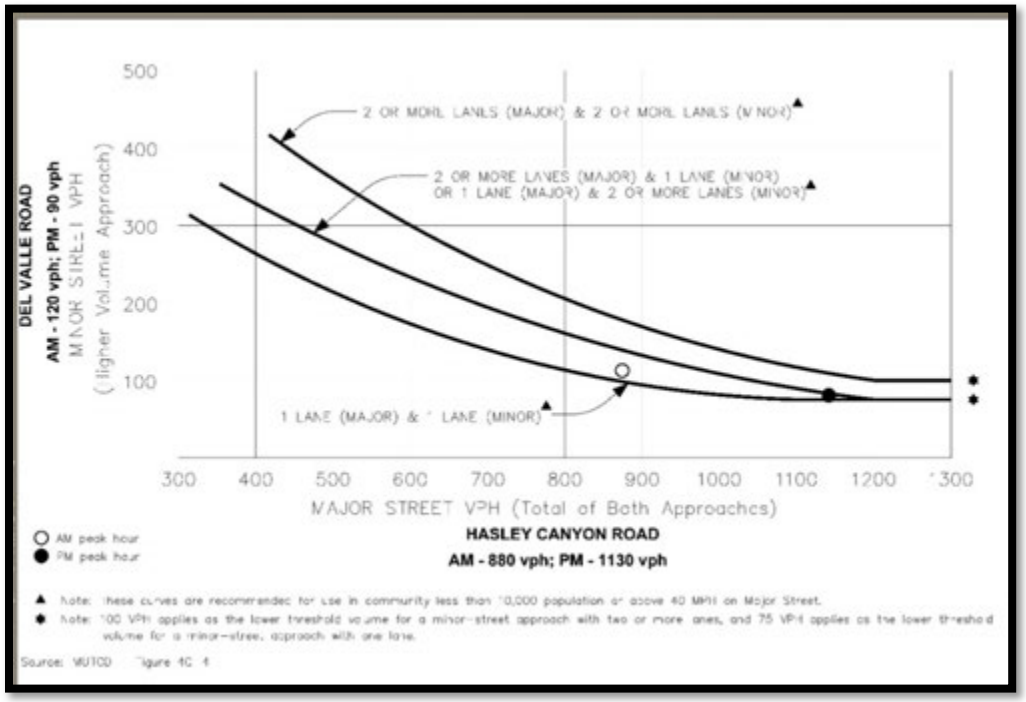

Note: Per the aforementioned mitigation at the intersection of Hasley Canyon Road and Del Valle Road, northbound right-turn lane is a free-flow movement. Therefore, northbound right-turn volumes were excluded from traffic signal warrant analyses.

Table 3-5 Mitigation Measures for Cumulative Impacts

Int #	Location	Mitigation	Project Traffic Share %
County Intersections			
4	Del Valle Road & Hasley Canyon Road	Install traffic signal Intersection modification to provide one northbound left-turn lane, one northbound free-flow right-turn lane, and one westbound left-turn lane	18.6%
5	Commerce Center & Hasley Canyon Road	Intersection modification to restripe the eastbound shared left and through lane to a shared left, through and right lane (for 1 EB Left, 1 shared EB Left/Through/Right and 1 EB Right)	10.3%
County/Caltrans Intersections			
1	Chiquito Canyon Road & SR-126	Intersection modification to provide two southbound left-turn lanes, three southbound through lanes, one southbound right-turn lane (for 2 SB Left, 3 SB Through and 1 SB Right), two westbound left-turn lanes, three westbound through lanes, one westbound right-turn lane (for 2 WB Left, 3 WB Through and 1 WB Right), two northbound left-turn lanes, two northbound through lanes, two northbound right-turn lanes (for 2 NB Left, 2 NB Through and 2 NB Right), two eastbound left-turn lanes, three eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 3 EB Through and 1 EB Right). Install traffic signal[1]	1.2%
6	The Old Road & I-5 SB Ramps (at Sedona Way)	Intersection modification to add one southbound left-turn lane (for 2 SB Left and 2 SB Through)	0.6%
14	Wolcott Way & SR-126	Intersection modification to provide two southbound left-turn lanes, one southbound through lane, one southbound right-turn lane (for 2 SB Left, 1 SB Through and 1 SB Right), two westbound left-turn lanes, four westbound through lanes, one westbound right-turn lane (for 2 WB Left, 4 WB Through and 1 WB Right), one northbound left-turn lanes, one northbound through lanes, two northbound right-turn lanes (for 1 NB Left, 1 NB Through and 2 NB Right), two eastbound left-turn lanes, four eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 4 EB Through and 1 EB Right)	0.9%

Note:
[1] Improvements identified in Caltrans SR-126 PSR
The intersection of Commerce Center Drive and SR-126 WB Ramps is forecast to operate at LOS C and is not significantly impacted based on Caltrans methodology, therefore mitigation is not required for that location.
See Appendix D for fair-share calculations

The need for a traffic signal for the seven on-site Project intersections has been evaluated. Since none of the on-site Project intersections are forecast to have volumes that meet the minimum threshold of 75 vehicle per hour to warrant a traffic signal, none of the on-site intersections will require a traffic signal.

For the intersection of Chiquito Canyon Road and SR-126, Caltrans has a Project Study Report (PSR) that has identified the need for the improvements identified here as mitigation for cumulative conditions, including the installation of a traffic signal at that location.

The Project's fair-share of each of the identified improvements would fully mitigate the Project's cumulative significant impact, as shown in Table 3-6.

3.5 CONGESTION MANAGEMENT PROGRAM ANALYSIS (CMP)

The Los Angeles County Congestion Management Program (CMP) requires that a proposed development address two major subject areas with respect to traffic impacts. These are the Project's impacts on the CMP highway system and the Project's impacts on the local and regional transit systems.

CMP Highway System

According to the CMP guidelines, the geographical area to be examined in a CMP traffic impact analysis (TIA) consists of the CMP monitoring locations that meet the following criteria:

- CMP identified arterial intersections where the proposed Project will add 50 or more trips during either the AM or PM weekday peak hours (determined based on adjacent street traffic)
- CMP identified mainline freeway locations where the Project will add 150 or more trips, in either direction, during either the a.m. or p.m. weekday peak hour.

None of the study area intersections are part of the CMP arterial monitoring intersections. Therefore, no CMP analysis was conducted.

The Project would add less than the CMP analysis guideline threshold of 150 peak hour trips at the nearest freeway monitoring stations. Therefore, CMP mainline freeway segment analysis is not required.

Local and Regional Transit Systems

Another component of the CMP transportation impact analysis is a review of transit impacts; public transit in the Santa Clarita Valley includes both bus and commuter rail service. The CMP transit impact review requires evidence that transit operators received the Notice of Preparation of the applicable draft environmental impact report, identification of existing transit services near the Project site, estimation of the number of Project trips assigned to transit, information on facilities and/or programs that will encourage public transit use, and an analysis of Project impacts on transit service. The following discussion describes the CMP transit analysis for the Project.

The Project's environmental documentation includes evidence that the applicable transit operators (i.e., City of Santa Clarita Transit (SCT), Metro, and Metrolink) received the Notice of Preparation.

Table 3-6 Intersection LOS Summary – Cumulative Conditions with Mitigation

Int #	Intersection Name	Control Type	Existing				Cumulative with Project with Mitigation				Net Change With Mitigation	
			AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour			
			ICU	LOS	ICU	LOS	Delay/ ICU	LOS	Delay/ ICU	LOS	AM	PM
County Intersections												
4	Del Valle Road & Hasley Canyon Road[1]	Stop	0.41	A	0.39	A	0.63	B	0.62	B	0.22	0.23
5	Commerce Center Drive & Hasley Canyon Road[1]	Signal	0.42	A	0.35	A	0.70	B	0.56	A	0.28	0.21
County/Caltrans Intersections												
1	Chiquito Canyon Road & SR-126[1]	Stop	0.44	A	0.43	A	29.5	C	39.6	D	n/a	n/a
6	The Old Road & I-5 SB Ramps (at Sedona Way)[1]	Signal	0.65	B	0.56	A	53.6	D	34.6	C	n/a	n/a
14	Wolcott Way & SR-126[1]	Signal	0.44	A	0.41	A	29.0	C	29.6	C	n/a	n/a

Note:
[1]See Table 3-5 for descriptions of the Mitigation Measures
The intersection of Commerce Center Drive and SR-126 WB Ramps is forecast to operate at LOS C and is not significantly impacted based on Caltrans methodology, therefore mitigation is not required for that location.

SCT provides bus route services to the entire City as well as connections to Amtrak and Metrolink. SCT Route 2 operates along Chiquito Canyon Road, Del Valle and SR-126. It provides services between Val Verde Park and the McBean Regional Transit Center. The nearest bus stop is approximately 1.5 miles away from the Project site.

The buildout of the Project is forecast to generate approximately 3,309 total ADT as mentioned in Section 2.1. To estimate the number of Project trips that would use public transit, the number of Project vehicle trips is multiplied by an occupancy factor (1.4), which is provided in the CMP, to determine total person trips. The number of person trips is then multiplied by the applicable Metro factor (3.5%), which is also provided in the CMP, to determine the number of transit trips generated by the Project. Based on this calculation, the Project is anticipated to generate approximately 162 daily transit trips, as shown in Table 3-7.

Table 3-7 Transit Trip Summary

Description	Time Period		
	Daily	AM Peak Hour	PM Peak Hour
Vehicle Trips	3,309	204	326
Person Trips[1]	4,633	286	456
Factor to Transit Trips	3.5%	3.5%	3.5%
Total Transit Trips	162	10	16
[1]Person Trips = Vehicle Trips x 1.4 Sources: Congestion Management Program for Los Angeles County 2010			

With respect to the Project's impacts on transit service, while the County does not have LOS standards applicable to future development such as the Project, the demand for transit service that would result from the Project, approximately 10 to 16 peak hour trips as shown in above Table 3-7 does not significantly impact transit services.

It is anticipated that, over time, the local bus service will expand as additional development occurs within the valley. Typically, bus route plans are evaluated on an annual basis by the transit agency, and routes are added and/or modified as appropriate and as funding permits. Therefore, as the Project site develops, service to the Project area could be added as determined at the discretion of City of Santa Clarita Transit. Meanwhile, the current transit arrangement is anticipated to continue to serve local residents of the area, connecting residential areas with employment and commercial centers.

With respect to commuter rail, Metrolink, governed by the Southern California Regional Rail Authority (SCRAA), provides commuter rail service between the Antelope Valley and Downtown Los Angeles, and also links Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego counties with transfer service between the bus and rail systems. The Metrolink station closest to the Project site is located along Soledad Canyon Road east of Bouquet Canyon Road. A second Metrolink station is located along Railroad Avenue just south of Lyons Canyon Road. Long-range plans include a potential Metrolink extension along the SR-126 corridor and land within Newhall Ranch is set aside for rail right-of-way and a park-and-ride and/or train station.

4.0 CONCLUSION

This traffic study was conducted to evaluate Project impacts associated with the development of the proposed Project consisting of residential uses, a commercial retail center, and neighborhood park uses. Existing conditions with and without Project, and a cumulative conditions scenario with 2028 as the horizon year, which includes buildout of the Project as well as the related projects in the proximity of the study area were analyzed, and the findings of each scenario are presented.

The on-site and local street intersections that would be used to access the Project site were also evaluated under 2035 General Plan Buildout conditions using forecast peak hour turning movement volumes. Based on the analysis, the proposed on-site intersections would operate at an acceptable LOS.

Based on the results of the LOS analyses and the criteria set forth by the County of Los Angeles and Caltrans, there are no intersections found to be significantly impacted by the Project.

Under cumulative conditions, the following intersections have been found to be significantly impacted by cumulative increases in traffic volumes including the Project:

1. Chiquito Canyon Road & SR-126 (County/Caltrans)
4. Del Valle Road & Hasley Canyon Road (County)
5. Commerce Center Drive & Hasley Canyon Road (County)
6. The Old Road & I-5 SB Ramps at Sedona Way (County/Caltrans)
14. Wolcott Way & SR-126 (County/Caltrans)

Feasible mitigation has been identified for each of the significantly impacted intersections listed above, which reduces the cumulative impact to less than significant. This mitigation is summarized in Table 4-1.

Mitigation identified for the County's Del Valle Road/Hasley Canyon Road intersection includes installation of a traffic signal and intersection modifications to provide one northbound left-turn lane, one northbound free-flow right-turn lane, and one westbound left-turn lane. Mitigation identified for the County's Commerce Center/Hasley Canyon Road intersection includes intersection modification to restripe the eastbound shared left and through lane to a shared left, through and right lane. The Project is responsible for its fair-share of the cost of these mitigation measures that address cumulative impacts, which ranges from approximately 10 percent to 19 percent.

In addition to the mitigation described above for County intersections, mitigation has also been identified for the intersections under Caltrans jurisdiction as summarized in Table 4-1. The Project is responsible for its fair-share of the cost of these mitigation measures that address cumulative impacts, which is approximately one percent at each location.

A CMP analysis of the Project's traffic impacts on the CMP highway system and on the local and regional transit systems determined that the Project would not have any impact to the CMP monitoring locations or to transit.

Table 4-1 Mitigation Measures

Int #	Location	Mitigation	Project Traffic Share %
County Intersections			
4	Del Valle Road & Hasley Canyon Road	Install traffic signal Intersection modification to provide one northbound left-turn lane, one northbound free-flow right-turn lane, and one westbound left-turn lane	18.6%
5	Commerce Center & Hasley Canyon Road	Intersection modification to restripe the eastbound shared left and through lane to a shared left, through and right lane (for 1 EB Left, 1 shared EB Left/Through/Right and 1 EB Right)	10.3%
County/Caltrans Intersections			
1	Chiquito Canyon Road & SR-126	Intersection modification to provide two southbound left-turn lanes, three southbound through lanes, one southbound right-turn lane (for 2 SB Left, 3 SB Through and 1 SB Right), two westbound left-turn lanes, three westbound through lanes, one westbound right-turn lane (for 2 WB Left, 3 WB Through and 1 WB Right), two northbound left-turn lanes, two northbound through lanes, two northbound right-turn lanes (for 2 NB Left, 2 NB Through and 2 NB Right), two eastbound left-turn lanes, three eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 3 EB Through and 1 EB Right). Install traffic signal[1]	1.2%
6	The Old Road & I-5 SB Ramps (at Sedona Way)	Intersection modification to add one southbound left-turn lane (for 2 SB Left and 2 SB Through)	0.6%
14	Wolcott Way & SR-126	Intersection modification to provide two southbound left-turn lanes, one southbound through lane, one southbound right-turn lane (for 2 SB Left, 1 SB Through and 1 SB Right), two westbound left-turn lanes, four westbound through lanes, one westbound right-turn lane (for 2 WB Left, 4 WB Through and 1 WB Right), one northbound left-turn lanes, one northbound through lanes, two northbound right-turn lanes (for 1 NB Left, 1 NB Through and 2 NB Right), two eastbound left-turn lanes, four eastbound through lanes, one eastbound right-turn lane (for 2 EB Left, 4 EB Through and 1 EB Right)	0.9%

Note:
[1] Improvements identified in Caltrans SR-126 PSR
The intersection of Commerce Center Drive and SR-126 WB Ramps is forecast to operate at LOS C and is not significantly impacted based on Caltrans methodology, therefore mitigation is not required for that location.

Appendix C ICU CALCULATION WORKSHEETS

INTERSECTION CAPACITY UTILIZATION

Peak hour intersection volume/capacity ratios are calculated by means of intersection capacity utilization (ICU) values.

The procedure is based on the critical movement methodology, and shows the amount of capacity utilized by each critical move. A capacity of 1,700 vehicles per hour (VPH) per lane is assumed together with a .05 clearance interval for City of Irvine intersections, and a capacity of 1,600 VPH is assumed for the City of Newport Beach intersection. A "de-facto" right-turn lane is used in the ICU calculation for cases where a curb lane is wide enough to separately serve both through and right-turn traffic (i.e., with a width of 19 feet from curb to outside of through-lane with parking prohibited during peak periods). Such lanes are treated the same as striped right-turn lanes during the ICU calculations, but they are denoted on the ICU calculation worksheets using the letter "d" in place of a numerical entry for right-turn lanes.

The methodology also incorporates a check for right-turn capacity utilization. Both right-turn-on-green (RTOG) and right-turn-on-red (RTOR) capacity availability are calculated and checked against the total right-turn capacity need. If insufficient capacity is available, then an adjustment is made to the total capacity utilization value. The following example shows how this adjustment is made.

Example for Northbound Right

1. Right-Turn-On-Green (RTOG)

If NBT is critical move, then:

RTOG = V/C (NBT)

Otherwise,

RTOG = V/C (NBL) + V/C (SBT) - V/C (SBL)

2. Right-Turn-On-Red (RTOR)

If WBL is critical move, then:

RTOR = V/C (WBL)

Otherwise,

RTOR = V/C (EBL) + V/C (WBT) - V/C (EBT)

3. Right-Turn Overlap Adjustment

If the northbound right is assumed to overlap with the adjacent westbound left, adjustments to the RTOG and RTOR values are made as follows:

RTOG = RTOG + V/C (WBL)

RTOR = RTOR - V/C (WBL)

4. Total Right-Turn Capacity (RTC) Availability for NBR

RTC = RTOG + factor x RTOR

Where factor = RTOR saturation flow factor (75%)

Right-turn adjustment is then as follows:

Additional ICU = V/C (NBR) - RTC

A zero or negative value indicates that adequate capacity is available and no adjustment is necessary. A positive value indicates that the available RTOR and RTOG capacity does not adequately accommodate the right-turn V/C; therefore, the right-turn is essentially considered to be a critical movement. In such cases, the right-turn adjustment is noted on the ICU worksheet and it is included in the total capacity utilization value. When it is determined that a right-turn adjustment is required for more than one right-turn movement, the word "multi" is printed on the worksheet instead of an actual right-turn movement reference, and the right-turn adjustments are cumulatively added to the total capacity utilization value. In such cases, further operational evaluation is typically carried out to determine if under actual operational conditions, the critical right-turns would operate simultaneously, and therefore a right-turn adjustment credit should be applied.

Shared Lane V/C Methodology

For intersection approaches where shared usage of a lane is permitted by more than one turn movement (e.g., left/through, through/right, left/through/right), the individual turn volumes are evaluated to determine whether dedication of the shared lane is warranted to any one given turn movement. The following example demonstrates how this evaluation is carried out:

Example for Shared Left/Through Lane

1. Average Lane Volume (ALV)

$$ALV = \frac{\text{Left-Turn Volume + Through Volume}}{\text{Total Left + Through Approach Lanes (including shared lane)}}$$

2. ALV for Each Approach

$$\text{ALV (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Lanes (including shared lane)}}$$

$$\text{ALV (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Lanes (including shared lane)}}$$

3. Lane Dedication is Warranted

If ALV (Left) is greater than ALV, then full dedication of the shared lane to the left-turn approach is warranted. Left-turn and through V/C ratios for this case are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (including shared lane)}}$$

$$\text{V/C (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (excluding shared lane)}}$$

Similarly, if ALV (Through) is greater than ALV then full dedication to the through approach is warranted, and left-turn and through V/C ratios are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (excluding shared lane)}}$$

$$\text{V/C (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (including shared lane)}}$$

4. Lane Dedication is not Warranted

If ALV (Left) and ALV (Through) are both less than ALV, the left/through lane is assumed to be truly shared and each left, left/through or through approach lane carries an evenly distributed volume of traffic equal to ALV. A combined left/through V/C ratio is calculated as follows:

$$\text{V/C (Left/Through)} = \frac{\text{Left-Turn Volume + Through Volume}}{\text{Total Left + Through Approach Capacity (including shared lane)}}$$

This V/C (Left/Through) ratio is assigned as the V/C (Through) ratio for the critical movement analysis and ICU summary listing.

If split phasing has not been designated for this approach, the relative proportion of V/C (Through) that is attributed to the left-turn volume is estimated as follows:

If approach has more than one left-turn lane (including shared lane), then:

V/C (Left) = V/C (Through)

If approach has only one left-turn lane (shared lane), then:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Single Approach Lane Capacity}}$$

If this left-turn movement is determined to be a critical movement, the V/C (Left) value is posted in brackets on the ICU summary printout.

These same steps are carried out for shared through/right lanes. If full dedication of a shared through/right lane to the right-turn movement is warranted, the right-turn V/C value calculated in step three is checked against the RTOR and RTOG capacity availability if the option to include right-turns in the V/C ratio calculations is selected. If the V/C value that is determined using the shared lane methodology described here is reduced due to RTOR and RTOG capacity availability, the V/C value for the through/right lanes is posted in brackets.

When an approach contains more than one shared lane (e.g., left/through and through/right), steps one and two listed above are carried out for the three turn movements combined. Step four is carried out if dedication is not warranted for either of the shared lanes. If dedication of one of the shared lanes is warranted to one movement or another, step three is carried out for the two movements involved, and then steps one through four are repeated for the two movements involved in the other shared lane.

LEVEL OF SERVICE

Site: The Old Road/I-5 SB Ramps & Hasley canyon - Existing - AM

New Site
Roundabout

	South	East	North	West	Intersection
LOS	B	B	B	B	B

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: SIDRA Roundabout LOS.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: SIDRA Roundabout LOS.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: SIDRA Roundabout LOS.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: SIDRA Roundabout LOS.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Tribal Consultation

From: Jairo Avila [mailto:jairo.avila@tataviam-nsn.us]
Sent: Wednesday, January 3, 2018 10:53 AM
To: Elizabeth Denniston <edenniston@dudek.com>
Subject: Sterling Ranch Estates Project THPO

Tribal Historic & Cultural Preservation Department

Project: ***Sterling Ranch Estates Project in the Community of Val Verde, Los Angeles County, California.***
Address: ***The community of Val Verde (North of Chiquito Canyon Road and Northwest and Southeast of Del Valley Road)***

Hello Elizabeth,

Thank you for reaching out to the Tribal Historic and Cultural Resources ("THCP") department of the Fernandeño Tataviam Band of Mission Indians (Tribe). We received your letter regarding the proposed project referenced above after December 12, 2017.

The proposed project area is located within the traditional ancestral territory, and encompasses the lineage-villages from which members of the Tribe descend. Therefore, the project is of interest to the THCP department.

At this moment we would like to request the contact information for the lead agency of the proposed project.

Respectfully,

--
Jairo F. Avila, M.A., R.P.A.
Tribal Historic and Cultural Preservation Officer

Fernandeño Tataviam Band of Mission Indians
1019 Second Street, Suite 1
San Fernando, California 91340
Office: (818) 837-0794

RE: Tribal Cultural Resources under the California Environmental Quality Act, AB 52 (Gatto, 2014). Formal Notification of the Proposed Project pursuant to Public Resources Code (PRC) §21080.3.1.

The Los Angeles County Department of Regional Planning is issuing this formal notification of the proposed project. Below please find a description of the proposed project, a map showing the project location, and our contact information along with the name of our point of contact, pursuant to PRC §21080.3.1(d).

Proposed Project: Green Valley Ranch Residential
Project No. 03-250 -5
Vesting Tentative Tract Map No. 60257

Project Description: To create 222 single-family residence lots, one commercial lot, private recreation lots and public infrastructure lots on 113.9 acres within Zone R-1 of the Castaic Area Community Standards District.

Project Location: 29053 Coolidge Avenue, Castaic, CA
(APNs 3271-004-003, -013 and 3271-005-024)

Lead Agency Contact Information:
Steven Jones
Land Divisions Section
Department of Regional Planning
320 W. Temple Street, Room 1360
Los Angeles, CA 90012
Tel: (213) 974-6433
Email: sdjones@planning.lacounty.gov

Pursuant to PRC §21080.3.1(b), you have 30 days from the receipt of this letter to request consultation, in writing, with the Department of Regional Planning. Written request must be submitted to the contact information listed above.

Our office hours are Monday through Thursday, 7:00 a.m. to 5:30 p.m. We are closed on Fridays.

Sincerely,
DEPARTMENT OF REGIONAL PLANNING
Amy J. Bodek, AICP
Director

5050 COMMERCE DRIVE BALDWIN PARK, CA 91706 (626) 430-5380

December 22, 2020

CASE: RTM-TR060257-28682
PROJECT: TR060257
PLANNER: Jones, Steven
LOCATION: 29053 Coolidge Avenue Castaic CA 91384

The Department of Public Health-Environmental Health Division has reviewed the above project to construct a community of 222 detached single-family homes on 57.9 acres with a passive pocket park on 0.2 acres, a parking lot, a shade structure, and tables on 3.4 acres, and a 21,000 square foot commercial building with 71 parking spaces on 2.5 acres. The applicant provided a December 17, 2020 letter from the sanitation district indicating that "The entire project area is outside the jurisdictional boundaries of the District and will require annexation into District before sewerage service can be provided to the proposed development." The applicant also provided a December 16, 2020 Water Service Availability letter.

Public Health provides the following conditional clearance with the condition(s) below that must be completed prior to Final Map approval.

---

1. Complete the annexation process through the Local Agency Formation Commission and provide a sanitation district "Will Serve" letter that indicates that sewerage services will be provided for the above project.

Please contact Shayne LaMont, Land Use Program for any questions regarding this report: slamont@ph.lacounty.gov.

E. APPENDIX E – SEWER FLOW TEST FOR MH #110 AND #100, DATED JUNE 20TH , 2019.

I. INTRODUCTION

The following AREA study has been prepared by Sikand Engineering Associates, to determine and show:

a) Determine the capacity of the existing sewer (P.C.'s 11572, 10942 & 11491) from the project location to the existing trunk line, to accept the flow from TM 60257.

b) Determine the pipe size, if necessary, for any downstream sewer replacement. This analysis will include the tributary flow to the sewer system from the proposed development and future development to the trunk line downstream of the proposed development.

This sewer area study analyzes flows in the sewer line for a proposed pump station that serves TR 60257, and ultimate gravity sewer that will serve both TR 60665 and TR 60257.

II. SITE DESCRIPTION

This proposed development is located South of Hasley Canyon Road and North of Hunstock Avenue, in the County of Los Angeles, State of California.

Sewer flows generated from the western half of the project, and the undeveloped land north of the project, will gravity flow south on Del Valle Road to the proposed pump station located at the intersection of Del Valle Road and Hunstock Avenue. The flows will be pumped through the proposed force main and will combine with gravity sewer flows from the eastern side of the project and TR 60665 residential lots. Sewer flows will continue to gravity flow northeasterly within Del Valle Road, to the existing sewer system on Hasley Canyon Road.

III. PROJECT DESCRIPTION

Tentative Tract Map No. 60257 consists of 221 residential lots and one commercial lot.

IV. SEWER PIPE CAPACITY ANALYSIS

The existing sewer pipes were analyzed per County Standard S-C4 for a maximum design depth at a ¾ full. All outlet pipes $\geq$ 18" diameter.

The design capacity for the existing pipe was obtained by using Kutter's Formula with "n=0.013" as shown in the flow diagram for the design of circular sanitary sewer system (see attached S-C4 chart in appendix VII).

The tributary sewer flow rate (Q) for the studied sewer lines are determined based on County Standards as follows:

Q = (Z)(A)
A = Tributary Area (Acre)
Z = Zoning Coefficients (see County attachment in appendix VII)
Q = # Units x .001 cfs/unit

V. CONCLUSION

This sewer area study analyzes flows in the sewer line for two scenarios.

1. The first scenario is for ultimate build out. Under this scenario there are several segments of the gravity line that are over capacity. The pipes which need to be replaced will be sized using Q's based on the ultimate build out scenario.
2. The second scenario is based on actual flow test results plus approved tentative maps, active tentative maps, the proposed development and vacant land contributing to the sewer shed.

This sewer area study shows the worst case scenario for mitigation for the proposed project (TM 60257). Per the attached study, the mitigation which will be required for this development is:

A. A new temporary pump station and associated force main located at the southwesterly corner of the project near Hunstock Avenue. The pump station and force main will be sized to accommodate flows from TM 60257.

B. A gravity sewer in Del Valle Road from the proposed force main in Del Valle Rd to the existing gravity sewer in Hasley Canyon Road. Sizing of the proposed sewer improvements are included in this analysis.

C. Pipe Replacement: Based on Theoretical Flows, replacement of downstream gravity sewer lines would be required due to construction of this project. The sewer area study shows that portions of the existing gravity sewer line in PC 10942 from MH #108 to the trunk sewer will be over ¾ full capacity due to construction of this project.

   The Ultimate Condition Analysis provides the following pipe mitigation:

   - The existing 18" pipe from MH #108 to MH #105 in Hasley Canyon Road would need to be replaced with a 30" VCP at the same slope to provide for capacity for the ultimate theoretical flow.

   - The existing 18" pipe from MH #105 to the Trunk Sewer would need to be replaced with a 36" VCP at the same slope to provide for capacity for the ultimate theoretical flow.

Flow Testing: Based on Flow Testing, no replacement of downstream sewers should be required at this time. Flow Test results have been provided in the Appendix of this Report.

Per our earlier phone conversation with Imelda and Pedro, we have reviewed the undeveloped but approved areas within the Commerce Center area tributary to Manhole 111. This manhole was flow tested per the sewer area study for TT 60257. The maximum flow rate that was measured in this testing period was 2.002 cfs. The ultimate sewershed area tributary to this manhole is 909.2 Acres. Of this area 635.7 acres was developed at the time of the flow test. In addition there are 68.2 Acres which

are currently approved but not constructed and an additional 205.3 Acres which are undeveloped and not approved.

Based on the flow test (2.002 cfs) divided by currently developed acreage (635.7 ac) a rate of .00315 cfs/ acre can be assumed for existing development. As agreed on the phone call, we have used this rate times the undeveloped and not approved areas (205.3 ac). This will add 205.3 x .00315 = .646 cfs to the 2.002 total from the flow test for a total of 2.648 cfs.

For the 68.2 acres which are currently approved but not developed, we originally proposed to pro-rate using the same factor. However, since these areas are part of previously approved developments, you stated that they should be analyzed using the theoretical values based on either zoning or use. Using the theoretical number based on zoning (M Zone) of 0.021 cfs / ac x 68.2 acres gives a value of 1.43 cfs. Adding this to the 2.648 cfs equals a total of 4.078 cfs. When this value is input into Table 6, the downstream sewer reaches between MH 111 and MH 108 (approx. 1100') and MH 104 and MH 99 (approx. 1080') would need to be replaced as they exceed the ¾ full criteria by between 5% to 12%.

We then looked at determining the flow rate for the 68.2 acres based on use. We have very solid information for the proposed development of PM 60030 which is 46.5 acres of the 68.2 total. Per the attached table (Sewer Flow Rates for PM 60030) we determined that an average of 5% of the total area of the buildings is Office with the remaining areas dedicated to various warehouse / manufacturing type uses. Using a 200 gpd / 1000 sf of office use and using a value of 100 gpd / 1000 sf of manufacturing use per City of Los Angeles flow coefficient gives a total of 0.3682 cfs for the remainder of PM 60030. Prorating that to the entire 68.2 acres (0.3682 x 68.2/46.5) equals .540 cfs of additional flow. Added to the 2.648 cfs from above equals a total of 3.188 cfs. When this value is input into Table 6, two downstream reaches will need replacing as flows are slightly above capacity (102.2% max.).

However, further analysis of the large undeveloped tributary area (2931.3 acres – A1.1) shows that we have assumed a coefficient of 0.001 cfs per acre as it is in an agricultural zone. Per the General Plan, this area is designated as RL-2 (1 du / 2Ac). This means that the maximum number of units that can be constructed within this area would be 2931.3/2 = 1466 du. That means that the coefficient that should be assumed for this subarea should be 0.001 cfs per du for a total of 1.466 cfs. Using this number in Table 6, all downstream reaches will not need to be replaced as maximum flow within the downstream pipes is 85.4% of capacity.

In our engineering determination, the "use" analysis is a more accurate representation of the approved but not developed areas and should offer the necessary assurances to the county that the proposed project (TT 60257) will not negatively impact future developments within the tributary Hasley sewershed.

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
LAND DEVELOPMENT DIVISION

AREA STUDY

An area study must be made for all private contract sewer projects. See attached sample. The area study must include the following items:

1. Area being served - In Acres
2. Determined Tributary area to main line being designed (incl. areas of future devel.)- In Acres
3. Existing and Land Use Zoning
4. Anticipated Sewer Discharge in cfs of total area based on zoning, and/or heavy water users
5. Existing or proposed utilities if in conflict
6. Existing and proposed sewers showing pipe size and grade leading up to the trunk line in order for you to evaluate the impact of your proposed development on the existing system
7. Direction of sewer flow
8. Contour lines
9. Scale not to be less than 1"=600'
10. North arrow pointing up or to the left

ZONING COEFFICIENTS

ZONE	COEFFICIENT (cfs/Acre)
Agriculture	0.001
Residential	
R-1	0.004
R-2	0.008
R-3	0.012
R-4	0.016 *
Commerical	
C-1 through C-4	0.015 *
Heavy Industrial	
M-1 through M-4	0.021 *

* Individual building, commercial or industrial plant capacities shall be the determining factor when they exceed the coefficients shown.

The coefficient to be used for any zoned areas not listed will be determined by the County based upon the intended development and use.

The County shall determine which of the coefficients or combination of coefficients shall be used for design as determined by the established or proposed zoning in the study area. Any modifications to these coefficients due to topography, development, or hazard areas, shall be approved by the Department of Public Works.

STORMWATER POLLUTION CONTROL REQUIREMENTS FOR SEWER CONSTRUCTION

1. Graded earthwork and other construction should be scheduled so grading and land disturbance activities occur during the dry season (April 15 - October 31).
2. Soils, silt, sediments and other loose materials shall be stored in appropriate areas and shall not be allowed to enter the storm drain system. The use of perimeter controls, silt fences, straw bales, sandbags or other devices shall be required as necessary to prevent sediment from leaving the site.
3. Erosion or wasted materials may not be washed into the public way or any other drainage system. Provisions shall be made to retain concrete rinsates on site and they may not be disposed of on public streets.
4. Trash and construction related solid wastes must be deposited into a covered receptacle to prevent contamination of rainwater and dispersal by wind.
5. Sweeping and other methods may not be limited from the site for various periods. Non-construction pollutant tracking shall be minimized so as to reduce sediments from being deposited into the public way. Accidental depositions must be swept up immediately and may not be washed down by use of water unless.
6. Any access into disturbed soils of materials of construction must be prevented so as to avoid erosion by wind and water.

The following items is required to be met and limited to the best management practices (BMP's) necessary to control storm water pollutant discharges, including, but not limited to, the following categories, as appropriate: Construction Activity, Pollution Prevention/Good Housekeeping for Contractors and Consultants, and Non-Storm Water Management.

CA01 = SCHEDULING
CA02 = PRESERVATION OF EXISTING VEGETATION

DOUBLE SCALE

PRIOR TO ACCEPTANCE FOR MAINTENANCE ALL SANITARY SEWER EASEMENT MUST BE RECORDED.

NO CONNECTION FOR THE DISPOSAL OF INDUSTRIAL WASTES SHALL BE MADE TO SEWER SHOWN ON THESE DRAWINGS UNTIL A PERMIT FOR INDUSTRIAL WASTEWATER DISCHARGE HAS BEEN ISSUED BY THE SANITATION DISTRICTS FOR SAID CONNECTION.

BEFORE BREAKING GROUND OR COMMENCING CONSTRUCTION ON A COUNTY SANITATION DISTRICT SEWER AND PRIOR TO FINAL ACCEPTANCE OF THE PROJECT, A SANITATION DISTRICT INSPECTOR SHALL BE NOTIFIED BY PHONE AT (562)908-4288, 30 THAT REQUIRED INSPECTIONS CAN BE MADE.

STANDARD PLANS:

STANDARD PLANS FOR PUBLIC WORKS CONSTRUCTION

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS

PRIVATE CONTRACT SEWER GENERAL NOTES

1. All sewer construction permit shall be approved and a pre-job conference scheduled and attended prior to the commencement of any work. Contact the Los Angeles County Sanitation Districts Inspection Section at (562) 908-4288, extension 2727 to schedule the pre-job conference.
2. Prior to beginning of work contact the construction notification system for subscribers and participants of the joint trench. Call Underground Service Alert (USA) at 1-800-422-4133.
3. If work is to be done in a State highway, a permit must be obtained from the State of California, Division of Highways, 120 South Spring Street and two (2) sets of plans submitted.
4. Permit is required for construction work within the jurisdiction of the Los Angeles County Department of Public Works. Contact the Permit Section at (626) 458-3129 for permit requirements.
5. The construction shall conform to the current edition of the "Specifications for Underground Sewers" as amended, of the Los Angeles County Sanitation Districts and the "Standard Specifications for Public Works Construction" as amended, of the Southern California Chapter of the American Public Works Association.
6. Acceptance of this plan by the Director of Los Angeles County Sanitation Districts is authorization to proceed with the construction of the sewer only. It is not authorization to proceed with the construction of any other facilities required for the project. Such facilities require separate approval.
7. Any change, revision, or modification to the approved plans shall be submitted to the Director of Los Angeles County Sanitation Districts for approval. Changes, revisions, or modifications made without approval may be cause for rejection of the work.
8. The contractor's attention is directed to Section 5-1.01, "Plans and Working Drawings" of the Standard Specifications for Public Works Construction, as amended by the Standard Special Provisions, which requires the contractor to submit working drawings for certain items of work.
9. Elevations are in feet above M.S.L. U.S. Geodetic Sea Level Datum of 1929.
10. No revisions shall be made in these plans without the approval of the Director of Public Works.
11. The determination of the requirements of public works will always be left out any portion of the work.
12. Unless otherwise noted, all construction is to be in accordance with the latest edition of the Standard Specifications for Public Works Construction, including the latest supplement thereto, and the Standard Plans for Public Works Construction, including the latest supplement thereto, adopted by the Los Angeles County Department of Public Works.
13. The Permittee hereby agrees that the Department of Public Works may perform such work as may be necessary to make said work conform to the standards established by said Department, and that the Permittee will reimburse said Department for the actual cost thereof. Said cost may be deducted from any deposit made by the Permittee to guarantee the performance of said work. Said Permittee further agrees that the Department of Public Works may perform such work as may be necessary to maintain or repair the work if the Permittee fails to do so after written notice from said Department to perform such maintenance or repair, and that the Permittee will reimburse said Department for the actual cost thereof. Said cost may be deducted from any deposit made by the Permittee to guarantee the performance of said work. Said Permittee further agrees that the Department of Public Works may perform such work as may be necessary to maintain or repair the work if the Permittee fails to do so after written notice from said Department to perform such maintenance or repair, and that the Permittee will reimburse said Department for the actual cost thereof. Said cost may be deducted from any deposit made by the Permittee to guarantee the performance of said work.
14. Where the proposed sewer is to be constructed in fill, the property line elevations at the property line shall be at the top curb elevation for those lots having curbs, or 6" above grade.

CONSTRUCTION NOTES

1. Protect existing sewer, etc. The property line on property lines perpendicular to the sewer line at the beginning of each manhole.
2. Vitrified clay pipe joints shall be type "C" or "D" per standard specifications section 208-3.
3. If a power pole is within 5 feet of the sewer, the sewer shall be encased per standard plan 2020-1, case 3, for a distance of 5 feet from the point of encroachment.
4. Telephone, television, fiber optic, and electrical lines shall be made with a rubber gasket joint, type "A" per ASTM C-443 or ASTM C-425.
5. Where laterals to be constructed into sockets at property line a vitrified clay pipe shall be used as noted.
6. Use of "Y" branches may be used for connections to maximum branch sizes except as noted.
7. If during the course of construction it is determined that there is more than one set of sewer lots, the use of a "Y" branch may be used for connection to the sewer lateral. Such "Y" branch shall be shown on the as-built plans to be sent to Sewer Maintenance Department of the Sanitation Districts.
8. Manholes to be precast, unless noted otherwise, to meet Los Angeles County Public Works or California State Highway Standards.
9. Full compliance with Section 306-1.4.4 of the Standard Specifications shall be required for backfill of trench, including the placement of sand backfill around the pipe and the use of a mechanical tamper for the backfill from the bedding of a minimum depth of sand to the bottom of the base material.
10. All manhole and pipe outside of street right of way to be level with finished grade.
11. Sewers to be tested for leakage per Section 306-1.5 of the Standard Specifications and special provisions.
12. All pipes and/or sewer laterals are to be located at least one foot apart and when possible not closer than one foot to any manhole.

STORMWATER POLLUTION CONTROL REQUIREMENTS FOR SEWER CONSTRUCTION

DOUBLE SCALE

1. Erected settlements and other pollutants must be retained on site and may not be transported from the site via sheet flow, swales, area drains, natural drainage courses, or wind.
2. Stockpiles of earth and other construction related materials must be protected from being transported from the site by the forces of wind or water.
3. Fuels, oils, solvents, and other toxic materials must be stored in accordance with their listing and are not to contaminate the soil and surface waters. All approved storage containers are to be protected from the weather. Spills must be cleaned up immediately and disposed of in a proper manner. Spills may not be washed into the drainage system.
4. Excess or waste concrete may not be washed into the public way or any other drainage system. Provisions must be made to retain concrete wastes on site until they can be disposed of as solid waste.
5. Trash and construction-related solid wastes must be deposited into a covered receptacle to prevent contamination of rainwater and dispersal by wind.
6. Sediments and other materials may not be tracked from the site by vehicle traffic. The construction entrance roadways must be stabilized so as to inhibit sediments from being deposited into the public way. Accidental depositions must be swept up immediately and may not be washed down by rain or other means.
7. Any slopes with disturbed soils or denuded of vegetation must be stabilized so as to inhibit erosion by wind and water.

* REFERS TO A.P.W.A. STD. DRAWING NO.

NO CONNECTION FOR THE DISPOSAL OF INDUSTRIAL WASTES SHALL BE MADE TO SEWERS SHOWN ON THESE DRAWINGS UNTIL A PERMIT FOR INDUSTRIAL WASTEWATER DISCHARGE HAS BEEN ISSUED BY THE SANITATION DISTRICTS FOR THE SAID CONNECTION.

BEFORE BREAKING INTO OR CONSTRUCTION ON A COUNTY SANITATION DISTRICT SEWER AND PRIOR TO FINAL ACCEPTANCE OF THE PROJECT, A SANITATION DISTRICT INSPECTOR SHALL BE NOTIFIED BY PHONE AT (562) 908-4288 SO THAT REQUIRED INSPECTIONS CAN BE MADE.

PRIVATE CONTRACT SEWER GENERAL NOTES

1. A sewer construction permit shall be obtained and a fee paid for construction inspection and record plans to the Department of Public Works at the Permit Counter, 900 South Fremont Avenue, 5th Floor, Alhambra, at least 72 hours prior to starting work under this permit. Copies of all other required permits, such as Road Excavation, Caltrans, etc., must be filed with the permit application.
2. Prior to issuance of any permit, the contractor shall file a permit for excavations and trenches from the State of California Division of Industrial Safety, and a Certificate of Worker's Compensation Insurance in accordance with the Department of Public Works manual on the Certificate holder to be notified 30 days prior to commencement of work.
3. If work is done in a State Highway, a permit must be obtained from the State of California Division of Highways, 120 South Spring Street, Los Angeles, California.
4. Where work is within a contract city, the contractor shall contact the Director of Public Works of that city to determine the location to vary the inspection fee.
5. The contractor shall contact the district office listed on the "Application for Construction Permit" to arrange for an acceptable construction start date.
6. Approval of the plans by the County of Los Angeles does not constitute a representation as to accuracy of the location or of the elevations of the existing or non-existences of any underground utility pipe or structure within the limits of this project. This note applies to all pipes.
7. All work shall be in accordance with the latest approved edition of the "Standard Specifications for Public Works Construction, including supplements and the latest Special Provisions for the Construction of Sanitary Sewers and shall be prosecuted only in the presence of the Department of Public Works.
8. The contractor's attention is directed to Section 7-10.4.1 of the Standard Specifications for Public Works Construction in regard to safety orders and also particularly to the "Minimum Public Safety Requirements" as shown on Los Angeles Department of Public Works' Standard D-6.
9. Elevations are in feet above M.S.L. of U.S. sea level datum of 1929.
10. No variations shall be made in these plans without the approval of the Director of Public Works.
11. No representative of the Department of Public Works will survey or lay out any portion of the work.
12. Grades to which this improvement is to be constructed are shown on plans and profiles. Grade points for top of curbs, centerlines of streets, or centerline of alleys, are shown for circles on profiles of all points between designated points. The grade shall be established as are to conform to a straight line drawn between said designated points.
13. The private engineer shall furnish the Department of Public Works with grade sheets and stationing for all house laterals and "Y" or "T" branches and shall provide station for them at their proper locations with elevations giving invert. All house laterals shall be constructed in a straight alignment at right angles from the main line sewer except as shown on the plans. House laterals from cleanouts shall not have an angle of less than 45 degrees with the M.L. sewer. Any change in alignment shall be requested in writing by the private engineer.
14. The private engineer shall furnish the house lateral depth at the property line below the top of curb elevation for each house lateral on the grade sheet.

CONSTRUCTION NOTES

1. Provide survey stakes on the property line or property lines proposed at right angles to the sewer line at the centerline of each manhole.
2. Vitrified clay pipe joints shall be type "O" or "C" per standard specifications section 208-3.
3. 7 ft. separation in either lines from face of the sewer, this sewer shall be shielded per standard plan S-22, case 1, two feet on each side from the point of interference.
4. All joints between cast iron pipe and vitrified clay shall be made with a rubber sleeve joint, type "D" (with bushing if necessary) per standard specifications section 208-3.
5. House laterals to be constructed with inverts at the property line 8 feet below curb grade except as noted.
6. Wye or tee branches may be used for connection to the maximum sewers except as noted.
7. If during the course of construction, it is determined that there is less than four feet of cover over the top of a vitrified clay pipe sewer which is not indicated on the plans, the plans shall be amended per standard plan S-22, case 1, unless otherwise approved by the Director of Public Works.
8. All structures shall be either brick sewer manholes per standard plan S-3 or precast concrete sewer manholes per standard plan S-4.2B, or reinforced precast concrete manholes per standard plan S-4, except as noted.
9. Centerline of trenches within paved areas to meet Los Angeles County Public Works or California State Highway requirements in accordance with the permit.
10. Any connection with section 309-1.2.6, of the standard specification will be required for backfill in sewer construction of bedded compaction and sand equivalents by a qualified civil engineer shall be provided by the permittee prior to the issuance of a certificate of partial occupancy.
11. All backfill and fills outside of the street right of way shall be compacted to 90% of the maximum density as determined by ASTM and compaction test D 1557-78 method "A" unless otherwise specified. This shall be certified by a qualified civil engineer. Such certification shall be submitted to the Construction Division of the Department of Public Works prior to the acceptance of the work by the county.
12. Concrete base to encroachment rights of way to be six inches above finished grade. Contractor to verify that manhole located in roadway shoulder conform to this requirement.
13. Sewers to be tested for leakage per section 306-1.14 of the standard specifications and special provisions.
14. Manhole from along Wesley Canyon Road will be required to have a 3'x6'x6" thick A.C. pad around the rim. See detail 1 on page 10.

PRIVATE ENGINEERS NOTICE TO CONTRACTORS:

THE EXISTENCE AND LOCATION OF ANY UNDERGROUND UTILITY PIPES OR STRUCTURES SHOWN ON THESE PLANS IS REQUIRED BY A SEARCH OF AVAILABLE RECORDS BY THE ENGINEER OF WORK. THERE ARE NO GUARANTEES MADE BY THE COUNTY AS SHOWN ON THIS MAP. THE CONTRACTOR IS REQUIRED TO TAKE PRECAUTIONARY MEASURES TO PROTECT THE UTILITY LINES SHOWN AND ANY OTHER LINES NOT SHOWN ON THE RECORDS BUT EXISTING ON THE GROUND. PRIOR TO EXCAVATION, THE CONTRACTOR SHALL CALL TOLL FREE 1-800-422-4133 TO VERIFY THE UNDERGROUND LOCATION OF GAS AND TELEPHONE LINES. THE CONTRACTOR SHALL ALSO CALL THE LOS ANGELES DEPARTMENT OF TRANSPORTATION AT 1-818-448-4911 SO THAT THEY CAN MARK THE LOCATION OF UNDERGROUND TELEPHONE CABLES.

REVISED

GENERAL NOTES:

1. ELEVATIONS ARE IN FEET BASED ON U.S.C. & G.S. MEAN SEA LEVEL DATUM OF 1929.
2. NO REVISIONS SHALL BE MADE IN THESE PLANS WITHOUT THE APPROVAL OF THE DIRECTOR OF PUBLIC WORKS.
3. NOTIFY THE DEPARTMENT OF PUBLIC WORKS AT LEAST TWO WORKING DAYS IN ADVANCE OF THE START OF WORK.
4. CONSULT UTILITY COMPANIES AND/OR OWNERS AS TO THE EXISTENCE AND LOCATION OF ANY UTILITIES SHOWN OR NOT SHOWN ON THESE PLANS PRIOR TO THE START OF ANY WORK. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY DAMAGE DONE BY HIS OPERATIONS TO ANY UTILITY FACILITIES AND SHALL BEAR THE COST OF REPAIR OR REPLACEMENT OF SUCH FACILITIES.
5. THE PRIVATE ENGINEER'S SEAL, UNDER THE DEPARTMENT OF PUBLIC WORKS' WITH GRADE SHEETS AND STAMPING FOR ALL HOUSE SEWERS SHALL BE AFFIXED TO AND SHALL INCLUDE ALL STAKE SHEETS THEREOF. THESE PRINTS / EQUATIONS WITH STATIONING FOR ALL HOUSE LATERALS SHALL BE CONSTRUCTED TO A STRAIGHT LINE BETWEEN MANHOLES AT THE MINIMUM GRADE INDICATED ON THE PLANS. HOUSE LATERAL STUBS CHANGE OF GRADE, ANGLE POINTS ARE ALLOWED ONLY AT THE MANHOLE OR AT THE CLEANOUT (C.O.) AT CHANGE SHALL BE REQUESTED IN WRITING BY THE PRIVATE ENGINEER.
6. THE PRIVATE ENGINEER'S CERTIFICATE THROUGH THE HOUSE LATERAL OUTLET AT THE PROPERTY LINE AND ON THE TOP OF CURB ELEVATION TO BE SHOWN ON THE GRADE SHEET.
7. BEFORE WORK CAN BE STARTED, THE CONTRACTOR MUST OBTAIN A PERMIT TO EXCAVATE IN THE COUNTY STREET(S) WITHIN THE CONSTRUCTION LIMITS OF THIS PROJECT FROM THE DEPARTMENT OF PUBLIC WORKS, PERMIT OFFICE, 900 SOUTH FREMONT AVENUE, ALHAMBRA, CALIFORNIA 91803 - 1331. A FEE WILL BE CHARGED TO COVER THE COST OF CONSTRUCTION INSPECTION AND RECORD PLANS.
8. A PERMIT FROM THE STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, 120 SOUTH SPRING STREET, LOS ANGELES, CALIFORNIA 90012 - 3606 MUST BE OBTAINED PRIOR TO ANY CONSTRUCTION WITHIN STATE HIGHWAY RIGHT-OF-WAY.
9. APPROVAL OF THESE PLANS BY THE COUNTY OF LOS ANGELES DOES NOT CONSTITUTE A REPRESENTATION AS TO THE ACCURACY OF THE LOCATION OR THE EXISTENCE OR NON-EXISTENCE OF ANY OTHER FACILITIES WITHIN THE PROJECT BOUNDARIES.
10. REFER TO SECTION 7-10.4 OF THE STANDARD SPECIFICATIONS REGARDING SAFETY ORDERS.
11. PRIOR TO THE ISSUANCE OF THE RELEASE OF GRADE (LESS THAN FINAL), THE CONTRACTOR SHALL SUBMIT TO THE ENGINEER OF WORK A COPY OF A PERMIT TO USE WATER FROM A FIRE HYDRANT OR OTHER SOURCE OF SUPPLY FOR CONSTRUCTION PURPOSES, ISSUED BY THE DEPARTMENT OF PUBLIC WORKS, WATER AND SANITATION DIVISION, 900 SOUTH FREMONT AVENUE, ALHAMBRA, CALIFORNIA 91803 - 1331. ALL WATER USED FOR CONSTRUCTION PURPOSES SHALL BE OBTAINED FROM FIRE HYDRANTS METERED BY THE DEPARTMENT OF PUBLIC WORKS. NO CONSTRUCTION WATER SHALL BE OBTAINED FROM ANY OTHER SOURCE UNLESS AUTHORIZED IN WRITING BY THE DIRECTOR OF PUBLIC WORKS OR HIS AUTHORIZED REPRESENTATIVE.

CONSTRUCTION NOTES:

1. WORK SHALL BE CONSTRUCTED IN ACCORDANCE WITH STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991, AND ADDENDUM NO. 2 DATED JULY 31, 1991, AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
2. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
3. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
4. WYE OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
5. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
6. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
7. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
8. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
9. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
10. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
11. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
12. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
13. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
14. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
15. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
16. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
17. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
18. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
19. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
20. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
21. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
22. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
23. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
24. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
25. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
26. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
27. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
28. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
29. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
30. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
31. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
32. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
33. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
34. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
35. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
36. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
37. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
38. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
39. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
40. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
41. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
42. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
43. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
44. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
45. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
46. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
47. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
48. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
49. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
50. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
51. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
52. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
53. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
54. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
55. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
56. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
57. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
58. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
59. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
60. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
61. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
62. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
63. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
64. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
65. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
66. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
67. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
68. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
69. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
70. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
71. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
72. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
73. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
74. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
75. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
76. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
77. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
78. ALL JOINTS SHALL BE TESTED FOR LEAKAGE IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, 1991 EDITION (GREEN BOOK) AND ADDENDUM NO. 1 DATED JULY 1, 1991 AND ADDENDUM NO. 2 DATED JULY 31, 1991 AND ANY SUBSEQUENT ADDENDUMS THERETO, EXCEPT AS MODIFIED BY SPECIAL PROVISIONS DATED JULY 31, 1991 AND SHALL BE INTERPRETED ONLY IN THE PRESENCE OF THE DEPARTMENT OF PUBLIC WORKS.
79. ANY CONTRACTOR SHALL NOTIFY ANY CONSTRUCTION SUPERINTENDENT BY TELEPHONE, AND FOR LESS THAN 8 HOURS NOTICE, AT LEAST TWENTY-FOUR HOURS BEFORE STARTING ANY WORK UNDER THIS CONTRACT.
80. HOUSE LATERALS SHALL NOT BE CONSTRUCTED WITH GRADES, AT PROPERTY LINE, 5 FEET BELOW CURB GRADE EXCEPT AS NOTED.
81. ANY OR TEE BRANCHES MAY BE USED IF CONVENIENT TO MAKE THE CONNECTIONS TO THE DEPARTMENT'S SYSTEM AS NOTED.
82. ALL 8 INCH PIPE SHALL BE EITHER SDR35 PLASTIC OR CLASS 150 PRECAST CONCRETE SEWER MEETING ASTM C 478 OR EXCEPT AS NOTED.
83. PROVIDE 5 INCH CLEAR IN THE PROPERTY LINE CLEANOUT PIPES PERPENDICULAR TO THE SEWER LINE AT THE CENTER LINE OF EACH SEWER LOT.
84. MANHOLE TOPS IN UNIMPROVED AREAS OF WAY TO BE SET 1 INCH ABOVE ADJACENT GROUND.
85. MANHOLE TO EXIT PIPE JOINT SHALL BE PER "D" OR "E" PIPE STANDARD DETAILS FROM SECTION 306-1.
86. A STAKED OFFSET TWO FEET OUTSIDE THE CURB FACE AT THE GRADE BREAK SHALL BE ESTABLISHED AT EACH MANHOLE AND CLEANOUT FROM WHICH THE DEPTH OF THE SEWER MAY BE DETERMINED.
87. REMOVE ALL TEMPORARY PIPE PLUGS AT THE TIME OF INSTALLATION OF THE ADJACENT SEWER LINE. ALL PIPE SHALL BE CLEAN AND FREE FROM DEBRIS AT THE POINT OF WITH REFERENCE.
88. PROVIDE THE COUNTY OF LOS ANGELES WITH A CERTIFICATE OF COMPLIANCE FOR THE INSTALLATION OF THE SEWER LINE(S) AND MANHOLE(S) AS REQUIRED BY THE DEPARTMENT OF PUBLIC WORKS' CODE, SECTION 7005.
89. SUBJECT: Halsey Canyon Rd Sewer Flow Study 2019, Valencia CA

Dear Mr. Williams,

ADS is pleased to submit the report for the Halsey Canyon Rd Sewer Flow Study 2019, Valencia CA completed on behalf of Sterling Gateway, LLC. The metering was conducted at three (3) locations over a 1-week period. The study was conducted during the period of May 31, 2019 - June 06, 2019.

The report contains depth, velocity, and quantity hydrographs as well as daily long tables for the metering period in pdf format. An Excel file containing depth, quantity, and velocity entities for the monitoring location in 5-minute format has already been provided.

In addition, we would be happy to further explain any details about the report that may seem unclear. Should you have any questions or comments, you may contact the Project Manager, Paul Mitchell at (714) 379-9778.

Thank you for choosing ADS products and services to meet your flow monitoring needs.

Sincerely,
ADS ENVIRONMENTAL SERVICES

Sean O'Donnell
Data Analyst

Scope and Methodology

Introduction

Sterling Gateway, LLC entered into an agreement with ADS Environmental Services to conduct flow monitoring at three (3) metering points within the City of Valencia, California. The study was conducted over a 1-week period. The objective of this study was to measure depth, velocity, and quantify flows. Data obtained will be used for planning purposes.

Project Scope

The scope of this study involved using flow monitors to quantify wastewater flows at the designated locations. Specifically, the study included the following key components.

- Investigate the proposed flow-monitoring sites for adequate hydraulic conditions.
- Flow monitor installations.
- Flow monitor confirmations and data collections.
- Flow data analysis.

Equipment installation was completed by May 30, 2019 for the monitoring period, which began on May 31, 2019 and was completed on June 06, 2019.

Flow Monitoring Equipment

The ***ADS FlowShark Triton*** monitor was selected for this project. This flow monitor is an area velocity flow monitor that uses both the Continuity and Manning's equations to measure flow.

The ADS FlowShark Triton monitor consists of data acquisition sensors and a battery-powered microcomputer. The microcomputer includes a processor unit, data storage, and an on-board clock to control and synchronize the sensor recordings. The monitor was programmed to acquire and store depth of flow and velocity readings at 5-minute intervals.

The FS Triton monitor features cross-checking using multiple technologies in each sensor for continuous running of comparisons and tolerances. The FS Triton monitor can support two (2) sets of sensors. The sensor option used for this project was:

The Peak Combo Sensor installed at the bottom of the pipe includes three types of data acquisition technologies.

The ***up looking ultrasonic depth*** uses sound waves from two independent transceivers to measure the distance from the sensor upward toward the flow surface; applying the speed of sound in the water and the temperature measured by sensor to calculate depth.

The ***pressure depth*** is calculated by using a piezo-resistive crystal to determine the difference between hydrostatic and atmospheric pressure. The pressure sensor is temperature compensated and vented to the atmosphere through a desiccant filled breather tube.

To obtain ***peak velocity*****,** the sensor sends an ultrasonic signal at an angle upward through the widest cross-section of the oncoming flow. The signal is reflected by suspended particles, air bubbles, or organic matter with a frequency shift proportional to the velocity of the reflecting objects. The reflected signal is received by the sensor and processed using digital spectrum analysis to determine the peak flow velocity.

Installation

Installation of flow monitoring equipment typically proceeds in four steps. First, the site is investigated for safety and to determine physical and hydraulic suitability for the flow monitoring equipment. Second, the equipment is physically installed at the selected location. Third, the monitor is tested to assure proper operation of the velocity and depth of flow sensors and verify that the monitor clock is operational and synchronized to the master computer clock. Fourth, the depth and velocity sensors are confirmed and line confirmations are performed.

In pipes up to 42 inches in diameter, the sensors were mounted on expandable stainless steel rings, inserted at least a foot upstream into influent pipes and tightened against the inside walls of the pipes. Influent pipe installations reduce the influences of turbulence and backwater often caused by changes in channel geometry in manholes.

Data Collection, Confirmation, and Quality Assurance

Data collects were done remotely via wireless connect on a weekly basis via ADS Field Representatives. During the monitoring period, field crews visit each monitoring location to verify proper monitor operation and document field conditions. The following quality assurance steps are taken to assure the integrity of the collected data:

Measure power supplies: monitors were powered by dry cell battery packs. Voltages were recorded and battery packs replaced, as necessary. Separate batteries provided back-up power to memory allowing primary batteries to be replaced without loss of data.

Clock synchronization: Field crews synchronized monitor clocks to master clocks.

Confirm depth and velocity readings: Field crews descended into meter manholes to manually measure depths and velocities and compare them to meter readings to confirm that they agreed. They also measured silt levels, if any, in the inverts of the pipes. Silt areas were subtracted from flow areas to compute true areas of flow.

Confirm average velocities through cross-sectional velocity profiles: Since ADS velocity sensors measure peak velocity, field crews collected cross-sectional velocity profiles in order to develop a relationship between peak and average velocity in lines that meet the hydraulic criteria.

Upload and Review Data: Data collected from the monitors were uploaded and reviewed by a Data Analyst for completeness, outliers and deviations in the flow patterns, which indicate system anomalies or equipment failure.

Flow Quantification Methods

There are two main equations used to measure open channel flow: the ***Continuity Equation*** and the ***Manning Equation.*** The Continuity Equation, which is considered the most accurate, can be used if both depth of flow and velocity are available. In cases where velocity measurements are not available or not practical to obtain, the Manning Equation can be used to estimate velocity from the depth data based on certain physical characteristics of the pipe (i.e. the slope and roughness of the pipe being measured). However, the Manning equation assumes uniform, steady flow hydraulic conditions with non-varying roughness, which are typically invalid assumptions in most sanitary sewers. The Continuity Equation was used exclusively for this study.

Continuity Equation

The Continuity Equation states that the flow quantity (Q) is equal to the wetted area (A) multiplied by the average velocity (V) of the flow.

$$Q = A * V$$

This equation is applicable in a variety of conditions including backwater, surcharge, and reverse flow.

Data Analysis and Presentation

Data Analysis

A flow monitor is typically programmed to collect data at either 15-minute or 5-minute intervals throughout the monitoring period. The monitor stores raw data consisting of (1) the ultrasonic depth, (2) the peak velocity and (3) the pressure depth. The data is imported into ADS's proprietary software and is examined by a data analyst to verify its integrity. The data analyst also reviews the daily field reports and site visit records to identify conditions that would affect the collected data.

Velocity profiles and the line confirmation data developed by the field personnel are reviewed by the data analyst to identify inconsistencies and verify data integrity. Velocity profiles are reviewed and an average to peak velocity ratio is calculated for the site. This ratio is used in converting the peak velocity measured by the sensor to the average velocity

used in the Continuity equation. The data analyst selects which depth sensor entity will be used to calculate the final depth information. Silt levels present at each site visit are reviewed and representative silt levels established.

Occasionally the velocity sensor's performance may be compromised resulting in invalid readings sporadically during the monitoring period. This is generally caused by excessive debris (silt) blocking the sensor's crystals, shallow flows (~< 1") that may drop below the top of the sensor or very clear flows lacking the particles needed to measure rate. In order to use the Continuity equation to quantify the flow during these periods, a Data Analyst and/or Engineer will use the site's historical pipe curve (depth vs. velocity) data along with valid field confirmations to reconstitute and replace the false velocity recordings with expected velocity readings for a given historical depth along the curve.

Selections for the above parameters can be constant or can change during the monitoring period. While the data analysis process is described in a linear manner, it often requires an iterative approach to accurately complete.

Data Presentation

This type of flow monitoring project generates a large volume of data. To facilitate review of the data, results have been provided in graphical and tabular formats. The flow data is presented graphically in the form of scattergraphs and hydrographs. Hydrographs are based on 5-minute averaging. Tables are provided in daily average format. These tables show the flow rate for each day, along with the daily minimum and maximums, the times they were observed, the total daily flow, and total flow for the month (or monitoring period). The following explanation of terms may aid in interpretation of the tables and hydrographs. In addition, please see the "Site Data Quality Summary" table included herein for more comments regarding data quality.

DEPTH - Final calculated depth measurement (in inches)

QUANTITY - Final calculated flow rate (in MGD)

VELOCITY - Final calculated flow velocity (in feet per second)

REPORT TOTAL - Total volume of flow recorded for the indicated time period (in MG)

Site Commentary

Site Information

Has100	
Pipe Dimensions	17.5 "
Silt Level	0.00"

Overview

Site Has100 functioned under normal conditions during the period Friday, May 31, 2019 to Thursday, June 6, 2019. No surcharge conditions were experienced at this location. Review of the scattergraph shows that flows remained free flowing throughout the period.

Flow depth and velocity measurements recorded by the flow monitor are consistent with field confirmations conducted to date and support the relative accuracy of the flow monitor at this location.

This location was installed downstream of site HAS110. A review of balancing shows a moderate net flow between the sites.

Observations

Average flow depth, velocity, and quantity data observed during Friday, May 31, 2019 to Thursday, June 6, 2019 , along with observed minimum and maximum data, are provided in the following table. The values presented are based on 5-minute data.

Observed Flow Conditions			
Item	Depth (in)	Velocity (ft/s)	Quantity (MGD)
Average	2.38	3.32	0.316
Minimum	1.58	1.21	0.070
Maximum	4.68	5.99	1.354
Time of Minimum	6/6/2019 4:45 AM	5/31/2019 2:40 AM	6/2/2019 3:00 AM
Time of Maximum	5/31/2019 2:40 PM	6/6/2019 10:50 AM	6/6/2019 10:50 AM

Data Quality

Data uptime observed during the Friday, May 31, 2019 to the Thursday, June 6, 2019 monitoring period is provided in the table below. Based upon the quality and consistency of the observed flow depth and velocity data, the Continuity equation was used to calculate flow rate and quantities during the monitoring period.

Overview

Site Indus02 functioned under normal conditions during the period Friday, May 31, 2019 to Thursday, June 6, 2019. No surcharge conditions were experienced at this location. Review of the scattergraph shows that flows remained free flowing throughout the period.

Flow depth and velocity measurements recorded by the flow monitor are consistent with field confirmations conducted to date and support the relative accuracy of the flow monitor at this location.

This location was installed upstream of site HAS110 (See Site HAS110 Site Commentary For More Details).

Observations

Average flow depth, velocity, and quantity data observed during Friday, May 31, 2019 to Thursday, June 6, 2019 , along with observed minimum and maximum data, are provided in the following table. The values presented are based on 5-minute data.

Observed Flow Conditions			
Item	Depth (in)	Velocity (ft/s)	Quantity (MGD)
Average	1.42	2.39	0.096
Minimum	1.12	0.90	0.024
Maximum	1.69	4.45	0.196
Time of Minimum	5/31/2019 4:30 AM	5/31/2019 3:55 AM	5/31/2019 4:05 AM
Time of Maximum	6/3/2019 11:25 AM	6/6/2019 8:25 PM	6/6/2019 10:05 AM

Data Quality

Data uptime observed during the Friday, May 31, 2019 to the Thursday, June 6, 2019 monitoring period is provided in the table below. Based upon the quality and consistency of the observed flow depth and velocity data, the Continuity equation was used to calculate flow rate and quantities during the monitoring period.

Percent Uptime	
Depth (in)	100
Velocity (ft/s)	100
Quantity (MGD)	100

STERLING RANCH
FIRE BEHAVIOR ANALYSIS AND REPORT
County of Los Angeles, California

Purpose and Scope of Report

Firesafe Planning Solutions performed an assessment of risks related to wildfires in order to assess the intensity of a wildfire approaching the Sterling Ranch project site and the adequacy of ingress and egress roadways to the project site and the community of Val Verde. This report provides the results of that assessment and objective hazard and risk assessments which can be used to establish the community mitigations (hazard less mitigations = risk) that are equal to or greater than the hazards which would be encountered in a worst-case scenario. The study takes into consideration existing/future vegetative interface fuels, topography, fire history and weather conditions during extreme fire conditions. The report provides results of computer calculations that measured the fire intensity, flame lengths, rate of spread and fire travel distance (arrival times) from worst-case scenario wildfires in both the extreme (Santa Ana wind) and the predominant (Onshore wind) wind conditions. The results of fire behavior calculations have been incorporated into the design of the interfaces of the Sterling Ranch project with adjacent wildlands and the Val Verde community.

The current address of the Project Site is 29053 Coolidge Avenue, Val Verde, CA 91384; and the site includes the following APNs: 3271-004-012, 3271-004-013, and 3271-005-032. Sterling Gateway, LP proposes the Sterling Ranch Estates Residential Project (Sterling Ranch project), a 113.9- acre residential Project Site. Of the proposed 222 residential lots, 91 residential lots would be 7,000 square feet to 10,000 square feet in size and 131 residential lots would be greater than 10,000 square feet in size, for an average of 11,364 square feet, consistent with Castaic Area Community Standards District (CSD) development standards.

In addition to the homes, 21,000 square feet of commercial uses on 2.5 acres is proposed along with five open space lots on 21 acres, six landscaped/open space HOA lots on 0.1 acre, three access strip lots at Trevylon Street (20' emergency access), Rainbow Drive (20' emergency access) and Lexington Drive (26' project access) on 0.2 acre, three infiltration basins and six debris basins on 8.8 acres, a pump station on 0.1 acre, and public streets and private and future streets for the Project Site on 19.7 acres.

The Sterling Ranch project also includes the following off-site improvements: a portion of Del Valle Road from the easterly Project boundary to approximately 772-feet east of the Project boundary within the adjacent property; the off-site construction of a mainline sewer from the Project site to Hasley Canyon Road within Del Valle Road; the upsizing of the existing water line within Hasley Canyon Road; and the dedication of off-site permanent open space on 37.9 acres. The Project also involves the construction of a one-million-gallon water tank, located on approximately 1.4 acres of disturbed land, at an elevation of 1575 feet, approximately 2.2 miles westerly from the Project site, and in the vicinity of the existing Cuyama water tank site.

The Project's system of public streets would access Del Valle Road. The extension of Chiquito Canyon Road (as Sterling Parkway) would provide access to the Project site and would include four new intersections with local roadways constructed within the Project site.

The Project site is currently undeveloped, apart from one single-family residential structure, unimproved hiking trails and dirt roads. The Project would demolish and remove the existing on-site residential structure, which is located off Hunstock Street and Coolidge Avenue (proposed Sterling Parkway).

General Geographic Description

The Project is in the community of Val Verde, north of Chiquito Canyon Road, as well as northwest and southeast of Del Valle Road. The Project site lies within unincorporated Los Angeles County, just west of the City of Santa Clarita and south of the community of Castaic. The Sterling Ranch project is located at the northern terminus of Chiquito Canyon Road. The eastern edge of the project site interfaces with Del Valle Road (which bisects the project site) just over ½ miles west of Hasley Canyon Road. The location is shown below in Figure 1 and Figure 2, on the next page.

The Project site varies from flat to moderate north and south facing slopes with elevations ranging from approximately 1,200 feet above mean sea level along the southern boundary to approximately 1,400 feet above mean sea level in the northeastern portion of the site.

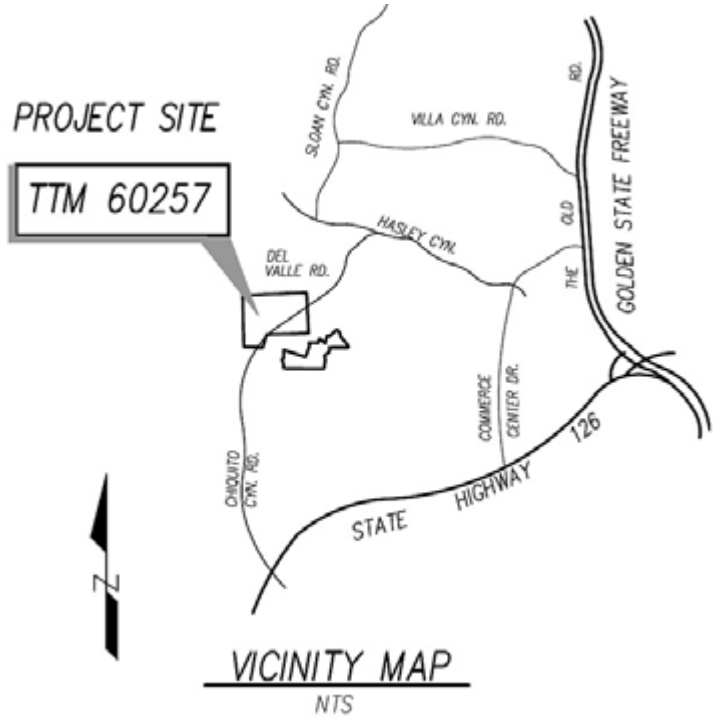

Figure 1 - Vicinity Map

The Project Site is situated NE of the current Val Verde community. With this location, most any fire approaching the area from the typical Santa Ana Wind Conditions (NE and ENE) would impact the Sterling Ranch project prior to impacting the balance of the community. Later in this report, discussion is provided on the slope, aspect and orientation of the wildland areas to the new development but it will also be discussed in terms of the two access roadways that service the entire community (Chiquito Canyon Road and Del Valle Road).

Chiquito Canyon Road runs through the bottom of the canyon for approximately two miles from State Route 126 to its termination at Hunstock Street in the heart of the Val Verde community. This roadway runs north and south with the roadway holding mostly to the west side of the canyon. The canyon has relatively steep walls, which are a plus and a minus in fire behavior and evacuation planning. Del Valle Road run northeast and southwest in alignment with the Santa Ana winds and some of the normal onshore winds. Del Valle Rd. runs through a saddle and along the base of slopes which are mostly N or NE facing.

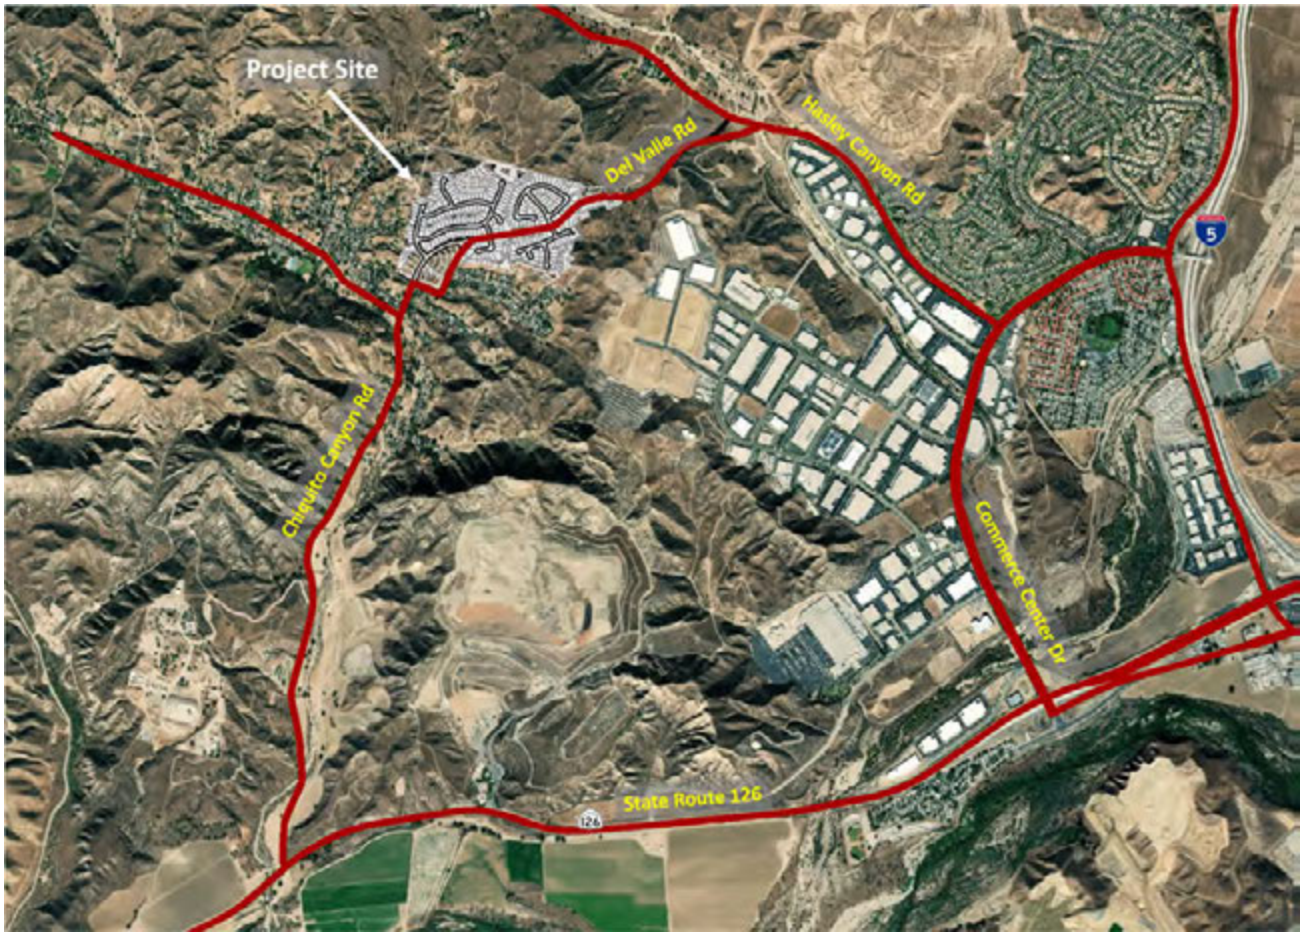

Figure 2 -Location Map

Sterling Ranch is located within CalFire Fire Hazard Severity Zones. The project site is within a State Responsibility Area (SRA). The Fire Severity Zones are geographical areas designated pursuant to California Public Resources Code Sections 4201 through 4204 and are classified as Very High, High, or Moderate in State Responsibility Areas or as Local Agency Very High Fire Hazard Severity Zones designated pursuant to California Government Code sections 51175 through 51189.

All areas within Very High Fire Hazard Severity Zones in either a SRA or Local Responsibility Area (LRA) areas are required by state code to comply with the Chapter 7A of the California Building Code, Chapter 49 of the California Fire Code and Section R337 of the California Residential Code as adopted and amended by the local agency (Los Angeles County). Areas within High and Moderate Zones within SRA areas are also required to comply with the same code sections.

These Fire Severity Zones are shown in red areas on the map on the next page (Figure 3). In addition to the project site, the two community access roadways are within the Very High Fire Hazard Severity Zone for the entire distance that each must be traveled. The only area within the immediate vicinity which is not mapped into a fire severity zone is the area around the intersection of Hasley Canyon Road and Commerce Center Drive (both the homes and commercial areas).

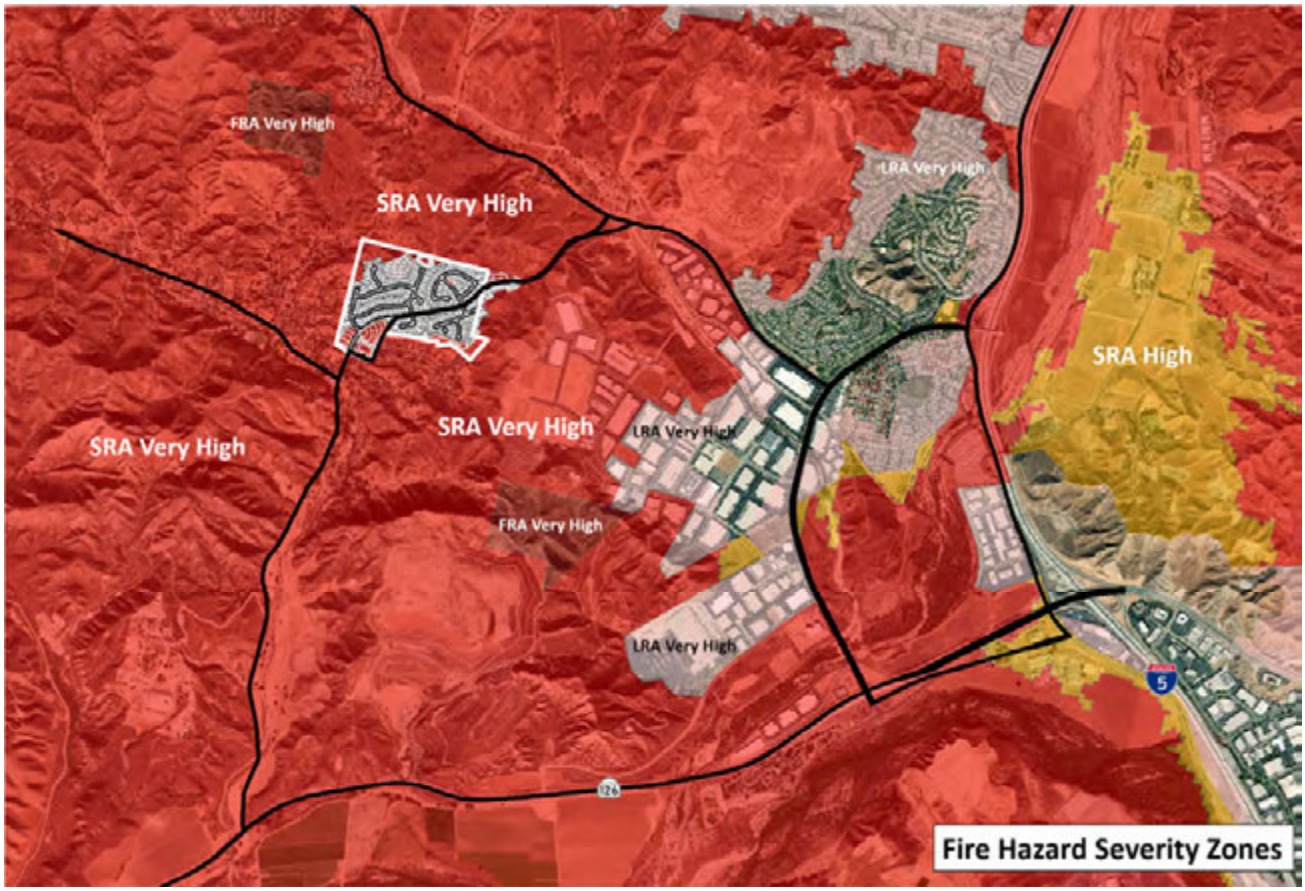

Figure 3 - Fire Hazard Severity Zones Project Site Outline in white

Fire Risk Assessment

Fire risk assessment is based on several factors. These include the fire history of the developed area and the surrounding areas; the vegetation (fuel) that surrounds the community; the weather history for the general area and the specific site; the topography of the project site (slope and aspect); and the placement of structures relative to the factors listed above.

The fire behavior analysis for this project site was completed to assess the risk factors from the modeling results (based on a worst-case scenario) for the Sterling Ranch project. By using the worst-case scenario fire conditions, it is expected that any future fires will be equal to, or less extreme, than those modeled here and would produce fire behavior spread/intensity that is within the risks analyzed and therefore safe. FPS completed the fire hazard assessment and expected wildland fire behaviors in order to provide objective data for consideration of the mitigations that may be necessary in the event of a wildland fire.

Fire History

A review of the CalFire database (FRAP), which maintains a statewide spatial database of fire perimeters from BLM, NPS, and USFS fires 10 acres and greater in size and CAL FIRE fires 300 acres and greater in size since 1980, is shown on the next page (Figures 5). Collection criteria for CAL FIRE fires changed in 2002 to include timber fires greater than 10 acres, brush fires greater than 50 acres, grass fires greater than 300 acres, fires destroying three or more structures, and fires causing $300,000 or more damage. In 2008 collection criteria for CAL FIRE fires eliminated the monetary criterion and redefined the definition of structures.

Sterling Ranch is outlined in white in the figure below (Figure 4). The fire perimeters are shown in red with a shading effect that allows the overlap between fire perimeters to be seen. The overlap areas are more highly shaded so that it is possible to see the areas that have had more fire activity and the extent of each of the perimeters without having to provide separate graphics for each.

As shown in the graphics, while there have been numerous fires on or near the project site in the past 50 years, only 10 have burned onto or immediately adjacent to the project site. Of these ten fires, only one (Ranch Fire) burned onto the project site and it did not make it to the development area. The areas on all sides of the project site are considered historic fire corridors. Fires are likely to continue to burn within these historic fire corridors and will likely burn to the edge of Sterling Ranch project.

In the past 20 years, the fire history in the general area (Figure 5 on next page) has been less impactful. It should be noted that some of these data files only include large fires (over 50 acres) while the more recent history contains fires as small as one acre. Of specific and considerable note is the lack of large fire history in the area between Chiquito Canyon Road, Del Valle Road, Hasley Canyon Road, Commerce Center Drive and State Route 126. Only three fires (Madison Fire 2013 @ 6 acres; Hasley Fire 2017 @ 1.4 acres; and Commerce Fire 2018 @ 14 acres) have burned within or at the edge of this area over the past 20 years which indicates a change in fire conditions. This lack of large fires in the area is likely a combination of development replacing fuels in this area, quicker response times to the area by fire resources with the opening of new fire stations in the area and a lack of fire starts during extreme weather conditions.

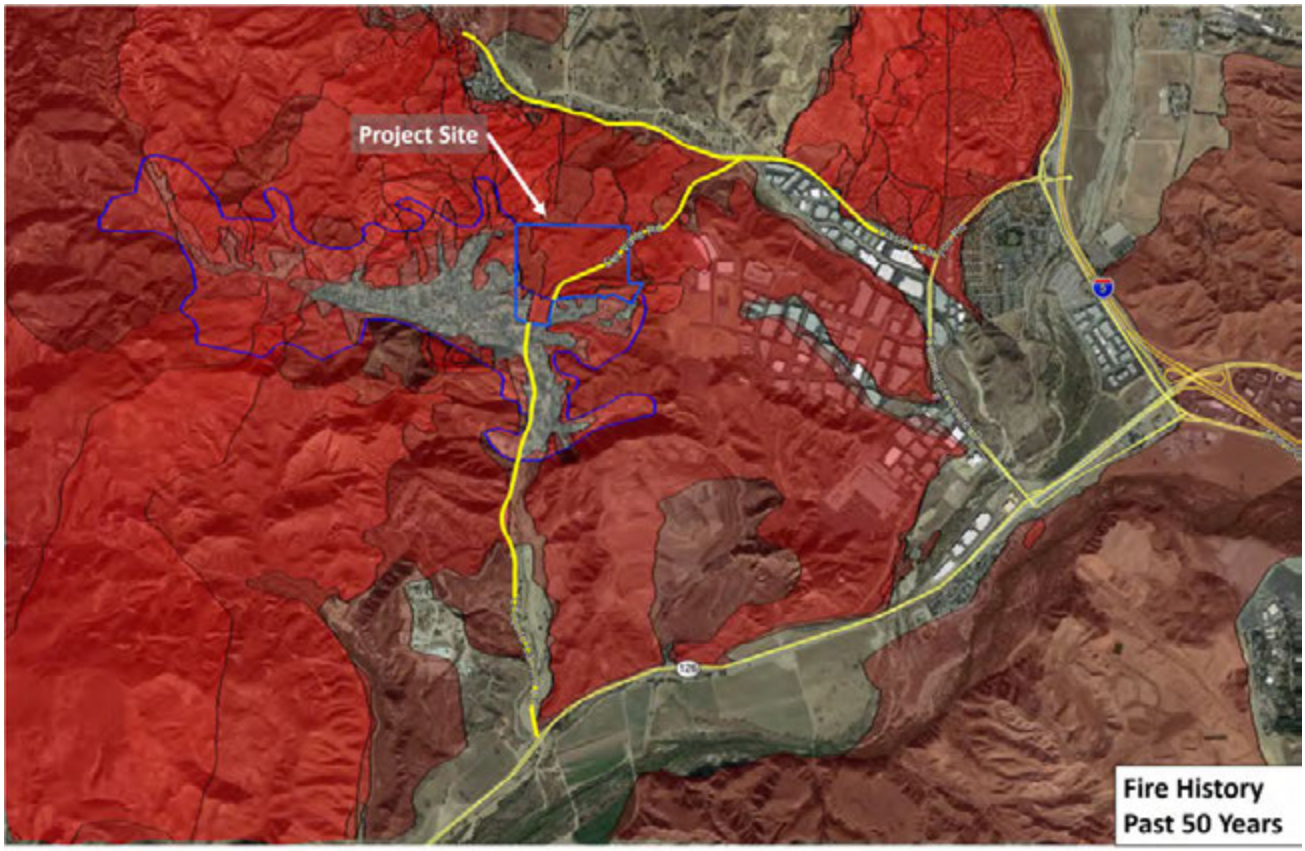

Figure 4 – Fire History Map (Past 50 years) Project Site and Val Verde Community outlined in Blue

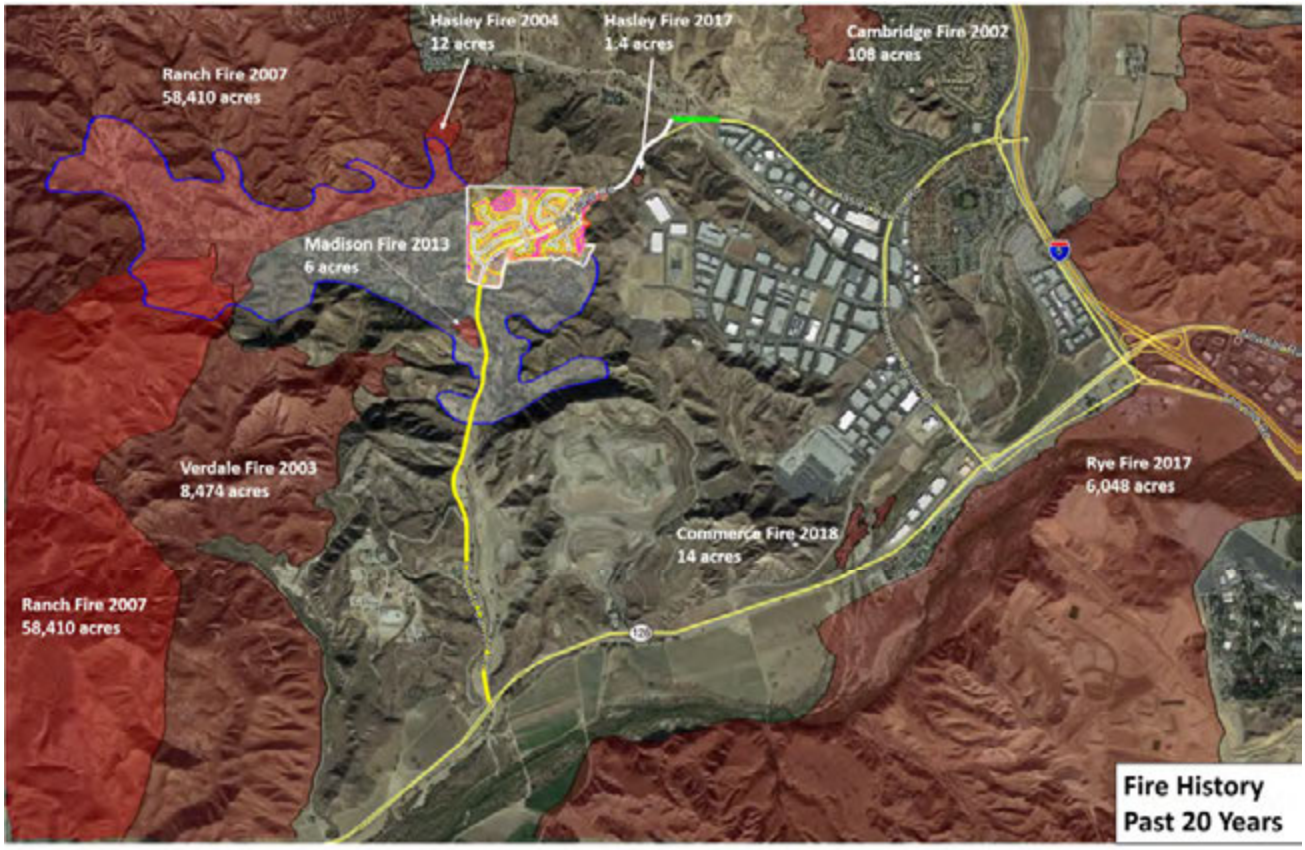

Figure 5 – Fire History (Past 20 years) Project Site oulined in White/Val Verde Community in Blue

With respect to the fire history and Chiquito Canyon Road, in the past 50 years, only one fire (Piru 1988) crossed over the canyon and burned on the other side. This is shown in Figure 6, on the next page. The balance of the fires, while having some impact on Chiquito Canyon Road, tended to hang up on the steep slope at the sides of the canyon due to the fact that the winds were blowing across the canyon rather than straight up or down canyon.

Del Valle Road and Chiquito Canyon Road have no fire history in the past 20 years that would compromise them as access roadways. In the 50-year fire history there has been several fires, including the 1988 Piru Fire, that crossed over Chiquito Canyon Road at its midpoint and several other which impacted the Del Valle Road. Figure 7, on page 10, provides an overlay of the Piru Fire on an older aerial (1994 as 1989 was not available) to show the configuration of the land at that time. Much of the development to the east of Val Verde and the project site was not present west of Commerce Center Drive at this time. While it is unlikely that both roads were impacted at the same time, no records could be found to answer this question.

The fire perimeter indicates that the Piru Fire (13,310 acres) burned over many days under changing weather conditions. It is likely (due to the shape of the fire perimeter and local weather data) that the fire burned through several transitions of offshore to onshore and back wind patterns. This type of back and forth tends to produce fire spread in all directions at one point or another. This is likely the reason that Val Verde Community has fire around its entire perimeter with limited burning into the community if the fire perimeter is accurate. Given the level of detail on the edges, it is likely very accurate.

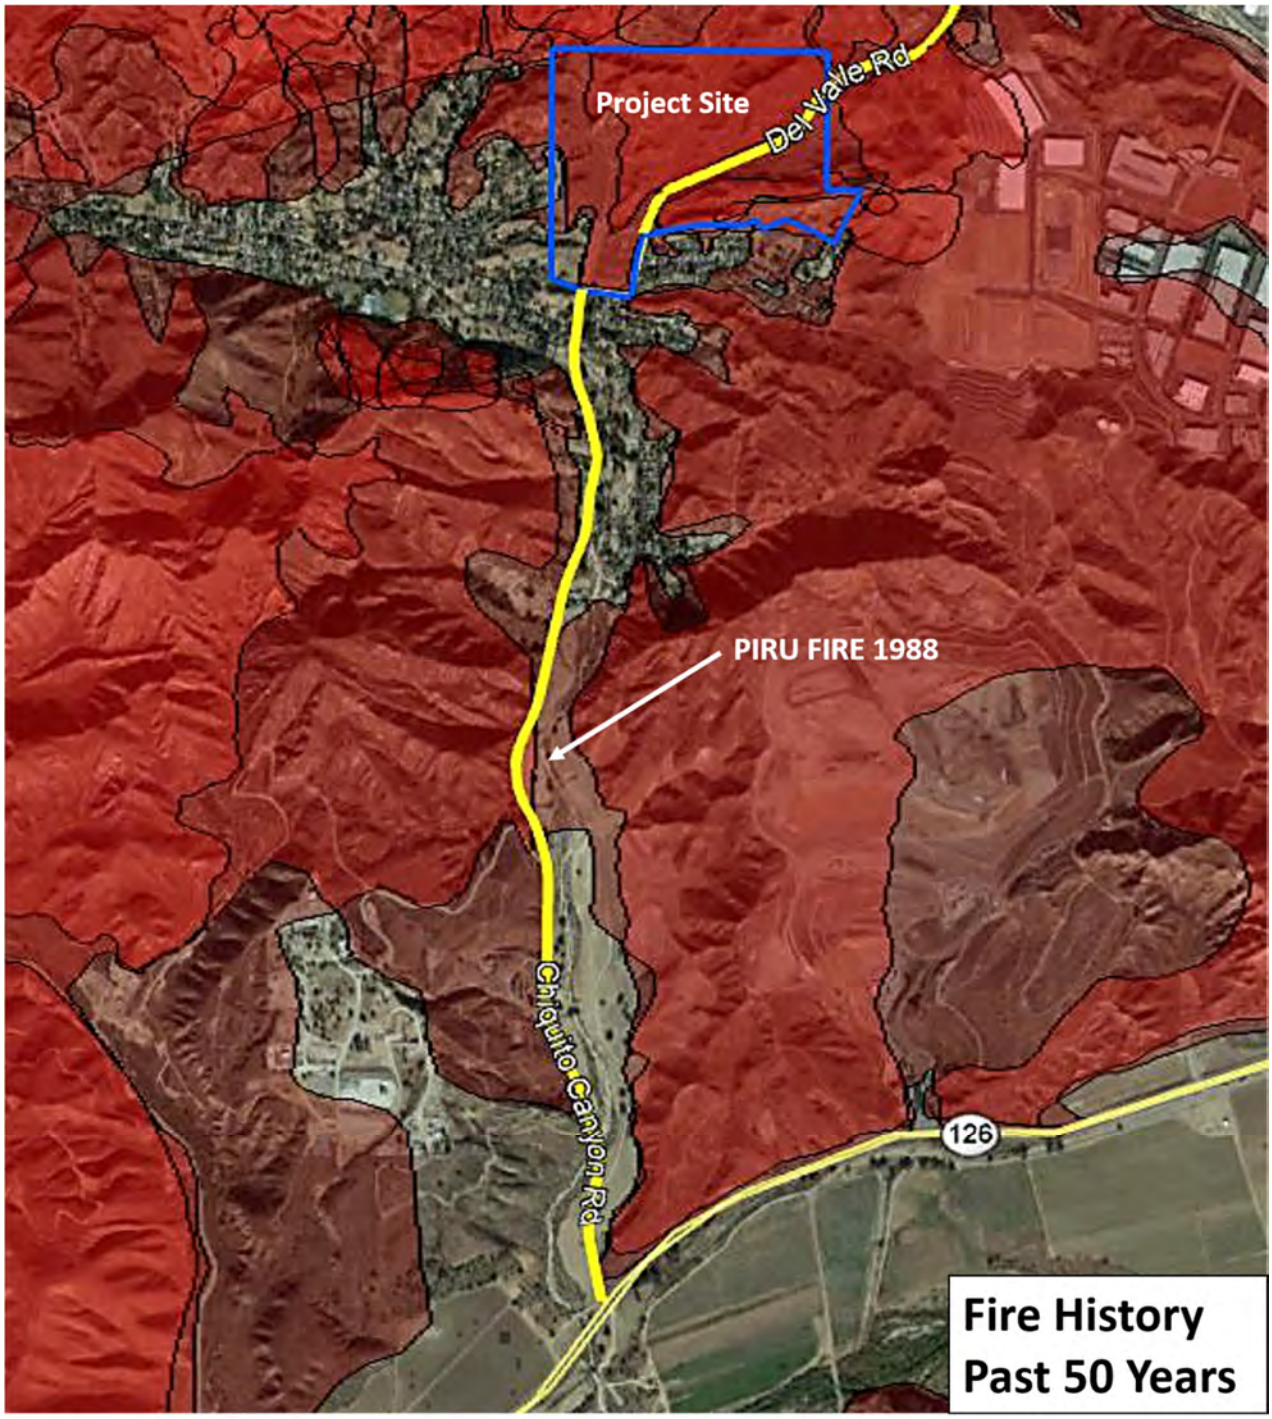

Figure 6 – Fire in Chiquito Canyon (past 50 years)

The fire history of this area is extremely complicated. It involves very dynamic terrain, a fuel mosaic that involves chaparral fuels and grasses and weather patterns which produce extreme fire behavior conditions on a regular basis.

In order to assess these factors, the BehavePlus, FlamMap and FARSITE fire modeling programs were used to produce accurate projected fire conditions that are consistent with this fire history and seek to reproduce the extreme fire behavior that has occurred in this area in the past.

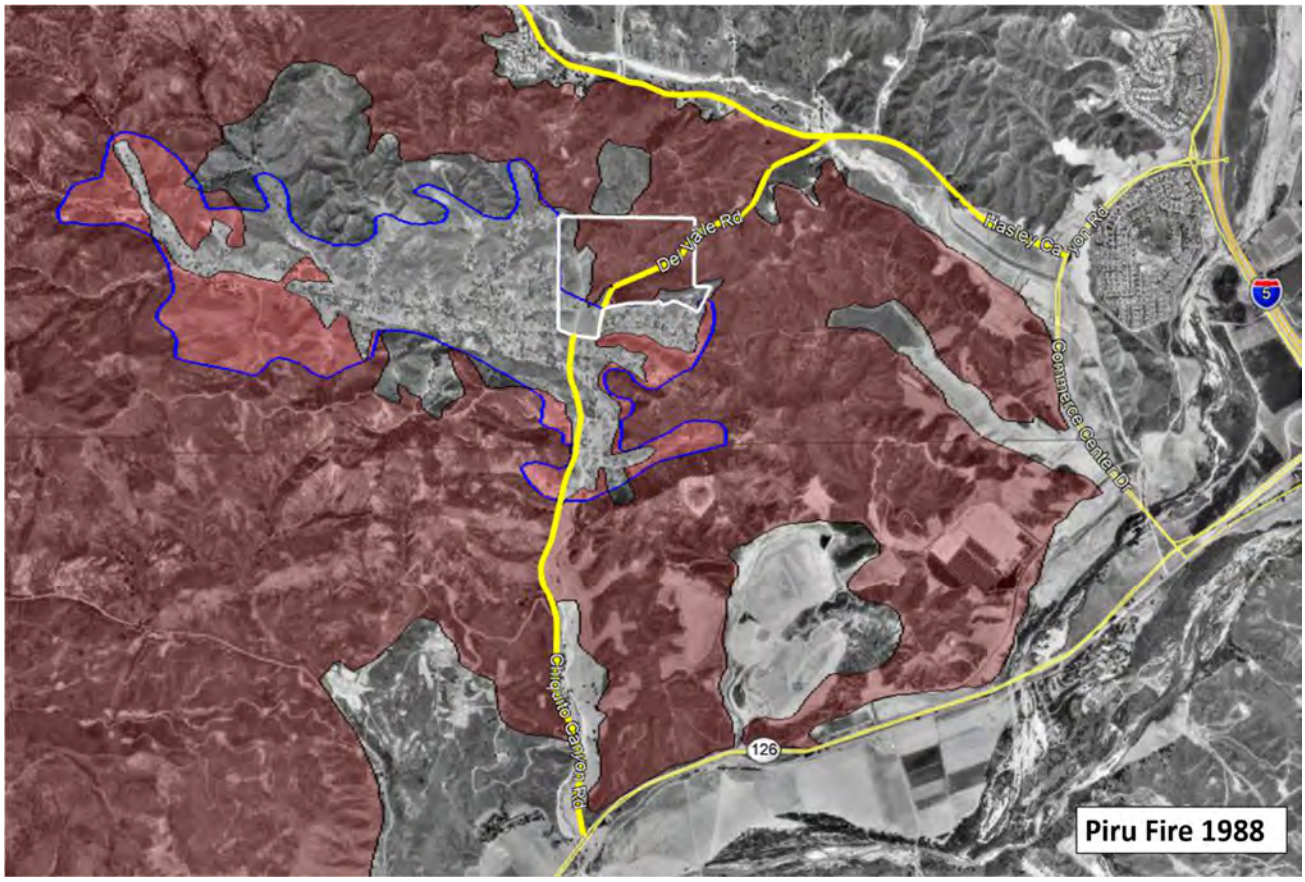

Figure 7 – Fire Perimeter for 1988 Piru Fire over 1995 aerial photo

Fire Behavior Analysis (BehavePlus)

The BehavePlus, Fire Behavior Prediction and Fuel Modeling System, is the most popular and accurate method for predicting wildland fire behavior in prefire defense planning. The BehavePlus fire behavior computer modeling system is utilized by wildland fire experts nationwide. Because the model was designed to predict the spread of a fire, the fire model describes the fire behavior only within the flaming front. The primary driving force in the fire behavior calculations is the amount of dead fuel less than ¼" in diameter; these are the fine fuels that carry the fire. Fuels larger than ¼" contribute to fire intensity, but not necessarily to fire spread. The BehavePlus fire model describes wildfire spreading through surface fuels, which are the burnable materials within 6' of the ground and contiguous to the ground. This type of modeling demonstrates the potential of a wind driven fire that could potentially enter the fuel modification zones from the adjacent wildland areas.

In addition to BehavePlus, the FlamMap/FARSITE model was used to model the fires across the landscape. The biggest difference between the two models is that FlamMap uses a single set of inputs to model the fire cell by cell (30 meter grids in this case) across the landscape whereas, FARSITE uses hourly weather inputs (using real fire weather in this case from the Thomas and Rye Fires) to provide movement across the landscape which is more realistic and likely more accurate.

Weather Inputs and Wind Patterns

Weather data was retrieved from the Del Valle Remote Automated Weather Station (RAWS) which is located at the fire training site on the top of the ridge near the mouth of Chiquito Canyon. This site is located approximately 1.3 miles SSW of the project site (Figure 8, on the next page).

The results of the RAWS data are shown on the wind rose graph in Figure 9, below. This data is for maximum wind direction per hours for 3 years (2017-2019). This graph clearly shows the prevailing wind direction is from the West (daytime onshore) and from the North to Northeast (Santa Ana winds and nightly offshore wind).

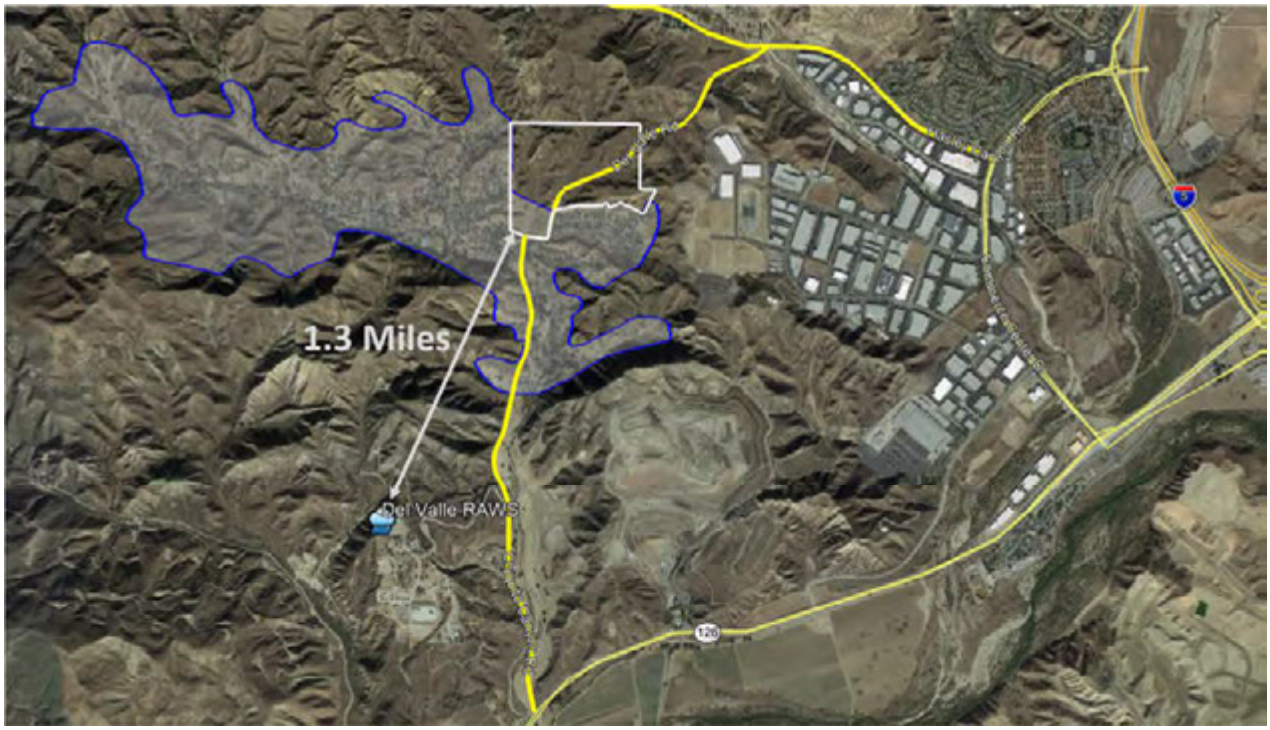

Figure 8 –Del Val **RAWS** Location

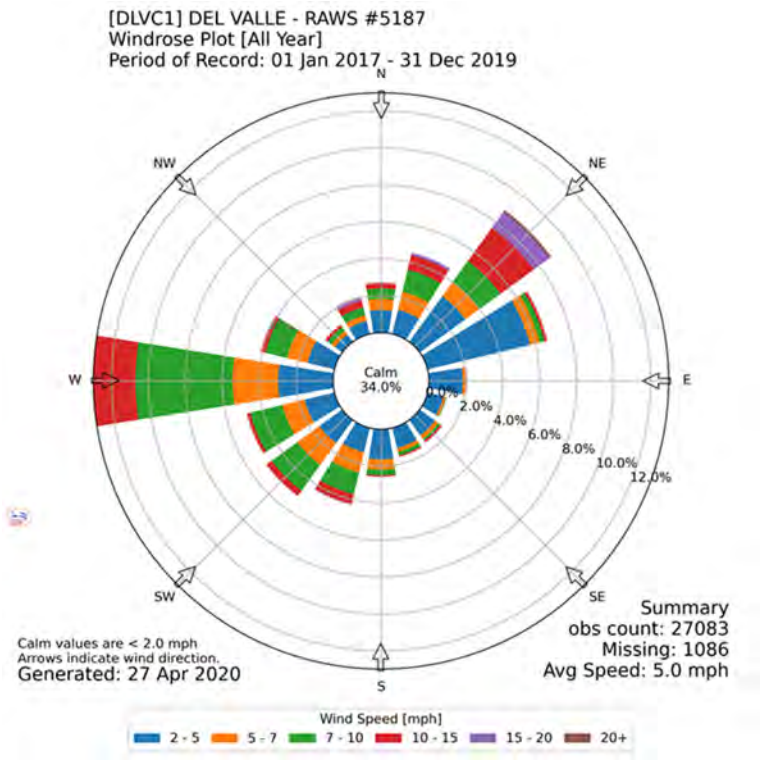

Figure 9 – Wind Rose Del Valle RAWS

With both the onshore and offshore winds, they tend to rotate around from the prominent to the transition. The West wind tends to move to the SW as it transitions, and the NE moves to the ENE while it transitions.

The Santa Ana winds tend to flow from the ENE and NE. and when they breakdown, the onshore flow returns, normally out of the West in the fall. Figure 10, on the next page is a data stream from the Del Valle RAWS that shows a typical offshore/onshore transition when the onshore winds are caused by heat inland which create a low pressure and the cooler air over the water rushes in to fill that low pressure area. This diurnal effect occurs regularly but not at this level of change and wind speed.

Figure 10 – Heat Generated Onshore Flow RAWS data

Within the RAWS dataset are two fires in the general area (Rye Fire and Thomas Fire) which both occurred in December of 2017. The close proximity of the RAWS to the fires and to the project site create a data set which is incredibly valuable. The FARSITE program requires hourly data to compute the fire travel across the landscape. In the modeling scenarios, this report has used the actual RAWS data from the early extreme fire behavior to model potential fires that would directly impact the project site, the access roadways for ingress/egress, and the Val Verde Community as a whole.

Figure 11 – RAWS data for Rye and Thomas Fires in 2017

A wind rose is superimposed onto the project site (Figure 12, on the next page) to illustrate the orientation of the wind and its relationship to the project boundaries. These same compass headings will be used to reference the aspect and fire spread direction during the fire behavior discussion.

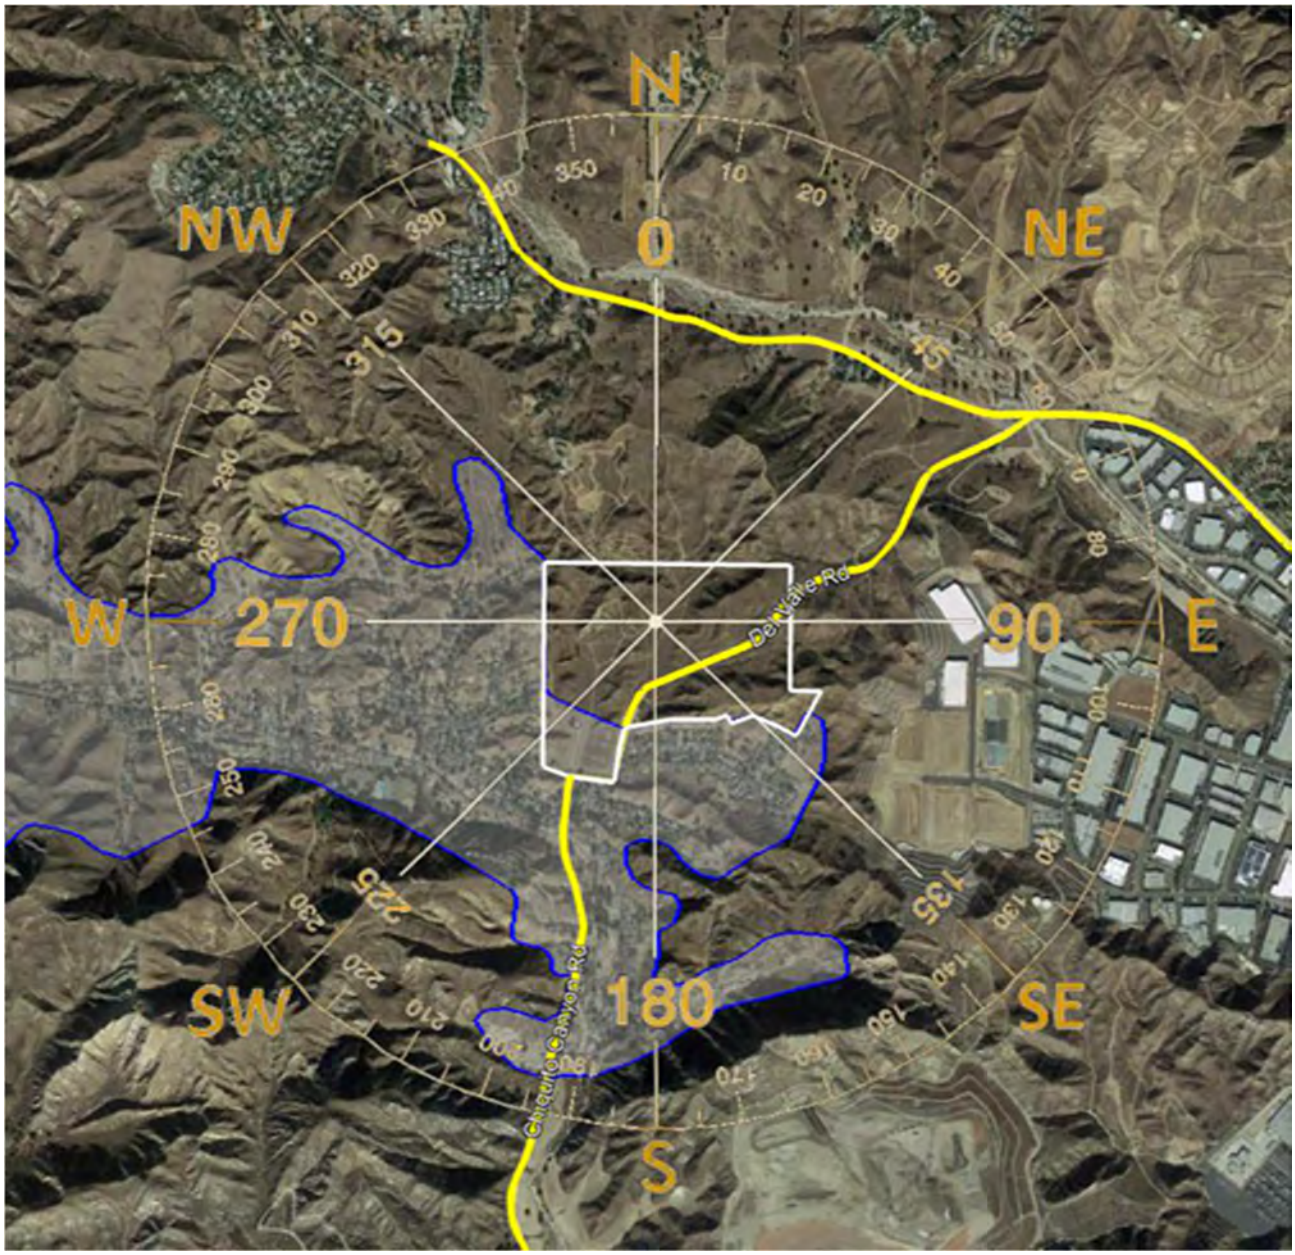

Figure 12 – Project Site with Compass Overlay

In addition to the general direction of the wind from the fire history and the RAWS data, the wind flow through and around the topography must also be considered. The project site was modeled in Wind Ninja (a computer program that computes spatially varying wind fields for wildland fire and other applications requiring high resolution wind prediction in complex terrain) to provide an illustration of the wind flow as the wind travels down through the project site, the Val Verde Community and the ingress/egress roadways. In all the wind scenarios yellow arrows represent the modeled wind speed for the domain average (average of the wind speed values for entire area of analysis). Figure 13, on the next page and several others that follow provide the outputs.

Areas of green indicate up to 40% lower than the modeled domain average and the blue arrows are 100% lower (zero wind) whereas the orange arrows are up to 40% above the average and the red arrows are up to nearly 200% of the modeled wind speed. Wind acceleration (red or orange) is present on the ridgetops around the project site and wind sheltering (green and blue) is present on the leeward

slope/bottom of drainages. Of interest to this report is that the south access roadway (Chiquito Canyon) has no wind acceleration area because much of the canyon is sheltered from a NE wind.

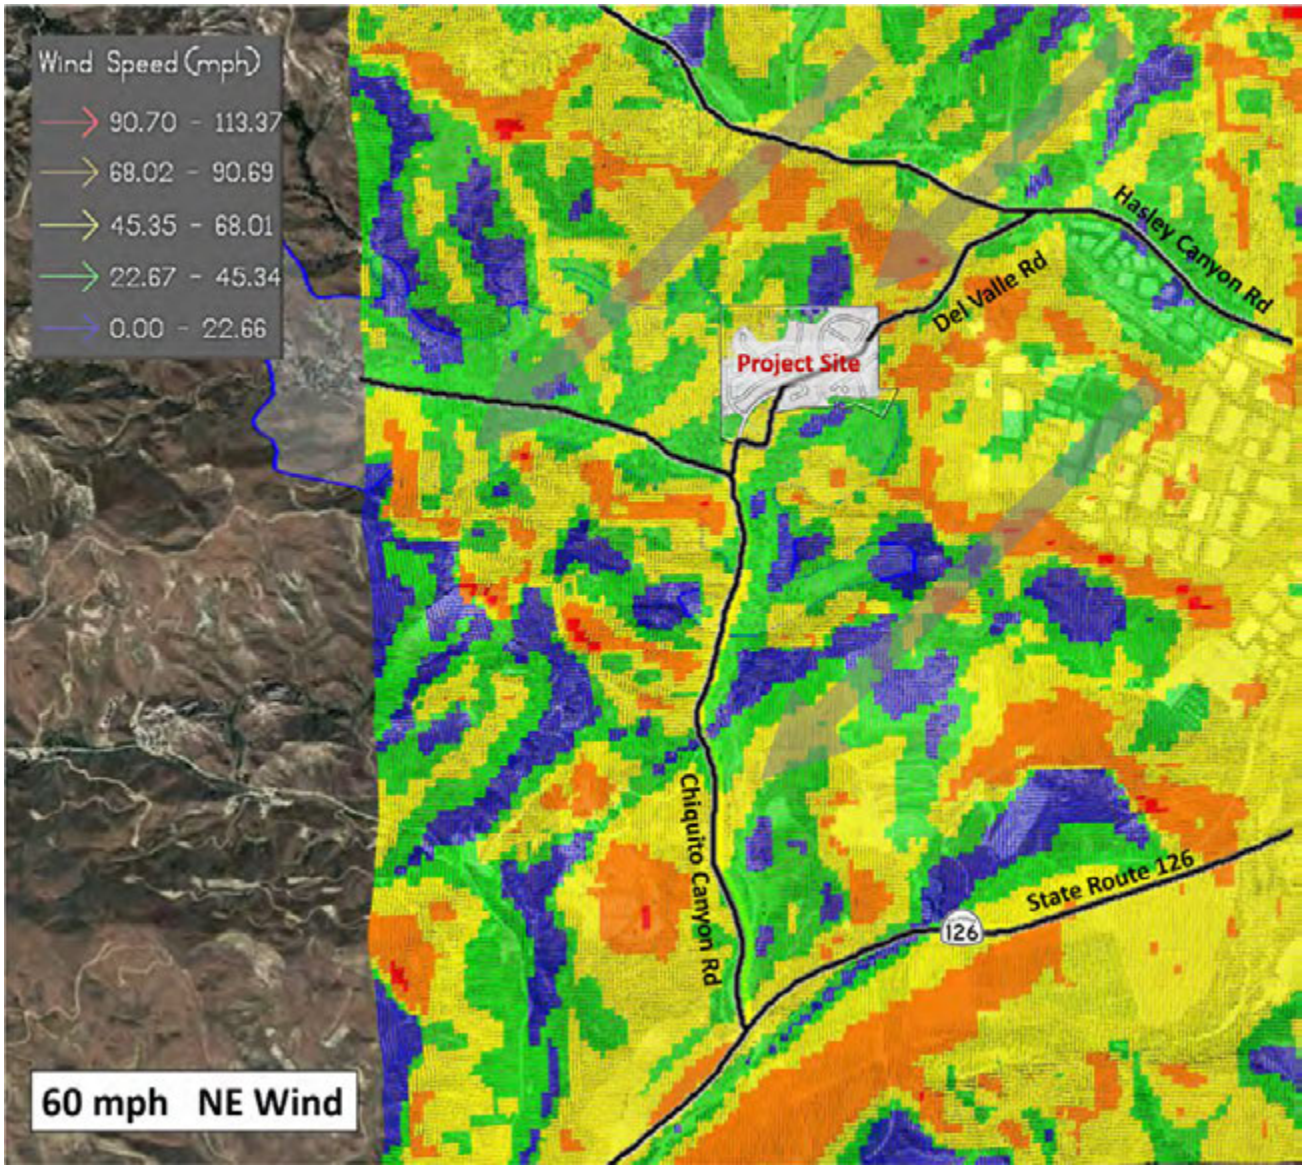

Figure 13 – Project Site Wind Directions (30,000 foot view)

The project site has one area (NE corner) where wind acceleration is a factor at the interface of the project site with the adjacent open space area. This area, along with the entire project interface, will have an approved fuel modification zone designed to provide the distances necessary for the fire behavior that is expected in this interface. The NE access roadway (Del Valle Road) is also only impacted at this same location. The balance of the roadway from the project boundary to the Halsey Canyon Road is either green or yellow (at or below the modeling wind speed). Figure 14, on the next page, provides a closer view of the Del Valle Road wind alignment and the location of the wind acceleration.

In the NE wind model Chiquito Canyon has no areas of acceleration (orange or red) and at the midpoint, there is a blue zone (lowest wind speeds) which causes the wind to change directions or swirl in some cases. Note that while the modeled wind direction is NE, in some of the wind sheltered

areas, the wind is actually running SSW. While the wind speeds are greatly reduced, the complexity is greatly increased (Figure 15, on next page).

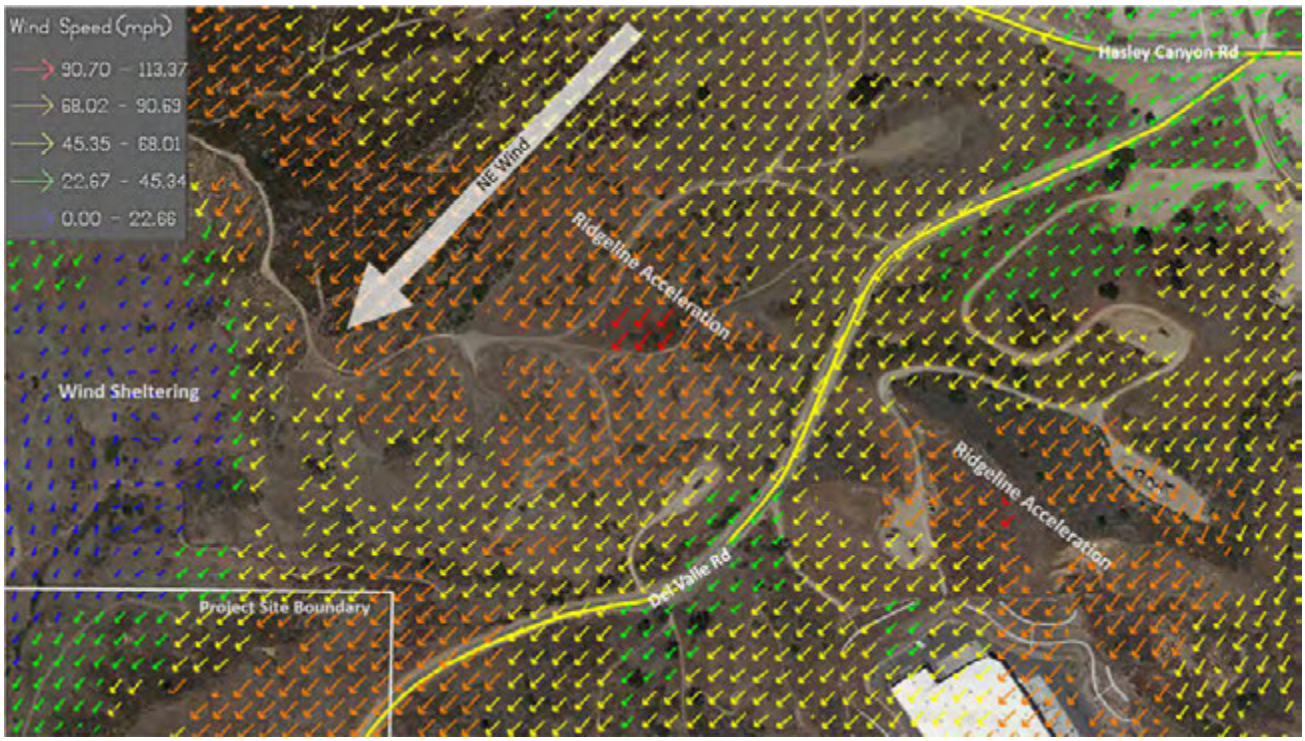

Figure 14 – Wind Ninja Output for NE 60 mph Del Valle Road

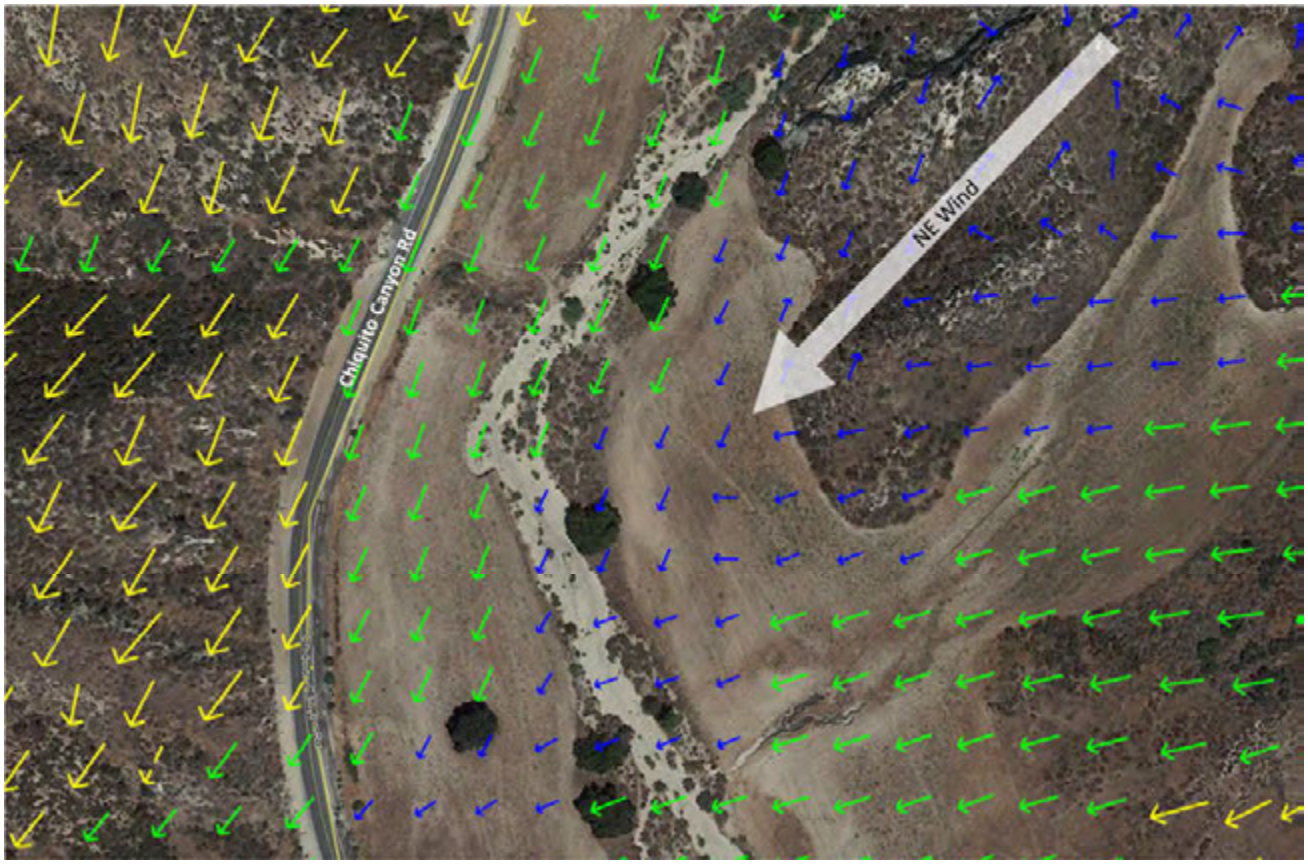

Figure 15 – Wind Ninja Output Chiquito Canyon NE 60 mph wind

Under a north wind (Ranch Fire 2007) the dynamics of the wind alignment change but the impacts are not significantly different. Chiquito Canyon aligns with the north wind and therefore, the wind sheltering is gone, and the acceleration areas are closer to the roadway but still up on the ridgelines (not below or at the road level) as shown below in an oblique view of the Wind Ninja outputs.

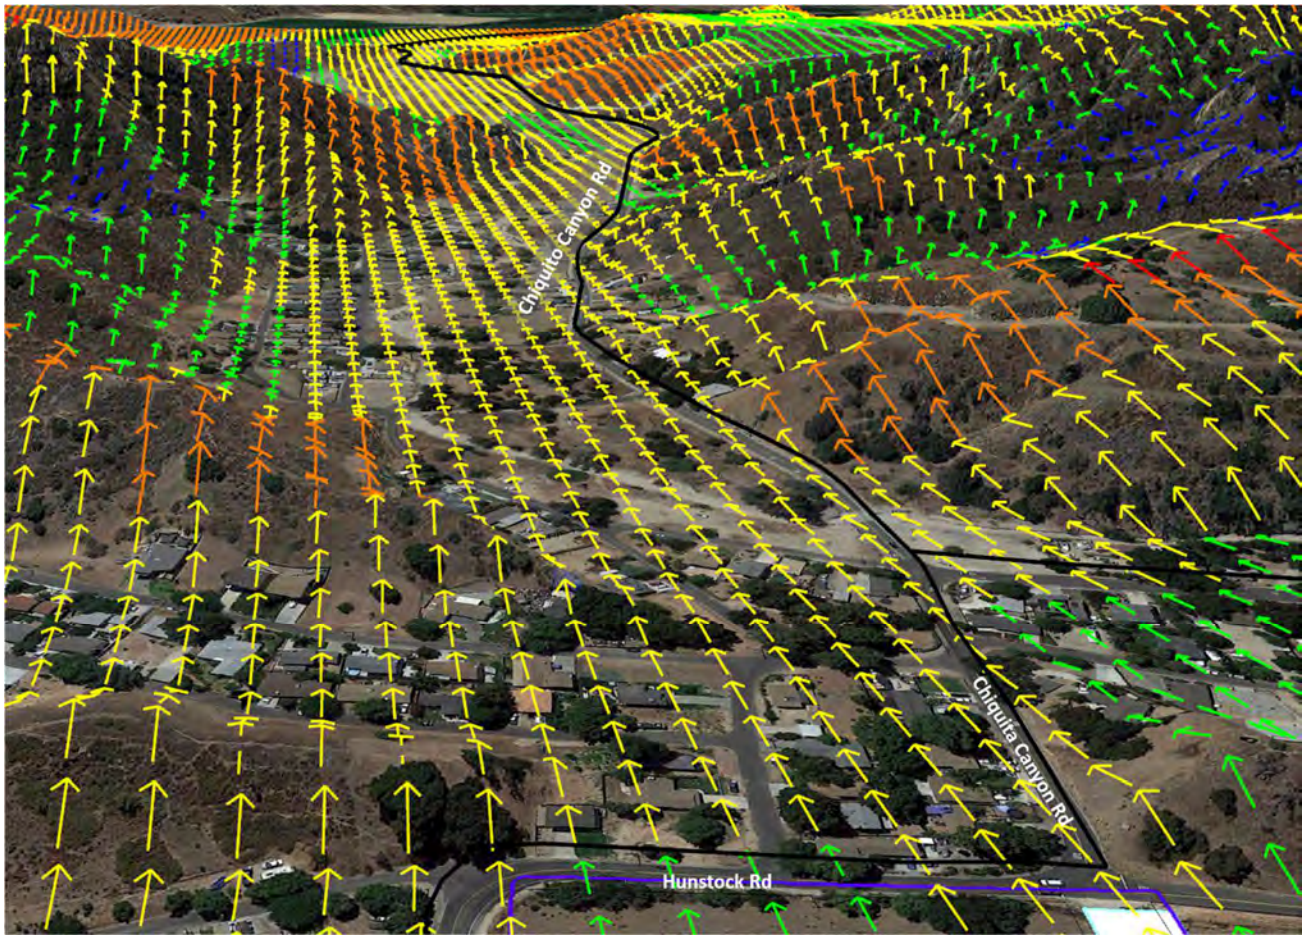

Figure 16- Wind Ninja Output Oblique Chiquito Canyon looking South from Hunstock Rd (North Wind at 60 mph)

Del Valle Road, under a north wind, has a similar condition where the winds at the roadway level of at or below the domain average and the adjacent ridgelines are wind acceleration but not where it impacts the roadway. This is illustrated in Figure 17, on the next page.

Wind impacts can change within a few degrees of rotation and this report does not discuss all of them but seeks to show the impacts of the worst-case conditions. Wind factors will be addressed in the fire behavior modeling as they are relevant to the FlamMap and FARSITE model outputs.

Overall, the project site has limited wind impacts (negative impacts) and the fuel modification zones have been designed to address potential impacts where they occur. The two access roadways (Del Valle Road and Chiquito Canyon Road) are not significantly impacted by the wind direction for winds from the North or NE, as a general rule, but are addressed specifically in the fire behavior discussion.

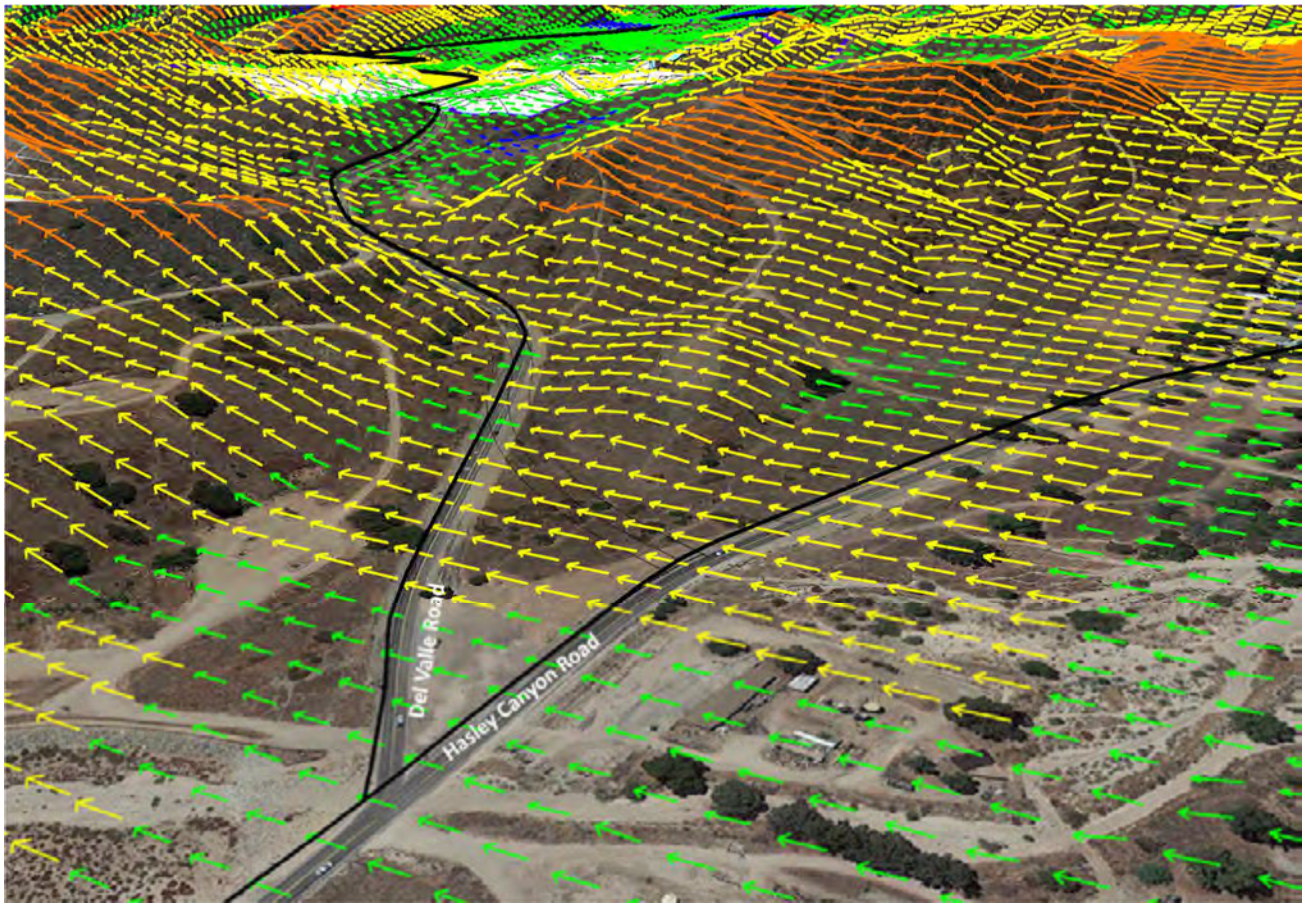

Figure 17 – Del Valle Road viewed from Hasley Canyon Road with Wind Ninja Output for NE 60 mph wind

Wildland Interface Fuel Types

For the purposes of the BehavePlus modeling the standardized fuel models were used as provided by the National LANDFIRE Database maintained by U.S. Department of the Interior | U.S. Geological Survey. Figure 18, on page 19, provides an illustration of the wildland fuels adjacent to Sterling Ranch. The parameter of each fuel type shown in the Landfire Database and those identified on the site survey are as follows:

Fuel **Model GR1** (101) Dry Climate Grass is short, patchy, and possibly heavily grazed. Spread rate moderate; flame length low. Dynamic. Moisture of extinction is 15%. Fuel bed depth is 0.4 feet.

Fuel **Model GR2** (102) Dry Climate - Moderately coarse continuous grass, average depth about 1 foot. Spread rate high; flame length moderate. Dynamic. Moisture of extinction is 15%. Fuel bed depth is 1.0 feet.

Fuel **Model GS1** (121) Dry Climate - Shrubs are about 1-foot high, low grass load. Spread rate moderate; flame length low. Dynamic. Moisture of extinction is 15%. Fuel bed depth is 0.9 feet.

Fuel **Model GS2** (122) Dry Climate - Shrubs are 1 to 3 feet high, moderate grass load. Spread rate high; flame length moderate. Dynamic. Moisture of extinction is 15%. Fuel bed depth is 1.5 feet.

Fuel **Model SH2** (142) Dry Climate - Moderate fuel load (higher than SH1), depth about 1 foot, no grass fuel present. Spread rate low; flame length low. Moisture of extinction is 15%. Fuel bed depth is 1.0 feet.

Fuel **Model SH7** (147) Dry Climate - Very heavy shrub load, depth 4-6 feet. Spread rate lower than SH5, but flame length similar. Spread rate high; flame length very high. Moisture of extinction is 15%. Fuel bed depth is 6.0 feet.

A site visit found the following fuel conditions in addition to those described above:

Fuel **Model SH5** (145) Dry Climate - Heavy shrub load, depth 4 to 6 feet. Spread rate very high; flame length very high. Moisture of extinction is 15%. Fuel bed depth is 6.0 feet.

Fuel **Model SCAL18** is a southern California specific model for coastal sage scrub and Buckwheat OR dominated by coastal sage scrub AND greater than 15 years maturity OR dominated by northern mixed chaparral AND greater than or equal to 3 years maturity AND less than or equal to 12 years maturity. The vegetation has an average fuel depth of 3 feet and a moisture of extinction of 25%.

The predominant fuels near the project site are grasses, grass/scrub mixtures, and shrub fuels, mostly on the north aspects, as shown on the next two figures and in a series of photos in Appendix B of this report. Each of the grids in the graphic is 30 meters square (just under ¼ acre). Fuels parameters for each grid are determined by the predominant fuel types. This does mean that other fuels can and may be present in each grid. All eight of the fuel models above are represented within the interface area.

In addition to the fuel models provided in the Landfire database, the project biological report provides a graphic that indicates the vegetation class as well. This information is provided on Figure 19 on page 20 and in the project biological report. The grasses, sage and buckwheat are clearly identified.

According to the Landfire database and confirmed with the site visit, the fuels adjacent to the project access roadways (Del Valle Road and Chiquito Canyon Road) are the same configuration as the interfaces detailed for the project site from a fire behavior standpoint. There are likely differences at a biologist's level but none that will influence fire behavior modeling when viewed at the time of this analysis. Table 1, on pages 20-21, provides an accounting of the specific grass and shrub fuels that have been found on the project site and the area that are adjacent.

Starting on page 21, is a series of site photos that provide a visualization of the types fuels which are present at or near the project site. As indicated previously, full site photos are provided in the appendices. Photo 1, on page 21, was taken from the roadside on Del Valle Road, provides an example of the annual grasses (gr2 or fuel 102) in the foreground and some grass/shrub mixture on the hillside in the distance. Photo 2, on page 22, is an example of a north aspect (right side of photo) and a south aspect (left side of photo) and the difference that the aspect can make on vegetation. The heavier fuels are sh5 (145) or sh7 (147) and only occur in pockets as indicated in Figures 18 and 19. Photo 3, on page 22 as well, is an example of a grass/shrub mixture (gs2); this the predominant fuel within the Landfire database and confirmed in the site visit.

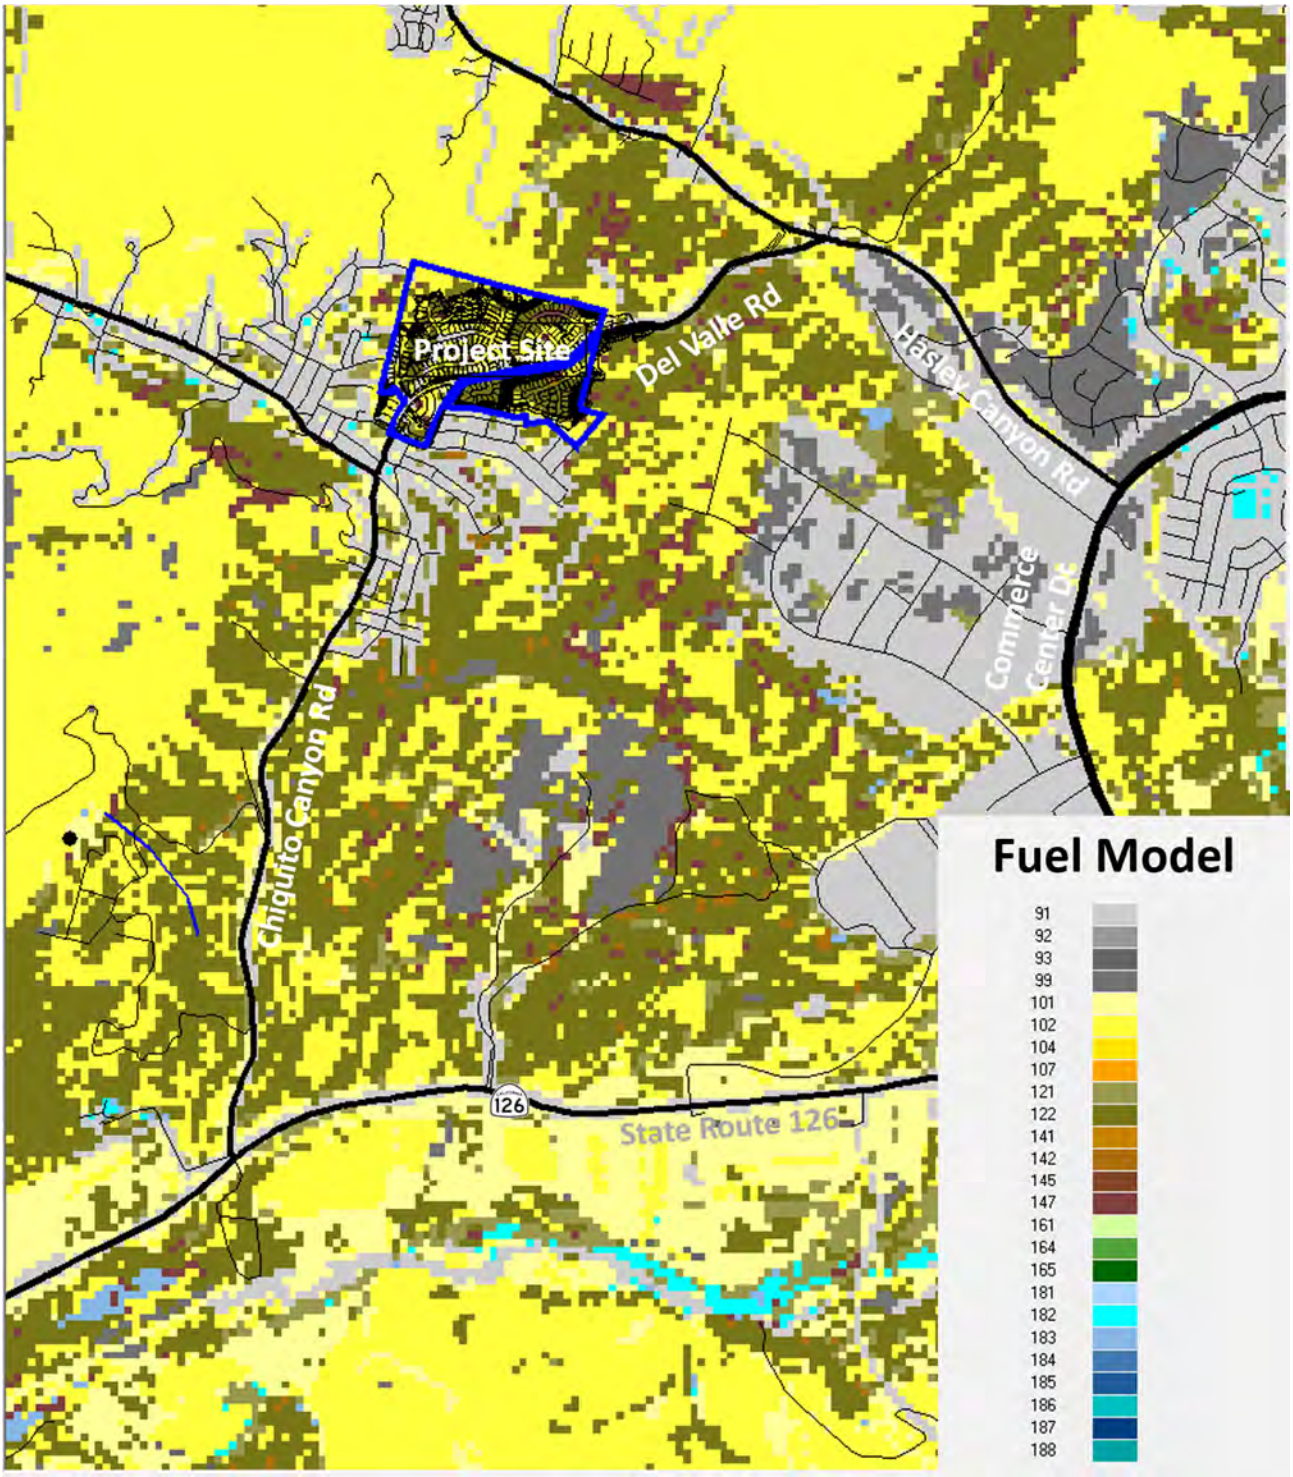

Figure 18 – Wildland Fuels (Landfire Database – Scott and Burgan 40)

Photo 4 provides a view of Del Valle Road looking to the SE from the project site. Here the north aspect fuels are obvious. It should be noted that they will all be removed in the grading process that creates the building pads in this area.

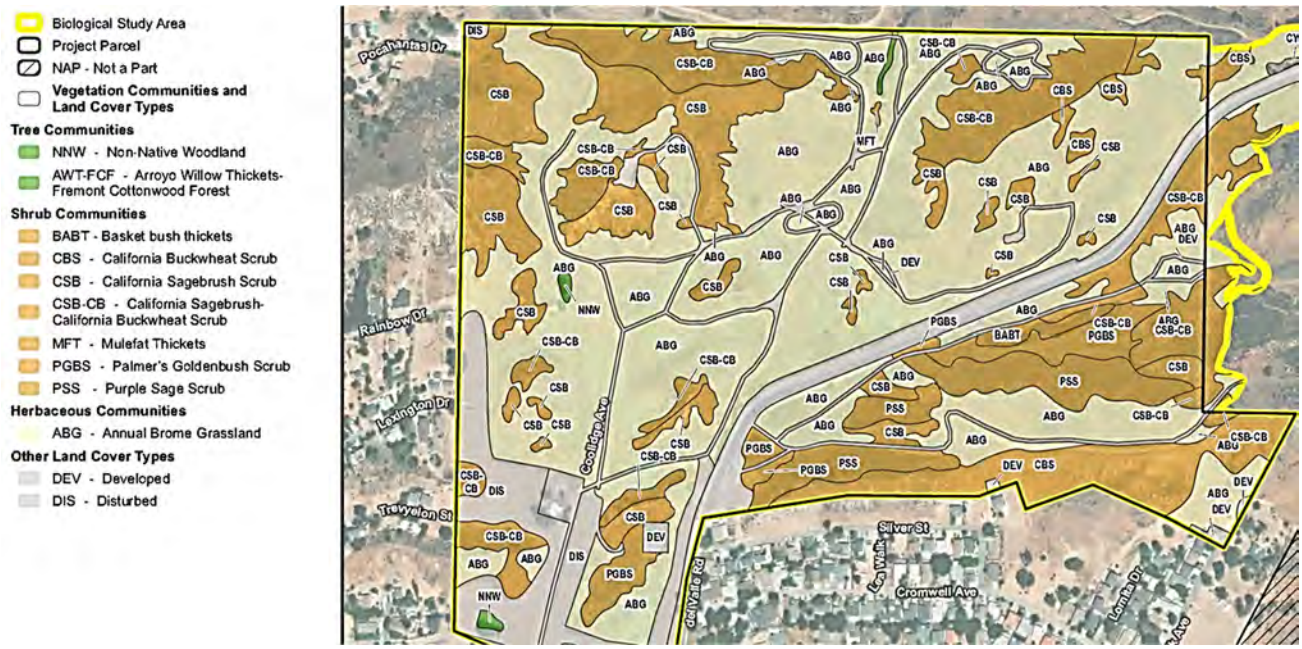

Figure 19 – Vegetation Classes for project site interfaces

	Developed Land	N/A	11.26	7.3%
		Total	155.10	100%[2]

[*] For alliances with state ranks of S1-S3, all associations within them are considered highly imperiled. A question mark (?) denotes an inexact numeric rank due to insufficient samples over the full expected range of the type, but existing information points to this rank (CDFW 2018f).

[1] Mulefat thickets totals 0.02% of the total acreage within the BSA.

[2] Total does not sum to 100% due to rounding

Photo 1

Fuels Discussion

Overall, the wildland fuels for the project site and access roadways to and from are light to moderate fuel at the interface for each area. The fuels adjacent to Del Valle Road are mostly grasses and grass/shrub mixtures, especially on the north side of the roadway were a NE wind driven fire would be approaching. Some portions of the road have north aspect fuels that are adjacent on the south side but none which are downslope from the roadway. Chiquito Canyon Road runs along the canyon bottom on its west side from Highway 126 to the community of Val Verde. The fuel loading ranges from mineral earth to moderate chaparral. In no case is the chaparral fuel below the roadway in any amount that could create extreme fire behavior. The interface to the west is upslope in nearly all areas and as it rises away from the roadway, it increases in depth and complexity. No adjustments have been made to the Landfire fuels database on the site visit (ground truthing).

Photo 2

Photo 3

Photo 4

Topography/Terrain

Topography is an important input to the fire modeling software. Topography includes elevation, slope and aspect. Each has its own impacts on wildland fuels, wind impacts, and fire behavior. First is elevation. Figure 20, on the next page, is a graphic representation of changes in elevation in and around the project site. The Santa Clarita river valley is obvious as it runs along State Route 126. Chiquito Canyon and Halsey Canyon are also easily recognizable on the elevation map. As elevation increases it is easy to see the ridgelines and mountains (green and blue areas) as well as the high mountain tops (purple areas). The orientation of these ridgelines and canyons is important. As previously identified, the strongest winds from a fire behavior perspective are from the NE. Many of the ridgelines are perpendicular to the NE winds and therefore create the greatest amount of wind acceleration at the ridgeline as previously shown. The project site ranges from about 1,200 to about 1,400 feet above sea level. The Santa Clarita Valley adjacent to the project site ranges from 900 to 1,000 feet above sea level. Chiquito Canyon Road slopes down from Val Verde to State Route 126 at a rate of about 125 feet per mile (2-3% overall grade). Del Valle Road begins and ends at about 1,200 foot elevation with a peak around 1,300-foot over its approximate one-mile length from Silver Street to Hasley Canyon Road. This equated to an average 4-6% grade for the area between Silver Street and the breakover point and 3-4% for the balance of the travel down to Hasley Canyon Road. These are important in relationship to the topography around the access roadways which is varied and complex in some areas.

While the overall grade of the roads is important to access issues for the fire resources and possible egress routes for residents of the area, the slope of the wildland is an important issue that drives the fire behavior. Slope can and does change on a regular basis in the native fuels. In Figure 21, on page 25, the slope of the adjacent native fuels is in 30-meter grids within the dataset (Landfire Dataset).

The maximum slope in any grid within the immediate areas is 90% (42 degrees). While some small areas are likely steeper than 42 degrees, the overall average and impact on fire behavior does not exceed this level. All interface areas which will be regraded will be reestablished with slope not to exceed 50% (2:1 slope).

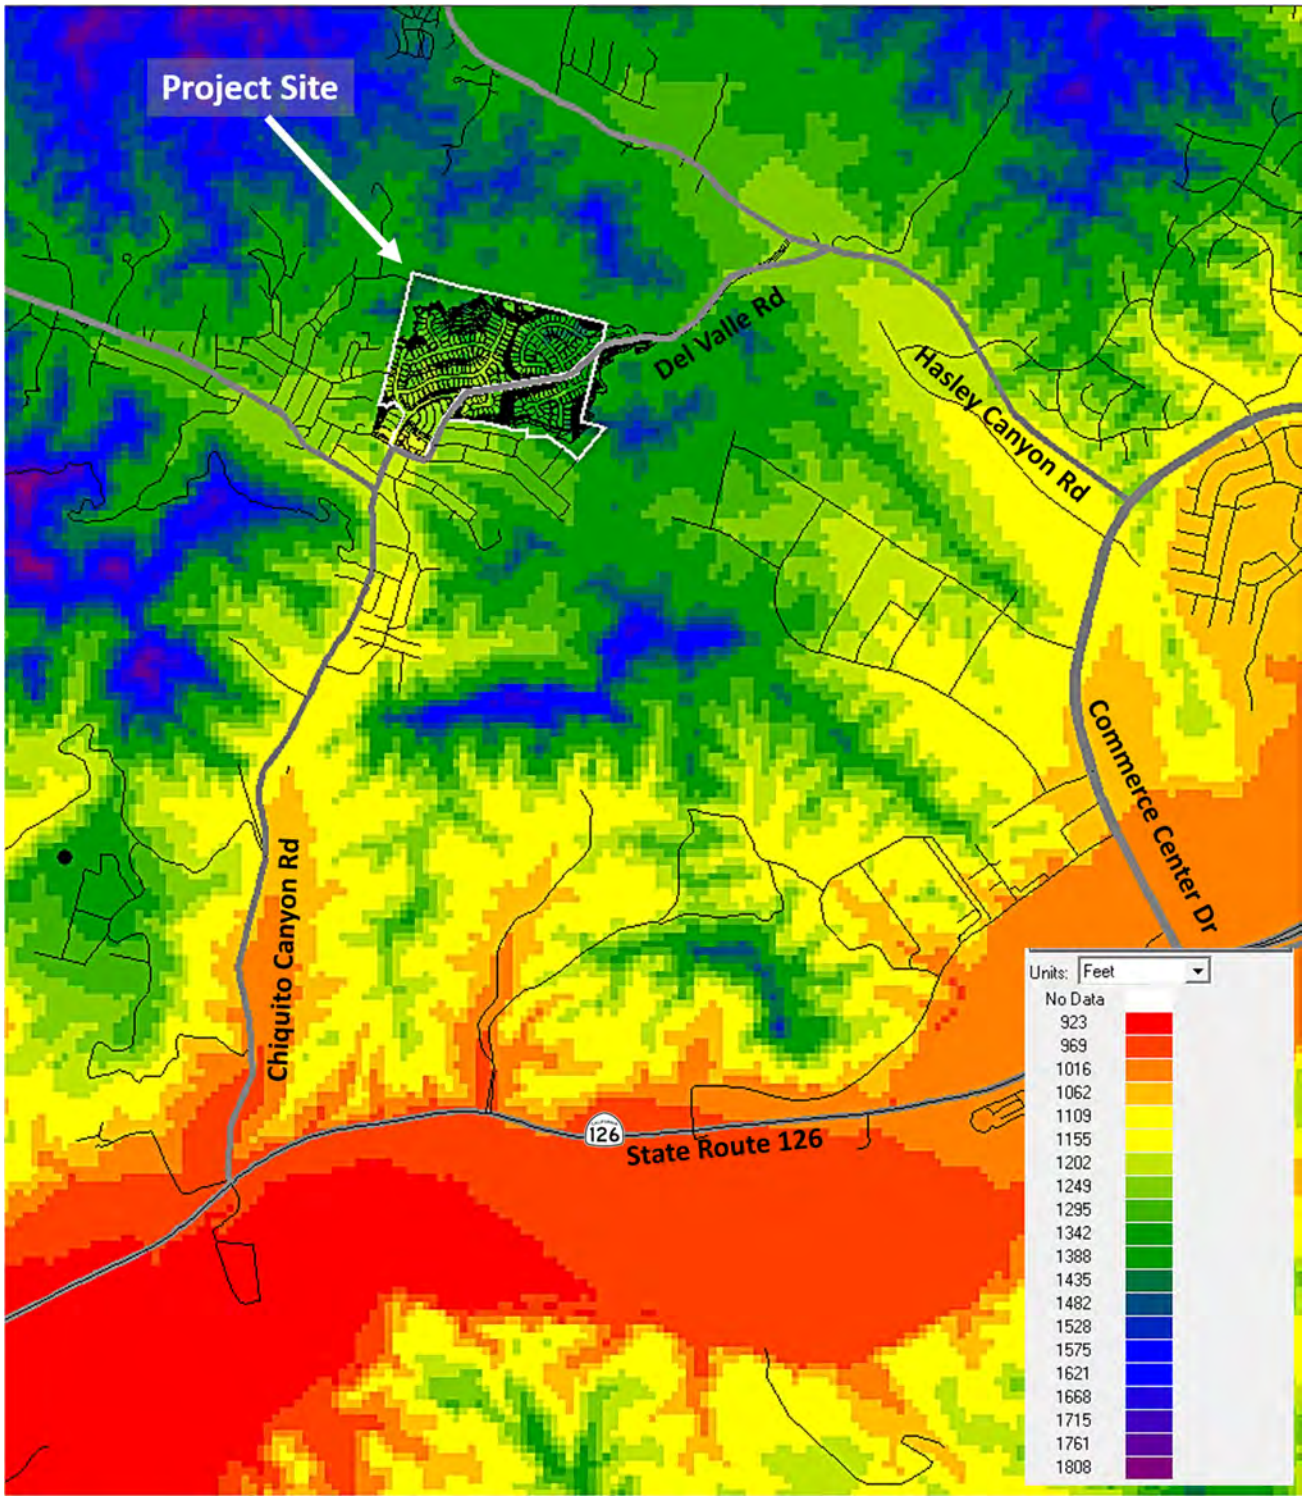

Figure 20 – Elevation Map from Landfire Database

Just as in the elevation map (above), the slope map (next page) outlines the ridgelines but the slope map has added detail, providing more ability to see the very steep area as opposed to the flatter areas.

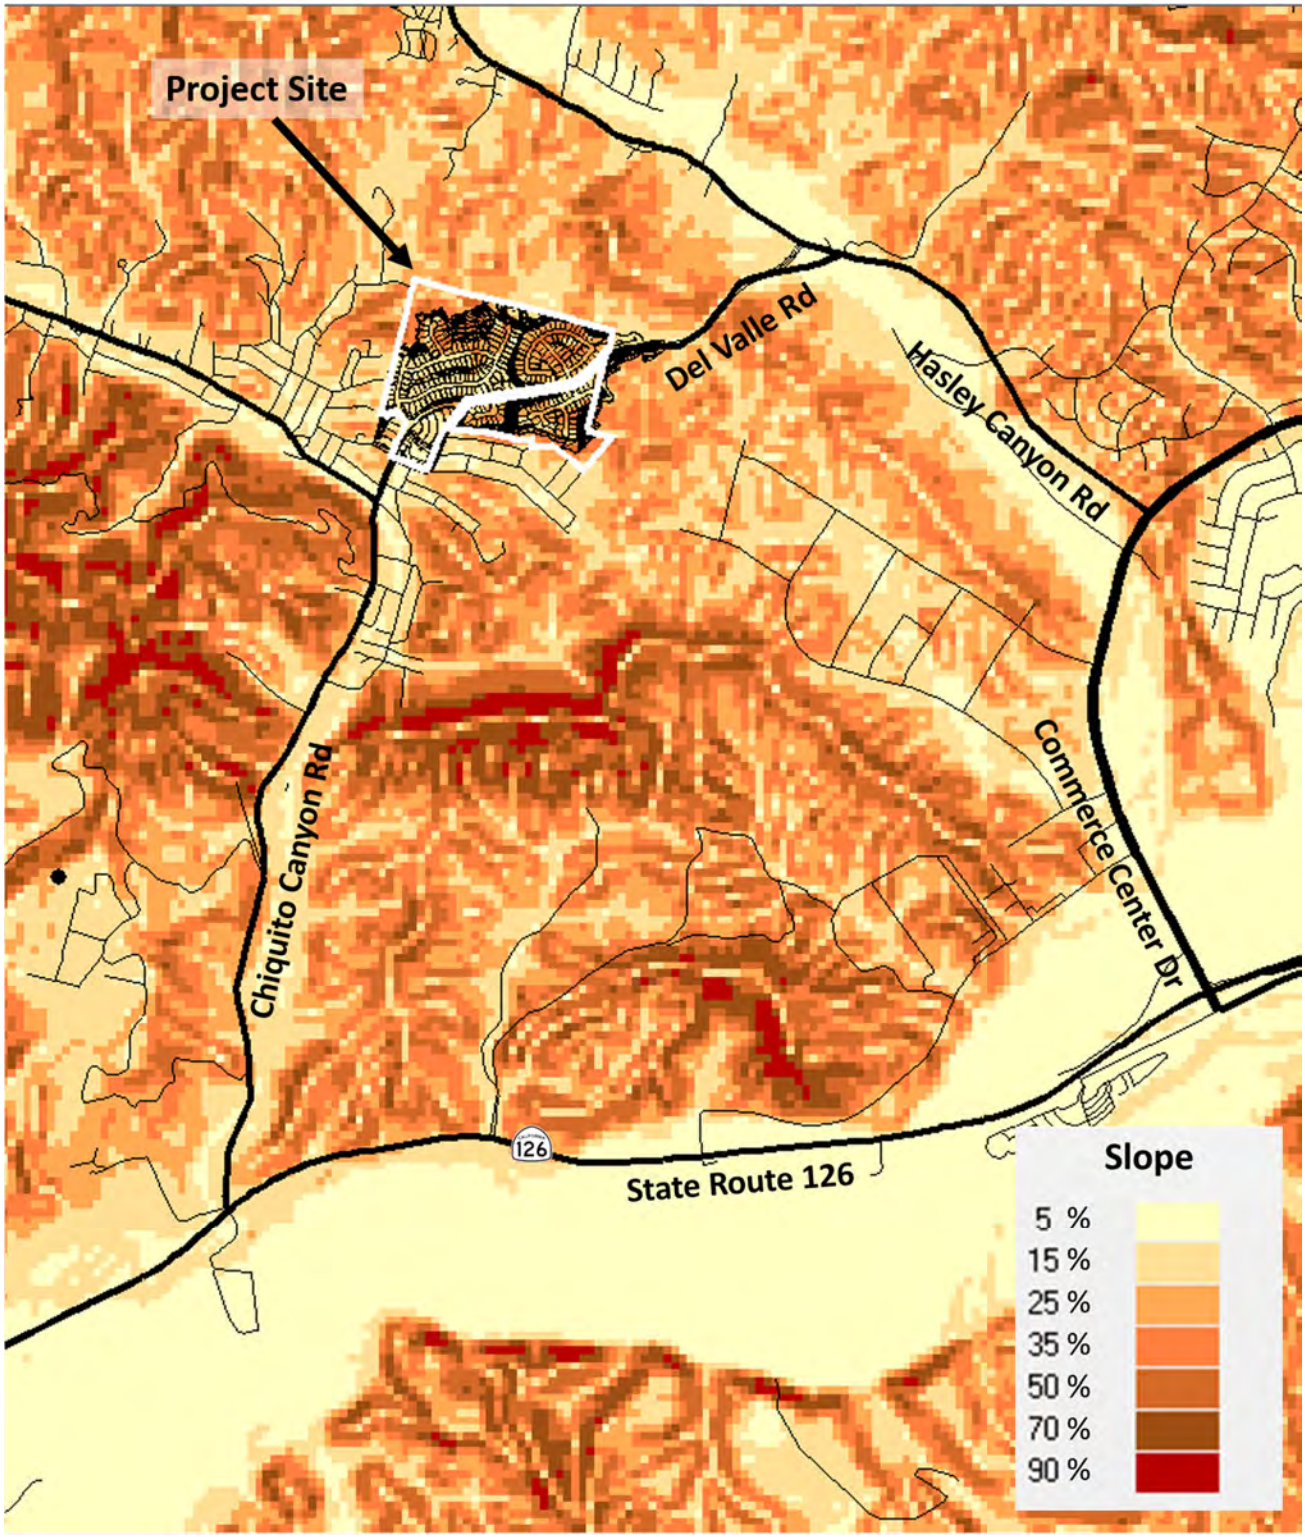

Figure 21 – Slope Analysis from Landfire Database. Project site outlined in white.

The project site access roadways, Del Valle Road and Chiquito Canyon Road, are typical canyon roads. They are near the edge of the canyon bottom (away from the flow line whenever possible

without having to complete massive grading into the canyon walls). This tendency generally creates a condition where only one side of the roadways has significant fuel loading. This is the case in Chiquito and Hasley Canyons. Del Valle Road, being a transition road between canyons, does not have this condition working in its favor. The worst-case fire conditions exist when topography, fuels and wind are in alignment. Full alignment (homes are up slope from the fuel modification zones and are in alignment with the extreme winds–Santa Ana) of all three factors does not occur in the project site as fuel modification will remove any fuels where wind, slope, and aspect align.

Aspect along the project perimeter varies due the orientation of the various drainages. This is shown in Figure 22, below.

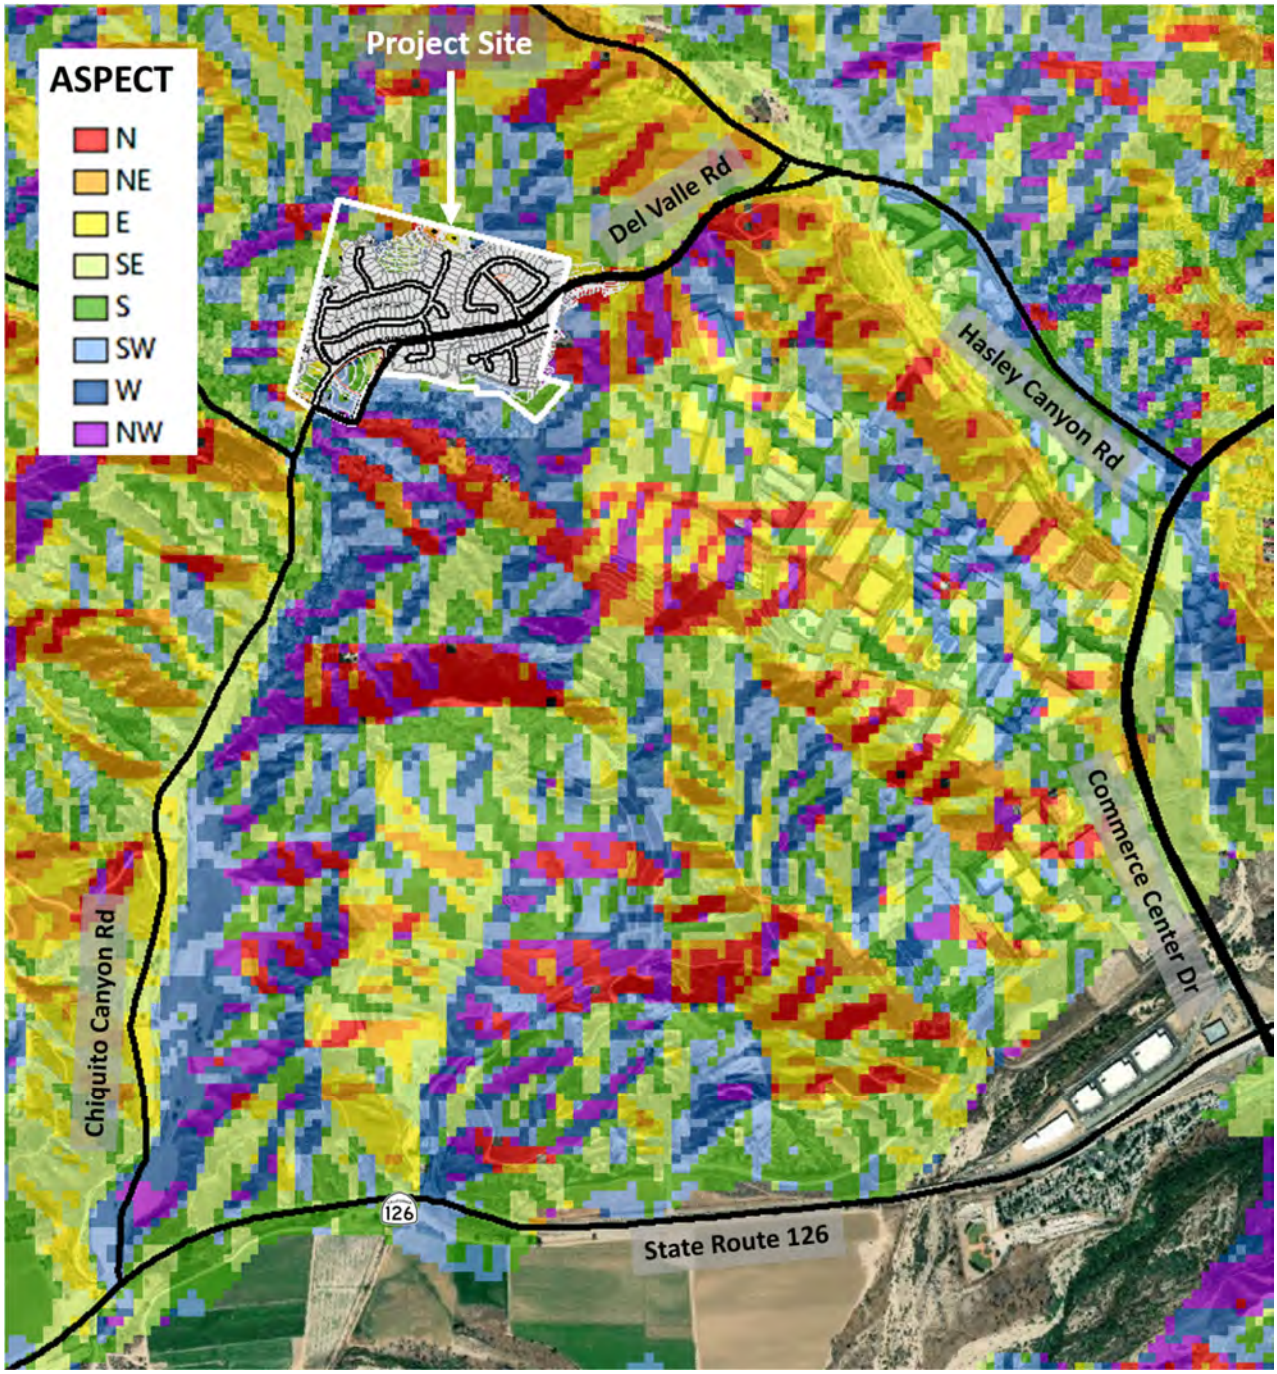

Figure 22 – Aspect Analysis from Landfire Database. Project site outlined in black

The same 30-meter grids that are used for fuels, slope and elevation are used here for the aspect calculation. While accurate overall, some anomalies can exist. For example, if a grid were half north, and half south aspect, the algorithm would average the two values (north = 0 degrees and south = 180 degrees) into an east aspect (90 degrees). Ground truthing is needed to correct these. The aspects have been checked and found to accurate in the areas of the project interface and in the overall general area.

Important to this discussion are the N, NE and NW aspect which tend to be protected from the sun for longer periods in the steeper slopes. This allows for more moisture to be retained and normally creates a higher fuel loading on these aspects. Photos 2, 3 and 4 previously indicated heavier fuels on the north aspect of the project site. Most of these problematic aspects are above or away from the project site building pad and/or access roadways.

Fire Behavior Inputs and Results:

Worst case National Wildfire Coordinating Group Fireline Handbook models have been used for analysis; specifically, all dry climate fuel models have been used. Worst case fire weather was used as well. Inputs for the BehavePlus Fire Behavior Model are as follows:

- One-hour dead fuel moistures were calculated at 3%; ten-hour at 4% and 100-hour at 5%.
- Live Herbaceous fuels were calculated at 30% in the wildland.
- Live Woody fuels were calculated at 50% in wildland.
- Worst-case scenarios assumed a 50% slope (27 degrees) in the wildland interface and the Landfire slope for the specific grid in the FlamMap and FARSITE calculations.
- Winds are calculated at 60 mph (20-foot wind speed) for the Behave and FlamMap calculation and actual wind speeds and directions for the FARSITE calculations.
- Aspect of the slope is assumed to be in alignment with the wind (directly upslope as worst-case) for the Behave runs.
- Spread direction is shown at the direction as indicated in the outputs.
- Wind adjustment factor of 0.5 was used under the worst-case scenario in Behave.

The inputs to the fire modeling are shown in Figures 23 and 24, Fuel Descriptions from the outputs have been added for readability.

Fuel Model	
gr2	Low load, dry climate grass (D) (102)
gs2	Moderate load, dry climate grass-shrub (D) (122)
sh7	Very high load, dry climate shrub (S) (147)
SCAL18	Sage / Buckwheat

Figure 23 – Fuel Model Descriptions (Behave run)

Full details for each model run are available in the appendices. Version 5.0.5 of the BehavePlus and FlamMap 6 Version 6.0 modeling programs were used for this analysis. The modeling inputs/outputs are attached in the appendixes but have been summarized here in the next few figures for discussion purposes.

Inputs: SURFACE

Figure 24 – Behave Inputs

Modeling Assumptions

In completing the modeling for the project site, the base for the worst-case scenario was established by using BehavePlus software, to show the characteristics of the scenario. Behave is a snapshot in time. It has static parameters. In this case, the moisture scenario was set at 3, 4, 5, 30, 50, as shown above for the live and dead fuels (also used in FlamMap). Wind was assumed to be 60 mph out of the NE (Aspect was aligned with the wind) and a 0.5 adjustment factor was used. A slope at the interface was assumed to be 2:1 or less. Finally, the spread direction was set to 15-degree intervals for a 360 degree look at the fire spread. At 225 degrees, the maximum impact is achieved (directly upslope).

For the Behave model runs, the fuels indicated on the Landfire database were used with one southern California specific fuel added (SCAL18/Sage and Buckwheat). All southern California fuels were considered and modeled for a comparison but since the fuel beds in the project area and roadsides are not dense enough to have an average six-foot fuel bed, the models with six foot fuel beds were eliminated except for the pockets of sh7 (147) that remain in the Landfire database (Figure 25, on the next page). Some of the north aspects in the general area would qualify, but none of these are next to the access roadways. All but the SCAL18 fuel were removed from the analysis based on the biology report and the fact that SCAL18 is the worst-case fuel for this set of fuels (Figure 26, also on the next page).

Using the Behave outputs to see when the FlamMap and FARSITE calculations reached the rate of spread, fire line intensity and flame lengths for the worst case scenario, it is possible to see the locations of the extreme fire behavior and where the fire behavior has been pushed to its maximum.

Fuel model parameters					
Fuel Model Code	Fuel Model Number	Dead load	Total Load	Percentage Dead Component	Fuel bed depth (ft)

Figure 26 – Behave Output for SCAL Fuels

Using the four selected fuels for Sterling Ranch, the Behave scenario was completed for the NE 60 mph wind event. Below are two of the outputs from the model. On the left is flame length and on the right is the Rate of Spread (ROS). Two conclusions can be drawn from these outputs relative to the project site building pads. First is the maximum expected flame length under the worst-case fire behavior scenario is 49.1 feet. Any structure 50 feet or more from the native fuels will not be directly impacted by flames. The second is that the flaming front of this fire is moving at 620 feet per minute or approximately 10 feet per second. There is simply not enough fuel to sustain a fire impact for a period of over one minute. This is extreme fire behavior which requires a continuous homogenous fuel bed and a fire which is burning in equilibrium (self-sustaining); sometimes referred to as "the perfect storm".

Figure 27 – Behave Outputs for Sterling Ranch Worst-Case Scenario

This extreme fire behavior can only exist for short periods of time when all of the factors needed are in alignment. Even when they align, only the tip of the fire front is burning with this intensity. As shown above in Figure 27, a 15 degree change of alignment reduces the maximum flame length from 49.1' to 21.2' (57% reduction); another 15 degrees further reduces the flame length to 12.0' (now a 76% reduction over the tip of the fire front). Not only does the flame length diminish, so does the ROS and Fireline Intensity. One of the reasons that Behave calculations are not applicable when applied across the entire area is that too many factors change as the fire moves. Flammap and FARSITE are used for this analysis. Behave is used here to calculate the worst-case of all factors to find the most impactful scenario on which to design the defense system.

FlamMap, calculates the same parameters as the Behave model for each of the 30-meter grids as the fire travels across the landscape. For this reason, FlamMap is more accurate to the specific conditions at any given point and allows for additional outputs to be considered since the element of time has been introduced to the model.

One of the main reasons for completing this fire behavior analysis is to provide objective data for the determination of the adequacy of issues such as the time arrival of fire resources and, when necessary, the evacuation of residents prior to fire impacting the community.

The assessment of property risk needs to examine the potential for a fire within the adjacent native fuel to damage or ignite a structure within the project site. This can happen in one of four ways. First is direct contact with the fire. The maximum flame length is 50 feet under any scenario. Any distance greater than 50 feet will keep the flames off of the structure.

Second is radiant heat. The laws of physics indicate that the decay of radiant heat is calculated by dividing the energy produced by the square of the distance from the heat source. Any structure 100 feet from the native fuels (two times the maximum flame length) is expected to have a radiant flux value of less than 20 kW/m^2 on the exposed structure which will be acceptable given the residence time for the 60 mph wind event based on Newton's Inverse Square Law. (Figure 28, below).

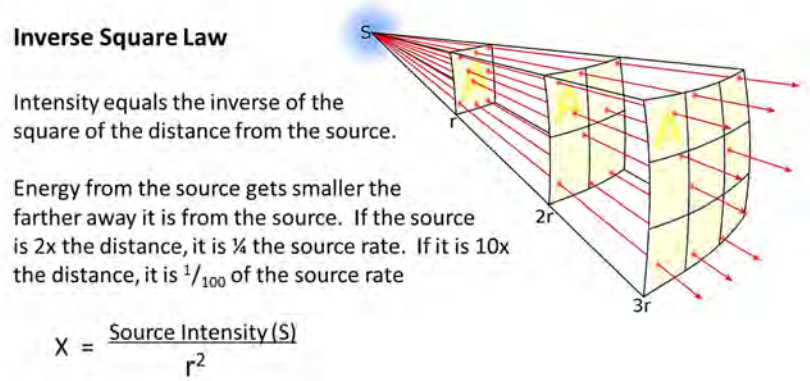

Figure 28 – Inverse Square Law

While this is simplified, it is accurate at a general level. Several models exist for the calculation of the Radiant Heat Flux on a structure from various fire sources. Most are complicated and require a set of complex assumptions that must be made. The Inverse Square Law does not specify a unit of measure. The decay is relational between the distance and the source. The drop in heat from the source to distance r is relational to distant 2r and 3r. Firesafe uses a simple formula as a "yardstick" for generalized assumptions about radiant heat from fire. This formula is the FI (Fireline Intensity) from the Behave outputs over the distance in feet squared. Because Newton's Law is relational, it does not specify a unit of measure. Firesafe has derived a "rule of thumb" from the research done by several researchers to provide some rationale for why we use "two times the maximum flame length" rather than some other distance.

Making the calculation in meters and then converting the distances to feet means that the 93,360,779 kW/m from the 50-foot flame lengths in the sh7 fuel model provides a radiant heat flux of 9.3 kW/m^2 using the formula at 100 feet of separation from the native fuels to the structure. Firesafe uses the

Fireline Intensity (FI) and divides this by the distance in feet squared and arrives at a value under 10 kW/m^2. This method will always overestimate the radiant heat flux by 17% over the meter formula which adds to the safety margin in the design criteria.

In nearly all cases, two times the maximum flame length will provide a radiant heat flux value of about 10 kW/m^2 or less. This stands to reason as flame length (LF) is a function of fireline intensity (*I*) in Byram's formula $LF=0.0775*I^{0.46}$ which most closely approximates the interchanges between these two values (fireline intensity and flame length) in the Behave program. We should be noticeably clear here; this is not the only factor of the amount of heat that might be subject to a specific structure. The real world is much more complicated than a simple formula. Most literature indicates that a hardened structure should be able to withstand 20 to 30 kW/m^2 for a period of 5 minutes or less and not ignite. Using the two times the maximum flame length on the worst-case fire should place the actual value much less than the ones calculated here when a fire actually burns in the interface.

Jack Cohen's SIAM (Structural Ignition Assessment Model) uses a radiant heat flux threshold of 20 kW/m^2 for 5.5 minutes as the baseline for structure ignition (Cohen, J.D., 1995. Structure Ignition Assessment Model (SIAM), USDA Forest Service Gen. Tech. Rep. PSW-GTR- 158). The residence time for a fire within the adjacent wildland would have a residence time of less than one minute under the worst-case scenario; far below the 5.5 minutes needed and would not have sufficient heat beyond the fuel medication zone to ignite any structures. The adjacent wildland areas simply lack the quantity of fuel necessary to burn at a high rate for a time period long enough to create a radiant heat issue at the distances provided at two times the maximum flame length.

The third method of fire encroachment is convected heat. This impact area is generally about 75% of the radiant heat impact zone. While small pulses of convected heat may exceed the radiant heat zone and be a danger to the respiratory tracts of firefighters, these pulses are not sufficient in duration to cause ignition of structural materials. This factor can change when large fuels are below the subject property and burn for an extended duration prior to the flaming front impacting the interface. This would be a condition where the Model 4 fuel model would be more appropriate creating a separation distance of over 200 feet. This condition does not exist on the project site. To be clear, the amount of radiant heat or convected heat that a structure can withstand and not ignite is far more than the human body can withstand. As indicated in Figure 29, on the next page, a rate of 18 kW/m^2 is fatal to 50% of those exposed for 30 seconds while a structure can withstand 20 kW/m^2 for over 5 minutes without igniting. These are not interchangeable environments.

The final method of fire encroachment would be embers and brands. These can and will travel great distances. The project site will be protected from this threat by compliance with California Residential Code Section R337. (*Section R337 applies to building materials, systems and/or assemblies used in the exterior design and construction of new buildings located within a High Fire Hazard Areas. Area covered by this section include: Roofing, Exterior Covering, Roof Eaves, Floor/Underfloor Protection, Decking, Venting and Exterior Windows/Doors*)

The use of the Behave model for the structure protection calculation is enough information to make reasonable assumptions and decisions on distances, configuration and acceptable risk. The calculations for community risk are more difficult and involve the issues of time, distance, and shielding.

Fire Access and Egress Route Analysis

This report also addresses how a fire might impact the two existing access roadways, Del Valle Road and Chiquito Canyon Road, which provide access to the project site and the surrounding community. This report will not address traffic modeling issue, which are addressed by traffic engineers in another report nor does this report provide the trigger points that could be developed for precautionary evacuations which need to be completed with the input from all stakeholders (Fire, Law Enforcement, Public Works, Disaster Management, Community Leaders, etc.). This report will analyze the expected fire behavior, how and when it might impact the community and the access roadways.

$Btu/s/ft^2$	kW/m^2	Time to Ignition		
Rate	Rate	seconds	minutes

1.2	4.3	18,000	300.00	5 hours to ignition
1.2	4.0			First degree burns after 20 seconds
0.7	2.3			Pain on exposed skin after 2 minutes
0.6	2.1			Minimum to cause pain after 60 second
0.5	1.7			Minimum to cause pain
0.3	1.0			Equal to the maximum radiant heat transfer on a clear sunny day

Figure 29 – Calculation of Radiant Heat Exposure

Time is the first issue. Is there enough time to react to a fire before the impacts are upon the community and if there is not time, how long will the exposure last? The issue of reaction involves the location of the fire in relationship to the community. If the fire is close, the reaction time is shortened but the size of the fire should be smaller, at least initially. California's history with wildland fires has clearly shown that populations in transit do not fare well in wildland fire conditions. Many of the fire deaths in California have been people trying to escape after the fire was upon them or in proximity to them. Moving populations out of "harm's way" is a complicated matter. Whenever possible, it is best to move the most at risk first. Having a safe route and a place which is safe are essential to making the decision to move people ahead of a fire.

A 2011 publication on this matter provides some excellent insight:

> No single protective option represents a universal solution to eliminating casualties in fire-prone areas—each one has circumstances where it eclipses the others as the best form of protection. For example, the 2003 Cedar Fire in San Diego County, California

involved evacuating hundreds of thousands of residents, but some last-minute evacuations by residents near the San Vicente Reservoir resulted in 14 fatalities. At the same time, a few neighboring households successfully sheltered in their homes [10,11]. Refuge shelter was also used in this event, as an estimated 300 people were directed to stay put in the Barona Casino rather than attempt to evacuate. In 2008, thousands of residents successfully evacuated from the path of the 2008 Tea Fire in Montecito, California, while an estimated 800 Westmont College students sought refuge in a campus gymnasium [12]. In general, evacuation, refuge shelter, and in-home shelter have all resulted in successful and unsuccessful outcomes in protecting people in wildfires and developing effective community protection plans is a significant policy and research focus. Cova, Thomas & Dennison, Philip & Drews, Frank. (2011). Modeling Evacuate versus Shelter-in-Place Decisions in Wildfires. Sustainability. 3. 1662-1687. 10.3390/su3101662.

The project site and Val Verde Community depend on Del Valle Road and Chiquito Canyon Road , which are fully paved public roads, for ingress and egress to the area. These two access roadways are separated by the community and some wildland areas. For a fire to impact both access roadways simultaneously, the fire would have to burn in a certain direction and could only originate in the upwind area of both roadways. Figure 30 below provides the three wind scenarios which are supported by the fire and weather history. These include a NE/SW travel, N/S travel and fire from the predominant onshore W wind.

Figure 30 – Orientation of Access Roadways to Wind/Fire Travel Paths

Using Hunstock Road and Chiquito Canyon Road as a start point, it is 1.9 miles to State Route 126 and 1.4 miles along Del Valle Road to a point on Hasley Canyon Road where it becomes a four-lane divided road (Figure 31, on next page). The project site will connect Chiquito Canyon Road directly with Del Valle Road (leaving Hunstock as an alternative). When the project site improvements are completed, the distance from the eastern edge of the project site to the same point on Hasley Canyon Road will be 0.75 miles or approximately half the distance.

Figure 31 – Wind/Fire Directions and Access Roadway Distances

In terms of fire related impacts, the reduction in the distance the roadway will travel through unmanaged vegetation is extremely important. A review of the fire history for the past 50 years indicates that no fire has burned through the community. Some fires have burned into the community but as whole, the community has served as a barrier to the fire's advancement as shown in Figure 32, on the next page, where the core of the community has no fire history.

With this in mind, a fire must travel around the community to impact both access roadways. The expansion of the community with the proposed project site will reduce the length of the Del Valle Road access which is susceptible to fire impacts by half. The areas within the new Project Site will be protected by fuel modification zones and managed in terms of the vegetation not only at the roadside but in the entire project site.

Chiquito Canyon Road will not be involved in the project site improvements, but it should be noted that only one fire in the past 50 years (Piru 1988) has burned up to Chiquito Canyon and continued on the other side. This fire crossed south of the Val Verde community. As illustrated in Figures 32 and 33 on the next two pages, the development of the Commerce Center Industrial Park in combination

with the improvement of the project site will create a small area of remaining vegetation that can burn between the two access roadways. In fact, a West or East wind will not impact this area and a North wind has limited ability to burn over both roads without a significant wind shift (Figure 33, on page 37).

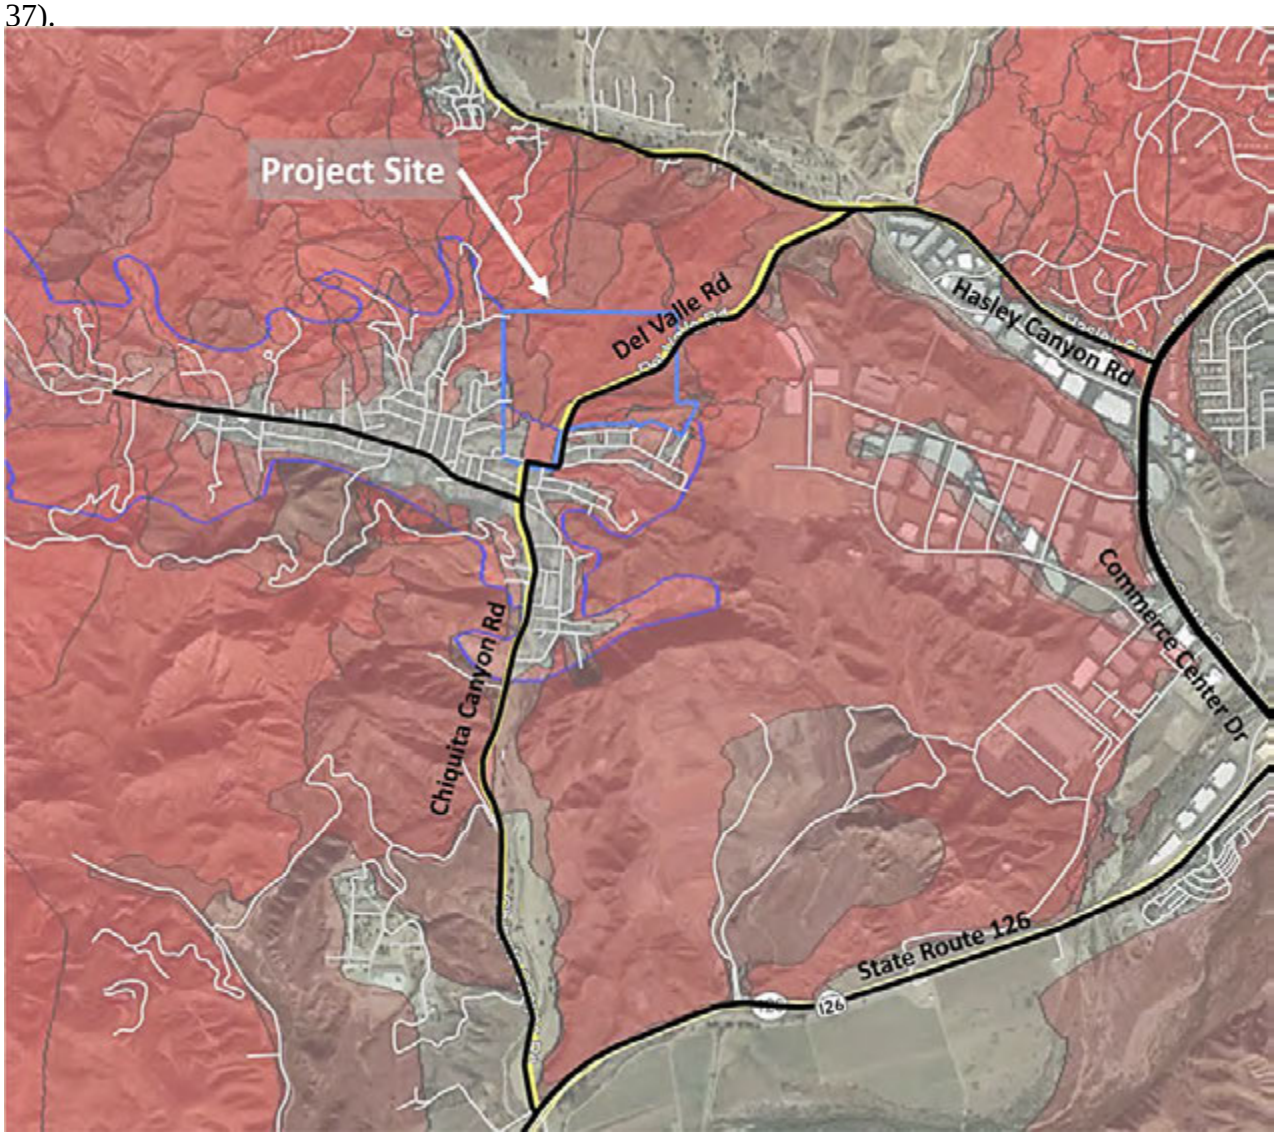

Figure 32 – Fire History Overlay (Past 50 Years)

In order to establish how a fire might impact the two access roadways, several locations have been selected to create fire scenarios for analysis. Five specific, points fire locations and four, line fire areas were established for analysis (provided in Figure 34, on page 37).

These points/lines were then modeled with different wind and weather inputs. Using FlamMap, NE, N and SW fire scenarios were completed and with the FARSITE program, fire weather from the Rye and Thomas fires was used. An additional June heat generated onshore was also used as discussed earlier in this report.

For each of the scenarios Firesafe was looking to the see if the fire would impact both access roadways in the same timeframe. To do this, we focused on "Arrival Times", "Major Flow Paths" and "Fire Perimeters". The modeling software has many outputs and some other output will be used but in order to be useful in comparison, the analysis has used the arrival times as the primary focus.

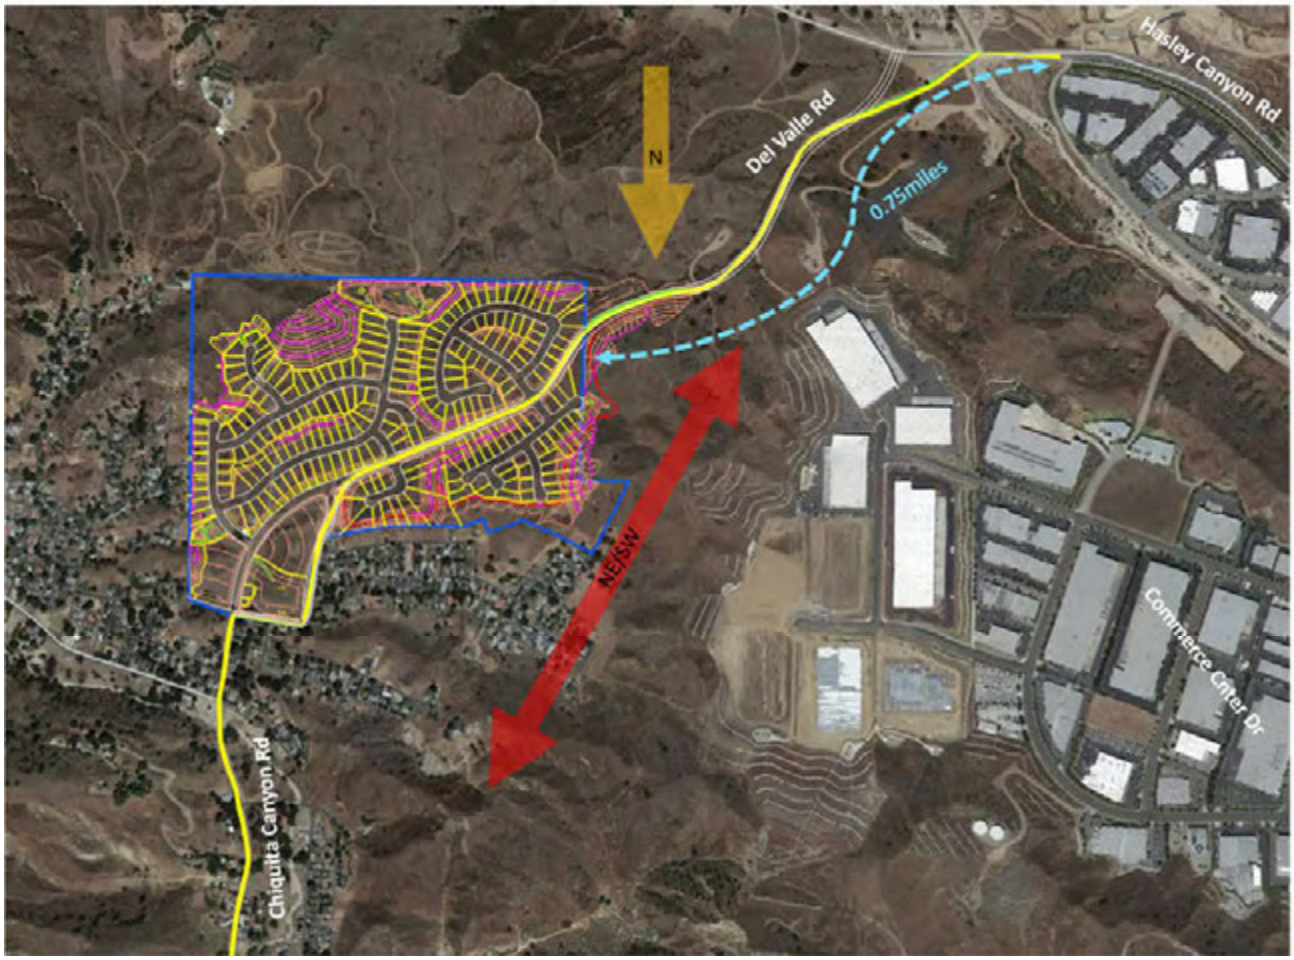

Figure 33 – Identification of Pinch Point between Project Site/Val Verde and Commerce Center Industrial Park

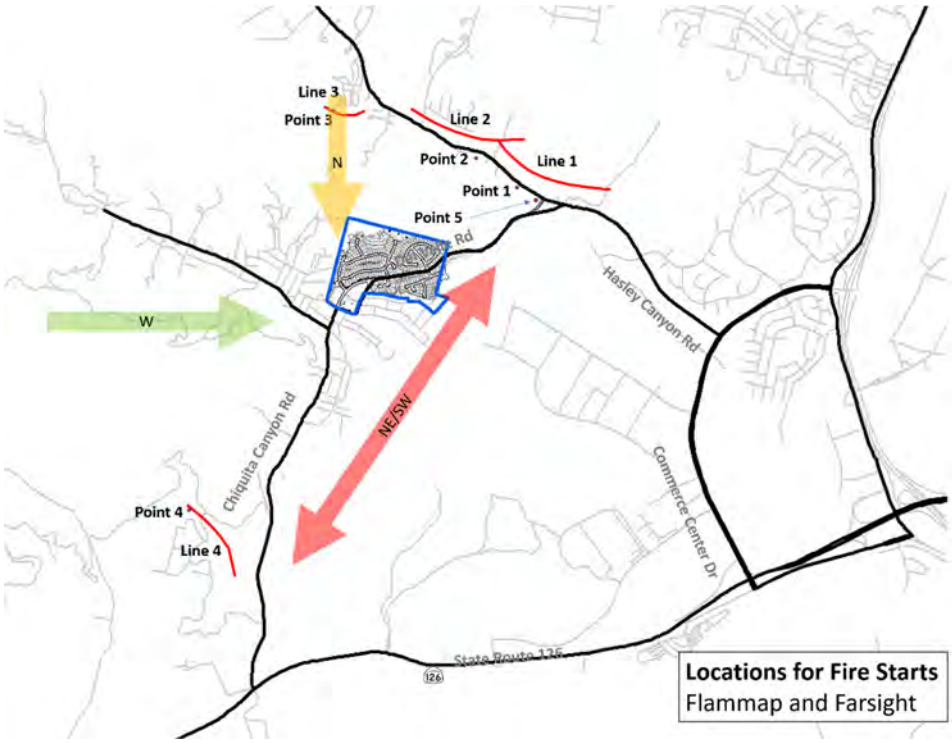

Figure 34 – Location of Start Points and Lines used in modeling scenarios

Using FlamMap, a point fire scenario was completed using a 60 mph NE wind. The graphic below provided the approximate arrival times for the flaming front of the fire. The location was used to maximize the impact to Del Valle Road. The fire impacts the road within 24 minutes but does not travel to the Chiquito Canyon Road interface for over two hours and does not cross the canyon for three hours. At the time the fire impacts the Chiquito Canyon Road access, only lateral and backing fire remain on the Del Valle Road access (only a small portion of the eastern section of the road would be impacted. This point source fire could be discarded smoking materials, a road flare from a car accident, a lightning strike, a downed power line or any number of other source point fire ignitions. Each of the source point fire needs to accelerate into a fire burning in equilibrium before it can burn at the maximum rate for the conditions in that specific area. Line fire (a line of fire or edge of an existing fire front) does not have this same component in the analysis.

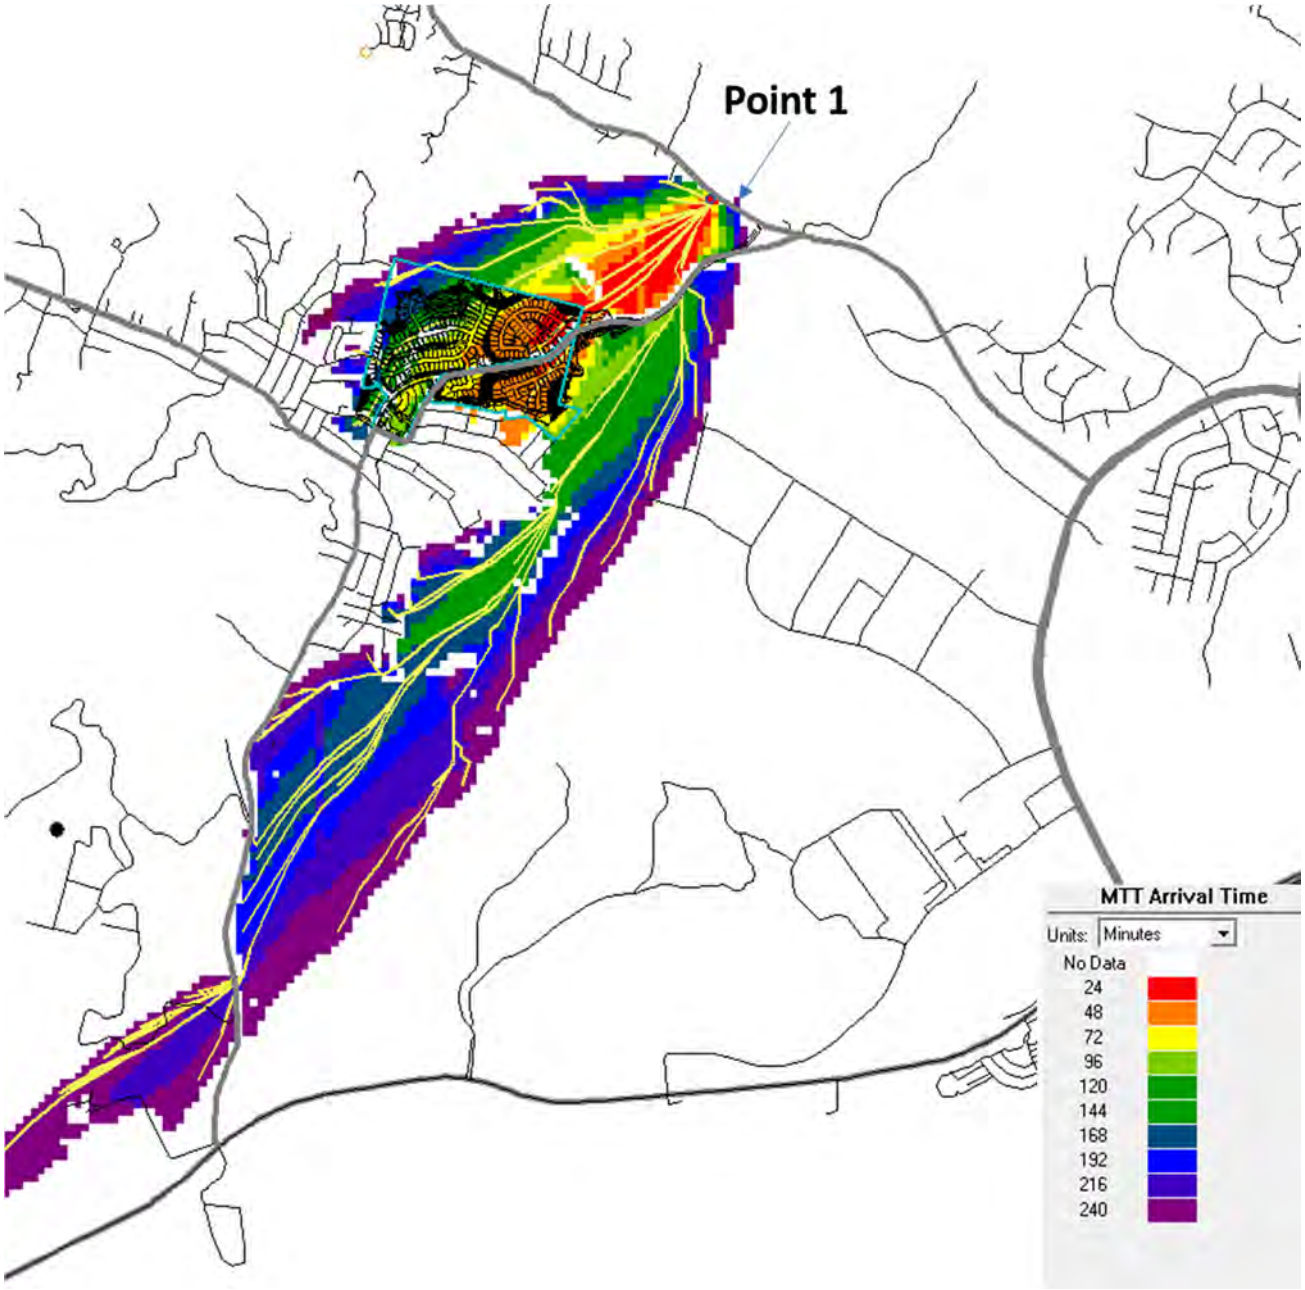

Figure 35 - FlamMap Arrival Times for Point Source Fire at Location 1

In this scenario, the fire was allowed to burn through the project site with the current fuel loading to illustrate how the entire Del Valle Road would be impacted in the hours with the added protection of the project site development and fuel modification zones.

Point source fires normally have little warning and can occur at any time or place. Line fire inputs are to see the impacts of an existing fire burning into the community. In the case of the Life Fire 1 location, it assumes the head of fire coming from the NE. It was placed on the NE side of the road to account for the impacts of the roadway on the fire behavior. The outputs for the line fire scenario are significantly different than the point fire outputs.

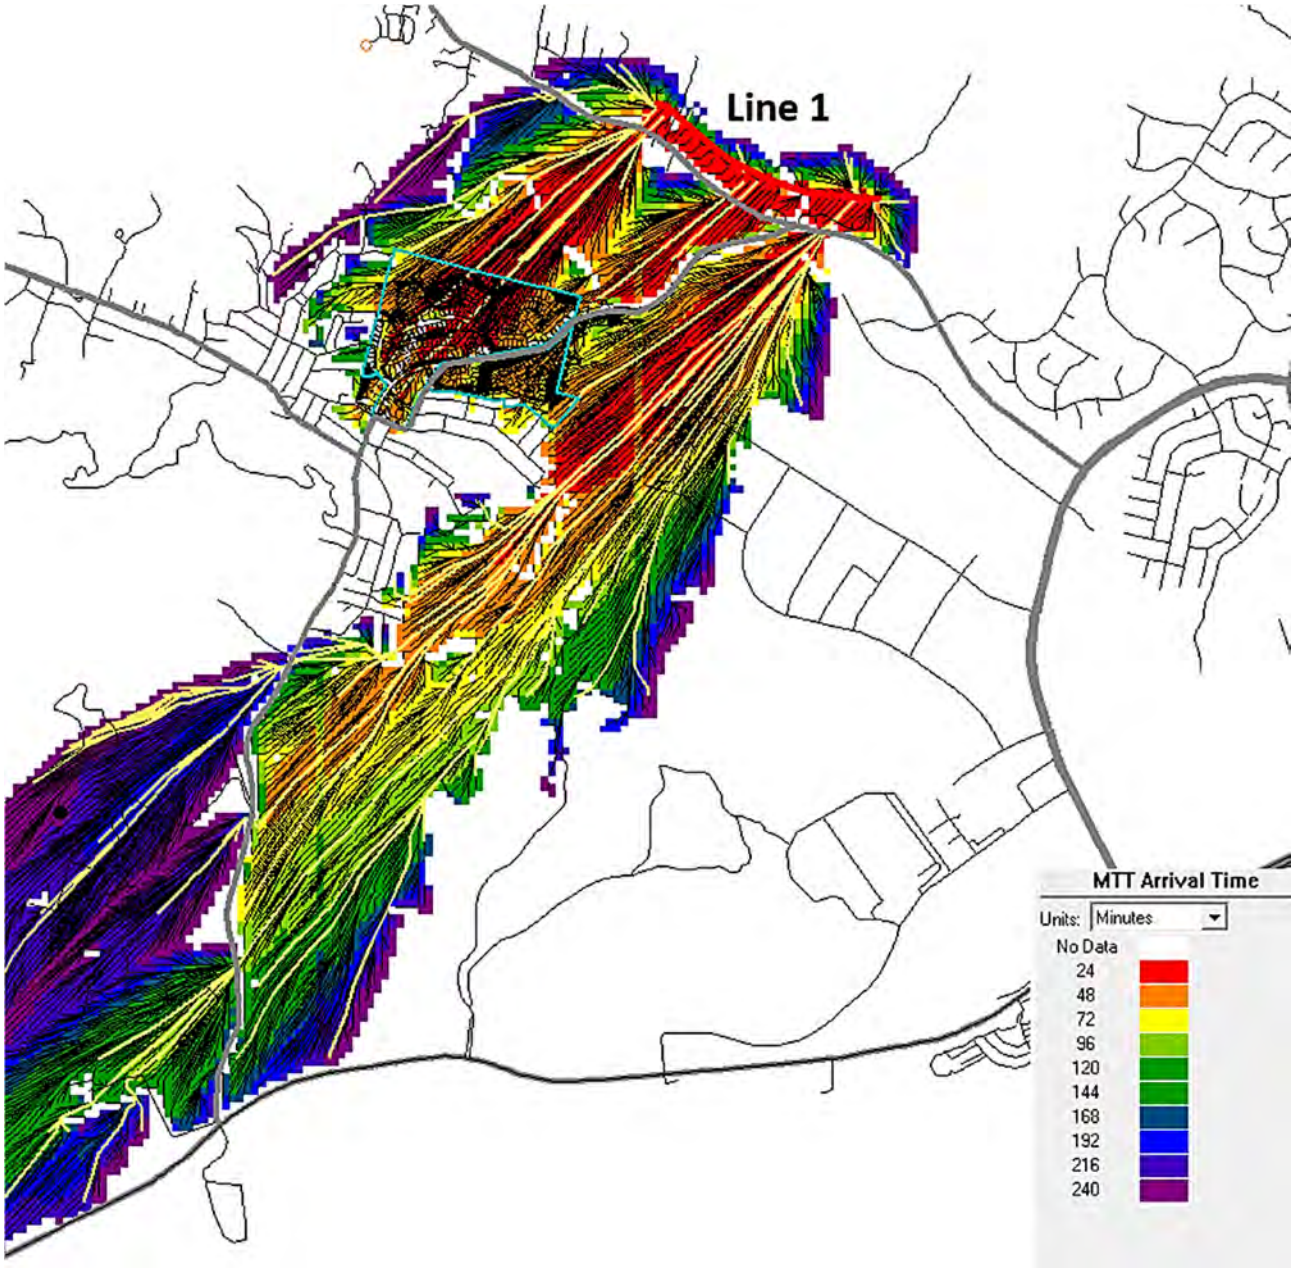

Figure 36 – FlamMap Arrival Times for Line Fire at Location 1

Due to the size and extent of the line of fire vs the point source fire, the fire travel and arrival times are much sooner to the access roadway. The complete length of Del Valle Road is impacted in under

24 minutes and the fire front reaches the Chiquito Canyon Road in 48 minutes. This is the scenario that would require the incident commander(s) or field officer of the fire and law enforcement agencies to decide on how to protect the citizens. Below is a simple decision tree for evacuation vs. protecting people in place. Evacuation is always the preferred option but sometimes, it is not possible. It should be noted that the scenario runs from the time the fire impacts Halsey Canyon Road. This fire would have already been burning and would no doubt be discovered and emergency personnel would be working on the decision below before the fire came to the point of the scenario but the modeling shows that if the fire reaches this point, evacuation is not a likely choice. If there is not enough time to safely move the population at risk to an uninvolved area, consideration of where to best protect them is the next action on the decision tree.

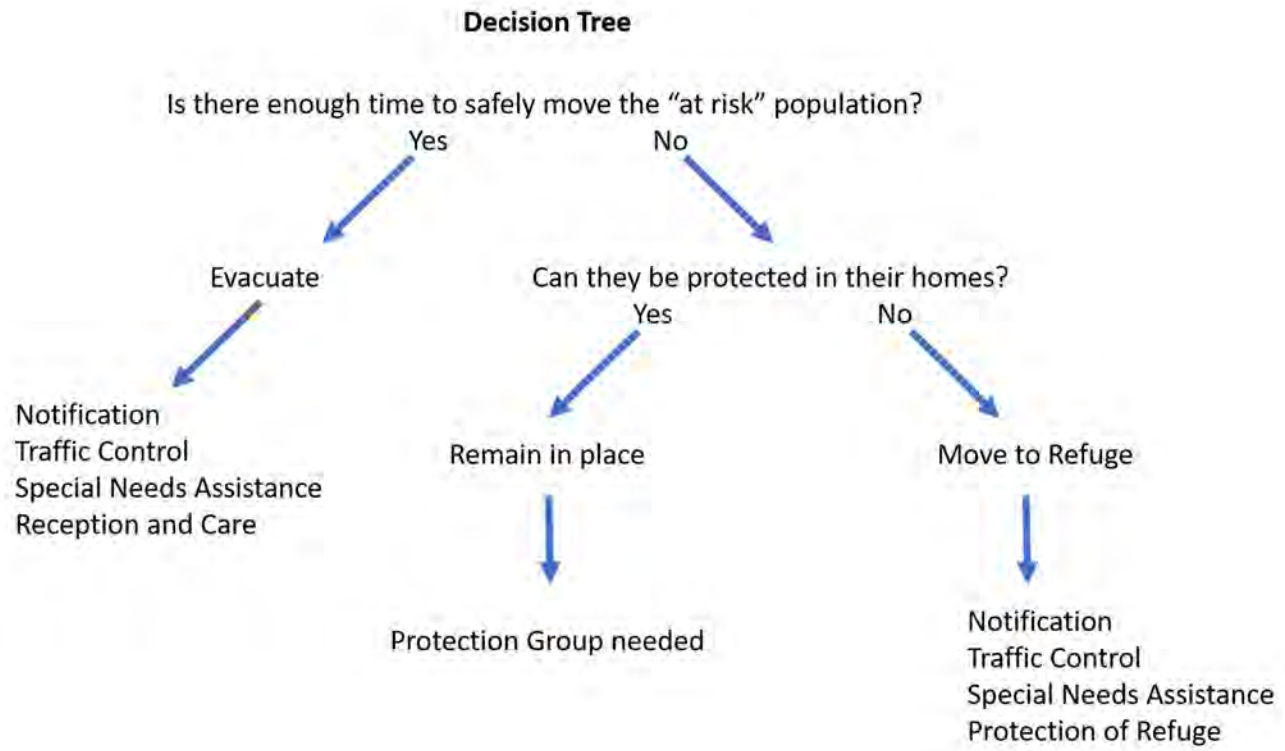

Figure 37 – Evacuation Decision Tree

For the project site, a remain in place order is not significant. Evacuation, if possible, is the safest and best choice but the new community will have fuel modifications zones, Chapter 7A/Section R337 construction features (including radiant heat mitigations, ember resistance and limited use of combustible materials on the exterior of the structures), wide streets, good water supply and defensible space around the structures. Fuels to the north and east of the project site are light to moderate at the edge of the Project Site. Only limited fire resources would be needed to protect the project site. Other portions of the Val Verde Community were not built to current codes, do not have wide streets or a robust water supply. For these reasons, the project site would be a good choice for refuge to the existing community if evacuation is not a possible for any reason.

FlamMap uses static wind and weather inputs to complete the grid by grid analysis (just as Behave uses static input) but FARSITE completes its calculation based on hourly changes to the wind and weather inputs. As indicated previously, the actual conditions for the Thomas and Rye fire have been used in the specific FARSITE scenario that have been completed. In Figure 38, on the next page it is

possible to see the impacts of the changing wind/weather condition on the fire behavior for a point fire at location 1. Note the increase westerly spread (more from the Rye Fire than from the Thomas Fire but significantly more than the FlamMap output which computes only the NE wind for the duration). *The FlamMap Flow Lines have been imposed on all three scenarios to provide reference points*

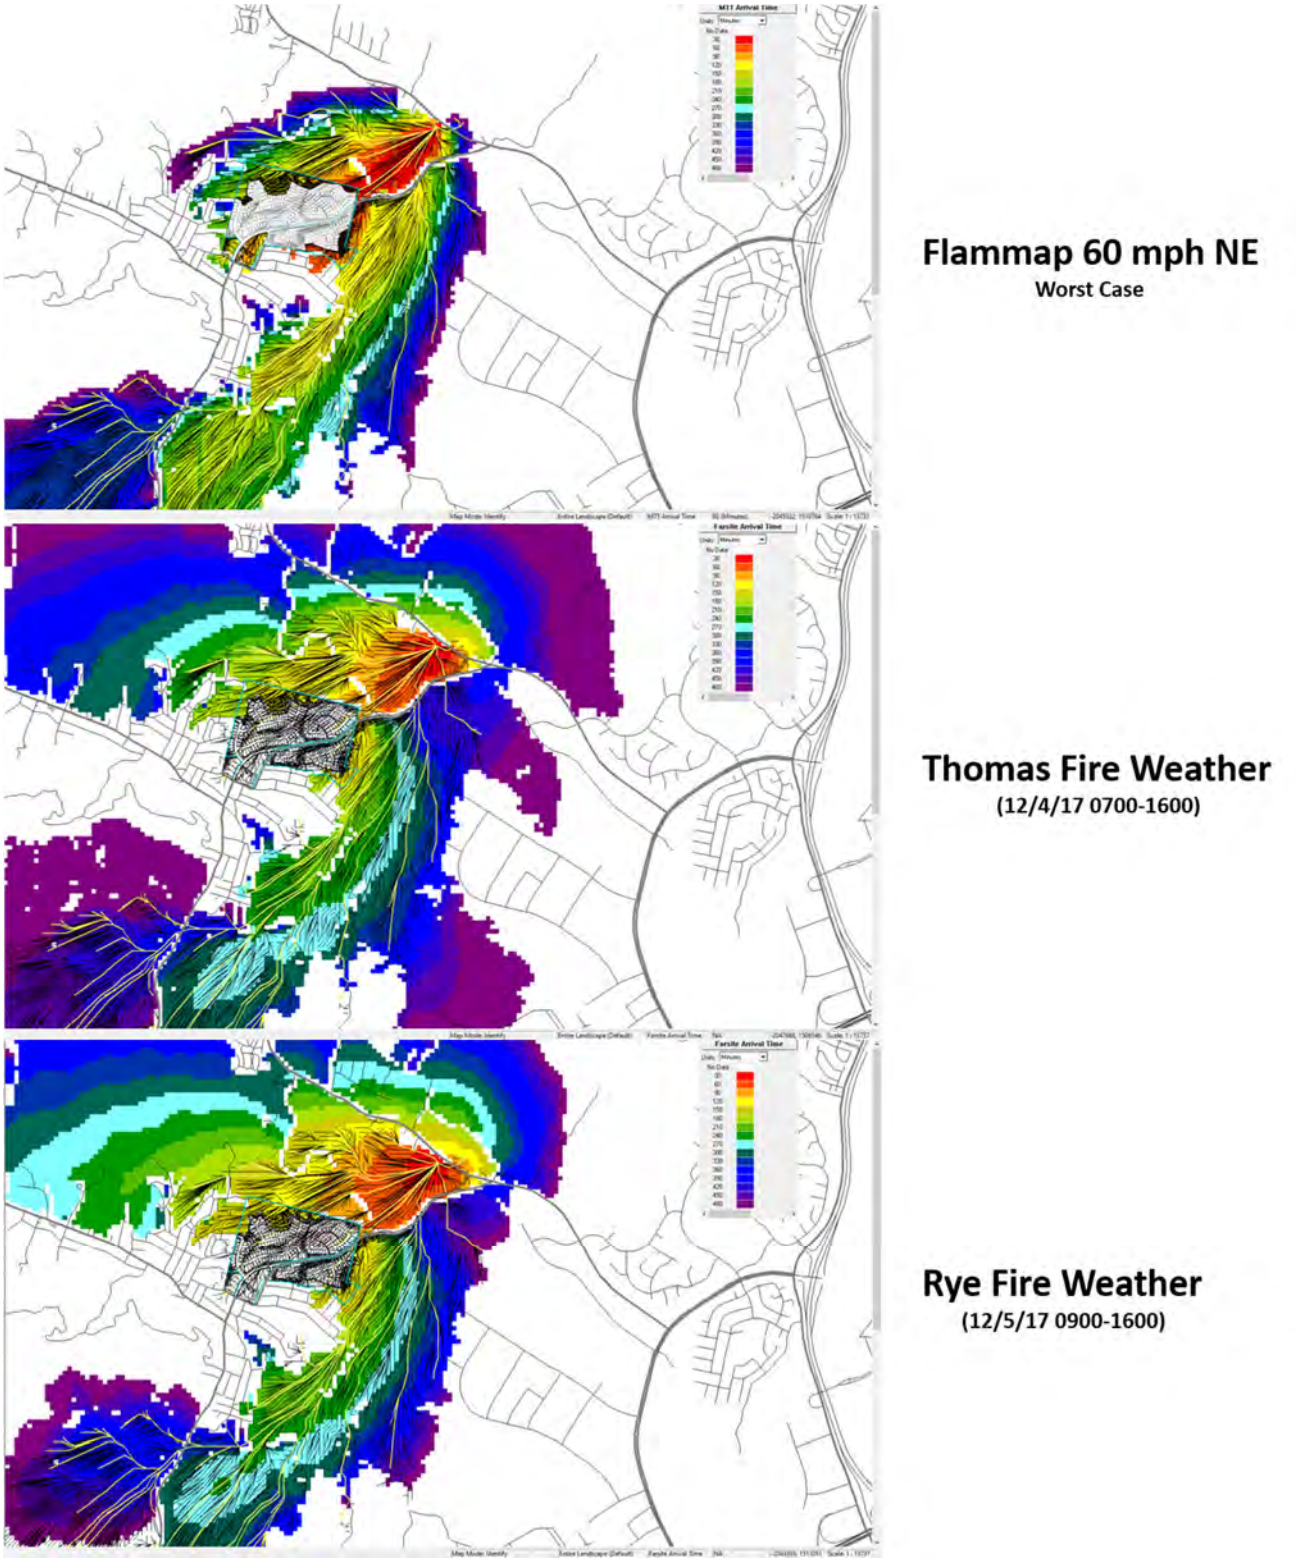

Figure 38 – Comparison of FlamMap and FARSITE Outputs for Source Point fire at Location 1

In all three cases (FlamMap NE 60 and FARSITE Rye and Thomas Fires for Point 1) the fire eventually burned through the gap between the Val Verde community and the Commerce Center Industrial Park. The fire moves the fastest in the FlamMap scenario where the NE wind is constant. This is the case with other ignition points as well. If the point of origin is moved to the NW, the fire burns directly into the community and the project site (Figure 39, below). Without suppression efforts, the fire will eventually burn around the east and down the State Route 126 but without alignment, it will be slow progress.

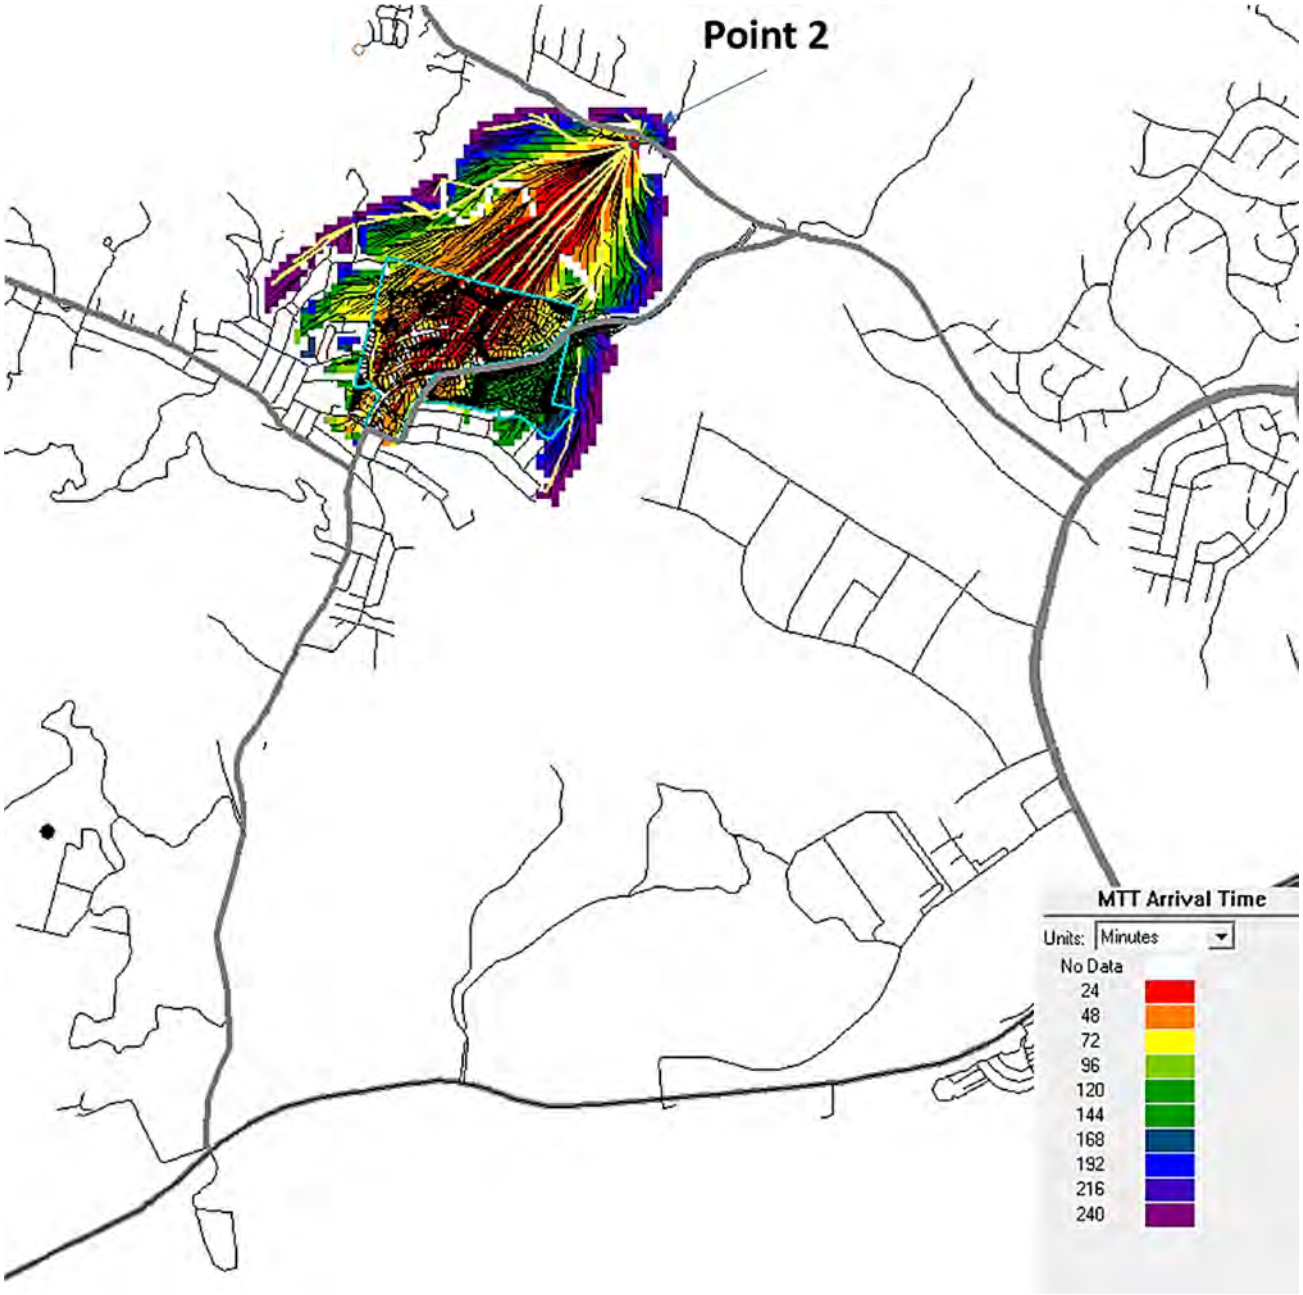

Figure 39- Northeast wind at 60 mph from a Source Point ignition at Point 2

Compare that with a North wind at the same location and the fire behavior is significantly different. The alignment of wind and fuels has the fire running hard to the south; reaching State Route 126 about two hours where the NE wind did not make it past Hunstock Road in eight hours (Figure 40, on the next page.

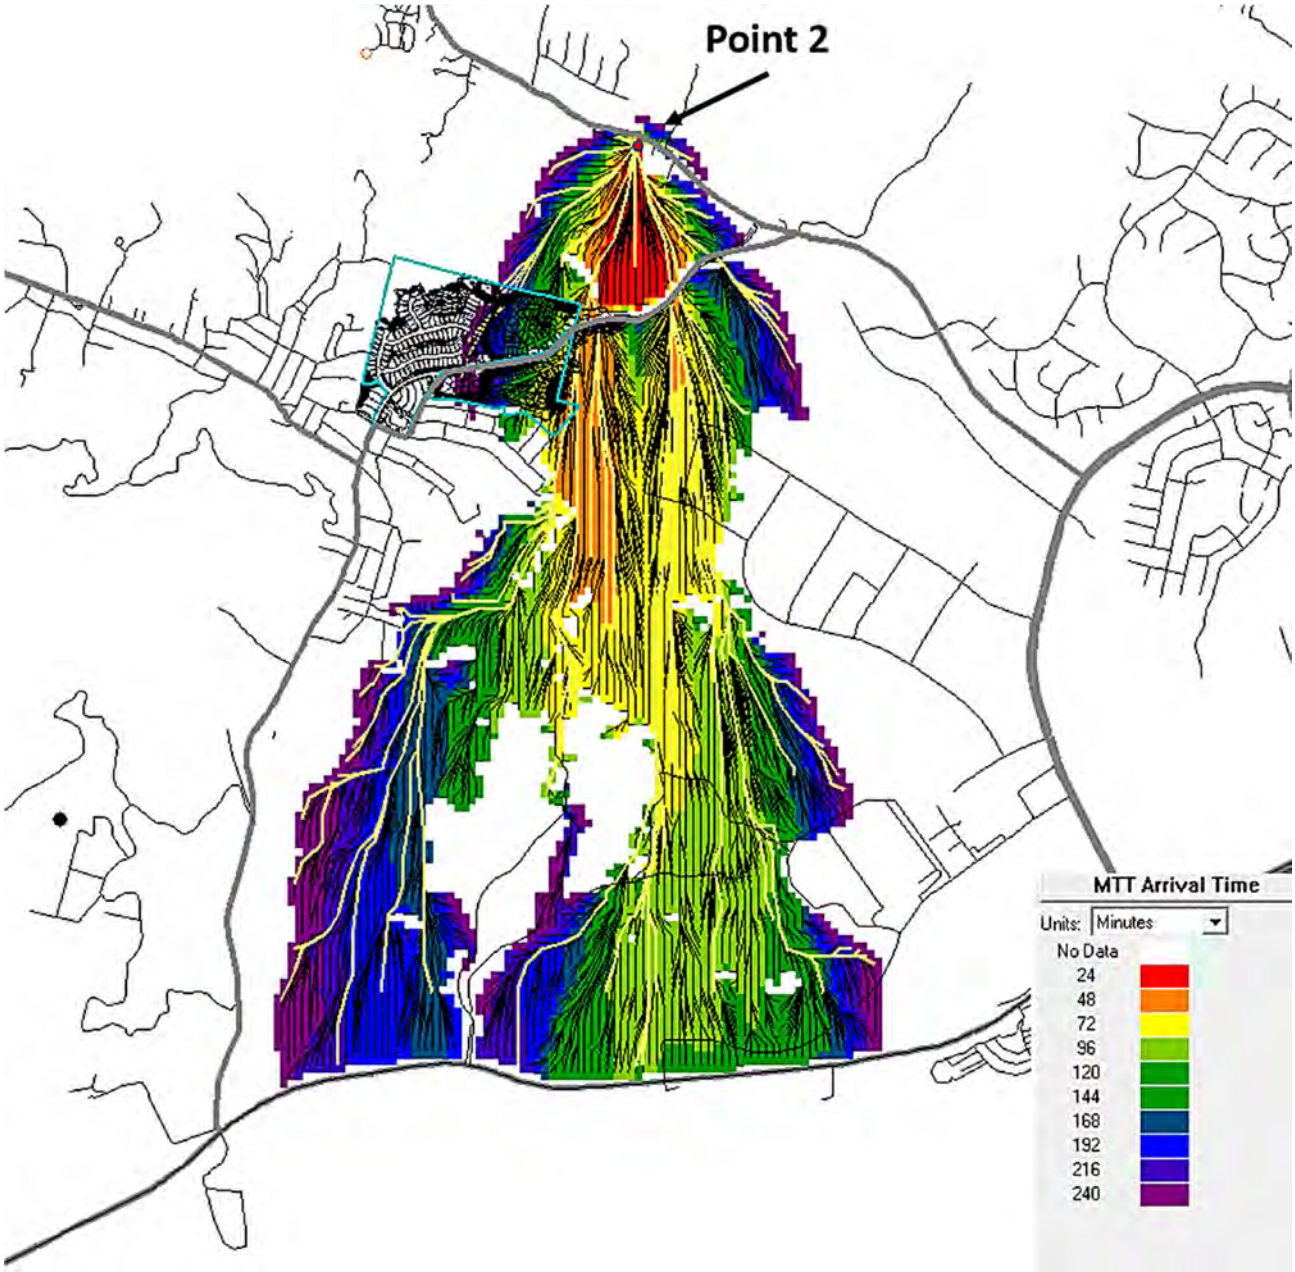

Figure 40 - North wind at 60 mph from a Source Point ignition at Point 2

Figures 41 and 42, on the next page, provide the results of the Line Fire scenarios for the N and NE winds. In four hours, the Chiquito Canyon Road access is not impacted from this location.

On page 45, Figure 43, a Line Fire scenario was used to Location 3. This scenario showed that the fire would not necessarily run around the west side of the community (it could still spot over the community but even with a spotting probability of 90%, the model did not show that outcome).

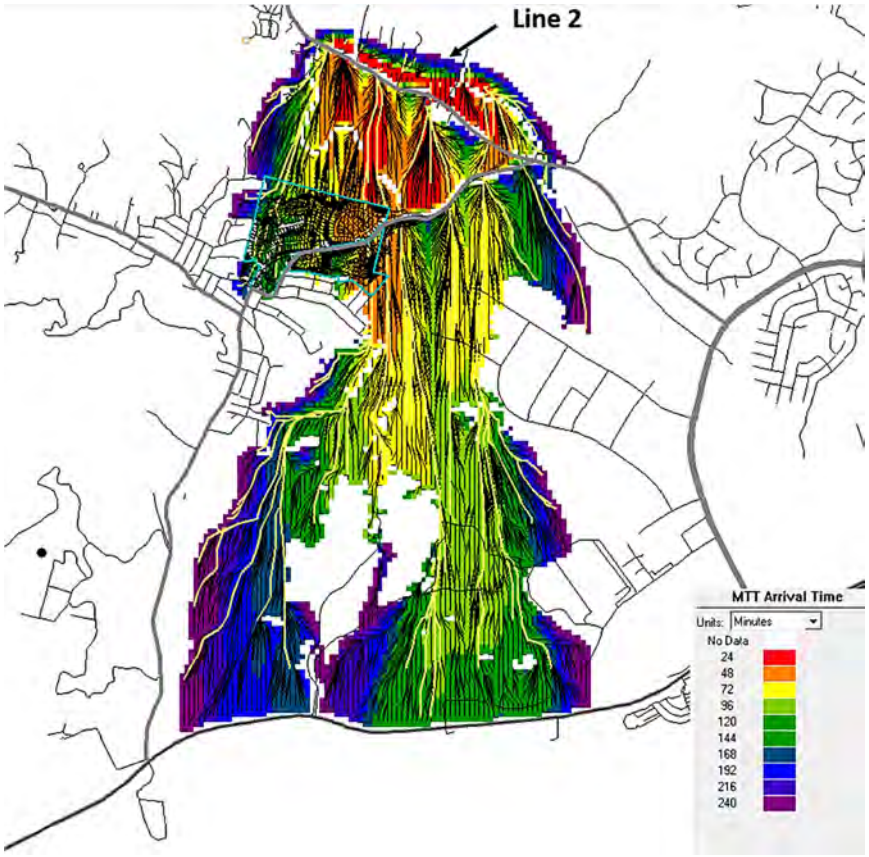

Figure 41 – FlamMap North Wind from Line Fire from Location 2

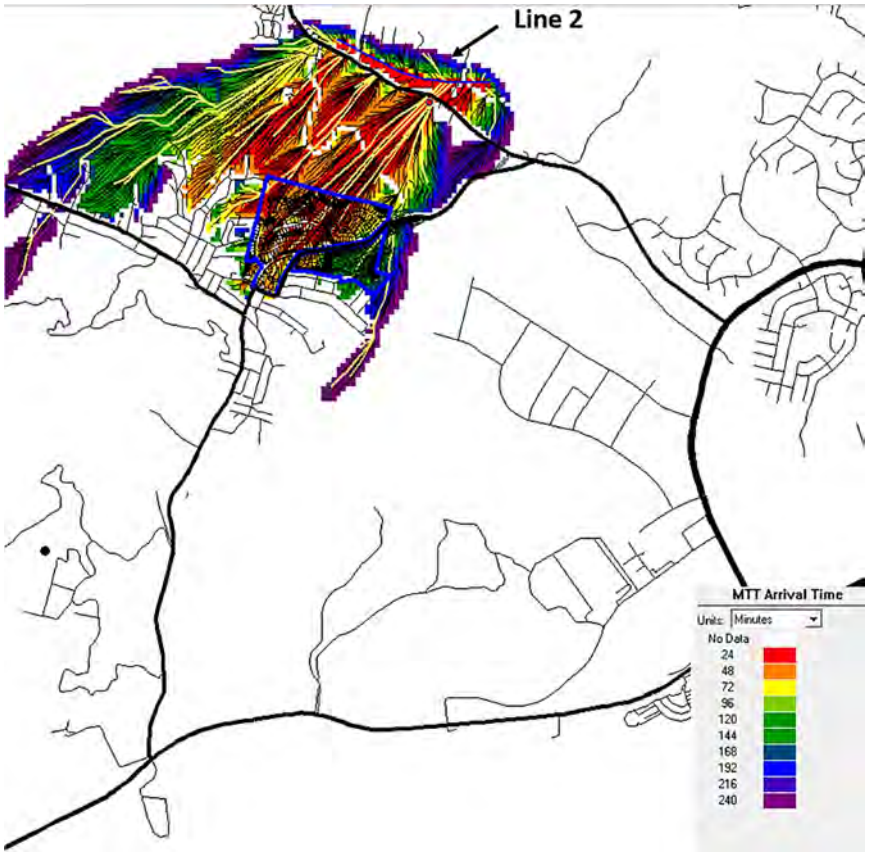

Figure 42 – FlamMap Northeast Wind Line Fire from Location 2

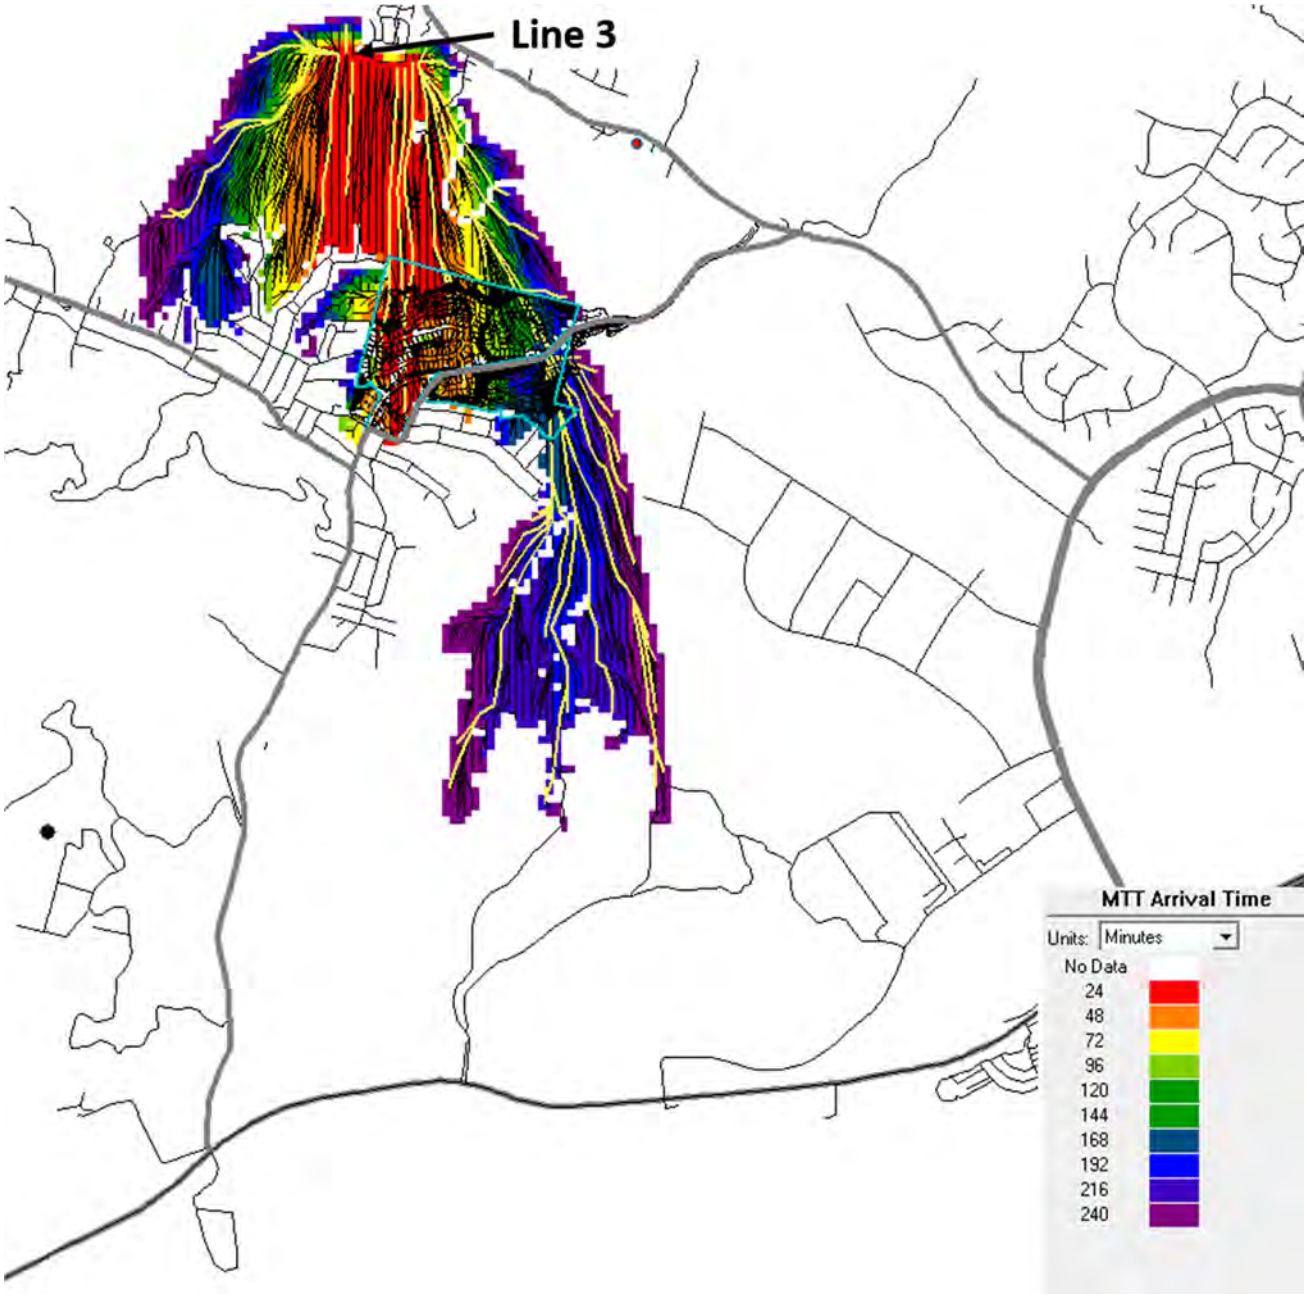

Figure 43 – FlamMap North Wind Line Fire from Location 3

It is necessary to see the impacts of an onshore fire run as well. A Line Fire scenario was completed at Location 4 using a 30 mph SW wind (unusual but not impossible) in the FlamMap and FARSITE programs. Figure 44, on the next page, provides the FlamMap output. The fire closes the Chiquito Canyon Road access quickly but takes about two hours to work its way up to the Del Valle Road access. By the time Del Valle Road is impacted, the head of the fire has passed the Val Verde Community and only lateral and backing fire is remaining as a threat. Given the wind direction and vegetation at the mouth of Chiquito Canyon, it is very likely that law enforcement could escort evacuees down and out of the community through Chiquito Canyon, but unless a wind shift is expected, the residents are likely safer remaining in place at this point.

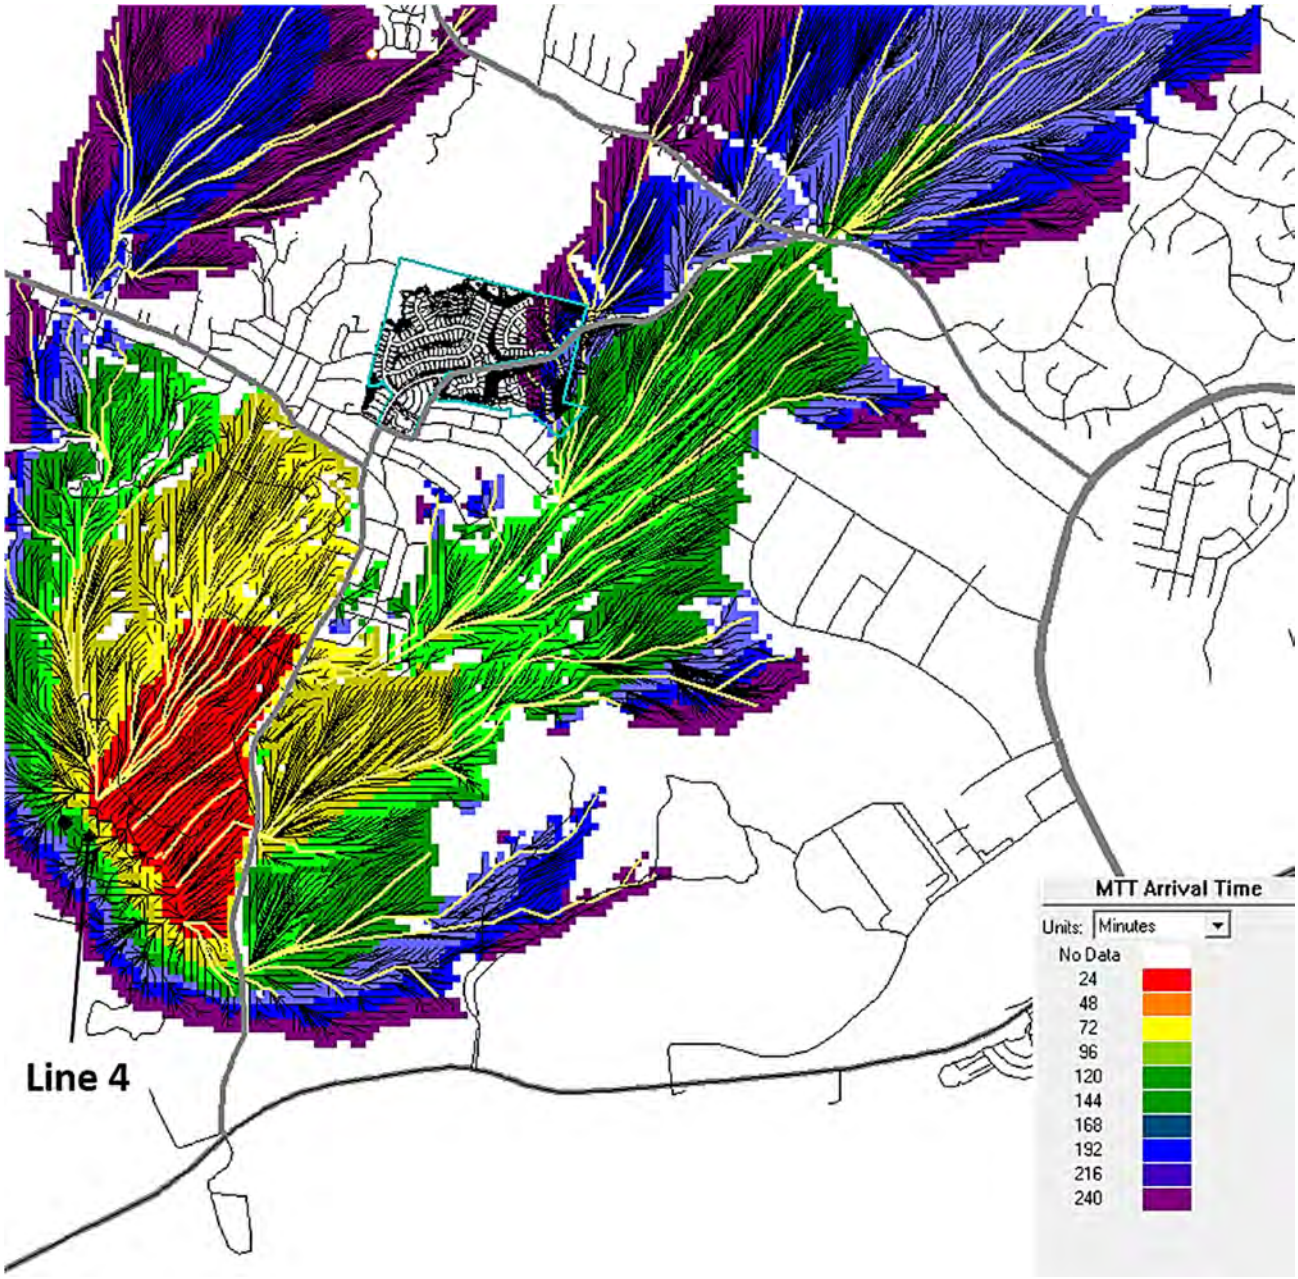

Figure 44 – FlamMap SW 30 mph Line Fire Scenario

Figure 45, on the next page, is the FARSITE output for the June 2017 onshore wind event detailed earlier in this report. As indicated, the movement is more easterly from the predominantly West wind. Without the sustained SW push, the fire does not impact the Del Valle Road access in the hours used in the modeling.

The W and SW winds are not a factor for creating a condition where both Chiquito Canyon Road and Del Valle Road would be impacted simultaneously.

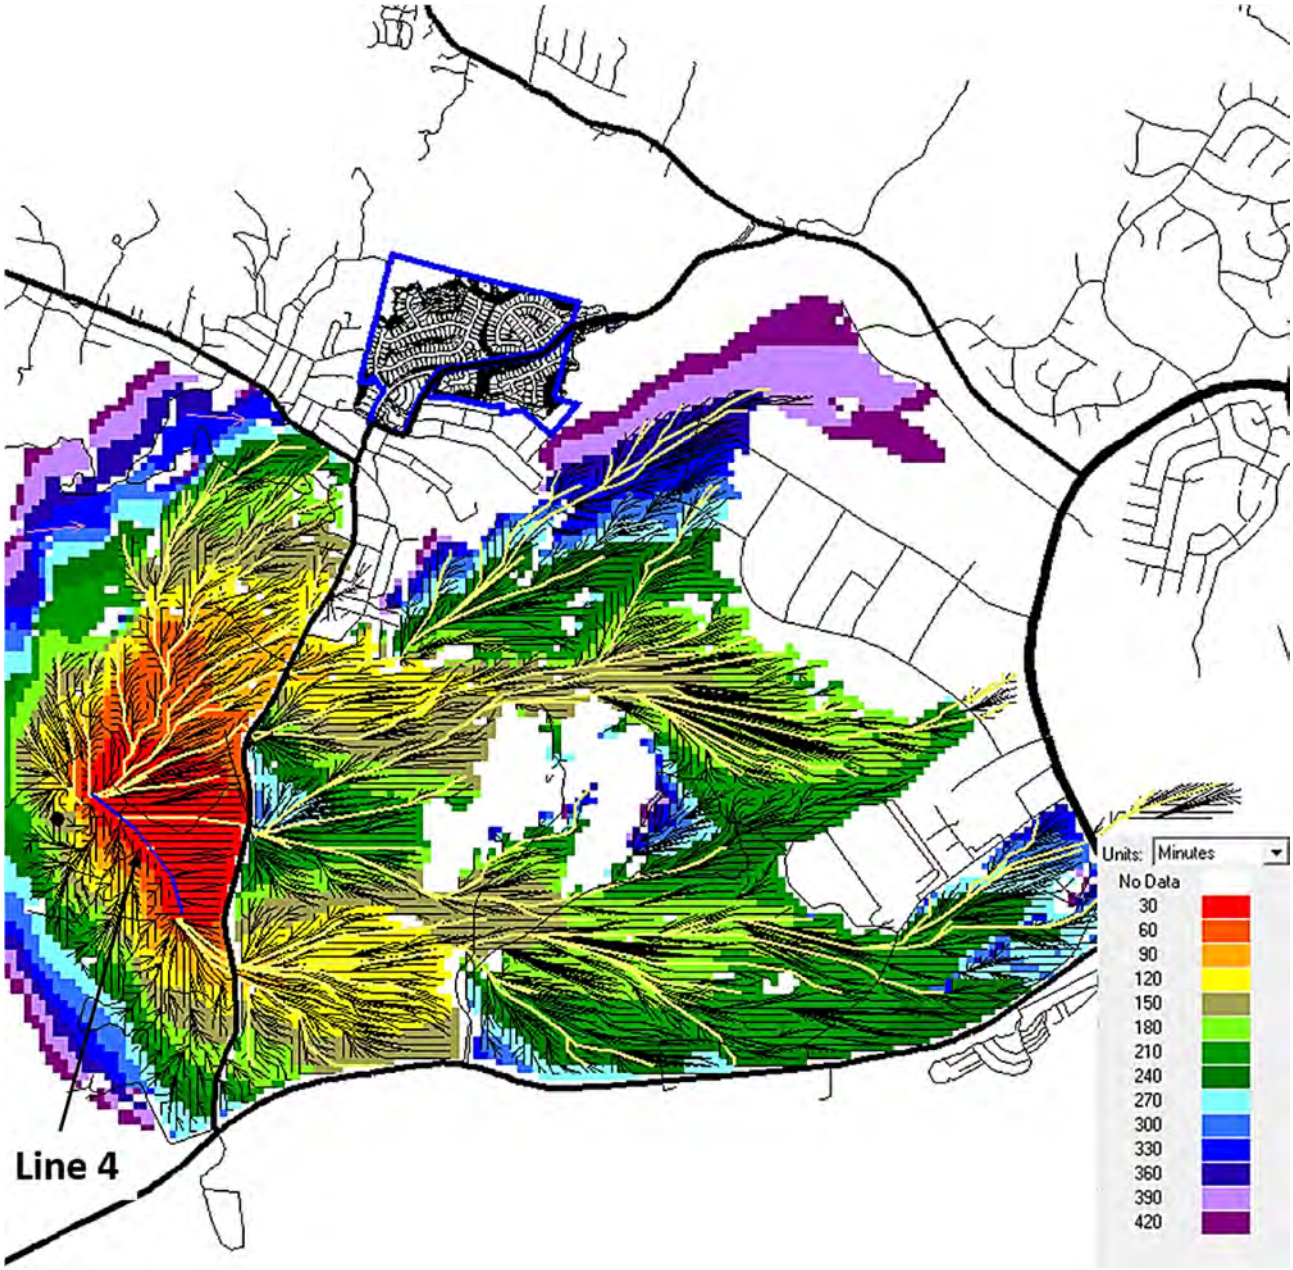

Figure 45 – FARSITE Onshore June 2017 Line Fire from Location 4

In the final analysis of this report, two, point source, fires are simulated from the NE with winds are 60 mph. Point 5 was selected as the most impactful location for a Point Source fire. Point 3 was included to show the effects of the different fuel and the impact of Del Valle Road (it runs parallel with the wind making it a more substantial barrier than it would be if it were perpendicular). The fire from Point 3 runs much faster into the community as it is mostly grasses. The fire at Location 3 will be impactful to that portion of the community but it will be over very quickly, and refuge could be taken in other parts of the community including the project site without evacuating completely out of the area initially. This would be an exact scenario where the Decision Tree process would be applicable.

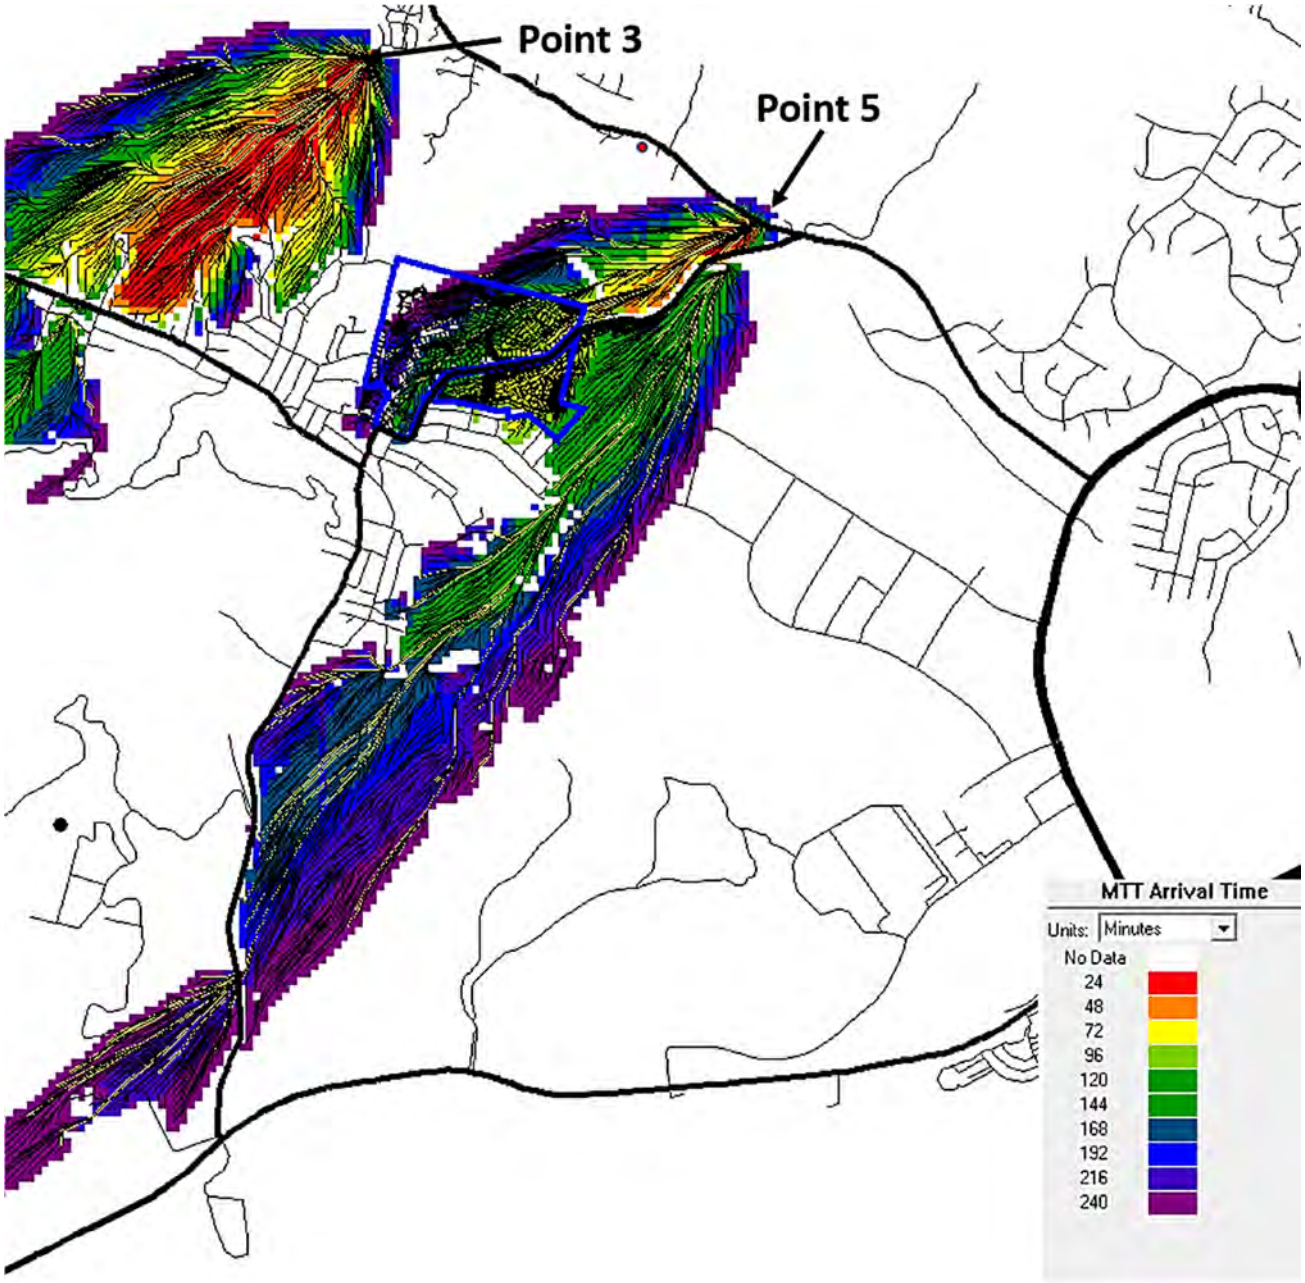

Figure 46 – FlamMap Scenario with Point Source Fires at Location 3 and 5

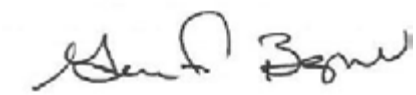
Fire Behavior Summary

The modeling indicates that flame lengths of just under 50 feet are possible under perfect fire conditions, in the worst case scenario in the interface at or near the project site. The design criteria for the project site must properly protect the structures from a wildland fire under these conditions. Most of the fuels are not aligned with the slope and wind and many of the interface fuels are not continuous enough to drive fire behavior to the level of the equilibrium spread rates used in the modeling for shrubs. In most of the areas adjacent to the fuel modification zones in the upslope condition, the areas are significantly wind sheltered. Criteria for these areas are less than the downslope area but are still within the prescriptive 100-foot distance. The entire defense system will be designed to protect all the structures regardless of specific location adjacent to the native fuels on the native vegetation interface to the Sterling Ranch Project Site.

Modeling for the purposes of examining ingress and egress reveals that even when a scenario can be constructed that impacts both of the access roadways (Chiquito Canyon Road and Del Valle Road) by a single fire event, the distance between the two roads, the orientation of the winds, and the nature of the vegetation at the roadside does not result in an event that would close both of the roadways at the same time. In the fast moving scenario fire travels the distance between the two roads in less than an hour is oriented in the perfect location. However, this same speed with which the fire is moving equated to the fire impacts being completed and the fire moving on to the alternative access route which would allow for it to be used. In most cases, there are two or more hours between the impacts of the alternative roads. With the limited number of homes in the community, even with the new homes from the project site, there is both time and space to protect the residents within the community until safe passage is insured.

In accordance with the fuel modification plan, a landscape plan that utilizes a plant palette consisting of fire-resistant plants, native and appropriate non-native drought tolerant species in accordance with Los Angeles County Fire Department guidelines will be designed and implemented within the fuel modification zones. The Sterling Ranch fuel modification plan has been reviewed and approved by LA County Fire Department.

The technical results provided as part of the Fire Behavior Analysis within this report were obtained using BehavePlus Plus version 5.0.5, FlamMap version 6.0 and Wind Ninja 3.6 software.



Gene F. Begnell
Fire Protection Analyst

Fire Behavior Analysis and Report Summary

Based on the scientific fire behavior analysis, the exterior portions of structures within the Sterling Gateway Estates Project will not ignite from the exposure to a wildland vegetation fire with the distances and configuration included in the project as designed, proposed and analyzed in this report. This is primarily because the greatest potential fire energy is too far away from the proposed structures due to lack of wildland fuels and fire intensity as it approaches the Project Site from the easterly direction; all of other edges of the Project Site are developed with residential uses. This does not account for windows or doors which are left open or other factors which may increase the risk of ignition but are not a factor of the design or construction of the Project Site.

The Fire Behavior modeling shows that the performance-based design offered for the Project Site provides the protection necessary to keep the structures safe during a wildland fire incident within the adjacent native fuels and that additional distance would not necessarily increase the safety of these structures beyond what is already provided by the approved Fuel Modification Plan for the Project.

The codes enforced by the Los Angeles County Fire Department for Fuel Modification and Hazard Reduction were developed to address the exact type of fuels that are interfacing with the development area of the Project Site. The approved fuel modification plan meets or exceeds the accepted fuel modification criteria provided by the prescriptive fuel modification distances and configuration. Based

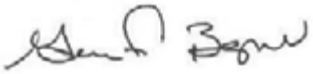
on the analysis, no modifications to the design of the Project or additional mitigation is recommended for the issues covered in this report.

Additionally, the use of FlamMap and FARSITE modeling software provided objective data outputs for consideration in the use and effectiveness of the two access roadways which serve the existing community of Val Verde and the Project Site. While it is possible to create a model scenario where fire travels across both Chiquito Canyon Road and Del Valle Road in the same fire event, the modeling showed that the timeframe in which this could happen is separated by hours in most cases, and in the case of an extremely fast moving fire (about an hour) the fire activity was completed on the first impacted roadway before the fire front impacted the alternative roadway.

The Project will be constructed in compliance with applicable standards that will keep residents safe from an adjacent wildland fire. Unless enough time is available to move residents safely and without additional risk, they would be safer remaining within the Project Site until they can be removed with a high degree of safety. This decision will be made by emergency responders as needed. Firesafe recommends that the community as a whole adopt the Firewise Community standards and adhere to the Ready, Set, Go criteria developed and implemented within California and Los Angeles County. Firewise USA® is a voluntary program that provides a framework to help neighbors get organized, find direction, and take action to increase the ignition resistance of their homes and community. These criteria are available for review on the NFPA (National Fire Protection Association) website: https://www.nfpa.org/Public-Education/Fire-causes-and-risks/Wildfire/Firewise-USA

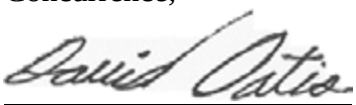
We recommend approval of this Fire Behavior Report as an accurate and acceptable assessment of the hazard and risk factors for the Sterling Ranch as they relate to wildland fire protection, Fuel Modification Zone design and fire department access/egress roadways. The Firesafe team is available to complete any additional analysis or to provide additional support materials for our position on this matter.

Respectfully;



Gene F. Begnell
Fire Protection Analyst

Concurrence;



David Oatis
Principal, Firesafe Planning Solutions

Site Photos Locations

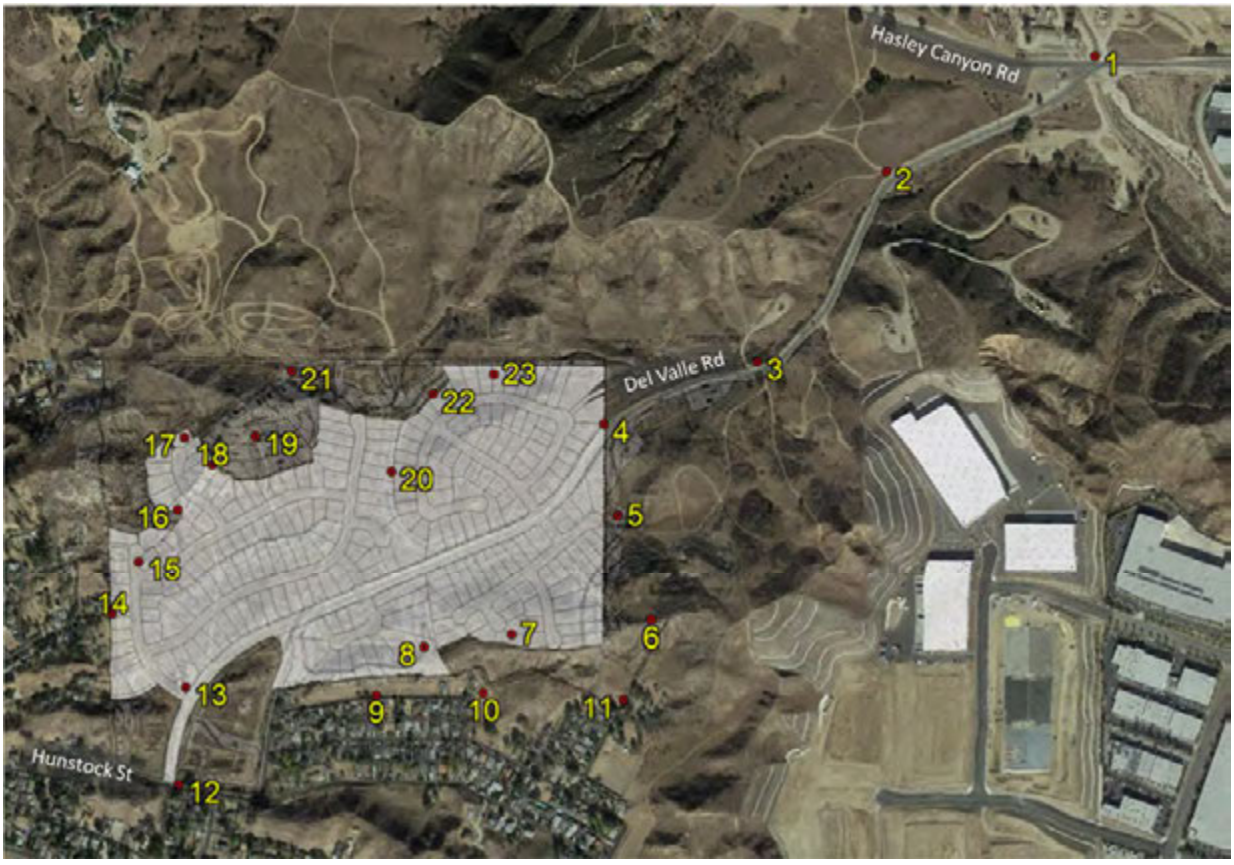

Photo locations are shown on the map above as reference points. Several photos were taken from each general location and are within a few feet of each other. For simplicity, these photo site have been grouped in the locations are shown above.

Photo Site 1 – Looking Southwest from Hasley Canyon Road to Del Valle Road.

Photo Site 2 - Looking Southwest on Del Valle Road.

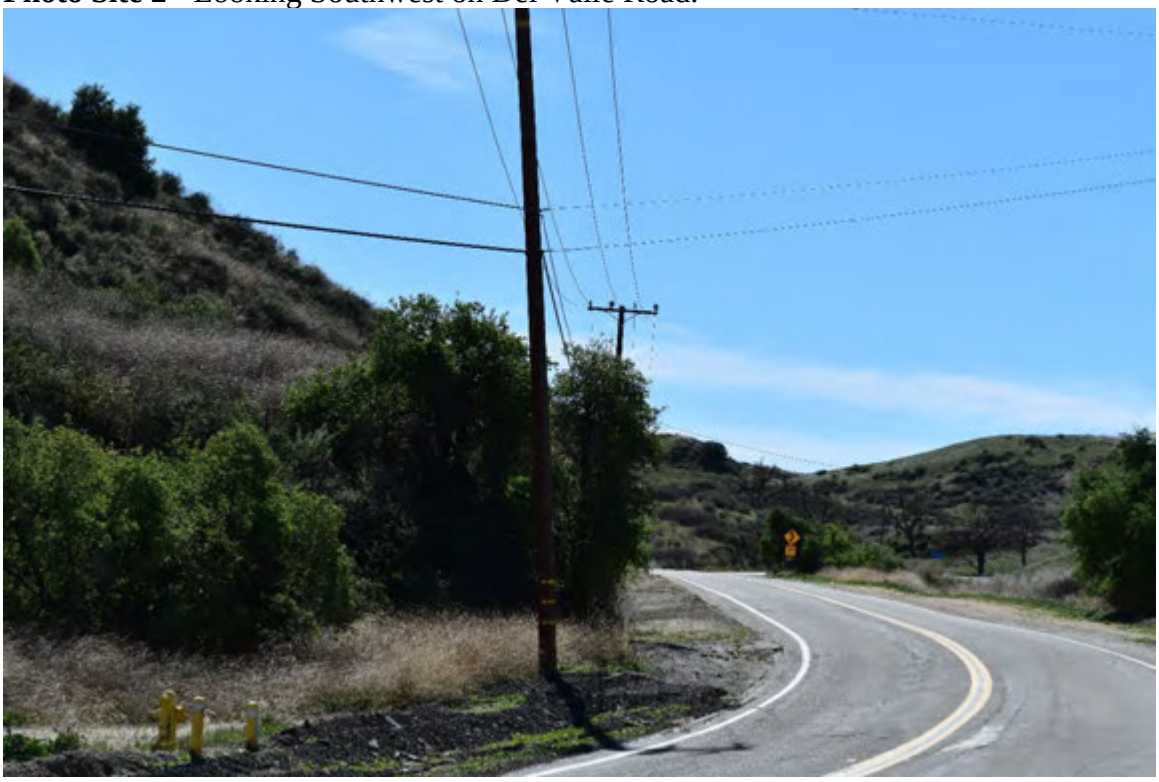

Photo Site 2 - Looking West Southwest on Del Valle Road.

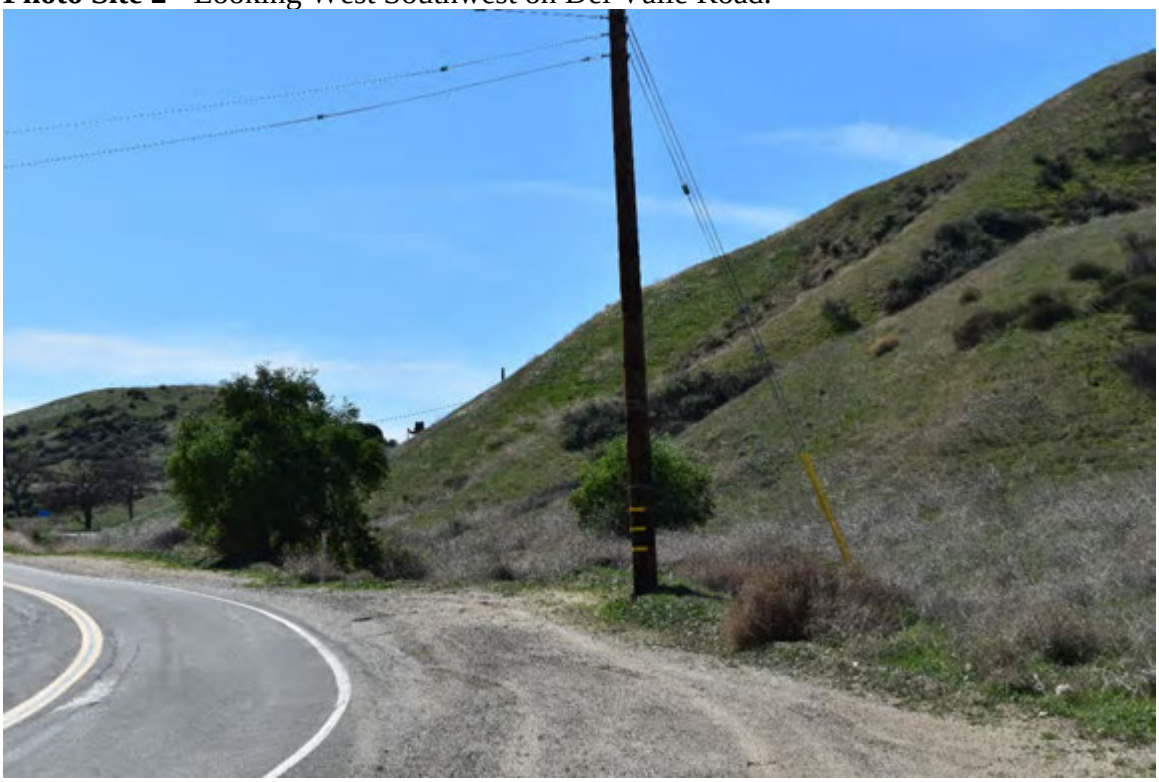

Photo Site 3 - Looking West Northeast on Del Valle Road.

Photo Site 3 - Looking Southwest on Del Valle Road.

Photo Site 3 - Looking North from Del Valle Road.

Photo Site 4 – Looking Northeast on Del Valle Road

---

Run Option Notes

Maximum reliable effective wind speed limit IS imposed [SURFACE].

Calculations are for the specified spread directions [SURFACE].

Fireline intensity, flame length, and spread distance are always for the direction of the spread calculations [SURFACE].

Wind and spread directions are degrees clockwise from north [SURFACE].

Wind direction is the direction from which the wind is blowing [SURFACE].

Output Variables

Surface Rate of Spread (ft/min) [SURFACE]

Fireline Intensity (kW/m) [SURFACE]

Flame Length (ft) [SURFACE]

Direction of Maximum Spread (from north) (deg) [SURFACE]
