Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A02	The difference between duplicate readings is less than the PQL.
A03	The sample concentration is more than 4 times the spike level.
A10	PQL's and MDL's were raised due to matrix interference.
A17	Surrogate not reportable due to sample dilution.
L21	The Laboratory Control Sample Soil (LCSS) recovery is not within laboratory established control limits.
Q01	Sample precision is not within the control limits.
Q02	Matrix spike precision is not within the control limits.
Q03	Matrix spike recovery(s) is(are) not within the control limits.
S09	The surrogate recovery on the sample for this compound was not within the control limits.
V01	The Initial Calibration Verification (ICV) recovery is not within established control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

1.0 INTRODUCTION

On behalf of Comstock Gage LLC, the landowner ("Comstock"), TRC has prepared this Remedial Action Plan ("Plan") to obtain regulatory approval from the California Regional Water Quality Control Board – Los Angeles Region ("RWQCB") to remediate the Comstock's property located at 7316 Gage Avenue in the City of Commerce, CA ("Site").

The Plan achieves Site remediation through:

- Total excavation of all cover soil and buried landfill waste material;
- Confirmation sampling of excavation floor to demonstrate removal of chemicals of potential concern (COPC); and
- Confirmation sidewall soil sampling (northern, eastern, and southern sidewalls) to demonstrate removal of landfill debris and/or removal of COPCs.

1.1 REMEDIATION OBJECTIVES

TRC will implement remediation of the Site through:

- Complete excavation and removal of cover soil and solid waste materials in the waste area;
- Decommission of groundwater monitoring wells to prevent potential impacts to groundwater, and
- Removal of accessible impacted soils underlying the waste area that do not meet the cleanup criteria.

All cover soil and waste materials will be removed from the waste area within the Site. No granular material or soil is proposed to be imported to the Site. Since all soil and waste materials will be removed from the site. As such, post-remediation monitoring and maintenance will not be required.

1.2 PLAN ORGANIZATION

The remainder of this Plan is structured to address the regulatory requirements stated above as follows:

- Section 2: Site Characterization
- Section 3: Proposed Soil Cleanup Criteria
- Section 4: Proposed Remediation Activities
- Section 5: Remediation Monitoring
- Section 6: Remediation Report
- Section 7: Post-Remediation Maintenance Activities
- Section 8: Schedule
- Section 9: References

- Appendix A: TRC Limited Environmental Site Assessment Report
- Appendix B: TRC Trench Logs and Official Laboratory Reports and Chain of Custody Records
- Appendix C: B&D Construction Company, Inc., Test Pit Work Summary/Results, and Sladden Laboratory Test Results
- Appendix D: Soil Sampling Plan
- Appendix E: Quality Assurance Project Plan
- Appendix F: Soil Cleanup Criteria
- Appendix G: Health and Safety Plan

Further subdivisions of the sections, and a list of tables and figures are provided in the Table of Contents.

2.0 SITE CHARACTERIZATION

2.1 SITE DESCRIPTION

The Site is identified on the CalRecycle website, formerly the CIWMB's Solid Waste Information System (SWIS) database as including the eastern portion of the Gage Avenue Dump, Solid Waste Information site (SWIS ID 19-AA-5543).

According to the Los Angeles County assessor's website, the Site is identified as assessor parcel number (APN) 6357-018-005 and consists of approximately 7.78 undeveloped acres.

Figure 1 is the Site Plan showing an aerial photograph of the surrounding properties. The Site is bounded to the:

- North by the Ramada Inn property and East Slauson Avenue;
- East by the Interstate 5 (Santa Ana) freeway;
- South by the Rio Hondo River Channel, a concrete lined flood control channel, and the Rio Hondo percolation basin; and
- West by the City of Commerce Veterans Memorial Park.

2.2 SITE HISTORY AND OPERATIONS

Based on aerial photographs the Site was:

- Undeveloped prior to 1947.
- Used for agricultural purposes from 1947 to 1950.
- Part of a disposal site permitted by Los Angeles County, and operated L.A. By-Products, Inc., from 1950 to 1954. The Site was also known as the Gage Avenue Dump, which reportedly accepted municipal solid wastes, construction debris and inert fill materials.

- Following in-place landfill remediation in 1958, a 52,160 square-foot rectangular commercial building and railroad spur was constructed over the waste area at the Site.
- The commercial building was demolished in 1992.

The Site is currently a vacant undeveloped land parcel that is partially covered with vegetation, asphalt, and concrete.

2.3 PHYSICAL AND ENVIRONMENTAL CHARACTERISTICS

The former eastern waste disposal area encompasses a surface area of approximately 5.52 acres (Figure 2) of the total Site area of approximately 7.78 acres, including the property access road. The waste disposal area is roughly rectangular in shape, approximately 650 feet long in a north-south direction and 370 feet wide in an east-west direction. The Test Pit and Trench Location Plan (Figure 2) show the approximate limits of the waste disposal area in relation to the property boundaries.

The waste disposal area surface is generally flat with numerous slight depressions (less than 1 foot in depth) in relation to the surrounding area. The cover soil ranges from 3 to 5 feet in thickness. In the northern and central portions average waste thickness is approximately 15 feet, assuming 4 feet of soil cover. In the southern portion, the average waste thickness is 16 feet (Sladden, 2004). Two cross sections through the Site are provided in Figure 3. The locations of the cross sections are shown on Figure 2.

2.3.1 Regional Hydrology and Geology

The Site is centrally situated at the southern edge of the Montebello Plain physiographic feature within the Coastal Plain of the Los Angeles Basin. According to published geologic maps and cross sections (CDWR, 1961), the Site overlies late Pleistocene-age sediments of the Lakewood formation. The Lakewood formation is described as being sedimentary in origin and consists of marine and continental gravel, sand, silty sand, silt, and clays. The Site lies within the Central Groundwater Basin, a subdivision of the Coastal Plain of Los Angeles County east and northeast of the Newport-Inglewood uplift. Local hydrostratigraphic features (from shallowest to deepest) include the Bellflower aquiclude, Exposition aquifer, and Gage aquifer within the Lakewood formation. Deeper hydrostratigraphic features of the underlying San Pedro formation include the Hollydale aquifer, Lynwood aquifer, Silverado aquifer, and Sunnyside aquifer. The aquifers of the Central Groundwater Basin are generally separated by low-permeability aquitards that limit vertical groundwater conductance between aquifers (CDWR, 1961).

The Site is located approximately 7 miles west of the Elsinore fault zone, Whittier section; 6 miles southwest of the East Montebello fault; and 10 miles east and northeast of the Newport-Inglewood-Rose Canyon fault zone. The Site does not appear in Alquist-Priolo (AP) Earthquake Fault Zones.

2.3.2 Local Hydrology and Geology

The Site is situated at an elevation of approximately 151 feet relative to mean sea level (msl) with the surface elevation sloping gently towards the south (USGS, 1981), and 85 feet below ground

surface (bgs) or greater to groundwater. According to the groundwater monitoring reports for the Arco Facility #1682, located at 7667 East Slauson Avenue, approximately 525 feet north-northeast of the Site, the regional groundwater flow direction is south-southeast towards the Rio Hondo River Channel (Geotracker, April 2013). Historical groundwater monitoring events conducted at the former Mobil Service Station, located at 7724 Telegraph Road (approximately 100 feet to the north), indicate depth to groundwater in monitoring well MW-7A, fluctuating from 73.70 to 104.57 feet bgs, the highest historical groundwater elevation was recorded in 2005 at 82.28 feet relative to msl and the most recent elevation recorded was 58.88 feet relative to msl.

The maximum excavation depth of the remediation activities contemplated by the Plan is 25 fbg, meaning approximately 48 feet of native soil will remain between the highest historical groundwater elevation and the excavation floor (Figure 4). Figure 4 presents a Conceptual Rough Final Grade Cross Section.

Soil boring logs from a 2004 geotechnical investigation by Sladden Engineering indicate the soils (up to 80.5 feet bgs) underlying the Site consist of silty sands, sandy silts, and fine-to coarse-grained alluvial sands with gravel (Sladden 2004). Groundwater was not encountered during the Sladden Engineering investigation.

2.3.3 GROUNDWATER MONITORING WELL

TRC identified one groundwater monitoring well in the southwest corner of the Site during its environmental assessment. Soil was encountered in the 4-inch diameter well casing at 84.49 feet below the top of the well casing when measured on January 21, 2014. TRC was unable to locate other groundwater monitoring wells or groundwater monitoring data for the Site (Geotracker, 2014). According to the Partner Engineering and Science, Inc., Phase I ESA Report "A total of three groundwater monitoring wells were observed onsite during the Site reconnaissance. The groundwater monitoring wells are most likely associated with the previous environmental investigations performed by other consultants at the subject property" on behalf of prior owners.

2.4 SUMMARY OF PREVIOUS INVESTIGATIONS

2.4.1 Geotechnical Investigation

In its 2004 Geotechnical Investigation, Sladden Engineering advanced nine soil borings up to 80.5 feet bgs to determine depth and density of onsite disposal waste, and underlying soil lithology and density. Disposal waste was reported at depths ranging from 7 to 29 feet bgs, at one boring location. The 2004 investigation reportedly included 218 supplemental borings in a 40-foot grid pattern to further evaluate the site conditions and depth of the disposal wastes (TRC, 2013a).

2.4.2 Phase I Environmental Site Assessment

In April 2013, TRC conducted a Phase I ESA to identify Recognized Environmental Conditions (RECs) at the Site, as defined by the ASTM E 1527-05 standard (TRC, 2013). A number of tasks were conducted including:

- Site and vicinity reconnaissance;

- Site and vicinity description and physical setting;
- Historical source review and description of historical Site conditions;
- Review of environmental databases and regulatory agency records;
- Review of previous environmental reports/documentation, as applicable; and
- Preparation of a report summarizing findings, opinions and conclusions.

The ESA revealed limited information regarding the Site history with respect to the nature and extent of landfill disposal activities previously conducted in the early 1950s.

2.4.3 Limited Environmental Site Assessment

In June 2013, TRC conducted a Limited Phase II ESA to:

- Characterize the nature of the disposed waste;
- Estimate the type and approximate quantities of waste material;
- Investigate the waste debris thickness; and
- Collect soil samples (see Appendix A). Five trenches were excavated in select portions of the Site up to 23 feet bgs.

TRC observed the trenching, described trench material and characterized waste in field notes, and documented with photographs. Logs of the test pits are provided within the report in Appendix B. A number of tasks were conducted that include:

- Excavation of five test trenches;
- Evaluation of ambient air and trench vapors using a photoionization detector and four gas meters for volatile organic compounds, methane, carbon dioxide, hydrogen sulfide, and percentage of oxygen;
- Collection of soil samples/material for analysis from the excavated waste area;
- Collection of natural soil samples for analysis from the trench floor; and
- Field monitoring and documentation of observations.

TRC did not conduct screening of waste materials to separate soil from waste particles during this trenching investigation. Soil/material samples of equal volume were collected at 1-foot depth intervals and composited (5-point composite) into one soil/material sample to assess chemical compounds in an approximately 5-foot vertical waste column. Each of the collected soil/material samples was composited in the field from the following depth intervals for submittal to the laboratory, as follows:

Soil Sample Collection Depth (fbg)	Composited Depth Interval (fbg)	Sample Identification
1, 2, 3, 4, 5	1 to 5	T1-5 through T5-5
6, 7, 8, 9, 10	6 to 10	T1-10 through T5-10
11, 12, 13, 14, 15	11 to 15	T1-15 through T5-15
16, 17, 18, 19, 20	16 to 20	T1-20, T3-20 and T5-21*

*Sample T5-21 composited soil depths 16 through 21 fbg (6-point composite).

Two excavation floor soil samples (T2-23 and T4-18) were collected during this investigation from two of the five exploratory trenches to evaluate soil conditions underlying the waste area. The two excavation floor soil sample results are summarized in Tables 1 through 5 of the Limited ESA (TRC, 2013a).

2.4.4 Additional Site Assessment/Summary

During January 2014, TRC was onsite to observe further limited exploratory excavation and collect environmental soil samples during the test pit work and material screening performed for Comstock by B&D Construction Company, Inc. (B&D).

B&D's exploratory work involved the excavation of four test trenches, each with an excavation floor footprint of approximately 20 by 50 feet, and a 100 by 100-foot test pit.

The Test Pit and Trench Location Plan are presented in Figure 2. The test pit and trenches (T6 through T9) were each excavated at depths between 15 and 26 feet bgs to expose the native soil underlying the disposed waste. At the time, Comstock had anticipated it would be able to reuse a significant amount of the impacted soils within the waste prism as engineered fill to reduce the volume of clean fill that would otherwise be needed to bring the Site to grade following excavation of buried wastes. To determine how much impacted soil could be potentially available for reuse, the excavated waste material was processed using two different types of portable screen plants, and final screen configurations, to determine the most suitable method of waste segregation from reusable soil. A “Grizzly” type of rock screen and two mesh gradations were used to produce three different gradations of materials. The three materials produced by the first screening process were:

(a) 3/8-inch minus sized material (screened soil for reuse);

(b) 1-to 6-inch sized waste debris; and

(c) greater than 6-inch sized waste debris.

The final screen size was later changed to produce a 1-inch minus material for consideration as reuse material.

TRC collected material samples of the 3/8-inch minus sized material for environmental analysis and Sladden collected samples of the 1-inch and 3/8-inch minus material for organic and/or gradation testing. TRC also collected excavation floor samples of native soils, underlying the removed waste for chemical analyses. The soil screened for reuse and floor samples were analyzed by a state-certified laboratory for Chemicals of Potential Concern (COPC).

A water pipeline was encountered within the excavation of Trench T9, limiting the accessibility of the excavator. No excavation floor or screened soil for reuse samples were collected. The separated waste products generated from the screening process were characterized by B&D to estimate an approximate waste debris composition and density. The B&D and Sladden Reports are provided in Appendix C. The TRC summary of laboratory results is presented in Tables 1 through 5 of this Remediation Plan.

2.5 RESULTS OF PREVIOUS INVESTIGATIONS

Samples were collected from the test pit and trench excavation floors, and from excavated waste and soil without screening, as well as from soils passing through the 3/8-inch mesh for consideration (screened soil) as engineered fill. All samples were analyzed for:

- Gasoline range organics (C4 to C12);
- Total petroleum hydrocarbons (TPH), carbon chain identification (C8 through C44);
- Volatile organic compounds (VOCs);
- Semi-volatile organic compounds (SVOCs);
- Organochlorine pesticides/PCBs; and
- CAM 17 (Title 22) metals (TRC, 2013 and 2014).

The analytical results are summarized in the TRC Limited ESA attached as Appendix A (Samples T2-23 & T4-18) and Tables 1 through 5 (6 samples from 2014) in this Plan. A summary of the chemical results of the test pit and trench excavation floor soil samples and the soil screened samples is presented below.

2.5.1 Test Pit and Trench Excavation Floor Sample Results (January 2014 Investigation)

- No gasoline-range organics (C4 to C12) were detected in any of the excavation floor soil samples above the practical quantification limit of 1.0 mg/kg.
- TPH (C8 to C44) was not detected in 7 of the 8 excavation floor soil samples. One soil Sample T4-18 was detected with a concentration of 2,400 mg/kg.
- VOCs were not detected in 7 of the 8 excavation floor soil samples. One excavation floor soil Sample T4-18 was detected with a naphthalene concentration of 0.014 mg/kg. Soil Sample T4-18 was also detected with benzene and ethylbenzene concentrations below the practical quantification limit of 0.005 mg/kg.
- No benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene or dibenz(a,h)anthracene concentrations were detected in any of the soil samples.
- Pesticides were not detected in 7 of the 8 excavation floor soil samples. The chemical compound 4-4'-DDT was detected above the practical quantification limit, at a concentration of 0.0010 mg/kg in excavation floor soil Sample T7-26.
- No PCBs were detected in any of the excavation floor soil samples.

- Except for arsenic, discussed below, other RCRA metals (barium, cadmium, chromium, lead, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the EPA Region 9, Regional Screening Level (RSL) for industrial use soil.
- Arsenic concentrations up to 4.3 mg/kg were detected in the excavation floor soil samples and averaged 2.58 mg/kg.

2.5.2 Screened Soil Sample Results (January 2014 Investigation)

- No gasoline-range organics (C4 to C12) were detected in any of the screened soil samples above the practical quantification limit of 1.0 mg/kg.
- TPH (C8 to C44) was detected in screened soil samples up to 1,100 mg/kg.
- Naphthalene was detected up to 0.079 mg/kg in 2 of the 5 screened soil samples. No other VOCs were detected in any of the screened soil samples above the practical quantification limit of 0.005 mg/kg.
- Benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene and dibenz(a,h)anthracene were not detected in 4 of the 5 screened soil samples. Benz[a]anthracene and chrysene concentrations of 0.11 and 0.16 mg/kg, respectively, were detected in soil Sample T7-CSS1.
- Pesticides were detected in 4 of the 5 screened soil samples. The chemical compounds 4-4' DDD, 4-4' DDT and dieldrin exceeded the RSL for industrial use soil, in 2 of the 5 samples. All other screened soil samples were detected at concentrations significantly below the RSL for industrial use soil.
- No PCBs were detected in any of the screened soil samples.
- Except for arsenic, discussed below, other RCRA metals (barium, cadmium, chromium, lead, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the RSL for industrial use soil.
- Arsenic concentrations up to 27 mg/kg were detected in the screened soil samples and averaged 10.9 mg/kg.

2.6 TPH-IMPACTED SOIL

2.6.1 Non-Screened Soil/Material Samples

TPH was detected in each of the 18 non-screened soil/material samples at concentrations ranging from 440 to 8,500 mg/kg, primarily in the C12 to C43 carbon ranges. The majority of the TPH detected was in the C23 to C36 range (see TRC Limited ESA, Table 1, Appendix B). The TPH detected in this range primarily represents oil-range organics. Gasoline-range organics (GRO) up to 39 mg/kg were detected in Trench Sample T1-5 and GRO up to 1.3 mg/kg were detected in Trenches 2 through 5. The GRO detected in Trench T1 may be associated with the 8,000-gallon, diesel underground storage tank, installed in 1975 by Alleluia Cushions and removed in 1989 by Petroleum Industry Consultants.

2.6.2 Screened Soil Samples (January 2014 Investigation)

Four soil samples, passing through the 3/8-inch screen were collected for laboratory testing. Two of the four samples were collected from the test pit, one sample from Trench 6, and one sample from Trench 7. The 3/8-inch and 1-inch screened soil samples were tested for organics by Sladden and found to contain approximately 0.2 and 0.6 percent organics, respectively.

TPH was detected in each of the four screened soil samples at concentrations up to 1,100 mg/kg. The majority of the TPH detected was in the C21 to C40 range (see Official Laboratory Reports in Appendix B). The TPH detected in this range primarily represents oil-range organics.

No gasoline-range organics were detected above the practical quantification limit of 1.0 mg/kg.

2.7 SOIL VAPOR MONITORING

Relatively small concentrations of methane, carbon dioxide, and VOC soil gas were measured using 4-gas and photoionization detectors (PID) during the TRC trench investigation and B&D Test Pit work. No methane soil gas exceeded 1 percent using the RKI Eagle 4-gas analyzer, and no lower explosive limit (LEL) gases were detected using the Mini Rae 4-gas analyzer during the Test Pit work within the excavation work area or within 1-3 inches of stockpiled waste material surface.

The minor methane values are consistent with the presence and age of the green waste and wood materials found in the solid waste area. The removal of the green waste and wood materials will further reduce the generation of methane to negligible amounts and therefore methane is not anticipated to be a concern after waste removal.

The LEA has performed site inspections and landfill gas monitoring of the soil gas probes located on the City-owned portion of the former Gage Avenue Dump which is located to the west and also on the Ramada Inn property to the north of the Site. No soil gas probes are located on the Comstock land parcel. No detectable sustained methane or significant soil gas concentrations have been reported by the LEA (CalRecycle, Inspection Reports, 2014).

2.8 CHEMICALS OF POTENTIAL CONCERN

The analysis of soils within the waste cell, identified pesticides (4-4’ DDD, 4-4’ DDT, dieldrin and endrin), arsenic, and lead in concentrations that exceed the recommended soil cleanup criteria presented in Table 6. Minor concentrations of VOC, SVOCs, PAHs, and other pesticides were detected at concentrations below the recommended soil cleanup criteria.

3.0 PROPOSED SOIL CLEANUP CRITERIA

The field sampling program during site remediation will include: 1) confirmation soil sampling within the excavation areas upon completion of waste material and cover soil removal, 2) stockpile sampling of excavated and screened soils, and 3) stabilization/solidification of metal affected soil for disposal at a Class III facility. The following sections provide specific sampling analysis methods, frequencies, and procedures. The Soil Sampling Plan provided in Appendix D describes

the decontamination procedures, sample handling, documentation, and the sample analysis program.

3.1 CONFIRMATION CHEMICAL ANALYSIS

All confirmation soil samples will be submitted to a California state-certified analytical laboratory for analysis. The excavation floor and sidewall soil samples will be analyzed for the following:

- Total petroleum hydrocarbons as gasoline (TPH-G) using EPA Method 8015M;
- Total petroleum hydrocarbons as diesel and motor oil (TPH-D/TPH-O), and carbon chain identification from C13 to C44 using EPA Method 8015M;
- VOCs using EPA Method 8260B/5035;
- SVOCs including polynuclear aromatic hydrocarbons using EPA Method 8270C;
- Organochlorine pesticides and PCBs using EPA Method 8081/8082; and
- Title 22 metals using EPA Method 6000/7000.

3.2 CONFIRMATION SAMPLING FREQUENCY

Confirmation sampling of the excavation floor and sidewall soils will be performed upon reaching the lateral and vertical limits of the waste pit or property boundary. Specifically, soil samples will be collected on 50-foot centers along the sidewalls and floor of the excavation to document the boundary conditions. All sampling will be performed in accordance with the sampling methods and criteria outlined in this section. The proposed soil sample locations are presented in Figure 5.

3.2.1 Excavation Floor Samples

Confirmation excavation floor samples will be collected on 50-foot centers along the floor of the excavation to document the native in-situ soil conditions. Additional excavation floor, subgrade soil sampling will occur at depths of 5 and 10 feet below the final excavation floor grade (approximately 25% to 30% of the total excavation floor samples) using a quasi-random sampling protocol where the excavation floor limits will be divided into smaller units or cells and one (1) random sample location will be selected for each cell. Figure 5 shows the cell locations (each cell is approximately 10,000 square feet) for the random sampling program. A Random Number Table will be used to generate one or more sets of two random two-digit integers for each cell. Each set of integers will be used to locate a random sample point within each cell using a simple x and y coordinate system with the origin at the northwest corner of the cell (e.g., integer set 25 05 would indicate a sample point located 25 feet east of the origin and then 5 feet south). Figure 5 shows the proposed excavation floor soil sample locations and excavation floor subgrade cell limits for random soil sampling.

3.2.2 Sidewall Samples

Soil samples will be collected on 50-foot lateral spacing's along designated sidewalls of the excavation to demonstrate the cleanup criteria has been achieved or document the boundary conditions. Since the waste area extends laterally west of the property boundary, no samples will

be collected of the waste debris along the western excavation sidewall. Figure 5 shows the proposed soil sidewall sample locations.

Sidewall Sample Methodology			
Description	Frequency	Depth (feet)	Sample Quantity
Northern	Each 50 lf	5 and 10 bgs	2 samples per each 50 lf
Eastern	Each 50 lf	Midpoint (half the vertical height of the sidewall)	1 sample per each 50 lf
Southern	Each 50 lf	Midpoint (half the vertical height of the sidewall)	1 sample per each 50 lf
Western	No samples	No samples	No samples

bgs - below ground surface, lf – linear feet

3.2.3 Backfill Soil Samples

No offsite backfill is anticipated to be imported to the Site. Onsite soils meeting the cleanup criteria may be used in the remedial excavation to attain a safe sidewall slope, level the excavation floor or cover landfill debris that extend offsite (e.g., western sidewall).

In the event that offsite backfill is required, clean soil from undeveloped sources not impacted by previous activities will be used. No soil will be imported to the Site absent prior approval from the RWQCB. The use of imported fill material will conform with the DTSC's Information Advisory for Clean Imported Fill Material.

3.3 RECOMMENDED SOIL CLEANUP CRITERIA

Recommended soil cleanup goals were developed as an element of the remedial action planning process. The numerical soil cleanup goals consider site-specific details such as:

- The depth to groundwater underlying the site; and
- The potential future use of the property.

The soil cleanup goals are intended to demonstrate that constituents of potential concern (COPCs) do not remain within the base or sidewalls of the excavation area at concentrations that could pose a potential threat to human health, groundwater, or ecological receptors. COPCs considered in this evaluation include those which were detected in samples of soil and/or landfill material during previous site investigation and characterization activities. The recommended soil cleanup criteria for the Site represent a combination of published soil screening levels (SSLs) and consider one or more of the following factors:

- Protection of human health;
- Protection of groundwater;
- Urban area ecotoxicity; and
- Background concentrations (for naturally-occurring metals and PAHs).

The objective of the proposed remediation activities is to restore the Site to a condition that allows for unrestricted use. Consequently, SSLs for protection of human health are based on residential standards. Appendix F provides a detailed description of the methodology and SSLs used to develop the recommended soil cleanup criteria. The recommended soil cleanup criteria are presented in the table below.

TABLE 6
RECOMMENDED SOIL CLEANUP CRITERIA

Chemicals of Potential Concern		**Recommend Soil Cleanup Criteria**	
		(mg/kg)	**Basis for Criteria**
Metals	Arsenic	12	Background
	Barium	750	Ecotoxicity
	Cadmium	6.9	Groundwater Protection
	Chromium	750	Ecotoxicity
	Lead	80	Human Health
	Mercury	0.33	Groundwater Protection
	Selenium	5.2	Groundwater Protection
	Silver	8	Groundwater Protection
Pesticides	4,4'-DDD	2.4	Human Health
	4,4'-DDE	1.7	Human Health
	4,4'-DDT	1.7	Human Health
	Dieldrin	0.0023	Groundwater Protection
	Endrin	0.00065	Groundwater Protection
Polychlorinated biphenyl (PCBs)	Total PCBs	0.22	Human Health
Polycyclic Aromatic Hydrocarbons (PAH)	Benzo(a)anthracene	2.4	Background
	Chrysene	24	Background
Volatile Organic Compounds (VOCs)	Benzene	0.044	Groundwater Protection
	Ethylbenzene	3.3	Groundwater Protection r
	Naphthalene	1.2	Groundwater Protection
	Toluene	2.9	Groundwater Protection

Chemicals of Potential Concern		Recommend Soil Cleanup Criteria (mg/kg)	Basis for Criteria
	1,2,4-Trimethylbenzene	0.21	Groundwater Protection
	Xylenes	2.3	Groundwater Protection r
Total Petroleum Hydrocarbons (TPH)[1]	TPH as Gasoline	500	Groundwater Protection
	TPH as Diesel	1,000	Groundwater Protection
	TPH as Motor oil	10,000	Groundwater Protection

Notes:
[1] The TPH soil cleanup criteria are derived from the Los Angeles RWQCB's *Interim Site Assessment and Cleanup Guidebook* (RWQCB, 1996) for TPH above drinking water aquifers. Groundwater at the Site is located at least 48 feet beneath the base of the landfill. The recommended TPH soil cleanup criteria for the Site are based on a minimum separation of between 20 and 150 feet between the source contamination and groundwater.

3.3.1 Excavation Floor Criteria

Excavation floor and native soils underlying the waste pit shall not exceed the recommended soil cleanup criteria as specified in the previous section (Table 6).

3.3.2 Sidewall Cleanup Criteria

The soil samples collected from the eastern and southern sidewalls, located at the property line will be used to document remediation cleanup/waste removal activity. Soil samples collected from the northern landfill limits/sidewall located within the property will conform to the cleanup criteria developed in this Plan. Soil samples collected from the northern sidewall that exceed the cleanup criteria will require further excavation and sampling until the cleanup criteria is achieved.

4.0 PROPOSED REMEDIATION ACTIVITIES

4.1 WASTE CONTENT AND VOLUME ESTIMATE

Based on the results of the Limited ESA, Test Pit Work/Summary, and the Supplemental Soil and Soil Vapor Sampling Plan:

- Large pieces of wood, trees, plastic, tires, and construction debris geotechnically and environmentally unsuitable for use as fill have been observed, primarily from a depth of approximately 5 to 25 feet bgs in the waste area; and
- Approximately 3 to 5 feet of soil was placed above the waste pile after disposal operations were discontinued in 1954.

The Plan envisions an estimated 193,326 cubic yards of waste material and cover soil may be

encountered, removed, and processed within the disposal pit area for export to permitted landfills or recycling facilities based on the estimated footprint (226,948 square feet) and average depth (23 feet bgs) of the waste area.

Based on available Site information, TRC estimates the composition of the material to be:

- 94,815 cubic yards (128,000 tons) of soil (treated, untreated, and non-RCRA) for offsite disposal.
- 98,511 cubic yards (65,000 tons) of screened waste including wood waste, green waste, glass, metal, rubber tires, plastic, paper, roofing shingles, small rocks, concrete and asphalt to be excavated and separated for offsite disposal or recycling.

The quantities cited are based on observations at a limited number of locations, thus actual quantities of the various materials may differ.

4.2 SEQUENCE OF WORK

The activities discussed in this section will be conducted to safely and effectively implement remedial action at the Site given the estimated volume and character of the waste, onsite location, and its present condition.

These activities constitute a remedial method that will remove cover soil, solid wastes, and inter-mixed soils which may pose a threat to public health and safety, and groundwater. Removal of soil wastes and associated soil will eliminate the need for post-remediation maintenance and prepare the Site for post-remediation residential use.

The tasks are based on the characterization information provided in Section 2 of this report. The contractor selected for work will be responsible for meeting the requirements of the HASP.
The Scope of Work for remedial action at the Site includes the following activities:

- Project Mobilization – Section 4.6
- Excavation and Sequencing – Section 4.7
- Material Sorting and Management – Section 4.9
- Waste Material Profiling and Disposal – Section 4.10
- Loading and Transportation – Section 4.11
- Confirmation Sampling – Section 3.2
- Final Grading and Drainage – Section 4.12
- Demobilization - Section 4.13

Further discussion of each of these activities is described in Subsections 4.3 through 4.12. Remediation monitoring activities are discussed in Section 5.0 and Figure 2 shows the property boundaries available for the contractor to use for remediation activities. The Site access road will

not be used for soil or material stockpiles.

4.3 METHODOLOGY FOR REMEDIAL ACTION

As previously discussed the existing material that makes up the disposal Site waste includes soil with elevated levels of TPH, metals, and pesticides. The remedial activities described in this Plan are designed to eliminate potential threats the waste may have on the surrounding environment and groundwater and include the following measures:

- All waste material, recyclable material, cover soil, and soils located within the waste cell will be removed, sorted, and segregated for offsite disposal and/or recycling;
- Excavation floor (in-situ) soil samples will be collected to characterize the final site conditions (see Section 3.2.1);
- Sub-grade excavation floor, random grid samples will be collected (5 & 10 foot depth intervals) below the excavation floor to verify the removal and/or leaching of potential chemicals of concern (see Section 3.2.1);
- Sidewall samples from the excavation will be collected to document final site conditions (see Section 3.2.2);
- Remediation limits and soil sample locations will be surveyed; and
- The excavation floor will be rolled using a compaction wheel at the completion of the work to reduce permeability, lower hydraulic conductivity, and reduce infiltration into the subsurface.

4.4 PERMITTING

The contractor will obtain all necessary permits prior to beginning work. These will include:

- A grading permit issued by the County of Los Angeles/City of Commerce;
- Application for coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (Construction General Permit [CGP] Order 2009-0009-DWQ) issued by the State Water Resources Control Board (SWRCB);
- Appropriate SCAQMD permits and plans; and
- Other required City of Commerce or Los Angeles County Permits.

4.5 SURVEYING

Prior to mobilization, a professional land surveyor (PLS) will prepare a limited topographical survey and establish control points using the appropriate City or County benchmark. The PLS will periodically visit the Site as the work progresses to survey remedial excavation limits and floor depth, or mark out and document other features at the conclusion of the remedial excavation. The surveyor may also layout the control points for the random sample grid locations.

The remediation field personnel will use a GPS unit with a minimum one meter level of accuracy to document soil confirmation sample locations or other features for final project reporting.

4.6 PROJECT MOBILIZATION

This activity includes mobilization of all personnel, equipment and supplies to the Site that are needed to perform the work described in this Plan.

The contractor will be responsible for providing its own project office or base of operations and will establish area(s) at the Site for processing of materials removed from the waste area, and stockpiling of various waste materials and soil. The exact location of the processing area(s) will be coordinated with the project manager to avoid conflict with neighboring businesses and property owners.

The contractor will provide sufficient heavy equipment for:

- Excavation of the waste;
- Onsite transportation of the excavated materials to the processing are;
- Material processing equipment to segregate soils from waste; and
- Delivery of solid waste materials to appropriately licensed disposal facilities.

The contractor will also protect existing facilities and utilities. Separation of the soils from the waste will be accomplished using:

- A Grizzly device for separation of trees, cobble, concrete, and other large waste; and
- Mechanized screen(s) for separation of soil and solid waste streams.

Water trucks will also be required for dust suppression across the site, and for adding moisture to the soil/material to prevent fugitive VOC, dust and noxious odor emissions.

4.7 EXCAVATION STAGING AND SEQUENCING

The contractor may begin excavation by removing of the top layer of soil, asphalt and concrete, etc. from the waste disposal area. Soil removed from this upper layer may be stockpiled for characterization for acceptance at a permitted disposal facility. If solid waste is encountered in this layer, it may be set aside for screening and disposal.

The excavated waste will be hauled to the processing area(s), where the waste materials will be processed directly or stockpiled to await processing and sorting. A water truck will be utilized to maintain dust control at the Site in the central processing area, material stockpiles, and haul routes. As the excavation progresses deeper into the waste area, ramp(s) may be built into the excavated area to allow access for equipment. Ramps may be extended and/or built in different locations throughout the excavation process to allow access and egress to all areas of the waste pit. The Site work will continue in this manner until a sufficient amount of buried waste and soil has been excavated from the waste pit and stockpiled in the central processing area. Subsequently, screening and sorting of the waste materials will begin. Excavation, screening, and material

sorting and management will occur simultaneously until all waste materials have been removed from the Site.

TRC field personnel, working under the direct supervision of a Professional Engineer or Geologist, will be present onsite at all times to observe and document the excavation process, and to visually inspect the buried materials as they are exposed.

Groundwater monitoring wells encountered during Plan activities will be properly decommissioned prior to the remedial work or during the work, if discovered during the remediation work. Groundwater monitoring wells discovered within the remediation limits will be decommissioned by over drilling to remove the well casing and annular materials. The borehole will then be filled from the bottom up in five foot increments using Portland cement hydrated with 5% bentonite gel.

4.8 UNKNOWN WASTES OR IMPACTS

If during excavation, heavily stained or oily material, or material with a strong hydrocarbon odor, is encountered, the contractor will be directed to place the material in a separate stockpile for characterization testing and offsite disposal.

In the event that a drum or container is discovered containing unknown waste content, the contractor will stop work in this area and notify the TRC field manager. The TRC field manager will perform the following:

- Visually assess the container from a safe distance;
- Evaluate atmospheric conditions in the work area/vicinity, using a PID and four gas meter;
- If the above conditions are determined to be safe, evaluate the container contents with a PID and four gas meter; and
- If all conditions are determined to be safe, isolate the container to a staging location and place it on plastic and cover pending environmental characterization testing for appropriate disposal.

If suspect asbestos containing material (ACM) or transite pipe is discovered, the material will be wetted with water and remain undisturbed until assessed by a California Certified Asbestos Consultant or contractor.

4.9 MATERIAL SORTING AND MANAGEMENT

4.9.1 Material Sorting Process

Mixed soil and waste materials will be transported from the waste pit to a central area(s) of the Site. A Grizzly device will used to remove oversized material (>12-inch diameter or length). Inert materials such as rock, concrete, or asphalt which are larger than 18 inches in diameter may be removed and stockpiled for processing and/or offsite disposal.

After removal of oversized materials, remaining materials will be processed through a series of

mechanized screen gradations onto a final screen opening, anticipated to between 1 and 3 inches for removal of remaining solid waste from the fine-grained materials.

4.9.2 Waste Segregation

All waste material streams recovered from the mechanized screening process will be stockpiled for appropriate offsite disposal, treatment, or recycling. Based on materials encountered during previous investigations, it is anticipated that waste debris to be disposed offsite will include various quantities of wood and green waste, treated wood, tires, plastic, metals, roof shingles, and other small quantities of material (glass, paper, etc.).

It is anticipated that stockpiles will be established for:

- Inert solid waste debris (pipe, cable, tire remnants, plastic, metal, glass, paper, non-treated wood, etc.);
- Nonhazardous soil;
- Treated soils (chemically stabilized/fixated with Portland cement);
- California hazardous waste soil; and
- Other categories deemed necessary based on compatibility, analytical testing, and permitted landfill acceptance requirements.

If any hazardous waste constituents, including contaminated soil, are discovered or suspected to be present based on visual observation during excavation, these materials will be segregated from the remainder of the excavated materials, profiled, recorded, manifested, and disposed of at an appropriate permitted landfill.

In the event containers are discovered with unknown contents, they will be segregated and stored based on physical characteristics and compatibility.

In particular, it is expected that selected areas of soil may contain elevated levels of TPH, metals, or pesticides and will likely be categorized as CalHaz waste. These materials will be segregated, profiled, and/or treated, then disposed at an appropriate disposal facility.

All cover soil, waste debris, and screened soils will be segregated and stockpiled in volumes not to exceed 1,000 cubic yards (cy) for chemical analysis, characterization, and/or offsite disposal. The sample collection shall be at a frequency of one sample per 1,000 cy. VOC-affected soils will be stockpiled in volumes not to exceed 200 cy and a total of no more than 1,000 cy of VOC-affected soil will be stockpiled onsite at any time.

4.9.3 Soil Treatment

The soils screened from the waste material and excavated soils will be placed in stockpiles no greater larger than 1,000 cy. Each stockpile will be sampled for total lead and other chemicals of concern (COC), pursuant to the disposal facility acceptance criteria. Soils containing elevated lead levels suitable for solidification/stabilization (fixation) will be treated onsite for disposal. Soil

fixation will be used to convert or stabilize soil containing soluble lead into a less soluble or non-mobile lead, suitable for disposal at a Class III facility. It is anticipated that a Portland cement and/or lime-fly ash binder/stabilizer and water process will be utilized to stabilize the lead-affected soil.

The contractor shall transport all processed materials offsite throughout the excavation and screening process to assure adequate land space necessary for the stockpiling of waste materials, and maintaining work performance and safety.

4.10 WASTE MATERIAL PROFILING AND DISPOSAL

As noted above cover soil, waste debris and screened soils will be segregated and stockpiled in volumes not to exceed 1,000 cubic yards (cy) for chemical analysis, characterization' and offsite disposal. The waste soil sample collection shall be at a frequency of one sample per 1,000 cy.

The following analytical methods are anticipated to be used as required for waste soil and/or material characterization:

- Total petroleum hydrocarbons as gasoline (TPH-G) using EPA Method 8015M;
- Total petroleum hydrocarbons as diesel and motor oil (TPH-D/TPH-O), carbon chain identification for C13 to C44 using EPA Method 8015M;
- VOCs using EPA Method 8260B/5035;
- SVOCs including polynuclear aromatic hydrocarbons using EPA Method 8270C;
- Organochlorine pesticides and PCBs using EPA Method 8081/8082;
- CAM 17 metals using EPA Method 6000/7000;
- Soluble threshold limit concentration (STLC); and
- Total Threshold Limit Concentration (TCLP).

Based on the results of waste profiling and classification, the waste materials will be transported to the appropriate permitted disposal facility.

Screened soil requiring onsite treatment will be treated and profiled for acceptance at a Class III disposal facility. Onsite treatment, transportation, and disposal activities will be performed in accordance with applicable Federal, State, and local laws, regulations, and ordinances. Excavated material will be shipped by a qualified (licensed/registered and insured) waste hauler in covered (tarp, hard top, etc.) end dump trailers or other appropriate container, under manifests or appropriate shipping documents to the disposal facility.

It is anticipated that the following waste material volumes and disposal facilities will be used for waste material and waste soil disposal:

Disposal Facility	Material	Tons	Cubic Yards
El Sobrante	Inert Waste Debris/Trash	65,000	98,511
Chiquita Canyon			
Chiquita Canyon	Non-Hazardous and Treated Non-Hazardous Soil	124,000	91,852
Simi Valley			
Azusa Land Reclamation			
South Yuma County	California Hazardous Soil (non-RCRA)	4,000	2,963

For the type of material, the disposal facility (ies), address (es), and contact information is provided as follows:

Inert Waste Debris/Trash

El Sobrante Landfill (owned by Waste Management, Inc.)
10910 Dawson Canyon Road
Corona, CA 92883
Phone: (951) 277-1740

Or

4.11 LOADING AND TRANSPORTATION

Tractor trailer end dumps and high side dumps, flatbed equipment trailer trucks, and other work vehicles exceeding 1 ton in weight will be utilized during this remediation project. Qualified transporters will be hired for hauling the excavated materials offsite. The hauling contractor(s) used to transport impacted material to the offsite disposal facilities will be fully licensed and permitted by the State of California and/or the EPA. Contractors shall comply with the County of Los Angeles Truck Route Ordinance and/or California Department of Transportation (Caltrans) approved truck routes.

Trucks used for the offsite transportation of materials will remain in the designated staging area(s) until called upon for loading by the remediation contractor. During loading, excessive noise, odor, and dust emissions will be minimized. Dust will be minimized by reducing the bucket height and drop distance of material during loading and by spraying material being loaded with water, if necessary.

All trucks will exit the Site through the decontamination staging area established near the exit gate. The staging area will contain equipment (brooms, brushes, scrappers, etc.) necessary to ensure all tires, truck trailers, dump beds, etc. are free of debris and loose materials prior to departure.

Haul trucks departing the Site will be visually inspected to ensure that no fluids are leaking, tires are clean, and material being hauled is six-inches below the dump trailer freeboard and properly secured and/or covered using tarps or other appropriate devices.

No haul truck will be allowed to depart the Site without the proper manifest or bill of lading.

The selected transporters will be licensed and insured for hauling the excavated soil/material. For transportation of hazardous wastes, the selected transporter will be a registered hazardous waste hauler. The remedial excavation contractor will verify that the selected transporter has a valid registration/license and insurance policy for transporting wastes offsite and verify that the transporter has not negligently released waste material/soil during transport.

The waste hauler will be required to have a contingency plan prepared to deal with the following conditions:

- When there are emergency situations (vehicle breakdown, accident, waste spill, waste leak, fire, explosion, etc.) during transportation of excavated materials/soil from the Site to the designated treatment/disposal facility;
- When the volumes of excavated soil change; or
- When waste characteristics change.

4.12 FINAL GRADING AND DRAINAGE

No backfilling of the remedial excavation with imported soil or material is proposed. Upon the completion of confirmation sampling, excavation floor soils may be graded or relocated to slope the remedial excavation sidewalls. Soils located outside of the landfill excavation limits may also be used in conjunction with the clean excavation floor soils to stabilize (buttress) the western sidewall.

A California PLS will survey the pre-remediation topography and final remediation floor depth and excavation sidewall limits.

The remedial excavation is proposed to remove all waste materials and soil up to the Veterans Memorial Park on the Site's western property line. The method used to stabilize the Veterans Memorial Park sidewall will be addressed in the Site grading plans.

A grading permit application, grading plan, and soils engineering/geology investigation report will be submitted to the County of Los Angeles, Department of Public Works, Land Development Division for the remediation work permit. The grading plan will include a rough finish grade and erosion control plan to facilitate subsequent future development of the Site. Temporary Best Management Practices (BMPs) will be implemented to comply with the General NPDES, Stormwater Construction General Permit. Silt fence or synthetic covers will remain in place to prevent erosion and sediment transport until final site stabilization and drainage control measures associated with the Site development are implemented. A copy of the grading plan and permit will be provided to the RWQCB and the LEA prior to the implementation of the remedial work.

4.13 DEMOBILIZATION

This activity includes final cleanup and removal of all equipment and materials from the Site after the remedial action is completed.

5.0 REMEDIATION MONITORING

5.1 SITE SECURITY PLAN

Site security will be controlled in accordance with the requirements of this security plan. During removal activities, security and facilities to protect work areas from unauthorized entry, vandalism, or theft will be maintained. Chain-link type fencing will be maintained along the perimeter of the

Site to prevent unauthorized entry to any work areas during working and nonworking hours. Gates will be locked at all times when Site personnel are not in attendance.

5.2 SITE ACCESS PLAN

Construction access to the Site will be through the existing gate located off Gage Avenue near the Ramada Inn. Construction traffic must utilize this point of access throughout the duration of the work. In general, the proposed remedial action incorporates the following Site access controls:

- Site will be enclosed by chain-link fencing at all times;
- Access to the Site will be limited to the existing gate located off Gage Avenue. The gate will be locked after work hours;
- Site access will be limited to authorized personnel;
- All personnel entering the Site will be required to have appropriate health and safety training and will sign the site-specific HASP each morning or upon entry;
- All visitors will be registered and must sign in upon entering the Site; and
- Access to the excavation and stockpile areas with exposed impacted soils will be restricted in accordance with the HASP.

Vehicles and equipment used in the handling of impacted soil will be decontaminated before leaving the Site.

5.3 TRAFFIC CONTROL

Traffic control measures will be implemented as needed during the performance of the remedial action. Traffic control for the Site will conform to the ordinances and regulations of the jurisdictional agency having authority over traffic control and will conform to the latest edition of the *Work Area Traffic Control Handbook (WATCH)*, 2006 (BNI Publications, 2006). The necessary permits for traffic control will be obtained.

Truck traffic will be regulated during hauling operations and as necessary to prevent haul trucks from stopping or parking along the paved portion of Gage Avenue leading to the Ramada Inn. Haul trucks will not be allowed to idle along the Site access road and a 5 mile per hour speed limit will be imposed to prevent dust.

5.4 HEALTH AND SAFETY

A Site Health & Safety Plan (HASP) has been prepared to address health and safety hazards, regulatory compliance, and specific tasks that will be performed. All employees, contractors and their subcontractors, and site visitors must read and understand the HASP before entering the work area. The HASP is presented in Appendix G of this Plan. Personal dust monitoring, and dust control requirements are discussed in Section 5.5 and 5.8 of this Plan.

The HASP outlines procedures to minimize the health risk from exposure to potentially harmful materials such as air-borne vapors, landfill gas and fugitive dust. The HASP focuses primarily on Site workers closest to the landfill debris and cover soil where the highest potential for exposure exists. By establishing strict health and safety requirements the health risks to workers or park users would also be conservatively mitigated. Potential exposure to hazards, as well as mitigation measures, will be communicated to Site workers as a component of planned site-specific health and safety training.

The HASP has been prepared under the supervision of a Certified Industrial Hygienist (CIH) who will assist in instituting recommendations to protect nearby workers and park users from potential health risks during remediation. The HASP describes the expected and potential chemical and physical hazards, health and safety training requirements, specific personal hygiene protocols, monitoring equipment, and personal protective equipment that will be used during remediation work.

Most Site workers will be operating or driving equipment and will not likely come in direct contact with the cover soils or landfill materials. For this reason, the potential for significant exposures are minimal. However, workers who may potentially come in contact with the landfilled materials or related contaminants will be required to wear appropriate personal protective equipment (PPE) in compliance with OSHA standards.

Monitoring for air-borne emissions such as landfill gas, vapors and dust that could potentially be released during the excavation and transport of landfill debris and cover material is another important component of the HASP. Landfill gas consists primarily of methane, carbon dioxide, and trace levels of volatile and semi-volatile organic compounds.

Methane and carbon dioxide are asphyxiants since they displace oxygen, and produce a hazardous oxygen-deficient atmosphere. These gasses are not considered to be carcinogenic. Methane also presents an explosion hazard if the concentration in air exceeds 5 percent by volume. Such concentrations would normally occur only in confined or enclosed spaces. Therefore, in addition to the air monitoring requirements for remediation workers, air measurements will also be performed at the Site boundary to ensure the health and safety of the nearby community.

5.5 SITE PERSONNEL MONITORING

Personal air sampling will be conducted to test for airborne contaminants during the performance of specific remediation tasks. The air sampling will be conducted at the beginning of the work during the excavation of waste material and soils, screening of waste material and soil, and other work, as deemed appropriate by the site safety officer. During each specific operation, representative crew members will wear battery powered sampling units, each outfitted with the sample filter collection media in the breathing zone. Representative air samples will be collected over an approximately eight hour work period for each crew member, and will be analyzed by a stationary laboratory for lead using the National Institute for Occupational Safety and Health (NIOSH) Test Method 7300 modified/ Occupational Safety and Health Administration (OSHA) ID-125G. Personal air monitoring laboratory analysis documentation will be included in final remediation report.

5.6 REGIONAL CLIMATE AND WIND FLOW PATTERNS

The site is situated in a Mediterranean climate zone, experiencing mild winters and warm to hot dry summers.

The prevailing wind directions during the dry season/summer months are predominantly from the west/southwest and are related to onshore flows. In winter the winds are more variable and include onshore winds from the west as well as strong winds from the southeast and north northwest (Los Angeles Airport).

5.7 ODOR CONTROL PLAN

The Odor Control Plan will identify potential odor and VOC emission sources and receptors, monitoring methods, provide worker protection criteria, and provide mitigation methods. This Plan anticipates a Site Specific Rule 1150 Excavation Permit/Rule 1166 Contaminated Soil Mitigation Plan (Excavation Plan) will apply to Site activities.

This Excavation Plan is required:

- Prior to commencing excavation of any landfill where refuse may be exposed to the atmosphere;
- Where an underground storage tank or transfer piping was used to store or transfer VOCs; and
- During excavation, handling and storage of VOC contaminated soils.

Minimum requirements for the Excavation Plan are as follows:

- Monitoring of wind direction and speed;
- Maintain moisture of excavated material and road surfaces to minimize dust and emissions;
- Removal of loose material from haul truck exteriors;
- Cover waste material in haul truck dump beds to prevent spillage;
- Cover inactive stockpiles to minimize dust and emissions;
- Description of mitigation measures for dust, odors, and VOCs; and
- Description of monitoring equipment and techniques.

5.8 DUST CONTROL AND TESTING

Contractor will comply with SCAQMD dust and odor control requirements contained in Rules 402, 403 and 1150. This Plan serves as the Excavation Management Plan and will be submitted to the SCAQMD for approval. The Plan will be available onsite throughout the remedial action.

The SCAQMD requirements for an Excavation Management Plan include the following:

- Provide information regarding the quantity and characteristics of the material to be

excavated and transported (see Sections 2.0 and 4.0);

- Identify mitigation measures to be activated as necessary to ensure a public nuisance condition does not occur (see remainder of Section 5.0); and
- Provisions for immediate cessation of excavation activities when the operator is notified by the Executive Officer that a public nuisance has occurred (see Section 5.8.1).

5.8.1 Dust Control Supervisor

Contractor will designate an onsite Dust Control Supervisor who has successfully completed the SCAQMD Fugitive Dust Control Class and a 3 hour training class on dust control planning. The Dust Control Supervisor will call for immediate cessation of excavation if a public nuisance has occurred or if notified to do so by the SCAQMD Executive Officer.

5.8.2 Best Available Control Measures

Best Available Control Measures to be employed by the Contractor to minimize visible emissions, public nuisances, and fugitive dust will include but not be limited to:

1. **Clearing and Grubbing**: Maintain stability of soil through pre-watering of Site prior, during, and immediately after clearing and grubbing. Maintain perennial vegetation where possible. Apply water in sufficient quantity to prevent dust plumes.
2. **Cut and Fill**: Pre-water soil prior to cut and fill activities, and stabilize soil during and after cut and fill activities. Using water trucks/pulls or sprinklers, pre-water soil then allow time for penetration to depth of subsequent cut.
3. **Disturbed Soil**: Stabilize disturbed soil throughout the construction Site. Limit vehicular traffic and disturbances on soils, where possible. Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
4. **Earth-Moving**: Pre-apply water to depth of proposed cuts, and re-apply water as necessary to maintain soils in a damp condition and ensure that visible emissions do not exceed 100 feet in any direction or extend offsite. Stabilize soils once earth-moving activities are complete. Consider use of upwind fencing to prevent material movement onsite.
5. **Truck Loading and importing/exporting of bulk materials**: Empty loader bucket close to the truck, and in such a manner that no visible dust plumes are created. Stabilize material while loading, transporting, and unloading to reduce fugitive dust emissions. Maintain at least 6 inches of freeboard on haul vehicles. Comply with Vehicle Code Section 23114. Use tarps or other suitable enclosures on haul trucks. Check belly-dump seals and remove rocks to prevent spillage. Comply with track-out prevention/mitigation requirements. Use water while loading and unloading to reduce visible dust plumes.
6. **Screening**: Pre-water material prior to screening. Limit fugitive dust emissions to opacity and plume length standards. Stabilize material immediately after screening. Dedicate water truck or high capacity hose to screening operation. Drop material through screen slowly and minimize drop height.
7. **Crushing**: Stabilize surface soils prior to operation of support equipment, follow permit

conditions for crushing equipment, pre-water material prior to loading in crusher, monitor emissions, and stabilize and water material after crushing.

8. **Staging Areas**: Stabilize staging areas during use, and at project completion.
9. **Stockpiles/Bulk Material Handing**: Stabilize stockpiled materials, and add or remove materials from the downwind portion of the storage pile. Stockpiles within 100 feet of offsite occupied buildings must: (1) not be greater than 8 feet in height, or (2) have a road bladed to the top to allow water truck access, or (3) have an operational water irrigation system that is capable of complete stockpile coverage. Avoid steep sides or faces on storage piles.

5.8.3 Large Scale Operations

If the project qualifies as a Large Operation (>5,000 cubic yards of material moved per day, for 3 or more days), a Large Operation Notification (Form 403) will be filed with the Executive Officer (SCAQMD) within 7 days of qualifying as a large operation. In addition to the abovementioned measure, the following dust control measures will be employed for large operations:

1. Earth moving, construction fill areas: Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method D-1557 or other equivalent method approved by the Executive Officer and the California Air Resources Board and the U.S. EPA, complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first 3 hours of active operations during a calendar day, and two such evaluations during each subsequent 4-hour period of active operations.

2. Earth moving, construction cut areas: Conduct watering as necessary to prevent visible emissions from extending more than 100 feet beyond the active cut or mining area unless the area is inaccessible to watering vehicles due to slope conditions or other safety factors.

3. Disturbed surface areas, except completed grading areas:
   a) Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface.
   b) Any areas which cannot be stabilized, as evidenced by wind-driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.

4. Completed grading, disturbed surface areas: Apply chemical stabilizers within 5 working days of grading completion; or take actions specified for inactive disturbed surface areas.

5. Inactive disturbed surface areas:
   a) Apply water to at least 80 percent of all inactive disturbed surface areas on a daily

basis when there is evidence of wind-driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; OR

b) Apply dust suppressants if sufficient quantity and frequency to maintain a stabilized surface; OR

c) Establish a vegetative ground cover within 21 days after active operations have ceased.

Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; OR

d) Utilize any combination of control actions (a), (b), and (c) such that, in total, these actions apply to all inactive disturbed surface areas.

6. Unpaved Roads:
   a) Water all roads used for any vehicular traffic at least once per every 2 hours of active operations (3 times per normal 8 hour work day); OR
   b) Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR
   c) Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.
7. Open storage piles:
   a) Apply chemical stabilizers; OR
   b) Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind-driven fugitive dust; OR
   c) Install temporary coverings; OR
   d) Install a three-sided enclosure with walls with no more than 50 percent porosity which extends, at a minimum, to the top of the pile.
8. General, all categories: Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified above may be used.

5.8.4 PM_{10} Fugitive Dust Monitoring

During the remedial excavation real time dust and particulate monitoring will be conducted. Dust monitoring will be performed on a daily basis along the waste excavation perimeter near areas where the potential for generation of dust is highest. Air monitoring stations will also be positioned upwind and downwind near applicable property boundaries.

Testing for Fugitive Dust control will be conducted to document that the difference between PM_{10} levels, and particulate matter with an aerodynamic diameter smaller than or equal to 10 microns (as measured by the applicable State and Federal reference standard) of simultaneous upwind and downwind monitors, do not exceed 50 micrograms per cubic meter.

Equipment

Real-time particulate monitoring will be performed using a combination of four MIE Model pDR-1000, personal/DataRAMs, or similar device. One pDR-1000 will be placed upwind and two pDR-1000 units will be placed downwind near the site perimeter. Instrument height will be approximately 4 feet above the ground surface. The locations of the dust monitors will be adjusted throughout the day when needed based upon prevailing wind direction as indicated by a weather vane installed at the site, weather station readings, or a hand-held wind speed meter. The fourth pDR-1000 unit will be a "roving" unit to be placed adjacent to the active excavation or dust generating activity and moved frequently throughout the day to identify potential dust issues before registering at the Site perimeter. The monitors will provide instantaneous and time-weighted average (TWA) concentrations of particulate matter in the size of 10 microns or less (PM_{10}).

At approximately 2-hour intervals during each day of operation, the technician will record the "instantaneous" (10-second) concentration displayed by each monitor. The technician will also document the activities or conditions that could potentially lead to elevated dust concentrations. Each unit will be set to record PM_{10} readings every 10 minutes during the hours of excavation operation. If practical, the data stored by each unit will be downloaded to a computer at the end of the day and printed out as a daily record (or at a minimum, the end of each work week).

PM_{10} fugitive dust monitoring will be performed by the contractor each day.

5.9 Documentation Activities

All stages of remediation shall be documented to provide evidence of satisfactory work performance. The information shall be recorded on a standardized form or in a bound field logbook.

Daily recordkeeping will be performed by the TRC Superintendent or field representative to record remedial excavation activities, including results of visual observations, laboratory/field test data, sampling, repairs, problems, solutions, and general field activity.

The daily field inspection reports (if necessary) shall be reviewed by the Engineer or Project Manager/Director for submittal to the Owner. One complete set of the daily reports shall be kept onsite by TRC personnel at all times. The contractor will be notified of the test results so that corrective action can be taken and retests completed.

6.0 REMEDIATION COMPLETION REPORT

Following completion of remedial activities, a final report for the eastern portion of the landfill will be prepared by the project geologist or engineer, documenting the removal of all waste materials from this area. The report shall include a description of field activities, figures, tables, official laboratory test results, manifests, and discuss typical removal conditions and procedures.

The report will be stamped by the professional civil engineer or professional geologist, and then submitted for approval to the RWQCB and the Local Enforcement Agency.

7.0 POST REMEDIATION MAINTENANCE ACTIVITIES

Since this remedial activity removes potential threats to water quality, post-maintenance activities for this Site are not planned.

8.0 SCHEDULE

Comstock intends to authorize mobilization for remediation activities upon receiving approval of this Plan by the RWQCB, upon receipt of any other permits or authorizations from the City of Commerce or other jurisdictional agencies and absent objections from the LEA. Construction activities are anticipated to be completed 6 months after providing the Contractor with a Notice to Proceed.

RE: LIMITED ENVIRONMENTAL SITE ASSESSMENT
FORMER GAGE AVENUE LANDFILL
7316 EAST GAGE AVENUE
COMMERCE, CALIFORNIA

Dear Mr. Comstock:

TRC is pleased to submit this report summarizing the findings of a limited environmental site assessment for the Former Gage Avenue Landfill property located at 7316 East Gage Avenue in Commerce, California.

If you have any questions regarding this report, please call me at (949) 341-7458.

Sincerely,

TRC

David Lennon
Principal Consultant

C Official Laboratory Reports and Chain of Custody Records

1.0 INTRODUCTION AND OBJECTIVE

This report presents the results of limited environmental site assessment activities conducted at 7316 East Gage Avenue, Commerce, California (the Site [see Figure 1]). The objective of these activities was to excavate five test trenches to verify the landfill material floor depth and collect soil samples for environmental testing. Figure 2 shows the five test trench locations.

This scope of work was conducted in accordance with TRC's Cost Estimate for Phase II Environmental Site Assessment dated April 25, 2013.

2.0 SITE DESCRIPTION

The Site consists of approximately 7.92 acres of vacant land with no structures in a mixed commercial/industrial area and is identified by the Los Angeles County Office of the Assessor as Parcel Number 6357-018-005. The property is bounded to the north by the Southern Pacific Railroad main line and right-of-way, to the east by Interstate 5 freeway, to the south by the Rio Hondo percolation basin/flood control channel and to the west by the Veteran's Memorial Park.

3.0 SITE HISTORY

From approximately 1950 to 1954, the Site was reportedly operating as the Gage Avenue Landfill, accepting municipal solid wastes, construction debris and inert fill materials. The Gage Avenue Landfill is identified in the California Solid Waste Information System (SWIS) database as facility No. 19-AA-5543. In 1958, an approximately 52,160 square-foot rectangular commercial building and railroad spur was constructed over the landfill material at the Site. The commercial building was declared unsafe by the County of Los Angeles Fire Department in February 1991 due to settling of the ground surface beneath the pile supported building structure and was demolished in 1992. The Site is currently vacant undeveloped land partially covered with asphalt.

4.0 GEOLOGY AND HYDROGEOLOGY

The Site situated at an elevation of approximately 151 feet relative to mean sea level (msl) with the surface elevation sloping gently towards the south. Depth to groundwater at the Site is estimated to be approximately 90 feet below grade (fbg) based on historical groundwater monitoring events conducted at 7825 Telegraph Road (GeoTracker, 2013). The Site is centrally situated at the southern edge of the Montebello Plain physiographic feature within the Coastal Plain of the Los Angeles Basin. According to published geologic maps and cross sections (CDWR, 1961), the Site overlies late Pleistocene-age sediments of the Lakewood formation. The Lakewood formation is described as being sedimentary in origin and consists of marine and continental gravel, sand, silty sand, silt, and clays. The Site lies within the Central Groundwater Basin, a subdivision of the Coastal Plain of Los Angeles County east and northeast of the Newport-Inglewood uplift. Local hydrostratigraphic features (from shallowest to deepest) include the Bellflower aquiclude, Exposition aquifer and Gage aquifer within the Lakewood

formation. Deeper hydrostratigraphic features of the underlying San Pedro formation include the Hollydale aquifer, Lynwood aquifer, Silverado aquifer, and Sunnyside aquifer. The aquifers of the Central Groundwater Basin are generally separated by low-permeability aquitards that limit vertical groundwater conductance between aquifers (CDWR, 1961).

5.0 PREVIOUS ENVIRONMENTAL ACTIVITIES

An 8,000 gallon diesel underground storage tank (UST) was installed at the Site in 1975 and removed in 1989. During UST removal, petroleum hydrocarbon contaminated soil was discovered in soil samples collected from within the former tank cavity. The California Regional Water Quality Control Board, Los Angeles Region, issued a regulatory case closure letter for this case on March 10, 1998.

A geotechnical investigation for Dynamics Builders was conducted in 2004. Ten soil borings were advanced to a maximum depth of 80.5 fbg indicating landfill cell debris up to 29 feet in depth. The 2004 effort subsequently advanced 173 supplemental borings, using a 40-foot grid pattern to further evaluate landfill cell thickness across the Site. During the supplemental investigation, an "oil contamination smell" was observed in Soil Boring 79. A copy of the 2004 Geotechnical Investigation Report is included in Appendix A.

6.0 ASSESSMENT ACTIVITIES

6.1 PRE-FIELD

Prior to conducting assessment activities:

- A site health and safety plan was prepared.
- The proposed trenching locations were staked and the property boundaries marked with white spray paint prior to Underground Service Alert (USA) notification. The owners of underground utilities in the area were notified by USA, and the utilities present at the property boundaries were marked.

6.2 TRENCH INVESTIGATION

On May 8, 2013, five trench locations (T1 through T5) were excavated throughout the Site to estimate the landfill cell floor depth, estimate the quantity of landfilled material in relation to soil within the cell, and to obtain soil samples for environmental testing. Figure 2 shows the approximate locations of the five test trenches. The surface dimensions of the five trenches were approximately 5 feet by 20 feet. The depth of the trenches ranged from approximately 19 to 23 fbg. Gray, fine-grained sand was encountered in the underlying soil at the bottom of each test trench. Groundwater was not encountered in any of the test trenches. A copy of the trench logs is provided in Appendix B.

6.3 SOIL SAMPLING AND ANAYSIS

Field-composited, landfill-derived soil samples were collected from the following depth intervals:

- 0 to 5 fbg (1, 2, 3, 4 & 5 foot depth intervals);
- 5 to 10 fbg (6, 7, 8, 9 & 10 foot intervals from the excavator bucket);
- 10 to 15 fbg (11, 12, 13, 14 & 15 foot intervals from the excavator bucket); and
- 15 to 20+ fbg (1 foot intervals starting at 16 fbg).

Two non-composited soil samples were collected of the material underlying the landfill cell floor at 18 and 23 fbg, approximately 1 foot below the cell floor. Soil samples T4-18 and T2-23 were collected from gray, fine-grained sand underlying the landfilled materials.

Soil gas was measured prior to and during trench excavation. A four-gas meter was utilized to measure methane, hydrogen sulfide, carbon dioxide and percentage of oxygen. A photoionization detector (PID) was used to measure volatile organic compounds (VOCs). Soil gases in ambient air were not detected prior to trench excavation. Methane concentrations up to 590 parts per million (ppm) and carbon dioxide up to 1,000 ppm were measured in the stockpiled material following excavation. VOCs were measured in Trench T1 at 4 fbg, up to 52 ppm.

A total of 22 soil samples were submitted to BC Laboratories, Inc. in Bakersfield, California for chemical analysis. Twenty soil samples (four samples per trench) were analyzed for total petroleum hydrocarbons as gasoline (TPH-G) by California LUFT, and TPH carbon chain (TPH-cc) by EPA Method 8015, VOCs by EPA Method 8260B, semi-volatile organic compounds (SVOCs) by EPA Method 8270C, organo-chlorine pesticides and polychlorinated biphenyls (PCBs) by EPA Method 8080 and Title 17 metals by EPA Methods 6010B/7000.

6.4 BACKFILLING

Excavated materials were placed back into the respective trench and tamped into place with the excavator bucket.

7.0 FINDINGS

A select summary of the results of laboratory analysis of soil samples collected is presented below. For all analyzed chemicals, refer to the Official Laboratory Report in Appendix C.

- Total petroleum hydrocarbons (C8 to C44) were detected in 19 of the 20 soil samples ranging from 440 to 8,500 milligrams per kilogram (mg/kg). Composited soil samples T1-5 and T4-15 reported TPH concentrations of 8,500 and 8,000 mg/kg, respectively. The majority of the hydrocarbons detected were within the oil range (C21 to C43).

- TPH-G (C4-C12) was detected in 15 of the 20 soil samples at concentrations ranging from 0.24J mg/kg to 39 mg/kg. Soil sample T1-5 collected from Trench 1 was reported with the highest concentration of 39 mg/kg.

- VOCs were detected at concentrations less than 1.0 mg/kg in 17 of the 20 soil samples. No detectable concentrations of tetrachloroethylene (PCE) or trichloroethylene (TCE) were detected in any of the soil samples. See Table 2.

VOCs were detected at concentrations less than 1.0 mg/kg in 17 of the 20 soil samples. No detectable concentrations of tetrachloroethylene (PCE) or trichloroethylene (TCE) were detected in any of the soil samples. See Table 2.

- SVOCs were detected in 6 of the 20 samples. Concentrations of bis(2-ethylhexyl)phthalate up to 11 mg/kg were detected in sample T1-5. Concentrations of fluorene, 2-methylnaphthalene, naphthalene, phenanthrene and pyrene were detected in soil sample T4-18. No detectable concentrations of polycyclic aromatic hydrocarbons (PAHs) were detected in the 19 other soil samples.

- Pesticides were detected in 13 of 20 soil samples. The compounds and their maximum concentrations are as follows: 4,4´-DDD (28 mg/kg), 4,4´-DDE (1.1 mg/kg), 4,4´-DDT (7.8 mg/kg), dieldrin (9.6 mg/kg), and endrin (0.59 mg/kg). The regional screening levels (RSLs) for pesticides in industrial soil were exceeded for 4,4´-DDD, 4,4´-DDT and dieldrin. See Table 4 the Summary of Organo-Chlorine Pesticides in Soil.

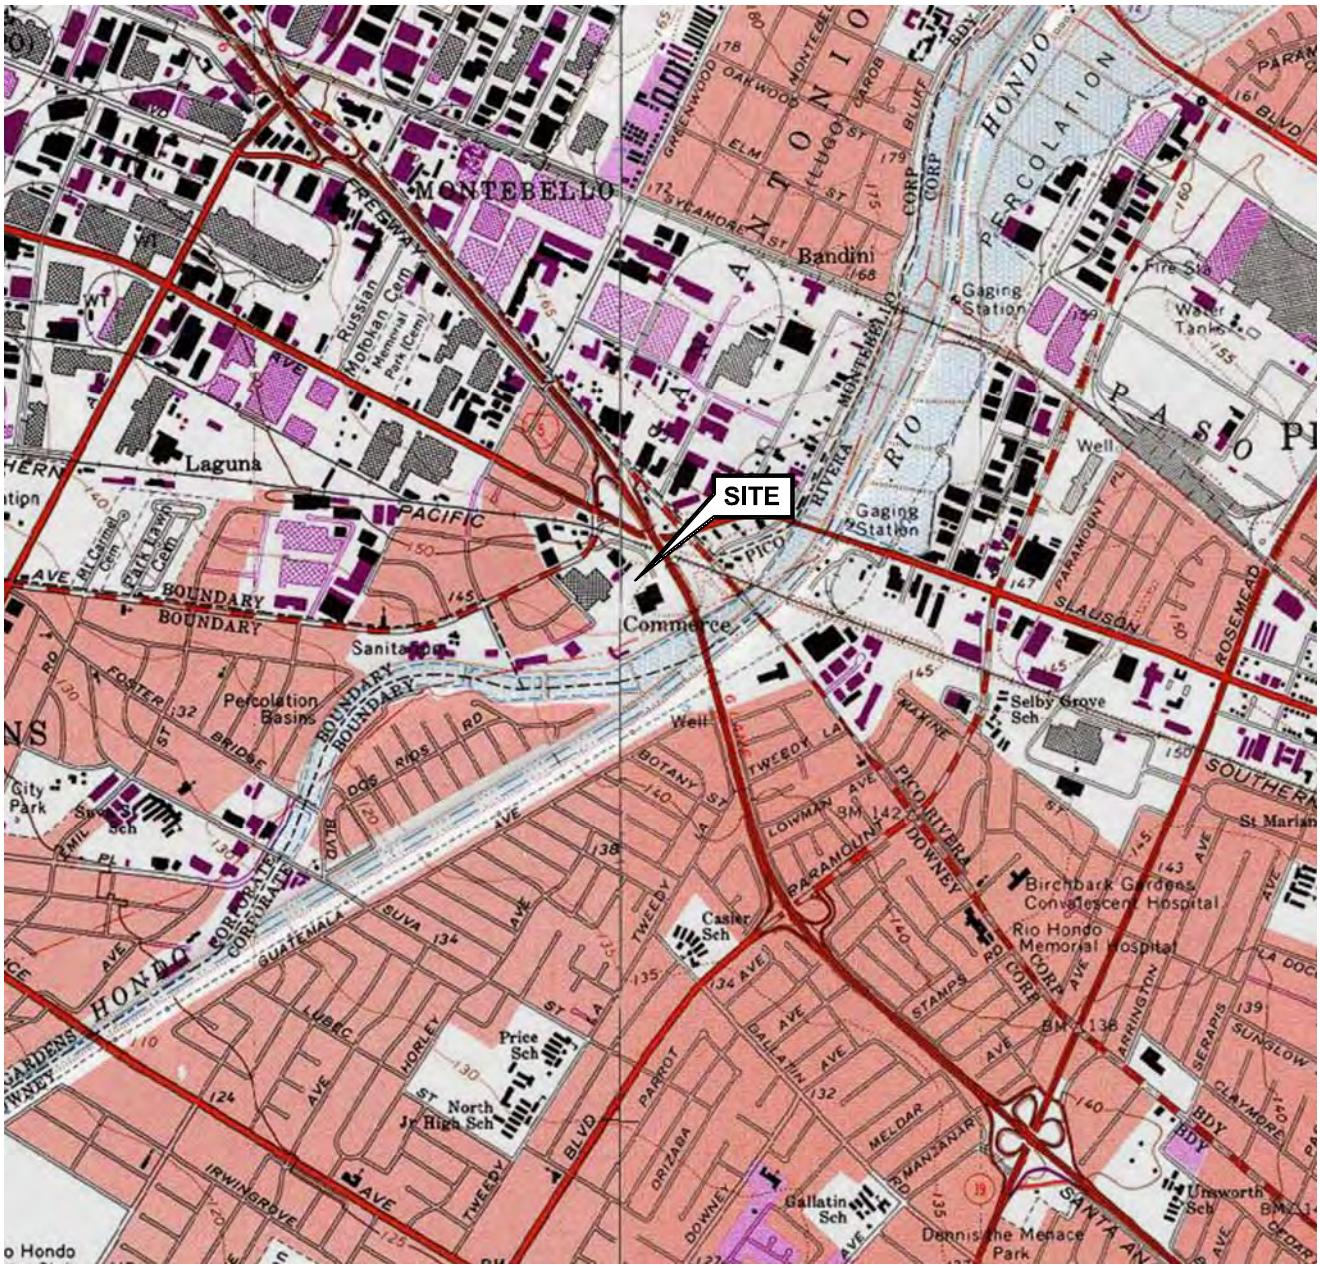
- PCBs were detected in 1 of the 20 soil samples. Soil sample T2-5 had a PCB-1260 concentration of 0.47 mg/kg.
- Total lead was detected in each of the 20 soil samples collected at concentrations ranging from 1.8J to 1,400 mg/kg. The RSL for lead in industrial soil (800 mg/kg) was exceeded in 6 of the 20 soil samples. See Table 5 for a summary of laboratory results.
- Total arsenic was detected in each of the 20 soil samples collected at concentrations ranging from 1.6 to 23 mg/kg. The RSL for arsenic in industrial soil (1.6 mg/kg) was exceeded in each of the 20 soil samples. These arsenic concentrations appear to be consistent with typical background concentrations for soils. See Table 5 for a summary of laboratory results.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The soil and/or fine grained material samples collected from the five trench excavations identified petroleum hydrocarbons, lead, and other organic chemical impacts at the Site. The chemicals identified in the samples were consistent with the anticipated impacts to the Site soil

and with the proposed closure plan for the Site. The landfill debris identified in each of the five trench excavation locations consisted primarily of wood, asphaltic building material, tire rubber, plastic, paper, green waste and metal. The debris profile is also consistent with the proposed closure plan for the Site. It is anticipated that a majority of the site soil will meet the site cleanup goals and will be available for reuse as backfill material for the Site.

Some concentrations of the detected chemical constituents exceed the EPA Region IX, Remedial Screening Levels for industrial sites. Therefore, it is anticipated that a limited amount of the chemical impacted soil will require offsite disposal. This soil will be either directly disposed of offsite in a Class III landfill or treated onsite prior to offsite disposal at Class III landfill. The offsite disposal of a limited amount of chemically impacted soil is consistent with the proposed landfill closure plan.



TRC recommends the land fill closure work plan submittal process commence. The work plan process is administered by the State of California Water Resources Control Board (SWRCB) and includes specific regulatory required steps to complete the closure of the landfill in accordance to California Code of Regulations, Title 27. The first step in the work plan process is to determine the future use of the site and identify the limits of the landfill that will be closed. The timeline for preparing and submitting the work plan is 15 business days after the completion of the field investigation, and the expected work plan approval by the SWRCB occurs approximately 60 - 90 days thereafter.

APPENDIX A

2004 GEOTECHNICAL INVESTIGATION REPORT

GEOTECHNICAL INVESTIGATION

PROPOSED INDUSTRIAL DEVELOPMENT

7316 EAST GAGE AVENUE

CITY OF COMMERCE, CALIFORNIA

Presented herewith is the report of our Geotechnical Investigation conducted at the site of the proposed industrial development located at 7316 East Gage Avenue in the City of Commerce, California. The investigation was performed in order to provide recommendations for site preparation and to assist in building foundation design.

This report presents the results of our field investigation and laboratory testing along with conclusions and recommendations for foundation design and site preparation. This report completes our agreed upon scope of services as understood in our proposal dated August 25, 2004.

We appreciate the opportunity to provide service to you on this project. If you have any questions regarding this report, our the recommendations provided herein, please contact the undersigned

APPENDIX C - 1997 UBC Seismic Design Criteria

INTRODUCTION

This report presents the results of our Geotechnical Investigation performed in order to provide recommendations for remedial site grading and to assist in the design and construction of the foundations for the proposed industrial buildings and the associated site improvements. The project site is located at 7316 East Gage Avenue in the City of Los Angeles, California. The proposed project consists of one or more industrial buildings along with various related site improvements. The associated site improvements will include paved parking areas and driveways, various underground utilities, and landscape areas.

SCOPE OF WORK

The purpose of our investigation was to determine certain engineering characteristics of the near surface soils on the site in order to develop recommendations for foundation design and site preparation. Our investigation included field exploration, laboratory testing, engineering analysis and the preparation of this report. Evaluation of environmental issues or hazardous wastes was not within the scope of services provided. Our investigation was performed in accordance with contemporary geotechnical engineering principles and practice. We make no other warranty, either express or implied.

PROJECT DESCRIPTION

The project site is located at 7316 East Gage Avenue in the City of Commerce, California. The preliminary plans indicate that the proposed development will include one or more industrial buildings along with various associated site improvements. It is our assumption that the proposed buildings will be of relatively lightweight concrete tilt-up, steel-frame or reinforced masonry construction and will be supported by conventional shallow spread footings and concrete slabs on grade. The associated site improvements will include paved parking areas and driveways along with various underground utilities.

At the time of our investigation, the project site was vacant and the ground surface was either paved or covered with base material. The site is identified as the former Gage landfill in several previous reports provided for our review. A review of previous geotechnical reports confirms the existence of extensive buried debris and artificial fills consistent with the previous landfill use.

The current surface of the site is relatively level overall and the property is near the elevation of the adjacent properties and streets. The Santa Ana Freeway corridor forms the eastern edge of the property. There is an existing ballfield directly west of the site and a hotel just north of the subject site

It is our assumption that the proposed industrial buildings will be of relatively lightweight steel-frame, concrete tilt-up or reinforced masonry construction and will be supported by conventional shallow spread footings and concrete slabs on grade. Based upon our previous experience with similar structures, we assume that the column loads will be less than 80 kips and wall loading will be less than 5.0 kips per linear foot. If the actual design loads exceed these assumed loads, the recommendations included in this report should be reviewed with respect to the increased loading and the adequacy should be verified.

SOIL CONDITIONS

The site is underlain primarily by extensive amounts of buried debris and artificial fill material overlying native silty sands, sandy silts and fine to coarse-grained alluvial sands with gravel. Artificial fill depths of up to 30 feet below existing grade were encountered within the areas of our exploratory borings dependent upon location. The artificial fill soils were comprised primarily of various types of debris consistent with the previous landfill use. The artificial fill soils and debris appeared very loose and highly compressible within each of our borings. The underlying native soils also appeared somewhat loose within the upper 5 to 10 feet within several of our borings but appeared firm below a depth of 10 feet.

The deeper native soils consisted primarily of sandy silts, silty sands and fine to coarse-grained alluvial sands with gravel. In general, the deeper native soils appear quite firm and sampler penetration resistance (as measured by field blowcounts) suggests that density within the native soils generally increases with depth. The near surface artificial fill soils and the underlying native soils were found to be moist throughout the depth of our exploratory borings. Laboratory testing indicated moisture content varying from 2 to 30 percent.

Laboratory classification testing indicates that the near surface artificial fills and native soils consist primarily of silty sands and sandy silts. Expansion testing indicates that the near surface soils are moderately expansive and fall within the "low" expansion category in accordance with the Uniform Building Code (UBC) classification system. Consolidation testing indicates that the deeper native soils are susceptible to only minor consolidation or compression related settlements as a result of the increased loading associated with engineered fills as well as the new building foundations.

Groundwater was not encountered within our exploratory borings that extended to a maximum depth of approximately 80 feet below the existing ground surface. Groundwater should not be a factor in foundation design or construction.

CONCLUSIONS AND RECOMMENDATIONS

Based upon our field and laboratory investigation, it is our opinion that the proposed industrial development is feasible from a soil mechanic's standpoint provided that the recommendations included in this report are considered in building foundation design and site preparation. Due to the presence of extensive amounts of artificial fill soils and debris throughout the site, extensive remedial grading is recommended for the proposed building areas. We recommend that remedial grading within the proposed building areas include complete removal and recompaction of the artificial fill soils, debris and any loose native soils encountered in order to provide uniform compacted soils beneath the building foundations. Specific recommendations for site preparation are presented in the Site Grading section of this report.

Groundwater was not encountered within our borings that extended to a maximum depth of 51 feet below the existing ground surface. Due to the depth to groundwater, specific liquefaction analyses were not performed. Based upon the depth to groundwater, the potential for liquefaction and the related surficial affects of liquefaction impacting the site are considered negligible.

The site is located within a seismically active area of Southern California and strong ground shaking resulting from seismic events on prominent faults in the region will likely impact the site during the expected lifetime of the project. As a minimum, the building addition should be designed in accordance with Uniform Building Code criteria for Seismic Zone 4. Pertinent seismic design criteria as described in the 1997 UBC are summarized in Appendix C.

Caving did occur within each of our borings and the site soils may be susceptible to caving within deeper excavations. All excavations should be constructed in accordance with the normal CalOSHA excavation criteria.

The surface soils encountered during our investigation were found to be moderately expansive. Laboratory testing indicated Expansion Indices of 21 and 32 for the near surface soils which correspond with the "low" expansion category in accordance with 1997 UBC Table 18-I-B.

The following recommendations present more detailed design criteria that have been developed on the basis of our field investigation and laboratory testing.

Foundation Design: The results of our investigation indicate that either conventional shallow continuous footings or isolated pad footings, that are supported upon properly compacted fill soils, may be expected to provide satisfactory support for the proposed new structure foundations. Proper demolition along with complete artificial fill removal and recompaction should be performed as recommended in the Site Preparation section of this report.

Exterior footings should extend at least 18 inches beneath lowest adjacent grade and interior footings should extend at least 12 inches below slab subgrade. Isolated square or rectangular footings at least 2 feet square and continuous footings at least 12 inches wide may be designed using an allowable bearing pressure of 2000 pounds per square foot. The allowable bearing pressure may be increased by approximately 250 psf for each additional 1 foot of width and 250 psf for each additional 6 inches of depth. The maximum allowable bearing pressure should be limited to 3000 psf unless confirmed subsequent to performing specific settlement calculations. The allowable bearing pressures are for dead and frequently applied live loads and may be increased by 1/3 to resist wind, seismic or other transient loading.

The recommendations made in the preceding paragraph are based on the assumption that all footings will be supported upon properly compacted fill soils. All demolition and foundation area preparation should be performed under the testing and inspection of the Soils Engineer or his representative. Prior to the placement of concrete, we recommend that the footing excavations be inspected in order to verify that they extend into compacted soil and are free of loose and disturbed materials.

Because the site soils may be susceptible to settlement due to the introduction of excessive amounts of water, care should be taken to see that bearing soils are not allowed to become saturated from the introduction of storm water runoff or irrigation. Drainage from the building areas should be rapid and complete.

Settlements: Settlements may result from the anticipated foundation loads. These estimated ultimate settlements are calculated to be a maximum of 1 inch when using the recommended bearing values. As a practical matter, differential settlements between footings can be assumed as one-half of the total settlement.

Lateral Design: Resistance to lateral loads can be provided by a combination of friction acting at the base of the slabs or foundations and passive earth pressure along the sides of the foundations. A coefficient of friction of 0.40 between soil and concrete may be used for dead load forces only. A passive earth pressure of 275 pounds per square foot, per foot of depth, may be used for the sides of footings that are poured against properly compacted native soils. Passive earth pressure should be ignored within the upper 1 foot except where confined (such as beneath a floor slab or pavement).

Retaining Walls: Cantilever retaining walls may be designed utilizing "active" soil pressures. The "active" pressures may be estimated utilizing an equivalent fluid weight of 35 pounds per cubic foot (pcf) for drained level native backfill soils. For restrained walls "at rest" pressures should be utilized in design. The equivalent fluid weight should be increased to 55 pcf for restrained walls with level free-draining native backfill soils. The lateral pressures provided above should be applicable for use in temporary shoring system design.

Expansive Soils: Due to the prominence of "low" expansion category soils near the surface, expansive soil design criteria should not be a factor in the design of foundations and concrete slabs-on-grade. Final slab design should be based upon post grading expansion test results in accordance with design criteria outlined within applicable portions of the Uniform Building Code and should be determined by the Structural Engineer.

Concrete Slabs-on-Grade: All surfaces to receive concrete slabs-on-grade should be underlain by compacted fill soils as described in the Site Preparation section of this report. Where slabs are to receive moisture sensitive floor coverings or where dampness of the floor slab is not desired, we recommend the use of an appropriate vapor barrier or an adequate capillary break. Vapor barriers should be protected by sand in order to reduce the possibility of puncture and to aid in obtaining uniform concrete curing. If preferred, a capillary break consisting of a minimum 4 inch thick layer of crushed rock may be utilized.

Reinforcement of slabs-on-grade in order to resist expansive soil pressures may be necessary dependent upon post grading expansion test results and the quality of the possible import soils. Reinforcement will also have a beneficial affect in containing cracking due to concrete shrinkage. Temperature and shrinkage related cracking should be anticipated in all concrete slabs-on-grade. Floor slab reinforcement and the spacing of control joints, should be determined by the Structural Engineer.

Soluble Sulfates: The soluble sulfate concentrations of the surface soils were determined to be 82, 897, and 66 parts per million (ppm). The sulfate content determined suggests that the site soils are generally considered non-corrosive with respect to concrete. The use of Type 5 cement and/or special sulfate resistant concrete mix designs should not be necessary.

Tentative Pavement Design: Although R-Value of the surface soils was not specifically determined, based upon the generally sandy nature of the surface soils encountered throughout the site, we expect that the R-Value will be in excess of 50. The following preliminary pavement sections are based upon a design R-Value of 50.

Parking areas and areas limited to auto and light truck traffic (Traffic Index = 5.0)
Use 3.0 inches of asphalt on 4.0 inches of Class 2 base material

Drive lanes and areas of intermittent truck traffic (Traffic Index = 6.5)
Use 4.0 inches of asphalt on 6.0 inches of Class 2 base material

The recommended pavement sections should be provided with a uniformly compacted subgrade and precise control of thickness and elevations during placement. Drainage from paved areas should be rapid and complete.

If concrete pavement is preferred, a standard section of 6 inches of Portland Cement Concrete (PCC) on 4 inches of aggregate base material should be adequate for most traffic conditions. The section should be increased to 8 inches of PCC on aggregate base material in areas where regular heavy truck traffic is expected.

Pavement and slab designs should be confirmed at the completion of site grading when the subgrade soils are in-place. This should include sampling and R-Value testing of the actual subgrade soils and an analysis based upon the anticipated traffic loading.

Shrinkage and Subsidence: Volumetric shrinkage of the material that is excavated and replaced as controlled compacted fill should be anticipated. We estimate that this shrinkage may vary from 10 to 15 percent within the near surface native soils. Subsidence of the surfaces that are scarified and compacted is expected to vary from one-tenth to two tenths of a foot. This will vary depending upon the type of equipment used, the moisture content of the soil at the time of grading and the actual degree of compaction attained. These values for shrinkage and subsidence are exclusive of losses that will occur due to the removal of unsuitable materials and other subsurface obstructions.

General Site Preparation: All grading should be performed in accordance with the grading ordinance of the City of Los Angeles, California. The following recommendations have been developed on the basis of our field and laboratory testing:

1. **Clearing and Demolition:** Proper demolition of any existing structure components, slabs, footings, pavements and underground utilities will be very important. Soils that are disturbed due to the removal of the previous improvements or structure foundations should be removed and replaced as controlled compacted fill under the direction of the Soils Engineer. Debris an dother unsuitable material should be removed from the site.

2. **Preparation of Building and Foundation Areas:** All artificial fill soils and debris should be removed from the site. Removals should extend to competent native soils or a minimum depth of 3 feet below the bottom of the footings, whichever is deeper. The exposed surface should be scarified, moisture conditioned and recompacted to at least 90 percent relative compaction. Once unsuitable materials are removed, the excavated soils may be replaced as controlled compacted fill. Removals should be observed and compaction should be verified by testing.

   Removals should extend to the property lines, shoring may be required to accomplish the recommended artificial fill and debris removal in areas where fill depths exceed 10 feet.

3. **Preparation of Exterior Slab and Pavement Areas:** Disturbed native soil or unsuitable fill material should be removed from pavement areas and replaced as compacted fill material. The underlying native soils should be scarified, brought to near optimum moisture content, and compacted to a minimum of 90 percent relative compaction prior to replacing the fill material. As a minimum, slabs and pavements should be supported by a minimum of 12 inches of compacted soil.

4. **Placement of Compacted Fill:** Fill materials consisting of on-site soils or approved imported granular soils, should be spread in thin lifts, and compacted at near optimum moisture content to a minimum of 90 percent relative compaction.

   Imported material should have an Expansion Index not exceeding 20. The contractor shall notify the Soils Engineer at least 48 hours in advance of importing soils in order to provide sufficient time for the evaluation of the proposed import materials. The contractor shall be responsible for delivering material to the site that complies with the project specifications. Approval by the Soils Engineer will be based upon material delivered to the site and not the preliminary evaluation of import sources.

   Our observations of the material encountered during our investigation indicate that compaction will be most readily obtained by means of heavy rubber-wheeled equipment and/or sheepsfoot compactors. At the time of our investigation, the moisture content of the site soils was found to be very inconsistent. A more uniform and near optimum moisture content should be maintained during fill placement and compaction.

5. **Testing and Inspection:** During grading tests and observations should be performed by the Soils Engineer or his representative in order to verify that the grading is being performed in accordance with the project specifications and applicable ordinances. Field density testing shall be performed in accordance with acceptable ASTM methods.

   The minimum acceptable degree of compaction should be 90 percent of the maximum dry density as obtained by the ASTM D1557-91 test method. Where testing indicates insufficient density, additional compactive effort shall be applied until retesting indicates satisfactory compaction.

GENERAL

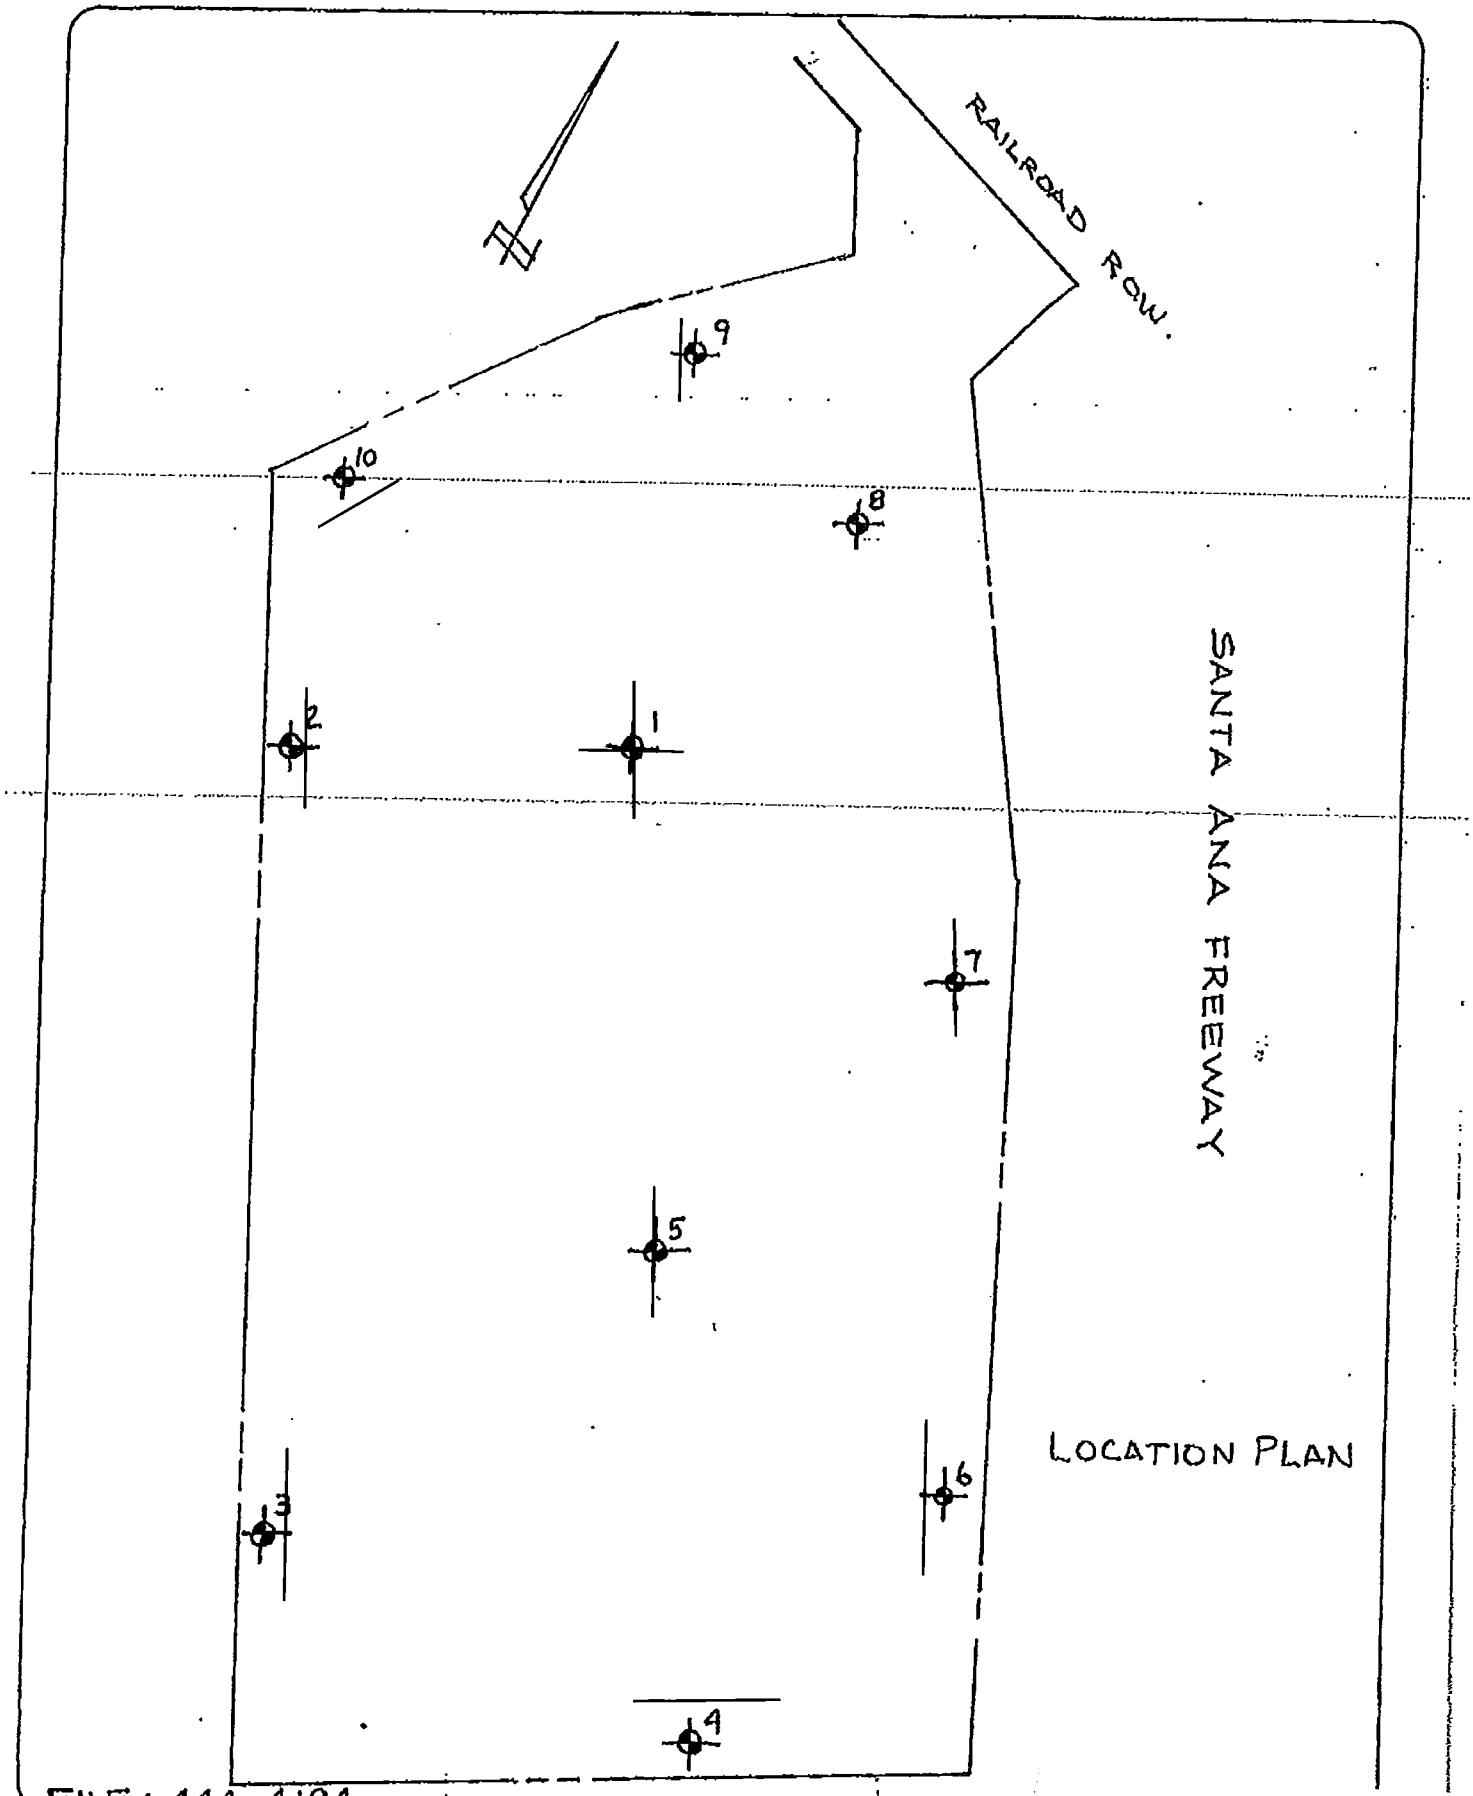
The findings and recommendations presented in this report are based upon an interpolation of the soil conditions between boring locations and extrapolation of these conditions throughout the proposed building addition area. Should conditions encountered during grading (or demolition) appear different than those indicated in this report, this office should be notified.

This report is considered to be applicable for use by [redacted] for the specific site and project described herein. The use of this report by other parties or for other projects is not authorized. The recommendations of this report are contingent upon monitoring of the grading operation by a representative of [redacted] All recommendations are considered to be tentative pending our review of the grading operations and additional testing, if indicated. If others are employed to perform any soil testing, this office should be notified prior to such testing in order to coordinate any required site visits by our representative and to assure indemnification of Sladden Engineering.

Our investigation was conducted prior to the completion of plans for the project. We recommend that a pre-job conference be held on the site prior to the initiation of site grading. The purpose of this meeting will be to assure a complete understanding of the recommendations presented in this report as they apply to the actual grading performed.

APPENDIX A

Site Plan
Boring Logs



APPENDIX A

FIELD EXPLORATION

For the initial phase of our field investigation 10 exploratory borings were excavated on September 22, 2004 using a truck mounted Mobile B-61 drilling rig and hollow-stem augers. The approximate exploratory boring locations are indicated on the site plan included in this appendix. Boring logs are included in this appendix. Additional borings to further evaluate artificial fill depths are currently underway.

Representative undisturbed samples were obtained within our borings by driving a thin-walled steel penetration sampler (California split spoon sampler) or a Standard Penetration Test (SPT) sampler with a 140-pound hammer dropping approximately 30 inches (ASTM D1586). The number of blows required to drive the samplers 18 inches was recorded in 6-inch increments and blowcounts are indicated on the boring logs.

The California samplers are 3.0 inches in diameter, carrying brass sample rings having inner diameters of 2.5 inches. The standard penetration samplers are 2.0 inches in diameter with an inner diameter of 1.5 inches. Undisturbed samples were removed from the sampler and placed in moisture sealed containers in order to preserve the natural soil moisture content. Bulk samples were obtained from the excavation spoils and samples were then transported to our laboratory for further observations and testing.

FORM #2

1997 UNIFORM BUILDING CODE SEISMIC DESIGN INFORMATION

The International Conference of Building Officials (ICBO) 1997 Uniform Building Code contains substantial revisions and additions to the earthquake engineering section in Chapter 16. New concepts contained in the updated code that will likely be relevant to construction of the proposed structures are summarized below.

Ground shaking is expected to be the primary hazard most likely to affect the site, based upon proximity to significant faults capable of generating large earthquakes. Major fault zones considered to be most likely to create strong ground shaking at the site are listed below.

Fault Zone	Approximate Distance From Site	Fault Type (1997 UBC)
Newport/Inglewood	11 km	B
Hollywood/Raymond	9 km	B

Based on our field observations and understanding of local geologic conditions, the soil profile type judged applicable to this site is S_D, generally described as stiff or dense soil. The site is located within UBC Seismic Zone 4. The following table presents additional coefficients and factors relevant to seismic mitigation for new construction upon adoption of the 1997 code.

Seismic Source	Near-Source Acceleration Factor, N_a	Near-Source Velocity Factor, N_v	Seismic Coefficient C_a	Seismic Coefficient C_v
Newport/Inglewood	1.0	1.0	$0.44N_a$	$0.64N_v$
Hollywood/Raymond	1.0	1.0	$0.44N_a$	$0.64N_v$

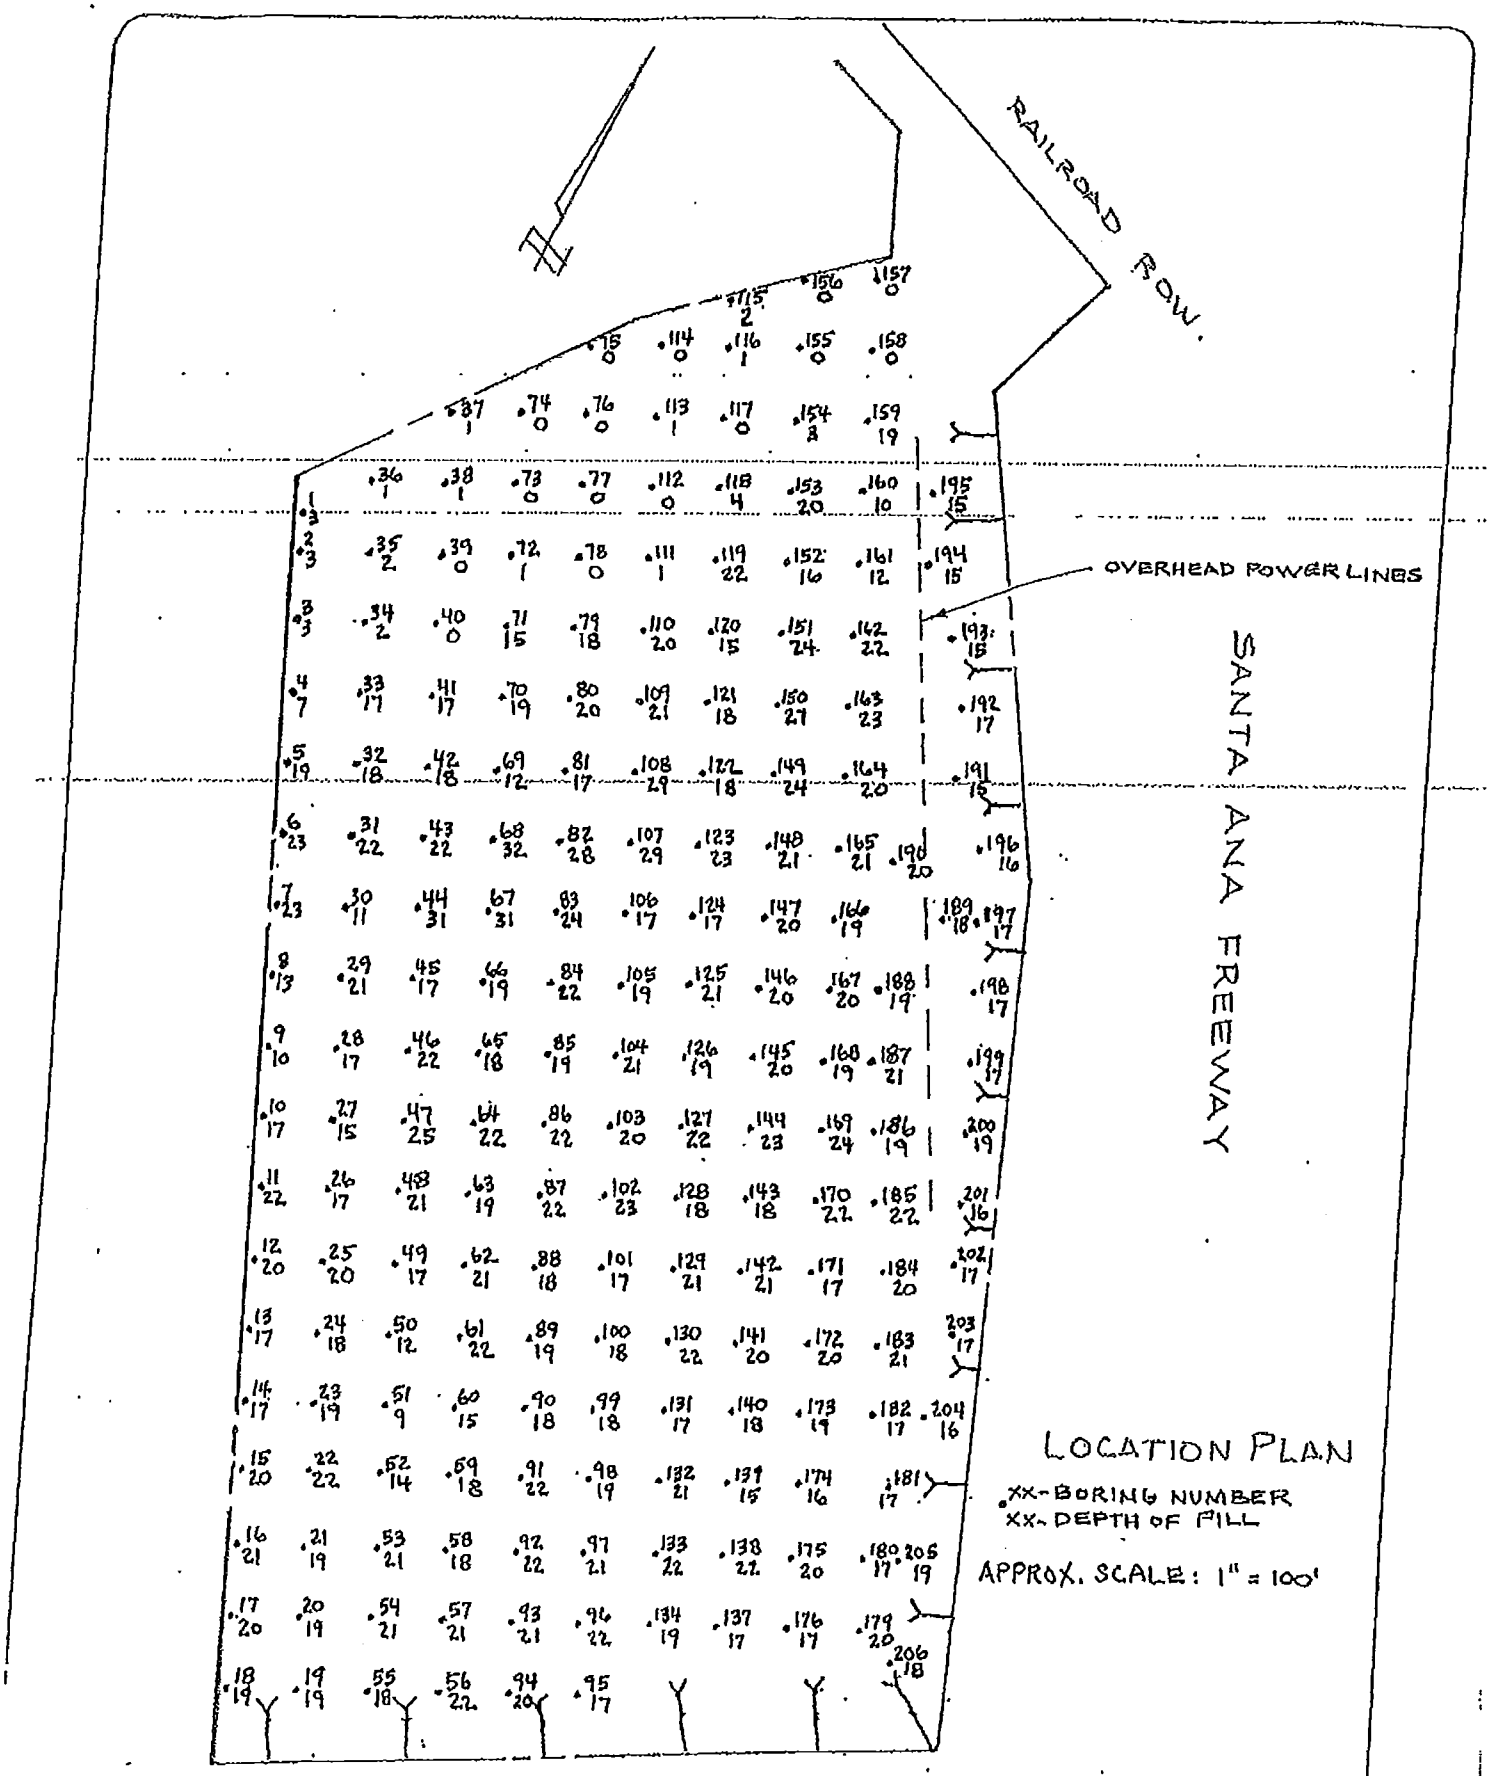
-END OF SEARCH- 69 FAULTS FOUND WITHIN THE SPECIFIED SEARCH RADIUS.



THE ELYSIAN PARK THRUST FAULT IS CLOSEST TO THE SITE.
IT IS ABOUT 0.0 MILES (0.0 km) AWAY.

LARGEST MAXIMUM-EARTHQUAKE SITE ACCELERATION: 0.5910 g

Summarized herein are the results of our supplemental exploratory boring program performed on the site to further evaluate the depth of artificial fill and debris on the subject property. The borings were excavated on an approximately 40 foot grid pattern across the site. The approximate depth of artificial fill and debris is indicated on the attached table and the approximate boring location are indicated on the attached plan.

If you have any questions regarding this memo or the referenced reports, please contact the undersigned.

Respectfully submitted,

OFFICIAL LABORATORY REPORT AND CHAIN OF CUSTODY RECORDS

BC Laboratories, Inc.
Environmental Testing Laboratory Since 1949

Date of Report: 05/17/2013

James Ferrara

TRC
123 Technology Drive
Irvine, CA 92618

Project:	Gage Ave Landfill
BC Work Order:	1309783
Invoice ID:	B146426

Enclosed are the results of analyses for samples received by the laboratory on 5/9/2013. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Molly Meyers

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A02	The difference between duplicate readings is less than the PQL.
A03	The sample concentration is more than 4 times the spike level.
A10	PQL's and MDL's were raised due to matrix interference.
A17	Surrogate not reportable due to sample dilution.
L21	The Laboratory Control Sample Soil (LCSS) recovery is not within laboratory established control limits.
Q01	Sample precision is not within the control limits.
Q02	Matrix spike precision is not within the control limits.
Q03	Matrix spike recovery(s) is(are) not within the control limits.
S09	The surrogate recovery on the sample for this compound was not within the control limits.
V01	The Initial Calibration Verification (ICV) recovery is not within established control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

APPENDIX B

TRC TRENCH LOGS, OFFICIAL LABORATORY REPORTS AND CHAIN OF CUSTODY RECORDS

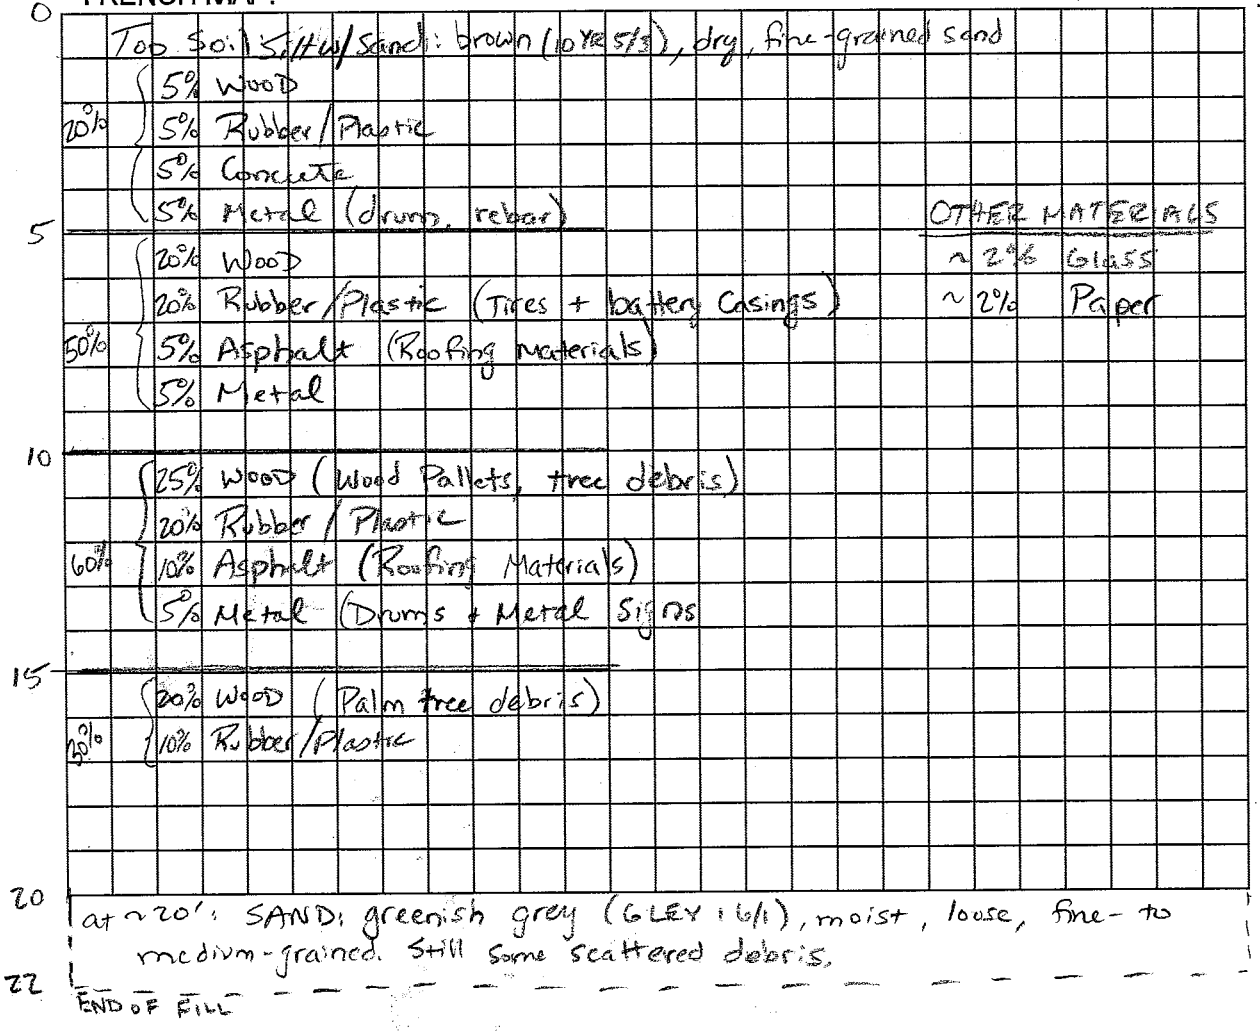
California Integrated Waste Management Board

TRENCH LOG

SITE: Former Gage Ave. Landfill

DATE: 1/10/14

TRENCH ID: Test Pit - SE Quadrant (50'x50'x23')



TIME: 1000

SAMPLER: R. Lovdahl

WEATHER: Sunny

TRENCH MAP:

MAP SCALE:

FIELD_NOTES

Total of 9 55gal drums found in this quadrant (5-15' deep). No PID hits, most drums were crushed or filled w/ construction materials. One drum was isolated on plastic, viscous tar escaping from sides.

Collected soil samples at 23 ft and 26 ft in this quadrant. (TP-2-23 and TP-2-26) on 1/10/14

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A10	PQL's and MDL's were raised due to matrix interference.
A17	Surrogate not reportable due to sample dilution.
Q02	Matrix spike precision is not within the control limits.
Q03	Matrix spike recovery(s) is(are) not within the control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A02	The difference between duplicate readings is less than the PQL.
A10	PQL's and MDL's were raised due to matrix interference.
Q02	Matrix spike precision is not within the control limits.
Q03	Matrix spike recovery(s) is(are) not within the control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A02	The difference between duplicate readings is less than the PQL.
A10	PQL's and MDL's were raised due to matrix interference.
Q03	Matrix spike recovery(s) is(are) not within the control limits.
S09	The surrogate recovery on the sample for this compound was not within the control limits.

TEST PIT WORK SUMMARY/RESULTS

B&D Construction recently completed the test pit work at 7316 East Gage Avenue in Commerce CA per the scope of work agreed upon in the contract with Comstock Realty Partners executed in December of 2013. The site was mobilized on January 6th and 7th of 2014 and excavation and screening activities began on January 9th. All site work was completed by January 28th. Allowing for 2 mobilization days, 1 demobilization day, and 2 days of relocating screening equipment to the perimeter trenching areas. The actual number of excavation/screening days used to perform the work totaled 12 complete working days. Due to the nature of the work scope and the goals of the project, B&D added equipment at the site, changed the screening system, and changed the screen deck sizes during the course of the project to optimize the percentage of reusable soil produced by the processing. These changes took several days to complete and this should be noted when considering the average amount of soil processed each day.

We recommend that a summary meeting be set at your earliest convenience to discuss the results and their potential implications for your upcoming development goals at the site. All interested parties, including WM, TRC, & Sladden should be asked to attend the meeting. It would also be appropriate for any other engineering consultants involved in the project to sit in on the meeting. We believe that this meeting will provide the maximum amount of efficient information exchange between the parties and facilitate the path forward. The following bullet points will summarize the work performed and the results achieved by performing the excavation/screening operation.

- The main test pit area and perimeter trenches were staked by B&D under the supervision of TRC on Jan 3 2014.
- Project site was mobilized on Jan 6&7 2014

- Initial equipment mobilized to project site – Screening plant, Loader, Excavator, Water Truck.
- A second excavator was added on Jan 14 to allow for simultaneous excavation and loading of the screen (due to growing excavation size).
- Soil was excavated and screened for a total of 10.5 working days.
- One large 100 x 100 pit was excavated to native soil elevations and sloped back on all four sides per OSHA requirements. All excavated materials were processed thru the screening plant.
- Four perimeter 25 x 75 foot trenches were excavated to native soil elevations and sloped back on all for sides per OSHA requirements. All excavated materials processed thru the screening plant
- A total of approx. 15,000 tons of material was processed thru the screening plant using the original Sandvik 331 plant and deck configuration set to produce 4 product sizes.
- The four product sizes included soil and three gradations of debris.
- This initial screening event produced approximately 35-40% reusable soil and 60 – 65% debris products that would not be reusable to any degree.
- Soil samples were taken by Sladden to confirm the compaction potential of the reusable soil pile. This soil has been deemed reusable per Sladden.
- Visible amounts of soil were visible in two of the debris products after the initial screening work was completed. A decision was made in the field to switch to another larger screening plant and reset the deck sizes to attempt to remove the remaining soil from the debris products and increase the amount of reusable soil generated by the screening process.
- Applicable debris products were rescreened using the new screening plant and reconfigured deck settings to extract more reusable soil from the debris piles. The new equipment and configuration worked very well and removed most of the soil from the debris products. This reprocessing increased the total amount of reusable soil at the site to 45-50%.
- The soil generated by the rescreening process was observed by Sladden and approved as being acceptable for reuse at the site.
- All processed soil and debris stockpiles have been covered with HDPE plastic liners and secured with sandbags. Demobilization of the site is currently near completion.
- There are 3 basic end products to the excavation/screening process at the Gage site: (a)Reusable soil, (b)1-6 inch debris, and (c)greater than 6 inch debris. All three products are stockpiled at the site and available for your review. Pictures of all three products are included as an attachment to this document (see attachment 1)

- The first product generated by the operation is soil acceptable for reuse at the site. Based on our field measurements and observations, we are ESTIMATING that there is approximately 45-50 % of this product in the total material mass of the excavation footprint. The reusable soil product has an approximate density of 1.26 tons per CYD.
- The second product generated by the operation is 1-6 inch debris. Based on our field measurements and observations, we are ESTIMATING that there is approximately 20-25% of this product in the total material mass of the excavation footprint. The 1-6 inch has an approximate density of 1.02 tons per CYD.
- The third product generated by the operation is greater than 6 inch debris. Based on our field measurements and observations, we are ESTIMATING that there is approximately 35-40% of this product in the total material mass of the excavation footprint. The greater than 6 inch debris has an approximate density of .96 tons per CYD
- We ESTIMATE that the soil product is 95% + soil with minimal debris.
- We ESTIMATE that the 1-6 inch debris product is comprised of approximately 70% wood and other organic constituents, 20% rock, concrete, and other inorganic debris, and 10% rubber and shredder fluff type debris.
- We ESTIMATE that the 6 inch plus debris product is comprised of approximately 60% wood, 20% rubber and shredder type debris, and 20% larger rock, brick, concrete, metal, and other inorganic debris.

Best Regards,

Vince Bartleman
B&D Construction Co Inc.

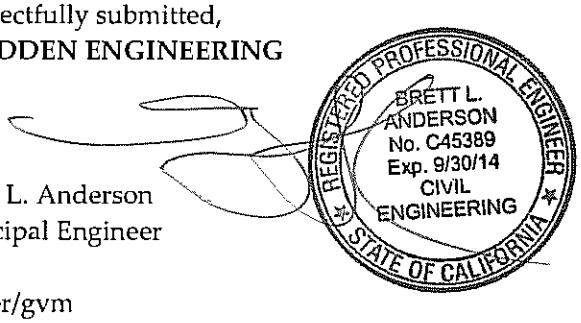
Subject: Laboratory Test Results – Samples of Screened Material



Ref: Geotechnical Investigation report prepared by Sladden Engineering dated October 18, 2004; Project No. 444-4194, Report No. 04-10-247

In accordance with your request, we obtained samples of processed and screened material during the recent excavation/screening operations. Laboratory testing consisted of gradation and organic content determination performed in accordance with ASTM Test Methods D422 and ASTM D2974, respectively. Test results are attached.

Upon review of the test data, it is apparent that the material passing through the 2 ½ inch screen (Sample #1) contains excessive amounts of organics (6.5 %) and is unsuitable for use as engineered fill soil. The material passing through the 3/8 inch screen (Sample #2) contains minimal amounts of organics (0.2 %) and would be suitable for use as engineered fill soil. The supplemental sample (Sample 3) of material passing through the 1 inch screen also contains minor amounts of organics (0.6 percent) and would also be suitable for use as engineered fill.

If you have questions regarding this memo or the test results summarized herein, please contact the undersigned.

Respectfully submitted,
SLADDEN ENGINEERING

Brett L. Anderson

ACRONYMS

DOT	Department of Transportation
EPA	United States Environmental Protection Agency
HASP	Health and Safety Plan
JSA	job safety analysis
ml	milliliter
PID	photoionization detector
TAT	Turn-around-time
VOC	volatile organic compound

D.1 SOIL SAMPLE COLLECTION

Soil confirmation samples will be collected from the excavation floor and sidewalls using either a slide hammer/core barrel attachment with a 1.5 or 2-inch diameter by 6-inch long, stainless steel sleeve or by inserting a new sample container (glass jar or metal sleeve) directly into the exposed soil surface. Soil sample locations that are not accessible due to depth or safety concerns may be collected using a using a backhoe bucket. A soil sample would be collected directly from the soil retained in the backhoe bucket.

All soil samples collected for VOC analysis will be collected directly from the exposed soil surface or sample container, when the exposed soil surface is not accessible using EPA method 5035 samplers. The soil samples collected for VOC analysis will be preserved in the field using pre-preserved 40-milliliter (ml) vials provided by the laboratory, Encores or O2si Smart Kits. The pre-preserved vials will contain measured amounts of methanol and sodium bisulfate. A 5-gram aliquot of soil will be carefully placed into each vial and immediately sealed. Each sample will be labeled with the sample identification number, sample depth, and date of collection. After the samples have been labeled and documented in the chain-of-custody record, they will be placed in a cooler with ice at ~4 degrees Celsius (4° C) for transport to a State-certified laboratory.

D.2 EQUIPMENT DECONTAMINATION

Soil confirmation samples collected directly from the soil surface using the sample container or disposable sample container will not require decontamination.

Equipment requiring decontamination during confirmation sampling is limited to tools such as, the steel trowel or shovel tip and core barrel samplers.

Sample equipment (e.g., trowels, core barrels, etc.) will be cleaned and decontaminated by scrubbing in a Liquinox solution, followed by a rinse, and then a final rinse with deionized water to prevent cross contamination.

The equipment will be allowed to air dry, or will be wiped dry with paper towels. New equipment will be cleaned prior to use. Decontamination water will be used to hydrate waste soil stockpiles prior to offsite disposal at permitted facilities.

D.3 SAMPLE HANDLING

D.3.1 Sample Containers and Preservation

Sample containers (e.g. glass jars, Smart Kits, Encores, etc.) will be delivered to the sampling site or office by the analytical laboratory using standard EPA-approved protocols. Sample containers will be protected from dust or other contamination between the time of receipt and the time of usage at the Site.

D.3.2 Sample Confirmation Sample Nomenclature/Labeling

Each sample will be assigned a unique sample identification number to allow for proper data management. These sample numbers will be included on the sample label, in the daily field sheets to identify notes pertaining to the sample, and on the chain-of-custody form. The sample identification number will consist of a unique sample location and a two-digit sample depth designator.

Samples will be labeled immediately after collection. The following information will be included on the sample label: sample location, sample identification number, date and time of collection, preservatives added (if any), and requested analysis. The labels will be filled out in indelible ink and firmly affixed to the sample container. Clear packing tape will then be used to cover the completed sample label to prevent damage to the label during shipping.

D.3.3 Stockpile Sample Nomenclature/Labeling

All stockpiles will be labeled with a stockpile identification number, material type and classification and the date the stockpile was started.

D.3.4 Stockpile Sample Shipping

A courier service will be used to transport the samples from the Site to the laboratory under chain of custody. The courier will be trained in the proper packaging and transportation of the samples and comply with Department of Transportation (DOT) and/or California Health and Safety Code requirements.

D.4 DOCUMENTATION

D.4.1 Stockpile Chain-of-Custody Record

The purpose of a chain-of-custody record is to create an accurate written record that can be used to trace the possession and handling of a sample from the moment of its collection through analysis. In addition, other information, such as holding times from the field to the laboratory, can be verified.

A chain of custody will be initiated and completed using the approved California Certified Laboratory's chain of custody during sample collection. Possession of every sample will be recorded from the time of collection until the analytical results are fully documented by the laboratory. Generally, the following information will be recorded in the spaces designated on the chain of custody:

- Project name and number
- Site name and address
- Sampler's name (signature and print), organization, and address
- Identification/field sample number (distinguish the number zero from the letter 'O' by drawing a slash through the number zero)
- Date and time of collection
- Sample type (soil, groundwater, etc.)
- Number of sample containers
- Laboratory parameters (use a separate column for each analysis, and check using an 'X', the specific parameter to be analyzed)
- Turn-around-time (TAT; i.e., 24 hours, 5 working days, etc.)

All individuals relinquishing and receiving samples will sign, date, and indicate the time in the lower portion of the chain of custody. If an error is made on the chain of custody prior to custody transfer, it will be crossed out and initialed, and the correct information written above the error. If an error is made after custody transfer, TRC will immediately notify the laboratory and any other organization to which the information was submitted of the correction.
The chain of custody will accompany the samples at all times while the samples are in transit. Upon receipt of the samples at the laboratory, the laboratory sample custodian will sign and date the chain of

custody, indicating acceptance of the samples. The original (white copy) of the completed chain of custody will be maintained at the laboratory until submittal of analytical results, at which time the original, or a photocopy if other laboratories are involved, is remitted with the analytical results. A copy of the completed chain of custody will be maintained by the project.

D.4.2 Field Notes

A daily record of significant events, observations, and measurements during field activities will be maintained by field personnel. All members of the field team will use a daily field log form, which will be kept as a permanent record.

It should be noted that field entries will be factual, detailed, and objective. The following are items which will, if applicable, be recorded during field activities:

- Name and location of the Site
- Name and affiliation of sampling team members
- Time of arrival on the Site
- Weather conditions
- Arrival and departure times of visitors
- Health and safety related issues (site-specific HASP and job safety analysis [JSAs] will be onsite at all times)
- Summary of day (e.g., excavation progress, down time, etc.)
- Dates and times of sample collections or events
- Numbers and types of samples collected, sample location, and sample identification
- A description of sampling methodology
- Field measurements of samples (i.e., PID readings)
- Description of lithology and observations related to soil excavations
- Record of telephone calls and/or contact with people at the Site
- Any problems or unusual observations

E.1 PROJECT MANAGEMENT

This Quality Assurance Project Plan (QAPP) has been prepared for the Gage Avenue Disposal Site (Site) located at 7316 East Gage Avenue in Commerce, California (Site), on behalf of Comstock Gage, LLC (Comstock).

The approach described in this QAPP generally follows the methods and procedures outlined in the following documents:

- Quality Assurance Guidance for Conducting Brownfields Site Assessments, U.S. EPA, 1998.
- Guidance for Quality Assurance Project Plans (EPA QA/G-5), U.S. EPA, 2002.

E.1.1 Project Definition and Background

This QAPP presents technical procedures, guidance and quality assurance (QA) requirements for activities required to complete soil remediation as described in the Remedial Action Plan (RAP) to ensure data precision, accuracy, completeness, representativeness, and comparability. The RAP describes specific procedures that will be used to implement the removal of all solid wastes and soil within the Site. A detailed description of Site history and previous investigations is given in Section 1.0 of the RAP.

E.1.2 Project Organization and Responsibility

Figure F-1 illustrates the relationships and the lines of communication among all project participants, including Project Director, Project Manager, Site Superintendent, Project QA/QC Officer, Project Health and Safety Officer, field technicians and subcontractors (land surveyors, analytical laboratory, and waste disposal and transportation services). The structure defined in this QAPP has been developed to enhance project control and obtain proper QA for the Site field activities.

The key responsible parties for the remediation excavation work at the Site are as follows:

Site Owner
Comstock Gage LLC
c/o Comstock Realty Partners, LLC

Remedial Excavation Contractor
B&D Construction Company
145 North 10th Avenue
Upland, CA 91786

Contact: Vince Bartleman
Phone: (310) 408-2415

E.1.2.1 Project Director

The Project Director has overall responsibility for all aspects of the project including communication with the Regional Water Quality Control Board - Los Angeles Region (RWQCB) and the owner for planning, scheduling, controlling, and coordination of assigned project tasks. The Project Director will designate a Project Manager, Site Superintendent, Quality Assurance/Quality Control (QA/QC) Officer, Health and Safety Officer, and field technicians. Monitoring the Project Manager's activities and overseeing the preparation and implementation of the RAP are also the responsibility of the Project Director.

E.1.2.2 Project Manager

The Project Manager assists the Project Director and has responsibility for communication with the RWQCB and the owner for planning, scheduling, controlling, and coordination of assigned project tasks. The Project Manager is responsible for the implementation, tracking, documentation and compliance verification of all field activities. The Site Superintendent is responsible for the oversight and documentation of field activities for the Project Manager. The Project Manager oversees all individual members of the QA Team and task managers.

E.1.2.3 Site Superintendent

The Site Superintendent has the responsibility for the completion of all day to day project activities and deliverables associated with those field activities. The Site Superintendent is responsible for the day to day control of field planning, oversight and implementation of the scope of work as detailed in the RAP. Additionally, the Site Superintendent monitors field personnel including subcontractors' activities and remediation team coordination.

E.1.2.4 Project QA/QC Officer

The QA/QC Officer reports to the Project Manager. The QA/QC Officer is responsible for monitoring and verifying that the activities conducted on the Site are in accordance with the provisions of the RAP. The QA/QC Officer also has the responsibility for assessing the effectiveness of the field QA/QC procedures at the Site and shall recommend any modifications to the Project Manager. The QA/QC Officer is also responsible for providing the Project Manager with a report on data reduction and data validation associated with field and laboratory activities

E.1.2.5 Project Health and Safety Officer

The Project Health and Safety Officer reports to the Project Manager and coordinates with the Site Superintendent. The Project Health and Safety Officer has the responsibility of monitoring the implementation of the Site Health and Safety Plan (HASP) and Job Safety Analysis (JSA) and verifying that the activities conducted at this Site are in accordance with the provisions of the HASP. The Project Health and Safety Officer also has the responsibility of advising the Project Manager with regard to health and safety issues.

E.1.2.6 Field Technicians

Each field technician is responsible for completion of assigned project activities. The field technicians are responsible for understanding and implementing this QAPP, HASP and RAP as it relates to their respective assignment. The field technicians also have the responsibility of ensuring that all subcontractors, staff, and visitors to the site follow health and safety protocol according to the HASP.

E.1.2.7 Qualifications of Personnel

Individuals following this RAP (including the QAPP and HASP) must receive, at a minimum, orientation to the project's purpose, scope, and methods of implementation and must do so prior to commencing any field activities. The Project Manager, Site Superintendent or Project Health and Safety Officer will perform this orientation. Onsite personnel must have documented experience or direct training in the procedures performed during each phase of the project, unless on-the-job training is provided by

experienced personnel qualified to conduct each trainee's assignment and the results of that training are documented.

Field technicians will be trained in site-related field activities and safety protocols outlined in the RAP. Field activities include excavation oversight, SCAQMD Rule 1150 and Rule 1166 monitoring, site safety monitoring, particulate monitoring and confirmation soil sample collection (e.g. EPA Method 5035 Encore samplers, etc.) and handling. Subcontractors are responsible for their own training, but will be reviewed by TRC personnel prior to commencing work. The TRC site superintendent and field technicians will monitor all field activities.

Field technicians, including subcontractor personnel, must be trained in the 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) course (including annual updates with 8-hour refresher courses), that are designed to meet the Occupational Safety and Health Administration (OSHA) training requirements for hazardous waste operations for general site workers as required by 29 CFR 1910.120(e)(3). Proof that all required training has been completed must be maintained on the site/project at all times, including:

- OSHA 40-Hour HAZWOPER Card
- OSHA 8-Hour Annual HAZWOPER Refresher Card

Verification of all cards will be determined during daily safety meetings prior to field activities.

E.1.2.8 Laboratory and Certifications

All samples will be analyzed by laboratories certified by the California Department of Health Services.

E.1.3 Quality Objectives and Criteria for Measurement Data

This section presents the data quality objectives (DQOs) for the project and the performance criteria necessary to meet these DQOs. Five DQOs for the assurance of quality data – accuracy, precision, completeness, representativeness, and comparability - are defined, and the procedures to be followed to support and assess these objectives are presented. Taken together, the quality assurance objectives provide both quantitative and qualitative assessments of data collection and analytical procedures at the field and laboratory levels.

E.1.3.1 Quantitative Objectives: Precision, Accuracy, and Completeness

Precision

Precision (reproducibility) is estimated by comparing the analytical results of duplicate samples. Precision is determined at both the field and laboratory levels. Split duplicate soil samples will be collected at the rate of approximately 10 percent of the primary soil samples collected. The samples will be collected and labeled as described in the Confirmation Sampling Plan (Appendix E of the RAP), except a greater volume will be collected. Once collected, the sample will be divided and placed into two or more laboratory-supplied sample containers. The samples will be divided into primary samples and duplicate samples. Duplicate samples will be analyzed for the same suite of analyses as their corresponding primary sample. Precision is also measured as an internal laboratory batch QC check for all analytical methods. As described below, matrix spikes (MS) and/or blank spikes (BS) are analyzed in

duplicate. The analytical results are compared and reported by the laboratory as the relative percent difference (RPD):

$$RPD = \frac{2|C_1 - C_2|}{C_1 + C_2} x100$$

where C_1 and C_2 are the concentrations in the duplicate samples.

In addition to the MS and BS, the laboratory may split an environmental sample from a single container to create a laboratory duplicate.

Precision goals (upper limits for the RPD) are established by the analytical laboratory for each method and detailed in analytical reports. Precision goals vary by MS, BS, and laboratory duplicates, and they are updated annually. Out-of-range precisions are summarized by the laboratory in a case narrative for the analytical report. This information is used for data validation as described in Section E.4.

Precision values will be calculated for the field duplicates upon receipt of the analytical data. The precision goals established by the laboratory for the BS will be adopted for the field duplicates. Precision will only be calculated for analytes at or above concentrations ten times the reporting limit. Out-of-range precision values for field duplicates will be used for data validation as described in Section E.4.

Accuracy

Accuracy quantifies the extent to which a measurement agrees with a known reference or true value. It is determined in the analytical laboratory by 'spiking' samples with a known concentration of analyte and comparing the measured concentration with the spiked value. Accuracy is expressed as a percentage, known as the recovery (R) of the measured concentration (C_m) less the sample or "background" concentration (C_b) to the spike concentration (C_s):

$$R = \frac{(C_m - C_b)}{C_s} x100$$

Accuracy is measured on both an individual sample basis with the use of surrogate spikes (organic analyses only) and for each group of samples analyzed together as a 'batch'. Surrogates are organic compounds that are similar to organic analytes of environmental interest in their behavior in the analytical process but are rarely found in environmental samples. They are spiked into each laboratory sample, including quality control (QC) samples, and percent recoveries are calculated and reported for each surrogate.

For the batch QC, one or more of the following types of spiked samples are used to assess the accuracy of the method for the batch:

- Matrix or Sample Spike (MS): One sample in the batch is spiked and analyzed to determine R (usually analyzed with a matrix or sample spike duplicate; see Precision)
- Blank Spike (BS): A laboratory-prepared blank sample is spiked and analyzed to determine R (usually analyzed with a blank spike duplicate; see Precision)

- Laboratory Control Sample (LCS): A laboratory-prepared blank sample is spiked and analyzed to determine R (usually not analyzed with a duplicate)

Accuracy goals (acceptance limits for R) are established by the analytical laboratory for each method and detailed in the analytical reports. Accuracy goals vary by surrogate, MS, BS, and LCS, and they are updated annually. Out-of-range recoveries are summarized by the laboratory in a case narrative for the analytical report. This information is used for data validation as described in Section E.4.

Completeness

Completeness (C) is the percentage of measurements planned (N_p) that are actually obtained and validated (N_v):

$$C = \frac{N_v}{N_p} x100$$

Each of the QC sample types (field duplicates, equipment blanks, and temperature blanks) is used in the data validation process; consequently, each plays a role in assessing completeness. Completeness provides a final, overall measure of data quality for the project. A realistic project goal of 90 percent for each analyte is established.

E.1.3.2 Qualitative Objectives: Comparability and Representativeness

Comparability

Comparability describes the extent to which valid comparisons between measurements taken at different locations and different times can be made. Like representativeness, comparability can only be ensured in a qualitative fashion. Consistency in sampling methods, measurement devices, calibration practices, and reporting limits and units (Table E-1) will help to ensure comparability. Deviations from protocols will be noted in field records and used for data validation as described in Section E.4.

Representativeness

An important goal of the field investigations is to collect data that are representative of conditions at the site. Since the true conditions, i.e., chemical concentrations, are not known in an absolute sense, they cannot be compared to the measured values in a quantitative fashion. Instead, quality control samples and other procedures are used to qualitatively assess data representativeness.

Field procedures, such as equipment decontamination before sampling and adherence to established practices for sample collection, help ensure that the data collected represent subsurface conditions at the site and are not compromised by sampling methods or cross-contamination.

As a check on cross-contamination from sampling equipment during soil sampling, equipment blanks will be collected at a rate of one per day when soil sampling occurs using field sampling tools. Prior to use in collecting a soil sample, laboratory grade de-ionized water will be poured over the field sampling tool (e.g. stainless steel hand shovel) and allowed to drain into sample containers. This is done in the field after equipment decontamination but prior to sample collection. Analytical data from the equipment blanks will be used for data validation as described in Section E.4.

Sample preservation and custody procedures, described in Section E.2.2, such as the check on sample temperature and headspace (for groundwater samples) by the laboratory upon receipt of samples, and

adherence to method preservation and holding time requirements (Table E-1) help ensure that subsurface analyte concentrations have not been altered in the storage and shipping process. Additionally, a temperature blank - a laboratory-supplied 40-milliliter (mL) glass container of water - will accompany each cooler to the laboratory, and the temperature will be measured upon arrival.

As a check on potential cross-contamination of volatile samples during storage and shipping, a trip blank, laboratory-supplied deionized water in the appropriate container(s) for volatile organic compound (VOC) analysis, is normally placed in each cooler sent to the laboratory. Trip blanks will not be required when VOC analysis is not performed.

At the laboratory level, a QC check on cross-contamination from laboratory equipment is accomplished with a method blank, a laboratory-prepared blank sample analyzed with each sample batch. Positive results in a method blank are discussed in the laboratory analytical reports and are used for data validation as discussed in Section E.4.

E.1.4 Documentation and Records

The following documents and records will be maintained for this project:

- RAP
- QAPP
- HASP
- Daily Field Reports (DFRs)
- Chain-of-custody (COC) forms
- Laboratory Data Reports (LDRs)
- Waste manifests and bills of lading
- Survey reports

The Project Manager is responsible for maintaining the above records. Documentation will be maintained for a minimum of 5 years following completion of the project.

E.2 DATA GENERATION AND ACQUISITION

This section describes the general procedures that are to be followed by all Field Staff involved in data collection.

E.2.1 Sampling Requirements

As described in detail in Section 3.0 of the RAP, the data collection program consists of randomly generated confirmation soil sample locations within remediation area floor.

Remedial excavation floor and sidewall soil samples will be analyzed for chemicals of potential concern (COPCs), as follows:

- Total petroleum hydrocarbons as gasoline (TPH-G) using United States Environmental Protection Agency (EPA) Method 8015M;
- Total petroleum hydrocarbons as diesel and motor oil (TPH-D/TPH-O), carbon chain identification, C13 to C44 using EPA Method 8015M;

- VOCs using EPA Method 5035/8260B;
- SVOCs including polynuclear aromatic hydrocarbons using EPA Method 8270C;
- Organochlorine pesticides and PCBs using EPA Method 8080; and
- Title 22 metals using EPA Method 6000/7000.

E.2.2 Sample Handling and Custody

E.2.2.1 Sample Containers, Preservation, and Holding Time

Container type, holding time, and preservation methods for analytical samples will conform to the specific analytical method as summarized in Table E-1.

E.2.2.2 Sample Numbering and Labeling

All samples submitted for analysis, including quality control samples, will be assigned a unique identification number.

All samples submitted for analysis, including QC samples, will be assigned a consecutive and increasing whole number as the sample identification. In addition to the sample number, the project location, sampler's initials, and the date and time of collection will be included on the sample label. Sample tracking will be accomplished via the COC records.

Equipment field blanks will also be submitted blind and will be given fictitious names beginning with "water" then the day of sample collection using the YYYY-MM-DD format. For example, the blank collected on August 18, 2015 would be "water-2015-10-18".

The location of each confirmation sample will be surveyed by a hand-held GPS in the field.

E.2.2.3 Sample Custody

All samples submitted to the analytical laboratory, including quality control samples, will be accompanied by a COC. COCs allow for the tracing of possession and handling of the samples from the time of field collection through laboratory analysis. Field Staff will be trained in the proper procedures for completing a COC.

The person accepting custody of samples at the analytical laboratory shall break the custody seals on the coolers and shall check the samples against the COC. The receiving personnel will enter all arriving samples into a laboratory logbook and note any problems or discrepancies between the samples, the COCs, sample containers, and seal conditions and report them immediately. If no problems or discrepancies are apparent, the receiving personnel shall sign the COCs. The samples shall be assigned a unique lab number for analysis, which will be cross-referenced to the original field sample number, recorded in the laboratory notebook, and reported in the laboratory report. The analytical laboratory retains one copy of the COC, and returns one copy of the COC to the site superintendent or QA/QC officer.

COC protocol is followed for all soil and water samples selected for laboratory analysis. The COC form(s) accompanies the samples from the Site to the laboratory, providing a continuous record of possession prior to analysis.

E.2.2.4 Sample Packing and Shipment

After the samples have been labeled and documented in the COC record, they are placed in a cooler with ice to achieve a temperature of approximately 4 degrees Celsius (ºC) prior to and during transport to a state-certified laboratory for analysis. Samples not selected for immediate analysis may be transported in a cooler with ice and archived in a frostless refrigerator at approximately 4ºC for possible future testing.

E.2.2.5 Field Documents and Records

Field technicians will document all field activities during site remediation activities. Field documentation to be completed includes:

HASP – Daily Meeting Attendance Record

Every day, prior to commencement of the field activities, field technicians will provide a site health and safety meeting to all personnel involved (including staff, visitors, agency leaders, and subcontractors). Following the meeting, all personnel will sign and date an attendance record to confirm that they have attended the meeting and they understand the scope of work and safety protocol involved in the field activities.

Daily Field Records

The Site Superintendent or a field technician will fill out a daily field record (DFR) sheet and include the job name, project number, day and date, location, and weather conditions. Other information to be recorded on DFR sheet will include:

- A detailed chronological record of activities and events
- Variances from the RAP or Confirmation Sampling Plan
- Records of telephone conversations
- Equipment cleaning and calibration notes
- Field Data Sheets and calibration record for specific equipment will be attached

Field Records

The following will be recorded in a field logbook by the Site superintendent or Field Technicians:

- The start and end of activities each day;
- The reason any sampling point cannot be accessed;
- The time of soil sampling at each sample location and the name of the sampler;
- The corresponding primary soil sample for each field duplicate soil sample that is collected;
- The time each cooler of confirmation samples are picked up by the laboratory's courier and the name of the courier; and
- Any deviations from these procedures, the reason(s) for the deviation, and the personnel involved in the decision.

E.2.3 Analytical Methods

Analytical methods are listed in Table E-1. Methods were selected in order to obtain reporting limits below the cleanup goals.

E.2.4 Quality Control

Field and laboratory quality control measures are discussed in Section E.1.4. Level 2 laboratory QA/QC measures will be implemented.

E.2.5 Instrument and Equipment Testing, Inspection, and Maintenance

Various field instruments (PID, four gas meter, etc.) will be used during field activities at the site, including monitors for airborne particulate monitoring. Field instrument maintenance will be documented in the field data sheet for each instrument used during field activities. Field equipment will be maintained when routine inspections indicate the need for maintenance. In the event that a piece of equipment needs repair, a list of the field equipment manufacturers' addresses, telephone numbers, and points of contact will be maintained on site during field activities. Field equipment routine maintenance may include:

- Calibrating equipment according to manufacturers' directions
- Removing surface dirt and debris
- Replacing and cleaning filters
- Ensuring proper storage of equipment
- Inspecting instruments prior to use
- Charging battery packs when not in use
- Maintaining spare and replacement parts in field to minimize downtime.

The primary objective of a preventive maintenance program is to help ensure the timely and effective completion of a measurement effort by minimizing the downtime of crucial equipment due to expected or unexpected component failure. Laboratory instrument maintenance including standard preventive maintenance procedures and schedules will also be followed. Instruments will be continually monitored by the use of daily standards, sensitivity, and response checks to determine if maintenance is required.

E.2.6 Instrument and Equipment Calibration and Frequency

Methods for calibration of field instruments will follow the specific instrument manufacturers' recommendations. All field instruments will be calibrated before each day of use. A calibration check at the end of the day will be performed to verify that the instrument remained in good working condition throughout the day. If the calibration check at the end of the day does not meet acceptance criteria, then the day's data will be flagged and the instrument calibration checks will increase to the operator's satisfaction that the instrument remains true to the initial calibration.

Laboratory instrument calibration will be performed as specified in the method documentation. Specific laboratory calibration techniques are established for the U.S. EPA methods to demonstrate that the analytical instrument is operating within the design specifications and that the quality of the data generated can be replicated.

E.2.7 Inspection and Acceptance for Supplies and Consumables

Supplies and consumables used during remediation activities (e.g., stainless steel sample tubes, deionized water, and calibration gases) will be inspected by field technicians for damage and cleanliness prior to use.

E.2.8 Data Acquisition Requirements (Non-direct Measurements)

Data needed for project implementation or decision-making that are obtained from non-direct measurements include historical site documents and literature files. Data from previous investigations (e.g., lithology, soil analytical data) may be used as a reference for field implementation or field decision-making aspects of this project.

E.3 ASSESSMENT AND OVERSIGHT

Performance assessments of laboratory and field operations may be conducted to assess the effectiveness of the QAPP, identify any non-conformances, and verify correction of identified deficiencies. Assessments include, but are not limited to, technical systems audit (i.e., laboratory audits), field operations audits, and audits/assessment of data quality.

E.3.1 Assessments and Response Actions

The QA/QC officer will evaluate the need for a performance audit of the laboratory with due consideration given to the recommendations of the Site Superintendent. Performance audits are utilized to quantitatively assess the accuracy of measurement data through the use of performance evaluation and blank check samples.

System audits may be conducted at the discretion of the QA/QC officer. The audits may be conducted of field operations to review the data generation process. The system audits may include on-site review of the field operations, sampling activities, equipment, calibration procedures, or any other procedures described in this QAPP.

E.3.2 Reports to Management

Audit and assessment reports will be reviewed by the Site Superintendent and/or Project Manager. The reports will contain information regarding:

- Status of the project
- Results of performance evaluations and system audits
- Results of periodic data quality assessments
- Significant quality assurance problems and recommended solutions

E.4 DATA VALIDATION AND USABILITY

This section of the QAPP addresses the final project QA to determine if the data collected during remediation activities conform to the specified criteria discussed in the Soil Sampling Plan (Appendix E of the RAP) and estimate the effects of any deviations. Field and laboratory data will be evaluated with respect to the DQOs discussed in Section E.1.4 of this QAPP. The process presented below will invalidate data determined to be inaccurate, imprecise, unrepresentative, or incomparable. Completeness will be calculated for each analyte as the last step in the validation process.

Step 1 – Laboratory Evaluation

Each LDR will be checked to ensure that the samples arrived intact and cold (temperature blank measurement of 4±2°C). For each analyte, the sample collection dates and times will be compared to the dates of analysis to ensure that required hold times (Table E-1) were not exceeded. Any non-

conformances will be discussed with the laboratory to determine the effects on the validity of the analytical results. This discussion will be used to determine, on a case-by-case basis, if the data are unrepresentative and should be invalidated.

Secondly, each LDR will be reviewed for non-conformances in internal laboratory QC samples – positive detects in method blanks, surrogate or spiked sample recoveries that are out the accepted accuracy range, and relative percent differences between spiked sample duplicates that may indicate an unacceptable method precision. Usually, any non-conformances will be noted in the laboratory report case narrative along with an assessment, based on internal laboratory procedures, of whether the batch data are acceptable. Any data deemed invalid by the laboratory will also be invalidated by the PC; conversely, data deemed acceptable by the laboratory will also be accepted by the PC.

Step 2 – Equipment and Trip Blank Evaluation

Analytical results for field equipment blanks will be evaluated to determine if potential contamination from field procedures could have occurred, for example, from improperly cleaned sampling equipment that could potentially cause cross-contamination from one sample location to another sample location. Any detections of analytes in the equipment blank will be compared to the detections in the field samples to determine if there is any correlation. Detections of analytes in the equipment blank that are determined to have a correlation with analytical results from field sample(s) will be noted on the LDR and will be subject to re-testing and/or additional field sampling.

Step 3 – Evaluation of Field Duplicates

To assess method precision, the RPD will be calculated for field duplicates as discussed in Section E.1.3.1. Out-of-range precision values for field duplicates will invalidate the data for both samples.

Step 4 – Completeness

Completeness will be calculated to provide a final, overall measure of data quality for the project. A completeness goal of 90 percent is established.

E.5 DATA MANAGEMENT

The principal objective of a data management plan is to provide consistent and rapid access to accurate, validated data useful to site decision-makers. Specific data management objectives for this project include:

- Ensuring that large volumes of both non-electronic and electronic data can be efficiently accessed
- Ensuring that uncorrupted field data are transferred to a long-term, easily accessed data storage system
- Ensuring that the description of each data point is accurate, meaningful, and complete

A data management plan for each site data medium is discussed below.

Field-Generated Data

All DFR sheets (Section E.1.4 and Section E.2.2.5) generated during the project will be photocopied and stored in the project file by the Project Manager. The originals will be maintained by the Site

Superintendent or field technician generating the data. GPS data will be submitted to the QA/QC Officers for input into the project database.

Laboratory-Generated Data

Laboratory analytical results will be received from the laboratory both as printed, signed reports (LDRs) and as electronic deliverables (EDDs) or Excel files. Laboratory data will be preserved in an Access database, which will be designed to easily manipulate data by date, location, medium, analyte, depth, QA/QC level, and Field Technicians generating the data (see below). Each sample will be uniquely identified as described in Section E.2.2.2.

Survey Data

Survey data will be obtained in electronic form from a licensed surveyor, and downloaded into the database.

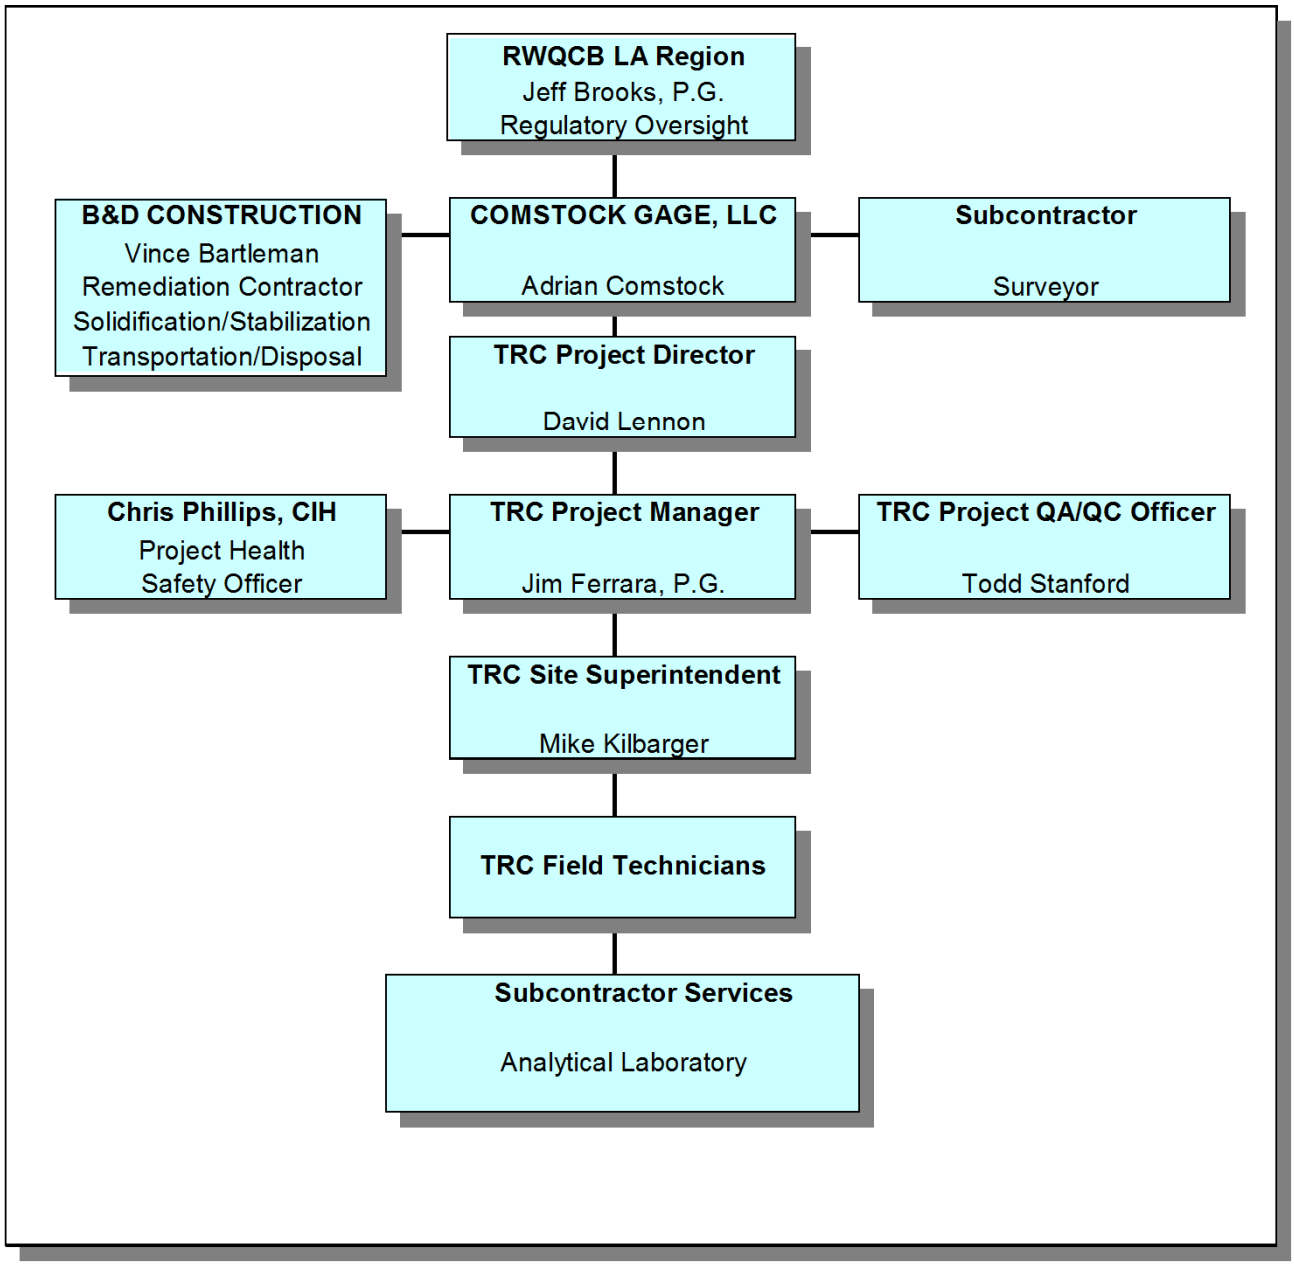

FIGURE E-1
PROJECT ORGANIZATIONAL CHART

TABLE E-1

SAMPLE CONTAINERS, PRESERVATION, AND HOLDING TIMES FOR SOIL
Gage Avenue Disposal Site
Commerce, California

Parameter (EPA Method)	Number of Containers Per Sample	Preservation	Holding Time
SOIL			
VOCs (EPA Method 5035/8260B)	O2si Sample Smart Samplers	None, 4°C	14 days from VTSR (1)
TPH C4 - C12 (EPA Method 8015B)	Two 8-oz glass jars with Teflon lid	None, 4°C	14 days from VTSR (1)
TPH C8 - C44 (EPA Method 8015B)			
SVOCs (EPA Method 8270C)			
Title 22 metals (EPA 6010B/7471A)			
Organo Chlorine Pesticides and PCBs (EPA 8080)			
WATER			
Petroleum Hydrocarbons (TPH-G) (EPA 8260B)	Three 40-mL VOA vials	HCl, 4°C	14 days from VTSR
VOCs (including Oxygenates) (EPA 8260B)			
Petroleum Hydrocarbons (TPH-D, TPH-O) (EPA 8015B[M])	One 500-mL amber glass	None, 4°C	7 days from VTSR for extraction
SVOCs (EPA 8270C)	One 1-L amber glass	$Na_2S_2O_3$, 4°C	7 days from VTSR for extraction
Title 22 metals (EPA 6010B/7471A)	One 250-ml HDPE	HNO_3, 4°C	180 days from VTSR
Organo Chlorine Pesticides and PCBs (EPA 8080)	One 1-L amber glass	None, 4°C	7 days from VTSR for extraction

Notes:
mL = milliliters
L = liters
EPA = Environmental Protection Agency
TPH-D = diesel range organics
HCl = hydrochloric acid
H_2SO_4 = sulfuric acid
VOA = volatile organic analysis/analyte
HDPE = high density polyethylene
VOCs = volatile organic compounds
VTSR = verified time of sample receipt
(1) = represents the minimum holding time for all parameters; metals (6010B) has a holding time of 180 days from VTSR, mercury (7471A) has a holding time of 28 days from VTSR, and SVOCs and PCBs have holding times of 14 days from VTSR for extraction and then 40 days after extraction for analysis

APPENDIX F

SOIL CLEANUP CRITERIA

APPENDIX F

Soil Cleanup Criteria

This appendix presents the methodology and soil screening levels (SSLs) used to select the recommended soil cleanup criteria for the property formerly known as the Gage Avenue Dump, eastern portion that currently lays underneath the 7.78 acre land parcel at 7316 Gage Avenue in the City of Commerce, CA (Site). The recommended soil cleanup criteria for the Site are a combination of published SSLs and background (ambient conditions) values for metals and PAHs.

The TPH soil cleanup criteria are from Los Angeles Regional Water Quality Control Board's (RWQCB) *Interim Site Assessment and Cleanup Guidebook* (RWQCB, 1996) for total petroleum hydrocarbons (TPH) above drinking water aquifers. The recommended TPH soil cleanup criteria for the Site are for TPH detected in soils that are at a distance ranging from 20 to 150 feet between the source contamination and groundwater. Groundwater at the site is located at least 48 feet below the base of the landfill.

The SSLs compiled for the recommended soil cleanup criteria for the remaining COPCs include protection of human health and groundwater, urban area ecotoxicity, ceiling values, and background concentrations (for certain naturally-occurring metals and PAHs that are ubiquitous in urban environs). Since the intent of the removal action is to restore the site for unrestricted use, SSLs for protection of human health are based on residential standards. Other factors considered in determining the proposed soil cleanup levels include urban area ecotoxicity and ceiling values. The SSLs are from the following hierarchy of sources:

- San Francisco Bay RWQCB December 2013 Environmental Screening Levels (ESLs) Table A-1. Shallow Soil Screening Levels (<3m bgs), Residential Land Use, (groundwater is current or potential drinking water resource) (RWQCB, 2013);
- Department of Toxic Substances Control (DTSC) July 14, 2014 *Human Health Risk Assessment Note 3, DTSC recommended methodology for use of U.S. EPA Regional Screening Levels (RSLs) in the human health risk assessment process at hazardous waste sites and permitted facilities*, Office of Human and Ecological Risk (HERO) (DTSC, 2014); and
- United States Environmental Protection Agency (USEPA) January 2015 Regional Screening Levels (RSLs) (USEPA, 2015).

In addition to potential direct human or ecological impacts, consideration was also given to protection of groundwater. The RWQCB and USEPA both have published SSLs for protection of groundwater. USEPA has established two types of screening levels that are based on groundwater protection (i.e., risk-based and maximum contaminant level [MCL]-based). As discussed above, preference was given to the RWQCB ESLs for protection of groundwater. In the event that a SSL for protection of groundwater was not established, USEPA risk-based SSLs were selected. If a risk-based USEPA SSL was not established, the MCL-based USEPA SSL was selected. Since the USEPA RSLs for the protection of groundwater were developed using a

dilution attenuation factor of 1, a dilution factor of 10 was applied to all USEPA RSLs for the protection of groundwater SSLs to account for the minimum distance of 48 feet between the base of the landfill and groundwater. The SSLs evaluated for the recommended soil cleanup criteria are provided in Tables F-1 and F-2.

As discussed above, background values for metals and PAHs were also evaluated for the recommended soil cleanup criteria. The background values for arsenic and PAHs were obtained from the following sources:

- *Determination of a Southern California Regional Background Arsenic Concentration in Soil* (Chernoff, et.al., 2008); and
- *PAH background from Use of the Northern and Southern California Polynuclear Aromatic Hydrocarbon (PAH) Studies in the Manufactured Gas Plant Site Cleanup Process* (PAH Advisory, DTSC, 2009).

The PAH background values presented in the PAH Advisory were developed for a benzo(a)pyrene (BaP) equivalent and range from 0.24 mg/kg (95% upper confidence limit [UCL] of the mean) to 0.9 mg/kg (95% upper threshold limit [UTL]). The BaP equivalent is calculated using measured concentrations of the carcinogenic PAHs and multiplying the values by California Environmental Protection Agency (CalEPA) potency equivalency factors listed in the PAH Advisory (DTSC, 2009). The PAH background values evaluated for the proposed soil cleanup criteria are based on the PAH Advisory 95% UCL BaP equivalent background value 0.24 mg/kg. This value was divided by CalEPA's chemical specific potency equivalency factors listed in the PAH Advisory (DTSC, 2009). The PAH and arsenic background values are presented in Table F-1.

The background values for the metals that do not have a published value were developed using background data sets published on DTSC's Envirostor for school sites that are located near the Site. The following schools site background data sets were used (Table F-3):

- Laguna Nueva School Site, Gage and Garfield Avenues, City of Commerce, California (CTL, 2002);
- Griffiths Middle School, 9633 Tweedy Lane, Downey, California (Levine-Fricke, 2005); and
- Proposed South Region Elementary School #3, Bell/Cudahy, California (URS, 2006). The background samples collected for this school were collected from two South Gate city parks located near Los Angeles Unified School District's South Gate Elementary School #7.

The background data set for these three schools provided a background data set for the Site with twenty (20) background samples. USEPA's ProUCL software (Version 5.0.00; USEPA, 2013) was used to develop UCLs based on the distribution of the data for each metal. This software considers non-detect values in the development of the UCLs. The 95% UCL of the arithmetic mean concentration was selected as the background concentration for each metal (Table F-1). Table F-4 presents the ProUCL output for the metals background dataset.

For the COPCs selected for evaluation as a component of this project, the proposed soil cleanup criteria represent the lowest SSL that is protective of human health, groundwater, urban area ecotoxicity, and ceiling values. For naturally occurring elements (e.g., metals) and PAHs that are ubiquitous in urban environments, representative background concentrations for these constituents were used when lowest of the SSL values was below the representative background concentration. Table F-1 presents the recommend soil cleanup criteria for the Site.

Abbreviations:
-- = Not available/applicable
mg/kg = Milligrams per kilogram

Footnotes:
[a] Background levels from the following sources:
Metals: G. Chernoff, W. Bosan and D. Oudiz March 2008 Determination of a Southern California Regional Background Arsenic Concentration in Soil. All other metals are the 95% upper confidence limit (UCL) of background soil samples collected for nearby schools, which are presented in Appendix F-3.
PAHs: PAH background from Use of the Northern and Southern California Polynuclear Aromatic Hydrocarbon (PAH) Studies in the Manufactured Gas Plant Site Cleanup Process. The 95% UCL of the mean of 0.24 mg/kg was selected. This value was divided by the chemical specific potency equivalent factor (benzo(a)anthracene 0.1 and chrysene 0.01).

[b] The human health residential soil screening levels, urban area ecotoxicity and ceiling values are from the San Francisco Bay Regional Water Quality Control Board (RWQCB) December 2013 Environmental Screening Levels (ESLs) Table A-1. Shallow Soil Screening Levels (>3m bgs), Residential Land Use, (groundwater is current or potential drinking water resource).

[c] The protection of groundwater soil screening levels are from the RWQCB ESLs published December 2013. If the RWQCB did not have a protection of ground-water value then the United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) published January 2015 were selected. The Risk-based RSLs were selected first. If no Risk-based RSL is available, the maximum contaminant level (MCL)-based RSL was selected. A dilution attenuation factor of 10 was applied to all USEPA protection of groundwater, since the groundwater at the site is at least 48 feet below the base of the landfill.

[d] The recommended soil screening level is the lowest screening level between residential, protection of groundwater, and ceiling values where no background levels are available. Background was selected as the recommended soil screening level if background value is higher than the lowest screening level.

Suggested UCL to Use			
95% Student's-t UCL	9.546		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)			
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.			
For additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

95% Gamma Approximate KM-UCL (use when n>=50)	1.914	95% Gamma Adjusted KM-UCL (use when n<50)	1.931
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detected data is small such as < 0.1			
For such situations, GROS method tends to yield inflated values of UCLs and BTVs			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.884	Mean	1.739
Maximum	2.6	Median	1.78

Mike Glenn / TRC Health & Safety Director	(949) 727-7347	(949) 697-7418

Notes:
*OHSO – On-Site Health & Safety Officer. The OHSO is 40-hour OSHA certified, is current on refresher training, and has OSHA 8-hour supervisor training. The OHSO can be Field Lead or a member of the Field Staff as suits the work at hand and/or the availability of qualified personnel.

1.2 Emergency Medical Assistance

Table 3 - Emergency Telephone Numbers		
Service	**Emergency Telephone Numbers**	**Direct Telephone Numbers**
Police: Los Angeles County Sheriff	**Emergency:** 911	**323-264-4151 Police Department**

Table 3 - Emergency Telephone Numbers		
Service	**Emergency Telephone Numbers**	**Direct Telephone Numbers**
	911	
Fire: Los Angeles County Fire Department		323-721-3886
Ambulance: ____Care Ambulance Service		323-720-1578
Poison Control: (use applicable local number)	800 222-1222	
CHEMTREC:		800-424-9300 (Customer No. CCN 671126)
WorkCare (Early Incident Intervention)	888 449-7787	

1.3 Medical Facility Identification and Directions

Hospitals or clinics identified for emergency medical care should be contacted, to verify that emergency care is provided at that location. Verify the exact location of the medical facility during this call.

Drive the emergency route as defined below before the fieldwork begins to verify that the planned route is feasible.

Nearest Hospital: Downey Regional Medical Center

Hospital Address: 11500 Brookshire Avenue

Hospital Telephone Number: 562-904-5111

Directions to Hospital (see attached Map):

Head northeast on Gage Ave.
Take the ramp to I-5 South
Turn right onto I-5 South
Take the Lakewood Blvd/CA-19 exit toward Rosemead Blvd
Keep right at the fork, follow signs to Brookshire Ave.
Turn left onto Brookshire Ave.
Downey Regional Medical Center will be on the left.

Map to Hospital:

1.4 Utility Clearance Information

Table 4 – Utility Clearance Information		
Clearance Organization, Number and Utilities Covered	**Clearance Numbers (or Other Documentation) and Date Obtained**	**Expiration Dates/Other Notes**
Specify Clearance Service – 811 ▪ Dig Alert ▪		
Local/Municipal/Other – None		
Local/Municipal/Other – None		
Local/Municipal/Other – None		
Notes: Use Drilling/Borehole/Excavation Checklist in **Appendix A** before conducting intrusive or overhead work with the potential to encounter utilities.		

2. Site Information

This Health and Safety Plan covers the activities associated with TRC's conduct of surface soil excavation, soil vapor probe installation, and soil sample collection.

The Site is the eastern 7.78 acre land parcel of what was known as the "Gage Avenue Dump" which operated between 1950 and 1954. During that period, the Site is reported to have accepted municipal solid wastes, construction debris and inert fill materials and was later redeveloped into an industrial property. Prior to 1950, aerial photographs show the Site was used for agricultural purposes. The Site is identified on the CalRecycle website, Solid Waste Information System (SWIS) database as Facility No. 19-AA-5543.

The Site was purchased by Comstock in December 2013, and retains the site address of 7316 East Gage Avenue. Several entities, including International Paper Company, have utilized the property for industrial purposes from the 1950s through the early 1990s. Subsequently, the property was cleared of its warehouse structures and envisioned by developers for numerous uses until recently acquired by Comstock.

3. Work Scope Summary

The proposed work will be performed by TRC (and any other subcontractor's name) and will include but may not be limited to the following activities:

Remove surface soil to approximately 2 to 3 feet in depth by 36 inches in width from five previously excavated trench sidewall locations for soil sample collection.
Install five (5) temporary soil vapor probes and collect one (1) soil vapor sample from each vapor probe, and
Hand auger/excavate beneath the rail road spur in five (5) different locations for soil sample collection.

4. Roles/Responsibilities

Per the TRC RMD HASP Template Development Memorandum, Roles and responsibilities descriptions are required in all cases where a specific safety-related plan or permit is required such as permit-required confined space entry and Lock Out/Tag Out. The OSC or Project Manager may also require role and responsibility at their discretion. Given the potential to encounter damaged electrical infrastructure and the emergency nature of the response actions tasked to TRC in this case, a description of roles and responsibilities is necessary and appropriate for this work is provided below. As noted below, per TRC policy all employees are empowered to stop work if they feel it is unsafe to continue. Safety issues must be brought to the attention of the Project Manager.

4.1 Stop Work Authority

All TRC employees and subcontractor employees have the authority and obligation to stop any project if they observe a condition that could put people or equipment at risk. TRC's Stop Work Authority policy is summarized below.

What is Stop Work Authority?: Stop Work Authority is the ability to stop work if there is a potential safety issue. Employees will not be reprimanded for issuing a stop work and all project employees will adhere to the stop work condition and no work will continue until the issues have been resolved. The Stop Work Process includes appropriate training, stopping the work, notifying Project Manager of the stop work condition, correcting the condition and resuming operation once the condition has been corrected.

Policy Understanding and Management Responsibility: Employees are required to read and understand the Stop Work Authority policy in order to recognize conditions that could warrant a stop work injunction. Project Managers will encourage employees to initiate stop work authority when necessary and notify other employees and the client of the stop work condition. The Project manager will conduct an investigation into the conditions that led to the stop work order and verify that the unsafe condition has been corrected before work can recommence. Work can only continue when it is safe to do so.

Stop Work Related Reporting: A written report will be prepared by the Project Manager that documents the reason for the stop work, the corrective measures taken and the lessons learned from the incident. These reports will be reviewed by the TRC Safety Department and Senior Management and also shared with the client. Once work has resumed after the stop work condition has been closed the

Project Manager or designee will conduct a follow-up inspection to verify that the safety concerns have been addressed and corrective measures implemented.

4.2 Project Manager

The TRC Project Manager is responsible for controlling the technical work in an environmentally safe manner, assuring that operational hazards are minimized and that appropriate precautionary actions are implemented this during project work. Specific responsibilities include but are not limited to:

- Implementing and confirming that all subcontractors to TRC are prequalified to conduct the work included in their Contract, including health and safety pre-qualifications.
- Verifying that all TRC personnel involved with this project have the required training and medical clearance for the work and environment they will be assigned.
- Verifying that all personnel involved with this project have read and understand this HASP and have signed the HASP.
- Assuring that all personnel involved with this project have attended a briefing or a tailgate safety meeting regarding the contents of the HASP and site-specific hazards prior to performing work.
- Determining that sufficient personal protective equipment (PPE), air monitoring equipment and other equipment, as required by this HASP, are available and that the personnel are training in the proper use of PPE as well as other administrative and/or engineered controls.
- Assuring that all subcontractor personnel submit documentation of employee participation in a medical, training and drug & alcohol programs (when applicable).
- Promoting and maintaining a high level of health and safety consciousness among the field personnel.

4.3 On-Site Health & Safety Officer

The On-Site Health & Site Safety Officer (OHSO) is responsible for ensuring the Health & Safety guidelines are followed, in addition to monitoring for airborne contaminants when necessary and evaluating new hazards and operation changes. The OHSO has the authority to correct all noncompliance situations immediately and to stop work in cases of immediate danger. Specific responsibilities include but are not limited to:

- Performing daily safety meetings prior to commencement of work, commencement of a new task and whenever new personnel arrive.
- Obtaining the air monitoring instrumentation required and conducting or directing the necessary air monitoring.
- Verifying that all PPE and other health and safety equipment are in proper working condition.
- Advising the Project Manager and field personnel on matters relating to health and safety.
- Recommending appropriate PPE and air monitoring instrumentation to protect personnel from site hazards and coordinating the upgrading and downgrading of PPE as specified in the HASP.
- Establishing and maintaining the work zones per the HASP.
- Conducting field observations to monitor the effectiveness of the HASP and to assure compliance with the HASP.
- Performing personal exposure monitoring where required and to determine the adequacy of protective measures and PPE specified by this HASP. Working with the Project Manager to ensure that sufficient PPE is available onsite.
- Conducting briefing meetings and apprising personnel of the contents of the HASP and site hazards.
- Supervising and monitoring the safety performance of all field personnel to ensure required safety and health procedures are followed and correct any deficiencies.
- Initiating emergency response procedures, as well as incident reporting and near miss reporting.
- Notifying the Project Manager and Office Safety Coordinator of all noncompliance and dangerous situations.
- Reporting all accidents/incidents/near misses to the Office Safety Coordinators and/or Project Manager.

4.4 Office Safety Coordinators and Line Managers

The OSCs and Line Managers are responsible for the following:

- Providing managerial and executive level support for all matters regarding project health and safety.
- Assisting the Project Manager in developing the HASP and identifying task-specific Job Safety Analyses (JSAs) to incorporate in the plan.
- Safety Observations.
- Near miss/incident investigations.
- Accident/incident investigations.

4.5 Field Lead

The TRC Field Lead is responsible for the field operations needed to complete the project. The Field Lead may also be the OHSO. Specific responsibilities include but are not limited to:

- Leading by example.
- Ensuring all equipment needed for the project is available and properly maintained.
- Ensuring field personnel have received the necessary training and Health & Safety briefings before work begins.
- Correcting any deficiencies regarding health, safety or operating procedures.
- Communicating newly identified hazards or noncompliance issues with the OHSO, OSC(s), and TRC Management
- Reporting any injuries and illnesses to the Project Manager, OSHO, and OSCs.

4.6 Field Personnel/Staff

All field personnel are responsible for following the health and safety procedures specified in this HASP and work practices specified in applicable operating procedures. Some specific responsibilities include but are not limited to:

- Maintaining an awareness of their training status and demonstrating that they have the required training and medical clearance for the work and environment they will be assigned.
- Reporting all accidents, incidents, injuries, illnesses, or near misses to the Field Lead.
- Complying with the requests of the OHSO and Field Lead.
- Immediately communicating newly identified hazards or noncompliance issues to the OHSO and Field Lead.

5. Hazard Assessment

This HASP assumes that an ongoing hazard assessment process with Project Management and TRC Office Safety Coordinators (OSCs) will take place regularly (via meetings/teleconferences), supplemented by ad hoc communication on project safety needs, to ensure the project work is conducted at a high level of technical excellence both safely and efficiently. Where the on-going hazard assessment indicates the presence of hazards, tasks, or other activities that are not adequately covered by the HASP and supporting documentation and/or staff training levels, supplemental planning will be conducted and documented in a revised or higher level HASP document and appropriately trained personnel assigned.

5.1 Chemical Hazards

Based on previous experience within urban areas and a review of other disposal sites in the area, the following contaminants is expected in soil and/or groundwater along the proposed pipeline route:

- Petroleum hydrocarbons (e.g., benzene, mineral oil dielectric fluid)
- Heavy Metals, i.e.: Arsenic
- Disposal site gases i.e.: Methane, Volatile Organic Compounds (VOCs)
- Pesticides

TRC also anticipates the presence of the following chemicals in laboratory bottles used as sample preservatives: hydrochloric acid. In addition, TRC anticipates the use of methyl alcohol (methanol) during decontamination procedures. Material Safety Data Sheets (MSDS) for preservatives and decontamination products are provided in **Appendix B**. Sample bottles containing hazardous preservatives will be handled with care. Sample bottles will be checked for leaks and lids tightened. Cut resistant and chemical resistant gloves and safety glasses will be worn at all times when handling sample bottles (see table below concerning edges and material handling).

Isobutylene will be used during a short time period at the beginning of each work day to calibrate the PID. 100 ppm isobutylene will be primarily contained in a tedlar bag. Any gas that is released to the air will quickly disperse and will not pose a threat to on-site workers. No further monitoring is required for isobutylene. A multi-gas meter will be used which will use a calibration gas containing methane, oxygen, carbon monoxide, and hydrogen sulfide.

5.2 Key Physical Hazards

Key physical hazards are outlined below. If a Job Safety Analysis (JSA; see Section 10 and supporting appendix) has been included, this is signified below in first column.

Table 5 - Key Physical Hazards Matrix

JSA	APPL.	KEY PHYSICAL HAZARDS	GENERAL CONTROL MEASURE
☐	☒	Edges/material handling	Cut resistant gloves are required to be worn at all times while performing all tasks. A glove selection guideline is presented in **Appendix C**.
☐	☒	Weather	Heat and cold stress are a potential concern for on-site workers. Please refer to **Appendix D** for the signs, symptoms and precautions for cold and heat stress, and required breaks. Work will also occur during a time of year when thunderstorms are possible/likely. If thunder or lightning is noted by onsite personnel, work will cease until the storm passes (thunder and/or lightning ceases and is not observed over at

Table 5 - Key Physical Hazards Matrix

JSA	APPL.	KEY PHYSICAL HAZARDS	GENERAL CONTROL MEASURE
			least a 15-minute period). Personnel will seek shelter in buildings or vehicles
☐	☒	Energized Sources (electrical equipment or hookups, lines, etc.)	Personnel engaged in electrical activities, and any facility equipment with moving parts must follow proper lock-out/tag-out procedures, and only properly trained employees will perform the work. Heed any caution signs or labels.
☐	☒	Slips, Trips, Falls	Be aware of uneven ground, and buried debris (metal, plastic, etc.), to avoid potential slip/trip/fall hazards, and use caution near open excavations. Maintain good housekeeping practices to eliminate physical hazards. Use proper lifting techniques to avoid injury and obtain help when lifting greater than 50 lbs. Be aware of uneven ground to avoid potential slip/trip/fall hazards and also of buried debris (metal, plastic, etc.). Sites with unprotected edges >6' require barricades and/or fall protection equipment. A fall protection plan will be required if there is leading edge work including excavations >6' deep.
☐	☒	Heavy Equipment	Use caution around construction equipment and emergency response vehicles. Ensure the operator of the construction/emergency equipment is aware of the location of onsite personnel at all times to avoid potential injury to onsite workers (e.g., maintain eye contact with the equipment operator). If full visibility is not possible during movement of equipment a spotter should be used to direct the movement of heavy equipment. A swing zone should be established with cones behind any excavators to prevent injury during movement of equipment. Exercise caution and wear protective equipment as noted herein (e.g., safety toe boots, hard hat, Class 3 reflective safety vest, ear plugs, etc.) around the heavy equipment to prevent crushing and pinching hazards.
☐	☒	Underground or Overhead Utilities	Existing underground utilities are present at the project site. Prior to conducting active excavation, the Site will be visually observed for potential overhead hazards (e.g., tree branches and wires), and drilling/excavation locations will be selected that are located at safe distances from the hazard. (The Dig Alert utility clearance ticket number(s) is (are): _____). Use caution when heavy equipment may come in contact with utilities. Maintain a minimum distance of 10 feet from overhead utilities at all times. Proceed cautiously and with due diligence to minimize the possibility of contacting underground or overhead utilities. Use TRC utility clearance checklist prior to starting any subsurface work.
☐	☒	Driving/Traffic Hazards	Driving to and from the Site each day is considered a physical hazard. Directions and travel time to the Site should be determined in advance (a.k.a. Journey Management Planning) and adequate time should be allocated to drive safely. The use of cellular phones is prohibited, and distracted driving should be avoided. Seatbelts must be worn at all times while the vehicle is moving. Use caution around traffic flow. Ensure proper traffic control (e.g., signs, traffic cones, jersey barriers, etc., or where jurisdictionally required, police details) are in place prior to and throughout the work day where work takes place in or near traffic. Work personnel must wear ANSI-rated class 3 reflective traffic vests at all times. A site-specific traffic management plan describing procedures to be employed, including barriers, signage, and police detail, will be used for tasks taking place in areas of vehicular traffic.

Notes:
APPL. – Abbreviation for "Applicable."
JSA – Job Safety Analysis

5.3 Other Common Physical Hazards Potentially Present

Other common physical hazards that might be encountered during the course of the work are outlined below. If a JSA (see Section 10 and supporting appendix) has been included, this is signified below in the first column.

Table 6 - Other Common Physical Hazards Matrix			
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Aboveground Storage Tanks (AST)	Be aware of any above ground storage tanks and the type of material being stored in them. Be aware of the potential of spills, sources of ignition, fires, explosions, etc., while working near the tanks. Stay clear of tanks whenever possible, and be aware of any equipment operators near the tank(s).
☐	☐	Arcing, welding, open flame work	TRC personnel will clear the area when work of this kind is undertaken by the client/subcontractor unless properly trained and equipped with PPE.
☐	☐	Blasting/Explosives	TRC personnel shall not handle any explosive devices or materials. TRC personnel should understand the blasting procedures being used by the subcontractor, and all of the associated health and safety precautions. The subcontractor shall handle, store, and use the explosives in accordance with 29 CFR 1926.900, Subpart H and U.
☐	☐	Boat or Barge	A boat or barge should be used that is adequately stable for the type of activity conducted. The boat or barge should have all of the appropriate and current licensing and registrations required by the applicable regulatory agencies. All applicable laws and regulations will be followed when launching the boat or barge, and when navigating to and from the work site. Personal floatation devices should always be worn while navigating the boat or barge. The boat must be registered and equipped with the following approved United States Coast Guard (USCG) safety equipment: A Type I, II, or III personal flotation device (PFD) for every person aboard (should be worn while navigating) The following equipment is also <u>recommended</u>: ✧ A Type IV throwable PFD ✧ Audible distress signal device (air horn, whistle) ✧ Fire extinguisher (if engine-propelled) ✧ Auxiliary propulsion (spare paddles, trolling motor) ✧ Bow and stern lines ✧ Anchor and anchor line ✧ First aid kit ✧ Visual distress signal device(s) (flares, dyes) ✧ Additional PFDs Be familiar with local weather and tidal characteristics. Do not conduct sampling from a boat/barge when threatening weather is imminent, or poor visibility exists. Sampling from a boat is prohibited in water containing substances likely to cause injury upon short-term or prolonged contact. Sampling from a boat is prohibited when the temperature of the water is high or low enough to cause injury upon short-term or prolonged exposure without an exposure suit specified on a project specific basis for use under the anticipated conditions evaluated. Avoid sampling from a boat when

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
			unsafe water turbulence (waves) exists. Avoid standing in a boat. Always use the buddy system when sampling from a boat or barge; one person should be on shore with visual contact of the barge and should be able to summon emergency assistance if needed Be familiar with local weather and tidal characteristics. Work on a boat or barge will not be performed when threatening or severe weather is impending or present.
☐	☐	Business Traffic	Be aware of traffic patterns associated with local businesses near the work site. Allow traffic to enter and exit the businesses in such a manner to avoid creating traffic hazards, back-ups, delays, or potential accident situations. Review directions before all business travel.
☐	☒	Cement Dust	Stay clear of mixing operations and avoid contact with, or breathing of the dust.
☐	☐	Chain Saws/Power Saws	Stay clear of any chain saw/power saw operations. Subcontractor is responsible for the safe use of chain saws/power saws on site.
☐	☒	Cleaning Agents	Use caution of applying cleaning agent to equipment. Use gloves, safety glasses, splash shields, and protective clothing as needed.
☐	☒	Client Activities	Be aware of client activities at or adjacent to the site. Work activities should be coordinated with other site activities to avoid conflicts.
☐	☐	Compressed Air or Gas Cylinders	Compressed air or gas cylinders should be clearly marked, and they should be stored, transported, and secured in accordance with Compressed Gas Association (CGA) requirements (i.e., Publication P-1 - Safe Handling of Compressed Gases in Containers).
☐	☐	Compressed Air/Gas, Pressurized Liquids Hoses, Lines & Fittings	Compressed air or gas, or pressurized liquid lines or hoses should be inspected at least daily, or in the event a leak develops, or if a line or hose is run over or crimped.
☐	☐	Concrete/Masonry/ Foundations	No construction loads shall be placed on a concrete structure or portion of a concrete structure unless a person who is qualified in structural design has determined that the structure or portion of the structure is capable of supporting the loads. All protruding reinforcing steel, onto and into which employees could fall, shall be guarded to eliminate the hazard of impalement. No employee shall be permitted to work under concrete buckets while buckets are being elevated or lowered into position. To the extent practical, elevated concrete buckets shall be routed so that no employee, or the fewest number of employees, are exposed to the hazards associated with falling concrete buckets. A limited access zone shall be established whenever a masonry wall is being constructed. All masonry walls over eight feet in height shall be adequately braced to prevent overturning and to prevent collapse unless the wall is adequately supported so that it will not overturn or collapse. The bracing shall remain in place until permanent supporting elements of the structure are in place.
☐	☐	Confined Spaces (tanks, vaults, vessels, trenches, manholes, some excavations, etc.)	The scope of this project does not entail entry into confined spaces. Confined spaces will not be entered unless a confined space entry permit or other planning has been completed, signed, and approved, and all participating personnel are trained in confined space entry procedures, including safety, and rescue procedures. Real and potential hazards of confined space are not addressed by this hazard assessment, and health and safety plan.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☒	Cutting Tools	Stay clear of contractors' cutting tools, especially saws and torches. Be aware that cutting operations could create other hazards, such as falling objects, or shifting materials, etc. All cutting tools must be inspected and saw blade type reviewed prior to starting work. Appropriate hand protection and safety glasses should be worn while using cutting tools. Spark-proof tools should be used when working in areas of potential explosive or flammable conditions.
☐	☐	Demolition Activities/Debris	Stay clear of walls, ceilings, roofs, etc., as they are being demolished. Demolition material should only be handled by appropriate equipment because of sharp points, edges, etc. Demolition material may also pose a trip hazard, fall, or puncture hazard, so avoid walking or climbing on debris piles, etc.
☐	☐	Dim Lighting	If electrical power has been disrupted causing dim/low lighting conditions and or work is required to be performed through the evening hours. Use a suitable flashlight and/or portable lighting in low lighting areas.
☐	☐	Drilling Operations	Drilling operations involve boring, augering or directionally pushing into soil or other surfaces. Various types of mechanical equipment may be used to provide the force of drilling. Drilling may be on a small scale, such as during the installation of monitoring wells, or a large scale project such as oil or gas well drilling**.** Drilling operations present physical and mechanical hazards as well. The equipment used in drilling can cause injury if not operated properly. Combustion engines are often used as a power source, and these also present hazards in terms of flammability, and as sources of vapors. Typical injuries that could result include eye injuries, burns, scrapes, and cuts from mechanical equipment. Chemical hazards could also be present in the water or soil resulting from drill cuttings.
☐	☐	Downed electrical wires	Downed wires can energize other objects, including fences, water pipes, bushes and trees, buildings, telephone/CATV/fiber optic cables and other electric utilities. Even manhole castings and reinforcement bars (re/bar) in pavement can become energized by downed wires. During storms, wind-blown objects such as canopies, aluminum roofs, siding, sheds, etc., can also be energized by downed wires. See **Appendix E** for an OSHA Fact Sheet on working safely around downed electrical wires.
☐	☐	Drums	If drums are used on-site, they should be clearly labeled with the name of the contents. Drums should only be handled with the appropriate equipment. Drums discovered during excavations, etc., shall not be opened or moved until appropriate identification can be performed. ***At a minimum, Level B protection is required for sampling any unlabeled drums discovered during remediation procedures. This HASP does not contemplate and upgrade to Level B. Coordinate in advance with your OSC, RMD Safety Manager, or TRC Health and Safety direct before conducting Level B work of any kind.***
☐	☒	Dust/Particulates	For general dust, work should be performed up-wind if possible. If conditions warrant it, monitoring should be done with PM-10 monitor as described herein. For hazardous dusts, a detailed air monitoring plan and a respiratory protection plan should be developed in consultation with a Certified Industrial Hygienist (CIH) for the site activities before proceeding.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Ground Fault Circuit Interrupters (GFCI) and Electrical Cords	GFCIs will be used on all 120 volt, single phase, 15 and 20-ampere receptacle outlets when electrical equipment is used on-site. Electrical cords will be inspected for cracks, tears, or general wear to the outer protective casing. If the wiring of the cord is exposed, the cord will be repaired, if possible, or discarded. All extension cords will contain a grounding prong. If the grounding prong is missing, or if the cord was designed to contain only two prongs, the cord will not be allowed for use. These cords are dangerous and cannot be grounded through the use of a GFCI.
☐	☐	Elevated Work	For any construction work activities elevated 6 feet or more, or other non-construction activities elevated 4 feet or more, fall protection must be provided. Caution should be taken on catwalks and ladders because of potential slippery conditions, or the potential for footwear to catch on the surfaces.
☐	☒	Equipment Exhaust	Equipment exhaust should be ventilated away from the work area while drilling inside structures. Industrial fans can be used to move exhaust out of the area.
☐	☒	Ergonomic Issues	Ergonomic hazards will be addressed on a site-specific basis once mobilization to the field has occurred.
☐	☐	Evening Work	If work is performed during the evening hours, work shall be limited by the availability and the quality of artificial lighting. Care should also be taken to avoid slip, trip, and fall hazards that are not as easy to identify during low light conditions.
☐	☒	Excavations	Stay clear of excavation walls. TRC personnel will not enter an excavation, in accordance with 1926 Sub Part P. Subcontractor must provide a competent person on site, if one is required by the planned activities. Side cuts should conform to 1926 Subpart P requirements, or shoring should be used. All open excavations should be secured using traffic cones, barrier tape, or barricade signs stating "Do Not Enter Excavations", especially if left open overnight. See **Appendix F** for an Excavation Hazard Recognition Guide for Trenching and Shoring and Site Assessment Questions to facilitate your understanding of potential hazards and other guidance.
☐	☐	Explosives	Be aware of potential explosive materials and how to identify them. No smoking is allowed on-site or near where potential explosive materials may be present.
☐	☐	Facility Conveyors (product or waste lines)	Stay clear of facility conveyors, product process lines, and waste disposal lines. Be aware of any client specific health and safety requirements to work in these areas.
☐	☒	Facility Equipment/Machinery	Be aware of active and moving client equipment on site.
☐	☐	Facility Piping (Above Ground)	Stay clear of above ground pipes. Unless other arrangements have been made, the Client and/or Facility owner is responsible to identify all applicable aboveground facility pipes prior to any work activities in the area on their facility. Pipes can be overhead hazards, or trip hazards. Pipes can be hazardous because of the material flowing through them, such as steam, natural gas, toxic chemicals, etc. Some pipes are also coated with hazardous material such as asbestos.
☐	☐	Facility Piping (Below Ground)	Unless other arrangements have been made, the Client and/or Facility owner is responsible to identify all applicable underground facility pipe locations prior to any subsurface activities.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Fall Hazard	Proper tie-off, harnesses, railings, etc. should be used when performing work on ladders, scaffolding, man-lifts, or on the roof of buildings, etc. Stay clear of the edges of pits, trenches, quarries, etc.
☐	☐	Falling Objects	Be aware of any potential falling objects or materials on site. Stay clear of any areas identified as potential falling object areas.
☐	☒	Fences	Be aware of fences in disrepair that may be trip hazards, or may have materials that could cause punctures or cuts. Use caution when crossing over or under fences.
☐	☒	Field Equipment	If field equipment is heavy or awkward to carry, get assistance or use carts to help move around the site.
☐	☒	Field Vehicle	TRC personnel shall follow all applicable state and federal traffic laws while traveling to and from the site, and while working on the site. In particular the following laws should be followed: speed limits, parking restrictions, use of wipers and lights during precipitation events, etc. The use of cellular phones is prohibited, and distracted driving should be avoided. It is the responsibility of the driver to verify that all safety equipment on the vehicle is working properly before they drive the vehicle. In particular the following items should be checked: tire pressure, tire tread, windshield wipers, windshield washer, headlights, tail lights, brake lights, spare tire, fire extinguisher, first aid kit, etc.
☐	☒	Fire Extinguisher Chemicals	To the extent practicable, minimize exposure to potentially toxic fire extinguishing chemicals. See **Appendix G** (Common Fire Extinguishing Agent Guide) for more information.
☐	☒	Fire Hazards	Eliminate sources of ignition in work areas that have ignitable materials. Provide an ABC fire extinguisher in close proximity to the support zone.
☐	☐	Flooded Areas	Do not drive through flooded areas or standing water. Do not wade into moving water, or water deeper than 2 feet without adequate assistance.
☐	☒	Flying Debris/ Eye Injuries	Be aware of any flying debris on site and wear protective eyewear when necessary.
☐	☐	Fork Lifts	Be aware of forklift patterns, and stay clear of those routes.
☐	☐	Gas Cylinders	See above.
☐	☒	Hand Tools	Use only the appropriate tool for the task at hand. Use the tool(s) as designed, described, and intended by the manufacturer. Hand tools will meet the manufacturer's safety standards. Hand tools will not be altered in any way. Makeshift tools will not be used. At a minimum, hand and eye protection will be used when working with hand tools (see glove selection guide provided herein). Wrenches, including adjustable, pipe, end and socket wrenches, will not be used when jaws are sprung to the point that slippage occurs. Impact tools such as drift pins, wedges and chisels, will be kept free of mushroom heads. Wooden handles will be free of splinters or cracks and secured tightly to the tool. At all times use appropriate hand protection when utilizing hand tools.
☐	☒	Heavy Equipment	Contractor is responsible for safe operation of equipment. All mobile heavy equipment must have a functioning backup alarm, and operators must comply with equipment manufacturer's instructions. Maintain proper distance and remain in line of sight of operator and out of reach of equipment. Recognize and take precaution not to enter equipment tail swing areas. Isolate equipment swings, if possible. Make eye contact with the equipment operator before approaching the equipment. Understand and review hand signals, and wear reflective safety vest.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☒	Heavy Lifting	Use proper lifting procedures and equipment when handling heavy objects such as drums, manhole covers, tank covers, etc. If a load is greater than 50 lbs, at least two people must be used.
☐	☐	High Pressure Gas Lines, etc.	Be aware of high pressure gas lines, and follow approved safety precautions when working with or around the lines.
☐	☐	Highway Traffic	Traffic control within the right-of-way will be in accordance with local highway department protocols. Work may be restricted within specific lanes during peak traffic times. Verify peak traffic times, and review planned activities with local highway department, so that appropriate lane closures can be coordinated.
☐	☒	Housekeeping	All field vehicles, job trailers, and field offices will be properly cleaned and organized to prevent cluttered work and storage areas.
☐	☐	Hunters/Firing Range, etc.	Be aware of surrounding activities that may involve hunting, firearms, etc. that may not be in your immediate area, but could be create an unsafe work environment.
☐	☐	Ice (thin)	When project activities include either crossing ice or working directly on the ice, a detailed plan should be developed that will be used to continually evaluate the ice conditions, and to determine when work should be terminated due to unsafe conditions. All staff working on the ice will wear an appropriate and approved personal floatation device. Other emergency equipment such as ropes, a throwable floatation device, a means to warm a wet and cold worker, etc. must be available. A buddy system should also be used for this type of work, such that one person is always on shore or at least on previously determined safe ice.
☐	☐	Ladders	Ladders should only be used if they are in good condition, conform to OSHA requirements, and if they will be used in an appropriate manner. Be especially cautious of slipping on ladders when the ladder or footwear is wet or dirty.
☐	☐	Landfill Gas (Methane, CO2, Hydrogen Sulfide)	Avoid breathing gas, especially in low oxygen areas (simple asphyxiant). Potentially flammable and explosive, so keep ignition sources away from gas. Explosive conditions of LEL >5% in a work area should be ventilated as soon as possible, or the area should be evacuated.
☐	☐	Leachate (Municipal Solid Waste - MSW)	MSW leachate may contain hazardous biological substances, so avoid physical contact with leachate and, if possible, stay up-wind. If contact is made with leachate, wash affected areas thoroughly with soap and water. If boots contact leachate they should be thoroughly washed with soap and water also.
☐	☒	Lead/Arsenic	Wear gloves when in contact with lead contaminated soil, etc. Thoroughly wash hands and arms when daily work is completed.
☐	☐	Lighting	Lighting will be provided so that a sufficient amount of light will illuminate the work area. All electrical lighting will be protected with a Ground Fault Circuit Interrupter (GFCI). In areas were flammable or combustible vapors or dust are encountered, all lighting will be approved for use in Class 1, Division 1 hazardous locations.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☒	Long Hours/Fatigue	Long work hours can lead to fatigue, and fatigue can lead to the physical inability to perform the work in a safe manner, or travel to, or from, a work site in a safe manner. If long work hours are scheduled, or if the scheduled work takes longer than planned, field staff should determine if fatigue is, or will be, an issue. Field staff should evaluate whether they are able to complete the work in a safe manner, or whether they are able to travel in a safe manner. If fatigue is an issue, appropriate breaks should be planned or taken, including overnight stays when necessary.
☐	☒	Material Handling	Move containers and heavy material only with the proper equipment, and secure them to prevent dropping, falling, or loss of control during transport. Stay clear of material handling operations, especially near slopes. Do not stand down the slope from equipment, supplies or materials being moved above on the slope, or being deployed onto the slope.
☐	☐	Material Storage	Stored material may be a falling hazard, or a crush hazard. Do not stand adjacent to materials stacked up, such as pipes, geosynthetic rolls, etc., or in the area of deployment.
☐	☐	Methane Gas (Landfill Gas)	Explosive conditions (5% LEL) will be ventilated, if encountered, prior to working in an area. Methane is a simple asphyxiant.
☐	☐	Mine or Quarry	No work shall be performed within 15 feet (or other designated client setback, whichever is greatest) of the mine or quarry walls. Be aware of the potential for falling rocks or slope failures.
☐	☐	Municipal Solid Waste (MSW)	MSW may contain hazardous biological substances, so avoid physical contact, and if possible stay up-wind. Wear appropriate PPE, such as gloves, safety shoes, and safety glasses. Wash hands, arms, and face after working near MSW. Reusable PPE and equipment should be thoroughly decontaminated after exposure to MSW. MSW may also contain sharp objects with the potential to puncture PPE.
☐	☐	Natural Gas	Natural gas is flammable and explosive. Keep ignition sources away from gas sources. Use spark proof tools when working with gas lines, etc.
☐	☒	Noise	Hearing protection must be worn when noise levels exceed 85 dBA in the work area. If you need to raise your voice to be heard at the work site, then hearing protection should be worn. Hearing protection will be worn near drill rigs.
☐	☐	Overhead Hazards	Pay attention to overhead equipment, piping, and structures. A hard hat must be worn at all times when overhead hazards are present on site.
☐	☐	Overhead Wires	If contact is possible (i.e., equipment, drill rig, excavator, etc.) one or more of the following will be done: ✧ Power sources will be disconnected by the utility. ✧ Power sources will be shielded by the utility. ✧ Object will get no closer than 10 feet to prevent arcing, unless site specific conditions or weather conditions warrant greater separation per best professional judgment, or as directed by utility representatives. ✧ Evaluate the need for shielding and coordinate with local utility representatives.
☐	☒	Pedestrian Traffic (public, client, workers)	Be aware of pedestrian traffic patterns and, route traffic around the exclusion zone(s), as necessary, to avoid distractions and the potential for exposures or accidents. Use appropriate barricades and caution tape to mark work areas.
☐	☐	Portable Heaters	Be aware of portable heater locations and stay a safe distance from them.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	**Power Tools**	All power tools will be inspected regularly (at least on a daily basis) and used in accordance with the manufacturer's instructions and its capabilities. Electrical tools will not be used in flammable areas, unless they are approved for that purpose. Portable electric tools will be used only with a GFCI. Proper hand, eye and hearing protection will be used when working with power tools and all appropriate safety guards must be in place. Personnel will be trained in the proper use of the specific tool. Any defective power tools will be immediately tagged and removed from service. Tools will be stored properly after use.
☐	☐	Power Washing Equipment	Stay clear of the power washing nozzles and equipment.
☐	☐	Propane Tanks	Be aware of propane tank locations, and any gas lines leading to or from the tanks.
☐	☐	Rock Blasting	Contractor is responsible for following safe blasting protocol. Heed all contractor warnings at time of blasting and stay well clear until safe to return to area, as indicated by the contractor.
☐	☒	Sample Preservative Chemicals	Wear safety glasses, cut resistant, and nitrile gloves or equivalent when adding preservative chemicals to sample bottles or vials. Have clean wash water nearby.
☐	☐	Scaffolding	Stay clear of scaffolding. Be aware of the OSHA safety requirements for using constructing and scaffolding.
☐	☐	Severe Weather	Work may be suspended if dangerous weather conditions (lightening, tornadoes, high winds, heavy rain, freezing rain, etc.) occur. Be aware of changing weather conditions, and be prepared to take shelter as necessary. Potential shelters should be identified prior to beginning work.
☐	☒	Sharp Objects	Wear appropriate cut resistant gloves when handling sharp objects, and use appropriate equipment to move objects. See **Appendix C** for the Glove Selection Guideline.
☐	☒	Slippery Ground/Surfaces	Exercise caution, especially on slopes, field trailer floors and stairs, after a precipitation event. Use slip resistant boots, or implement surface preparations to eliminate the slippery nature of the surface prior to accessing the area. Spill control measures and general housekeeping should be utilized to help prevent slipping on wet floors, wet pavement, and general work areas.
☐	☒	Slips, Trips, and Falls:	Maintain clear walkways for work areas.
☐	☐	Steam Cleaning Equipment	Stay clear of the steam cleaning nozzles and equipment. All personnel performing this task must wear a face shield.
☐	☐	Steel Erection	All materials, equipment, and tools, which are not in use while aloft, shall be secured against accidental displacement. The controlling contractor shall bar other construction processes below steel erection unless overhead protection for the employees below is provided. Employees engaged in steel erection activities on a walking/working surfaces with an unprotected side or edge more than 15 feet above a lower level shall be protected from fall hazards by guardrail systems, safety net systems, personal fall arrest systems, positioning device systems or fall restraint systems.
☐	☐	Steep Slopes or Banks	Pay attention to footing and walking. Stay a safe distance from unstable or extremely steep slopes. Wear appropriate footwear. Be aware of potential slope or bank failures. Heavy equipment should not be operated on or near unstable slopes or banks.
☐	☐	Strong Nuisance Odors	Strong odors should be ventilated before entering a work area, or a respirator shall be worn as needed.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Sunburn	For extended periods of time outdoors on sunny days, sunglasses, long-sleeved shirts and long pants should be worn to help prevent sunburn and eye problems. Wear sunscreen as appropriate for the project.
☐	☐	Surface Water	Working next to or on, bodies of water shall be done using the buddy system. Staff shall wear USCG-approved personal floatation devices when on or adjacent to bodies of water.
☐	☒	Terrain	Uneven or steep terrain can cause hazardous conditions for walking and transporting equipment around the site. Site personnel should use caution when working on uneven surfaces, and they should avoid working down-slope from heavy equipment, or materials being moved or stored.
☐	☒	Traffic (client, contractors, public, semi-trucks, forklifts, etc.)	Obey all posted speed limits. Park in designated areas only. Be aware of traffic patterns on site, and during access to the site. Use orange traffic cones and barrier warning tape, as needed, or if within 25 feet of the right-of-way. TRC personnel must wear safety vests when working in or near traffic areas. For work in public roadways/highways, coordination with local officials and prepare a traffic safety plan.
☐	☐	Trains/Railroad Tracks	Be aware of any train activities on the site, entering or leaving the site, or immediately adjacent to the site. Do not walk between the rails or on the railroad ties. All work must be at least 25 feet away from the tracks unless you have a railroad representative acting as a flagman. When driving, stop at all railroad crossings, even if they are unmarked, and look in both directions before proceeding across the tracks. Coordinate with TRC Project Manager as special permitting may be required for this work, even if not conducted on railroad property or right of way.
☐	☐	Transporting Hazardous Materials	TRC personnel who transport hazardous materials shall have the required DOT and/or IATA training prior to transporting materials, and will comply with all applicable DOT regulations and requirements and IATA guidance for labeling, packaging, etc. See also the Required Personnel Training section of this HASP to review/specify if DOT/IATA training is required for this project.
☐	☐	Tree Cutting	Stay clear of tree cutting activities.
☒	☒	Trenching	TRC personnel will not enter trenches not in accordance with 1926 Sub Part P. Be aware that some trenching conditions may result in a confined space condition. See **Appendix F** (Excavation Hazard Recognition Guide [Trenching/Shoring], Site Assessment Questions, and Related Guidance) for additional guidance.
☐	☒	Trip Hazards (wires, cords, hoses, debris, corn stubble, uneven surfaces, etc.)	Temporary wires, cords, hoses, etc., should be properly located, marked, and protected to help prevent tripping and disruption to work activities. Trip hazards are particularly a problem early in the morning, late in the day, or under other poor lighting conditions.
☐	☐	Under Ground Storage Tanks (USTs) (Septic Tanks)	If any unknown UST's are encountered, drilling or excavations will be terminated in that location until a new scope of work, Risk Assessment and Health & Safety Plan can be developed. Please see Appendix__N/A__ for safety guidelines during UST removal.
☐	☒	Uneven Surfaces	Be aware of uneven walking or driving surfaces and exercise caution when moving around the site.

	Table 6 - Other Common Physical Hazards Matrix		
JSA	**APPL.**	**PHYSICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Utilities – Overhead	**Electrical, telephone, cable TV, etc. –** In advance of the field work, a subcontractor, the client, or TRC will locate and identify all overhead utilities. The owner or client will be responsible for identifying all applicable overhead utilities, product lines, pipes, and aboveground tanks. A minimum clearance of 10 feet must be maintained between equipment and overhead utility lines. Notification timeframes vary regionally. Coordinate with the TRC Project Manager as to specific timeframes and responsibilities.
☐	☐	Utilities –Underground	**Electric, gas, telephone, water, storm sewer, sanitary sewer, cable TV, etc. -** In advance of the field work, A subcontractor, the client, or TRC will call Digger's Hotline to locate all underground utilities. The owner or client will be responsible for marking all applicable on-site underground utilities, product lines, pipes, and tanks. Coordinate with the TRC Project Manager as to specific timeframes and responsibilities.
☐	☐	Waterways	Exercise caution near, around, or in waterways. Harnesses should be worn when working in, or within 4 feet of, the waterway, especially when attempting to sample from shore or a boat or barge. All applicable laws and regulations will be followed when navigating a boat or barge to and from a work site.
☐	☐	Welding Tools	Stay clear of welding operations, and do not look directly at the welding process without appropriate eyewear and shield.
☐	☐	Cold Stress	Work schedules may be modified when temperatures are below 20° F as measured by the wind chill factor. Take frequent breaks to warm up. Drink plenty of fluids. Wear appropriate clothing, and monitor for cold stress symptoms (frostbite, hypothermia, etc.). See **Appendix D** for additional information.
☐	☒	Heat Stress	The work schedule may be modified if the ambient temperature is more than 80° F. Take breaks as necessary, and drink plenty of fluids. If necessary, wear sunscreen and sunglasses on bright days. Monitor site personnel for signs of heat stress symptoms (heat rash, heat cramps, heat exhaustion, or heat stroke). See **Appendix D** for more information.
Notes: APPL. – Abbreviation for "Applicable." N/A – Not applicable JSA – Job Safety Analysis			

5.4 Biological Hazards

	Table 7- Common Biological Hazards Matrix		
JSA	**APPL.**	**BIOLOGICAL HAZARD**	**GENERAL CONTROL MEASURE**
☐	☐	Animals (dogs, etc.)	Be aware of any animals on site or adjacent to the site. Appropriate care should be taken if any feral (wild) animals are encountered. Dogs often are not leashed and may be unfriendly. Bites from dogs and wild animals can cause infections or transmit disease. In general, it is best to not approach dogs even if they appear to be friendly, and wild animals should never be approached. If bitten, the area should be washed with soap and water. If the bite resulted in puncturing or tearing of the skin, the wound should be covered with a sterile dressing and medical attention should be sought immediately. A description of the dog should be noted and if possible, the dog's owner.
☐	☐	Blood-Borne Pathogens	Injuries received in the field may require assistance from a field team member to perform first aid. Contact with blood and certain body fluids can contain pathogens that may be transmitted by contact with an open wound by the caregiver. The following precautions should be used when giving first aid: ✧ Use nitrile gloves to avoid contact with blood/fluids. Spent bandages and gloves used to perform first aid should be placed in a plastic bag and properly disposed. ✧ Blood/fluid should be cleaned from surfaces that may be contacted by other individuals. ✧ Use an appropriate barrier if required to perform rescue breathing.
☐	☐	Briars or Thistles	Be aware of any briars or thistles on site. Wear appropriate clothing and gloves. Avoid contact with briars or thistles whenever possible.
☐	☒	Insects (ticks, bees, spiders, etc.)	Site workers with known allergies to insect bites should carry their own medication. In case of emergencies, inform fellow workers of any severe allergies. Use insect repellant as necessary, and as specifically allowed on site. If possible, wear long-sleeved shirts and pants. If appropriate, check for ticks at the end of each day. Have other appropriate first aid supplies handy for bites. **Ticks -** Avoid wooded and bushy areas with high grass and lots of leaf litter. If you do go into areas like this, try to stay in the center of a cleared trail to avoid contact with overgrown grass, brush, and leaf litter. Use effective tick repellants and apply according to the label instructions. For more information on repellants see the EPA Insect Repellants: Use and Effectiveness site. Wear long sleeves, long pants, and long socks to keep ticks on the outside of clothing. Light clothing will help spot ticks. Tuck shirts into pants and pants into shoes or socks to keep ticks on the outside of clothing. If outside for an extended period of time then tape pant legs where pants and socks meet so that ticks cannot crawl under clothes. Perform daily tick checks after being outdoors in areas where ticks are present, even in one's own yard. Remove ticks from clothing, gear, and pets before going inside. Inspect all parts of the body carefully, especially the armpits, scalp, and groin. Shower or bathe as soon as possible to wash off any ticks that still remain on you. Tumble clothes in a dryer on high heat for an hour to kill remaining ticks. Attached ticks should be immediately removed with fine-tipped tweezers. To remove an attached tick, grasp it with narrow-bladed tweezers or forceps as close as possible to attachment (skin) site, and pull upward and out with a firm and steady tension. If tweezers are not available, use fingers shielded with tissue paper or rubber gloves. Do not handle with bare hands. Be careful not to squeeze, crush or puncture the body of the tick which may contain infectious fluids. After tick removal, thoroughly disinfect the bite site and wash hands. Seek medical attention if there is a concern about incomplete tick removal. It is important that a tick be

	Table 7- Common Biological Hazards Matrix		
JSA	**APPL.**	**BIOLOGICAL HAZARD**	**GENERAL CONTROL MEASURE**
			properly removed as soon as it is discovered. Seek medical attention if you develop a rash or fever within several weeks of removing a tick. **Mosquitos -** Reduce the risk of being bitten by mosquitoes. Minimize time spent outdoors around dusk and dawn when mosquitoes are most active. Wear shoes, socks, long pants, and a long-sleeved shirt when outdoors for long periods of time, or when mosquitoes are most active. Clothing should be light colored and made of tightly woven materials that keep mosquitoes away from the skin. Consider the use of an EPA-registered insect repellent. Follow the directions on the package. Be sure to use insect repellent and wear long sleeves and pants at these times or consider staying indoors during these hours. **Spiders -** Spiders typically seek cover in dark protected areas. Common areas where spiders may be encountered are heavy vegetation and trees or infrequently used buildings and structures. Spiders also are found in basements and enclosed spaces where sampling may be performed. Spider bites may cause swelling, pain and respiratory problems. Avoid dense vegetation, and use caution when sampling in dark or poorly illuminated locations. If bitten, wash the area and use ice on the bite area to reduce swelling. If respiratory stress, significant pain or swelling is noted, or discoloration around the bite area occurs, seek immediate medical attention. **Stinging Insects -** Like spiders, wasps and yellow jackets often nest in dense vegetation and in the ground, in long-standing protective casings on monitoring wells and shielded gate locks, or in infrequently used buildings and structures. An insect sting can cause pain, swelling, and respiratory problems that may be life-threatening to certain individuals. If stung, remove stinger if present using tweezers or similar, and wash the area and use ice on the sting area to reduce swelling. If respiratory stress, significant pain or swelling is noted, or discoloration around the sting area occurs, seek immediate medical attention.
☐	☒	Long Hours/Fatigue	Long work hours can lead to fatigue, and fatigue can lead to the physical inability to perform the work in a safe manner, or travel to, or from, a work site in a safe manner. If long work hours are scheduled, or if the scheduled work takes longer than planned, field staff should determine if fatigue is, or will be, an issue. Field staff should evaluate whether they are able to complete the work in a safe manner, or whether they are able to travel in a safe manner. If fatigue is an issue, appropriate breaks should be planned or taken, including overnight stays when necessary.
☐	☐	Poisonous Plants	Be able to identify any local poisonous plants and avoid them if possible, or wear protective clothing as necessary. When removing potentially exposed clothing or PPE, the clothing or PPE should be carefully and thoroughly washed or decontaminated.
☐	☐	Snakes	Be aware of the potential for snakes in the area and wear snake boots, snake chaps, gaiters, or leggings as needed.

Notes:
APPL. – Abbreviation for "Applicable."
JSA – Job Safety Analysis

5.5 Radiological Hazards

No radiological hazards are expected onsite. If any new condition is encountered during this activity, the HASP will be adjusted accordingly.

Table 8 - Radiological Hazards Matrix

JSA	APPL.	PHYSICAL HAZARD	GENERAL CONTROL MEASURE
☐	☐	Radiation (ionizing)	Exposure to ionizing radiation can be controlled by one of three methods. Time, distance, or shielding. Limit your time near the radioactive source. Keep your distance from the radioactive source. Shield yourself from the radioactive source with appropriate shielding material. If the radioactive source(s) are from TRC equipment, the TRC employee using the equipment needs required training to use the equipment, and must be monitored using a dosimeter badge. Update contact information for TRC subject matter expertise and regulatory authorities.
☐	☐	X-Ray Fluorescence Instruments (a.k.a., XRF Guns)	XRF units for field metals analysis are only to be used by trained employees with radiation safety training. Licensing requirements can vary by state. Coordinate with a TRC CIH before utilizing in the field to set up dosimetry protocols and instrument specific safety procedures.

Notes:
APPL. – Abbreviation for "Applicable."
XRF – X-ray fluorescence
JSA – Job Safety Analysis

6. Air Monitoring

6.1 Air Monitoring Equipment and Use Recommendations

The following table outlines monitoring equipment needs and rationale. Note that an upgrade to a higher level of respiratory protection (C or higher) will warrant revision or addendum to this HASP and consultation with a TRC Certified Industrial Hygienist (CIH) before work recommences.

Table 9 - Air Monitoring Equipment Use Recommendations

Instrument	Use Code	Action Levels	Notes/Rationale
PID	R	5 ppmv*	Recommended for VOC screening to monitor airborne VOC concentrations in breathing zone levels. If PID readings are sustained above 5 ppmv in the breathing zone for at least 5 minutes, move to an upwind location for 15 minutes. After 15 minutes, measure again. If PID readings are still above 5 ppmv in the breathing zone, contact the OSC or TRC Safety Director to evaluate suitable response actions. Any upgrade in respiratory protection will be coordinated with the corporate health and safety director and/or the OSC. Withdraw from area if PID readings exceed 50 ppmv.
TSI Dustrak™ (or equivalent)	C	> 150 µg/m^3; 15 minute average**	Use where contaminants could adhere to fugitive dust, and where fugitive dust migration could potentially serve as a significant exposure pathway. Half-faced APR for particulates to be used intermittently/temporarily where dust control measures cannot maintain dust levels below action level. Use is optional for dust levels below the action level. Use of a half-face APR for dust does not require CIH approval where dust action level excursions are limited in duration and where dust control measures will be implemented until below the action level. However, personnel must be trained, medically certified and fit tested for half-face APR use.
O^2/LEL	C	19.5%	Recommended for landfill work/confined space work.
H_2S Meter	C	1 ppm	Recommended for landfill, lagoon work and confined space entry, sewer gases, anaerobic degradation sites.
CO	C	25 ppm	½ of the PEL (PEL = 50 ppm)
CGI	C	10% LEL	Recommended safe level to prevent explosive conditions.
MINIRAM (or equivalent)	O		Supplement operation of Dustrak™ stations for work near sensitive receptors.
Radiation meters	N/A		Not known or anticipated to be a Contaminant of Concern.
Other _____			Coordinate all additional instrumentation with the OSC.

Notes:
* Site/project specific action levels for VOCs may be established in consultation with the OSC.
** Above background upwind levels

PID – Photoionization detector	LEL – Lower Explosive Limit	O_2 – Oxygen
H_2S – Hydrogen Sulfide	CO – Carbon Monoxide	ppm – Parts per Million
CGI – Combustible Gas Indicator	VOC – Volatile organic compound	

Use codes: R – Required, C – Condition specific, O – Optional, N/A – Not applicable

6.2 Air Monitoring Procedures

The OHSO will measure organic vapor concentrations in the breathing zone using the PID during investigative activities. Fugitive dust emissions are not anticipated to be a concern. When required, air monitoring will be performed using a combination of real-time dust monitoring upwind and downwind of the work area, and at a point near the closest receptor. Please see the Client's Emergency Response Plan for additional details.

6.3 Exposure Limits for Potential Airborne Contaminants

The following table summarizes anticipated concentrations and accepted exposure limits of chemicals potentially present within the Project Corridor, based on TRC's review of regulated Disposal Sites along the pipeline route.

Table 10 - Summary of Exposure Limits – Known/Suspected Potential Airborne Contaminants

Chemical of Concern	Detected Concentration	OSHA PEL/ACGIH TLV
Petroleum (TPH)	440-8,500 mg/kg	100 ppm (OSHA PEL for Naphtha [coal tar]) 1 ppm (OSHA PEL for benzene)
Inorganic Arsenic	1.7-27.0 mg/kg	0.01 mg/M^3 TWA (a)
Cadmium (metal dust)	84 mg/kg	0.005 mg/M^3 TWA (b)
4,4'- DDD	16-40 mg/kg	NA (c)
4,4'- DDT	29-170 mg/kg	1 mg/M^3 TWA (skin) (b)
Dieldrin	2.7-6.1 mg/kg	0.25 mg/M^3 TWA (c)
Nuisance Total Dust (1) Respirable fraction (1)	Unknown	10 mg/M^3 TWA 5 mg/M^3 TWA Cal/OSHA
Flame retardants/extinguishing chemicals	Unknown	See **Appendix G** for further guidance

Notes: *Exposure and hazard data obtained from the NIOSH Pocket Guide to Chemical Hazards* unless otherwise noted.

ppm – parts per million
OSHA – Occupational Safety and Health Administration
TLV – Threshold Limit Value
PEL – Permissible Exposure Limit

(a) Proposed Cleanup Level – 12 mg/kg
(b) California Human Health Screening Level – Industrial Soil 4,4'-DDT is 6.3 mg/kg; Cadmium is 7.5 mg/kg
(c) Regional Screening Level – Industrial Soil 4,4'-DDD is 7.2 mg/kg; Dieldrin is 0.11 mg/kg

Table 11 - Preservatives and Decontamination Products		
Chemical of Concern	**On-Site Usage and Potential Exposures**	**Control Method/Other Notes**
Hydrochloric Acid (HCl)	Less than 20 ml quantities used for sample preservation. Air phase exposure is expected to be minimal and incidental to sample containerization.	5 ppm (OSHA PEL)
Nitric Acid (HNO_3)	Less than 20 ml quantities used for sample preservation. Air phase exposure is expected to be minimal and incidental to sample containerization.	5 mg/m^3 (OSHA PEL)
Isobutylene	100 ppm gas for use during calibration of PID instruments	No specific exposure limits for isobutylene (simple asphyxiant). Maintain oxygen levels above 19.5%. Before attaching regulator to cylinder, verify that the regulator is off. Before opening regulator, make sure that tubing connecting regulator to monitoring device/tedlar bag is secure. To use a tedlar bag, put bag control valve in an open position and close after filling. Before disconnecting gas from the instrument and/or tedlar bag, verify the regulator is closed. Empty bag of contents after calibration in a downwind position and/or to avoid inadvertent inhalation.
Notes: ppm – parts per million ml – milliliters ug/m3 – micrograms per cubic meter OSHA – Occupational Safety and Health Administration PEL – Permissible Exposure Limit		

7. Personal Protective Equipment (Non-Respiratory)

TRC personnel will use Level D PPE as noted/modified below:

Table 12 - Level D Personal Protective Equipment

Item	Rationale/Notes
Hardhat	Appropriately rated hard hats will be worn by personnel for protection against overhead hazards, including electrical.
Hearing protection	Hearing protection will be worn by all personnel exposed to at least 85 dB of sound during the workday.
Safety boots (steel toe/steel shank)	Steel-toe safety boots will be worn by all personnel during project work described in this HASP and at all times on site.
Eye protection (safety glasses)	Eye protection will be worn when personnel are exposed to flying debris, chemical vapors or particulates. Chemical splash goggles will be worn for protection against chemical gases, vapors or particulates. Safety glasses will be worn for protection against flying objects.
Safety vest	Utilize in areas in or near vehicular traffic of any kind on or off property.
Chemical Protective Clothing (CPC) and Gloves	CPC and gloves will be inspected according to TRC's Personal Protective Equipment Program. CPC will be chosen with assistance from the OSC according to the chemical hazards present. Gloves to be changed between samples to avoid cross-contamination.
Cut resistant work gloves	As indicated herein, use Cut and Abrasion Resistance gloves when necessary for hand protection during field tasks. See **Appendix C** for a Glove Selection Guide**.** ***Leather work gloves are expressly prohibited.***

A basic first aid kit will be readily available on-site in the event of an emergency.

Fire extinguisher should be present with the rig. All personnel working on or around the drill rig should know the location of and how to operate the fire extinguisher.

8. Personal Protective Equipment (Respiratory)

TRC's respiratory protection program is established to coordinate the use and maintenance of respiratory protective equipment in order to (1) reduce employee exposure to toxic chemical agents; and (2) to allow employees to work safely in hazardous work environments (those with potentially unknown, toxic, explosive, and/or oxygen deficient atmospheres). Management is concerned not only with meeting federal and/or state regulations, but also maintaining employee health and safety. All respirators, cartridges, medical monitoring and training required by this program will be provided at no cost to the employees.

Respirators will be needed during the following situations until exposure conditions are known:

Asbestos monitoring inside containment
Conducting surveys for asbestos
Lead/Arsenic exposure conditions
Dusty conditions
Mercury exposure conditions
Demolition of concrete structures
Confined space work
Mold abatement work and monitoring
Level C and B work.

The policy for the RMD Safety Program is to ensure that a TRC Certified Industrial Hygienist (CIH) has reviewed (or helped craft) and approved all Level C or higher respiratory protection elements documented in the HASP before field implementation.

8.1 Evaluating the Need for a Respiratory Protection Upgrade

TRC's health and safety goal is to avoid using respiratory protection unless it is absolutely necessary or required. Administrative controls or engineering controls should always be considered as a means to reduce potential exposures before PPE is required or considered consistent with the hierarchy of control philosophy (elimination/substitution > engineering controls > administrative controls > personal protective equipment).

For TRC operations that require the use of a respirator, the TRC Project Manager (and Contractor equivalent) must verify that Field Personnel are medically approved to use respiratory equipment, fit tested, and trained in the proper use of respirators. Only respirators that are NIOSH/MSHA[1] approved are to be used.

Respiratory protection is mandatory if workers are required to complete tasks within a hazardous atmosphere. Per that Occupational Health and Safety Administration (OSHA), a hazardous atmosphere is defined as:

- Flammable gas, vapor, or mist in excess of 10-percent of the Lower Explosive Limit (LEL).
- Atmospheric oxygen is below 19.5-percent or above 23.5-percent.
- When concentration of a known contaminant is greater than the permissible exposure limit (PEL).
- Airborne combustible dust exceeds its LEL (approximated when dust obscures vision at a distance of 5 feet or less).

Other conditions may warrant a respiratory protection upgrade per the discretion of the TRC Project Manager, OSC, RMD Safety Manager, or Health & Safety Director as well as the client.

1 NIOSH – National Institute for Occupational Safety and Health; MSHA – Mine Safety and Health Administration

Air monitoring may be required to verify the presence or absence of a hazardous atmosphere. Conduct air monitoring whenever a situation or condition arises that could reasonably result in a hazardous atmosphere.

Any worker wearing a respiratory protective device in a potentially or known hazardous atmosphere must demonstrate a proper fit test with that device. Fit test records are maintained on file by TRC. The proper fitting of respiratory protective devices requires the use of a fit test. The fit test is needed to determine a proper match between the face piece of the respirator and the face of the user. Fit testing will be conducted after medical approval has been obtained. Qualitative fit-tests involve the use of a test atmosphere that employees can sense. If they are not responsive to the test material then other test methods must be deployed. Quantitative fit-tests provide a respirator specific protection factor. TRC usually does qualitative fit-tests.

Please see Chapter 12 (Respiratory Protection) of the 10/5/2010 TRC Health and Safety Manual for detailed guidance.

8.2 Air-Purifying Particulate Respirators

Field work involving construction and earthmoving operations that result in nuisance dust and particulates may use air-purifying respirators. Particulate respirators can be used in situations where nuisance dust and particulates are the only contaminants posing an inhalation hazard. Particulate respirators are not to be used in oxygen deficient atmosphere or if hazardous levels of gas/vapor contaminants are also present.

High efficiency particulate air (HEPA) P100 respirators should be used in place of commercially available "dust masks." Select cartridges that are based on the amount of oil and liquid vapors present. Magenta is the color code for HEPA cartridges.

Use Organic Vapor or Organic Vapor Acid Gas (OVA) cartridges in atmospheres with VOC detected. Organic Vapor cartridges are color coded in black and OVA cartridges are color coded in yellow. These cartridges may be used in combination with HEPA cartridges.

8.3 Air-Purifying Gas/Vapor Respirators

TRC employees and Contractors are required to wear half-face, air-purifying respirators with the appropriate chemical cartridge under the following circumstances:

- When concentration of a known contaminant continuously exceeds permissible exposure limit (PEL) time-weighted average or the threshold limit value (TLV) time-weighted average.
- When volatile organic compound (VOC) vapors in the work area continuously exceed the threshold limit value-time-weighted average (TLV-TWA).
- When, at any time, VOC vapors in the work area exceed the threshold limit value - short-term exposure limit (TLV-STEL).

See Table 10 for site-specific or additional information on regulatory exposure limits for chemicals/exposures of concern at this site.

Air purifying respirators (APRs) with chemical cartridges can be used under the following conditions:

- If the oxygen concentration is between 19.5-percent and 23.5-percent.
- If chemical contaminants have been identified, the toxic concentrations are known and the respirator cartridges are effective in removing the contaminants.
- The respirator and cartridges are NIOSH/MSHA approved.
- The contaminants have noticeable warning qualities such as odor and visibility characteristics including color.

In the event workers are required to wear APRs with chemical cartridges, the following requirements must be met:

- The TRC Project Manager or Contractor's SSO must verify that workers are:
  - ✧ Medically approved (within one year) to use respiratory protection,
  - ✧ Fit-tested for the specific respirator to be used, and
  - ✧ Trained in the proper care, use and limitations of the respirator to be used.
- Contractors must provide proof of the above to the TRC Project Manager, upon request.
- If an employee or contractor has not cleared by the Project Manager to use a respirator, they will not be assigned tasks that may potentially expose them to contaminants.
- Personnel with interfering facial hair are not permitted to wear respirators and shall not be permitted in areas where respiratory protection is required.
- Respirators must be sized to the employee
- Qualitative fit tests conducted by trained employees

Note that the protection factor (PF) on a ½ face APR is 10. If air concentrations/ levels are more than 10-times the TLV, the upgrade would require a full face APR (which has a PF of 50). All APR selections for a project are subject to TRC CIH review.

8.4 Supplied Air Respirators

Supplied-air respirators, such as a Self-Contained Breathing Apparatus (SCBA) or airline-equipped full-face respiratory protection, are not anticipated to be required at the site. This level of respiratory protection is utilized in oxygen deficient atmospheres or atmospheres considered to be at or above immediately dangerous to life and health (IDLH) levels. These conditions will only occur in rare, if any, circumstances such as confined space entry or emergency situations. The use of air-supplied respiratory protection is not permitted without approval and guidance from the OSC and TRC CIH.

9. Site Control/Work Zones (Optional)

TRC anticipates that Work Zones (i.e., clean area, decontamination area, work area), as appropriate, have already been established as remediation activities are underway. If needed, TRC personnel will demarcate Work Zones, as appropriate. Access to the work area, specifically the immediate area surrounding the remediation activities, will be limited to authorized personnel only to the extent TRC has authorization.

Table 13 - Site Control/Work Zones Matrix

APPL.	CONTROL ELEMENT	SPECIFY/DESCRIBE [1]

Notes:
1- Were applicable, summarize or reference relevant plan, procedure, etc.
APPL. – Abbreviation for "Applicable."
HASP – health and safety plan
N/A – Not applicable
OSHO – TRC's On-Site Health and Safety Officer
PPE – Personal Protective Equipment

10. Job Safety Analyses

A Job Safety Analysis (JSA) is a safety management tool in which the risks or hazards of a specific job in the workplace are identified, and then measures to eliminate or control those hazards are determined and implemented. More specifically, a job safety analysis is a process of systematically evaluating certain jobs, tasks, processes or procedures and eliminating or reducing the risks or hazards to as low as reasonably practical (ALARP) in order to protect workers from injury or illness. The JSA process is documented and the JSA document is used in the workplace or at the job site to guide workers in safe job performance. The JSA document is also a living document that is adjusted as conditions warrant.

The JSA process begins with identification of the potential hazards or risks associated with a particular job. Once the hazards are understood, the consequences of those hazards are then identified, followed by control measures to eliminate or mitigate the hazards. The following lists those tasks and/or hazards for which JSAs have been prepared (also noted in Tables 5 through 8, as applicable):

- Heavy Equipment
- Driving/Traffic Hazards

Please refer to **Appendix H** for the Job Safety Analyses prepared for this project.

11. Required Personnel Training

TRC field personnel will have the training outlined below before on-site work activities:

Table 14 - Project Training Requirements

(* required for all sites; but minimum recommended)

Check "A" if training required for everyone, and check "T" if training required for specific task or per notations.

A	T	SUBJECT	REFERENCE	
			29 CFR 1910	29 CFR 1926 or Other
☒	☐	HAZWOPER 40 hour*	1910.120	1926.65

Client-specific training: ☐ Not Applicable ☐ Specify				
Client-specific training: ☐ Not Applicable ☐ Specify				
Client-specific training: ☐ Not Applicable ☐ Specify				

Note:
1 Per the TRC Health and Safety Policy and Procedure Manual, each TRC project will have at least one certified CPR/first aid trained person on site at all times. All Project Managers and anyone acting as the on-site Health and Safety Officer must be current in First Aid/CPR.
2 Required for all personnel involved in response actions conducted at electrical substations.
3 Compressed Gas Association's Commodity Specification for Air
4 TRC Health and Safety Policy and Procedure Manual (Revision 1, May 2010), Section 27, Electrical Safety
5 TRC RMD Hand Protection Policy, August 2012
6 Guidelines for Employers to Reduce Motor Vehicle Crashes (joint white paper by NETS, NHTSA and OSHA)
7 TRC Driver and Vehicle Management Policy and Procedure Manual, Rev 1 (April 2012)

Project training requirements beyond those provided in the above table will require a HASP revision/upgrade or concurrence of the TRC Safety Director or RMD Safety Manager.

12. Medical Monitoring

Medical monitoring will apply routinely to all employees who are or may be exposed to hazardous substances or health hazards at or above the established permissible exposure limit, above the published exposure levels for these substances, without regard to the use of respirators, for 30 days or more a year (40 CFR 1910.120[f][2][i]). Said TRC field personnel will have the medical surveillance outlined in the table below prior to commencing on-site work activities.

Table 15 - Medical Surveillance Required

*Baseline is minimum recommended.

	29 CFR 1910	29 CFR 1926 or Other	Notes
☒ HAZWOPER Physical - Baseline*	1910.120	1926.65	
☒ HAZWOPER Physical – Annual	1910.120	1926.65	
☐ HAZWOPER Physical - Biennial*	1910.120	1926.65	
☒ Medical clearance for respirator use	1910.134	N/A	Unrestricted clearance.
Client-specific drug testing[1]	☐ Not Applicable ☐ Specify		
Client-specific medical monitoring[1]	☐ Not Applicable ☐ Specify		
Site-specific medical monitoring:	☐ Not Applicable ☐ Specify		

Note:
N/A – Not applicable.
[1] Client required drug testing or medical monitoring should be coordinated through the Project Manager.

TRC has a Drug and Alcohol-Free Workplace Policy (TRC Academy Course #900013753). TRC may require employees or subcontractors to be tested upon reasonable suspicion, following accidents or incidents during work activities, or during travel to or from a project site. Client policies may be stricter in regard to procedures following an accident. Project Managers must be aware of these and inform employees and subcontractors of any additional requirements.

13. General Safety Requirements

The general safety rules listed below apply to all TRC personnel present at the site.

- A tailgate health and safety meeting will be held with all field team members and subcontractors each day prior to the start of work.
- Adhere to all requirements of this health and safety plan (HASP).
- Wear protective clothing appropriate for the designated level of protection and decontaminate before entering clean areas when applicable.
- Use safety equipment in accordance with OSHA guidance and labeling instructions.
- Maintain safety equipment in good condition and proper working order and make sure that the equipment is calibrated prior to use.
- Immediately report unsafe acts or conditions to the Project Manager and OSC.
- Eating, drinking, and smoking are prohibited on site, except in designated areas.
- Maintaining a position upwind from intrusive activities is encouraged.
- The emergency shutoff switch should be demonstrated to be working prior to initiating drilling.
- An adequately stocked first-aid kit will be maintained at the work site.

14. Tailgate Safety Meetings

A tailgate safety meeting will be conducted daily prior to commencement of the work day (see checklist provided in **Appendix I**) or if site conditions change.

Topics covered by the tailgate safety meeting will include, but not be limited to:

- Scope of work and who will conduct each task
- Potential hazards for the scope of work
- weather forecast
- PPE
- Emergency procedures and the route to the medical facility
- Site conditions and features
- Communication guidelines related to stakeholder engagement and visitors

Safety meetings will be held to address modifications to this HASP and any addenda prepared to supplement the HASP. Subcontractors and personnel present at the tailgate safety meeting shall be required to sign an acknowledgement form after each meeting.

15. Emergency/Contingency Plan

Before commencing any on-site operations, the TRC OHSO will advise all personnel of potential emergencies. Personnel will be advised on their roles in the event of an emergency, and the steps to take for a timely and controlled response.

Communication networks/chain of command - All on-site personnel will communicate any accident, injury or near miss to the TRC OHSO who will provide instruction on how to proceed further.

First Aid / Safety Equipment - First aid equipment should be readily available in the event of an emergency. First aid equipment should include a well-stocked first aid kit, fire extinguisher and emergency eye wash.

Evacuation Plans and Refuge Area - All personnel should safely remove themselves from danger in the event of an emergency and safely access the refuge area. The refuge area should be in an upwind location a safe distance from the work zone. The refuge area will be determined during the daily safety briefing.

Notifications of Fire, Police and Emergency Facilities - In the event of an emergency that cannot be controlled by on-site personnel, the appropriate emergency contact shall be notified. All personnel shall remove themselves from the area of danger and wait for the arrival of help in the predetermined refuge area. The following is a list of local emergency contacts:

15.1 Non-Emergency Medical Assistance

If an injury does occur and it is not life threatening, then the employee or employee's supervisor/project manager should contact WorkCare as soon as possible, but within the first hour after an injury. WorkCare information is proved in **Appendix J**. This information will help assist the injured employee by connecting them with instant access to a medically qualified professional in order to provide guidance on appropriate first aid measures and medications.

Table 16 - Non-Emergency Telephone Number

Service	Telephone Numbers	Notes
TRC Work Care Service	888-449-7787	See **Appendix J**

16. Observations

Note that the Project Manager and/or OSC will notify field staff if their site activities may be the subject of Safety Observation, an integral part of the continuous improvement safety culture promoted at TRC. If subject to an observation, please note the following:

- ✧ The Observation will tend to focus on the highest risk activity (as a general example, drilling in a public right-of-way).
- ✧ Follow-up observations may need to occur on previous observes, depending on prior data collected.
- ✧ The observer's preparation before visiting the site will be a review of the HASP, JSAs, client-specific requirements, etc., and a review of the work scope with the Project Manager to ensure the context of the work is well understood in advance.
- ✧ Review items may include PPE, body use and positioning, work environment, operating procedures, and tools and equipment (see **Appendix K**).
- ✧ The observation should last between 30 and 60 minutes.

Observations are documented on a form in **Appendix K**. Both positive and negative observations are candidates for documentation and discussion. The overarching goals are to identify and correct questionable practices, and to identify and promote good, safe and efficient practices. This data gathering process allows TRC safety specialists to identify root causes for safety issues in both categories to better inform policy decisions.

17. Incident/Near Miss Reporting

In case of an accident, TRC personnel must report the incident or near miss immediately to their project manager/supervisor and/or OSC, and client's representative, and follow the TRC Incident Response and Reporting Process (see **Appendix L**). If neither is available, the incident shall be reported to the TRC Safety Director (Mike Glenn). Blue section of the TRC Incident Response and Reporting form must be completed within 24 hours following the incident. Accident/injury/exposure information must be recorded per TRC policy (see **Appendix L**) and will be the basis of any accident/incident investigations. A Near Miss Reporting "short form" is also included in Appendix L for use in expediting the reporting of near misses.

18. Acknowledgement

TRC personnel working under this HASP must read the HASP and sign the acknowledgment in **Appendix M**.

19. Subcontractors and Health and Safety Planning

TRC personnel must provide the complete HASP to all subcontractors for their reference in advance of the work. Subcontractors must prepare their own HASP and provide evidence of HASP preparation before the start of site work to ensure that the subcontractor has an understanding of the safety hazards associated with the work that they are performing. Subcontractor HASPs are not required to be included unless contractually/client required, of is so desired by the Project Manager or OSC.

20. Other Supporting Documentation

Supporting documentation and plans may be appended per the discretion of the Project Manager or OSC.

Drilling, Borehole, Excavation Checklist

EXCAVATION CHECKLIST

(To be completed by a Competent Person)

SITE LOCATION:			
DATE:	TIME:	COMPETENT PERSON:	
SOIL CLASSIFICATION:	EXCAVATION DEPTH:	EXCAVATION WIDTH:	
TYPE OF PROTECTIVE SYSTEM USED:			

Indicate for each item: YES - NO - or N/A for not applicable

1. General Inspection of Jobsite:	
A. Excavations, adjacent areas, and protective systems inspected by a competent person daily before the start of work.	
B. Competent person has the authority to remove employees from the excavation immediately.	
C. Surface encumbrances removed or supported.	
D. Employees protected from loose rock or soil that could pose a hazard by falling or rolling into the excavation.	
E. Hard hats worn by all employees.	
F. Spoils, materials, and equipment set back at least two feet from the edge of the excavation.	
G. Barriers provided at all remotely located excavations, wells, pits, shafts, etc.	
H. Walkways and bridges over excavations four feet or more in depth are equipped with standard guardrails and toeboards.	
I. Warning vests or other highly visible clothing provided and worn by all employees exposed to public vehicular traffic.	
J. Employees required to stand away from vehicles being loaded or unloaded.	
K. Warning system established and utilized when mobile equipment is operating near the edge of the excavation.	
L. Employees prohibited from going under suspended loads.	
M. Employees prohibited from working on the faces of slopes or benched excavations above other employees.	
2. Utilities:	
A. Utility companies contacted and/or utilities located.	
B. Exact location of utilities marked.	
C. Underground installations protected, supported, or removed when excavation is open.	
3. Means of Access and Egress:	
A. Lateral travel to means of egress no greater than 25 feet in excavations four feet or more in depth.	
B. Ladders used in excavations secured and extended three feet above the edge of the trench.	
C. Structural ramps used by employees designed by a competent person.	
D. Structural ramps used for equipment designed by a registered professional engineer (RPE)	
E. Ramps constructed of materials of uniform thickness, cleated together on the bottom, equipped with no-slip surface.	
F. Employees protected from cave-ins when entering or exiting the excavation.	

4. Wet Conditions:	
A. Precautions take to protect employees from the accumulation of water.	
B. Water removal equipment monitored by a competent person.	
C. Surface water or runoff diverted or controlled to prevent accumulation in the excavation.	
D. Inspections made after every rainstorm or other hazard-increasing occurrence.	
5. Hazardous Atmosphere:	
A. Atmosphere within the excavation tested where there is a reasonable possibility of an oxygen deficiency, combustible or other harmful contaminant exposing employees to a hazard.	
B. Adequate precautions taken to protect employees from exposure to an atmosphere containing less than 19.5% oxygen and/or to other hazardous atmospheres	
C. Ventilation provided to prevent employee exposure to an atmosphere containing flammable gas in excess of 10% of the lower explosive limit of the gas.	
D. Testing conducted often to ensure that the atmosphere remains safe.	
E. Emergency equipment, such as breathing apparatus, safety harness and lifeline, and/or basket stretcher readily available where hazardous atmospheres could or do exist.	
F. Employees trained to use personal protective and other rescue equipment.	
G. Safety harness and lifeline used and individually attended when entering bell bottom or other deep confined excavations.	
6. Support Systems:	
A. Materials and/or equipment for support systems selected based on soil analysis, trench depth, and expected loads.	
B. Materials and equipment used for protective systems inspected and in good condition.	
C. Materials and equipment not in good condition have been removed from service.	
D. Damaged materials and equipment used for protective systems inspected by a registered professional engineer (RPE) after repairs and before being placed back into service.	
E. Protective systems installed without exposing employees to the hazards of cave-ins, collapses, or threat of being struck by materials or equipment.	
F. Members of support system securely fastened to prevent failure.	
G. Support systems provided in ensure stability of adjacent structures, buildings, roadways, sidewalks, walls, etc.	
H. Excavations below the level of the base or footing supported, approved by an RPE.	
I. Removal of support systems progresses from the bottom and members are released lowly as to note any indication of possible failure.	
J. Backfilling progresses with removal of support system.	
K. Excavation of material to a level no greater than two feet below the bottom of the support system and only if the system is designed to support the loads calculated for the full depth.	
L. Shield system placed to prevent lateral movement.	
M. Employees are prohibited from remaining in shield system during vertical movement.

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Acetone	67-64-1	100

Toxicological Data on Ingredients: Acetone: ORAL (LD50): Acute: 5800 mg/kg [Rat]. 3000 mg/kg [Mouse]. 5340 mg/kg [Rabbit]. VAPOR (LC50): Acute: 50100 mg/m 8 hours [Rat]. 44000 mg/m 4 hours [Mouse].

Section 3: Hazards Identification

Potential Acute Health Effects:
Hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact (permeator).

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female, Reproductive system/toxin/male [SUSPECTED]. The substance is toxic to central nervous system (CNS). The substance may be toxic to kidneys, the reproductive system, liver, skin. Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention.

Skin Contact:
In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if symptoms appear.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention if symptoms appear.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Flammable.

Auto-Ignition Temperature: 465°C (869°F)

Flash Points: CLOSED CUP: -20°C (-4°F). OPEN CUP: -9°C (15.8°F) (Cleveland).

Flammable Limits: LOWER: 2.6% UPPER: 12.8%

Products of Combustion: These products are carbon oxides (CO, CO2).

Fire Hazards in Presence of Various Substances: Highly flammable in presence of open flames and sparks, of heat.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Slightly explosive in presence of open flames and sparks, of oxidizing materials, of acids.

Fire Fighting Media and Instructions:
Flammable liquid, soluble or dispersed in water. SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use alcohol foam, water spray or fog.

Special Remarks on Fire Hazards: Vapor may travel considerable distance to source of ignition and flash back.

Special Remarks on Explosion Hazards:
Forms explosive mixtures with hydrogen peroxide, acetic acid, nitric acid, nitric acid + sulfuric acid, chromic anydride, chromyl chloride, nitrosyl chloride, hexachloromelamine, nitrosyl perchlorate, nitryl perchlorate, permonosulfuric acid, thiodiglycol + hydrogen peroxide, potassium ter-butoxide, sulfur dichloride, 1-methyl-1,3-butadiene, bromoform, carbon, air, chloroform, thitriazylperchlorate.

Section 6: Accidental Release Measures

Small Spill:
Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container.

Large Spill:
Flammable liquid. Keep away from heat. Keep away from sources of ignition. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not touch spilled material. Prevent entry into sewers, basements or confined areas; dike if needed. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep away from heat. Keep away from sources of ignition. Ground all equipment containing material. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Wear suitable protective clothing. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, reducing agents, acids, alkalis.

Storage:
Store in a segregated and approved area (flammables area) . Keep container in a cool, well-ventilated area. Keep container tightly closed and sealed until ready for use. Keep away from direct sunlight and heat and avoid all possible sources of ignition (spark or flame).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 500 STEL: 750 (ppm) from ACGIH (TLV) [United States] TWA: 750 STEL: 1000 (ppm) from OSHA (PEL) [United States] TWA: 500 STEL: 1000 [Austalia] TWA: 1185 STEL: 2375 (mg/m3) [Australia] TWA: 750 STEL: 1500 (ppm) [United Kingdom (UK)] TWA: 1810 STEL: 3620 (mg/m3) [United Kingdom (UK)] TWA: 1800 STEL: 2400 from OSHA (PEL) [United States]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Fruity. Mint-like. Fragrant. Ethereal

Taste: Pungent, Sweetish

Molecular Weight: 58.08 g/mole

Color: Colorless. Clear

pH (1% soln/water): Not available.

Boiling Point: 56.2°C (133.2°F)

Melting Point: -95.35 (-139.6°F)

Critical Temperature: 235°C (455°F)

Specific Gravity: 0.79 (Water = 1)

Vapor Pressure: 24 kPa (@ 20°C)

Vapor Density: 2 (Air = 1)

Volatility: Not available.

Odor Threshold: 62 ppm

Water/Oil Dist. Coeff.: The product is more soluble in water; log(oil/water) = -0.2

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility: Easily soluble in cold water, hot water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Excess heat, ignition sources, exposure to moisture, air, or water, incompatible materials.

Incompatibility with various substances: Reactive with oxidizing agents, reducing agents, acids, alkalis.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE. Acute oral toxicity (LD50): 3000 mg/kg [Mouse]. Acute toxicity of the vapor (LC50): 44000 mg/m3 4 hours [Mouse].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH. DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female, Reproductive system/toxin/male [SUSPECTED]. Causes damage to the following organs: central nervous system (CNS). May cause damage to the following organs: kidneys, the reproductive system, liver, skin.

Other Toxic Effects on Humans:
Hazardous in case of skin contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact (permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans:
May affect genetic material (mutagenicity) based on studies with yeast (S. cerevisiae), bacteria, and hamster fibroblast cells. May cause reproductive effects (fertility) based upon animal studies. May contain trace amounts of benzene and formaldehyde which may cancer and birth defects. Human: passes the placental barrier.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects: Skin: May cause skin irritation. May be harmful if absorbed through the skin. Eyes: Causes eye irritation, characterized by a burning sensation, redness, tearing, inflammation, and possible corneal injury. Inhalation: Inhalation at high concentrations affects the sense organs, brain and causes respiratory tract irritation. It also may affect the Central Nervous System (behavior) characterized by dizziness, drowsiness, confusion, headache, muscle weakeness, and possibly motor incoordination, speech abnormalities, narcotic effects and coma. Inhalation may also affect the gastrointestinal tract (nausea, vomiting). Ingestion: May cause irritation of the digestive (gastrointestinal) tract (nausea, vomiting). It may also

affect the Central Nevous System (behavior), characterized by depression, fatigue, excitement, stupor, coma, headache, altered sleep time, ataxia, tremors as well at the blood, liver, and urinary system (kidney, bladder, ureter) and endocrine system. May also have musculoskeletal effects. Chronic Potential Health Effects: Skin: May cause dermatitis. Eyes: Eye irritation.

Section 12: Ecological Information

Ecotoxicity:
Ecotoxicity in water (LC50): 5540 mg/l 96 hours [Trout]. 8300 mg/l 96 hours [Bluegill]. 7500 mg/l 96 hours [Fatthead Minnow]. 0.1 ppm any hours [Water flea].

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The product itself and its products of degradation are not toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 3: Flammable liquid.

Identification: : Acetone UNNA: 1090 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
California prop. 65: This product contains the following ingredients for which the State of California has found to cause reproductive harm (male) which would require a warning under the statute: Benzene California prop. 65: This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Benzene California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer which would require a warning under the statute: Benzene, Formaldehyde Connecticut hazardous material survey.: Acetone Illinois toxic substances disclosure to employee act: Acetone Illinois chemical safety act: Acetone New York release reporting list: Acetone Rhode Island RTK hazardous substances: Acetone Pennsylvania RTK: Acetone Florida: Acetone Minnesota: Acetone Massachusetts RTK: Acetone Massachusetts spill list: Acetone New Jersey: Acetone New Jersey spill list: Acetone Louisiana spill reporting: Acetone California List of Hazardous Substances (8 CCR 339): Acetone TSCA 8(b) inventory: Acetone TSCA 4(a) final test rules: Acetone TSCA 8(a) IUR: Acetone

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-2: Flammable liquid with a flash point lower than 37.8°C (100°F). CLASS D-2B: Material causing other toxic effects (TOXIC).

DSCL (EEC):
R11- Highly flammable. R36- Irritating to eyes. S9- Keep container in a well-ventilated place. S16- Keep away from sources of ignition - No smoking. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.

HMIS (U.S.A.):

Health Hazard: 2

Fire Hazard: 3

Reactivity: 0

Personal Protection: h

National Fire Protection Association (U.S.A.):

Health: 1

Flammability: 3

Reactivity: 0

Specific hazard:

Protective Equipment:
Gloves. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Splash goggles.

* Reference to ANSI and EN 388 glove testing standards. Listed gloves meet the standards in the table, but are not the only gloves that meet the standard.			
This selection chart is not intended to address all chemical hazards. Gloves used for chemical protection shall provide cut/puncture resistance, or be used in tandem with cut/puncture protection. Nitrile gloves used for environmental sampling must be used in tandem with a cut/puncture resistant glove.			
Gloves available in high visibility colors have shown to be effective and are preferred.			

Appendix D
Heat & Cold Stress

COLD STRESS

Ambient air temperatures during site activities may create cold stress for on-site workers. Procedures for recognizing and avoiding cold stress must be followed. Cold stress can range from frostbite to hypothermia. The signs and symptoms of cold stress are listed below.

Frostbite is defined as the actual freezing of one or more layers of skin. In severe cases, organs and structures below the skin can become frozen. Usually, body areas exposed to the most cold, and least body warmth, are affected first. These areas include fingers, toes, ears, and the tip of your nose. Frostbite is characterized by pain and loss of dexterity in the affected limb. The tissue initially appears reddened, but may progress to white, blue, or black.

> **FIRST AID:** Bring the affected employee indoors and call the local emergency clinic. Rewarming of frostbitten parts is best left to a medical doctor in a controlled setting.

Hypothermia is the condition that occurs when the body's natural warming mechanisms (muscle activity and shivering) cannot counteract the loss of body heat to the environment. The onset of hypothermia is greatly hastened by being wet. Hypothermia is marked by severe, uncontrollable shivering. The patient will show signs of excessive fatigue, drowsiness, irritability, or euphoria. As hypothermia progresses, the patient will begin to lose consciousness, blood pressure will drop, shivering will cease, and the patient may slip into a coma and possibly die.

> **FIRST AID:** If these symptoms occur, remove the patient to a warm, dry place. If clothing is wet, remove and replace with dry clothing. Keep the patient warm, but not overheated. The patient should be gradually rewarmed to prevent shock. If the patient is conscious and alert, warm liquids should be provided. Coffee and other caffeinated liquids should be avoided because of diuretic and circulatory effects. Notify the emergency clinic if conditions worsen, the patient loses consciousness, or the patient has an altered mental status. Have the patient transported to an emergency facility.

General Precautions. The reduction of adverse health effects from cold exposure can be achieved by adopting the following work practices.

- Provide adequate insulating clothing to maintain core temperature at 98.6° F if work is to be performed in air temperatures below 40° F. Wind chill cooling rates and the cooling power of air are critical factors. The higher the wind speed and the lower the air temperature in the work area, the greater the insulation value of the protective clothing should be.
- If the air temperature is 32° F or less, hands should be protected by mittens/gloves.
- If only light work is involved and if the clothing on the worker may become wet on the job site, the outer layer of clothing should be impermeable to water. With more severe work under such conditions, the outer layer should be water repellent, and the outer layer should be changed as it becomes wet. The outer garments should include provisions for easy ventilation in order to prevent wetting of the inner layer by sweat.
- If available clothing does not give adequate protection to prevent cold injury, work should be modified or suspended until adequate clothing is available, or until weather conditions improve.
- For prolonged work, heated shelters should be available. Workers should be encouraged to use these at regular intervals, with the frequency depending on the severity of the environmental exposure. When entering the shelter, the outer layer of clothing should be removed and the remainder of the clothing loosened to permit heat evaporation, or a change of work clothing should be provided.

- Warm, sweet drinks, such as hot cocoa or soup, should be available at the work site to provide caloric intake and fluid volume. The intake of coffee should be limited because of diuretic and circulatory effects.
- The weight and bulk of cold-weather gear should be included in estimating the required work performance and weights to be lifted in the field.

Workers should be instructed in safety and health procedures regarding cold work environments as part of the pre-work safety meeting. The training program should include instruction in preventing, recognizing, and treating cold stress conditions.

Wind Chill Chart

Frostbite Times: 30 minutes; 10 minutes; 5 minutes

$$\text{Wind Chill (°F)} = 35.74 + 0.6215T - 35.75(V^{0.16}) + 0.4275T(V^{0.16})$$

Where, T= Air Temperature (°F) V= Wind Speed (mph) *Effective 11/01/01*

HEAT STRESS

There is a potential for heat stress from the use of protective clothing and climate conditions. One or more of the following procedures may be employed to alleviate potential heat stress problems in the event that site conditions warrant the use of personal protective equipment (PPE), or ambient temperatures exceed 85° F. Heat stress training must be emphasized during the daily safety meetings, and adequate supplies of potable water must be provided to workers each day.

General Precautions. Provide plenty of liquids. To replace body fluids (water and electrolytes) lost because of sweating, use a 0.1 percent saltwater solution, more heavily salted foods, or commercial drink mixes. The commercial mixes may be preferable for those employees on a low sodium diet. Employees on low sodium diets, or other special diets, are advised to contact their personal physician for recommendations regarding appropriate electrolyte replacement fluids/beverages.

In extremely hot weather, conduct operations in early morning or evening and rotate shifts of workers wearing impervious clothing. Install mobile showers and/or hose-down facilities to reduce body temperature and cool protective clothing.

Ensure that adequate shelter is available for breaks to protect personnel against heat, which can decrease physical efficiency and increase the probability of accidents.

Acclimatization for workers not accustomed to working in elevated temperature environments will be considered and implemented as appropriate in accordance with American Conference of Governmental and Industrial Hygienists (ACGIH) Guidelines.

Heat Stress Monitoring.

For monitoring the body's recuperative ability toward excess heat, one or more of the following techniques should be used as a screening mechanism. Monitoring of personnel wearing impervious clothing should commence when the ambient temperature is 70° F or above. Frequency of monitoring should increase as the ambient temperature increases or as slow recovery rates are indicated. When temperatures exceed 80° F, regardless of the use of Personal Protective Equipment (PPE), workers will be monitored for heat stress after every work period.

Good hygienic standards must be maintained by the employee to aid in the prevention of heat stress illnesses. At a minimum, frequent changes of clothing and daily showering should occur with clothing being allowed to dry during rest periods. Persons who notice skin problems should immediately inform their supervisor.

Heart rate (HR) should be measured by the radial pulse for 30 seconds as early as possible in the resting period. The HR at the beginning of the rest period should not exceed 110 beats/minute. If the HR is higher, the next work period should be shortened by 25 percent. The HR is then measured again, once each minute for 2 minutes (a total of three measurements), after the initial rest period measurement. The HR should decrease by ten beats per minute between each measurement (a total reduction of 20 beats). If the HR does not decrease, the work period should be reduced by an additional 25 percent.

Body temperature can be measured orally with a clinical thermometer as early as possible in the resting period. Oral temperature (OT) at the beginning of the rest period should not exceed 99°F. If it is greater than 99°F, the next work period should be shortened by 25 percent. The OT should be measured again at the end of the rest period to make sure that it has dropped below 99° F.

Effects of Heat Street

If the body's physiological processes fail to maintain a normal body temperature because of excessive heat loading, a number of physical reactions can occur. The severity of these reactions ranges from mild (such as fatigue, irritability, anxiety, and decreased concentration, dexterity, or movement) to severe (fatal).

Heat-related illnesses include:

Heat rash (also known as prickly heat rash) is caused by continuous exposure to heat and humid air and aggravated by chafing clothes. Heat rash decreases the ability to tolerate heat as well as being a nuisance. Signs are not limited to, but may include, a red prickly rash.

FIRST AID: Employees exhibiting signs of heat rash will be directed to shower and change into clean, dry clothing.

Heat cramps are caused by profuse perspiration with inadequate fluid intake and electrolyte replacement (especially salts). Signs are muscle spasms and pain in the extremities and abdomen, and may occur several hours after work has stopped.

FIRST AID: Employees showing signs of heat cramps will be directed to lie in a cool, shady area, and drink cool fluids. If symptoms persist or worsen, the employee will be transported to an emergency facility.

Heat exhaustion is caused by increased stress on various organs to meet increased demands to cool the body. Signs are shallow breathing; pale, cool, moist skin; profuse sweating; dizziness and lassitude.

FIRST AID: Employees with signs of heat exhaustion will be brought to a cool, shady location and given fluids. After recovering, the employee will be dismissed for the day. If employee is unconscious, or conditions persist, the employee will be transported to a hospital.

Heat stroke is the most severe form of heat stress. The body must be cooled immediately to prevent severe injury and/or death. Signs and symptoms are red, hot, dry skin; no perspiration; nausea; dizziness and confusion; strong, rapid pulse; and/or coma.

FIRST AID: HEAT STROKE IS A MEDICAL EMERGENCY. Employees will be brought to a cool area, aggressively treated by removing constricting clothes and applying wet towels or ice packs, and transported without delay to an emergency facility.

TABLE KEY

ACGIH TLV-TWA	American Conference of Governmental Industrial Hygienists, Threshold Limit Value-Time Weighted Average
NIOSH REL	National Institute of Occupational Safety & Health, Recommended Exposure Limit
STEL	Short Term Exposure Limit (Gasoline STEL is by ACGIH; BTEX STELs are by NIOSH)
OSHA PEL	Occupational Safety and Health Administration, Permissible Exposure Limit
IDLH	Immediately Dangerous to Life and Health
ppm	parts per million
CNS	Central Nervous System
n/a	not available (i.e., no value has been established)

DEFINITIONS

Threshold Limit Value: Threshold limit values (TLVs) refer to airborne concentrations of substances and represent conditions under which it is believed nearly all workers may be repeatedly exposed, day after day, without adverse health effects.

Threshold Limit Value - Time Weighted Average: The time weighted average (TWA) is a concentration for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers may be repeatedly exposed, day after day, without adverse effect. TLV-TWAs are established by the ACGIH.

Recommended Exposure Limit: Unless otherwise noted, the recommended exposure limit (REL) is a TWA concentration for up to a 10-hour workday during a 40-hour workweek. RELs are established by NIOSH to reduce or eliminate adverse occupational health effects.

Short Term Exposure Limit: A short term exposure limit (STEL) is defined as a 15-minute TWA exposure that should not be exceeded at any time during a workday. When compared to the REL (or TLV-TWA for ACGIH standards), the STEL allows the worker to be exposed to a higher concentration, BUT for a shorter period of time. Exposures above the REL up to the STEL should not be longer than 15 minutes and should not occur more than four times per day.

Permissible Exposure Limit: Permissible exposure limits (PELs) are TWA concentrations that must not be exceeded during any 8-hour work shift of a 40-hour workweek. PELs are established by OSHA (29 CFR 1910.1000).

Immediately Dangerous to Life and Health: Immediately dangerous to life and health (IDLH) values are established as concentrations from which a worker can escape within 30 minutes without suffering loss of life, irreversible health effects, or other deleterious effects that could prevent him/her from escaping the hazardous environment. The purpose of establishing an IDLH exposure concentration is to ensure that workers can escape from a given contaminated environment in the event of failure of respiratory protection equipment.

Known or Suspected Carcinogen Classification: ACGIH categories for carcinogenicity classification:

A1 – Confirmed Human Carcinogen – The agent is carcinogenic to humans based on the weight of evidence from epidemiologic studies.

A2 – Suspected Human Carcinogen – Human data are accepted as adequate in quality but are conflicting or insufficient to classify the agent as a confirmed human carcinogen; OR the agent is carcinogenic in experimental animals at dose(s), by route(s) of exposure, at site(s), of histologic type(s), or by mechanism(s) considered relevant to worker exposure. The A2 is used primarily when there is limited evidence of carcinogenicity in humans and sufficient evidence of carcinogenicity in experimental animals with relevance to humans.

A3 – Confirmed Animal Carcinogen with Unknown Relevance to Humans – The agent is carcinogenic in experimental animals at a relatively high dose, by route(s) of administration, at site(s), of histologic type(s), or by mechanism(s) that may not be relevant to human exposure. Available epidemiologic studies do not confirm an increased risk of cancer in exposed humans. Available

evidence does not suggest that the agent is likely to cause cancer in humans except under uncommon or unlikely routes or levels of exposure.

A4 – Not Classifiable as a Human Carcinogen – Agents which cause concern that they could be carcinogenic for humans but which cannot be assessed conclusively because of a lack of data. In vitro or animal studies do not provide indications of carcinogenicity which are sufficient to classify the agent into one of the other categories.

A5 – Not Suspected as a Human Carcinogen – The agent is not suspected to be a human carcinogen on the basis of properly conducted epidemiologic studies in humans. These studies have sufficiently long follow-up, reliable exposure histories, sufficiently high dose, or adequate statistical power to conclude that exposure to the agent does not convey a significant risk of cancer to humans; OR evidence suggesting a lack of carcingenicity in experimental animals is supported by mechanistic data.

Table

OCCUPATIONAL HEALTH GUIDELINES AND TOXICOLOGICAL INFORMATION

Contaminant	ACGIH TLV-TWA (ppm)	NIOSH REL (ppm)	OSHA PEL (ppm)	CAL-OSHA PEL (ppm)	STEL (ppm)	IDLH (ppm)	Routes of Exposure
Benzene C_6H_6	71-43-2	REL: 0.1 ppm PEL: 1 ppm STEL: 5 ppm TLV=0.5	500 ppm	YES	Inhalation, absorption, ingestion, and contact	(FP) 12° F (VP) 75 mm (IP) 9.25 eV	**ACUTE:** Irritation to eyes, nose, respiratory system; giddy, headache; nausea; staggered gait; fatigue; abdominal pain **CHRONIC**: Causes anorexia, lassitude, dermatitis, and Leukemia

Introduction

Excavation and trenching are among the most hazardous construction operations. The Occupational Safety and Health Administration's (OSHA) Excavation and Trenching standard, *Title 29 of the Code of Federal Regulation* (*CFR*), Part 1926.650, covers requirements for excavation and trenching operations. This booklet highlights key elements of the standard, shows ways to protect employees against cave-ins, and describes safe work practices for employees.

What is the difference between an excavation and a trench?

OSHA defines an excavation as any man-made cut, cavity, trench, or depression in the earth's surface formed by earth removal. This can include excavations for anything from cellars to highways. A trench is defined as a narrow underground excavation that is deeper than it is wide, and no wider than 15 feet (4.5 meters).

What are the dangers of trenching and excavation operations?

Trenching and excavation work presents serious hazards to all workers involved. Cave-ins pose the greatest risk and are much more likely than other excavation-related accidents to result in worker fatalities. Other potential hazards include falls, falling loads, hazardous atmospheres, and incidents involving mobile equipment.

OSHA's Excavation and Trenching Standard

What does the OSHA standard cover, and what protections does it offer?

The rule applies to all open excavations made in the earth's surface, including trenches. Strict compliance with all sections of the standard will prevent or greatly reduce the risk of cave-ins as well as other excavation-related accidents.

What kinds of excavations and trenches are not covered?

The standard does not apply to house foundation/ basement excavations, including those that become trenches by definition when constructing formwork, foundations, or walls. For this exemption to apply, all the following conditions must exist:

- The excavation is less than 7-1/2 feet (2.5 meters) deep or is benched for at least 2 feet (.61 meters) horizontally for every 5 feet (1.52 meters) or less of vertical height;
- The bottom of the excavation, from the excavation face to the formwork or wall, is at least 2 feet (.61 meters) wide, and wider if possible;
- No water, surface tension cracks, or other environmental conditions reduce the excavation's stability;
- No heavy equipment is vibrating the excavation while employees are in it;

- Soil, equipment, and material surcharge loads are no closer to the top edge of the excavation than the excavation is deep. When you use front-end loaders to dig the excavations, place the soil surcharge load as far back from the edge of the excavation as possible, but never closer than 2 feet (.61 meters);
- The fewest crew members possible are performing the work; and
- Workers spend the minimum time possible in the excavation.

This exemption does not apply to utility excavations or trenches, which are covered by *29 CFR* 1926.652.

Preplanning

Why is it important to preplan the excavation work?

No matter how many trenching, shoring, and backfilling jobs you have done in the past, it is important to approach each new job with the utmost care and preparation. Many on-the-job accidents result directly from inadequate initial planning. Waiting until after the work has started to correct mistakes in shoring or sloping slows down the operation, adds to the cost, and increases the possibility of a cave-in or other excavation failure.

What safety factors should you consider when bidding on a job?

Before preparing a bid, you will want to know as much as possible about the jobsite and the materials you will need to have on hand to perform the work safely and in compliance with OSHA standards. A safety checklist may prove helpful when you consider specific site conditions such as the following:

- Traffic,
- Proximity and physical conditions of nearby structures,
- Soil,
- Surface and ground water,
- Location of the water table,
- Overhead and underground utilities, and
- Weather.

You can determine these and other conditions through jobsite studies, observations, test borings for soil type or conditions, and consultations with local officials and utility companies. This information will help you determine the amount, kind, and cost of safety equipment you will need to perform the work in the safest manner possible.

How can you avoid hitting underground utility lines and pipes during excavation work?

Before starting work, the OSHA standard requires you to do the following:

- Determine the approximate location of utility installations—sewer, telephone, fuel, electric, and water lines; or any other underground installations;
- Contact the utility companies or owners involved to inform them of the proposed work within established or customary local response times; and
- Ask the utility companies or owners to find the exact location of underground installations. If they cannot respond within 24 hours (unless the period required by state or local law is longer) or cannot find the exact location of the utility installations, you may proceed with caution.

If your excavation work exposes underground installations, OSHA regulations require you to protect, properly support, or remove them.

What should you tell workers before they start the project?

When you share the details of your safety and health program with employees, it is important to emphasize the critical role you expect them to play in keeping the jobsite safe. You may want to emphasize specific rules to help reduce the risk of on-the-job injuries. These rules may include requirements that workers

- Remove or minimize all surface obstacles at the worksite that may create a hazard,
- Wear warning vests or other reflective or high-visibility garments that you provide when they are exposed to vehicular traffic,
- Wear or use prescribed protective gear and equipment correctly,
- Operate equipment only if they have been trained properly in its use and alerted to its potential hazards, and
- Follow safe work practices.

It also is important to establish and maintain a safety and health management system for the worksite that provides adequate systematic policies, procedures, and practices to protect employees from, and allow them to recognize, job-related safety and health hazards. For more information about establishing such a system, see page 18.

Protective Systems

How can you prevent cave-ins?

OSHA requires that all excavations in which employees could potentially be exposed to cave-ins be protected by

- Sloping or benching the sides of the excavation,
- Supporting the sides of the excavation, or
- Placing a shield between the side of the excavation and the work area.

How do you choose the most appropriate protective system design?

Designing a protective system can be complex because you must consider many factors: soil classification, depth of cut, water content of soil, changes due to weather and climate, or other operations in the vicinity. You are free to choose the most practical design approach for any particular circumstance. Once you have selected an approach, however, the system must meet the required performance criteria.

The OSHA standard describes methods and approaches for designing protective systems such as the following:

Method 1 — Slope the sides to an angle not steeper than 1-1/2:1; for example, for every foot of depth, the trench must be excavated back 1-1/2 feet. All simple slope excavations 20 feet (6.11 meters) or less deep should have a maximum allowable slope of 1-1/2:1. These slopes must be excavated to form configurations similar to those for Type C soil, as described in Appendix B of the standard. A slope of this gradation or less is safe for any type of soil.

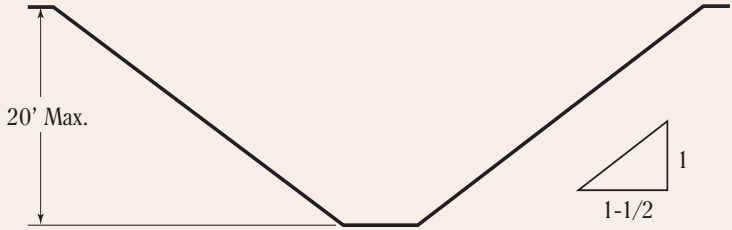

Figure 1. *Excavations Made in Type C Soil*

Method 2 — Use tabulated data such as tables and charts approved by a registered professional engineer to design the excavation. These data must be in writing and must include enough explanatory information, including the criteria for making a selection and the limits on the use of the data, for the user to make a selection. At least one copy of the data, including the identity of the registered professional engineer who approved it, must be kept at the worksite during construction of the protective system. After the system is completed, the data may be stored away from the jobsite, but a copy must be provided upon request to the Assistant Secretary of Labor for OSHA.

Method 3 — Use a trench box or shield designed or approved by a registered professional engineer or based on tabulated data prepared or approved by a registered professional engineer. Timber, aluminum, or other suitable materials may also be used. OSHA standards permit the use of a trench shield (also known as a welder's hut) if it provides the same level of protection or more than the appropriate shoring system.

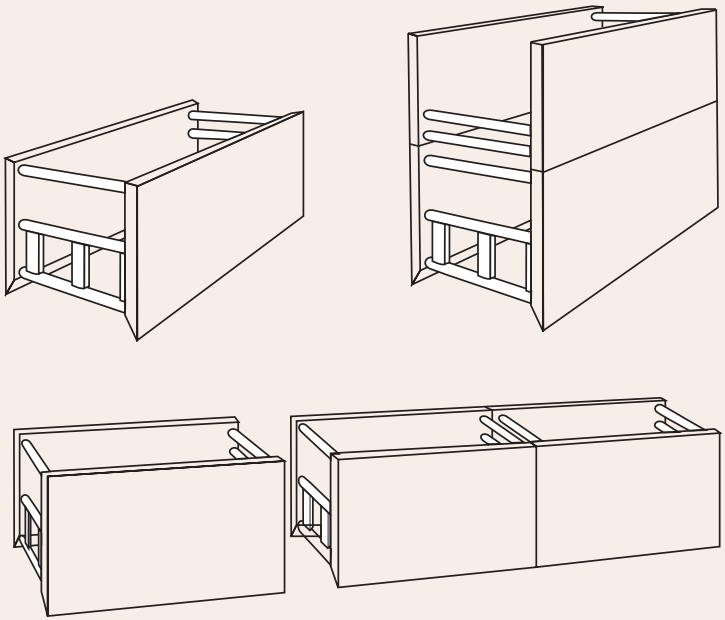

Figure 2. *Trench Shields*

Employers can choose the most practical method for the particular circumstance, but that system must meet the required performance criteria. The standard does not require a protective system when an excavation is made entirely in stable rock or is less than 5 feet (1.52 meters) deep, if a competent person has examined the ground and found no indication of a potential cave-in.

What other safety precautions are you required to take?

The standard requires you to provide support systems such as shoring, bracing, or underpinning to ensure that adjacent structures such as buildings, walls, sidewalks, or pavements remain stable. The standard also prohibits excavation below the base or footing of any foundation or retaining wall unless

- You provide a support system such as underpinning,
- The excavation is in stable rock, or
- A registered professional engineer determines that the structure is far enough away from the excavation and that excavation will not pose a hazard to employees.

Excavations under sidewalks and pavements are prohibited unless you provide an appropriately designed support system or another effective means of support.

How do you safely install and remove protective systems?

The standard requires you to take the following steps to protect employees when installing support systems:

- Connect members of support systems securely,
- Install support systems safely,
- Avoid overloading members of support systems, and
- Install other structural members to carry loads imposed on the support system when you need to remove individual members temporarily.

In addition, the standard permits excavation of 2 feet (.61 meters) or less below the bottom of the members of a

support or shield system of a trench if the system is designed to resist the forces calculated for the full depth of the trench. In addition, there must be no indications, while the trench is open, of a possible cave-in below the bottom of the support system. Also, you must coordinate the installation of support systems closely with the excavation work.

As soon as work is completed, you are required to backfill the excavation when you dismantle the protective system. After the excavation is cleared, remove the protective system from the bottom up, taking care to release members slowly.

How should you maintain materials and equipment used for protective systems?

You are responsible for maintaining materials and equipment used for protective systems. Defective and damaged materials and equipment can cause failure of a protective system and other excavation hazards.

To avoid possible failure of a protective system, you must ensure that

- Materials and equipment are free from damage or defects;
- Manufactured materials and equipment are used and maintained consistent with the manufacturer's recommendations, so as to prevent employee exposure to hazards; and while in operation,
- A competent person examines any damaged materials and equipment. You must remove unsafe materials and equipment from service until a registered professional engineer evaluates and approves them for use.

Additional Hazards and Protections

What other excavation hazards do you need to protect workers against?

In addition to cave-ins and related hazards, workers involved in excavation work also are exposed to hazards involving falls, falling loads, and mobile equipment. To protect employees from these hazards, OSHA requires you to take the following precautions:

- Keep materials or equipment that might fall or roll into an excavation at least 2 feet (.61 meters) from the edge of excavations, or use retaining devices, or both.
- Provide warning systems such as mobile equipment, barricades, hand or mechanical signals, or stop logs to alert operators to the edge of an excavation. If possible, keep the grade away from the excavation.
- Provide scaling to remove loose rock or soil, or install protective barricades and other equivalent protection to protect employees against falling rock, soil, or materials.
- Prohibit employees from working on faces of sloped or benched excavations at levels above other employees unless you provide the employees at the lower levels adequate protection from the hazard of falling, rolling, or sliding material or equipment.
- Prohibit employees from standing or working under loads being handled by lifting or digging equipment. Require workers to stand away from vehicles being loaded or unloaded to protect them from being struck by any spillage or falling materials. You may permit operators to remain inside cabs of vehicles if they provide adequate protection from falling loads during loading and unloading operations.

What is the effect of water accumulation on excavation safety?

Among the additional hazards stemming from water in an excavation are undermining the sides and making it more difficult to get out of the excavation. The OSHA standard prohibits employees from working without adequate protection in excavations where water has accumulated or is accumulating. If you use water removal equipment to control or prevent water accumulation, you must ensure that a competent person monitors the equipment and its operation to ensure proper use. OSHA standards also require the use of diversion ditches, dikes, or other suitable means to prevent surface water from entering an excavation and to provide adequate drainage of the adjacent area. In addition, a competent person must inspect excavations subject to runoffs from heavy rains.

How can you protect workers against hazardous atmospheres inside excavations?

A competent person must test any excavation deeper than 4 feet (1.22 meters) or where an oxygen deficiency or a hazardous atmosphere is present or could reasonably be expected, such as a landfill or where hazardous substances are stored nearby, before an employee enters it. If there are any hazardous conditions, you must provide the employee controls such as proper respiratory protection or ventilation. In addition, you are responsible for regularly testing all controls used to reduce atmospheric contaminants to acceptable levels.

If unhealthful atmospheric conditions exist or develop in an excavation, you must provide emergency rescue equipment such as a breathing apparatus, safety harness and line, and basket stretcher and ensure that it is readily available. This equipment must be attended when in use.

What means of access and egress are you required to provide?

OSHA requires you to provide safe access and egress to all excavations, including ladders, steps, ramps, or other safe means of exit for employees working in trench excavations 4 feet (1.22 meters) or deeper. These devices must be located in the excavation within 25 feet (7.62 meters) of all workers.

Any structural ramps you use in your operation must be designed by a competent person if they are used for employee access or egress, or by a competent person qualified in structural design if they are used for vehicles. Also, structural members used for ramps or runways must be uniform in thickness and joined in a manner to prevent tripping or displacement.

What protective equipment are employees in pier holes and confined footing excavations required to use?

An employee who enters a bell-bottom pier hole or similar deep and confined footing excavation must wear a harness with a lifeline. The lifeline must be attached securely to the harness and must be separate from any line used to handle materials. Also, while the employee wearing the lifeline is in the excavation, an observer must be on hand to ensure that the lifeline is working properly and maintain communication with the employee.

When should you conduct a site inspection?

The standard requires that a competent person inspect an excavation and the areas around it daily for possible cave-ins, failures of protective systems and equipment, hazardous atmospheres, or other hazardous conditions. Inspections also are required after natural events such as heavy rains or manmade events such as blasting that may increase the potential for hazards. If the inspector finds any unsafe conditions during an inspection, you must clear employees from the hazardous area until you take safety precautions.

The standard also requires that a competent person inspect excavations and the adjacent areas daily for possible cave-ins, failures of protective systems and equipment, hazardous atmospheres, and other hazardous conditions. If the competent person finds these conditions, all exposed employees must leave the hazardous area until necessary safety precautions are taken.

Larger and more complex operations should have a full-time safety official who makes recommendations to improve implementation of the safety plan. In a smaller operation, the safety official may be part-time and usually will be a supervisor.

Supervisors are the contractor's representatives on the job. Supervisors should conduct inspections, investigate accidents, and anticipate hazards. They should ensure that employees receive on-the-job safety and health training. They also should review and strengthen overall safety and health precautions to guard against potential hazards, get the necessary worker cooperation in safety matters, and make frequent reports to the contractor.

OSHA Assistance, Services, and Programs

How can OSHA help me?

OSHA can provide extensive help through a variety of programs, including assistance about safety and health programs, state plans, workplace consultations, Voluntary Protection Programs, strategic partnerships, training and education, and more.

How does safety and health program management help employers and employees?

Effective management of worker safety and health protection is a decisive factor in reducing the extent and severity of work-related injuries and illnesses and their related costs. In fact, an effective safety and health management system forms the basis of good worker protection and can save time and money—about $4 for every dollar spent—and increase productivity.

To assist employers and employees in developing effective safety and health programs, OSHA published recommended *Safety and Health Program Management Guidelines* (*Federal Register* 54(18):3904–3916, January 26, 1989). These voluntary guidelines can be applied to all worksites covered by OSHA.

The guidelines identify four general elements critical to the development of a successful safety and health management program:

- Management leadership and employee participation,
- Worksite analysis,
- Hazard prevention and control, and
- Safety and health training.

The guidelines recommend specific actions under each of these general elements to achieve an effective safety and health program. The *Federal Register* notice is available online at ***www.osha.gov***.

What are state plans?

State plans are OSHA-approved job safety and health programs operated by individual states or territories instead of Federal OSHA. The *Occupational Safety and Health Act of 1970* (*OSH Act*) encourages states to develop and operate their own job safety and health plans and permits state enforcement of OSHA standards if the state has an approved plan. Once OSHA approves a state plan, it funds 50 percent of the program's operating costs. State plans must provide standards and enforcement programs, as well as voluntary compliance activities, that are at least as effective as those of Federal OSHA.

There are 26 state plans: 23 cover both private and public (state and local government) employment, and 3 (Connecticut, New Jersey, and New York) cover only the public sector. For more information on state plans, see the listing at the end of this publication, or visit OSHA's website at ***www.osha.gov***.

How can consultation assistance help employers?

In addition to helping employers identify and correct specific hazards, OSHA's consultation service provides free, onsite assistance in developing and implementing effective workplace safety and health management systems that emphasize the prevention of worker injuries and illnesses.

Comprehensive consultation assistance provided by OSHA includes a hazard survey of the worksite and an appraisal of all aspects of the employer's existing safety and health management system. In addition, the service offers assistance to employers in developing and implementing an effective safety and health management system. Employers also may receive training and education services, as well as limited assistance away from the worksite.

Who can get consultation assistance and what does it cost?

Consultation assistance is available to small employers (with fewer than 250 employees at a fixed site and no more than 500 corporatewide) who want help in establishing and maintaining a safe and healthful workplace.

Funded largely by OSHA, the service is provided at no cost to the employer. Primarily developed for smaller employers with more hazardous operations, the consultation service is delivered by state governments employing professional safety and health consultants. No penalties are proposed or citations issued for hazards identified by the consultant. The employer's only obligation is to correct all identified serious hazards within the agreed-upon correction time frame.

Can OSHA assure privacy to an employer who asks for consultation assistance?

OSHA provides consultation assistance to the employer with the assurance that his or her name and firm and any information about the workplace will not be routinely reported to OSHA enforcement staff.

Can an employer be cited for violations after receiving consultation assistance?

If an employer fails to eliminate or control a serious hazard within the agreed-upon time frame, the consultation project manager must refer the situation to the OSHA enforcement office for appropriate action. This is a rare occurrence, however, since employers request the service for the expressed purpose of identifying and fixing hazards in their workplaces.

Does OSHA provide any incentives for seeking consultation assistance?

Yes. Under the consultation program, certain exemplary employers may request participation in OSHA's Safety and Health Achievement Recognition Program (SHARP). Eligibility for participation in SHARP includes, but is not limited to, receiving a full-service, comprehensive consultation visit, correcting all identified hazards, and developing an effective safety and health management system.

Employers accepted into SHARP may receive an exemption from programmed inspections (not complaint or accident investigation inspections) for a period of 1 year initially, or 2 years upon renewal. For more information concerning consultation assistance, see the list of consultation offices beginning on page 42, contact your regional or area OSHA office, or visit OSHA's website at ***www.osha.gov***.

What are the Voluntary Protection Programs?

Voluntary Protection Programs (VPPs) represent one part of OSHA's effort to extend worker protection beyond the minimum required by OSHA standards. VPP—along

with onsite consultation services, full-service area offices, and OSHA's Strategic Partnership Program (OSPP)—represents a cooperative approach which, when coupled with an effective enforcement program, expands worker protection to help meet the goals of the *OSH Act*.

How do the VPP work?

There are three levels of VPPs: Star, Merit, and Demonstration. All are designed to do the following:

- Recognize employers who have successfully developed and implemented effective and comprehensive safety and health management systems;
- Encourage these employers to continuously improve their safety and health management systems;
- Motivate other employers to achieve excellent safety and health results in the same outstanding way; and
- Establish a relationship between employers, employees, and OSHA that is based on cooperation.

How do VPP help employers and employees?

VPP participation can mean the following:

- Fewer worker fatalities, injuries, and illnesses;
- Lost-workday case rates generally 50 percent below industry averages;
- Lower workers' compensation and other injury- and illness-related costs;
- Improved employee motivation to work safely, leading to a better quality of life at work;
- Positive community recognition and interaction;

- Further improvement and revitalization of already-good safety and health programs; and a
- Positive relationship with OSHA.

How does OSHA monitor VPP sites?

OSHA reviews an employer's VPP application and conducts a VPP Onsite Evaluation to verify that the safety and health management systems described are operating effectively at the site. OSHA conducts onsite evaluations on a regular basis, annually for participants at the Demonstration level, every 18 months for Merit, and every 3 to 5 years for Star. Each February, all participants must send a copy of their most recent annual evaluation to their OSHA regional office. This evaluation must include the worksite's record of injuries and illnesses for the past year.

Can OSHA inspect an employer who is participating in the VPP?

Sites participating in VPP are not scheduled for regular, programmed inspections. OSHA handles any employee complaints, serious accidents, or significant chemical releases that may occur at VPP sites according to routine enforcement procedures.

Additional information on VPP is available from OSHA national, regional, and area offices, listed beginning on page 31. Also, see **Outreach** on OSHA's website at ***www.osha.gov***.

How can a partnership with OSHA improve worker safety and health?

OSHA has learned firsthand that voluntary, cooperative partnerships with employers, employees, and unions can be a useful alternative to traditional enforcement and an effective way to reduce worker deaths, injuries, and illnesses. This is especially true when a partnership leads to the development and implementation of a comprehensive workplace safety and health management system.

What is OSHA's Strategic Partnership Program (OSPP)?

OSHA Strategic Partnerships are alliances among labor, management, and government to foster improvements in workplace safety and health. These partnerships are voluntary, cooperative relationships between OSHA, employers, employee representatives, and others such as trade unions, trade and professional associations, universities, and other government agencies. OSPPs are the newest of OSHA's cooperative programs.

What do OSPPs do?

These partnerships encourage, assist, and recognize the efforts of the partners to eliminate serious workplace hazards and achieve a high level of worker safety and health. Whereas OSHA's Consultation Program and VPP entail one-on-one relationships between OSHA and individual worksites, most strategic partnerships seek to have a broader impact by building cooperative relationships with groups of employers and employees.

What are the different kinds of OSPPs?

There are two major types:

- Comprehensive, which focus on establishing comprehensive safety and health management systems at partnering worksites; and
- Limited, which help identify and eliminate hazards associated with worker deaths, injuries, and illnesses, or have goals other than establishing comprehensive worksite safety and health programs.

OSHA is interested in creating new OSPPs at the national, regional, and local levels. OSHA also has found limited partnerships to be valuable. Limited partnerships might address the elimination or control of a specific industry hazard.

What are the benefits of participation in the OSPP?

Like VPP, OSPP can mean the following:

- Fewer worker fatalities, injuries, and illnesses;
- Lower workers' compensation and other injury- and illness-related costs;
- Improved employee motivation to work safely, leading to a better quality of life at work and enhanced productivity;
- Positive community recognition and interaction;
- Development of or improvement in safety and health management systems; and
- Positive interaction with OSHA.

For more information about this program, contact your nearest OSHA office or go to the agency website at ***www.osha.gov***.

Does OSHA have occupational safety and health training for employers and employees?

The OSHA Training Institute in Des Plaines, IL, provides basic and advanced training and education in safety and health for federal and state compliance officers, state consultants, other federal agency personnel, and private-sector employers, employees, and their representatives.

Institute courses cover diverse safety and health topics including electrical hazards, machine guarding, personal protective equipment, ventilation, and ergonomics. The facility includes classrooms, laboratories, a library, and an audiovisual unit. The laboratories contain various demonstrations and equipment, such as power presses, woodworking and welding shops, a complete industrial ventilation unit, and a sound demonstration laboratory. More than 57 courses dealing with subjects such as safety and health in the construction industry and methods of compliance with OSHA standards are available for personnel in the private sector.

In addition, OSHA's 73 area offices are full-service centers offering a variety of informational services such as personnel for speaking engagements, publications, audiovisual aids on workplace hazards, and technical advice.

For more information on grants, training, and education, write: OSHA Training Institute, Office of Training and Education, 1555 Times Drive, Des Plaines, IL 60018; call (847) 297–4810; or see **Outreach** on OSHA's website at ***www.osha.gov***.

Does OSHA give money to organizations for training and education?

OSHA awards grants through its Susan Harwood Training Grant Program to nonprofit organizations to provide safety and health training and education to employers and workers in the workplace. The grants focus on programs that will educate workers and employers in small business (fewer than 250 employees), training workers and employers about new OSHA standards or about high-risk activities or hazards. Grants are awarded for 1 year and may be renewed for an additional 12 months depending on whether the grantee has performed satisfactorily.

OSHA expects each organization awarded a grant to develop a training and/or education program that addresses a safety and health topic named by OSHA, recruit workers and employers for the training, and conduct the training. Grantees are also expected to follow up with people who have been trained to find out what changes were made to reduce the hazards in their workplaces as a result of the training.

Each year OSHA has a national competition that is announced in the *Federal Register* and on the Internet at www.osha-slc.gov/Training/sharwood/sharwood.html. If you do not have access to the Internet, you can contact the OSHA Office of Training and Education, 1555 Times Drive, Des Plaines, IL 60018, (847) 297–4810, for more information.

Does OSHA have other assistance materials available?

OSHA has a variety of materials and tools available on its website at ***www.osha.gov***. These include eTools, Expert Advisors, Electronic Compliance Assistance Tools (e-CATs), Technical Links, regulations, directives, publications, videos, and other information for employers and employees. OSHA's software programs and compliance assistance tools walk you through challenging safety and health issues and common problems to find the best solutions for your workplace. OSHA's comprehensive publications program includes more than 100 titles to help you understand OSHA requirements and programs.

OSHA's CD-ROM includes standards, interpretations, directives, and more and can be purchased on CD-ROM from the U.S. Government Printing Office. To order, write to the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, or phone (202) 512–1800. Specify *OSHA Regulations, Documents and Technical Information on CD-ROM (ORDT)*, GPO Order No. S/N 729-013-00000-5.

What do I do in case of an emergency or if I need to file a complaint?

To report an emergency, file a complaint, or seek OSHA advice, assistance, or products, call (800) 321–OSHA or contact your nearest OSHA regional or area office listed at the end of this publication. The teletypewriter (TTY) number is (877) 889–5627.

You can also file a complaint online and obtain more information on OSHA federal and state programs by visiting OSHA's website at ***www.osha.gov***.

OSHA Regional and Area Offices

OSHA Regional Offices

Region I
(CT,* ME, MA, NH, RI, VT*)
JFK Federal Building, Room E340
Boston, MA 02203
(617) 565–9860

Region II
(NJ,* NY,* PR,* VI*)
201 Varick Street, Room 670
New York, NY 10014
(212) 337–2378

Region III
(DE, DC, MD,* PA,* VA,* WV)
The Curtis Center
170 S. Independence Mall West
Suite 740 West
Philadelphia, PA 19106-3309
(215) 861–4900

Region IV
(AL, FL, GA, KY,* MS,
NC,* SC,* TN*)
SNAF
61 Forsyth Street SW
Room 6T50
Atlanta, GA 30303
(404) 562–2300

Region V
(IL, IN,* MI,* MN,* OH, WI)
230 South Dearborn Street,
Room 3244
Chicago, IL 60604
(312) 353–2220

Region VI
(AR, LA, NM,* OK, TX)
525 Griffin Street, Room 602
Dallas, TX 75202
(214) 767–4731 or 4736 x224

Region VII
(IA,* KS, MO, NE)
City Center Square
1100 Main Street, Suite 800
Kansas City, MO 64105
(816) 426–5861

Region VIII
(CO, MT, ND, SD, UT,* WY*)
1999 Broadway, Suite 1690
PO Box 46550
Denver, CO 80202-5716
(303) 844–1600

Region IX
(American Samoa, AZ,* CA,* HI,
NV,* Northern Mariana Islands)
71 Stevenson Street, Room 420
San Francisco, CA 94105
(415) 975–4310

Region X
(AK,* ID, OR,* WA*)
1111 Third Avenue, Suite 715
Seattle, WA 98101-3212
(206) 553–5930

*These states and territories operate their own OSHA-approved job safety and health programs (Connecticut, New Jersey and New York plans cover public employees only). States with approved programs must have a standard that is identical to, or at least as effective as, the federal standard.

Appendix G
Common Fire Extinguishing Agent Guide

PUTTING OUT FIRES

FACILITATOR GUIDE

FEMA

ACTIVITY: PUTTING OUT FIRES

Purpose: The purpose of this activity is to educate participants about how to extinguish a fire.

Objectives:

- Identify the elements necessary for a fire.
- Demonstrate how to use a fire extinguisher.

Preparation and Needed Materials: Prior to conducting this activity:

- Ask the local fire department to participate by setting a controlled fire and demonstrate how to use a fire extinguisher. You should **not** do this activity without the support of the local fire department.
- Determine if local merchants or organizations will donate fire extinguishers to those who cannot afford them.

Presentation Tips: Refer the participants to the Fire Basics handout.

- Explain that fire requires the following three elements to exist:
  - **Heat:** Heat is required to elevate the temperature of a material to its ignition point. Sources of heat include matches, stoves, sparks, etc.
  - **Fuel:** The fuel for a fire may be a solid (e.g., coal, wood, paper, cloth, hay, etc.), liquid (e.g., gasoline, kerosene, alcohol, paint, cooking oil, etc.), or gas (e.g., propane, natural gas, butane, etc.). The type and quantity of the fuel will determine which method should be used to extinguish the fire.
  - **Oxygen:** Most fires will burn vigorously in any atmosphere of at least 20 percent oxygen. Without oxygen, most fuels could be heated until entirely vaporized, yet would not burn.
- Note that these three elements, called the "fire triangle," create a chemical exothermic reaction, which is fire. **Ask participants to find sources of heat and fuel in the meeting room or building.**

ACTIVITY: PUTTING OUT FIRES

Presentation Tips: (Continued)

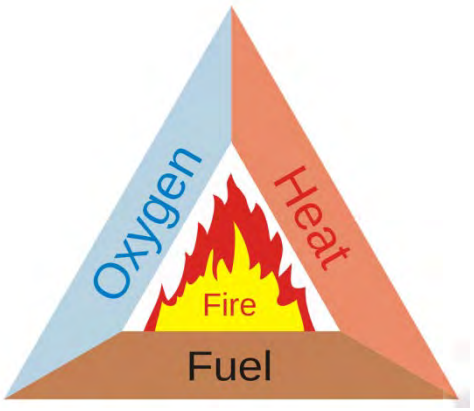
- Next, explain each class of fire. Emphasize the following key points:
  - It is very important to identify the type of fuel feeding the fire to select the correct method and agent for extinguishing the fire.
  - Never use water on a fire unless you know what is burning. Water conducts electricity which could spread the problem and cause more shorting in the equipment. Water will also carry burning oil, gas, and other petroleum products into new areas to ignite.
- Distribute the Fire Extinguishers handout. Using a fire extinguisher, explain the features and capabilities of fire extinguishers. Make sure to point out the symbols and information concerning the fire classes and capacity of the fire extinguisher(s).

  Ask the participants to find the list of questions to answer when determining whether to use a fire extinguisher. Give the participants time to review the questions. Emphasize that **if you answer "NO" to <u>any</u> of these questions or if you are unable to put out the fire in 5 seconds using the extinguisher, you should not use a fire extinguisher**. Tell the participants in that case, they should:
  - Leave the building immediately.
  - Shut all doors as you leave to slow the spread of the fire.
  - As soon as you get out of the building, call 911.

  If you answer "YES" to all of the questions but still feel unable to extinguish the fire, you should leave immediately. **You should always remember the 5-second rule.**
- **Activity:** Present some "what-if" situations and have the participants determine whether to use the fire extinguisher. Provide feedback on the participants' decisions.

ACTIVITY: PUTTING OUT FIRES

Presentation Tips: (Continued)



- Next, refer the participants to the **"PASS"** steps illustrated on the handout. Explain each of the following steps:

  - **STEP 1: PULL.** Pull the pin. This will also break the tamper seal.
  - **STEP 2: AIM.** Aim low, pointing the extinguisher nozzle (or its horn or hose) at the base of the fire. Note: Do not touch the plastic discharge horn on CO2 extinguishers; it could get very cold and may damage skin.
  - **STEP 3: SQUEEZE.** Squeeze the handle to release the extinguishing agent.
  - **STEP 4: SWEEP.** Sweep from side to side at the base of the fire until it appears to be out. Watch the area. If the fire re-ignites, repeat steps 2 through 4.

- **Demonstration:** Work with your fire department as they set a small, contained fire. Demonstrate how to put out the fire using the extinguisher. If you have the time and resources, have each participant practice using a fire extinguisher. Do **not** do this activity unless the local fire department is there with you!
- Distribute the Fire Safety Rules handout. Review the safety guidelines. Emphasize that only those trained in the proper use and maintenance of fire extinguishers should consider using them when appropriate.
- Ask the participants if they have any questions. Respond to any questions and tell the participants about other related sessions and community resources.

Fire Triangle

Fire requires the following three elements to exist:

- **Heat:** Heat is required to elevate the temperature of a material to its ignition point. Sources of heat include matches, stoves, sparks, etc.
- **Fuel:** The fuel for a fire may be a solid (e.g., coal, wood, paper, cloth, hay, etc.), liquid (e.g., gasoline, kerosene, alcohol, paint, cooking oil, etc.), or gas (e.g., propane, natural gas, butane, etc.). The type and quantity of the fuel will determine which method should be used to extinguish the fire.
- **Oxygen:** Most fires will burn vigorously in any atmosphere of at least 20 percent oxygen. Without oxygen, most fuels could be heated until entirely vaporized, yet would not burn.

These three elements, called the "fire triangle," create a chemical exothermic reaction, which is fire.

What are some examples of heat and fuel in this room?

Classes of Fire

Knowing the type of fuel helps determine what kind of fire extinguisher to use and how to use it. There are five common classes of fires:

Fire Class	Fuel
A	Ordinary combustibles such as paper, cloth, wood, rubber, and many plastics
B	Flammable liquids (e.g., oils, gasoline) and combustible liquids (e.g., charcoal lighter fluid, kerosene)
C	Energized electrical equipment (e.g., wiring, motors) – when the electricity is turned off, the fire becomes a Class A fire
D	Combustible metals (e.g., aluminum, magnesium, titanium)
K	Vegetable oils, animal oils, or fats in cooking appliances

Source: U.S. Fire Administration

It is very important to identify the type of fuel feeding the fire to select the correct method and agent for extinguishing the fire.

Never use water on a fire unless you know what is burning. Water conducts electricity, causing the problem to spread and cause more shorting in the equipment. Water will also move burning oil, gas, and other petroleum products into new areas to ignite.

Fire Extinguishers: Overview

Understanding Fire Extinguishers

- Portable fire extinguishers are invaluable for putting out small fires. A well prepared home or workplace will have at least two portable fire extinguishers of the appropriate type for the location.
- The type of fuel that is burning will determine which resources to select to fight a fire. Most household fires are:

Class A (ordinary combustible)

Class B (flammable liquids)

Class C (energized electrical equipment)

Class D (flammable metals – commercial use)

Class K (cooking oils, animal fats)

- A dry chemical extinguisher can be used on any type of fire. Common characteristics of dry chemical extinguishers include:
  - **Capacity.** Approximately 10 to 20 seconds discharge time.
  - **Range.** Standard range is 8 to 12 feet.
  - **Pressure.** Standard pressure is 175 to 250 pounds per square inch.

Deciding to Use a Fire Extinguisher: Before attempting to put out a fire with a portable fire extinguisher, you must quickly answer the following questions:

- Has someone called the fire department?
- Are there two ways to exit the area quickly and safely if I attempt to extinguish the fire? (The first priority for you is safety.)
- Do I have the right type of extinguisher for the type of fire?
- Is the extinguisher large enough for the fire?
- Is the fire small and contained (like in a wastepaper basket)?
- Is the area free from other dangers, such as hazardous materials or any debris?

Fire Extinguishers: Overview (Continued)

If you answer "NO" to any of these questions or if you will be unable to put out the fire in 5 seconds using the extinguisher, you should not use a fire extinguisher. Rather, you should:

- Leave the building immediately.
- Shut all doors as you leave to slow the spread of the fire.
- As soon as you get out of the building, call 911.

If you answer "YES" to all of the questions but still feel unable to extinguish the fire, you should leave immediately. **You should always remember the 5-second rule.**

If the fire is extinguished in 5 seconds and the area is safe, you should stay and carefully check the fire scene for hidden fire or sparks in an effort to prevent the fire from rekindling. Separate any burned or charred material to allow it to cool completely.

Fire Extinguisher: Steps

To use a fire extinguisher, remember "**PASS**":

P	**PULL.** Pull the pin. This will also break the tamper seal.
A	**AIM.** Aim low, pointing the extinguisher nozzle (or its horn or hose) at the base of the fire. Stand approximately 8 feet away. Note: Do not touch the plastic discharge horn; it may get very cold and may damage skin.
S	**SQUEEZE.** Squeeze the handle to release the extinguishing agent.
S	**SWEEP.** Sweep from side to side at the base of the fire until it appears to be out. Watch the area. If the fire re-ignites, repeat steps 2 through 4.

Fire Extinguisher: Steps (Continued)

When using a fire extinguisher:

- Always stand with an exit at your back.
- Stand several feet away from the fire, moving closer once the fire starts to diminish.
- Use a slow, sweeping motion and aim the fire extinguisher nozzle at the base of the fire.
- If possible, use a "buddy system" to have someone back you up or to call for help if something goes wrong.

After putting out the fire, call 911. Be sure to watch the area for a while to ensure the fire does not re-ignite.

If you have the slightest doubt about your ability to stop the fire . . . EVACUATE IMMEDIATELY!

Installing and Maintaining Fire Extinguishers

- Extinguishers should be installed in plain view, above the reach of children, near an escape route, and away from stoves and heating appliances.
- Extinguishers require routine care. Read your operator's manual to learn how to inspect your extinguisher. Follow the manufacturer's instructions on maintenance.
- You must service rechargeable models after every use. Disposable fire extinguishers can be used only once and must be replaced after use.

- **Always have two ways to exit the fire area.** Fires spread much faster than you might think. Always have a backup escape plan in case your main escape route becomes blocked.
- **Look at the door.** If air is being sucked under the door or smoke is coming out the top of the door, do not touch the door.
- **Feel closed doors with the back of the hand, working from the bottom of the door up.** Do not touch the door handle before feeling the door. If the door is hot, there is fire behind it. Do not enter! Opening the door will feed additional oxygen to the fire.
- **Confine the fire**, whenever possible, by closing doors and keeping them closed.
- **Stay low to the ground.** Smoke will naturally rise. Keeping low to the ground will provide you with fresher air to breathe.
- **Don't get too close. Stay near the outer range of your extinguisher.** If you feel the heat, you are too close.
- **Never turn your back on a fire when backing out.**
- **When you have extinguished the fire, carefully check to be sure that it is out, and stays out.** Sometimes, what you don't do when suppressing fires is as important as what you should do.
- **Don't forget that your personal safety is your first priority.** Don't put it at risk.
- **Don't try to suppress a large fire.** If you can't put out the fire in **5 seconds** or less, the fire it too large. Get out.
- **Don't enter smoke-filled areas.** Suppressing fires in smoke-filled areas requires equipment other than a portable fire extinguisher.

Remember . . . Only those trained in the proper use and maintenance of fire extinguishers should consider using them when appropriate.

[1] JOB TASKS	[2] POTENTIAL HAZARDS	[3] HAZARD CONTROLS (beyond wearing "Required" PPE)
1. Set-up Activities	a. Lack of concentration or focus	a. Review all plans (HASP, Work, Utility Plans, etc.) and logs in field notebook prior to starting a new task. Identify daily tasks and required personnel actions.
	b. Fire and explosion	b. No smoking or open flame. Periodically monitor ambient air concentrations with PID/LEL Meter. Shut down job and move personnel and equipment upwind if hydrocarbon concentrations are > 300 ppm or >10% of LEL. b. Place 2-20lb ABC Fire extinguishers in accordance with site safety officer's direction.
	c. Electric Shock / Electrocution	c. Have a qualified electrician from power company cut all power connections to the site and remove main breaker from power panel. c. De-Energize all circuits/power sources and follow TRC's Lock-Out, Tag-Out (LOTO) procedures.
	d. Malfunctioning Heavy Equipment Safety Devices	d. Perform all equipment and safety checks prior to event startup (per operating manual).
2. Excavation of landfilled materials	a. Eye injury from flying debris.	a. Wear ANSI approved-safety glasses at all times.
	b. High Noise Level.	b. Wear Ear Plugs or Ear Muffs when equipment is operating onsite.
	c. Being struck by moving vehicles or equipment onsite.	c. Establish eye contact with operators when moving about. Use hazard communications contained in HASP.
	d. Cut/Pinched fingers or toes; and strained muscles	d. Wear proper work and protective clothing (long pants, sleeved-shirt, steel-toed boots, safety vest, safety glasses, Kevlar gloves, and safety helmet) at all times while on jobsite. e. Lift heavy objects utilizing leg muscles and get assistance when equipment exceeds 50-lbs.
	e. Equipment tip over.	f. Watch equipment location & swing points, monitor live & dead loads adjacent to the excavation. g. Maintain 2-foot safety buffer at edge of excavation.
	f. Landfill gas	h. Monitor ambient atmosphere with PID and four gas meter prior to excavation and during excavation. i. Shut down job and move personnel and equipment upwind if hydrocarbon concentrations are > 300 ppm or >10% of LEL
	g. Slip/trips and falls.	j. Pre excavtion methane gas detector reading at location of proposed

COMPANY/ PROJECT NAME or ID/ LOCATION (City, State) **TRC/Former Gage Avenue Landfill**		DATE PREPARED FOR HSP: **1/4/14**	☐ NEW ☒ REVISED from S: Drive
JSA WORK ACTIVITY (Description): **Landfill Excavation**		List of Contractor(s) and key work activity: **B&D Construction**	
	h. Physical injury to visitors/spectators	excavation prior to start. If gas detection is >= 10% of the LEL (5% gas by volume) work will not begin until gas levels drop below this limit. k. Methane gas detector readings at site will be constantly monitored throughout the day. If gas detection is >= 10% of the LEL (5% gas by volume) work will be shut down until gas levels drop below this limit. l. Hydrogen sulfide gas detector readings at site will be constantly monitored throughout the day. If gas detection is >10 ppm a respirator is required. m. Maintain good house keeping - place unused equipment out of walkways and work areas. Clean-up all spills and debris. n. Control entry in work area using exclusions zones and use check-in logs (found in field notebook)	
3. Staging and dumping of HC Impacted Soil	a. Bad organization creating confusion and hazard	a. Identify staging area, clearly mark and keep area clear of parked vehicles or stored materials/equipment. a. Identify truck ingress/egress lanes and keep clear. a. Clear stockpile area (including overhead obstructions) so that loader bucket doesn't impact a surface appurtenance or overhead line.	
4. Clean-up	a. Slips, trips, and falls b. Storm water Run-off	a. Use good house-keeping, put equipment away as it is disconnected. b. Cover all impacted spoils piles and berm to contain storm water run-off .

Field Notes:

LIMITATION: As part of TRC's EHS Policy, a JSA is provided by TRC for its employees. The purpose of a JSA is NOT to identify all hazards associated with a task, but to identify key potential hazards to get TRC and other onsite personnel thinking about other potential safety hazards and mitigating actions for unsafe conditions and behavior during various works. TRC recognizes that JSA's may not cover every conceivable step or hazard that emerges during a job, so we've provided a "Field Change" section below to amend a JSA if required. The JSA does not supersede or replace any local, state or federal permit, regulation, statute or other entities policies and procedures but is simply a tool for enhancing the execution of safe work at a jobsite under TRC's supervision. Similarly, all subcontractors are required to provide their own JSA(s) for their specialty prior to performing any work for TRC or its customers in accordance with TRC's EHS Policy; however, any unsafe condition or hazard not covered in any JSA is ultimately the direct responsibility of the person or entity performing the work.

Always perform a Safety Assessment (Hazard Hunt): 1) prior to starting work; 2) when changing tasks; and 3) throughout the day. Focus on each new task, procedures, and skill sets to be used.

[1] JOB TASKS	[2] POTENTIAL HAZARDS	[3] HAZARD CONTROLS (beyond wearing "Required" PPE)
1) Set-up	a. Lack of concentration or focus.	a1. Review all plans (HASP, Work, Utility, Site Plans, etc.), logs, and field notes prior to starting a new task. Identify daily tasks and required personnel actions. a2. Conduct safety tailgate meeting with subcontractor personnel prior to beginning work activities. Explain the site safety hazards and work precautions outlined in the HASP and obtain signatures indicating the HASP was discussed.
	b. Fire and explosion.	b1. No smoking or open flame. Periodically monitor ambient air concentrations with PID/LEL Meters. Shut down job and move personnel and equipment upwind if hydrocarbon concentrations are HASP defined action levels. b2. Deploy 2-20lb ABC Fire extinguishers in accordance site safety officer's direction.
	c. Electric shock/ electrocution.	c1. Have a qualified electrician cut all power connections to the site and remove main breaker from power panel. c2. De-energize all circuits/power sources and follow TRC's Lock-Out, Tag-Out (LOTO) procedures for circuits within 3-feet of boring location or 10-feet' of overhead utilities.

Always perform a Safety Assessment (Hazard Hunt): 1) prior to starting work; 2) when changing tasks; and 3) throughout the day. Focus on each new task, procedures, and skill sets to be used.		
[1] JOB TASKS	**[2] POTENTIAL HAZARDS**	**[3] HAZARD CONTROLS (beyond wearing "Required" PPE)**
1) Cont'd	d. Malfunctioning heavy equipment safety devices.	d1. Inspect drill rig to determine if in good condition. Perform all equipment and safety checks prior to event startup (per operating manual).
	e. Being struck by moving vehicles or equipment onsite.	e1. Always wear safety vest, establish eye contact with operators utilizing flag men wear appropriate. e2. Vehicles shall use reverse beepers or flagmen. e3. Create an exclusion zone at least 10-feet beyond the limits of the boring to limit access to staging/work area using snow fencing, barricades, delineators, cones and/or caution tape. e4. Face the direction of oncoming traffic during work activities when possible.
	f. Bad organization creating confusion and hazard.	f1. Identify staging area with good lateral and vertical access for loading and unloading of trucks.
	g. Unauthorized personnel in exclusion zone.	g1. Use visitor check-in log and allow no-one in exclusion area without proper PPE (as defined on this JSA) and training documentation (e.g., HAZWOPER, other as defined in the HASP).
2) Drilling	a. Contact with subsurface water, gas, electrical, and/or fiber optic lines in the vicinity of drilling locations.	a1. Following the hole clearance and drilling procedures outlined in TRC's Drilling/Borehole/Excavation Checklist. a2. If unknown lines or obstructions are encountered, stop drilling and notify PM. Do not undermine any utilities.
	b. Broken rod.	b1. Do not stand in close proximity of the rods being pushed into the ground. Stand off to the side and wear required PPE.
	c. Distracted driller.	c1. Always communicate with the driller before approaching the operating drill stem.
	d. Slips, trips, and falls.	d1. Spread absorbent to soak up any pools of water that accumulate during drilling. d2. Maintain a clean, unobstructed work area by good housekeeping and placing unused equipment away from work area.
	e. Soil cross contamination.	e1. Ensure downhole sampling equipment is cleaned between samples. e2. Create a clean sample collection area with removable poly sheeting/aluminum foil or other method ensure a clean work surface that is refreshed between each sample.
	f. Cut/pinched fingers or toes; and strained muscles.	f1. See PPE Quick Summary. f2. Use proper lifting techniques and 2-man rule as outlined in TRC's Employee IIPP Handbook and "Back Safety: A User's Guide" training module" handbook, when moving heavy objects (>50 lbs).

Always perform a Safety Assessment (Hazard Hunt): 1) prior to starting work; 2) when changing tasks; and 3) throughout the day.

[1] JOB TASKS	[2] POTENTIAL HAZARDS	[3] HAZARD CONTROLS (beyond wearing "Required" PPE)
2) Cont'd	g. Noise.	g1. All personnel will use hearing protection within work area while heavy machinery is operating at >85 dB.
	h. Flying particles, dust and hazardous substances from clearance activities.	h1. See PPE Quick Summary.
	i. Exposure to impacted soil or groundwater.	i1. Wear latex or nitrile gloves during handling of soil or ground water.
	j. Toxic or explosive atmosphere.	j1. Periodically monitor ambient atmosphere with PID or LEL meter. Shut down job and move personnel and equipment upwind if concentrations are detected above HASP defined action levels.
	k. Opening/handling core sleeves.	k1. Do not attempt to open retrieved core sleeves. Request the driller to open the plastic sleeves using ANSI cut level 5 Kevlar gloves. TRC personnel must have ANSI cut level 4 Kevlar gloves when handling/transporting open core sleeves.
	l. Inclement weather/ lightning.	l1. Monitor forecasted weather prior to and during drilling activities. Hault drilling activities if lightning is observed or anticipated and wait in personal/company vehicle until weather passes or until directed otherwise by the project manager.
	m. Heat illness.	m1. Refer to Activity Performed in Hot Illness Prevention JSA.
	n. Cold illness.	n1. Refer to Activity Performed in Cold Illness Prevention JSA.
3) Boring Completion	a. Bad organization causing cross-contamination of soil, groundwater, or personnel.	a1. Waste management—Identify and delineate soil stockpile area or storage area if soil cuttings/purge water are to be drummed. a2. Blot up puddles of standing water and the work area will be swept.
	b. Moving heavy objects (>50-lbs) and mixing grout/concrete.	b1. Get assistance for moving heavy objects and mixing grout/concrete. Use mechanical aids to move objects or mix grout/concrete.
	c. Opening/closing/ moving drums.	c1. Wear must wear ANSI cut rated 4 or 5 Kevlar gloves during the opening and closing of drums to protect fingers. c2. Use only drum dolly to move drums with soil, hydrated bentonite grout, or concrete or other heavy contents. c3. Empty metal drums could also cause strain or injury if not moved properly. Use caution and appropriate tools (e.g., dolly).
	d. Slips, trips, falls and physical injury during auger removal.	d1. Place all removed rods to side, so as not to become a trip hazard.

Always perform a Safety Assessment (Hazard Hunt): 1) prior to starting work; 2) when changing tasks; and 3) throughout the day. Focus on each new task, procedures, and skill sets to be used.		
[1] JOB TASKS	**[2] POTENTIAL HAZARDS**	**[3] HAZARD CONTROLS (beyond wearing "Required" PPE)**
3) Cont'd	e. Overspray and cross-contamination during rod decontamination.	e1. See PPE Quick Summary. e2. Do not overspray while cleaning rods. Create a "clean zone" with plastic liner for placement of decontaminated rods.
	LOCATION(S) WHERE HAZARD IS TO BE EXPECTED	**[3] HAZARD CONTROLS (beyond wearing "Required" PPE)**
1.	a.	a.
2.	a.	a.

JSA WORK ACTIVITY (Description): **Mob - Demob**		List of Contractor(s) and key work activity:	
		a. Get assistance for heavy objects (object > 50 lbs.).	
6. Inspect Vehicle Equipment	a. Vehicle failures	a. Inspect fluids, tires, connections and safety equipment regularly. a. Inspect gas tank level. a. Note any hazards with vehicle and report to the appropriate employee.	
	LOCATION(S) WHERE HAZARD IS TO BE EXPECTED	**[3] HAZARD CONTROLS (beyond wearing "Required" PPE)**	
1. Vehicle Rolling Unattended	a. When parked on slope or with engine idling.	a. All large trucks should use chocks at all times when parking or leaving the vehicle unattended. a. When parking on a hill or stopping with the engine idling, use parking brakes, parking gear if available and use chocks immediately upon leaving the driver's compartment. If other personnel are available ask them do the chocking before the driver exits the vehicle, then the driver should double-check the chocks. a. All towed trailers need chocking before disconnecting from main vehicle. a. Vehicles with leveling jacks do not need chocks if the jacks are in use.	
2.	a.	a.	
3.	a.	a.	

Field Notes:

LIMITATION: As part of TRC's EHS Policy, a JSA is provided by TRC for its employees. The purpose of a JSA is NOT to identify all hazards associated with a task, but to identify key potential hazards to get TRC and other onsite personnel thinking about other potential safety hazards and mitigating actions for unsafe conditions and behavior during various works. TRC recognizes that JSA's may not cover every conceivable step or hazard that emerges during a job, so we've provided a "Field Change" section below to amend a JSA if required. The JSA does not supersede or replace any local, state or federal permit, regulation, statute or other entities policies and procedures but is simply a tool for enhancing the execution of safe work at a jobsite under TRC's supervision. Similarly, all subcontractors are required to provide their own JSA(s) for their specialty prior to performing any work for TRC or its customers in accordance with TRC's EHS Policy; however, any unsafe condition or hazard not covered in any JSA is ultimately the direct responsibility of the person or entity performing the work.

Always perform a Safety Assessment: 1) prior to starting work; 2) when changing tasks; and 3) throughout the day. Focus on each new task, procedures, and skill sets to be used.

[1] JOB TASKS	[2] POTENTIAL HAZARDS	[3] HAZARD CONTROLS (beyond wearing "Required" PPE)
1. Set-up Activities	a. Lack of concentration or focus	a. Review all plans (HASP, Work, Utility Plans, etc.) and logs in field notebook prior to starting a new task. Identify daily tasks and required personnel actions.
	b. Fire and explosion	b. No smoking or open flame. Periodically monitor ambient air concentrations with PID/LEL Meter. Shut down job and move personnel and equipment upwind if hydrocarbon concentrations are > 300 ppm or >10% of LEL. b. Place 2-20lb ABC Fire extinguishers in accordance with site safety officer's direction.
	c. Electric Shock / Electrocution	c. Have a qualified electrician from power company cut all power connections to the site and remove main breaker from power panel. c. De-Energize all circuits/power sources and follow TRC's Lock-Out, Tag-Out (LOTO) procedures.
	d. Malfunctioning Heavy Equipment Safety Devices	d. Perform all equipment and safety checks prior to event startup (per operating manual).
2. Excavation of HC Impacted Soil	a. Eye injury from flying debris.	a. Wear ANSI approved-safety glasses at all times.
	b. High Noise Level.	b. Wear Ear Plugs or Ear Muffs when equipment is operating onsite.
	c. Being struck by moving vehicles or equipment onsite.	c. Establish eye contact with operators when moving about. Use hazard communications contained in HASP.
	d. Cut/Pinched fingers or toes; and strained muscles	d. Wear proper work and protective clothing (long pants, sleeved-shirt, steel-toed boots, safety vest, safety glasses, and safety helmet) at all times while on jobsite. Wear ANSI cut level 4 or 5 Kevlar gloves. d. Lift heavy objects utilizing leg muscles and get assistance when equipment exceeds 50-lbs.
	e. Working with a high-vacuum "super-sucker" hose	e. Do not engage high vacuum hoses when personnel are within 18" of hose. e. Do not force vacuum hose if it becomes stuck, secure vacuum and lift out (get help if needed).
	f. Equipment tip over.	f. Watch equipment location & swing points, monitor live & dead loads adjacent to the excavation. f. Maintain 2-foot safety buffer at edge of excavation.

Appendix I
Tailgate Meeting/Checklist

TAILGATE SAFETY MEETING CHECKLIST

Date / Time of Tailgate Meeting: _____

☐ **Vehicle Inspection:** Driver will perform Driver's Daily Vehicle Inspection Checklist before leaving the yard or if changing drivers during the day.

☐ **Personnel training/qualifications:** Check cards for OSHA HAZWOPER 40-hour certification/8-hour-refresher training (or any other specialized training to perform the task if appropriate). TRC personnel have been trained on the Company's Drug and Alcohol Policy and will inform all site personnel.

☐ **Supplies:** Indicate location of first aid kit, fire extinguisher, clean water supply (drinking, eye wash), and Site Health and Safety Plan (HASP).

☐ **Emergency services:** Discuss location of nearest telephone and directions to hospital. Map, directions, phone numbers are provided in the HASP (Attachment C).

- **First-Aid/CPR volunteers:** _____
  _____

☐ **Site background:** Discuss types, locations, and concentrations of chemicals found onsite, presence of free product, depth to groundwater, etc.

☐ **Offsite Permits/Access Permits:** Discuss any permitting requirements for the site.

[ ] **Work activities:** Discuss scope of work for the day and activities to be performed.

☐ **Potential hazards: Review JSAs.** Discuss physical, chemical and biological hazards Discuss the prohibiting of any eating, drinking, and/or smoking in the work zone.

☐ **Personal protective equipment (PPE):** Discuss required level of protection; review additional PPE requirements in JSAs, as needed.

☐ Hard Hat ☐ Safety Shoes/Boots ☐ Safety Vest ☐ Eye Protection - ☐ glasses

☐ goggles ☐ face shield ☐ Hand Protection - ☐ Kevlar ☐ nitrile ☐ other _____ ☐ Hearing Protection

☐ Respiratory Protection - ☐ APR Particulate ☐ APR Chemical cartridge ☐ other _____

☐ Protective Clothing - ☐ Tyvex ☐ Nomex ☐ Coveralls ☐ other _____

☐ **Utilities:** Utilities have been cleared/marked by appropriate divisions.

☐ **Traffic control** (vehicular and pedestrian): Work area is properly delineated and cordoned off from traffic. Technician will put a traffic cone at all four corners of his parked vehicle. Upon completion of work, walk around vehicle to pick up cones and check all four sides and underneath vehicle for obstacles prior to moving truck.

☐ **Dispenser Emergency Shut-off Switch:** Location has been identified/communicated with field personnel.

☐ **Dealer Notification:** Notify dealer/owner of site work activities to be performed.

WorkCare Program Information

WorkCare® Making Health Count

FACT SHEET

EARLY INCIDENT INTERVENTION®

Immediate Access to Medical Advice for Work Related Incidents

(888) 449-7787

INTRODUCTION

WorkCare, Inc. (WorkCare) and TRC have partnered together to promote Incident Intervention®, a resource designed to support company safety goals/targets—while reducing runaway-costs associated with workplace injuries and illnesses.

PURPOSE

Early Incident Intervention provides TRC employees with **IMMEDIATE** telephonic access to WorkCare clinicians at the time of a presumed, non-emergency workplace injury or illness. Clinicians provide expert guidance on the evaluation of symptoms, appropriate first aid, and the need for additional medical evaluation or treatment.

When utilizing this service within the first hour of an incident, known as the "Golden Hour," licensed medical staff can guide the case so that medical evaluation and treatment are rendered appropriately.

> ***"…helps the worker traverse the unpredictable terrain of work-related injuries and illness."***

PRINCIPLES OF EARLY INCIDENT INTERVENTION

- Utilizes principles of the "Golden Hour."
- Provides workers immediate clinician support at the time of an incident.
- Focuses on providing the right care, at the right time in the proper setting.

BENEFITS FOR EMPLOYEES

- Instant access to a medically qualified professional for evaluation of symptoms and possible outcomes.
- Professional guidance on appropriate first aid measures and medications.
- Professional advice regarding the need for additional medical evaluation or treatment.

BENEFITS FOR TRC

- Point of contact for emergency and non-emergency medical clinicians.
- Triages the incident to determine risk and urgency, delivering interventions that are consistent with medical guidelines for the specified injury and illness.
- Maintains communication with clinicians to ensure accurate and timely reporting.

1.0 INTRODUCTION

1.1 OVERVIEW

This Response Plan (Response Plan or Plan) was prepared by SCS Engineers (SCS) on behalf of Comstock Gage, LLC (Comstock) and the City of Commerce (City) for the clean closure of the former solid waste landfills designated the Gage Avenue and Fletcher Dumps, located at 7316 Gage Avenue and Veterans Memorial Park (Park) at 6364 Zindell Avenue respectively, in the City of Commerce, California. For purposes of this document, the Park property will be referred to as the Site and the eastern portion of the Gage Avenue Dump will be referred to as the "Eastern Parcel." The combined Site and Eastern Parcel will be referred to collectively as the Project. A map showing the general location of the Project and surrounding area is provided as **Figure 1**.

This Plan is being implemented under the lead oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) in general accordance with the provisions of the California Land Reuse and Revitalization Act (CLRRA) of 2004 and responds to comments from the RWQCB as set forth in its letter of February 10, 2020. Specifically, Comstock has entered into a CLRRA Agreement with RWQCB to implement the Response Plan with respect to the Site, which is currently owned by the City, to enable response action to be completed at the Site concurrently with remedial work identified in the Remedial Action Plan (RAP) previously approved by RWQCB on August 4, 2016 with respect to the Eastern Parcel of the former Gage Avenue Dump. However, this Plan will incorporate activities for the entire Project.

Prior environmental assessment activities for the Project have determined that subsurface materials (soil and waste materials) within the waste mass have indicated that volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, and certain metals due to historic landfilling operations are the primary Chemicals of Concern (COC) with respect to the Project. Comstock has entered into a CLRRA Agreement with the goal of developing the Site as part of the Project, which will be utilized for recreational, commercial and residential uses. Control and cleanup activities were designed to allow redevelopment of the Site and the Eastern Parcel. This Plan presents a summary of the preferred remedial technology selected to address the COCs and conditions at the Project with the objectives of protecting human health (for the proposed land use) and reducing the potential for groundwater impacts by removing all buried landfill material..

The Plan achieves Project remediation through clean closure consisting of the following:

- Total excavation and removal from the Site and Eastern Parcel, of all buried landfill waste material;
- Confirmation sampling of the excavation floor and sidewalls to demonstrate removal of COCs; and
- Confirmation sidewall soil sampling to demonstrate removal of landfill debris, impacted media, and/or removal of COCs.

1.2 OBJECTIVES

This Plan presents the activities performed to date to assess the environmental impacts to the Project as well as the proposed implementation plan to prepare the Site and Eastern Parcel for redevelopment that is protective of human health and the environment.

The objectives of this Plan are:

- Summarize environmental conditions at the Project and identify a remedy that will be protective of human health and the environment given anticipated land use; and

- Provide technical information to support the public participation process as part of the regulatory and administrative review and approval process.

Upon approval of this Plan by the RWQCB, Comstock and the City acknowledge that the RWQCB shall retain oversight of the implementation and rights to approval of the completed response actions herein pursuant to CLRRA, as to the Site, and pursuant to the RAP as to the Eastern Parcel.

1.3 PLAN ORGANIZATION

The remainder of this Plan is structured to address the regulatory requirements as follows:

- **Section 2: Project Background**, which summarizes the Project history, background, usage, prior investigations/remediation, regulatory context, and proposed redevelopment plan.

- **Section 3: Project Conceptual Model**, which describes the origin and extent of contaminants affecting the Project.

- **Section 4: Remedial Action Plan (RAP)**, which describes the remedial action objectives (RAOs) of the remedial action, proposed cleanup criteria, subsequent groundwater well installation and monitoring, as well as the regulatory framework guiding the implementation.

- **Section 5: References** used in preparation of this Plan

2.0 PROJECT BACKGROUND

2.1 PROJECT DESCRIPTION

The Site is part of the 17.32-acre development which includes the Eastern Parcel of the former Gage Avenue Dump which is designated APN 6357-018-005 and is currently a 7.92-acre vacant parcel. The Site itself consists of the following assessor parcel numbers (APNs):

- APN 6357-018-900: 4.98-acre portion of the Park

- APN 6357-019-904: 4.40-acre portion of the Park

- APN 6357-019-905: 0.02-acre portion of the Park

The eastern approximately two-thirds of the Project (APNs 6357-018-005 and 6357-018-900) is identified in the California Department of Resources, Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) database, as the Gage Avenue Dump (SWIS ID 19-AA-5543). As to this portion, RWQCB previously approved a RAP on August 4, 2016 for the Eastern Parcel. The western third of the Project (APN 6357-019-904) is the former Fletcher Dump (also known as Doris Haney Johnes Dump) which does not have a SWIS ID.

Figure 2 is a plan view showing an aerial photograph of the Project and surrounding properties. The Project is bounded to the:

- North by East Slauson Avenue, the Ramada Inn property, and commercial and residential properties;
- East by the Interstate 5 (Santa Ana) freeway;
- South by the Rio Hondo River Channel, a concrete lined flood control channel, and the Rio Hondo percolation basin; and
- West by residential properties.

2.2 PROJECT HISTORY AND OPERATIONS

Based on historical investigation including review of aerial photographs the Project was:

- Undeveloped prior to 1947.
- Used for agricultural purposes from 1947 to 1950.
- The eastern approximately two-thirds of the Project was a disposal facility, permitted by Los Angeles County, that was owned and operated by L.A. By-Products, Inc. from 1950 to 1954. This portion of the Project was known as the Gage Avenue Dump, and reportedly accepted municipal solid wastes, construction debris, and inert fill materials.
- Following landfill closure:
  - The Eastern Parcel was improved in 1958 with a 52,160 square-foot rectangular commercial building and railroad spur constructed over the eastern one-third of the Eastern Parcel. The commercial building was demolished in 1992; and
  - The Site, i.e., the remainder (western portion) of the Gage Avenue Dump together with additional acreage to the west which was also used for disposal, (operating as the Fletcher Dump from 1941 to 1944, and as the Doris Haney Johnes Dump from 1945 to 1948) was acquired by the City and improved together with additional acreage with a public park in the mid-1960s.
- Park improvements, including a recreation building and adjacent tennis courts, constructed in 1970, reportedly involved excavation and removal of all or most waste fill in an approximately 1 acre area at the western edge of the Site.

2.3 PHYSICAL AND ENVIRONMENTAL CHARACTERISTICS

The Project totals approximately 17.32 acres (Figure 2), including the access roads, and its dimensions vary from approximately 1,200 feet long in an east-west direction and approximately 400 to 700 feet in a north-south direction (Figure 2) and can be divided into the following three sections:

- The Site (aka western parcel of Gage Avenue Dump and Fletcher Dump)

- Western Parcel of Gage Avenue Dump. This parcel is the eastern half of Veterans Memorial Park and the surface is generally flat and developed for various recreational activities (ballpark, etc.). Based on soil boring data (LeRoy Crandall & Assoc., 1963), waste thickness is approximately 15 to 17 feet.

- Fletcher Dump (also known as Doris Haney Johnes Dump). This parcel is the western half of Veterans Memorial Park, and the surface is generally flat and developed for various recreational activities (ballpark, etc.). Based on soil boring data (LeRoy Crandall & Assoc., 1963), waste thickness ranges from approximately 11 to 28 feet.

- Eastern Parcel (aka Gage Avenue Dump, Eastern Parcel).

  - The waste disposal area surface is generally flat with numerous slight depressions (less than 1 foot in depth) in relation to the surrounding area. The cover soil ranges from 3 to 5 feet in thickness. In the northern and central portions average waste thickness is approximately 15 feet, assuming 4 feet of soil cover. In the southern portion, the average waste thickness is 16 feet (Sladden, 2004).

2.3.1 Regional Hydrology and Geology

The Project is centrally situated at the southern edge of the Montebello Plain physiographic feature within the Coastal Plain of the Los Angeles Basin. According to published geologic maps and cross sections (CDWR, 1961), the Project overlies late Pleistocene-age sediments of the Lakewood Formation. The Lakewood Formation is described as being sedimentary in origin and consists of marine and continental gravel, sand, silty sand, silt, and clays. The Project lies within the Central Groundwater Basin, a subdivision of the Coastal Plain of Los Angeles County east and northeast of the Newport-Inglewood uplift. Local hydrostratigraphic features (from shallowest to deepest) include the Bellflower aquiclude, Exposition aquifer, and Gage aquifer, all within the Lakewood Formation. Deeper hydrostratigraphic features of the underlying San Pedro Formation include the Hollydale aquifer, Lynwood aquifer, Silverado aquifer, and Sunnyside aquifer. The aquifers of the Central Groundwater Basin are generally separated by low-permeability aquitards that limit vertical groundwater conductance between aquifers (CDWR, 1961).

The Project is located approximately 7 miles west of the Elsinore fault zone, Whittier section; 6 miles southwest of the East Montebello fault; and 10 miles east and northeast of the Newport-Inglewood-Rose Canyon fault zone. The Project does not appear in Alquist-Priolo (AP) Earthquake Fault Zones.

2.3.2 Local Hydrology and Geology

Project elevation ranges from approximately 140 to 145 feet relative to mean sea level (msl) with the surface elevation sloping gently towards the south (USGS, 1981). Current depth to first groundwater is estimated at approximately 90 feet below ground surface (bgs) or greater. According to the groundwater monitoring reports posted on GeoTracker for the Arco Facility #1682, located at 7667 East Slauson Avenue, approximately 525 feet north-northeast of the Project, the regional groundwater flow direction is south-southeast towards the Rio Hondo River Channel. Historical groundwater monitoring events conducted at the former Mobil Service Station, located at 7724 Telegraph Road (approximately 100 feet to the north), indicate depth to groundwater in monitoring well MW-7A, fluctuating from 73.70 to 104.57 feet bgs. The highest historical groundwater elevation was recorded in 2005 at 82.28 feet relative to msl. Those nearby properties are no longer conducting groundwater monitoring, however the Baker Hughes facility at 7400 East Slauson Avenue (about 2,000 feet to the northwest) indicates groundwater at an elevation of approximately 33 to 37 feet relative to msl in May 2019.

The maximum excavation depth of the remediation activities described by the Plan is approximately 25 feet below ground surface (bgs), meaning approximately 35 feet of native soil will remain between the highest historical groundwater elevation and the excavation floor.

Soil boring logs from a 2004 geotechnical investigation by Sladden Engineering indicate the soil (up to 80.5 feet bgs) underlying the Eastern Parcel consists of silty sand, sandy silt, and fine-to coarse-grained alluvial sand with gravel (Sladden 2004). Groundwater was not encountered during the Sladden Engineering investigation. Borings drilled in the western parcel of the Gage Dump and the Fletcher Dump (LeRoy Crandall & Assoc., 1963) found predominantly fine grained sand with some silty sand, clayey silt, silty clay, and clay layers below the waste. Borings were drilled to a maximum depth of 80 feet below ground surface (bgs) and did not encounter groundwater.

2.4 SUMMARY OF PREVIOUS INVESTIGATIONS

2.4.1 1963 Foundation Investigation

In a 1963 Foundation Investigation of the Site, LeRoy Crandall & Associates drilled and sampled 13 borings on what is now Veterans Memorial Park, which includes the western half of the Gage Dump and essentially all of the Fletcher Dump. Borings were drilled to a maximum depth of 50 feet bgs and selected intervals were sampled for geotechnical parameters. Waste-containing fill was found to be between 11 and 28 feet thick. The description of the wastes encountered included wood, concrete, tire casings, metal, rubber gaskets, glass, brick, wire, tile, and chunks of concrete. The approximate locations of the boings are shown in **Figure 3**.

2.4.2 1998 Soils Investigation

In a 1998 soils investigation of the Eastern Parcel, Duco Engineering, Inc. drilled eight borings to determine the depth of refuse, and excavated six test pits to determine the northerly limits of the Gage Avenue Dump. Borings were drilled to a maximum depth of 75 feet bgs and selected intervals were sampled for geotechnical parameters. The maximum depth of waste varied between 10 and 23 feet in the borings. The description of the wastes encountered included wood, tar paper, tire beads, glass, wire, paper, and concrete. The approximate location of the borings and trenches are shown in **Figure 3**.

2.4.3 2004 Geotechnical Investigation

In a 2004 Geotechnical Investigation of the Eastern Parcel, Sladden Engineering advanced nine soil borings up to 80.5 feet bgs to determine depth and density of onsite disposal waste, and underlying soil lithology and density. Waste was reported at depths of 7 to 29 feet bgs at one boring location. The description of the wastes encountered included wood, rubber, tires, concrete, and debris. The approximate locations of the boings are shown in **Figure 3**. In addition, the 2004 investigation reportedly included 218 supplemental borings in a 40-foot grid pattern to further evaluate the conditions and depth of the disposal wastes (TRC, 2013a).

2.4.4 2013 Phase I Environmental Site Assessment

In April 2013, TRC conducted a Phase I Environmental Site Assessment (ESA) for the Eastern Parcel to identify Recognized Environmental Conditions (RECs) (as defined by the ASTM E 1527-05 standard). A number of tasks were conducted, including:

- Eastern Parcel and vicinity reconnaissance;
- Eastern Parcel and vicinity description and physical setting;

- Source review and description of historical conditions on the Eastern Parcel;
- Review of environmental databases and regulatory agency records;
- Review of previous environmental reports/documentation, as applicable; and
- Preparation of a report summarizing findings, opinions and conclusions.

Only limited information was available on Eastern Parcel history with respect to the nature and extent of landfill disposal activities conducted in the 1940s and 1950s.

2.4.5 2013 Limited Environmental Assessment

In June 2013, TRC conducted a Limited Phase II ESA for the Eastern Parcel consisting of the excavation and sampling of five trenches, designated T-1 through T-5, located in the eastern portion of the former Gage Avenue Dump in order to characterize the nature of the disposed waste. The approximate location of the trenches is presented in **Figure 3**.

Eighteen composited waste samples from the five trenches were analyzed for Total Petroleum Hydrocarbons (TPH) carbon chain (C8-C44) by EPA Method 8015, volatile organic compounds (VOCs) by EPA Method 8260B, semi-volatile organic compounds (SVOCs) by EPA Method 8270C, organochlorine pesticides (pesticides) and polychlorinated biphenyls (PCBs) by EPA Method 8080, and RCRA Title 22 metals by EPA Methods 6010B/7000. TRC compared analytical results to the current (2014) EPA Regional Screening Levels (RSLs) for Industrial soil. Analytical results from composite samples and commentary of the 2013 industrial RSLs are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were detected in 14 of the 18 composite samples at levels up to 39 mg/kg.
  - Total TPH (C8 to C44) was detected in all of the composite soil samples at levels up to 8,500 mg/kg.

- VOCs were detected in 16/18 composite samples, with the following detected concentrations:
  - 1,2,4-Trimethylbenzene: 0.0018 to 0.045 mg/kg
  - Benzene: 0.0015 to 0.0067 mg/kg
  - Ethylbenzene: 0.0020 to 0.027 mg/kg
  - Toluene: 0.0014 to 0.0019 mg/kg
  - Total Xylenes: 0.0045 to 0.013 mg/kg
  - Naphthalene: 0.012 to 0.057 mg/kg
  - No other VOCs were detected
  - All VOC detections were below the RSL for industrial use

- SVOCs were not detected in any of the 18 composite samples analyzed.

- Pesticides were detected in 13/18 composite samples, with the following detected concentrations:
  - 4,4'-DDD: 0.013 to 28 mg/kg, which is above industrial RSLs
  - 4,4'-DDE: 0.0063 to 1.1 mg/kg, which is below industrial RSLs
  - 4,4'-DDT: 0.0052 to 7.8 mg/kg, which is above industrial RSLs
  - Dieldrin: 0.056 to 9.6 mg/kg, which is above industrial RSLs
  - Endrin: 0.0084 to 0.59 mg/kg, which is below industrial RSLs

- PCBs were detected in 1/18 samples at 0.47 mg/kg, which is below the industrial RSL

- Metals results:
  - Except for arsenic and lead, discussed below, other RCRA metals (barium, cadmium, chromium, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the RSL for industrial soil.
  - Arsenic concentrations up to 23 mg/kg were detected in the composite soil samples.
  - Lead concentrations up to 1,400 mg/kg were detected in the composite soil samples.

In addition, two excavation bottom soil samples from two of the exploratory trenches were collected and analyzed during this investigation to evaluate soil conditions underlying the waste area. The approximate location of the bottom samples is presented in **Figure 3**. TRC compared analytical results to the 2013 RSLs for Industrial soil. Analytical results from excavation bottom samples and commentary of the 2014 industrial RSLs are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were detected in one of the bottom samples (T4-18) at 0.46 mg/kg.
  - TPH (C8 to C44) was detected in one of the bottom samples (T4-18) at 2,400 mg/kg.

- VOCs were detected in bottom sample T4-18, with the following detected concentrations:
  - Benzene: 0.0022 mg/kg
  - Ethylbenzene: 0.0027 mg/kg
  - Naphthalene: 0.014 mg/kg
  - No other VOCs were detected
  - All VOC detections were below the RSL for industrial use

- SVOCs were not detected in either of the 2 bottom samples analyzed.

- Pesticides were not detected in either of the 2 bottom samples analyzed.

- No PCBs were not detected in either of the 2 bottom samples analyzed.

- Metals results:
  - Except for arsenic and lead, discussed below, RCRA metals (barium, cadmium, chromium, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the RSL for industrial soil.
  - Arsenic concentrations of 1.8 and 4.3 mg/kg were detected in the excavation bottom samples. These concentrations are within the range of concentrations usually considered as soil background in southern California.
  - Lead concentrations of 1.8 and 1,100 mg/kg were detected in the excavation bottom samples.

The investigation also identified one groundwater monitoring well in the southwest corner of the eastern parcel of the Gage Dump. The well was dry and soil was encountered in the 4-inch diameter well at 84.49 feet below the top of the well casing when measured on January 21, 2014. No other groundwater monitoring wells were identified during the assessment. However, as noted by Partner (Partner 2012), "A total of three groundwater monitoring wells were observed onsite during the Eastern Parcel reconnaissance."

On December 19, 2019, SCS opened and sounded five potential wells located on the Project. Of the five locations, three were identified as groundwater wells, one was a piezometer, and one was a

vapor probe. SCS staff sounded the three groundwater wells and determined that all three were dry, with a total depth of 90-91 feet bgs. The location of the three wells is presented on **Figure 3**.

2.4.6 2014 Additional Eastern Parcel Assessment

In January 2014, additional excavation was conducted on the Eastern Parcel. TRC observed further limited exploratory excavation and collected soil samples for analysis during the test pit work and material screening performed by B&D Construction Company, Inc. (B&D).

B&D's exploratory work involved the excavation of four test trenches (Identified as T-6 through T-9), each with an excavation floor footprint of approximately 20 by 50 feet. In addition, B&D excavated a 100- by 100-foot test pit, designated TP-1. The approximate location of the trenches and pit is presented in **Figure 3**.

The test pit and trenches were excavated to varied depths, ranging from 15 to 26 feet bgs to expose the native soil underlying the disposed waste. After on-site screening for size, down to material passing through a 3/8-inch sieve, TRC collected five material samples for analysis of the same analytes used in the 2013 trenching investigation. Analysis indicated the presence of TPH, three different VOCs, one SVOC, five pesticides, and various metals in the composited waste samples. PCBs were not detected in any of the composite samples. While full detailed results are contained in the TRC RAP from 2015 (TRC 2015), analytical results from composite samples and TRC commentary on comparison to the 2014 industrial RSLs are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were detected in 1 of the 5 composite samples at 0.13 mg/kg.
  - Total TPH (C8 to C44) was detected in 4/5 composite soil samples at levels up to 1,100 mg/kg.

- VOCs were detected in 4/5 composite samples, with the following detected concentrations:
  - Benzene: One detection of 0.0018 mg/kg
  - Ethylbenzene: Two detections of 0.0023 and 0.024 mg/kg
  - Naphthalene: Two detections of 0.0037 and 0.079 mg/kg
  - No other VOCs were detected
  - All VOC detections were below the RSL for industrial use

- SVOCs were detected in 1/5 composite samples, with the following detected concentrations:
  - Benzo(a)anthracene: One detection of 0.11 mg/kg
  - Chrysene: One detection of 0.16 mg/kg

- Pesticides were detected in 4/5 composite samples, with the following detected concentrations:
  - 4,4'-DDD: 0.0032 to 40 mg/kg, which is above industrial RSLs
  - 4,4'-DDE: 0.0063 to 1.1 mg/kg, which is below industrial RSLs
  - 4,4'-DDT: 0.0013 to 170 mg/kg, which is above industrial RSLs
  - Dieldrin: 2.7 and 6.1 mg/kg, which is above industrial RSLs
  - Endrin: 0.19 to 6.1 mg/kg, which is below industrial RSLs

- PCBs were note detected in any of the composite samples

- Metals results:
  - Except for arsenic and cadmium, discussed below, other RCRA metals (barium, chromium, lead, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the RSL for industrial use.
  - Arsenic concentrations ranging from 5.2 to 27 mg/kg were detected in the composite soil samples.
  - One sample had a cadmium detection of 84, mg/kg, which is above the industrial RSL. All other composite samples were below the industrial RSLs.

TRC also collected six bottom samples from TP-1 and T-6 through T-8. A water pipeline was encountered within the excavation of T-9, limiting the accessibility of the excavator, and thus no excavation bottom or screened soil samples were collected in this location. The approximate location of the bottom samples are presented in **Figure 3**. Analytical results from excavation bottom samples along with TRC commentary on applicability of 2014 RSLs are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were not detected in any of the bottom samples.
  - TPH (C8 to C44) was not detected in any of the bottom samples.

- VOCs were not detected in any of the bottom samples.

- SVOCs were detected in any of the bottom samples analyzed.

- Pesticides were detected in 1/6 bottom samples analyzed. 4-4'-DDT was detected at a concentration of 0.0010 mg/kg.

- No PCBs were not detected in any of the bottom samples analyzed.

- Metals results:
  - Except for arsenic, discussed below, RCRA metals (barium, cadmium, chromium, lead, mercury, selenium, and silver) were either not detected, or were detected at concentrations significantly below the RSL for residential use soil.
  - Arsenic concentrations ranging from 0.68 to 3.9 mg/kg were detected in the excavation bottom samples. These concentrations are within the range of concentrations usually considered as soil background in southern California.

2.4.7 2015 Landfill Gas Investigation

In 2015, Ninyo & Moore conducted a landfill gas (LFG) investigation that included the Project (Site and Eastern Parcel), as well as the former Salvage Corporation/Freight Terminals property to the west, the adjacent Ramada Inn property to the north, and the Travelodge property to the east across the Interstate 5 Freeway. The work was conducted for CalRecycle by Ninyo and Moore (Ninyo 2014).

A total of 10 of the 17 borings (LFG-1 through LFG-5, WLFG-1, WLFG-12, LFG-13, HA-1 and HA-2) installed were located on or adjacent to the Project. Of these 10 borings, six (LFG-1 through LFG-5 and LFG-13) were located around the perimeter of the Project and four were located within the waste footprint of the Fletcher (WLFG-12) and western portion of the Gage Avenue Dump (WLFG-1, HA-1 and HA-2). Seven of the 10 borings were converted to landfill gas monitoring wells (LFG-1 through LFG-5, WLFG-1, and WLFG-12). The approximate locations of the borings/wells are presented in **Figure 3**.

No waste was encountered in any of these six perimeter borings, while waste was encountered in the Fletcher Dump footprint to a depth of 15 feet and within the western portion of the Gage Avenue Dump to a depth of 16 feet. Out of the 10 borings, four material samples were analyzed for TPH via EPA Method 8015M, one material sample was analyzed for VOCs, six material samples were analyzed for SVOCs via EPA Method 8270C, one material sample was analyzed for pesticides via EPA Method 8081A, one material sample was analyzed for PCBs via EPA Method 8082, and 13 material samples were analyzed for CCR Title 22 metals via EPA Methods 6010B/7417. Analytical results from in-refuse samples along with Ninyo commentary on applicability of 2015 residential and industrial RSLs are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were detected in one material sample (HA-1 @ 5 feet bgs) at a concentration of 0.53 mg/kg.
  - TPH Diesel (C13-C22) was detected in 4/4 samples at levels from 29 to 210 mg/kg.
  - TPH Motor Oil (C23-C40) was detected in 4/4 samples at levels from 220 to 1,800 mg/kg.

- VOCs were not detected in the one sample analyzed (WLFG-12 @ 6 feet bgs).

- SVOCs were detected in 6/6 samples, with the following detected concentrations:
  - Benzo(a)anthracene: One detection of 0.86 mg/kg, which is above residential RSLs and below industrial RSLs.
  - Bezo(b)fluoranthene: Two detections (0.14 and 1.5 mg/kg), with the lower sample below residential RSLs and the higher sample between residential and industrial RSLs.
  - Benzo(k)fluoranthene: Two detections (0.11 and 1.6 mg/kg), which are both above between residential and industrial RSLs.
  - Benzo(a)pyrene: One detection of 1.4 mg/kg, which is above the industrial RSL.
  - Benzo(g,h,i)perelyene: One detection, which does not have a specific RSL.
  - Benzoic acid: Three detections ranging from 0.29 to 2.0, all of which are below the residential RSL.
  - Bis(2-ethylhexyl)phthalate: One detection of 0.20 mg/kg which is below the residential RSL.
  - Butyl benzyl phthalate: One detection of 0.32 mg/kg, which is below the residential RSL.
  - Chrysene: Two detections (0.13 and 1.5 mg/kg), both of which are below residential RSLs.
  - Dibenz(a,h)anthracene: One detection of 0.30 ng/kg, which is above the industrial RSL.
  - Di-n-butyl phthalate: One detection of 0.22 mg/kg, which does not have a specific RSL.
  - Fluoranthene: Two detections (0.12 and 0.72 mg/kg), both of which are below the residential RSL.
  - Indeno(1,2,3-cd)pyrene: One detection of 0.60 mg/kg, which is between the residential and industrial RSLs.
  - Pheneanthrene: One detection of 0.13 mg/kg, which does not have a specific RSL.
  - Pyrene: Three detections ranging from 0.11 to 1.0, all of which are below residential RSLs.
  - Phenol: One detection of 0.81, which is below the residential RSL.

- Only one pesticide (4,4'-DDE) was detected at 0.016 mg/kg, which is below the residential RSL.

- PCBs were not detected in the one sample analyzed (WLFG-12 @ 6 feet bgs).

- Metals results:
  - Except for arsenic, lead, and thallium, discussed below, Title 22 metals (antimony, barium, beryllium, cadmium, cobalt, copper, mercury, molybdenum, nickel, selenium, silver, vanadium, and zinc) were either not detected, or were detected at concentrations below the RSL for residential use soil. Note that total chromium concentrations ranged from 19 to 230 mg/kg, with no associated RSL listed by Ninyo.
  - Arsenic concentrations ranging from 4.6 to 29 mg/kg were detected in the waste material samples, all of which are above the industrial RSLs.
  - One lead sample had a level of 400 mg/kg, which is equal to the 2015 RSL for lead.
  - Thallium concentrations ranging from 1.1 to 1.2 mg/kg were detected in the waste material samples, which is between the residential and industrial RSL.

Two soil samples collected from perimeter borings LFG-4 and LFG-13 were analyzed for SVOCs and metals. Analytical results from these perimeter borings along with Ninyo commentary on applicability of 2015 residential and industrial RSLs are summarized below:

- SVOCs were not detected in either of the samples analyzed.

- Metals results:
  - Title 22 metals (antimony, arsenic, barium, beryllium, cadmium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc) were either not detected, or were detected at concentrations below the RSL for residential use soil. Note that total chromium concentrations ranged from 7.6 to 12 mg/kg, with no associated RSL listed by Ninyo.

In addition to soil sampling, gas samples were collected from completed landfill gas wells (LFG-1 through LFG-5, LFG-13, WLFG-1 and WLFG-12) on two separate dates and analyzed for fixed gasses (methane, carbon dioxide, oxygen, nitrogen, and carbon monoxide) and VOCs. Methane was detected in only one in-waste well (LFG-1) at a peak concentration of 4.3 percent. Twenty-three VOCs were detected in landfill gas samples collected from the in-waste wells.

Methane was not detected in any of the samples collected from the six perimeter wells. And, while 13 VOCs were detected in samples collected from the perimeter wells, the depth and nature of the detected VOCs was generally different from the VOCs detected in the waste mass. Full detailed results are contained in the Ninyo and Moore Report.

2.4.8 2015 Supplemental Soil and Vapor Assessment Report

In October, 2015, TRC submitted a report to the RWQCB for the Eastern Parcel detailing additional in-waste profiling results associated with the trenches previously excavated in the eastern portion of the Gage Avenue Dump, as well as the former rail spur that was installed on this portion of the Eastern Parcel.

A total of 34 samples were collected from inside the waste mass. Samples were analyzed for TPH via 8015M, VOCs via EPA Method 8260, SVOCs (including 1-4-Dioxane) via EPA Method 8270C,

perchlorate via EPA Method 314.0, pesticides and PCBs via EPA method 8080, and metals via EPA Methods 6010B/7471A/7199. Analytical results from the additional in-waste samples along with TRC commentary on applicability of the TRC-RSCC are summarized below:

- TPH results:
  - Gasoline-range organics (C4 to C12) were detected in 11/34 samples at levels from 0.25 to 530 mg/kg. Only one sample was above the TRC-RSCC.
  - Total TPH (C8 to C44) was detected in 27/34 samples at levels up to 38,000 mg/kg. 4/34 samples had total TPH levels above the TRC-RSCC.

- VOCs were detected in 19/34 samples, with the following detected concentrations:
  - Benzene: 15 detections ranging from 0.0011 to 0.013 mg/kg, which are all below the TRC-RSCC.
  - Bromomethane: One detection of 0.042 mg/kg, which is below the TRC-RSCC.
  - N-Butylbenzene: Two detections (0.028 and 0.030 mg/kg), both below the TRC-RSCC.
  - sec-Butylbenzene: Two detections (0.021 and 0.025 mg/kg), both of which are below the TRC-RSCC.
  - Chloromethane: One detection of 0.031 mg/kg, which is below the TRC-RSCC.
  - 1-3,Dichlorobenzene: One detection at 0.0053 mg/kg, which is below the TRC-RSCC.
  - 1,4-Dichlorobenzene: One detection at 0.027, which is below the TRC-RSCC.
  - Ethylbenzene: Two detections (0.023 and 0.027 mg/kg), both below the TRC-RSCC.
  - Isopropylbenzene: Two detections (0.015 and 0.019), both below the TRC-RSCC.
  - p-Isoprpylbenzene: Two detections (0.042 and 0.049), both below the TRC-RSCC.
  - Napthalene: Three detections (0.018, 0.70, and 8.3), only one of which was above the TRC-RSCC.
  - n-propylbenzene: Two detections (0.027 and 0.032 mg/kg), both below the TRC-RSCC.
  - Toluene: 11 detections ranging from 0.0010 to 0.0039, all of which are below the TRC-RSCC.
  - 1,2,4-Trimethylbenzene: Two detections (both 0.16 mg/kg), both below the TRC-RSCC.
  - Total Xylenes: Two detections (0.012 and 0.013 mg/kg), both below the TRC-RSCC.

- SVOCs were detected in 5/34 samples, with the following detected concentrations:
  - Benzo butyl phthalate: One detection of 16 mg/kg, which is above the TRC-RSCC.
  - Bis(2-ethylhexyl)phthalate: Two detections (0.65 and 0.80 mg/kg), both below the TRC-RSCC.
  - Butyl benzyl phthalate: One detection of 0.035 mg/kg, which is below the TRC-RSCC.
  - Diethyl phthalate: Two detections (0.13 and 1.5 mg/kg), both of which are below residential RSLs.
  - Di-n-butyl phthalate: Two detections (0.036 and 0.40 mg/kg), both below the TRC-RSCC.
  - 1-4-Dioxane was not detected in any of the 34 samples analyzed.
  - Fluoranthene: One detection of 0.020 mg/kg, which is below the TRC-RSCC.
  - Pheneanthrene: One detection of 0.024 mg/kg, which is below the TRC-RSCC.
  - Pyrene: Two detections (0.017 and 0.27 mg/kg), both below the TRC-RSCC.

- Perchlorate was detected in 5/34 samples at levels ranging from 0.014 to 0.32, all of which are below the TRC-RSCC.

- Pesticides were detected in 8/34 samples, with the following detected concentrations:
  - 4,4'-DDD: Six detections ranging from 0.0026 to 0.12, all of which are below the TRC-RSCC.
  - 4,4'-DDE: Seven detections ranging from 0.00011 to 0.01, all of which are below the TRC-RSCC.
  - 4,4'-DDT: Three detections (0.00011, 0.0010, and 0.0035) all of which are below the TRC-RSCC.

- PCBs were detected in 12/34 samples with levels ranging from 0.11 to 2.2. Eight samples were above the TRC-RSCC of 0.22 mg/kg.

- Metals results:
  - Of the 11 metals analyzed, only three (barium, chromium, and silver) had levels that in which all 34 samples were lower than the TRC-RSCC. The remaining eight metals are discussed below.
  - Arsenic concentrations ranging from 0.6 to 33 mg/kg were detected in the waste material samples, however only three samples were above the TRC-RSCC of 12 mg/kg.
  - Cadmium concentrations ranging from 0.011 to 8.6 mg/kg were detected in the waste material samples, however only one sample was above the TRC-RSCC of 6.9 mg/kg.
  - Hexavalent Chromium concentrations ranging from 0.4 to 2.4 mg/kg were detected in the waste material samples, however only three samples were above the TRC-RSCC of 2.0 mg/kg.
  - Copper concentrations ranging from 6 to 9,000 mg/kg were detected in the waste material samples, however only seven samples were above the TRC-RSCC of 230 mg/kg.
  - Lead concentrations ranging from 5 to 2,100 mg/kg were detected in the waste material samples, however 17 samples were above the TRC-RSCC of 80 mg/kg.
  - Mercury concentrations ranging from 0.4 to 1.5 mg/kg were detected in the waste material samples, however only eight samples were above the TRC-RSCC of 0.33 mg/kg.
  - Selenium concentrations ranging from 1.4 to 16 mg/kg were detected in the waste material samples, however only two samples were above the TRC-RSCC of 5.2 mg/kg.
  - Zinc concentrations ranging from 15 to 5,500 mg/kg were detected in the waste material samples, however only seven samples were above the TRC-RSCC of 600 mg/kg.

As part of the 2015 investigation, TRC also collected six soil vapor samples from within the refuse footprint. The five samples were analyzed for VOCs via EPA Method 8260B, with a summary of the analytical results provided below:

- VOCs were detected in 6/6 samples, with the following detected concentrations:
  - Benzene: Five detections ranging from 0.040 to 0.49 µg/L.
  - n-Butylbenzene: Two detections (0.010 and 0.020 µg/L).
  - sec-Butylbenzene: Three detections (0.020, 0.020, and 0.040 µg/L).
  - Carbon Disulfide: Three detections (0.080, 0.14, and 0.023 µg/L).
  - Chlorobenzene: One detection at 0.080 µg/L.
  - cis-1,2-Dichlorobenzene: One detection at 0.050 µg/L.
  - 1,4-Dichlorobenzene: One detection at 0.010 µg/L.

- Ethylbenzene: Three detections (0.020, 0.040, and 0.10 µg/L).
- Isopropylbenzene: Two detections (0.030 and 0.080 µg/L).
- para-Isopropyltoluene: Three detections (0.020, 0.020, and 0.030 µg/L).
- Styrene: One detection at 0.010 µg/L.
- 1,2,4-Trimethylbenzene: Three detections (0.020, 03030, and 0.030 µg/L).
- n-Propylbenzene: Three detections (0.020, 0.020, and 0.050 µg/L).
- Toluene: Six detections ranging from 0.020 to 0.110 µg/L).
- 1,3,5-Trimethylbenzene: One detection oat 0.010 µg/L.
- Vinyl Chloride: One detections at 0.11 µg/L.
- meta- and para-Xylenes: Four detections ranging from 0.020 to 0.15 µg/L.
- ortho-Xylene: Two detections (0.040 and 0.060 µg/L).

2.5 FUTURE REDEVELOPMENT PLANS

The proposed redevelopment plan for the Project is a mixed-use development including park and open-space, residential and commercial uses. The proposed redevelopment project includes the relocation and reconstruction of the existing Veterans Memorial Park to the Eastern Parcel along with construction of 825 residential units, and approximately 165,000 square feet of entertainment retail on the Site and Eastern Parcel. These future development plans are depicted in Figure 5 through 6B of the California Environmental Quality Act (CEQA) Initial Study and can be viewed at the following link: http://ca-commerce.civicplus.com/DocumentCenter/View/4548. The Project re-development plans call for excavation and removal of significant volumes of soil in accordance with the architectural and engineering plans. Accordingly, implementation of the re-development plan will require the excavation, stockpiling, profiling, and appropriate disposal of all former landfill materials encountered during the Project redevelopment activities.

3.0 PROJECT – SITE CONCEPTUAL MODEL

This section summarizes the Site Conceptual Model (SCM) for the Project identifying the sources and locations of chemical impacts.

3.1 LAND USE AND RECEPTORS

The Project was used as a permitted (Gage Avenue Dump) and unpermitted (Fletcher Dump) landfilling operations from approximately 1941 to 1954 (1941 to 1948: Fletcher Dump; and 1950 to 1954: Gage Avenue Dump), as described in Section 2, with wastes deposited including wood, tar paper, bricks, tire casings, tire beads, glass, tile, wire, and metals. The operation of the Project as landfills were the original source of the chemicals observed within the Project subsurface. The Project is currently partially vacant (eastern portion of Gage Avenue Dump) and partially developed as a community park (western portion of Gage Avenue Dump and Fletcher Dump). The re-development plan consists of a one-level podium-style parking structure below the residential and office developments. The land use in the vicinity of the Project is primarily industrial/commercial.

3.2 DETERMINATION OF CHEMICALS OF CONCERN

Due to the nature of former operations, as well as both perimeter and in-refuse sampling, the impacts to the soils at the Project are primarily within the refuse footprint of the former landfills. In the following sections, the chemicals of concern (COC) will be identified. Cleanup criteria will be developed for all COCs.

3.2.1 In-Waste Sample Summary

The analysis of material within the waste cells identified elevated concentrations of TPH, VOCs, SVOCs, pesticides, PCBs, and metals. Any detections of any of these compounds are considered COCs. SCS considered any analyte detected in soils from prior investigations to be a COC as well. A summary of all detected in-waste COCs is presented in **Table 1**, below.

Table 1. Waste Characterization COC Summary
(all concentrations are listed as mg/kg)

Analyte/COC		Frequency of Detection	Highest Result
Total TPH Carbon Chain		53/61	38,000
VOCs[1]	Benzene	32/58	0.0082
	Bromomethane	1/58	0.042
	n-Butylbenzene	2/58	0.030
	sec-Butylbenzene	2/58	0.025
	Chloromethane	1/58	0.031
	1,3-Dichlorobenzene	1/58	0.0053
	1,4-Dichlorobenzene	1/58	0.027
	Ethylbenzene	12/58	0.027
	Isopropylbenzene	2/58	0.019
	p-Isopropylbenzene	2/58	0.049
	Naphthalene	18/58	8.3
	n-Propylbenzene	2/58	0.032
	Toluene	16/58	0.0044
	1,2,4-Trimethylbenzene	8/58	0.045
	Total Xylenes	5/58	0.013
SVOCs[1]	Benzo(a)anthracene	2/62	0.86
	Benzo(b)fluoranthene	2/62	0.86
	Benzo(k)fluoranthene	2/62	1.6
	Benzo(a)pyrene	1/62	1.4
	Benzo(g,h,i)perylene	1/62	0.65
	Benzoic Acid	3/62	2.0
	Bis(2-ethylhexyl)phthalate	3/62	0.80
	Butyl benzyl phthalate	1/62	0.32

Analyte/COC		Frequency of Detection	Highest Result
	Chrysene	3/62	1.5
	Dibenz(a,h)anthracene	1/62	0.30
	Diethyl phthalate	1/62	0.035
	Di-n-butyl phthalate	3/62	0.40
	Fluoranthene	3/62	0.78
	Indeno (1,2,3-cd) pyrene	1/62	0.60
	Phenanthrene	1/62	0.024
	Pyrene	5/62	1.0
	Phenol	1/62	0.81
Perchlorate		5/34	0.32
Pesticides[1]	4,4'-DDD	23/58	40
	4,4'-DDE	17/58	1.1
	4,4'-DDT	16/58	170
	Dieldrin	6/58	9.6
	Endrin	7/58	4.8
Total PCBs		1/24	0.47
Metals	Arsenic	65/65	33
	Barium	65/65	340
	Beryllium	1/31	0.48
	Cadmium	53/65	84
	Chromium	57/57	280
	Chromium, Hexavalent	34/34	2.4
	Cobalt	8/8	11
	Copper	42/42	9,000
	Lead	65/65	2,100
	Mercury	60/65	1.8
	Molybdenum	8/8	55
	Nickel	8/8	160
	Selenium	50/65	16
	Silver	44/65	20
	Thallium	3/8	1.2

Analyte/COC		Frequency of Detection	Highest Result
	Vanadium	7/8	51
	Zinc	42/42	5,500

[1]Only detected analytes are listed.

3.2.2 Outside Waste Sample Summary

As shown in **Table 1** above, there are a total of 57 compounds that are considered COCs for this Plan. In order to verify that the COC selection is adequate, the list of COCs were compared to the outside waste (e.g. perimeter sample and bottom sample results) sapling results. As discussed in Section 2.4, several samples were collected from the bottom of excavations/trenches installed by TRC and in the perimeter borings installed by Ninyo, and analyzed for TPH, VOCs, SVOCs, pesticides, PCBs, and metals. A summary of the non-waste soil sampling is provided in **Table 2**, below.

Table 2. Non-Waste Sample Results
(all concentrations are listed as mg/kg)

Analyte[1]		Frequency of Detection	Highest Result	Listed as a COC?
Total TPH Carbon Chain		1/8	2,400	Yes
VOCs[1]	Benzene	1/8	0.0022	Yes
	Ethylbenzene	1/8	0.0027	Yes
	Naphthalene	1/8	0.014	Yes
SVOCs[1]		0/10	ND	Yes
Pesticides[1]	4,4'-DDT	1/8	0.0010	Yes
Total PCBs		0/8	ND	Yes
Metals	Arsenic	13/13	7.7	Yes
	Barium	13/13	130	Yes
	Cadmium	2/13	0.29	Yes
	Chromium	13/13	22	Yes
	Cobalt	5/5	8.8	Yes
	Copper	5/5	22	Yes
	Lead	13/13	1,100	Yes
	Mercury	6/13	0.072	Yes
	Molybdenum	2/5	1.1	Yes
	Nickel	5/5	15	Yes
	Selenium	7/13	4.7	Yes

	Silver	2/8	0.45	Yes
	Thallium	1/5	1.3	Yes
	Vanadium	5/5	38	Yes
	Zinc	5/5	48	Yes

[1]Only detected analytes are listed.

As shown in Table 2, the all of the detected compounds identified in Table 2 are listed as COCs in Table 1. Thus, all COCs have been identified during in-waste sampling.

4.0 RESPONSE PLAN

4.1 REMEDIAL ACTION OBJECTIVES

Remedial Action Objectives (RAOs) established for the Project is to protect human health and the environment from identified unacceptable risk which are further described as follows:

- Protect human health by limiting exposures to COCs in soil and soil vapor via dermal contact, ingestion, and/or inhalation of particulates/vapors present in ambient air;

- Reduce the potential for migration of COCs to the underlying groundwater and protect the current and potential beneficial uses of groundwater to the extent feasible and practicable; and

- Allow for the proposed re-development mitigating risks of residual chemical impacts to below regulatory thresholds through clean closure (e.g. excavation) of all refuse materials.

The Project is currently slated for mixed residential, public, and commercial land use. It was determined that the complete removal of all waste, followed by confirmation sampling, as well as installation of a groundwater monitoring network, would provide the maximum level of protection of human health and environment, thus an evaluation of remedial alternatives was not necessary. Project-Specific remediation goals for the Site and Eastern Parcel are as follows:

- Shallow Soils – All refuse-containing material in shallow soils (estimated to be up to 25-feet bgs), will be excavated and removed from the Site and Eastern Parcel. As no waste will remain within the Project boundary, the only remediation goals for the removal of refuse material will be disposal facility criteria, since all refuse-containing material will be removed from the Project. Confirmation soil samples will be analyzed for COCs and the results will be compared to a numerical remediation goal (e.g., background concentrations, RWQCB SSLs, DTSC SSLs) – See Section 4.2 that follows for additional detail on the development of numeric remediation goals.

- Shallow Soil Vapor impacts – The complete removal of the impacted waste materials from the Project will include the removal of any soil vapors that are entrained within the refuse mass. No refuse materials will remain on-site following the implementation of this Plan.

- Deep Soils – Soils directly beneath the base of waste will be subject to waste removal confirmation sampling, in order to verify there are no impacts on deeper soils (e.g., below base of waste) from the former refuse mass, and additional deeper soil samples will be

collected at five and ten-feet below the base of waste and down to the first confining unit and/or groundwater.

- Groundwater – In order to verify there have been no impacts to groundwater, following waste removal, a network of up to five groundwater wells will be installed around the perimeter of the Project, and monitored for a period of time, to ensure that, 1) there have not been any impacts to groundwater from the former landfills, and 2) the remedial activities did not impact groundwater.

4.2 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

Applicable and Relevant and Appropriate Requirements (ARARs) are used to define the minimum level of protection for human health and the environment that must be provided by a remedy selected and implemented in accordance with California Health and Safety Code (CHSC), Chapters 6.82 and 6.83, California Water Code (CWC), Chapter 7, California Code of Regulations (CCR), Title 27, State Water Resources Control Board (SWRCB) Resolutions 92-49 and 68-16, and the RWQCB's Basin Plan, among others. The ARARs, identified for the remedial actions should comply with Federal environmental law or more stringent State environmental law. Chemical-, location- and action-specific ARARs were evaluated for the Project are listed below.

4.2.1 Chemical Specific ARARs

Chemical-specific ARARs are typically health-based or risk-based numerical values that establish the acceptable concentration of a COC that may remain in, or be discharged to, the environment. At the Project, chemical-specific ARARs consider site-specific details such as:

- The depth to groundwater underlying the Project; and
- The potential future use of the Project.

The soil cleanup goals are intended to demonstrate that COCs do not remain within the base or sidewalls of the excavation area at concentrations that could pose a potential threat to human health, groundwater, or ecological receptors. COCs considered in this evaluation include those which were detected in samples of soil and/or landfill material during previous investigation and characterization activities at levels above EPA RSLs. The recommended soil cleanup criteria for the Project represent a combination of published soil screening levels (SSLs) and consider one or more of the following factors:

- Protection of human health;
- Protection of groundwater;
- Background concentrations (for naturally occurring metals and PAHs).

The objective of the proposed remediation activities is to restore the Project to a condition that allows for unrestricted use. Consequently, SSLs for protection of human health are based on residential standards. **Appendix A** provides a detailed description of the methodology and SSLs used to develop the recommended soil cleanup criteria. The recommended soil cleanup criteria are presented in **Appendix A, Tables A-2b and A-3**.

4.2.2 Location Specific ARARs

No location-specific ARARs were identified since the Project is not located in any sensitive or protected area.

4.2.3 Action-Specific ARARs

The potential action-specific requirements for the Project include:

- RWQCB: Water effluent standards are applied to waste water, groundwater, and stormwater runoff from the Project;
- South Coast Air Quality Management District (SCAQMD): Landfill excavation restrictions, emissions of gases, particulate matter, and fugitive dust are set by the SCAQMD and may apply if they are part of the State Implementation Plan pursuant to the Clean Air Act;
- National Pollution Discharge Elimination System (NPDES): Requires the elimination of most non-stormwater discharges, Stormwater Pollution Prevention Plan (SWPPP) preparation, and stormwater discharge monitoring;
- California Civil Code and CHSC governing land use restrictions;
- California Occupational Safety and Health Administration code governing the safety of the construction workers at the Project;
- CEQA; and
- DTSC hazardous constituent regulations as outlined in 22 CCR Division 4.5.

4.3 REMEDIAL ACTION DESCRIPTION

The field sampling program during Response Plan implementation will include: 1) confirmation soil sampling within the excavation areas upon completion of waste material and cover soil removal, 2) stockpile sampling of excavated and screened soils, and 3) stabilization/solidification of metal affected soil for disposal at a Class III facility. The following sections provide specific sampling analysis methods, frequencies, and procedures. The Soil Sampling Plan provided in Appendix B describes the decontamination procedures, sample handling, documentation, and the sample analysis program.

4.3.1 Confirmation Chemical Analysis

All confirmation soil samples will be submitted to a California state-certified analytical laboratory for analysis. The excavation floor and sidewall soil samples will be analyzed for the following:

- Total petroleum hydrocarbons as gasoline (TPH-G), as diesel (TPH-D), and as heavier oils (TPH-O) using EPA Method 8015M;
- VOCs using EPA Method 8260B/5035;
- SVOCs using EPA Method 8270C;
- Pesticides and PCBs using EPA Method 8081/8082; and
- CCR Title 22 metals using EPA Methods 6000/7000.

4.3.2 Remedial Activity Confirmation Sampling

Confirmation sampling of the excavation floor and sidewall soils will be performed upon reaching the lateral and vertical limits of the waste pit or property boundary. Specifically, soil samples will be collected on 50-foot centers along the sidewalls and floor of the excavation to document the boundary conditions. All sampling will be performed in accordance with the sampling methods and criteria outlined in this section. The proposed soil sample locations are presented in **Figure 4**.

As described in the Quality Assurance Project Plan (QAPP) in **Appendix C**, field duplicate samples for laboratory analysis will be collected at a rate of approximately 10% of the primary samples for all environmental confirmation samples, post remediation groundwater samples, and post remediation soil gas samples. For disposal characterization of excavated wastes, multiple samples will be collected from the waste streams, generally composite samples, thus rendering duplicate samples of multiple samples unnecessary. All laboratory analytical data will be reported to method detection limits (MDLs). For each laboratory test method, MDLs will be reported at or below the recommended soil cleanup criteria.

4.3.2.1 Excavation Floor Samples

Confirmation excavation floor samples will be collected on 50-foot centers along the floor of the excavation to document the native in-situ soil conditions. Within each 50-foot grid, a sample will be collected for analysis within the first six-inches of the surface.

4.3.2.2 Sidewall Samples

Soil samples will be collected on 50-foot lateral spacing's along designated sidewalls of the excavation to demonstrate the cleanup criteria has been achieved. Samples will be collected from the approximate vertical midpoint of the sidewall within the first six inches of soil. **Figure 4** shows the proposed soil sidewall sample locations and the following table summarizes the sampling methodology.

4.3.2.3 Backfill Soil Samples

No offsite backfill is anticipated to be imported to the Project. Onsite soils meeting the cleanup criteria may be used in the remedial excavation to attain a safe sidewall slope, level the excavation floor, etc.

In the event that offsite backfill is required, clean soil from undeveloped sources not impacted by previous activities will be used. If needed, the use of imported fill material will conform to the DTSC's Information Advisory for Clean Imported Fill Material.

4.3.3 Deep Soil Confirmation Sampling

Following confirmation sampling performed under the RAP (see Section 4.3.2), additional excavation floor, subgrade soil sampling will occur at selected locations at depths of five- and ten-feet below the final remedial excavation floor grade and at depth intervals where contamination is evident from visual or olfactory observations or where the screening instrument (such as the organic vapor analyzer) readings (headspace or other) above ambient air concentrations indicate that contamination is present.

The deeper sampling locations will be selected at a rate of approximately 30% of the total excavation floor samples by dividing the bottom area into 150- by 150-foot cells. Thus, one deeper sample

location will be selected for each approximately 22,500 square foot cell using either field indications (i.e., discoloration, odor, etc.), or at the centroid of each cell, with preference given to discolored or odorous areas.

Per discussions with the RWQCB, in the event that both the five- and ten-foot samples within each grid contain any COCs at levels above the established cleanup criteria, additional, deeper sampling at five-foot intervals will continue until two, continuous samples are collected with concentrations of COCs below the cleanup criteria. At a minimum, three deeper borings (approximately one per 900-foot grid will be installed.

4.3.4 Groundwater Confirmation Sampling

In order to verify there have been no historic impacts to groundwater, following waste removal, a network of up five groundwater wells and/or groundwater grab samples will be installed within and around the perimeter of the Project. While grab samples will be analyzed one time, installed groundwater monitoring wells will be monitored for a period of time pursuant to an approved groundwater monitoring work plan, to ensure that, 1) there have not been any impacts to groundwater form the former landfills, and 2) that the remedial activities did not impact groundwater. The proposed location of the groundwater monitoring wells are presented on **Figure 5**.

4.3.4.1 Pre-Drilling Work Activities

Prior to conducting intrusive activities at the Project:

- Well permits will be obtained from the Los Angeles County Department of Public Health, Environmental Health Services Division, Drinking Water Program (LADPH) in connection with any post-remediation and excavation groundwater monitoring.

- An encroachment permit or license, if necessary, may be obtained from the Los Angeles Flood Control District (LACFCD) and/or United States Army Corps of Engineers (USACE) to conduct well installation activities on the Project from the Rio Hondo Bike Path.

- The proposed well locations will be marked with white paint and Underground Service Alert (USA) will be notified approximately 48 hours prior to initiation of the drilling activities. The owners of underground utilities in the area will be notified by USA, and the utilities present in the area of the proposed well locations will be marked.

- Preparation of a Project-specific Health & Safety Plan (HASP) designed to promote project personnel safety and preparedness during the proposed activities.

- A geophysical survey will be conducted to locate underground utilities that may be present near the proposed well locations.

- The RWQCB and LADPH will be notified a minimum of 72 hours prior to commencing well installation activities.

4.3.4.2 Well Installation Activities

Five (5) groundwater monitoring wells; designated MW-1 through MW-5 are to be installed at the proposed locations shown on **Figure 5**. The monitoring well placement will assess groundwater direction and gradient, and groundwater quality conditions. Based on depths at nearby wells described in Section 2, depth to groundwater is anticipated to be between 90 and 100 feet bgs.

Groundwater monitoring wells will be placed up gradient (e.g. to the north) to measure back ground water quality as well as in the southeastern and southwestern corners of the Project to measure downgradient water quality.

The wells will be constructed using 4-inch diameter, Schedule 40, polyvinyl chloride (PVC) casing with a screened casing (0.020-inch slot size) interval extending from approximately 50 to 110 feet bgs; the actual screen interval may be adjusted in the field at the time of installation based on the depth to first encountered groundwater. A filter pack of No. 2/12 or 3 graded sand will be placed around the well screen and will extend approximately 2 feet above the top of the well screen. Filter pack sand will be placed into the annular space between the hollow-stem auger and well casing. After placement of the filter pack, a 2-foot thick bentonite seal will be installed in a similar manner and hydrated. The remaining annulus will be sealed using an approved grout material, and the well will be completed at the surface by the installation of flush-mounted, traffic-rated protective cover or monument well cover, set in concrete. Following installation, the wells will be developed and surveyed. The groundwater monitoring well development, groundwater sampling and chain of custody procedures to be implemented during the field activities will be presented in a workplan prepared before commencement of field work.

A California-licensed land surveyor will survey the wells to a benchmark of known elevation.

4.3.4.3 Chemical Analysis and Sampling Methodology

Immediately following groundwater monitoring well installation and development activities, the fluid levels will be monitored and one (1) round of ground water samples will be collected from the newly installed wells. Fluid level monitoring and groundwater purging and sampling activities will be presented in a workplan prepared before commencement of field work.

A state-certified laboratory will perform all laboratory analyses. Chain of custody protocol will be followed for all samples selected for analysis, thus providing a continuous record of sample possession prior to actual analysis.

COCs for groundwater will include all detected chemical analytes from all groundwater samples collected as part of the Project investigation and cleanup activities. As such, all groundwater samples will be analyzed for the following:

- TPH, full range for gasoline, diesel, and oil via EPA Method 8015M.
- VOCs, full list including fuel oxygenates via EPA Method 8260B.
- SVOCs via EPA Method 8270C.
- Pesticides and PCBs via EPA Method 8080.
- Title 17 California metals via EPA Methods 6010B/7000.

4.3.4.4 Quality Assurance/Quality Control Procedures

Quality assurance/quality control (QA/QC) procedures will be used in the field to ensure that equipment used during groundwater monitoring well installation and sampling activities is properly calibrated and/or decontaminated prior to use.

QA/QC procedures include:

- Daily calibration of all meters used during the investigation.
- Daily collection of field blanks. The collection of field blanks involves the pouring of laboratory-prepared de-ionized water into sample containers during routine environmental sample collecting activity (e.g., soil sampling).
- Transporting of the samples to the laboratory at the end of each sampling day.
- Utilization of trip/travel and temperature blanks to verify sample handling procedures.

Chain of custody protocol will be followed for all water and QA/QC samples selected for laboratory analysis. The chain of custody form will accompany the samples from the sampling locality to the laboratory, providing a continuous record of possession prior to analysis. Copies of the official chain of custody records will be provided in the monitoring report (see Section 6.5).

4.4 RESPONSE PLAN IMPLEMENTATION

4.4.1 Waste Content and Volume Estimate

Based on the results of their prior investigations, TRC made the following assessment (TRC, 2015) of waste in place in the Eastern Parcel portion of the former Gage Avenue Dump:

- Large pieces of wood, trees, plastic, tires, and construction debris geotechnically and environmentally unsuitable for use as fill have been observed, primarily from a depth of approximately 5 to 25 feet bgs in the waste area; and
- Approximately 3 to 5 feet of soil was placed above the waste pile after disposal operations were discontinued in 1954.

TRC estimated approximately 193,326 cubic yards (cy) of waste material and cover soil may be encountered in the Eastern Parcel of the Project and would be removed and processed within the disposal pit area for export to permitted landfills or recycling facilities based on the estimated footprint (226,948 square feet) and average depth (23 feet bgs) of the waste area. Based on available Eastern Parcel information, TRC estimated the composition of the material in this area to be:

- 94,815 cy (128,000 tons) of soil (treated, untreated, and non-RCRA) for offsite disposal.
- 98,511 cy (65,000 tons) of screened waste including wood waste, green waste, glass, metal, rubber tires, plastic, paper, roofing shingles, small rocks, concrete and asphalt to be excavated and separated for offsite disposal or recycling.

Based on the results of the 1963 geotechnical investigation at the Site (LeRoy Crandall, 1963), which comprises the eastern two-thirds of the Project, thickness of waste fill averaged approximately 15 feet. The area of the Park property is approximately 9.9 acres (including parking and road areas). Based on these two items, waste fill is estimated at approximately 239,580 cy in this portion of the Project. If, similar to the estimate above, we assume that, after screening, half of this volume is soil and half is waste, approximately 120,000 cy of each will result from excavation and screening. Thus for the whole Project it is estimated that there will be approximately:

- 120,000 cy (162,000 tons) of soil for offsite disposal.

- 120,000 cy (79,200 tons) of screened waste for offsite disposal or recycling.

The quantities cited are based on observations at a limited number of locations, thus actual quantities of the various materials may differ.

4.4.2 Sequence of Work

The activities discussed in this section will be conducted to safely and effectively implement remedial action at the Project given the estimated volume and character of the waste, onsite location, and its present condition.

These activities constitute a remedial method that will remove cover soil, solid wastes, and intermixed soils which may pose a threat to public health and safety, and groundwater. Removal of soil wastes and associated soil will eliminate the need for post-remediation maintenance and prepare the Project for post-remediation residential use.

The tasks are based on the characterization information provided in Section 2 of this report. The contractor selected for work will be responsible for meeting the requirements of the HASP. The Scope of Work for remedial action at the Project includes the following activities:

- Project Mobilization – Section 4.4.6
- Excavation and Sequencing – Section 4.4.7
- Material Sorting and Management – Section 4.4.9
- Waste Material Profiling and Disposal – Section 4.4.10
- Loading and Transportation – Section 4.4.11
- Confirmation Sampling – Section 4.3.2
- Final Grading and Drainage – Section 4.4.12
- Demobilization – Section 4.4.13

Further discussion of each of these activities is described in Subsections 4.6 through 4.13. Remediation monitoring activities are discussed in Section 4.5 and **Figure 2** shows the property boundaries available for the contractor to use for remediation activities. The Project access road will not be used for soil or material stockpiles.

4.4.3 Methodology for Remedial Action

As previously discussed, the Project waste includes soil impacted by TPH, SVOCs, pesticides, and metals. The remedial activities described in this Plan are designed to eliminate potential threats the waste may have on the surrounding environment and groundwater and include the following measures:

- All waste material, recyclable material, and soils located within the waste cells will be removed, sorted, and segregated for offsite disposal and/or recycling;

- Excavation floor (in-situ) soil samples will be collected to characterize the final Project conditions (see Section 4.3.2.1);

- Sub-grade excavation floor, random grid samples will be collected (5- and 10-foot depth intervals) below the excavation floor to verify the removal and/or leaching of potential chemicals of concern (see Section 4.3.2.1);

- Sidewall samples from the excavation will be collected to document final Project conditions (see Section 4.3.2.2);

- Remediation limits and soil sample locations will be surveyed; and

- The excavation floor will be rolled using a compaction wheel at the completion of the work to reduce permeability, lower hydraulic conductivity, and reduce infiltration into the subsurface.

4.4.4 Permitting

The contractor will obtain all necessary permits prior to beginning work at the Project including:

- A grading permit issued by the County of Los Angeles/City of Commerce;

- Application for coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (Construction General Permit [CGP] Order 2009-0009-DWQ) issued by the State Water Resources Control Board (SWRCB);

- Appropriate SCAQMD permits and plans; and

- Other required City of Commerce or Los Angeles County Permits.

Necessary permits and approvals from other governmental agencies will also be obtained prior to the implementation of the remedial excavation work. Permits and/or approvals are anticipated but not limited to Cal Recycle and Los Angeles County Department of Environmental Health.

4.4.5 Surveying

Prior to mobilization, a professional land surveyor (PLS) will prepare a limited topographical survey and establish control points using the appropriate City or County benchmark. The PLS will periodically visit the Project as the work progresses to survey remedial excavation limits and floor depth, or mark out and document other features at the conclusion of the remedial excavation. The surveyor may also layout the control points for the random sample grid locations.

The remediation field personnel will use a GPS unit with a minimum one meter level of accuracy to document soil confirmation sample locations or other features for final project reporting.

4.4.6 Project Mobilization

This activity includes mobilization of all personnel, equipment and supplies to the Project that are needed to perform the work described in this Plan.

The contractor will be responsible for providing its own project office or base of operations and will establish area(s) at the Project for processing of materials removed from the waste area, and stockpiling of various waste materials and soil. The exact location of the processing area(s) will be coordinated with the project manager to avoid conflict with neighboring businesses and property owners.

The contractor will provide sufficient heavy equipment for:

- Excavation of the waste;
- Onsite transportation of the excavated materials to the processing area,
- Material processing equipment to segregate soils from waste; and
- Delivery of solid waste materials to appropriately licensed disposal facilities.

The contractor will also protect existing facilities and utilities. Separation of the soils from the waste will be accomplished using:

- A Grizzly device for separation of trees, cobble, concrete, and other large waste; and
- Mechanized screen(s) for separation of soil and solid waste streams.

Water trucks will also be required for dust suppression across the site, and for adding moisture to the soil/material to prevent fugitive VOCs, dust and noxious odor emissions.

4.4.7 Excavation Staging and Sequencing

The contractor may begin excavation by removing of the top layer of soil, asphalt, concrete, etc., from the waste disposal area. Soil removed from this upper layer may be stockpiled for characterization for acceptance at a permitted disposal facility. If solid waste is encountered in this layer, it may be set aside for screening and disposal.

The excavated waste will be hauled to the processing area(s), where the waste materials will be processed directly or stockpiled to await processing and sorting. A water truck will be utilized to maintain dust control at the Project in the central processing area, material stockpiles, and haul routes. As the excavation progresses deeper into the waste area, ramp(s) may be built into the excavated area to allow access for equipment. Ramps may be extended and/or built in different locations throughout the excavation process to allow access and egress to all areas of the waste pit. The Project work will continue in this manner until a sufficient amount of buried waste and soil has been excavated from the waste pit and stockpiled in the central processing area. Subsequently, screening and sorting of the waste materials will begin. Excavation, screening, and material sorting and management will occur simultaneously until all waste materials have been removed from the Project.

SCS field personnel, working under the direct supervision of a Professional Engineer or Geologist, will be present onsite at all times to observe and document the excavation process, and to visually inspect the buried materials as they are exposed.

The groundwater monitoring well known to exist on the Eastern Parcel (see Section 2.3.3 above) will be properly decommissioned prior to the start of remedial activities. Any other groundwater monitoring wells encountered prior to or during Plan implementation will be properly decommissioned in concert with the remedial work. All groundwater monitoring wells within the remediation limits will be decommissioned per DWR standards (DWR Bulletins 74-81 and 74-90) by over drilling to remove the entire well casing and annular materials. The borehole will then be filled using a tremie pipe from the bottom of the borehole upward. Portland cement hydrated with 5% or less bentonite gel or approved sealant will be placed in the borehole using the tremie, as the auger is slowly removed to prevent void space, freefall, bridging, and dilution of sealing materials, and/or prevent separation of aggregate from sealants collapsing. A Los Angeles County Department of Environmental Health well permit will be obtained for each groundwater monitoring well slated for decommissioning, prior to decommissioning.

4.4.8 Unknown Wastes or Impacts

If during excavation, heavily stained or oily material, or material with a strong hydrocarbon odor, is encountered, the contractor will be directed to place the material in a separate stockpile for characterization testing and offsite disposal.

In the event that a drum or container is discovered containing unknown waste content, the contractor will stop work in this area and notify the SCS field manager. The SCS field manager will perform the following:

- Visually assess the container from a safe distance;
- Evaluate atmospheric conditions in the work area/vicinity, using a PID and four gas meter;
- If the above conditions are determined to be safe, evaluate the container contents with a PID and four gas meter; and
- If all conditions are determined to be safe, isolate the container to a staging location and place it on plastic and cover pending environmental characterization testing for appropriate disposal.

If suspect asbestos containing material (ACM), such as transite pipe, is discovered, the material will be wetted with water and remain undisturbed until assessed by a California Certified Asbestos Consultant or contractor.

4.4.9 Material Sorting and Management

4.4.9.1 Material Sorting Process

Mixed soil and waste materials will be transported from the waste pit to one or more centrally located areas of the Project. A Grizzly device will used to remove oversized material (>12-inch diameter or length). Inert materials such as rock, concrete, or asphalt which are larger than 18 inches in diameter may be removed and stockpiled for processing and/or offsite disposal.

After removal of oversized materials, remaining materials will be processed through a series of mechanized screen gradations onto a final screen opening, anticipated to between 1 and 3 inches for removal of remaining solid waste from the fine-grained materials.

The contractor will employ designated separation equipment with screen-size and vibration motion characteristics which will maximize the effect of separating soil/granular material from the inert debris. During these operations, the debris will be rinsed during dust control operations to help dislodge soil particles.

Prior to the initiation of the Plan, in order to demonstrate the effectiveness of the screening process, the contractor will conduct analysis of grab samples collected from the existing screened stockpiles of debris on site. Three grab samples will be collected randomly from the existing stockpiles (so that approximately 3 samples per 1,000 cubic yards of debris are collected). The wipe samples will be analyzed for lead by an offsite laboratory. The analytical results of the grab samples will be presented to the appropriate off-site receiving facility for acceptance under their permit to operate.

Based on the grab sample results, the screening contractor may refine the screening process for acceptance pursuant to the permitted disposal or recycling facility acceptance criteria.

4.4.9.2 Waste Segregation

All waste material streams recovered from the mechanized screening process will be stockpiled for appropriate offsite disposal, treatment, or recycling. Based on materials encountered during previous investigations, it is anticipated that waste debris to be disposed offsite will include various quantities of wood and green waste, treated wood, tires, plastic, metals, roof shingles, and other small quantities of material (glass, paper, etc.).

It is anticipated that stockpiles will be established for:

- Inert solid waste debris (pipe, cable, tire remnants, plastic, metal, glass, paper, non-treated wood, etc.);
- Nonhazardous soil;
- Treated soils (chemically stabilized/fixated with Portland cement);
- California hazardous waste soil; and
- Other categories deemed necessary based on compatibility, analytical testing, and permitted landfill acceptance requirements.

If any hazardous waste constituents, including contaminated soil, are discovered or suspected to be present based on visual observation during excavation, these materials will be segregated from the remainder of the excavated materials, profiled, recorded, manifested, and disposed of at an appropriate permitted landfill.

In the event containers are discovered with unknown contents, they will be segregated and stored based on physical characteristics and compatibility.

Some areas of soil may contain elevated levels of TPH, metals, or pesticides and could be categorized as CalHaz waste. These materials will be segregated, profiled, and/or treated, then disposed at an appropriate disposal facility.

All cover soil, waste debris, and screened soils will be segregated and stockpiled in volumes not to exceed 1,000 cy for chemical analysis, characterization, and/or offsite disposal. The sample collection shall be at a frequency of one composite sample per 1,000 cy. VOC-affected soils will be stockpiled in volumes not to exceed 200 cy and a total of no more than 1,000 cy of VOC-affected soil will be stockpiled onsite at any time.

4.4.9.3 Soil Treatment

The soils screened from the waste material and excavated soils will be placed in stockpiles no greater larger than 1,000 cy. Each stockpile will be sampled for select COCs, pursuant to the disposal facility acceptance criteria. Soils containing elevated lead levels suitable for solidification/stabilization (fixation) will be treated onsite for disposal. Soil fixation will be used to convert or stabilize soil containing soluble lead into a less soluble or non-mobile lead, suitable for disposal at a Class III facility. It is anticipated that a Portland cement and/or lime-fly ash binder/stabilizer and water process will be utilized to stabilize the lead-affected soil.

In order to assure that the fixation process is adequate, the soil mixing contractor will complete the following:

- Provide a copy of its transportable treatment unit ("TTU"), DTSC permit and SCAQMD permit to the RWQCB prior to the initiation of treatment activities. The TTU achieves waste stabilization adequate to allow for management of lead containing California-regulated hazardous waste constituents at Class III landfill facilities.

- Perform soil treatment batch testing prior to the initiation of soil treatment to ensure that the treated soil complies with the DTSC Transportable Treatment Unit (TTU) permit requirements and meets the non-hazardous soil acceptance requirement for the proposed Class III facility. This will be conducted each time 10,000 tons of soil subject to treatment is generated and stockpiled.

- Collect discrete approximately five cubic yard soil treatability samples from the first 10,000 tons of stockpiled soil to be treated. The 10 individual treatability samples will be processed through the TTU. Then 10 composite samples will be collected from the soil samples that have been processed through the TTU. The composite samples of the treated soil will then be analyzed for soluble lead at an offsite laboratory. The data from the treatability samples will be used to adjust the volume of Portland cement and/or fly ash to meet the <5 mg/L non-hazardous soil requirement and allow for disposal at the appropriate landfill facility. Additional discrete treatability soil samples will be processed through the TTU and then analyzed at the offsite laboratory, as needed, to verify the TTU mix for processing the soil achieves the non-hazardous requirement. The total number of discrete treatability soil samples required to be processed for verification of the TTU mix will be one treatability sample per 1,000 tons of soil for treatment (10 samples per 10,000 tons of stockpiled material).

The contractor will transport all processed materials offsite throughout the excavation and screening process to assure adequate land space necessary for the stockpiling of waste materials, and maintaining work performance and safety.

4.4.10 Waste Material Profiling and Disposal

As noted above cover soil, waste debris and screened soils will be segregated and stockpiled in volumes not to exceed 1,000 cy for chemical analysis, characterization and offsite disposal. The waste soil sample collection shall be at a frequency of one sample per 1,000 cy.

Specific analyses for materials going offsite will be based on the requirements of the receiving facility. Some or all of the following analytical methods are anticipated to be used as required for waste soil and/or material characterization:

- Total petroleum hydrocarbons as gasoline (TPH-G) using EPA Method 8015M;

- Total petroleum hydrocarbons as diesel and motor oil (TPH-D/TPH-O), carbon chain identification for C13 to C44 using EPA Method 8015M;

- VOCs using EPA Method 8260B/5035;

- SVOCs including polynuclear aromatic hydrocarbons using EPA Method 8270C;

- Organochlorine pesticides and PCBs using EPA Method 8081/8082;
- CAM 17 metals using EPA Method 6000/7000;
- Soluble threshold limit concentration (STLC); and
- Total Threshold Limit Concentration (TCLP).

Based on the results of waste profiling and classification, the waste materials will be transported to the appropriate permitted disposal facility.

Screened soil requiring onsite treatment will be treated and profiled for acceptance at a Class III disposal facility. Onsite treatment, transportation, and disposal activities will be performed in accordance with applicable Federal, State, and local laws, regulations, and ordinances. Excavated material will be shipped by a qualified (licensed/registered and insured) waste hauler in covered (tarp, hard top, etc.) end dump trailers or other appropriate container, under manifests or appropriate shipping documents to the disposal facility.

Arranged by type of material, potential disposal facilities, addresses, and contact information is as follows:

Inert Waste Debris/Trash

El Sobrante Landfill (owned by Waste Management, Inc.)
10910 Dawson Canyon Road
Corona, CA 92883
Phone: 951-277-1740

Or

Chiquita Canyon Landfill
29201 Henry Mayo Drive
Castaic, CA 91384
Phone: 661-257-3655

Non-Hazardous and Treated Non-Hazardous Soils

Chiquita Canyon Landfill
29201 Henry Mayo Drive
Castaic, CA 91384
Phone: 661-257-3655

Or

Simi Valley Landfill and Recycling Center

Azusa, CA 91702
Phone: 626-815-0233

California Hazardous (Non-RCRA) Impacted Soil

South Yuma County Landfill
19536 S Avenue 1 East #1E
Yuma, AZ 85365
Phone: (928) 341-9300

Or

Clean Harbors Buttonwillow Landfill Facility
2500 West Lokern Road
Buttonwillow, CA 93206
(661) 762-6200

4.4.11 Loading and Transportation

Tractor trailer end dumps and high side dumps, flatbed equipment trailer trucks, and other work vehicles exceeding 1 ton in weight will be utilized during this remediation project. Qualified transporters will be hired for hauling the excavated materials offsite. The hauling contractor(s) used to transport impacted material to the offsite disposal facilities will be fully licensed and permitted by the State of California and/or the EPA. Contractors shall comply with the County of Los Angeles Truck Route Ordinance and/or California Department of Transportation (Caltrans) approved truck routes.

Trucks used for the offsite transportation of materials will remain in the designated staging area(s) until called upon for loading by the remediation contractor. During loading, excessive noise, odor, and dust emissions will be minimized. Dust will be minimized by reducing the bucket height and drop distance of material during loading and by spraying material being loaded with water, if necessary.

All trucks will exit the Project through the decontamination staging area established near the exit gate. The staging area will contain equipment (brooms, brushes, scrappers, etc.) necessary to ensure all tires, truck trailers, dump beds, etc. are free of debris and loose materials prior to departure.

Haul trucks departing the Project will be visually inspected to ensure that no fluids are leaking, tires are clean, and material being hauled is six-inches below the dump trailer freeboard and properly secured and/or covered using tarps or other appropriate devices.

No haul truck will be allowed to depart the Project without the proper manifest or bill of lading.

The selected transporters will be licensed and insured for hauling the excavated soil/material. For transportation of hazardous wastes, the selected transporter will be a registered hazardous waste hauler. The remedial excavation contractor will verify that the selected transporter has a valid registration/license and insurance policy for transporting wastes offsite and verify that the transporter has not negligently released waste material/soil during transport.

The waste hauler will be required to have a contingency plan prepared to deal with the following conditions:

- When there are emergency situations (vehicle breakdown, accident, waste spill, waste leak, fire, explosion, etc.) during transportation of excavated materials/soil from the Prroject to the designated treatment/disposal facility;

- When the volumes of excavated soil change; or

- When waste characteristics change.

4.4.12 Final Grading and Drainage

No backfilling of the remedial excavation with imported soil or material is proposed. Upon the completion of confirmation sampling, excavation floor soils may be graded or relocated to slope the remedial excavation sidewalls. Soils located outside of the landfill excavation limits may also be used in conjunction with the clean excavation floor soils to stabilize (buttress) the western sidewall.

A California PLS will survey the pre-remediation topography and final remediation floor depth and excavation sidewall limits.

The remedial excavation is proposed to remove all waste materials and soil to the base of fill. The method used to stabilize sidewalls will be addressed in the Project grading plans.

A grading permit application, grading plan, and soils engineering/geology investigation report will be submitted to the County of Los Angeles, Department of Public Works, Land Development Division for the remediation work permit. The grading plan will include a rough finish grade and erosion control plan to facilitate subsequent future development of the Project. Temporary Best Management Practices (BMPs) will be implemented to comply with the General NPDES, Stormwater Construction General Permit. Silt fence or synthetic covers will remain in place to prevent erosion and sediment transport until final stabilization and drainage control measures associated with the Project development are implemented. A copy of the grading plan and permit will be provided to the RWQCB and the LEA prior to the implementation of the remedial work.

4.4.13 Demobilization

This activity includes final cleanup and removal of all equipment and materials from the Project after the remedial action is completed.

4.5 REMEDIATION MONITORING

4.5.1 Project Security

During removal activities, security and facilities to protect work areas from unauthorized entry, vandalism, or theft will be maintained. Chain-link type fencing will be maintained along the perimeter of the Project to prevent unauthorized entry to any work areas during working and nonworking hours. Gates will be locked at all times when Project personnel are not in attendance.

4.5.2 Project Access

Construction access to the Project will be through the existing gate located off Gage Avenue near the Ramada Inn and possibly other gates established during the implementation of the Plan. Construction traffic must utilize this point of access throughout the duration of the work. In general, the proposed remedial action incorporates the following Project access controls:

- Project will be enclosed by chain-link fencing at all times;
- Access to the Project will be limited to the existing gate located off Gage Avenue. The gate will be locked after work hours;
- Project access will be limited to authorized personnel;
- All personnel entering the Project will be required to have appropriate health and safety training and will sign the site-specific HASP each morning or upon entry;
- All visitors will be registered and must sign in upon entering the Project; and
- Access to the excavation and stockpile areas with exposed impacted soils will be restricted in accordance with the HASP.

Vehicles and equipment used in the handling of impacted soil will be decontaminated before leaving the Project.

4.5.3 Traffic Control

Traffic control measures will be implemented as needed during the performance of the remedial action. Traffic control for the Project will conform to the ordinances and regulations of the jurisdictional agency having authority over traffic control and will conform to the latest edition of the *Work Area Traffic Control Handbook (WATCH),* 2006 (BNI Publications, 2006). The necessary permits for traffic control will be obtained.

Truck traffic will be regulated during hauling operations and as necessary to prevent haul trucks from stopping or parking along the paved portion of Gage Avenue leading to the Ramada Inn. Haul trucks will not be allowed to idle along the Project access road and a 5 mile per hour speed limit will be imposed to prevent dust.

4.5.4 Health and Safety

A Project-specific HASP will be been prepared prior to implementation of field activities in order to address health and safety hazards, regulatory compliance, and specific tasks that will be performed at the Project. All employees, contractors and their subcontractors, and visitors must read and understand the HASP before entering the work area. Although it will be included in the HASP, personal dust monitoring, and dust control requirements are discussed in Section 5.5 and 5.8 of this Plan.

The HASP will outline procedures to minimize the health risk from exposure to potentially harmful materials such as air-borne vapors, landfill gas and fugitive dust. The HASP will focus primarily on Project workers closest to the landfill debris and cover soil where the highest potential for exposure exists. By establishing strict health and safety requirements, the health risks to workers or park users would also be conservatively mitigated. Potential exposure to hazards, as well as mitigation measures, will be communicated to Project workers as a component of planned Project-specific health and safety training.

The HASP will be prepared under the supervision of a Certified Industrial Hygienist (CIH) who will assist in instituting recommendations to protect nearby workers and park users from potential health risks during remediation. The HASP will describe the expected and potential chemical and physical

hazards, health and safety training requirements, specific personal hygiene protocols, monitoring equipment, and personal protective equipment that will be used during remediation work.

Most Project workers will be operating or driving equipment and will not likely come in direct contact with the cover soils or landfill materials. For this reason, the potential for significant exposures are minimal. However, workers who may potentially come in contact with the landfilled materials or related contaminants will be required to wear appropriate personal protective equipment (PPE) in compliance with OSHA standards.

Monitoring for air-borne emissions such as landfill gas, vapors, and dust that could potentially be released during the excavation and transport of landfill debris and cover material will be another important component of the HASP. Landfill gas consists primarily of methane, carbon dioxide, and trace levels of volatile and semi-volatile organic compounds.

Methane and carbon dioxide are asphyxiants since they displace oxygen, and produce a hazardous oxygen-deficient atmosphere. These gasses are not considered to be carcinogenic. Methane also presents an explosion hazard if the concentration in air exceeds 5 percent by volume. Such concentrations would normally occur only in confined or enclosed spaces. Therefore, in addition to the air monitoring requirements for remediation workers, air measurements will also be performed at the Project boundary to ensure the health and safety of the nearby community.

4.5.5 Project Personnel Monitoring

Personnel air sampling may be conducted to test for airborne contaminants during the performance of specific remediation tasks. The air sampling will be conducted at the beginning of the work during the excavation of waste material and soils, screening of waste material and soil, and other work, as deemed appropriate by the safety officer. During each specific operation, representative crew members will wear battery powered sampling units, each outfitted with the sample filter collection media in the breathing zone. Representative air samples will be collected over an approximately eight hour work period for each crew member, and will be analyzed by a stationary laboratory for lead using the National Institute for Occupational Safety and Health (NIOSH) Test Method 7300 modified/ Occupational Safety and Health Administration (OSHA) ID-125G. Personal air monitoring laboratory analysis documentation will be included in final remediation report.

4.5.6 Regional Climate and Wind Flow Patterns

The Project is situated in a Mediterranean climate zone, experiencing mild winters and warm to hot dry summers.

The prevailing wind directions during the dry season/summer months are predominantly from the west/southwest and are related to onshore flows. In winter the winds are more variable and include onshore winds from the west as well as strong winds from the southeast and north northwest (Los Angeles Airport).

4.5.7 Odor Control Plan

An Odor Control Plan will be prepared which will identify potential odor and VOC emission sources and receptors, monitoring methods, provide worker protection criteria, and provide mitigation methods. This Plan anticipates a Project-Specific Rule 1150 Excavation Permit/Rule 1166 Contaminated Soil Mitigation Plan (Excavation Plan) will apply to Project activities.

This Excavation Plan is required:

- Prior to commencing excavation of any landfill where refuse may be exposed to the atmosphere;
- Where an underground storage tank or transfer piping was used to store or transfer VOCs; and
- During excavation, handling and storage of VOC contaminated soils.

Minimum requirements for the Excavation Plan are as follows:

- Monitoring of wind direction and speed;
- Maintain moisture of excavated material and road surfaces to minimize dust and emissions;
- Removal of loose material from haul truck exteriors;
- Cover waste material in haul truck dump beds to prevent spillage;
- Cover inactive stockpiles to minimize dust and emissions;
- Description of mitigation measures for dust, odors, and VOCs; and
- Description of monitoring equipment and techniques.

4.5.8 Dust Control and Testing

Contractor will comply with SCAQMD dust and odor control requirements contained in Rules 402, 403, 1150, and 1466. This Plan serves as the Excavation Management Plan and will be submitted to the SCAQMD for approval. The Plan will be available onsite throughout the remedial action. The SCAQMD requirements for an Excavation Management Plan include the following:

- Provide information regarding the quantity and characteristics of the material to be excavated and transported (see Sections 2.0 and 4.0);
- Identify mitigation measures to be activated as necessary to ensure a public nuisance condition does not occur (see remainder of Section 5.0); and
- Provisions for immediate cessation of excavation activities when the operator is notified by the Executive Officer that a public nuisance has occurred (see Section 5.8.1).

4.5.8.1 Dust Control Supervisor

Contractor will designate an onsite Dust Control Supervisor who has successfully completed the SCAQMD Fugitive Dust Control Class and a 3 hour training class on dust control planning. The Dust Control Supervisor will call for immediate cessation of excavation if a public nuisance has occurred or if notified to do so by the SCAQMD Executive Officer.

4.5.8.2 Best Available Control Measures

Best Available Control Measures to be employed by the Contractor to minimize visible emissions, public nuisances, and fugitive dust will include but not be limited to:

1. **Clearing and Grubbing:** Maintain stability of soil through pre-watering of Project prior, during, and immediately after clearing and grubbing. Maintain perennial vegetation where possible. Apply water in sufficient quantity to prevent dust plumes.

2. **Cut and Fill:** Pre-water soil prior to cut and fill activities, and stabilize soil during and after cut and fill activities. Using water trucks/pulls or sprinklers, pre-water soil then allow time for penetration to depth of subsequent cut.

3. **Disturbed Soil:** Stabilize disturbed soil throughout the construction area. Limit vehicular traffic and disturbances on soils, where possible. Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.

4. **Earth-Moving:** Pre-apply water to depth of proposed cuts, and re-apply water as necessary to maintain soils in a damp condition and ensure that visible emissions do not exceed 100 feet in any direction or extend offsite. Stabilize soils once earth-moving activities are complete. Consider use of upwind fencing to prevent material movement onsite.

5. **Truck Loading and Importing/Exporting of Bulk Materials:** Empty loader bucket close to the truck, and in such a manner that no visible dust plumes are created. Stabilize material while loading, transporting, and unloading to reduce fugitive dust emissions. Maintain at least 6 inches of freeboard on haul vehicles. Comply with Vehicle Code Section 23114. Use tarps or other suitable enclosures on haul trucks. Check belly-dump seals and remove rocks to prevent spillage. Comply with track-out prevention/mitigation requirements. Use water while loading and unloading to reduce visible dust plumes.

6. **Screening:** Pre-water material prior to screening. Limit fugitive dust emissions to opacity and plume length standards. Stabilize material immediately after screening. Dedicate water truck or high capacity hose to screening operation. Drop material through screen slowly and minimize drop height.

7. **Crushing:** Stabilize surface soils prior to operation of support equipment, follow permit conditions for crushing equipment, pre-water material prior to loading in crusher, monitor emissions, and stabilize and water material after crushing.

8. **Staging Areas:** Stabilize staging areas during use, and at project completion.

9. **Stockpiles/Bulk Material Handing:** Stabilize stockpiled materials, and add or remove materials from the downwind portion of the storage pile. Stockpiles within 100 feet of offsite occupied buildings must: (1) not be greater than 8 feet in height, or (2) have a road bladed to the top to allow water truck access, or (3) have an operational water irrigation system that is capable of complete stockpile coverage. Avoid steep sides or faces on storage piles.

4.5.8.3 Large-Scale Operations

If the project qualifies as a Large Operation (>5,000 cy of material moved per day, for 3 or more days), a Large Operation Notification (Form 403) will be filed with the Executive Officer (SCAQMD)

within 7 days of qualifying as a large operation. In addition to the abovementioned measure, the following dust control measures will be employed for large operations:

1. **Earth Moving, Construction Fill Areas:** Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method D-1557 or other equivalent method approved by the Executive Officer and the California Air Resources Board and the U.S. EPA, complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first 3 hours of active operations during a calendar day, and two such evaluations during each subsequent 4-hour period of active operations.

2. **Earth Moving, Construction Cut Areas:** Conduct watering as necessary to prevent visible emissions from extending more than 100 feet beyond the active cut or mining area unless the area is inaccessible to watering vehicles due to slope conditions or other safety factors.

3. **Disturbed Surface Areas, Except Completed Grading Areas:**

    a. Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface.

    b. Any areas which cannot be stabilized, as evidenced by wind-driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.

4. **Completed Grading, Disturbed Surface Areas:** Apply chemical stabilizers within 5 working days of grading completion; or take actions specified for inactive disturbed surface areas.

5. **Inactive Disturbed Surface Areas:**

    a. Apply water to at least 80 percent of all inactive disturbed surface areas on a daily basis when there is evidence of wind-driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; OR

    b. Apply dust suppressants if sufficient quantity and frequency to maintain a stabilized surface; OR

    c. Establish a vegetative ground cover within 21 days after active operations have ceased. Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; *OR*

    d. Utilize any combination of control actions (a), (b), and (c) such that, in total, these actions apply to all inactive disturbed surface areas.

6. **Unpaved Roads:**

    a. Water all roads used for any vehicular traffic at least once per every 2 hours of active operations (3 times per normal 8 hour work day); *OR*

b. Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; *OR*

c. Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.

7. **Open storage piles:**

   a. Apply chemical stabilizers; *OR*

   b. Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind-driven fugitive dust; *OR*

   c. Install temporary coverings; *OR*

   d. Install a three-sided enclosure with walls with no more than 50 percent porosity which extends, at a minimum, to the top of the pile.

8. **General, All Categories:** Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified above may be used.

4.5.8.4 PM_{10} Fugitive Dust Monitoring

During the remedial excavation real time dust and particulate monitoring will be conducted by the employee designated as the dust control supervisor. Dust monitoring will be performed on a daily basis along the waste excavation perimeter upwind and downwind near applicable property boundaries. The instruments used to monitor air will provide instantaneous and time-weighted average (TWA) concentrations of particulate matter in the size of 10 microns or less (PM_{10}). Testing will be conducted to document that the difference between PM_{10} levels of simultaneous upwind and downwind monitors does not exceed 25 micrograms per cubic meter averaged over a 2 hour period.

Equipment

Real-time particulate monitoring will be performed using SCAQMD-approved instrumentation capable of data logging. One instrument will be placed upwind of the work area and at least one will be placed downwind near the Project perimeter. Instrument height will be approximately 6 to 8 feet above the ground surface. The locations of the dust monitors will be adjusted when needed based on the prevailing wind direction as indicated by a weather vane installed at the Project, weather station readings, or a hand-held wind speed meter.

Besides recording dust concentrations, the dust control supervisor will document activities and conditions that could potentially lead to elevated levels of dust. If practical, the data stored by each unit will be downloaded to a computer at the end of the day and printed out as a daily record (or at a minimum, the end of each work week).

4.5.9 Documentation Activities

All stages of remediation shall be documented to provide evidence of satisfactory work performance. The information shall be recorded on a standardized form or in a bound field logbook.

Daily recordkeeping will be performed by the SCS Superintendent or field representative to record remedial excavation activities, including results of visual observations, laboratory/field test data,

sampling, repairs, problems, solutions, and general field activity. The daily field inspection reports (if necessary) shall be reviewed by the Engineer or Project Manager/Director for submittal to the Owner. One complete set of the daily reports shall be kept onsite by SCS personnel at all times. The contractor will be notified of the test results so that corrective action can be taken and retests completed.

4.6 REMEDIAL ACTION COMPLETION REPORT (RACR)

The activities completed under this Response Plan will be documented in a Remedial Action Completion Report to be prepared by the project geologist or engineer, documenting the removal of all waste materials from this area as well as the results of the deep soil and groundwater confirmation sampling. The report shall include a description of field activities, figures, tables, official laboratory test results, manifests, and discuss typical removal conditions and procedures.

The RACR will be submitted for approval to the RWQCB.

4.7 POST-REMEDIATION MAINTENANCE ACTIVITIES

Since the work addressed by the Response Plan calls for complete excavation of all waste and impacted media and thus removes potential threats to water quality, no post-remediation maintenance will be required.

4.8 PROJECT SCHEDULE

The activities described in this Plan will be performed following the satisfaction of necessary pre-construction contingencies which include obtaining all required entitlements, permits and approvals from the City of Commerce for the Project development, securing all necessary construction and/or project financing and finalizing the design and construction schedule for all phases of the Project. Upon such satisfaction, Comstock intends to authorize mobilization for remediation activities upon receiving approval of this Plan by the RWQCB, receipt of any other permits or authorizations from the City of Commerce or other jurisdictional agencies and absent objections from the LEA. A general Project Schedule is presented in **Table 3**, below.

Table 3. General Project Schedule

Activity	Schedule
Finalize Community Baseline Assessment	Completed - 1/14/20
RWQCB posts letter commenting on Draft Response Plan on GeoTracker	Completed - 2/10/20
Comstock-SCS submit updated Response Plan for RWQCB review/ approval	In progress – est. 2/19/20
Mail Fact Sheet to Occupants and Owners within a 500-ft radius of the site	Within 7 days of Response Plan publication
LARWQCB issues Appropriate Care Determination Letter	Est. 2/27/20
Publication of Response Plan	3/4/20

Activity	Schedule
30 day public review and comment for Response Plan period	Upon Publication of Response Plan 3/4/20 to 4/3/20
LARWQCB-Comstock draft response to public comments on Response Plan	After the 30 day public review and comment period 4/3/20
Revise Response Plan and submit for RWQCB approval	4/28/20
RWQCB approves Response Plan	Upon Adoption of EIR - 5/13/20
RWQCB files NOD for Response Plan approval	Upon Adoption of EIR - 5/14/20
Comstock issues a Notice of Completion of remediation and submits RACR	Upon completion of remediation work - 4/15/21
RWQCB approves RACR and issues a Certificate of Completion of No Further Action	Within 30 days of submittal of the Notice of Completion - 6/15/21
