EXECUTIVE SUMMARY

Chaparral Solar, LLC, Rabbitbrush Solar, LLC, and Tumbleweed Solar, LLC (the Applicants) have proposed to develop the AVEP Solar Project (the Project) in the Antelope Valley of Kern County, California. Western EcoSystems Technology, Inc. (WEST) was retained by the Applicants to prepare a Biological Resources Technical Report (BRTR) to evaluate the existing environmental conditions at the Project site, examine potential impacts of the Project on special-status biological resources, and to recommend measures to avoid or substantially lessen potentially significant biological impacts.

The proposed Project would be located on approximately 2,117 acres (857 hectares [ha]; Project site) of primarily undeveloped desert and disturbed agricultural land in the western Antelope Valley, approximately eight miles (12.9 kilometers [km]) west of SR-14, approximately 12 miles (19.3 km) northwest of the City of Lancaster, and approximately 30 miles (48.3 km) east of Interstate 5. The Project would involve the construction, operation, and eventual decommissioning of three separate solar photovoltaic power generating facilities referred to as the Chaparral Solar Facility, the Rabbitbrush Solar Facility, and the Tumbleweed Solar Facility (hereafter referred to as Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar). These three proposed facilities would have a collective capability of producing up to approximately 375 megawatts of renewable electricity.

Geographically, the Project site is located in the Antelope Valley which comprises the western tip of the Mojave Desert, bounded by the Tehachapi Mountains to the northwest, the San Gabriel Mountains to the southwest, and the Great Basin to the east. The Antelope Valley is characterized by relatively flat land, punctuated by occasional buttes, with elevations ranging from 2,300 to 3,500 feet (701 to 1,067 meters [m]) above mean sea level. Land use in the western Antelope Valley, in the vicinity of the Project, includes undeveloped desert, solar and wind energy development, agricultural (irrigated cropland and orchards), and rural residences and farmsteads. Within the Project site, land use is a mix of undeveloped desert and active and abandoned agricultural fields (orchards). Native desert vegetation communities within the Project site are dominated by creosote bush scrub, white bursage scrub, and alkaline desert scrub, which are common throughout the western Mojave region. The currently operating Antelope Valley Solar Facility, as well as the Rosamond and Willow Springs Solar Facilities, both currently under construction, lie adjacent to the Project site.

Focused biological field surveys were conducted in the spring and summer of 2017 by Ecology and Environment, Inc. (E&E) throughout the Chaparral Solar, Rabbitbrush Solar and Tumbleweed Solar sites. In the spring and summer of 2018, WEST surveyed an additional 50 acres (20 ha) of land added to the Project in late 2017, and in the spring of 2019, WEST surveyed an additional 132 acres (53 ha) of land added to the Project in early 2019 (hereafter 2018 and 2019 Expansion Lands, respectively). The 2017, 2018, and 2019 survey efforts included protocol-level surveys for special-status plants, desert tortoise, burrowing owl, and Swainson's hawk nests. For special-status plants, desert tortoise, and burrowing owl surveys, the survey area included 100% coverage of each of the three solar facilities plus a 500-foot

buffer surrounding each facility. For the Swainson's hawk nest survey, the survey area included each solar facility plus a five-mile buffer surrounding each facility. In addition to the focal species listed above, all plant and wildlife species observed during surveys were recorded, including the location of all bird nests, and burrows suitable for use by other special-status species (i.e., desert kit fox, and American badger).

The shared generation-tie line that Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar will use to interconnect to Southern California Edison's Whirlwind Substation, as well as the majority of AVEP's off-site collector line corridors, were surveyed and analyzed via the Rosamond and Willow Springs Solar Array Projects' respective Environmental Impact Reports (EIRs). Because any impacts associated with these Project components have already been studied and the relevant areas approved for the intended use by Kern County, the 2017, 2018, and 2019 biological surveys conducted for the Project did not include these areas but the relevant information from those prior studies is included as part of this BRTR's impact analysis. Several small sections of the Project's off-site collector line corridor, totaling approximately 30 acres (12 ha), were not surveyed as part of the Rosamond and Willow Springs solar project's EIRs. These areas were, therefore, surveyed by WEST in the spring and summer of 2018, at the same time the 2018 Expansion Lands were surveyed, and the results provided herein. Jurisdictional waters surveys were conducted for the Project in the winter of 2017/spring of 2018/spring of 2019 by Huffman-Broadway Group, Inc., the results of which are presented in a separate report.

A survey for special-status plants, following methodology described in the 2001 California Native Plant Society Botanical Survey Guidelines, was conducted in April and May 2017, with supplemental surveys conducted within the Project's 2018 and 2019 Expansion Lands, and along previously unsurveyed portions of the off-site collector line corridor in April 2018 and April 2019. A single special-status plant species, alkali mariposa lily, was identified within the western portion of Chaparral Solar during the 2019 survey. No other special-status plant species or plant communities were observed on any of the three solar facilities, or the collector line corridor during the survey efforts.

A desert tortoise survey was conducted in accordance with USFWS 2017 survey protocols in April 2017, with supplemental surveys conducted within the 2018 and 2019 Expansion Lands and collector line corridor in April 2018 and April 2019. No desert tortoise or desert tortoise burrows were observed on any of the three solar facilities or along the surveyed portions of the collector line corridor.

A burrowing owl survey, following survey protocols described in the 2012 California Department of Fish and Wildlife (CDFW; formerly California Department of Fish and Game) Staff Report on Burrowing Owl Mitigation, was conducted April – July 2017, with supplemental surveys conducted within the 2018 Expansion Lands and collector line corridor in April – July 2018 and within the 2019 Expansion Lands in April 2019. No burrowing owls or active burrows were observed on any of the three solar facilities; however, five inactive burrows with evidence of past use by burrowing owls were observed on Chaparral Solar in 2017, suggesting likely use by

burrowing owls on that proposed Facility during the previous winter. Additionally, a single active burrowing owl burrow was identified within the off-site collector line corridor in June 2018.

Surveys for Swainson's hawk nests were conducted April – July 2017, April – July 2018, and April – May 2019 in accordance with the California Energy Commission and CDFW (2010) Swainson's hawk survey protocols. During each year, the survey area included each solar facility plus a five-mile buffer surrounding each facility. No active Swainson's hawk nests were documented within the Project site; however, three active nests were observed within the survey area during the 2017 survey effort: one nest approximately 65 feet (20 m) to the south of Tumbleweed Solar, one nest approximately one mile (1.6 km) east of Tumbleweed Solar, and one nest approximately 3.1 miles (5.0 kilometers [km]) to the north of Chaparral Solar. No active Swainson's hawk nests were identified during the 2018 or 2019 surveys.

Over the course of biological surveys conducted from 2017 – 2019, nine special-status plant and wildlife species were documented within the Project site. These include one California rare plant species (alkali mariposa lily), one state-threated species (Swainson's hawk), six California Species of Special Concern (northern harrier, loggerhead shrike, Le Conte's thrasher, mountain plover, burrowing owl, and American badger [sign only]), and one species protected by the CDFW as a fur-bearing animal (desert kit fox). While not observed during surveys, several additional special-status species were determined to have at least a possibility of occurrence (i.e., possible, likely, or known to occur) at the Project site, based on known species' range and habitat information, including golden eagle, long-eared owl, Townsend's big-eared bat, and pallid bat. Special-status wildlife species, as well as more common wildlife species, could be impacted directly (loss of individuals or loss of nesting/foraging habitat) or indirectly (disturbance) as a result of Project construction and operation. These impacts are potentially significant; however, implementation of avoidance, minimization, and/or mitigation measures would reduce these impacts to a level that is less than significant.

ACKNOWLEDGEMENTS

Biological resource surveys for species-status species at the AVEP Solar Project were conducted by E&E and WEST. The 2017 field surveys were conducted by experienced and qualified E&E field biologists including David Schultz, Joe Carlo, Ellen Cotterman, and Matthew Church, following established, agency-accepted survey protocols. Supplemental field surveys were conducted in 2018 and 2019 by WEST biologists and botanists Stephanie Herrera, Cyrus Moqtaderi, Christina Van Oosten, Kurt Flaig, and Greg Johnson, and WEST subcontractors Bruce Weise and Jeff Valentine. WEST has prepared this BRTR using the spatial data, datasheets, field notes, and photos provided by E&E detailing the survey effort and results of field work completed at the Project during the spring and summer of 2017, and amended to include the results of supplemental field surveys conducted by WEST in 2018 and 2019. A memorandum, prepared by E&E, detailing the survey methodologies for the 2017 plant and wildlife surveys conducted at the Project is included as an appendix to this BRTR. The jurisdictional waters survey was conducted by Huffman-Broadway Group, Inc. during the winter of 2017/spring of 2018/spring of 2019. The results of that survey effort are detailed in a separate wetlands and jurisdictional waters report prepared for the Project.

1.0 INTRODUCTION

Chaparral Solar, LLC, Rabbitbrush Solar, LLC, and Tumbleweed Solar, LLC (the Applicants) have proposed to develop the AVEP Solar Project (the Project) in the Antelope Valley of Kern County, California (**Figure 1**). Western EcoSystems Technology, Inc. (WEST) was retained by the Applicants to prepare a Biological Resources Technical Report (BRTR) to evaluate the existing environmental conditions at the proposed Project, examine potential impacts of the Project on special-status biological resources, and to recommend measures to avoid or substantially lessen potentially significant biological impacts for the purpose of assisting Kern County with its environmental review of the Project. This BRTR includes the following chapters:

- **Chapter 1.0 – Introduction.** This section explains the purpose of the BRTR, provides a description of all Project components, and introduces the regulatory framework under which the Project will proceed.
- **Chapter 2.0 – Environmental Context.** This chapter describes the existing physical and biological characteristics of the Project site and the surrounding area.
- **Chapter 3.0 – Preliminary Database and Literature Review.** This chapter presents the methods and results of the initial database and literature review conducted prior to the start of focused field studies, including the potential for special status plant and wildlife species to occur within the proposed Project.
- **Chapter 4.0 – Biological Resource Surveys.** All field survey methods and results are presented in this chapter. Methods are presented for focused field surveys conducted for special-status plant and wildlife species and other relevant biological resources. This chapter also presents all major findings pertaining to the biological resources known or expected to occur within the Project. A wetlands and jurisdictional waters survey was also conducted for the Project, the results of which will be presented in a separate report.
- **Chapter 5.0 – Impacts to Biological Resources.** This chapter describes the effects of the Project on biological resources and identifies the potential significance of those effects.
- **Chapter 6.0 – Avoidance and Minimization Measures.** A discussion of all feasible mitigation and monitoring measures that would avoid or substantially lessen the potentially significant biological impacts of the Project are presented in this chapter.
- **Chapter 7.0 – References.** This chapter lists all references cited within the BRTR.

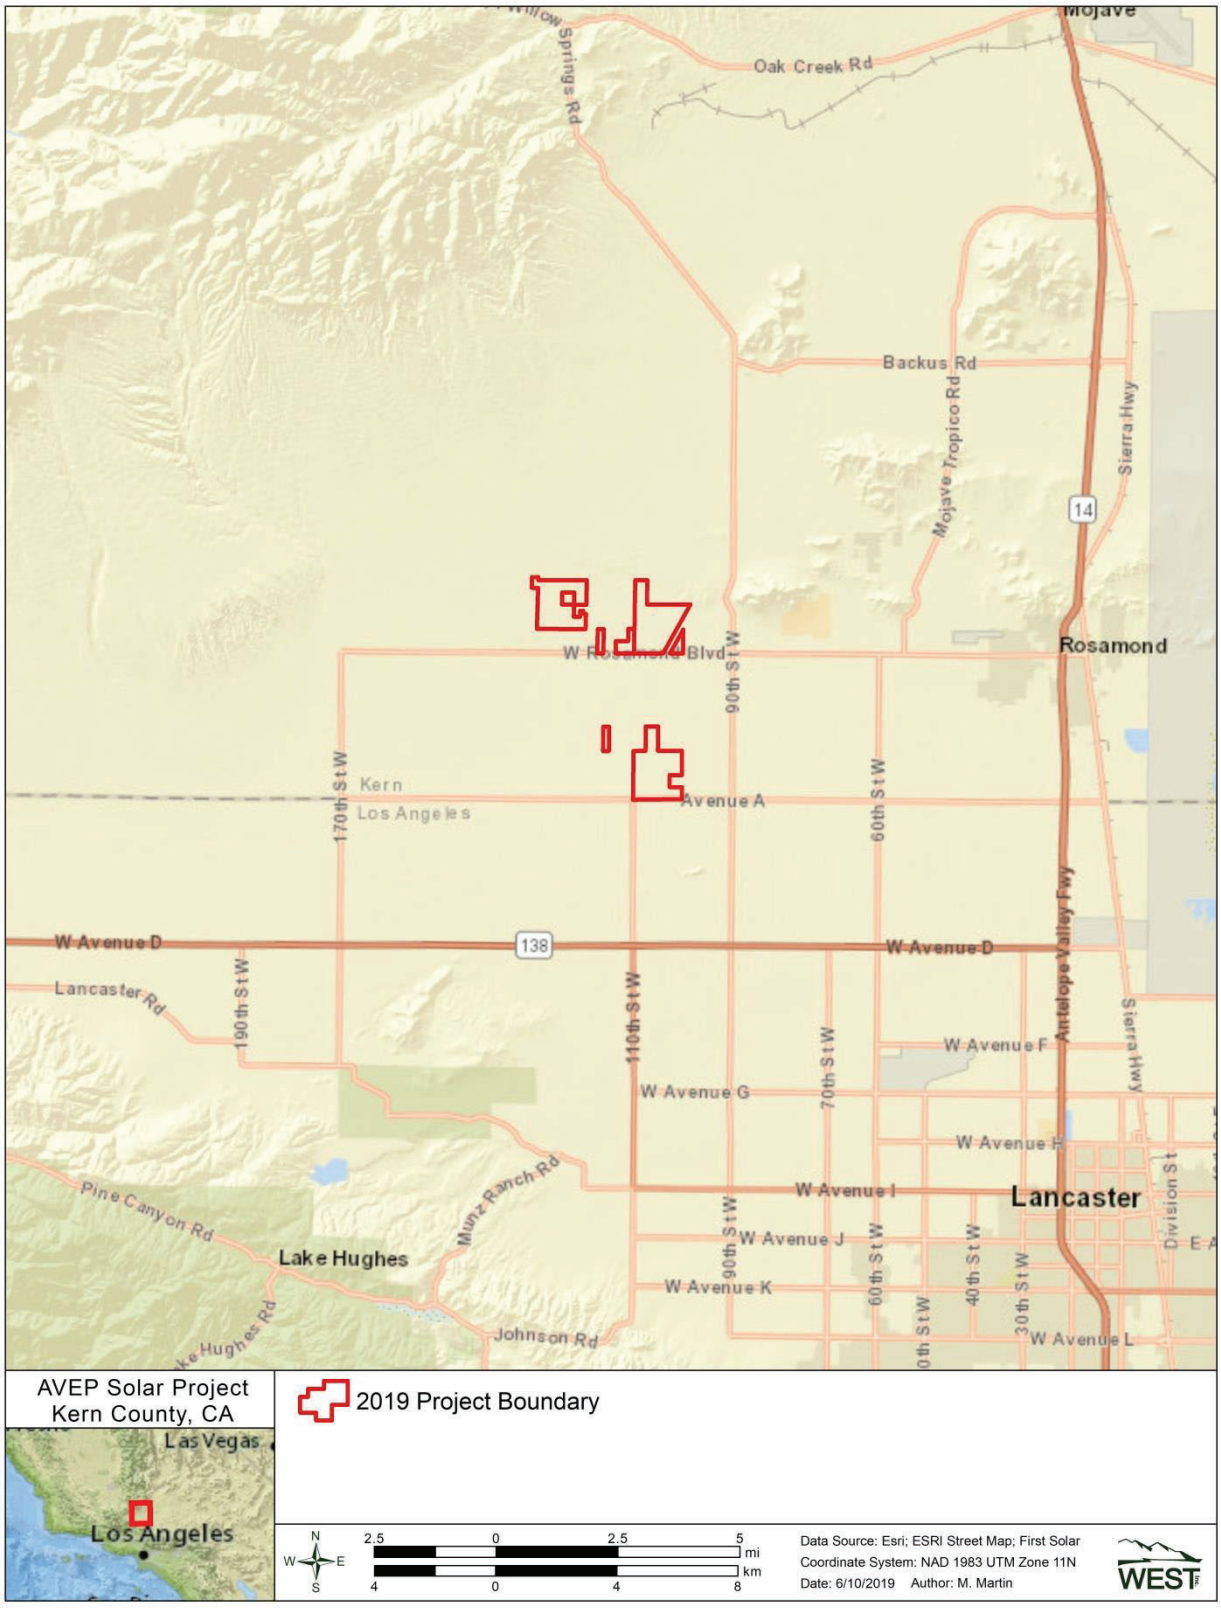

Figure 1. Location of the AVEP Solar Project, Kern County, California.

1.1 Project Location

The proposed Project is located on approximately 2,117 acres (857 hectares [ha]; Project site) of primarily undeveloped desert and disturbed agricultural land in south-central Kern County, California, approximately eight miles (12.9 kilometers [km]) west of SR-14, approximately 12 miles (19.3 km) northwest of the City of Lancaster, and approximately 30 miles (48.3 km) east of Interstate 5 (**Figure 1**). Geographically, the Project site is located in the Antelope Valley, which comprises the western tip of the Mojave Desert, bounded by the Tehachapi Mountain to the northwest, the San Gabriel Mountains to the southwest, and the Great Basin to the east. The Project site is generally bounded by Avenue of the Stars to the north, West Avenue A to the south, 130th Street West to the west, and 100th Street West to the east (**Figure 2**). The Project vicinity, as shown in Figures 1 and 2, includes a variety of land uses, although the majority of the surrounding lands are unoccupied desert, fallow or active agricultural lands, and solar energy facilities.

1.2 Project Description

The Project would involve the construction, operation, and eventual decommissioning of three separate solar photovoltaic power generating facilities referred to as the Chaparral Solar Facility, the Rabbitbrush Solar Facility, and the Tumbleweed Solar Facility (hereafter referred to as Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar; **Figure 2**). These three facilities would have a collective capability of producing up to approximately 375 megawatts (MW) of renewable electricity.

Major components of each facility would include photovoltaic modules mounted on fixed-tilt or horizontal tracker systems, an onsite electrical collection system, an Energy Storage System (ESS), one or more microwave or other telecommunications towers, two meteorological stations, meteorological towers (if tracker technology is utilized), private access roads and an off-site collection system. Each facility would have a single O&M building of up to approximately 2,000 square feet, a parking area, an aboveground water storage tank, permanent water lines, a septic system, and other associated facilities. Permanent chain-link security fencing would be installed around the individual facility site perimeters, substations, ESSs, and other areas requiring controlled access.

The 125-MW Chaparral Solar Facility comprises approximately 764 contiguous acres (309 ha) and is generally bordered by Rosamond Boulevard to the south, 100th Street West to the east, Avenue of the Stars to the north and 114th Street West to the west. Chaparral Solar would have two microwave or other telecommunications towers and the ESS would cover approximately eight acres (three ha).

The 125-MW Rabbitbrush Solar Facility comprises approximately 632 acres (256 ha), occurs in two proximate but non-contiguous portions (eastern and western), and is generally bordered by Rosamond Boulevard to the south, 115th Street West to the east, Avenue of the Stars to the north and 130th Street West to the west. Rabbitbrush Solar would have one microwave or other telecommunications tower and the ESS would cover approximately five acres (two ha).

The 125-MW Tumbleweed Solar Facility comprises approximately 721 acres (292 ha), occurs in two proximate but non-contiguous portions (eastern and western), and is generally bordered by West Avenue A to the south, 100th Street West to the east, Willow Avenue to the north and 117th Street West to the west. Tumbleweed Solar would have one microwave or other telecommunications tower and the ESS would cover approximately five acres.

Each facility would construct an off-site collection system that would interconnect into one of the Project's two interconnection options. Interconnection Option 1 would connect to the California Independent System Operator (CAISO) grid at the existing Southern California Edison (SCE) Whirlwind Substation, located approximately eight miles to the west of the Project (**Figure 2a**). Interconnection Option 2 would connect to the Los Angeles Department of Water and Power (LADWP) Barren Ridge – Rinaldi transmission line via a switchyard being developed by LADWP, just south of Chaparral Solar (**Figure 2b**). For Interconnection Option 1, the Project would require modifications to the existing Rosamond and Willow Springs Solar Projects substations and SCE improvements made at the existing SCE Whirlwind substation. For Interconnection Option 2, the Project would require the construction of a new substation on Chaparral Solar (**Figure 2b**) and optionally a new substation on Tumbleweed Solar (**Figure 2c**), where the electrical output would be transformed to a voltage of 230 kilovolts (kV), a 230-kV generation-tie (gen-tie) line to interconnect with LADWP, and improvements made by LADWP at the LADWP switchyard.

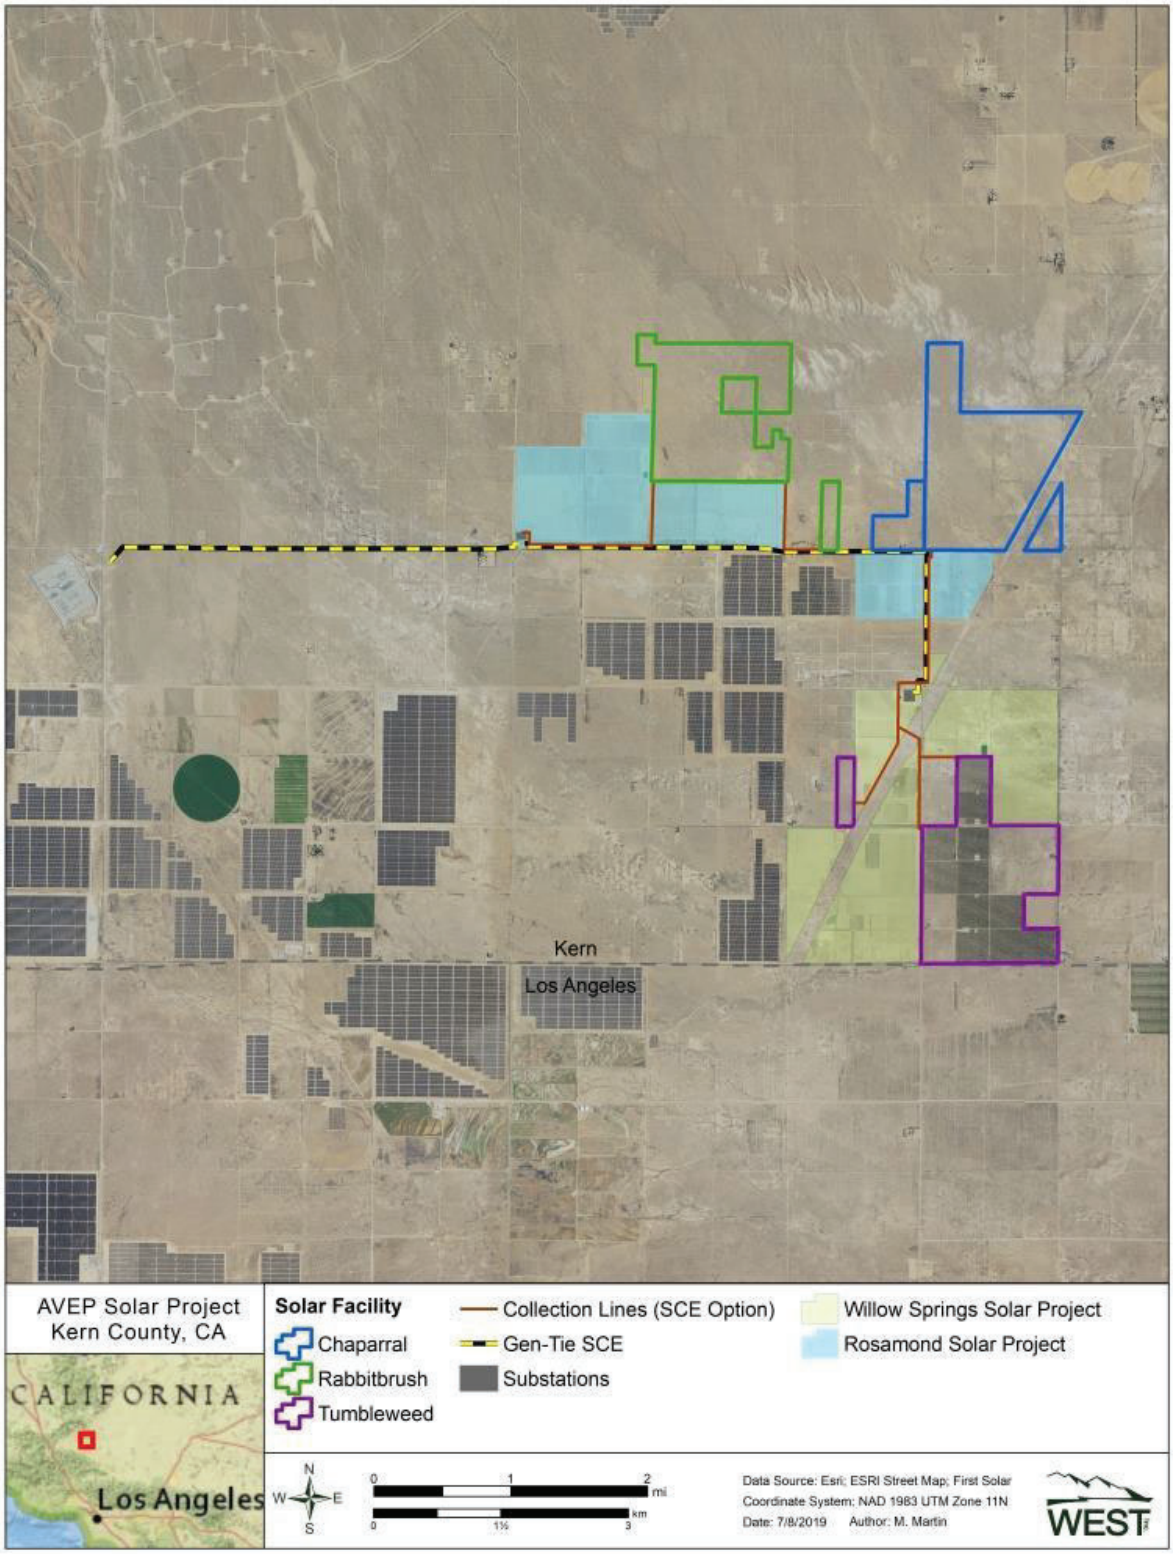

Figure 2a. Location of the proposed Tumbleweed, Rabbitbrush, and Chaparral Solar Facility sites comprising the AVEP Solar Project, Kern County, California. Option 1: connection to the California Independent System Operator grid at the existing Southern California Edison Whirlwind Substation

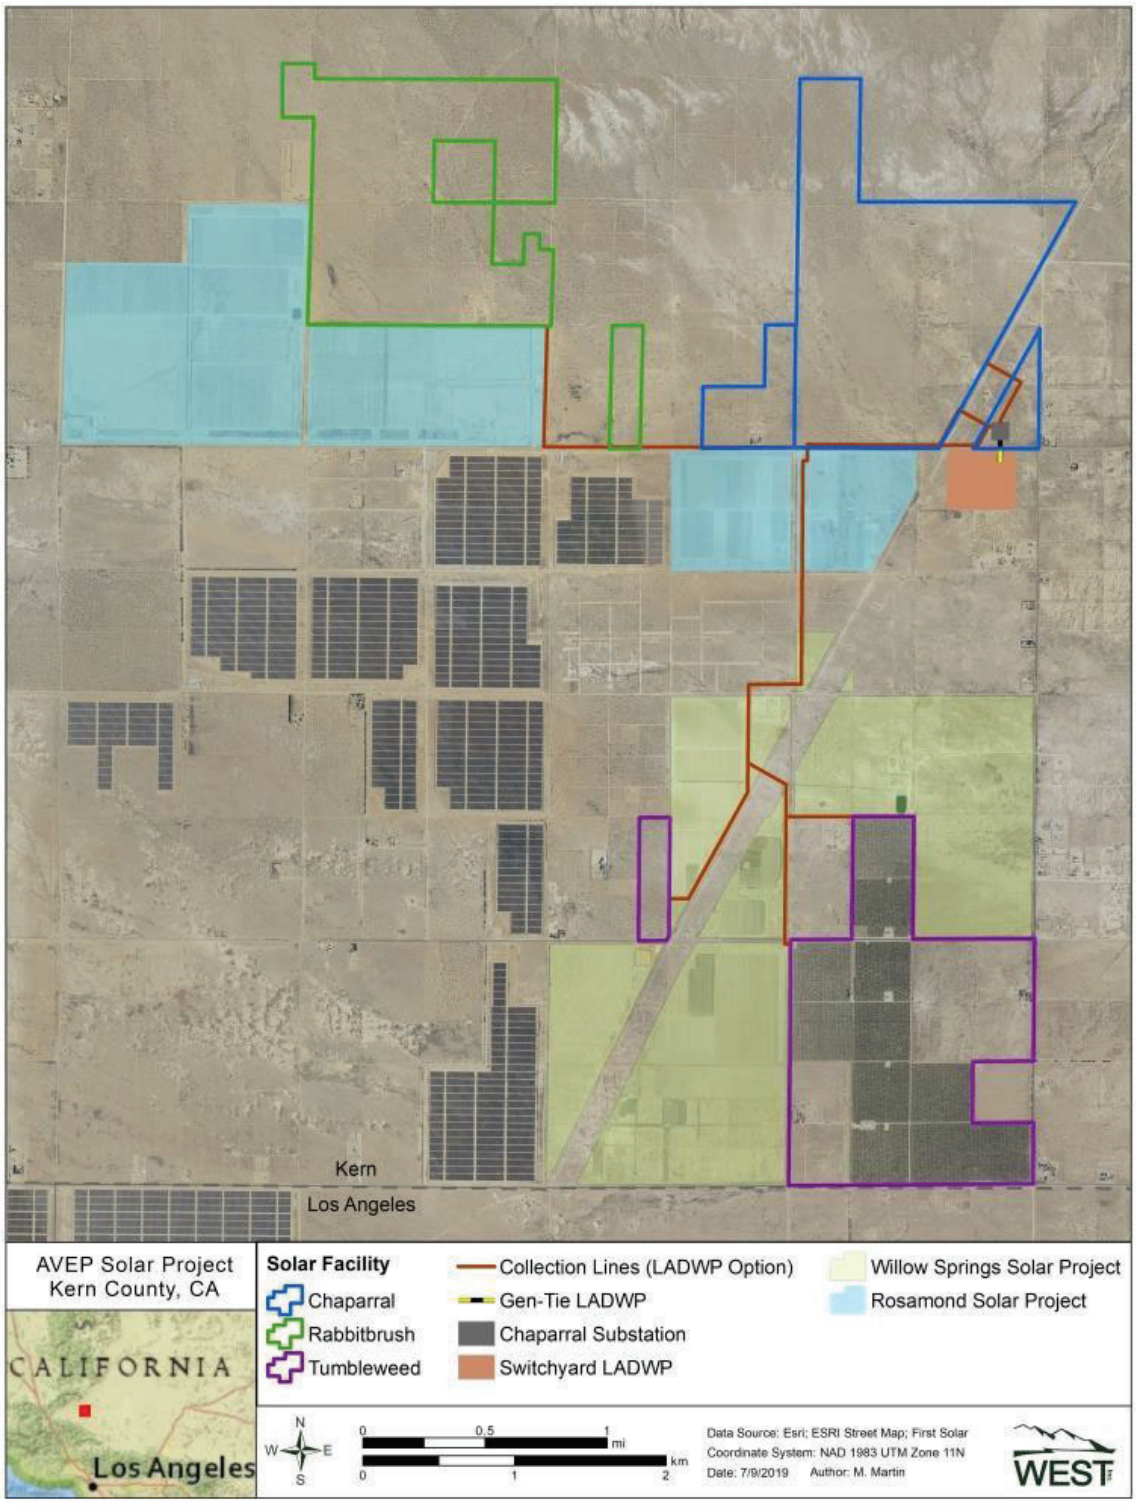

Figure 2b. Location of the proposed Tumbleweed, Rabbitbrush, and Chaparral Solar Facilities comprising the AVEP Solar Project, Kern County, California. Figure illustrates Interconnection Option 2: connection to the Los Angeles Department of Water and Power (LADWP) Barren Ridge – Rinaldi transmission line via a switchyard being developed by LADWP, requiring construction of a new substation at Chaparral Solar.

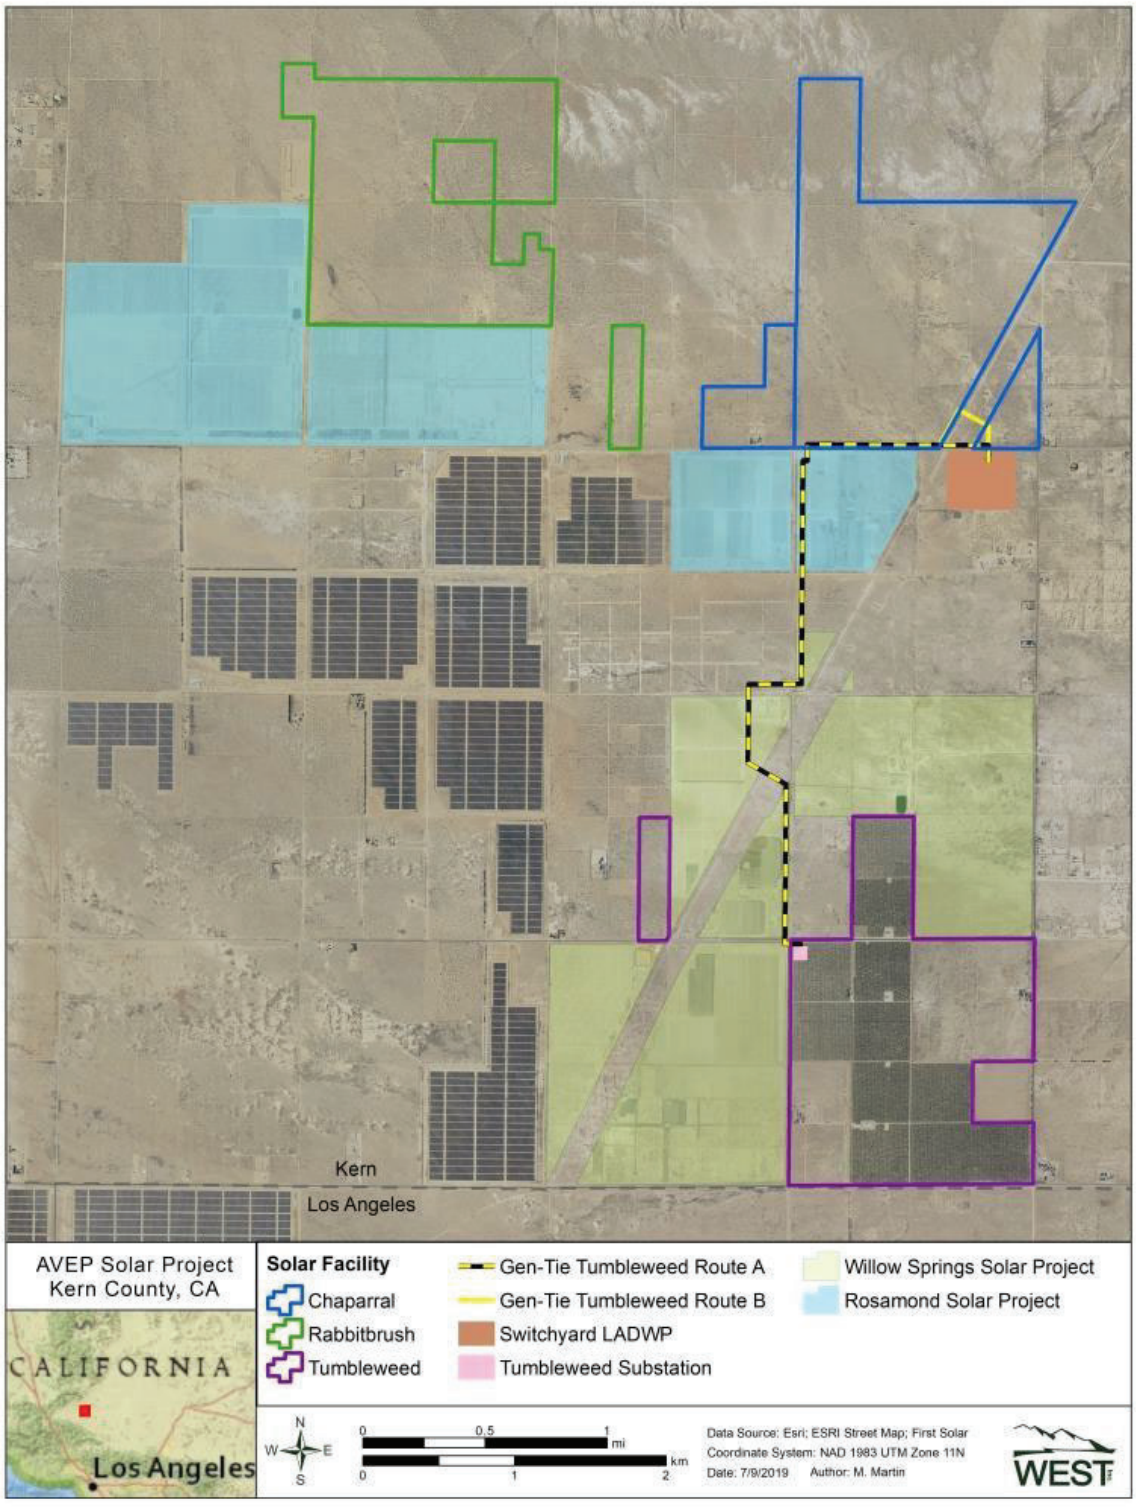

Figure 2c. Location of the proposed Tumbleweed, Rabbitbrush, and Chaparral Solar Facilities comprising the AVEP Solar Project, Kern County, California. Figure illustrates Option 2 (connection to the Los Angeles Department of Water and Power (LADWP) Barren Ridge – Rinaldi transmission line) but with a sub-option of construction of a new substation at Tumbleweed Solar. Rabbitbrush Solar and Chaparral Solar would have the same interconnection as shown in Figure 2b.

1.3 Regulatory Framework

Regulated or special-status biological resources evaluated herein include state and/or federal special-status plant and wildlife species, nesting birds (including raptors), special-status plant communities, locally-protected resources, and wildlife movement corridors. For the purposes of this BRTR, special-status species are defined as state or federal listed or candidate species, plant species with California Native Plant Society (CNPS) Rare Plant Rank of 1 or 2 (CNPS 2019), California Fully Protected wildlife species, and wildlife designated as California Species of Special Concern (SSC; CDFW 2017). This section provides an overview of the federal, state, and local statutes and conservation plans relevant to the evaluation.

1.3.1 Environmental Statutes

The following federal, state, and local authorities were considered in the evaluation of potential impacts to biological resources in the Project site and immediate vicinity:

- Federal Endangered Species Act (ESA)
- Migratory Bird Treaty Act (MBTA)
- Bald and Golden Eagle Protection Act (BGEPA)
- California Desert Native Plants Act (CDNPA)
- California Environmental Quality Act (CEQA)
- California Endangered Species Act (CESA)
- California Fish and Game Code (CFGC)
- California Native Plant Protection Act
- Kern County General Plan
- Kern County Willow Springs Specific Plan

1.3.2 Guidelines for Determining CEQA Significance

The Kern County CEQA Environmental Checklist Form (Kern County Planning and Community Development Department [KCPCDD] 2012b) provides a list of threshold criteria for evaluating whether or not a Project would have significant environmental impacts pursuant to CEQA. Based on these criteria, the Project would have significant effects on biological resources if it will:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife (CDFW) or US Fish and Wildlife Service (USFWS).

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS.

c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

f. Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

2.0 ENVIRONMENTAL CONTEXT

The Project site is located in the Antelope Valley which encompasses northern Los Angeles County and the southeastern portion of Kern County, California. The Antelope Valley region represents a large groundwater basin in the western part of the Mojave Desert. It is characterized by relatively flat land, punctuated by occasional buttes, with elevations ranging from approximately 2,300 to 3,500 feet (700 to 1,070 m) above mean sea level. The basin is bounded on the northwest by the Garlock Fault zone at the base of the Tehachapi Mountains and on the southwest by the San Andreas Fault zone at the base of the San Gabriel Mountains. The principle cities in the Antelope Valley are Lancaster and Palmdale, located approximately 12 and 20 miles (19.3 and 32.2 km) to the southeast of the Project site, respectively (**Figure 1**).

The Antelope Valley California State Poppy Reserve, administered by the California State Parks Department, is located approximately seven miles (11.3 km) to the southwest of the Project site. The majority of the land in the surrounding region is comprised of private, unoccupied desert, agricultural (primarily alfalfa [*Medicago sativa*], onions [*Allium cepa*], and dry wheat [*Triticum aestivum*] farming), grazing lands, and solar and wind energy development, along with rural residential development and scattered rural homes/farmsteads.

The Project site is located near the center of the western Antelope Valley. Chaparral Solar and Rabbitbrush Solar consist primarily of native desert scrub plant communities including Mojave creosote bush *(Larrea tridentata*) scrub, white bursage (*Ambrosia dumosa*) scrub, and alkaline mixed scrub. Tumbleweed Solar is predominately an active pistachio orchard with smaller areas of fallow agricultural fields, grassland, and native desert scrub. The vegetation types and land uses present within the Project site are regionally abundant. Scattered occupied and abandoned residences are present within and adjacent to the Project site. The currently operating Antelope Valley Solar Facility, as well as the Rosamond and Willow Springs Solar Facilities, both currently under construction, lie adjacent to the Project site (**Figures 2a-2c**).

2.1 Climate

The Antelope Valley, characterized as high desert, is predominantly semiarid with average annual precipitation of less than eight inches (20 centimeters [cm]) on the valley floor (US Climate Data 2018). Approximately 60% of the mean annual precipitation falls in the winter months, including an average of two inches (five cm) of snowfall per year (US Climate Data 2018). The mean winter temperature is 46 degrees, with mean daily winter temperatures

ranging from 32 to 60 degrees Fahrenheit (F). Summer precipitation is limited to local thunderstorms, mostly at the higher altitudes. The mean summer temperature, recorded in the city of Lancaster, is 80 degree F, with mean daily summer temperatures ranging from 64 to 96 degrees F (US Climate Data 2018).

2.2 Topography and Soils

The Project site is underlain by eight soil mapping units (**Figure 3**; US Department of Agriculture [USDA] Natural Resource Conservation Service [NRCS] 2018). Four of the eight mapping units are common within the Project, composing at least 10% of the overall Project site. Soil textures within these mapping units range from fine sandy loams to loamy sands and all are composed of alluvium derived from granite. The landform, or landscape position, associated with these soil mapping units is alluvial fans (USDA NRCS 2018). Topography in the Project site is relatively flat, and slopes to the southeast. Elevations range from a high of approximately 2,762 feet (842 meters [m]) in the north and northwestern portion of the Project to a low of about 2,434 feet (742 m) in the southeast portion of the Project (**Figure 4**).

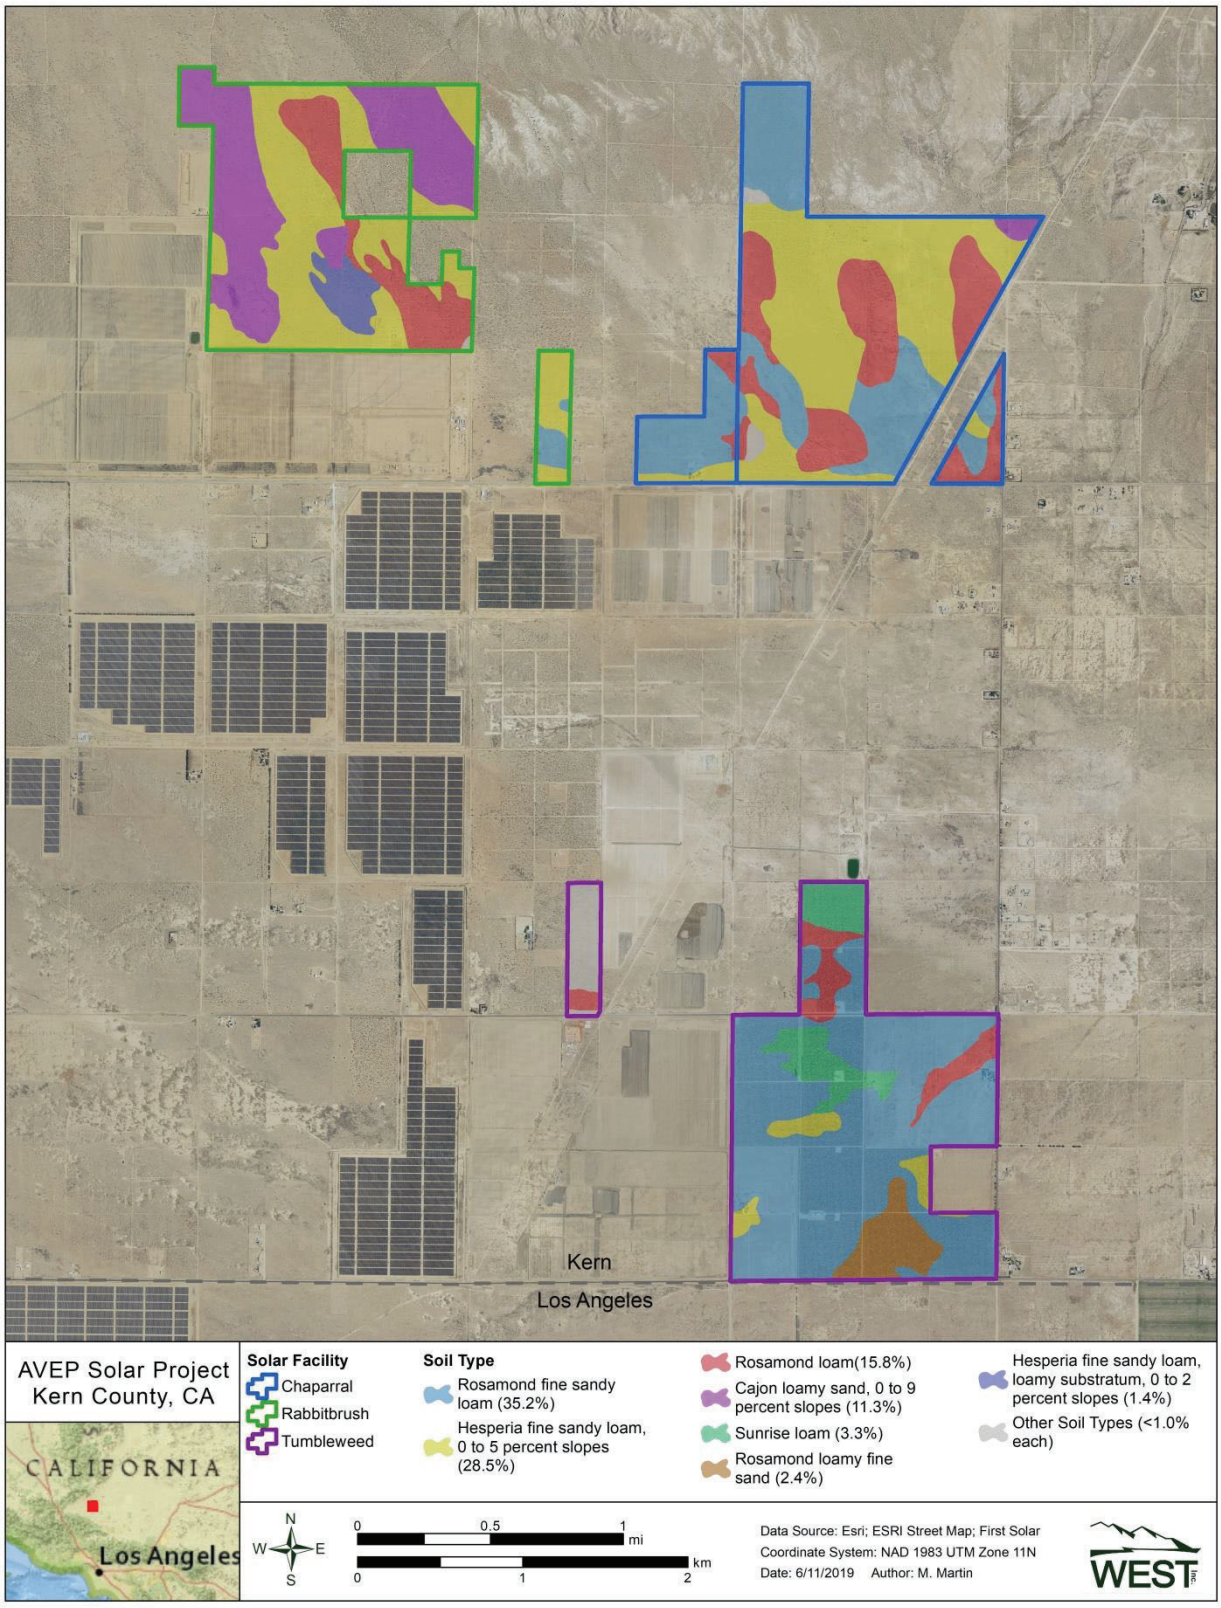

Figure 3. Soil types (and % composition) within the proposed AVEP Solar Project, Kern County, California.

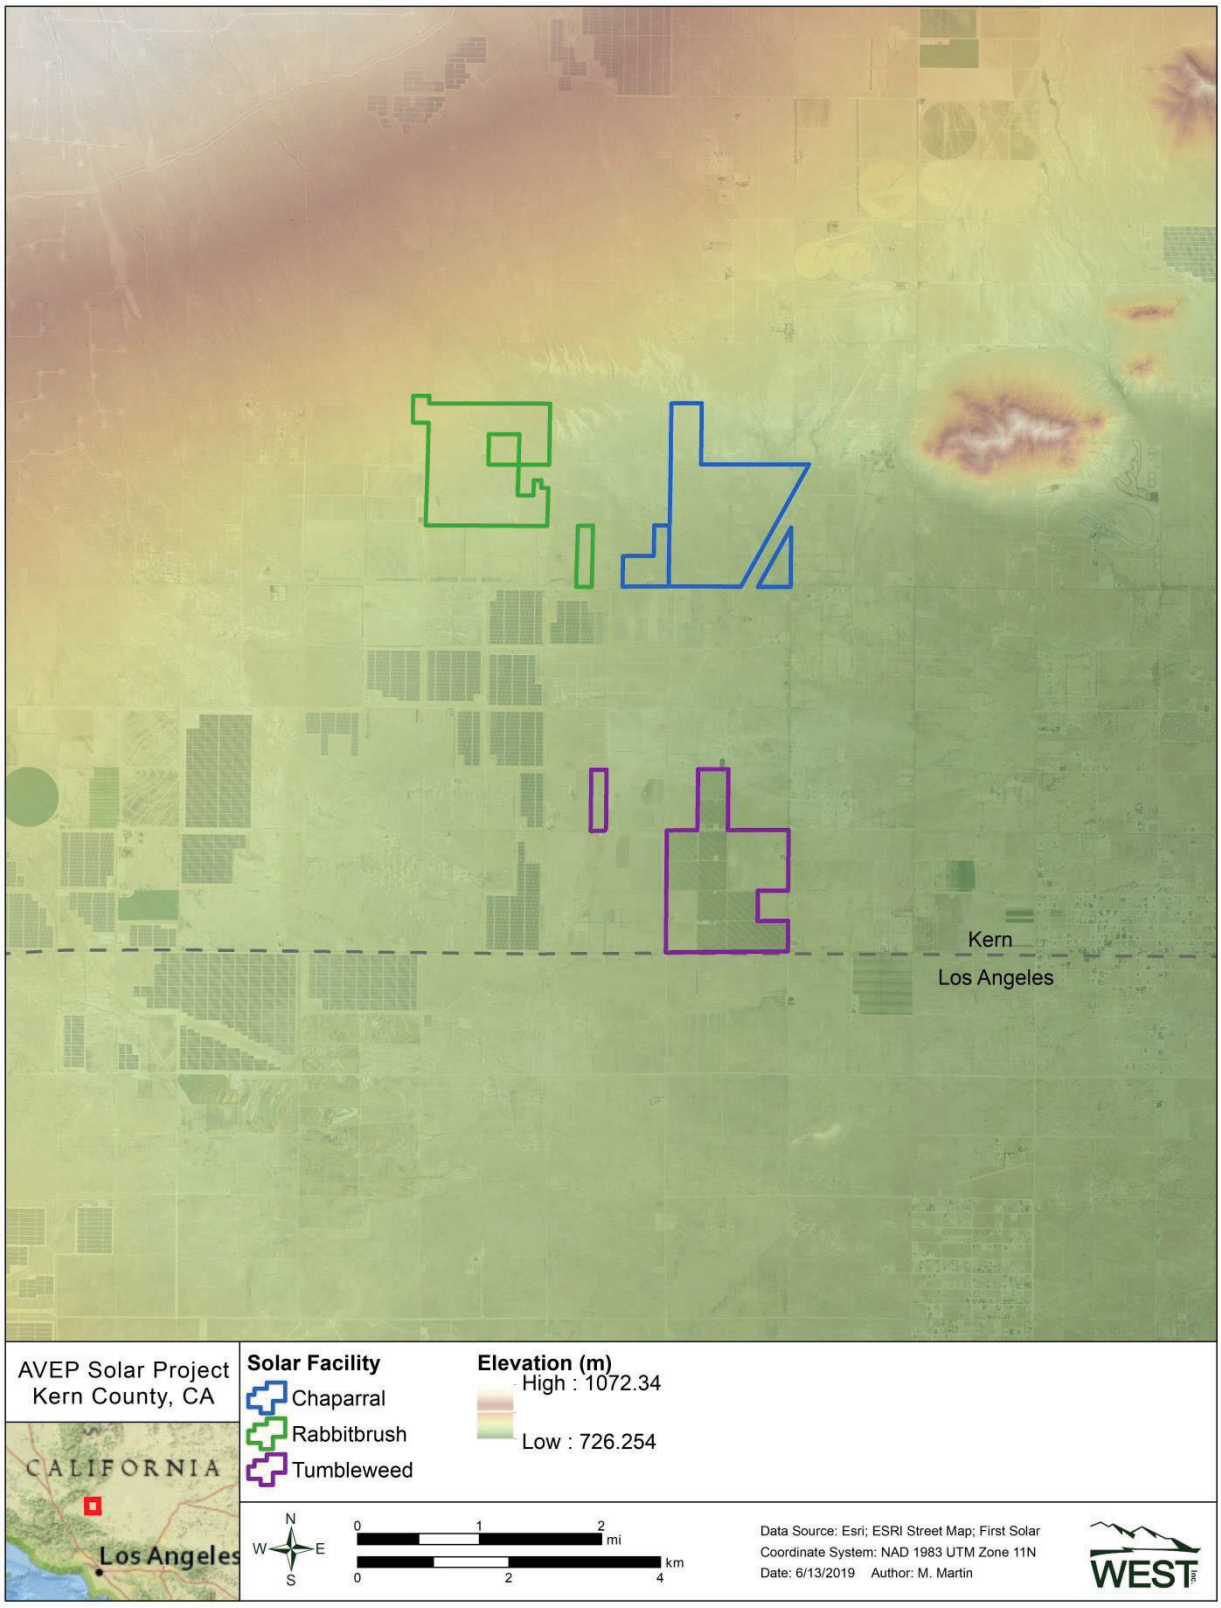

Figure 4. Digital Elevation Model of the proposed AVEP Solar Project, Kern County, California.

2.3 Vegetation

Chaparral, Rabbitbrush, and Tumbleweed Solar are composed of a mix of native and non-native vegetation communities (Table 1). Based on vegetation mapping conducted in 2013 in support of the Desert Renewable Energy Conservation Plan (DRECP; CDFW 2016, Menke et al. 2016), the majority of the Project site consists of active and fallow agricultural areas (26.5%), as well as several native desert vegetation communities including creosote bush scrub (28.0%), California annual and perennial grassland (22.3%), white bursgage scrub (8.8%), alkaline mixed scrub (8.4%), and rabbitbrush scrub (4.7%; Table 1; **Figure 5**). The only other landcover type present within the Project site is developed land (1.4%; Table 1) which is associated with farms or residences. Descriptions of the vegetation communities and other landcover types present within the three solar facilities are provided in the sections below.

Table 1. Acreage and percent composition of vegetation communities/cover types present within the Chaparral, Rabbitbrush, and Tumbleweed Solar Facilities, Kern County, California.

	Chaparral Solar		Rabbitbrush Solar		Tumbleweed Solar		Total	
Vegetation Community	**Acres**	**%**	**Acres**	**%**	**Acres**	**%**	**Acres**	**%**
Active and fallow agriculture	0	0	0	0	555	77.0	561	26.5
Alkaline mixed scrub	145	19.0	25	4.0	7	1.0	177	8.4
California annual and perennial grassland	336	44.0	24	3.8	112	15.5	472	22.3

White bursage scrub	0	0	175	27.7	11	1.5	186	8.8
Total	**764**	**100**	**632**	**100**	**721**	**100**	**2,117**	**100**

Data Source: CDFW (2016)

2.3.1 Active and Fallow Agriculture

Active agricultural areas are characterized by the presence of crops or signs of recent (i.e., within the past growing season) use for crops, while fallow agricultural areas have not been cultivated, tilled, or irrigated for at least one growing season. Fallow/abandoned agricultural fields, as well as other areas that have historically been disturbed by heavy grazing or clearing for other human uses, have plant species composition that are highly variable but are generally composed of early seral, disturbance-associated species. Common plant species within these areas include native forbs and grasses such as fiddleneck (*Amsinckia menziesii*), goldfields (*Lasthenia* spp.), and Sandberg's bluegrass (*Poa secunda*), and non-native forbs and grasses such as redstem filaree (*Erodium cicutarium*), foxtail brome (*Bromus madretensis* ssp. *rubens*), rattail sixweeks grass (*Festuca myuros*), Arabian schismus (*Schismus arabicus*), and downy chess (*Bromus tectorum*).

Chaparral Solar Facility: There are no areas characterized as active or fallow agricultural fields within Chaparral Solar; however, portions of the facility, particularly in the east, exhibit signs of recent heavy grazing by sheep.

Rabbitbrush Solar Facility: There are no areas characterized as active or fallow agricultural fields within Rabbitbrush Solar).

Tumbleweed Solar Facility: Active and fallow agricultural fields is the dominant vegetation community present on Tumbleweed Solar, covering 555 acres (77.0%) of the proposed facility (Table 1; **Figure 5**). Most of Tumbleweed Solar is an active pistachio orchard, while areas to the northeast and southwest of the orchard contain fallow agricultural fields.

2.3.2 Alkaline Mixed Scrub

Alkaline mixed scrub communities often occur as a mosaic on the landscape with creosote bush and other scrub communities, but typically occupy topographically lower areas (e.g., micro depressions, swales, playas) with finer textured soils. These soils typically have a slightly higher alkalinity and may be somewhat saline. Although more closely spaced than creosote bush scrub, stands of alkaline mixed scrub range from relatively open to dense, and typically decrease spacing with an increase in available soil moisture. Common alkaline mixed scrub species include several species of saltbush (e.g., allscale [*Atriplex polycarpa*], shadscale [*A. confertifolia*], four-wing [*A. canescens*], rabbitbrush [*Chrysothamnus nauseosus*], hopsage [*Grayia spinose*], and winter fat [*Krascheninnikovia lanata*]). A variety of understory grass and forb species may be present, and composition and density are site-dependent.

Chaparral Solar Facility: Alkaline mixed scrub is interspersed among other desert plant communities throughout Chaparral Solar, comprising 145 acres (19.0%), primarily in the southwestern corner of the facility (Table 1; **Figure 5**).

Rabbitbrush Solar Facility: Alkaline mixed scrub is present on 25 acres in the southeastern portion of Rabbitbrush Solar (4.0% of the facility; Table 1; **Figure 5**).

Tumbleweed Solar Facility: Alkaline mixed scrub is present within a very small area (seven acres) of the northwestern portion of Tumbleweed Solar (1.0% of the facility; Table 1; **Figure 5**).

2.3.3 California Annual and Perennial Grassland

California annual and perennial grasslands are characterized by an evenly distributed herbaceous layer of native and nonnative herbs and grasses. Species characteristic of this vegetation community include fiddleneck, California poppy (*Eschscholzia californica*), California goldfields (*L. californica*), monolopia (*Monolopia lanceolata*), tidy tips (*Layia platyglossa*), tickseed (*Coreopsis calliopsidea*), dotseed plantain (*Plantago erecta*), and small fescue (*Vulpia microstachys*).

Chaparral Solar Facility: This is the dominant vegetation community on Chaparral Solar comprising 336 acres, or 44.0% of the proposed facility (Table 1; **Figure 5**).

Rabbitbrush Solar Facility: California annual and perennial grassland is present within two small areas of Rabbitbrush Solar, totaling 24 acres (3.8%), primarily in the southeast (Table 1; **Figure 5**).

Tumbleweed Solar Facility: This vegetation community is present on 112 acres (15.5%) in the southwestern and northeastern (non-orchard) portions of Tumbleweed Solar (Table 1; **Figure 5**).

2.3.4 Creosote Bush Scrub

Mojave creosote bush scrub communities are dominated by widely spaced creosote bush with a sparse understory of annual plant species. They are typically found on alluvial fans, dry slopes, and valleys with well-drained soils. White bursage and Mormon tea *(Ephedra* spp.) are common shrub associates. Land use practices can have a significant effect on the herbaceous (i.e., grass and forb) understory vegetation composition. For example, excessive grazing by sheep can result in a preponderance of non-native annual grasses. This is not uncommon for such habitats in the Antelope Valley region. Scattered Joshua trees (*Yucca brevifolia*) occur within portions of the creosote bush scrub in the Project site, but they do not occur at a density high enough to consider them a woodland community.

Chaparral Solar Facility: Creosote bush scrub is found on 179 acres (23.4%; Table 1) of Chaparral Solar, primarily in the northwestern portion of the facility (**Figure 5**).

Rabbitbrush Solar Facility: This vegetation community is present on 392 acres (62.0%; Table 1) of Rabbitbrush Solar (**Figure 5**).

Tumbleweed Solar Facility: Creosote bush scrub is found on 21 acres (2.9%; Table 1) within the northwest (non-contiguous) portion of Tumbleweed Solar (**Figure 5**).

2.3.5 Developed

Developed areas include residential farmhouses and associated outbuildings. The only developed areas within the Project site are two farm/homesteads on Tumbleweed Solar totaling 14 acres, or 1.9% of that facility, a single residence on each of Rabbitbrush Solar and Chaparral Solar totaling 16 and six acres (2.5% and 0.8%) on each of those two facilities, respectively (Table 1; **Figure 5**).

2.3.6 Rabbitbrush Scrub

Any single or combinations of species of rabbitbrush are dominant shrubs of this vegetation community. In the Project site, rubber rabbitbrush (*Ericameria nauseosa*) and Cooper's goldenbush (*E. cooperi*) dominate this community. Rabbitbrush scrub occurs frequently on dry slopes or flats in the High Desert Plains. Associated species include chaparral shrubs such as buckwheat (*Eriogonum* spp.) and dry and alkaline grasses and forbs.

Chaparral Solar Facility: Rabbitbrush scrub is present on 98 acres (12.8%; Table 1) of Chaparral Solar, interspersed with grassland and creosote bush scrub communities (**Figure 5**).

Rabbitbrush Solar Facility: This vegetation community is not present on Rabbitbrush Solar.

Tumbleweed Solar Facility: This vegetation community is present on a very small section (one acre; 0.4%; Table 1) of Tumbleweed Solar (**Figure 5**).

2.3.7 White Bursage Scrub

In the white bursage scrub community, white bursage is greater than 1% cover, creosote bush is less than 1% cover, and no other species has equal or higher cover (Thomas et al. 2004). White bursage scrub communities occur within washes, alluvial fans, bajadas, upland slopes, rocky hills, and stabilized sand fields, where sandy soils are present (CNPS 2018).

Chaparral Solar Facility: This vegetation community is not found within Chaparral Solar.

Rabbitbrush Solar Facility: White bursage scrub is present on 175 acres (27.7%; Table 1) throughout Rabbitbrush Solar (**Figure 5**).

Tumbleweed Solar Facility: This vegetation community occurs on 11 acres (1.5%; Table 1) within the northwestern-most (non-contiguous) portion of Tumbleweed Solar (**Figure 5**).

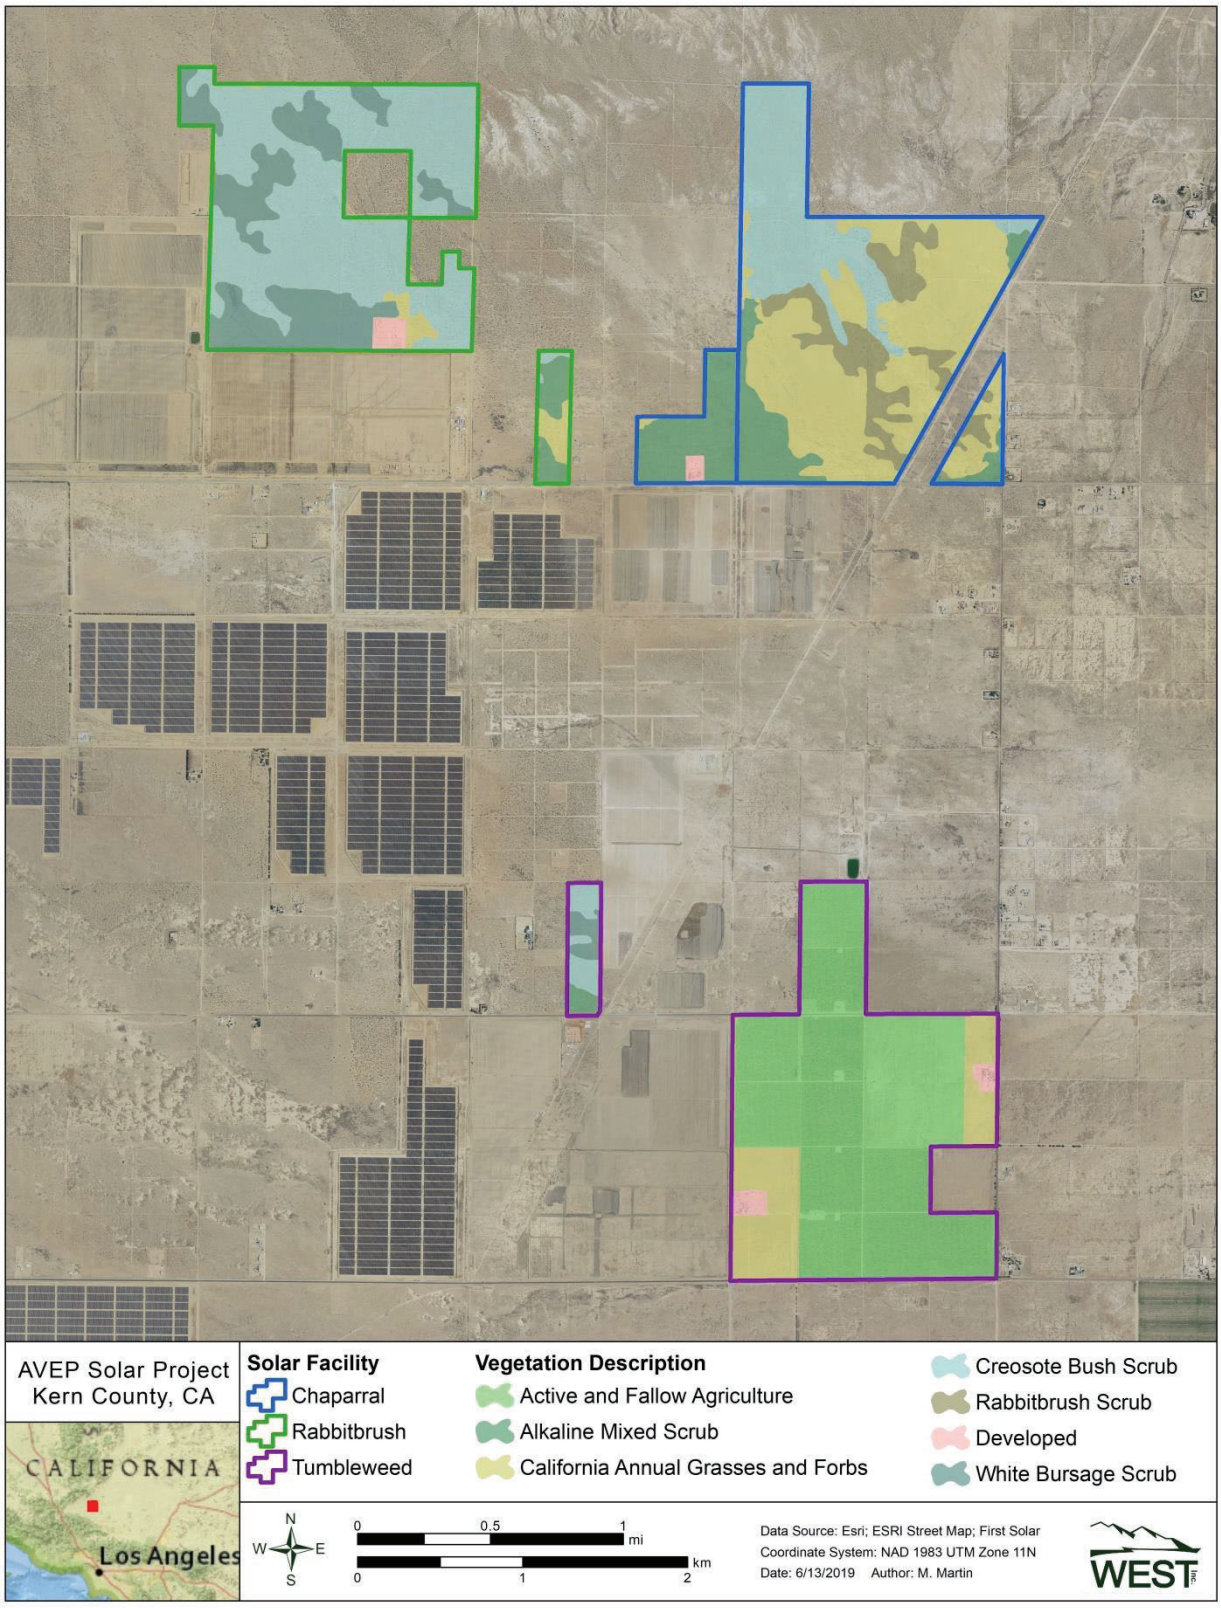

Figure 5. Vegetation communities/landcover within the proposed AVEP Solar Project, Kern County, California (CDFW 2016)

3.0 PRELIMINARY DATABASE AND LITERATURE REVIEW

3.1 Methods

The database and literature review methods described in the section below were adapted from *Methodology of Wildlife and Plant Surveys for AVEP Solar Project, April-July, 2017* prepared by Ecology & Environment (E&E; 2018) and included as Appendix A. Prior to the initiation of the focused field surveys described in Chapter 4 of the BRTR, environmental resources within the Project site and immediate vicinity were examined through a search of existing publicly available data. Published literature, field guides and other reference materials, public data sets, and results of site-specific surveys conducted for renewable energy sites in the surrounding area were among the resources reviewed to identify known environmental resources within the region and to help guide focused biological field surveys at the proposed Project. Information was obtained from the following sources:

- Bat Conservation International (BCI) species accounts and range maps (BCI 2018).
- Biological Resources Technical Reports for the Rosamond, Willow Springs, Valentine, and Antelope Valley Solar Projects (Ironwood Consulting 2011a, 2011b, 2014a, 2014b, SWCA 2015; AECOM 2010).
- CDFW Special Animals List (CDFW 2017).
- California Natural Diversity Database (CNDDB) records within a five-mile radius of the Project site (CNDDB 2018). The search area included the Willow Springs and Little Butte US Geological Survey (USGS) 7.5-minute quadrangle maps on which the Project occurs, and the surrounding ten quadrangles, including Tehachapi South, Monolith, Mojave, Soledad Mountain, Rosamond, Lancaster West, Del Sur, Lake Hughes, Fairmont Butte, and Tylerhorse Canyon.
- CNPS *Online Inventory of Rare and Endangered Plants of California* (CNPS 2019).
- California Wildlife Habitat Relationships (CWHR) information system, life history accounts and range maps, maintained by the CDFW (CWHR 2018).
- eBird online bird checklist (eBird 2018).
- Soil Survey Geographic (SSURGO) Database for Kern County, California (USDA NRCS 2018);
- USFWS Critical Habitat designations (USFWS 2018a).
- USFWS Environmental Conservation Online System Species Report by County (USFWS 2018b).
- USFWS National Wetland Inventory (NWI) data (USFWS NWI 2016).
- USGS topographic maps and digital elevation data (USGS 2015; USGS DEM 2016).
- Vegetation map developed in support of the DRECP (CDFW 2016, Menke et al. 2016).

WEST determined the likelihood that a special-status plant or animal species may occur within the Project site by considering the species' range, habitat suitability within the Project site, species' mobility, population size, and records of occurrence within or adjacent to the Project site. The primary factor determining the potential for a species' occurrence is whether or not the Project falls within the known range of a species; habitat suitability is used to modify the likelihood of occurrence. For species where the Project occurs outside of the known range, the likelihood of occurrence is either None or Not Expected. For species where the Project occurs within the known range, the likelihood of occurrence ranges from Not Expected to Likely, based on whether or not habitat is present within the Project site. Based on these factors, the likelihood of occurrence was defined for each sensitive species using the following categories:

- None – Project outside the species known range, no suitable habitat within the Project site, restricted mobility and small population size.
- Not Expected – Project outside the species known range or suitable habitat appears absent from the Project site.
- Possible – Project is located within the range of the species and contains marginal suitable habitat; species highly mobile and may occur during one or more seasons.
- Likely – Project is located within the range of the species and contains suitable habitat; records of species occurrence in the surrounding area but absent from the Project site.
- Occurs – Records of species occurrence within the Project site based on CNDDB data or other survey data.

Focused wildlife and plant surveys were conducted for special-status species with a possible, likely, or known occurrence in the Project site and which could potentially be impacted directly by Project construction or operation. Additionally, though the desert tortoise is not expected to occur within the Project site, protocol-level surveys for desert tortoise were undertaken due to the Project's location within the Desert Tortoise Western Mojave Recovery Unit and the species' regional importance.

3.2 Results

3.2.1 Special-Status Plant Species

Based on the preliminary database and literature review, 22 special-status plant species were evaluated for their likelihood to occur within the Project site or immediately surrounding area (i.e., within five miles of the Project site; Appendix B1). Of these, 11 species were identified as possibly occurring within the Project site based on known species' range and habitat requirements, and historical locations (Appendix B1). Two of the special-status plant species identified in the database and literature review (alkali mariposa lily [*Calochortus striatus*; CNPS 1B.2] and Horn's milk-vetch [*Astragalus hornii*; CNPS 1B.1]) are known to occur within 0.5 miles of the Project site (CNDDB 2018; **Figure 6**), and are discussed in greater detail in the sections below. Additionally, while Bakersfield cactus (*Opuntia basilaris* var. *treleasei*) is not known to occur within five miles of the Project site, suitable habitat for the species may be present. Due to the high level of concern for this state and federal listed endangered species, Bakersfield cactus is also addressed in further detail below.

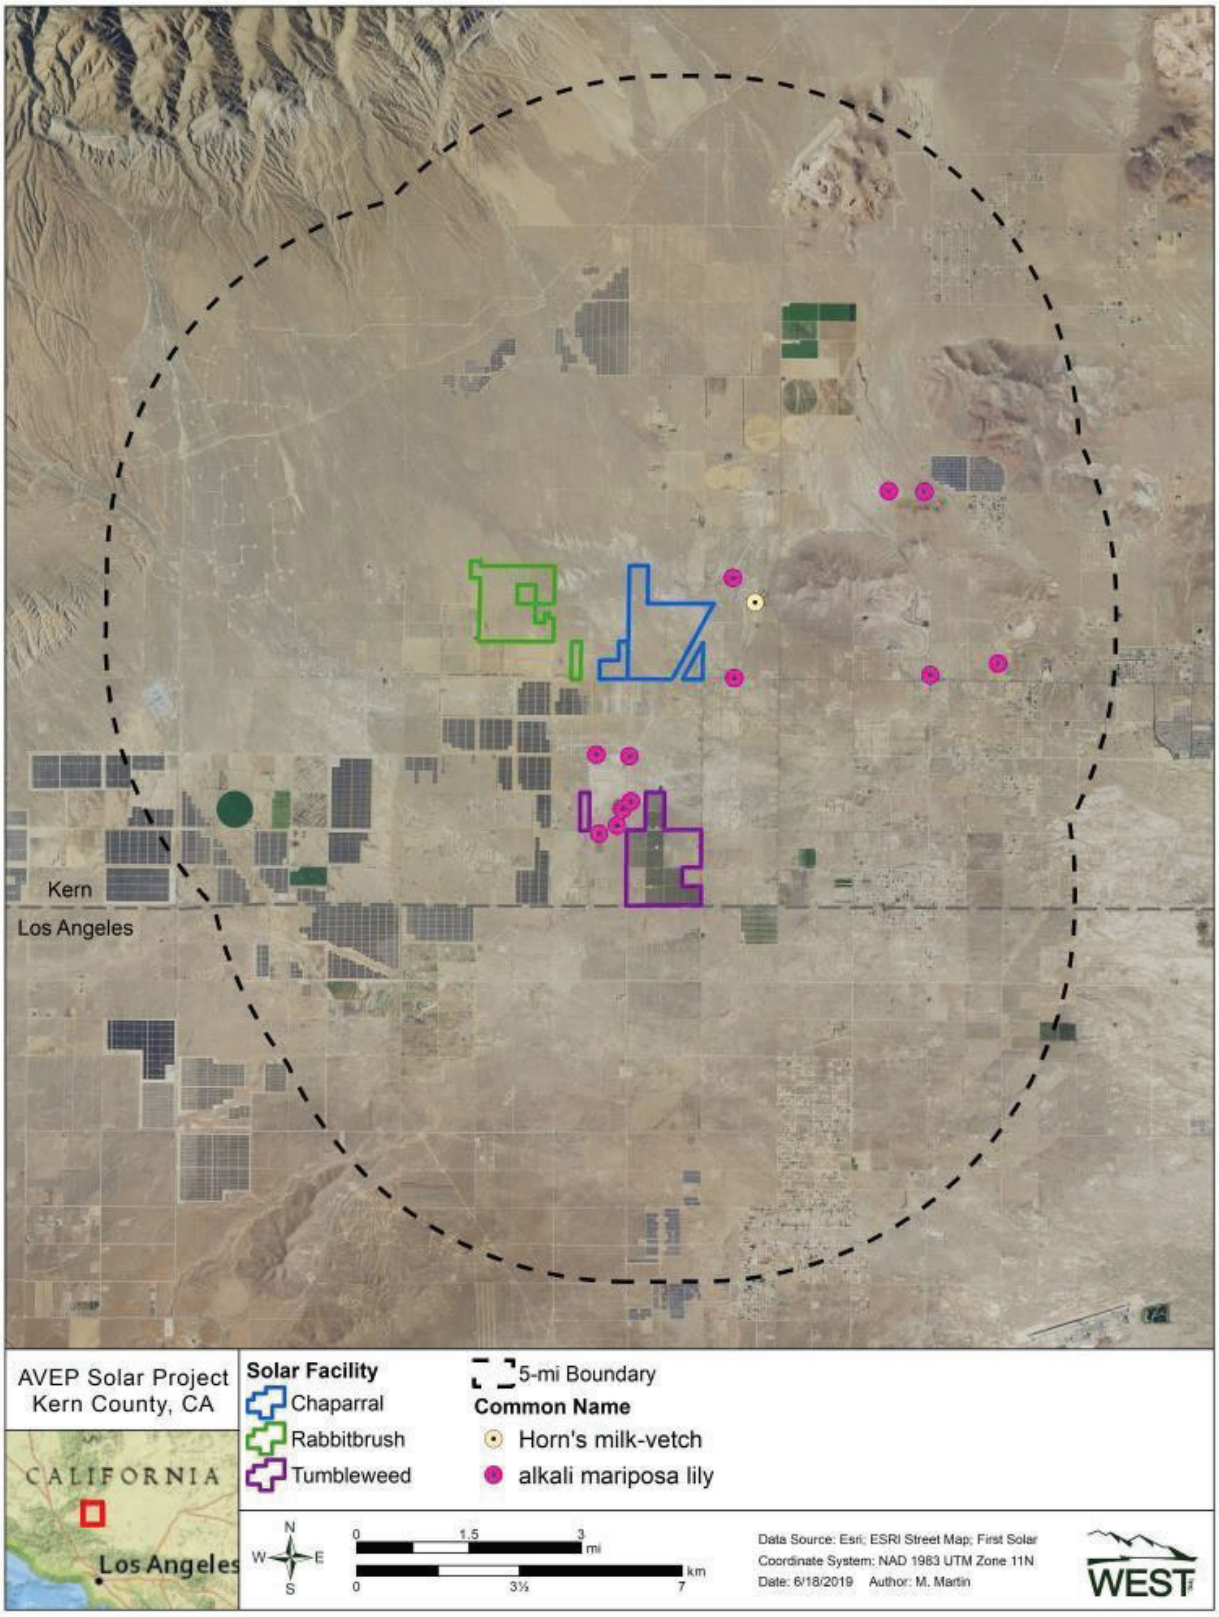

Figure 6. Location of special-status plant species documented within five miles of the proposed AVEP Solar Project, Kern County, California (Ironwood 2011b, CNDDB 2018).

3.2.1.1 Alkali Mariposa Lily

Alkali mariposa lily occurs in Mojave Desert scrub (corresponds to creosote bush and white bursage scrub), chenopod scrub (corresponds to alkaline mixed scrub), chaparral, and meadows and seeps. Specifically, the lily grows in seasonally moist alkaline areas, including alkali meadows, ephemeral washes, and micro-depressions within saltbush scrub and desert scrub communities. Suitable habitat for the alkali mariposa lily is likely present within Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar. Occurrences of alkali mariposa lily were detected in the immediate Project vicinity during 2010 botanical surveys conducted by Ironwood Consulting for the Willow Springs Solar Project (Ironwood 2011b; **Figure 6**). The CNDDB contains additional occurrences of the lily between 0.4 and 4.0 miles to the east of Chaparral Solar (**Figure 6**). According to the literature search and based on habitats present within the Project site, and known occurrence in adjacent areas, alkali mariposa lily could possibly occur within the Project site and, thus, surveys were conducted throughout the Project site in 2017 and 2018.

3.2.1.2 Horn's Milk-Vetch

Horn's milk-vetch occurs in meadows and seeps, and playas, typically on alkaline sites. The occurrence reported in the CNDDB, approximately 0.5 miles east of the Project (**Figure 6**), appears to be located within a broad drainage swale that may receive runoff from an upslope pond and orchard. No such habitat, or meadows and seeps, or playas are present within the Project site, thus Horn's milk-vetch is not expected to occur on any of the three solar facilities.

3.2.1.3 Bakersfield Cactus

Bakersfield cactus occurs on flood plains, ridges, bluffs and rolling hills in saltbush scrub plant communities, and occasionally in blue oak (*Quercus douglasii*) woodland or riparian woodland at elevations from 460 to 1,800 feet (140 to 549 m; USFWS 2011a). Bakersfield cactus generally grows on sandy soils, although gravel, cobbles, or boulders also may be present. Though not well documented, the historic distribution of Bakersfield cactus appears to have been fairly continuous within the southeastern corner of the San Joaquin Valley, from just north of Bakersfield south to the Wheeler Ridge area (USFWS 2011a). Currently, the species is known to occur in small, more isolated populations within its historic range in the southern San Joaquin Valley (USFWS 2011a; Cypher et al. 2014)

Individuals of Bakersfield cactus within its historically recognized range, which is at least 20 miles to the northwest of the Project, are fairly distinct in appearance from the more common beavertail cactus (*O. b.* var. *basilaris*) found throughout the Mojave Desert and the Antelope Valley. Specifically, the Bakersfield cactus is identified by the presence of spines (greater than seven millimeters in length) and level or raised areoles, while the beavertail cactus has no spines and depressed areoles. Recent surveys on the southeast side of the Tehachapi Mountains have identified individuals of *O. basilaris sp*. with characteristics of both beavertail and Bakersfield cactus. Based on preliminary genetic analysis of these individuals (Smith 2013), the Tehachapi populations were found to be genetically distinct from Bakersfield cactus, but more closely aligned with Bakersfield cactus than to beavertail cactus, indicating potential hybridization. It is currently unclear whether these potential hybrid cacti should be protected as

the endangered Bakersfield cactus; however, additional genetic analysis is ongoing and the CDFW currently recognizes individuals exhibiting at least some characteristics of Bakersfield cactus as *O. b.* var. *treleasie*.

Bakersfield cactus has not been documented within the Project vicinity, despite a number of special-status plant surveys conducted for renewable energy projects in the surrounding area (Ironwood Consulting 2011a, 2011b, SWCA 2014). At the Garland Solar Project, located approximately 10 miles west of the Project site, two potential Bakersfield cactus specimens were recorded during surveys (Rincon 2014). These specimens had the general appearance of the common beavertail cactus, but with spines present, suggesting the individuals were hybrids (Rincon 2014). Despite being well outside of the known distribution of Bakersfield cactus, suitable habitat is present within the Project site and it is possible that Bakersfield cactus, or hybrids between Bakersfield cactus and the more common beavertail cactus, occur within the Project site.

3.2.2 Special-Status Plant Communities

A plant community of both state and local concern occurring in the region is Joshua tree woodland. The CDFW considers Joshua tree woodland to be a sensitive natural plant community and compliance with the California Desert Native Plants Act of the California Food and Agricultural Code, Division 23, is required for the removal of Joshua trees. Locally, Joshua tree habitat receives protection under the Willow Springs Specific Plan (Kern County Department of Planning Services 1992). Scattered, widely-spaced Joshua trees occur throughout portions of the creosote bush scrub communities present within Rabbitbrush Solar and Chaparral Solar; however, they do not occur at a density high enough to consider them a distinct woodland community.

No other CDFW-designated sensitive plant communities are known to occur within five miles of the Project site. The closest sensitive natural plant communities to the Project are wildflower field and Valley needlegrass, both of which are documented in the CNDDB as occurring approximately 6.1 miles (9.8 km) to the southwest of the Project within the Antelope Valley California Poppy Reserve. Neither of these plant communities is expected to occur within the Project site.

3.2.3 Special-Status Wildlife Species

A total of 21 special-status wildlife species were evaluated for their likelihood to occur within the Project site or immediate vicinity (Appendix B2). Of these, 12 species were determined at have at least the possibility of occurring within the Project vicinity based on documented occurrences or known range and habitat requirements. This includes a single state threatened species (Swainson's hawk [*Buteo swainsoni*]), one California fully protected species (golden eagle [*Aquila chrysaetos*]), nine species designated as California species of special concern (SSC; six bird species and three mammal species), and one species protected as a fur-bearing mammal by the CFGC (desert kit fox [*Vulpes macrotis arsipus*]; Appendix B2). The natural history of these 12 special-status wildlife species considered to possibly occur within the Project site are discussed briefly in the sections below, including a discussion of habitat requirements that was

used to assess each solar facilities' ability to support special-status species. Additionally, although desert tortoise (*Gopherus agassizii*) and Mohave ground squirrel (*Spermophilus mohavensis*) are not expected to occur within the Project site, both species are discussed in the sections below due to their regional significance. The remaining seven wildlife species evaluated were not expected to occur within the Project site based on the species' range and habitat requirements (see Appendix B2) and are not addressed further in this BRTR.

3.2.3.1 Desert Tortoise

The Mojave population of the desert tortoise, including those animals living north and west of the Colorado River in the Mojave Desert of California, Nevada, Arizona, and southwestern Utah and in the Sonoran (Colorado) Desert in California, is listed as threatened under the ESA and CESA. The "take" of these species as defined by the ESA and CESA, respectively, therefore requires incidental take permits from the USFWS and the CDFW, as applicable. The Project lies at the western extent of the species range within the Western Mojave Recovery Unit. The closest desert tortoise critical habitat to the Project lies approximately 24 miles (38.6 km) to the east.

Desert tortoises occur at elevations ranging from below sea level to 7,300 feet (2,225) where they occupy a variety of habitats from flats and gentle slopes dominated by creosote bush scrub at lower elevations to rocky slopes in blackbrush (*Coleogyne ramosissima*) and juniper (*Juniperus californica*) woodlands at higher elevations (USFWS 2011b). Typical habitat for the desert tortoise in the Mojave Desert is characterized as creosote bush scrub below 5,500 feet (1,677 m), where precipitation ranges from two to eight inches, the diversity of plants is relatively high, and production of ephemerals is high (Baxter 1988). Tortoises most commonly occur on gently sloping terrain with sandy-gravel soils where there is sparse cover of low-growing shrubs and soil friable enough for digging burrows, but firm enough so that burrows do not collapse (USFWS 2011b). As an adaptation for living in a highly variable and often hard desert environment, desert tortoises spend much of their lives in burrows. In late winter or early spring, tortoises emerge from their burrows and typically remain active through the fall, although activity often decreases during summer when tortoises emerge only after summer rains. During periods of activity, tortoises forage on a variety of herbaceous vegetation, particularly grasses and the flowers of annual plants (Luckenbach 1982) found within native desert scrub habitats such as creosote bush and white bursage scrub. Tortoises are slow-growing and long-lived, requiring 13 to 20 years to reach maturity. The reproductive success of female desert tortoises depends on a variety of factors including environment, habitat, availability of forage and drinking water, and physiological factors (USFWS 2011b).

Although the Project falls within the Western Mojave Recovery Unit, it is outside of the current known range for the desert tortoise. Historically, desert tortoise may have occurred in the region; however, anthropogenic disturbances in the Project vicinity, including agriculture, OHV recreation, roads, utility corridors, energy and residential development, sheep grazing, and illegal trash dumping, appear to have reduced habitat suitability and limited tortoise populations in the region. The closest reported desert tortoise occurrence to the Project, based on a search of the CNDDB, is a 2006 observation of a single adult tortoise crossing Tehachapi-Willow

Spring Road approximately 4.2 miles (6.8 km) northeast of Chaparral Solar (**Figure 7**). Additionally, several adult tortoises were recorded approximately 4.5 miles (7.3 km) to the north of Rabbitbrush Solar and Chaparral Solar during surveys for the nearby Pacific Wind Energy Project, Catalina Renewable Energy Project, and Avalon Wind Energy Project (KCPCDD 2010, 2011, 2012a). Protocol-level desert tortoise surveys have been conducted at a number of sites proposed for solar energy development in the immediate vicinity of the Project including the Rosamond Solar Project (Ironwood Consulting 2011a), the Willow Springs Solar Project (Ironwood Consulting 2011b), the Solar Star 1 and 2 Project (previously the Antelope Valley Solar Project; AECOM 2010), and the Valentine Solar Project (SWCA 2015). No desert tortoises, carcasses, or sign (e.g. scat, burrows, courtship rings, or drinking pallets) were detected at any of these nearby projects.

Based on the preliminary database and literature review, the Project falls outside of the current known range for the species, which is generally to the north and east of the Project. Based on the USGS desert tortoise habitat model (Nussear et al. 2009), predicted desert tortoise habitat is present within the northern portions of the Project site; however, anthropogenic disturbances have likely limited the suitability of these habitats for desert tortoise in the region, as evidenced by the lack of desert tortoise detections in the immediate vicinity of the Project. Desert tortoise is not expected to occur within the Project site.

3.2.3.2 Swainson's Hawk

Swainson's hawk is listed as threatened under the CESA, and occurs over a limited range in California. The species nests in two distinct populations: the Central Valley population and the Antelope Valley population (Woodbridge 1998). The Antelope Valley comprises the southern extent of the hawk's breeding range in California. The current land uses in the Antelope Valley support approximately 10 breeding pairs of Swainson's hawks, making them particularly susceptible to extirpation (CEC and CDFG 2010). Historically, Swainson's hawks in the Antelope Valley are known to have nested in Joshua tree woodlands and foraged in grasslands and native desert scrub communities. Currently, they nest in Joshua trees, ornamental roadside trees, and windrow or perimeter trees in active and historical agricultural areas and Joshua tree woodlands. Foraging habitat includes dry land and irrigated agricultural fields and orchards; however, they may also forage in grasslands, Joshua tree woodlands, and other desert scrub habitats that support sufficient prey. Home ranges of less than 1,000 hectares (ha; 2,470 acres) occur in habitats dominated by natural vegetation types (Bechard 1982, Woodbridge 1991) while home ranges greater than 2,500 ha (6,180 acres) are found in more fragmented agricultural landscapes (Estep 1989, Babcock 1995). Swainson's hawks arrive in the Antelope Valley from their southern wintering grounds in March, and generally depart by October.

The CNDDB includes records of several historical Swainson's hawk nest locations in the Project vicinity, the majority of which are near the perimeter of Tumbleweed Solar (**Figure 7**). Additionally, active Swainson's hawk nests have been documented in the Project vicinity during protocol-level surveys conducted for the adjacent Rosamond and Willow Springs Solar Projects (Ironwood Consulting 2011a, 2011b, 2014a, 2014b). Swainson's hawks are likely to occur within the Project site.

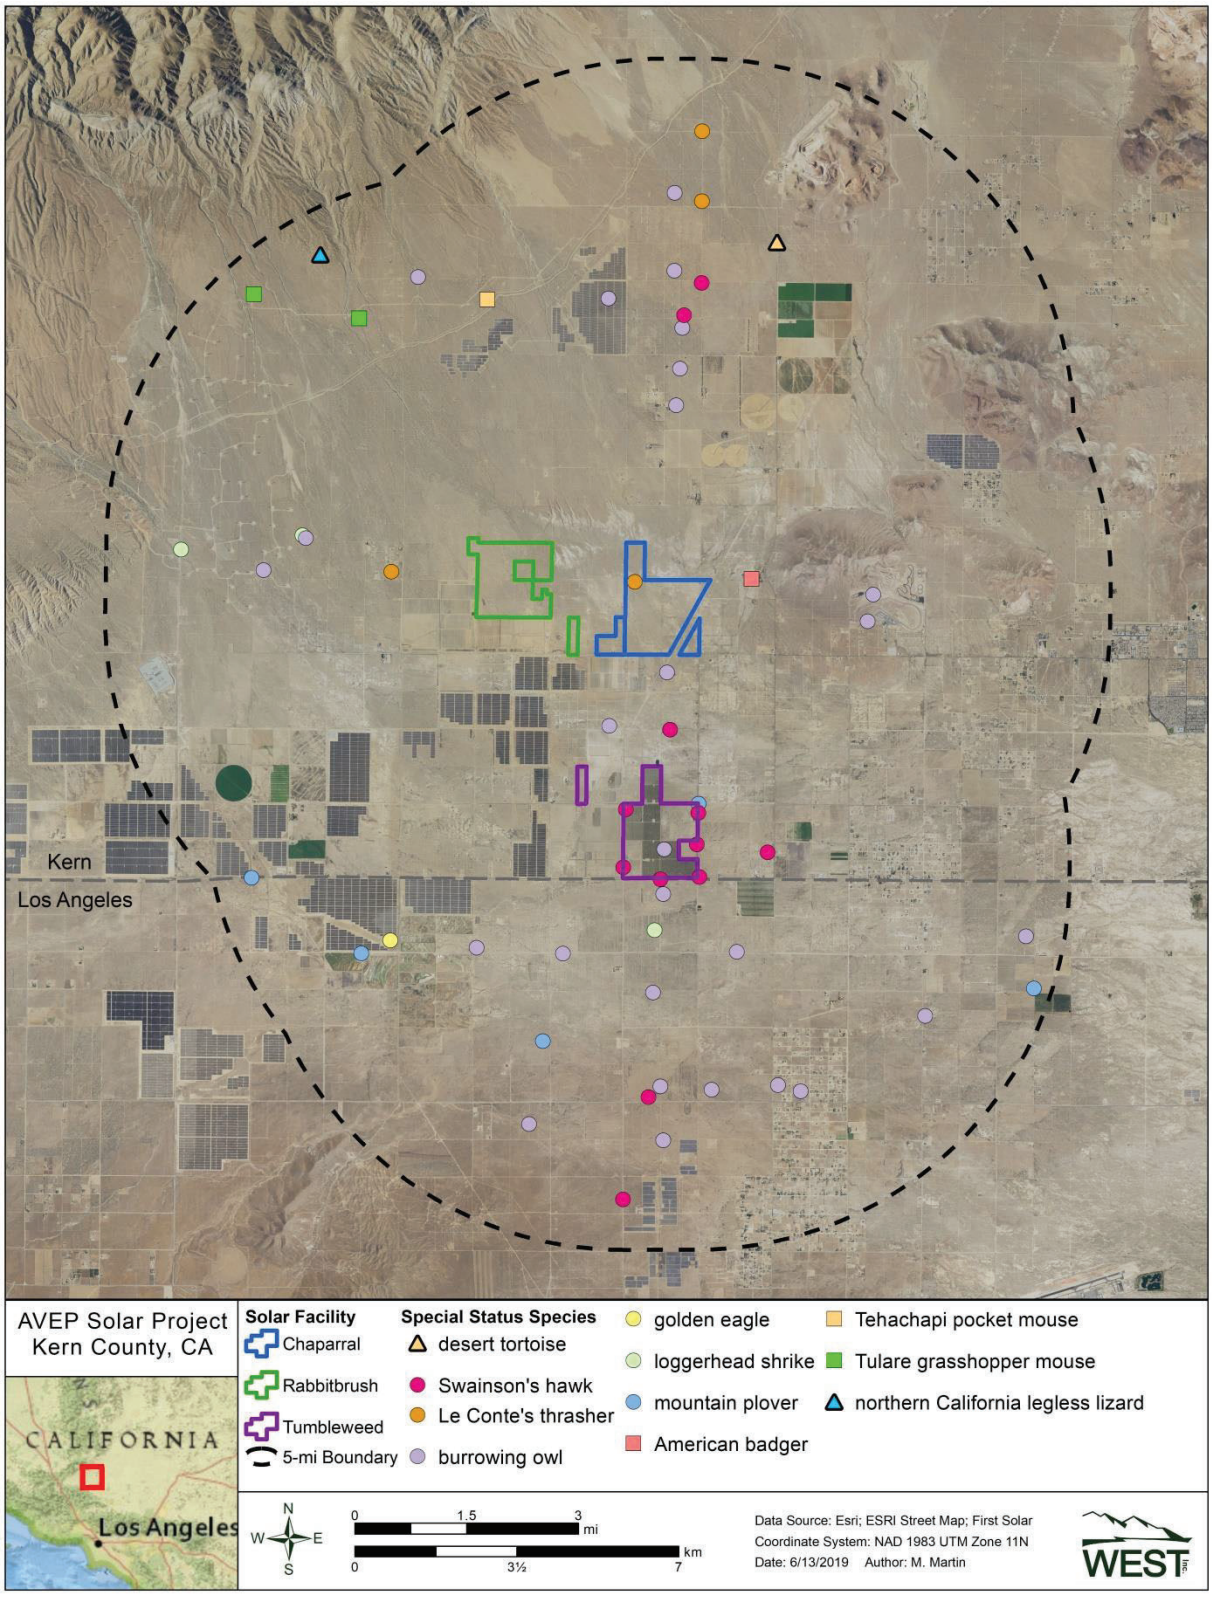

Figure 7. Location of special-status wildlife species documented within five miles of the proposed AVEP Solar Project, Kern County, California (CNDDB 2018).

3.2.3.3 Burrowing Owl

Though not listed under the CESA or ESA, the burrowing owl is designated as a California SSC. In California, the burrowing owl's preferred habitat is generally characterized as short, sparse vegetation with few shrubs, level to gently sloping topography, and well-drained soils (Haug et al. 1993). Habitat types known to be used by burrowing owls include grassland, shrub steppe, desert scrub, and some agricultural areas. Burrowing owls are opportunistic predators that will consume arthropods, small mammals, birds, amphibians, and reptiles (Haug et al. 1993; Gervais et al. 2008). The owls require underground burrows for nesting during the breeding season and for roosting and cover year round, and typically use burrows that have been excavated by other species such as ground squirrels, kit fox, or American badger (*Taxidea taxus*). Burrowing owls exhibit high site-fidelity and reuse burrows year after year. In California, the breeding season for burrowing owls generally occurs between February 1 and August 31.

Burrowing owls are known to occur year round in the Antelope Valley with numerous locations documented within five miles of the Project site, based on information from the CNDDB (**Figure 7**). Portions of all three solar facilities contain suitable habitat for wintering and/or nesting burrowing owls, and the species is likely to occur.

3.2.3.4 Golden Eagle

The golden eagle is a fully protected species in California, and is provided further protection under the federal BGEPA. Golden eagles are uncommon permanent residents and migrants throughout most of California including the western Mojave Desert. Golden eagles nest on cliffs, rocky outcrops, and large trees and require open terrain such as grasslands, deserts, and savannahs for foraging (Kochert et al. 2002).

The Project and surrounding area lack suitable nesting habitat for golden eagles in the form of cliffs, rock outcrops, or large trees; the closest known historical eagle nest to the Project site is located on a desert butte approximately eight miles (12.9 km) to the northeast of the Project and within the Tehachapi Mountains approximately 12 miles (19.3 km) to the northwest and 16 miles (25.7 km) to the north (CDFW pers. comm. 2018). The golden eagle likely occurs in the area year round, occasionally foraging within the Project's desert scrub and grassland habitats.

3.2.3.5 Northern Harrier

The northern harrier (*Circus cyaneus*), a state SSC, occurs throughout most of California and is a year-round resident of the Antelope Valley. The species typically occurs in meadows, grasslands, open rangelands, desert sinks, and fresh and saltwater emergent wetlands; it is seldom found in wooded areas. Northern harriers nest on the ground in shrubby vegetation, usually along at the edge of a marsh or other wetland (Brown and Amadon 1968); however, they may also nest in grasslands, grain fields, or on sagebrush flats several miles from water. Northern harriers feed primarily on voles and other small mammals, birds, frogs, small reptiles, crustaceans, and insects.

Northern harriers are not expected to nest within the Project site due to the absence of suitable nesting habitat; however, the species likely forages throughout the Project site, primarily in the winter or during spring and fall migration.

3.2.3.6 Long-Eared Owl

The long-eared owl (*Asio otus*), a state SSC, is an uncommon yearlong resident throughout most of California. In the Mojave Desert, it is described as an uncommon resident distributed widely but locally, including within the Antelope Valley (Garrett and Dunn 1981). Long-eared owls nest in conifer, oak, riparian, pinyon-juniper, and desert woodlands that are either open or are adjacent to grasslands, meadows, or shrubland (Marks et al. 1994). Key habitat elements include dense cover for nesting and roosting, suitable nest platforms, and open foraging areas. Long-eared owls nest mainly in old corvid or hawk nests but also in woodrat and squirrel nests, mistletoe brooms, or natural platforms (e.g., debris piles) in trees (Bloom 1994).

During surveys conducted for the Rosamond Solar Project in 2010 (Ironwood Consulting 2011a), a long-eared owl was observed roosting in a salt cedar wind break, approximately two miles west of Rabbitbrush Solar. Suitable foraging habitat is present throughout the Project site, with potential nesting and roosting habitat present within the few dense windrows found within the solar facilities and surrounding area. Based on the documented occurrence of long-eared owls in proximity to the Project and the presence of suitable habitat, the species possibly occurs within the Project site.

3.2.3.7 Loggerhead Shrike

The loggerhead shrike (*Lanius ludovicianus*), a state SSC, is a common year-round resident in lowlands and foothills throughout California. The species prefers open habitats with scattered shrubs, trees, fences, and utility lines or other perches. Based on CNDDB records (**Figure 7**), as well as surveys conducted for adjacent solar energy projects (Ironwood Consulting 2011a, 2011b), the species is known to occur in the Project vicinity. Suitable nesting and foraging habitat is present throughout the Project site, and the species is likely to occur throughout the year.

3.2.3.8 Le Conte's Thrasher

The Le Conte's thrasher (*Toxostoma lecontei*), a state SSC, is an uncommon to rare, local resident in southern California Deserts. The species occurs primarily in open desert wash, desert scrub, alkali desert scrub, and desert succulent shrub habitats, and may also occur in Joshua tree habitat with scattered shrubs. The CNDDB contains several records of Le Conte's thrasher in the Project vicinity, including one within Chaparral Solar (**Figure 7**). Suitable nesting and foraging habitat is present within the Project site, and the species is likely to occur year-round.

3.2.3.9 Mountain Plover

Mountain plover (*Charadrius montanus*) is a California SSC. The species is a winter resident of California's Central Valley, as well as the foothill valleys west of San Joaquin Valley, Imperial

Valley, plowed fields of Los Angeles and San Bernardino counties, and along the central Colorado River valley. Mountain plovers occur on short grasslands and plowed fields with little vegetation, and open sagebrush areas, often roosting in depressions such as ungulate hoof prints and plow furrows (Knopf and Rupert 1995).

Based on information from the CNDDB, mountain plovers have been documented at several locations in the Project vicinity including one occurrence within 0.25 miles of Tumbleweed Solar (**Figure 7**). Mountain plovers are unlikely to forage or roost within the Project site due to the absence of suitable grassland and agricultural habitat; however, the species may forage in plowed agricultural fields adjacent to the Project, and may therefore fly over or near any of the three solar facilities. The species possibly occurs within the Project site.

3.2.3.10 American Badger

The American badger, a California SSC, is an uncommon, permanent resident throughout most of the state. The species is most abundant in drier stages of shrub, forest, and herbaceous habitat with friable soil for excavating burrows used for reproduction and cover. Their primary diet includes fossorial rodents including rats, mice, chipmunks, and especially ground squirrels and pocket gophers. American badgers have large home range sizes, ranging up to 100 mi^2 (Apps et al. 2002).

The CNDDB documents the occurrence of American badger approximately 0.5 miles east of Chaparral Solar (**Figure 7**). American badger habitat is present on all three solar facilities, though ongoing agricultural operations on the majority of Tumbleweed Solar make these areas unsuitable for badgers. American badgers are likely to occur within the Project site.

3.2.3.11 Desert Kit Fox

Although not listed under the ESA or CESA, the desert kit fox is protected by the CDFW as a fur-bearing mammal under California Code of Regulations Title 14, Section 460, and may not be taken at any time. The desert kit fox is an uncommon to rare, permanent resident of arid and semi-arid regions of the southern half of the state. The species inhabits annual grasslands or grassy open stages of vegetation dominated by scattered brush, shrubs, and scrub (Cypher 2010). Their primary diet consists of black-tailed jackrabbits (*Lepus californicus*), desert cottontails (*Sylvilagus audubonii*), and rodents. Kit fox excavate dens in level areas with loose-textured soils that they use for reproduction (i.e., natal dens), as well as shelter, cover, and escape (i.e., escape dens). Desert kit foxes may utilize many dens throughout their home range and give birth in larger, natal den complexes in March and April.

Desert kit fox were not documented during focused field surveys for the adjacent Rosamond and Willow Springs solar projects (Ironwood Consulting 2011a, 2011b); however, suitable foraging and denning habitat is present within portions of all three solar facilities and desert kit fox are likely to occur within the Project site.

3.2.3.12 Mohave Ground Squirrel

The Mohave ground squirrel, endemic to the western Mojave Desert of California, is listed as threatened under the CESA. The species has been found at elevations ranging from 1,800 to 5,000 feet (549 to 1,524 m) above mean sea level (Brooks and Matchett 2002; Johnson 2008) where they typically inhabit creosote bush scrub, saltbush scrub, and Joshua tree woodland communities (Scarry et al. 1996, Leitner and Leitner 1998) occurring on flat to moderately-sloped terrain (Laabs 1998). Mohave ground squirrels are able to survive the harsh conditions of the Mojave Desert by spending six or more months of the year hibernating in underground burrows. Widespread conversion of native habitats by agriculture, military operations, and land development are implicated in the disappearance of the species over much of its range.

Review of available Mohave ground squirrel range maps and occurrence information reveal that the generally-recognized range boundaries (see Leitner 2015) have remained relatively unchanged since a range map was first published by Gustafson (1993) in a report to the CDFW. The Project lies approximately seven miles (11.3 km) outside of the western boundary of the Mohave ground squirrel range, although its historical range may have included the western Antelope Valley. Despite the presence of apparent suitable desert scrub habitat, there has never been any record of the species to the west of SR-14 between Mojave and Palmdale (Leitner 2015). Because of extensive wind energy development in the area to the southwest of the town of Mojave, the West Mojave Plan (WMP; US Bureau of Land Management 2005) and the CDFW recommended that the region be surveyed to determine if it might support a previously undocumented population of Mohave ground squirrels. Between 2008 and 2012, protocol-level trapping was conducted at 159 sites in areas proposed for wind and solar energy development, including at the Rosamond and Willow Springs Solar Projects located adjacent to the Project (see Ironwood Consulting 2011a and 2011b; Leitner 2015). Despite this intensive sampling effort, there have been no visual detections or captures of Mohave ground squirrels in the region. According to Leitner (2015), no further surveys are warranted in the western Antelope Valley.

Based on information from the CNDDB, the closest recorded Mohave ground squirrel occurrence to the Project is approximately eight miles (12.9 km) to the east (CNDDB 2018). Two incidental Mohave ground squirrel observations were reported to the southwest of the town of Mojave in 2006 and were previously included in the CNDDB; however, these two observations were apparently based on mistaken identification and were subsequently removed from the database. The CDFW Mohave Ground Squirrel Survey Guidelines (CDFW 2010), state that “since the limits of the geographic range are not known precisely, surveys may be required in areas up to five miles (8 km) from currently-documented boundaries”. Because the Project is located greater than five miles from the known occupied habitat for Mohave ground squirrel, focused surveys for Mohave ground squirrel are not warranted. The Mohave ground squirrel is not expected to occur within the Project site.

3.2.3.13 Pallid Bat and Townsend’s Big-Eared Bat

Both pallid (*Antrozous pallidus*) and Townsend’s big-eared bats (*Corynorhinus townsendii*) are designated as state SSC. The pallid bat occupies a wide variety of habitats in California

including grasslands, shrublands, woodlands, and forests (BCI 2018). The species is most common is open, dry habitats with rocky areas for roosting (Vaughn and O'Shea 1976). Day roosts are in caves, crevices, mines, and occasionally in hollow trees and buildings. Maternity colonies form in early April and may have 12 to 100 individuals. The pallid bat is known for its unique habit of feeding almost entirely from the ground. Common prey of pallid bats include crickets, beetles, grasshoppers, and scorpions (BCI 2018).

Townsend's big-eared bat is also found throughout California, with the exception of subalpine and alpine habitats. Their most typical habitat is arid western desert scrub and pine forest communities (BCI 2018). In the spring and summer, females form maternity colonies in mines, caves, or buildings, while males roost individually (Pierson 1998).

Both species of bat have been documented as occurring on Soledad Mountain (Brown and Berry 2007), located approximately eight miles to the northeast of the Project. Townsend's big-eared bats were observed exiting several of the mines on the Mountain, although no large concentrations were discovered. Pallid bats were recorded acoustically at Soledad Mountain and likely roost in the rock crevices on the Mountain. Roosting habitat (e.g., caves, mines, or rock crevices) for both bat species is absent from all three solar facilities; however, suitable foraging habitat is present throughout the Project site and both species likely occur.

4.0 BIOLOGICAL FIELD SURVEYS

Based on the preliminary database and literature review discussed above, it was determined that focused field surveys were warranted for the following wildlife species: desert tortoise, burrowing owl, American badger, desert kit fox, and nesting Swainson's hawk. Additionally, a survey for all special-status plant species potentially occurring within the Project site was undertaken concurrently with focused wildlife surveys. With the exception of desert tortoise, which is not expected to occur within the Project site, focused wildlife and plant surveys were conducted specifically for special-status species with a possible, likely, or known occurrence in the Project site and which could potentially be impacted directly by Project construction or operation. Surveys for desert tortoise were undertaken due to the Project's location within the Desert Tortoise Western Mojave Recovery Unit and the species' regional importance. Due to the intensity of the field survey effort (100% coverage of the Project site) it was believed that pedestrian transect surveys for these focal species would be sufficient to detect the other special-status wildlife species occurring within the Project site, if present. A jurisdictional waters survey was conducted for each of the three solar facilities in the winter of 2017/spring of 2018 by Huffman-Broadway, the results of which are presented in a separate report (Huffman-Broadway 2019).

In the spring and summer of 2017 focused biological field surveys were conducted by E&E throughout approximately 1,935 acres within Rabbitbrush Solar, Chaparral Solar, and Tumbleweed Solar. In late 2017, the Project boundary was amended to include two additional parcels: a 40-acre (16-ha) parcel within Chaparral Solar and a 10-acre (4-ha) parcel within Rabbitbrush Solar (2018 Expansion Lands; **Figure 8**). In early 2019, the Project boundary was

again amended to include an additional 151 acres: 80 acres in Chaparral Solar, 33 acres in Rabbitbrush, and 38 acres in Tumbleweed (2019 Expansion Lands; **Figure 8**). In order to achieve 100% coverage of the Project site, WEST conducted supplemental focused field surveys within the 2018 and 2019 Expansion Lands in the spring and summer of 2018 and 2019. Additionally, a second and third year of Swainson's hawk nest surveys was conducted for the entire Project site in 2018 and 2019, respectively.

The shared gen-tie line that Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar will use to interconnect to SCE's Whirlwind Substation, as well as the majority of the Project's off-site collector line corridors, were surveyed and analyzed via the Rosamond and Willow Springs Solar Array Projects' respective Environmental Impact Reports (EIRs; KCPCDD 2014, 2016; see **Figures 2a-2c**). Because any impacts associated with these Project components have already been studied and the relevant areas approved for the intended use by Kern County, the 2017 – 2019 biological surveys conducted for AVEP did not include these areas but the relevant information from those prior studies is included as part of this BRTR's impact analysis. As specified in their respective EIRs, avoidance and minimization measures will be implemented for the Rosamond and Willow Springs projects including project design features, resource monitoring, and resource-level mitigation measures. Pre-construction surveys for sensitive biological resources will be conducted within the Rosamond and Willow Springs project sites immediately prior to ground-disturbing activities or vegetation removal associated with the construction of each project. The only portions of the Project's off-site collector line corridors that were not previously surveyed via the Rosamond and Willow Spring's EIRs consists of several small sections totaling approximately 30 acres (**Figure 8**). Therefore, these sections were surveyed by WEST in the spring and summer of 2018 at the same time the 2018 Expansion Lands within Chaparral Solar and Rabbitbrush Solar were surveyed.

The biological survey methods described in the sections below reflect those used by E&E during the 2017 field survey effort (E&E 2018; Appendix A), as well as those used by WEST during the supplemental field surveys conducted within the 2018 and 2019 Expansion Lands and along the previously unsurveyed portions of the off-site collector line corridor.

4.1 Field Survey Methods

For special-status plants, desert tortoise, burrowing owl, American badger, and desert kit fox, the survey area included each of the three solar facilities plus a 500-foot (152-m) buffer surrounding each facility. Surveys along the off-site collector line route included a corridor ranging from 110 to 500 feet (34 to 152 m) in width; as shown in **Figure 8**). The Swainson's hawk nest survey area, in each of 2017, 2018, and 2019, included a five-mile buffer surrounding each facility. All surveys were ground-based and biologists used binoculars to survey buffer areas in locations where access had not been granted. In addition to the focal species listed above, nests of all bird species observed during the surveys were documented, and all plant and wildlife species observed during the surveys were recorded. A description of each survey type is presented in the sections below, and further described in the survey methodology document prepared by E&E (2018) and included as Appendix A.

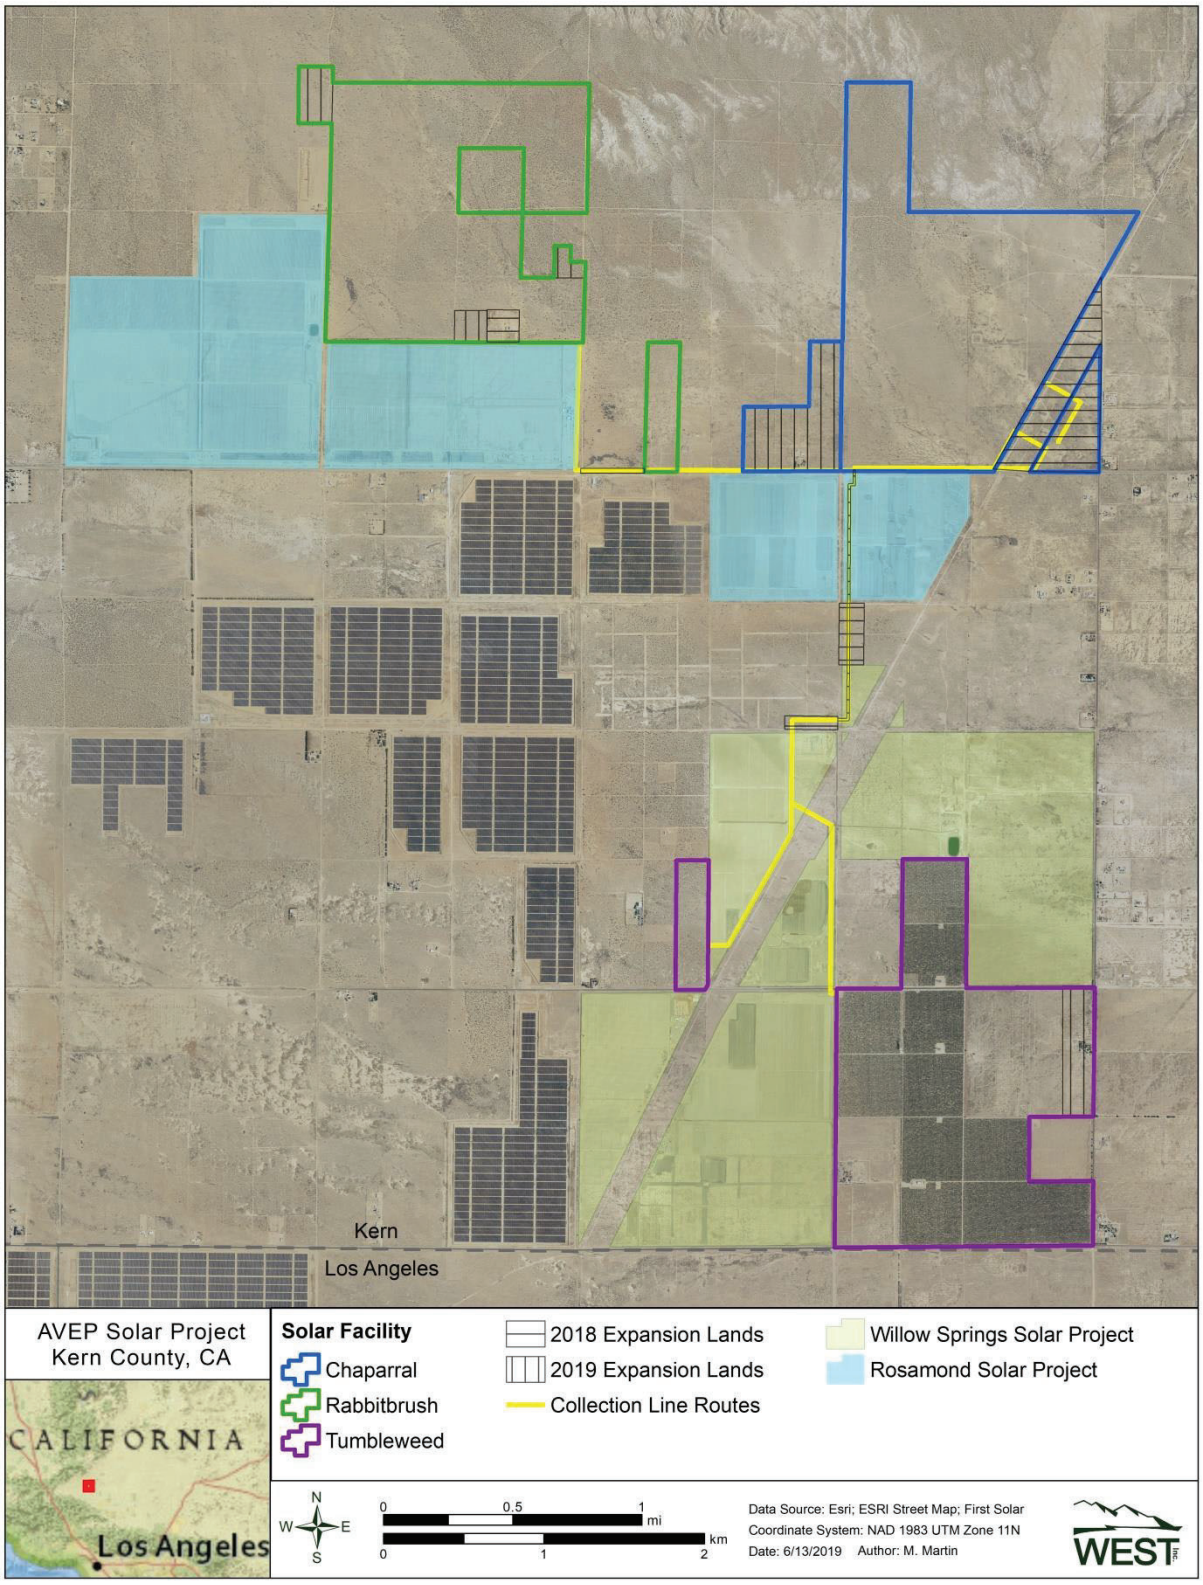

Figure 8. 2018 and 2019 Expansion Lands and portions of the off-site collector line routes surveyed during the Spring/Summer 2018 and 2019 field surveys for the proposed AVEP Solar Project, Kern County, California.

4.1.1 Rare Plant Survey

A rare/special-status plant survey, following methodology described in the California Native Plant Society Botanical Survey Guidelines (CNPS 2001), was conducted by E&E throughout Rabbitbrush Solar, Chaparral Solar, and Tumbleweed Solar on April 10-14, 2017. Supplemental surveys were conducted by WEST on April 24 and June 18, 2018 within the Chaparral Solar and Rabbitbrush Solar 2018 Expansions Lands, as well as the previously unsurveyed portions of the collector line corridor. Additional surveys were conducted by WEST within the 2019 Expansion Lands on April 22-23 and May 3, 2019. The special-status plant surveys were conducted concurrently with pedestrian transects for wildlife species described below. Surveys were conducted by qualified E&E and WEST botanists familiar with the flora of the western Mojave Desert. Surveyors walked line transects spaced seven to 10 m apart throughout each solar facility plus a 500-foot buffer surrounding each facility, if access was permitted by neighboring property owners. Species identified as having at least some potential to occur within the Project site, based on the initial database and literature review, were targeted during surveys. Prior to conducting surveys, surveyors visited accessible known populations of target species to better understand the species' local bloom period and microhabitat conditions. Surveyors identified all plants observed to the lowest taxon necessary to confirm that none were of special status. All plant species observed during the survey were recorded.

4.1.2 Desert Tortoise Survey

A desert tortoise survey, following protocols described in *Preparing for Any Action that May Occur Within the Range of the Mojave Desert Tortoise* (*Gopherus agassizii*) (USFWS 2017), was conducted by E&E throughout Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar on April 10–14, 2017. Supplemental protocol-level desert tortoise surveys were conducted by WEST on April 19, 2018 within the 2018 Expansion Lands and the previously unsurveyed portions of the collector line corridor. Additional surveys within the 2019 Expansion Lands were conducted by WEST on April 29-30, 2019. The USFWS recommends that desert tortoise surveys be undertaken if a project is located within a Desert Tortoise Recovery Unit or within the known range of the species. The Project lies just outside of the current, known range for the species; however it does fall within the Western Mojave Recovery Unit. At approximately 2,000 acres (809 ha), the Project site does qualify for probabilistic sampling, which the USFWS identifies as an appropriate option for survey areas encompassing more than 1,066 acres (431 ha) in the Western Mojave Recovery Unit (USFWS 2017). However, because burrowing owl and rare plant surveys were already being conducted over the entirety of the Project site, the same 100% survey coverage was used for the desert tortoise survey.

Surveys in 2017, 2018, and 2019 were led by an Authorized Desert Tortoise Biologist, approved by the USFWS to lead surveys for and handle desert tortoises for sites in the western Antelope Valley. During the survey effort, the surveyors walked line transects spaced seven to 10 m (23 to 33 feet) apart across all three solar facilities plus a 500-foot buffer surrounding each facility, where access was allowed. Surveyors used handheld tablets to maintain transect spacing and navigate within survey area boundaries. Surveyors searched the ground, including under vegetation, and inspected all identified burrows for desert tortoise sign (e.g., characteristic half-

moon shaped burrow, pallets, live tortoises, shells, bones, tracks, and scat). Surveys were conducted during the desert tortoise's most active period (April) and in temperatures below 104 degrees Fahrenheit.

4.1.3 Burrowing Owl Survey

Burrowing owl surveys, consistent with the methodology presented in the CDFW Staff Report on Burrowing Owl Mitigation (CDFG 2012), were conducted throughout Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar by E&E in the spring and summer of 2017. WEST conducted additional burrowing owl surveys in the spring and summer of 2018 and 2019 within the 2018 and 2019 Expansion Lands and portions of the collector line corridor. Surveys were conducted within each facility's boundary plus a 500-foot buffer surrounding each facility, when access was permitted by the neighboring landowner. In 2017, a total of four separate surveys were conducted during the peak burrowing owl breeding season, with the initial habitat assessment and survey conducted April 10-14 and the final survey conducted June 29-July 1. In 2018, four separate surveys were conducted on April 19, May 11, June 18, and July 9. As directed in the CDFW Staff Report, each of the four surveys was spaced at least three weeks apart with the final survey conducted after June 15 (CDFG 2012). In 2019, an initial survey was conducted April 29-30, with a follow-up survey conducted on May 28. Because burrowing owls and vegetation types representing suitable burrowing owl habitat occur within each of the facilities (dry grasslands and scrublands), the habitat and initial survey visit were combined. During each survey visit, biologists walked straight line transects spaced seven to 10 m apart, using handheld tablets to maintain transect spacing and navigate within Project site boundaries. Surveyors documented all burrows that could potentially be used by a burrowing owl via photograph and Global Positioning System (GPS) and noted any burrowing owl sign associated with each burrow (e.g., prey remains, pellets, feathers, excrement). Surveys were not conducted during poor weather conditions (e.g., high winds, precipitation, fog, or low temperatures) that may have affected probability of detection.

4.1.4 American Badger and Desert Kit Fox Survey

Concurrent with surveys for special-status plants, desert tortoise, and burrowing owls in the spring and summer of 2017, 2018, and 2019, surveys for American badger and desert kit fox burrows or sign of these species was undertaken throughout all portions of Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar. During the surveys, biologists walked straight line transects spaced seven to 10 m apart and recorded all potential badger and kit fox dens, as well as sign such as scat, tracks, or prey remains. In 2017, the majority of the Project site was surveyed April 10–14, with follow-up surveys to identified potential burrows made throughout the spring and summer to determine whether or not the den was active. In 2018, surveys within the Expansion Lands and along portions of the off-site collector line corridor were surveyed on April 19 with follow up surveys conducted in May and June. In 2019, an initial survey was conducted on April 29-30 with a follow-up survey on May 28.

4.1.5 Swainson's Hawk Nest Survey

A Swainson's hawk nest survey, following survey guidelines described in *Swainson's Hawk Survey Protocols, Impact Avoidance, and Minimization Measures for Renewable Energy*

Projects in the Antelope Valley of Los Angeles and Kern Counties, California (CEC and CDFG 2010), was conducted within each of the three solar facilities, plus a five-mile radius buffer surrounding each facility, in the spring and summer of 2017 and in the spring and summer of 2018. In 2017, the survey effort included four separate visits conducted on April 10-14, May 16-18, June 6-7, and June 29-July 1, while surveys in 2018 were conducted on April 18-20, May 11-12, and June 18. Visits during both years correspond with Periods II, III, and IV of the survey guidelines (CEC and CDFG 2010). In 2019, only a single survey was warranted which occurred May 2-3. Surveys were not conducted during the optional Period I in any year as this survey period is used primarily for the purpose of locating potential nest structures within the survey area prior to the arrival of the Swainson's hawks from their wintering ground and documenting nests of competing species (e.g., great horned owl [*Bubo virginianus*] and red-tailed hawk [*B. jamaicensis*]). Survey Periods are defined as follows:

- Survey Period I: January – March 31 (pre-arrival)
- Survey Period II: April 1 – April 30 (arrival; nest building)
- Survey Period III: May 1 – May 30 (egg laying; incubation)
- Survey Period IV: June 1 – July 15 (fledging)

Surveys during all years were undertaken using a combination of driving and pedestrian line transect surveys during each survey period. Driving surveys were performed along publicly-accessible roads at five mph with each road driven from both directions. Pedestrian surveys within each solar facility were performed concurrently with desert tortoise and burrowing owls surveys. Surveyors, with the aid of binoculars and spotting scopes, documented all large stick nests observed and recorded all observations of Swainson's hawks. Additionally, surveyors visited the locations of all historical Swainson's hawk nests that had been previously identified during surveys for nearby renewable energy facilities. Each identified nest was visited repeatedly during each survey period until the species and outcome of the nests were determined.

4.2 Field Survey Results

The results of field surveys presented in the sections below are based on plant and wildlife surveys conducted by E&E throughout the Project site during the spring and summer of 2017, and supplemented by WEST in the spring and summer of 2018 and 2019, as described in the methods section above. WEST has prepared the following results section of the BRTR based on the spatial data, field notes, datasheets, and photographs provided by E&E from their 2017 surveys. Prior to the initial preparation of the BRTR, in February of 2018, WEST thoroughly reviewed the survey materials provided by E&E and conducted a reconnaissance-level site visit to experience the Project site conditions first hand and to visit biological resources (e.g., active burrows, nests, vegetation communities) identified by E&E during the 2017 field surveys. While this site visit was not a repeat, or even a verification of, the surveys conducted by E&E in 2017, it provided WEST a better understanding of the biological resources present on the Project site and allowed for a more accurate presentation and interpretation of the survey results included in this BRTR.

4.2.1 General Vegetation and Wildlife

Much of the Project site exhibits some degree of disturbance, including past and current grazing, OHV use, illegal dumping and shooting, active agricultural operations (orchards) or abandoned agricultural fields, and occupied and abandoned residences. Chaparral Solar and Rabbitbrush Solar have the greatest proportion of unoccupied desert with native vegetation and are comprised primarily of creosote bush scrub, white bursage scrub, alkaline mixed scrub, and California annual and perennial grasslands, which are common throughout the western Mojave region. Tumbleweed Solar is occupied predominantly by an active pistachio orchard with smaller areas of abandoned agricultural fields and a small section of native desert scrub in the far northwest of the facility (**Figure 5**). Structures within the Project site include several residences, active farm buildings, and a few abandoned buildings. Large trees such as tamarisk (*Tamarix* ssp), Siberian elm (*Ulmus pumila*), and cypress are present in windbreaks along roads and at the margins of agricultural fields and in ornamental plantings associated with home sites in the area. Representative photos of the habitat features and vegetation communities within the three solar facilities are included in Appendix C (Photos 1-8).

Despite varying degrees of disturbance across much of the Project site, habitats within the three solar facilities support a wide variety of desert reptiles, birds, and mammals. Common reptiles inhabiting the Project site include western fence lizard (*Sceloporus occidentalis*), side-blotched lizard (*Uta stansburiana*), western whiptail (*Aspidoscelis tigris*), gopher snake (*Pituophis catenifer*), and Mojave rattlesnake (*Crotalus scutulatus*). Bird species observed nesting within the Project or in areas adjacent to the Project during the 2017, 2018, and 2019 field studies include: red-tailed hawk (*Buteo jamaicensis*), Swainson's hawk, barn owl (*Tyto alba*), great horned owl (*Bubo virginianus*), common raven (*Corvus corax*), cactus wren (*Campylorhynchus brunneicapillus*), and western meadowlark (*Sturnella neglecta*; **Figures 9 and 10**). The majority of bird nests documented within the Project site and vicinity were on manmade structures such as transmission line towers, although several were in Joshua trees. Several barn owl boxes were observed within the orchard on Tumbleweed Solar; however, none of these showed evidence of being used for nesting. Other species of birds that were observed during surveys that have the potential to nest within the Project site include horned lark (*Eremophila alpestris*), lark sparrow (*Chondestes grammacus*), California quail (*Callipepla californica*), western kingbird (*Tyrannus verticalis*), lesser nighthawk (*Chordeiles acutipennis*), and northern mockingbird (*Mimus polyglottos*).

Mammal species observed during field surveys or otherwise known to occur in the area include: white-tailed antelope squirrel (*Ammospermophilus leucurus*), California ground squirrel (*Otospermophilus beecheyi*), Botta's pocket gopher (*Thomomys bottae*), black-tailed jackrabbit (*Lepus californicus*), and coyote (*Canis latrans*). In general the native habitats present in Chaparral Solar and Rabbitbrush Solar support a higher diversity of native plant and wildlife species and have a higher likelihood of supporting special-status species. Ongoing agricultural operations across the majority of Tumbleweed Solar likely lessen the habitat quality for many native desert species within this portion of the Project. A list of all plant and wildlife species observed during the 2017, 2018, and 2019 field studies is included in Appendix D.

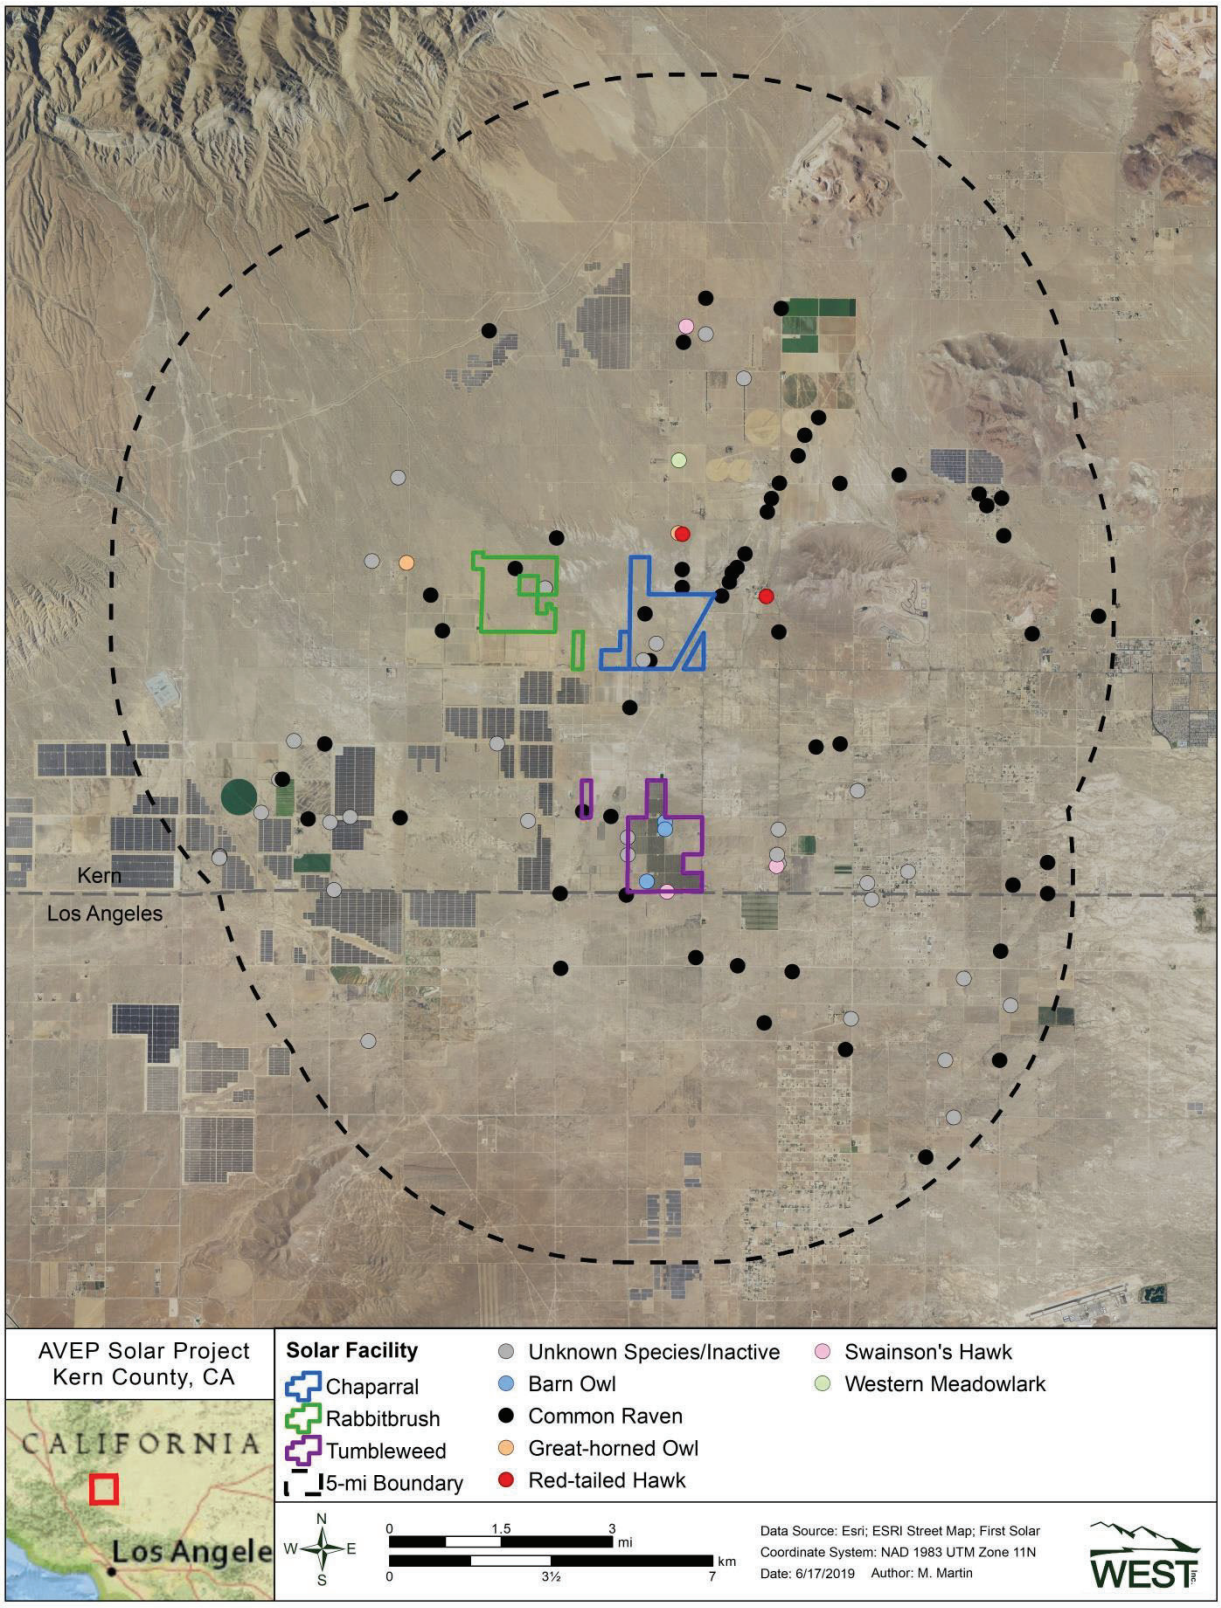

Figure 9. Location of bird nests documented during 2017 field surveys for the proposed AVEP Solar Project in Kern County, California, April – July, 2017.

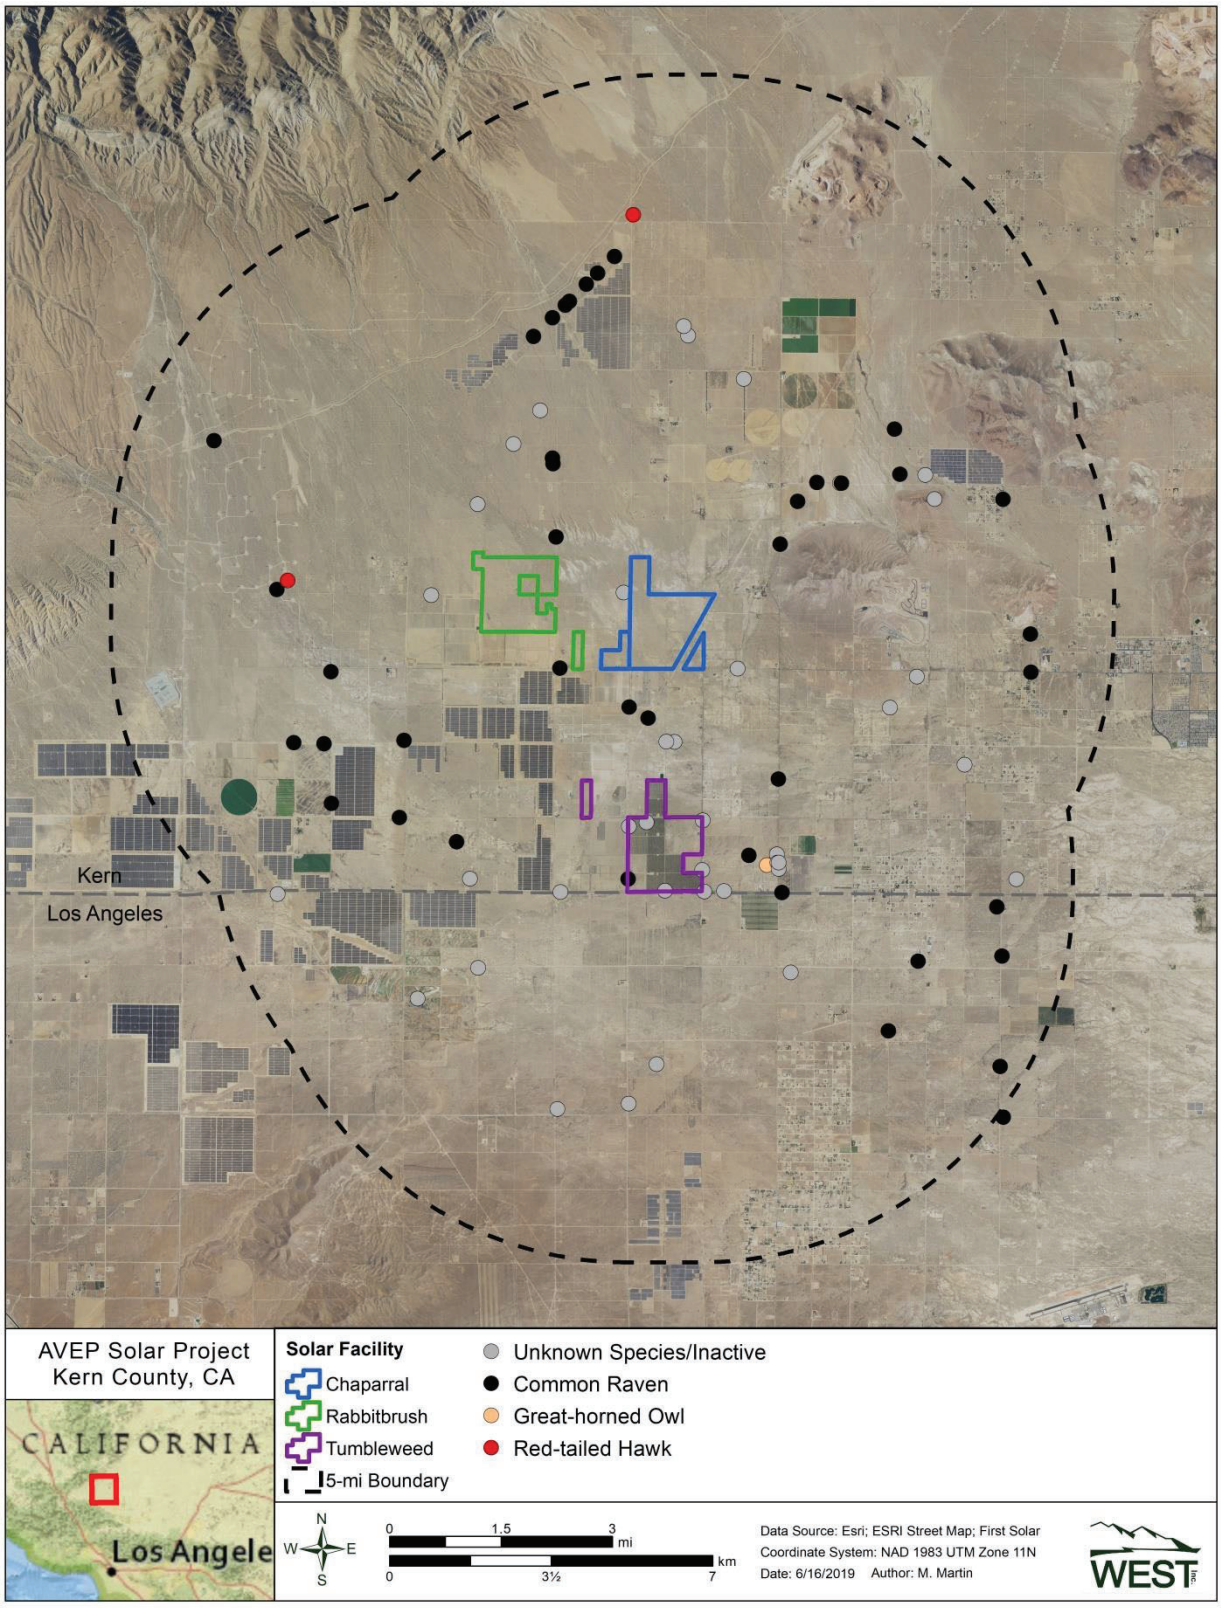

Figure 10. Location of bird nests documented during 2018 and 2019 field surveys for the proposed AVEP Solar Project in Kern County, California, April – July, 2018 and April – May, 2019.

4.2.2 Special-Status Plant Species

Special-status plant surveys, in accordance with the CNPS's Botanical Survey Guidelines (CNPS 2001), were conducted by E&E within Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar in April and May 2017. In April 2018, WEST conducted supplemental special-status plant surveys within the 2018 Expansion Lands and previously unsurveyed portions of the off-site collector line corridor; in April 2019, WEST conducted surveys within the 2019 Expansion Lands. No special-status plant species were detected during the 2017 or 2018 field surveys; however, one species, alkali mariposa lily (CNPS Rare Plant Rank 1B.2; Appendix B1; Appendix C, Photo 9), was documented in Chaparral Solar during supplemental surveys within the 2019 Expansion Lands (**Figure 11**). The population identified within this area was estimated to contain approximately 400 individual plants distributed relatively evenly throughout the mapped polygon (**Figure 11)**, with an average of about 3.3 feet (1.0 m) between individual plants. Upon discovery of this population, portions of the Project site to the east were surveyed to ensure the identified population did not extend onto the adjacent portions of Chaparral Solar surveyed by E&E in 2017. No alkali mariposa lilies were identified in adjacent areas of Chaparral Solar.

E&E and WEST botanists visited the previously identified alkali mariposa lily population on the adjacent Willow Springs Solar Project (Ironwood Consulting 2011b; see **Figure 6**) prior to conducting the 2017 and 2018 surveys at the Project to better understand the species' local bloom period and microhabitat characteristics. While this known reference population near the Project site was found to be in full bloom in April of 2017 and 2018, no populations of alkali mariposa lily were identified within the Project boundary during either survey year. A review of precipitation data from October 1, 2016 to April 31, 2017 shows that precipitation during the fall/winter/spring time period preceding the survey was about average for the region (94% of average; US Climate Data 2018). Thus it would be expected that individuals of alkali mariposa lily would have been visible within those portions of the Project site surveyed in 2017, if present. Precipitation for the same period preceding the 2018 survey was substantially lower (40% of average), while precipitation preceding the 2019 survey was more typical for the region (97% of average; US Climate Data 2019).

While Bakersfield cactus was not detected during the 2017, 2018, or 2019 plant surveys, individuals of the similar but more common beavertail cactus were identified within the Project site during the survey. Given the potential for Bakersfield cactus to hybridize with beavertail cactus, as documented at sites to the north of the Project and on the southeastern side of the Tehachapi Mountains, all cacti belonging to the *Opuntia* genus were closely examined for characteristics of Bakersfield cactus. None of the *Opuntia basilaris* sp. identified during the survey exhibited any characteristics of Bakersfield cactus such as depressed areoles or the presence of spines; thus it was determined that Bakersfield cactus is not present within the Project site.

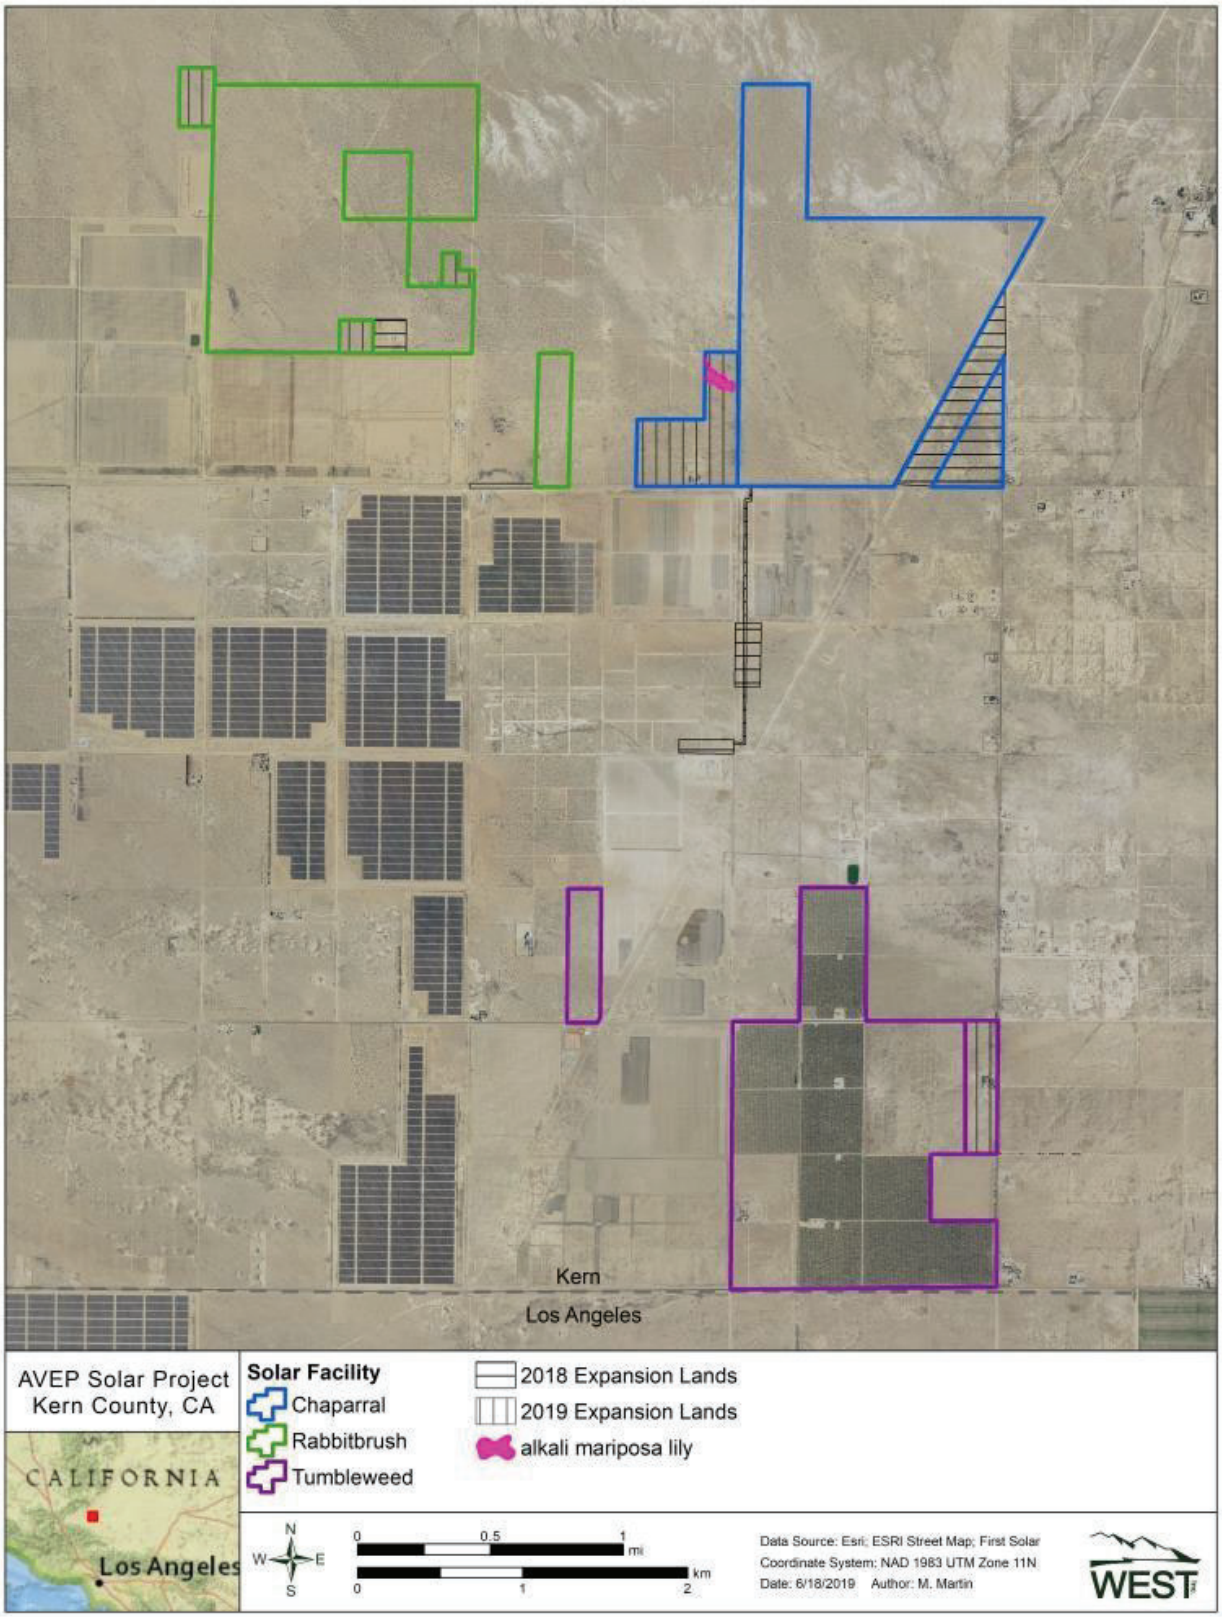

Figure 11. Location of special-status plant species observed during 2017, 2018, and 2019 field surveys for the proposed AVEP Solar Project in Kern County, California

4.2.3 Special-Status Wildlife Species

The results of focused field surveys for desert tortoise, burrowing owl, American badger, desert kit fox, and Swainson's hawk nests are presented in the sections below. Although not the focus of the field surveys, several additional species-status wildlife species (all California SSC) were observed during surveys including a single Le Conte's thrasher observed foraging within Rabbitbrush Solar, a northern harrier observed foraging on Chaparral Solar, several loggerhead shrikes observed throughout the Project site, and a single mountain plover observed within Rabbitbrush Solar.

4.2.3.1 Desert Tortoise

The focused desert tortoise surveys conducted at the Project in the spring of 2017, 2018, and 2019 resulted in 100% visual coverage of Chaparral Solar, Rabbitbrush Solar, and Tumbleweed Solar, as well as approximately 30 acres of previously unsurveyed collector line route. During these surveys, no desert tortoises or tortoise burrows were observed. One small disturbed area measuring approximately 1.2 x 1.0 feet (0.4 x 0.3 m), which may or may not represent a former desert tortoise pallet, was recorded near the northwest corner of Rabbitbrush Solar during the 2019 Expansion Lands survey (**Figure 12**; Appendix C Photo 10). A pallet is a shallow depression used by tortoises for shelter from heat and predators. While it is not certain that the observed soil depression is an old tortoise pallet or even created by a desert tortoise, it was potentially characteristic of such, and therefore is included in this report to be overly conservative. The pallet showed no evidence of current or recent (i.e., within 1-2 years) use and no other potential desert tortoise sign was observed throughout the Project site. In the absence of stronger, less ambiguous desert tortoise sign (e.g., live tortoises, skeletal remains, scat, tracks, or burrows) observed within the Project site during the extensive field survey effort, particularly in the immediate vicinity of the potential pallet, the likelihood of desert tortoise presence in the Project site is low.

Suitable desert tortoise habitat in the form of creosote and white bursage scrub is present throughout much of Chaparral Solar and Rabbitbrush Solar; however, such habitat is degraded and appears to be of marginal quality for desert tortoise. Furthermore, the Project site is generally isolated from occupied habitat to the north and east of the Project by intervening rural communities, agricultural fields, solar energy developments, and numerous roads. Within Tumbleweed Solar, suitable habitat for desert tortoise is present only within the desert scrub habitat in the far northwestern portion of the facility. The remainder of the facility is comprised of an orchard and abandoned agricultural fields (i.e., disturbed/non-native grasslands) which are not suitable for desert tortoise.

Chaparral Solar Facility: No desert tortoises, tortoise sign, or burrows suitable for use by tortoises were found within Chaparral Solar during the field studies. Suitable desert scrub habitats are found within the facility, particularly within the northwestern portion with more varied topography and the presence of a desert wash. Other portions of the facility exhibit evidence of heavy grazing and other disturbance which likely limits the suitability of habitat for desert tortoise.

Rabbitbrush Solar Facility: No desert tortoises or burrows suitable for use by tortoises were found within Rabbitbrush Solar during the field surveys. As noted above, a depression which may or may not represent a former desert tortoise pallet was observed near the northwest corner of Rabbitbrush Solar (**Figure 12**; Appendix C Photo 10); however, is it unclear if this was an actual tortoise pallet as no sign of recent use was detected and no other tortoise sign was observed within the facility. Suitable habitat is present throughout the facility in the form of creosote and white bursage scrub; however, evidence of heavy grazing and other anthropogenic disturbance has likely limited the suitability of this habitat for desert tortoise.

Tumbleweed Solar Facility: No desert tortoises, tortoise sign, or burrows suitable for use by tortoises were found within Tumbleweed Solar during the field surveys. Suitable desert scrub habitat is found only with the northwestern-most portion of the facility.

4.2.3.2 Burrowing Owl

During focused 2017, 2018, and 2019 burrowing owl surveys, no burrowing owls or sign of currently active burrows were recorded on any of the three solar facilities; however, burrows with sign of past use by burrowing owls were observed on Chaparral Solar (**Figure 12**) likely indicating use by burrowing owls during the previous winter. One active burrowing owl burrow was identified along a portion of the collector line corridor surveyed in the spring and summer of 2018 (**Figure 12**; Appendix C Photo 11). Based on the presence of sign observed at the burrow during the initial April 19, 2018 burrowing owl survey, this burrow was flagged as a potentially active burrowing owl burrow. During follow-up surveys conducted on May 11, June 18, and July 9, the burrow was determined to be occupied by a pair of adult burrowing owls. The results of the 2017, 2018, and 2019 surveys, as well as habitat suitability, are discussed for each of the individual solar facilities below.

Chaparral Solar Facility. During the 2017 survey of Chaparral Solar, burrowing owl sign (i.e., excrement, pellets) was observed at five burrow locations (**Figure 12**; Appendix C Photo 12). Despite repeated visits to these burrows between April and July, no burrowing owls or sign of current activity were recorded. It is likely that these burrows had been used by wintering owls that had left the area during the breeding season. During supplemental surveys conducted in 2018 and 2019, no burrows with sign of use by burrowing owls were observed.

Rabbitbrush Solar Facility. During the field surveys conducted for Rabbitbrush Solar, no burrowing owls, sign, or potentially suitable burrows were observed; however, suitable burrowing owl habitat is present throughout this facility.

Tumbleweed Solar Facility. During field surveys conducted for Tumbleweed Solar, no burrowing owls, sign, or potentially suitable burrows were observed. Suitable burrowing owl habitat is present only within the non-orchard portions of this facility, including the fallow agricultural fields/disturbed grasslands to the east and southwest of the orchard, and the desert scrub habitat in the far northwest of the facility.

4.2.3.3 American Badger

During 2017, 2018, and 2019 field surveys, no American badgers were observed within the Project site, or along surveyed portions of the collector line corridor; however, one potentially active badger burrow was located within Rabbitbrush Solar (**Figure 12**). The results of the surveys, as well as habitat suitability, with respect to the individual solar facilities are discussed below.

Chaparral Solar Facility. No potentially active American badger burrows were recorded within Chaparral Solar during 2017 field surveys; however, two burrows with evidence of recent badger activity (i.e., freshly disturbed soil apron and lateral claw marks) were recorded within 0.3 miles of the facility during surveys (**Figure 12**; Appendix C Photo 13). No potentially active American badger burrows were observed within the Chaparral Solar Expansion Lands surveyed in 2018 and 2019. Suitable foraging habitat for American badgers is present throughout Chaparral Solar and the presence of nearby burrows suggests badgers may forage within the facility.

Rabbitbrush Solar Facility. One potentially active American badger burrow was recorded on Rabbitbrush Solar during 2017 field surveys (**Figure 12**). Although surveyors did not observe any badgers at this burrow, the burrow showed signs of recent badger activity (i.e., freshly disturbed soil apron and claw marks). No potentially active American badger burrows were observed within the Rabbitbrush Solar Expansion Lands surveyed in 2018 and 2019. Suitable foraging habitat for American badgers is present throughout Rabbitbrush Solar.

Tumbleweed Solar Facility. No burrows suitable for use by American badgers were observed on Tumbleweed Solar. Badgers may forage within this facility or traverse the facility between foraging areas; however, ongoing agricultural activities across most the facility likely limits the habitat quality for badgers.

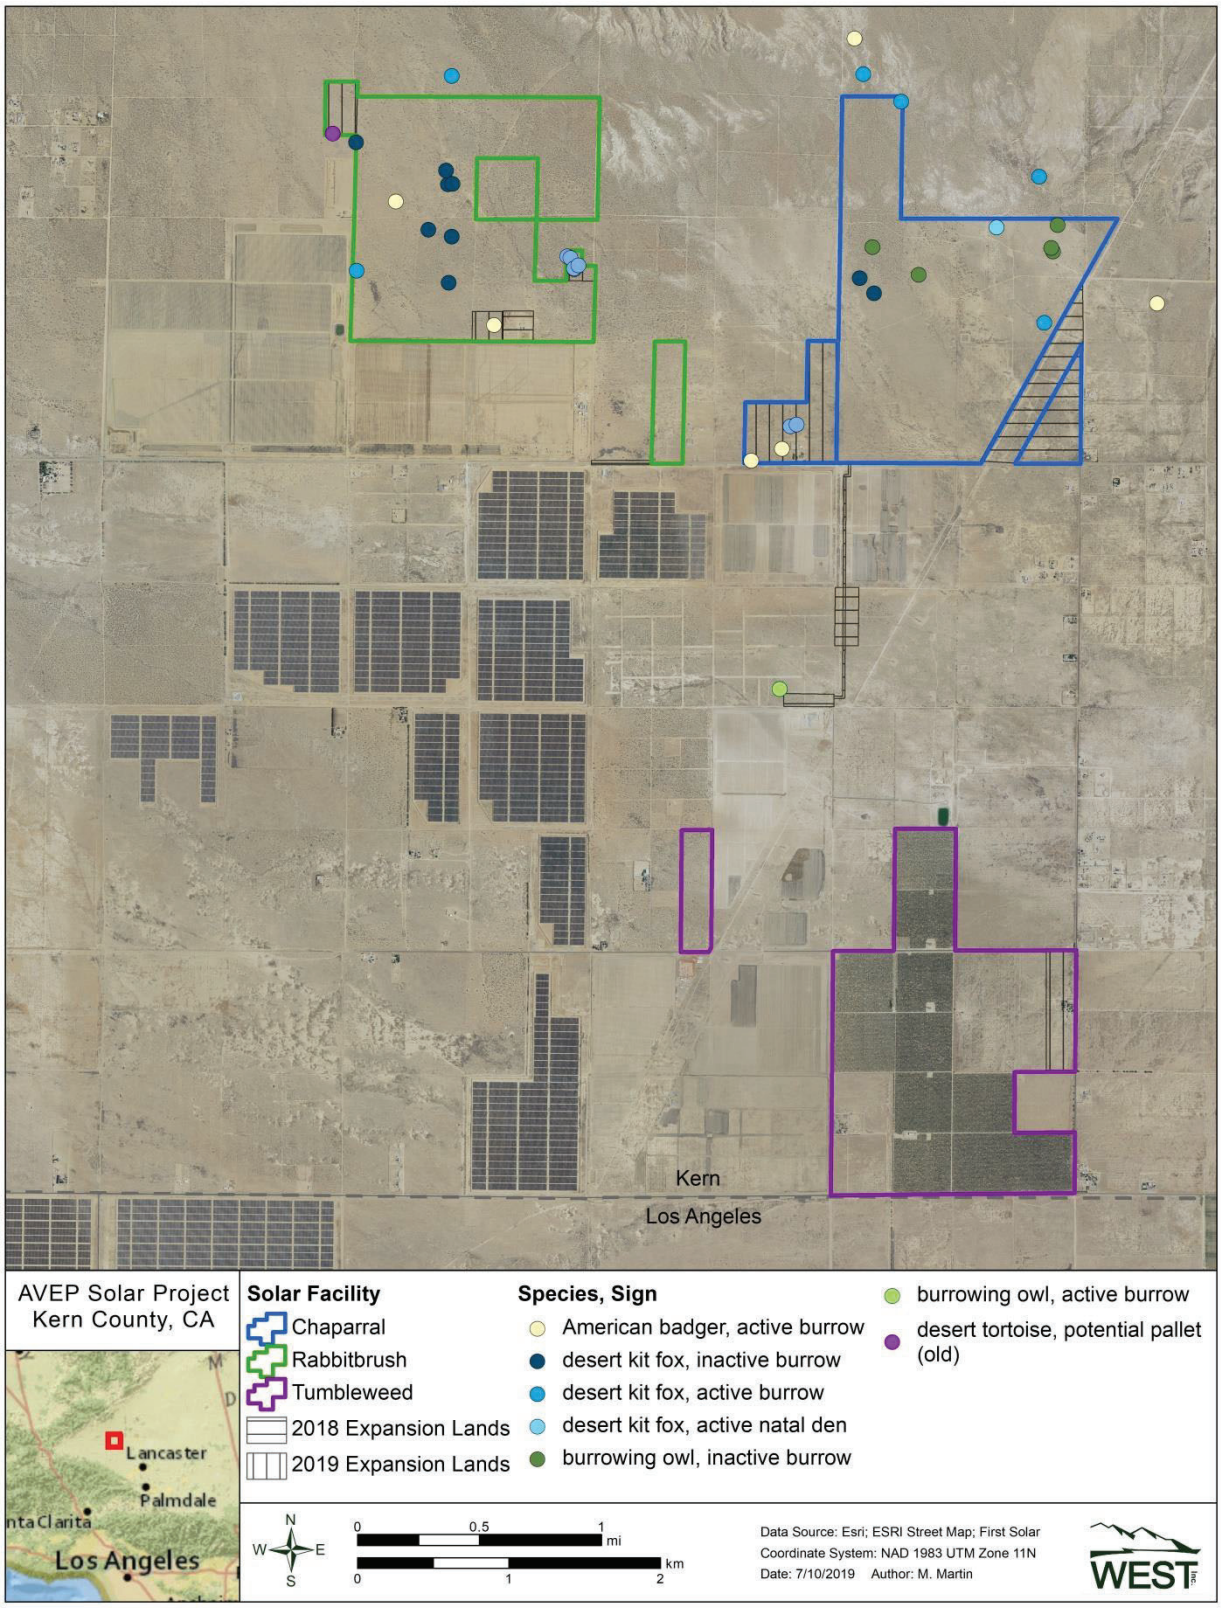

Figure 12. Location of special-status wildlife species and sign documented during 2017, 2018, and 2019 field surveys for the proposed AVEP Solar Project in Kern County, California.

4.2.3.4 Desert Kit Fox

During spring/summer 2017 field surveys, one active kit fox natal den was observed on Chaparral Solar (**Figure 12**) and several active escape dens were observed on Chaparral Solar and Rabbitbrush Solar (**Figure 12**). No active kit fox dens were observed during the 2018 and 2019 surveys conducted within the Expansion Lands or along previously unsurveyed portions of the collector line corridor. More detailed survey results and habitat suitability, with respect to each of the three facilities is presented below.

Chaparral Solar Facility. During 2017 field surveys, a single desert kit fox natal den was observed on Chaparral Solar (**Figure 12**; Appendix C Photo 14). This den was initially found in April and identified as a potentially active kit fox den. During May surveys, four to five desert kit fox pups were observed in the den area. The den was no longer occupied during the June surveys, possibly due to the presence of grazing sheep and a shepherd with herding dogs near the den. Two potentially active escape dens were also observed on Chaparral Solar during 2017 surveys (**Figure 12**; Appendix C Photo 4). While no desert kit fox were observed using these escape dens, kit fox sign (i.e., tracks, scat, freshly disturbed soil aprons) was observed at each. No active dens were observed with the Expansion Lands surveyed in 2018 and 2019. Suitable habitat for desert kit fox is present throughout Chaparral Solar.

Rabbitbrush Solar Facility. During 2017 surveys, one active kit fox escape den was observed on Rabbitbrush Solar (**Figure 12**; Appendix C Photo 15), and a second active escape den was observed just north of Rabbitbrush Solar (**Figure 12**). While no desert kit fox were observed using these dens, kit fox sign (i.e., tracks, scat, freshly disturbed soil aprons) was documented at each. No active dens were observed within the Expansion Lands surveyed in 2018 and 2019. Suitable habitat for desert kit fox is present throughout Rabbitbrush Solar.

Tumbleweed Solar Facility. No dens suitable for desert kit fox were observed on Tumbleweed Solar during the field surveys. Desert kit fox may forage throughout the facility and travel across the facility en route to foraging areas; however, ongoing agricultural operations within much of the facility likely limit the habitat quality for kit fox.

4.2.3.5 Swainson's Hawk

During the 2017 survey effort, three active Swainson's hawk nests were documented within the survey area (**Figure 9**). No active Swainson's hawk nests were documented within the survey area during 2018 or 2019 surveys. The results of the surveys, as well as habitat suitability for Swainson's hawks with respect to each of the three facilities are discussed below.

Chaparral Solar Facility. All three active Swainson's hawk nests located during the 2017 surveys were within five miles of Chaparral Solar and included a single nest located approximately 3.1 miles (5.0 km) north of the facility, and two nests located approximately 2.8 and 3.0 miles (4.5 and 4.8 km) south of the facility. The northern nest was located in a large Joshua tree in the vicinity of a historic Swainson's hawk nest first identified during 2011 surveys conducted for the Willow Springs Solar Project (Ironwood Consulting 2011b) and was also found to be active during surveys conducted in 2014 (Ironwood Consulting 2014b; **Figure 9**;

Appendix C Photo 19). During Period IV surveys, three Swainson's hawk chicks were observed in the nest (Appendix C Photo 20). The other two active nests to the south of the facility included a nest in a large pine (*Pinus* spp.) tree along Avenue A, just south of Tumbleweed Solar, and a nest in a windrow tree near a residential area approximately one mile (1.6 km) east of Tumbleweed Solar (**Figure 9**; Appendix C Photos 16-18). During the 2018 and 2019 nest survey efforts, all three of the active nests identified in 2017 were found to be inactive or occupied by common ravens and no new active Swainson's hawk nests were identified, although several observations of foraging Swainson's hawks were recorded during the 2018 survey effort. Suitable foraging habitat for Swainson's hawk is present throughout Chaparral Solar; however, nesting habitat is limited to the northwestern portion of the facility where a few of the scattered Joshua trees are large enough to support a Swainson's hawk nest.

Rabbitbrush Solar Facility. All three of the active Swainson's hawk nests identified during the 2017 survey were located within five miles of Rabbitbrush Solar. These nests were located 3.5 miles (5.6 km) to the northeast, and 3.2 and 3.7 miles (5.1 and 6.0 km) to the southeast of the facility (**Figure 9**; Appendix C Photos 16-20). No active Swainson's hawk nests were identified in 2018 or 2019. Suitable nesting habitat for Swainson's hawk is limited to a few larger Joshua trees present within the southwestern and northeastern portions of the facility; however, suitable foraging habitat is present throughout Rabbitbrush Solar.

Tumbleweed Solar Facility. Two of the three active Swainson's hawk nests recorded during 2017 surveys were within the five-mile survey buffer of Tumbleweed Solar. The closest nest to this facility was located in a large pine approximately 65 feet (20 m) outside the southern boundary of the facility along Avenue A (**Figure 9**; Appendix C Photo 16). This nest is difficult to see from the ground and no young were visible in the nest; however, adult Swainson's hawks were observed tending to the nest during all survey periods. This is a known historic nest that was determined to be active in 2014 during surveys conducted for the Willow Springs Solar Project (Ironwood Consulting 2014b). The second nest recorded during the 2017 surveys was located in a windrow tree near a residential area approximately one mile (1.6 km) east of Tumbleweed Solar (**Figure 9**; Appendix C Photos 17-18). Two chicks were observed in this nest on June 28. No active Swainson's hawk nests were identified in 2018 or 2019. No suitable nesting habitat is located within the boundary of Tumbleweed Solar; however, larger trees alongside the roads and windrows surrounding the facility have the potential to be used by nesting Swainson's hawks. Suitable foraging habitat is present within the non-orchard portions of the facility, including the fallow agricultural fields/disturbed grasslands to the east and southwest of the orchard and the desert scrub habitat in the far northwest of the facility.

4.3 Wildlife Movement

In recent decades, conserving landscape connectivity has received increasing recognition as key strategy to protect biodiversity and maintain viable ecosystems and wildlife populations (Rosenberg et al. 1997). The Project site lies near the center of the western Antelope Valley which is generally flat with few well-defined canyons, riparian corridors, or other corridor-like topographic features that would serve to channel the movement of terrestrial wildlife species. As

such, wildlife movement across the Valley is likely diffuse, with roads, fences, and agriculture serving as barriers or filters to movement.

Based on a review of existing scientific documentation pertaining to habitat linkages in the Project region (i.e., at a landscape-scale), the predominant movement paths include the Tehachapi Connection (White and Penrod 2012) and the Sierra Madre-Castaic Connection (Penrod et al. 2005). The Tehachapi Connection links the Sierra Nevada and Sierra Madre Mountains. This connection includes much of Tejon Ranch and runs along the northwestern edge of the Antelope Valley from Quail Lake to Red Rock Canyon State Park. Similarly, the Sierra Madre-Castaic Connection links the Castaic Range, located south of the Site, to points west in Los Padres National Forest. Combined, these two connections serve as the primary linkage for most terrestrial wildlife moving from Angeles National Forest and the Sierra Nevada rather than across the floor of the Antelope Valley. Both of these primary linkages are located greater than eight miles to the northwest and southwest of the Project site, and, therefore, will not be impacted by Project development.

The primary goal of the California Desert Connectivity Project is to identify areas where maintenance or restoration of ecological connectivity is essential for conserving the unique biological diversity of California's deserts, and to inform land management, land acquisition, habitat restoration, and stewardship in connectivity zones (Penrod et al. 2012). The California Desert Connectivity Project has identified 23 "crucial linkages", each defined by a pair of landscape blocks that should remain connected (Penrod et al. 2012). Designated crucial linkages do not include the Project site or surrounding areas; however a linkage planning area is proposed approximately 15 miles (24 km) to the east of the Project, connecting the San Gabriel Mountains with Edwards Air Force Base. In addition, neither the California Essential Habitat Connectivity Project (Spencer et al. 2010), nor any of South Coast Wildlands' Missing Linkages studies (South Coast Wildlands 2008) identify the site or areas immediately surrounding the site as essential connectivity areas.

While the existing studies do not call out the Project site or surrounding areas as essential connectivity areas, the site may be used for more local wildlife movement. The Project site does contain areas of relatively undisturbed desert vegetation that are used by species on a smaller-scale; however, these habitats are fragmented by roads, fences, rural residences, agricultural fields, and solar energy developments which likely limits the Project site as a significant corridor for wildlife movement. Scattered small washes run throughout the Project site; however, riparian vegetation to support concentrations of wildlife and to facilitate wildlife movement is absent. Likewise, while habitats within the Project site do provide stopover and wintering habitat for birds, there are no riparian habitats or other sources of water that would attract concentrations of birds during migration. Fenced areas, particularly the existing solar energy developments in areas immediately adjacent to the Project, likely limit the movement of larger terrestrial wildlife species (e.g., kit fox, badger, coyote) through the area.

5.0 IMPACTS TO BIOLOGICAL RESOURCES

Potential impacts to special-status biological resources were evaluated pursuant to the threshold criteria identified in the Kern County CEQA Environmental Checklist Form (Section 1.3.2). Development of the proposed Project has the potential to impact sensitive biological resources. The following sections discuss potential Project impacts to special-status plants and wildlife, wildlife movement, local policies and ordinances, and conservation plans, as well as the significance of those impacts. Additionally, an evaluation of cumulative impacts is provided below. Potential impacts to jurisdictional waters are addressed in a separate report prepared for the Project (Huffman-Broadway 2019).

5.1 Special-Status Species

5.1.1 Plants and Plant Communities

One special-status plant species, alkali mariposa lily, was identified within the Project site during focused rare plant surveys. This occurrence was limited to a single population, totaling an estimated 400 plants, located in the western portion of Chaparral Solar during the 2019 Expansion Lands survey. No special-status plant species were identified along previously unsurveyed portions of the collector line corridors. Any adverse impacts to alkali mariposa lily as a result of Project activities are considered potentially significant under CEQA; however, implementation of avoidance and minimization measures described in Section 6 would reduce these impacts to a less than significant level. These measures include environmental awareness training for all Project personnel and contractors (Section 6.1), as well as pre-construction disturbance surveys during the appropriate bloom period (Section 6.4.1), to ensure that alkali mariposa lilies on the Project site are identified and measures are taken to protect them from construction disturbance. A Biological Monitor, retained by the Applicants, will be present within the Project site during ground-disturbing activities to ensure avoidance and minimization measures are properly implemented (Section 6.2).

While not considered special-status species, Joshua tree, beavertail cactus, and cholla (*Cylindropuntia* sp.) are afforded protection under the CDNPA, California Food and Agricultural Code, Division 23. All three species were documented within the Project site during focused special-status plant surveys (see Appendix D1). The Project would be required to comply with the CNDPA in connection with covered species, including any applicable local permitting requirements; therefore, impacts to native desert plants covered under the Act are expected to be less than significant.

No special-status plant communities have been documented as occurring within the Project site. Joshua tree woodland is considered a sensitive natural community by the CDFW and Kern County and is protected under the CDNPA, and the Willow Spring Specific Plan (Kern County Department of Planning and Development 1992; see Section 5.3 below). Although areas containing scattered, widely-spaced Joshua trees are present throughout the Project site, the density of Joshua trees is not high enough for these communities to be characterized as Joshua

tree woodlands. Therefore, Project development would result in no impacts to special-status plant communities.

Native vegetation communities within the Project site are dominated by creosote bush scrub, white bursage scrub, and salt desert scrub, which are common throughout the western Mojave region. The majority of Tumbleweed Solar is occupied by an active pistachio orchard, with smaller areas of abandoned agricultural fields. Impacts to the desert scrub plant communities and agricultural areas within the Project site would be less than significant.

5.1.2 Wildlife

Special-status wildlife species observed or detected within the Project site, or along the portions of the collector line corridor surveyed during 2017, 2018, and 2019 field surveys included one state-threated species (Swainson's hawk), six California SSC (northern harrier, loggerhead shrike, Le Conte's thrasher, mountain plover, burrowing owl, and American badger [sign only]), and one species protected by the CDFW as a fur-bearing animal (desert kit fox). Additionally, several native bird species, protected by the CFGC and the MBTA were documented nesting within, or adjacent to, the Project site during surveys including red-tailed hawk, Swainson's hawk (also protected as a threatened species under CESA), barn owl, great horned owl, common raven, cactus wren, and western meadowlark.

Though not observed during field surveys, several additional special-status species were determined to have at least a possibility of occurring (i.e., possible, likely, or known to occur) within the Project site due to the presence of suitable foraging habitat. These included one state Fully-Protected species (golden eagle) and three state SSC (long-eared owl, Townsend's big-eared bat, and pallid bat; see Appendix B2). While each of these species has at least some potential to use habitats within the Project site for foraging, no suitable nesting or roosting habitat is present. Additionally, though not documented nesting within the Project site during the field surveys, two special-status bird species (Le Conte's thrasher and loggerhead shrike) have the potential to nest within the Project site and a number of additional native bird species protected by the CFGC and the MBTA may nest within the Project site.

There is potential for the development of the Project to directly or indirectly impact wildlife species, particularly impacts to special-status species through loss of foraging or breeding habitat, and impacts to nesting birds during construction. Measures discussed in Sections 6.1-6.4 are recommended to avoid or minimize direct and indirect impacts to wildlife species. Impacts to several special-status species (burrowing owl, Swainson's hawk, American badger, and desert kit fox) for which focused field surveys were conducted in 2017, 2018, and 2019, are discussed in greater detail below. Additionally, while desert tortoises are not expected to occur within the Project site, impacts to this species are also analyzed due to the presence of suitable habitat within the Project site and the species' regional significance.

5.1.2.1 Desert Tortoise

Desert tortoises were not expected to occur within the Project site based on the initial database and literature review (Appendix B2), and none were observed during focused desert tortoise

surveys conducted at the Project in 2017, 2018, and 2019. As noted above, a depression which may or may not represent a former desert tortoise pallet was observed near the northwest corner of Rabbitbrush Solar; however, no evidence of recent use was observed and no other tortoise sign was recorded within the Project site. The nearest reported desert tortoise occurrences are located approximately 4.2-4.5 miles north/northeast of Rabbitbrush Solar and Chaparral Solar (**Figure 7**, KCPCDD 2010, 2011, 2012a). Suitable habitat occurs within the Project site (particularly at Rabbitbrush Solar and Chaparral Solar), but is generally degraded and appears to be of marginal quality for desert tortoise. Furthermore, it is isolated from occupied habitat to the north and east of the Project by rural communities and other developments and the likelihood of occurrence is extremely remote. However, because suitable habitat is present within portions of the Project site, several proposed avoidance and minimization measures are described in Section 6 that would reduce any potential impacts to a less than significant level. Specifically, environmental awareness training will be provided to all Project personnel and contractors working on the site to ensure any desert tortoises encountered on site are identified and measures are taken to protect them (Section 6.1). A Biological Monitor, retained by the Applicants, will be present at the Project site during ground-disturbing activities in the unlikely event a desert tortoise should enter the active work area during Project construction (Section 6.2). Additionally, a pre-construction clearance survey will be conducted by a qualified biologist within 14 days of any vegetation or ground-disturbing construction activities (Section 6.4.4). Should desert tortoises be identified on the Project site, a Desert Tortoise Translocation and Monitoring Plan will be developed and submitted to the USFWS. A number of more general measures to avoid or minimize impacts to wildlife throughout construction, operation, and decommissioning of the Project are presented in Section 6.3.

5.1.2.2 Burrowing Owl

Burrowing owls were expected to occur within the Project site based on the initial database and literature review (Appendix B2) and their sign was observed at Chaparral Solar. While no burrowing owls were observed within the Project site, an active burrow inhabited by a pair of adult burrowing owls was identified along a portion of the collector line corridor surveyed in the spring and summer of 2018. Burrowing owls are known from numerous locations within five miles of the Project site (**Figure 7**) and all three solar facilities contain suitable habitat for wintering and/or nesting burrowing owls. Construction activities have the potential to result in burrowing owl mortality or injury, nest abandonment or failure, in addition to a reduction in available foraging and breeding habitat. Any adverse impacts to burrowing owls as a result of Project activities are considered potentially significant under CEQA; however, implementation of avoidance and minimization measures described in Section 6 would reduce these impacts to a less than significant level. These measures include environmental awareness training for all Project personnel and contractors such that burrowing owls and active burrows on the Project site are identified and measures taken to protect them (Section 6.1). A pre-construction disturbance survey for burrowing owls and their burrows will be conducted within 14 days of vegetation or ground-disturbing activities (Section 6.4.3). Should a burrowing owl or active burrow be identified, disturbance will be avoided or minimized through the use of buffers, visual screens, or passive relocation in accordance with the CDFW (2012) Staff Report on Burrowing

Owl Mitigation (Section 6.4.3). A Biological Monitor, retained by the Applicants, will be present within the Project site during ground-disturbing activities to ensure avoidance and minimization measures are properly implemented (Section 6.2). Additionally, more general minimization measures for potential impacts to wildlife are presented in Section 6.3.

5.1.2.3 American Badger

American badgers were expected to occur within the Project site based on the preliminary database and literature review (Appendix B2) and one potentially-active badger burrow was located within Rabbitbrush Solar, although no individuals were observed within the Project site. Badgers are known from one location within five miles of the Project site (**Figure 7**) and suitable habitat is located throughout Rabbitbrush Solar and Chaparral Solar whereas low-quality habitat exists at Tumbleweed Solar. Construction activities have the potential to result in American badger mortality or injury, in addition to a reduction in available foraging and breeding habitat. Any adverse impacts to badgers as a result of Project activities are considered potentially significant under CEQA; however, implementation of avoidance and minimization measures described in Section 6 will reduce these impacts to a less than significant level. Specifically, these measures include environmental awareness training for all Project personnel and contractors working on the site (Section 6.1), a pre-construction disturbance survey for American badgers and their sign within 14 days of ground-disturbing construction activities (Section 6.4.5), and the presence of a Biological Monitor on the site during ground-disturbing activities such that avoidance and minimization measures (e.g., no-disturbance buffers or passive relocation) are properly implemented (Section 6.2). More general minimization measures for potential impacts to wildlife are presented in Section 6.3.

5.1.2.4 Desert Kit Fox

Desert kit fox were expected to occur within the Project site based on the preliminary database and literature review (Appendix B2), and several active dens were observed within Chaparral Solar and Rabbitbrush Solar, including an active natal den recorded within Chaparral Solar (**Figure 11**). Suitable habitat for desert kit fox is present throughout Rabbitbrush Solar and Chaparral Solar, whereas suitable habitat within Tumbleweed Solar is limited to the far northwestern portion of the facility. Construction activities have the potential to result in desert kit fox mortality or injury, in addition to a reduction in available foraging and breeding habitat. Any adverse impacts to kit fox as a result of Project activities are considered potentially significant under CEQA; however, implementation of avoidance and minimization measures described in Section 6 will reduce these impacts to a less than significant level. Specifically, these measures include environmental awareness training for all Project personnel and contractors working on the site (Section 6.1), a pre-construction disturbance survey for desert kit fox and their sign within 14 days of ground-disturbing construction activities (Section 6.4.5), and the presence of a Biological Monitor on the site during ground-disturbing activities such that avoidance and minimization measures (e.g., no-disturbance buffers or passive relocation) are properly implemented (Section 6.2). More general minimization measures for potential impacts to wildlife are presented in Section 6.3.

5.1.2.5 Swainson's Hawk

Swainson's hawks were expected to occur within the Project site based on the initial database and literature review (Appendix B2) and three active nests were documented outside the Project site boundary but within the Project survey area (five-mile buffer) in 2017. Two active nests were within one mile of Tumbleweed Solar (one nest was 65 feet from the boundary) and the other active nest was approximately 3.1 miles north of Chaparral Solar. Swainson's hawks are known from numerous locations within five miles of the Project site (**Figure 7**), with a concentration of historical nests around the Tumbleweed site. No active Swainson's hawk nests were documented within five miles of the Project site during the 2018 and 2019 surveys. Suitable nesting habitat occurs within Rabbitbrush Solar and Chaparral Solar (limited numbers of Joshua trees) and near Tumbleweed Solar (larger trees alongside the roads and windrows surrounding the facility). Suitable foraging habitat occurs throughout Rabbitbrush Solar and Chaparral Solar, but is restricted to the non-orchard portions of Tumbleweed Solar. Overall, the Project site contains both suitable nesting and foraging habitat for Swainson's hawks.

Construction activities have the potential to cause disturbance to nesting Swainson's hawks, potentially resulting in nest abandonment or failure, in addition to a reduction in available nesting and foraging habitat. Any adverse impacts to Swainson's hawks as a result of Project activities are considered potentially significant under CEQA; however, implementation of avoidance and minimization measures described in Section 6 will reduce these impacts to a less than significant level. These measures include environmental awareness training for all Project personnel and contractors working on the site that will include identification of Swainson's hawks and potential Swainson's hawk nests, as well as the measures taken to protect them (Section 6.1). If disturbance activities associated with Project construction are to occur during the nesting season (March 1 – September 15), pre-construction disturbance survey for occupied Swainson's hawk nests will be undertaken within 0.5 miles of the Project site within 30 days of disturbance activities (Section 6.4.2). Should an active Swainson's hawk nest be identified, a no-disturbance buffer will be established around the nest until the young have fledged (Section 6.4.2). A Biological Monitor, retained by the Applicants, will be present on the Project site during ground-disturbing activities to ensure avoidance and minimization measures are implemented and the appropriate avoidance buffers are maintained (Section 6.2). More general minimization measures for potential impacts to wildlife are presented in Section 6.3.

5.2 Wildlife Movement

The Project site lies outside of known habitat linkages in the region and is part of the broad expanse of desert located between the primary wildlife linkages and corridors described above in Section 4.4 The undeveloped desert vegetation throughout much of the Project site and adjacent areas allows for unimpeded movement of some wildlife on a smaller-scale; however, existing roads, fences, residences, and agricultural operations likely serve as barrier to movement for many species. While several small washes run throughout the Project site, no riparian vegetation is present to facilitate wildlife movement or to concentrate wildlife. Wildlife-friendly fencing will be utilized for the perimeter security fencing, as well as any interior fencing, to enable kit foxes, badgers, and other wildlife to pass through the Project site after construction. Given the Project's location in an already fragmented landscape and outside of

identified wildlife connectivity areas or crucial linkages, potential impacts related to wildlife movement would be less than significant.

5.3 Local Policies and Ordinances

Locally, Joshua trees and Joshua tree woodlands receive protection under the Willow Springs Specific Plan (Kern County Department of Planning and Development 1992). Scattered, widely-spaced Joshua trees occur throughout portions of the Project site; however, they do not occur at a density high enough to consider them a distinct woodland community. Therefore, impacts to Joshua tree woodland would be less than significant.

As discussed above in Section 5.1.1, Joshua trees, Beavertail cactus, and cholla are each afforded protection under the CDNPA. All three species were documented within the Project site during surveys (see Appendix D1). The Project Applicants are required to be in conformance with all state and local regulations protecting biological resources. Therefore, impacts to native desert species protected under the CDNPA, as implemented under Kern County, are expected to be less than significant.

5.4 Conservation Plans

The Project site is located within the Draft West Mojave Plan (WMP) planning area. The Draft WMP is a pending Habitat Conservation Plan (HCP) pursuant to the federal ESA and an amendment to the California Desert Conservation Area Plan. However, the WMP currently applies only to federal public lands managed by the Bureau of Land Management (BLM) and is not an adopted Habitat Conservation Plan (HCP) or Natural Community Conservation Plan (NCCP). The site is also located within a Development Focus Area of the DRECP, a joint state and federal NCCP. Development Focus Areas have been identified because of their potential for energy generation and minimal conflict with sensitive biological resources and are, therefore, more likely to be appropriate for renewable energy development. However, the DRECP, is still in the development stage and has not been adopted by any agency. Because the proposed Project would not conflict with the provisions of an adopted HCP or NCCP, or other local, regional, or State habitat conservation plan, impacts would be less than significant.

5.5 Cumulative Impacts

Developing a cumulative impacts analysis is a complicated undertaking and requires information on a project's impacts combined with the impacts of other related past, present, and reasonably foreseeable future projects. Article 20, Section 15355 of the CEQA Guidelines states that "cumulative impacts refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." These impacts may be the result of numerous effects of a single project, or the added effects of numerous projects, including projects that have not yet been initiated or may happen in the foreseeable future. Section 15130 of the CEQA Guidelines defines how a determination of significant cumulative effects is reached.

Prior to evaluating the cumulative impacts for each resource addressed in the EIR, a list of past, present, and reasonably foreseeable future projects is compiled for consideration in the analysis. For example, the Final EIR (FEIR) for the neighboring Willow Springs Solar Project included 70 projects in the Western Antelope Valley for the cumulative impacts analysis (See Willow Springs FEIR Table 3-4, Figure 3-10). Thus, as it is beyond the scope of the BRTR to develop a comprehensive cumulative project list because the project list applies to all resources, WEST examined the cumulative impacts conclusions in other EIR documents for PV solar facilities in the area to determine if there is potential for significant cumulative impacts for a biological resource. Cumulative impacts analysis for other PV solar facilities are relevant for the Project for several reasons. First, there are several recently permitted PV solar facilities that neighbor the Project and similar biological resources were evaluated in those EIRs. Second, the EIR for one project was completed in February 2016 making the list of cumulative projects relevant temporally to the cumulative impacts that will be conducted for the Project's FEIR. Thus, this cumulative impact preliminary assessment is predicated on no substantial increases or decreases beyond the Project in the foreseeable projects presented in EIRs for neighboring projects.

Similar to the conclusion reached for other PV projects, it is anticipated that cumulative impacts to special-status plants and plant communities from the Project would be similar and not cumulatively considerable as no special-status plants or plant communities are present within the Project site.

The general conclusion in other EIRs was that in addition to other cumulative projects, the examined projects would result in a significant contribution to cumulative loss of habitat for sensitive species. For the Project, similar cumulative impacts conclusions are anticipated for Swainson's hawk, burrowing owl, and other foraging raptors based on the Project-specific impacts assessment and mitigation measures proposed for these species. Given the one potentially active American badger burrow in the Project and two within one mile of the Project, it is possible that the Project would result in a potentially significant contribution to cumulative loss of habitat for American badger.

6.0 RECOMMENDED AVOIDANCE AND MINIMIZATION MEASURES

The following recommended avoidance and minimization measures are integral to Project construction and long-term operation and will reduce the anticipated Project impacts to a level that is less than significant for all sensitive biological resources.

6.1 Environmental Awareness Training

Prior to working on the Project site, workers will be required to attend an environmental education program presented via video or other digital format. This program will emphasize the conservation of the biological resources during Project construction and operations and will include:

- The purpose of resource protection and relevant requirements;

- A description of the existing habitats and special-status species;
- Biological protection measures that will be implemented in conjunction with Project construction and operation;
- Instructions describing actions to be taken should a potentially sensitive biological resource be encountered; and
- Training on the identification of special-status species (e.g., alkali mariposa lily, Swainson's hawk, burrowing owl, desert tortoise, American badger, desert kit fox) and the measures taken if encountered.

6.2 Biological Monitoring

To address potential threats to sensitive biological resources, the Applicants will retain a qualified Biological Monitor for activities associated with ground disturbing activities such as grading, trenching, vegetation removal, etc., in connection with construction, operation and maintenance or decommissioning activities. The Biological Monitor must be knowledgeable of general and focused species issues on the Project site, and must be competent to monitor all biological avoidance, minimization, and mitigation measures identified in this BRTR. The Biological Monitor will oversee implementation of the following measures:

- If an injured or dead state and/or federal listed wildlife species is encountered, the Biological Monitor has the authorization to stop all work within the immediate vicinity and notify the relevant Applicant immediately who will in turn notify Kern County, CDFW, and/or USFWS, as appropriate. No one will be allowed to move an individual listed wildlife species except as authorized through consultation with CDFW.
- The Biological Monitor will ensure that all established buffers surrounding alkali mariposa lilies, active bird nests, active burrowing owl burrows, and active badger or kit fox dens are maintained.
- Steep trenches, bores, and other excavations will be inspected by construction personnel at the beginning of each work day and immediately before backfilling to monitor for wildlife entrapment. Large/steep excavations will be covered and/or fenced nightly to prevent wildlife entrapment, or escape ramps provided to allow wildlife to escape. If any wildlife has become entrapped, construction will not continue until the animal has left the trench voluntarily or the Biological Monitor has removed the animal. No listed species will be handled without the appropriate permits.
- Special-status species or nesting birds may use construction pipes, culverts, or similar structures for refuge or nesting. Therefore, all construction pipes, culverts, or similar structures with a diameter of four inches (10 cm) or more that are stored at the Project site for one or more nights should be thoroughly inspected by construction personnel for special-status wildlife or nesting birds before the pipe is moved, capped, or buried. All pipes, culverts, or similar structures having a diameter of 12 inches (30 cm) or less will be capped prior to storing on the Project site overnight. If a special-status species or nesting bird is discovered inside a pipe, that section of pipe should not be moved until

the Biological Monitor has been consulted and the animal has been relocated. Special-status species must be allowed to relocate on their own.

6.3 Avoidance and Protection of Biological Resources

The following general avoidance measures are recommended during the construction, operation and maintenance, and decommissioning of the Project:

- The Project will limit the areas of disturbance to the extent feasible. Parking areas, new roads, staging, storage, excavation, and disposal site locations should be confined to the smallest areas practicable.
- Spoils will be stockpiled in disturbed areas that lack native vegetation, or areas that are planned for future construction disturbance, whenever possible.
- Twenty mile per hour speed limits will be enforced for vehicles traveling on the Project site.
- Employees and contractors will look for wildlife beneath vehicles and equipment before movement. If wildlife is observed, no vehicles or equipment will be moved until the animal has left voluntarily or is removed by the Biological Monitor.
- Vehicular traffic to and from the Project site will use approved, existing routes of travel.
- Trash will be stored properly (i.e., in a manner that is inaccessible to scavengers including condors, ravens, and raccoons) and removed from the site on a regular basis.
- Pets and firearms will not be permitted on the site.
- Feeding of wildlife will not be permitted on the site.
- Entry to all areas flagged, staked, or otherwise marked as sensitive by the Biological Monitor will be prohibited.
- Perimeter fencing shall be made wildlife friendly by raising the bottom up 7.0 inches (18 cm) from the ground to allow movement of American badgers, desert kit foxes, and other wildlife species through the Project site. If desert tortoise exclusionary fencing is required at the Project (see Section 6.4.3), wildlife-friendly perimeter fencing, designed to exclude desert tortoise, will be installed.
- All outdoor Project lighting will be directed toward the ground and shielded from the sky to avoid disturbance to wildlife. Outdoor lighting will use the lowest wattage bulbs necessary for security and other functional purposes and will be motion-activated such that nighttime lighting is only on when personnel are present.

6.4 Pre-Construction Disturbance Surveys

Before initiating ground-disturbing tasks (e.g., mechanized clearing, grading, or digging) associated with Project-related construction, O&M, or decommissioning disturbance activities, qualified biologists will conduct pre-construction disturbance surveys of the work site for special-status plant and wildlife species and bird nests (if ground-disturbance activities occur during the

alkali mariposa lily bloom period [i.e., April-June] or avian nesting season [i.e., February – August]). During these surveys the biologists will:

- Search work areas and appropriate buffers for any special-status species and bird nests;
- Ensure that potential habitats within and near (distance varies depending on species) the work areas are not occupied by special-status species or contain occupied burrows or nests; and
- If a non-listed, ground-dwelling, special-status wildlife species is encountered, the Biological Monitor will establish an appropriate buffer around the species.

6.4.1 Alkali Mariposa Lily Pre-construction Disturbance Survey

To ensure local populations of alkali mariposa lily are avoided to the extent feasible, a pre-construction survey will be conducted during the blooming period (April-June) to determine the most current limits of distribution within the Project site and the Project will avoid, to the extent feasible, any alkali mariposa lily populations identified during the survey. If construction occurs outside of the blooming period, the Project will avoid, to the extent feasible, those areas where the species was documented during the focused surveys in 2019. If avoidance of the identified alkali mariposa lily population is not feasible, mitigation for the impacts to the population would occur through purchasing conservation bank credits, creation of a Habitat Management Plan (HMP), or other appropriate mitigation. The HMP would be developed by a qualified biologist to ensure adequate management and conservation of the lily, including compensatory mitigation for the replacement of the impacted population. Mitigation lands would provide sufficient alkali mariposa lily habitat at a 1:1 ratio for any impacted plant (or population area) impacted, comparable to habitat to be impacted by the proposed Project. The HMP will detail the maintenance and monitoring requirements for the mitigation lands including non-native species management and habitat enhancement to ensure maintenance of habitat conditions on the mitigation site.

6.4.2 Swainson's Hawk Pre-construction Disturbance Survey

To ensure that nesting Swainson's hawks are not disturbed by Project-related activities during construction, O&M or decommissioning, if disturbance activities are to occur during the nesting season (March 1 – September 15), a qualified biologist will conduct a ground-based pre-construction nesting survey within 0.5 miles of the Project site in areas with potentially suitable nesting habitat for Swainson's hawks no more than 30 days prior to commencement of disturbance activities. If an active nest site is found, Project related activities that may cause nest abandonment by a Swainson's hawk or force fledging of young will not be conducted within a 0.5-mile buffer area around the nest until the young have fledged. Routine vehicle traffic, including construction-related traffic, along established roadways within the buffer area will be permitted. Buffer zones may be adjusted in consultation with CDFW. If construction activities are paused for more than 30 days within specific work areas, additional pre-construction survey will be repeated within 0.5 miles of the work area before construction activities can resume. If new disturbance activities are to occur outside of the nesting season (September 16 – February 28), no Swainson's hawk pre-construction survey is required.

6.4.3 Burrowing Owl Pre-construction Disturbance Survey

Pre-construction disturbance burrowing owl surveys will be conducted by a qualified biologist in accordance with the CDFW Staff Report on Burrowing Owl Mitigation (CDFG 2012) within 150-m of all Project areas slated for vegetation clearing or ground disturbing activities. The surveys will be conducted no more than 14 days prior to the commencement of disturbance activities. If an active burrowing owl burrow is found during breeding season (February 1 through August 31), the Project shall avoid direct destruction of occupied burrows and shall minimize disturbance impacts to occupied burrows while project activities are occurring through the use of buffer zones, visual screens or other protective measures as determined by the qualified biologist and consistent with the best practices recommended in the 2012 Staff Report on Burrowing Owl Mitigation (CDFG 2012).

If an active burrowing owl burrow is found, and it is infeasible to protect in place, during the non-breeding season (September 1 – January 31) or during the breeding season where resident owls have not yet begun egg laying or incubation or where the juveniles are foraging independently and capable of independent survival, a qualified biologist shall implement a passive relocation program in accordance with the CDFW (2012) Staff Report on Burrowing Owl Mitigation. If passive relocation is anticipated, a qualified biologist shall prepare a Burrowing Owl Exclusion Plan in accordance with CDFW (2012) Staff Report on Burrowing Owl Mitigation for review by CDFW prior to passive relocation activities.

6.4.4 Desert Tortoise Pre-construction Disturbance Survey

A pre-construction survey for desert tortoise shall be conducted within all areas of suitable habitat that are proposed for ground-disturbing activities within the Project site no more than 14 days prior to the commencement of ground-disturbing activities. Surveys may be conducted concurrently with other preconstruction surveys. If no tortoises or burrows are discovered during pre-construction surveys, no additional action is required.

If burrows or tortoises are identified during the pre-construction survey, the applicable Applicant shall be required to secure the necessary take authorizations from both the USFWS and the CDFW to comply with the federal ESA and CESA, respectively. If tortoises are identified on the Project site, a Desert Tortoise Translocation and Monitoring Plan shall be developed and submitted to the USFWS. The Desert Tortoise Translocation and Monitoring Plan will include prescribed mitigation measures addressing identification and health assessment, buffering, handling, recipient site selection, project fencing, and post-translocation monitoring and adaptation reporting.

6.4.5 American Badger and Desert Kit Fox Pre-construction Disturbance Survey

A pre-construction disturbance clearance survey for American badger and desert kit fox will be conducted by a qualified biologist no more than 14 days prior to the commencement of Project-related ground-disturbing activities during construction, O&M, and decommissioning. Surveys shall be conducted within all areas of suitable habitat (i.e., desert scrub) that are proposed for ground-disturbing activities. If a potential American badger or desert kit fox den is encountered, the potential den will be marked with flagging and monitored until it can be confirmed that the

den is active or inactive. If a potential American badger or desert kit fox den is observed, the following measures are recommended to avoid potential adverse impacts to these species:

- If a qualified biologist determines that the den is inactive, and it is not a known historic natal/pupping den, the biologist shall excavate the burrow by hand with a shovel and collapse the den to prevent American badgers or desert kit fox from re-using them during construction.
- If the den is determined to be inactive but is a known historic natal/pupping den, a no-disturbance buffer will be established around the den, at the discretion of the qualified biologist, and the den will not be excavated until after consultation with the CDFW.
- If the qualified biologist determines that the den is active, no ground-disturbance activities shall be conducted within an appropriate distance of the active (natal/pupping or escape) den, as determined by the qualified biologist.
- If the active den is observed during the non-breeding season (September 1 – January 14), and avoidance of the den is infeasible, an on-site passive relocation program may be implemented following consultation with the CDFW. Passive relocation shall entail blocking the entrance(s) to the den with soil, sticks, and debris for three to five days to discourage use of the den prior to Project-related ground disturbance activities. The den entrance(s) shall be blocked to an incrementally greater degree over the three- to five-day period. After the qualified biologist determines that badgers or kit fox have stopped using the active den, it shall be hand-excavated with a shovel to prevent re-use during construction.
- No destruction of an active (natal/pupping or escape) den is to occur during the breeding season (January 15 – August 31).

6.4.6 Nesting Raptor/Bird Pre-construction Disturbance Survey

If vegetation removal and/or ground-disturbing activities are scheduled to occur during the nesting/breeding season of raptors and other native bird species potentially occurring in the Project site (typically February 1 – August 31 in the Antelope Valley, or as determined by a qualified biologist), pre-construction nesting bird surveys shall be conducted within the Project site no more than 14 days prior to such activities. Surveys need not be conducted for the entire Project site at a time; rather, they may be phased so that surveys occur within 14 days prior to construction activities within a specific work area. If work activities are paused for more than 14 days, the pre-construction survey effort will be repeated before vegetation removal and/or ground-disturbance can resume.

If active nests are found, a qualified biologist will evaluate the potential for construction activities to affect a nest and determine at what distance construction can take place without causing disturbance. For all bird species, a nest is considered active if it contains eggs or chicks. Additionally, for raptors, a nest is also considered active upon initiation of nest building or when “nest decorating” behavior is observed; these nests typically cannot be destroyed regardless if active or inactive, depending on the raptor species. A nest shall no longer be considered active once a qualified biologist has determined that the birds have fledged. Buffers around active

nests will be marked with highly visible means (e.g., flagging) and Project personnel will be alerted.

If construction is scheduled to occur during the non-breeding season (September 1 – January 31), no pre-construction surveys or additional measures with regard to nesting birds are required.

Re: Methodology of Wildlife and Plant Surveys for AVEP Solar Project, April-July, 2017

This memorandum identifies the methods employed during wildlife and rare plant surveys conducted from April through July, 2017, by Ecology and Environment, Inc. (E & E) biologists for the AVEP Solar Project (Project) in Kern County, California.

E & E biologists conducted field surveys to document the presence of special status plant and wildlife species and their habitats within the Project area. The survey area for all species encompassed the boundaries of each of the three solar facilities (Rabbitbrush, Chaparral, and Tumbleweed) as defined on the date of the surveys plus a 500-foot buffer outward from the perimeter of each facility. The Swainson's hawk survey area encompassed the boundaries of each solar facility plus a 5-mile buffer. Biologists used binoculars to survey buffer areas for off-site locations where they did not have access approval from the third-party landowner. The field surveys focused on special status species that had a potential to occur within the Project area and region, based on the results of a literature review.

Literature Review

Prior to conducting biological resource surveys within the Project area, E & E conducted a literature review to better understand the known or potential presence and extent of special status plant and wildlife species habitat in the Project area. The status and distributions of plant and animal species in the Project area were evaluated based on a review of literature, survey reports from nearby projects, and federal and state databases, including the California Natural Diversity Database (CNDDB). The field team also drew on results of E & E's previous survey and monitoring efforts in the Project area and knowledge of Antelope Valley. E & E's lead biologist, David Schultz, recently spent more than two years continuously surveying and monitoring in the Project vicinity, and is deeply familiar with the habitats, species, and even individual animals in the Project area. The following resources were consulted to develop species lists and an understanding of the Project area:

- The California Native Plant Society (CNPS) online inventory of Rare and Endangered Plants of California (CNPS 2017)
- The 2013 California Vegetation Map in Support of the DRECP (Menke et al. 2013)
- CNDDB records within a 5-mile radius of the Project site (CNDDB 2017)
- The California Department of Fish and Wildlife (CDFW) 2017 Special Animals List (CDFW 2017)
- The U.S. Fish and Wildlife Service (USFWS) Environmental Conservation Online System (USFWS-designated critical habitat) (USFWS 2017)
- Willow Springs Solar Array Biological Resources Technical Report (Ironwood Consulting 2011a) and Updated Biological Evaluation (Ironwood Consulting 2014)

- Biological Resources Technical Report, Rosamond Solar Array, Kern County, California (Ironwood Consulting 2011b)
- Focused Survey for Desert Tortoise for the Antelope Valley Solar Project, Kern and Los Angeles Counties, California (AECOM 2010)
- eBird database (eBird 2012)

Based on results of the literature review, 39 special status species were identified as having the potential to occur onsite (Tables 3-1 and 3-2 in the Biological Resources Technical Report [E & E 2017]). Protocol surveys were undertaken for rare plants, Swainson's hawk, burrowing owl, desert tortoise.

Due to the results of the literature review, protocol surveys were not conducted for Mohave ground squirrel. In the past ten years, extensive trapping efforts in a number of areas south of State Highway 58 have revealed that the only significant population of Mohave ground squirrels remaining within their historic range is in one region in the eastern portion of Edwards Air Force Base located approximately 20 miles from the Project area (Desert Managers Mohave Ground Squirrel Working Group n.d.). The species appears to be absent from extensive portions of its historic range in the Antelope Valley, Lancaster, and Palmdale regions. There has never been any documented record of the species to the west of State Route 14 between Mojave and Palmdale, in spite of extensive protocol trapping over much of this area (Leitner 2015). In the past seven years, this species has not been identified during protocol-level trapping surveys on numerous commercial solar projects in the western Antelope Valley. Because of the low potential for this species to occur on the AVEP Solar Project, trapping surveys were not undertaken onsite.

Field Surveys

On April 10-14, 2017, E & E biologists conducted an initial site visit to perform protocol-level burrowing owl, Swainson's hawk, rare plant, and desert tortoise surveys (Table 1). During this initial site visit, biologists David Schultz, Joe Carlo, and Ellen Cotterman performed burrowing owl, desert tortoise, nesting bird, Swainson's hawk, and rare plant surveys within the project boundaries. Matthew Church performed Swainson's hawk driving surveys within 5 miles of the project boundary, then joined the onsite wildlife surveys.

Burrowing owl, Swainson's hawk, and rare plant survey protocols dictate multiple surveys over a peak activity period. After the initial April, 2017, site visit, David Schultz conducted subsequent surveys for burrowing owl, Swainson's hawk, and rare plants between May and July, 2017 (Table 1). Subsequent survey visits focused on areas within each solar facility that contained potentially suitable habitat for focal wildlife and rare plants. A detailed description of surveys completed is provided below.

Table 1 Biological Survey Timing, Weather, Surveyors, and Focal Resources for the AVEP Solar Project.

Survey Date and Time	Weather Conditions	Surveyors	Focal Resources
April 10: 0600–1525	Clear skies, variable winds, 45–76°F	David Schultz Joe Carlo Ellen Cotterman Matthew Church Greg Mazer	Burrowing owl (habitat assessment and survey 1), rare plants, wetlands and waterways, desert tortoise, Swainson's hawk (survey period II), nesting birds,
April 11: 0600–1605	Clear skies, WNW winds 0–15 mph, 40–72°F		
April 12: 0600–1510	Clear skies, NW winds 3–15 mph, 52–70°F		
April 13: 0530–1550	Clear skies, WNW winds 15–22 mph, 49–64°F		

Table 1 Biological Survey Timing, Weather, Surveyors, and Focal Resources for the AVEP Solar Project.			
Survey Date and Time	**Weather Conditions**	**Surveyors**	**Focal Resources**
April 14: 0600–1332	Clear skies, NW winds 10–20 mph, 60–72°F		desert kit fox, American badger
May 16: 0515–1730	Clear skies, SW winds 10–15 mph, 52–70°F	David Schultz	Burrowing owl (survey 2), rare plants, Swainson's hawk (survey period III), nesting birds, desert kit fox, American badger
May 17: 0520–1530	Clear skies, WSW/NNW 20–30 mph, 52–66°F		
May 18: 0530–1130	Clear skies, W winds 0–4 mph, 47–79°F		
June 6: 0530–1930	Clear skies, variable winds to 20 mph, 58–95°F	David Schultz	Burrowing owl (survey 3), Swainson's hawk (survey period IV), nesting birds, desert kit fox, American badger
June 7: 0530–1930	Clear skies, variable winds to 20 mph, 62–92°F		
June 29: 1450-1720	Clear skies, W winds 2-11mph, 100°F	David Schultz	Burrowing owl (survey 4), Swainson's hawk (survey period IV), nesting birds, desert kit fox, American badger
June 30: 0530-1730	Clear skies, W winds 1-4mph, 64-109°F		
July 1: 0510-0945	Clear skies, NW winds 1-5mph, 64-100°F

°F degrees Fahrenheit
mph miles per hour
NW northwest
NNW north-northwest
SW southwest
W west
WNW west-northwest
WSW west-southwest

Surveyor Specialties:
David Schultz – lead biologist; rare plants, burrowing owl, desert tortoise, Swainson's hawk
Joe Carlo – general wildlife, desert tortoise
Ellen Cotterman – rare plants, general wildlife
Matthew Church – Swainson's hawk; rare plants

Burrowing Owl Surveys

Protocol: California Department of Fish and Game [Wildlife] Staff Report on Burrowing Owl (*Athene cunicularia*) Mitigation (CDFG 2012)

Four burrowing owl surveys were conducted during peak burrowing owl breeding season (15 April – 15 July) each survey was spaced at least three weeks apart, and the last survey occurred after 15 June (Table 1). The first survey visit typically involves a habitat assessment, which is conducted to evaluate the likelihood that a site supports burrowing owl. However, since burrowing owls are known to occur in the Project area based on E & E's prior observations, and vegetation types representing suitable burrowing owl habitat occur onsite based on the literature review (dry grasslands and scrublands), the habitat assessment and first occupancy survey were combined during the initial site visit.

Surveys were undertaken in all portions of the Project site during the initial site visit, regardless of whether the area represented suitable burrowing owl habitat. Where access was permitted, surveyors identified suitable habitat onsite and within 500 feet of the facility boundaries. Habitat elements included

open, dry grasslands, scrubland, and desert, with short vegetation and suitably sized small mammal burrows. Follow-up surveys focused on areas of suitable habitat identified during the initial site visit.

Surveyors walked line transects spaced 7 to 10 meters apart and used handheld tablets to maintain transect spacing and navigate within Project boundaries. Surveyors documented all burrows (via photo and Global Positioning System, or GPS) that could potentially be used by a burrowing owl and noted any burrowing owl sign associated with the burrow (e.g., prey remains, pellets, feathers, excrement). The surveyors encountered no poor weather (e.g., high winds, precipitation, fog, or low temperatures) that may have affected detectability during surveys.

Swainson's Hawk Surveys

Protocol: Swainson's Hawk Survey Protocols, Impact Avoidance, and Minimization Measures for Renewable Energy Projects in the Antelope Valley of Los Angeles and Kern Counties, California (CEC and CDFG 2010)

The Swainson's hawk survey area included the area within boundaries of each solar facility plus a 5-mile buffer surrounding these areas. Surveys were performed by E & E biologists in all suitable nesting habitats within the Swainson's hawk survey area during Periods II, III, and IV (Table 1). Survey Period I is considered optional according to the protocol, and was omitted. Swainson's hawk pedestrian line transects within the Project boundaries were performed concurrently with burrowing owl and desert tortoise surveys during all site visits.

Driving surveys were undertaken by Matthew Church during the initial site visit, and by David Schultz following the pedestrian line transects in subsequent site visits. Driving surveys were performed at 5 mph, and roads were approached from both directions. Surveyors also visited the locations of all historic Swainson's hawk nests identified in survey reports from adjacent projects. Surveyors identified and mapped all large stick nests and recorded all observations of Swainson's hawks. Binoculars and spotting scopes were used to facilitate visual coverage. David Schultz also visited each active nest identified during initial surveys several times over the course of each multi-day follow-up survey.

Nesting Bird Surveys

Protocol: Burrowing owl and Swainson's hawk survey protocols, referenced above

Nesting bird surveys were undertaken concurrently with, and using the same methods as, burrowing owl and Swainson's hawk pedestrian and vehicular line transects. Worldwide, line transects are a preferred bird survey method since they are efficient and adaptable, and can be used to survey extensive areas and individual species, groups of species, and interactions between birds and their habitat (Gregory et al. 2004). Nesting bird surveys were undertaken during all four site visits, which encompassed peak nesting bird season in the Antelope Valley. Surveyors searched for nests in or on all suitable substrate (ground, shrubs, trees, electrical poles) and were attentive to any birds observed for signs of nesting such as flushing, defending, displaying, or carrying nesting material, provisions, or fecal sacs. Surveyors identified all bird species and nests encountered. All nests observed were identified to species, if possible, and recorded via GPS. Attributes, such as nest substrate, species, and habitat, were recorded using a hand-held tablet.

Desert Tortoise Surveys

Protocol: Pre-Project Field Survey Protocol for Potential Desert Tortoise Habitat, Preparing for any action that may occur within the range of the Mojave desert tortoise (*Gopherus agassizii*)(USFWS 2010)

The USFWS recommends that desert tortoise surveys be undertaken if a project is located within a Desert Tortoise Recovery Unit or the known range of this species. The Project area falls within the Western

Mojave Recovery Unit, but outside the current known range for this species. Probabilistic sampling is an appropriate option for survey areas encompassing more than 1,066 acres in the Western Mojave Recovery Unit (USFWS 2010). At approximately 3,019 acres, the Project qualifies for probabilistic sampling. However, because full-coverage burrowing owl and rare plant transect surveys were also performed, these same survey methods served to satisfy the full-coverage desert tortoise pedestrian transect methodology recommended in the survey protocol. The protocol states that 100% coverage surveys are always an acceptable option.

Surveys were led by David Schultz, an Authorized Desert Tortoise Biologist who has been approved by USFWS to lead surveys for, relocate, and handle desert tortoises for projects in the western Antelope Valley. Mr. Schultz was assisted by Joe Carlo, Ellen Cotterman, and Matthew Church. Surveyors conducted pedestrian line transect surveys spaced 7 to 10 meters apart across the entirety of the Project site. Surveyors used handheld tablets to maintain transect spacing and navigate within Project boundaries. Surveyors searched under vegetation and inspected all burrows encountered for any sign of desert tortoise (e.g., characteristic half-moon shaped burrows, pallets, live tortoises, shells, bones, tracks, and scat). Surveys were conducted in April, the desert tortoise's most active period, in temperatures below 104 degrees Fahrenheit.

Rare Plant Surveys

Protocol: California Native Plant Society Botanical Survey Guidelines (CNPS 2001)

Rare plant surveys were undertaken concurrently with pedestrian transects for burrowing owl and desert tortoise on April 10-14, 2017. Surveys were performed by biologists familiar with the flora of the Western Mojave. Surveys were led by David Schultz, who was assisted by Ellen Cotterman and Joe Carlo. Surveyors conducted linear pedestrian line transects spaced 7 to 10 meters apart across the entirety of the Project site. Transects were performed to maximize the likelihood of locating special status plant species or their habitats in the Project area.

Based on the results of a literature review, 13 rare plants had potential to occur in the Project area (Table 3-1 in the Biological Resources Technical Report [E & E 2017]). Tehachapi monardella blooms between June and August, and Horn's milk-vetch blooms between May and October, but because no suitable habitat occurs onsite for either species (montane coniferous forest/juniper woodland and alkaline seeps along lake margins, respectively) these two species were omitted from rare plant surveys. The remaining 11 rare plant species bloom in April, and thus, the surveys were undertaken during the blooming period of these target species.

Alkali mariposa lily had the highest potential to occur onsite, since it is known to occur on the Willow Springs Solar Project adjacent to the AVEP Solar Project. During the initial site visit in April, David Schultz and Ellen Cotterman visited accessible known populations to better understand the species' local bloom period and microhabitat conditions.

Surveyors identified all plants observed to the lowest taxon necessary to confirm that none were of special status. Follow-up site visits were spaced sufficiently to capture an accurate inventory of all plants onsite. No specimens were collected. Since no rare plants were observed, no populations were documented or mapped.

Appendix B: Special-Status Plant and Wildlife Species Identified in the Preliminary Database and Literature Review, and their Potential to Occur Within the AVEP Solar Project in Kern County, California

Appendix B1. Special-status plant species identified in the CNDDB and CNPS queries and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status*	Habitat Description	Potential for Occurrence
Mt. Pinos onion *Allium howellii* var. *clokeyi*	1B.3	Pinyon and juniper woodland; Great Basin scrub; meadows and seeps (edges).	**Not Expected**. No suitable habitat on-site. Nearest occurrence on Tehachapi South quadrangle, at least 7 miles northwest of site.
Horn's milk-vetch *Astragalus hornii*	1B.1	Meadows and seeps; playas (lake margins, alkaline sites).	**Not Expected**. No suitable habitat on-site. Known occurrence within Willow Springs quadrangle.
Lancaster milk-vetch *Astragalus preussii* var. *laxiflorus*	1B.1	Chenopod scrub.	**Possible.** Suitable habitat may be present, but historic occurrence within Lancaster West quadrangle presumed extirpated.
Palmer's mariposa-lily *Calochortus palmeri* var. *palmeri*	1B.2	Chaparral; lower montane coniferous forest; meadows and seeps.	**Not Expected.** No suitable habitat on-site. Nearest occurrence on Tehachapi South quadrangle, at least 6 miles northwest of site.
Alkali mariposa lily *Calochortus striatus*	1B.2	Chaparral; chenopod scrub; Mojavean desert scrub; meadows and seeps	**Occurs.** Documented on Chaparral Solar during 2019 field surveys; CNDDB contains known occurrences within Willow Springs and Little Buttes quadrangles.
San Fernando Valley spineflower *Chorizanthe parryi* var. *fernandina*	FC/1B.1	Coastal sage scrub; valley and foothill grassland	**Not Expected.** No suitable habitat. Known occurrence within Lake Hughes quadrangle.
Parry's spineflower *Chorizanthe parryi* var. *parryi*	1B.1	Chaparral; cismontane woodland; coastal scrub; valley and foothill grassland (sandy or rocky openings).	**Not Expected.** No suitable habitat. Known occurrence within Lancaster West quadrangle.
Clokey's cryptantha *Cryptantha clokeyi*	1B.2	Mojavean desert scrub.	**Possible.** Suitable habitat present on-site. Known occurrences on Fairmont Butte, Lake Hughes, and Del Sur quadrangles.
Recurved larkspur *Delphinium recurvatum*	1B.2	Chenopod scrub; cismontane woodland; valley and foothill grassland.	**Possible.** Suitable habitat may be present on-site. Known occurrence within Soledad Mountain quadrangle.
Calico monkeyflower *Diplacus pictus*	1B.2	Broadleaved upland forest; cismontane woodland (granitic, disturbed areas).	**Not Expected.** No suitable habitat on-site. Known occurrence within Tehachapi South quadrangle.
Rosamond eriastrum *Eriastrum rosamondense*	1B.1	Chenopod scrub (openings); vernal pools (edges); alkaline hummocks	**Possible.** Suitable habitat may be present. Known occurrences within Rosamond and Lancaster West quadrangles.
Coulter's goldfields *Lasthenia glabrata* ssp. *coulteri*	1B.1	Marshes and swamps; playas; vernal pools.	**Not Expected.** No suitable habitat on-site. Known occurrence within Tehachapi South quadrangle.

Appendix B1. Special-status plant species identified in the CNDDB and CNPS queries and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status*	Habitat Description	Potential for Occurrence
Pale-yellow layia *Layia heterotricha*	1B.1	Cismontane woodland; coastal scrub; pinyon and juniper woodland; valley and foothill grassland.	**Not Expected.** No suitable habitat present. Known occurrences within Tehachapi South, Monolith, and Mojave quadrangles.
Sagebrush loeflingia *Loeflingia squarrosa* var. *artemisiarum*	2B.2	Desert dunes; Great Basin scrub; Sonoran desert scrub.	**Possible.** Suitable habitat may be present on-site. Known occurrences within Soledad Mountain and Rosamond quadrangles.
Tehachapi monardella *Mondardella linoides* var. *oblonga*	1B.3	Lower montane coniferous forest; pinyon and juniper woodland; upper montane coniferous forest.	**Not Expected.** No suitable habitat on-site. Known occurrences within Tehachapi South, Monolith, and Tylerhorse Canyon quadrangles.
Spreading navarretia *Navarretia fossalis*	FT/1B.1	Chenopod scrub; marshes and swamps; playas; vernal pools.	**Possible.** Suitable habitat may be present on-site. Known occurrence within Lake Hughes quadrangle.
Baja navarretia *Navarretia peninsularis*	1B.2	Chaparral; lower montane coniferous forest; meadows and seeps; pinyon and juniper woodlands.	**Not Expected.** No suitable habitat present on-site. Known occurrence within Tehachapi South quadrangle.
Short-joint beavertail *Opuntia basilaris* var. *brachyclada*	1B.2	Chaparral; Joshua tree woodland; Mojavean desert scrub; pinyon and juniper woodland.	**Possible.** Suitable habitat may be present. Known occurrences within Del Sur and Lake Hughes quadrangles.
Bakersfield cactus *Opuntia basilaris* var. *treleasei*	FE/SE/1B.1	Chenopod scrub; cismontane woodland; valley and foothill grassland.	**Possible.** Suitable habitat may be present; however, known occurrences are greater than 25 miles to the northwest.
Latimer's woodland-gilia *Saltugilia latimeri*	1B.2	Chaparral; Mojavean desert scrub; pinyon and juniper woodland.	**Possible.** Suitable habitat may be present. Known occurrence within Monolith quadrangle.
Salt spring checkerbloom *Sidalcea neomexicana*	2B.2	Chaparral; coastal scrub; lower montane coniferous forest; Mojavean desert scrub; playas (alkaline, mesic).	**Possible.** Suitable habitat may be present. Known occurrence within Lake Hughes quadrangle.
Grey-leaved violet *Viola pinetorum* var. *grisea*	1B.2	Meadows and seeps; subalpine coniferous forest; upper montane coniferous forest.	**Not Expected.** No suitable habitat on-site. Known occurrence within Tehachapi South quadrangle.

***California Rare Plant Ranks (formerly known as CNPS Lists)**

1A: plants presumed extirpated in California and either rare or extinct elsewhere

1B: plants rare, threatened, or endangered in California and elsewhere

2A: plants presumed extirpated in California, but common elsewhere

2B: plants rare, threatened, or endangered in California, but more common elsewhere

Threat Ranks

0.1: seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)

0.2: moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat)

0.3: not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

CDFW Ranks

SE: State Endangered Species

USFWS Ranks

FC: Federal Candidate species

FT: Federal Threatened species

Appendix B2. Special-status wildlife species identified in the CNDDB query and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status[1]	Habitat Description	Potential for Occurrence
Birds			
burrowing owl *Athene cunicularia*	SSC	Inhabits open dry grasslands, desert, and scrubland characterized by low-growing vegetation. Utilizes subterranean nests constructed by burrowing mammals.	**Occurs.** Suitable habitat present throughout the Project site. Known to breed and winter in the Antelope Valley. Burrows with sign of previous burrowing owl activity were observed on Chaparral Solar during 2017 field surveys, and an active burrow was identified within the off-site collector line corridor during 2018 surveys. CNDDB documents numerous locations for the species in the Project vicinity.
California condor *Gymnogyps californianus*	FE, SE	Requires vast expanses of open savanna, grassland, and foothill chaparral in mountains and foothills; tends to avoid large, open valleys. Nests in clefts of rocky walls or deep canyons or hollows of large trees. Roosts on cliffs, in large trees, and snags. Can forage up to 180 km from nest/roost.	**None.** No nesting/roosting habitat present within the Project site and Project is outside of the species' current and historic range. Critical habitat for the species is present in Tehachapi Mountains 14 miles west of the Project.
Golden eagle *Aquila chrysaetos*	SFP	Uncommon permanent resident and migrant throughout California; inhabits rolling hills, sage-juniper flats and deserts. Uses secluded cliffs and rocky outcrops and large trees for nesting.	**Likely.** Year-round resident and migrant in region. No suitable nesting habitat within Project site (closest known nest is eight miles from Project site); however, eagles may occasionally forage within Project site.
Le Conte's thrasher *Toxostoma lecontei*	SSC	Occurs in open desert wash, desert scrub, alkali desert scrub, and desert succulent shrub habitats; also Joshua tree habitat with scattered shrubs.	**Occurs.** Suitable nesting and foraging habitat present throughout the Project site. Observed foraging on Rabbitbrush Solar during 2017 field surveys. CNDDB documented several occurrences in the Project vicinity including one location within Chaparral Solar.
loggerhead shrike *Lanius ludovicianus*	SSC	Uses open habitats with shrubs, trees, posts, fences, and low utility lines for perching. Forages in edge habitats, preferring shrubs adjacent to grasslands.	**Occurs.** Suitable nesting and foraging habitat present throughout Project site; observed within Rabbitbrush Solar during 2017 field surveys. CNDDB documents numerous locations in Project vicinity.
long-eared owl *Asio otus*	SSC	Uses riparian or other thickets with relatively small densely canopied trees for roosting and nesting. For wintering,	**Possible.** Suitable foraging habitat occurs throughout Project site; nesting/roosting habitat may be present within windrows adjacent to Project site.

Appendix B2. Special-status wildlife species identified in the CNDDB query and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status[1]	Habitat Description	Potential for Occurrence
		requires dense stands of vegetation adjacent to large tracts of open habitat for foraging.	The species was documented roosting in a wind break during 2010 surveys conducted for the adjacent Rosamond Solar Project.
mountain plover *Charadrius montanus*	SSC	Winter resident in California, inhabits short, open, grasslands, plowed fields, open sagebrush areas, and foothill valleys.	**Occurs.** Suitable habitat present; winter resident and/or migrant; observed on Rabbitbrush Solar during 2017 field surveys. CNDDB documents species' occurrence at a number of locations within five miles of the Project, primarily to the south.
northern harrier *Circus cyaneus*	SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded habitats	**Occurs.** Suitable nesting habitat not present but may occasionally forage in Project site during winter and/or during migration. Observed on Chaparral Solar during 2017 field surveys.
Swainson's hawk *Buteo swainsoni*	ST	Breeds in grasslands and desert scrub habitats with scattered trees, Juniper-sage flats, Joshua tree woodlands, riparian areas, and agricultural or ranch lands; requires adjacent foraging areas supporting rodent populations.	**Occurs.** Suitable nesting and foraging habitat occurs throughout the Project site. Three active nests recorded within five miles of the Project boundary during 2017 field surveys; no active nests recorded during 2018 surveys. Observed foraging within Project site in 2017 and 2018. CNDDB documents 12 historic nest locations within five miles of Project, including six nests within 0.25 miles of Tumbleweed Solar.
tricolored blackbird *Agelaius tricolor*	SSC	Highly colonial species, largely endemic to California, and most numerous in Central Valley. Requires open water, protected nesting substrate, and nearby foraging area with insect prey.	**Not Expected.** No suitable nesting habitat in Project site or surrounding area.
Mammals			
American badger *Taxidea taxus*	SSC	Most abundant in drier, open stages of most shrub, forest, and herbaceous habitats with friable soils for digging burrows.	**Occurs.** Suitable habitat present throughout Project site. Potentially active burrows with sign of recent use documented within Rabbitbrush Solar and Chaparral Solar during 2017 field surveys. CNDDB documents species occurrence just outside eastern boundary of Chaparral Solar.
desert kit fox *Vulpes macrotis arsipus*	None[2]	Inhabits creosote bush scrub and dry grassland habitats throughout the Mojave	**Occurs.** Suitable habitat present throughout Project site. Active natal den documented on Chaparral

Appendix B2. Special-status wildlife species identified in the CNDDB query and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status[1]	Habitat Description	Potential for Occurrence
		Desert.	Solar and active escape dens observed on Chaparral Solar and Rabbitbrush Solar during 2017 field surveys.
Mohave ground squirrel *Spermophilus mohavensis*	ST	Inhabits creosote bush scrub, saltbush scrub, and Joshua tree woodland communities occurring on flat to moderately-sloped terrain. Restricted to western Mojave desert. No records of species occurring west of State Route 14 despite extensive survey effort over past decade.	**Not Expected.** Project falls outside of current known range for species; closest documented occurrence is eight miles to the east of the Project (CNDDB 2018).
pallid bat *Antrozous pallidus*	SSC	Inhabits arid grassland, shrubland, and woodlands from sea level to sub-alpine mixed conifer forest. Roosts in rock crevices, buildings, and bridges.	**Likely.** Limited roosting habitat is present, but species likely forages throughout the Project site.
Tehachapi pocket mouse *Perognathus alticolus inexpectatus*	SSC	Occurs in a diversity of habitats including Joshua tree woodland, pinyon-juniper woodland, oak savanna, and non-native grasslands; burrows in friable, sandy soil. Historically occurred in the vicinity of Tehachapi Pass.	**Not Expected.** Suitable habitat may be present, but range is generally to the west and south of the Project. CNDDB documents species' occurrence approximately three miles to northwest.
Townsend's big-eared bat *Corynorhinus townsendii*	SSC	Typically inhabits arid western desert scrub and pine forest. Forms maternity roosts in caves, mines, or buildings. In winter, hibernates in caves and abandoned mines.	**Likely.** No suitable roosting habitat present, but species likely forages throughout the Project site.
Tulare grasshopper mouse *Onychomys torridus tularensis*	SSC	Occurs in arid shrubland communities in hot, arid grasslands and shrubland associations such as alkali sink; known to occur along the western margin of the Tulare Basin including western Kern County.	**Not Expected.** Suitable habitat may be present but range is generally to the west of the Project site; CNDDB documents species' occurrence at two locations approximately 3.5 and 4.5 miles to the northwest of the Project.
Reptiles			
coast horned lizard *Phrynosoma blainvillii*	SSC	Occurs in loose sandy soils and alkali flats in a variety of habitats, including chaparral, grassland, saltbrush (*Atriplex* spp.) scrub,	**Not Expected.** Elements of suitable habitat present within Project site; however, Project lies outside of species known range and documented occurrences

Appendix B2. Special-status wildlife species identified in the CNDDB query and literature review, and their potential to occur within the AVEP Solar Project, Kern County, California.

Species	Conservation Status[1]	Habitat Description	Potential for Occurrence
		coastal sage scrub, and clearings in riparian woodlands. Require abundant prey base of ants and other insects.	are generally to the west of the Project, closer to the Tehachapi Mountains (CNDDB 2018).
desert tortoise *Gopherus agassizii*	FT, ST	Occurs in gravelly desert washes, canyon bottom, and rocky hillsides in habitats including the creosote, shadscale, and Joshua tree/Mohave yucca series of Mojave Desert scrub, the lower Colorado River Valley subdivision of Sonoran Desert scrub, and semi-arid grasslands. Prefers habitats where diversity of perennial species and production of ephemerals is relatively high. Requires friable soils for burrow construction.	**Not Expected.** Habitat of moderate suitability; Project is located near edge of species range. Desert tortoises or tortoise sign not observed during focused 2017 and 2018 field surveys throughout Project site. Species not detected during protocol surveys at adjacent solar projects. CNDDB documents nearest occurrence as 2.8 miles to northeast of the Project.
northern California legless lizard *Anniella pulchra*	SSC	Occurs in moist, warm, loose soil with plant cover including sparsely vegetated areas of beach dune, chaparral, pine-oak woodlands, desert scrub, and sandy washes.	**Not Expected.** Suitable, moist soil not likely present within Project site; range is generally to northwest of Project, closer to the Tehachapi Mountains. CNDDB documents species occurrence approximately 4.5 miles to northwest of Project.
silvery legless lizard *Amniella pulchra*	SSC	Burrowing species associated with sandy or loose loamy soils with sparse vegetation; uses chaparral, pine-oak woodland, washes, and streamside terraces; requires elevated soil moisture.	**Not Expected.** Suitable habitat not present within Project site.

Re: Biological Resources Technical Report Update for AVEP Solar Project Revision

---

I. INTRODUCTION

Western EcoSystems Technology, Inc. (WEST) prepared the Biological Resources Technical Report (Report) for the proposed AVEP Solar Project (Project) to evaluate the existing environmental conditions at the Project site, to examine potential impacts of the Project on special-status biological resources, and to recommend measures to avoid or substantially lessen potential significant biological impacts (WEST 2019). Since preparing the Report, the Project has undergone modifications. The primary components of these modifications consist of (1) the removal of the previously identified approximate 721-acre Tumbleweed Solar Facility from the Project; and (2) increasing the proposed site for the Chaparral Solar Facility from approximately 764 acres to approximately 774 acres to include an optional location (one of two potential locations on the Chaparral Solar Facility) for a proposed energy storage system (ESS), through the addition of an approximate 10-acre parcel to the proposed Chaparral Solar Facility site.

The added Chaparral Solar Facility 10-acre parcel is located at the northwest corner of Holiday Avenue and 110th Street West, directly across Holiday Avenue from the existing Willow Springs Solar Project Substation. The proposed capacity of the ESS on both the Rabbitbrush and Chaparral Solar Facilities has been increased, to store up to 1,000 megawatt-hours (MWh) of energy on each facility (for a combined Project total of up to 2,000 MWh), however, the proposed acreage of each ESS would remain at approximately five acres of land within each facility site. As shown on Figure 1 – Project Map, and Figures 2a and 2b – Site Plan, a portion of the remainder of the 10-acre parcel added to the Chaparral Solar Facility for the ESS would be occupied by access easements for electric collection and temporary water lines.

This memorandum updates the technical analysis and the evaluation of the potential impacts of the Project on special-status biological resources as presented in the Report. In summary, the Project modifications result in a reduction of the environmental effects as previously analyzed and presented in the above referenced Report; however, the significance determination and proposed mitigation measures presented in Report remain unchanged.

II. MODIFIED PROJECT DESCRIPTION

The Project would involve the construction, operation, and eventual decommissioning of two solar photovoltaic (PV) power generating facilities that would be capable of delivering a total of approximately 250 megawatts of alternating current (MW-ac) electricity, along with associated facilities including the ESS units. The proposed Project consists of two non-contiguous solar generating facilities, the Rabbitbrush Solar Facility (125 MW-ac) and the Chaparral Solar Facility (125 MW-ac), each with a separate ESS to store approximately 1,000 megawatt-hours (MWh) per facility, for a total of approximately 2,000 (MWh).

III. MODIFICATIONS TO THE ANALYSIS

Potential environmental effects resulting from the Project modifications as compared to the Project previously analyzed in the Report are presented below. Implementing the Project modifications, either separately or as a whole, would not result in any new or more severe environmental effects than those identified in the Report. The modifications would not affect the significance conclusions presented in the Report. Accordingly, the modifications would not require any new recommended mitigation measures compared to those recommended in the above referenced Report.

To reach these conclusions, WEST analyzed the individual effects of removing the Tumbleweed Solar Facility and the addition of an optional location for an ESS at the Chaparral Solar Facility on special-status biological resources. This analysis consisted of a review of the results of field surveys conducted throughout the Project and surrounding area from 2017 through 2019. We then evaluated whether each Project modification would result in an increase, decrease, or no change to potential impacts to special-status biological resources identified in the Report as occurring in the region. Finally, based on this evaluation of impacts, we reexamined the significance conclusions and proposed mitigation measures presented in the Report to determine whether they remain valid for the modified Project. The memorandum then presents our analysis of the combined effect of the two actions on special-status biological resources and the resulting significance conclusions for both Project modifications combined.

a. Removing the Tumbleweed Solar Facility

We analyzed the impact on special-status biological resources resulting from the removal of the Tumbleweed Solar Facility. We determined that the modification would reduce the environmental effects and otherwise improve the environmental condition of the Project when compared to the Project analyzed in the Report.

Removal of the proposed Tumbleweed Solar Facility would effectively reduce the Project footprint by 721 acres and eliminate approximately the southern-most one-third of the previously proposed Project site, including the area with the greatest concentration of historical Swainson's hawk nests, as identified during the initial database and literature review (Figure 4). Based on the focused, transect-based field surveys conducted within the Tumbleweed Solar Facility in 2017 and 2019, no special-status biological resources were documented within the Tumbleweed Solar

Facility boundary. Biological resources evaluated for this project included sensitive habitats, special-status plant and animal species, and potential for wildlife movement corridors. The potential for special-status species to occur on the project site is based on the results of database research, biological assessments, surveys conducted on the project site and vicinity, presence of suitable habitat, and the proximity of the project site to previously recorded occurrences in the California Natural Diversity Database (CNDDB; 2018). The majority of this previously proposed facility is an active pistachio orchard with most of the areas outside of the orchard composed of fallow agricultural fields, with the remainder being undeveloped land (open desert) and scattered residences and associated outbuildings. Based on information from the CNDDB (2018), 11 historical Swainson's hawk nest locations have been documented within one mile of the Tumbleweed Solar Facility (Figure 4). During Swainson's hawk nest surveys conducted within five miles of the Project in 2017, 2018, and 2019, two of the active Swainson's hawk nests documented during the surveys, were within one mile of the Tumbleweed Solar Facility site, with one of the nests located approximately 65 feet from the southern boundary of the site (Figure 4).

With the removal of the Tumbleweed Solar Facility from the Project, the nearest active Swainson's hawk nest to the Project, based on the 2017-2019 survey results, is approximately 2 miles south of the modified Project (Figure 4). Removal of the Tumbleweed Solar Facility would reduce potential impacts to the two Swainson hawk nests that are located within one mile of that facility, particularly the nest adjacent to the facility, both in terms of potential disturbance to the nest during construction and operations, as well as a reduction in loss of foraging habitat in proximity to these nests. While the majority of the site for the Tumbleweed Solar Facility is not considered suitable foraging habitat for Swainson's hawk due to the presence of orchards, there are approximately 285 acres of fallow agricultural fields and open desert that are considered suitable foraging habitat for the hawk that will no longer be impacted by Project development. Additionally, as Swainson's hawks typically forage in areas of suitable habitat adjacent to their nest site, the non-orchard portions of the Tumbleweed Solar Facility may provide foraging habitat for the species due to their location adjacent to historical Swainson's hawk nests to that facility.

Although the removal of the previously proposed Tumbleweed Solar Facility would likely cause a decrease in impacts to Swainson's hawk, the overall impacts to Swainson's hawk resulting from development of the modified Project would remain potentially significant. Implementation of the proposed mitigation measures presented in the Report would reduce this impact to less than significant. Therefore, the significance conclusions presented in the Report remain the same with the removal of the Tumbleweed Solar Facility and no change to the mitigation measures proposed in the above referenced Report is required. Based on this Project modification, impacts to biological resources remain less than significant with mitigation.

b. Adding optional location for the ESS for the Chaparral Solar Facility

We analyzed the impact on special-status biological resources resulting from the addition of an optional location for the ESS for the Chaparral Solar Facility. This modification includes adding a 10-acre parcel to the proposed Chaparral Solar Facility at a location at the northwest corner of Holiday Avenue and 110th Street West, directly across Holiday Avenue from the existing Willow Springs Solar Project Substation. We determined that this modification does not result in any new

significant environmental effects or a significant increase in the severity of environmental effects that were previously analyzed in the Report. Therefore, the modification would not affect the environmental effects analysis or significance conclusions of the Report and no change to the proposed mitigation measures is applicable.

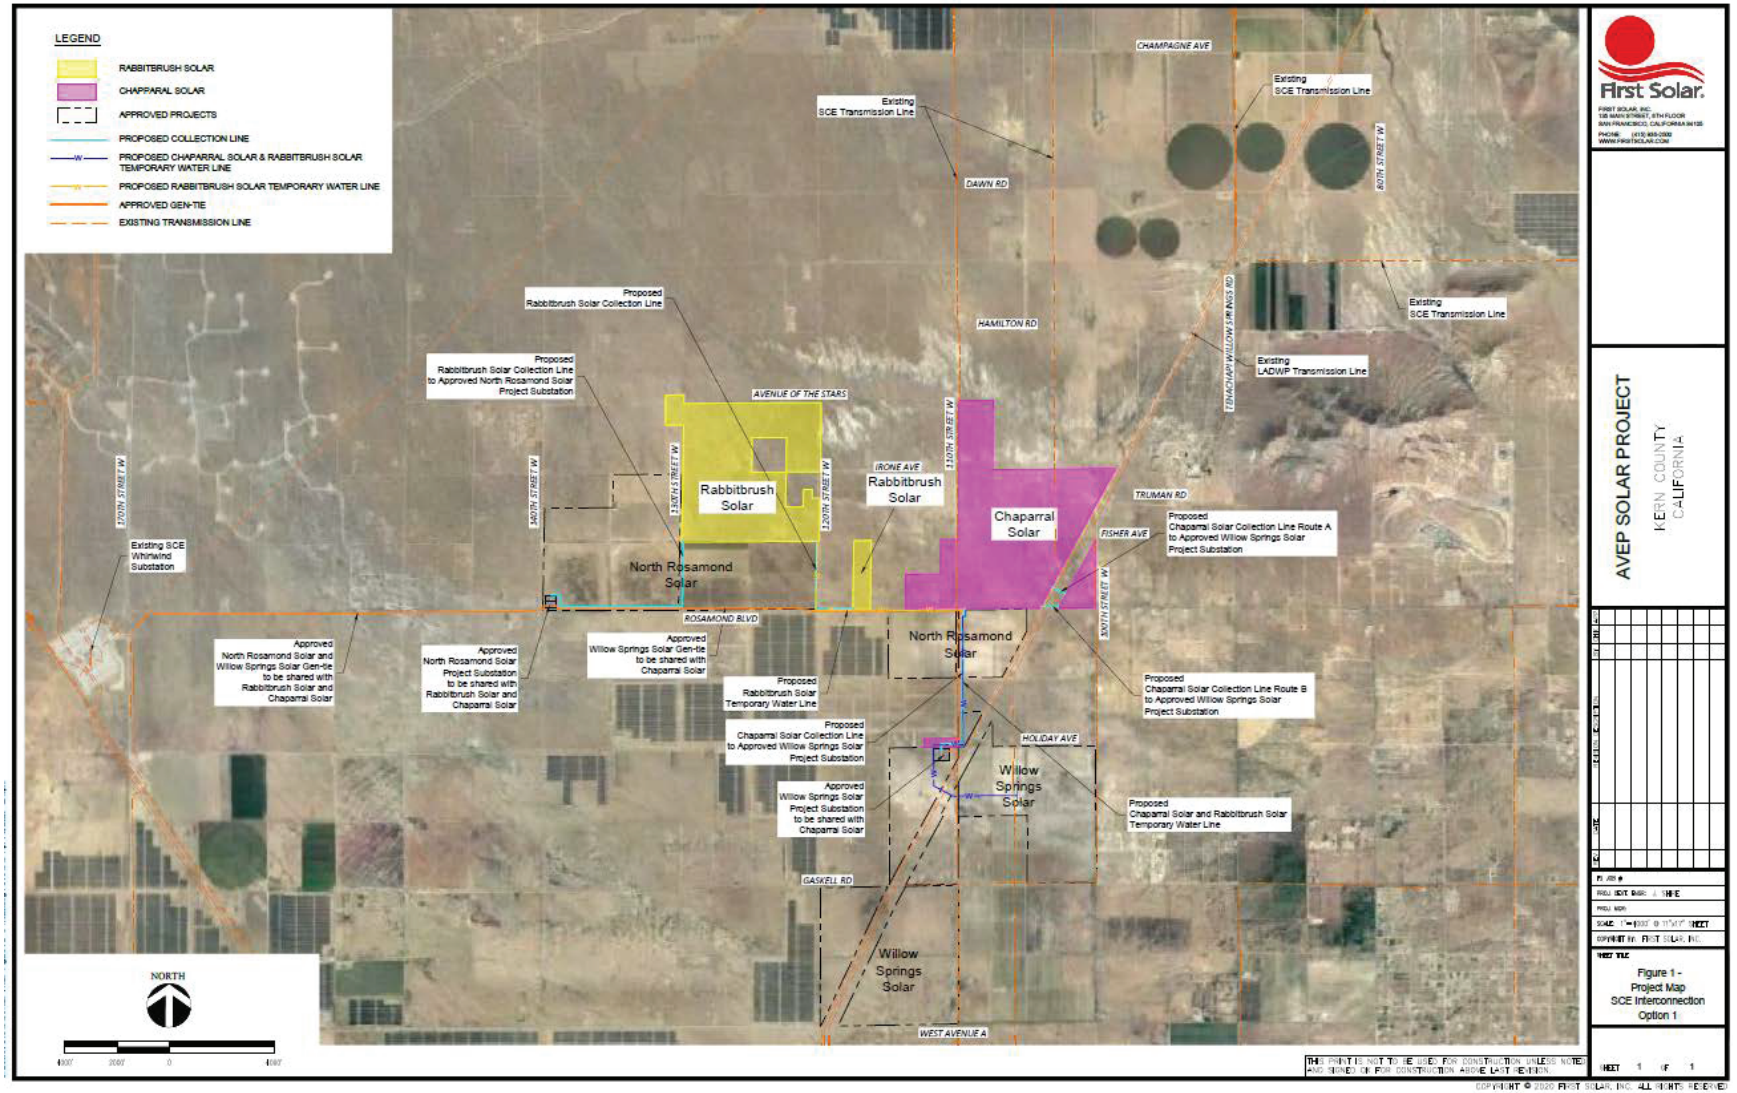
The 10-acre parcel added to the proposed Chaparral Solar Facility site for an optional ESS location was previously included in the effects analysis in the Report as it falls entirely within a portion of the proposed collection line corridor evaluated for the Facility (as shown on Figure 2b of the Report). To examine potential impacts to biological resources associated with the proposed collection line, WEST conduced focused, transect-based surveys along the collection line corridor on the north side of Holiday Avenue, which includes the entirety of the aforementioned 10-acre ESS parcel, during the spring of 2018. As such, this ESS parcel was completely surveyed for special-status species following the survey protocols used throughout other portions of the Project and described in detail in the Report. The only special-status biological resource documented during the survey of the 10-acre ESS parcel, was a single active burrowing owl burrow located approximately 19 meters to the north of the parcel (Figure 5). This observation occurred outside of the 10-acre parcel, but within the survey buffer viewed by biologists with binoculars for off-site locations where they did not have access approval from the third-party landowner used during the transect surveys, and is discussed in detail in the Report (WEST 2019).

Because this 10-acre parcel was previously studied in the field and included in the Report's impact analysis, the significant conclusions presented in the Report remain unchanged and no change to the mitigation measures recommended in the above referenced Report are required.

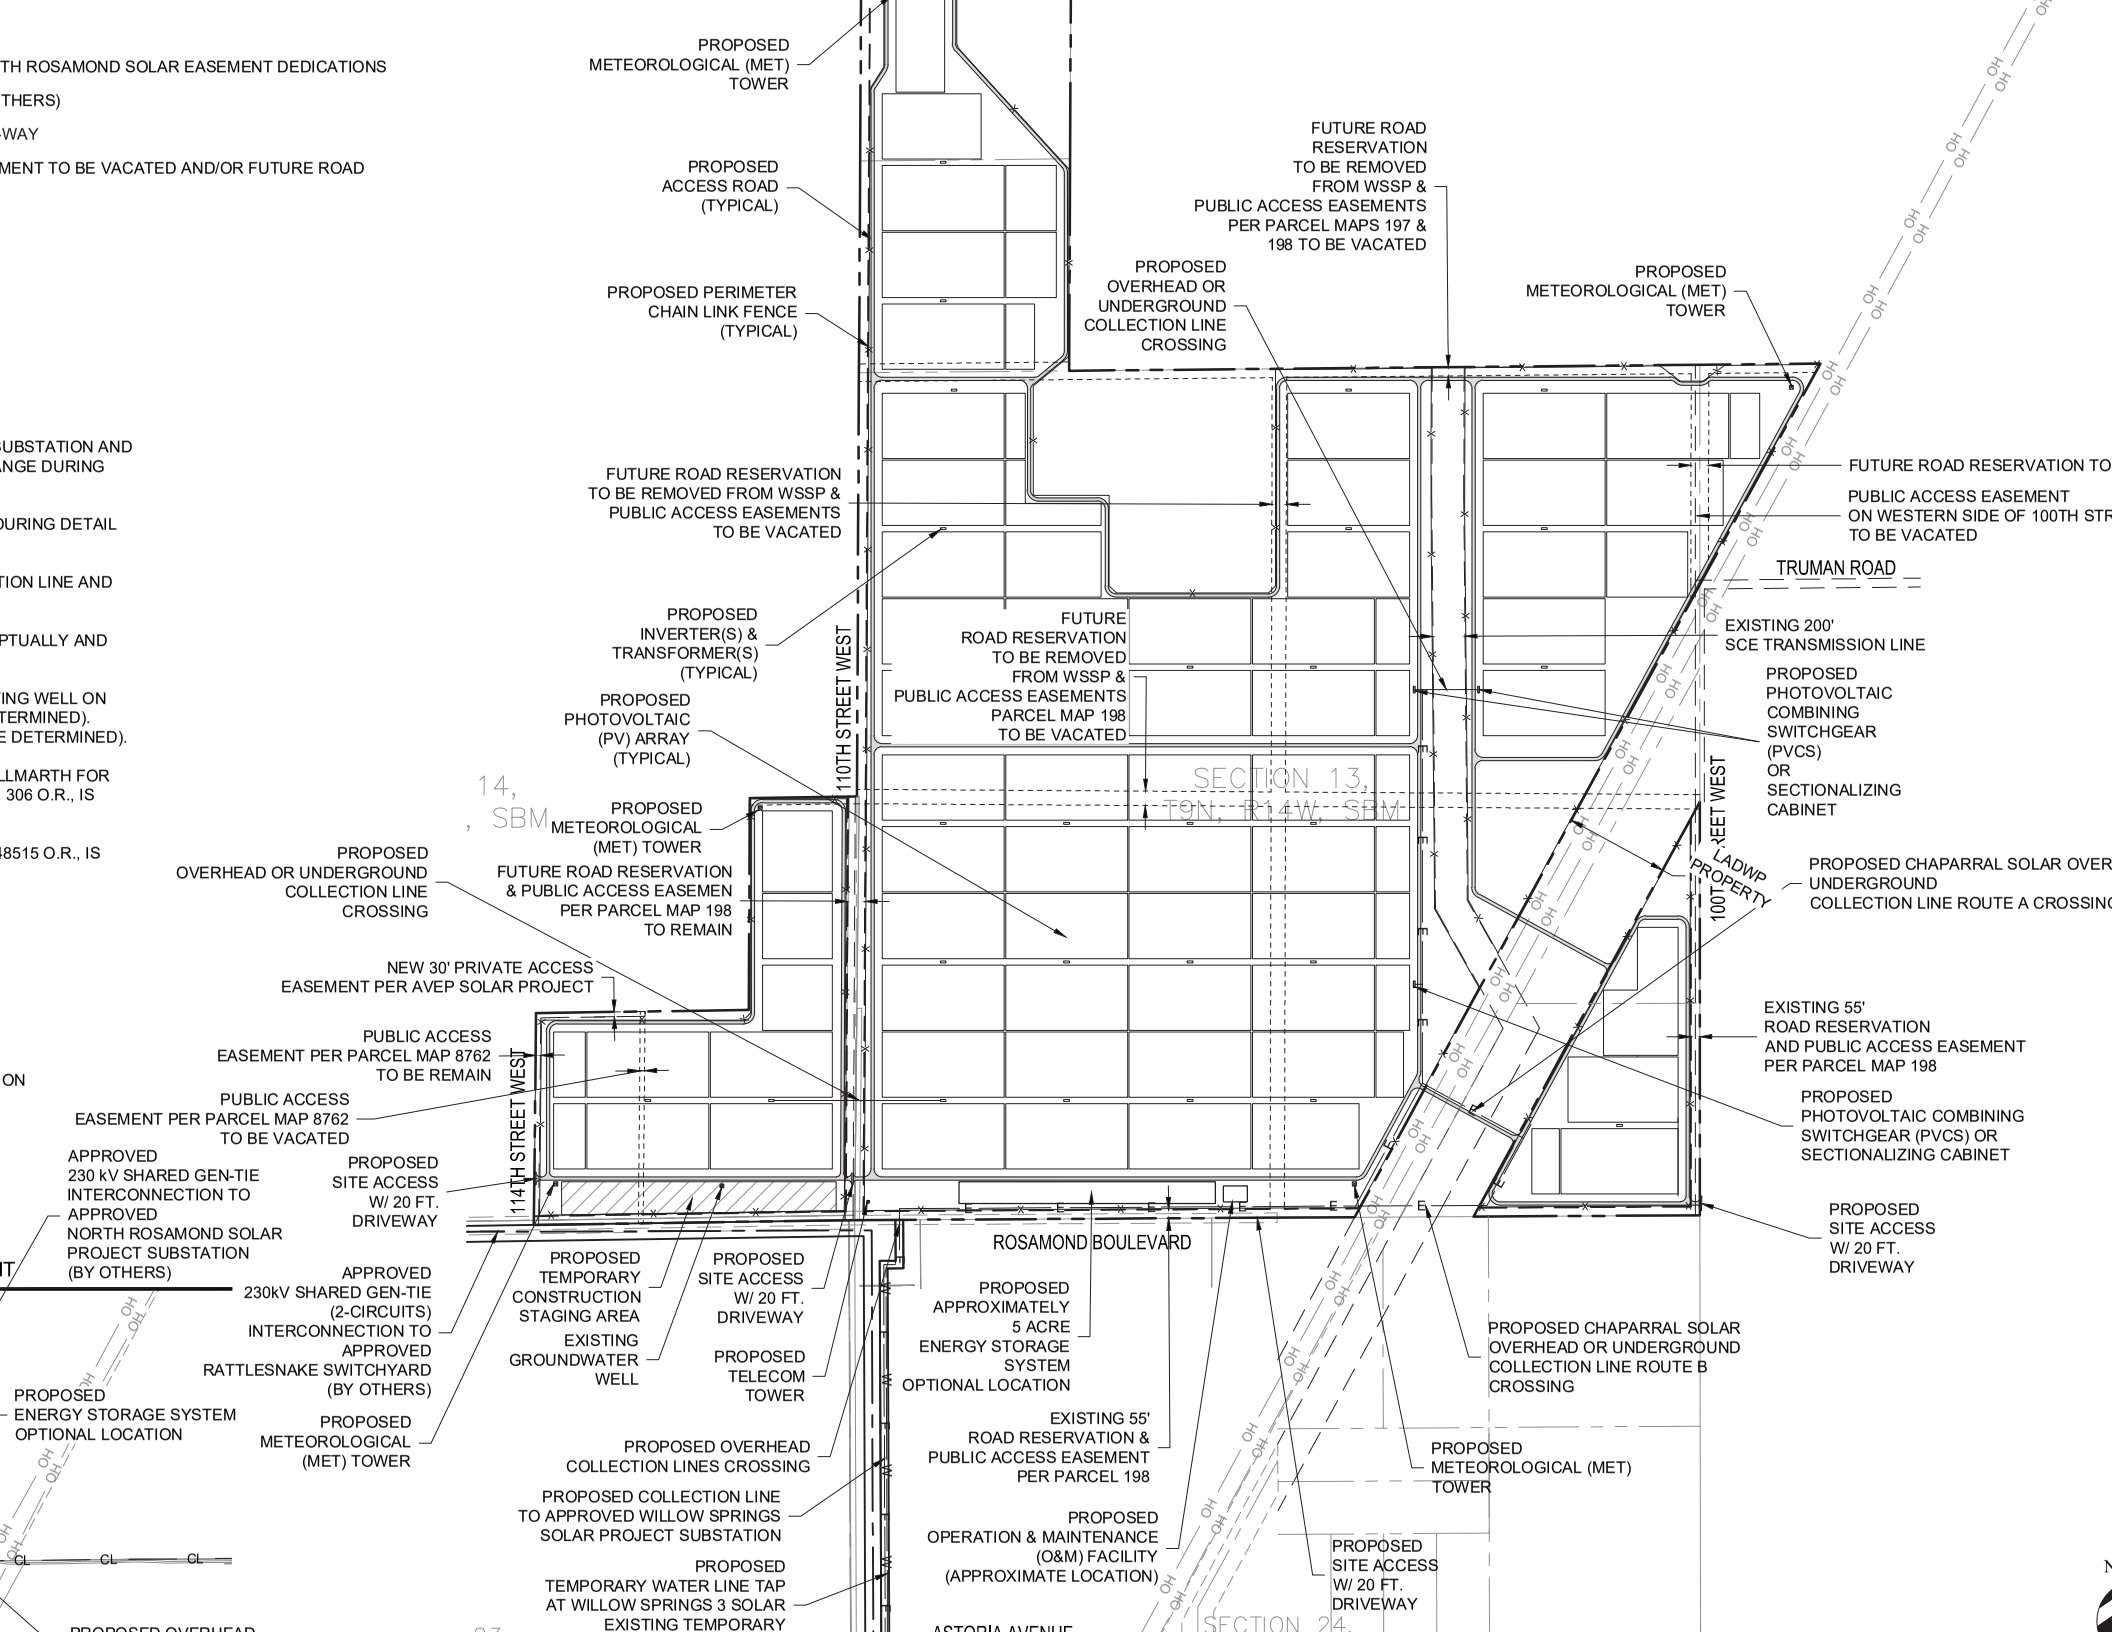
c. Combined Effect of Both Project Modifications

Finally, we analyzed the combined effect on special-status biological resources resulting from removal of the proposed Tumbleweed Solar Facility and the addition of an optional location for the ESS for the proposed Chaparral Solar Facility. We determined that the modifications, when considered together, do not result in any new or more severe significant effects compared to the effects previously identified in the above referenced Report. Therefore, there is no need to change the prior significance conclusions or to evaluate new mitigation measures.

As described above, the removal of the proposed Tumbleweed Solar Facility would reduce the overall impact to special-status biological resources resulting from development of the Project by reducing the overall Project footprint and eliminating portions of the Project most proximal to known Swainson's hawk nest sites. Addition of the 10-acre ESS parcel to the proposed Chaparral Solar Facility would have no additional impact to special-status biological resources as this area was previously studied and already included in the Report's impact analysis. Combined, these two Project modifications would result in an overall reduction in potential impacts to biological resources. However, because potential impacts to Swainson's hawks resulting to the Rabbitbrush and Chaparral Solar Facilities remain potentially significant, the combined effects of both Project modifications would not affect the significance conclusions presented in the Report and no change to the proposed mitigation measures are required.



IV. CONCLUSION



When considered both individually and together, the modifications to the Project would not result in any new or more severe significant effects to special-status biological resources. Accordingly, the above referenced Report's previous analysis and conclusions regarding impacts and recommended mitigation measures would not change.

Appendix F: November 2, 2020 Reconnaissance Level Joshua Tree Surveys

Addendum to AVEP Solar Project Biological Resources Technical Report

Reconnaissance Level Joshua Tree Surveys

Addendum to AVEP Solar Project Biological Resources Technical Report

Rabbitbrush and Chaparral Solar Facilities

November 2, 2020

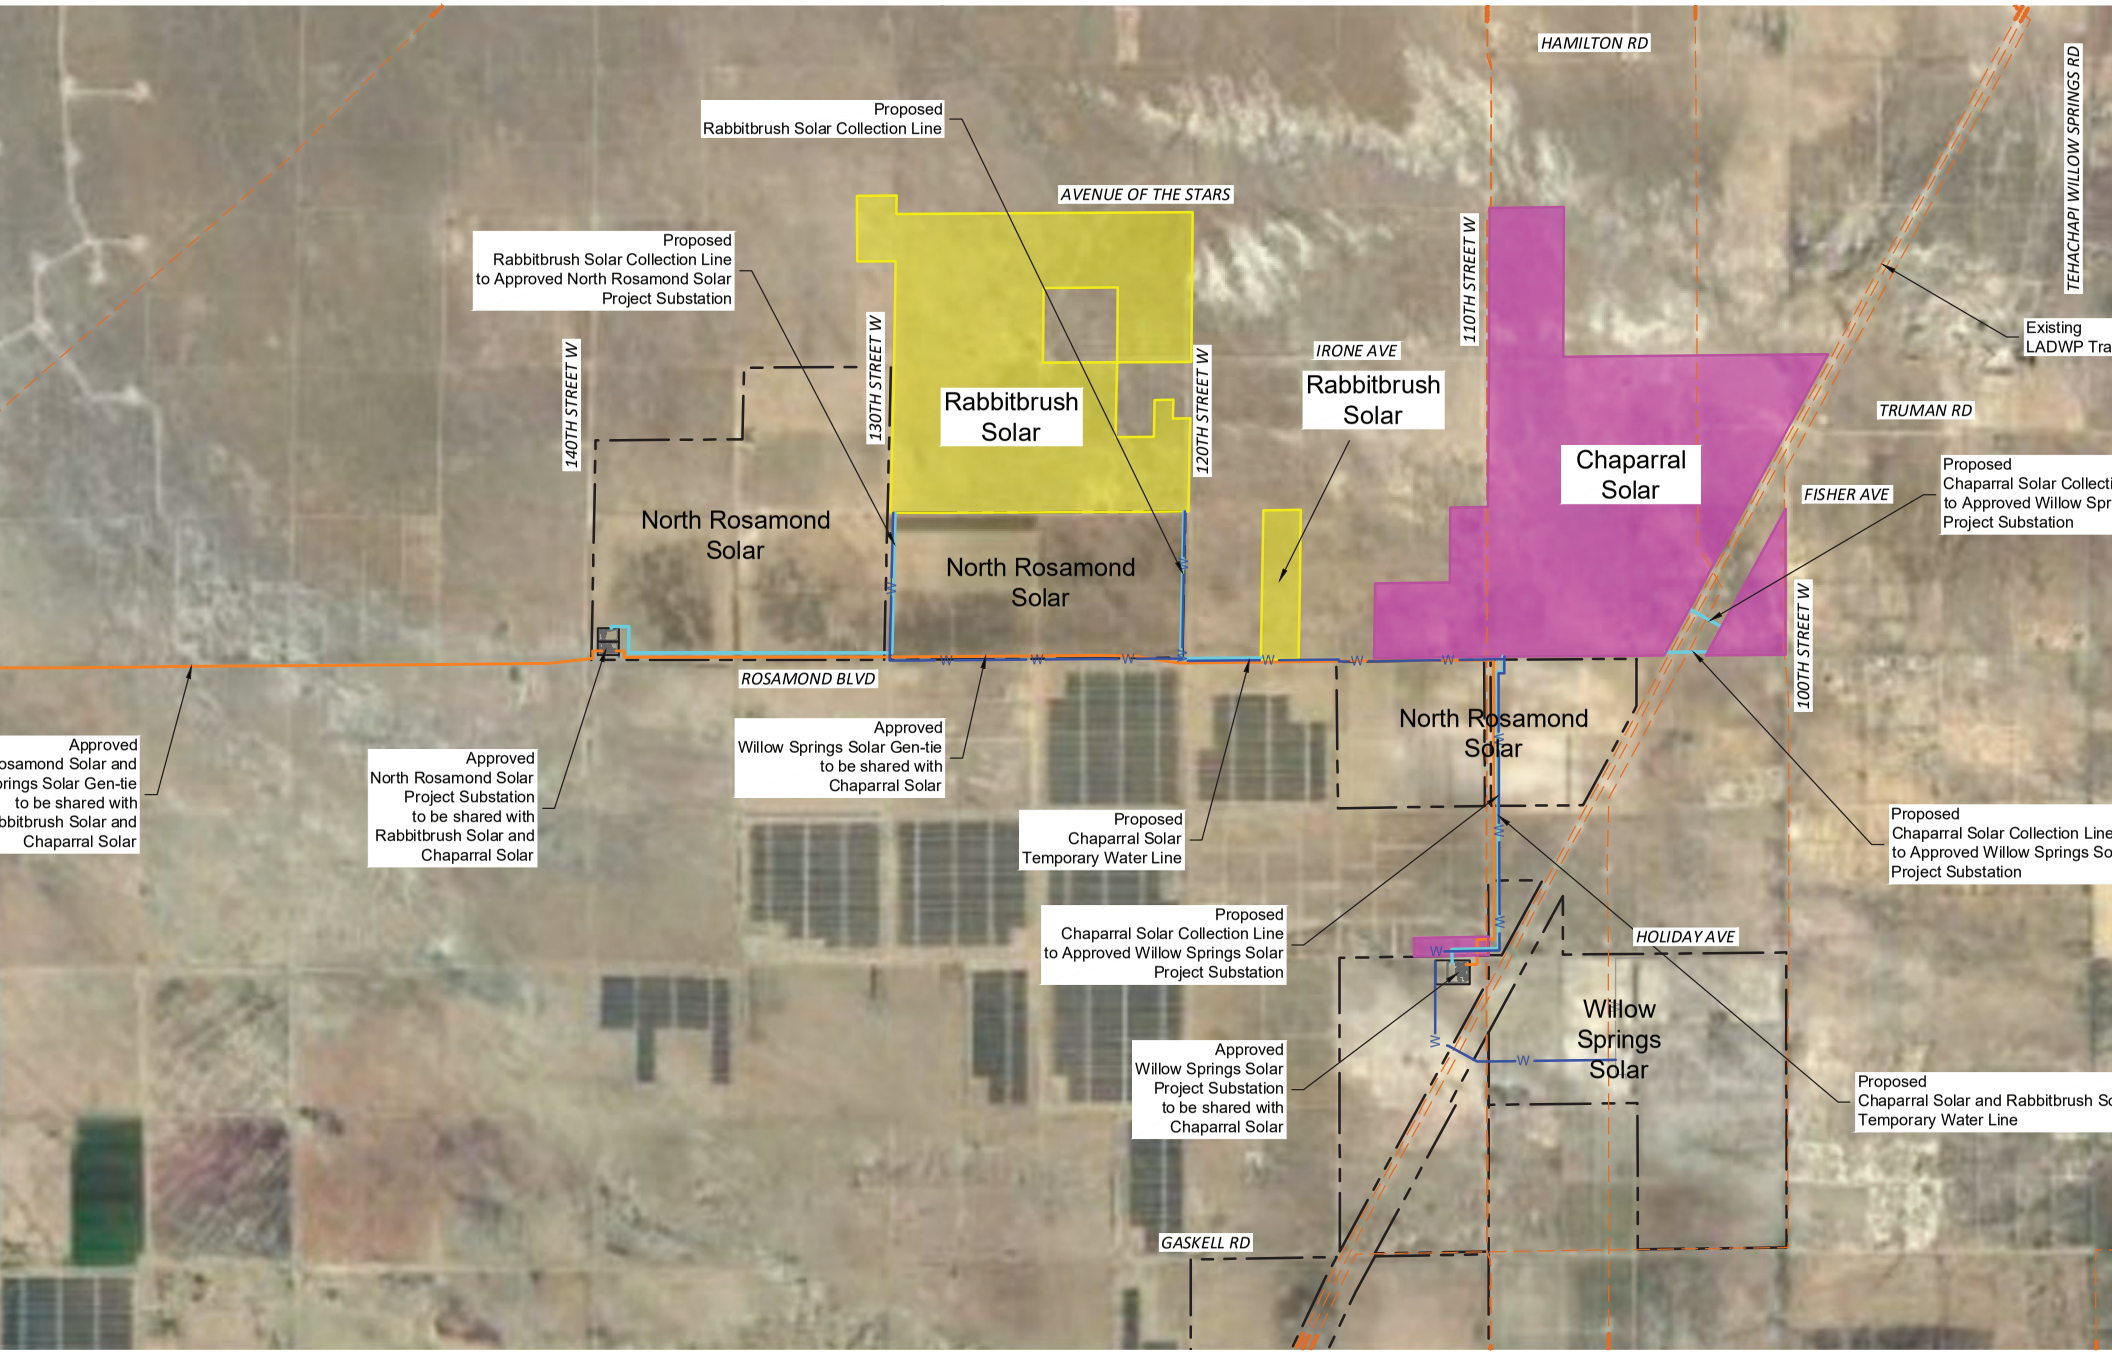
1 Introduction

On September 22, 2020, the California Fish and Game Commission (the Commission) voted to designate the western Joshua tree (*Yucca Brevifolia*) as a candidate species under the California Endangered Species Act (CESA). This interim designation commences a status review of up to one year of the species by California Department of Fish and Wildlife (CDFW), during which time the western Joshua tree is protected as a candidate species under CESA. The Commission will make a final decision whether listing as threatened or endangered is warranted at a future meeting once CDFW's status review is completed. During this same September 22 meeting, the Commission adopted an emergency regulation pursuant to Fish and Game Code Section 2084 to authorize conditional take of western Joshua tree during its candidacy for 15 solar energy projects in California expected to break ground within the year. Both the Rabbitbrush and Chaparral solar facilities are designated on the Section 2084 list of projects.[1]

2 Reconnaissance Level Surveys

As a result of the anticipated listing of the western Joshua tree as a candidate species, the applicant conducted additional reconnaissance level surveys to further identify both the number and size of western Joshua trees present on the Rabbitbrush and Chaparral solar facility sites. Project site surveys were completed over several visits to the Rabbitbrush (August 4, 2020, September 19 through 30, 2020) and Chaparral (August 4, 2020, October 13 through 27, 2020) solar facility sites from early August through October 2020 by Dudek biologists specializing in desert environments (see Figure 1 for location of each facility). A combination of aerial mapping and field verification (pedestrian surveys) were utilized to identify each visible western Joshua tree. During the pedestrian survey effort, transects spaced approximately 40 meters apart were walked throughout each facility site. Photographs of the project

[1] California Department of Fish and Wildlife, September 25, 2020 *Proposed Emergency Regulatory Language*. https://fgc.ca.gov/Regulations/2020-New-and-Proposed#749_10E



impact area were also taken depicting example visual representation of both the spatial distribution and height of the trees; a sampling of larger trees were measured utilizing a pre-marked/graduated measuring stick. Approximately 50 percent of the western Joshua trees at each of the facilities were less than 1.5 meters, 48 percent were between 1.5 meters and 5 meters, and a small percentage (~ 2%) at each facility were at or above 5 meters. For the Rabbitbrush solar facility, an average of approximately 1.6 western Joshua trees per acre were identified on the 632-acre facility. For the Chaparral solar facility, an average of approximately 0.8 western Joshua trees per acre were identified within the 774-acre facility.

3 Distribution of Trees on Project Site

To qualify as Joshua tree woodland, western Joshua trees must be evenly distributed, not scattered or clumped, and must compose at least 1% of total cover (Menke et al. 2013). Western Joshua trees on both facility sites were observed to be widely scattered, unevenly distributed, and below the 1% threshold of canopy cover necessary to be considered a Joshua tree woodland. Using a conservative assumption of each tree having a 3-meter diameter canopy, western Joshua Trees on the Rabbitbrush solar facility compose approximately 1.8 acres of total cover, which is approximately 0.3% of the facility site; western Joshua trees on the Chaparral solar facility compose approximately 1 acre of total cover which is approximately 0.1% of the facility site.

4 Conclusion

While western Joshua trees do not occur at the Rabbitbrush and Chaparral solar facilities at a high-enough density to qualify as Joshua tree woodland, it is recommended that impacts to individual western Joshua trees resulting from Project construction be avoided or mitigated consistent with applicable regulatory and/or permit requirements. Consistent with the Commission's emergency regulation authorization conditional take of western Joshua tree, a Joshua Tree Census will be conducted by a CDFW-approved biologist, and the resulting report will be submitted to and approved by CDFW prior to construction of each of the respective solar facilities should construction occur while western Joshua trees are subject to CESA protection. All impacts to western Joshua trees within the facilities will mitigated as required by the CDFW and the Environmental Impact Report being prepared by Kern County for the AVEP Solar Project; such mitigation may consist of avoidance (i.e., establishing avoidance buffers around trees) and/or compensatory mitigation.

1.0 INTRODUCTION

1.1 Purpose and Scope of Work

At the request of Tumbleweed Solar, LLC, Rabbitbrush Solar, LLC, and Chaparral Solar, LLC (Applicants), Huffman-Broadway Group, Inc. (HBG) conducted an aquatic resources identification and delineation for the Antelope Valley Expansion Project (AVEP), Kern County, California (Appendix A, Figures 1 and 2). The Project will consist of three individual photovoltaic solar facilities and are referred to hereafter as the "Facilities", or by individual Facility name: "Tumbleweed Solar", "Rabbitbrush Solar", and "Chaparral Solar". The investigation consisted of evaluating the Study Areas for the three Facilities in the Antelope Valley area of Kern County, California (Appendix A, Figures 1 and 2). The purpose of this report was to assess whether aquatic resources are present and, if present, to determine if they are potentially subject to (1) US Army Corps of Engineers (Corps) and US Environmental Protection Agency (US EPA) regulation under Section 404 of the Clean Water Act (CWA) (33 U.S.C. 1344); (2) Corps jurisdiction under Section 10 of the Rivers and Harbors Act (RHA) (33 U.S.C. 403); (3) California Department of Fish and Wildlife (CDFW) jurisdiction under the Department's Lake and Streambed Alteration Agreement Program (California Fish and Game Code [FGC] Sections 1600-1616) (LSAA); and/or (4) State Water Resources Control Board (WRCB) and the Lahontan Regional Water Quality Control 2 Board (RWQCB) as part of their federally delegated 401 Water Quality Certification Program (401 WQC) and state legislated Porter-Cologne Water Quality Control Act Program (PCA). This delineation report provides technical information to assist the County in evaluating potential impacts associated with the AVEP Project Facilities as part of its California Environmental Quality Act (CEQA) review process. HBG conducted this study in accordance with:

- Code of Federal Regulations (CFR) definitions of jurisdictional waters;
- US Environmental Protection Agency and US Army Corps of Engineers. 2008. *Clean Water Act Jurisdiction Following the US Supreme Court's Decision in Rapanos v. United States & Carabell v. United States* (Revised memorandum). December 2 (aka, *Rapanos Guidance*).
- US Army Corps of Engineers and US Environmental Protection Agency. 2007. *US Army Corps of Engineers Jurisdictional Determination Form Instructional Guidebook*, Appendix D,
  Legal Definition of "Traditional Navigable Waters. May 30.
- August 28, 2015 Clean Water Rule: Definition of "Waters of the United States;
- *Corps of Engineers Wetlands Delineation Manual* (Corps 1987 Manual; Environmental Laboratory 1987);
- *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (Arid West Supplement; Corps of Engineers 2008);
- *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (OHWM Field Guide; Lichvar & McColley 2008);

- State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State. Adopted April 2, 2019 by the State Water Resource Control Board; and
- Sections 1600-1607 California Fish and Game Code.
- California Environmental Quality Act, Guidelines Appendix G Environmental Checklist Form.

1.2 General Site Description

The Antelope Valley covers portions of northern Los Angeles County, including the Cities of Lancaster and Palmdale, and the southeast portion of Kern County. It comprises the westernmost desert valley of the Mojave Desert and lies between the Tehachapi and the San Gabriel Mountains. The three Facility Sites are located just north of the Los Angeles County boundary within Kern County and are 7 to 10 miles west of the Kern County city of Rosamond.

For this investigation, HBG's Study Area for each of the three Facility Sites comprised the defined boundaries for each Facility surrounded by a 300-foot buffer area (Figures 1 – 3); specific Project Facility and Study Area boundaries are shown on Figures 7a – 7c.

1.2.1 Chaparral Facility Site

The Chaparral Facility Site constitutes two irregular polygons adjacent to a Los Angeles Department of Water and Power easement that trends northeast/southwest (Appendix A, Figures 1, 2, and 7a). There is also one 4.0-acre collector line segment. This Facility Site is west of the unincorporated town of Willow Springs. Its southern boundary is West Rosamond Boulevard; eastern and western boundaries respectively are 100th Street West "St. W") and 110th St. W. Avenue of the Stars forms the northern boundary of the westernmost portion of the Facility Site. The Chaparral Facility Site is within portions of Township 9 north, Range 14 west, Sections 12 and 13, San Bernardino Base and Meridian, with a smaller portion in T9N R13W Section 18 (Appendix A, Figures 2 and 7a). The latitude and longitude of the two portions of this 764-acre Facility Site in decimal degrees are shown on Appendix A, Figure 1. The Chaparral Study Area comprises 1,023 acres.

1.2.2 Rabbitbrush Facility Site

The Rabbitbrush Facility Site constitutes two irregular polygons west of the Chaparral Facility Site (Appendix A, Figures 1, 2, and 7b). The southern boundary of the smaller Facility polygon is West Rosamond Boulevard; its eastern boundary is 115th St. W and its northern boundary is Fisher Avenue. The larger polygon for the Rabbitbrush Facility Site is bordered on the south by Fisher Avenue, by 120th St. W on the east and 130th St. W on the west, and Avenue of the Stars on the north. The Rabbitbrush Facility Site lies within portions of T9N R14W Sections 10, 14, and 15, San Bernardino Base and Meridian (Appendix A, Figures 2 and 7b). The latitude and longitude of the two portions of this 632-acre Facility Site in decimal degrees are shown on Appendix A, Figure 1. The Rabbitbrush Study Area comprises 932 acres.

1.2.3 Tumbleweed Facility Site

The Tumbleweed Facility Site comprises one large area and three smaller ones, two of which are proposed collector line segment areas (Appendix A, Figures 1, 2, and 7c). The large area is roughly bounded by Avenue A to the south, 100th St. W and 110th St. W on the east and west respectively, and Gaskell Road toward the north – an area that covers most of T9N R14W s\Section 36 – plus the east half of the southwest quarter of T9N R14W section 25 (Appendix A, Figures 2 and 7c). One of the smaller polygons for this Facility Site is a strip of land farther west on Gaskell Road in the eastern portion of the SW1/4 of T9N R14W Section 26; this area abuts the Los Angeles Department of Water and Power easement seen on Appendix A, Figure 7c. The collector line segment areas A and B abut 110th Street W between Holiday and Astoria Avenues and are 10 and 15 acres in size, respectively (see Appendix A, Figure 7c). The latitude and longitude of the four portions of this 721-acre Facility Site in decimal degrees are shown on Appendix A, Figure 1. The Tumbleweed Study Area comprises 1,062 acres.

2.0 REGULATORY FRAMEWORK

2.1 Corps / USEPA Clean Water Act

Title 33 Code of Federal Section 404 of the Federal Clean Water Act (CWA) (33 U.S.C. 1251, et seq.) authorizes the Corps and US EPA to regulate activities that discharge dredged or fill material to waters of the United States including wetlands.

Waters of the United States. The Corps' regulations (Title 33 *Code of Federal Regulations* [CFR] 328.3(a)) define the term "waters of the United States" in California under the new CWA rule promulgated by the Corps and EPA in July 2015.[1] The purpose of the new CWA rule is to clarify the scope of "waters of the United States" that are protected under the Clean Water Act (CWA). The rule articulates how the two agencies will determine whether an area qualifies as a water of the United States (WOUS).[2] According to Section 328.3(a), include both Primary and Non-Primary WOUS. Primary WOUS include:

1. All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide.
2. All interstate waters, including interstate wetlands.
3. Territorial seas.
4. All impoundments of waters otherwise identified as waters of the United States under this section

Non-Primary WOUS include four other waters that may be WOUS, depending on their: (a) connection; (b) proximity, or (c) nexus with a Primary WOUS.[3] These include:

1. Tributaries
2. Adjacent waters
3. Specific types of waters (e.g., California vernal pools)
4. Waters in the 100-year floodplain or waters within 4,000 feet of the high tide line or ordinary high water mark

Wetlands. The Corps regulations (33 CFR 328.3(b) define the term *wetlands* as

> those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

1 80 FR 37054 (June 29 2015).
2 WOUS is used for both water of the United States and waters of the United States herein.
3 Adjacent waters are evaluated based on the significance of their nexus with one or more of the four Primary WOUS, and any tributaries determined to be a WOUS. All other non-Primary WOUS are evaluated based on their nexus with Primary WOUS 1 – 3.

The term "*under normal circumstances*" refers to situations in which the vegetation has not been substantially altered by human activities as defined in Appendix A of the Corps' 1987 *Wetlands Delineation Manual* (hereinafter *Corps 1987 Manual*).

As described at 33 CFR Part 328.4, the geographic limits of relevant federal jurisdiction are defined in the following manner:

> (a) *Territorial Seas.* The limit of jurisdiction in the territorial seas is measured from the baseline in a seaward direction a distance of three nautical miles. (See 33 CFR 329.12)
>
> (b) *Tidal waters of the United States.* The landward limits of jurisdiction in tidal waters: (1) Extends to the high tide line, or (2) When adjacent non-tidal waters of the United States are present, the jurisdiction extends to the limits identified in paragraph (c) of this section.
>
> (c) *Non-tidal waters of the United States.* The limits of jurisdiction in non-tidal waters: (1) In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark, or (2) When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands. (3) When the water of the United States consists only of wetlands the jurisdiction extends to the limit of the wetland.

2.2 Corps Rivers and Harbors Act

Section 10 of the Rivers and Harbors Act of 1899 requires authorization from the Secretary of the Army, acting through the Corps of Engineers, for the construction of any structure in or over any navigable water of the United States. Structures or work outside the limits defined for navigable waters of the United States require a Section 10 permit if the structure or work affects the course, location, or condition of the water body. As described by Corps regulation 33 CFR 322.1, Section 10 of the RHA of 1899 (33 U.S.C. 403) authorizes the Corps to regulate certain structures or work in or affecting navigable waters. Navigable waters are defined in 33 CFR 329.4:

> Navigable waters of the US are those waters subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or might be susceptible for use to transport interstate or foreign commerce.

Three factors must be examined when making a determination whether a waterbody is a navigable water (33 CFR 329.5): "… (a) past, present, or potential presence of interstate or foreign commerce; (b) physical capabilities for use by commerce…, and (c) defined geographic limits of the waterbody."

If a river or lake is determined to be "navigable" the regulatory jurisdiction extends laterally to the entire water surface and bed of a navigable lake or river, which includes all the land and waters below the ordinary high water mark. (33 CFR 329.11)

> (a) *Jurisdiction over entire bed.* Federal regulatory jurisdiction, and powers of improvement for navigation, extend laterally to the entire water surface and bed of a navigable waterbody, which includes all the land and waters below the ordinary high water mark. Jurisdiction thus extends to the edge (as determined above) of all such waterbodies, even though portions of the waterbody may be extremely shallow, or obstructed by shoals, vegetation or other barriers. Marshlands and similar areas are thus considered navigable in law, but only so far as the area is subject to inundation by the ordinary high waters.

2.3 CDFW Lake and Streambed Alteration Program

Fish and Game Code (FGC) Section 1602 requires any person, state or local governmental agency, or public utility subject to FGC 1600 through 1616 to notify CDFW of any proposed activity that may substantially divert or obstruct a river, stream, or lake. Section 1602(a) specifically provides that:

> An entity may not substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake unless all of the following occur:
>
> (1) The department receives written notification regarding the activity in the manner prescribed by the department.

The program developed by CDFW to implement FGC Section 1602 is generally referred to as the Lake and Streambed Alteration Agreement Program. CDFW's regulations implementing the FGC (Title 14 California Code of Regulations or 14 CCR) define the relevant rivers, streams and lakes over which the agency has jurisdiction to constitute "all rivers, streams, lakes, and streambeds in the State of California, including all rivers, streams and streambeds which have intermittent flows of water." 14 CCR § 720. The regulations further define the terms "stream" and "lake" as follows:

> 14 CCR § 1.72. Stream (Includes Creeks and Rivers).
>
> A stream is a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation.

14 CCR § 1.56. Lake.

Includes natural lakes or Man-Made reservoirs.

2.4 WRCB and RWQCB 401 Clean Water Act and Porter-Cologne Act

The Water Code defines "waters of the state" broadly to include "any surface water or groundwater, including saline waters, within the boundaries of the state." The mission of the State Water Resources Control Board and the Regional Water Quality Control Boards (Water Boards) includes the preservation, enhancement, and restoration of the quality of California's water resources for the protection of the environment and all beneficial uses for the benefit of present and future generations. In accordance with the Porter-Cologne Water Quality Control Act (Water Code, § 13000 et seq.), the Water Boards are authorized to regulate discharges of waste, which includes discharges of dredged or fill material, that may affect the quality of waters of the state. As described below, waters of the state include some, but not all, features that are defined as wetlands, as well as other features, including the ocean, lakes, and rivers.

The Water Boards define an area as wetland as follows:

> An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

The Water Code defines "waters of the state" broadly to include:

> Any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the state" [4]includes all "waters of the U.S." The following wetlands are waters of the state:
>
> 1. Natural wetlands,
> 2. Wetlands created by modification of a surface water of the state, [5]and

4 Therefore, wetlands that meet the current definition, or any historic definition, of waters of the U.S. are waters of the state. In 2000, the State Water Resources Control Board determined that all waters of the U.S. are also waters of the state by regulation, prior to any regulatory or judicial limitations on the federal definition of waters of the U.S. (California Code or Regulations title 23, section 3831(w).) This regulation has remained in effect despite subsequent changes to the federal definition. Therefore, waters of the state includes features that have been determined by the U.S. Environmental Protection Agency (U.S. EPA) or the U.S. Army Corps of Engineers (Corps) to be "waters of the U.S." in an approved jurisdictional determination; "waters of the U.S." identified in an aquatic resource report verified by the Corps upon which a permitting decision was based; and features that are consistent with any current or historic final judicial interpretation of "waters of the U.S." or any current or historic federal regulation defining "waters of the U.S." under the federal Clean Water Act.

5 "Created by modification of a surface water of the state" means that the wetland that is being evaluated was created by modifying an area that was a surface water of the state at the time of such modification. It does not include a wetland that is created in a location where a water of the state had existed historically, but had already been completely eliminated at some

3. Artificial wetlands [6]that meet any of the following criteria:

a. Approved by an agency as compensatory mitigation for impacts to other waters of the state, except where the approving agency explicitly identifies the mitigation as being of limited duration;

b. Specifically identified in a water quality control plan as a wetland or other water of the state;

c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or

d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more of the following purposes (i.e., the following artificial wetlands are not waters of the state unless they also satisfy the criteria set forth in 2, 3a, or 3b):

i. Industrial or municipal wastewater treatment or disposal,

ii. Settling of sediment,

iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial stormwater permitting program,

iv. Treatment of surface waters,

v. Agricultural crop irrigation or stock watering,

vi. Fire suppression,

vii. Industrial processing or cooling,

viii. Active surface mining – even if the site is managed for interim wetlands functions and values,

ix. Log storage,

x. Treatment, storage, or distribution of recycled water, or

xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits); or

xii. Fields flooded for rice growing.[7]

All artificial wetlands that are less than an acre in size and do not satisfy the criteria set forth in

time prior to the creation of the wetland. The wetland being evaluated does not become a water of the state due solely to a diversion of water from a different water of the state.

6 Artificial wetlands are wetlands that result from human activity.

7 Fields used for the cultivation of rice (including wild rice) that have not been abandoned due to five consecutive years of non-use for the cultivation of rice (including wild rice) that are determined to be a water of the state in accordance with these Procedures shall not have beneficial use designations applied to them through the Water Quality Control Plan for the Sacramento and San Joaquin River Basins, except as otherwise required by federal law for fields that are considered to be waters of the United States. Further, agricultural inputs legally applied to fields used for the cultivation of rice (including wild rice) shall not constitute a discharge of waste to a water of the state. Agricultural inputs that migrate to a surface water or groundwater may be considered a discharge of waste and are subject to waste discharge requirements or waivers of such requirements pursuant to the Water Board's authority to issue or waive waste discharge requirements or take other actions as applicable.

2, 3.a,1 3.b, or 3.c are not waters of the state. If an aquatic feature meets the wetland definition, the burden is on the applicant to demonstrate that the wetland is not a water of the state.

2.4 CEQA Appendix G Environmental Check List

The Kern County CEQA Environmental Checklist Form (Kern County Planning and Community Development Department [KCPCDD] 2019) provides a list of threshold criteria for evaluating whether or not a Project would have significant environmental impacts pursuant to CEQA, including impacts related to aquatic resources. Based on the checklist criteria, the Project would have significant effects on biological resources related to aquatic resources if it will:

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

- Have a substantial adverse effect on federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

3.0 ENVIRONMENTAL SETTING

This section describes the environmental setting of the Study Area based on review of published resources identified below and an initial site reconnaissance on November 2, 2017. In preparation for detailed field investigations, HBG staff obtained and reviewed the following background environmental information on the Chaparral, Rabbitbrush, and Tumbleweed Facility Study Areas from published sources to identify site conditions and existing landforms that would potentially contain aquatic resources (wetlands and other waters) within the three Study Areas:

- U.S. Geological Survey (USGS) topographic mapping (Appendix A, Figure 2);
- A general vegetation map of the Study Areas (Appendix A, Figure 3);
- USGS National Hydrography Dataset (NHD) Hydrologic Unit Code (HUC) watershed mapping and flowlines (Appendix A, Figures 4a, 4b, 5, and 11;
- Environmental Systems Research Institute (ESRI) 2016 High Resolution Imagery (Esri, HERE, Garmin, © OpenStreetMap contributors; Appendix A, Figures 7a -7c);
- Natural Resources Conservation Service (NRCS) Custom Soil Resources Reports for the Chaparral, Rabbitbrush, and Tumbleweed Study Areas (Appendix B);
- NRCS WETS current and historical precipitation and temperature data (Appendix C);
- Federal Emergency Management Agency (FEMA) Flood Insurance Rate Mapping (flood insurance rate map panels 3650E and 4000E; https://msc.fema.gov/portal/search#searchresultsanchor); and
- U.S. Fish and Wildlife Service National Wetlands Inventory (NWI) Mapping (Figures 6a - 6e).

3.1 Topography

Elevations within the combined Study Areas of the Facility Sites range from 2,700 feet NAVD88 in the northwestern portion of the Study Areas near the intersection of Avenue of the Stars and 130th St. W (in the Rabbitbrush Facility Site) to 2,460 feet in the southeastern portion of the Study Areas near the intersection of Avenue A and 100th Street W (in the Tumbleweed Facility Site). Land slopes gently toward the southeast in the northern portion of the combined Study Areas, becoming easterly in the southern portion of the Study Areas [8] (Appendix A, Figure 2).

3.2 Land Use

The Facility Sites are in an area where a number of existing solar projects are present. The Chaparral and Rabbitbrush Facility Sites are undeveloped. Most of the Tumbleweed Facility Site is developed as a pistachio (*Pistacia sp.)* orchard.

3.3 Geology

The following[9] provides a general description of the geology of the Antelope Valley:

> . . . . The Antelope Valley region is a wedge-shaped portion of the western Mojave Desert. The north and west sides of the wedge border the Tehachapi Mountains; the south side of the wedge borders the Gabriel Mountains, the Sierra Pelona Mountains, and Portal Ridge. The east side is an open continuation of the Mojave Desert. Geology has influenced the topography of the Antelope Valley, the surrounding mountains, and the neighboring desert. The distinguishing geologic features . . . are valley fill, alluvial soils, diverging fault lines, and relatively young rocks. The Antelope Valley region is a geologically old basin that more recent alluvium has filled. Intermittent and ephemeral streams drain into two playas within the basin: Rosamond and Rogers Dry Lakes (U.S. Department of Agriculture, Soil Conservation Service). The valley landform resulted from a depression at the intersection of diverging fault lines from branches of the Garlock and San Andreas Faults. The valley's steep vertical relief evolved from a strike slip on the San Andreas Fault or an associated, branching fault. The relatively young age of the alluvial fill contrasts with the age of rocks in the surrounding areas. The alluvial fill is Quaternary (2 million years ago to recent). Surrounding the Antelope Valley region, the rocks generally date to the Cretaceous Period (65 to 136 million years ago), the Jurassic Period (136 to 190 million years ago), and the Triassic Period (190 to 225 million years ago).

3.4 Soils

Appendix B presents Natural Resources Conservation Service (NRCS) custom soil resources reports for the three Facility Sites Study Areas. The soils mapped within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas are listed in Tables 1, 2, and 3, below. The dominant soils as defined by percent Study Area covered range between loams, loamy sands, and sandy loams. Soil permeability ranges from moderately well drained, to well drained, to excessively well drained. The parent material of all of the listed soils is alluvium derived from granite. The soils do not flood or pond. Depth to the water table is greater than 80 inches. None are rated by the NRCS as hydric soils (Appendix B).

Table 1. Summary of Soil Series Mapped by NRCS in the Chaparral Facility Site Study Area

Map Unit Symbol	Map Unit Name	Acres in Study Area	Percent of Study Area
CaC	Cajon loamy sand, 2 to 9 percent slopes	10.9	1.1%
HgA2	Hesperia loamy fine sand, 0 to 2 percent slopes,	4.9	0.5%
HkA	Hesperia fine sandy loam, 0 to 2 percent slopes	170.8	16.7%
HkB	Hesperia fine sandy loam, 2 to 5 percent slopes	224.7	21.9%

3.5 Vegetation

Figure 3 is a vegetation map for the Study Areas. Vegetation was mapped as part of a study conducted by Menke, et al. (2013) in support of the Desert Renewable Energy Conservation Plan funded by the California Department of Fish and Wildlife's Renewable Energy Program and the California Energy Commission (Appendix A, Figure 3). Dominant plant associations mapped within the Study Areas are summarized below:

- Chaparral Facility Site Study Area: creosote bush (*Larrea tridentata*), annual grasses and forbs, rabbitbrush (*Ericameria nauseosa*), alkaline mixed scrub, and minor urban/developed areas.
- Rabbitbrush Facility Site Study Area: creosote bush, white bursage (*Ambrosia dumosa*), annual grasses and forbs, alkaline mixed scrub, and a small urban/developed area.
- Tumbleweed Facility Site Study Area: pastures and crop, annual grasses and forbs, and urban/developed in the largest area; creosote bush, white bursage, annual grasses and forbs, and rabbitbrush in the three smaller areas.

The following link provides a California Native Plant Society CALSCAPE list and photographs of plants found within the Lancaster, California area which include the Chaparral, Rabbitbrush, and Tumbleweed Facility Sites Study Areas: http://calscape.org/loc-Lancaster,CA/cat-All-Plants/ord-popular/page-3/np-0?&srchcr=sc5b1f36cb9cab4

3.6 Climate

The Study Areas have a desert climate with hot, dry summers and mild winters. HBG obtained climate data for the Lancaster, California, WETS Station, located at Lancaster's General William J Fox Airport, approximately 9 miles southeast of the Study Areas (Appendix A, Figure 1). Average monthly temperatures (° F) for the period of record (1981 – 2010) are presented in the

Table below (http://agacis.rcc-acis.org/?fips=06037) (Appendix C):

Table 4. Average Monthly Temperatures, WETS Station: LANCASTER, CA												
Month/ Temperature (°F)	Jan	Feb	March	April	May	June	July	Aug	Sept	Oct	Nov	Dec
Average	44.9	48.3	53.2	59.1	68.2	76.1	82.3	80.9	73.7	62.7	51.4	43.8
Average Daily Maximum	58.7	61.7	67.1	73.2	82.3	90.9	97.8	97.5	90.7	79.4	66.9	57.9
Average Daily Minimum	31.1	34.9	39.3	44.9	54.0	61.3	66.8	64.3	56.6	45.9	35.9	29.7

Appendix C presents average monthly precipitation data for the LANCASTER, CA WETS Station for the period of record (1971 – 2010); the range of precipitation for the period of record considered to be normal (30 % chance precipitation will be < or > average); and total monthly precipitation between 1974 and May 2019. Average annual precipitation is 7.38 inches. The greatest rainfall occurs between October and April, when average precipitation ranges from 0.35 to 1.78 inches.

3.7 Hydrology

USGS Watershed Boundary Dataset [10] ***(WBD) Watersheds***. Appendix A, Figures 4a and 4b identify US Geological Survey Watershed Boundary Dataset Hydrologic Unit Code (HUC) regional subbasins and subwatersheds within which the Study Areas occur. The Study Areas lie within the "Antelope-Fremont Valleys" 8-digit HUC subbasin (18090206) (Appendix A, Figure 4a). Appendix A, Figure 4b shows the HUC 12-digit subwatersheds within which the three Study Areas lie:

- The Chaparral Study Area is predominantly in HUC 12-digit subwatershed 180902061702, with edges in the "Bean Canyon" subwatershed (180902061703) and the "Burham Canyon" subwatershed (180902061704).

- The Rabbitbrush Study Area is predominantly in the "Burham Canyon" subwatershed, with small portions in subwatershed 180902061702.

10 "The National Hydrography Dataset (NHD) and Watershed Boundary Dataset (WBD) are used to portray surface water on The National Map. The NHD represents the drainage network with features such as rivers, streams, canals, lakes, ponds, coastline, dams, and streamgages. The WBD represents drainage basins as enclosed areas in eight different size categories. Both datasets represent the real world at a nominal scale of 1:24,000-scale…. The NHD and WBD are digital vector datasets used by geographic information systems (GIS). These datasets are designed to be used in general mapping and in the analysis of surface water systems." https://nhd.usgs.gov/

- The two southern polygons of Tumbleweed Study Area are in the "Tylerhorse Canyon" subwatershed (180902061802); the two smaller northern polygons are in the "Burham Canyon" subwatershed (180902061704).

National Hydrography Dataset Flowlines. Figure 5 shows USGS National Hydrography Dataset (NHD) surface water flowlines and flow directions for the Study Areas and vicinity. As seen on Appendix A, Figure 5, surface water flow in the vicinity of the Study Areas is generally to the southeast. Appendix A, Figures 7a – 7c, and Section 5.0 provide technical findings regarding surface water hydrology relative to the Facility Sites. Appendix A, Figure 11 provides USGS NHD mapping of surface water flows within and adjacent to the Study Areas and provides indication that surface flows generated in the HUC 8 Antelope-Fremont Valleys watershed either terminate at Rosamond Lake or Rogers Lake. Surface and channel flooding can occur within the Study Area any time of year, however, many years can pass between surface flow events. Generally, winter and summer storms generate low amounts of precipitation that typically infiltrate the ground where it falls, with little or no surface flow generated. If flow does occur, it typically runs within small, localized, areas before it infiltrates the soil. Flooding because of high intensity thunderstorms typically lasts only a few hours at most and typically occurs in localized areas.

3.8 FEMA Flood Zone

Review of Federal Emergency Management Agency (FEMA) flood insurance rate map panels 3650E and 4000E for Kern County unincorporated areas effective September 26, 2008, shows that the Study Areas are in Flood Hazard Zone A, an area subject to flooding by the 1 percent annual chance flood; no base flood elevations have been determined (https://msc.fema.gov/portal/search#searchresultsanchor).

3.9 Wetlands Mapping

3.9.1 National Wetlands Inventory

. HBG reviewed current NWI mapping, dated December 12, 2019 (https://www.fws.gov/wetlands/data/mapper.html).

The on-line mapping shows areas mapped as wetlands within the AVEP Solar Project Chaparral, Rabbitbrush, and Tumbleweed Facilities Study Areas. Appendix A, Figures 6a – 6c, shows National Wetlands Inventory mapping of the Study Area; Figures 6d and 6e provide a key to the NWI Map Codes. The mapping show areas identified as PUSJx (Palustrine Unconsolidated Shore Intermittently Flooded Excavated) and R4SBJ (Riverine Intermittent Streambed) wetlands to be present within the Chaparral Facility Study Area; R4SBJ wetlands to be present within the Rabbitbrush Facility Study Area; and PUSJx, PUSJ (Palustrine Unconsolidated Shore Intermittently Flooded) , and PUSCx (Palustrine Unconsolidated Shore Seasonally Flooded Excavated) wetlands to be present within the Tumbleweed Facility Study Area.

Because the National Wetlands Inventory (NWI) is largely compiled from remote sensing data (e.g., aerial photography), it is not uncommon to find areas designated as "wetlands" by the NWI that do not meet the requirements necessary to fall within the federal Clean Water Act (CWA)

jurisdiction of the Corps, or other state and local agencies that regulate wetlands. In fact, the NWI's manual contains the following cautionary language.

> The wetlands displayed on the Wetlands Mapper show wetland type and extent using a biological definition of a wetland. Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

The accuracy of the NWI mapping as compared to the technical findings of this report are as follows:

Chaparral Facility Study Area. The NWI mapped Palustrine Unconsolidated Shore Intermittently Flooded Excavated wetland (PUSJx) was found upon site inspection to be an abandoned irrigation reservoir. The soils were well drained and pump facilities had been removed. Riverine Intermittent Streambed wetlands (R4SBJ) was found to be inaccurate omitting both active and dormant channels and including active channels that had been covered by wind-blown sands.

Rabbitbrush Facility Study Area. The Riverine Intermittent Streambed wetlands (R4SBJ) mapped by NWI was found to be inaccurate omitting both active and abandoned channels and several active floodplain watercourses.

Tumbleweed Facility Study Area. The NWI Palustrine Unconsolidated Shore Intermittently Flooded Excavated wetland (PUSJx) mapped within the Study Area was found upon site inspection to be an abandoned irrigation reservoir. It was also found that the NWI mapping failed to identify two other such abandoned irrigation reservoirs. A single mapped Palustrine Unconsolidated Shore Seasonally Flooded Excavated (PUSCx) wetlands was also found to be an abandoned reservoir with well drained reservoir. The mapped Palustrine Unconsolidated Shore Intermittently Flooded (PUSJ) wetlands within the Study Area were found not to be wetlands but playette landforms that are the result of eolian geomorphological process with no connecting watercourse. Both relict and active coppice dunes were found within or abutting the landform. Soil cracking observed based on soil pit excavation was due to the clay properties of the exposed subsoil layer exposed by wind erosion. Soils mapped by the NRCS characterized in their soil descriptions as being well drained (Appendix B). No physical indication of watercourse ponding in the form of desiccation mud cracks, curls, or drapes were found (see Subsection 5.1.3).

3.9.2 Corps of Engineers. The technical and jurisdictional findings for the AVEP Solar Project Chaparral, Rabbitbrush, and Tumbleweed Facilities Study Areas presented in Sections 5.0 and 8.0 of this report and supporting technical documentation included in Appendices A – G were reviewed by the Corps based on an October 9, 2019 letter request from the Applicants for an Approved Jurisdictional Determination. Based on the Corps' review it was determined on

December 18, 2019 (Appendix H) that “waters of the United States do not occur on the project site”. The Corps letter further indicates that:

> The aquatic resources identified as "Chaparral S-1" and “Rabbitbrush S-1” in project documentation you provided are intrastate isolated waters with no apparent interstate or foreign commerce connection. As such, these aquatic resources are not currently regulated by the Corps of Engineers. This disclaimer of jurisdiction is only for Section 404 of the Clean Water Act. Other federal, state, and local laws may apply to your activities. In particular, you may need authorization from the California State Water Resources Control Board, the California Department of Fish and Wildlife, and/or the U.S. Fish and Wildlife Service. (Corps File No. SPL-2019-00954-EBR)

4.0 DELINEATION METHODS

4.1 Overview of Sampling Methodology

HBG's investigation focused on identifying and mapping aquatic resource areas potentially meeting the: (1) definitions of wetlands and other waters of the US under Section 404 of the CWA and navigable waters under Section 10 of the RHA of 1899; (2) WRCB and RWQCB 401 CWA and PCA definitions of wetlands and waters; and (3) CDFW LSAA Program definitions of lake and stream as defined by 14 CCR. Section 2.0 provides a regulatory overview of investigation methods including:

- the geographic extent and limits of Section 404 CWA and Section 10 RHA jurisdiction;
- definitions of wetlands and other waters of the US;
- wetland delineation criteria and methods related to the use of hydrophytic vegetation, hydric soil, and wetland hydrology field indicators;
- the use of field indicators to identify the ordinary high water mark (OHWM) for non-tidal waters to establish CWA jurisdictional limits;
- the use of field indicators to identify the OHWM for non-tidal waters to establish RHA jurisdictional limits.
- the geographic extent and limits of wetlands and other waters of the state under Section 404 of the CWA and the PCA; and
- definitions of lakes and streams under the CDFW LSAA Program.

The objectives of aquatic resources investigations are to:

1. Determine the presence or absence of vegetation, hydric soil, and hydrology indicators of wetland conditions as defined by the Corps methodology;
2. Determine within any non-tidal drainage or depressional area found, the presence or absence of indicators of an ordinary high water mark (OHWM) resulting from the presence of an aquatic resource and document the location(s) of the OHWM;[11] and
3. Determine within any watercourse area found, the presence or absence of indicators of fluvial steam flooding or lake ponding.

4.2 Preliminary Study Area Investigations

Preliminary investigations consisted of identifying land surface features within the Study Area (Appendix A, Figure 2) for each Facility Site where aquatic resources may potentially occur. The investigations included reviewing the resource materials listed below and conducting an onsite terrain reconnaissance during early November 1 and 2, 2017.

1. USGS 7.5 minute 1:24,000 scale quadrangle series topographic mapping (Appendix A, Figure 2);
2. Vegetation mapping (Appendix A, Figure 3);
3. USGS Watershed Boundary Dataset HUC 8 and HUC 12 mapping (Appendix A, Figures 4a

[11] Note that in the absence of wetlands, these types of areas with an identifiable OHWM are considered "other Waters" of the US.

and 4b);
4. USGS National Hydrography Dataset high-resolution mapping with flow arrows (Appendix A, Figures 5 and 11);
5. USFWS National Wetlands Inventory Mapping (Appendix A, Figures 6a, - 6e);
6. Kern County 2016 high resolution orthorectified digital aerial imagery (Appendix A, Figures 7a – c); and
7. NRCS Custom Soil Resources Reports (Appendix B).

Each Study Area was defined as a 300-foot wide perimeter boundary surrounding each Facility Site boundary (Appendix A, Figures 7a, 7b, and 7c). Using USGS 7.5 minute 1: 24,000 scale quadrangle series topographic mapping as a base map, each Facility Site Study Area was divided into 0.3-mile grid squares using ESRI ArcGIS software. Landscape features were evaluated in a systematic fashion within each grid square through review of 1.0-foot contour topographic mapping and orthorectified aerial imagery to determine the presence or absence of any land surface features which appeared to potentially have the visual characteristics of an aquatic resource such as a wetland, stream, other type of watercourse, lake or manmade reservoir. Areas found with potential aquatic resource landform features present were identified for further follow-up detailed field investigations as described in Section 4.3, below. At this preliminary reconnaissance stage of the investigation, due to the lack of physical data for analysis obtained from field surveys, no determination was made regarding whether any particular potential aquatic resource identified was hydrologically an active, dormant, abandoned, or relict landform.

4.3 Detailed Study Area Investigations

Following preliminary investigations, detailed field investigations were conducted to determine the presence or absence of aquatic resources meeting the technical definition of wetlands or other waters potentially subject to CWA jurisdiction. Site investigations were conducted on July 6, November 2, 3, and 30, and December 1, 2017; January 14-16, March 23 - 25, 2018; and April 17 – 19, 2019 by walking linear transects located in an east-west direction across each of three Study Areas. Transects were spaced approximately 300 to 500 feet apart depending on land surface visibility. Field work conducted during March 2019 included resampling 2017 and 2018 data collection points for the presence or absence of a dominance of wetland vegetation and/or wetland hydrology indicators following significant rainfall periods which occurred during December 2018 and January thru the beginning of March 2019. A detailed description of sampling methodology follows.

4.3.1 CWA and PCA Wetlands

For wetland identification and delineation, HBG followed the methods described in the Arid West Supplement; Corps regulatory guidance documents; Corps/US EPA regulations (33 CFR 328); the Clean Water Rule: Definition of “Waters of the United States” dated August 28, 2015, that define CWA wetlands; and the definition of PCA wetlands as adopted April 2, 2019 by the WRCB. Vegetation, soil, and hydrology observations were made at sampling locations

determined to be representative of landforms within a Facility Site Study Area where the soils may potentially flood, pond, and / or saturate and support the formation of a wetland aquatic resource.

The presence or absence of dominant wetland vegetation was determined based on percent plant cover observed within 3-foot x 3-foot sampling plots. Observations for wetland hydrology indicators were then made within the same sampling plot followed by soil profile observations for the presence or absence of hydric soil indicators based on soil pits dug within the same sample plot to a depth of at least 20 inches where permissible using a shovel, hand auger, or by observing naturally eroded or artificially cut bank surfaces. Wetland vegetation, wetland hydrology, and hydric soil field indicators observed were recorded on the Corps' Wetland Determination Data Forms – Arid West Region ("Arid West Data Forms") (Appendix D). Sample locations were documented as point features using a hand-held Trimble Geo XH Global Positioning System (GPS) unit with sub-meter accuracy after geo-processing. It should be noted that given local precipitation, ephemeral nature of surface water flows, and well-drained soil conditions encountered, sampling for wetland indicators such as hydric soils were limited to representative sample locations once data being collected for potential aquatic land surface features became repetitive.

4.3.2 CWA and PCA Other Waters

Potential CWA other waters within a Study Area were identified in accordance with the regulatory definitions of non-tidal other waters of the US (33 CFR 328) and determined (delineated) following the CWA definitions of an OHWM (33 CFR 328.3(e), 33 CFR 328.4(c); Regulatory Guidance Letter (RGL) 05-05(d)); the Clean Water Rule: Definition of "Waters of the United States" dated August 28, 2015; and the definition of PCA waters as adopted April 2, 2019 by the WRCB.

Physical data collected in the field included: (1) presence or absence of geomorphic indicators of uplands and aquatic landforms (Table 5); (2) average stream width; (3) presence or absence of an OHWM; (4) OHWM width, if present; (5) representative onsite photographs; and (6) soil infiltration testing at representative locations where abandoned or relict stream channels were found. Field data collection locations or sample points and photo points were memorialized as point features using a hand-held, Trimble XT global positioning system (GPS) unit with sub-meter accuracy after geoprocessing.

Geomorphic indicator data was collected at representative upland / aquatic resource landforms and was recorded on a field data form (Appendix D1) developed for this study based on the indicators listed in Table 5 which are described by Lichvar and McCooley 2008 as an aid in determining fluvial areas versus upland areas when making OHWM determinations. Documentation of physical indicators providing evidence of aquatic resource areas as opposed to upland areas provided a technical basis for: (1) determining the presence or absence of a stream, other types of watercourse, and lake/manmade reservoir, and (2) if present, determining if surface water flooding or ponding occurs.

Table 5. Physical Geomorphic Indicators of Upland and Aquatic Resources*		
Physical Indicators of Upland Landforms	**Physical Indicators of Aquatic Landforms**	
☐ Av Horizon	☐ Bars: mud, sand & gravel	☐ Ripples
☐ Biotic Soil Crust	☐ Beach ridges	☐ Scour
☐ Biotubation	☐ Bifurcated flow	☐ Secondary channels
☐ Caliche: coatings, layers, rubble	☐ Biotic crusts	☐ Secondary channel bypassing obstruction
☐ Carbonate etching	☐ Drainage swales	☐ Sediment sheets
☐ Clast / rock weathering	☐ Crusts: carbonate, salt, & soda	☐ Sand filled channels
☐ Coppice dunes: active & relict	☐ Cut banks	☐ Scour holes downstream of obstructions
☐ Deflated surfaces	☐ Desiccation Mud: cracks, curls / drapes	☐ Sediment plastering
☐ Desert pavement	☐ Drift: organic	☐ Sediment ramps
☐ Overturned rock	☐ Exposed roots below intact soil layer	☐ Sediment sorting
☐ Relict bar & swale	☐ Flow or streaming lineations	☐ Sediment tails
☐ Relict channel	☐ Headcuts	☐ Springs
☐ Rock fracture in place	☐ Imbricated gravel	☐ Staining of rocks
☐ Rock varnish	☐ Knick Points	☐ Stepped-bed morphology in gravel
☐ Rock weathering	☐ Levee Ridges: sand & gravel	☐ Substrate staining
☐ No flow or ponding indicators	☐ Observed inundation: flooding, ponding, or substrate saturation	☐ Vegetation - channel alignment
☐ Rubified rock undersides		
☐ Soil development	☐ Out of channel flow	☐ Water-cut benches
☐ Surface rounding of landform	☐ Overturned rocks	☐ Water level marks
☐ Woody debris in place	☐ Rills	☐ Wrack: woody
* Adapted from: *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual* (Lichvar and McColley 2008).		

Average width data was collected for each individual watercourse (stream channel) or enclosed depression encountered along the transects by taking width measurements at the top of the bank or extent of recent identifiable fluvial indicators of surface flow, if beyond the top of the channel or enclosed depression. Where a stream was crossed more than once by a separate transect, an average watercourse width was determined by averaging the sum of the width

measurements collected. For lake / manmade reservoirs and watercourses (landforms other than streams), the landform location was memorialized as polygon features using a hand-held GPS instrument.

The methodology used to identify and define an OHWM within a stream channel, watercourse, or depressional area (OHWM) was based on the OHWM Field Guide (Lichvar and McCooley 2008) and supporting Corps regulatory guidance documents. Physical features indicative of a high water mark, such as bank scour, sediment lines, and debris lines, were recorded on an Arid West Ephemeral and Intermittent Streams OHWM Datasheet ("OHWM Datasheet") (see Appendix D). OHWM widths of aquatic features along streams were measured at representative locations using a measuring tape or folding ruler perpendicular to the linear reach of the aquatic resource feature. For watercourses and depressional land surface features identified, the location of the OHWM was memorialized as polygon features using a hand-held GPS instrument and the OHWM width measurements were recorded on the OHWM Datasheets for watercourses.

Given local precipitation, ephemeral nature of surface water flows, and well-drained soil conditions encountered, detailed sampling for stream OHWM indicators was limited to representative sample locations once data being collected for OHWM became repetitive and then sampling along transects where streams were encountered became limited to only identifying and measuring OHWM widths and locations of measurement. These data are shown in Appendix F data summary tables.

Soil infiltration testing was conducted to determine the rate of stormwater percolation through soils where dormant / relict channels were found. Soil infiltration is the process of water entering the soil; the infiltration rate is the velocity at which water penetrates the soil surface. To determine soil infiltration rate testing involved conducted a saturated soil test at 8 sampling locations using 6- and 12-inch infiltration rings, repeating the test a minimum of 2 times to flood the soil column before running the test to time the rate of infiltration.

4.3.3 RHA Navigable Waters "

Potential RHA Navigable Waters were identified with respect to the presence or absence of an OHWM in accordance with 33 CFR 329.11, which defines the geographic and jurisdictional limits of rivers and lakes. Data were documented in the manner described in Section 4.3.2.

4.3.4 RHA Navigable Waters "

Potential RHA Navigable Waters were identified with respect to the presence or absence of an OHWM in accordance with 33 CFR 329.11, which defines the geographic and jurisdictional limits of rivers and lakes. Data were documented in the manner described in Section 4.3.2, above.

4.3.5 CDFW Lakes and Streams

Physical data collected in the field included: (1) presence or absence of geomorphic indicators of uplands and aquatic landforms (Table 5); (2) average stream width; and (3) representative

onsite photographs; and (4) soil infiltration testing at representative locations where abandoned or relict stream channels were found. Field data collection locations or sample points and photo points were memorialized as point features using a hand-held, Trimble XT global positioning system (GPS) unit with sub-meter accuracy after geoprocessing.

Average width data was collected for each individual watercourse (stream channel) or enclosed depression encountered along the transects by taking width measurements at the top of the bank or extent of recent identifiable fluvial indicators of surface flow, if beyond the top of the channel or enclosed depression. Where a stream was crossed more than once by a separate transect, an average watercourse width was determined by averaging the sum of the width measurements collected. For lake / manmade reservoirs and watercourses (landforms other than streams), the landform location was memorialized as polygon features using a hand-held GPS instrument.

The CDFW 1994 publication A Field Guide to Lake and Streambed Alteration Agreements, Sections 1600-1607 California Fish and Game Code was used for general guidance, however this publication lacks sufficient specificity for identifying fluvial watercourses in the field. The types of physical indicators used to identify potential CDFW jurisdictional waters for this investigation are similar to those used by the Corps of Engineers (Lichvar and McCooley 2008) to define ordinary high water marks, except they were adapted and used to define the geographical extent of uplands, lakes/manmade reservoirs, streams, and other fluvial watercourse land features. Field indicators of uplands and fluvial watercourses as described by Brady and Vyverberg (2013) were also used.

Geomorphic indicator data was collected at representative upland / aquatic landforms and was recorded on a field data form developed for this study based on the indicators listed in Table 5, above which is a combination of those described by Lichvar and McCooley 2008 and Brady and Vyverberg (2013) (Appendix D). Documentation of physical indicators providing evidence of aquatic resource areas as opposed to upland areas provided a technical basis for: (1) determining the presence or absence of a stream, other types of watercourse, and lake/manmade reservoir, and (2) if present, determining if the landform is active, dormant, abandoned, or relict as defined by the following criteria developed by Brady and Vyverberg (2013).

4.4 Rainfall Analysis

A WETS analysis was conducted to assess whether rainfall periods during the period of study fall within the normal range of precipitation based on long-term records collected at the nearest appropriate NWS cooperative weather station. Climate data for the nearby Lancaster California WETS Station (Appendix A, Figure 1) were obtained from the Western Regional Climate Center Cooperative Observer Program (Appendix C). The rainfall analysis followed the *Technical Standard for Water-Table Monitoring of Potential Wetland Sites* (Corps 2005), by which the Corps determines what is a normal, below normal, and above normal rainfall month

for any given year of record. This was accomplished by comparing recorded precipitation data collected prior to HBG's on-site investigations with WETS historical average monthly rainfall data (1981 – 2010), all recorded from the Lancaster, Ca WETS Station. (https://www.wcc.nrcs.usda.gov/climate/wets_doc.html).

The purpose of the WETS analysis is to aid in: (1) determining whether the climatic/hydrologic conditions observed on the site are typical for the time of year the field investigation is conducted (e.g., rainy season versus dry season); and (2) establishing whether observations made of surface and near-surface hydrology indicators, or the lack thereof, are the result of naturally problematic hydrology conditions (e.g., drought year, extreme precipitation/stormwater runoff event) preceding the field investigations.

4.5 Mapping

Once field data collection was completed, recorded GPS data were incorporated into a Geographic Information System (GIS) and georeferenced in overlay fashion onto Kern County 2016 Imagery. This imagery was orthorectified to USGS 7.5 minute 1: 24,000 scale quadrangle series topographic mapping of the Study Areas following national mapping standards. Engineer level 1.0-foot contour interval topographic mapping was also added to the map overlay to aid in photointerpretation pf land features (Wallace Group. 2017). The GIS located field data sampling points were used to assist in the identification and heads-up digitization of the location and geographic extent of aquatic resource features such as stream, other watercourses, and mam-made reservoirs identified within the Chaparral, Rabbitbrush, and Tumbleweed Facility Sites Study Areas. Physical upland / aquatic landform indicator data collected in the field was analyzed to determine if the mapped stream, other watercourses, and man-made reservoirs were active, dormant, abandoned, or relict. Discrete stream channels and their abutting out of bank flow areas were mapped as line features. man-made reservoirs and other watercourses identified were mapped as polygon features. Area calculations for streams were based on average width data taken in the field (which included the OHWM and active channel and abutting watercourse to the geographical extent of identifiable fluvial indicators) and the mapped channel length based on heads-up digitizing. Area calculations for other watercourses and man-made reservoirs was based on area calculations using GIS ESRI software. Data overlays of field observations were also used to assist in the analysis of collected field data to determine if identified potential aquatic resource areas met the definition and technical criteria for Corps/USEPA for Section 404 CWA wetlands or other waters (jurisdictional waters); RHA Navigable Waters; WRCB and RWQCB 401 CWA and PCA wetlands and waters; and/or the CDFW LSAA Program lakes or streams (see Section 2.0). The geographic extent of aquatic resource areas identified as being potential aquatic resources were mapped and classified using the US Fish and Wildlife Service's Classification System for Wetland and Deepwater Habitats (Cowardin et al. 1979).

5.0 TECHNICAL FINDINGS: CORPS/USEPA WETLANDS AND OTHER WATERS

This section presents the technical findings of HBG's investigation. Section 5.1 discusses technical findings regarding the presence or absence of wetland vegetation, soil, and hydrology indicators that, when applying the Corps' and US EPA technical criteria and methodology collectively, define the presence and geographical extent of wetlands. Section 5.2 discusses technical findings regarding the presence or absence of indicators of an OHWM, which, when applying the Corps' and USEPA technical criteria and methodology, define the presence and landward boundary of other waters. Appendix D, Field Data, provides:

- Identification of Potential Aquatic Resource Areas: Geomorphic Indicators of Upland and Watercourse Areas (Appendix D1)
- Identification of Potential Wetland Areas: Arid West Wetland delineation sheets for representative sampling points (Appendix D2).
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Stream Sample Sites with an OHWM (Appendix D3).
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Stream Sample Sites without an OHWM (Appendix D4)
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Other Watercourses with an OHWM (Appendix D5)
- Soil Infiltration Test Results (Appendix D6).
- AVEP Facility Study Areas Sample and Photo Locations and Soil Associations Summary (Appendix D7)

Appendix E provides representative site photos of sample sites. Appendix F provides a summary of data computations for delineated areas where potential aquatic resources met the technical criteria as a potential water of the US.

5.1 Aquatic Resources: Wetlands

For aquatic resources that are wetlands, federal jurisdiction extends to the geographical extent (boundary) of the wetland as defined at 33 CFR 328.3(b) (see Section 2.0) and determined by the collective presence of wetland vegetation, soil, and hydrology indicators. Land surface features identified within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas where potential aquatic resources meeting the Corps / USEPA technical criteria for "wetlands" may occur included stream channels, water courses within stream floodplains, and man-made reservoirs. Technical findings are presented in Subsections 5.1.1 - 5.1.4, below.

5.1.1 Field Indicators of Wetland Vegetation

Vegetation Indicator Conditions. Vegetation conditions were determined to not be significantly

disturbed within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas except for man-made reservoir areas in the Chaparral and Tumbleweed Study Areas and orchard areas in the Tumbleweed Study Area where vegetation conditions were determined to be significantly disturbed (Appendix A, Figure 7c). Based on rainfall data vegetation indicators were determined to not be naturally problematic.

Wetland Vegetation Indicators. Potential aquatic resource areas observed in the relatively undisturbed portions of the Chaparral, Rabbitbrush, and Tumbleweed Study Areas; irrigated orchards in the Tumbleweed Study Area; and within the exposed bottom of dried up man-made reservoirs in the Chaparral and Tumbleweed Study Areas were either non-vegetated or the vegetation present was sparse and typically comprising < 5 percent of the ground cover with the remainder area bare channel sediment. A few sample sites had plant cover values ranging between 20 and 70 percent. Dominant plant species observed were found to have an upland wetland indicator status (Table 6).

Table 6. Dominant Plant Species Observed Within Stream, Watercourse, and Man-Made Reservoir Areas and Their National Wetland Plant List Indicator Status*

SCIENTIFIC NAME	COMMON NAME	WETLAND INDICATOR STATUS
Ambrosia dumosa	White bursage	UPL**
Bromus carinatus	California brome grass	UPL**
*Chrysothamnus nauseosus (*Ericameria nauseosa)	Rabbit-brush	UPL
Festuca octoflora	Six weeks fescue	UPL**
Larrea tridentata	Creosote bush	UPL

* Lichvar, R.W., D.L. Banks, W.N. Kirchner, and N.C. Melvin. 2016. *State of California 2016 Wetland Plant List* a subset of *The National Wetland Plant List: 2016 Wetland Ratings*. Phytoneuron 2016-30: 1-17. Published 28 April 2016. ISSN 2153 733X. http://wetland_plants.usace.army.mil/.

** Plant species not listed in the National Wetland Plant List are considered UPL for wetland delineation purposes.

Indicator Status Codes:

OBL = Obligate wetland; occur almost always (estimated probability >99%) under natural conditions in wetlands.

FACW = Facultative Wetland; usually occur in wetlands (estimated probability 67%-99%) under natural conditions in wetlands. FAC = Facultative; equally likely to occur in wetlands or non-wetlands (estimated probability 34%-66%).
FACU = Facultative Upland; usually occur in non-wetlands (estimated probability 67%-99%).
UPL = Obligate Upland; occur almost always (estimated probability >99%) in non-wetlands in the region specified.
? = May or may not occur in wetlands depending upon species.

5.1.2 Field Indicators of Hydric Soils

Hydric Soil Indicator Conditions. The NRCS Custom Soil Resources Report in Appendix B provides detailed soil mapping and soils descriptions. Onsite field reconnaissance found that the soil mapping is relatively accurate**.** Surface soil conditions were determined to not be significantly disturbed except for man-made reservoir areas within the Chaparral and Tumbleweed Study Areas and orchard areas in the Tumbleweed Study Area where surface soils were found to be significantly disturbed by cultivation and excavation activities (Appendix A, Figure 7c). Soil indicators were determined to not be naturally problematic as

problem indicators were not found.

Hydric Soil Indicators. No hydric soil indicators were found in the ephemeral drainages and associated floodplains observed in the relatively undisturbed portions of the streams identified Chaparral and Rabbitbrush, Study Areas; stream watercourse flood plains within the Rabbitbrush Study Area; irrigated orchards in the Tumbleweed Study Area; or within soils associated with man-made irrigation reservoirs in the Chaparral and Tumbleweed Study Areas. Soil permeability testing in the Chaparral Study Area found the soil infiltration rates to be rapid ranging from over 2 inches to 12+ inches per hour (Appendix D6). This is consistent with the NRCS soils series descriptions for soils mapping within the area (Appendix B).

5.1.3 Field Indicators of Wetland Hydrology Conditions

Rainfall. Water received within the Study Areas comes from direct vertical precipitation and stormwater runoff. No seeps or spring discharges or saturated soil surfaces were observed. As seen in the WETS Precipitation Data Summary in Appendix C, above normal precipitation occurred during the months of December 2016 and January and February 2017 with monthly average precipitation of 1.59, 2.47, and 1.88 inches, respectively; the monthly average for March and December 2018 was 1.53 and 1.58 inches, respectively; and the monthly average for January 2019 was 1.97 inches. February 2019 had a monthly average precipitation amount of 1.92 inches. While this was in the normal range (0.75 to 2.04 inches) of normal precipitation received over the period of record (1974 – 2019), it is a high normal amount of precipitation. The presence of wetland hydrology indicators such as B2 – Sediment Deposits and B3 – Drift Deposits observed in stream channels and floodplain watercourses during 2017, 2018, and 2019 provide evidence that the amount of precipitation received within the Study Area was enough to generate surface water flow and / or ponding from direct precipitation and stormwater runoff of sufficient magnitude and duration to create physical indicators of surface water flow and ponding in the recent past. This information aided in determining if a stream, other type of watercourse, or man-made reservoir was active or would be active during normal hydrology conditions.

Landforms. The Chaparral, Rabbitbrush, and Tumbleweed Study Areas were dominated by upland alluvial fan landforms shaped by eolian and fluvial geomorphological processes (Schoeneberger and Wysocki, 2017). Geomorphic upland field indicators found included deflated surfaces, coppice dunes, no flow or ponding indicators, and surface rounding of landform in areas not altered by current or past crop production activities. Small areas of basin floor and terrace landforms were also found within the Tumbleweed and Rabbitbrush Study Areas, respectively. Geomorphic upland field indicators found included relic and active coppice dunes, no flow or ponding indicators, and surface rounding of landform in areas not altered by current or past crop production activities. A playette landform was also found within a small area of the Tumbleweed Site (Appendix A, Figure 7c; Appendix D1 Sites T13 – T19, T21, and T28). This landform typically consists of very small, playa-like, shallow, closed depression typically with a salt-encrusted surface, little or no vegetation in semi-arid to arid climates and

infrequently subject to ponding from precipitation events, and commonly lacks the component parts of a playa except for a small playa floor. The playette landform observed is the result of eolian geomorphological process and no connecting watercourse was found. Both relict and active coppice dunes were found within and abutting the landform. Soil cracking observed based on soil pit excavation was due to the clay properties of the exposed subsoil layer exposed by wind erosion. Soils mapped by the NRCS are characterized as being well drained (Appendix B). No physical indication of watercourse ponding in the form of desiccation mud cracks, curls, or drapes were found.

Land features which may contain wetland hydrology indicators were also identified with the upland landforms. These included stream channels, watercourses within stream floodplains, and man-made reservoirs. The following describes indicator conditions as relate to significant disturbance and normal circumstances followed by a description of wetland hydrology indicators observed by land feature type.

Wetland Hydrology Indicator Conditions. Surface wetland hydrology conditions were determined to be significantly disturbed by graded road cuts within Chaparral, Rabbitbrush, and Tumbleweed Study Areas. Surface hydrology conditions were found to be significantly disturbed within orchard areas found within the Tumbleweed Study Area where the ground surface is disturbed by cultivation and subsurface irrigation activities. Surface hydrology conditions were also found to be significantly disturbed within excavated and graded man-made reservoir areas in the Chaparral and Tumbleweed Study Areas (Appendix A, Figures 7a and 7c). Based on WETS analysis of rainfall data prior to and during field investigations (Appendix C) wetland hydrology conditions were determined to not be naturally problematic (Appendix D).

Wetland Hydrology Indicators: Streams
Ephemeral stream channels were found in both the Chaparral and Rabbitbrush Study Areas (Appendix A, Figures 7a and 7b). Wetland hydrology indicators providing evidence of surface water flow included B2 – Sediment Deposits and B3 – Drift Deposits.

Wetland Hydrology Indicators: Floodplain Watercourses
Several expansive floodplain watercourse landforms were found in the northern portion of the Rabbitbrush Study Area. These depressional areas become ponded due to overbank flooding from an adjacent ephemeral stream channel(s) (Appendix A, Figure 7b). Wetland hydrology indicators providing evidence of surface water flow included B2 – Sediment Deposits; B3 – Drift Deposits; and B6 - Surface Soil Cracks. Dominant vegetation was creosote bush a non-wetland indicator upland plant species.

Wetland Hydrology Indicators: Manmade Reservoirs
One man-made reservoir was found within the Chaparral Study Area and three man-made reservoirs were found in the Tumbleweed Study Area. All of the reservoirs were found to be no longer in use. The purpose of the reservoirs was to hold water for crop irrigation. Based on the

use of a hand auger it was determined that the reservoirs are unlined and consist of well drained sandy loam soils (Appendix D2, Sites T5 and T7). Abandonment was determined based on the observations that: (1) the well and irrigation pumps had been removed from each reservoir area and (2) there were no physical indicators of ponding found within the reservoirs.

Summary of Wetland Hydrology Indicators Found.
Wetland hydrology indicators were identified in ephemeral drainages within the Chaparral and Rabbitbrush Study Areas and floodplain watercourses adjacent to ephemeral drainages were found within the Rabbitbrush Study Area. No wetland hydrology indicators were found within the Tumbleweed Study Area. The table below provides a summary of wetland hydrology indicators found within areas were surface water flows occur.

Table 7. Summary of Wetland Hydrology Indicators Found

Land Surface Feature	Study Area Location	Wetland Hydrology Indicator(s) Observed
Ephemeral Drainage	Chaparral	B1[1] – Water Marks; B2 – Sediment Deposits; and B3 – Drift Deposits.
Ephemeral Drainage	Rabbitbrush	B1 – Water Marks; B2 – Sediment Deposits; and B3 – Drift Deposits.
Other Watercourse (floodplain between drainages)	Rabbitbrush	B1 – Water Marks; B2 – Sediment Deposits; B3 – Drift Deposits; and B6 - Surface Soil Cracks.

[1] See Arid West Manual for indicator list and descriptions.

5.1.4 Technical Findings: Wetlands

Although wetland hydrology indicators were found within stream channels, no areas were found within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas which met the Corps / USEPA technical definition and technical criteria for wetlands due to the lack of a dominance of wetland vegetation (hydrophytes) and hydric soils. This is due to short-lived stormwater flow events typical of the region with durations lasting for hours not days and the well-drained nature of the soils within the watershed both in uplands and sediments within the stream drainages, other watercourses, and man-made reservoirs.

5.2 Aquatic Resources: Other Waters

For non-tidal aquatic resources other than wetlands, federal jurisdiction extends to the ordinary high water mark (OHWM) when no adjacent wetlands are present (33 CFR 328.4(c)(1)). The Corps definition of OHWM applies to “waters of the United States” under the Clean Water Act (33 CFR 328.3(e)) and to “navigable waters of the United States” under the Rivers and Harbors Act (33 CFR 329.11(a)(1)). These definitions are identical, and define OHWMs as observable physical features, such as “a clean, natural line impressed on the bank,” that result from fluctuations of water. The frequency and/or duration of such fluctuations is not defined. Importantly, however, the definitions state that the OHWM is also established by “other

appropriate means that consider the characteristics of the surrounding areas" (citations above). As described in Section 2.0, an OHWM provides a technical basis for (a) determining the presence a potential water of the United States, and (b) defining the geographic extent of potential waters of the United States.

Land surface features identified within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas where potential aquatic resources meeting the Corps / USEPA technical criteria for "other waters" may occur included stream channels, water courses within stream floodplains, and man-made reservoirs. Technical findings are presented in Subsections 5.2.1 - 5.2.2, below.

5.2.1 Field Indicators of Ordinary High Water Marks

Identifiable OHWMs consisting of either sediment deposits, drift deposits, and/or bank scour were found in stream channels where surface water flow occurs.

5.2.2 Technical Findings: Other Waters

OHWMs were found in the single ephemeral drainage channels in the Chaparral and Rabbitbrush Study Areas shown by Figures 8a and 8b in Appendix A (Appendix D3). No ephemeral drainage channels were observed within the Tumbleweed Study Area (Appendix A, Figure 8c); Appendix D4). In addition, three floodplain watercourse areas formed adjacent to ephemeral drainage channels (Appendix D5, W-1, W-2, and W-3) in the northern portion of the Rabbitbrush Study Area were found to have OHWMs (Appendix A, Figure 8b).

No OHWM was found within either the three excavated reservoirs in the Tumbleweed Study Area or the one excavated reservoir in the Chaparral Study Area (Appendix A, Figures 7c and 7a; Appendix D4).

6.0 TECHNICAL FINDINGS: CDFW LAKES AND STREAMS

The following sections describe the physical indicators found within the Study Area that are indicative of aquatic surface features which include lake/manmade reservoir, stream channel, and associated floodplain watercourse. As seen in the WETS Precipitation Data Summary in Appendix C, above normal precipitation occurred during the months of December 2016 and January and February 2017 with monthly average precipitation of 1.59, 2.47, and 1.88 inches, respectively; the monthly average for March and December 2018 was 1.53 and 1.58 inches, respectively; and the monthly average for January 2019 was 1.97 inches. February 2019 had a monthly average precipitation amount of 1.92 inches. While this was in the normal range (0.75 to 2.04 inches) of normal precipitation received over the period of record (1974 – 2019) it is a high normal amount of precipitation. The presence of organic drift (organic flotsam) and desiccation mud cracks / curls observed in active stream channels, floodplain watercourses, and unimproved earthen road potholes and ruts during 2017, 2018, and 2019 provide evidence that the amount of precipitation received within the Study Area was enough to generate surface water flow and / or ponding from direct precipitation and stormwater runoff of sufficient magnitude and duration to create physical indicators of surface water flow and ponding in the recent past. This information aided in determining if a lake / manmade reservoir, stream, or other type of watercourse was active or dormant (aquatic landform) versus abandoned or relict (upland landform).

6.1 Aquatic Landforms

The Chaparral, Rabbitbrush, and Tumbleweed Study Areas are dominated by upland alluvial fan landforms shaped by eolian and fluvial geomorphological processes (Schoeneberger and Wysocki, 2017). Geomorphic upland field indicators found included deflated surfaces, coppice dunes, no flow or ponding indicators, and surface rounding of landform in areas not altered by current or past crop production activities. Small areas of basin floor and terrace landforms are also found within the Tumbleweed and Rabbitbrush Study Areas, respectively. Geomorphic upland field indicators found included relic and active coppice dunes, no flow or ponding indicators, and surface rounding of landform in areas not altered by current or past crop production activities. A playette landform was also found within a small area of the Tumbleweed Site (Appendix A, Figure 7c and Appendix D1 Sites T13 – T19, T21, and T28). This landform consists of very small, playa-like, shallow, closed depression typically with a salt-encrusted surface, little or no vegetation in semi-arid to arid climates and infrequently subject to ponding from precipitation events; and commonly lacks the component parts of a playa except for a small playa floor. The playette landform observed is the result of eolian geomorphological process and no connecting watercourse was found. Both relict and active coppice dunes were found within the landform. Soil cracking observed based on soil pit excavation was due to the clay properties of the exposed subsoil layer exposed by wind erosion. Soils mapped by the NRCS within abandoned stream areas are characterized in their soil descriptions as being well drained (Appendix B). No physical indication of watercourse ponding in the form of desiccation mud cracks, curls, or drapes were found.
Vegetation association mapping for the Chaparral, Rabbitbrush, and Tumbleweed Study Areas

is shown by Appendix A Figure 3 and soil association mapping for these areas can be found in Appendix B. Based on field inspection during this study the vegetation and soils mapping was determined to be relatively accurate.

The following provides a detailed description of the manmade reservoirs, stream channels, and watercourses found within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas.

6.1.1 Lakes / Manmade Reservoirs

No lakes were found within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas, however, manmade reservoirs identified on Figures 7a (MMR 1) and 7c (MMR 1 – 3) of Appendix A were found within the Chaparral (one) and Tumbleweed (three) Study Areas. The reservoirs were constructed as part of an irrigation system for cropland irrigation which has been abandoned. Based on the use of a hand auger it was determined that the reservoirs are unlined and consist of well drained sandy loam soils (Appendix D1 Sites T5 and T7). Abandonment was determined based on: (1) well and irrigation pumps being removed and (2) no physical indicators of ponding being found within the reservoir.

6.1.2 Streams

Active Streams. Active stream channel landforms were found in both the Chaparral and Rabbitbrush Study Areas (Appendix A, Figures 7a and 7b). Physical features providing indication of active flow included those shown in Table 8 below (Appendix D1).

Dormant Streams. Dormant stream channel landforms were found in the Chaparral Study Area. (Appendix A, Figure 7a). The stream channels identified as dormant appear to obtain their principal water source from an active upslope stream (Appendix A, Figures 7a stream channel S-1) during extreme flow periods greater than those experienced during 2017, 2018, and 2019, but with less frequent return intervals. These drainages, therefore, retain the potential for hydrologic reactivation and stream / watercourse function. Physical features providing indication of dormant stream channel conditions included those shown in Table 8 below (Appendix D1).

Abandoned Streams. Abandoned stream channel landforms were found in the Chaparral and Rabbitbrush Study Areas (Appendix A, Figures 7a and 7b). Each of these channels was found to be hydrologically isolated or cut off from its principal up-slope or overland surface water flow source by active sheet sand movement and coppice dune formation. These areas consist of partially or completely filled curvilinear surface features with vegetation beginning to grow within the channel areas. The dominant vegetation typically consisted of creosote bush and/or grasses. Field indicators of surface flow were typically not present or, if present, surface water flow would only be over a short distance (several feet) within the channel before infiltrating into the soil. Soils mapped by the NRCS within abandoned stream areas are characterized in their soil descriptions as being well drained (Appendix B) and in situ soil infiltration tests conducted as part of this investigation within a representative abandoned stream area at in the

Chaparral Facility Study Area found the soils to have rapid infiltration (Ksat) rates ranging approximately between 2+ to 12+ inches per hour (Appendix D6). Review of 2016 Kern County high resolution imagery found that although the abandoned channels had a visible channel signature, they lacked strong visible signatures of an abutting floodplain which is typical of active and dormant stream channels and other watercourses. This is believed to be because of the lack of waterborne fine-grained sediment within the floodplain watercourse after flow was cut off and weathering has occurred due to eolian process and/or direct precipitation events without surface / out of bank flow. Physical features providing indication of abandoned stream channel conditions included those shown in Table 8 below (Appendix D1).

Relict Streams. Relict stream channel landforms were found in both the Chaparral and Rabbitbrush Study Areas (Appendix A Figures 7a and 7b). These areas consist of partially or completely filled curvilinear surface features that were nearly or completely covered by vegetation. The dominant vegetation growing within the channel areas typically consisted of creosote bush and/or grasses. Soils mapped by the NRCS within relict channel areas are characterized in their soil descriptions as being well drained (Appendix B) and in situ soil infiltration tests conducted as part of this investigation within representative relict stream areas in the Chaparral Facility Study Area found the soils to have rapid infiltration (Ksat) rates ranging approximately between 2+ to 12+ inches per hour (Appendix D6). Review of 2016 Kern County high resolution imagery found that although the relict stream channels had a visible channel signature (or partial remnant thereof) they lacked strong visible signatures of an abutting floodplain which is typical of active and dormant stream channels and other watercourses. This is believed to be because of the lack of waterborne fine-grained sediment within the floodplain watercourse after flow was cut off and weathering has occurred due to eolian process and/or direct precipitation events without surface / out of bank flow. Physical features providing indication of relict stream channel conditions included those shown in Table 6 below (Appendix D).

6.1.3 Other Watercourses

Several expansive watercourse landforms were found in the northern portion of the Chaparral Study Area. These depressional areas become ponded due to overbank flooding from an adjacent active stream channel (Appendix A, Figure 7a). Physical features providing indication of dormant stream channel conditions included those shown in Table 8, below (Appendix D1). Dominant vegetation was creosote bush.

Table 8. Summary of Physical Indicators of Aquatic and Upland Landforms Within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas

Study Area	Landform	Indicators
Chaparral		
	Upland	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform;
	Manmade Reservoir	No flow or ponding indicators. Pumps and water delivery system removed.

Table 8. Summary of Physical Indicators of Aquatic and Upland Landforms Within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas		
Study Area	**Landform**	**Indicators**
	Active Channel	Cut banks; Drift: organic; Exposed roots below intact soil layer; Flow or streaming lineations; Headcuts; Knick Points; Sediment sheets
	Dormant Channel	Sand filled channels
	Abandoned Channel	No flow or ponding indicators; Woody debris in place
	Relict Channel	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform; Woody debris in place. Channel often difficult to define as bottom elevation nearly same as adjacent land surface or the same as the adjacent land surface.
	Other Watercourse	Desiccation mud cracks, curls and drapes (Active)
Rabbitbrush		
	Upland	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform; Woody debris in place
	Active Channel	Cut banks; Drift: organic; Exposed roots below intact soil layer; Flow or streaming lineations; Headcuts; Knick Points; Sediment sheets
	Abandoned Channel	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform;
	Relict Channel	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform; Woody debris in place. Channel often difficult to define as bottom elevation nearly same as adjacent land surface or the same as the adjacent land surface.
	Other Watercourse	Desiccation mud cracks, curls and drapes (Active)
Tumbleweed		
	Upland	Coppice dunes: active & relict; No flow or ponding indicators; Soil development; Surface rounding of landform; wind erosion indicators; Woody debris in place. (Note: Major portions of Study Area Irrigated orchards)
	Manmade Reservoir	No flow or ponding indicators. Pumps and water delivery system removed.

7.0 TECHNICAL FINDINGS: WRCB WETLANDS AND OTHER WATERS

This section presents the technical findings of HBG's investigation. Section 7.1 discusses technical findings regarding the presence or absence of wetlands when applying the Corps' and US EPA technical criteria and methodology and the WRCB definition of wetlands. Section 7.2 discusses technical findings regarding the presence or absence of indicators of an OHWM, which, when applying the Corps' and USEPA technical criteria and methodology and the WRCB definition of waters of the state. Appendix D, Field Data, provides:

- Identification of Potential Aquatic Resource Areas: Geomorphic Indicators of Upland and Watercourse Areas (Appendix D1)
- Identification of Potential Wetland Areas: Arid West Wetland delineation sheets for representative sampling points (Appendix D2).
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Stream Sample Sites with an OHWM (Appendix D3).
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Stream Sample Sites without an OHWM (Appendix D4)
- Identification of Potential Other Waters: Arid West Ephemeral and Intermittent Stream OHWM Datasheets Representative of Other Watercourses with an OHWM (Appendix D5)
- Soil Infiltration Test Results (Appendix D6)
- AVEP Facility Study Area Sample and Photo Locations and Soil Associations Summary (Appendix D7)

Appendix E provides representative site photos of sample sites. Appendices F1 – F3 provide summary data computations for delineated areas where potential aquatic resources meet the technical criteria as a potential water of the US and waters of the state under Section 404 of the CWA. Appendices F9 – F11 provides a summary of data calculations for delineated areas where potential aquatic resources as defined by the WRCB's definitions of wetlands and waters of the state occur.

7.1 Technical Findings: Wetlands

As indicated in Section 5.1, above although wetland hydrology indicators were found within active stream channels, no areas were found within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas which met the Corps / USEPA technical criteria for wetlands due to the lack of a dominance of wetland vegetation (hydrophytes) and presence of hydric soils. This is due to short-lived stormwater flow events typical of the region with durations lasting for hours not days and the well-drained nature of the soils within the watershed both in uplands and sediments within the stream drainages, other watercourses, and man-made reservoirs.

No areas were found that met the WRCB wetland definition. No evidence was found within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas that the active and dormant ephemeral stream channels observed have had a duration of soil or substrate saturation sufficient to cause anaerobic conditions in the upper substrate as would be evidenced by the presence of hydric soil indicators.

7.2 Technical Findings: Other Waters

OHWMs were found in the single ephemeral drainage channels in the Chaparral and Rabbitbrush Study Areas shown by Figures 8a and 8b in Appendix A (Appendix D3). No ephemeral drainage channels were observed within the Tumbleweed Study Area (Appendix A, Figures 7c and 8c) (Appendix E4). In addition, three floodplain watercourse areas formed adjacent to ephemeral drainage channels (Appendix D5, W-1, W-2, and W-3) in the northern portion of the Rabbitbrush Study Area were found to have OHWMs (Appendix A, Figure 8b). No OHWM was found within either the three excavated reservoirs in the Tumbleweed Study Area or the one excavated reservoir in the Chaparral Study Area (Appendix A, Figures 7c and 7a; Appendix D4).

Evidence of surface water flow was found in the Chaparral and Rabbitbrush Study Areas beyond the OHWM within active and dormant streams as discussed in Sections 6.1.2 and 6.1.3, above. These areas are shown by Appendix A, Figures 9a and 9b.

8.0 AREAS POTENTIALLY SUBJECT TO FEDERAL JURISDICTION

This section presents the findings of this delineation with respect to the identification and geographic extent of aquatic resources that meet the Corps / USEPA technical criteria for either wetlands or other types of aquatic resources that potentially could be regulated by the Corps and the US EPA as a water of the US under Section 404 of the CWA and / or by the Corps as a Navigable Water under Section 10 of the RHA if proposed to be adversely affected by one or more of the Facilities. Review of the Applicants' designs indicates that aquatic resources (wetlands / other waters of the US) potentially subject to Corps / USEPA jurisdiction would be avoided and would therefore not be impacted by ground disturbing activities.

8.1 CWA Wetlands

Based on an analysis of the technical findings in Sections 5.1, no area was identified within the Study Area that "potentially" meets the Corps and USEPA technical wetland criteria, due to the lack of a collective presence of hydrophytic vegetation, hydric soil, wetland hydrology indicators as required by the Corps' 1987 Manual, the Arid West Supplement, guidance documents, and Corps/US EPA regulations.

8.2 CWA Other Waters

Based on an analysis of the technical findings in Section 5.2 the ephemeral streams found in the Chaparral and Rabbitbrush Study Areas to have an Ordinary High Water Mark meet the technical criteria for Other Waters of the US. The locations of these "potential" other waters of the US are shown by Appendix A, Figures 8a and 8b. Table 9 summarizes by Cowardin class and flow regime the aquatic resources identified within the Study Areas based on Corps delineation methodology. No potential Other Waters of the US were found in the Tumbleweed Study Area Appendix A, Figure 8c.

Table 9. Aquatic Resources Found Within the AVEP Study Areas Based on Section 404 CWA Technical Definitions for Wetlands or Other Waters

AVEP Study Area	Waters ID[1]	Waters Type	Cowardin Class and Flow Regime[2]	Length (Ft)[1]	Acres
Chaparral	No Wetlands Found	Wetlands	NA	0	0
	Streams with OHWMs Found (See Appendix E3)	Other Waters	Riverine Intermittent Streambed / Flow: Intermittently Flooded	26,767	0.80
Rabbitbrush	No Wetlands Found	Wetlands	NA	0	0
	Streams with OHWMs Found (See Appendix E3)	0.28	0.28	0.28	0.28
Subtotal				**35,542**	**1.08**
Rabbitbrush	No Wetlands Found	Wetlands	NA	0	0

Table 9. Aquatic Resources Found Within the AVEP Study Areas Based on Section 404 CWA Technical Definitions for Wetlands or Other Waters

AVEP Study Area	Waters ID[1]	Waters Type	Cowardin Class and Flow Regime[2]	Length (Ft)[1]	Acres
	Watercourses Adjacent to Streams with OHWMs Found (See Appendix E5: W-1, W-2, & W-3)	Other Waters	Floodplain consisting of multiple Riverine Intermittent Streambeds / Flow: Riverine Intermittent	NA	3.34
Subtotal				**NA**	**3.34**
Tumbleweed	No Wetlands Found	NA	NA	0	0
	No Other Waters Found	NA	NA	0	0
Subtotal				**NA**	**NA**
Totals				**35,542**	**4.42**

1. See Appendix G for data calculations summary
2. Waters of the US classified using the US Fish and Wildlife Service's Classification System for Wetland and Deepwater Habitats (Cowardin et al. 1979).

As indicated in the Section 5.2 technical findings above, the ephemeral drainages identified by Appendix A, Figures 8a and 8b mapping direct surface and near-surface stormwater flows toward Rosamond Lake, a terminal dry lake playa approximately 2.0 miles north of the northern Study Area boundary. However, the surface flows are hydrologically isolated as they do not flow into the dry lake playa before infiltrating into the soil within or adjacent to the Chaparral and Rabbitbrush Study Areas (Appendix A, Figure 11). Furthermore, the dry lake bed is not on the Los Angeles District Corps of Engineers list of Navigable Waters[12] or meets the definition of a Traditional Navigable Water.[13]

Following the analysis procedures outlined in the Corps' Approved Jurisdictional Determination Form (Appendix G), it was determined that none of the aquatic resources identified in Section 5.0 (see Table 9) and shown by Appendix A, Figures 8a and 8b as "Potential Waters of the US Subject to Corps / USEPA CWA Jurisdiction" are waters of the US. The ephemeral drainages identified do not have a surface or near-surface hydrologic connection with a Traditional Navigable Water (TNW)and therefore fail the Significant Nexus Test. In addition, there is no evidence to support a conclusion that the ephemeral drainages are used or susceptible for use to transport interstate or foreign commerce. Appendix G provides a record of this analysis and determination. Table 10 below lists these non-jurisdictional waters and summarizes the rationale for determining that they are not subject to CWA jurisdiction.

Table 10. Non-Jurisdictional Waters Based on Following the Analysis Procedures in the Corps' Approved Jurisdictional Determination Form (See Appendix G)

AVEP Study Area	Waters ID [1]	Habitat Type 2	Waters Type	Acres	Length (Ft)	Non-Jurisdictional Waters Rationale
Chaparral	See Appendix D3: Active & Dormant Streams	Riverine Intermittent Streambed / Flow: Intermittently Flooded	Isolated	NA	26,767	1. Ephemeral streams, as defined by an OHWM, direct surface water flow toward an isolated intrastate dry lake (Rosamond / Rogers Dry Lake) without surface flows reaching it. 2. Intrastate water, the use, degradation, or destruction of which does not affect interstate commerce. 3. No substantial nexus to interstate (or foreign) commerce.
Rabbitbrush	See Appendix D3 Active Streams	Floodplain consisting of multiple Riverine Intermittent Streambeds / Flow: Riverine Intermittent	Isolated	NA	8,775	1. Ephemeral streams, as defined by an OHWM direct surface water flow toward an isolated intrastate dry lake (Rosamond / Rogers Dry Lake) without surface flows reaching it. 2. Intrastate water, the use, degradation, or destruction of which does not affect interstate commerce. 3. No substantial nexus to interstate (or foreign) commerce.
Rabbitbrush	See Appendix D5: Watercourses W-1, W-2, & W-3.	Palustrine Open Water (excavated) / Flow: Artificially Flooded	Isolated	3.34	NA	1. Ephemeral streams, as defined by an OHWM, direct surface water flow toward an isolated intrastate dry lake (Rosamond / Rogers Dry Lake) without surface flows reaching it. 2. Intrastate water, the use, degradation, or destruction of which does not affect interstate commerce. 3. No substantial nexus to interstate (or foreign) commerce.
Totals				**3.34**	**35,542**	

[1] See Appendix F for data calculations summary and Appendix G for Corps Approved Jurisdictional Determination Forms. [2] Waters of the US classified using the US Fish and Wildlife Service's Classification System for Wetland and Deepwater Habitats (Cowardin et al. 1979).

8.3 RHA Navigable Waters

Based on an analysis of the technical findings in Section 5.2 the ephemeral streams found in

the Chaparral and Rabbitbrush Study Areas have an Ordinary High Water Mark which technically defines the geographical reach of Navigable Waters under the RHA. However, based on review of the Los Angeles District Corps of Engineers listing of Navigable Waters, no navigable waters [14] occur within the Chaparral, Rabbitbrush, or Tumbleweed Study Areas that may potentially be subject to Corps jurisdiction under Section 10 of the RHA Act.

[14] https://www.spl.usace.army.mil/Missions/Regulatory/Jurisdictional-Determination/Navigable-Waterways/

9.0 AREAS POTENTIALLY SUBJECT TO CDFW JURISDICTION

This section presents the findings of this delineation with respect to the identification and geographic extent of areas within the Facility Study Areas that could potentially be subject to CDFW jurisdiction under the 1600 Lake and Streambed Alteration Agreement Program if proposed to be adversely affected by one or more of the Facilities. Review of the Applicants' designs indicates that aquatic resources (lakes and stream type habitats) potentially subject to CDFW jurisdiction would be avoided and would therefore not be impacted by ground disturbing activities.

9.1 Lakes

No areas were found within the Study Area meeting the definition of man-made reservoirs. These areas were constructed as a standard regional arid lands agricultural practice to hold water for cropland irrigation. The reservoirs found were considered not to be potentially jurisdictional as (1) crop production on the lands irrigated by water from these reservoirs had been abandoned, (2) well pumps used to fill the reservoirs had been removed, and (3) there were no physical indicators of recent ponding within the reservoirs.

9.2 Streams

Areas were found that meet the Title 14 CCR Section 1.72 definition of a stream. These watercourses are potentially subject to jurisdiction under the CDFW's Lake and Streambed Alteration Agreement Program (FGC Sections 1600-1616) if proposed to be adversely affected by the relevant Facility (i.e., the Facility would substantially divert or obstruct the natural flow of, or substantially change or use any material from the steam). This finding is based on the presence of observed physical evidence that water had moved across the land surface within the confines of a streambed or where water had overflowed the confines of the streambed prior to infiltrating into the soils. Fluvially active and dormant watercourses were considered as potentially subject to CDFW jurisdiction. Fluvial channels hydrologically isolated or cut off from upgradient stream channel or floodplain watercourses were not considered to be potentially subject to CDFW jurisdiction. These types of watercourses were considered abandoned or relict based on field indicator data and review of aerial imagery.

Table 11 provides a summary of potential CDFW jurisdictional acreage within the Study Areas. Potential jurisdictional acreage for individual delineated stream and floodplain watercourses was calculated using the total linear distance of the channel multiplied by the average width. As described in Section 4.0, channel width was measured from where indicators of fluvial process were found within the watercourse either within the channel or to the extent surface water flow indicators was evident outside the channel bank. Potential jurisdictional acreage for floodplain watercourses was measured using an area calculation based on the perimeter of the watercourse ponding indicators (i.e., desiccation cracks) identified in the field. Appendix A, Figures 9a,9b, and 9c provides mapping stream / watercourse areas potentially subject to CDFW jurisdiction as well as hydrologically cut-off abandoned watercourses not considered to be jurisdictional. Table 12 is a summary of watercourses not considered to be jurisdictional.

Relict stream course features were not mapped given the difficulty in identification as these land surface features were obscured by moving sand sheets. Appendix F provides computations for delineated areas shown in Appendix A, Figures 9a,9b, and 9c.

Table 11. Summary of Linear Distance and Acreage of Lake/Man-Made Reservoir, Stream, and Other Watercourse Landforms Found Within the Chaparral, Rabbitbrush, and Tumbleweed Study Areas Potentially Subject to CDFW Jurisdiction

Jurisdictional Waters	Linear Distance (Ft.)	Acres

10.0 AQUATIC RESOURCES POTENTIALLY SUBJECT TO STATE WRCB AND RWQCB JURISDICTION

This section presents the findings of this delineation with respect to the identification and geographic extent of aquatic resources that meet the Corps / USEPA technical criteria for either wetlands or other types of aquatic resources that potentially could be regulated by the WRCB and RWQCB as a wetland or other waters of the state under Section 401 of the CWA and / or by the Porter-Cologne Act if proposed to be adversely affected by one or more of the Facilities. Review of the Applicants' designs indicates that aquatic resources (wetlands / other waters of the State) potentially subject to WRCB and RWQCB jurisdiction would be avoided and would therefore not be impacted by ground disturbing activities.

10.1 401 CWA Wetland Wetlands

No area was identified within the Study Areas that "potentially" meets the Corps and USEPA technical wetland criteria based on an analysis of the technical findings in Sections 7.1 and 7.2, which describe the collective presence of hydrophytic vegetation, hydric soil, wetland hydrology indicators as required by the Corps' 1987 *Manual*, the *Arid West Supplement*, guidance documents, and Corps/US EPA regulations.

10.2 401 CWA Other Waters

Based on an analysis of the technical findings in Section 7.2 the ephemeral streams found in the Chaparral and Rabbitbrush Study Areas to have an Ordinary High Water Mark meet the technical criteria for other waters of the US and therefore waters of the state under the WRCB and RWQCB's 401 CWA Program. No areas were found with an OHWM in the Tumbleweed Study Area. The locations of these "potential" other waters of the US and state are shown by Appendix A, Figures 8a, 8b, and 8c. Table 13 summarizes by Cowardin class and flow regime the aquatic resources identified within the Study Area based on Corps delineation methodology.

10.3 PCA Wetlands

No area was identified within the Study Areas that "potentially" meets the WRCB and RWQCB's definition of wetlands based on an analysis of the technical findings in Sections 7.1 and 7.2.

10.4 PCA Other Waters

Based on an analysis of the technical findings in Section 7.2 the ephemeral streams found in the Chaparral and Rabbitbrush Study Areas potentially meet the technical criteria of being a surface waters of the state. No surface water areas were found with the Tumbleweed Study Area. The locations of these "potential" other waters of the state are shown by Appendix A, Figures 10a, 10b, and 10c. Table 14 summarizes by Cowardin class and flow regime the aquatic resources identified within the Study Areas based on Corps delineation methodology. It should be noted that these potential other waters included both active and dormant streams potentially subject

to CDFW jurisdiction (Appendix A, Figures 9a and 9b).

Table 13. Aquatic Resources Found Within the AVEP Study Areas Based on Corps / USEPA CWA Jurisdictional Delineation Methodology for Wetlands and Other Waters

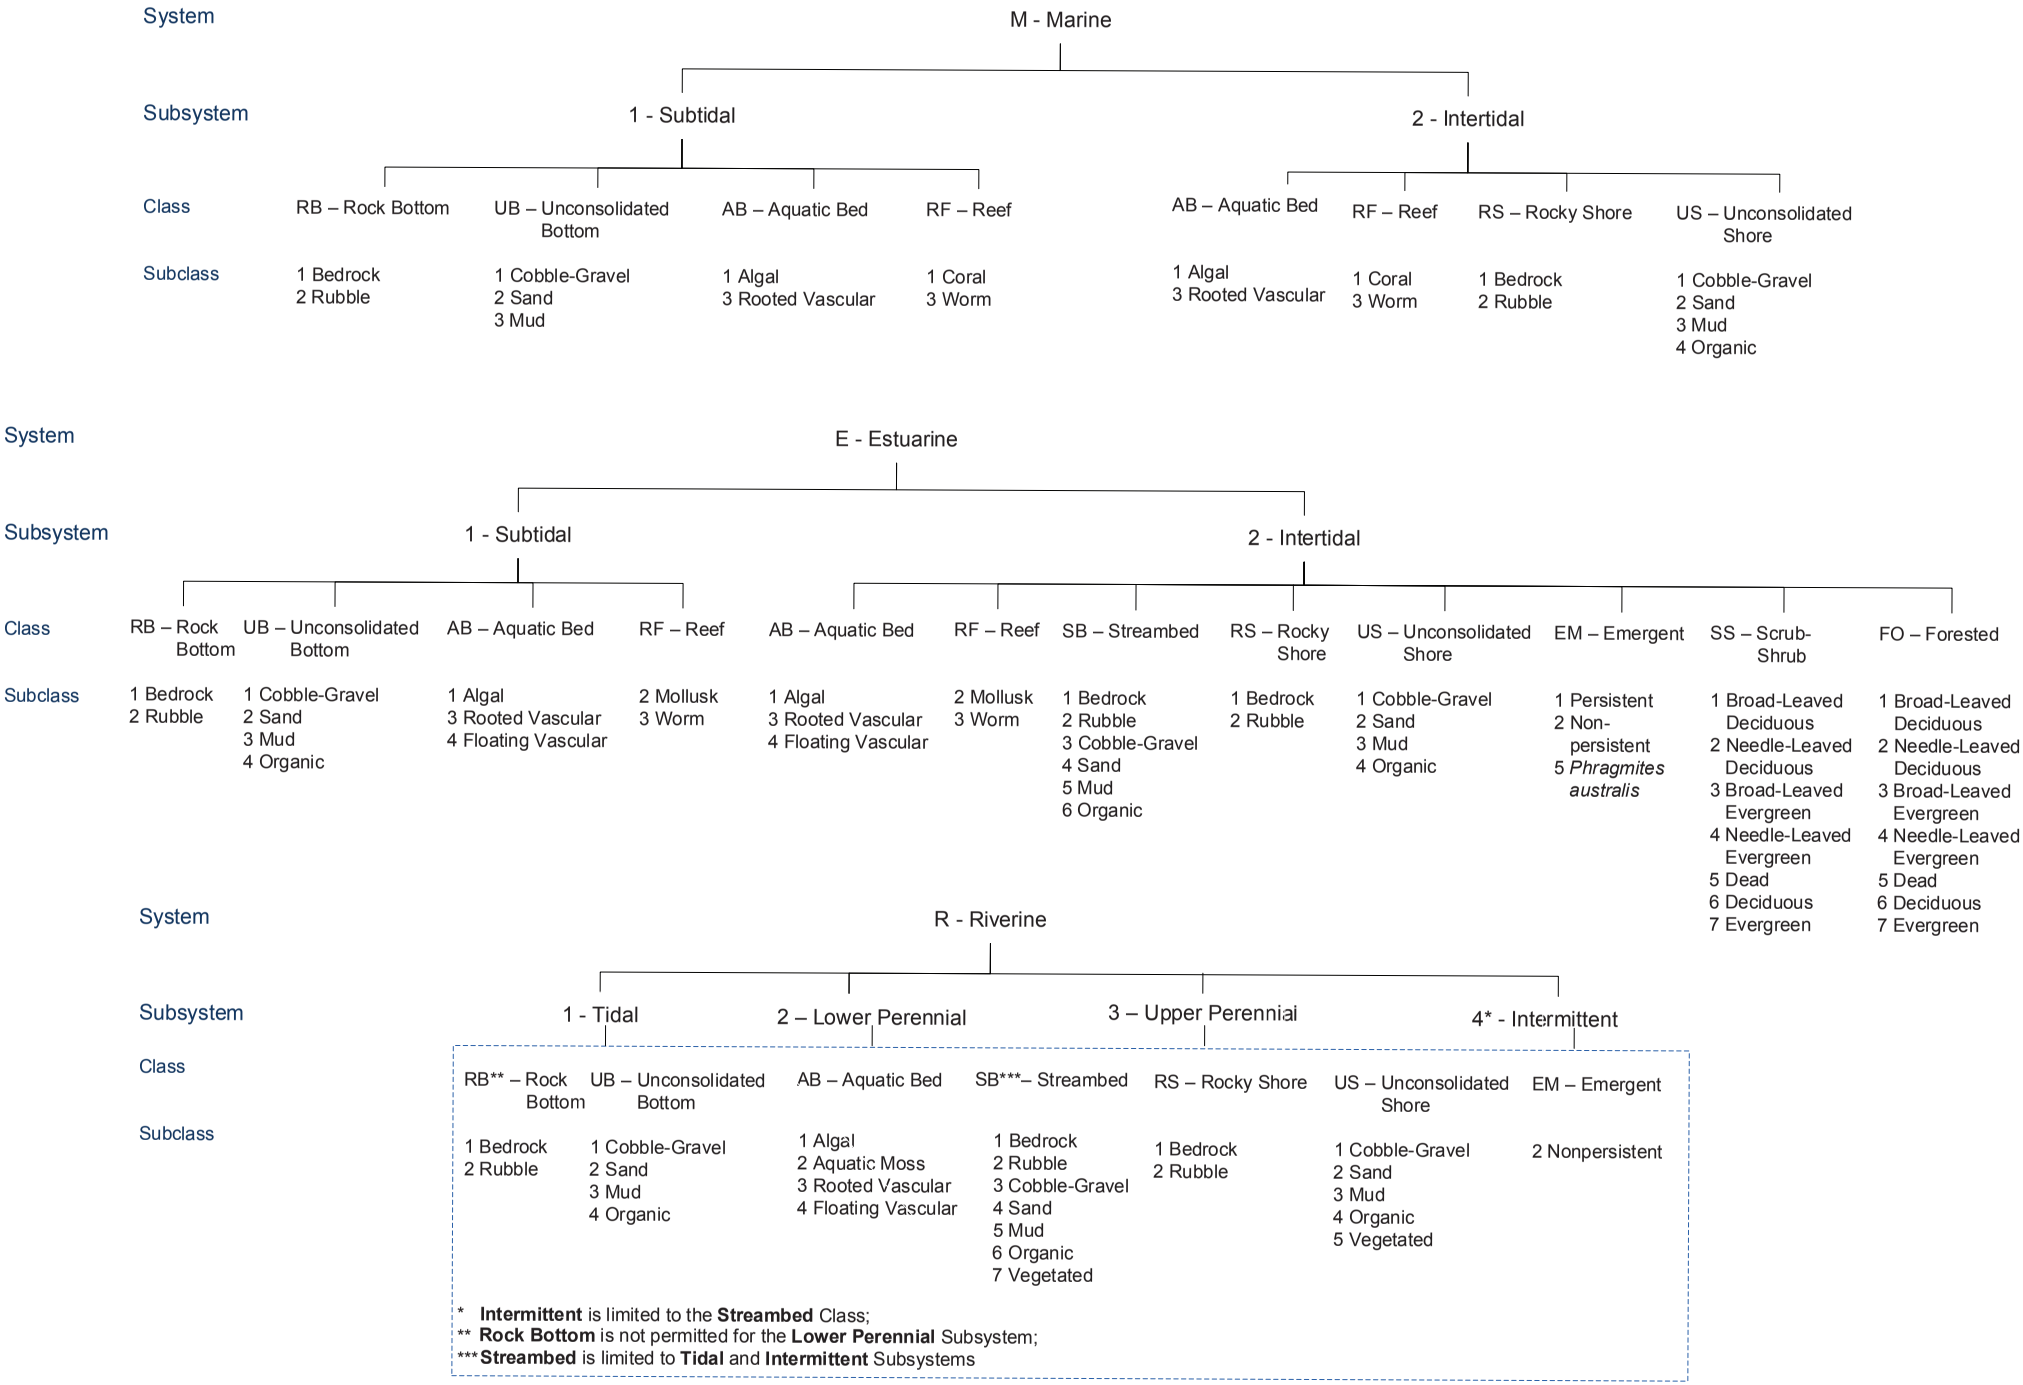
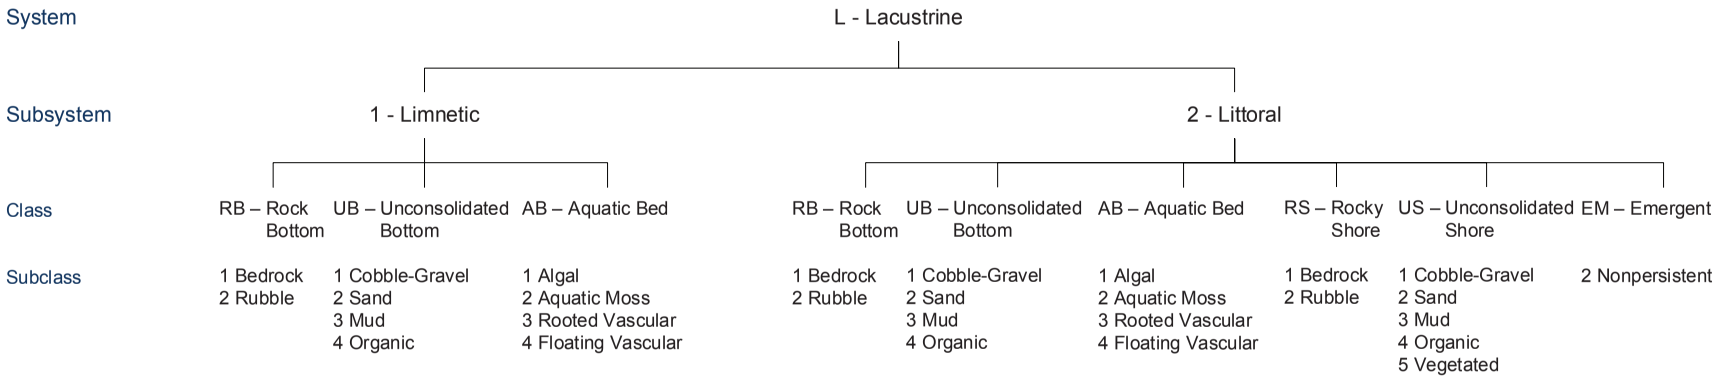
NWI Wetlands and Deepwater Map Code Diagram





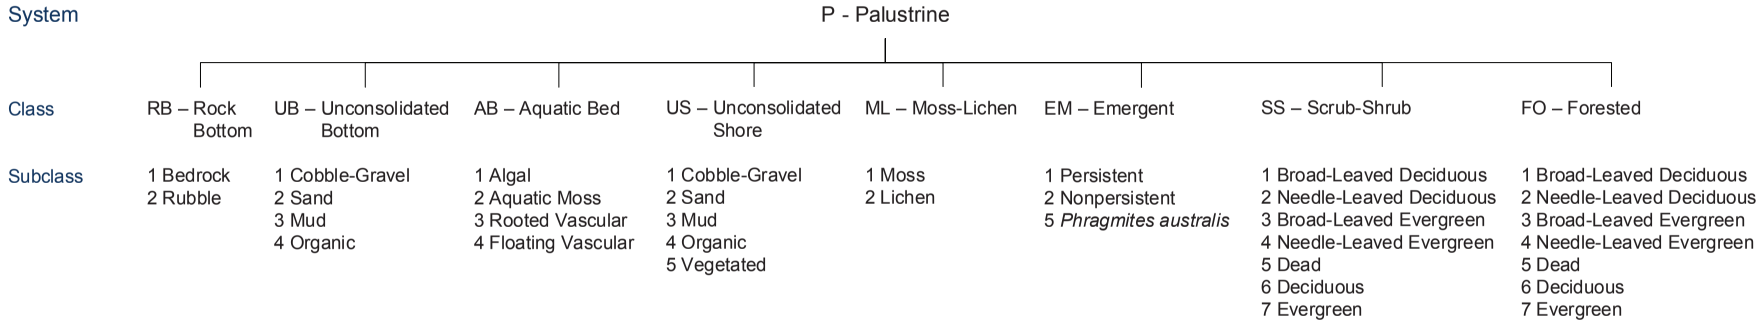


Figure 6d. NWI Wetlands and Deepwater Code Map Diagram, Part 1

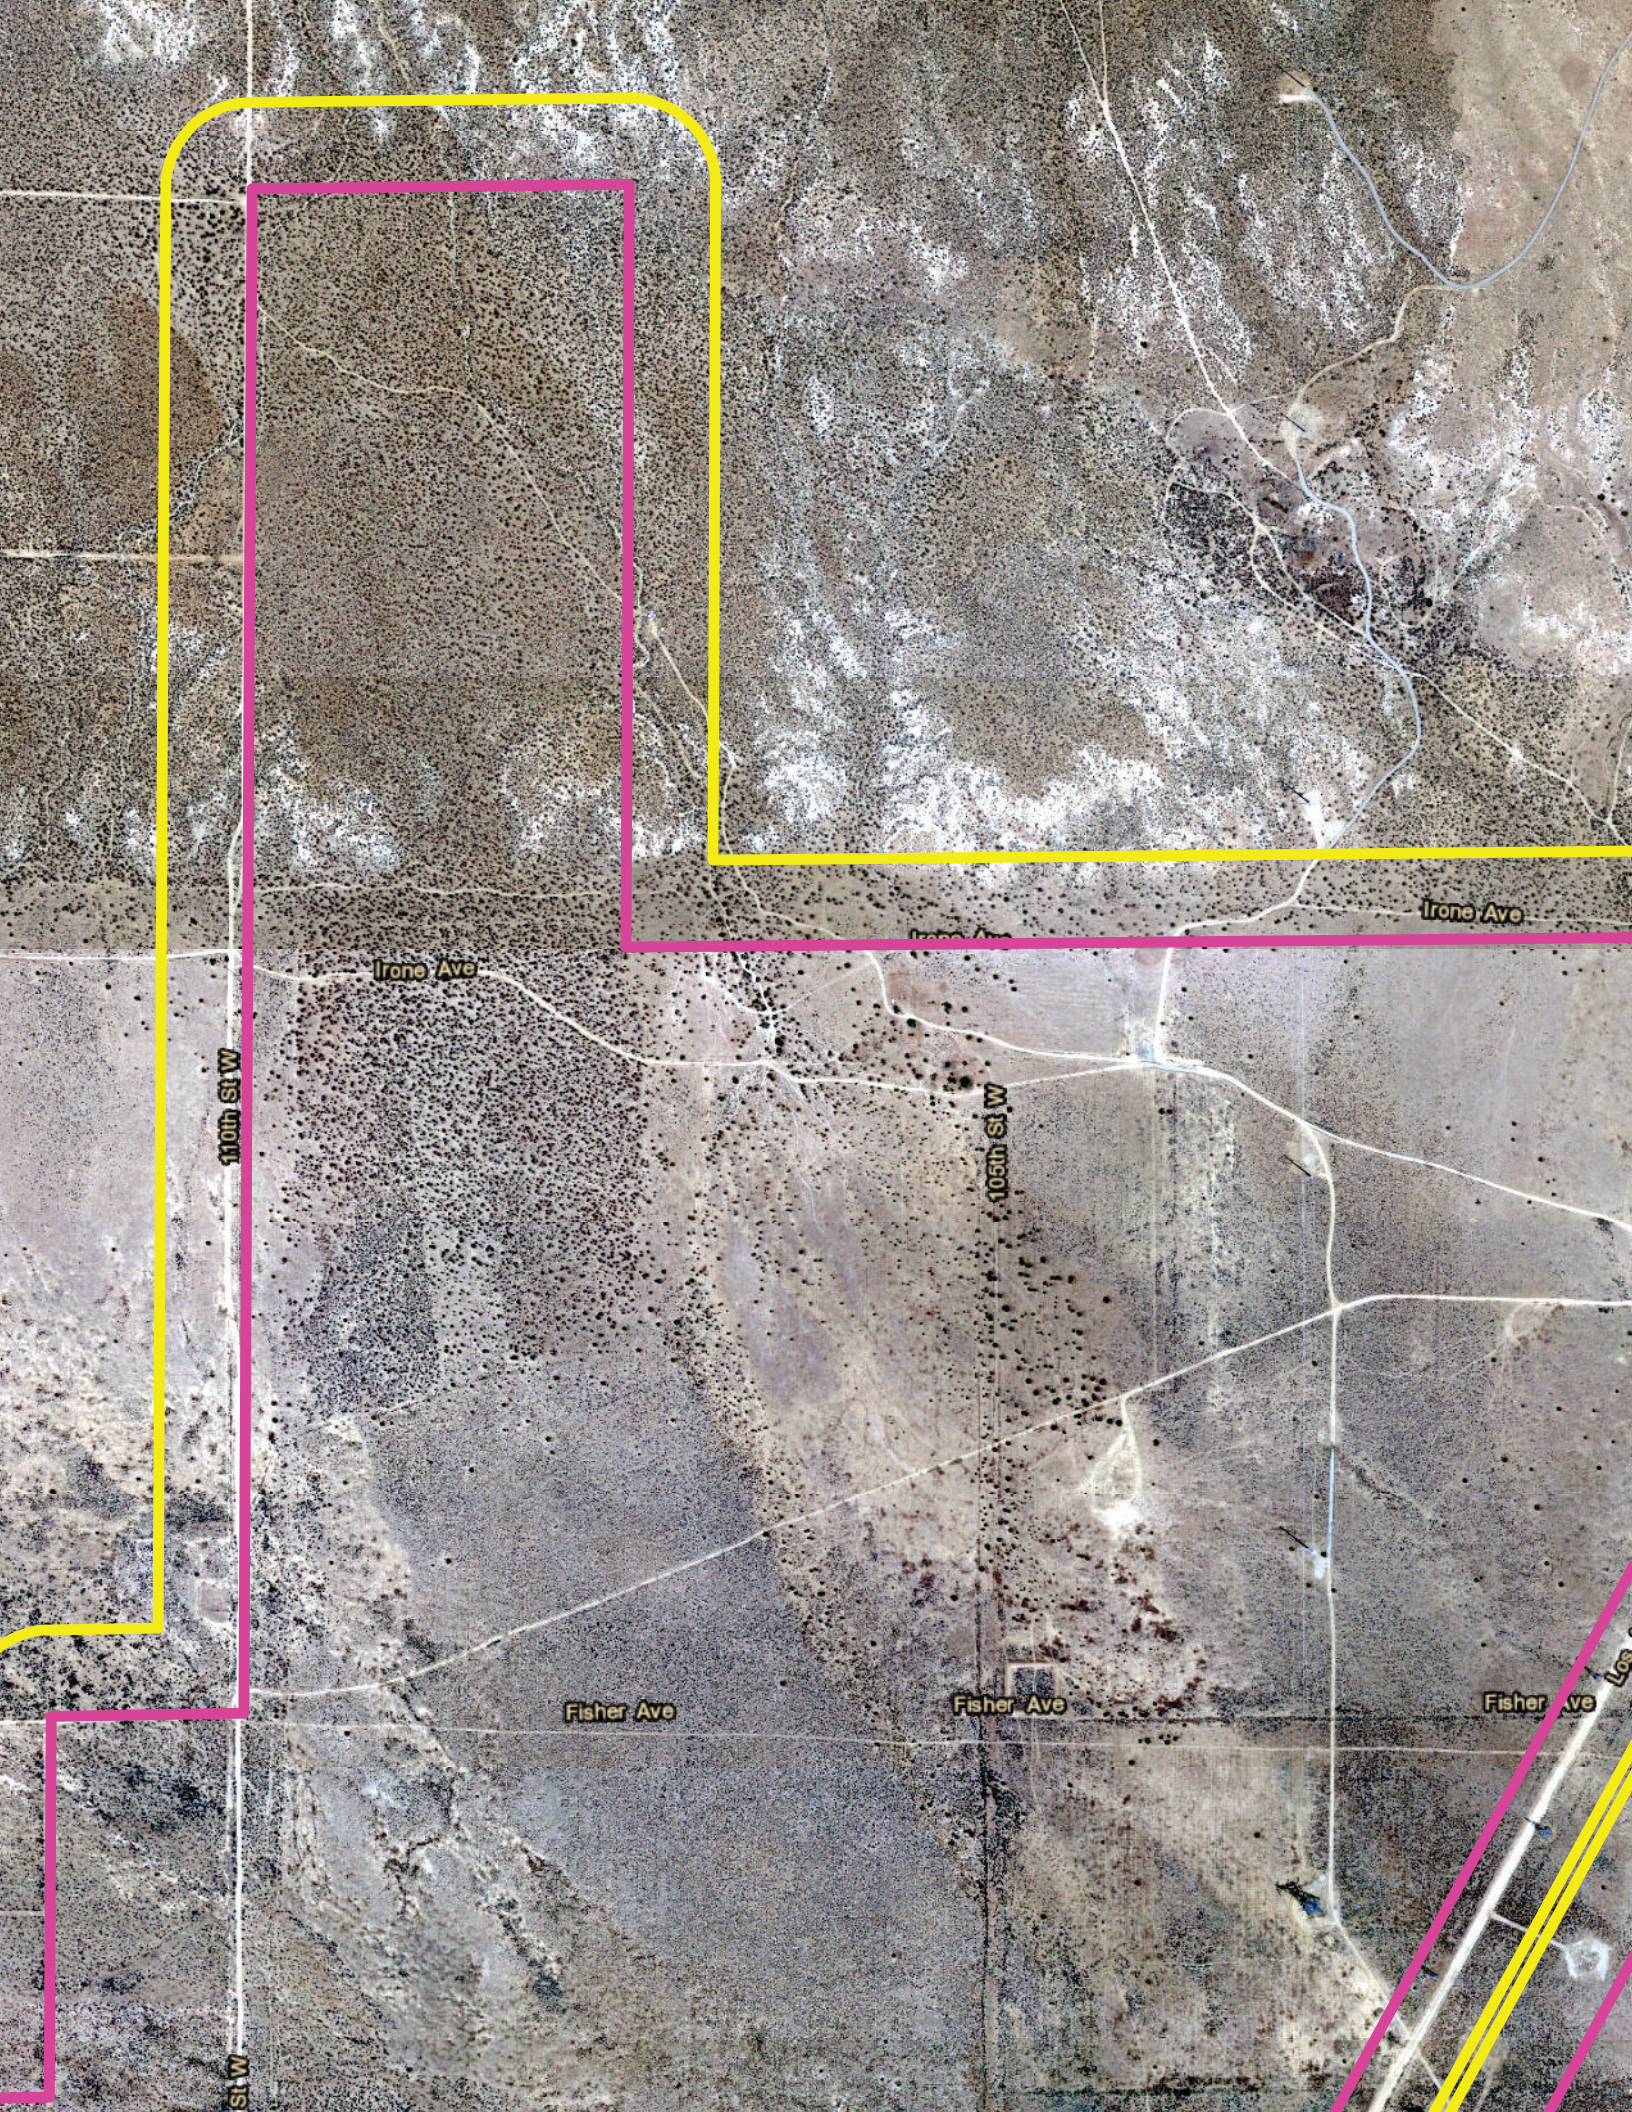
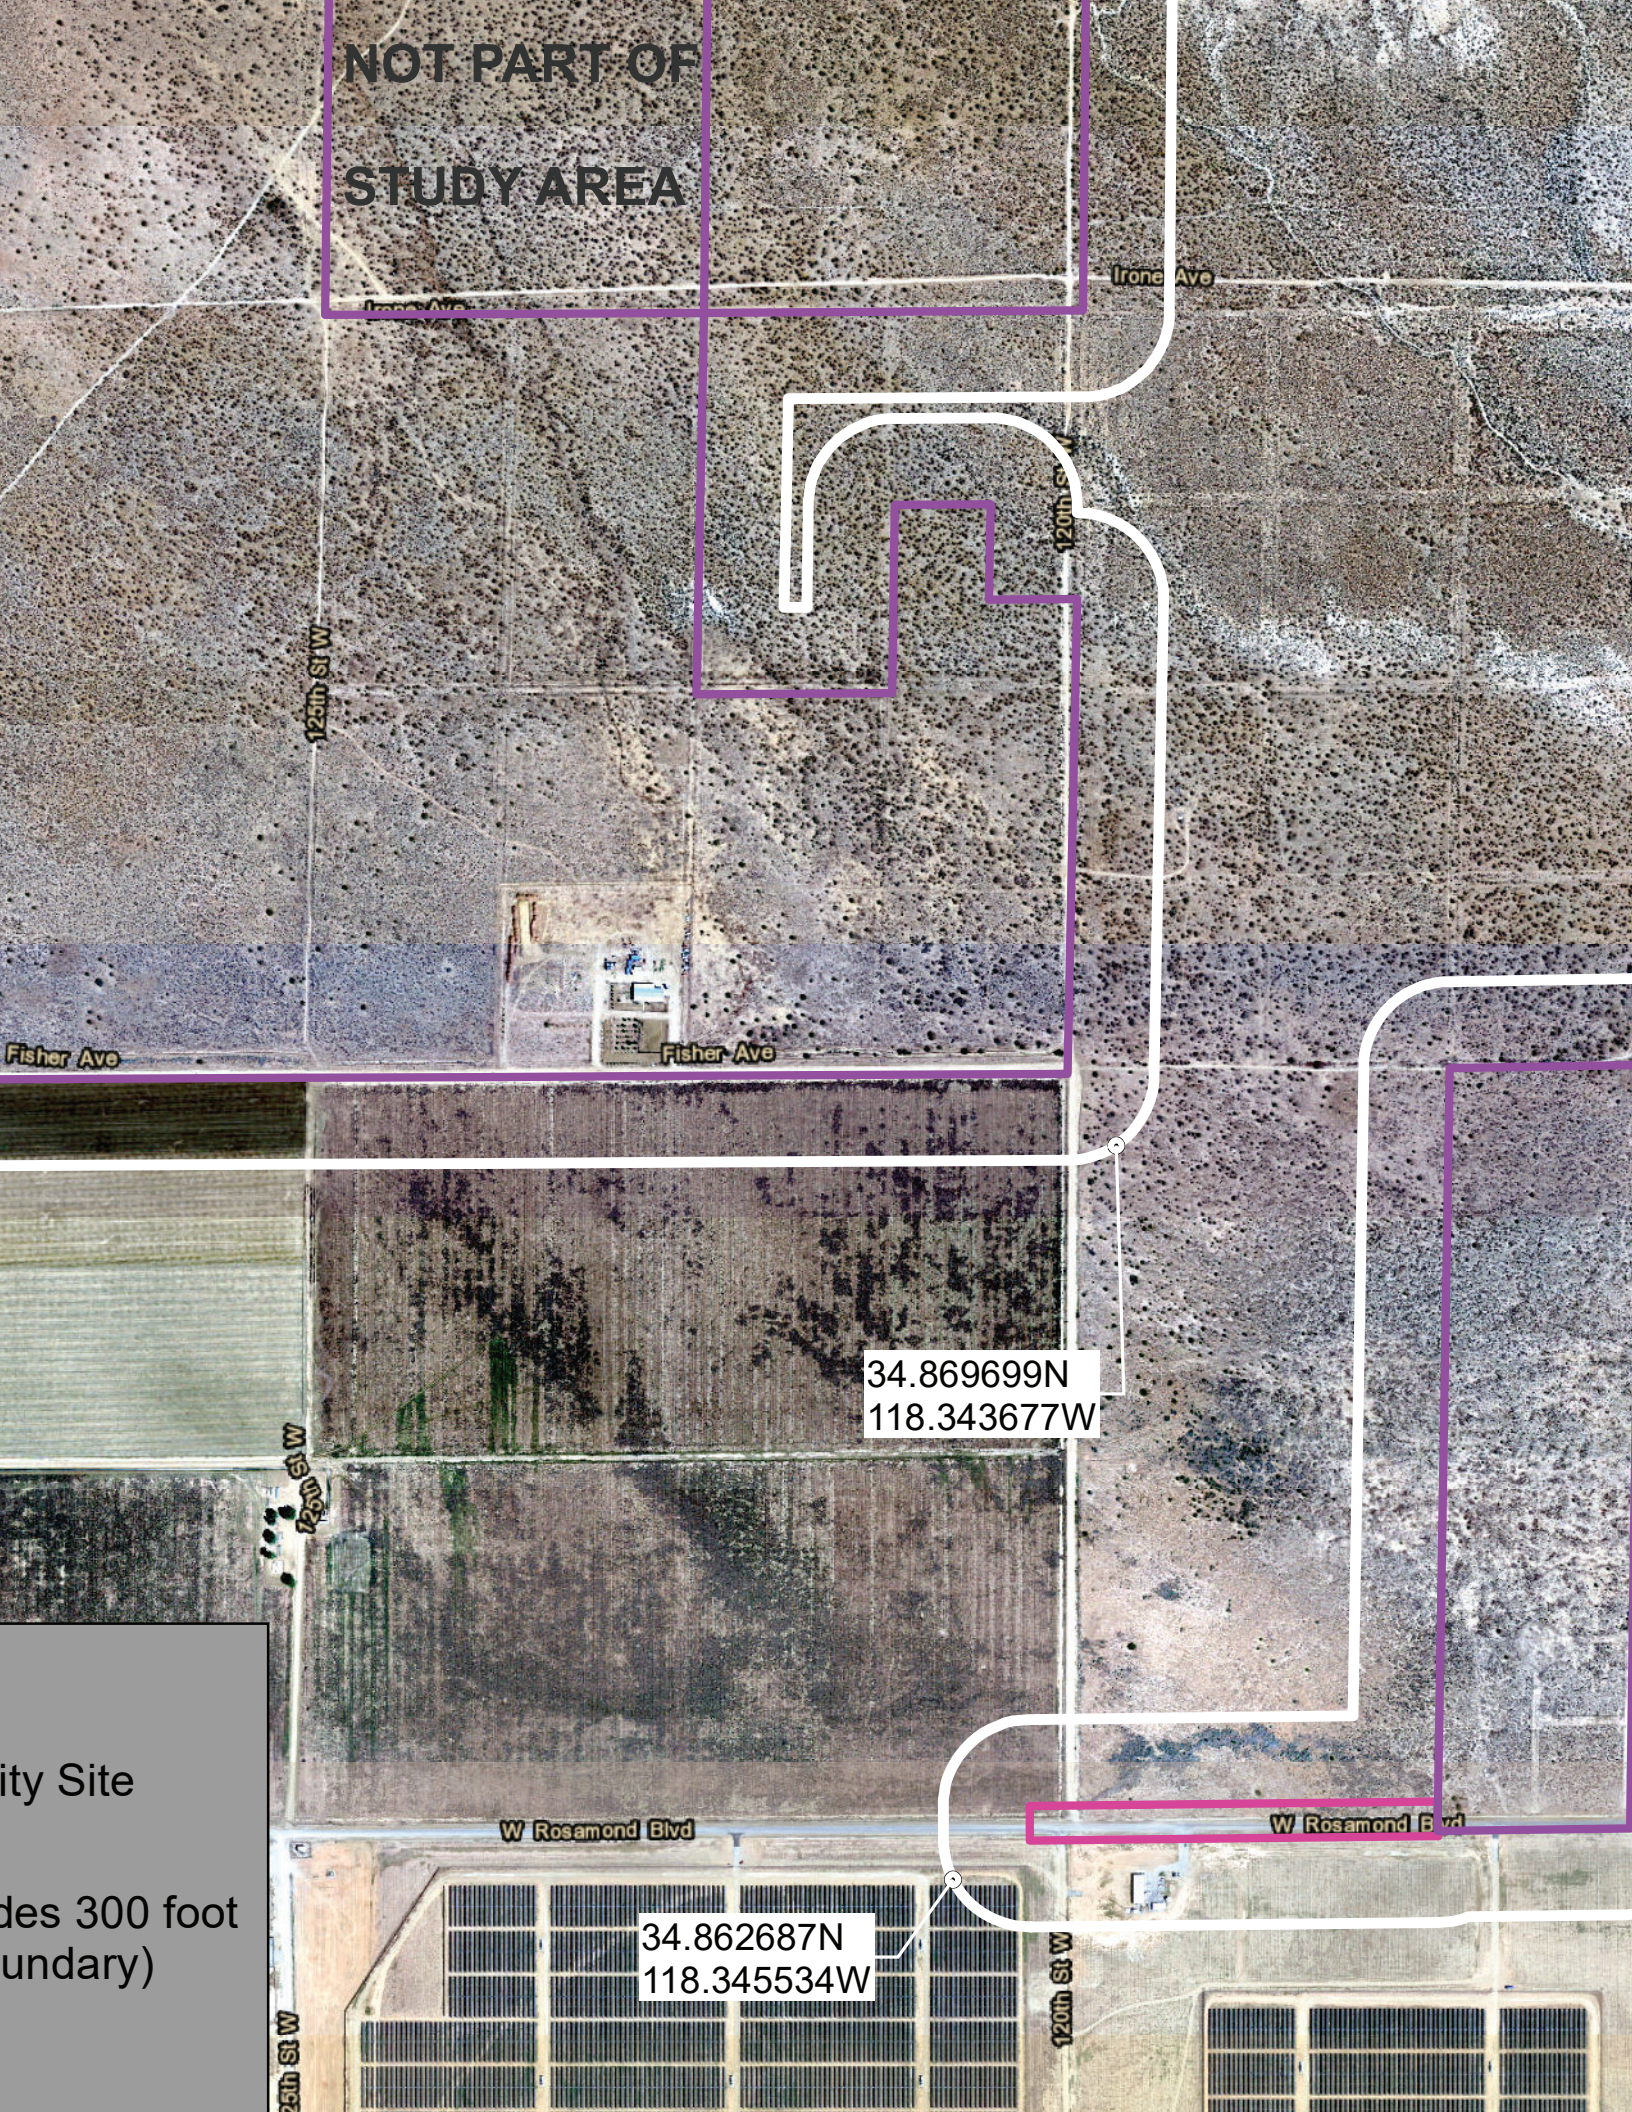
August, 2015

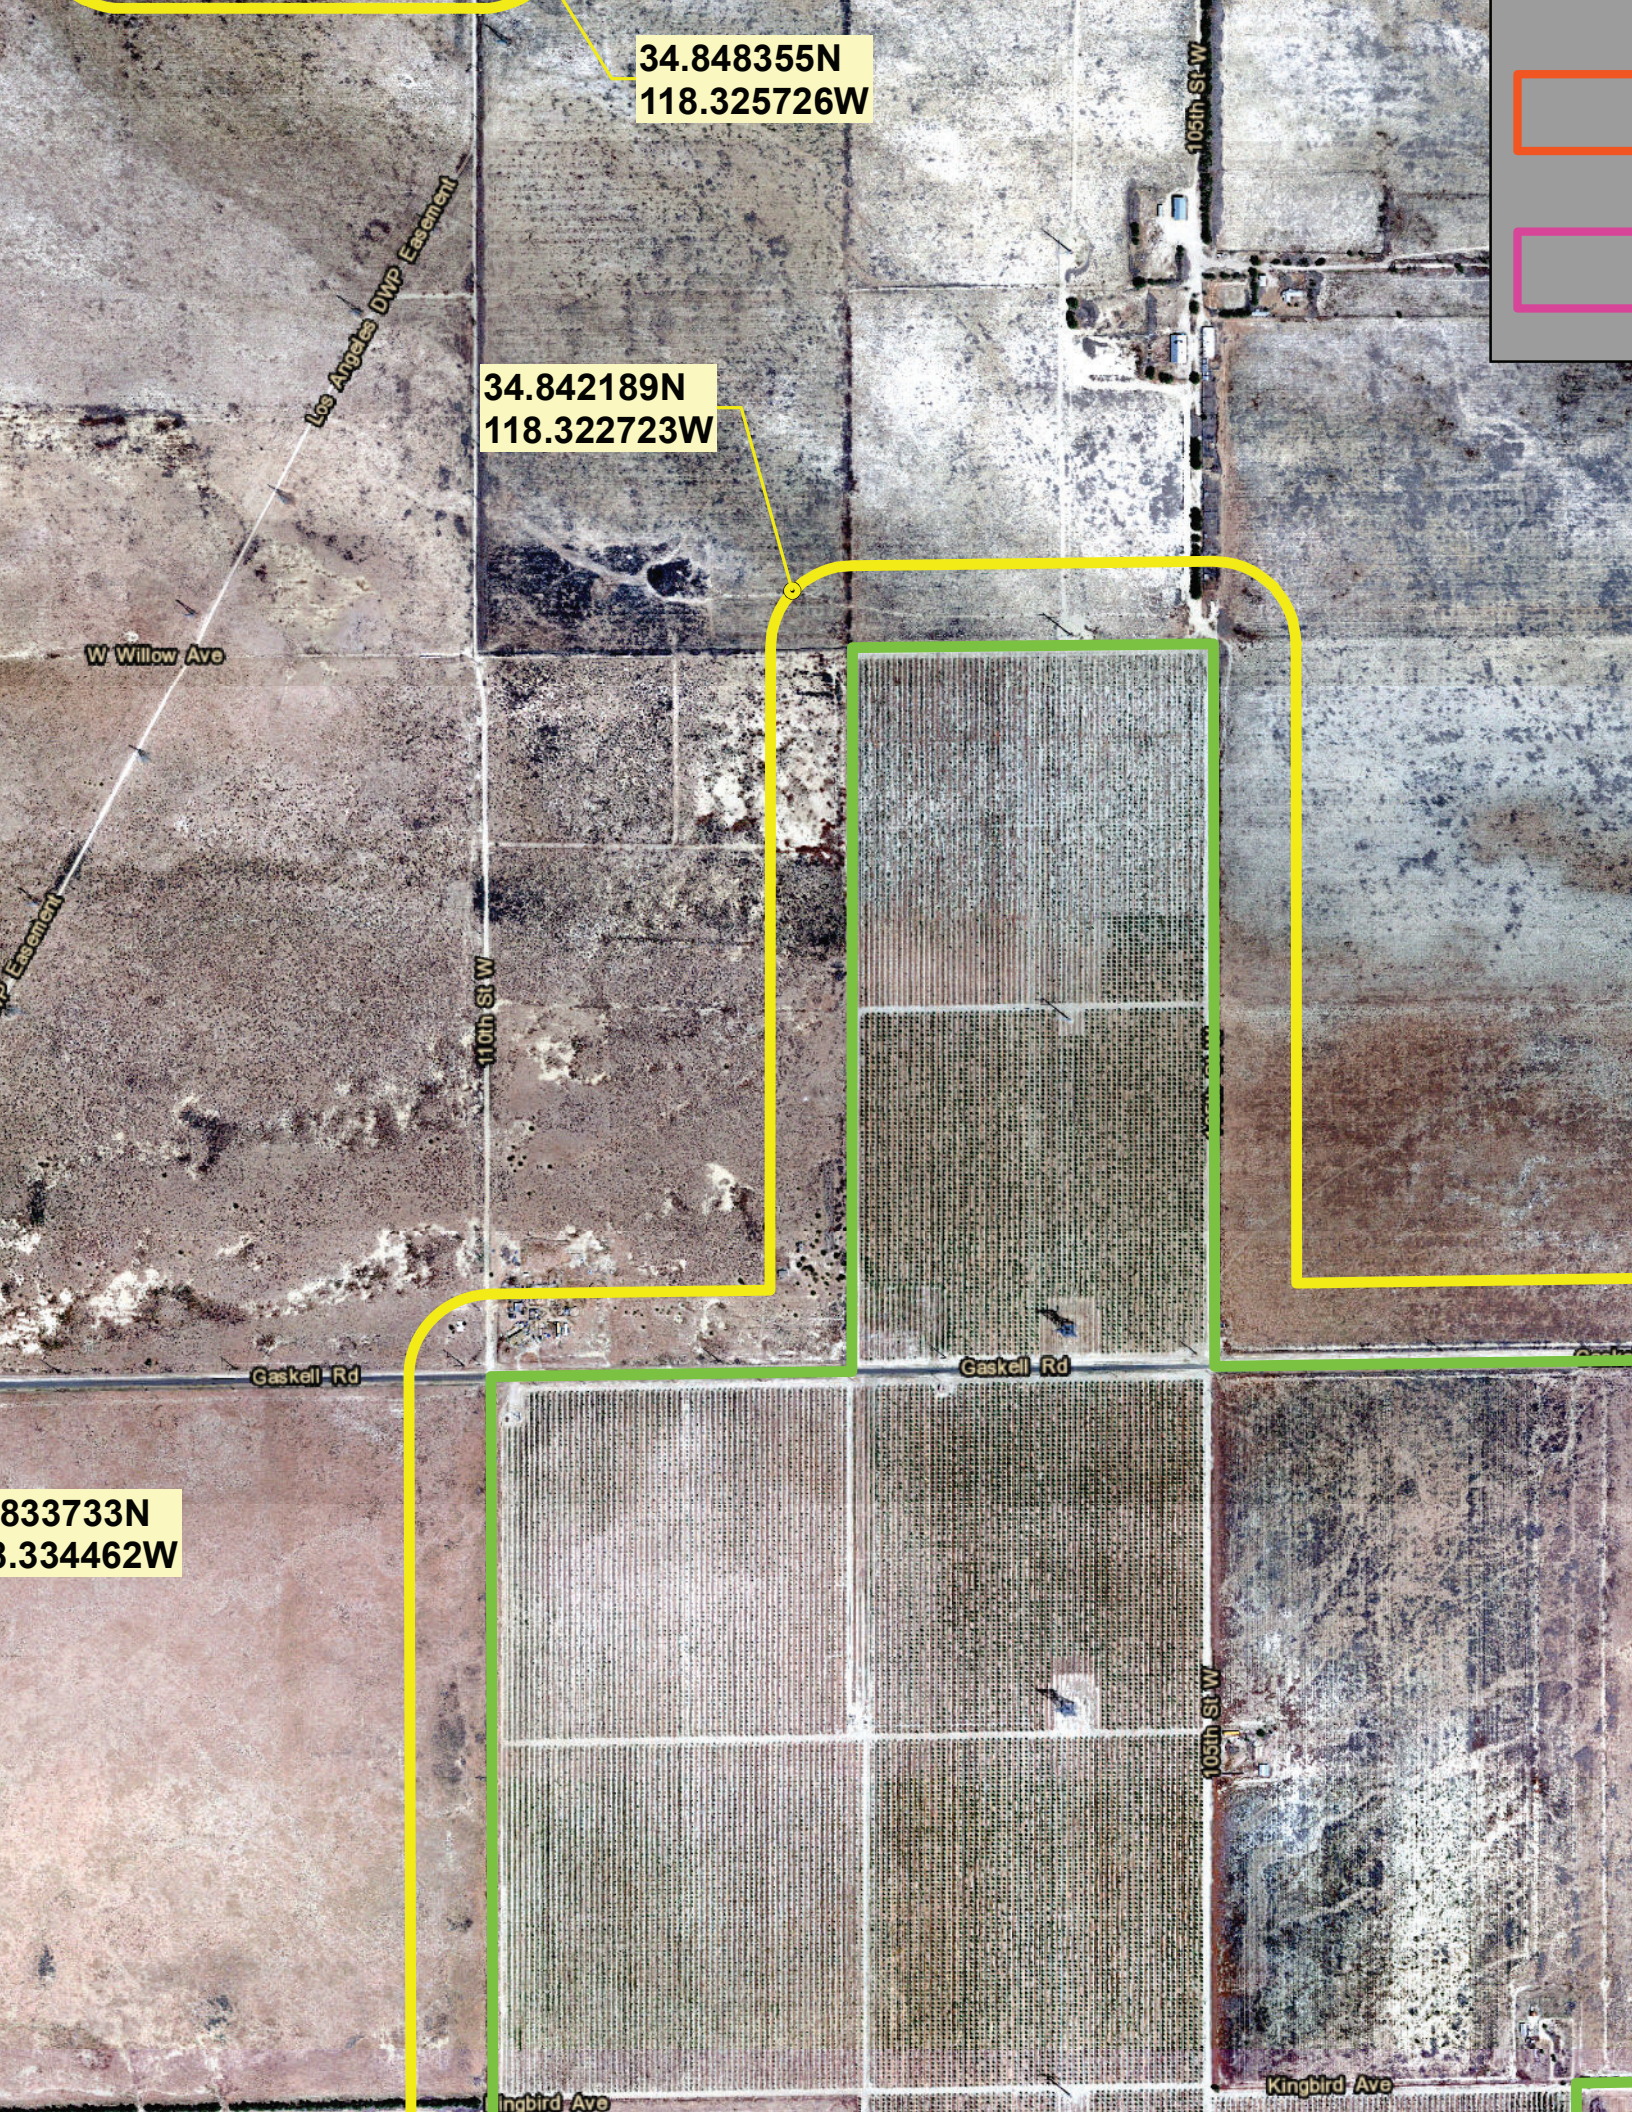
Classification of Wetlands and Deepwater Habitats of the United States, Cowardin *et al.* 1979

NWI Wetlands and Deepwater Map Code Diagram

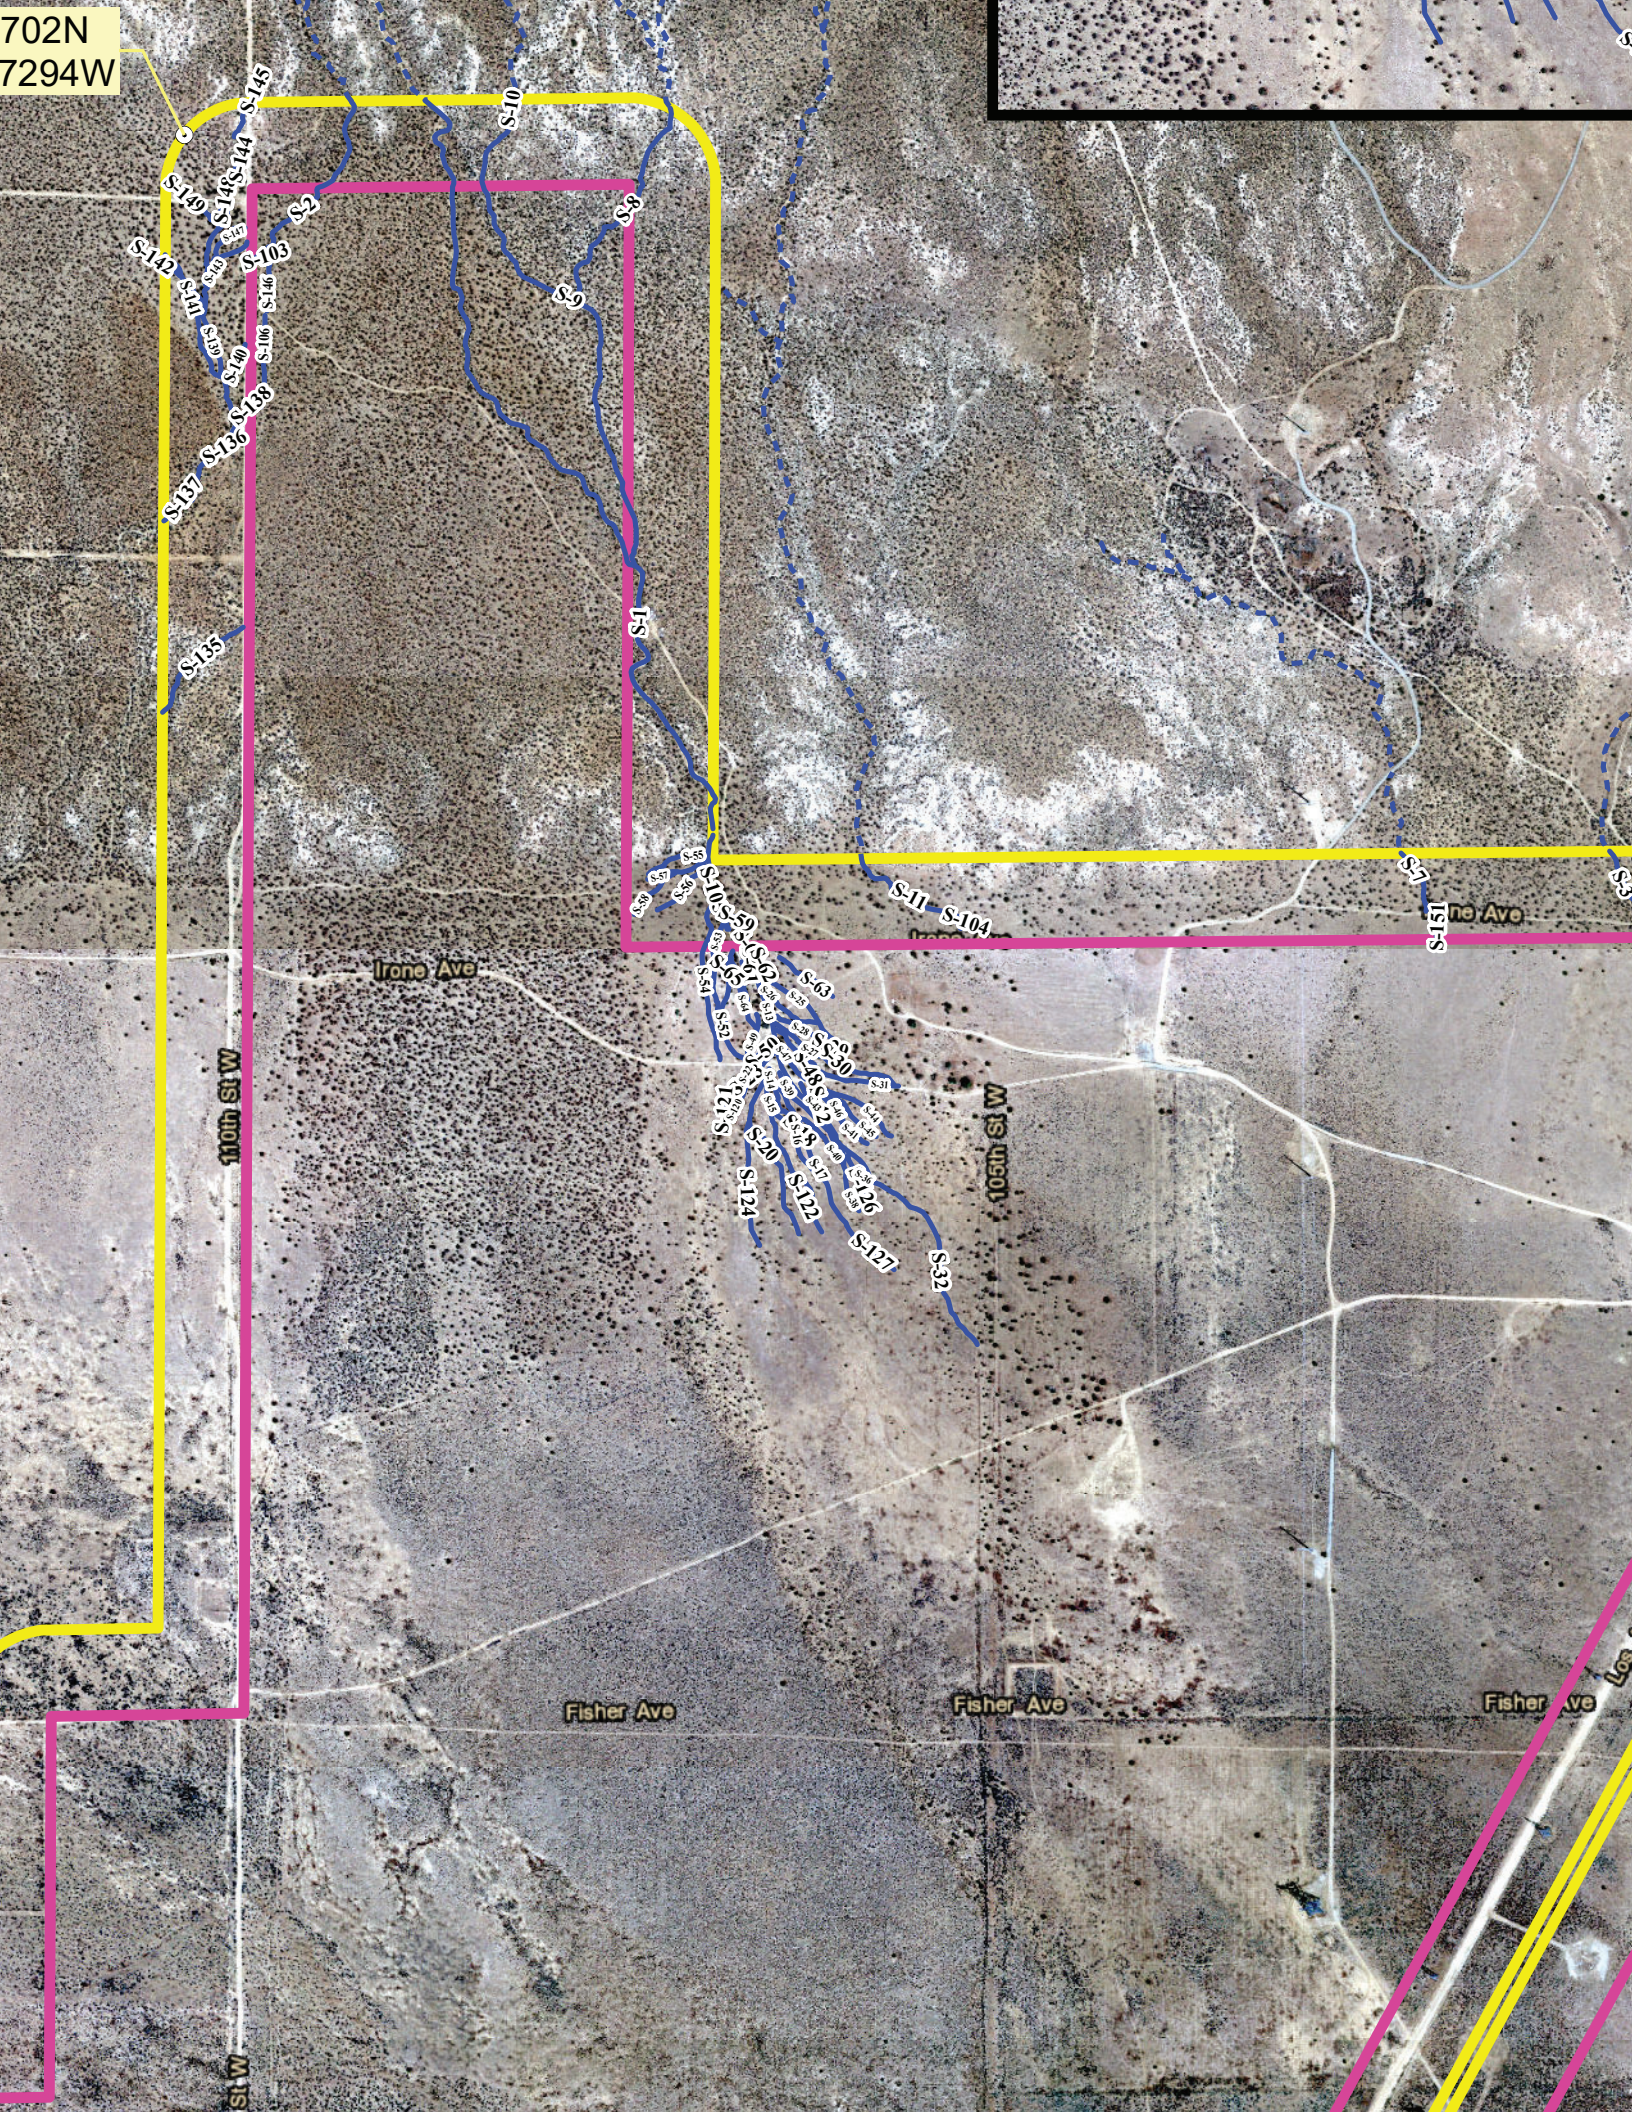




MODIFIERS



In order to more adequately describe the wetland and deepwater habitats, one or more of the water regime, water chemistry, soil, or special modifiers may be applied at the class or lower level in the hierarchy.



Water Regime			Special Modifiers	Water Chemistry		Soil
Nontidal	**Saltwater Tidal**	**Freshwater Tidal**		**Halinity/Salinity**	**pH Modifiers for Fresh Water**	
A Temporarily Flooded	L Subtidal	S Temporarily Flooded- Fresh Tidal	b Beaver	1 Hyperhaline / Hypersaline	a Acid	g Organic
B Seasonally Saturated	M Irregularly Exposed	Q Regularly Flooded-Fresh Tidal	d Partly Drained/Ditched	2 Euhaline / Eusaline	t Circumneutral	n Mineral
C Seasonally Flooded	N Regularly Flooded	R Seasonally Flooded-Fresh Tidal	f Farmed	3 Mixohaline / Mixosaline (Brackish)	i Alkaline	
D Continuously Saturated	P Irregularly Flooded	T Semipermanently Flooded-Fresh Tidal	m Managed	4 Polyhaline		
E Seasonally Flooded / Saturated		V Permanently Flooded-Fresh Tidal	h Diked/Impounded	5 Mesohaline		
F Semipermanently Flooded			r Artificial Substrate	6 Oligohaline		
G Intermittently Exposed			s Spoil	0 Fresh		
H Permanently Flooded			x Excavated			
J Intermittently Flooded						
K Artificially Flooded

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Antelope Valley Area, California; and Kern County, California, Southeastern Part

Antelope Valley Expansion Project, Chaparral Study Area

July 16, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

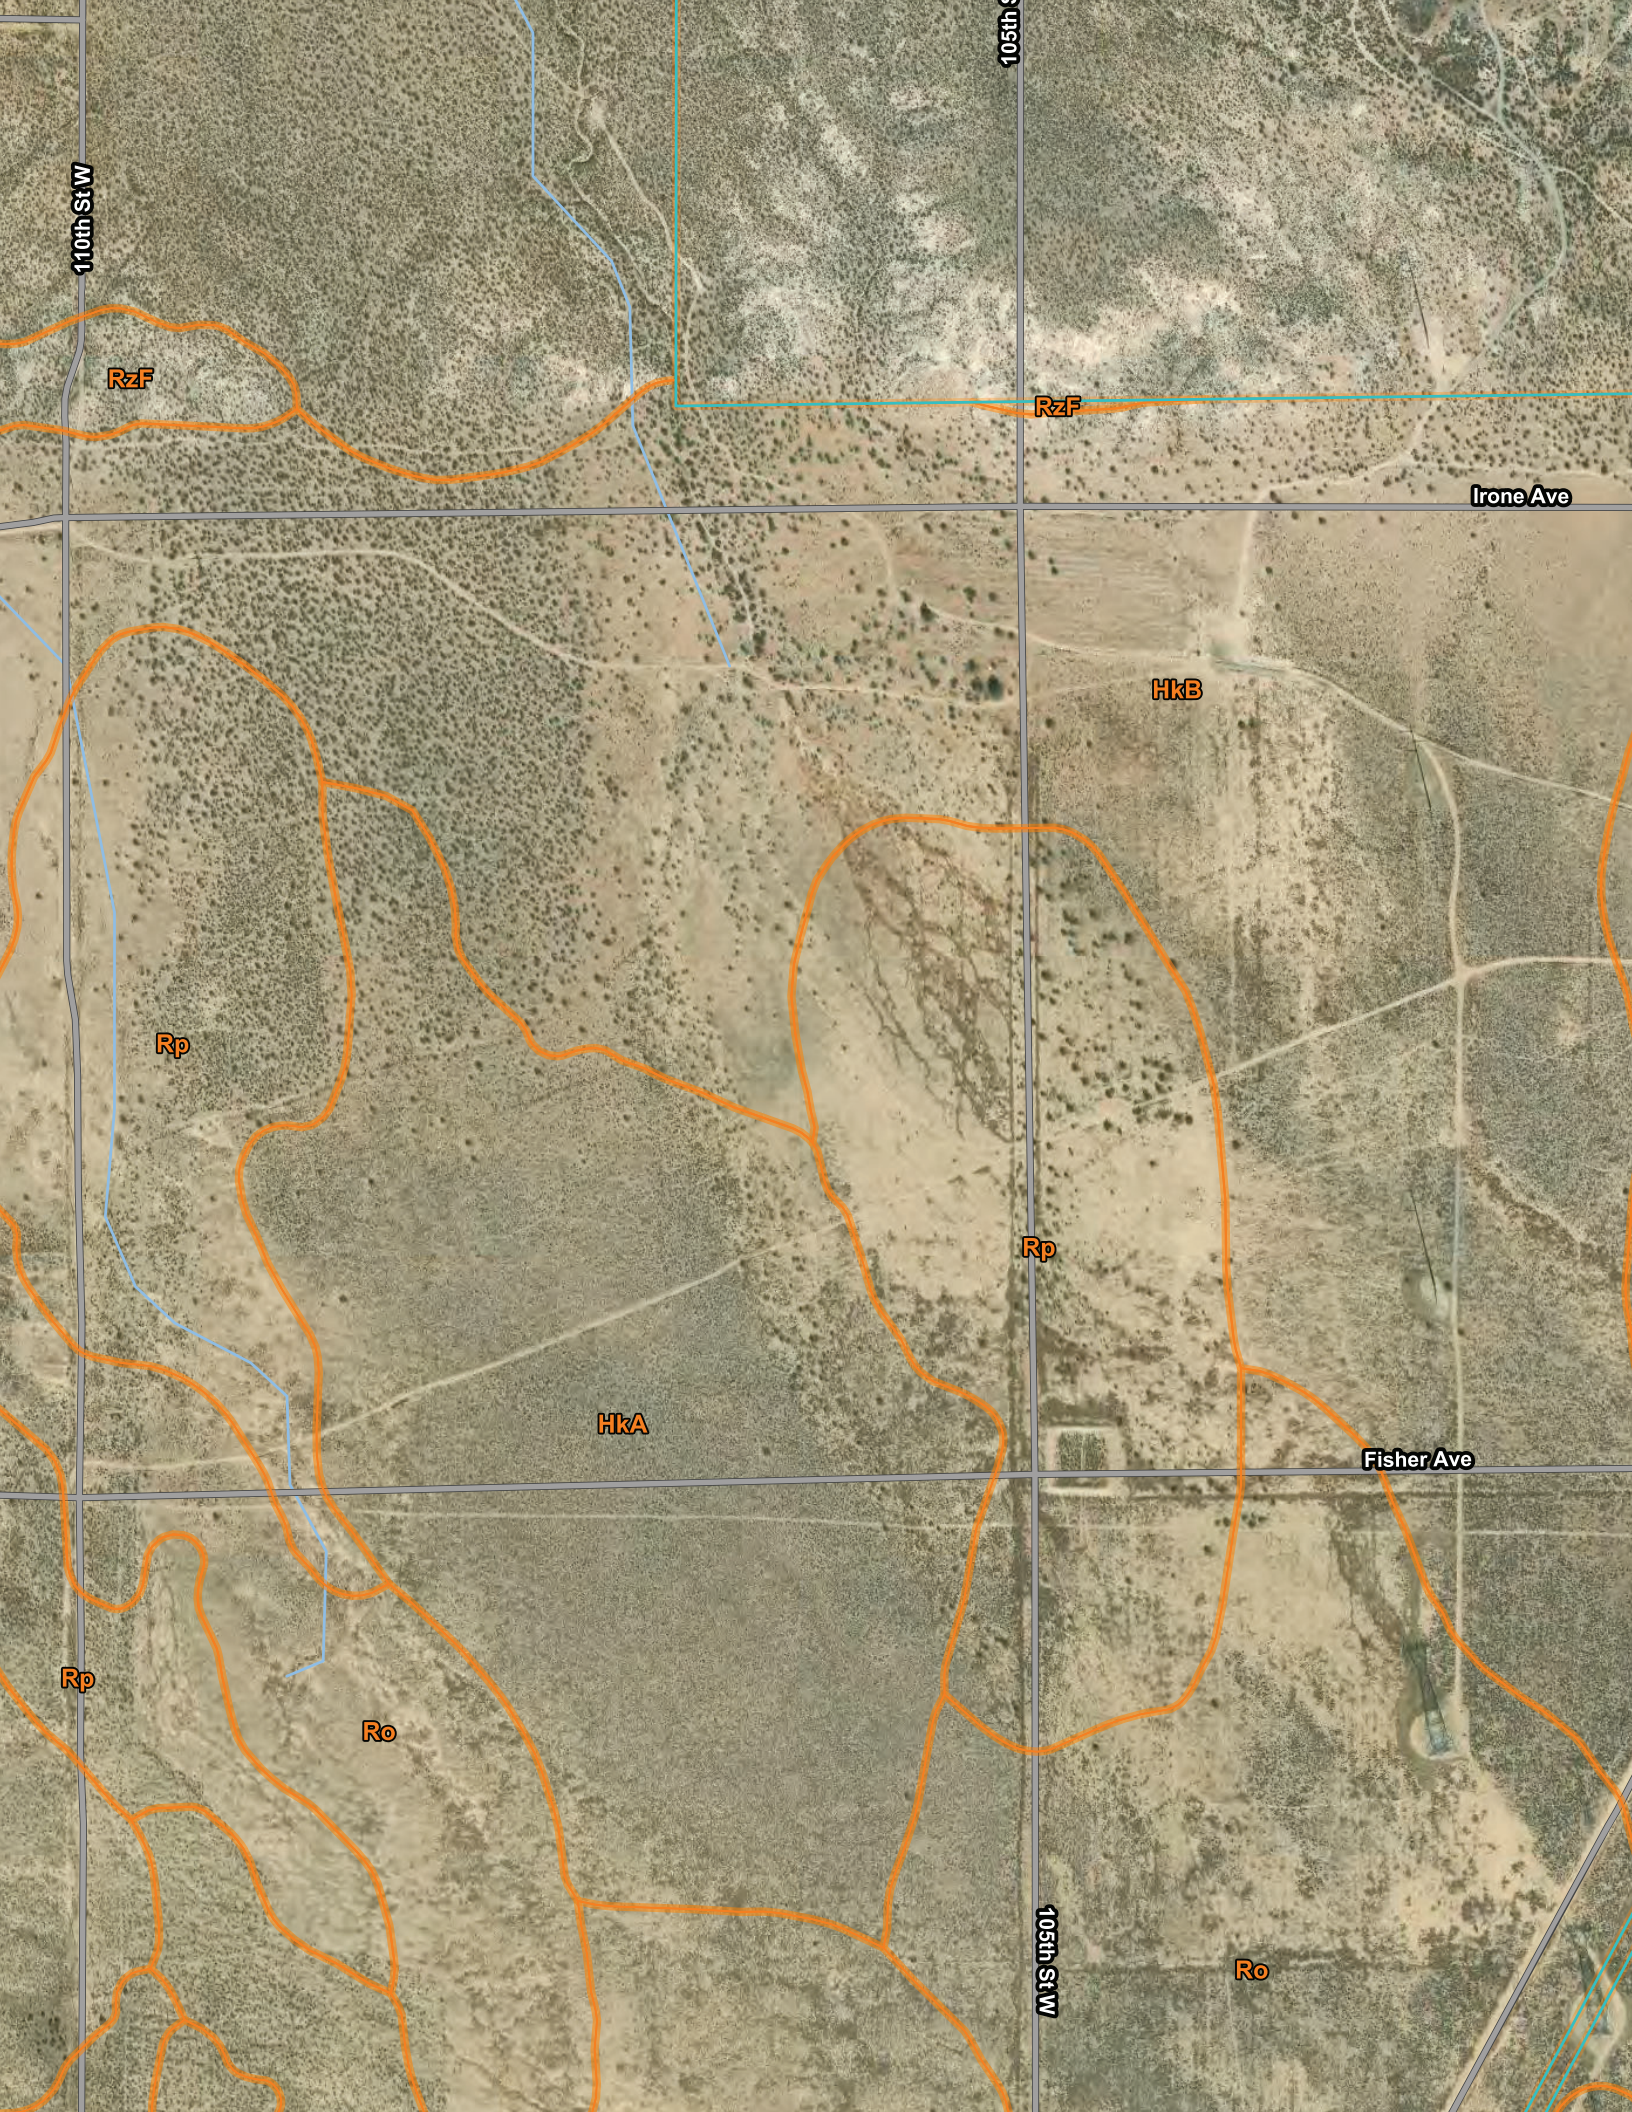
Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require



alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Antelope Valley Area, California
Survey Area Data: Version 11, Sep 17, 2018

Soil Survey Area: Kern County, California, Southeastern Part
Survey Area Data: Version 9, Sep 20, 2018

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

MAP LEGEND

MAP INFORMATION

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 1, 2016—Nov 5, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CaC	Cajon loamy sand, 2 to 9 percent slopes	10.9	1.1%
HgA2	Hesperia loamy fine sand, 0 to 2 percent slopes, hummocky	4.9	0.5%
HkA	Hesperia fine sandy loam, 0 to 2 percent slopes	170.8	16.7%
HkB	Hesperia fine sandy loam, 2 to 5 percent slopes	224.7	21.9%
Ro	Rosamond fine sandy loam	334.0	32.6%
Rp	Rosamond loam	257.2	25.1%
RzF	Rough broken land	12.3	1.2%
Subtotals for Soil Survey Area		**1,014.9**	**99.1%**

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
112	Badland-Orthents complex, 30 to 75 percent slopes	0.9	0.1%
114	Cajon loamy sand, 0 to 5 percent slopes	7.8	0.8%
Subtotals for Soil Survey Area		**8.8**	**0.9%**
Totals for Area of Interest		**1,023.6**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called

noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can

be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Antelope Valley Area, California

CaC—Cajon loamy sand, 2 to 9 percent slopes

Map Unit Setting

National map unit symbol: hccy
Elevation: 400 to 4,000 feet
Mean annual precipitation: 3 to 9 inches
Mean annual air temperature: 63 to 70 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Cajon and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cajon

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 9 inches: loamy sand
H2 - 9 to 60 inches: fine sand, sand
H2 - 9 to 60 inches:

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Excessively drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 5 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: A
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

Landform: Playas
Hydric soil rating: Yes

HkA—Hesperia fine sandy loam, 0 to 2 percent slopes

Map Unit Setting
National map unit symbol: hcfd
Elevation: 200 to 4,000 feet
Mean annual precipitation: 6 to 9 inches
Mean annual air temperature: 61 to 70 degrees F
Frost-free period: 225 to 310 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition
Hesperia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hesperia

Setting
Landform: Alluvial fans

Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 4 inches: fine sandy loam
H2 - 4 to 54 inches: sandy loam, fine sandy loam
H2 - 4 to 54 inches: coarse sandy loam, sandy loam
H3 - 54 to 77 inches:
H3 - 54 to 77 inches:

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 10 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Very high (about 15.6 inches)

Interpretive groups

Land capability classification (irrigated): 2e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: A
Ecological site: LOAMY 4-9" (R030XG021CA)

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Antelope Valley Area, California

Antelope Valley Expansion Project, Rabbitbrush Study Area

July 16, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

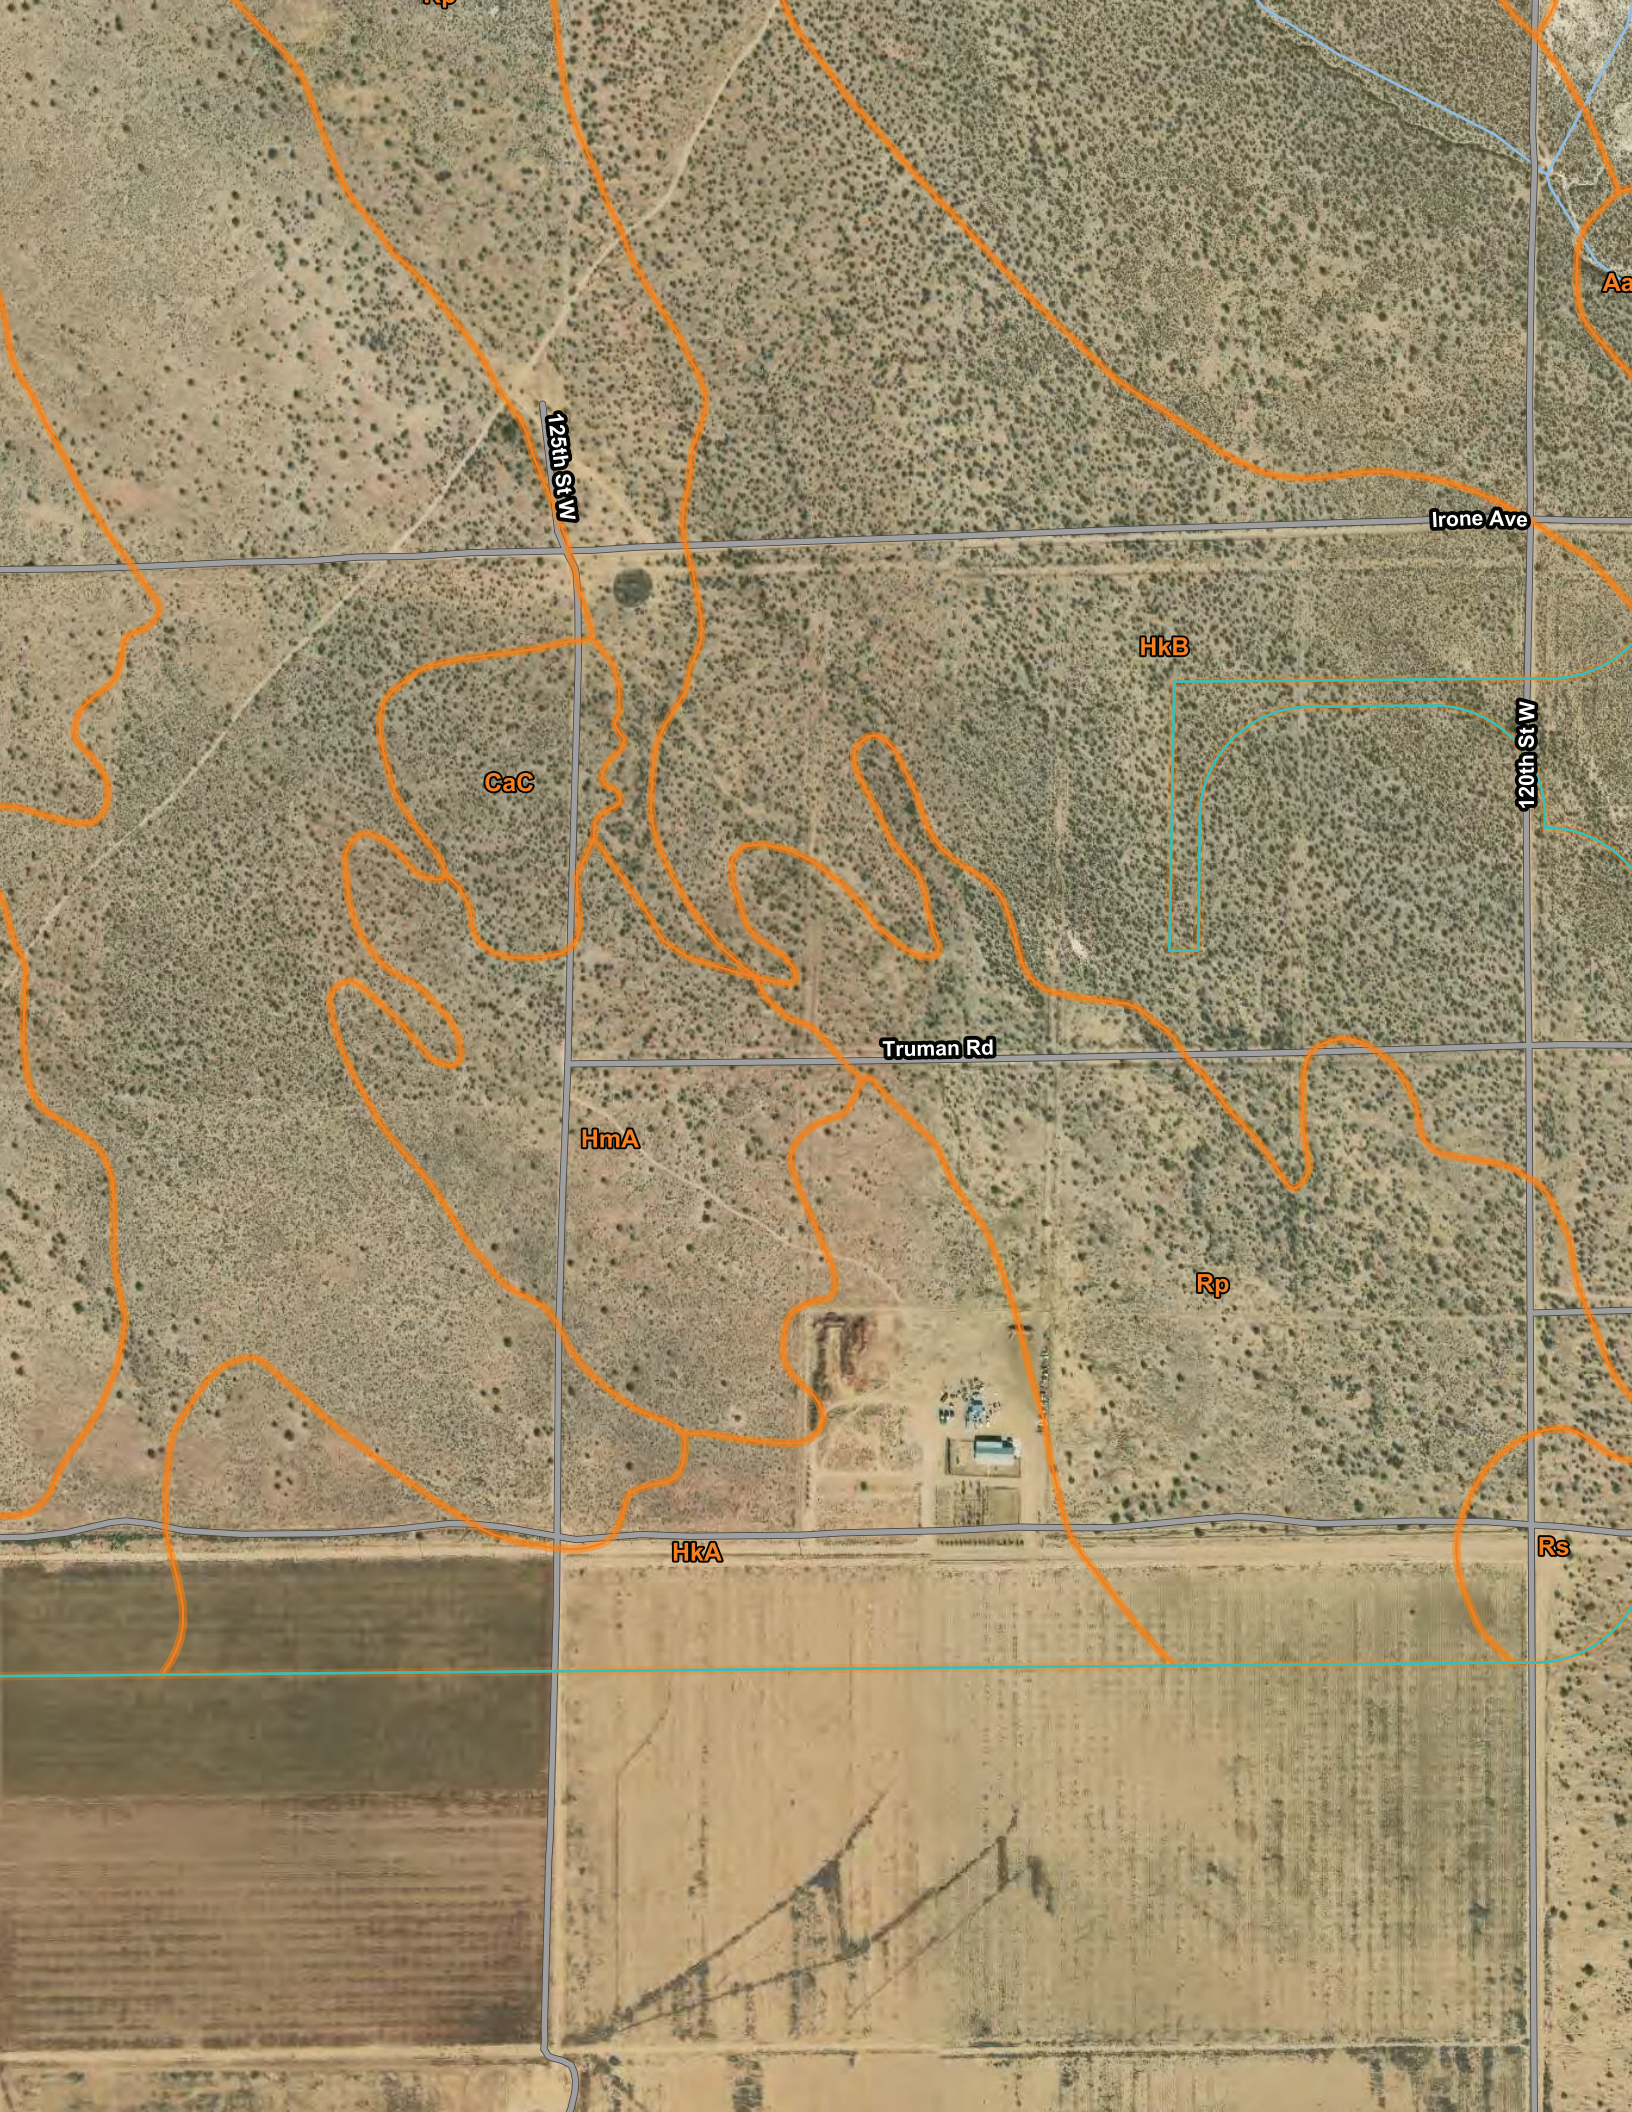
Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require



alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Antelope Valley Area, California
Survey Area Data: Version 11, Sep 17, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 1, 2016—Nov 5, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
AaB	Adelanto loamy sand, 2 to 5 percent slopes	2.4	0.3%
CaC	Cajon loamy sand, 2 to 9 percent slopes	292.0	31.3%
CbA	Cajon loamy sand, loamy substratum, 0 to 2 percent slopes	0.3	0.0%
HgA	Hesperia loamy fine sand, 0 to 2 percent slopes	1.2	0.1%
HkA	Hesperia fine sandy loam, 0 to 2 percent slopes	126.4	13.6%

Totals for Area of Interest		**932.0**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion

of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Antelope Valley Area, California

AaB—Adelanto loamy sand, 2 to 5 percent slopes

Map Unit Setting

National map unit symbol: hccl
Elevation: 2,000 to 3,000 feet
Mean annual precipitation: 6 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 250 to 260 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Adelanto and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Adelanto

Setting

Landform: Terraces, alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 16 inches: loamy sand
H2 - 16 to 41 inches: coarse sandy loam, sandy loam
H2 - 16 to 41 inches: sandy loam
H3 - 41 to 80 inches: stratified loamy sand to coarse sandy loam
H4 - 80 to 86 inches:

Properties and qualities

Slope: 2 to 5 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: High (about 9.5 inches)

Interpretive groups

Land capability classification (irrigated): 2e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: A
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

Minor Components

Cajon

Percent of map unit: 10 percent
Hydric soil rating: No

Mojave

Percent of map unit: 5 percent
Hydric soil rating: No

CaC—Cajon loamy sand, 2 to 9 percent slopes

Map Unit Setting

National map unit symbol: hccy
Elevation: 400 to 4,000 feet
Mean annual precipitation: 3 to 9 inches
Mean annual air temperature: 63 to 70 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Cajon and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cajon

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 9 inches: loamy sand
H2 - 9 to 60 inches: fine sand, sand
H2 - 9 to 60 inches:

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Excessively drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Calcium carbonate, maximum in profile: 5 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: A
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

Minor Components

Arizo

Percent of map unit: 5 percent
Hydric soil rating: No

Hesperia

Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed

Percent of map unit: 5 percent
Hydric soil rating: No

CbA—Cajon loamy sand, loamy substratum, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hccz
Elevation: 1,800 to 2,800 feet
Mean annual precipitation: 4 to 9 inches
Mean annual air temperature: 66 degrees F
Frost-free period: 240 to 260 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Cajon and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cajon

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 9 inches: loamy sand
H2 - 9 to 30 inches: fine sand, sand
H2 - 9 to 30 inches: stratified sand to clay loam
H3 - 30 to 60 inches:

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Excessively drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 5 percent
Salinity, maximum in profile: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Available water storage in profile: Moderate (about 6.8 inches)

Interpretive groups

Land capability classification (irrigated): 2e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: B
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

Hydric soil rating: Yes

HgA—Hesperia loamy fine sand, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hcf9
Elevation: 200 to 4,000 feet
Mean annual precipitation: 6 to 9 inches
Mean annual air temperature: 61 to 70 degrees F
Frost-free period: 225 to 310 days

Farmland classification: Prime farmland if irrigated

Map Unit Composition

Hesperia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hesperia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 8 inches: loamy fine sand
H2 - 8 to 54 inches: sandy loam, fine sandy loam
H2 - 8 to 54 inches: coarse sandy loam, sandy loam
H3 - 54 to 77 inches:
H3 - 54 to 77 inches:

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 10 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Very high (about 14.8 inches)

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Antelope Valley Area, California

Antelope Valley Expansion Project, Tumbleweed Study Area

July 16, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

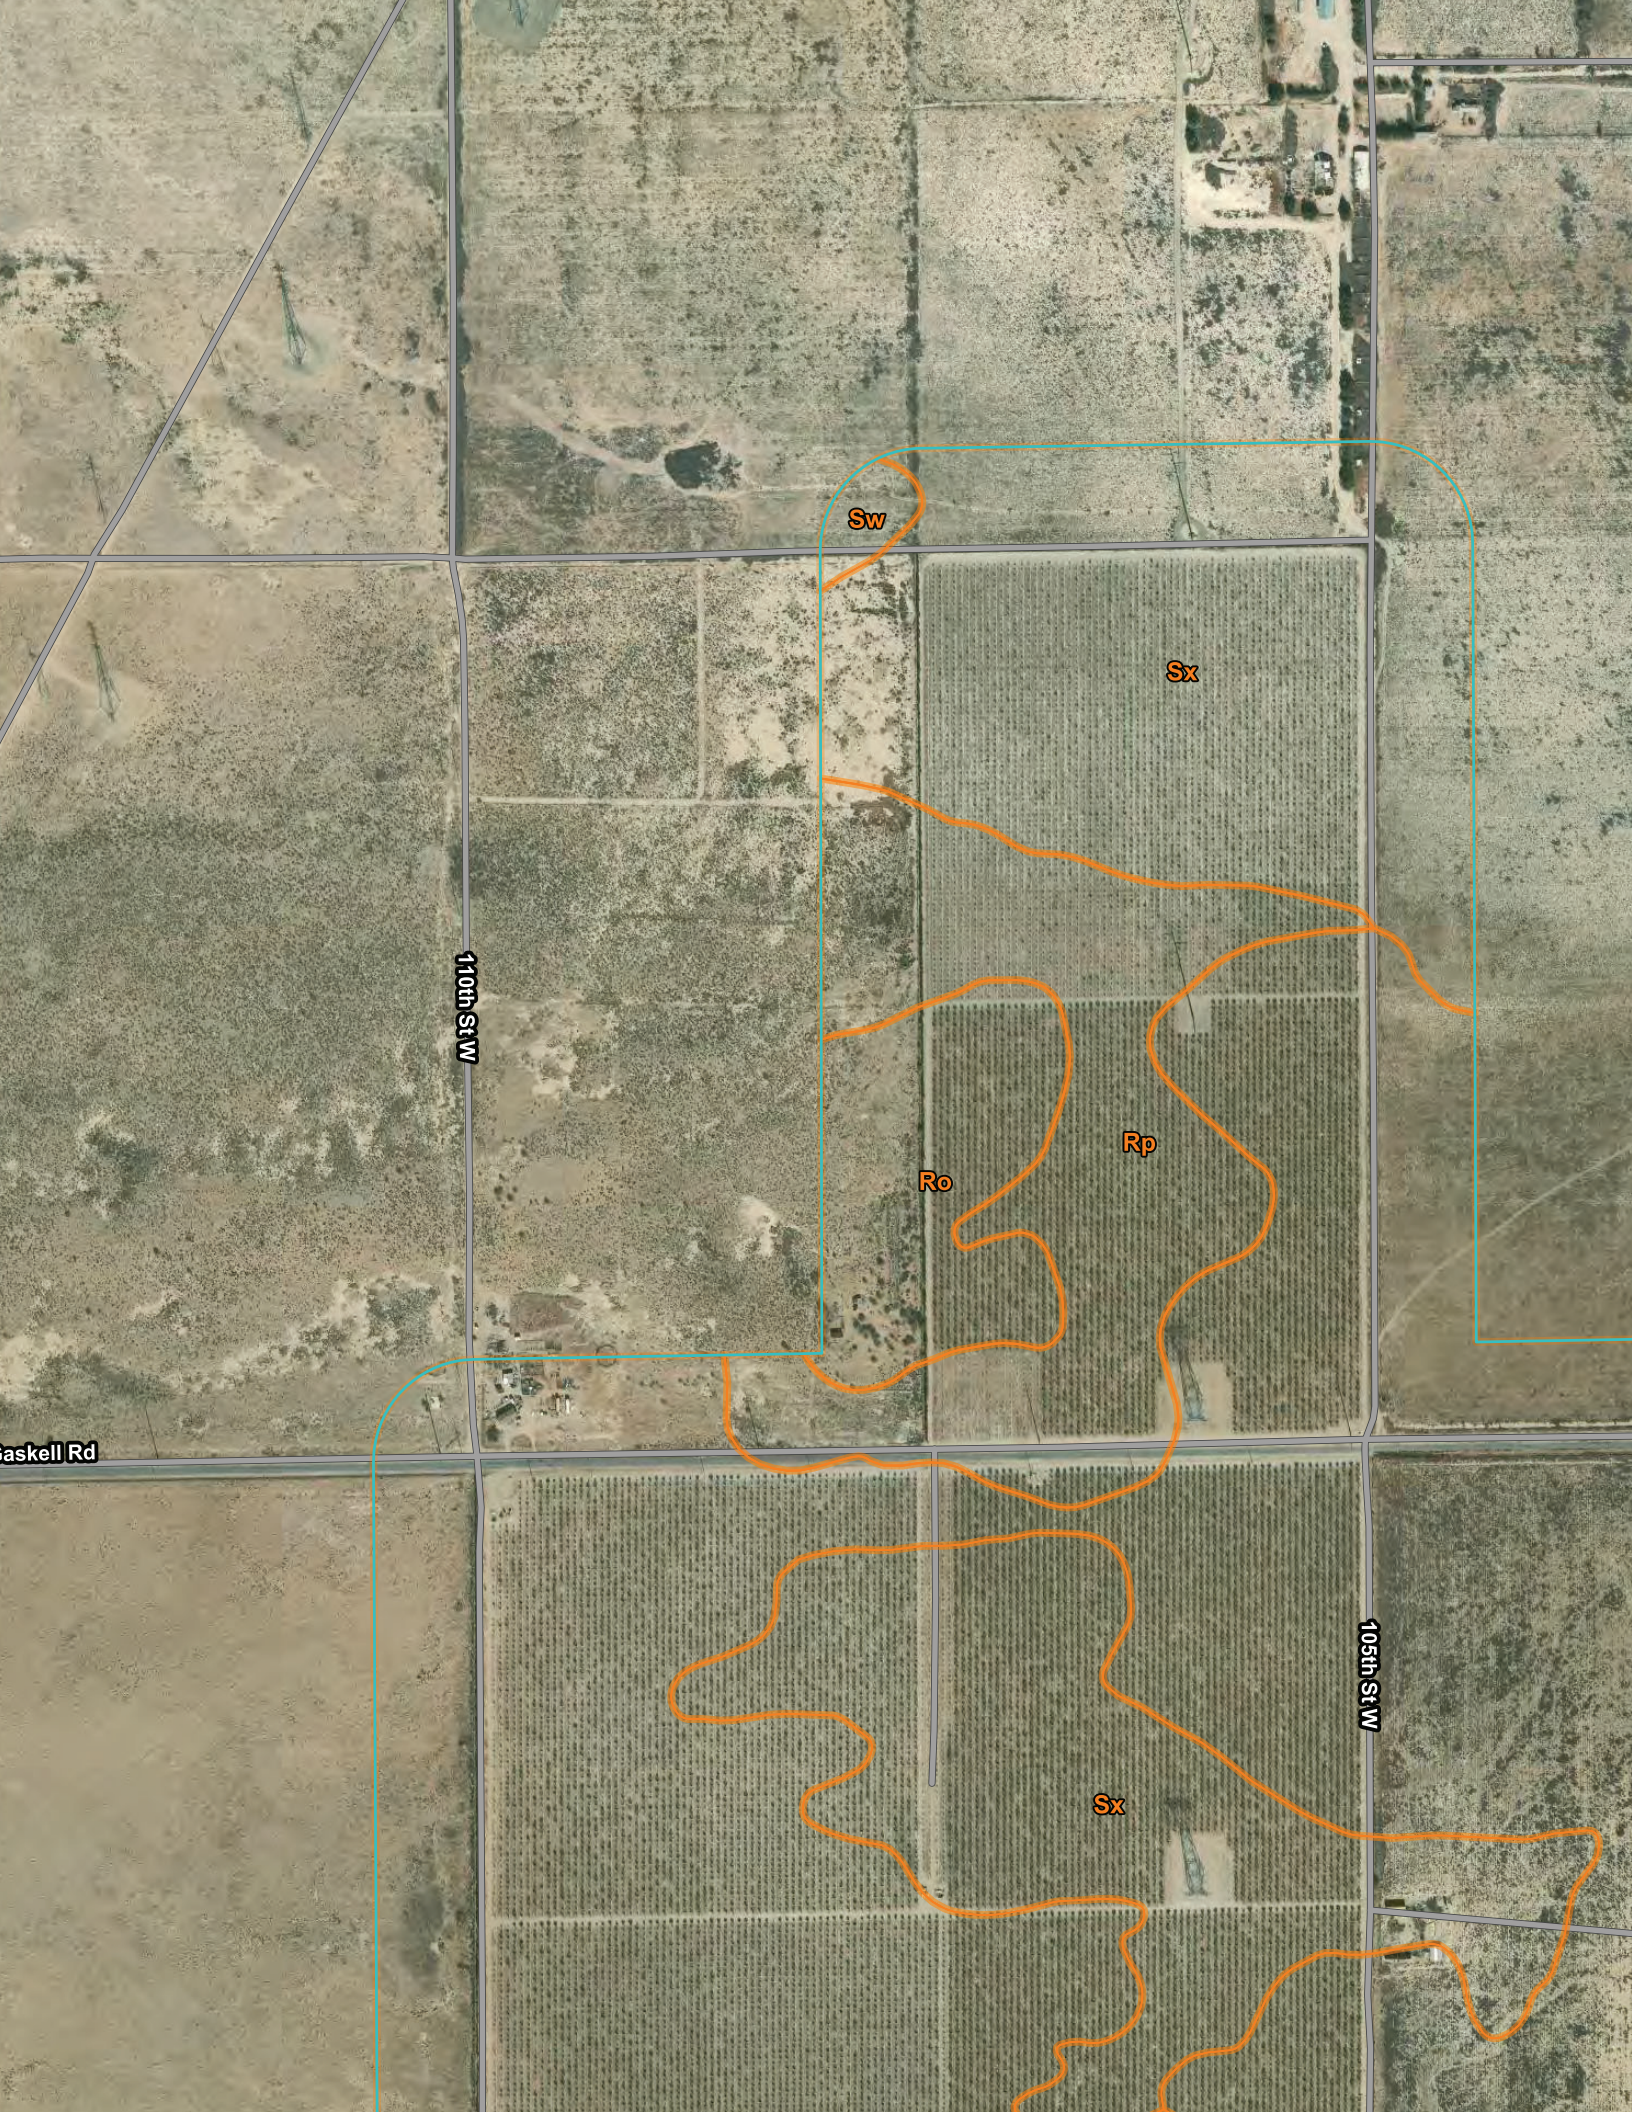
Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require



alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Antelope Valley Area, California
Survey Area Data: Version 11, Sep 17, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 1, 2016—Nov 5, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CbA	Cajon loamy sand, loamy substratum, 0 to 2 percent slopes	34.3	3.2%
HgA2	Hesperia loamy fine sand, 0 to 2 percent slopes, hummocky	1.2	0.1%
HkA	Hesperia fine sandy loam, 0 to 2 percent slopes	69.4	6.5%
Rm	Rosamond loamy fine sand	63.3	6.0%
Ro	Rosamond fine sandy loam	624.2	58.8%
Rp	Rosamond loam	76.7	7.2%
Sv	Sunrise sandy loam	59.4	5.6%
Sw	Sunrise sandy loam, shallow	36.8	3.5%
Sx	Sunrise loam	97.1	9.1%
Totals for Area of Interest		**1,062.4**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit

descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Antelope Valley Area, California

CbA—Cajon loamy sand, loamy substratum, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hccz
Elevation: 1,800 to 2,800 feet
Mean annual precipitation: 4 to 9 inches
Mean annual air temperature: 66 degrees F
Frost-free period: 240 to 260 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Cajon and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cajon

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 9 inches: loamy sand
H2 - 9 to 30 inches: fine sand, sand
H2 - 9 to 30 inches: stratified sand to clay loam
H3 - 30 to 60 inches:

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Excessively drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 5 percent
Salinity, maximum in profile: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Available water storage in profile: Moderate (about 6.8 inches)

Interpretive groups

Land capability classification (irrigated): 2e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: B
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

Minor Components

Unnamed
Percent of map unit: 10 percent
Hydric soil rating: No

Cajon
Percent of map unit: 4 percent
Hydric soil rating: No

Unnamed
Percent of map unit: 1 percent
Landform: Playas
Hydric soil rating: Yes

HgA2—Hesperia loamy fine sand, 0 to 2 percent slopes, hummocky

Map Unit Setting
National map unit symbol: hcfb
Elevation: 200 to 4,000 feet
Mean annual precipitation: 6 to 9 inches
Mean annual air temperature: 61 to 70 degrees F
Frost-free period: 225 to 310 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition
Hesperia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hesperia

Setting
Landform: Alluvial fans
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile
H1 - 0 to 8 inches: loamy fine sand
H2 - 8 to 54 inches: sandy loam, fine sandy loam
H2 - 8 to 54 inches: coarse sandy loam, sandy loam
H3 - 54 to 77 inches:
H3 - 54 to 77 inches:

Properties and qualities
Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained

Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 10 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Very high (about 14.8 inches)

Interpretive groups
Land capability classification (irrigated): 2e
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: A
Ecological site: SANDY 4-9" (R030XG022CA)
Hydric soil rating: No

May	82.3	54.0	68.2	0.09	0.00	0.07	0	0.0
Jun	90.9	61.3	76.1	0.05	0.00	0.00	0	0.0
Jul	97.8	66.8	82.3	0.09	0.00	0.04	0	0.0
Aug	97.5	64.3	80.9	0.10	0.00	0.00	0	0.0
Sep	90.7	56.6	73.7	0.15	0.00	0.13	0	0.0
Oct	79.4	45.9	62.7	0.44	0.09	0.36	1	0.0
Nov	66.9	35.9	51.4	0.54	0.20	0.57	1	0.0
Dec	57.9	29.7	43.8	1.15	0.43	1.32	2	1.3
Annual:					4.76	9.29		
Average	77.0	47.1	62.0	-	-	-	-	-
Total	-	-	-	7.38			16	2.3

Columns marked with an asterisk (*) indicate monthly NCEI normals.
These may not be exactly equal to the average for the years 1981-2010.

GROWING SEASON DATES

Requested years of data:	1981 - 2010		
Years with missing data:	24 deg = 2	28 deg = 0	32 deg = 0
Years with no occurrence:	24 deg = 0	28 deg = 0	32 deg = 0
Data years used:	24 deg = 28	28 deg = 30	32 deg = 30

Probability	Temperature		
	24 F or higher	28 F or higher	32 F or higher
	Beginning and Ending Dates Growing Season Length		
50 percent *	2/12 to 11/27 288 days	3/7 to 11/11 249 days	4/1 to 10/31 213 days
70 percent *	2/5 to 12/4 302 days	2/28 to 11/19 264 days	3/27 to 11/6 224 days

** Percent chance of the growing season occurring between the Beginning and Ending dates.*

CHAPARRAL STUDY AREA SAMPLE POINT DATA

Field Data Sheet: Identification of Geomorphic Indicators of Upland and Watercourse Areas		
Sample Point # C3 ; and/or Drainage ID # _____	Date: 1/14/18	Representative photo taken? ✓ Yes / ____ No
Upland Indicators	***Watercourse Indicators***	
Av Horizon	Bars: mud, sand & gravel	Ripples
Biotic Soil Crust	Beach ridges	Scour
Biotubation	Bifurcated flow	Secondary channels
Caliche: coatings, layers, rubble	Biotic crusts	Secondary channel bypassing obstruction
Carbonate etching	Drainage swales	✓ Sediment sheets
Clast / rock weathering	Crusts: carbonate, salt, & soda	Sand filled channels
Coppice dunes: active & relict	✓ Cut banks	Scour holes downstream of obstructions
Deflated surfaces	Desiccation Mud: cracks, curls / drapes	Sediment plastering
Desert pavement	✓ Drift: organic	Sediment ramps
Over-turned rock	Exposed roots below intact soil layer	Sediment sorting
Relict bar & swale	Flow or streaming lineations	Sediment: tails
Relict channel	Headcuts	Springs
Rock fracture in place	Imbricated gravel	Staining of rocks
Rock varnish	✓ Knick Points	Stepped-bed morphology in gravel
No flow or ponding indicators	Levee Ridges: sand & gravel	Substrate staining
Rubified rock undersides	Observed inundation: flooding, ponding, or substrate saturation	Vegetation – channel alignment
Soil development	Out of channel flow	Water-cut benches
Surface rounding of landform	Overturned rocks	Water level marks
Woody debris in place	Rills	Wrack: woody
Notes:		

***Adapted from: A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual (Lichvar and McColley 2008); and Methods to Describe and Delineate Episodic Stream Process on Arid Landscapes for Permitting Utility-Scale Solar Power Plants (Brady and Vyverberg, 2013).**

Field Data Sheet: Identification of Geomorphic Indicators of Upland and Watercourse Areas

Sample Point # C9 ; **and/or Drainage ID #** _____	**Date:** 1/14/18	**Representative photo taken?** ✓ **Yes** / ____ **No**

Field Data Sheet: Identification of Geomorphic Indicators of Upland and Watercourse Areas

Sample Point # C/D ; and/or Drainage ID # _____	Date: 1/14/18	Representative photo taken? ✓ Yes / ____ No

Upland Indicators	*Watercourse Indicators*	
Av Horizon	Bars: mud, sand & gravel	Ripples
Biotic Soil Crust	Beach ridges	Scour
Biotubation	Bifurcated flow	Secondary channels
Caliche: coatings, layers, rubble	Biotic crusts	Secondary channel bypassing obstruction
Carbonate etching	Drainage swales	Sediment sheets
Clast / rock weathering	Crusts: carbonate, salt, & soda	✓ Sand filled channels
Coppice dunes: active & relict	Cut banks	Scour holes downstream of obstructions
Deflated surfaces	Desiccation Mud: cracks, curls / drapes	Sediment plastering
Desert pavement	Drift: organic	Sediment ramps
Over-turned rock	Exposed roots below intact soil layer	Sediment sorting
Relict bar & swale	Flow or streaming lineations	Sediment: tails
Relict channel	Headcuts	Springs
Rock fracture in place	Imbricated gravel	Staining of rocks
Rock varnish	Knick Points	Stepped-bed morphology in gravel
No flow or ponding indicators	Levee Ridges: sand & gravel	Substrate staining
Rubified rock undersides	Observed inundation: flooding, ponding, or substrate saturation	Vegetation – channel alignment
Soil development	Out of channel flow	Water-cut benches
Surface rounding of landform	Overturned rocks	Water level marks
Woody debris in place	Rills	Wrack: woody

Notes: Atens of Active Channel. Transitional Area to Dormant Channel filled w/ Sand. Extreem flow events would likely move Sand further down Dormant Channel.

***Adapted from: A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States, A Delineation Manual (Lichvar and McColley 2008); and Methods to Describe and Delineate Episodic Stream Process on Arid Landscapes for Permitting Utility-Scale Solar Power Plants (Brady and Vyverberg, 2013).**

Rock fracture in place	Imbricated gravel	Staining of rocks
Rock varnish	✓ Knick Points	Stepped-bed morphology in gravel
No flow or ponding indicators	Levee Ridges: sand & gravel	Substrate staining
Rubified rock undersides	Observed inundation: flooding, ponding, or substrate saturation	Vegetation – channel alignment
Soil development	Out of channel flow	Water-cut benches
Surface rounding of landform	Overturned rocks	Water level marks
Woody debris in place	Rills	Wrack: woody

Notes:

Field Data Sheet: Identification of Geomorphic Indicators of Upland and Watercourse Areas

Sample Point # C19; and/or Drainage ID # _____	Date: 1/15/18	Representative photo taken? ✓ Yes / ____ No

Upland Indicators	*Watercourse Indicators*	
Av Horizon	Bars: mud, sand & gravel	Ripples
Biotic Soil Crust	Beach ridges	Scour
Biotubation	Bifurcated flow	Secondary channels
Caliche: coatings, layers, rubble	Biotic crusts	Secondary channel bypassing obstruction
Carbonate etching	Drainage swales	Sediment sheets
Clast / rock weathering	Crusts: carbonate, salt, & soda	Sand filled channels
✓ Coppice dunes: active & relict	Cut banks	Scour holes downstream of obstructions
Deflated surfaces	Desiccation Mud: cracks, curls / drapes	Sediment plastering
Desert pavement	Drift: organic	Sediment ramps
Over-turned rock	Exposed roots below intact soil layer	Sediment sorting
Relict bar & swale	Flow or streaming lineations	Sediment: tails
Relict channel	Headcuts	Springs
Rock fracture in place	Imbricated gravel	Staining of rocks
Rock varnish	Knick Points	Stepped-bed morphology in gravel
✓ No flow or ponding indicators	Levee Ridges: sand & gravel	Substrate staining
Rubified rock undersides	Observed inundation: flooding, ponding, or substrate saturation	Vegetation – channel alignment
