EXECUTIVE SUMMARY

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) resulting from the construction of the proposed AVEP Solar Project (Project) within unincorporated Kern County (Kern County). This Health Risk Assessment was prepared in accordance with the requirements of the Eastern Kern Air Pollution Control District (EKAPCD), the County of Kern, and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur.

The Project is located within the Antelope Valley, approximately seven miles west of the City of Rosamond, in the southeast potion of unincorporated Kern County. The Antelope Valley is within the western portion of the Mojave Desert and is bounded by the Tehachapi Mountains to the northwest and the San Gabriel Mountains to the southwest. Land uses in the Project area include undeveloped desert, fallow and active agriculture, low-density residences, and energy development (e.g., solar and wind).

The Project will construct, operate and eventually decommission three solar photovoltaic (PV) power generating facilities ("Facilities") that would be capable of delivering a total of up to approximately 375 megawatt alternating current (MW-ac) of electricity. The Project consists of three non-contiguous Facilities, the Tumbleweed Solar Facility (125 MW-ac), Rabbitbrush Solar Facility (125 MW-ac) and Chaparral Solar Facility (125 MW-ac) totaling approximately 2,117 acres of private lands in southeastern Kern County.

Health Risk Impacts. The HRA demonstrates that Cancer, Chronic, and Acute risk impacts related to the simultaneous construction of the three individual Facilities would not exceed established EKAPCD and the OEHHA thresholds at nearby sensitive receptors. Additionally, non-carcinogenic and acute hazards at nearby sensitive receptors are calculated to be within acceptable limits for the Project. As such, the health risk impact attributed to the construction, operation and maintenance, and eventual decommissioning of the Project would not exceed EKAPCD and OEHHA thresholds.

1.0 INTRODUCTION

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) resulting from the construction, operation and eventual decommissioning of the proposed AVEP Project (Project) within unincorporated Kern County (Kern County). This Health Risk Assessment was prepared in accordance with the requirements of the Eastern Kern Air Pollution Control District (EKAPCD), the County of Kern, and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur.

1.1 PROJECT LOCATION

The Project site is located approximately seven miles west of the unincorporated community of Rosamond in the western portion of the Antelope Valley, in the northwestern portion of the Mojave Desert. It is located approximately 50 miles southeast of the City of Bakersfield in the Antelope Valley. The region surrounding the Project site – and characteristic of the Antelope Valley – includes open desert, fallow agriculture, active agriculture (irrigated and dry land), low-density residential, transmission infrastructure and renewable energy development; refer to Exhibit 1, *Regional Vicinity*. The major north-south route in the region is State Route 14 (SR-14), a four-lane highway located east of the Project site. The major east-west route near the Project site is State Route 138 (SR-138), which is a two-lane road, and intersects with SR-14 approximately eight miles east of the Project area. Other roads serving the Project site include Rosamond Boulevard, West Avenue A to the south, and 100th Street West to the east. Paved and unpaved roadways, generally following section lines, are located throughout the area.

1.2 PROJECT DESCRIPTION

The Project will construct, operate and eventually decommission three solar photovoltaic (PV) power generating facilities that would be capable of delivering a total of up to approximately 375 megawatt alternating current (MW-ac)[1] of electricity. The Project consists of three non-contiguous Facilities, the Chaparral Solar Facility (125 MW-ac), Tumbleweed Solar Facility (125 MW-ac), and Rabbitbrush Solar Facility (125 MW-ac) totaling 2,117 acres of private lands in southeastern Kern County. Refer to Exhibit 2, *Site Vicinity*, for a depiction of the Project boundaries and surrounding uses. The individual Solar Facilities and components of the Project are shown in Exhibits 3a through 3c, *Conceptual Site Plans*. Refer to Exhibit 4, *SCE Interconnection*, Exhibit 5a, *LADWP Interconnection – Solar Collection Lines*, and Exhibit 5b, *LADWP Interconnection – Gen-Tie Lines* for the different interconnection options.

[1] To deliver 375 MW-ac of electricity at the point of interconnection, the Project needs to be overbuilt to address parasitic load, AC system losses, step-up transformer losses and transmission line losses.

AVEP SOLAR PROJECT • HEALTH RISK ASSESSMENT

LADWP Interconnection – Gen-Tie Lines

Exhibit 5b

Chaparral Solar Facility. The 125 MW-ac[2] Chaparral Solar Facility comprises approximately 764 contiguous acres and is generally bordered by Rosamond Boulevard to the south, 100th Street West to the east, Avenue of the Stars to the north and 110th Street West to the west. The two options for interconnection into Southern California Edison (SCE) or Los Angeles Department of Water and Power (LADWP) are described in more detail in the Section 1.3, *Interconnection Options*.

Tumbleweed Solar Facility. The 125 MW-ac Tumbleweed Solar Facility comprises approximately 721 acres in two proximate but non-contiguous land areas (eastern and western) and is generally bordered by West Avenue A to the south, 100th Street West to the east, Willow Avenue to the north and 117th Street West to the west. The two options for interconnection into SCE or LADWP are described in more detail in the Section 1.3.

Rabbitbrush Solar Facility. The 125 MW-ac Rabbitbrush Solar Facility comprises approximately 632 acres in two proximate but non-contiguous land areas (eastern and western) and is generally bordered by Rosamond Boulevard to the south, 115th Street West to the east, Avenue of the Stars to the north and 130th Street West to the west. The two options for interconnection into SCE or LADWP are described in more detail in the Section 1.3.

The Applicants will install arrays of solar PV modules to convert solar energy to electrical power to supply the existing electrical grid. The solar PV modules convert sunlight to direct current (DC) power, which is subsequently transformed to alternating current (AC) power through the use of inverters. Transformers will increase AC voltage for collection and then additional transformers will further increase AC voltage for transmission and interconnection to the electrical grid.

The Facilities would utilize high-efficiency commercially available solar PV modules that are Underwriters Laboratory (UL) listed or approved by another nationally recognized testing laboratory. Materials commonly used for solar PV modules include monocrystalline silicon, polycrystalline silicon, amorphous silicon, cadmium telluride (CdTe), and copper indium selenide/sulfide. The Applicants are considering using First Solar's proprietary thin film solar PV modules. The principal materials incorporated into the PV modules include glass, steel, and various semiconductor metals, including CdTe.

The PV modules will be mounted either on fixed-tilt systems, horizontal tracker systems, or a combination thereof. The mounting system for the modules will be supported by steel posts driven into the ground. Depending upon soil and hydrologic conditions, the posts would be driven into the soil up to ten feet deep, however, other embedded foundation designs may be utilized depending on final engineering design.

[2] Each of the three Facilities is currently projected to generate approximately 125 MW-ac of nominal electric generating capacity. With advancements in module technology (i.e., higher efficiency modules), however, the ability to generate more power with the same modules may increase and, therefore, lead to an increase in nominal electric generating capacity beyond 125 MW-ac for the same footprint and layout, and corresponding impacts analysis. Thus, we expect that, by the time of construction, each Facility will be able to exceed 125 MW-ac but, at this time, have included this conservative generating capacity based on current technology.

The Facilities will have multiple rows of mounted solar PV modules installed in arrays which, in combination, make up the solar field. Tracker rows will be arranged in north-south rows, fixed tilt rows will be arranged in east-west rows.

Tracker systems will have additional meteorological towers and battery or generator backup located at each power conversation station (PCS). The PCS is where the inverter and medium voltage step up transformer are located. The Facilities will have diesel, propane, or battery powered backup generators as required by applicable County or local codes for emergency backup power during Project operations for stowing the trackers, or to maintain critical electronic equipment that is used for operation of the plant.

Each Facility will have a collection system connecting PV modules to the substation which includes a combination of underground, aboveground cable trays and overhead (poles or H frame structures) DC and AC electrical and communication cables. DC electrical collection lines would connect the PV modules to the inverter. Inverters will convert the DC power into AC power. AC electrical lines will connect inverters to transformers. Transformers will increase the AC power to medium voltage (MV). MV AC electrical lines will connect MV transformers to the high voltage (HV) transformer(s) in the substation. Photovoltaic combining switchgear (PVCS), Sectionalizing Cabinets (SC) or other electrical combiner boxes may be installed to combine electrical lines on the collection system.

The overhead collection system may contain single or multiple three phase electrical circuits and communication lines on the same structures. Overhead collection systems typically consist of wood or steel poles on monopoles or H frame structures. The height for the collection system structures is approximately 75 feet but may vary based on voltage, minimum height to avoid shading over modules, ground elevation, crossing of existing or proposed facilities, National Electric Safety code and right-of-way requirements.

Energy Storage Systems. The Project may have up to three Energy Storage Systems (ESS) (one on each facility site) taking up approximately 5 acres per Facility. The Chaparral Solar ESS has two potential locations which are dependent on which Interconnection option is selected. Preliminary ESS locations and areas are shown on Exhibits 3a through 3c.

Each Facility's ESS would consist of self-contained battery storage modules placed in racks, converters, switchboards, inverters, transformers, controls, and integrated heating, ventilation, and air conditioning (HVAC) units, all enclosed in one or more buildings or in prefabricated metal containers. If the ESS uses prefabricated metal containers, each container will be an ISO 40-foot x 8-foot container, with side-doors accessibility to the battery racks that are installed inside. Adjacent to one or two DC battery containers will be one PCS (PCS) container (20'x7'9"x8'6" standard) that will hold the inverter and Medium voltage transformer. The containers will be shipped and placed on a concrete foundation at the ESS. Approximately 100 DC battery containers and approximately 50 20-foot PCS containers will be installed. The battery storage modules would use proven storage technologies such as Lithium Ion, Sodium-Sulphur, Vanadium-Redox-Flow, Zinc-based, or Iron-based batteries. More containers may be required due to the lower energy density of some of the technologies. The enclosures or building would have appropriate fire suppression systems built to applicable state and local code requirements.

The final design would include appropriate containment features to prevent the escape of liquids or spills from the ESS site.

1.3 INTERCONNECTION OPTIONS

Each Facility may interconnect to SCE's Whirlwind Substation (Interconnection Option 1) or LADWP's Barren Ridge – Rinaldi transmission line via a new switching station being independently developed by LADWP and permitted by the CPUC (Interconnection Option 2 – with scenarios 2A and 2B). To the extent commercially feasible, the Project intends to utilize previously approved and/or existing interconnection facilities associated with other generating and transmission projects to minimize potential environmental impacts.

INTERCONNECTION OPTION 1 - SCE INTERCONNECTION (EXISTING WHIRLWIND SUBSTATION)

Under Interconnection Option 1, the Project will interconnect to the existing SCE Whirlwind Substation, as shown on Exhibit 4. The Project will share off-site substations and gen-tie lines associated with the existing Willow Springs Solar and Rosamond Solar Projects.

Chaparral Solar Interconnection Option 1 (SCE). The Chaparral Solar Facility will interconnect into the SCE Whirlwind Substation through shared access over the existing gen-tie line for the Willow Springs Solar Project and Rosamond Solar Project.

Chaparral Solar will construct an off-site collection line to run electricity generated by Chaparral Solar from the southwest corner of the Chaparral Solar Facility approximately one mile south along 110th Street West to the existing Willow Springs Solar Project substation, located on the southwest corner of 110th Street West and Holiday Avenue. One or more additional transformers and associated equipment will be added to the Willow Springs Solar Project substation to accommodate the Chaparral Solar Facility, to step up voltage to 230 kilovolt (kV). From the Willow Springs Project Substation, 230 kV electricity, including electricity generated by Chaparral Solar, will travel on the Willow Springs Project gen-tie line to the Rosamond Solar Project (North Rosamond Solar, LLC) substation and then travel on the shared Rosamond Solar/Willow Springs Solar Projects' gen-tie line to the SCE's Whirlwind Substation.

No additional construction on the Willow Springs Solar/Rosamond Solar Projects' gen-tie line will be required to accommodate delivery of the electricity generated by the Chaparral Solar Facility, however, modifications will be required at the Willow Springs Solar Project substation, Rosamond Project substation, and at the SCE Whirlwind Substation. These modifications are described in the *Willow Springs Solar Project Substation Modifications*, *Rosamond Solar Project Substation Modifications*, and *SCE Substation Modifications*, sections below.

Tumbleweed Solar Interconnection Option 1 (SCE). The Tumbleweed Solar Facility will interconnect into the SCE Whirlwind Substation through shared access over the existing gen-tie line for the Willow Springs Solar Project and Rosamond Solar Project.

Tumbleweed Solar will construct off-site collection lines to run electricity generated by Tumbleweed Solar from the eastern and western portions of the Tumbleweed Solar Facility to the existing Willow Springs Solar Project substation. The collection line from the eastern portion will run approximately one mile north along 110th Street West, under the existing LADWP transmission line and northeast across Willow Springs Solar Project land via private easement to the Willow Springs Solar Project substation. The collection line from western parcel will run across the Willow Springs Solar Project land via private easement for approximately one-mile northeast to the Willow Springs Solar Project substation. One or more additional transformers and associated equipment will be added to the Willow Springs Solar Project substation to accommodate the Tumbleweed Solar Facility, to step up voltage to 230 kV. From the Willow Springs Project substation, the 230 kV electricity, including electricity generated by Tumbleweed Solar, will then travel on the existing Willow Springs Project gen-tie line to the approved Rosamond Solar Project substation, and then travel on the shared Rosamond Solar/Willow Springs Solar Projects' gen-tie line to the SCE's Whirlwind Substation.

No additional construction on the Willow Springs Solar/Rosamond Solar Projects' gen-tie line will be required to accommodate delivery of the electricity generated by the Tumbleweed Solar Facility, however, modifications will be required at the Willow Springs Solar Project substation, Rosamond Project substation, and at the SCE Whirlwind Substation. These modifications are described in the *Willow Springs Solar Project Substation Modifications*, *Rosamond Solar Project Substation Modifications*, and *SCE Substation Modifications*, sections below.

Rabbitbrush Solar Interconnection Option 1 (SCE). The Rabbitbrush Solar Facility will interconnect into the SCE Whirlwind Substation through shared access over the existing gen-tie line for the Willow Springs Solar Project and Rosamond Solar Project.

Rabbitbrush Solar will construct off-site collection lines to run electricity generated by Rabbitbrush Solar from the eastern and western portions of the Rabbitbrush Solar Facility to the existing Rosamond Solar Project substation. The off-site collection line will run from the eastern portion of the Rabbitbrush Solar Facility approximately a quarter mile west along Rosamond Boulevard, then run north approximately a half mile along 120th Street West to the southeastern corner of the western portion of the Rabbitbrush Solar Facility. Once the eastern portion's collection lines enter the western portion they will become part of the onsite collection lines. From southwestern corner of the western portion of Rabbitbrush Solar Facility, the eastern and western portions' off-site collection lines will run approximately a half mile south along 130th Street West, then run approximately one mile west along Rosamond Boulevard across the Rosamond Solar Project, via private easement, to the existing Rosamond Project Solar Project substation.

One or more additional transformers and associated equipment will be added to the Rosamond Solar Project substation to accommodate the Rabbitbrush Solar Facility to step up voltage to 230 kV. From the Rosamond Solar Project substation, the 230 kV electricity, including electricity generated by Rabbitbrush Solar, will then travel on the shared Rosamond Solar and Willow Springs Solar Projects 230 kV gen-tie line to the SCE's Whirlwind Substation.

No additional construction on the Willow Springs Solar/Rosamond Solar Projects' gen-tie line will be required to accommodate delivery of the electricity generated by the Rabbitbrush Solar

Facility, however, modifications will be required at the Rosamond Project substation, and at the SCE Whirlwind Substation. These modifications are described in the *Rosamond Solar Project Substation Modifications* and *SCE Substation Modifications*, sections below.

The Project will share use of the following facilities: From the Willow Springs Solar Project Substation on the Willow Springs Solar Project site, the existing 230 kV gen-tie line runs for approximately one mile north along 110th Street West, then runs west for approximately three miles along Rosamond Boulevard to the Rosamond Solar Project Substation. The Rosamond Solar Project Substation is located on the corner of 140th Street West and Rosamond Boulevard on the Rosamond Solar Project. From the Rosamond Solar Project Substation the existing 230 kV gen-tie line travels for approximately three and a quarter mile west along Rosamond Boulevard to the existing SCE Whirlwind Substation on the corner of 170th Street West and Rosamond Boulevard.

Willow Springs Solar Project Substation Modifications. New 230 kV HV transformer(s), breakers, buswork, site control centers (SCC) and other associated equipment may be installed or modified in the existing Willow Springs Solar Project Substation for Chaparral Solar and Tumbleweed Solar. New equipment will be installed on new concrete pads or precast concrete foundations. Expansion of the substation fence and grounding grid will be required. A temporary construction area for the substation expansion may be located next to the Willow Springs Solar Project Substation on Willow Springs Solar Project property.

Rosamond Solar Project Substation Modifications. New 230 kV HV transformer(s), breakers, buswork, SCC and other associated equipment may be installed or modified in the Rosamond Solar Project Substation for Rabbitbrush Solar. A temporary construction area for substation expansion may be located next to the Rosamond Solar Project Substation on Rosamond Solar Project property.

SCE Whirlwind Substation Modifications. Project interconnection will require SCE to install new interconnection-related components at the Whirlwind Substation such as additional control equipment and may also include ground disturbance to construct poles or lattice towers up to approximately 120 feet in height that would be located on SCE property prior to the gen-tie entering into the Whirlwind Substation proper and associated telecommunication communication lines. Approval of the SCE Interconnection Facilities is within the sole discretionary permitting jurisdiction of the California Public Utilities Commission (CPUC). However, because CEQA requires analysis of the environmental impacts of the full Project, the Project description includes the SCE Interconnection Facilities related to the proposed Project for this purpose.

INTERCONNECTION OPTION 2 (INCLUDING SCENARIOS 2A AND 2B) - LADWP INTERCONNECTION (PLANNED ROSAMOND SWITCHING STATION)

Under Interconnection Option 2, the Project will interconnect to the existing LADWP Barren Ridge – Rinaldi transmission line via LADWP's planned Rosamond switching station being developed and constructed by LADWP and permitted by the CPUC independently of the Project.

The switching station will be located in an area south of Rosamond Boulevard. The preliminary location is shown on Exhibit 5a and Exhibit 5b and is subject to change by LADWP. There are two scenarios under Interconnection 2 for Tumbleweed Solar: Scenario 2A (Sharing Chaparral Substation) and Scenario 2B (Onsite Substation), as described below.

Chaparral Solar Interconnection Option 2. The Chaparral Solar Facility would interconnect into the 230 kV LADWP Barren Ridge – Rinaldi transmission line via the planned Rosamond switching station being developed and constructed by LADWP and permitted by the CPUC. The switching station is planned to be located on LADWP owned land south of Rosamond Boulevard.

The Chaparral Solar Facility would construct a new on-site substation with one or more transformers to step up voltage to 230 kV and an approximately 500 to 2,500-foot 230 kV gen-tie line, depending on the ultimate LADWP switching station location. The Chaparral Solar substation will be separately fenced and located on the Chaparral Solar site, north of Rosamond Boulevard, and the overhead gen-tie and underground communication line will cross Rosamond Boulevard and run south to terminate in the LADWP switching station. The Chaparral Solar collection line will travel underneath LADWP's transmission corridor in order to reach the Chaparral Solar substation located southeast of the LADWP transmission corridor. See Exhibit 3a for Route A and Route B that include proposed overhead or underground collection line and access road routes. The new LADWP switching station will require modifications to accommodate the Chaparral Solar Facility and are described in *LADWP Rosamond Switching Station Modifications*, below.

Tumbleweed Solar Interconnection Option 2 (LADWP). There are two scenarios under Interconnection 2 for Tumbleweed Solar: Scenario 2A (Sharing Chaparral Substation) and Scenario 2B (Onsite Substation). The Tumbleweed Solar Facility would interconnect into the 230 kV LADWP Barren Ridge – Rinaldi transmission line via the planned Rosamond switching station being developed and constructed by LADWP and permitted by the CPUC. See Exhibit 5a and Exhibit 5b for switching station location.

Interconnection into the 230 kV LADWP Barren Ridge – Rinaldi transmission line would be via an on-site substation or via a shared substation on the Chaparral Solar Facility site.

Tumbleweed Solar Interconnection Option 2 – Scenario 2A:

Chaparral Solar Substation Option. Tumbleweed Solar will construct off-site collection lines from the eastern and western portions of the Facility to the Chaparral Solar substation. The collection line from the eastern portion of the Facility will cross Willow Springs Solar Project land via private easement and run approximately one mile north along 110th Street West, under the existing LADWP transmission line, then run an additional approximate one mile north along 110th Street West, cross Rosamond Boulevard then run across the Chaparral Solar Facility site up to one mile east on to the proposed Chaparral Solar substation.

The collection line from western parcel will run northeast and across the Willow Springs Solar Project land via private easement for approximately one mile and then run approximately one mile north along 110th Street West, cross Rosamond Boulevard then run on Chaparral Solar up to

one mile east on to the proposed Chaparral Solar substation. Tumbleweed Solar will share the new Chaparral Solar substation and gen-tie line to the LADWP switching station. See Chaparral Solar Facility, above, for a description of how Chaparral Solar will interconnect to the LADWP switching station.

Tumbleweed Solar Interconnection Option 2 – Scenario 2B:

On-Site Substation Option. The Facility would construct a new on-site substation located at the southeast corner of Gaskell Road and 110th Street West with one or more transformers to step up voltage to 230 kV and an approximately 3.5-mile 230 kV gen-tie line, depending on the ultimate LADWP switching station location. A collection line from western parcel would run along Gaskell Road via a private easement for approximately 0.5-mile to the on-site substation. From the on-site substation, the gen-tie line would cross Willow Springs Solar Project land via a private easement and run approximately one mile north along 110th Street West, under the existing LADWP transmission line, then run an additional approximate one mile north along 110th Street West, cross Rosamond Boulevard then run up to one mile east to the LADWP Rosamond switching station.

Rabbitbrush Solar Interconnection Option 2. The Rabbitbrush Solar Facility would interconnect into the 230 kV LADWP Barren Ridge – Rinaldi transmission line via the planned Rosamond Switching Station being developed and constructed by LADWP. Refer to *Chaparral Solar Interconnection Option 2* for switching station location. Rabbitbrush Solar will construct off-site collection lines from the eastern and western portions of the Rabbitbrush Solar Facility to the Chaparral Solar substation. The collection line from western parcel will run approximately a half mile south along 120th Street West, then run approximately one mile east along Rosamond Boulevard to the southwest corner of Chaparral Solar then run on Chaparral Solar up to one mile east on to the proposed Chaparral substation.

The collection line from eastern parcel will run approximately one mile east along Rosamond Boulevard to the southwest corner of Chaparral Solar then run across Chaparral Solar up to one mile east on to the proposed Chaparral substation. Rabbitbrush Solar will share the new Chaparral substation and gen-tie line to the LADWP switching station. See Chaparral Solar Facility, above, for a description of how Chaparral Solar will interconnect to the LADWP switching station.

LADWP Rosamond Switching Station Modifications. The Project gen-tie conductors would terminate at the new LADWP switching station. Overhead and underground communications would terminate at the LADWP communication facilities. Depending on LADWP final designed switching station, modifications in or adjacent to their facility may be needed for the Project to interconnect. Project interconnection will require LADWP to install new interconnection-related components at the planned LADWP Rosamond Switching Station including a 230 kV circuit breaker and two 230 kV disconnect switches, occupying an area of approximately 625 square feet (25' x 25'). Approval of the LADWP Interconnection Facilities is within the sole discretionary permitting jurisdiction of the CPUC. However, because CEQA requires analysis of the environmental impacts of the full project, the project description includes the LADWP Interconnection Facilities related to the proposed Project for this purpose.

1.4 CONSTRUCTION

As discussed above, the Project will consist of three solar PV power generating Facilities with the capability of delivering a total of approximately 125 MW-ac of power each. Project construction activities will include site preparation and clearing/grading, collection system installation, foundations, PV system installation, testing, and site cleanup/restoration work.

Construction of the Project is anticipated to take 12 to 36 months. Each Solar Facility will have different completion dates depending upon power procurement contracts. The on-site construction workforce will consist of laborers, artisans, supervisory personnel, support personnel, and construction management personnel.

Construction activities would be conducted consistent with Kern County Ordinance Section 8.36.020 regarding hours of construction or as approved by Kern County. Certain activities such as high-voltage system modifications may need to occur at nighttime and will be performed with shielded, temporary lighting.

Construction of the Project will require the following temporary facilities:

- One or more construction staging areas on the Project site consisting of construction trailers for offices and first aid station, parking, portable toilets or a septic system, temporary generators, truck loading and unloading and material staging and assembly area, and storage materials and trash;
- A construction staging area to be used for substation modifications on Rosamond Solar and/or Willow Springs Solar Project property;
- Construction workforce parking area with adequate parking spaces for the workforce necessary for construction of the Project;
- Off-site stringing and pulling sites and temporary construction areas at each new structure for the Tumbleweed Solar, Chaparral Solar, and Rabbitbrush Solar collection lines;
- Off-site stringing and pulling sites and temporary construction areas at each new structure for the new Tumbleweed Solar and shared Chaparral Solar 230 kV gen-tie line; and
- Temporary lined basins or aboveground tanks to hold water during construction and temporary water lines.

Sediment and erosion controls will be installed in accordance with a Kern County approved erosion and sediment control plan. Existing structures and debris will be removed. Materials will be recycled where feasible, with remaining disposal in landfills in compliance with applicable laws.

Within the solar field areas, a combination of mowing, "disk-and-roll" techniques and, where necessary, conventional grading may be used to prepare the site for array installation. In areas where mowing will not yield a satisfactory work surface, disk-and-roll techniques may be

utilized. Disk-and-roll site preparation uses tractors pulling disking equipment to till under vegetation. Grading will be minimized to the extent practical. Conventional grading techniques may be used for access roads, parking areas, substations, energy storage systems, building or equipment foundations, detention and retention ponds, and laydown areas.

Construction will begin with the installation of fencing around the perimeter of each individual Solar Facility site. The perimeter fence will also include signs providing directions to primary site access. Road corridors, buried electrical lines, PV array locations, and the locations of other facilities may be flagged and staked in order to guide construction activities.

Each individual solar PV Facility installation will include site preparation to accommodate the placement of PV arrays, concrete for foundations, the substation (if a part of final design), access roads, and drainage features.

The construction of the solar field will proceed in array blocks and will include the following:

- Installation of steel posts and mounting system;
- Installation of PV modules;
- Installation of concrete pads or precast vaults for PCS, PVCS, or other electrical equipment;
- Installation of overhead, aboveground, or underground collection system cable and associated equipment on concrete pads, vaults, posts or poles; and
- Concrete foundations for substation equipment, ESS, and O&M buildings. Final concrete specifications will be determined during detailed design engineering in accordance with applicable building codes. These concrete foundations may be precast or cast in place.

Each new or existing substation will be separately fenced to provide required security around the high-voltage electrical equipment. Each new Chaparral and Tumbleweed substation areas will be excavated, a copper grounding grid will be installed, and the foundations for transformers and metal structures will be installed. The area will first be backfilled, compacted, and leveled, followed by the application of an aggregate rock base. Next, equipment installation associated with the transformers, breakers, bus-work, and metal dead-end structures will follow. The mineral oil-filled transformers may arrive pre-filled or may be filled onsite. The substation will have a SCC equipment building(s), located in or next to the new or existing substation, which will house substation and plant control equipment, meters, battery or generator backup and other electrical equipment.

During construction of Chaparral Solar and Tumbleweed Solar, if interconnection Option 2 to connect to the LADWP line is utilized, a 230 kV gen-tie line will be installed with the location of each transmission pole surveyed and staked. Poles may be approximately 100 to 150 feet in height. Foundations for each transmission pole will be constructed, the transmission poles erected, and transmission pole arms and insulators installed. After transmission pole installation occurs, conductor stringing and terminations will be performed to ensure the new 230 kV gen-tie

line is operating correctly. Primary overhead and redundant underground and/or overhead communication lines will also be installed.

The Project may have up to three onsite ESS (one for each Solar Facility developed). Each ESS will be composed of battery storage modules placed in multiple prefabricated enclosures or in a building near the on-site substation. The area would be graded, compacted, and leveled, followed by the application of an aggregate rock base. The ESS area will be separately fenced. If placed in prefabricated enclosures, the construction will include moving the ESS enclosures with a crane or forklift to the appropriate location. If a building is used it will be assembled on site. The final location of the ESS enclosures is dependent on final design and may require construction of a vault or other form of supporting foundation.

The Project may include up to three O&M areas, one for each Solar Facility. Each O&M area may include a permanent one-story O&M building up to 500 square feet that will house administrative, operation, and maintenance equipment along with sanitary facilities. Concrete foundations will be poured to support the permanent O&M building, and a 1,500 square foot area adjacent to the building will be graveled or paved for employee parking. Aboveground water storage tank, permanent water lines to the Solar Facility water source, septic system and other associated facilities will be constructed in the O&M area. Storage enclosures may be installed on concrete pads. The design and construction of the O&M building(s) will comply with applicable County building standards.

Construction activities for the proposed Project is anticipated to require approximately 900 acre-feet of water. Temporary lined storage ponds may be excavated, or aboveground water storage tanks may be used to store the water used for construction onsite. Water storage tanks for domestic water may also be installed onsite.

CONSTRUCTION SCHEDULE AND EQUIPMENT

The three-different solar Facilities are anticipated to be constructed in one continuous build cycle with no phasing over a period of 12 to 36 months. The on-site construction workforce will consist of laborers, craftsmen, supervisory personnel, support personnel, and construction management personnel. Each Solar Facility will have different completion dates depending upon power procurement contracts. Therefore, all three Facilities may be built at the same time or they may be constructed in sequence.

For air quality modeling purposes, it is conservatively assumed that the construction would be done over a 12-month period and that all three facilities will be constructed at the same time, which would result in the maximum potential impacts to air quality. Table 1, *Chaparral Construction Duration and Equipment by Activity*, Table 2, *Rabbitbrush Construction Duration and Equipment by Activity*, and Table 3, *Tumbleweed Construction Duration and Equipment by Activity*, list the timeline for the different construction activities at each Solar Facility and the construction equipment that is planned to be used at each Solar Facility. The construction information shown in Table 1 through Table 3 was provided by First Solar, Inc.

Table 1
Chaparral Construction Duration and Equipment by Activity

Activity[1]	Duration (working days)[1]	Equipment	Number of Pieces
Move-on (Laydown, construction trailers, and parking area)	10 days	Graders	1
		Rubber Tired Dozers	1
		Scrapers	1
		Rubber Tired Loaders	1
		Tractors/Loaders/Backhoes	1
		Skid Steer Loaders	1
		Generator Sets (30kW)	1
		Generator Sets (45kW)	0.5
Substation Construction	172 days	Other General Industrial Equipment	1
		Tractors/Loaders/Backhoes	1
		Cranes	1
		Rough Terrain Forklifts	2
		Aerial Lifts	1
		Graders	1
		Rubber Tired Dozers	1
		Scrapers	1
		Rubber Tired Loaders	1
		Excavators	1
		Tractor/Loaders/Backhoes	1
Gen-tie Line installation	128 days	Tractor/Loaders/Backhoes	1
		Cranes	1
		Crawler Tractors	1
		Bore/Drill Rigs	1
		Rough Terrain Forklifts	1
		Other Construction Equipment	1
		Generator Sets	1
Site preparation and Grading	107 days	Pumps (Water Pull)	2
		Graders	2
		Rubber Tired Dozers	1
		Scrapers	3
		Rubber Tired Loaders	3
		Tractor/Loaders/Backhoes (Tractor Buster)	2
		Tractor/Loaders/Backhoes (Tractor Disk)	2
		Rollers	1
		Skid Steer Loaders	2
		Generator Sets (30kW)	1
		Generator Sets (45 kW)	1
Underground work (trenching)	131 days	Tractor/Loaders/Backhoes (Cable plow)	1
		Trenchers (Cable Trenchers)	1
		Plate Compactors	1
		Excavators	1
		Trenchers	4
		Crushing/Processing Equipment (Padder)	1
		Tractors/Loaders/Backhoes	2
		Rollers	2
System Installation	109 days	Rough Terrain Forklifts	5
		Aerial Lifts	3
		Skid Steer Loaders	10
		Air Compressors	1
		Other Construction Equipment (Post Machines)	7
		Generator Sets (30 kW)	1
		Generator Sets (45kW)	1
Cleanup/Testing/Restoration	105 days	Tractors/Loaders/Backhoes	1
		Graders	1
		Scrapers	2

Notes:
1. Construction duration is conservatively estimated to be within a 12-month rolling period with some of the activities overlapping.
2. The Generator Sets (45kW) equipment would be in operation for approximately 6 hours per day and would not operate for an entire construction day during the Move-on (Laydown, construction trailers, and parking area) phase.

Table 2
Rabbitbrush Construction Duration and Equipment by Activity

Activity[1]	Duration (working days)[1]	Equipment	Number of Pieces
Move-on (Laydown, construction trailers, and parking area)	10 days	Graders	1
		Rubber Tired Dozers	1
		Scrapers	1
		Rubber Tired Loaders	1
		Tractors/Loaders/Backhoes	1
		Skid Steer Loaders	1
		Generator Sets (30kW)	1

		Graders	1
		Scrapers	2

Notes:
1. Construction duration is conservatively estimated to be within a 12-month rolling period with some of the activities overlapping.
2. The Generator Sets (45kW) equipment would be in operation for approximately 6 hours per day and would not operate for an entire construction day during the Move-on (Laydown, construction trailers, and parking area) phase.

OPERATION AND MAINTENANCE ACTIVITIES

The operation and maintenance of each Solar Facility will require up to ten full-time equivalent (FTE) personnel (or personnel hours totaling ten FTE positions) consisting of plant operators and maintenance technicians totaling 30 FTEs for the Project. Operations and maintenance staff will typically work during regular business hours Monday through Friday. During periods when non-routine maintenance or major repairs are in progress, the maintenance staff will typically work nights when the Project is not generating power to the grid. The Project may utilize 24-hour security.

Preventive maintenance kits and certain critical spare equipment will typically be stored on-site, while all other components will be readily available from a remote warehouse facility.

The Project's operational water consumption is expected to be approximately 30 acre-feet per year to be used for O&M buildings (toilets and hand washing facilities), and potentially used for PV solar panel washing. Water storage tanks may be installed at the O&M areas to provide water for fire protection and operations. Additional potable water may be delivered for O&M staff consumption.

Operational water for the three solar facilities will be supplied from wells on each individual facility site and/or wells shared by one or more of the three facilities, or wells on the Willow Springs Solar Project site.

DECOMMISSIONING AND REPOWERING

Solar equipment has an expected lifespan of over 30 years. The Project expects to sell the renewable energy produced by the Project under the terms of a long-term Power Purchase Agreement (PPA) with a utility, commercial entity or other power off taker. Upon completion of the PPA term, the Project owner may, at its discretion, choose to enter into a subsequent PPA or decommission and remove the system and its components. Upon decommissioning, the solar site could be converted to other uses in accordance with applicable land use regulations in effect at that time.

It is anticipated that, during Project decommissioning, Project structures that would not be needed for subsequent use would be removed from the Project site. Above-ground equipment that may be removed would include module posts and support structures, on-site transmission poles that are not shared with third parties and the overhead collection system within the Project site, inverters, transformers, electrical wiring, equipment on the inverter pads, and related equipment and concrete pads. The substations would be removed if it is owned by the Project. However, if a public or private utility assumes ownership of the substations, the substations may remain on-site to be used as part of the utility service to supply other applications.

Equipment would be de-energized prior to removal, salvaged (where possible), and shipped off-site to be recycled or disposed of at an appropriately licensed disposal facility. Once the solar modules are removed, the racks would be disassembled, and the structures supporting the racks would be removed. Site infrastructure would be removed, including fences, and concrete pads

that may support the inverters, transformers and related equipment. The demolition debris and removed equipment may be cut or dismantled into pieces that can be safely lifted or carried by standard construction equipment. The fence and gates would be removed, and all materials would be recycled to the extent practical. Project roads would be restored unless they may be used for subsequent land use. The area would be thoroughly cleaned, and all debris removed. Most materials would be recycled to the extent feasible, with the remainder disposed of in landfills in compliance with all applicable laws.

2.0 ENVIRONMENTAL SETTING

2.1 CLIMATE AND METEOROLOGY

The California Air Resources Board (CARB) divides the State into 15 air basins that share similar meteorological and topographical features. The Project site lies within the Mojave Desert Air Basin (Basin) and is within the jurisdiction of EKAPCD. The Basin encompasses more than 20,000 square miles of California's desert. The Basin consists of the eastern half of Kern County, the northern desert potion of Los Angeles County, most of San Bernardino County, and eastern Riverside County.

The Basin is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains which dot the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the Basin are out of the west and southwest. These prevailing winds are due to the proximity of the Basin to the Pacific Ocean and the blocking nature of the Sierra Nevada Mountains to the north. Air masses pushed onshore in southern California by differential heating are channeled through the Basin. The Basin is separated from the southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet), the passes of which form the main channels for these air masses.

The Basin is characterized by hot summers, cold winters, large diurnal ranges in temperature, low relative humidity, and irregular rainfall. During the summer, the Basin is generally influenced by a Pacific Subtropical High cell that sits off the coast to the west, inhibiting cloud formation and encouraging daytime solar heating. The Basin is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist and unstable air masses from the south. Away from the cooling effects of the Pacific Ocean, the Basin's climate can be characterized as hot in summer and cold in winter, compared with the coastal basins where the climate is moderated by the adjacent ocean. Average temperatures recorded in the Rosamond – Lancaster area, range from a low of 30 degrees Fahrenheit (°F) in December to highs of 98°F in July and August.[3] Rainfall is light, averaging about seven inches a year in Lancaster.[4] The Basin averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The Basin is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, which indicates at least three months have maximum average temperatures over 100.4°F. Most of the air basin is sparsely populated and produces very few human-made pollutants, although dust can become airborne under high wind conditions. The proposed Project is located entirely in the Basin. Most of the Basin is sparsely populated and produces very few human-made pollutants, although dust can become airborne under high wind conditions. Air movement in and out of the Project area is restricted by the Tehachapi Mountains to the north and west and the San Gabriel Mountains to the south.

[3] United States Climate Data, Climate Lancaster – California, https://www.usclimatedata.com/climate/ lancaster/california/united-states/usca0591, accessed July 15, 2019.

[4] Ibid.

Prevailing winds are from the south and west, and rapid daytime heating of the lower air leads to convective activity.

2.2 TOXIC AIR CONTAMINANTS

TACs are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Hazardous Air Pollutants (HAP) is a term used by the Federal Clean Air Act (FCAA) that includes a variety of pollutants generated or emitted by industrial production activities. Identified as TACs under the California Clean Air Act (CCAA), ten have been singled out through ambient air quality data as being the most substantial health risk in California. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. CARB provides emission inventories for only the larger air basins.

TACs do not have ambient air quality standards because no safe levels of TACs can be determined. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588) apply to facilities that use, produce, or emit toxic chemicals. Facilities subject to the toxic emission inventory requirements of the act must prepare and submit toxic emission inventory plans and reports, and periodically update those reports.

Toxic contaminants often result from fugitive emissions during fuel storage and transfer activities, and from leaking valves and pipes. For example, the electronics industry, including semiconductor manufacturing, uses highly toxic chlorinated solvents in semiconductor production processes. Sources of air toxics go beyond industry, however. Automobile exhaust also contains toxic air pollutants such as benzene and 1,3-butadiene.

Acetaldehyde. Acetaldehyde is directly emitted into the atmosphere and is also formed in the atmosphere from photochemical oxidation. Acetaldehyde is generated as exhaust from mobile sources and fuel combustion from stationary internal combustion engines, boilers, and process heaters. Acetaldehyde is a carcinogen that can also cause chronic non-cancer toxicity in the respiratory system. Symptoms of chronic intoxication of acetaldehyde in humans resemble those of alcoholism. The primary short-term effect of inhalation exposure to acetaldehyde is irritation of the eyes, skin, and respiratory tract. At higher exposure levels, erythematic, coughing, and pulmonary edema, and necrosis may also occur.

Benzene. Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer health effects. Brief inhalation exposure to high concentrations can cause central nervous system symptoms of nausea, tremors, drowsiness, dizziness, headache, intoxication, and unconsciousness.

Neurological symptoms of inhalation exposure to benzene include drowsiness, dizziness, headaches, and unconsciousness. Ingestion of large amounts of benzene may result in vomiting, dizziness, and convulsions. Exposure to liquid and vapor may irritate the skin, eyes, and upper respiratory tract. Redness and blisters may result from dermal exposure to benzene. Chronic inhalation of certain levels of benzene causes blood disorders because benzene specifically affects bone marrow, which produces blood cells. Aplastic anemia, excessive bleeding, and damage to the immune system (by changes in blood levels of antibodies and loss of white blood cells) may develop. Increased incidence of leukemia (cancer of the tissues that form white blood cells) has been observed in humans occupationally exposed to benzene.

1,3-Butadiene. The majority of 1,3-butadiene emissions comes from incomplete combustion of gasoline and diesel fuels. 1,3-butadiene has been identified as a carcinogen in California. Butadiene vapors at elevated levels cause neurological effects such as blurred vision, fatigue, headache, and vertigo. Dermal exposure to 1,3-butadiene causes a sensation of cold, followed by a burning sensation, and can lead to frostbite. Chronic exposure to 1,3-butadiene via inhalation has been shown to result in an increase in cardiovascular diseases, and increase in the occurrence of leukemia, and an increased incidence of respiratory, bladder, stomach, and lymphato-hematopoietic cancers.

Diesel Particulate Matter. DPM is emitted from both mobile and stationary sources. DPM is typically composed of carbon particles ("soot" also called black carbon, or BC) and numerous organic compounds, including over 40 known cancer-causing organic substances. It should be noted that CARB has developed several plans and programs to reduce diesel emissions such as the Diesel Risk Reduction Plan (DRRP), the Statewide Portable Equipment Registration Program (PERP), and the Diesel Off-Road Reporting System (DOORS). The PERP and DOORS programs allow owners or operators of portable engines and certain other types of equipment can register their units in order to operate their equipment throughout California without having to obtain individual permits from local air districts.

Diesel exhaust and many individual substances contained in it (including arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles.

In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Using information from OEHHA's assessment, CARB estimates that diesel particle levels measured in California's air in 2000 could cause 540 "excess" cancers in a population of 1 million people over a 70-year lifetime. Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health (NIOSH), have calculated cancer risks from diesel exhaust similar to those developed by OEHHA and California Resources Board (CARB).

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Diesel engines are a major source of fine particulate pollution. The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. In California, diesel exhaust particles have been identified as a carcinogen.

2.3 SENSITIVE RECEPTORS

Sensitive populations are more susceptible to the effects of air pollution than is the general population. Sensitive populations (sensitive receptors) that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. The distances listed in Table 4, *Sensitive Receptors*, are based on the distance from the different solar Facilities within the Project to the nearest sensitive receptors.

Table 4
Sensitive Receptors

Type	AVEP Solar Facility	Sensitive Receptor #	Distance from Project Site (feet)[1]	Direction from Project Site	Location
Rural Residential (very low density)	Chaparral	1	165	East	3300 100th St W, Rosamond, CA 93560
		2	175	East	3144 100th St W, Rosamond, CA 93560

	Willow Springs Substation Improvements [4]	39	2,640	Northwest	Northeast of the Abarth Ave and 117th St W intersection

Notes:
1. Distances are measured from the exterior of the Solar Facilities boundary only and not from individual construction projects/areas within the interior of the Solar Facilities.
2. Receptor #13 would be acquired as part of the proposed Project and therefore is not evaluated in this Health Risk Assessment. Receptor #13 is included in Table 4 for informational purposes only.
3. APN's 358-152-06-04 and 358-152-07-2 do not have registered street addresses and are classified as vacant lots per the Kern County Assessor-Recorder. However, based off Google Earth imagery, these parcels of land have development on-site. Thus, it is conservatively assumed in this analysis that these parcels of land have sensitive receptors on-site.
4. The Rosamond and Willow Springs Substations are already built and are not a part of the AVEP Solar HRA footprint

3.0 REGULATORY FRAMEWORK

3.1 FEDERAL

Federal Clean Air Act (FCAA). The FCAA of 1970 and the FCAA Amendments of 1971 required the U.S. Environmental Protection Agency (EPA) to establish National Ambient Air Quality Standards (NAAQS), with states retaining the option to adopt more stringent standards or to include other specific pollutants. The FCAA was amended in 1990 to address a large number of air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. They were 188 specific pollutants and chemical groups initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

Mobile Source Air Toxics (MSAT) Rule. In 2001, the EPA issued its first MSAT Rule, which identified 21 MSAT compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. More recently, the EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have NAAQS making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAP) Program. Under federal law, 188 substances are listed as HAPs. Major sources of specific HAPs are subject to the requirements of the NESHAP program. The EPA is establishing regulatory schemes for specific source categories and requires implementation of Maximum Achievable Control Technologies (MACTs) for major sources of HAPs in each source category. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and is aimed at HAPs that are a problem in California. The state has formally identified 244 substances as TACs and is adopting appropriate control measures for each. Once adopted at the state level, each air district will be required to adopt a measure that is equally or more stringent.

3.2 STATE

California Air Toxics "Hot Spots" Information and Assessment Act (AB 2588). The California Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) is a state-wide program enacted in 1987. AB 2588 requires facilities that exceed recommended OEHHA levels to reduce risks to acceptable levels. CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588, the Air Toxics "Hot Spots" Information and Assessment Act of 1987. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment

and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, the "Hot Spots" Act was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel exhaust is mainly composed of particulate matter and gases, which contain potential cancer-causing substances. Emissions from diesel engines currently include over 40 substances that are listed by EPA as hazardous air pollutants and by CARB as toxic air contaminants. On August 27, 1998, CARB identified particulate matter in diesel exhaust as a TAC, based on data linking diesel particulate emissions to increased risks of lung cancer and respiratory disease.

Tanner Air Toxics Act of 1983. CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions.

Diesel Reduction Plan. In September 2000, CARB adopted a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce diesel PM emissions and the associated health risk by 75 percent in 2010 and by 85 percent by 2020. As part of this plan, CARB identified ATCM for mobile and stationary emissions sources. Each ATCM is codified in the California Code of Regulations, including the ATCM to limit diesel-fueled commercial motor vehicle idling, which puts limits on idling time for large diesel engines (13 CCR Chapter 10 Section 2485).

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles. On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce particulate matter (PM) and oxides of nitrogen (NO_x) emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks must be retrofitted with PM filters beginning January 1, 2012, and older trucks must be replaced starting January 1, 2015. By January 2023, nearly all trucks and buses would need to have 2010 model year engines or equivalent.

The regulation applies to nearly all privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks by reporting and there are many extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

Heavy-Duty Vehicle Idling Emission Reduction Program. The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to diesel

particulate matter and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles.[5] The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, would require that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

3.3 LOCAL

EASTERN KERN AIR POLLUTION CONTROL DISTRICT

The EKAPCD has primary responsibility for regulating stationary sources of air pollution situated within its jurisdictional boundaries. To this end, EKAPCD implements air quality programs required by State and Federal mandates, enforces rules and regulations based on air pollution laws, and educates businesses and residents about their role in protecting air quality. The EKAPCD is also responsible for managing and permitting existing, new, and modified sources of air emissions within Kern County to ensure conformance with Federal, State, and local standards for air quality. PM emissions are a critical concern for the EKAPCD.

EKAPCD 2017 Ozone Attainment Plan. In 2008, EPA adopted a more stringent 8-hour Ozone NAAQS of 0.075 parts per million (ppm). Although the Eastern Kern Air Pollution Control District (District) attained the 1997 8- Hour Ozone NAAQS, and the Indian Wells Valley (IWV) planning area met the new (2008) standard, the District's Design Value was higher than 0.075 ppm.

In 2012, a portion of the District was classified "Marginal" non-attainment pursuant to the 2008, 8-hour Ozone NAAQS Air Quality Designations. However, the District failed to meet the 0.075 ppm standard by the applicable attainment date and was reclassified as "Moderate" nonattainment, effective June 3, 2016. As a result, the District was required to submit a SIP revision for the nonattainment area by January 1, 2017, which showed compliance with statutory and regulatory conditions applicable to the Moderate classification.

The District, in partnership with the CARB, conducted photochemical modeling along with supplemental analyses to determine whether the District could attain the 2008 Ozone NAAQS by the Moderate deadline. Modeling indicated the District would not meet the 0.075 ppm standard by the Moderate deadline but could attain it by 2020, the attainment date for "Serious" nonattainment areas. Pursuant to Section 181(b)(3) of the CAA "Voluntary Reclassification", the District requests CARB formally submit a request to EPA asking for voluntary reclassification of

[5] The ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is codified in Title 13 of the California Code of Regulations, Chapter 10, Section 2485.

the Eastern Kern Air Pollution Control District from "Moderate" to "Serious" non-attainment for the 2008, 8-hour Ozone NAAQS, and revise the attainment date to December 31, 2020. The District expects EPA to approve the request to be reclassified as "Serious" non-attainment, therefore this Ozone attainment plan addresses all required elements, emissions reductions, and control measures necessary to demonstrate attainment with the 2008, 8-hour Ozone NAAQS by 2020.

The EKAPCD has established rules and regulations to ensure compliance with local, State, and Federal air quality regulations. Those applicable to the proposed Project are listed below.

Rule 210.1. Rule 210.1 establishes stationary source offset levels for new and modified stationary sources of air pollutants. Under this rule the EKAPCD has established required offsets for when the emissions from a source exceed the following trigger levels:

- PM_{10} - 15 tons per year (tons/year)
- Sulfur oxides (as SO_2) – 27 tons/year
- VOCs – 25 tons/year
- NO_x (as NO_2) – 25 tons/year

Rule 401. Rule 401 states that a person shall not discharge into the atmosphere, from any single source of emissions whatsoever, any air contaminant for a period or periods aggregating more than 3 minutes in any one hour which is:

- As dark or darker in shade as that designated as No. 1 on the Ringlemann Chart, as published by the U.S. Bureau of Mines, or
- Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in Subsection A [of the Rules].

Rule 402. Rule 402 of the EKAPCD's rules and regulations addresses significant man-made dust sources from active operations. An active operation is defined as "Activity capable of generating fugitive dust, including any open storage pile, earth-moving activity, construction/demolition activity, disturbed surface area, and non-emergency movement of motor vehicles on unpaved roadways and any parking lot served by an unpaved road subject to this Rule." Rule 402 applies to specified bulk storage, earthmoving, construction and demolition, and man-made conditions resulting in wind erosion, and includes the following requirements.

- A person shall not cause or allow emissions of fugitive dust from any active operation to remain visible in the atmosphere beyond the property line of the emission source, excluding unpaved roadways.
- A person shall utilize one or more Reasonably Available Control Measures (RACMs) to minimize fugitive dust emissions from each source type that is part of any active operations, including unpaved roadways.
- No person shall conduct a large operation without filing for and obtaining an approved fugitive dust emission control plan. Large operation is defined as "Any construction

activity on any site involving 10 or more contiguous acres of disturbed surface area, or any earthmoving activity exceeding a daily volume of 10,000 cubic yards or relocating more than 2,500 cubic yards per day of bulk materials at least three days per year."

- EKAPCD may require on-site PM10 monitoring for any large operation that causes downwind PM10 ambient concentrations to increase more than 50 micrograms per cubic meter above upwind concentrations as determined by utilizing high-volume particulate matter samplers, or other EPA- approved equivalent method(s).

Rule 404.1. Rule 404.1 pertains to PM Concentration – Desert Basin and states:

- A person shall not discharge into the atmosphere from any single source operation, in service on the date this Rule is adopted, particulate matter in excess of 0.2 grains per cubic foot of gas at standard conditions.
- A person shall not discharge into the atmosphere from any single source operation, the construction or modification of which commenced after the adoption of this Rule, particulate matter is excess of 0.1 grains per cubic foot of gas at standard conditions.

Rule 419. Rule 419 states that a person shall not discharge from any source whatsoever such quantities of contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public or that endanger the comfort, repose, health, or safety of such persons or the public or that cause or have a natural tendency to cause injury or damage to business or property.

Rule 423. (National Emission Standards for Hazardous Air Pollutants and Source Categories [NESHAPs]): Provision of Title 40, Chapter 1, parts 61 and 63, Code of Federal Regulations, in effect October 10, 2017, are hereby adopted by reference and made a part hereof. All sources of hazardous air pollution shall comply with applicable standards, criteria and requirements set forth therein.

The EKAPCD has adopted the *Guidelines for Implementation of the California Environmental Quality Act (CEQA) of 1970, as Amended*. The purpose of the guidelines is to set forth the definitions, procedures, and forms use by the EKAPCD to implement CEQA and to supplement State CEQA guidelines. The guidelines also establish the thresholds for specific pollutants, emissions above which are considered significant.

This page intentionally left blank

4.0 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 SIGNIFICANCE CRITERIA

HEALTH RISK ANALYSIS THRESHOLDS

In order to determine whether or not a proposed project would cause a significant effect on the environment, the impact of the project must be determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. With guidance from California Environmental Protection Agency (Cal-EPA) and OEHHA, the EKAPCD recommends that the following significance air pollution thresholds be used by lead agencies in determining whether the proposed Project is significant.[6] If the lead agency finds that the proposed Project has the potential to exceed the air pollution thresholds, the Project should be considered significant. The thresholds for air toxic emissions are as follows.

- *Cancer Risk:* Emit carcinogenic or toxic contaminants that exceed the maximum individual cancer risk of 10 in one million.
- *Non-Cancer Risk:* Emit toxic contaminants that exceed the maximum hazard quotient of 1 in one million.

No existing facility in Eastern Kern County poses an increased cancer risk of more than 10 in 1 million after 70 years of exposure.[7] To provide a perspective on this level of risk and using information from the National Center for Health Statistics it was determined: the risk of death by heart disease is 200,000 in 1 million, the risk of death by car accident is 10,000 in 1 million, and the risk of death by drowning is 112 in 1 million.[8] The 10 in 1 million threshold is based on the latest scientific data, and is designed to protect the most sensitive individuals in the population as each chemical's exposure level includes large margins of safety. In addition to this carcinogen threshold, OEHHA recommends that the non-carcinogenic hazards for TACs at ground level should not exceed a chronic hazard index of greater than one.

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. The gas phase is composed of many of the urban HAPs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particulate phase has many different types that can be classified by size or composition. The sizes of diesel particulates of greatest health concern are fine and ultrafine particles. These particles may be composed of elemental carbon with adsorbed[9] compounds such

[8] Ibid.

[9] This term is specifically used for gases.

as organics, sulfates, nitrates, metals, and other trace elements. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines.

Exhaust emissions of diesel particulates from the construction equipment are below the 10 and 2.5-micron range (PM_{10} and $PM_{2.5}$, respectively). EKAPCD recommends using diesel exhaust PM_{10} emissions for analysis of DPM in HRAs.[10] DPM is the only toxic air pollutant looked at for this cancer risk analysis (which uses a 1-year-average emission rate for residential sensitive receptor risks) since the cancer slope factor established by OEHHA for the assessment of DPM cancer risk includes consideration of the individual toxic species that could be adsorbed onto DPM particles.

4.2 METHODOLOGY

HEALTH RISK ASSESSMENT

The air dispersion modeling for the HRA was performed using the U.S. EPA AERMOD dispersion model, version 18081. AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height (AERMET Data). Based on discussions with EKAPCD, surface and upper air meteorological data from the General William J. Fox Airfield Airport (Station ID 3159) was selected as being the nearest, most representative meteorology.[11] [12]The Station ID 3159 AERMET Data was taken directly from CARB and includes all of the necessary meteorological data listed above.

The Project site was modeled as three defined polygonal area sources. These three polygonal area sources represent the construction emissions from the Project, consisting of the individual Chaparral, Rabbitbrush, Tumbleweed Facilities. In addition, the Project's hauling and water truck trips were modeled as two line-volume sources along West Rosamond Boulevard and West Avenue A. United States Geological Survey (USGS) 1/3 arc-second (about 10 meters) National Elevation Dataset (NED) terrain data was processed with AERMAP[13] and imported into AERMOD for the Project area. The maximum PM_{10} exhaust emissions for all on-site diesel equipment was used to produce an emission rate in terms of grams per second (g/s) for each individual Facility. Further, PM_{10} exhaust emissions associated with the Project's hauling and water truck trips was modeled for the cumulative Project scenario (all three solar facilities built concurrently) to represent the worst-case exhaust emissions scenario. These exhaust emissions were derived from an excel spreadsheet model that was populated by the Project applicant and was accepted by EKAPCD. The emissions from construction trucks and equipment were assigned a release height of 15 feet (~5 meters). A release height of 5 meters is representative of

[13] U.S. Environmental Protection Agency, *User's Guide for the AERMOD Terrain Preprocessor (AERMAP),* https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P100QXHO.TXT, accessed July 14, 2019.

the average stack height for heavy duty construction emissions and is recommend by the Sacramento Metropolitan Air Quality Management District for PM_{10} exhaust emissions.[14]

Individual model runs were done to obtain the peak 1-hour and annual average PM_{10} concentration in micrograms per cubic meter [$\mu g/m^3$] at nearby sensitive receptors for each of the three Facilities and another model run was done for the Project as a whole (assuming simultaneous construction of all three facilities). The nearby sensitive receptors were modeled with individual discrete receptor grids of 20-meter by 20-meter (66 feet) grid spacing over each individual property. Additionally, a 10,000 meter by 10,000-meter grid with a 100 meter (328 feet) spacing for background concentrations; refer to Exhibit 6, *Project AERMOD Model*. Note that the concentration estimate developed using this methodology is considered conservative and is not a specific prediction of the actual concentrations that would occur at any one point over the course of the construction period. Actual 1-hour and annual average concentrations are dependent on many variables, particularly the number and type of equipment working at specific distances during time periods of adverse meteorology. Various activities would occur at different locations throughout the 2,117 acres of the Project site, and equipment would be close to sensitive receptors for a limited period of time, and then several thousand feet from the same receptor at other times.

A health risk computation was performed to determine the potential risk using the maximum annual average and hourly concentration for a one-year construction period, and the risk of developing an excess cancer was calculated on a 1-year exposure scenario, as DPM emissions would cease once construction of the Project is complete. Operational emissions tied to the Project would stem from mobile vehicle trips, ESS facility operations, and emergency backup generators. These operational TAC emissions would follow all EKAPCD and CARB rules and regulations and are not anticipated to trigger an operational HRA. The chronic and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA Human Health Evaluation Manual and the OEHHA Guidance Manual. Only the risk associated with construction operations was assessed as operational toxic emissions from the solar facilities would be negligible and would follow proper compliance from EKAPCD and Kern County. No sources of air toxics are proposed on-site, besides potential emergency backup generators that would follow CARB ATCM and EKAPCD compliance.

AVEP SOLAR PROJECT • HEALTH RISK ASSESSMENT

Project AERMOD Model

Exhibit 6

RISK AND HAZARD ASSESSMENT

The Hotspots Analysis and Reporting Program Version 2 (HARP2) Air Dispersion & Risk Tool (ADMRT) version 19121 was employed to calculate the health risks at nearby sensitive receptors. HARP was created for the purpose of assisting and supporting the local California Air Pollution Control and Air Quality Management Districts (districts) with implementing the requirements of AB 2588. Although designed to meet the programmatic requirements of the Air Toxics "Hot Spots" Program, HARP 2 modules have also been used for preparing risk assessments for other air related programs (e.g., air toxic control measure development, facility permitting applications, roads, ambient monitoring evaluations, CEQA reviews).

The risk analysis algorithms and default values used in HARP 2 are based on the OEHHA guidelines set forth in the revised Technical Support Document for Exposure Assessment and Stochastic Analysis. All equations, default parameter values, and variable distributions encoded into HARP 2 are from the OEHHA Guidance Manual. More specifically, the ADMRT module in HARP 2 allows user to:

- Performs air dispersion analysis using EPA's AERMOD modeling system;
- Calculates potential health impacts for one or multiple facilities and multiple pollutants;
- Calculates cancer and noncancer (acute, 8-hour, and chronic) health impacts using the new risk assessment guidelines in the OEHHA Guidance Manual
- Uses point estimates to calculate inhalation and multipathway risks;
- Calculates population exposures and uses spatial averaging methods to determine exposure concentrations or potential cancer risk;
- Presents the results as tabular reports that can be printed, added to word processing documents, or off-ramped to a Geographic information Systems (GIS) program.
- Uses point estimates to calculate inhalation and multi-pathway risks; and
- Performs stochastic health risk analyses.

CANCER RISK

Based on the OEHHA methodology, the residential inhalation cancer risk from the annual average DPM concentrations is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor (ASF), the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. These factors are discussed in more detail below. It is important to note that exposure duration is based on a one-year construction period. Cancer risk must be separately calculated for specified age groups, because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure.

Exposure through inhalation (Dose-air) is a function of the breathing rate, the exposure frequency, and the concentration of a substance in the air. For residential exposure, the breathing rates are determined for specific age groups, so Dose-air is calculated for each of these age groups, 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = (C_{air} * \{BR/BW\} * A * EF * 10^{-6})$$

Where:

Dose-air	=	dose through inhalation (mg/kg/day)
C_{air}	=	air concentration ($\mu g/m^3$) from air dispersion model
{BR/BW}	=	95th percentile daily breathing rate normalized to body weight (L/kg body weight – day) (361 L\kg BW-day for 3rd Trimester, 1090 L/kg BW-day for 0<2 years, 861 L/kg BW-day for 2<9 years, 745 L/kg BW-day for 2<16 years, 335 L/kg BW-day for 16<30 years, and 290 L/kg BW-day 16<70 years)
A	=	Inhalation absorption factor (unitless [1])
EF	=	exposure frequency (unitless), days/365 days (0.69 [255 days of construction duration])
10^{-6}	=	conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to take into account the increased sensitivity to carcinogens during early-in-life exposure. In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood and an ASF of 1 for ages 16 through 70 years.

Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the following FAH values: from the third trimester to age <2 years, 85 percent of time is spent at home; from age 2 through <16 years, 72 percent of time is spent at home; from age 16 years and greater, 73 percent of time is spent at home.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air} * CPH * ASF * ED/AT * FAH)$$

Where:

$Risk_{inh\text{-}res}$	=	residential inhalation cancer risk (potential chances per million)
$Dose_{air}$	=	daily dose through inhalation (mg/kg-day)
CPF	=	inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF	=	age sensitivity factor for a specified age group (unitless)

ED	=	exposure duration (in years) for a specified age group (0.25 years for 3rd trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70)
AT	=	averaging time of lifetime cancer risk (years)
FAH	=	fraction of time spent at home (unitless)

Due to the uncertainty in assessing cancer risk from very short-term exposures, OEHHA does not recommend assessing cancer risk for projects lasting less than two months at the maximally exposed individual resident (MEIR). OEHHA recommends that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. To allow for the use of the ASFs, OEHHA recommends that the exposure should be assumed to start in the third trimester. Therefore, the analysis analyzes exposure during the entire 1-year construction period.

CHRONIC NON-CANCER HAZARD

Non-cancer chronic impacts are calculated by dividing the annual average concentration by the Reference Exposure Level (REL) for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. Based off OEHHA guidance, the current REL for DPM is 5 μg/m^3.[15] The following equation was used to determine the non-cancer risk:

$$\text{Hazard Quotient} = Ci/RELi$$

Where:

Ci	=	Concentration in the air of substance i (annual average concentration in μg/m^3)
RELi	=	Chronic noncancer Reference Exposure Level for substance i (μg/m^3)

ACUTE NON-CANCER HAZARD

The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. Currently, OEHHA has not set an Acute REL for DPM. To be conservative the acute REL for Acrolein is used instead, as Acrolein is a major component of diesel exhaust and is considered the worst case acute REL for diesel exhaust emissions. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. The equation is as follows:

$$\text{Acute HQ} = \text{Maximum Hourly Air Concentration } (\mu g/m^3) / \text{Acute REL } (\mu g/m^3)$$

[15] California Air Resources Board, Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Value, https://www.arb.ca.gov/toxics/healthval/contable.pdf, accessed November 13, 2018.

5.0 POTENTIAL HEALTH RISK IMPACTS

5.1 CHAPARRAL SOLAR FACILITY

CONSTRUCTION

The construction the Chaparral Solar Facility would generate short-term DPM air quality impacts. Construction of the Chaparral Solar Facility would include 600 cubic yards of cut and fill during the Site Preparation and Grading phase. Construction activities would involve the following phases: move-on, substation construction, gen-tie line installation, site preparation and grading, underground work, system installation, and cleanup/testing/restoration. Construction activities, duration, and equipment's are listed in Table 5, *Chaparral Solar Facility: Construction Duration and Equipment by Activity*. The Chaparral construction DPM emissions utilized within AERMOD were derived from a spreadsheet from the Project applicant. Variables factored into estimating the total construction DPM emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations.

OPERATION AND MAINTENANCE

The Chaparral Solar Facility may have an emergency backup diesel generator (Backup Generator) on site. This emergency Backup Generator would follow strict compliance with EKAPCD and CARB rules and regulations. The anticipated emissions from this generator would be nominal and would disperse quickly from the Chaparral Solar Facility. Thus, as this Backup Generator would be approved and permitted with EKAPCD and would follow strict compliance with EKAPCD and CARB rules and regulations, the operational DPM emissions from this generator were not calculated in the HRA.

DECOMMISSIONING

At such time as the Chaparral Solar Facility is decommissioned, equipment operation and site restoration activities would result in impacts to air quality. Given the assumption that much of the construction equipment necessary to construct the Chaparral Solar Facility would also be required to decommission the site, it is reasonable to assume that decommissioning activities would be similar in nature to activities associated with construction of the Chaparral Solar Facility. Although EMFAC predicts future diesel emissions to be reduced with cleaner engines and newer technologies, it should be noted that this analysis does not take into account any future improvement in technology or subsequent reductions in air emissions. Chaparral Solar Facility decommissioning is projected to be shorter in duration than construction and take four months to complete, instead of 12-months for construction. Although decommission is anticipated to be shorter in duration and 30 years in the future, it is conservatively assumed in this analysis that the decommissioning health risk will be equivalent to that of the construction health risk.

Table 5
Chaparral Solar Facility: Construction Duration and Equipment by Activity

Activity[1]	Duration (working days)[1]	Equipment	Number of Pieces

Source: Refer to Appendix A, *Health Risk Assessment Data*.

CARCINOGENIC RISK IMPACTS

The emission rate for DPM from the construction equipment and timeline of the Chaparral Solar Facility was calculated at 0.011 (g/s); refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations. This emission rate was applied in the AERMOD model and was assumed to be emitted evenly over the entire area source over the entire one-year period. The source treatment included one individual area sources of approximately 764 acres, which represents the total potential disturbed area from construction activities. This methodology essentially applies all of the DPM emissions over the Chaparral Solar Facility area and provides a worst-case assessment of the impacts to sensitive receptors.

The expected DPM health risk from the AERMOD run and HARP2 RAST tool are shown below in Table 6, *Chaparral Solar Facility: Construction Cancer Risk*. The highest overall annual concentration of diesel exhaust at a discrete receptor would be 0.042 $\mu g/m^3$. The point of maximum impact (PMI) would result in a risk of 5.38 in one million over the 1-year exposure period/construction period. It should be noted that the highest concentration and PMI would occur at a vacant/undeveloped area and would not occur at a sensitive receptor. At the MEIR (Sensitive receptor 1), the carcinogenic risk would be 5.48 in one million, which would not exceed the threshold of 10 in one million. Therefore, carcinogenic exposures from the construction of the Chaparral Solar Facility are calculated to be within acceptable limits and would not exceed EKAPCD or OEHHA thresholds.

NON-CARCINOGENIC HAZARDS

The non-carcinogenic chronic and acute hazard impacts associated with construction activities of the Chaparral Solar Facility is evaluated and shown in Table 7, *Chaparral Solar Facility: Construction Chronic and Acute Hazard Risk*. Based on the model results, the MEIR would result in a maximum chronic hazard index of 0.0941 (sensitive receptor #2) and a maximum acute hazard index of 0.1452 (sensitive receptor #3), which are below the chronic and acute hazard index threshold of 1.0. At the PMI, non-cancer indices would be 0.1277 for chronic hazards and 0.2092 for acute hazards. As indicated in Table 7, the non-carcinogenic chronic and acute hazard threshold are below the threshold of 1.0. Therefore, non-carcinogenic hazards impacts are calculated to be within acceptable limits.

35	0.0022	0.0633	1	No
PMI[4]	0.1277	0.2092	1	No

Notes:
1. Refer to Table 4 for locations of the individual receptors.
2. The REL for acrolein was used as diesel exhaust does not have a defined REL for acute effect (only has a carcinogenic and chronic effect).
3. Receptor #13 would be acquired as part of the proposed Project and therefore is not evaluated in this Health Risk Assessment. Receptor #13 is included in Table 4 for informational purposes only.
4. The highest overall concentrations would not occur at a discrete receptor (i.e., existing sensitive receptor), but would be located at a Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 380135.85, 3859420.15) for chronic Hazard and at the Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 378835.85, 3861120.15) for Acute Hazard. The PMI (risk is provided for informational purposes as sensitive receptors do not currently exist at this location.

Source: Refer to Appendix A, *Health Risk Assessment Data*.

CONCLUSION

Based upon the results of the HRA analysis, the DPM emissions from the construction of the Chaparral Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year construction period. As decommissioning is conservatively assumed to have the same impacts as the construction of the Chaparral Solar Facility, the DPM emissions from the decommissioning of the Chaparral Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year decommissioning period. Additionally, the DPM emissions from the construction and decommissioning of the Chaparral Solar Facility would not exceed the

Chronic and Acute Hazard Index Threshold of 1.0. Therefore, construction and decommissioning of the Chaparral Solar Facility would not result in a health risk related impact.

RECOMMENDED MITIGATION MEASURES:

No mitigation measures are recommended.

5.2 TUMBLEWEED SOLAR FACILITY

CONSTRUCTION

The construction the Tumbleweed Solar Facility would generate short-term toxic air quality impacts. Construction of the Tumbleweed Solar Facility would include 350 cubic yards of cut and fill during the Site Preparation and Grading phase. Construction activities would involve the following phases: move-on, substation construction, gen-tie line installation, site preparation and grading, underground work, system installation, and cleanup/testing/restoration. Construction activities, duration, and equipment's are listed in Table 8, *Tumbleweed Solar Facility: Construction Duration and Equipment by Activity*. The Tumbleweed Solar Facility construction DPM emissions utilized within AERMOD were derived from a spreadsheet from the Project applicant. Variables factored into estimating the total construction DPM emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations.

OPERATION AND MAINTENANCE

The Tumbleweed Solar Facility may have a Backup Generator on site. This emergency Backup Generator would follow strict compliance with EKAPCD and CARB rules and regulations. The anticipated emissions from this generator would be nominal and would disperse quickly from the Tumbleweed Solar Facility. Thus, as this Backup Generator would be approved and permitted with EKAPCD and would follow strict compliance with EKAPCD and CARB rules and regulations, the operational DPM emissions from this generator were not calculated in the HRA.

DECOMMISSIONING

At such time as the Tumbleweed Solar Facility is decommissioned, equipment operation and site restoration activities would result in impacts to air quality. Given the assumption that much of the construction equipment necessary to construct the Tumbleweed Solar facility would also be required to decommission the site, it is reasonable to assume that decommissioning activities would be similar in nature to activities associated with construction of the Tumbleweed Solar Facility. Although EMFAC predicts future diesel emissions to be reduced with cleaner engines and newer technologies, it should be noted that this analysis does not take into account any future improvement in technology or subsequent reductions in air emissions. Tumbleweed Solar Facility decommissioning is projected to be shorter in duration than construction and take four months to complete, instead of 12-months for construction. Although decommission is anticipated to be shorter in duration and 30 years in the future, it is conservatively assumed in this analysis that the decommissioning health risk will be equivalent to that of the construction health risk.

CARCINOGENIC RISK IMPACTS

The emission rate for DPM from the construction equipment and timeline of the Tumbleweed Solar Facility was calculated at 0.0078 g/s; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations. This emission rate was applied in the AERMOD model and was assumed to be emitted evenly over the entire area source. The source treatment included one individual area sources of approximately 721 acres, which represents the daily potential disturbed area during construction activities. This methodology essentially applies all of the DPM emissions over the Tumbleweed Solar Facility area and provides a worst-case assessment of the impacts to sensitive receptors.

The expected DPM health risk from the AERMOD run and HARP2 RAST tool are shown below in Table 9, *Tumbleweed Solar Facility: Construction Cancer Risk*. The highest overall annual concentration of diesel exhaust would be 0.035 $\mu g/m^3$, which conservatively assumes activity occurring at the area source. The highest concentration would result in a risk of 6.17 in one million over the 1-year exposure period/construction period. It should be noted that the highest concentration and PMI would occur at a vacant/undeveloped area and would not occur at a sensitive receptor. At the MEIR (Receptor 26 and 27), the carcinogenic risk would be 4.82 in one million, which would not exceed the threshold of 10 in one million. Therefore, carcinogenic exposures from the construction of the Tumbleweed Solar Facility are calculated to be within acceptable limits and would not exceed EKAPCD or OEHHA thresholds .

Notes:
1. Refer to Table 4 for locations of the individual receptors.
2. Receptor #13 would be acquired as part of the proposed Project and therefore is not evaluated in this Health Risk Assessment. Receptor #13 is included in Table 4 for informational purposes only.
3. The highest overall concentrations would not occur at a discrete receptor (i.e., existing sensitive receptor), but would be located at a Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 379935.85, 3854620.15). The PMI risk is provided for informational purposes as sensitive receptors do not currently exist at this location.

Source: Refer to Appendix A, *Health Risk Assessment Data*.

NON-CARCINOGENIC HAZARDS

The non-carcinogenic chronic and acute hazard impacts associated with construction activities of the Tumbleweed Solar Facility are evaluated and depicted in Table 10, *Tumbleweed Solar Facility: Construction Chronic and Acute Hazard Risk*. Based on the model results, the maximum exposed sensitive receptor would result in a maximum chronic hazard index of 0.0828 (sensitive receptor #27), and a maximum acute hazard index of 0.1377 (sensitive receptor #31), which are below the chronic and acute hazard index threshold of 1.0. At the PMI, non-cancer indices would be 0.1060 for chronic hazards and 0.1638 for acute hazards. As indicated in Table 10, the non-carcinogenic

chronic and acute hazard threshold are below the threshold of 1.0. Therefore, non-carcinogenic hazards impacts are calculated to be within acceptable limits.

CONCLUSION

Based upon the results of the HRA analysis, the DPM emissions from the construction of the Tumbleweed Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year construction period. As decommissioning is conservatively assumed to have the same impacts as the construction of the Tumbleweed Solar Facility, the DPM emissions from the decommissioning of the Tumbleweed Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year decommissioning period. Additionally, the DPM emissions from the construction and decommissioning of the Tumbleweed Solar Facility would not exceed the Chronic and Acute Hazard Index Threshold of 1.0. Therefore, construction and decommissioning of the Tumbleweed Solar Facility would not result in a health risk related impact.

RECOMMENDED MITIGATION MEASURES:

No mitigation measures are recommended.

5.3 RABBITBRUSH SOLAR FACILITY

CONSTRUCTION

The construction the Rabbitbrush Solar Facility would generate short-term DPM air quality impacts. Construction of Rabbitbrush Solar Facility would include 350 cubic yards of cut and fill during the Site Preparation and Grading phase. Project construction activities would involve the following phases: move-on, substation construction, gen-tie line installation, site preparation and grading, underground work, system installation, and cleanup/testing/restoration. Construction activities, duration, and equipment's are listed in Table 11, *Rabbitbrush Solar Facility: Construction Duration and Equipment by Activity*. The Rabbitbrush Solar Facility construction DPM emissions utilized within AERMOD were derived from a spreadsheet from the Project applicant. Variables factored into estimating the total construction DPM emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations.

Source: Refer to Appendix A, *Health Risk Assessment Data*.

OPERATION AND MAINTENANCE

The Rabbitbrush Solar Facility may have a Backup Generator on site. This emergency Backup Generator would follow strict compliance with EKAPCD and CARB rules and regulations. The anticipated emissions from this generator would be nominal and would disperse quickly from the Rabbitbrush Solar Facility. Thus, as this Backup Generator would be approved and permitted with EKAPCD and would follow strict compliance with EKAPCD and CARB rules and regulations, the operational DPM emissions from this generator were not calculated in the HRA.

DECOMMISSIONING

At such time as the Rabbitbrush Solar Facility is decommissioned, equipment operation and site restoration activities would result in impacts to air quality. Given the assumption that much of the construction equipment necessary to construct the Rabbitbrush Solar facility would also be required to decommission the site, it is reasonable to assume that decommissioning activities would be similar in nature to activities associated with construction of the Rabbitbrush Solar Facility. Although EMFAC predicts future diesel emissions to be reduced with cleaner engines and newer technologies, it should be noted that this analysis does not take into account any future improvement in technology or subsequent reductions in air emissions. Rabbitbrush Solar Facility decommissioning is projected to be shorter in duration than construction and take four months to complete, instead of 12-months for construction. Thus, it is conservatively assumed in this analysis that the decommissioning health risk will be equivalent to that of the construction health risk.

CARCINOGENIC RISK IMPACTS

The emission rate for DPM from the construction equipment and timeline of the Rabbitbrush Solar Facility was calculated at 0.0078 g/s; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations. This emission rate was applied in the AERMOD model and was assumed to be emitted evenly over the entire area source. The source treatment included one individual area sources of approximately 632 acres, which represents the total potential disturbed area from construction activities. This methodology essentially applies all of the DPM emissions over the Rabbitbrush Solar Facility area and provides a worst-case assessment of the impacts to sensitive receptors.

The expected DPM health risk from the AERMOD run and HARP2 RAST tool are shown below in Table 12, *Rabbitbrush Solar Facility: Construction Cancer Risk*. The highest overall annual concentration of diesel exhaust at a discrete receptor would be 0.030 $\mu g/m^3$. The PMI would result in a risk of 5.26 in one million over the 1-year exposure period/construction period. It should be noted that the highest concentration and PMI would occur at a vacant/undeveloped area and would not occur at a sensitive receptor. At the MEIR (Sensitive receptor 19), the carcinogenic risk would be 2.88 in one million, which would not exceed the threshold of 10 in one million. Therefore, carcinogenic exposures from the construction of the Rabbitbrush Solar Facility is calculated to be within acceptable limits and would not exceed EKAPCD or OEHHA thresholds.

Table 12
Rabbitbrush Solar Facility: Construction Cancer Risk

Notes:
1. Refer to Table 4 for locations of the individual receptors.
2. Receptor #13 would be acquired as part of the proposed Project and therefore is not evaluated in this Health Risk Assessment. Receptor #13 is included in Table 4 for informational purposes only.
3. The highest overall concentrations would not occur at a discrete receptor (i.e., existing sensitive receptor), but would be located at a Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 376835.9, 3859920.15). The PMI risk is provided for informational purposes as sensitive receptors do not currently exist at this location.

Source: Refer to Appendix A, *Health Risk Assessment Data*.

NON-CARCINOGENIC HAZARDS

The non-carcinogenic chronic and acute hazard impacts associated with construction and decommissioning activities of the Rabbitbrush Solar Facility are evaluated and listed in Table 13, *Rabbitbrush Solar Facility: Construction Chronic and Acute Hazard Risk*. Based on the model results, the MEIR would result in a maximum chronic hazard index of 0.0496 (sensitive receptor #19), and a maximum acute hazard index of 0.1235 (sensitive receptor #17), which are below the chronic and acute hazard index threshold of 1.0. At the PMI, non-cancer indices would be 0.0903 for chronic hazards and 0.170 for acute hazards. As indicated in Table 13, the non-carcinogenic

chronic and acute hazard threshold are below the threshold of 1.0. Therefore, non-carcinogenic hazards impacts are calculated to be within acceptable limits.

CONCLUSION

Based upon the results of the HRA analysis, the DPM emissions from the construction of the Rabbitbrush Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year construction period. As decommissioning is conservatively assumed to have the same impacts as the construction of the Rabbitbrush Solar Facility, the DPM emissions from the decommissioning of the Rabbitbrush Solar Facility would be below the Cancer Risk Threshold of 10 in one million during the 1-year decommissioning period. Additionally, the DPM emissions from the construction and decommissioning of the Rabbitbrush Solar Facility would not exceed the Chronic and Acute Hazard Index Threshold of 1.0. Therefore, construction and decommissioning of the Rabbitbrush Solar Facility would not result in a health risk related impact.

RECOMMENDED MITIGATION MEASURES:

No mitigation measures are recommended.

5.4 AVEP SOLAR PROJECT (THREE COMBINED FACILITIES)

CONSTRUCTION

The Project construction would result in the development of the three individual Facilities simultaneously, which would generate short-term air quality impacts during construction. Project construction would include 1,300 cubic yards of cut and fill. Project construction activities would involve the following phases: move-on, substation construction, gen-tie line installation, site preparation and grading, underground work, system installation, and cleanup/ testing/restoration. Construction activities, duration, and equipment's are listed in Table 14, *Project: Construction Duration, and Equipment by Activity*. The Project's construction equipment and the water and hauling trucks DPM emissions utilized within AERMOD was derived from the three individual Solar Facilities and their spreadsheet from the Project applicant. Variables factored into estimating the total Project construction emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, length and location of hauling and water truck access roads, average daily hauling and water truck trips, and the amount of materials to be transported on- or off-site; refer to Appendix A, *Health Risk Assessment Data*, for all assumptions and calculations.

OPERATION AND MAINTENANCE

The Project may have up to three Backup Generators, one for each separate Facility. These emergency Backup Generators would follow compliance with EKAPCD and CARB rules and regulations. The anticipated emissions from this generator would be nominal and would disperse quickly from the Project. Thus, as these Backup Generators would be approved and permitted with EKAPCD and would follow strict compliance with EKAPCD and CARB rules and regulations, the operational DPM emissions from these Backup Generators were not calculated in the HRA.

DECOMMISSIONING

At such time as the Project is decommissioned, equipment operation and site restoration activities would result in impacts to air quality. Given the assumption that much of the construction equipment necessary to construct the Project would also be required to decommission the site, it is reasonable to assume that decommissioning activities would be similar in nature to activities associated with construction of the Project. Although EMFAC predicts future diesel emissions to be reduced with cleaner engines and newer technologies, it should be noted that this analysis does not take into account any future improvement in technology or subsequent reductions in air emissions. Project decommissioning is projected to be shorter in duration than construction and take four months to complete, instead of 12-months for construction. It is conservatively assumed in this analysis that the decommissioning health risk will be equivalent to that of the construction health risk.

CARCINOGENIC RISK IMPACTS

The emission rate for DPM from the construction equipment and timeline of the Chaparral Solar Facility, Rabbitbrush Solar Facility, and Tumbleweed Solar Facility were all modeled cumulatively. These emission rates were applied in the model and was assumed to be emitted evenly over their own entire area source. The source treatment included three individual area sources of approximately 2,117 acres, which represents the total potential disturbed area from the construction activities of the Project. Further, the Project's water and hauling truck trips were modeled along West Rosamond Boulevard and West Avenue A. This methodology essentially applies all of the DPM emissions over the entire Project area, including the main paved off-site access roads, and provides a worst-case assessment of the impacts to sensitive receptors.

The expected diesel construction emission concentrations from AERMOD are depicted below in Table 15, *Project: Construction Cancer Risk*. The highest overall annual concentration of diesel exhaust would be 0.045 $\mu g/m^3$, which conservatively assumes construction occurring at all three solar facilities simultaneously. The highest concentration would result in a risk of 8.00 in one million over the 1-year exposure period/construction period. It should be noted that the highest concentration would occur at a vacant/undeveloped area and would not occur at a sensitive receptor. At the MEIR, sensitive receptor #1, the carcinogenic risk would be 6.00 in one million, which would not exceed the threshold of 10 in one million.

Table 15

NON-CARCINOGENIC HAZARDS

The non-carcinogenic chronic and acute hazard impacts associated with construction activities are evaluated and depicted in Table 16, *Project: Construction Chronic and Acute Hazard Risk*. Based on the model results, the MEIR would result in a maximum chronic hazard index of 0.1032 (sensitive receptor #1) and a maximum acute hazard index of 0.1642 (sensitive receptor #17), which are below the chronic and acute hazard index threshold of 1.0. At the PMI, non-cancer indices would be 0.1375 for chronic hazards and 0.2229 for acute hazards. As indicated in Table 16, the non-carcinogenic chronic and acute hazard threshold are below the threshold of 1.0. Therefore, non-carcinogenic hazards impacts are calculated to be within acceptable limits.

PROJECT CONCLUSION

Based upon the results of the HRA analysis, the DPM emissions from the construction of the Project would be below the Cancer Risk Threshold of 10 in one million during the 1-year construction period. It should be noted that the emission concentrations and following cancer risk modeled within this HRA is considered conservative and is not a specific prediction of the actual concentrations that would occur at any one point over the course of the construction period. Actual 1-hour and annual average concentrations are dependent on many variables, particularly the number and type of equipment working at specific distances during time periods of adverse meteorology. In reality, construction activities would be dispersed throughout the 2,117-acre Project site and would not be concentrated near sensitive receptors for substantial durations of time. Further, PM_{10} exhaust emissions associated with the Project's hauling and water truck trips was modeled for the cumulative Project scenario (all three solar facilities built concurrently) to represent the worst-case exhaust emissions scenario. Additionally, actual construction of the Project and subsequent individual solar facilities is expected to be phased and is not anticipated to occur all at once during a one-year period. Decommissioning is conservatively assumed to have the same impacts as the construction of the Project. As such the DPM emissions from the decommissioning of the Project would be below the Cancer Risk Threshold of 10 in one million during the 1-year decommissioning period. Additionally, the DPM emissions from the construction and decommissioning of the Project would not exceed the Chronic and Acute Hazard Index Threshold of 1.0. Therefore, construction and decommissioning of the Project would not result in a health risk related impact.

RECOMMENDED MITIGATION MEASURES:

No mitigation measures are recommended.

Notes:
1. Refer to Table 4 for locations of the individual receptors.
2. The REL for acrolein was used as diesel exhaust does not have an acute effect (only has a carcinogenic and chronic effect).
3. Receptor #13 would be acquired as part of the proposed Project and therefore is not evaluated in this Health Risk Assessment. Receptor #13 is included in Table 4 for informational purposes only.
4. The highest overall concentrations would not occur at a discrete receptor (i.e., existing sensitive receptor), but would be located at a Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 380135.85, 3859420.15) for Chronic Hazard and at Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 378935.85, 3861120.15) for Acute Hazard. The PMI is provided for informational purposes as sensitive receptors do not currently exist at this location.

ADDENDUM A
HRA Report Update for AVEP Solar Project Revisions

Michael Baker INTERNATIONAL

We Make a Difference

MEMORANDUM

To: Beth Hoffman, First Solar

From: Eddie Torres, Michael Baker International
Zhe Chen, Michael Baker International

Date: August 25, 2020

Subject: Health Risk Assessment Report Update for AVEP Solar Project Revisions

---

INTRODUCTION

Michael Baker International prepared the Health Risk Assessment (HRA) Report for the AVEP Solar Project (Project) dated January 15, 2020 (Report). Since preparing the Report, the Project has undergone modifications. The components of these modifications consist of (1) the removal of the approximately 721-acre Tumbleweed Solar Facility from the Project; and (2) increasing the Chaparral Solar Facility from 764 acres to 774 acres to include an optional location for the proposed energy storage system (ESS), through the addition of an approximately 10-acre parcel to the Chaparral Solar Facility site.

The added Chaparral Solar Facility 10-acre parcel is located at the northwest corner of Holiday Avenue and 110th Street West, directly across Holiday Avenue from the existing Willow Springs Solar Project Substation. The proposed capacity of the ESS on both the Rabbitbrush and Chaparral Solar Facilities has been doubled, to store up to 1,000 megawatt-hours (MWh) of energy on each facility (for a combined project total of up to 2,000 MWh), however, the proposed acreage of each ESS would remain at approximately five acres of land within each facility site. As shown on Figure 2b, a portion of the remainder of the 10-acre parcel added to the Chaparral Solar Facility for the ESS would be occupied by access easements for electric collection and temporary water lines. Figure 1 (Project Map) and Figure 2a (Chaparral Solar Site Plan) are also attached.

This memorandum updates the technical analysis and the evaluation of the potential health risk impacts of the Project as presented in the Report. In summary, the Project modifications would not result in any new or more severe significant effects to health risk as previously analyzed and presented in the Report.

MODIFIED PROJECT DESCRIPTION

As proposed, the Project would construct, operate, and eventually decommission two solar photovoltaic (PV) power generating facilities that would be capable of delivering a total of approximately 250 megawatts of alternating current (MW-ac) electricity, along with associated facilities including ESS units. The

5 Hutton Centre Drive, Suite 500, Santa Ana, CA 92707
Office: 949.472.3505 | Fax: 949.472.8373
MBAKERINTL.COM

Project consists of two non-contiguous solar generating facilities, the Rabbitbrush Solar Facility (125 MW-ac) and Chaparral Solar Facility (125 MW-ac) and ESS to store up to 1,000 megawatt-hours (MWh) for each facility, for a total of up to 2,000 MWh).

MODIFICATIONS TO THE ANALYSIS

Potential environmental effects resulting from Project modifications, as compared to the Project scenario analyzed in the Report, are presented below. Implementing the Project modifications would not result in any new or more severe environmental impacts than identified in the Report. The modifications would not affect the significance conclusions presented in the Report. No mitigation measures were recommended in the Report and the modifications would not require the addition of any mitigation measures.

To reach these conclusions, this memorandum analyzes the individual effect that removing the Tumbleweed Solar Facility and the addition of an optional location for ESS at the Chaparral Solar Facility would have on health risk impacts. The memorandum then analyzes the combined effect of the two actions on health risk impacts. As discussed in the Report, operation and maintenance of the Project would only cause potential health risk impacts from backup generators. Since the Project modifications do not increase the number or use of backup generators (which provide emergency onsite backup power during project operations, as opposed to ESS facilities which provide power to the electrical grid), health risk impacts from Project operation and maintenance would be consistent with the background technical report. In addition, the Report conservatively assumed that the decommissioning health risk would be equivalent to that of the construction health risk. Therefore, the following analysis only discusses health risk impacts from Project construction and decommissioning is still assumed to be equivalent to construction. The modeling results from the Report were utilized to estimate the changes in health risk levels from Project modifications.

Removing the Tumbleweed Solar Facility

The impact on health risk due to the removal of the Tumbleweed Solar Facility was analyzed. The originally planned construction activities for the Tumbleweed Solar Facility would no longer occur with this modification, and thus no diesel particulate matter (DPM) emissions would be generated. As such, no health risk impacts would occur at any of the modeled receptor locations as a result of the originally planned Tumbleweed Solar Facility construction activities. Table 1, *Health Risk Levels from Tumbleweed Solar Facility (To be Removed from Overall Project Risk Levels)* summarizes health risk levels from Tumbleweed Solar Facility; these levels would be removed with the Project modification. Under the cumulative Project scenario (all three solar facilities built concurrently), the health risk levels at all modeled receptor locations would be reduced and the impacts would remain less than significant. Therefore, the modification would reduce the health risk impacts of the Project when compared to the Project analyzed in the Report.

Notes:
PMI = point of maximum impact
1. Refer to Health Risk Assessment Report (dated January 15, 2020), for assumptions and calculations and locations of the individual receptors.
2. Receptor #13 would be acquired as part of the proposed Project and therefore was not evaluated. Receptor #13 is included for informational purposes only.
3. The highest overall concentrations would not occur at a discrete receptor (i.e., existing sensitive receptor), but would be located at the Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 380135.85, 3859420.15) for Cancer Risk, at the Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 380135.85, 3859420.15) for Chronic Hazard, and at the Cartesian grid receptor location (UTM NAD83 Zone 11N coordinate location 378835.85, 3861120.15) for Acute Hazard. The PMI risk is provided for informational purposes as sensitive receptors do not currently exist at this location.

Addition of an optional location for the ESS for the Chaparral Solar Facility

The impact on health risk due to the addition of an optional location for the ESS at the Chaparral Solar Facility was analyzed. This modification includes adding a 10-acre parcel to the Chaparral Solar Facility at

a location at the northwest corner of Holiday Avenue and 110th Street West, directly across Holiday Avenue from the existing Willow Springs Solar Project Substation. With this modification, the Chaparral Solar ESS would have two potential location options, and the ultimate location would be dependent on final design. A conservative assumption was made in this analysis that both optional ESS sites would be disturbed/graded. The assumption of a 1.3% of emissions increase was used as the 10-acre parcel is equivalent to approximately 1.3 percent of the originally plan area (764-acre) of the Chaparral Solar Facility. As discussed below, HRA modeling uses emissions divided by area as an input, and as both emission and area increase by the same level for this conservative approach, the findings of the HRA modeling do not change.

Based on this conservative analysis of both optional sites being disturbed or graded, the addition of a 10-acre parcel would potentially increase the construction activities for the Chaparral Solar Facility and the associated DPM emissions. However, the construction site was modeled in the Report as a polygon area source and the modeled DPM emission rate (grams per second per square meter) was calculated from DPM emissions (grams per second) divided by the modeled area (square meter). As a result, the previously modeled DPM emission rate would not be affected by the addition of a 10-acre parcel as both the DPM emissions and the modeled area would increase by the same level. In addition, the potential relocation of the ESS facility would move a small portion of the construction area farther away from some sensitive receptor locations, especially Receptors 1 through 12 (as referenced in Table 4 of the Report) which were evaluated to be subject to the highest levels of health risk during the construction of the Chaparral Solar Facility. As a result, the DPM concentration would be slightly lower at these sensitive receptors, and the associated health risk levels would also be slightly lower. Even though the relocated ESS facility would be closer to Receptors 31 through 35, these sensitive receptors were evaluated to be subject to low levels of health risk (less than 1 in one million cancer risk, less than 0.01 chronic hazard, and less than 0.1 acute hazard; refer to Table 6 and Table 7 of the Report) during the construction of Chaparral Solar Facility, and the slight increase of DPM concentration would not cause an exceedance of the cancer risk threshold or the non-cancer hazard threshold.

As such, the modification of adding an optional location for the ESS for the Chaparral Solar Facility by adding a 10-acre parcel to the Chaparral Solar Facility would not result in any new significant health risk impacts or a significant increase in the severity of environmental impacts that were previously analyzed in the Report. Therefore, the modification would not affect the environmental impacts analysis or significance conclusions of the Report and no mitigation measures are required.

Combined Effect of Both Project Modifications

Finally, the combined effect on health risk due to removing the Tumbleweed Solar Facility and the addition of an optional location for the ESS for the Chaparral Solar Facility was analyzed. Even though the removal of Tumbleweed Solar Facility would significantly reduce material hauling and water truck trips and the addition of an optional location for the ESS for the Chaparral Solar Facility would slightly increase material hauling and water truck trips during construction, as a conservative analysis, it was assumed that the total number of material hauling and water truck trips during Project construction would not change due to the Project modifications. As discussed above, the effect of the addition of an optional location for the ESS for the Chaparral Solar Facility to health risk levels would be nominal, and therefore by continuing to account for the material hauling and water truck trips required for the Tumbleweed Solar Facility, the nominal effect would be compensated. Table 2, *Project Construction Health Risk Levels with Modifications Removal of Tumbleweed and addition of Chaparral 10-acre parcel)* summarizes health risk levels with Project modifications.

As shown in Table 2, the cancer risk, chronic hazard, and acute hazard at all modeled receptor locations under the cumulative Project scenario would not exceed the cancer risk threshold or the non-cancer hazard threshold, and consistent with the Report, no mitigation measures are recommended. The impacts significance determination with modifications considered together would remain the same as in the Report and would not result in any new or more severe significant effects compared to the effects previously identified in the Report. Therefore, there is no need to change the significance conclusions of the Report or to evaluate new mitigation measures.

35	0.23	10	No	0.0038	0.0001	1	No
PMI[3]	-	10	-	-	-	1	-

Notes:
PMI = point of maximum impact
1. Refer to Health Risk Assessment Report (dated January 15, 2020), for assumptions and calculations and locations of the individual receptors.
2. Receptor #13 would be acquired as part of the proposed Project and therefore was not evaluated. Receptor #13 is included for informational purposes only.
3. With Project modifications, the highest overall concentrations would not occur at the same receptor locations as presented in the Health Risk Assessment Report (dated January 15, 2020). Therefore, the PMI risk is not provided in the table.

CONCLUSION

When considered both individually and together, the modifications to the Project would not result in any new or more severe significant effects to health risk. Accordingly, the Report's previous analysis and conclusions regarding impacts and recommended mitigation measures would not change.

- APPROVED 230kV GEN-TIE (BY OTHERS)
- OTHER EASEMENTS/RIGHTS-OF-WAY
- EXISTING PUBLIC ACCESS EASEMENT TO BE VACATED AND/OR FUTURE ROAD RESERVATION TO BE REMOVED
- EXISTING PARCEL LINE
- OH — EXISTING TRANSMISSION LINE

NOTES

1. NOT FOR CONSTRUCTION.
2. ARRAY, COLLECTION LINE, ENERGY STORAGE, SUBSTATION AND GEN-TIE LINE CONFIGURATION SUBJECT TO CHANGE DURING DETAIL DESIGN.
3. EXACT FENCE ALIGNMENT TO BE DETERMINED DURING DETAIL DESIGN.
4. FENCE LINE TO BE 55 FEET MINIMUM FROM SECTION LINE AND OUTSIDE OF KERN COUNTY RIGHT-OF-WAY.
5. CONSTRUCTION STAGING AREA SHOWN CONCEPTUALLY AND MAY CHANGE.
6. POTENTIAL WATER SOURCE IS TO USE AN EXISTING WELL ON SITE OR DRILL A NEW ONE (LOCATION TO BE DETERMINED). TEMPORARY WATER STORAGE (LOCATION TO BE DETERMINED).
7. AN EASEMENT RESERVED UNTO CHARLES T. WILLMARTH FOR ROAD AND UTILITY PURPOSES PER BK. 3451, PG. 306 O.R., IS PROPOSED TO BE VACATED.
8. A PRIVATE ACCESS EASEMENT PER DOC. #210048515 O.R., IS PROPOSED TO BE VACATED.

THIS PRINT IS NOT TO BE USED FOR CONSTRUCTION UNLESS NOTED AND SIGNED OK FOR CONSTRUCTION ABOVE LAST REVISION.

AVEP Project Hauling and Water Trucks

Emissions Calculations

AVEP Truck Movement	Emission Factor PM10 (g/mi)[1]	Average Daily Truck Trips(roundtrip)[2]	length of Line Volume Source (m)	length (mi)	g/day	g/sec
Trucks - West Rosamond Boulevard[3]	0.04	92	10270.5	6.38	2.35E+01	2.72E-04
Trucks - West Avenue A[4]	0.04	42	10263.9	6.38	1.07E+01	1.24E-04

Sources:

1. Emission Factor from the EMFAC2017 Run for EKAPCD; refer to Construction Emissions Spreadsheet within AQGHG Study.
2. Average Daily truck trips were calculated from the AVEP AQGHGConstruction Emission Spreadsheets. This calculation looked at the total number of trips and divided it by the number of working days (255) for each solar facility.
3. West Rosamond Boulevard would be the hauling road for the Chaparral and Rabbitbrush Solar Facilities.
4. West Avenue A would be the hauling road for the Tumbleweed Solar Facility.

- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
```

**Other Options Specified:
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 2 Short Term Average(s) of: 1-HR 24-HR
and Calculates ANNUAL Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and 10469 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 14134

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 712.60 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 4.9 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: AVEP_Chaparral.err
**File for Summary of Results: AVEP_Chaparral.sum

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
```

**Other Options Specified:
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 2 Short Term Average(s) of: 1-HR 24-HR
and Calculates ANNUAL Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and 10469 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 14134

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 712.60 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 4.9 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: AVEP_Rabbitbrush.err
**File for Summary of Results: AVEP_Rabbitbrush.sum
