NOTICE OF PREPARATION

DRAFT ENVIRONMENTAL IMPACT REPORT

Date: September 30, 2019

To: State Clearinghouse
Governor's Office of Planning and Research
Alameda County Clerk
Responsible and Trustee Agencies
Interested Individuals and Organizations

From: Chris Stevens
Chief Facilities Operations Officer
Dublin Unified School District
7471 Larkdale Avenue
Dublin, CA 94568
stevenschris@dublinusd.org

The Dublin Unified School District (District) will be the Lead Agency and will prepare an Environmental Impact Report (EIR) for the Promenade High School Project (proposed project). The District is requesting written comments from responsible Trustee agencies regarding the scope and content of the environmental document. The public is also invited to submit written comments regarding the scope of the EIR and issues that should be addressed as the document is prepared.

A Scoping Meeting will be held on Thursday, October 10th at 6:00 p.m. at Fallon Middle School, located at 3601 Kohnen Way in the City of Dublin.

Additionally, the District is accepting written responses within the California Environmental Quality Act (CEQA)-mandated 30-day comment period that begins on October 1, 2019 and ends **no later than 5:00 p.m. on October 30, 2019.** Public agencies should indicate a contact person in their response to this Notice of Preparation.

Responses should be directed to: Chris Stevens, Chief Facilities Operations Officer, Dublin Unified School District, 7471 Larkdale Avenue, Dublin, CA 94568; dusdceqa@dublinusd.org.

Project Location: The proposed school site is a 23.46-acre vacant property located at the southeast corner of Central Parkway and Chancery Lane in the City of Dublin, Alameda County, California (Assessor's Parcel Numbers [APNs] 985-78-2, -3, -4, -5, -6 and -7). The site also includes the areas that make up 0.71 acres of the total 23.46 acres and are identified as part of South Grafton Street and East Finnian Way on Assessor's Map 985 in between APNs 985-78-5, -6. And -7. The City of Dublin is surrounded by San Ramon and unincorporated Contra Costa County to the north, unincorporated Alameda County to the east and west, and Pleasanton and Livermore to the south and southeast, respectively. Figure 1, Project Site Location, and Figure 2, Project Site Plan, show the proposed project site in its surrounding and local contexts. Pursuant to the City of Dublin General Plan, the project site is designated Public/Semi-Public and Parks/Public Recreation on the west side and Neighborhood Commercial on the central and eastern portion. According to the official zoning map for the City of Dublin, the site is zoned Planned Development (PD). The project site is surrounded primarily by Medium/High-Density Residential and High-Density Residential land uses.

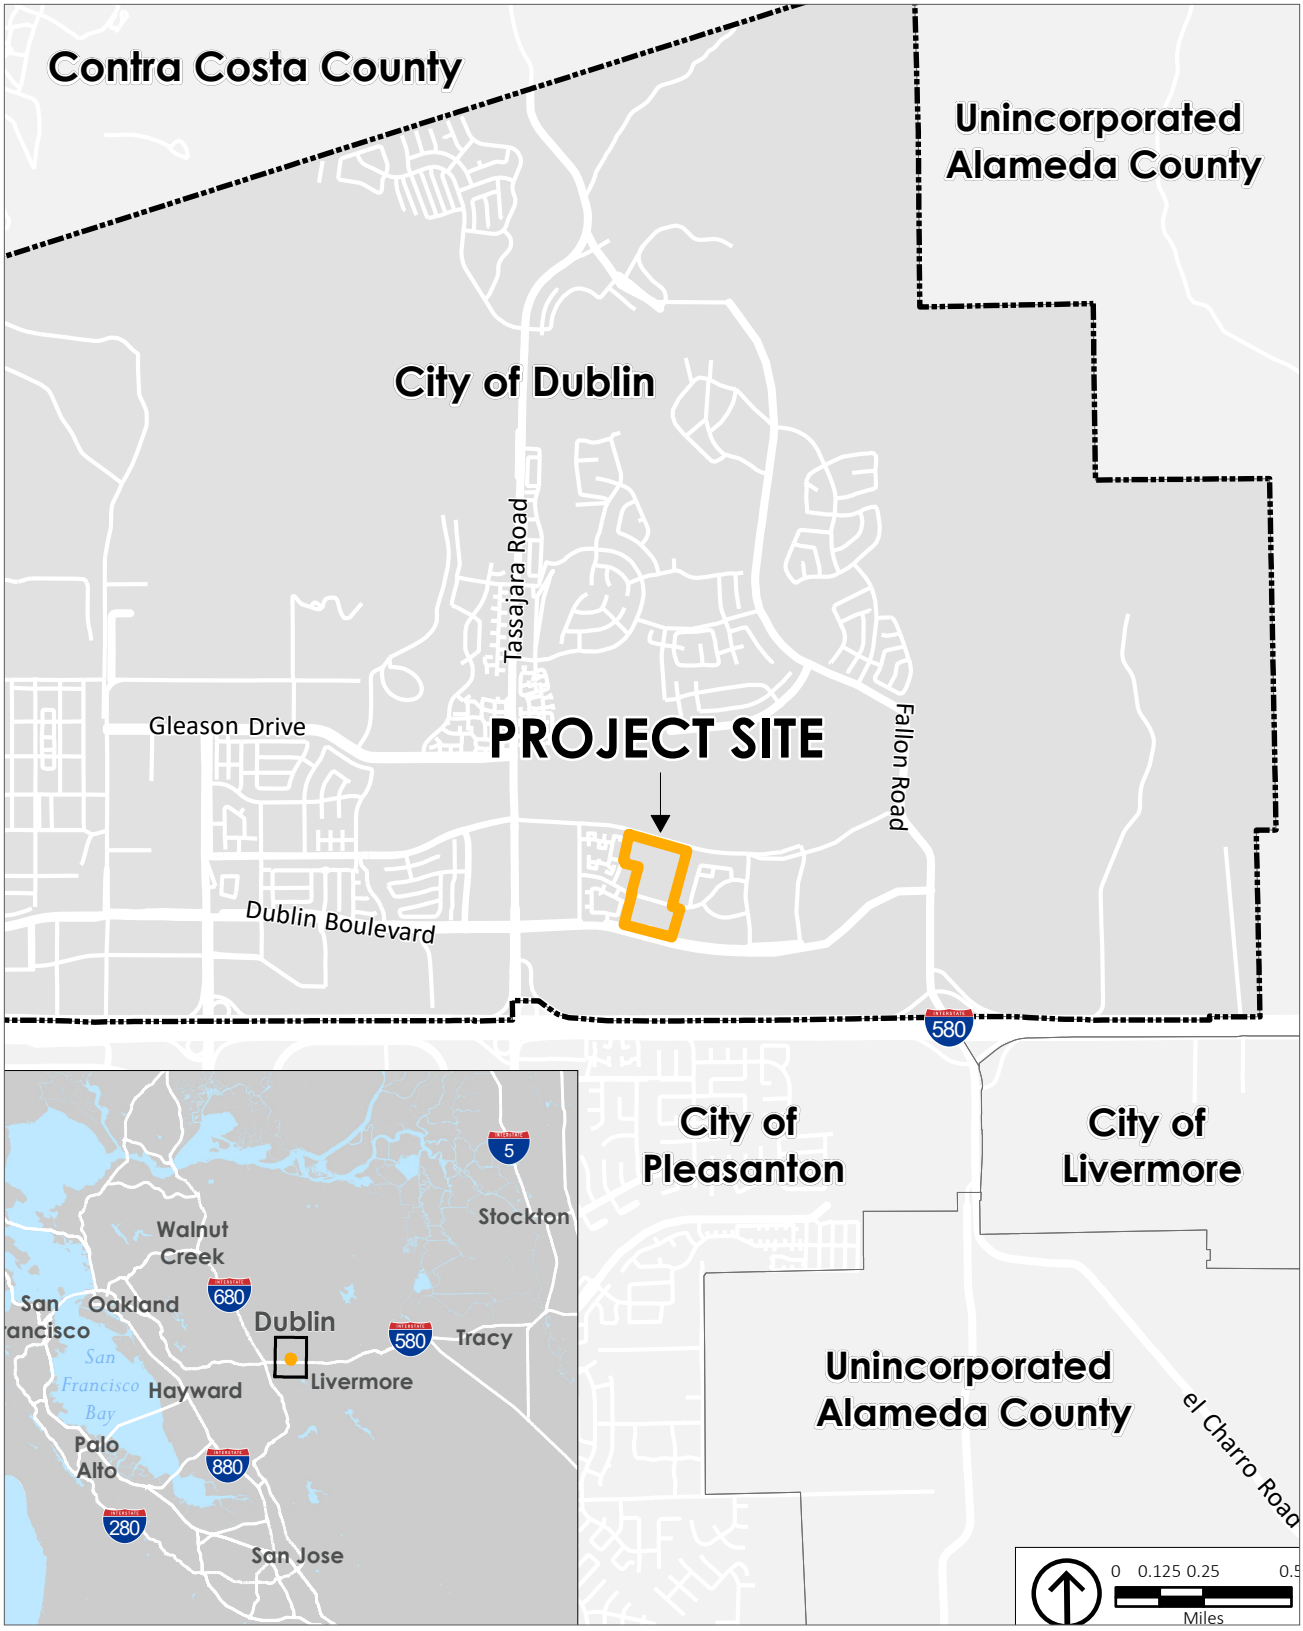
Board of Trustees
Amy Miller, President
Megan Rouse, Vice President
Dan Cherrier
Gabrielle Blackman

Superintendent
Dave Marken, Ph.D.
markendave@dublinusd.org

Project Background Information: The need for the proposed project is based on population growth and increased residential and commercial development in the City of Dublin, which has caused the District's school facilities to approach capacity. The District currently educates over 12,592 transitional-kindergarten/kindergarten through 12th grade students in its 12 schools; approximately 3,291 of these are at the high school level. Dublin High School, the only comprehensive high school that the District operates, has current capacity for 2,481 students. Thus, as of fall of 2018, Dublin High School's student enrollment exceeds capacity of the existing facility. The District, through a Draft Facilities Master Plan prepared in 2016, identified the need for construction of new schools and the modernization and improvement of existing schools, including the construction of a new comprehensive high school.

According to the 2019 School Facilities Needs Analysis prepared on behalf of the District, the District will experience an increase in student enrollment of approximately 554 students from new development that is planned within the District, including 98 at the high school level, over the next five years. A demographics study prepared by Davis Demographics on behalf of the District projects that the District will experience an increase of approximately 1,298 students overall at the high school level from fall of 2018 to the fall of 2025. Thus, according to the Davis Demographics study, Dublin High School will have a deficit of capacity of well over 1,000 students by 2025, and construction of new facilities must occur to relieve this current and projected deficiency.

Project Description: The proposed project consists of the development, construction, operation, and maintenance of a District high school and related educational purposes, including all uses necessary, incidental, or convenient thereto. The new high school is planned to ultimately accommodate approximately 2,500 students and will be built in two phases (Phase I and Phase II).

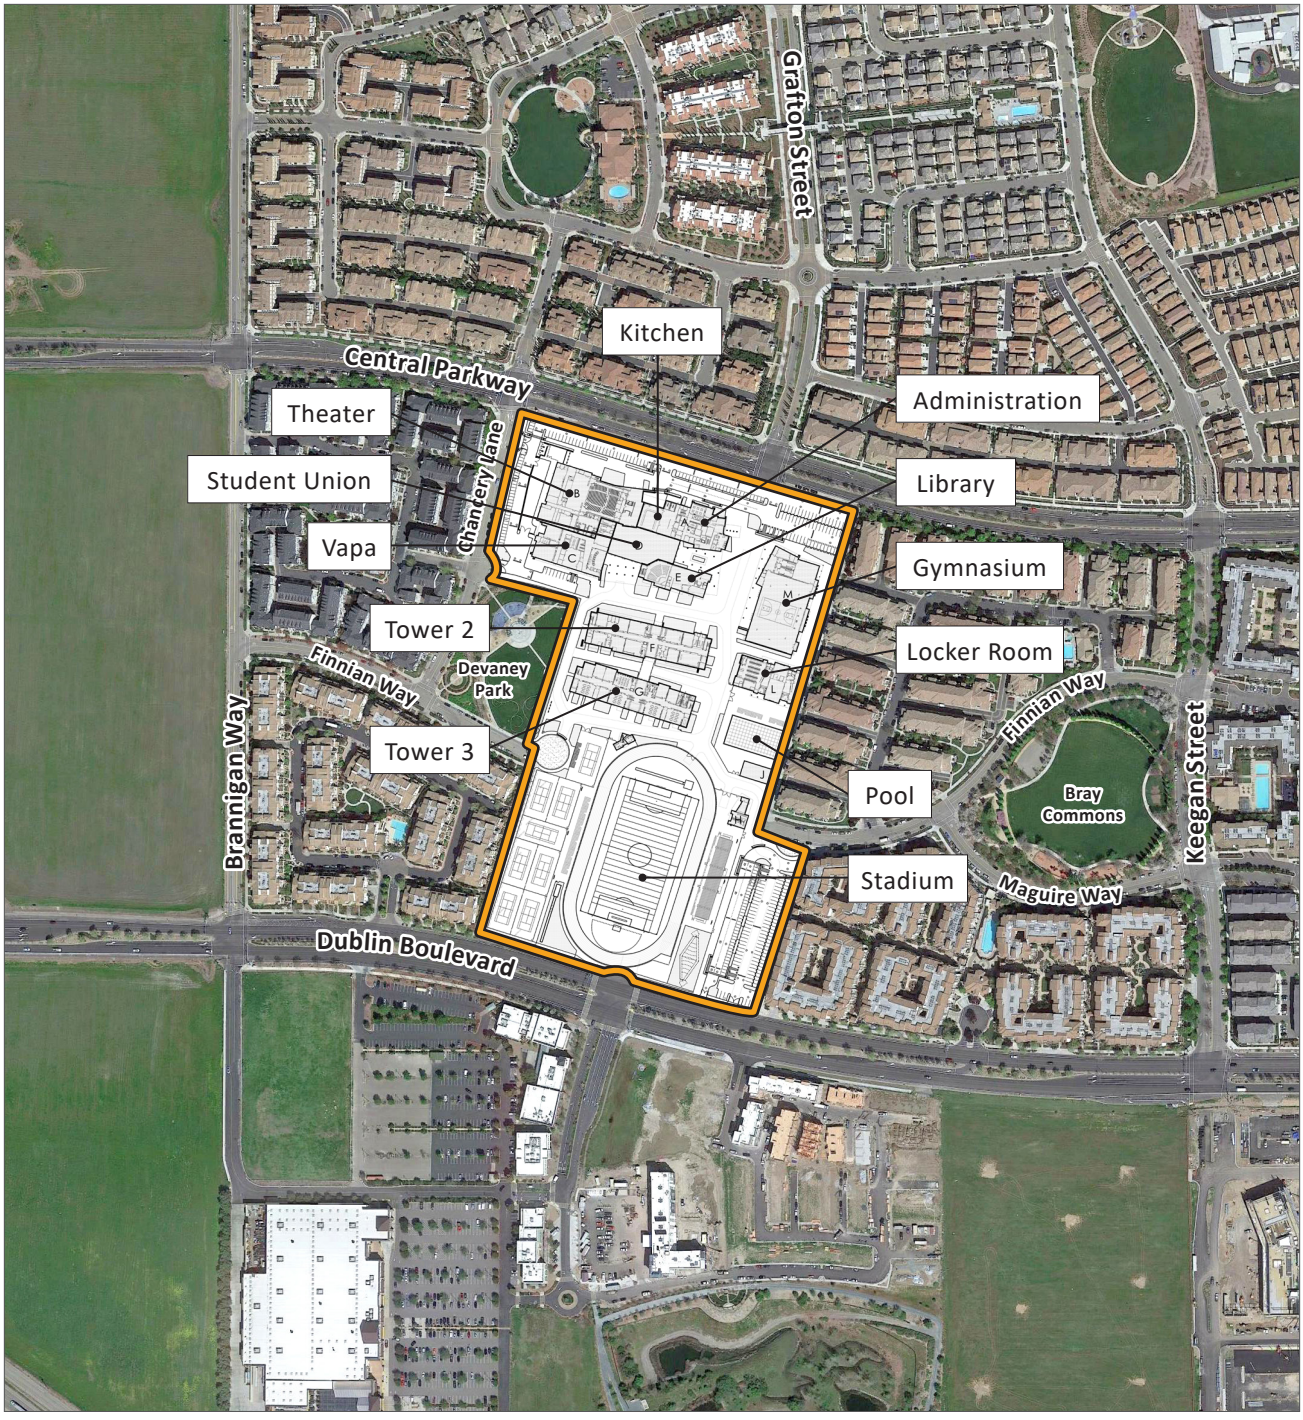


Phase I will accommodate 1,308 students, and will consist of the construction of a 22,330 square foot (sf) administration building, a 13,200 sf student union, a 6,500 sf kitchen, a 20,900 sf library, a 31,000 sf gymnasium, a 17,500 sf locker room, a 70,500 sf academy, 17,059 sf of Visual and Performing Arts Guidance (VAPA) classrooms, an all-weather track with drainage, a synthetic field with drainage, four overhead field lights, eight tennis courts, and a 134 stall parking garage.

Phase II will accommodate the remaining 1,237 students, and will consist of a second 70,500 sf academy, a 26,490 sf theatre, an orchestra pit, 5,060 sf of VAPA classrooms, a 7,815 sf basement, 4,500 sf of concessions, an aquatic complex, a 400 sf pressbox, and 4,000 sf of bleachers.

Construction of the proposed project would occur on a total of approximately 24 acres.

Potential Environmental Effects: The EIR will evaluate the project for potential impacts on the environment and determine the potential environmental consequences of future change. The proposed project could potentially affect the following environmental factors, each of which will be addressed in the EIR: Aesthetics; Air Quality and Greenhouse Gas Emissions; Biological Resources; Cultural Resources; Geology and Soils; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Noise; Population and Housing; Public Services; Transportation and Circulation; Tribal Cultural Resources; Energy; Recreation; Utilities and Service Systems; and Wildfire.



Environmental Effects Not Likely to Require Further Analysis: The proposed project is not anticipated to result in significant environmental effects in the following areas: Agricultural Resources; or Mineral Resources, and these topics are not anticipated to be analyzed in the EIR.

SUBJECT: Response to the Notice of Preparation of a Draft Environmental Impact Report for the Promenade High School Project in Dublin

Dear Mr. Stevens,

Thank you for the opportunity to comment on the Notice of Preparation (NOP) of the Draft Environmental Impact Report (DEIR) for the Promenade High School Project in Dublin. The proposed project would construct a new high school, on the currently vacant 23.5-acre site, with capacity for approximately 2,500 students and is split into two phases of construction. Phase 1 includes just under 199,000 square-feet of academic and administrative support facilities as well as a 134-space parking garage. In Phase 2 the proposed project would construct another 325,000 square feet of academic and performance art facilities. The project site is located at the southeast corner of Central Parkway and Chancery Lane, in the City of Dublin. The project site is designated as Public/Semi-Public and Park/Public Recreation on the west side and Neighborhood Commercial on the central and eastern portion under the City of Dublin's General Plan and zoned as Planned Development.

The Alameda County Transportation Commission (Alameda CTC) respectfully submits the following comments:

Basis for Congestion Management Program (CMP) Review

- It appears that the proposed project may generate at least 100 p.m. peak-hour trips over existing conditions, and therefore the CMP Land Use Analysis Program requires the City to conduct a transportation impact analysis of the project. For information on the CMP, please visit: https://www.alamedactc.org/planning/congestion-management-program/.

Use of Countywide Travel Demand Model

- The Alameda Countywide Travel Demand Model should be used for CMP Land Use Analysis purposes. The CMP requires local jurisdictions to conduct travel model runs themselves or through a consultant. The City of Dublin and the Alameda CTC signed a Countywide Model Agreement on July 17, 2008. Before the model can be used for this project, a letter must be submitted to the Alameda CTC requesting use of the model and describing the project. A copy of a sample letter agreement is available upon request. The most current version of the Alameda CTC Countywide Travel Demand Model was updated in June 2018 to be consistent with the assumptions of Plan Bay Area 2040.

Impacts

- The DEIR should address all potential impacts of the project on the Metropolitan Transportation System (MTS) roadway network.
  - MTS roadway facilities in the project area include
    - In the city of Dublin: Dublin Boulevard, Tassajara Road, I-580, I-680, Fallon Road
    - In the city of Pleasanton: I-680, Santa Rita Road
  - For the purposes of CMP Land Use Analysis, the Highway Capacity Manual 2010 freeway and urban streets methodologies are the preferred methodologies to study vehicle delay impacts.
  - The Alameda CTC has *not* adopted any policy for determining a threshold of significance for Level of Service for the Land Use Analysis Program of the CMP. Professional judgment should be applied to determine the significance of project impacts (Please see Chapter 6 of the 2019 CMP for more information).

- The DEIR should address potential impacts, including both capacity and performance of the project on Metropolitan Transportation System (MTS) transit operators.
  - MTS transit operators potentially affected by the project include: BART and LAVTA (Wheels)
  - Transit impacts for consideration include the effects of project vehicle traffic on mixed flow transit operations, transit capacity, transit access/egress, need for future transit service, and consistency with adopted plans. See Appendix J of the 2019 CMP document for more details.

- The DEIR should address potential impacts of the project to people biking and walking in and near the Promenade High School Project area, especially nearby roads included in the Countywide High-injury Network and major barriers identified in the Countywide Active Transportation Plan.
  - Impacts to consider on conditions for cyclists include effects of vehicle traffic on cyclist safety and performance, site development and roadway improvements, and consistency with adopted plans. See Appendix J of the 2019 CMP document for more details.

Mitigation Measures

- Alameda CTC's policy regarding mitigation measures is that to be considered adequate they must be:
  - Adequate to sustain CMP roadway and transit service standards;
  - Fully funded; and
  - Consistent with project funding priorities established in the Capital Improvement Program of the CMP, the Countywide Transportation Plan (CTP), and the Regional Transportation Plan (RTP) or the Federal Transportation Improvement Program, if the agency relies on state or federal funds programmed by Alameda CTC.

- The DEIR should discuss the adequacy of proposed mitigation measure according to the criteria above. In particular, the DEIR should detail when proposed roadway or transit route improvements are expected to be completed, how they will be funded, and the effect on service standards if only the funded portions of these mitigation measures are built prior to Project completion. The DEIR should also address the issue of transit funding as a mitigation measure in the context of the Alameda CTC mitigation measure criteria discussed above.

- Jurisdictions are encouraged to discuss multimodal tradeoffs associated with mitigation measures that involve changes in roadway geometry, intersection control, or other changes to the transportation network. This analysis should identify impacts to automobiles, transit, bicyclists, and pedestrians. The HCM 2010 MMLOS methodology is encouraged as a tool to evaluate these tradeoffs, but project sponsors may use other methodologies as appropriate for particular contexts or types of mitigations.

- The DEIR should consider the use of TDM measures, in conjunction with roadway and transit improvements, as a means of attaining acceptable levels of service. Whenever possible, mechanisms that encourage ridesharing, flextime, transit, bicycling, telecommuting and other means of reducing peak hour traffic trips should be considered. The Alameda CTC CMP Menu of TDM Measures and TDM Checklist may be useful during the review of the development proposal and analysis of TDM mitigation measures (See Appendices F and G of the 2019 CMP). The proposed project may also consider enrollment in the Alameda County Safe Routes to School Program as a TDM strategy.

Thank you for the opportunity to comment on this NOP. Please contact me at (510) 208-7426 or Chris G. Marks, Associate Transportation Planner at (510) 208-7453, if you have any questions.

Sincerely,

Saravana Suthanthira
Principal Transportation Planner

Promenade High School Project – Notice of Preparation (NOP)

Dear Chris Stevens:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Promenade High School Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the September 30, 2019 NOP.

Project Understanding

The Dublin Unified School District proposes to develop, construct, operate, and maintain a high school and related educational purposes. The new high school is planned to ultimately accommodate approximately 2,500 students and will be built in two phases. Phase I will accommodate 1,308 students, and will consist of the construction of a 22,330 square foot (sf) administration building, a 13,200 sf student union, a 6,500 sf kitchen, a 20,900 sf library, a 31,000 sf gymnasium, a 17,500 sf locker room, a 70,500 sf academy, 17,059 sf of Visual and Performing Arts Guidance (VAPA) classrooms, an all-weather track with drainage, a synthetic field with drainage, four overhead field lights, eight tennis courts, and a 134 stall parking garage.

Phase II will accommodate the remaining 1,237 students, and will consist of a second 70,500 sf academy, a 26,490 sf theatre, an orchestra pit, 5,060 sf of VAPA classrooms, a 7,815 sf basement, 4,500 sf of concessions, an aquatic complex, a 400 sf press box, and 4,000 sf of bleachers. Construction of the proposed project

would occur on a total of approximately 24 acres. Regional access is provided from the Interstate (I)-580 and Tassajara Road interchange about 0.56 mile away.

Travel Demand Analysis

Please submit a travel demand analysis that provides Vehicle Miles Traveled (VMT) analysis resulting from the proposed project. With the enactment of Senate Bill (SB) 743, Caltrans is focusing on transportation infrastructure that supports smart growth and efficient development to ensure alignment with State policies using efficient development patterns, innovative travel demand reduction strategies, multimodal improvements, and VMT as the primary transportation impact metric. Please ensure that the travel demand analysis includes:

- A vicinity map, regional location map, and site plan clearly showing project access in relation to the State Transportation Network (STN). Ingress and egress for all project components should be clearly identified. Clearly identify the State right-of-way (ROW). Project driveways, local roads and intersections, car/bike parking, and transit facilities should be mapped.

- A VMT analysis pursuant to the City of Dublin's guidelines or, if the City of Dublin has no guidelines, the Office of Planning and Research's Draft Guidelines. Projects that result in automobile VMT per capita greater than 15% below existing (i.e. baseline) city-wide or regional values for similar land use types may indicate a significant impact. If necessary, mitigation for increasing VMT should be identified. Mitigation should support the use of transit and active transportation modes. Potential mitigation measures that include the requirements of other agencies such as Caltrans are fully enforceable through permit conditions, agreements, or other legally-binding instruments under the control of the City of Dublin.

- A schematic illustration of walking, biking and auto conditions at the project site and study area roadways. Potential safety issues for all road users should be identified and fully mitigated.

- The project's primary and secondary effects on pedestrians, bicycles, travelers with disabilities and transit performance should be evaluated, including countermeasures and trade-offs resulting from mitigating VMT increases. Access to pedestrians, bicycle, and transit facilities must be maintained.

- Clarification of the intensity of events/receptions to be held at the location and how the associated travel demand and VMT will be mitigated.

Traffic Operations

Phase I and Phase II traffic impacts to the eastbound and westbound ramp intersections at both the I-580/Tassajara Rd/Santa Rita Rd and I-580/Fallon Rd/El Charro Rd interchanges should be analyzed and mitigation should be proposed as needed. Also, please identify the expected number of peak hour trips.

Multimodal Planning

The project's primary and secondary effects on pedestrians, bicyclists, travelers with disabilities, and transit users should be evaluated, including countermeasures and trade-offs resulting from mitigating VMT increases. Access for pedestrians and bicyclists to transit facilities must be maintained. Smart growth approaches are consistent with MTC's Regional Transportation Plan/SCS and should help meet Caltrans Strategic Management Plan targets.

Vehicle Trip Reduction

From Caltrans' *Smart Mobility 2010: A Call to Action for the New Decade*, the project site is identified as **Place Type 4d: Suburban Communities (Neighborhoods)** where location efficiency factors, such as community design, are relatively weak and regional accessibility varies. Given the place, type and size of the project, it should include a robust Transportation Demand Management (TDM) Program to reduce VMT and greenhouse gas emissions. Such measures are critical to facilitating efficient site access. The measures listed below can promote smart mobility and reduce regional VMT.

- Project design to encourage walking, bicycling and transit access;
- Transit and trip planning resources such as a commute information kiosk;
- Real-time transit information system;
- Transit subsidies on an ongoing basis;
- Ten percent vehicle parking reductions;
- Charging stations and designated parking spaces for electric vehicles;
- Carpool and clean-fuel parking spaces;
- Designated parking spaces for a car share program;
- Unbundled parking;
- Showers, changing rooms and clothing lockers for employees that commute via active transportation;
- Emergency Ride Home program;
- Employee transportation coordinator;

- Secured bicycle storage facilities;
- Fix-it bicycle repair station(s);
- Bicycle route mapping resources;
- Participation/Formation in/of a Transportation Management Association (TMA) in partnership with other developments in the area; and
- Aggressive trip reduction targets with Lead Agency monitoring and enforcement.

Transportation Demand Management programs should be documented with annual monitoring reports by an onsite TDM coordinator to demonstrate effectiveness. If the project does not achieve the VMT reduction goals, the reports should also include next steps to take in order to achieve those targets. Also, reducing parking supply can encourage active forms of transportation, reduce regional VMT, and lessen future transportation impacts on State facilities. These smart growth approaches are consistent with the MTC's Regional Transportation Plan/SCS goals and would help meet Caltrans Strategic Management Plan sustainability goals.

For additional TDM options, please refer to the Federal Highway Administration's *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (Chapter 8). The reference is available online at: http://www.ops.fhwa.dot.gov/publications/fhwahop12035/fhwahop12035.pdf.

Transportation Impact Fees

Please identify project-generated travel demand and estimate the costs of public transportation improvements necessitated by the proposed project; viable funding sources such as development and/or transportation impact fees should also be identified. We encourage a sufficient allocation of fair share contributions toward multi-modal and regional transit improvements to fully mitigate cumulative impacts to regional transportation. We also strongly support measures to increase sustainable mode shares, thereby reducing VMT.

Construction-Related Impacts

Potential impacts to the State ROW from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified in the EIR. Project work that requires movement of oversized or excessive load vehicles on state roadways requires a transportation permit that is issued by Caltrans. To apply, visit: https://dot.ca.gov/programs/traffic-operations/transportation-permits.

Prior to construction, coordination is required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to the STN.

Lead Agency

As the Lead Agency, the Dublin Unified School District is responsible for all project mitigation, including any needed improvements to the STN. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Andrew Chan at 510-622-5433 or andrew.chan@dot.ca.gov.

Sincerely,

Mark Leong
District Branch Chief

Subject: Notice of Preparation for Draft Environmental Impact Report for Promenade High School Project

Dear Mr. Stevens,

The City of Dublin appreciates the opportunity to provide comments on the scope of the Draft Environmental Impact Report (EIR) that will be prepared for the Promenade High School (proposed project) and issues that should be addressed. The proposed project would develop a new high school and related educational facilities for approximately 2,500 students on a vacant 23.46-acre site located north of Dublin Boulevard, south of Central Parkway, east of Chancery Way, and adjacent to Finnian Way at both the eastern and western boundaries.

Existing Conditions

The Draft EIR should acknowledge the following existing conditions related to public improvements and easements adjacent to and within the project site:

- There are two unimproved dedicated public streets within the properties (Finnian Way and Grafton Street), along with unimproved easements (Public Access Easement, Sidewalk Easement, and Emergency Vehicle Access Easement).
- There are two parcels within the subject properties, known as Parcels A and B of Parcel Map 9717, which are intended for future conveyance to the City as public streets (Finnian Way and Grafton Street).
- There are existing improvements and facilities located within the properties in the Public Service Easement and Storm Drain Easement.
- The existing City facilities within the properties are a 60-inch diameter storm drain line, 30-inch diameter storm drain line, 24-inch to 30-inch diameter storm drain line, and 24-inch to 36-inch to 42-inch storm drain line, along with appurtenant structures and facilities (i.e., manholes and drainage inlets).

City Council 925.833.6650
City Manager 925.833.6650
Community Development 925.833.6610
Economic Development 925.833.6650
Finance/IT 925.833.6640
Fire Prevention 925.833.6606
Human Resources 925.833.6605
Parks & Community Services 925.833.6645
Police 925.833.6670
Public Works 925.833.6630

100 Civic Plaza
Dublin, CA 94568
P 925.833.6650
F 925.833.6651
www.dublin.ca.gov

- There is an existing "Easement Grant Deed" to the City, dated February 2, 2001, County Recorder No. 2001060792, for a non-exclusive easement for public access purposes over portions of parcels shown on the Tract 7148 final map as "Public Access Easement (PAE)."
- There is an existing "Maintenance and Irrevocable License Agreement Relating to Parcel Map 9717" with the City, dated October 6, 2009, County Recorder No. 2009367778, for permitted uses (public access, traffic signs, street lights, street trees, utilities) within the licensed areas depicted on the parcel map as "Sidewalk Easement (SWE)."
- There is a "stub-out" for a future fourth leg of the intersection of Dublin Boulevard and Grafton Street, which is located along the southern boundary. The stub-out has existing pavement, curb ramps, curb and gutter, and traffic signal facilities.
- There is a "stub-out" for a future fourth leg of the intersection of Central Parkway and Grafton Street, which is located along the northern boundary. The stub-out has existing pavement, curb and gutter, and traffic signal facilities.
- There is a "stub-out" for a future fourth leg of the intersection of Chancery Lane and Dunmore Lane, which is located along the north side of Devaney Square. The stub-out has existing pavement and curb and gutter.
- Each "dead end" of Finnian Way at the eastern and western boundaries has an unpaved turnaround located on the subject properties.
- The City park, Devany Square, has improved pathways that "dead end" at the property lines of the subject properties.
- There is an existing concrete pedestrian pathway located on the subject properties along the eastern boundary adjacent to the existing residences.
- There are existing ornamental trees and a concrete pathway located on the subject properties along the western boundary from Finnian Way to Dublin Boulevard adjacent to existing residences.

Impact Analysis

- Aesthetics – Given the close proximity of existing high density residential development to the project site, the EIR should evaluate potential aesthetic impacts that may result from the degradation of the existing visual character and quality of the site and its surroundings. Mitigation should consider the placement of proposed buildings, parking areas, swimming pool, football stadium, and other facilities and the addition of landscaping and/or other buffers to reduce impacts to surrounding residential uses. In addition, lighting of proposed parking areas, swimming pool, football stadium, tennis courts, and other facilities would introduce new sources of light and glare that could result in adverse impacts. Mitigation should consider the placement of lighting, height of light standards, brightness, cut off features, and other methods to reduce impacts to surrounding residential uses.
- Land Use and Planning – The proposed project has the potential to divide an established neighborhood by eliminating Finnian Way as a through street and, in particular, would alter public access to Devany Square for residents who live east of the project site. Mitigation for impacts to the neighborhood should consider providing circulation through the site to connect the two neighborhoods and access to Devany Square from the east. In addition, the proposed project would

not be consistent with the Dublin General Plan as documented in the attached March 18, 2018 Planning Commission Staff Report on Dublin Unified School District's Acquisition of the Dublin Ranch Area G Property and General Plan Conformity, which should be disclosed in the EIR.

- Noise – The proposed project has the potential to permanently increase ambient noise levels in the surrounding area during the day, night and weekends. Potential noise impacts from public announcement equipment, class bell system, and general noise from student activities and school events should be evaluated in the EIR with consideration given to nearby residents. Mitigation should consider building placement to provide buffering, limiting the hours of noise generating activities, and other methods to reduce noise impacts to surrounding residential uses.

- Recreation – Given the close proximity of an existing City park to the project site, the EIR should evaluate the potential increase in use of Devany Square such that physical deterioration of the park would occur or be accelerated. Mitigation should include limitations on the use of the park by students, increase trash pick-up, possible improvements or changes to the park to address future use by students, and other methods to ensure the impacts to the park are reduced.

- Transportation – The traffic impact analysis prepared for the proposed project must be analyzed using the current version of the City of Dublin Citywide Travel Demand Model (Citywide Model). In order to adequately analyze impacts, the Citywide Model land uses must be updated to reflect the changes associated with the new high school. The Citywide Model street network also needs to be updated to incorporate street network changes proposed by the project. Signalize intersections that should be included in the analysis must be evaluated using the Select Link analysis approach to determine the trip distribution associated with the new high school. The initial list of intersections that are needed for the traffic impact analysis include the following, but these should be updated with the Select Link analysis indicated above in coordination with the City of Dublin staff:

    - Dublin Boulevard/Grafton Street
    - Dublin Boulevard/Brannigan Street
    - Dublin Boulevard/Tassajara Road
    - Dublin Boulevard/Keegan Street
    - Dublin Boulevard/Fallon Road
    - Fallon Road/Central Parkway
    - Fallon Road/Gleason Drive
    - Tassajara Road/Gleason Drive
    - Gleason Drive/ Branigan Street
    - Gleason Drive/ Grafton Street
    - Central Parkway/Brannigan Street
    - Central Parkway/Tassajara Road
    - Central Parkway/Grafton Street
    - Central Parkway Chancery Lane
    - Central Parkway/Keegan Street

- Central Parkway/Finnian Way

If the proposed project attracts vehicle trips that are accessing the project from the I -80 freeway, additional intersections must be included at the I -80 interchanges. Additionally, all project driveways must be evaluated for safe access and circulation for all modes of transportation and for all project scenarios.

Additional Comments

The City's Public Works Department has the following additional project-related comments:

- **Storm Water** – Site improvements and development of the subject properties will affect the ability of the City to enter the subject properties to inspect and maintain the existing City storm drainage facilities until they are removed or relocated with the future construction of the high school. Will Dublin Unified School District (DUSD) take on the maintenance of the existing storm drainage facilities in the interim? Will DUSD take on the ownership and maintenance of any new and relocated storm drainage facilities in perpetuity? DUSD will be required to collect and convey all storm water run-on and runoff and discharge to an adequately sized facility downstream, after appropriate treatment and flow control measures. Connection to and use of the City's public storm drainage system will require review and approval by the City Public Works Department.
- **Storm Water** – The subject properties shall comply with the California Regional Water Quality Control Board San Francisco Bay Region Order No. R2-2003-0031 for waste discharge requirements for the Dublin Ranch watershed. Connection to and use of the City's public storm drainage system will require review and approval by the City Public Works Department.
- **Emergency Vehicle Access** – Site improvements and development of the subject properties will affect the ability for emergency services to use the existing Emergency Vehicle Access Easement (EVAE) until the easement is relocated with the future development of the site for the future high school. Will DUSD allow emergency services to use the existing EVAE in the interim?
- **Pedestrian and Bicycle Access** – Site improvements and development of the subject properties may affect the ability of the public to use the existing pathways along the eastern and western boundaries, and the existing Sidewalk Easement (SWE) or Public Access Easement (PAE) until they are relocated with the future development of the site for the future high school. Will DUSD allow the public to use the existing SWE and PAE in the interim? Will DUSD provide relocated or new public access easements for pedestrians and bicycles through the subject properties in perpetuity?
- **Public Right of Way Improvements, Pedestrian/Bicycle, Landscaping** – Improvements and development of the frontages of Dublin Boulevard, Central Parkway, Chancery Lane, and Finnian Way will require City review and issuance of an Encroachment Permit for any work within the public street rights of way. All proposed sidewalks shall meet ADA and Public Works standards for sidewalks, pedestrian paths, and bike paths within the public street rights of way. All pedestrian/bicycle facilities and landscaping within the public street rights of way shall be in compliance with the City's adopted Bicycle and Pedestrian Master Plan, Eastern Dublin Specific Plan, and Streetscape Master Plan, as applicable.
- **Public Right of Way Improvements, Traffic Signals** – Modifications to the existing traffic signals and appurtenances at the intersections of Dublin Boulevard/Grafton Street and Central Parkway/Grafton Street shall be coordinated and reviewed by the City Public Works Department.

- **Public Right of Way Improvements, Bus Stops** – Installation of bus stops, pull-outs, shelters, etc. along Dublin Boulevard and Central Parkway shall be coordinated and reviewed by LAVTA and the City Public Works Department.
- **Public Right of Way Improvements, Finnian Way turnarounds** – Turnarounds shall be provided at each terminus of Finnian Way east and west and shall be in compliance with Fire District requirements and reviewed by the City Public Works Department.
- **Public Park Interface** – Improvements within or adjacent to Devany Square will require City review and potentially issuance of an Encroachment Permit for any work on City-owned property. All connections to existing pedestrian pathways within Devany Square shall be coordinated with City Public Works Department. Will DUSD connect to or separate high school use from the public park use? Will there be increased need for City maintenance services (i.e. waste receptacles service, landscape maintenance due to increased wear and tear, etc.)?

Should you have any questions or need additional information, please feel free to contact me at (925) 833-6610 or by e-mail at kristie.wheeler@dublin.ca.gov.

STAFF REPORT
PLANNING COMMISSION

DATE: **March 13, 2018**

TO: Planning Commission

SUBJECT: Report on Dublin Unified School District's Proposed Acquisition of the Dublin Ranch Area G Property and General Plan Conformity
Prepared by:Mandy Kang, Senior Planner and Lauren Quint, Assistant City Attorney

EXECUTIVE SUMMARY:

The Dublin Unified School District (DUSD) is considering the acquisition of real property within the City of Dublin for use as a public school. The subject property consists of approximately 25.1 acres located at the southeast Corner of Chancery Lane and Central Parkway, known as Area G or more commonly known as "The Promenade" property. The majority of the site has a General Plan land use designation of Neighborhood Commercial, with a smaller portion designated Public/Semi-Public.

In accordance with Public Resources Code 21151.2, DUSD provided the City with written notification of its proposed acquisition, which provides the Planning Commission with an opportunity to investigate the proposed site and provide a written report of the investigation and recommendation. In addition, per Government Code section 65402, prior to DUSD acquiring the property, the Planning Commission must review the proposal for consistency with the General Plan.

The proposed use of the site for a school is inconsistent with the existing Neighborhood Commercial land use designation in the General Plan. Understanding that DUSD has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and uses their ability to override applicable zoning ordinances, recommendations are provided in order to help ensure compatibility with the surrounding uses.

RECOMMENDATION:

Staff recommends that the Planning Commission approve the Written Report of the Planning Commission to the Dublin Unified School District pursuant to Public Resources Code §21151.2 and Government Code §65402, for submission to the Dublin Unified School District.

SITE DESCRIPTION:

The subject property consists of approximately 25.1 acres located at the southeast Corner of Chancery Lane and Central Parkway as shown in Figure 1 below. The APN's

are 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005. 985-0078-006, and 985-0078-007. The site is currently empty and commonly referred to as "Dublin Ranch Area G" or the "Promenade" property.

Figure 1. Subject Property

The property has a General Plan land use designation of Neighborhood Commercial and Public/Semi-Public and is zoned Planned Development. The property is surrounded by Medium Density Residential to the north, Medium-High Density and High Density Residential to the east, Parks/Public Recreation and High Density Residential to the west, and Mixed Use commercial and residential uses to the south.

The Dublin Unified School District (DUSD) is considering the acquisition of the subject property in the City of Dublin for use as a public school. In accordance with Public Resources Code 21151.2, DUSD has provided the City with written notification of the proposed acquisition (Attachment 1). The Public Resources Code states that "to promote the safety of pupils and comprehensive community planning the governing board of each school district before acquiring title to property for a new school site or for an addition to a present school site, shall give the planning commission having jurisdiction notice in writing of the proposed acquisition. The planning commission shall investigate the proposed site and within 30 days after receipt of the notice shall submit to the governing board a written report of the investigation and its recommendations concerning acquisition of the site."

In addition, the law provides that the governing board shall not acquire title to the property until the report of the Planning Commission has been received, and if the report does not favor the acquisition of the property for a school site, the governing board of the school district shall not acquire title to the property until 30 days after the report is received.

Finally, pursuant to Government Code section 65402(a), the acquisition of a property by a public agency must be reviewed by the Planning Commission for consistency with the

General Plan, and a determination as to this consistency must be made within forty (40) days.

ANALYSIS:

Consistency with the General Plan (Government Code §65402):

The acquisition of the site for use as a public school is not consistent with the General Plan land use designation of Neighborhood Commercial.

The majority of the proposed school site (approximately 22.0 acres) has a current General Plan land use designation of Neighborhood Commercial which provides for the creation of community and neighborhood oriented commercial centers that serve the retail, service and entertainment needs of the community. A small portion of the site (approximately 3.1 acres) has a General Plan land use designation of Public/Semi-Public which provides for a combination of public facility and semi-public facility land uses.

Uses allowed within the Neighborhood Commercial designation include, but are not limited to: office uses which provide neighborhood and citywide services such as real estate, accounting and legal establishments; local-serving commercial services such as laundries, dry cleaners, beauty salons or finance establishments; local and community serving retail; restaurants and bars; hotels and bed-and-breakfast inns; and entertainment and cultural facilities. Uses allowed within the Public/Semi-Public designation include, but are not limited to: child care centers, youth centers, senior centers, special needs program facilities, religious institutions, clubhouses, community centers, community theatres, hospitals, private schools and other facilities that provide cultural, education, or other similar services and benefit the community.

The current Neighborhood Commercial land use designation does not allow for use of the site as a public school.

Consistency with the Zoning Designation:

The acquisition of the site by DUSD to operate a public school is not consistent with the current zoning designation for the subject site and the proposed use does not conform to the requirements of the Planned Development Zoning Development Plan for Dublin Ranch Area G.

The site is part of the Eastern Dublin Specific Plan which highlights many policies and guidelines related to the overall development of sites designated for commercial uses within a neighborhood. The site is part of a Planned Development Zoning District (Ordinance No. 06-00) with a specific development plan for Dublin Ranch Area G. The Planned Development identifies specific uses for Public/Semi-Public sites which would allow uses such as, but not limited to public facilities, community centers and religious facilities. The majority of the site is designated PD-Village Center (Neighborhood Commercial) and would include, but not be limited to the following uses: drug stores, bakeries, small retail, offices and small eating, drinking and entertainment establishments.

There are several other development standards in the Planned Development Zoning which address vehicular streets, sidewalks and streetscape elements, open spaces, pedestrian circulation, etc. throughout the site. The overall intent for this site was to have six PD-Village Center parcels and one Public/Semi-Parcel parcel, with a network of small streets connecting the neighborhood to shopping areas.

A public school is inconsistent with the existing requirements and standards set forth above.

DUSD's Ability to Render Zoning Inapplicable

In general, although there is no explicit requirement that local agencies, such as DUSD, comply with general plans, local agencies are required to comply with applicable zoning ordinances of the City in which the territory of the local agency is situated. (See Gov. Code, § 53091.) However, the governing board of a school district, "by a vote of two-thirds of its members, may render a city or county zoning ordinance inapplicable to a proposed use of property by the school district." (Gov. Code, § 53094, subd. (b).)

Investigation and Recommendations (Public Resources Code §21151.2)

An investigation of the site has been completed and the following recommendations are made in accordance with Public Resources Code §21151.2. Understanding that DUSD has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and utilizes their power to override applicable zoning ordinances, the Planning Commission offers the following recommendations in accordance with Public Resources Code §21151.2. The District has not yet presented a development plan for the site. Therefore, the comments and recommendations are general in nature and should be considered when planning a school for this site in order to help ensure compatibility with the surrounding uses. It will also be important for the District to engage in a conversation with the surrounding residents during the design phase of the project.

<u>Site Planning</u>
The subject property was originally envisioned as a walkable, neighborhood serving commercial center that is surrounding by existing dense townhomes, condominiums and apartments. These residential units were designed with the presumption that this site would ultimately develop with small scale commercial uses. Therefore, DUSD should use sensitive site planning to maintain a high quality of life and reduce potential negative impacts to the surrounding neighborhoods with the operation of a school on this site. The following are general comments regarding site planning:

- Buildings, parking areas, and play fields should be located in such a manner to reduce impacts to surrounding residential uses.
    - Careful consideration should be given to the placement of on-site play fields and the impact resulting from lights, public announcement equipment, and general noise during the day time, evenings and weekends.
    - Parking areas should be located to reduce visual impacts, noise impacts, and nuisances to surrounding residents.
    - Adequate parking should be provided to ensure that overflow parking does not impact the surrounding neighborhoods.
    - Building placement should be carefully considered given the close proximity of residential uses, including the potential visual impacts of

buildings and noise impacts generated by the use of a class bell system and areas for students to congregate.

- The homes fronting on to the site have a minimal setback and separation to the site. It was anticipated that future development of the site would include a buffer separating the uses. Please consider providing a generous buffer, such as landscaping, to separate these homes from the proposed school.
- The interface with the adjacent 2 acre Devany Square should be taken into consideration when creating the site plan for the school.

Traffic and Circulation

The City has planned a comprehensive circulation network through the General Plan and the Bicycle and Pedestrian Master Plan. The intent is to facilitate movement by all modes of transportation through the site and to facilitate connections the surrounding neighborhoods. Careful consideration to the location and design of the access points to the school is critical to ensure efficient circulation to and from the school while minimizing impacts to the surrounding neighborhoods. The City would like to collaborate with DUSD on traffic and circulation. Therefore, we request that DUSD consult with the City's Transportation and Operations Manager early and often during the design process. The following are general comments regarding traffic and circulation:

- The General Plan and the Bicycle and Pedestrian Master Plan should be consulted and adhered to as best as possible to facilitate full and efficient connectivity for all modes of transportation.
- The location of the primary and secondary access points to the school site should be designed to minimize potential impacts to the roadway network and surrounding neighborhoods.
- Access and circulation by all modes of transportation (i.e. vehicles, pedestrians and bicycles) should be considered when designing the site.
- The loading and unloading of students from buses and vehicles should be coordinated with pedestrian entrances.
- Currently, Grafton Street is planned to connect north/south through the site and Finnian Way is planned to connect east/west through the site. Consideration should be given to the development of the site and impacts to access and circulation to and through the site.
- Similarly, a future extension of the Class 1 bike path is planned to extend along the western side of the site from Central Parkway to Dublin Boulevard, between the Neighborhood Commercial and Public/Semi-Public parcels. This pathway will connect northern neighborhoods to the commercial areas south of Dublin Boulevard. Consideration should be given to maintaining such a planned connection.

Public Works

- There are future planned public improvements that still need to be implemented as part of the site improvements, including but not limited to street extensions, street widening, traffic signals, street dedication, and easement dedications.
- The proposed project site is located in the Dublin Ranch Water Shed and will require coordination with the Dublin Ranch Home Owner's Association.
- The proposed project will also be subject to the clean water requirements of the Municipal Regional Permit (MRP), as applicable, including provisions C-3, C-6 and C-10.

Report to DUSD

A written report of the above findings is included as Attachment 2 of this Staff Report. The Planning Commission may choose to incorporate some or all of the comments set forth into the report.

ENVIRONMENTAL REVIEW

Determination of compliance with the General Plan is not considered a project as defined pursuant to Section §21065 of the California Environmental Quality Act (CEQA), and therefore no further environmental review is required at this time. Should DUSD proceed with the development of a school on this site, that would be considered a project and subject to review under CEQA.

NOTICING REQUIREMENTS/PUBLIC OUTREACH

Per Section 8.132 of the Zoning Ordinance, a Notice of Public Hearing is only required when a Public Hearing is required for certain projects. Since determination of compliance with the General Plan is not considered a project, a Public Hearing is not required, and therefore, a Notice of Public Hearing is not required. It is anticipated that future actions by DUSD to acquire the site and construct a school would be subject to a public notice

Re: Dublin Unified School District/Proposed Property Acquisition Project; Notification Pursuant to Public Resources Code Section 21151.2 and Government Code Section 65402

Dear Chris:

This is to advise you that the Dublin Unified School District is considering the acquisition of real property in the County of Alameda and within the City of Dublin sphere of influence for District use. The subject property consists of approximately 23 acres located at the Southwest corner of Chancery Lane and Central Parkway in Dublin, Alameda County APNs 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005, 985-0078-006, and 985-0078-007. The site is commonly referred to as the "Promenade" property. The District is considering the acquisition of the property for a potential public school. The property is generally depicted in the attached for your reference.

This letter is to provide you with formal notice under Public Resources Code section 21151.2 and Government Code section 65402 regarding the possible acquisition of the property. (Copies of those code sections also are attached for your reference.)

Please process this notice in accordance with the above-referenced code sections. If you have any questions, please contact the undersigned at your convenience. Thank you.

Sincerely,

Joe Sorrera
Assistant Superintendent
Business Services

Enclosures

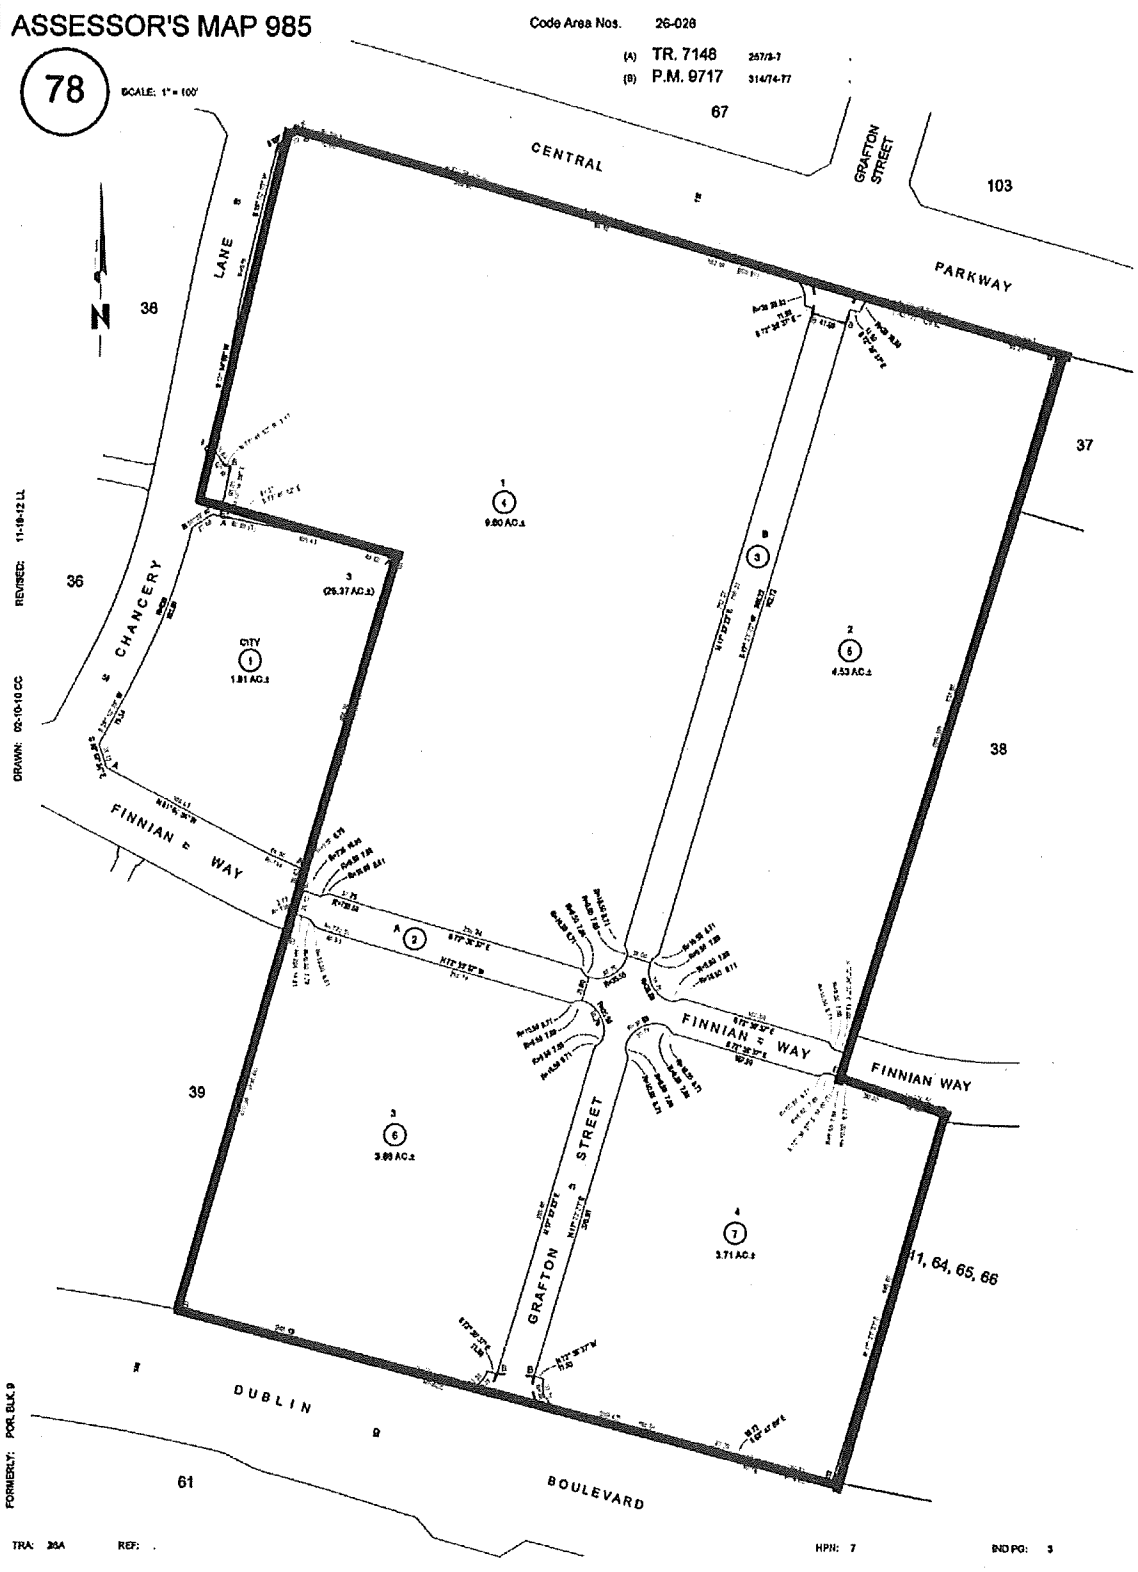
PUBLIC RESOURCES CODE SECTION 21151.2:

To promote the safety of pupils and comprehensive community planning the governing board of each school district before acquiring title to property for a new school site or for an addition to a present school site, shall give the planning commission having jurisdiction notice in writing of the proposed acquisition. The planning commission shall investigate the proposed site and within 30 days after receipt of the notice shall submit to the governing board a written report of the investigation and its recommendations concerning acquisition of the site.

The governing board shall not acquire title to the property until the report of the planning commission has been received. If the report does not favor the acquisition of the property for a school site, or for an addition to a present school site, the governing board of the school district shall not acquire title to the property until 30 days after the commission's report is received.

GOVERNMENT CODE SECTION 65402:

(a) If a general plan or part thereof has been adopted, no real property shall be acquired by dedication or otherwise for street, square, park or other public purposes, and no real property shall be disposed of, no street shall be vacated or abandoned, and no public building or structure shall be constructed or authorized, if the adopted general plan or part thereof applies thereto, until the location, purpose and extent of such acquisition or disposition, such street vacation or abandonment, or such public building or structure have been submitted to and reported upon by the planning agency as to conformity with said adopted general plan or part thereof. The planning agency shall render its report as to conformity with said adopted general plan or part thereof within forty (40) days after the matter was submitted to it, or such longer period of time as may be designated by the legislative body.



If the legislative body so provides, by ordinance or resolution, the provisions of this subdivision shall not apply to: (1) the disposition of the remainder of a larger parcel which was acquired and used in part for street purposes; (2) acquisitions, dispositions, or abandonments for street widening; or (3) alignment projects, provided such dispositions for street purposes, acquisitions, dispositions, or abandonments for street widening, or alignment projects are of a minor nature.

(b) A county shall not acquire real property for any of the purposes specified in paragraph (a), nor dispose of any real property, nor construct or authorize a public building or structure, in another county or within the corporate limits of a city, if such city or other county has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, and a city shall not acquire real property for any of the purposes specified in paragraph (a), nor dispose of any real property, nor construct or authorize a public building or structure, in another city or in unincorporated territory, if such other city or the county in which such unincorporated territory is situated has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, until the location, purpose and extent of such acquisition, disposition, or such public building or structure have been submitted to and reported upon by the planning agency having jurisdiction, as to conformity with said adopted general plan or part thereof. Failure of the planning agency to report within forty (40) days after the matter has been submitted to it shall be conclusively deemed a finding that the proposed acquisition, disposition, or public building or structure is in conformity with said adopted general plan or part thereof. The provisions of this paragraph (b) shall not apply to acquisition or abandonment for street widening or alignment projects of a minor nature if the legislative body having the real property within its boundaries so provides by ordinance or resolution.

(c) A local agency shall not acquire real property for any of the purposes specified in paragraph (a) nor dispose of any real property, nor construct or authorize a public building or structure, in any county or city, if such county or city has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, until the location, purpose and extent of such acquisition, disposition, or such public building or structure have been submitted to and reported upon by the planning agency having jurisdiction, as to conformity with said adopted general plan or part thereof. Failure of the planning agency to report within forty (40) days after the matter has been submitted to it shall be conclusively deemed a finding that the proposed acquisition, disposition, or public building or structure is in conformity with said adopted general plan or part thereof. If the planning agency disapproves the location, purpose or extent of such acquisition, disposition, or the public building or structure, the disapproval may be overruled by the local agency.

Local agency as used in this paragraph (c) means an agency of the state for the local performance of governmental or proprietary functions within limited boundaries. Local agency does not include the state, or county, or a city.

For Assessment Use Only

WRITTEN REPORT OF THE PLANNING COMMISSION TO THE DUBLIN UNIFIED SCHOOL DISTRICT PURSUANT TO PUBLIC RESOURCES CODE §21151.2 AND GOVERNMENT CODE §65402

The Planning Commission of the City of Dublin finds that the proposed acquisition of approximately 23 acres located at the southeast corner of Chancery Lane and Central Parkway (APN's 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005. 985-0078-006, and 985-0078-007) is inconsistent with the General Plan and associated Zoning Ordinance.

Understanding that the Dublin Unified School District has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and utilizes their power to override applicable zoning ordinances, the Planning Commission offers the following recommendations in accordance with Public Resources Code §21151.2. The District has not yet presented a development plan for the site. Therefore, the comments and recommendations are general in nature and should be considered when planning a school for this site in order to help ensure compatibility with the surrounding uses. It will also be important for the District to engage in a conversation with the surrounding residents during the design phase of the project.

Site Planning

The subject property was originally envisioned as a walkable, neighborhood serving commercial center that is surrounding by existing dense townhomes, condominiums and apartments. These residential units were designed with the presumption that this site would ultimately develop with small scale commercial uses. Therefore, DUSD should use sensitive site planning to maintain a high quality of life and reduce potential negative impacts to the surrounding neighborhoods with the operation of a school on this site. The following are general comments regarding site planning:

- Buildings, parking areas, and play fields should be located in such a manner to reduce impacts to surrounding residential uses.
    - Careful consideration should be given to the placement of on-site play fields and the impact resulting from lights, public announcement equipment, and general noise during the day time, evenings and weekends.
    - Parking areas should be located to reduce visual impacts, noise impacts, and nuisances to surrounding residents.
    - Adequate parking should be provided to ensure that overflow parking does not impact the surrounding neighborhoods.
    - Building placement should be carefully considered given the close proximity of residential uses, including the potential visual impacts of buildings and noise impacts generated by the use of a class bell system and areas for students to congregate.
- The homes fronting on to the site have a minimal setback and separation to the site. It was anticipated that future development of the site would include a buffer separating the uses. Please consider providing a generous buffer, such as landscaping, to separate these homes from the proposed school.
- The interface with the adjacent 2-acre Devany Square should be taken into consideration when creating the site plan for the school.

Traffic and Circulation

The City has planned a comprehensive circulation network through the General Plan and the Bicycle and Pedestrian Master Plan. The intent is to facilitate movement by all modes of

transportation through the site and to facilitate connections the surrounding neighborhoods. Careful consideration to the location and design of the access points to the school is critical to ensure efficient circulation to and from the school while minimizing impacts to the surrounding neighborhoods. The City would like to collaborate with DUSD on traffic and circulation. Therefore, we request that DUSD consult with the City's Transportation and Operations Manager early and often during the design process. The following are general comments regarding traffic and circulation:

- The General Plan and the Bicycle and Pedestrian Master Plan should be consulted and adhered to as best as possible to facilitate full and efficient connectivity for all modes of transportation.
- The location of the primary and secondary access points to the school site should be designed to minimize potential impacts to the roadway network and surrounding neighborhoods.
- Access and circulation by all modes of transportation (i.e. vehicles, pedestrians and bicycles) should be considered when designing the site.
- The loading and unloading of students from buses and vehicles should be coordinated with pedestrian entrances.

- Currently, Grafton Street is planned to connect north/south through the site and Finnian Way is planned to connect east/west through the site. Consideration should be given to the development of the site and impacts to access and circulation to and through the site.
- Similarly, a future extension of the Class 1 bike path is planned to extend along the western side of the site from Central Parkway to Dublin Boulevard, between the Neighborhood Commercial and Public/Semi-Public parcels. This pathway will connect northern neighborhoods to the commercial areas south of Dublin Boulevard. Consideration should be given to maintaining such a planned connection.

<u>Public Works</u>

- There are future planned public improvements that still need to be implemented as part of the site improvements, including but not limited to street extensions, street widening, traffic signals, street dedication, and easement dedications.
- The proposed project site is located in the Dublin Ranch Water Shed and will require coordination with the Dublin Ranch Home Owner's Association.
- The proposed project will also be subject to the clean water requirements of the Municipal Regional Permit (MRP), as applicable, including provisions C-3, C-6 and C-10.

Subject: Notice of Preparation for Draft Environmental Impact Report for Promenade High School Project

Dear Mr. Stevens,

The City of Dublin appreciates the opportunity to provide comments on the scope of the Draft Environmental Impact Report (EIR) that will be prepared for the Promenade High School (proposed project) and issues that should be addressed. The proposed project would develop a new high school and related educational facilities for approximately 2,500 students on a vacant 23.46-acre site located north of Dublin Boulevard, south of Central Parkway, east of Chancery Way, and adjacent to Finnian Way at both the eastern and western boundaries.

Existing Conditions

The Draft EIR should acknowledge the following existing conditions related to public improvements and easements adjacent to and within the project site:

- There are two unimproved dedicated public streets within the properties (Finnian Way and Grafton Street), along with unimproved easements (Public Access Easement, Sidewalk Easement, and Emergency Vehicle Access Easement).
- There are two parcels within the subject properties, known as Parcels A and B of Parcel Map 9717, which are intended for future conveyance to the City as public streets (Finnian Way and Grafton Street).
- There are existing improvements and facilities located within the properties in the Public Service Easement and Storm Drain Easement.
- The existing City facilities within the properties are a 60-inch diameter storm drain line, 30-inch diameter storm drain line, 24-inch to 30-inch diameter storm drain line, and 24-inch to 36-inch to 42-inch storm drain line, along with appurtenant structures and facilities (i.e., manholes and drainage inlets).

Dublin, CA 94568
P 925.833.6650
F 925.833.6651
www.dublin.ca.gov

- There is an existing "Easement Grant Deed" to the City, dated February 2, 2001, County Recorder No. 2001060792, for a non-exclusive easement for public access purposes over portions of parcels shown on the Tract 7148 final map as "Public Access Easement (PAE)."
- There is an existing "Maintenance and Irrevocable License Agreement Relating to Parcel Map 9717" with the City, dated October 6, 2009, County Recorder No. 2009367778, for permitted uses (public access, traffic signs, street lights, street trees, utilities) within the licensed areas depicted on the parcel map as "Sidewalk Easement (SWE)."
- There is a "stub-out" for a future fourth leg of the intersection of Dublin Boulevard and Grafton Street, which is located along the southern boundary. The stub-out has existing pavement, curb ramps, curb and gutter, and traffic signal facilities.
- There is a "stub-out" for a future fourth leg of the intersection of Central Parkway and Grafton Street, which is located along the northern boundary. The stub-out has existing pavement, curb and gutter, and traffic signal facilities.
- There is a "stub-out" for a future fourth leg of the intersection of Chancery Lane and Dunmore Lane, which is located along the north side of Devaney Square. The stub-out has existing pavement and curb and gutter.
- Each "dead end" of Finnian Way at the eastern and western boundaries has an unpaved turnaround located on the subject properties.
- The City park, Devany Square, has improved pathways that "dead end" at the property lines of the subject properties.
- There is an existing concrete pedestrian pathway located on the subject properties along the eastern boundary adjacent to the existing residences.
- There are existing ornamental trees and a concrete pathway located on the subject properties along the western boundary from Finnian Way to Dublin Boulevard adjacent to existing residences.

Impact Analysis

- Aesthetics – Given the close proximity of existing high density residential development to the project site, the EIR should evaluate potential aesthetic impacts that may result from the degradation of the existing visual character and quality of the site and its surroundings. Mitigation should consider the placement of proposed buildings, parking areas, swimming pool, football stadium, and other facilities and the addition of landscaping and/or other buffers to reduce impacts to surrounding residential uses. In addition, lighting of proposed parking areas, swimming pool, football stadium, tennis courts, and other facilities would introduce new sources of light and glare that could result in adverse impacts. Mitigation should consider the placement of lighting, height of light standards, brightness, cut off features, and other methods to reduce impacts to surrounding residential uses.
- Land Use and Planning – The proposed project has the potential to divide an established neighborhood by eliminating Finnian Way as a through street and, in particular, would alter public access to Devany Square for residents who live east of the project site. Mitigation for impacts to the neighborhood should consider providing circulation through the site to connect the two neighborhoods and access to Devany Square from the east. In addition, the proposed project would

not be consistent with the Dublin General Plan as documented in the attached March 18, 2018 Planning Commission Staff Report on Dublin Unified School District's Acquisition of the Dublin Ranch Area G Property and General Plan Conformity, which should be disclosed in the EIR.

- Noise – The proposed project has the potential to permanently increase ambient noise levels in the surrounding area during the day, night and weekends. Potential noise impacts from public announcement equipment, class bell system, and general noise from student activities and school events should be evaluated in the EIR with consideration given to nearby residents. Mitigation should consider building placement to provide buffering, limiting the hours of noise generating activities, and other methods to reduce noise impacts to surrounding residential uses.
- Recreation – Given the close proximity of an existing City park to the project site, the EIR should evaluate the potential increase in use of Devany Square such that physical deterioration of the park would occur or be accelerated. Mitigation should include limitations on the use of the park by students, increase trash pick-up, possible improvements or changes to the park to address future use by students, and other methods to ensure the impacts to the park are reduced.
- Transportation – The traffic impact analysis prepared for the proposed project must be analyzed using the current version of the City of Dublin Citywide Travel Demand Model (Citywide Model). In order to adequately analyze impacts, the Citywide Model land uses must be updated to reflect the changes associated with the new high school. The Citywide Model street network also needs to be updated to incorporate street network changes proposed by the project. Signalize intersections that should be included in the analysis must be evaluated using the Select Link analysis approach to determine the trip distribution associated with the new high school. The initial list of intersections that are needed for the traffic impact analysis include the following, but these should be updated with the Select Link analysis indicated above in coordination with the City of Dublin staff:

    - Dublin Boulevard/Grafton Street
    - Dublin Boulevard/Brannigan Street
    - Dublin Boulevard/Tassajara Road
    - Dublin Boulevard/Keegan Street
    - Dublin Boulevard/Fallon Road
    - Fallon Road/Central Parkway
    - Fallon Road/Gleason Drive
    - Tassajara Road/Gleason Drive
    - Gleason Drive/ Branigan Street
    - Gleason Drive/ Grafton Street
    - Central Parkway/Brannigan Street
    - Central Parkway/Tassajara Road
    - Central Parkway/Grafton Street
    - Central Parkway Chancery Lane
    - Central Parkway/Keegan Street

- Central Parkway/Finnian Way

If the proposed project attracts vehicle trips that are accessing the project from the I -80 freeway, additional intersections must be included at the I -80 interchanges. Additionally, all project driveways must be evaluated for safe access and circulation for all modes of transportation and for all project scenarios.

Additional Comments

The City's Public Works Department has the following additional project-related comments:

- **Storm Water** – Site improvements and development of the subject properties will affect the ability of the City to enter the subject properties to inspect and maintain the existing City storm drainage facilities until they are removed or relocated with the future construction of the high school. Will Dublin Unified School District (DUSD) take on the maintenance of the existing storm drainage facilities in the interim? Will DUSD take on the ownership and maintenance of any new and relocated storm drainage facilities in perpetuity? DUSD will be required to collect and convey all storm water run-on and runoff and discharge to an adequately sized facility downstream, after appropriate treatment and flow control measures. Connection to and use of the City's public storm drainage system will require review and approval by the City Public Works Department.
- **Storm Water** – The subject properties shall comply with the California Regional Water Quality Control Board San Francisco Bay Region Order No. R2-2003-0031 for waste discharge requirements for the Dublin Ranch watershed. Connection to and use of the City's public storm drainage system will require review and approval by the City Public Works Department.
- **Emergency Vehicle Access** – Site improvements and development of the subject properties will affect the ability for emergency services to use the existing Emergency Vehicle Access Easement (EVAE) until the easement is relocated with the future development of the site for the future high school. Will DUSD allow emergency services to use the existing EVAE in the interim?
- **Pedestrian and Bicycle Access** – Site improvements and development of the subject properties may affect the ability of the public to use the existing pathways along the eastern and western boundaries, and the existing Sidewalk Easement (SWE) or Public Access Easement (PAE) until they are relocated with the future development of the site for the future high school. Will DUSD allow the public to use the existing SWE and PAE in the interim? Will DUSD provide relocated or new public access easements for pedestrians and bicycles through the subject properties in perpetuity?
- **Public Right of Way Improvements, Pedestrian/Bicycle, Landscaping** – Improvements and development of the frontages of Dublin Boulevard, Central Parkway, Chancery Lane, and Finnian Way will require City review and issuance of an Encroachment Permit for any work within the public street rights of way. All proposed sidewalks shall meet ADA and Public Works standards for sidewalks, pedestrian paths, and bike paths within the public street rights of way. All pedestrian/bicycle facilities and landscaping within the public street rights of way shall be in compliance with the City's adopted Bicycle and Pedestrian Master Plan, Eastern Dublin Specific Plan, and Streetscape Master Plan, as applicable.
- **Public Right of Way Improvements, Traffic Signals** – Modifications to the existing traffic signals and appurtenances at the intersections of Dublin Boulevard/Grafton Street and Central Parkway/Grafton Street shall be coordinated and reviewed by the City Public Works Department.

- **Public Right of Way Improvements, Bus Stops** – Installation of bus stops, pull-outs, shelters, etc. along Dublin Boulevard and Central Parkway shall be coordinated and reviewed by LAVTA and the City Public Works Department.
- **Public Right of Way Improvements, Finnian Way turnarounds** – Turnarounds shall be provided at each terminus of Finnian Way east and west and shall be in compliance with Fire District requirements and reviewed by the City Public Works Department.
- **Public Park Interface** – Improvements within or adjacent to Devany Square will require City review and potentially issuance of an Encroachment Permit for any work on City-owned property. All connections to existing pedestrian pathways within Devany Square shall be coordinated with City Public Works Department. Will DUSD connect to or separate high school use from the public park use? Will there be increased need for City maintenance services (i.e. waste receptacles service, landscape maintenance due to increased wear and tear, etc.)?

Should you have any questions or need additional information, please feel free to contact me at (925) 833-6610 or by e-mail at kristie.wheeler@dublin.ca.gov.

Sincerely,

Kristie R. Wheeler

STAFF REPORT
PLANNING COMMISSION

DATE: **March 13, 2018**

TO: Planning Commission

SUBJECT: Report on Dublin Unified School District's Proposed Acquisition of the Dublin Ranch Area G Property and General Plan Conformity
Prepared by:Mandy Kang, Senior Planner and Lauren Quint, Assistant City Attorney

EXECUTIVE SUMMARY:

The Dublin Unified School District (DUSD) is considering the acquisition of real property within the City of Dublin for use as a public school. The subject property consists of approximately 25.1 acres located at the southeast Corner of Chancery Lane and Central Parkway, known as Area G or more commonly known as "The Promenade" property. The majority of the site has a General Plan land use designation of Neighborhood Commercial, with a smaller portion designated Public/Semi-Public.

In accordance with Public Resources Code 21151.2, DUSD provided the City with written notification of its proposed acquisition, which provides the Planning Commission with an opportunity to investigate the proposed site and provide a written report of the investigation and recommendation. In addition, per Government Code section 65402, prior to DUSD acquiring the property, the Planning Commission must review the proposal for consistency with the General Plan.

The proposed use of the site for a school is inconsistent with the existing Neighborhood Commercial land use designation in the General Plan. Understanding that DUSD has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and uses their ability to override applicable zoning ordinances, recommendations are provided in order to help ensure compatibility with the surrounding uses.

RECOMMENDATION:

Staff recommends that the Planning Commission approve the Written Report of the Planning Commission to the Dublin Unified School District pursuant to Public Resources Code §21151.2 and Government Code §65402, for submission to the Dublin Unified School District.

SITE DESCRIPTION:

The subject property consists of approximately 25.1 acres located at the southeast Corner of Chancery Lane and Central Parkway as shown in Figure 1 below. The APN's

are 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005. 985-0078-006, and 985-0078-007. The site is currently empty and commonly referred to as "Dublin Ranch Area G" or the "Promenade" property.

Figure 1. Subject Property

The property has a General Plan land use designation of Neighborhood Commercial and Public/Semi-Public and is zoned Planned Development. The property is surrounded by Medium Density Residential to the north, Medium-High Density and High Density Residential to the east, Parks/Public Recreation and High Density Residential to the west, and Mixed Use commercial and residential uses to the south.

The Dublin Unified School District (DUSD) is considering the acquisition of the subject property in the City of Dublin for use as a public school. In accordance with Public Resources Code 21151.2, DUSD has provided the City with written notification of the proposed acquisition (Attachment 1). The Public Resources Code states that "to promote the safety of pupils and comprehensive community planning the governing board of each school district before acquiring title to property for a new school site or for an addition to a present school site, shall give the planning commission having jurisdiction notice in writing of the proposed acquisition. The planning commission shall investigate the proposed site and within 30 days after receipt of the notice shall submit to the governing board a written report of the investigation and its recommendations concerning acquisition of the site."

In addition, the law provides that the governing board shall not acquire title to the property until the report of the Planning Commission has been received, and if the report does not favor the acquisition of the property for a school site, the governing board of the school district shall not acquire title to the property until 30 days after the report is received.

Finally, pursuant to Government Code section 65402(a), the acquisition of a property by a public agency must be reviewed by the Planning Commission for consistency with the

General Plan, and a determination as to this consistency must be made within forty (40) days.

ANALYSIS:

Consistency with the General Plan (Government Code §65402):

The acquisition of the site for use as a public school is not consistent with the General Plan land use designation of Neighborhood Commercial.

The majority of the proposed school site (approximately 22.0 acres) has a current General Plan land use designation of Neighborhood Commercial which provides for the creation of community and neighborhood oriented commercial centers that serve the retail, service and entertainment needs of the community. A small portion of the site (approximately 3.1 acres) has a General Plan land use designation of Public/Semi-Public which provides for a combination of public facility and semi-public facility land uses.

Uses allowed within the Neighborhood Commercial designation include, but are not limited to: office uses which provide neighborhood and citywide services such as real estate, accounting and legal establishments; local-serving commercial services such as laundries, dry cleaners, beauty salons or finance establishments; local and community serving retail; restaurants and bars; hotels and bed-and-breakfast inns; and entertainment and cultural facilities. Uses allowed within the Public/Semi-Public designation include, but are not limited to: child care centers, youth centers, senior centers, special needs program facilities, religious institutions, clubhouses, community centers, community theatres, hospitals, private schools and other facilities that provide cultural, education, or other similar services and benefit the community.

The current Neighborhood Commercial land use designation does not allow for use of the site as a public school.

Consistency with the Zoning Designation:

The acquisition of the site by DUSD to operate a public school is not consistent with the current zoning designation for the subject site and the proposed use does not conform to the requirements of the Planned Development Zoning Development Plan for Dublin Ranch Area G.

The site is part of the Eastern Dublin Specific Plan which highlights many policies and guidelines related to the overall development of sites designated for commercial uses within a neighborhood. The site is part of a Planned Development Zoning District (Ordinance No. 06-00) with a specific development plan for Dublin Ranch Area G. The Planned Development identifies specific uses for Public/Semi-Public sites which would allow uses such as, but not limited to public facilities, community centers and religious facilities. The majority of the site is designated PD-Village Center (Neighborhood Commercial) and would include, but not be limited to the following uses: drug stores, bakeries, small retail, offices and small eating, drinking and entertainment establishments.

There are several other development standards in the Planned Development Zoning which address vehicular streets, sidewalks and streetscape elements, open spaces, pedestrian circulation, etc. throughout the site. The overall intent for this site was to have six PD-Village Center parcels and one Public/Semi-Parcel parcel, with a network of small streets connecting the neighborhood to shopping areas.

A public school is inconsistent with the existing requirements and standards set forth above.

DUSD's Ability to Render Zoning Inapplicable

In general, although there is no explicit requirement that local agencies, such as DUSD, comply with general plans, local agencies are required to comply with applicable zoning ordinances of the City in which the territory of the local agency is situated. (See Gov. Code, § 53091.) However, the governing board of a school district, "by a vote of two-thirds of its members, may render a city or county zoning ordinance inapplicable to a proposed use of property by the school district." (Gov. Code, § 53094, subd. (b).)

Investigation and Recommendations (Public Resources Code §21151.2)

An investigation of the site has been completed and the following recommendations are made in accordance with Public Resources Code §21151.2. Understanding that DUSD has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and utilizes their power to override applicable zoning ordinances, the Planning Commission offers the following recommendations in accordance with Public Resources Code §21151.2. The District has not yet presented a development plan for the site. Therefore, the comments and recommendations are general in nature and should be considered when planning a school for this site in order to help ensure compatibility with the surrounding uses. It will also be important for the District to engage in a conversation with the surrounding residents during the design phase of the project.

<u>Site Planning</u>
The subject property was originally envisioned as a walkable, neighborhood serving commercial center that is surrounding by existing dense townhomes, condominiums and apartments. These residential units were designed with the presumption that this site would ultimately develop with small scale commercial uses. Therefore, DUSD should use sensitive site planning to maintain a high quality of life and reduce potential negative impacts to the surrounding neighborhoods with the operation of a school on this site. The following are general comments regarding site planning:

- Buildings, parking areas, and play fields should be located in such a manner to reduce impacts to surrounding residential uses.
    - Careful consideration should be given to the placement of on-site play fields and the impact resulting from lights, public announcement equipment, and general noise during the day time, evenings and weekends.
    - Parking areas should be located to reduce visual impacts, noise impacts, and nuisances to surrounding residents.
    - Adequate parking should be provided to ensure that overflow parking does not impact the surrounding neighborhoods.
    - Building placement should be carefully considered given the close proximity of residential uses, including the potential visual impacts of

buildings and noise impacts generated by the use of a class bell system and areas for students to congregate.

- The homes fronting on to the site have a minimal setback and separation to the site. It was anticipated that future development of the site would include a buffer separating the uses. Please consider providing a generous buffer, such as landscaping, to separate these homes from the proposed school.
- The interface with the adjacent 2 acre Devany Square should be taken into consideration when creating the site plan for the school.

Traffic and Circulation

The City has planned a comprehensive circulation network through the General Plan and the Bicycle and Pedestrian Master Plan. The intent is to facilitate movement by all modes of transportation through the site and to facilitate connections the surrounding neighborhoods. Careful consideration to the location and design of the access points to the school is critical to ensure efficient circulation to and from the school while minimizing impacts to the surrounding neighborhoods. The City would like to collaborate with DUSD on traffic and circulation. Therefore, we request that DUSD consult with the City's Transportation and Operations Manager early and often during the design process. The following are general comments regarding traffic and circulation:

- The General Plan and the Bicycle and Pedestrian Master Plan should be consulted and adhered to as best as possible to facilitate full and efficient connectivity for all modes of transportation.
- The location of the primary and secondary access points to the school site should be designed to minimize potential impacts to the roadway network and surrounding neighborhoods.
- Access and circulation by all modes of transportation (i.e. vehicles, pedestrians and bicycles) should be considered when designing the site.
- The loading and unloading of students from buses and vehicles should be coordinated with pedestrian entrances.
- Currently, Grafton Street is planned to connect north/south through the site and Finnian Way is planned to connect east/west through the site. Consideration should be given to the development of the site and impacts to access and circulation to and through the site.
- Similarly, a future extension of the Class 1 bike path is planned to extend along the western side of the site from Central Parkway to Dublin Boulevard, between the Neighborhood Commercial and Public/Semi-Public parcels. This pathway will connect northern neighborhoods to the commercial areas south of Dublin Boulevard. Consideration should be given to maintaining such a planned connection.

Public Works

- There are future planned public improvements that still need to be implemented as part of the site improvements, including but not limited to street extensions, street widening, traffic signals, street dedication, and easement dedications.
- The proposed project site is located in the Dublin Ranch Water Shed and will require coordination with the Dublin Ranch Home Owner's Association.
- The proposed project will also be subject to the clean water requirements of the Municipal Regional Permit (MRP), as applicable, including provisions C-3, C-6 and C-10.

Report to DUSD

A written report of the above findings is included as Attachment 2 of this Staff Report. The Planning Commission may choose to incorporate some or all of the comments set forth into the report.

ENVIRONMENTAL REVIEW

Determination of compliance with the General Plan is not considered a project as defined pursuant to Section §21065 of the California Environmental Quality Act (CEQA), and therefore no further environmental review is required at this time. Should DUSD proceed with the development of a school on this site, that would be considered a project and subject to review under CEQA.

NOTICING REQUIREMENTS/PUBLIC OUTREACH

Per Section 8.132 of the Zoning Ordinance, a Notice of Public Hearing is only required when a Public Hearing is required for certain projects. Since determination of compliance with the General Plan is not considered a project, a Public Hearing is not required, and therefore, a Notice of Public Hearing is not required. It is anticipated that future actions by DUSD to acquire the site and construct a school would be subject to a public notice

Re: Dublin Unified School District/Proposed Property Acquisition Project; Notification Pursuant to Public Resources Code Section 21151.2 and Government Code Section 65402

Dear Chris:

This is to advise you that the Dublin Unified School District is considering the acquisition of real property in the County of Alameda and within the City of Dublin sphere of influence for District use. The subject property consists of approximately 23 acres located at the Southwest corner of Chancery Lane and Central Parkway in Dublin, Alameda County APNs 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005, 985-0078-006, and 985-0078-007. The site is commonly referred to as the "Promenade" property. The District is considering the acquisition of the property for a potential public school. The property is generally depicted in the attached for your reference.

This letter is to provide you with formal notice under Public Resources Code section 21151.2 and Government Code section 65402 regarding the possible acquisition of the property. (Copies of those code sections also are attached for your reference.)

Please process this notice in accordance with the above-referenced code sections. If you have any questions, please contact the undersigned at your convenience. Thank you.

Sincerely,

Joe Sorrera
Assistant Superintendent
Business Services

Enclosures

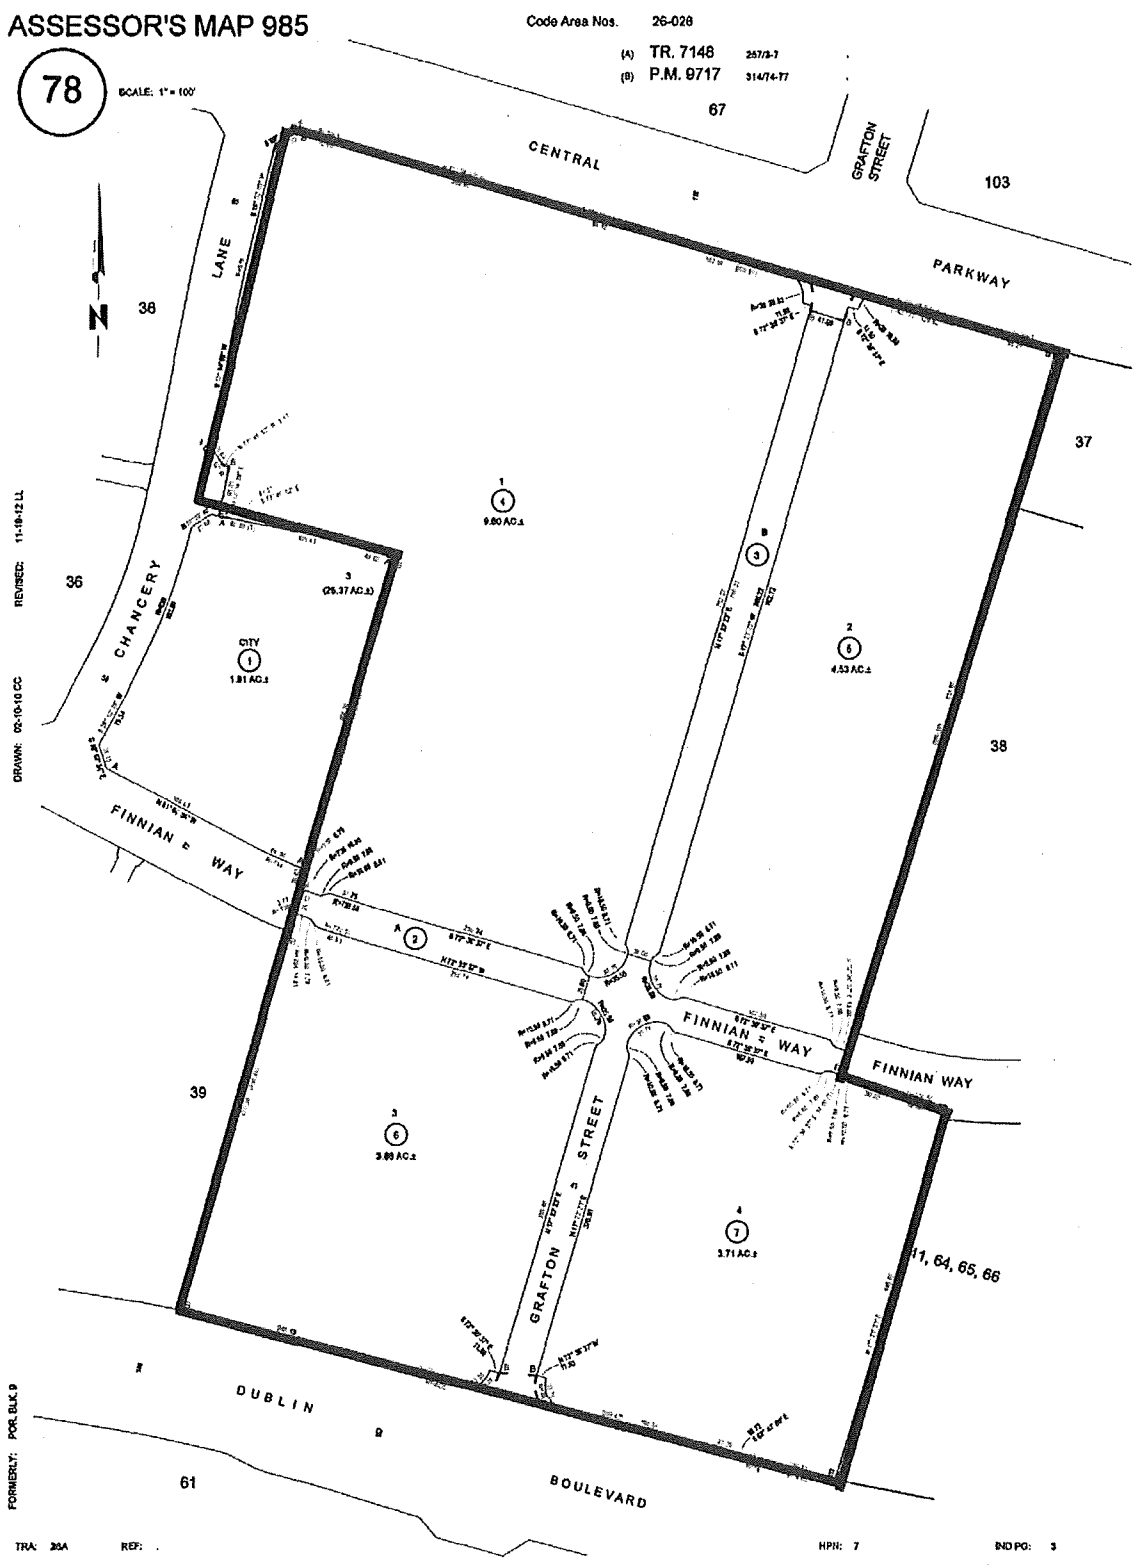
PUBLIC RESOURCES CODE SECTION 21151.2:

To promote the safety of pupils and comprehensive community planning the governing board of each school district before acquiring title to property for a new school site or for an addition to a present school site, shall give the planning commission having jurisdiction notice in writing of the proposed acquisition. The planning commission shall investigate the proposed site and within 30 days after receipt of the notice shall submit to the governing board a written report of the investigation and its recommendations concerning acquisition of the site.

The governing board shall not acquire title to the property until the report of the planning commission has been received. If the report does not favor the acquisition of the property for a school site, or for an addition to a present school site, the governing board of the school district shall not acquire title to the property until 30 days after the commission's report is received.

GOVERNMENT CODE SECTION 65402:

(a) If a general plan or part thereof has been adopted, no real property shall be acquired by dedication or otherwise for street, square, park or other public purposes, and no real property shall be disposed of, no street shall be vacated or abandoned, and no public building or structure shall be constructed or authorized, if the adopted general plan or part thereof applies thereto, until the location, purpose and extent of such acquisition or disposition, such street vacation or abandonment, or such public building or structure have been submitted to and reported upon by the planning agency as to conformity with said adopted general plan or part thereof. The planning agency shall render its report as to conformity with said adopted general plan or part thereof within forty (40) days after the matter was submitted to it, or such longer period of time as may be designated by the legislative body.



If the legislative body so provides, by ordinance or resolution, the provisions of this subdivision shall not apply to: (1) the disposition of the remainder of a larger parcel which was acquired and used in part for street purposes; (2) acquisitions, dispositions, or abandonments for street widening; or (3) alignment projects, provided such dispositions for street purposes, acquisitions, dispositions, or abandonments for street widening, or alignment projects are of a minor nature.

(b) A county shall not acquire real property for any of the purposes specified in paragraph (a), nor dispose of any real property, nor construct or authorize a public building or structure, in another county or within the corporate limits of a city, if such city or other county has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, and a city shall not acquire real property for any of the purposes specified in paragraph (a), nor dispose of any real property, nor construct or authorize a public building or structure, in another city or in unincorporated territory, if such other city or the county in which such unincorporated territory is situated has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, until the location, purpose and extent of such acquisition, disposition, or such public building or structure have been submitted to and reported upon by the planning agency having jurisdiction, as to conformity with said adopted general plan or part thereof. Failure of the planning agency to report within forty (40) days after the matter has been submitted to it shall be conclusively deemed a finding that the proposed acquisition, disposition, or public building or structure is in conformity with said adopted general plan or part thereof. The provisions of this paragraph (b) shall not apply to acquisition or abandonment for street widening or alignment projects of a minor nature if the legislative body having the real property within its boundaries so provides by ordinance or resolution.

(c) A local agency shall not acquire real property for any of the purposes specified in paragraph (a) nor dispose of any real property, nor construct or authorize a public building or structure, in any county or city, if such county or city has adopted a general plan or part thereof and such general plan or part thereof is applicable thereto, until the location, purpose and extent of such acquisition, disposition, or such public building or structure have been submitted to and reported upon by the planning agency having jurisdiction, as to conformity with said adopted general plan or part thereof. Failure of the planning agency to report within forty (40) days after the matter has been submitted to it shall be conclusively deemed a finding that the proposed acquisition, disposition, or public building or structure is in conformity with said adopted general plan or part thereof. If the planning agency disapproves the location, purpose or extent of such acquisition, disposition, or the public building or structure, the disapproval may be overruled by the local agency.

Local agency as used in this paragraph (c) means an agency of the state for the local performance of governmental or proprietary functions within limited boundaries. Local agency does not include the state, or county, or a city.

For Assessment Use Only

WRITTEN REPORT OF THE PLANNING COMMISSION TO THE DUBLIN UNIFIED SCHOOL DISTRICT PURSUANT TO PUBLIC RESOURCES CODE §21151.2 AND GOVERNMENT CODE §65402

The Planning Commission of the City of Dublin finds that the proposed acquisition of approximately 23 acres located at the southeast corner of Chancery Lane and Central Parkway (APN's 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005. 985-0078-006, and 985-0078-007) is inconsistent with the General Plan and associated Zoning Ordinance.

Understanding that the Dublin Unified School District has identified the need for an additional school site, if the District proceeds with the proposed site acquisition and utilizes their power to override applicable zoning ordinances, the Planning Commission offers the following recommendations in accordance with Public Resources Code §21151.2. The District has not yet presented a development plan for the site. Therefore, the comments and recommendations are general in nature and should be considered when planning a school for this site in order to help ensure compatibility with the surrounding uses. It will also be important for the District to engage in a conversation with the surrounding residents during the design phase of the project.

Site Planning

The subject property was originally envisioned as a walkable, neighborhood serving commercial center that is surrounding by existing dense townhomes, condominiums and apartments. These residential units were designed with the presumption that this site would ultimately develop with small scale commercial uses. Therefore, DUSD should use sensitive site planning to maintain a high quality of life and reduce potential negative impacts to the surrounding neighborhoods with the operation of a school on this site. The following are general comments regarding site planning:

- Buildings, parking areas, and play fields should be located in such a manner to reduce impacts to surrounding residential uses.
    - Careful consideration should be given to the placement of on-site play fields and the impact resulting from lights, public announcement equipment, and general noise during the day time, evenings and weekends.
    - Parking areas should be located to reduce visual impacts, noise impacts, and nuisances to surrounding residents.
    - Adequate parking should be provided to ensure that overflow parking does not impact the surrounding neighborhoods.
    - Building placement should be carefully considered given the close proximity of residential uses, including the potential visual impacts of buildings and noise impacts generated by the use of a class bell system and areas for students to congregate.
- The homes fronting on to the site have a minimal setback and separation to the site. It was anticipated that future development of the site would include a buffer separating the uses. Please consider providing a generous buffer, such as landscaping, to separate these homes from the proposed school.
- The interface with the adjacent 2-acre Devany Square should be taken into consideration when creating the site plan for the school.

Traffic and Circulation

The City has planned a comprehensive circulation network through the General Plan and the Bicycle and Pedestrian Master Plan. The intent is to facilitate movement by all modes of

transportation through the site and to facilitate connections the surrounding neighborhoods. Careful consideration to the location and design of the access points to the school is critical to ensure efficient circulation to and from the school while minimizing impacts to the surrounding neighborhoods. The City would like to collaborate with DUSD on traffic and circulation. Therefore, we request that DUSD consult with the City's Transportation and Operations Manager early and often during the design process. The following are general comments regarding traffic and circulation:

- The General Plan and the Bicycle and Pedestrian Master Plan should be consulted and adhered to as best as possible to facilitate full and efficient connectivity for all modes of transportation.
- The location of the primary and secondary access points to the school site should be designed to minimize potential impacts to the roadway network and surrounding neighborhoods.
- Access and circulation by all modes of transportation (i.e. vehicles, pedestrians and bicycles) should be considered when designing the site.
- The loading and unloading of students from buses and vehicles should be coordinated with pedestrian entrances.

- Currently, Grafton Street is planned to connect north/south through the site and Finnian Way is planned to connect east/west through the site. Consideration should be given to the development of the site and impacts to access and circulation to and through the site.
- Similarly, a future extension of the Class 1 bike path is planned to extend along the western side of the site from Central Parkway to Dublin Boulevard, between the Neighborhood Commercial and Public/Semi-Public parcels. This pathway will connect northern neighborhoods to the commercial areas south of Dublin Boulevard. Consideration should be given to maintaining such a planned connection.

Public Works

- There are future planned public improvements that still need to be implemented as part of the site improvements, including but not limited to street extensions, street widening, traffic signals, street dedication, and easement dedications.
- The proposed project site is located in the Dublin Ranch Water Shed and will require coordination with the Dublin Ranch Home Owner's Association.
- The proposed project will also be subject to the clean water requirements of the Municipal Regional Permit (MRP), as applicable, including provisions C-3, C-6 and C-10.

Future DUSD Comprehensive High School Project EIR

1 message

Computer Person <ts1234ts@gmail.com> Thu, Oct 17, 2019 at 11:24 AM
To: dusdceqa@dublinusd.org

RE Building Plans and EIR for New Dublin HS:

There are NO tennis court facilities in the fly-over at all.
That's terrible for PE students, teams, and general public. (There need to be at least 12 lighted courts with sufficient side spacing and separate entrancing.)

There is not enough parking provided. (High Schools need lots of parking for classes and events.)
There is not a sufficient dedicated drop-off and wait line location. (Traffic congestion and traffic flow are not properly planned.)

Planners are being incompetent here on some basics.

RESPONSE TO DRAFT EIR - Promenade High School Project (proposed project).

David Hammer <davidrhammer45@gmail.com> Mon, Oct 14, 2019 at 4:39 PM
To: dusdceqa@dublinusd.org
Cc: milleramy@dublinusd.org, rousemegan@dublinusd.org, cherrierdan@dublinusd.org, blackmangabi@dublinusd.org, Mukherjee2525@mydusd.org, Athi9183@mydusd.org, markendave@dublinusd.org, bustosvicki@dublinusd.org

Dear Mr. Stevens,

I am an attorney representing a home owner in Dublin who will be affected by the proposed school. My client does not wish to be identified.

This is a formal response pursuant to CEQA to the Draft EIR.

As noted in the project plans, the proposed school would be surrounded by high density residential housing. On three sides there are three story condominiums and apartments. Along the entire east side there is no street or buffer zone between the school and the adjacent condominiums. The negative environmental impacts of noise and traffic cannot be mitigated. The problem is that the parcel is too small and does not allow for a buffer zone between non-compatible adjacent uses. In contrast, the existing Dublin High School located at the corner of Village Parkway and Brighton Dr. has a buffer zone around all of the school property, except for nine single family dwellings to the southeast and eight mixed housing units to the northwest. The EIR needs to fully address these issues so that the project can be evaluated on its merits.

I am confident when the unmitigated environmental effects are identified that the project will be cancelled, and litigation can be avoided.

Please acknowledge receipt of this response.

Thank you for your courtesy and consideration.

Chris Stevens

Chief Facilities Operations Officer

Dublin Unified School District

7471 Larkdale Avenue

Dublin,CA 94568

Dear Mr. Stevens,

Recently, I received from you a Notice of Preparation for the Promenade High School Project Draft Environmental Impact Report. Within this letter it states that the public is invited to comment regarding the scope of the EIR and issues that should be addressed.

Being that I live adjacent to the project site, and after reviewing the enclosed site plan, I have concerns regarding traffic circulation, and parking within the site and in the surrounding neighborhoods.

My first concern regards parking. The project description cites a 134 stall parking garage, but I do not see an actual garage location indicated on the project site plan. Is the garage located along Central Parkway, or is it located at the southeast corner of the project site? Are the 134 spaces inclusive of staff parking, or are the 134 spaces reserved for the student body. Either way, 134 spaces seems to be far below what will be needed, especially when phase II is completed; and most importantly, street parking in my neighborhood is already very limited. How will students be discouraged from parking in my neighborhood? Carpooling parking preference? Permits for residents? If so, who will administer the permits for residents (and not at our expense)?

My biggest concern is about the potential negative impact the Promenade High School will have on traffic flow along Central Parkway. The project site plan appears to indicate a number of parking spaces along the northern border of the site adjacent to Central Parkway. This street is only one lane in each direction. I think that vehicular access to the high school from Central Parkway is a terrible idea, which will result in traffic jams 2X daily, air pollution from stationary vehicles, and will be unsafe for cyclists. I frequently ride my bike, and I always try to avoid riding near school zones; with this project being so near my home, I'll have no route choice. A Central Parkway access point can't be good for students who ride their bikes, either. Additionally, I don't see where this project site has included a safe pickup and drop-off area. There should be an adequate one, and it should be located along Dublin Boulevard and not Central Parkway.

My final concern is about noise generated from events held at the stadium. It is my hope that a curfew, rigidly enforced, is set no later than 9pm.

Thank you for allowing me to suggest issues to be included in the Draft EIR for the Promenade High School site.

Sincerely,

James R Hull

Re: Promenade High School Project – Notice of Preparation of an EIR

Dear Mr. Stevens,

Zone 7 Water Agency (Zone 7, or Zone 7 of the Alameda County Flood Control and Water Conservation District) has reviewed the referenced document in the context of Zone 7's mission to provide water supply, flood protection, and groundwater and stream management within the Livermore-Amador Valley. Following are our comments for your consideration:

1. Stormwater Evaluation and Detention. The EIR should include a comprehensive analysis of stormwater runoff. We encourage DUSD and the City of Dublin to explore options to incorporate more detention into this site; this could include deeper / larger ponds or ditches beyond the MRP C.3 or GSI requirements.

2. Artificial turf. It is our understanding that artificial turf, in practice, is not water-free and has potential environmental concerns including runoff of pollutants. While Zone 7 does not have an official position on the use of artificial turf, we feel these are important issues that should be fully addressed in the EIR.

3. Groundwater Wells. A preliminary records search indicates that there are no wells or groundwater issues in the project area. Please verify these results in the field and report any unknown wells to Zone 7. Also, be advised that a Zone 7 drilling permit is needed for any water well or soil boring work that may be planned for this project. The drilling permit application and fee schedule can be downloaded from our website: http://www.zone7water.com/permits-a-fees/64-well-drilling-and-destruction-permits.

4. Development Impact Fee. New development and the expansion of existing development may impose a burden on the existing flood protection and storm drainage infrastructure within the Zone 7 service area. Developments creating new impervious areas within the Livermore-Amador Valley are subject to the assessment of the Development Impact Fee for Flood Protection and Storm Water Drainage. These fees are collected for Zone 7 by the local governing agency: 1) upon approval of final map for public improvements creating new impervious areas; and/or 2) upon issuance of a building or use permit required for site improvements creating new impervious areas. Fees are dependent on whether post-project impervious area

conditions are greater than pre-project conditions and/or whether fees have previously been paid. Please refer to Zone 7's Flood Protection & Storm Water Drainage Development Impact Fee Ordinance and additional information at: http://www.zone7water.com/permits-a-fees.

In an effort to ensure that mailed notices and referrals from your agency make their way to the appropriate staff at Zone 7 in a timely manner, we are requesting that your databases / mailing lists are updated to reflect the following points of contact, specifically for routine development referrals and for CEQA / environmental reviews.

For CEQA / environmental review:	**For development review / referral:**
Zone 7 Water Agency **Attn: CEQA Review / Elke Rank** 100 North Canons Parkway Livermore, CA 94551 ceqa@zone7water.com Staff contact: Elke Rank, erank@zone7water.com	Zone 7 Water Agency **Attn: Dev Referral / Steven Ellis** 100 North Canons Parkway Livermore, CA 94551 reviewers@zone7water.com Staff contact: Steven Ellis, sellis@zone7water.com

We appreciate the opportunity to comment on this project. If you have any questions on this letter, please feel free to contact me at (925) 454-5005 or via email at erank@zone7water.com .

Sincerely,

Elke Rank

Chris

This High School project is proposed to be built in most dense residential area in our community.

There are at least three other locations nearby that would not affect the lives of residents as much as the proposed location.

1 – Between Tassajara RD. and Lowes store/Brannigan St, near I580.

2 – Between new Kaiser Medical facility and Target, near I580.

3 - Between new Kaiser Medical facility and Hotel Aloft, near I580.

With potential late afternoon or evening games, the residents facing the parking and stadium would likely be exposed to a significantly increased amount of noise, commotion and traffic. This proposed location is definitely not ideal and it poses a real concern with respect to noise, safety and the overall enjoyment of our otherwise peaceful community.

I've been speaking with a number of residence and all have expressed the same concerns.

We are asking Dublin School District to please reconsider the location of this school.

Regards,

Richard Wieckowski

Comments on the Future Comprehensive high school in Dublin Draft EIR:

I am living right next to the High school. So I am Really covered about the noise and traffic of it.

I am on the pool and locker room side. will any walls being bulid to stop noise?

~~Can we build more~~

Also Dublin Blvd is pretty busy now, ~~How will~~ we should Have more students go through central park way

~~I am~~ I am not comfortable to Have more students come though the sides to school. it will be noise around as well

Comments on the Future Comprehensive high school in Dublin Draft EIR:

Traffic control & Noise control are main issue..

Name: Kristi Marleau

Agency/Address: 3551 Central Pkwy

Contact Information: kmarleau@gmail.com

Comments on the Future Comprehensive high school in Dublin Draft EIR:

When analyzing VMT, include the effects of additional traffic on Central Parkway if parking is sited on the Central side of campus, which may impact [redacted] biking and pedestrian comfort levels and therefore increase VMT.

When one parking lot is full, will drivers have to go all the way around the block to get to the other? How will this impact VMT?

All parking access should be on Dublin Blvd, which can handle the traffic. Bicyclists and pedestrians should have low stress access to campus via Central Parkway

Nobody Cares <a.spambox2011@gmail.com> Tue, Oct 15, 2019 at 8:20 PM
To: dusdceqa@dublinusd.org

"Over two dozen planning meetings with students, staff, the City, and our community"

I call this BS. Nobody ever spoke with community and Promenade neighborhood. Never. Please correct your statement. So far every single resident in this community is strongly against building school in the middle of residential high density development with inadequate roads, parking space and many other issues that your planning community never discussed. Please, include this in your future press releases as well.

Thank you!

Soil Haul [1]

Construction Activities	Haul Truck Capacity (cy)	Import Volume (CY)	No. of total one-way import haul (trip ends)	No. of total one-way haul (trip ends/day)	Export Volume (CY)	No. of total one-way export haul (trip ends)	No. of total one-way haul (trip ends/day)	Total Days
Rough Grading	25	45,000	3600	360	12,650	1,012	101	10

Export Haul Travel Distance (1-Way): 20

Architectural Coating
Percentage of Proposed Buildings' Interior Painted: 100%
Percentage of Proposed Buildings' Exterior Painted: 100%

BAAQMD Regulation 8, Rule 3
Interior Paint VOC content: 100 grams per liter
Exterior Paing VOC content: 150 grams per liter

Non-Residential Structures	Land Use Square Feet	CalEEMod Factor[2]	Total Paintable Surface Area	Paintable Interior Area[1]	Paintable Exterior Area[1]
Total Building	323,954	2.0	647,908	485,931	161,977
			647,908	485,931	161,977
Parking Lot	246,169	6%	14,770	-	14,770
			14,770		14,770

[1] CalEEMod methodology calculates the paintable interior and exterior areas by multiplying the total paintable surface area by 75 and 25 percent, respectively.
[2] The program assumes the total surface for painting equals 2.7 times the floor square footage for residential and 2 times that for nonresidential square footage defined by the user. Architectural coatings for the parking lot is based on CalEEMod methodology applied to a surface parking lot (i.e., striping), in which 6% of surface area is painted.
[3] 100% of the interior and exterior of buildings to be modernized will be painted

BAAQMD Construction BMPs

Replace Ground Cover	PM10:	5	% Reduction
Replace Ground Cover	PM2.5:	5	% Reduction

TOTAL	100%	1,408,874	0	5,855,581

Water Use (Gal/Yr)

Indoor 11,561,910.00
Outdoor 28,317,600.00
*assumes 100% aerobic treatment

Solid Waste (Tons/Yr) 579.89

Architectural Coating *see Construction Assumptions*

Electricity (Buildings)
Existing Energy

Existing residential and non-residential modeled using historic energy demand rates in CalEEMod. Modeling is conservative because the net increase in energy use due to the project is likely smaller than reflected due to improved building energy efficiency between the project and existing land uses.

Non-Residential Exceed Title 24	**30%**	Improvement over 2016

Water/Wastewater/Solid Waste Calculations

Water Use (CalEEMod Defaults)

Land Use	Indoor	Outdoor	Total (gal/yr)
High School	11,012,400.00	28,317,600.00	39,330,000.00

*Assumes 100% aerobic treatment.

Solid Waste (CalEEMod Defaults

Land Use	Total Solid Waste (tons/yr)
High School	456.25

Water Use During Events (assumes all indoor/wastewater)

Event	No. of Spectators	Water Demand Rate (gal/day/seat)*	Total Indoor Water Use (gal/event)	No. of Events	Annual Indoor Water Use (gal/yr)
Stadium Capacity Events	4,000	4	16,000	11	176,000
Games	400	4	1,600	34	54,400
Practices	131	4	525	186	97,650
Student Events	1,000	4	4,000	24	96,000
Theater (Capacity)	820	4	3,280	26	83,640
Theater (Non-Capacity)	410	4	1,640	26	41,820
				TOTAL	**549,510**

**School Stadium Sewage Generation Rate. City of Los Angeles. 2006. L.A. CEQA Thresholds Guide.*

Solid Waste

Spectator Solid Waste Rate:* 0.09 tons/100 visitors/year

Event	No. of Users	No. of Events	Total Users Per Year	Solid Waste Generation Rate (ton/user/year)	Solid Waste (ton/yr)
Stadium Capacity Events	4,000	11	44,000	0.0009	40
Games	400	34	13,600	0.0009	12
Practices	131	186	24,413	0.0009	22
Student Events	1,000	24	24,000	0.0009	22
Theater (Capacity)	820	26	20,910	0.0009	19
Theater (Non-Capacity)	410	26	10,455	0.0009	9
				TOTAL	**123.64**

**Based on CalEEMod solid waste generation rate for an arena (see Appendix D of the California Emissions Estimator Model User's Guide, Version 2016.3.2, October 2017)*

Water Use (Gal/Yr)	
Indoor	11,561,910.00
Outdoor	28,317,600.00
Solid Waste (Tons/Yr)	579.89

Architectural Coating *see Construction Assumptions*

Electricity (Buildings)

Existing Energy

Existing residential and non-residential modeled using historic energy demand rates in CalEEMod. Modeling is conservative because the net increase in energy use due to the project is likely smaller than reflected due to improved building energy efficiency between the project and existing land uses.

Non-Residential Exceed Title 24	**30%**	Improvement over 2016

City of Dublin Carbon Intensity Factor Calculator

The project team calculated a custom electricity emissions factor for East Bay Community Energy (EBCE) by consulting the most recent data from the US EPA's Emissions & Generation Resource Integrated Database (eGRID). This database includes records of GHG emissions and power generation by all power plants in the United States. Using this information, the team determined the electricity emissions factor for all power plants within California by fuel source, since it is not feasible to identify the specific power plants that supply EBCE. The team consulted EBCE's Power Mix, which identifies the percent of EBCE's electricity generated by various fuel sources. Using the average emissions factor for power plants by fuel source, in combination with EBCE's specific fuel mix, the team was able to calculate an emissions factor that accurately reflects EBCE's particular sources of electricity.

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Los Angeles (SC) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

EMFAC2017 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2022
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN

EMFAC2017 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2022
Season: Summer
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN

EMFAC2017 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2022
Season: Winter
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN

Construction Model

Promenade High School Development Construction - Alameda County, Annual

Future High School Development Construction

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	323.95	1000sqft	6.36	323,954.00	0
Enclosed Parking Structure	56.67	1000sqft	1.30	56,669.00	0
Other Asphalt Surfaces	11.25	1000sqft	0.26	11,250.00	0
Other Non-Asphalt Surfaces	487.55	1000sqft	11.19	487,545.00	0
Parking Lot	189.50	1000sqft	4.35	189,500.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	63
Climate Zone	4			**Operational Year**	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - accounts for academy 1 building with 3 floors

Construction Phase - construction schedule provided by applicant

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - assuming one excavator for landscaping

Off-road Equipment - assuming one excavator for landscaping

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - no additional equipment required for grading soil haul

Off-road Equipment - assuming 1 excavator for trenching

Trips and VMT - 4 vt/water truck/day, assuming 25 cy truck for hauling

Grading -

Architectural Coating - only accounting for parking area

Construction Off-road Equipment Mitigation - BAAQMD BMPs

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - accounts for academy 1 building with 3 floors

Construction Phase - construction schedule provided by applicant

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - assuming one excavator for landscaping

Off-road Equipment - assuming one excavator for landscaping

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - no additional equipment required for grading soil haul

Off-road Equipment - assuming 1 excavator for trenching

Trips and VMT - 4 vt/water truck/day, assuming 25 cy truck for hauling

Grading -

Architectural Coating - only accounting for parking area

Construction Off-road Equipment Mitigation - BAAQMD BMPs, MM: Tier 4 Final for equipment >50 HP

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Rough Grading - 2020

Unmitigated Construction On-Site

Future High School Operations Run - Alameda County, Annual

Future High School Operations Run

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	2,500.00	Student	6.36	323,954.00	0
Enclosed Parking with Elevator	56.67	1000sqft	1.30	56,670.00	0
Other Asphalt Surfaces	11.25	1000sqft	0.26	11,250.00	0
Other Non-Asphalt Surfaces	487.54	1000sqft	11.19	487,540.00	0
Parking Lot	189.50	1000sqft	4.35	189,500.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	63
Climate Zone	4			**Operational Year**	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	358.04	**CH4 Intensity (lb/MWhr)**	0.041	**N2O Intensity (lb/MWhr)**	0.005

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - accounts for the high school building sqft and building footprint

Construction Phase -

Vehicle Trips - see assumptions file for trips calculation and notes

Area Coating - parking AC accounts only for parking area

Energy Use -

Water And Wastewater - increase in indoor water to account for stadium water use, assumes 100% aerobic treatment

Solid Waste - accounts for stadium solid waste generation

Energy Mitigation -

Water Mitigation - MM: assuming 100% reclaimed outdoor water

Fleet Mix - see assumptions file for adjustments to the fleet mix

Appendix C:
Health Risk Assessment

1. Health Risk Assessment

1.1 CONSTRUCTION HEALTH RISK ASSESSMENT

The Dublin Unified School District (DUSD) proposes to redevelop a comprehensive high school (project) in the City of Dublin. The proposed school site is a 23.46-acre vacant property located at the southeast corner of Central Parkway and Chancery Lane in the City of Dublin, Alameda County, California. The proposed project would involve grading, site preparation, and the construction of classroom and administrative buildings, gymnasium, library, and related educational purposes, as well as an all-weather track and field, hardcourts and playfields. The following provides the background methodology used for the construction health risk assessment for the proposed project.

The latest version of the Bay Area Air Quality Management District (BAAQMD) CEQA Air Quality Guidelines requires projects to evaluate the impacts of construction activities on sensitive receptors (BAAQMD, 2017). Project construction is anticipated to take place starting at the beginning of June 2020 and be completed by July 2022 (approximately 535 work days). The nearest sensitive receptors to the project site include the adjacent multi-story residences to the east and to the west. The BAAQMD has developed *Screening Tables for Air Toxics Evaluation During Construction* (2017) that evaluate construction-related health risks associated with residential, commercial, and industrial projects. According to the screening tables, the residences are closer than the distance of 100 meters (328 feet) that would screen out potential health risks and, therefore, could be potentially impacted from the proposed construction activities. As a result, a site-specific construction health risk assessment (HRA) has been prepared for the proposed project. This HRA considers the health impact to off-site sensitive receptors (children at the nearby residences) from construction emissions at the project site, including diesel equipment exhaust (diesel particulate matter or DPM) and particulate matter less than 2.5 microns ($PM_{2.5}$).

It should be noted that these health impacts are based on conservative (i.e., health protective) assumptions. The United States Environmental Protection Agency (USEPA, 2005) and the Office of Environmental Health Hazard Assessment (OEHHA, 2015) note that conservative assumptions used in a risk assessment are intended to ensure that the estimated risks do not underestimate the actual risks. Therefore, the estimated risks may not necessarily represent actual risks experienced by populations at or near a site. The use of conservative assumptions tends to produce upper-bound estimates of exposure and thus risk.

For residential-based receptors, the following conservative assumptions were used:

- It was assumed that maximum-exposed off-site residential receptors (both children and adults) stood outdoors and are subject to DPM at their residence for 8 hours per day, and approximately 260 construction days per year. In reality, California residents typically will spend on average 2 hours per day outdoors at their residences (USEPA, 2011). This would result in lower exposures to construction related DPM emissions and lower estimated risk values.

- The calculated risk for infants from third trimester to age 2 is multiplied by a factor of 10 to account for early life exposure and uncertainty in child versus adult exposure impacts (OEHHA, 2015).

A survey of additional sensitive receptor types was conducted in addition to the nearby residential receptors. The closest school to the project site is Kolb Elementary School located over 1,200 feet northeast of the site. The closest day care facility is Dublin Kidz Daycare and Preschool at 4458 Tarcento Lane, approximately 900 feet northeast of the site. In general, school and day care-based sensitive receptors would be present on-site fewer days per year (i.e., typically 180 school days per year) as compared to residential receptors (i.e., 350 days per year). Additionally, health risk calculations for elementary school students would use a different age range (i.e., ages 2 to 16, age sensitivity factor of 3) than child residents (i.e., third trimester pregnancy to age 2, age sensitivity factor of 10). Thus, the determined health risks for child residents would be multiplied by the larger factor of 10 to account for early life exposure as compared to students or day care children. Given the distance to the day care facility and the school site, shorter exposure frequency of school and day care occupants compared to residents, and smaller age sensitivity factor for elementary students, the health risk determination was conservatively based on the nearby residential receptors. The school and day care receptors were omitted from the evaluation.

1.2 METHODOLOGY AND SIGNIFICANCE THRESHOLDS

For this HRA, the BAAQMD significance thresholds were deemed to be appropriate and the thresholds that were used for this project are shown below:

- Excess cancer risk of more than 10 in a million
- Non-cancer hazard index (chronic or acute) greater than 1.0
- Incremental increase in average annual $PM_{2.5}$ concentration of greater than 0.3 $\mu g/m^3$

The methodology used in this HRA is consistent with the following BAAQMD and the OEHHA guidance documents:

- BAAQMD, 2017. *California Environmental Quality Act (CEQA) Air Quality Guidelines*. May 2017.
- BAAQMD, 2016. *Planning Healthy Places*. May 2016.
- BAAQMD, 2010. *Screening Tables for Air Toxics Evaluation During Construction.* May 2010.
- BAAQMD, 2012. *Recommended Methods for Screening and Modeling Local Risks and Hazards*. Version 3.0. May 2012.
- OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments.* February, 2015.

Potential exposures to DPM and $PM_{2.5}$ from proposed project construction were evaluated for off-site sensitive receptors in close proximity to the site. Pollutant concentrations were estimated using an air dispersion model, and excess lifetime cancer risks and chronic non-cancer hazard indexes were calculated. These risks were then compared to the significance thresholds adopted for this HRA.

1.3 CONSTRUCTION EMISSIONS

Construction emissions were calculated as average daily emissions in pounds per day, using the proposed construction schedule and the latest version of California Emissions Estimation Model, known as CalEEMod Version 2016.3.2 (CAPCOA, 2016). DPM emissions were based on the CalEEMod construction runs, using annual exhaust PM_{10} construction emissions presented in pounds (lbs) per day. The $PM_{2.5}$ emissions were taken from the CalEEMod output for exhaust $PM_{2.5}$ also presented in lbs per day.

The project was assumed to take place over 2 years (535 work days) from beginning of June 2020 to July 2022. The average daily emission rates from construction equipment used during the proposed project were determined by dividing the annual average emissions for each construction year by the number of construction days per year for each calendar year of construction (i.e., 2020, 2021, and 2022). The off-site hauling emission rates were adjusted to evaluate localized emissions from the 0.35-mile haul route within 1,000 feet of the project site. The CalEEMod construction emissions output and emission rate calculations are provided in Appendix A of the HRA.

1.4 DISPERSION MODELING

Air quality modeling was performed using the AERMOD atmospheric dispersion model to assess the impact of emitted compounds on sensitive receptors near the project. The model is a steady state Gaussian plume model and is an approved model by BAAQMD for estimating ground level impacts from point and fugitive sources in simple and complex terrain. The on-site construction emissions for the project were modeled as poly-area sources. The off-site mobile sources were modeled as adjacent line volume sources. The model requires additional input parameters, including chemical emission data and local meteorology. Inputs for the construction emission rates are those described in Section 1.3. Meteorological data obtained from the BAAQMD for the nearest representative meteorological station (Livermore Municipal Airport) with the five latest available years (2009 to 2013) of record were used to represent local weather conditions and prevailing winds.

The modeling analysis also considered the spatial distribution and elevation of each emitting source in relation to the sensitive receptors. To accommodate the model's Cartesian grid format, direction-dependent calculations were obtained by identifying the Universal Transverse Mercator (UTM) coordinates for each source location. In addition, digital elevation model (DEM) data for the area were obtained and included in the model runs to account for complex terrain. An emission release height of 4.15 meters was used as representative of the stack exhaust height for off-road construction equipment and diesel truck traffic, and an initial vertical dispersion parameter of 1.93 m was used, per California Air Resources Board (CARB) guidance (2000).

To determine contaminant impacts during construction hours, the model's Season-Hour-Day (HRDOW) scalar option was invoked to predict flagpole-level concentrations (1.5 m for ground-floor receptors, 6.1 m for 2nd-floor, 9.14 m for 3rd floor) for construction emissions generated between the hours of 7:00 AM and 4:00 PM with a 1-hour lunch break. In addition, a scalar factor was applied to the risk calculations to account for the number of days residents are exposed to construction emissions per year.

A unit emission rate of 1 gram per second was used for all modeling runs. The unit emission rates were proportioned over the poly-area sources for on-site construction emissions and divided between the volume sources for off-site hauling emissions. The maximum modeled concentrations from the output files were then multiplied by the emission rates calculated in Appendix A to obtain the maximum flagpole-level concentrations at the off-site maximum exposed receptors (MER). The off-site MER is a multi-family residence immediately east of the site along Fitzwilliam Street. The MER location is the receptor location associated with the maximum predicted AERMOD concentrations from the on-site emission source. The calculated on-site emission rates are approximately 2-3 orders of magnitude higher than the calculated off-site emission rates (see Appendix A). Therefore, the maximum concentrations associated with the on-site emission sources produce the highest overall ground-level MER concentrations and, consequently, highest calculated health risks.

The air dispersion model output for the emission sources is presented in Appendix B. The model output DPM and $PM_{2.5}$ concentrations from the construction emission sources are provided in Appendix C.

1.5 RISK CHARACTERIZATION

1.5.1 Carcinogenic Chemical Risk

A threshold of ten in a million ($10x10^{-6}$) has been established as a level posing no significant risk for exposures to carcinogens. Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. The cancer risk probability is determined by multiplying the chemical's annual concentration by its cancer potency factor (CPF), a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It is an upper-limit estimate of the probability of contracting cancer as a result of continuous exposure to an ambient concentration of one microgram per cubic meter ($\mu g/m^3$) over a lifetime of 70 years.

Recent guidance from OEHHA recommends a refinement to the standard point estimate approach with the use of age-specific breathing rates and age sensitivity factors (ASFs) to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose for each age group. Once determined, contaminant dose is multiplied by the cancer potency factor in units of inverse dose expressed in milligrams per kilogram per day $(mg/kg/day)^{-1}$ to derive the cancer risk estimate. Therefore, to accommodate the unique exposures associated with the residential receptors, the following dose algorithm was used.

$$\text{Dose}_{\text{AIR,per age group}} = \left(C_{air} \times EF \times \left[\frac{BR}{BW}\right] \times A \times CF\right)$$

Where:

$Dose_{AIR}$	=	dose by inhalation (mg/kg-day), per age group
C_{air}	=	concentration of contaminant in air ($\mu g/m^3$)
EF	=	exposure frequency (number of days/365 days)
BR/BW	=	daily breathing rate normalized to body weight (L/kg-day)

A	=	inhalation absorption factor (default = 1)
CF	=	conversion factor ($1x10^{-6}$, µg to mg, L to m^3)

The inhalation absorption factor (A) is a unitless factor that is only used if the cancer potency factor included a correction for absorption across the lung. The default value of 1 was used for this assessment. For residential receptors, the exposure frequency (EF) of 0.96 is used to represent 350 days per year to allow for a two week period away from home each year (OEHHA, 2015). The 95th percentile daily breathing rates (BR/BW), exposure duration (ED), age sensitivity factors (ASFs), and fraction of time at home (FAH) for the various age groups are provided herein:

Age Groups	BR/BW (L/kg-day)	ED	ASF	FAH
Third trimester	361	0.25	10	0.85
0-2 age group	1,090	2	10	0.85
2-9 age group	861	7	3	0.72
2-16 age group	745	14	3	0.72
16-30 age group	335	14	1	0.73
16-70 age group	290	54	1	0.73

For construction analysis, the exposure duration spans the length of construction (e.g. 535 work days). As the length of construction is equal to 2.05-year, only the third trimester and 0-2 age bins apply to the construction analysis for the off-site residential receptors.

To calculate the overall cancer risk, the risk for each appropriate age group is calculated per the following equation:

$$\text{Cancer Risk}_{\text{AIR}} = \text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{FAH} \times \frac{\text{ED}}{AT}$$

Where:

Dose_{AIR}	=	dose by inhalation (mg/kg-day), per age group
CPF	=	cancer potency factor, chemical-specific $(\text{mg/kg-day})^{-1}$
ASF	=	age sensitivity factor, per age group
FAH	=	fraction of time at home, per age group (for residential receptors only)
ED	=	exposure duration (years)
AT	=	averaging time period over which exposure duration is averaged (70 years)

The CPFs used in the assessment were obtained from OEHHA guidance. The excess lifetime cancer risks during the construction period to the maximally exposed resident were calculated based on the factors provided above. The cancer risks for each age group are summed to estimate the total cancer risk for each toxic chemical species. For purposes of this assessment, and as stated, the calculated residential cancer risks associated with construction activities are based on the 3rd trimester and 0-2 year old age groups. The final step converts the cancer risk in scientific notation to a whole number that expresses the cancer risk in "chances per million" by multiplying the cancer risk by a factor of $1x10^6$ (i.e. 1 million).

The calculated results are provided in Appendix C.

1.5.2 Non-Carcinogenic Hazards

An evaluation was also conducted of the potential non-cancer effects of chronic chemical exposures. Adverse health effects are evaluated by comparing the annual receptor level (flagpole) concentration of each chemical compound with the appropriate reference exposure limit (REL). Available RELs promulgated by OEHHA were considered in the assessment.

The hazard index approach was used to quantify non-carcinogenic impacts. The hazard index assumes that chronic sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). Target organs presented in regulatory guidance were used for each discrete chemical exposure. To calculate the hazard index, each chemical concentration or dose is divided by the appropriate toxicity value. This ratio is summed for compounds affecting the same toxicological endpoint. A health hazard is presumed to exist where the total equals or exceeds one.

The chronic hazard analysis for DPM is provided in Appendix C. The calculations contain the relevant exposure concentrations and corresponding reference dose values used in the evaluation of non-carcinogenic exposures.

1.5.3 Criteria Pollutants

The BAAQMD has recently incorporated $PM_{2.5}$ into the District's CEQA significance thresholds due to recent studies that show adverse health impacts from exposure to this pollutant. An incremental increase of greater than 0.3 $\mu g/m^3$ for the annual average $PM_{2.5}$ concentration is considered to be a significant impact.

1.6 CONSTRUCTION HRA RESULTS

The calculated results are provided in Appendix C and the results are summarized in Table 1.

TABLE 1. CONSTRUCTION RISK SUMMARY - UNMITIGATED

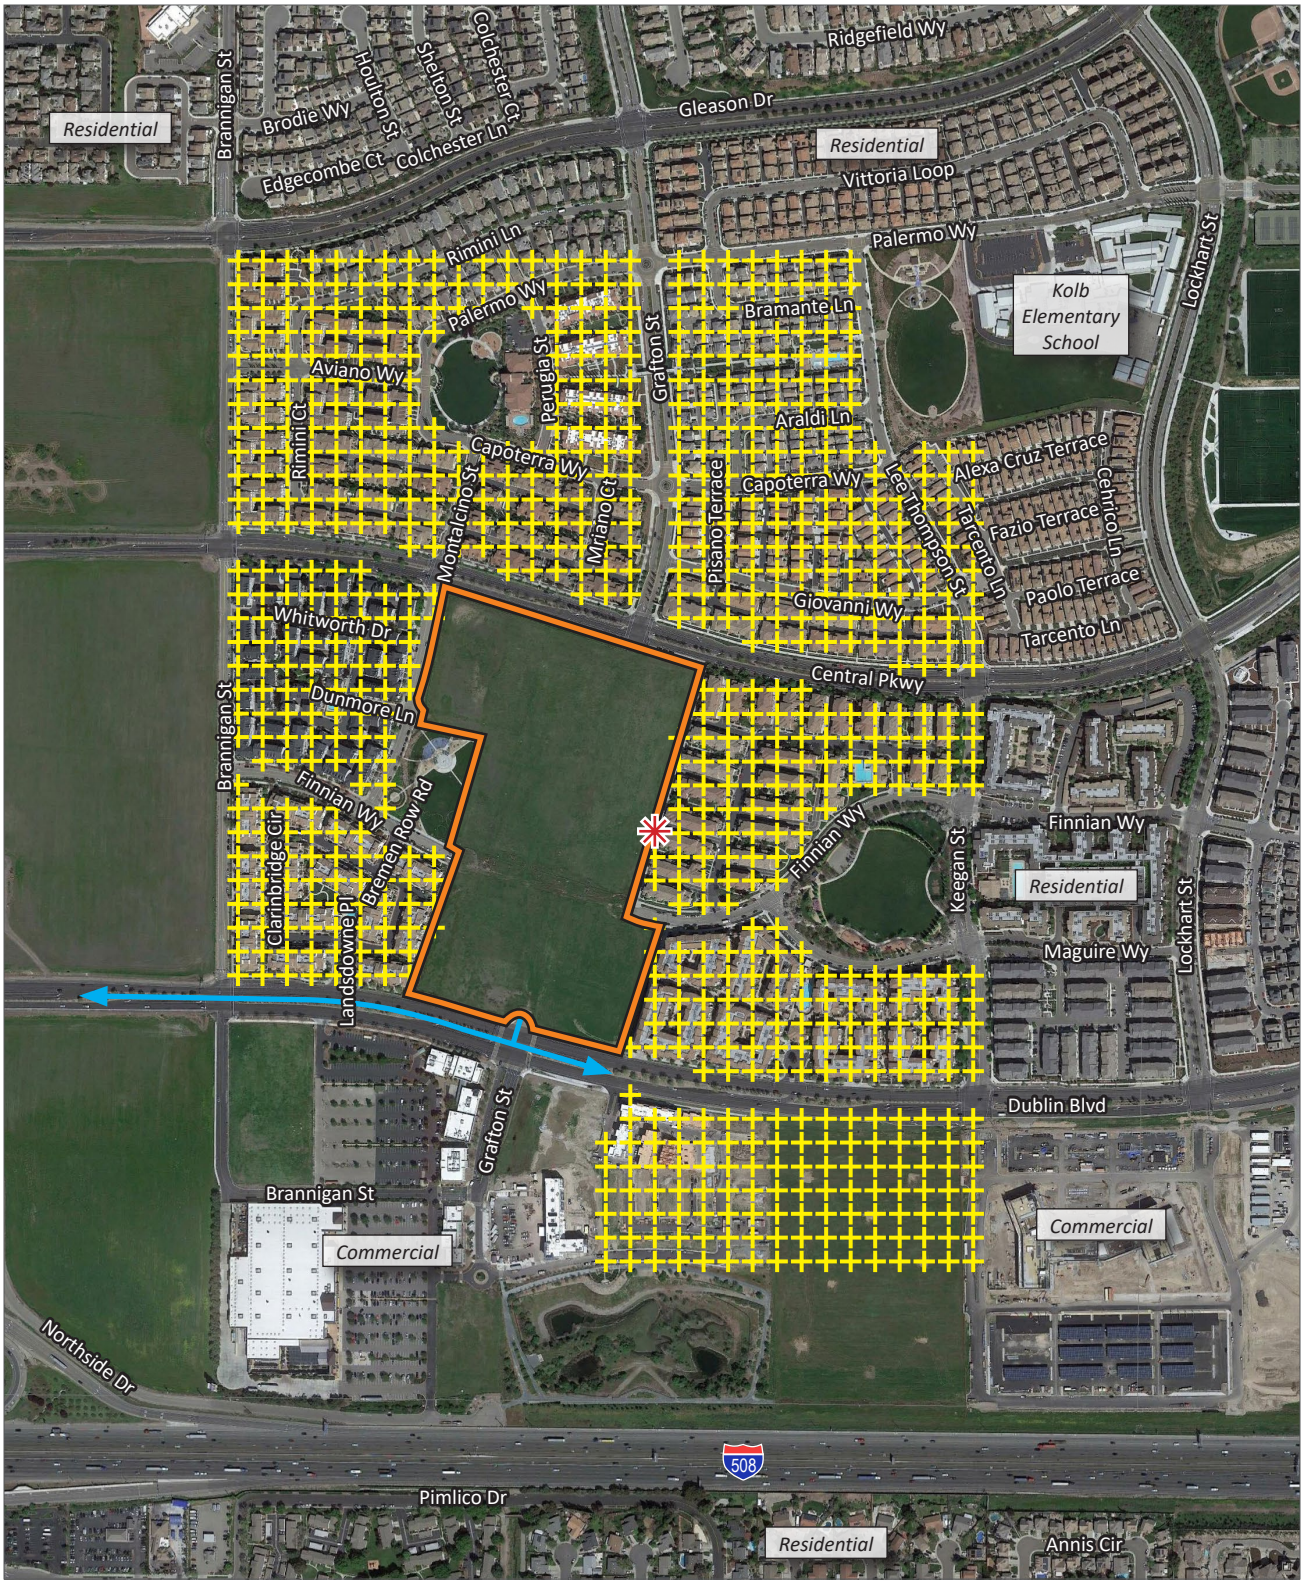
Receptor	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ ($\mu g/m^3$)
Maximum Exposed Receptor – Off-site Residences	36.2	0.090	0.18
BAAQMD Threshold	10	1.0	0.30
Exceeds Threshold?	**Yes**	**No**	**No**

Note: Cancer risk calculated using 2015 OEHHA HRA guidance.

Cancer risk for the maximum exposed receptor (MER) from project-related construction emissions was calculated to be 36.2 in a million, which exceeds the 10 in a million significance threshold. In accordance with the latest 2015 OEHHA guidance, the calculated total cancer risk conservatively assumes that the risk for the MER consists of a pregnant woman in the third trimester that subsequently gives birth to an infant during the approximately 2-year construction period; therefore, all calculated risk values were multiplied by a factor of 10. In addition, it was conservatively assumed that the residents were outdoors 8 hours a day, 260-262 construction days per year and exposed to all of the daily construction emissions.

For non-carcinogenic effects, the chronic hazard index identified for each toxicological endpoint totaled less than one for all the off-site sensitive receptors. Therefore, chronic non-carcinogenic hazards are within acceptable limits. Additionally, the highest annual $PM_{2.5}$ concentration of 0.18 $\mu g/m^3$ would not exceed the BAAQMD significance threshold of 0.3 micrograms per cubic meter ($\mu g/m^3$).

Because cancer risk for the MER would exceed BAAQMD's significance thresholds due to construction activities associated with the proposed project, the following mitigation measure is proposed:



> **Mitigation Measure AQ-3:** Prior to issuance of any construction permit, the applicant/general contractor for the project shall demonstrate to the local jurisdiction that all off-road equipment greater than 50 hp that will be operating for more than 20 hours over the entire duration of the construction activities at the site, including equipment from subcontractors meets the following requirement:
>
> - Have engines that meet either US EPA or California Air Resources Board (CARB) Tier 4 Final emission standards. Ensure that all construction plans submitted to the School District clearly show the selected emission reduction strategy for construction equipment over 50 horsepower.
> - Maintain a list of all operating equipment in use on the project site for verification by the School District official or his/her designee. The construction equipment list shall state the makes, models, and number of construction equipment on-site. Ensure that all equipment shall be properly serviced and maintained in accordance with the manufacturer's recommendations.
> - Communicate with all sub-contractors in contracts and construction documents that all non-essential idling of construction equipment is restricted to 5 minutes or less in compliance with California Air Resources Board Rule 2449 and is responsible for ensuring that this requirement is met

Mitigation Measure AQ-3 would reduce the project's localized construction emissions, as shown in the following table. The results indicate that, with mitigation, cancer risk would be less than the BAAQMD's significance thresholds for residential-based receptors. Therefore, the project would not expose off-site sensitive receptors to substantial concentrations of air pollutant emissions during construction and impacts would be *less than significant* with mitigation.

TABLE 2 CONSTRUCTION RISK SUMMARY – MITIGATED

Receptor	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ ($\mu g/m^3$)[a]
Maximum Exposed Receptor – Offsite Residences	3.4	0.008	0.02
BAAQMD Threshold	10	1.0	0.3
Exceeds Threshold?	**No**	**No**	**No**

Risks incorporate Mitigation Measure AQ-3, which includes using construction equipment which meets USEPA Tier 4 Final engine requirements for equipment over 50 horsepower.
Note: Cancer risk calculated using 2015 OEHHA HRA guidance.

**Model Set To Continue RUNning After the Setup Testing.
```

Model Output
Unit Emission Rates (1 g/s)

```
**The AERMET Input Meteorological Data Version Date:  14134

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   119.80 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      4.1 MB of RAM.

**Input Runstream File:          aermod.inp
**Output Print File:             aermod.out

**Detailed Error/Message File:   dublin.err
**File for Summary of Results:   dublin.sum
```

OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2020
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: Emissions: tons/day, Fuel Consumption: gallons/year, Activity: hours/year, HP-Hours: HP-hours/year

Region	CalYr	VehClass	MdlYr	HP_Bin	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2_5_tpd	PM_tpd	SOx_tpd	NH3_tpd	Fuel_gpy	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy

OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2021
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: Emissions: tons/day, Fuel Consumption: gallons/year, Activity: hours/year, HP-Hours: HP-hours/year

Region	CalYr	VehClass	MdlYr	HP_Bin	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2_5_tpd	PM_tpd	SOx_tpd	NH3_tpd	Fuel_gpy	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy

OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: Emissions: tons/day, Fuel Consumption: gallons/year, Activity: hours/year, HP-Hours: HP-hours/year

Region	CalYr	VehClass	MdlYr	HP_Bin	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2_5_tpd	PM_tpd	SOx_tpd	NH3_tpd	Fuel_gpy	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy

EMFAC2017 (v1.0.2) Emissions Inventory
Region Type: Sub-Area
Region: Alameda (SF)
Calendar Year: 2021
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, trips/day for Trips, tons/day for Emissions, 1000 gallons/day for Fuel Consumptior

RE: Geotechnical Engineering Investigation
Proposed Dublin Unified New High School
Central Parkway and Chancery Lane
Dublin, Alameda County, California

Dear Mr. Iwanaga:

In accordance with your request, we have completed a Geotechnical Engineering Investigation for the above-referenced site. The results of our investigation are presented in the attached report.

If you have any questions, or if we may be of further assistance, please do not hesitate to contact our office at (925) 907-1160.

Respectfully submitted,
KRAZAN & ASSOCIATES, INC.

David R. Jarosz, II

GEOTECHNICAL ENGINEERING INVESTIGATION
PROPOSED NEW HIGH SCHOOL
CENTRAL PARKWAY AND CHANCERY LANE
DUBLIN, ALAMEDA COUNTY, CALIFORNIA

INTRODUCTION

This report presents the results of our Geotechnical Engineering Investigation for the proposed Dublin Unified New High School site to be located at the southeast corner of Central Parkway and Chancery Lane in Dublin, Alameda County, California. Discussions regarding site conditions are presented herein, together with conclusions and recommendations pertaining to site preparation, Engineered Fill, utility trench backfill, drainage and landscaping, foundations, concrete floor slabs and exterior flatwork, retaining walls, and pavement design.

A site plan showing the approximate boring locations is presented following the text of this report. A description of the field investigation, boring logs, and the boring log legend are presented in Appendix A. Appendix A contains a description of the laboratory testing phase of this study, along with the laboratory test results. Appendices B and C contain guides to earthwork and pavement specifications. When conflicts in the text of the report occur with the general specifications in the appendices, the recommendations in the text of the report have precedence.

PURPOSE AND SCOPE

This investigation was conducted to evaluate the soil and groundwater conditions at the site, to make geotechnical engineering recommendations for use in design of specific construction elements, and to provide criteria for site preparation and Engineered Fill construction.

Our scope of services was outlined in our proposal dated May 13, 2019 (KA Proposal No. P292-19) and included the following:

- A site reconnaissance by a member of our engineering staff to evaluate the surface conditions at the project site.
- A review of available data for evaluation of subsurface conditions at the project site.
- A search of geologic and seismologic literature pertaining to the area of the site.
- Evaluation of potential geologic hazards.

- A field investigation consisting of drilling 49 borings to depths ranging from approximately 10 to 50 feet for evaluation of the subsurface conditions at the project site.

- Performing laboratory tests on representative soil samples obtained from the borings to evaluate the physical and index properties of the subsurface soils.

- Evaluation of the data obtained from the investigation and an engineering analysis to provide recommendations for use in the project design and preparation of construction specifications.

- Preparation of this report summarizing the results, conclusions, recommendations, and findings of our investigation.

PROPOSED CONSTRUCTION

We understand that design of the proposed school is currently underway. Some of the final details pertaining to the structures are unavailable. It is understood the New High School site project within the Dublin Unified School District is in the final design stages. The project scope consists of constructing classroom buildings, a multi-use building, day care building and administrative offices. The structures are planned to utilize concrete slab-on-grade construction. Foundation loads are anticipated to be light to moderate. Construction of on-site play courts, walkways, parking, and landscaping are also planned.

In the event, these structural or grading details are inconsistent with the final design criteria, the Soils Engineer should be notified so that we may update this writing as applicable.

SITE LOCATION, SITE HISTORY AND SITE DESCRIPTION

The Dublin Unified New High School site is located along the northern edge of the Amador Valley within the eastern portion of the City of Dublin in Alameda County, California (see Vicinity Map, Figure 1). The proposed school campus encompasses approximately 23 acres and is comprised of a recently graded vacant lot located in a partially developed area. The site is located on the southeast corner of Central Parkway and Chancery Lane. The Dublin Unified New High School Campus is bound to the north, east and west by multi-family and single-family residential construction; and to the south by commercial developments. The school property is located at longitude 121.86485° West and latitude 37.70726° North. The US Geological Survey Livermore, California 7.5-minute Quadrangle, dated 1961, photo revised 1980, indicates that surface elevations in the vicinity of the site are on the order of 350 to 361 feet above mean sea level (amsl). However, the site has been recently graded as part of a mass development. The minor drainage-course that trended through the site and vicinity had been backfilled as part of the mass grading performed on the site and surrounding properties. The minor watercourse identified as the Arroyo Las Pasitas is located approximately 4,000 feet south of the subject site.

Site history was obtained by reviewing historical aerial photographs taken in 1939, 1940, 1949, 1958, 1966, 1968, 1979, 1982, 1993, 1998, 2002, 2007, 2009 and 2016. Review of the 1939 aerial photograph indicates the school site and surrounding properties were utilized as agricultural land for farming and

pasture. A seasonal stream trended northwest to southeast through the central portion of the site. A rural residential development was located approximately 800 feet north of the subject site. No structures appeared to occupy the site.

Review of the 1940 through 1998 aerial photographs show similar conditions with the subject site still being utilized as agricultural land or pastureland.

Review of the 2002 aerial photograph shows the subject site was used as a staging area for construction equipment and supplies for development of the surrounding properties. Central Parkway had been constructed along the northern edge of the site. Dublin Boulevard had been constructed along the southern edge of the site. Chancery Lane had been constructed along the northwestern edge of the site. The remainder of the site was predominately surrounded by residential and commercial developments under construction and agricultural land.

Review of 2007 aerial photograph indicates the subject site conditions were relatively similar to that noted in the 2002 aerial photograph.

Review of the 2009 aerial photograph indicates that the project site predominately consisted of vacant land. The majority of the equipment and supplies had been removed from the site. Several vehicles and trailers were still present in the southern portion of the site. Some remnants of gravel were still present throughout the site.

Review of the 2016 aerial photograph indicates that the project site conditions appeared to be relatively similar to that noted in the 2009 aerial photograph.

The proposed school campus is presently a vacant previously graded lot. Some construction equipment was located on the site. Central Parkway has been constructed along the northern edge of the site. The proposed new buildings with associated landscaping, pavement and sidewalk improvements are planned to be constructed throughout the school campus. (See Site Geologic Map, Figure 2). The area proposed for development is previously vacant graded land. The site is covered by a moderate weed growth that has been recently disced. The surface soils have a loose consistency. Buried utility lines, such as electrical, water, and storm drain are located within the project site vicinity. The areas of proposed development are located on areas of fill soil. The areas of proposed development are relatively level with no major changes in grade. The school property has a gentle slope toward the south with approximately 10 to 15 feet of relief across the campus. Storm water is collected within drainage swales along the edges of the site and diverted to a storm water drainage system.

No evidence of surface faulting was observed on the property during our reconnaissance. No evidence of slope failures or instabilities were observed on the subject property or adjoining properties.

GEOLOGIC SETTING

General

The project area is located at the base of the foothills of Mt. Diablo, along the northern edge of the Amador Valley, within the central portion of the Coast Ranges Geomorphic Province of California. The foothills of Mt. Diablo are bound by Mt. Diablo on the north, on the west by Las Trampas Ridge and San Ramon Valley, on the east by the foothills of Mt. Diablo and Las Positas Valley, and on the south by Amador Valley. The Coast Ranges generally consist of an alternating series of parallel mountains and valleys located adjacent to the Pacific Coast. The bedrock units that form the range have been disrupted by intense folding, faulting, and crushing that occurred when the range was formed by the processes of plate tectonics. During the Jurassic and Cretaceous Periods (about 150 to 80 million years ago), the Pacific Oceanic Plate, which was progressively moving towards the east, collided with the North American Continental Plate, which was moving toward the west. This collision caused the less rigid Pacific Oceanic Plate to be subducted beneath the North American Continental Plate. The colliding motion of the two plates caused portions of the Pacific Oceanic Crust and overlying marine sediments to be piled onto the North American Continental Plate along the west coast of California. The resulting chaotic jumble of bedrock units scraped off onto the North American Plate, is known as the "Franciscan Assemblage" and comprises a large portion of the Coast Range Province. Subsequent development of a series of northwest-trending fault zones has further contributed to the deformation of the Coast Ranges.

During the Pleistocene Epoch ("Ice Age"), the San Francisco Bay depression was formed by down faulting (down warping) of the earth's crust. During this time, sea levels lowered by as much as 350 feet, leading to increased erosion by the streams and rivers discharging into the bay. With the melting of the last ice sheets, beginning about 12,000 years ago, the sea level gradually rose to its present level. Much of the clay and silt carried by the river flood waters were deposited within the quiet bay waters, resulting in significant accumulations of "bay mud" in marshlands and mudflats.

Tassajara Creek, Cottonwood Creek, Arroyo Las Positas, and Arroyo Valle are the principal drainage courses in the area. Alluvial fans and flood deposits formed by these drainage courses are the predominant geomorphic features in the Valley area. The area of the subject site is characterized by sediment accumulation during the early Pleistocene interval of erosion and deposition in the Livermore Valley.

A Regional Geologic Map, Regional Geologic Cross-Section, and Local Geologic Maps are presented on Figures 4, 5, and 6, respectively.

Lithology

In general, the Coast Ranges are composed of sedimentary bedrock interspersed with volcanics. Nearer the surface, layers of alluvium fill the intervening valleys. The 1990 Geologic Map of the San Francisco-San Jose Quadrangle, indicates that the near-surface deposits in area of the subject site are identified as the Pliocene nonmarine Tassajara Formation. The Tassajara Formation is more commonly known as the Livermore Gravels. These units consist of sands, silts, clays and gravel.

The 2006 Geologic Map of the Livermore Quadrangle further defines the near-surface deposits in the area of the subject site as valley sediments of Livermore basin, sub-lithified, age of Pliocene to early Pleistocene. The sediments are identified locally as the Livermore Gravel consisting of pebble, gravel, sand, and predominately clay.

The modern depositional processes operating on the foot hills, valleys and lowlands are mainly the result of the region's Mediterranean climate and active tectonic setting. The interaction between easily eroded bedrock and the heavy winter rains causes large seasonal fluctuations in the sediment loads carried by streams from the uplands down to the bay. During times of high surface-water runoff, sediments are supplied from slopewash, landslides, and gullying, then carried by shifting alluvial channels to the marshlands and bay. Some material is deposited on the alluvial plain, especially when streams overtop their banks and spread their sediment-laden waters over the low plains and basins.

According to Helley and others, (1979), "the younger deposits make up the alluvial fans being formed under the existing regime. The streams forming these young fans are graded to present sea level. These younger deposits and the bay mud into which they grade are informally referred to as Holocene deposits. The older alluvial deposits now partly covered by the Holocene deposits, make up alluvial fans formed by these same streams when they were graded to lower strands of sea level during the late Pleistocene (prior to about 10,000 years ago). These older deposits are informally referred to as late Pleistocene alluvium. The Holocene alluvium is differentiated further into depositional units called facies on the basin of textural characteristics (that is, gravel, sand, silt, and clay) and the depositional environment (such as stream levees and floodbasins). These facies grade from coarse-grained gravel and sand deposits, which form prominent stream levees at the highest part of the alluvial fans, into medium-grained sand and silt deposits, which form broad flood plains and subdued levees along the lower margins of the alluvial fans. These stream deposits grade into and interfinger with fine-grained silt and clay deposits, which form the flat floor of flood basins between stream levees on the outer margins of the alluvial fans directly adjacent to the bay marshlands. This gradation from coarse-grained to fine-grained sediment in the Holocene alluvium is a natural consequence of very recent stream erosion, transportation, and deposition. The coarsest rock debris eroded from the bedrock uplands is deposited near the base of the hills where the rapidly flowing streams enter the broad, gently sloping alluvial plain. Only the finer-grained debris is carried by the ever-slackening water to the lower parts of the alluvial fans and eventually into the bay itself."

The subsurface information obtained in conjunction with the limited subsurface investigation performed concurrent with this study indicates that the surface and near-surface deposits at the subject site generally consist of silty clay, clayey silt, sandy clayey silt, silty sand, or clayey sand. These observed deposits are consistent with those mapped in the area, and are further described in the Soil Profile section of this report.

Structure and Faults

The San Francisco Bay region is tectonically dominated by horizontal shear caused by the relative motion of the Pacific and North American plates. The northwest-southeast shear, probably with some other superposed influences, produces right-lateral strike-slip, plus a variety of other types of crustal

movements. Since the boundary of the plates is generally diffuse, the various structural responses occur over a relatively broad band from the foot of the continental slope to the Central Valley. Transform-type plate movement did not begin at the latitude of San Francisco until about 10 to 7 million years ago, a time interval of transition in tectonics and sedimentation. The recent and current transform movement has superimposed a structural fabric on the pre-existing highly deformed structure created by Jurassic and Cretaceous subduction and emplacement of the Franciscan Formation.

Active faults in the region of the subject site are predominately characterized by strike-slip motion (right-lateral). Major nearby faults showing evidence of earthquake activity within historic time (past 200 years) in relation to the site include the Mount Diablo (2.6 miles east), the Calaveras (3.8 miles west), the Greenville (7.9 miles east), the Hayward-Rodgers Creek (10.6 miles west), and the San Andreas (29 miles west) faults. These faults are considered to be active, as they have demonstrated geologic displacement with the past 10,000 years.

Crustal movements measured in California today sample deformation processes that have been continued through at least the past 5 Ma of Pliocene, Pleistocene, and Holocene time. During this interval, several hundred kilometers of right-lateral offset has accumulated across the San Andreas fault system, and many thousands of great earthquakes similar to the historical events of 1857 and 1906 have undoubtedly occurred. The observed deformation results from relative right-lateral translation of the Pacific and North American plates far from the main plate-boundary faults, which are either freely slipping and without major seismic activity, or are in locked frictional contact and slip episodically in repeated great earthquakes. Aseismic fault slip (creep), as occurs across the San Andreas fault in central California causes no crustal deformation beyond a growing offset across the fault, although this offset may be distributed across a zone as broad as a few tens or hundreds of meters. Where the plate-boundary fault is alternately locked aseismically in its upper 10 km or so and abruptly slipping in great earthquakes, deformation extends several tens of kilometers into the plate interiors. Between large events, elastic strains build up in this zone and are episodically released every few hundred years. Subsequent postearthquake recovery processes redistribute the strains aseismically for years to decades after a major shock, and this deformation gradually merges into the steady accumulation of elastic-strain energy that persists until the frictional strength of the fault is again exceeded. This sequence of interearthquake strain accumulation, coseismic strain release, and postseismic readjustment is a recurring process.

The 8.25 magnitude earthquake of April 18, 1906, ranks as one of the most significant earthquakes of all time. Rupturing the northernmost 430 km of the San Andreas fault from the northwest of San Juan Bautista to the triple junction at Cape Mendocino, the earthquake confounded contemporary geologists with its large, horizontal displacements and great rupture length.

The characteristics and amount of surface fault slip in this earthquake varied to a remarkable degree along the length of the rupture. Peak displacements of 6 m were measured near Olema on the Point Reyes peninsula, where the surface trace of the rupture formed a sharp, well-defined break. In contrast, the fault break was extremely difficult to recognize along its southernmost 90 km, where the surface offset averaged only about 1½ m or less. The slip rate along the San Andreas fault in the vicinity of the project site is on the order of 17 mm/yr. to 24 mm/yr.

The Hayward-Rodgers Creek fault system is 150 km long, extending from near Healdsburg on the north to the Warm Springs district of Fremont on the south. South of San Pablo Bay, the fault passes through heavily urbanized areas where much evidence of the fault is obscured. The southern part of the fault produced the regionally damaging 1868 M6.8 earthquake. The East Bay Source Characterization Group considers the Hayward-Rogers Creek fault to be a three-segment system, identified as the Rogers Creek fault, the northern segment of the Hayward fault (Hayward North) and the southern segment of the Hayward fault (Hayward South).

The northern boundary of the Rogers Creek fault is a $\pm$5 km-wide zone south of Healdsburg in which the Holocene trace of the fault appears to die out. The southern boundary is a $\pm$5 km zone offshore beneath San Pablo Bay. The 6 km stepover from the Rogers Creek to the Hayward North fault is coincident the western edge of a prominent gravity low that extends approximately 20 km to the east of the step-over. There are no geophysical data that indicate the presence of a structural depression or extensional faulting within the stepover. It is also not known whether Rogers Creek and the Hayward North fault join at depth beneath this structure or remain individual faults through the seismogenic crust. Based on modeling of rupture propagation across steps in faults, the San Pablo Bay stepover continues to be viewed as a major structural and geometric barrier for ruptures propagating into it.

The Hayward North fault extends from the San Pablo Bay stepover to near Montclair in Oakland. With the timing constraint of the moist recent event (formerly the 1836 earthquake) removed, the primary basis for defining the Hayward North fault is that it is the section of the Hayward fault that did not rupture in 1868. An uncertainty of $\pm$5 km is assigned to the northern boundary in San Pablo Bay. The southern endpoint is less certain. The possible north end of the 1868 rupture near Rocky Mound is 20 km north of the segment boundary near San Leandro adopted by the East Bay Source Characterization Group, where the evidence for 1868 surface rupture was distinct (Lawson, 1908). Trenching evidence suggests the 1868 surface rupture extended at least to Montclair (Lienkaemper and Williams, 1999). There are no obvious geometric or lithologic changes along this reach of the fault that provide a physical basis for proposing a segment boundary. Therefore, a southern endpoint is possible anywhere between Mira Vista on the north, which did not rupture at the surface in 1868, and San Leandro. The segment endpoint selected by the East Bay Source Characterization Group lies at Montclair, about midway between Mira Vista and San Leandro, with an uncertainty of $\pm$10 km.

The East Bay Source Characterization Group takes the Hayward South fault to be the extent of the 1868 rupture. Nothing is known about the slip distribution of the 1868 earthquake or of the variability in rupture lengths and/or slip distributions of pre-historic Hayward South fault events. It is possible that Hayward North and Hayward South fault ruptures could overlap 10 to 20 km in the broad boundary between the two segments. The southern endpoint of the Hayward South fault is midway between the south end of known 1868 surface rupture at Agua Caliente Creek (Lawson, 1908) and the Alum Rock seismicity trend.

Slip rates for the Hayward-Rogers Creek fault are $\pm$2 mm/yr for each of the three fault segments based on paleoseimic and fault-creep data consistent with new paleoseismic observations of a minimum rate of 7-10 mm/yr for the past 8,400 years on the Hayward South fault at Union City (Lienkaemper and Borchardt, 1996) and 8.4$\pm$2 mm/yr for the past 900 years on Rogers Creek fault (Schwartz and others,

1992). Measurements of surface creep (Lienkaemper and others, 2001) show that the Hayward fault has an average creep rate of about 4 to 6 mm/yr with a high of 9 mm/yr near Fremont, a significant fraction of the overall geologic slip rate. Williams (1999) reports a long-term (35 ka) slip rate of 10±1 mm/yr on the Hayward North fault from offset of Strawberry Canyon.

The Calaveras fault, the closest active fault to the site, is a prominent part of the San Andreas fault system. To the east of the Hayward-Rogers Creek fault, the Calaveras fault extends 123 km, splaying from the San Andreas fault near Hollister and terminating at Danville at its northern end. The Calaveras fault forms the western margin of Livermore Valley and San Ramon Valley. The Calaveras fault is one of the most geologically active and complex faults in San Francisco Bay Region. As many as twelve M>5 earthquakes have occurred on the Calaveras fault during historical time. The Calaveras fault exhibits heterogeneous surface creep in the southern section, with slip rates as high as 17 mm/yr. Slip rates at the town of Hollister decrease from about 11 mm/yr. to 7 mm/yr. within 2.3 km along the fault. Surface creep is absent along the northern section. Although no significant elastic strain has been observed adjacent to the central section of the fault from geodetic data between 1970 and 1985, three moderate events occurred (M5.9 on 6 August 1979, M6.2 on 24 April 1984, and M5.1 on 13 June 1988), progressing sequentially northward along this section of the fault. Slip along the northern Calaveras fault appears to step across to the Concord-Green Valley fault zone along a northeast-trending conjugate left-lateral fault that produced the April 1990 Alamo earthquake sequence with the largest event of magnitude 4.5 (Oppenheimer and MacGregor-Scott, 1991). Analysis of historical seismic data has also identified persistent aseismic zones that are believed to represent locked patches of the southern and central Calaveras fault as well as most of the northern Calaveras fault.

One significant seismotectonic source is the Great Valley fault zone (Coast Ranges-Central Valley boundary zone), located west of the site. The Great Valley fault zone is the geomorphic boundary of the Coast Ranges and the Central Valley and is underlain by a 300-mile long seismically active fold and thrust belt that has been the source of recent earthquakes, such as the 1983 magnitude 6.5 Coalinga and the 1985 magnitude 6.1 Kettleman Hills earthquakes. Nearly the entire thrust system is concealed or "blind". The basal detachment of this thrust system dips at a shallow angle to the west. East-directed thrusting over ramps in the detachment and west-directed thrusting on backthrusts are responsible for the uplift along the eastern range front of the Coast Ranges. Based on earthquake focal mechanisms, movement on the thrust zone is generally perpendicular to the strike of the geomorphic boundary and trend of the San Andreas Fault system. Shortening along the geomorphic boundary is driven by a component of the Pacific-North American Plate motion that is normal to the plate boundary. The Great Valley fault zone is considered the dominant seismic feature with potential for affecting the subject site. The Great Valley fault zone – Segment 7 is located approximately 19.3 miles west of the subject site. The Great Valley fault zone – Segment 6 is inferred to be located beneath the City of Antioch. However, Segment 6 of this fault was omitted from the CGS 2002 California Fault Model. (Lao, T and others, 2003).

The northwest-trending central Greenville fault system, consisting of several segments or strands, is located approximately 7.1 miles east of the site. The fault is exposed for over 80 km along its length, from the north end, near Mt. Diablo, to its southern terminus in San Antonio Valley along the eastern side of Livermore Valley.

On January 24, 1980, an earthquake of magnitude 5.5 (Bolt et al., 1981) caused discontinuous right-lateral surface displacements along the southeastern branch of the Greenville fault, approximately 12 km southeast of Mount Diablo. Fault-plane solutions indicate a focal depth of 11.8 km (Bolt et al., 1981). The first principal shock was followed by a rapid succession of magnitude 5.0 and 4.0 earthquakes, resulting in a relatively long duration of ground shaking. The earthquake was followed by a series of aftershocks, culminating in a magnitude 5.6 event on January 27, 1980, located 12 km to the south of the first principal shock. The focal depth of the January 27 earthquake was 11.8 km. The maximum peak horizontal ground acceleration recorded during the earthquake was 0.26g at Del Valle Reservoir, located 11miles from the epicenter.

Contractional structures in the eastern San Francisco Bay area are part of a late Cenozoic fold-thrust belt, the Mt. Diablo fold-and-thrust belt (MDFTB), that can be traced from the northern Diablo Range, south of Livermore Valley, to the western Sacramento-San Joaquin Delta region. The MDFTB is bounded by dextral faults, the Greenville and Concord faults on the east and the Calaveras fault on the west. Thrust faults and associated folds in the MDFTB generally trend west-northwest, oblique to strike-slip faults on the San Andreas system, and exhibit a well-defined right-steeping en echelon geometry. The Mt. Diablo thrust fault, the largest structure the in the MDFTB, is driven by a restraining transfer of dextral slip from the Greenville fault to the Concord fault. The Mt. Diablo thrust fault is potentially capable of generating an earthquake of about M_W 6¾, which is comparable to the 1983 Coalinga M_L 6.7 and 1994 Northridge (M_W 6.7) earthquakes.

A group of northward-trending faults on the northeast flank of the Mt. Diablo antiform were evaluated with regard to their seismogenic potential during geological, seismological, and geophysical investigations of the proposed Los Vaqueros Dam site in eastern Contra Costa County. The faults, collectively referred to as the Vaqueros Faults, included the Brentwood, Kellogg, Vaqueros, Davis, and Camino Diablo faults. They occur along the southern projection of the Antioch Fault and in the area directly east and north of the more north-westerly-trending, active Marsh Creek-Greenville segments of the Greenville fault zone. This fault segment was the source of the 1980 M_L 5.9 and 5.3 Livermore earthquakes. Analysis of soil stratigraphy exposed in trenches and geomorphic analyses along faults reveals no evidence indicating that the Vaqueros faults have been active in Holocene time. The observed displacements on the Vaqueros faults appear to be associated with the formation of the Mt. Diablo antiform, beginning about 3 million years ago, rather than due to direct accommodation of plate motion in the present-day San Andreas Fault System (Bigger and Wong, 1992).

As noted above, several dominant faults with seisomgenic structures are located in the vicinity of the subject site. Table I is a listing of active faults or seismogenic structures within 50 miles (80 km) of the site, and a Fault Map is provided on Figure 7.

GEOLOGIC HAZARDS

Fault Rupture Hazard Zones in California

The Alquist-Priolo Geologic Hazards Zones Act went into effect in March, 1973. Since that time, the act has been amended 10 times (Hart, 1994). The purpose of the Act, as provided in DMG Special Publication 42 (SP 42), is to prohibit the location of most structures for human occupancy across the traces of active faults and to mitigate thereby the hazard of fault-rupture." The act was renamed the Alquist-Priolo Earthquake Fault Zoning Act in 1994, and at that time, the originally designated "Special Studies Zones" was renamed the "Earthquake Fault Zones."

The subject site is located on the Fault Rupture Hazard Zones Map for the Livermore Quadrangle dated January 1, 1982. However, the site is not within a Fault-Rupture Hazard Zone. The nearest zoned fault is a portion of an unnamed fault located about 1.5 miles west of the site. The closest well known fault is the Calaveras fault located more than 3.8 miles west of the subject site (refer to Fault Rupture Hazard Zone Map, Figure 11).

Seismic Hazard Zones in California

In 1990, the California State Legislature passed the Seismic Hazard Mapping Act to protect public safety from the effects of strong shaking, liquefaction, landslides, or other ground failure, and other hazards caused by earthquakes. The Act requires that the State Geologist delineate various seismic hazards zones on Seismic Hazards Zones Maps. Specifically, the maps identify areas where soil liquefaction and earthquake-induced landslides are most likely to occur. A site-specific geotechnical evaluation is required prior to permitting most urban developments within the mapped zones. The Act also requires sellers of real property within the zones to disclose this fact to potential buyers. The area of the subject site is included on the Seismic Hazard Zone Map entitled "Livermore Quadrangle", Official Map dated August 27, 2008 (refer to Seismic Hazard Zone Map, Figure 12). The site is located within areas identified as susceptible to liquefaction.

Historic Seismicity/Earthquake Epicenter Distribution

The Dublin/Livermore area has historically experienced a moderate to high degree of seismicity. A listing of historic earthquakes with magnitudes greater than 4.0 within approximately 50 miles (80 kilometers) of the subject site was obtained from the comprehensive California Geological Survey computerized earthquake catalog for the State of California, the Townley and Allen (1939) catalog and the U.S. Geological Survey Earthquake Data Base System. In addition, a listing was obtained for all historic earthquakes with magnitudes greater than 5.0 within approximately 100 miles of the site. The listings include the date, time, location, depth, magnitude, and intensity all recorded events within the search radius between 1800 and 2018. A review of the literature for pre-1900 earthquakes (Toppozada, 1991) does not reveal any significant recorded seismic events in the vicinity of the subject site prior to the period covered by the above listing.

The historic earthquake listings are included in Appendix B. A plot of epicenters associated with historic earthquakes in the region of the site with magnitudes greater than 5 is shown on Figure 8, Epicenter Map. The earthquake data indicates that 330 events with magnitudes greater than 4.0 occurred within 60 miles of the subject site between 1800 and 2018. One of the listed events occurred within 4.8 miles of the site. The data indicates that 13 events exceeded magnitudes 5.0 within 20 miles of the subject site. The nearest listed event occurred approximately 4.8 miles southwest of the site in 2003 with a magnitude of 4.1. Thirty-six of the listed earthquakes with magnitudes greater than 4.0 occurred within 20 miles of the site. Numerous earthquakes are listed with magnitudes between 5.0 and 6.0 beyond about 40 miles of the site. One event was recorded with a magnitude of 6.8 within 13 miles of the site.

The San Francisco earthquake of 1906 is undoubtedly the most important earthquake to have affected the central California area during historic time. It was investigated in great detail by geologists, seismologists, and engineers of the State Earthquake Investigation Commission, and the results of this investigation have served as the basis for much of our understanding of the relationship between earthquakes and faulting. The importance of this earthquake to our understanding of future earthquakes in the central California area is that it is the only "look-alike" for the "great" earthquake that is expected along the 1857 Break of the San Andreas Fault. Had the 1857 quake itself been studied in the detail that was given to the 1906 event, it would have been the most important event. However, very little is known about this earthquake that is useful for the objective stated above.

Another event likely to have caused a significant seismic effect in the area of the subject site during historic time is the 1892 Vacaville-Winters Earthquake. This earthquake likely occurred on the Coast Range Central Valley (CRCV) boundary zone thrust belt currently referred to as the Great Valley fault. This earthquake and related foreshocks and aftershocks are described by Bennett (1987), as follows: "Vacaville's night watchman, S.N. Bettis, was walking down Main Street at 2:40 a.m., lantern in hand, when "his attention was attracted by a rumbling sound coming from the hills, west of town. The noise resembled distant thunder or the roaring of water which had suddenly been let loose by the bursting of huge dam gates. Bettis stood still and listened a few seconds, while the noise increased to a roar and the ground beneath his feet seemed to heave up... "I felt as if I was on the deck of a vessel during a heavy storm, and I put my hands to the ground to prevent myself from falling on my face... After that, brick walls and chimneys began to fall around and the noise for a minute or so was deafening." On that Tuesday morning, April 19, 1892 most of northern California and west-central Nevada was shaken by an earthquake of about Richter magnitude (M) 6.5. Major damage was concentrated in the communities of Vacaville and Dixon in Solano County, and Winters in Yolo county, and surrounding rural areas along the western margin of the lower Sacramento Valley. Two days later at 9:43 a.m. on Thursday, April 21, a second severe earthquake in the M6 range shook the area again, causing further damage. The largest of numerous aftershocks, (approximately M5.5 event) occurred several days later. The larger April 19, 1892 event resulted in damage of intensity VII or greater effects were felt as far north as the communities of Esparto and Capay in Yolo County and also at Vacaville and Fairfield in Solano County to the south.

Recurrence of an event of similar magnitude in the Vacaville-Winters area today could be a threat to a vastly increased population and attendant facilities in the west Central Valley and San Joaquin Delta areas. The 1892 Vacaville-Winters earthquakes were comparable in destructive potential to the 1983 Coalinga earthquake (Mw6.4) or the 1971 San Fernando earthquake (Mw6.4). "Total damage in the relatively sparsely populated Coalinga area was $31 million; in the densely populated San Fernando area damage was over $500 million."

Wakabayashi and Smith (1994), in describing the historical seismicity of the Coast Range Central Valley region (CRCV) indicate that, "it appears probable that several large (M>6) earthquakes occurred too far east of the San Andreas and related strike-slip faults, and too far west of any probable Sierra Nevada extensional faulting, to be associated with any fault system other than the CRCV." These authors believe that previous estimates underestimated the magnitude of earthquakes in the Coast Range region. They recalculated magnitudes and showed that, in the period 1850 to 1985, there have been 11 large (>M6) earthquakes associated with the CRCV. They found that "the largest historical earthquakes attributed to the CRCV are the twin earthquakes of the 1892 Vacaville-Winters sequence. The largest of the two 1892 events may have been Mw6.8, compared to Mw6.5 for the 1983 Coalinga event."

The Livermore Valley, including the adjacent Dublin area, has experienced strong ground shaking during historic earthquakes. The July 1861 earthquake centered on the Calaveras fault had an estimated magnitude of 6.0 and produced severe damage in the Livermore Valley, near the present site of the city of Livermore (Radbruch, 1968). In 1906, the great San Francisco Earthquake (of magnitude 8+) on the San Andreas fault produced minor structural damage in Livermore Valley. Damage included cracked brick chimneys (approximately 50 percent collapsed), a fallen water tank, and ground fissures located about 1 mile (1.6 km) north of the city of Livermore with a maximum vertical uplift of about 19 inches (48 cm) (Lawson et al., 1908).

At 11:00 a.m. PST on Thursday, January 24, 1980, an earthquake of Magnitude 5.5 (M 5.5) shook the San Francisco Bay area. The epicenter of the quake was located approximately 12 kilometers southeast of Mount Diablo, in the sparsely-populated hills north of Livermore Valley. According to Bolt and others (1980), the M 5.5 earthquake was followed within two minutes by after-shocks of M 5.2 and M 4.2. This close repetition of M > 4 events resulted in a relatively long duration of shaking felt by people in the Livermore Valley and surrounding hills. Based on different methods of computation, the focal depth of the M 5.5 event earthquake was reported to be 11.8 kilometers (University of California Seismograph Station at Berkeley) and 6.5 kilometers (U. S. Geological Survey at Menlo Park). Discontinuous surface rupture associated with the earthquake was located approximately 12 kilometers south of the epicenter where a trace of the Greenville fault, previously mapped by Rogers (1966), crosses Vasco Road.

On January 26, 1980, at 6:33 p.m. PST, a second earthquake jolted the Livermore Valley and surrounding area. The epicenter of the second quake was located in the vicinity of Frick Lake, 14 kilometers south of the first earthquake epicenter and approximately 10 kilometers northeast of the town of Livermore. Seismologists from the University of California, Berkeley, reported a M 5.8 and a focal depth of 14.5 kilometers while the U. S. Geological Survey at Menlo Park reported a M 5.2 and a focal

depth of 9 kilometers. New zones of surface rupture were observed south of Vasco Road and across Laughlin Road along a projected trace of the Greenville fault previously mapped by Huey (1948) and Herd (1977).

Damage from the earthquakes was most evident in Livermore, the largest city close to the epicenters. After the January 24 event, 10,000 people were inconvenienced by loss of power for more than two hours. Plate glass windows shattered and piles of merchandise were scattered in shop aisles. Many mobile homes at the Sunrise Mobile Home Park were knocked off their foundations, buildings swayed and cracked in numerous places, and gas lines snapped. The overpass along Interstate 580 at Greenville Road was closed when paving on the east side of the structure settled nearly 30 centimeters as a result of shaking in fill materials. Although the overpass did not break, traffic was diverted until repairs and resurfacing of the road were completed. Fortunately, only a few minor injuries and one death (possibly from a heart attack) were reported as a result of the quake.

Probably of most concern to residents of Livermore were reports of damage to the nuclear research center at Lawrence Livermore Laboratory. However, most of the damage was non-structural, consisting largely of broken PVC pipes, paneling, glassware, overturned book shelves and untied trailers. Buildings housing radioactive materials and a reactor were unharmed. Costly damage was also experienced at the Wente Bros. Livermore winery where over a dozen giant stainless steel tanks were overturned by earthquake shaking and 168 out of 208 wine tanks suffered collapse or failure to some degree.

Geologic Subgrade

Information obtained from the geologic literature, as well as data from the above-described site exploration, indicate the general soil profile at the site consists predominately of loose/soft to dense/very stiff silty sand, sandy gravel, silty clay, and sandy clay. Assuming that any loose surface soil and fill material on the site are removed and recompacted as recommended in our Geotechnical Engineering Investigation, the geologic subgrade of the site can be conservatively approximated as "stiff soil". A Joyner-Boore Class C subgrade classification is considered appropriate for the soil profile and corresponds with a National Earthquake Hazard Reduction Program (NEHRP) (BSSC, 1994) Site Class D. The site class definition from the 2016 California Building Code that is most consistent with the site conditions is Site Class D.

Soil Liquefaction

Soil liquefaction is a state of soil particles suspension caused by a complete loss of strength when the effective stress drops to zero. Liquefaction normally occurs in soils such as sand in which the strength is purely friction. However, liquefaction has occurred in soils other than clean sand. Liquefaction usually occurs under vibratory conditions such as those induced by seismic event.

To evaluate the liquefaction potential of the site, the following items were evaluated:

1) Groundwater depth;

2) Soil type;

3) Relative density;

4) Initial confining pressure;

5) Intensity and duration of groundshaking.

The soils encountered within a depth of 50 feet on the project site predominately consist of stiff to hard silty clay, sandy clay, clayey silt and sandy clayey silt or loose to dense clayey sand or silty sand. Moderate cohesion strength is associated with the clayey soils. Groundwater was encountered below the site within a depth of about 15½ feet during subsurface exploration. Available groundwater depth mapping, as well as our experience in the area, indicates that historically groundwater has been located at depths as shallow as 8 feet below grade in the general vicinity of the site.

The potential for soil liquefaction during a seismic event was evaluated using the LIQUEFYPRO computer program (version 5.8h) developed by CivilTech Software. For the analysis, a maximum earthquake magnitude of 7.29 was used. A peak horizontal ground surface acceleration of 0.674g was considered conservative and appropriate for the liquefaction analysis. A groundwater depth of 8 feet was used for the analysis. The computer analysis indicates that soils above a depth of 8 feet are non-liquefiable due to the absence of groundwater. Some of the soils below a depth of 8 feet are considered to be liquefiable with factors of safety of 0.26 to 5.0. The analysis indicates that the total and differential seismic induced settlement is not anticipated to exceed 4 inches and 2⅔ inches, respectively. Accordingly, the liquefaction potential at the site is considered moderate and measures to mitigate liquefaction potential are provided in the site preparation section of this report.

Based on the estimated seismic settlements, liquefaction is considered a viable geologic hazard at the subject site.

Seismic Settlement

The estimated seismic settlement was determined at the site using the settlement analysis method by Tokimatsu, Seed, and Bolton (1987). The results of the settlement analysis are included as follows:

Location	Seismic Settlement (inches)				
	Saturated Settlement	Unsaturated Settlement	Total Settlement	Range of Differential Settlement	Design for Differential Settlement
B1	0.311	0.04	3.15	1.157 to 2.078	2⅔ Inches in 100 Feet
B19	4.01	0.00	4.01	2.005 to 2.647	
B30	0.75	0.00	0.75	0.377 to 0.498	

The above settlement values were determined at specific boring locations. The Consolidated Settlement (under static load of specific structures) and Differential Settlement (per specified length in building area) are indicated in the Foundations section of this report.

The native soils within the project site are not conducive to hydrocollapse due to the relatively firm to very stiff soil conditions, low void-ratio, shallow ground water, and moderate penetration resistance measured. Any loose fill material at the site could be vulnerable to hydrocollapse. However, the proposed structure is planned to be supported on Engineered Fill. Therefore, the structure will not be vulnerable to significant hydrocollapse. In addition, this hazard can be mitigated by following the design and construction recommendations of current and future Geotechnical Engineering Investigations (over-excavation and rework of any loose soils and/or uncertified fill materials).

An approximately 8 foot high hill has been recently reconstructed within the adjacent community park property west of the proposed school site. A small seasonal creek/drainage channel was previously located trending north-south through the site. The stream channel was backfilled and rerouted away from the site as part of the mass grading for the surrounding commercial and residential developments. The grading was approved and performed in accordance with Alameda County requirements. The potential for lateral spreading was evaluated using the "Revised Multilinear Regression Equations for Predication of Lateral Spread Displacement" by Youd, Hansen, Corbett and Bartlett (2002). Based on a lack of shallow liquefiable soils within the subject site, the distance of proposed structures from any existing streams or significant slopes, the site is not likely subject to lateral spreading hazards.

Subsidence Due to Fluid Withdrawal

Portions of California, such as the San Joaquin Valley, have been subject to land subsidence due to fluid withdrawal (groundwater and petroleum). However, the area of the subject site is not known to be subject to such subsidence hazards.

Non-Tectonic Faulting is most commonly encountered in suburban areas that have intense fluctuation in groundwater levels. The subject site is located in a densely populated portion of the San Francisco Bay Area. The local water districts regularly monitor the local groundwater levels. As such, the area is not likely to be subject to intense groundwater withdrawal or groundwater banking by the local water district which can subsequently create problems with nontectonic faulting. Therefore, non-tectonic faulting is not anticipated to affect the proposed development.

Expansive Soils

The surface and near surface soils observed on the site consist of predominately silty clays and sandy clays. The clayey soils are considered to be moderately to highly expansive. Therefore, it is recommended that mitigation measures to reduce the potential problems associated with expansive soils be followed as indicated in the Site Preparation section of this report. In addition, it is recommended that mitigation measures to reduce the potential problems associated with expansive soils be included, as needed, in subsequent Geotechnical Engineering Investigation Report(s) for specific development

and redevelopment projects at the subject site. We would not expect the expansive nature of these clayey soils to present a significant geologic hazard to the site provided that the recommendations of this report and future Geotechnical Engineering Investigation(s) are followed.

Inundation Hazards

A review of Federal Emergency Management Agency (FEMA) Flood Insurance Mapping for the area of the subject site (Community Panel Number 06001C0328G) indicates that the subject site is within "Zone X". "Areas determined to be outside the 0.2% annual chance floodplain. A FEMA Flood Insurance Map is included as Figure 10.

A review of the Office of Emergency Services, the City of Dublin, Alameda County, and Corps of Engineers Dam Inundation Mapping for the area of the subject site indicates that the subject site is not within an "Inundation Area" should a failure occur at the Dam structures of the Three J Ranch, Patterson, and Del Valle Reservoirs located 6, 9, and 9 miles from the site, respectively.

Tsunamis and Seiches

A tsunami is a series of ocean waves generated in the ocean by an impulsive disturbance. Due to the inland location of the subject site and an elevation greater than 400 feet above mean sea level, tsunamis are not considered a threat to the site. Seiches are standing waves in a body of water such as a lake or reservoir. Because such a body of water is not located near the site, seiches are not anticipated to affect the subject site.

Slope Stability and Potential for Slope Failure

Due to the generally flat-lying nature of the site and some of the immediately surrounding areas, as well as the plan to grade a relatively level site, problems from landslides are not anticipated to affect this site.

The subject site is presently located in an area of formerly hilly terrain. Mass grading had been performed within the project site and vicinity to construct relatively level building pads for proposed residential and commercial developments. The proposed school site is relatively level with no major changes in grade. However, an approximately 8 foot high, 6:1 (horizontal to vertical) slope has been constructed within the community park west of the site. The slope reconfiguration was approved by the county and included as part of the existing development. It is recommended that all school related structures be set back a minimum of 20 feet or ⅓ the height of this slope, from the slope edge. Although the existing slope may not be part of the school property, it is recommended that the slope be well vegetated and maintained for the life of the surrounding developments. This site is in an Alameda County Geologic Hazard Abatement District zone. Therefore, slope stabilization and maintenance requirements are currently performed in accordance with state and county requirements.

Volcanic Hazards

The subject site is not within an area known to be affected by volcanic hazards (Miller, 1989, USGS Bulletin, 1847).

County Seismic Safety Element

Documentation and mapping included in the Environmental Hazards section of the Alameda-East County Area Plan dated November 2000, and the Seismic Safety and Safety Element section of the City of Dublin General Plan, dated November 2008, were reviewed. The seismic information contained within these publications are somewhat dated or generalized and are superseded by more recent information and analyses described herein. The referenced documents generally indicate that the site area is subject to relatively moderate to high seismicity and related hazards.

FIELD AND LABORATORY INVESTIGATIONS

Subsurface soil conditions were explored by drilling 49 borings to depths ranging from approximately 10 to 50 feet below existing site grade, using a truck-mounted drill rig. In addition, 4 bulk subgrade samples were obtained from the site for laboratory R-value testing. The boring and bulk sample locations are shown on the Site Geologic Map, Figure No. 2. During drilling operations, penetration tests were performed at regular intervals to evaluate the soil consistency and to obtain information regarding the engineering properties of the subsoils. Soil samples were retained for laboratory testing. The soils encountered were continuously examined and visually classified in accordance with the Unified Soil Classification System. Site Geologic Cross Sections based on the exploratory drilling data are provided on Figure No. 3.

Laboratory tests were performed on selected soil samples to evaluate their physical characteristics and engineering properties. The laboratory testing program was formulated with emphasis on the evaluation of natural moisture, density, gradation, shear strength, consolidation potential, expansion potential, plasticity, R-value and moisture density relationships of the materials encountered. In addition, chemical tests were performed to evaluate the soil-cement reactivity. Details of the laboratory test program and results of the laboratory tests are summarized in Appendix A. This information, along with the field observations, was used to prepare the final boring logs in Appendix A.

SOIL PROFILE AND SUBSURFACE CONDITIONS

Based on our findings, the subsurface conditions encountered appear typical of those found in the geologic region of the site. In general, the upper soils consisted of approximately 1 to 4 feet of fill material. The fill material predominately consisted of clayey sand, silty clay and sandy clay with minor gravel and concrete pieces. The thickness and extent of fill material was determined based on limited test borings and visual observation. Thicker fill may be present at the site. Limited testing was performed on the fill soils during the time of our field and laboratory investigations. The limited testing indicates some compaction effort had been performed during fill placement. Representative samples of the clayey soils had expansion indices ranging from 106 to 139.

Below the fill material, approximately 4 to 5 feet of firm to hard sandy clay and gravelly sandy clay or loose to very dense clayey sand were encountered. Field and laboratory test suggest that these soils are moderately strong and slightly compressible. The clayey soils have a moderate to high potential for expansion. Penetration resistance ranged from 14 blows per foot to greater than 50 blows per 6 inches.

Dry densities ranged from 79 to 114 pcf. Representative soil samples consolidated approximately 1 percent under a 2 ksf load when saturated. Representative soil samples had angles of internal friction of 10 and 19 degrees.

Below 6 to 9 feet, layers of loose to very dense silty sand, sandy silt and clayey sand or firm to hard silty clay and sandy clay were encountered. Penetration resistance ranged from 6 to 50 blows per foot. Dry densities ranged from 92 to 117 pcf. Representative soil samples contained 16 to 87 percent fines. These soils had similar strength characteristics as the upper soils and extended to the termination depth of our borings.

For additional information about the soils encountered, please refer to the logs of borings in Appendix A.

GROUNDWATER

Test boring locations were checked for the presence of groundwater during and immediately following the drilling operations. Groundwater was encountered within the borings at depths of 15½ to 21 feet below existing site grade. Information obtained from the California Geological Survey indicates that groundwater has been historically as shallow as 8 feet within the project site vicinity.

It should be recognized that water table elevations may fluctuate with time, being dependent upon seasonal precipitation, irrigation, land use, and climatic conditions, as well as other factors. Therefore, water level observations at the time of the field investigation may vary from those encountered during the construction phase of the project. The evaluation of such factors is beyond the scope of this report.

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings of our field and laboratory investigations, along with previous geotechnical experience in the project area, the following is a summary of our evaluations, conclusions, and recommendations.

Administrative Summary

In brief, the subject site and soil conditions, with the exception of the existing development, loose surface soils, fill material, estimated seismic settlement and expansive nature of the clayey soils, appear to be conducive to the development of the project. The surface soils have a loose consistency. These soils are disturbed, have low strength characteristics and are highly compressible when saturated.

Approximately 1 to 4 feet of fill material was encountered within the site. The fill material predominately consisted of clayey sand, sandy clay, gravelly sandy clay, and sandy clay with traces of gravel. The thickness and extent of fill material was determined based on limited test borings and visual observation. Thicker fill may be present at the site. Limited testing was performed on the fill soils at the time of our investigation. The limited testing indicates that some compaction effort had been applied to the fill soils during placement. It is recommended that compaction test reports be provided to our office for review. Some of the fill soils had varying strength characteristics ranging from loosely

placed to compacted. Therefore, it is recommended that any fill soils which have not been properly compacted and certified be excavated and stockpiled so that the native soil can properly prepared. The fill material will be suitable for reuse as Engineered Fill, provided it is cleansed of excessive organics and debris. Supplemental testing should be performed on the fill soils prior to construction to verify their suitability for use as Engineered Fill.

The areas of proposed development are adjacent to existing structures, pavement and landscaped areas consisting of grass, shrubs, and trees. The exposed surface soils have a loose consistency. Pavement consisting of concrete and asphaltic concrete are located along the edges of the site. In addition, several structures are located within the project site vicinity. Associated with these developments are buried structures, such as utility lines that may extend into the project site. Demolition activities should include proper removal of any buried structures. Any buried structures or loosely backfilled excavations encountered during construction should be properly removed and the resulting excavations backfilled. It is suspected that demolition activities of the existing structures, utilities, and pavement will disturb the upper soils. Areas disturbed by demolition activities should be completely removed to firm native ground or certified Engineered Fill. The resulting excavations should be backfilled with Engineered Fill.

The upper native soils and fill material are predominately sandy clay and clayey sand with varying amounts of gravel. The clayey soils appear to have a moderate to high swell potential. The estimated swell pressure of the clayey material may cause movement-affecting slabs and brittle exterior finishes. To reduce the potential soil movement, it is recommended that the upper 36 inches of soil within slab-on-grade or exterior flatwork areas be non-expansive fill. The fill material should be a well-graded silty sand or sandy silt soil. A clean sand or very sandy soil is not acceptable for this purpose. A sandy soil will allow the surface water to drain into the expansive clayey soils below, which may result in swelling. The replacement soil and/or the upper 36 inches of Imported Fill soils should meet the specifications as described under the subheading Engineered Fill. The replacement soils should extend 5 feet beyond the perimeter of the buildings. The non-expansive replacement soil should be compacted to at least 90 percent relative compaction based on ASTM Test Method D1557. The exposed native soils in the excavation should not be allowed to dry out and should be kept continuously moist prior to backfilling. In addition, it is recommended that slab-on-grade continuous footings and slabs be nominally reinforced to reduce cracking and vertical off-set.

As an alternative to the use of non-expansive soils, the upper 36 inches of soil supporting slab-on-grade and exterior flatwork areas can consist of lime-treated clayey soils. The lime-treated soils should be recompacted to a minimum of 90 percent of maximum density. Preliminary application rate of lime should be 5 percent by dry weight. The lime material should be calcium oxide, commonly known as quick-lime. The clayey soils should be at or near optimum moisture during the mixing operations. As an alternative, within exterior flatwork areas, the upper 18 inches of soil can consist of lime-treated clayey soils overlain by 4 inches of aggregate base. However, some movement of the exterior flatwork may occur with this alternative.

The total seismic-induced settlement is not expected to exceed 4 inches. Differential settlement caused by a seismic event should be less than 2⅔ inches. The anticipated differential settlement is estimated over the width of the building. If the project's Structural Engineer deems these settlements excessive for spread and continuous footings, a post-tensioned or structural slab foundation may be utilized. If the post tensioned slab is designed to withstand the uplift pressures associated with the clayey soils, the previously recommended non-expansive or lime-treated soil under the slabs can be eliminated.

After completion of the recommended site preparation, the site should be suitable for shallow footing support. The proposed structure footings may be designed utilizing an allowable bearing pressure of 2,500 psf for dead-plus-live loads. Footings should have a minimum embedment of 18 inches.

Groundwater Influence on Structures/Construction

During our field investigations, groundwater was encountered at depths of 15½ to 21½ feet below site grade. However, review of historical data indicates groundwater has been as shallow as 8 feet within the project site vicinity. If groundwater is encountered during construction our firm should be consultant prior to dewatering the site. Installation of a standpipe piezometer is suggested prior to construction should groundwater levels be a concern.

In addition to the groundwater level, if earthwork is performed during or soon after periods of precipitation, the subgrade soils may become saturated, "pump," or not respond to densification techniques. Typical remedial measures include: discing and aerating the soil during dry weather; mixing the soil with dryer materials; removing and replacing the soil with an approved fill material; or mixing the soil with an approved lime or cement product. Our firm should be consulted prior to implementing remedial measures to observe the unstable subgrade conditions and provide appropriate recommendations.

Site Preparation - General

General site clearing should include removal of vegetation; existing utilities; structures including foundations; basement walls and floors; existing stockpiled soil; trees and associated root systems; rubble; rubbish; and any loose and/or saturated materials. Site stripping should extend to a minimum depth of 2 to 4 inches, or until all organics in excess of 3 percent by volume are removed. Deeper stripping may be required in localized areas. These materials will not be suitable for use as Engineered Fill. However, stripped topsoil may be stockpiled and reused in landscape or non-structural areas.

Approximately 1 to 4 feet of fill material was encountered within the site. The fill material predominately consisted of clayey sand, sandy clay, gravelly sandy clay, and sandy clay with traces of gravel. The thickness and extent of fill material was determined based on limited test borings and visual observation. Thicker fill may be present at the site. Limited testing was performed on the fill soils at the time of our investigation. The limited testing indicates that some compaction effort had been applied to the fill soils during placement. It is recommended that compaction test reports be provided to our office for review. Some of the fill soils had varying strength characteristics ranging from loosely placed to compacted. Therefore, it is recommended that any fill soils which have not been properly compacted and certified be excavated and stockpiled so that the native soil can properly prepared. Prior

to fill placement, Krazan & Associates Inc. should inspect the bottom of the excavation to verify no additional removal will be required. Supplemental testing should be performed on the fill soils prior to construction to verify their suitability for use as Engineered Fill.

The site is presently adjacent to existing structures, pavement, and landscaped areas consisting of grass, shrubs, and trees. The exposed surface soils have a loose consistency. Pavement consisting of concrete and asphaltic concrete are located along the edges of the site. Several structures are located within the project site vicinity. Associated with these developments are buried structures, such as utility lines that may extend into the project site. Demolition activities should include proper removal of any surface and buried structures. Any buried structures or loosely backfilled excavations encountered during construction should be properly removed and the resulting excavations backfilled with Engineered Fill, compacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Following stripping, demolition activities, and fill removal operations and/or certification verification, the exposed subgrade in building pad, exterior flatwork, and pavement areas should be excavated/scarified to a depth of at least 12 inches, worked until uniform and free from large clods, moisture-conditioned to at least 2 percent above optimum moisture, and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557. Limits of recompaction should extend 5 feet beyond structural elements. This compaction effort should stabilize the surface soils and locate any unsuitable or pliant areas not found during our field investigation.

It is recommended that the upper 36 inches of soil within proposed conventional slabs-on-grade and exterior flatwork areas consist of non-expansive Engineered Fill or lime-treated Engineered Fill. The intent is to support slab-on-grade and exterior flatwork areas with 36 inches of non-expansive or lime-treated fill. The fill placement serves two functions: 1) it provides a uniform amount of soil which will more evenly distribute the soil pressures and 2) it reduces moisture content fluctuation in the clayey material beneath the building area. The non-expansive fill material should be a well-graded silty sand or sandy silt soil. The on-site, non-expansive sandy silt and silty sand soils will be suitable for this purpose. A clean sand or very sandy soil is not acceptable for this purpose. A sandy soil will allow the surface water to drain into the expansive clayey soil below, which may result in soil swelling. Imported Fill should be approved by the Soils Engineer prior to placement. The fill should be placed as specified as Engineered Fill. As an alternative, within exterior flatwork areas, the upper 18 inches of soil can consist of lime-treated clayey soils overlain by 4 inches of aggregate base. However, some movement of the exterior flatwork may occur with this alternative.

As indicated previously, fill material is located on the site. It is recommended that any uncertified fill material encountered within pavement areas be removed and/or recompacted. The fill materials should be moisture-conditioned to near optimum moisture and compacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557. As an alternative, the Owner may elect not to recompact the existing fill within paved areas. However, the Owner should be aware that the paved areas may settle, which may require annual maintenance. At a minimum, it is recommended that the upper 12 inches of subgrade soil be moisture-conditioned to a minimum of 2 percent above optimum moisture content and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Several trees are located within the project site vicinity. If not utilized for the proposed development, tree removal operations should include roots greater than 1 inch in diameter. The resulting excavations should be backfilled with Engineered Fill, compacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

The upper soils, during wet winter months become very moist due to the absorptive characteristics of the soil. Earthwork operations performed during winter months may encounter very moist unstable soils, which may require removal to grade a stable building foundation. Project site winterization consisting of placement of aggregate base and protecting exposed soils during the construction phase should be performed.

Existing structures surround portions of the site. Construction activities are being performed on adjacent properties and may extend into the project site. Excavations, depressions, or soft and pliant areas extending below planned finished subgrade levels, should be cleaned to firm, undisturbed soil and backfilled with Engineered Fill. Any buried structures encountered during construction should be properly removed and backfilled. In general, any septic tanks, debris pits, cesspools, or similar structures should be entirely removed. Concrete footings should be removed to an equivalent depth of at least 3 feet below proposed footing elevations or as recommended by the Soils Engineer. Any other buried structures should be removed in accordance with the recommendations of the Soils Engineer. The resulting excavations should be backfilled with Engineered Fill.

A representative of our firm should be present during all site clearing and grading operations to test and observe earthwork construction. This testing and observation is an integral part of our service as acceptance of earthwork construction is dependent upon compaction of the material and the stability of the material. The Soils Engineer may reject any material that does not meet compaction and stability requirements. Further recommendations of this report are predicated upon the assumption that earthwork construction will conform to recommendations set forth in this section and the Engineered Fill section.

Supplemental Site Preparation - Geogrid Option

Subsurface soils within the site are prone to liquefaction under high groundshaking acceleration during an earthquake. If the potential differential settlement is not acceptable, the proposed structures can be constructed over a geogrid reinforced soil mat. If this option is utilized, the building area should be excavated to a minimum depth of 5 feet below the bottom of the deepest foundation and the resulting excavation should be backfilled with a layered system of Engineered Fill and geogrid reinforcement. The depth of the over-excavation should be measured from existing ground or rough pad grade, whichever is deeper.

The first layer of geogrid reinforcement will be placed directly at the bottom of the excavation. The geogrid material should be overlapped a minimum of 3 feet in all directions. The geogrid strips should be "shingled" such that the exposed geogrid edge is opposite the direction of fill placement (as roof shingles to rain runoff). The interlock between the geogrid and Engineered Fill will provide load transfer. No vehicles may traverse the geogrid prior to placement of the Engineered Fill cover.

The next layer of geogrid should be placed on top of the compacted Engineered Fill. This and subsequent layers need only be overlapped a minimum of 1 foot on all sides. The geogrid strips of this layer, and all subsequent layers within the footprint, should be placed with lengths perpendicular to those in the layer immediately below. The fill soils excavated from the area beneath the structure may be moisture-conditioned and recompacted between geogrid layers as reinforced fill. The reinforced fill should be conditioned to near optimum moisture and recompacted to a minimum of 90 percent of maximum density based on ASTM D1557 Test Method.

A total of 5 geogrid layers, including the layer at the base of the excavation, should be installed at vertical increments of 1 foot. The geogrid layers should extend to a minimum of 5 feet beyond the exterior footing perimeter of the structure. The geogrid reinforcement fabric should consist of Tensar® BX 6100 Geogrid, TriAx TX-5 or equivalent. Any unstable soils within building areas should be excavated and backfilled with Engineered Fill as requested by the Soil Engineer.

It is recommended that each building site be excavated at once, and soils be stockpiled. The geogrid and excavated soil may then be placed and recompacted as recommended herein. Alternatively, the Contractor may elect to excavate the site in two stages, where excavated soil can be stockpiled over one-half of the site while the other half is mitigated. However, if the Contractor elects the option of two stages over the preferred option of using one stage, a minimum of 5 feet of geogrid from the first half should overlap the second half. Furthermore, the overlapping geogrid should be protected from damages, which may be caused by operating equipment. It is further recommended that flexible utility connections be used for the project.

Engineered Fill

The organic-free, on-site, upper, native and fill soils are predominately sandy clay, gravelly sandy clay, clayey sand, silty clay, and sandy clay with a trace of gravel. The clayey soils will not be suitable for reuse as non-expansive Engineered Fill. These clayey soils will be suitable for reuse for fill placement within the upper 36 inches of conventional slab-on-grade and exterior flatwork areas, provided they are lime-treated. The preliminary application rate of lime should be 5 percent by dry weight. The lime material should be calcium oxide, commonly known as quick-lime. The clayey soils should be at or near optimum moisture content during mixing operations. Additional testing is recommended to determine the appropriate application rate of lime prior to placement. These clayey soils will be suitable for reuse as General Engineered Fill, provided they are moisture-conditioned to at least 2 percent above optimum moisture.

The preferred materials specified for Engineered Fill are suitable for most applications with the exception of exposure to erosion. Project site winterization and protection of exposed soils during the construction phase should be the sole responsibility of the Contractor, since he has complete control of the project site at that time.

Imported Fill should consist of a well-graded, slightly cohesive, fine silty sand or sandy silt, with relatively impervious characteristics when compacted. This material should be approved by the Soils Engineer prior to use and should typically possess the following characteristics:

Percent Passing No. 200 Sieve	20 to 50
Plasticity Index	10 maximum
UBC Standard 29-2 Expansion Index	15 maximum

Fill soils should be placed in lifts approximately 6 inches thick, moisture-conditioned to a minimum of 2 percent above optimum moisture content, and compacted to achieve at least 90 percent of maximum density as determined by ASTM Test Method D1557. Additional lifts should not be placed if the previous lift did not meet the required dry density or if soil conditions are not stable.

Drainage and Landscaping

The ground surface should slope away from building pad and pavement areas toward appropriate drop inlets or other surface drainage devices. In accordance with Section 1804 of the 2016 California Building Code, it is recommended that the ground surface adjacent to foundations be sloped a minimum of 5 percent for a minimum distance of 10 feet away from structures, or to an approved alternative means of drainage conveyance. Swales used for conveyance of drainage and located within 10 feet of foundations should be sloped a minimum of 2 percent. Impervious surfaces, such as pavement and exterior concrete flatwork, within 10 feet of building foundations should be sloped a minimum of 1 percent away from the structure. Drainage gradients should be maintained to carry all surface water to collection facilities and off-site. These grades should be maintained for the life of the project.

Slots or weep holes should be placed in drop inlets or other surface drainage devices in pavement areas to allow free drainage of adjoining base course materials. Cutoff walls should be installed at pavement edges adjacent to vehicular traffic areas; these walls should extend to a minimum depth of 6 inches below pavement subgrades to limit the amount of seepage water that can infiltrate the pavements. Where cutoff walls are undesirable, subgrade drains can be constructed to transport excess water away from planters to drainage interceptors. If cutoff walls can be successfully used at the site, construction of subgrade drains is considered unnecessary.

Utility Trench Backfill

Utility trenches should be excavated according to accepted engineering practices following OSHA (Occupational Safety and Health Administration) standards by a Contractor experienced in such work. The responsibility for the safety of open trenches should be borne by the Contractor. Traffic and vibration adjacent to trench walls should be reduced; cyclic wetting and drying of excavation side slopes should be avoided. Depending upon the location and depth of some utility trenches, groundwater flow into open excavations could be experienced, especially during or shortly following periods of precipitation.

Sandy and gravelly soil conditions were encountered at the site. These cohesionless soils have a tendency to cave in trench wall excavations. Shoring or sloping back trench sidewalls may be required within these sandy and gravelly soils.

Utility trench backfill placed in or adjacent to buildings and exterior slabs should be compacted to at least 90 percent of the maximum density based on ASTM Test Method D1557. The utility trench backfill placed in pavement areas should be compacted to at least 90 percent of the maximum density based on ASTM Test Method D1557. Pipe bedding should be in accordance with pipe manufacturer's recommendations.

The Contractor is responsible for removing all water-sensitive soils from the trench regardless of the backfill location and compaction requirements. The Contractor should use appropriate equipment and methods to avoid damage to the utilities and/or structures during fill placement and compaction.

Foundations - Conventional

The proposed structures may be supported on a shallow foundation system, bearing on a minimum of 24 inches of Engineered Fill. Spread and continuous footings can be designed for the following maximum allowable soil bearing pressures:

Load	Allowable Loading
Dead Load Only	1,875 psf
Dead-Plus-Live Load	2,500 psf
Total Load, including wind or seismic loads	3,325 psf

Exterior footings should have a minimum depth of 18 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is lower. Interior footings should have a minimum depth of 12 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is lower. Footings should have a minimum width of 12 inches, regardless of load.

The total soil movement associated with foundation loads is not expected to exceed ¾ inch. Differential soil movement, along a 20-foot exterior wall footing, or between adjoining column footings, should be less than ½ inch, producing an angular distortion of 0.002. Most of the soil movement is expected to occur during construction as the loads are applied. However, additional post-construction soil movement may occur if the foundation soils are flooded or saturated.

The estimated total seismic-induced settlement is not anticipated to exceed 4 inches. Differential settlement caused by a seismic event is estimated to be less than 2⅔ inches. The anticipated differential settlement is estimated over a horizontal distance of 100 feet. The seismic settlements would develop if liquefaction of the underlying saturated subsoils were to occur during a seismic event. If the structures are supported on geogrid reinforced Engineered Fill, the differential movement associated with a seismic event is estimated to be less than 1 inch over 100 feet.

Providing the site is prepared as recommended in our report, seasonal rainfall, water run-off, or normal watering practice of trees and landscaping areas, around the proposed building, should not flood and/or saturate the footings, and consequently produce additional post-construction soil movement.

The footing excavations should not be allowed to dry out any time prior to pouring concrete. It is recommended that footings be reinforced by at least one No. 4 reinforcing bar in both top and bottom.

Resistance to lateral footing displacement can be computed using a friction factor of 0.3 acting between the base of foundations and the supporting subgrade. Lateral resistance for footings can alternatively be developed using an allowable equivalent fluid passive pressure of 250 pounds per cubic foot acting against the appropriate vertical footing faces. The frictional and passive resistance of the soil may be combined without reduction in determining the total lateral resistance. A ⅓ increase in the above value may be used for short duration, wind, or seismic loads. All of the above earth pressures are unfactored and are, therefore, not inclusive of factors of safety. It is recommended a factor of safety of 1.5 be incorporated into the design.

Foundations - Post-Tension or Structural Slab

The buildings may be supported on a post-tension slab or structural slab/foundation system. A structural slab system will help reduce structural damage caused by the potential soil movement of the clayey soils and potential settlement associated with seismic settlement. In addition, utilization of a post-tensioned slab will eliminate the requirement for 36 inches of non-expansive or lime-treated Engineered Fill below slab-on-grade. However, the previously recommended densification of the upper native soils and fill material at the site should still be performed. In addition, the moisture content of the upper 12 inches of subgrade soil below the post-tensioned slabs should be increased to a minimum of 3 percent above optimum moisture content prior to pouring the slabs. The moisture content should be verified by our office within 48 hours of pouring the slabs.

The thickness of the slab-on-grade and locations and sizing of stiffening beams (if used) should be determined by the structural consultant during a subsequent structural analysis, which incorporates our design recommendations, including a deepened perimeter or edge section. Post-tensioned slab-on-grade foundations should be structurally designed to resist or distribute the stresses that are anticipated to develop as the result of supporting soil movement. The following preliminary parameters are recommended for use in the structural design of the post-tensioned slab-on-grade foundations in accordance with *Design of Post-Tensioned Slabs-on-Ground*, 3rd Edition, by the Post-Tensioning Institute. In addition, the computer software program Volflo 1.5, by Geostructural Tool Kit, Inc. was also utilized in the analyses. A preliminary allowable bearing pressure of 1,500 pounds per square foot due to dead plus live loads may be considered in design of the slab. The recommended edge moisture variation (e_m) and differential swell (y_m) values for use in preliminary design of post-tensioned slabs are as follows:

Edge Moisture Variation Distance:	Estimated Differential Swell:
Center lift, e_m = 8.3 feet	Center lift, y_m = 1 inch
Edge lift, e_m = 4.2 feet	Edge lift, y_m = 1½ inches

To aid in reducing the potential for differential soil movement associated with shrinkage and swelling of the fine-grained soils due to changes in moisture contents with changing seasons and landscaping, we recommend that the exterior edge of the slab be deepened to provide a moisture cut-off around the

perimeter of the building. The deepened edge should extend at least 18 inches below the top of the pad grade, where the top of pad grade is defined as the grade beneath the bottom of the capillary moisture break gravel course or the adjacent exterior subgrade, whichever is deeper.

In addition, the slab should be designed to withstand a potential total and differential static settlement of 4 inches and 2⅔ inches, respectively.

Slabs adjacent to landscape areas may be subject to additional distress due to increased soil moisture level fluctuations from flowerbed watering, as well as drying from tree root moisture removal. Therefore, we recommend that the school district be notified of the potential for soil movement and resulting slab distress which may occur in these instances of landscape neglect. In addition, it is recommended the school site maintain consistent moisture levels and avoid extreme fluctuations in any flowerbeds adjacent to structures, and to avoid planting trees with invasive root systems within 10 feet of the structures.

The thickness of the slab-on-grade and locations and sizing of stiffening beams (if used) should be determined by the project Structural Engineer. Post-tensioned concrete slabs designed to be of uniform thickness without interior stiffening beams should be designed in accordance with the procedures presented in *Design of Post-Tensioned Slabs-on-Ground*. Perimeter columns located outside of the main structure, such as those required for covered terraces or second floor areas projecting out beyond the building footprint should not be founded on isolated spread footings structurally separated from the slab foundation.

The post-tensioned slab-on-grade foundation system will not prevent the structure from undergoing vertical displacement as a result of shrinkage and swelling of the underlying expansive soils. However, the use of a post-tensioned slab-on-grade foundation system, as opposed to a conventionally reinforced non-structural slab-on-grade, will reduce the amount of objectionable slab cracks and vertical off-set of adjacent concrete panels. However, cracking and distress in brittle finishes, such as stucco and drywall should be anticipated. The use of post-tension reinforcement does not necessarily eliminate the development of bending stresses in the slab due to differential movement of the supporting soils. This type of slab essentially distributes the differential movement of the supported structure over a longer span through controlled bending of the slab.

Resistance to lateral displacement can be computed using an allowable friction factor of 0.3 acting between the base of foundations and the supporting subgrade. Lateral resistance for footings can alternatively be developed using an allowable equivalent fluid passive pressure of 250 pounds per cubic foot acting against the appropriate vertical footing faces. The frictional and passive resistance of the soil may be combined without reduction in determining the total lateral resistance. A ⅓ increase in the above value may be used for short duration, wind, or seismic loads. All of the above earth pressures are unfactored and are, therefore, not inclusive of factors of safety.

Floor Slabs and Exterior Flatwork

Concrete slab-on-grade should be appropriate for this project. In areas where it is desired to reduce floor dampness, such as office areas, slab-on-grade construction should have a water vapor retarder incorporated into the floor slab design. In areas that will utilize moisture-sensitive floor coverings, concrete slab-on-grade floors should be underlain by a water vapor retarder. The water vapor retarder should be installed in accordance with accepted engineering practice. The water vapor retarder should consist of a vapor retarder sheeting underlain by a minimum of 3 inches of compacted, clean, open-graded coarse rock of ¾-inch maximum size.

The floor slab should be reinforced as a minimum with No. 3 reinforcement bars at 18 inches on-center, each way, within the floor slabs middle-third. Thicker floor slabs with increased concrete strength and reinforcement should be designed wherever large vehicular loads, heavy concentrated loads, heavy equipment, or machinery is anticipated.

The exterior floors should be poured separately in order to act independently of the walls and foundation system. Exterior finish grades should be sloped a minimum of 1 to 1½ percent away from all interior slab areas to preclude ponding of water adjacent to the structures. All fills required to bring the building pads to grade should be Engineered Fills.

Lateral Earth Pressures and Retaining Walls

Walls retaining horizontal backfill and capable of deflecting a minimum of 0.1 percent of its height at the top may be designed using an equivalent fluid active pressure of 50 pounds per square foot per foot of depth. Walls incapable of this deflection or are fully constrained walls against deflection may be designed for an equivalent fluid at-rest pressure of 70 pounds per square foot per foot of depth. Expansive soils should not be used for backfill against walls. The wedge of non-expansive backfill material should extend from the bottom of each retaining wall outward and upward at a slope of 2:1 (horizontal to vertical) or flatter. The stated lateral earth pressures do not include the effects of hydrostatic water pressures generated by infiltrating surface water that may accumulate behind the retaining walls; or loads imposed by construction equipment, foundations or roadways.

During grading and backfilling operations adjacent to any walls, heavy equipment should not be allowed to operate within a lateral distance of 5 feet from the wall, or within a lateral distance equal to the wall height, whichever is greater, to avoid developing excessive lateral pressures. Within this zone, only hand operated equipment ("whackers," vibratory plates, or pneumatic compactors) should be used to compact the backfill soils.

Retaining and/or below grade walls should be drained with either perforated pipe encased in free draining gravel or a prefabricated drainage system. The gravel zone should have a minimum width of 12 inches wide and should extend upward to within 12 inches of the top of the wall. The upper 12 inches of backfill should consist of native soils, concrete, asphaltic concrete or other suitable backfill to reduce surface drainage into the wall drain system. The aggregate should conform to Class 2 permeable materials graded in accordance with Section 68-2.02F(3) of the CalTrans Standard Specifications

(2018). Prefabricated drainage systems such as Miradrain®, Enkadrain®, or an equivalent substitute, are acceptable alternatives in lieu of gravel provided they are installed in accordance with the manufacturer's recommendations. If a prefabricated drainage system is proposed, our firm should review the system for final acceptance prior to installation.

Drainage pipes should be placed with perforations down and should discharge in a non-erosive manner away from foundations and other improvements. The pipes should be placed no higher than 6 inches above the heel of the wall in the centerline of the drainage blanket and should have a minimum diameter of 4 inches. Collector pipes may be either slotted or perforated. Slots should be no wider than ⅛ inch in width, while perforations should be no more than ¼ inch in diameter. If retaining walls are less than 6 feet in height, the perforated pipe may be omitted in lieu of weep holes on 4 feet maximum spacing. The weep holes should consist of 4-inch diameter holes (concrete walls) or unmortared head joints (masonry walls) and not be higher than 18 inches above the lowest adjacent grade. Two 8-inch square overlapping patches of geotextile fabric (conforming to Section 88-1.02 of the CalTrans Standard Specifications for "edge drains") should be affixed to the rear wall opening of each weep hole to retard soil piping.

R-Value Test Results and Pavement Design

Four subgrade soil samples were obtained from the project site for R-value testing at the locations shown on the attached site plan. The samples were tested in accordance with the State of California Materials Manual Test Designation 301. Results of the tests are as follows:

Sample	Depth	Description	R-Value at Equilibrium
1	12-24"	Sandy Clay (CL)	Less than 5
2	12-24"	Sandy Clay (CL)	Less than 5
3	12-24"	Sandy Clay (CL)	Less than 5
4	12-24"	Sandy Clay (CL)	Less than 5

The test results are low and indicate poor subgrade support characteristics under dynamic traffic loads. The following table shows the recommended pavement sections for various traffic indices.

Traffic Index	Asphaltic Concrete	Class II Aggregate Base*	Class III Aggregate Subbase	Compacted Subgrade**
4.0	2.0"	8.5"	--	12.0"
4.0	2.0"	4.5"	4.5"	12.0"
4.5	3.0"	9.0"	--	12.0"
4.5	3.0"	4.0"	5.5"	12.0"
5.0	3.0"	11.0"	--	12.0"
5.0	3.0"	5.0"	6.5"	12.0"

5.5	3.0"	11.5"	--	12.0"
5.5	3.0"	5.0"	7.0"	12.0"
6.0	3.0"	13.5"	--	12.0"
6.0	3.0"	6.5"	8.0"	12.0"
6.5	3.5"	14.0"	--	12.0"
6.5	3.5"	6.0"	9.0"	12.0"
7.0	4.0"	15.5"	--	12.0"
7.0	4.0"	6.5"	10.0"	12.0"
7.5	4.0"	17.0"	--	12.0"
7.5	4.0"	7.5"	10.5"	12.0"

**** 95% compaction based on ASTM Test Method D1557 or CAL 216***
***** 90% compaction based on ASTM Test Method D1557 or CAL 216***

If traffic indices are not available, an estimated (typical value) index of 4.5 may be used for light automobile traffic, and an index of 7.0 may be used for light truck traffic.

The following recommendations are for light-duty and heavy-duty Portland Cement Concrete Pavement Sections based on the design procedures developed by the Portland Cement Association.

PORTLAND CEMENT PAVEMENT
LIGHT DUTY

Traffic Index	Portland Cement Concrete***	Class II Aggregate Base*	Compacted Subgrade**
4.5	6.0"	5.0"	12.0"

HEAVY DUTY

Traffic Index	Portland Cement Concrete***	Class II Aggregate Base*	Compacted Subgrade**
7.0	7.0"	6.0"	12.0"

**** 95% compaction based on ASTM Test Method D1557 or CAL 216***
***** 90% compaction based on ASTM Test Method D1557 or CAL 216***
******Minimum Compressive Strength of 3000 psi***

As indicated previously, fill material is located throughout the site. It is recommended that any uncertified fill material encountered within pavement areas be removed and/or recompacted. The fill material should be moisture-conditioned to near optimum moisture and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557. As an alternative, the Owner may elect not to recompact the existing fill within paved areas. However, the Owner should be aware that the paved areas may settle which may require annual maintenance. At a minimum, it is recommended that the upper 12 inches of subgrade soil be moisture-conditioned as necessary and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Seismic Parameters – 2016 California Building Code

The Site Class per Section 1613A of the 2016 California Building Code (2016 CBC) and Table 20.3-1 of ASCE 7-10 is based upon the site soil conditions. It is our opinion that a Site Class D is most consistent with the subject site soil conditions. For seismic design of the structures based on the seismic provisions of the 2016 CBC, we recommend the following parameters:

Seismic Item	Value	CBC Reference
Site Class	D	Section 1613A.3.2
Site Coefficient F_a	1.000	Table 1613A.3.3 (1)
S_s	1.796	Section 1613A.3.1
S_{MS}	1.796	Section 1613A.3.3
S_{DS}	1.197	Section 1613A.3.4
Site Coefficient F_v	1.500	Table 1613A.3.3 (2)
S_1	0.602	Section 1613A.3.1

Soil Cement Reactivity

Excessive sulfate in either the soil or native water may result in an adverse reaction between the cement in concrete (or stucco) and the soil. HUD/FHA and UBC have developed criteria for evaluation of sulfate levels and how they relate to cement reactivity with soil and/or water.

Soil samples were obtained from the site and tested in accordance with State of California Materials Manual Test Designation 417. The sulfate concentrations detected from these soil samples were less than 0.1 percent and are below the maximum allowable values established by HUD/FHA and UBC. However, it is recommended a Type II cement be utilized to compensate for sulfate reactivity with the cement.

Compacted Material Acceptance

Compaction specifications are not the only criteria for acceptance of the site grading or other such activities. However, the compaction test is the most universally recognized test method for assessing the performance of the Grading Contractor. The numerical test results from the compaction test cannot be used to predict the engineering performance of the compacted material. Therefore, the acceptance of compacted materials will also be dependent on the stability of that material. The Soils Engineer has the option of rejecting any compacted material regardless of the degree of compaction if that material is considered to be unstable or if future instability is suspected. A specific example of rejection of fill

material passing the required percent compaction is a fill which has been compacted with an in situ moisture content significantly less than optimum moisture. This type of dry fill (brittle fill) is susceptible to future settlement if it becomes saturated or flooded.

Testing and Inspection

A representative of Krazan & Associates, Inc. should be present at the site during the earthwork activities to confirm that actual subsurface conditions are consistent with the exploratory fieldwork. This activity is an integral part of our service, as acceptance of earthwork construction is dependent upon compaction testing and stability of the material. This representative can also verify that the intent of these recommendations is incorporated into the project design and construction. Krazan & Associates, Inc. will not be responsible for grades or staking, since this is the responsibility of the Prime Contractor.

LIMITATIONS

Soils Engineering is one of the newest divisions of Civil Engineering. This branch of Civil Engineering is constantly improving as new technologies and understanding of earth sciences advance. Although your site was analyzed using the most appropriate and most current techniques and methods, undoubtedly there will be substantial future improvements in this branch of engineering. In addition to advancements in the field of Soils Engineering, physical changes in the site, either due to excavation or fill placement, new agency regulations, or possible changes in the proposed structure after the soils report is completed may require the soils report to be professionally reviewed. In light of this, the Owner should be aware that there is a practical limit to the usefulness of this report without critical review. Although the time limit for this review is strictly arbitrary, it is suggested that 2 years be considered a reasonable time for the usefulness of this report.

Foundation and earthwork construction is characterized by the presence of a calculated risk that soil and groundwater conditions have been fully revealed by the original foundation investigation. This risk is derived from the practical necessity of basing interpretations and design conclusions on limited sampling of the earth. The recommendations made in this report are based on the assumption that soil conditions do not vary significantly from those disclosed during our field investigation. If any variations or undesirable conditions are encountered during construction, the Soils Engineer should be notified so that supplemental recommendations may be made.

The conclusions of this report are based on the information provided regarding the proposed construction. If the proposed construction is relocated or redesigned, the conclusions in this report may not be valid. The Soils Engineer should be notified of any changes so the recommendations may be reviewed and re-evaluated.

This report is a Geotechnical Engineering Investigation with the purpose of evaluating the soil conditions in terms of foundation design. The scope of our services did not include any Environmental Site Assessment for the presence or absence of hazardous and/or toxic materials in the soil, groundwater, or atmosphere; or the presence of wetlands. Any statements, or absence of statements, in

this report or on any boring log regarding odors, unusual or suspicious items, or conditions observed, are strictly for descriptive purposes and are not intended to convey engineering judgment regarding potential hazardous and/or toxic assessment.

The geotechnical engineering information presented herein is based upon professional interpretation utilizing standard engineering practices and a degree of conservatism deemed proper for this project. It is not warranted that such information and interpretation cannot be superseded by future geotechnical engineering developments. We emphasize that this report is valid for the project outlined above and should not be used for any other sites.

If you have any questions, or if we may be of further assistance, please do not hesitate to contact our office at (925) 907-1160.

Respectfully submitted,
KRAZAN & ASSOCIATES, INC.

Fault along which historic (last 200 years) displacement has occurred and is associated with one or more of the following:

(a) a recorded earthquake with surface rupture. (Also included are some well-defined surface breaks caused by ground shaking during earthquakes, e.g. extensive ground breakage, not on the White Wolf fault, caused by the Arvin-Tehachapi earthquake of 1952). The date of the associated earthquake is indicated. Where repeated surface ruptures on the same fault have occurred, only the date of the latest movement may be indicated, especially if earlier reports are not well documented as to location of ground breaks.

(b) fault creep slippage - slow ground displacement usually without accompanying earthquakes.

(c) displaced survey lines.

A triangle to the right or left of the date indicates termination point of observed surface displacement. Solid red triangle indicates known location of rupture termination point. Open black triangle indicates uncertain or estimated location of rupture termination point.

Date bracketed by triangles indicates local fault break.

No triangle by date indicates an intermediate point along fault break.

Fault that exhibits fault creep slippage. Hachures indicate linear extent of fault creep. Annotation (creep with leader) indicates representative locations where fault creep has been observed and recorded.

Square on fault indicates where fault creep slippage has occured that has been triggered by an earthquake on some other fault. Date of causative earthquake indicated. Squares to right and left of date indicate terminal points between which triggered creep slippage has occurred (creep either continuous or intermittent between these end points).

Holocene fault displacement (during past 11,700 years) without historic record. Geomorphic evidence for Holocene faulting includes sag ponds, scarps showing little erosion, or the following features in Holocene age deposits: offset stream courses, linear scarps, shutter ridges, and triangular faceted spurs. Recency of faulting offshore is based on the interpreted age of the youngest strata displaced by faulting.

Late Quaternary fault displacement (during past 700,000 years). Geomorphic evidence similar to that described for Holocene faults except features are less distinct. Faulting may be younger, but lack of younger overlying deposits precludes more accurate age classification.

Quaternary fault (age undifferentiated). Most faults of this category show evidence of displacement sometime during the past 1.6 million years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age. Unnumbered Quaternary faults were based on Fault Map of California, 1975. See Bulletin 201, Appendix D for source data.

Pre-Quaternary fault (older that 1.6 million years) or fault without recognized Quaternary displacement. Some faults are shown in this category because the source of mapping used was of reconnaissnce nature, or was not done with the object of dating fault displacements. Faults in this category are not necessarily inactive.

California Geological Survey

This Map Shows Both Alquist-Priolo Earthquake Fault Zones and Seismic Hazard Zones

This map shows the location of Alquist-Priolo (AP) Earthquake Fault Zones and Seismic Hazard Zones, collectively referred to here as Earthquake Zones of Required Investigation. The Geographic Information System (GIS) digital files of these regulatory zones released by the California Geological Survey (CGS) are the "Official Maps." GIS files are available at the CGS website http://maps.conservation.ca.gov/cgs/informationwarehouse/. These zones will assist cities and counties in fulfilling their responsibilities for protecting the public from the effects of surface fault rupture and earthquake-triggered ground failure as required by the AP Earthquake Fault Zoning Act (Public Resources Code Sections 2621-2630) and the Seismic Hazards Mapping Act (Public Resources Code Sections 2690-2699.6). For information regarding the general approach and recommended methods for preparing these zones, see CGS Special Publication 42, *Fault-Rupture Hazard Zones in California*, and CGS Special Publication 118, *Recommended Criteria for Delineating Seismic Hazard Zones in California*.

For information regarding the scope and recommended methods to be used in conducting required site investigations refer to CGS Special Publication 42, Appendix C *Guidelines for Evaluating the Hazard of Surface Rupture*, and CGS Special Publication 117A, *Guidelines for Evaluating and Mitigating Seismic Hazards in California*. For a general description of the AP and Seismic Hazards Mapping acts, the zonation programs, and related information, please refer to the website at www.conservation.ca.gov/cgs/.

MAP EXPLANATION

ALQUIST-PRIOLO EARTHQUAKE FAULT ZONES

Earthquake Fault Zones
Zone boundaries are delineated by straight-line segments; the boundaries define the zone encompassing active faults that constitute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Section 2621.5(a) would be required.

Active Fault Traces
Faults considered to have been active during Holocene time and to have potential for surface rupture: Solid Line in Black or Red where Accurately Located; Long Dash in Black or Solid Line in Purple where Approximately Located; Short Dash in Black or Solid Line in Orange where Inferred; Dotted Line in Black or Solid Line in Rose where Concealed; Query (?) indicates additional uncertainty. Evidence of historic offset indicated by year of earthquake-associated event or C for displacement caused by fault creep.

SEISMIC HAZARD ZONES

Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

OVERLAPPING ALQUIST-PRIOLO AND SEISMIC HAZARD ZONES

Overlap of Earthquake Fault Zone and Liquefaction Zone
Areas that are covered by both Earthquake Fault Zone and Liquefaction Zone.

Overlap of Earthquake Fault Zone and Earthquake-Induced Landslide Zone
Areas that are covered by both Earthquake Fault Zone and Earthquake-Induced Landslide Zone.

Note: Mitigation methods differ for each zone –
AP Act only allows avoidance; Seismic Hazard Mapping Act allows mitigation by engineering/geotechnical design as well as avoidance.

APPENDIX A

FIELD AND LABORATORY INVESTIGATIONS

Field Investigation

The field investigation consisted of a surface reconnaissance and a subsurface exploratory program. Forty-nine 4½-inch to 6½-inch exploratory borings were recently advanced. The boring locations are shown on the site plan.

The soils encountered were logged in the field during the exploration and, with supplementary laboratory test data, are described in accordance with the Unified Soil Classification System.

Modified standard penetration tests and standard penetration tests were performed at selected depths. These tests represent the resistance to driving a 2½-inch and 1½-inch diameter split barrel sampler, respectively. The driving energy was provided by a hammer weighing 140 pounds falling 30 inches. Relatively undisturbed soil samples were obtained while performing this test. Bag samples of the disturbed soil were obtained from the auger cuttings. The modified standard penetration tests are identified in the sample type on the boring logs with a full shaded in block. The standard penetration tests are identified in the sample type on the boring logs with half of the block shaded. All samples were returned to our Clovis laboratory for evaluation.

Laboratory Investigation

The laboratory investigation was programmed to determine the physical and mechanical properties of the foundation soil underlying the site. Test results were used as criteria for determining the engineering suitability of the surface and subsurface materials encountered.

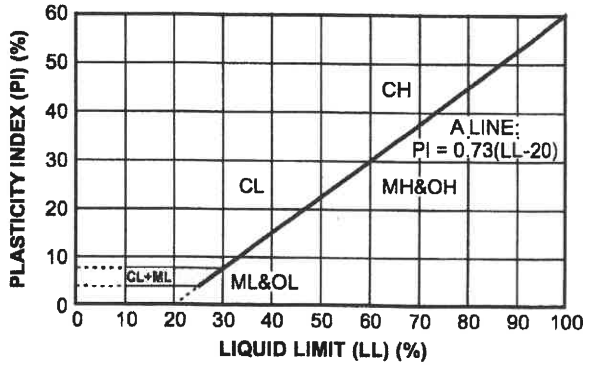
In-situ moisture content, dry density, consolidation, direct shear, and sieve analysis tests were completed for the undisturbed samples representative of the subsurface material. Atterberg limits, expansion index and R-value tests were completed for select bag samples obtained from the auger cuttings. These tests, supplemented by visual observation, comprised the basis for our evaluation of the site material.

The logs of the exploratory borings and laboratory determinations are presented in this Appendix.

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS (more than 50% of material is larger than No. 200 sieve size.)			
GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)	GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)	SW	Well-graded sands, gravelly sands, little or no fines
		SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)	SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more of material is smaller than No. 200 sieve size.)			
SILTS AND CLAYS Liquid limit less than 50%		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils



CONSISTENCY CLASSIFICATION

Description	Blows per Foot
Granular Soils	
Very Loose	< 5
Loose	5 – 15
Medium Dense	16 – 40
Dense	41 – 65
Very Dense	> 65
Cohesive Soils	
Very Soft	< 3
Soft	3 – 5
Firm	6 – 10
Stiff	11 – 20
Very Stiff	21 – 40
Hard	> 40

GRAIN SIZE CLASSIFICATION

Grain Type	*Standard Sieve Size*	*Grain Size in Millimeters*
Boulders	Above 12 inches	Above 305
Cobbles	12 to 13 inches	305 to 76.2
Gravel	3 inches to No. 4	76.2 to 4.76
Coarse-grained	3 to ¾ inches	76.2 to 19.1
Fine-grained	¾ inches to No. 4	19.1 to 4.76
Sand	No. 4 to No. 200	4.76 to 0.074
Coarse-grained	No. 4 to No. 10	4.76 to 2.00
Medium-grained	No. 10 to No. 40	2.00 to 0.042
Fine-grained	No. 40 to No. 200	0.042 to 0.074
Silt and Clay	Below No. 200	Below 0.074

APPENDIX B

EARTHWORK SPECIFICATIONS

GENERAL

When the text of the report conflicts with the general specifications in this appendix, the recommendations in the report have precedence.

SCOPE OF WORK: These specifications and applicable plans pertain to and include all earthwork associated with the site rough grading, including but not limited to the furnishing of all labor, tools, and equipment necessary for site clearing and grubbing, stripping, preparation of foundation materials for receiving fill, excavation, processing, placement and compaction of fill and backfill materials to the lines and grades shown on the project grading plans, and disposal of excess materials.

PERFORMANCE: The Contractor shall be responsible for the satisfactory completion of all earthwork in accordance with the project plans and specifications. This work shall be inspected and tested by a representative of Krazan and Associates, Inc., hereinafter known as the Soils Engineer and/or Testing Agency. Attainment of design grades when achieved shall be certified by the project Civil Engineer. Both the Soils Engineer and the Civil Engineer are the Owner's representatives. If the Contractor should fail to meet the technical or design requirements embodied in this document and on the applicable plans, he shall make the necessary readjustments until all work is deemed satisfactory as determined by both the Soils Engineer and the Civil Engineer. No deviation from these specifications shall be made except upon written approval of the Soils Engineer, Civil Engineer or project Architect.

No earthwork shall be performed without the physical presence or approval of the Soils Engineer. The Contractor shall notify the Soils Engineer at least 2 working days prior to the commencement of any aspect of the site earthwork.

The Contractor agrees that he shall assume sole and complete responsibility for job site conditions during the course of construction of this project, including safety of all persons and property; that this requirement shall apply continuously and not be limited to normal working hours; and that the Contractor shall defend, indemnify and hold the Owner and the Engineers harmless from any and all liability, real or alleged, in connection with the performance of work on this project, except for liability arising from the sole negligence of the Owner or the Engineers.

TECHNICAL REQUIREMENTS: All compacted materials shall be densified to a density not less than 90 percent relative compaction based on ASTM Test Method D1557 or CAL-216, as specified in the technical portion of the Soil Engineer's report. The location and frequency of field density tests shall be as determined by the Soils Engineer. The results of these tests and compliance with these specifications shall be the basis upon which satisfactory completion of work will be judged by the Soils Engineer.

SOILS AND FOUNDATION CONDITIONS: The Contractor is presumed to have visited the site and to have familiarized himself with existing site conditions and the contents of the data presented in the soil report.

The Contractor shall make his own interpretation of the data contained in said report, and the Contractor shall not be relieved of liability under the Contract documents for any loss sustained as a result of any variance between conditions indicated by or deduced from said report and the actual conditions encountered during the progress of the work.

DUST CONTROL: The work includes dust control as required for the alleviation or prevention of any dust nuisance on or about the site or the borrow area, or off-site if caused by the Contractor's operation either during the performance of the earthwork or resulting from the conditions in which the Contractor leaves the site. The Contractor shall assume all liability, including court costs of codefendants, for all claims related to dust or windblown materials attributable to his work.

SITE PREPARATION

Site preparation shall consist of site clearing and grubbing and the preparations of foundation materials for receiving fill.

CLEARING AND GRUBBING: The Contractor shall accept the site in this present condition and shall demolish and/or remove from the area of designated project earthwork all structures, both surface and subsurface, trees, brush, roots, debris, organic matter, and all other matter determined by the Soils Engineer to be deleterious or otherwise unsuitable. Such materials shall become the property of the Contractor and shall be removed from the site.

Tree root systems in proposed building areas should be removed to a minimum depth of 3 feet and to such an extent which would permit removal of all roots larger than 1 inch. Tree roots removed in parking areas may be limited to the upper 1½ feet of the ground surface. Backfill of tree root excavations should not be permitted until all exposed surfaces have been inspected and the Soils Engineer is present for the proper control of backfill placement and compaction. Burning in areas which are to receive fill materials shall not be permitted.

SUBGRADE PREPARATION: Surfaces to receive Engineered Fill, building or slab loads shall be prepared as outlined above, excavated/scarified to a depth of 12 inches, moisture-conditioned as necessary, and compacted to 90 percent relative compaction.

Loose soil areas, areas of uncertified fill, and/or areas of disturbed soils shall be moisture-conditioned as necessary and recompacted to 90 percent relative compaction. All ruts, hummocks, or other uneven surface features shall be removed by surface grading prior to placement of any fill materials. All areas which are to receive fill materials shall be approved by the Soils Engineer prior to the placement of any of the fill material.

EXCAVATION: All excavation shall be accomplished to the tolerance normally defined by the Civil Engineer as shown on the project grading plans. All over-excavation below the grades specified shall be backfilled at the Contractor's expense and shall be compacted in accordance with the applicable technical requirements.

FILL AND BACKFILL MATERIAL: No material shall be moved or compacted without the presence of the Soils Engineer. Material from the required site excavation may be utilized for construction site fills provided prior approval is given by the Soils Engineer. All materials utilized for constructing site fills shall be free from vegetation or other deleterious matter as determined by the Soils Engineer.

PLACEMENT, SPREADING AND COMPACTION: The placement and spreading of approved fill materials and the processing and compaction of approved fill and native materials shall be the responsibility of the Contractor. However, compaction of fill materials by flooding, ponding, or jetting shall not be permitted unless specifically approved by local code, as well as the Soils Engineer.

Both cut and fill areas shall be surface-compacted to the satisfaction of the Soils Engineer prior to final acceptance.

SEASONAL LIMITS: No fill material shall be placed, spread, or rolled while it is frozen or thawing or during unfavorable wet weather conditions. When the work is interrupted by heavy rains, fill operations shall not be resumed until the Soils Engineer indicates that the moisture content and density of previously placed fill are as specified.

APPENDIX C

PAVEMENT SPECIFICATIONS

1. DEFINITIONS - The term "pavement" shall include asphaltic concrete surfacing, untreated aggregate base, and aggregate subbase. The term "subgrade" is that portion of the area on which surfacing, base, or subbase is to be placed.

The term "Standard Specifications": hereinafter referred to is the 2018 Standard Specifications of the State of California, Department of Transportation, and the "Materials Manual" is the Materials Manual of Testing and Control Procedures, State of California, Department of Public Works, Division of Highways. The term "relative compaction" refers to the field density expressed as a percentage of the maximum laboratory density as defined in the applicable tests outlined in the Materials Manual.

2. SCOPE OF WORK - This portion of the work shall include all labor, materials, tools, and equipment necessary for, and reasonably incidental to the completion of the pavement shown on the plans and as herein specified, except work specifically noted as "Work Not Included."

3. PREPARATION OF THE SUBGRADE - The Contractor shall prepare the surface of the various subgrades receiving subsequent pavement courses to the lines, grades, and dimensions given on the plans. The upper 12 inches of the soil subgrade beneath the pavement section shall be compacted to a minimum relative compaction of 90 percent. The finished subgrades shall be tested and approved by the Soils Engineer prior to the placement of additional pavement courses.

4. UNTREATED AGGREGATE BASE - The aggregate base material shall be spread and compacted on the prepared subgrade in conformity with the lines, grades, and dimensions shown on the plans. The aggregate base material shall conform to the requirements of Section 26 of the Standard Specifications for Class 2 material, 1½ inches maximum size. The aggregate base material shall be spread and compacted in accordance with Section 26 of the Standard Specifications. The aggregate base material shall be spread in layers not exceeding 6 inches and each layer of aggregate material course shall be tested and approved by the Soils Engineer prior to the placement of successive layers. The aggregate base material shall be compacted to a minimum relative compaction of 95 percent.

5. AGGREGATE SUBBASE - The aggregate subbase shall be spread and compacted on the prepared subgrade in conformity with the lines, grades, and dimensions shown on the plans. The aggregate subbase material shall conform to the requirements of Section 25 of the Standard Specifications for Class 2 material. The aggregate subbase material shall be compacted to a minimum relative compaction of 95 percent, and it shall be spread and compacted in accordance with Section 25 of the Standard Specifications. Each layer of aggregate subbase shall be tested and approved by the Soils Engineer prior to the placement of successive layers.

6. ASPHALTIC CONCRETE SURFACING - Asphaltic concrete surfacing shall consist of a mixture of mineral aggregate and paving grade asphalt, mixed at a central mixing plant and spread and compacted on a prepared base in conformity with the lines, grades and dimensions shown on the plans. The viscosity grade of the asphalt shall be PG 64-10. The mineral aggregate shall be Type B, ½ inch maximum size, medium grading and shall conform to the requirements set forth in Section 39. The drying, proportioning and mixing of the materials shall conform to Section 39.

The prime coat, spreading and compacting equipment and spreading and compacting mixture shall conform to the applicable chapters of Section 39, with the exception that no surface course shall be placed when the atmospheric temperature is below 50° F. The surfacing shall be rolled with a combination of steel wheel and pneumatic rollers, as described in Section 39-6. The surface course shall be placed with an approved self-propelled mechanical spreading and finishing machine.

7. FOG SEAL COAT - The fog seal (mixing type asphaltic emulsion) shall conform to and be applied in accordance with the requirements of Section 37.

-END OF SEARCH- 330 EARTHQUAKES FOUND WITHIN THE SPECIFIED SEARCH AREA.

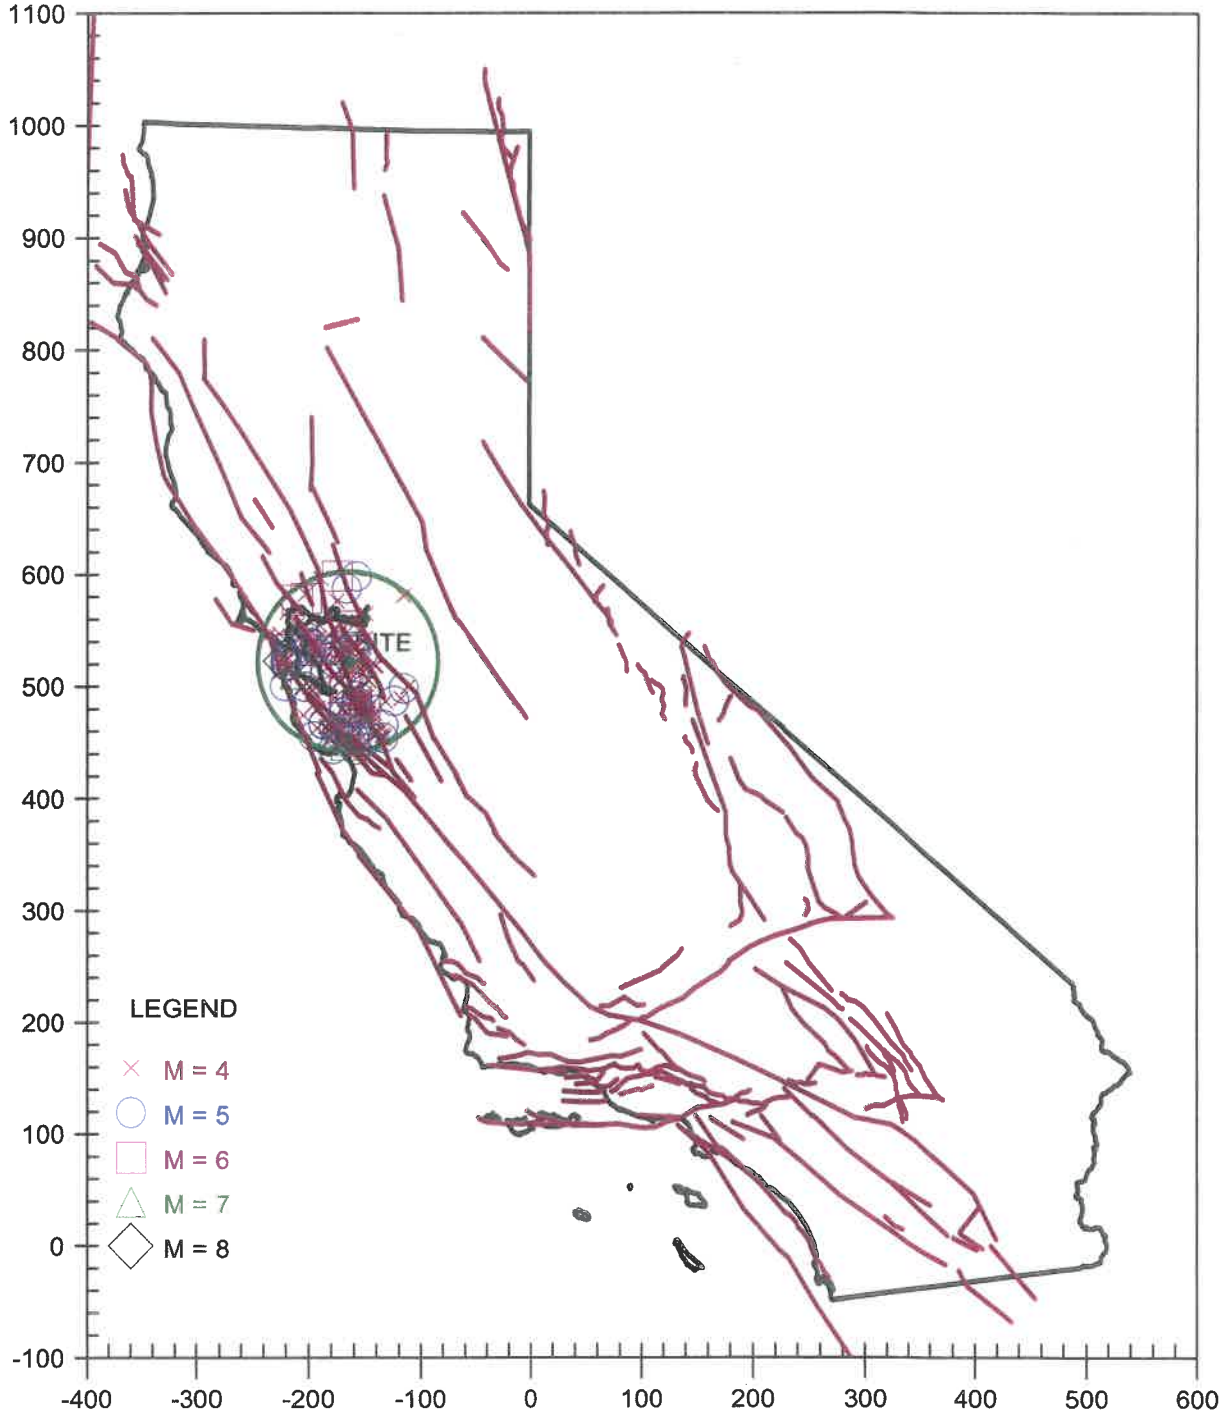
TIME PERIOD OF SEARCH: 1800 TO 2018

LENGTH OF SEARCH TIME: 219 years

THE EARTHQUAKE CLOSEST TO THE SITE IS ABOUT 4.8 MILES (7.8 km) AWAY.

LARGEST EARTHQUAKE MAGNITUDE FOUND IN THE SEARCH RADIUS: 8.3

LARGEST EARTHQUAKE SITE ACCELERATION FROM THIS SEARCH: 0.240 g



COEFFICIENTS FOR GUTENBERG & RICHTER RECURRENCE RELATION:
a-value= 2.749
b-value= 0.653
beta-value= 1.504

TABLE OF MAGNITUDES AND EXCEEDANCES:

Earthquake Magnitude	Number of Times Exceeded	Cumulative No. / Year
4.0	330	1.51376
4.5	123	0.56422
5.0	62	0.28440
5.5	37	0.16972
6.0	14	0.06422
6.5	6	0.02752
7.0	3	0.01376
7.5	1	0.00459
8.0	1	0.00459

-END OF SEARCH- 119 EARTHQUAKES FOUND WITHIN THE SPECIFIED SEARCH AREA.

TIME PERIOD OF SEARCH: 1800 TO 2018

LENGTH OF SEARCH TIME: 219 years

THE EARTHQUAKE CLOSEST TO THE SITE IS ABOUT 7.4 MILES (11.9 km) AWAY.

LARGEST EARTHQUAKE MAGNITUDE FOUND IN THE SEARCH RADIUS: 8.3

LARGEST EARTHQUAKE SITE ACCELERATION FROM THIS SEARCH: 0.240 g

COEFFICIENTS FOR GUTENBERG & RICHTER RECURRENCE RELATION:
a-value= 1.367
b-value= 0.369
beta-value= 0.850

TABLE OF MAGNITUDES AND EXCEEDANCES:

Earthquake Magnitude	Number of Times Exceeded	Cumulative No. / Year
4.0	119	0.54587
4.5	119	0.54587
5.0	119	0.54587
5.5	60	0.27523

Input File Name: C:\Liquefy5\04219017B1.liq
Title: New High School - Dublin
Subtitle: Boring B1

Surface Elev.=
Hole No.=B1
Depth of Hole= 50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 15.50 ft
Max. Acceleration= 0.67 g
Earthquake Magnitude= 7.29

Input Data:

Surface Elev.=
Hole No.=B1
Depth of Hole=50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 15.50 ft
Max. Acceleration=0.67 g
Earthquake Magnitude=7.29
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
2. Settlement Analysis Method: Tokimatsu/Seed
3. Fines Correction for Liquefaction: Modify Stark/Olson
4. Fine Correction for Settlement: During Liquefaction*
5. Settlement Calculation in: All zones*
6. Hammer Energy Ratio, Ce = 1.25
7. Borehole Diameter, Cb= 1
8. Sampling Method, Cs= 1
9. User request factor of safety (apply to CSR) , User= 1.3
   Plot one CSR curve (fs1=User)
10. Use Curve Smoothing: Yes*

* Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
0.00	20.00	119.00	85.00
4.00	44.00	120.00	61.00
8.00	13.00	128.00	87.00
13.00	3.00	116.00	84.00
18.00	15.00	122.00	16.00

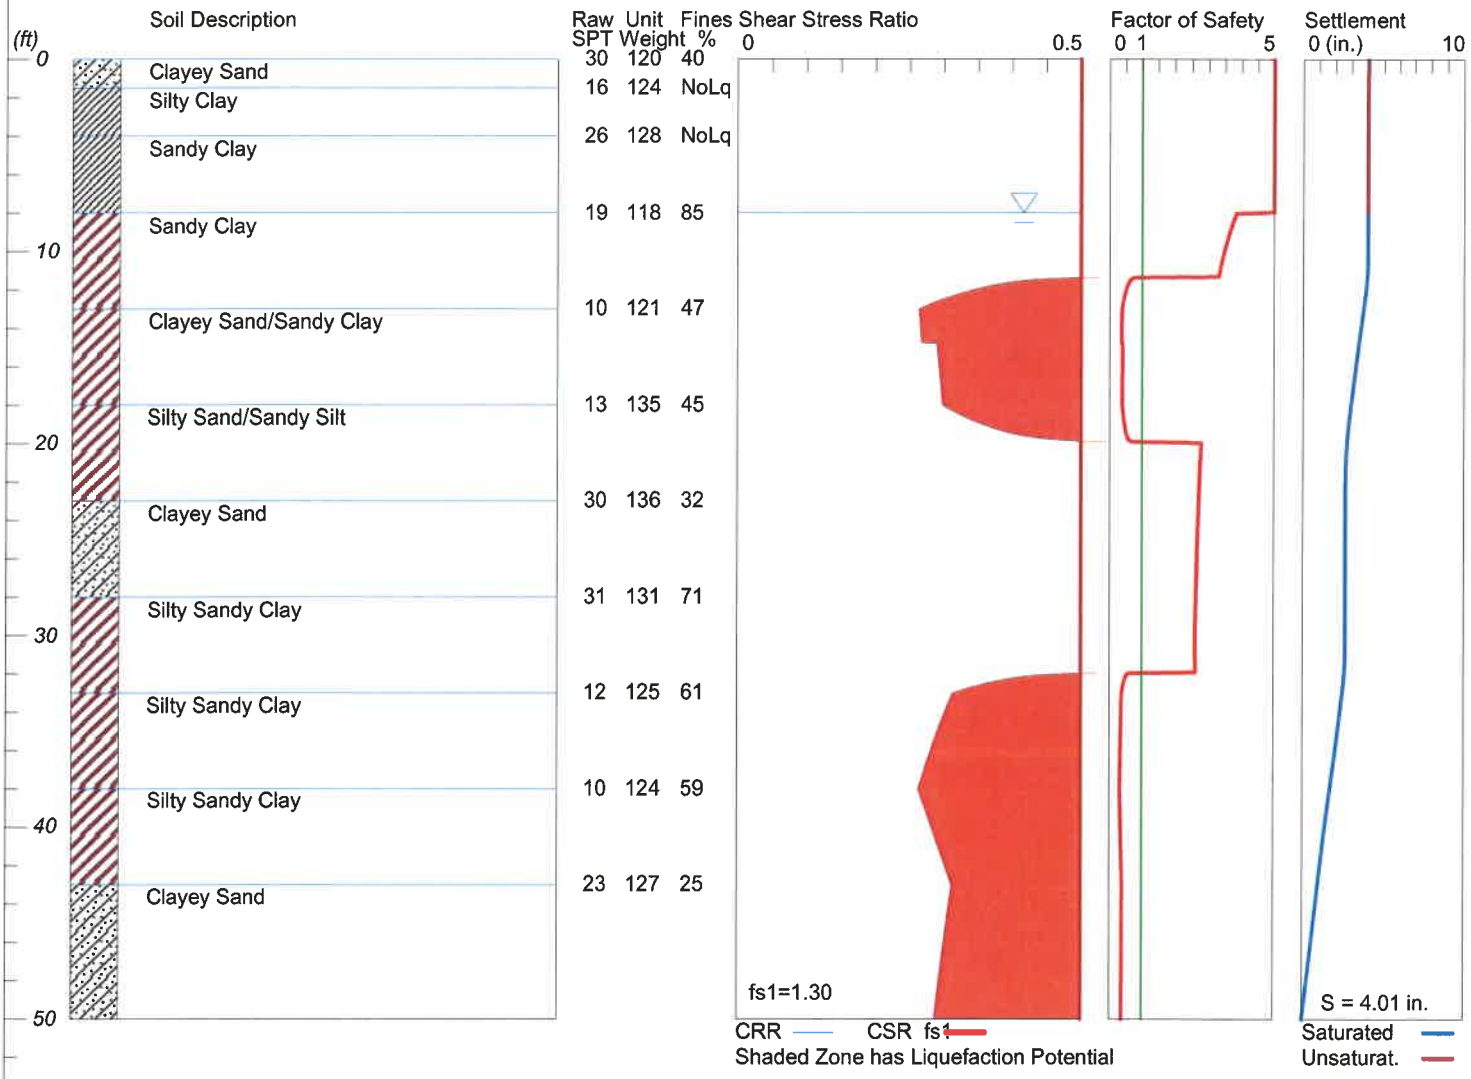
* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

---

1 atm (atmosphere) = 1 tsf (ton/ft2)



CRRm	Cyclic resistance ratio from soils
CSRsf	Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
F.S.	Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
S_sat	Settlement from saturated sands
S_dry	Settlement from Unsaturated Sands
S_all	Total Settlement from Saturated and Unsaturated Sands
NoLiq	No-Liquefy Soils

LIQUEFACTION ANALYSIS

New High School - Dublin

Hole No.=B19 Water Depth=8 ft

Magnitude=7.29
Acceleration=0.674g

Input File Name: C:\Liquefy5\04219017B19.liq
Title: New High School - Dublin
Subtitle: Boring B19
Surface Elev.=
Hole No.=B19
Depth of Hole= 50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 18.50 ft
Max. Acceleration= 0.67 g
Earthquake Magnitude= 7.29

Input Data:

Surface Elev.=
Hole No.=B19
Depth of Hole=50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 18.50 ft
Max. Acceleration=0.67 g
Earthquake Magnitude=7.29
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
2. Settlement Analysis Method: Tokimatsu/Seed
3. Fines Correction for Liquefaction: Modify Stark/Olson
4. Fine Correction for Settlement: During Liquefaction*
5. Settlement Calculation in: All zones*
6. Hammer Energy Ratio, Ce = 1.25
7. Borehole Diameter, Cb= 1
8. Sampling Method, Cs= 1
9. User request factor of safety (apply to CSR) , User= 1.3
   Plot one CSR curve (fs1=User)
10. Use Curve Smoothing: Yes*

* Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
0.00	30.00	120.00	40.00
1.50	16.00	124.00	NoLiq
4.00	26.00	128.00	NoLiq
8.00	19.00	118.00	85.00
13.00	10.00	121.00	47.00
18.00	13.00	135.00	45.00
23.00	30.00	136.00	32.00
28.00	31.00	131.00	71.00
33.00	12.00	125.00	61.00
38.00	10.00	124.00	59.00
43.00	23.00	127.00	25.00
50.00	23.00	127.00	25.00

Output Results:

Settlement of Saturated Sands=4.01 in.
Settlement of Unsaturated Sands=0.00 in.
Total Settlement of Saturated and Unsaturated Sands=4.01 in.
Differential Settlement=2.005 to 2.647 in.

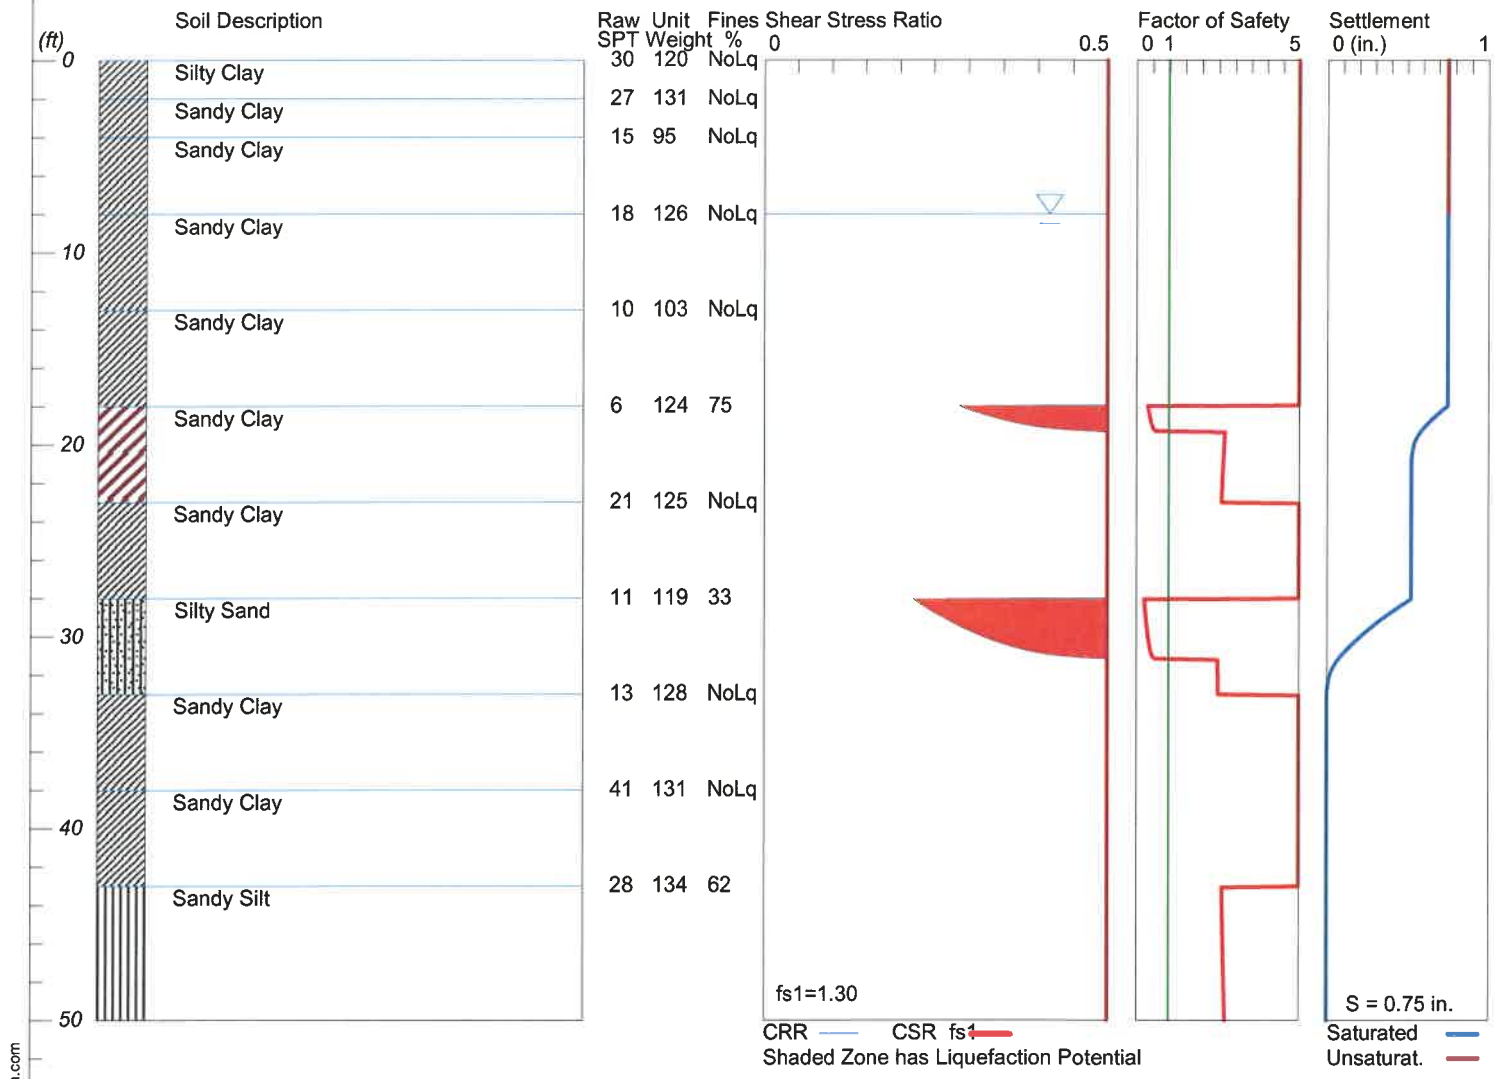
* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

---

1 atm (atmosphere) = 1 tsf (ton/ft2)



CRRm	Cyclic resistance ratio from soils
CSRsf	Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
F.S.	Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
S_sat	Settlement from saturated sands
S_dry	Settlement from Unsaturated Sands
S_all	Total Settlement from Saturated and Unsaturated Sands
NoLiq	No-Liquefy Soils

LIQUEFACTION ANALYSIS

New High School - Dublin

Hole No.=B30 Water Depth=8 ft

Magnitude=7.29
Acceleration=0.674g

Input File Name: C:\Liquefy5\04219017B30.liq
Title: New High School - Dublin
Subtitle: Boring B30
Surface Elev.=
Hole No.=B30
Depth of Hole= 50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 19.00 ft
Max. Acceleration= 0.67 g
Earthquake Magnitude= 7.29

Input Data:

Surface Elev.=
Hole No.=B30
Depth of Hole=50.00 ft
Water Table during Earthquake= 8.00 ft
Water Table during In-Situ Testing= 19.00 ft
Max. Acceleration=0.67 g
Earthquake Magnitude=7.29
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
2. Settlement Analysis Method: Tokimatsu/Seed
3. Fines Correction for Liquefaction: Modify Stark/Olson
4. Fine Correction for Settlement: During Liquefaction*
5. Settlement Calculation in: All zones*
6. Hammer Energy Ratio, Ce = 1.25
7. Borehole Diameter, Cb= 1
8. Sampling Method, Cs= 1
9. User request factor of safety (apply to CSR) , User= 1.3
   Plot one CSR curve (fs1=User)
10. Use Curve Smoothing: Yes*

* Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
0.00	30.00	120.00	NoLiq
2.00	27.00	131.00	NoLiq
4.00	15.00	95.00	NoLiq
8.00	18.00	126.00	NoLiq
13.00	10.00	103.00	NoLiq
18.00	6.00	124.00	75.00
23.00	21.00	125.00	NoLiq
28.00	11.00	119.00	33.00
33.00	13.00	128.00	NoLiq
38.00	41.00	131.00	NoLiq
43.00	28.00	134.00	62.00
50.00	28.00	134.00	62.00

Output Results:

Settlement of Saturated Sands=0.75 in.
Settlement of Unsaturated Sands=0.00 in.
Total Settlement of Saturated and Unsaturated Sands=0.75 in.
Differential Settlement=0.377 to 0.498 in.

1. Introduction

1.1 INTRODUCTION

This report has been prepared for the proposed Promenade School Site (proposed project) and provides an evaluation on whether the proposed project conforms to the state school facility standards, which apply to state-funded new school facilities projects. The State of California's standards for school site selection are found in Title 5 of the California Code of Regulations (CCR) Section 14010; additional codes and regulations applicable to school facilities are found in the Education, Government, and Public Resources Codes.

1.2 PROJECT LOCATION

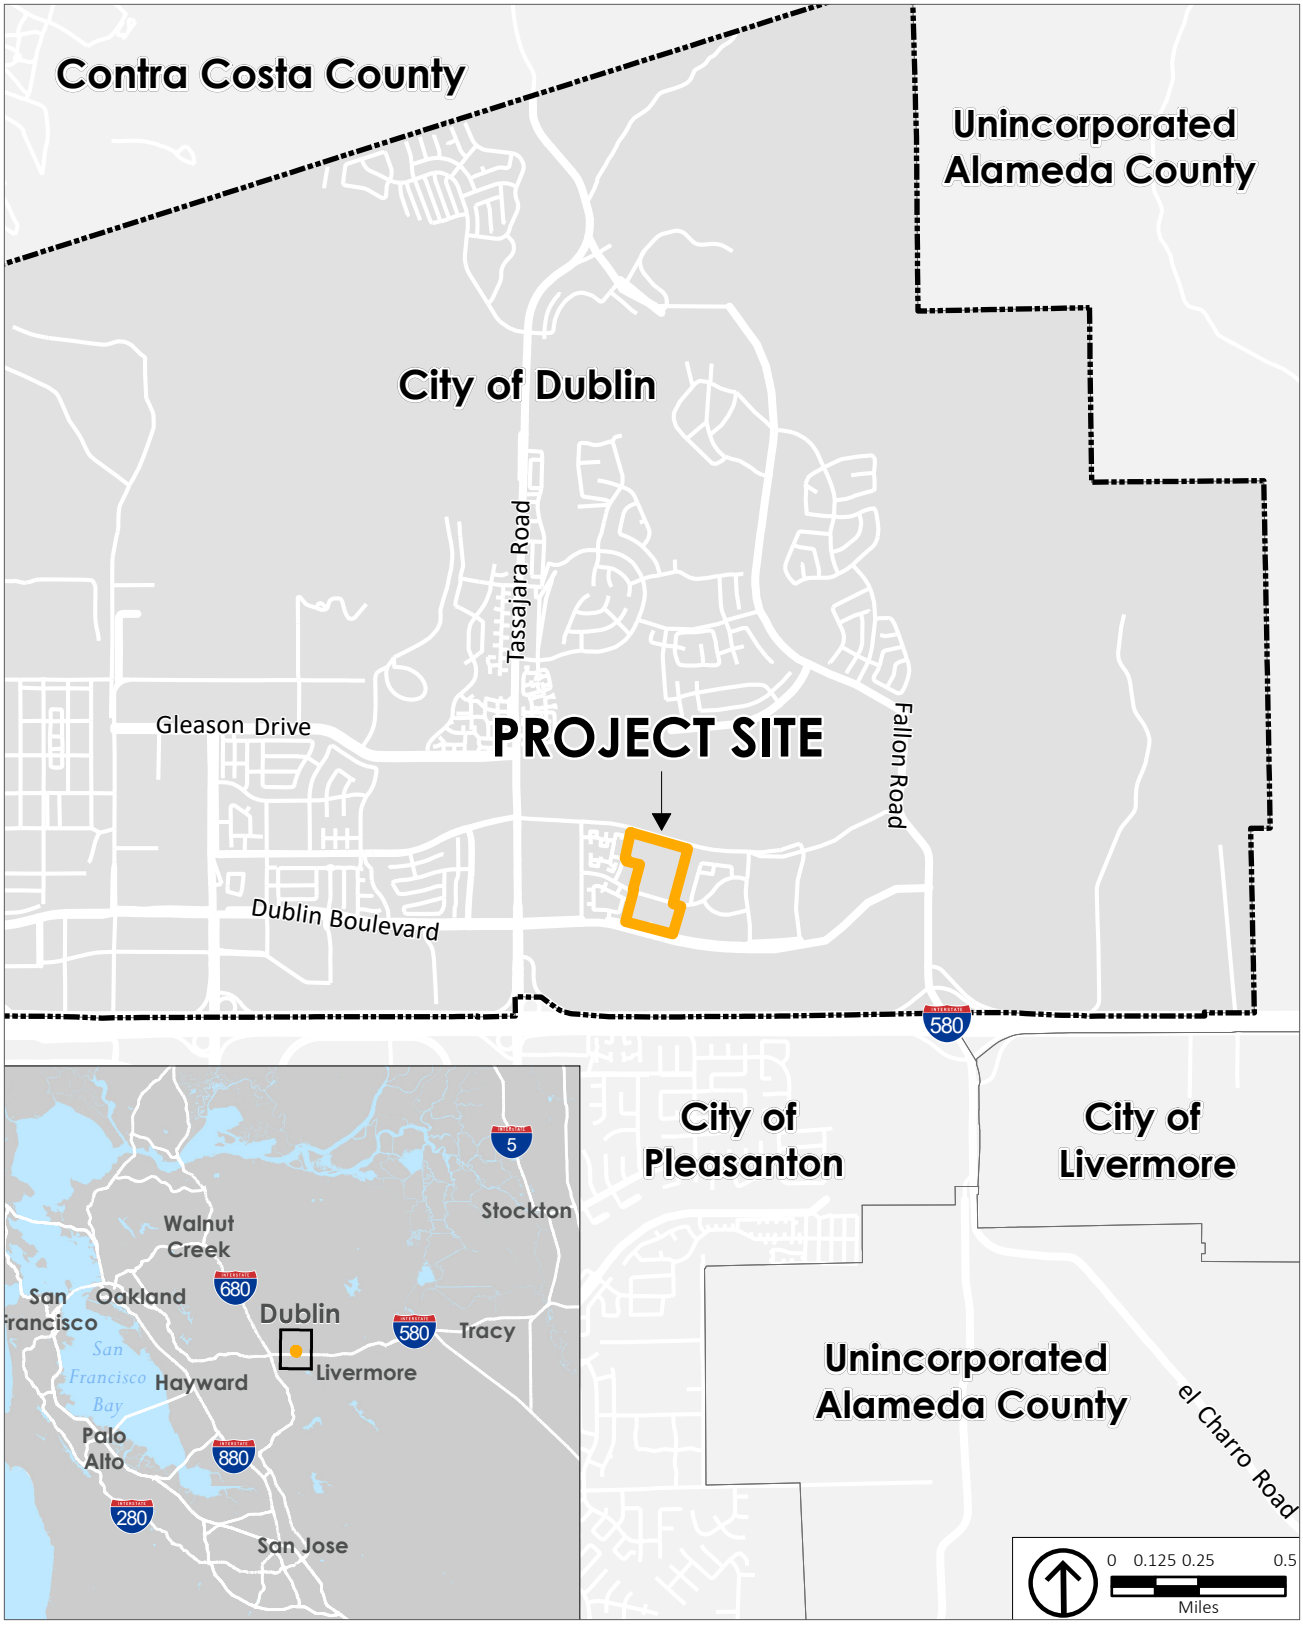
The project site (Site) is a vacant lot located at the southeast corner of Central Parkway and Chancery Lane in the City of Dublin, Alameda County, California (Assessor's Parcel Numbers [APNs] 985-78-2, -3, -4, -5, -6 and -7). Regional access to the proposed school is provided by Interstate 580 (I-580), located to the south. The City of Dublin is surrounded by San Ramon and unincorporated Contra Costa County to the north, unincorporated Alameda County to the east and west, and Pleasanton and Livermore to the south and southeast, respectively. Figure 1, Regional and Vicinity Map, and Figure 2, Project Site, show the project site in its surrounding and local contexts.

1.3 PROJECT DESCRIPTION

Dublin Unified School District is evaluating the vacant lot located at the southeast corner of Central Parkway and Chancery Lane in Dublin (Site) for possible site acquisition for a new school site. The Site is approximately 23 acres in size.

1.4 CONCLUSIONS/RECOMMENDATIONS

Based on a review of various information sources contained in this report, the following potentially environmental health and safety hazards are subject to further evaluation:



- The southwest corner of the project site is mapped within a liquefaction zone by the State of California. Further geotechnical investigation would be required during the design phase of the project for proper site-specific mitigation.

- Livermore Municipal Airport is located within two nautical miles southeast of the project site. CDE performed an initial school site evaluation that recommended a Caltrans Airport Assessment. California Department of Transportation [Caltrans] assessed the project and identified that the site is within the Airport Influence Area of Livermore Municipal Airport in the Alameda County Airport

1. Introduction

Land Use Compatibility (ALUC) Plan, which recommends that an avigation easement restricting the heights of buildings or trees be dedicated to the City of Livermore.

- A Preliminary Environmental Assessment is currently in preparation based on the historical agricultural use of the site.
- The District would need to coordinate with the City of Dublin and the Dublin San Ramon Services District to modify existing easements for water lines and emergency access on the site. The existing easements were dedicated with the assumption that the site would be used for residential land use. A school land use would require modification and/or elimination of the existing easements.

2.1 STATE STANDARDS FOR SCHOOL FACILITIES

The State of California's standards for school site selection are found in Title 5 of the California Code of Regulations (CCR) Section 14010, and additional codes and regulations applicable to school facilities are located in the Education, Government and Public Resources Codes. The following checklist provides a list of questions and code citations related to State-funded new school facilities.

(Documentation for SFPD 4.0, 4.01-4.03, School Site Approval)

Topic	Code References
Air Quality	
Is the boundary of the proposed school site within 500 feet of the edge of the closest traffic lane of a freeway or busy traffic corridor? If yes, would the project create an air quality health risk due to the placement of the school?	Ed. Code §17213(c)(2)(C); CCR Title 5 §14010(q)
Would the project create an air quality hazard due to the placement of a school within one-quarter mile of: (a) permitted and non-permitted facilities identified by the jurisdictional air quality control board or air pollution control district; (b) freeways and other busy traffic corridors; (c) large agricultural operations; and/or (d) a rail yard, which might reasonably be anticipated to emit hazardous air emissions, or handle hazardous or acutely hazardous material, substances, or waste?	Ed. Code § 17213(b); CCR Title 5 §14010(q)
Geology and Soils	
Does the site contain an active earthquake fault or fault trace, or is the site located within the boundaries of any special studies zone or within an area designated as geologically hazardous in the safety element of the local general plan?	Ed. Code, §17212 and §17212.5; CCR Title 5 §14010(f)
Would the project involve the construction, reconstruction, or relocation of any school building on the trace of a geological fault along which surface rupture can reasonably be expected to occur within the life of the school building?	Ed. Code §17212.5
Would the project involve the construction, reconstruction, or relocation of any school building on a site subject to moderate-to-high liquefaction, landslides, or expansive soils?	CCR, Title 5 §14010(i) School Site Selection and Approval Guide, Appendix H
Are naturally occurring asbestos minerals located at the site?	School Site Selection and Approval Guide, Appendix H
Hazards and Hazardous Materials	
Does the proposed school site contain one or more pipelines, situated underground or aboveground, which carry hazardous substances, acutely hazardous materials, or hazardous wastes, unless the pipeline is a natural gas line that is used only to supply natural gas to that school or neighborhood?	Ed. Code §17213(a)(3)
Is the proposed school site located near an aboveground water or fuel storage tank or within 1,500 feet of an easement of an aboveground or underground pipeline that can pose a safety hazard to the site?	CCR, Title 5 § 14010 (h)

2. Environmental Checklist

Is the school site in an area designated in a city, county, or city and county general plan for agricultural use and zoned for agricultural production, and if so, do neighboring agricultural uses have the potential to result in any public health and safety issues that may affect the pupils and employees at the school site? *(Does not apply to school sites approved by CDE prior to January 1, 1997.)*	Ed. Code § 17215.5
Is the property line of the proposed school site less than the following distances from the edge of respective power line easements: (1) 100 feet of a 50–133 kV line; (2) 150 feet of a 220–230 kV line; or (3) 350 feet of a 500–550 kV line?	CCR, Title 5 § 14010 (c)
Does the project site contain a current or former hazardous waste disposal site or solid waste disposal site and, if so, have the wastes been removed?	Ed. Code § 17213(a)(1)
Is the project site a hazardous substance release site identified by the state Department of Health Services in a current list adopted pursuant to §25356 for removal or remedial action pursuant to Chapter 6.8 of Division 20 of the Health and Safety Code?	PRC § 21151.8 (a)(1)(B); Ed. Code § 17213(a)(2)
If prepared, has the risk assessment been performed with a focus on children's health posed by a hazardous materials release or threatened release, or the presence of naturally occurring hazardous materials on the schoolsite?	Ed. Code § 17210.1(a)(3)
If a response action is necessary and proposed as part of this project, has it been developed to be protective of children's health, with an ample margin of safety?	Ed. Code § 17210.1(a)(4)
Is the proposed school site situated within 2,000 feet of a significant disposal of hazardous waste?	CCR, Title 5 § 14010 (t)
Is the site within 300 feet of an active oil or natural gas well?	Fire Code § 3406.3.1
Hydrology and Flooding	
Is the project site subject to flooding or tank/dam inundation or street flooding?	Ed. Code § 17212 and 17212.5; CCR, Title 5 § 14010 (g) School Site Selection and Approval Guide, Appendix H
Land Use and Planning	
Would the proposed school conflict with any existing or proposed land uses, such that a potential health or safety risk to students would be created?	Ed. Code § 17213; Gov't. Code § 65402; CCR, Title 5 § 14010 (m)
Are there easements on or adjacent to the site that would restrict access or building placement?	CCR, Title 5 § 14010(r)
Is the school site proportionate in its length to width ratio to accommodate the building layout, parking and playfields that can be safely supervised and does not exceed the allowed passing time to classes for the district?	CCR, Title 5 § 14010(j)
Is the site located within the proposed attendance area to encourage student walking and avoid extensive bussing unless bussing for ethnic diversity?	CCR, Title 5 § 14010(n)
Has the district considered environmental factors of light, wind, noise, aesthetics, and air pollution in its site selection process?	CCR, Title 5 § 14010(q)
Is the site within a designated Farmland Security Zone?	Government Code § 51296.5
Noise	
Is the proposed school site located adjacent to or near a major arterial roadway or freeway whose noise generation may adversely affect the educational program?	CCR, Title 5 § 14010 (e)
Public Services	
Does the site promote joint use of parks, libraries, museums, and other public services?	CCR, Title 5, § 14010 (o)
Is the site conveniently located for public services, including but not limited to fire protection, police protection, public transit and trash disposal wherever feasible?	CCR, Title 5, § 14010 (p)
Transportation/Traffic	
Are traffic and pedestrian hazards mitigated per Caltrans' School Area Pedestrian Safety manual?	CCR, Title 5 § 14010 (l)
Is the site easily accessible from arterials and is the minimum peripheral visibility maintained for driveways per Caltrans' Highway Design Manual?	CCR, Title 5 § 14010 (k)

Is the proposed school site within 1,500 feet of a railroad track easement?	CCR, Title 5 § 14010 (d)
Is the proposed school site within two nautical miles, measured by air line, of that point on an airport runway or potential runway included in an airport master plan that is nearest to the site? *(Does not apply to school sites acquired prior to January 1, 1966.)*	Ed. Code § 17215 (a)&(b)

School building "means and includes any building used, or designed to be used, for elementary or secondary school purposes and constructed, reconstructed, altered, or added to…" (Ed. Code § 17283).

Note: Any documentation related to the California Environmental Quality Act is provided under separate cover.

2. Environmental Checklist

This page intentionally left blank.

3. Environmental Analysis

Section 2.1 provided a checklist of the State of California's health and safety standards for school sites. This section provides documentation and evaluation of applicable standards and mitigation measures where appropriate.

3.1 AIR QUALITY

3.1.1 Is the boundary of the proposed school site within 500 feet of the edge of the closest traffic lane of a freeway or busy traffic corridor? If yes, would the project create an air quality health risk due to the placement of the school?

No Significant Hazard. Public Resources Code Section 21151.8(b)(9) and Education Code Section 17213(d)(9) define a "freeway or other busy traffic corridors" as roadways that on an average day have traffic in excess of 50,000 vehicles in a rural area or 100,000 vehicles in an urban area or 100,000 average daily trips (ADT).

Residential, recreational and retail uses surround the project site. Streets within 500 feet of the site are designated as arterial, collector or local residential streets (Dublin General Plan 2016). The traffic volume on Central Parkway was measured in 2011 near the intersection with Chancery Lane at 3,027 ADT. The traffic volume on Dublin Boulevard near the southeast corner of the Site was measured in 2016 at 14,864 ADT.

3.1.2 Would the project create an air quality hazard due to the placement of a school within one-quarter mile of: (a) permitted and non-permitted facilities identified by the jurisdictional air quality control board or air pollution control district; (b) freeways and other busy traffic corridors; (c) large agricultural operations; and/or (d) a rail yard, which might reasonably be anticipated to emit hazardous air emissions, or handle hazardous or acutely hazardous material, substances, or waste?

No Significant Hazard. The Bay Area Air Quality Management District (BAAQMD) has developed screening analysis tools for identifying stationary and mobile sources within a quarter-mile radius of project sites that have the potential to generate hazardous air emissions. BAAQMD's screening tools provide an easy-to-use initial comparison of health risks to determine if nearby emission sources may expose an existing or proposed new receptor to concentrations above BAAQMD's thresholds of significance. According to a review of BAAQMD's screening tools, there are two permitted facilities and two mobile sources within one-quarter mile of the site. The two stationary sources have permits for diesel-fueled emergency generators at Lowe's on Grafton Street 735 feet southwest of the Site and Terraces Homeowners Association at 3448 Finnian Way 500 feet east of the Site. The two mobile sources are Interstate 580 approximately 1,300 feet south of the site and Dublin Boulevard immediately to the south.

A screening-level health risk evaluation was conducted for the Site. Since BAAQMD's screening level risk values are for residential receptors, the risk values were adjusted for school-based receptors (i.e., high school students and staff) per BAAQMD recommendations. The adjusted risk values for the two stationary and two mobile sources were then compared to carcinogenic and non-carcinogenic thresholds established by BAAQMD and the Office of Environmental Health Hazard Assessment (OEHHA).

A copy of the Health Risk Assessment (HRA) Screening is included in Appendix A (PlaceWorks 2018a). As presented in Table 4 of Appendix A, the adjusted health risk values for school-based receptors do not exceed BAAQMD's thresholds of significance for health risk. Therefore, the nearby stationary and mobile sources are not anticipated to pose an actual or potential endangerment to occupants of the proposed school, and no mitigation measures are required.

3.2 GEOLOGY AND SOILS

Based on a review of the United States Geological Survey (USGS) 7.5-minute Topographic Series, Livermore, California Quadrangle Map (USGS 2015), the property is located in the eastern portion of the Amador Valley within the Coast Ranges Geomorphic Province. The Coast Ranges Geomorphic Province is a long region of moderate relief containing many elongate ridges and narrow valleys that are approximately parallel to the coast. The Coast Ranges Geomorphic Province extends about 600 miles from the Oregon border to the Santa Ynez River and is subdivided into the ranges north of San Francisco Bay and ranges south of the bay to Santa Barbara County. The property itself sits atop alluvium (Dibblee and Minch 2006).

The geographic coordinates for the subject site are 37.4227 north Latitude and 121.5153 west Longitude. The subject site lies at an approximate elevation of 356 feet above sea level. The topography in the vicinity of the Site has a general gradient toward the southwest. It has been reported in the draft Phase I Environmental Site Assessment for the site by Terraphase Engineering, Inc. that the subsurface of the site has been described as clay with laterally discontinuous layers of gravel and sand in the capillary fringe and saturated zone.

3.2.1 Does the site contain an active earthquake fault or fault trace, or is the site located within the boundaries of any special studies zone or within an area designated as geologically hazardous in the safety element of the local general plan?

No Significant Hazard. Based on a review of Dibblee and Minch (2006), the California Geological Survey Information Warehouse and the City of Dublin General Plan Environmental Resources Management: Seismic Safety and Safety Element, the project site is not on a known fault and is not within an earthquake fault zone.

3.2.2 Would the project involve the construction, reconstruction, or relocation of any school building on the trace of a geological fault along which surface rupture can reasonably be expected to occur within the life of the school building?

No Significant Hazard. The site is not within or immediately adjacent (i.e., within a few hundred feet) of a fault zone (California Geological Survey [CGS] and Earthquake Zones of Required Investigation, 2018a). The nearest potentially active fault is the Pleasanton Fault located approximately 1.42-miles southwest of the site. Based on a review of the readily-available geologic literature, the site is not on a pressure ridge, and there

are no known active faults on or immediately adjacent to the site. On this basis, the potential for tectonic fault rupture at the site is considered negligible.

3.2.3 Would the project involve the construction, reconstruction, or relocation of any school building on a site subject to moderate-to-high liquefaction, landslides, or expansive soils?

No Significant Hazard.

Liquefaction

Based on a review of the *Earthquake Zones of Required Investigation, Livermore Quadrangle* (CGS 2008a), the southwest corner of the Site is within a Liquefaction Zone. If structures are planned within this portion of the site, further investigation would be required. However, any potential liquefaction would be mitigated in accordance with the 2016 CBC. Therefore, project implementation would not result in a significant impact from liquefaction.

Landslides

The project site and vicinity are relatively flat and have a slope of less than 0.3% (USGS 2015). Therefore, landslides are not a potential hazard at the project site.

Expansive Soils

Expansive soils swell when they become wet and shrink when they dry out, resulting in the potential for cracked building foundations and in some cases, structural distress of the buildings themselves. In each case, minor to severe damage to overlying structures is possible. Based on the *2008 Seismic Hazard Zone Report for the Dublin 7.5-minute Quadrangle*, in general, there are few landslides in the Dublin area (CGS 2008b). The only area that is susceptible to landslides due to the presence of expansive clay shale is the hills west of the San Ramon Valley. Additionally, since the site is a proposed school site, CGS and DSA will ensure that the buildings are sufficiently mitigated for the condition. Therefore, the project will not expose people or the new school buildings to adverse effects associated with expansive soils.

3.2.4 Are naturally occurring asbestos minerals located at the site?

No Significant Hazard. No known naturally occurring serpentine rock or rock formations—which may contain significant quantities of asbestos—are within 10 miles of the project site (Van Gosen and Clinkenbeard 2011). Additionally, based on a review of *A General Location Guide for Ultramafic Rocks in California: Areas More Likely to Contain Naturally Occurring Asbestos* (Department of Conservation, Division of Mines and Geology 2000) and Van Gosen and Clinkenbeard (2011), the site is not located within a 10-mile radius of an area thought to contain naturally occurring asbestos. Therefore, project implementation would not result in the exposure of hazardous materials or naturally occurring hazardous materials on the school site.

3.3 HAZARDS AND HAZARDOUS MATERIALS

3.3.1 Does the proposed school site contain one or more pipelines, situated underground or aboveground, which carry hazardous substances, acutely hazardous materials, or hazardous wastes, unless the pipeline is a natural gas line that is used only to supply natural gas to that school or neighborhood? Does the proposed school site contain pressurized sewer lines and high pressure water pipelines within 1,500 feet of the proposed site?

No Significant Hazard. There are no petroleum or chemical pipelines on the site based on a review of the National Pipeline Mapping System online mapping database (NPMS 2018). Based on information from Terraphase Engineering, Inc., there are no pressurized sewer lines or water pipelines on the project site. According to the response from Pacific Gas and Electric (PG&E), one high-pressure natural gas pipeline is located to the south within 1,500 feet of the project site, on the south side of and parallel to Interstate 580. Based on the results of the Pipeline Safety Hazard Assessment, the hazard footprints of the 16-inch natural gas transmission pipeline do not reach the proposed school site, and would not pose a risk to students or staff onsite (PlaceWorks 2018b).

3.3.2 Is the proposed school site located near an aboveground water or fuel storage tank or within 1,500 feet of an easement of an aboveground or underground pipeline that can pose a safety hazard to the site?

Aboveground Water or Fuel Storage Tanks

No Significant Hazard. No aboveground water or fuel storage tanks were identified within a 1,500-foot radius, based on a review of Google Earth Pro and the GeoTracker website (2018). The development of the project will not create a new hazard or exacerbate the current conditions.

Hazardous Substance Pipelines

No Significant Hazard. There are no petroleum or chemical pipelines within a 1,500-foot radius, according to the National Pipeline Mapping System (online mapping database (NPMS 2018). According to the response from PG&E, one high-pressure natural gas pipeline is located south of the project site running parallel to, and along the south side of Interstate 580. A copy of the response from PG&E is included in Appendix B. Based on the results of the Pipeline Safety Hazard Assessment, the hazard footprints of the 16-inch natural gas transmission pipeline do not reach the proposed school site, and would not pose a risk to students or staff onsite (PlaceWorks 2018b).

Sewer and Water Pipelines

No Significant Hazard. Based on information provided by Terraphase Engineering, Inc., there are water mains with diameters of 14, 15, and 20 inches along Dublin Boulevard south of the project site, a 12-inch diameter water main along Central Parkway north of the project site, and two recycled water mains along Dublin Boulevard with diameters of 12 and 20 inches in diameter. A 30-inch gravity flow sewer main is also located along Dublin Boulevard, south of the project site. A Water Pipeline Flooding Analysis is recommended to address these pipelines. A copy of the PlaceWorks request to the Dublin San Ramon Services District is included in Appendix B along with a copy of the draft Terraphase Engineering, Inc.

report in Appendix C. A water pipeline flooding analysis was conducted on the water pipelines in the Pipeline Safety Hazard Assessment which concluded that a full-flow rupture of any of the water mains would not result in flooding at the proposed school site (PlaceWorks 2018b).

3.3.3 Is the school site in an area designated in a city, county, or city and county general plan for agricultural use and zoned for agricultural production, and if so, do neighboring agricultural uses have the potential to result in any public health and safety issues that may affect the pupils and employees at the school site? (Does not apply to school sites approved by CDE prior to January 1, 1997.)

No Significant Hazard. As shown in the aerial photograph in Figure 2, the project site is in an area characterized by suburban residential and commercial development. Properties within a quarter-mile radius of the site are generally zoned for residential and commercial. Based on a review of the City of Dublin GIS, the City of Dublin website, and a previous draft Phase I, no agricultural activities have occurred on adjoining areas since at least 2005.

3.3.4 Is the property line of the proposed school site less than the following distances from the edge of respective power line easements: (1) 100 feet of a 50–133 kV line; (2) 150 feet of a 220–230 kV line; or (3) 350 feet of a 500–550 kV line?

No Significant Hazard. According to PG&E, the property line of the project site is not within 100 feet of a 50-133 kilovolt (kV) line, 150 feet of a 220-230 kV line, or 350 feet of a 500-550 kV line. A copy of the response from PG&E is included in Appendix B.

3.3.5 Does the project site contain a current or former hazardous waste disposal site or solid waste disposal site and, if so, have the wastes been removed?

No Significant Hazard. Based on a review of the EnviroStor and GeoTracker the project site does not contain a current or former hazardous waste disposal site or solid waste disposal site (DTSC 2018; SWRCB 2018).

3.3.6 Is the project site a hazardous substance release site identified by the state Department of Health Services in a current list adopted pursuant to §25356 for removal or remedial action pursuant to Chapter 6.8 of Division 20 of the Health and Safety Code?

No Significant Hazard. Based on a review of the EnviroStor and GeoTracker databases, no hazardous substance release sites were identified within the project site (DTSC 2018; SWRCB 2018).

3.3.7 If prepared, has the risk assessment been performed with a focus on children's health posed by a hazardous materials release or threatened release, or the presence of naturally occurring hazardous materials on the schoolsite?

Potentially Significant Hazard. A draft Phase I Environmental Site Assessment (Phase I ESA) was prepared for the site under separate cover by Terraphase Engineering, Inc. (2017). Based on a review of historical information; the subject site had been used historically for agricultural purposes. A Preliminary

Environmental Assessment (PEA) is currently in preparation to evaluate if the former agricultural activities may have left residual pesticides in the soil.

Searches on databases concluded that the project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5.

3.3.8 If a response action is necessary and proposed as part of this project, has it been developed to be protective of children's health, with an ample margin of safety?

Potentially Significant Hazard. Based on the findings of the PEA, a determination can be made on whether a response action is necessary for the project.

3.3.9 Is the proposed school site situated within 2,000 feet of a significant disposal of hazardous waste?

No Significant Hazard. Based on review of the GeoTracker website, the project site is not within 2,000 feet of a significant disposal of hazardous waste (DTSC 2018; SWRCB 2018).

3.3.10 Is the site within 300 feet of an active oil or natural gas well?

No Significant Hazard. According to the Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) Well Finder, the project site is not within 300 feet of an active oil or natural gas well (DOGGR 2018). The closest oil well is located approximately 3.2-miles northeast of the subject site. The well is identified as a plugged and abandoned dry hole advanced by Trico Industries, Inc. drilled in 1967 to a depth of 5,050 feet and was abandoned in 1968.

3.4 HYDROLOGY AND FLOODING

Based on an analysis of the topography in the site vicinity, sheet flow runoff from the site during periods of intense or prolonged precipitation would be expected to flow to the southwest. According to FEMA, the closest 100-year flood plain is located 0.12 mile south of the site.

The site is in the western portion of the Livermore-Amador Valley Hydrologic Region of the Livermore Valley Groundwater Basin, which is approximately 40 miles east of San Francisco within the Diablo Range. The Livermore Valley consists of continental deposits from alluvial fans, outwash plains, and lakes from the Livermore Formation, and the Tassajara Formation. Surface bodies of water near the site include the Arroyo Mocho and Arroyo Las Positas to the south-southeast, and Tassajara Creek to the west. These surface features all drain towards the San Francisco Bay (Terraphase Engineering, 2017). Hydrogeologic investigations were not performed on the site for this investigation; therefore, it is unknown to what extent localized variations in groundwater presence and flow occur on the site.

3.4.1 Is the project site subject to flooding or tank/dam inundation or street flooding?

No Significant Hazard. According to the FEMA Map Service Center website, the site does not lie within a 100-year flood zone or within a dam inundation zone. As stated in Section 3.3.1, there are no water tanks within 1,500 feet of the site.

3.5 LAND USE AND PLANNING

3.5.1 Would the proposed school conflict with any existing or proposed land uses, such that a potential health or safety risk to students would be created?

No Significant Hazard. As shown in the aerial photograph in Figure 2, the project site is in an area characterized by suburban residential and commercial development. Properties within a quarter-mile radius of the site are generally zoned for residential and commercial. Based on a review of the City of Dublin GIS and the City of Dublin website, there are currently no proposed land use or zoning changes in the project area (City of Dublin GIS, 2018). Therefore, there is no significant hazard to the project.

3.5.2 Are there easements on or adjacent to the site that would restrict access or building placement?

No Significant Hazard. Based on the easements that exist around the proposed Finnian Way extension and around the water pipelines that exist on the site, the District, Dublin San Ramon Services District, and the City will need to coordinate on how the project will move forward with the proposed land use changing from a residential use to a school use. In addition, an avigation easement associated with the site's proximity to Livermore Municipal Airport was recommended by Caltrans. These proposed easement changes would be necessary prior to moving forward with construction of the school. Therefore, there is no significant hazard to the project.

3.5.3 Is the school site proportionate in its length to width ratio to accommodate the building layout, parking and playfields that can be safely supervised and does not exceed the allowed passing time to classes for the district?

No Significant Hazard. The school will be developed with footprint proportionality and ease of student access in mind. Therefore, there is no significant hazard to the project.

3.5.4 Has the district considered environmental factors of light, wind, noise, aesthetics, and air pollution in its site selection process?

Light and Wind

No Significant Hazard. No Significant Hazard. The project site would be exposed to standard climate conditions experienced by the City of Dublin in Alameda County, California, which is generally characterized by Mediterranean conditions. As applicable, the operation of the proposed project would consider these environmental conditions. Therefore, project implementation would not expose site occupants to adverse light or wind conditions.

Aesthetics

No Significant Hazard. No Significant Hazard. Project development would not degrade the existing visual character of the site. The project site is in an area with residential, school, and commercial land uses. The building of the proposed project would be consistent with the surrounding land uses. The character and quality of the site would not be incompatible with the nearby structures.

Air Pollution

No Significant Hazard. No Significant Hazard. According to the Bay Area Air Quality Management District (BAAQMD), there are two permitted facilities within a one-quarter mile of the site. Lowe's on Grafton Street about 744 feet southwest of the Site has a permit for an emergency generator. Terraces Homeowners Association at 3448 Finnian Way about 879 feet east of the Site has a permit for an emergency generator. Based on an Operational Health Risk Assessment prepared for the site and a comparison of hazardous air emissions from the nearby stationary sources to carcinogenic and non-carcinogenic thresholds established by BAAQMD and OEHHA, the nearby stationary sources are not anticipated to pose an actual or potential endangerment to occupants of the proposed structures, and no mitigation measures are required. A copy of the Health Risk Assessment Screening is included in Appendix A.

3.6 NOISE

3.6.1 Is the proposed school site located adjacent to or near a major arterial roadway or freeway whose noise generation may adversely affect the educational program?

No Significant Hazard. The project site is located about 1,250 feet to the north of the Arthur H. Breed, Jr Freeway (Interstate 580). Residential dwellings bound the site to the north, east, and west. Southwest and across Dublin Boulevard there are commercial properties. The proposed project would not exacerbate the current noise conditions at the site from traffic.

3.7 PUBLIC SERVICES

3.7.1 Does the site promote joint use of parks, libraries, museums, and other public services?

No Significant Hazard. The site could be made available for public use as the scheduling of scholastic purposes allows, following District policies, and the Civic Center Act. No impacts to nearby public facilities and services would occur as a result of the proposed project. No significant impacts would occur as a result of the proposed project.

3.7.2 Is the site conveniently located for public services, including but not limited to fire protection, police protection, public transit and trash disposal wherever feasible?

No Significant Hazard. The project site is located in a developed area. The project site will have regularly scheduled trash collection and access to public transit. There is no significant hazard. Fire Station No. 18 is approximately 3,316.27-feet to the northeast of the site. The Alameda County Sheriff's Department is located approximately 0.98-miles to the northwest of the site. The Dublin Boulevard and Grafton Street Bus Stop is located near the southwest edge of the site, and the Central Parkway and Chancery Lane Bus Stop is located near the northwest edge of the site.

3.8 TRANSPORTATION/TRAFFIC

3.8.1 Are traffic and pedestrian hazards mitigated per Caltrans' School Area Pedestrian Safety manual?

No Significant Hazard. Based on existing conditions, the future project is not expected to have any significant traffic hazards to overcome. Furthermore, the School Area Pedestrian Safety Manual will be used as a guide, and decisions related to particular traffic control devices at particular locations shall be made on the basis of an engineering and traffic survey. The school district governing board may request the appropriate city, county, or state agency to consider the installation of traffic control devices if the engineering and traffic survey determines the request to be justified. Traffic control devices include (Caltrans, 1996):

1. Warning signs and markings.
2. Variable speed limits.
3. Intersection stop signs.
4. Flashing yellow beacons.
5. Traffic signals.
6. Remove visibility obstructions.
7. School Safety Patrol.
8. Adult Crossing Guard.
9. Pedestrian separation structures.
10. Pedestrian walkways along the roadway.
11. Pedestrian walkways separated from the roadway.
12. Parking controls and curb-use zones.

3.8.2 Based on the traffic volumes mentioned in Section 3.1.1 and the existing sidewalks and crosswalks in the site vicinity, the project would not have any significantly adverse traffic or pedestrian hazards to overcome.Is the site easily accessible from arterials and is the minimum peripheral visibility maintained for driveways per Caltrans' Highway Design Manual?

No Significant Hazard. Based on existing conditions, the future project is not expected to have any significant traffic hazards to overcome. The site is located in an established portion of the City of Dublin that has wide, relatively flat streets with gentle curves for open viewing of oncoming traffic. Driveways would be designed to meet the requirements of the Caltrans Highway Design Manual. Future transportation facilities are subject to review and approval by the City of Dublin.

3.8.3 Is the proposed school site within 1,500 feet of a railroad track easement?

No Significant Hazard. Based on a review of Google Earth, the site is not located within 1,500 feet of a railroad track easement. The terminus of the nearest BART heavy rail line is located in the median of Interstate 580 about one-mile west-southwest of the site. In the event that BART opted to extend the line to Livermore in the future, therail track would be within 1,500 feet of the project site. However, the presence of an electric-powered train in the median of a freeway would not be likely to pose a risk to future school occupants, as pedestrian barriers already exist for the freeway, and the train would not significantly increase the amount of particulates or noise at the project site.

3.8.4 Is the proposed school site within two nautical miles, measured by air line, of that point on an airport runway or potential runway included in an airport master plan that is nearest to the site? (Does not apply to school sites acquired prior to January 1, 1966.)

Potentially Significant Hazard. Based on a review of area maps and recent aerial photographs, the site is within two nautical miles of an existing airport or proposed airport runway. The nearest airport is Livermore Municipal Airport located approximately 1.75-nautical miles to the southeast. CDE performed an initial school site evaluation that recommended a Caltrans Airport Assessment. Based on the response from the Caltrans Division of Aeronautics, the school site is located outside of all California Code of Regulations Safety Zones, but within the Airport Influence Area of Livermore Municipal Airport in the Alameda County Airport Land Use Compatibility (ALUC) Plan. Caltrans identifies that the Alameda County ALUC Plan recommends an avigation easement for the site restricting the heights of structures or trees be dedicated to the City of Livermore. Additionally, Caltrans indicates that occasional noise from individual aircraft may potentially impact the site based on the location of the site in relation to flight patterns from Livermore Municipal Airport, but that the noise levels could be reduced in the buildings through acoustical design standards.A copy of the response from Caltrans is included in Appendix B.

3.9 EXEMPTIONS TO SITING STANDARDS

3.9.1 Is the district seeking any exemptions to the standards found in CCR, Title 5, § 14010(c-i), (l), (m), (q), (c), (t)?

No Significant Hazard. The District will not be seeking any exemptions to the standards found in CCR Title 5 Section 14010.

3.9.2 If so, has mitigation been identified that demonstrates that the standard may be overridden without compromising a safe and supportive school environment?

No Significant Hazard. The proposed project would comply with all CCR Title 5 standards.

Exceeds Threshold?					**Yes**	**No**	**No**	**Yes**	Highway 101 (link 23) exceeds threshold

Note: To adjust the screening cancer risk values from 70-year residential values to school-based values, the Dose and concentration of TACs, assuming 100% DPM, was back-calculated using the screening cancer risks values. Once the concentration of DPM was determined, the staff and student screening cancer risks were determined (Table 2).

Bay Area Air Quality Management District

Roadway Screening Analysis Calculator

County specific tables containing estimates of risk and hazard impacts from roadways in the Bay Area.

INSTRUCTIONS:

Input the site-specific characteristics of your project by using the drop down menu in the "Search Parameter" box. We recommend that this analysis be used for roadways with 10,000 AADT and above.

• County: Select the County where the project is located. The calculator is only applicable for projects within the nine Bay Area counties.

• Roadway Direction: Select the orientation that best matches the roadway. If the roadway orientation is neither clearly north-south nor east-west, use the highest values predicted from either orientation.

• Side of the Roadway: Identify on which side of the roadway the project is located.

• Distance from Roadway: Enter the distance in feet from the nearest edge of the roadway to the project site. The calculator estimates values for distances greater than 10 feet and less than 1000 feet. For distances greater than 1000 feet, the user can choose to extrapolate values using a distribution curve or apply 1000 feet values for greater distances.

• Annual Average Daily Traffic (ADT): Enter the annual average daily traffic on the roadway. These data may be collected from the city or the county (if the area is unincorporated).

When the user has completed the data entries, the screening level PM2.5 annual average concentration and the cancer risk results will appear in the Results Box on the right. Please note that the roadway tool is not applicable for California State Highways and the District refers the user to the Highway Screening Analysis Tool at: http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx

Notes and References listed below the Search Boxes

Results

Alameda County

EAST-WEST DIRECTIONAL ROADWAY

PM2.5 annual average

0.284 ($\mu g/m^3$)

Cancer Risk

14.32 (per million)

Data for Alameda County based on meteorological data collected from Pleasanton in 2005

Notes and References:

1. Emissions were developed using EMFAC2011 for fleet mix in 2014 assuming 10,000 AADT and includes impacts from diesel and gasoline vehicle exhaust, brake and tire wear, and resuspended dust.
2. Roadways were modeled using CALINE4 air dispersion model assuming a source length of one kilometer. Meteorological data used to estimate the screening values are noted at the bottom of the "Results" box.
3. Cancer risks were estimated for 70 year lifetime exposure starting in 2014 that includes sensitivity values for early life exposures and OEHHA toxicity values adopted in 2013.

Alameda County

PM2.5 Concentrations and Cancer Risks Generated from Surface Streets

How to use the screening tables:

- Distance is from the edge of the nearest travel lane of a street to the facility or development
- When two or more streets are within the influence area, sum the contribution from each street

Project Name	Promenade School Site
Address	Vacant Lot at the southeast corner of Central Parkway and Chancery Lane
City	Dublin
County	Alameda
Type (residential, commercial, mixed use, industrial, etc.)	Vacant undeveloped lot
Project Size (# of units or building square feet)	23-acres

Comments: Please provide emission rate of health risk values for stationary sources within 1,320 feet of site. See attached map.

For Air District assistance, the following steps must be completed:

1. Complete all the contact and project information requested in Table A. Incomplete forms will not be processed. Please include a project site map.

2. Download and install the free program Google Earth, **http://www.google.com/earth/download/ge/,** and then download the county specific Google Earth stationary source application files from the District's website, **http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx.** The small points on the map represent stationary sources permitted by the District (Map A on right). These permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc. Click on a point to view the source's Information Table, including the name, location, and preliminary estimated cancer risk, hazard index, and PM2.5 concentration.

3. Find the project site in Google Earth by inputting the site's address in the Google Earth search box.

4. Identify stationary sources within at least a 1000ft radius of project site. Verify that the location of the source on the map matches with the source's address in the Information Table, by using the Google Earth address search box to confirm the source's address location. Please report any mapping errors to the District.

5. List the stationary source information in Table B *blue* section only.

6. Note that a small percentage of the stationary sources have Health Risk Screening Assessment (HRSA) data INSTEAD of screening level data. These sources will be noted by an asterisk next to the Plant Name (Map B on right). If HRSA values are presented, these values have already been modeled and cannot be adjusted further.

7. Email this completed form to District staff. District staff will provide the most recent risk, hazard, and PM2.5 data that are available for the source(s). If this information or data are not available, source emissions data will be provided. Staff will respond to inquiries within three weeks.

Note that a public records request received for the same stationary source information will cancel the processing of your SSIF request.

Submit forms, maps, and questions to Areana Flores at 415-749-4616, or aflores@baaqmd.gov

Subject: Pipeline Information Request for a school site in Dublin California

*****CAUTION: This email was sent from an EXTERNAL source. Think before clicking links or opening attachments.*****

Dublin Unified School District, in compliance with CCR Title V Section 14010 (h), has contracted the services of PlaceWorks to complete safety hazard assessments related to high pressure (over 80 psig) natural gas pipelines located within a 1,500-foot radius of the site. The potential school site is a 21.7-acre parcel located south of Central Parkway, east of Chancery Lane, and north of Dublin Boulevard, Dublin, California.

This letter requests the location and diameter of all high pressure natural gas pipelines operated by Pacific Gas and Electric located within a 1,500-foot radius of each of the site. I have attached a map that shows the site highlighted in red and an approximately 1,500-foot radius around the site in yellow.

Thank you so much for your help, and please contact me if you have any questions or need more information.

Subject: Powerline Information Request for a school site in Dublin California

*****CAUTION**: This email was sent from an EXTERNAL source. Think before clicking links or opening attachments.*****
Dear Mike Allen and Michael Herz,

Dublin Unified School District, in compliance with CCR Title V Section 14010 (h), have contracted the services of PlaceWorks to complete a safety hazard assessment related to powerlines. The location of the potential school site is a 21.7-acre parcel located south of Central Parkway, east of Chancery Lane, and north of Dublin Boulevard, Dublin, California.

I have attached a map to this email that shows the parcel filled in with red.

Given the following parameters, could you help me determine if the site is located near power transmission or distribution lines:

The property line of the site shall be at least the following distance from the edge of respective power line easements:

(1) 100 feet for 50-133 kV line.
(2) 150 feet for 220-230 kV line.
(3) 350 feet for 500-550 kV line.

Thank you so much for all your help. Please contact me if you have any questions or need more information.

Attachments: SSIF_DublinSchoolSite_af.xlsx; Copy of RollupPermittedSourceRiskBY2014 _allsources.xlsx; Diesel IC Engine Multiplier Tool.xlsx; emissions_18395_2017.txt; emissions_18054_2017.txt

Hi Danielle,

Attached you will find your request for:

1. Promenade School Site, Dublin

A couple things to note:

2. We have updated our data to include the OEHHA factor and more accurate location of permitted sources (2014 data attached)

3. Any missing or zero values in the "Cancer Risk" column signify a cancer risk level of NONE.

4. Attached you will find emissions data for sites 18054 and 18395 for the year 2017. You can use this to further your analysis with the most recent data.

5. For major roads with >30,000 AADT (annual average daily traffic) and/or rail lines near your sensitive receptor we recommend it be considered in your local pollutant analysis. Below is a link to raster files with cancer risk and PM2.5 associated with these roads. They show the modeled values for each source (high = highway, majstr = major streets, and rail = rail) in 20 x 20 meter grid cells. The raster files incorporate AADT for that highway using EMFAC 2014 data for fleet mix and includes the OEHHA factor. Let me know if you are able to download and view on ArcMap and if you need help understanding its use.

Subject: SSIF for a School Site in Dublin CA

Dear Areana Flores,

PlaceWorks is working on a Geologic and Environmental Health Assessment on behalf of the Dublin Unified School District for a 23-acre site located at the southeast corner of Central Parkway and Chancery Lane Dublin, California.

Could you please provide emission rate of health risk values for stationary sources withing 1,320-ft of the site (see attached map).

Attached to this email is the SSIF Form for the proposed school site and a map that has the site highlighted in red with an approximatley 1,320-ft radius around the site in yellow.

Thank you so much for your help, and please contact me if you have any questions or need more information.

Livermore Municipal Airport
Alameda County School File
Alameda County

Making Conservation a California Way of Life.

August 22, 2018

Mr. John Gordon, Field Consultant
School Facilities Planning Division
California Department of Education
1430 N Street, Suite 1201
Sacramento, CA 95814-5901

Dear Mr. Gordon:

In response to your request of July 9, 2018, and Section 17215 of the California Education Code (EC), the California Department of Transportation (Caltrans), Division of Aeronautics, has analyzed the proposed Promenade High School site. The proposed school site is located north of Dublin Boulevard, south of Central Parkway, and east of Chancery Lane in Dublin near the Livermore Municipal Airport (Airport). The proposed school site is located approximately 10,775 feet northwest of the approach end of Runway 7L.

Pursuant to EC section 17215, our analysis was conducted in accordance with the Title 21, California Code of Regulations (CCR) section 3570. Caltrans also considered the Alameda County Airport Land Use Compatibility Plan (ALUCP), the California Airport Land Use Planning Handbook (Handbook), a Caltrans flight to determine where the proposed school site is located relative to aircraft flight paths and aircraft generated noise, our files, and other publications relating to aircraft operations at the Airport. The Alameda County Airport Land Use Commission and the Airport's management were given an opportunity to comment, and their comments were considered.

The Livermore Municipal Airport is designated by the Federal Aviation Administration (FAA) as a Reliever Airport that serves to relieve the three most congested Bay Area air carrier airports (Oakland, San Francisco, and San Jose). The Airport is the twelfth busiest airport in California with approximately 150,000 operations per year with two parallel runways designed to accommodate nearly all types of general aviation aircraft. Runway 7L/25R is 5,253 feet long, and Runway 7R/25L is 2,699 feet long. The proposed school site location is closest to Runway 7L/25R.

The CCR runway criteria was applied to the existing Runway 7L/25R, and it was found that the proposed school site is located outside of all CCR Safety Zones. According to the ALUCP the proposed school site falls inside Safety Zone 7, identified as the Airport Influence Area (AIA). The ALUCP guidance states that an avigation easement, restricting the heights of structures or trees, should be dedicated to the city of Livermore as a condition for any discretionary local approval for any property within the AIA.

Additionally, the ALUCP provides a list of potential flight hazards associated with land uses that should be avoided in the AIA, unless the uses are consistent with FAA rules, regulations, and guidelines. Specific characteristics to be avoided are: glare or distracting lights that could be

mistaken for airport lights, sources of dust, heat, steam, smoke that may impair pilot vision, sources of steam or other emissions that may cause thermal plumes that generate turbulence within the flight paths, sources of electrical interference with aircraft communication or navigation, and features that create an increased attraction for wildlife, such as certain recreational or agricultural uses that attract large flocks of birds.

Airport management provided written comments and concerns about the proposed school site stating in part: "The proposed school site is approximately two miles from the Airport and close to the extended centerline for Runway 25R/7L. This, and the school's location under the Airport traffic pattern, may result in regular aircraft overflights at relatively low altitude. Some staff members and students may find the noise generated by the aircraft to be objectionable."

On August 8, 2018, Caltrans conducted a flight inspection of the proposed school site. Our flight evaluation revealed the proposed site will be subject to periodic over-flights from general aviation aircraft and corporate jet aircraft departing from and arriving at the Airport from the northwest at an altitude of approximately 1,000 to 1,500 feet above the ground level. Inspection of the traffic pattern for Runway 7L/25R demonstrated that the proposed school is less than one quarter mile from the crosswind leg to the downwind leg of the traffic pattern for Runway 25R. As such, it may be exposed to individual aircraft noise events that could reach a level that could be disruptive.

Although the proposed school site is outside the 55 decibel Community Noise Equivalent Level aircraft noise contour, the potential exists for persons at this site to be annoyed by individual aircraft noise events. Therefore, if this site is selected, we recommend that the school include provisions for buildings to have air circulation or air conditioning, so that all windows and doors can remain closed. The school should also include acoustical treatment in the design and construction of any buildings for use by students, faculty, or administrators to reduce individual irritation from aircraft noise or disruption to instruction.

In conclusion, the school site is within the AIA according to the ALUCP. As such, the potential flight hazards (described above), associated with land use in the AIA should be avoided. Additionally, an avigation easement restricting the heights of structures or trees should be dedicated to the city of Livermore. While there is generally a low risk of an accident occurring at the proposed site, the potential consequences of any accident could be severe. Caltrans cannot guarantee the safety of this or any other site. However, based upon our evaluation of existing conditions and planned development, Caltrans has no objections to the proposed school site. If this proposed site is approved, the site must be occupied by August 20, 2023, or another site evaluation by Caltrans is required prior to occupation.

This Caltrans recommendation is furnished pursuant to EC section 17215. This recommendation does not relieve the sponsor of compliance responsibilities relating to any law, ordinance, or regulation of any federal, State, or local government body, nor does it constitute Caltrans approval relative to the California Public Utilities Code (PUC), the CCR, and other State statutory or regulatory codes.

Additionally, PUC sections 21670 through 21679.5 establish a mandated process to implement airport land use laws throughout the State. Pertinent portions of PUC section 21670(a) state that it is "in the public interest to provide for the orderly development of each public use airport in this state and . . . to prevent the creation of new noise and safety problems." These sections require the creation of ALUCs within the counties, set forth the commissions' powers and duties, and call for the adoption of land use measures around the vicinity of public-use airports. Section 21670(f) specifically states that school districts are included among the local agencies that are subject to airport land use laws and other requirements of the PUC. School site acquisitions pursuant to EC section 17215 must comply with the above PUC sections.

Sincerely,

Original Signed by

DONALD E. HAUG
Aviation Safety Officer

SIGNATURE OF ENVIRONMENTAL PROFESSIONAL

This report is intended to meet the requirements of American Society for Testing and Materials International (ASTM) Standard Practice E1527-13 and has been prepared by the undersigned environmental professional. The environmental assessment described herein was conducted by the undersigned employees of Terraphase Engineering Inc.

The assessment consisted solely of the activities described in the Introduction of this report, and was performed in accordance with the ASTM Designation E1527-13 guidelines for Phase I Environmental Site Assessments and the Terms and Conditions of the Standard Consulting Services Agreement signed prior to initiation of the assessment, as applicable. The assessment was conducted in a manner consistent with the level of care and skill ordinarily exercised by professional engineers, professional geologists, and environmental scientists.

I declare that, to the best of my professional knowledge and belief, I meet the definition of environmental professional as defined in §312.10 of 40 Code of Federal Regulations (CFR) 312, and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the property. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

DRAFT

EXECUTIVE SUMMARY

Terraphase Engineering Inc. (Terraphase) has performed a Phase I Environmental Site Assessment (ESA) of the Promenade site ("the Subject Property" or "the Site"; Figures 1 and 2). The Subject Property is undeveloped land bounded to the north by Central Parkway, bounded to the east by multi-tenant housing, to the south by Dublin Boulevard, and to the west by Chancery Lane, in Dublin, Alameda County, California. The ESA was prepared on behalf of the Fagan Friedman and Fulfrost LLP (F3Law), in accordance with F3Law's authorization of Terraphase's proposal dated December 9, 2016. Per the Alameda County Assessor (2017), the Subject Property is assigned Assessor's Parcel Numbers (APNs) 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005, 985-0078-006, and 985-0078-007. Per the deed information provided by Environmental Data Resources, Inc. (EDR) in the Environmental Lien and Activity and Land Use Limitation (AUL) Search report (EDR 2016a; Appendix B), all six parcels are owned by Grafton Station LLC, a California Domestic Limited Liability Company. The Subject Property is proposed to be developed into a school site.

The Phase I ESA was performed in conformance with the scope and limitations of American Society for Testing and Materials International (ASTM) Standard Practice E1527-13 and California Department of Education (CDE) and Department of Toxic Substances Control (DTSC) school siting guidelines (DTSC 2001; CDE 2016). Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report.

Findings

The Subject Property was used for agricultural purposes, reportedly hay production and grazing and possibly row crop cultivation, from approximately 1939 to the mid-1990s. No structures or corrals were historically present on the Subject Property. The Subject Property was planned to be part of the surrounding residential construction between 2005 and 2009. Fill material was imported and utilities were installed and preliminary grading and development was conducted, but the proposed residential development ended in 2009, and no other use or development has been conducted since 2009.

Grading, soil stockpiling, and construction equipment staging occurred on the Subject Property from 2005 until 2009. Soil sampling and analytical testing was previously conducted by Berlogar Geotechnical Consultants (Berlogar Geotech) in 2008 and 2009. Berlogar concluded that isolated areas of low concentrations of diesel (TPHd) and motor oil range (TPHmo) petroleum hydrocarbons were present, as well as minor concentrations of organochlorine pesticides. The prior soil sampling was not sufficient to adequately characterize the imported fill material or prior agricultural soil below it for potential use of the site as a school. Potential build-out of the Subject Property will require geotechnical and additional environmental soil testing.

Terraphase identified the following RECs during this Phase I ESA:

- The Site has been historically undeveloped land, and although predominantly used as grazing land, there is a potential for agricultural chemicals to be present in shallow soil at the Site.

- Fill material was imported to the Site from undocumented sources prior to construction activities in 2005. Prior soil sampling of the fill is insufficient to characterize the material for residential/school use.

Terraphase did not identify any historical RECs (HRECs), or controlled RECs (CRECs) during this Phase I ESA. A Phase I ESA questionnaire was not returned by the User, which constitutes a data gap. The lack of the User questionnaire is not considered to be a significant data gap.

Recommendations

This Phase I ESA presents Terraphase's interpretation of the information with respect to RECs at the Site. Following ASTM E1527-05 and 2017 CDE and DTSC school reporting guidelines. Terraphase concludes that further investigation through a Preliminary Endangerment Assessment (PEA), including sampling or testing, to determine if a release of hazardous material has occurred and, if so, the extent of the release is needed to assess the Site. Terraphase makes the following recommendations:

- In accordance with DTSC Interim Guidance for Sampling Agricultural Properties, (Third Revision) (DTSC 2008), the Site was historically used for row crops; therefore, the potential for the presence of pesticides at the Site exists. It is unlikely that the Site was ever irrigated. DTSC guidance (DTSC 2008) indicates that for sites that were dry-land farmed one sample should be collected from each quadrant of the Site. The samples should be analyzed for organochlorine pesticides (U.S. EPA Method 8081B), arsenic, and asbestos. Care will be needed in the field to assess where the fill/native soil surface lies so that samples of the native soil are collected.
- While Berlogar Geotech conducted extensive studies of the fill material brought to the Site, and conducted additional sampling for diesel range petroleum hydrocarbons in other areas of the Site, the presence of pesticides and PCBs in the underlying native soils does not appear to have been addressed.
- Conduct a specific geological study at the Site to comply with the CGS Note 48 requirements.
- Conduct a pipeline risk assessment for large-diameter water and natural gas pipelines in the vicinity of the Site.
- Conduct a separate noise study at the Site to verify that the noise complies with state regulations.
- Prepare a letter outlining the proposed school site and the location of the Livermore Municipal Airport (within two nautical miles) and submit it to the California Department of Education for processing.
- Due to the Site's proximity to the proposed BART track extension (within 1,500 feet), Terraphase recommends obtaining a letter signed by a California professional civil engineer indicating that the potential BART tracks do not pose a significant threat to the Site.

- Conduct a ¼ mile survey around the proposed school site location. This survey should include a reconnaissance around the site to visually assess whether any buildings have placards indicating the presence of hazardous materials, drums, or unpermitted exhaust stacks. If the survey identifies any hazardous materials within ¼ mile of the school site, appropriate mitigation measures should also be recommended.

DRAFT

1.0 INTRODUCTION

At the request of the Fagen Friedman and Fulfrost LLP (F3Law), Terraphase Engineering Inc. (Terraphase) has completed this Phase I Environmental Site Assessment (ESA) for the Promenade site which is vacant land bounded to the north by Central Parkway, bounded to the east by multi-tenant housing, to the south by Dublin Boulevard, and to the west by Chancery Lane, in Dublin, Alameda County, California ("the Subject Property" or "the Site"), on behalf of F3Law and in accordance with F3Law's authorization of Terraphase's proposal dated December 9, 2016. Per the Alameda County Assessor, the Subject Property is listed under Assessor's Parcel Numbers (APNs) 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005, 985-0078-006, and 985-0078-007. All six parcels are owned by Grafton Station LLC, a California Domestic Limited Liability Company, per the Deed recorded on May 7, 2013. The Subject Property was previously agricultural land, predominantly used for grazing. A housing project was pursued at the Site from 2005-2009 and utilities were installed and fill material brought onto the Site. The developers did not complete the project. The Subject Property is proposed to be developed into a school site. A Site Location map is provided as Figure 1 and a Site Map showing Site details is provided as Figure 2.

This Phase I ESA includes information gathered from federal, state, and local agencies; review of historical documents; a reconnaissance visit; interviews; and a review of previously conducted environmental studies. The qualifications of the environmental professional who prepared this report are included in Section 11.

1.1 Purpose

The purpose of a Phase I ESA is to evaluate the potential for environmental contamination on the Subject Property, and to evaluate if contamination could potentially occur in the future because of activities or conditions on or near the Subject Property. The Phase I ESA was conducted in accordance with the processes prescribed in the American Society for Testing and Materials International (ASTM) "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" (ASTM Designation E1527-13; ASTM 2013) and CDE and DTSC school siting guidelines (DTSC 2001; CDE 2016). Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report.

This Phase I ESA identifies recognized environmental conditions (RECs) and environmental concerns at the Subject Property. As defined by ASTM, a REC is the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or the material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include "de minimis" conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

1.2 Phase I ESA Scope of Services

The following services were included in this Phase I ESA:

- review of historical sources of information, such as aerial photographs, Sanborn fire insurance maps, and land use records;
- review of previously conducted environmental studies;
- review of government records, including regulatory reports for both the Subject Property and adjoining properties;
- review of an environmental database search;
- review of local regulatory agencies, including the local fire department and other local government entities that have jurisdiction over hazardous waste management, permitting, and site investigations;
- reconnaissance level visual inspection of the Subject Property, including observations of adjoining properties and general land uses, with photographs to document current conditions;
- review the Subject Property to look for evidence of the release(s) of hazardous materials and petroleum products and to assess the potential for on-site releases of hazardous materials and petroleum products resulting from current and historical land use activities and nearby operations; and
- preparation of a report that documents our research, observations, and the results of the environmental inquiry, which specifically identifies any areas that will require invasive site investigation, including a summary of conclusions. In accordance with the 2017 California Department of Education School Facilities, General Education Code Provisions, Terraphase will also evaluate the following safety factors: (1) proximity to airports, § 17215; (2) proximity to high-voltage power transmission lines; (3) presence of toxic and hazardous substances; (4) hazardous air emissions and facilities within a quarter mile, § 17213(b); (5) other health hazards, § 17213(a); (6) proximity to railroads, See CCR, Title 5, Section 14010(d); (7) proximity to high-pressure natural gas lines, gasoline lines, pressurized sewer lines, or high-pressure water pipelines, § 17213; (8) proximity to propane tanks; (9) noise; (10) proximity to major roadways; (11) results of geological studies and soils analyses, § 17212 and 17212.5; (12) condition of traffic and school bus safety; (13) safe routes to school; and (14) safety issues for joint-use projects.
- The presence of potentially toxic or hazardous substances on or in the vicinity of a prospective school site is another concern relating to the safety of students, staff, and the public. During site evaluation, Terraphase shall give special consideration to the following hazards: (1) landfill areas on or adjacent to the site; (2) proximity of the site to current or former dump areas, chemical plants, oil fields, refineries, fuel storage facilities, nuclear generating plants, abandoned farms and dairies, and

DRAFT

agricultural areas where pesticides and fertilizer have been heavily used; and (3) naturally occurring hazardous materials, such as asbestos, oil, and gas.

1.2.1 Non-Scope Services

As defined pursuant to Section 13.1.5 of the ASTM Standard Practice, the following list includes several non-scope considerations. Non-scope considerations are considered beyond the scope of standard practice and no assessment of such non-scope considerations is required as defined by ASTM Standard Practice.

No implication is intended as to the relative importance of such non-scope considerations and the list below is not intended to be all inclusive:

- Testing of building materials for presence of asbestos-containing material
- Biological agents
- Cultural and historical resources
- Ecological resources
- Endangered species
- Health and safety
- Indoor air quality unrelated to releases of hazardous substances or petroleum products into the environment
- Industrial hygiene
- Testing of building materials for presence of lead-based paint
- Lead in drinking water
- Methane gas
- Mold
- Testing for presence of radon
- Regulatory compliance
- Wetlands
- Compliance with activity and use limitations

1.2.2 Significant Assumptions

This Phase I ESA provides appropriate inquiry into the previous ownership and use of the Subject Property consistent with good commercial and customary practice to minimize liability. Terraphase also assumes that the information provided by Environmental Data Resources, Inc. (EDR), the regulatory database provider, and regulatory agencies is true and reliable.

DRAFT

1.2.3 Limitations and Exceptions

The opinions and recommendations presented in this report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by Terraphase and F3Law. This report was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and circumstances established by the environmental consulting industry as practiced in California. To the extent that Terraphase relied upon any information prepared by other parties not under contract to Terraphase, no representation as to the accuracy or completeness of such information is made. Only F3Law may make use of and rely upon the information in this report.

This information can only be utilized for a period not to exceed 180 days in accordance with ASTM's "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" ASTM Designation E1527-13, and/or the Code of Federal Regulations (CFR) 40CFR Part 312 "Standards and Practices for All Appropriate Inquiries: Final Rule," dated November 1, 2005, and amended December 30, 2013. After 180 days, the report must be updated in accordance with ASTM Standards and federal regulations.

The findings presented in this report apply solely to conditions existing at the time of the assessment. It must be recognized, however, that a Phase I ESA is intended for the purpose of evaluating the potential for contamination through limited research and investigative activities, and in no way represents a conclusive or complete characterization. Conditions in other parts of the Subject Property may vary from those at the locations where data were collected.

Terraphase's interpretation of investigation results is related to the availability of the data and the extent of the investigation activities; 100% confidence in Phase I ESA conclusions cannot reasonably be achieved. Therefore, Terraphase does not provide any guarantees, certifications, or warranties (express or implied) that a property is free from environmental contamination. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and all applicable laws, codes, regulations, or standards.

1.2.4 User Reliance

This document was prepared for the use of F3Law. No other party should rely on the information contained herein without the prior written consent of Terraphase and F3Law.

DRAFT

2.0 SUBJECT PROPERTY DESCRIPTION

2.1 Subject Property and Vicinity General Description

The Subject Property is six parcels, APNs 985-0078-002 through 985-0078-007, comprising 25.37 acres of vacant land with underground utility improvements bounded to the north by Central Parkway, bounded to the east by multi-tenant housing, to the south by Dublin Boulevard, and to the west by Chancery Lane in Dublin, Alameda County, California. The Subject Property is owned by Grafton Station LLC. Per the Alameda County Assessor Use Code 3000, the Site is described as vacant commercial land. The previous use codes 1000 – vacant residential land and 7300 – condo-single residential housing unit, indicate that the parcels were once part of a housing development project. Per the City of Dublin Zoning Land Use, the Site is zoned as "PD" a planned development, and general land use as "NC" neighborhood commercial.

The Subject Property is surrounded by residential communities to the north (across Central Parkway), west (adjoining and across Chancery Lane), and east (adjoining), Devany Square park to the west, and vacant land to the southeast (across Dublin Boulevard). The Grafton Street retail center is located to the south-southwest of the Subject Property (Figure 2).

2.2 Site Geology and Hydrogeology

Based on the EDR GeoCheck® Physical Setting Source Summary, the average elevation of the Site is approximately 356 feet above mean sea level and the topography slopes gently to the southwest. The EDR Radius Map™ with Geocheck® report (EDR 2016b; "the EDR Report") is provided in Appendix C.

The City of Dublin is located within the Coast Ranges Geomorphic Province of California, an area characterized by a series of northwestern trending ridges and valleys dominated by the San Andreas Fault System. The East Bay Hills, the western extent of the Diablo Range, are formed from compressional forces between the Calaveras fault to the east and the Hayward fault to the west. The Calaveras fault zone separates the highly folded Upper Cretaceous Great Valley sequence to the west of the fault and Plio-Pleistocene Livermore gravels on the east side of the fault. Most of the bedrock exposed in the hills consists of Cretaceous marine sedimentary rocks, parts of which belong to the Great Valley Sequence. The Cretaceous units exposed in the Dublin area are composed of varying amounts of graywacke, sandstone, siltstone, shale, and conglomerate. These units are unconformably overlain by Miocene age marine sedimentary rocks that include shales and sandstones. Based on geological information from a site within the vicinity of the Subject Property (SWRCB 2017: Geotracker, Jordan Ranch 2010), the subsurface contains clay with some laterally discontinuous layers of sand and gravel in the capillary fringe and saturated zone. Geologic maps of the area indicate that the northwestern portion of the property is underlain by alluvium from the Pleistocene (Qpa) consisting of sand, silt, and gravel. The southeastern portion of the Subject Property is underlain by alluvium from the Holocene (Qha) consisting of gravel, sand, silt, and clay. The EDR GeoCheck® - Physical Setting Source Summary provided information on dominant soil composition in the general area of the Site. The soil type identified was

Clear Lake clay, with very slow infiltration rates, and a high-water table. Depth to groundwater was encountered at depths ranging from 17 to 27 feet below ground surface (bgs; SWRCB 2017: Geotracker, Jordan Ranch 2010).

Per the California Geological Survey's Fault Activity Map of California, the Calaveras Fault is the nearest active fault and located approximately 3.5 miles east of the Subject Property (CGS 2010). The Site is specifically located in the western portion of the Livermore-Amador Valley Hydrologic Region, within the Livermore Valley Groundwater Basin. The Livermore Valley Groundwater Basin lies approximately 40 miles east of San Francisco within a structural trough of the Diablo Range. The entire floor of the Livermore Valley is underlain by continental deposits from alluvial fans, outwash plains, and lakes that include valley-fill materials, the Livermore Formation, and the Tassajara Formation. Surficial water bodies in the vicinity of the Subject Property include Arroyo Mocho and Arroyo Las Positas (to the south-southeast), and Tassajara Creek to the west. All streams converge on the west side of the basin to form Arroyo de la Laguna, which flows south and joins Alameda Creek in Sunol Valley, and ultimately draining to the San Francisco Bay (DWR 2006). The regional groundwater flow direction is reportedly to the south. The Livermore Valley Groundwater Basin has deep aquifers that are used for drinking and agricultural water under management of the Zone 7 Water Agency. The Site is located outside the 100- and 500-year flood plain areas. The flood plain areas are illustrated on the Overview Map of the EDR Report included in Appendix C.

Berlogar Geotechnical Consultants reported that groundwater was present between 16.5 and 18 feet bgs at the time of their geotechnical investigation (Berlogar Geotech 2008). Groundwater likely flows with downward sloping topography toward the large lakes (former sand and gravel quarries) located to the south-southeast of the Site.

DRAFT

3.0 CLIENT/USER PROVIDED INFORMATION

This section describes certain information provided to Terraphase by the Client (i.e., "the User" of this Phase I ESA). A User questionnaire was not completed by the Client.

3.1 Title Record

The Environmental Lien and Activity and Land Use Limitation (AUL) Search report provided by EDR (EDR 2016a) indicated that the last transfer of parcels with APNs 985-0078-002 through 985-0078-007, was recorded on May 7, 2013, when the property was transferred from James and Mei F. Tong to Grafton Station LLC, the current owner.

3.1.1 Alameda County Assessor's and Recorder's Office Records

Information obtained from the Alameda County Assessor's office, concurred with the parcel information described above. Files from the records reviewed are provided in Appendix A.

3.2 Environmental Liens and Activity and Use Limitations

The User did not return the questionnaire. It is unknown if the User has any knowledge of environmental liens or AULs associated with the Subject Property. A review of the EDR Environmental Lien and AUL Search report did not indicate any environmental liens or AULs associated with the Subject Property.

3.3 Valuation Reduction for Environmental Liens

The User did not return a questionnaire. It is unknown if the User has knowledge that indicates a value reduction of Subject Property due to environmental liens.

3.3.1 Specialized Knowledge and Commonly Known or Reasonably Ascertainable Information

The User did not return a questionnaire. It is unknown if the User has any specialized knowledge or information regarding the Subject Property.

DRAFT

4.0 AGENCY RECORDS REVIEW

4.1 Standard Environmental Record Sources

The regulatory agency database report discussed in this section, provided by EDR, was reviewed for information regarding reported releases of hazardous substances and petroleum products on or near the property. The EDR Report, including a description of all regulatory databases and associated acronyms, is included in Appendix C.

Terraphase reviewed applicable and reasonably ascertainable federal, state, and local environmental-related databases as part of this Phase I ESA. Of the databases searched in accordance with the ASTM Practice E1527-13, EDR identified 69 listings within the ASTM-prescribed search radii. The records for these listings were reviewed to help identify RECs and environmental concerns in connection with the Subject Property. As per ASTM Standard E 1527-13, due to the urban industrial setting, density, and large number of sites reported within the search area, the entirety of the information within the minimum search distance cannot be feasibly reviewed for its potential impact on the Subject Property. Therefore, in accordance with Section 8.1.2.1 of the ASTM Standard, the minimum search distances were adjusted and an assessment of impact has been limited to discuss the sites which, based on their location and classification, appear to have a potential to impact the Subject Property via groundwater migration. The search distances were adjusted to include only adjacent sites and sites with a documented release which are located within a ¼-mile radius of the Subject Site. Specific information about each listing is listed Appendix C.

4.1.1 Subject Property

The Subject Property was not listed on any of the databases searched by EDR.

4.1.2 Nearby Listed Properties

Of the databases searched in accordance with the ASTM Practice E1527-13, the following additional listings were found within the ASTM-prescribed search radii. A list of the government records searched, including the definition of the acronyms used, is provided in the EDR Report.

- **Arrivare – Central Parkway and Grafton Street (48 feet north-northeast of Subject Property)**
  The site is listed on the EDR National Pollutant Discharge Elimination System database for construction that was terminated. Based on the lack of information regarding hazardous materials, this site is not considered a REC or environmental concern for the Subject Property.

- **City West Structures Inc – 3553 Finnian Way (67 feet west of Subject Property)**
  The site is listed on the EDR HAZNET database for a transport, storage, and disposal facility in 2005 for hydrocarbon solvents. Based on the lack of information regarding a release to soil or groundwater, and cross gradient location, this site is not considered a REC or environmental concern for the Subject Property.

- **Terraces Home Owner's Association – 3448 Finnian Way (187 feet east-southeast of Subject Property)**
  The site is listed on the EDR EMI and FINDS databases for the Bay Area Air Quality Management District (BAAQMD) in 2010-2014. Based on this site's cross-gradient location and the lack of information regarding a release to soil or groundwater, this site is not considered a REC or environmental concern for the Subject Property.

- **Toll Bros Inc – 3448 Finnian Way (187 feet east-southeast of the Subject Property)**
  The site is listed on the EDR HAZMAT database for disposal of wastes at the landfill for unspecified organic liquid mixture in 2005, and treatment/incineration of contaminated soil from site clean-up in 2005. Based on removal of the contaminant source and the downgradient location, this site is not considered a REC or environmental concern for the Subject Property.

Two "unmappable" (or "orphan") listings were identified within the database report. Unmappable sites are listings that could not be plotted with confidence, but are potentially in the general area of the property based on the partial street address, city, or zip code. These sites were ALCO East County Hall of Justice and Santa Rita Property, which are too distant, not related to, or do not pose a concern to the Subject Property.

4.2 Vapor Encroachment Screening

ASTM Standard E2600-10 Standard Guide for Vapor Encroachment Screening (VES) on Property Involved in Real Estate Transactions was used as guidance for conducting a VES for the Subject Property. The purpose of the screening is to determine whether a Vapor Encroachment Condition (VEC) exists from chemicals of concern that may migrate as vapors onto a property because of contaminated soil and groundwater on or near the Subject Property.

Soil vapor is one of the pathways of contamination to the Subject Property, along with groundwater and soil. ASTM E1527-13 requires that vapor migration be treated no differently than contaminated groundwater. The soil-vapor contaminant pathway needs to be considered in evaluation of RECs or other environmental concerns. The estimated groundwater flow direction is to the southwest.

In accordance with ASTM E2600-10 (Tier 1; Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions), there are no potential petroleum hydrocarbon sources (active leaking underground storage tank [LUST] cases) for vapor intrusion within 1/10 mile of the Subject Property or volatile organic compounds (VOCs) sources (active Spills Leaks and Investigation Cleanup [SLIC] cases) within ⅓ mile. There were no properties identified with the potential to cause a VEC at the Subject Property (Appendix D, EDR 2016c).

4.3 Additional Environmental Record Sources

In addition to EDR review, Terraphase contacted additional local, county, state, and federal environmental record sources, as described below.

4.3.1 Property Tax Files

The EDR Property Tax Report indicated that the Subject Property consists of six parcels comprising 25.37 acres, identified as APN 985-0078-002 through 985-0078-007 (EDR 2016h). The City of Dublin online GIS Portal parcel viewer (https://gis.dublin.ca.gov/Html5Viewer/) provided information on each parcel, including addresses, hazards, Federal Emergency Management Agency (FEMA) flood, and land use. The parcel reports are included in Appendix A. Per EDR's Environmental Lien and AUL Search Report, the Subject Property is currently owned by Grafton Station LLC.

The County of Alameda Assessors and Recorders Office online search provided information on the history of the parcels for Promenade, and is summarized below:

- **APNs # 985-0078-002, 985-0078-003, 985-0078-004, 985-0078-005, 985-0078-006, and 985-0078-007**: Grantor – James and Mei F. Tong and Grantee – Grafton Station LLC recorded May 7, 2013 (Grant Deed 2013160396). Six parcels associated with the Grafton Station LLC parcel: 985-0078-002 through 985-0078-007, and seven parcels associated with James and Mei F. Tong: 985-0078-002 through 985-0078-007, and *985-009-009-2*, all listed as vacant commercial land use (3000). A Memorandum of Agreement was signed on February 20, 2012, between James Tong and Mei Fong Tong (Seller) and KB HOME South Bay Inc., a California corporation (buyer) recorded on February 24, 2012 (MA 2012061653). A Quitclaim Deed was recorded on May 2, 2013, between James Tong and Mei Fong Tong and KB HOME South Bay Inc., a California corporation (Quitclaim Deed 2013153929).

- **APN # 985-009-009-2**: Grantor – DR Acquisition II LLC c/o Charter Properties and Grantee - James & Mei F Tong recorded November 6, 2009 (Grant Deed recorded February 23, 2006 as 2006068092). Seven parcels associated with James and Mei F. Tong: 985-0078-002 through 985-0078-007, and 985-009-009-2, and nine parcels associated with DR Acquisition II LLC c/o Charter Properties: 985-009-004-3, *985-009-008*, 985-009-009, 985-009-009-2, *985-009-010*, *985-009-011*, *985-009-012*, *985-009-014*, and 985-048-001, all listed as vacant commercial land use (3000).

- **APNs # 985-009-008, 985-009-010, 985-009-011, and 985-009-012**: Grantor – DR Acquisition II LLC c/o Charter Properties and Grantee – Toll Dublin LLC c/o Jon Paynter recorded February 16, 2001 (Grant Deed 2001060794). The use code for the 1,020 parcels associated with Toll Dublin LLC c/o Jon Paynter are for vacant residential land zoned four units or less (1000) that indicates the land was subdivided into individual parcels for multi-tenant houses.

- **APN # 985-009-014**: Owner – DR Acquisition II LLC c/o Charter Properties recorded August 17, 2000 (Grant Deed 2000247986). Nine parcels associated with this owner: *985-009-004-3*, 985-009-008, 985-009-009, 985-009-009-2, 985-009-010, 985-009-011, 985-009-012, 985-009-014, and 985-048-001, all listed as use code for vacant residential land zoned four units or less (1000).

- **APN # 985-009-004-3**: Grantor – Lin Chang S & Hong Y & Hong L c/o Charter Properties and Grantee - DR Acquisition II LLC c/o Charter Properties recorded August 17, 2000 (Grant Deed 2000247986). Nine parcels associated with DR Acquisition II LLC c/o Charter Properties: 985-009-004-3, 985-009-008, 985-009-009, 985-009-009-2, 985-009-010, 985-009-011, 985-009-012, 985-009-014, and 985-

048-001, and three parcels associated with Lin Chang S & Hong Y & Hong L c/o Charter Properties: 985-009-004-1, 985-009-004-3, and *985-009-005-1*, all listed as use code for vacant residential land zoned four units or less (1000).

- **APN # 985-009-005-1**: Owner – Lin Chang S &Hong Y & Hong L recorded April 10, 2000. Three parcels associated with this owner: 985-009-004-1, 985-009-004-3, and 985-009-005-1, all listed as use code for rural property in transition to a higher use (5600).

4.3.2 Local Regulatory Records

4.3.2.1 City of Dublin Building and Planning Departments

Terraphase contacted the City of Dublin Building and Planning Departments on January 5, 2017, to review documents or records pertaining to the Subject Property. Several addresses were found online from the City of Dublin Parcel Report for four of the six parcels that comprise the Site. The addresses related to the Promenade Site include:

- (APN # 985-0078-004): 3553 Finnian Way (mailing address for Terraces at Dublin Ranch Villages Owners Association), **3644 Central Parkway**, 3646 Central Parkway, **4449 Chancery Lane,** and 4451 Chancery Lane;
- (APN # 985-0078-005): **3501 Finnian Way**;
- (APN # 985-0078-006): 3501 Dublin Boulevard; and
- (APN # 985-0078-007): 4205 Grafton Street, 4239 Grafton Street, 4243 Grafton Street, 4247 Grafton Street, 4251 Grafton Street, 4255 Grafton Street, 4259 Grafton Street, 4263 Grafton Street, 4267 Grafton Street, **3448 Finnian Way**, and 3460 Finnian Way.

It is believed that the majority of these addresses were created for the housing development that was previously proposed at the Subject Property. Five addresses for the four parcels with Building Department files are discussed below.

- **3644 Central Pkwy** – a temporary power pole was installed at the Subject Property in August and October 2005 and again in August 2006; building permits for installation of eight site signs for Toll Brothers in September 2006; all for residential construction under the ownership/developer Toll Brothers, Inc.
- **4449 Chancery Lane** – installation of kiosk sign at Dublin Boulevard and Tassajara Road for Dublin Ranch Villages in February 2003; installation of land use signs for Area G Dublin Ranch Villages were submitted in March 2003; building plans were submitted in July 2007 for Sorrento, Trevi Village 2, floor truss calculations and plans (this is not related to the Promenade, rather a residential development north of the Subject Property); all for residential construction under the ownership/developer Toll Brothers Inc.

DRAFT

- **3448 Finnian Way** – the Terraces west parking structure shoring permit was filed in August 2004; in July 2004, the west building temporary shoring and earth retention plan review was prepared for the Toll Brothers; the west building super pad was checked for elevation on September 2004 (grading plans by MacKay & Somps dated July 2004); the shoring for the west parking garage was inspected by Construction Testing Services in September 2004; in April 2008, Berlogar Geotech provided an opinion on geotechnical aspects of construction of the West Terraces at Dublin Ranch per reports from April 1999 and October 2003; and a report from PB&A Structural Engineers Inc. was prepared and titled *Engineering Calculations – Temporary Soil nailed Shoring System – Terraces at Dublin Ranch Villages* in June 2004; drawings for the temporary soil nail wall shoring for the Terraces at Dublin Ranch was submitted in October 2004; all for residential construction under the ownership/developer Toll Brothers Inc.

- **3501 Dublin Blvd** – The Dublin Ranch Area G corporation/sales yards (sales trailers and locations) and sales office layout drawings were submitted to the building department for approval in December 2001 under the ownership of James Tong/DR Acquisition II (corner of Grafton and Dublin Blvd) for Toll Brothers Inc.; The Dublin Ranch Area G permit for a modular building (modular temporary sales trailer with exterior pediment) was submitted to the building department in December 2001 for the Toll Brothers residential development; in October 2004 temporary shoring and earth retention system for H-2 (as built) Terraces at Dublin Ranch Villages Area G were prepared by PB&A Inc. for Toll Brothers; all for residential construction under the ownership/developer Toll Brothers Inc.

The files for the addresses researched indicated preliminary drawings and permits for temporary trailers and equipment were filed for the Subject Property in 2006.

4.3.3 County Regulatory Records

4.3.3.1 Alameda County Department of Environmental Health Hazardous Materials/CUPA

On January 5, 2017, Terraphase visited the Alameda County Department of Environmental Health (ACDEH) Certified Unified Program Agency (CUPA) and requested records pertaining to related to hazardous waste generators, Hazardous Materials Business Plans, underground storage tanks (USTs), tiered permitting (including Fire Department records), and aboveground storage tank (AST) programs for the Subject Property APNs and addresses. No documents were identified in the system for the Subject Property.

4.3.3.2 Alameda County Department of Environmental Health LOP/SLIC/LUST

On January 4, 2017, Terraphase researched the online ACDEH SLIC, Local Oversight Program (LOP), and LUST regulatory database (http://www.co.alameda.ca.us/aceh/lop/index.htm), to review records pertaining to petroleum product storage, usage, release, USTs, ASTs, and/or leaking underground fuel tanks for the Subject Property APNs and addresses. No documents were identified in the system for the Subject Property.

4.3.4 State Regulatory Records

4.3.4.1 Department of Toxic Substances Control

Terraphase reviewed the DTSC's EnviroStor database,[1] which houses information on permits and corrective action at hazardous waste facilities, as well as site cleanup projects, for relevant records related to the Subject Property and/or adjoining properties. The Subject Property and immediately adjacent properties were not identified in the database search results.

4.3.4.2 State Water Resources Control Board

Terraphase reviewed the GeoTracker database,[2] the State Water Resources Control Board (SWRCB) data management system for sites that impact groundwater or have the potential to impact groundwater. The Subject Property and adjacent properties were not identified in the database search results.

4.3.4.3 Division of Oil, Gas, and Geothermal Resources Files

Oil and gas wells were not observed within the Subject Property during our reconnaissance. A review of the California Division of Oil, Gas, and Geothermal Resources website for oil and gas fields in California and Alaska (CDCDOGGR 2017) indicated that there are no oil or gas wells located on or within 0.5 mile of the Subject Property (Section 4, Township 3 South, and Range 1 East).

4.3.5 Federal Regulatory Records

4.3.5.1 National Pipeline Mapping System

Terraphase reviewed the National Pipeline Mapping System (NPMS) public viewer website[3] for gas transmission pipelines and hazardous liquid trunk lines on or close to the Subject Property. Per the information on the NPMS, a natural gas transmission pipeline operated by Pacific Gas & Electric (PG&E) Company is located approximately 1/3 mile south of the Subject Property. No spills or incidents were reported by NPMS for the Subject Property (NPMS 2017).

4.3.5.2 U.S. Environmental Protection Agency

Review of the United States Environmental Protection Agency (EPA) Envirofacts website[4] revealed that the Subject Property is not listed in the searched databases. These sources of information, as well as interviews conducted, previous environmental reports, and Site observations (discussed in Sections 5, 6, and 7, respectively) were found to be sufficient for Terraphase to evaluate for the existence of RECs, historical RECs (HRECs), controlled RECs (CRECs), and/or de minimis conditions as part of this Phase I ESA.

5.0 INTERVIEWS

5.1 Interview with Current Owner Representatives

On January 9, 2017, an interview with the current owner's representative, Mr. James Tong with Grafton Street LLC. was conducted during the Subject Property reconnaissance visit. Mr. Tong said that he owned the property for 17 years. Historically, the property has been used for agricultural purposes, including hay production and grazing. Mr. Tong noted that no corrals, barns, or other structures related to agriculture were located on the property during his ownership. Mr. Tong reported that from 2005 to 2009, Toll Brothers set up a temporary sales office and construction trailers in the southern and northwestern portion of the Subject Site for onsite and adjacent residential construction projects. However, no fueling or maintenance activities were conducted on the Subject Property. Clearance soil sampling was conducted by Toll Brothers after the office trailers were removed from the property. Mr. Tong also identified the existence of the Berlogar Stevens & Associates (Berlogar Stevens) Phase I ESA dated December 21, 2016 (See Section 6.4). No RECS or environmental concerns were identified. Mr. Tong indicated that he has no knowledge of the following:

- any environmental records or specialized knowledge associated with the Subject Property
- environmental liens or AULs associated with the Subject Property
- chemical uses or releases associated with the Subject Property
- contamination and/or environmental cleanups associated with the Subject Property.

A questionnaire completed by Mr. Tong is provided in Appendix A.

5.2 Interview with Former Owner Representative

Interviews with the Subject Property owners prior to Mr. Tong were not conducted.

5.3 Interviews with Regulatory Agency Representatives

Terraphase contacted local, county, and state agencies via telephone, electronic mail, letter, or in person to inquire as to whether they possessed relevant records regarding the Site, as discussed in Section 4.3.

DRAFT

6.0 HISTORICAL REVIEW

A variety of sources were reviewed to develop the history of the Site and adjacent properties to assess for environmental conditions at the Site. These resources included the following:

- aerial photographs, provided by EDR, and dated 1939, 1940, 1949, 1958, 1966, 1968, 1979, 1982, 1993, 1998, 2005, 2006, 2009, 2010, and 2012 (EDR 2016d);
- topographic maps, USGS Pleasanton, California, 15-Minute Quadrangle, dated 1906, and 1941; and USGS Livermore and West Dublin, California, 7.5-Minute Quadrangles, dated 1953, 1961, 1968, 1973, 1980, and 1959, 1973, 1980, 1995, 1996, and 2012, respectively (EDR 2016e); and
- city directories, provided by EDR, dated 1975, 1980, 1985, 1989, 1992, 1995, 1999, 2003, 2008, and 2013 (EDR 2016f).

Historical aerial photographs, topographic maps, and city directories were reviewed for the years listed above. City directory listings are described where significant findings were present or where they correspond with other historical documents. Historically and/or environmentally significant findings from the maps and photographs are summarized below. Copies of historical aerial photographs, topographic maps, and city directories are provided in Appendices E, F, and G, respectively.

Although requested by Terraphase, no Certified Sanborn® fire insurance maps or building permit records were available for the Subject Property. EDR's certification of no coverage (EDR 2016g) is provided in Appendix H and the building permit report (EDR 2016i) is included in Appendix I.

6.1 Aerial Photographs

1939 – 1968 Photographs – The Subject Property appears to be undeveloped or agricultural land, with the adjoining area to the northwest showing a few structures. The road for Highway 580 is shown to the south of the Subject Property. Undeveloped or agricultural land surrounds the property to the north, south, west, and east. By the 1949 photograph, the western portion of the Subject Property appears to have a small drainage stream going through it, and a dense set of structures is located further to the northwest, possibly for agriculture. Hay baling appears to be taking place on the property in the 1940 aerial photograph.

1979 – 1998 Photographs – The Subject Property appears to be agricultural land, with more development of streets in all directions. The road footprint for Highway 580 appears to be in current configuration to the south, and residential development shown south of Highway 580. By 1998, the structures to the northwest are gone, and Dublin Boulevard appears as an improved roadway.

2005 Photograph – In 2005 the Subject Property contains multiple trailers and appears to have been graded for development; a front entry structure is shown along Dublin Boulevard within a landscaped parking area. Additional trailers are shown along the Central Parkway and Chancery Lane portion of the Subject Property. Residential structures are developed on adjoining properties to the west and east;

undeveloped land still exists to the north and south. Devany Square (to the west along Finnian Way and Chancery Lane) is being developed. In 2006, the Subject Property appears similar to the 2005 photo; however, there are fewer trailers and less equipment on the Site. Grading and development to the north along Central Parkway is visible with no development of property to the south across Dublin Boulevard.

2009 Photograph - In 2009, all trailers and equipment that were previously on the Site have been removed, and the Subject Property appears to be vacant. Devany Square is completed (adjoining property to the west), new residential houses are visible across Central Parkway to the north, and a commercial shopping center is shown to the south-southwest, across Dublin Boulevard (Grafton Station).

2010 and 2012 Photographs - The Subject Property is in its current configuration and is vacant, undeveloped land.

2016 Google Earth satellite image - The Subject Property is vacant land surrounded to the east, north, and west by residential properties and a park (to the west), and to the south by a commercial shopping center (Grafton Station).

6.2 USGS Topographic Maps

1906 and 1941 Historical Topographic Maps – The Subject Property and the general vicinity is mostly undeveloped land in an area located east of Tassajara Creek, in Santa Rita. There is little development in the surrounding area.

1953, 1961, 1968, and 1973 Historical Topographic Maps – A general increase in urban development to the distant west and southwest of the Subject Property was observed. The Parks Air Force Base, Santa Rita Rehabilitation Center, and main hospital are shown to the west of the Site (across Tassajara Road) in the topographic maps from 1953 to 1973. Highway 580 is labeled Highway 50 (two lanes each direction) until 1973, when it is shown with the current highway number.

1980 Historical Topographic Map - Highway 580 is shown in its current configuration, and the Camp Parks Base is no longer identified. There is continued urban development south of Highway 580 and along Tassajara Road to the west.

2012 Historical Topographic Map - The Subject Property is surrounded by the current configuration of streets.

6.3 City Directories

The Subject Property has several proposed addresses; however, it has never been developed. One address associated with the Subject Property was identified as the following:

- 3448 Finnian Way: “Toll Brothers Inc” (2008)

Adjacent listings included individual residences on Finnian Way and both residential and commercial properties on Dublin Boulevard.

6.4 Prior Environmental Assessments

- *Phase I Environmental Site Assessment, Parcel Map 9717, APNs 985-78-2, 985-78-3, 985-78-4, 985-78-5, 985-78-6, and 985-78-7, Dublin Boulevard and Grafton Street, Dublin, California*, prepared by Berlogar Stevens, dated December 21, 2016.

  This Phase I ESA was performed on the 25.37-acre Site identified as Parcel Map 9717, comprising six separate parcels APNs 985-78-2, 985-78-3, 985-78-4, 985-78-5, 985-78-6, and 985-78-7, that is located on the north side of the intersection of Dublin Boulevard and Grafton Street, extending from Dublin Boulevard north to Central Parkway, in Dublin, California. Some previous grading, soil stockpiling, and construction equipment staging occurred on the property from approximately 2005 to 2009. The Site was undeveloped at the time of Berlogar Stevens's visit, with only vegetation and perimeter fencing.

  It was reported that during previous 2008-2009 soil sampling and analytical testing conducted by Berlogar Geotech, the imported soil fill was sampled on multiple occasions and analytical tests were performed to ascertain potential contaminant presence. Those results showed that analytes tested for were not detected in the soil samples and metals were present at levels attributed to natural occurrence. However, the presence of asphalt debris at the Site was suspected to be the source of low-level total petroleum hydrocarbon (TPH) detections.

  As part of the Phase I ESA, additional soil sampling and analysis for general soil quality was performed in the area of the 2008-2009 sample locations and at four locations areas along the eastern side of the Site that were not previously sampled. Soil analytical test results indicated some low-level detections of diesel range petroleum hydrocarbons, motor oil range petroleum hydrocarbons, CAM17 heavy metals, and organochlorine pesticides that were all below current Environmental Screening Levels (ESLs) for both commercial and residential land use for the San Francisco Bay Area (Berlogar Stevens 2016). The concentration of arsenic detected in the soil samples was above the current ESLs, however arsenic concentrations were considered to be present at background levels concentrations due to the minerology of the geologic units in the project area. No RECs or other indications of hazardous material contamination were identified at the Site, and no further investigation was recommended.

- *Analytical Soil Sampling and Testing, Promenade, Area G of Dublin Ranch, Grafton Street and Central Parkway, Dublin, California*, prepared by Berlogar Geotech, dated October 16, 2008.

  In 2008, Berlogar Geotech collected soil samples using a hand auger or drilling rig at several locations on the Subject Property within the 17-acre area between Central Parkway and Dublin Boulevard at the intersection with Grafton Street to assess the environmental quality of soil. The work was conducted for the Toll Brothers. At the Grafton North (June 20, 2008) location, 13 soil

samples were collected from 11 locations with a hand auger from the upper 2 feet in the northeast corner of the Site, analytical results indicated that the soil did not contain diesel range petroleum hydrocarbons above low levels representative of naturally occurring organics. At the Grafton South (July 3, 2008) location, four soil samples were collected with a hand auger from 0 to 1 foot below grade in the southwest corner of the Site. Analytical results indicated that the soil was not contaminated. At the Promenade (September 15 and 22, 2009) location, 32 samples were collected using a drilling rig from 0 to 1 foot below grade within a 150-foot grid. Analytical results indicated three samples contained VOCs above the San Francisco Bay Regional Water Quality Control Board (RWQCB) ESL, and three composite samples contained diesel and motor oil range petroleum hydrocarbons above the ESL. Subsequent to these detections, additional soil samples were collected from the Promenade in this area (October 9 and 12, 2009). Four shallow soil samples were collected with a hand auger at depths of 0.5 to 2.0 feet below grade and analyzed for various VOCs, semi-volatile organic compounds (SVOCs), nonhalogenated organics (TPH diesel and motor oil range organics), organochlorine pesticides, chlorinated herbicides, organophosphorus pesticides, polychlorinated biphenyls (PCBs), and CAM 17 metals. Analytical results indicated that most constituents were not detectable, including herbicides, pesticides, PCB, and TPH as gasoline. However, VOCs and SVOCs were detected and Berlogar Geotech concluded that surficial soil in the Promenade Site contains isolated areas with minor concentrations of diesel and motor oil range petroleum hydrocarbons that could be derived from "the demolition and spreading of asphalt, concrete, and leaks from vehicles and construction equipment". They also concluded that the existing soil at this Site could be used as commercial or industrial fill.

- *Analytical Testing of Existing Surface Soil, Grafton Center, Dublin Boulevard East of Landsdowne Street, Dublin, California*, prepared by Berlogar Geotechnical Consultant (Berlogar Geotech), dated July 15, 2008.

  Berlogar Geotech collected samples from a soil stockpile located in the northeastern area of the Subject Property to determine if any contamination was present. The soil was derived from grading activities conducted on the adjacent residential and commercial development. The stockpile averaged about 2 feet, and ranged from about 1-foot thick at the southern end to about 4-feet thick in the northwest corner. The area was reportedly open range land prior to this development. On June 20, 2008, thirteen bulk samples were obtained at random locations from soil stockpile from depths of 0.5 to 2 feet across the stockpile. The samples were analyzed for VOCs, SVOCs, nonhalogenated organics (diesel range petroleum hydrocarbons), organochlorine pesticides, PCBs, and CAM 17 metals. Although some analytes were detected, only arsenic was present at a concentration above all the agency screening levels, and vanadium was above the RWQCB remediation goal. Berlogar Geotech concluded that the concentrations of arsenic, chromium, and vanadium are typical of the background concentrations in Bay Area soils. They also concluded that the stockpiled soil at this Site is not considered to be contaminated and can be utilized as fill at most sites; however, the receiver of the soil should make the final determination as to the acceptance of this soil.

7.0 OTHER ENVIRONMENTAL CONDITIONS

Additional research was conducted to evaluate the potential hazards associated with the proposed school site location. The additional research guidelines were taken from DTSC and CDE guidance. The scope of work did not include testing of electrical equipment for the potential presence of PCBs, asbestos, or lead-based paints.

7.1 Power Lines

State regulations require that "*The property line of the site … shall be at least the following distance from the edge of respective power line easements: 1. 100 feet for 50-133 kV line; 2. 150 feet for 220-230 kV line; and 3. 350 feet for 500-550 kV line*."

According to the Alameda County Assessor's Office Parcel Viewer Website, and the overview map provided in the EDR Report, the Subject Property is not within the specified distances from a high-voltage power line easement and no overhead power lines or transmission lines were observed during the Site reconnaissance. Terraphase also reviewed voltage and powerline location information provided by PG&E and confirmed that no power lines above the voltage and distance guidelines are present.

7.2 Railroad Tracks

State regulations require that additional special studies be conducted if the proposed school site is within 1,500 feet of a railroad track easement. The closest railroad tracks are tracks associated with the Bay Area Rapid Transit (BART) line and are located approximately 5,300 feet to the southwest of the Subject Property, along Highway 580. However, BART intends to extend the rail line along Highway 580 to Livermore, which would bring the tracks within 1,500 feet of the school site. It is our opinion that, a non-freight commuter rail line poses little to no risk to adjacent properties and none to a site more than 1,000 feet from the tracks. BART provides sufficient safeguards and safety barriers, such as fencing, to protect pedestrians from any accidental access/crossing of the lines or contact with the electric third rail.

7.3 Traffic Noise and Major Roadways

The California Code of Regulations, Title 5, Section 14010(e), states: "*The site shall not be adjacent to a road or freeway that any site-related traffic and sound level studies have determined will have safety problems or sound levels which adversely affect the educational program*." CDE considers noise levels above 70 decibels to be distracting (CDE 2016). The Subject Property is located approximately 1,250 feet north of Highway 580, which has a traffic flow of 204,456 annual average daily trips as estimated in the 2010 Interstate 580 East Corridor System Management Plan, Volume 1, prepared by the California Department of Transportation (Caltrans), May 7, 2010. The City of Dublin General Plan, 2011 Existing Noise Exposure Contours map estimates the Subject Property will be exposed to between 60 and 65 decibels, which is projected to increase to between 60 and 70 decibels by the year 2035. Per the special route restrictions on the Caltrans website, there are no limitations on cargo hauling on the section of

Highway 580 near the Subject Property, therefore dangerous cargos are likely transported on Highway 580 every day.

Dublin Boulevard, which is located adjacent south of the Subject Property, is classified as an arterial road, meaning that it accommodates between 25,000 and 100,000 annual average daily trips (Alameda 2017, Dublin 2013). Terraphase recommends that a separate noise study be conducted at the Subject Property to verify that the noise complies with state regulations.

7.4 Flood/Dam Inundation

Terraphase contacted the California Governor's Office of Emergency Services (CGOES) on January 23, 2017, and requested current dam failure flood hazard inundation information. Ms. Lori Newquist, the Emergency Services Coordinator with the CGOES Mitigation Planning Division, responded with maps depicting dam failure inundation limits and flood arrival times for areas in and around the City of Dublin, including the Subject Property location. Terraphase cross-referenced the maps provided by the CGOES with historical topographic maps and determined that, although the southeastern corner of the Subject Property almost contacts the limits of inundation depicted on the CGOES maps, the Subject Property is not located within a dam failure inundation hazard area.

In addition, according to the Dublin General Plan, which is based on information from the FEMA Federal Flood Insurance Rate Maps of the area, the Subject Property is not within a 500- or 100-year flood plain.

7.5 High-Pressure Water Pipelines, Reservoirs, and Water Storage Tanks

No large water storage tanks or reservoirs were identified on or within 1,500 feet of the Site during the historical review or Site reconnaissance.

Terraphase contacted the Dublin San Ramon Services District (DSRSD) to identify water pipelines greater than 12 inches in diameter within 1,500 feet of the Subject Property. Based on information provided by Bonifacio Duenas at the DSRSD, several water mains, recycled water mains, and sewer mains with diameters of 12 inches in diameter and greater are present within 1,500 feet of the Site Subject Property. There are water mains of 14, 15, and 20 inches in diameter running along Dublin Boulevard adjacent to the South of the Subject Property, and there is a 12-inch diameter water main along Central Parkway adjacent to the North. A 12-inch diameter recycled water main runs along Central Parkway and two recycled water mains of 12 and 20 inches in diameter, respectively, run along Dublin Boulevard. A 30-inch diameter sewer main also runs along Dublin Boulevard, south of the Subject Property.

The presence of the pipelines in the vicinity of the school will require that a pipeline risk assessment for the Site be prepared which will assess the risks posed by a rupture or leak of the pipelines and propose mitigation measures if appropriate to mitigate the risks.

7.6 Propane Tanks

Propane tanks were not observed at the Site or on adjacent properties during the Site reconnaissance.

7.7 Geohazards

According to the Association of Bay Area Governments Resilience Program Liquefaction Susceptibility Map, the Subject Property is located in a zone of moderate susceptibility to liquefaction hazards (ABAG 2017a: http://gis.abag.ca.gov/website/Hazards/?hlyr=apZones). The California Geological Survey (CGS) (2008a, 2008b) maps the site as being in a liquefaction hazard zone.

7.8 Air Quality/Hazardous Facilities Within ½ Mile

Terraphase contacted the BAAQMD to identify sources of hazardous air emissions located within ½ mile of the Site. The BAAQMD informed Terraphase that two permitted facilities were located within ½ mile of the Subject Property. One permitted facility (Facility # 18054) is the Terraces Home Owner's Association, located 0.16 miles east of the Subject Property at 3448 Finnian Way, and is permitted for emissions associated with a standby generator. The second permitted facility (Facility # 19395) is the Lowes of Dublin, California, #2273, located 0.19 miles south of the Subject Property at Grafton Street and Northside Drive, and is also permitted for emissions related to a standby generator. The specific toxic pollutant information provided by the BAAQMD for each facility is included in Table 1. Any actual or potential health risks posed by the non-emergency operation of the standby engines can be mitigated by having the engine owner or operator agree to maintenance and reliability testing of such engines during non-school hour.

The City of Dublin Land Use Map (http://www.ci.dublin.ca.us/DocumentCenter/View/14514) does not indicate that any of the land located within ¼ mile of the Site will be used for industrial purposes.

7.9 Potentially Asbestos-Containing Material

Terraphase reviewed geologic maps of the area prepared by the CGS for the presence of ultramafic rocks, which are most likely to contain naturally occurring asbestos, near the Subject Property vicinity, within the Subject Property's watershed, or within 10 miles of the Subject Property. No ultramafic rock formations were mapped in the vicinity of the Subject Property or watersheds that would impact the Subject Property (CGS 2000). Therefore, it is unlikely that the Subject Property is affected by naturally occurring asbestos, unless it was brought in with the import fill.

7.10 Airport Runways

State regulations require that special procedures be followed if the proposed school site is located within 2 nautical miles of an airport runway. The southeastern corner of the Subject Property, which is nearest to the Livermore Municipal Airport Runway, is located approximately 1.75 nautical miles northwest of Livermore Municipal Airport Runway, as measured on Google Earth®. The Livermore Municipal Airport Runway is the nearest airport runway to the Subject Property. As the Site is within 2 nautical miles of an airport, the Caltrans Aeronautics Program, Office of Airports will need to be consulted regarding the suitability of the Site for school purposes. Regulations concerning the school site's proximity to runways are contained in Education Code Section 17215 [as amended by Assembly

Bill 747, Chapter 837, Statutes of 1999; see CCR, Title 5, Section 14011(k)]. Terraphase recommends that a letter outlining the proposed school site and the location of the Livermore Municipal Airport be prepared and submitted to the CDE for processing.

7.11 Pipelines

Terraphase reviewed the NPMS public viewer website for gas transmission pipelines and hazardous liquid trunk lines on or close to the Subject Property. According to the information on the NPMS, one natural gas transmission pipeline owned by PG&E (operator ID 15007, pipeline ID 22308.32, system name 2408-05) is located along the south side of Highway 580 approximately 1,450 feet south of the southern boundary of the Subject Property, (Pipeline and Hazardous Materials Safety Administration [PHMSA] online: https://pvnpms.phmsa.dot.gov/PublicViewer/#).

The presence of the pipeline in the vicinity of the school will require that a pipeline risk assessment for the Site be prepared which will assess the risks posed by the pipelines and propose mitigation measures if appropriate to mitigate the risks.

7.12 Other Naturally Occurring Materials

7.12.1 Metals and Metalloids

Background concentrations of arsenic in California can typically range up to 11.0 milligrams per kilogram (mg/kg) and it is likely, based on previous sampling at the Site, that naturally occurring arsenic levels in soils at the Site exceed the U.S. EPA Residential Screening Level, as modified by the Human and Ecological Risk Office (HERO) Note 3 (DTSC 2016) for arsenic of 0.11 mg/kg.

7.12.2 Hydrogen Sulfide

No evidence of potential sources of hydrogen sulfide (e.g., sewage sludge, liquid manure, sulfur hot springs, or natural gas) was noted during the Site reconnaissance or during the sources review for this Phase I ESA.

7.12.3 Radon

Sections 307 and 309 of the Indoor Radon Abatement Act of 1988 directed the U.S. EPA to list and identify areas of the U.S. with the potential for elevated indoor radon levels. U.S. EPA's Map of Radon Zones (EPA-402-R-93-071) assigns each of the 3,141 counties in the U.S. to one of three zones based on radon potential:

- Zone 1 counties have a predicted average indoor radon screening level greater than 4 picocuries per liter (pCi/L).
- Zone 2 counties have a predicted average indoor radon screening level between 2 and 4 pCi/L.
- Zone 3 counties have a predicted average indoor radon screening level less than 2 pCi/L.

The Geocheck Physical Setting Source Map Findings for radon, based on such factors as indoor radon measurements, geology, aerial radioactivity, and soil permeability, the U.S. EPA has designated Alameda County as Zone 2, with moderate radon concentrations at average levels between 2 pCi/L and 4 pCi/L. Radon concentrations at, or above, 4 pCi/L are considered to be of environmental concern to California EPA and U.S. EPA.

The California Department of Public Health's (CDPH's) Radon Program provides a list of radon test results from throughout the state which are sorted by zip code. According to the database, 27 tests were conducted at sites in the same zip code as the Subject Property, only one of which had results that exceeded 4 pCi/L, with a radon concentration of 5.5 pCi/L (CDPH 2016). Therefore, it is unlikely that radon is a significant hazard for the Subject Property. Radon testing was not performed at the Subject Property and was beyond the scope of work for this Phase I ESA.

7.13 Agricultural Use

As discussed in Section 6, it appears that the Site has historically been used for agricultural purposes, reportedly for grazing and growing hay, and possibly for row crops from approximately 1939 to the mid-1990s.

7.14 Mines

The Subject Property does not appear to have been used as a mine; therefore, it is not expected that the Site would contain abandoned or inactive mine waste.

7.15 Former Government Ownership

The Site was not listed as a Formerly Used Defense Site (FUDS) in the EDR Report. The Parks Reserve Forces Training Area is located in Dublin (formerly Camp Parks) and historically encompassed a larger area of Dublin than the current boundaries. A review of historical boundaries of the military installation indicate they did not extend east of Tassajara Road[5], and no evidence of historical military ownership or use of the Site was identified during the review of publicly available information for this Phase I ESA. Therefore, there is a low likelihood that munitions or explosives of concern are present at the Site.

7.16 Current or Past Residential Use

Based on the historical aerial photographs, it does not appear the Site has ever been developed for residential purposes. Plans were prepared for a multi-family residential development with retail shops, but the developer did not complete the project due to an economic downturn.

7.17 Lead Based Paint

The Subject Property has been historically undeveloped, except for usage as a temporary staging area for equipment, materials, and temporary offices/trailers and during construction and development of

[5] http://www.militarymuseum.org/FleetCity.html

surrounding parcels, as depicted in the 2005 and 2006 aerial photos. Based on the lack of permanent structural development, there is a low likelihood that lead-based paint was ever used at the Subject Property.

7.18 Easements

Terraphase examined property deed information for the Subject Property provided in the EDR Environmental Lien and AUL Search (Appendix B). There are no easements recorded in the deed information provided by EDR.

7.19 Petroleum Deposits

No evidence of petroleum deposits or use at the Site was observed during the Site reconnaissance or during review of the sources referenced for this Assessment. In addition, there is no evidence of the presence of oil fields, oil and gas wells, oil production areas, natural gas production areas, oil or natural gas reserves, storage tanks and dispensing systems, or sources of methane or hydrogen sulfide. In addition, Terraphase reviewed the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (CDCDOGGR) Online Mapping System database for oil and gas well locations within 1 mile of the Site. There were no wells interpreted to be located within a 1-mile radius of the Site.

7.20 Fill Material and Debris

A previous study on the soil fill at the Site was performed by Berlogar Geotech in 2008-2009. Several areas of imported soil fill were identified over a large portion of the Subject Property. These soil fill areas appeared to vary up to several feet thick depending upon location. The fill areas contained varying amounts of gravel, broken asphaltic concrete, concrete, geotextile fabric, and plastic pipe. The soil was apparently generated and imported from nearby construction activities around the subject property. The imported soil appears to have been placed for anticipated future site use, including use for pads for construction trailers, gravel for access roads, and rough grading of areas for construction materials and equipment storage during construction of the surrounding residential projects. The results of analytical testing performed on samples of soil fill are described on Figure 3 – Historical Soil Results and are discussed in Section 6.4. However, imported fill material was not adequately sampled and analyzed for residential/school use. Terraphase can provide a workplan for additional soil fill analysis if requested.

7.21 Illegal Drug Manufacturing

No evidence of illegal drug manufacturing was noted on the Site during the Site reconnaissance. A review of the National Clandestine Laboratory Register (https://www.dea.gov/clan-lab/ca.pdf) maintained by the United States Department of Justice did not identify any onsite facilities at the Site, or within the City of Dublin.

7.22 Surface Drainage

Because no “releases” or “naturally occurring” hazardous materials have been documented at the Site, an evaluation of surface drainage pathways was considered to be beyond the scope of work for this Assessment and is not provided herein.

DRAFT

8.0 SUBJECT PROPERTY RECONNAISSANCE

8.1 Methodology and Limiting Conditions

On January 9, 2017, Ms. Melissa McAssey and Ms. Laurie Israel of Terraphase conducted a reconnaissance visit of the Subject Property to assess current land-use activities and environmental conditions. The Site reconnaissance visit was documented with notes and photographs. Observations made during the reconnaissance visits are discussed below and a photograph log is provided following the figures. The focus of the reconnaissance is to identify conditions that have the potential to cause adverse environmental impacts.

As part of the reconnaissance, Terraphase searched for evidence of the presence, use, or storage of hazardous substances, including but not limited to the following:

- areas of disturbed or discolored soil;
- suspect equipment and/or building materials which may contain hazardous substances;
- areas of distressed vegetation;
- wastewater discharge areas;
- evidence of storage tanks/septic systems;
- waste management/disposal areas;
- lagoons, pits, or sumps;
- surface water management areas; and
- stained surfaces, etc.

8.2 Site Reconnaissance Observations

8.2.1 Current Use of the Property and General Observations

The Subject Property is currently vacant land with utility improvements. The entrance to the Site is located at Grafton Street and Dublin Boulevard, and has barricades before the cyclone fence (Photograph 1). The southeastern corner of the Subject Property contained ponding of rainwater due to poor grading (Photographs 2 and 3). Additional ponding of rainwater was observed on the northwestern side of the Site, near the intersection of Central Parkway and Chancery Way (Photograph 7). Devany Square Park is located along the western side of the Site off Chancery Lane and Finnian Way (Photograph 8). Several aboveground and underground transformers (owned by PG&E) were observed along the perimeter of the Site (Photograph 9). A concrete pad was identified in the southwest corner of the Site with two polyvinyl chloride (PVC) piezometer pipes and one large open PVC pipe; the purpose of this setup was not identified (Photograph 12). Several concrete-capped manholes for storm water and sanitary sewer, and smaller concrete encased water boxes (some marked “recycled water”) are located along the perimeter of the Site (Photographs 10, 13, 14, 15, 18 and 19). Several small surface depressions and fenced drainage areas were observed (Photograph 16). Most of these are in the vicinity of a temporary road that is assumed to be within the proposed alignment of Finnian Way (eastern locations Photograph 4; western locations Photograph 19). Some debris (paper, broken plastic, wood) is

DRAFT

scattered on the property, including a small fire extinguisher and a large concrete circular section (Photograph 20) in the northeastern and northwestern parts of the Subject Property, respectively. The Site is bound to the east, north, and west with multi-family residential adjoining properties, and to the south by a commercial shopping center and undeveloped lot. The perimeter of the Subject Property contains cyclone fencing, with additional fencing between the northern and southern extents of the Site.

8.2.2 Subject Property Interior and Exterior Observations

No buildings exist at the Site. Only exterior observations were made.

Element	Observation
Current or former USTs	None observed.
Current or former ASTs and silos	None observed.
Polychlorinated biphenyl (PCB)-containing equipment	None observed.
Hazardous materials and/or petroleum product use/storage	None observed.
Hazardous waste	None observed.
Drums or other containers	None observed.
Non-hazardous solid waste	Some trash and debris were observed, including a fire extinguisher and concrete ring.
Wastewater	None observed.
Floor drains, sumps, and drywells	None observed.
Odors	None observed.
Stains, pitting, or corrosion (interior areas)	None observed.
Stained or corroded exterior surfaces	None observed.
Pools of liquid	Pools of rainwater were observed along the eastern and western boundaries.
Pits, ponds, or lagoons	None observed.
Stressed vegetation	None observed.
Storm water	None observed.
Onsite water wells	None observed.
Septic systems	None observed.
Other petroleum product transmission/storage	None observed.

DRAFT

8.2.3 Adjoining Property Observations

During the reconnaissance, Terraphase observed the adjoining properties from public roadways and the Subject Property. The purpose of these observations was to identify obvious uses or conditions at the adjoining properties likely indicative of a REC at the Subject Property.

The Subject Property is in a densely populated residential area, and is surrounded to the north, west, and east by multi-family houses (apartments and/or condominiums). The Subject Property is bound to the west by Devany Square park, to the south-southwest by Dublin Boulevard and a commercial shopping center – Grafton Station, and to the southeast by an undeveloped lot.

DRAFT

9.0 FINDINGS AND CONCLUSIONS

Terraphase has performed a Phase I ESA of the Subject Property in conformance with the scope and limitations of ASTM Practice E1527-13. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report. The Subject Property was used for agricultural row crops, and grazing, from approximately 1939 to the mid-1990s. The Subject Property appears to have been used in relation to the surrounding residential construction between 2005 and 2009. Utilities were installed (water, sewer, and storm water lines) and preliminary grading and development planned, but the proposed residential development activities ended in 2009. No other use or development appears to have occurred since 2009.

Grading, soil stockpiling, and construction equipment staging occurred on the Subject Property from 2005 until 2009. The Site was graded for a housing development and several office trailers and storage structures were stored onsite. The Dublin Ranch Area G corporation/sales yards (sales trailers and locations) were situated at 3501 Dublin Boulevard, near the southern portion of the Site (at Grafton Street).

A Phase I ESA that included additional soil sampling was performed in 2016 by Berlogar Stevens and Associates for Grafton Station LLC, courtesy of Charter Properties, Inc., to determine if prior use as a construction staging area caused environmental impairment to the Subject Property, and to evaluate if contaminants of concern were present in soil. This work included collection and analysis of shallow soil samples, all collected from between 0.5 and 2 feet bgs across the Subject Property. In 2008 and 2009, soil sampling and analytical testing of the upper two feet of imported fill soil was conducted by Berlogar Geotechnical Consultants (Berlogar Geotech), who concluded that soil at the Site was not contaminated with volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), herbicides, pesticides, polychlorinated biphenyls (PCBs), and gasoline range petroleum hydrocarbons (TPHg). However, isolated areas of low concentrations of diesel (TPHd) and motor oil range (TPHmo) petroleum hydrocarbons were detected that were concluded to likely be from demolition activities including the spreading of asphalt and leaks from vehicles and construction equipment. The soil was deemed useful as commercial or industrial fill. From the 2016 shallow soil sample analyses, Berlogar Geotech concluded that detectable concentrations of TPHd and TPHmo ranged from 1.1 to 75 milligrams per kilogram, which were below the current ESLs for residential and commercial land use. Samples along the eastern portion of the Site contained low level detectable concentrations of organochlorine pesticides and CAM 17 Metals. The reported concentrations were below current ESLs for residential and commercial land use with the exception of arsenic, chromium, and vanadium which Berlogar Geotech further concluded were typical of soils in the Bay Area.

9.1 RECs

A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or the material threat of a

release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

Terraphase identified the following RECs during this Phase I ESA:

- The Site has been historically undeveloped agricultural land, and although predominantly used as grazing land, row crops are visible in historical aerial photographs indicating a potential for agricultural chemicals to be present in shallow soil at the Site, beneath the layer of fill material imported to the Site.
- Fill material was imported to the Site from undocumented sources prior to construction activities in 2005. Prior soil sampling of the fill is insufficient to characterize the material for residential/school use.

9.2 Controlled RECs

Terraphase identified no CRECs during this Phase I ESA.

9.3 Historical RECs

Terraphase identified no HRECs during this Phase I ESA.

9.4 De Minimis Conditions

Terraphase did not identify any de minimis conditions during this Phase I ESA.

9.5 Data Gaps

A data gap is a lack or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice. One data gap was identified: The Phase I ESA questionnaire was not returned by the User. The lack of the User questionnaire is not considered to be a significant data gap.

9.6 Deviations and Non-Scope Services

In performance of this Phase I ESA, Terraphase has identified no exceptions or deviations from the ASTM E1527-13 standard of practice.

DRAFT

10.0 RECOMMENDATIONS

This Phase I ESA presents Terraphase's interpretation of the information with respect to RECs at the Site, following ASTM E1527-05 and 2017 CDE and DTSC school reporting guidelines. The Phase I ESA concludes that further investigation through a Preliminary Endangerment Assessment (PEA) is needed. The Phase I ESA also demonstrates that the potential release at the Site of hazardous materials may pose a threat to public health or the environment. Therefore, Terraphase makes the following recommendations:

- The Site may have historically been used for hay and row crops; therefore, the potential for the presence of pesticides at the Site exists in the soil beneath the imported fill in accordance with *DTSC Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008). Although the guidance document states that it is not applicable to former agricultural sites that have received fill, the guidance document is still used as a basis for assessing the soil beneath the fill material. Based on this guidance, sampling the shallow native soil for organochlorine pesticides (U.S. EPA Method 8081B) and arsenic is recommended. Care will be needed in the field to assess where the fill/native soil surface lies so that samples of the native soil are collected.

- While Berlogar Geotech conducted extensive studies of the fill material brought to the Site, and conducted additional sampling for diesel range petroleum hydrocarbons in other areas of the Site, the presence of pesticides and arsenic in the underlying native soils does not appear to have been addressed. In addition, a review of the sampling results indicated that the previous sampling at the Site of the imported fill material was not adequate for residential/school use. Therefore, additional sampling of the fill at the Subject Property is recommended.

In addition, the following recommendations are made based on CDE school siting guidelines:

- Conduct a specific geological study at the Site to comply with the CGS Note 48 requirements.

- Conduct a pipeline risk assessment for large-diameter water and natural gas pipelines in the vicinity of the Site.

- Conduct a separate noise study at the Site to verify that the noise complies with state regulations or if mitigation measures will be required.

- Prepare a letter outlining the proposed school site and the location of the Livermore Municipal Airport (within two nautical miles) and submit it to the California Department of Education for processing.

- Due to the Site's proximity to the proposed BART track extension (within 1,500 feet), Terraphase recommends obtaining a letter signed by a California professional civil engineer indicating that the potential BART tracks do not pose a significant threat to the Site.

DRAFT

- Conduct a ¼ mile survey around the proposed school site location. This survey should include a reconnaissance around the site to visually assess whether any buildings have placards indicating the presence of hazardous materials, drums, or unpermitted exhaust stacks. If the survey identifies any hazardous materials within ¼ mile of the school site, appropriate mitigation measures should also be recommended.

1.0 INTRODUCTION

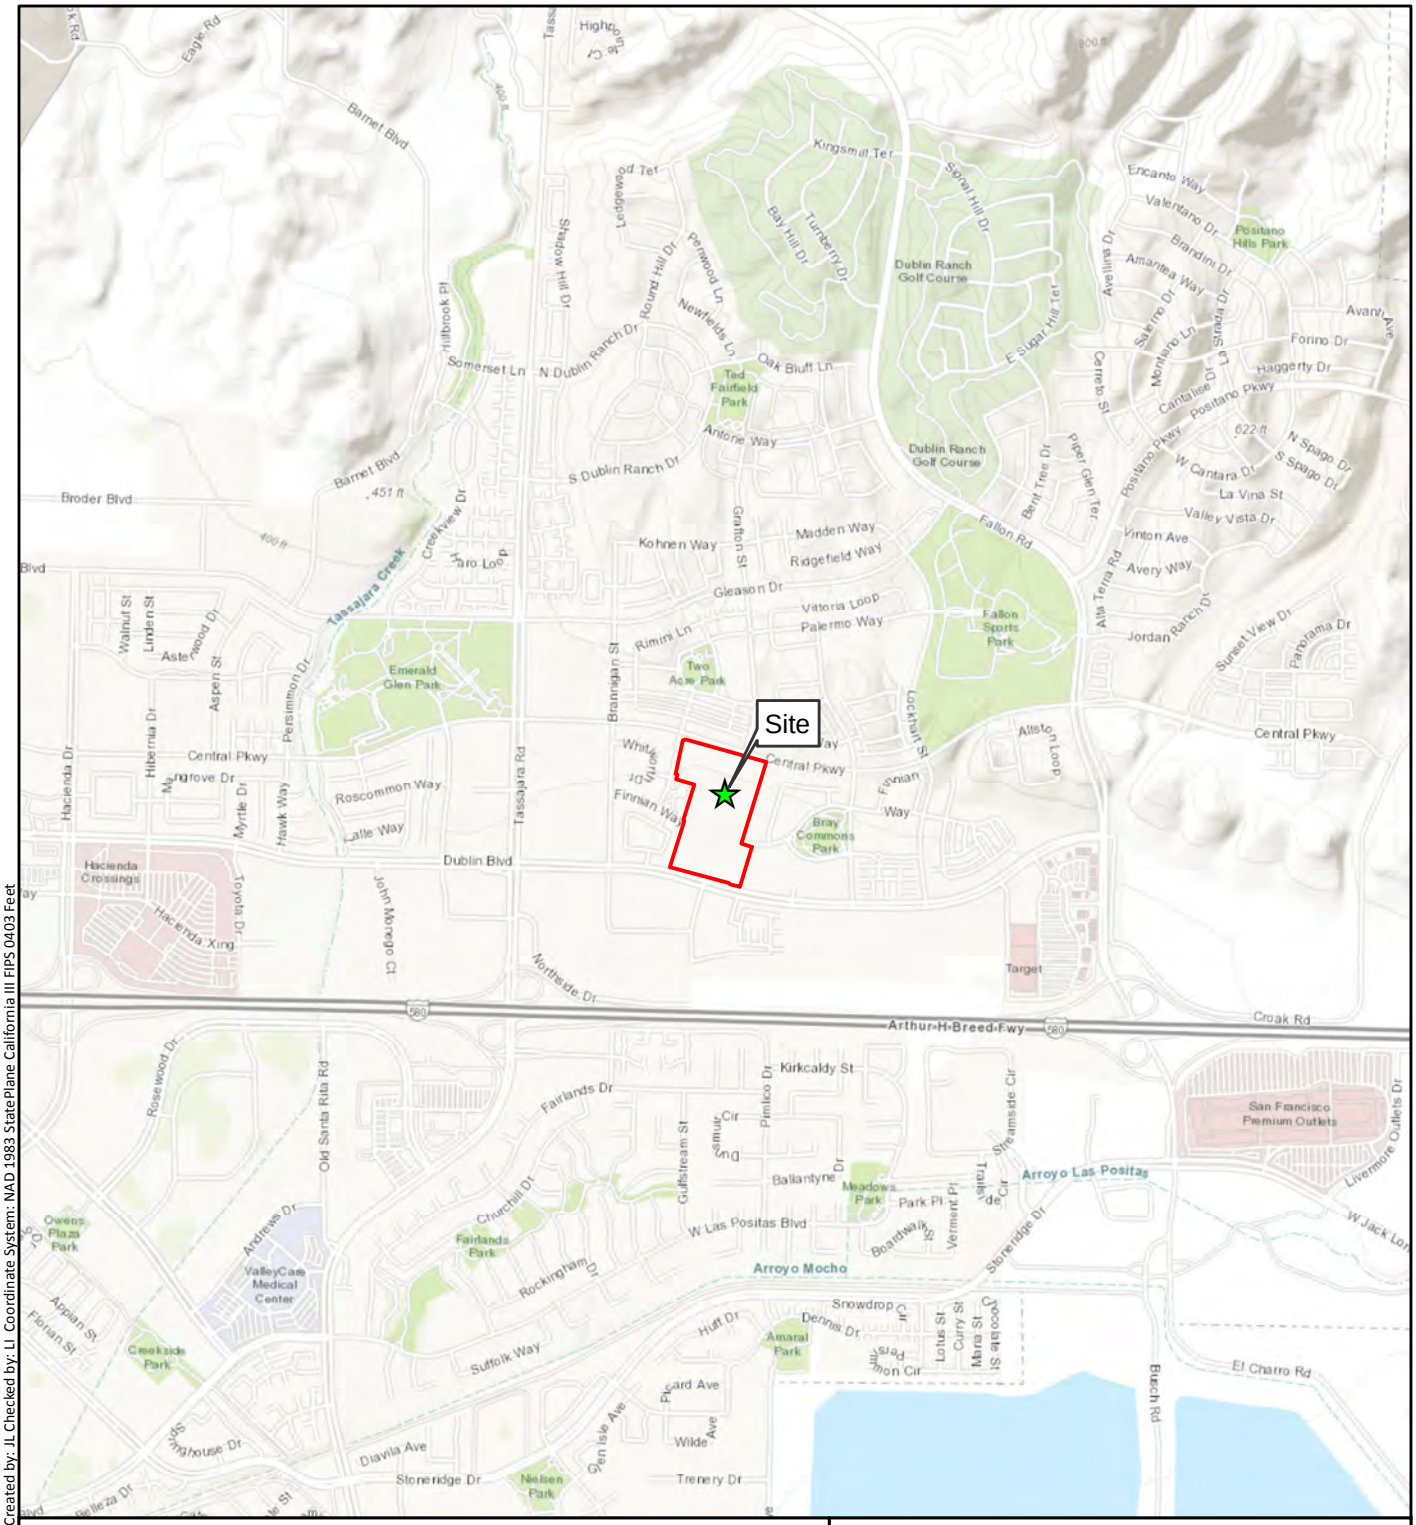
On behalf of the Dublin Unified School District ("the District"), Terraphase Engineering Inc. (Terraphase) has prepared this Phase II Investigation Report ("Phase II Report") for the former Promenade site located at the intersection of Dublin Boulevard and Chancery Lane in Dublin, California ("the Site"). The former Promenade site consists of approximately 24 acres of former agricultural land bounded to the north by Central Parkway, to the east by multi-tenant housing, to the south by Dublin Boulevard, and to the west by Chancery Lane (Figure 1). The District is nearing completion of negotiations to acquire the Site to construct the "New 2nd Comprehensive High School". The new school will provide 94 classrooms and have a capacity of 2,585 students.

Terraphase completed Phase I and II due diligence investigations of the Site on behalf of the District in 2018 and 2019.

This Phase II Report was prepared by Terraphase for submittal to the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) as part two of a Preliminary Endangerment Assessment (PEA) equivalent. Part one of the PEA equivalent, a Phase I Environmental Site Assessment (ESA) Report, was submitted to the DTSC with an Environmental Oversight Program Application Agreement application on November 8, 2019.

1.1 Purpose and Objectives

The Phase II Report is intended to identify whether a release or threatened release of hazardous substances exists at the Site and to evaluate the potential risk to human health and/or the environment.



The overall objectives of the Phase II include the following:

- Evaluate historical information regarding the past use, storage, disposal, or release of hazardous wastes and/or substances at the Site;
- Conduct a field sampling and analysis program to characterize the nature, concentration, and extent of any hazardous wastes and/or substances present at the Site; and
- Estimate the potential threat to public health and/or the environment posed by identified hazardous constituents at the Site using a residential land use scenario.

Using information developed during the Phase II and conservative human health risk evaluation, DTSC can make an informed decision regarding potential risks, if any, posed by the Site. Possible decisions that the DTSC can make include the following:

- The requirement for further assessment through the remedial investigation and feasibility study process if the Site is found to be significantly affected by hazardous substances;
- The need to perform a removal action for areas where localized impacts by hazardous substance(s) and/or release(s) are found; or

- Issuance of a "No Further Action" letter if the Site is found not to be affected or if risks to human health and the environment are found to be within acceptable levels based on the conservative screening-level risk assessment.

1.2 Scope of Work

The scope of the Phase II investigation is intended to address Recognized Environmental Conditions (RECs) identified in the Phase I ESA prepared for the Site by Terraphase dated April 29, 2019 (Terraphase 2019). The following RECs were identified in the Phase I ESA:

- Fill material was previously imported to the Site. Based on information reviewed (and presented in Section 2.0), it appears that the soil may have been imported from the surrounding area as part of development activities in the area that occurred prior to 2005. While Berlogar Geotechnical Consultants (BGC) and Berlogar Stevens (herein referred to as BGC) conducted sampling of the fill material brought to the Site, most of the soil samples were composited prior to analysis. Additionally, BGC did not collect samples of the fill for asbestos analysis.

- The Site was historically used for row crops; therefore, there is a potential for agricultural chemicals to be present in shallow native soil, beneath the layer of fill material imported to the Site. It is unlikely that the Site was ever irrigated. The underlying native soils were not assessed for organochlorine pesticides (OCPs) by BGC when fill samples were collected.

Based on the findings of the Phase I ESA, additional investigation of the Site was recommended to address the above RECs, as follows:

- Per DTSC Interim Guidance for Sampling Agricultural Properties, Third Revision (DTSC 2008), for sites that were dry-land farmed, one soil sample should be collected from each quadrant of the Site within the native soil. The samples should be analyzed for OCPs, lead, and arsenic.

- Soil samples of the import fill should be further assessed for total petroleum hydrocarbons (TPH), metals, semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and asbestos.

To meet the above objectives and address the RECs identified in the Phase I, Terraphase performed the following work:

- Advancement of 16 soil borings to depths ranging from 5 feet below ground surface (bgs) to 12 feet bgs, and collection of the following soil samples for analysis of the contaminants of potential concern (COPCs) identified at the Site:

  - 16 discrete samples from native soil, approximately 1.5 to 5 feet bgs, for analysis of OCPs, lead, and arsenic;

  - 1 discrete sample from native soil, approximately 1.5 feet bgs, for analysis of metals, PCBs, TPH, SVOCs, polycyclic aromatic hydrocarbons (PAHs), and asbestos;

DRAFT

- 15 discrete samples from imported fill, approximately 0.5 to 1.5 feet bgs, for analysis of metals, PCBs, TPH, SVOCs, PAHs, and asbestos;
- 4 four-point composite samples from the imported fill, approximately 0.5 to 1.5 feet bgs for analysis of OCPs, metals, PCBs, TPH, SVOCs, and PAHs; and
- 4 four-point composite soil samples from the native soil, approximately 1.5 to 5 feet bgs for analysis of OCPs and metals.

- Obtained analytical laboratory data from the soil samples of sufficient quality and detection limits to allow comparison to applicable residential screening levels for the Site. The applicable screening levels are presented in Section 4.6.
- Estimated the potential threat to public health and/or the environment posed by known hazardous constituents at the Site using a conservative unrestricted land use scenario.

1.3 Significant Assumptions

This report provides appropriate inquiry into the previous ownership and use of the Site consistent with good commercial and customary practice in an effort to minimize liability. Terraphase also assumes that the information provided by the District, previous landowners, the regulatory database provider, and regulatory agencies is true and reliable.

DRAFT

2.0 SITE DESCRIPTION

The Site is approximately 24 acres in size and is located on the corner of Dublin Boulevard and Chancery Lane. The property is identified with six separate Assessor's Parcel Numbers (APNs): APNs 985-78-2, 985-78-3, 985-78-4, 985-78-5, 985-78-6, and 985-78-7.

The Site was previously agricultural land, predominantly used for grazing. A housing project was started at the Site from 2005 to 2009. Utilities were installed and fill material was brought onto the Site, but the developers did not complete the project. A Site Map showing Site features is provided as Figure 2.

The Site is currently vacant commercial land and is owned by Grafton Station, LLC. Previous use codes indicate that the parcels were once part of a housing development project. Per the City of Dublin Zoning Land Use, the Site is zoned as a planned development (PD) and general land use as neighborhood commercial (NC).

The Site is surrounded by residential communities to the north (across Central Parkway), west (adjoining and across Chancery Lane), and east (adjoining), Devany Square park to the west, and vacant land to the southeast (across Dublin Boulevard). The Grafton Street retail center is located to the south-southwest of the Site (Figure 2).

The Site will be developed into a school containing approximately 94 classrooms with a capacity for 2,585 students.

2.1 Site Geology and Hydrogeology

According to information obtained in the Phase I ESA report (Terraphase 2019), the topography of the Site is relatively flat with a slight downward slope to the southwest. The elevation of the Site is approximately 356 feet above mean sea level.

The Site is located within the San Ramon Valley, a northwest-trending depression extending north from the western terminus of the Amador Valley structural basin which nearly bisects the Diablo Range of the Coast Range Geomorphic Province. The local topography consists of northwest-trending ridges and valleys dominated by the San Andreas Fault System where the ridges are typically composed of resistant sandstones or marine volcanics, and the valley areas are relatively deep alluvial deposits.

During the 2018 Phase II investigation at the Site, Terraphase observed black clayey sands and clays with organic material below the fill material at the Site up to 9.5 feet bgs. According to information provided in a PEA conducted for the nearby Dublin High School Campus, located approximately 3.4 miles to the northwest of the Site, the Site is underlain by alluvium deposited from the surrounding highlands during the Holocene (5,000 to 7,000 years before the present) to late Pleistocene (11,000 to 70,000 years before the present). The alluvium underlying the site consists of unconsolidated, permeable sand and silt generally extending 20 to 30 feet deep deposited over older, weakly-consolidated irregularly interbedded clay, silt, sand, and gravel. Permeability decreases in the older, more consolidated sediments compared to the surficial site soil (LFR 2008).

Site Map

FIGURE 2

File: K:\GIS\Prj\0098 DUSD\MXDs\Site Map_wFeatures.mxd 3/13/2019 Created by: JL Checked by: LI Coordinate System: NAD 1983 StatePlane California III FIPS 0403 Feet

Per the California Geological Survey's Fault Activity Map of California, the northwest-trending Calaveras Fault, which lies at the western edge of the San Ramon and Amador Valleys, is the nearest active fault and located approximately 3.5 miles west of the Site (CGS 2010). The Site does not lie within an Alquist-Priolo Special Studies Zone for known active faulting.

The nearest significant surface-water body is Tassajara Creek which is located approximately 0.8 mile west of the Site. The Site is located outside the 100- and 500-year flood plain areas.

According to LFR's 2008 PEA investigation report prepared for the nearby Dublin High School, groundwater may vary in depth as a result of seasonal variations and municipal withdrawal (LFR 2008). In an updated conceptual site model (CSM) prepared by ENGEO for a site approximately 0.2 mile northeast from the site, groundwater was present in thin, perched, laterally discontinuous lenses (ENGEO 2013). BGC reported that groundwater was present between 16.5 and 18 feet bgs on the Site at the time of their geotechnical investigation (BGC 2008). According to ENGEO's 2013 CSM, regional groundwater is expected to flow south-southwest considering the surface topography for the region, as interpreted from the Livermore Quadrangle map (ENGEO 2013).

2.2 Prior Site Assessments

Several investigations were conducted at the Site from 2008 to 2016 by BGC on behalf of the Toll Brothers. The results of previous analytical testing performed by BGC on samples of imported fill material were detailed in the Phase I ESA (Terraphase 2019) and are summarized below. Appendix A contains a Site Map showing the locations of the previous soil sampling locations. Analytical results from the previous Site assessments were compared to screening levels identified as the DTSC's Human and Ecological Risk Office (HERO) Modified Screening Levels (DTSC-SLs) provided in the DTSC HERO Note 3 (2018) for residential soil screening levels. These data were reviewed again however, as described in Section 6.0 using 2019 screening levels. Although arsenic was detected above screening levels, the detected concentration was within a range of background concentrations typically detected in Bay Area soil (Duverge 2011).

In 2009, BGC collected numerous soil/fill samples across the Site at depths of 0 to 1-foot bgs. Discrete samples were submitted for laboratory analysis of volatile organic compounds (VOCs), SVOCs, TPH-g, TPH-d, TPH-mo, OCPs, PCBs, and metals. Again, with the exception of arsenic, analytes were not detected above the screening levels defined above. In general, the detection limits were below the screening levels, with the exception of several SVOCs, which are detailed on Table 6 of the Phase I ESA (Terraphase 2019). Low levels of TPH-d and TPH-mo were detected in the soil samples (Table 2 of the Phase I ESA; Terraphase 2019), which BGC attributed to asphalt being present in the samples submitted for analysis. In October 2009, select locations from the September 2009 sampling were resampled and analyzed for TPH-d and TPH-mo. TPH-d and TPH-mo were not detected in the soil samples above the screening levels defined above (Table 2 of the Phase I ESA; Terraphase 2019).

In December 2016, BGC completed a Phase I ESA for the Site, and as part of the Phase I, soil sampling and analysis for general soil quality was performed. Samples were collected and submitted for analysis of VOCs, TPH-d, TPH-mo, OCPs, PCBs, metals, and SVOCs (Appendix A).

DRAFT

With the exception of arsenic, analytical results were consistent with previous investigations and were not detected above the screening levels defined above. Although arsenic was detected above screening levels, the detected concentration was within a range of background concentrations typically detected in Bay Area soil (Duverge 2011). In general, the detection limits were below the screening levels defined above, with the exception of several SVOCs, which are detailed on Table 6 of the Phase I ESA (Terraphase 2019).

The BGC Phase I did not identify any RECs or other indications of hazardous material contamination at the Site, and no further investigation was recommended.

2.3 Information Provided by the Current Owner Representative

Mr. James Tong with Grafton Street, LLC, the current owner's representative, was interviewed by Terraphase on March 14, 2019. Mr. Tong stated that he owned the property for 17 years. Historically, the property has been used for agricultural purposes, including hay production and grazing. Mr. Tong noted that no corrals, barns, or other structures related to agriculture were located on the property during his ownership. Mr. Tong reported that from 2005 to 2009, Toll Brothers set up a temporary sales office and construction trailers in the southern and northwestern portions of the Site for onsite and adjacent residential construction projects. However, no fueling or maintenance activities were conducted onsite. Clearance soil sampling, which was performed by BGC on behalf of the Toll Brothers, was conducted after the office trailers were removed from the property and is detailed in Section 2.2.

DRAFT

3.0 CURRENT ENVIRONMENTAL SETTING

3.1 Conceptual Site Model

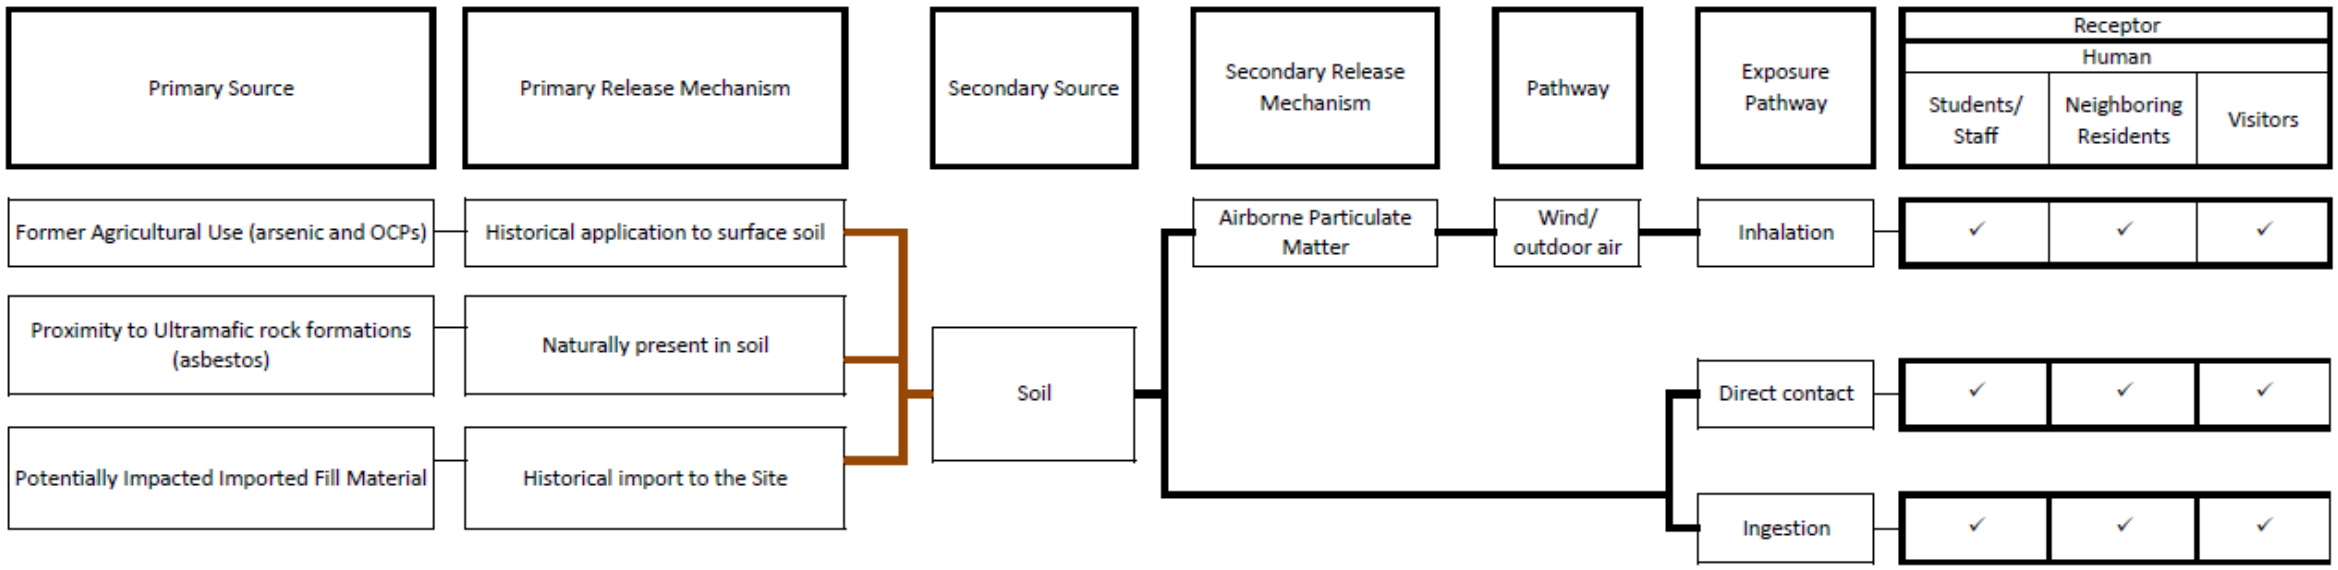
A CSM depicting the potential sources of contamination, transport mechanisms, exposure routes, and receptors is depicted on Figure 3. The current CSM identifies the potential sources of contamination discussed in Section 2.0. Potential exposure routes to the identified receptors include ingestion, inhalation, and/or direct contact with affected soil.

3.2 Factors Related to Soil Pathways

The Site is relatively flat with a slight downward slope to the southwest. The elevation of the Site is approximately 356 feet above mean sea level.

As detailed in Section 2.1, the Site is located in the Coast Ranges Geomorphic Province of California, an area characterized by a series of northwestern trending ridges and valleys dominated by the San Andreas Fault System.

The Site is currently fenced and vacant. The nearest current sensitive receptors to the Site are the local residences surrounding the Site. The possible routes of exposure for the surface soil pathway would be dermal contact and incidental soil ingestion.



3.3 Factors Related to Water Pathways

Currently, residual concentrations of COPCs are likely to be limited to shallow soil. Because the COPCs identified at the Site are related to surface soil releases, the potential for COPCs to impact groundwater at the Site is considered to be minimal. In addition, groundwater is not used as a drinking water source at the Site and no surface water features were identified at the Site. Therefore, no exposure pathways related to water were currently identified at the Site.

3.4 Factors Related to Air Pathways

Inhalation of chemically impacted dust that is not currently covered by pavement or landscaping is a potential exposure pathway.

4.0 SAMPLING ACTIVITIES

The following subsections describe the activities completed at the Site by Terraphase as part of the Phase II Investigation conducted in May 2018. The sampling locations are shown on Figures 4, 5, and 6. Soil samples collected as part of the Phase II investigation were submitted for laboratory analysis to Enthalpy Analytical (Enthalpy) in Berkeley, California, with the exception of soil samples analyzed for asbestos which were submitted to Forensic Analytical Laboratories (Forensic) located in Hayward, California.

4.1 Sampling Activities

A total of sixteen soil borings (SB-1 through SB-16) were advanced by Gregg Drilling, Inc., a California-licensed (C-57) driller under the supervision of Terraphase field personnel, for the collection of both imported fill samples and native soil samples. Borings SB-1 through SB-11 were advanced to a total depth of 5 feet bgs using a hand auger. SB-12 through SB-16 were advanced to 5 feet bgs using a hand auger and to total depths ranging from 6.5 feet bgs to 12 feet bgs using a direct-push rig equipped with a dual-tube sampling system (Appendix B).

Samples were collected from the 16 borings for both imported fill and native soil using a hand auger or dual-tube sampler. In addition to retaining discrete samples, the following discrete import fill and discrete native soil samples were composited for laboratory analysis (Figure 4):

<u>Import Fill Samples</u>

- Samples SB-2-0.5-F, SB-3-0.5-F and SB-4-1.5-F were composited as COMP-2-4-F;
- Samples SB-5-0.5-F, SB-6-1.5-F, SB-7-1.5-F and SB-8-1.5-F were composited as COMP-5-8-F;
- Samples SB-9-1.5-F, SB-10-1.5-F, SB-11-1.5-F and SB-12-1.5-F were composited as COMP-9-12-F; and
- Samples SB-13-1.5-F, SB-14-1.5-F, SB-15-1.5-F and SB-16-1.5-F were composited as COMP-13-16-F.

<u>Native Soil Samples</u>

- Samples SB-1-1.5-N, SB-2-1.5-N, SB-3-1.5-N and SB-4-5-N were composited as COMP-1-4-N;
- Samples SB-5-1.5-N, SB-6-5-N, SB-7-5-N and SB-8-5-N were composited as COMP-5-8-N;
- Samples SB-9-5-N, SB-10-5-N, SB-11-5-N and SB-12-5-N were composited as COMP-9-12-N; and
- Samples SB-13-5-N, SB-14-5-N, SB-15-5-N and SB-16-5-N were composited as COMP-13-16-N.

PROJECT: Phase II Investigation Report The New 2nd Comprehensive High School, Dublin, CA	
PROJECT NUMBER: 0098.003.002	FIGURE 4

File: K:\GIS\Prj\0098 DUSD\MXDs\Fig4_Sample Compositing Strategy.mxd 12/18/2019 Created by: JL Checked by: LI Coordinate System: NAD 1983 StatePlane California III FIPS 0403 Feet

At each boring location, soils were described by a Terraphase field geologist under the supervision of a Terraphase California-licensed Professional Geologist, in general accordance with the visual-manual procedures of the ASTM International Standard D2488 for guidance (ASTM International 2009) which is based on the Unified Soil Classification System (USCS). Borings logs are included in Appendix B. The soil samples were placed in laboratory-supplied glass jars.

4.1.1 Imported Fill Material Sampling

During the Phase II Investigation, the samples collected from the imported fill, from depths of approximately 0.5 to 1.5 feet bgs, were analyzed for the following:

- 4 four-point composite samples for analysis of OCPs by U.S. EPA Method 8081A; and
- 4 four-point composite samples and 15 discrete samples for analysis of metals by U.S. EPA Method 6010, PCBs by U.S. EPA Method 8082, TPH-d and TPH-mo by U.S. EPA Method 8015, SVOCs by U.S. EPA Method 8270, PAHs by U.S. EPA Method 8270C, and asbestos using the California Air Resources Board 435 polarized light microscopy 400 point count Method.

4.1.2 Native Soil Sampling

During the Phase II Investigation, the samples collected from the native soil, from depths of approximately 1.5 to 5 feet bgs, were analyzed for the following:

- 4 four-point composite soil samples for analysis of OCPs by U.S. EPA Method 8081A and metals by U.S. EPA Method 6010;
- 16 discrete samples for analysis of OCPs by U.S. EPA Method 8081A, lead and arsenic by U.S. EPA Method 6010; and
- 1 discrete sample for analysis of metals by U.S. EPA Method 6010, PCBs by U.S. EPA Method 8082, TPH-d and TPH-mo by U.S. EPA Method 8015, SVOCs by U.S. EPA Method 8270, PAHs by U.S. EPA Method 8270C, and asbestos using the California Air Resources Board 435 polarized light microscopy 400 point count Method.

4.2 Surveying

Terraphase located each sampling location using a Trimble GeoXH handheld global positioning system unit which has an approximate horizontal accuracy of +/- 30 centimeters during the field activities. Sampling locations are shown in Figures 5 and 6.

4.3 Decontamination Procedures

Equipment that came in contact with potentially contaminated soil was decontaminated and rinsed with distilled water before and between use at each sampling location. Disposable equipment intended for one-time use was packaged for appropriate disposal and was not

File: K:\GIS\Prj\0098 DUSD\MXDs\PEA Figures\Figure 5 - TPH-D & TPH-MO Concentrations.mxd 12/2/2019 Created by: JL Checked by: LI Coordinate System: NAD 1983 StatePlane California III FIPS 0403 Feet

decontaminated or reused. Non-disposable sampling devices used were decontaminated using the following procedures:

- Laboratory-grade detergent and tap water wash, in a 5-gallon plastic bucket, using a brush;
- Initial tap water rinse, in a 5-gallon plastic bucket; and
- Final deionized water rinse, in a 5-gallon plastic bucket.

At the completion of sampling activities, the rinse water was containerized in a Department of Transportation-approved 55-gallon steel drum with the drilling cuttings. The rinse water consisted of water, non-phosphate detergent, and a small amount of surface soil.

4.4 Investigation-Derived Waste Disposal

The investigation-derived waste was transported by American Integrated Services Inc. to the Potrero Hills Landfill located in Suisun, California, and disposed of as non-hazardous waste.

4.5 Sample Handling

Following sample collection, sample labels with unique identifiers were affixed to each sample container. Each sample was placed in a resealable plastic bag to keep the sample container and the label dry. All glass sample containers were protected with foam cushioning material and bubble wrap to prevent breakage.

Samples were packed securely in a cooler with a laboratory-supplied temperature blank. Wet ice (double-bagged in resealable bags) was added to the cooler in sufficient quantity to keep the samples cooled to at least 4 degrees Celsius, for the duration of the shipment to the laboratory.

A chain-of-custody (COC) record accompanied the sample shipment for laboratory analysis. The COCs recorded the contents of each shipment and maintained the custodial integrity of the samples. Information contained on the COC record included the sampler's name; date and project number of the sampling event; sample number; date and time of sample collection; sample type; number of containers associated with each sample; analyses requested; and the names, dates, and times of custody.

Completed COCs were provided with the samples and copies were included in the final analytical reports (Appendix C). No discrepancies were noted by the analytical laboratory.

Samples were received within the acceptable temperature range upon arrival at the laboratory. Samples were received in good condition and were analyzed within the proper holding times for the analyses requested.

4.6 Screening Levels

The applicable screening levels used to evaluate the Terraphase Phase II data include DTSC's HERO Modified Screening Levels (DTSC-SLs) provided in DTSC's HERO Note 3 for residential soil (DTSC 2019) or the EPA's RSLs for residential soil developed by the EPA for analytes that do not

DRAFT

have a DTSC-SL developed (EPA 2019). In addition, the SFRWQCB Tier 1 ESLs for residential soil were used as screening levels for TPH-d and TPH-mo (SFRWQCB 2019).

The residential DTSC-SL of 0.11 milligrams per kilogram (mg/kg) for arsenic is considered low and technically infeasible. Metals are naturally occurring and ubiquitous in soils and other geological materials of the San Francisco Bay Area. Multiple studies have been conducted to document background concentrations of arsenic in Bay Area soils.

The background concentration for Bay Area soils has been established as 11 mg/kg, which is the proposed upper estimate for background arsenic (99th percentile) within undifferentiated flatland soils of the Bay Area, in accordance with the 2011 *Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region* (Duverge 2011). The Terraphase Phase II soil data were evaluated using this accepted value for arsenic.

DRAFT

5.0 DISCUSSION OF SOIL SAMPLING RESULTS

The following sections describe the results of the Phase II investigation activities performed by Terraphase at the Site. Certified analytical laboratory reports and COC documentation are provided in Appendix C and analytical data are provided in Tables 1 through 16. Screening levels used in the discussion below were previously presented in Section 4.6.

5.1 Imported Fill Material Sampling Results

The analytical results for the imported fill material soil samples are summarized below and compared to their respective screening levels. The screening levels are presented in detail in the corresponding tables.

5.1.1 OCPs

Four 4-point composite samples from imported fill were analyzed for OCPs (Table 8). No OCPs were detected above their respective reporting limits. The reporting limits were at/or below the screening levels discussed in Section 4.6.

5.1.2 Metals

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for metals (Tables 2 and 9). Antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, vanadium, and/or zinc were detected above laboratory reporting limits at concentrations below the applicable screening levels.

5.1.3 Arsenic

Each of the 15 discrete samples and 4 composite samples analyzed for arsenic had concentrations above the reporting limit, ranging from 4.7 mg/kg to 6.5 mg/kg (Tables 2 and 9). However, all concentrations of arsenic in the discrete and composite fill samples were less than the established background concentration in Bay Area soils of 11 mg/kg (Duverge 2011).

5.1.4 PCBs

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for PCBs (Tables 3 and 10). Aroclor 1260 was detected in three of the discrete samples at concentrations ranging from 0.00078 mg/kg to 0.0012 mg/kg (Table 3), which are below the applicable screening level. No other PCBs were detected in the discrete or composite soil samples collected.

5.1.5 TPH

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for TPH-d and TPH-mo (Tables 4 and 11). Although concentrations of TPH-d (ranging from 3.3 mg/kg to 17 mg/kg) and TPH-mo (ranging from 22 mg/kg to 210 mg/kg) were detected in all soil samples, no concentrations detected were above the applicable ESLs of 260 mg/kg and 1,600 mg/kg, respectively.

DRAFT

5.1.6 PAHs

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for PAHs (Tables 6 and 13). No concentrations of PAHs were detected above laboratory reporting limits in any of the samples analyzed. However, the reporting limits for the following PAHs were higher than their respective screening levels, as shown on Tables 6 and 13.

- Benz(a)anthracene;
- Benzo(a)pyrene;
- Benzo(b)fluoranthene;
- Dibenz(a,h)anthracene; and
- Indeno(1,2,3-c,d)pyrene.

5.1.7 SVOCs

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for SVOCs (Tables 5 and 12). Bis(2-ethylhexyl)phthalate and 4-methylphenol were each detected in one discrete sample at concentrations of 0.015 mg/kg and 0.02 mg/kg, respectively, which are below the applicable screening criteria. No other SVOCs were detected at or above their respective reporting limits. However, the reporting limits for the following SVOCs were higher than their respective screening levels, as shown on Tables 5 and 12.

- 2,4-Dinitrotoluene;
- 2,6-Dinitrotoluene;
- 3,3-Dichlorobenzidine;
- 4,6-Dinitro-2-methylphenol;
- 4-Chloroaniline
- Bis(2-chloroethyl)ether;
- Hexachlorobenzene;
- Hexachlorocyclopentadiene;
- Hexachloroethane
- Nitrobenzene
- N-Nitrosodimethylamine;
- N-Nitrosodi-n-propylamine; and
- Pentachlorophenol.

5.1.8 Asbestos

Discrete samples from 15 locations, and four 4-point composite samples of imported fill were analyzed for asbestos. As shown on Tables 7 and 14 asbestos was not detected at or above the reporting limit of 0.25% in the fill samples.

DRAFT

5.1.9 Imported Fill Sampling Results Summary

Based on review of the analytical data, the imported fill material at the Site contains low concentrations of TPH-d, TPH-mo, metals, PCBs, and SVOCs. However, the detected COPC concentrations are below applicable screening levels, indicating that previous uses of the Site and/or the fill material have not resulted in impacts that adversely affect current site conditions.

5.2 Native Soil Sampling Results

The analytical results for the native soil samples are summarized below and compared to their respective screening levels. The screening levels are presented in detail in the corresponding tables.

5.2.1 OCPs

Discrete samples of native soil from 16 locations and four 4-point composite samples of native soil were analyzed for OCPs (Tables 1 and 8). Of the sixteen discrete samples, there was one detection of chlordane (trans) (gamma) at a concentration of 0.00014 mg/kg, and six detections of endrin aldehyde at concentrations ranging from 0.00042 to 0.0012 mg/kg, all of which are below their respective screening levels. No other OCPs were detected at or above their respective reporting limits or screening levels in the discrete or composite samples.

5.2.2 Metals

Discrete samples of native soil from 16 locations were analyzed for lead, as well as four 4-point composite samples (Tables 2 and 9). Additionally, one discrete sample and four 4-point composite samples were analyzed for metals. Each of the 16 discrete samples and 4 composite samples analyzed for lead had concentrations above the reporting limit, ranging from 7.5 mg/kg to 11 mg/kg. However, all concentrations of lead in the discrete native soil samples were less than the screening level of 80 mg/kg.

In the one discrete native soil sample and four composite samples analyzed for additional metals, antimony, barium, beryllium, cadmium, chromium, cobalt, copper, mercury, molybdenum, nickel, vanadium, and/or zinc were detected above laboratory reporting limits. However, no metal concentrations were above the applicable screening levels (Tables 2 and 9).

5.2.3 Arsenic

Each of the 16 discrete samples and 4 composite samples analyzed for arsenic had concentrations above the reporting limit, ranging from 2.3 mg/kg to 7.1 mg/kg. However, all concentrations of arsenic in the discrete native soil samples were less than the established background concentration for Bay Area soils of 11 mg/kg (Duverge 2011; Table 2).

5.2.4 PCBs

One discrete native soil sample was analyzed for PCBs. No concentrations of PCBs were detected above laboratory reporting limits in the sample (Table 3).

DRAFT

5.2.5 TPH

One discrete native soil sample was analyzed for TPH-d and TPH-mo (Table 4). TPH-d and TPH-mo were detected above the laboratory reporting limits at concentrations of 1.6 mg/kg and 12 mg/kg, respectively. Both concentrations are below SFRWQCB ESLs for TPH-d and TPH-mo of 260 mg/kg and 1,600 mg/kg, respectively.

5.2.6 PAHs

One discrete native soil sample was analyzed for PAHs. No concentrations of PAHs were detected above laboratory reporting limits in the sample (Table 6). However, the reporting limit for dibenz(a,h)-anthracene was higher than the respective screening level, as shown on Table 6.

5.2.7 SVOCs

One discrete native soil sample was analyzed for SVOCs. No concentrations of SVOCs were detected above laboratory reporting limits in the sample (Table 5). However, the reporting limits for the following SVOCs were higher than their respective screening levels, as shown on Table 5.

- 3,3-Dichlorobenzidine;
- Bis(2-chloroethyl)ether;
- Hexachlorobenzene;
- N-nitrosodi-n-propylamine; and
- N-nitrosodimethylamine.

5.2.8 Asbestos

One discrete native soil sample was analyzed for asbestos. As shown on Table 7 asbestos was not detected at or above the reporting limit of 0.25% in the native soil samples.

5.2.9 Native Soil Sampling Results Summary

Based on a review of the data collected, the native soil at the Site does not contain COPCs at concentrations exceeding risk-based screening criteria. OCPs were not detected above screening criteria, and arsenic concentrations were consistent with background concentrations for Bay Area soils, suggesting that previous agricultural activities at the Site did not significantly impact the site soils.

DRAFT

6.0 HUMAN HEALTH SCREENING EVALUATION

6.1 Soil Exposure Pathways

As discussed in the preceding sections, the Site is proposed for development of a school. The receptor population for this future use would include school children, staff, and visitors. However, potential future land use of the Site was assumed to be residential which, given the exposure time frame assumption (24 hours per day; 350 days per year; for 26 years) is a significantly more conservative assumption than 4-year occupancy during high school years use. It should be noted that the Site is not currently used for residential purposes, and the District does not intend at any time for the property to be used for residential purposes.

COPCs detected in soil at the Site during previous investigations and/or the Phase II conducted in 2018 include metals, OCPs, PCBs, TPH, VOCs, and SVOCs. Under the hypothetical future unrestricted use scenario, the potential exposure scenarios for these chemicals in soil are through direct contact (i.e., incidental ingestion of and dermal contact with surface soil) and inhalation of soil-derived windborne particulates.

6.2 Exposure Concentrations and Chemicals in Soil

The COPCs in soil considered for the human health screening evaluation and risk/hazard characterization conservatively included any chemical detected in at least one soil sample collected from the Site during previous investigations and/or this Phase II Investigation, with the exception of arsenic. Although arsenic was detected above screening levels, the detected concentration was within a range of background concentrations typically detected in Bay Area soil (Duverge 2011). Results from previous investigation are included in Appendix D.

Table 15 presents the list of chemicals detected in onsite fill and/or native soil and identifies which of those chemicals were included as COPCs for the human health screening evaluation and risk/hazard characterization. The maximum detected concentration of each COPC was conservatively used as the exposure point concentration (EPC).

6.3 Screening Levels

As discussed in Section 4.6, the screening levels in soil were generally identified as the DTSC-SLs provided in DTSC's HERO Note 3 for residential soil (DTSC 2019) or the EPA's RSLs for residential soil developed by the EPA for COPCs that do not have a DTSC-SL developed (EPA 2019). The SFRWQCB Tier 1 ESLs for residential soil were used as screening levels for TPH-d, and TPH-mo (SFRWQCB 2019). Human health risks from lead in soil at the Site were evaluated using default residential soil screening level of 80 mg/kg derived by DTSC using DTSC's Lead Risk Assessment Spreadsheet.

6.4 Toxicity Values

The screening levels described in Section 5.3 were utilized to perform the human health screening evaluation and risk/hazard characterization for COPCs; therefore, the selection and compilation of specific toxicity values was not necessary.

DRAFT

6.5 Soil Risk/Hazard Characterization Summary

A risk/hazard screening evaluation was performed for the Site. In doing so, estimated cumulative cancer risks associated with potential human exposure to COPCs in soil at the Site were compared to the cumulative risk management goal of 1 in 1 million (i.e., 1 x 10^{-6}) for supporting decisions regarding the Site. Similarly, the estimated noncancer hazard index (HI) associated with potential human exposure to COPCs in soil at the Site was compared to the noncancer HI risk management goal of 1.0. In order to evaluate potential human exposures to lead in soil, concentrations detected were compared to DTSC's generic residential screening level of 80 mg/kg.

Overall, the risks from COPCs were evaluated and then combined to obtain an upper-bound estimate of cumulative cancer risk and noncancer HI for the Site. To streamline the risk calculations, single-chemical cancer risks and noncancer hazard quotients (HQs) were calculated by comparing the EPC to the carcinogenic and non-carcinogenic-based screening levels for each COPC as follows:

For a carcinogenic chemical:

$$\frac{EPC}{Cancer - Based\ Screening\ Level} x\ 10^{-6} = Chemical\ Cancer\ Risk$$

For a non-carcinogenic chemical:

$$\frac{EPC}{Noncancer - Based\ Screening\ Level} = Hazard\ Quotient$$

The single-chemical cancer risks and noncancer HQs were then summed to obtain cumulative cancer risks and noncancer HIs, respectively.

Lead in soil was evaluated separately by comparing to DTSC's generic default screening level as discussed below.

6.6 Cumulative Risk Screening Summary

As shown on Table 16, the estimated upper-bound cumulative cancer risk for exposure to COPCs in soil at the Site is 1.8 x 10^{-6}, which is slightly above the cumulative cancer risk management goal of 1.0 x 10^{-6}. The estimated upper-bound noncancer HI for exposure to COPCs in soil is 0.9 which is below the noncancer HI risk management goal of 1.0.

6.6.1 Lead in Soil Risk Screening Summary

The EPC for lead was conservatively defined as the maximum detected concentrations in the Phase II soil samples, or 11 mg/kg. This EPC is below the screening level of 80 mg/kg.

DRAFT

6.7 Uncertainty Analysis

Potential future land use of the Site was assumed to be residential regardless of the actual proposed use. Because the planned future use of the Site is a school, the assumption of an unrestricted land use likely overestimates the risks for the intended future use of the Site.

Due to limitation of available scientific data and in the amount and type of site investigation data collected, every risk assessment will have some degree of uncertainty. Uncertainties in exposure parameter assumptions are related to the general lack of quantitative studies describing important aspects of human behavior such as incidental soil ingestion rates (particularly adults), length of time spent at one residence, time spent outdoors, etc. In general, this uncertainty has been dealt with by erring on the conservative side and using upper-bound exposure assumptions that will tend to overestimate the exposure occurring to most individuals.

Incorporating slightly less conservative exposure parameters into the assessment would reduce the predicted carcinogenic risk considerably. In addition, the predicted risks and hazards are based on the maximum COPC concentrations detected in the soil samples that were collected during this Phase II. This significantly conservative assumption results in an overestimation of health risks.

Important uncertainties in toxicity criteria include: 1) the complete absence of reference doses or colony-stimulating factors for some chemicals, 2) the lack of an adequate toxicological basis for some toxicity criteria, 3) the uncertainty associated with applying oral route toxicity criteria to the inhalation route or dermal route, and 4) the complete lack of toxicity criteria for the dermal route. The general lack of toxicity criteria based on a solid database of underlying toxicological data results in a reduced ability to accurately quantify both non-cancer and cancer risks. This may result in both under- and over-estimation of health risks.

In addition, although PAHs and SVOCs (except for one detection each of bis-[2-ethylhexylphthalate and 4-methylphenol) were not detected in soil samples above the reporting limits, the reporting limits for several SVOCs and PAHs exceeded the screening criteria as summarized in Section 5.0. Given that PAHs and SVOCs were not detected in the majority of soil samples collected from the Site at concentrations exceeding the reporting limits, and the reporting limits were below the screening criteria in those samples, it is unlikely that PAHs and/or SVOCs are present in soil at the Site at concentrations exceeding screening criteria; therefore, PAHs and SVOCs were not included in the risk estimate calculations, except for bis(2-ethylhexyl)phthalate and 4-methylphenol.

DRAFT

7.0 ECOLOGICAL SCREENING EVALUATION

The Site will be developed into a future school site. Proposed redevelopment activities would not maintain any potential wildlife habitat on the Site. Therefore, an ecological screening evaluation was not completed for the Site given its intended future use.

7.1 Biological Characterization

The Site is currently vacant and undeveloped and is proposed for development for use as a school. The existing site conditions and proposed development activities would not maintain any potential wildlife habitat on the Site.

7.2 Ecological Pathway Assessment

Because the Site would not have significant numbers of wildlife based on proposed development activities, no assessment of potential exposure to sensitive ecological receptors is necessary.

7.3 Ecological Screening Evaluation Summary

An ecological screening evaluation was not conducted for the Site given its current condition and intended future use.

DRAFT

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 Conclusions

During the Terraphase Phase II investigation, soil sampling was performed based on RECs identified in the Phase I ESA (Terraphase 2019). These REC's were developed after review of extensive soil sampling conduct at the site on behalf of the former owner by BGC, and was intended to supplement and confirm their results. Shallow native soil samples and import fill samples were collected from approximately evenly spaced areas across the Site and analyzed for OCPs, metals, PCBs, TPH, SVOCs, PAHs, and asbestos. As summarized in Tables 1 through 14, COPCs were not detected in native soil or imported fill at levels exceeding conservative risk-based screening values for residential land use, with the exception of arsenic. However, all detections of arsenic in native soil and imported fill were below the established background concentration for arsenic in Bay Area soils of 11 mg/kg (Duverge 2011).

The risk/hazard characterization assumes potential human exposure under the very conservative residential use scenario. Based on the results of previous and Phase II investigations, and associated preliminary human health screening, the estimated upper-bound cumulative cancer risk for exposure to COPCs in soil at the Site is 1.8×10^{-6}, which is only slightly above the cumulative cancer risk management goal of 1.0×10^{-6}. The estimated upper-bound noncancer HI for exposure to COPCs in soil is 0.9 which is below the noncancer HI risk management goal of 1.0. Therefore, the upper-bound risk and HI estimates for residential exposure to soil would not pose an unacceptable risk to human health, especially given the significantly lower exposure time frame assumptions used in the residential exposure evaluation (24 hours per day; 350 days per year; for 26 years).

8.2 Data Gaps

A data gap is a lack or inability to obtain information required despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required. No significant data gaps were identified.

8.3 Recommendations

Based on the results of previous investigations as well as the Phase II investigation, no further action is recommended for the Site. Terraphase recommends that the DTSC consider the issuance of a "No Further Action" determination for the Site.

Depth (feet)	Sample Type	Sample Number	Material Type	Graphic Log	MATERIAL DESCRIPTION	REMARKS AND OTHER TESTS
1	2	3	4	5	6	7

COLUMN DESCRIPTIONS

1 Depth (feet): Depth in feet below the ground surface.
2 Sample Type: Type of soil sample collected at the depth interval shown.
3 Sample Number: Sample identification number.
4 Material Type: Type of material encountered.
5 Graphic Log: Graphic depiction of the subsurface material encountered.
6 MATERIAL DESCRIPTION: Description of material encountered. May include consistency, moisture, color, and other descriptive text.
7 REMARKS AND OTHER TESTS: Comments and observations regarding drilling or sampling made by driller or field personnel.

FIELD AND LABORATORY TEST ABBREVIATIONS

CHEM: Chemical tests to assess corrosivity
COMP: Compaction test
CONS: One-dimensional consolidation test
LL: Liquid Limit, percent
PI: Plasticity Index, percent
SA: Sieve analysis (percent passing No. 200 Sieve)
UC: Unconfined compressive strength test, Qu, in ksf
WA: Wash sieve (percent passing No. 200 Sieve)

MATERIAL GRAPHIC SYMBOLS

AF
SILT, SILT w/SAND, SANDY SILT (ML)
Low plasticity PEAT (OL)

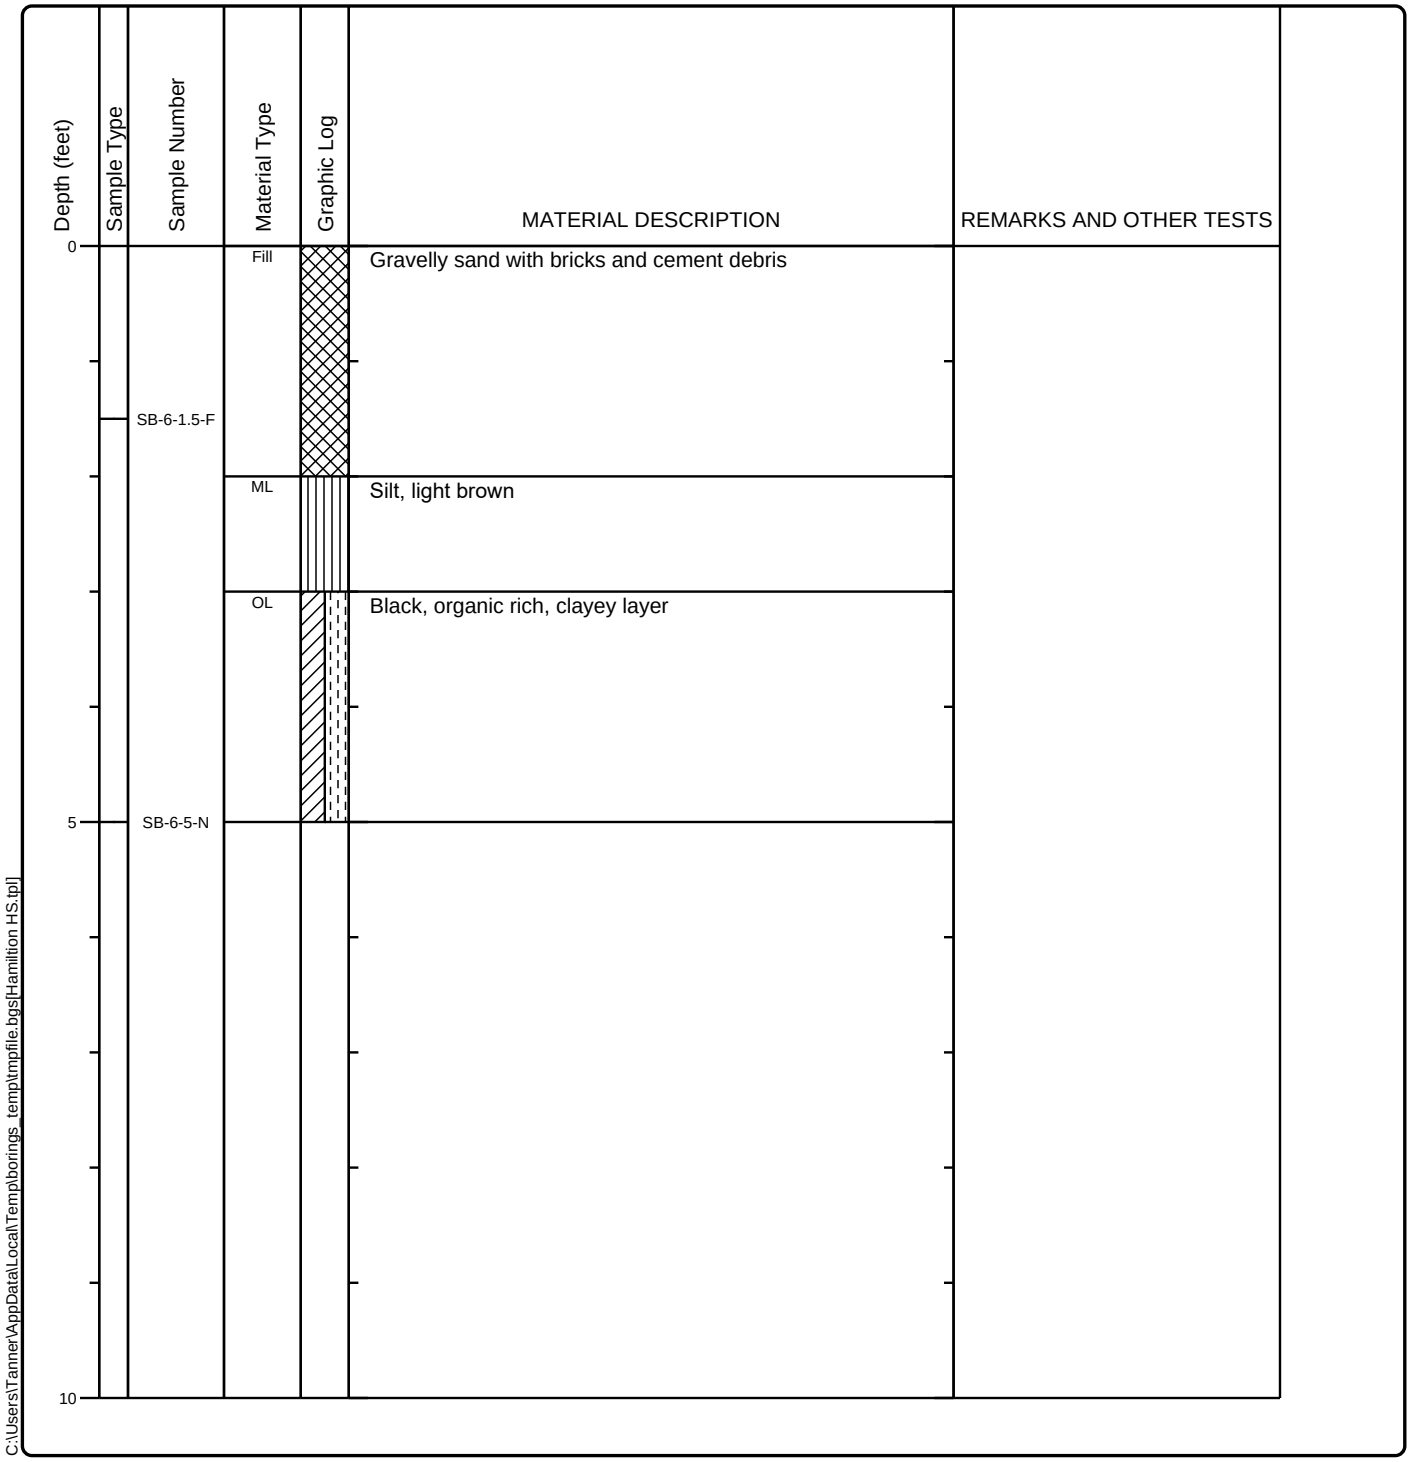
TYPICAL SAMPLER GRAPHIC SYMBOLS

Auger sampler
Bulk Sample
3-inch-OD California w/ brass rings
CME Sampler
Grab Sample
2.5-inch-OD Modified California w/ brass liners
Pitcher Sample
2-inch-OD unlined split spoon (SPT)
Shelby Tube (Thin-walled, fixed head)

OTHER GRAPHIC SYMBOLS

Water level (at time of drilling, ATD)
Water level (after waiting)
Minor change in material properties within a stratum
Inferred/gradational contact between strata
Queried contact between strata

GENERAL NOTES



1: Soil classifications are based on the Unified Soil Classification System. Descriptions and stratum lines are interpretive, and actual lithologic changes may be gradual. Field descriptions may have been modified to reflect results of lab tests.
2: Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or times.

Sheet 1 of 1

Depth (feet)	Sample Type	Sample Number	Material Type	Graphic Log	MATERIAL DESCRIPTION	REMARKS AND OTHER TESTS
1	2	3	4	5	6	7

COLUMN DESCRIPTIONS

1 Depth (feet): Depth in feet below the ground surface.
2 Sample Type: Type of soil sample collected at the depth interval shown.
3 Sample Number: Sample identification number.
4 Material Type: Type of material encountered.
5 Graphic Log: Graphic depiction of the subsurface material encountered.
6 MATERIAL DESCRIPTION: Description of material encountered. May include consistency, moisture, color, and other descriptive text.
7 REMARKS AND OTHER TESTS: Comments and observations regarding drilling or sampling made by driller or field personnel.

FIELD AND LABORATORY TEST ABBREVIATIONS

CHEM: Chemical tests to assess corrosivity
COMP: Compaction test
CONS: One-dimensional consolidation test
LL: Liquid Limit, percent
PI: Plasticity Index, percent
SA: Sieve analysis (percent passing No. 200 Sieve)
UC: Unconfined compressive strength test, Qu, in ksf
WA: Wash sieve (percent passing No. 200 Sieve)

MATERIAL GRAPHIC SYMBOLS

SILT, SILT w/SAND, SANDY SILT (ML)
Clayey SAND (SC)
Poorly graded SAND with Clay (SP-SC)

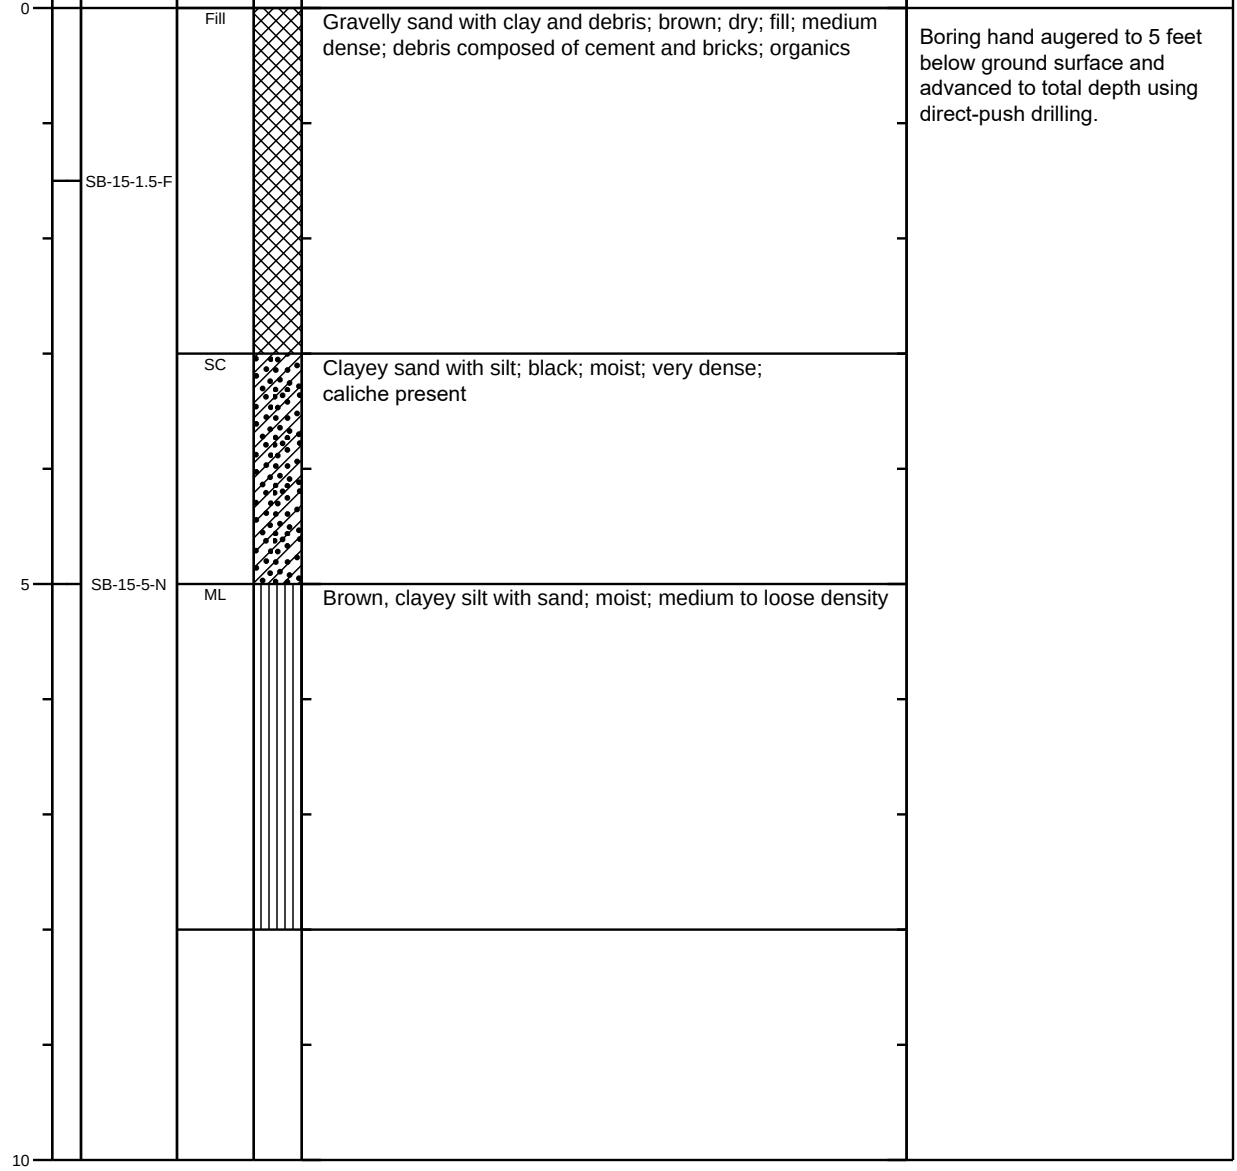
TYPICAL SAMPLER GRAPHIC SYMBOLS

Auger sampler
Bulk Sample
3-inch-OD California w/ brass rings
CME Sampler
Grab Sample
2.5-inch-OD Modified California w/ brass liners
Pitcher Sample
2-inch-OD unlined split spoon (SPT)
Shelby Tube (Thin-walled, fixed head)

OTHER GRAPHIC SYMBOLS

Water level (at time of drilling, ATD)
Water level (after waiting)
Minor change in material properties within a stratum
Inferred/gradational contact between strata
Queried contact between strata

GENERAL NOTES



1: Soil classifications are based on the Unified Soil Classification System. Descriptions and stratum lines are interpretive, and actual lithologic changes may be gradual. Field descriptions may have been modified to reflect results of lab tests.
2: Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or times.

CASE NARRATIVE

Laboratory number:	**300550**
Client:	**Terraphase Engineering**
Project:	**0098.003.001**
Location:	**DUSD Promenade**
Request Date:	**06/18/18**
Samples Received:	**05/30/18**

This data package contains sample and QC results for fifteen soil samples, requested for the above referenced project on 06/18/18. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):
SB-9-1.5-F (lab # 300550-008), SB-11-1.5-F (lab # 300550-010), and SB-15-1.5-F (lab # 300550-014) were diluted due to the dark and viscous nature of the sample extracts. No other analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
Matrix spikes QC935647,QC935648 (batch 260436) were not reported because the parent sample required a dilution that would have diluted out the spikes. High recoveries were observed for 2,4-dinitrotoluene and 4-nitrophenol in the LCS for batch 260436; these analytes were not detected at or above the RL in the associated samples. High surrogate recovery was observed for phenol-d5 in SB-5-0.5-F (lab # 300550-004); no target analytes were detected in the sample. High surrogate recoveries were observed for terphenyl-d14 in SB-3-0.5-F (lab # 300550-002) and SB-5-0.5-F (lab # 300550-004); no target analytes were detected in these samples. Many samples were diluted due to the dark and viscous nature of the sample extracts. No other analytical problems were encountered.

PCBs (EPA 8082):
All samples underwent sulfuric acid cleanup using EPA Method 3665A. All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. Matrix spikes QC935535,QC935536 (batch 260410) were not reported because the parent sample required a dilution that would have diluted out the spikes. Many samples were diluted due to the color of the sample extracts. No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
A number of analytes were detected between the MDL and the RL in the method blank for batch 260616. No other analytical problems were encountered.

CARB 435 Asbestos (CARB 435):
Forensic Analytical in Hayward, CA performed the analysis (not NELAP certified). Please see the Forensic Analytical case narrative.

To: Tracy Babjar <tracy.babjar@enthalpy.com>

Hi Tracy,

We would like to proceed with analyzing the extracts for all the samples presented in the login below (300550) for the following analytes:

- TPHd and TPHmo by 8015
- SVOCs by 8270
- PCBs by 8082

We would also like to analyze this same list of samples for the following:

- Title 22 Metals by 6010
- Asbestos by CARB 435

We would like these analyzed on a standard turn around time.

Thanks,

Daren

Cc: Andy Lojo <andrew.lojo@terraphase.com>

Hi Tracy,

We would like to have the **extraction** completed for **SVOCs, TPHd/TPHmo, and PCBs** for select samples from the subject sample group. This will apply to the following samples:

1- • SB-2-0.5-F -028
2- • SB-3-0.5-F -027
3- • SB-4-1.5-F -026
4- • SB-5-0.5-F- 020
5- • SB-6-1.5-F -019
6- • SB-7-1.5-F -018
7- • SB-8-1.5-F -017
8- • SB-9-1.5-F -009
9- • SB-10-1.5-F -010
10- • SB-11-1.5-F -011
11- • SB-12-1.5-F -012
12- • SB-13-1.5-F -001
13- • SB-14-1.5-F- 002
14- • SB-15-1.5-F -003
15- • SB-16-1.5-F -004

Please prioritize the extractions from the samples that were collected on 5/29 on Monday, and then complete the extractions from the samples collected on 5/30 to avoid missing the hold times for any of these samples.

Let me know if you have any questions.

Thanks,

Daren

SAMPLE RECEIPT CHECKLIST

Section 1: Login # 300213 Client: Terraphase

Date Received: 5.30.18 Project: DUSD Promenade

Section 2: Samples received in a cooler? ☑ Yes, how many? 4 ☐ No (skip Section 3 below)

If no cooler Sample Temp (°C): _____ using IR Gun # ☐ A, or ☐ B

☐ Samples received on ice directly from the field. Cooling process had begun

If in cooler: Date Opened 5.30.18 By (print) KP (sign) KP

Shipping info (if applicable) _____

Are custody seals present? ☑ No, or ☐ Yes. If yes, where? ☐ on cooler, ☐ on samples, ☐ on package

☐ Date: _____ How many _____ ☐ Signature, ☐ Initials, ☐ None

Were custody seals intact upon arrival? ☐ Yes ☐ No ☐ N/A

Section 3: ***Important*: Notify PM if temperature exceeds 6°C or arrive frozen.**

Packing in cooler: (if other, describe) _____

☐ Bubble Wrap, ☐ Foam blocks, ☑ Bags, ☐ None, ☐ Cloth material, ☐ Cardboard, ☐ Styrofoam, ☐ Paper towels

☐ Samples received on ice directly from the field. Cooling process had begun

Type of ice used: ☐ Wet, ☐ Blue/Gel, ☐ None Temperature blank(s) included? ☑ Yes, ☐ No

Temperature measured using ☐ Thermometer ID: _____, or IR Gun # ☐ A ☒ B

Cooler Temp (°C): #1: 2.3, #2: 1.6, #3: 1.1, #4: 3.8, #5: _____, #6: _____, #7: _____

Section 4:	YES	NO	N/A
Were custody papers dry, filled out properly, and the project identifiable			
Were Method 5035 sampling containers present?		X	
If YES, what time were they transferred to freezer?			
Did all bottles arrive unbroken/unopened?	X		
Are there any missing / extra samples?		X	
Are samples in the appropriate containers for indicated tests?	X		
Are sample labels present, in good condition and complete?	X		
Does the container count match the COC?	X		
Do the sample labels agree with custody papers?		X	
Was sufficient amount of sample sent for tests requested?	X		
Did you change the hold time in LIMS for unpreserved VOAs?			X
Did you change the hold time in LIMS for preserved terracores?			X
Are bubbles > 6mm absent in VOA samples?			X
Was the client contacted concerning this sample delivery?			
If YES, who was called? By Date:			

Section 5:	YES	NO	N/A
Are the samples appropriately preserved? (If N/A, skip the rest of section 5)			X
Did you check preservatives for all bottles for each sample?			
Did you document your preservative check?			

pH strip lot# _____, pH strip lot# _____, pH strip lot# _____

Preservative added:

☐ H2SO4 lot# _____ added to samples _____ on/at _____

☐ HCL lot# _____ added to samples _____ on/at _____

☐ HNO3 lot# _____ added to samples _____ on/at _____

☐ NaOH lot# _____ added to samples _____ on/at _____

Section 6:

Explanations/Comments: Sample 2 - time (sample) doesn't match COC → ID & date matched

Sample 20 - sample time doesn't match COC → ID & date matched

Sample 24 & 25 - sample ID doesn't completely match COC, missing "N"

Sample 30 & 34 - sample labels were wrong, called client to figure out which sample was ~~empty~~ which since the 2 small jars have the same label & 2 large jars had same label instead of 1 large jar & 1 small jar per the rest of the job.

Date Logged In 5/31/18 **By (print)** KP **(sign)** KP

Date Labeled 5/31/18 **By (print)** KP **(sign)** KP

Bulk Asbestos Material Analysis

(Air Resources Board Method 435, June 6, 1991)

Enthalpy Analytical LLC
Tracy Babjar
2323 Fifth St.

Berkeley, CA 94710

Client ID: 1137
Report Number: N010694
Date Received: 06/19/18
Date Analyzed: 06/22/18
Date Printed: 06/22/18

Job ID/Site: 300550 - DUSD Promenade

PLM Report Number: N/A

FALI Job ID: 1137
Total Samples Submitted: 15
Total Samples Analyzed: 15

Sample Preparation and Analysis:

Samples were analyzed by the Air Resources Board's Method 435, Determination of Asbestos Content of Serpentine Aggregate. Samples were ground to 200 particle size in the laboratory. Approximately 1 pint was retained for analysis. Samples were prepared for observation according to the guidelines of Exception I and Exception II as defined by the 435 Method. Samples which contained less than 10% asbestos were prepared for observation according to the point count technique as defined by the 435 Method. This analysis was performed with a standard cross-hair reticle.

Sample ID	Lab Number	Layer Description
SB-2-0.5-F	12045832	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
SB-3-0.5-F	12045833	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
SB-4-1.5-F	12045834	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
SB-5-0.5-F	12045835	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.
